Illinois Environmental Protection Agency (IEPA)
Notice of Water Discharge Permit Public Hearing
NPDES Permit No. IL0077666

Exhibit 1

Williamson Energy, L.L.C.
Pond Creek Mine No. 1
Williamson and Franklin Counties

Public Hearing
Wednesday, December 18, 2019 6:00pm

Diamond Club, Rent One Park
1000 Miners Drive
Marion, Illinois 62959

The Illinois EPA Bureau of Water has prepared a draft renewed National Pollutant Discharge Elimination System (NPDES) permit with modifications for Williamson Energy, L.L.C., whose mailing address is P.O. Box 300, Johnston City, IL 62951. The Pond Creek Mine facility is located approximately four miles east of Johnston City in Williamson and Franklin Counties and proposes to discharge into Pond Creek, unnamed tributaries of Pond Creek, and into the Big Muddy River. Additional information is available online at https://www2.illinois.gov/epa/public-notices/npdes-notices/Pages/default.aspx (please enter IL0077666 in the search box above "Posting Data").

The Illinois EPA is holding a hearing to accept comments from the public on the proposed reissuance of a permit with modifications for this project, prior to making a final decision on the permit application. Issues relevant to this proceeding include the antidegradation analysis and the applicant's compliance with requirements of the federal Clean Water Act and Subtitles C and D, 35 Ill. Adm. Code. Issues related to the mining operations are not relevant in this proceeding and should be directed to the Illinois Department of Natural Resources, Office of Mines and Minerals.

The applicant operates surface facilities for an underground coal mine (SIC 1222). Mine operations result in the discharge of alkaline and acid mine drainage.

Comments are invited on the draft reissued permit which incorporates the following modifications:

1. Addition of three new outfalls designated as Outfall Numbers 009, 009ES, and 011;
2. Incorporation of various mining operation and drainage control plan revisions;
3. Incorporation of 229.78 acres for new Disposal Area Number 3;
4. Incorporation of 70.7 acres for a pipeline to the Big Muddy River;
5. Incorporation of 145.32 acres for Incidental Boundary Revisions (IBR's).
6. Addition of bi-annual metals monitoring for Outfall Numbers 006, 007, 008, 009, 009ES, and 011; and,
7. Incorporation of previously-issued State Construction and Operating Permits.

The Illinois EPA has made a tentative determination to reissue this NPDES permit with modifications for discharge into waters of the state in accordance with 35 Ill. Adm. Code Subtitle C (Water Pollution),

Subtitle D (Mine Related Water Pollution), the Illinois Environmental Protection Act and the federal Clean Water Act. The draft NPDES permit and the public notice/fact sheet were public noticed on July 12, 2019. The antidegradation assessment, which is part of the public notice, and other documents for this proceeding can be viewed on the IEPA website: https://www2.illinois.gov/epa/public-notices/npdes-notices/Pages/default.aspx (please enter IL0077666 in the search box above "Posting Data").

The draft permit, public notice/fact sheet, the regulations governing the conduct of the hearing and other documents can be reviewed and copied at the Illinois EPA, 1021 N. Grand Avenue East, Springfield, Illinois; 217-782-0610. Please call ahead for an appointment.

For information or requests about the draft permit, please contact: Barb Lieberoff, Office of Community Relations, Illinois EPA, 1021 N. Grand Ave. East, P.O. Box 19276, Springfield, IL 62794-9276, 217/524-3038 or by email at barb.lieberoff@illinois.gov

The hearing will be conducted under 35 Ill. Adm. Code 166 in accordance with provisions of 35 Ill. Adm. Code 309.115 through 309.119. Requests for special needs interpreters must be made to the Illinois EPA hearing officer by November 22, 2019. The hearing record is a file containing the hearing transcript and written comments. **Written comments must be physically received by January 17, 2020; mailed comments must be postmarked in sufficient time to arrive at Illinois EPA by January 17, 2020 when the hearing record closes.**

E-mails with written comments must be sent to epa.publichearingcom@illinois.gov and should specify **Pond Creek Mine or IL0077666 in the subject line**. Email comments originating on third party systems or servers intended for submittal of multiple emails of the same or nearly the same content will not be accepted without prior written approval from the hearing officer, Christine Zeivel, Christine.Zeivel@illinois.gov. Comments need not be notarized and should be sent to:

Exhibit 2

NPDES Permit No. IL0077666
Notice No. 7516c

Public Notice Beginning Date: **July 12, 2019**

Public Notice Ending Date: **August 12, 2019**

National Pollutant Discharge Elimination System (NPDES)
Permit Program

Draft Renewed NPDES Permit to Discharge into Waters of the State

Public Notice/Fact Sheet Issued By:

Illinois Environmental Protection Agency
Bureau of Water, Division of Water Pollution Control
Permit Section
1021 North Grand Avenue East
Post Office Box 19276
Springfield, Illinois 62794-9276
217/782-0610

Name and Address of Discharger:

Williamson Energy, LLC
P.O. Box 300
Johnston City, Illinois 62951

Name and Address of Facility:

Williamson Energy, LLC
Pond Creek Mine
4 miles east of Johnston City, Illinois
(Williamson and Franklin Counties)

The Illinois Environmental Protection Agency (IEPA or Agency) has made a tentative determination to issue an NPDES permit to discharge into waters of the state and has prepared a draft permit and associated fact sheet for the above named discharger. The Public Notice period will begin and end on the dates indicated in the heading of this Public Notice/Fact Sheet. Comments will be accepted until midnight of the Public Notice period ending date indicated above, unless a request for an extension of the original comment period is granted by the Agency. Interested persons are invited to submit written comments on the draft permit to the IEPA at the above address. Commenters shall provide his or her name, address and the nature of the issues raised and the evidence supporting those issues. Commenters may include a request for public hearing. The NPDES permit and notice number(s) must appear on each comment page.

The application, engineer's review notes, Public Notice/Fact Sheet, draft permit, comments received, and other documents are available for inspection and may be copied at the IEPA between 9:30 a.m. and 3:30 p.m. Monday through Friday when scheduled by the interested person.

As provided in 35 Ill. Adm. Code 309.115(a) any person may submit a request for a public hearing and if such written comments or requests indicate a significant degree of public interest in the draft permit, the permitting authority may, at its discretion, hold a public hearing. The Agency shall issue public notice of such hearing no less than thirty (30) days prior to the date of such hearing in the manner described by 35 Ill. Adm. Code 309.109 through 309.112 for public notice. The Agency's responses to written and/or oral comments will be provided in the Responsiveness Summary provided when the final permit is issued.

The applicant proposes additional surface facilities area to an existing underground coal mine (SIC 1222). Mine operations result in the discharge of alkaline and acid mine drainage.

Public comments are invited on the entire draft permit. The following proposed modifications were incorporated into this Permit renewal:

Incorporated three (3) new outfalls designated as Outfall Nos. 009, 009ES and 011.

Various mining operation and drainage control plan revisions.

229.78 acres incorporated for new Refuse Disposal Area No. 3.

70.7 acres incorporated for the pipeline to the Big Muddy River.

145.32 acres for various IBR's for additional permit area.

Addition of bi-annual metals monitoring of discharges from Outfall Nos. 006, 007, 008,009, 009ES and 011.

Incorporated previously issued State Construction and Operating Permits (Subtitle D Permits).

This facility has eight (8) existing discharges which are located in Williamson County, Illinois. The following information identifies the discharge points and receiving streams:

Outfall	Receiving Stream	Latitude (North)	Longitude (West)
001	Unnamed tributary of Pond Creek	37° 50' 59.2"	88° 49' 37.5"
002	Unnamed tributary of Pond Creek	37° 50' 26.0"	88° 49' 51.5"
003	Unnamed tributary of Pond Creek	37° 50' 26.0"	88° 49' 58.0"
004	Unnamed tributary of Pond Creek	37° 50' 25.0"	88° 49' 56.6"
005	Unnamed tributary of Pond Creek	37° 50' 9.1"	88° 50' 00.0"
006	Unnamed tributary of Pond Creek	37° 50' 28.4"	88° 50' 40.6"
007	Unnamed tributary of Pond Creek	37° 50' 29.5"	88° 49' 34.0"
008	Unnamed tributary of Pond Creek	37° 50' 31.4"	88° 49' 33.9"

The stream segment NG-02 of Pond Creek receiving the flow from the unnamed tributary into which Outfall 001, 002, 003, 004, 005, 006, 007 and 008 discharges is not on the 2016 303(d) list of impaired waters.

Application is made for three (3) new discharges which are located in Williamson and Franklin Counties, Illinois. The following information identifies the discharge points and receiving streams:

Outfall	Receiving Stream	Latitude (North)	Longitude (West)
009	Pond Creek	37° 51' 16.1"	88° 49' 25.5"
009ES	Unnamed tributary to Pond Creek	37° 50' 52.3"	88° 48' 43.7"
011	Big Muddy River	37° 52' 37"	89° 01' 49"

The stream segment NG-02 of Pond Creek receiving the discharge from Outfalls 009 and 009ES is on the 2016 303(d) list of impaired waters.
The following parameters have been identified as the pollutants causing impairment.

Outfall	Pollutant
009, 009ES	Alteration in stream-side or littoral vegetative cover Changes in stream depth and velocity patterns Chlorides Loss of instream cover, dissolved oxygen, Sedimentation/siltation

The stream segment N-11 of Big Muddy River receiving the discharge from Outfall 011 is on the draft 2016 303(d) list of impaired waters. The following parameters have been identified as the pollutants causing impairment.

Outfall	Pollutant
011	Iron, Oxygen, dissolved; Sedimentation/Siltation Total Suspended Solids (TSS) Mercury, Polychlorinated biphenyls Fecal Coliform

The alkaline mine discharge from this facility shall be monitored and limited at all times as follows:

Outfalls: 001, 002, 003, 004, 005

Discharge Condition	Parameters											
	Total Suspended Solids (3) (mg/l)		Iron (total) (3) (4) (mg/l)		pH (3) (S.U.)	Alkalinity/ Acidity (3)	Sulfate (1) (mg/l)	Chloride (mg/l)	Cadmium (Cd) (mg/l) (6)	Hardness (5)	Flow (MGD)	Settleable Solids (2) (ml/l)
	30 day average	daily maximum	30 day average	daily maximum								
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	0.0144	Monitor only	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	500	-	Monitor only	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	500	-	Monitor only	Measure When Sampling	-
IV	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	0.0144	Monitor only	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.110(a), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period less than or equal to the 10-year, 24 hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hour precipitation event for this area is considered to be 5.21 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b).

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For outfalls which have no allowed mixing, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

(1) Sulfate water quality standards and effluent limitations determined in accordance with 35 Ill. Adm. Code 302.208(h).
(2) Settleable solids are monitored only as a result of a discharge due to precipitation events which exceed a predetermined 24-hour duration or snowmelt total. Settleable solids effluent limitations for alkaline mine discharges are contained in 35 Ill. Adm. Code 406.110.
(3) Effluent standards for mine discharges are contained in 35 Ill. Adm. Code 406.106.
(4) Discharges from Outfall 001, 002, 003, 004 and 005 are subject to a 30-day average effluent limitation for Iron of 3.0 mg/l. Daily maximum effluent concentrations are calculated as twice the 30-day average.
(5) Hardness monitoring is required to determine the appropriateness of the sulfate permit limit.
(6) The Cadmium water quality standards and effluent limitations determined in accordance with 35 Ill. Adm. Code 302.208(h).

The acid mine discharge from this facility shall be monitored and limited at all times as follows:

Outfalls: 006, 007

Discharge Condition	Parameters												
	Total Suspended Solids (3) (mg/L)		Iron (total) (3) (4) (mg/L)		pH (3) (S.U.)	Alkalinity/ Acidity (3)	Sulfate (1) (mg/L)	Chloride (mg/L)	Cadmium (Cd) (mg/l) (6)	Mn (total) (mg/L)	Hardness (5)	Flow (MGD)	Settleable Solids (2) (ml/l)
	30 day average	daily maximum	30 day average	daily maximum									
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	0.0144	1.0	Monitor only	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	500	-	-	Monitor only	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	500	-	-	Monitor only	Measure When Sampling	-
IV	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	0.0144	1.0	Monitor only	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.110(b), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 1-year, 24-hours precipitation event, but less than or equal to the 10-year, 24 hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 1-year, 24-hour precipitation event for this area is considered to be 2.97 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hours precipitation event for this area is considered to be 5.21 inches.

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For outfalls which have no allowed mixing, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

(1) Sulfate water quality standards and effluent limitations determined in accordance with 35 Ill. Adm. Code 302.208(h).
(2) Settleable solids are monitored only as a result of a discharge due to precipitation events which exceed a predetermined 24-hour duration or snowmelt total. Settleable solids effluent limitations for acid mine drainage discharges are contained in 35 Ill. Adm. Code 406.110(b), (c), and (d).
(3) Effluent limitations for mine discharges are contained in 35 Ill. Adm. Code 406.106.
(4) Discharges from Outfall 006 and 007 are subject to a 30-day average effluent limitation for Iron of 3.0 mg/l. Daily maximum effluent concentrations are calculated as twice the 30-day average.
(5) Hardness monitoring is required to determine the appropriateness of the sulfate permit limitation.
(6) The Cadmium water quality standards and effluent limitations determined in accordance with 35 Ill. Adm. Code 302.208(h).

The acid mine discharge from this facility shall be monitored and limited at all times as follows:

Outfall: 008

Discharge Condition	Parameters											
	Total Suspended Solids (3) (mg/L)		Iron (total) (3) (4) (mg/L)		pH (3) (S.U.)	Alkalinity/ Acidity (3)	Sulfate (1) (mg/L)	Chloride (mg/L)	Mn (total) (mg/L)	Hardness (5)	Flow (MGD)	Settleable Solids (2) (ml/l)
	30 day average	daily maximum	30 day average	daily maximum								
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	1.0	Monitor only	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	500	-	Monitor only	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	500	-	Monitor only	Measure When Sampling	-
IV	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	1.0	Monitor only	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.110(b), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 1-year, 24-hours precipitation event, but less than or equal to the 10-year, 24 hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 1-year, 24-hour precipitation event for this area is considered to be 2.97 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hours precipitation event for this area is considered to be 5.21 inches.

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For outfalls which have no allowed mixing, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

(1) Sulfate water quality standards and effluent limitations determined in accordance with 35 Ill. Adm. Code 302.208(h).
(2) Settleable solids are monitored only as a result of a discharge due to precipitation events which exceed a predetermined 24-hour duration or snowmelt total. Settleable solids effluent limitations for acid mine drainage discharges are contained in 35 Ill. Adm. Code 406.110(b), (c), and (d).
(3) Effluent limitations for mine discharges are contained in 35 Ill. Adm. Code 406.106.
(4) Discharges from Outfall 008 are subject to a 30-day average effluent limitation for Iron of 3.0 mg/l. Daily maximum effluent concentrations are calculated as twice the 30-day average.
(5) Hardness monitoring is required to determine the appropriateness of the sulfate permit limitation.

The alkaline mine discharge from this facility shall be monitored and limited at all times as follows:

Outfall: 009

Discharge Condition	Parameters												
	Total Suspended Solids (3) (mg/L)		Iron (total) (3) (4) (mg/L)		pH (3) (S.U.)	Alkalinity/ Acidity (3)	Sulfate (1) (mg/L)	Chloride (mg/L)	Mn (total) (mg/L)		Hardness (5)	Copper (CU) (mg/L)	Flow (MGD)	Settleable Solids (2) (ml/l)
	30 day average	daily maximum	30 day average	daily maximum					30 day average	daily maximum				
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	2.0	4.0	Monitor only	0.0245	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	See Special Condition No. 14	-	-	Monitor only	-	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	See Special Condition No. 14	-	-	Monitor only	-	Measure When Sampling	-
IV	35	70	3.0	6.0	6.0-9.0	Alk.>Acid	1250	See Special Condition No. 14	2.0	4.0	Monitor only	0.0245	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall at times of "low flow" or "no flow" conditions in the receiving stream as defined in Special Condition No. 14.

II In accordance with 35 Ill. Adm. Code 406.110(a), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period less than or equal to the 10-year, 24 hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hour precipitation event for this area is considered to be 2.97 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b).

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. At such time that receiving stream flow subsides to the degree that the mixing ratio specified in Special Condition No. 14 is not available, monitoring requirements and permit limitations shall revert to Discharge Condition I.

(1) Sulfate water quality standards and effluent limitations determined in accordance with 35 Ill. Adm. Code 302.208(h).
(2) Settleable solids are monitored only as a result of a discharge due to precipitation events which exceed a predetermined 24-hour duration or snowmelt total. Settleable solids effluent limitations for alkaline mine discharges are contained in 35 Ill. Adm. Code 406.110.
(3) Effluent standards for mine discharges are contained in 35 Ill. Adm. Code 406.106.
(4) Discharges from Outfall 009 are subject to a 30-day average effluent limitation for Iron of 3.0 mg/l. Daily maximum effluent concentrations are calculated as twice the 30-day average
(5) Hardness monitoring is required to determine the appropriateness of the sulfate permit limitation.

The alkaline mine discharge from this facility shall be monitored and limited at all times as follows:

Outfall: 009ES

Discharge Condition	Parameters													
	Total Suspended Solids (3) (mg/L)		Iron (total) (3) (4) (mg/L)		pH (3) (S.U.)	Alkalinity/ Acidity (3)	Sulfate (1) (mg/L)	Chloride (mg/L)	Mn (total) (mg/L)		Hardness (5)	Copper (CU) (mg/L)	Flow (MGD)	Settleable Solids (2) (ml/l)
	30 day average	daily maximum	30 day average	daily maximum					30 day average	daily maximum				
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	2.0	4.0	Monitor only	0.0245	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	500	-	-	Monitor only	-	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	500	-	-	Monitor only	-	Measure When Sampling	-
IV	35	70	3.0	6.0	6.0-9.0	Alk.>Acid	1250	500	2.0	4.0	Monitor only	0.0245	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.110(a), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period less than or equal to the 10-year, 24 hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hour precipitation event for this area is considered to be 2.97 inches.

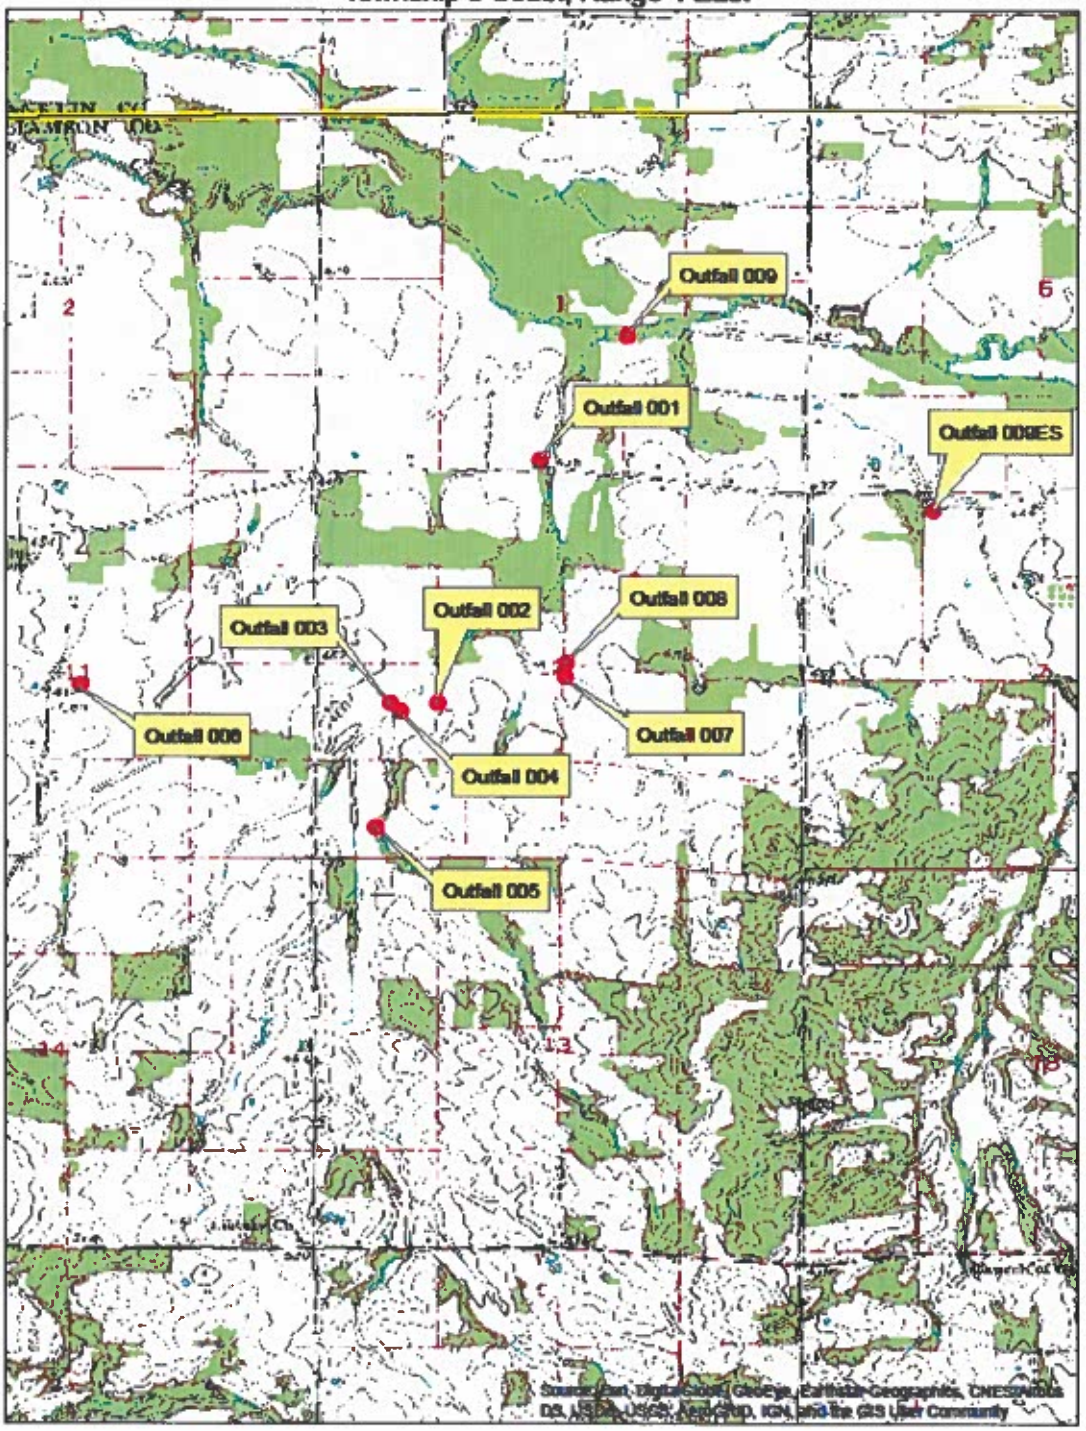
III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b).

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For outfalls which have no allowed mixing, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

(1) Sulfate water quality standards and effluent limitations determined in accordance with 35 Ill. Adm. Code 302.208(h).
(2) Settleable solids are monitored only as a result of a discharge due to precipitation events which exceed a predetermined 24-hour duration or snowmelt total. Settleable solids effluent limitations for alkaline mine discharges are contained in 35 Ill. Adm. Code 406.110.
(3) Effluent standards for mine discharges are contained in 35 Ill. Adm. Code 406.106.
(4) Discharges from Outfall 009ES are subject to a 30-day average effluent limitation for Iron of 3.0 mg/l. Daily maximum effluent concentrations are calculated as twice the 30-day average
(5) Hardness monitoring is required to determine the appropriateness of the sulfate permit limitation.

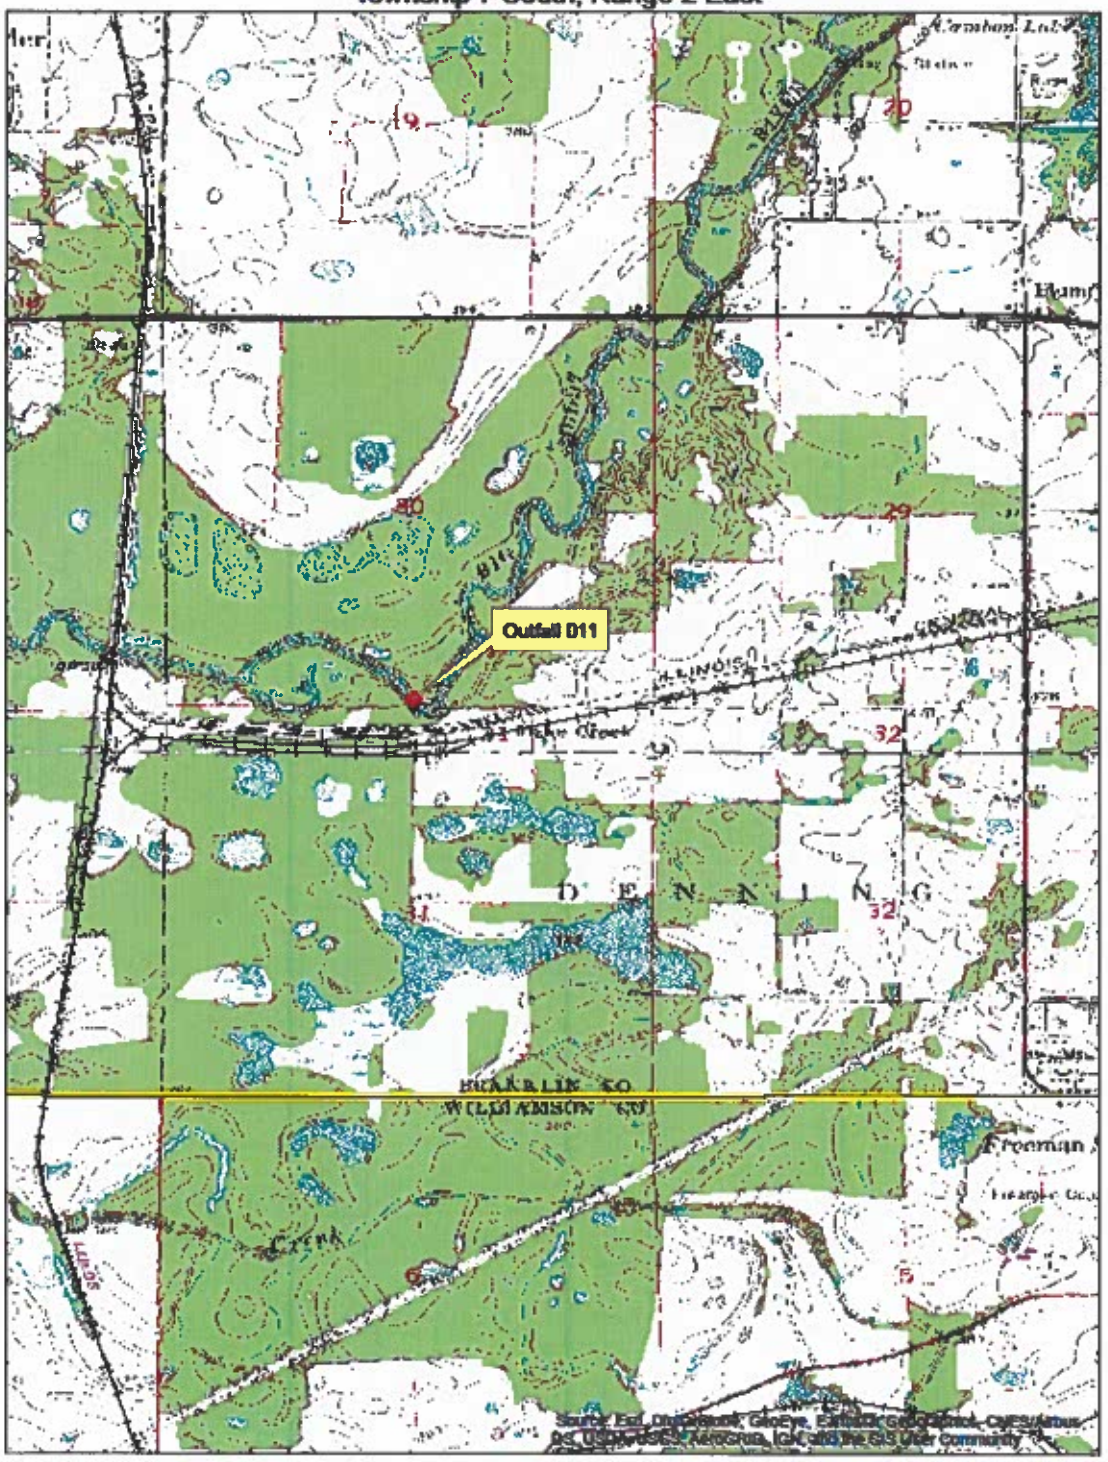
The alkaline mine discharge from this facility shall be monitored and limited at all times as follows:

Outfall: 011



Parameters														
Total Suspended Solids (1) (mg/l)		Iron (total) (2) (mg/l)		pH (3) (S.U.)	Alkalinity/ Acidity (4)	Sulfate (5) (mg/l)	Chloride (mg/l)	Mn (total) (mg/l) (2)		Hardness (6)	Nickel (mg/L)	Copper (mg/L)	Flow (MGD)	Iron (Dissolved)
30 day average	daily maximum	30 day average	daily maximum					30 day average	daily maximum					
35	70	3.0	6.0	6.0-9.0	Alk.>Acid	See Special Condition No. 16	See Special Condition No. 16	2.0	4.0	Monitor only	See Special Condition No. 16	See Special Condition No. 16	Measure When Sampling	See Special Condition No. 16

For any discharge not meeting the water quality standard for any of the above parameters, such discharge shall be subject to the limitations and monitoring requirements of Special Condition No. 16.



(1) Effluent standards for Total Suspended Solids in mine discharges are established pursuant to 35 Ill. Adm. Code 406.106.
(2) Effluent standards for Iron and Manganese are established pursuant to 35 Ill. Adm. Code 304.124.
(3) Pursuant to 35 Ill. Adm. Code 406.106, pH shall not be less than 6.0 or greater than 9.0 S.U.
(4) Pursuant to 35 Ill. Adm. Code 406.106, total acidity shall not exceed total alkalinity.
(5) Sulfate water quality standards and effluent limitations determined in accordance with 35 Ill. Adm. Code 302.208(h).
(6) Hardness monitoring is required to determine the appropriateness of the sulfate permit limitation.

To assist you in identifying the location of the discharges, please refer to the attached map. The permit area for this facility is located in Sections 2, 3, 4, 7, 8, 9, 10, 12, 14, 15, 16, 17, 18 and 29, Township 8 South, Range 4 East, and Sections 11, 12, 13, 35, 36, Township 8 South, Range 3 East, Williamson County, 3rd P.M., Illinois, and Sections 1, 2 and 12, Township 8 South, Range 2 East, and Sections 7, 8, 9, 11, 14, 15, 16, and 17, Township 8 South, Range 3 East, and Sections 27, 28, 29, 30, 31, 32, 34 and 35, Township 7 South, Range 2 East, Franklin County , 3rd P.M., Illinois.

Antidegradation Assessment for RDA #3
Williamson Energy, LLC
Pond Creek Mine
NPDES Permit No. IL0077666
Williamson County

Williamson Energy, LLC –Pond Creek Mine No. 1 is creating a new Refuse Disposal Area No. 3. This proposed disposal area will tie into the existing Refuse Disposal Area No. 1 & 2. Associated with the new Refuse Disposal Area No. 3, a new sediment basin will be installed to control the rainfall that falls on the out-slopes of the sediment basin and will discharge through new Outfalls 009 and 009ES.

The facility is also requesting a modification to Outfall 005. The facility is proposing to stop using the geotextile tubes, which were operated in a no discharge configuration. The facility was using the geotextile tubes to remove fine refuse and collecting the water and pumping it to the existing refuse disposal area. Williamson Energy, LLC is requesting to modify the drainage control plan to allow stormwater runoff from the area to discharge through sediment ditches and spillway, into Ditch D-5C and through Pond 005. This drainage pattern is not a deviation from the originally approved drainage plan. Due to the nature of the geotextile tubes, surface water quality is not anticipated to be affected once the geotextile tubes are out of service and no longer being utilized.

To not increase chlorides and sulfates due to the construction of RDA No. 3, the mine is eliminating or reclaiming the outslopes of RDA No. 1 and RDA No. 2 that previously discharged through Outfalls 007 and 008. Therefore, there will not be an increase in loading due to the construction of RDA No. 3.

The information in this antidegradation assessment came from the December 2014 NPDES Renewal #2 for Permit #IL0077666 report by Alliance Consulting, Inc. titled "Pond Creek Mine No. 1 & Refuse Disposal Area No. 3" and the anti-degradation assessment provided on November 18, 2016.

Identification and Characterization of the Affected Water Body.

The subject facility proposed to discharge to Pond Creek through Outfall 009 at a point where 0 cfs of flow exists upstream of the outfalls during critical 7Q10 low-flow conditions. Pond Creek is classified as a General Use Water. Pond Creek is not listed as a biologically significant stream in the 2008 Illinois Department of Natural Resources Publication *Integrating Multiple Taxa in a Biological Stream Rating System*, nor is it given an integrity rating in that document. Pond Creek, Waterbody Segment, NG-02, is listed on the draft 2016 Illinois Integrated Water Quality Report and Section 303(d) List as impaired for aquatic life use with potential causes given as alteration in stream-side or littoral vegetative cover (non-pollutant), changes in stream depth and velocity patterns (non-pollutant), chlorides, loss of instream cover (non-pollutant), dissolved oxygen (non-pollutant), and sedimentation/siltation. Primary contact recreation and secondary contact uses are fully supported. Pond Creek is not subject to enhanced dissolved oxygen standards.

Identification of Proposed Pollutant Load Increases or Potential Impacts on Uses.

The mine outfalls will be classified as acid mine drainage. Suspended solids will be treated in the sedimentation ponds. Effluent discharged from these ponds will contain suspended solids loadings that are similar to those occurring from the land in its present use. Sulfates and chlorides will undergo an increase in loading to the receiving streams as a result of the mining activities. Based on estimated effluent concentrations for this mine, chloride and sulfate will meet water quality standards in the receiving stream based on the mixing provided by my December 13, 2016 water quality memo.

Fate and Effect of Parameters Proposed for Increased Loading.

Suspended solids discharged will eventually be incorporated into bed sediments and will continue to move downstream. Sulfate and chloride will remain dissolved in the water and will move through the downstream continuum. Small amounts of these substances will be removed by organisms as these substances are necessary for life. No adverse impacts to the receiving streams will occur as all water quality standards will be met.

Purpose and Social & Economic Benefits of the Proposed Activity.

The disposal of excess water, including the water infiltrating the mine, will allow the mine to continue to operate. The Pond Creek Mine is expected to generate 5 - 6 million tons of useable coal annually. According to information given in a document dated November 18, 2016 entitled Anti-degradation Assessment, Pond Creek No. 1 Mine, NPDES Permit IL0077666, continued operation of the existing mine will continue to provide jobs for 203 employees with an annual payroll of approximately $18 million. In addition to these 203 direct employees, it is estimated that another 100 persons are employed in daily work associated with the Mine's production. This includes truck drivers, supply and support personnel, train crews, and technical personnel. In addition, other local businesses would also benefit from the wealth created by the mine. The operation of the mine provides tax revenues through payroll, coal severance, and mineral resource taxes for the surrounding counties and the State of Illinois. The total local, state, and federal revenues generated by the continuation of this Mine are approximately $78 million annually. Current employment statistics indicate that the unemployment rate for Williamson County was 7.5%.

Williamson County

Assessments of Alternatives for Less Increase in Loading or Minimal Environmental Degradation.

Alternatives to discharge through Outfall 009 have been evaluated by the mine company in a document dated November 18, 2016 entitled Anti-degradation Assessment, Pond Creek No. 1 Mine, NPDES Permit and are summarized as follows:

Chloride and Sulfate

Membrane Processes. Standard reverse osmosis (RO) treatment results in a waste stream of water with a high concentration of contaminants that is typically 25% of the flow being sent to the RO treatment system. The reject stream must still be disposed of in a responsible manner. Due to the disposal issue, the Membrane Process is not viable.

Deep Well Injection of the Entire Groundwater Stream. The untreated groundwater infiltrate could be discharged directly to a deep well. Considering the cost and operational difficulties experienced to date for the two wells that have been installed at the nearby Sugar Camp Coal facility to accept 0.45 MGD each, deep well injection of the untreated groundwater infiltrate is not considered either applicable or feasible for the operation of the Mine.

Discharge to POTW or Other Sources. POTWs are not designed to treat wastewaters containing dissolved substances such as chloride or sulfate. This option is not feasible.

No discharge. Given the climate of Williamson County, the mine company concludes that evaporation is not a viable option for disposal of the stormwater runoff mine effluent.

Mechanical Evaporation. Mechanical evaporation uses high temperatures and pressure to remove the water. The equipment is expensive to construct/install, operate, and maintain. Also, there would be materials to dispose of either in a landfill or in the Injection Wells that have been found to be unreliable for nearby mines. Therefore, this option is not considered either applicable or feasible for the operation of the mine.

Crystallizaton. Crystallization equipment is expensive to construct/install, operate and maintain. The cost is estimated at $0.25/gallon, the mine company concludes that crystallization is not a viable option for disposal of the stormwater runoff mine effluent.

Cost Effective Sulfate Removal (CESR) process. This is a proprietary technology that uses hydrated lime and proprietary chemicals to precipitate gypsum, metals and ettringite. Sludge would be produced that would require landfill disposal. The proprietary technology is still being developed. Additionally, this method is not proven to remove chlorides. These drawbacks make the CESR process infeasible for use at the coal mine.

Chemical Precipitation. Alkaline chemicals may be added to acid mine effluent to precipitate metals. The sludge produced must be disposed of and in some cases will contain hazardous materials added to the wastewater to attain precipitation. The additives used require mining in their own right. The water discharged may contain these additives, such as aluminum, in elevated concentrations. Additionally, this method is not proven to remove chlorides. These drawbacks make chemical precipitation infeasible.

Sedimentation/Siltation

Sedimentation. The facility is proposing to pump the groundwater infiltration to a Water Staging Cell where the water will have an opportunity for solids to settle out. The water will then be discharged to the Big Muddy River though the diffuser.

Use alternate sediment control and treatment devices. Alternatives to the use of sediment control ponds exist for control of discharge of settleable solids. Such alternatives include chemical soil stabilizers, erosion control blankets, geotextile filter bags, fiber rolls, silt fencing, straw mulch, straw bale dikes, and temporary seeding. These measures are aimed at minimization of the generation of settable solids. Most of these measures have been used previously during the construction and operations and in accordance with the current permit, as supplemental treatment and prevention of generation of settable solids. The use of alternative sediment control measures is considered practical and cost effective for the treatment and control of surface runoff in conjunction with sediment control ponds. However, the use of these practices to eliminate the proposed sediment control ponds is not feasible. Instead, it is being proposed that these BMPs be incorporated into the proposed alternative as needed.

No discharge. Given the climate of Williamson County, the mine company concludes that evaporation is not a viable option for disposal of the stormwater runoff mine effluent.

Filtration. Filtration is a technology that is not feasible for the proposed facility because: filtration is much more expensive than sediment ponds, filtration processes require a steady stream of water for treatment which is not the case in treating stormwater runoff, a large area of land would be required for such a facility, and maintenance and supervision of the filtration and sludge disposal operation would be burdensome and would increase production costs.

Antidegradation Assessment for RDA #3
Williamson Energy, LLC
Pond Creek Mine
NPDES Permit No. IL0077666
Williamson County

Constructed Wetlands. Constructed wetlands have proven to be effective for treatment of suspended solids with several limitations. These limitations include; low and consistent rates of inflow, eventual sludge accumulation requiring dredging and wetland reconstruction, and release of hydrogen sulfide and other digestive gases into the atmosphere from sulfate digestion processes. Use of wetlands in mine stormwater runoff treatment would be limited by the enormous amount of land required to construct a wetland of sufficient size for the flow rates to be expected from such an operation.

Chemical Precipitation. Alkaline chemicals may be added to acid mine effluent to precipitate metals. The sludge produced must be disposed of and in some cases will contain hazardous materials added to the wastewater to attain precipitation. The additives used require mining in their own right. The water discharged may contain these additives, such as aluminum, in elevated concentrations. Concerns with the use of chemical precipitation at the proposed coal mine include; worker safety regarding the chemicals to be used, treatment costs, process operation and maintenance, disposal of precipitate sludge in a landfill, necessity of treatment considering that acid water is not considered a factor for the proposed operation, susceptibility to system malfunction due to high volume flows from storm events, and improbability of actual improvement in overall water quality when compared to the use of sediment ponds. These drawbacks make chemical precipitation infeasible.

Summary Comments of the Illinois Department of Natural Resources, Regional Planning Commissions, Zoning Boards or Other Entities

On November 2, 2016, the IDNR EcoCAT web-based tool was used and indicated that there were no aquatic endangered/threatened species present in the vicinity of the discharge. While the IDNR EcoCAT web-based tool did not terminate the consultation because of the nearby presence of Chuck-Will's-Willow (*Caprimulgus carolinensis*), future termination is likely.

Agency Conclusion.

This preliminary assessment was conducted pursuant to the Illinois Pollution Control Board regulation for Antidegradation found at 35 Ill. Adm. Code 302.105 (antidegradation standard) and was based on the information available to the Agency at the time the draft permit was written. We tentatively find that the proposed activity will result in the attainment of water quality standards; that all existing uses of the receiving stream will be maintained; that all technically and economically reasonable measures to avoid or minimize the extent of the proposed increase in pollutant loading have been incorporated into the proposed activity; and that this activity will benefit the community at large by allowing the continuation of coal mining with all of its economic benefits to the local economy. Comments received during the NPDES permit public notice period will be evaluated before a final decision is made by the Agency.

Antidegradation Assessment for Big Muddy River Mixing
Williamson Energy, LLC
Pond Creek Mine
NPDES Permit No. IL0077666
Williamson County

Williamson Energy, LLC operates the Pond Creek No. 1 Mine which is located in Williamson County. The mining complex contains an estimated 383.3 million tons of clean, recoverable coal reserves. Williamson Energy commenced construction of the Mine in 2005. The Mine has a life expectancy of more than 20 years. The mine has one operating longwall system. The Preparation Plant facilities are capable of processing 2,000 tons of coal per hour. The productive capacity of the mine is 5-6 million tons per year. Coal is shipped by rail, truck and barge (via railroad).

Williamson currently operates the mine under the existing Permit 375 and Permit 417 from the Illinois Department of Natural Resources, Office of Mines and Minerals (IDNR-OMM). The Mine currently discharges under NPDES Permits IL0077666.

The Pond Creek Mine has submitted an antidegradation report as part of the following NPDES permit activities:

- To respond to the over capacity of water on-site, a new outfall to the Big Muddy River is proposed. The outfall structure will be a multi-port diffuser and a mixing zone is being requested for the discharge; and
- The mine permit modification request includes the discharge of stormwater from stormwater ponds associated with the proposed Refuse Disposal Area No. 3 to Pond Creek. (Discussed under another antidegradation assessment.) A mixing zone is being requested for Pond Creek.

The mine uses water in two areas of operation; dust suppression during coal extraction and wash water in the preparation plant. The water used in the coal extraction process is fresh, untreated water purchased from the City of Johnston City and it not recoverable. The water used to wash the coal in the preparation plant comes from the fresh water lake. Over time, the fine solid particles present in the thickener underflow that is pumped to the Slurry Impoundment/RDA No. 3 settle to the bottom of the impoundment leaving clarified water on the surface. There is some loss of water during the washing process. Additionally, since the fines do not all settle immediately in the slurry impoundment, the quality of the clarified water results in a need for additional water for the preparation plant. Therefore, preparation plant water is supplemented with mine infiltration water and/or stormwater.

An aquifer above the coal seam causes an influx in water into the Mine. The infiltrating groundwater is from a saline aquifer, with a chloride content of approximately 1,099 to 2,799 mg/L. The sulfate ranges between 1,720 and 2,120 mg/L. Presently, the mine is removing 2.7 MGD of this high-chloride groundwater from the active mine. During normal coal processing operations, the preparation plant requires approximately 2.3 MGD. It is necessary to remove the water from the mine to protect the health and safety of the workforce, as well as, the overall mining operation.

Water will be stored in the Water Staging Cell and will be pumped to the Big Muddy River diffuser for mixing. An evaluation of the mixing zone will be reported in a separate memo.

The information in this antidegradation assessment came from the December 2014 NPDES Renewal #2 for Permit #IL0077666 report by Alliance Consulting, Inc. titled "Pond Creek Mine No. 1 & Refuse Disposal Area No. 3" and the anti-degradation assessment provided on November 18, 2016 entitled Anti-degradation Assessment, Pond Creek No. 1 Mine, NPDES Permit IL0077666

Identification and Characterization of the Affected Water Body.

The subject facility proposes to discharge to the Big Muddy River through Outfall 011 at a point where 37.0 cfs of flow exists upstream of the outfall during critical 7Q10 low-flow conditions. The Big Muddy River is classified as a General Use Water. The Big Muddy River is not listed as a biologically significant stream in the 2008 Illinois Department of Natural Resources Publication *Integrating Multiple Taxa in a Biological Stream Rating System*, nor is it given an integrity rating in that document. The Big Muddy River, Waterbody Segment, N-11, is listed on the draft 2016 Illinois Integrated Water Quality Report and Section 303(d) List as impaired for aquatic life use with potential causes given as iron (dissolved), dissolved oxygen (non-pollutant), sedimentation/siltation (non-pollutant), and total suspended solids; fish consumption use with potential causes given as mercury and polychlorinated biphenyls; and primary contact recreation use with potential cause given as fecal coliform. Aesthetic quality use is fully supported. This segment of the Big Muddy River is not subject to enhanced dissolved oxygen standards.

Identification of Proposed Pollutant Load Increases or Potential Impacts on Uses.

The constituents of concern are chloride, sulfates, manganese, iron, and total suspended solids. The chloride loading will range from 19,141 to 1,197,698 lbs/day at a concentration ranging from 1,699 to 12,000 mg/L. The sulfate loading will range from 9,720 to 476,031 lbs/day at a concentration ranging from 820 to 2,120 mg/L. The manganese loading will range from 33 to 336 lbs/day at a concentration ranging from 0.125 to 0.419 mg/L. The Iron (total) loading will range from 34 to 348 lbs/day at a concentration ranging from 0.216 to 1.835 mg/L. Iron (dissolved) is only a fraction of the Iron (total) and will meet the water quality standard at the end-of-pipe or at the edge of the mixing zone. The Nickel loading will range from 1 to 8 lbs/day at a concentration ranging from 0.004 to 0.014 mg/L. The Copper loading will range from 1 to 8 lbs/day at a concentration ranging from 0.011 to 0.32 mg/L. The TSS loading will range from 2,337 to 118,332 lbs/day at a concentration ranging from 7 to 70 mg/L.

Antidegradation Assessment for Big Muddy River Mixing
Williamson Energy, LLC
Pond Creek Mine
NPDES Permit No. IL0077666
Williamson County

Fate and Effect of Parameters Proposed for Increased Loading.

Chloride and sulfates would remain dissolved in the water and would move through the downstream continuum. Manganese, iron, Nickel, Copper, and total suspended solids will most likely settle and become part of the bed sediment load in the river. A mixing zone in the Big Muddy River will be utilized to dissipate chloride and sulfate to water quality standard levels. A zone of initial dilution will be utilized to dissipate Copper to water quality standard levels. Small amounts of chloride and sulfates would be removed by organisms as these substances are necessary for life. Because of the near real-time continuous monitoring of upstream and downstream conditions in the receiving stream, and the ability of the permittee's diffuser to adjust to flow and background concentration conditions, discharges will always be into a waterbody that is below water quality standards and in concentrations and flow combinations that will not cause or contribute to an exceedance downstream of the mixing zone. No adverse impacts to streams would occur as all water quality standards are expected to be met in the receiving water.

Purpose and Social & Economic Benefits of the Proposed Activity.

The disposal of excess water, including the water infiltrating the mine, will allow the mine to continue to operate. The Pond Creek Mine is expected to generate 5 - 6 million tons of useable coal. According to information given in a document dated November 18, 2016 entitled Anti-degradation Assessment, Pond Creek No. 1 Mine, NPDES Permit IL0077666, continued operation of the existing mine will continue to provide jobs for 203 employees with an annual payroll of approximately $18 million. In addition to these 203 direct employees, it is estimated that another 100 persons are employed in daily work associated with the Mine's production. This includes truck drivers, supply and support personnel, train crews, and technical personnel. In addition, other local businesses would also benefit from the wealth created by the mine. The operation of the mine provides tax revenues through payroll, coal severance, and mineral resource taxes for the surrounding counties and the State of Illinois. The total local, state, and federal revenues generated by the continuation of this Mine are approximately $78 million annually. Current employment statistics indicate that the unemployment rate for Williamson County was 7.5%.

Assessments of Alternatives for Less Increase in Loading or Minimal Environmental Degradation.

Excess water is proposed to be discharged to the Big Muddy River. Alternatives to this system have been evaluated by the mine company in a document dated November 18, 2016 entitled Anti-degradation Assessment, Pond Creek No. 1 Mine, NPDES Permit and are summarized as follows:

Chloride and Sulfate

Membrane Processes. Standard reverse osmosis (RO) treatment results in a waste stream of water with a high concentration of contaminants that is typically 25% of the flow being sent to the RO treatment system. The reject stream must still be disposed of in a responsible manner. Due to the disposal issue, the Membrane Process is not viable.

Deep Well Injection of the Entire Groundwater Stream. The untreated groundwater infiltrate could be discharged directly to a deep well. Considering the cost and operational difficulties experienced to date for the two wells that have been installed at the nearby Sugar Camp Coal facility to accept 0.45 MGD each, deep well injection of the untreated groundwater infiltrate is not considered either applicable or feasible for the operation of the Mine.

Discharge to POTW or Other Sources. POTWs are not designed to treat wastewaters containing dissolved substances such as chloride or sulfate. This option is not feasible.

No discharge. Given the climate of Williamson County, the mine company concludes that evaporation is not a viable option for disposal of the stormwater runoff mine effluent.

Mechanical Evaporation. Mechanical evaporation uses high temperatures and pressure to remove the water. The equipment is expensive to construct/install, operate, and maintain. Also, there would be materials to dispose of either in a landfill or in the Injection Wells that have been found to be unreliable for nearby mines. Therefore, this option is not considered either applicable or feasible for the operation of the mine.

Crystallizaton. Crystallization equipment is expensive to construct/install, operate and maintain. The cost is estimated at $0.25/gallon, the mine company concludes that crystallization is not a viable option for disposal of the stormwater runoff mine effluent.

Cost Effective Sulfate Removal (CESR) process. This is a proprietary technology that uses hydrated lime and proprietary chemicals to precipitate gypsum, metals and ettringite. Sludge would be produced that would require landfill disposal. The proprietary technology is still being developed. Additionally, this method is not proven to remove chlorides. These drawbacks make the CESR process infeasible for use at the coal mine.

Antidegradation Assessment for Big Muddy River Mixing
Williamson Energy, LLC
Pond Creek Mine
NPDES Permit No. IL0077666
Williamson County

Chemical Precipitation. Alkaline chemicals may be added to acid mine effluent to precipitate metals. The sludge produced must be disposed of and in some cases will contain hazardous materials added to the wastewater to attain precipitation. The additives used require mining in their own right. The water discharged may contain these additives, such as aluminum, in elevated concentrations. Additionally, this method is not proven to remove chlorides. These drawbacks make chemical precipitation infeasible.

Sedimentation/Siltation

Sedimentation. The facility is proposing to pump the groundwater infiltration to a Water Staging Cell where the water will have an opportunity for solids to settle out. The water will then be discharged to the Big Muddy River though the diffuser.

Use alternate sediment control and treatment devices. Alternatives to the use of sediment control ponds exist for control of discharge of settleable solids. Such alternatives include chemical soil stabilizers, erosion control blankets, geotextile filter bags, fiber rolls, silt fencing, straw mulch, straw bale dikes, and temporary seeding. These measures are aimed at minimization of the generation of settable solids. Most of these measures have been used previously during the construction and operations and in accordance with the current permit, as supplemental treatment and prevention of generation of settable solids. The use of alternative sediment control measures is considered practical and cost effective for the treatment and control of surface runoff in conjunction with sediment control ponds. However, the use of these practices to eliminate the proposed sediment control ponds is not feasible. Instead, it is being proposed that these BMPs be incorporated into the proposed alternative as needed.

No discharge. Given the climate of Williamson County, the mine company concludes that evaporation is not a viable option for disposal of the stormwater runoff mine effluent.

Filtration. Filtration is a technology that is not feasible for the proposed facility because: filtration is much more expensive than sediment ponds, filtration processes require a steady stream of water for treatment which is not the case in treating stormwater runoff, a large area of land would be required for such a facility, and maintenance and supervision of the filtration and sludge disposal operation would be burdensome and would increase production costs.

Constructed Wetlands. Constructed wetlands have proven to be effective for treatment of suspended solids with several limitations. These limitations include; low and consistent rates of inflow, eventual sludge accumulation requiring dredging and wetland reconstruction, and release of hydrogen sulfide and other digestive gases into the atmosphere from sulfate digestion processes. Use of wetlands in mine stormwater runoff treatment would be limited by the enormous amount of land required to construct a wetland of sufficient size for the flow rates to be expected from such an operation.

Chemical Precipitation. Alkaline chemicals may be added to acid mine effluent to precipitate metals. The sludge produced must be disposed of and in some cases will contain hazardous materials added to the wastewater to attain precipitation. The additives used require mining in their own right. The water discharged may contain these additives, such as aluminum, in elevated concentrations. Concerns with the use of chemical precipitation at the proposed coal mine include; worker safety regarding the chemicals to be used, treatment costs, process operation and maintenance, disposal of precipitate sludge in a landfill, necessity of treatment considering that acid water is not considered a factor for the proposed operation, susceptibility to system malfunction due to high volume flows from storm events, and improbability of actual improvement in overall water quality when compared to the use of sediment ponds. These drawbacks make chemical precipitation infeasible.

Summary Comments of the Illinois Department of Natural Resources, Regional Planning Commissions, Zoning Boards or Other Entities.

On November 2, 2016, the IDNR EcoCAT web-based tool was used and indicated that there were no aquatic endangered/threatened species present in the vicinity of the discharge. While the IDNR EcoCAT web-based tool did not terminate the consultation because of the nearby presence of Chuck-Will's-Willow (*Caprimulgus carolinensis*), future termination is likely.

Agency Conclusion.

This preliminary assessment was conducted pursuant to the Illinois Pollution Control Board regulation for Antidegradation found at 35 Ill. Adm. Code 302.105 (antidegradation standard) and was based on the information available to the Agency at the time the draft permit was written. We tentatively find that the proposed activity will result in the attainment of water quality standards; that all existing uses of the receiving stream will be maintained; that all technically and economically reasonable measures to avoid or minimize the extent of the proposed increase in pollutant loading have been incorporated into the proposed activity; and that this activity will benefit the community at large by allowing the continuation of coal mining with all of its economic benefits to the local economy. Comments received during the NPDES permit public notice period will be evaluated before a final decision is made by the Agency.

Antidegradation Assessment for RDA #3 (Supplemental Information)
Williamson Energy, LLC
Pond Creek Mine
NPDES Permit No. IL0077666
Williamson County

Pond 009 has an emergency discharge via Outfall 009ES. During normal operations, Pond 009 will discharge directly to Pond Creek via Outfall 009 and has provisions for allowed mixing. Outfall 009ES is not expected to have a discharge, except during an emergency.

Identification and Characterization of the Affected Water Body.

The subject facility discharges to an unnamed tributary of Pond Creek through Outfall 009ES at a point where 0 cfs of flow exists upstream of the outfalls during critical 7Q10 low-flow conditions. The unnamed tributary of Pond Creek is classified as a General Use Water. The unnamed tributary of Pond Creek is not listed as a biologically significant streams in the 2008 Illinois Department of Natural Resources Publication *Integrating Multiple Taxa in a Biological Stream Rating System*, nor is it given an integrity rating in that document. The unnamed tributary of Pond Creek, tributary to Waterbody Segment, NG-02, is not listed on the draft 2016 Illinois Integrated Water Quality Report and Section 303(d) List since it has not been assessed. The unnamed tributary of Pond Creek is not subject to enhanced dissolved oxygen standards.

Agency Conclusion.

Upon completing the assessment, it has been determined that the proposed activity will result in only short-term, temporary increases in pollutant loading and will not result in long term or permanent impacts to existing uses including aquatic life habitat; therefore, we find that it is subject to Subsection (d) "Activities Not Subject to a Further Antidegradation Assessment" of 35 Ill. Adm. Code 302.105.

NPDES Permit No. IL0077666

Illinois Environmental Protection Agency

Division of Water Pollution Control

1021 North Grand Avenue, East

P.O. Box 19276

Springfield, Illinois 62794-9276

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

Renewed NPDES Permit

Expiration Date:

Issue Date:
Effective Date:

Name and Address of Permittee:

Williamson Energy, LLC
P.O. Box 300
Johnston City, Illinois 62951

Facility Name and Address:

Williamson Energy, LLC
Pond Creek Mine
4 miles east of Johnston City, Illinois
(Williamson and Franklin Counties)

Discharge Number and Classification:		Receiving waters
001, 002, 003, 004, 005	Alkaline Mine Drainage	Unnamed tributary to Pond Creek
006, 007, 008	Acid Mine Drainage	Unnamed tributary to Pond Creek
009	Alkaline Mine Drainage	Pond Creek
009ES	Alkaline Mine Drainage	Unnamed tributary to Pond Creek
011	Alkaline Mine Drainage	Big Muddy River

In compliance with the provisions of the Illinois Environmental Protection Act, Subtitle C and/or Subtitle D Rules and Regulations of the Illinois Pollution Control Board, and the Clean Water Act, the above-named permittee is hereby authorized to discharge at the above location to the above-named receiving stream in accordance with the standard conditions and attachments herein.

Permittee is not authorized to discharge after the above expiration date. In order to receive authorization to discharge beyond the expiration date, the permittee shall submit the proper application as required by the Illinois Environmental Protection Agency (IEPA) not later than 180 days prior to the expiration date.

Darin E. LeCrone, P.E.
Manager, Industrial Unit, Permit Section
Division of Water Pollution Control

DEL:IKW:cs/7516c/06-19-19

NPDES Permit No. IL0077666

Effluent Limitations and Monitoring

From the effective date of this Permit until the expiration date, the effluent of the following discharge shall be monitored and limited at all times as follows:

Outfalls*: 001, 002, 003, 004, 005 (Alkaline Mine Drainage)

Discharge Condition	Parameters											
	Total Suspended Solids (mg/L) ***		Iron (total) (mg/L) ***		pH** (S.U.) ***	Alkalinity/ Acidity ***	Sulfate (mg/L) ***	Chloride (mg/L) ***	Cadmium (Cd) (mg/l)	Hardness ***	Flow (MGD)	Settleable Solids (ml/l)
	30 day average	daily maximum	30 day average	daily maximum								
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	0.0144	Monitor only	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	500	-	Monitor only	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	500	-	Monitor only	Measure When Sampling	-
IV	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	0.0144	Monitor only	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.110(a), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period less than or equal to the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hour precipitation event for this area is considered to be 5.21 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b).

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For outfalls which have no allowed mixing, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

Sampling during all Discharge Conditions shall be performed utilizing the grab sampling method.

*** There shall be a minimum of nine (9) samples collected during the quarter when the pond is discharging. Of these 9 samples, a minimum of one sample each month shall be taken during either Discharge Condition I or IV should such discharge condition occur. A "no flow" situation is not considered to be a sample of the discharge. In the event that Discharge Conditions II and/or III occur, grab sample of each discharge caused by the above precipitation events (Discharge Conditions II and/or III) shall be taken and analyzed for the parameters identified in the table above during at least 3 separate events each quarter. For quarters in which there are less than 3 such precipitation events resulting in discharges, a grab sample of the discharge shall be required whenever such precipitation event(s) occur(s). Should a sufficient number of discharge events occur during the quarter, the remaining three (3) quarterly samples may be taken during any of the Discharge Conditions described above.

The water quality standards for sulfate and chloride must be met in discharges from the above referenced outfall as well as in the receiving stream.

---

* The Permittee is subject to the limitations, monitoring, and reporting requirements of Special Condition No. 13 for the discharges from Outfalls 001, 002, 003, 004 and 005 and unnamed tributary of Pond Creek receiving such discharges.

** No discharge is allowed from any above referenced permitted outfall during "low flow" or "no flow" conditions in the receiving stream unless such discharge meets the water quality standards of 35 Ill. Adm. Code 302.204 for pH.

NPDES Permit No. IL0077666

Effluent Limitations and Monitoring

From the effective date of this Permit until the expiration date, the effluent of the following discharge shall be monitored and limited at all times as follows:

Outfalls*: 006, 007 (Acid Mine Drainage)

Discharge Condition	Parameters												
	Total Suspended Solids (mg/L) ***		Iron (total) (mg/L) ***		pH** (S.U.) ***	Alkalinity/ Acidity ***	Sulfate (mg/L) ***	Chloride (mg/L) ***	Cadmium (Cd) (mg/l) ***	Mn (total) (mg/L) ***	Hardness ***	Flow (MGD)	Settleable Solids (ml/l)
	30 day average	daily maximum	30 day average	daily maximum									
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	0.0144	1.0	Monitor only	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	500	-	-	Monitor only	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	500	-	-	Monitor only	Measure When Sampling	-
IV	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	0.0144	1.0	Monitor only	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.110(b), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 1-year, 24-hour precipitation event, but less than or equal to the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 1-year, 24-hour precipitation event for this area is considered to be 2.97 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hour precipitation event for this area is considered to be 5.21 inches.

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For outfalls which have no allowed mixing, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

Sampling during all Discharge Conditions shall be performed utilizing the grab sampling method.

*** There shall be a minimum of nine (9) samples collected during the quarter when the pond is discharging. Of these 9 samples, a minimum of one sample each month shall be taken during either Discharge Condition I or IV should such discharge condition occur. A "no flow" situation is not considered to be a sample of the discharge. In the event that Discharge Conditions II and/or III occur, grab sample of each discharge caused by the above precipitation events (Discharge Conditions II and/or III) shall be taken and analyzed for the parameters identified in the table above during at least 3 separate events each quarter. For quarters in which there are less than 3 such precipitation events resulting in discharges, a grab sample of the discharge shall be required whenever such precipitation event(s) occur(s). Should a sufficient number of discharge events occur during the quarter, the remaining three (3) quarterly samples may be taken during any of the Discharge Conditions described above.

The water quality standards for sulfate and chloride must be met in discharges from the above referenced outfall as well as in the receiving stream.

---

* The Permittee is subject to the limitations, monitoring, and reporting requirements of Special Condition No. 13 for the discharges from Outfalls 006 and 007 and unnamed tributary of Pond Creek receiving such discharges. Also, discharges from Outfalls 006 and 007 shall be subject to the limitations, monitoring, and reporting requirements of Special Condition No. 18.

** No discharge is allowed from any above referenced permitted outfall during "low flow" or "no flow" conditions in the receiving stream unless such discharge meets the water quality standards of 35 Ill. Adm. Code 302.204 for pH.

NPDES Permit No. IL0077666

Effluent Limitations and Monitoring

From the effective date of this Permit until the expiration date, the effluent of the following discharge shall be monitored and limited at all times as follows:

Outfall*: 008 (Acid Mine Drainage)

Discharge Condition	Parameters											
	Total Suspended Solids (mg/L) ***		Iron (total) (mg/L) ***		pH** (S.U.) ***	Alkalinity/ Acidity ***	Sulfate (mg/L) ***	Chloride (mg/L) ***	Mn (total) (mg/L) ***	Hardness ***	Flow (MGD)	Settleable Solids (ml/l)
	30 day average	daily maximum	30 day average	daily maximum								
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	1.0	Monitor only	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	500	-	Monitor only	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	500	-	Monitor only	Measure When Sampling	-
IV	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	1.0	Monitor only	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.110(b), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 1-year, 24-hour precipitation event, but less than or equal to the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 1-year, 24-hour precipitation event for this area is considered to be 2.97 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hour precipitation event for this area is considered to be 5.21 inches.

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For outfalls which have no allowed mixing, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

Sampling during all Discharge Conditions shall be performed utilizing the grab sampling method.

*** There shall be a minimum of nine (9) samples collected during the quarter when the pond is discharging. Of these 9 samples, a minimum of one sample each month shall be taken during either Discharge Condition I or IV should such discharge condition occur. A "no flow" situation is not considered to be a sample of the discharge. In the event that Discharge Conditions II and/or III occur, grab sample of each discharge caused by the above precipitation events (Discharge Conditions II and/or III) shall be taken and analyzed for the parameters identified in the table above during at least 3 separate events each quarter. For quarters in which there are less than 3 such precipitation events resulting in discharges, a grab sample of the discharge shall be required whenever such precipitation event(s) occur(s). Should a sufficient number of discharge events occur during the quarter, the remaining three (3) quarterly samples may be taken during any of the Discharge Conditions described above.

The water quality standards for sulfate and chloride must be met in discharges from the above referenced outfall as well as in the receiving stream.

---

* The Permittee is subject to the limitations, monitoring, and reporting requirements of Special Condition No. 13 for the discharges from Outfalls 008 and unnamed tributary of Pond Creek receiving such discharges. Also, discharges from Outfalls 008 and 009ES shall be subject to the limitations, monitoring, and reporting requirements of Special Condition No. 18.

** No discharge is allowed from any above referenced permitted outfall during "low flow" or "no flow" conditions in the receiving stream unless such discharge meets the water quality standards of 35 Ill. Adm. Code 302.204 for pH.

NPDES Permit No. IL000077666

Effluent Limitations and Monitoring

From the effective date of this Permit until the expiration date, the effluent of the following discharge shall be monitored and limited at all times as follows:

Outfall*: 009 (Alkaline Mine Drainage)

Discharge Condition	Parameters													
	Total Suspended Solids (mg/L) ***		Iron (total) (mg/L) ***		pH** (S.U.) ***	Alkalinity/ Acidity ***	Sulfate (mg/L) ***	Chloride (mg/L) ***	Mn (total) (mg/L) ***		Hardness ***	Copper (Cu) ***	Flow (MGD)	Settleable Solids (ml/l)
	30 day average	daily maximum	30 day average	daily maximum					30 day average	daily maximum				
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	2.0	4.0	Monitor only	0.0245	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	See Special Condition No. 14	-	-	Monitor only	-	Measure When Sampling	0.5
III	-	-	-	-	6.0-9.0	-	1250	See Special Condition No. 14	-	-	Monitor only	-	Measure When Sampling	-
IV	35	70	3.0	6.0	6.0-9.0	Alk.>Acid	1250	See Special Condition No. 14	2.0	4.0	Monitor only	0.0245	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall at times of "low flow" or "no flow" conditions in the receiving stream are subject to Special Condition No. 14.

II In accordance with 35 Ill. Adm. Code 406.110(a), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period less than or equal to the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hour precipitation event for this area is considered to be 2.97 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b).

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. At such time that receiving stream flow subsides to the degree that the mixing ratio specified in Special Condition No. 14 is not available, monitoring requirements and permit limitations shall revert to Discharge Condition I.

Sampling during all Discharge Conditions shall be performed utilizing the grab sampling method.

*** There shall be a minimum of nine (9) samples collected during the quarter when the pond is discharging. Of these 9 samples, a minimum of one sample each month shall be taken during either Discharge Condition I or IV should such discharge condition occur. A "no flow" situation is not considered to be a sample of the discharge. In the event that Discharge Conditions II and/or III occur, grab sample of each discharge caused by the above precipitation events (Discharge Conditions II and/or III) shall be taken and analyzed for the parameters identified in the table above during at least 3 separate events each quarter. For quarters in which there are less than 3 such precipitation events resulting in discharges, a grab sample of the discharge shall be required whenever such precipitation event(s) occur(s). Should a sufficient number of discharge events occur during the quarter, the remaining three (3) quarterly samples may be taken during any of the Discharge Conditions described above.

Discharges from the above referenced outfall that are subject to the requirements of Discharge Conditions II, III and/or IV must meet the water quality standards for sulfate and chloride in the receiving stream.

---

* The Permittee is subject to the limitations, monitoring, and reporting requirements of Special Condition No. 14 for the discharges from Outfall 009 and Pond Creek receiving such discharges. Also, discharges from Outfall 009 shall be subject to the limitations, monitoring and reporting requirements of Special Condition No. 18.

** No discharge is allowed from any above referenced permitted outfall during "low flow" or "no flow" conditions in the receiving stream unless such discharge meets the water quality standards of 35 Ill. Adm. Code 302.204 for pH.

NPDES Permit No. IL000077666

Effluent Limitations and Monitoring

From the effective date of this Permit until the expiration date, the effluent of the following discharge shall be monitored and limited at all times as follows:

Outfall*: 009ES (Alkaline Mine Drainage)

Discharge Condition	Parameters													
	Total Suspended Solids (mg/L) ***		Iron (total) (mg/L) ***		pH** (S.U.) ***	Alkalinity/ Acidity ***	Sulfate (mg/L) ***	Chloride (mg/L) ***	Mn (total) (mg/L) ***		Hardness ***	Copper (Cu) ***	Flow (MGD)	Settleable Solids (ml/l)
	30 day average	daily maximum	30 day average	daily maximum					30 day average	daily maximum				
I	35	70	3.0	6.0	6.5-9.0	Alk.>Acid	1250	500	2.0	4.0	Monitor only	0.0245	Measure When Sampling	-
II	-	-	-	-	6.0-9.0	-	1250	500	-	-	Monitor only	-	Measure When Sampling	0.5

IV	35	70	3.0	6.0	6.0-9.0	Alk.>Acid	1250	500	2.0	4.0	Monitor only	0.0245	Measure When Sampling	-

I Dry weather discharge (base flow or mine pumpage) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.110(a), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period less than or equal to the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b). The 10-year, 24-hour precipitation event for this area is considered to be 2.97 inches.

III In accordance with 35 Ill. Adm. Code 406.110(d), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.106(b).

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For outfalls which have no allowed mixing, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

Sampling during all Discharge Conditions shall be performed utilizing the grab sampling method.

*** There shall be a minimum of nine (9) samples collected during the quarter when the pond is discharging. Of these 9 samples, a minimum of one sample each month shall be taken during either Discharge Condition I or IV should such discharge condition occur. A "no flow" situation is not considered to be a sample of the discharge. In the event that Discharge Conditions II and/or III occur, grab sample of each discharge caused by the above precipitation events (Discharge Conditions II and/or III) shall be taken and analyzed for the parameters identified in the table above during at least 3 separate events each quarter. For quarters in which there are less than 3 such precipitation events resulting in discharges, a grab sample of the discharge shall be required whenever such precipitation event(s) occur(s). Should a sufficient number of discharge events occur during the quarter, the remaining three (3) quarterly samples may be taken during any of the Discharge Conditions described above.

The water quality standards for sulfate and chloride must be met in discharges from the above referenced outfall as well as in the receiving stream.

---

* The Permittee is subject to the limitations, monitoring, and reporting requirements of Special Condition No. 14 for the discharges from Outfall 009ES and Pond Creek receiving such discharges. Also, discharges from Outfall 009ES shall be subject to the limitations, monitoring and reporting requirements of Special Condition No. 18.

** No discharge is allowed from any above referenced permitted outfall during "low flow" or "no flow" conditions in the receiving stream unless such discharge meets the water quality standards of 35 Ill. Adm. Code 302.204 for pH.

NPDES Permit No. IL0077666

Effluent Limitations and Monitoring

From the effective date of this Permit until the expiration date, the effluent of the following discharge shall be monitored and limited at all times as follows:

Outfall*: 011* (Alkaline Mine Drainage)

Parameters													
Total Suspended Solids (mg/l)		Iron (total) (mg/l)		pH** (S.U.)	Alkalinity/ Acidity	Sulfate (mg/l)	Chloride (mg/l)	Mn (total) (mg/l)		Hardness	Nickel (mg/L)	Copper (mg/L)	Flow (MGD)	Iron (Dissolved)
30 day average	daily maximum	30 day average	daily maximum					30 day average	daily maximum					
35	70	3.0	6.0	6.5-9.0	Alk.>Acid	See Special Condition No. 16	See Special Condition No. 16	2.0	4.0	Monitor only	See Special Condition No. 16	See Special Condition No. 16	Measure When Sampling	See Special Condition No. 16

All sampling shall be performed utilizing the grab sampling method.

* Operation and management of pumpage to Outfall 011 is subject to the requirements of Special Condition No. 16. Also, discharges from Outfall 011 shall be subject to the limitations, monitoring, and reporting requirements of Special Condition No. 18.

NPDES Permit No. IL0077666

Effluent Limitations and Monitoring

Upon completion of Special Condition 10 and approval from the Agency, the effluent of the following discharge shall be monitored and limited at all times as follows:

Outfalls*: 001, 002, 003, 004, 005, 006, 007, 008, 009, 009ES (Reclamation Area Drainage)

Discharge Condition	Parameters					
	pH** (S.U.) ***	Sulfate (mg/L) ***	Chloride (mg/L) ***	Hardness ***	Flow (MGD)	Settleable Solids (ml/l) ***
I	6.5-9.0	1250	500	Monitor only	Measure When Sampling	0.5
II	6.0-9.0	1250	500	Monitor only	Measure When Sampling	0.5
III	6.0-9.0	1250	500	Monitor only	Measure When Sampling	-
IV	6.5-9.0	1250	500	Monitor only	Measure When Sampling	0.5

I Dry weather discharge (base flow, if present) from the outfall.

II In accordance with 35 Ill. Adm. Code 406.109(b), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period less than or equal to the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations. The 10-year, 24-hour precipitation event for this area is considered to be 5.21 inches.

III In accordance with 35 Ill. Adm. Code 406.109(c), any discharge or increase in the volume of a discharge caused by precipitation within any 24-hour period greater than the 10-year, 24-hour precipitation event (or snowmelt of equivalent volume) shall comply with the indicated limitations instead of those in 35 Ill. Adm. Code 406.109(b).

IV Discharges continuing 24 hours after cessation of precipitation event that resulted in discharge. For reclamation area discharges, monitoring requirements and permit limitations of Discharge Condition IV are identical to Discharge Condition I to which the outfall discharge has reverted.

Sampling during all Discharge Conditions shall be performed utilizing the grab sampling method. A "no flow" situation is not considered to be a sample of the discharge.

*** One sample per month (1/month) shall be collected if and/or when a discharge occurs under either Discharge Condition I, II or IV and analyzed for the parameters identified in the table above. In addition, at least three (3) grab samples shall be taken each quarter from separate precipitation events under Discharge Condition III and analyzed for parameters indicated in the above table. For quarters in which there are less than 3 such precipitation events, a grab sample of the discharge shall be required whenever such precipitation event(s) occur(s).

The water quality standards for sulfate and chloride must be met in discharges from the above referenced outfall as well as in the receiving stream.

---

* The Permittee is subject to the limitations, monitoring, and reporting requirements of Special Condition Nos. 13 and 15 for the discharges from Outfalls 001, 002, 003, 004, 005, 006, 007, 008 and 009ES and unnamed tributary to Pond Creek and Outfall 009 tributary to Pond Creek receiving such discharges.

** No discharge is allowed from any above referenced permitted outfall during "low flow" or "no flow" conditions in the receiving stream unless such discharge meets the water quality standards of 35 Ill. Adm. Code 302.204 for pH.

NPDES Permit No. IL0077666

Effluent Limitations and Monitoring

Upon completion of Special Condition No. 11 and approval from the Agency, the effluent of the following discharge shall be monitored and limited at all times as follows:

Outfalls: 001, 002, 003, 004, 05, 006, 007, 008, 009, 009ES (Stormwater Discharge)

Parameters	
pH* (S.U.) **	Settleable Solids (ml/l) **
6.0-9.0	0.5

Stormwater discharge monitoring is subject to the following reporting requirements:

Analysis of samples must be submitted with second quarter Discharge Monitoring Reports.

If discharges can be shown to be similar, a plan may be submitted by November 1 of each year preceding sampling to propose grouping of similar discharges and/or updated previously submitted groupings. If updating of a previously submitted plan is not necessary, a written notification to the Agency, indicating such is required. Upon approval from the Agency, one representative sample for each group may be submitted.

Annual stormwater monitoring is required for all discharges until Final SMCRA Bond is released and approval to cease such monitoring is obtained from the Agency.

---

* No discharge is allowed from any above referenced permitted outfalls during "low flow" or "no flow" conditions in the receiving stream unless such discharge meets the water quality standards of 35 Ill. Adm. Code 302.204 for pH.

** One (1) sample per year shall be collected and analyzed for the indicated parameter; however, such sampling and analysis is required only if and/or when a discharge occurs from the individual Outfall(s) identified above.

NPDES Permit No. IL0077666

Construction Authorization No. 3117-15

Authorization is hereby granted to the above designee to construct and operate the mine and mine refuse area described as follows:

Surface facilities in support of an underground mine containing a total of 986.10 acres, also identified as IDNR/OMM Permit Nos. 375 417 and 456, located in Sections 2, 3, 4, 7, 8, 9, 10, 12, 14, 15, 16, 17, 18 and 29, Township 8 South, Range 4 East, and Sections 11, 12, 13, 35, 36, Township 8 South, Range 3 East, Williamson County, 3rd P.M., Illinois, and Sections 1, 2 and 12, Township 8 South, Range 2 East, and Sections 7, 8, 9, 11, 14, 15, 16, and 17, Township 8 South, Range 3 East, and Sections 27, 28, 29, 30, 31, 32, 34 and 35, Township 7 South, Range 2 East, Franklin County , 3rd P.M., Illinois.

The surface facilities at this site contain drainage control structures (ditches) and nine (9) sediment basins, incline slope, coal preparation plant, coal stockpiles, refuse disposal areas, coal conveyors, railroad loop, ventilation shafts, parking areas, access roads, and office and maintenance buildings. The following additional areas are being added to the original facilities approved for this operation.

An additional area of 4.05 acres, identified as IBR No. 4 to OMM Permit No. 375, located in Section 12, Township 8 South, Range 3 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log Nos. 2416-06 and 2416-06-A, installation of three (3) boreholes and associated pipeline to ensure mine ventilation is approved. Runoff from the area approved herein should be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 9.71 acres, identified as IBR No. 5 to OMM Permit No. 375, located in Section 13, Township 8 South, Range 3 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log Nos. 2380-06 and 2380-06-A, installation of the support facilities to ensure mine ventilation is approved. Runoff from the area approved herein should be controlled by two temporary catch basins, silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 3.20 acres, identified as IBR No. 10 to OMM Permit No. 375, located in Section 8, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log Nos. 1396-07 and 1396-07-A, installation of two (2) boreholes and a vertical pump to ensure mine ventilation is approved. Runoff from the area approved herein should be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 12.50 acres, identified as IBR No. 11 to OMM Permit No. 375, located in Sections 4, 7 and 8, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log Nos. 1525-07 and 1525-07-A, this area is incorporated for the installation of the water line from the Locust Grove Shaft area to Pond 006. Runoff from the area approved herein should be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 0.36 acres, identified as IBR to OMM Permit No. 375, located in Sections 11 and 12, Township 8 South, Range 3 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log Nos. 0190-08 and 0190-08-A, re-alignment of access road is approved. Runoff from the area approved herein should be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc

An additional area of 3.57 acres, identified as IBR No. 14 to OMM Permit No. 375, located in Section 9, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log No. 0369-08, two (2) boreholes will be drilled and a vertical pump will be installed to ensure mine ventilation. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 8.1 acres, identified as IBR No. 25 to OMM Permit No. 375, located in Sections 9 and 10, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log No. 8091-10, two (2) concrete transport boreholes and access road will be constructed and a turbine pump, buried waterline and power line will be installed. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 2.13 acres, identified as IBR No. 55 to OMM Permit No. 375, located in Section 9 and 16, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log No. 5530-13 a buried pump discharge pipeline and electrical power line will be installed. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 4.18 acres, identified as IBR No. 52 to OMM Permit No. 375, located in Section 15, Township 8 South, Range 4 East, Williamson County, Illinois. As proposed and depicted in IEPA Log No. 5168-13, this area is being incorporated for the construction of an underground mine support facility including a borehole and installation of an electric vertical turbine pump. The area will also include a buried pipeline and electric power line. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 3.3 acres, identified as IBR No. 57 to OMM Permit No. 375, located in Section 18, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log No. 4088-14, two (2) boreholes will be constructed and a pump and waterline will be installed to pump underground mine pumpage to an existing waterline along Jordan Fort Road. Topsoil stockpiles will also be located with the IBR area. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 3.3 acres, identified as IBR No. 58 to OMM Permit No. 375, located in Sections 8 and 17, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log No. 5477-13, two (2) boreholes will be constructed and a pump and waterline will be installed to pump underground mine water and to ensure underground ventilation. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 9.89 acres, identified as IBR No. 60 to OMM Permit No. 375, located in Section 13, Township 8 South, Range 3 East, Williamson County, Illinois. As proposed and depicted in IEPA Log No. 4237-14, this area is for the development of topsoil and subsoil storage areas and construction of associated drainage ditches. Two (2) drainage ditches, identified as Collection Ditch Nos. D-5E-1 and D-5D-1, directs runoff from this area to existing Ditch D-5c and Pond 005.

An additional area of 1.0 acres, identified as IBR No. 78 to OMM Permit No. 375, located in Section 13, Township 8 South, Range 3 East, and Sections 7 and 18, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log No. 9082-19, this area is incorporated into this permit for a buried four-inch waterline to be installed. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 19.9 acres, identified as IBR No. 79 to OMM Permit No. 375, located in Sections 35 and 36, Township 7 South, Range 3 East, in Franklin County, Illinois. As proposed and depicted in IEPA Log No. 9083-19, this area is incorporated into this permit for installation of a supply shaft to transport supplies underground as required for the continued effective operation of approved mine plan, belt air shaft and fan to supply required ventilation along with six (6) steel cased boreholes with a diameter less ten 10 5/8 inches for power and other supplies, power substation, dry storage barn and equipment yard. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

An additional area of 17.01 acres, identified as IBR No. 83 to OMM Permit No. 375, located in Sections 2, 3, 9 and 10, Township 8 South, Range 4 East, in Williamson County, Illinois. As proposed and depicted in IEPA Log No. 9109-19, this area is incorporated into this permit for a access roadway, one 16.5 foot bleeder shaft, utility boreholes, concrete pad for transformer, a compressor station and a portable crib plant. Runoff from the area approved herein will be controlled by silt fence, mulching, seeding, vegetation, rock check dams, erosion control blankets, etc.

As described in IEPA Log No. 7395-11 and previously approved under Subtitle D Permit No. 2012-MA-7395-1, a permit area consisting of 9.82 acres located in Section 10, Township 8 South, Range 4 East, Williamson County, is incorporated into this permit for the construction of compressor bore hole, installation of a buried power line and an access road. All runoff from this area shall be monitored in accordance with stormwater monitoring requirements of Special Condition No. 11 of this NPDES Permit. This additional area is included in the total permit acreage cited above.

As described in IEPA Log No. 6141-12 and previously approved under Subtitle D Permit No. 2012-MA-6141-1, a permit area consisting of 0.64 acres located in Section 13, Township 8 South, Range 3 East, Williamson County, is incorporated into this permit for the construction of borehole for the batch material supply of crushed stone and concrete to the underground mine. All runoff from this area shall be monitored in accordance with stormwater monitoring requirements of Special Condition No. 11 of this NPDES Permit. This additional area is included in the total permit acreage cited above.

As described in IEPA Log No. 6562-12 and previously approved under Subtitle D Permit No. 2013-MA-6562, a permit area consisting of 3.81 acres located in Section 16, Township 8 South, Range 4 East, Williamson County, is incorporated into this permit for the construction of a steel-liner drill hole and temporary installation of a pumpable cement product mixing plant used for underground mine. All runoff from this area shall be monitored in accordance with stormwater monitoring requirements of Special Condition No. 11 of this NPDES Permit. This additional area is included in the total permit acreage cited above.

As described in IEPA Log No. 6039-12 and previously approved under Subtitle D Permit No. 2015-MA-6039, a permit area consisting of 4.65 acres located in Section 14, Township 8 South, Range 4 East, Williamson County, is incorporated into this permit for installation of ventilation shaft site. All runoff from this area shall be monitored in accordance with stormwater monitoring requirements of Special Condition No. 11 of this NPDES Permit. This additional area is included in the total permit acreage cited above.

As described in IEPA Log No. 2273-16 and previously approved under Subtitle D Permit No. 2016-MA-2273, a permit area consisting of 6.5 acres located in Section 29, Township 8 South, Range 4 East, Williamson County, is incorporated into this permit for the construction of a concrete lined South District Supply Shaft to provide supplies to underground workings, three (3) boreholes, a pole barn and an access road. All runoff from this area shall be monitored in accordance with stormwater monitoring requirements of Special Condition No. 11 of this NPDES Permit. This additional area is included in the total permit acreage cited above.

As previously approved under Subtitle D Permit No. 2014-MW-4275, a fine coal refuse (slurry) disposal area incorporating the use of geotextile tubes was developed at Pond Creek Mine site. As described and depicted in IEPA Log Nos. 4275-14, 4275-14-A, 4275-14-B, 1475-14-C development of this area included construction of a low permeability liner consisting of four (4) foot compacted clay with a hydraulic conductivity of 1 x 10^{-7} cm/sec, or less. Surface runoff and dewatering of the geotextile tubes is collected in a "no-discharge" perimeter containment basin and pumped to existing refuse disposal area or coal preparation plant. Hereby incorporated into this permit is a modification of the drainage control plan to allow stormwater runoff from the area to discharge through sediment ditches and spillway into existing Ditch D-5C and through Pond No. 005, as described and depicted in IEPA Log No. 3117-15. Reclamation of the geotextile tube refuse disposal area shell consists of construction of a low permeability cap consisting of four (4) foot compacted clay with hydraulic conductivity of 1x10^{-7}cm/sec, or less. Rooting medium and topsoil required for establishment of vegetative cover shall be in addition to the four (4) foot compacted clay low permeability cap. Four (4) monitoring wells identified as Well Nos. GW-29, GW-30, GW-31 and GW-32 shall be installed at each corner of the geotextile tube placement area. Groundwater monitoring shall be performed in accordance with Special Condition No. 12.

As described in IEPA Log Nos.1186-17, 1186-17-Band 1385-17, and previously approved under Subtitle D Permit No. 2017-MA-1186-1, a permit area consisting of 17.7 acres located in Section 12, Township 8 South, Range 3 East, Williamson County, is incorporated into this permit for construction of a Water Management Facility consisting of three (3) water holding cells. Construction and development of the water Management facility includes topsoil removal, grading, foundation preparation and installation of a low permeability liner consisting of four (4) foot compacted clay liner with a hydraulic conductivity of 1 x 10^{-7} cm/sec within the water holding cells. Compacted clay liner shall also be subject to and in accordance with the specifications and testing requirements of Condition No. 12. All runoff from this area shall be monitored in accordance with stormwater monitoring requirements of Special Condition No. 11 of this NPDES Permit. This additional area is included in the total permit acreage cited above. Four (4) monitoring wells identified as Well Nos. GW-33, GW-34, GW-35 and GW-36 shall be installed as depicted in IEPA Log Nos. 1186-17, 1186-17-B and 1385-17 Groundwater monitoring shall be performed in accordance with Special Condition No.13. This additional area is included in the total permit acreage cited above.

The following mining operations plan changes are incorporated into this permit:

Log No. 2413-06	The Mining Operations Plan has been revised to include the construction of an access tunnel under the railroad loop and administration building.
Log No. 2414-06	The Mine Operations Map has been revised to depict the revised various structures within the support facility.
Log No. 0371-08	Installation of a concrete sump at the existing road tunnel and a pipeline which will discharge to Sediment Pond No. 003, identified as IPR No. 13 to OMM Permit No. 375.

Surface drainage control is provided by eleven (11) sedimentation ponds with discharges designated as 001, 002, 003, 004, 005, 009, 09ES and 011 classified as alkaline mine drainage, and Outfalls 006, 007, 008 classified as acid mine discharge. The sanitary wastewater water treatment system will be approved by the Illinois Department of Public Health.

The location and receiving stream of the Outfalls at this facility is as follows:

Outfall No.	Latitude			Longitude			Receiving Water
	DEG	MIN	SEC	DEG	MIN	SEC	
001	37°	50'	59.2"	88°	49'	37.5"	Unnamed tributary to Pond Creek
002	37°	50'	26.0"	88°	49'	51.5"	Unnamed tributary to Pond Creek
003	37°	50'	26.0"	88°	49'	58.0"	Unnamed tributary to Pond Creek
004	37°	50'	25.0"	88°	49'	56.6"	Unnamed tributary to Pond Creek
005	37°	50'	9.1"	88°	50'	00.0"	Unnamed tributary to Pond Creek
006	37°	50'	28.4"	88°	50'	40.6"	Unnamed tributary to Pond Creek
007	37°	50'	29.5"	88°	49'	34.0"	Unnamed tributary to Pond Creek
008	37°	50'	31.4"	88°	49'	33.9"	Unnamed tributary to Pond Creek
009	37°	51'	16.1"	88°	49'	25.5"	Pond Creek
009ES	37°	50'	52.3"	88°	48'	43.7"	Unnamed tributary to Pond Creek
011	37°	52'	37"	89°	01'	49"	Big Muddy River

Original Sedimentation Ponds with discharges designated as Outfall Nos. 007 and 008 have been re-designed as described and depicted in IEPA Log No. 8554-10.

Refuse disposal
Refuse Disposal Area as previously approved in IEPA Log No. 3054-05, was constructed in phases as depicted and described in IEPA Log No. 2377-06 (RDA No. 1), Refuse Disposal Area No. 2 was constructed at Pond Creek Mine facilities as proposed and described in IEPA Log Nos. 1465-07, 1465-07-B, 1465-07-D, 1465-07-E, 1465-07-G, 1520-07, 0346-08, 9005-09, 9198-09, 9198-09-A, 8114-10, 8114-10-A, 7185-11, 7225-11, 6431-12, 6431-12-A and 5378-13.

As previously approved under Subtitle D Permit No. 2015-MA-3432, construction and development of Refuse Disposal Area No. 3 includes topsoil removal, grading, foundation preparation for refuse area, also construction of the water holding cell and installation of four (4) foot compacted clay liner was performed in accordance with the procedures discussed and outlined in IEPA Log No. 3432-15. As described in IEPA Log No. 3432-15, all stormwater runoff from the deposited coarse refuse within the RDA No. 3 is collected and maintained within the RDA No. 3 and/or is pumped into the slurry impounding structure of the existing RDA, which is an integral part of the Pond Creek Mine No. 1 coal preparation plant closed circuit wastewater handling system.

As described and depicted in IEPA Log Nos. 3001-15 and 3001-15-C Refuse Disposal Area No. 3 (RDA 3) is approved for construction. RDA 3 is located immediately east of the RDA 1 and RDA 2 areas, contains 229.78 acres, and is included in the above cited total Permit acreage. The area for RDA 3 is located in Section 12, Township 8 South, Range 3 East and Section 7, Township 8 South, Range 4 East, Williamson County, Illinois. To not increase chloride and sulfates due to construction of RDA 3, the mine is reclaiming the outslopes of the RDA 1 and RDA 2 that previously discharged through Outfalls 007 and 008. There will be no increase in loading due to the construction of RDA 3. Runoff from this area will be tributary to previously constructed water holding cell with the designated NPDES Outfalls 009 and 009ES, as depicted in IEPA Log No. 3117-15-A. Construction of four (4) foot compacted clay liners for the Refuse Disposal Area No. 3, Sediment Pond 009 and associated drainage control structures shall be subject to and in accordance with the specifications and testing requirements of Condition No. 12. With prior approval as to thickness and installation procedures, an HDPE synthetic liner may be utilized in lieu of the compacted clay liners proposed.

Mixing Zone (Big Muddy River)
Excess water will be transported from the Pond Creek Mine to Outfall No. 011 on the Big Muddy River through a high-density polyethylene (HDPE) pipeline. Water will be pumped from the Water Holding Cell by pumps through approximately 12.5 miles of pipe to the diffuser located at the mixing zone location. The pipeline ROW will be approximately 50 feet in width with a total permitted area of approximately 70.7 acres. The amount of water that could be discharged through the Pipeline depends upon the chloride concentration in the discharge stream, the background chloride content and the flow in the Big Muddy River. The upper limit to the discharge will be based on the pumping capacity of the facility. Maximum pumping rate of 5,000 gallons per minute or 11.1 cfs. from the facility. The volume of water discharged to Big Muddy River will be dependent upon the flow in the Big Muddy River and the chloride concentration of the water in the Water Holding Cell and the chloride concentration coming downstream in the River.

During operations of the pipeline, continuous flow monitors will be installed to provide protection against leakage. Flow will be monitored near the pump discharge while the pipeline is within the sediment control structure of Pond Creek Mine. Flow will also be monitored at the mixing zone location. This instrumentation will be connected to an alarm monitoring system and flow data will be transmitted to a central location for tracking and assessing system operations. The flow monitoring system operation and maintenance is subject to the requirements of Special Condition No. 16.

Groundwater monitoring for the facility will consist of Monitoring Well Nos.GW-1, GW-2, GW-3, GW-4, GW-5GW-9, GW-30, GW-33, GW-34, GW-35 and GW-36. Monitoring Well Nos. MW-8R, MW-10, MW-11, MW-12, MW-13, MW-14 and MW-28, as depicted in IEPA Log No. 3001-15, will monitor effects of the initial refuse disposal area. Groundwater monitoring requirements are outlined in Condition No. 13.

This Construction Authorization replaces Construction Authorization No. 3054-05.

The abandonment plan shall be executed and completed in accordance with 35 Ill. Adm. Code 405.109.

All water remaining upon abandonment must meet the requirements of 35 Ill. Adm. Code 406.202. For the constituents not covered by 35 Ill. Adm. Code Parts 302 or 303, all water remaining upon abandonment must meet the requirements of 35 Ill. Adm. Code 406.106.

NPDES Permit No. IL0077666

Construction Authorization No. 3117-15

This Authorization is issued subject to the following Condition(s). If such Condition(s) require(s) additional or revised facilities, satisfactory engineering plan documents must be submitted to this Agency for review and approval to secure issuance of a Supplemental Authorization to Construct.

1. If any statement or representation is found to be incorrect, this permit may be revoked and the permittee thereupon waives all rights thereunder.

2. The issuance of this permit (a) shall not be considered as in any manner affecting the title of the premises upon which the mine or mine refuse area is to be located; (b) does not release the permittee from any liability for damage to person or property caused by or resulting from the installation, maintenance or operation of the proposed facilities; (c) does not take into consideration the structural stability of any units or parts of the project; and (d) does not release the permittee from compliance with other applicable statutes of the State of Illinois, or with applicable local laws, regulations or ordinances.

3. Final plans, specifications, application and supporting documents as submitted by the permittee and approved by the Agency shall constitute part of this permit in the records of the Agency.

4. There shall be no deviations from the approved plans and specifications unless revised plans, specifications and application shall first have been submitted to the Agency and a supplemental permit issued.

5. The permit holder shall notify the Agency (217/782-3637) immediately of an emergency at the mine or mine refuse area which causes or threatens to cause a sudden discharge of contaminants into the waters of Illinois and shall immediately undertake necessary corrective measures as required by 35 Ill. Adm. Code 405.111. (217/782-3637 for calls between the hours of 5:00 p.m. to 8:30 a.m. and on weekends.)

6. The termination of an NPDES discharge monitoring point or cessation of monitoring of an NPDES discharge is not authorized by this Agency until the permittee submits adequate justification to show what alternate treatment is provided or that untreated drainage will meet applicable effluent and water quality standards.

7. Initial construction activities in areas to be disturbed shall be for collection and treatment facilities only. Prior to the start of other activities, surface drainage controls shall be constructed and operated to avoid violations of the Act or Subtitle D. At such time as runoff water is collected in the sedimentation pond, a sample shall be collected and analyzed, for the parameters designated as 1M through 15M under Part 5-C of Form 2C and the effluent parameters designated herein with the results sent to this Agency. Should additional treatment be necessary to meet the standards of 35 Ill. Adm. Code 406.106 or applicable water quality standards, a Supplemental Permit must be obtained. Discharge from ponds is not allowed unless applicable effluent and water quality standards are met in the basin discharge(s).

8. This Agency must be informed in writing and an application submitted if drainage, which was previously classified as alkaline (pH greater than 6.0), becomes acid (pH less than 6.0) or ferruginous (base flow with an iron concentration greater than 10 mg/L). The type of drainage discharging to the basin should be reclassified in a manner consistent with the applicable provisions of 35 Ill. Adm. Code Part 406. The application should discuss the treatment method and demonstrate how the discharge will meet the applicable standards.

9. A permittee has the obligation to add a settling aid if necessary to meet the suspended solids or settleable solids effluent standards. The selection of a settling aid and the application practice shall be in accordance with a. or b. below

    a. Alum ($Al_2(SO_4)_3$), hydrated lime ($Ca(OH)_2$), soda ash (Na_2CO_3), alkaline pit pumpage, acetylene production by-product (tested for impurities), and ground limestone are acceptable settling aids and are hereby permitted for alkaline mine drainage sedimentation ponds.

    b. Any other settling aids such as commercial flocculents and coagulants are permitted only on prior approval from the Agency. To obtain approval a permittee must demonstrate in writing to the Agency that such use will not cause a violation of the toxic substances standard of 35 Ill. Adm. Code 302.210 or of the appropriate effluent and water quality standards of 35 Ill. Adm. Code parts 302, 304, and 406.

10. A general plan for the nature and disposition of all liquids used to drill boreholes shall be filed with this Agency prior to any such operation. This plan should be filed at such time that the operator becomes aware of the need to drill unless the plan of operation was contained in a previously approved application.

11. Any of the following shall be a violation of the provisions required under 35 Ill. Adm. Code 406.202:

    a. It is demonstrated that an adverse effect on the environment in and around the receiving stream has occurred or is likely to occur.

b. It is demonstrated that the discharge has adversely affected or is likely to adversely affect any public water supply.

c. The Agency determines that the permittee is not utilizing Good Mining Practices in accordance with 35 Ill. Adm. Code 406.204 which are fully described in detail in Sections 406.205, 406.206, 406.207 and 406.208 in order to minimize the discharge of total dissolved solids, chloride, sulfate, iron and manganese. To the extent practical, such Good Mining Practices shall be implemented to:

i. Stop or minimize water from coming into contact with disturbed areas through the use of diversions and/or runoff controls (Section 406.205).

ii. Retention and control within the site of waters exposed to disturbed materials utilizing erosion controls, sedimentation controls, water reuse or recirculation, minimization of exposure to disturbed materials, etc. (Section 406.206).

iii. Control and treatment of waters discharged from the site by regulation of flow of discharges and/or routing of discharges to more suitable discharge locations (Section 406.207).

iv. Utilized unconventional practices to prevent the production or discharge of waters containing elevated contaminant concentrations such as diversion of groundwater prior to entry into a surface or underground mine, dewatering practices to remove clean water prior to contacting disturbed materials and/or any additional practices demonstrated to be effective in reducing contaminant levels in discharges (Section 406.208).

12. The four (4) foot compacted clay liner to be constructed course refuse disposal area, fine coal refuse area (RDA No. 3) and Sedimentation Basin 009 shall be subject to the specifications and procedures presented in IEPA Log No. 3001-15-C.

Construction Specifications

a. All soils to be used for the compacted clay liner shall be free of grass, vines, vegetation and rock or stones greater than four (4) inches in diameter.

b. Samples collected from the borrow area shall be evaluated in accordance with ASTM D422, D4318 and D2487 to ensure classification criteria are met.

c. Each successive soil lift shall be placed to a 6 to 8 inch loose thickness; however, in no instance shall the loose lift thickness exceed the length of the pads or feet on the compactor or roller.

d. Each soil lift shall be compacted to the minimum Standard Prototor (ASTM D698) density identified in item no. 12(q) below, at a moisture content of 0% to 5% above the optimum moisture content of the soil.

e. Inter-lift surfaces shall be adequately scarified to ensure inter-lifting bonding.

f. Liner construction shall be performed to consistent achievement of density, moisture content, and hydraulic conductivity for each successive lift.

g. The placement of frozen material or the placement material on frozen ground is prohibited.

h. Contemporaneous placement or protective covering shall be provided to prevent drying, desiccation and/or freezing where necessary.

i. Liner construction shall be completed in a manner which reduces void spaces within the soil and liner.

j. All construction stakes shall be removed during construction, and all test holes (Shelby tube samples) are to be backfilled with bentonite.

k. The compacted clay liner shall be constructed in a manner to achieve a uniform barrier with a hydraulic conductivity of 1×10^{-7} cm/sec.

l. In the event that acceptable compaction results are not achieved, the soil lift shall be reprocessed or removed and replaced. If moisture content is less than optimum, or greater than 5% above optimum, the falling material shall be wetted or dried to a moisture content within specification and re-compacted. If the dry density is below specification, the failing material shall be re-compacted until a passing test is achieved.

m. In the event of a failing conductivity test, the soil may be removed or re-compacted and retested until a passing result is obtained; or the soil immediately above and below the test specimen from the same Shelby tube may be tested. If both tests pass, the original test shall be nullified. If either test fails, that portion of the liner shall be rejected and shall be reconstructed and retested until passing results are obtained. The limits of necessary reconstruction shall be determined by additional sampling and testing within the failed region, thereby isolating the failing area of work.

Testing Specifications

n. Prior to initiating soil liner construction, borrow soils shall be identified, qualified, and verified. At minimum, a representative sample of each soil type identified within the borrow area is to be collected and analyzed for gradation, compaction, and hydraulic conductivity characteristics.

o. Samples collected from borrow area shall be evaluated in accordance with ASTM D422, D4318 and D2487 to ensure classification criteria are met.

p. Samples collected from the borrow area shall be tested in accordance with ASTM D 698 to determine maximum dry density and optimum moisture content of the soil.

q. Samples collect from the borrow area shall be compacted to 90% and 95% standard Proctor density at or near optimum moisture content. The hydraulic conductivity of the re-compacted samples shall be determined in accordance with ASTM D5084 procedures. The results of this testing shall be used to establish the minimum dry density for soil liner compaction necessary to achieve a hydraulic conductivity of 1×10^{-7} cm/sec or less.

r. Moisture and density testing by nuclear methods (ASTM D2922 and D3017) shall be conducted at a rate of at least one test per 1,000 cubic yards placed. Testing locations shall be random and shall not be known to the earthwork contractor prior to lift placement.

s. To ensure the accuracy and reproducibility of the nuclear testing, all nuclear density gauges shall be certified to calibration. Soil compaction tests shall be double-checked with independent test methods. A drive cylinder test and laboratory moisture content determination shall be conducted and compared to gauge readings. These independent checks shall be made at the outset of construction and on a bi-weekly basis (e.g., every ten working days) thereafter.

t. Samples for hydraulic conductivity verification shall be retrieved from the compacted soil liner and tested in accordance with ASTM D5084 procedures. Samples shall be retrieved using three-inch Shelby tubes. Samples shall be completed at frequency of one sample/test per 20,000 cubic yards placed. The vertical location of the recovered samples shall be varied so that representative portions or lifts of the contractor prior to soil liner construction.

u. Survey checks shall be conducted at a minimum spacing of 100 ft. centers, and at 100 ft. intervals along each line where a break in slope occurs, to verify liner thickness. To verify liner thickness, the survey checks shall be taken before and after liner construction.

13. Groundwater monitoring requirements for Well Nos. MW-12, MW-13, MW-14, MW-8R and MW-28 are as follows:

a. Ambient background monitoring shall be performed for all referenced wells. Such ambient monitoring shall consist of six (6) samples collected during the first year (approximately bi-monthly) following well installation but no later than during the first year of operation or disturbance to determine ambient background concentrations. Background monitoring shall include the following list of constituents:

Aluminum	Fluoride	Sulfate
Antimony	Iron (dissolved)	Thallium
Arsenic	Iron (total)	Total Dissolved Solids
Barium	Lead	Vanadium
Beryllium	Manganese (dissolved)	Zinc
Boron	Manganese (total)	pH (field)
Cadmium	Mercury	Acidity
Chloride	Molybdenum	Alkalinity
Chromium	Nickel	Hardness
Cobalt	Phenols	Static Water Elevation
Copper	Selenium	
Cyanide	Silver	

b. Following the ambient monitoring as required under Condition No. 13(a) above, routine monitoring shall continue on a quarterly basis as follows:

i. Monitoring Well Nos. MW-12, MW-13, MW-14, MW-8R and MW-28 shall continue to be monitored quarterly for the contaminants identified in Condition No. 12(a) above.

ii. Monitoring Well Nos. MW-12, MW-13, MW-14, MW-8R and MW-28 shall be monitored quarterly as required by IDNR/OMM for the following list of constituents:

Chloride	Total Dissolved Solids
Iron (dissolved)	Hardness
Iron (total)	Acidity
Manganese (dissolved)	Alkalinity
Manganese (total)	pH
Sulfate	Static Water Elevation

c. Following completion of active mining and reclamation, post-mining monitoring of all above referenced wells shall consist of six (6) samples collected during a 12-month period (approximately bi-monthly) to determine post-mining concentrations. Post-mining monitoring shall include the list of constituents identified in Condition No. 13(a) above.

d. Groundwater monitoring reports shall be submitted to the Agency in accordance with Special Condition Nos. 3 and 5 of this NPDES permit.

e. A statistically valid representation of background and/or post mining water quality required under Condition No. 13(b) above shall be submitted utilizing the following method. This method shall be used to determine the upper 95 percent confidence limit for each parameter listed above.

Should the Permittee determine that an alternate statistical method would be more appropriate based on the data being evaluated, the Permittee may request utilization of such alternate methodology. Upon approval from the Agency, the alternate methodology may be utilized to determine a statistically valid representation of background and/or post mining water quality.

The following method should be used to predict the confidence limit when single groundwater samples are taken from each monitoring (test) well.

i. Determine the arithmetic mean $\left(\overline{X}_b\right)$ of each indicator parameter for the sampling period. If more than one well is used, an equal number of samples must be taken from each well.

$$\overline{X}_b = \frac{X_1 + X_2 + \ldots X_n}{n}$$

Where:

$\overline{X}_b$ = Average value for a given chemical parameter

X_n = Values for each sample

n = the number of samples taken

ii. Calculate the background and/or post mining variance (S_b^2) and standard deviation (S_b) for each parameter using the values (X_n) from each sample of the well(s) as follows:

$$S_b^2 = \frac{(X_1 - \overline{X}_b)^2 + (X_2 - \overline{X}_b)^2 + \ldots + (X_n - \overline{X}_b)^2}{n-1}$$

$$S_b = \sqrt{S_b^2}$$

iii. Calculate the upper confidence limit using the following formula:

$$CL = \overline{X}_b \pm t\sqrt{1 + 1/n}\ (S_b)$$

Where:

CL = upper confidence limit prediction
(upper and lower limits should be calculated for pH)
t = onetailed t value at the required significance
level and at n1 degrees of freedom from Table 1
(a twotailed t value should be used for pH)

iv. If the values of any routine parameter for any monitoring well exceed the upper confidence limit for that parameter, the permittee shall conclude that a statistically significant change has occurred at that well.

v. When some of the background and/or post mining values are less than the Method Detection Limit (MDL), a value of one-half (1/2) the MDL shall be substituted for each value that is reported as less than the MDL. All other computations shall be calculated as given above.

If all the background and/or post mining values are less than the MDL for a given parameter, the Practical Quantitation Limit (PQL), as given in 35 Ill. Adm. Code Part 724 Appendix I shall be used to evaluate data from monitoring wells. If the analytical results from any monitoring well exceed two (2) times the PQL for any single parameter, or if they exceed the PQLs for two or more parameters, the permittee shall conclude that a statistically significant change has occurred.

Table 1
Standard tTables Level of Significance

Degrees of freedom	tvalues (onetail)		tvalues (twotail)*	
	99%	95%	99%	95%
4	3.747	2.132	4.604	2.776
5	3.365	2.015	4.032	2.571
6	3.143	1.943	3.707	2.447
7	2.998	1.895	3.499	2.365
8	2.896	1.860	3.355	2.306
9	2.821	1.833	3.250	2.262
10	2.764	1.812	3.169	2.228
11	2.718	1.796	3.106	2.201
12	2.681	1.782	3.055	2.179
13	2.650	1.771	3.012	2.160
14	2.624	1.761	2.977	2.145
15	2.602	1.753	2.947	2.131
16	2.583	1.746	2.921	2.120
17	2.567	1.740	2.898	2.110
18	2.552	1.734	2.878	2.101
19	2.539	1.729	2.861	2.093
20	2.528	1.725	2.845	2.086
21	2.518	1.721	2.831	2.080
22	2.508	1.717	2.819	2.074
23	2.500	1.714	2.807	2.069
24	2.492	1.711	2.797	2.064
25	2.485	1.708	2.787	2.060
30	2.457	1.697	2.750	2.042
40	2.423	1.684	2.704	2.021

Adopted from Table III of "Statistical Tables for Biological Agricultural and Medical Research" (1947, R.A. Fisher and F. Yates).

* For pH only when required.

NPDES Permit No. IL0077666

Special Conditions

Special Condition No. 1: No effluent from any mine related facility area under this permit shall, alone or in combination with other sources, cause a violation of any applicable water quality standard as set out in the Illinois Pollution Control Board Rules and Regulations, Subtitle C: Water Pollution.

Special Condition No. 2: Samples taken in compliance with the effluent monitoring requirements shall be taken at a point representative of the discharge, but prior to entry into the receiving stream.

Special Condition No. 3: All periodic monitoring and reporting forms, including Discharge Monitoring Report (DMR) forms, shall be submitted to the Agency according to the schedule outlined in Special Condition No. 4 or 5 below with one (1) copy forwarded to each of the following addresses:

Illinois Environmental Protection Agency
Division of Water Pollution Control
1021 North Grand Ave., East
P.O. Box 19276
Springfield, IL 62794-9276

Attn: Compliance Assurance Section

Illinois Environmental Protection Agency
Mine Pollution Control Program
2309 West Main Street, Suite 116
Marion, Illinois 62959

The Permittee will be required to submit electronic DMRs (NetDMR) instead of mailing paper DMRs to the IEPA, unless a waiver is approved by the Agency. More information, including registration information for the NetDMR program, can be obtained on the IEPA website, https://www2.illinois.gov/epa/topics/water-quality/surface-water/netdmr/Pages/quick-answer-guide.aspx.

Special Condition No. 4: Completed Discharge Monitoring Report (DMR) forms and as well as upstream and downstream monitoring results, shall be retained by the Permittee for a period of three (3) months and shall be submitted electronically (or mailed if waiver is approved by the Agency) and received by the IEPA at the addresses indicated in Special Condition No. 3 above in accordance with the following schedule, unless otherwise specified by the permitting authority.

Period	Received by IEPA
January, February, March	April 15
April, May, June	July 15
July, August, September	October 15
October, November, December	January 15

The Permittee shall record discharge monitoring results on Discharge Monitoring Report (DMR) forms using one such form for each Outfall and Discharge Condition each month. In the event that an Outfall does not discharge during a monthly reporting period or under a given Discharge Condition, the DMR form shall be submitted with "No Discharge" indicated.

Any and all monitoring results, other than NPDES outfall discharge results reported through NetDMR, shall be submitted to the Agency at the addresses indicated in Special Condition No. 3 above.

Special Condition No. 5: Completed periodic monitoring and reporting, other than DMR's and stream monitoring (i.e., groundwater monitoring, coal combustion waste analysis reports, etc.), shall be retained by the Permittee for a period of three (3) months and shall be mailed and received by the IEPA at the addresses indicated in Special Condition No. 3 above in accordance with the following schedule, unless otherwise specified by the permitting authority.

Period	Received by IEPA
January, February, March	May 1
April, May, June	August 1
July, August, September	November 1
October, November, December	February 1

Special Condition No. 6: The Agency may revise or modify the permit consistent with applicable laws, regulations or judicial orders.

Special Condition No. 7: If an applicable effluent standard or limitation is promulgated under Sections 301(b)(2)(C) and (D), 304(b)(2), and 307(a)(2) of the Clean Water Act and that effluent standard or limitation is more stringent than any effluent limitation in the permit or controls a pollutant not limited in the NPDES Permit, the Agency shall revise or modify the permit in accordance with the more stringent standard or prohibition and shall so notify the permittee.

Special Condition No. 8: The permittee shall notify the Agency in writing by certified mail within thirty days of abandonment, cessation, or suspension of active mining for thirty days or more unless caused by a labor dispute. During cessation or suspension of active mining, whether caused by a labor dispute or not, the permittee shall provide whatever interim impoundment, drainage diversion, and wastewater treatment is necessary to avoid violations of the Act or Subtitle D Regulations.

Special Conditions

Special Condition No. 9: Plans must be submitted to and approved by this Agency prior to construction of any future sedimentation ponds. At such time as runoff water is collected in the sedimentation pond, a sample shall be collected and analyzed for the parameters designated as 1M-15M under Part 5-C of Form 2C and the effluent parameters designated herein with the results sent to this Agency. Should additional treatment be necessary to meet these standards, a Supplemental Permit must also be obtained. Discharge from a pond is not allowed unless applicable effluent and water quality standards are met.

Special Condition No. 10: The special reclamation area effluent standards of 35 Ill. Adm. Code 406.109 apply only on approval from the Agency. To obtain approval, a request form and supporting documentation shall be submitted to request the discharge be classified as a reclamation area discharge. The Agency will notify the permittee upon approval of the change.

Special Condition No. 11: The special stormwater effluent standards apply only on approval from the Agency. To obtain approval, a request with supporting documentation shall be submitted to request the discharge to be classified as a stormwater discharge. The documentation supporting the request shall include analysis results indicating the discharge will consistently comply with reclamation area discharge effluent standards. The Agency will notify the permittee upon approval of the change.

Special Condition No. 12: Annual stormwater monitoring is required for all discharges not tributary to a sediment basin until Final SMCRA Bond is released and approval to cease such monitoring is obtained from the Agency.

a. Each discharge must be monitored for pH and settleable solids annually.

b. Analysis of samples must be submitted with second quarter Discharge Monitoring Reports. A map with discharge locations must be included in this submittal.

c. If discharges can be shown to be similar, a plan may be submitted by November 1 of each year preceding sampling to propose grouping of similar discharges and/or update previously submitted groupings. If updating of a previously submitted plan is not necessary, a written notification to the Agency indicating such is required. Upon approval from the Agency, one representative sample for each group may be submitted.

Special Condition No. 13: Sediment Pond Operation and Maintenance (Outfalls 001, 002, 003, 004, 005, 006, 007, 008, 009ES):

a. For discharges resulting from precipitation events, in addition to the alternate effluent (Discharge Condition Nos. II and III) monitoring requirements, as indicated on the applicable effluent pages of this Permit, discharges from Outfalls 001, 002, 003, 004, 005, 006, 007, 008, 009ES shall be monitored and reported for Discharge Rate, Sulfate, Chloride and Hardness.

b. The following sampling and monitoring requirements are applicable to flow in the unnamed tributary to Pond Creek which receive discharges from Outfalls 001, 002, 003, 004, 005, 006, 007, 008, 009ES.

   i. All sampling and monitoring required under 13(b)(ii) and (iii) below shall be performed during a discharge and monitoring event from the associated outfall.

   ii. Unnamed tributary to Pond Creek shall be monitored and reported quarterly for Discharge Rate, Chloride, Sulfate and Hardness downstream of the associated outfall. This downstream monitoring shall be performed a sufficient distance downstream of the associated outfall to ensure that complete mixing has occurred. At such time that sufficient information has been collected regarding receiving stream flow characteristics and in-stream contaminant concentrations the permittee may request a re-evaluation of the monitoring frequency required herein for possible reduction or elimination. For the purpose of re-evaluating the downstream monitoring frequency of the receiving stream, "sufficient information" is defined as a minimum of ten (10) quarterly sampling events.

   In the event that downstream monitoring of the receiving waters is eliminated during the term of this permit based on an evaluation of the quarterly data, a minimum of three (3) additional samples analyzed for the parameters identified above must be submitted with the permit renewal application a minimum of 180 days prior to expiration of this permit.

   iii. Unnamed tributary to Pond Creek shall be monitored and reported annually for Discharge Rate, Chloride, Sulfate and Hardness upstream of the associated outfall.

Special Condition No. 14: Sediment Pond Operation and Maintenance (Outfall 009):

a. No discharge is allowed from Outfall No. 009 during "low flow" or "no flow" conditions in the receiving stream, unless such discharge meets the water quality standards of 35 Ill. Adm. Code 302.

Pursuant to 35 Ill. Adm. Code Part 302.102, discharges from the referenced outfalls that otherwise would not meet the water quality standards of 35 Ill. Adm. Code Part 302 may be permitted if sufficient flow exists in the receiving stream to ensure that applicable water quality standards are met. That is, discharges not meeting the water quality standards of 35 Ill. Adm. Code Part 302 may only be discharged in combination with stormwater discharges from the basin, and only at such times that sufficient flow exists in the receiving stream to ensure that water quality standards in the receiving stream beyond the area of allowed mixing will not be exceeded.

The permittee shall determine the effluent limitation for chloride and/or the maximum effluent flow rate allowable to maintain water quality in the receiving stream. The following equations shall be used to make such determinations:

$$C_{DS} = [C_E Q_E + 0.25 C_{US} Q_{US}]/ (0.25 Q_{US} + Q_E)$$

Where:

C_E = Effluent concentration (mg/L)

Q_E = Effluent flow rate (cfs) for Outfall 009

Q_{US} = Upstream flow rate (cfs)

C_{US} = Upstream concentration (mg/L)

C_{DS} = Downstream concentration

The "calculated" downstream concentration shall be less than 500 mg/L for chloride and reported on the discharge monitoring reports (DMRs).

The permittee shall install a gauging station and conductivity monitor upstream of the discharge to determine an upstream flow (Q_{US}) and a chloride concentration (C_{US}) correlated to the conductivity value. In addition, the permittee shall install a continuous conductivity monitor downstream to ensure that the chloride concentration (correlated to the conductivity value) stays within the chloride water quality standard. The daily maximum downstream chloride concentration controlled to conductivity shall be reported on the DMR"s.

If there is no upstream mixing available for Outfall 009, the NPDES permit shall be regulated at 500 mg/L for Chloride and 1250 mg/L for Sulfate.

The upstream and downstream conductivity monitoring locations need to be approved by the Agency.

b. The following sampling and monitoring requirements are applicable to flow in Pond Creek which receives the discharges from Outfall 009.

   i. All sampling and monitoring required under 14(b)(ii) and (iii) below shall be performed during a discharge and monitoring event from the associated outfall.

   ii. Pond Creek shall be monitored and reported quarterly for Discharge Rate, Sulfate, Chloride and Hardness downstream of the associated outfall. This downstream monitoring shall be performed a sufficient distance downstream of the associated outfall to ensure that complete mixing has occurred. At such time that sufficient information has been collected regarding stream flow characteristics and in-stream contaminant concentrations, the permittee may request a re-evaluation of the monitoring frequency required herein for possible reduction or elimination. For the purpose of re-evaluating the downstream monitoring frequency of the receiving stream, "sufficient information" is defined as a minimum of ten (10) quarterly sampling events.

   In the event that downstream monitoring of the receiving waters is eliminated during the term of this permit based on an evaluation of the quarterly data, a minimum of three (3) additional samples analyzed for the parameters identified above must be submitted with the permit renewal application a minimum of 180 days prior to expiration of this permit.

   iii. Pond Creek shall be monitored and reported annually for Discharge Rate, Sulfate, Chloride and Hardness upstream of the associated outfall.

Special Condition No. 15: Sediment Pond Operation and Maintenance (Outfall 009 – Reclamation Area Discharge Classification):

a. For discharges resulting from precipitation events, in addition to the alternate effluent (Discharge Condition Nos. II and III) monitoring requirements, as indicated on the applicable effluent pages of this Permit, discharges from Outfall 009 shall be monitored and reported for Discharge Rate, Sulfate, Chloride and Hardness.

b. The following sampling and monitoring requirements are applicable to flow in the Middle Fork Big Muddy River which receive discharges from Outfall 009.

Special Conditions

i. All sampling and monitoring required under 15(b)(ii) and (iii) below shall be performed during a discharge and monitoring event from the associated outfall.

ii. Middle Fork Big Muddy River shall be monitored and reported quarterly for Discharge Rate, Chloride, Sulfate and Hardness downstream of the associated outfall. This downstream monitoring shall be performed a sufficient distance downstream of the associated outfall to ensure that complete mixing has occurred. At such time that sufficient information has been collected regarding receiving stream flow characteristics and in-stream contaminant concentrations the permittee may request a re-evaluation of the monitoring frequency required herein for possible reduction or elimination. For the purpose of re-evaluating the downstream monitoring frequency of the receiving stream, "sufficient information" is defined as a minimum of ten (10) quarterly sampling events.

In the event that downstream monitoring of the receiving waters is eliminated during the term of this permit based on an evaluation of the quarterly data, a minimum of three (3) additional samples analyzed for the parameters identified above must be submitted with the permit renewal application a minimum of 180 days prior to expiration of this permit.

iii. Middle Fork Big Muddy River shall be monitored and reported annually for Discharge Rate, Chloride, Sulfate and Hardness upstream of the associated outfall.

Special Condition No. 16: Sediment Pond Operation and Maintenance (Outfall 011):

a. Pursuant to 35 Ill. Adm. Code Part 302.102, discharges from the referenced outfalls that otherwise would not meet the water quality standards of 35 Ill. Adm. Code Part 302 may be permitted if sufficient flow exists in the receiving stream to ensure that applicable water quality standards are met. That is, discharges not meeting the water quality standards of 35 Ill. Adm. Code Part 302 may only be discharged in combination with stormwater discharges from the basin, and only at such times that sufficient flow exists in the receiving stream to ensure that water quality standards in the receiving stream beyond the area of allowed mixing will not be exceeded.

The permittee shall determine the effluent limitation for chloride and/or the maximum effluent flow rate allowable to maintain water quality in the receiving stream. The following equations shall be used to make such determinations:

$$C_{DS} = [C_E Q_E + 0.25 C_{US} Q_{US}]/ (0.25 Q_{US} + Q_E)$$

Where:

C_E = Effluent concentration (mg/L)

Q_E = Effluent flow rate (cfs) for Outfall 011

Q_{US} = Upstream flow rate (cfs)

C_{US} = Upstream concentration (mg/L)

C_{DS} = Downstream concentration

The "calculated" downstream concentration (CDS) shall be less than 500 mg/L for chloride and reported on the discharge monitoring reports (DMRs).

Chloride is limited in the NPDES permit at the limits described below. The maximum flow from Outfall 011 is 5,000 gpm and the maximum chloride concentration is 12,000 mg/L.

Sulfate and Iron (dissolved) shall be monitored from the effluent monthly when discharging.

The permit only allows a discharge when the Big Muddy River is flowing above 30 cfs. The maximum dispersion required for all water quality parameters is 34:1. Model predictions have been made for a maximum effluent total flow rate of 11.1 cfs. At the maximum chloride concentration of 12,000 mg/L, this maximum discharge requires a river flow of 1,734 cfs to meet a dispersion of 34:1 in less than 25 % of the river volume. The maximum distance to meet the water quality standard for all scenarios is 251 feet downstream with a plume width of 25 feet. The maximum zone of initial dilution to meet the acute Copper water quality standard for all scenarios is 18.2 feet downstream with a plume width of 4 feet.

The upstream flow (Q_{US}) should be based on the full flow measurement upstream of the proposed Outfall 011 that shall be approved by the Agency.

The upstream and downstream conductivity monitoring locations need to be approved by the Agency.

Special Conditions

The permittee shall install a conductivity monitor upstream of the discharge to determine a chloride concentration (C_{US}) correlated to the conductivity value. In addition, the permittee shall install a continuous conductivity monitor downstream to ensure that the chloride concentration (correlated to the conductivity value) stays within the chloride water quality standard. The daily maximum downstream chloride concentration controlled to conductivity shall be reported on the DMR's.

b. The following sampling and monitoring requirements are applicable to flow in Big Muddy River which receives the discharges from Outfall 011.

i. All sampling and monitoring required under 16(b)(ii) and (iii) below shall be performed during a discharge and monitoring event from the associated outfall.

ii. The Big Muddy River shall be monitored and reported quarterly for Discharge Rate, Sulfate, Chloride and Hardness downstream of the associated outfall. This downstream monitoring shall be performed a sufficient distance downstream of the associated outfall to ensure that complete mixing has occurred. At such time that sufficient information has been collected regarding stream flow characteristics and in-stream contaminant concentrations, the permittee may request a re-evaluation of the monitoring frequency required herein for possible reduction or elimination. For the purpose of re-evaluating the downstream monitoring frequency of the receiving stream, "sufficient information" is defined as a minimum of ten (10) quarterly sampling events.

In the event that downstream monitoring of the receiving waters is eliminated during the term of this permit based on an evaluation of the quarterly data, a minimum of three (3) additional samples analyzed for the parameters identified above must be submitted with the permit renewal application a minimum of 180 days prior to expiration of this permit.

iii. The Big Muddy River shall be monitored and reported annually for Discharge Rate, Sulfate, Chloride and Hardness upstream of the associated outfall.

Special Condition No. 17: Data collected in accordance with Special Condition Nos. 13, 14, 15 and 16 above will be utilized to evaluate the appropriateness of the effluent limits established in this Permit. Should the Agency's evaluation of this data indicate revised effluent limits are warranted; this permit may be reopened and modified to incorporate more appropriate effluent limitations. This data will also be used for determination of effluent limitations at the time of permit renewal.

Special Condition No. 18: Discharges from Outfalls 006, 007, 008, 009, 009ES and 011 shall be monitored twice annually with such monitoring spaced at approximately 6-month intervals during the entire 5-year term of this NPDES Permit. Sampling of the discharges shall be performed utilizing the grab sampling method and analyzed for total (unfiltered) concentrations. The results of the sampling required under this Special Condition shall be submitted twice annually to the Agency in January and July of each calendar year to the addresses indicated in the Special Condition No. 3 above. The parameters to be sampled and the detection limits (minimum reported limits) are as follows:

Parameter	Detection Limit
Arsenic	0.05 mg/L
Barium	0.50 mg/L
Cadmium	0.001 mg/L
Chromium (hexavalent)	0.01 mg/L
Chromium	0.05 mg/L
Copper	0.005 mg/L
Lead	0.05 mg/L
Manganese	0.50 mg/L
Mercury*	1.00 ng/l**
Nickel	0.005 mg/L
Phenols	0.005 mg/L
Selenium	2.000 µg/l***
Silver	0.003 mg/L
Zinc	0.025 mg/L

* Utilize USEPA Method 1631E and the digestion procedure described in Section 11.1.1.2 of 1631E.
** 1.00 ng/l (nanogram/liter) = 1 part per trillion.
*** µg/l = micrograms/liter

I am calling for a public hearing on your proposal to discharge mine waste water into the Big Muddy River. This is a completely unnecessary action in our era of moving away from coal to promote, invest in, and build clean, sustainable energy sources.

I suspect you are being pressured by state and Congressional politicians and for short-term political gain — rather than environmental protection. A public hearing will let us get a clearer set of facts on this proposal. The Big Muddy is not a straight channel: look at a map!

RE: Williamson County Energy - Pond Creek Mine

TO WHOM IT MAY CONCERN:

Please consider this correspondence as a resounding NO to allowing the dumping of waste water from Pond Creek Mine into the Big Muddy River. We are just now recovering from a disastrous flood. The thought of contamination of the river, the fish and wildlife it serves, as well as farmland and recreational areas around the river is something that cannot be ignored.

It is my understanding from Pond Creek Mine's application and/or permit that we are looking at potentially 3.5 million gallons per day dumping into the Big Muddy River. THIS IS UNACCEPTABLE!!! This is a problem for Pond Creek Mind to resolve, not those who live on and use the Big Muddy River. The people of southern Illinois deserve better from the IEPA than to allow this to happen.

Sincerely,

Debra Mileur

Dear Sir:

Please reconsider dumping millions of gallons of toxic water into the Big Muddy River from the Pond Creek Mine. This could cause flooding, damage to fish and wildlife, and environmental problems. We should be taking care of the environment, not causing problems.

Also please consider how this will affect people living along this river. Thank you for considering my opinion.

Yours truly,
Linda Craig

To Whom it may Concern,

This is in response to the request of Williamson Energy to dump mine waste water into the Big Muddy River.

This area is a rural, low income region. The river is a source of recreation as well as wild life watering. Most importantly, it is a food source to many. The Big Muddy provides fish for many low income families who try to supplement their food supply to ease their financial burdens. As a child I fished the river with my father many times for just such a reason.

This proposed dumping would make the fish inedible, that is, if they don't die first.

I site U.S. Dept of the Interior Water resources investigations Report 99-4288 2000 as supportive evidence.

Please don't do this to S. Illinois!

Ladies & Gentlemen

I am writing to voice my complete opposition to dumping waste water from the Pond Creek Mine into the Big Muddy River.

I am opposed because it would be quite possible for the operators of the mine to dig a pit for their waste water and to treat it on their own property. This is just another example of a private corporation reaping profits while dispersing liabilities to the public.

Our environment faces plenty of challenges and is being degraded daily. It's time to actually try to protect it, rather than turn it over to corporations trying to evade their responsibilities.

VOICE OF THE READER

Big Muddy River crisis

.To the Editor:

Thanks to The Southern for keeping us informed about the Pond Creek Mine's application to dump millions of gallons of toxic water into the Big Muddy River.

I'm urging all of you to write to the IEPA opposing their "tentative" approval of this project and to request a public hearing.

No environmental impact studies have been done on the long term effects of this proposal: cumulative water quality, effects on fish and wildlife, bank erosion, flooding, the climate crisis, social and environmental costs to the people along the course of the river, many of whom are already impoverished. The public hearing held by IDNR last October was poorly publicized. This wealthy corporation is offering little bonding to offset any problems that might arise, and no plan for detoxifying the water beyond a series of sediment ponds, which of course can overflow during periods of heavy rain.

Also, to clear up some misinformation: There is NO Severance Tax on coal in Illinois. Legislation to create one has stalled in the legislature since March. So neither the state nor the local communities will benefit from that.

Most of this coal will be sold abroad, also no benefit to Southern Illinoisans.

The email address to comment is: darin.lecrone@illinois.gov. Include the NPDES IL0077666 & Notice No. 7516c in your subject line and on each page. You can also use USPS address 1021 North Grand Avenue East, Post Office Box 19276 Springfield, Illinois 62794-9276. The deadline is Aug. 12 – for receipt, not postmark, so act soonest!

Thank you.

Re: NPDES IL0077666 & Notice No. 7516c

I respectfully ask that the proposal to allow Williamson Energy to dump waste water into the Big Muddy River be denied. The thought of one more of this country's beautiful water ways being polluted by yet another energy corporation is mind boggling. How many more water sources do we have to poison to realize that we, as a human race, have no more drinkable water? We are not just poisoning ourselves but all of the plants and animals that depend upon these resources for survival. The crops that are grown next to these water ways will be toxic and guess who then will consume them? So, we will in fact be contributing to our own demise by lack of clean water and also by contaminated produce. I think the biggest question we need to ask ourselves is how do explain to our children, grandchildren, and perhaps our great grandchildren how we allowed THEIR water to be so contaminated and so scarce that they have to ration it and perhaps do without? We are water beings; our bodies depend on clean water to function properly. If we have to ration water or drink contaminated water our bodies will not be able to operate properly. The water we drink now already had so much chemicals in it that I filter my water and just look at around at all of the stories in the news regarding lead poisoning from the pipes, all of the fluoride in our water, arsenic, etc. At the rate in which the human race is destroying virtually every resource we have upon and within this planet I shutter to think what is in store for my descendants. I want to be able to look them in the eye and tell them I did everything I could to preserve the resources on this planet. We have much more at stake here than jobs or lining the pockets of the already uber rich. This is our very existence. The time has come to not just consider renewable energy it is time to put it in place. Then we create jobs and save our resources at the same time. Please reconsider the ramification of what is being proposed.

NPDES Permit No. IL0077666 Notice No 751c

I live in Murphysboro, IL, and I would like a hearing about the decisions to allow coal waste dumped into one of the main waterways in our area. The Big Muddy feeds into many lakes and rivers in the region - a region that has a healthy amount of tourism for fishing, swimming, and hunting bringing in money to the area - and destroying the animals that live there is unacceptable.

We do not need the business of a coal company that wants to pollute one of the main rivers in this area. We need to keep our rivers clean and our environment unpolluted.

I am against this 100% and I demand that a public hearing be held to discuss this disastrous and stupid idea.

Thank you,
Jennifer "Jay" Bull

Subject: [External] Pond Creek Mine wastewater

I am against the Pond Creek Mine being granted a permit to dump its wastewater into the Big Muddy River (or any river at all).

I don't see how dumping 3 million gallons of wastewater A DAY from a coal mine could possibly be considered ENVIRONMENTAL PROTECTION. The IEPA isn't protecting a damn thing by dumping water containing chloride and sulfates into a PUBLIC WATERWAY.
There is also increased danger of flooding.
This is going to have negative impacts on everything that lives in and depends on the water, including people.

RE: NPDES IL0077666
Notice # 7516C
To whom it may Concern:

I sincerely hope you will deny the application from Williamson Energy regarding their plan to run their poisonous chemical water into the Big Muddy River. There are too many unknowns about the massive discharge. Who will be in charge of monitoring and testing these chemicals? You sure can't rely on the mine company to monitor it.

When there is flooding, like we seem to have yearly, where will these toxic chemicals go — directly on peoples yards and farm fields!

You are supposed to be protecting the people of the State of IL, not lining the pockets of one Coal Company. Please consider us in your decision and deny this application.

Sincerely

Wilma Hammel

DeSoto, IL 62924

To Whom It May Concern:

I am very much against Pond Creek dumping wastewater into the Big Muddy River for or several reasons.

I live very close to the Big Muddy River in the North West corner of Williamson County. Because we have had so much rain this year the low area behind my house has been full of water since April or May and has just recently subsided. The Water also gets over the road south and up into my lower field. In 2011 it also flooded the road north of me so I could not get out either way. It also came over my pond dam.

Dumping 3.5 million gallons of water into the river each day will increase the flooding problem in this area. The water gets up almost to the road along 149, around the Pentecostal church and covers the road leading into Blairsville. This happens almost every spring. The extra 3.5 gallons will only increase the problem and flooding damage. Along with this water come mosquitos and the smell of rotten vegetation.

I also have concerns about the chemicals will be dumped into the river and the effect on the environment. Many people still fish in the Big Muddy and the wildlife in the area drink and live in and along the river. I see no way the chemicals that are going to be in this water will improve the river. We have eagles nesting along the river bank along with many land creatures that make their home in my wooded acreage. I don't want these animals and trees/foliage to be eliminated by the water that will be coming from this mine.

I hope you will keep the residents that live along this river in mind when you make a decision on this dumping. Please consider what is a stake if this river is damaged with chemicals and the amount of flooding that will affect so many along the river path.

To: Darin Lecrone, et al
Subject: NPDES IL0077666 & Notice No. 7516c

Dear Mr. Lecrone and officials at IEPA and IDNR,

I oppose the use of the Big Muddy River for dumping of coal mining waste. The Big Muddy River basin includes many tributaries and drinking water sources in southern Illinois. There are too many public health and environmental risks.

Instead, Williamson Energy should utilize technology and science to process its waste without using public land and water.

Thank you for respecting public comments regarding this matter. We should do everything we can to ensure clean drinking water and biodiversity in our beautiful part of Illinois. Allowing this dumping permit could also someday cost the state which could be found liable for future health impacts.

As noted in the Southern Illinoisan newspaper, the Big Muddy River belongs to the people of Illinois. The state should not have the authority to sublet an entire river.

Sincerely,
Deb Browne

Subject: [External] NPDES IL0077666 & Notice No. 7516c

Greetings:

I am writing with regard to the proposed pipeline and dumping of coal mine waste water into the Big Muddy River.

According to the Shawnee Group of the Sierra Club:

•" No assessment is provided of the biological or other environmental impacts of the proposed mixing of this contaminated mine water on the ecosystem and current uses (fishing, livestock, recreation, etc.) of the Big Muddy River

• No assessment is provided of the cumulative water quality impacts on the Big Muddy River from this proposal over the many years of continued coal mining

• No assessment is given either of what such a large groundwater withdrawal quantity could be doing to the local area or what implications this might have for the future"

According to the Illinois Natural History Survey (2019), "LaRue Pine Hills Ecological Area, located within the Shawnee National Forest, contains one of the finest assemblages of diverse vegetation in the Midwest. The site represents species of northern, southern, eastern and western affinities, including 40 species rare in Illinois." This is only one of such areas that would be disastrously impacted by the proposed dumping.

According to an April 4, 2019 article in the Southern, the newspaper out of Carbondale:

"Recently, Murphysboro mayor Will Stephens spoke out against the request, noting that Williamson Energy had amended its request 24 times. Stephens said, correctly in our estimation, that the company lacks foresight, or at worst, isn't acting in good faith.

Which brings us to a vital point.

Who is going to make sure the discharge meets water quality standards and who is going to make sure the discharge doesn't exceed the allowable volume?

Is anyone willing to take the coal company at its word?

The Illinois Department of Natural Resources is woefully understaffed. And, even if a violation is detected, it could be too late to prevent an environmental disaster. The Big Muddy flows through agricultural lands downstream as well as some of the most unique and sensitive biological areas in the state."

As a citizen of southern Illinois, it strikes me that the fact that these plans are proceeding without environmental impact assessments and realistic plans for oversight demands immediate cessation.

Polluting our waterways is never a wise idea.

The Big Muddy River should not be a sewer for corporate profit.

The unique biological diversity of the region must be preserved for the enjoyment of all its creatures, big and small.

Sincerely,

Kathy Livingston

To Whom It May Concern (And it concerns us all!)

Please, please do not allow the Big Muddy River to become polluted by fracking water. Water is a most precious and irreplaceable commodity. If the government does permit this water being released into our river we will guarantee that it will become heavily polluted and that pollution will continue downstream into the Mississippi River and then the oceans. A public hearing would greatly improve the ability of those of us who live along the Big Muddy and surrounding areas to voice our desire not to permit fracking water in our river.

Please consider our plea

Darin LeCrone
IEPA Bureau of Water, Water Pollution Control Permit Section,
1021 North Grand Ave. East,
Springfield, IL 62794-9276
darin.lecrone@illinois.gov

Dear Darin LeCrone, IEPA Bureau of Water staff, and other government officials:

I am writing in concern of NPDES IL0077666 & Notice No. 7516c, wherein Foresight Energy/Williamson Energy/Pond Creek Coal Mine wants a permit to dump coal waste water into our Pond Creek and Big Muddy River in southern Illinois, which then flows to the Mississippi River through Oakwood Bottoms below Little Grand Canyon. Please schedule a public hearing on this issue. Please do not permit this company to build their pipeline and continue dumping coal waste water into our waterways which already exceed TMDL limits.

The mathematical "dilution" of or change in TMDL calculation (to thus gerry-rig or enable consideration of the permit) is an inappropriate solution to poisoning our aquatic life and the ecological system that feeds off of the aquatic life. I previously wrote about this in an article last winter: https://www.sierraclub.org/sites/www.sierraclub.org/files/sce/shawnee-group/ShawneeTrailsDec2018forWeb.pdf.
Hence your conclusion copied below is highly suspect because of recent TMDL calculation maneuvers:
"IEPA Conclusion: Upon completing the assessment, it has been determined that the proposed activity will result in only short term temporary increase in pollutant loading and will not result in long term or permanent impact to existing uses including aquatic life habitat; therefore we find that it is subject to Subsection (d) "Activities not subject to a further Antidegradation Assessment" of 35 ILL. Adm. Code 302.105"
I do not accept this recent trick on the public to erase our polluted water problems via fancy mathematical averaging.

It doesn't seem that the mining company has improved their permit application since last year; instead they are simply attempting to legitimate their already happening violations of waste water pollution discharge into Pond Creek with their additional listing of discharge points (that flows to the Big Muddy River), in addition to the pipeline. All the pollution is being released into already TMDL impacted waters.

Given the recent death of Chris Cline, maybe the mine should just be decommissioned if they cannot treat and contain the waste water onsite, even though they allocate profit to other sectors. The mine pollution should not be left for the rest of southern Illinoisans to incur and clean up at expense to our health, local ecological health, and our pocket books. Coal mining costs our state (https://reinvestil.org/the-facts/), so it needs to be transitioned out.

I have canoed in the Big Muddy, and I wouldn't want it to be more polluted than it already has been for other southern Illinoisans to enjoy recreating on and around. We owe it to our children to leave them a safe place to play, learn and grow. The Will Scarlet debacle was bad enough to not repeat, or even approach.

I frequently hike in the Little Grand Canyon area near the Big Muddy, and enjoy seeing the wildlife that lives in this habitat, spring, summer, fall and winter. It's bothersome that our recent flooding upstream on the Mississippi River pushed water into and flooding the Big Muddy up into the creeks in the Little Grand Canyon area. Additional high volume water discharge coming from the pipeline is just going to add to the problematic flooding conditions brought on by climate change and other misuse of our waterways. I also hope to see the IEPA protect the wildlife like eagles and otters, and the other fish and mussels and such, on which they feed. Flooding also impacts municipalities like Murphysboro and other towns, roads and fields along the Big Muddy River. You're supposed to protect our national bird and other threatened and endangered species (see weblinks in article above), no matter what our misguided current federal administration tries to ignore (while they repeal Acts and Rules that were supposed to protect out water, air, land, health and wildlife) so they can grab all the fossil fuel they can scrounge up for their own profits. Don't argue "jobs" because people need to be

retrained into less harmful jobs, as some of us in the region are working toward (plus this particular mine's managers already has a problematic labor history). Please do not be an accomplice to the current corrupt federal administration. The state of Illinois should fight the current corruption in Washington.

Please help move southern Illinois toward use of alternate renewable energy resources and energy efficiency instead. Please preserve southern Illinois for its outdoor tourism, cultural history and recreation that we are known for; this area is not a sacrifice zone for the mining company profiteers.

Please schedule a public hearing on this issue. Please do not permit this company to build their pipeline and continue dumping coal waste water into our waterways, many of which already exceed TMDL limits that should be cleaned up.

Sincerely,

Sabrina Hardenbergh

To whom it may concern,

Please schedule a public hearing for the Pond Creek Mine permit application. The Big Muddy River is a precious resource for Southern Illinois. It flows through some of the most scenic and unique landscapes of the Shawnee National Forest. Aquatic life in the Big Muddy and in the wetlands along it's banks should not be subjected to pollutants in the discharged water. The river should not be sacrificed for the benefit of a coal mining corporation. The people of Illinois deserve to have a public hearing to gather all evidence and comments before any action is taken on the permit application. Please schedule the hearing and let the voices of the people be heard.

Thank you,
Jennifer Reiman

Even if this mine does filter the water before it dumps it via direct pipeline into the Big Muddy River, the pollutants it will carry will kill aquatic life and vegetation. The mussels that are part of the ecosystem of the river survive by siphoning river water. Through the way they take in their nutrients in this manner, these pollutants will accumulate in their bodies and thereby killing them. Mussels are already an endangered species. I have friends who camp, fish and boat on the river. The pollutants will contaminate the fish and vegetation. I understand the Sugar Creek mine has already been approved and apparently dumping this crap into our river already. Allowing this mine to get rid of this problem in this way will double these horrendous results. How did this get approved when the results of this contamination are readily discernible and common sense? The fellow that owns this mine is notorious for not taking care of the problems he creates. I don't trust him nor should you. I descend from a long line of coal miners, 2 great grandpas, both grandpas, and my dad were all coal miners. The mines used to provide a good way to make a living here, but automation has taken away most the jobs, as I understand it today only about 2000 coal miners work here due to this automation. To enrich Mr Murray at the expense of all of the rest of us should not be allowed. If we no longer have fresh water to drink or fresh air to breathe, what good will corporate profits do? The incidence of cancer is so high in this area and I believe the coal mines are a big part of the blame. I do not trust Mr Murray to adhere or follow any law so how are you going to monitor the amount of sulfates and chlorides in this water? If it's his responsibility, I would not trust the results. Unfortunately, the victims of this malpractice will be us, the people that unfortunately live here. As I understand, Mr Murray does not live in Southern Illinois so why would he want to be a good caretaker of our area. To him it's the almighty dollar. I wish to request that this permit not be issued or at least let us have a public hearing to decide the matter.

Subject: [External] Proposal of dumping mine water into the Big Muddy

To Whom It May Concern:

This letter pertains to the proposal of Pond Creek Mine dumping waste water into the Big Muddy.
We have owned 23 acres of wooded land on the Big Muddy for the last 25 years. My family and I camp, picnic, kayak, boating, and fishing on this river. We grew up on this river. It is our recreational area now and has been for many years.

This letter hopes that the EPA will take a second look at how this will affect those that live on the Big Muddy. Please stand up for those of us that can't.

Also, it would be nice to have a public meeting about this issue. It is sad that we hear about this after part of the process went through for the permit. I would think that the EPA would want to hear both sides of the situation. So if at all possible, please have a public meeting to discuss the dumping of waste water in the Big Muddy.

I am opposed to the Pond Creek Mine's plan to dump mine wastewater into the Big Muddy River. As a longtime resident of Illinois, and a taxpayer I am asking for a public hearing in Murphysboro, Illinois. I am shocked the IEPA approved the Permit. The Big Muddy River and Murphysboro will be effected by this dumping, as will everyone along the River. Wildlife populations will be effected as well as the general ecosystem. The almost seasonal flooding in Riverside Park will carry particles outside of the River's bank and into the park area. Recreational boating on the river will quite possibly be effected. Passing along waste to another area is not a viable solution. Pond Creek Mine needs to find another way to dispose of its waste. I look forward to a public hearing where residents can express their opinions directly to State officials.

Dear Mr. Lecrone,

I am writing to protest the request of Williamson Energy to dump millions of gallons of wastewater into the Big Muddy River. I refer to the following: NPDES IL0077666 Notice No. 7516C. I'm enclosing two letters from a recent edition of the Southern Illinoisan newspaper that point to many good reasons many of us have in opposing Williamson Energy's request to dump thousands of gallons of polluted chemical liquids into a river that means a great deal to those who care for what happens to our river.

I urge you not to allow this vast pollution to take place. I hope my letter and the two letters I'm enclosing will convince IEPA not to allow this permanent dumping to take place. Please put a permanent and clear end to this IEPA proposal.

Sincerely,

Isabel Madry Zimmerman

 from the Southern Illinoisan newspaper

The Big Muddy River

To the Editor:

This river is one of very few inland rivers within the boundary of the state of Illinois. It is 156 miles long, passes through Rend Lake and eventually joins the great Mississippi. It is called the Big Muddy for a reason: It has a mud bottom for the most most part, and drains a 2,344-square-mile watershed. Although it appears unfit for human consumption, the water quality was assessed as "fair to good" in 1995.

My property in Murphysboro overlooks the Big Muddy. Frequently, I observe fishermen, kayaks, canoes, jet skies, ski and pontoon boats, and occasional hikers and campers making their journey along this river enjoying the beautiful scenery and experiencing the abundance of wildlife and forest area that abounds. The deer, waterfowl, wildlife, etc., is very plentiful and allows so many to just marvel at their presence and behaviors. Very few things are more beautiful than observing the great bald eagles fish and bathe in the river and annually bear young and teach them survival skills that should ensure the species' existence for the future.

The actions of so few can affect so many. Decisions made concerning the Big Muddy to possibly be used as a dumping source of hundreds of thousands of gallons of polluted chemical liquids by a local coal mine will have an everlasting effect on the many humans, wildlife, adjoining forests and watersheds, and the Mississippi River which empties into the Gulf of Mexico.

This is a wake-up call for local folks to start protecting our God-given planet for the sake of all mankind. Please contact your local mayor, state representative, Department of Natural Resources, governor's office, or any organization that you can sound off to before it is too late.

Michael L. Duncan
Murphysboro

Our watershed

To the Editor:

The Big Muddy is our watershed. It runs through eastern Williamson County past De Soto, toward Carbondale and through Murphysboro (right through the town!) then south to skirt some of the most glorious land formations in the watershed, the sheer limestone cliffs and Chalk Bluff, Horseshoe Bluff and then the ecological area of La-Rue Pine Hills on its way to the Mississippi.

If we cannot halt this permanent despoiling, it will happen without environmental impact studies, even though the threat is real to poison the entire ecosystem. We, at least, need to learn what chemicals would be released and what effects they have on living organisms. Let's get some publicity about that. In our watershed, there are those who use wells for their drinking water, to irrigate crops, make wine. They all need to know what is being proposed and what our IEPA signed off on.

In a true market-based economy, this coal mine might have to concede that caring for its waste in environmentally sound ways costs more than the coal is worth out of the ground. That's an important lesson to publicize. What value is the IEPA giving to all the proposed damage and loss in the lower Big Muddy River watershed ecosystem?

Southernmost Illinois has glorious natural gifts. Much of our economy depends on them: clean lakes, agriculture, fishing, recreation and winery tourism. We want to attract people and businesses that depend on healthy land and waters. If we must choose between assisting one coal mine and all that comes with an environmentally sound watershed for generations to come, we must choose the future.

Comment for NPDES Permit No. IL0077666/Notice No. 7516c

First, I want to request to have a public hearing where the public can ask questions about and raise concerns with the current draft permit. After reading through the entirety of the permit, I see many deficiencies with regard to environment protections.

Big Muddy River

The draft permit states that the Big Muddy River is already compromised, although it does not mention that according to the EPA report (2004), abandoned coal mines are the "likely source" of sulfate and manganese pollution. Despite the fact that coal mines have already caused pollution to the Big Muddy River, the IEPA/IDNR wants to allow yet another coal mine to add coal mine discharge without properly filtering the water. Diffusing wastewater with the river water itself and having a sedimentation process is not going to adequately filter the water for contaminants such as lead, mercury, and arsenic that will most likely be present in the discharge waters. It already has a fish advisory warning for mercury and PCBs. And how can adding more sulfate to a river with already high levels of sulfate possible? How is this proposed process going to eliminate the toxins that will be present in the mine wastewater from entering the river?

The Big Muddy River was not mentioned in the draft permit as being a candidate for a National Wild and Scenic River. This gives it special federal protections. Have the agencies been contacted to determine whether the mine wastewater would be detrimental to this river for potentially becoming a listed wild and scenic river? I

read the proposal for the Army Corps of Engineer which did consult with the US Fish and Wildlife. I was dismayed that the US Fish and Wildlife signed-off on this project saying it would have no impact on threatened/endangered species even though it states that there are threatened/endangered species within the area of the river. Even on their own website it says that "because acid mine drainage can destroy a stream's aquatic community for miles, many of the old mining sites are being reclaimed." (US Fish and Wildlife 2019). It is already up to the "stakeholders" to deal with the pollution caused by the abandoned mines. Will the stakeholders also have to try to deal with even more pollution in the future? A water protection group has already formed with regard to the Big Muddy River. And it is seeking help in getting the Big Muddy River cleaned up. How does the EPA ensure that Pond Creek Mine will not become another company which we have to clean up after. The company is already in financial trouble. How is it going to deal with the already existing sediment ponds it has? How is the pollution from those going to be mitigated in the future?

The Big Muddy River runs through the Shawnee National Forest. Has it been consulted about this project since it is one of the four agencies which help oversee the Wild and River Scenic Act? It also flows adjacent to Little Grand Canyon and through La Rue Pine Hills both of which are National Natural Heritage Landmarks which are federally protected. La Rue Pine Hills has up to 40 listed endangered, threatened, and rare plant and animal species. Have all these species been considered? Specifically the ones which would be within the watershed of the Big Muddy River. La Rue Pine Hill/Otter Pond is also a federal natural research area with protections. Can these species live in long-term exposure levels of 500mg/L of chlorides? (See Appendix A)

Effects on Aquatic Life

The only mention of the effects on aquatic life is the statement that there would be no effects because water quality standards would be met. How does mixing 12,000mg/L of chloride into the river to be diluted down to 500mg/L occur, especially within 250 feet downstream as the permit states? How can the EPA say with a clear conscience that there will be no adverse effects on aquatic life? Has there been studies on a river the size of the Big Muddy that have had 3 million gallons a day injected into with elevated levels of chlorides and sulfates? According

with science-backed evidence

to a study by University of Rhode Island (2012) long-term exposure amounts as low as 230mg/L of chloride can be detrimental to aquatic life. Can mussels withstand 500mg/L of chloride on a continuous basis? 44% of the mussel species of Illinois are already endangered. What about the endangered Illinois chorus frog? And how can testing only quarterly assure that the water quality standards are being met? Could not the mine, just make sure on the day of testing they are not dumping as much wastewater as on other days? And why is the permit asking for the pipeline to be built just below the monitoring station?

Issues Not Addressed

There are several important issues I did not see addressed in the draft permit. The first one is soil erosion. I did not see information regarding the effects on erosion of riverbanks of an extremely winding river when there could be up to three million gallons a day discharged into it. Have the accumulative effects been determined of this kind of water entering a small river on a continual basis? The second issue pertains to the fact that I did not read anywhere in the draft permit mentioning the enormous amounts of mine discharge water that will be dumped into the river. It was discussed in the initial permit application, but I did not read it in the draft permit. Why has this extremely important information been left out? How is a river that fluctuates wildly between low flow and flooding be a good candidate for this huge amount of water to be discharged into it. And that brings me to the third issue not addressed. The actual size and geography of the river is not discussed. Compared to rivers such as the Ohio and the Mississippi, the Big Muddy is very small. Being continually infused with high levels of sulfates and chlorides and other contaminants will be detrimental to the already compromised composition of the river.

In closing, I want to add that in the draft permit there is a paragraph discussing the economic benefits of keeping this coal mine in operation. It does not discuss the environmental cost. Coal mines cause contamination and pollution.

> Mining operations can negatively impact water supplies, often with long-lasting effects. The fundamental issue involves contamination of nearby rivers, lakes, and aquifers by what comes *out* of a coal mine—usually highly acidic water containing heavy metals like arsenic, copper, and lead... Runoff can change the pH of nearby streams to the same level as *vinegar*. (Union of Concerned Scientists 2019)

There is a global movement to phase out the use of fossil fuels as quickly as we can. Allowing this permit will just allow a coal mine to keep operating for longer. We are in a planetary climate change crisis. Money made from coal is costing us exponentially more than the salaries being made. Illinois already has programs helping coal miners transition to safer jobs such as solar installation. Solar jobs already outnumber coal mining jobs. IEPA and IDNR are not supposed to be concerned about making jobs. These agencies are about protecting our environment and resources. Has the IEPA/IDNR analyzed the long-term environmental cost that allowing this mine to expand will have? And finally, does Foresight Energy have a clean record for adhering to water quality standards? How many violations does it have?

Appendix A

Endangered and Threatened Plants from the Larue-Pine Hills-Otter Pond Complex

The list of Endangered and Threatened Plants of Illinois was published by the Illinois Species Endangered Species Board of May 15, 2015

I have collected or seen specimens of each of the following:

ENDANGERED

Asplenium bradleyi	Bradley's Spleenwort
Asplenium resiliens	Black Spleenwort
Botrychium biternatum	Southern Grape Fern
Carex alata	Winged Sedge
Carex decomposita	Cypress Knee Sedge
Carex gigantea	Large Sedge
Carex intumescens	Swollen Sedge
Carex physorhynca	Chert Sedge
Carya pallida	Pale Hickory
Cypripedium parviflorum	Small Ladies'-slipper
Dichanthelium joori	Joor's Rosette Grass
Glyceria arkansana	Arkansas Manna Grass
Hydrolea uniflora	One-flowered Hydrolea
Malus angustifolia	Narrow-leaved Crab Apple
Penstemon tubaeflorus	Tube-flowered Beards-tongue
Pinus echinata	Shortleaf Pine
Ptilimnium nuttallii	Nuttall's False Bishop's-weed

Sparganium americanum	American Bur-reed
Spiranthes vernalis	Spring Ladies'-tresses
Torreyochloa pallida	Pale Manna Grass
Trichophyllum cespitosum	Tufted Bulrush
Trillium viride	Green Trillium
THREATENED	
Carex communis	Upland Sedge
Carex oxylepis	Sedge
Carex willdenowii	Willdenow's Sedge
Methoria pendula	Squirting Cucumber
Quercus montana	Mountain Chestnut Oak
Quercus phellos	Willow Oak
Styrax americana	American Snowbell Bush

FROM: Jerry and Carolyn Worthen
3974 Watt Hill Road
Murphysboro, IL. 62966

PERMIT: NPDES IL0077666 NOTICE NO. 7516C

We are responding to the Pond Creek Mine dumping waste in to The Big Muddy River.

The Worthen farm has been in the family since 1836. We raise grain and have cattle. It is registered with The state of Illinois as a "Centennial Farm". This farm is located 5 miles southwest of Murphysboro on The Big Muddy River. The farm is prime bottom ground and is susceptible to flooding. This year our whole farm was flooded and prevented us from planting. Our son does the planting as I am disabled. We have hopes of the farm being carried through for generations. This farm is our living. So is the mine going to compensate us for that?

We find the dumping of waste water, will contaminate our ground, kill fish, and wildlife, cause erosion, and high water. Not only is that our concern, but those who have farm wells will have contaminated drinking water. The Big Muddy runs into the Mississippi - more land and water contamination. No end to it!

There are many farms and towns up and down the river. What kind of an effect would that cause them?

Since when did the IEPA, not protect all ground and waterways, at our cost? If this goes through it will be a disaster and cause hardship for those of us just trying to make an honest living. The mine is taking advantage of a lot of people's lives. We request a meeting with the Illinois EPA in our area, Southern Illinois!

RE: POND CREEK MINE PERMIT APPLICATION TO DUMP WASTEWATER INTO BIG MUDDY RIVER
NPDES PERMIT #IL0077666 NOTICE#7516c

I strongly protest permitting Pond Creek Mine to dump TOXIC wastewater into the Big Muddy River. This proposed activity can cause more flooding and can poison a large portion of the surrounding area. This will negatively impact recreational opportunities, to say the least, and will be just one more fatal blow to our fragile planet.

I also request a public hearing to allow affected residents and all concerned citizens to express their views.

Thank you,
Lynn Winston

Concerns of detrimental environmental impacts upon aquatic life and water quality

It was found in previous situations where wastewater was allowed to be unloaded into local waterways that there was a large net negative impact to the local environment persisting a good distance downstream. In the 2014 Belmer et. al. paper "Impact of a coal mine waste discharge on water quality and aquatic ecosystems in the Blue Mountains World Heritage area" it was found that there was a loss of invertebrate richness of more than 66% and abundance of over 80%. While there was not a direct study upon other forms of life it can be inferred that there was a loss of life that is statistically significant of other forms as well. Besides the direct impact on aquatic life it was found that major changes occurred in the physical and chemical properties of the water in comparison to samples taken upstream of the dump site. Something to note is that the coal mined in this area is of higher quality than that found in Southern Illinois meaning it has lower sulfur, chlorine, nickel, and zinc content of which there were still major increases in the quantity found. So, my concern is this, if an area that has cleaner coal is found to have such major detrimental changes to aquatic life and water quality how can it not be assumed that even worse will occur here. Even if some of the pollutants are found to be compliant of regulations that ecologically hazardous conditions will occur and be persistent throughout the future. I believe that public hearing should occur in order to answer questions of what mitigation steps they have in place of conditions that break regulations, potential for other wastewater disposal methods that were mentioned but not specified, as well as other concerns that may not be addressed here.

Darin Lecrone, et al

1021 North Grand Avenue East, Post Office Box 19276 Springfield, Illinois 62794-9276.

Subject: NPDES IL0077666 & Notice No. 7516c

Dear Mr. Lecrone et al,

I am writing with regard to the proposed pipeline and dumping of coal mine waste water into the Big Muddy River.

According to the Shawnee Group of the Sierra Club:

•" No assessment is provided of the biological or other environmental impacts of the proposed mixing of this contaminated mine water on the ecosystem and current uses (fishing, livestock, recreation, etc.) of the Big Muddy River

• No assessment is provided of the cumulative water quality impacts on the Big Muddy River from this proposal over the many years of continued coal mining

• No assessment is given either of what such a large groundwater withdrawal quantity could be doing to the local area or what implications this might have for the future"

According to the Illinois Natural History Survey (2019), "LaRue Pine Hills Ecological Area, located within the Shawnee National Forest, contains one of the finest assemblages of diverse vegetation in the Midwest. The site represents species of northern, southern, eastern and western affinities, including 40 species rare in Illinois." This is only one of such areas that would be disastrously impacted by the proposed dumping.

According to a April 4, 2019 article in the Southern, the newspaper out of Carbondale: "Recently, Murphysboro mayor Will Stephens spoke out against the request, noting that Williamson Energy had amended its request 24 times. Stephens said, correctly in our estimation, that the company lacks foresight, or at worst, isn't acting in good faith.

Which brings us to a vital point.

Who is going to make sure the discharge meets water quality standards and who is going to make sure the discharge doesn't exceed the allowable volume?

Is anyone willing to take the coal company at its word?

Subject: NPDES IL0077666 & Notice No. 7516c cont'd

The Illinois Department of Natural Resources is woefully understaffed. And, even if a violation is detected, it could be too late to prevent an environmental disaster. The Big Muddy flows

through agricultural lands downstream as well as some of the most unique and sensitive biological areas in the state."

The fact that these plans are proceeding without environmental impact assessments and realistic plans for oversight spark suspicions of corporate/state government corruption.

The Big Muddy River should not be a sewer for corporate greed.

The unique biological diversity of the region must be preserved for the enjoyment of all its people.

Sincerely,

Kathy Livingston

Darin LeCrone
IEPA Bureau of Water
Water Pollution Control Permit Section
1021 North Grand Ave East
Springfield, IL 62794-9276

Re: NPDES IL0077666 & NOTICE No. 7516C

Dear Mr. LeCrone,

After seeing the articles in the Southern Illinoisan about the Pond Creek Mine discharging pollutants into the Big Muddy along with other unnamed tributaries, I decided to take a look at the draft permit for such discharging.

It is a hard read, but a few points:

1.) on page 13, there is an error in the name of the bird Chuck's-Will-Widow, not Willow. I found at least 2 instances of this. I am told researchers and the papers they write go through at least 5 editors. Obviously, this got missed. I have a background in biology/zoology, and this error jumped out at me. It makes me wonder what other errors are included in this draft permit.

2.) I find it disrespectful to list the Big Muddy as a waterway that is not a biological significant stream. This attitude shows the utter disregard humans have for the land and water around them and monitizes everything. I did check the publication where this information came from, Integrating Multiple Taxa in a Biological Stream Rating System, which in their own words state, "One of the goals of the previous BSC initiatives was to update stream ratings on an annual basis and to publish the revised ratings every five years. However, the original BSC stream ratings were updated only once based on data that were collected through 1993. Similarly, the BSS project was based on data collected through 1991 and has not been updated since. Therefore, stream designations identified in these projects are based on data that is at least 14 years old. Given that these ratings are used by a diverse group of stakeholders, it was clear that an updated version was required. "

3.) The 303 jobs employed by the mine, coal mining is a dying industry, if anything it will become more and more mechanized. If this mine has produced so much wealth, where is it?

4.) Dilution is not the solution in this case. In your own words the chloride and sulfates would remain dissolved in the water and more through the downstream continuum. I am not really reassured that no adverse impacts to streams would occur as all water quality standards *are expected* to be met in the receiving water.

Finally, as companies, are now given "personhood" via Citizens United, they should have to pay a fee to the people impacted by them dumping pollutants into a public waterway, since everything always relates to the dollar. I know personal friends who would be impacted by this dumping as their business in Murphysboro, the Douglas School Glass Studio, is prone to flooding.

In conclusion, I urge that a public hearing is called in a central area where the people who are impacted most can attend and so that an individual with a second opinion can look at the numbers and give a plain and clear answer to the real amount of pollutant discharge.

Sincerely,

Karen Fiorino

Exhibit 54

Good Morning:

Please keep protection in:

Environmental
Protection
Agency

Our water is our most precious resource - please protect our precious!

Russ Kramer
Jude Baker

VOICE OF THE SOUTHERN NPDES IL 0077666

NOTICE NO. 7516C

The state should not turn Big Muddy River into wastewater

EPA.

The "P" stands for protection. Not Pond Creek. And not permission.

That's our viewpoint concerning the Illinois Environmental Protection Agency making a tentative determination approving Williamson Energy's request to dump millions of gallons of wastewater into the Big Muddy River.

The proposal states that up to 3.5 million gallons of water per day could be dumped into the river. During the summer months, that figure would represent about one-tenth of the river's daily flow.

The IEPA's approval is apparently part one of a two-part process. The final ruling will come at the end of a public comment period that closes Aug. 12.

We're hoping this indicates that the "P" in EPA may stand for procedural and that the agency isn't actually considering giving the agency the green light to turn the Big Muddy River into its own private sewer.

The coal company has been required to amend its proposal more than a dozen times. At one point, it had asked to pump water with high concentrations of chlorides and sulfates, both of which are toxic to aquatic organisms, into the river.

The latest proposal apparently calls for water to be diluted through a system of tanks prior to being discharged. Frankly, this isn't any more palatable.

We understand jobs are critical to Southern Illinois. We understand much of Southern Illinois is impoverished, but what price are we willing to pay for the state to subsidize one employer?

Virtually every manufacturing operation generates waste material that needs to be disposed. This newspaper certainly does. However, it isn't the state's job to see that our waste is disposed of properly. We're not asking the people of Illinois to bury old newspapers at Giant City State Park or at Lake Murphysboro.

Nor, should we think it is acceptable for the state to grant permission to turn the Big Muddy into a Williamson Energy subsidiary. The Big Muddy River belongs to the people of Illinois. The state should not have the authority to sublet an entire river.

It's not just the newspaper opposing the project.

Recently, Murphysboro mayor Will Stephens spoke out against the request, noting that Williamson Energy had amended its request 24 times. Stephens said, correctly in our estimation, that the company lacks foresight, or at worst, isn't acting in good faith.

Which brings us to a vital point.

Who is going to make sure the discharge meets water quality standards and who is going to make sure the discharge doesn't exceed the allowable volume?

Is anyone willing to take the coal company at its word?

The Illinois Department of Natural Resources is woefully understaffed. And, even if a violation is detected, it could be too late to prevent an environmental disaster. The Big Muddy flows through agricultural lands downstream as well as some of the most unique and sensitive biological areas in the state.

The ecological importance of the lower Big Muddy River seems to be ample justification for denying the request.

In the name of environmental protection, the use of farm chemicals is regulated to keep harmful materials from flowing into ditches, which empty into creeks, which empty into rivers. Yet, it seems the IEPA may approve the discharge of 3.5 million gallons of polluted water into one of the state's major rivers.

Finally, public sentiment, at least what we've been able to gauge, is adamantly opposed to the mine's proposal. Granted, making decisions based on group think isn't necessarily the proper course of action, but in this case, it certainly merits consideration.

It is "We the people" who will have to live with the consequences of this decision.

Area residents have until Aug. 12 to make their voices heard.

 7 AUG '19 SOUTHERN ILLINOISAN

The Big Muddy River

To the Editor:

This river is one of very few inland rivers within the boundary of the state of Illinois. It is 156 miles long, passes through Rend Lake and eventually joins the great Mississippi. It is called the Big Muddy for a reason: It has a mud bottom for the most most part, and drains a 2,344-square-mile watershed. Although it appears unfit for human consumption, the water quality was assessed as "fair to good" in 1995.

My property in Murphysboro overlooks the Big Muddy. Frequently, I observe fishermen, kayaks, canoes, jet skies, ski and pontoon boats, and occasional hikers and campers making their journey along this river enjoying the beautiful scenery and experiencing the abundance of wildlife and forest area that abounds. The deer, waterfowl, wildlife, etc., is very plentiful and allows so many to just marvel at their presence and behaviors. Very few things are more beautiful than observing the great bald eagles fish and bathe in the river and annually bear young and teach them survival skills that should ensure the species' existence for the future.

The actions of so few can affect so many. Decisions made concerning the Big Muddy to possibly be used as a dumping source of hundreds of thousands of gallons of polluted chemical liquids by a local coal mine will have an everlasting effect on the many humans, wildlife, adjoining forests and watersheds, and the Mississippi River which empties into the Gulf of Mexico.

This is a wake-up call for local folks to start protecting our God-given planet for the sake of all mankind. Please contact your local mayor, state representative, Department of Natural Resources, governor's office, or any organization that you can sound off to before it is too late.

Michael L. Duncan
Murphysboro

Our watershed

To the Editor:

The Big Muddy is our watershed. It runs through eastern Williamson County past De Soto, toward Carbondale and through Murphysboro (right through the town!) then south to skirt some of the most glorious land formations in the watershed, the sheer limestone cliffs and Chalk Bluff, Horseshoe Bluff and then the ecological area of La-Rue Pine Hills on its way to the Mississippi.

If we cannot halt this permanent despoiling, it will happen without environmental impact studies, even though the threat is real to poison the entire ecosystem. We, at least, need to learn what chemicals would be released and what effects they have on living organisms. Let's get some publicity about that. In our watershed, there are those who use wells for their drinking water, to irrigate crops, make wine. They all need to know what is being proposed and what our IEPA signed off on.

In a true market-based economy, this coal mine might have to concede that caring for its waste in environmentally sound ways costs more than the coal is worth out of the ground. That's an important lesson to publicize. What value is the IEPA giving to all the proposed damage and loss in the lower Big Muddy River watershed ecosystem?

Southernmost Illinois has glorious natural gifts. Much of our economy depends on them: clean lakes, agriculture, fishing, recreation and winery tourism. We want to attract people and businesses that depend on healthy land and waters. If we must choose between assisting one coal mine and all that comes with an environmentally sound watershed for generations to come, we must choose the future.

RE: NPDES IL 007666
NO:7516

Dear Sirs and Madams:

The Carbondale Park District located in Carbondale Illinois, has very serious concerns regarding the tentative determination to allow Williamson Energy request to release water into the Bid Muddy River. I respectfully request that a public hearing be held to discuss this issue with area residents.

The District owes and maintains property adjacent to the Big Muddy River and have experienced detrimental flooding from the Big Muddy on to said properties. High chloride and sulfate content in the water are of great concern for Hickory Ridge Golf Course, a 300-acre tract of land used for recreation, encompasses an 18-hole course and an 18-hole Frisbee golf course. The irrigation lakes that serve these properties have great potential to be contaminated by this wastewater, as even at its current flow rate, flood waters were on the golf course for over two months in 2019.

Based on concerns for the health of humans, plants and wildlife in addition to the concerns about flooding the Park District respectfully requests that no wastewater from Williamson energy be allowed to be introduced into the Big Muddy River.

Sincerely,

Kathy Renfro, Executive Director

To Darin Lecrone, IEPA
Re: NPDES IL0077666 Notice No. 7516c

Are we not paying you and funding the IEPA to PROTECT the ENVIRONMENT? And paying a lot. What's going on here? No, we won't stand for you using our river like a sewer drain.

The Big Muddy is our watershed. It runs through eastern Williamson Co. past DeSoto, toward Carbondale and through Murphysboro, (right through the town!) then south to skirt some of the most glorious land formations in the watershed, the sheer limestone cliffs and Chalk Bluff, Horseshoe Bluff and then the ecological area of La-Rue Pine Hills on its way to the Mississippi.

If we cannot halt this permanent despoiling, it will happen without environmental impact studies, even though the threat is real to poison the entire ecosystem. We at least need to learn what chemicals would be released and what effects they have on living organisms. Let's get some publicity about that. In our watershed, where I live, there are those who use wells for their drinking water, to irrigate crops, make wine. They all need to know what is being proposed and what our IEPA signed off on.

In a true market based economy, this coal mine would have to concede that caring for its waste in environmentally sound ways costs more than the coal is worth out of the ground. That's an important lesson to publicize. What value is the IEPA giving to all the proposed damage and loss in the lower Big Muddy River watershed ecosystem?

Southernmost Illinois has glorious natural gifts. Much of our economy depends on them: clean lakes, agriculture, fishing, recreation, and winery tourism. We want to attract people and businesses that depend on healthy land and waters. If we must choose between assisting one coal mine and all that comes with an environmentally sound watershed for generations to come, we must choose the future.

Re: NPDES IL0077666 & Notice No. 7516c

I respectfully ask that the proposal to allow Williamson Energy to dump waste water into the Big Muddy River be denied. The thought of one more of this country's beautiful water ways being polluted by yet another energy corporation is mind boggling. How many more water sources do we have to poison to realize that we, as a human race, have no more drinkable water? We are not just poisoning ourselves but all of the plants and animals that depend upon these resources for survival. The crops that are grown next to these water ways will be toxic and guess who then will consume them? So, we will in fact be contributing to our own demise by lack of clean water and also by contaminated produce. I think the biggest question we need to ask ourselves is how do explain to our children, grandchildren, and perhaps our great grandchildren how we allowed THEIR water to be so contaminated and so scarce that they have to ration it and perhaps do without? We are water beings; our bodies depend on clean water to function properly. If we have to ration water or drink contaminated water our bodies will not be able to operate properly. The water we drink now already had so much chemicals in it that I filter my water and just look at around at all of the stories in the news regarding lead poisoning from the pipes, all of the fluoride in our water, arsenic, etc. At the rate in which the human race is destroying virtually every resource we have upon and within this planet I shutter to think what is in store for my descendants. I want to be able to look them in the eye and tell them I did everything I could to preserve the resources on this planet. We have much more at stake here than jobs or lining the pockets of the already uber rich. This is our very existence. The time has come to not just consider renewable energy it is time to put it in place. Then we create jobs and save our resources at the same time. Please reconsider the ramification of what is being proposed.

Exhibit 58

Dear Mr. LeCrone,

I request a public hearing about the IEPA's permit that allows Pond Creek Mine to run a pipeline through southern Illinois and to dump mine wastewater into the Big Muddy River. My concerns include the mining company's poor track record and violations, incomplete considerations of the consequences of pipeline breaks or leaks, and disregard for the area that people, plants and creatures use as their home. Why is IEPA and IDNR and the legislators ignoring the Southern Illinoisan news-papers' call for NO permit? In a word, it is greed. The mining company can afford to make whole and good the outcomes of their dirty extraction business, or they

R02946

can take their mining elsewhere. If the mining company insists that their investment in southern Illinois is not worth providing appropriate clean-up and management of the toxic mess they are making, the public should not bear the consequences. IEPA is supposed to care for creation and hold private industry accountable for its deadly practices. Deny the permit; or if you will not do so, then let the people who live here be heard in a public hearing!

Springfield, Illinois 62794-9276

Dear IEPA,

I am writing this letter in response to Williamson Energy's application that will allow its Pond Creek Mine operation to pump millions of gallons of high chloride, high sulfate wastewater into the Big Muddy River. I understand that this wastewater will be diluted in a system of tanks, prior to emptying into the Big Muddy, but one of my major concerns is how will the public and your organization know if this dilution system is effective, especially if the proposed egress of the wastewater is downstream from the gauging station where water is measured and analyzed. This brings into question, has the wastewater been tested before and after diluted measures taken place on a normal day? and week of operation? And, what exactly does "diluted measures" mean? The only difference I see between concentrated and diluted wastewater is that former option will contaminate an ecosystem immediately and the latter option will do it more slowly.

This leads to my second issue about the presence of heavy metals within the chloride and sulfate wastewater. How effective and how much of the heavy metals are recovered in the process on a daily, weekly, and monthly period? I don't imagine the quality of water being dumped into the Big Muddy River will be like a natural spring, but how dangerous will this water be for the ecosystem? Is it safe for anyone or anything to consume, bath, and swim? If not, why not?

My third issue is the economic impact as it relates to the tourism and recreation industry. What are the financial numbers unique to the townships and businesses (restaurants, hotels, etc) located downstream from this proposed egress. Residents living near and afar tend to boat and to fish on the Big Muddy River. Southern Illinois has more to offer through its tourism industry than an energy industry that is on its last legs. No one is coming to this region because our waterways will be polluted with wastewater.

It's difficult enough to concede to an industry that contributes towards rising greenhouse effects and now climate crisis and climate apartheid, all because it's a cheap (heavily subsidized) way to keep the lights on. Given the existence of alternative modes of energy production, it's embarrassing as an evolved species, community, and government that the obvious harmful system continues to operate, while responsible Green alternatives continue to struggle. If only there was a system that would protect the environment by phasing out the old and phasing in the new. Sure, there is a point when the old and new will be coexisting together, but there is also a point when the old must concede, especially when it proves economically unsalvageable. What makes a system unsalvageable? When it willfully ignores its own faults (to the physical well-being of its workers and community) and tries to squeeze pennies into thin strands of copper wire or until the momentum of the lobbyists-politician life cycle ends.

This leads to my last point about Williamson Energy's concern for the health and well-being of its workers, since they brought it up, by saying that pumping this water will keep its workers safe. What is Williamson Energy's safety and health record for its miners? Does Williamson Energy care about

the health of the community and ecosystem near it's facilities? If so, to what degree, beyond words and future promises? How have other mines dealt with this similar situation? How are the waterways dealing with wastewater? How is the physical health of individuals living near and on the water in similar areas? What was the economic impact of other river town communities in allowing wastewater being dumped in the water system? Were similar river towns, located further downstream, elated with the waste water or did anyone or other municipal governments file lawsuits. Given that the Big Muddy River flows into the Mississippi River, how will this impact the nutrient loading into this waterway. Where is the evidence that this will not contribute to algal blooms and oxygen deficiency in the Big Muddy River? Given the recent and regularly increasing weather patterns of drought and floods, what impact will this have on the quality of soil near the banks of the river? What about house and land property values? Who would want to live or operate along the Big Muddy if it's well known that wastewater is emptied into the system?

Lastly, I understand, according to The Southern newspaper article, that "there were other alternatives to dumping the diluted wastewater into the river, but they were ultimately passed on for a variety of reasons, including financial and technological concerns." This is a clear and present warning that a system is unsalvageable, bankrupt, and ethically irresponsible. An energy company is unwilling to finance its own technological solution for the benefit of both miners and the ecosystem? Why are these mines allowed to operate without implementing such environmental safeguards. Have they tried to raise funds through other means (grants/loans) to keep their operation in business without this wastewater alternative? I think the public deserves to know what those other financial and technological concerns. Perhaps, the community can be of assistance. Instead, the quick and cheap solution is to dilute the harmful contaminants and let it be someone else's problem and claim that it will benefit everyone's bank account and payroll. If the mining company invests in the technology in doing it the safe and proper way, they too would be contributing to jobs and probably have a greater chance in doing business for the long run. What is the environmental safety record for similar transporting pipelines? Have any leaked? Who is liable if the pipeline does leak? Whose property does the pipeline extend? If so, is there a backup plan and who will be responsible? Do sulfate and chloride contribute to pipeline corrosion? Who is installing the pipes?

One more question, when will this wastewater valve be turned on and what is the projected amount of settled contaminants in the river bed over a period of 1 month, 6 months, 1 year, 5 years, and 10 years time? Based on the economic forecast of the coal industry, how long will Williamson Energy be around before alternative energy industries will replace old technologies? Is building the pipeline worth it for even one day, if the inevitable collapse of an industry is on the horizon.

In the Southern newspaper article, it mentioned an IEPA fact sheet that reads "Small amounts of these substances [Sulfate and Chloride] will be removed by organisms as these substances are necessary for life. No adverse impacts to the receiving streams will occur as all water quality standards will be met." Are there any guarantees that large colonies of sulfur-reducing bacteria will not result from short and long term wastewater dumping? What does independent-reviewed research show based on similar wastewater management systems?

Sincerely,

Antonio Jacob Martinez

To: Ward, Iwona; Stricklin, Gail
Subject: [External] Public Hearing Request NPDES IL0077666 Notice No. 7516c

Dear Ms. Ward and Ms. Stricklin,

I am writing today to object to the proposed 14 mile pipeline traveling from Pond Creek Mind to the Big Muddy River near Benton. As I understand it, this mine plans to pump an average of 3 million gallons of unfiltered mining discharge water, filled with chrorides and sulfates into the Big Muddy River on a daily basis. This will also increase the volume of water in the river by 10-20% per day. In addition to increasing flooding concerns (strategically positioned downstream of the Plumfield Gage Station where the Corps of Engineers could monitor water flow), the unprocessed water could have an impact on the balance of life in the river.

Please include my comments in your consideration of this permit and choose to decline. We have an obligation beyond financial benefits of certain entities to uphold. We must care for our water and the habitat that it provides if we plan to sustain ourselves and our planet for future generations. Thank you for your consideration of the information I've included herein.

Barb,

I am a resident of Murphysboro, IL and I wanted to express my opposition to the IEPA granting a permit to Williamson Energy for a pipeline that would allow Pond Creek Mine to pump millions of contaminated water into the Big Muddy River. I think the impact would be disastrous for the waterways and residents in southern Illinois. I request a public hearing and once again oppose the IEPA grating this permit.

Please consider the impact on my community. Southern Illinois should not a dumping ground for energy companies. We are already battling contaminants from the past and don't need new pollutants dumped into our rivers.

Thanks you for your time and consideration.

I am contacting you to express concern about plans for the Big Muddy River and to request a public hearing on the above. I live near the Big Muddy River and cross it every day on my way to work. It is flooding with increased regularity and the addition of millions of gallons of chemical water would impact all downstream as well as cause further erosion. There is already mine pollution from permitted sites being put in that river. I do not believe there has been an assessment of the cumulative water impacts of these and the proposed addition of sulfates and chlorides which usually exceed the water quality standard allowed to be discharged. In addition the pipeline input into the river would be just below a pumping station where water contents are measured.

I also do not believe there was an assessment of the long range impact of the large amount of groundwater being removed. The local mayor opposes this action despite having a parent and grandparent working in the mines. Towns downstream have to pay to treat their wastewater, so the company should have to also. I would like to see an assessment of the full social, health, environmental, and climate costs over the long term. I do not understand why the public will have to underwrite the long term bad effects of a mining company, Foresight Energy, who has made billions of dollars of profits on Illinois coal mining. Only looking at short term economics without consideration of the environment and subsequent impacts including financial of people is what got us in trouble with climate change. Please require the mine to build a water treatment plant on-site instead of using southern Illinois as its sewer to make more profits.

As a resident of Jackson Co, IL and a citizen concerned about water quality I request a hearing on the Pond Creek Mine permit application to discharge waste water into the Big Muddy River. Rivers are a diverse habitat that support life, they are not sewers for discharging waste produced by industry.
Several concerns are:

- adverse short-term or long-term effects of elevated levels of chlorides and sulfates on aquatic plants and animals
- the amount of waste water being discharged
- how penalties for violations would be applied
- who is responsible for monitoring the chemicals in the discharge

Subject: [External] NPDES IL0077666 & Notice No. 7516c

Dear Mr. Lecrone:

I am dismayed that the IEPA is apparently in the process of making a decision that will allow the Pond Creek Mine to dump millions of gallons of toxic water into the Big Muddy River.

I had thought—obviously naively—that the IEPA is in place to protect the people of Illinois.

This decision would not only affect the people of Illinois, but because the Big Muddy flows into the Mississippi River, which flows into the Gulf of Mexico—it would impact all aquatic and human life along the way.

The owners of the Pond Creek Mine claim they can't afford the cost of properly filtering the wastewater generated by the mine. I am skeptical.

I request a public hearing regarding NPDES IL0077666—one that is adequately publicized.

Thank you.

Murphysboro, IL. 62966
Ph. # 618-841-8731

My home/property is located along the North side of the Big Muddy River in Murphysboro, IL. I have approx. 3 acres that overlooks the river and an abundance of wildlife that utilizes it for drinking, bathing, feeding, & habitat.
Commonly are the Bald Eagles, Canadian Geese, Deer, Racoons, Coyotes, and an enormous amount of species of Egrets & Herons and common birds.

Every year the Big Muddy rises and covers approximately 1.5 - 2 acres of my back yard and stays for two or three months . With that comes an abundance of wildlife activity that any person would enjoy. Only a short distance downstream is the Murphysboro park where families and their children attend and enjoy nature, fishing, concerts,outdoor activities, etc.

I certainly oppose Pond Creek Mines project of dumping any amount of toxic contaminates into the Big Muddy River that very well impose danger to families, wildlife, and vegetation species along our Shawnee Forest area.

Respectfully submitted,

Michael L. Duncan

Dear Mr. LeCrone,

Re: NPDES IL0077666 Notice No. 7516c

I am writing to express deep concerns with the plan for Pond Creek Mine to release water into the Big Muddy River. I own property along the Big Muddy near De Soto and experience flooding every year. I am unable to access some of the land for several months due to flooding. This year was particularly difficult as the water remained high for many months. The additional water from the mine will no doubt make this problem considerably worse for me and many others who live along the river. I pay taxes on this land and cannot use during months of flooding. One of my neighbors has a building that becomes flooded when the water is high, and there are many farmers near me that cannot get their crops out or sometimes even leave their property without a boat. I am also concerned about the pollutants (sulfates and chlorides) added to the water for our fish, wildlife and our drinking water. We need to take action now to protect our environment.

While I support mining, I do not support mining that damages our environment by increasing flooding pollutants or the use of fracking measures to extract ore. The Pond Creek Mine should seek other avenues that do not negatively impact all residents along the Big Muddy and lower Mississippi Rivers.

Please share my concerns with others and for the good of southern Illinois, please do not approve this permit.

Thank you.

Subject: [External] Big Muddy River / Pond Creek Mine toxic water

As a resident of this planet and more specifically a resident of Jackson County, Illinois and one who has been a water-person since growing up on the Ohio at Metropolis, I am particularly dismayed/disgusted that anyone would propose to dump toxic mine waste into our public water system. I just can't imagine the arrogance to think that it is OK to do this to our environment - to poison the fish, reptiles, waterfowl, and people who depend on this natural resource flowing out of Rend Lake and through farmland, new public recreation and winery facilities, the City of Murphysboro, and the Pine Hills/Larue Swamp area !!!! . . . and then into the Mississippi River. It is the responsibility of the coal extraction company to make sure their holding/sediment ponds (as many as needed) protect our creeks and rivers from contamination.

Thank you for this opportunity to comment. Robert Swenson

RE: NPDES IL0077666 - Notice #7516c

Dear IEPA,

I am requesting a Public Hearing.

I am opposed to tentative approval of Pond Creek Mine's application to dump millions of gallons of toxic water into Big Muddy River.

No environmental studies have been done on the long term effects of proposal: cumulative water quality, effects on fish and wildlife, bank erosion, flooding, climate crisis, social and environmental costs to people along course of river, many of whom are already impoverished.

The public hearing held by IDNR last October was poorly publicized.

This wealthy corporation is offering little bonding to offset any problems that might arise, and no plans for detoxifying the water beyond a series of sediment ponds, which of course can overflow during periods of heavy rain.

Also there is no severance tax on coal in Illinois. Legisation to create one has stalled in the legislature since March 2019.

Most of Pond Creek Mine's coal will be sold abroad, also no benefit to Southern Illinoisans.

Truly,
Kathryn Jenkel, Very Concerned Citizen

Subject: [External] Public Hearing Request NPDES IL0077666 Notice No. 7516c

We the People request a public hearing for Public Hearing for NPDES IL0077666 Notice No. 7516c.

So somehow the mine is permitted to dump millions of pounds of toxic pollutants into our river... and for free? Why is this even being considered? Who does allowing this benefit? A few number of very rich people will get a little tiny bit richer. The people of the state of illinois lose an important waterway asset forever. You can't clean this stuff up at any cost. Once it's in there, it's there forever. If there was a safe, affordable way to clean it up, the company would be doing it.

I sure hope whatever personal gains you people are getting out of this is worth the literal death, cancer, organ failure, chronic sickness, pain, suffering and destruction to our families, our children, children's children and to our pets, livestock, wildlife, farms- our very economic future is at stake. Why trash the place for everyone, forever? We should fight to preserve what little clean drinkable water we have left - not go out of our way to encourage an unnecessary mass industrial shitting in it.

Do the right thing. Say "NO". Leave something left for your grand kids to exploit. Oh BTW, Can I drop everybody's garbage at your house? Just figured you wouldn't mind...you know, since there's nothing "wrong" with it- lets spread it on your neighborhood instead...

Henry-

Subject: [External] Fwd: Big Muddy permit, NPDES IL0077666

Hello Darin, this is Sheila Simon, from Carbondale. I am very concerned about the proposed waste dumping into the Big Muddy.

My husband and I are regular bike riders and pass over a creek just off the river almost every day. When there are floods the river backs up into the creek, so the landscape changes regularly. We stop at the bridge on every ride to look for herons, turtles and gar (the gar look like sharks!).

We are far from the only folks who enjoy this spot. Just this morning on the bridge a driver stopped to tell us about a huge turtle that she and her young son saw when they stopped there the other day.

I am sure the mine owners portray Southern Illinois as coal territory. And there are a few people left who earn their living from coal. But the natural beauty of our area is an economic resource that will far outlast coal reserves if we are wise.

Please do what you can to protect our land. And let me know if there is anything else I can do.

To: LeCrone, Darin
Subject: [External] NPDES IL0077666 and Notice No. 7516c

My name is Christina Krost and I am requesting a public hearing on NPDES IL0077666 Notice No. 7516c.

Address: 78 Ledford Rd., Harrisburg, IL 62946.

CONCERNS: The Big Muddy is already impacted by permitted and pre-regulations mine pollution from upstream and downstream sources. What is a full assessment of the biological or other environmental impacts of the proposed mixing of this contaminated mine water on the river ecosystem and current uses (fishing, private land and other recreational uses) of the Big Muddy River?

-No assessment of the cumulative water quality impacts on the Big Muddy River from this proposal over the many years of continued coal mining
-No assessment of potential to add to flooding, river bank erosion and downstream impacts
-No assessment of what such a large groundwater withdrawal quantity (millions of gallons a day infiltrating underground mine works) could be doing to the local area or what implications this might have for the future
-No assessment of the full social, health, environmental, and climate costs of this mine and whether those are greater than the claimed $78 million in local, state, and federal revenues that it claims to generate each year
-Proposed pipeline route from the IDNR mining permit materials
The Pond Creek mine should be required to build a water treatment plant on-site to ensure their water discharges meet all regulations instead of using the Big Muddy River as a "dilution solution." The Big Muddy River flows into the Mississippi River and is considered a water of the state. Public entities pay to treat their sewage and millions have been spent on efforts to clean up Mississippi River water quality. The mine should be required to manage their pollution without shifting the risks and potential problems and costs to the public.

As a person of faith, I believe I should speak up on behalf of our shared land, air, and water. Therefore, I am requesting a public hearing on NPDES IL0077666 Notice No. 7516c.

Dear Mr. Lecrone;

I am respectfully requesting that the IEPA hold an open hearing by August 12 on the item referenced. The proposed discharge of toxic mine waste into the Big Muddy River has been demonstrated to be hazardous for the environment, local wildlife, and those who depend on the river for their livelihood. If that weren't bad enough, should the discharge prove --- as is fully expected --- to be environmentally and fiscally disastrous, there is no way in which Pond Creek Mine can be held accountable for the damage.

Sincerely,

Ann E. Wheeler

Re: NPDES IL0077666 Notice No. 7516c

Are we not paying you and funding the IEPA to PROTECT the ENVIRONMENT? And paying a lot. What's going on here? No, we won't stand for you using our river like a sewer drain.

The Big Muddy is our watershed. It runs through eastern Williamson Co. past DeSoto, toward Carbondale and through Murphysboro, (right through the town!) then south to skirt some of the most glorious land formations in the watershed, the sheer limestone cliffs and Chalk Bluff, Horseshoe Bluff and then the ecological area of La-Rue Pine Hills on its way to the Mississippi.

If we cannot halt this permanent despoiling, it will happen without environmental impact studies, even though the threat is real to poison the entire ecosystem. We at least need to learn what chemicals would be released and what effects they have on living organisms. Let's get some publicity about that. In our watershed, where I live, there are those who use wells for their drinking water, to irrigate crops, make wine. They all need to know what is being proposed and what our IEPA signed off on.

In a true market based economy, this coal mine would have to concede that caring for its waste in environmentally sound ways costs more than the coal is worth out of the ground. That's an important lesson to publicize. What value is the IEPA giving to all the proposed damage and loss in the lower Big Muddy River watershed ecosystem?

Southernmost Illinois has glorious natural gifts. Much of our economy depends on them: clean lakes, agriculture, fishing, recreation, and winery tourism. We want to attract people and businesses that depend on healthy land and waters. If we must choose between assisting one coal mine and all that comes with an environmentally sound watershed for generations to come, we must choose the future.

Hello,
I am writing you in regards to the a Pond Creek project. I disagree with the proposal to let the mine run a pipeline directly to the big muddy river. There are countless reasons not to do so. I feel the most important reason though, is establishing past practice. Once pond creek has been allowed to do so, it has opened the doors for every other business in Illinois to ask for the same conditions. The Big Muddy River is a glorified creek that runs though some of southern illinois greatest nature escapes. Allowing any change to that ecosystem could have a domino effect on the plants and wildlife. Take for instance the red legged frog incident in California, who change and loss of habitat crushed it's population. Now a program is in place to restore the population costing taxpayers money.

Use pond creek for an example. If they don't follow the guidelines (which they will not, history has shown that non union coal mines feel its cheaper to pay the fines rather than be safe), then they dump contaminated water just below the measuring station. This is strategic to use our waterways way to help dilute their waste. What if they start killing a frog population, that leads to the decline of predator food, which leads to the decline in wildlife.

In closing, the big muddy river is a public waterway that belongs to the public. If you want to get the best numbers possible, then you should put it on the ballot it 2020 in all of the counties that border the big muddy river. My family stands strongly against the pond creek project. If they need to dump water, then they need to build a water treatment facility like every other business and community in southern illinois.
Thank you for your time,
The kimmel family

I read in the paper to direct comments to you regarding my opinion on allowing the Pond Creek Mine in southern IL to dump into the Big Muddy River. If this isn't correct, please let me know.
My name is Jamie Nash-Mayberry, and I'm a teacher in the Shawnee School District which includes floodplain land that the Big Muddy River flows through. For the past 10 years my students and I have raised awareness of the deteriorating levees both along the Muddy and the Mississippi River, and our fear that one day those levees will fail us, and leave my students without homes, farms, and a school. When I read about the mine's plan to dump waste into the Muddy, I was so upset. First of all, it will increase water levels along the muddy, and that is never needed. We now have seen where a flash flood, which is essentially what the New Year Flood of Dec 2015/Jan 2016 was, can result in catastrophic river flooding. Thus, we must do all we can to prevent adding extra water into the muddy at any time, whether it be during a flood or not. We never know when the next big week of rains might come and result in horrific results. Tied to that, if the river overflows, those contaminants will spread into areas where people reside. Second, I worry about what the pollutants will do to our natural beautiful area. I don't want to see places like the beautiful valleys around Grand Tower, IL become polluted. Third, many farmers grow crops in those valleys and it could hurt the health of those who consume those crops if they grow in polluted areas. Finally, I worry about the pollutants seeping into the water supply of people's wells and other areas. For all these reasons, and more, I ask that you NOT allow the dumping of wastes into the Big Muddy River.
Sincerely,
Jamie Nash-Mayberry
Shawnee High School

We are strongly against the IEPA allowing Williamson Energy to dump wastewater into the Big Muddy River. One would think that this matter would be a "no-brainer", due to the level of pollution being considered and the obvious potential ecological and health related problems this could create. I also refer you to the editorial in the 8/4/19 Southern Illinoisan. And honestly, I really thought this level of industrial pollution and betrayal of the public trust was outlawed thirty years ago.

Tried to send this before but keeps getting rejected. If you allow that polluted water to be dumped in the Big Muddy you just as well absolve the IEPA. It's your job to protect,I think that's what the P is for. I worked in one of the wettest coal mines that Murry Enterprises ever owned and don't recall one accident caused by wet conditions. He doesn't want to spend the money to pump and clean the water and that's the bottom line. At least make him dump above the sampling station so he can be monitored,you'll for sure have to.

Dear Illinois Government Workers,

Please, please, and please again - do not let this coal company dump wastewater into the Big Muddy River. The agricultural runoff is bad as it is. This will exacerbate the life that is trying to survive there.

If you decide to let this happen, many will have to live with the consequences of this decision. I wouldn't feel comfortable kayaking the Big Muddy again. Wildlife will be compromised. A southern Illinois treasure will be tainted forever.

Please put the "Protection" back in the IEPA. Better to be the Illinois Environmental Protection Agency than the Illinois Environmental Pollution Agency!

I am registering my opinion concerning wastewater dumping in the Big Muddy River.

As a lifelong resident of Royalton, Illinois my life has always been connected to the Big Muddy.

As a child my Dad often took me to fish and gather nuts around the river. The local joke was often made that we were "special" because we drank it's water.

I believe that if dumping more wastewater into the river
by the mines is allowed, the joke may come true.

I have no doubt that there will be UNFORSEEN DAMAGE to the ecosystem of
the Big Muddy if it is made a wastewater dump site.

I am **against** allowing the mine to pollute these waters with ANY of their waste.

I am writing to express my dismay over the potential of a permit being provided to Williamson Energy to allow the dumbing of diluted mine waste water into the Big Muddy River. The majority of my relatives either farm or have worked in coal mines in the past and I believe strongly that responsible resource development is critical for maintaining the economy of Southern Illinois. However, the owners of Williamson Energy have proven themselves over and over not to be responsible developers and the potential for increased flooding associated with the additional water and potential contamination from the waste far out way the limited economic benefits. This may be the most irresponsible development scheme I have observed proposed and potentially authoraized Southern Illinois.

Mr. Darin LeCrone,

Attached you will find my request for a public hearing regarding **NPDES IL0077666 and Notice No. 7516c.** I hope the IEPA will take the right action and allow the citizens of Southern Illinois to be heard.

Please keep me informed of any public hearing about this permit in a timely manner.

Sincerely,

Cameron J. Smith

Darin LeCrone
IEPA Bureau of Water
Water Pollution Control Permit Section
1021 North Grand Ave. East
Springfield, IL 62794-9276

Mr. Darin LeCrone,

Regarding: NPDES IL0077666 and notice No. 7516c

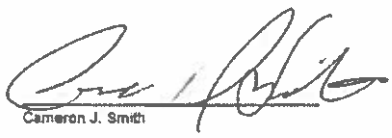
I am writing to you and the Department of the Illinois Environmental Protection Agency (IEPA) to request a public hearing regarding NPDES IL0077666 and notice No. 7516c. I am a co-owner of the Douglass School Art Place, 900 Douglass St. Murphysboro, IL. The historic Douglass School (The Doug) was Murphysboro's segregated school for 75 years, first built in 1897. It has withstood two tornados, one on March 18, 1925 and another on December 18, 1957, and the record flood of May 3, 2011. Since The Doug was Murphysboro's segregated school, it was built in the low lying area of town close to the Big Muddy River.

On May 3, 2011 the Big Muddy River reached a record high of 40.47 feet at the Murphysboro, IL gauge station on the Route 127 Bridge. At that time the 127 Bridge was closed and under water. The river water was so high you could no longer see the guard rails on either the side of the bridge. The Route 13 Bridge was being threatened too, but remained open and was closely monitored by IDOT. During that time the flood water was so high and strong that the water was vibrating the bridge, so it was decided by IDOT to rebuild and raise the level of the Route 13 Bridge. I have to wonder what that cost the state of Illinois.

Meanwhile when this flood was happening I was busy sandbagging around, and pumping the water out of the basement of The Historic Douglass School of Murphysboro. I believe I was on the sixth day of running three sump pumps in two basements on May 3. At the crest of the river I calculated that the water would have been 20 inches deep in the basements without the pumps. If the river had risen to the projected height of 42 feet above flood level, as predicted, the water would have flowed directly over the basement door threshold, rather than just infiltrating from below.

Regarding: NPDES IL0077666 and notice No. 7516c

And now the IEPA is considering the permit application from Pond Creek Mine to allow the mine to dump 2.5 to 3.5 million, with a peak of 7 million gallons of waste water per day. How can anyone think this is a good idea? Where is the protection, and whose environment is the IEPA protecting? It would be only one problem if it was clean fresh water being dumped into the Big Muddy River but the Pond Creek Mine wants to dump its unfiltered groundwater and coal production wash water into the river.



This infiltrated groundwater is full of chloride and sulfate; this would produce the discharge into the Big Muddy River of up to 1.2 million pounds of chloride and 476,000 pounds of sulfate per day. This increased pollution will kill the river life as we know it. Plus it will destroy nearby farmers' fields and disrupt the balance of the underground water wells along the river, making them undrinkable. What agency will protect them if this project goes through?

What agency will monitor the discharge of pollution? Hypothetically speaking, if the Pond Creek Mine is so caring about its workers and the environment why do they propose to place the diffusing pipe outlet downstream of the Big Muddy River second gauge station at Plumfield? There are only three river gauge stations on the Big Muddy River: the one at Rend Lake, Plumfield and Murphysboro, which is about 2000 feet upstream from the Douglass School. By putting the outlet pipe downstream of the Plumfield gauge station, the Corps of Engineers will not have a true reading of the water level and may release more water from Rend Lake, causing more flooding and pollution downstream.

It would be unconscionable to let a multibillion dollar private business take advantage of other private businesses and citizens. The Southern Illinois citizens need to be heard. We need a public hearing so the IEPA can meet the citizens face to face. The IEPA needs to see whose lives will be destroyed forever if this fiasco were to take place.

IEPA, please grant a hearing so our voices will be heard, and please do not permit this project.

Sincerely,

Cameron J. Smith

Subject: [External] Pond Creek Mine NPDES IL0077666 & Notice No. 7516c

Mr. Lecrone,
I want to voice my extreme displeasure that the Illinois Environmental Protection Agency and Illinois Department of Natural Resources is considering the permit to allow the Pond Creek Mine to dump vast quantities of waste water into the Big Muddy River.
This makes no sense on a variety of levels.
The Big Muddy River belongs to the people of Illinois. What right does Williamson Energy have to turn the river into its private sewer. Disposing of the waste water is part of the mine's cost of doing business. The state doesn't provide waste removal services for other businesses.
Some of the most environmentally sensitive lands in Illinois are downstream from the mine. The Shawnee National Forest's famed Snake Road could be adversely affected. Snake Road is closed each year for the migration of cottonmouths, timber rattlesnakes and copperheads. It is unique in the State of Illinois. It is also in the Big Muddy's floodplain.
Third, who is going to monitor the effluent.
Will IDNR have someone there on a daily basis when water is being released. Please don't rely on Murray Energy to police itself.
This is a terrible idea that should never be considered. Please turn down the application.

i am writing to object to the proposal to allow Williamson Energy to dump contaminates into the Big Muddy River. This group made money extracting coal and made an environmental mess in the process. They should be required to clean up the mess and store the contaminents properly. Pouring the mess into a river for others to worry about must become a thing of the past. The Big Muddy flows by cities and parks and empties into the Mississippi and eventually into the Gulf. Illinois cannot put itself in the position of further polluting our waterways and the waterways of other states. We have to protect the biodiversity that we have left and that we have not already ruined. We have to protect the animals, the soil and water quality along the whole water way. I request that the Illinois Environmental Protection agency block this proposal. Thank you.

I am writing to express my opposition to the proposal by Williamson Energy Coal Company to be permitted to dump wastewater into the Big Muddy River. Here in southern Illinois we are blessed to have beautiful and pristine waterways winding through the landscapes of the most beautiful area of the State of Illinois. A variety of wildlife is in abundance and utilize the waterways.
Discharging wastewater is a hazard to the waters of the Big Muddy River and its many living organisms and the wildlife that depend upon the water for survival.
Making a quick buck for a coal company at the expense of the natural environment is not a good plan for the near future and generations to come.
The IEPA exists to protect our environment and thus should deny the permit to discharge wastewaters into the Big Muddy River.

Thank you,
Lee M. Fronabarger

Sent: Tuesday, August 6, 2019 10:02 PM
To: LeCrone, Darin
Subject: [External] NPDES IL0077666 & NOTICE No. 7516C

Dear Mr. LeCrone,

After seeing the articles in the Southern Illinoisan about the Pond Creek Mine discharging pollutants into the Big Muddy along with other unnamed tributaries, I decided to take a look at the draft permit for such discharging.

It is a hard read, but a few points:

1.) on page 13, there is an error in the name of the bird Chuck's-Will-Widow, not Willow. I found at least 2 instances of this. I am told researchers and the papers they write go through at least 5 editors. Obviously, this got missed. I have a background in biology/zoology, and this error jumped out at me. It makes me wonder what other errors are included in this draft permit.

2.) I find it disrespectful to list the Big Muddy as a waterway that is not a biological significant stream. This attitude shows the utter disregard humans have for the land and water around them and monitizes everything. I did check the publication where this information came from, Integrating Multiple Taxa in a Biological Stream Rating System, which in their own words state, "One of the goals of the previous BSC initiatives was to update stream ratings on an annual basis and to publish the revised ratings every five years. However, the original BSC stream ratings were updated only once based on data that were collected through 1993. Similarly, the BSS project was based on data collected through 1991 and has not been updated since. Therefore, stream designations identified in these projects are based on data that is at least 14 years old. Given that these ratings are used by a diverse group of stakeholders, it was clear that an updated version was required. "

3.) The 303 jobs employed by the mine, coal mining is a dying industry, if anything it will become more and more mechanized. If this mine has produced so much wealth, where is it?

4.) Dilution is not the solution in this case. In your own words the chloride and sulfates would remain dissolved in the water and more through the downstream continuum. I am not really reassured that no adverse impacts to streams would occur as all water quality standards *are expected* to be met in the receiving water.

Finally, as companies, are now given "personhood" via Citizens United, they should have to pay a fee to the people impacted by them dumping pollutants into a public waterway, since everything always relates to the dollar. I know personal friends who would be impacted by this dumping as their business in Murphysboro, the Douglas School Glass Studio, is prone to flooding.

In conclusion, I urge that a public hearing is called in a central area where the people who are impacted most can attend and so that an individual with a second opinion can look at the numbers and give a plain and clear answer to the real amount of pollutant discharge.

Sincerely,

Karen Fiorino

I am writing today to oppose allowing Williamson Energy to dump polluted waste water from it's Pond Creek Mine into the Big Muddy River. This river is the water supply for Rend Lake and therefore many southern Illinois communities. Additionally, it draws tourists and outdoors people to enjoy the stunning beauty of the region. The IEPA regulates farm chemicals so they do not poison the water so why would you allow a coal company to do so? Tourism is as much of an economic driver as a coal company. You simply must not allow this corporation to ruin our environment.

Subject: [External] Public Hearing Request NPDES IL0077666 Notice No. 7516c

I wish request a public hearing to address this permit # NPDES IL0077666 Notice No. 7516c concerning pumping of mining water into the Big Muddy. The plan allows 2.5 million to 3.5 millions gallons of unfiltered water per day. Increasing the flow of the big muddy by 10 to 20% each day.
My concerns are:
1. The potential for flooding down stream is greatly increased. I have a personal connection in that my brother and his wife own property and a business right along the Big Muddy down stream from the discharge, in Murphysboro. It has been close to flood stage almost every year. With the extra water that is proposed, the risk is much higher. It a concern that the core of Engineers would allow the water to be discharged below the "Plufield Gage Station". By allowing this there seems like there is no way to keep track of the extra water coming into the Big Muddy, making it unclear whose responsible for the damage.
2. On my Brother's land is the Historic building Fredrick Dougless School which was founded in 1897 as Murphyboro's only segregated school. If it became flooded more than money would be lost. Next door to the School is Hud low cost housing in which many African American families live. Flooding would add insult to injury and it would be one more mark on the wrong side of history.
3. Most of the Big Muddy River bottom is covered in mud, which means the sediment is deposited rather than flushed down stream. With the addition of the unprocessed water carrying high volume of chlorides and sulfates it seems most likely that they will be deposited as well, changing the environment of the river for plant and animal life. Who will take responsibility for the loss that will incur.
4. I am concerned about the loss of jobs, disruption of lives the flooding will cause.

Respectfully Gordon Smith

Williamson was the most productive underground coal mine in the United States during the first five years of its history based on clean tons produced per man hour worked—according to MSHA data. It reclaimed this title in 2017.

The mine has not provided any valid data on alternatives to dumping this mine problem water into the public's lap via a pipe to the Big Muddy River. Meeting regulations is part of doing business and the mine should be required to manage their pollution without shifting the risks and potential problems and costs to the public. This groundwater is stated to be coming into the underground sections of the mine and is listed as being as much as 3,500,000 gallons per day. How much coal mine waste water do you want us to drink in a day?

This mine should be required to build a water treatment plant on-site to insure their water discharges meet all regulations instead of using the Big Muddy River as this mine's "dilution solution." The Big Muddy River flows into the Mississippi River and is considered a water of the state. Public entities pay to treat their sewage and millions have been spent on efforts to clean up Mississippi River.

According to the Shawnee Group of the Sierra Club:

- No assessment is provided of the biological or other environmental impacts of the proposed mixing of this contaminated mine water on the ecosystem and current uses (fishing, livestock, recreation, etc.) of the Big Muddy River

- No assessment is provided of the cumulative water quality impacts on the Big Muddy River from this proposal over the many years of continued coal mining

- No assessment is given either of what such a large groundwater withdrawal quantity could be doing to the local area or what implications this might have for the future

What's more, we live downsteam. The mine's activity will pollute the drinking water of Cedar Lake and Lake Kinkaid. Fewer regulations is not the answer.

Here are the highlights of a past study stating, "Over 50% of the Big Muddy River drainage is in agriculture, much of which is under intensive tillage and subject to severe erosion. The drainage, nevertheless, serves as a major center in Illinois for water-based activities such as boating, fishing, waterfowl hunting, and camping" and "Early studies conducted by students of W. M. Lewis, Sr. at Southern Illinois University at Carbondale concluded that toxic pollution in the drainage was spasmodic and localized and that the most toxic conditions were confined to tributaries." (Burr 1991)

Here's a list of the stream names, cities, counties, and reservoirs of the Big Muddy River drainage. A, Rend Lake; B, Crab Orchard Lake; C, Devil's Kitchen Lake; D, Little Grassy Lake; E, Cedar Lake; F, Kincaid Lake. 1, Big Muddy River; la, Casey Fork; lb, Rayse Creek; lc, Fraine Creek; ld, Pond Creek; le, Long Creek; lf, Hurricane Creek; lg, Cedar Creek; lh, Kincaid Creek; li, Worthen Bayou. 2, Little Muddy River; 2a, Reese C reek; 2b, Six Mile Creek. 3, Middle Fork Big Muddy River; 3a, Ewing Creek; 3b, Sugar Camp Creek. 4, Beaucoup Creek; 4a, bust Creek; 4b, Swanwick Creek; 4c, Galurn Creek; 4d, Rattlesnake Creek. 5, Crab Orchard Creek; 5a, Wolf Creek; 5b, Drury Creek; 5c, Little Crab Orchard Creek.

Here's the information on the web regarding Williamson Energy's Pond Creek No 1 Mine

Located in Williamson and Franklin Counties in southern Illinois, it was their first greenfield project. They began development in 2005 and started its longwall operation in 2008. Williamson was the most productive underground coal mine in the United States during the first five years of its history based on clean tons produced per man hour worked—according to MSHA data. It reclaimed this title in 2017.

Mach #1 Mine
Operated by Mach Mining LLC
MSHA ID: 1103141

One longwall mine
Two continuous miner units
2,000 tons per hour preparation plant
Productive Capacity: 7.5 million tons per year
Coal Production: 6.3 million tons in 2017
Coal Reserves: 370.6 million tons
Heat Content: 11,893 Btu/lb
Transportation: Rail (Canadian National with potential access to Union Pacific), barge on the Ohio River and the Mississippi River (via truck or railroad)
http://www.foresight.com/operations/

Operations | Foresight Energy

I am very concerned and will continue to ask a lot of questions.Pond Creek Mine dumping chloride and sulfate into the Big Muddy River is toxic to fish reproduction and livestock.

The Big Muddy leads to Drury Creek. Drury Creek drains into Midland Hills Lake where I live. Midland Hills Lake falls into Cedar Lake where C'dale's drinking water comes from.

Early studies conducted by students of W. M. Lewis, Sr. at Southern Illinois University at Carbondale concluded that toxic pollution in the drainage was spasmodic and localized and that the most toxic conditions were confined to tributaries.

Our environment is our economy, eh SIU?

I would like to to comment and oppose the dumping of waste water from the coal company from Williamson Energy Company into our Big Muddy River. That river flows through a very precious treasure of the La Rue Pine Hills swamp area that has one of the most diverse varieties of life anywhere. People come to visit and study its rich diversity. What a disaster it would be to jeopardize destroying such a beautiful part of our eco system. To trust that "man" will honor chemical levels being dumped in our part of the state is foolish.

To whom it may concern:

I am a resident of Murphysboro, IL and I strenuously object to the Illinois EPA determination approving Williamson Energy's request to dump 3.5 millions of gallons of water PER DAY into the Big Muddy River.

I understand that jobs are critical to Southern Illinois, but this is wrong to put residents' health at risk who live along all the miles of the Big Muddy. The Big Muddy belongs to all residents of the state of Illinois, not just one company.

Yours truly

Nancy Spear

Subject: [External] Big Muddy Dumping

Dear Mr. Lecrone: I find it almost unbelievable that the IL EPA has given initial approval of Williamson Energy's request to use the Big Muddy River as a dumping ground for their waste.

As a long-time professor of microbiology and expert in microbial ecology, I can guarantee you, that the substances in the mine wastewater that you feel should be allowed to pollute the Big Muddy will have a significant impact on the microbial communities that reside in the water and the sediments. You wana' see downstream problems—boy or boy, you will see problems.

The highly diverse and supportive existing microbial communities will be replaced by fast-growing weed species of microbes that will alter the geochemistry of the river even beyond the damage that Williamson Energy's fouling will cause and could make the river totally uninhabitable. Have you never seen the effects of acid mine drainage? This will be a whole new version of such.

I strenuously object to the environmentally fatal dumping request of Williamson Energy. The few jobs that last but a few years are not worth the long term damage you will cause by allowing this pollution event. Please deny the needed permit and save the Big Muddy for the residents of Illinois.

Yours sincerely, M. T. Madigan.

This is Ruth and Russell Miner 10188 Hwy 127 Murphysboro Illinois 62966-5484 and we are strongly opposed to the above projected proposal re the dumping of contaminated mine water into the Big Muddy River. The Big Muddy River is a large natural resource for the southern part of Illinois and drains directly into the Mississippi River.

We feel the IEPA has NOT ordered enough research into this plan to adequately assess the HUGE impact on the natural resources along the Big Muddy River and the MIssissippi River.

-No assessment og the cumulative water quality impacts in the Big Muddy River from this proposal over the many years of continued coal mining.

-No assessment of potential to add to flooding, river bank erosion, and downstream impacts.

-No assessment of what such a large groundwater withdrawal quantity(millinois of gallons a day infiltrating underground mine works) could be doing to the local area or what implications this might have for the future

-No assessment of the full social, health,environmental and climate costs of this mine and whether those are greater the the claimed $78 million in local, state and federal revenues it claims to generate each year.

PLEASE reconsider this porposal. Ask for further clarification from the mining company re the FULL impact this proposal presents.

Resepctfully,

Ruth and Russell Miner
Life Long Residents of Murphysboro, Illinois

Mr. LeCrone:

This is to voice our objection to the IEPA's tentative approval of the the project proposed by Williamson Energy LLC that involves dumping mine wastewater into the Big Muddy River. We find it hard to believe that, after so many years of being the watchdog of our environment, your institution would even consider approving such a request. At any rate, in addition to protesting this action, we are requesting a well-publicized public hearing on this matter.

We live a quarter mile from the river, and spring rains cause repeated flooding. Generations of our family have been involved in mining, so we are no strangers to this subject. We are concerned about ground water contamination, soil contamination, and contamination of aquatic animals.
Since there has been no assessment of these subjects, we don't see how your approval could be granted.

Please respond to concerned voters and safeguard the people of this state.

Respectfully,

Allen and Madeline Meadows

Re: Williamson Energy Pond Creek Mine NPDES IL0077666, Notice Number 7516c

Dear Mr. LeCrone:

I am requesting a public hearing and extended public comment period for the proposed discharge outfall 011 from Pond Creek Mine into the Big Muddy River. I also urge IEPA to conduct a full Environmental Impact Statement on this proposed pollution increase in this permit application. I am concerned about the extremely high concentration and volume of chlorides and sulfates and also heavy metals that would be going into the Big Muddy River for the following reasons:

> This proposed increase in water volume and pollution affects me directly because I go canoeing and kayaking on the Big Muddy River, when I come into direct contact with the water in the Big Muddy river.

> There is commercial fishing on the Big Muddy River, which would be directly affected by the proposed discharge since high levels of chlorides and sulfates are toxic to fish. Some people trap muskrats and other fur bearers that depend on the river for survival. IEPA should be consulting with these people to assess the possible damage to the trappers' and fishers' livelihood.

> LaRue-Pine Hills area of Shawnee National Forest is the most biologically diverse area in Illinois and arguably in the whole country, with many state threatened and endangered species. The Big Muddy River floods this area annually, but how would increased flooding and pollution on the Big Muddy affect this area? IEPA should take into account how the red headed woodpecker and other sensitive species in this area would be affected.

> Other wildlife that would be directly affected includes the bald eagles that nest next to the river and depend on the fish from the river. River otters, which also depend on fish, are returning to southern Illinois, ducks nest in the riparian areas of the Big Muddy, and migrating waterfowl depend on plants growing in the river for energy needed in their migration. What are the likely effects of this additional pollution on wildlife?

> There is already flooding in the City of Murphysboro and other areas next to the Big Muddy River. Is the IEPA taking account of increased damage in those areas in your evaluation of the economic and environmental impacts of the proposed discharge?

Re: Williamson Energy Pond Creek Mine NPDES IL0077666, Notice Number 7516c, Comments from Barbara McKasson, 2 Hillcrest Drive, Carbondale, IL 62901

> The Illinois Natural History Survey Technical Report 2012 (11) states "Freshwater mussel populations have been declining for decades and are among the most seriously impacted aquatic animals worldwide. (Bogan 1993, Williams et.al. 1993). It is estimated that nearly 70% of the approximately 300 North American mussel taxa are extinct, federally-listed as endangered or threatened, or in need of conservation status (Williams, et.al., 1993, Strayer et. Al. 2004). In Illinois, 25 of the 62 extant species (44%) are listed as threatened or endangered (Illinois Endangered Species Protection Board 2011)." Further on, the study states: "It is possible that the Big Muddy River provides a haven for the recruitment of many mussel species, based on the dead shells less than 3 years of age found at site 30, the nature of its substrates, and the river's connection with the Mississippi River."
What is the effect of high levels of chlorides, sulfates, iron and other heavy metals on populations of mussels, fish and other wildlife that depend on the Big Muddy River?

> The mine owners are required to monitor the level of the chlorides and sulfates, but by what means and how often would the IEPA check to make sure the mining company is monitoring correctly?

> The closest EPA water monitor for the Big Muddy River is upstream of the proposed wastewater discharge area. How far downstream from the proposed discharge area is the next water monitor? IEPA should consider adding an additional water monitoring station directly below the proposed #011 discharge area.

> The Big Muddy River already is carrying a heavy load of pollutants from farm runoff, acid mine drainage and other sources. What is the cumulative effect of the current pollutants?

> The Pond Creek Mine has been one of the most lucrative mines in the whole country for several years. There is no reason why the public, wildlife and the environment should bear the cost of the pollution that this mine creates. Foresight Energy, the corporate mine owner, is making so much money from this mine that it should not be an economic hardship for the company to build a water treatment plant on the mine site in order to reduce the amount of chlorides and sulfates being discharged into public waters.

> The IEPA should conduct an Environmental Impact Statement for this proposed discharge so that the agency, the government and the public will better know the true cost of the proposal to the environment, local economy, public and private land, and wildlife. It appears that this discharge is likely to have very significant effects since, according to the IEPA anti-degradation assessment cited in the permit notice, the levels to be discharged to the Big Muddy River could be as high as 12,000 mg/L chloride and 2,120 mg/L sulfate, totaling up to 1.2 million pounds/day of chloride and 476,000 pounds/day of sulfate.

> The anti-degradation document that IEPA is using in its assessment is outdated and is not even specific to the Big Muddy River and this proposed discharge. The anti-degradation studies should be conducted again specifically for this new proposed permit.

Re: Williamson Energy Pond Creek Mine NPDES IL0077666, Notice Number 7516c, Comments from Barbara McKasson, 2 Hillcrest Drive, Carbondale, IL 62901

> Pond Creek Mine operations get up to 6.5 MGD of raw water indirectly from Rend Lake, through Johnston City and possibly other sources. What effect is this likely to have during drought conditions, especially considering future droughts that are likely to be more severe due to climate change. How will this affect water available to cities and towns in Southern Illinois that get their water from Rend Lake. Pond Creek Mine is consuming more water than per day than any of the cities on the Rend Lake water system.

> Other corporations have to adhere to environmental regulations, so why is Foresight Energy, which was just fined $80,000 because of multiple permit violations at Pond Creek Mine, being allowed to continue to even operate when they have not been adhering to best management practices, as documented by IEPA in reference to the Illinois Pollution Control Board case # 2019-085? In addition, this shows that the operators of this mine cannot really be trusted to monitor and report correct measurements of pollutants and volume of discharge.

> What is the status of the Total Maximum Daily Load (TMDLs) at Pond Creek and in this section of the Big Muddy River for sulfates, chlorides, iron and other metals (mercury, arsenic, etc.)? This should be determined in order to correctly assess the effects of the proposed additional discharge from Pond Creek Mine.

Respectfully submitted,
Barbara McKasson

This letter is in regard to: NPDESIL0077666 No.7516c

To Whom This May Concern,

I would like to voice my objection to the POND CREEK mining company dumping their waste into OUR BIG MUDDY RIVER!

As POND CREEK MINE states they need to dump their waste (2.5 to 3.7 million gallons per day) to protect their employees from seepage into the mines, I believe It is the responsibility of this ONE COAL MINE POND CREEK, to protect their coal mining employees from seepage but not at the expense of the safety of our citizens, the demise of our wildlife, and our environment. If the private company POND CREEK MINE believes it is too expensive for them to handle their own waste in an environmentally sound way, and the costs of managing their waste exceeds the value of the coal out of the ground, then as with any business it is time to close their doors in Southern Illinois. This PRIVATE COMPANY should NOT BE ALLOWED to dump their waste into OUR public waterway. Unfortunately it seems the poorest communities seem to suffer the most to facilitate Corporate Profits, in this case PRIVATE Corporate Profits.

It is my understanding POND CREEK MINE operated by Williamson and Foresight Energy (controlled through majority interest by Murray Energy Company) is currently dumping THEIR waste into an unnamed tributary to Pond Creek. According to NexStar Broadcasting 6-5-2019 Murray energy company is being sued by a group of West Virginia Environmental Advocacy Groups for their Harrison County Coal Mine discharging 220 times the permitted limit of aluminum into a tributary of the West Fork and Ohio Rivers. This indicates current compliance issues with Murray Energy Company. Murray Energy Company has also had lawsuits against the EPA and the Obama Administration for what they perceive to be unfair regulations. With more study the reader will learn of generous political campaign contributions from Foresight Energy (Parent Company for Williamson Energy LLC) who owns POND CREEK MINE to a few past governors and many well known Southern Illinois elected officials. The article continues to inform the reader after Brandon Phelps retirement he soon became a as lobbyist for Foresight Energy (Lyderisen, K. , Neighbors Say State and Federal Regulators Haven't Held Foresight Energy Accountable for Hundreds of Safety and Environmental Violations, Energy News Network, 3-21-2018).

A Private company being allowed to dump their wastes into OUR PUBLIC BIG MUDDY RIVER will have everlasting effects on humans, wildlife, adjoining forests, contaminating groundwaters, watersheds and the Mississippi River which empties into the Gulf of Mexico. Typical waste discharge is highly acidic water containing heavy metals like selenium, mercury, arsenic, copper, and lead. Federal regulations for coal water pollution are decades out of date. The chloride and sulfate will exceed allowed standards and negatively impact fish reproduction and other aquatic species. Swimming in or eating fish from these waters

are linked to cancer, neurological disorders and cardiovascular disease (Hitt, M.A., EPA Must Enact Strong Water Pollution Standards. Sept 29, 2015 Sierra Club). After coal is mined it is typically washed to remove impurities. The resultant coal slurry can leak into nearby water sources, documented in numerous studies.

Page 2 NPDESIL0077666 no7516c

I grew up with the Big Muddy River near my front yard, I as well as many other southern Illiniosans have fished and boated played in the waters of the Big Muddy River. I hope that today and tomorrows children will enjoy the same pleasures of playing in local streams/rivers, fishing, boating, camping and enjoying the plants and wildlife which live along the banks of the river. I among many others feel OUR BIG MUDDY RIVER should continue to belong to the people NOT be sublet to a Private Company with intent to destroy our waterway.

I only pray our government officials will fight against this Corporate ruin which will compromise the health of families and communities in the long run.
I would like to request a public hearing on this issue.

Respectfully

NPDES IL0077666 and Notice No. 7516cl

Please don't.

Request a public hearing.

The Big Muddy River is already impacted by permitted and pre-regulations mine pollution from upstream and downstream sources.

No more.

Dear IEPA official;
I first became aware of the permit application 456 and Pond Creek Mine desiring to dump a massive amount of water containing contaminants into the Big Muddy river. At that time I wrote the IDNR concerning my questions and concerns. I am sending a copy of that letter below which expresses my feelings on the subject. I do not see how this additional water could not increase flooding which is already a concern with the Big Muddy. I am very concerned it will cause other problems as shown in my questions in the letter below.
I appreciate you reading and considering the concerns I expressed in it.
My address is shown at the bottom of that letter.
Thank you.
Linda Wyatt
jerlinwyatt@juno.com.
Dear officials of IDNR,
I just became aware of the permit application 456 (Pond Creek Mine dumping water into Big Muddy). I have read the public meeting Oct 23,2018 transcripts and exhibits from your site, I could not get the application and maps to open but have reviewed maps from ISGS site. That said it does leave me with concerns about unanswered questions in the minds of those who spoke and in my mind.
I feel mine jobs are important but mining needs to include safety for the miners, the public, for wildlife, and with as little harm as possible to the environment.
At this point I question if the harm that will be caused has been carefully considered. We already know that the Big Muddy often cannot handle spring rains - would not this extra water cause the floods to be sooner and more damaging? That it is known that the chlorides and sulfates are above accepted levels is another big concern - how much above? and constantly above as it appears in the news report? How much affect would this have on tourism which is another major resource of southern Illinois? Why is there a need to change what is being done with the water now? or is there going to be an increase in water dumping from current levels? Has there been damage in the area the mine is now dumping water in?
What about iron, heavy metals, and bacteria often(always?) found in mine water? I have not seen that question asked.
I read in the transcript that a gentleman told of Sugar Creek's attempt to get a mixing zone with a ro process which would make the water safe to release - no reason given why they were not allowed to do that but it did sound like a solution for the contaminants in the water.
That the questions and concerns have not been openly publicly addressed and impact studies done or released, if they have been done, seems like good reasons for delaying or denying (whatever your rules permit) the application at this point. As I just found out about this, I am sure I am not totally up to speed on this.
To get an idea of how much water, I did research and find that RLCD sells in the neighborhood of 5 billion gallons a year, dividing that is 13,698,630 / day sold to, I believe to 60 communities in 9 counties - and the 2.7-3.5 million/ day would be 20-25% of that amount of water - dumped by one pipeline into the Big Muddy - it seems like it would cause big issues which brings me back to the questions of are they dumping that much now and is it causing problems now? If the answers are yes and no - why change? If they are increasing what they are dumping or if it is causing problems, then I am back to the need for impact disclosures to the public and careful consideration of how this will change/affect southern Illinois.
Thank you
Linda Wyatt

NPDES IL0077666 Notice#7516C

8/09/2019

Dear Mr. LeCrone,

I request that you refuse to issue a permit for the construction of a pipeline and diffuser as requested by Pond Creek Mine. Do not allow this company to drain its toxic water through outfall 011 into the Big Muddy River or add other outfalls (points of pollution) to those it already possesses. I believe this to be detrimental to the environment and impact the health and well being of both human and non-human stakeholders (fish, other aquatic life, and wildlife.)

I am also requesting a public hearing where the questions of concerned citizens can be answered more fully with depth and clarity. I believe part of your mission as the Illinois Environmental Protection Agency is to address the questions and concerns of stakeholders, and this draft permit on its own is not helpful in this regard.

I request the IEPA create a fact sheet for public consumption. The draft NPDES raises more questions than it provides answers. Unless there is a public hearing, our comments, questions, and concerns are not addressed until you already have come to your conclusions. This process does not result in fair, transparent exchanges with stakeholders, such as myself.

In an August 9, 2019 article the US News and World reported that the "Environmental Protection Agency had gone above and beyond in response to President Donald Trump's 'two-for-one' executive order, according to an inspector general report. The investigation was intended to examine the agency's response to Trump's "two-for-one" executive order, which requires that "for every one new regulation issued, at least two prior regulations be identified for elimination. The inspector general also recommended the EPA "increase transparency when it comes to regulatory actions through additional outreach to stakeholders. "It is deeply concerning that the EPA is so eager to deregulate when the mandate for the organization to "protect the environment." It also becomes more evident why the EPA might want to make it more difficult for citizens to be involved. I hope this isn't true for the IEPA as well.

The Big Muddy River is an essential waterway for those of us who live nearby. We care about the river and want to stop the pattern of using it as a drainage facility for mining operations since it is already impacted by permitted and pre-regulation mine pollution upstream and downstream. According to your document, the stream segment N11 of the Big Muddy River receiving the discharge from Outfall 011 is on the list of impaired waters with problems including iron, sedimentation/siltation, total suspended solids, mercury, PCBs and fecal coliform. Pond Creek eventually flows into the Big Muddy River as well, and therefore the additional outfall pollution eventually ends up in the Big Muddy River. To this mix, you have deemed it safe to add high levels of chloride and sulfate? This does not make sense. You also seem to be monitoring cadmium in Outfalls 001 -006 but not in 008, 009, 009Es or 011. Why is this?

The NPDES permit describes your monitoring plan for each outfall but nowhere in this information do I see reference to the cumulative effects of adding these chemicals to a river that's impaired and continually receives discharges from other sources. Where is this information? Why has there been no assessment of the cumulative impacts on water quality?

The permit also references Special Condition 16 in the outfall to 011 "For any discharge not meeting the water quality standard for any of the above parameters, such discharge shall be subject to the limitations and monitoring requirements of Special Condition No. 16. "

> Pursuant to 35 Ill. Adm. Code Part 302.102, discharges from the referenced outfalls that otherwise would not meet the water quality standards of 35 Ill. Adm. Code Part 302 may be permitted if sufficient flow exists in the receiving stream to ensure that applicable water quality standards are met. That is, discharges not meeting the water quality standards of 35 Ill. Adm. Code Part 302 may only be discharged in combination with stormwater discharges from the basin, and only at such times that sufficient flow exists in the receiving stream to ensure that water quality standards in the receiving stream beyond the area of allowed mixing will not be exceeded.
>
> The permittee shall determine the effluent limitation for chloride and/or the maximum effluent flow rate allowable to maintain water quality in the receiving stream.

This doesn't make sense! Why would the permittee determine the effluent limitation for chloride and the maximum effluent flow? How would this be monitored? Given the violations related to this company concerning its other outfall sites, why would you trust that regulations will be followed?

Further, the NPDES permit does not include a reference to the impacts on the millions of gallons of groundwater infiltrating the mine and piped to the Big Muddy River. What are the long-term impacts of continual water usage and water withdrawal on nearby communities?

The Mine Creek mine defends its plan by suggesting the following as evidence of its importance to the community

> *The disposal of excess water, including the water infiltrating the mine, will allow the mine to continue to operate. The Pond Creek Mine is expected to generate 5 - 6 million tons of useable coal annually. According to the information given in a document dated November 18, 2016, entitled Anti-degradation Assessment, Pond Creek No. 1 Mine, NPDES Permit IL0077666, continued operation of the existing mine will continue to provide jobs for 203 employees with an annual payroll of approximately $18 million. In addition to these 203 direct employees, it is estimated that another 100 persons are employed in daily work associated with the Mine's production. This includes truck drivers, supply and support personnel, train crews, and technical personnel. In addition, other local businesses would also* benefit *from the wealth created by the mine. The operation of the mine provides tax revenues through payroll, coal severance, and mineral resource taxes for the surrounding counties and the State of Illinois. The total local, state and federal revenues generated by the continuation of this Mine are approximately $78 million annually. Current employment statistics indicate that the unemployment rate for Williamson County was 7.5%.*

While jobs are very important, there is no assessment in this document of the long-term health and environmental costs of this plan to the countless human and non-human stakeholders.

Several alternatives proposals were deemed too expensive. As an example:

> *Crystallization. Crystallization equipment is expensive to construct/install, operate, and maintain. The cost is estimated at $0.25/gallon, the mining company concludes that crystallization is not a viable option for disposal of the stormwater runoff mine effluent.*

Certainly, a mine that earns profits such as the Pond Creek Coal Mine or its parent company, Foresight Energy can afford the alternative to dumping its waste into a public waterway. Murray Energy recently acquired Foresight Energy. Robert Murray's personal estimated net worth as of August 2017 is 4.73 million dollars. Robert D. Moore, the chairman of the Board and Chief Executive Officer and Director of Foresight Energy, receives yearly compensation in the amount of 1.8 million. (St. Louis Post Dispatch) Billionaire Christopher Cline, who died in a helicopter accident on his way to his private island sold his interest in Foresight Energy for 1.4 billion. Cline donated 1 million to President Trump's inaugural committee and gave thousands to conservative causes. (Bloomberg News) That's a lot of money floating around and indeed appears to have resulted in President Trump's "two-for-one" executive order. The company and you the ILEPA who seem to be acquiescing to this plan want us to believe that Pond Creek Coal Mine and its parent companies don't have enough money to solve this problem without dumping their waste in public waters?

Again we can look to the behavior of the EPA and the inspector general's recent report. *Some of the agency's most cost-saving deregulatory actions over those two years include delaying water pollution limits for coal-burning power plants, increasing regulatory flexibility and decreasing monitoring for coal ash waste site operators.* Could it be that the IL EPA is under pressure from Representative Bost who voted to repeal the Stream Protection Rule? Alternatively, under pressure from the USEPA who has begun to roll back regulations? How is this affecting your decision-making process?

The 1977 Surface Mining Control and Reclamation Act says that mining companies should not cause "material damage to the environment to the extent that it is technologically and economically feasible." Given the company's profits and top executive earnings, I suggest an alternative (crystallization or water treatment plant on-site) would have less detrimental impacts on the environment and is economically feasible without affecting workers jobs. The mine should be able to manage its pollution. This is not the public's responsibility.

I don't care if the Big Muddy River is not listed as a "biologically significant stream" in the 2008 Illinois Department of Natural Resources Publication *Integrating Multiple Taxa in a Biological Stream Rating System*, nor is it given an integrity rating in that document." The Big Muddy River means a lot to me. I frequently visit Riverside Park in Murphysboro. Lewis Creek runs across my property and when the Big Muddy floods and backs up, its water enters the creek. I know from spending time on my land how much wildlife relies on these waters.

It is worth bringing up the history of the EPA as cited on your website. *The stage had been set by the first Earth Day that April and memorialized in the "new" 1970 Illinois State Constitution that contained a separate Environmental Article that declared: "The public policy of the State and the duty of each person is to provide and maintain a healthful environment for the benefit of this and future generations."* Please follow through on this declaration. Protect the streams that feed into the Big Muddy River. Protect the Big Muddy River and its inhabitants, especially the stakeholders who cannot speak for themselves.

Dear Mr. Lecrone,

Regarding: NPDESIL0077666 Notice Number 7516c, I do not want Pond Creek Mine to discharge polluted water into the Big Muddy. The company's proposal is a short-sighted solution that benefits one company at the expense of our entire population. If Pond Creek Mine cannot continue to operate without polluting the Big Muddy, then I suggest the company cooperate with the EPA to seek state or federal dollars, matched by its own corporate dollars, to re-train its employees and transition its company to the production of sustainable green energy solutions. Whatever long-term solutions the company seeks, polluting our water is not an option. If the company cannot sustain operations, or seek alternative environmentally sound solutions, then it can shutter its business. One company's fate (and even one industry's fate) is a much lower priority than the collective health and safety of our land, water, and people.

Thank you for protecting our environment by denying this permit.

Sincerely,

Diana Brawley Sussman

To: LeCrone, Darin
Subject: [External] NPDES IL0077666 & Notice No. 7516c

In regard to NPDES IL0077666 & Notice No. 7516c, it unfathomable to me that in this day and age and the science that we know about pollution and life cycles and environment disaster, that the IDNR would even be CONSIDERING the idea of Williamson Energy's request to dump millions of gallons of wastewater into the Big Muddy River. It was bad enough the IEPA approved the request, we certainly don't need a second governmental agency to give the final approval. Stand up for the people of the area, the animals and plants of the area and the future of the area.
The Big Muddy flows through agricultural lands downstream as well as some of the most unique and sensitive biological areas in the state. The coal company says it needs to be able to dump trash into the river to keep miners safe. But, an "IEPA fact sheet that accompanies a draft permit for the project shows that there were other alternatives to dumping the diluted wastewater into the river, but they were ultimately passed on for a variety of reasons, including financial and technological concerns." So, the concerns of drinking water and water which will flow through and damage wild life aren't big enough concerns?
The coal company has been required to amend its proposal more than a dozen times. At one point, it had asked to pump water with high concentrations of chlorides and sulfates, both of which are toxic to aquatic organisms, into the river. The latest proposal apparently calls for water to be diluted through a system of tanks prior to being discharged. Who's going to monitor this so it doesn't happen because once it happens, will IEPA and IDNR just say, "oh, bad, bad company. Here's your fine." Because, I'm going to guess that the fine(s) will be far less expensive to Williamson Energy so it is a better financial way for them to do business. It's certainly not a better way for them to be a responsible business nor for the IEPA and IDNR to do business.
Vote no. Say no. Do not give Williamson Energy the right or opportunity to pollute our waterways. I thought those practices were deemed bad back in the 70s/80s/90s. Why would we go backwards?

Sincerely,

Susan Walch-Pimentel

To whom it may concern,

This is in response to the proposal that states that up to 3.5 million gallons of water per day could be released into the big muddy river by Williamson Energy. My family lives on a creek that feeds the big muddy river, when the river floods it moves this water well up into my back yard. This is the backyard in which my dog and family visit often when not under water. I am deeply concerned about the proposal not just from my prospective but the impact that it will have on the water way and the natural world that depends on the river. Please do not allow this proposal to proceed.

Subject: [External] NPDES IL0077666. Notice No. 7516c

Please do not allow Williamson Energy/Pond Creek Mine to discharge its waste into the Big Muddy River.

Even if all this discharge did was poison the river and anything in it, it would devastate sensitive ecological systems in ways difficult if not impossible to ever repair.

The Big Muddy floods. It floods frequently. The toxins in the discharge will poison surrounding farmland, rendering it useless as farmland. Any food that might later be grown on that land might also carry those toxins.

Flood water has a way of moving to places no one could anticipate. Those toxins will end up in the groundwater, and in flooded homes and businesses. The state of Illinois cannot afford to clean up the mess. Illinois cannot afford to monitor the discharge to be sure any particular level of toxin or quantity is not exceeded. Illinois cannot afford to lose tax dollars from residents or businesses flooded out.

Unless Williamson Energy can purify the discharge to levels consistent with drinking water, and they pay for the monitoring, they should not be allowed to put any water into the Big Muddy.

Post Office Box 19276
Springfield, IL 62794-9276
RE: NPDES IL0077666 - Notice #7516c
Dear Mr. Lecrone:

I am requesting a Public Hearing on the Pond Creek Coal Mine water discharge plan. The public hearing held by IDNR last October was poorly publicized.

That said, I am adamantly opposed to approval of Pond Creek Coal Mine's application to dump millions of gallons of toxic water into the Big Muddy River.

•No assessment is provided of the biological or other environmental impacts of the proposed mixing of this contaminated mine water on the ecosystem and current uses (fishing, livestock, recreation, etc.) of the Big Muddy River.

•No assessment is provided of the cumulative water quality impacts on the Big Muddy River from this proposal over the many years of continued coal mining.

•No assessment is given either of what such a large groundwater withdrawal quantity could be doing to the local area or what implications this might have for the future.

•No environmental studies have been done on the long-term effects of proposal: cumulative water quality, effects on fish and wildlife, bank erosion, flooding, climate crisis, social and environmental costs to southernmost Illinoisans living along course of river, many of whom are already impoverished. As proven by this year's flooding and the reoccurring flooding, this waste water has the potential of ending up in the back yards of citizens who live along the Big Muddy River.

This wealthy corporation is offering little bonding to offset any problems that might arise, and no plans for detoxifying the water beyond a series of sediment ponds, which of course can overflow during periods of heavy rain. It appears likely that Illinois taxpayers will again get stuck with the bill to clean up the mess after the mine closes and/or the company sells out.

Also, there is no severance tax on coal in Illinois. Legislation to create one has stalled in the legislature since March 2019. And most, if not all, of Pond Creek Mine's coal will be sold abroad, also no benefit to Southernmost Illinoisans.

In light of the recent passing by boththe Illinois Senate and House of Senate Bill 9, The Coal Ash Pollution Prevention Act, it behooves you and the IEPA to recognize that the polluted waste

water from the Pond Creek Coal Mine is equally hazardous to human health and the environment. To approve sending it down stream is not acceptable.

Sincerely,
Rhonda Rothrock

Subject: [External] NPDS IL0077666 Notice No. 7516 Thank you SAVE THE BIG MUDDY RIVER

Dear Darin LeCrone,
I have been informed that you are the official responsible for representing our right to a public hearing on Williamson Energy's pending request for a permit to release mining waste into Big Muddy River. As a resident of Southern Illinois, I am strongly opposed to this plan to use the river as a toxic chemical dump. To rely on Williamson Energy's assurances that dumping millions of gallons of chloride and sulfate rich mining waste will have no environmental impact, would be to ignore the long history of back-room deals that have destroyed clean drinking water in so many communities. We are very lucky to have protected our clean tap water when so many communities have lost theirs. We don't want to have to buy bottled water like people in Flint. Please stand up to those who would take advantage of you and those you represent. You work for the citizens of Illinois, not Williamson Energy.

Subject: [External] NPDESIL 0077666, Notice No. 7516c Williamson Energy, LLC, Pond Creek mine Williamson County

I would like to add my voice to those opposed to the proposed 12 mile pipeline to be constructed from the Pond Creek Mine in Williamson County, Illinois. I am concerned with up to 3.5 million gallons of mine infiltration water with the high concentrations of pollutants (including sulfites and chlorides) being piped through federal wildlife areas and rural farmland and then dumped into the Big Muddy River. I am concerned with the environmental and public health issues that will impact human, wildlife and plant life along the route of the pipeline and the Big Muddy River's watershed habitat. I am concerned with Foresight Energy's poor environmental record having been cited in the past for repeated violations of chloride and other pollutant discharge levels. I am concerned with the scheduling of previous public hearings on Pond Creek's pipeline request and provisions in the Total Maximum Daily Load (TMDL) that would allow the dumping of high concentrations of sulfites and chlorides into the Big Muddy River.

I urge the IEPA and DNR to address the many questions and concerns related to Pond Creek's application and the proposed TMDL. There are many concerned citizens living along or near the pipeline path and the Big Muddy River who need more information on the proposal before any final decisions are made.

Sincerely,

Tom Redmond

Subject: [External] NPDES IL0077666 Notice No. 7516c

Dear Darin LeCrone,

I am sending this email to express my concern about the application by the Pond Creek coal mine to discharge mine water into the Big Muddy River.

I live in Murphysboro, IL. My name is Darby Ortolano, 239 S. 14th St., Murphysboro, IL 62966.

The mine water has very high levels of chloride and sulfates which, on a local level, will be harmful to fish reproduction and other aquatic life.

In addition, the Big Muddy River has a continuing problem of flooding in Murphysboro, and this will additionally add to that problem. We have a serious business interest that is planning on building a Holiday Inn Express on the intersection of Route 127 and 149, and this site is directly next to the Big Muddy. Murphysboro needs this facility to augment it's tourism traffic, in addition to any pollution concerns, and if the application is approved, the Holiday Inn Express may not be built.

Tourism has become important to Murphysboro (I am on the Murphysboro Tourism Commission), and the Big Muddy River lies directly next to our beautiful and famous Riverside Park. We hold many events in the park, including extremely popular and growing ones featuring Music and Craft Beer and our local wines. Additional water, contaminated with pollutants, could seriously hinder the use of the park.

PLEASE HOLD A PUBLIC MEETING ASAP TO HEAR THE PEOPLE OF THE AREA.

Thank you,

Darby Ortolano

Re: Williamson Energy Pond Creek Mine NPDES IL0077666, Notice Number 7516c

Dear Mr. LeCrone:

I write as a long-time resident of Jackson County to add my voice to any others that request a public meeting regarding the plan under consideration to shuttle water that has been used in the Pond Creek mine to a point in the Big Muddy River. As one who has used the Big Muddy River as a recreational site, I am seriously concerned over any action that would increase the amount of water carried by that stream.

Anyone who has walked along that waterway during various times of the year would be quick to tell you that the amount of water handled by the Big Muddy River from an area near Herrin to an area near the old site of Brownsville (near Murphysboro) was certain to vary considerably. I've seen the water reduced to almost a trickle, with places in it where one might think it reasonable to wade from one to the other; I've also been astonished, at a later point in the year, to find that water so increased in its size and its flow that it would cause a problem for even a small boat to pass under one of the bridges that span it.

I understand that the Big Muddy rises and falls depending on a variety of circumstances. The river is a product of a number of small tributaries in this relatively flat region of that state, and a strong rainfall in some part of a faraway county will almost certainly have an impact in Jackson and Williamson CountyI also understand that the Mississippi River uses the Big Muddy as a channel to handle its excess. It's no surprise, then, the Big Muddy can change so radically, even within the course of a week or two. Adding another water source, then, would be like introducing a new avenue to the traffic at a busy crossroads, and the proposal deserves the chance for public review and comment.

I should add that one site where the Big Muddy is a subtle but effective asset is the region by the Walker's Bluff resort. This is a site, as is perhaps not yet well known, that has been identified as the place that the state has approved to develop a casino. That casino would bring new business that would contribute to the tax base of a number of communities in Southern Illinois. It may not be the case that its existence would be jeopardized by increased flow of the Big Muddy, but this possibility might need to be discussed, if there were any likelihood that it could occur.

Subject: [External] RE: NPDESIL0077666 & notice no. 7516c --Williamson Energy Pond Creek

Dear Mr. Lacrone,

I am writing to request a public meeting on Foresight's Pond Creek Mine permit request (NPDESIL0077666 & notice no. 7516c)

I am particularly interested in how Public coal and water resources are subsidizing the "low costs" Foresight website declares for operating its' mines including Pond Creek.

Of particular interest to me, is how Foresight uses Rend Lake water in more initial stages of production, what is Foresight's mine daily Rend Lake Water use in initial stages of coal production and what does it pay both Adena Resources and the State of Illinois for this use. The 2007 agreement signed by Ron Blagojevich, "Rend Lake Water Agreement between the State of Illinois, Adena Resources and Adkin Water District" is unclear and does not specifically talk about the cost of the water. I am also interested in finding out if any of Tennessee Valley Authority's (TVA) Illinois coal reserves are being mined by the Pond Creek Mine. If so, what are they paying TVA for this coal? IEPA needs to help the public understand. Have a public hearing! Explain the Water contracts and Foresight's use of TVA Coal!

I would also like to have a hearing on how the unfiltered water discharged into the Big Muddy will be monitored and by whom? Could this water be filtered? Who and how is the discharge monitored? I called the IEPA project engineer on this request and they are on vacation, so I got a variety of responses from IEPA and IDNR officials and "yes" they said, the water could be filtered. One person said the water would be filtered. When I asked if all toxins, namely chlorides and sulfates, would be filtered I got a different response. "No" the discharge of these chemicals into the Big Muddy would be monitored by the owners of the Pond Creek Mine. "How?", I asked. The River discharges are monitored based on "Current Levels" of the Big Muddy. Current levels here refers to whether the River's water currents are "high or low" with the company water monitoring

occurring when the current is low. Company reports these levels to both the IEPA and IDNR. It seems to me that monitoring needs to occur at all times to assess chemical discharge. IEPA Have a hearing and help the public understand this process as proposed

Thank you,

Mary O'Hara, (618)713-0820 104 N. Parrish Lane Carbondale, Illinois

Dear Mr. Lacrone

Please forgive me getting into responding to this request late in the game. If you could Answer these questions or direct me to the places where these questions are addressed

1. I am interested in finding out what Water district Williamson Energy LLC Pond Creek Mine uses for its' operations? Does it pay for this water? I know that their Permit request IDNR(#456) addresses using Big Muddy Water for disposal of water and Rend Lake is the likely source but what water district provides its water. From some calls I have made I think the water may be from Rend Lake but the Mine gets the Rend lake water from a Water district that Rend Lake sells to.
2. Are options other than disposal of unfiltered water into the Big Muddy being discussed (reverse osmosis, filtration)?
3. Is Williamson Energy LLC buying coal rights from the Tennessee Valley Authority?

Thank You, Mary O'Hara (618)713-0820

Subject: [External] NPDES IL0077666 and notice No. 7516c

Mr LeCrone,

Regarding: NPDES IL0077666 and notice No. 7516c

We the People of Illinois respectfully request a public hearing for the Pond Creek application which seeks to allow upwards of 3.5 millions gallons of mine waste water to be discharged into the Big Muddy River north of Murphysboro. This discharge includes mine process water and ground water seeping into the mine during normal operations. The mining waste will have concentrations of dangerous levels of chlorides and sulfates that will be harmful to all aquatic life downstream of the discharge point.
Big Muddy River is already impacted by permitted and pre-regulation mine pollution. The cumulative impact will not be good for Southern IL or the Big Muddy River.

There has been no assessment of cumulative water quality impacts from continued coal mining.
There has been no assessment of increased water volume with regard to flooding, sedimentation, and downstream impacts.
There has been no assessment for the large withdrawals of underground water resources and the impact and implications that might have on future groundwater resources.
And there has been no assessment of the full social, health, environmental, economic or climate cost this mine will cost IL tax payers.

For these reasons, we ask for a public hearing for Pond Creek Mine: NPDES IL0077666 and notice No. 7516c

Sincerely
Jyotsna Kapur
Murphysboro

Subject: [External] Pond Creek Mine - request for public hearing

Hello,

I'm writing to request a public hearing regarding the Pond Creek Mine permit number IL0077666 and 7516c.

As a citizen of Murphysboro who lives on the Big Muddy River, we cannot allow more dumping of waste into our waters and I oppose this pipeline. I've experienced three 50 year floods in the last decade and this excess water and waste would only exacerbate this problem. It would be extremely detrimental to the environment - plants, animals, and humans alike - all downstream from there. In this day and age, we need to take responsibility for the damage we do to the earth while we do business. We can't turn a business's waste problem into future human health and ecological problems.

Thank you,

Jen Haselhorst

This is the most absurd thing I've ever heard. There is not enough money on earth to restore the damages this chemical waste dumping would cause. We may be on the poor end of the state, but we are far from stupid. The remaining citizens in this state do not need one more reason to up and move. This will cause significant damage to wildlife, the landscape and most likely loss of many forms of life, Including humans. People all around this area camp, fish and swim in that river. They pay taxes, get licenses, spend money and enjoy the relaxation the Big Muddy brings. We have for generations. The fact that this was even considered blows my mind. SERIOUSLY? That mining outfit has no soul. They're just greedy. Not like toxic chemicals will be running through their backyard so to hell with it. This will save us tons.
Well, myself and many others do not agree. We do not see anything but devastation coming from this. PLEASE, PLEASE do not allow this to happen. It WILL be detrimental. Make the coal mine pay for cleansing and riddance of this water the same way every other company has to. It's called being responsible and running a business. The Big Muddy as well as all the other waterways in the land has never been intended to be a sewer.
P L E A S E.....STOP THIS INSANITY.
Thank you for your time. I pray common sense and pride in mother nature win this one.

I am writing this email to adamantly oppose the mine's proposal concerning the Big Muddy River. The Big Muddy River is an important fishery and estuary in Southern Illinois. Many people who live in this area as well as visitors to the area use the Big Muddy for recreational fishing, canoeing, etc. The things that draw people to this area are of an outdoor nature, boating, camping, hiking, and of course the wine trail. We need to take care of and promote these activities, not destroy them. No one wants to eat from or be in contaminated water. Even if the coal companies tried to maintain their equipment so as to be safe, all it takes are a few hours of equipment malfunction to contaminate the river and kill the wildlife for years to come.
Please protect the Big Muddy River.

Sincerely,
The McLean Family

Subject: [External] Pond Creek mine discharge

Hey Darin,

My name is Alex Bishop. I'm a resident of Desoto, IL and am a licensed wastewater operator for the city of Carbondale. I've been seeing a considerable number of posts on social media concerning the proposed Pond Creek mine discharge. I've seen very little data on what the mine is actually discharging beyond 3.0MGD, sulfate, and chloride.

Has there been an actual chemical assay performed on the effluent? If so, is there adequate data from samples collected from above and below the proposed discharge location to show there is no impact on water quality? If a decision like this is going to be made I feel like this data should exist and be public knowledge. Because this information is not available, I'd like to request that a hearing be performed to thoroughly evaluate this decision. If the 3.0-MGD number I've been seeing is correct, that is just way too much flow to not be transparent about.

Thank you for reading this as well as any time you invest further investigating this matter.

Sincerely,

Alex Bishop

Re: Comment Regarding NPDES Permit No. IL0077666, Notice No. 7516c
Williamson Energy, LLC, Pond Creek Mine
REQUEST FOR PUBLIC HEARING

Dear Mr. LeCrone and other IEPA officials,

The Illinois Chapter of the Sierra Club and Prairie Rivers Network object to the provisions of the draft NPDES permit proposed to be reissued to Williamson Energy, LLC to allow mine waste from the Pond Creek mine to be discharged into Pond Creek, a Pond Creek tributary and the Big Muddy River. We request a hearing be held so our members and other members of the public can share our concerns and ask questions of Agency staff.

The Illinois Chapter of Sierra Club represents over 33,000 members and Prairie Rivers Network has 1,000 members in Illinois. Our members are affected by pollutant discharges into Pond Creek, the Pond Creek tributary, the Big Muddy River and downstream water bodies and would use these waters more frequently were they not affected by pollution from this facility and other sources. Our members and others rely on clean waters in the Big Muddy watershed for activities including hunting, recreational fishing, commercial fishing, trapping, paddling, boating, birdwatching and other wildlife viewing. We are concerned about the additional harm that this facility may cause if this permit is reissued without additional protections.

OBJECTIONS BASED ON THE CURRENT RECORD AVAILABLE TO COMMENTERS

Sierra Club and Prairie Rivers Network object to the permit on the following grounds, each described in greater detail below:

I. The facility has current and recent violations of their NPDES permit that have yet to be resolved.

II. In view of the frequent violations and the danger of discharges of chemicals that are toxic to aquatic life, the monitoring is inadequate.

III. The Chloride acute limit is too weak and the permit lacks a chronic chloride limit and thus fails to protect aquatic life and violates 35 Ill. Adm. Code 302.105(a), 302.210, 304.105. And 309.143.

IV. The Reasonable Potential Analysis is improper because the IEPA did not use the multipliers recommended by U.S. EPA to assure measure reasonable potential or require an adequate amount of testing. See *Des Plaines Watershed Alliance v. Illinois EPA*, 2007 Ill. Env. Lexis 149 *138 (IPCB 2007).

V. The potential effect of the increased discharges has not been determined as to flooding, groundwater use and other factors.

VI. Increased chloride levels may increase toxicity of algal blooms in Big Muddy and other waters.

I. The facility has current and recent violations of their NPDES permit that have yet to be resolved and better monitoring is necessary.

According to EPA's Enforcement and Compliance History Online (ECHO) database, this facility is currently in noncompliance with its CWA permit, and has been in noncompliance for 5 of the past 12 quarters reported.[1] The Detailed Facility Report shows additional information of concern, including:

- The last inspection was conducted almost 10 years ago on 09/09/2009
- The current compliance status is listed as "Violation Identified"
- The most recent quarter reported (04/01-07/26/19) reports a violation of the chloride limit by 38% and a violation of the sulfate limit by 108%
- Violations of the chloride and sulfate limit by 220% are reported for 3rd Quarter 2018, 367% for chlorides in 2nd Quarter 2017, and 620% for chlorides in 2nd Quarter 2016.
- It appears that the pH limit was violated in Spring 2018 according to IEPA records.
- IEPA should not issue a new and expanded permit without determining whether permittee has been filing DMRs properly under its existing permit. It appears that the discharger may be only filing data regarding pH and settleable solids and is otherwise failing to comply with reporting requirements in it current permits. For example, Outfall

[1] https://echo.epa.gov/detailed-facility-report?fid=110023026884

003 reports settleable solids and pH frequently between 2015 and 2019, but the measurements for chloride and other chemicals are reported as "no discharge." Other outfalls have similar issues. The lack of information on the quantity and nature of past discharges makes it impossible to determine the effect of potential future discharges. The monitoring required by the draft permit is inadequate under 35 Ill. Adm. Code 309.146.

II. In view of the frequent violations and the danger of discharges of chemicals that are toxic to aquatic life, the monitoring is inadequate.

The DMRs for 2018 that are kept by IEPA seem to only report on pH and settleable solids. Discharge monitoring should include data on volume of discharge to allow determination of impact on downstream water quality.

III. The Chloride acute limit is too weak and the permit lacks a chronic chloride limit and thus fails to protect aquatic life and therefore the permit violates 35 Ill. Adm. Code 302.105(a), 302.210, 304.105. And 309.143.

Studies and evidence presented in PCB 18-32 shows that acute limit should be less than 500 mg/L given hardness of 141 and temperatures in excess of 25 C in Big Muddy most of May to September. Mixing that would allow levels that exceed protective levels under 35 Ill. Adm. Code 302.102(b)(4) should not be allowed. No increased discharge should be allowed to any area where it might harm existing uses under 302.105(a). The lack of a chronic limit is intolerable given that permit allows dry weather discharges. As there is no chronic limit provided by Illinois numeric standards, chronic limit should be calculated using studies and calculations presented by Dr. Soucek in PCB 18-32 to establish chronic limits.

Additional pollution loading of the river, particularly at times of low flow, are a concern to us in addition to the known problems high levels of chlorides cause for fish and other aquatic life. Chlorides are stated in some sources to be accumulative. There is nothing in the application that was found to assess what the daily and long-term biological and water quality impacts of the high levels of chlorides and sulfates will do.

Additionally, the permit has granted mixing zone in Pond Creek (Outfall 009), and the modeling shows that chloride concentrations could be in the range of 188 to 411 mg/L, well above a potential future chronic standard of 283 mg/L.

IV. The Reasonable Potential Analysis is improper because the IEPA did not use the multipliers recommended by U.S. EPA to assure measure reasonable potential or require an adequate amount of testing. See *Des Plaines Watershed Alliance v. Illinois EPA*, 2007 Ill. Env. Lexis 149 *138 (IPCB 2007).

Despite the IPCB's New Lenox decision in Des Plaines Watershed Alliance v. Illinois EPA, 2007 Ill. Env. Lexis 149 *138 (IPCB 2007), in the reasonable potential analysis in this case IEPA declines to use the multipliers that have been determined by U.S. EPA in its Technical Support Document to properly analyze the risk of toxic discharges. The grounds given for this is that IEPA believes that the multipliers are too large when there are few samples.

There is, however, a way to avoid the alleged problem cited by IEPA. This is to require more samples. This will bring down the U.S. EPA multiplier without risking the environment.

V. The potential effect of the increased discharges has not been determined as to flooding, groundwater use and other factors.

The potential effect of the increased discharges has not been determined as to flooding, groundwater use and other factors all of which are relevant to determining whether the permit would in fact benefit social or economic development in the area. Further, increased chloride levels may increase toxicity of algal blooms in Big Muddy and other waters.

The Big Muddy River is indicated as Public Waters by IDNR (https://www.dnr.illinois.gov/WaterResources/Pages/PublicWaters.aspx). The full impacts of this added discharge do not appear to have been adequately evaluated and essential information for this application appears to be lacking. There is no information on what the added 2,700,000 to 3,500,000 gallons per day will mean to erosion impacts, river water levels, public use of the river for recreation or other public uses. This river is already prone to flooding and has documented low flows which clearly could mean different impacts from the proposed discharges that have not been adequately assessed.

There is no information on what the stated rate of groundwater pumping and groundwater drawdown are doing to the hydrology of the area. There is no information on the impacts to other springs, streams or non-potable water uses in the county or if there are any long-term concerns for this withdrawal of groundwater.

VI. Increased chloride levels may increase toxicity of algal blooms in Big Muddy and other waters.

There are studies indicating that increased chloride levels may increase the levels of cyanobacteria in water bodies and the potential for toxic algal blooms. (Attachments 1-4) IEPA must thoroughly consider this issue before allowing the levels of chloride discharger contemplated by this draft permit.

Also, the permit proposes to use conductivity as a surrogate for chlorides. Other factors may cause conductivity to be high without chlorides also being high. This could result in a poor calibration curve unless done properly.

QUESTIONS AND ISSUES FOR THE PUBLIC HEARING

There is a large level of public interest in this permit (See for example, https://thesouthern.com/news/local/environment/residents-still-concerned-as-idnr-decides-whether-to-grant-permit/article_a08dfa90-d882-5c01-90e2-83b24b4b3f34.html?fbclid=IwAR3wPxIKov0ReSj9DKVG26vlHRO9BvNmfJ13H_Bciq-JzC5LCe7vjB_nPes) and the complex facts and technical issues plainly require that a public hearing be held. In addition to discussion of the issues raised by our objections to the draft permit stated above, issues that should be discussed at the hearing include:

1. What are the daily water quality, biological, and downstream impacts of this proposal on the Big Muddy River?
2. What the actual discharges and pollutant levels have been for the last five years?
3. What will the proposed daily discharge of high levels of chlorides and sulfates do to existing fish and aquatic life in the Big Muddy River and to other downstream uses?
4. What volume of water will be discharged to the Big Muddy River? Is 11 cubic feet per second a hard limit?
5. What are the impacts of the ongoing pumping of groundwater at the mine and its potential effect on social and economic development in the area?
6. Whether use of groundwater to dilute mining waste will cause or contribute to violations of water quality standards in water bodies hydrologically connected to that groundwater?
7. Whether the monitoring that has been done of the applicant's effluent is adequate to determine its potential effect?

8. What fish and aquatic species are currently utilizing the proposed discharge section of the Big Muddy River and are there any locations downstream that have mussel populations? What are the biological and environmental impacts of the high chloride levels?
9. The uses of the Big Muddy River and other downstream waters that might be adversely affected by the proposed permit?
10. Whether there should be a total dissolved solids or conductivity limit given the science presented in the U.S. EPA conductivity guidance ? See Draft Field-Based Methods for Developing Aquatic Life Criteria for Specific Conductivity. EPA, December 23, 2016.
11. Wastewater treatments for the polluted water to be discharged under the permit that are alternatives to simple dilution and primitive lagoon treatment?
12. Whether there are alternatives to discharging the wastewater to rivers and streams?
13. Whether coal production can properly be considered as a benefit given the effects of coal combustion on the global climate?

A public hearing would allow an opportunity to have these and other questions answered, and would give our members and other local community members a chance to raise their questions and concerns.

Thank you for your attention to our comments. We look forward to your response.

Understanding the Effect of Salinity Tolerance on Cyanobacteria Associated with a Harmful Algal Bloom in Lake Okeechobee, Florida

By Barry H. Rosen,[1] Keith A. Loftin,[1] Jennifer L. Graham,[1] Katherine N. Stahlhut,[1] James M. Riley,[2] Brett D. Johnston,[1] and Sarena Senegal[1]

Abstract

In an effort to simulate the survival of cyanobacteria as they are transported from Lake Okeechobee to the estuarine habitats that receive waters from the lake, a bioassay encompassing a range of salinities was performed. An overall decline in cyanobacteria health in salinity treatments greater than 18 practical salinity units (psu) was indicated by loss of cell membrane integrity based on SYTOX® Green staining, but this loss varied by the kind of cyanobacteria present. *Microcystis aeruginosa* was tolerant of salinities up to 18 psu; however, higher salinities caused leaking of microcystin from the cells. *Dolichospermum circinale*, another common bloom-former in this system, did not tolerate salinities greater than 7.5 psu. Stimulation of mucilage production was observed and is likely a mechanism used by both species to protect organism viability. At 7.5 psu, microcystin increased relative to chlorophyll-*a*, providing some evidence of biosynthesis when *M. aeruginosa* is exposed to this salinity. This study indicates that as freshwater cyanobacteria are transported to brackish and marine waters, there will be a loss of membrane integrity which will lead to the release of cellular microcystin into the surrounding waterbody. Additional research would be needed to determine the exact effect of salinity on this relationship.

Introduction

Lake Okeechobee (located at 27° north latitude and 81° west longitude) is a large shallow lake (1,900 square kilometers [km^2]) that receives inflow from the Kissimmee River and other smaller tributaries (fig. 1). The bloom material for this study came from Eagle Bay on the north side of the lake. An earthen dike that surrounds the lake was constructed to control adjacent flooding. When lake stage threatens the integrity of the dike, water is released to the Atlantic Ocean through the St. Lucie Canal and to the Gulf of Mexico through the Caloosahatchee River. Releases follow the Lake Okeechobee Regulation Schedule, developed and implemented by the U.S. Army Corps of Engineers and the South Florida Water Management District (SFWMD), to ensure the lake is at a low enough stage to accommodate summer season runoff and rainfall (U.S. Army Corps of Engineers, 2008).

Lake Okeechobee is classified as a moderately eutrophic (Brezonik and Engstrom, 1998) shallow waterbody that has undergone ecological changes because of external nutrient loading from agriculture (Havens and others, 1996) and, more recently, by internal loading of phosphorus from lakebed sediments (Pollman and James, 2011). Ample phosphorus and other nutrients create the ideal conditions for cyanobacterial blooms and have been documented in the lake since 1970 by the SFWMD (1989). The first large-scale bloom occurred in 1986, was dominated by *Dolichospermum circinale* (formerly *Anabaena circinalis*), and covered approximately 310 km^2.

Some of the conditions that lead to cyanobacterial blooms are warm temperatures, sunlight, water-column stability, and sufficiently high concentrations of nitrogen and (or) phosphorus. While all cyanobacteria need ample phosphorus to thrive, inorganic nitrogen limitation allows a subset of cyanobacteria, those capable of using atmospheric nitrogen, to be more successful. *Dolichospermum* (formerly *Anabaena*) has the ability to fix nitrogen (Rosen and others, 2017), compared to *Microcystis*, a nonnitrogen fixing genus, that needs to acquire nitrogen from inorganic sources.

During the summer of 2016, regulatory discharges from Lake Okeechobee into the Caloosahatchee River and the St. Lucie Canal and Estuary occurred during an extensive cyanobacterial bloom (National Aeronautics and Space Administration, 2016). The Florida Department of Environmental Protection (FDEP), in conjunction with the Florida Fish and Wildlife Commission, reports cyanobacteria species composition and microcystin concentrations weekly in Lake Okeechobee and attending waterways (FDEP, 2018). In late June 2016, a large cyanobacterial accumulation occurred

[1]U.S. Geological Survey.

[2]U.S. Army Corps of Engineers.

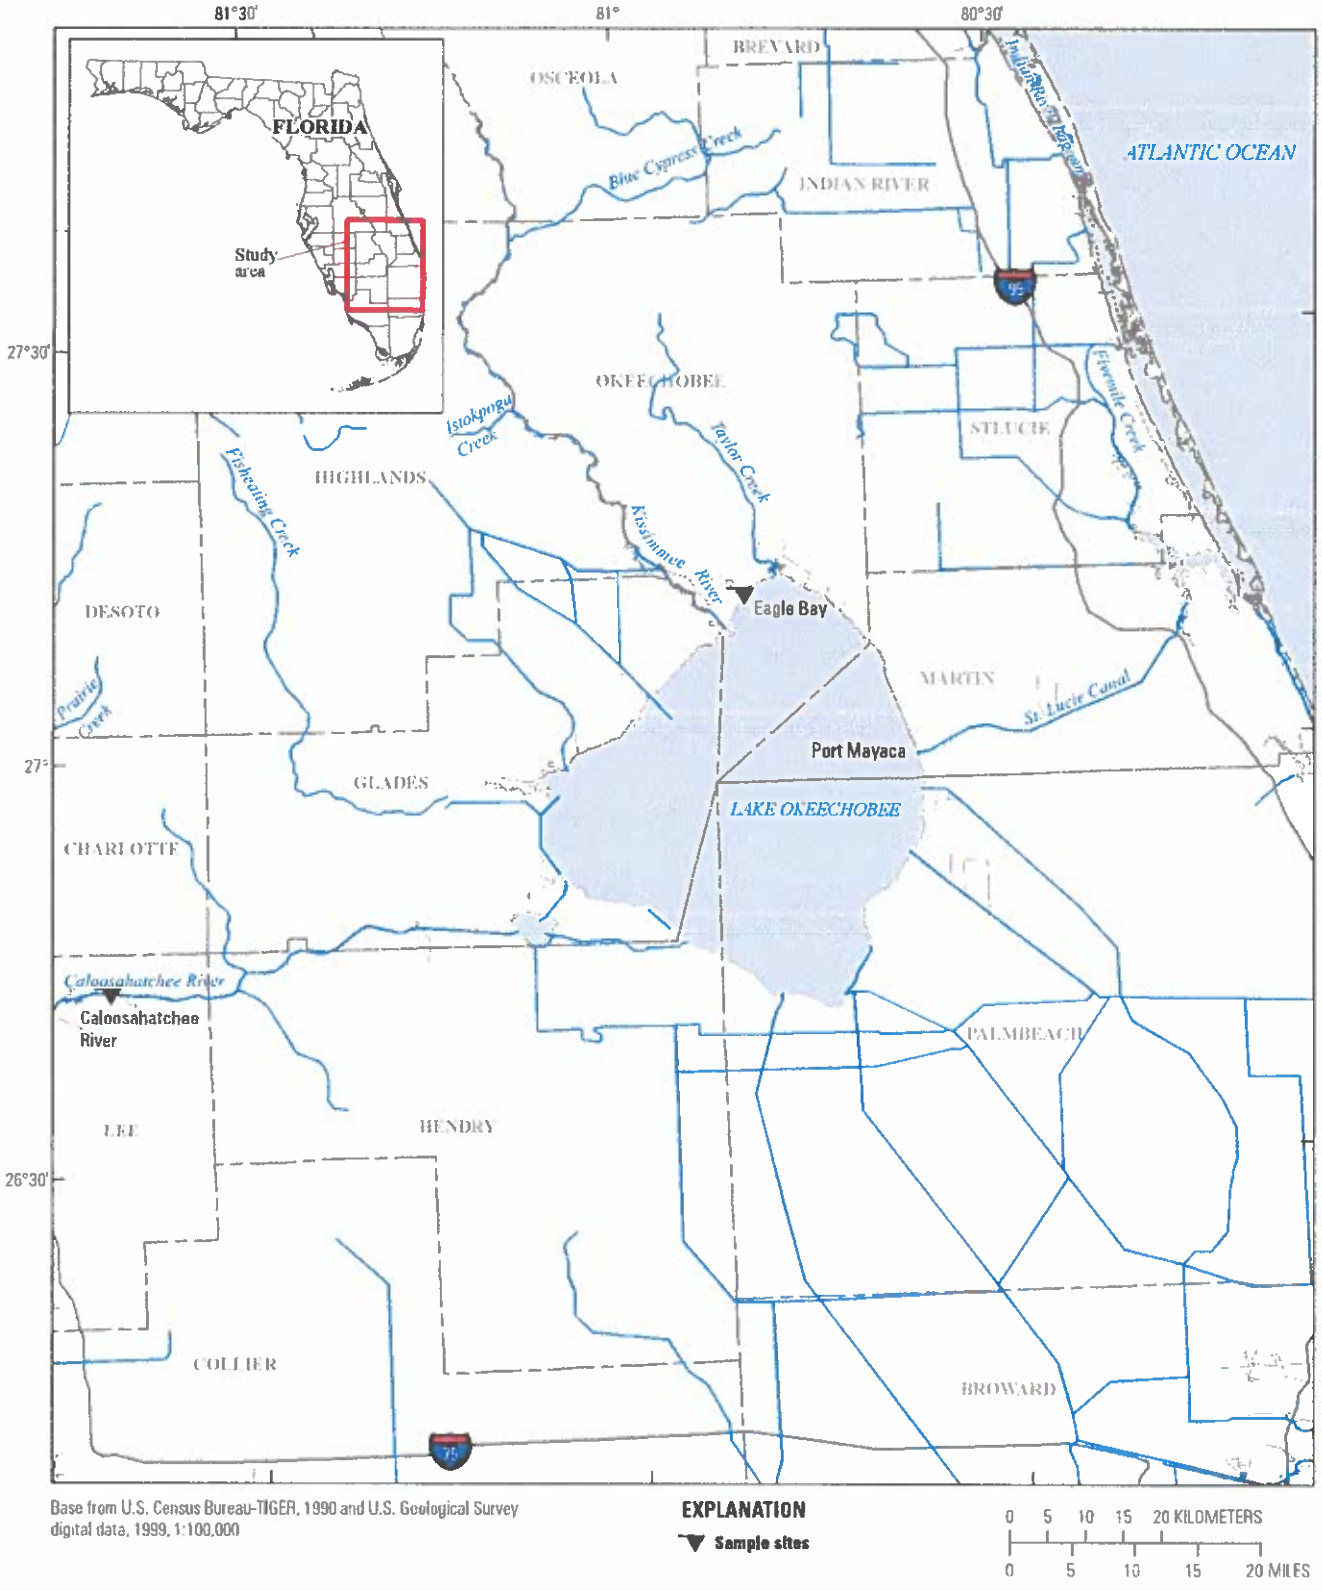

Figure 1. The location of Lake Okeechobee, the tributary system in and out of the lake, and Eagle Bay, where samples were taken for this study, July 7, 2017.

in the St. Lucie Estuary, prompting the Governor of Florida to issue a state of emergency for three affected counties. The FDEP data indicated that Lake Okeechobee and (or) the canal system had existing populations of cyanobacteria (FDEP, 2017) that were likely transported downstream when water was discharged from Lake Okeechobee. Local and coastal basin nutrient runoff, with cyanobacterial proliferation in the backwater areas, also contributed organisms to estuarine and marine habitats, mainly in the St. Lucie Estuary and Indian River Lagoon. In 2005, a similar event occurred with a large cyanobacteria population in the St. Lucie Estuary, which occurred during regulatory discharges from Lake Okeechobee (Phlips and others, 2012).

Salinity tolerance determines how long cyanobacteria originating from freshwater habitats will survive at the salinities typical of estuarine and marine environments (Batterton and Van Baalen, 1971; Orr and others, 2004; Tonk and others, 2007), and collectively, these studies indicate that many freshwater cyanobacteria experience mortality at salinities between 15 and 21 practical salinity units (psu). In the Dutch delta and its associated impoundments, such as Lake Volkerak in the Netherlands, water management strategies have been developed for *Microcystis* blooms (Verspagen and others, 2016) based on salinity tolerance in their systems.

Using cyanobacteria isolated from Lake Okeechobee, the U.S. Geological Survey (USGS), in cooperation with the U.S. Army Corps of Engineers, conducted a 4-day laboratory bioassay with four different salinity treatments and a control. Response variables included morphological changes to cyanobacterial filaments and colonies, changes in growth rate, physiological indicators, intracellular and extracellular (released) microcystin, and an approximation of cell membrane integrity. Collectively, these data provide converging lines of evidence about how Lake Okeechobee cyanobacteria might respond to increased salinity under natural conditions as water mixes in downstream estuaries. Additional data related to this study can be found in King and others (2018a, b).

Methods

The organisms used for the study were collected from Lake Okeechobee and brought into the laboratory in Orlando, Fla., for this study.

Initial Bloom Material

Water and floating bloom material were collected from the upper 10 cm of the water surface at noon on July 7, 2017, from Eagle Bay, Lake Okeechobee, Fla. (latitude 27°11'42.19"N, longitude 80°49'46.24"W). Approximately 35 liters (L) of water and bloom material (fig. 2) were collected in two large carboys and immediately transported to the laboratory, which was approximately 3 hours away, without being cooled or held in the dark. All water and bloom materials were blended and mixed thoroughly in the laboratory and distributed to eighteen 1-L glass graduated cylinders (fig. 3). The 1-L graduated cylinders were used to simulate a water column approximately 35 centimeters (cm) in depth to allow the diurnal migration typically exhibited by planktonic cyanobacteria. Cylinders were incubated in a west-northwest window, and they were treated as batch reactors. Daily temperature and solar irradiance was recorded by using a Li-Cor LI-200/R pyranometer. Average temperature ranged from 23 to 26 degrees Celsius (°C), and light readings yielded 8.9 microwatts per square meter ($\mu W m^{-2}$; plus or minus one standard deviation).

Approximately 20 hours after collection, triplicate cylinders were dosed with sodium chloride (NaCl) to increase salinity by 7.5, 10, 15, or 18 g L^{-1} to yield 7.5, 10, 15, or 18 psu; NaCl was not added to three control cylinders. The time zero samples were taken just prior to dosing the cylinders with the NaCl. Time one began after 24 hours of exposure, at approximately 9:00 every morning. The water in the cylinders was thoroughly mixed by completely inverting the cylinders 5 times, and the volume needed for all the analytical procedures was quickly poured from the cylinder. During the time period of the experiment, no attached algae grew on the cylinder walls. Although not part of the original planned bioassay, some of the original sample was placed into water with higher salinities (20, 25, 30, and 35 psu) in graduated cylinders 2 days after the main bioassay was started. The assessment of these treatments was limited to microscopic observations and physiological assessment.

Biomass Indicator—Chlorophyll-*a*

Chlorophyll provided an overall indication of algal biomass. Ten-milliliter (mL) subsamples collected from each cylinder daily were filtered as described in Hambrook Berkman and Canova (2007), stored (frozen with desiccant), and quantified by using a modification of U.S. Environmental Protection Agency Method 445.0 (Arar and Collins, 1997). Instead of acetone extraction, samples were extracted in heated ethanol (Sartory and Grobbelar, 1986), and the fluorometer was modified with a flow-through cell (Knowlton, 1984). Samples were analyzed in duplicate, and the results were reported as an average.

Biomass Indicator—Cell Numbers

A 10-milliliter (mL) sample from each of the 18 cylinders was collected by 10-mL graduated pipette dispensed into a 15-mL screw-cap plastic centrifuge tube, preserved with 100 microliters (µL) of Lugol's iodine, and refrigerated at 4 °C until it was processed. For counting, the samples were homogenized by vigorous shaking to disperse the colonies, an aliquot was withdrawn, and the precise weight was determined (x 0.0001 gram [g]) with an Ohaus Explorer EX224 Analytical Electronic Balance. The weight was considered equivalent to the volume (1 mL = 1 g) and evenly distributed under a

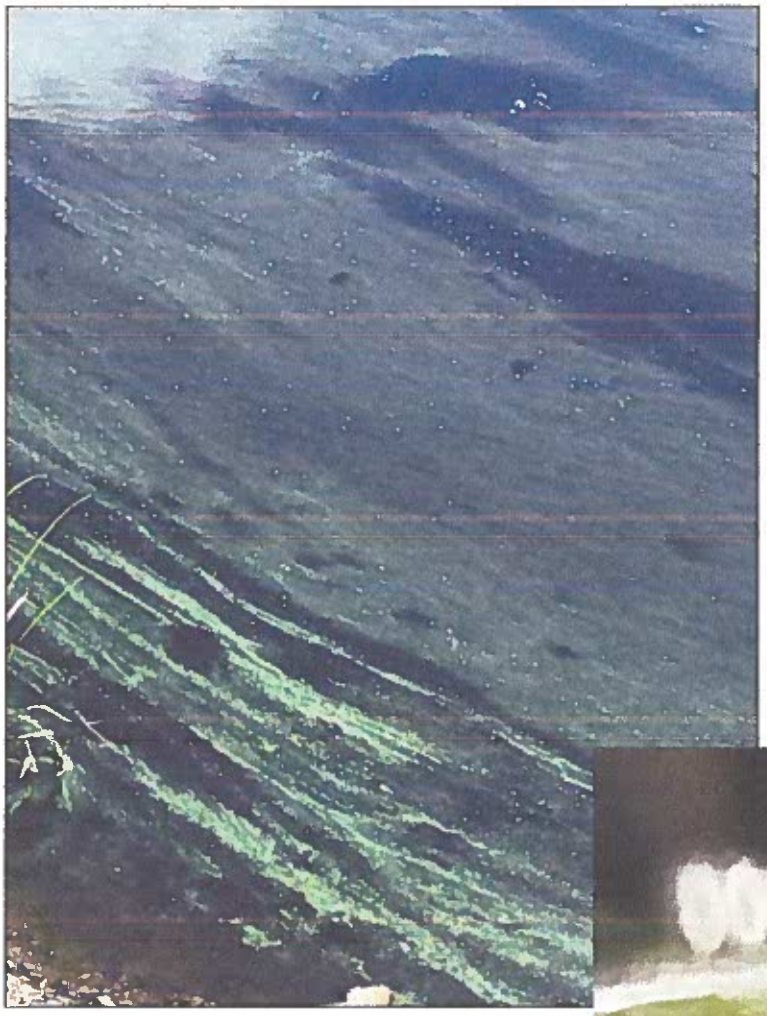

Figure 2. Area where water and bloom materials were collected for bloom bioassay, 2017 Eagle Bay, Lake Okeechobee, Florida. (Photograph by Barry H. Rosen, U.S. Geological Survey.)

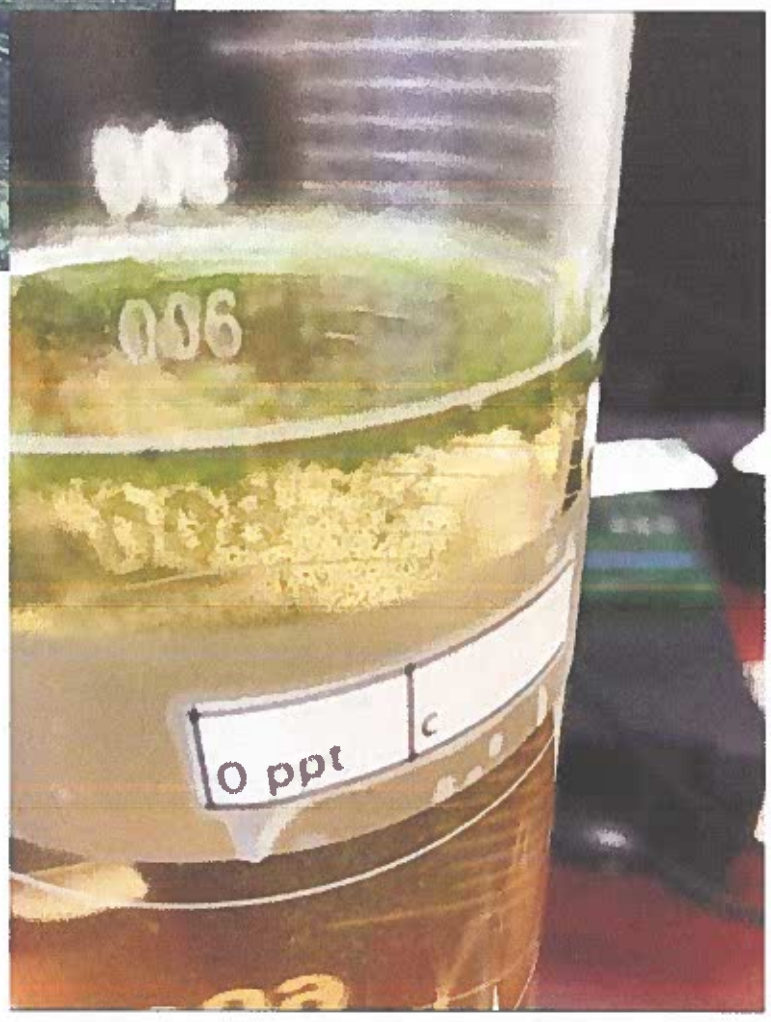

Figure 3. A 1-liter graduated cylinder with initial bloom material. (Photograph by Barry H. Rosen, U.S. Geological Survey.)

22-square-millimeter (mm^2) glass coverslip. Counting was conducted microscopically at 400x by enumerating the cyanobacteria observed in a linear strip along the full length of the coverslip. The diameter of the strip was measured with a stage micrometer. Using the volume distributed under the coverslip per unit area, the number of organisms per unit volume was calculated. For *Microcystis*, its dense, colonial form does not allow an exact direct cell count. We were able to enumerate the number of colonies and optically image a subset of colonies to obtain an average number of cells per colony. This average number of cells per colony was multiplied by the number of colonies found in each sample to get estimated cell count.

Live Organism Physiological Assessment

Approximately 0.020 mL of live material taken from each salinity treatment was examined daily to assess the health of cells by following the protocol of Rosen and others (2010). Microscopic observations were made with a BX51 Olympus microscope with differential interference contrast and epifluorescence using ultraviolet and wide blue excitation sources. SYTOX® Green (Invitrogen, Carlsbad, Calif.), a deoxyribonucleic acid (DNA) stain excluded from live cells, was added (Rosen and others, 2010) to assess if cells lost cellular membrane integrity.

Microcystin Analysis by Enzyme-Linked Immunosorbent Assay

For analysis of total microcystin, a 10-mL subsample was taken daily from each cylinder and frozen. For analysis of dissolved microcystin, the filtrate (Millipore Type TSTP 3.0-micrometer [µm], 25-millimeter [mm] diameter) from a 10-mL subsample was collected daily from each cylinder and frozen. These samples were processed and analyzed as described in Loftin and others (2016), except that an Abraxis streptavidin amplified enhanced sensitivity (SAES) enzyme-linked immunosorbent assay kit was used with a 5-psu sodium chloride microcystin-LR (MCLR) calibration curve custom made by Abraxis, Inc. (Warminster, Pa.). A four-parameter curve-fit was used for calibration. Measurements of kit diluent and laboratory reagent water were below the kit minimum reporting level (0.10 microgram per liter [µg/L]), 0.75-µg/L MCLR kit controls were analyzed every 10th sample, and 28 percent of samples were laboratory replicates. Mean kit control recovery was 106 percent, mean percent relative standard deviation (PRSD) was 9.6 percent, and laboratory replicate PRSD was 20 percent. Particulate microcystin was calculated by subtracting dissolved concentration from total concentration.

Additional Studies

The influence of circulation was evaluated in unamended water and bloom material. Three 4-L glass beakers were filled with 2.5 L of water and bloom material, set atop magnetic stir plates, and separately circulated at velocities of 0.00 foot per second (ft/s; "nonstirred"), 0.27 ft/s, and 0.95 ft/s. The beakers were sealed with plastic to prevent evaporation. Velocity was measured with a USGS pygmy current meter by using the 0.6-depth method (Turnipseed and Sauer, 2010). High-frequency sensor data were collected at 5-minute intervals. Data were collected by using a multiparameter sonde (Xylem/YSI EXO2), calibrated in accordance with manufacturer protocols (YSI Incorporated, 2017) to measure water temperature, specific conductance, dissolved oxygen, pH, chlorophyll-*a* fluorescence, and phycocyanin fluorescence. The high-resolution visualization resulting from these data provides insight into the biogeochemical processes in relation to the results from less frequently collected discrete analyses (Downing and others, 2017).

Results

The majority of the results center on the salinity bioassay conducted; however, ancillary data were collected from the same water and bloom material to provide some understanding of how stirred conditions affect physio-chemical parameters.

Initial Bloom Material

The bloom material collected from Lake Okeechobee on July 7, 2017, contained three species of *Microcystis*: *M. aeruginosa*, *M. flosaquae*, and *M. wesenbergii*. *Microcystis aeruginosa* was the most frequently observed species of this genus. Also present were *Dolichospermum circinale*, *Planktolyngbya contorta*, *Planktolyngbya limnetica*, and *Cuspidothrix tropicalis* (fig. 4). Microcystin concentration in the surface scum collected directly from Lake Okeechobee was 560 µg/L, indicating the presence of microcystin-producing species.

Although rare in the initial community of organisms, two additional cyanobacteria genera grew during the experimental treatments. *Planktothrix* was found on day eight of the experiment in water with salinity of 15 psu, and *Cuspidothrix tropicalis* was found on day four in water with salinity up to 18 psu.

Biomass Indicators

Chlorophyll-*a* concentrations and cyanobacterial abundance were used to quantify changes in algal biomass during the bioassay (figs. 5–7). For chlorophyll-*a*, all concentrations declined from day zero to day four, with the

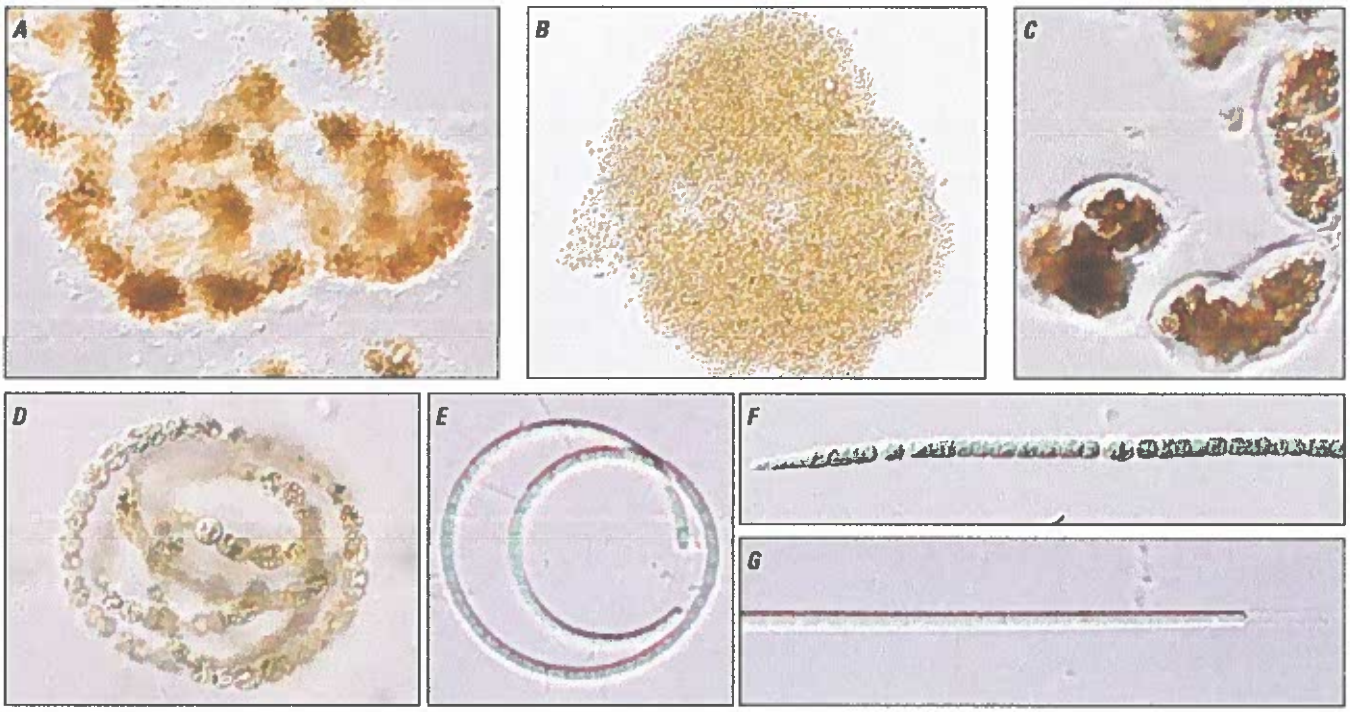

Figure 4. The initial cyanobacterial community in the water sample collected July 7, 2017, from Eagle Bay, Lake Okeechobee, Florida. *A, Microcystis aeruginosa* (most abundant); *B, M. flosaquae*; *C, M. wesenbergii*; *D, Dolichospermum circinale*; *E, Planktolyngbya contorta*; *F, Cuspidothrix tropicalis*; *G, Planktolyngbya limnetica*.

greatest declines in the control (0 psu) and 7.5-psu treatments (fig. 5). The 10, 15, and 18 psu treatments showed greater amounts of chlorophyll-*a* than the lower salinity treatments.

Microcystis aeruginosa and *Dolichospermum circinale* were the dominant cyanobacteria in the initial community used for the bioassay. For *Microcystis*, all of the treatments showed an initial increase in the number of cells during the first time interval from time zero through the first 24 hours, and then the number of cells decreased during the next 24-hour time period (fig. 6), including the control treatment with no added salt. Because the bloom collected from Eagle Bay had been thriving in full sunlight, this adaptation to a laboratory setting was an anticipated response.

Dolichospermum circinale abundance in the control and all of the treatments substantially decreased during the first 24 hours of the bioassay (fig. 7).

Microcystin

Microcystin was reported as a total concentration in whole water and as a dissolved phase in the water after the cells were removed by filtration. Total concentration (fig. 8*A*) decreased to less than 20 µg/L in the control. The 7.5- and 10-psu salinity treatments initially declined but increased to more than 40 µg/L by the end of the 4-day bioassay.

The dissolved phase (fig. 8*B*) is a combination of microcystin leaked from live or unhealthy cells and from those cells that died and released microcystin. In the control, the amount of dissolved-phase microcystin remained less than 2 µg/L, with the largest amounts in the 15- and 18-psu treatments (12–13 µg/L) and in the 7.5- and 10-psu treatments (8–10 µg/L). At all the salinities greater than the control, the amount of dissolved microcystin increased over time (fig. 8*B*), indicating that some of the cells in the treatments were leaking cellular microcystin and cell lysis was occurring. The partitioning of microcystin between the amount retained in cells (calculated particulate) and the dissolved phase (fig. 8*C*) has a similar pattern as the total microcystin (fig. 8*A*), with more retained or produced in the 7.5- and 10-psu treatments.

The calculated particulate microcystin to chlorophyll-*a* ratio was examined (fig. 8*D*) to normalize the toxin concentration to a cell abundance surrogate (chlorophyll-*a*). Cell abundance was not used for this calculation because chlorophyll-*a* was a more precise measurement then cell abundance, given the difficulty and potential variability in estimating cell numbers. In addition, particulate microcystin and particulate chlorophyll-*a* are both intracellular constituents. Using this calculation, by day four, the 7.5- and 10-psu treatments showed an increase in this ratio that is approximately double the ratios in the 15- and 18-psu treatments.

Physiological Response to Salinity

Overall, the *Microcystis aeruginosa* colonies maintained integrity during the first 24 hours of exposure at salinities up to 25 psu (fig. 9; 30 and 35 psu were not photographed at this time interval). After 4 days, complete disintegration of all *Microcystis aeruginosa* colonies did not occur, even up to 35 psu (fig. 10). Although most colonies remained intact, a few disintegrated to small clusters and individual cells (fig. 11).

Dolichospermum circinale was much less abundant, leaving a less complete picture of salinity effects. Intact filaments were present after 1 day; however, the cells seem to be separating in the 20- and 25-psu treatments (fig. 12). After 2 days of exposure, *Dolichospermum* has additional separation of cells at higher salinity (fig. 13). *Dolichospermum circinale* was tolerant of 7.5 psu and was in good condition after 8 days (fig. 14), but was not found at any salinity greater than 7.5 psu by the end of the bioassay.

In addition to overall morphological changes in colonies and filaments of these two genera of cyanobacteria, evidence of adaptation was observed microscopically. The production of mucilage was observed enveloping the filaments and the colonies (fig. 15).

Physiological Response as Determined by SYTOX® Green Visualization

Cell health was analyzed by using epifluorescence microscopy in conjunction with SYTOX® Green, a DNA stain that emits green light in the presence of DNA. If the cellular membrane of an organism is intact, SYTOX® Green does not penetrate, providing an indication of cell health. In figures 16–22, the denotation is (1) LM—organisms illuminated with differential interference light microscopy for overall cell and colony structure; (2) UV—organisms illuminated with ultraviolet light, with variations in pigment color an indicator of cell health; (3) WB—organisms illuminated with "wide blue" as the baseline color before adding SYTOX® Green; (4) SYTOX® Green—organisms stained with this dye are bright green when DNA is present (Rosen and others, 2010). The photographs are representative of the overall condition of the colonies or filaments in the treatments.

After 1 day of exposure, the SYTOX® Green is only seen outside of the *Microcystis* colony, with no penetration of the stain into the cells in all treatments (fig. 16). After 2 days of exposure, the SYTOX® Green penetrated the *Microcystis* cells in the 18-, 20-, and 25-psu treatments as seen in figure 17 where the cells are green compared to the 15-psu treatment. After 3 days of exposure, the SYTOX® Green is seen only external to the *Microcystis* colonies, with no penetration of the stain into the cells in all treatments, with the exception of the 15-psu treatment (fig. 18). In the 15-psu treatment, the SYTOX® Green penetration and the pigment shift to yellow under UV indicate that this colony was no longer viable. After 4 days of exposure, with one of two *Microcystis* colonies in the 15-psu treatment and all of the colonies in treatments of 20 psu or greater salinity, the SYTOX® Green penetration and the pigment shift to yellow under UV indicate that these colonies were no longer viable (fig. 19). After 8 days of exposure, the 18-psu treatments had some *Microcystis* colonies that were still viable and some that were not, while all lower salinity treatments had viable colonies (fig. 20).

R03140

After 1 day of exposure, *Dolichospermum* was much less abundant in the treatments, hence the sparse observations (fig. 21). The Green was observed to have penetrated one of two filaments observed after 1 day of exposure at 20 psu.

Dolichospermum filaments were seen in the control and in the 7.5-psu treatment, but were absent in salinity greater than 7.5 psu after day one. After 8 days, the only treatments with any *Dolichospermum* were the control and the 7.5-psu treatment, and *Dolichospermum* were rare in both samples (fig. 22). The few filaments observed in both of these treatments were viable and appeared healthy.

Physio-Chemical Conditions

Ancillary to the bioassay itself, a continuously recording sonde was used to collect physical and water-chemistry data from water associated with the initial cyanobacteria sample collection and a simulation of water flow without any salinity treatments. Material was placed in 4-L beakers that were either stirred or not stirred. The nonstirred treatment is the most similar to the actual bioassay in the sense that the graduated cylinders used for the bioassay were not stirred. Dissolved oxygen initially showed a small increase to 4 milligrams per liter (mg/L), then decreased and maintained a fairly constant level of 3 mg/L in the nonstirred treatment. A slight diurnal pattern was present that dissipated after day two (fig. 23). Both stirred treatments had higher dissolved oxygen than the nonstirred treatment, with the highest concentration of oxygen at the fastest rate of stirring, 0.95 ft/s, reaching 8 mg/L.

Temperature varied diurnally from a low of 23 °C to a high slightly greater than 27 °C in the nonstirred treatment (fig. 24). Water in both stirred beakers (on a magnetic plate with a stir bar) had elevated temperatures that were 2 to 4 °C higher than temperatures in the nonstirred treatment.

In the nonstirred treatment, specific conductance was 307 microsiemens per centimeter at 25 degrees Celsius (µS/cm at 25 °C) on the first day of the test; specific conductance increased to 322 µS/cm by the end of the test (fig. 25). The stirred treatments had the same initial specific conductance as that of the nonstirred treatment; however, specific conductance was approximately 30 µS/cm greater in the stirred treatments than in the nonstirred treatment by the end of the test.

The pH peaked at just over 7.3 in the nonstirred treatment (fig. 26). In the stirred treatments, pH values were higher on average. In the treatment that was stirred at a rate of 0.27 ft/s, the maximum pH was 7.6. In the treatment that was stirred at a rate of 0.95 ft/s, the maximum pH was 7.9.

For all treatments, chlorophyll-*a* fluorescence exhibited the greatest decrease during the first day as the bloom was moved from Lake Okeechobee to the laboratory setting (fig. 27). The decrease of chlorophyll-*a* fluorescence in the nonstirred treatment leveled off for the duration of the experiment; however, fluorescence in both stirred treatments was higher than in the nonstirred treatment, and chlorophyll-*a* fluorescence increased in the stirred treatments after day three.

Phycocyanin fluorescence decreased substantially across all treatments over the course of the experiment, though fluorescence did remain higher in the treatment that was stirred at the fastest rate (0.95 ft/s; fig. 28).

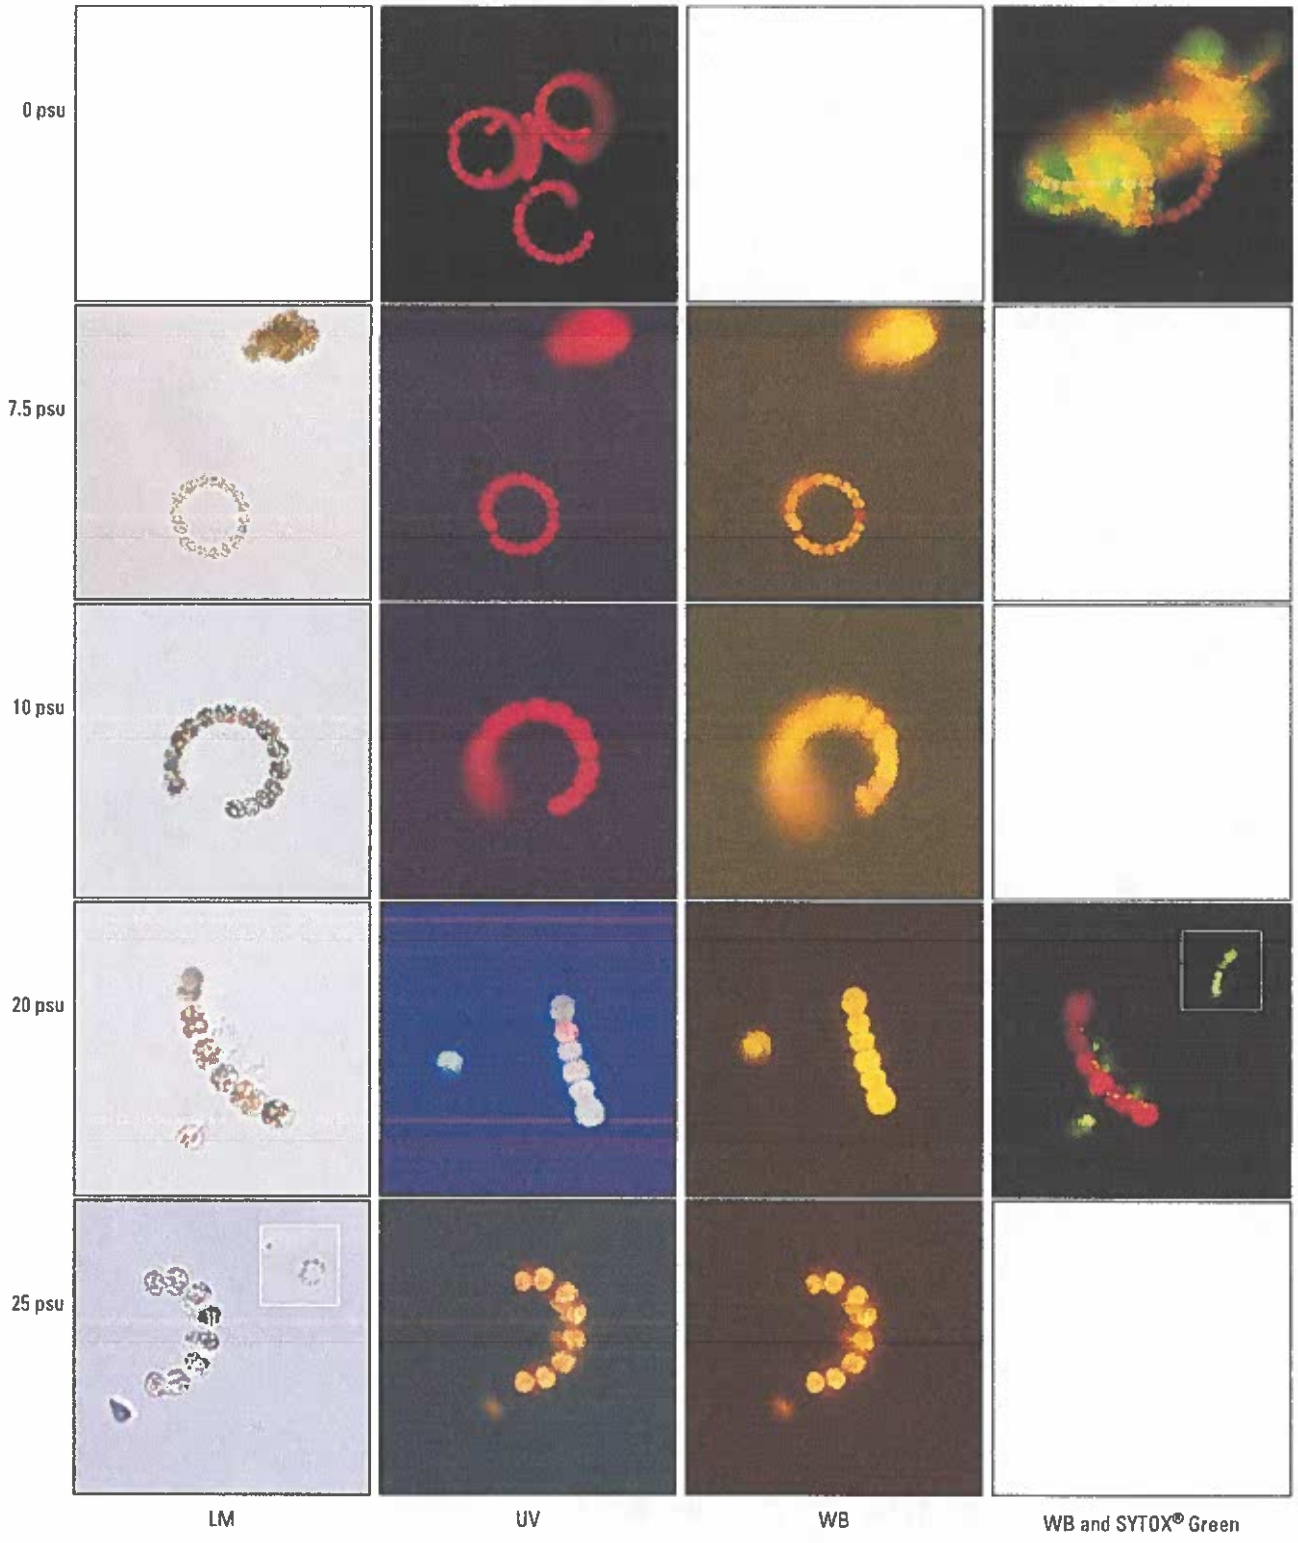

Figure 21. Response of *Dolichospermum circinale* after 1 day of exposure to treatments with different salinities (LM, differential interference microscopy; UV, epifluorescence microscopy; WB, wide-blue epifluorescence microscopy; WB and SYTOX® Green, wide-blue microscopy with the DNA stain SYTOX® Green added. Blank boxes indicate that data were not available).

Discussion

It is frequently assumed that when cyanobacteria from freshwater lakes, reservoirs, and rivers reach saline estuaries, they will die off after some period of time. The hydrologic dynamics in these transition areas influence the salinity conditions that these organisms experience. In a study that included a period of augmented flow from Lake Okeechobee in 2005, Phlips and others (2012) found that *Microcystis aeruginosa* persisted in the St. Lucie Estuary. The Phlips study reported that the South Fork of the St. Lucie Estuary had dense surface accumulations of cyanobacteria, with chlorophyll-*a* reaching 2,863 $\mu g/L^{-1}$ at the surface, and the cyanobacteria seem to have come from the St. Lucie Canal. Only a few studies have attempted to define the effects of salinity on cell growth, cell death, toxicity, pigmentation, and cell morphology (Batterton and Van Baalen, 1971; Orr and others, 2004). Tonk (Tonk and others, 2007) found the salinity tolerance of *Microcystis* did not exceed 20 psu.

The bloom used for this bioassay was collected from Eagle Bay, Lake Okeechobee, on July 7, 2017, and brought into a laboratory setting. The bloom was moved from an open-water habitat where it experienced wind and wave activity and nutrient and light variability associated with an open waterbody. Moving the community from its natural environment into the laboratory and into batch growth conditions (the graduated cylinders) altered many parameters that would equate to physiological stress on the organisms; however, the approach used in this study ensured physiological variables were similar across the treatments, leaving salinity changes as the only variable. The responses of dissolved oxygen and pH indicate the loss of a typical diurnal pattern that likely existed in the lake (figs. 23 and 26). The increase in specific conductance (fig. 25) may be explained by greater evaporation in the stirred treatments, which were also warmer than the nonstirred treatment (fig. 24) because of the heat produced by the stir plates. On a cellular level, if the cells were being disrupted and leaking cellular contents mineralized by bacteria, it could also explain the increase in specific conductance, as well as being a possible factor for the observed decline in fluorescence.

Overall, the control and treatments showed a downward trend in chlorophyll-*a* and phycocyanin fluorescence over time (figs. 27 and 28), and numerous possibilities exist for this phenomenon, including moving organisms from a high-light environment to a laboratory setting and changing nutrient dynamics that affect pigment fluorescence (Rosen and Lowe, 1984).

The water collected contained the targeted organism, *Microcystis aeruginosa,* with a density of approximately 400,000 cells per milliliter (cells/mL). This original sample contained ample microcystin (560 µg/L), which allowed us to monitor the presence of microcystin in cells and the amount released to the water as a result of salinity stress. Another major bloom-forming organism from the lake (Rosen and others, 2017), *Dolichospermum circinale*, was present at an initial density that was more than 140,000 cells/mL. The response of these two organisms provided information on the colonial and filamentous forms of cyanobacteria, *Microcystis* and *Dolichospermum*, respectively.

Generally, cyanobacteria health declined in salinity treatments greater than 18 psu as indicated by a loss of cell membrane integrity. In any given waterbody, the cyanobacteria colonies and filaments are not identical; rather, they are in various physiological states. Some colonies and filaments contain healthy cells that are likely better able to withstand stress, such as salinity changes, while others are unhealthy and more easily disrupted. Mucilage production, a mechanism commonly observed in response to desiccation in cyanobacteria (Pereira and others, 2009; Rosen and Mareš, 2016) and salinity (Ozturk and Aslim, 2010), was also an indicator of response to salinity in *Microcystis* and *Dolichospermum* (fig. 15). For mucilage production to occur, the filaments/colonies have to be alive and able to synthesize compounds that are excreted from the cells. The extracellular polymeric substance is mainly composed of complex polysaccharides that serve as a protective boundary between the cells and the water that surrounds them (Kehr and Dittmann, 2015). Nitrogen limitation has also been found to increase polysaccharide production in *Microcystis* cells, and light intensity seems to play an important role (Yang and others, 2012).

Initially, individual *Microcystis* colonies contained hundreds of cells (fig. 4*A*), and the effect of salinity on colony integrity did not show a single pattern. Some colonies maintain their overall shape with several hundreds of cells, even after 4 days of exposure in treatments up to 35 psu (fig. 10), while other colonies broke up into individual cells at 10 psu or greater (fig. 11). Although some cells of *Microcystis* lost integrity after 2 days of exposure to salinity greater than 18 psu, as indicated by being stained green with SYTOX® Green (fig. 17), other cells and colonies were left intact even after 4 days of exposure to salinity up to 20 psu. Cell mortality occurred after 4 days of exposure to salinity of 25 psu or greater (fig. 19), even if the colonies appeared to be intact. This range in colony breakdown in response to salinity is likely because of the natural variability in the health of each individual colony in a bloom, similar to the concept of the "paradox of the plankton" (Hutchinson, 1961).

Dolichospermum circinale cells decreased substantially in all treatments during the first 24 hours, indicating this species is not tolerant of the salinities in the ranges tested (fig. 7). Filaments were initially coiled (fig. 4*D*), but became shortened fragments within 1 day of salinity exposure (fig. 12). Separation of the cells in a filament was observed and likely the cause of fragmentation. *Dolichospermum*

tolerated the lowest salinity treatment, 7.5 psu (fig. 14*B*), for 8 days, but filaments were not observed in the higher salinities in this timeframe. From these observations, this other common Lake Okeechobee bloom-forming organism is much less tolerant of salinity compared to *Microcystis*. Although some of the fragments were stained with SYTOX® Green after 2 days of exposure to the 7.5-psu treatment, this salinity does not appear to cause complete mortality, as indicated by filamentous colonies that were still viable after 8 days at 7.5 psu. *Dolichospermum circinale* did not tolerate conditions greater than 7.5 psu.

Total, dissolved, or calculated microcystin concentrations, as total, dissolved, or calculated particulate, increased over time and were greater in the salinity treatments compared to the control. The amount of microcystin was greatest in the dissolved phase at the two highest salinities (fig. 8*B*), indicating that either a greater amount leaked from the cells in general or that cellular contents were released by dead cells. The particulate microcystin and chlorophyll-*a* give us information about the cellular content of organisms, hence we gain a more direct understanding of the cellular microcystin response as a function of salinity. The 7.5- and 10-psu treatments contained a greater amount of microcystin per unit of chlorophyll, indicating toxin stimulation at these concentrations. In contrast, in the 15- and 18-psu salinity treatments, the microcystin to chlorophyll ratios were similar to or lower than in the control, suggesting the inhibition of microcystin at these salinities. Additional experiments are needed to determine the mechanisms by which salinity stimulates or inhibits microcystin production.

Summary and Conclusions

This study documents an overall decline in cyanobacteria health in salinity treatments greater than 18 psu. A dominant bloom in this system, *Microcystis aeruginosa*, was tolerant of salinities up to 18 psu; however, higher salinities caused leaking of microcystin from the cells. *Dolichospermum circinale*, another common bloom-former in this system, did not tolerate salinities greater than 7.5 psu. Both organisms produced extracellular mucilage as a protective response to salinity, which is a common ecological strategy in cyanobacteria undergoing desiccation. At 7.5 psu, microcystin increased relative to chlorophyll-*a*, providing some evidence of biosynthesis when *M. aeruginosa* is stressed at these salinities. This study indicates that as freshwater cyanobacteria are transported to brackish and marine waters, there will be a loss of membrane integrity which will lead to the release of cellular microcystin into the surrounding waterbody. Additional research would be needed to determine the exact effect of salinity on this relation.

Edited by John E. Hobbie, Marine Biological Laboratory, Woods Hole, MA, and accepted by Editorial Board Member David W. Schindler March 8, 2017 (received for review December 8, 2016)

The highest densities of lakes on Earth are in north temperate ecosystems, where increasing urbanization and associated chloride runoff can salinize freshwaters and threaten lake water quality and the many ecosystem services lakes provide. However, the extent to which lake salinity may be changing at broad spatial scales remains unknown, leading us to first identify spatial patterns and then investigate the drivers of these patterns. Significant decadal trends in lake salinization were identified using a dataset of long-term chloride concentrations from 371 North American lakes. Landscape and climate metrics calculated for each site demonstrated that impervious land cover was a strong predictor of chloride trends in Northeast and Midwest North American lakes. As little as 1% impervious land cover surrounding a lake increased the likelihood of long-term salinization. Considering that 27% of large lakes in the United States have >1% impervious land cover around their perimeters, the potential for steady and long-term salinization of these aquatic systems is high. This study predicts that many lakes will exceed the aquatic life threshold criterion for chronic chloride exposure (230 mg L^{-1}), stipulated by the US Environmental Protection Agency (EPA), in the next 50 y if current trends continue.

limnology | chloride | road salt | impervious surface | ecosystem services

Due to landscape position, lake ecosystems are influenced by surrounding terrestrial processes, and their generally long water residence times can contribute to the accumulation of external inputs and pollutants (1). Therefore, although lakes cover only 3% of the continental land surface (2), long-term trends in lakes are often early warning indicators of significant local, regional, or global changes (3). One such early warning indicator is change in lake chloride concentrations. Naturally occurring in freshwaters at low concentrations, chloride is a highly soluble and conservative ion that has also been shown to be a reliable proxy for chloride-based road salts (typically sodium chloride) (4, 5). Although chloride concentrations in freshwaters can vary cyclically due to climatic processes, such as extended periods of drought (6), elevated chloride concentrations in lakes often result from agricultural, industrial, and transportation practices (7). Elevated chloride concentrations can have adverse effects on water quality and aquatic ecosystems (8–11), including both immediate and long-term alterations to community structure, diversity, and productivity (12–14).

Salt application for de-icing roadways has been recognized as a major source of chloride to groundwater (15–17), streams and rivers (5, 10, 18, 19), and lakes (7, 9, 20, 21, 22) across north temperate climates in North America and Europe. In the United States, road salting became a standard practice in the 1940s, and road salt sales over the subsequent 50 y increased from 0.15 to over 18 million metric tons per year (4). In Canada, despite its addition to the List of Toxic Substances (23) and the implementation of the Code of Practice for the Environmental Management of Road Salts in 1999, an average of 5 million metric tons of road salt per year was applied to roadways between 1995 and 2001 (23, 24). Following application, road salt quickly dissolves and is transported into rivers and lakes through leaching and runoff (5, 25). A few studies have characterized the negative short term or localized impacts of elevated road salt concentrations in freshwaters (5, 15, 25), but there have been no large-scale analyses of chloride trends in freshwater lakes.

Here, we investigate trends in lake chloride concentration, using a dataset of long-term chloride concentrations in lakes and reservoirs in North America. We identify regions of high salinization, where aquatic ecosystems may be at risk, and contrast the role of climate versus the anthropogenic practice of road salting in driving chloride variability. Lakes included in the dataset were required to have at least 10 y of chloride data, a mean chloride concentration ≤ 1 g L^{-1} (to exclude brackish lakes), and a surface area ≥ 4 ha. The median length of an individual time series was

Significance

In lakes, chloride is a relatively benign ion at low concentrations but begins to have ecological impacts as concentrations rise into the 100s and 1,000s of mg L^{-1}. In this study, we investigate long-term chloride trends in 371 freshwater lakes in North America. We find that in Midwest and Northeast North America, most urban lakes and rural lakes that are surrounded by >1% impervious land cover show increasing chloride trends. Expanding on this finding, thousands of lakes in these regions are at risk of long-term salinization. Keeping lakes "fresh" is critically important for protecting the ecosystem services freshwater lakes provide, such as drinking water, fisheries, recreation, irrigation, and aquatic habitat.

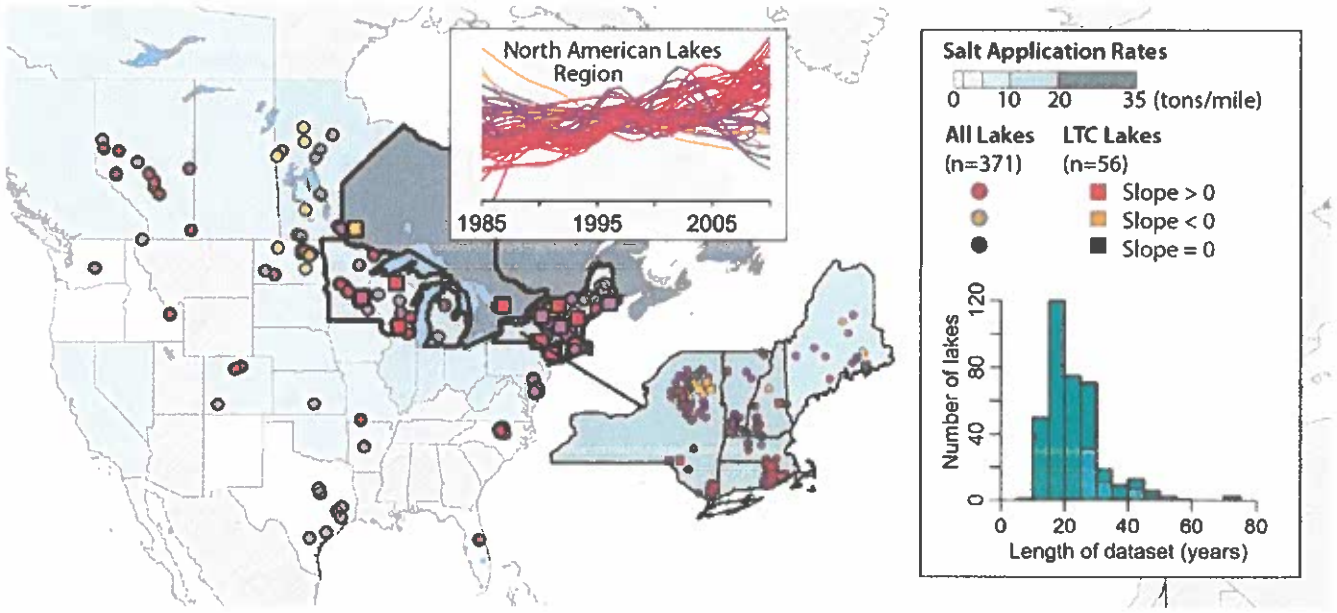

Fig. 1. Chloride trends for North American freshwater lakes (circles and squares, $n = 371$). The states and province included in the NALR are outlined in black. Points are colored by the slope value of linear regression models (red, positive slope; yellow, negative slope; purple, zero or nonsignificant slope). Squares denote lakes with at least biennial chloride concentrations recorded from 1985 to 2010 ($n = 56$). These LTC datasets are a subset of lakes in the NALR, which is a region of dense sampling ($n = 284$). *Upper Inset* of chloride time series from 1985 to 2010 are colored by slope value. Road salt application rates for North American provinces and states range from 0 to 35 US tons per mile and are shown in blue. No salt application rates were available in areas with hatched lines. The lengths of all individual datasets (dark green) as well as the lengths of LTC datasets (light green) are shown in the *Inset* histogram.

21 y. The dataset included lake morphometric characteristics, climate statistics on temperature and precipitation, and atmospheric sea salt deposition. As a proxy for road salt application, land cover metrics were calculated, including road density (26) [length of road in a given area (km km^{-2})] and percent impervious land cover (25) within a 100- to 1500-m buffer surrounding each lake. Road density and impervious land cover represent the best proxies for road salt application, given that variability in road salt application, both spatially and on a year-to-year basis, prevents application rates from being calculated at spatial and temporal scales relevant to lakes.

Lakes in this dataset were not randomly sampled and thus do not necessarily represent the distribution of lakes within each state or province. To limit sampling bias in this dataset, we focused our analyses on a geographic area with dense sampling coverage: a North American lakes region (NALR), which includes Connecticut, Maine, Massachusetts, Michigan, Minnesota, New Hampshire, New York, Ontario, Rhode Island, Vermont, and Wisconsin (Fig. 1). We excluded North Dakota lakes from this grouping, as many are part of the Devil's Lake watershed, an endorheic (closed-basin) system where water levels have risen ~10 m since 1992, and therefore, the hydrology is vastly different from exorheic (open) lakes (27). Likewise, Manitoba lakes were excluded, as many were enlarged or drained during hydroelectric construction along the Churchill and Nelson Rivers (28). Of the 371 North American lakes in our dataset, 284 were in the NALR (Fig. 1). Mean chloride concentrations in lakes across the NALR ranged from 0.18 to 240.8 mg L^{-1}, with a median value of 6.0 mg L^{-1}.

Chloride time series for each lake differed in the frequency, duration, and depth of sampling. We pooled all depth samples for analyses, based on observations that chloride concentrations track similar trends throughout the water column of most lakes and that previous studies of long-term chloride trends have shown similarity with depth (7, 29). To reduce autocorrelation due to seasonality, we reduced all time series to annual averages. To enable comparison of chloride trends across lakes, a linear model was fit to the annual data, where chloride (standardized to a distribution with mean = 0 and SD = 1) was a function of time. Lakes were classified by simple linear regression models into three possible long-term trends: decreasing ($n = 42$, slope < 0, $P < = 0.01$), stationary ($n = 204$, slope $= 0$, $P > 0.01$), or increasing ($n = 125$, slope > 0, $P < = 0.01$). Of the 125 lakes with a positive trend in chloride, 99 were in the NALR (Fig. 1).

To investigate both linear trends and time-series patterns over a comparable period, any site in the NALR that had at least biennial data from 1985 to 2010 was included in a subset of long-term continuous (LTC) data. Clustering the 56 LTC lakes into three groupings using a hierarchical clustering analysis revealed three characteristic trends in chloride concentrations: neutral/decreasing (cluster 1, $n = 16$), oscillating (cluster 2, $n = 4$), and increasing (cluster 3, $n = 36$) (Fig. 2*A*). Cluster 1 was a geographical mix of lakes with both decreasing and neutral slope trends, cluster 2 lakes were exclusively in Maine and had neutral slope trends, and cluster 3 lakes, 21 of which were in Minnesota, had predominantly increasing slope trends (35 of 38) (Fig. 2*B*).

Potential drivers of increasing lake chloride were first assessed by relating slope values to lake, climate, and landscape characteristics of lakes in the NALR (Fig. 3 *A*–*C*). Due to the prevalence of zero-values in the data, it was not possible to build robust log-linear models for most of the landscape characteristics. Therefore, we used both classification/regression trees and random forests to build predictive models for the NALR data. A classification/regression tree and a random forest were created for each of three response variables: linear slope, tested as both continuous numerical and categorical (positive, zero, negative) variables, and hierarchical cluster grouping (1, 2, or 3). Categorical slope was used as a response variable to further remove any bias in our linear model application by removing magnitude. The motivation for using two approaches and three response variables was to improve the accuracy of our analytics, in much the same way as ensemble modeling.

Results of the three classification/regression trees and three random forests revealed that impervious land cover and road

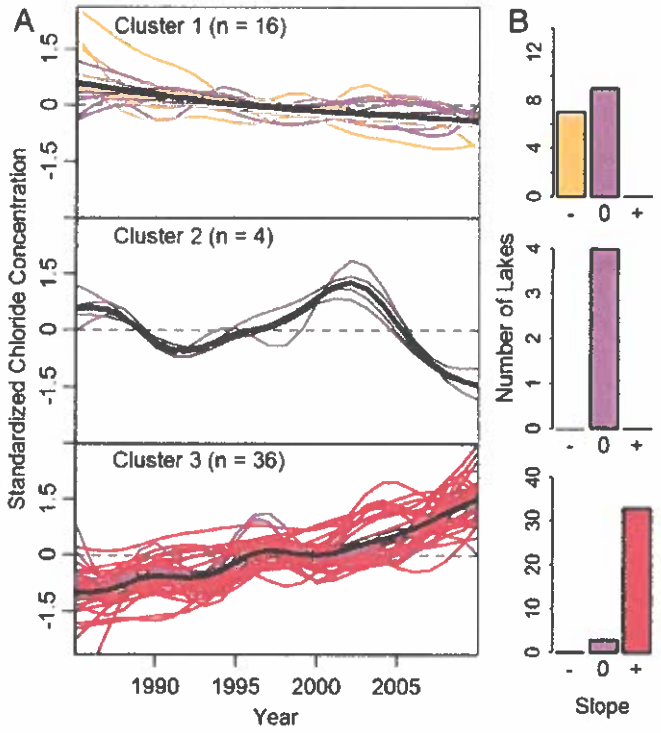

Fig. 2. (*A*) LTC lakes (n = 56) with biennial chloride data from 1985 to 2010 grouped into three clusters using a hierarchical cluster analysis. In general, the three clusters show a neutral/decreasing (cluster 1), oscillating (cluster 2), or increasing (cluster 3) pattern. Thick black lines are GAMs fit to all lakes within each cluster, to represent the average pattern. (*B*) Histograms display the number of lakes in each cluster by linear slope (yellow, negative slope; purple, zero slope; red, positive slope).

density surrounding each lake were the primary classification splits and the most important predictors for lake chloride trends and cluster grouping (Table 1).

The predictors used in the tree-based models were all static variables, meaning values did not vary with time. This limitation may misrepresent relationships between chloride concentrations and drivers that vary on a subannual basis (e.g., precipitation). Monthly precipitation data were obtained from the PRISM high-resolution spatial climate dataset, which covers the United States at a spatial resolution of 4 km (30). To account for the lag in chloride retention in a watershed (19), a LOESS curve was fit to mean monthly precipitation (mm/d) from 1985 to 2010 at each LTC site. A correlation between precipitation and chloride concentration at each LTC lake was calculated from annual data predicted from the LOESS precipitation curve and the generalized additive model (GAM) of chloride concentration. There was a strong negative correlation (r^2 = 0.71–0.87) between precipitation and chloride concentration for the four Maine lakes that group into cluster 2 (oscillating pattern). These four lakes are all less than 0.25 km^2 and receive ~1.25 m of precipitation per year and have no impervious land cover within 500 m. Without knowledge of the groundwater hydrology of these lakes, it may be that precipitation controls the chloride balance, with heavy rains and large snowfalls diluting the chloride concentrations. A strong relationship between precipitation and chloride is not evident for lakes that group into cluster 1 or 3 (median r^2 = 0.12, range = 0–0.61).

Of our NALR sites, 44% of freshwater lakes have undergone long-term salinization. Positive chloride trends were present in lakes with as little as 1% impervious coverage. This finding is consistent with studies of US streams that found increased chloride concentrations associated with any urban land cover (31) or roads (32, 33) and substantiates findings of ecological community thresholds associated with low levels of catchment urbanization (34). Across the NALR, lakes with mean chloride concentrations >1 mg L^{-1} (mean value of the time series) were more likely to be associated with positive trends in chloride (Fig. 3*D*). This suggests that high chloride concentrations in this region may be an indicator and warning sign of recent salinization.

If impervious land cover surrounding a lake is a robust predictor of water quality, it is important to understand the probability of its occurrence across all lakes within a region or country. Using national hydrography and land cover datasets for the continental United States, we found that the median percent impervious land cover within 500 m of all lakes greater than 4 ha is 0.31% (n = 149,350; Fig. 4). Of these US lakes, 28% had greater than 1% impervious land cover in a 500-m buffer zone. The density of roads and other impervious surfaces surrounding lakes in US regions where road salt is applied should therefore be of high concern. In the NALR, 70% (94 out of 134) of lakes with > 1% impervious land cover in the 500-m

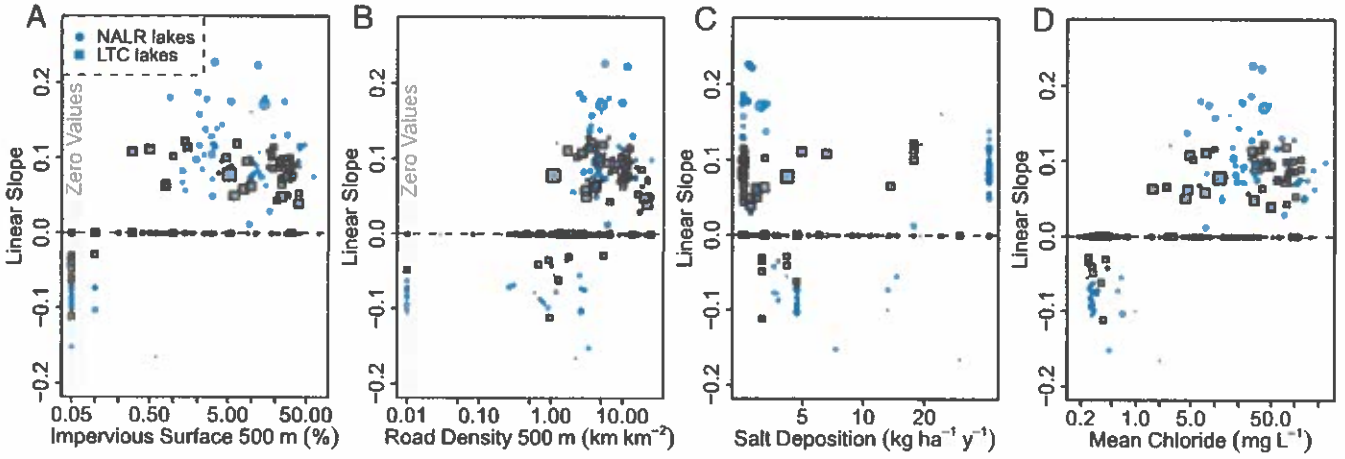

Fig. 3. Scatterplots of linear regression slope values versus (*A*) impervious surface within a 500-m buffer, (*B*) road density within a 500-m buffer, (*C*) rate of atmospheric salt deposition, and (*D*) mean in-lake chloride concentration over the entire time series for all NALR sites (n = 284). In all plots, the size of the symbol is scaled by lake area. Squares with black borders denote LTC lakes. In *A* and *B*, zero values have been adjusted to fit on the x axis and are highlighted in gray.

Table 1. Primary node splits from regression/classification tree models and the top predictor from random forest models

Response variable	Subset of data	Regression/classification tree primary node split	Random forest top predictor, variance explained
Linear slope, numerical	*NALR*	Impervious land cover 100 m	Road density 500 m, 50%
Linear slope, categorical	*NALR*	Impervious land cover 500 m	Impervious land cover 500 m
Cluster, categorical	*NALR LTC*	Impervious land cover 100 m	Impervious land cover 200 m

Models were built using linear slope (both as a number and a category), and cluster category as response variables for NALR lakes (all data $n = 284$ and LTC $n = 56$). Predictors included lake surface area, road density and impervious land cover (100-, 200-, 300-, 400-, 500-, 1,000-, 1500-m buffers), mean January air temperature, annual precipitation, wet/dry chloride deposition, and distance from the coast. For random forest models using a numerical response variable, % variance explained by the model is provided.

buffer had increasing chloride trends. If this result is extrapolated to all lakes in the US NALR (CT, MA, ME, MI, MN, NH, NY, RI, VT, and WI), ~7,770 lakes may be experiencing elevated chloride concentrations, likely due to road salt runoff. This is calculated as 70% of the 11,104 out of 38,603 lakes in the US NALR greater than 4 ha that have >1% impervious land

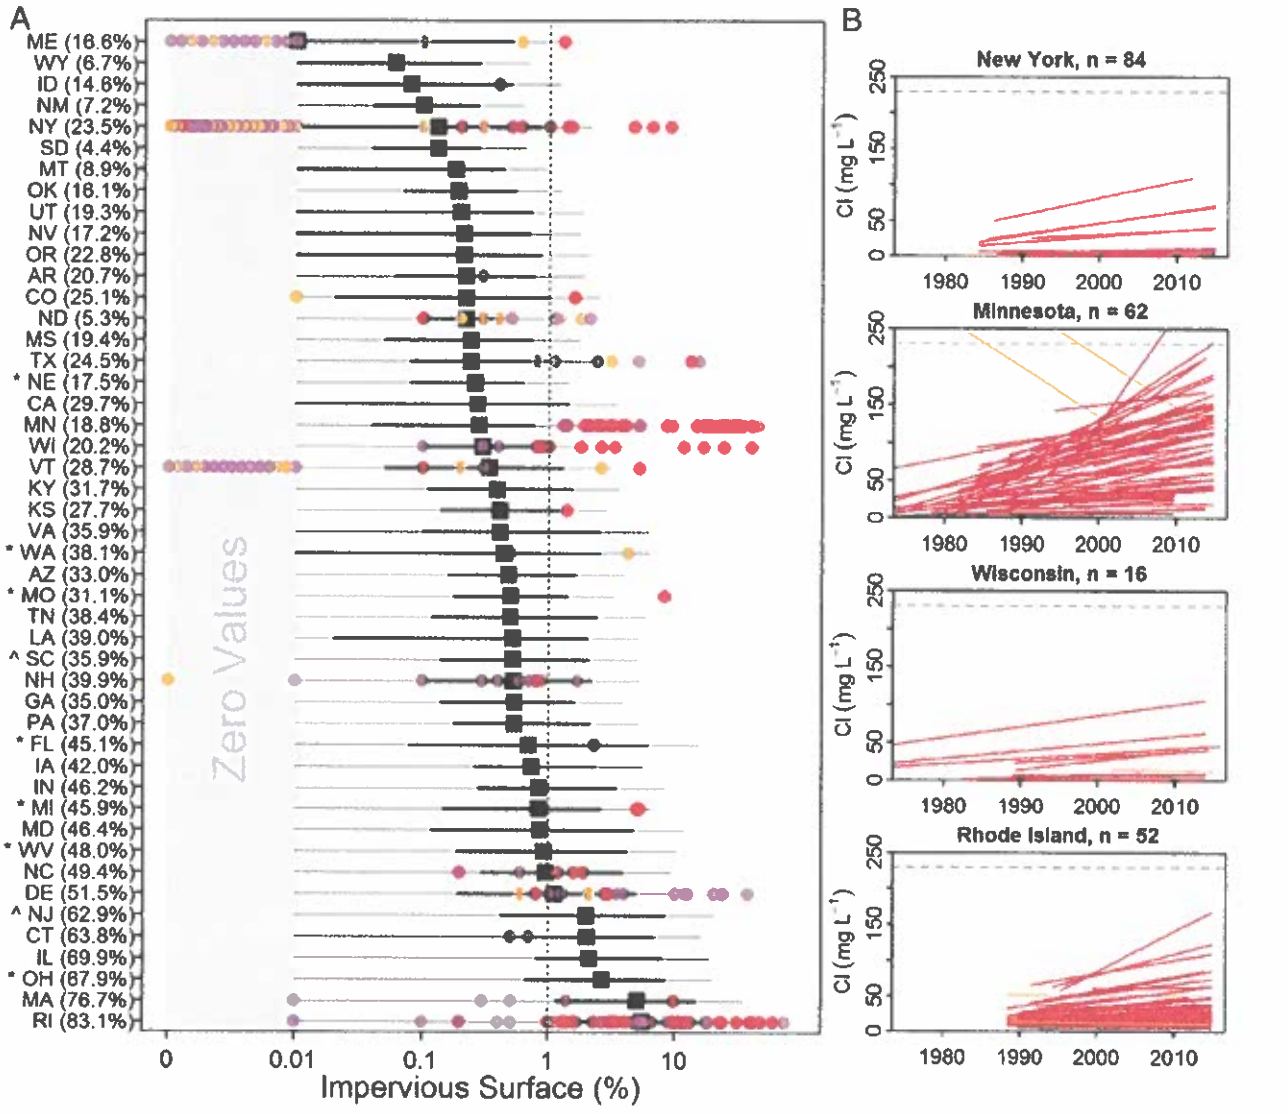

Fig. 4. (*A*) Distribution of impervious land cover within a 500-m buffer of all lakes >4 ha in the lower 48 United States ($n = 149{,}350$). Black squares represent the median impervious land cover percentage in each state. Thick horizontal black lines denote the interquartile range of the distribution, and thin black lines extend to 1.5 times the interquartile range. The vertical dashed line is shown at impervious land surface = 1%. Circles represent lakes included in this study, colored by slope (yellow, negative slope; purple, zero slope; red, positive slope). Due to the frequency of zero values on the *x* axis, circles are spread out within the gray rectangle. Percentages following *y* axis labels represent the percent of lakes in that state with greater than 1% impervious land cover within a 500-m buffer. In states with >10 lakes present in the dataset, an asterisk denotes that the sampling distribution in our dataset was significantly different from statewide distribution (Mann–Whitney test, $P < 0.05$), and ^ denotes that the sampling distribution was not significantly different from statewide distribution. (*B*) Chloride trends, as represented by linear regression model fits, are shown for four states with relatively large sample sizes (New York, Minnesota, Wisconsin, and Rhode Island). The dotted gray line demarcates the EPA's aquatic life criterion of 230 mg L^{-1}.

cover within 500 m. We note that data from Wisconsin and Minnesota are heavily biased toward urban lakes, whereas data from Maine, New York, and Vermont are heavily biased toward lakes in remote areas. This dataset (Fig. 4) includes lakes from all environments and should be representative of the Midwest and Northeast US region as a whole.

In North America, specifically in the Midwest and Northeast, local salt application leaves freshwater lakes vulnerable to salinization. Of the 284 lakes in the NALR, 26 already have a chloride concentration above 100 mg L^{-1} at their last sampling date. The median impervious land cover within a 500-m buffer surrounding these 26 lakes is 24.8%, compared with the US mean 0.31%. If a linear relationship between time and chloride concentration is extrapolated, 47 lakes are on track to reach 100 mg L^{-1} by the year 2050, and 14 are expected to surpass the EPA's aquatic life criterion concentration of 230 mg L^{-1} by 2050 (Fig. 4*B*). This is also the concentration at which a deterioration in drinking water taste is perceptible.

Elevated chloride concentrations in lakes can alter the composition and function of phytoplankton, zooplankton, macroinvertebrate, and fish communities (10–12, 35). As a consequence of salinization, aquatic species richness and abundance may decline, which could result in trophic cascades and altered water quality and ecosystem structure and function (36). In extreme cases, salinization can generate density gradients within the lake water column that prevent vertical mixing. Permanent stratification can result in anoxia and internal nutrient and metal resuspension, which decreases lake habitability and water quality (37). All of these ecosystem alterations can significantly affect lake water quality, which has millions of dollars in economic value (38, 39).

Our estimate that 7,770 lakes in the US NALR may be at risk for elevated chloride concentrations is likely an underestimate, as it does not consider regions of heavy road salt application where no long-term lake data were available, such as Québec or the Maritime provinces of Canada. Many states and municipalities are aware of the importance of shoreline management for maintaining healthy lakes; however, many shoreline zoning regulations are only enforced within 300 m or less of a lake (e.g., Wisconsin and Minnesota regulate 300 m, whereas Vermont and Maine only regulate 76 m). Because impervious surfaces and road density within at least 500 m of a lake are associated with increased chloride in areas that apply road salt, best management practices should recognize that lakeshore management extends well beyond the lake perimeter. Further, many jurisdictions lack consistent long-term monitoring programs, which provide data for predictive models and can be used to raise awareness and inform policy and management decisions used to curtail the threat of lake salinization. Clearly, keeping lakes "fresh" is critically important for protecting the ecosystem services freshwater lakes provide, such as drinking water sources, commercial fisheries, tourism, recreation, irrigation, and aquatic habitat.

Methods and Materials

Impervious land coverage at 20- to 30-m resolution was available for lakes in the United States as the degree of impervious surface per pixel (0–100%) and for Canadian and US lakes as a boolean value (0 or 1) representing whether the majority of each pixel was impervious surface. We adjusted Canadian values to match US values by using a conversion constructed from pooled impervious surface data from the United States ($r^2 = 0.91$, $P \sim 0$, Eq. 1), assuming that the relationship between boolean and percent impervious classifications would be similar in the United States and Canada:

$$\textit{Revised Impervious Surface} = \textit{Impervious Surface as Boolean(Canada)} * 0.388 \quad [1]$$

Using log-transformed, nonzero values ($n = 302$), we found that the means of impervious land cover across seven buffer sizes (100–500, 1,000, and 1,500 m) were statistically equal (Bartlett Test for homogenous variance $P = 1$; ANOVA $F = 0.18$, $P = 0.98$). For road density ($n = 435$), this was only true for buffer sizes of 400 m through 1,500 m (Bartlett Test $P = 0.11$; ANOVA $F = 2.58$, $P = 0.052$). Median road density across our 371 lakes decreased from 3.2 km km^{-2} to 1.9 km km^{-2} as the buffer size increased from 100 to 1,500 m. Because the variability in road density and impervious land cover was much greater between lakes than for a single lake within a range of buffer sizes, the choice of buffer size was not a determining factor in this analysis. Therefore, for most analyses we present road density and impervious land cover estimates within a 500-m buffer of each lake, and these generally represent average conditions.

Road salt (as sodium chloride) application rates were difficult to find at the local or regional level. If available, the rates were typically published as single values of average annual use or only included data for a single year. The best available data were at the state, provincial, or county level. In the United States, state-level highway data were obtained from the 1991 National Research Council published report on salt use (40), individual Department of Transportation reports [CT (41), KS (42), NC (43), PA (44), RI (45)], and by contacting individual states (ND). Many of these estimates were conservative, with much higher values being cited in recent years for some states, including IA (46), ME (47), and WI (48). Canadian provincial salt application rates were calculated by dividing metric tonnage per year (49) by the number of lane miles per province (50). All road salt data are presented in units of US tons per lane mile. State- and provincial-level application rates were multiplied by road density to give an approximation of potential road salt loading for North American lakes.

LTC lakes were fit with a GAM to predict chloride trends from 1985 to 2010 at a regularly spaced time interval. GAMs were fit using the mgcv package in R [v.1.8–12 (51)] using standardized chloride data and allowing *k* (basis dimension for smoothing term) to vary for each penalized thin-plate regression spline. A hierarchical cluster analysis was performed on the LTC time series to test if similar temporal patterns in chloride concentrations were present across multiple lakes. We used Ward clustering, under which dissimilarities were squared before clustering, on a dissimilarity matrix constructed from Euclidean distances [R package: TSclust v.1.2.3 (52)]. We performed a *k*-means clustering on the LTC data and visually identified the optimal number of clusters to be three, based on a sum of squares screen plot. No distinct trends were exposed by moving beyond three clusters.

Two statistical techniques were used to build predictive models:

i) Classification/regression trees [R package: rpart v.4.1–10 (53)]. Regression trees were split using the ANOVA method, which maximizes the sum of squares between groups. Classification trees were used only when cluster group was the response variable and used the Gini index as the splitting criterion.

ii) Random forest [R package: randomForest v.4.6–12 (54)].

Static predictor variables sourced from the dataset were lake area, road density, and percent impervious land cover (100-, 200-, 300-, 400-, 500-, 1,000-, and 1,500-m buffer) surrounding each lake, January mean monthly air temperatures, mean annual precipitation, distance to the coast, and mean annual sea salt deposition.

To assess the potential for salinization of lakes at the country scale, we calculated the percent impervious land cover in 500-m and 1,000-m buffers for all lakes ≥4 ha in the United States, using shapefiles from the National Hydrography Dataset ($n = 152{,}199$) and the 2011 US National Land Cover Database Percent Developed Impervious layer (55).

Analytical scripts are available from the corresponding author.

ACKNOWLEDGMENTS. We thank two anonymous reviewers whose recommendations greatly improved this manuscript. This analysis was made possible by our many data contributors: Kellogg Biological Station Long Term Ecological Research (LTER), US Geological Survey, Wisconsin Department of Natural Resources, New York City Department of Environmental Protection, Andreas Kleeberg at the Leibniz-Institute of Freshwater Ecology and Inland Fisheries, Minnesota Pollution Control Agency, John Stoddard at the US Environmental Protection Agency, North Temperate Lakes LTER #DEB-1440297, University of Rhode Island Watershed Watch Program, Manitoba Conservation and Water Stewardship, IISD Experimental Lakes Area, Alberta Environment and Parks, Ministry of Environment and Climate Change, Ontario Ministry of the Environment and Climate Change, Janos Korpanai at the University of West Hungary, UK Uplands Waters Monitoring Network, Lauri Arvola at the Finnish Environment Institute, French National Institute for Agronomical Research, the Swedish Department of Water and Environment, City of Zurich Water Supply, and Michela Rogora at the CNR Institute of Ecosystem Study. Road Salts as Environmental Constraints in Urban Pond Food Webs

Robin J. Van Meter[1]*, Christopher M. Swan[2]

Abstract

Freshwater salinization is an emerging environmental filter in urban aquatic ecosystems that receive chloride road salt runoff from vast expanses of impervious surface cover. Our study was designed to evaluate the effects of chloride contamination on urban stormwater pond food webs through changes in zooplankton community composition as well as density and biomass of primary producers and consumers. From May – July 2009, we employed a 2×2×2 full-factorial design to manipulate chloride concentration (low = 177 mg L^{-1} Cl^-/high = 1067 mg L^{-1} Cl^-), gray treefrog (*Hyla versicolor*) tadpoles (presence/absence) and source of stormwater pond algae and zooplankton inoculum (low conductance/high conductance urban ponds) in 40, 600-L mesocosms. Road salt did serve as a constraint on zooplankton community structure, driving community divergence between the low and high chloride treatments. Phytoplankton biomass (chlorophyll [a] μg L^{-1}) in the mesocosms was significantly greater for the high conductance inoculum ($P<0.001$) and in the high chloride treatment ($P=0.046$), whereas periphyton biomass was significantly lower in the high chloride treatment ($P=0.049$). Gray treefrog tadpole time to metamorphosis did not vary significantly between treatments. However, mass at metamorphosis was greater among tadpoles that experienced a faster than average time to metamorphosis and exposure to high chloride concentrations ($P=0.039$). Our results indicate differential susceptibility to chloride salts among algal resources and zooplankton taxa, and further suggest that road salts can act as a significant environmental constraint on urban stormwater pond communities.

Introduction

Regional and local factors such as dispersal, competition, timing of colonization events and environmental filters in concert determine community composition [1]. In particular, environmental constraints can present very stressful conditions, such as high pollutant loads or changes in hydroperiod, that exceed species' tolerances and prevent successful colonization to new habitats [1–2]. Environmental constraints or stressors, as detailed and studied herein, refer to anthropogenic influences to aquatic ecosystems. In systems that experience fluctuating environmental stress, such as pulses of contaminant loads, food web dynamics can be very cyclic when species are well adapted to specific abiotic conditions. Species adapted to opposite ends of the contaminant spectrum will be intermittently dominant within the community as the environment changes or they may even be lost from the system completely [1,3]. However, species that are able to withstand intense environmental stresses may do so at the expense of being less competitive when biotic factors regulate community composition [4]. Pollutants of rising concern can serve as environmental filters by limiting community composition to those species that are able to withstand the stress. In human dominated landscapes, environmental constraints may be the prevailing local factor in determining community assembly.

The importance of environmental constraints in structuring aquatic communities has been emphasized within the last decade as concerns of habitat alteration and degradation continually increase. Studies of freshwater zooplankton communities show that variability in water chemistry is often the best predictor of community composition. Gradients or changes in pond turbidity, hydroperiod, salinity or conductivity and pH can result in distinct zooplankton assemblages [5–9]. Similar water quality parameters are reported as main factors in community assembly among diatoms [10], phytoplankton [11], aquatic invertebrates [6] and amphibians [4]. To better predict community composition in rapidly changing landscapes, gaining a better understanding of the relationship between species tolerance thresholds and relevant environmental constraints is essential.

Across the northeast United States, freshwater salinization is becoming a year-round phenomenon due to long-term storage and transport of dissociated road salt ions (e.g., chloride, sodium, magnesium) in groundwater and soils [12–15]. This emerging environmental contaminant is of particular concern in urban areas where natural wetland acreage continues to decline and man-made stormwater ponds are common watershed features [16]. While stormwater detention ponds are designed to accumulate a myriad of contaminants, recent research has highlighted the susceptibility of these urban aquatic ecosystems to road salt deicers

resulting in freshwater salinization [17]. An unintended consequence of installing numerous stormwater detention ponds is that many organisms have been documented making use of these man-made habitats despite their extremely poor water quality [18–24 and others]. Given their position within urbanized landscapes, stormwater detention ponds present a unique system for exploring road salts as an environmental constraint on aquatic community structure.

Road salt exposure at sub-lethal concentrations can result in significant direct and indirect effects within a community, as well as alter ecosystem structure of freshwater habitats. Van Meter et al. [25] obtained algae, zooplankton and frogs from pristine wetland communities and reported a decline in zooplankton densities in experimental pond mesocosms at chloride concentrations known to be sub-lethal to gray treefrog larvae. As a result of the loss of this algal grazer from the ecosystem, gray treefrog larvae gained access to algal resources and metamorphosed faster and at a larger mass [25]. Our current study expands on this previous work by considering the potential for adaptation and altered community structure among urban stormwater pond communities that experience high chloride levels year-round. Recent work by Petranka and Doyle [26] indicated that road salts can alter seasonal pond communities in favor of salt tolerant insects such as mosquitoes, which may serve as competitors to larval amphibians and zooplankton. Jose de Paggi et al. [27] described unique zooplankton communities between the inlet and outlet of an urban stormwater pond receiving chloride inputs, and Olding [28] found distinct algal assemblages between stormwater ponds retaining different chloride concentrations. Given that road salt contamination is a rising concern to freshwater ecosystems and differential susceptibility exists among aquatic organisms to these contaminants, exploring patterns in stormwater pond communities is essential in understanding the ecology of the urban landscape.

While several studies have explored the effects of chloride contamination on pond populations and communities, none have evaluated such effects in habitats experiencing perpetual disturbance through contaminated runoff. The purpose of this study was to evaluate the impact of a hypothesized environmental constraint, road salt (low and high chloride treatments), on the community structure in experimental stormwater pond systems assembled from different colonist pools (i.e., zooplankton and algal inoculum source) and in the presence of a major biotic factor, gray treefrog (*Hyla versicolor*) tadpoles. While previously published studies have explored experimental road salt effects on pristine pond communities [25–26] and have surveyed community structure in stormwater ponds with high chloride levels [27–29] as detailed above, our experiment was designed to evaluate whether chloride salts serve as an environmental stressor to pond communities thriving in urban ecosystems where chloride levels are consistently elevated for much of the year. Our hypothesis was that road salt inputs do serve as an important environmental constraint on pond communities and that urban pond communities experiencing continual salt stress would contain a species pool that is more tolerant of elevated chloride.

Materials and Methods

Ethics Statement

This research was approved by the University of Maryland Baltimore County Institutional Animal Care and Use Committee (protocol #CS070210710) and carried out in accordance with the Association of Ichthyologists and Herpetologists Guidelines for Use of Live Amphibians and Reptiles in Field and Laboratory Research. Permission to collect gray treefrogs for this study was given by the Maryland Department of Natural Resources (Scientific Collecting Permit #46158). Collection of periphyton, phytoplankton and zooplankton did not require specific permissions as these samples were obtained from public stormwater ponds. This study did not involve the use or collection of endangered or protected species.

Our experimental design was a 2×2×2 full factorial (Table 1) with a chloride treatment as an environmental effect (high, low), tadpole treatment as a biotic effect (present, absent), and algae/zooplankton inoculum treatment as the colonist pool (low conductance pond, high conductance pond) applied randomly to 40 polyethylene mesocosms, each 600 L in volume. These mesocosms were arranged in a 5×8 grid in a grassy, open field at the University of Maryland, Baltimore County (UMBC), Baltimore, Maryland, USA. The open field provided uniformity in the amount of ambient light, wind and rain that the mesocosms received over the course of the study. On May 6–7, 2009, we filled the mesocosms with tap water and allowed the water to age for 24–48 hours before adding 12.5 g of rabbit chow to supply nutrients, 95 g of dry leaves (*Quercus* sp.) to provide cover, and 10 unglazed ceramic tiles, each 103.2 cm^2, as a surface for periphyton colonization in all mesocosms. We obtained inoculum for periphyton, phytoplankton and zooplankton from two stormwater detention ponds in the Red Run Watershed, Owings Mills, Baltimore County, Maryland. These ponds were part of two stormwater detention pond surveys between 2007–2009 (ponds E94 and H85; [29–30]. Gallagher et al. [30] analyzed sediment samples for trace metals and polycyclic aromatic hydrocarbons and water samples for major ions in 68 stormwater ponds in the Red Run Watershed, including the two ponds used in this study. A strong correlation between chloride ions and conductivity was reported for all ponds sampled [30]. Pond E94 was classified as having a low conductance (average specific conductance from April – June 2009 = 153±15.5 (SE) µS, n = 4) while pond H85 was classified as having a high conductance (average specific conductance from April – June 2009 = 1924±303 (SE) µS, n = 4; [25]. Before adding to the mesocosms, we filtered the pond water inoculum through a 500 µm sieve to remove larger invertebrates and debris. We added 5 L of low conductance inoculum to 20 mesocosms and 5 L of high conductance inoculum to the remaining 20 mesocosms on May 8, 14 and 20, 2009 for a total of 15 L to each mesocosm. We covered each mesocosm with 60% shade cloth, secured covers with drawstrings to prevent insect colonization, then allowed them to remain undisturbed until June 7, 2009.

This study was designed to be sublethal to gray treefrog (*Hyla versicolor*) larvae; therefore, the higher chloride concentration used reflected the uppermost limit for successful embryonic and larval survival as determined by Brand et al. [31]. The stormwater ponds used to collect inoculum were representative of those in Red Run Watershed that can support successful amphibian development and survival [23]. We measured specific conductance (µS) and temperature (°C) for each mesocosm 3 times between June 6 and July 21 (study day 0, 24 and 45), 2009 using a YSI-85 handheld probe. Specific conductance of the aged tap water added to each mesocosm before chloride addition was 260 µS (68.5 mg L^{-1} Cl^-) (for chloride-conductivity equation see Karraker [32]). On May 8, 2008 we oven-dried granular sodium chloride (99% NaCl) at 30°C for two hours, then added 89.7 g NaCl to 20 mesocosms receiving the low chloride treatment and 823.8 g NaCl to the remaining 20 mesocosms receiving the high chloride treatment. This resulted in a final chloride concentration of 177.2 mg L^{-1} in 500 L of water and average specific conductance of 675.5±4.3 (SE) µS for the 20 mesocosms receiving the low chloride treatment and a final

Table 1. 2×2×2 factorial design applied to 40 outdoor mesocosms (n = 5 per treatment combination) with a road salt treatment (low or high), tadpole treatment (present or absent) and inoculum treatment (collected from low or high conductance stormwater pond).

chloride concentration of 1067 mg L^{-1} and average specific conductance of 3016±21.9 (SE) µS for the 20 mesocosms receiving the high chloride treatment.

On May 29, 2009 we collected 5 amplexed pairs of gray treefrogs (*Hyla versicolor*) from a stormwater detention pond in the Red Run Watershed and transported them to UMBC in pond water collected from the breeding site (specific conductance 270 µS). After oviposition was complete, we removed adult treefrogs and allowed the embryos to develop in aquaria until they reached Gosner stage 17 [33]. To mix clutches, we transferred all treefrog larvae into three large plastic bins filled with 50 L of aged tap water (specific conductance 315 µS). Treefrog larvae were reared in these bins until they reached the free feeding stage (Gosner stage 25; [33]). On June 7, 2009 (day 1), we added 30 gray treefrog (*Hyla versicolor*) tadpoles (Gosner stage 25; [33]) to the 20 mesocosms assigned the tadpole treatment.

The first gray treefrog metamorph emerged from the experimental mesocosms at day 25 (July 1, 2009) after tadpole addition to the mesocosms. After emergence of the first metamorph we performed daily checks for metamorphs until the study was terminated at day 54 (July 30, 2009). Upon emergence, all metamorphs were housed in the laboratory at UMBC until tail resorption was complete (Gosner stage 46), at which point all individuals were weighed. On the last day of the study, we collected, measured wet weight and staged [33] any remaining tadpoles in each mesocosm.

We analyzed both periphyton and phytoplankton samples for chlorophyll [a] concentration (µg L^{-1}) using the non-acidified chlorophyll [a] module on a Trilogy fluorometer [34]. On days 3, 24 and 45 (June 9, June 30 and July 21, 2009), we collected periphyton samples from each mesocosm by scraping the entire surface of one ceramic tile and bringing the sample to a total volume of 100 mL using distilled water. We vacuum filtered a 25 mL subsample onto a 47 mm Whatman GF/F [35]. On days 5, 26 and 47 (June 11, July 2 and July 23, 2009), we collected phytoplankton samples by submerging a 1.27 cm diameter PVC tube spanning the entire depth of the water column in three haphazard places within each mesocosm. We then filtered 100 mL of the resulting composite water sample onto a 47 mm Whatman GF/F. We stored all filtered periphyton and phytoplankton samples in 90% acetone in the dark at 4°C for a maximum of 96 hours before analysis.

We collected zooplankton samples on day 47 by submerging a 5.1 cm diameter PVC tube vertically into the water column making sure to sample the entire depth of the mesocosm and collecting 2 L of water. We poured this water sample through a 63 µm sieve and stored zooplankton samples in 80% ethanol. To estimate zooplankton density, we standardized the volume of each mesocosm sample by bringing total volume to 500 mL using distilled water. We homogenized the 500 mL sample by stirring with a plastic pipette, and then viewed 10, 2 mL subsamples under a compound microscope using a 1 mm^2 gridded Sedgewick Rafter. We sorted and counted the zooplankton into the following groups for density estimates: adult copepods, copepod nauplii (juveniles), ostracods, rotifers and daphnia. To estimate zooplankton species composition across treatments, we further identified zooplankton to order or family, and in some occasions to genus and species when possible. For species identification, we brought each sample to a total of 50 mL and viewed 1, 2 mL subsample to generate a species area curve for each mesocosm.

We measured dissolved oxygen (mg L^{-1}) on one sampling date, day 24, using a YSI 20 handheld meter. Although we cannot rule out large changes in dissolved oxygen or pH over the course of the study, our previous research in these artificial pond systems suggested there would be no dramatic shifts in either of these parameters and no systematic shifts with our study treatments [25]. Given the high nitrogen content of waste released by developing tadpoles [36], we also collected water samples on day 45 to obtain nitrate estimates. We filtered water samples using 25 mm Whatman GF/F, prepared samples using LaMotte Nitrogen kits and analyzed for absorbance (AB) using the absorbance module on a Trilogy fluorometer [34]. To obtain final nitrate estimates in mg L^{-1}, we made sodium nitrate standards and created a standard curve of sodium nitrate (g L^{-1}) versus absorbance.

Statistical Analysis

We performed all statistical analyses related to algal biomass and zooplankton density, as well as tadpole time to and mass at metamorphosis, in SAS version 9.1.3 [37]. To determine the effects of the tadpole, chloride and inoculum treatments on phytoplankton and periphyton we used a repeated measures analysis of variance (RMANOVA) with compound symmetry covariance structure to account for any correlation among experimental units. We used a 3-way analysis of variance (ANOVA) to determine the effects of tadpole, chloride and inoculum treatments on zooplankton density. All periphyton, phytoplankton and zooplankton data was $\log_{10}$ transformed to maintain normality and homogeneity of variances. When necessary, we grouped residual variances by treatments using the GROUP option in PROC MIXED following the method of Littell et al. [38]. We performed a logistic regression using PROC GENMOD to assess the impact of the chloride treatment on percent tadpole survival. We used the scale = deviance option within PROC GENMOD to handle over-dispersion of data. Mass at metamorphosis among gray treefrogs was analyzed using analysis of covariance (ANCOVA) with chloride and inoculum treatment modelled as a class variable and time to metamorphosis as a continuous variable. Time to metamorphosis was analyzed using a Generalized Linear Model (GLM) with chloride and inoculum treatment modelled as a class variable and survival as a continuous variable. When survival was found to have no significant effect, time to metamorphosis was analyzed using ANOVA.

To evaluate any effects of the tadpole, chloride and inoculum treatments as well as study day on conductivity, temperature or

dissolved oxygen we performed factorial ANOVA with Type 3 Sums of Squares analyses using the aov() and drop1() functions in R statistical computing environment [39]. To determine if chloride served as an environmental constraint on zooplankton community composition, we also performed analyses in R. We approached analyzing zooplankton community composition in two ways. First, we examined compositional divergence using the adonis() function on a Bray-Curtis dissimilarity matrix. This analysis is a non-parametric permutation MANOVA that determines if dissimilarity was related to the factorial design. Second, since we hypothesized that road salt served as a significant constraint on zooplankton communities, we analyzed turnover, or variation in community structure among mesocoms within and across treatments. This was carried out using the betadisper() function in R, which is an analysis of multivariate homogeneity of group dispersions, an analogue of the univariate Levene's test for homogeneity of variance [40]. If the presence of deicer is an environmental filter, variation in community structure, or taxonomic turnover, should be lower among mesocosms receiving road deicer. This procedure is a permutation test based on 999 randomizations, resulting in a p-value associated with an F-test comparing the two salt treatment groups. Results were visualized using non-metric multidimensional scaling based on the Bray-Curtis dissimilarity matrix. Points closer together represent communities more similar in taxonomic composition than those further apart.

Results

Abiotic Environmental Variables

Specific conductance (µS) in both the low and high chloride treatments remained stable over the duration of the study, with some minor dilution across the study period due to periods of heavy rainfall (Low = 568±6.7 (SE) µS; High = 2856±14.7 (SE) µS). Mean specific conductance (µS) and water temperature (°C) measured three times between days 0 and 45 are reported in Table 2 along with dissolved oxygen (mg L^{-1}) as measured once on day 24 and nitrate (mg L^{-1}) values measured on day 45 (Table 2; Table S1). There were only nominal concentrations of nitrate present in the mesocosms at the end of the study.

Table 2. Mean abiotic environmental variables measured in all mesocosms (n = 20 per chloride treatment) from study days 0–47± standard error.

Phytoplankton and Periphyton Biomass

Phytoplankton was 29% more abundant in the high chloride treatment relative to the low chloride treatment (RMANOVA chloride main effect; Table 3; Table S2) and 53% greater in mesocosms receiving inoculum from the high conductance stormwater ponds as compared to ponds receiving inoculum from the low conductance stormwater ponds (RMANOVA inoculum main effect; Table 3, Fig. 1A). Neither the tadpole treatment (RMANOVA tadpole main effect; Table 3) nor sampling date (RMANOVA sampling date main effect; Table 3) had a significant main effect on phytoplankton biomass. There was a significant 3-way interactive effect of chloride treatment, inoculum source and sampling date on phytoplankton (RMANOVA chloride x inoculum x date effect $F = 4.68_{2,64}$; $P = 0.0126$). On the first sampling date, phytoplankton biomass was much lower in the low chloride, low inoculum treatment relative to all other chloride and inoculum treatments (mean phytoplankton biomass: day 1 low chloride, low inoculum = 9.11 µg L^{-1}; low chloride, high inoculum = 28.28 µg L^{-1}; high chloride, high inoculum = 23.62 µg L^{-1}; high chloride, low inoculum = 27.25 µg L^{-1}). This trend continued throughout the second and third sampling dates for the low chloride, low inoculum treatment relative to the high chloride, high inoculum treatment (mean phytoplankton biomass: day 2 low chloride, low inoculum = 12.72 µg L^{-1}; high chloride, high inoculum = 28.14 µg L^{-1}; day 3 low chloride, low inoculum = 11.13 µg L^{-1}; high chloride, high inoculum = 18.53 µg L^{-1}).

Periphyton biomass was 15% greater in the low chloride treatment than the high chloride treatment (RMANOVA chloride effect; Table 3; Table S3). In the mesocosms where tadpoles were present, periphyton biomass was 28% lower than in the mesocosms without tadpoles (RMANOVA tadpole effect; Table 3). Inoculum source had no significant effect (RMANOVA inoculum effect; Table 3, Fig. 1B). Periphyton biomass differed by sampling date (RMANOVA sampling date effect; Table 3) and there was a significant interaction between tadpole treatment and sampling date (RMANOVA tadpole x sampling date effect $F = 7.67_{2,64}$; $P = 0.001$). Periphyton was least abundant mid-way through the study on June 30 (day 24), and this decline was most apparent in the mesocosms receiving high chloride, tadpoles and high conductance inoculum treatment (mean periphyton biomass: day 2 = 216.64±17.61 (SE) µg L^{-1}; day 24 = 86.52±30.74 (SE) µg L^{-1}; day 45 = 95.26±21.37 (SE) µg L^{-1}day).

Zooplankton Density & Community Composition

Total zooplankton density was significantly affected by the chloride treatment (ANOVA chloride effect; Table 3) but not by the tadpole (ANOVA tadpole effect; Table 3) or inoculum (ANOVA inoculum effect; Table 3) treatments. Total zooplankton density was 80% greater in the high chloride treatment relative to the low chloride treatment, largely due to an overwhelming abundance of rotifers in the high chloride treatment (see details on community composition below). None of the interactive effects between chloride, tadpole and inoculum treatments were significant with respect to total zooplankton density (ANOVA; Table 3).

Across all treatments, we identified four rotifer families and 2 genera (family Brachionidae (genus *Brachionus* and *Keratella*), Synchaetidae, Notommatidae and Lecanidae), two copepod orders (Harpacticoid and Copepoid) and four families of cladocerans belonging to seven genera (family Sididae (genus *Diphanosoma*), Daphniidae (genus *Ceriodaphnia*, *Simocephalus*, *Scapholeberis* and *Daphnia*), Chydoridae (genus *Chydrous*) and Moinidae (genus *Moina*))

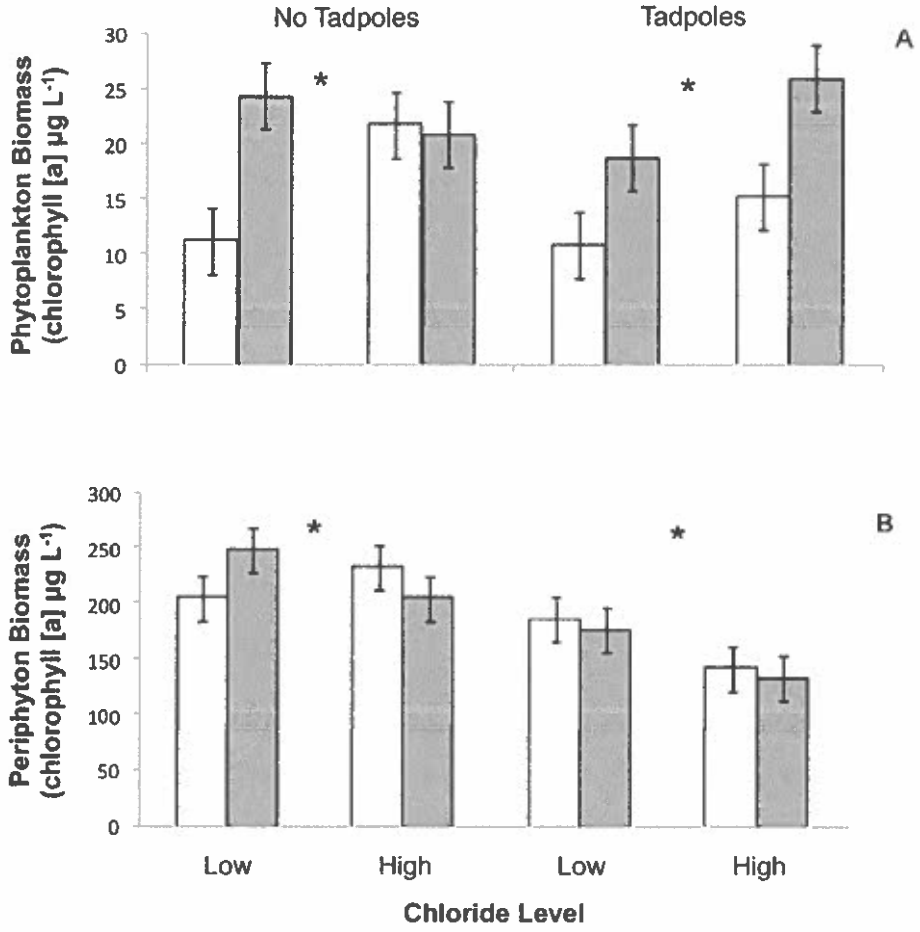

Figure 1. Mean phytoplankton (A) and periphyton (B) biomass (measured as chlorophyll [a] concentration in µg L^{-1}) across chloride (low/high), tadpole (absent/present) and pond inoculum conductance level (low/high) treatments (n = 5 per treatment combination) over the duration of the study. Open bars represent low pond inoculum conductance levels and shaded bars represent high pond inoculum conductance levels. Asterisks indicate a statistically significant difference ($p<0.05$) between low and high chloride treatments using RMANOVA. Error bars represent standard error.
doi:10.1371/journal.pone.0090168.g001

(Table S4). We did not identify ostracods or copepod nauplii (juveniles) beyond order. The zooplankton community in the high chloride treatment was dominated (93% of total zooplankton) by the rotifer family Brachionidae (3586 individuals belonging to family Brachionidae out of 3853 total zooplankton individuals counted in the high chloride treatment) (Fig. 2). Within this family, *Brachionus plicatilus*, a species common to salt and brackish waters [41], was the most abundant (data not shown). In contrast, the Brachionidae only accounted for 27% of total zooplankton community composition in the low chloride treatment (103 individuals belonging to family Brachionidae out of 379 total zooplankton individuals counted in the low chloride treatment). Ostracods, cladocerans, copepod adults and nauplii and other rotifers were much more abundant in the low chloride treatment relative to the high chloride treatment (Fig. 2).

The addition of chloride to the mesocosms resulted in a significant divergence in zooplankton community composition (chloride effect $F_{1,36} = 22.5$; $P = 0.001$). However, neither the inoculum source nor the tadpole treatment played a role in driving zooplankton community composition (inoculum effect $F_{1,36} = 1.32$; $P = 0.204$ and tadpole effect $F_{1,36} = 1.04$; $P = 0.320$). Similarly, there were no interactive effects between the chloride, tadpole and inoculum source treatments on the zooplankton community (all 2- and 3-way interactions $P > 0.05$).

Zooplankton community composition within chloride treatments was much more similar (Bray-Curtis index High:High = 0.468; Low:Low = 0.666) than between chloride treatments (Bray-Curtis index values High:Low = 0.886). Furthermore, there was a significant difference in zooplankton species turnover between the high and low chloride treatments ($F_{1,35} = 9.764$; $P = 0.003$) suggesting high chloride served as a strong environmental constraint on taxon membership among mesocosms, and thus lower compositional turnover rate (Fig. 3). NMDS analysis results in 3-axes requiring an acceptable stress level of 0.159. Axis 1 is plotted against axes 2 and 3 separately, as visualizing axes 2 vs 3 is redundant.

Tadpoles Survival, Mass at and Time to Metamorphosis

Average gray treefrog survival across all mesocosms was 90%. Neither chloride (X^2 df = 1; $P = 0.3175$) nor inoculum (X^2 df = 1; $P = 0.8853$) had an effect on survival. Mass at and time to metamorphosis were not affected by survival when used as a covariate, therefore survival was removed from the final analysis (Table S5). There was no significant effect of chloride, inoculum or

the interaction between chloride and inoculum (chloride effect, inoculum effect, chloride x inoculum effect; Table 4) on days to metamorphosis.

When days to metamorphosis was used as a covariate, there was a significant effect of both chloride (chloride effect; Table 4) and the interaction between chloride and days to metamorphosis (chloride x days to metamorphosis effect; Table 4) on mass at metamorphosis. The higher chloride concentration in the mesocosms increased mass at metamorphosis by 8.5%. This chloride effect was only significant, however, for tadpoles experiencing a faster time to metamorphosis (25^{th} percentile = 46.65 days to metamorphosis). Among tadpoles experiencing faster time to metamorphosis, the average mass of metamorphs in the high chloride treatment was 326±18.2 (SE) mg and 270±18.0 (SE) mg in the low chloride treatment. This chloride effect was not significant for tadpoles reaching metamorphosis at or beyond the average number of days (average = 49.12 days; average mass in high chloride = 318±13.9 (SE) mg, low chloride = 295±13.8 (SE) mg; 75^{th} percentile = 51.63 days; average mass in high chloride = 309±16.2 (SE) mg, low chloride = 321±18.0 (SE) mg). The inoculum treatment had no significant main or interactive effects on gray treefrog mass at metamorphosis (Table 4).

Discussion/Conclusions

Road salt run-off in urban areas has been documented as a pollutant source to freshwater ecosystems [17] and associated lethal and sublethal impacts to aquatic organisms continue to emerge [25,29,31–32,42–46]. Our study highlights the potential

for chloride salts to act as a significant environmental constraint on pond communities experiencing different specific conductance or road salt concentrations by limiting the aquatic community to more tolerant species. As predicted, the changes in phytoplankton biomass, zooplankton community composition and, to a smaller extent, the tadpole mass at metamorphosis results we obtained from our experimental mesocosm work does support the likelihood of environmental filtering in urban ponds by chloride salts. Furthermore, through identifying zooplankton taxa by colonist pool and across chloride treatments, our research emphasizes the role that tolerance to perceived environmental stressors plays in shaping impacted communities and in eliciting both direct and indirect effects within an aquatic food web. Chloride road salts, an emerging local environmental filter, may alter community composition and structure by presenting novel physiochemical conditions in typical freshwater habitats where species tolerances and thresholds are exceeded beyond their capacity for adaptation.

Our earlier surveys of stormwater ponds in the Red Run watershed, Owings Mills, Baltimore County, Maryland [29] revealed greater algal biomass in stormwater ponds across an increasing chloride gradient; this concurs with our current phytoplankton data. Relative to the low chloride treatment, phytoplankton biomass in the high chloride treatment was 29% greater in our experimental mesocosms. Furthermore, phytoplankton biomass was 53% greater in mesocosms that received the inoculum from higher conductance stormwater ponds in the Red Run watershed. Although we did not identify phytoplankton by class or species, we hypothesize that the phytoplankton communities developing in our mesocosms were filtered or sorted by their ability to acclimate to or tolerate high chloride loads. At concentrations even lower than those used in our study, salinity was identified as the main environmental driver of phytoplankton community composition and biomass in artificial sea salt-harvesting ponds in Tunisia [47]. Hypersaline ponds were dominated by phytoplankton class Chlorophyceae, a halophilic type of green algae. At its peak in 2003, phytoplankton biomass ranged from 2.5–12.5 times greater in a high salinity pond relative to the 3 lowest salinity ponds. Due to extreme saline conditions, phytoplankton communities in the hypersaline ponds were considered mature to the point of competitive exclusion [47]. Similarly, conductivity was reported as one of five major local environmental factors in predicting phytoplankton community structure in ponds in Belgium [11]. The conductivity range of these ponds was low relative to the conductivity we established in our experimental ponds. In considering community shifts in ponds with specific conductance values that closely resemble both our high and low chloride treatments, Olding [28] documented the dominance of marine and brackish water diatoms (e.g., *Caloneis amphibaena, Entomeoneis alata*) in a high conductance stormwater pond in Ontario, Canada while a lower conductance pond was dominated by nutrient tolerant taxa (e.g., *Euglena*). Pilkaityte et al. [48] found that sodium chloride shifts phytoplankton communities in favor of filamentous cyanobacteria at much higher salinities than those used in our study. Shifts in algal community structure and physiological parameters should be measured in future studies of algal resources experiencing salt stress. Given that species sorting toward tolerant taxa has been reported in a variety of studies at salinities both above and below those used here, is likely that salt stress contributed substantially to increases in phytoplankton biomass measured in our study.

Previous research exploring algal resources in stormwater ponds indicates that variation in tolerance to chloride inputs exists among species [27–28]. Differing from our predictions, we measured significantly greater periphyton biomass under low chloride conditions, regardless of inoculum source. These results do not indicate that chloride salts act as an environmental filter on periphyton in urban stormwater ponds, but likely reflect an observed interaction between phytoplankton and periphyton resources where abundant phytoplankton blooms can indirectly reduce periphyton biomass through shading effects [49]. Given that there was no significant interactive effect between chloride and tadpoles treatments, this precludes heavier tadpole grazing in high chloride treatments as a likely explanation for reduced periphyton biomass. To determine whether periphyton resources are declining as an indirect result of phytoplankton shading or through direct negative effects of elevated chloride and associated

Figure 3. Non-metric multi-dimensional scaling (NMDS) results representing mesocosms receiving high (filled points) and low (open points) chloride. Points closer together indicate higher taxonomic similarity than those further apart. Centroids for each treatment reside under the "High" and "Low" labels. The shaded areas are the 95% confidence ellipses for the centroids. Each treatment group is bounded by the convex hull to aid in visualizing compositional spread about the centroids. The NMDS required three axes to produce a satisfactory stress (0.159). Therefore, axis 1 vs 2 (A) and 1 vs 3 (B) are portrayed. Note the scales of each are the same.
doi:10.1371/journal.pone.0090168.g003

filtering, it would be necessary to study these algal resources in mesocosms independent of one another. However, this is logistically very difficult.

Filtering of zooplankton communities from salt loading in aquatic systems has been well documented in recent studies. Research on zooplankton assemblages from the Patuxent Wildlife Research Center (PWRC), Laurel, Maryland, a relatively pristine habitat, showed that elevated chloride levels (645 mg L^{-1} Cl^{-} = 2200 µS) were most harmful to adult copepods and cladocerans, however, copepod nauplii, ostracods and rotifers were unaffected [25]. Stormwater pond survey results showed that zooplankton densities differ across a chloride gradient with several taxa (ostracods, rotifers and cladocerans) colonizing medium conductance ponds (mean specific conductance ~1150–2150 µS) at greater densities relative to high conductance ponds (mean specific conductance ~ 6090–8370 µS; [29]). Zooplankton results from this study follow similar trends indicating that certain rotifers, particularly those belonging to family Branchionidae, proliferate under moderate conductance levels (~3000 µS). Likewise, experimental research with wetland sediments from South Australia that were artificially flooded with a range of fresh to saline waters (300–15,000 mg L^{-1} salinity) resulted in substantially different zooplankton communities after a 21-day incubation period [50]. Sediments with higher natural salinities developed similar zooplankton communities to one another regardless of overlying water salinity, while the sediment with low natural salinity produced distinct communities with lower zooplankton species richness under more saline conditions. As confirmed by our study, more salt-tolerant zooplankton, such as the rotifer *Brachionus plicatilus* (Family Brachionidae), were most abundant in the microcosms containing high salinity sediments and water [50].

Tolerance thresholds to chloride salts differ greatly among zooplankton taxa and are known to serve as an important variable in determining zooplankton community composition and species richness. Previous research in southern France indicates that copepods are quite tolerant of high salinity conditions in temporary wetlands as 29% of cladoceran species recorded were found in high salinity waters [7]. Some cladoceran species are known as sensitive to the chloride concentrations similar to our low chloride treatment [51–52] while others are much more tolerant of elevated chloride levels [7,53–55]. Bilkovic et al. [56] reported significant increases in total zooplankton densities in meso-

oligohaline marshes after substantial periods of rainfall and subsequently lower salinities. While this increase in density was primarily due to proliferation of calanoid copepods under more freshwater conditions, cyclopoid copepods and cladoceran densities also increased. In two interrelated mesocosms studies, Nielson et al. [57–58] reported that with salinity increases (up to 15,000 mg L^{-1} sea salt), the developing zooplankton communities diverged greatly from the original freshwater species pool and ultimately resulted in domination by a small number of salt-tolerant species. As salinity levels in these artificial ponds were subsequently decreased (<2500 mg L^{-1} sea salt), zooplankton communities became increasingly similar with more taxa representative of freshwater systems. While freshwater zooplankton eggs can remain dormant under extremely elevated chloride levels and later successfully hatch, success of freshwater zooplankton is fully dependant on a return to lower salinity levels. Given substantial variability in tolerance to chloride salts among zooplankton, species composition is likely to differ within urban aquatic ecosystems experiencing perpetual road salt contamination and relative to more pristine habitats.

While there is strong evidence of direct effects of road salts in shaping the zooplankton community, indirect effects of salt on zooplankton and phytoplankton may also be prevalent in our study given that zooplankton are grazers of phytoplankton. Under elevated chloride conditions, tolerant phytoplankton species may have shaped the zooplankton community by providing species-specific preferred food resources. Conversely, chloride filtering among the zooplankton community may have indirectly resulted in dominance of non-preferred algal resources, thus accounting for increases in algal biomass under elevated salt conditions through a release in grazing pressure. A shift in community composition in stormwater ponds towards more tolerant taxa, whether propagated through direct or indirect effects, is likely given the temporal variation of chloride inputs and fluctuating hydrologic regime.

Much like zooplankton communities, research on the impacts of road salt deicers on tadpole grazers has revealed differential susceptibility among species. Early spring breeding Wood frog tadpoles (*Rana sylvatica*) have relatively low survival in the presence of road salts [23,45] while later spring and summer breeding green frog tadpoles (*Rana clamitans*) have high survival rates [32]. Gray treefrogs (*Hyla versicolor*), the species used in our study, experience very low embryonic survival at chloride levels exceeding 1050 mg L^{-1} Cl- (~ 3000 µS; [31]). However, gray treefrog larvae that persist during these early developmental stages do have high survival rates as they develop through metamorphosis in high salt concentrations [31]. Furthermore, these individuals reared under elevated chloride conditions experience faster time to and larger size at metamorphosis [25,31]. We obtained gray treefrog embryos for these previous studies from PWRC which is a rather pristine and protected environment. Since the treefrogs used in the current study were obtained from stormwater detention ponds and presumably experience more consistent exposure to road salt inputs, we predicted that gray treefrogs living in or near stormwater detention ponds in urban areas would be better adapted to elevated chloride concentrations. As a result, changes in the time to and size at metamorphosis would only be apparent if elevated chloride inputs directly reduced the competing zooplankton population, thereby indirectly providing tadpole grazers with access to greater algal resources.

The urban gray treefrog population used in our study appears to be tolerant to elevated chloride road salt concentrations as common to stormwater detention ponds. Neither chloride nor inoculum treatment had direct effects on tadpole survival or mass at metamorphosis among gray treefrogs in the current study. Tadpoles in the high chloride treatment that metamorphosed quickly (within the 25th percentile of days to metamorphosis) had a greater mass relative to those individuals at the average or greater than the average number of days to metamorphosis. This concurs with previous work [25,31] and is unusual as frogs typically exhibit a trade-off between mass at and time to metamorphosis in which those that undergo metamorphosis early are usually smaller in size [59]. From previous research [25], we speculated that tadpoles developing under chloride salt stress had access to more abundant algal resources as a result of declines in zooplankton density. We cannot preclude the possibility of competitive release between tadpole and zooplankton grazers as a possible mechanism resulting in the greater size at metamorphosis in the high chloride treatment as seen in this study. Zooplankton belonging to family Brachionidae may not serve as strong competitors for gray treefrog tadpole preferred algal resources, but it is difficult to determine the magnitude of this interaction since our study was not designed with this species-specific competitive interaction in mind. Another possible explanation for increases size at metamorphosis is an osmoregulatory shift in tadpoles reared in the high chloride treatment. It is likely that chloride addition created a more isosmotic environment for the developing gray treefrog tadpoles, which are typically hyperosmotic to the surrounding aquatic environment [36]. Under isomotic conditions, tadpoles might redirect energy away from osmoregulation and redirect that energy towards feeding and growth. Given serious concerns about the long-term survival of amphibians in a human-dominated landscape [60], studies that evaluate road salt effects across generations and in combination with other biotic and abiotic stressors is strongly encouraged.

Environmental constraints, such as that due to chloride road salts, contribute substantially to the formation and development of urban aquatic communities and will play increasingly larger roles in developing urban ecosystems. Tolerance among urban pond dwelling organisms may be critical to their long-term survival in a constantly changing environment. Gaining a better understanding of tolerance thresholds and adaptive responses to pollutants in urban stormwater pond habitats will be important in evaluating potential changes in competitive and predatory interactions between and within trophic levels. As chloride salt loading in urban ponds fluctuates over time, dominant species within a community may oscillate in correspondence with environmental conditions and tolerance levels. Despite the fact that wetland acreage continues to decline across the globe [61–62] and urban ponds are compromised by high contaminant loads, these unique aquatic communities persist. With continued salinization of freshwaters, community composition may be shifted away from freshwater species and towards more brackish or marine species, thereby permanently altering the species pool in urban aquatic habitats.

Abstract. The quality of freshwater ecosystems is decreasing worldwide because of anthropogenic activities. For example, nutrient over-enrichment associated with agricultural, urban, and industrial development has led to an acceleration of primary production, or eutrophication. Additionally, in northern areas, deicing salts that are an evolutionary novel stressor to freshwater ecosystems have caused chloride levels of many freshwaters to exceed thresholds established for environmental protection. Even if excess nutrients and road deicing salts often contaminate freshwaters at the same time, the combined effects of eutrophication and salinization on freshwater communities are unknown. Thus by using outdoor mesocosms, we investigated the potentially interactive effects of nutrient additions and road salt (NaCl) on experimental lake communities containing phytoplankton, periphyton, filamentous algae, zooplankton, two snail species (*Physa acuta* and *Viviparus georgianus*), and macrophytes (*Nitella* spp.). We exposed communities to a factorial combination of environmentally relevant concentrations of road salt (15, 250, and 1000 mg Cl^-/L), nutrient additions (oligotrophic, eutrophic), and sunlight (low, medium, and high) for 80 d. We manipulated light intensity to parse out the direct effects of road salts or nutrients from the indirect effects via algal blooms that reduce light levels. We observed numerous direct and indirect effects of salt, nutrients, and light as well as interactive effects. Added nutrients caused increases in most producers and consumers. Increased salt (1000 mg Cl^-/L) initially caused a decline in cladoceran and copepod abundance, leading to an increase in phytoplankton. Increased salt also reduced the biomass and chl *a* content of *Nitella* and reduced the abundance of filamentous algae. Added salt had no effect on the abundance of pond snails, but it caused a decline in banded mystery snails, which led to an increase in periphyton. Low light negatively affected all taxa (except *Nitella*) and light levels exhibited multiple interactions with road salt, but the combined effects of nutrients and salt were always additive. Collectively, our results indicate that eutrophication and salinization both have major effects on aquatic ecosystems and their combined effects (through different mechanisms) are expected to promote large blooms of phytoplankton and periphyton while causing declines in many species of invertebrates and macrophytes.

Key words: algae; eutrophication; food web; freshwater ecosystems; macrophyte; salinization; zooplankton.

Introduction

Lake ecosystems offer multiple ecosystem services, such as the provisioning of drinking water, water for industry and agriculture, recreation, and fisheries (Malmqvist and Rundle 2002, Keeler et al. 2012). Humans have exploited and contaminated lake resources causing extensive degradation and loss of biodiversity (Naiman et al. 2002). The contaminants can dramatically alter the structure and function of freshwater lake ecosystems, triggering a loss of ecosystem services (Hintz et al. 2017). Eutrophication and salinization are two major threats to lake ecosystems (Carpenter et al. 1985, Jackson et al. 2016, Dugan et al. 2017) and, while they co-occur throughout much of the world, their additive and synergistic effects are not well understood. Thus, it is important to understand whether these co-occurring disturbances interact to affect lakes ecosystems and food webs, and what the implications might be for lake ecosystem services and future mitigation efforts.

Over the last two centuries, human activities have enriched freshwater ecosystems with nutrients that have altered the trophic state of systems around the world (Conley et al. 2009). Nutrient pollution frequently occurs in human-dominated systems, causing eutrophication, harmful algal blooms, hypoxia, and changes in aquatic food webs (Conley et al. 2009, Paerl and Paul 2012). Moreover, algal blooms can reduce light availability, negatively affecting primary producers that are unable to migrate, drift, or extend toward the water surface (e.g., vascular plants and benthic algae; Cronin and Lodge 2003, Havens et al. 2003). Therefore, increased pelagic primary productivity might limit the persistence and growth of benthic primary producers (Scheffer et al. 1993).

Human activities in higher latitudes have also contaminated freshwater ecosystems by the usage of deicing salts, for the purpose of increasing driving safety during winter (Novotny et al. 2008, Corsi et al. 2010, Cañedo-Argüelles et al. 2016). The most common deicer is rock salt that consists mainly of sodium chloride (NaCl; Thunqvist 2004, Novotny et al. 2008, Rogora et al. 2015), and in 2013, the annual rock salt use on roads was 20.4 million metric tonnes in the United States, 5 million tonnes in Canada, and 0.2–0.3 million tonnes in Sweden (Thunqvist 2004, Howard and Maier 2007, Bolen 2013). As snow and ice melt, the dissolved salt runs off into streams, rivers, and lakes or infiltrates soil and groundwater (Thunqvist 2004. During runoff events, chloride levels can reach 4300 mg/L in streams and 5000 mg/L in ponds and wetlands (Environment Canada 2001). These levels far exceed the current chronic (230 mg Cl^-/L) and acute (860 mg Cl^-/L) thresholds that were established for the protection of freshwater biota by the U.S. Environmental Protection Agency (EPA 1988).

Organisms in freshwater ecosystems vary in their tolerance to NaCl, and both chronic and acute chloride concentrations (from NaCl) negatively affect macroinvertebrate species richness in streams (Horrigan et al. 2005, Kefford et al. 2006). Chronic and acute chloride concentrations also negatively affect the abundance of lake and pond zooplankton (Sarma et al. 2006, Van Meter et al. 2011, Hintz et al. 2017, Stoler et al. 2017). Increased chloride concentrations have also been linked to algal blooms, which can reduce light availability and alter food-web structure in freshwater ecosystems (Dananay et al. 2015, Cañedo-Argüelles et al. 2016). Consequently, increased salinization can alter the freshwater community structure (Petranka and Doyle 2010, Cañedo-Argüelles et al. 2016). Although studies have been conducted on the salinity tolerance of freshwater macrophytes, these studies often focus on biogeochemical and molecular mechanisms on a cellular level, and not on food-web implications or changes in macrophyte abundance (Haller et al. 1974, Rout et al. 1997, Rout and Shaw 2001, Parida and Das 2005).

It is particularly valuable to understand how macrophytes respond to changes in their environment (e.g., light conditions), since macrophytes play an essential role in freshwater ecosystems (Carpenter and Lodge 1986, Scheffer et al. 1993), and since conditions in waterbodies have been altered by different types of pollution and invasion of species (Anderson et al. 2002, Kovalenko et al. 2010). Most aquatic plants cannot tolerate salt concentrations greater than 10 g/L, but tolerance varies among species, life stage, type of salt, and the duration and intensity of the exposure (Deegan et al. 2005, Lacoul and Freedman 2006). Furthermore, environmentally relevant chloride concentrations have been shown

to favor salt-tolerant species and alter the biomass of primary producers (Petranka and Doyle 2010, Van Meter et al. 2011, Hintz et al. 2017).

Our objective was to examine the combined effects of salt contamination and nutrient pollution on freshwater communities. We expected both contaminants to cause an algal bloom, but through different mechanisms. Road salts would indirectly cause an algal bloom by reducing the abundance of zooplankton (i.e., top-down), whereas nutrients would directly increase the growth rate of algae (i.e., bottom-up). Because algal blooms can have cascading effects on food webs and ecosystems by reducing light transmission through the water column, we also manipulated light levels to parse out the direct and indirect effects of an algal bloom caused by nutrients or salt. We employed outdoor mesocosms, which are commonly used to test the effects of anthropogenic impacts on aquatic systems, because they provide a venue to manipulate and replicate conditions in a controlled manner (e.g., Rowe and Dunson 1994, Downing and Leibold 2002, Hua and Relyea 2014).

We hypothesized that the combination of stressors would cause additive and interactive effects on primary and secondary biomass and abundance. Specifically, we predicted that (1) higher chloride concentrations will cause a decrease in zooplankton and other animals and a subsequent bloom in phytoplankton, (2) higher nutrient concentrations will cause an increase in productivity of all primary producers, (3) increased phytoplankton production due to elevated nutrient or salt levels will have an indirect negative effect on the benthic macroalgae (*Nitella* spp.) and grazers, due to reduced light availability, (4) low light levels will mimic the effects of reduced light transparency caused by algal blooms produced by increased salt and nutrients, and (5) increased salt, increased nutrients, and reduced light will have multiple interactive effects.

Materials and Methods

Experimental design

We conducted the experiment at Rensselaer Polytechnic Institute's Aquatic Research Laboratory in Troy, New York, USA, during the summer of 2015. We used a completely randomized design that employed a full factorial combination of three salt concentrations (15, 250, and 1000 mg Cl^-/L), two nutrient levels (high eutrophic and ambient oligotrophic), and three light levels (low [10%], medium [35%], and high [70%] of ambient sunlight). As noted earlier, the three sunlight manipulations acted as a proxy for the shading effect of an algal bloom that is independent of the other impacts that an algae bloom can have on a food web. Four replicates of each of the 18 treatment combinations resulted in 72 experimental units.

Our experimental units were 1200-L plastic mesocosms (i.e., cattle tanks). On 15 June, we filled the mesocosms with 850 L of water from Lake George (Warren County, New York, USA) due to its low chloride concentration (15 mg Cl^-/L) and oligotrophic state. Two days later, we added 140 L (5 cm deep) of sand substrate to the mesocosms and allowed the water to sit undisturbed for 10 d, until the soil particles settled. When the water was clear, we placed two unglazed clay tiles (10 × 15 cm) vertically on the north side of each mesocosm to serve as periphyton samplers during the experiment.

We established highly similar ecological communities in each mesocosm. We initiated a zooplankton community on 27 June by collecting zooplankton from Lake George using a zooplankton net (64 μm) and adding 600 mL of the concentrated zooplankton slurry to each of the mesocosms. In addition to zooplankton, the collected water also introduced microbial and algal assemblages to each mesocosm. On the same day, we collected banded mystery snails (*Viviparus georgianus*) from a local lake and added six individuals (two large and four small) to each mesocosm. On 1 July, we collected a mixture of the *Nitella* species (*N. flexilis*, *N. opaca*, and *N. tenuissima*) from Lake George and placed 200 g (wet weight) on the bottom of each mesocosm after rinsing and removing undesirable species (e.g., macrophytes and snails) that were visible. *Nitella* spp. are macroalgae (Characeae) that live in monoculture meadows in deep water (7–12 m; Boylen et al. 2014), and since its growth form resembles an aquatic plant, it is categorized as a macrophyte (Cushing and Allan 2001). The collected *Nitella* also contained attached pond snails (*Physa acuta*), so we quantified the number of attached pond snails and estimated that an average of four individuals (3–6) were introduced to each mesocosm.

On 7 July (defined as day 1 of the experiment), we applied the light treatments by covering the mesocosms with mesh lids with three different light transmittance percentages (10, 35, and 70% sunlight). Prior to this date, all mesocosms had identical mesh lids that allowed 35% light transmittance. These lids also prevented organisms from colonizing or leaving the mesocosms (Howeth and Leibold 2010).

On 10 July, we added road salt to the mesocosms in the form of NaCl (Solar Salt; Morton Salt, Chicago, Illinois, USA; 99.8% pure NaCl; 60.7% chloride, free of additives). Given that the ambient chloride concentration of the lake water was 15 mg Cl^-/L, we added salt to reach medium and high concentrations (250 and 1000 mg Cl^-/L, respectively). We chose these three concentrations because the U.S. EPA maximum acceptable level for drinking water is 250 mg Cl^-/L (EPA, 2016), and 1000 mg Cl^-/L exceeds the standards for acute events but is representative of North American lakes with the highest road salt concentrations (Novotny et al. 2008). The highest concentration observed in North American ponds and wetlands is approximately 4300 mg Cl^-/L (Environmental Canada 2001). We added the sodium chloride to each mesocosm by extracting 5 L of water and mixing the salt with the water until it was dissolved. We added the chloride to each mesocosm assigned to a salt treatment in a slow, circular movement to ensure that the mixture was evenly dispersed. On the next day, we measured the chloride concentrations to ensure that we reached our goals for each mesocosm.

On the same day as salt additions, we applied our nutrient treatments. In the low-nutrient treatment, no nutrients were added to represent an oligotrophic lake (Lake George, TP mean of 4.36 μg/L over 30 yr; Boylen et al. 2014). For the high-nutrient treatment, we added 0.185 g of potassium phosphate and 4.2 g of sodium nitrate (16N:1P) on 10 July. We set the target eutrophic conditions at 100 μg/L of P and 1600 μg/L of N (see, e.g., Schuler et al. 2017*a*). We dosed the mesocosms assigned to the high-nutrient treatment a second time on 4 August to maintain higher nutrient levels since there is a 5% day^{-1} loss of nutrients to the bottom substrate (Howeth and Leibold 2010). To control for disturbance, we gently agitated the surface water of all mesocosms not receiving nutrients or salt.

Response variables

We quantified phytoplankton abundance on days 8, 16, 20, 30, 42, and 78, with an average of 13 days between sampling occasions (Table 1). Phytoplankton were sampled to reflect when we observed the most dramatic changes. We sampled phytoplankton by collecting 450 mL of water from the middle of each mesocosm and vacuum-filtered all samples through GF/C glass fiber filters (Whatman, Inc., Massachusetts, USA). Each filter was wrapped in aluminum foil and frozen (−20°C) to prevent chlorophyll breakdown. We later measured the concentration of chlorophyll *a* in each filter using a fluorometer (Model ED-700; Turner Designs) following Arar and Collins (1997).

We measured periphyton biomass on days 32 and 77 (Table 1), by removing one tile each time from each mesocosm and scrubbing the tile with a brush. We rinsed the tile and brush, and the resulting slurry was filtered through pre-dried (60°C for 48 h) and pre-weighed 1.2-μm glass fiber filters (Whatman GF/C). After drying the filters at 60°C for 48 h, we re-weighed them to determine dry periphyton biomass.

We also sampled the living *Nitella* from each mesocosm on day 80 (Table 1) to assess final biomass and chlorophyll *a* content. We rinsed the samples to remove attached filamentous algae and snails and then dried the *Nitella* samples at 60°C for 48 h. After drying, we weighed each sample. From each *Nitella* sample, we also clipped a 4-cm piece to analyze it for chlorophyll *a* content. The *Nitella* pieces were wrapped in aluminum foil and frozen (−20°C) to prevent chlorophyll breakdown. We later measured the concentration of chlorophyll *a* in each sample by shaking the bottle for 1 min until the fragile plant tissue had become suspended in acetone solution (Gitelson et al. 2003). We then used the fluorometer to quantify

Table 1. Schematic overview of sampling intensity of each response variable or group of response variables.

Response variables	Day					
	7–8	14–16	19–21	30–32	42–43	77–80
Phytoplankton	X	X	X	X	X	X
Periphyton	–	–	–	X	–	X
Macroalgae	–	–	–	–	–	X
Snails	–	–	–	–	–	X
Zooplankton	–	–	X	–	–	X
Abiotic	X	X	X	X	X	X

chlorophyll *a* (Model ED-700; Turner Designs) following Arar and Collins (1997).

On day 80, we also estimated the abundance of the filamentous algae (floating and submerged). Three observers each made a single estimate of the amount of filamentous algal cover in each mesocosm by ranking it from 1 to 5 (1 = 1–5%, 2 = 5–10%, 3 = 10–25%, 4 = 25–65%, 5 = 65–100%), and these rankings were then averaged.

We quantified the abundance of juvenile snails on day 80 (Table 1) by collecting a benthic sample of snails. The benthic sample was collected by sweeping an aquarium net (width = 10 cm, mesh size = 250 μm) against the bottom, from the center of the mesocosm advancing to the side wall in all four cardinal directions. We preserved all snails in 70% ethanol and later enumerated the number of banded mystery snails and pond snails (juveniles were <0.5 cm). We only enumerated the number of juvenile snails because adult snails were very rare in all samples.

To quantify zooplankton abundance when they were diverging among treatments, we sampled the mesocosms two times during the experiment (Table 1). On days 19 and 78, we sampled 450 mL of water from six locations in a given mesocosm and then pooled the six samples. We poured the pooled sample through a 64-μm net and preserved the collected zooplankton in 30% ethanol to ensure that the zooplankton stayed intact. We later enumerated the zooplankton in three taxonomic categories: copepods, cladocerans, and rotifers.

Throughout the 80 d of the experiment, we quantified temperature (°C), pH, dissolved oxygen (mg O_2/L), and chloride concentrations (mg Cl^-/L) on days 7, 14, 21, 32, 43, and 78 (Table 1) using a calibrated digital water meter (YSI Professional Plus, Yellow Springs, Ohio, USA). We measured all abiotic parameters at approximately half the water depth. The nominal salt concentration of 15 and 1000 mg Cl^-/L differed from actual salt concentrations of 11 and 1072 mg Cl^-/L by 26%, and 7%. On average there was no difference between actual and nominal concentration for 250 mg Cl^-/L.

Statistical analysis

This study includes a large number of response variables, some of which were measured multiple times. Therefore, we used several different analyses to examine the effects of our treatments. We used univariate repeated-measures analysis of variance (ANOVA) for phytoplankton (sampled at six time points) and periphyton (sampled at two time points). We conducted two additional multivariate analyses of variance (MANOVAs): one on macroalgae (*Nitella* dry biomass, *Nitella* chlorophyll *a* content, and filamentous algae rank abundance) and one on juvenile snail abundance (pond snails and banded mystery snails). For *Nitella* biomass, we analyzed the dry mass of *Nitella* because wet and dry mass were highly correlated (Pearson correlation = 0.98). We conducted repeated-measures MANOVAs (rm-MANOVA) on zooplankton (cladocerans, copepods, and rotifers) which were sampled at two time points and on the abiotic water quality variables which were measured at six time points (temperature, pH, and DO). When we found significant multivariate effects, we conducted subsequent univariate repeated-measures ANOVAs on each response variable. When we detected time-by-treatment interactions, we used ANOVAs to analyze the treatment effects on each sample date. For all significant ANOVAs, we conducted Tukey's HSD post hoc test because the number of possible mean comparisons was low. Data were log-transformed when needed to fit parametric assumptions of normality and homogeneity of variance. All analyses were preformed in R version 3.3.1, using packages vegan and car.

Results

Phytoplankton

We found effects of salt, light, nutrients, and salt-by-light and nutrient-by-light interactions with time on phytoplankton chlorophyll *a* concentration; the other interactions were not significant. (Appendix S1: Table S1). Given the time-by-treatment interactions, we analyzed phytoplankton for each sample date, and detailed descriptions are available in Appendix S1.

On the first sample date, there was no main effect of salt, but there was a main effect of light, nutrients, and a light-by-nutrient interaction (Table 2, Fig. 1a). Added nutrients caused an increase of phytoplankton, and the magnitude of the increase was greatest under high light. On the second sample date (day 16), there were main effects of salt, light, and nutrients, but no

Table 2. Results of an ANOVA for phytoplankton chl *a* concentration at each sample day based on significant interactions from rm-ANOVA.

Notes: Bold numbers indicate statistical significance at the alpha level of 0.05. Additional interactions were not significant in the rm-ANOVA (Appendix S1: Table S1).

interactions among treatments (Table 2, Fig. 1b). Once again, the combination of added nutrients and high light caused an increase in phytoplankton. In addition, the high chloride concentration caused an increase in phytoplankton. On the third sample date (day 20), there was no effect of salt, but there were effects of light, nutrients, and a light-by-nutrient interaction (Table 2, Fig. 1c). The increase in phytoplankton with added nutrients and high light was once again apparent. On the fourth sample date (day 30), there was an effect of salt and nutrients on phytoplankton, but not light (Table 2, Fig. 1d). The added nutrients and high salt concentration both caused an increase in phytoplankton. On the fifth and sixth sampling dates (days 42 and 78), phytoplankton was only affected by salt (Table 2, Fig. 1e–f). In both cases, the high concentration of salt caused an increase in phytoplankton.

Periphyton

The repeated-measures ANOVAs on periphyton revealed effects of salt and nutrients, but no effects of light or any interactions (Appendix S1: Table S1). However, there was a nearly significant effect of time, because it was only at the second sampling that elevated nutrients caused a 68% increase in periphyton biomass (day 32: $F_{1,54} = 2,1$, $P = 0.149$; day 78: $F_{1,54} = 6.3$, $P = 0.015$; Fig. 2). In 1000 mg Cl^-/L, periphyton biomass was 110% and 78% higher, respectively, compared to 15 mg Cl^-/L (day 32: $F_{2,54} = 3,9$, $P = 0.024$; day 78: $F_{2,54} = 3.1$, $P = 0.051$).

Macroalgae

The MANOVA on *Nitella* dry biomass, *Nitella* chl *a*, and filamentous algae rank abundance indicated a multivariate effect of salt (Wilks' λ, $F_{2,54} = 11.5$, $P < 0.001$) and a nearly significant effect of light (Wilks' λ, $F_{2,54} = 2.0$, $P = 0.072$), but no effect of nutrients (Wilks' λ, $F_{1,54} = 1.2$, $P = 0.314$) or any treatment interactions. We then conducted separate ANOVAs for each response variable.

In the analysis of *Nitella* dry biomass, we found main effects of salt, light, and a salt-by-light interaction (Table 3, Fig. 3a). The post hoc comparison revealed that the *Nitella* biomass in low light declined by about half with 250 mg Cl^-/L ($P = 0.013$) and by 98% with 1000 mg Cl^-/L ($P < 0.001$), compared to 15 mg Cl^-/L. In medium sunlight, *Nitella* biomass was 77% higher in 15 mg Cl^-/L than in 1000 mg Cl^-/L ($P = 0.003$). In high sunlight, *Nitella* biomass was much lower and there were no effects of salt treatments ($P > 0.7$). When we examined the effect of sunlight within each salt treatment, we found that *Nitella* biomass declined by 65% between high and low light in 15 mg Cl^-/L ($P = 0.004$). However, there were no effects of light within the 250 and 1000 mg Cl^-/L salt treatments (all: $P > 0.7$).

The analysis of chlorophyll *a* in *Nitella* revealed an effect of salt (Table 3, Fig. 3b) and a nearly significant negative effect of light, but no salt-by-light interaction. Post hoc comparisons showed that there was 53–54% higher chl *a* concentration in *Nitella* exposed to 15 or 250 mg Cl^-/L compared to *Nitella* exposed to 1000 mg Cl^-/L (all: $P < 0.001$). There was also 29% lower chl *a* concentration in *Nitella* with high light compared to low light ($P = 0.049$; Fig. 3b).

In our analysis of the filamentous algae rank abundance, we found an effect of salt, but no effects of light or nutrients (Table 3). Post hoc

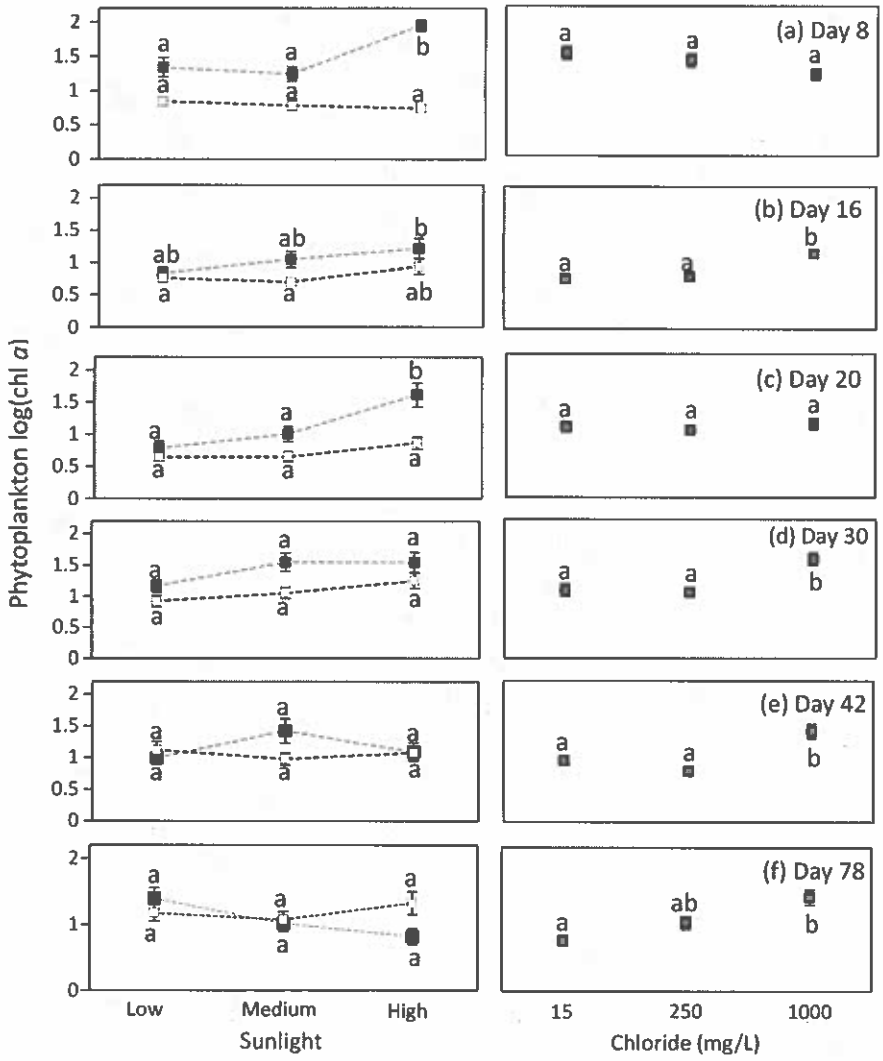

Fig. 1. Effects of nutrients (black boxes indicate high and white boxes indicate low nutrient concentration), sunlight (low 10%, medium 35%, and high 70%), and salt (15, 250, and 1000 mg Cl^-/L) on phytoplankton (chl *a*) concentration on six sampling dates (a–f). Letters indicate significant difference between and within treatments. Data are logged means ± 1 SE.

comparisons showed that there was no difference between 15 and 250 mg Cl^-/L ($P = 0.822$). However, filamentous algae did not decline from 15 to 250 mg Cl^-/L, but it did decline from 15 and 1000 mg Cl^-/L ($P < 0.001$) and 250 to 1000 mg Cl^-/L ($P < 0.001$).

Snails

The MANOVA on juvenile snail abundance revealed a multivariate effect of salt, light, nutrients, and a salt-by-light interaction (Appendix S1: Table S2). In the subsequent univariate analysis on pond snails, we found main effects of light and nutrients, with a 70% increased abundance from low to high light ($F_{1,54} = 14.9$, $P < 0.001$) and a 60% increased abundance in mesocosms with added nutrients ($F_{2,54} = 4.5$, $P = 0.019$; Fig. 4a). There was no effect of salt ($F_{2,54} = 1.9$, $P = 0.158$) or a salt-by-light interaction ($F_{4,54} = 0.9$, $P = 0.496$).

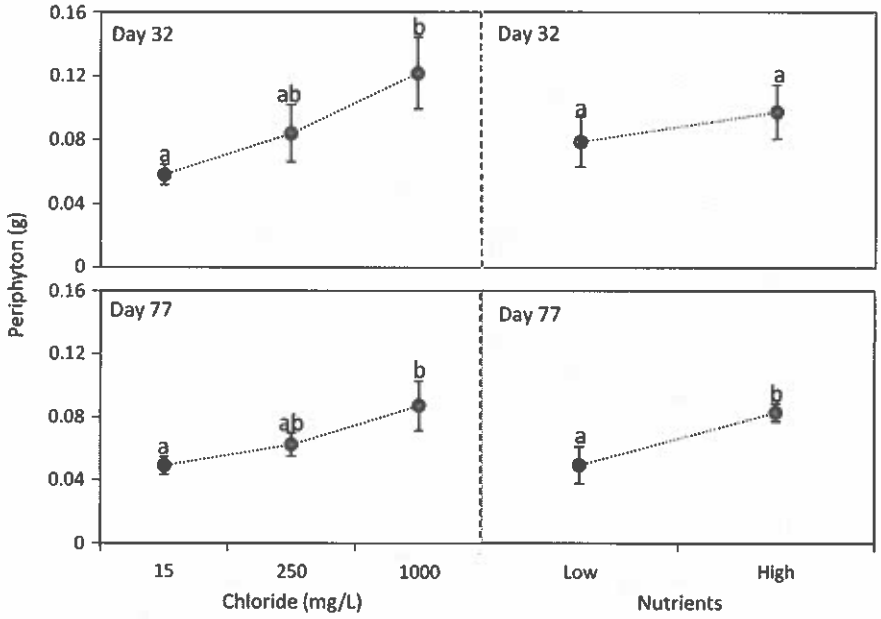

Fig. 2. Effects of nutrients (low and high) and salt (15, 250, and 1000 mg Cl^-/L) on total periphyton biomass (g/15 cm^2) on two sampling dates. Data are means ± 1 SE.

Notes: Bold numbers indicate statistical significance at the alpha level of 0.05. Subscripted numbers indicate degrees of freedom. The preceding MANOVA indicated no effects of nutrients or its interactions.

In the univariate analysis on banded mystery snails, there were no effects of nutrients, but we found effects of salt ($F_{2,54}$ = 18.8, P < 0.001), light ($F_{2,54}$ = 13.1, P < 0.001), and a salt-by-light interaction ($F_{4,54}$ = 5.0, P = 0.002; Fig. 4b). Under low-light conditions, snail abundance was low and there were no differences among the salt treatments. Under medium-light conditions, banded mystery snail abundance was 83% higher with 250 mg Cl^-/L than with 1000 mg Cl^-/L (P = 0.001), but there was no difference between 15 and 250 mg Cl^-/L (P = 0.131) or between 15 and 1000 mg Cl^-/L (P = 0.777). Under high-light conditions, snail abundance declined sharply by 92% and 94% with 1000 mg Cl^-/L compared to 15 and 250 mg Cl^-/L, respectively (all: P < 0.001).

Zooplankton

The MANOVA on cladocerans, rotifers, and copepods revealed multivariate effects of light, nutrient, time, and a salt-by-time interaction; no other interactions were significant (Appendix S1: Table S3). The subsequent univariate analyses also showed interactions between salt and time, and we therefore analyzed all groups of zooplankton within sampling dates for salt treatments (Tables 4 and 5).

For cladoceran abundance, there was a main effect of light and nutrients, and there was also an interaction between salt and time (Table 4, Fig. 5). Cladocerans also showed a 43% increase from low to medium light (P = 0.043) and a 53% increase from low to high light (P = 0.009). They

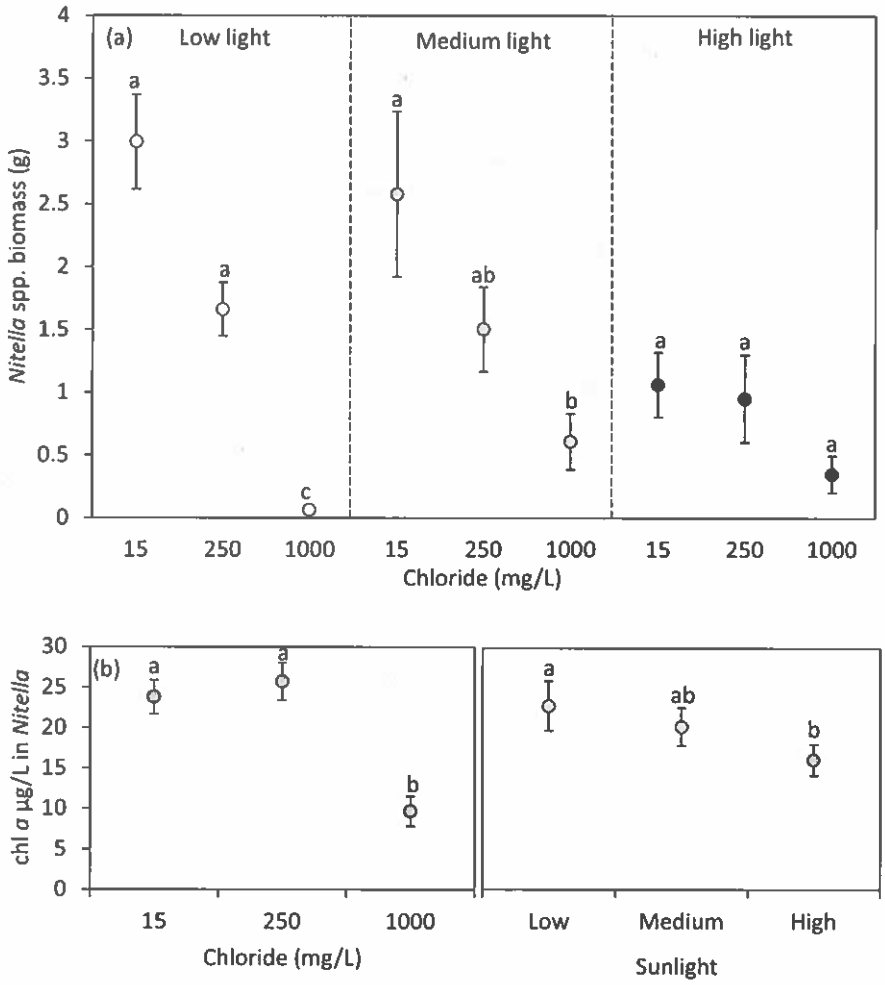

Fig. 3. (a) Effects of sunlight (low 10%, medium 35%, and high 70%) and salt (15, 250, and 1000 mg Cl^-/L) on *Nitella* biomass. (b) Effects of salt (15, 250, and 1000 mg Cl^-/L) and sunlight (low 10%, medium 35%, and high 70%) on the chlorophyll *a* content in *Nitella*. Data are means ± 1 SE.

experienced a 41% increase from low to high nutrients ($P = 0.004$). On the first sample date, cladocerans exhibited a 38–40% lower abundance with 1000 mg Cl^-/L compared to the 250 and 15 mg Cl^-/L (all: $P \leq 0.04$). On the second sample date, there was no effect of salt.

For rotifer abundance, there was a main effect of nutrients and light and a marginal effect of salt (Table 4, Fig. 5). Post hoc comparisons showed that rotifers were also 57–70% less abundant in low light compared to medium and high light ($P \leq 0.05$). They also experienced a 50% increase with added nutrients ($P = 0.031$). On the second sample date, there was a 53–63% higher abundance with 1000 mg Cl^-/L compared to 15 and 250 mg Cl^-/L ($P \leq 0.049$). On the first sample date, there were no effects of salt.

Copepod abundance was affected by salt, nutrients, and a salt-by-time interaction (Table 4, Fig. 5). Copepods experienced a 64% increase with increased nutrients (Table 5). On the first sampling, copepods were 76% more abundant with 15 mg Cl^-/L than with 1000 mg Cl^-/L ($P = 0.006$). On the second sample date, copepods were 86% more abundant with 250 mg Cl^-/L than with 1000 mg Cl^-/L treatments ($P < 0.001$).

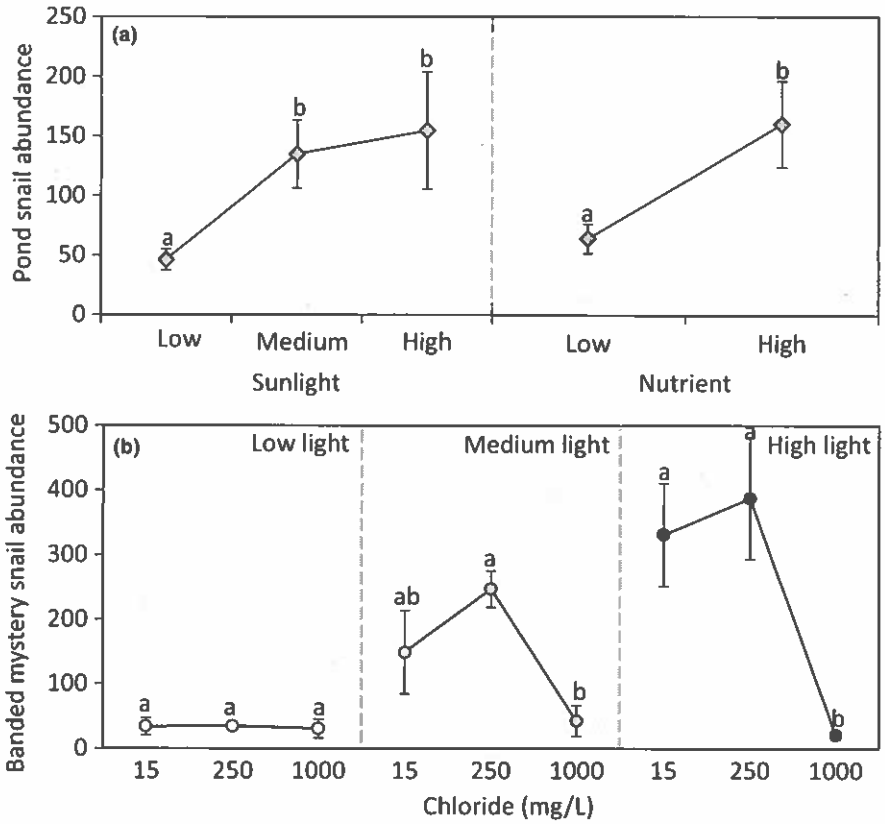

Fig. 4. Effects of sunlight (low 10%, medium 35%, and high 70%) and salt (15, 250, and 1000 mg Cl^-/L) on (a) juvenile pond snails and (b) juvenile banded mystery snails. The white, gray, and black dots represent different sunlight levels (10, 35, and 70%). Data are means ± 1 SE.

Abiotic conditions

The analysis of abiotic measurements detected multivariate effects of salt, light, nutrients, time, and their interactions (Appendix S1: Table S4). We therefore conducted rm-ANOVAs on each response variable to understand which response variables were driving the multivariate effects and then used subsequent ANOVA for each response variable at

Table 4. Univariate repeated-measures ANOVA on copepods, cladocerans, and rotifers for those factors found to be significant in the rm-MANOVA (see Appendix S1: Table S3).

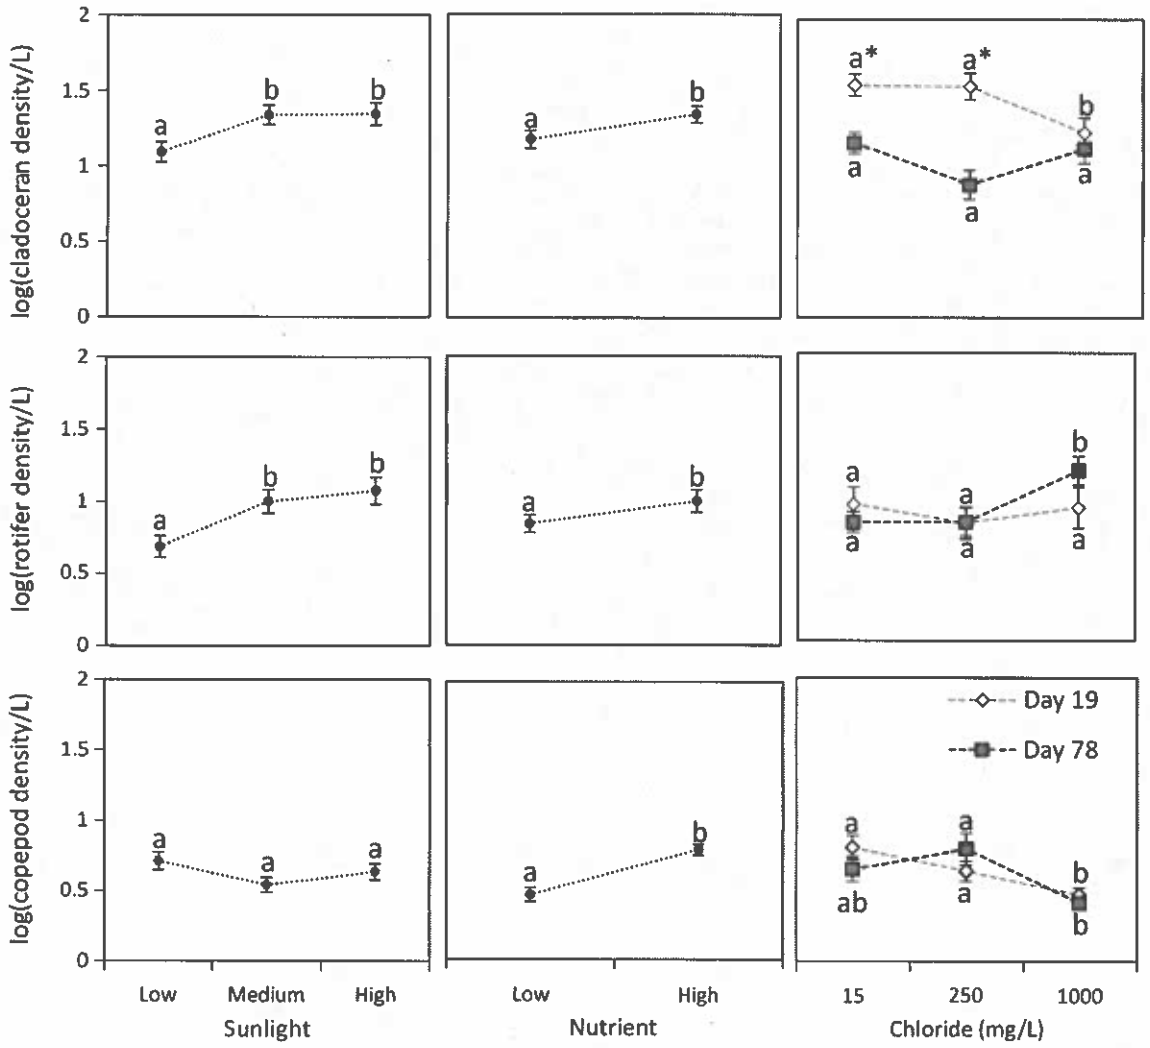

Fig. 5. Effects of nutrients (low and high), sunlight (low 10%, medium 35%, and high 70%), and salt (15, 250, and 1000 mg Cl^-/L) on cladocerans, rotifers, and copepods on two sampling dates (days 19 and 78). Letters indicate significant differences between treatments, and asterisks (*) indicate significant differences between sampling occasions. Data are logged means ± 1 SE.

each sample date if treatments interacted with time (Fig. 6, Appendix S1: Tables S5–S6). Detailed supplementary results for each sampling date for DO, temperature, and pH are available in Appendix S1. During the experiment, the chloride concentrations remained the same; that is, they did not have an interaction with time (all: $P > 0.1$).

The univariate analysis of DO revealed effects of light, salt, nutrients, time, and light-by-nutrient, salt-by-time, and nutrient-by-time interactions (Appendix S1: Table S5). Averaged over time, DO levels were higher with high light and added nutrients (Fig. 6; Appendix S1: Table S6).

For temperature, the analysis revealed effects of light, time, and light-by-time interaction (Fig. 6; Appendix S1: Tables S5–S6). During the first part of summer, temperatures were highest in high sunlight treatment, whereas in the later parts of summer, temperatures were highest in the low sunlight treatment.

Analysis of pH showed effects of salt, light, nutrient, time, and salt-by-time and nutrient-by-time

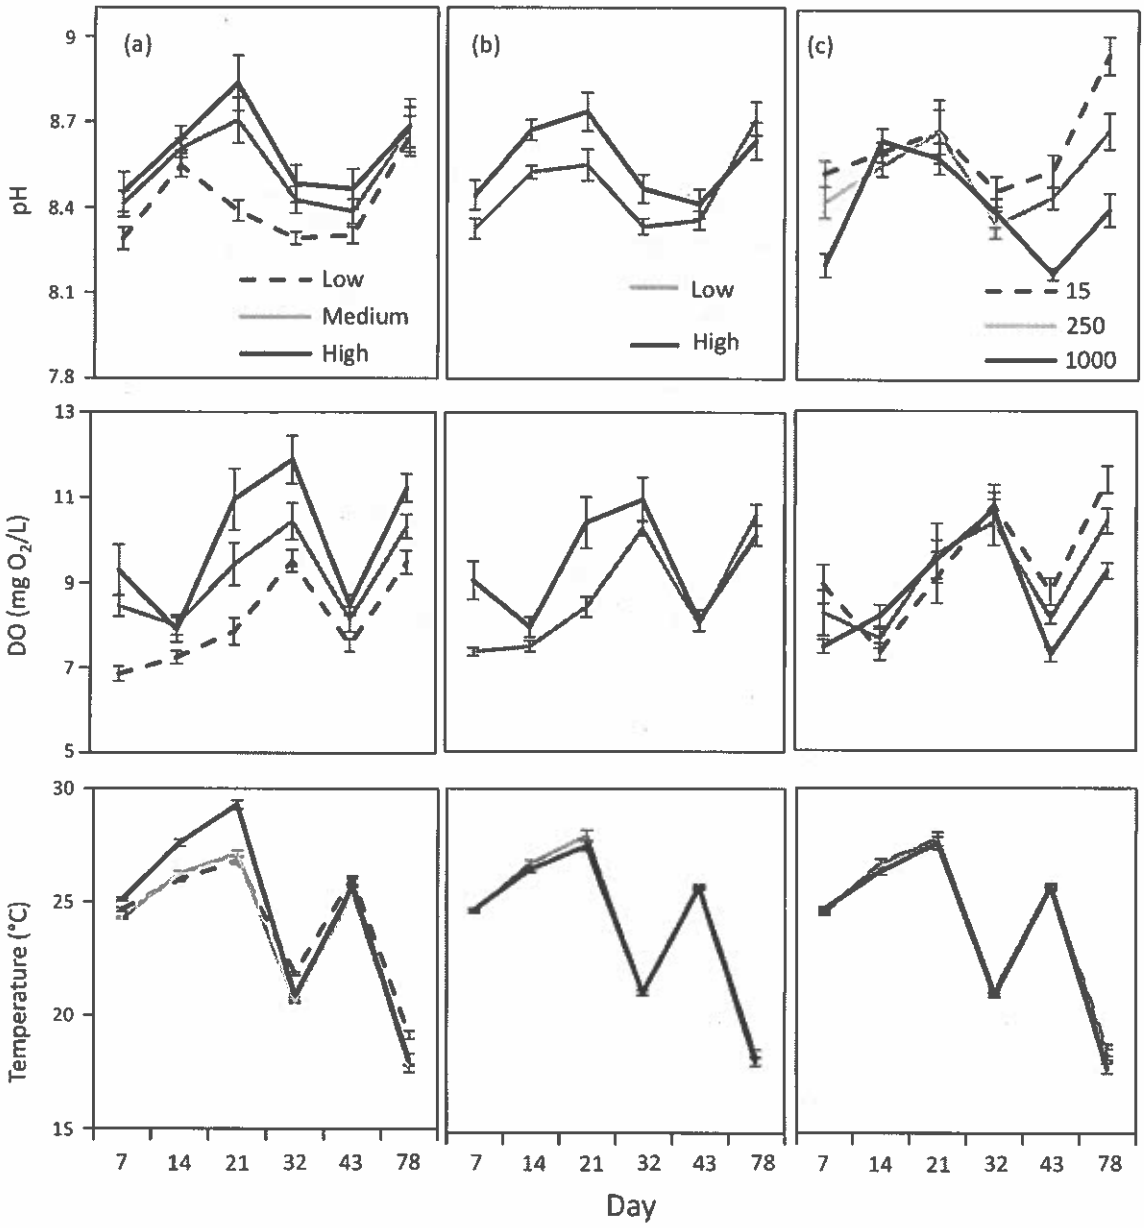

Fig. 6. pH, DO (dissolved oxygen; mg O_2/L), and temperature (°C) for each sampling day and each treatment: (a) sunlight (low 10%, medium 35%, and high 70%), (b) nutrients (low and high), and (c) salt (15, 250, and 1000 mg Cl^-/L).

interactions (Fig. 6; Appendix S1: Tables S5–S6). The pH levels were generally increasing with increasing light and nutrients levels while decreasing with increasing salt concentrations. The pH ranged between 7.46 and 9.95 with an average of 0.2 pH units lower in 1000 vs. 15 mg Cl^-/L.

Discussion

Salinization and eutrophication in freshwater ecosystems is a serious environmental problem (Van Meter et al. 2011, Paerl and Paul 2012, Cañedo-Argüelles et al. 2016, Hintz et al. 2017).

We discovered that altered nutrients, sunlight, and salt concentrations altered the structure of ecological communities by causing direct effects as well as top-down and bottom-up indirect effects that altered the abundance of primary producers and consumers. Adding nutrients caused our community to experience increased productivity, including the increased growth of phytoplankton and periphyton, one of the two snail species, and all three zooplankton groups. Adding salt caused declines in two of the three zooplankton groups, an increase in phytoplankton and periphyton, sharp declines in the *Nitella* macroalgae, and sharp declines in the abundance of banded mystery snails. In short, we found that the combination of increased chloride and nutrients creates a highly eutrophied ecosystem with decreasing macrophyte coverage, higher pelagic primary production, and altered abundances of consumers for higher trophic levels. Reduced sunlight caused a decline in the abundance of pond snails and banded mystery snails (although the latter depended on salt concentration), declines in phytoplankton (although only under high-nutrient conditions), and declines in cladocerans and rotifers. However, there was no evidence that declines in sunlight caused by salt- and nutrient-induced increases in phytoplankton or macroalgae caused any indirect effects on the food web. Below, we elaborate on these findings and interpretations.

Phytoplankton and periphyton

Phytoplankton and periphyton increased in our experiment when exposed to high nutrients or elevated salt concentrations (Figs. 1 and 2). The increase in phytoplankton under high-salt conditions was likely caused by a decline in the copepods and cladocerans that consume phytoplankton. This outcome has also been observed in past lake and wetland ecosystems (Van Meter et al. 2011, Hintz et al. 2017) and is similar to that seen for other contaminants that are lethal to zooplankton, including insecticides (Hua and Relyea 2014, Bendis and Relyea 2016).

While it was not surprising that phytoplankton became more abundant when nutrients were added (Conley et al. 2009, Paerl and Paul 2012), it was interesting that nutrients and sunlight had interactive effects; reduced sunlight had no effect under low-nutrient conditions but caused a large decline in phytoplankton under high-nutrient conditions. This suggests that while phytoplankton abundance is commonly nutrient-limited, it becomes light-limited when nutrients are abundant (e.g., Karlsson et al. 2009).

We hypothesized that the increases in phytoplankton caused by added nutrients or salt would shade the deeper periphyton and thereby reduce the biomass of periphyton. When we added nutrients, periphyton initially showed no change in biomass, but after 77 d, it showed an increase. The increase exhibited no interaction with light levels, suggesting that while the periphyton was nutrient-limited, it was not light-limited (unlike phytoplankton). In the case of added salt, we also observed an increase in periphyton, which was in contrast to our shading hypothesis: that the increase of phytoplankton caused by nutrient and salt additions would indirectly cause a decline in periphyton due to a shading effect. The most likely explanation for our observation of increased periphyton with salt addition is that the salt was toxic to one of the major periphyton grazers (e.g., banded mystery snails); as a result, the lower grazing pressure by snails in the high-salt treatments allowed for an increase in periphyton. Consistent with this result are other recent studies that have found periphyton increases with elevated salt (e.g., Van Meter et al. 2011, Dananay et al. 2015). However, the novel takeaway message is that increases in nutrients and salts appear to affect phytoplankton and periphyton abundance additively and not synergistically.

Macroalgae

We also found several surprising responses to our manipulations on the *Nitella* macroalgae. First, *Nitella* showed no increase in biomass when we added nutrients (Fig. 3). This suggests not only that this macroalga is not limited by nutrients, but also that it is not limited by the reduced sunlight availability that occurred as the added nutrients initiated a phytoplankton bloom. This resiliency of *Nitella* under different nutrient conditions may reflect its ability to extract and store considerable amount of nutrients from the water (Kufel and Kufel 2002).

Clear evidence that *Nitella* is not harmed by reduced sunlight availability comes from the results of our light manipulations (Fig. 3). In the absence of added salt (e.g., 15 mg Cl^-/L), large

reductions in sunlight resulted in substantial higher *Nitella* biomass. Previous studies have shown that charophytes, such as *Nitella*, can use low light intensities effectively and can therefore survive in deep water (Blindow 1992, Kufel and Kufel 2002). The fact that *Nitella* did not respond favorably to the shading effect of the phytoplankton bloom that occurred with added nutrients suggests that the reduced light availability from the phytoplankton bloom was weaker than the reduced light availability in our light manipulations, or might have caused some type of resource competition that we did not measure.

We also found, for the first time, that *Nitella* is highly sensitive to increased salt. This is surprising given that *Nitella* has been found in salinities up to 5000 mg/L (James et al. 2003). When growing well under low-light conditions, increases in salt severely reduced *Nitella* biomass in our treatments. Moreover, photosynthetic pigment concentration can indicate the physiological status of a plant (Peñuelas et al. 1995) and the lower chl *a* concentration in *Nitella* in high-salt treatments also indicates that the macrophyte was experiencing physiological stress caused by elevated salt concentration. While the impact of salt disappeared under high-light conditions, this was simply because *Nitella* grew so poorly under high-light conditions that there was very little remaining scope for a response to salt.

This high sensitivity to increased salt concentrations is particularly relevant given that many salt-polluted lakes can achieve salt concentrations of 250 to 1,000 mg Cl^-/L (Novotny et al. 2008). An additional concern arises if tributaries carry high salt concentrations into lakes and then this water sinks to lake bottoms (due to the higher density of the salty water). Under this scenario, concentrated salt water would descend to the deeper waters where *Nitella* lives and this would cause a major decline in *Nitella* abundance, with potential cascading effects on the animals that depend on the *Nitella* meadows for habitat. In summary, our results suggest that *Nitella* meadows are very susceptible to increased salt, but do not respond to increases in nutrients.

For filamentous algae, we did not find any effects of increased nutrients or light. However, we found filamentous algae to decrease with elevated salt indicating that filamentous algae have a similar salinity tolerance as *Nitella*. Hintz et al. (2017) also found that the biomass of filamentous algae decreased substantially with elevated salt levels. Thus, this may turn out to be a common observation in salt-impacted freshwater habitats.

Snails

While neither snail species performed well under low-light conditions, they had unique responses to increased salt and nutrients. The negative response to low-light conditions is likely a response to low periphyton productivity. While we measured periphyton standing crop, which did not respond to light, it appears that the productivity of periphyton growth was quite limiting to the growth of pond snails. Further support for this conclusion can be found in the pond snails, which experienced a higher abundance when nutrients were added, which increased periphyton standing crop. In contrast, banded mystery snails did not respond to the nutrient addition (Fig. 4).

Banded mystery snails are more commonly found in mesotrophic and eutrophic lakes and ponds (Browne 1978, Lee et al. 2002), although they also can be abundant in some oligotrophic lakes (e.g., Lake George, New York, USA). We therefore expected an increase in banded mystery snails with nutrient addition. The difference in sensitivity to nutrients may reflect differences in their feeding habits. Banded mystery snails are primarily detritivores, whereas pond snails are primarily periphyton grazers (Lee et al. 2002, Evans-White and Lamberti 2009). As a result, increased nutrients that cause increased periphyton productivity should favor an increased production of pond snails but have weaker effects on banded mystery snails.

A major difference between the two snail species was in their response to increased salt. Pond snails exhibited no harmful effects of increased salt, whereas banded mystery snails were nearly exterminated by high salt concentrations. However, the harmful impact of salt on banded mystery snails could only be observed under medium- and high-light conditions, since low-light conditions caused very few banded mystery snails to survive. Collectively, this suggests that the two snail species have dramatically different tolerances to salt. Moreover, as detritivores,

banded mystery snails assimilate contaminants from the sediments (which can have higher salt concentrations since saltier water has a higher density), while pond snails are grazers and would be less likely to directly assimilate contaminants from the sediments (Lee et al. 2002, Evans-White and Lamberti 2009). As a result, even if banded mystery snails and pond snail have a similar tolerance to salt, banded mystery snails may be exposed to higher levels of salt because of their habit of feeding on the detritus of sediments. Previous studies have shown pond snails to have a high tolerance to salinity (Kefford and Nugegoda 2005, Hintz et al. 2017) and that the tolerance increases with life stage (Kefford et al. 2004, 2007), while no studies on the salt tolerance of banded mystery snails were found. We clearly need much more information on the variation in salt tolerance among gastropods to better understand how salt will alter species assemblages in freshwater habitats. However, the data from our study indicate that the impacts of salt and nutrient inputs on snails are additive rather than synergistic.

Zooplankton

The zooplankton responded positively to increased sunlight and nutrients (Fig. 5). The positive response to increased sunlight and nutrients is not particularly surprising, since both of these factors combined produce a larger standing crop of phytoplankton. Increases in phytoplankton driving increases in zooplankton populations are a common observation in freshwater ecosystems (Canfield and Jones 1995, Ger et al. 2014). When more than 50% of total phytoplankton biomass are cyanobacteria, negative effects from eutrophication start to occur (Ger et al. 2014). However, zooplankton abundance did not suffer any negative effects under high-nutrient conditions; on the contrary, zooplankton populations in our mesocosms tracked the increase in phytoplankton following nutrient addition.

The more novel finding was the decline in zooplankton with increased salt and that this dynamic changed over time. We found that cladocerans and copepods experienced declines in abundance as we increased salt from 250 to 1000 mg Cl^-/L (Fig. 5). These declines are consistent with past studies of zooplankton sensitivity to salt (e.g., Petranka and Doyle 2010, Van Meter and Swan 2014, Hintz et al. 2017, Stoler et al. 2017). We also found rotifers to be less sensitive to increased salt, which is also consistent with previous studies (Sarma et al. 2006, Hintz et al. 2017). Collectively, these studies suggest that the decline in copepods that we observed in our mesocosm study was the result of direct toxicity to the added salt.

Given the direct toxicity of the high-salt treatment and given the fact that sodium and chloride do not break down or leave the system, it is quite interesting that the negative impact of salt diminished over time. A similar observation was made recently by Hintz et al. (2017) who tracked zooplankton abundance over time, and a follow-up study provided the underlying explanation. In the case of cladocerans, Coldsnow et al. (2017) found that large populations that experience high concentrations of salt are initially greatly reduced in abundance but not completely eliminated. The few that persist possess salt tolerance and, over time, these salt-tolerant cladocerans reproduce and ultimately rise to an abundance that is similar to the abundance of cladocerans that were never exposed to salt. Given this discovery, it may be the case that the copepods also evolve increased tolerance during the experiment. Many copepods experience different feeding modes during their development with some copepods changing from feeding on phytoplankton to becoming predatory (Brandl 2005). Therefore, the increase in cladocerans and rotifers in the second sampling occasion might be an indirect effect of released predation pressure as higher amount of copepods might still be in earlier developmental stages. However, even if there is always a chance of missing some patterns throughout the sampling period, our samples were taken in response to when communities were diverging among the treatments. Temperature could also influence zooplankton reproduction; however, we did not see any general drastic drop in the zooplankton community in the second sampling occasion that would indicate such a pattern (Figs. 5 and 6). In terms of our focus on the combined effects of added nutrients and road salts, our results suggest that the two anthropogenic factors have additive effects and not synergistic or antagonistic effects.

R03190

Conclusions

Eutrophication and salinization are two ecosystem stressors that are being experienced in aquatic ecosystems around the world. While eutrophication has been studied for decades, the ecological effects of salinization are only recently receiving attention and the combined effects of the two stressors have received no attention. Our study has found that the combined effects of the two stressors—across the range of values examined—are entirely additive for all of the taxa we examined including phytoplankton, periphyton, macroalgae, snails, and zooplankton. While the impacts of anthropogenic additions of nutrients and salt are not synergistic, their combined effects on aquatic ecosystems are still of tremendous concern since they both contribute to major changes including phytoplankton and periphyton blooms (via bottom-up and top-down mechanisms, respectively). Equally important are the impacts of salinization alone, including causing a major decline in numerous taxa including zooplankton, snails, and macroalgae. One would reasonably predict that such declines would have further cascading effects on consumers that rely on the salt-sensitive prey and on species that rely on the expansive *Nitella* meadows (and perhaps other salt-sensitive macrophyte species) in freshwater lakes for habitats. Overall, the combined effects of salinization and eutrophication might fast-forward the process of lakes becoming hypertrophic, and this could potentially result in devastating algal blooms and poor water quality.

As the first study to examine the combined effects of salt and nutrients, there is clearly much more work to be done. For example, the striking negative effects of NaCl road salt on macroalgae suggest that many other macroalgae species, and perhaps many aquatic plant species that are adapted to low salinities, may be highly susceptible to road salt pollution in freshwater ecosystems. The rebounding of both cladocerans and copepods after initial declines following salt exposure suggests evolved tolerance, but our current insights into this possibility are limited to only one species of cladoceran (Coldsnow et al. 2017). There has also been growing interest in using other road salts (or mixtures of salts) for deicing roads including $MgCl_2$ and $CaCl_2$. Little research has examined the ecological impacts of these alternative salts and organic salt additives (but see Schuler et al. 2017*b*, Schuler and Relyea 2018). As we move forward on these frontiers, we will have a much more holistic idea of how anthropogenic impacts are altering aquatic ecosystems and develop management strategies for their mitigation.

Through these direct and indirect temperature effects, in combination with reduced wind speed and reduced cloudiness, summer heatwaves boost the development of harmful cyanobacterial blooms. These findings warn that climate change is likely to yield an increased threat of harmful cyanobacteria in eutrophic freshwater ecosystems.

Acknowledgments

LL, MS, WH, DJ, BM, AS, and RR conceived and designed the experiment. LL, MS, WH, BM, DJ, AS, and RR performed the experiment and collected the data. LL preformed all statistical analyses, and LL, MS, WH, DJ, BM, AS, and RR wrote the manuscript. RR also secured funding support and equipment. Funding was provided by Rensselaer Polytechnic Institute start-up funds to RR, and by The Jefferson Project at Lake George, which is a collaboration of Rensselaer Polytechnic Institute, IBM, and The FUND for Lake George. We thank James Hu, Christina Akirtava, Alex Brooks, Jeevan Narendran, Reilly Cooper, Brent Walker, Mike Kalonstian, Cody Van DeLaarschot, Kelsey Sudol, Sherese Morgan, and Alison Samsel for their help throughout the experiment and with sample processing.

Dear Mr. LeCrone,

I have attached my comments on the proposed Williamson Energy, LLC permit to discharge mine waste into the Big Muddy River (NPDES IL0077666, Notice No. 7516c).

In my comments, I request an extension of the comment period and a public hearing. I also ask that the IEPA conduct an additional study that would provide an Environmental Impact Statement.

Please include my comments in the official record for this permit application.

Sincerely,
Jane Cogie

Re: Williamson Energy Pond Creek Mine NPDES IL0077666, Notice Number 7516c

Dear Mr. LeCrone:

I am writing to ask the Illinois Environmental Protection Agency to extend the comment period for the Pond Creek Mine's draft-renewed permit application. One month for comments is inadequate, particularly given the interlocking sets of data to be considered. I also urge the IEPA to hold a hearing to provide a public forum for citizen input.

Furthermore, I request that the IEPA study the impact of the waste water the proposed pipeline would dump into the Big Muddy—in other words, that the IEPA compile an Environmental Impact Statement. Such a study seems warranted, in particular for determining the cumulative impact of contaminants, including not just the Pond Creek Mine contaminants, which I note below, but also those contaminants already being emitted into the river from other sources, such as the Sugarcreek Mine and runoff from surrounding farm lands.

I submit these requests as a concerned citizen. From the documents I have reviewed, it is clear that concern is warranted. Available data on Pond Creek Mine waste water show that it contains high levels of chloride, sulfates, and heavy metals—dangerous to fresh water mussels and fish that inhabit the Big Muddy, not to mention other wildlife that depends on the river to survive.

Concern about the Pond Creek Mine dumping waste into this river should not be limited to the contaminants. There is also the concern over the greater flooding that would result with the addition of the millions of gallons of Pond Creek Mine waste water, particularly following heavy rain events. Such rain events have become far more frequent with climate change. Indeed one of Williamson Energy's rationales for this permit application is that steps are needed to prevent contaminants from overtopping the holding basins and harming the health of the mine's workers. Although Williamson Energy's plan includes monitoring of contaminant levels, its plan does not address the flooding potential from the sheer quantity of mine waste water to be added daily to the Big Muddy's fluctuating flow.

The company's proposed pipeline is not a solution for the handling toxic waste produced at the Pond Creek Mine. An actual solution would be for Williamson Energy to clean the waste water in an onsite water treatment plant before emitting it. A highly

Re: Williamson Energy Pond Creek Mine NPDES IL0077666, Notice Number 7516c

profitable company, Williamson can and should use some of its profits to clean up its own waste. During a time when scientists recognize that fossil fuels must be replaced by renewable energy, this kind of de facto subsidy for Williamson Energy is unacceptable. Williamson Energy doesn't own the Big Muddy River. It belongs to all of us.

Thank you for taking my comments into consideration—and for convening a hearing to review Williamson Energy's permit application and on the impacts approval of it would have on the Big Muddy.

Respectfully submitted,
Jane Cogie

Dear Sir,

I am writing to urge you not to approve the dumping of polluted water by Williamson Energy into the Big Muddy River. Please consider your responsibilities to protect the people and ecosystems in this state. This dumping can create mass devastation of an enormous amount of ecosystems. With the muddy bottom, pollutants could become trapped in the sediments and create toxic environments for both wildlife and humans even beyond the point of ceased dumping. And please do not forget that the Big Muddy eventually dumps into the Mississippi and we can and will be held responsible for any outstate damage that WILL happen as well. You can and should prevent this from happening. No amount of of kickbacks you might be getting should be more important than the protection of our wildlife, ecosystems, and people. No amount of jobs you might feel responsible for maintaining or creating should be more important that the protection of our wildlife, ecosystems, and people. It is your job to do nothing but protect our wildlife, ecosystems, and people from pollution - do your job, only your job, and DO NOT ALLOW THIS TO HAPPEN.

Sincerely,

Casey R. Stout

My interest in the quality of water in the Big Muddy River is a personal one. My partner and I have lived in Pomona since 1978. Our property is .5 miles from Cedar Creek which flows into the Big Muddy which flows into the Mississippi River. When the water backs up, we can put our canoes and kayaks in at the bridge. There is no current; we paddle through tree tops on our way to the Big Muddy. It is a beautiful and surreal experience. We have been able to do that at least four times in the last two years.

With the scarcity of potable water being a world wide crisis, to pollute (even a bit) such a treasure as the Big Muddy makes no economic, aesthetic or rational sense. Unhealthy/toxic byproducts need to be "disarmed" if possible, but to damage a healthy ecosystem in order to dispose of the waste from a dying industry is not sane.

I also have an investment in Southern Illinois being an environmentally safe recreational area, for me, my neighbors and the people that visit. I live here because of the natural beauty of the Shawnee National Forest. George and I are the owners of the Pomona Winery, founded in 1991. We are proud of being part of the tourism industry in southern Illinois and want to help it flourish without degradation to the environment. We need to protect these resources.

Sincerely,
Jane Payne, owner of the Pomona Winery

I am against this for many reasons. I understand finding somewhere to put toxic byproducts is difficult, but please do not use the Big Muddy to do so. We fish and get frogs out of the river. I wish you the best of luck with dealing with this, but please do not allow more pollution in this river.

Thank you,
Becky Schneider

NPDES IL0077666
Notice No. 7516c
August 12, 2019
Public Comments Pond Creek Mine Pipeline Application
I am writing to urge that the Illinois Department of Natural Resources (IDNR) and the Illinois Environmental Protection Agency (IEPA) to deny or reverse any permits needed to facilitate the Pond Creek Mine's application to construct a pipeline that would dump millions of gallons of mine waste into the Big Muddy River.
According to newspaper accounts and government documents, this company (Williamson Energy) already has a shaky record of pollution of tributaries of the Big Muddy and groundwater mining that has severely impacted neighboring households and communities. There are numerous economic and environmental arguments against allowing this project to go forward.
This project does not make economic sense. The pipeline project would allow mine operators to externalize the cost of treating the wastewater created by its operation to the public. In a true market economy this coal mine might have to concede that dealing with the wastes that it generates in an environmentally sound way costs more than it is worth to take the coal out of the ground. So by allowing this project to proceed the IEPA and IDNR are not only facilitating the poisoning of the Big Muddy River, but also hastening global climate change. The jobs created by this mining operation are not a fair justification for the economic damage that has already been done in local communities, or that would be done downstream from its discharge, if implemented. If the State of Illinois is seriously concerned about the livelihoods of Illinois coal miners, it would do well to enact a severance tax on Illinois coal so that a fund could be establish to retrain coal miners into non-fossil fuel energy sector jobs.
This project does not make environmental sense. No environmental impact studies have been done on the long term effects of this project, including: cumulative water quality, fish and wildlife effects, bank erosion, and the social and environmental costs to the communities and individuals that live along and use the Big Muddy River. As a frequent recreational visitor to Oakwood Bottoms, Greentree Reservoir, I would echo the words of the Southern Illinoisan's 8-4-19 Editorial "The ecological importance of the lower Big Muddy River seems to be ample justification for denying the (permit) request."
I urge IDNR and IEPA to hold a public hearing be held so that citizens may be given an opportunity to publicly comment on this project, that if allowed to proceed will provide no benefits to the people of the region or the nation.
Thank you.

RE: Public Hearing Request for NPDES Permit No. IL 0077666 Notice No. 7516c Williamson Energy LLC, Permit No. 456

The proposed pipeline to transport coal wastewater from Pond Creek Mine in Williamson County to be discharged into the Big Muddy River in Franklin County must be denied. Pond Creek Mine must not pollute a navigable waterway with coal mine water that should be the responsibility of Williamson Energy LLC.

How did Williamson Energy LLC dispose of the high chloride /sulfate water in the past? It is known that this mine has had water accumulation problems for years. Longwall mining creates havoc for landowners' property and especially their wells, lakes, and ponds. I saw the devastation that Pond Creek mining did to Charles DuBose's home, lake, pond and well. Now this mine has the audacity to request that the taxpayer further subsidizes this mine and allow even more harm to a public waterway.

A Public Hearing would allow concerned citizens to express how approval of NPDES No. IL0077666 Notice No. 7516c would impact their lives and the quality of their environment.

The IEPA should not be allowing polluted waste water into the Big Muddy River. It will pollute land, wildlife, people, and is a bad decision.
Please have a open hearing on this topic and allow our community to voice concerns over this bad proposal. We live here, we fish the waters, we hunt on the land, and your agency should not allow a company to destroy public lands and waters. PERIOD. You are the Illinois ENVIRONMENTAL PROTECTION agency. Now, PROTECT OUR ENVIRONMENT.
Thank you,
Matthew Borowicz

Subject: [External] Mine Waste Pollution of our Big Muddy River

Dear Mr. LeCrone,

I am dismayed that the state of Illinois would allow a coal mining company to pollute our waters, which goes against our state constitution and all human decency.

The very least we can expect is that the mine treat all wastewater onsite with reverse osmosis treatment to reduce the amount of pollutants entering the river. Since it appears the company is incapable of regular monitoring and reporting, we also request the installation of a SCADA system at the point of discharge so the public can monitor, in real time, the discharge and flow of treated water that enters the river. We also request a maximum volume of treated water to be discharged in any given event be less than 500,000 gallons, and only during times when the river is below flood stage. Or, if the lower limit cannot be achieved, we recommend the company treat the waste water on site AND install a pipeline to go all the way to the Mississippi River to avoid the sensitive ecological areas south of Murphysboro. Again, with a SCADA system at the outfall of the pipe.
There has been no assessment of cumulative water quality impacts from continued coal mining.
There has been no assessment of increased water volume with regard to flooding, sedimentation, and downstream impacts.
There has been no assessment for the large withdrawals of underground water resources and the impact and implications that might have on future groundwater resources.
And there has been no assessment of the full social, health, environmental, economic or climate cost of this mine to Illinois tax payers.
For these reasons, I ask for a public hearing for Pond Creek Mine: NPDES IL0077666 and notice No. 7516c

To whom it may concern,

This is regarding Williamson Energy's request to dump millions of gallons of diluted wastewater from Pond Creek Mine into the Big Muddy River. (permit number IL0077666, notice no.7516c)

I strongly oppose allowing this. Totally neutralizing all by products of mining operations is the standard that Williamson Energy should be held to. If they can't do this because they are unable to pass the cost on to their customers and make a profit, they don't deserve to be in business. Public resources such as the Big Muddy should not be used to finish the dilution their effluent. Levels of what is safe evolve over time and allowing this practice to go forward because it meets "todays standards" is short sighted. Do the right thing and deny this request!

Sincerely,

David Kidd

August 11, 2019
Pond Creek Mine Pipeline Application
darin.lecrone@illinois.gov
NPDES IL0077666
Notice No. 7516c

Dear Mr. Lecrone:
I am writing to oppose the Pond Creek Mine's application to construct a pipeline that would dump millions of gallons of mine waste into the Big Muddy River.
No environmental impact studies have been done on the long term effects of this project, including: cumulative water quality, fish and wildlife effects, bank erosion, and the social and environmental costs to the communities and individuals that live along and use the Big Muddy River.
This pipeline project would allow this corporation to externalize its costs to the public. In a true market economy this coal mine might have to concede that dealing with the wastes that it generates in an environmentally sound way costs more than it is worth to take the coal out of the ground. So by allowing this project to proceed the IEPA and IDNR and not only facilitating the poisoning of the Big Muddy River, but also hastening global climate change.
I urge the IEPA and IDNR to reject all proposals for this harmful project.
I request that a public hearing be held so that citizens may be given an opportunity to publicly comment on a project that if allowed to proceed will provide no benefits to the people of the region or the nation.
Thank you,

Laurel Toussaint

Subject: [External] NPDESIL0077666 Notice No.7516c

Dear Mr. Lecrone,

As a citizen in Jackson County and near the Big Muddy River, I am asking you to please reconsider giving the Pond Creek Mine final permission to discharge mine waste water with high levels of sulfates and chlorides in the Big Muddy. I have canoed/kayaked on this body of water and do not want to see the damage this act will do. The sheer volume of water to be discharged alone is frightening as the maximum amount of wastewater allowed would have over 7 million gallons of wastewater and this is terrible. I know during heavy rain periods and during the spring, the river already floods many areas of Murphysboro and points upstream and downstream of us. My area where I live was impacted this May into June by flooding that subsequently flooded the creek near my home. It flooded the low-lying area of the Shawnee Forest (on the way to my house) that there was over 4 feet of floodwater over the road for more than a month. The "natural" river water alone was devastating to the wildlife and plant life in our area. I can NOT imagine what having cancer causing products in this water would do to the wildlife, plants and humans that would come in contact with these agents. Many of my neighbors do fish the river and these contaminates would have an awful impact on fish, other aquatic creatures and PEOPLE. Please do not give permission for this action. The mine should be building a water treatment plant onsite to take care of their water to ensure the discharges meet environmental regulations and not count on the Big Muddy River to "dilute" this contaminated water.

I also urge you to hold public hearings in the Jackson County (or Murphusboro) area. Many of the area residents would be interested in hearing the details for this action. The fact that the Big Muddy also dumps into the Mississippi River is a concern. The Gulf has had way too much damage from pesticide runoff (agriculture), floods, pollution. The impact of all of this in the Mississippi and Gulf has already taken a toll on coral and aquatic life. The extra sulfates and chloride would not be a good addition to the water.

Thank you for your consideration

Regarding: NPDES IL0077666 and notice No. 7516c

Dear Mr. LeCrone,

I am writing to request that the IEPA hold a public hearing on the above permit application by Williamson Energy's Pond Creek Mine, and to deny the permit altogether as being not in the best interests of the southern Illinois Environment.

I am a co-owner of the Douglass School Art Place in Murphysboro, Illinois. My partner Cameron Smith has written to you about our problems with the Big Muddy flooding our historic building, Murphysboro's former segregated elementary school, the Frederic Douglass School. Further problems can be anticipated if 3.5 million gallons of water are added to the river's volume on a daily basis. This is a one-hundred year old building with porous foundation bricks extending down to two feet below the 2011 flood level. Continued saturation by Big Muddy water would eventually undermine the entire building.

There are many areas of concern with this permit: No environmental assessments have ever been done on the cumulative effects of this discharge on riparian life—fish, mussels, crustaceans, amphibians, birds and mammals, or humans. Since the opening of this mine in 2006 permits have been issued piecemeal for their various initiatives, but the TOTAL effect has never been assessed. Many Compliance and Discharge Monitoring Records are incomplete or missing from the public record. There is reason to believe that the Mine has substantially exceeded their permitted levels in the past. There seems to be little or no monitoring of their activities.

I am also concerned that the proposed diffuser outlet is to be sited **downstream** from the Plumfield Gauging Station. This means that the measurements taken by this gauging station, which include not only volume but also flow rates, pH, turbidity, conductance, temperature, nitrate and nitrite levels, etc. will be inaccurate with regards to downstream effects. And also will not accurately reflect whether the Mine has adhered to the requirements of **this** permit. At the very least, if this permit is to go forward, the Mine should be required to re-route their pipeline to a diffuser upstream from the Plumfield station.

Williamson Energy and Foresight Energy are extremely rich corporations. Foresight brags on its website that the Pond Creek Mine "was the most productive underground coal mine in the United States during the first five years of its history based on clean tons produced per man hour worked." They also continually refer to their "low operating costs." Part of this is secured by their transportation assets which include locomotives, coal cars, extensive rail lines and contractual access to others, and a 20 million ton per year Sitran loading facility on the Ohio River. Most of this coal will be shipped abroad, so it is no benefit to the people of Illinois. And there is no coal Severance Tax in Illinois, so we get no tax

Regarding: NPDES IL0077666 and notice No. 7516c

benefit from them either. It is just outrageous that the people of Illinois should pay for Foresight's garbage treatment in the form of added degradation to a Water of the State. They should be required to appropriately treat this water on site before being allowed to dump it into the river. And their systems should be properly monitored and controlled with an appropriate SCADA system.

This is high sulfur, high Btu coal—the most polluting in the world. The climate crisis is upon us. The burning of coal must stop if we are to survive. It is not the time to be building out more infrastructures to tie us to more fossil fuel use when we must now learn how to use less.

For all these reasons I urge the IEPA to fulfill their legal mandate to protect our environment and hold a well publicized, timely and accessible public hearing so the people can make their concerns known. This permit should be denied.

Thank you for your consideration.

SAFE
Southern Illinoisans Against Fracturing Our Environment
PO Box 1325
Vienna, IL 62995

Mr. Darin LeCrone
Illinois Environmental Protection Agency
Water Pollution Control Permit Section
1021 North Grand Ave. East
Springfield, IL 62794-9276

Regarding: NPDES IL0077666 and notice No. 7516c

Dear Mr. LeCrone,

On behalf of all members of Southern Illinoisans Against Fracturing Our Environment, many of whom live in Williamson, Jackson and Union County, we respectfully request a public hearing for the Pond Creek application which seeks to allow upwards of 3.5 million gallons of mine waste water to be discharged into the Big Muddy River north of Murphysboro.

Our concerns are based on the results of information obtained from Freedom of Information Act, and public records.

The Permit IL0077666 for Williams Energy LLC expired in 2010 and the mine has been in non compliance for several years, releasing effluents containing excessive amounts of sulfates and chlorides, and unsafe pH levels. Only one informal enforcement action has been recorded (https://echo.epa.gov/detailed-facility-report?fid=110023026884#summary) Many reports are incomplete.

In 2018 alone, sulfite and chloride exceeded expired permit levels with 102,455 lb/yr dumped into Pond Creek Tributary. (https://echo.epa.gov/trends/loading-tool/reports/dmr-pollutant-loading?permit_id=IL0077666&year=2018) In 2017, sulfate exceeded 413,320 lb/yr and chlorides exceeded 409,744 lb/yr dumped into Pond Creek Tributary. (https://echo.epa.gov/trends/loading-tool/reports/dmr-pollutant-loading?permit_id=IL0077666&year=2017) All these bi-products eventually flow downstream into the Big Muddy River. The concentrated mining waste includes dangerous levels of chlorides and sulfates which are harmful to all aquatic life downstream, beyond the discharge point. The Big Muddy River is already impacted by permitted and pre-regulation mine pollution. The cumulative impact is not good for Southern Illinois or the Big Muddy River.

The NPDES permit expired nearly a decade ago and the Discharge Monitoring report is incomplete. Given the lack of governmental oversight and enforcement, and the lack of consequences for expired permits, neither the agency nor the affected communities have any good reason to suppose that the company is in compliance with local, state and federal regulations now, or in the future.

According to the EPA EJscreen mapper, (https://ejscreen.epa.gov/mapper/) those who live downstream of the discharge point along the Big Muddy River near Murphysboro, Illinois and to the south where the river empties into the Mississippi, are considered low income, over 65 and have less than a highschool education, which means that the impacted community that will receive the discharge waste is an Environmental Justice Community. Multiple public housing locations are in low lying areas that are prone to flooding by the Big Muddy River, and in 2019 there have been more than 145 days of water levels above flood stage due to extreme precipitation events. We think it's worth noting that the communities most impacted by additional volumes of mining waste discharge are those with the least ability to relocate to higher, safer ground.

We understand the safety of the miners is important, as are all the people and nature downstream. We request that the mine treat all wastewater onsite with reverse osmosis treatment to reduce the amount of pollutants entering the river. Since it appears the company is incapable of regular monitoring and reporting, we also request the installation of a SCADA system at the point of discharge so the public can monitor, in real time, the discharge and flow of treated water that enters the river. We also request a maximum volume of treated water to be discharged in any given event be less than 500,000 gallons, and only during times when the river is below flood stage. Or, if the lower limit cannot be achieved, we recommend the company treat the waste water on site AND install a pipeline to go all the way to the Mississippi River to avoid the sensitive ecological areas south of Murphysboro. Again, with a SCADA system at the outfall of the pipe.

There has been no assessment of cumulative water quality impacts from continued coal mining.

There has been no assessment of increased water volume with regard to flooding, sedimentation, and downstream impacts.

There has been no assessment for the large withdrawals of underground water resources and the impact and implications that might have on future groundwater resources.

And there has been no assessment of the full social, health, environmental, economic or climate cost of this mine to Illinois tax payers.

For these reasons, we ask for a public hearing for Pond Creek Mine: NPDES IL0077666 and notice No. 7516c

Sincerely,

Mr. Darin LeCrone
Illinois Environmental Protection Agency
Water Pollution Control Permit Section
1021 North Grand Ave. East
Springfield, IL 62794-9276

Regarding: NPDES IL0077666 and notice No. 7516c

Dear Mr. LeCrone,

On behalf of all members of Southern Illinoisans Against Fracturing Our Environment, many of whom live in Williamson, Jackson and Union County, we respectfully request a public hearing for the Pond Creek application which seeks to allow upwards of 3.5 million gallons of mine waste water to be discharged into the Big Muddy River north of Murphysboro.

Our concerns are based on the results of information obtained from Freedom of Information Act, and public records.

The Permit IL0077666 for Williams Energy LLC expired in 2010 and the mine has been in non compliance for several years, releasing effluents containing excessive amounts of sulfates and chlorides, and unsafe pH levels. Only one informal enforcement action has been recorded (https://echo.epa.gov/detailed-facility-report?fid=110023026884#summary) Many reports are incomplete.

In 2018 alone, sulfite and chloride exceeded expired permit levels with 102,455 lb/yr dumped into Pond Creek Tributary. (https://echo.epa.gov/trends/loading-tool/reports/dmr-pollutant-loading?permit_id=IL0077666&year=2018) In 2017, sulfate exceeded 413,320 lb/yr and chlorides exceeded 409,744 lb/yr dumped into Pond Creek Tributary. (https://echo.epa.gov/trends/loading-tool/reports/dmr-pollutant-loading?permit_id=IL0077666&year=2017) All these bi-products eventually flow downstream into the Big Muddy River. The concentrated mining waste includes dangerous levels of chlorides and sulfates which are harmful to all aquatic life downstream, beyond the discharge point. The Big Muddy River is already impacted by permitted and pre-regulation mine pollution. The cumulative impact is not good for Southern Illinois or the Big Muddy River.

The NPDES permit expired nearly a decade ago and the Discharge Monitoring report is incomplete. Given the lack of governmental oversight and enforcement, and the lack of consequences for expired permits, neither the agency nor the affected communities have any good reason to suppose that the company is in compliance with local, state and federal regulations now, or in the future.

According to the EPA EJscreen mapper, (https://ejscreen.epa.gov/mapper/) those who live downstream of the discharge point along the Big Muddy River near Murphysboro, Illinois and to the south where the river empties into the Mississippi, are considered low income, over 65 and have less than a highschool education, which means that the impacted community that will receive the discharge waste is an Environmental Justice Community. Multiple public housing locations are in low lying areas that are prone to flooding by the Big Muddy River, and in 2019 there have been more than 145 days of water levels above flood stage due to extreme precipitation events. We think it's worth noting that the communities most impacted by additional volumes of mining waste discharge are those with the least ability to relocate to higher, safer ground.

We understand the safety of the miners is important, as are all the people and nature downstream. We request that the mine treat all wastewater onsite with reverse osmosis treatment to reduce the amount of pollutants entering the river. Since it appears the company is incapable of regular monitoring and reporting, we also request the installation of a SCADA system at the point of discharge so the public can monitor, in real time, the discharge and flow of treated water that enters the river. We also request a maximum volume of treated water to be discharged in any given event be less than 500,000 gallons, and only during times when the river is below flood stage. Or, if the lower limit cannot be achieved, we recommend the company treat the waste water on site AND install a pipeline to go all the way to the Mississippi River to avoid the sensitive ecological areas south of Murphysboro. Again, with a SCADA system at the outfall of the pipe.

There has been no assessment of cumulative water quality impacts from continued coal mining.

There has been no assessment of increased water volume with regard to flooding, sedimentation, and downstream impacts.

There has been no assessment for the large withdrawals of underground water resources and the impact and implications that might have on future groundwater resources.

And there has been no assessment of the full social, health, environmental, economic or climate cost of this mine to Illinois tax payers.

For these reasons, we ask for a public hearing for Pond Creek Mine: NPDES IL0077666 and notice No. 7516c

Sincerely,

SAFE, PO Box 1325, Vienna, IL 62995

Mr. LeCrone,

Please schedule a public hearing for the Pond Creek Mine permit application. The Big Muddy River is a precious resource for Southern Illinois. It flows through some of the most scenic and unique landscapes of the Shawnee National Forest. Aquatic life in the Big Muddy and in the wetlands along it's banks should not be subjected to pollutants in the discharged water. The river should not be sacrificed for the benefit of a coal mining corporation. The people of Illinois deserve to have a public hearing to gather all evidence and comments before any action is taken on the permit application. Please schedule the hearing and let the voices of the people be heard.

Thank you,
Jennifer Reiman

Pond Creek Mine Pipeline Application
darin.lecrone@illinois.gov
NPDES IL0077666
Notice No. 7516c

Dear Mr. Lecrone:
I oppose the Pond Creek Mine's application to construct a pipeline that would dump millions of gallons of mine waste into the Big Muddy River and request a public hearing to allow public comments on a project that provides no benefits but damages the environment and people of this area.
Several years ago I put up sandbags at a friend's house that was being flooded by the Big Muddy. The first floor of her house was inundated. I can't imagine how much worse it would have been if that water were more polluted.
No environmental impact studies have been done on the long term effects of this project, including: cumulative water quality, fish and wildlife effects, bank erosion, and the social and environmental costs to the communities and individuals that live along and use the Big Muddy River.
This pipeline project would allow this corporation to externalize its costs to the public. In a true market economy this coal mine might have to concede that dealing with the wastes that it generates in an environmentally sound way costs more than it is worth to take the coal out of the ground. So by allowing this project to proceed the IEPA and IDNR and not only facilitating the poisoning of the Big Muddy River, but also hastening global climate change.
I urge the IEPA and IDNR to reject all proposals for this harmful project.

Thank you,

Sarah Heyer

Mr LeCrone,

Regarding: NPDES IL0077666 and notice No. 7516c

I am calling for a public hearing on the proposed release of toxic mine waste which would make its way into the Big Muddy River and to all other water systems into which it feeds. I believe this constitutes an unacceptable pollution of the local water systems.

The long ter effects of this release have been insufficiently studied and once it is done, there is no way to alleviate the damage it could do to both wildlife and humans.

An insufficiently studied release of these toxins is simply irresponsible.

Therefore, I ask for a public hearing for Pond Creek Mine: NPDES IL0077666 and notice No. 7516c before actions are taken which cannot be reversed or remedied

Sincerely,
Robert Morwell

RE: NPDES Permit No. IL0077666 Notice No. 7516c

Request for Public Hearing and Preliminary Comments

August 9, 2019

This letter is to request the IEPA hold a public hearing regarding your proposed NPDES Permit No. IL0077666 regarding the Williamson Energy, LLC, Pond Creek coal mine located east of Johnston City, Williamson County. The proposal of permitting 2.7 to 3.5 million gallons per day, or more, of mine water discharge containing high levels of chlorides and sulfates to the river is a concern to the entire region and the future of the Big Muddy river ecosystem.

It is my opinion that the proposed permit does not give adequate consideration of downstream impacts, including toxicity levels to invertebrates and fish on which migrating waterfowl, resident wildlife and human fishing, including commercial fishing and other activities depend. I do not see that IEPA is taking into any kind of adequate consideration the already significant levels of pollutants being discharged into the Big Muddy River watershed from currently operating and closed coal mines, agricultural run-off and other pollution along the river.

As an Illinois citizen and taxpayer, I have direct concerns in this issue. It looks to me that this coal mine is taking advantage of public resources, impacting wetlands without mitigation and in other ways putting what should rightfully be their due costs of operating onto the public and environmental resources. This mine is causing the excess contaminated water problem and should be required to pay the costs of dealing with it as due costs of doing business. This mine could change to a different area for their coal extraction, change mining techniques including doing room and pillar instead of longwall, or build a water treatment plant on their property instead of planning to use the Big Muddy River for diluting their pollution to insure their own profits. That is not right in my opinion and such practices should be ended.

I am very concerned that IEPA appears to be allowing use of an out-dated Antidegradation Assessment, found on page 11 of your Public Notice/Fact Sheet. It appears that the information lacks any specifics regarding the proposed NPDES discharge 011 at the Big Muddy River. In paragraph 7 on page 11 it has: "No adverse impacts to the receiving streams will occur as all water quality standards will be met." In a brief review of the federal EPA ECHO database it does not appear that this mine is meeting water quality standards and that is has had repeated problems in doing so for some time.

Comments and Questions:

1. Does IEPA take into consideration the history of permit compliance before approving new NDPES permits? If not, why is that?

2. The Antidegradation Statement does not have any information on the social and economic benefits of the Big Muddy River; the wetlands this proposal will impact; the values of the fishing, hunting and other recreation along and in the river; anything regarding potential costs of additional erosion or flooding or the harm to the ecosystem the addition of mine discharges could exacerbate. Can you require a new Antidegradation Statement that includes the current commercial, recreational, environmental and ecosystem social and economic benefits and has more of a total assessment instead of only what is of benefit to the mine?

3. Can IEPA require an Environmental Impact Statement for this permit? This mine should be required to provide a full EIS because of the plans to discharge directly to the Big Muddy River.

There is a large range of concerns beyond just the NPDES discharge points, including the impacts of the pipeline that will be built for discharge point 011. Pond Creek is already used for numerous discharge points and it is difficult to understand how the addition of more discharge locations will not cause problems downstream. Mine statements that no adverse impacts will occur are not reliable and cannot be accepted based on their history of permit compliance. As recently as this year, this mine was the subject of Illinois Pollution Control Board Case PCB-2019-085 filed by the Office of the Illinois Attorney General who was pursuing pollution at this mine on behalf of the IEPA.

I am very concerned about pollution loading to area surface and groundwater resources and the increasingly alarming impacts downstream affecting the Mississippi River. The catastrophic levels of pollution throughout much of the Mississippi River Basin are expanding the dead zone in the Gulf of Mexico. In addition, coal pollutants, including from mining, are a significant part of the global climate crisis which humans have caused and which is currently happening. In an October, 2018, report, the United Nations Intergovernmental Panel on Climate Change stated that if global greenhouse gas emissions continue at the current rate, our atmosphere is predicted to warm 2.7 degrees Fahrenheit above pre-industrial levels by 2040. This rise is seen as irreversible and catastrophic. I respect IEPA has specific regulations for these permit reviews, but I would like to ask: when is your agency water division going to face the issues of our time to be part of the emergency solutions needed to face climate crisis on behalf of the state of Illinois? Thank you for the opportunity to comment.

RESOLUTION 2019-R-43

A JOINT RESOLUTION OF THE CARBONDALE CITY COUNCIL AND THE CARBONDALE PARK DISTRICT BOARD OPPOSING THE WILLIAMSON ENERGY APPLICATION TO DISPOSE OF WASTE WATER INTO THE BIG MUDDY RIVER FROM THE POND CREEK MINE

WHEREAS, the City of Carbondale, Illinois, is a home rule unit of local government under the Illinois Constitution, 1970, Article VII, Section 6; and

WHEREAS, the Carbondale Park District is a public taxing authority in Jackson County, in the City of Carbondale, and has a vested interest in the health of citizens, plants, and wildlife; and

WHEREAS, Williamson Energy, a subsidiary of Murray Energy, operates the Pond Creek Mine in Franklin County, Illinois and is proposing to construct a 12-mile pipeline to discharge 3 million gallons of waste water daily into the Big Muddy River; and

WHEREAS, the waste water that Williamson Energy proposes to dump into the Big Muddy River, a public waterway, will be high in sulfates and chlorides which threaten all kinds of plants and wildlife; and

WHEREAS, the Carbondale Park District has irrigation waters and public open space which are affected by the waters of the Big Muddy River; and

WHEREAS, the Big Muddy River runs through the zoning jurisdiction of the City of Carbondale affecting Carbondale residents; and

WHEREAS, Carbondale, Jackson County, and southern Illinois are home to diverse wildlife, fauna, and natural resources; and

WHEREAS, Murray Energy has a history of violating environmental and labor standards and has paid more than $30 million in penalties associated with health, environmental, and labor violations; and

WHEREAS, Murray Energy realized over $525 million in corporate profits in 2019 alone; and

WHEREAS, in consideration of Murray Energy's regulatory track record and their ample financial resources, the Carbondale City Council and the Carbondale Park District request that the Illinois Environmental Protection Agency (IEPA) prioritize the water quality, natural resources, and public health of our residents over the financial interests of Murray Energy; and

WHEREAS, the IEPA can demonstrate its commitment to the environment and public health of the residents served by the City of Carbondale and the Carbondale Park District by denying Williamson Energy's proposal to pump polluted water into the Big Muddy River.

NOW, THEREFORE, BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF CARBONDALE, ILLINOIS AS FOLLOWS:

SECTION 1. That the Carbondale City Council and the Carbondale Park District oppose Williamson Energy's application to dispose of any waste water into the Big Muddy River.

SECTION 2. That this Resolution be spread at length upon the minute records of the City Council and Carbondale Park District.

SECTION 3. That this Resolution shall take effect upon its passage, approval, recording, and publication in pamphlet form in accordance with law.

This Resolution is adopted at a Special Joint Meeting of the Carbondale Park District and the Carbondale City Council of Carbondale, Illinois on the 12th day of August, 2019.

Subject: [External] NPDES IL0077666 Notice No. 7516c

Dear Sir:

I understand that the Illinois EPA is considering a request from Williams Energy to be allowed to dump 3.5 million gallons of toxic waste water each day into the Big Muddy River.

As a citizen of Illinois and a resident of southern Illinois I go on record as being strongly opposed to the granting of such permission.

The Big Muddy, a tributary of the Mississippi River, is the largest stream in the central and western parts our region and is one of the major rivers in the State. It is a recreational asset that flows through or near towns, villages, and environmentally sensitive areas. It is an important element of the natural and scenic landscape that citizens of this region require to promote a growing and badly needed tourist economy. What better way to undercut and ultimately destroy the very basis of such a developing industry than to allow steady pollution of one of its main attractions? Owing to the increasing difficulty of coal mining and sales to compete against natural gas, wind power, solar energy, and public opposition it will not be long before the number of tourist-related jobs in this region must exceed those of a dying coal industry.

In the final analysis, there is no moral, ethical, or economic reason why the population of this region can be expected to permit the degradation of its waters, fields, and forests to increase the profits of a single company or a class of similar corporations. It would be a tragic error to risk southern Illinois, or any other part of our great State of the damage that resulted from the Kingston (TN) or the Dan River (VA) toxic coal waste pollution, just to mention two recent examples.

Please listen to the many of the citizens of this region and refuse permission for Williams Energy to pollute and degrade the quality of the Bug Muddy River.

Thank you for your consideration.

Sincerely,

Jay Zimmerman

Dear sir,
It's your job to protect people, wildlife, and the environment. Nobody should dump wastes into a river. That's a no-brainer. Review the cancer rate in southern Illinois.....it's way above the rest of the state. Would you be responsible for possibly adding to that with wastes in our water and environment? Certainly, it's your job to protect us. So, do it.
Sincerely,
Mary Ann Stout
Anna, IL

Hello.

I would like to register my extreme concern about allowing the Pond Creek Mine to dump polluted water into the Big Muddy River (NPDES IL0077666, Notice No. 7516c). This would be disastrous for a number of reasons.

I urge you to hold a public hearing on this matter. Thank you very much.

Subject: [External] I oppose Pond Creek mine dumping wastewater into big muddy

If the water is so safe, why can't it just be poured on the ground on site? Why is a 12 mile pipe line more economical than disposing of "safe" water? This company has a history of being unsafe. I strongly oppose allowing A permit to dump waste water from Pond creek mine or any mining operation into the big muddy river.--

NPDES IL0077666 & Notice No. 7516c

Mr LeCrone,

Regarding: NPDES IL0077666 and notice No. 7516c

We the People of Illinois respectfully request a public hearing for the Pond Creek application which seeks to allow upwards of 3.5 millions gallons of mine waste water to be discharged into the Big Muddy River north of Murphysboro. This discharge includes mine process water and ground water seeping into the mine during normal operations. The mining waste will have concentrations of dangerous levels of chlorides and sulfates that will be harmful to all aquatic life downstream of the discharge point.
Big Muddy River is already impacted by permitted and pre-regulation mine pollution. The cumulative impact will not be good for Southern IL or the Big Muddy River.

There has been no assessment of cumulative water quality impacts from continued coal mining.
There has been no assessment of increased water volume with regard to flooding, sedimentation, and downstream impacts.
There has been no assessment for the large withdrawals of underground water resources and the impact and implications that might have on future groundwater resources.
And there has been no assessment of the full social, health, environmental, economic or climate cost this mine will cost IL tax payers.

For these reasons, we ask for a public hearing for Pond Creek Mine: NPDES IL0077666 and notice No. 7516c

Sincerely,
Rebecca Schlosser

Subject: [External] NPDES IL0077666 /Notice No. 7516c

Dear Mr. Lecrone,
I am writing to demand a public hearing on the Pond Creek Mine plan to discharge millions of gallons daily of toxic waste into the Big Muddy River.
This dumping of mine waste will have catastrophic impacts in several areas and communities along the Big Muddy River- and subsequently The Mississippi River, down to the Gulf of Mexico.
First I would like to state the impact of the amount of water that would be discharged daily would double the flow of the Big Muddy River, and that River is already taxed with high levels from rainfall. It will wipe out private properties along the River, it will make our bridges and infrastructure more vulnerable.
Second, and most importantly, our water ways can not be used as toxic dumping sites! We cannot put more pressure and chemicals into our eco systems and diverse biological growth systems. This is an absolute abomination that it would be considered. Our fish, turtles, snake, birds, will die! Our plants and vegetation will die! Our other wildlife that use the Big Muddy River as drinking source will die!
I am not ok with any of those things! As the head of the IEPA, you shouldn't be either.
Third, the increase in River flow will devastate our River communities. We are already seeing the flooding from rainfall that has destroyed families livlihoods. Flooding for miles and miles. This is not what I want for my communities.

I strongly OPPOSE the approval of Pond Creek Mine discharged waste water into the Big Muddy River.

I am resident of Murphysboro Illinois, the River is in my community and we don't want this!
We are trying to be good stewards of our planet, not the continuous destruction of our ecological and biological resources.

I DEMAND A PUBLIC HEARING

RE: NPDES Permit No. IL0077666 Notice No. 7516c Pond Creek Mine

Dear Mr. LeCrone,

I have been authorized by the Shawnee Chapter of Illinois Audubon Society's Board of Directors to submit the following on behalf of the organization and its membership. Please consider this as the Shawnee Chapter's official comments on the Illinois Environmental Protection Agency (IEPA) National Pollutant Discharge Elimination System (NPDES) tentative determination (draft) to issue Permit No. IL0077666 Notice No. 7516c to Williamson Energy, LLC, for the Pond Creek Mine Facility in Williamson and Franklin Counties for a total of 11 different outfalls and discharges of alkaline and acid mine discharges into Pond Creek, into unnamed tributaries of Pond Creek and into the Big Muddy River.

Founded in 1995, the purpose of the Shawnee Chapter of Illinois Audubon Society (SCIAS) is to actively promote the perpetuation of our native flora and fauna and their habitats. Our organization is the southernmost chapter of the Illinois Audubon Society, the oldest non-governmental conservation organization in the state. The majority of SCIAS members reside in southern Illinois.

Of primary concern to SCIAS are the three new designated outfalls/discharge locations of mine drainage for Pond Creek, for an unnamed tributary of Pond Creek and for the Big Muddy River (Outfall Nos. 009, 009ES and 011), especially in light of the current eight outfall/discharge locations (Outfall Nos. 001 - 008) already found on unnamed tributaries of Pond Creek. The discharges consist of alkaline and acid mine drainage from groundwater that infiltrates the mine, which averages approximately 2.7 million gallons per day, but may be as much as 3.5 million gallons. The discharged water is also known to be high in chloride and in sulfates, in concentrations above IEPA limits that are toxic to humans, to fish and other aquatic life.

Pond Creek is a tributary of the Big Muddy River, which provides habitat to a number of aquatic organisms including macro-invertebrates, fish, amphibians, reptiles and mammals. Numerous avian species also use the river for feeding, and its floodplain for feeding, roosting and nesting. The vegetation in and around the flood plain of the Big

Muddy provides important food and shelter for both aquatic organisms and terrestrial wildlife. Areas of importance for wildlife include Riverside Park in Murphysboro and the Shawnee National Forest, including Oakwood Bottoms, Little Grand Canyon and LaRue Pine Hills, all located in Jackson County.

Since the concentrations of chlorides and sulfates in this discharge are too toxic, Williamson Energy proposes mixing or diluting them for discharging into the Big Muddy River, an important public waterway of the state. While important habitat for wildlife, both the Big Muddy River and Pond Creek are already considered impaired by IEPA at the sites in questions due to sedimentation, total suspended solids, dissolved oxygen levels, chlorides and other toxins. Even though the concentrations of toxins may be more diluted, the addition of more chlorides and sulfates in waters that are already impaired, simply impair this waterway, further. The further degradation puts more stress on aquatic organisms and all others, both humans and wildlife that feed on them.

State listed, endangered and threatened animal species are known to occur in the Big Muddy River and more are known to feed on aquatic organisms found in the river. Federal and state listed, endangered and threatened plants and animals are found within the Big Muddy River floodplain. What will be the impacts from the additional volume of water, and from the additional wastewater toxins contained in the floodwaters on the rare floodplain flora and fauna?

It is not clear to us if the additional daily average of 2.7 million gallons of wastewater discharge will go directly into outfall no. 011 on the Big Muddy River, or if it will be dispersed into all three of the newly proposed outfalls (009 and 009ES). Since Pond Creek is a tributary of the Big Muddy, has IEPA considered the cumulative impacts from the newly proposed discharge along with the other eight existing outfall/discharge locations? If so what will those cumulative impacts be? What is the total volume of water and total overall pollutants?

Have studies been undertaken to consider the impacts on shoreline erosion that the additional 2.7 million gallons of water per day on river flow may have on the shoreline of the Big Muddy River? Will it create more suspended solids in the river? Total suspended solids are a pollutant already identified as causing impairment to the Big Muddy River.

Considering the overall impacts from this proposal, we believe further studies should be conducted. The project would significantly increase the volume of water in the river the impacts from the additional toxins that would be introduced into the Big Muddy River, a significant waterway that passes through and inundates important habitats during flood times at Riverside Park in the City of Murphysboro and on the Shawnee National Forest, will be far reaching. As such, we believe a project of this magnitude and of national significance should trigger a full blown Environmental Impact Statement (EIS) study under the National Environmental Policy Act (NEPA) of 1970.

It seems that some of us just have not learned the lesson that, "dilution is not the solution to water pollution!"

With consideration to the aforementioned concerns, SCIAS also respectfully asks that the public notice period ending today be extended and does formally request that IEPA conduct a public hearing on this draft NPDDES Permit No. IL0077666.

Thank you for considering these comments. Please keep SCIAS apprised as to any developments regarding this draft permit.

Sincerely,

John B. Wallace
President, Shawnee Chapter
Illinois Audubon Society

To whom it may concern:
It is the EPA's fiduciary responsibility to protect our environment! I don't even understand it was given a second thought!!! NO! Should have been the first and final answer to allowing Williamson Energy's request to dump poison into the Big Muddy River! If water accumulating in the mine is a problem, why are they just now dealing with the problem!?!? Surely, their engineers have given thought ahead of time, don't you think? Why allow them to poison the water, land, kill animal life...then pull up stakes and move on??? Oh well...what's done is done...No, stop it NOW!!! Coal is no longer king...it's not long before it's a "thing" of the past! Just look around to all the closures in So IL. Do the right thing!!! Say NO, save the BIG MUDDY!

I am writing to urge you to hold public hearings on the proposed discharge by Pond Creek of mine waste water into the Big Muddy River north of Murphysboro. There is insufficient assessment of many of the effects of this proposed discharge. There is strong community opposition to this permit and significant interest as evidenced by The Southern Illinoisan's editorial of 6/23 and again on 8/4. In addition letters to the editor have strongly opposed this permit. The mayor of Murphysboro has also expressed opposition and a resolution opposing the permit was passed unanimously tonight by a joint meeting of the Carbondale City Council and the Carbondale Park Board.

The significant potential effects and the deep community concern are ample grounds to hold a public hearing before any action is taken on this permit application.

Email: darin.lecrone@illinois.gov

RE: NPDES Permit No. IL0077666 Notice No. 7516c Pond Creek Mine

Dear Mr. LeCrone,

Please consider the following as our official comments on the Illinois Environmental Protection Agency (IEPA) National Pollutant Discharge Elimination System (NPDES) tentative determination (draft) to issue Permit No. IL0077666 Notice No. 7516c to Williamson Energy, LLC, for the Pond Creek Mine Facility in Williamson and Franklin Counties for a total of 11 different outfalls and discharges of alkaline and acid mine discharges into Pond Creek, into unnamed tributaries of Pond Creek and into the Big Muddy River.

While we have concerns about the eight existing permitted outfalls and discharges, of most concern to us are the three new designated outfalls/discharges for Pond Creek, for an unnamed tributary of Pond Creek and for the Big Muddy River (Outfall Nos. 009, 009ES and 011). We ask that the public notice period ending today be extended and we request a public hearing on this draft NPDDES permit.

Have any biological assessments been undertaken to evaluate the plan's proposed discharge of polluted water and overall increase in water volume for this river? Even though it comes from ground water, we understand that the wastewater to be discharged contains chloride and sulfate in excess of state water quality standards for such a discharge and that the wastewater discharged into the Big Muddy River is expected to average 2.7 million gallons, daily.

We are recreational users of the Big Muddy River that boat and fish on the river in Jackson County. We also bird watch, wildlife watch, botanize, hike, and camp, within the floodplain of the Big Muddy and on the nearby uplands on public land in Jackson County, downstream of the existing and proposed mine drainage discharges. We cannot imagine that our use of and appreciation for this natural resource will not be negatively impacted by this proposed upstream discharge of polluted water into the river.

What kind of impacts will this discharge have on nearby residents and communities near the Big Muddy River, downstream of the discharge? What effect will this discharge have on the floodplain? Will the increase in volume affect its flooding? How will this floodwater affect agricultural lands located in the floodplain? How will this discharge affect some of the unique areas such as Oakwood Bottoms, Little Grand Canyon, LaRue Swamp Ecological Area and other Shawnee National Forest floodplain ecosystems?

Do you know the full impacts from pumping out this quantity of polluted ground water into an above ground waterway? If pumping out this water is so important for the operation of the privately owned mine, why should the responsibility of dealing with (treating and containing) this contaminated water not fall to the mine owners/operators? Why should that responsibility of dealing with the consequences of dumping these wastes and this volume of water then also fall to the public, (i.e. taxpayers of Illinois)?

The Big Muddy River provides habitat to a number of aquatic organisms including macro-invertebrates, fish, amphibians, reptiles and mammals. Numerous avian species also use the river for feeding, and its floodplain for feeding, roosting and nesting. The vegetation in and around the flood plain of the Big Muddy provides important food and shelter for both aquatic organisms and terrestrial wildlife. Areas of importance for wildlife include Riverside Park in Murphysboro and the Shawnee National Forest, including Oakwood Bottoms, Little Grand Canyon and LaRue Pine Hills, all located in Jackson County.

What will the impacts of the discharge be on the macro-invertebrates, fish, amphibians and reptiles that inhabit the river downstream from the discharge? How about the impact on migratory waterfowl that inhabit the river and floodplain or the impact on other birds that eat the macro-invertebrates, fish or amphibians in the river that absorb or consume higher amounts of sulfates and chloride from the discharge? The concentrations of chlorides and sulfates in this discharge are too toxic. As such, Williamson Energy proposes mixing or diluting them for discharging into the Big Muddy River, an important public waterway of the state. While the Big Muddy River is important habitat for wildlife, it is already considered impaired at the proposed discharge site. According to IEPA this is due to sedimentation, total suspended solids, dissolved oxygen levels and other toxins. Even though the concentrations of toxins may be more diluted, the addition of more chlorides and sulfates in waters that are already impaired, simply impair this waterway, further. The further degradation puts more stress on aquatic organisms and all others, both humans and wildlife that use the area and feed on them.

State listed, endangered and threatened animal species are known to occur in the Big Muddy River and more are known to feed on aquatic organisms found in the river. Federal and state listed, endangered and threatened plants and animals (including golden eagle and Indiana bat) are found within the Big Muddy River floodplain. What will be the impacts from the additional volume of water, and from the additional wastewater toxins contained in the floodwaters on the rare floodplain flora and fauna?

It is not clear to us if the additional daily average of 2.7 million gallons of wastewater discharge will go directly into outfall no. 011 on the Big Muddy River, or if it will be dispersed into all three of the newly proposed outfalls (009 and 009ES). Since Pond Creek is a tributary of the Big Muddy, has IEPA considered the cumulative impacts from the newly proposed discharge along with the other eight existing outfall/discharge locations? If so what is the total volume of water and total overall pollutants and what will those impacts be?

Have studies been undertaken to consider the impacts on shoreline erosion that the additional 2.7 million gallons of water per day on river flow may have on the shoreline of the Big Muddy River? Will it create more suspended solids in the river? Total suspended solids are a pollutant already identified as causing impairment to the Big Muddy River.

Considering the overall impacts from this proposal, we believe further studies should be conducted. The project would significantly increase the volume of water in the river and would negatively impact the water quality, from the additional toxins that would be introduced into the Big Muddy River. Since the Big Muddy is a significant waterway that passes through and inundates important habitats during flood times at Riverside Park in the City of Murphysboro and on the Shawnee National Forest, the negative

impacts will be far reaching. As such, we also believe a project of this magnitude and of such significance would likely trigger an Environmental Impact Statement (EIS) study under the National Environmental Policy Act (NEPA) of 1970. Has an EIS for this project been considered?

We reiterate our request that the public notice period ending today be extended and our request for a public hearing on this draft NPDDES permit.

Please keep us informed about the status of this application and other such proposed projects that may impact the Big Muddy River. Thank you for your consideration in processing these comments.

Sincerely,

Karen J. Frailey

Hi,

Please consider this article to be my comment against dumping in the Big Muddy. In addition, I'd like to request a public hearing,

Thank you,
Rachel Cristaudo

"Voice of The Southern: The state should not turn Big Muddy River into wastewater

- Aug 4, 2019 Updated Aug 9, 2019
-

Save

EPA.

The "P" stands for protection. Not Pond Creek. And not permission.

That's our viewpoint concerning the Illinois Environmental Protection Agency making a tentative determination approving Williamson Energy's request to dump millions of gallons of wastewater into the Big Muddy River.

The proposal states that up to 3.5 million gallons of water per day could be dumped into the river. During the summer months, that figure would represent about one-tenth of the river's daily flow.

The IEPA's approval is apparently part one of a two-part process. The final ruling will come at the end of a public comment period that closes Aug. 12.

We're hoping this indicates that the "P" in EPA may stand for procedural and that the agency isn't actually considering giving the agency the green light to turn the Big Muddy River into its own private sewer.

The coal company has been required to amend its proposal more than a dozen times. At one point, it had asked to pump water with high concentrations of chlorides and sulfates, both of which are toxic to aquatic organisms, into the river.

The latest proposal apparently calls for water to be diluted through a system of tanks prior to being discharged. Frankly, this isn't any more palatable.

We understand jobs are critical to Southern Illinois. We understand much of Southern Illinois is impoverished, but what price are we willing to pay for the state to subsidize one employer?

Virtually every manufacturing operation generates waste material that needs to be disposed. This newspaper certainly does. However, it isn't the state's job to see that our waste is disposed of properly. We're not asking the people of Illinois to bury old newspapers at Giant City State Park or at Lake Murphysboro.

Nor, should we think it is acceptable for the state to grant permission to turn the Big Muddy into a Williamson Energy subsidiary. The Big Muddy River belongs to the people of Illinois. The state should not have the authority to sublet an entire river.

It's not just the newspaper opposing the project.

Recently, Murphysboro mayor Will Stephens spoke out against the request, noting that Williamson Energy had amended its request 24 times. Stephens said, correctly in our estimation, that the company lacks foresight, or at worst, isn't acting in good faith.

Which brings us to a vital point.

Who is going to make sure the discharge meets water quality standards and who is going to make sure the discharge doesn't exceed the allowable volume?

Is anyone willing to take the coal company at it's word.

The Illinois Department of Natural Resources is woefully understaffed. And, even if a violation is detected, it could be too late to prevent an environmental disaster. The Big Muddy flows through agricultural lands downstream as well as some of the most unique and sensitive biological areas in the state.

The ecological importance of the lower Big Muddy River seems to be ample justification for denying the request.

In the name of environmental protection, the use of farm chemicals is regulated to keep harmful materials from flowing into ditches, which empty into creeks, which empty into rivers. Yet, it seems the IEPA may approve the discharge of 3.5 million gallons of polluted water into one of the state's major rivers.

Finally, public sentiment, at least what we've been able to gauge, is adamantly opposed to the mine's proposal. Granted, making decisions based on group think isn't necessarily the proper course of action, but in this case, it certainly merits consideration.

It is "We the people" who will have to live with the consequences of this decision."

Mr Lecrone,

Regarding: NPDES IL0077666 and notice No. 7516c

We the People of Illinois respectfully request a public hearing for the Pond Creek application which seeks to allow upwards of 3.5 millions gallons of mine waste water to be discharged into the Big Muddy River north of Murphysboro. This discharge includes mine process water and ground water seeping into the mine during normal operations. The mining waste will have concentrations of dangerous levels of chlorides and sulfates that will be harmful to all aquatic life downstream of the discharge point.
Big Muddy River is already impacted by permitted and pre-regulation mine pollution. The cumulative impact will not be good for Southern IL or the Big Muddy River.

There has been no assessment of cumulative water quality impacts from continued coal mining.
There has been no assessment of increased water volume with regard to flooding, sedimentation, and downstream impacts.
There has been no assessment for the large withdrawals of underground water resources and the impact and implications that might have on future groundwater resources.
And there has been no assessment of the full social, health, environmental, economic or climate cost this mine will cost IL tax payers.

For these reasons, we ask for a public hearing for Pond Creek Mine: NPDES IL0077666 and notice No. 7516c

Sincerely,
Alex Trujillo

I am 100% opposed to the Pond Creek M8ne #1 being allowed to dump 3.5 million gallons of mine waste into the Big Muddy. Anyone who works for the Illinois Environmental Protection Act should be smart enough to know this is WRONG. It is dangerous to our air, water, land and wildlife. Also why doesnt Illinois get a coal severance tax from the coal companies like West Virginia and Kentucky do? Please have a public hearing. Put that public hearing notice in our LICAL newspapers and LOCAL radio stations and share the date and time with those of us who have emailed.
Use your common sense. I am 100% sure that NONE of you who work at the iepa and even the epa are part of the 1%. You and your family will suffer along with the rest of us when our land air and water is ruined!

To whom it may concern,

This is in response to the proposal that states that up to 3.5 million gallons of water per day could be released into the big muddy river by Williamson Energy. My family lives on a creek that feeds the big muddy river, when the river floods it moves this water well up into my back yard. This is the backyard in which my dog and family visit often when not under water. I am deeply concerned about the proposal not just from my prospective but the impact that it will have on the water way and the natural world that depends on the river. Please do not allow this proposal to proceed. This is not in the best interest of the people of southern Illinois or the natural habitats that we greatly treasure.

I am submitting comments for Pond Creek Mine NPDES Permit No. IL0077666, specifically regarding the portion of the permit concerning Outfall #011 which would allow significant amounts of mine wastewater to be pumped into the Big Muddy River. I am a teacher, unpaid environmental advocate, and long-term resident of southern Illinois. I am an avid hiker, kayaker, swimmer, and bicyclist. I remain in this area specifically because of the unique beauty of our area, and I frequently (at least once a week) utilize our state parks and national forest areas. I live only a few miles from the Big Muddy River and only a couple of blocks from Little Crab Orchard Creek, one of the tributaries in the Big Muddy Watershed.

I am adamantly opposed to this permit as is. At minimum, there needs to be a proper filtration system for wastewater; using a dilution method with the river's own water is not going to be able to filter millions of gallons of toxic water that is going to be discharged. The following pages list some of the concerns and questions I have after reading through the draft permit and related materials concerning this issue. I believe, they all have a direct relation to the Clean Water Act and antidegradation analysis. This is by no means an exhaustive account of my concerns.

Williamson Energy History of Violations

The Attorney General (on behalf of the people of Illinois) sued Williamson Energy February, 2019 on eight counts of violations that occurred in 2016 due to a pump failure which dumped approximately 90,000 gallons of coal slurry/acid mine discharge into an unnamed tributary of Pond Creek. An example of some of the counts include: discharging contaminants into the water; depositing contaminants onto the land; violating water quality standards for chloride and iron; and INTENTIONAL diversion of a waste stream from sediment pond to and outflow into a tributary of Pond creek. There was only one announcement in the *Marion Repu*blican regarding this case; no one requested a hearing. Williamson Energy did not admit to the violations, and the case was settled without a hearing. They only had to pay a civil penalty for $80,000 even though five of the eight counts had a $50,000 penalty (the other three had $10,000 each).

According to information provided in the Pond Creek Watershed Inventory (2019) created by Greater Egypt Regional Planning and Development Commission, Williamson Energy had over 45 outfall effluent violations between 2015 and 2017 (Source of violation history is from EPA-ECHO). Some of the pollutants include: chloride, sulfate, nitrogen, pH, manganese, and total dissolved oxygen (TSS).

Question: How many more violations have occurred since 2017? How many violations in total does Williamson Energy have? Have the impacts of these violations on aquatic life been assessed?

Question: Are there any IEPA regulations or stipulations under the Clean Water Act regarding granting new permits or additions to existing permits when the company requesting them have an extensive history of violations? Citizens do not get to keep violating law without increasing consequences (e.g. prison time, permanently losing a driving license, losing child custody, etc.). If there are not rules/regulations which can prohibit granting companies new permits and/or terminating a permit due to continued and repeated violations which cause harm to the environment and its inhabitants, then the IEPA needs to create them. Companies should not be allowed to violate laws endlessly with only monetary fines as their penalty.

p. 3 Amorelli

Question: Can the IEPA be held accountable by law for allowing a pipeline to discharge acid mine drainage with elevated concentrations of numerous pollutants into a river that is currently listed as impaired and is also a candidate for wild and scenic river designation?

There were 11 violations related to sulfates and ten to chloride in Pond Creek, a tributary of Big Muddy River (Pond Creek Watershed Inventory, Greater Egypt Regional Planning and Development Commission, 2019, p.85). In addition, the report states the following:

- "...chloride is listed as an impairment to aquatic life in the waterbody." (p.74)
- "The mine also had a number of single event violations including: improper operation and maintenance, numeric effluent, unapproved bypass, and an unauthorized discharge." (p.85)
- "Pond Creek has been listed for chloride and sedimentation/siltation impairments since 2010, and dissolved oxygen since 2012. In 2008, the stream was listed for iron, manganese, pH, total suspended solids (TSS), and fecal coliform." (p.74)
- The Illinois Integrated Water Quality Report categorizes Pond Creek as having three designated uses; aquatic life, which is not supported... (p. 72)

Water Quality

In the IEPA Big Muddy River TDML 2004 report it states that the Big Muddy River is a compromised and impaired river and is due in part because of mining operations. It states that "abandoned coal mines should be identified **in addition to other mining activity** which could contribute to manganese and sulfate concentrations..." According to the Antidegradation Analysis report (2016), the Big Muddy River is listed in the 2014 Section 303 (d) list for sedimentation/ siltation, sulfates, total suspended solids (TSS), mercury, and polychlorinated biphenyl (PCBs). The site is on the 2016 Section 303(d) list for impaired waters due to sedimentation/ siltation, TSS, mercury, PCBs, iron, dissolved oxygen, pH, and fecal coliform.

And just recently, the Upper Big Muddy River TDML Report (IEPA 2019) was released which stated that elevated concentrations of Iron and Manganese were

found in Big Muddy Watershed and according to IEPA have negative impacts on aquatic life.

> Iron TMDL: IEPA identified one segment, Andy Creek (IL_NZN-13), with elevated concentrations of dissolved iron. Elevated concentrations of dissolved iron can negatively impact aquatic species by disturbing normal metabolic and osmoregulatory functions. Aquaculture studies have also demonstrated that increased dissolved iron concentrations in the water column may negatively impact gill functionality in certain fish species and thus reduce biodiversity in certain stream environments. 4 Excessive iron within the water column may harm aquatic species such as fish and macroinvertebrates. Certain metals species dissolve in water and may be absorbed by fish and other aquatic organisms. Small concentrations of certain dissolved metals may be, in the short term, toxic to fish and aquatic species and, in the long term, may bioaccumulate in certain aquatic species.

Question: Why is the water quality standard for Iron listed on the draft permit for the Pond Creek Pipeline as 3mg/6mgL when the standard on the IEPA Water Quality Standard Report 2019 states that the acceptable level is 1mg/L?

> Manganese TMDL: IEPA identified one segment, Beaver Creek (IL_NGAZ-JC-D1), with elevated concentrations of dissolved manganese. Elevated dissolved manganese concentrations in the water column have many of the same negative effects of dissolved iron on fish species and biodiversity of the water column and benthic environments. Excessive manganese within the water column may harm aquatic species such as fish and macroinvertebrates. Certain metals species dissolve in water and may be absorbed by fish and other aquatic organisms. Small concentrations of certain dissolved metals may be, in the short term, toxic to fish and aquatic species and, in the long term, may bioaccumulate in certain aquatic species. (Upper Big Muddy River TDML Report, IEPA, 2019).

The Union of Concerned Scientists state that

> "mining operations can negatively impact water supplies, often with long-lasting effects. The fundamental issue involves contamination of nearby

p. 5 Amorelli

> rivers, lakes, and aquifers by what comes *out* of a coal mine—usually highly acidic water containing heavy metals like arsenic, copper, and lead. The process is known as **acid mine drainage**. It happens when certain substances (typically iron sulfide, FeS2, or fool's gold) is oxidized after being exposed to air and water. Runoff can change the pH of nearby streams to the same level as *vinegar* (Coal and Water Pollution, Union of Concerned Scientists,https://www.ucsusa.org/clean-energy/coal-and-other-fossil-fuels/coal-water-pollution, Accessed 7.22.2019.)

According to U.S. Fish and Wildlife, "Because acid mine drainage can destroy a stream's aquatic community for miles, many of the old mining sites are being reclaimed (Acid Mine Drainage, U.S. Fish and Wildlife, https://www.fws.gov/mountain-prairie/contaminants/acidMineDrainage.php, accessed 7.2019)

Question: Does this mean then that the IEPA is going against its own implementation plans (2004/2019) by considering granting a permit for a pipeline which will infuse the river more with elevated levels of chlorides, sulfates, manganese and other pollutants? Does this not go against the Clean Water Act?

Interestingly, there is no mention of the Pond Creek in the TDML IEPA 2019 Upper Big Muddy Watershed report, even though other tributaries are discussed.

Question: Why is Pond Creek not included in this report since according to the Greater Egypt Regional Planning and Development Commission just released a watershed-based plan (2019) which was created because of the creek being polluted? It is already polluted with some of the very pollutants the mine will be discharging such as chloride, iron, manganese, and TSS.

In 2018 and 2019, The Big Muddy River had a fish advisory for mercury by the Illinois Health Department. Mercury is one of the pollutants which is to be monitored in the acid mine discharge. The advisory for Mercury has recently been removed from the website.

p. 6 Amorelli

Question: Why has the mercury advisory suddenly been lifted?

Question: Has the fact that elevated sulfates can cause Mercury to undergo methylation into its most toxic form methylmercury according to Orem, W. in "Sulfate as a Contaminant in Freshwater Ecosystems: Sources, Impacts and Mitigation" (U.S. Geological Survey, assessed 10.2019)

Chlorides

IEPA has listed the acceptable levels for chloride concentrations in waterways as 500mg/L. According to the Pine Creek Pond Permit Application No. 456, samples taken of the mine wastewater showed high levels of both chlorides and sulfates that far exceed the acceptable level for water quality standards. The average chloride concentration of the samples taken was 2, 237 mg/L.

- The national standard for sustaining aquatic life is 230mg/L for chronic (long-term) levels and 860 mg/L for acute (short-term). (https://www.epa.gov/wqc/national-recommended-water-quality-criteria)
- Missouri revised their chloride levels in 2012 to 178mg/L for chronic and as low as 288mg/L for acute. (EPA Region 7, 2015)
- Indiana adopted new criterion in 2012 for chloride levels for Lake Michigan to be 250 mg/L. (Indiana Preliminary Adopts Revised Chloride and Sulfate Water Quality Criteria, BDlegal.com, 2019).
- According to Kentucky state website (2019), acute chloride levels ranging from 2500 to 8400 mg/L can be toxic to aquatic life such as snails, minnows, catfish, and trout.
- Another study by University of Rhode Island has much lower long-term exposure rates of 250mg/L and 860 mg/L for short-term exposure. (Hunt, Herron, & Green. *Chlorides in Fresh Water*. University of Rhode Island. March 2012)

Question: Why does Illinois EPA have much higher accepted levels of chloride than surrounding states especially since what is considered to be safe levels for aquatic life is much lower than the Illinois accepted level of 500mg/L? Why does IEPA not have both an acute and a chronic level like other states and the national standard?

p. 7 Amorelli

Question: According to the draft permit for the pipeline samples taken from the acid mine discharge showed chloride levels greater than 2,000 mg/ and levels of up to 12,000mg/L are permissible from the discharge point into the Big Muddy River. This grossly exceeds both the national and state accepted levels. How can the IEPA allow such a gross violation of its own and national regulation? 12,000mg/L would be 48x the national standard and 24x the state standard. Is it truly be diluted "immediately" and rapidly" which is what is stated in the In Section 302.102 12(e) Allowed Mixing, Mixing Zones and ZIDs (TITLE 35: ENVIRONMENTAL PROTECTION SUBTITLE C: WATER POLLUTION CHAPTER I: POLLUTION CONTROL BOARD PART 302 WATER QUALITY STANDARDS SUBPART A: GENERAL WATER QUALITY PROVISIONS, 2019)

Sulfates:

The accepted sulfate level is listed as 1250 mg/l on the draft permit; however, the average sulfate concentration taken from the Pond Creek mine wastewater was 1,940 mg/L and the IEPA antidegradation assessment states that the levels to be discharged to the Big Muddy River could be as high as 2,120 mg/L sulfate. This would be the equivalent of 476,000 pounds per day of sulfate.

According to Kentucky State website (2019). "Problems caused by sulfates are most often related to their ability to form strong acids which change the pH. Sulfate ions also are involved in complexing and precipitation reactions which affect solubility of metals and other substances."

In addition to the afore mentioned pollutants in the Big Muddy River, the IEPA has recently listed four sections (IL0029165, IL0031704, IL0027871, IL0027898) of the Big Muddy River under the Nutrient Assessment Reduction Plan/Illinois Nutrient Loss Reduction Strategy Implementation (2019). These sections of the river are all downstream from the proposed pipeline.

According to a study by Kaushal in 2005, many of our waterways are becoming victims of 'freshwater salinization syndrome', where "high levels of chloride and other salt ions can kill freshwater animals, from zooplankton at the base of the food web to insects and fish, because they make it hard for the creatures to osmotically regulate their cell's ion concentrations." Furthermore, the study

p.8 Amorelli

states that high levels of chlorides and other salts can cause more algal blooms due to dying off of algae-eating zooplankton which in turn can cause the releasing of toxins and deplete oxygen. In addition, higher salt levels can "favor invasive species that better survive in brackish water," and "at nonlethal levels, salt can stunt the reproduction and growth of freshwater organisms, lowering biodiversity and shifting the structure of the food webs." (*For Healthier Lakes, Rivers, and Drinking Water Hold the Salt*, Lockwood, D., Chemical and Engineering News, 2019).

Question: Has the IEPA considered the impact of discharging millions of gallons of unfiltered mine wastewater with elevated levels of chlorides, sulfates and other contaminants on the already elevated nutrient load of the Big Muddy River which is supposed to be being mitigated?

Question: Has the EPA taken into consideration current studies regarding effects of salination on aquatic animals?

<u>Mixing Zones</u>

There are numerous issues with the granting of this permit which could possibly violate the water quality standards as listed by the IEPA Pollution Control Board (2019):

In Section 302.102 Allowed Mixing, Mixing Zones and ZIDs.

> 4) Mixing is not allowed in waters containing mussel beds, endangered species habitat, fish spawning areas, areas of important aquatic life habitat, or any other natural features vital to the well-being of aquatic life in such a manner that the maintenance of aquatic life in the body of water as a whole would be adversely affected.

Question: Has this been determined by the IEPA/IDNR? There was no mention of this in the draft permit.

> 6) Mixing must allow for a zone of passage for aquatic life in which water quality standards are met.

p. 9, Amorelli

Question: Has this been determined? Again, there was no mention of this in the permit.

> 7) The area and volume in which mixing occurs, alone or in combination with other areas and volumes of mixing, must not intersect any area of any body of water in such a manner that the maintenance of aquatic life in the body of water as a whole would be adversely affected.

Question: Has the current state of the river (i.e. known pollutants) as well as the Sugar Creek Mine discharge pipeline been considered in determining this?

> 9) No mixing is allowed when the water quality standard for the constituent in question is already violated in the receiving water.

Question: Given that the Big Muddy River already has elevated levels of sulfates and manganese, mixing would be violating this regulation. How then can a permit be granted for a mixing zone?

> 12) The area and volume in which mixing occurs must be as small as is practicable under the limitations prescribed in this subsection (b), and in no circumstances may the mixing encompass a surface area larger than 26 acres. c) All water quality standards of this Part must be met at every point outside of the area and volume of the receiving water within which mixing is allowed. The acute toxicity standards of this Part must be met within the area and volume within which mixing is allowed, except as provided in subsection (e).
>
> e) Pursuant to the procedures of Section 39 of the Act and 35 Ill. Adm. Code 309, a person may apply to the Agency to include as a condition in an NPDES permit a ZID as a component portion of a mixing zone. The ZID shall, at a minimum, be limited to waters within which effluent dispersion is immediate and rapid. For the purposes of this subsection, "immediate" dispersion means an effluent's merging with receiving waters without delay in time after its discharge and within close proximity of the end of the discharge pipe, so as to minimize the length of exposure time of aquatic life to undiluted effluent, and "rapid" dispersion means an effluent's merging with receiving waters so as to minimize the length of exposure time of

p.10 Amorelli

> aquatic life to undiluted effluent. Upon proof by the applicant that a proposed ZID conforms with the requirements of Section 39 of the Act and this Section, the Agency shall, pursuant to Section 39(b) of the Act, include within the NPDES permit a condition defining the ZID.
>
> (TITLE 35: ENVIRONMENTAL PROTECTION SUBTITLE C: WATER POLLUTION CHAPTER I: POLLUTION CONTROL BOARD PART 302 WATER QUALITY STANDARDS SUBPART A: GENERAL WATER QUALITY PROVISIONS, 2019)

Question: With up to 5,000gals/minute or 300,000gals/hr. of mine waster discharge being permissible, how can there be an "immediate" or "rapid" dispersion to avoid having to adhere to Section 302.102, 12, (c), which states that acute toxicity standards must be met within the mixing zone. How can up to 12,000mg/l chlorides be rapidly dispersed in a small river?

Endangered Species

I am still trying to find out what species specific to Big Muddy River are Endangered or Threatened. I have contacted numerous government agencies, including: U.S. Fish and Wildlife, IDNR, IEPA, Illinois Endangered Species Protection Board, and Shawnee National Forest. No one has been able to give me any information. I have been trying since Fall 2018 after the initial hearing at IDNR.

Question 8: How can this permit be granted if none of these agencies seem to know exactly what species are endangered and threatened in the Big Muddy River Watershed as well as Pond Creek watershed?

Freshwater Mussels

Since 2018, US Fish and Wildlife Service has been under litigation for not protecting critical habitat for certain endangered mussels in 18 states, including three that occur in Illinois-Spectaclecase, Sheepnose, and Snuffbox. These and many more are protected under the 2019 Endangered Species Act. Anyone requiring federally funded or permitted projects in mussel's habitats must consult the US Fish and Wildlife Service to ensure habitat would not be damaged. There are more mussel species in the eastern U.S. than anywhere in the world;

p. 11 Amorelli

however, 70% of species are either endangered, threatened or extinct already. (Center for Biological Diversity)

According to a study conducted by the Illinois Natural History Survey, "Freshwater Mussels of the Big Muddy River" (2012), six species of mussels previously detected in the Big Muddy River were not found; although five of these are commonly found in other rivers in Illinois. These include: pink heelsplitter, pimpleback (listed as federally endangered), deertoe, creeper, fawnsfoot, plain pocketbook. 19 others were detected. "In Illinois, 25 of the 62 extant species (44%) are listed as threatened or endangered. Some of the species listed in the study that were documented in the Big Muddy River are: Lilliput, paper pondshell, pondhorn, white heelsplitter, giant floater, maple leaf, pink papershell.

The study lists the abandoned coal mines, specifically in the Murphsyboro area of the Big Muddy River, as a source of pollution. The study goes on to state that

mussels are more sensitive to sodium chloride and potassium chloride and that the current USEPA AWQC may not be protective of freshwater mussels (2013 Science Inventory). In addition, the study states that sedimentation and siltation might be causing a lack of species.

Question: Are any of the mussel species that exist in the Big Muddy watershed listed as threatened or endangered or rare? If this is not known, then it is pertinent to find out given the fact that most mussel species are now listed as threatened or endangered or already extinct and that they have been found to be sensitive to chloride levels as well as sedimentation/siltation both of which will be inflated due to the discharge of up to millions of gallons a day of acid mine discharge with extremely high levels of chloride and sulfates.

Fish Species

According to "Fishes of the Big Muddy" (1999), at least ten native fish species within a 100 year period are no longer found due to pollution, cultivation, and habitat lost. The study suggests the need for "continual vigorous reclamation of abandoned mines lands and treatment of acid mine drainage." The study goes on to say that "Big Muddy River drainage...has been subjected to an array of enviro

stresses that have permanently disrupted its hydrological cycle, and ultimately altered its fish fauna."

The following are list of fish species that were recorded at time of study: bluegill, channel catfish, largemouth bass, sauger, striped bass, white bass, white crappie, yellow bullhead.

Question: What is the current state of the fish population in the Big Muddy and how will these elevated levels of chlorides/sulfates affect them as well as possible other toxins such as manganese and iron? Are any of these species listed as endangered or threatened?

Other Endangered/Threatened Species

The alligator snapping turtle is listed as a threatened species in Illinois.

Question: Has it been determined if their habitat includes the Big Muddy Watershed?

Ecologically Sensitive Areas

The Big Muddy flows adjacent to two very ecologically diverse areas, Little Grand Canyon and La Rue Pine Hills, both of which are National Natural Registered Landmarks with many rare, threatened, and endangered plant and animal species. "LaRue-Pine Hills Ecological Area, located within the Shawnee National Forest, contains one of the finest assemblages of diverse vegetation in the Midwest. The site represents species of northern, southern, eastern, and western affinities, including 40 species rare in Illinois." (Prairie Research Institute). Some threatened and endangered animal species include the Indian Bat, Illinois chorus frog, eastern woodrat which is only located in the La Rue Pine hills area, several fish species, and many plant species. La Rue Pine Hills/Otter Pond is also a national Research Natural Area which is protected federally.

Question: Are any of these species being considered? In the draft permit, it states that there will be no adverse effects on species because water quality standards will be met. However, in the case of Williamson Energy, this is obviously not the case. Water quality standards are not met. How then can species be protected? Under the Clean Water Act, section. 101(a)2, water quality provides for the protection and propagation of fish, shellfish, and

p.13 Amorelli

wildlife. In addition, the Big Muddy River is already polluted with elevated levels of manganese, sulfates, phosphorus, mercury and has a fish advisory for PCBs. How the does adding elevated levels of chloride, sulfate and other toxins known to have adverse effects on animal and plant species permissible under this section of the Clean Water Act?

There is also a large area in southwestern Illinois listed as a Conservation Opportunity Area for La Rue Pine Hills under IDNR which includes sections of the Big Muddy River in both Jackson and Union County (IDNR, accessed 2019).

Fifty-two miles of the Big Muddy River, from S.R. 14 south of Rend Lake to Southern Illinois Airport (U.S. 51), is a candidate for the Wild and Scenic River Designation (National Rivers Inventory, 2019) and is listed as having "Outstanding Remarkable Value", exactly the area where the proposed pipeline is supposed to discharge. Due to this fact, special considerations need to be considered.

> The Council on Environmental Quality (CEQ), under 5(d)(1) Wild and Scenic River Act authority, provides guidance to federal agencies with permitting and/or granting authority for projects on or near rivers listed on the NRI. In accordance with executive memorandum, all agencies must "take care to avoid or mitigate adverse effects" to rivers identified in the Nationwide Rivers Inventory.

The following information is listed on the National Park Services website regarding rivers listed on the National Rivers Inventory:

1. Determine whether the proposed action could affect an NRI river.

- Check the current regional/state NRI list to determine whether the proposed action could affect an NRI river (i.e., is the proposed action location in the vicinity of the NRI segment).
- If an NRI river segment could be affected by the proposed action, an environmental assessment or and environmental impact statement may be required depending on the significance of the effects.

2. Determine whether the proposed action could have an adverse effect on the natural, cultural, and recreational values of the NRI segment. These values are listed as "outstandingly remarkable values" (ORVs) on the state NRI list.

p.14 Amorelli

Adverse effects on NRI rivers may occur under conditions which include, but are not limited to:

- Destruction or alteration of all or part of the free flowing nature of the river;
- Deterioration of water quality; or

3. Determine whether the proposed action could foreclose options to classify any portion of the NRI segment as wild, scenic, or recreational river areas.

- In some cases, impacts of a proposed action could be severe enough to preclude inclusion in the Wild and Scenic River System, or lower quality of the classification (e.g., from wild to recreational). If the proposed undertaking could effectively downgrade any portion of the NRI segment, you should consult with NPS.
- Proposed actions (whether uses or physical changes), which are theoretically reversible, but which are not likely to be reversed in the short term, should be considered to have the effect of foreclosing for all practical purposes Wild and Scenic River status. This is because a river segment, when studied for possible inclusion in the Wild and Scenic River System, must be judged as it is found to exist at the time of the study, rather than as it may exist at some future time.
- If a proposal, including one or more alternatives, could have an adverse effect on an NRI river, an EA, or if the effects are significant, an EIS must be prepared.

4. Incorporate mitigation/avoidance measures in the proposed action to the maximum extent feasible within the agency's authority.

Question: Has the IEPA taken into consideration that numerous sections of the Big Muddy River downstream from the pipeline are listed not only on the National Rivers Inventory but also in several state and federally listed special environmental zones and therefore has special protections?

<u>IEPA Exhibiting Conflict of Interest</u>

1) The IEPA included in the draft permit a section on social/economic benefits of the proposed activity (pipeline). Goes on to list statistics about jobs and

p. 15 Amorelli

revenue for state. My argument is that an agency that was supposedly created for the purpose of protecting our environment should not take economic nor social factors into account.

2) The IEPA also goes on to favor the mine company by stating that "filtration is a technology that is not feasible for the proposed facility because: filtration is much more expensive than sediment ponds...a large area of land would be required for such a facility, and maintenance and supervision of the filtration and sludge operation would be burdensome and would increase production costs."

Question: Is the EPA supposed to be taking into consideration financial aspects of a company in lieu of protecting the environment? Is it supposed to weigh economic benefit over protecting the environment? And why has not the IEPA commented on the economic cost to the citizens of Illinois due to pollution already caused by the mine and the pollution that will be caused by the mine? The Big Muddy River is already polluted and there are now two implementation plans that have been created by the IEPA (2004, 2019) costing hundreds of millions of dollars to implement. The mines, which are listed as one of the causes of pollution, are not held accountable for paying for these costly plans, rather the "stakeholders" and concerned citizens are told they must try to find monies to clean up the rivers. To date, no watershed-based plan group has been formed based on the 2004 findings.

<u>Illinois Constitution</u>

The Illinois Constitution in Article XI states that we have a right to a healthy environment. Since Williamson Energy has numerous and frequent violations which can have and have had adverse impacts on the watersheds and its inhabitants and the IEPA has already listed the Big Muddy River as well as some of its tributaries such as Pond Creek as being impaired for numerous pollutants some as a direct result of both past and current mining activities. It seems that IEPA would be violating the constitution for granting a permit to a company that has a history of polluting public waters and the fact that the nature of the permit would allow even more pollutants to enter the watershed.

p. 16 Amorelli

Question: Has the IEPA fully considered whether granting this permit for dumping more pollutants into the already impaired Big Muddy River will violate the law as stated in Article XI of our state constitution?

River Rights

Question: Has the IEPA considered that the river itself should have its own rights. It is already dammed and polluted? How much more should the Big Muddy River endure? The IEPA has already granted another similar permit for a discharge pipeline into the Big Muddy River with even higher expected levels of chlorides form the Sugar Camp Mine only 12.5 miles above stream from the proposed Pond Creek Mine pipeline.

And I end this with one final question to each of the IEPA staff.

Question: If this river was flowing through your backyard/property/town/county would you want millions of gallons of mine wastewater dumped into it without being filtered of all contaminants?

JB PRITZKER, GOVERNOR JOHN J. KIM, DIRECTOR

INTERNAL MEMORANDUM

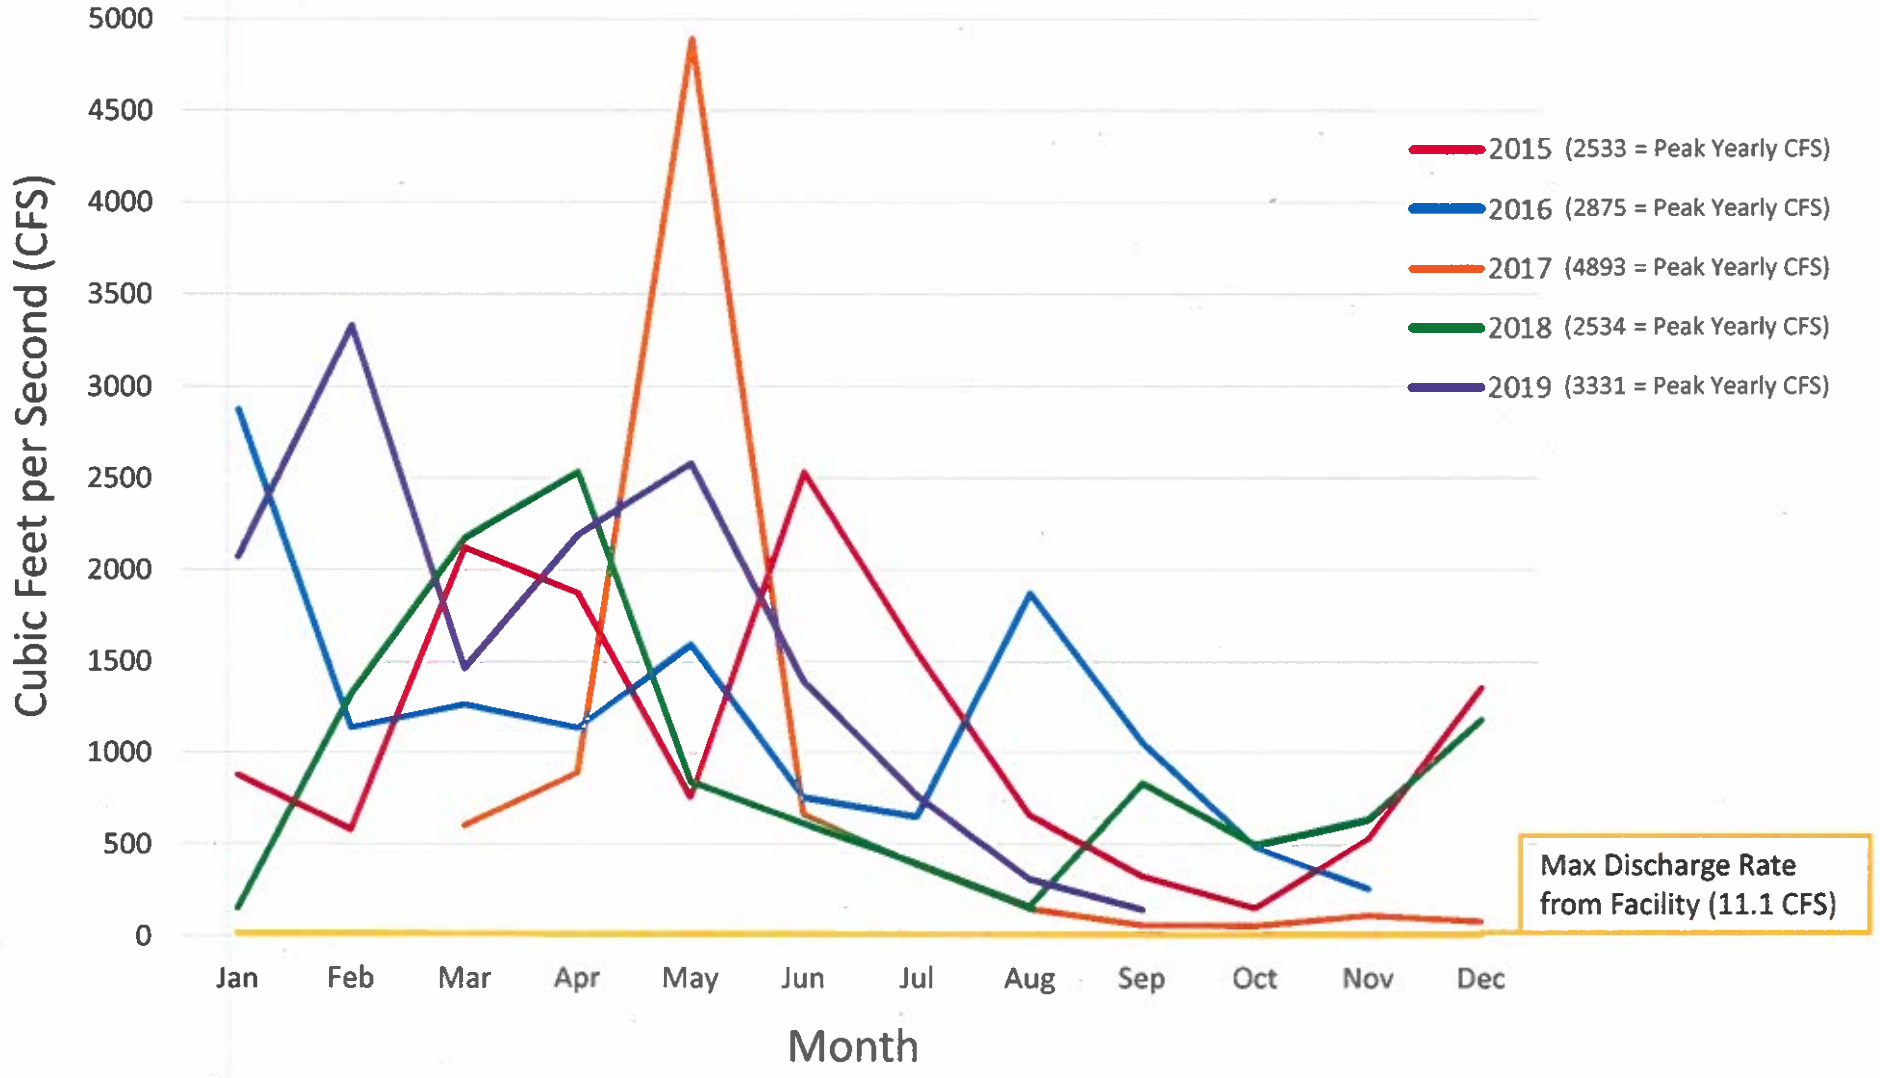
TO: **John J. Kim, Director**
Christine Zeivel, Hearing Officer

FROM: Sanjay Sofat, BOW Bureau Chief SKS

DATE: December 11, 2019

RE: **Williamson Energy Pond Creek Mine NPDES Permit Hearing Board**
NPDES Permit No. IL0077666

Pursuant to the Director's delegation of authority to appoint an NPDES Permit Hearing Board as prescribed by 35 Ill. Adm. Code 309.115, I designate the following individuals to serve as the Hearing Board for the Pond Creek Mine NPDES Permit Hearing:



1. Christine Zeivel, Hearing Officer and Board Chairperson
2. Iwona Ward, Permit Engineer, Mine Pollution Control Program
3. Darin LeCrone, Industrial Permit Section Manager
4. Scott Twait, Water Quality Standards Section
5. Amy Zimmer, Groundwater Division
6. Stefanie Diers, Division of Legal Counsel

The designated members of the Hearing Board will sit on the Illinois EPA panel at the Public Hearing to be held on Wednesday, December 18, 2019, in Marion, Illinois. The Hearing Officer will render a recommendation required by 35 Ill. Adm. Code 309.118 based upon the technical and legal advice provided by the other designated members of the Hearing Board.

Williamson Energy NPDES Renewal Public Hearing
December 18, 2019

Clayton Cross

Good Evening. My name is Clayton Cross, and I am the Director of Engineering at Foresight and Williamson Energy. Williamson Energy operates one of the safest and most productive coal mines in the entire world.

This is no mistake. Williamson Energy has invested in the best people, best systems, and best equipment to build this coal mine. In all, over $600 million has been invested into this property. We are responsible for employing 194 coal miners directly. Another 283 contractors work supplying, servicing, or performing some other activity for our operation. That means almost 500 families in this area directly depend upon the success of this mine for their livelihood – to pay their mortgages, educate their children, and buy Christmas gifts. Furthermore, every year this mine directly or indirectly generates $78 million in state, county, and local revenues. The economic boost that this mining operation provides to southern Illinois is very significant.

Given the extensive coal reserve that we have the rights to mine, this mine could be operating for another 50 years at current production levels. We need this permit renewed to keep this mine open long term and operating in an environmentally responsible manner, while ensuring that our coal miners are not exposed to the unnecessary dangers of excessive water. This mine has operated since 2006, and the purpose of this hearing is to take comments on IEPA's decision to renew and modify our NPDES permit. Generally, the NPDES permit allows us to discharge water at our mining operation under certain conditions.

Exhibit 241

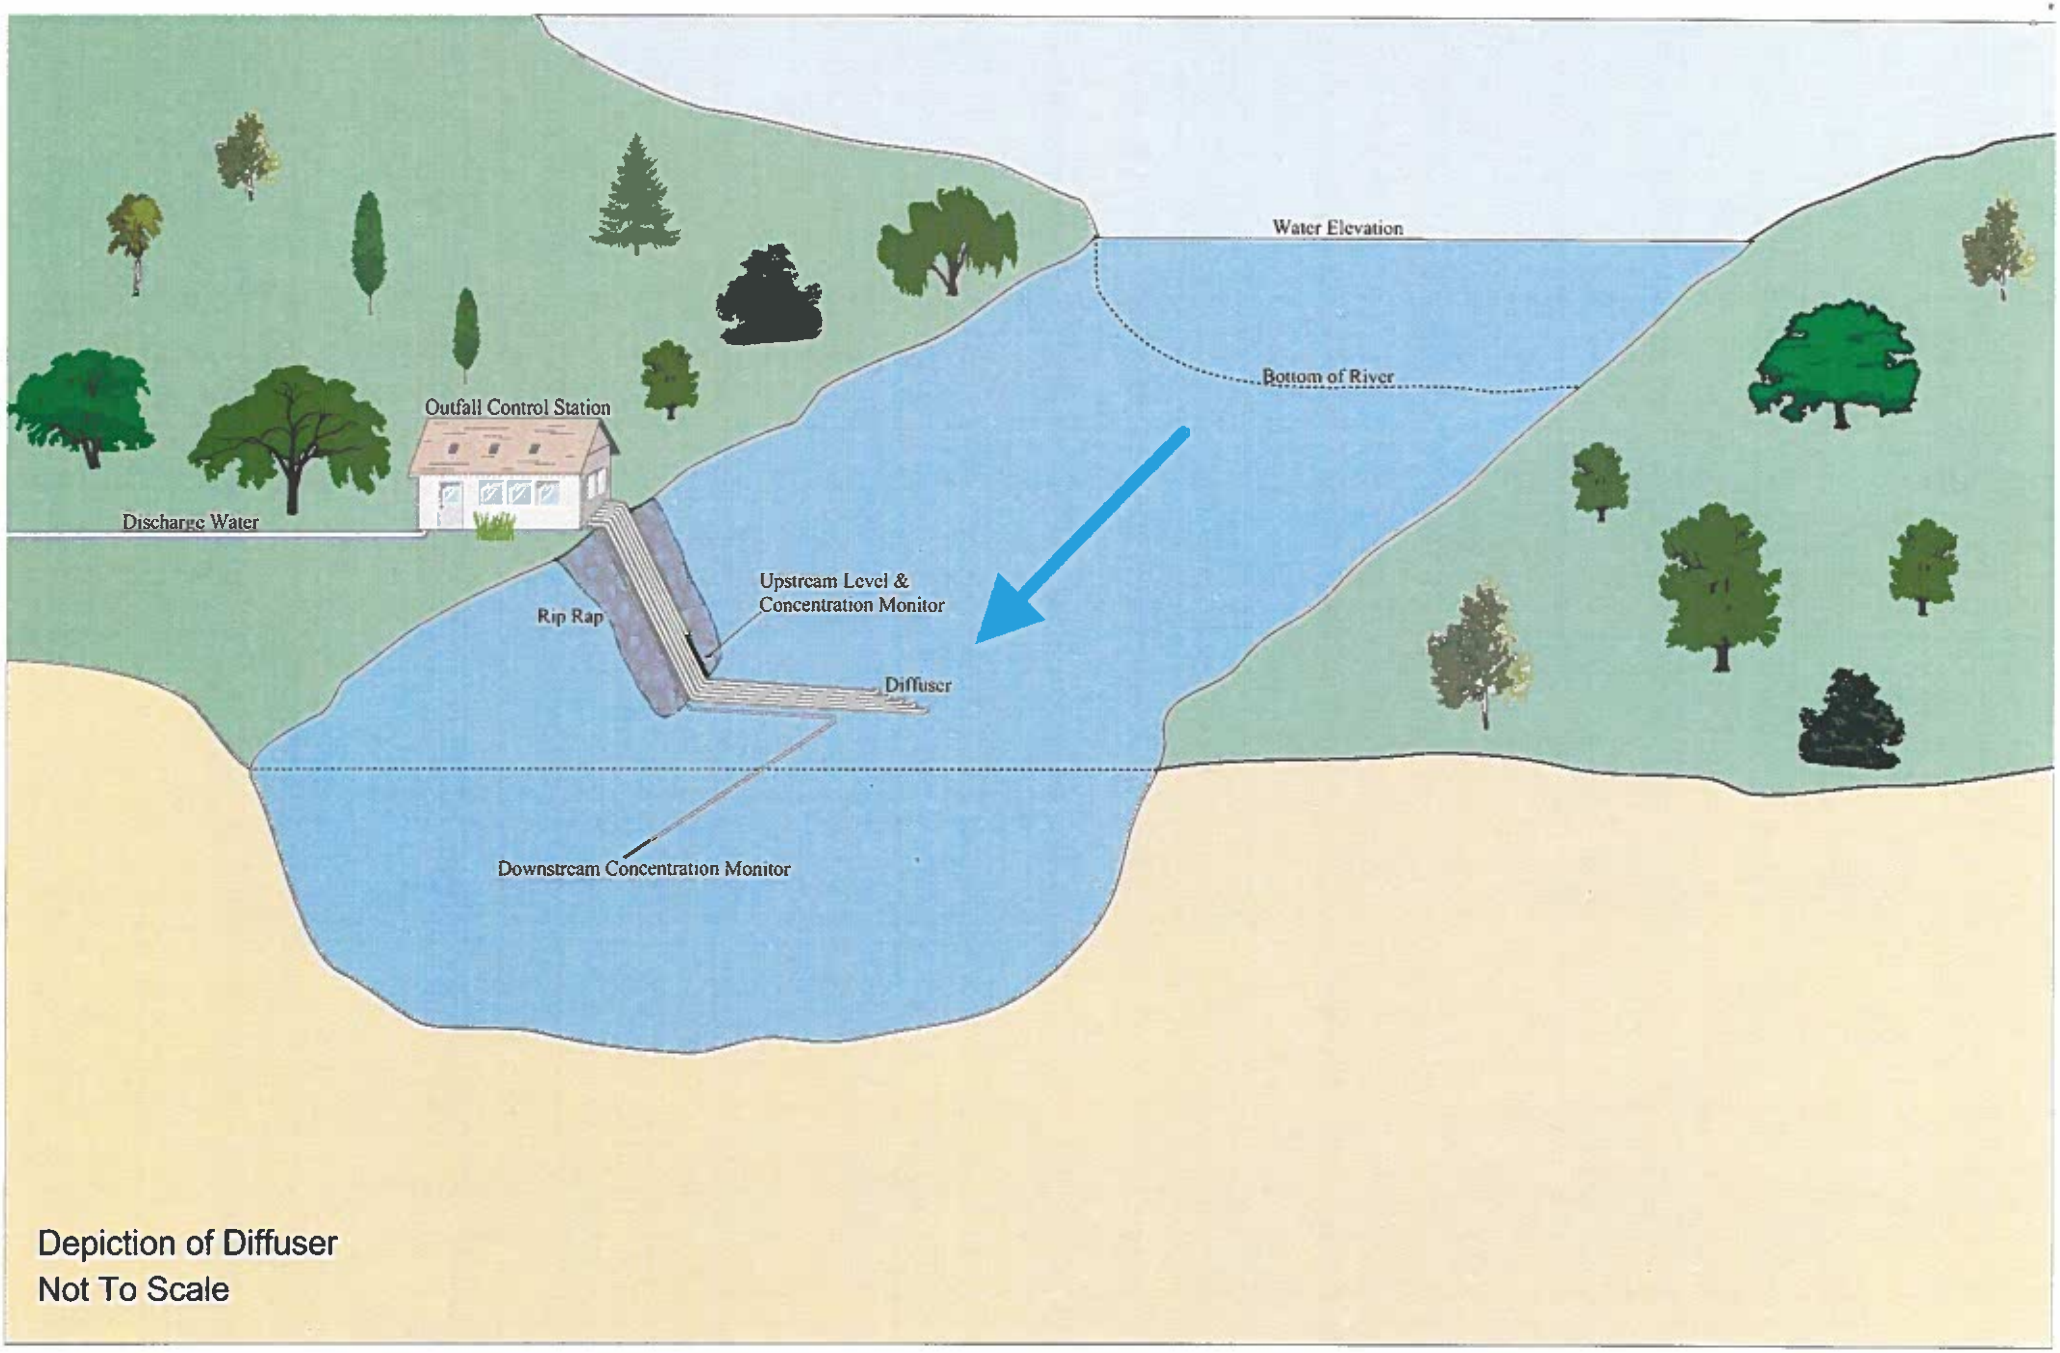
When we first started this mine in 2006, the mine was very dry, meaning we had to import almost all of our water for various uses. In other words, the mine didn't "make" much water. Now, as our mine has expanded for 13 years, we have had to handle an increasing amount of groundwater that is seeping into our mine.

This groundwater infiltrating into our underground coal mine presents two main problems for us. First, we have to get it out of the mine because the water has the ability to block our critical ventilation systems or flood escapeways out of the mine, any of which leads to serious risks to our miners. We HAVE to get the water out of the mine. We do this with pumps that bring the water to the surface, and pipelines to convey it to our main facilities.

That brings me to the second problem: the groundwater that is infiltrating our mine has naturally occurring sulfates and chlorides in it. So, one non-technical way to look at it: it's a little bit salty or what you might call "brackish" water.

Again, this little bit of "saltiness" is naturally occurring in the water. It is not caused by anything we add to the water or because the water comes into contact with our coal. But, because it is relatively "salty," we have to deal with it differently than normal water. Historically, we have stored the water in surface ponds or impoundments, but they have limited capacities. We recirculate and use as much of the brackish water as we can on site through various processes, but we still have an excess.

So, as many of you know, the plan to deal with this problem long term involves Williamson Energy building a twelve and one-half mile buried pipeline to the Big Muddy River, installing a multi-port diffuser, and tying the diffuser to real-time continuous monitors. All of these elements will work together to strategically discharge the water through a mixing zone into a water body that can easily assimilate it WITHOUT violating the water quality standard. We evaluated other alternatives – Reverse Osmosis, Evaporation, and Crystallization to name a few, but these methods consume a tremendous amount of energy and require the disposal of the concentrated cake to a separate landfill. It is not as simple as filtering the water. The salt is dissolved.



This mixing zone is not going to be just an open pipe dumping continuously into the river. There are very specific controls to make sure the discharges are compliant with water quality standards. Water quality standards are adopted and approved by both the US and Illinois EPA based on a rigorous scientific process that result in standards that are conservatively protective of aquatic life. In addition, we have reviewed the aquatic life present in the Big Muddy River in conjunction with academic experts and they have concluded that our discharges will not adversely impact aquatic life in the Big Muddy River.

We will install continuous water quality monitors upstream and downstream of the diffuser (or outfall structure). This will give us virtually continuous data on the chloride levels in the receiving water, the Big Muddy River. If we see on these monitors that the Big Muddy is not capable of accepting our water without violating a water quality standard, then we will not discharge. Instead, we will hold the water until the river can

receive it without violating the standard. This provides the ability to control the flow so that water quality standards will be met on a continuous basis.

Lastly, I wish to address the concern for increasing the flood risk. Our discharge will not have any practically measureable impact to the surface water elevation and to the flood extent. For example, we had a large rain event in this area on October 26 of this past year. It produced nearly 3.5-inches of rain. This is almost equivalent to a two year, 24-hour rain event for this area. The Big Muddy River at the Plumfield Bridge monitoring station eventually crested at a height of almost 10 feet, flowing 834 cubic feet per second – which is 374,326 gallons per minute. Again, almost 375,000 gallons per minute. If we were to pump our max capacity of just under 5,000 gallons per minute, our contribution would increase the water elevation at the Route 13 Bridge in Murphysboro by about 1.8 mm. This is equivalent to the thickness of a quarter. Not practically measurable.

Approving the requested mixing zone is the safest, most environmentally sound, and most effective way for Williamson Energy to manage its excess water to ensure miners safety and enhance our ability to meet the mandated water quality standards. We are fully committed to operating this system within the legal limits of the permit. This long-term solution will allow our first class operation to continue and support about 500 local families. Thank you.

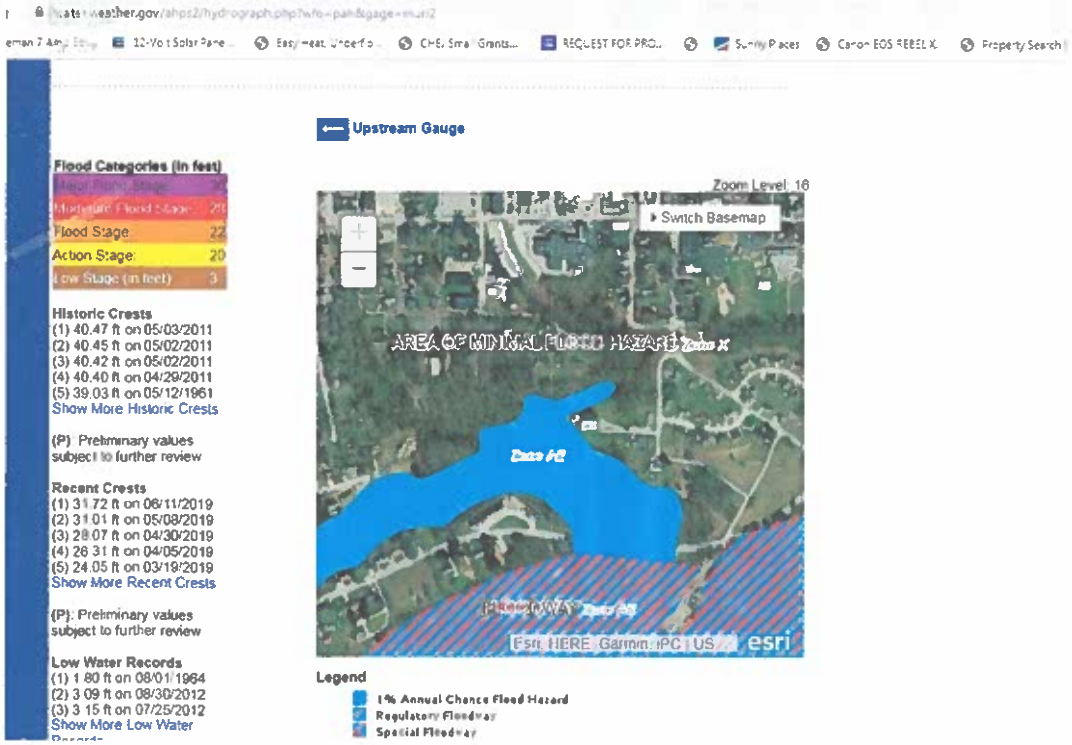
Exhibit 242

My name is Cameron Smith, I live Murphysboro, IL and I am a member of SAFE.

I am here to protect my property and I am not here to take anyone's job away from them.



My wife and I co-own the Historic Douglass School in Murphysboro.

The Frederick Douglass School was first built in 1897, way before the building of the Rend Lake Dam; it was Murphysboro's segregated school and they built it next to the Big Muddy River, back in the day when the Big Muddy was a navigable river.

Today FEMA has classified our building as being in an AE Flood Zone. So it is not a matter of **if** it will flood, it is **when** it will flood.

On May 3, 2011 the Big Muddy River reached a record high of 40.47 feet at the Murphysboro gauge station on the Route 127 Bridge. At that time the 127 Bridge was closed and under water. The river water was so high you could no longer see the guard rails on either the side of the bridge. The Route 13 Bridge was being threatened too, but remained open and was closely monitored by IDOT. During that time the flood water was so high and strong that the water was vibrating the bridge, so it was decided by IDOT to rebuild and raise the level of the Route 13 Bridge. I have to wonder if IDOT calculated for this increase of water flow.

This spring we had standing water on our property for 148 day. Most of the time the flood water goes out as fast as it comes in. But this spring the water was standing in our yard so long, that we could see hundreds if not thousands of minnows and tadpoles along the water edge. I have to wonder what the extra chlorides and sulfates will do the wildlife population?

On 11/8/2019, 8:59 am, the USGS report from the gauging station at Plumfield the river was discharging 236 cubic feet per second and at Murphysboro it was discharging 992 cubic feet per second.
https://waterdata.usgs.gov/nwis/uv?site_no=05597000%2C05350490%2C05599490&format=gif_mult_sites&PARAmeter_cd=00060&period=7

At Murphysboro the 3.5 million gallons per day ~~or 40.5 per second~~ would only be .5% to 1% increase, which doesn't sound like much. But my understanding is that the **mine** will be allowed to increase they water discharge when the Big Muddy is high. **I have to wonder what would that 1% increase of salty water will do our historic building.**

How much longer will we continue to pollute our waters and not care? I ask the IEPA to deny or delay this permit to allow further study of what the impact will have on all the people of Southern Illinois.

Exhibit 243

Public Comment: Pond Creek Mine
Permit: #IL0077666 and 7516C
Date: 12/18/2019
Marion IL

My name is Connie Schmidt. I serve as the Chairperson of the Executive Committee of the Sierra Club IL Chapter. We are a BIG Group. I represent 100,000 members and supporters across the state who are concerned that we have a clean healthy environment for all residents of IL. This includes clean water, which is what brings me here today.

The request by the Pond Creek mine owners for discharge of dirty wastewater carrying high concentrations of chloride and sulfate into the Big Muddy River is ludicrous at best. These pollutants impact aquatic life both plants and organisms by altering their ability to reproduce and killing many of them off, thus drastically impacting the ecosystem and other species who depend on those life forms.

Dumping waste into a natural resource like the Big Muddy is harmful to southern Illinois and beyond. The Big Muddy carries water to the Mississippi and on to the Gulf of Mexico. This is already an area in serious peril. In addition, the Big Muddy is important to humans. It provides tourism and recreational options to visitors and local residents, not to mention safe haven to countless fish and aquatic species. This area is also prone to flooding so the polluted waters would harm the riparian areas of the watershed as well. Endangering these factors is like shooting a healthy resource in the foot.

The plan to monitor this discharge is flawed at best. The discharge would enter the river at its bed where contaminants are more difficult to detect and the entry point is strategically placed just downstream of a monitoring system. This river does not have a rock bottom that naturally acts as a filtration. By it's very name; we know that mud lines the river basin trapping pollution within its banks. Even if the pollutants could seep through the river they would enter an aquifer that no doubt connects to human drinking water at some point. It is just not a good idea to allow pollution into a water source.

In conclusion, please deny the request to dump dirty wastewater from this mine into any water system sustaining life for recreation or creatures of our environment.

December 18, 2019

Comments prepared for the IEPA Public Hearing regarding:

NPDES Permit No. IL0077666 No. 7516c, Williamson Energy, LLC, Pond Creek Mine

On behalf of the Southern Illinois Kayak and Canoe Club, I appreciate the opportunity to submit some concerns regarding the proposed pipeline from Pond Creek Mine No. 1 and the Big Muddy River. The key issues include:

1. Although we have been assured that the discharge of 2,700,000 to 3,500,000 gallons per day of mine water into the Big Muddy will not pose a hazard to individuals using the river for kayaking and canoeing, it is difficult to believe that this will not create enough **turbulence** to pose a danger to some individuals less experienced with maneuvering around water hazards. I realize the diffusers are proposed to be placed near the bottom of the river and directed downstream, but when the water level is low, there seems to be some potential danger.
2. In addition to the turbulence issue, there is concern that the high concentrations of sulfates, chlorides, and other **pollutants** pose a danger to individuals using the Big Muddy for recreation, especially if they fall into the river in the region of the

diffusers. Will this area be clearly marked to warn people to stay away from the side of the stream where the mine water effluent is most concentrated?

3. The **Anti-degradation Assessment** is deficient because:
   a. It totally is focused on the water quality issues without giving any assessment of the impact on recreational use of the Big Muddy and the potential economic impact on reducing the Big Muddy's contribution to the region as a tourism destination
   b. The assessment identifies that the Big Muddy is already impaired due to sulfates, chlorides, and several other factors, but ignores the fact that the plan will inevitably result in MORE contamination of the river. The reality is that the proposed dumping will result in some increase in the TMDL (Total Maximum Daily Load). Just because the diffusers are located near the bottom of the river out of sight does not change the dumping impact. At best it minimizes the portion of the river that is immediately impacted and the "plume" may not be evident to observers. **We would hope that the IEPA is not saying that the pollution is acceptable, as long as the water quality limits are not exceeded.** That would be like saying that "The Big Muddy is already impaired, so what is a little more contamination?" Rather than a diffuser hidden underwater and out of sight, it would be preferable for the pipeline to dump directly and visibly into the Big Muddy for all to see the issue and be able to visibly monitor when discharge is occurring. Then folks could see the potential hazards.
4. How will the monitoring equipment be installed to ensure that it is secured when the water levels vary so drastically in that region? There are no bridges or other sturdy structures to shield the

instruments from trees and other large floating debris during flood conditions.

5. How will the diffuser vents be protected from people continuing to use the location as a dump site for large objects? (People historically have used the site to discard items into the river so the next flood will dispose of objects.)

Thank you for receiving these concerns.

Galen Thomas

Exhibit 245

DATE: August 1, 2019

TO: IEPA Bureau of Water
Water Pollution Control Permit Section
1021 North Grand Ave. East
Springfield, IL. 62794-0276

FROM: Jerry and Carolyn Worthen
3974 Watt Hill Road
Murphysboro, IL. 62966

PERMIT: NPDES IL0077666 NOTICE NO. 7516C

We are responding to the Pond Creek Mine dumping waste in to The Big Muddy River.

The Worthen farm has been in the family since 1836. We raise grain and have cattle. It is registered with The state of Illinois as a "Centennial Farm". This farm is located 5 miles southwest of Murphysboro on The Big Muddy River. The farm is prime bottom ground and is susceptible to flooding. This year our whole farm was flooded and prevented us from planting. Our son does the planting as I am disabled. We have hopes of the farm being carried through for generations. This farm is our living. So is the mine going to compensate us for that?

We find the dumping of waste water, will contaminate our ground, kill fish, and wildlife, cause erosion, and high water. Not only is that our concern, but those who have farm wells will have contaminated drinking water. The Big Muddy runs into the Mississippi - more land and water contamination. No end to it!

There are many farms and towns up and down the river. What kind of an effect would that cause them?

Since when did the IEPA, not protect all ground and waterways, at our cost? If this goes through it will be a disaster and cause hardship for those of us just trying to make an honest living. The mine is taking advantage of a lot of people's lives. We request a meeting with the Illinois EPA in our area, Southern Illinois!

Re: Pond Creek Mine NPDES
Illinois Environmental Protection Agency
1021 North Grand Avenue East
P. O. Box 19276
Springfield, IL 62794-9276

Below are my comments on the proposed revised NPDES permit No. IL0077666 for Pond Creek Mine for the hearing on December 18, 2019. I reserve the right to add written comments during the comment period ending on January 17, ~~2019~~ 2020

I live near the Big Muddy River and often visit natural areas that are impacted by the Big Muddy River, such as LaRue - Pine Hills National Natural Landmark and Little Grand Canyon. LaRue-Pine Hills is currently one of the most biologically diverse areas in the United States – in competition with Smoky Mountain National Park. I have spent many hours in efforts to combat invasive species in the area, especially in the area next to LaRue Swamp, which is commonly referred to as the area along Snake Road, in order to help preserve the many native plants in that area. I am very active in Shawnee Group Sierra Club, which has sponsored many nature walks at LaRue-Pine Hills. I have also participated in hikes through Little Grand Canyon, sponsored by Shawnee Group. Both of those places are highly impacted whenever the Big Muddy River floods.

I have hiked, gone wildlife viewing, enjoyed the wildflowers and just enjoyed the beautiful views of these areas. I would hate to see them damaged by the proposed increased pollution from the mine discharge. Considering the increased pollution, I certainly hope that Shawnee Group Sierra Club will be able to be confident in sponsoring canoe outings on the Big Muddy River with the proposed increased pollution.

The record of violations – past and present – by Williamson Energy at the Pond Creek Mine does not give me confidence, especially with such a complicated proposal For outfall 011 that will vary with the volume of water from the mine, the volume of water in the Big Muddy River and the variation in the amount of chlorides, sulfates and heavy metals concentrations. How will IEPA verify that all these calibrations will work so that the effluent will stay within the limits of the regulations? Is that why IEPA is allowing huge fluctuations of the sulfates and chlorides – sometimes far above the standards set by the regulations? Even with a diffuser, what gives IEPA any confidence that there will not be acutely high concentrations that can gravely harm the fish, macroinvertebrates, mussels, plants and other wildlife that depend on the Big Muddy River, especially near the #011 outflow location? Science has shown that organisms have trouble regulating osmosis through their tissues with such high concentrations of chlorides. How current are surveys of fish and macroinvertibrates in Pond Creek and the Big Muddy River? Shouldn't IEPA conduct these surveys before granting this permit so that you will be better prepared to know how much the aquatic life is being affected by the effuluent from Pond Creek Mine?

The fact that the bond required for the discharge pipe into the Big Muddy does not cover harm caused by the effluent does not give me confidence. It also is another instance of a corporation taking profits

by polluting the environment and then leaving the cost of the clean-up to the public. The people and environment of Illinois are already continuing to pay the price of acid mine drainage from abandoned mines. Why is Williamson Energy not required to put up a bond for repairing damage that may be caused by their operations - that is - damage to the Big Muddy River wildlife and the people who depend on the Big Muddy for recreation? What if there is a big fish kill – can IEPA hold Williamson Energy responsible and charge them reparations for the damage? Can Williamson Energy be held responsible for restoring fish populations? Murray Energy, the parent company, filed for bankruptcy in October of this year, and the stock of Foresight Energy, and affiliate of Williamson Energy, has dropped to around eight cents per share. So we must ask: what is the financial status of Williamson Energy? Would they be able to ameliorate or mitigate any harmful events? Does the corporation and IEPA expect public funds and the environment to absorb the costs?

I am concerned that the proposed location of the Downstream Monitoring Probe is too far downstream to measure and evaluate the level of pollutants at the outfall. The permit specifies that "This downstream monitoring shall be performed a sufficient distance downstream of the associated outfall to ensure that complete mixing has occurred." If the mine places the probe further downstream, they gain additional mixing. Why are they not required to monitor as close as possible to the edge of the designated mixing zone, which is the point of compliance? Is IEPA encouraging Williamson Energy to cheat?

I am also concerned about the Outfall 009, which goes into Pond Creek, which has been designated in the past as impaired by chloride in TMDL evaluation. Pond Creek is listed in the public notice and appears to be impaired for chlorides. Why are you proposing to grant the mine a

mixing zone for chlorides at the Pond Creek outfall if the Big Muddy River is already impaired? Why was the level of chlorides in Pond Creek found by IEPA to no longer be of concern by the recent TMDL assessment when it already has been measured at or near the maximum of 500mg/L? According to the Pond Creek Watershed Inventory (2019) created by Greater Egypt Regional Planning and Development Commission (p. 74), "Pond Creek has been listed for chloride and sedimentation/siltation impairments since 2010, and dissolved oxygen since 2012. In 2008, the stream was listed for iron, manganese, pH, total suspended solids (TSS), and fecal coliform."

Methyl mercury is known to cause serious nerve and organ problems in humans. Will the increased chloride and total dissolved solids levels in the Big Muddy River cause higher methyl mercury levels? Will the acid mine drainage allowed in this permit also increase the conversion of mercury to methyl mercury? Can IEPA assure us that it will not? We know that there is commercial fishing and recreational fishing in the Big Muddy River. Because of bioaccumulation of heavy metals up the food chain, we are concerned that anyone eating catfish, bass or other predatory fish will be harmed. Has IEPA evaluated the possible harm to humans from increased methyl mercury that could be caused by granting this permit? According to <science direct.com> "Mercury speciation, which is affected by chloride, will impact mercury bioavailability to methylating bacteria, affecting subsequent MeHg production and bioaccumulation in these systems." Also, the Illinois Department of Public Health has issued a methyl mercury advisory for predator fish in all the waters of the state.
<http://www.idph.state.il.us/envhealth/factsheet/fishadv.htm>

In summary, considering these concerns, I am opposed to IEPA granting this permit number IL0077666 to Williamson Energy, LLC or Foresight Energy or Mach Mine or whatever they are going to call themselves tomorrow.

Sugar Camp mine, with the same owner, will be discharging into this same stream, with high amounts of chlorides and sulfates and heavy metals. These permits should not be considered in isolation. . Assuming that they operate their discharge correctly, they plan to put enough chloride into the river to raise a quarter of the river to 500 mg/l. By the time that water reaches the downstream Pond Creek mine discharge, the entire river will have a chloride concentration of 147 mg/l. If Pond Creek is also discharging at its limit, the river downstream of Pond Creek will now be around 240 mg/l - the entire stream. This isn't just worst case. This is the likely result because the mines are expanding and judging from the Williamson Energy statement that they will have to discharge continuously in order to try to stay under the limits, it is very likely that there will be times when there are huge spikes of the pollutants.

PETITION TO PROTECT BIG MUDDY RIVER

Exhibit 247

The People of IL call on Governor Pritzker to Protect Big Muddy River from further degradation. We ask Governor Pritzker to en pre- treat the mining waste water with reverse osmosis treatment to remove salts, chlorides and heavy metals , install a SCADA line, real time water monitoring) at the point of discharge and to reduce the volume of treated water to less than 500,000 gallo when the Big Muddy River is below flood level.

PETITION TO PROTECT BIG MUDDY RIVER

The People of IL call on Governor Pritzker to Protect Big Muddy River from further degradation. We ask Governor Pritzker to ensure that Williamson Energy LLC pre- treat the mining waste water with reverse osmosis treatment to remove salts, chlorides and heavy metals , install a SCADA monitoring system (public on-line, real time water monitoring) at the point of discharge and to reduce the volume of treated water to less than 500,000 gallons per discharge event and only when the Big Muddy River is below flood level.

What is Acid Mine Drainage

Sources of Non-point Source Pollution

Acid Mine Drainage (AMD) is currently the main pollutant of surface water in the mid-Atlantic region. AMD is caused when water flows over or through sulfur-bearing materials forming solutions of net acidity. AMD comes mainly from abandoned coal mines and currently active mining. AMD degrades more than 4,500 stream miles in the mid-Atlantic region with the loss of aquatic life, and restricts stream use for recreation, public drinking water and industrial water supplies.

What is Mine Drainage?

- Mine drainage is metal-rich water formed from chemical reaction between water and rocks containing sulfur-bearing minerals.
- The runoff formed is usually acidic and frequently comes from areas where ore or coal mining activities have exposed rocks containing pyrite, a sulfur bearing mineral.
- Metal-rich drainage can also occur in mineralized areas that have not been mined.

How does Mine Drainage Occur?

- Mine drainage is formed when pyrite, an iron sulfide, is exposed and reacts with air and water to form sulfuric acid and dissolved iron.
- Some or all of this iron can precipitate to form the red, orange, or yellow sediments in the bottom of streams containing mine drainage
- The acid runoff further dissolves heavy metals such as copper, lead, mercury into ground or surface water
- The rate and degree by which acid-mine drainage proceeds can be increased by the action of certain bacteria.

Problems Associated with Mine Drainage

- Contaminated drinking water
- Disrupted growth and reproduction of aquatic plants and animals
- Corroding effects of acid on parts of infrastructure such as bridges

Acid Mine Drainage

- Mines built as early as the 1800's were developed in a manner which utilized gravity drainage, to avoid excessive water accumulation in the mines
- As a result, water polluted by acid, iron, sulfur and aluminum drained away from the mines and into streams

Results of Acid Mine Drainage

- Acid mine drainage is one of Region 3 most serious water pollution problems
- It is not only an ecological concern to the states but an economic concern as well

Economic Concerns Resulting from Acid Mine Drainage

- A region impacted by acid mine drainage often has a decline in valued recreational fish species such as trout as well as a general decline in outdoor recreation and tourism along with contamination of groundwater drinking supplies

Big Muddy River threatened

My name is Karl Finley. I am 72 years old and have lived on the river all my life in Murphysboro. I have been a commercial fisherman since I was 15. I am currently the president of the so. Ill. waterfowl assoc. which represents the southern 9 counties in Ill.

This river is the lifeblood of the region from Rend Lake to the Mississipi. The entire ecological system is being threatened by this proposal.

All the fish, waterfowl, wildlife, trees and adjoining lands will be decimated by this waste water. The good lord made this river for us and I'm sure he didn't intend for it to be turned into a sewer from any coal mines.

This poison water will kill fish. Bald Eagles nesting along the river will feed these fish to their young and wipe out generations of eagles. All species of waterfowl use this river year around. Especially in the spring they feed on invertebrates in the water to get the protein to sustain their northward migration.

Extended periods of high water will kill trees and ruin farmland.

The coal mines need to build their own wastewater plants and not be

allowed to ruin our beautiful river. I pray that government agencies will not allow this to happen. In God we trust.

Exhibit 251

December 18, 2019
IEPA Pond Creek Mine Hearing
IL0077666
Marion, IL

My name is Christina Krost. I am the Southern Illinois Outreach Coordinator for Faith in Place, an interfaith creation care and environmental justice organization. I live near Harrisburg and do outreach and organizing all over southern IL. I'm a person of faith, a mother, and a concerned citizen.

Thank you for holding this hearing today. I appreciate the chance to explain why I am **opposed to the approval of the Pond Creek Mine permit,** because I feel the activities at the mine threaten human health and the environment for all Illinoisans, and the plants and animals living in the Big Muddy River watershed.

Water is life. Without it we cannot survive. This truth echoes through the generations and across all faiths and cultural backgrounds. People have also long known that everyone is downstream or downwind of someone, so it's important to steward the land, air, and water where you live, so you don't adversely affect your neighbors.

This permit includes a 12.5 mile pipeline for discharge of millions of gallons of high chloride and sulfate water to dump directly into the Big Muddy River near West Frankfort. As a parent and concerned citizen, I did some research about the public health impacts of chloride and sulfate in water. It turns out that these pollutants can cause gastrointestinal tract problems such as diarrhea, nausea, inflammatory bowel disease, and consequent dehydration from these conditions. This is a threat to public health.

I also learned that chloride increases the corrosivity of water and reacts with metal ions, increasing levels of metals in drinking water. I am acutely aware of the dangers of heavy metals poisoning, as I grew up not far from Flint, MI. But we don't have to go very far to see the effects of this in Illinois. In 2016, one in five Chicago homes tested had high levels of lead, even after running the water for 3-5 minutes before using the water. What we've learned from Flint is that when the public is kept in the dark about water issues, like this mine permit, terrible things can happen and then be covered up.

My research also led to a better understanding of how water travels from the Big Muddy River. The Big Muddy basin includes Kinkaid Lake, Rend Lake, Crab Orchard Lake, Devil's Kitchen Lake, Little Grassy Lake and Cedar Lake. Of particular concern to me is Little Grassy Lake.

My husband is a United Methodist pastor, and my family has been attending camp at Little Grassy United Methodist Camp for many years. To learn that this mine discharge could affect my family's beloved camp was deeply concerning. I've watched countless families and young adults deepen their spiritual relationship with their Creator through

their time at Little Grassy. This place changes lives. I cannot stand by and let this place be harmed because of a company's pursuit of profit at the expense of a beautiful natural resource.

As a mother and a person of faith, I must speak out about potential harm to my children and my neighbor's children. As a southern Illinois resident, I must ask you to consider the impact of this mine discharge on our shared land, air and water, and the people and wildlife sustained by it. And as an environmental justice advocate, I urge you to assure that communities are not abandoned by polluters who refuse responsibility for their pollution should a disaster occur. Please consider cumulative impacts of pollution on vulnerable communities and on the plants and animals that call the Big Muddy River their home.

IEPA, you have a chance to assure safe drinking water for my children, your children, and the next generation to come. Please do not approve this permit.

Thank you again for hosting this hearing. And thank you for working to protect the environment and Illinois residents.

Exhibit 252

December 18, 2019
IEPA Pond Creek Mine Hearing
IL0077666
Marion, IL

My name is Madeline Krost. I am a high school freshman and I live in Harrisburg.

I've been going to Little Grassy United Methodist Camp since I was in 4th grade. I've experienced swimming in Little Grassy Lake and hiking its shores. The lake is so clear you can see the fish moving under you. I've made clam shell sand castles on the beach. There are more butterflies there than I've ever seen anywhere else.

My mom told me about how water travels from the Big Muddy River and then to Little Grassy Lake. And she said that there's a mine that wants to dump waste water into the Big Muddy River.

To learn that this mine discharge could affect my family's favorite camp was upsetting. What would happen to the plants and animals that live in Little Grassy Lake? Will it still be safe for us to swim in? It makes me sad to think that it might not always be there and be safe for us to enjoy.

IEPA, I am asking you to not approve this permit for the Pond Creek Mine.

Thank you for hosting this hearing. And thank you for working to protect the environment and Illinois residents.

Carbondale, IL 62901
618-771-0154
Earthwater365@gmail.com

I am submitting comments for Pond Creek Mine NPDES Permit No. IL0077666, specifically regarding the portion of the permit concerning Outfall #011 which would allow significant amounts of mine wastewater to be pumped into the Big Muddy River. I am a teacher, unpaid environmental advocate, and long-term resident of southern Illinois. I am an avid hiker, kayaker, swimmer, and bicyclist. I remain in this area specifically because of the unique beauty of our area, and I frequently (at least once a week) utilize our state parks and national forest areas. I live only a few miles from the Big Muddy River and only a couple of blocks from Little Crab Orchard Creek, one of the tributaries in the Big Muddy Watershed.

I am adamantly opposed to this permit as is. At minimum, there needs to be a proper filtration system for wastewater; using a dilution method with the river's own water is not going to be able to filter millions of gallons of toxic water that is going to be discharged. The following pages list some of the concerns and questions I have after reading through the draft permit and related materials concerning this issue. I believe, they all have a direct relation to the Clean Water Act and antidegradation analysis. This is by no means an exhaustive account of my concerns.

Williamson Energy History of Violations

The Attorney General (on behalf of the people of Illinois) sued Williamson Energy February, 2019 on eight counts of violations that occurred in 2016 due to a pump failure which dumped approximately 90,000 gallons of coal slurry/acid mine discharge into an unnamed tributary of Pond Creek. An example of some of the counts include: discharging contaminants into the water; depositing contaminants onto the land; violating water quality standards for chloride and iron; and INTENTIONAL diversion of a waste stream from sediment pond to and outflow into a tributary of Pond creek. There was only one announcement in the *Marion Repu*blican regarding this case; no one requested a hearing. Williamson Energy did not admit to the violations, and the case was settled without a hearing. They only had to pay a civil penalty for $80,000 even though five of the eight counts had a $50,000 penalty (the other three had $10,000 each).

According to information provided in the Pond Creek Watershed Inventory (2019) created by Greater Egypt Regional Planning and Development Commission, Williamson Energy had over 45 outfall effluent violations between 2015 and 2017 (Source of violation history is from EPA-ECHO). Some of the pollutants include: chloride, sulfate, nitrogen, pH, manganese, and total dissolved oxygen (TSS).

Question: How many more violations have occurred since 2017? How many violations in total does Williamson Energy have? Have the impacts of these violations on aquatic life been assessed?

Question: Are there any IEPA regulations or stipulations under the Clean Water Act regarding granting new permits or additions to existing permits when the company requesting them have an extensive history of violations? Citizens do not get to keep violating law without increasing consequences (e.g. prison time, permanently losing a driving license, losing child custody, etc.). If there are not rules/regulations which can prohibit granting companies new permits and/or terminating a permit due to continued and repeated violations which cause harm to the environment and its inhabitants, then the IEPA needs to create them. Companies should not be allowed to violate laws endlessly with only monetary fines as their penalty.

p. 3 Amorelli

Question: Can the IEPA be held accountable by law for allowing a pipeline to discharge acid mine drainage with elevated concentrations of numerous pollutants into a river that is currently listed as impaired and is also a candidate for wild and scenic river designation?

There were 11 violations related to sulfates and ten to chloride in Pond Creek, a tributary of Big Muddy River (Pond Creek Watershed Inventory, Greater Egypt Regional Planning and Development Commission, 2019, p.85). In addition, the report states the following:

- "...chloride is listed as an impairment to aquatic life in the waterbody." (p.74)
- "The mine also had a number of single event violations including: improper operation and maintenance, numeric effluent, unapproved bypass, and an unauthorized discharge." (p.85)
- "Pond Creek has been listed for chloride and sedimentation/siltation impairments since 2010, and dissolved oxygen since 2012. In 2008, the stream was listed for iron, manganese, pH, total suspended solids (TSS), and fecal coliform." (p.74)
- The Illinois Integrated Water Quality Report categorizes Pond Creek as having three designated uses; aquatic life, which is not supported... (p. 72)

Water Quality

In the IEPA Big Muddy River TDML 2004 report it states that the Big Muddy River is a compromised and impaired river and is due in part because of mining operations. It states that "abandoned coal mines should be identified **in addition to other mining activity** which could contribute to manganese and sulfate concentrations..." According to the Antidegradation Analysis report (2016), the Big Muddy River is listed in the 2014 Section 303 (d) list for sedimentation/ siltation, sulfates, total suspended solids (TSS), mercury, and polychlorinated biphenyl (PCBs). The site is on the 2016 Section 303(d) list for impaired waters due to sedimentation/ siltation, TSS, mercury, PCBs, iron, dissolved oxygen, pH, and fecal coliform.

And just recently, the Upper Big Muddy River TDML Report (IEPA 2019) was released which stated that elevated concentrations of Iron and Manganese were

found in Big Muddy Watershed and according to IEPA have negative impacts on aquatic life.

> Iron TMDL: IEPA identified one segment, Andy Creek (IL_NZN-13), with elevated concentrations of dissolved iron. Elevated concentrations of dissolved iron can negatively impact aquatic species by disturbing normal metabolic and osmoregulatory functions. Aquaculture studies have also demonstrated that increased dissolved iron concentrations in the water column may negatively impact gill functionality in certain fish species and thus reduce biodiversity in certain stream environments. 4 Excessive iron within the water column may harm aquatic species such as fish and macroinvertebrates. Certain metals species dissolve in water and may be absorbed by fish and other aquatic organisms. Small concentrations of certain dissolved metals may be, in the short term, toxic to fish and aquatic species and, in the long term, may bioaccumulate in certain aquatic species.

Question: Why is the water quality standard for Iron listed on the draft permit for the Pond Creek Pipeline as 3mg/6mgL when the standard on the IEPA Water Quality Standard Report 2019 states that the acceptable level is 1mg/L?

> Manganese TMDL: IEPA identified one segment, Beaver Creek (IL_NGAZ-JC-D1), with elevated concentrations of dissolved manganese. Elevated dissolved manganese concentrations in the water column have many of the same negative effects of dissolved iron on fish species and biodiversity of the water column and benthic environments. Excessive manganese within the water column may harm aquatic species such as fish and macroinvertebrates. Certain metals species dissolve in water and may be absorbed by fish and other aquatic organisms. Small concentrations of certain dissolved metals may be, in the short term, toxic to fish and aquatic species and, in the long term, may bioaccumulate in certain aquatic species. (Upper Big Muddy River TDML Report, IEPA, 2019).

The Union of Concerned Scientists state that

> "mining operations can negatively impact water supplies, often with long-lasting effects. The fundamental issue involves contamination of nearby

> rivers, lakes, and aquifers by what comes *out* of a coal mine—usually highly acidic water containing heavy metals like arsenic, copper, and lead. The process is known as **acid mine drainage**. It happens when certain substances (typically iron sulfide, FeS2, or fool's gold) is oxidized after being exposed to air and water. Runoff can change the pH of nearby streams to the same level as *vinegar* (Coal and Water Pollution, Union of Concerned Scientists,https://www.ucsusa.org/clean-energy/coal-and-other-fossil-fuels/coal-water-pollution, Accessed 7.22.2019.)

According to U.S. Fish and Wildlife, "Because acid mine drainage can destroy a stream's aquatic community for miles, many of the old mining sites are being reclaimed (Acid Mine Drainage, U.S. Fish and Wildlife, https://www.fws.gov/mountain-prairie/contaminants/acidMineDrainage.php, accessed 7.2019)

Question: Does this mean then that the IEPA is going against its own implementation plans (2004/2019) by considering granting a permit for a pipeline which will infuse the river more with elevated levels of chlorides, sulfates, manganese and other pollutants? Does this not go against the Clean Water Act?

Interestingly, there is no mention of the Pond Creek in the TDML IEPA 2019 Upper Big Muddy Watershed report, even though other tributaries are discussed.

Question: Why is Pond Creek not included in this report since according to the Greater Egypt Regional Planning and Development Commission just released a watershed-based plan (2019) which was created because of the creek being polluted? It is already polluted with some of the very pollutants the mine will be discharging such as chloride, iron, manganese, and TSS.

In 2018 and 2019, The Big Muddy River had a fish advisory for mercury by the Illinois Health Department. Mercury is one of the pollutants which is to be monitored in the acid mine discharge. The advisory for Mercury has recently been removed from the website.

p. 6 Amorelli

Question: Why has the mercury advisory suddenly been lifted?

Question: Has the fact that elevated sulfates can cause Mercury to undergo methylation into its most toxic form methylmercury according to Orem, W. in "Sulfate as a Contaminant in Freshwater Ecosystems: Sources, Impacts and Mitigation" (U.S. Geological Survey, assessed 10.2019) been considered in the granting of this permit?

Chlorides

IEPA has listed the acceptable levels for chloride concentrations in waterways as 500mg/L. According to the Pine Creek Pond Permit Application No. 456, samples taken of the mine wastewater showed high levels of both chlorides and sulfates that far exceed the acceptable level for water quality standards. The average chloride concentration of the samples taken was 2, 237 mg/L.

- The national standard for sustaining aquatic life is 230mg/L for chronic (long-term) levels and 860 mg/L for acute (short-term). (https://www.epa.gov/wqc/national-recommended-water-quality-criteria)
- Missouri revised their chloride levels in 2012 to 178mg/L for chronic and as low as 288mg/L for acute. (EPA Region 7, 2015)
- Indiana adopted new criterion in 2012 for chloride levels for Lake Michigan to be 250 mg/L. (Indiana Preliminary Adopts Revised Chloride and Sulfate Water Quality Criteria, BDlegal.com, 2019).
- According to Kentucky state website (2019), acute chloride levels ranging from 2500 to 8400 mg/L can be toxic to aquatic life such as snails, minnows, catfish, and trout.
- Another study by University of Rhode Island has much lower long-term exposure rates of 250mg/L and 860 mg/L for short-term exposure. (Hunt, Herron, & Green. *Chlorides in Fresh Water*. University of Rhode Island. March 2012)

Question: Why does Illinois EPA have much higher accepted levels of chloride than surrounding states especially since what is considered to be safe levels for aquatic life is much lower than the Illinois accepted level of 500mg/L? Why does IEPA not have both an acute and a chronic level like other states and the national standard?

p. 7 Amorelli

Question: According to the draft permit for the pipeline samples taken from the acid mine discharge showed chloride levels greater than 2,000 mg/ and levels of up to 12,000mg/L are permissible from the discharge point into the Big Muddy River. This grossly exceeds both the national and state accepted levels. How can the IEPA allow such a gross violation of its own and national regulation? 12,000mg/L would be 48x the national standard and 24x the state standard. Is it truly be diluted "immediately" and rapidly" which is what is stated in the In Section 302.102 12(e) Allowed Mixing, Mixing Zones and ZIDs (TITLE 35: ENVIRONMENTAL PROTECTION SUBTITLE C: WATER POLLUTION CHAPTER I: POLLUTION CONTROL BOARD PART 302 WATER QUALITY STANDARDS SUBPART A: GENERAL WATER QUALITY PROVISIONS, 2019)

Sulfates:

The accepted sulfate level is listed as 1250 mg/l on the draft permit; however, the average sulfate concentration taken from the Pond Creek mine wastewater was 1,940 mg/L and the IEPA antidegradation assessment states that the levels to be discharged to the Big Muddy River could be as high as 2,120 mg/L sulfate. This would be the equivalent of 476,000 pounds per day of sulfate.

According to Kentucky State website (2019). "Problems caused by sulfates are most often related to their ability to form strong acids which change the pH. Sulfate ions also are involved in complexing and precipitation reactions which affect solubility of metals and other substances."

In addition to the afore mentioned pollutants in the Big Muddy River, the IEPA has recently listed four sections (IL0029165, IL0031704, IL0027871, IL0027898) of the Big Muddy River under the Nutrient Assessment Reduction Plan/Illinois Nutrient Loss Reduction Strategy Implementation (2019). These sections of the river are all downstream from the proposed pipeline.

According to a study by Kaushal in 2005, many of our waterways are becoming victims of 'freshwater salinization syndrome', where "high levels of chloride and other salt ions can kill freshwater animals, from zooplankton at the base of the food web to insects and fish, because they make it hard for the creatures to osmotically regulate their cell's ion concentrations." Furthermore, the study

states that high levels of chlorides and other salts can cause more algal blooms due to dying off of algae-eating zooplankton which in turn can cause the releasing of toxins and deplete oxygen. In addition, higher salt levels can "favor invasive species that better survive in brackish water," and "at nonlethal levels, salt can stunt the reproduction and growth of freshwater organisms, lowering biodiversity and shifting the structure of the food webs." (*For Healthier Lakes, Rivers, and Drinking Water Hold the Salt*, Lockwood, D., Chemical and Engineering News, 2019).

Question: Has the IEPA considered the impact of discharging millions of gallons of unfiltered mine wastewater with elevated levels of chlorides, sulfates and other contaminants on the already elevated nutrient load of the Big Muddy River which is supposed to be being mitigated?

Question: Has the EPA taken into consideration current studies regarding effects of salination on aquatic animals?

<u>Mixing Zones</u>

There are numerous issues with the granting of this permit which could possibly violate the water quality standards as listed by the IEPA Pollution Control Board (2019):

In Section 302.102 Allowed Mixing, Mixing Zones and ZIDs.

> 4) Mixing is not allowed in waters containing mussel beds, endangered species habitat, fish spawning areas, areas of important aquatic life habitat, or any other natural features vital to the well-being of aquatic life in such a manner that the maintenance of aquatic life in the body of water as a whole would be adversely affected.

Question: Has this been determined by the IEPA/IDNR? There was no mention of this in the draft permit.

> 6) Mixing must allow for a zone of passage for aquatic life in which water quality standards are met.

p. 9, Amorelli

Question: Has this been determined? Again, there was no mention of this in the permit.

> 7) The area and volume in which mixing occurs, alone or in combination with other areas and volumes of mixing, must not intersect any area of any body of water in such a manner that the maintenance of aquatic life in the body of water as a whole would be adversely affected.

Question: Has the current state of the river (i.e. known pollutants) as well as the Sugar Creek Mine discharge pipeline been considered in determining this?

> 9) No mixing is allowed when the water quality standard for the constituent in question is already violated in the receiving water.

Question: Given that the Big Muddy River already has elevated levels of sulfates and manganese, mixing would be violating this regulation. How then can a permit be granted for a mixing zone?

> 12) The area and volume in which mixing occurs must be as small as is practicable under the limitations prescribed in this subsection (b), and in no circumstances may the mixing encompass a surface area larger than 26 acres. c) All water quality standards of this Part must be met at every point outside of the area and volume of the receiving water within which mixing is allowed. The acute toxicity standards of this Part must be met within the area and volume within which mixing is allowed, except as provided in subsection (e).
>
> e) Pursuant to the procedures of Section 39 of the Act and 35 Ill. Adm. Code 309, a person may apply to the Agency to include as a condition in an NPDES permit a ZID as a component portion of a mixing zone. The ZID shall, at a minimum, be limited to waters within which effluent dispersion is immediate and rapid. For the purposes of this subsection, "immediate" dispersion means an effluent's merging with receiving waters without delay in time after its discharge and within close proximity of the end of the discharge pipe, so as to minimize the length of exposure time of aquatic life to undiluted effluent, and "rapid" dispersion means an effluent's merging with receiving waters so as to minimize the length of exposure time of

> aquatic life to undiluted effluent. Upon proof by the applicant that a proposed ZID conforms with the requirements of Section 39 of the Act and this Section, the Agency shall, pursuant to Section 39(b) of the Act, include within the NPDES permit a condition defining the ZID.
>
> (TITLE 35: ENVIRONMENTAL PROTECTION SUBTITLE C: WATER POLLUTION CHAPTER I: POLLUTION CONTROL BOARD PART 302 WATER QUALITY STANDARDS SUBPART A: GENERAL WATER QUALITY PROVISIONS, 2019)

Question: With up to 5,000gals/minute or 300,000gals/hr. of mine waster discharge being permissible, how can there be an "immediate" or "rapid" dispersion to avoid having to adhere to Section 302.102, 12, (c), which states that acute toxicity standards must be met within the mixing zone. How can up to 12,000mg/l chlorides be rapidly dispersed in a small river?

Endangered Species

I am still trying to find out what species specific to Big Muddy River are Endangered or Threatened. I have contacted numerous government agencies, including: U.S. Fish and Wildlife, IDNR, IEPA, Illinois Endangered Species Protection Board, and Shawnee National Forest. No one has been able to give me any information. I have been trying since Fall 2018 after the initial hearing at IDNR.

Question 8: How can this permit be granted if none of these agencies seem to know exactly what species are endangered and threatened in the Big Muddy River Watershed as well as Pond Creek watershed?

Freshwater Mussels

Since 2018, US Fish and Wildlife Service has been under litigation for not protecting critical habitat for certain endangered mussels in 18 states, including three that occur in Illinois-Spectaclecase, Sheepnose, and Snuffbox. These and many more are protected under the 2019 Endangered Species Act. Anyone requiring federally funded or permitted projects in mussel's habitats must consult the US Fish and Wildlife Service to ensure habitat would not be damaged. There are more mussel species in the eastern U.S. than anywhere in the world;

p. 11 Amorelli

however, 70% of species are either endangered, threatened or extinct already. (Center for Biological Diversity)

According to a study conducted by the Illinois Natural History Survey, "Freshwater Mussels of the Big Muddy River" (2012), six species of mussels previously detected in the Big Muddy River were not found; although five of these are commonly found in other rivers in Illinois. These include: pink heelsplitter, pimpleback (listed as federally endangered), deertoe, creeper, fawnsfoot, plain pocketbook. 19 others were detected. "In Illinois, 25 of the 62 extant species (44%) are listed as threatened or endangered. Some of the species listed in the study that were documented in the Big Muddy River are: Lilliput, paper pondshell, pondhorn, white heelsplitter, giant floater, maple leaf, pink papershell.

The study lists the abandoned coal mines, specifically in the Murphsyboro area of the Big Muddy River, as a source of pollution. The study goes on to state that

mussels are more sensitive to sodium chloride and potassium chloride and that the current USEPA AWQC may not be protective of freshwater mussels (2013 Science Inventory). In addition, the study states that sedimentation and siltation might be causing a lack of species.

Question: Are any of the mussel species that exist in the Big Muddy watershed listed as threatened or endangered or rare? If this is not known, then it is pertinent to find out given the fact that most mussel species are now listed as threatened or endangered or already extinct and that they have been found to be sensitive to chloride levels as well as sedimentation/siltation both of which will be inflated due to the discharge of up to millions of gallons a day of acid mine discharge with extremely high levels of chloride and sulfates.

Fish Species

According to "Fishes of the Big Muddy" (1999), at least ten native fish species within a 100 year period are no longer found due to pollution, cultivation, and habitat lost. The study suggests the need for "continual vigorous reclamation of abandoned mines lands and treatment of acid mine drainage." The study goes on to say that "Big Muddy River drainage...has been subjected to an array of enviro

stresses that have permanently disrupted its hydrological cycle, and ultimately altered its fish fauna."

The following are list of fish species that were recorded at time of study: bluegill, channel catfish, largemouth bass, sauger, striped bass, white bass, white crappie, yellow bullhead.

Question: What is the current state of the fish population in the Big Muddy and how will these elevated levels of chlorides/sulfates affect them as well as possible other toxins such as manganese and iron? Are any of these species listed as endangered or threatened?

Other Endangered/Threatened Species

The alligator snapping turtle is listed as a threatened species in Illinois.

Question: Has it been determined if their habitat includes the Big Muddy Watershed?

Ecologically Sensitive Areas

The Big Muddy flows adjacent to two very ecologically diverse areas, Little Grand Canyon and La Rue Pine Hills, both of which are National Natural Registered Landmarks with many rare, threatened, and endangered plant and animal species. "LaRue-Pine Hills Ecological Area, located within the Shawnee National Forest, contains one of the finest assemblages of diverse vegetation in the Midwest. The site represents species of northern, southern, eastern, and western affinities, including 40 species rare in Illinois." (Prairie Research Institute). Some threatened and endangered animal species include the Indian Bat, Illinois chorus frog, eastern woodrat which is only located in the La Rue Pine hills area, several fish species, and many plant species. La Rue Pine Hills/Otter Pond is also a national Research Natural Area which is protected federally.

Question: Are any of these species being considered? In the draft permit, it states that there will be no adverse effects on species because water quality standards will be met. However, in the case of Williamson Energy, this is obviously not the case. Water quality standards are not met. How then can species be protected? Under the Clean Water Act, section. 101(a)2, water quality provides for the protection and propagation of fish, shellfish, and

wildlife. In addition, the Big Muddy River is already polluted with elevated levels of manganese, sulfates, phosphorus, mercury and has a fish advisory for PCBs. How the does adding elevated levels of chloride, sulfate and other toxins known to have adverse effects on animal and plant species permissible under this section of the Clean Water Act?

There is also a large area in southwestern Illinois listed as a Conservation Opportunity Area for La Rue Pine Hills under IDNR which includes sections of the Big Muddy River in both Jackson and Union County (IDNR, accessed 2019).

Fifty-two miles of the Big Muddy River, from S.R. 14 south of Rend Lake to Southern Illinois Airport (U.S. 51), is a candidate for the Wild and Scenic River Designation (National Rivers Inventory, 2019) and is listed as having "Outstanding Remarkable Value", exactly the area where the proposed pipeline is supposed to discharge. Due to this fact, special considerations need to be considered.

> The **Council on Environmental Quality (CEQ)**, under 5(d)(1) Wild and Scenic River Act authority, provides guidance to federal agencies with permitting and/or granting authority for projects on or near rivers listed on the NRI. In accordance with **executive memorandum**, all agencies must "take care to avoid or mitigate adverse effects" to rivers identified in the Nationwide Rivers Inventory.

The following information is listed on the National Park Services website regarding rivers listed on the National Rivers Inventory:

1. Determine whether the proposed action could affect an NRI river.

- Check the current regional/state NRI list to determine whether the proposed action could affect an NRI river (i.e., is the proposed action location in the vicinity of the NRI segment).
- If an NRI river segment could be affected by the proposed action, an environmental assessment or and environmental impact statement may be required depending on the significance of the effects.

2. Determine whether the proposed action could have an adverse effect on the natural, cultural, and recreational values of the NRI segment. These values are listed as "outstandingly remarkable values" (ORVs) on the state NRI list.

p.14 Amorelli

Adverse effects on NRI rivers may occur under conditions which include, but are not limited to:

- Destruction or alteration of all or part of the free flowing nature of the river;
- Deterioration of water quality; or

3. Determine whether the proposed action could foreclose options to classify any portion of the NRI segment as wild, scenic, or recreational river areas.

- In some cases, impacts of a proposed action could be severe enough to preclude inclusion in the Wild and Scenic River System, or lower quality of the classification (e.g., from wild to recreational). If the proposed undertaking could effectively downgrade any portion of the NRI segment, you should consult with NPS.
- Proposed actions (whether uses or physical changes), which are theoretically reversible, but which are not likely to be reversed in the short term, should be considered to have the effect of foreclosing for all practical purposes Wild and Scenic River status. This is because a river segment, when studied for possible inclusion in the Wild and Scenic River System, must be judged as it is found to exist at the time of the study, rather than as it may exist at some future time.
- If a proposal, including one or more alternatives, could have an adverse effect on an NRI river, an EA, or if the effects are significant, an EIS must be prepared.

4. Incorporate mitigation/avoidance measures in the proposed action to the maximum extent feasible within the agency's authority.

Question: Has the IEPA taken into consideration that numerous sections of the Big Muddy River downstream from the pipeline are listed not only on the National Rivers Inventory but also in several state and federally listed special environmental zones and therefore has special protections?

<u>IEPA Exhibiting Conflict of Interest</u>

1) The IEPA included in the draft permit a section on social/economic benefits of the proposed activity (pipeline). Goes on to list statistics about jobs and

revenue for state. My argument is that an agency that was supposedly created for the purpose of protecting our environment should not take economic nor social factors into account.

2) The IEPA also goes on to favor the mine company by stating that "filtration is a technology that is not feasible for the proposed facility because: filtration is much more expensive than sediment ponds...a large area of land would be required for such a facility, and maintenance and supervision of the filtration and sludge operation would be burdensome and would increase production costs."

Question: Is the EPA supposed to be taking into consideration financial aspects of a company in lieu of protecting the environment? Is it supposed to weigh economic benefit over protecting the environment? And why has not the IEPA commented on the economic cost to the citizens of Illinois due to pollution already caused by the mine and the pollution that will be caused by the mine? The Big Muddy River is already polluted and there are now two implementation plans that have been created by the IEPA (2004, 2019) costing hundreds of millions of dollars to implement. The mines, which are listed as one of the causes of pollution, are not held accountable for paying for these costly plans, rather the "stakeholders" and concerned citizens are told they must try to find monies to clean up the rivers. To date, no watershed-based plan group has been formed based on the 2004 findings.

<u>Illinois Constitution</u>

The Illinois Constitution in Article XI states that we have a right to a healthy environment. Since Williamson Energy has numerous and frequent violations which can have and have had adverse impacts on the watersheds and its inhabitants and the IEPA has already listed the Big Muddy River as well as some of its tributaries such as Pond Creek as being impaired for numerous pollutants some as a direct result of both past and current mining activities. It seems that IEPA would be violating the constitution for granting a permit to a company that has a history of polluting public waters and the fact that the nature of the permit would allow even more pollutants to enter the watershed.

p. 16 Amorelli

Question: Has the IEPA fully considered whether granting this permit for dumping more pollutants into the already impaired Big Muddy River will violate the law as stated in Article XI of our state constitution?

River Rights

Question: Has the IEPA considered that the river itself should have its own rights. It is already dammed and polluted? How much more should the Big Muddy River endure? The IEPA has already granted another similar permit for a discharge pipeline into the Big Muddy River with even higher expected levels of chlorides form the Sugar Camp Mine only 12.5 miles above stream from the proposed Pond Creek Mine pipeline.

And I end this with one final question to each of the IEPA staff.

Question: If this river was flowing through your backyard/property/town/county would you want millions of gallons of mine wastewater dumped into it without being filtered of all contaminants?

Exhibit 254

Jane Logie
jane.logie@gmail.com

R03388

As a resident of Jackson County living near the Big Muddy and a volunteer advocating for this river's use by all residents and all economic entities, large and small, I am here to oppose Pond Creek Mine permit No. IL0077666. In particular, my comment relates to the permit section concerning Outfall #011. This provision would, if approved, allow the Pond Creek Mine to pump millions of gallons of toxic mine waste water into the Big Muddy River, a body of water that should remain a resource for everyone who lives and works and gains their livelihood in and around the Big Muddy.

I will review in brief some of the facts that led to my decision to oppose this permit—facts that have not yet, to my knowledge, been adequately addressed ~~by the mine's owner, Williamson Energy, LLC~~.

(1.) The Pond Creek Mine facility has been found to violate its NPDES permit, and those violations have not been fully addressed.

(2.) Given these violations and also the harm that would be done to aquatic and wild life by the chloride and sulphate in the PCM's discharge, residents depending on the Big Muddy for their own economic livelihood and recreation, have a right, should this permit be approved, to demand ~~constant~~ frequent monitoring of toxicity of the mine's discharge at a number of locations. To my knowledge, how, how often, and by whom this testing should be carried out has not been specified.

As a taxpayer and resident of Jackson County, I would see it as ~~unacceptable~~ a conflict of interest to have Williamson Energy LLC designate the entity that would do the testing. Indeed, for the testing to achieve its purpose—to avoid harm to the Big Muddy's eco-system ~~and maintain the delicate balance of the life that depends on the river and that the river depends on~~—the US Geological Survey would be ~~the most~~ a credible entity to do the monitoring, both because of the frequency of their testing—as I understand it, they test daily—and their status as a neutral governmental agency.

(3.) Another concern ~~among many~~ I have is that the PCM permit should ~~definitely~~ not be approved until the permitted Sugar Camp Mine waste discharge has already been assessed for toxicity levels—assessed not just as those levels have been projected but as they have been determined once the Sugar Camp discharge has begun. Surely, determining of the impact of the Sugar Camp Mine discharge would be essential to assessing whether the Pond Creek Mine's permit should be approved.

(4.) Before closing, I want to make a more general point: Safe, clean water is now understood to be a ~~highly valuable~~, irreplaceable resource for sustaining life and the variety of livelihoods and activities people pursue that depend on clean, safe water. Thus waiting and seeing whether and how often the Pond Creek Mine's discharge would exceed the permitted level, should not be acceptable. Companies ~~such as the Williamson Energy, LLC~~ that increase toxins in our waters and ~~rob the larger public of~~ our shared resources, must be made to take full responsibility for the waste they produce. Jeopardizing a public resource for the benefit of one industry is more and more clearly unacceptable.

Comments on NPDES Permit No. IL0077666 Pond Creek Mine No. 1
Public Hearing: Wednesday, December 18, 2019
Submitted by William Sasso, 9 Pinewood Drive, Carbondale, IL 62901

Thank you for the opportunity to speak on this topic.

I speak against granting the requested permit, on the grounds that the increased release of contaminants into the Big Muddy River and its tributaries may not be adequately controlled and therefore may put the residents of Williamson, Franklin, and Jackson Counties at risk. Those risks include contamination of groundwater aquifers as well as risks from contact with the water itself, especially when the Big Muddy and its tributaries overflow their banks. Since the Big Muddy is itself a tributary of the Mississippi River, increased contamination of the Big Muddy clearly leads to increased contamination of the Mississippi, threatening additional residents of Union and Alexander Counties as well as those of of Missouri, Arkansas, Louisiana, Kentucky, Tennessee, and Mississippi.

My concern that the proposed contaminant discharges may not be adequately controlled is based on the sampling plans described in the Special Conditions section (pages 36 – 40) of NPDES Permit No. IL0077666, Notice No. 7516c (the Draft Renewed NPDES Permit to Discharge into Waters of the State Public Notice/Fact Sheet Issued By: Illinois Environmental Protection Agency Bureau of Water, Division of Water Pollution Control, Permit Section).

Here are my specific concerns.

First, the conditions specify ongoing monitoring of the discharge flows as well as monitoring of the rivers and creeks, both upstream and downstream of the proposed points of discharge. However, in Special Conditions 13 (see 13.b.ii and 13.b.iii), 14 (see 114.b.ii and 14.b.iii), 15 (see 15.b.ii and 15.b.iii), 16 (see 16.b.ii and 16.b.iii), and 18, sampling is required on an infrequent basis such as quarterly, semi-annually, or annually. In "Water Sampling: Traditional Methods and New Approaches in Water Sampling Strategy," published in Trends in Analytical Chemistry, Yolanda Madrid and Zoyne Pedrero Zayas state that "Sampling frequency is … an important factor …. Low sampling frequency could underestimate the occasional presence of samples with high analyte concentration." In other words, given that the mine wastewater will have varying levels of contamination over time, and that the creeks and rivers will flow at different rates within the normal range of river behavior, infrequent sampling may well fail to identify problematic levels of contaminants.

This issue is aggravated by the fact that even these minimal sampling schedules may be reduced or eliminated upon request by the Mine. That would mean that intermittent additional contamination of the river and its tributaries might not be detected at all. And while sampling downstream from the point of wastewater discharge is important, at best it enables us to close the barn door after the horse is gone.

A second issue is that the sampling is conducted by Pond Creek Mine, rather than by a disinterested third party organization. This assignment of responsibility creates potential for a significant conflict of interest, which could jeopardize the timeliness and accuracy of the water sampling and reporting process.

Finally, I am concerned about the reporting requirements specified in the Special Conditions. In many cases, the monitoring observations are reported to IEPA on a quarterly basis, meaning that a violation of the conditions under which the permit is requested might come to IEPA's attention as much as three

months after the violation occurred. In order to minimize risk to the public and the environment, I suggest that at minimum, 24-hour exception reporting standards be incorporated.

Let's remember that the Big Muddy River is part of our natural heritage, something that should be restored to its natural state rather than contaminated further. Even if humans don't use its waters for bathing or for drinking, many species of animals and migrating waterfowl do. Let's reject this permit as proposed, in order to respect and honor the interdependent web of nature.

The McCann Family and the Big Muddy River since 1871

My great grandfather James McCann was born in Ireland in 1831, he came to America and settled on the eastern bank of the river, south of Rattlesnake Ferry in 1871 at a spot called Kings Ferry. The USDA Forest Service has a picnic area in that general location named for my family, McCann Springs. My great grandfather and grandfather were loggers; they started a log yard at Kings Ferry.

My grandfather Charles McCann was born in 1872, my dad James was born in 1911, and I, Charles D. McCann was born in 1947. We (as a family) continue to own the property that was settled by my great-grandfather, the farm is on the county line with 40 acres in Jackson County and 259 acres in Union County.

As a child I was always attracted to the river, nothing was more fun than going to the Pine Hills Farm, we fished, hunted and trapped the river. We picked up pecans from the trees that our farmer, farmed around. Our farmer in my youth was an outdoors person named Howard Clover, he instilled in me a love for all things that were associated with the river.

I annually and have for years purchased a commercial fishing license my 2019 license # is 020370725 and my trapping license # is 020066686.

The river is full of fish. Catfish and buffalo (of various species) plus game fish are available to those that are willing to work for them. Otter, beaver, coons, mink and muskrats can all be taken along the banks of the river. Unfortunately right now wild fur is not in great demand but all these creatures can be found in good numbers along the river. I often see deer and wild turkey just west and north of the old Rt. 13 Bridge in Murphysboro.

For every big creature like an eagle, mallard duck, otter, beaver, turkey, deer, flathead catfish or buffalo fish that call the river and the surrounding area home, there are literally millions of lesser creatures that form the base of the food pyramid. These lesser creatures salamanders and crawfish for example are the first to be influenced by pollution; a slight change in the ph of the water for example, can spell disaster in the food chain. Without the food source at the base

of pyramid the creatures at the top won't last for long. Very few people come home saying, "You won't believe what I saw today, a newt."

How do you measure the economic valve of certain experiences? Gigging a bull frog at 2 am on the 4th of July, lifting a hoop net at dawn in the heat of the summer on my birthday in late August, picking up pecans on the afternoon of Veterans Day, shooting a fat coon from a oak tree a little after sunset on Christmas Eve, are all experiences that are associated with the river.

I also remember some negative experiences associated with the river. **In the 50's and early 60's the river would sometimes be full of dead fish from accidents at the tie plant in the Carbondale area.**

Others have different experiences that are river related, more people are into kayaking for example, the biggest challenged to river goers is access. Murphysboro Park has a boat ramp that was constructed in 1971, it is often muddied over, and while monies were appropriated for the construction no money was awarded for regular maintenance. The more river access points that are available, the more the public will take advance of the river. (that is another issue)

Coal and coal production is old school technology. I can remember when no one wanted their child/son to be a miner. Now for some strange reason the life (income) of a miner has become something that is positive. Let's focus on the new technologies that make life better for all and leave our streams, river and lands unpolluted. By allowing these companies the right to pollute, we are giving away what we have worked hard to achieve in quality over the past several decades.

Feel free to call (I have a conflict with another meeting that evening).

Dear Barb Lieberoff,

I attempted to send the following message to the address listed on the Pond Creek Hearing flyer, but it was not deliverable. Hence, I am sending it snail mail. Is the address listed in the flyer not correct?

From: Susan VanDyk <grandmavandyk@gmail.com>

Subject: **Pond Creek Mine**

Date: December 18, 2019 at 3:51:52 PM CST
To: epa.publichearingcom.illinois.gov@gmail.com

I am very concerned to hear about the potential dumping of wastewater from the Pond Creek Mine into the Big Muddy River. Please do NOT allow that. The mine should be required to treat and neutralize all contaminants on site, and not expect to use our public waters as their company sewer. I like to fish with my grandchildren and am very concerned that the IDNR, instead of protecting the environment for the people, may be placing a mining company's profits ahead of our ability to enjoy southern Illinois' natural beauty.

Thank you for considering my comment.

Re: Pond Creek Mine NPDES,

Please do not allow companies to discharge chloride, sulfate or other chemicals into the Big Muddy River. I am a taxpayer and do not want our waters polluted for the financial benefit of a company. In Southern Illinois, we depend on outdoor activities for our economic well being, such as tourist for the wineries or hunters coming here. Allowing these wastes into the public waterway will harm our economy.

Thank you

Re: Pond Creek Mine IL0077666

Dear Madam,
I attended the public hearing for the Pond Creek Mine on 12-18-19 and I want to enter into the record comments questioning the validity to issue a permit for this mine to dump pollutants into the Big Muddy River.

1. Several documents have said the pipeline is only for 10 years and then it will be removed. Is this the projected end of the date of the coal seam and mine closure? On page APP B-1 the IL DOA of the Results of Review, Permanent Program Permit Application No 456, says the pipeline is only for 10 years. Is this the projected end of the mine and its closure? Especially in the light that the first commenter of the night and mine booster said the mine had enough coal for the next 50 years. The citation (https address) given is grossly inaccurate as there are spelling errors within the link itself. Plus, who is going to pay for the removal of this pipeline as Foresight energy stocks which Williamson Energy, LLC is a subsidiary are tanking, and Foresight as of 12-20-19 Files An 8-K Entry into a Material Definitive Agreement https://t.co/xrHayH1eAG .

Why would the IEPA issue a permit to a company when the company is going into bankruptcy? Because Williamson Energy is a LLC, in a chapter 7 business bankruptcy, the LLCs assets are sold and used to pay the LLC's creditors. After the bankruptcy, the LLC's remaining debts are wiped and and the LLC is no longer in business. The LLC's owners are generally not responsible for the LLCs debts like retirement, ESOPs and 401K's and the 500 or so employees of Williamson Energy will have more problems besides losing just their jobs. They will lose their retirement pensions as well.

2. To address the issue of oversight of discharge from the mine, How many Marion water pollution control and mine staff are there now versus 20 years

ago? There are 10 on staff 20 years ago and now 4. How will a staff of 4 people monitor the discharge from this mine along with all the other places in the region. Mines are to be inspected by the IEPA 2-4 times as a federal requirement. How many mine have between routinely inspected in the past 12 years? How many times has The Pond Creek Mine been inspected since the mine began?

How does a staff of 4 manage to do this while writing mining permits for mining companies? As per,

https://www.chicagotribune.com/news/environment/ct-met-illinois-epa-budget-cuts-20191205-pkwnmzzvuvgk3fgbplvxhbji6q-story.html Illinois also cut its environmental agency's workforce by 38% during the same period — more than any other state.

With a smaller staff and less money, the state agency has failed repeatedly to identify hazards to public health and hold polluters accountable, said Eric Schaeffer, a former top U.S. EPA enforcement official who directs the nonprofit Environmental Integrity Project and compiled one of the reports.

In conclusion, these comments along with the multitude of comments against issuing of a permit for Pond Creek Mine a private company to dump pollutants into a public waterway from my fellow citizens of the area implore you to not approve the permit referenced above to the Pond Creek Mine.

Sincerely,

Karen Fiorino

To Whom it may concern,

As a southern Illinois coal miner, I just want to say that I am shocked and in a total state of disbelief that the EPA would sit back and let a coal mine dump millions of gallons of water into one of our rivers.

It is embarrasing to call myself a coal miner at this point. The track record of Bob Murray and the mines that he operates is proof alone that none of these people actually care about the coal miner.

It is up to you to defend our environment. By letting this happen, you are proving that the EPA is a pointless, farce. You are proving that the environment is not what you are protecting, it is the wallets of billionaire coal mine owners and the lobbyist groups at their feet.

THE OFFICE OF THE DIRECTOR

To whomever it may concern:

I would like to state the reasons as to why allowing mine waste to be dumped into the big muddy river is a bad idea + why I do not support it.

The Big Muddy river is a water source for many people around here. Having mine waste dumped into the river would cause the people to have to drink contaminated water. The waste has many different chemicals in it, + none of which are healthy to ingest. No one can be sure of the long time effects this has on a person, or the sicknesses that could be caused by the mine waste. [redacted] animals, including fish + birds, would also be negatively affected. Since the fish digest the water, they could become sick, which would then cause the animals that ate the fish, including humans, to become sick. There is literally nothing good that would come out of this. It's not worth the possible damage that could happen.

Thank you, for your Consideration,

Bella Stephenson

To whom it may concern:

I want to publicly state that I do not support the possibility of polluted mine water waste being dumped into the Big Muddy. Nobody can be sure of the long term outcome as far as wildlife or the effect on humans. I'm sure Bob Murray wouldn't want his family swimming in it. Why should we have to. Water is Sacred. Water is life. Take Care of it.

Sincerely,
Alycia Snyder

Dear EPA Staff,

Please do not allow Pond Creek Mine to discharge high chloride and sulfate waste water into the Big Muddy River. As a citizen of Illinois, I believe we must hold Pond Creek Mine Inc to a higher standard of environmental protection. Our water resources are some of our most important to protect, especially as we watch other parts of the country struggle with water shortage. It would be short-sighted to allow extra pollution into one of Illinois' rivers.

Thank you for your consideration,

Lisa Gades

To whom it may concern,

I am against this pipeline due to several concerns regarding water levels of the river, wildlife/human safety among others.
I agree that no company should dump their waste and essentially, "problems" into public water ways. The risk is too great regarding safety for many reasons.

I am one of the ones against this pipeline.
I was not able to attend the public meeting but wanted to express my opinion on the matter.

Thank you for your time,

I am writing to formally note my strong opposition to Pond Creek Mine dumping mine waste into our waterways. My family hunts and fishes in and near the Big Muddy River and we have seen first hand some of the runoff issues from mines in other areas. There are too many unknowns and several issues with this deal are suspicious. It is NOT worth the risks. I am at St. Jude Children's Research Hospital at this moment with my son with brain cancer. When waste is poured into unnatural places like this, we have no idea the possible outcomes. How many times must we learn these lessons? Come look these bald and sick children in the eyes and tell them you're going to allow this. Again these risks are NOT worth it. I doubt the powers that be would be willing to live near and eat from this river with no concerns. If they say they are okay with it, they are either lying or ignorant. Please don't allow this to happen.

Sincerely,
Elizabeth McKinney

It is my opinion that the dumping of waste water from Williamson Energy's mine into the Big Muddy River is not in the best interest of the public, and is an environmentally poor use of our waterways. I am against the dumping of polluted water into our public rivers for the benefit of a private enterprise.

Exhibit 338

From: Debra Singleton
To: EPA.PublicHearingCom
Subject: [External] DENY W.E. pipeline permit
Date: Wednesday, December 18, 2019 6:39:47 PM

To the Illinois EPA:
I am writing to express my STRONG OBJECTION to Williamson Energy's permit for the Pond Creek Mine that would allow them to build a 12.5-mile discharge pipeline into the Big Muddy River. It is irresponsible to allow the discharge of millions of gallons of highly toxic high-chloride and sulfate water into the Big Muddy - or any waterway. Given that the Big Muddy is a major public waterway and a principal tributary of the MIssissippi River, any toxins released into the Big Muddy would not only contaminate the environment of the Big Muddy, they would also flow downstream into the Mississippi, affecting a large number of communities downstream from the discharge. Furthermore, when the Mississippi backflows into the Big Muddy, toxins intended to flow downstream would flow back into the big Muddy watershed, adversely affecting agricultural areas and communities for 40 miles along the Big Muddy.

This is an issue that affects public health, the health of ecosystems and agriculture, and environmental justice. Any company that operates in our state must be held accountable for the toxicity of its byproducts and for handling them in a fashion that protects public and environmental health - not forcing the public and the ecosystem to suffer the consequences and costs of dumping them into public tributaries.

I urge you to DENY the Williamson Energy request for this discharge pipeline permit.

Sincerely,
Debra Singleton

Re: Pond Creek Mine NPDES, Permit No. IL0077666

Dear Barb Lieberoff---

My name is Sam Stearns. I am the third generation of my family which has worked in coal mines: both my grandfathers came to Southern Illinois from Europe to mine coal. My father retired from Sahara Coal Company; many of my male relatives worked in the mines; and I myself worked underground for Zeigler Coal Company.

I grew up in Two Patch, a suburb of the old coal mining community of Ledford, just outside of Harrisburg. Two Patch was named for the Old Number Two Mine which had operated there long before I was born. I grew up playing on the old mine spoils and swimming in the mine pits in that area. My parents loved me. Had they known what we now know about the poison soil which is brought to the surface by mining; had they known about the chemicals leaching into those pits; they would never have let me play in those places. But they did, out of honest ignorance---they simply did not know any better.

We can no longer plead ignorance.

There are already too many acres of blighted mined land in Williamson and surrounding counties. Thousands of acres of land in this area are already spoiled and poisoned for innumerable years to come---FOREVER in terms of human existence.

Once the topography and the hydrology of the land is changed, it is changed forever. The notion of mine reclamation is a fraud. It is simply putting makeup on a corpse.

I realize that periodically extractive industries like coal and government bureaucracies like the IEPA and IDNR will hold ceremonies where they slap each other on the backs and give each other plaques & awards and congratulate each other on how well they have "reclaimed" some small piece of land in those thousands of mined acres or "mitigated" some environmental degradation; but I repeat, mitigation efforts and reclamation are a fraud; it is putting makeup on a corpse.

Diluting mine discharge water or putting a few inches of top soil back on top of many feet of poison substrate can produce some shallow-rooted crops for a few years as long as that layer of topsoil is treated with probiotics and fed fertilizers. But the soil structure and hydrology are changed forever and that land will never be able to support deep-rooted native trees and plants again.

Citizens like me who have watched these coal wastelands for decades have little confidence in the state agencies which are charged with protecting us and our streams from the discharges of these polluting sacrifice zones. We know that agencies such as the IEPA operate at the whim of politicians who are in the pocket of industry and are many times staffed with corporate shills who put the interests of industry over the health of our citizens.

My parents let me play in poisoned soil and swim in poisoned water out of benign, honest ignorance of the situation. But we no longer have the luxury of ignorance: now we know better.

That is why I ask you to deny this proposed permit for a discharge of mine water into the watershed of the Big Muddy River. We now know that there is no way that the pollutants from the water and soil of a coal mine can be safely discharged into the watershed of the Big Muddy without harming citizens of this State.

I would like to ask

Has the IEPA ever rejected a mine discharge permit, even to a company which has a record of serial violations of their mining permits?

Does the IEPA have the authority to refer a case to the Illinois Attorney General when permit violations are found; and if so, how many times has the IEPA done so?

These are comments for Pond Creek Mine NPDES Permit No. IL0077666, specifically regarding the portion of the permit concerning Outfall #011 which would allow significant amounts of mine wastewater to be pumped into the Big Muddy River. I have visited the Big Muddy River and various places in its watershed for most of my 65 years.

I am adamantly opposed to this permit as is. At minimum, there needs to be a proper filtration system for wastewater; using a dilution method with the river's own water is not going to be able to filter millions of gallons of toxic water that is going to be discharged. We should be long past the pathetic rhetoric that dilution is the solution for pollution. The following pages list some of the concerns and questions I have after reading through the draft permit and related materials concerning this issue. I believe, they all have a direct relation to the Clean Water Act and antidegradation analysis. This is by no means an exhaustive account of my concerns.

Williamson Energy History of Violations

The Attorney General (on behalf of the people of Illinois) sued Williamson Energy February, 2019 on eight counts of violations that occurred in 2016 due to a pump failure which dumped approximately 90,000 gallons of coal slurry/acid mine discharge into an unnamed tributary of Pond Creek. An example of some of the counts include: discharging contaminants into the water; depositing contaminants onto the land; violating water quality standards for chloride and iron; and INTENTIONAL diversion of a waste stream from sediment pond to and outflow into a tributary of Pond creek. There was only one announcement in the Marion Republican regarding this case; no one requested a hearing. Williamson Energy did not admit to the violations, and the case was settled without a hearing. They only had to pay a civil penalty for $80,000 even though five of the eight counts had a $50,000 penalty (the other three had $10,000 each).

According to information provided in the Pond Creek Watershed Inventory (2019) created by Greater Egypt Regional Planning and Development Commission, Williamson Energy had over 45 outfall effluent violations between 2015 and 2017 (Source of violation history is from EPA-ECHO). Some of the pollutants include: chloride, sulfate, nitrogen, pH, manganese, and total dissolved oxygen (TSS).

Question: How many more violations have occurred since 2017? How many violations in total does Williamson Energy have? Have the impacts of these violations on aquatic life been assessed?

Question: Are there any IEPA regulations or stipulations under the Clean Water Act regarding granting new permits or additions to existing permits when the company requesting them have an extensive history of violations? Citizens do not get to keep violating law without increasing consequences (e.g. prison time, permanently losing a driving license, losing child custody, etc.). If there are not rules/regulations which can prohibit granting companies new permits and/or terminating a permit due to continued and repeated violations which cause harm to the environment and its inhabitants, then the IEPA needs to create them. Companies should not be allowed to violate laws endlessly with only monetary fines as their penalty.

Question: Can the IEPA be held accountable by law for allowing a pipeline to discharge acid mine drainage with elevated concentrations of numerous pollutants into a river that is currently listed as impaired and is also a candidate for wild and scenic river designation?

There were 11 violations related to sulfates and ten to chloride in Pond Creek, a tributary of Big Muddy River (Pond Creek Watershed Inventory, Greater Egypt Regional Planning and Development Commission, 2019, p.85). In addition, the report states the following:

• "…chloride is listed as an impairment to aquatic life in the waterbody." (p.74)

• "The mine also had a number of single event violations including: improper operation and maintenance, numeric effluent, unapproved bypass, and an unauthorized discharge." (p.85)

• "Pond Creek has been listed for chloride and sedimentation/siltation impairments since 2010, and dissolved oxygen since 2012. In 2008, the stream was listed for iron, manganese, pH, total suspended solids (TSS), and fecal coliform." (p.74)

• The Illinois Integrated Water Quality Report categorizes Pond Creek as having three designated uses; aquatic life, which is not supported… (p. 72)

Water Quality

In the IEPA Big Muddy River TDML 2004 report it states that the Big Muddy River is a compromised and impaired river and is due in part because of mining operations. It states that "abandoned coal mines should be identified in addition to other mining activity which could contribute to manganese and sulfate concentrations…" According to the Antidegradation Analysis report (2016), the Big Muddy River is listed in the 2014 Section 303 (d) list for sedimentation/ siltation, sulfates, total suspended solids (TSS), mercury, and polychlorinated biphenyl (PCBs). The site is on the 2016 Section 303(d) list for impaired waters due to sedimentation/ siltation, TSS, mercury, PCBs, iron, dissolved oxygen, pH, and fecal coliform.

And just recently, the Upper Big Muddy River TDML Report (IEPA 2019) was released which stated that elevated concentrations of Iron and Manganese were found in Big Muddy Watershed and according to IEPA have negative impacts on aquatic life.

Iron TMDL: IEPA identified one segment, Andy Creek (IL_NZN-13), with elevated concentrations of dissolved iron. Elevated concentrations of dissolved iron can negatively impact aquatic species by disturbing normal metabolic and osmoregulatory functions. Aquaculture studies have also demonstrated that increased dissolved iron concentrations in the water column may negatively impact gill functionality in certain fish species and thus reduce biodiversity in certain stream environments. 4 Excessive iron within the water column may harm aquatic species such as fish and macroinvertebrates. Certain metals species dissolve in water and may be absorbed by fish and other aquatic organisms. Small concentrations of certain dissolved metals may be, in the short term, toxic to fish and aquatic species and, in the long term, may bioaccumulate in certain aquatic species.

Question: Why is the water quality standard for Iron listed on the draft permit for the Pond Creek Pipeline as 3mg/6mgL when the standard on the IEPA Water Quality Standard Report 2019 states that the acceptable level is 1mg/L?

Manganese TMDL: IEPA identified one segment, Beaver Creek (IL_NGAZ-JC-D1), with elevated concentrations of dissolved manganese. Elevated dissolved manganese concentrations in the water column have many of the same negative effects of dissolved iron on fish species and biodiversity of the water column and benthic environments. Excessive manganese within the water column may harm aquatic species such as fish and macroinvertebrates. Certain metals species dissolve in water and may be absorbed by fish and other aquatic organisms. Small concentrations of certain dissolved metals may be, in the short term, toxic to fish and aquatic species and, in the long term, may bioaccumulate in certain aquatic species. (Upper Big Muddy River TDML Report, IEPA, 2019).

The Union of Concerned Scientists state that

"mining operations can negatively impact water supplies, often with long-lasting effects. The fundamental issue involves contamination of nearby rivers, lakes, and aquifers by what comes out of a coal mine—usually highly acidic water containing heavy metals like arsenic, copper, and lead. The process is known as acid mine drainage. It happens when certain substances (typically iron sulfide, FeS2, or fool's gold) is oxidized after being exposed to air and water. Runoff can change the pH of nearby streams to the same level as vinegar (Coal and Water Pollution, Union of Concerned Scientists,https://www.ucsusa.org/clean-energy/coal-and-other-fossil-fuels/coal-water-pollution, Accessed 7.22.2019.)

According to U.S. Fish and Wildlife, "Because acid mine drainage can destroy a stream's aquatic community for miles, many of the old mining sites are being reclaimed (Acid Mine Drainage, U.S. Fish and Wildlife, https://www.fws.gov/mountain-prairie/contaminants/acidMineDrainage.php, accessed 7.2019)

Question: Does this mean then that the IEPA is going against its own implementation plans (2004/2019) by considering granting a permit for a pipeline which will infuse the river more with elevated levels of chlorides, sulfates, manganese and other pollutants? Does this not go against the Clean Water Act?

Interestingly, there is no mention of the Pond Creek in the TDML IEPA 2019 Upper Big Muddy Watershed report, even though other tributaries are discussed.

Question: Why is Pond Creek not included in this report since according to the Greater Egypt Regional Planning and Development Commission just released a watershed-based plan (2019) which was created because of the creek being polluted? It is already polluted with some of the very pollutants the mine will be discharging such as chloride, iron, manganese, and TSS.

In 2018 and 2019, The Big Muddy River had a fish advisory for mercury by the Illinois Health Department. Mercury is one of the pollutants which is to be monitored in the acid mine discharge. The advisory for Mercury has recently been removed from the website.

Question: Why has the mercury advisory suddenly been lifted?

Question: Has the fact that elevated sulfates can cause Mercury to undergo methylation into its most toxic form methylmercury according to Orem, W. in "Sulfate as a Contaminant in Freshwater Ecosystems: Sources, Impacts and Mitigation" (U.S. Geological Survey, assessed 10.2019)

Chlorides

IEPA has listed the acceptable levels for chloride concentrations in waterways as 500mg/L. According to the Pine Creek Pond Permit Application No. 456, samples taken of the mine wastewater showed high levels of both chlorides and sulfates that far exceed the acceptable level for water quality standards. The average chloride concentration of the samples taken was 2, 237 mg/L.

• The national standard for sustaining aquatic life is 230mg/L for chronic (long-term) levels and 860 mg/L for acute (short-term). (https://www.epa.gov/wqc/national-recommended-water-quality-criteria)

• Missouri revised their chloride levels in 2012 to 178mg/L for chronic and as low as 288mg/L for acute. (EPA Region 7, 2015)

• Indiana adopted new criterion in 2012 for chloride levels for Lake Michigan to be 250 mg/L. (Indiana Preliminary Adopts Revised Chloride and Sulfate Water Quality Criteria, BDlegal.com, 2019).

• According to Kentucky state website (2019), acute chloride levels ranging from 2500 to 8400 mg/L can be toxic to aquatic life such as snails, minnows, catfish, and trout.

• Another study by University of Rhode Island has much lower long-term exposure rates of 250mg/L and 860 mg/L for short-term exposure. (Hunt, Herron, & Green. Chlorides in Fresh Water. University of Rhode Island. March 2012)

Question: Why does Illinois EPA have much higher accepted levels of chloride than surrounding states especially since what is considered to be safe levels for aquatic life is much lower than the Illinois accepted level of 500mg/L? Why does IEPA not have both an acute and a chronic level like other states and the national standard?

Question: According to the draft permit for the pipeline samples taken from the acid mine discharge showed chloride levels greater than 2,000 mg/ and levels of up to 12,000mg/L are permissible from the discharge point into the Big Muddy River. This grossly exceeds both the national and state accepted levels. How can the IEPA allow such a gross violation of its own and national regulation? 12,000mg/L would be 48x the national standard and 24x the state standard. Is it truly be diluted "immediately" and rapidly" which is what is stated in the In Section 302.102 12(e) Allowed Mixing, Mixing Zones and ZIDs (TITLE 35: ENVIRONMENTAL PROTECTION SUBTITLE C: WATER POLLUTION CHAPTER I: POLLUTION CONTROL BOARD PART 302 WATER QUALITY STANDARDS SUBPART A: GENERAL WATER QUALITY PROVISIONS, 2019)

Sulfates:

The accepted sulfate level is listed as 1250 mg/l on the draft permit; however, the average sulfate concentration taken from the Pond Creek mine wastewater was 1,940 mg/L and the IEPA antidegradation assessment states that the levels to be discharged to the Big Muddy River could be as high as 2,120 mg/L sulfate. This would be the equivalent of 476,000 pounds per day of sulfate.

According to Kentucky State website (2019). "Problems caused by sulfates are most often related to their ability to form strong acids which change the pH. Sulfate ions also are involved in complexing and precipitation reactions which affect solubility of metals and other substances."

In addition to the afore mentioned pollutants in the Big Muddy River, the IEPA has recently listed four sections (IL0029165, IL0031704, IL0027871, IL0027898) of the Big Muddy River under the Nutrient Assessment Reduction Plan/Illinois Nutrient Loss Reduction Strategy Implementation (2019). These sections of the river are all downstream from the proposed pipeline.

According to a study by Kaushal in 2005, many of our waterways are becoming victims of 'freshwater salinization syndrome', where "high levels of chloride and other salt ions can kill freshwater animals, from zooplankton at the base of the food web to insects and fish, because they make it hard for the creatures to osmotically regulate their cell's ion concentrations." Furthermore, the study states that high levels of chlorides and other salts can cause more algal blooms due to dying off of algae-eating zooplankton which in turn can cause the releasing of toxins and deplete oxygen. In addition, higher salt levels can "favor invasive species that better survive in brackish water," and "at nonlethal levels, salt can stunt the reproduction and growth of freshwater organisms, lowering biodiversity and shifting the structure of the food webs." (For Healthier Lakes, Rivers, and Drinking Water Hold the Salt, Lockwood, D., Chemical and Engineering News, 2019).

Question: Has the IEPA considered the impact of discharging millions of gallons of unfiltered mine wastewater with elevated levels of chlorides, sulfates and other contaminants on the already elevated nutrient load of the Big Muddy River which is supposed to be being mitigated?

Question: Has the EPA taken into consideration current studies regarding effects of salination on aquatic animals?

Mixing Zones

There are numerous issues with the granting of this permit which could possibly violate the water quality standards as listed by the IEPA Pollution Control Board (2019):

In Section 302.102 Allowed Mixing, Mixing Zones and ZIDs.

4) Mixing is not allowed in waters containing mussel beds, endangered species habitat, fish spawning areas, areas of important aquatic life habitat, or any other natural features vital to the well-being of aquatic life in such a manner that the maintenance of aquatic life in the body of water as a whole would be adversely affected.

Question: Has this been determined by the IEPA/IDNR? There was no mention of this in the draft permit.

6) Mixing must allow for a zone of passage for aquatic life in which water quality standards are met.

Question: Has this been determined? Again, there was no mention of this in the permit.

7) The area and volume in which mixing occurs, alone or in combination with other areas and volumes of mixing, must not

intersect any area of any body of water in such a manner that the maintenance of aquatic life in the body of water as a whole would be adversely affected.

Question: Has the current state of the river (i.e. known pollutants) as well as the Sugar Creek Mine discharge pipeline been considered in determining this?

9) No mixing is allowed when the water quality standard for the constituent in question is already violated in the receiving water.

Question: Given that the Big Muddy River already has elevated levels of sulfates and manganese, mixing would be violating this regulation. How then can a permit be granted for a mixing zone?

12) The area and volume in which mixing occurs must be as small as is practicable under the limitations prescribed in this subsection (b), and in no circumstances may the mixing encompass a surface area larger than 26 acres. c) All water quality standards of this Part must be met at every point outside of the area and volume of the receiving water within which mixing is allowed. The acute toxicity standards of this Part must be met within the area and volume within which mixing is allowed, except as provided in subsection (e).

e) Pursuant to the procedures of Section 39 of the Act and 35 Ill. Adm. Code 309, a person may apply to the Agency to include as a condition in an NPDES permit a ZID as a component portion of a mixing zone. The ZID shall, at a minimum, be limited to waters within which effluent dispersion is immediate and rapid. For the purposes of this subsection, "immediate" dispersion means an effluent's merging with receiving waters without delay in time after its discharge and within close proximity of the end of the discharge pipe, so as to minimize the length of exposure time of aquatic life to undiluted effluent, and "rapid" dispersion means an effluent's merging with receiving waters so as to minimize the length of exposure time of aquatic life to undiluted effluent. Upon proof by the applicant that a proposed ZID conforms with the requirements of Section 39 of the Act and this Section, the Agency shall, pursuant to Section 39(b) of the Act, include within the NPDES permit a condition defining the ZID.

(TITLE 35: ENVIRONMENTAL PROTECTION SUBTITLE C: WATER POLLUTION CHAPTER I: POLLUTION CONTROL BOARD PART 302 WATER QUALITY STANDARDS SUBPART A: GENERAL WATER QUALITY PROVISIONS, 2019)

Question: With up to 5,000gals/minute or 300,000gals/hr. of mine waster discharge being permissible, how can there be an "immediate" or "rapid" dispersion to avoid having to adhere to Section 302.102, 12, (c), which states that acute toxicity standards must be met within the mixing zone. How can up to 12,000mg/l chlorides be rapidly dispersed in a small river?

Endangered Species

I am still trying to find out what species specific to Big Muddy River are Endangered or Threatened. I have contacted numerous government agencies, including: U.S. Fish and Wildlife, IDNR, IEPA, Illinois Endangered Species Protection Board, and Shawnee National Forest. No one has been able to give me any information. I have been trying since Fall 2018 after the initial hearing at IDNR.

Question 8: How can this permit be granted if none of these agencies seem to know exactly what species are endangered and threatened in the Big Muddy River Watershed as well as Pond Creek watershed?

Freshwater Mussels

Since 2018, US Fish and Wildlife Service has been under litigation for not protecting critical habitat for certain endangered mussels in 18 states, including three that occur in Illinois-Spectaclecase, Sheepnose, and Snuffbox. These and many more are protected under the 2019 Endangered Species Act. Anyone requiring federally funded or permitted projects in mussel's habitats must consult the US Fish and Wildlife Service to ensure habitat would not be damaged. There are more mussel species in the eastern U.S. than anywhere in the world;

however, 70% of species are either endangered, threatened or extinct already. (Center for Biological Diversity)

According to a study conducted by the Illinois Natural History Survey, "Freshwater Mussels of the Big Muddy River" (2012),

six species of mussels previously detected in the Big Muddy River were not found; although five of these are commonly found in other rivers in Illinois. These include: pink heelsplitter, pimpleback (listed as federally endangered), deertoe, creeper, fawnsfoot, plain pocketbook. 19 others were detected. "In Illinois, 25 of the 62 extant species (44%) are listed as threatened or endangered. Some of the species listed in the study that were documented in the Big Muddy River are: Lilliput, paper pondshell, pondhorn, white heelsplitter, giant floater, maple leaf, pink papershell.

The study lists the abandoned coal mines, specifically in the Murphsyboro area of the Big Muddy River, as a source of pollution. The study goes on to state that

mussels are more sensitive to sodium chloride and potassium chloride and that the current USEPA AWQC may not be protective of freshwater mussels (2013 Science Inventory). In addition, the study states that sedimentation and siltation might be causing a lack of species.

Question: Are any of the mussel species that exist in the Big Muddy watershed listed as threatened or endangered or rare? If this is not known, then it is pertinent to find out given the fact that most mussel species are now listed as threatened or endangered or already extinct and that they have been found to be sensitive to chloride levels as well as sedimentation/siltation both of which will be inflated due to the discharge of up to millions of gallons a day of acid mine discharge with extremely high levels of chloride and sulfates.

Fish Species

According to "Fishes of the Big Muddy" (1999), at least ten native fish species within a 100 year period are no longer found due to pollution, cultivation, and habitat lost. The study suggests the need for "continual vigorous reclamation of abandoned mines lands and treatment of acid mine drainage." The study goes on to say that "Big Muddy River drainage…has been subjected to an array of environmental stresses that have permanently disrupted its hydrological cycle, and ultimately altered its fish fauna."

The following are list of fish species that were recorded at time of study: bluegill, channel catfish, largemouth bass, sauger, striped bass, white bass, white crappie, yellow bullhead.

Question: What is the current state of the fish population in the Big Muddy and how will these elevated levels of chlorides/sulfates affect them as well as possible other toxins such as manganese and iron? Are any of these species listed as endangered or threatened?

Other Endangered/Threatened Species

The alligator snapping turtle is listed as a threatened species in Illinois.

Question: Has it been determined if their habitat includes the Big Muddy Watershed?

Ecologically Sensitive Areas

The Big Muddy flows adjacent to two very ecologically diverse areas, Little Grand Canyon and La Rue Pine Hills, both of which are National Natural Registered Landmarks with many rare, threatened, and endangered plant and animal species. "LaRue-Pine Hills Ecological Area, located within the Shawnee National Forest, contains one of the finest assemblages of diverse vegetation in the Midwest. The site represents species of northern, southern, eastern, and western affinities, including 40 species rare in Illinois." (Prairie Research Institute). Some threatened and endangered animal species include the Indian Bat, Illinois chorus frog, eastern woodrat which is only located in the La Rue Pine hills area, several fish species, and many plant species. La Rue Pine Hills/Otter Pond is also a national Research Natural Area which is protected federally.

Question: Are any of these species being considered? In the draft permit, it states that there will be no adverse effects on species because water quality standards will be met. However, in the case of Williamson Energy, this is obviously not the case. Water quality standards are not met. How then can species be protected? Under the Clean Water Act, section. 101(a)2, water quality provides for the protection and propagation of fish, shellfish, and wildlife. In addition, the Big Muddy River is already polluted with elevated levels of manganese, sulfates, phosphorus, mercury and has a fish advisory for PCBs. How the does adding elevated levels of chloride, sulfate and other toxins known to have adverse effects on animal and plant species permissible under this section of the Clean Water Act?

There is also a large area in southwestern Illinois listed as a Conservation Opportunity Area for La Rue Pine Hills under

IDNR which includes sections of the Big Muddy River in both Jackson and Union County (IDNR, accessed 2019).

Fifty-two miles of the Big Muddy River, from S.R. 14 south of Rend Lake to Southern Illinois Airport (U.S. 51), is a candidate for the Wild and Scenic River Designation (National Rivers Inventory, 2019) and is listed as having "Outstanding Remarkable Value", exactly the area where the proposed pipeline is supposed to discharge. Due to this fact, special considerations need to be considered.

The Council on Environmental Quality (CEQ), under 5(d)(1) Wild and Scenic River Act authority, provides guidance to federal agencies with permitting and/or granting authority for projects on or near rivers listed on the NRI. In accordance with executive memorandum, all agencies must "take care to avoid or mitigate adverse effects" to rivers identified in the Nationwide Rivers Inventory.

The following information is listed on the National Park Services website regarding rivers listed on the National Rivers Inventory:

1. Determine whether the proposed action could affect an NRI river.

• Check the current regional/state NRI list to determine whether the proposed action could affect an NRI river (i.e., is the proposed action location in the vicinity of the NRI segment).

• If an NRI river segment could be affected by the proposed action, an environmental assessment or and environmental impact statement may be required depending on the significance of the effects.

2. Determine whether the proposed action could have an adverse effect on the natural, cultural, and recreational values of the NRI segment. These values are listed as "outstandingly remarkable values" (ORVs) on the state NRI list.

Adverse effects on NRI rivers may occur under conditions which include, but are not limited to:

• Destruction or alteration of all or part of the free flowing nature of the river;

• Deterioration of water quality; or

3. Determine whether the proposed action could foreclose options to classify any portion of the NRI segment as wild, scenic, or recreational river areas.

• In some cases, impacts of a proposed action could be severe enough to preclude inclusion in the Wild and Scenic River System, or lower quality of the classification (e.g., from wild to recreational). If the proposed undertaking could effectively downgrade any portion of the NRI segment, you should consult with NPS.

• Proposed actions (whether uses or physical changes), which are theoretically reversible, but which are not likely to be reversed in the short term, should be considered to have the effect of foreclosing for all practical purposes Wild and Scenic River status. This is because a river segment, when studied for possible inclusion in the Wild and Scenic River System, must be judged as it is found to exist at the time of the study, rather than as it may exist at some future time.

• If a proposal, including one or more alternatives, could have an adverse effect on an NRI river, an EA, or if the effects are significant, an EIS must be prepared.

4. Incorporate mitigation/avoidance measures in the proposed action to the maximum extent feasible within the agency's authority.

Question: Has the IEPA taken into consideration that numerous sections of the Big Muddy River downstream from the pipeline are listed not only on the National Rivers Inventory but also in several state and federally listed special environmental zones and therefore has special protections?

IEPA Exhibiting Conflict of Interest

1) The IEPA included in the draft permit a section on social/economic benefits of the proposed activity (pipeline). Goes on to

list statistics about jobs and revenue for state. My argument is that an agency that was supposedly created for the purpose of protecting our environment should not take economic nor social factors into account.

2) The IEPA also goes on to favor the mine company by stating that "filtration is a technology that is not feasible for the proposed facility because: filtration is much more expensive than sediment ponds…a large area of land would be required for such a facility, and maintenance and supervision of the filtration and sludge operation would be burdensome and would increase production costs."

Question: Is the EPA supposed to be taking into consideration financial aspects of a company in lieu of protecting the environment? Is it supposed to weigh economic benefit over protecting the environment? And why has not the IEPA commented on the economic cost to the citizens of Illinois due to pollution already caused by the mine and the pollution that will be caused by the mine? The Big Muddy River is already polluted and there are now two implementation plans that have been created by the IEPA (2004, 2019) costing hundreds of millions of dollars to implement. The mines, which are listed as one of the causes of pollution, are not held accountable for paying for these costly plans, rather the "stakeholders" and concerned citizens are told they must try to find monies to clean up the rivers. To date, no watershed-based plan group has been formed based on the 2004 findings.

Illinois Constitution

The Illinois Constitution in Article XI states that we have a right to a healthy environment. Since Williamson Energy has numerous and frequent violations which can have and have had adverse impacts on the watersheds and its inhabitants and the IEPA has already listed the Big Muddy River as well as some of its tributaries such as Pond Creek as being impaired for numerous pollutants some as a direct result of both past and current mining activities. It seems that IEPA would be violating the constitution for granting a permit to a company that has a history of polluting public waters and the fact that the nature of the permit would allow even more pollutants to enter the watershed.

Question: Has the IEPA fully considered whether granting this permit for dumping more pollutants into the already impaired Big Muddy River will violate the law as stated in Article XI of our state constitution?

River Rights

Question: Has the IEPA considered that the river itself should have its own rights. It is already dammed and polluted? How much more should the Big Muddy River endure? The IEPA has already granted another similar permit for a discharge pipeline into the Big Muddy River with even higher expected levels of chlorides form the Sugar Camp Mine only 12.5 miles above stream from the proposed Pond Creek Mine pipeline.

Listen to the many, not to the money: health over wealth.

Sincerely submitted…

To Barb Lieberoff, Illinois Environmental Protection Agency

It is with grave concern that I write this letter in objection to Williamson Energy's permit for the Pond Creek Mine to discharge millions of gallons of high chloride and sulfate water into the Big Muddy River. This highly toxic discharge will impact everything downstream including wildlife, property, and the environmental health and public uses of the river.

As a member of the Carbondale Unitarian Fellowship, I have respect for the interdependent web of all existence of which we are a part. The proposed discharge of these toxic substances and the environmental impact it will have, moves me to speak out for those who cannot speak for themselves; our shared land, air, and water, as well as our neighbors that will be negatively impacted.

In addition, allowing a corporation to benefit financially from harm done to our common home is an offense to our community.

Hoping this action is stopped, I am

Dear IEPA staff—Thank you for hosting the Pond Creek mine hearing. The testimonies by participants were very moving and I hope provided convincing content to support protecting the Big Muddy River from being used as a toxic dumping medium. Two comments I would like to contribute:

1. Rivers are among the highest echelon of nature's creations. Rivers and waterways are the most diverse biosystems for natural habitat and need to receive the of the utmost level of protection. As Rachael Carson wrote in *Silent Spring*, nature is supremely adapted to closing the loop of recycling natural waste, however, when chemicals and manmade toxins are dumped into the system in astronomical quantities (such as mine waste and agricultural run off) nature is oversaturated and overstressed, and becomes sick and dies. Please, for the sake of our present life (fish, mammals, in/vertebrates, and plants that live in riparian areas) and future generations, do not allow rivers to be used as sewers.
2. There are precedents for agency decisions being repealed, as the following lawsuit where in Seattle, WA—on Oct 15 2019, a Federal Court for the Western District of Washington ruled the Army Corps' commercial shellfish aquaculture general permit, which is used to permit the vast majority of the shellfish aquaculture in Washington, to be unlawful. In response to a lawsuit brought by Center for Food Safety (CFS), the court found that Army Corps failed to adequately consider impacts of commercial shellfish aquaculture to Washington shorelines and wildlife habitat. The court also ruled that Army Corps' conclusory findings of minimal cumulative impact were not supported by the evidence before the agency, which shows harm to the environment, including damage to crucial fish habitat.

Sincerely, Patty Weyhich, concerned citizen, landowner, Carbondale, IL

CENTER FOR FOOD SAFETY PROTECTS WASHINGTON'S ICONIC COASTLINES AND WILDLIFE FROM EXPANDING INDUSTRIAL SHELLFISH AQUACULTURE

Center for Food Safety Protects Washington's Iconic Coastlines and Wildlife from Expanding Industrial Shellfish Aquaculture

Court Rules Army Corps Failed to Protect Clean Water and Assess Cumulative Environmental Impacts

Seattle, WA—On Friday, a Federal Court for the Western District of Washington ruled the Army Corps' commercial shellfish aquaculture general permit, which is used to permit the vast majority of the shellfish aquaculture in Washington, to be unlawful. In response to a lawsuit brought by Center for Food Safety (CFS), the court found that Army Corps failed to adequately consider impacts of commercial shellfish aquaculture to Washington shorelines and wildlife habitat. The court also ruled that Army Corps' conclusory findings of minimal cumulative impact were not supported by the evidence before the agency, which shows harm to the environment, including damage to crucial fish habitat that support iconic species like salmon and orcas.

Army Corps' permit, Nationwide Permit 48 (NWP 48) issued by the Trump administration in 2017, would have allowed an enormous expansion of an over $100 million dollar-a-year industry without sufficient marine wildlife or water quality protections for these unique and sensitive ecosystems. After reviewing the information before the Corps, the court found that the evidence of environmental impacts from shellfish aquaculture (such as harm to eelgrass, a crucial seagrass, and all the species that rely on it) could not support the agency's conclusion that allowing thousands of these operations would only have minimal impact.

"Army Corps has failed to protect public waters from the harmful environmental impacts of industrial shellfish aquaculture for years, but now the agency must finally accept that this type of aquaculture is not benign and follow federal law," **said Amy van Saun, senior attorney at CFS**, based out of its Pacific Northwest office. "We're relieved that the court did the right thing and prevented this unbridled expansion of industrial aquaculture at the expense of Washington's wildlife and residents."

Industrial aquaculture already threatens Washington's iconic, invaluable shorelines and bays, which are home to numerous marine species including endangered salmon. The expansion would have allowed shellfish aquaculture acreage to double to an estimated 72,300 acres—or a third of all Washington shorelines—including critical spawning and feeding grounds for forage fish, birds, invertebrates like Dungeness crab, and finfish like salmon and green sturgeon.

As the evidence before the Army Corps showed, many of these species rely on eelgrass and other aquatic vegetation. Eelgrass also helps to mitigate the effects of climate change on oceans. Industrial shellfish aquaculture is known to reduce or eliminate eelgrass, including through the industry's intentional the use of pesticides. Yet the new permit did not place any restrictions on impacts to eelgrass, through pesticide use or otherwise.

"As a business owner and lover of Willapa Bay, and someone personally impacted by the spraying of toxic pesticides on shellfish beds, I am thrilled that the Corps will no longer be able to shirk its responsibility to evaluate pesticide impacts to our Bay, as well as the massive expansion of industrial-scale clam and oyster aquaculture over so much of the Bay," **said Fritzi Cohen, Pacific County resident, owner and proprietor of the Moby Dick Hotel on Willapa Bay.** "The science shows that pesticides harm both the wildlife that are exposed to them, and can show up in the very oysters that are being grown for people to eat, and the Corps must address this danger in its shellfish permitting."

The permit also failed to restrict the enormous use of plastics by the industry, like the 42,000 PVC tubes per acre that are covered in plastic netting and used to grow geoducks (a type of clam grown almost exclusively for the luxury export market). Netting can trap and entangle wildlife, and the plastics break down into microplastics that are hazardous to marine organisms, including the very shellfish being grown for human consumption.

The court found that "the Corps acknowledged that reissuance of NWP 48 would have foreseeable environmental impacts on the biotic and abiotic components of coastal waters, the intertidal and subtidal habitats of fish, eelgrass, and birds, the marine substrate, the balance between native and non-native species, pollution, and water quality, chemistry, and structure, but failed to describe, much less quantify, these consequences."

As a result of the Corps' refusal to evaluate these various impacts, and their cumulative impact, at the outset, as well as its reliance on cherry-picked data, its adoption of NWP 48 in Washington was unlawful under the National Environmental Policy Act and the Clean Water Act. The court set aside NWP 48 in Washington, but is allowing limited additional briefing on how to revoke the general permit.

Case No. 17-1209RSL

ORDER HOLDING NWP 48 UNLAWFUL IN THE STATE OF WASHINGTON AND REQUESTING ADDITIONAL BRIEFING

This matter comes before the Court on cross-motions for summary judgment filed by the parties and intervenors in the above-captioned matters. Dkt. # 36, # 44, and # 45 in C16-

0950RSL; Dkt. # 31, # 43, and # 44 in C17-1209RSL. The Court has also considered the Swinomish Indian Tribal Community's submission in a related case, C18-0598RSL (Dkt. # 28). Plaintiffs challenge the U.S. Army Corps of Engineers' issuance of Nationwide Permit 48 ("NWP 48") authorizing discharges, structures, and work in the waters of the United States related to commercial shellfish aquaculture activities. Plaintiffs argue that the Corps failed to comply with the Clean Water Act ("CWA"), the National Environmental Policy Act ("NEPA"), and the Endangered Species Act ("ESA") when it reissued NWP 48 in 2017. They request that the decision to adopt NWP 48 in Washington[1] be vacated under the Administrative Procedures Act ("APA") and that the Corps be required to comply with the environmental statutes before issuing any new permits or verifications for commercial shellfish aquaculture in this State.[2]

BACKGROUND

The CWA authorizes the Army Corps of Engineers to issue permits for the discharge of dredged or fill material into the navigable waters of the United States. 33 U.S.C. § 1344(a). If the Corps determines that activities involving discharges of dredged or fill material "are similar in nature, will cause only minimal adverse environmental effects when performed separately, and will have only minimal cumulative adverse effect on the environment," it may issue general permits on a state, regional or nationwide basis permitting the activities for a five year period. 33

---

[1] The Coalition to Protect Puget Sound Habitat seeks to bar the use of NWP 48 only in Puget Sound.

[2] The Court finds that one or more members of plaintiff Center for Food Safety has/have standing to pursue the CWA, NEPA, and ESA claims based on their concrete, particularized, and imminent injuries arising from activities in Washington that are permitted under the 2017 version of NWP 48.

U.S.C. § 1344(e). "[T]he CWA imposes substantive restrictions on agency action" (Greater Yellowstone Coalition v. Flowers, 359 F.3d 1257, 1273 (10th Cir. 2004)): if "the effect of a general permit will be more than minimal, either individually or cumulatively, the Corps cannot issue the permit" (Wyoming Outdoor Council v. U.S. Army Corps of Eng'rs, 351 F. Supp. 2d 1232, 1255-57 (D. Wyo. 2005)). General permits often impose requirements and standards that govern the activities undertaken pursuant to the permit, but they relieve operators from the more burdensome process of obtaining an individual, project-based permit.

In 2017, the Corps reissued NWP 48, thereby authorizing "the installation of buoys, floats, racks, trays, nets, lines, tubes, containers, and other structures into navigable waters of the United States. This NWP also authorizes discharges of dredged or fill material into waters of the United States necessary for shellfish seeding, rearing, cultivating, transplanting, and harvesting activities." NWP003034. The nationwide permit authorizes(a) the cultivation of nonindigenous shellfish species as long as the species has previously been cultivated in the body of water at issue, (b) all shellfish operations affecting ½ acre or less of submerged aquatic vegetation, and (c) theall operations affecting more than ½ acre of submerged aquatic vegetation if the area had been used for commercial shellfish aquaculture activities at any point in the past 100 years. NWP003034-35.[3]

In addition to the CWA's requirement that the Corps make "minimal adverse effect" findings before issuing a general permit, "NEPA imposes procedural requirements on federal agencies to analyze the environmental impact of their proposals and actions." O'Reilly v. U.S.

[3] The 100-year look back provision was not in the 2012 version of NWP 48.

Army Corps of Engr's, 477 F.3d 225, 228 (5th Cir. 2007). Federal agencies are required to do an environmental assessment ("EA") of their proposed action, providing a brief discussion of the anticipated environmental impacts and enough evidence and analysis to justify a no-significant-impact determination. 40 C.F.R. § 1508.9. If the agency, after conducting an EA, is unable to state that the proposed action "will not have a significant effect on the human environment," a more detailed and comprehensive environmental impact statement ("EIS") must be prepared. 40 C.F.R. § 1508.11 and § 1508.13.[4]

The Corps' EA regarding the 2017 reissuance of NWP 48 is presented in a Decision Document dated December 21, 2016. NWP003034-3116. An additional condition was later imposed by the Seattle District through its Supplemental Decision Document dated March 19, 2017. COE 127485-611. The Court has considered both Decision Documents to the extent they reflect the Corps' analysis of the anticipated environmental impacts of issuing the nationwide permit and imposing the additional regional condition. The Decision Documents set forth the Corps' discussion of anticipated environmental impacts and the evidence and analysis justifying its determination "that the issuance of [NWP 48] will not have a significant impact on the quality of the human environment," making an EIS unnecessary under NEPA. NWP003106. The Decision Documents also reflect the Corps' determination that the "activities authorized by [NWP 48] will result in no more than minimal individual and cumulative adverse effects on the aquatic environment" for purposes of the CWA. NWP003107. The Seattle District, for its part, concluded that if it added a regional condition preventing the commercial harvest of clams by

[4] "Impact" and "effect" are used interchangeably in the regulations and are deemed synonymous. 40 C.F.R. § 1508.8.

means of hydraulic escalator equipment and evaluated proposed activities as they were verified under the reissued permit, the effects of the permitted activities would be individually and cumulatively minimal. COE 127592-93.

Plaintiffs argue that these conclusions must be invalidated under the APA because the record does not support the Corps' conclusions regarding the environmental effects of individual shellfish aquaculture activities or their cumulative impacts and the EA does not accurately describe the anticipated environmental impacts of NWP 48 or otherwise justify a no-significant-impact determination. Under the APA, a reviewing court must set aside agency actions, findings, or conclusions that are "arbitrary, capricious, an abuse of discretion, [] otherwise not in accordance with law" or "without observance of procedure required by law." 5 U.S.C. § 706(2)(A) and (D). Agency action is arbitrary and capricious "if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise." Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983). Although agency predictions within the agency's area of expertise are entitled to the highest deference, they must nevertheless have a substantial basis in fact. Ctr. for Biological Diversity v. Zinke, 900 F.3d 1053, 1067 (9th Cir. 2018). In determining whether a decision is supported by substantial evidence in the record, the Court will not substitute its own judgment for that of the agency but rather considers whether the decision is based on relevant evidence that a reasonable mind might accept as adequate to support the agency's conclusion.

San Luis & Delta-Mendota Water Auth. v. Jewell, 747 F.3d 581, 601 (9th Cir. 2014).[5]

DISCUSSION

Having reviewed the submissions of the parties and the administrative record, and having heard the arguments of counsel, the Court finds that there is insufficient evidence in the record to support the agency's conclusion that the reissuance of NWP 48 in 2017 would have minimal individual and cumulative adverse impacts on the aquatic environment for purposes of the CWA and that the Corps' environmental assessment does not satisfy NEPA's requirements. Although the minimal impacts finding is repeated throughout the Corps' Decision Document (see NWP003038, NWP003045-46, NWP003049, NWP003051, NWP003091, NWP003107), it is based on little more than (1) selectively chosen statements from the scientific literature, (2) the imposition of general conditions with which all activities under nationwide permits must comply, and (3) the hope that regional Corps districts will impose additional conditions and/or require applicants to obtain individual permits if necessary to ensure that the adverse impacts will be minimal. Each of these considerations is discussed below.

(1) Effects Analysis

At various points in its analysis, the Corps acknowledges that commercial shellfish aquaculture activities can have adverse environmental impacts. See NWP003040 (commercial

[5] Plaintiffs also argue that the agency action should be invalidated because the Corps (a) failed to analyze a reasonable range of alternative actions in the EA, (b) failed to allow for meaningful public participation, and (c) failed to re-initiate consultation with expert wildlife agencies under the ESA when the 2017 version of NWP 48 was modified to increase the acreage on which commercial shellfish production was authorized, failed to incorporate assumed conservation measures and conditions, and failed to analyze the impacts of pesticides on endangered species. Because the Court finds that the Corps violated the CWA and NEPA, it has not considered these alternative theories for why NWP 48 should be invalidated.

shellfish aquaculture activities "have some adverse effects on the biotic and abiotic components of coastal waters, including intertidal and subtidal areas"); Id. (noting that "at a small spacial scale (e.g., the site directly impacted by a specific aquaculture activity) there will be an adverse effect."); NWP003041 (acknowledging "some impacts on intertidal and subtidal habitats, fish, eelgrass, and birds"); NWP003042 (recognizing that "commercial shellfish aquaculture activities do have some adverse effects on eelgrass and other species that inhabit coastal waters"); COE 127559 (stating that "marine debris is a serious impact on the marine environment"); COE 127570 (acknowledging "potential adverse impacts" to riffle and pool complexes); COE 127584 (noting that "[c]ommercial shellfish aquaculture activities can result in conversion of substrates (e.g. mudflats to gravel bars), impacts to submerged aquatic vegetation, alteration in aquatic communities from native to non-native shellfish species, and water quality impacts from harvest activities"). It concludes that these impacts are no more than minimal, however, (a) when considered on a landscape rather than a site-by-site scale, (b) because the relevant ecosystems are resilient, and (c) because the impacts are "relatively mild" in comparison "to the disturbances and degradation caused by coastal development, pollution, and other human activities in coastal areas." NWP003040 and NWP003044.

(a) Scale of Impacts Evaluation

In determining the potential effects of a proposed discharge of dredged or fill material in an aquatic environment, the Corps is required to determine the nature and degree of the environmental impact the discharge will have, both individually and cumulatively. "Consideration shall be given to the effect at the proposed disposal site of potential changes in substrate characteristics and elevation, water or substrate chemistry, nutrients, currents,

circulation, fluctuation, and salinity, on the recolonization and existence of indigenous aquatic organisms or communities." 40 C.F.R. § 230.11(e) (emphasis added). Ignoring or diluting site-specific, individual impacts by focusing solely on a cumulative, landscape-scale analysis is not consistent with the governing regulations.

(b) Resilient Ecosystems

The Decision Document issued by Corps Headquarters acknowledges that "[t]he effects of commercial shellfish aquaculture activities on the structure, dynamics, and functions of marine and estuarine waters are complicated, and there has been much discussion in the scientific literature on whether those effects are beneficial or adverse." NWP003040. Relying in large part on a paper published by Dumbauld and McCoy for the U.S. Department of Agriculture in 2015, the Corps concluded that the individual and cumulative impacts of the activities authorized by NWP 48 would be minimal "because the disturbances caused by these activities on intertidal and subtidal ecosystems are temporary and those ecosystems have demonstrated their ability to recover from those temporary disturbances." NWP003045-46.[6]

---

[6] The Corps also cites a 2009 paper co-written by Dumbauld, which it describes as "a review of empirical evidence of the resilience of estuarine ecosystems and their recovery (including the recovery of eelgrass) after disturbances caused by shellfish aquaculture activities." NWP003044. The Corps relies on the 2009 Dumbauld paper to support its conclusion that commercial shellfish production can have beneficial impacts on some aspects of the aquatic environment. See NWP003406 ("Many species co-exist with commercial shellfish aquaculture activities and many species benefit from these activities."); NWP003086 (noting improved water and habitat quality at moderate shellfish population densities); NWP003087 ("Activities authorized by this NWP may alter habitat characteristics of tidal waters. Some species of aquatic organisms will benefit from those changes, while others will be adversely affected."); NWP003104 ("Sessile or slow-moving animals in the path of discharges of dredged or fill material and aquaculture equipment may be destroyed. Some aquatic animals may be smothered by the placement of fill materials. Some aquatic organisms will inhabit the physical structure created by equipment used for commercial shellfish aquaculture activities."). The fact that there are environmental winners and losers when activities authorized under NWP 48 are undertaken does not resolve the issue of whether the

Dumbauld and McCoy's research cannot justify such a broad, sweeping conclusion regarding the resilience of entire ecosystems in both the intertidal and subtidal zones. According to the Corps' own summary of the paper, the authors evaluated only the effects of oyster aquaculture activities on submerged aquatic vegetation. NWP003044. The paper itself shows that Dumbauld and McCoy were studying the effects of intertidal oyster aquaculture on the seagrass *Zostera marina*. There is no discussion of the impacts on other types of aquatic vegetation, on the benthic community, on fish, on birds, on water quality/chemistry/structures, or on substrate characteristics. There is no discussion of the subtidal zone. There is no discussion regarding the impacts of plastic use in shellfish aquaculture and only a passing reference to a possible side effect of pesticide use. The Corps itself does not remedy these deficiencies: although it identifies various resources that will be adversely impacted by issuance of the national permit (along with resources that may benefit from shellfish production), it makes virtually no effort to characterize the nature or degree of those impacts. The Decision Document's "Impact Analysis" consists of little more than an assurance that district engineers will consider the direct and indirect effects caused by the permitted activity on a regional or case-by-case basis. NWP003073-74.

---

proposed agency action has more than minimal impacts or obviate the need for a "hard look" at all impacts, beneficial and adverse. Native Ecosys. Council v. U.S. Forest Serv., 428 F.3d 1233, 1238-39 (9th Cir. 2005). The 2009 review clearly shows, and the Corps acknowledges, that at least some aquatic species and characteristics are adversely affected by commercial shellfish aquaculture. The Ninth Circuit, faced with a similar situation under NEPA, noted that "even if we had some basis for assuming that [the agency's] implementation of the BiOp would have exclusively beneficial impacts on the environment, we would still lack a firm foundation for holding that [the agency] need not prepare an EA and, if necessary, an EIS." San Luis & Delta-Mendota Water Auth. v. Jewell, 747 F.3d 581, 652 n.52 (9th Cir. 2014).

Under the CWA, the Corps must find that the proposed activity "will cause only minimal adverse environmental effects when performed separately, and will have only minimal cumulative adverse effect on the environment" before it issues a general permit. 33 U.S.C. § 1344(e). Under NEPA, the Corps is required to "[b]riefly provide sufficient evidence and analysis for determining whether to prepare an environmental impact statement or a finding of no significant impact." 40 C.F.R. § 1508.9(a)(1). The agency is required to take a "hard look" at the likely environmental impacts of the proposed action and prepare an EA to determine whether the impacts are significant enough to necessitate the preparation of an EIS. Native Ecosys. Council, 428 F.3d at 1238-39. The analysis, though brief, "must be more than perfunctory" and must be based on "some quantified or detailed information; . . . [g]eneral statements about possible effects and some risk do not constitute a hard look absent a justification regarding why more definitive information could not be provided." Klamath-Siskiyou Wildlands Ctr. v. Bureau of Land Mgmt., 387 F.3d 989, 993-94 (9th Cir. 2004) (alteration in original, citations omitted).

In this case, the Corps acknowledged that reissuance of NWP 48 would have foreseeable environmental impacts on the biotic and abiotic components of coastal waters, the intertidal and subtidal habitats of fish, eelgass, and birds, the marine substrate, the balance between native and non-native species, pollution, and water quality, chemistry, and structure, but failed to describe, much less quantify, these consequences. The Corps cites the two Dumbauld papers for general statements regarding the positive or negative effects of shellfish aquaculture on certain aquatic resources or characteristics (focusing on seagrass), but it makes no attempt to quantify the effects or to support its conclusion that the effects are no more than minimal.

Even if the health and resilience of seagrass were the only concern - and, as discussed

above, it is not - the 2015 Dumbauld and McCoy paper cannot reasonably be interpreted as evidence that seagrass is only minimally impacted by commercial shellfish aquaculture. As noted above, the paper evaluated only the effect of oyster aquaculture. In that context, it recognized the research suggesting that oyster aquaculture has direct impacts on native seagrasses at the site of the activity and in short temporal spans. These impacts are then ignored by both Dumbauld and the Corps in favor of a landscape, cumulative analysis which, as discussed above, is inadequate. Just as importantly, NWP 48 authorizes the discharge of dredged and fill material from not only oyster operations, but also from mussel, clam, and geoduck operations carried out on bottom substrate, in containers, and/or on rafts or floats. Thus, Dumbauld and McCoy did not evaluate, and drew no conclusions regarding, the impact that many of the activities authorized by NWP 48 would have on seagrass (much less other aquatic resources). The Seattle District, for its part, acknowledged the breadth of species and cultivation techniques that are encompassed in the phrase "commercial shellfish aquaculture." A draft cumulative impact assessment generated in February 2017 dedicated twenty-five pages to discussing the wide range of work and activities covered by NWP 48 and noting the species-dependent variability in cultivation techniques, gear, and timing. COE 125591-616.[7] These variations gave rise to a wide array of effects on the aquatic habitat (COE 125635-36), none of which is acknowledged or evaluated in the national Decision Document. In its Supplement, the Seattle District noted:

---

[7] The Corps acknowledges that the draft regional impact assessment "was a NEPA-level analysis," but faulted the author because that level of analysis should be performed by Headquarters for a nationwide permit. COE 125856. No comparable analysis is included in the national Decision Document, however.

> The impacts to eelgrass from aquaculture can be temporary, depending on the activity, because the habitat conditions themselves (elevation, water quality, etc.) are not permanently altered which allows eelgrass to eventually recover given sufficient time. In Washington State, the timeframe for recovery has been documented to be about 5 years depending on the activity and other factors. For example, when a geoduck farm is seeded it is covered with tubes and nets for 2 or more years and then the tubes and nets are removed until harvest, 3-5 years later. The eelgrass would have died back under the nets, had a chance to return when nets were removed, and then eelgrass is disturbed/removed again when harvest occurs. While this process allows for eelgrass return at the site, the frequency of disturbance and relatively long recovery times result in a local habitat condition where eelgrass more often than not is either not present or present at a much reduced functional state. This effect would persist as long as aquaculture is occurring at the site. In some cases, such as when nets are placed over planted clam beds, any eelgrass is likely to be permanently smothered and not recover. This is because of the permanence of the nets, which are only removed between harvest and the next planting cycle. The time between harvest and planting may only be a matter of weeks or months. Other impacts are discussed in the national decision document. This existing cycle of impacts to eelgrass represents the existing environment from aquaculture activities authorized under NWP [48] 2012; and these or similar effects may continue if verification under NWP 48 2017 is requested and received.

COE 127587-88.

Agency predictions within their areas of expertise are entitled to the highest deference, but they must have a substantial basis in fact. The Corps recognized that certain shellfish operations would displace eelgrass entirely for extended periods of time. In some cases, nets are used to smother the vegetation, precluding any chance of recovery. Where smothering nets are not in use, the eelgrass may recover to some extent, but was not likely to return to is full functional state before being disturbed and/or removed again for the next harvest or seeding

activity. The impacts of commercial shellfish aquaculture on eelgrass (and presumably on all species that rely on eelgrass) would continue as long as the permitted activity continued. Under the 2017 version of NWP 48, a significant number of additional acres that were not cultivated under the 2012 NWP could be put into shellfish aquaculture if the area had been commercially productive during the past 100 years. See COE 118145-49; COE 127584. Any such "reopened" beds could result in additional losses of seagrass and the benefits it provides. COE 127589 ("[F]or many current operations, verification under NWP 2017 will create no appreciable change to the baseline environmental conditions, and the impacts will be minimal both individually and cumulatively.[8] For other operations, however, activities may create a change in current conditions, for example if activities are proposed on land populated with recovered eelgrass."). The national Decision Document does not quantify the periodic and permanent losses of seagrass[9] or the impact on the wider aquatic environment. A reasonable mind reviewing the

---

[8] By quoting this portion of the Seattle District Supplement, the Court is not adopting its reasoning. National, regional, and state permits issued under the authority of the CWA last for only five years. When a NWP is reissued, the environmental impacts of the agency action logically include all activities conducted under the auspices of the permit, regardless of whether those operations are brand new or are simply "verified" as covered by the reissued NWP. The governing regulations expressly impose upon the Corps the obligation to consider the ongoing effects of past actions when conducting a cumulative impacts analysis. 40 C.F.R. § 1508.7. See Ohio Valley Envtl. Coalition v. Hurst, 604 F. Supp. 2d 860, 886-87 (S.D. W. Va. 2009) (rejecting the Corps' *post hoc* rationalization that past authorizations of moutaintop mining had no continuing effects and noting that, in the court's "common sense judgment," "[t]hese losses and impacts do not exist in a vacuum; they are not corrected or cured every five years with the renewal of a new nationwide permit. Nor do these accumulated harms become the baseline from which future impacts are measured. Before authorizing future activities with such tremendous impacts, the Corps must at least consider the present effects of past activities . . . .").

[9] The cumulative impacts of reissuing NWP 48 are to be analyzed in accordance with 40 C.F.R. § 230.7(b)(3), pursuant to which the Corps must predict "the number of activities expected to occur until the general permit expires." NWP003043. The Corps' estimates of how many acres are likely to be cultivated under the reissued national permit vary widely, however. The estimate provided in Section

record as a whole would not accept Dumbauld and McCoy's limited findings regarding the landscape-level impact of oyster cultivation on a species of seagrass in the intertidal zone as support for the conclusion that entire ecosystems are resilient to the disturbances caused by shellfish aquaculture or that the impacts of those operations were either individually or cumulatively minimal.

(c) Impacts of Other Human Activity

Although the Corps does not rely on this line of reasoning in opposing plaintiffs' motions for summary judgment, its Decision Document is replete with various forms of the following statement: "[c]ommercial shellfish aquaculture activities are a minor subset of human activities that affect coastal intertidal and subtidal habitats and contribute to cumulative effects to those coastal habitats." NWP003041. See also NWP003040; NWP003042-44; NWP003061; NWP003068; NWP003075-76; NWP003081; NWP003083-85. To the extent the Corps' minimal impacts determination is based on some sort of comparison between the environmental impacts of shellfish aquaculture and the environmental impacts of the rest of human activity (see

---

7.2.2 of the Decision Document states that NWP 48 will be utilized 1,625 times over the five-year period, resulting in impacts to approximately 56,250 acres of water. NWP003098. Those numbers are reportedly based on past uses of the NWP plus an estimate of the number of activities that did not require pre-construction notification and were not voluntarily reported to the Corps district. Id. According to the Seattle District, however, over 56,000 acres of marine tidelands were permitted under the 2012 version of NWP 48 in Washington State alone, and that number was only going to increase under the 2017 version. COE 127590. Recognizing the long history of commercial shellfish operations in the State's waters and the 100-year look back for identifying "existing" operations, the Seattle District estimated that 72,300 acres of Washington tidelands could be authorized for commercial shellfish production under the 2017 NWP 48. COE 127590-92. Thus, even if Headquarters had attempted to quantify the proposed action's impacts on seagrass (or any other aquatic resource) before reissuing NWP 48, its data regarding past uses of the permit was incorrect and its estimates of future uses are suspect.

NWP003046 (commercial shellfish aquaculture activities "cause far less change to the environmental baseline than the adverse effects caused by development activities, pollution, and changing hydrology that results from the people living and working in the watersheds that drain to coastal waters . . ."); NWP003078 ("[T]here are many categories of activities that contribute to cumulative effects to the human environment. The activities authorized by this NWP during the 5-year period it will be in effect will result in no more than minimal incremental contributions to the cumulative effects to these resource categories."); NWP003081 ("The activities authorized by this NWP will result in a minor incremental contribution to the cumulative effects to wetlands, streams, and other aquatic resources in the United States because, as discussed in this section, they are one category of many categories of activities that affect those aquatic resources.")), the analysis is inadequate. NEPA and the CWA were enacted because humans were adversely affecting the environment to a noticeable and detrimental extent. See 42 U.S.C. § 4331(a) (Congressional recognition of "the profound impact of man's activity on the interrelations of all components of the natural environment"); 33 U.S.C. § 1251(a) ("The objective of [the CWA] is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters."). Noting that a particular environmental resource is degraded is not an excuse or justification for further degradation. The Corps must analyze the individual and cumulative impacts of the proposed activity against the environmental baseline, not as a percentage of the decades or centuries of degrading activities that came before.

The Corps makes a similarly untenable argument whenever the use of pesticides in a shellfish operation permitted under NWP 48 is discussed. While acknowledging that these substances are used and released into the environment during permitted activities, the Corps

declines to consider the environmental impacts of pesticides because they are regulated by some other entity. See NWP003077. Even if the Corps does not have jurisdiction to permit or prohibit the use of pesticides, it is obligated to consider "other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions." NWP003074 (quoting 40 C.F.R. § 1508.7). The Corps' decision to ignore the foreseeable uses and impacts of pesticides in the activities it permitted on a nationwide basis does not comport with the mandate of NEPA or with its obligations under the CWA. Having eschewed any attempt to describe the uses of pesticides in commercial shellfish aquaculture or to analyze their likely environmental impacts, the decision to permit such activities through NWP 48 cannot stand.

(2) General Conditions of NWP 48

In making its minimal impact determinations, the Corps relied in part on the general conditions imposed on all nationwide permits. NWP003072. According to the Corps, the prohibitions it has imposed against impacts on the life cycle movements of indigenous aquatic species (general condition 2), spawning areas (general condition 3), migratory bird breeding areas (general condition 4), concentrated shellfish beds (general condition 5), and endangered or threatened species (general condition 18), and the requirements that permittees use non-toxic materials (general condition 6) and confer with other regulatory agencies as needed (general condition 19) will ensure that the individual and cumulative environmental effects of NWP 48 are minimal. Even if the Court were to assume that the general conditions will be universally heeded, regulatory fiat does not satisfy NEPA's requirement that the EA contain "sufficient evidence and analysis for determining whether to prepare an environmental impact statement or

a finding of no significant impact." 40 C.F.R. § 1508.9(a)(1). The general conditions are just that: general. They apply to all NWPs and do not reflect a "hard look" at the environmental sequellae of commercial shellfish aquaculture. For purposes of the CWA, the general conditions on which the Corps relies do not necessarily prohibit substantial impacts: general condition 3, for example, precludes the most destructive of activities in spawning areas but leaves unregulated many activities that could significantly impact those areas. In addition, the general conditions relate to only some of the environmental resources the Corps acknowledges are impacted by the permitted activities and do not address the cumulative impacts of commercial shellfish aquaculture at all. 40 C.F.R. § 1508.7 ("Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.").

The Court does not intend to suggest, and is not suggesting, that the general terms and conditions imposed on a nationwide, regional, or state permit cannot be relevant to and supportive of a finding of minimal impacts. They are simply too general to be the primary "data" on which the agency relies when evaluating the impacts of the permitted activities.

(3) Regional Conditions and District Engineers

Any permit authorizing activities on a nationwide level runs the risk of sanctioning activities that have more than minimal environmental impacts. In order to safeguard against that risk, regional district engineers have the discretionary authority to modify, suspend, or revoke the NWP within a particular region or class of waters, to add regional conditions to the NWP, to impose special conditions on a particular project, and/or to require an applicant to seek an individual permit. NWP003037 (citing 33 C.F.R. §§ 330.4(e) and 330.5). Although permittees may generally proceed with activities authorized by an NWP without notifying the district

engineer, (33 C.F.R. § 330.1(e)(1)), general condition 18(c) requires the submission of a pre-construction notification ("PCN") if the proposed activity may affect or is in the vicinity of a species listed or habitat designated as critical under the ESA. Because all aquaculture operations in the State of Washington occur in waters where there are threatened/endangered species and/or critical habitat, applicants who seek to operate under the auspices of NWP 48 in this State must submit a PCN and obtain a "verification" that the activity falls within the terms of the permit and that the requirements of the ESA have been satisfied. COE 127592. "For a project to qualify for verification under a general permit, a Corps District Engineer must conclude that it complies with the general permit's conditions, will cause no more than minimal adverse effects on the environment, and will serve the public interest." Sierra Club v. U.S. Army Corps of Eng'rs, 803 F.3d 31, 39 (D.C. Cir. 2015) (citing 33 C.F.R. §§ 330.1(e)(2), 330.6(a)(3)(i)).

There is nothing arbitrary, capricious, or unlawful about having the regional district engineer review site-specific proposals to "cement [Headquarters'] determination that the projects it has authorized will have only minimal environmental impacts." Ohio Valley Envtl. Coalition v. Bulen, 429 F.3d 493, 501 (4th Cir. 2005). Tiering the review and decision-making tasks is permissible, but there must be a national decision document that actually evaluates the impacts of the proposed activity in light of any regional conditions imposed. The problems here are that the Corps' minimal impact determinations were entirely conclusory and the regional conditions that it assumed would minimize impacts were not in place at the time NWP 48 was adopted. The record is devoid of any indication that the Corps considered regional data, catalogued the species in and characteristics of the aquatic environments in which commercial shellfish aquaculture activities occur, considered the myriad techniques, equipment, and

materials used in shellfish aquaculture, attempted to quantify the impacts the permitted activity would likely have on the identified species and characteristics, or evaluated the impacts of the as-yet-unknown regional conditions.

Faced with incredible diversity in both the environment and the activities permitted under NWP 48, the Corps effectively threw up its hands and turned the impact analyses over to the district engineers. The "Impact Analysis" section of the national Decision Document simply reiterates the district engineer's powers to revoke, modify, or condition the NWP and directs the district engineers to make minimal adverse environmental effects determinations after considering certain factors. NWP003073-74. Its "Cumulative Effects" analysis bluntly acknowledges that "[i]t is not practical or feasible to provide quantitative data" regarding the cumulative effects of NWP 48 other than the estimated number of times the permit will be used. NWP003081.

Because a nationwide analysis was impossible, the task of conducting a cumulative impacts analysis in specific watersheds was devolved to the district engineers. NWP003077. Even where adverse impacts are acknowledged, the Corps ignores its obligation to analyze and quantify them, instead relying on the district engineers to perform the analysis on a project-by-project basis. In the context of the public interest discussion regarding impacts to fish and wildlife, for example, the Corps recognizes that NWP 48 may "alter the habitat characteristics of tidal waters," that "[s]ome species of aquatic organisms will benefit from those changes, while other species will be adversely affected," and that equipment used in commercial shellfish operations may impede bird feeding activities and trap birds." NWP003087. It then states:

The pre-construction notification requirement[] provides the district engineer with

> an opportunity to review those activities and assess potential impacts on fish and wildlife values and ensure that the authorized activity results in no more than minimal adverse environmental effects.

Id. This abdication of responsibility is not authorized under the CWA or NEPA.[10]

As discussed in the preceding sections, Headquarters' prediction that the issuance of NWP 48 would have minimal individual and cumulative impacts on the environment, though repeatedly stated in the Decision Document, is not based on relevant evidence that a reasonable mind might accept as adequate to support the agency's conclusion, and the inclusion of general permit conditions does not obviate the need to analyze the impacts of proposed federal action. Thus, the Corps' impact analyses are based in large part on the hope that district engineers will mitigate any adverse environmental effects by revoking NWP 48, imposing regional or project-based conditions, and/or requiring an applicant to seek an individual permit. In this context, the Court finds that the Corps may not rely solely on post-issuance procedures to make its pre-issuance minimal impact determinations. See Bulen, 429 F.3d at 502 ("We would have substantial doubts about the Corps' ability to issue a nationwide permit that relied solely on post-

---

[10] The Corps' analysis with regards to plastic debris discharged into the marine environment is even more problematic. The Corps acknowledges the many public comments raising concerns about the introduction of plastics into the marine food web, but relies on the fact that "[d]ivision engineers can impose regional conditions to address the use of plastics" in response to these concerns. NWP003402. The Seattle District, for its part, declined to quantify the impact of plastics, instead noting that "it would not be a practicable solution to regionally condition NWP 48 to not allow the use of PVC and HDPE gear as there are no current practicable alternatives to use of the materials." COE 127559. The CWA requires the Corps to make minimal adverse effect findings before issuing a general permit. If, as appears to be the case with regards to the discharge of plastics from the permitted operations, the Corps is unable to make such a finding, a general permit cannot issue. The Corps has essentially acknowledged that it needs to individually evaluate the impacts of a particular operation, including the species grown, the cultivation techniques/gear used, and the specific location, before it can determine the extent of the impacts the operation will have.

issuance, case-by-case determinations of minimal impact, with no general pre-issuance determinations. In such a case, the Corps' 'determinations' would consist of little more than its own promise to obey the law.").

CONCLUSION

A nationwide permit can be used to authorize activities involving the discharge of dredged or fill material only if the Corps makes a determination that the activity will have only minimal individual and cumulative adverse effects on the environment. In issuing NWP 48, the Corps has opted to interpret the "similar in nature" requirement of 33 U.S.C. § 1344(e)(1) broadly so that all commercial shellfish aquaculture activities in the United States could be addressed in a single nationwide permit. That choice has made assessing the impacts of disparate operations difficult: the Corps essentially acknowledges that the permitted activity is performed in such different ways and in such varying ecosystems that evaluating impacts on a nationwide level is nearly impossible. It tries to avoid its "statutory obligations to thoroughly examine the environmental impacts of permitted activities" by promising that the district engineers will do it. Hurst, 604 F. Supp. 2d at 901-02. The Court finds that the Corps has failed to adequately consider the impacts of commercial shellfish aquaculture activities authorized by NWP 48, that its conclusory findings of minimal individual and cumulative impacts are not supported by substantial evidence in the record, and that its EA does not satisfy the requirements of NEPA and the governing regulations.

For all of the foregoing reasons, plaintiffs' motions for summary judgment (Dkt. # 36 in C16-0950RSL and Dkt. # 31 in C17-1209RSL) are GRANTED and defendant's and intervenors' cross-motions (Dkt. # 44 and # 45 in C16-0950RSL and Dkt. # 43 and # 44 in C17-1209RSL)

are DENIED. The Corps' issuance of a nationwide permit, at least with respect to activities in the waters of the State of Washington, was arbitrary and capricious and not in accordance with NEPA or the CWA. Pursuant to 5 U.S.C. § 706(2), the Court holds unlawful and sets aside NWP 48 insofar as it authorizes activities in Washington.

The only remaining issue is whether NWP 48 should be vacated outright to the extent it has been applied in Washington, thereby invalidating all existing verifications, or whether equity requires that the permit be left in place while the agency performs an adequate impact analysis and environmental assessment to correct its unlawful actions. Idaho Farm Bureau Fed'n v. Babbitt, 58 F.3d 1392, 1405 (9th Cir. 1995).

> Although not without exception, vacatur of an unlawful agency action normally accompanies a remand. Alsea Valley All. v. Dep't of Commerce, 358 F.3d 1181, 1185 (9th Cir. 2004). This is because "[o]rdinarily when a regulation is not promulgated in compliance with the APA, the regulation is invalid." Idaho Farm Bureau Fed'n[, 58 F.3d at 1405]. When equity demands, however, the regulation can be left in place while the agency reconsiders or replaces the action, or to give the agency time to follow the necessary procedures. See Humane Soc. of U.S. v. Locke, 626 F.3d 1040, 1053 n.7 (9th Cir. 2010); Idaho Farm Bureau Fed'n, 58 F.3d at 1405. A federal court "is not required to set aside every unlawful agency action," and the "decision to grant or deny injunctive or declaratory relief under APA is controlled by principles of equity." Nat'l Wildlife Fed'n v. Espy, 45 F.3d 1337, 1343 (9th Cir. 1995) (citations omitted).

All. for the Wild Rockies v. United States Forest Serv., 907 F.3d 1105, 1121 (9th Cir. 2018). Courts "leave an invalid rule in place only when equity demands that we do so." Pollinator Stewardship Council v. U.S. E.P.A., 806 F.3d 520, 532 (9th Cir. 2015) (internal quotation marks and citation omitted). When determining whether to leave an agency action in place on remand,

we weigh the seriousness of the agency's errors against "the disruptive consequences of an interim change that may itself be changed." Cal. Cmties. Against Toxics v. U.S. E.P.A., 688 F.3d 989, 992 (9th Cir. 2012). In the context of environmental regulation, courts consider whether vacating the invalid rule would risk environmental harm and whether the agency could legitimately adopt the same rule on remand or whether the flaws were so fundamental that it is unlikely the same rule would result after further analysis. Pollinator Stewardship, 806 F.3d at 532.

Despite the fact that both plaintiffs clearly requested vacatur as the remedy for unlawful agency action, defendants provided very little evidence that would justify a departure from the presumptive relief in this APA action. The federal defendants state that additional briefing as to remedy should be permitted once the seriousness of the agency's error is determined. The intervenors assert that vacatur would cause disruption in the Washington shellfish farms and industry, including significant impacts to employees and the communities in which they live. Neither tact is compelling. The substantive defects in the agency's analysis when adopting the 2017 NWP are significant, the existing record suggests that adverse environmental impacts will arise if NWP 48 is not vacated, and, given the nature of the analytical defects and record evidence that seagrass is adversely impacted in the immediate vicinity of shellfish aquaculture, it seems unlikely that the same permit could issue following remand. As for the disruptive consequences to Washington businesses, employees, and communities, more information is required. As plaintiffs point out, shellfish growers can apply for individual permits (as they did before 2007). In addition, the Court has the equitable power to allow a period of time in which growers can avail themselves of that process before the existing verifications would be

invalidated or to fashion some other equitable remedy to minimize both the risks of environmental harm and any disruptive consequences.

While the current record does not support deviation from the presumptive remedy for an APA violation, the Swinomish Indian Tribal Community has requested an opportunity to be heard regarding the scope of the remedy. C18-0598RSL (Dkt. # 28). Swinomish also challenge the Corps' minimal impacts analyses in reissuing NWP 48, but, unlike the plaintiffs in the above-captioned matters, does not seek vacatur of verifications or permits issued under the NWP. The Court will accept additional briefing regarding the appropriate remedy.

Because there is a presumption in favor of vacatur, defendants, intervenors, and Swinomish will be the moving parties and may file motions, not to exceed 15 pages, regarding the appropriate relief for the APA violations discussed above. Only one motion may be filed in each of the three cause numbers at issue, C16-0950RSL, C17-1209RSL, and C18-0598RSL. The motions, if any, shall be filed on or before October 30, 2019, and shall be noted for consideration on November 15, 2019. Plaintiffs' responses, if any, shall not exceed 15 pages. Replies shall not exceed 8 pages.

The Clerk of Court is directed to docket a copy of this order in Swinomish Indian Tribal Community v. Army Corps of Engineers, C18-0598RSL.

Dated this 10th day of October, 2019.

Re: Pond Creek Mine IL0077666

Dear Madam,
I attended the public hearing for the Pond Creek Mine on 12-18-19 and I want to enter into the record comments questioning the validity to issue a permit for this mine to dump pollutants into the Big Muddy River.

1. Several documents have said the pipeline is only for 10 years and then it will be removed. Is this the projected end of the date of the coal seam and mine closure? On page APP B-1 the IL DOA of the Results of Review, Permanent Program Permit Application No 456, says the pipeline is only for 10 years. Is this the projected end of the mine and its closure? Especially in the light that the first commenter of the night and mine booster said the mine had enough coal for the next 50 years. The citation (https address) given is grossly inaccurate as there are spelling errors within the link itself. Plus, who is going to pay for the removal of this pipeline as Foresight energy stocks which Williamson Energy, LLC is a subsidiary are tanking, and Foresight as of 12-20-19 Files An 8-K Entry into a Material Definitive Agreement https://t.co/xrHayH1eAG .

Why would the IEPA issue a permit to a company when the company is going into bankruptcy? Because Williamson Energy is a LLC, in a chapter 7 business bankruptcy, the LLCs assets are sold and used to pay the LLC's creditors. After the bankruptcy, the LLC's remaining debts are wiped and and the LLC is no longer in business. The LLC's owners are generally not responsible for the LLCs debts like retirement, ESOPs and 401K's and the 500 or so employees of Williamson Energy will have more problems besides losing just their jobs. They will lose their retirement pensions as well.

2. To address the issue of oversight of discharge from the mine, How many Marion water pollution control and mine staff are there now versus 20 years ago? There are 10 on staff 20 years ago and now 4. How will a staff of 4 people monitor the discharge from this mine along with all the other places in the region. Mines are to be inspected by the IEPA 2-4 times as a federal requirement. How many mine have between routinely inspected in the past 12 years? How many times has The Pond Creek Mine been inspected since the mine began?

How does a staff of 4 manage to do this while writing mining permits for mining companies? As per,

https://www.chicagotribune.com/news/environment/ct-met-illinois-epa-budget-cuts-20191205-pkwnmzzvuvgk3fgbplvxhbji6q-story.html Illinois also cut its environmental agency's workforce by 38% during the same period — more than any other state.

With a smaller staff and less money, the state agency has failed repeatedly to identify hazards to public health and hold polluters accountable, said Eric Schaeffer, a former top U.S. EPA enforcement official who directs the nonprofit Environmental Integrity Project and compiled one of the reports.

In conclusion, these comments along with the multitude of comments against issuing of a permit for Pond Creek Mine a private company to dump pollutants into a public waterway from my fellow citizens of the area implore you to not approve the permit referenced above to the Pond Creek Mine.

Sincerely,

Karen Fiorino

The Illinois Department of Natural Resources, Office of Mines and Minerals, Land Reclamation Division (Department), the Regulatory Authority in Illinois under the Surface Mining Control and Reclamation Act of 1977 (Federal Act), 30 U.S.C. Section 1201 *et seq.*, has reviewed Permit Application No. 456 in accordance with the Surface Coal Mining Land Conservation and Reclamation Act (State Act), 225 ILCS 720, and the Department's regulations at 62 Ill. Adm. Code 1700-1850.

The applicant has submitted in writing the modifications required by the Department's letter dated December 20, 2018 (Appendix A). These modifications have been reviewed and approved by the Department. Pursuant to 62 Ill. Adm. Code 1773.19, the Department is approving the application as modified. The Department's decision is based upon a review of the record as a whole, and is supported and documented by the record. The findings and reasons for the Department's decision are set forth below. The period for administrative review under 62 Ill. Adm. Code 1847.3 commences as of the date of this decision.

I. SUMMARY OF APPLICATION

The application proposes a permit on 70.7 acres. The proposed permit area consists of 70.7 acres, of which all the acreage is are proposed to be used for support facilities.

The following is a summary of the pre-mining land uses and the proposed post-mining land uses. NOTE: Land uses are categorized under the definitions found in 62 Ill. Adm. Code 1701.5. Land use classifications under other regulatory programs and agencies may be different.

Land Use	Pre-Mining Acres	Post-Mining Acres
Cropland	16.4	16.4
Water Resources	0.2	0.2
Residential	0.1	0.1
Industrial/Commercial	8.2	8.2
Fish & Wildlife Habitat	45.8	45.8
Total	70.7	70.7

II. SUMMARY OF THE PUBLIC PARTICIPATION PROCESS

The Department finds that the public participation requirements of 62 Ill. Adm. Code 1773.13 and 1773.14 have been met.

The application was filed with the Department on May 25, 2017, and was deemed complete on July 13, 2017. The applicant placed a newspaper advertisement of the proposed operation in the Marion Republican and the Benton News, newspapers of general circulation in the area affected, once a week for four consecutive weeks, beginning on July 18, 2018. The applicant filed two (2) copies of the application with the County Clerks of Williamson County and Franklin County, in accordance with 62 Ill. Adm. Code 1773.13(a)(2), on July 18, 2018. Copies of the application were sent to the following State Agencies: Illinois Department of Agriculture (IDOA), and Illinois Environmental Protection Agency (IEPA), and the United States Department of Agriculture, Natural Resources Conservation Service (NRCS), and the United States Fish and Wildlife Service (USFWS) on July 13, 2018, for review and comment. In addition, copies were circulated with the appropriate Offices within the Illinois Department of Natural Resources (Department). Written notification of the application was given to those governmental agencies and entities required to receive notice under 62 Ill. Adm. Code 1773.13(a)(3).

State Agency comments on this application have been received by the Department, with the source and date of comments as follows: IDOA (September 21, 2018) and IEPA (August 30, 2018).

Comments on this application were also received from the NRCS dated September 12, 2018 and USFWS dated September 4, 2018 and October 2, 2019.

The Department received a request for a public hearing. The Department held a public hearing on October 23, 2018, in the Office of Mines and Minerals, Southern Illinois Regional Office in Benton, Illinois.

All comments received in writing and at the public hearing have been considered by the Department in reviewing this application. The Department's responses to these comments are set forth in Appendix B.

All comments received on this application have been furnished to the applicant, and have been filed for public inspection at the office of the County Clerk of the county in which the application is located.

III. SUMMARY OF THE DEPARTMENT'S FINDINGS

The Department, upon completing its review of the information set forth in the application, the required modifications submitted, if any, and information otherwise available, and made available to the applicant, and after considering the comments of State Agencies, and all other comments received, makes the following findings:

A. Findings Required by 62 Ill. Adm. Code 1773.15

REVIEW OF VIOLATIONS

Section 1773.15(b)(1): Based on a review of all reasonably available information concerning violation notices and ownership or control links involving the applicant, including information obtained pursuant to Sections 1773.22, 1773.23, 1778.13 and 1778.14, the Department has determined that the applicant or a person who owns or controls the applicant is currently in violation of the State Act, Federal Act or other law or regulation referred to in Section 1773.15(b)(1). Pursuant to this Section, the Department has determined that:

Section 1773.15(b)(1)(A): For the identified current violations, the applicant submitted proof that the current violations have been or are in the process of being corrected to the satisfaction of the agency that has jurisdiction over the violations.

Documentation provided by the applicant to comply with Section 1773.15(b)(1)(A) is attached as Appendix E.

Section 1773.15(b)(2): This permit is being conditionally issued on the basis of proof submitted under Section 1773.15(b)(1)(A) that the violation is in the process of being corrected. The conditional issuance is set forth in Part IV.

Section 1773.15(e): The Department received updated compliance information in the applicant's modifications response received October 21, 2019 and updated information on December 2, 2019. Based on the compliance review required by Section 1773.15(b)(1), a review of the OSM Applicant Violator System for outstanding violations, and in light of no new information submitted pursuant to Sections 1778.13(i) and 1778.14(e), the Department reconsidered its decision to approve the application and found that no change in its decision to issue the permit is necessary.

SECTION 1773.15(c)(1) FINDINGS

Section 1773.15(c)(1): The application, as modified, is accurate and complete and all requirements of the Federal and State Acts and the regulatory program have been met.

TOPSOIL SUBSTITUTION FINDING

Section 1817.22(b): The applicant has proposed the use of selected overburden materials as a substitution for, and a supplement to topsoil as delineated in the application. In accordance with Section 1817.22(b), the Department finds that the applicant has adequately demonstrated that the resulting soil medium is equal to, or more suitable for, sustaining vegetation than existing topsoil, and the resulting soil medium is the best available in the permit area to support vegetation. Permission is hereby granted to use the selected overburden as requested.

SEDIMENT POND EXEMPTION

Section 1817.46(e): A sediment pond exemption is requested for an area delineated in the application. The regulations at Section 1817.46(e) allow the Department to grant exemptions from the requirement to pass all disturbed drainage through a siltation structure when:

a. The disturbed drainage area within the total disturbed area is small; and

b. Alternate sediment control measures as described in Section 1817.45(b) are used in lieu of a siltation structure, and the applicant demonstrates that siltation structures are not necessary for drainage from the disturbed area to meet the effluent limitations and water quality standards for the receiving waters set forth in Section 1817.42.

The Department has determined that the area for which a sediment pond exemption is requested meets the criteria established in Section 1817.46(e) and hereby grants an exemption from the use of a sedimentation pond for this area.

STREAM BUFFER ZONE VARIANCE

Section 1817.57(a)(1): The applicant has requested a stream buffer zone variance for an area as delineated in the application. In accordance with Section 1817.57(a)(1), the Department finds that:

a. The original stream channel and its associated riparian vegetation will be restored; and

b. Surface mining activities will not cause or contribute to a violation of Section 1817.42 and will not adversely affect the water quantity and quality or other environmental resources of the stream.

Therefore, the Department authorizes surface mining activities closer than one hundred (100) feet of the top of the bank of the normal channel of the perennial or intermittent stream or through the stream.

SECTION 1773.15(c)(2) – (c)(13) FINDINGS

Section 1773.15(c)(2); The applicant has demonstrated that reclamation as required by the Federal and State Acts and the regulatory program can be accomplished under the reclamation plan contained in the application, as modified.

Section 1773.15(c)(3)(A): The proposed area is not within an area under study or administrative proceedings under a petition, filed pursuant to Section 1764, to have an area designated as unsuitable for surface coal mining operations.

Section 1773.15(c)(3)(B): The proposed area is not within an area designated as unsuitable for mining pursuant to Sections 1762 and 1764 or subject to the prohibitions or limitations of Section 1761.11.

Section 1761.11(a): The proposed area does not include any lands within the boundaries of the National Park System, the National Wildlife Refuge System, the National System of Trails, the National Wilderness Preservation System, the Wild and Scenic Rivers System, or National Recreation Areas designated by Act of Congress.

Section 1761.11(b): The proposed area is not on any Federal lands within the boundaries of any national forest.

Section 1761.11(c): The proposed surface coal mining and reclamation operations will not adversely affect any publicly owned park or any privately owned or publicly owned places included on the National Register of Historic Places.

Section 1761.11(d): The proposed area is within one hundred (100) feet measured horizontally of the outside right-of-way line of public roads in Williamson and Franklin Counties, described as follows: Interstate 57, State Route 37, Williams Prairie Road, Harris School Road, Old Ben Road, Old Frankfort Road, Eberhardt Road, Duncan Road, Monroe Road, Collin Road, Horseshoe Road, Freeman Spur Blacktop (Franklin Co. Rte. 6), Deason Road, Sandburg Road, Freemanspur Road, Gossage Road, Lake Creek Road, and Cheatman Road.

The proposed area is adjacent to the right-of-way of Interstate 57, State Route 37, Williams Prairie Road, Harris School Road, Old Ben Road, Old Frankfort Road, Eberhardt Road, Duncan Road, Monroe Road, Collin Road, Horseshoe Road, Freeman Spur Blacktop (Franklin Co. Rte. 6), Deason Road, Sandburg Road, Freemanspur Road, Gossage Road, Lake Creek Road, and Cheatman Road. The proposed activities in the application area include the installation of pipeline and boring underneath the roads

No approvals from the authority with jurisdiction over the roads were required for areas outside the right of way. The permittee shall be responsible for all permits required from the road authorities necessary for any access and operations performed within the right of way of said roads. See Condition K.

The applicant provided proper public notice and opportunity for a public hearing. A public hearing was held on October 23, 2018 and while many written comments were submitted to the Department, none of the written comments were concerning these roads.

The Department finds the interests of the public and affected landowners will be protected from the proposed mining operations as a result of the measures to be

taken by the applicant as described in the mining operations plan concerning these roads.

Section 1761.11(e): The proposed area is within three hundred (300) feet measured horizontally of several occupied dwellings.

The owners of the dwellings have provided written waivers pursuant to Section 1761.15 consenting to surface coal mining operations closer than three hundred (300) feet.

Section 1761.11(f): The proposed area is not within three hundred (300) feet measured horizontally of any public building, school, church, community or institutional building, or public park from which the applicant will be required to maintain a three hundred (300) foot buffer zone.

Section 1761.11(g): The proposed area is not within one hundred (100) feet measured horizontally of a cemetery.

Section 1773.15(c)(4): This section is applicable to surface mining operations only.

Section 1773.15(c)(5): The Department has assessed the probable cumulative impacts of all anticipated coal mining on the hydrologic balance in the cumulative impact area, in accordance with Part 1784 and finds that the operations proposed under the application have been designed to prevent material damage to the hydrologic balance outside the proposed area (see Appendix C).

Section 1773.15(c)(6): The applicant has not proposed the use of any existing structures in the application requiring compliance with Section 1700.11(d).

Section 1773.15(c)(7): The applicant will submit fees required by these regulations before the permit is issued. The fee required is $1,767.50 for the term of the permit, which may be paid in annual increments. The Department finds that the applicant has paid all reclamation fees from previous and existing operations as required by 30 CFR 870.

Section 1773.15(c)(8): See Part III – Subpart B.

Section 1773.15(c)(9): The applicant has satisfied the requirements for a long-term, intensive agricultural post-mining land use, in accordance with the requirements of Section 1817.111(d).

Section 1773.15(c)(10): The operation as approved will not affect the continued existence of endangered or threatened species or result in destruction or adverse modification of their critical habitats, as determined under the Endangered Species Act of 1973 (16 USC 1531 *et seq.*, see Appendix F).

Section 1773.15(c)(11): The requirements of this section are not applicable as there are no proposed remining operations.

Section 1773.15(c)(12): The effect of the proposed permitting action on properties listed on or eligible for listing on the National Register of Historic Places has been taken into account by the Department.

Section 1773.15(c)(13): The requirements of this section are not applicable as there are no proposed remining operations.

B. Findings Required by 62 Ill. Adm. Code 1785 (Applicable Sections)

PRIME FARMLANDS

A soil survey was submitted by the applicant that shows prime farmland soils identified in this application which have been historically used as cropland. The soil survey prepared by the USDA provides the required soil information.

The applicant has, with respect to prime farmland, satisfied the requirements of Section 1785.17. (See Part B, below, and Appendices D and G.)

Section 1785.17(e)(1): The Department finds that the approved post-mining land use of the prime farmlands is cropland.

Section 1785.17(e)(2): The Department finds that the permit incorporates as specific conditions the contents of the plan submitted under Section 1785.17(c), after consideration of any revisions to that plan suggested by the State Conservationist under Section 1785.17(d).

Section 1785.17(e)(3): The Department finds that the applicant has the technological capability to restore the prime farmland, within a reasonable time, to equivalent or higher levels of yield as non-mined prime farmland in the surrounding area under equivalent levels of management.

Section 1785.17(e)(4): The Department finds that the proposed operations will be conducted in compliance with the requirements of Section 1823 and other environmental protection performance and reclamation standards for mining and reclamation of prime farmland of the regulatory program.

Section 1785.17(e)(5): The Department finds that the aggregate total prime farmland acreage has not been decreased from that which existed prior to mining. Water bodies, if any, are located within the post-reclamation non-prime farmland portions of the permit area and the consent of all affected property owners has been obtained.

Section 1785.20: The requirements of this section are not applicable to this application.

C. Compliance with 62 Ill. Adm. Code 1773.19

Section 1773.19(a)(1): The Department has based its decision to approve, as modified, the application, based on public participation as provided by Sections 1773.13 and 1773.14, compliance with all applicable provisions of Section 1785, and the processing and complete review of the application.

Section 1773.19(a)(3): The Department is providing written notification of its final permit decision to the following persons and entities:

a. The applicant, each person who filed comments or objections to the application, and each party to the public hearing;

b. The County Board of the counties in which the application is located; and,

c. The Office of Surface Mining.

All materials supporting these findings are a part of the public record and are hereby incorporated by reference.

IV. PERMIT CONDITIONS

A. The permittee shall conduct surface coal mining and reclamation operations only on those lands specifically designated as the permit area on the maps submitted with the application and authorized for the term of the permit and that are subject to the performance bond or other equivalent guarantee in effect pursuant to 62 Ill. Adm. Code 1800.

B. The permittee shall conduct all surface coal mining and reclamation operations as described in the approved application, except to the extent that the Department otherwise directs in the permit.

C. The permittee shall comply with the terms and conditions of the permit, all applicable performance standards of the Federal and State Acts, and the requirements of the regulatory program.

D. Without advance notice, delay, or a search warrant, upon presentation of appropriate credentials, the permittee shall allow the authorized representatives of the Department and Secretary of the United States Department of the Interior to:

1. Have the right of entry provided for in 62 Ill. Adm. Code 1840.12; and,

2. Be accompanied by private persons for the purpose of conducting an inspection in accordance with 62 Ill. Adm. Code 1840, when the inspection is in response to an alleged violation reported to the Department by the private person.

E. The permittee shall take all possible steps to minimize any adverse impacts to the environment or public health and safety resulting from noncompliance with any term or condition of this permit, including, but not limited to:

1. Accelerated or additional monitoring necessary to determine the nature and extent of noncompliance and the results of the noncompliance;

2. Immediate implementation of measures necessary to comply; and,

3. Warning, as soon as possible after learning of such noncompliance, any person whose health and safety is in imminent danger due to the noncompliance.

F. As applicable, the permittee shall comply with 62 Ill. Adm. Code 1700.11(d) for compliance, modification, or abandonment of existing structures.

G. The permittee shall pay all reclamation fees required by 30 CFR 870 for coal produced under this permit for sale, transfer, or use.

H. Within thirty (30) days after a cessation order is issued under 62 Ill. Adm. Code 1843.11, for operations conducted under the permit, except where a stay of the cessation order is granted and remains in effect the permittee shall either submit to the Department the following information, current to the date the cessation order was issued, or notify the Department in writing that there has been no change since the immediately preceding submittal of such information:

1. Any new information needed to correct or update the information previously submitted to the Department by the permittee under 62 Ill. Adm. Code 1778.13(c); or

2. If not previously submitted, the information required from a permit application by 62 Ill. Adm. Code 1778.13(c).

I. Species Protection:

1. Issuance of this permit under the Surface Coal Mining Land Conservation and Reclamation Act does not in any way authorize any take of any listed species in violation of the Illinois Endangered Species Protection Act, 520 ILCS 10/1 *et seq*. With respect to the Indiana bat, an Incidental Take authorization has been approved as part of this permitting action consistent with and in compliance with the Endangered Species Act of 1973, 16 USC 1531 *et seq*. The Department has determined that this project may affect the northern long-eared bat, but that any resulting Incidental Take is not prohibited by the Final 4(d) rule and is consistent with the U.S. Fish and Wildlife Service Jan 2016 Programmatic Biological Opinion on the Final 4(d) rule. The Department and the applicant are in compliance with

Section 7 of the Endangered Species Act of 1973, as amended. If any other "take" as defined by these Acts is anticipated to result from permitted activities, it is recommended that the permittee apply for an Incidental Take permit from the Illinois Department of Natural Resources, Office of Resource Conservation for state listed species.

2. Issuance of this permit under the Surface Coal Mining Land Conservation and Reclamation Act does not in any way authorize any take of a bald or golden eagle, including nests or eggs, in violation of the Bald Eagle Protection Act (16 U.S.C. 668 *et seq.*). If "take" as defined by the Bald Eagle Protection Act is anticipated to result from permitted activities, it is recommended that the permittee should apply for an Incidental Take (non-purposeful take) permit from the U.S. Fish and Wildlife Service. The Department and the U.S. Fish and Wildlife Service shall be notified if a bald or golden eagle nest is observed in the permit area or in the vicinity of the permit area.

3. If any onsite stream and/or wetland mitigation is required based on upon U.S. Army Corps of Engineers requirements, then the Department shall be notified to establish appropriate permitting actions under SMCRA.

J. If the permit is conditionally issued under 62 Ill. Adm. Code Section 1773.15(b)(2) on the basis of **(1)** a presumption supported by certification under 62 Ill. Adm. Code Section 1778.14 that the violation is in the process of being corrected; **(2)** proof submitted under 62 Ill. Adm. Code Section 1773.15(b)(1)(A) that the violation is in the process of being corrected; or **(3)** pending the outcome of an appeal described in 62 Ill. Adm. Code Section 1773.15(b)(1)(B), issuance is conditioned as follows:

1. If subsequent to permit issuance applicant is issued a failure-to-abate cessation order, the permit shall be suspended and/or rescinded in accordance with the procedures for 62 Ill. Adm. Code Section 1773.20(c) Improvidently Issued Permits within 30 days of the issuance of the failure-to-abate cessation order.

2. If subsequent to permit issuance the Department is notified by the agency that has jurisdiction over the violation that the violation is no longer in the process of being corrected to the satisfaction of said agency, the permit shall be suspended and/or rescinded in accordance with the procedures for 62 Ill. Adm. Code Section 1773.20(c) Improvidently Issued Permits within 30 days of such notification.

3. If subsequent to permit issuance the circuit or district court reviewing the violation either denies a stay applied for in the appeal or affirms the violation, then the applicant shall submit the proof required under 62 Ill. Adm. Code Sections 1773.15(b)(1)(A) within 30 days after the court's decision or the permit shall be suspended and/or rescinded in accordance with the procedures for 62 Ill. Adm. Code Section 1773.20(c) Improvidently Issued Permits within 30 days of such failure to submit required proof.

K. Pursuant to Section 1778.15, the permittee shall possess all necessary legal rights to enter and conduct surface coal mining and reclamation operations within the permit area until final bond release is obtained.

The permittee has indicated valid permits shall be obtained from the Illinois Department of Transportation and private rail lines. Pursuant to 1778.15(a), and as committed in Attachment I.2.A, the permittee shall provide the Department with valid right of entry agreements with the (1) Illinois Department of Transportation and (2) private railways prior to the commencement of operations in regard to areas controlled by the Illinois Department of Transportation and the private railway lines.

L. The permittee shall commence all groundwater and surface water monitoring approved by this permit upon initial disturbance of lands within the permit area. Monitoring shall be in accordance with the approved permit and/or as outlined in Appendix C of this finding document.

M. The substitute topsoil material referenced in the response to Part II(13) (D and F) of the application shall be limited to the Rend, Bluford, Hickory-Kell, Okaw, Belknap and Orthent soil series where the subsoil texture is a silt loam. In addition, the pH, phosphorus, and potassium of the borrow materials shall be fertilized with rates to achieve a pH of 6.5, and phosphorus and potassium levels of 50 ponds/acre and 260 pounds/acre, respectively.

N. The approved operations plan includes the installation of a pipeline within a defined permit corridor and a diffuser site in the Big Muddy River. As required by 62 Ill. Adm. Code 1784.23 and 1784.30, the permittee shall submit an as-built certification of the pipeline and discharge structure within 30 days of completion of installation of the pipeline. The as-built shall be sealed by a qualified registered professional engineer and at a minimum include the following information:

1. Verification that the pipeline was installed within the permitted corridor at the minimum depths indicated in the Illinois Department of Agriculture's Pipeline Construction Standards and Policies for Agricultural Impact Mitigation (Attachment IV.2.B.3) and in the Typical Stream Crossing Drawing (Attachment IV.7.I) included in the permit application.

2. Location of all monitoring stations on a Surface Operations Map.

3. List of the monitoring equipment installed at each station.

4. Actual diameter of the installed pipeline and/or diameter of sections of the pipeline if different diameters were used.

5. Cross section of the discharge structure/diffuser site if any changes to the approved plan were made to these structures during installation.

O. The approved operations plan includes plans for monthly visual and physical monitoring of the pipeline, as well as an annual testing of the monitoring equipment. To ensure compliance with 62 Ill. Adm. Code 1784.11(b)(6) and 1817.45(a), the applicant shall:

1. Submit to the Department the results of the pressure testing performed prior to putting the pipeline in service. The initial testing results shall be included in the as-built document required by condition N.

2. Submit to the Department the results of the annual pipeline testing of the monitoring system with a clear description of any identified deficiencies and the steps that would be taken to maintain safe pipeline performance. The results of the annual testing of the pipeline monitoring system shall be submitted to the Department within 30 days of completion.

V. CONCLUSIONS

Based upon the information contained in the application, information otherwise available and made available to the applicant, the comments of State Agencies, the foregoing analysis of the probable impact of the proposed operations, all findings and information contained herein and conditions set forth in Part IV, the Department finds that there is a reasonable basis on which to issue a permit for the application, as modified.

Enter on behalf of the Illinois Department of Natural Resources, Office of Mines and Minerals, Land Reclamation Division as Regulatory Authority.

Re: Modification to Permit Application No. 456
Pond Creek Mine

The Department, after reviewing the information contained in the permit application and information otherwise available to the applicant, and after considering all comments received, has determined that modification of Permit Application No. 456 is necessary. The modifications to the application shall comply with the requirements of 62 Ill. Adm. Code 1777.11. The modifications required by the Department are enclosed here. If the applicant does not desire to modify the permit application as described below, it may, by filing a written statement with the Department, deem the permit application denied, and such denial shall constitute final action.

Pursuant to 62 Ill. Adm. Code 1773.15(a)(1)(B)(i), modifications required by the Department shall be received within one year from the date of this letter. Absent the modifications required by the Department, the application does not demonstrate compliance with the requirements of the Illinois Surface Coal Mining Land Conservation and Reclamation Act, Regulations and Regulatory Program and the Department will issue a written finding denying the application.

The period for administrative review (62 Ill. Adm. Code 1847.3) shall commence upon:

- receipt by the applicant of a written decision from the Department, approving the application as modified, or
- if the applicant's modifications are insufficient, or if the applicant fails to submit the required modifications in accordance with 62 Ill Adm. Code 1773.15(a)(1)(B)(i), receipt by the applicant of a written decision from the Department denying the permit application, or
- receipt by the Department of the applicant's denial statement.

The modifications required by the Department are as follows:

1. Pursuant to 62 Ill. Adm. Code 1779.25(b), 1780.14(c), and 1780.25(a), and as required by Part 1.6 of the application, the Department is requiring the applicant to modify the application by submitting engineering certifications where the modifications result in changes to maps, plans, or cross sections submitted under the original application.

2. Pursuant to 62 Ill. Adm. Code 1777.11(c), and as required by Part I.1 of the application, the Department is requiring the submittal of a verification by a responsible official of the applicant for the information being submitted as a result of this modification letter.

3. Pursuant to 62 Ill. Adm. Code 1778.15 and Operator Memorandum 2011-01, the applicant is required to provide a signed notarized waiver from landowners for properties not owned or controlled by the permittee. Information provided in Attachment I.2.A reveals property not under control by the applicant and shall require a landowner waiver.

4. Pursuant to 62 Ill. Adm. Code 1778.13(c), the applicant shall provide information for each person who owns or controls the applicant under the definition of "owned or controlled" and "owns or controls" in 62 Ill. Adm. Code 1773.5. Review of the information provided and available to the Department, the applicant failed to provide ownership and control information for an owner/controller of the applicant, specifically Foresight Energy Services, LLC and Foresight Reserves LP as part owner/controller of Foresight Energy GP, LLC. The applicant shall provide current, updated ownership and control information for Williamson Energy, LLC including the necessary information for Foresight Energy Services, LLC or end date and complete ownership and control for Foresight Reserves LP or update ownership for Foresight Energy GP, LLC removing as part owner.

   Further review of the information provided in the ownership and control should be made by the applicant for other omissions or inaccuracies. The Department finds discrepancies with begin dates for some of the officers listed in the organizations ownership and control information.

5. Pursuant to 62 Ill. Adm. Code 1773.15(b)(1)(A), the applicant shall submit to the Department proof that current violations have been or are in the process of being corrected to the satisfaction of the issuing agency. Specifically, the Department finds two violations listed in Attachment I.9, CO 171025 and CO 171028, that will require additional information regarding the progress of abatement.

   The applicant shall provide proof from the PA Department of Environmental Protection of the progress of these violations. Review shall be made by the applicant to ensure all documents are included for all outstanding violations required to be reported.

6. Pursuant to 62 Ill. Adm. Code 1778.18, an application shall contain a certificate of liability insurance in compliance with 62 Ill. Adm. Code 1800.60. The Department finds the

certificate provided is not with an "authorized" insurer and shall require a revised certificate that is in compliance with the required regulations.

7. The response to Part V.1.B of the application is incomplete. Pursuant to 62 Ill. Adm. Code 1800.14, the applicant shall include the following:

   a. Information on the costs associated with removing the diffuser and all associated items from the Big Muddy River. Include all potential costs (such as possible coffer dam to divert water from the work site, divers to work in the Big Muddy River if needed, etc.)

   b. Information on possible removal costs associated with the pipeline such as air relief valves and other pipeline structure that cannot remain permanently post reclamation.

8. Pursuant to 62 Ill. Adm. Code 1783.21, Part II.13.D of the application, page II-8, must be modified to provide for a minimum topsoil removal thickness of 6 inches or greater where present.

9. Pursuant to 62 Ill. Adm. Code 1783.21, Part IV.2.B.3 of the application, page IV-2, must be modified to identify the qualifications of the person referenced in the soil handling procedure. In addition, the response must clarify it uses the most current version of the IDOA pipeline guidelines during construction.

10. Attachment IV.1 "Figure 2 Water Flow Diagram Proposed System" shows an Outfall 010 referred to as the "Pond Creek Stormwater Mixing Zone." This outfall and mixing zone are also referenced in the Attachment IV.1 narrative. Pursuant to 62 Ill. Adm. Code 1784.14(i) the applicant shall clarify if Outfall 010, "Pond Creek Stormwater Mixing Zone" is proposed as part of Permit Application No. 456.

11. According to Attachment IV.1, the applicant states that the holding cell will hold mine infiltration water as well as decant water from the slurry cell. Pursuant to 62 Ill. Adm. Code 1784.14(i), the applicant shall clarify whether the IEPA mixing zone permit has considered potential constituents contained within the clarified decant water.

12. The following concerns the response to Part III.2.D.1.a. Considering the response to Modification Question 11 and pursuant to 62 Ill. Adm. Code 1784.14(b)(1), the applicant shall provide representative water quality data from the water holding cell and clarify whether the chloride and sulfate data represent only the infiltrating groundwater or a mix of infiltrating groundwater and process water (if applicable).

13. In response to Part III.2.D.1.a, the applicant states an anticipated maximum flow rate of infiltration water from the mine is 3,500,000 gallons per day. Pursuant to 62 Ill. Adm. Code

1784.14(b)(2), the applicant shall clarify what this value represents in relation to the amount of water the company intends to discharge from the facility.

14. The Department is in receipt of a letter addressed to the applicant dated August 30, 2018 from the Illinois EPA (IEPA) requesting changes or clarification. Pursuant to 62 Ill. Adm. Code 1784.14, the applicant shall provide responses to the questions in the IEPA letter. If any response to the IEPA letter results in changes to the permit application, the applicant shall clearly indicate which application part and/or map is being revised.

15. In response to Part IV.1, the applicant references Attachment IV.1 for operations plan information. Page 3 of Attachment IV.1 indicates the preparation plant requires 2,300,000 gpd. In contrast, the water flow diagram proposed system depicts the preparation plant supply to be of 2,880,000 gpd. Pursuant to 62 Ill. Adm. Code 1777.11, clarify the apparent discrepancy in preparation plant volumes.

16. In response to Part IV.5.C.2, the applicant references Attachment IV.5.C.2 for additional information concerning the water management pipeline. Pursuant to 62 Ill. Adm. Code 1817.41(a), the applicant shall provide the following information and update all appropriate responses as necessary:

    a. Locate on the Operations Map automatic and manual shut off valves and pressure gauges.

    b. Provide additional detail on the process to pressure test pipeline integrity after it has been constructed and prior to being placed into operation.

    c. Provide additional detail on the operational monitoring of the pipeline to detect leaks and the actions taken to shut down the pipeline should monitoring indicate a potential leak is occurring.

    d. Provide additional detail on procedures and actions to be taken should a spill occur.

17. In response to Part IV.7.I, the applicant requests a stream buffer variance to multiple streams for the temporary construction practices involved in placing the transport pipeline. Pursuant to 62 Ill. Adm. Code 1817.57, the following additional information shall be provided concerning disturbances in the buffer zone and channel of the Big Muddy River.

    a. The response discusses adequately sized riprap to be keyed into the toe of the embankment. The applicant shall provide minimum sizing design based on expected stream flow velocities to assure a stable bank is maintained.

    b. The applicant shall expand the narrative to address construction steps of the diffuser port within the Big Muddy River channel. Detail on the anticipated extent of the

disturbance during installation and specific steps to control and contain off-site impacts shall be provided.

c. The area not to be disturbed shall be designated a buffer and marked as specified in Section 1817.11.

18. In response to Part IV.7.B, it appears the applicant answered the questions referring to handling of drainage after the pipeline has been put in place and covered by soil material. To ensure compliance with 62 Ill. Adm. Code 1817.45(a), the applicant shall expand the discussion in this response to explain which erosion and sediment control measures will be used to handle drainage from unaffected areas during the construction of the waterline.

19. In Attachment IV.1, the applicant states that monitoring of the water pipeline will include a monthly visual inspection of each road and highway crossing, the Pond Creek crossing and the Big Muddy discharge site. It will also include a physical inspection of the monitoring equipment. Pursuant to 62 Ill. Adm. Code 1817.41(a), the applicant shall provide:

a. A list of all inspection sites and a map defining the inspection site locations.

b. Additional information describing how the entire pipeline corridor will be maintained for access by both the Department's staff to inspect and for company personnel to maintain and make necessary repairs in a timely manner.

c. Specifically what monitoring equipment is intended to be physically inspected.

d. Further information addressing the need to physicaliy inspect air release valve locations and other similar critical junctions in the pipeline system as part of the monthly inspection.

20. Pursuant to 62 Ill. Adm. Code 1780.23 and 1784.15, the applicant shall provide the acreage and capability of each land use within the proposed permit area, employing only land use categories of 62 Ill. Adm. Code 1701.5. Further, the "fish and wildlife" land use category must be subdivided as required by Operator Memorandum 2015-01. **Use only these land uses for completing the land use maps.**

a. The individual land use acreages provided in the Pre-mining Land Use Table in Part II.4 of the application do not calculate to the Total Permit Acreage provided within this table. The applicant shall clarify this discrepancy.

b. The applicant shall revise all Tables, Maps and Figures to reflect only the "fish and wildlife" land use categories outlined within Operator Memorandum 2015-01.

21. Pursuant to 62 Ill. Adm. Code 1777.11(a)(3) and as required by Part V.2.A of the application, the applicant shall provide acreage figures for each post-mining land use proposed and designate the post-mining land uses on the Post-Mining Land Use Maps.

    a. The applicant shall revise all Tables, Maps and Figures to reflect **only** the "fish and wildlife" land use categories outlined within Operator Memorandum 2015-01.

    b. The individual land use acreages provided in the Post-Mining Land Use Table in Part V.2.A of the application do not calculate to the Total Permit Acreage provided within this table. The applicant shall clarify this discrepancy.

    c. Acreage for post-mining land uses provided by the applicant in the Post-Mining Land Use Table in Part V.2.A of the application are not the same as that provided in the Pre-mining Land Use Table in Part II.4. The applicant states in multiple locations of the application that post-mining land uses are the same as pre-mining land use. The acreage provided within the tables contradicts this statement and the applicant shall clarify this discrepancy.

22. Pursuant to 62 Ill. Adm. Code 1817.97(f) and required by Part V.B.3, the applicant is required to provide a statement explaining how impact control measures, management techniques, and monitoring methods will be utilized to protect or enhance habitats of unusually high value for fish and wildlife such as wetlands and riparian areas to be affected by the proposed mining and reclamation operations. The applicant shall address the following pertaining to the proposed water management pipeline construction corridor.

    a. In response to Part V.B.3, the applicant states that "no habitats of unusually high value have been observed within the project area". The applicant has provided a Stream and Wetland delineation report as Attachment II.9 to Part II of the application identifying streams and wetlands located within the proposed permit area. The applicant shall provide a statement in Part V.B.3 explaining how impact control measures, management techniques, and monitoring methods will be utilized to protect or enhance these areas.

    b. The applicant has provided a Stream and Wetland delineation report as Attachment II.9 to Part II of the application. Wetland A and Wetland B are not part of this proposed permit and shall be removed from all applicable parts of the application.

    c. As required by Part V.3.B.1, the applicant shall provide information on whether or not ponds on site will contain hazardous concentrations of toxic-forming materials and if so, then describe how control measures, management techniques, and monitoring methods will be used to ensure how wildlife protected under the

Endangered Species Act, Migratory Bird Treaty Act, and the Bald Eagle Protection Act are excluded from these areas or justify why this information is not provided.

23. Pursuant to 62 Ill. Adm. Code 1817.111, 1817.114, and as required by in Part V.1.D.3, the applicant is required to describe methods to be used in planting and seeding.

    a. In response to Part V.1.D.3, the applicant refers to planting of the proposed refuse disposal area. No refuse disposal area is proposed as part of this application. The applicant shall clarify this discrepancy.

    b. In response to Part V.1.D.3, the applicant provides a list of considerations and recommendations to prepare the site for planting. The applicant is required by Part V.6.D.3 to provide the actual methods to be used in planting and seeding rather than considerations and recommendations. The applicant shall revise this response in the application to include the actual methods to be implemented.

24. Pursuant to 62 Ill. Adm. Code 1784.21(a)(2)(A) and 1817.97(b), the applicant is required to provide site specific resource information for threatened and endangered species including but not limited to the Indiana bat *(Myotis sodalis)* (INB) and northern long-eared bat *(Myotis septentrionalis)* (NLEB). This information has been provided in Attachment II.8 and Part V.3.B.4; however, the following information/updates are required:

    a. Attachment II.8 refers to Permit 434 within the title on Page 1. This shall be revised to reflect the correct permit number.

    b. Attachment II.8 and Part V.3.B.4 of the application states that NLEB were not identified within the project area and therefore, in accordance with current USFWS protocol, are not present within the project area. The applicant did not survey the entire project alignment, thus probable absence cannot be assumed within the portions of the project that were not surveyed. The applicant shall update Attachment II.8 and Part V.3.B.4 of the application, including the discussion of whether the project is consistent with the northern long-eared bat *(Myotis septentrionalis)* Final 4(d) Rule published in the Federal Register in January 2016.

    c. The applicant has identified 3.9 acres of forested acres to be disturbed within known INB habitat based on the survey information provided. It is required that at least 70 percent of the total INB habitat that will be lost should be replaced or mitigated off-site as described in the 2013 Indiana bat Protection and Enhancement Guidelines published by the USFWS. The applicant shall update the Long-Term Habitat Replacement section of the INB PEP.

d. Tree Clearing restrictions within the INB PEP state that tree clearing operations will only occur from November 15 to March 31, unless otherwise authorized. These dates are not consistent with those described in the 2013 Indiana bat Protection and Enhancement Guidelines published by the USFWS. The applicant shall clarify this inconsistency.

e. The applicant has stated within the summary of the INB PEP that forested acres cleared during construction operations will be supplemented in the short-term by erecting bat boxes. The applicant shall update the Short-term Habitat Replacement section of the PEP to reflect this statement and provided further details as to the timing and number of bat boxes to be erected.

If you have any questions, please contact this office at (217) 782-4970, or our Southern office in Benton at (618) 439-9111.

Sincerely,

Nick San Diego, Supervisor
Office of Mines and Minerals

APPENDIX B

CONSIDERATION OF COMMENTS AND OBJECTIONS

62 Ill. Adm. Code 1773.13(b) allows submission of written comments on applications. The following are comments received from the State Agencies, County Board and other members of the public and the Department's response to those comments.

Illinois Department of Agriculture

Comment: The Illinois Department of Agriculture (IDOA) has reviewed the above referenced permit application. The application is for a 12.5-mile long 18 and 24-inch water mains to pump water from the underground mine to the Big Muddy River. All water from the mine will go through holding cells before being discharged to the pipeline. The pipeline will follow the railroad right-of-way (ROW), both active and abandoned, a gas pipeline and road ROW. Construction affects 12.67 acres of cropland. The pipeline will be in place for 10-years then removed. The mine has indicated they will follow the IDOA's Pipeline Construction Standards and Policies. The IDOA requests that the revision shown on the agricultural website be used. See: *https://www2.illinois.gov/sites/agr/Resources/LandWater/Documents/pipelinestandardspolicies.pdf.*

Response: The Department required modification of the application (Appendix A, Modification Question No. 9) to ensure the most current version of the IDOA Pipeline Constructions Standards and Policies were included in the permit.

Illinois Environmental Protection Agency

Comment:

1. To ensure compliance with 62 Ill. Adm. Code 1817.42 as it pertains to mine discharge quality, the Schedule A contained in Part III of the application should be revised as follows:
    a. Iron concentrations are indicated to be within the range of 3.0 - 6.0 mg/1. The applicant should revise this indication to provide an "estimate" of basin discharge Iron concentrations rather than the acceptable range from the Subtitle D regulations.
    b. Total Suspended Solids concentrations are indicated to be within the range of 35.0 - 70.0 mg/1. The Applicant should revise this indication to provide an "estimate" of basin discharge Total Suspended Solids concentrations rather than the acceptable range from the Subtitle D regulations.
2. The pipeline corridor area should be included in the annual stormwater monitoring plan.

Response: Please see the response to Appendix A, Modification Question No. 14.

U.S. Department of Agriculture, Natural Resource Conservation Service

Comment: Any bare soil exposed following surface coal mining should be seeded, limed, fertilized and mulched to minimize soil erosion. Please refrain from using tall fescue or reed canary grass in seeding mixtures and only plant native trees and shrubs for wildlife areas. Following pipeline installation, drainage should be provided where necessary to return the affected areas to their former land use. Wetlands should be returned to historic hydrologic conditions. Prime Farmland acreage should be reclaimed to standards established by the Illinois Surface Coal Mining Land Conservation and Reclamation Act.

Response: This comment has been noted and forwarded to the applicant.

U.S. Department of the Interior, Fish and Wildlife Service

Comment: To facilitate compliance with Section 7(c) of the Endangered Species Act of 1973, as amended, Federal agencies are required to obtain from the Fish and Wildlife Service (Service) information concerning any species, listed or proposed to be listed, that have ranges which include the project area. As the State of Illinois has been delegated the responsibility of issuing mining permits by the Office of Surface Mining, we are providing the following list of threatened and endangered species to assist in your evaluation of the proposed permit. The list for the proposed permit area includes the endangered Indiana bat (Myotis sodalis), endangered piping plover (Charadrius melodus), and threatened northern long-eared bat (Myotis septentrionalis). There is no designated critical habitat in the project area at this time.

Response: Comment noted and forwarded to the applicant.

Comment: Applicants should be directed to our Information, Planning, and Conservation System (IPaC) at the link below to determine whether any federally threatened and endangered species, designated critical habitat, or other natural resources of concern may be affected by a proposed project and to obtain a preliminary or official U.S. Fish and Wildlife species list. For projects that require FWS review, request an official species list from the Regulatory Documents page. https://ecos.fws.gov/ipac/

Response: This comment has been forwarded to the applicant. In addition, the Department has supplied the Service's website to future applicants as an encouraged and available resource.

Comment: Based on the location of the proposed permit area, the Service concurs that the proposed project is not likely to adversely affect the piping plover.

Response: Comment noted and forwarded to the applicant.

Comment: Information in the permit application indicates that 3.9 acres of known Indiana bat habitat will be impacted by the proposed mining activity. Presence of the Indiana bat was documented in a mist net survey conducted in 2017, thus a Protection and Enhancement Plan (PEP) was developed for the proposed mine area that lies within the 2.5 mile buffer of the documented maternity roost tree in accordance with the 2009 Range-wide Indiana Bat PEP Guidelines, as revised in 2013. The PEP includes a number of protection and enhancement measures including avoidance of the majority of wooded habitat within the permit area, winter tree clearing from November 15 to March 31, tree girdling and bat box installation to provide temporary habitat, riparian buffer zone protection, and maintenance of watering areas. The applicant is not proposing to replant the forested habitat acres to be disturbed.

The PEP guidelines state that at least 70 percent of the total Indiana bat forest habitat that will be lost should be replaced or mitigated off-site. The applicant should develop a replacement plan or off-site mitigation measures. Information in the permit application indicates that the post mining acres for fish and wildlife woody will increase and may account for the replacement. The PEP should be reconciled with the post-mining land use in the reclamation plan.

The applicant did not survey the entire project alignment, thus probable absence for the northern long-eared bat cannot be assumed within the portions of the project that were not surveyed. The applicant should include the northern long-eared bat in the PEP or rely upon the finding of the programmatic biological opinion for the northern long-eared bat final 4(d) rule and utilize the streamlined section 7 consultation framework to fulfill their project-specific section 7 responsibilities for the northern long-eared bat. If the applicant utilizes the streamlined consultation framework, then the streamlined consultation form should be completed.

See https://www.fws.gov/midwest/endangered/mammals/nleb/s7.html

Based on the lack of information in the permit application, the Service is not able to provide concurrence for listed bat species at this time. The Service requests the additional information be provided for review and concurrence.

Response: The Department would like to take this opportunity to outline protection an enhancement measures that have changed from the original submittal based on modification requirements.

The Indiana bat (*M. sodalis*) and northern long-eared bat (*M. septentrionalis*) Protection and Enhancement Plan (PEP) located in Attachment II.8 has been updated to address long term habitat replacement requirements. The applicant has

proposed to reforest 2.73 acres, restoring 70% of the known habitat proposed to be removed by this project and therefore complying with the 2013 Guidelines.

Additionally, tree clearing restrictions within the PEP have been modified to state that tree clearing operations will only occur from October 15 to March 31. These dates appropriately reflect those outlined for winter tree clearing in the 2103 guidelines.

The applicant has also modified the PEP to state "the probable absence of the NLEB cannot be assumed". The applicant has included a discussion utilizing the key to the northern long-eared bat 4(d) rule for federal actions to conclude that the proposed actions are not prohibited and therefore a PEP for this species is not required. However, the applicant has chosen to include this species within the PEP found in Attachment II.8 of the application. The applied protection and enhancement measures will potentially be beneficial to the northern long-eared bat.

Based on information provided by the applicant and appropriate agency consultations, the Department has determined that this project may affect the northern long-eared bat, but that any resulting Incidental Take is not prohibited by the Final 4(d) rule and is consistent with the U.S. Fish and Wildlife Service Jan 2016 Programmatic Biological Opinion on the Final 4(d) rule. The Department has completed the IPAC Determination Key: Northern Long-Eared Bat (NLEB) Consultation and 4(d) Rule Consistency, which was submitted to the Service via IPAC on July 31, 2019.

Comment: [Per the follow-up USFWS correspondence dated October 2, 2019] - Based on the lack of information in the permit application, the Service was not able to provide concurrence for listed bat species. We requested additional information be provided for our review and concurrence. Information in your response indicates that the Protection and Enhancement Plan (PEP) was updated to address long-term habitat replacement requirements for the Indiana bat. Based on this information, the Service has determined that the take of 3.9 acres of known habitat is not likely to jeopardize the continued existence of the Indiana bat.

Information in your letter indicates that consultation for the northern long-eared bat was addressed by using our northern long-eared bat determination key within our Information for Planning and Consultation (IPaC) system. Based upon the IPaC submission, the action is consistent with activities analyzed in the Programmatic Biological Opinion on the Final 4(d) Rule for the northern long-cared bat and issuance of the verification letter concludes consultation for the northern long-eared bat. This information sufficiently addresses our comments regarding the northern long-eared bat.

Response: Comment noted and forwarded to the applicant.

Comment: Although the bald eagle has been removed from the threatened and endangered species list, it continues to be protected under the Migratory Bird Treaty Act and the Bald and Golden Eagle Protection Act (BGEPA). The Service developed the National Bald Eagle Management Guidelines to provide landowners, land managers, and others with information and recommendations regarding how to minimize potential project impacts to bald eagles, particularly where such impacts may constitute "disturbance," which is prohibited by the BGEPA. A copy of the guidelines is available at:

http://www.fws.gov/midwest/eagle/pdf/NationalBaldEagleManagementGuidelines.pdf

The Service is unaware of any bald eagle nests in the permit area; however, if a bald eagle nest is found in the permit area or vicinity of the permit area then our office should be contacted and the guidelines implemented.

Response: The applicant has provided a statement outlining that the applicant is unaware of any bald or golden eagle nests within one mile of the project. The applicant includes a discussion committing to contacting the U.S. Fish and Wildlife Service for the development of a protection and enhancement plan if a nest is encountered. See Part V.2.B.2 of the application.

Comment: [Per the follow-up USFWS correspondence dated October 2, 2019] - The Service indicated that it is unaware of any bald eagle nests in the permit area; however, if a bald eagle nest is found in the permit area or vicinity of the permit area then our office should be contacted. The applicant provided a statement that no eagle nests are known within the project area or vicinity. This information sufficiently addresses our comments.

Response: Comment noted and forwarded to the applicant.

Comment: The permit area includes 23.0 acres of cropland, 16.8 acres of fish and wildlife herbaceous, 18.6 acres of fish and wildlife woody, 0.4 acres of fish and wildlife water, 3.7 acres of fish and wildlife wetland, 0.1 acres residential, and 8.2 acres industrial/commercial.

Response: The Department would like to take this opportunity to clarify that information in the modified permit application indicates that the permit area will includes 16.4 acres of cropland, 20.7 acres of fish and wildlife herbaceous, 21.1 acres of fish and wildlife woody, 0.4 acres of fish and wildlife water, 3.6 acres of fish and wildlife wetland, 0.2 acres developed water resources, 0.1 acres residential, and 8.2 acres industrial/commercial.

Comment: [Per the follow-up USFWS correspondence dated October 2, 2019] - Thank you for your letter dated August 6, 2019, providing response to our comments on permit

application No. 456 by Williamson Energy, LCC (Pond Creek Mine), for surface coal mining and reclamation operations in Franklin and Williamson Counties, Illinois. The permit area is 70.7 acres and the proposed mining activity will impact a total of 70.7 acres. The permit area includes 16.4 acres of cropland, 20.7 acres of fish and wildlife herbaceous, 21.1 acres of fish and wildlife woody, 0.4 acres of fish and wildlife water, 3.6 acres of fish and wildlife wetland, 0.2 acres of developed water resources, 0.1 acres residential, and 8.2 acres industrial/commercial. These comments are provided under the authority of and in accordance with the provisions of the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.); the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.) and, the National Environmental Policy Act (83 Stat. 852, as amended P.L. 91-190, 42 U.S.C. 4321 et seq.).

Response: Comment noted and forwarded to the applicant.

Comment: Information in the permit application indicates that proposed activities will impact a total of 3.7 acres of wetlands including 0.4 acres of unconsolidated bottom wetlands. The proposed post mining land use plan includes 3.7 acres of wetlands.

The Service has no objection to the proposed wetland mitigation.

The Service recommends that the seed mix for emergent wetland restoration include native forbs, which will provide greater benefits to native pollinators and the monarch butterfly.

Response: The Department would like to take this opportunity to clarify that information in the modified permit application indicates that the proposed activities will impact a total of 3.6 acres of fish and wildlife wetland and proposed post mining land use plan includes 3.6 acres of wetlands. The recommendation by the Service to incorporate native forbs into the seeding mix for emergent wetland restoration has been forwarded to the applicant.

Comment: Information in the permit application indicates that the reclaimed area will include 22.1 acres of woody fish and wildlife habitat and 21.0 acres of herbaceous fish and wildlife habitat.

The Service recommends that the planting of any non-native, exotic, and invasive species be avoided.

The Service also recommends the incorporation of native forbs in the seeding mix which will provide greater benefits to native pollinators.

The Service recommends that the applicant include an invasive species control plan in the reclamation plan.

Response: The Department would like to take this opportunity to clarify that information in the modified permit application indicates that the reclaimed area will include 21.1 acres of woody fish and wildlife habitat and 20.7 acres of herbaceous fish and wildlife habitat.

The applicant has proposed native and non-native species for Fish and Wildlife post-mining land uses (PMLUs). See Attachment V.1.D.2.b. of the application that contains species lists and justification for the use of some non-native species. The regulations found at Section 1816.111(a)(2) and (c) allow non-native species if they are necessary to achieve the desired post-mining land use or are necessary for erosion control. In addition, the 2013 Indiana bat guidelines provides the same flexibility in Section 2.4.2.2 item no. 3 for the use of non-native woody area herbaceous ground cover if the applicant demonstrates the proposed species are slow growing and beneficial for wildlife. The applicant has proposed non-native species for temporary/cover crop vegetation. The Department does not have the regulatory authority to require native species for temporary seed mixes. The recommendation by the Service to incorporate native forbs in the herbaceous seeding mix was noted and has been forwarded to the applicant.

Pursuant to Section 1816.116(b)(1) and 1784.15(b)(1), the Department required the applicant to achieve the approved species and/or PMLU vegetation success standards during the applicable period of liability. Undesirable invasive species control will be part of the remedial action plan if deemed necessary by the applicant or the Department.

Comment: [Per the follow-up USFWS correspondence dated October 2, 2019] - The Service recommended that the planting of any non-native, exotic, and invasive species be avoided and that the applicant include an invasive species control plan in the reclamation plan. The Service also recommended the incorporation of native forbs into the seeding mix. Information included in the response sufficiently addresses our comments.

Response: Comment noted and forwarded to the applicant.

Public Comments

The Department has considered and evaluated all comments concerning the effects of mining within the proposed permit areas and adjacent areas. The issues raised that are deemed pertinent to the permit application are addressed below.

Comment 1: Commenters asked if their questions were going to be answered at the hearing, expressed dismay that questions were not answered and requested clarification as to how they will obtain those answers to their questions.

Response: The regulations at 62 Ill. Adm. Code 1773.14(d)(2) states that "The hearing officer shall allow the county board, the applicant, and any interested persons to present data, views, or arguments." The purpose of the hearing is not to inform the public but to allow the public to "present data, views, or arguments" concerning the application to the Department. Comments pertinent to the application are then taken into consideration by the Department, with each specialist in their individual scientific area reviewing the application and addressing those comments in the permit decision document.

Comment 2: Commenters expressed concern over the impact of the project on the quality of the Big Muddy River.

Response: The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenters' concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the Illinois Environmental Protection Agency's (IEPA). Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 3: A commenter asked what is currently being done with the water generated at the mine.

Response: It is assumed the commenter, by using the term "generated," is referring to mine infiltration water removed from the underground workings. According to the currently approved NPDES Permit IL0077666, the mine infiltration water that is pumped from the underground works is routed to Pond 006. This water is used at the wash plant or stored on the permitted surface area in existing impoundments and ponds.

Comment 4: A commenter asked about details of the water to be discharged and the concentration of pollutants in the water.

Response: Please see the response to Appendix A, Modification Question Nos. 11 and 12.

Comment 5: A commenter asked if the pipeline work had begun and when a decision on the application would be made.

Response: At the time of this comment, the Permit No. 456 application for the pipeline was still under review. Any work related to the pipeline as it relates to the proposed surface coal mining and reclamation operations detailed for this application cannot lawfully begin until the Department approves the application and issues the permit decision. Here, after completion of review, it was determined that modifications of the application were required and the applicant had one year to provide appropriate

responses to the request for modifications. Those responses have since been submitted and approved. This permit findings document memorializes the Department's decision to issue the permit.

Comment 6: Commenters questioned the impact to the water level of the Big Muddy River, including during low flow conditions as a result of the proposed discharge.

Response: Based on information provided in the application, the volume of mine water to be discharged in the Big Muddy River will be dependent on the flow of the river upstream of the point of discharge. Thus, the discharge will be intermittent and will be adjusted accordingly. The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenters' concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 7: Commenters asked how the concentrations of chlorides and sulfates in the discharge water would impact the receiving stream, adjacent waterways and water courses further downstream, including the anticipated effects on local biota and the public.

Response: The IEPA is the regulatory agency that determines the concentrations of chlorides and sulfates that can be discharged into a water body through its NPDES permitting process. The potential impacts to the receiving stream, adjacent waterways and water courses further downstream, including the anticipated effects on local biota and the public, is an issue for the IEPA to address through that process. Potential impacts resulting from another agency's permitting responsibility is beyond the purview of the Department.

Comment 8: Commenters indicated the hydrologic balance investigation for the application should include the areas included within the longwall panels and that the analysis was an attempt to obscure the effects on the local water table. One of these commenters asked what the actual cone of depression created by the mine pumpage.

Response: This permit application is for the construction and operation of a pipeline to transport underground mine infiltration water to a diffuser system at the Big Muddy River. This permit application does not cover the shadow area encompassed by the longwall mining panels. Nevertheless, the Department does not believe there is a cone of depression as this water is leaking into the mine from cracks in the overlying unit above the coal seam. The water is then physically pumped out of the mine, not the overlying unit.

Comment 9: Commenters were concerned there are, or may be, adverse impacts accruing from the rate of water pumping and area groundwater drawdown, as well as the long-term impacts to local water quantity that may be needed in the future.

Response: There have been no reported issues from surrounding citizens regarding the company pumping out infiltrating groundwater out of the mine. According to data presented in the application, this groundwater is naturally high in chlorides and sulfates, making it unfavorable as a source of potable groundwater. The Department is unaware of any plans or proposals to utilize this water bearing sandstone as a source of potable water.

Comment 10: A commenter indicated Permit No. 375 incorrectly reflected the depth of the coal seam and that the shallower depth of mining negatively impacted his ponds and well. Further, the commenter indicated the Department needed to monitor his well to understand the hydraulic balance of the area.

Response: The issues raised relate to underground mining and subsidence and are not pertinent to the activities proposed in Permit No. 456. Potential subsidence impacts to a well will not provide relevant information on the hydrologic balance of the proposed permit area in this application.

Comment 11: Commenters expressed concerns that the public wasn't given adequate or appropriate notice of the permit application or the public hearing and sufficient time to prepare for the hearing. One stated that "I own a significant amount of land I do not live here full time, but I would have thought that there might be a better communication system to land owners regarding important items such as this. The meeting was quickly called and not very publicized. Your written comment deadline is also too short given that many people have only barely heard of the Big Muddy River pollution by Williamson Energy, LLC, and Pond Creek Mine, and they have not had time to read the application and gather their research and comments on the permit proposal."

Response: The purpose of the public hearing, as stated at 62 Ill. Adm. Code 1773.14(d)(2), is to "allow the county board, the applicant, and any interested persons to present data, views, or arguments." The application has been on file with the Williamson and Franklin Counties Clerk Offices since July 18, 2018. In addition, the application was posted to the Department's website on July 20, 2018. Notice of the application was published by the applicant in the Marion Republican four (4) times, with the first publication on July 18, 2018, and the last on August 8, 2018. The application was available for public review for more than three (3) months prior to the close of the comment period. It is the Department's opinion the public has been provided all the opportunities prescribed by the regulations to review the application and the additional ten (10)-day period afforded after the public hearing provided adequate time for interested parties to review the application and submit written comments.

The regulations at 62 Ill. Adm. Code 1773.14(b) require that "The Department shall publish notice of the hearing in a newspaper of general circulation within the county. Such notice shall be published by the Department at least two (2) weeks prior to the scheduled hearing date."

The notice published for the public hearing explained what application was to be covered by the hearing, and the time. place and location of the hearing. It also provided the Department's contact information. That notice was published October 2, 2018 in the Southern Illinoian.

The Department's requirements for public notification of the public hearing were met.

Comment 12: Commenters indicated that insufficient research had been done to insure irreparable damage to water systems will not occur. Those concerns addressed effects to endangered species that may come to the area (gray wolf, black bear and mountain lion), the redheaded woodpecker, hellbenders, the alligator snapping turtle and other reptiles and amphibians living in and around the waterways which would receive the discharge. Commenters also expressed concern regarding these effects on the LaRue-Pine Hills area and its diverse biota.

Response: The IEPA is the regulatory agency that determines the effluent concentrations that can be discharged into a water body through its NPDES permitting process. The potential impacts to the receiving stream, adjacent waterways and water courses further downstream, including the anticipated effects on endangered species and other local biota, is an issue for the IEPA to address through that process. Potential impacts resulting from another agency's permitting responsibility is beyond the purview of the Department.

Comment 13: A commenter indicated the bond paid for reclamation was insufficient and needed to take into account the value of fishing, boating and the ecosystem impacted by the proposed action.

Response: The regulations at 62 Ill. Adm. Code 1800.14(b) require that "[t]he amount of the bond shall be sufficient to assure the completion of the reclamation plan if the work has to be performed by the Department in the event of forfeiture..." The amount of bond calculated by the Department is in regard to the pipeline installation requested in the proposed permit. Therefore, the topics noted in the comment are beyond the purview of "completion of the reclamation plan." Any determination of the effect of the water on the ecosystem and recreational sports would be outside the scope of the Department's regulatory jurisdiction.

Comment 14: Commenters indicated an on-site water treatment system, or other solutions should be considered by the applicant in lieu of the pipeline. In addition, a commenter indicated the IDNR should require evidence of such assessments. Commenters also

asked what the mine has done to fully review other options to treat the groundwater on-site and suggested that IDNR should request that the mine show serious assessments or other ways of dealing with this water, as there were no clear examples in the permit application of other options that were considered to treat the high chloride and sulfate levels at the mine.

Response: The Department does not have the regulatory authority to require the type of assessments addressed in the comment.

Comment 15: The Douglas School is an old school turned into artists' studio spaces. A commenter expressed concerns that the Old Historic Douglas School could be negatively impacted by high water and water quality during periods of flooding.

Response: The Department does not have the regulatory authority to evaluate the potential downstream effects related to the proposed mixing zone. The authority for such an evaluation is under the regulatory jurisdiction of the IEPA.

Comment 16: The Big Muddy River is indicated as Public Waters by IDNR. Impacts of this added discharge do not appear to have been adequately evaluated and essential information for this application appears to be lacking. There is no information on what the added 2,700,000 to 3,500,000 gallons per day will mean to erosion impacts, river water levels, public use of the river for recreation or other public uses. This river is already prone to flooding and has documented low flows which clearly could mean different impacts from the proposed discharges that have not been adequately assessed. The amount of water that would flow into the Big Muddy River on a daily basis would overwhelm the levy structures in place on the Big Muddy River.

Response: Based on information provided in the application, the volume of mine water to be discharged in the Big Muddy River will be controlled by a diffuser and be metered at any given time based on the actual flow volume in the river as well as the water quality of the discharge and receiving stream.

The IEPA is the regulatory agency that determines the discharge flow volumes and concentrations of monitored parameters that can be discharged into a water body through its NPDES permitting process.

Several measures are proposed to reduce erosion impacts from the discharge flow. The design of the diffuser includes 5 ports that will be submerged to maximize dispersion and minimize effects on the receiving water. The diffuser ports will be mounted on a steel structure that will be supported by piles. A 50-inch-thick revetment with a D50 riprap size of 25 inches has been proposed to be used on the river bank where the diffuser will be located. Other temporary sediment control measures to be used during construction of the diffuser site include: silt fences, silt socks, straw/hay bales and removal and storage of subsoil and topsoil. The

Department will monitor the performance of the erosion control measures and take appropriate action should erosion become an issue.

Comment 17: A commenter suggested the mining operations should be converted from longwall mining to room and pillar mining and potentially avoid the mine water generation to begin with.

Response: The concern expressed would be better directed to the applicant. The Department is not involved in business decisions made by private entities.

Comment 18: Commenters questioned if the applicant intentionally located the pipeline diffuser below the closest gauging station and if the Department had given consideration to the volume of water proposed to be discharged and its effect on the public's right to use the river. These comments also suggested that by putting the outlet downstream of the Plumfield gauging station the Corps of Engineers would not have a true reading of the of the water level and may release more water at Rend Lake, causing more flooding downstream.

Response: Based on information provided in the application, the volume of mine water to be discharged in the Big Muddy River will be dependent on the flow of the river upstream of the point of discharge. Thus, the discharge will be intermittent and will be adjusted accordingly. The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenters' concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 19: A commenter asked what the current levels of chlorides and sulfates are in the Big Muddy River.

Response: This is outside the scope of the Department's regulatory purview. The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenters' concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 20: A commenter asked if full consultation with other divisions within IDNR had been conducted.

Response: The Land Reclamation Division of IDNR (LRD), upon receipt of a complete application, notifies various offices within the IDNR, as well as other State, local and Federal agencies, allowing each to submit comments to be taken in to consideration during the application review process. Here, LRD forwarded

notification to the other offices within IDNR on July 20, 2018. All agency comments have been considered in LRD's review of the application and are addressed in the Part III Summary of the Department's Findings.

Comment 21: A commenter asked why IDNR or EPA would ever allow water with elevated chlorides or sulfates to further pollute the Big Muddy River.

Response: The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenters' concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 22: Commenters expressed opinions about the poor quality of old mines and asked if IDNR or EPA had been successful in cleaning up pollution caused by old mines.

Response: LRD is involved in the regulation of active coal mining operations. The reclamation of "old" mines, or lands impacted by mining prior to the permanent program rules and regulations is under the jurisdiction of the Department's Abandoned Mine Lands Division. Questions related to IEPA's involvement with "cleaning up pollution caused by old mines" should be directed to that agency.

Comment 23: Commenters asked about how climate change would impact the need for water in the future and how this proposal would affect the local water supply.

Response: The concern expressed related to climate change is outside the regulatory purview of the Department.

Comment 24: A commenter indicated the mining industry caused public health issues and this proposal would exacerbate that issue.

Response: The concern expressed is outside the regulatory purview of the Department. This comment has been forwarded to the applicant.

Comment 25: A commenter indicated that the sulfate and chloride concentrations presented throughout the application were inconsistent, and the final discharge concentration was well in excess of those concentrations expressed elsewhere in the application.

Response: Please see the responses to Appendix A, Modification Questions Nos. 11 and 12.

Comment 26: A commenter asked if the applicant is pumping to a tributary of Pine Creek (as the permit indicates) is working why do they need this application.

Response: The Department is unaware of a "Pine Creek" in the vicinity of the Pond Creek Mine, and therefore assumes that the commenter is referring to Pond Creek. The

Pond Creek Mine does not pump water directly into a tributary of Pond Creek. However, water from the mine's sediment ponds (Outfalls 001, 002, 003, 004, 005, 006, 007, and 008) can discharge into an unnamed tributary of Pond Creek. Please refer to the Department's response to Comment 3 above for a description of the mine's current handling of infiltration water from the underground works. According to the application, Williamson Energy, LLC has a finite capacity to store water and expects to encounter an increase in groundwater infiltration as mining progresses.

Comment 27: One commenter questioned why the mine is attempting to pump high sulfate and high chloride water to the Big Muddy when an earlier request for a mixing zone was rejected years ago.

Response: The IEPA is the regulatory entity that approves mixing zones. The Department permits any actual conveyance system that would be necessary for such a mixing zone. The Department received a permit application (No. 455) for such a conveyance system January 30, 2017 which the applicant subsequently withdrew on March 2, 2017. This application was withdrawn by the applicant prior to review and not denied as the commenter alludes. Any other actions taken by the IEPA on Permit No. 455 are best addressed by that agency.

Comment 28: Commenters stated that the Big Muddy River is already listed as impaired on the 2018 Illinois EPA 303(d) list and is given a medium rating. Their concern is that the river is already at risk from pollutants and there does not appear to be adequate consideration of a full range of mine alternatives to the discharges requested in this permit application or other best practices the mine could utilize are not provided in any significant variety or detail.

Response: The Department does not have the regulatory authority to require the type assessment addressed in the comment. The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenters' concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 29: Commenters questioned what will the proposed daily discharge of high levels of chlorides and sulfates do to existing fish and aquatic life in the Big Muddy River and to other downstream uses? Those commenters indicated that additional pollution loading of this river, particularly at times of low flow, are a concern to us in addition to the known problems high levels of chlorides cause for fish and other aquatic life. Chlorides are stated in some sources to be accumulative. There is nothing in the application that was found to assess what the daily and long-term biological and water quality impacts of the high levels of chlorides and sulfates will do.

Response: The IEPA is the regulatory agency that determines the concentrations of chlorides and sulfates that can be discharged into a water body through its NPDES permitting process. The potential impacts the receiving stream, adjacent waterways and water courses further downstream, including the anticipated effects on local biota, such as fish and other aquatic life, is an issue for the IEPA to address through that process. Potential impacts resulting from another agency's permitting responsibility is beyond the regulatory purview of the Department.

Comment 30: Commenters had questions regarding what fish and aquatic species are currently utilizing the proposed discharge section of the Big Muddy River and are there any locations downstream that have mussel populations? What are the biological and environmental impacts of the high chloride levels? The Big Muddy River is also listed as having varieties of mussels and information on any mussel beds and what impacts the discharges could mean is lacking.

Response: The IEPA is the regulatory agency that determines the concentrations of chlorides and sulfates that can be discharged into a water body through its NPDES permitting process. The potential impacts the receiving stream, adjacent waterways and water courses further downstream, including the anticipated effects on local biota, such as fish and other aquatic species, is an issue for the IEPA to address through that process. Potential impacts resulting from another agency's permitting responsibility is beyond the regulatory purview of the Department.

Comment 31: A commenter asked what different mining practices could be done to reduce the amount of groundwater infiltrating the mine?

Response: The scope of the commenter's question falls beyond the regulatory purview of the Department. The comment has been forwarded to the applicant.

Comment 32: Commenters indicated the diffuser is located on a cut bank of the river, which could potentially experience expedited erosion and bank stability problems risking infrastructural damages.

Response: Engineering practices at the river bank will be utilized to reduce significant erosion impacts and enhance aquatic habitat. The diffuser ports will be mounted on a steel structure that will be supported by piles. Stream bank stabilization proposed for the bank of the Big Muddy River consist of a 50-inch-thick revetment using median riprap size of 25 inches. The riprap will be keyed into the toe of the slope with native plantings on the banks above. This bank stabilization will help prevent further erosion due to the stream channel and protect the water management facilities and infrastructure. The Department will monitor the performance of the erosion control measures and take appropriate action should erosion become an issue.

Comment 33: Commenters indicated it is unclear what heavy metals or other possible contaminants such as arsenic or radioactive materials and what the cumulative effect of additional pollutants will be. The application is also unclear about whether there is a chance of this water mixing with acid mine drainage.

Response: Please consult with the IEPA regarding what other parameters were reviewed for this mixing zone. The Department finds that the chance of acid mine drainage mixing with the water destined for the mixing zone is low to negligible.

Comment 34: A commenter indicated the Stream Protection Rule was created to clarify vague and problematic components of SMCRA, but even though it was rescinded it should be used to mitigate the damage caused by Foresight Energy.

Response: The Department cannot enforce regulations that have not been promulgated or are not in force.

Comment 35: A commenter asked how will the low water quality with its high sulfates and chlorides effect timber along the river and who would be responsible for the monetary loss to land owners?

Response: The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenter's concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Monetary loss to landowners based on water quality issues resulting from another agency's permitting responsibility is beyond the regulatory purview of the Department.

Comment 36: A commenter asked if they drain water into the Big Muddy, will it be via Pond Creek? If so, who will be responsible for cleaning up the creek due to the number of log jams on it.

Response: The application proposes a pipeline to pump mine water from underground into the Big Muddy River. The concerns expressed regarding the log jams are beyond the regulatory purview of the Department.

Comment 37: Commenters indicated the average concentrations listed for Chloride (2237 mg/l) and Sulfate (1940 mg/l) in the effluent, coupled with the discharge rate equal approximately 22,700 kg/d Cl2- and 19,400 kg/d SO42- were significant quantities when considering the hydrological characteristics of the Big Muddy River at this point in its watershed.

Response: The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenters' concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 38: A commenter indicated the negative charges of Chloride and express a high affinity to remobilize any positively charged cations in channel sediments of the Big Muddy River. This becomes an important concern when considering metals like Manganese, Magnesium, Iron, Cadmium, Arsenic, Lead, etc. can be present in riverbed sediments. The negative charges extract these positive charged cations, causing elements that would otherwise be immobile, to be brought back into solution and transported downstream. This topic is not discussed anywhere in the application, yet is a real concern considering the quantity, concentration, and duration the mine anticipates the point source effluent to be active.

Response: The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenters' concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 39: A full Environmental Impact Statement should be conducted to determine the full effects of this proposed pipeline.

Response: An environmental impact statement is not required under 62 Ill. Adm. Code Parts 1700-1850 for this proposed surface coal mining and reclamation operation.

Comment 40: Drinking water pollutant levels are more restrictive than river water; the proposed discharges fail to meet drinking water standards, which mean public uses of Big Muddy River water could incur additional treatment costs in the years ahead.

Response: The concern expressed is beyond the regulatory purview of the Department. The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenter's concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

Comment 41: Commenters indicated that we share concerns about the lack of regulatory enforcement that most mines in Illinois have not been inspected in 12 years.

Response: The regulations at 62 Ill. Adm. Code 1800.11(a-b) require that "(a) The Department shall conduct an average of at least one partial inspection per month of each active surface coal mining and reclamation operation under its jurisdiction and shall

conduct partial inspections of each inactive surface coal mining and reclamation operation under its jurisdiction to ensure enforcement of the approved State program... (b) The Department shall conduct an average of at least one complete inspection per calendar quarter of each active or inactive surface coal mining and reclamation operation under its jurisdiction..."

The Department continues to meet its inspection mandate.

Comment 42: A commenter questioned how much affect would this have on tourism which is another major resource of southern Illinois?

Response: The effects on tourism are outside scope of the Department's regulatory purview.

Comment 43: Commenters asked if the pipeline be granted eminent domain or will the mine owner purchase easements from landowners?

Response: Eminent domain is not applicable to the proposed pipeline. It is the applicant's responsibility to obtain the necessary right of entry for the project.

Comment 44: Commenters questioned that since the pipeline crosses over the county line, if the pipeline breaks in one county does the other county have to pay for the cleanup and what recourse will farmers have when the pipeline breaks and damages their field?

Response: Operators of such pipelines are responsible for cleanup of any spillage as well as damages.

Comment 45: A commenter asked what will happen to their property when the Big Muddy River floods again with the extra salt and sulfides and dead wildlife washing in? The river will flood again without the extra 2.5 million gallons of water from the Pond Creek Mine.

Response: The Department's review of the application is conducted pursuant to 62 Ill. Adm. Code Parts 1700 – 1850. The commenter's concerns relate to the discharge of water into rivers and streams, which is an activity regulated by the IEPA. Please consult with IEPA to address issues related to maximum discharge quantities, river loading capacities, proposed mixing zones, and other related matters.

APPENDIX C

Williamson Energy, LLC, Pond Creek Mine
Application for Permit No. 456
And Permit Nos. 375 & 417
And Revisions No. 1, 2, 3, 5, 6, 9, 10, and 11 to Permit No. 375
Assessment and Findings of Probable Cumulative Hydrologic Impacts

Williamson Energy, LLC (hereinafter referred to as "permittee" or "applicant" as applicable) was required to submit a determination of probable hydrologic consequences of the proposed mining and reclamation operations, both on and off the permit area, pursuant to 62 Ill. Adm. Code 1784.14(e) for underground mines.

Pursuant to 62 Ill. Adm. Code 1773.15(c)(5), the Department must make an assessment of the probable cumulative impacts of all anticipated coal mining on the hydrologic balance in the cumulative impact area, in accordance with 62 Ill. Adm. Code 1784.14(f), and find in writing that the proposed operation has been designed to prevent material damage to the hydrologic balance outside the permit area.

The following assessment and findings are intended to fulfill the above requirements.

I. GENERAL INFORMATION

A. Historical Coal Mines (ISGS)

Several coal mines have operated in the vicinity of the Pond Creek Mine. Former coal mines were present to the west, south and east of the Pond Creek Mine.

Both surface and underground mines operated in the area, with operations dating back to 1944.

1. Ziegler No. 4 Mine (1944-1980)

To the south and west of the Permit No. 375 area is the former Ziegler No. 4 underground mine. This mine encompasses approximately 4,726 acres and operated as a room and pillar mine.

2. Orient No. 4 Mine (1952-1987)

Also to the south of the Permit No. 375 area, the former Orient No. 4 underground mine operated. This mine was approximately 6,530 acres in size and operated as a room and pillar mine from 1952 to 1987.

3. Malone No. 1 Mine (1976-1979)

This former surface mine is located to the east of the permit area. The Malone mine operated as a small surface mine from 1976 to 1979 and was approximately 82 acres in size.

4. Phoenix No. 1 Mine (1988-1993)

To the east, occupying the same general location as the form Malone No. 1 surface mine, the Phoenix No. 1 Mine was present. Two permits were issued by the Department. Permit No. 200 was issued in 1988 and Permit No. 270 was issued in 1992. The mine ceased operations in 1993 and in 2008, the Department placed the permit areas into forfeiture status.

B. Active Coal Mines

Pond Creek Mine (2005-current)

1. Permit No. 375 (issued 2005)

The original Pond Creek Mine permit was issued for an underground coal mining operation. Permit No. 375 was originally for approximately 540 acres to be used as surface support facilities for an underground coal mining operation. The surface support facilities include a coal preparation plant, parking lots, access roads, drainage control structures, office buildings, changing rooms, assembly rooms, warehousing facilities, storage facilities, ventilation facilities, refuse disposal areas, power distribution facilities, power lines, water lines, stockpile areas and other associated facilities. Williamson Energy extracts the Herrin No. 6 Coal Seam, at a depth ranging from 450 to 600 vertical feet from the surface, utilizing room and pillar and longwall mining within the originally permitted 4,631 (approximately) acre shadow area. The room and pillar mining is designed to prevent subsidence and/or to be areas of unplanned subsidence, while the longwall mine area is planned subsidence.

2. Permit No. 375, Significant Revision Nos. 1, 3, 5, 6, 7, and 9 (issued 2007, 2010, 2011, 2012, 2013, and 2014, Respectively)

Revision Nos. 1, 3, 5, 6, 7 and 9 to Permit No. 375 approved additional shadow area to allow for both room and pillar developmental and longwall mining operations. The additional shadow area totals approximately 10,588 acres.

3. Permit No. 375, Significant Revision No. 2 (issued 2009)

Revision No. 2 to Permit No. 375 converted previously approved permit area to Refuse Disposal Area No. 2 for the mine.

4. Permit No. 375, Significant Revision No. 4 (Withdrawn)

This proposed revision was withdrawn by the applicant and not issued.

5. Permit No. 375, Significant Revision No. 8 (Withdrawn)

Revision No. 8 to Permit No. 375 is a proposal to inject coal slurry into the former underground works of the Pond Creek Mine. This application has been withdrawn.

6. Permit No. 417 and Significant Revision No. 10 to Permit No. 375 (issued 2015)

Permit No. 417 and Significant Revision No. 10 to Permit No. 375 added approximately 230 acres for an additional refuse disposal area, to be known as Refuse Disposal Area No. 3.

7. Permit No. 375, Significant Revision No. 11 (issued 2018)

Significant Revision No. 11 to Permit No. 375 added 10,913.7 acres of shadow area to the existing mining operations. To date, 57 Insignificant Permit Revisions (IPRs), 84 Incidental Boundary Revisions (IBRs), and 14 minor field decisions have been issued by the Department since the original permit was issued. The IPRs were issued for a variety of reasons, including, but not limited to: surface drainage modifications; pond design changes; rail loop load-out modifications; underground boreholes for rockdust, power supplies and ventilation; installation/replacement of groundwater monitoring wells; changes to the existing refuse disposal areas.

The IBRs were also issued for a variety of reasons, including but not limited to: refuse disposal area changes; borehole installation; soil stockpile changes; addition of diversion ditches, and other surface water drainage; mine ventilation changes and shadow area expansions of 20 acres or less. Through IBRs, Williamson Energy has added approximately 229.3 acres to the original surface facilities permit area and approximately 592 acres of shadow area.

The total surface facilities permit area is now approximately 1,070 acres, whereas, the total shadow area is approximately 25,715 acres.

8. Application for Permit No. 456

The Application for Permit No. 456 proposes to add a 12.5-mile pipeline from the currently approved water holding cells on the western boundary of the mine site to the Big Muddy River. According to the application, the pipe size will be a minimum of 18 inches throughout its total length. The permittee also has an application pending with the Illinois Environmental Protection Agency (IEPA) for a mixing zone. According to the application, the mixing zone is being requested due to the inability to dispose of water infiltrating into the mine. This water has naturally elevated chloride and sulfate concentrations. The amount of water that can be discharged into the Big Muddy River at any given moment is dependent on the chloride concentration of the mine effluent,

the chloride concentration in the receiving stream, and the flow of the receiving stream. However, the maximum pumping rate for this facility will be limited to 5,000 gallons per minute according to the draft NPDES permit and the Application for Permit No. 456 documentation.

II. PROBABLE CUMULATIVE HYDROLOGIC IMPACT ASSESSMENT (CHIA) OF APPLICATION FOR PERMIT NO. 456

A. Cumulative Impact Area (CIA) Evaluation

For purposes of a Cumulative Hydrologic Impact Assessment (CHIA), the Cumulative Impact Area (CIA) is defined as follows:

> The area, including the permit area, within which impacts resulting from the proposed operation may interact with the impacts of all anticipated mining on surface and groundwater systems. Anticipated mining shall include, at a minimum, the entire projected lives through bond release of:
>
> the proposed operation;
>
> all existing operations;
>
> any operation for which a permit application has been submitted to the Department.

This is based upon baseline geologic and hydrologic information. See 62 Ill. Adm. Code Sections 1701.Appendix A and 1784.14.

1. Office of Surface Mining Guidance

The Federal Office of Surface Mining Mid-Continent Region (OSM-MCR) developed a document in June 2007 entitled *Hydrologic Considerations for Permitting and Liability Release, a Technical Reference for the Mid-Continent Region*. In determining whether a CHIA is required, OSM-MCR states that "the operative word in the CHIA concept is *cumulative* which seemingly necessitates the potential interaction of two or more anticipated mining operations." (p. 17) Further OSM-MCR states, "While it may be possible that for a single hydrologically isolated mine the probable hydrologic consequences determination made by the operator would be adopted by the regulatory authority as the CHIA, nevertheless such a conclusion must be reached by the regulatory authority on a case-by-case basis." (p.17)

2. CIA Determination for Application for Permit No. 456

Please see the CHIA for Significant Revision No. 2 to Permit No. 375 for baseline information regarding the original permit and shadow areas and for the Department's determination of the CIA for Permit No. 375. The proposed 12.5 – mile pipeline encompasses a total of 70.51 acres that will terminate at a mixing zone in the Big Muddy River. The proposed pipeline route will cross the

following HUC-12 watersheds, West Frankfort - Pond Creek, Lake Creek, Chittyville - Pond Creek, and Cambon Lake - Big Muddy River. Although the pipeline crosses these four watersheds the assessment area was only expanded to the permit boundaries of the proposed Application for Permit No. 456 area.

According to the Water Management Operations section in the application, the infiltrating groundwater is from an overlying sandstone which has naturally elevated concentrations of chlorides and sulfates. Part III of the application states, chloride concentration generally varies between 1,699 mg/L and 2,799 mg/L, whereas the sulfate values range between 820 mg/L and 2,120 mg/L. As mentioned previously, this water cannot be discharged through the existing sediment ponds on site without exceeding the NPDES permit limits. Therefore, the mine is seeking to discharge this water into the Big Muddy River via a pipeline and a mixing zone (pending IEPA approval).

According to the application and the draft NPDES permit, the volume of mine effluent that can be discharged to the Big Muddy River will be dependent on the flow of the Big Muddy River, chloride concentration of the Big Muddy River, and chloride concentration of the mine discharge water. The maximum pumping rate from the facility has been limited to 5,000 gallons per minute. The application states, the proposed pipeline will be an 18-inch high-density polyethylene (HDPE) pipe that will be buried and capable of handling 125 psi of pressure. The pipeline will be installed using both open trench and boring techniques. The applicant has committed to installing a secondary containment pipe outside of the transport pipe within the 100-foot stream buffer zone of Pond Creek. The applicant has additionally committed to minimize impacts to agricultural lands according to the Standards and Policies for Agricultural Mitigation.

The applicant states the pipeline will be monitored for leaks or potential problems using ultrasonic or similar technology flow meters. These flow meters will be clamped to the pipe and hooked into a telemetry or fiber optic network that can relay real-time information back to the mine. This system will also be tied to an alarm system that activates if a specific difference in flow rate is exceeded. The system will utilize pressure gauges and air release valves to release any potentially trapped air in the pipeline. In the event excessive pressure is measured, the pumps will be shut off, according to the application. The applicant has additionally committed to monthly inspections of the pipeline at road boring sites, the Pond Creek boring site, the Big Muddy River discharge site, and the monitoring stations housing the flow meters, air valves, and pressure gauges.

As mentioned previously, the proposed pipeline route will cross four watersheds. In determining a CIA area, the Department first evaluated the area encompassed by these four watersheds. However, given the construction parameters of the pipeline, the monitoring constraints, and the applicant's commitment to monthly inspections and/or maintenance, the Department does not expect there to be any negative impacts to the hydrologic balance from the proposed operations. The construction activities as proposed in the application will only temporarily affect the area encompassed by the proposed permit. The Department does not expect the surface water and groundwater will be negatively impacted by the temporary construction activities proposed for the installation of the pipeline. As such, the Department is expanding the CIA for the Application for

Permit No. 456 by 70.51 acres, which is the acreage of the proposed pipeline. The Department has determined that as long as the applicant properly operates the pipeline per the commitments given in the application, there should be minimal to no impact to the surface water or groundwater within the CIA area. Further, the Department expects no impacts outside the CIA area.

The CIA acreage has also been expanded to encompass surface IBRs previously not included in the assessment area. These surface IBRs include additional area for vertical turbine pumps, pipelines, boreholes, man/material shafts, and ventilation shafts. The original surface water and groundwater assessment areas were within the Town of West Frankfort – Pond Creek HUC-12 watershed. The additional surface IBRs spread the facility into the following watersheds: Tilley Creek – Ewing Creek, Prairie Creek – Middle Fork Saline River, Gassaway Branch – Middle Fork Saline River, Brushy Creek, and Buckley Creek – Crab Orchard Creek. The Department evaluated the above listed watersheds to account for the mine expansion and to possibly extend the assessment area. However, the Department determined that expanding the assessment area beyond the permit areas in the watersheds would make the CIA too large for the relatively minor facilities approved by the aforementioned IBRs. These IBRs were approved for facilities and the Department assumes they will not fail. Thus, the CIA has been expanded to only include the additional permitted acreage.

The new CIA acreage is 4,245 acres and depicted on Map 1. This includes the original Permit No. 375 area, Permit No. 417 area, all the surface IBRs previously not included, and the proposed Application for Permit No. 456 area.

B. Assessment of the Probable Hydrologic Consequences (PHC)

1. Permit Area and the Shadow Area

Previously, the Department conducted the required hydrologic assessment on the original Permit No. 375 permit area, shadow area, and their respective adjacent areas, as well as Significant Revision No. 11 to Permit No. 375, which added additional shadow area. Application for Permit No. 456 does not propose any additional shadow area, therefore, the Department is not revising the assessment at this time.

Per 62 Ill. Adm. Code Section 1701.Appendix A, the following terms are defined:

The "permit area" is defined as:

> [T]he area of land and water within the boundaries of the permit which are designated on the permit application maps, as approved by the Department. This area shall include all areas which are or will be affected by the surface coal mining and reclamation operations during the term of the permit indicated on the approved map which the operator submitted with the operator's application and which is required to be bonded under 62 Ill. Adm. Code 1800 and where the operator proposes to conduct surface coal mining and reclamation operations under the permit, including all disturbed areas; provided, that areas adequately

> bonded under another valid permit may be excluded from a permit area. The permit area excludes the area defined in this Part as the shadow area.

The "shadow area" is defined as:

> [A]ny area beyond the limits of the permit area in which underground mine workings are located. This area includes all resources above and below the coal that are protected by the State Act that may be adversely impacted by underground mining operations including impacts of subsidence.

The "adjacent area" is defined as:

> [T]he area located outside the permit area, or shadow area, where a resource or resources, determined according to the context in which adjacent area is used, are or reasonably could be expected to be adversely impacted by proposed mining operations.

As described in Section I.B.8 above, the proposed permit area for the Application for Permit No. 456 consists of 70.51 acres. The permittee provided information obtained from the Illinois State Geological Survey on domestic groundwater wells within ½ mile of the proposed permit area. As mentioned previously in Section II.A.2, the CIA was also expanded to encompass the acreage approved by the surface IBRs previously not included in the assessment area. Given the minimal disturbance expected from the proposed operations and the facilities approved by the aforementioned IBRs, for the purposes of this CHIA, the Department has determined there is no adjacent area as no impacts are expected outside of the proposed permit area or the IBR areas being added to the assessment area.

a. Regional Hydrologic Area

The existing permit and shadow areas, as well as the proposed permit area are located in the glaciated upland area of northern Williamson County. It is situated at the headwaters of the major drainage systems of the region. Unnamed tributaries of Pond Creek, named and unnamed tributaries of Middle Fork Saline River, as well as unnamed tributaries of the Big Muddy River pass near and through the existing and proposed permit and the existing shadow area.

b. Permit Area Surface Waters Assessment Area

The Permit Area Surface Water Assessment Area was evaluated in the CHIA for Permit No. 375 Revision No. 10 and Permit No. 417 but has been revisited by the Department for Application for Permit No. 456. The Permit Area Surface Water Assessment Area has been defined as the approximately 4,245 acres which includes the existing Permit No. 375 area, Permit No. 417 area, the surface IBR areas previously not included in the assessment area, and the Application for Permit No. 456 area (Map 1). An explanation of the delineation of the original surface water assessment area in the Pond Creek Watershed can be found in the CHIA for Permit No. 417 and Revision No. 10 to Permit No. 375. As mentioned in Section II.A.2, the Department extended the

assessment area to include the permit areas encompassed by the surface IBRs east of Permit No. 417 and the Application for Permit No. 456 area. Since all these areas are for facilities related to the mining operation (pipeline, borehole, shafts, etc.), the Department is assuming these operations will not fail and will not negatively impact the hydrologic balance.

c. Permit Area Groundwater Assessment Area

Based upon the assumption that shallow groundwater mimics the topography in the area, the Permit Area Groundwater Assessment Area is the same as has been described in II.B.1.b above and as depicted in Map 1.

d. Shadow Area Surface Waters Assessment Area

The Shadow Area Surface Waters Assessment Areas were evaluated in the CHIAs for Significant Revision Nos. 9 and 11 to Permit No. 375. The Shadow Area Surface Waters Assessment Area, associated with Significant Revision No. 11 to Permit No. 375, is approximately 17,625 acres. The Shadow Area Surface Waters Assessment Area associated with Significant Revision No. 9 to Permit No. 375 is approximately 22,441 acres. This application does not propose to modify any of the previously approved shadow area permits. Please refer to the CHIAs for Significant Revision Nos. 9 and 11 to Permit No. 375 for discussion of the Shadow Area Surface Waters Assessment Areas.

e. Shadow Area Groundwater Assessment Area

The Shadow Area Groundwater Assessment Areas are the same as the Shadow Area Surface Water Assessment Areas. The Shadow Area Groundwater Assessment Areas were evaluated in the CHIA's for Significant Revision Nos. 9 and 11 to Permit No. 375. The Shadow Area Groundwater Assessment Area, associated with Significant Revision No. 11 to Permit No. 375, is approximately 17,625 acres. The Shadow Area Groundwater Assessment Area associated with Significant Revision No. 9 to Permit No. 375 is approximately 22,441 acres. This application does not propose to modify any of the previously approved shadow area permits. Therefore, they will no longer be discussed in this CHIA. Please refer to the CHIAs for Significant Revision Nos. 9 and 11 to Permit No. 375 for discussion of the Shadow Area Groundwater Assessment Areas.

2. Geologic Information Required by 62 Ill. Adm. Code 1784.22

a. Baseline Information

Application for Permit No. 456 provides similar information on the regional bedrock geology of the area as the original Permit Application for Permit No. 375 did. The geology of the area consists of typical Pennsylvanian system formations, where approximately sixty percent of the Pennsylvanian strata is classified as sandstones and the remaining forty percent is classified as siltstones and shales. Of this forty percent, coal and/or limestones make up approximately one

percent of this material. The Cottage Grove Fault System is located in the region but is not within the existing or proposed permit areas.

Unconsolidated deposits within the proposed permit area are Pleistocene in age and range from 4 to 33 feet thick. These deposits consist mainly of clay, silt and till materials, but known, limited areas of sand can be found. Surface topography in the proposed permit area is relatively flat-lying, with the southern portion of the area topographically higher than the northern portion of the area.

Site-specific geology, was provided in the boring and corehole logs submitted with the original permit application, as well as the Applications for Permit No. 417 and Significant Revision No. 10 to Permit No. 375. The Herrin No. 6 Coal seam is overlain by alternating layers of shale and limestone.

As stated in the Application for Permit No. 456, the infiltrating groundwater is from a saline zone within the Anvil Rock or Gimlet Sandstone units. The interburden between the Herrin No. 6 coal seam and the base of the Anvil Rock varies between 10 feet and 60 feet. The applicant believes the sandstone units are mostly discontinuous and the caved zone above the mined longwall panels extends into these sandstone units which leads to the water infiltrating into the mine.

b. Geologic Information Findings

The applicant presented no acid base accounting data with this application since the applicant is not proposing any changes in the coal refuse management. The applicant has committed to constructing the pipeline using the best management construction techniques that follow the provisions of Standards and Policies for Agricultural Mitigation.

The applicant also presented information on the sandstone units overlying the Herrin No. 6 coal seam that is the source of the infiltrating groundwater. To protect the miners underground, the operator must pump this water out of the mine. Since the water is naturally high in chlorides and sulfates the applicant is requesting a mixing zone from the IEPA. Otherwise, this water could not be discharged from the existing NPDES outfalls on site without exceeding compliance limits. The Department finds as long as the pipeline is properly constructed, maintained, operated, and the limits of the NPDES permit are adhered to, any impacts to the hydrologic balance should be minimized.

3. Hydrologic Information Required by 62 Illinois Adm. Code 1784.14

a. Baseline Information

i. Surface Water Quantity Baseline Information

No baseline surface water quantity information from stream monitoring points in the vicinity of the proposed permit area was presented in this application. The applicant did provide data for the existing stream monitoring points in the vicinity of the main surface facilities. Surface water

quantity information was previously discussed in the CHIAs for the original permit application and Permit No. 417. The applicant is expecting minimal impacts to the surface water quantity in the vicinity of the proposed permit area during the construction of the pipeline and little to no impacts when the pipeline is operational. According to Attachment IV.1 of the application, the applicant will monitor the pipeline for leaks using a network of flow meters. Additionally, the plan has provisions to double wall the pipeline within the Pond Creek stream buffer zone. Attachment IV.1 of the application also states the mine can discharge as much as 5,000 gallons per minute into the Big Muddy River via a diffuser system based on the flow of the river and other conditions specified in the NPDES permit.

ii. Surface Water Quality Baseline Information

No baseline surface water quality information from stream monitoring points in the vicinity of the proposed permit area was presented with this application. The applicant did provide data for the existing stream monitoring points in the vicinity of the main surface facilities. The applicant is expecting minimal impacts to the surface water quality in the vicinity of the proposed permit area during the construction of the pipeline and little to no impacts when the pipeline is operational given the provisions discussed in the previous section.

The applicant did provide the water quality expected out of the water holding cell prior to entering the pipeline. Table III.2.D.1.a in the application displays representative data obtained from the water holding cell which could contain a mixture of mine infiltration water, process water from the preparation plant, and decant water from the slurry cells. The chloride concentration varied between 1,699 mg/L and 2,799 mg/L, whereas the sulfate concentration varied between 820 mg/L and 2,120 mg/L. According to Attachment IV.1 of the application, the water that will be discharged will be process water and mine infiltration water. The document goes on to say an Anti-Degradation document was submitted to IEPA on November 18, 2016 and the clarified decant water from the slurry cell was considered in the analysis. Surface water quality for the main surface facilities was previously discussed in the CHIAs for the original permit application and Permit No. 417 and will not be changed due to this application.

iii. Groundwater Quantity Baseline Information

The applicant installed no groundwater monitoring wells for this permit application. The applicant felt the minimal disturbance from the construction activities should not affect the shallow groundwater quantity in the vicinity of the proposed permit area. The applicant surveyed the Illinois State Geological Survey (ISGS) public water well records to identify users who may be utilizing the groundwater. In Attachment III.2.B.1 and the Hydrologic Maps of the Application for Permit No. 456, the applicant identified eight private water wells and their respective users within ½ mile of the proposed permit boundary. One of the wells is noted to be plugged according to the information the applicant obtained from the ISGS records. The applicant did not conduct a door – to – door survey given the minimally invasive construction methods and protections that will be employed to install the pipeline. As such, the applicant does not expect any listed well owner to experience groundwater quantity issues as a result of this operation.

In Attachment IV.1 of the application, the applicant states the daily quantity of mine infiltration water required to be pumped out amounts to 2,700,000 gallons per day. The applicant anticipates the maximum flow of mine infiltration water to be 3,500,000 gallons per day. The application notes the applicant is not aware of any groundwater users using the water from the Anvil Rock or Gimlet Sandstone units. Most private groundwater well users are utilizing the shallow groundwater from the unconsolidated layer. The applicant noted one user who has a well drilled down to these sandstones, however it appears it was drilled deep for additional storage capacity in the well according to the application.

iv. Groundwater Quality Baseline Information

As mentioned in the previous section, the applicant notes the construction methods to install the pipeline should be minimally invasive. As such, the applicant does not believe the shallow groundwater quality will be affected by the proposed operations. The application states the infiltrating groundwater has elevated chloride and sulfate levels that would not otherwise be allowed to discharge through the outfalls currently approved in the NPDES permit. Table III.2.D.1.a in the application displays representative data obtained from the water holding cell which could contain a mixture of mine infiltration water, process water from the preparation plant, and decant water from the slurry cells according to Attachment IV.1 of the application. The chloride concentration varied between 1,699 mg/L and 2,799 mg/L, whereas the sulfate concentration varied between 820 mg/L and 2,120 mg/L according to the application.

The applicant is assuming the primary driver for the elevated chloride and sulfate concentration is the infiltrating groundwater. Since this water has naturally elevated chlorides and sulfates, the applicant notes there are no known private users of this groundwater. As mentioned in the previous section, the applicant notes one user who has a well that is drilled into this interval, but the applicant asserts this was done for additional storage capacity in the well rather than utilization of the unit for water.

b. Findings

i. Surface Water Quantity Findings

Previous surface water assessments can be found in the CHIAs for Permit Nos. 375 and 417. The applicant presented information in the application to indicate the construction of this pipeline will be minimally invasive. Additionally, the applicant has committed to provisions in the pipeline construction and operation to prevent leaks and ensure reliable operation. Therefore, the Department finds the construction of this pipeline will cause little to no impact to the surface water quantity in the vicinity of the proposed permit area. This conclusion also applies to the previously approved surface IBRs now being included in the assessment area.

The application states up to 5,000 gallons per minute can be discharged into the Big Muddy River depending on the flow of the river and other conditions specified in the draft NPDES

permit for this mine. The mixing zone is currently pending approval by IEPA, however the draft NPDES permit suggests their analysis found the additional volume of water would not negatively affect the Big Muddy River. Therefore, the Department will not comment any further on the volume of water going to the Big Muddy River.

Shadow Area

Application for Permit No. 456 will have no impact on the surface water quantity that may be present within the existing shadow areas.

ii. Surface Water Quality Findings

Given the relatively non-invasive construction, maintenance commitment, and operational provisions of the pipeline to prevent leaks, the Department finds the surface water quality will be minimally affected or not affected at all by the proposed operations. This conclusion also applies to the previously approved surface IBRs now being included in the assessment area.

Table III.2.D.1.a in the application gave representative water quality data for the holding cell and showed elevated chloride and sulfate values. Attachment IV.1 of the application stated the water holding cell could contain a mixture of mine infiltration water, process water from the preparation plant, and decant water from the slurry cells. The applicant also stated this was considered in the Anti-Degradation Analysis conducted by IEPA for the mixing zone into the Big Muddy River. According to the draft NPDES permit, the IEPA determined the mixing zone will not negatively affect the Big Muddy River, as such, the Department will not comment further on their analysis. Therefore, the Department finds as long as the applicant follows and meets the provisions laid out in the NPDES permit, the surface water quality should not be negatively affected.

Shadow Area

Application for Permit No. 456 will have no impact on the surface water quality that may be present within the existing shadow areas.

iii. Groundwater Quantity Findings

It is not anticipated the shallow groundwater quantity will be significantly impacted by the proposed operations. Attachment III.2.B.1 and the Hydrologic Maps of the Application for Permit No. 456 identified eight private water wells and their respective users within ½ mile of the proposed permit boundary. One of the wells is noted to be plugged according to the information the applicant obtained from the ISGS records. The Department does not expect the groundwater quantity of the private well users to be impacted by the proposed operations. Given the relatively non-invasive construction, maintenance commitment, and operational provisions of the pipeline to prevent leaks, the Department finds the groundwater quantity will be minimally affected or not affected at all by the proposed operations. This conclusion also applies to the previously approved surface IBRs now being included in the assessment area.

As stated in previous CHIAs for this mine, the groundwater infiltrating in the mine works originates in sandstone aquifers that are currently (and historically) not in use by local residents for two reasons. The first is the cemented nature of the sandstone creates low aquifer yield and the second is the documented poor quality of this water. Local residents tend to obtain their drinking water from surface sources due to the highly mineralized water that is present in this sandstone unit.

Therefore, the effect of the pumping of this groundwater that infiltrates the mine workings is not anticipated to have a negative impact on any current drinking, domestic, or usable aquifer quantity.

Shadow Area

Application for Permit No. 456 will have no impact on the groundwater quantity that may be present within the existing shadow areas.

iv. Groundwater Quality Findings

Similar to the Groundwater Quantity Findings, it is not anticipated the shallow groundwater quality will be significantly impacted by the proposed operations. Attachment III.2.B.1 and the Hydrologic Maps of the Application for Permit No. 456 identified eight private water wells and their respective users within ½ mile of the proposed permit boundary. One of the wells is noted to be plugged according to the information the applicant obtained from the ISGS records. The Department does not expect the groundwater quality of the private wells users to be impacted by the proposed operations. Given the relatively non-invasive construction, maintenance commitment, and operational provisions of the pipeline to prevent leaks, the Department finds the groundwater quality will be minimally affected or not affected at all by the proposed operations. This conclusion also applies to the previously approved surface IBRs now being included in the assessment area.

As mentioned in the previous section, the groundwater infiltrating in the mine works originates in sandstone aquifers that are currently (and historically) not in use by local residents due to low aquifer yield and poor quality. Local residents tend to obtain their drinking water from surface sources due to the highly mineralized water that is present in this sandstone unit. Therefore, the effect of the pumping of this groundwater that infiltrates the mine workings is not anticipated to have a negative impact on any current drinking, domestic, or usable aquifer quality.

Shadow Area

Application for Permit No. 456 will have no impact on the groundwater quality that may be present within the existing shadow areas.

III. CONCLUSION

The surface water and groundwater monitoring programs have been designed to provide sufficient lead time for notification of any potential impacts, as well as to provide ample time for investigation and mitigation of any impacts prior to reaching off-site. Both the groundwater and surface water monitoring programs are dynamic and as such, the Department reserves the right to add monitoring parameters or monitoring locations should the need arise. The applicant/permittee is required to monitor the surface water and groundwater throughout the life of the mine, up to and including the time of final bond release.

The Department has now conducted a hydrogeologic assessment on the proposed additional acreage described in the Application for Permit No. 456 and the previously approved surface IBRs now being included in the assessment area. As noted in the discussions throughout this document, the Department has concluded that the additional proposed surface facilities permit area will not have a negative impact on either the surface water or groundwater regimes.

Neither the surface water nor groundwater within the assessment areas will be materially damaged unless the quantity and/or quality of water is degraded on a long-term or permanent basis, beyond the applicable standards or a long-term or permanent loss of use is reported. Material damage occurs when the impact is immitigable. Neither the applicant/permittee, nor the Department anticipates that this will occur.

Therefore, the cumulative hydrologic impact assessment finds that the proposed operations have been designed to prevent material damage to the hydrologic balance beyond the permitted areas.

In summary, the assessment and findings of the probable cumulative impact of all anticipated mining in the area on the hydrologic balance finds that this operation has been designed to prevent material damage to the hydrologic balance outside the permit areas.

APPENDIX D

DECISION ON PROPOSED POST-MINING LAND USE OF PERMIT AREA

The pre-mining and post-mining land use acreage of the permitted area is as follows*:

	Pre-mining	Post-mining
Cropland	16.4	16.4
Water Resources	0.2	0.2
Residential	0.1	0.1
Industrial/Commercial	8.2	8.2
Fish & Wildlife Habitat**	45.8	45.8
Total	70.7	70.7

*The Department notes that other agencies with environmental and land use authority may use land use definitions other than 62 Ill. Adm. Code 1701.5. Reports for those agencies which may be included in the application will classify and tabulate land uses based on their definitions. As a result, those land use tabulations may not directly correlate with the above tables.

** To facilitate the assessment of the revegetation success performance standards, the post-mining land use of Fish and Wildlife Habitat is broken out as follows:

Wildlife-Herbaceous	Wildlife-Woody	Wildlife-Wetland	Wildlife-Water
20.7	21.1	3.6	0.4

The Department thus finds the areas affected by surface coal mining operations will be restored in a timely manner to conditions that are capable of supporting the use which they were capable of supporting before mining or to higher or better use achievable under the criteria and procedures of 62 Ill. Adm. Code 1817.133, or as noted above. The plan of restoration submitted by the applicant does not present any actual or probable hazard to public health or safety nor does it pose any actual threat of water diminution or pollution as indicated in Appendix C, and the proposed land uses following mining are not impractical or unreasonable as all the post-mining land uses existed prior to mining and are compatible with the surrounding areas. The land uses are consistent with applicable land use policy and plans known to the Department and no objections were received from any governmental agency with such authority. The plan does not involve unreasonable delay

in implementation and is not in violation of any other applicable law known to the Department. Federal court decisions, commonly known and the "Flannery decisions" and current regulations provide for the distinct difference between surface and underground mining. In this permit the operations will involve the trenching and burying of a pipeline through the permit area. Reclamation by soil replacement and revegetation will occur shortly afterward as part of the operation with the exception of any surface access areas. There are no land use or land capability changes requested by the permitee. These disturbances are considered minor in comparison to surface mining and the removal of overburen and coal.

CONSENT ASSESSMENT OF CIVIL PENALTY

This Consent Assessment of Civil Penalty ("CACP") is entered into this 23 day of August 2017, by and between the Commonwealth of Pennsylvania, Department of Environmental Protection ("Department") and Canterbury Coal Company ("Canterbury Coal").

The Department has found and determined the following:

A. The Department is the agency with authority to administer and enforce [The Clean Streams Law, Act of June 22, 1937, P.L. 1987, *as amended*, 35 P.S. §§ 691.1--691.1001]; [the Surface Mining Conservation and Reclamation Act, Act of May 31, 1945, P.L. 1198, *as amended*, 52 P.S. §§ 1396.1--1396.19a ("Surface Mining Act")]; [the Coal Refuse Disposal Control Act, Act of September 24, 1968, P.L. 1040, *as amended*, 52 P.S. §§ 30.51--30.66 ("Coal Refuse Act")]; [the Noncoal Surface Mining Conservation and Reclamation Act, Act of December 19, 1984, P.L. 1093, *as amended*, 52 P.S. §§ 3301 -- 3326 ("Noncoal Act")]; [the Bituminous Mine Subsidence and Land Conservation Act, Act of April 27, 1966, P.L. 31, *as amended*, 52 P.S. §§ 1406.1--1406.21 ("Bituminous Subsidence Act)]; Section 1917-A of the Administrative Code of 1929, Act of April 9, 1929, P.L. 177, *as amended*, 71 P.S. § 510-17, and the rules and regulations promulgated thereunder.

AUG 24 2017

Received Electronically
Dept. of Natural Resources
October 21, 2019
Office of Mines and Minerals
Land Reclamation Division

H. On May 5, 2017 as evidenced by Sample No. 4137-091, Canterbury Coal caused or allowed a discharge of water at the David/Dianne Mine, from outfall 001, with an aluminum concentration of 1.524 mg/L which exceeds the permit limit of 0.75 mg/L.

I. Canterbury Coal's conduct set forth above constitutes a violation of Sections 301, 307, 315, and 611 of the Clean Streams Law, 35 P.S. §§ 691.301, 691.307, 691.315, 691.611 and Section 86.13 of the Rules and Regulations, 25 Pa. Code § 86.13.

J. The violations described in Paragraph(s) F through I above constitute unlawful conduct under Section 611 of the Clean Streams Law, 35 P.S. § 691.611 and Section 17a of the Bituminous Subsidence Act, 52 P.S. § 1406.17a and subject Canterbury Coal to a claim for civil penalty liability under Section 605 of the Clean Streams Law, 35 P.S. § 691.605 and Section 17 of the Bituminous Subsidence Act, 52 P.S. § 1406.17.

After full and complete negotiation of all matters set forth in this CACP and upon mutual exchange of the covenants herein, the parties desiring to avoid litigation and intending to be legally bound, it is hereby ASSESSED by the Department and AGREED to by Canterbury Coal as follows:

1. Assessment. In resolution of the Department's claim for civil penalties, which the Department is authorized to pursue under Section 605 of the Clean Streams Law, 35 P.S. § 691.605, and Section 17f of the Mine Subsidence Act, 52 P.S. § 1406.17(f). The Department hereby assesses a civil penalty of TWO THOUSAND FIVE HUNDRED SEVENTY-TWO DOLLARS ($2,572), which Canterbury Coal hereby agrees to pay.

2. Civil Penalty Settlement. Canterbury Coal consents to the assessment of the civil penalty assessed in Paragraph 1, which shall be paid in full upon signing this CACP. This payment is in settlement of the Department's claim for civil penalties for the violations set forth in the paragraphs above for the date[s] set forth therein. The payment shall be by corporate check or the like, made payable to the Commonwealth of Pennsylvania and sent to Compliance Specialist, PA DEP - New Stanton District Office, 131 Broadview Road, New Stanton, PA 15672.

3. Findings.

a. Canterbury Coal agrees that the findings in Paragraphs A through J are true and correct and, in any matter or proceeding involving Canterbury Coal and the Department, Canterbury Coal shall not challenge the accuracy or validity of these findings.

b. The parties do not authorize any other persons to use the findings in this CACP in any matter or proceeding.

4. Reservation of Rights. The Department reserves all other rights with respect to any matter addressed by this CACP, including the right to require abatement of any conditions resulting from the events described in the Findings. Canterbury Coal reserves the right to challenge any action which the Department may take, but waives the right to challenge the content or validity of this CACP.

IN WITNESS WHEREOF, the parties have caused this CACP to be executed by their duly authorized representatives. The undersigned representatives of Canterbury Coal certify, under penalty of law, as provided by 18 Pa. C. S. § 4904, that they are authorized to execute this CACP on behalf of Canterbury Coal, that Canterbury Coal consents to the entry of this CACP as

Re: Notice of Non-Issuance of Compliance Commitment Agreement
Violation Notice: W-2019-50002
Sugar Camp Energy
W0558010004

Dear Mr. Schuerger:

The Illinois Environmental Protection Agency ("Illinois EPA") has reviewed the proposed Compliance Commitment Agreement ("CCA") terms submitted by **Sugar Camp Energy** in a letter dated **June 26, 2019**, in response to the Violation Notice dated **March 25, 2019**, and has decided not to issue a proposed CCA for these violations. Due to the nature and seriousness of the violations, the Illinois EPA has determined that these violations may not be able to be resolved without the involvement of the Office of the Attorney General or the State's Attorney.

Because the violations remain the subject of disagreement between the Illinois EPA and **Sugar Camp Energy**, this matter will be considered for referral to the above-referenced prosecutorial authorities for formal enforcement action and the imposition of penalties.

Questions regarding this matter should be directed to Greg Spencer at 217/782-9871. Written communications should be directed to:

Illinois EPA – Division of Water Pollution Control

RE: The Marshall County Coal Company
6 South 1 Airshaft
U200707 NOV 6

Mr. Harvey,

This letter is in response to the remedial measures stated in NOV 6 for The Marshall County Coal Company's 6 South #1 Airshaft, WVDEP Permit U200707.

As you are aware, the completion of the site has taken longer than planned. This is largely due to the amount of unsuitable material encountered during construction. Another significant factor has been the performance of the on-site contractor. This contractor has since been removed from the project and a replacement contractor has resumed construction. The new contractor has since installed five additional culverts and removed the Trans Canada gas line that was intersecting the access road.

Currently the development of the drainage control system continues. Much of the pad and access road is at final grade and a number of culverts have been installed. Enclosed is a status report of the drainage components proposed in the design. At this time The Marshall County Coal Company requests a thirty day extension of the October 4th abatement date in order to complete the installation of the remaining ditches and culverts.

Regards,

Joe Williams

NOV Follow-up. The permittee has provided a letter detailing the amount of soil removed from the 5N #3 site. It is estimated 20 cubic yards of topsoil and 485 cubic yards of subsoil were removed and taken to the ball field. They also provided plant nutrient testing results of the soil. A potential site has been identified to find replacement soil. The NOV will be extended to complete the required work.

Dear The Muhlenberg County Coal Co LLC:

The Kentucky Department for Environmental Protection (DEP) has issued the enclosed Notice of Violation for violations discovered at your facility for the 2018 monitoring period attached (see 2nd page). Please review the Notice of Violation carefully to ensure that all remedial measures are completed by the specified deadlines.

Your cooperation and attention to this matter is appreciated. If you have any questions, please contact me at 502-782-6852 or linda.metts@ky.gov.

NOTICE OF VIOLATION

To: The Muhlenberg County Coal Co LLC
46226 National Rd
Saint Clairsville, OH 43950

AI Name: The Muhlenberg County Coal Co LLC **AI ID:** 124971 **Activity ID:** ENV20190001
County: Muhlenberg
KPDES Permit: KYGW40062
DNR Permit: 889-5020, 889-7012, 889-9007
Date(s) Violation(s) Observed: 06/12/2019

This is to advise that you are in violation of the provisions cited below:

1 Violation Description for Subject Item AIOO0000124971():
No person shall, directly or indirectly, throw, drain, run or otherwise discharge into any of the waters of the Commonwealth, or cause, permit or suffer to be thrown, drained, run or otherwise discharged into such waters any pollutant, or any substance that shall cause or contribute to the pollution of the waters of the Commonwealth in contravention of the standards adopted by the cabinet or in contravention of any of the rules, regulations, permits, or orders of the cabinet or in contravention of any of the provisions of this chapter. [KRS 224.70-110]

Description of Non Compliance:
Failing to comply with 401 KAR 5:065, Section 2(1), which cites to 40 CFR 122.41(a), by failing to comply with the KPDES permit limits for **Total Recoverable Iron (TRFe)**, for permit KYGW40062. The permitted limits for TRFe are a monthly average of 3.0 mg/l and a daily maximum of 4.0 mg/l. The reported results are as follows:

Outfall 001: a monthly average of 5.509 mg/l and a daily maximum of 10.7 mg/l for December of 2018.

The remedial measure(s), and date(s) to be completed by are as follows:
The Muhlenberg Co Coal Co LLC shall comply with the terms and conditions of the current KPDES permit of the facility, KYGW40062. [KRS 224.70-110]

Violations of the above cited statute(s) and/or regulation(s) are subject to a civil penalty per day per violation. Violations carry civil penalties of up to $25,000 per day per violation depending on the statutes/regulations violated. In addition, violations may be concurrently enjoined. Compliance with remedial measures and their

RE: Murray Maple Eagle Coal, LLC
Permit Renewal
S-6020-89 NOV 63

Mr. Thomas,

This letter is in response to the remedial measures stated in NOV 63 for Murray Maple Eagle Coal, LLC's permit renewal on WVDEP Permit S-6020-89. At this time, Murray Maple Eagle Coal, LLC has submitted an application for permit renewal, and is currently working on replying to the corrections sent by the DEP.

Murray Maple Eagle Coal, LLC requests a 30 day extension of the abatement date in order to finish the corrections.

Regards,

Hodge Hunter
Environmental Engineer
Murray Maple Eagle Coal, LLC

I recommend approval up to 12-12-19.

11-12-19

INSPECTION COMMENTS

Marshall County Coal Company - 6S #1. Company has requested an additional 30-day extension of NOV 6 to allow completion of abatement requirements. Aerial overflight inspection on 10/24 showed significant progress on the road and ditches. An additional 30 days is being granted putting the new abatement date at 11/29/2019.

APPENDIX F

THREATENED AND ENDANGERED SPECIES
Endangered Species Act of 1973, 16 USC 1531, et seq.
62 Ill. Adm. Code 1773.15(c)(10)

The Department reviewed Permit Application No. 456 for potential effects of coal mining operations and reclamation activities on federally listed threatened and endangered species. The following factors were considered for all species that could potentially be adversely affected: status of species in the proposed permit area and adjacent area, site specific resource information, direct and indirect effects, and cumulative effects.

Five primary sources were utilized to identify federally listed threatened and endangered species that could potentially be affected by the proposed coal mining operations and reclamation activities. These sources include threatened and endangered species review information submitted by the applicant, public comments, the U.S. Fish and Wildlife Service (USFWS), the Illinois Department of Natural Resources/Division of Real Estate Services and Consultation/Office of Realty and Capital Planning (ORCP), and Department records.

Information Submitted by the Applicant

The threatened and endangered species review srubmitted by the applicant as a requirement of the Department's UCM-1 application addressed state listed species known to occur in Williamson County, Franklin County, and applicable adjacent areas using records obtained from the Illinois Natural Heritage Database. Records for fourteen state listed threatened or endangered species, the barn owl (*Tyto alba*), the bewick's wren (*Thryomanes bewickii*), the ornate box turtle (*Terrapene ornate*), the chuck-will's widow (*Caprimulgus carolinensis*), the least bittern (*Ixobrychus exilis*), the little blue heron (*Egretta caerulea*), the river cooter (*Pseudemys cancinna*), the river redhorse (*Moxostoma carinatum*), the yellow-crowned night heron (*Nyctanassa violacea*), climbing milkweed (*Matelea decipiens*), dull meadow beauty (*Rhexia mariana*), eryngo (*Eryngium prostratum*), false bugbane (*Cimicfuga racemose*), and green trillium (*Trillium viride*) were deemed by the applicant as possible to occur on the proposed project area. The applicant provided Site Specific Resource Information and Protection and Enhancement Plan for each of these species. None of these species are currently listed as federally threatened or endangered.

Information in the permit application indicates that 3.9 acres of known Indiana bat habitat will be impacted by the proposed mining activity. Presence of the Indiana bat was documented in a mist net survey conducted in 2017, thus a Protection and Enhancement Plan (PEP) was developed for the proposed permit area that lies within the 2.5-mile buffer of the documented maternity roost tree in accordance with the USFWS revised 2013 edition of the "2009 Range-wide Indiana Bat Protection and Enhancement Plan Guidelines" (Guidelines).

Information in the permit application indicates that probable absence of the northern long-eared bat cannot be assumed. The project will not impact known northern long-eared bat hibernacula or disturb known northern long-eared bat maternity roost trees or trees within a quarter mile of a known maternity roost tree. Therefore, the project is consistent with the northern long-eared bat Final 4(d) rule (Federal Register, January 2016) and subsequent "no critical habitat" determination (Federal Register, April 2016) issued by the USFWS. Although the project is consistent with the 4(d) rule, the applicant chose to include the northern long-eared bat in the PEP because the species will also benefit from the outlined protection and enhancement measures.

Public Comments

Public comments were recorded from the requested Public Hearing held on October 23, 2018 and written comments submitted to the Department relevant to this application. Comments supplied by the public were focused on the effects of allowable discharge into adjacent waterways, which is not an approvable action by the Department. The Illinois Environmental Protection Agency (IEPA) is the regulatory agency that determines the effluent concentrations that are allowed to be discharged into a water body through its NPDES permitting process. The potential impacts the receiving stream, adjacent waterways and water courses further downstream is an issue for the IEPA to address through that process. Effects and potential impacts resulting from another agency's permitting responsibility is beyond the purview of the Department. Comments received by the public are further addressed within Appendix B of this findings document.

U.S. Fish and Wildlife Service

The USFWS provided comments on this application in a letter dated September 4, 2018 and follow up comments and concurrence in a letter dated October 2, 2019. The USFWS identified three federally listed species for the proposed permit area, the endangered Indiana bat, the endangered piping plover, and the threatened northern long-eared bat. The USFWS concluded that there is "no designated critical habitat in the project area at this time."

The USFWS stated that "based on the location of the permit area, the Service concurs that the proposed project is not likely to adversely affect the piping plover."

Based on confirmed presence of the Indiana bat, as documented in a mist net survey conducted in 2017, an Indiana bat PEP was developed for the proposed permit area that lies within the 2.5-mile buffer of the documented maternity roost tree. This includes 3.9 acres of known Indiana bat habitat. The USFWS stated that "The PEP includes a number of protection and enhancement measures including avoidance of the majority of wooded habitat within the permit area, winter tree clearing from November 15 to March 31, tree girdling and bat box installation to provide temporary habitat, riparian buffer zone protection, and maintenance of watering areas. The applicant is not proposing to replant the forested habitat acres to be disturbed." Upon on permit modifications supplied by the applicant as required by the Department the USFWS stated that "that the Protection and Enhancement Plan (PEP) was updated to address long-term habitat replacement requirements for the Indiana bat." Based on this information the USFWS indicated that "the Service has determined

that the take of 3.9 acres of known habitat is not likely to jeopardize the continued existence of the Indiana bat."

The Department completed the USFWS's Information Planning and Consultation (IPaC) Determination Key: Northern Long-Eared Bat (NLEB) Consultation and 4(d) Rule Consistency, which was submitted to the Service via IPaC on July 31, 2019. The USFWS stated that "Based upon the IPaC submission, the action is consistent with activities analyzed in the Programmatic Biological Opinion on the Final 4(d) Rule for the northern long-eared bat and issuance of the verification letter concludes consultation for the northern long-eared bat. This information sufficiently addresses our comments regarding the northern long-eared bat."

Illinois Office of Realty and Capital Planning

Pursuant 17 Ill. Adm. Code Section 1075 the Department consulted with ORCP (previously the Office of Realty and Environmental Planning) via the online EcoCAT (Ecological Compliance Assessment Tool) system regarding state listed species within the permit boundary and adjacent area. The initial consultation was conducted on December 5, 2018, and a termination letter was provided on December 17, 2018, which concluded that adverse effects to the protected resources identified are unlikely. Taking into account the consultation termination issued by ORCP, the Department concurs that the operations as approved are unlikely to adversely affect any species protected under the Illinois Endangered Species Protection Act (520 ILCS 10/1 *et seq.*).

Department Records and Determination

The Department utilized the Illinois Department of Natural Resources DIRT (Detailed Impact Review Tool) mapping system to review whether or not the project lies within the buffer zone of documented occurrences of any state or federally listed threatened or endangered species.

The applicant submitted the required information to the Department regarding the Indiana bat and the northern long-eared bat including summer survey data documenting the presence of the Indiana bat, suitable habitat determination, and an Indiana bat PEP. The Department has determined that the applicant correctly and diligently followed the protocol specified in the Guidelines (USFWS, 2013); by following these guidelines the applicant is in compliance with the USFWS and Office of Surface Mining Reclamation and Enforcement (OSMRE) 1996 Biological Opinion on the implementation of the Surface Mining Control and Reclamation Act of 1977 (PL 98-87) with regard to assuring compliance with the Endangered Species Act. The Department determined that a PEP was necessary for the known Indiana bat habitat within the proposed permit area that lies within the 2.5-mile buffer of the documented maternity roost tree. The applicant documented presence of the Indiana bat and followed the Guidelines (USFWS, 2013) to develop the PEP. The Department utilized the key to the northern long-eared bat 4(d) rule for federal actions to conclude that proposed actions are not prohibited, therefore a PEP for this species was not required, however the applicant chose to include the northern long-eared bat in the PEP.

The Department considered site specific resource information, information provided by the applicant, concurrence by the USFWS that adverse effects to federally listed species are not likely, termination of the ORCP Section 1075 consultation, and Department records. The Department has determined the proposed mining operations and reclamation activities will not affect the continued existence of threatened or endangered species or result in destruction or adverse modification of their critical habitats, as determined under the Endangered Species Act of 1973 (16 USC 1531 *et seq.*).

Status of Potentially Adversely Affected Species

Indiana bat

The Guidelines (USFWS, 2013) specify the necessity to consider whether known or suitable winter habitat (hibernacula) and/or suitable summer habitat (maternity roosting/feeding) and/or swarming habitat (mating behavior/assessment of hibernacula suitability (Van Schaik, 2015)) of the endangered Indiana bat are located within the proposed permit area. Winter hibernation habitat for the species includes caves, abandoned underground mine workings, and railroad tunnels. Summer maternity roosting habitat includes trees or snags greater than or equal to 5 inches diameter at breast height (dbh) with exfoliating bark (USFWS, 2013) under which female bats, usually numbering less than 100 individuals, roost (Menzel, et al 2001). Suitable swarming habitat consists of forested areas with the described trees that are located within a 10 mile radius of any potential hibernacula (USFWS, 2013).

A major cause of the decline of the Indiana bat is associated with impediments to functioning hibernacula including blocked cave entrances, improper bat gate designs which may impede bat flight into caves or impede proper air flow through caves (USFWS, 1999 and Federal Register, 2007). Arousal following human disturbance to hibernating bats can lead to premature emergence from hibernacula, decreased body condition, and decreased survival (Menzel, et al 2001). Additional causes of decline in the species can be attributed to disturbances or removal of active maternity roost trees and loss of critical habitat. More recently, White Nose Syndrome (WNS) has been identified as having a negative effect on Indiana bat populations.

The range of the Indiana bat covers most of the eastern half of the United States with the majority of roosting colonies in Indiana, Kentucky, and Missouri (USFWS, 2014). For the Indiana bat, recent population data comparing 1997 estimates with historic levels indicate that the range wide population is less than half of historical levels. Indiana bats have declined significantly in some states including Kentucky and Missouri, but have increased in some states, most notably Indiana. Population estimates show an increase of about 30% in Illinois from historical levels to the present (Clawson 2002, Clawson 2004). In 2012 the Service reported an increase in Indiana bats in Illinois from 21,677 in 2001 to 55,956 in 2011.

Northern long-eared bat

Suitable winter habitat for this species includes caves and underground mines with high humidity, no air currents, and a constant temperature range (USFWS, 2015). The USFWS indicated in the *Federal Register* (April 2016) that a critical habitat designation is not necessary for this species, however Appendix H (USFWS, 2014) does define suitable summer roosting habitat as any forested area or isolated live tree or snag that is "≥ 3 inches dbh with exfoliating bark, cracks, crevices, and/or cavities". Suitable swarming habitat is typically within 5 miles of a known or potential hibernaculum and can include linear features such as fence rows, riparian buffers, or other travel corridors (USFWS, 2014).

The USFWS indicates that because the above described roosting habitat for the northern long-eared bat is not limited, habitat loss is not a significant threat to the species. The Final 4(d) Rule (Federal Register, January 2016) prevents "take" during sensitive life stages and prohibits incidental take where WNS occurs under these circumstances: if the take occurs within a hibernaculum, if the take occurs from tree removal within 0.25 miles of a known hibernaculum, or if the take occurs from the removal of a known/occupied maternity roost tree or tree within 150 foot radius of the maternity tree between June 1st and July 31st.

The range of the northern long-eared bat in the United States extends across 37 states in the eastern and north-central areas of the country, including Illinois (Federal Register, 2015 and USFWS, 2015). A contributing factor to the overall decline of the species is WNS, a fungal disease affecting hibernating bats with widespread mortality (USGS, 2015). First observed in New York in 2006, WNS has rapidly spread throughout the Northeast and Midwest; northern long-eared bat populations have been reduced by 99% in parts of its range (USFWS, 2015). The first documented observance of WNS in Illinois affecting a northern long-eared bat occurred in LaSalle County in 2013; WNS has since been documented in at least ten additional Illinois counties (IDNR, 2015). The Federal Register Final Rule (2015) listing the species as federally threatened indicates that "overall, summer surveys from Illinois have not documented a decline due to WNS to date".

Site Specific Resource Information

A survey was conducted to assess the presence or absence of the Indiana bat and northern long-eared bat within the proposed permit area. The survey was conducted by a qualified wildlife biologist from May 18, 2017 through May 25, 2017 with tracking persisting through July 1, 2017. The survey was conducted in accordance with the USFWS's 2107 Range-Wide Indiana Bat Summer Survey Guidelines (USFWS 2017). During this survey, one pregnant/female Indiana bat was captured and tracked to a roost north of the proposed permit area, thus identifying a 2.5-mile protective buffer around the documented maternity roost tree in accordance with the USFWS Guidelines. The Department determined that a PEP was necessary for the 3.9 acres of known Indiana bat habitat within the proposed permit area that lies within the 2.5-mile buffer. The survey confirmed that the Indiana bat is present in the proposed permit area and will be adversely affected and possibly "taken" as defined in the Endangered Species Act; federal guidelines requires the applicant to obtain Incidental Take authorization for the 3.9 acres of known Indiana bat habitat within the proposed permit.

Information in the permit application indicates that no northern long-eared bats were captured during this survey, but probable absence of the northern long-eared bat cannot be assumed. Furthermore, no known caves or underground openings where northern long-eared bats hibernate or could potentially hibernate exist within the permit area. No known/occupied maternity roost tree data is known near the project area for the northern long-eared bat. The Department utilized the key to the northern long-eared bat 4(d) rule for federal actions to conclude that proposed actions are not prohibited.

Direct and Indirect Effects

Take of an Indiana bat and/or a northern long-eared bat is a possible consequence of the proposed mining operations and associated activities. Take could result from killing or injuring bats if roost trees were knocked down while occupied by vulnerable females and/or young; in areas identified as known habitat the applicant has committed to honor a "no cut" period during the time of year bats could be present in trees to minimize the likelihood of such take. Removal of feeding habitat, even if done when the bats are not present, could have indirect effects on the species until this feeding habitat can be restored. The applicant has proposed to replace the required 70% of pre-mining known habitat that is removed during the course of proposed mining operation and associated activities. Emphasis will be placed on planting tree species that are recommended in the Guidelines (USFWS, 2013) for the benefits they provide to threatened and endangered bat species. Habitat modifications resulting from clearing trees in general could also be interpreted as take under the Endangered Species Act (Romanik, 2010); the applicant has requested an Incidental Take authorization to account for this broader definition of take. Incidental Take authorization for the Indiana bat is hereby granted under the authority of the 1996 Biological Opinion issued by the USFWS to OSMRE (USFWS 1996). In addition, the Department has determined that this project may affect the northern long-eared bat, but that any resulting Incidental Take is not prohibited by the Final 4(d) rule. Therefore this project is consistent with the USFWS January 2016 Programmatic Biological Opinion on the Final 4(d) rule. The Department and the applicant are in compliance with Section 7 of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*).

The applicant has committed to the following measures to be implemented within the identified known habitat which should serve to minimize disturbances and adverse impacts to Indiana bats and northern long-eared bats:

1. The applicant will limit tree clearing to October 15 through March 31 of any calendar year to avoid take of a female and/ or young Indiana bat or northern long-eared bat.

2. The applicant will provide short-term roosting habitat by girdling 24 trees adjacent to the project area as described in the Indiana bat and northern long-eared bat PEP.

3. The applicant will provide long term habitat replacement by restoring 70% of the known habitat with woody species known to be beneficial to threatened and endangered bat species as described in the reclamation plan and northern long-eared bat PEP.

4. The applicant will utilize herbaceous ground cover species as described in the Indiana bat PEP that will provide cover and resources for wildlife, reduce competition for tree seedlings/saplings, and provide soil stability and erosion control.

Cumulative Effects

Cumulative effects under the Endangered Species Act are defined at 50 CFR Section 402.02 which states "Cumulative effects are those effects of future state, or private activities, not involving federal activities, that are reasonably certain to occur within the action area of the federal action subject to consultation." In the case of a mining permit being issued by the State of Illinois to a private company to develop a privately owned coal reserve, there is no federal action subject to consultation. Therefore, there are no cumulative effects to consider as that term is defined under Section 402.02. The Department nevertheless has considered other future state, county, township and private activities that are reasonably certain to occur within the adjacent land area. Adjacent and nearby land consists of active coal mining operations, agricultural crop land, scattered residential areas, county roads, small lakes, streams, and forested areas. Most of the adjacent acreage is owned and managed by private entities other than the active underground mining operations which are currently owned by permittee. In regards to adjacent and nearby land holdings, the Department has no reason to believe that detrimental cumulative effects to any threatened or endangered bat species would result from state, county, township, and/or private land management practices or activities. If the applicant chooses to submit a new application to the Department for surface effects on nearby lands that contain streams or forested acres, then new threatened and endangered species reviews and PEPs will be required. The Department is not aware of any state, county, township or private activities that would reasonably be certain to occur in the area adjacent or close to the proposed permit area that would adversely affect any threatened or endangered bat species.

Summary

The Department considered the status of the federally endangered Indiana bat and the federally threatened northern long-eared bat, both with the potential to be adversely impacted by the proposed mining operations and associated activities. Although overall populations continue to decline, the Indiana bat population in Illinois is stable or increasing (Clawson, 2004 and USFWS, 2011). Northern long-eared bat population data in the Midwest is limited, however estimates indicate possibly as many as four million northern long-eared bats in 6 states of the Midwest; 21 hibernacula have been documented in Illinois, mostly from the southern region (Federal Register, 2015).

The Department has considered site specific resource information; a survey confirmed that the Indiana bat is present in the proposed permit area and will be adversely affected and possibly "taken" as defined in the Endangered Species Act; federal guidelines requires the applicant to obtain Incidental Take authorization for the 3.9 acres of known Indiana bat habitat within the proposed permit. The USFWS determined that the take of 3.9 acres of known habitat is not likely to jeopardize the continued existence of the Indiana bat. No northern long-eared bats were captured

during survey efforts, but probable absence of the northern long-eared bat could not be assumed. The Department utilized the key to the northern long-eared bat 4(d) rule for federal actions to conclude that proposed actions are not prohibited.

The Department considered direct and indirect effects of proposed operations on the Indiana bat and northern long-eared bat; the most significant threat to these species from mining operations and associated activities is take due to disturbance of an occupied maternity roost tree. The applicant has committed to honor a "no-cut" restriction period within the areas identified as known habitat to prevent the possibility of this type of take. Removal of trees may also affect feeding habitat; the best technology currently available for replacement of feeding habitat includes planting trees during reclamation. The applicant has committed to this post-mining reclamation activity along with other provision set forth in the Indiana bat PEP.

The Department has considered cumulative effects as defined under 50 CFR 402.02 and has considered future state and private activities reasonably certain to occur in the adjacent area and is not aware of any such activities which could adversely affect the Indiana bat or the northern long-eared bat.

Conclusion

Pursuant to Section 1817.97(a), the applicant has proposed to minimize disturbances and adverse impacts to the Indiana bat and the northern long-eared bat by implementing measures described above, while using the best technology currently available. Following these measures will minimize and appropriately mitigate adverse impacts to the Indiana bat and northern long-eared bat. Incidental Take for the Indiana bat is authorized by the Department via this permitting action and the Department has determined that any Incidental Take of the northern long-eared bat is not prohibited by the Final 4(d) Rule.

The Incidental Take as authorized is a take provided for by the Endangered Species Act of 1973 (16 USC 1531 *et seq.*) and is not a violation of this Act. Except as specifically authorized, no other take of a federally listed species is allowed; the applicant remains subject to the prohibitions found at Section 1817.97(d) of taking a federally listed species protected under the Endangered Species Act. Unauthorized take is a violation of Section 1817.97(d); in addition, failure of the applicant to implement the measures specified in the approved plan as part of this permit will subject the applicant to enforcement measures under Sections 1773.17(b), 1817.97(a), and in the case of a take in violation of the Endangered Species Act, Section 1817.97(d).

After having considered the status of the Indiana bat and northern long-eared bat, site specific resource information, direct and indirect effects, and cumulative effects, and in the context of the applicant's commitments for measures to minimize and mitigate disturbances and adverse impacts to the Indiana bat and northern long-eared bat and conditions imposed by the Department, the Department finds that the operation will not affect the continued existence of endangered or threatened species or result in destruction or adverse modification of their critical habitats, as determined under the Endangered Species Act of 1973 (16 USC 1531 *et seq.*).

APPENDIX G

FINDINGS ON THE OPERATOR'S TECHNOLOGICAL CAPABILITY TO RESTORE PRIME FARMLAND

The original permit application and subsequent modification of the application addressed the requirements of Section 1785.17. Pursuant to Section 1785.17(c), the applicant submitted detailed plans for the mining and restoration of the prime farmlands affected by surface mining activities.

1785.17(c)(1): The applicant has submitted a soil survey of the permit area which meets the standards of the National Cooperative Soil Survey. Itemized prime farmland soil map units and soil descriptions can be obtained from the Custom Soil Survey Report provided in the application. Additional reference documents include the NRCS Web Soil Survey and the University of Illinois Agricultural Experiment Station - Bulletin 811, which were used as references to evaluate the pre-mining data.

1785.17(c)(2): The proposed method and type of equipment to be used for removal, storage, and replacement of the soils were described pursuant to Sections 1823.12 and 1823.14. The A, B and C horizons will be removed by conventional equipment used for pipeline installation. Replacement will be with the same equipment.

1785.17(c)(2): Soil will be temporarily stockpiled adjacent to the excavation; plans for identifying the prime soils and plans for soil stabilization before redistribution were submitted in conformance with 1823.13. Stockpile stabilization will occur by establishment of a vegetative cover and mulch, if necessary; these measures will minimize erosion.

1785.17(c)(3): Documents were reviewed supporting the use of B/C horizon mixtures in place of the original B horizon. This information supports the belief that the proposed methods of reclamation will achieve, within a reasonable time, equivalent or higher levels of yield than those of non-mined prime farmland in the surrounding area.

Jansen, Ivan, 1981. "Reconstruction Soils After Surface Mining of Prime Agricultural Land", Mining Eng., March SME Rpt.78-F-375.

McSweeny, I. Jansen, 1984. "Soil Structure and Associated Rooting Behavior in Minesoils", SSSA Jour 48:607-612.

Christ, Richard, 1980, "The Effect of Soil from B and C Horizons on Yield Potential of Soybeans", Unpublished Thesis, Dept. of Plant and Soil Sci., Southern Ill. Univ. Carbondale, Il.

Spindler, D. and J. Bauer, 1986 Prime Farmland Restoration Plans - Planning and Information Needs" Proc. Nat. Assoc. State Land Recl., Sept 1986, Columbia, S.C.

In addition to relying on the above data, the Department has relied on the expertise of its Land Reclamation Division and the fact that thousands of acres of prime farmland and high capability land have met the cropland productivity performance standards using a B/C soil horizon mix. Pipeline and drainage tile installation type activities have a minimum impact on farmland due to the small area of disturbance. The applicant will be following the Illinois Department of Agriculture guidelines for pipeline installation. Based on this evidence, the Department considers it quite probable that the applicant will meet bond release requirements on the prime farmland areas which will be mined and reclaimed.

1785.17(c)(4): Due to the narrow size of the individual fields, yield data was not available for the fields within the permit area. The operator will be required to lime and fertilize the reclaimed prime farmland and cropland fields as needed to bring them to levels required under an optimum level of management. In addition, to satisfy the requirements of Section 1785.17(c)(4), the Department consulted the productivity indexes for each of the soil types on the permit area in "Optimum Crop Productivity Ratings for Illinois Soil", University of Illinois, Bulletin 811.

The Department has determined the soil productivity after mining will be returned to equivalent levels of yield as non-mined prime farmlands of the same soil type in the surrounding area under equivalent management practices, as discussed hereafter.

The Federal Act specifically requires in Section 510(d)(1) that two findings be made by the Regulatory Authority in granting a permit to mine on prime farmland; the Department regulations at Section 1785.17 also require a prime farmland finding. Section 510(d)(1) states:

> "In addition to finding the application in compliance with subsection (6) of this section, if the area proposed to be mined contains prime farmland pursuant to Section 507(b)(16), the Regulatory Authority shall, after consultation with the Secretary of Agriculture, and pursuant to regulations issued hereunder by the Secretary of Interior with the concurrence of the Secretary of Agriculture, grant a permit to mine on prime farmland if the Regulatory Authority finds in writing that the operator has the technological capability to restore such mined area, within a reasonable time, to equivalent or higher levels of yield as non-mined

prime farmland in the surrounding area under equivalent levels of management and can meet the soil reconstruction standards in Section 515(b)(7). Except for compliance with subsection (b), requirements of this paragraph (1) shall apply to all permits issued after the date of enactment of this Act."

The first requirement concerns the operator's technological capability to restore the mined area, within a reasonable time, to equivalent or higher levels of yield as non-mined farmland in the surrounding area under equivalent levels of management. The Department, or the Regulatory Authority has reviewed other data not submitted by the operator which supports the Regulatory Authority's finding:

Dancer, W. S. and I. Jansen. 1981 "Greenhouse evaluation of solum and substratum materials in the southern Illinois coal field: I Forage crops", Jour. Environ. Qual. 10:396-400.

Powell, J., et al., 1985, "Reclamation of Prime Farmland in Kentucky", Pres Nat. Mtg. of Am. Soc. Surf. Min. and Recl. Oct, Denver, Co.

Spindler, Dean, 1981, "Three Case Studies on Rowcrop Production on Mined Land" prepared for the Symposium on Surface Mining Hydrology, Sedimentation and Reclamation, University of Kentucky, Lexington, KY, December 7-11.

The Regulatory Authority has also reviewed the information from its testing program that thousands of acres of prime farmland and high capability land have met the cropland productivity performance standards. These documents are available for inspection at the Land Reclamation Division Office in Springfield.

The second requirement of Section 510(d)(1) concerns soil reconstruction standards in Section 515(b)(7). The Regulatory Authority has reviewed the application concerning the operator's plan to comply with these requirements and find it complies with Section 515(b)(7) of the Federal Act and Sections 1785.17 and 1823 of the Department's regulations. In addition, the Regulatory Authority has considered the method and equipment to be utilized and has found that the planned method is appropriate to successfully comply with the requirements of 510(d)(1) and Section 1823 of the Department's regulations.

1785.17(d): The Regulatory Authority has consulted with the USDA, Natural Resource Conservation Service (NRCS), designated representative of the Secretary of Agriculture. The Department's consideration of the NRCS comments are addressed in Appendix B.

1785.17(e)(1): The approved post-mine land use of the reclaimed prime farmlands will be cropland.

1785.17(e)(2): The Department has considered the comments of the representative of the U.S. Secretary of Agriculture (NRCS).

1785.17(e)(3): As previously discussed, the Department believes the applicant has the technological capability to restore prime farmland, within a reasonable time, to equivalent or higher levels of yields as non-mined prime farmland.

1785.17(e)(4): The special requirements for prime farmland restoration of Section 1823 have been addressed below in accordance with Section 1785.17(e)(4). Some of the subsections in Section 1823 have been previously addressed by Section 1785.17 discussions. Only those items not previously discussed will be below.

1823.14(a)(1): The minimum depth of the reconstructed prime farmland soil will be 60 inches.

1823.14(a)(2): This section is applicable to the Ava series. The proposed B/C mix for root media will meet or exceed high capability standards.

1823.14(b): Topsoil will be replaced to its premining thickness after the root medium replacement and the area is returned to final grade.

1823.14(c): Compaction will be minimized by handling the soil during dry weather and/or the Department will require a compaction alleviation plan if it is determined that excessive compaction is causing low yields.

1823.14 (d): The permittee will be excavating the B and C horizons immediately underneath the B horizons as part of the pipeline trenching. Pipeline and drainage tile installation type activities have a minimum impact on farmland due to the small area of disturbance. The applicant will be following the Illinois Department of Agriculture guidelines for pipeline installation. The subsoil will be returned to its required thickness.

1823.14 (e): The original A horizon will be replaced. The operator has proposed multiple soil series sources of supplemental topsoil material in the proposed permit area. The department has limited that substitute material to the Rend, Bluford, Hickory-Kell, Okaw, Belknap and Orthent soil series where the subsoil texture is a silt loam. In addition, the pH, phosphorus, and potassium of the borrow materials shall be fertilized with rates to achieve a pH of 6.5, and phosphorus and potassium levels of 50 ponds/acre and 260 pounds/acre, respectively. Please see Part IV Condition No. M. Topsoil will be returned to the required thickness and suitably protected from erosion.

1823.14(f): The applicant has made a commitment for fertilization based on soil tests.

1823.15: The applicant will comply with the seeding and mulching requirements pursuant to Sections 1823.15, 1816.113 and 1816.114.

In making this finding, the Regulatory Authority has relied on available data and opinions of experts, as found relevant to this application. In addition, the Regulatory Authority has relied on the expert technical opinion of its staff. Such reliance was intended by Congress as is apparent in

the legislative history of the Federal Act. At page 105 of the House Conference Report No. 95-493, the Conferees state:

> "It is the intention of the Conferees that the written finding that the regulatory authority is required to make before a permit is granted to mine on prime farmland can be based in part on the expert opinion of the regulatory authority, the operator has the technological capability to perform the soil reconstruction standards of Section 515(b)(7) and the performance of those standards will result in the restoration of the mined area to equivalent or higher levels of agricultural yield as non-mined prime farmland in the surrounding area under equivalent levels of management. This does not mean that mining and restoration must have taken place in the surrounding area, but simply that the operator can show by agricultural school studies, or other data for comparable areas that equivalent yields can be obtained after mining."

This finding is based on significant and substantial evidence and is in keeping with the standards for prime farmland review approved by the Office of Surface Mining. (See letter from Acting Director Reeves to Illinois Director Evilsizer, dated April 7, 1980, which is incorporated by reference.)

This finding is based solely upon characteristics peculiar to this particular operator and the prime farmland soil types involved.

All materials supporting this finding are a part of the public record and are hereby incorporated by reference.

Based upon the foregoing analysis of the probable impact of the proposed operations and a review of the application and Interagency and public comments thereon, the Department finds that there is a reasonable basis on which to issue the permit as requested by the applicant.

Enter on behalf of the Illinois Department of Natural Resources, Office of Mines and Minerals, Land Reclamation Division, as the Regulatory Authority.

About FORESIGHT ENERGY LP (NYSE:FELP)

Foresight Energy LP is engaged in the mining and marketing of coal from reserves and operations located in the Illinois Basin. The Company controls over three billion tons of coal in the state of Illinois. Its reserves consist principally of over three contiguous

blocks of high heat content (high Btu) thermal coal, which are used for longwall operations. Thermal coal is used by power plants and industrial steam boilers to produce electricity or process steam. The Company operates over four underground mining complexes in the Illinois Basin, including Williamson, which is located in southern Illinois near the town of Marion; Sugar Camp, which is located in southern Illinois approximately 10 miles north of Williamson; Hillsboro, which is located in central Illinois near the town of Hillsboro, and Macoupin, which is located in central Illinois near the town of Carlinville. Williamson, Sugar Camp and Hillsboro are longwall operations, and Macoupin is a continuous miner operation.

Exhibit 354

From: Theresa Nelson
To: EPA.PublicHearingCom
Subject: [External] Pond Creek Mine, No!
Date: Saturday, December 21, 2019 7:46:16 AM

To whom it may concern,
I live in Murphysboro with my two year old son. No way should the Pond Creek Mine be allowed to dump into the Bug Muddy River. This river already is polluted with farm field run offs, water treatment plant waste and mine waste from other mines. Where the heck does the dumping end. There has not been enough research done to understand the effects these chemicals/ mercury levels have on our animals and plant life. You can google damage it has caused in other parts of the country. I don't want us to learn the hard way. The Big Muddy is already flooding properties and risking homes. We don't need more flooding of this river. Again, no mine waste in the Big Muddy.

Thank you,
Concerned citizen Theresa Nelson 38 yrs, Murphysboro, IL.

Exhibit 355

From: Kelsie Neal
To: EPA.PublicHearingCom
Subject: [External] Pond creek mine permit
Date: Tuesday, December 24, 2019 7:42:19 AM

I am a concerned citizen on the pond creek mine permit matter. The water they are wanting to dump contains sulfides, chlorides, and other contaminants. The water should be tested by a third party not the mine for obvious reasons. They should be responsible for cleaning the water thoroughly on site not just dumping it into the river. We already have such contaminated water. Children here are getting sick, getting cancer. My child was born with breathing issues. Please, please don't bailout the mine to simply dump the water.
Thank you for your time and I hope you will reconsider this permit.

Exhibit 350

Date: Tuesday, December 24, 2019 8:30:34 AM

Member of the IEPA panel,

I am Maria Cruzat, Carbondale resident and I attended the hearing Wednesday 18th. I am submitting my opposition to the authorization of water waste in the Big Muddy River.

I appreciate that the protocol was well conducted, the Hearing was a hearing, and concerned citizens were able to speak.

In my view, there were abundant good reasons for not granting the authorization to dump mine discharges to the Big Muddy river. I hope you consider all points of view expressed and feel comfortable and **backed** by the community to deny the authorization. Unemployment has a solution, polluted water doesn't.

I was impressed by your preparedness for the hearing, but also by a well-educated community member that cannot be disregarded. They presented multiple perspectives to shine a light on the right solution, "save our water", with the exception of the first speaker. Poetry, art, sports, nature lovers, families owning property by the river, testimonies of experts in water shed, accounting, environmental law, fishermen, farmers, indigenous people, miners, presented well-informed reports.

All my best in this endeavor, our children are thanking you all.

Maria Cruzat

Exhibit 357

From: Jim Carl
To: EPA.PublicHearingCom
Subject: [External] Pine Creek Mine NPDES IL007766
Date: Thursday, December 26, 2019 8:54:49 PM

Barb Lieberoff

Illinois IEPA

I attended the public comment hearing regarding Pond Creek Mine NPDES , on December 18, in Marion. I filled out a card prior to the 6pm meeting, but did not get a chance to speak, as the meeting was called to a close about 9:30pm. I wish to submit these comments.

I live in rural Jackson County. A am retired, after 30 years at Southern Illinois University (SIU), first as a civil servant and later as an administrator. Two and a half years were as director of admissions. I moved to southern Illinois as a student. I fell in love with the area and stayed here for the last 42 years.

The Big Muddy River is central to much of what is southern Illinois. The selling point of this area is the scenery, the forest, the fresh air, the lakes and streams. Simply, the great outdoors.

The only person, in three and a half hours of public comment, to support the permit was the representative of Williamson Energy LLC. His argument was that the pipeline and dump into the river was necessary to support the families of the mine workers. The implication was that mining is the biggest industry. Actually, SIU is the biggest employer in the region. As director of admissions, part of my job was oversight of recruitment and enrollment management. The view books my staff distributed to high school guidance counselors and to community colleges, were the primary printed material the University used to encourage prospective students to attend SIU. The cover of the viewbooks, for years, was an arieal shot of the Big Muddy River. We drew attention to that river and its surroundings to encourage people to move here, attend school here and to spend their money here. The prospective faculty, who would teach these students, must also be recruited. We don't have a big city to attract people. We have the Shawnee Forest, the lakes and the Big Muddy River.

If you look at a satellite map of southern Illinois, you will see that the Big Muddy River looks like an artery moving its life giving water through this area. This is our home.

I am a float enthusiast, both in a canoe and kayak. I am a hiker. I fish. Whether it is attending events at Riverside Park, in Murphysboro, fishing off its boat ramp or plotting float trips from it, I anticipate clean, if muddy water. When I am at Oakwood Bottoms or up overlooking the bluff at LaRue/Pine Hills, I expect the river I am enjoying to be a natural river. This proposal turns it into a sewer. ***I urge you to reject it.***

James Carl

Exhibit 358

From: Katie Carl
To: EPA.PublicHearingCom
Subject: [External] Pond Creek Mine
Date: Friday, December 27, 2019 6:27:06 PM

I strongly object to Pond Creek Mine's proposal to discharge mine water into the Big Muddy River.

The company's poor safety and financial records make it very likely to collapse, leaving local and downstream residents stuck when the inevitable leaks, spillages, and other disasters happen. A company which has filed bankruptcy escapes any accountability for their poor management and environmental damage. It is local governments and the Illinois government who will bear the costs, and local residents who will pay the health and safety price.

The high chloride which can be expected from the discharged water has been demonstrated to harm fish and wildlife.

To: EPA.PublicHearingCom
Subject: [External] Pond creek mine. Il0077666
Date: Thursday, January 2, 2020 8:50:11 AM

I do not think it is a good idea to let mine water be discharged into the river. This would damage everything in and along the river. Once we let the coal company start this you will not be able to control them. You can fine them, but all they will do is take you to court for years. Then it will be to late. Let's give are kids and grandkids something better than bad water and dead ground.

Exhibit 340

From: Parr, Charles A
To: EPA.PublicHearingCom
Subject: [External] IL0077666
Date: Thursday, January 2, 2020 1:09:26 PM

As a resident of Jackson county, I oppose the Pond Creek Mine dumping water from their operation into the surface waters of Southern Illinois. The Big Muddy River does not have enough flow to dilute such chemical effluent. The mining industry needs to make their system clean and not dump onto the public their wastes.

---

It would be gross negligence and a breach of fiduciary duty for the EPA to permit a permit with actual knowledge that the company making the request is insolvent. The economic impact on the many communities will be devastating in the event of even one thing going wrong, as the company is admittedly in no position to fund any necessary remedial action.

On December 20, Foresight Energy filed an 8-K Entry into a material definitive agreement. See attached.

The SEC mandates filing an **8-K** for delisting of stock, failure to meet listing standards, unregistered sales of securities, and **material** modifications to shareholder rights. An **8-K** is required when a business changes accounting firms used for certification.

FORM 8-K

CURRENT REPORT

Pursuant to Section 13 or 15(d) of the Securities Exchange Act of 1934

Date of Report (date of earliest event reported): December 19, 2019

FORESIGHT ENERGY LP
(Exact Name of Registrant as Specified in Charter)

Delaware	001-36503	80-0778894
(State or Other Jurisdiction of Incorporation)	(Commission File Number)	(IRS Employer Identification No.)
211 North Broadway, Suite 2600 Saint Louis, MO		63102
(Address of Principal Executive Offices)		(Zip Code)

(Registrant's telephone number, including area code): (314) 932-6160

(Former Name or Former Address, if Changed Since Last Report)

Check the appropriate box below if the Form 8-K filing is intended to simultaneously satisfy the filing obligation of the registrant under any of the following provisions (*see* General Instruction A.2. below)

☐ Written communications pursuant to Rule 425 under the Securities Act (17 CFR 230.425)

☐ Soliciting material pursuant to Rule 14a-12 under the Exchange Act (17 CFR 240.14a-12)

☐ Pre-commencement communications pursuant to Rule 14d-2(b) under the Exchange Act (17 CFR 240.14d-2(b))

☐ Pre-commencement communications pursuant to Rule 13e-4(c) under the Exchange Act (17 CFR 240.13e-4(c))

Securities registered pursuant to Section 12(b) of the Act:

Title of each class	Trading Symbol(s)	Name of each exchange on which registered
Common units representing limited partner interest	*	*

*On November 25, 2019, a Form 25 relating to the delisting and deregistration under Section 12(b) of the Registrant's common units representing limited partner interests was filed by the New York Stock Exchange LLC. The common units currently trade on the OTCQX® Best Market under the symbol "FELPU."

Indicate by check mark whether the registrant is an emerging growth company as defined in Rule 405 of the Securities Act of 1933 (§ 230.405 of this chapter) or Rule 12b-2 of the Securities Exchange Act of 1934 (§ 240.12b-2 of this chapter).

Emerging growth company ☐
If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act. ☐

Item 1.01 Entry into a Material Definitive Agreement.

As previously disclosed, on December 13, 2019, Foresight Energy LLC and Foresight Energy Finance Corporation (wholly owned subsidiaries of Foresight Energy LP (the "**Partnership**")) (together, the "**Issuers**") solicited the consent of the holders (the "**Holders**") (such solicitation, the "**Consent Solicitation**") of the Issuers' 11.50% Second Lien Senior Secured Notes due 2023 (the "**Notes**") to amend (such amendments, the "**Amendments**") the indenture governing the Notes (as amended, supplemented or otherwise modified from time to time, the "**Indenture**"), as more fully described below. The Consent Solicitation expired at 5:00 p.m., New York City time, on December 19, 2019 (the "**Expiration Time**").

As of the Expiration Time, the Issuers had received consents to the Amendments from Holders of at least a majority in aggregate principal amount of the outstanding Notes not owned by the Issuers or their affiliates. As a result, on December 19, 2019, the Issuers, the guarantors party thereto and Wilmington Trust, National Association, the trustee (the "**Trustee**") for the Notes, entered into a second supplemental indenture (the "**Second Supplemental Indenture**") providing for the Amendments to the Indenture.

The Amendments (i) amend Section 6.01(b) of the Indenture to extend the grace period for payment of interest due on the Notes from 90 days to 150 days and (ii) amend Section 4.03 of the Indenture to eliminate the requirement that the Issuers periodically hold a publicly accessible conference call to discuss the Issuers' financial information for the relevant fiscal period.
The Partnership continues to engage in discussions with its creditor constituencies and explore potential restructuring alternatives.

The foregoing descriptions of the Amendments, the Second Supplemental Indenture and the Indenture are qualified in their entirety by reference to the full text of the Second Supplemental Indenture, the First Supplemental Indenture dated as of October 30, 2019 and the Indenture, each of which is incorporated herein by reference to **Exhibit 4.1**, **Exhibit 4.2** and **Exhibit 4.3** to this Current Report on Form 8-K, respectively.

Item 3.03 Material Modification to Rights of Security Holders.

The disclosure set forth in Item 1.01 of this Current Report on Form 8-K is incorporated into this item by reference.

CAUTIONARY STATEMENT REGARDING FORWARD-LOOKING STATEMENTS

Certain statements and information in this Current Report on Form 8-K and certain oral statements made by our representatives from time to time may constitute "forward-looking statements." The words "propose," "believe," "expect," "anticipate," "plan," "intend," "foresee," "outlook," "estimate," "potential," "continues," "may," "will," "seek," "approximately," "predict," "anticipate," "should," "would," "could" or other similar expressions are intended to identify forward-looking statements, which are generally not historical in nature. Forward-looking statements also include statements about our liquidity, our capital structure and expected results of operations. These forward-looking statements are based on the Partnership's current expectations and beliefs concerning future developments and their potential effect on us. While management believes that these forward-looking statements are reasonable as and when made, there can be no assurance that the future developments affecting us will be those that we anticipate.

We continue to experience substantial financial, business, operational and reputational risks that threaten our ability to continue as a going concern and could materially affect our present expectations and projections. For additional information regarding known material factors that could cause our actual results to differ from those contained in or implied by forward-looking statements, please see the section entitled "Risk Factors" in the Partnership's Annual Report on Form 10-K for the year ended December 31, 2018, filed with the Securities and Exchange Commission on February 27, 2019 and subsequent Quarterly Reports on Form 10-Q.

You are cautioned not to place undue reliance on forward-looking statements, which are made only as of the date hereof. We undertake no obligation to publicly update or revise any forward-looking statements after the date they are made, whether as a result of new information, future events or otherwise, except as required by law.

EXHIBIT 4.1

SECOND SUPPLEMENTAL INDENTURE

SECOND SUPPLEMENTAL INDENTURE to the Indenture (as defined below) (the "*Supplemental Indenture*"), dated as of December 19, 2019, is made by and among Foresight Energy LLC, a Delaware limited liability company (the "*Company*"), Foresight Energy Finance Corporation, a Delaware corporation ("*Co-Issuer*", and together with the Company, the "*Issuers*"), the guarantors party hereto (the "*Guarantors*") and Wilmington Trust, National Association, as trustee (in such capacity, the "*Trustee*"), and amends the Indenture, dated as of March 28, 2017, among the Issuers, the Guarantors and the Trustee, as amended by the First Supplemental Indenture, dated as of October 30, 2019 (as further amended and supplemented from time to time, the "*Indenture*").

RECITALS:

WHEREAS, pursuant to the Indenture, the Issuers have issued $425,000,000 in aggregate principal amount of 11.50% Second Lien Senior Secured Notes due 2023 (the "*Notes*");

WHEREAS, the Issuers have requested consents of the Holders of the Notes to amend the terms of the Indenture as set forth in Article I herein (the "*Proposed Amendments*");

WHEREAS, pursuant to Section 9.02 of the Indenture, the written consent of Holders of at least a majority in aggregate principal amount of the outstanding Notes (the "*Requisite Consents*") is sufficient to adopt the Proposed Amendments set forth in Article I;

WHEREAS, the holders of at least a majority in aggregate principal amount of the Notes outstanding (which excludes any Notes owned by the Issuers or their affiliates) have validly tendered consents and not validly withdrawn their consents to the adoption of the Proposed Amendments effected by this Supplemental Indenture in accordance with the provisions of the Indenture;

WHEREAS, having received the Requisite Consents for all of the Proposed Amendments, the Issuers and the Guarantors desire to amend the Indenture as provided herein;

WHEREAS, the Issuers have delivered to the Trustee, pursuant to Section 9.02 of the Indenture, an Officer's Certificate stating that the Issuers have received the Requisite Consents, and have provided certification of such receipt to the Trustee;

WHEREAS, the Issuers have also delivered to the Trustee, pursuant to Sections 7.02(b), 9.02 and 9.05 of the Indenture, (i) a resolution of the Board of Directors of the Company authorizing the execution of this Supplemental Indenture, and (ii) an Officer's Certificate and an Opinion of Counsel, each stating that the execution of this Supplemental Indenture is authorized or permitted by the Indenture and that all conditions precedent to the execution and delivery of this Supplemental Indenture have been satisfied; and

WHEREAS, all other conditions and requirements necessary to make this Supplemental Indenture a valid, binding and legal instrument enforceable in accordance with its terms have been performed and fulfilled by the parties hereto, and the execution and delivery thereof have been in all respects duly authorized by the parties hereto.

NOW, THEREFORE, in consideration of the foregoing and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties mutually covenant and agree for the equal and ratable benefit of the Holders of the Notes as follows:

ARTICLE I
AMENDMENTS

Section 1.01. **Amendments to Indenture**.

(i) Section 6.01(b) of the Indenture is hereby amended and restated in its entirety to read as follows:

"(b) the Issuers default in the payment of interest on any Note when the same becomes due and payable, and the default continues for a period of 150 days,"

(ii) Section 4.03(d) of the Indenture is hereby deleted and amended and restated to read in its entirety as set forth below:
"(d) [Intentionally omitted] "

(iii) Section 4.03(e) of the Indenture is hereby amended to delete the reference to ", and a publicly accessible quarterly conference call of such Parent".

(iv) The first sentence of Section 4.03(f) of the Indenture is hereby amended to (i) add the word "and" immediately before the word "furnishes", (ii) delete the reference to ", and holds a publicly accessible quarterly conference call" and (iii) replace the reference to "Sections 4.03(a) and (d)" with "Section 4.03(a)".

ARTICLE II
MISCELLANEOUS

Section 2.01. Effectiveness. This Supplemental Indenture shall become effective upon the execution and delivery of the Supplemental Indenture by the parties hereto.

Section 2.02. Confirmation. Except as expressly amended hereby, the Indenture is in all respects ratified and confirmed and all the terms, conditions and provisions thereof shall remain in full force and effect. For the avoidance of doubt, this Supplemental Indenture shall not impair or affect the contractual right of any Holder of a Note or Notes to receive any principal payment or interest payment on such Holder's Note or Notes, on or after the Stated Maturity thereof, or to institute suit for the enforcement of any such payment. Upon the execution and

delivery of this Supplemental Indenture by the Issuers, the Guarantors and the Trustee, this Supplemental Indenture shall form a part of the Indenture for all purposes, and every Holder of Notes heretofore or hereafter authenticated and delivered shall be bound hereby. Any and all references to the Indenture, whether within the Indenture or in any notice, certificate or other instrument or document, shall be deemed to include a reference to this Supplemental Indenture (whether or not made), unless the context shall otherwise require.

Section 2.03. Counterparts. The parties may sign any number of copies of this Supplemental Indenture. Each signed copy shall be an original, but all of them together represent the same agreement. The exchange of copies of this Supplemental Indenture and of signature pages by facsimile, .pdf transmission or other electronic means shall constitute effective execution and delivery of this Supplemental Indenture for all purposes. Signatures of the parties hereto transmitted by facsimile or .pdf transmission or other electronic means shall be deemed to be their original signatures for all purposes.

Section 2.04. Capitalized Terms. Capitalized terms used herein without definition shall have the meanings assigned to them in the Indenture.

Section 2.05. GOVERNING LAW. THIS SUPPLEMENTAL INDENTURE SHALL BE GOVERNED BY AND CONSTRUED IN ACCORDANCE WITH THE LAWS OF THE STATE OF NEW YORK.

Section 2.06. Effect of Headings. The section headings herein are for convenience only and shall not affect the construction hereof.

Section 2.07. Acceptance by the Trustee. The Trustee accepts the amendments to the Indenture effected by this Supplemental Indenture and agrees to execute the trusts created by the Indenture as hereby amended, but only upon the terms and conditions set forth in the Indenture; *provided, however*, that to the extent the Requisite Consents of Holders of Notes to any amendment effected by or delivered in connection with this Supplemental Indenture are determined by a court of competent jurisdiction to have not been validly obtained in accordance with the Indenture or applicable laws, such amendment shall not be deemed to have occurred.

Section 2.08. Trustee Disclaimer. The recitals contained herein and the statements made in any Officer's Certificate shall be taken as the statements of the Issuers, and the Trustee assumes no responsibility for their correctness, and none of the recitals contained herein or the statements made in any Officer's Certificate are intended to or shall be construed as statements made or agreed to by the Trustee. The Trustee makes no representations as to the validity or sufficiency of this Supplemental Indenture or the consequences of any amendment provided herein.

IN WITNESS WHEREOF, the parties hereto have caused this Supplemental Indenture to be duly executed and attested, all as of the date first above written.

Barb Lieberoff, Mail code #5
Re: Pond Creek Mine NPDES
Illinois Environmental Protection Agency
1021 North Grand Avenue East P. O. Box 19276
Springfield, IL. 62794-9276

Dear Ms. Lieberoff,

As we live within the Big Muddy River watershed – not far from it actually, I attended the public hearing on Dec. 18th and thought that your office did a very good job of managing the comment portion. It did run very long though, and I was not able to stay for my name to be called.

The following is what I would have liked to impart to you and the decision makers at IEPA. We live on Macedonia Rd. in Jackson County, but barely. We have no city water supply offered to us. Never have. All the families in our area either have cisterns to which they gather rainwater or haul water from Cobden when necessary, or they have dug wells. The majority use wells. These are primarily poor people, many of whom have lived on their land for generations, fishing from the Big Muddy and just getting by. Some of my neighbors still gather their drinking water in jugs from springs along the Snake Road, as they have for generations. Surely this ground water risks severe contamination from the Big Muddy floodwaters, which overflow regularly. Cancer has been prevalent in our area. I myself, suffered through a radical nephrectomy, after a large cancerous tumor destroyed my kidney. This was described to me as an environmental cancer.

For several generations now there haven't been ample choices for jobs for these people, but we have recently seen, mainly through the tourism and winery businesses, opportunities for economic growth. High school girls getting waitress jobs at the wineries, and guys at the orchards or in forest service part time work. But of course, most must leave the region to find good work as they raise families.

Our hope for this region relies on the renewable natural resources which we have – the forest, sustainable agriculture, our lakes and streams. We feel that the health and beauty of southern Illinois' lands and water set it apart from the rest of the state and could be our only opportunity for economic growth. We desperately need it not to be spoiled. Using our rivers as sewers for privately owned mining interests is stupid and surely could be considered criminal in the long run. The coal mining industry could not be economically feasible if all the environmental costs – such as this toxic water flushing – were taken into account.

We just want the IEPA to protect our environment. That is your job. Other agencies promote industries and their economic growth. Your job is to make sure our lands and waters stay clean and healthy to promote its economic possibilities. We hope you will always error on the side of safety when there are health concerns, such as there are in this case. We all know that the Big Muddy has been dumped in for decades, but must we make it worse? How about making it better? How about helping southern Illinois develop a clean and healthy environmental reputation? We feel our future depends on it. Thank you for listening to our concerns and working for the people.

Sincerely,

I am writing to express my opposition to the release of mine waste water from the Pond Creek Mine into the Big Muddy River. My concern is two-fold:

1. We should not allow further contamination of our water resources. Animals and humans along and within the river will be negatively impacted. We cannot afford as a society to purposely contaminate our water resources.

2. I live along the river and my property already becomes flooded at times during the year. With this additional water, I likely will be severely impacted by flooding most of the year. I pay taxes on this property and to not be able to use it at all is a tremendous hardship that will not only impact me, but every other landowner along the big muddy.

To allow this to happen is just not acceptable. Please do not authorize this action. I am not opposed to mining, so long as it does not include fracking, but there has to be some other way for the mine to deal with this issue without impacting residents and the aquafer all along the river.

Please do not allow this. Thank you.

I vote no on the current discharge permit. Currently this will have a negative impact on this river ecosystem. Dilution is not the solution.

I would like to officially make public comment in opposition to the addition of a pipeline to discharge from the Pond Creek Mine into the Pond Creek and Big Muddy River. Our largest park in Murphysboro, Riverside Park, abutts the Big Muddy River downstream from the proposed pipeline. The additional 3,000,000 gallons of discharge of contaminated water has serious implications for the park district. The Big Muddy River has already been suffering increased flooding over the last three years. Our park floods significantly at even moderate flood stages and those floodwaters enter into areas of the park not only manicured and maintained but frequented by park goers and their pets. Without a complete analysis of the water to be pumped into that watershed how can we know what contaminants may be left behind in the park each time the river floods into it. Which has been 2-3 times per year in the last few years. There is also a City of Murphysboro sewer main that runs directly through the flood water path, including an area of that fills with the backwater. Could there not be a potential concern for contaminants to seep into those as well. How do we know what contaminants could be deposited without at least a full analysis prior to the permit being issued? The mine will eventually run out of minerals and move on but the elements and compounds deposited by that pipeline will remain long after that mine has closed.

Thank you for your time and consideration of our concerns.

Joe Fry

Dear Ms. Lieberoff,

I am a student at Southern Illinois University Carbondale majoring in geology and minoring in environmental studies. As an undergraduate, I've been studying remediation methods of acid mine drainage (AMD) and coal drainage, specifically of arsenic, using clay minerals and naturally occurring nanoparticles. I am very knowledgeable of the toxic effects of AMD and am aware that it negatively affects ecosystems and human communities.

Having grown up in Carbondale since I was ten, I've come to value the Shawnee and other ecosystems deeply and personally. I speak for myself and others in the Southern Illinois community when I ask you to please protect the Big Muddy and Pond Creek from Williamson Energy Pond Creek Mine's toxic discharge.

I would really like to see the EPA step up and stand for environmental social justice by inhibiting the coal industry from polluting our waters.

Sincerely,

Cecilia Albert-Black

Subject: [External] Pond Creek mine discharge into the Big Muddy river
Date: Tuesday, January 14, 2020 12:08:38 PM

Hello,

I attended the public hearing over the discharge of mine wastewater into the Big Muddy river from the Pond Creek mine. I was unable to speak at the hearing due to the large number of people speaking against this discharge being permitted.

My specific concern is with the accumulation of heavy metals in the soil of the riverbed and flood areas. There have been articles published about similar discharge from other mines in recent years causing this problem.

The amount of heavy metals that will be discharged and how that will be monitored has not been mentioned in this case, that I have found.

Also, even if these metals are discharged into the river at low rates, or after being diluted, they will accumulate over time. This is a concern for myself and my family because we eat fish out of this river.

I am not opposed to the mine doing business, however I would like for them to be held accountable for keeping the wildlife and people affected by this operation safe.

Thank you,

Justin Riley

To whom it may concern:

I urge you to reject the application to discharge polluted water into the Big Muddy River. Pollution is already one of the most significant and worrisome environmental problems we face. Allowing more pollution flies in the face of what good stewardship should look like. My children and grandchildren are avid outdoor enthusiasts. They frequently fish in the Big Muddy River. Others of them are birdwatchers, and spend time observing birds and other wildlife along the River. They deserve to inherit clean air, clean water, and a healthy planet. We owe it to them.

Please do the right thing: Do not permit pollution to continue unchecked.

Date: Wednesday, January 15, 2020 7:05:14 PM

To Whom It May Concern,

My name is Matt Battaglia and I am sending this email regarding the NPDES for the Pond Creek Mine the permit number is IL0077666. I am a fourth generation farmer and the bulk of my family's farm ground either borders the Big Muddy River or the tributary that branches off of it. My concern with allowing this permit to go through is that, in a typical year, the Big Muddy River pushes backwater into our fields in the Spring time. I am roughly 1-1.5 miles down river from where the discharge pipe is located. This waste water, as the gentleman from the mine said at the hearing, is nothing more than salt water. To anyone that knows anything about growing crops, this salt water that will back up in our fields will create dead spots. Plants do not grow in salty ground. With yearly floods, this salt water will have a cumulative effect and build up in the ground, causing lasting effects. My question to your legal department is, who will be responsible for the decline in our crop yields? The state for allowing the permit or the company for disposing the waste water? That is why I ask that you consider the smaller businesses in the area this will affect.

The Big Muddy River, 156 miles long, draining a 2,344-square-mile watershed, flows through the significant environmental regions, La Rue-Pine Hills and Oakwood Bottoms, to join the Mississippi River southwest of Murphysboro and on to the Gulf of Mexico. It is already an ecosystem under assault: The Illinois Department of Public Health has issued a mercury advisory on common carp, croppie, and largemouth bass. PCB contamination was noted in the common carp. IDNR has stopped recreational use during its frequent and prolonged flooding.

Williamson Energy operates Pond Creek Mine, noted as the highest producing mine in the US in 2017. The continued operation of this mine employs approximately 203 employees and an additional estimated 100 people involvbed in ancillary or support services. Yet, in order tyo ensure the safety of their employees by pumping out large amounts of excess water from groundwater infiltrating underground mining areas, they are posing, from available hydrogeologic information, serious safety, environmental and property risks affecting both these employees and hundreds of others. Such risks deserve our careful consideration.

The primary danger comes from the introduction of high concentrations of chloride--and sulfates--into the Big Muddy. Scientists who study watersheds use chloride concentrations as an indicator of pollution in a body of water. It is present in 1 to 100 ppm in solution with water in underground aquifers, geologic formations containing groundwater. Once such contaminants get into groundwater they persist there for years. Once in solution there is no biologic process known to remove chloride.

So, a high concentration of chloride is of particular concern. The effect of high levels of chloride, while always present,varies according to species and the time their life cycle is interrupted. Newly laid eggs are particularly susceptible as is the transitional life forms, larvae and tadpoles. High chloride concentrations achieve their serious effects on all life forms by interfering with osmoregulation, the process by which cells remain intact and viable, thereby hindering growth, reproduction, and, ultimately survival. Acceptable chloride levels to prevent acute exposure effects have been set at 860 ppm to prevent acute exposure effects, to prevent chronic effects at 230 ppm.

Williamson Energy proposesa as its solution specified in application #456 a 12.5-mile long pipeline carrying 21.7-3.5 million gallons/day of high-concentraTED CHLORIDE EFFLUENT TO DUMP INTO AN ALREADY FRAGILE ECOSYSTEM. tHE MINEW LISTED an veragfe chloride concentration in this effluent as 2,237 mg/L, an amount far esdceeding water

This Pond Creek pipe line is a terrible idea! How can it be in the year 2020 someone is still thinking that it's OK to pollute our waterways? Didn't we learn anything from the past 50 years of cleaning up our air and waterways? Are we really OK with polluting our waterways for decades so that one corporation can make profits for just a few years? It's just not worth it.

The price we'll have to pay to clean up this mess outweighs the value of allowing Williamson Energy to pollute the Big Muddy River in the first place. This is just bad economics. The easiest way to clean up environmental disasters is to not create them in the first place. It makes more sense for the state of Illinois and the EPA to help Williamson Energy properly dispose of the waste rather than dump that waste in the river. I would pay a special property tax fee to support the proper collection and disposal of that mine waste at the mine if we can avoid having it dumped into the Big Muddy River. That is a better use of our tax dollars than to create the environmental mess and later try to clean it up at an exponentially greater cost.

It is a waste of decades of taxpayer support for the EPA if in the end you rubber stamp corporate pollution plans that pollute our streams and rivers. At this very moment, January 16, 2020, the Big Muddy is backing up due to recent heavy rains. That water is being spread all over farm fields, residential yards, and in neighborhoods. It is going to seep into the ground water and into people's drinking water. If that water was filled with the pollution from the Pond Creek mine it's going to pollute the ground and the seep into the water table. It's going to get polluted water into people's drinking water. So the issue isn't just the pollution being dumped into the Big Muddy River and flowing into the Mississippi River, the concern is also about when the Big Muddy backs up and floods fields and neighborhoods.

We have a small tributary behind our house. When the Big Muddy backs up, the valley behind us fills with water. Sometimes that water sits there for weeks at a time. I don't want mine waste settling in my back yard. Am I going to have to breathe what ever is emanating from that polluted water? What if my dogs go down there and drink from it? What happens to the wildlife that lives in these back flow areas?

If Williamson Energy paid for the proper disposal of the waste and added that cost to the price of the coal, it wouldn't be economically viable for them to keep mining the coal. But they can afford to build a pipeline and add that cost to the price of their coal. We the people of Southern Illinois have to absorb their costs when they pollute our streams, rivers, and ground water. Why do corporations get away with dumping the true costs of their operations on society while they pocket the "profits" for their own private gain? Who's going to pay to clean up our waterways or deal with the cancer that will surely develop from this pollution? If society has to absorb the costs, we should get reimbursed with some of the profits. In a sense, Williamson Energy wants to promote socialism where we as a society take on some of the costs of their "for-profit" operation. Williamson Energy: please don't promote Socialism and pretend that it's Capitalism: if you want to keep the profits for yourself, then YOU must absorb ALL of the costs of bringing that product to market.

The Bird Conservation Network coalition has serious concerns about the draft renewed National Pollutant Discharge Elimination System (NPDES) permit (IL0077666) for the Pond Creek Mine. We urge you to deny the proposal by Williamson Energy to pump polluted mine wastewater over 12 miles from the Pond Creek Mine into the Big Muddy River and to increase pollution into Pond Creek.

We urge the IEPA to deny the draft water discharge permit for a number of well understood reasons:

1. Williamson Energy's discharge of high chloride and high sulfate water into the Big Muddy River and Pond Creek will harm mussels, fish, and other aquatic organisms, and the various bird species that feed in the Big Muddy and nest along it.. The draft permit and anti-degradation assessment do not adequately address impacts to these organisms, nor require pre- or post- construction biological sampling.

2. Williamson Energy's plan to monitor chloride concentrations is complex and requires monitoring of several parameters and a conductivity correlation, yet gives no way for the Agency or the public to evaluate if the permittee is doing that monitoring properly. The mine proposes to continually balance their high-chloride effluent with the chloride levels already in the river. Given the public interest in this project and the company's history of past violations, the proposed monitoring plan is insufficient and infeasible.

3. The draft permit and anti-degradation assessment fail to take into consideration potential increases of Methyl-Mercury levels or other pollutants like copper, iron, selenium and nickel.

4. The anti-degradation assessment has not adequately or accurately considered the economic impacts of the proposed project. New reports have indicated a continuing and projected decline of coal production in the Illinois Basin.

5. Murray Energy, the parent company of Williamson Energy, filed for bankruptcy in fall 2019. The IEPA's estimates of local economic impact and jobs failed to consider these developments.

Thank you for considering the BCN coalition's comments in opposition to permit (IL0077666) for the Pond Creek Mine

Bob Fisher, Communications Chair
Bird Conservation Network
media@bcnbirds.org

630 985 2956
http://bcnbirds.org/

BCN promotes public awareness, knowledge, appreciation and enjoyment of birds, and other wildlife and wildlife habitat, and both proposes and supports public and private programs designed to protect, restore, and enhance the natural environment, and conserve/increase native bird populations.

BCN seeks to inform the members of our coalition, public and private agencies and landowners in our region, and the general public, about specific threats to birds, and other wildlife and wildlife habitat – and to recommend appropriate action against these threats.

BCN actively coordinates the accumulation and maintenance of long-term monitoring records and other information on Illinois birds and their habitats, to be used as an aid to their perpetuation, and as an indicator of environmental quality.

BCN is a regional coalition of about 20 organizations (bird clubs, Audubon chapters, ornithological societies and conservation organizations) sharing an interest in the conservation of birds. The groups' members aggregate to more than 35,000 people living primarily in the Chicago area, but also throughout Illinois, northeastern Indiana, and southern Wisconsin.

Re: NPDES Permit No. IL0077666, Notice 7516c- Williamson Energy, LLC

Dear Ms. Lieberoff,

Coal is dead.

No one can doubt that coal fueled the Industrial Revolution but it has out lived its livelihood. Yes our cultural roots are buried deep within coal. It is what gave us the luxuries that we have today, something we cannot ignore, but also caused many of the problems we have with today's pollution and global climate change.

All the coal that is mined in Pond Creek Mine (Mach Mine) goes overseas and none of the citizens of Southern Illinois, except the mine owners and hand full of it employees, benefit from it. I guess you could count the river barge owners and ocean vessels which are profiting from the coal in Southern Illinois, but the average landowner and people who live here do not. We are the ones who have to put up with the waste and clean up after the industry. We the citizens of Southern Illinois don't even benefit from a Severance Tax from the coal.
http://knowledgecenter.csg.org/kc/system/files/7.15.2017.pdf

Coal is like a beloved relative who won't leave after the holidays. They continue to take up space, make a mess in your home, use up your resources and will not leave. The coal industry continues to have its hand out and wants more while doing less, and we are the ones who have to clean up the mess it leaves behind. One of these clean ups will be the waste water the mine wants to dispose into the Big Muddy River, full chlorides and sulfates endangering fish and wildlife who live in and around the river.

My main concern about this permit is the excess of water being pumped into the Big Muddy. According to the FOIA reports from IEPS, stated in a letter from Alliance Consulting, Inc, the HEC-RAS steady flow model shows that the mines' addition of water to the Big Muddy River would have a maximum increase in water surface elevation of approximately 0.009 feet during "a 2-year 24-hour storm event." With the Williamson Diffuser discharging at 11.1 cfs, with a maximum of 22.2 cfs, or raising the height to .018 feet -- 1/8" to 1/4". I have to agree that does sound like much, but when you own property downstream on the Big Muddy River, and it floods continually, even 1/4" means a lot. Plus, can we truly trust the Pond Creek Mine's numbers to be correct?

As of 1/10/2020 we had another storm event. In that 24 hour period we received 5.5" of rain in Murphysboro, IL and according to the Rain Event Table for Flood Study Distributions of Heavy Precipitation in Illinois Updated Bulletin

70, Illinois State Water Survey, March 2019, that makes this a ten year storm event. Now, as of 1/15/2020, 7:30 pm the Big Muddy River is 29.92' above flood stage and has a flow rate of 17,400 cfs at the gauging station in Murphysboro, IL and they are predicting another storm event this weekend.
https://water.weather.gov/ahps2/hydrograph.php?wfo=pah&gage=muri2
https://waterdata.usgs.gov/monitoring-location/05599490/?agency_cd=USGS

On May 3, 2011 the Big Muddy River reached a record high of 40.47 feet at the Murphysboro gauge station on the Route 127 Bridge. At that time the 127 Bridge was closed and under water. The river water was so high you could no longer see the guard rails on either the side of the bridge. The Route 13 Bridge was being threatened too, but remained open and was closely monitored by IDOT. During that time the flood water was so high and strong that the water was vibrating the bridge, so it was decided by IDOT to rebuild and raise the level of the Route 13 Bridge. Meanwhile when this flood was happening I was busy sandbagging around, and pumping out the water in the basement of, The Historic Douglass School of Murphysboro. I believe I was on the sixth day of running three sump pumps in two basements on May 3. At the crest of the river I calculated that the water would have been 20 inches deep in the basements without the pumps. According to the 18435E1 Flood Map provided by Alliance Consulting, Inc, our property at 900 Douglass St. in Murphysboro, IL is completely surrounded by flood water. FEMA even has us in the **AE flood zone**. So yes, I count the water levels in quarters of inches.

I know my letter will be fruitless and fall on deaf ears but I still have to voice my concerns to **stop this permit** and all future permits of this nature. I have to ask myself, what would an IEPA employee do in my place if one of you lived where I do and owned the Historic Frederick Douglass School? We all live downstream from some peril; this just happens to mine.

But really what is the point if the current administration gets His/Their way, all NEPA reviews and concerns will be gone and our planet will be in deeper trouble than it already is.

Here is a story from Mother Jones News Service you all might enjoy:

https://www.motherjones.com/environment/2020/01/trumps-latest-environmental-rollback-is-a-middle-finger-to-common-sense/ 1/12/2020

"Trump's gift to the fossil fuel industry and special interests will silence ordinary Americans while giving polluters a free pass to trash the environment, destroy public lands and kill wildlife," Brett Hartl, government affairs director at the Center for Biological Diversity, said in a statement.

In the last decade, the US experienced at least 119 climate and weather disasters with losses exceeding $1 billion each, more than double the number of billion-dollar disasters during the 2000s, according to a federal report released this week. Costs from those disasters over the last 10 years exceeds $800 billion.

Thank you for your time, and care on.

One World, One Planet.

Cameron J. Smith

R03687

Table 7.15
STATE SEVERANCE TAXES: 2017

State	Title and application of tax (a)	Rate
Alabama	Iron Ore Mining Tax (c)	$.03/ton
	Forest Products Severance Tax	Varies by species and ultimate use.
	Oil and Gas Conservation & Regulation of Production Tax	2% of gross value at point of production, of all oil and gas produced. 1% of the gross value (for a 5-year period from the date production begins) for well, for which the initial permit issued by the Oil and Gas Board is dated on or after July 1, 1996 and before July 1, 2002, except a replacement well for which the initial permit was dated before July 1, 1996; 1.66% gross proceeds from offshore production greater than 8,000 ft. below sea level.
	Oil and Gas Privilege Tax on Production	8% of gross value at point of production; 4% of gross value at point of incremental production resulting from a qualified enhanced recovery project; 4% if wells produce 25 bbl. or less oil per day or 200,000 cu. ft. or less gas per day; 6% of gross value at point of production for certain on-shore and off-shore wells. A 50% rate reduction for wells permitted by the oil and gas board on or after July 1, 1996 and before July 1, 2002 for 5 years from initial production, except for replacement wells for which the initial permit was dated before July 1, 1996; 3.65% gross proceeds from offshore production greater than 8,000 ft. below sea level.
	Coal and Lignite Severance Tax	$.20/ton in addition to coal severance tax. In 2012 state legislature extended through 2021.
	Local Solid Minerals Tax	Varies by county for sand, clay, gravel, granite, shale, and other products.
	Uniform Natural Minerals Tax	$.10/ton.
Alaska	Common Property Fisheries Assessment (b)	$0.10/lb for 2016, determined annually by the department of revenue.
	Dive Fishery Management Assessment (b)	Elective; currently 5% or 7% of value for select dive fishery species in select management regions.
	Fisheries Business Tax	Tax based on unprocessed value of fishery resources processed in or exported from the state. 1% of value for shore-based processing in developing fisheries; 3% of value for floating processing in developing fisheries or shore-based processing in established fisheries; 4.5% of value for salmon cannery processing in established fisheries; 5% of value for floating processing in established fisheries.
	Fishery Resource Landing Tax	Tax based on unprocessed value of fishery resources processed outside and first landed in the state. 1% of value for developing fisheries; 3% of value for established fisheries.
	Mining License Tax	Up to 7% of net income and royalties received in connection with mining properties and activities in Alaska. Quarry rock, sand and gravel, and marketable earth mining operations are exempt from the mining license tax. New mining operations exempt for 3-1/2 years after production begins.
	Alaska Oil Production Tax	Alaska will impose a base rate of 35 percent on oil companies' net profits in the state.
	Salmon Enhancement Tax (b)	Elective; 2% or 3% of value for salmon sold in or exported from select aquaculture regions.
	Seafood Development Tax (b)	Elective; currently 1% of value for select commercial fish species in select seafood development regions.
	Seafood Marketing Assessment (b)	Elective; currently 0.5% of value for all commercial fish species exported from, landed or processed in-state.
Arizona	Severance Tax	.025% for metalliferous mining; 0.0312% for nonmetal mining. Additional severance taxes on these and other products are levied at the city or county level.
Arkansas	Timber Severance Tax	$0.178/ton (pine), all other $0.125/ton.
	Natural Gas Severance Tax	1.25%, 1.5%, and 5% depending on well classification.
	Oil Severance Tax	Crude oil 4% to 5% depending on production levels; additional taxes of 5 mils and $0.02 per barrel of oil produced in the state.
	Other Severance Taxes	Separate Rate for each Substance.
	Oil and Gas Conservation Assessment	Maximum 43 mills/bbl. of oil and 9 mills per MCF produced of gas.
California	Oil and Gas Production Assessment	Rate determined annually by Department of Conservation to fund agency operations; no state severance tax. The assessment rate for fiscal year 2016/17 is $0.3626051.
	Lumber Products Assessment	1% on purchases of lumber products and engineered wood products for use in California, based on the selling price of the products.
Colorado	Severance Tax	$0.803 for amount of coal produced above 300,000 tons, rate updated monthly by the department of revenue. 2.25% for metallic minerals above $19 million in gross producer income. $0.05/ton of molybdenum above 625,000 tons Oil and gas rate varies from 2% to 5% depending on gross income brackets; up to 15 barrels per day of oil 90,000 cubic feet of gas per producing day are exempt. Oil shale is taxed based on years of operation, where 1 year = 1%, 2 years, = 2%, etc. up to 4% of the gross proceeds above the threshold and after the first 180 days of production.
	Oil and Gas Conservation Levy (d)	0.07% charge on all oil, natural gas, and CO_2 produced.

See footnotes at end of table.

STATE SEVERANCE TAXES: 2017—Continued

State	Title and application of tax (a)	Rate
Florida	Oil Production Tax	5% of gross value for small well oil, and 8% of gross value for ordinary oil production, and 12.5% for escaped oil; tiered formula for tertiary oil.
	Gas and Sulfur Production Tax	The gas base rate ($0.171) times the gas base adjustment rate each fiscal year for gas (2016-17 rate $0.188 per MCF); and the sulfur base rate ($2.43) times the sulfur base rate adjustment each fiscal year for sulfur (2016–17 rate $5.13 per ton).
	Solid Minerals Tax (e)	8% of the value of the minerals severed; heavy minerals (rate computed annually at $1.34/ton plus times the base rate adjustment currently at 3.26288). Year 2017 Tax Rate $4.37 per ton; phosphate rock (rate computed annually at a base rate of $1.80/ton).
Idaho	Mine License Tax	1% of net value of ores mined or extracted and royalties received from mining.
	Oil and Gas Production Tax	2.5% of the gross income earned for the sale of oil and gas.
Illinois	Oil and Gas Production Assessment (f)	0.1% fee per well of gross revenue for oil and natural gas.
	Timber Fee	4% of purchase price.(g)
Indiana	Petroleum Severance Tax (h)	1% of value of petroleum; $0.24 per barrel for oil; and $0.03 per 1000 cu. ft. of natual gas.
Kansas	Mineral Tax (i)	8% of gross value of oil and gas, less property tax credit of 3.67%; and $1/ton of coal.
	Oil Inspection Fee/barrel (i)	$0.015/barrel
	Oil and Gas Conservation Tax	91.00 mills/bbl. crude oil or petroleum marketed or used each month; 12.9 mills/1,000 cu. ft. of gas sold or marketed each month.
	Mined-Land Conservation & Reclamation Tax	The first-time fee for a mining license is $300. Licenses must be renewed annually. The annual renewal fee varies between $25 and $150 depending upon the amount of material sold or consumed in the previous year. Plus per ton fee of $.03.
Kentucky	Oil Production Tax	4.5% of market value.
	Coal Severance Tax	4.5% of gross value, less transportation expenses; $0.50/ton minimum for extraction and processing.
	Natural Resource Severance Tax	4.5% of gross value, less transportation expenses.
Louisiana	Natural Gas Severance Tax (j)	The natural gas severance tax rate effective July 1, 2016 through June 30, 2017 has been set at 9.8 cents per thousand cubic feet (MCF) measured at a base pressure of 15.025 pounds per square inch absolute and at the temperature base of 60 degrees Fahrenheit.
	Oil/Condensate Severance Tax (j)	Value on a per barrel basis (42 gallons) the rates are: full-rate, 12.5%; incapable oil rate, 6.25%; stripper oil rate, 3.125%; reclaimed oil, 3.125%; produced water full-rate, 10%; produced water incapable oil rate, 5.0%; produced water stripper oil rate, 2.5%
	Timber Severance Tax (j)	
	Mineral Severance Tax (j)	Various fees on a per ton basis for products like sulphur, salt, marble, stone, sand, lignit, and others.
	Oil Field Site Restoration Fee	$.015 per barrel of oil and condensate; $.003 for every thousand cubic feet of gas.
	Freshwater Mussel Tax	5% of revenues from the sale of whole freshwater mussels at the point of first sale.
Maine	Mining Excise Tax	The greater of a tax on facilities and equipment or a tax on gross proceeds.
Maryland	Mine Reclamation Surcharge	$.15/ton of coal removed by open-pit, strip or deep mine methods. Of the $.15, $.06 is remitted to the county from which the coal was removed.
Michigan	Gas and Oil Severance Tax	5% (gas), 6.6% (oil) and 4% (oil from stripper wells and marginal properties) of gross cash market value of the total production. Maximum additional fee of 1% of gross cash market value on all oil and gas (2017 fee).
Minnesota	Taconite and Iron Sulfides	$2.659 per taxable ton of concentrates or pellets (rate indexed to inflation by law).
	Direct Reduced Iron (k)	$2.659 per taxable ton of concentrates plus an additional $.03 per ton for each 1% that the iron content exceeds 72%.
Mississippi	Natural Gas Severance Tax	6% of value at point of gas production; 1.3% for gas produced from a horizontally drilled well for the first 30 months from the first sale of production or until payout of the well cost is achieved, whichever comes first.
	Oil Severance Tax	6% of value at point of oil production; 3% reduced rate for wells using the enhanced oil recovery method; 1.3% for oil produced from a horizontally drilled well for the first 30 months from the first sale of production or until payout of the well cost is achieved, whichever comes first.
	Timber Severance Tax	Varies depending on type of wood and ultimate use.
	Salt Severance Tax	3% of value of entire production in state.

See footnotes at end of table.

STATE SEVERANCE TAXES: 2017—Continued

State	Title and application of tax (a)	Rate
Oregon	Forest Products Harvest Tax	$3.7487/1000 board ft. harvested from public and private land— through Dec. 31, 2017. The first 25,000 board feet of timber harvested by an owner each year is exempt.
	Oil and Gas Production Tax	6% of gross value at well.
	STF Severance Tax— Eastern Oregon Forestland Option	$4.39/1000 board ft. harvested from land under the Small Tract Forestland Option—through Dec. 31, 2017.
	STF Severance Tax— Western Oregon Forestland Option	$5.65/1000 board ft. harvested from land under the Small Tract Forestland Option—through Dec. 31, 2017.
Pennsylvania	Natural Gas Impact Fee	The state issues an annual fee based on the average price of gas for that year along with the number on a schedule that considers a wells years in production. Local fees and taxes determined by county.
South Carolina	Forest Renewal Tax	Softwood products: 50 cents per 1,000 board feet or 20 cents per cord. Hardwood products: 25 cents per 1,000 board feet or 7 cents per cord.
South Dakota	Precious Metals Severance Tax	$4 per ounce of gold severed plus additional tax depending on price of gold; 10% on net profits or royalties from sale of precious metals and 8% of royalty value.
	Energy Minerals Severance Tax (s)	4.5% of taxable value of any energy minerals.
	Conservation Tax	2.4 mills of taxable value of any energy minerals.
Tennessee	Oil and Gas Severance Tax	3% of sales price.
	Coal Severance Tax (t)	$1.00/ton (effective 7/17/13)
	Mineral Tax	Up to $0.15 per ton, rate set by county legislative body.
Texas	Natural Gas Production Tax	7.5% of market value of gas. Condensate Production Tax: 4.6% of market value of gas.
	Crude Oil Production Tax	4.6% of market value or $.046/bbl.
	Cement Production Tax	$0.55 per ton or $.0275/100 lbs. or fraction of 100 pounds of taxable cement.
	Oil-Field Cleanup Regulatory Fees	5/8 of $.01/barrel; 1/15 of $.01/1000 cubic feet of gas. (u)
	Oyster Sales Fee	$1 per 300 lb. barrel of oysters taken from Texas waters.
Utah	Mining Severance Tax	2.6% of taxable value for metals or metalliferous minerals sold or otherwise disposed of.
	Oil and Gas Severance Tax	3% of value for the first $13 per barrel of oil, 5% from $13.01 and above; 3% of value for first $1.50/mcf natural gas, 5% from $1.51 and above; and 4% of taxable value of natural gas liquids.
	Oil and Gas Conservation Fee	.002% of market value at wellhead.
Virginia	Forest Products Tax	$1.15 per 1,000 feet B.M. of pine lumber and 1000 board feet of pine logs. $0.475 collected per cord of pine pulpwood.
	Coal Surface Mining Reclamation Tax	Varies depending on balance of Coal Surface Mining Reclamation Fund and the type of mine.
Washington	Enhanced Food Fish Tax	0.09% to 5.62% of value (depending on species) at point of landing.
	Timber Excise Tax	5% of stumpage value for harvests on public and private lands.
West Virginia	Coal Severance Tax	Coal: State rate is greater of 5% or $.75 per ton. Special state rates for coal from new low seam mines. For seams between 37" and 45" the rate is greater of 2% or $.75/ton (1.65% for state purposes and .35% for distribution to local governments). For seams less than 37" the rate is greater of 1% or $.75/ton (.65% for state purposes and .35% for distribution to local governments). For coal from gob, refuse piles, or other sources of waste coal, the rate is 2.5% (distributed to local governments). Additional tax for workers' compensation debt reduction is $.56/ton. Two special reclamation taxes at $.07/clean ton and $.02/clean ton.
	Natural Resource Severance Taxes	5% for sand, gravel, oil, natural gas, coabled methane, limestone, sandstone, or other natural gas liquids.
	Timber Severance Tax	1.50%
Wisconsin	Mining Net Proceeds Tax	Progressive net proceeds tax ranging from 0% to 15% is imposed on the net proceeds from mining metalliferous minerals. The tax brackets are annually adjusted for inflation based on the change in the GNP deflator.
	Oil and Gas Severance Tax	7% of market value of oil or gas at the mouth of the well.
	Forest Crop Law Severance Tax	$2.52 per acre, rate effective through 2017.
	Managed Forest Law Tax	Open land $2.14/acre; close land $10.68/acre.

See footnotes at end of table.

STATE SEVERANCE TAXES: 2017—Continued

State	Title and application of tax (a)	Rate
Wyoming	Severance Taxes	Severance Tax is defined as an excise tax imposed on the present and continuing privilege of removing, extracting, severing or producing any mineral in this state. Except as otherwise provided by W.S. 39-14-205. The total Severance Tax on crude oil, lease condensate or natural gas shall be six percent (6%). Stripper oil is taxed at four percent (4%). Surface coal is taxed at seven percent (7%). Underground coal is taxed at three and three-fourths percent (3.75%). Trona is taxed at four percent (4%). Bentonite, sand and gravel, and all other minerals are taxed at two percent (2%). Natural Gas (6%). Uranium (4%).

Source: The Council of State Governments, 2017.

Note: Severance tax collection totals may be found in the Chapter 7 table entitled "State Government Revenue, By Type of Tax."

Key:

(a) Application of tax is same as that of title unless otherwise indicated by a footnote.

(b) Tax rates and applicability for these severance taxes determined by a vote of the appropriate association within the seafood industry, by the Alaska Seafood Marketing Institute, or by the Department of Revenue. Proceeds from these elective assessments are customarily appropriated for benefit of the seafood industry.

(c) The iron ore tax was suspended as of Oct. 1, 2014 by administrative rule due to the cost of administering the collection of the tax exceeded the total amount of the tax collected.

(d) As of July 1, 2007, set at .0007 mill/$1.

(e) Clay, gravel, phosphate rock, lime, shells, stone, sand, heavy minerals and rare earths.

(f) Fee sunsets in 2018 under state law.

(g) Buyer deducts amount from payment to grower; amount forwarded to Department of Natural Resources.

(h) Petroleum, oil, gas and other hydrocarbons. Oil inspection fee rate based Dept. of Revenue factsheet.

(i) Coal, oil and gas, based on Department of Revenue information.

(j) Oil inspection fee rate based Dept. of Revenue factsheet.

(k) Coal, oil and gas, based on Department of Revenue information.

(l) Production is considered commercial when it exceeds 50,000 tons annually. There is a six-year phase-in of the tax. In years one and two, the rate is zero. In year three, it is 25% of the statutory rate and 50% and 75% in years four and five respectively. An Aggregate Materials Tax is imposed by resolution of county boards. It is not required that any county impose the tax, which is $.10/cubic yard or $.07/ton on materials produced in the county.

(m) Metals, precious and semi-precious stones and gems.

(n) The maximum rate of 0.3% is split between the Oil or Gas Conservation Tax and the Oil, Gas and Coal Natural Resource Account Fund. Currently the Oil or Gas Conservation Tax is .18% and the Oil, Gas and Coal Natural Resource Account fund tax rate is .08%.

(o) Cement and gypsum or allied products.

(p) Natural resources except oil, natural gas, liquid hydrocarbons or carbon dioxide.

(q) Oil, coal, gas, liquid hydrocarbons, geothermal energy, carbon dioxide and uranium.

(r) Rate reduced by 50 percent if burned in cogeneration facility using renewable resources as fuel to generate at least 10 percent of its energy output. Coal shipped out of state is subject to the $.02/ton tax and 30% of the $.375/ton tax. The coal may be subject to up to the $.375/ton tax at the option of the county in which the coal is mined.

(s) Asphalt and ores bearing lead, zinc, jack, gold, silver, copper or petroleum or other crude oil or other mineral oil, natural gas or casinghead gas and uranium ore.

(t) Any mineral fuel used in the production of energy, including coal, lignite, petroleum, oil, natural gas, uranium and thorium.

(u) Counties and municipalities also authorized to levy severance taxes on sand, gravel, sandstone, chert and limestone at a rate up to $.15/ton.

(v) Fees will not be collected when Oil-Field Cleanup Fund reaches $20 million, but will again be collected when fund falls below $10 million.

Trump's Latest Environmental Rollback Is a Middle Finger to Common Sense

"The oil and gas industry wins. The American people lose."

Alexander C. Kaufman and Chris D'Angelo

US President Donald Trump. Nicholas Kamm/Getty

This piece was originally published in HuffPost *and appears here as part of our* Climate Desk Partnership.

The Trump administration on Thursday unveiled plans to gut one of America's most important environmental laws—a move experts say is as much of a handout to polluting industries as it is a slap in the face to science and local communities.

The proposed rules would change how the federal government implements the National

Environmental Policy Act, a 50-year-old law that protects air, water and land by requiring federal agencies to conduct detailed environmental assessments of major infrastructure projects. Agencies would no longer be required to consider climate change when evaluating the environmental effects of pipelines, power plants, oil and gas drilling, airports, highways and other development.

President Donald Trump announced the reforms in a speech at the White House Thursday morning, saying the federal permitting process is "big government at its absolute worst."

"The United States will not be able to compete and prosper in the 21st century if we continue to allow a broken and outdated bureaucratic system hold us back from building what we need," he said.

The rules from the White House Council on Environmental Quality, which oversees NEPA, have been a long time coming. They seek to codify what has become common practice since 2017, when the White House rescinded Obama-era guidelines that tasked agencies with considering greenhouse gas emissions and climate change in NEPA reviews. The move is the latest in a relentless deregulatory effort by the Trump administration that has largely benefited the fossil fuel industry.

The controversial overhaul is aimed at speeding up energy projects and other development by limiting the number of projects that require in-depth environmental review and expediting the process for those that do. It would establish strict two-year limits for completing reviews on major projects and a one-year deadline for smaller projects. Trump on Thursday highlighted a number of projects that took a decade or longer to get federal approval.

Most alarming to environmentalists is that the proposal would allow agencies to not only ignore a project's vulnerability to climate change, but also its "cumulative" effects on global warming, which is already wreaking havoc around the world.

Christy Goldfuss, a former chair of the environmental council under President Barack Obama and current senior vice president for energy and environment policy at the left-leaning Center for American Progress, called the proposal "the ultimate silencing of science and facts in our policymaking around infrastructure." She said it puts a huge amount of power in the hands of industry.

"The oil and gas industry wins. The American people lose," Goldfuss said. "The purpose of rewriting these regulations is to build new pipelines and more fossil fuel infrastructure. You would not have to look at the cumulative impacts of a wind turbine or a solar panel because there is no long-term pollution. This is about building towards the past and sticking our head in the sand about the impacts of dirty fossil fuels."

The proposal would be the first major update to the law in more than four decades. The rules are certain to face legal challenges.

NEPA has long been a target of industry groups, developers and Republican lawmakers who say it places unnecessary burdens on business and is used as a tool to block and delay fossil fuel projects. Trump has prioritized advancing major pipeline projects like Keystone XL, a proposed 1,179-mile, $8.5 billion system that would transport some 830,000 barrels of crude oil per day from Alberta, Canada, to Nebraska. A federal judge halted construction of Keystone XL in 2018, ruling that the Trump administration violated NEPA by approving a federal permit without taking into account greenhouse gas emissions and climate change effects. Trump called the judge's decision "a disgrace." And appeals court later lifted that injunction.

The American Petroleum Institute, the oil and gas industry's leading lobbying group, declined to comment on the specifics of the upcoming NEPA changes but pointed to a November letter in which it called on the Trump administration to "modernize" a review and permitting process it said would reduce "delays and uncertainties associated with infrastructure investment."

Diane Katz, a senior research fellow at the right-wing Heritage Foundation, said "streamlining provisions" would help reduce the cost of roads, bridges and railways, but may not even go far enough.

"In fact, the NEPA is entirely out of sync with current environmental, political, social, and economic realities, and outright repeal would not make a whit of difference to the environment or public health."

"In fact, the NEPA is entirely out of sync with current environmental, political, social, and economic realities, and outright repeal would not make a whit of difference to the environment or public health," she said by email.

Trump is an outspoken critic of the federal permitting process and vowed throughout his 2016 presidential campaign to cut government red tape. "We built the Empire State Building in just one year," he said in his 2018 State of the Union address. "Isn't it a disgrace that it can now take 10 years just to get a minor permit approved for the building of a simple road?"

On Jan. 1—NEPA's 50th anniversary—Trump issued a statement criticizing the law and foreshadowing Thursday's announcement.

"While the goals of NEPA remain the same as they did 50 years ago, the environmental review process designed to improve decision-making has become increasingly complex and difficult to navigate," he said. The regulatory update, he added, would "benefit our economy and environment" and provide greater certainty to "project sponsors and ordinary Americans seeking decisions on permits."

But fewer projects requiring environmental review means fewer opportunities for the public to weigh in on potentially damaging construction.

"Trump's gift to the fossil fuel industry and special interests will silence ordinary Americans while giving polluters a free pass to trash the environment, destroy public lands and kill wildlife," Brett Hartl, government affairs director at the Center for Biological Diversity, said in a statement.

If the proposed reforms take effect, taxpayers are likely to end up footing bigger bills for infrastructure damage from climate-linked environmental disasters, as agencies would no longer have to consider the threat that sea-level rise, flooding, wildfires or extreme weather pose to a project.

"We will now be building infrastructure with a blindfold at a time when we know extreme weather is just getting more and more extreme," Goldfuss said.

In the last decade, the US experienced at least 119 climate and weather disasters with losses exceeding $1 billion each, more than double the number of billion-dollar disasters during the 2000s, according to a federal report released this week. Costs from those disasters over the last 10 years exceeds $800 billion.

Interior Secretary David Bernhardt, a former oil lobbyist, said Thursday at the White House news conference that he was "thrilled" by Trump's decision. The reforms "will be the most significant deregulatory proposal" the president implements during his time in office, he said.

"This proposal affects virtually every significant decision made by the federal government that affects the environment," Bernhardt added.

Trump stressed the administration was just getting started.

"We will not stop until our nation's gleaming new infrastructure has made America the envy of the world again," he said. "It used to be the envy of the world, and now we're like a third world country. It's really sad."

To whom it may concern:
My wife and I have lived on the banks of the Big Muddy River for years. Dumping untreated wastewater from the mine into the river is a terrible idea, and should most definitely not be allowed. Neither we nor our neighbors support this, and I struggle to understand how anyone possibly could. If you want to dump wastewater into the river, it should be treated first. We often drink water from our well near the river, and we eat fish caught from the river by our house. In addition, the river regularly floods, exposing all the farmland near the river as well as the crops grown on it to contaminants from the mine. I absolutely insist that any wastewater dumped into the river by the mine be treated before putting it into the river. I strongly urge the EPA to do their duty and to forbid the mine from dumping untreated wastewater into the river.
Thank you for your consideration in this matter.

Re: 7516c- NPDES Permit No. IL0077666, Notice Williamson Energy, LLC

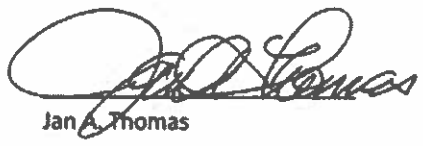
Dear Ms. Lieberoff,

I am a resident of Murphysboro, Illinois, a member of SAFE and a property owner near the banks of the Big Muddy River, and I am totally opposed to the issuance of this permit. I have several objections.

The first is the financial unreliability of this company. Foresight Energy is in near bankruptcy, its partner company, Murray Energy, having gone into bankruptcy in October of 2019. Murray owned 80% of Foresight's stock which has dropped from $17.17 per share on the NYSE in 2015 to less than $.06 per share right now. Foresight missed a 24.4 million dollar interest payment at the end of the third quarter of 2019, got an extension from the SEC twice and still has not made this payment on their 1.25 billion dollar debt. https://ieefa.org/coal-analysts-say-bankruptcy-filing-is-increasingly-likely-for-illinois-basins-foresight-energy/ Coal mines are going bankrupt at record rates as electricity generation transitions to cheaper fracked gas and even solar and wind, as storage abilities increase and become more economical. In the big picture, Illinois basin coal mines will be out of business in twenty years at the latest according to The IEEFA, the Institute for Energy Economics and Financial Analysis. https://ieefa.org/wp-content/uploads/2019/12/Dim-Future-for-Illinois-Basin-Coal_December-2019.pdf

Why should we permit the build out of expensive infrastructure for a dying industry? Who will pay for the cleanup when this company goes down? Peabody just closed the Wildcat Hills Mine in Energy; Murray/Foresight has put its Paradise #9 in Kentucky on "temporarily idled" status as of April of last year. ("Temporary idled status" is basically a legal dodge which permits companies from discharging their financial obligations to laid-off workers who, theoretically, could be recalled at any time.) Many of the coal burning power plants that Foresight's website says it sells to domestically are scheduled to close in the next few years. International sales are declining too, as other countries strive to cut their carbon emissions; also Russia and Columbia, among others, are dumping a lot of cheap coal on the international market. The IDNR Permit states that the proposed pipeline will only be in place for ten years and then be removed. Why is that? And will Foresight still exist then anyway? Will the Foresight miners find themselves in the same state as those Blackjewel Miners in Harlan County KY this last summer who had to camp out on the tracks to prevent the last shipment of coal from their newly bankrupt coal company from being carried out, when their paychecks had

bounced and new ones were not forthcoming? Recently the US Congress approved a bailout of 100,000 miners' pensions caused by the demise of coal mining companies, another example of coal mines not paying their contractual obligations and leaving the tab to the American people. And by the way, Robert Murray, CEO of Murray Energy, got 14 million dollars before his company went belly-up, and gave 1 million to climate-change-denying groups.



At the December 18 Hearing I asked the question of why the option of deep injection wells for this salty water has not been considered. The answer given was that Foresight has tried this option at Sugar Camp Mine, and it proved not to be economical for them. That seems to me to be an inadequate response. Who determines what is economically acceptable? Has Foresight provided any hard numbers to the IEPA to justify their assertion? Have they provided any concrete evidence that other options, such as pre-treating the water for removal of salts before dumping, are not "economical" for them? Or are you just taking their word for it?

Deep injection wells are a common practice in the fracking industry in which each frack produces millions of gallons of toxic water, at least as much as this mine is producing. And we are told this water contains none of the toxic industrial chemicals such as benzene, formaldehyde, lead, etc. which are added to frack water, and which are implicated in causing earthquakes and polluting ground waters, nor any of the toxins contained in the flowback water picked up from the deep earth such as TENORMs. If it comes from saline aquifers why not return it to them instead of dumping it into surface waters containing life?

This brings me to the really critical issue, the climate catastrophe which is barreling down upon us. I realize that you are supposed only to consider legal and technical issues in deciding this permit, but the time for that has passed. Many other commentators will be discussing the numerous violations of Foresight with regard to their already existing permits, the technical issues around pollution limits, the chemistry of salts on existing pollutants in the riverbed, the effects of salty water on wildlife, the lack of any substantive environmental studies and many other such issues. I am asking you to also consider the bigger picture because you are charged with **protecting our environment.** Article XI of the Illinois Constitution mandates that "The public policy of the State and the duty of each person is to provide and maintain a healthful environment for the benefit of this and future generations" and that "Each person may enforce this right **against any party, governmental or private..."** It is way past time to start thinking holistically. What this permit would do is basically allow Foresight Energy to export Illinois coal to the rest of the world to burn inexpensively, thus exacerbating the climate crisis and endangering us all. There is no benefit to the people of Illinois, not even a Severance Tax! Business as usual will not save us now. Indeed business as usual is what has gotten us into the crisis we are now facing. With the current national administration doing its worst to deregulate all polluting industries and limit citizens' rights to resist, as exemplified by the current assault on NEPA, it is more crucial than ever for states to stand up and protect their citizens.

Please deny this permit for the good of us all.

Sincerely,

Jan A. Thomas

Coal analysts say bankruptcy filing is 'increasingly likely' for Illinois Basin's Foresight Energy

S&P Global Market Intelligence ($):

One of the few major U.S. coal companies to dodge the bankruptcy court may soon need to file for Chapter 11 restructuring if the current market and economic forces working against the coal industry persist, according to recent securities filings.

Over the past few weeks, Foresight Energy LP exercised an option to delay a $24.4 million interest payment and negotiated the right to skip a publicly accessible quarterly call to discuss its third-quarter finances. As management of the Illinois Basin coal miner management works to restructure its balance sheet, the New York Stock Exchange delisted its stock and Foresight affiliate Murray Energy Corp. filed for a bankruptcy reorganization.

"With a significant debt load and a near-term pricing recovery increasingly unlikely, a Chapter 11 bankruptcy filing appears increasingly likely," B. Riley FBR analyst Lucas Pipes wrote in a Nov. 14 note.

While some coal companies struggled to sell assets even through bankruptcy auctions, Pipes noted that Foresight still owns some attractive mining assets, with its longwall mines capable of producing coal at a lower cost than its peers. However, the company has about $1.25 billion in gross debt on its balance sheet.

"The partnership continues to engage in discussions with its creditor constituencies and is exploring potential restructuring alternatives," Foresight wrote in a Nov. 12 securities filing. "As a result of these discussions and potential restructuring efforts, it may be necessary for us to file a voluntary petition for relief under Chapter 11 of the United States Bankruptcy Code in order to implement a restructuring, or our creditors, under certain circumstances, could force us into an involuntary bankruptcy or liquidation."

Illinois Basin producers turned to a recent boom in export markets to make up for a decline in domestic demand, but that demand is retrenching. In the third quarter of 2018, Foresight captured $140.8 million in international coal sales. In the third quarter of 2019, it reported $34.8 million from export markets, a 75.3% decline. Domestic sales fell from $151.2 million to $146.7 million in the same period.

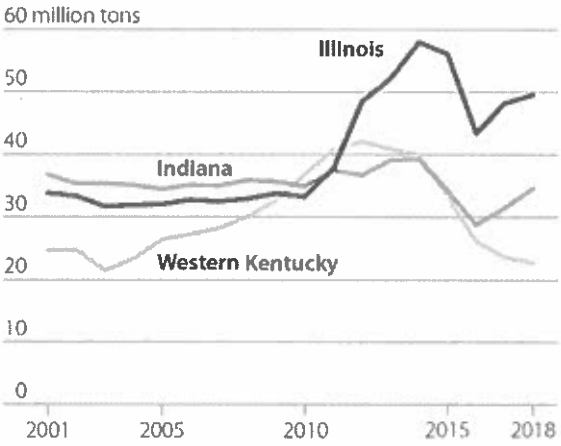
Dim Future for Illinois Basin Coal



Market Forces and Shifting Preferences Are Eroding Customer Base Domestically and Abroad

Executive Summary

Twenty years from now, most of the Illinois Basin coal industry will be gone. Currently one of the major U.S. producing regions of thermal coal for domestic and foreign electricity generation, by 2040 it will have largely faded away as utilities shift to cleaner, cheaper generation resources.

In 2018, the Illinois Basin produced 106.8 million tons of thermal coal, about 14 percent of the total mined nationwide. Most of that total was used domestically, the remainder was exported. The Basin, which straddles the Ohio River in parts of three states—southern Illinois, southwest Indiana and western Kentucky—does not produce any of the metallurgical coal used in steelmaking, meaning it cannot escape the rapid transition now under way in the electric generation sector, both domestically and abroad.

Illinois Basin Coal Production by State

Source: Energy Information Administration

Domestic utilities, which bought nearly 80 percent of the region's coal in 2018, have already announced retirement dates for a significant number of plants over this period, as competitive electric markets compel a shift to newer, less expensive and cleaner wind, solar and gas generation, increasingly supported with energy storage. Notably, these retirements include the largest single purchaser of Illinois Basin coal, Duke's Gibson plant in Indiana, which will close in phases by 2038.

Gibson's closing will not be unique, however. From the beginning of 2019 through 2024, at least 15 U.S. plants that buy Illinois Basin coal—in Alabama, Florida, Georgia, Indiana, Kentucky, North Carolina and Tennessee—will be fully or partially retired. That number, which only reflects formal announcements by utilities, is likely to grow as the economics of coal-fired generation continue to deteriorate relative to renewables and gas.

Even those plants that remain online are likely to be used less and less, reflecting a trend that has seen capacity factors at most coal-fired power plants in the U.S. decline sharply over the past decade.

Coal exports, seen just a decade ago as a potential growth market, face the same market threats, particularly in Europe which is moving aggressively away from thermal coal. In addition, there is growing competition from foreign coal suppliers such as Russia and Columbia for this shrinking market.

These threats are already having a major impact in the region. Just in the past year, producers have closed or idled mines that produced almost nine million tons of coal in 2018. Further closures are likely, both in the near- and long-term.

The Illinois Basin will clearly be hit hard economically by the structural decline of the region's coal industry. Now is the time for local, state and federal policymakers to be planning for the transition in order to minimize the impact of additional coal mine closures, job losses and mining company financial hardships.

Overview

By 2020, Illinois Basin production will have fallen 40 percent since its peak in 1990, part of a widespread decline in the U.S. (see the chart below). Other major coal-producing regions such as Appalachia[1] and the Powder River Basin[2] [3] are faring even worse, with the drop in Appalachian production expected to hit 70 percent by next year compared to its peak, also in 1990. In the West, the decline has been happening even faster, and on a bigger scale: peak production occurred only a decade ago, in 2008, but by the end of 2020 will have been cut almost in half. The entire U.S. coal sector—long dominant in terms of electricity generation market share—is losing out to cheaper forms of energy that include gas-fired power and renewables (wind and solar), and it is doing so at a quickening pace.[4]

U.S. Regional Coal Production, 1985-2018, With Estimates to 2020

Output has fallen sharply in all three major coal mining regions. From their peak years to 2020 (using the latest estimates from the U.S. Energy Information Administration), production is expected to have fallen by 40 percent in the Interior, which includes the Illinois Basin, 47 percent in the West, and 70 percent in Appalachia

Source: Energy Information Administration (2019-2020 estimates from Nov. 2019 Short-Term Energy Outlook)

Power markets are modernizing, and traditional coal-fired generation is becoming increasingly anachronistic. In 2018, 15,500 megawatts (MW), or 6 percent of all coal-fired capacity in the U.S., was retired, with an additional 14,000MW retiring this year, and many plants that are still in operation are being used less and less frequently by utilities. This year alone, power generation from coal has fallen by 13.4 percent through September, compared to the same period in 2018.[5] The result has been widespread financial carnage over the past two years for the coal industry,

R03705

in which 11 U.S. mining company bankruptcies have occurred. One recent news headline crystallized the trend and put the very future of American coal mining in question—"Bankrupt giants hand unwanted coal mines to unknown firms."[6]

In the Illinois Basin specifically, the pace of mine closure announcements has picked up in recent months. In addition, other Illinois Basin mines have been "temporarily idled," a misleading industry term that suggests those mines will reopen when economic conditions improve, but in fact likely will never return to production. Such idlings, can, however, serve as a way to stave off mandated reclamation.

Put bluntly, declining demand means more mines across the Illinois Basin will need to close in the months and years ahead—just as more coal mines will close nationally—and those closures will likely come at a faster rate than has previously been seen.

The decline of the American coal industry more generally is gaining momentum, pushed out by cheap gas from fracking and rapidly falling costs for wind, solar and storage. These trends are discussed in greater detail in IEEFA's annual coal-outlook report published eight months ago[7] and in regional IEEFA research published this year that has included analysis of the Powder River Basin of Montana and Wyoming and of coal-fired generation in the Southeast U.S. (Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee and Virginia).[8]

The continuing rise of renewables, which are increasingly competitive and in many cases cheaper than coal-fired power, was detailed in a Lazard report published just this month.[9] "That phenomenon has increased this year," a Lazard representative said in a report follow-up.[10] "There are situations where the cost of building new wind and the cost of building new solar are cheaper than keeping a coal or nuclear plant operating. And even on an unsubsidized basis, we're starting to see those costs undercut the marginal cost of coal and nuclear."

Similar sentiments have even been voiced by executives within the coal-mining industry itself. Speaking generally of Illinois Basin coal mines, a Hallador Energy executive, for instance, said on an earnings report call in May of this year, "Some of these assets are not long for this world."[11]

Likewise, executives at big utility companies are openly acknowledging the phase-out of coal-fired generation. The CEO of Xcel Energy, for example, said in a June 2018 speech, "It's not a matter of if we're going to retire our coal fleet in this nation, it's just a matter of when."[12] Xcel is of note for two reasons. One, its size (Xcel sells power across the Upper Midwest and in the West), and, two, its aggressive renewable energy buildout, which S&P Global Market Intelligence concluded in a

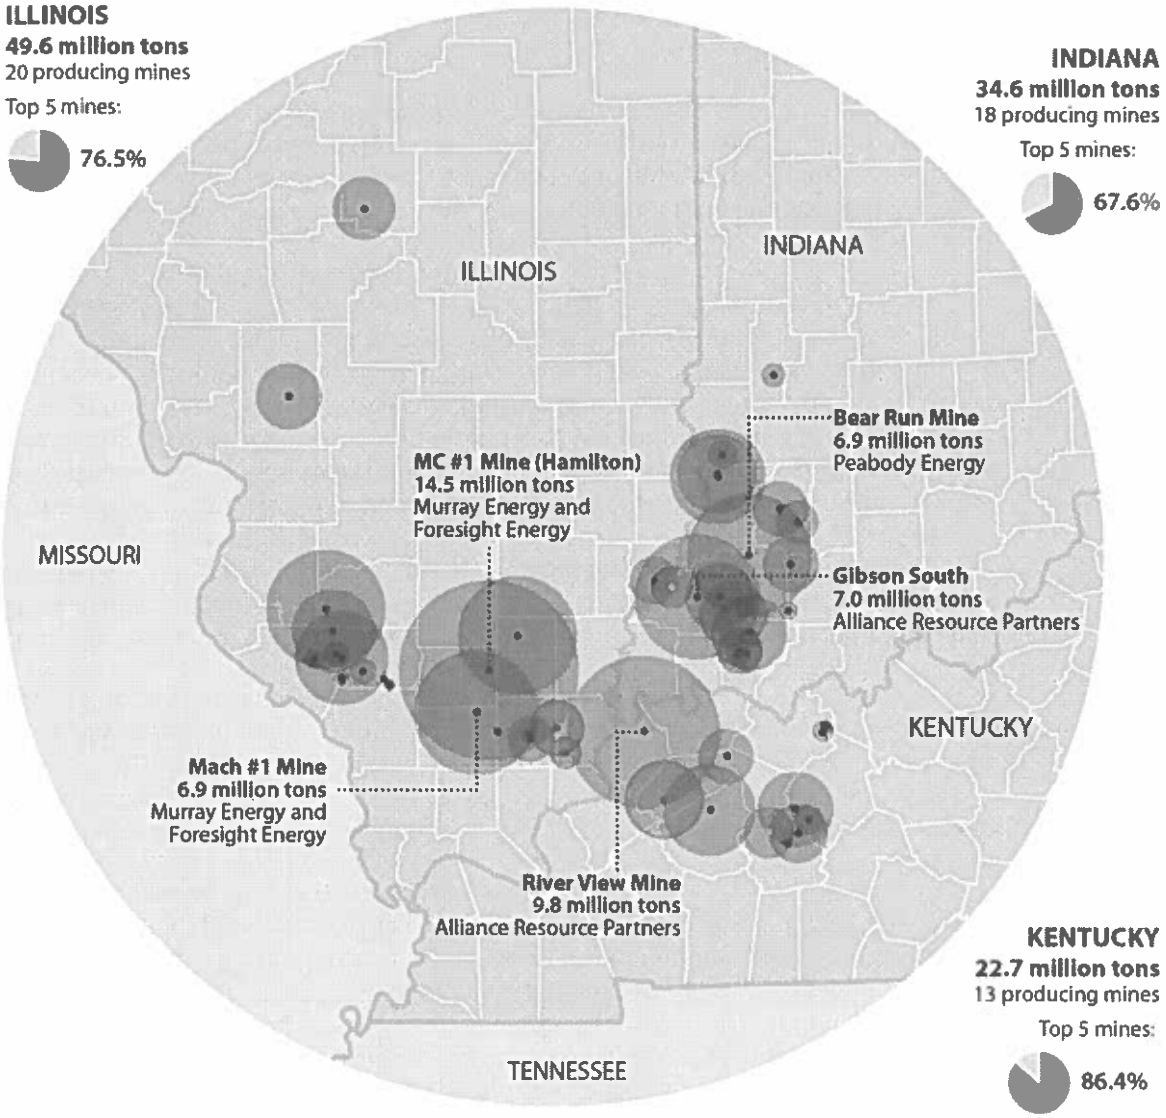
[12] Greentech Media. Xcel CEO Says Retiring the US Coal Fleet 'Just a Matter of When'. June 2018.

September 2018 analysis "augers well" for Xcel to deliver on its goals of increasing long-term earnings per share by 5 to 6 percent annually and increase dividends annually by 6 to 7 percent.[13]

As the decline in Illinois Basin's coal-production continues, companies that have mines in the region will continue to face market pressure. They include (ranked by amount of Illinois Basin production) Alliance Resource Partners, Murray Energy and its partner Foresight Energy, Peabody Energy, Hallador, Arch Coal and White Stallion.

State-by-state reviews of these companies' utility customers offer another window on why the Illinois Basin coal industry is in such peril. As major customers in states like Florida, for instance, continue to move aggressively away from coal, demand for Illinois Basin coal will weaken further. And export markets aren't likely to be of much help, as Murray Energy executives conceded when the company filed for bankruptcy in October.[14]



The map on page 7 shows recent coal-industry activity across the Illinois Basin.

Illinois Basin Coal Production, 2018

Total production: **106.8 million tons**

Market forces are beginning to work against the coal-mining industry in the Illinois Basin. Declines in export demand and gathering momentum around retirements of coal-fired plants will affect every state and every company in the basin. Recent mine closures and idlings are part of an emerging long-term trend that will likely result in fewer mines regionally and far less production. On this map, circle sizes are proportional to production; the top five regional mines are labeled.

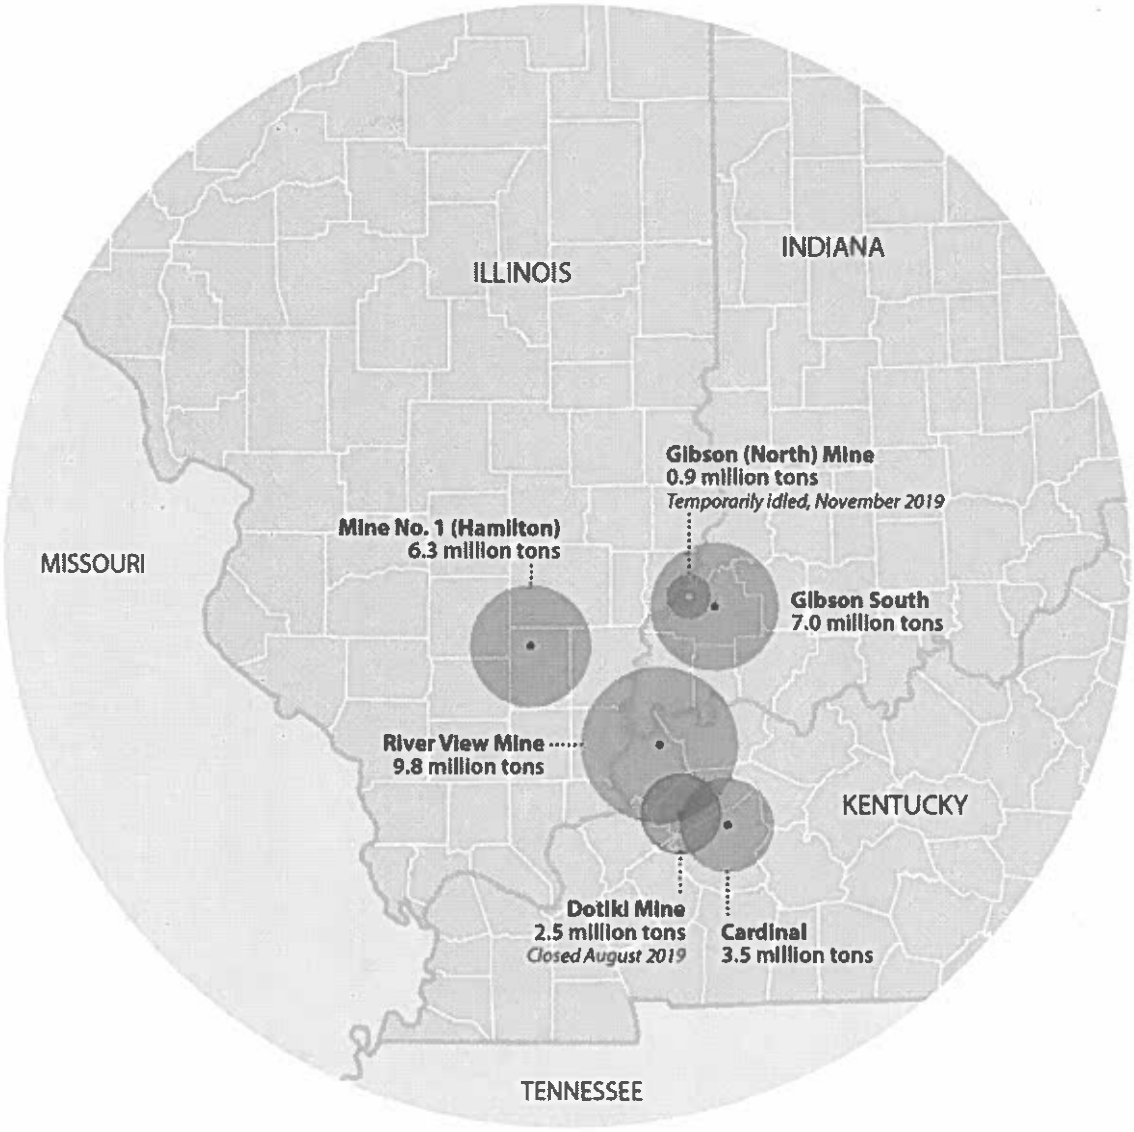
The Company-by-Company View

Alliance, Murray-Foresight, Peabody, Hallador, Arch, White Stallion

The company-by-company maps on the following pages show the geographic presence of the six biggest producers in the basin. Ranked by Illinois Basin production in 2018, they are Alliance Resource Partners (29.9 million tons), Murray/Foresight Energy (28.6 million tons), Peabody Energy (18.6 million tons), Hallador Energy (7.6 million tons), Arch Coal (6.3 million tons) and White Stallion (5.6 million tons); together these companies produced 90 percent of all the coal mine produced in the basin in 2018.

Collectively, the maps suggest stability—that is, they show how most mines in the region remain open. But they also show a developing trend of either permanent closures or companies designating mines as "temporarily idled," a highly misleading term. The reality in today's rapidly changing electric generation market is that these idled mines will probably never reopen.

Thus, the "temporary" idling in November of the Gibson North Mine in Indiana by Alliance likely means this mine will never again produce coal; 185 workers were affected. Gibson North produced nearly 900,000 tons in 2018, and 1.7 million tons in the first nine months of 2019.15 In August, Alliance permanently closed the Dotiki mine in Kentucky, affecting about 200 workers. At this mine, production in 2018 totalled 2.5 million tons.16 Similarly, Murray Energy/Foresight Energy ceased production in April at Paradise #9 in Kentucky, which produced 1.1 million tons in 2018, and Peabody in October closed the Somerville Central Mine in Indiana, which produced 2.1 million tons in 2018. In December, Peabody will finish closing its Wildcat Hills mine complex in Illinois, which produced 1.7 million tons in 2018, and the company in the past year has closed two smaller mines—one each in Illinois and Indiana— that together produced 600,000 tons in 2018.



Collectively, then, almost 9 million tons, or 8.4 percent of the Illinois Basin's 106.8 tons of production in 2018 has been taken off the market in the past year or so for lack of demand, and additional production cuts are likely based on the EIA's short-term forecast for 2020, which sees production cuts increasing to 11 million tons.

The effect will be substantial on companies that operate in the Illinois Basin, and the recent mine closures noted above—by Alliance, by the recently bankrupt Murray/Foresight and by Peabody—signal a future in which Illinois Basin producers will continue to lose customers in the U.S. and in foreign markets alike.

State-by-State and Customer-Base Slippage

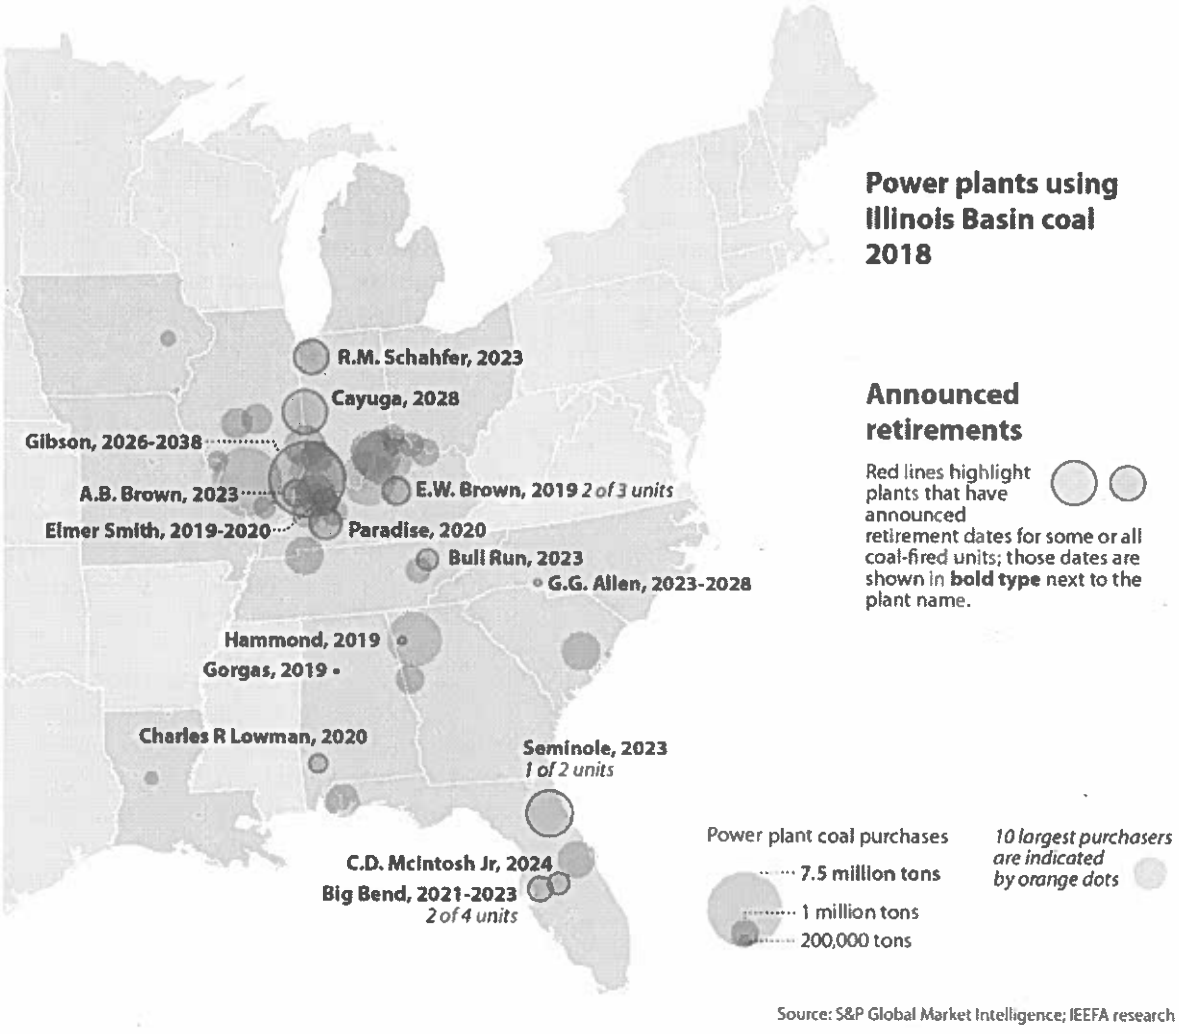
Retirement Dates Loom for More Coal Plants

The problem facing the Illinois Basin coal-mining industry is made clear by focusing on its 49 domestic power-plant customers, which collectively consumed nearly 80 percent of 2018 production and are scattered across states that run from the heart of the Midwest into the Deep South. The 10 largest customers, shown below with orange circles, stretch across Florida, Georgia, Illinois, Indiana and Kentucky, and together use more than half of the coal the basin delivers domestically. The other 39 customers are marked by purple circles. The size of the circles is proportional to the amount of Illinois Basin coal delivered.

Sources: S&P Global Market Intelligence; Energy Information Administration

A significant portion of this customer base will be phased out over the next five years, based on already-announced retirement plans (see the map on page 17).

A clear view of the future of the basin's customer base can be seen in Duke Energy Indiana's June announcement about its retirement plan for the Gibson coal-fired plant. The closure of this plant, the Illinois Basin's largest single coal customer, accounting for almost 10 percent of sales in 2018, almost certainly signals an end date for most of the Illinois Basin coal industry. Situated on the Wabash River across from Mt. Carmel, Ill., the Gibson plant is one of the largest power plants in the U.S., with more than 3,100MW of capacity, and it sits in the heart of Indiana's coal-mining area, very close to Alliance Resource Partners' Gibson coal mine complex.



The dates of the planned closures of the plant's five units, each of which has a nameplate capacity of about 630MW, suggest the timeline the decline of the region's coal industry will follow as well. Unit 4, for example, will now be shut down in 2026, nearly 20 years earlier than its originally-planned retirement in 2044, according to Duke (all the units began operation between 1975 and 1982). Units 3 and 5 will now be shut in 2034, a decade before their previously expected retirements in 2043 and 2047, respectively. The last two units, Units 1 and 2, will be retired in 2038 instead of 2041 and 2040. Yet even these retirement dates may be optimistic: utilities have frequently accelerated their retirement timeframes as coal-plant economics have worsened.

Existing plants have been running less, too. As coal has become less competitive against gas and renewables, larger utilities have been able to fuel-switch across their generation fleets, favoring these cheaper sources whenever they can. As a result, Gibson has been running less than it could. In August, for example, the plant operated at just 33 percent of capacity, its lowest monthly level in at least two decades. In addition, as coal plants like Gibson age, they require more maintenance, and if they are run less, the overall cost of their power goes even higher, making such plants even less competitive.

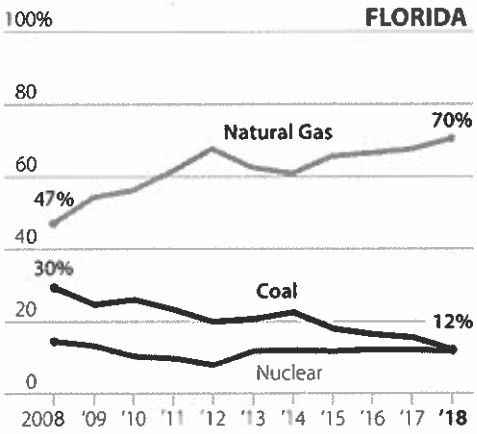
With the economics of coal-fired power deteriorating, more and more utilities have been accelerating retirement dates. In northern Indiana, for instance, the utility NIPSCO recently said it would save $4 billion by retiring its coal plants early and passing those savings on to customers.

It is worth noting that the corporate and financial relationships between the coal-mining companies and the utilities that buy their coal plays a significant role in how quickly coal is being phased out in the Illinois Basin—and across the U.S., for that matter. For the most part, utilities do not have financial stakes in coal mining, and the coal plants they have are usually part of a larger fleet of generation assets that run on a mix of fuels. This encourages them—as is broadly required by state utility oversight agencies—to operate their plants in the most economically efficient way possible, freeing them to cut expensive coal generation without incurring losses when the mines they buy from are closed. They are usually just buyers of fuel, and not in the business of extracting and processing that fuel.

In Illinois, though, there is one major exception: the 1,624MW Prairie State Energy Campus in Washington County. Prairie State is owned by a group of municipalities, public authorities and rural electric cooperatives who also own the neighboring Lively Grove coal mine that supplies the generation station. This practically-new plant, opened in 2012, is the second-largest consumer of Illinois Basin coal, accounting for 8.6 percent of all production in 2018, but it comes entirely from the Lively Grove mine. This self-contained economic structure has locked the owners into very high power costs without much flexibility to shift to cheaper and cleaner generation resources, either from their own renewables or from regional power markets that are increasingly supplying low-cost wind power. IEEFA has written extensively about the situation in past reports.[17] [18]

[17] IEEFA. Cost of Coal From 'Mine-Mouth' Prairie State Plant Isn't the Bargain That Was Promised. April 2015.

[18] IEEFA. 2014, Another Year of Unmet Promises for the Prairie State Energy Campus. February 2015.



Florida, Georgia, Illinois, Indiana, Kentucky

FLORIDA

Coal-fired generation in the Sunshine State is on the way out, as can be seen in well-rooted trends that date back a decade at least. Gas-fired generation now accounts for 70 percent of all electricity production in Florida. Coal-fired plants contributed 30 percent to Florida's power mix as recently as 2008; that number had fallen to 12 percent by 2018.

The 2010 census put the state's population at 18.8 million, and by 2018 that number had risen 6 percent, to 21.3 million.[19] While electricity consumption in the state has climbed with its population boom, none of that demand increase was supplied by coal.[20]

Fuel Share for Electric Power Generation (Utility Scale, All Sectors)

Only fuels with 5% or more share in any year are shown.
Source: Energy Information Administration

While gas-fired generation has taken a bigger and bigger share of the market, the state's three biggest utilities—Duke Energy Florida, Florida Power and Light, and Teco Energy—have plans to install more than 11GW of solar over the next 10 years.[21] While the state comes belatedly to solar—a circumstance rich with irony, considering how Florida's nickname is the Sunshine State—it has recently made a hard pivot toward utility-scale solar. In 2018, the three major utilities brought a total of 876MW of utility-scale solar online,[22] roughly enough capacity to power almost a million homes. Simultaneously, battery storage is coming online in a fast-spreading advance that stands to bolster the uptake of solar.

Florida's coal-fired capacity has fallen by more than half over the past decade to 7,883MW, of which 2,094MW will be retired by 2024, according to utility-company announcements.

R03719

GEORGIA

Electricity-generation trends in Georgia are similar to Florida's. Coal-fired generation market share fell from 63 percent in 2008 to 25 percent in 2018. That share will drop further in the near future— and for the same reasons seen in Florida. Gas-fired generation is cheaper, as is utility scale solar (Georgia Power plans to have 2,260MW of utility-scale and distributed solar online by 2024).

Georgia has only three coal-fired generation plants, although two are the largest in the U.S., the 3,392MW Plant Scherer and the 3,200MW Plant Bowen. The third, 1,744MW Plant Wansley, is very likely to follow in the footsteps of Plant McIntosh (142MW) and Plant Hammond (840MW),[23] both of which were retired this past July. Plant Bowen is an especially big Illinois Basin customer, ranking fifth among Illinois Basin users in 2018 (3.93 million tons). Its owner, the Southern Company subsidiary Georgia Power, published an updated integrated resource plan (IRP) this year noting "economic challenges"[24] facing the plant.

ILLINOIS

Illinois has the strongest renewable energy standards of the five states noted here, with a goal of getting 25 percent of its power from renewable sources by 2025.[25]

It is also where markets are driving a wave of coal plant closures that are very quickly reshaping the state's energy economy. Vistra Energy is the prime example, having recently announced that it would close the 585MW E.D. Edwards plant at the end of

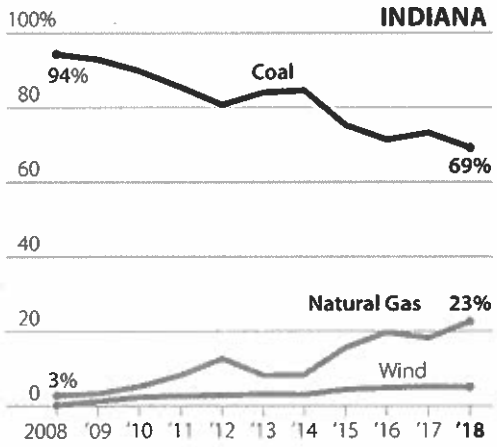
[25] National Conference of State Legislatures. State Renewable Portfolio Standards and Goals. accessed November 2019.

2022.[26] The company had already announced that it would close four other coal-fired plants in Illinois this year with a total capacity of about 2,000MW.

Vistra, an energy behemoth with 10 coal-fired plants in the U.S. that have a total of 11,000MW of generation capacity, in October announced new emissions-reduction goals in which executives at the company said it "anticipates retiring more coal assets."[27]



INDIANA

Indiana is not considered a leader in electricity-generation transition policy, but market-driven changes are occurring, nonetheless.

The state has a formal goal of getting 10 percent of its electricity from "clean energy" by 2025, but the parameters for meeting that target are loosely defined and favor "clean coal" technology and gas-fired generation.

Market changes may outpace state policy, however. The Northern Indiana Public Service Company (NIPSCO) this year announced plans to abandon coal-fired electricity generation entirely and to focus on utility-scale solar generation and other renewable generation. In October, NIPSCO published requests for proposals for development of 2,300MW of solar and 300MW of wind-powered generation.

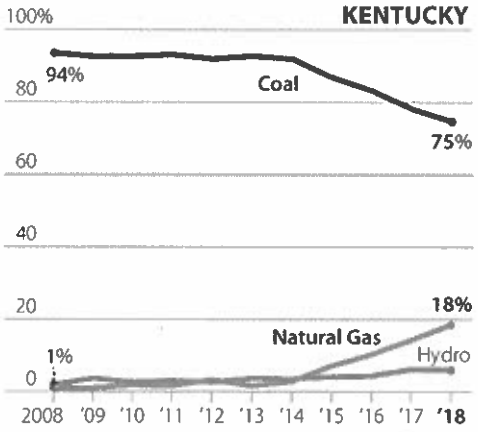
Fuel Share for Electric Power Generation (Utility Scale, All Sectors)

Only fuels with 5% or more share in any year are shown.
Source: Energy Information Administration

"The driver for how we make decisions is really rooted in economics and costs for our customer," an executive at the company said when the RFPs were announced.[28]

KENTUCKY

Even Kentucky, reliant on coal for 94 percent of its electricity generation a decade ago, is changing. Coal's share of the state's power-generation market dropped 19 points from 2008 to 2018, a shift owing almost entirely to the rise of gas-fired generation.



[26] **Utility Dive.** Judge OKs $8.6M Vistra coal plant closure settlement seen by NGOs as model for helping impacted communities. November 2019.

[28] **Greentech Media.** The Solar Boom Takes Off in the Industrial Midwest. October 2019.

R03721

Although Kentucky has deep cultural connections with coal, existing national power-generation trends will likely gain momentum in the state for purely economic reasons. They will be driven also by corporate policy initiatives, as U.S. companies that do business in Kentucky are adopting increasingly stringent requirements on where their electricity comes from.

Utility companies in Kentucky are also evolving. Kentucky Utilities and Louisville Gas & Electric are both subsidiaries of PPL Corporation, which last year announced plans to cut its carbon-dioxide emissions by 70 percent from 2010 levels by 2050. According to the corporation, among the measures that will be needed to reach that goal "include replacing Kentucky coal-fired generation over time with a mix of renewables and natural gas while meeting obligations to provide least-cost and reliable service to customers."[29]

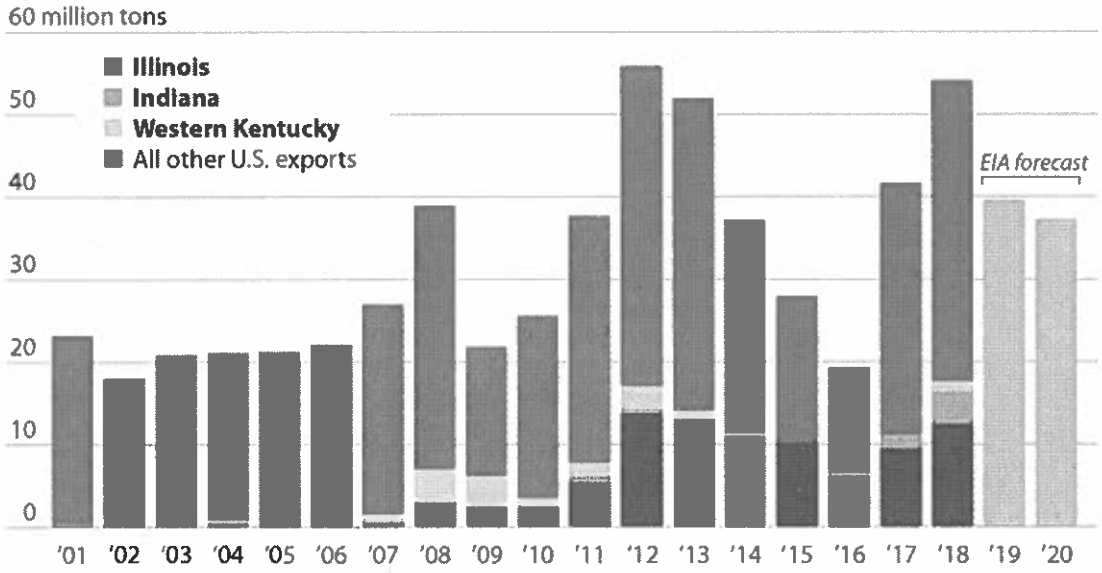
The Export-Market Problem

Market Forces Continue to Work Against Coal Overseas, Too



Beginning about a decade and a half ago, Illinois Basin producers saw potential in shipping coal to Europe, India and elsewhere for power-generation purposes.

These ambitions paid off as European demand for U.S. coal rose—for a while. But the same market forces that are moving against coal in the U.S. are working against European coal-fired generation too. A handful of countries in the 28-member European Union continue to rely heavily on coal-fired power but even nations like Poland, which in some ways is the Kentucky of Europe, are seeing change.[30]

U.S. Thermal Coal Exports, and Exports from the Illinois Basin

Exports from the Illinois Basin have surged over the past decade, rising to roughly one-third of all U.S. exports. Most of that volume is from mines in one state, Illinois.

Source: Energy Information Administration, Annual Coal Distribution Reports

An October report published by the Carbon Tracker Initiative showed how four of five coal-fired power plants in the EU are losing money.[31] The report put EU coal fleet losses at €6.6 billion (US$7.1 billion) in 2019 alone.

"Policymakers and investors should prepare to phase out coal by 2030 at the latest," Carbon Tracker concluded, and—indeed—financiers,[32] political leaders,[33] and even mining companies[34] continue to distance themselves from European coal-fired power.

In addition, competition from other thermal coal-exporting countries is increasing, and they may be better positioned than exporters in the Illinois Basin. For example, Platts recently reported that Colombian and Russian coal is more price competitive in European markets than Illinois Basin, Northern and Central Appalachian coal."[35]

Outside Europe, other countries that are big importers of U.S. thermal coal, including India, South Korea and Japan, are also accelerating their adoption of renewable power in an effort to both cut pollution and reduce dependence on imported energy. As demand for coal declines, it will be increasingly difficult to

[31] Carbon Tracker Initiative. Four in five EU coal plants unprofitable as renewables and gas power ahead. October 2019.

sustain Illinois Basin exports.

All U.S. coal exports are highly dependent on international market prices, and volumes have waxed and waned with those price fluctuations, illustrating the fundamental volatility that defines the basin's export market.

U.S. Thermal Coal Exports, Quarterly

U.S. coal export volume has fluctuated considerably in recent years, but has tracked closely with market prices. Forecasts for the fouth quarter of 2019 and 2020 are from the EIA's November Short-Term Energy Outlook.

Source: Energy Information Administration

Conclusion

Structural and Permanent Decline; Opportunity in New Energy Models

The Illinois Basin's coal industry is entering a period of structural decline.

Within the next 20 years, virtually all of the U.S. coal-fired plants that currently buy the basin's coal will be either retired or little used, the result of an economic and technologically driven energy transition in the electric power industry that favors lower-cost and cleaner alternatives. In particular, wind, solar and battery storage—especially when combined—already offer utilities distinct advantages in grid resiliency, modernization and low maintenance, all with zero fuel expenses and declining construction costs. Inexpensive gas from hydraulic fracturing is also playing a major role in this transition, though the cost of renewables has already reached parity or undercut gas in many areas. No new American coal plants will be built.

As a result of this transition, a significant portion of the Illinois Basin's domestic power-plant customers now have dates for retirement within the next few years. IEEFA expects many more retirements beyond those over the next two decades. Further, coal consumption at existing power plants has begun to decline as they become less economically competitive, a trend that will accelerate as the difference in generation cost widens.

Growth in exports, which had masked declines in domestic demand until recently, appear to have peaked and turned lower. The same technology and market-based forces at work in the U.S. are at work as well in many of the basin's current or potential export markets, including Europe, India, Japan and South Korea, where utilities plan to cut coal use while increasing power generation from renewables. This will make it challenging for U.S. thermal coal exports over the long term. As demand in these markets starts to fall, international coal markets will likely be oversupplied, leading to intense price competition. The inherent volatility of the international export market, combined with permanently shrinking domestic demand and the generally weak financial condition of the coal-mining sector will necessarily lead to lower production and fewer companies (either from attrition or consolidation) operating in the region.

Twenty years from now, most of the Illinois Basin coal industry will be gone. While this may seem like a relatively far-off time, the economic impact from the constant drumbeat of coal-plant closures, mine closures and job losses will likely be significant in the region. Limiting the harm—and benefiting from the emerging economic opportunities—from this transition will require leadership, planning and support from federal, state and local officials.

And there are many real benefits, including long-term, non-agricultural income for farmers and counties from renewable power projects, lower electricity costs for individuals and businesses, economic activity from a regional buildout of renewables, improved power-grid resilience and construction and engineering jobs. Policymakers and communities that embrace this transition will be in the best position to gain a long-term advantage from these changes, and better able to offer lasting improvements that will be beneficial for everyone.

The Union County Democrat Central Committee Members are 100 percent against the Pond Creek Mine Pipeline to Big Muddy River The wastewater flow would have a daily rate of 2.7 to 3.5M to 3.5 million gallons daily and contain toxic chloride and sulfate that typically exceed allowed standards. The amount of water discharged would be equal to about 10% of the Big Muddy's Flow during the dry summer months.
Due to the following:
The effects of high concentrations of chlorides and sulfates on fish and other wildlife
Increased flooding in your area
The effects of sedimentation on wildlife, covering up fish eggs or insect larvae
Areas where you have seen erosion caused by flooding
Your concern about direct contact with the water because of chlorides and sulfates when you are fishing, canoeing or kayaking on the Big Muddy River
Effects on sensitive wildlife areas, such as LaRue Swamp
The effects on riparian vegetation –
What more need be said? Come on EPA protect our environment!

Dear members of the EPA,

Southern Illinois has been about as perfect a place to grow up in as I could ask for. My family moved here in 2007, when I was four years old. Many of my favorite memories have to do with Southern Illinois' waterways--kayaking in Devil's Kitchen Lake, catching crawdads in the creek in Ferne Clyffe, swimming in Big Creek. As I get older, I'm learning that these places are valuable not only for their place in the hearts of many locals, but also for scientific and economic reasons. Southern Illinois is home to a Ramsar Wetland of International Importance, a flourishing tourism industry including a wine trail, and over 250,000 acres of national forest.

However, Southern Illinois is currently caught up in a tiresomely cliche story: a big company trying to profit off small town folks by misusing local resources. If this were a storybook and I a publisher, I wouldn't take the story because it's been overdone. Everyone knows how it goes and what's supposed to happen: the community should rise up, led by the children, and send the company packing (with, of course, a happy ending as the mine owners turn their resources towards clean energy and the miners can work in renewable energy fields).

Foresight Energy has applied for a permit to discharge more mine water from the Pond Creek Mine into Pond Creek and to run a pipeline over 12 miles to dump some directly into the Big Muddy, a beautiful river that's already struggling with pollution.
At the public hearing, I heard a representative from Williamson Energy claim that the water that the Pond Creek Mine proposes to dump into the Big Muddy is simply slightly brackish and salty water, because it's groundwater seepage rather than water from a treatment process. However, that is misleading. The West Virginia Geological Survey explains, "When coal is mined, fresh sulfur-bearing minerals in the coal and rocks are exposed to air and water. The resulting chemical reactions produce sulfuric acid and precipitates. The acid water flowing from coal mines, if not treated, can damage life forms in the receiving streams" (2017). The mine water is not, in fact, harmless, but will further pollute Pond Creek and the Big Muddy, damaging our natural resources and endangering aquatic life.

The sections of the Big Muddy and Pond Creek that would receive the extra mine water discharge are on the United States Environmental Protection Agency's 2016 and 2018 biannual list of impaired waters (p. 3, 40). Once a section of water is put on the list of impaired waters, additional pollutant loadings are not allowed until that section is removed from the list. Sections of water can be removed either because the pollution levels have subsided, or because a total maximum daily load for each pollutant has been approved by the EPA and put into practice (IEPA, 2014). I am concerned that these sections of the Big Muddy and Pond Creek will be removed from the list by statistical recalculations without significant change in the chemical content of the water. The current pollution level of the water needs to be addressed before we consider adding new point sources.

These proposed discharge sites will affect not only the immediate area, but everything downstream. For example, the LaRue swamp, listed as a priority resource by the Illinois

Department of Natural Resources (2019), is downstream from the current discharge sites and the proposed new ones. LaRue is listed for its "high diversity of reptiles and amphibians," certainly species that are affected by water quality. Although much research has been done on the LaRue area, it's a wonderfully rich habitat and there's still a lot of potential for new discoveries. It's imprudent to risk either the value that we already understand or the value we haven't yet discovered. Foresight Energy's financial savings are not worth jeopardizing areas and species that we haven't fully researched yet. The species in this area, and in all the downstream areas that will be affected, should be exhaustively mapped and understood before introducing potentially ecosystem-altering chemicals.

Freshwater mussels in the Big Muddy River have already been affected by pollution levels, as reported by concerned local citizens at the EPA hearing who have lived near the Big Muddy for decades and have noticed a decline in the population. The US Fish and Wildlife Service reports that freshwater mussels are "one of the most imperiled groups of animals in the world," and are "generally underrepresented in toxicity databases" (2019). In a study done on a similar species, fingernail clams, acute concentrations less than 150% of the allowed chloride limit were enough to kill half of the population of clams in 96 hours (Linton, 2008, p. 9). It has also been shown that the early development of native fish can be disturbed by high levels of sulfates (Wang et al. 2015a).

Many studies on aquatic life are done on daphnia and tubifex worms, tiny creatures that few non-biologists have heard of. In general, the studies show a level of sensitivity to pollution that should cause us to be very careful about the decision to dump pollutants (Wang et al., 2015b). Other tiny creatures that are critical to the food web have been shown to be negatively affected by higher levels of total dissolved solids (Timpano et al., 2010), such as would result from this proposed additional pollutant load. It can be difficult to care deeply about the well-being of water fleas, but these microscopic creatures are deeply enmeshed in the food web, supporting the bluegill, kingfishers, and other river life that we do know and love.

Pollutant limits ought to keep wildlife safe. However, based on the company's record, it's questionable at best whether Foresight Energy can be trusted to follow the limits set out in the proposed permit. In the last three years, Foresight Energy has violated the legal pollutant limits during five of the 12 quarters (US EPA 2019). Foresight Energy has been recorded discharging over 300% of the allowed chloride limit, an amount known to be detrimental, if not lethal, to aquatic life (Linton et al., 2008).

However, the effects of water pollution reach far beyond the health of the river. The beautiful natural areas of Southern Illinois are a reason for the growing importance of tourism in the region. Tourists come to enjoy the rivers flowing through our beautiful parks and national forest through canoeing and kayaking, hiking, and fishing. If we allow our waterways to become spoiled, we'll certainly incur losses in tourism.

Foresight Energy is pushing its costs onto the community. The costs of repairing or avoiding any environmental damage caused by the company should rightfully be part of its cost of operation. By taking a cheaper water disposal option and failing to cover the costs of treating the damage it causes, the company is forcing the community to bear its costs in the form of health costs, water treatment, and loss of beauty and health of the environment. If the company doesn't have the financial resources to cover its own costs, it should not be in operation.

This story is so cliche that were this a storybook, the next step in the chapter would be to call on the Secret Magical Forces of the river. Unfortunately, it seems that we may have to rely on the forces of common sense. Tourism is a growing part of the economy, and mining is a dying part. As a community, as a state, and as a nation, we must look ahead for the long term good. It is not profitable, advisable, or sensible to prop up a dying company with the resources belonging to the community. This is the world that I and my generation will inherit. We are counting on the Environmental Protection Agency to manage our natural resources for the long term.

Thank you for considering my comment.

Sincerely,

Laurel J. Evans

Darin,

I am writing to object to the IEPA granting permission to Pond Creek Mine to pump mine wastewater into the Big Muddy River. Our farm of 355 A. and home are located along the banks of the Big Muddy River in Jackson County south of DeSoto and down river from the effluence point of the pipeline. Every year we are dealing with more flooding issues due to more levee building or heightening of existing levees. As I compose this email we have 30 + acres of farmland with winter wheat under water from the Big Muddy. I fear the additional millions of gallons the mine wishes to pump into the Big Muddy daily will have a devastating impact on our farm and eventually our home in two ways! First, the addition of millions of gallons of water will raise the level of an already flooded river resulting in more acres under water. Second, the salts of chlorides and sulfates will negatively impact the productivity of good farmland. The combination of these effects will be devastating! Additionally, the negative environmental impact on the ecology of the river will lead to loss of the recreational use of the river.

It seems your duty is to protect our environment. Please make the correct decision.

Please deny permission to Pond Creek Mine for this pipeline.

Thank you for your service and consideration of my request.
Regards,
Michael R. Durr, D.M.D.

RE: Pond Creek Mine IL0077666

Thank you for the opportunity to make comments on the transporting of coal mine wastewater from the Pond Creek Mine to the Big Muddy River.

I respectfully request that this proposal by Williamson Energy, LLC be denied due to the undoubted negative effects on the ecology and quality of water resources. The toxicity of coal and the unhealthy impacts of coal and products exposed to coal must be addressed.

Impacts to coalfield communities have been essentially ignored by IDNR and IEPA. Reading through responses of IDNR to the comments related to the construction of the pipeline, the same pattern of approving the request of the mine over the outcries of the surrounding communities was apparent.

Experiencing firsthand the construction of Deer Run Mine in Hillsboro, IL gave me a view of the imbalance of how coal mining regulations are applied to communities versus the coal industry. Coalfield communities are not protected from harmful health impacts or damage to their environment.

At the public hearings related to Permit 399, IDNR assured concerned citizens that their air and water would be overseen by IEPA and that there would be no violations of the Clean Water Act and the Clean Air Act. Permit 399 was approved with the coal processing plant next door to Hillsboro Hospital.

IEPA conducted public hearings on the NPDES permit for Deer Run Mine discharges. The mine discharges drained into Structure 5 that then passes through Central Park Creek. This creek was located between Hillsboro High School and Hillsboro Middle School as it progressed through the community. This exposure of mine waste to the youth and citizens in the area was disconcerting to all of us.

Through a FOIA request to the IEPA, I received the NPDES application that Hillsboro Energy, LLC (HEL) used to apply for the water permit necessary to mine coal. Basically, the form listed what organic and inorganic chemicals were "believed" to be present or involved in their operation. The chemicals that were checked had to be monitored for a certain time. The only toxic chemical that HEL indicated as being present was mercury.

We all know that coal has many other harmful chemicals including metals like arsenic, lead, cadmium, chromium, cobalt, selenium, etc. Most importantly, coal contains many polycyclic aromatic hydrocarbons that are mutagenic, teratogenic, and carcinogenic. The Agency for Toxic Substances and Disease Registry (ATSDR) published a list of the top 20 Hazardous Substances in 2001. Coal has 7 of the top 10 chemicals on the list that exist in all coal and coal by products.

There was no public hearing involved with the air permit for Deer Run Mine. In the air permit application to IEPA, HEL listed how much coal would be processed per year. With that information and a small fee, the construction air permit was granted to Deer Run Mine. A little later the construction permit became a lifetime air permit with no particulate restrictions or air monitoring.

Once Deer Run Mine was in operation, there was a major problem with coal dust permeating the area. The community signed 2 petitions to IEPA asking for air monitors in the community to determine what days were not safe for school children and health compromised individuals to be outside. The petitions for air monitors were turned down with the community still lacking any safe air monitoring in the area.

The pendulum to promote and subsidize coal must swing toward cleaner and safer energy sources. Communities are tired of the damaging impacts from coal mining and having regulatory agencies disregard the negative outcomes on their lives.

Please do not allow Pond Creek Mine to continue to abuse the environment and the Big Muddy River. The proposal by Williamson Energy, LLC must NOT be approved.

Sincerely yours,

Mary Ellen DeClue

Re: Pond Creek Mine NPDES

Hi Barb,

Sierra Club, Illinois Chapter collected comments from our members and other members of the public on the proposed renewal of the Pond Creek Mine's NPDES Permit IL0077666. We have compiled those comments into one document for you. The attached file contains responses from 132 people who signed on to our basic comment letter. Another 187 people added their own personal comments to the letter which we have listed individually with their name and town. Please let me know if you or any other staff have any questions about these comments.

Thanks!

Cindy

Barb Lieberoff, Mail Code #5
Re: Pond Creek Mine NPDES
Illinois Environmental Protection Agency
1021 North Grand Avenue East
P. O. Box 19276
Springfield, IL 62794-9276

Dear Ms. Lieberoff and other IEPA officials,

I ask you to deny Williamson Energy's proposal to pipe polluted water from the Pond Creek coal mine 12 ½ miles to the Big Muddy River and to increase their pollution to Pond Creek. The IEPA should deny the permit because:

1. Williamson Energy's proposal is not a benefit to the community at large who wish to see improved conditions in the Big Muddy River and Pond Creek, not an increase in pollution.
2. Increased salt levels in river water can increase the bio-available form of toxic mercury, harming aquatic life in the waterways.
3. Williamson Energy has not provided the proper water quality testing of their discharges and the receiving streams to justify their proposal to increase the pollution they discharge into waterways.
4. The Big Muddy floods. The potential impacts of an increase in salinity in the river's water on farms, private properties and natural areas including the Little Grand Canyon and LaRue Pine Hills have not been properly evaluated.

Thank you for this opportunity to comment on the proposed changes to the Clean Water Act permit held by Williamson Energy.

Signed:

These additional people signed the above comment letter and added their personal comments as follows:

Allowing this proposed dumping of waste water threatens our most important resource directly: water. Threatening the quality of our water puts everything we have at risk. Our region has only our beautiful land and waterways and rich wildlife as an asset; our rural land's agriculture is one of the few ways our citizens can profit financially in order to support our families. Our land and water is already stressed and threatened in so many ways; allowing this proposed dumping adds unacceptable insult to our lives, from which we may never recover. Allowing this will ultimately force our people out of their homes as we see life wither away from the damage it will cause. We have so few job opportunities here, we have only our way of lives which we have built on beautiful land with beautiful resources. This will rob us of our lives. Dumping this waste water will leave our region more impoverished, and likely diseased. Then where would we go? Away from here. Dont allow it
Rebecca King, Harrisburg

Why should they be able to dump their poisonous waste into a public river without doing anything to lean it up first? Floods of polluted water will impact natural areas, agricultural property, homeowners, and businesses along the Big Muddy River and in the watershed. It does not benefit the community-at-large. Instead it increases pollution in waterways used for boaters, paddlers, anglers, and hunters. High levels of salts can increase the availability of toxic mercury to aquatic life. 7 Million gallons per day of toxic pollution dumped into this river is completely unacceptable. They made the mess. Tell them to find some other place to dump it. It is a coal mine. Who needs coal these days? Shut down the mine and save the lives of the miners. This is a state subsidy to the fossil fuel industry. Don't do it!!
Richard Stuckey, Chicago

i was a pumper in old ben mine number 26 as such i pumped a lot of water out of the mine. it was very clear but if you left a brand new shovel in the water it would rust away in a couple of weeks .I was also a material man and hauled in barrels of oil every shift ..55gallon barrels as well as glue for roof bolts by the pallet .i also hauled solscenic fluid for the longwall mine system when the roof got bad sometimes i brought barrels of glue which was pumped into the roof to stabilize it . all i ever brought out was empty barrels.nothing else the rest of the chemicals were left underground
Richard Livingston, Carterville

Water is sacred because all life depends on it. It is our Civic and spiritual duty to protect it. It's also in our economic interest, because the natural beauty of Southern Illinois drawers tourist from all over, bringing much-needed Revenue to depressed areas. If the delicate ecosystem is thrown out of balance, no one will come hiking, or boating, or enjoy driving around the wine trail, or go ziplining. Please say no to this company, who is in constant violation of their current regulations and has built no trust with the people of this state that they will protect our aquifers.
Bridget Rose, Carbondale

This decision would ultimately cause long term effects that would be detrimental to the ecology of the big muddy river as well as surrounding natural areas throughout southern Illinois that this river feeds. By allowing this decision to past, you are making the decision to destroy natural areas that have been here much longer than any of us, and will continue to remain given that we don't allow this type of infliction, all for the progress and profit of an industry that has already been shown to lack sustainability and concern for the regions it resides.
Alec Ashby, Carterville

This issue matters to me because I manage a park system that has direct contact with the big muddy downstream. With us constantly getting flood waters in our public park additional, potentially polluted water is a huge concern. Also as we plan recreational activities such as kayaking and canoeing our participants' safety would have a new layer of concern we can't even calculate. I urge you to deny this application for a mine that has a relatively short lifespan asking to pollute the natural beauty and waters of our rivers that could generational effects.
Joe Fry, Murphysboro

No other entity, such as businesses and municipalities, are al,lowed to dump toxic materials into Waters of the State without thoroughly cleaning it first. Why should a coal company be exempt? Besides, the long-term environmental effects of coal mining and burning include a continued ramping up of greenhouse gases which increase the climate crisis. Coal companies are going bankrupt all over the Illinois basin. What guarantee do the people of Illinois have that Williamson Energy will not follow suite and leave us with yet another environmental cleanup?
Jan Thomas, Murphysboro

I am dismayed, to say the least, to find out about this action by IIDNR which is especially disconcerting because water quality issues are still being protested to the IEPA. The IEPA and IDNR are integral aides of the problems that will be caused by the Pond Creek mine proposal. There is no longer any reason of any kind to delay addressing problems caused by industries whose products are central to the problems of carbon pollution. This is a dilemma that we need to have solved by yesterday so today is certainly a time when we should act!
Edward Brunner, Carbondale

We own the Historic Douglass School in Murphysboro by the Big Muddy River and we are in the FEMA AE flood zone. I know mine says the amount of water will only raise the water an 1/8 of an inch, but I don't believe them. Do you? Plus why would I want the extra pollution on my property when the river floods and it will flood. It has every year. Last spring the water was in

our yard for 180 days. As I write this we are in other torrential rain storm. Please take your time and look at all the facts, better yet don't permit this pipeline.
Cam Smith, Murphysboro

This proposal to dump coal waste contaminants into the Big Muddy river is wrong on so many levels. It threatens to destroy aquatic life in the river and has the potential to endanger one of our most prized treasures, the natural environment of the Shawnee National Forest. We have seen increased flooding in our area in recent years. Floods of this polluted water will affect even more human and wildlife in our Southern Illinois homeland. I urge you to deny the request of Williamson energy to pollute our environment in this way.
Sherry Sullivan, Goreville

I am a geologist. You do not need me to tell you that poisoning our rivers will not only harm the natural ecosystem, but permeate to into groundwater reservoirs and potentially risk the health of thousands in the Southern Illinois area. The fact that this is even being debated is obscene. This situation is occurring because private coal companies have claimed natural resources as their own despite unified public interest in them, and have now found it profitable to risk public safety. Be ashamed.
David Szoke, Carbondale

As a former resident of southern Illinois I still find myself connected to the community and the land as it is a unique and beautiful place. My concern is the flooding of the Big Muddy and the reach of the contamination. Southern Illinois is home to such a diverse ecosystem. Something like dumping contaminated water in the largest flowering source of water wool certainly have a negative effect on that ecosystem. Please do not allow the dumping of waste in a place I still consider home.
Jaclyn Kern, Springfield

As somebody who has well water in a Northern county in Illinois, McLean specifically I find this devastating. I can't imagine having to worry about the water that my children and I drink. And even if I did want to move to another area with somebody else want to buy the house with tainted water. The state is a disaster I need to stop making decisions that help big business think about the people that elect you and pay taxes. Also think about the families and children this will impact.
Tracie Chamberlain, Arrowsmith

Do not allow Williamson Energy to discharge these toxic mine waste contaminants into the Big Muddy River, an Illinois river that flows through the Shawnee National Forest. a recreational destination beloved by my family and me, and many others. The high levels of chlorides and sulfates from the polluted wastewater will kill fish and other aquatic life and negatively impact the region's ability to offer residents and visitors a healthy environment in which to live, work, and play.
Susan Lannin, Chicago

Pollution from mines, agriculture (chemicals and siltation) and industry already negatively impact the Big Muddy River. Adding an additional 7 million gallons of heavily polluted mine waste per day is unacceptable. As a state we should be focused on improving our waters that the

benefit of the people and wildlife that depend upon clean water, not on satisfying the self-serving needs of one corporation. Please deny Williamson Energy's proposal to pollute the Big Muddy River.
Theresa Treacy, Petersburg

I walk my dog every single day at Riverside Park. The Big Muddy is now overflowing its banks. How can it even be a possibility to dump toxic chemicals into this waterway, increasing the spread of the pollution? Do the right thing and not allow this to happen. As a side note - what kind of piping system will not be corroded by the chemicals over time? Not only the Big Muddy will be polluted, but the 12 1/2 miles of land to get to the river risks becoming polluted too.
Shirley Krienert, Murphysboro

5. Because this is the 21st century. Have we not learned that polluting our waters is bad for people, planet and progress? 6. Who does this benefit other than Williamson Energy? 7. We, as a human race, are smarter than this! There are alternatives! Please, PLEASE. It is time to respect our planet, not continue to damage it for the benefit of the few; for the benefit of a faceless corporation while residents suffer the consequences.
Sincerely,
Celeste Longbucco, Champaign

There is no possible justification for approving this pipeline, which would dump millions of toxic mine waste water into the Big Muddy daily. There is even less justification given the failure of the IEPA to collect all the data necessary for a full vetting of the impactTs of the proposed pipeline and also given the highly questionable financial status of Williamson Energy LLC, owned by Murray, which recently declared bankruptcy.
Lynn Winston, Carbondale

Williamson Energy has a horrible track record with regards to polluting the environment. They will take advantage of any ability to dump into the waterways and abuse it. Allowing this would be the kiss of death to our local waterways affecting flora and fauna in innumerable ways. We depend on fishing, hunting and clean water for human health as well. Please do not allow this to devestate our area in so many ways. Thank you.
Jon Womack, Pomona

I lam a monitor for the Illinois Butterfly Network and my transect runs along the Snake Road adjacent to the river. This is a high quality area that is home to many songbirds as well as butterflies, dragonflies, and other indicators of high quality habitat. I also regularly paddle the Big Muddy and have brought Boy Scout groups to hike and paddle in this area. This high quality area needs protection not pollution.
Mary McCarthy, Murphysboro

I already sent in comments but have another question. Is there a regulation requiring discharge pipelines to be a certain distance from each other? This was not addressed I don't think in the draft permit. Sugar camp mine discharge, I believe, is less than fifteen miles away, closer to 12

from proposed pond Creek pipeline. If there is indeed a regulation what is the accepted distance between two discharges?
Lucia Amorelli, Carbondale

Do not dump polluted wastewater into Big Muddy River. This wastewater does not benefit the community at large. This wastewater increases pollution in waterways used by boaters, paddlers and fishermen. The high levels of salt are toxic to aquatic life. Floods from polluted water impact us ALL. We are all down stream! I am against Pond Creek coal mine dumping their polluted wastewater into Big Muddy River!
Kathryn Jenkel, Carbondale

In a time where we are at the very cusp of a catastrophic climate crisis, it is astounding that any institution would even consider allowing companies to further pollute the environment. Enough is enough. We need to be reversing damage, not adding more. We need to protect our community instead of bowing down to corporations again and again. Please, fight this with us. Be on the right side of history.
Rachel Brenningmeyer, Goreville

As a resident and outdoor enthusiast I see only degradation as an effect of this project. Our economy will not benefit nor the ecological diversity that does encourage tourism and sporting in our area. Corporations do not need our protection and allowances; they are taking advantage of our uneducated population and lack of political involvement. Please advise considering the community's input.
Trisha Morelli, Makanda

I have lived in southern Illinois for over 5 decades and during everyone of those I have hiked, camped, biked and kayaked the area...especially the Big Muddy River. Early morning trips are especially rewarding with viewing many wildlife, having baby wood ducks follow your craft, a lone coyote at the edge of the bank treating himself to a drink. This can all change in a short time. It is WRONG!
Michael Scott, Goreville

We know only too well how heavy rains, such as we had this past weekend, quickly result in the Big Muddy overflowing its banks. The same is true of the tributary streams that flow into it. All of this drainage area is potentially at risk if Williamson Energy is permitted to discharge pollutants into the river. Please live up to your name and protect our environment. Sincerely,
Roland Person, Carbondale

Please say no to this proposal. The flood impact itself is hard enough. With more pollutants in the water it will make our already devastating flooding problem worse. Please don't make ya the next Flint, Michigan. Think of the residents that are stuck dealing with the repercussions of your decisions. A mom of 3 with one already in heaven. Please don't risk the health of my rainbow babies.
Christina Chancey, Murphysboro

Yet another reason this permit should be denied is because this is another example of dumping toxic waste where it will negatively affect some minority families and poor families as many of the residents along the Big Muddy fit into those categories. It's time we stop victimizing those who cannot speak up for themselves or who might be unaware of the danger they are being threatened with.
Rhonda Rothrock, Pomona

This dumping will poison waters in an area prone to flooding. Poisoning the water is unacceptable. Poisoning the water where there is a high likelihood flooding will spread the toxins in ways no one can accurately predict is even worse. Coal companies have a pattern of declaring bankruptcy and leaving the clean-up for taxpayers. There are no acceptable reasons to allow this dumping.
Jill Skinner, Cobden

Do not allow the mine to dump polluted wastewater into the Big Muddy River. This will disrupt the watershed and floodplain. Salt and pollutants from the waste water will change the delicate balance of freshwater communities and decrease the abundance and biodiversity of the area. In flooding events, local homeowners, farms and businesses should not need to worry about their health.
Kimberly Rohling, Marion

As a 35 year resident of the area I find it appalling that the State of Illinois would even consider this proposal that would ONLY benefit a profit making corporation and pollute our precious watershed for generations. My children and their children deserve a better solution! Do not allow this apocalyptic proposal to proceed!
Malcolm Robertson, Carbondale

As a citizen of Illinois, I say enough with rampant pollution that puts the lives of Illinois citizens at risk. People's lives are at risk. As a polluter, you are destroying ecosystems, communities, aquatic life, agricultural land, property values, and businesses. This will lead to nothing but devastation. Accountability is essential! Time is of the essence!
Nicole Saulsberry, Springfield

Although I now live in Springfield, most of my family and friends still live in southern Illinois. I was born and lived, worked, camped, hiked, fished, rode, and enjoyed every square foot of the BM floodplain. My family began in Zeigler and Macedonia. I plan on returning upon retirement. Please don't allow this pipeline and the pollution of this river.
Jason Kern, Springfield

Any polluted water must be completely treated before discharging into any stream, river, lake or pond. Anything less than this is completely unacceptable. While the location of this request does not directly affect m, I am concerned that if approved, it will be used through out the state to justify similar requests.
James McGrath, Barrington

I don't want to drink or use nasty water for the rest of my life because you sellouts want to make a quick dollar! Disgusting! What about our children? Can't you do this in a way that doesn't destroy our environment? If you can't, then we don't want your business here in Illinois, or this continent for that matter!
Steven Bozarth, Carbondale

My mom lives near the Big Muddy in Grand Tower. When it floods, AND IT WILL FLOOD, the polluted water will cause hazardous conditions for the people, and animals in the area. This polluted water will make its way to the Mississippi. Please deny this pipeline, it's not just the Big Muddy that will be affected.
Johnna Russell, Anna

We should not further pollute our environment, affecting not only the health of the aquatic creatures but also the health of humans who come in contact with this waterway. Furthermore, we should not require the future payments of millions/billions of dollars to clean up the damage incurred in this action.
Anna Morris, Carterville

What Williamson Energy is proposing is totally irresponsible! They apparently care little for the environment and its inhabitants that rely on the ecosystem they are proposing to foul! Send the message to them to step up and become part of the solution to be caretakers of our precious resources and world!
Marsha Bockmann, Stonefort

Southern Illinois depends on tourism. I addition to the reasons listed above adding additional potential toxins to the Big Muddy (and eventually Mississippi) systems can never have a beneficial effect in this area. Please look at this decision in long term rather than short term consequence. Thank you.
Anthony y Gerard, Vienna

Water is a human right, adding known pollutants to our waterways has always eventually come back to bite us- and really to disadvantage local communities who rely on that water table for survival. Companies who cause this pollution should be the ones bearing the burden of their waste not the community.
Mel Whitehouse, Chicago

Helens Ford crosses the Big Muddy in Franklin Co. My sister owns that property. We have spent the last 48 years on the river fishing, camping and enjoying it. Contaminating that water is wrong and will break our hearts and our children and grandchildren. Please think about your decision. Thank you
Melody Gulley, Buckner

My child is fighting brain cancer right now. Let's NOT dump more junk into our water which may have unknown consequences like this. Let your children eat from these waste waters if you

want, but nobody in their right mind would be comfortable with this. I'm ashamed this is even being considered.
Elizabeth Mckinney, Vergennes

I am very Against The Dumping of this polluted water into the Big Muddy River. My home currently is on a private well not very far from the river. This would mean a significant increase for me every year financially in that i will need to have pollution levels checked with in my drinking water.
Laura Herzog, Pomona

Can I dump my garbage in the street? Look---there is no such place as "away"--every disposal affects nature and biology. Believe it or not, you are part of nature. Respect the others. We are already "knee deep in the Big Muddy" with Trump---don't be another "big fool (who) said to push on."
Margaret Glaser, Chicago

When will the Environmental Protection Agency actually stand up and protect the environment? At a minimum, pretreatment procedures should be required to remove much of the salts and pollution from the water prior to discharge. The Big Muddy River should not be a dumping ground for mining.
Natalie Neuman, Glenwood

We are seriously blessed in southern IL to have clean and abundant aquifers, when we watch the western states struggle with water shortages. Why would contaminating our water sources even be an option. Say absolutely NO to allowing a commercial mining company to destroy our environment!!
Erin Downs, Cobden

Williamson Energy has NOT earned the public trust required to allow this. Their record is dismal. Short-term profits for a few should not trump clean water for people and wildlife. They will simply declare bankruptcy and walk away. Please at least DELAY this request, if not DENY it.
Kathleen Carl, Makanda

It's time we stand up to companies, municipalities that are only looking at money and not anticipating the long term effects that filling the Big Muddy would have on fish, wildlife, as well people that use that water. Yes, some still do. Please, help us fight against this atrocity!
Lisa Childers, Carbondale

Please do not contaminate our water. There must be a different way to get rid of the waste. As of now I will not eat fish and I am telling my friends and family to not eat fish or any marine life. It is not safe. Cancer is at an all time high and we cant ignore the causes of it.
Melissa Waun, Jonesboro

Please do not jeopardize the community, we rely on you to stand up for our safety and our environmental concerns. This company needs to find alternative collection and treatment processes for it's waste. Releasing it into the community rivers is not an acceptable option .
Dawn Kwiatkowski, Woodridge

It's sickening to hear that dumping polluted water would even be voted upon. The safety and health of my three children and all the children in this region should be at top priority. Coal mining is not the future, our environment and children are. Do the right thing.
Ashley DeVillez, West Frankfort

These areas have been damaged enough. The public should not have to pay the environmental cost for such pollution! Nor should the public pay anymore than they already have for the environmental and health costs. The stakeholders should eat all the costs. Every cent.
Kathryn Kinder, Grayslake

Please do not allow Williamson Energy to pollute the Big Muddy River. The river is used for recreation and provides water for wildlife all along its shores.Rather than pollute the river and Pond Creek why can't the waste water be dumped into abandoned mine shafts?
Beverly Mason, Newton

The Shawnee National Forest and other natural areas are critically important to southern Illinois. The extraordinary natural splendor is what keeps me here, even though I could make a lot more money elsewhere. Please help protect the Big Muddy River and Pond Creek.
Joshua Vossler, Carbondale

I fear for the lives of the human beings that live near The Big Muddy, as well as the animals. Its a chain reaction by poisoning one thing. Please be considerate and think about future generations and what they will have to live with. Sincerely,
Sarah Smith, Argenta

It is past time for the energy industry to look at the after effects of production in coal, gas and nuclear waste products. Time to draw the line and look at clean energy! The Big Muddy flows through such a big stretch of land. Do not pollute our backyard!
Barbara Rester, Carbondale

the solution to pollution is NOT dilution. The people in Southern Illinois do not pack up and move away like the miners after they have finished mining and polluting. The Big Muddy deserves to remain free from the prospect of contamination forever.
Ruth Schroeder, Hillsboro

We have to protect the natural beauty & environmental diversity of our region! The coal industry should not call the shots. Those workers should be retrained so we can shut down the coal industry as much as possible & protect our waterways. Thanks!
Craig Wilson, Carbondale

I have grown up on the big muddy river fishing for catfish and duck hunting and expect my kids to do the same. Please stop greedy companies and/or anyone from polluting this waterway. If it's not an improvement to the quality it shouldn't be done.
Dan Pestka, Carterville

The Big Muddy River is an important part of southern Illinois. My family lives within a stone's throw of it, we fish in it, camp on its banks and enjoy the beautiful scenery on boat rides. Tell the coal company to dump their sh** somewhere else!!!
Patricia Barone, Rockwood

Here in Farmersville, we deal with the impact of the mines daily and for the rest of our lives. Our water, land and environment has been changed forever. Water is life and very few, if any places have clean uncontaminated water. WATER IS LIFE!
Kelly Robbins, Farmersville

Thousands of local residents and countless more people visit Southern Illinois to experience nature and recreate. We value our natural resources and want to protect them. We need to break the cycle of fossil fuel dependence, not enable it.
Tharran Hobson, Murphysboro

Please don't destroy our water ways and environment by dumping this poison in our water. This river floods into the lake I live at and I don't want it to kill the fish and wildlife in our area and other areas it will affect. Thank you.
Ranae Irvin, Mulkeytown

This issue matters to me in Central Illinois because this mine has a history of lack of compliance with regulations and is harming what are public resources, risking public health and the environment for all creatures who depend on it.
Joyce Blumenshine, Peoria

Recreation contributes to personal well-being. It is important for a community to have recreation opportunities that appeal to a wide diversity of interests. Clean waters contribute to healthier individuals and a healthier economy.
Susan Murray, Godfrey

I attended that hearing. We in Southern Illinois do not want pollution, cancer causing chemicals or other bad things to happen in our area. The owners of the mine have had other safety violations. Do not allow a permit for this.
Carla Womack, Pomona

There is no acceptable dumping of chemicals - it will harm the ecosystem and our quality of life - this is management and laziness- if you can't handle the process of mining then figure it out but dumping is not acceptable-
Danielle Taylor, Dongola

I visit this beautiful area of our state every year. I hope degradation of the area from such acts against nature don't stop me and scores of others from visiting and contributing to the local economy in the future.
Athena Hubert, Pontoon Beach

Coal is a fuel that endangers the planet and our very existence. Our resources should be directed at developing clean energy alternatives that will gradually reverse global warming. The permit should be denied.
Hal Ensor, Murphysboro

Please do not pass this polluting exemption. The area to be impacted are extremely unique habitats. I have hiked LaRue Pine Hills on a reptile & amphibian tour. It is an amazing place and needs to be preserved.
Claire Entas, DeKalb

Allowing Williamson Energy to dispose of their wastewater in the Big Muddy River is a tragic act of government bowing down to the very industries that are decimating our communities and our natural resources.
Amelia Estrich, Chicago

We suffer enough from the climate changes in this country. Please don't add to the pollution and climate issues. We live in a beautiful area in our state. Please don't help destroy this beauty and wildlife
Nancy Reach, Marion

Clean water is one of the most important things on earth. We don't need salts and toxins in our clean water. The pollutants will harm local agriculture and the health of citizens who live in Southern IL.
Robert Jorgensen, East Peoria

You know the only right thing to do is stop any effort to pipe polluted water into the Creek. Do the right thing. It will feel good and it will be so much more comfortable looking yourself in the mirror.
Kathleen Van Kampen, Palos Park

Please do not destroy the Big Muddy by allowing this to happen. People in my community depend upon fish from that river to provide food for their families and quality time outdoors with their children.
Shannon Clapsaddle, Cobden

I live in the Shawnee National Forest and want to protect it from pollution. Please don't allow this company to kill our aquatic life and destroy the natural balance of our beautiful river. Thank you.
Kate Zager, Cobden

I've lived by the big muddy river my whole life. I dont want to see my hometown and other towns affected negatively from waste being dumped into the big muddy river. Please stop this from happening.
Lacey Randall, Murphysboro

I have lived in southern Illinois all my life.. I do not want the water ways to be polluted by waste from mining. Clear creek is a run off of the big muddy.. please stop this hurt to the earth.
Catrina Craver, McClure

We must stop polluting our waterways and seek clean energy alternatives. The CEJA provides job training and future employment opportunities to assist workers displaced from dirty energy jobs.
Jan Mangers, Aurora

Jeopardizing the health and safety of the community members and environment is unacceptable! Deny Williamson Energy permission to run waste of any kind into or near the Big Muddy River.
Lisa Bustos, Murphysboro

I live very close to this river and it's very special to us. All the plants and animals that live on the river are special. They are already at risk for the pollution already dumped.
Theresa Nelson, Murphysboro

I will be spreading the word about this cause to my friends in southern Illinois, but also those with local roots who live in other areas of the state, the country and the world.
Susan Drone-Prickett, Carbondale

Whether Lake Michigan or Big Muddy, water in Illinois is an asset too valuable to contaminate or waste. The permit should be revoked or conditioned to comply with good practices.
David Bryant, LaGrange

Please don't allow our rivers and streams to be polluted. Those chemicals will poison everything they touch and kill animals, likely including threatened and endangered species.
Elisabeth Turner, Galatia

Southern Illinois is beautiful and fun, it's a wonderful respite from polluted Chicago. For God's sake don't allow an important natural water source to be polluted.
Sarah Fiola, Chicago

Southern Illinois is a gem that shouldn't be ruined by high sulfur coal from Illinois. So you ruin the area taking it out and then pollute the skis burning it. makes no sense.
Brad Grey, Glen Ellyn

Disappointment again over the lack of compassion of compassion... Please do your part to ensure the future planet we are leaving to our children has been loved and cared for!
Jennifer Johnson, Ozark

And as 1-14-20 foresight energy, the parent company of Williamson energy, stacks are tanking at .06 per share. I wouldn't want to invest in such a loser company. Would you?
Karen Fiorino, Makanda

I have fond memories of vacations and holidays spent down on the big muddy, please do not let mining destroy our beautiful Illinois ecosystems and wilderness territory.
Max Lewis, Park Ridge

The Big Muddy is ONE property from my house. The Bald Eagles who nest here cannot be exposed to these chemicals (much less all of the other 100s of species present)!!
Liz Robinson, Murphysboro

Please do not allow this to happen. I am very concerned about the pollution to the River & our water resources and flooding of the river downstream. Thank you.
Tess Ford, De Soto

I live less than 1/4 mile from the Big Muddy, and rely on it for recreation. Allowing these discharges will greatly negatively impact the quality of this waterway.
James Ricks, Murphysboro

I am pro coal. But I'm not for this. There is no good reason to dump in a river for everyone to have to deal with. You handle your own waste and issues from it.
Crystal Keigley, Dowell

As an Ecologist working in southern Illinois, I've seen the damage from poor environmental policies firsthand. Please protect our water by denying this permit.
Chris Benda, Makanda

Please protect the beauty and quality of natural resources in Southern Illinois. I appeal for the sake of my five grandchildren. Sincerely,
Joanna Christopher, Gorham

Hi, although I'm sorry the miners will have to find other work, I am strongly OPPOSED to allowing this waste to be discharged into the Big Muddy. Thank you.
Amelia Robinson, Carbondale

I enjoyed the waterways of southern IL as a child and I'd like to protect them, as well as downstream areas for my children and their children to enjoy.
Victoria Goessling, Waterloo

are you all crazy? dumping dirty waste water into our protected areas and water sources. your grandkids are all doing to die from cancer at young ages.
Wil Maring, Cobden

Southern Illinois is important and waste dumping is not the answer. If we dilute our natural resources we will destroy our much needed eco systems.
Lori Kenniker, Christopher

Illinois EPA should not allow this burden of pollution to be carried by the public. Pond Creek Coal Mine should clean up its mess or stop mining.
Linda Sullivan, Lombard

My home is near this river and we've survived three 50 year floods in the last 10 years - the waterways can't support this business's waste.
Jennifer Haselhorst, Murphysboro

No more polluting! We have to learn how to protect, maintain, and improve our natural resources for all wildlife and our future generations.
Moira sims, Creal Springs

The flooding in Jackson County concerns me the most. Spreading pollutants onto the land and then into the air, our lungs and our food.
Michael Wagner, Carbondale

What a terrible, selfish, greedy action to take. You don't care to poison people, the Earth and her inhabitants. This is disgraceful!
Tami Hottes, Pinckneyville

Why would this be ok? Because you can't afford to pay to have the water treated before discharging it? This is absolutely ridiculous!
Heather Craver, Carbondale

As a resident of Murphysboro, IL, I have seen the flooding. It would be wrong for the coal company to jeopardize fragile ecosystems.
Cindy Parrone, Murphysboro

Please don't allow this. Think of all the harm it will do to the ecosystem. We are counting on you to protect our natural resources.
Amber Boulton, Murphysboro

This river already has to many pesticides that run off into it. Quit destroying everything south of Chicago with all the pollution
Blaine Bunton, Duquoin

As if the environment is not under enough assault! Can we please for just one moment think of the impact on our children's lives!
Debby Towne, Energy

Water is life. This proposal threatens our water quality and resources. Please say no to Pond Creek coal mine pipe line proposal.
Heather Horsley, West Chicago

My kids and I live in this area and play in this water. There HAS to be an alternative to dumping waste into our water system.
Jessie Warner, Cobden

We cannot continue to pollite our waters. For the people, the environment, the animals. Take care of your business cleanly.
Roger Palmer, Mt Vernon

Clean water is critical to our existence. Please help stop this and understand how important this is to protect this land.
Milisa Parrish, Chicago

No more pollution in this watershed! As an organic grower, no more destruction of our watershed & recreational locations.
Kathryn Ward, Carbondale

I live downstream of the big muddy River, I don't want this poison to get in to the aquifer. My house uses well water.
Chris Ortolano, Carbondale

You are going to kill the ecosystem !!! How would you like this kind of waste going into your home and drinking water?
Ric Thalman, Carbondale

I went to college at SIU. The forest and biodiversity is what makes southern Illinois unique. Please don't ruin that.
Katherine Pultorak, Rockford

How would you like it if you had a Riverside house near where they plan to dump? Please deny the mine's request.
Ross Bauer, Carbondale

This is so alarming! Please help our environment! Our legacy should be to help the environment not destroy it!!
Mickey Finch, Anna

We are made out of water. We need fresh water to survive and so do fish and other animals. Clean water for all.
Susan Livingston, Carbondale

No more polluting and dumping in rural areas where it affects agriculture, drinking water and so much more!
Joan Listen, Carbondale

This mine is directly behind my property and I don't want your pollution in my ground water and water ways
Roger Mull, West Frankfort

The people working in the mines are exposed to toxins, and the mine has already outgrown its usefulness.
Dorothy McDaniel, Carbondale

My property goes to the edge of the Big Muddy. Please protect my beautiful river from chemical damage!
Joan Bishop Murphysboro

Do not allow this to happen. It will destroy a fishery that has fish up to one hundred years old..
Walter Ridgeway, Pinckneyville

Southern Illinois is an amazing and beautiful place, but it won't be if we don't take care of it.
Jennifer Kennedy, Pomona

Deny making our water, land, air a dumping ground. More people will leave IL if turn it trashier
Kris Flint, Mt Vernon

You say it's safe but why take the chance? The Big Muddy is too beautiful to risk it! Please no!
Ellen Meinhardt, Springfield

This is heartbreaking. No waste should be dumped into waterways. We must protect wildlife.
Lily Robinson, Anna

Please protect the purity of our rivers and streams. Future generations will be thankful.
Michael Horsley, West Chicago

Stop corporations from destroying our environment. This is unacceptable and disgusting!
Jennifer Miller, Mattoon

This is a growing community of families, please think of the future of this community.
Judith Jones, De Soto

We do not need more toxins in the waters, nor in the public use areas. Please vote no!
Phillip North, Jonesboro

PLEASE DENY THE PROPOSAL!!! This is way too harmful and awful to even think of doing
Hallie Lundberg, Alto Pass

Simply ridiculous. They can drill a well 5000' deep and dispose of the water safely.
Kris Mason, Flora

Please don't let money mean more than the health of citizens and the environment!
Aleska Hagan, De Soto

Pond creek mine waste released into the Big Muddy River will ruin our community.
Rachel Ensor, Murphysboro

We should be moving away from coal, not letting this company pollute our waters.
Mark Giardina, Chicago

I do not want to see another river ruined in our State Thank you
Linda A Cole, Aurora

Please push forward with some other resolution to this disagreeable decision.
Shannon Sweetin, West Frankfort

We, the citizens of Illinois, are counting on you to protect our environment.
Jane Ward, Peoria

It is time to hold polluters accountable, not to ease their polluting ways.
Mike Dudley, Harrisburg

It matters to me because, bio life means alot & it's harming aquatic life!
Tiffany Fairless, Tunnel hill

Please for the sake of our children's future and this planet's. Thank you,
Laura Eriks, Carterville

This has to stop! Clean water is a neccesity we can't live without it!
Sherma Boner, Jonesboro

This is a big mistake. Help keep Southern Illinois beautiful and SAFE!
Michelle Stokes, Carbondale

I live close to the Big Muddy and am asking your help in this matter.
Brynn Freed, Murphysboro

I'm a nature lover. I do not want this danger for me or my children!!
Deanna Tate, Jonesboro

Please deny the proposal. It is so very vital that this not happen...
Deborah Nash, Cobden

No one should ever be allowed to dump harmful toxins into waterways!
Kary Brenton, Edwardsville

We experience flooding regularly. This will only add to the problem.
Helen Cox, Virgennes

This issue matters to me because the health of the earth matters!
Elnora Maggos, Carbondale

Please do not let them poison our water. Our future is at stake.
Shannon Griffin, Carbondale

Protect our water resources from harmful coal mine waste water.
Mary Ellen DeClue, Litchfield

Have We not made a BIG enough mess of the Environment already
John Kennedy, Batavia

Please don't make my kids swim in even heavier polluted water!
Alycia Stephenson, De Soto

Please help keep our water source safe for our kids. Thank you,
Stephanie McCarty, Harrisburg

Dumping your bi-product downstream is not responsible policy.
Orlan Brown, Murphysboro

WE all know better than to let this pipeline be installed!
Daniel Huntsha, Rolling Meadows

EPA protect the quality of the Big Muddy and Pond Creek!
Shari Sweeney-Sadowski, Anna

Please, save the Bug Muddy. Do the right thing here.
Adam Stenhaug, Alton

This doesn't need to take place on so many reasons
Margie Dailey, Cobden

Humans have done enough damage to our waterways.
Tonya Browning, Anna

For obvious reasons please deny this pipeline.
Kelsie Smith, Goreville

My children deserve better than a poison river
Temetra Gibson, Herrin

This is such a bad idea. Totally unacceptable.
Ginny Lee, Springfield

Absolutely not, we do not want or need this
Rachel Bozarth, Carbondale

Please save our enviroment for our children
Laura Sperstad, Joliet

I want clean water. I need clean water.
Rose Hogan, Cobden

Please protect the Big Muddy River !
Mark Sanders, Royalton

Please don't pollute the Big Muddy!
Darla Judd, Bush

Polluting our water is unexceptable
Ruth Hoak, Makanda

I support saving the muddy river
April Elliott, Anna

Please SAVE our water resources.
Annette Jaynes, Murphysboro

People matter more than profit.
Ellen Wolcott, Charleston

STOP the Pollution NOW, Please!
Patricia Preston, Carbondale

Protect us, don't infect us!
Wendy Garner, DuQuoin

Have a conscious! Please!
Barbara Burke, Monee

Stop ruining our planet!
Kimberly Mott, West Frankfort

Please have some sense.
Braden Fritsche, Carbondale

PLEASE SAVE OUR WATER!
Jennifer McSparin, Carbondale

Stop killing earth!!
Marta Ayala, Bensenville

It's never too late
Mark Denzer, Carbondale

stop the pollution!
Abby Nickens, Du Quoin

Stop this madness!
Lance Jack, Carbondale

Thank you.
Selena Sasser, Marion

Stop this
Judi Holcomb, Rockwood

laureltous@hotmail.com

I am submitting comments for Pond Creek Mine NPDES Permit No. IL0077666, specifically regarding the portion of the permit concerning Outfall #011 which would allow significant amounts of mine wastewater to be pumped into the Big Muddy River. For the reasons included in these comments, other evidence submitted at the December hearing in Marion, and the inability of the applicant to adequately respond to many crucial questions, I am asking that IEPA to reject this permit.

I have lived in Southern Illinois for 40 years. I am a retired nurse, who is concerned about the health of area residents. I have seen first hand, the impact of coal mining on the health of area residents. I am a hiker and birder in our extensive public lands, both State and Federally owned. I canoe area rivers (including the Big Muddy), swamps and lakes.. Southern Illinois is my chosen home because its natural beauty and rich biodiversity. I belong to several environmental organizations and work with fellow members to protect area natural resources. I am aLife member of Sierra Club , holding leadership positions, over several decades. I am also a member to Prairie Rivers Network. I support the comments submitted to IEPA regarding Pond Creek NPDES Permit No. IL0077666 by Sierra Club Illinois Chapter and Prairie Rivers Network.

I live a few blocks from Little Crab Orchard Creek, a major tributary of the Big Muddy. I walk along Little Crab Orchard at least once a week. Green Earth Chautauqua Bottoms, a 37 acre privately owned nature preserve is dissected by Crab Orchard Creek, and its trails are used by dozens of people every day. In recent years flooding has occurred much more frequently and the Creek is often out-of-bank. After heavy rainfalls roads near the Creek become impassable and the Creek flows upstream.

In recent years the Mississippi River is flooding more frequently. Record rainfall is being recorded in Illinois and as far north as Minnesota and the Dakotas.. In 2019 our region received 60" of rainfall, and thousands of acres in the Big Muddy flood plain in Jackson County, remained flooded from February through

September. Mississippi flooding was so extensive that it broke the record set by the 1927 Great Flood. Today the National Weather Service measured the Big Muddy at, flood stage (29.67 ft.). 2020 is likely to break 2019 flooding records.

When the Mississippi floods, water flows backwards up the Big Muddy. These waters also back up in its tributaries, including Little Crab Orchard Creek, and contaminants discharged into the Big Muddy flood waters flow directly into our community.

It is obvious that when terrestrial flooding occurs, the amount of contaminated water from Pond Creek Mine discharged into the Big Muddy will also increase, adding more water to the already flooded Big Muddy. The permit application analysis includes no projections on what will happen when the the Big Muddy flood water flows backwards and water covers the flood plain and backs up into tributaries. ***How will this stagnation of river waters during floods impact assumptions and projections on the "dilution" process and the distribution of polluted mine water across the landscape? Will the applicant be allowed to pump contaminants into the Big Muddy during periods when it is flowing backwards? How will the applicant monitor dilution of mine wastes in the water column during periods of backwards flow and stagnation? If the mine waste contaminants don't go downstream, will they spread out over fields and forests and how will the applicant monitor the distribution of mine wastes?*** Typically, as Big Muddy flood waters recede, isolated "ponds" of water are left behind for months, and are frequented by large flocks of wading birds and ducks. ***Will contaminants become more concentrated as the flood water recede? What will be the impact of these mine waste contaminants on farm soils and wildlife?***

The permit application analysis also did not include an adequate consideration of the impact of mine waste contaminants on the unique environmental resources downstream of the proposed discharge point, especially during high flood stages when the river is stagnant and contaminants can potentially concentrate and settle into the surrounding landscape. The Big Muddy River flows along Little Grand Canyon and LaRue-Pine Hills, a National Natural Landmark, in the Shawnee National Forest. These are areas of spectacular beauty and unique geology, and plant and animal life. The LaRue Swamp is a wetland of international significance.

> *LaRue-Pine Hills' unique physical characteristics dictate and support a rich biodiversity not found anywhere else in the country. In all, the area covers about 4.5 square miles (3547 acres) and contains 14 natural communities including forests, wetland, prairie, glade and barren ecosystems and geologic features. Please help protect this special place for future generations to enjoy, study and appreciate.*
>
> *Shawnee National Forest* https://www.fs.usda.gov/recarea/shawnee/recarea/?recid=35185

The Big Muddy Levy is intended to protect LaRue Pine Hills from Mississippi and Big Muddy River flood waters. However, in 2019 the levies failed to protect thousands of acres on both sides of Route 3. The levies were not overtopped or breached. Saturated soil allowed water to percolate under the levies and form lakes in fields where farmers were unable to plant crops last year. Roads were underwater for months and large flocks of birds inhabited the flood waters trapped behind the levees. When U.S. Route 3 was flooded, the bridge from Illinois to Cape Girardeau was closed and traffic was diverted north to Chester. The economic and human costs were tremendous.

Given the importance of these resources to the State and Nation, the applicant must consider and document the potential harm from mine waste discharge to this area, especially during periods of high waters and sluggish flows. ***What are the impacts to the LaRue Swamp if polluted mine water seeps under the Big Muddy Levy?***

Once again, I urge the IEPA to reject this application. Thank you for this opportunity to comment on this important public decision.

Sincerely,

Laurel Toussaint

Dear Sir(s),
I am commenting on the Pond Creek Mine permit to dump mining waste into our environment. I am someone who benefits from hunting and fishing. I am also dependent on our local tap water and local crops. I strongly discourage you from allowing this permit. The waste must be treated and stored until it will no longer endanger our natural resources.
Sincerely,
Mr. Clint David Samuel

I am concerned, as a Union Count resident, about the push by the IEPA and the EPA to permit the Pond Creek Mine to dump millions of gallons of toxic waste into the Big Muddy River endangering local farms, wildlife, and a beautiful natural resource in Illinois. Please do not tell me that monitoring by the IEPA and or the EPA will protect the river. Information has been extremely vague on how much water will be added to the Big Muddy River, what is the exact and total chemical composition, and the safety and regular inspection of the proposed 12 mile pipeline to carry this disgusting and poisonous venom. My past experiences with monitoring factory farms was very disappointing. Many officials and supporters of these two organizations, local and statewide, had strong connections to the corporate or local economic practices that had little or no concern for the environment. I am now in the process of researching members of the EPA and the IEPA and their connections and close alliances to members of corporations. I distinctly remember the recent meeting with other citizens about The Pond Creek Mine in Marion Illinois where a women reminded the representatives of the EPA what those letters represented.
She stated loudly "ENVIRONMENTAL PROTECTION AGENCY". It is time for you to do your mission, protect the environment, not corporate interests.

Christine Zeivel:

The WSJ article example was included to simply document the pending bankruptcy status of Foresight Energy, and its business associates that are already in bankruptcy, wherein other articles and the other SEC filings weblinks I gave could potentially be substituted to document the pending bankruptcy status, or house-of-cards. From news and SEC filings, it appears the immediate subsidiary coal company is possibly maneuvering on your permit decision; however, their operations are clearly unstable at this point, with the history of Williamson Energy/Pond Creek violations and problematic market. Bob Murray's other coal mining is also unstable and in bankruptcy (e.g., https://cases.primeclerk.com/MurrayEnergy/), although he has a history of flipping assets for some years now which doesn't bode well for things like pensions or environmental clean up, despite the redirection of large sums of payments to cover his tracks (https://theintercept.com/2019/12/17/murray-energy-bankruptcy-climate-change/, https://www.documentcloud.org/documents/6580262-142050311162-Rep-1412102639.html). Peabody is decommissioning a nearby mine, so this is really a prime time to be transitioning to renewable energy and more energy efficient design, as the earlier federal administration was attempting to do with its Clean Power Plan, and our own state's related FEJA and CEJA legislation. However, if you open up the weblink (https://www.wsj.com/articles/foresight-energy-seeks-more-time-for-bondholder-talks-after-missed-interest-payment-11576269555?fbclid=IwAR1G0jeE_a9RHUElbtjKrnrP-LtyFAr18VAhY_AC8WjkcXWzupQaW5ENRgQ), it reads as follows, below:

*****

"PRO BANKRUPTCY DISTRESS

Foresight Energy Seeks More Time for Bondholder Talks After Missed Interest Payment

Foresight, the coal miner controlled by bankrupt Murray Energy, missed an interest payment in October

By Soma Biswas
Dec. 13, 2019 3:39 pm ET

Foresight Energy LP, the coal miner controlled by bankrupt Murray Energy Corp., asked bondholders for more time to negotiate after missing an interest payment and starting restructuring talks.

The St. Louis-based company missed an interest payment of over $24 million Oct. 1, starting the clock on a grace period that is scheduled to end at the end of the year. Now, Foresight is asking bondholders to give the company until the end of February.

Foresight and Murray, both producers of thermal coal, have struggled to cope with declining demand in recent years as coal-fired power plants shut down around the country and suppliers switched to cheaper natural gas and renewables. Foresight has roughly $1.3 billion of debt on its balance sheet.

Foresight and Murray, both producers of thermal coal, have struggled to cope with declining demand in recent years as coal-fired power plants shut down around the country and suppliers switched to cheaper natural gas and renewables. Foresight has roughly $1.3 billion of debt on its balance sheet.

The company has given bondholders until Thursday to vote on the extension request.

Foresight's bonds due 2023 last traded at close to 4 cents on the dollar last week, according to MarketAxess.

Murray Energy, which acquired a majority stake in Foresight in 2015 for $1.4 billion, filed for bankruptcy in October as declining coal sales and export prices and high interest on debt choked off the company's cash flow.

In November, Foresight reported a 38% decline in coal sales for the most recent quarter compared with the same period last year. Foresight is working with Jefferies LLC and Paul Weiss Rifkind Wharton & Garrison LLP on restructuring talks, according to people familiar with the matter.

Foresight and Paul Weiss didn't respond to requests for comment. A spokesman for Jefferies declined to comment."

****

Thank you to you and the other EPA staff for reviewing the many factors and details of this case, and its place in the bigger picture of a clean energy transition for our state, in the context of broader considerations like the Paris Agreement (or its update) and IPCC reports (https://www.ipcc.ch/reports/).

Sincerely,

Sabrina Hardenbergh

Ms. Hardenbergh,

Thank you for submitting your comments regarding NPDES Permit No. IL0077666. The email below and its linked information will be entered into the hearing record as Exhibit 388. However, the link you included to the WSJ website only allows subscription access, so if you want that particular article included in the record for review, I will accept your submission of the article to this email address within three calendar days. If it is not received by midnight on Sunday, January 26, 2020, Agency staff will not have that specific information available as part of the permit hearing record.

Thank you,

Christine Zeivel

P.O. Box 19276
Springfield, IL 19276

Re: Pond Creek Mine, IL0077666

Dear Barb Lieberoff:

Over the past year and a few months, I have emailed the IEPA in opposition to the Pond Creek Mine, IL0077666, pipeline permit, wherein Williamson Energy LLC proposes to dump their coal mine waste water into the Big Muddy River and its tributary Pond Creek. I am emailing to oppose this again, plus I attended your public hearing on Dec. 18, 2019 in Marion, IL, in opposition to the pipeline permit.

I hope you will continue to include my concerns indicated in earlier publications re Pond Creek Mine's many violations and pending water pollution, as well as the problem that their coal becomes some of that burned in nearby Indian's power plants that contributes to our regional air pollution and health problems:
https://www.sierraclub.org/sites/www.sierraclub.org/files/sce/shawnee-group/ShawneeTrailsDec2018forWeb.pdf
https://www.sierraclub.org/sites/www.sierraclub.org/files/sce/shawnee-group/ShawneeTrailsMar2019forWeb.pdf

Foresight Energy, of which Williamson Energy LLC is a subsidiary, is in bankruptcy court, wherein their likelihood of remediating their pollution is in serious question. They already don't seem to be concerned about the many violations they've incurred discharging toxic chemicals into Pond Creek over the years they've been in operation, so why would you give them a permit to continue such acts?
https://www.otcmarkets.com/filing/html?id=13805068&guid=UCdjUnejEdjreEh (Note amendment, extending interest payment out 150 days; they're not solvent.)
https://www.otcmarkets.com/stock/FELPU/disclosure
https://www.wsj.com/articles/foresight-energy-seeks-more-time-for-bondholder-talks-after-missed-interest-payment-11576269555

Please also consider the health cost to our medically under served, low-income community by the company's coal being used in our wider region, such as Indiana power plants. See for instance, health costs of the coal mine continuing, contributing to regional air pollution (assuming Indiana burns some of our coal, http://www.foresight.com/sales-markets/, https://www.eia.gov/state/analysis.php?sid=IN), as well as the water pollution of more specific focus in the permit application issue:
SW Indiana
https://ejscreen.epa.gov/mapper/ (the PM 2.5 concentration has diminished in our region since the time of the article's writing a year ago...compare current maps to screen shot in https://www.sierraclub.org/sites/www.sierraclub.org/files/sce/shawnee-group/ShawneeTrailsMar2019forWeb.pdf)

https://www.gem.wiki/Gibson_Generating_Station
https://www.gem.wiki/Petersburg_Generating_Station
S Illinois
https://www.gem.wiki/Baldwin_Energy_Station

https://www.gem.wiki/Marion_Plant_(existing)
https://www.gem.wiki/Joppa_Steam_Plant
We've long had to treat Black Lung disease and COPD in S. IL: https://www.sih.net/about-us/history-of-sih, http://www.shawneehealth.com/services/black-lung-program/, http://www.dph.illinois.gov/sites/default/files/publications/IL-Counties-COPD-111716.pdf

Southern Illinoisans must deal with the flood and other climate change weather-related costs that harm agricultural land and health. Similar to the Deception Dossiers (re oil/climate change), coal knew too... https://www.huffpost.com/entry/coal-industry-climate-change_n_5dd6bbebe4b0e29d7280984f?guccounter=1&fbclid=IwAR2sMxeEnL084IEPe2zGMDpjemRV-0uZ_IQcaHk58JsMk_Gc8acjC5Ip3yM

I personally would like to be able to enjoy wildlife viewing along the Big Muddy since I frequent places like Little Grand Canyon just above it. I have canoed on the river too, but I'm not sure that this is safe. It would be a shame if our national bird, the bald eagle, were diminished by lack of food or poisoned food (fish) in the Big Muddy River. I believe this is a federal offense to damage our national bird. Don't allow the mine to do so.

Also, following the health references above, given that previous coal mine air pollution has quite possibly been among contributing factors to my mother's Alzheimer's condition, which has taken a great financial and physical toll on me to be her caretaker, I am very angry that anyone would allow such socioeconomic and human health costs to be allowed to continue. The coal mining and power generation pollute our air, and harm us all in myriad ways.

You are supposed to be the Environmental Protection Agency, put in place under President Nixon, despite our current federal administration's attempt to do away with its mandate. Please DO NOT PERMIT the Pond Creek Mine pipeline to be built, and keep on top of the mine's other pollution violations. Maybe the mine should be decommissioned soon as other mines are doing elsewhere in the country so as to transition to cleaner energy sources.

Sincerely,

Sabrina Hardenbergh

Pond Creek Mine Pipeline Permit No. 456 and TMDL

by Sabrina Hardenbergh

> *"The purpose of the Water Management Pipeline and the diffuser is to discharge high concentrations of sulfites and chlorides.... There are no public water supplies near the Water Management Pipeline discharge; therefore, no adverse effects are anticipated."*
> *--Foresight Energy, Pond Creek Mine, permit application No. 456*

You might have easily missed notice of the recent public hearing and comment periods for the Pond Creek Mine Pipeline Permit No. 456 and draft report for the Big Muddy Watershed Total Maximum Daily Load (TMDL), given IDNR did their typical scheduling, concurrent with congressional debates, elections and holidays. However, Chris Cline and Bob Murray are furthering their Foresight Energy enterprise with plans to pipe process and mine infiltration water from their longwall coal mine 12 miles across farmland, streams, federal wildlife land, under roads, past homes, and into the Big Muddy River. Presently the waste water has been discharged into a nearby tributary of Pond Creek; Pond Creek has been 303(d) listed for high chloride levels. Review the mine's repeated EPA non-compliance or violations for its three discharge points on the perimeter of the mine site, wherein high chloride and sulfate levels are recurrent issues. The high-sulfur coal gets sold to foreign countries to offset financial asset and debt juggling; millions of gallons of polluted water could soon be dumped into the river near Zeigler, Illinois, where it then meanders to Murphysboro, Oakwood Bottoms (by Little Grand Canyon and Inspiration Point), and the Mississippi River.

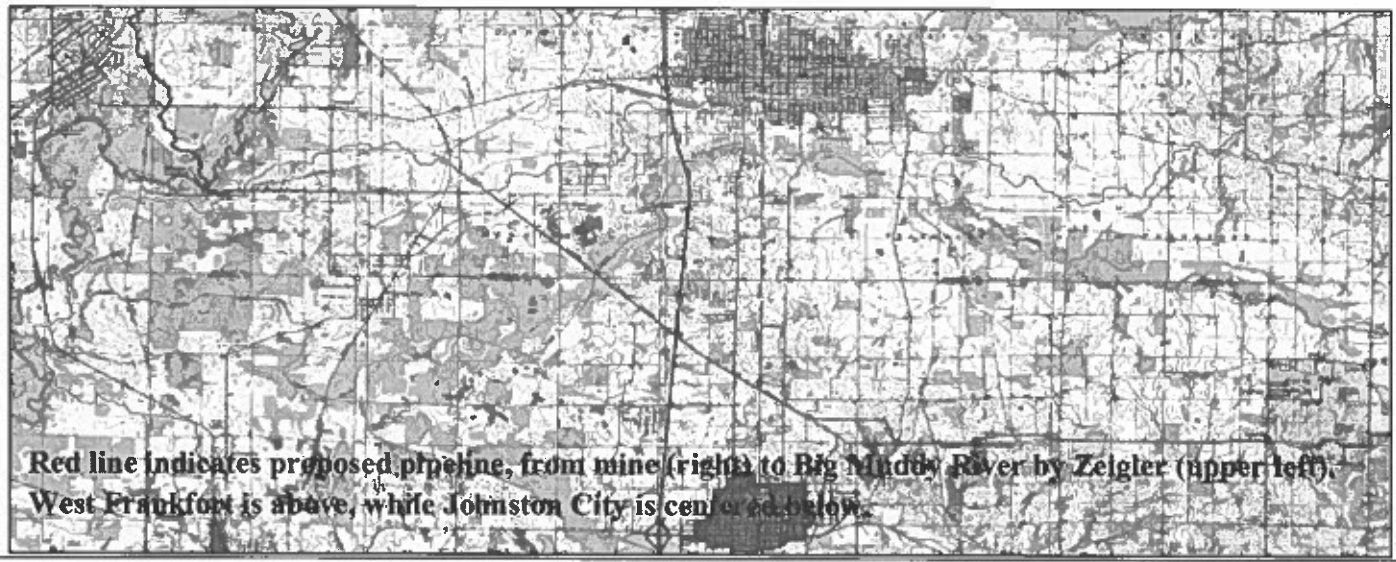
Basically, the Foresight Energy aka Williamson Energy aka Mach Mine aka Pond Creek longwall coal mine floods with mine infiltration water from the overlying sandstone. The company chose to invest hundreds of millions of dollars to develop such a site that puts underground miners' safety at risk, and that causes environmental and property risk to properly hold back polluted water; IDNR permitted the initial mine. The average 2,237 mg/L chloride and 1,940 mg/L sulfate concentration of this water exceeds quality standards allowed to be discharged into receiving waters. Approximately 2.7 million gallons of water are pumped from the mine daily, and this may increase to 3.5 million gallons. While the application admits chloride and sulfate issues, nothing is said of other toxic trace elements potentially found in Herrin coal, that might end up in the infiltration water. Oxidizing coal particles in water reduce the oxygen available for invertebrates like mussels, with damages up *(Continued on Page 2)*

(Pond Creek Mine Pipeline , Continued from Page 1)

the food chain, and water quality for local mussel and fish diversity are of concern on the Big Muddy River. The application denies acidic impact to the river, yet such water pollution is common with coal mining, and the Pond Creek Mine has had non-compliant pH discharge levels. Acid mine drainage from high sulfur coal mining contaminates drinking water, disrupts aquatic plant and animal growth and reproduction, and corrodes infrastructure such as bridges and culverts (and by inference, pipelines); we know this from Appalachian mining and our own Will Scarlet Mine debacle. Foresight has incurred such problems, including its Hillsboro Deer Run mine (also recently offloaded because of a combustion event and unrecoverable buried equipment). Foresight proposes water go to water holding cells on the mining site (and possibly to their preparation plant or slurry impoundment), and then through the pipeline and diffuser to a "mixing zone" in the Big Muddy River.

Transcripts and news articles of the October 23rd public hearing document complaints of minimal notice, speaking and research time for those concerned about the pipeline permit and the larger coal industry operations. People are concerned about drop in the water table impacting their ponds and wells, high chloride and sulfite levels' impact on human and wildlife health, impact to outdoor recreation (canoeing, kayaking, fishing), and the overall impact of the coal industry to climate change and economic imbalances. In reviewing the company's application, maps, and their correspondence with IDNR, a little more geographical detail was added to the paperwork, and the pipeline plans changed to boring under roads and streams instead of cutting through them. However, the updated Foresight application superficially accounts for environmental impact in the immediate pipeline construction zone, and it largely ignores the project's impact to the Big Muddy River and its surrounding watershed habitat. Foresight admits earlier violations in its application, including poor water quality (e.g., acidic, high iron, aluminum, manganese, chloride, black water/coal fine, drilling fluid, ammonia/ nitrogen, dust suppressant, possible asbestos, etc.), inappropriate discharges into wetlands and streams, coal waste in ditch, inappropriate or lack of water monitoring, gob pile gullies, and pipe breakage. Such issues do not prompt confidence in a safe pipeline project; instead, Foresight seems to be taking advantage of the recent federal administration's repeal of the new Stream Protection Act and weakening of EPA Acts and Rules.

> *"When coal is mined, fresh sulfur-bearing minerals in the coal and rocks are exposed to air and water. The resulting chemical reactions produce sulfuric acid and precipitates. The acid water flowing from coal mines, if not treated, can damage life forms in the receiving streams. The iron and sulfate precipitates often discolor stream beds with yellow and orange stains. In a similar manner, when burned, sulfur escaping in the flue gases can combine with water in the atmosphere to produce acidic precipitation ("acid rain"). For the same reasons, burning high-sulfur coal can be corrosive to the metal equipment used in a power plant." -- WV Geological & Economic Survey*



> *"The negative impacts of acid mine drainage are high levels of dissolved solids, especially iron, sulfates, chlorides, and manganese associated with the mine drainage." -- IEPA*

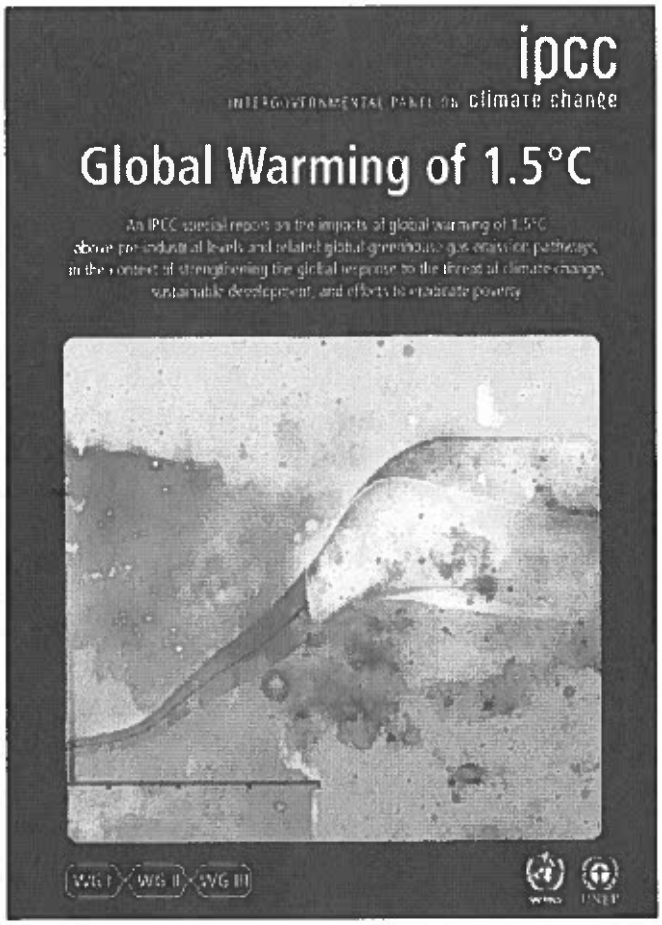
Some of us possibly remember the poor condition of the Big Muddy River a few decades ago before it became somewhat more cleaned up. However, significant sections of the Big Muddy and Pond Creek are still 303(d) listed for pollution problems. In 2012, the Big Muddy was still a Priority 1 on the 303(d) list for cleanup, whether sulfates, fecal matter, or other water quality problems. Its tributary Pond Creek had high chloride levels, near Foresight's mine. Another tributary, the Middle Fork Big Muddy near Foresight's Sugar Camp mine, also has been 303(d) listed for chloride. In 2004, the Big Muddy River had low pH and Dissolved Oxygen, and too much manganese and sulfate, attributed to local coal mines impact on groundwater. Earlier reports indicate exposed gob piles in Franklin County coal mining impacted the Big Muddy and its fish with acid runoff. The federal government attempted to change the forest habitat in the lower *(Continued on Page 3)*

(Pond Creek Mine Pipeline, Continued from Page 2)

Oakwood Bottoms to improve habitat for endangered and threatened wildlife species, and the area has been a fishing and canoeing or kayaking recreation area. This river and wetland habitat support bald and golden eagles, river otters, bats and other endangered, threatened and protected wildlife species. High chloride levels are no help to the water resistance of river otter's fur, and the food chain for otters (which are making a comeback); aquatic wildlife and eagles could diminish from the chloride and sulfite pollution. Foresight's pipeline application does not indicate how they intend to protect such species.

While the public comment period for Foresight's pipeline already passed on November 2nd, a public comment period on a related draft report on Total Maximum Daily Load (TMDL) for the Big Muddy River watershed is open until **December 15th**. Directions to write a comment to Abel Haile, Manager, Planning (TMDL) Unit Watershed Management Section, Bureau of Water, Illinois Environmental Protection Agency 1021 North Grand Avenue East, P.O. Box 19276, Springfield, IL 62794-9276, Abel.Haile@illinois.gov, are here. Copy your comment to the pipeline public comment emails too, dnr.mmlrd@illinois.gov, and nick.sandiego@illinois.gov, with subject line "Permit Application No. 456, Williamson Energy, LLC, Pond Creek Mine, Williamson County." If a site is 303(d) listed, no additional loadings are to be permitted until the waterbody is delisted; however, shenanigans are happening with the 303(d) listing and TMDL. The draft report indicates that parts of the Big Muddy River (IL_N-11 - Sulfates) and its tributary Pond Creek (IL_NG-02 Chloride) by the mine can be delisted, with the aid of a new TMDL calculation method that adjusts for seasonal/periodic water flow variation. Thus, Pond Creek's periodic high concentration of chloride becomes mathematically "diluted" with other seasonal measurements, even though periodic high concentrations during dry seasons may impact aquatic life. Interaction of varying combinations of water quality variables like sulfate, pH, and temperature is unclear. Pond Creek has been 303(d) listed for chloride in 2016, 2014 and 2012 reports, concurrent with Foresight's nearby mine operation, and the mine has repeatedly violated chloride discharge levels. The explanation of the math focuses the reader on fecal matter examples, deflecting attention from the sulfate, chloride, manganese and pH violations from mining. Yet the strategy to delist sulfite and chloride impairments may now "legitimate" permitting Foresight to pollute the waterways with the very delisted items, when they should be denied the pipeline permit and continue to be monitored for chloride, sulfites, and other TMDL violations (and possibly shut down). The pipeline shunts the TMDL problem down river, to the edge of the TMDL reporting area, pushing the impact off on areas of the Big Muddy River that have been improved. One wonders about industry and government collusion in the concurrent adoption of new TMDL sampling and calculations and the expensive and invasive pipeline project. Foresight just closed their Hillsboro mine after an incident, so they continue financial asset and debt management with sale of their more productive mines' coal to foreign buyers, helped by the recent lenient federal administration, and possibly the state of Illinois with this pipeline permit.

Red line indicates proposed pipeline, from mine (right) to Big Muddy River by Zeigler (upper left). West Frankfort is above, while Johnston City is centered below.



WINTER 2018/2019 SIERRA CLUB PROGRAMS:

Note: Access Carbondale Township Hall (217 E. Main) via REAR entrance, a green door in the alley, across from Rock Hill Baptist Church (at Monroe and Marion Streets). The front door is locked! FREE and open to the public. Refreshments and socializing before and after meeting.

Thursday, December 13, 2018
6:15 pm: Member & Guest Potluck
7:00 pm to 8:15 pm: Reflecting Back on 2018 and Looking Forward to 2019 — Join us for a year-end discussion of our activities this past year and priorities for projects to pursue in the coming year.
Location for both potluck and meeting: Carbondale Township, 217 E. Main Street

Thursday, January 17, 2019, 7 pm
Title: Solar for Southern Illinois Energy Forum: Reaping the Benefits of the Future Energy Jobs Act for Rooftop and Community Solar Projects
Presenters: Rebecca Judd, Sierra Club Illinois Clean Energy Advocate and Scott Allen, Citizens Utility Board
Location: TBD
5 pm Dinner: location TBA

Thursday, February 21, 2019, 7 pm
Title: Unpacking the 2018 Intergovernmental Panel on Climate Change Report
Presenter: Prof Justin Schoof, SIUC Dept. of Geography & Environmental Resources
Location: Carbondale Township, 217 E. Main Street
5 pm Dinner: location TBA

Volunteers Needed to Help Protect Shawnee National Forest
Protecting Shawnee National Forest involves frequent communication with the Forest Service, research on issues, and educating others about those issues. We especially need help in keeping oil and gas wells out of the forest - including fracking wells. Please contact Barb at babitaji@aol.com if you are interested in helping in any way.

The Illinois Chapter Sierra Club's Frack Fight Team is steered by Terri Treacy (terri.treacy@sierraclub.org).
To receive periodic updates and communications from local and national Sierra Club, become a member of Illinois Chapter's Frack Fight Team:
http://action.sierraclub.org/site/Survey?ACTION_REQUIRED=URI_ACTION_USER_REQUESTS&SURVEY_ID=138181

FYI, to receive more timely alerts from the Illinois Chapter of the Sierra Club, sign up online at their state website:
https://secure.sierraclub.org/site/SPageNavigator/Chapter/il_newsletter_signup.html;jsessionid=84420F4C49A5A8CD264E1E3C3F131E25.app205a

Call for articles and photographs for Shawnee Trails! The next issue will be published in March. Please send your Word, PDF or JPG files to sabrina@midwest.net by **February 4th.**

WINTER 2018/2019 SHAWNEE GROUP SIERRA CLUB OUTINGS

Rim Rock and Garden of the Gods Hike, Sunday, December 2, 2018
We will meet in the Murdale Shopping Center parking lot in Carbondale near the Murdale sign before 10 am. We will then travel together south of Harrisburg to the Rim Rock National Recreation Trail and the Garden of the Gods Recreation Area. They are both scenic, unique sites with beautiful views. We will do approximately 1-mile hikes at each site. Wear appropriate hiking shoes and bring water and a hiking staff. To sign up for the hike, call Steve Eberhart at 618-967-8690. The hike may be cancelled if no hikers have signed up prior to December 2.

Giant City Red Cedar Trail Hike, Sunday, January 6, 2019
Meet at the Giant City Visitor's Center before 10 am. This will be a moderate hike of 3 miles. We will see bluffs and other beautiful views in Giant City State Park. Resolve to start your new year out right by hiking and experiencing nature. Be sure to wear appropriate clothing and hiking shoes. You must call Bob Mulcahy at 618-942-6342 to go on this hike.

Jackson Hollow Hike, Sunday, February 24, 2019
Meet at Murdale shopping center in Carbondale (by the Murdale sign) before 9:30 or at the Marion Rural King parking lot (near the trailers/farm implements) before 10 am. The Jackson Hollow Natural Area features incredible rock formations and rare plant species. We will hike along the bluff lines on the north and south sides of the hollow. It will be a moderately difficult hike of about 3 miles. We may have to cross over downed trees and water. Wear appropriate hiking shoes and bring water. You must call Kevin Rohling at 618-694-8150 in order to attend this hike.

***

High Quality Natural Areas Need Your Help: Helping to Preserve Rare Native Plants
Shawnee Group Sierra Club is working with Illinois DNR to protect some of the highest quality natural areas in Illinois from non-native invasive plants (NNIS). Currently, we are focusing on Fern Rocks Nature Preserve. To save these areas from being overrun by invasive species and to protect the rare and beautiful native plants, we need lots of help. Each outing will include introductions and orientation on the invasive plants and safety measures.

Fern Rocks Nature Preserve in Giant City State Park, Saturday, December 8 2018, 1:00 – 4:00 PM
Meet at Giant City Visitor's Center in Makanda – about six miles south of Carbondale. We will also meet people who need transportation at the SIU arena parking lot at NOON, if you contact us at least by noon two days before the event.

Bring a water bottle and work gloves (if you have some). We will provide work gloves to those who need them, plus snacks. Wear appropriate clothing, including closed toe sturdy shoes and long pants and sleeves. IDNR will provide orange vests.

Contact: Barbara McKasson, certified Sierra Club Outings Leader at 618-529-4824 or Email at babitaji@aol.com or Text 618-534-7440.

Piasa Palisades Group Outings Chair:

Other short notice outings and events may be announced on our Facebook page:
https://www.facebook.com/SierraClubShawnee

Dear Governor-Elect Pritzker
By Barbara McKasson, Conservation co-chair

Illinois Chapter Sierra Club endorsed JB Pritzker for Governor and worked hard to help elect him. Now is the time to speak up for the trees, wildlife and environment… and for the Illinois Department of Natural Resources (IDNR). You may have read Les Winkeler's excellent open letter to Pritzker that was in The Southern on November 9th that addressed the need to rebuild IDNR, which has been decimated by years of budget cuts and sweeping of funds meant for the agency. Now it is our turn to add our voices to support increased funding of IDNR and increased concern for the wildlife and natural resources that IDNR has a mandate to protect. So let's start sending Emails and Facebook messages to JB to let him know how much we care about those special places, plants and animals. Offered here are some facts, arguments, perspectives in support of greater funding for IDNR that may help get you thinking of what you would like to include in your letter to the Governor-Elect.

- At what points – besides tax time – do people really feel the state government affects them? How about when they can spend a Sunday afternoon with their whole family taking a walk in a state park or when their child comes home from a school field trip excited about seeing salamanders under a log, a long snake skin or crayfish in a stream. Those great experiences are possible only when there is money to maintain those trails or to pay a site interpreter. Please increase IDNR funding to maintain our state parks and to hire more full-time site interpreters. There are currently only seven full-time site interpreters in the whole state!

- The IDNR has a mandate to protect our natural resources, not encourage exploitation by corporations to mine or drill on our public lands. I urge you to appoint a biologist as Director of IDNR and highly qualified professionals for the departments within IDNR to make sure the agency does not lose sight of its primary mission.

- As Les Winkeler points out in his November 9th article in The Southern, each wildlife and fisheries biologist is currently covering five or six counties and each conservation police officer covers several counties. This makes it very difficult to protect the wildlife and the natural resources from damage. I urge you to fully staff the Illinois Department of Natural Resources so our parks and wildlife will be adequately protected. In fact, our most popular state park, Starved Rock, is being loved to death, and sorely needs more staff to make sure it does not die a slow death, which is where it is headed.

- Site superintendents are stretched so thin that they must shuttle between two, five or even twelve sites, with maintenance workers and volunteers left to greet the public and make sure public property is not damaged. This is abuse – of our parks and of the superintendents, who do their best to fulfill the demands of an impossible job. I urge you to hire enough site superintendents so that one superintendent does not have to oversee more than one major state park and so that each major state park has its own superintendent.

- Mr. Pritzker, we know you are concerned about childhood education, but how familiar are you with the gaping hole in our children's education and well-being, which is now called "nature deficit disorder." The iGeneration is so glued to their iphones and other screens that most of them hardly ever play outside and are increasingly disconnected from nature. An increasing number of studies have shown that this is resulting in a generation of kids that have trouble navigating their physical environment, have trouble with dexterity, and have increased anxiety and decreased attention span. You can help solve this problem by increasing the budget for parks, open spaces and environmental educators and park site interpreters.

- I urge you, Mr. Pritzker, to make a New Year's Resolution to not sweep any funds from the Open Space Lands Acquisition and Development Fund (OSLAD) and the Natural Areas Acquisition Fund (NAAF). OSLAD helps local governments acquire, protect and manage public parks and open space, which is a state-financed grant program. NAAF money is for acquisition, preservation and stewardship of natural areas, including high quality natural communities, habitats for endangered and threatened species and natural heritage sites. Since Illinois is 48th out of the 50 states in amount of publicly accessible state and national lands per capita, it is evident that we need to spend OSLAD and NAAF funds for their intended purpose.

- I urge you to suspend bobcat hunting until scientific studies determine that there is a low risk of the species returning to protected list status. The hunting and trapping of bobcats is currently unconscionable since there is not sufficient scientific evidence to support it.

- I urge you to bring stakeholders together to plan a comprehensive strategy to protect Monarch butterflies in Illinois. Having the Illinois Department of Transportation planting and preserving milkweed is not enough, especially since roadways are dangerous areas for butterflies and other pollinators. We need cooperation between government and organizations to map out protected areas for planting and protecting milkweed for the larvae and nectar flowers for the adults.

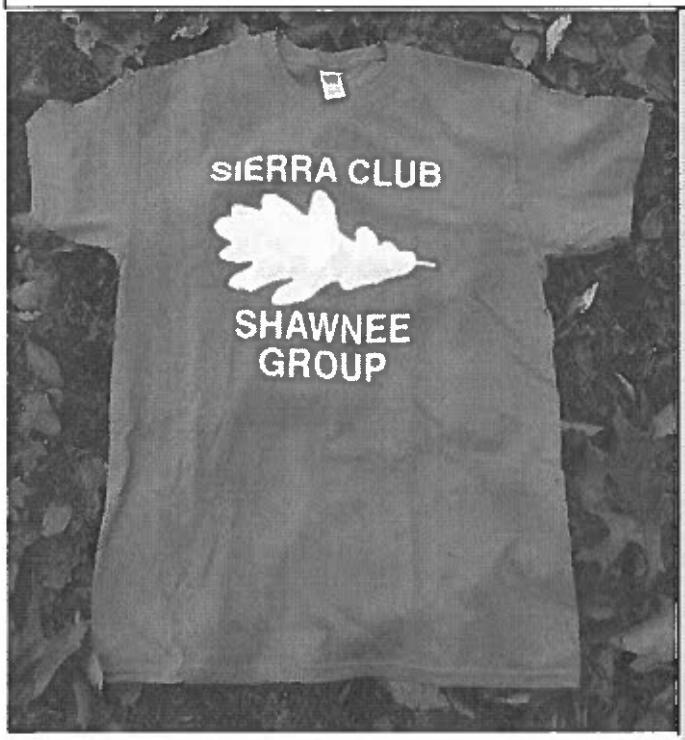
Has Your Email Address Changed?

To receive notification when the latest Shawnee Group newsletter is posted online, be sure to inform the Group when you change your email address. Send email address updates to: jane.cogie@gmail.com



Read current and past newsletters on our website: http://www.sierraclub.org/illinois/shawnee. The website also lists information on upcoming local programs and outings, plus state and national Sierra Club issues.

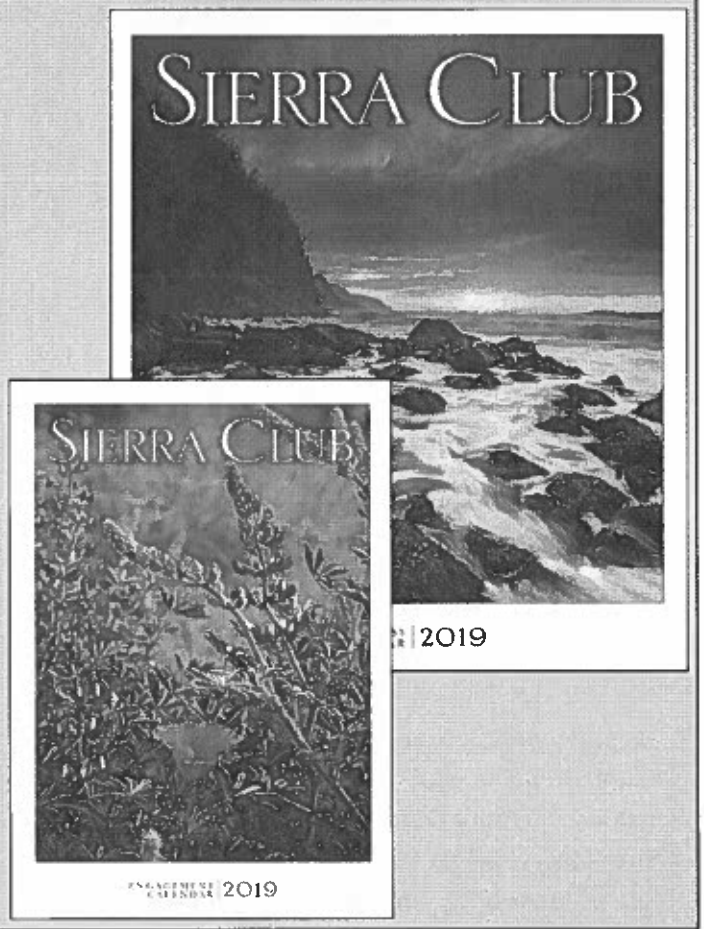
Leadership Opportunities

Run for the Board! We need a few good women and men. Join the board of directors (the executive committee, also known as the ExCom) in overseeing the Shawnee Group's strategic direction and economic health. Board members meet monthly for about 2 hours. Board terms are for two years. We are always interested in potential candidates.

We need Hospitality team members

Provide refreshments for one monthly meeting each year (2nd Thursday). Be the Hospitality Chair to organize refreshment providers and greeters OR Act as a greeter for a monthly meeting or welcome and assist our speaker OR Select and make reservations at a local restaurant for our monthly "Dinner Before the Meeting." Contact Jane Cogie, 618-549-4673 jane.cogie@gmail.com.

Shawnee Group Sierra Club T-Shirts for Sale!



Show your support for our local group's activities. For sale during our monthly meetings.

Color: White logo on blue T-Shirt

$15 Medium Large or X-Large

2019 Sierra Club Calendars!

Buy at our monthly meetings this fall. Or contact Barb McKasson (babitaji@aol.com). We also seek volunteers to sell calendars.

VP Pence: Another Dirty Secret Back Home Entering Our Backyard

By Sabrina Hardenbergh

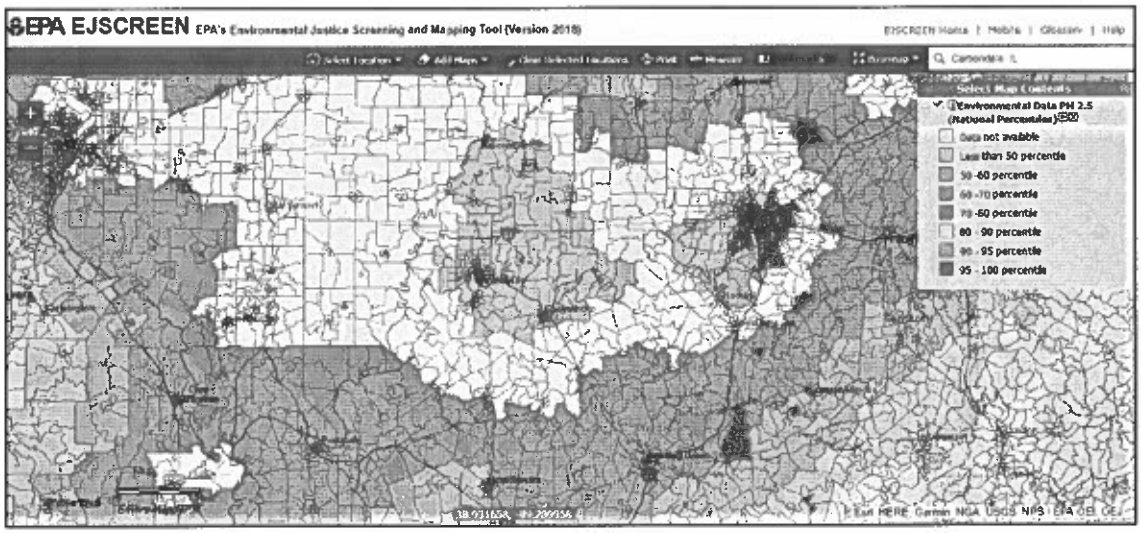
Environmentally concerned southern Illinoisans have spoken up about the many problems of coal and the need to transition to renewable energy for many years. The recent federal repeal of EPA regulations intended to protect water, air, and our health, and the many fossil fuel proponents in top federal positions, is disturbing, to say the least. We fight in Springfield and Washington, yet we also need to look just across our state border at our neighbors' decisions that impact us. While reading yet another health research article on a topic of key interest concerning a relative, regarding PM 2.5 air pollution's relationship to Alzheimer's (a condition where many systemic or inflammation factors are of concern), the thought occurred to look up the air pollution maps on the EPA EJScreen. Particulate matter is also a factor in asthma, lung cancer, heart disease, diabetes, and premature birth; Illinois is among states with high PM 2.5. On the EJScreen map, southern Illinois is layered with even higher proportions of PM 2.5, ozone and other hazards. Upon zooming out, the PM 2.5 pollution appears to emanate from Evansville, Indiana. A Google search reveals coal power plants and a new permit for a plant to liquify coal to gas. EPA EasyRSEI air data is discouraging too. Not recalling the exposé of Evansville's air pollution health hazard being well known in southern Illinois, despite its being an Indiana Sierra Club Beyond Coal issue, some details follow.

Seven coal fired power plants are within 40 miles of Evansville. In 2014, the Center for Public Integrity examined two large toxic air release and greenhouse gas emissions databases. A third of toxic releases come from a top 100 out of 20,000 power plants, factories and other sources. Twenty-two "Super Polluters" appeared on both lists. **Four** Super Polluters are in southwest Indiana, home to 5 of Indiana's 6 coal fired power plants. The study found that more toxic pollution from utility coal plants was sent into the air within 30 miles of Evansville than around any other mid-sized or large American city, which also is impacted by air pollution from other manufacturing. The 6 Indiana power plants made a quarter of Indiana air emissions, and within its 7 most southwestern counties, three-quarters of the air pollution recorded in the inventory came from the 6 coal plants. A couple nearby Kentucky plants add to regional air pollution. Indiana ranks first out of 56 states/territories nationwide based on total highest toxic chemical releases per square mile, although part of the pollution is produced by manufacturing such as steel, aluminum and plastics production. Some coal-fired plants are being closed, but mostly in central Indiana. Indiana, then under Governor Pence, was among 27 states suing the federal government over the Clean Power Plan. Eight northeastern states sued the EPA for permitting too much air pollution in upwind Indiana and other coal mining and coal power plant states.

By the Wabash River and I64, 25 miles northwest of Evansville, **Gibson** is Duke Energy's largest plant at 3,145 megawatts, *(Continued on Page 2)*

(Our Backyard , Continued from Page 1)

the 4th-largest coal plant in the country by capacity. It released 2.9 million pounds of air pollutants in 2014, according to the toxics inventory, much of that sulfuric acid, contributing to the formation of fine particles, a lung irritant. Lead, arsenic and mercury, all neurotoxins, added up to 1,000 pounds that year too. Gibson was the 4th top greenhouse gas polluting site nationwide.



Rockport Generating Station, with its nearly world record 1,038-foot stack, operated by Indiana Michigan Power, a subsidy of American Electric Power, tied for tenth-largest coal plant in the country. Spencer County ranks 23 for toxic releases among all United States counties in the EPA's Toxic Release Inventory, from AK Steel and this coal-fired power plant, which has non-compliance violations. In 1999, the EPA, environmental groups and eight states (not Indiana) sued American Electric Power for emissions at coal plants; settlement remains pending.

Recently, although Indiana Department of Environmental Management denies significant impact, southwestern Indiana residents are also concerned about a new coal hydrogenation plant in Dale, IN adding to Spencer County and the region's pollution. Finely ground coal slurry mixed with hydrogen, heated to 450° C, yields hot gas, which then is condensed to liquid crude oil to fractionate into gasoline, middle oil, and heavy oil. Riverview Energy Corporation anticipates marketing 4.8 million barrels of low-sulfur diesel fuel, 2.5 million barrels of naphtha, and sulfur, made from 1.6 million tons of coal a year. This process can release hydrogen cyanide, phenols, cresols, carbonyl and hydrogen sulfides, ammonia, mercaptans, thiocyanides, aniline, arsenic, trace metals and various polycyclic hydrocarbons if mismanaged, risks for cancer, cardiac, endocrine, neurological and respiratory problems.

AES Corp.'s Petersburg power plant, 40 miles northeast of Evansville, put more chemicals into the air in 2014 than all but eight other sites nationwide. **Petersburg** was 35th for greenhouse gases. The plant had multiple emissions violations.

Warrick (Alcoa) and F.B. Culley (Vectran Corp.) coal-fired power plants are located 7 miles southeast of Evansville in Warrick County. **Warrick** power plant is also among the top 100 toxic releases and greenhouse gas emissions in the nation, and has had many violations. F.B. Culley has also had violations.

"In Southwest Indiana, ozone pollution is a problem during spring, summer, and early fall, while fine particulate pollution may be a problem year-round. These and other air pollutants can be hazardous to our health and environment." – Vanderburg County Health Department

Vanderburg County Health Department acknowledges the health hazard of air pollution around Evansville, including posting alerts of days with high ozone and particulate matter. However, they do not say anything about the many area power plant sources. Instead they advise residents to reduce their own fossil fuel consumption by less vehicle, lawn mower and appliance use, insulating homes, and planting trees. They state that this upholds their mission to "insure that the citizens of Southern Indiana have healthy air to breathe, while not suffering hindered economic development due to air quality problems." Other websites report air quality, like the EPA's Air Now, Easy RSEI, and Weather Underground. A local group, Valley Watch, notes that air pollution monitors have often been down for "maintenance" when air pollution is high, lending to no alerts or documentation. Vanderburg had higher PM 2.5 levels than nearly 90 percent of U.S. counties.

SPRING 2019 SIERRA CLUB PROGRAMS:

Note: Access Carbondale Township Hall (217 E. Main) via REAR entrance, a green door in the alley, across from Rock Hill Baptist Church (at Monroe and Marion Streets). The front door is locked! FREE and open to the public. Refreshments and socializing before and after meeting.

Thursday, March 14, 2019 Program 7 pm
Title: Discovering the Shawnee
Presenter: Prof Gary Kolb, SIUC Cinema & Photography Department, Emerita
Location: Carbondale Township Hall, 217 E. Main (back entrance)
5 pm Dinner: Keeper's Quarters

Thursday, April 11, 2019 Program, 7 pm
Title: Regenerative Agriculture: The What, Where & Why
Presenter: Kim Erndt-Pitcher, Habitat & Agriculture Programs Specialist, Prairie River Network
Location: Carbondale Township Hall, 217 E. Main (back entrance)
5 pm Dinner: Location TBA

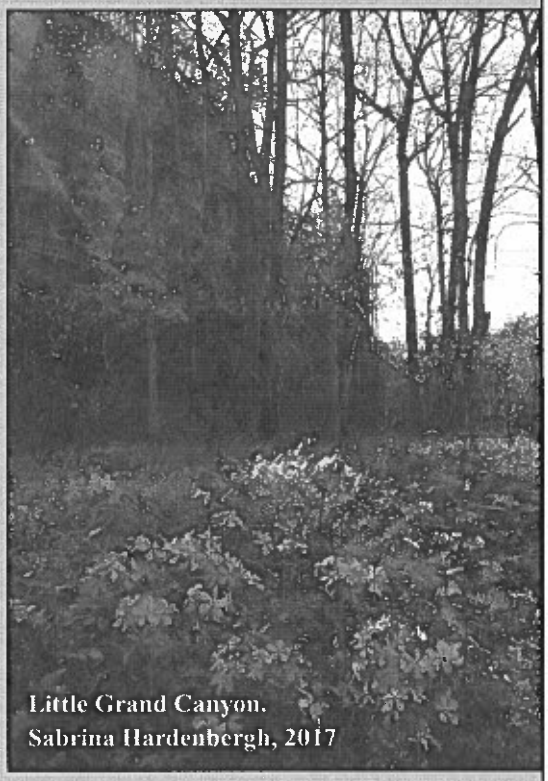
Thursday, May 23, 2019 Program, 7 pm
Title: Molecular Evolution Research: What Is It, Why Is It Important, and Why Do Scientific Names Change Because of It?
Presenter: Marisa Szubryt, SIUC Graduate Student in Plant Biology
Location: Carbondale Township, 217 E. Main Street
5 pm Dinner: location TBA

Save the Date: Sunday, June 30, 2019 for a member-guest gathering, sharing a meal at Scratch Brewery in Ava. This event will replace our June Picnic. Details will follow, in our summer newsletter and the Shawnee Group of the Sierra Club Facebook page.

Volunteers Needed to Help Protect Shawnee National Forest
Protecting Shawnee National Forest involves frequent communication with the Forest Service, research on issues, and educating others about those issues. We especially need help in keeping oil and gas wells out of the forest - including fracking wells. Please contact Barb at babitaji@aol.com if you are interested in helping in any way.

Concerned about fracking?

Contact Barb McKasson at babitaji@aol.com if you are interested to help. New bills to support in Springfield, include HB282 (fracking transparency bill) and HB1562 (People's Property Protection Act, concerning subsurface trespass), so do contact your legislators. However, Barb can alert you of many action, outreach and planning opportunities that come up.



FYI, to receive more timely alerts from the Illinois Chapter of the Sierra Club, sign up online at their state website: https://secure.sierraclub.org/site/SPageNavigator/Chapter/il_newsletter_signup.html;jsessionid=84420F4C49A5A8CD264E1E3C3F131E25.app205a

Call for articles and photographs for Shawnee Trails! The next issue will be published in May. Please send your Word, PDF or JPG files to sabrina@midwest.net by **May 6th.**

SPRING 2019 SHAWNEE GROUP SIERRA CLUB OUTINGS

Kincaid Lake Trail hike; Sunday, March 10, 2019, 10:00 AM
Meet at the US Forest Service at 2221 Walnut in Murphysboro before 10 am to carpool. This moderate hike of up to 5 miles will offer views of Kinkaid Lake, rock ledges and a cave. Wear hiking shoes and bring water. Contact Bob Mulcahy at 618-942-6342, bobmulcahy29@yahoo.com, to sign up for the hike.

Little Grand Canyon Hike; Sunday, April 14, 2019, 10:00 AM
Meet at the Forestry Station at 2221 Walnut St in Murphysboro before 10 am to carpool to this moderate hike. We will hike along the upper trail and then down and through the canyon. We will also see views of the Big Muddy river valley. Bring water, hiking staff, and hiking boots. Contact Steve Eberhart at 618-967-8690, eberpsy@icloud.com, to sign up for the hike.

Little Grand Canyon.
Sabrina Hardenbergh, 2017

Jackson Hole and Double Branch Hole hike; Sunday, May 5, 2019, 9:30 AM
Meet at the Murdale shopping center in Carbondale by the Murdale sign before 9:30 am or at the Marion Rural King parking lot before 10 am. This moderate 3-mile hike will go through two natural areas of the Greater Shawnee Hills. We will see cliffs, valleys and waterfalls. Call Kevin Rohling at 618-694-8150, kgr7998@gmail.com, to sign up for the hike.

***

Service Outings – Native Plant Rescue Team

Shawnee Group is committed to helping rid high-quality natural areas of non-native invasive plants (NNIS) that are threatening to out-compete the natives, many of which are threatened, endangered or rare. In particular, we have been holding invasive pulls and lopping at the Fern Rocks Nature Preserve (Trillium Trail) and at LaRue – Pine Hills area in Shawnee National Forest.

Because our ability to hold these service outings depend so much on the weather and condition of the ground, we cannot nail down dates very far ahead. Thus, if you are interested in participating, please contact us and we will put you on our Email list to be notified when we do set dates. Please respond to Barb to be on our Native Plant Rescue Team with your name and Email address.

Contact Barb by phone at 618-529-4824 (voice mail) OR by text only to 618-534-7440.

Piasa Palisades Group Outings Chair:
Carol Klinger, 618-288-5506, ciklinger@yahoo.com

Spring 2019 Monarch Team News

Reports indicate increased monarch hibernation in Mexico, according to a recent World Wildlife Fund survey. However, they also warn that monarch butterflies continue to face threats such as climate change, forest degradation in Mexico, and milkweed depletion along their migratory route.

Photo by Terry Foster, Master Naturalist/Master

"Pollinators~ Through the Artist's Eye" ART SHOW Coming to Carbondale in June!

It won't be long until Monarchs that overwintered in the forested mountains of Michoacán, Mexico start making their way northward. In mid-April, when weather warms, we'll start seeing their orange and back wings flitting above our greening meadows.

For butterflies and other pollinators, June is high season. Milkweeds, wildflowers and home gardens are in full bloom; a veritable nectar feast and procreation party.

June is the perfect time to celebrate pollinators! In collaboration with Carbondale Community Arts, we are putting on an art show, *"Pollinators ~ Through the Artist's Eye"*. Drawings, paintings, photography, fiber art and sculpture by local artists and students will on exhibit during June at CCA's, Gallery 304, located at 304 W. Walnut. The show is made possible by a grant from the Illinois Sierra Club and generous in-kind donation from CCA.

Please watch for the show flyer with specifics about entering the show, and info on the opening reception, workshops and lectures on the life cycles and conservation of pollinators in the on-line CCA newsletter, www.carbondalearts.org.

URGENT!! Will Illinois Be a Leader In Easing the CLIMATE CRISIS? YOU DECIDE!

By Barbara McKasson

Illinois Chapter Sierra Club and hundreds of environmental, healthcare, consumer, faith-based, community, and environmental justice groups plus businesses have joined together as the Illinois Clean Jobs Coalition to up the ante on fighting against the worst consequences of our human-caused climate crisis. We partnered to pass the Future Energy Jobs Act of 2016, which has led to a winning solar and energy efficiency industry. Now we are raising the level of our game to pass the new Clean Energy Jobs Act (CEJA).

The finer details of CEJA are still being worked out, but the "Clean Energy Jobs – Tech" bills have been introduced in both the Illinois House (HB3624) and the Illinois Senate (SB2132). Rep. Ann Williams is the main sponsor in the House, and Senator Cristina Castro is the main sponsor in the Senate. There are a good number of legislators signed on as co-sponsors of the bills, but more are needed to help move the bills along in the process. We need you to educate your legislators now.

The recent Intergovernmental Panel on Climate Change (IPCC) "Special Report on Global Warming of 1.5° C" is strongly urging all earthlings and governments to take immediate action to keep earth from warming to 1.5° C above pre-industrial levels to avoid many dire consequences, and that the pledges made in the Paris COP21 Agreement is insufficient to meet the "below 1.5° C" goal. The report warns that to stabilize global temperatures at any level requires us to reduce net CO2 emissions to ZERO! Earth has already warmed by 1° C and the current rate of warming is 0.2° C per decade. We have LESS THAN TWELVE YEARS TO GET DOWN TO ZERO NET CO2 EMISSIONS!

The Clean Energy Jobs Act will repower Illinois equitably with the following goals:

- Power more than 4 million homes and lower electricity bills while pushing back against harmful federal attacks on clean energy.
- Create more than $30 billion in new private investment in Illinois through incentives.
- Expand access to clean energy careers, build community wealth, and improve air and water quality, leading to healthier communities.
- Reduce pollution from transportation by increasing electric vehicles and support systems, and cleaner, more convenient public transportation.
- Decarbonize the electric grid.
- Prioritize jobs and economic opportunities, especially for economically disadvantaged and minority communities.

HOW YOU CAN HELP

1. Find your State Representative's and Senator's contact information on the list on page 7 OR go online at www.illinoispolicy.org/maps and type in your address.
2. Call their offices and ask them to co-sponsor the Clean Energy Jobs Act – HB3624/SB2132.
    a. State your name and let them know you live in their district.
    b. Say you want your Rep/Senator to co-sponsor HB3624/SB2132, the Clean Energy Jobs Act. If they are already a co-sponsor, thank them for co-sponsoring.
    c. Let them know your personal concerns if you want to – don't be shy!

Note: Gov. Pritzker signed Illinois onto the U.S. Climate Alliance, and he supports the CEJA bill.

REGISTERING YOUR SUPPORT FOR ENVIRONMENTAL LEGISLATION

We hope you will join us in Springfield for the following Spring 2019 Lobby Days. Each one focuses on legislation targeting specific high priority environmental issues:

- **Conservation and Nutrient Pollution Lobby day - March 13:** To express your support for conserving our water and protecting it from nutrient pollution, such as from CAFOs and other agricultural practices.

- **Water & Toxics Lobby Day - April 10:** To forward legislation on lead service line replacement, water infrastructure, and more.

- **Clean Energy Lobby Day -- May 9:** To support sustainable energy and jobs created from its infrastructure.

Opportunity for Constituents in IL Senate District 59 (Dale Fowler) and IL House District 117 (Dave Severin) or 118 (Patrick Windhorst): GRASSROOTS VOLUNTEER LOBBY TEAM VACANCIES: If you are a constituent of Dale Fowler and either Dave Severin or Patrick Windhorst and are interested in lobbying these legislators in their in-district offices on Sierra Club environmental legislative priorities, please contact the Shawnee Group Chair, Jane Cogie (see contact information below).

The aim in pushing to fill these vacancies is to ensure state legislators hear about our top environmental bills face-to-face from their constituents.

Lobby team members need not have previous lobbying or policy experience. We provide them with basic lobby training and a briefing on priority bills. To volunteer for this position, you need only to be a strong communicator and be willing to attend trainings and schedule and attend lobby visits.

For more information on the three spring lobby days or the in-district lobby team openings for Senate District 59, please contact Jane Cogie, Chair, Shawnee Group of the Sierra Club (618-713-7024; jane.cogie@gmail.com).

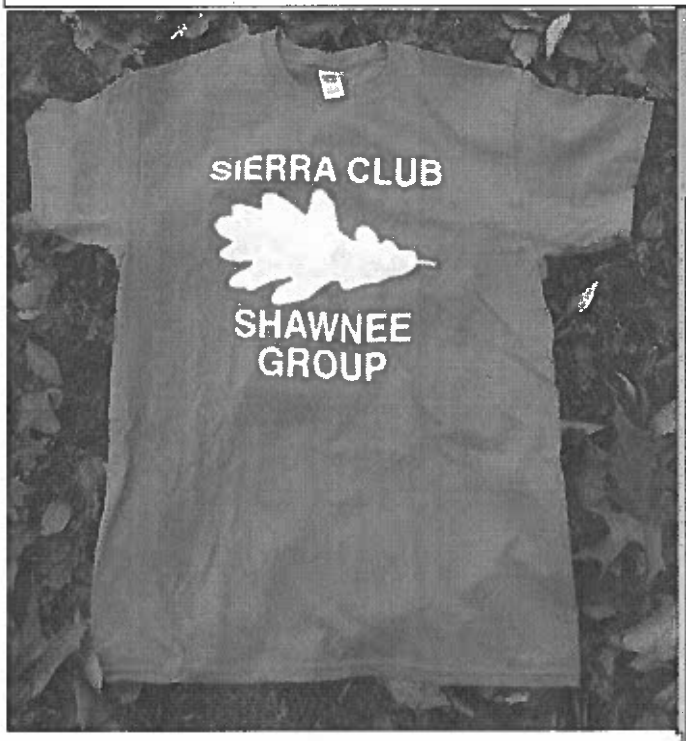
Has Your Email Address Changed?

To receive notification when the latest Shawnee Group newsletter is posted online, be sure to inform the Group when you change your email address. Send email address updates to: jane.cogie@gmail.com



Read current and past newsletters on our website: http://www.sierraclub.org/illinois/shawnee. The website also lists information on upcoming local programs and outings, plus state and national Sierra Club issues.

Leadership Opportunities

Run for the Board! We need a few good women and men. Join the board of directors (the executive committee, also known as the ExCom) in overseeing the Shawnee Group's strategic direction and economic health. Board members meet monthly for about 2 hours. Board terms are for two years. We are always interested in potential candidates.

We need Hospitality team members

Provide refreshments for one monthly meeting each year (2nd Thursday). Be the Hospitality Chair to organize refreshment providers and greeters OR Act as a greeter for a monthly meeting or welcome and assist our speaker OR Select and make reservations at a local restaurant for our monthly "Dinner Before the Meeting." Contact Jane Cogie, 618-549-4673 jane.cogie@gmail.com.

UNITED STATES
SECURITIES AND EXCHANGE COMMISSION
WASHINGTON, DC 20549

FORM 8-K

CURRENT REPORT

Pursuant to Section 13 or 15(d) of the Securities Exchange Act of 1934

Date of Report (date of earliest event reported): December 19, 2019

FORESIGHT ENERGY LP

(Exact Name of Registrant as Specified in Charter)

Delaware	001-36503	80-0778894
(State or Other Jurisdiction of Incorporation)	(Commission File Number)	(IRS Employer Identification No.)
211 North Broadway, Suite 2600 Saint Louis, MO (Address of Principal Executive Offices)		63102 (Zip Code)

(Registrant's telephone number, including area code): (314) 932-6160

(Former Name or Former Address, if Changed Since Last Report)

Check the appropriate box below if the Form 8-K filing is intended to simultaneously satisfy the filing obligation of the registrant under any of the following provisions (*see* General Instruction A.2. below):

? Written communications pursuant to Rule 425 under the Securities Act (17 CFR 230.425)

? Soliciting material pursuant to Rule 14a-12 under the Exchange Act (17 CFR 240.14a-12)

? Pre-commencement communications pursuant to Rule 14d-2(b) under the Exchange Act (17 CFR 240.14d-2(b))

? Pre-commencement communications pursuant to Rule 13e-4(c) under the Exchange Act (17 CFR 240.13e-4(c))

Securities registered pursuant to Section 12(b) of the Act:

Title of each class	Trading Symbol(s)	Name of each exchange on which registered
Common units representing limited partner interest	*	*

*On November 25, 2019, a Form 25 relating to the delisting and deregistration under Section 12(b) of the Registrant's common units representing limited partner interests was filed by the New York Stock Exchange LLC. The common units currently trade on the OTCQX® Best Market under the symbol "FELPU."

Indicate by check mark whether the registrant is an emerging growth company as defined in Rule 405 of the Securities Act of 1933 (§ 230.405 of this chapter) or Rule 12b-2 of the Securities Exchange Act of 1934 (§ 240.12b-2 of this chapter).

Emerging growth company ?
If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act. ?

Item 1.01 Entry into a Material Definitive Agreement.

As previously disclosed, on December 13, 2019, Foresight Energy LLC and Foresight Energy Finance Corporation (wholly owned subsidiaries of Foresight Energy LP (the "**Partnership**")) (together, the "**Issuers**") solicited the consent of the holders (the "**Holders**") (such solicitation, the "**Consent Solicitation**") of the Issuers' 11.50% Second Lien Senior Secured Notes due 2023 (the "**Notes**") to amend (such amendments, the "**Amendments**") the indenture governing the Notes (as amended, supplemented or otherwise modified from time to time, the "**Indenture**"), as more fully described below. The Consent Solicitation expired at 5:00 p.m., New York City time, on December 19, 2019 (the "**Expiration Time**").

As of the Expiration Time, the Issuers had received consents to the Amendments from Holders of at least a majority in aggregate principal amount of the outstanding Notes not owned by the Issuers or their affiliates. As a result, on December 19, 2019, the Issuers, the guarantors party thereto and Wilmington Trust, National Association, the trustee (the "**Trustee**") for the Notes, entered into a second supplemental indenture (the "**Second Supplemental Indenture**") providing for the Amendments to the Indenture.

The Amendments (i) amend Section 6.01(b) of the Indenture to extend the grace period for payment of interest due on the Notes from 90 days to 150 days and (ii) amend Section 4.03 of the Indenture to eliminate the requirement that the Issuers periodically hold a publicly accessible conference call to discuss the Issuers' financial information for the relevant fiscal period.
The Partnership continues to engage in discussions with its creditor constituencies and explore potential restructuring alternatives.

The foregoing descriptions of the Amendments, the Second Supplemental Indenture and the Indenture are qualified in their entirety by reference to the full text of the Second Supplemental Indenture, the First Supplemental Indenture dated as of October 30, 2019 and the Indenture, each of which is incorporated herein by reference to **Exhibit 4.1**, **Exhibit 4.2** and **Exhibit 4.3** to this Current Report on Form 8-K, respectively.

Item 3.03 Material Modification to Rights of Security Holders.

The disclosure set forth in Item 1.01 of this Current Report on Form 8-K is incorporated into this item by reference.

CAUTIONARY STATEMENT REGARDING FORWARD-LOOKING STATEMENTS

Certain statements and information in this Current Report on Form 8-K and certain oral statements made by our representatives from time to time may constitute "forward-looking statements." The words "propose," "believe," "expect," "anticipate," "plan," "intend," "foresee," "outlook," "estimate," "potential," "continues," "may," "will," "seek," "approximately," "predict," "anticipate," "should," "would," "could" or other similar expressions are intended to identify forward-looking statements, which are generally not historical in nature. Forward-looking statements also include statements about our liquidity, our capital structure and expected results of operations. These forward-looking statements are based on the Partnership's current expectations and beliefs concerning future developments and their potential effect on us. While management believes that these forward-looking statements are reasonable as and when made, there can be no assurance that the future developments affecting us will be those that we anticipate.

We continue to experience substantial financial, business, operational and reputational risks that threaten our ability to continue as a going concern and could materially affect our present expectations and projections. For additional information regarding known material factors that could cause our actual results to differ from those contained in or implied by forward-looking statements, please see the section entitled "Risk Factors" in the Partnership's Annual Report on Form 10-K for the year ended December 31, 2018, filed with the Securities and Exchange Commission on February 27, 2019 and subsequent Quarterly Reports on Form 10-Q.

You are cautioned not to place undue reliance on forward-looking statements, which are made only as of the date hereof. We undertake no obligation to publicly update or revise any forward-looking statements after the date they are made, whether as a result of new information, future events or otherwise, except as required by law.

EXHIBIT 4.1

SECOND SUPPLEMENTAL INDENTURE

SECOND SUPPLEMENTAL INDENTURE to the Indenture (as defined below) (the "*Supplemental Indenture*"), dated as of December 19, 2019, is made by and among Foresight Energy LLC, a Delaware limited liability company (the "*Company*"), Foresight Energy Finance Corporation, a Delaware corporation ("*Co-Issuer*, and together with the Company, the "*Issuers*"), the guarantors party hereto (the "*Guarantors*") and Wilmington Trust, National Association, as trustee (in such capacity, the "*Trustee*"), and amends the Indenture, dated as of March 28, 2017, among the Issuers, the Guarantors and the Trustee, as amended by the First Supplemental Indenture, dated as of October 30, 2019 (as further amended and supplemented from time to time, the "*Indenture*").

RECITALS:

WHEREAS, pursuant to the Indenture, the Issuers have issued $425,000,000 in aggregate principal amount of 11.50% Second Lien Senior Secured Notes due 2023 (the "*Notes*");

WHEREAS, the Issuers have requested consents of the Holders of the Notes to amend the terms of the Indenture as set forth in Article I herein (the "*Proposed Amendments*");

WHEREAS, pursuant to Section 9.02 of the Indenture, the written consent of Holders of at least a majority in aggregate principal amount of the outstanding Notes (the "*Requisite Consents*") is sufficient to adopt the Proposed Amendments set forth in Article I;

WHEREAS, the holders of at least a majority in aggregate principal amount of the Notes outstanding (which excludes any Notes owned by the Issuers or their affiliates) have validly tendered consents and not validly withdrawn their consents to the adoption of the Proposed Amendments effected by this Supplemental Indenture in accordance with the provisions of the Indenture;

WHEREAS, having received the Requisite Consents for all of the Proposed Amendments, the Issuers and the Guarantors desire to amend the Indenture as provided herein;

WHEREAS, the Issuers have delivered to the Trustee, pursuant to Section 9.02 of the Indenture, an Officer's Certificate stating that the Issuers have received the Requisite Consents, and have provided certification of such receipt to the Trustee;

WHEREAS, the Issuers have also delivered to the Trustee, pursuant to Sections 7.02(b), 9.02 and 9.05 of the Indenture, (i) a resolution of the Board of Directors of the Company authorizing the execution of this Supplemental Indenture, and (ii) an Officer's Certificate and an Opinion of Counsel, each stating that the execution of this Supplemental Indenture is authorized or permitted by the Indenture and that all conditions precedent to the execution and delivery of this Supplemental Indenture have been satisfied; and

---

WHEREAS, all other conditions and requirements necessary to make this Supplemental Indenture a valid, binding and legal instrument enforceable in accordance with its terms have been performed and fulfilled by the parties hereto, and the execution and delivery thereof have been in all respects duly authorized by the parties hereto.

NOW, THEREFORE, in consideration of the foregoing and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties mutually covenant and agree for the equal and ratable benefit of the Holders of the Notes as follows:

ARTICLE I

WHEREAS, all other conditions and requirements necessary to make this Supplemental Indenture a valid, binding and legal instrument enforceable in accordance with its terms have been performed and fulfilled by the parties hereto, and the execution and delivery thereof have been in all respects duly authorized by the parties hereto.

NOW, THEREFORE, in consideration of the foregoing and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties mutually covenant and agree for the equal and ratable benefit of the Holders of the Notes as follows:

ARTICLE I
AMENDMENTS

Section 1.01. Amendments to Indenture.

(i) Section 6.01(b) of the Indenture is hereby amended and restated in its entirety to read as follows:

"(b) the Issuers default in the payment of interest on any Note when the same becomes due and payable, and the default continues for a period of 150 days;"

(ii) Section 4.03(d) of the Indenture is hereby deleted and amended and restated to read in its entirety as set forth below:
"(d) [Intentionally omitted]."

(iii) Section 4.03(e) of the Indenture is hereby amended to delete the reference to ", and a publicly accessible quarterly conference call of such Parent".

(iv) The first sentence of Section 4.03(f) of the Indenture is hereby amended to (i) add the word "and" immediately before the word "furnishes", (ii) delete the reference to ", and holds a publicly accessible quarterly conference call" and (iii) replace the reference to "Sections 4.03(a) and (d)" with "Section 4.03(a)".

ARTICLE II
MISCELLANEOUS

Section 2.01. Effectiveness. This Supplemental Indenture shall become effective upon the execution and delivery of the Supplemental Indenture by the parties hereto.

Section 2.02. Confirmation. Except as expressly amended hereby, the Indenture is in all respects ratified and confirmed and all the terms, conditions and provisions thereof shall remain in full force and effect. For the avoidance of doubt, this Supplemental Indenture shall not impair or affect the contractual right of any Holder of a Note or Notes to receive any principal payment or interest payment on such Holder's Note or Notes, on or after the Stated Maturity thereof, or to institute suit for the enforcement of any such payment. Upon the execution and

---

delivery of this Supplemental Indenture by the Issuers, the Guarantors and the Trustee, this Supplemental Indenture shall form a part of the Indenture for all purposes, and every Holder of Notes heretofore or hereafter authenticated and delivered shall be bound hereby. Any and all references to the Indenture, whether within the Indenture or in any notice, certificate or other instrument or document, shall be deemed to include a reference to this Supplemental Indenture (whether or not made), unless the context shall otherwise require.

Section 2.03. Counterparts. The parties may sign any number of copies of this Supplemental Indenture. Each signed copy shall be an original, but all of them together represent the same agreement. The exchange of copies of this Supplemental Indenture and of signature pages by facsimile, .pdf transmission or other electronic means shall constitute effective execution and delivery of this Supplemental Indenture for all purposes. Signatures of the parties hereto transmitted by facsimile or .pdf transmission or other electronic means shall be deemed to be their

delivery of this Supplemental Indenture by the Issuers, the Guarantors and the Trustee, this Supplemental Indenture shall form a part of the Indenture for all purposes, and every Holder of Notes heretofore or hereafter authenticated and delivered shall be bound hereby. Any and all references to the Indenture, whether within the Indenture or in any notice, certificate or other instrument or document, shall be deemed to include a reference to this Supplemental Indenture (whether or not made), unless the context shall otherwise require.

Section 2.03. Counterparts. The parties may sign any number of copies of this Supplemental Indenture. Each signed copy shall be an original, but all of them together represent the same agreement. The exchange of copies of this Supplemental Indenture and of signature pages by facsimile, .pdf transmission or other electronic means shall constitute effective execution and delivery of this Supplemental Indenture for all purposes. Signatures of the parties hereto transmitted by facsimile or .pdf transmission or other electronic means shall be deemed to be their original signatures for all purposes.

Section 2.04. Capitalized Terms. Capitalized terms used herein without definition shall have the meanings assigned to them in the Indenture.

Section 2.05. GOVERNING LAW. THIS SUPPLEMENTAL INDENTURE SHALL BE GOVERNED BY AND CONSTRUED IN ACCORDANCE WITH THE LAWS OF THE STATE OF NEW YORK.

Section 2.06. Effect of Headings. The section headings herein are for convenience only and shall not affect the construction hereof.

Section 2.07. Acceptance by the Trustee. The Trustee accepts the amendments to the Indenture effected by this Supplemental Indenture and agrees to execute the trusts created by the Indenture as hereby amended, but only upon the terms and conditions set forth in the Indenture; *provided, however*, that to the extent the Requisite Consents of Holders of Notes to any amendment effected by or delivered in connection with this Supplemental Indenture are determined by a court of competent jurisdiction to have not been validly obtained in accordance with the Indenture or applicable laws, such amendment shall not be deemed to have occurred.

Section 2.08. Trustee Disclaimer. The recitals contained herein and the statements made in any Officer's Certificate shall be taken as the statements of the Issuers, and the Trustee assumes no responsibility for their correctness, and none of the recitals contained herein or the statements made in any Officer's Certificate are intended to or shall be construed as statements made or agreed to by the Trustee. The Trustee makes no representations as to the validity or sufficiency of this Supplemental Indenture or the consequences of any amendment provided herein.

IN WITNESS WHEREOF, the parties hereto have caused this Supplemental Indenture to be duly executed and attested, all as of the date first above written.

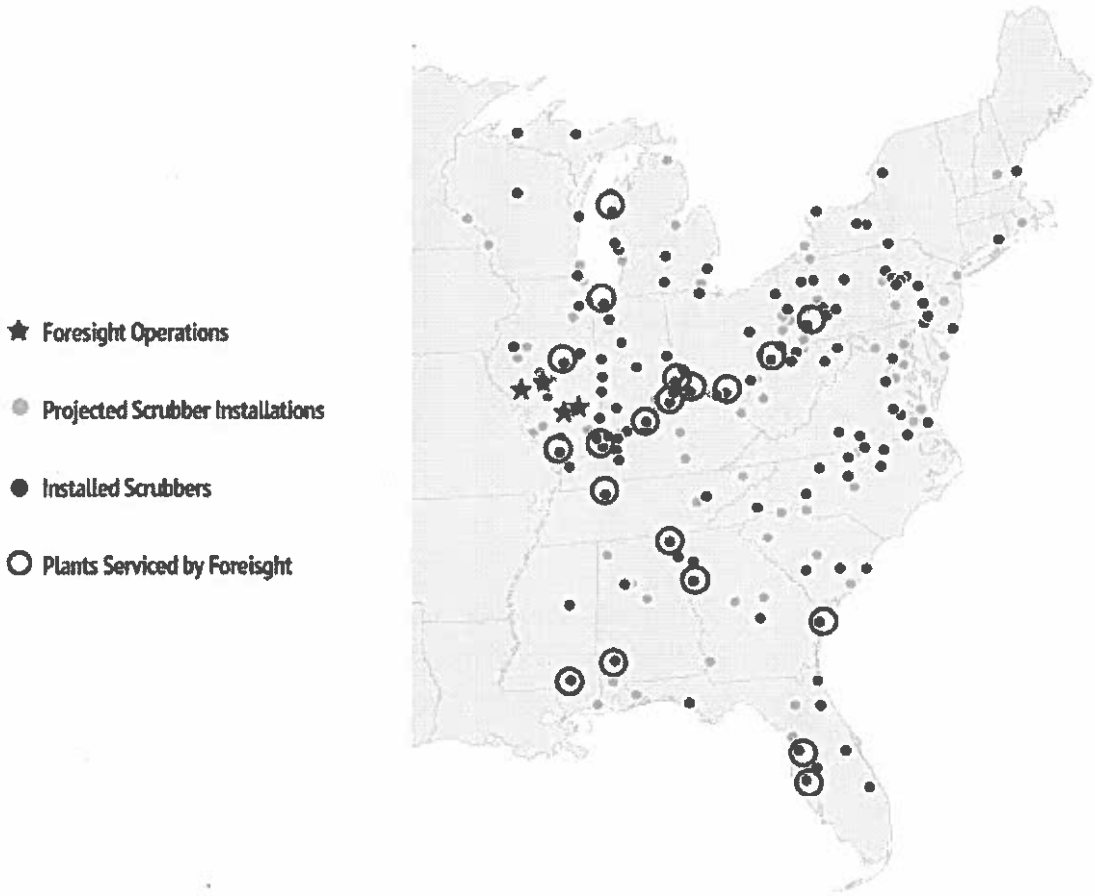
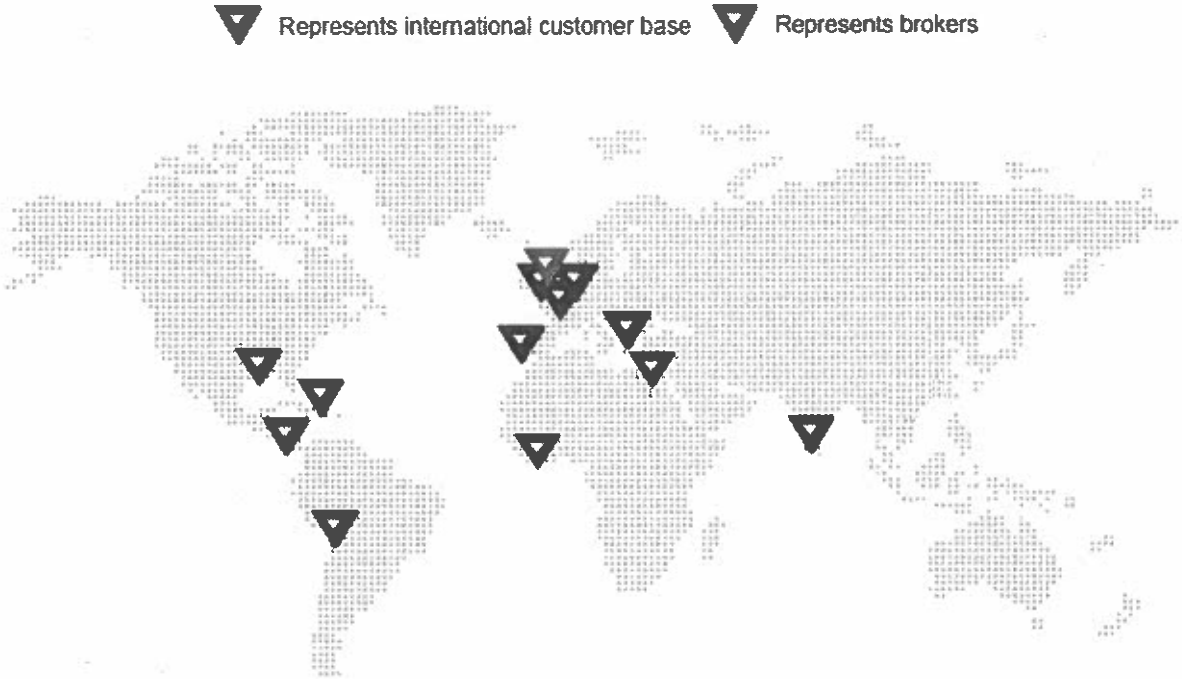
Sales & Markets



We know that it's not enough to be low cost at the mine. We also want to be low cost on a delivered basis. Our ability to access multiple rail carriers as well as other modes of transportation such as river barge and trucks allow us to reach a wide range of customers at cost effective prices. Foresight's coal production is consumed by electric utilities and industrial customers both inside and outside of the U.S.

Market Locations



Our primary target market in the United States primarily consists of power plants located in the eastern U.S. that have been updated with emission-control equipment needed to comply with existing and future environmental regulations.

Similarly our off-shore customers consist of utilities or intermediaries that use our coal at scrubbed power plants or blend our coal to meet local environmental emission standards.

INDIANA

State Profile and Energy Estimates

Newly released in Beta: State Energy Portal featuring customizable dashboards and more state data.

Profile Analysis

Print State Energy Profile (overview, data, & analysis)

Last Updated: May 16, 2019

Overview

Indiana, located in the nation's Interior Plains just west of the Appalachian Mountains, extends from Lake Michigan south to the Ohio River.[1,2] Sediments deposited over millions of years,[3] when the state was covered by inland seas and later by lush swamps,[4,5] became the geologic layers that contain Indiana's fossil fuel resources, predominantly coal but also crude oil and some natural gas.[6,7,8] The flat plains and slightly rolling terrain in the northern two-thirds of the state are the result of the 2,000-foot-thick glacier that covered much of the state during the Ice Ages. The retreat of the glacier more than 10,000 years ago left behind the excellent topsoil that supports Indiana's agriculture.[9] Ample summer rainfall and rich prairie soils allow Indiana farmers to produce abundant corn and soybean crops that make the state a major producer of ethanol and biodiesel.[10,11,12,13,14] Indiana's open farmland also has substantial wind energy resources, and most of the state's wind farms are in the central and western part of the state.[15,16]

Although Indiana is one of the smallest states in land area west of the Appalachian Mountains, it has a varied climate because of its length from north to south. In the north, Indiana experiences lake-effect snows and winds off Lake Michigan. In the south, the hilly terrain creates localized weather variations. The climate statewide is influenced by the interplay of polar air moving south from Canada and warm, moist air moving north from the Gulf of Mexico. Indiana's winters can be bitterly cold, spring weather often includes tornadoes, and summer days may have oppressive humidity and heat.[17] In part because of those weather extremes, Indiana ranks among the top 10 states in total and residential energy use per capita.[18,19] The industrial sector is the state's largest end-use energy consuming sector, using almost half of the energy consumed in the state.[20] Indiana's industrial activities include the energy-intensive chemical, petroleum, and steelmaking industries.[21,22] Overall, more than three times as much energy is consumed in the state as is produced there.[23]

Coal

Indiana has about 1.5% of U.S. economically recoverable coal reserves[24] and is the nation's eighth-largest coal producer. The state accounts for nearly 3% of U.S. coal production. Bituminous coal is produced from almost 20 surface and underground mines located in southwestern Indiana within the Indiana portion of the coal-rich Illinois Basin.[25,26,27] About one-fourth of the approximately 30 million tons of coal produced annually in Indiana is shipped to a dozen other states by rail, barge, and truck.[28,29] A small amount of Indiana coal is exported to other countries.[30]

Indiana is the nation's second-largest coal consumer, after Texas.

Even though Indiana is one of the top coal producers in the nation, state production does not meet state demand.[31,32] In 2017, Indiana's total coal consumption ranked second after Texas.[33] Additional coal arrives by rail and barge from mines primarily in West Virginia, Illinois, Kentucky, and Wyoming.[34] The amount of coal Indiana consumes for electricity generation ranks third in the nation, after Texas and Missouri. The state is also third, after Pennsylvania and North Dakota, in the amount of coal used by the industrial sector.[35,36] Because Indiana is a leader in steel manufacturing, nearly one-tenth of the coal used in the state is delivered to coking plants that supply the state's steel industry.[37,38,39,40] However, the industrial sector's coal consumption has declined every year, except for one, since 2005.[41] A very small amount of coal is used in the commercial sector and no appreciable coal is used in the residential sector, where 0.1% of households heat with coal.[42,43]

Electricity

Indiana is among the top five states in the share of its electricity that is generated from coal. Although coal-fired electricity generation has declined by 30% in the past decade, about 70% of the state's electricity was still generated from coal in 2018.[44,45] Eight of Indiana's 10 largest power plants are coal-fired,[46] but more than 3,300 megawatts of coal-fired capacity have retired since 2010.[47] The share of the state's net generation from natural gas has increased [48,49]

Indiana is among the top six states in electricity retail sales to the industrial sector.

more than fourfold during the same period, reaching more than one-fifth of state generation in 2018. Almost nine-tenths of the nearly 1,600 megawatts of new generating capacity that was brought online in Indiana during 2018 was powered by natural gas, while the rest of the new generation was powered by renewable energy sources.[50] Wind provided 5% of Indiana's electricity generation in 2018, and other renewable resources—biomass, solar, and hydroelectric power—together accounted for slightly more than 1% of the state's utility-scale net generation. Nearly all of Indiana's solar generation comes from larger, utility-scale facilities. The rest of the state's net electricity generation comes from other gases, other energy sources, and petroleum liquids.[51]

As coal-fired generation has decreased, Indiana's total generation has decreased. Indiana consumers use more electricity than in-state generators can supply. To meet power demand in 2017, one-tenth of Indiana's electricity supply came from other states.[52] Out-of-state power supplies are delivered by the two interstate power grids serving Indiana: the PJM Interconnect in the northeast corner of the state and the Midcontinent Independent System Operator in the west and south.[53] Indiana is among the top six states in electricity retail sales to the industrial sector.[54] Total electricity consumption from all sectors in Indiana is in the top one-fourth of the states.[55] Three in 10 Indiana households rely on electricity as their primary energy source for home heating.[56]

Renewable energy

Indiana is among the nation's top producers of liquid biofuels. The state's abundant corn and soybean crops provide the feedstock for biofuel production.[57] Indiana's 14 fuel ethanol plants use corn as their feedstock, and the biodiesel plants use soy oil and other feedstocks.[58,59,60] Indiana is the fifth-largest producer of ethanol in the nation and makes about 1.2 billion gallons per year, almost 8% of the nation's total.[61] The state also has the sixth-largest production capacity for biodiesel at more than 100 million gallons per year.[62]

Indiana is the fifth-largest ethanol producer in the nation.

Renewable energy supplied more than 6% of Indiana's net electricity generation in 2018. Wind is the state's primary renewable resource used for electric power generation, and 5% of Indiana's net electricity generation came from wind turbines in 2018.[63] Indiana's first utility-scale wind project, the 103.5-megawatt Benton County Wind Farm, came online in 2008.[64] Currently, wind turbines stretch across central Indiana, and the state has more than 2,300 megawatts of wind capacity, up from 2,100 megawatts in 2017.[65]

Additional small amounts of electricity are generated from solar, biomass, and hydroelectric facilities.[66] Extreme southwestern Indiana has the state's best solar resources, but solar facilities are found statewide.[67,68] The state's biomass resources include crop and forest residues, animal waste, and solid biomass resources.[69] Most of Indiana's biomass power plants are landfill gas facilities located in the northern half of the state.[70] There are also three small wood pellet plants in Indiana that convert wood waste into pellets used for heating and electricity generation. They have a combined manufacturing capacity of about 47,000 tons of pellets per year.[71] The state's only large hydroelectric power plant is on the Ohio River at Indiana's southeastern boundary.[72,73]

Although Indiana's geothermal energy resources are modest,[74] the state has one large geothermal installation, located at Ball State University in Muncie. That system was designed to replace aging coal-fired boilers and provide heating and cooling to 47 university buildings.[75]

In 2011, Indiana's legislature created a voluntary clean energy portfolio standard; however, as of 2018, no Indiana utility had chosen to participate.[76] If an electric utility elected to participate, they had to agree to acquire an average of 4% of the electricity they sold to customers from clean energy sources between 2013 and 2018. In 2019 the target increased to 7%, and in 2025 the target will rise to 10%.[77] Among the eligible sources are wind, solar, coalbed methane, clean coal technology, nuclear energy, combined heat and power systems, and natural gas plants built after July 1, 2011 that displace electricity generation from coal.[78]

Indiana utilities are required to offer net metering for customer-sited renewable generating facilities with less than 1 megawatt of capacity. Customers are compensated for any electricity they generate that is in excess of what they use. At the end of 2017, 49 megawatts of customer-sited capacity were connected under the net metering program. In 2017, the legislature increased the limit on a utility's net metered connections from 1% to 1.5% of the utility's peak summer load. The law reserves 40% of the 1.5% of capacity for residential customers and 15% of the 1.5% for organic biomass. There are no restrictions on the remainder. In 2017, the Indiana legislature also reduced the rate customers receive from utilities for their distributed (small-scale, customer-sited) generation. Compensation was switched from a system based on a higher retail rate for electricity to one linked to the lower wholesale power rate.[79]

Petroleum

Indiana's proved crude oil reserves are small and have declined from about 40 million barrels in 1979 to 5 million in 2017.[80,81] The Trenton Field, discovered in east-central Indiana in 1876, was the nation's first oil field to produce more than 100 million barrels of crude oil. The field ceased production in the early 20th century, and the center of the state's crude oil production moved to the Illinois Basin in southwestern Indiana, where output peaked in 1956.[82] Although advanced drilling technology had increased Indiana's crude oil production in recent years,[83] the state's production dropped to its lowest level in more than 35 years in 2018.[84,85] Indiana crude oil production now accounts for less than 0.1% of the nation's total oil production.[86]

The Whiting refinery in Indiana is the largest inland crude oil refinery in the nation.

The Whiting refinery, located in northwest Indiana, is one of the state's two petroleum refineries and is one of the oldest U.S. refineries, having opened in 1889. Whiting is the largest inland crude oil refinery in the nation; only six Gulf Coast refineries have higher capacities.[87] The Whiting refinery can process about 413,500 barrels of crude oil per calendar day and produces large quantities of motor gasoline, diesel fuel, and jet fuel as well as about 5% of the nation's asphalt.[88,89] A second, small refinery is located in Mount Vernon at the southern tip of Indiana. That refinery processes Illinois Basin crude oil from southern Indiana, southern Illinois, and western Kentucky. Its refined products—motor gasoline, diesel fuel, and lubricants—are delivered to customers in Indiana, Illinois, Michigan, Ohio, and Kentucky.[90] A plastics-to-fuel plant that will be able to process 100,000 tons of non-recycled plastic waste into 18 million gallons of ultra-low sulfur diesel fuel is in development in Indiana.[91]

Nearly half of the Indiana's petroleum consumption is in the form of motor gasoline, and three-tenths is distillate fuel oil, including diesel fuel. Although conventional motor gasoline can be used in most of Indiana, reformulated motor gasoline blended with ethanol is required in the state's northwest corner near Chicago. In addition, motor gasoline formulated to reduce emissions that contribute to ground-level ozone is required during the summer months in southeast Indiana near Louisville, Kentucky.[93,94] Most of the petroleum not used by the transportation sector is used by industry. The rest is used in the commercial and residential sectors, which consume almost equal amounts.[95] Distillate fuel (heating oil) sales to the residential sector have declined over the past three decades.[96] Currently, nearly 1% of Indiana households use fuel oil or kerosene for home heating, and 7% use hydrocarbon gas liquids, mostly propane.[97] A small amount (less than 0.2%) of Indiana's electricity is petroleum-fired.[98]

Natural gas

Indiana has minor natural gas reserves, and, in 2017, the state's annual natural gas production was only 0.02% of the U.S. total.[99,100] There was a brief spike in production in 2011 when the number of wells completed using hydraulic fracturing, which improved initial production, increased.[101,102] Most of the state's natural gas fields are in the east central part of the state where natural gas was first discovered in the mid-1870s.[103] The availability of advanced drilling technologies has created renewed interest in a shallow natural gas play in the Albany Shale in southwestern Indiana, which, along with potential coalbed methane resources, could add new natural gas reserves.[104]

Indiana is crossed by nine interstate natural gas pipelines. Those pipelines bring natural gas produced in Appalachia, the Gulf Coast, and western Canada into the state.[105] Natural gas enters Indiana primarily from Illinois and Ohio, and about one-fourth of that natural gas is used in Indiana. Most of the rest is sent on to Michigan and Ohio.[106] Some of the natural gas that enters Indiana is put in storage. The state has 21 natural gas storage fields with a combined total capacity of 113 billion cubic feet.[107,108]

Indiana has 21 natural gas storage fields that can hold 113 billion cubic feet of natural gas.

Indiana's natural gas consumption is much greater than state production.[109,110] The industrial sector is the largest natural gas consumer in Indiana and accounts for more than half of the natural gas used in the state.[111] The state's electric power sector has experienced an almost five-fold increase in the use of natural gas for electricity generation in the past decade.[112] Since 2016, the electric power sector's natural gas consumption has exceeded the residential sector's use. The residential sector uses one-sixth of the natural gas consumed in Indiana. Three-fifths of the state's households use natural gas for home heating.[113,114]

Rockport Plant

For the proposed gasification plant in Indiana, go to Indiana SNG

Rockport Plant is a 2,600 megawatt (MW) coal-fired power station owned and operated by American Electric Power subsidiary Indiana Michigan Power (I&M). The plant is located near Rockport, Indiana. Indiana Michigan Power states that "portions of Rockport Plant are dedicated to I&M customers 1960 MW, Kentucky Power 390 MW, Progress Energy/Carolina 250 MW".[1]

Death and disease attributable to fine particle pollution from Rockport

In 2010, Abt Associates issued a study commissioned by the Clean Air Task Force, a nonprofit research and advocacy organization, quantifying the deaths and other health effects attributable to fine particle pollution from coal-fired power plants.[3] Fine particle pollution consists of a complex mixture of soot, heavy metals, sulfur dioxide, and nitrogen oxides. Among these particles, the most dangerous are those less than 2.5 microns in diameter, which are so tiny that they can evade the lung's natural defenses, enter the bloodstream, and be transported to vital organs. Impacts are especially severe among the elderly, children, and those with respiratory disease. The study found that over 13,000 deaths and tens of thousands of cases of chronic bronchitis, acute bronchitis, asthma, congestive heart failure, acute myocardial infarction, dysrhythmia, ischemic heart disease, chronic lung disease, and pneumonia each year are attributable to fine particle pollution from U.S. coal plant emissions. These deaths and illnesses are major examples of coal's external costs, i.e. uncompensated harms inflicted upon the public at large. Low-income and minority populations are disproportionately impacted as well, due to the tendency of companies to avoid locating power plants upwind of affluent communities. To monetize the health impact of fine particle pollution from each coal plant, Abt assigned a value of $7,300,000 to each 2010 mortality, based on a range of government and private studies. Valuations of illnesses ranged from $52 for an asthma episode to $440,000 for a case of chronic bronchitis.[4]

Table 1: Death and disease attributable to fine particle pollution from Rockport Plant

Type of Impact	Annual Incidence	Valuation
Deaths	140	$1,000,000,000
Heart attacks	210	$23,000,000
Asthma attacks	2,300	$120,000

Hospital admissions	99	$2,300,000
Chronic bronchitis	84	$37,000,000
Asthma ER visits	104	$52,000

Coal Waste Site

Rockport Plant Bottom Ash Complex

Rockport ranked 87th on list of most polluting power plants in terms of coal waste

In January 2009, Sue Sturgis of the Institute of Southern Studies compiled a list of the 100 most polluting coal plants in the United States in terms of coal combustion waste (CCW) stored in surface impoundments like the one involved in the TVA Kingston Fossil Plant coal ash spill.[5] The data came from the EPA's Toxics Release Inventory (TRI) for 2006, the most recent year available.[6]

Rockport Plant ranked number 87 on the list, with 281,995 pounds of coal combustion waste released to surface impoundments in 2006.[5]

Rockport ninth in 2009 mercury emissions

The 2011 Environmental Defense Fund report, "Mercury Alert: Cleaning up Coal Plants for Healthier Lives" found that 25 plants alone are responsible for nearly a third of all mercury emissions in the power sector, while providing only eight percent of U.S. electricity. The findings are based on 2009 U.S. Department of Energy data. The plant with the ninth highest mercury emissions was **Rockport Plant**, releasing 852 lbs in 2009.[7] According to Katheryn R. Mahaffey, Ph.D., of the U.S. EPA, mercury affects the environment and human health in the following ways:[8]

Mercury in the air settles into surface waters or onto land where it is washed into water. Deposited in lakes

and ponds, this mercury is converted by certain microorganisms to a highly toxic form of the chemical known as methylmercury.

Methylmercuryaccumulates in fish and shellfish, as well as birds and mammals that feed on fish. Humans are exposed to mercury when they eat contaminated fish and shellfish. Fish and shellfish are the main sources of human methylmercuryexposure.

Mercury exposure at high levels can harm the brain, heart, kidneys, lungs, and immune system of people of all ages. Unborn babies and young children are particularly vulnerable to high levels of methylmercuryin their bloodstreams.

High levels of methylmercurycan harm the developing nervous systems of fetuses and young children, resulting in later difficulties thinking and learning.

An estimated average of 410,000 infants are born annually in the U.S. to mothers with blood mercury concentrations in excess of EPA's Reference Dose

Petersburg Generating Station Pond C

Petersburg ranked 85th on list of most polluting power plants in terms of coal waste

In January 2009, Sue Sturgis of the Institute of Southern Studies compiled a list of the 100 most polluting coal plants in the United States in terms of coal combustion waste (CCW) stored in surface impoundments like the one involved in the TVA Kingston Fossil Plant coal ash spill.[5] The data came from the EPA's Toxics Release Inventory (TRI) for 2006, the most recent year available.[6]

Petersburg Generating Station ranked number 85 on the list, with 309,961 pounds of coal combustion waste released to surface impoundments in 2006.[5]

Retirement

In May 2016, plant owner Dynegy (now Vistra Energy) said it plans to cease operations at units 1 and 3 of its Baldwin Power Station over the next year. The company attributed the shutdowns on the failure to recover the plants' "basic operating costs" in the most recent MISO (Midcontinent Independent System Operator) electricity auction.[1]

Unit 3 was mothballed in October 2016. That month plant owner Dynegy (now Vistra Energy) said that Unit 1, which was scheduled to go offline on March 31, 2017, will retire in September 2018. Unit 2 will continue operating.[2]

The EIA 860M (November 2018) states unit 3 is "Out of service and NOT expected to return to service in next

calendar year."[3]

Ownership

On April 9, 2018, Texas-based Vistra Energy, the parent company for TXU Energy and Luminant, announced it had completed its merger with Dynegy. Vistra Energy will be the name of the combined company moving forward.[4]

Plant Data

Owner: Dynegy Midwest Generating
Parent Company: Vistra Energy
Plant Nameplate Capacity: 1,895 MW
Units and In-Service Dates: 625 MW (1970), 635 MW (1973), 635 MW (1975)[5]
Location: 10901 Baldwin Rd., Baldwin, IL 62217
GPS Coordinates: 38.203889, -89.85416
Coal Consumption:
Coal Source:
Number of Employees:

Emissions Data

2006 CO_2 Emissions: 12,826,618 tons
2006 SO_2 Emissions: 28,985 tons
2006 SO_2 Emissions per MWh:
2006 NO_x Emissions: 16,413 tons
2005 Mercury Emissions: 500 lb.

Death and disease attributable to fine particle pollution from Baldwin Energy Station

In 2010, Abt Associates issued a study commissioned by the Clean Air Task Force, a nonprofit research and advocacy organization, quantifying the deaths and other health effects attributable to fine particle pollution from coal-fired power plants.[6] Fine particle pollution consists of a complex mixture of soot, heavy metals,

sulfur dioxide, and nitrogen oxides. Among these particles, the most dangerous are those less than 2.5 microns in diameter, which are so tiny that they can evade the lung's natural defenses, enter the bloodstream, and be transported to vital organs. Impacts are especially severe among the elderly, children, and those with respiratory disease. The study found that over 13,000 deaths and tens of thousands of cases of chronic bronchitis, acute bronchitis, asthma, congestive heart failure, acute myocardial infarction, dysrhythmia, ischemic heart disease, chronic lung disease, and pneumonia each year are attributable to fine particle pollution from U.S. coal plant emissions. These deaths and illnesses are major examples of coal's external costs, i.e. uncompensated harms inflicted upon the public at large. Low-income and minority populations are disproportionately impacted as well, due to the tendency of companies to avoid locating power plants upwind of affluent communities. To monetize the health impact of fine particle pollution from each coal plant, Abt assigned a value of $7,300,000 to each 2010 mortality, based on a range of government and private studies. Valuations of illnesses ranged from $52 for an asthma episode to $440,000 for a case of chronic bronchitis.[7]

Table 1: Death and disease attributable to fine particle pollution from Baldwin Energy Station

Type of Impact	Annual Incidence	Valuation
Deaths	56	$410,000,000
Heart attacks	86	$9,400,000
Asthma attacks	940	$49,000
Hospital admissions	40	$930,000
Chronic bronchitis	34	$15,000,000
Asthma ER visits	60	$22,000

Coal Waste Site

Baldwin Energy Station Ash Pond System

Baldwin ranked 31st on list of most polluting power plants in terms of coal

waste

In January 2009, Sue Sturgis of the Institute of Southern Studies compiled a list of the 100 most polluting coal plants in the United States in terms of coal combustion waste (CCW) stored in surface impoundments like the one involved in the TVA Kingston Fossil Plant coal ash spill.[8] The data came from the EPA's Toxics Release Inventory (TRI) for 2006, the most recent year available.[9]

Baldwin Energy Station ranked number 31 on the list, with 1,324,467 pounds of coal combustion waste released to surface impoundments in 2006.[8]

Illinois Power Company and Dynegy Midwest Generation EPA Settlement

On March 7, 2005 the U.S. Department of Justice and the U.S. EPA along with the State of Illinois announced a settlement between Illinois Power Company and its sucesscor, Dynegy, addressing alleged violations of New Source Review provisions of the Clean Air Act at company's **Baldwin Energy Station**. The EPA noted that sulfur dioxide (SO2) and nitrogen oxide (NOx) emissions at the plant will decrease by 54,000 tons each year through the installation of approximately $500 million worth of new pollution control equipment. In addition to the Baldwin Generating Station, the Havana Power Station, Hennepin Power Station and Vermilion Power Station, Wood River Station were involved in the settlement.

The EPA stated that this "settlement requires installation of four new flue gas desulfurization devices (scrubbers) to control SO2; four new baghouses to control particulate matter (soot); and operation of existing control equipment, including three selective catalytic reduction (SCR) systems, year-round to control NOx. The entire five-plant system will be subject to annual emission caps to assure that significant system-wide reductions for both SO2 and NOx are achieved."[10]

History of SIH

In 1938, local physicians Dr. J.W. Barrow and Dr. Leo J. Brown formed a partnership to practice

medicine in Carbondale, Illinois. Two years later, they were joined by Dr. John Lewis and Dr. John Taylor, eventually calling their group the Carbondale Clinic. The physicians practiced together until World War II intervened, leaving only one of them behind to treat patients. When the group reassembled after the war, their increasing knowledge of medicine made it obvious to them that new medical specialties would be needed in the region. To carry out their plans they needed their own hospital but, under Illinois law, would also need their own corporation for ownership.

About that time, Dr. Brown made a trip to nearby Herrin Hospital to promote his radiology services. Herrin Hospital had been built in 1914 as a center for black lung disease and other coal mine-related injuries; ten dollars was taken out of each miner's paycheck to fund the hospital. By the end of the war, the town was economically depressed and it was doubtful the hospital could remain open. Upon Dr. Brown's visit to Herrin in 1946, he learned the hospital was for sale for the asking price of $105,000. Two days later, the four physicians of the Carbondale Clinic formed the not-for-profit Southern Illinois Hospital Corporation in order to purchase Herrin Hospital.

Shortly thereafter, the doctors decided to move ahead with plans to also construct their own hospital, and by 1950 Doctors Hospital had opened in Carbondale. In 1961, they also purchased nearby Holden Hospital, which was subsequently torn down to expand Doctors Hospital, rather than attempt to renovate the facility originally built in 1875 as a drug treatment center.

The two remaining hospitals in Herrin and Carbondale existed as Southern Illinois Healthcare until 1995, when it was agreed they would purchase St. Joseph Memorial Hospital in nearby Murphysboro, Illinois. St. Joseph had begun as a makeshift emergency center after a railroad accident in 1895. The Franciscan Sisters, who spearheaded the permanent facility originally called St. Andrews, ran the hospital for 58 years before handing it over to the Sisters Adorers of the Most Precious Blood. When the current facility was built in 1960, the name was changed to St. Joseph from St. Andrew to avoid confusion with a local public home for aged men.

Today, Southern Illinois Healthcare remains a not-for-profit integrated health system and employs nearly 3,400 people. It is now comprised of over thirty facilities, including three inpatient hospitals, three clinics, numerous physician offices, three walk-in clinics and dedicated centers that include neurology, cancer, heart, sleep and rehabilitation.

Although the three hospitals retain strong individual cultures from their very diverse beginnings, the corporation as a whole is still guided by the values of its founding physicians: respect, integrity, compassion, collaboration, stewardship, accountability and quality. They remain as committed to

quality health services today as when the first hospital opened, and strive to treat every patient as if that patient is the person most cared about in the world, and treat them like that person every single time.

Coal Knew, Too

A newly unearthed journal from 1966 shows the coal industry, like the oil industry, was long aware of the threat of climate change.

By Élan Young

| 11/22/2019 05:45 am ET | **Updated** Dec 16, 2019

AdChoices

"Exxon knew." Thanks to the work of activists and journalists, those two words have rocked the politics of climate change in recent years, as investigations revealed the extent to which giants like Exxon Mobil and Shell were aware of the danger of rising greenhouse gas emissions even as they undermined the work of scientists.

But the coal industry knew, too — as early as 1966, a newly unearthed journal shows.

In August, Chris Cherry, a professor in the Department of Civil and Environmental Engineering at the University of Tennessee, Knoxville, salvaged a large volume from a stack of vintage journals that a fellow faculty member was about to toss out. He was drawn

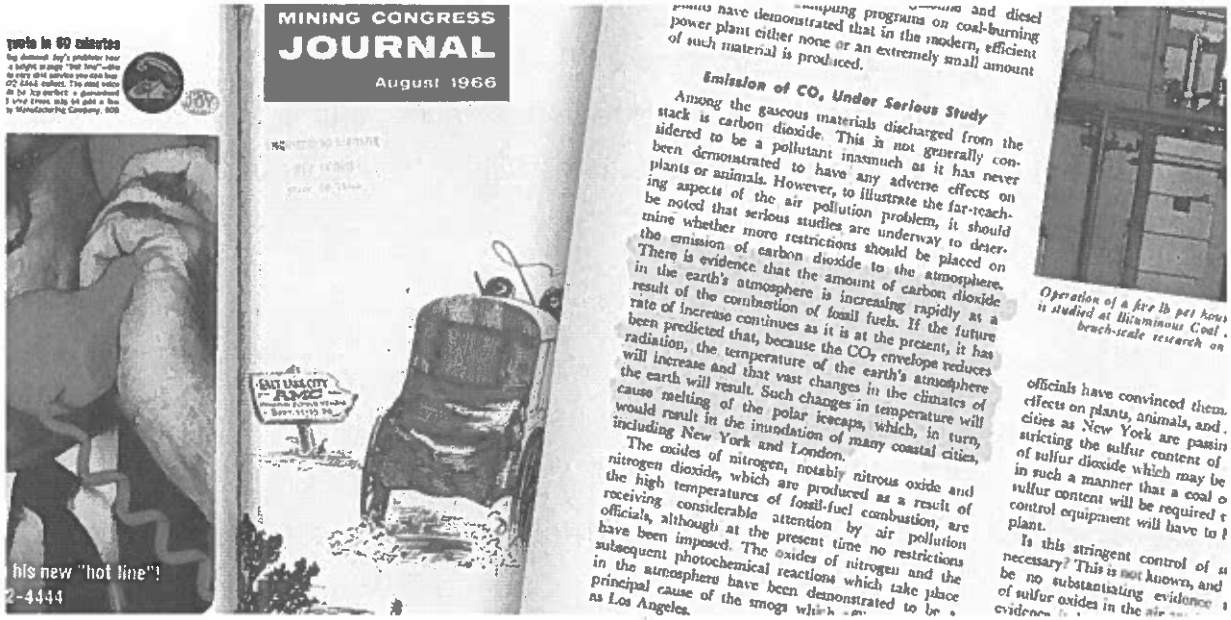
to a 1966 copy of the industry publication Mining Congress Journal; his father-in-law had been in the industry and he thought it might be an interesting memento.

Cherry flipped it open to a passage from James R. Garvey, who was the president of Bituminous Coal Research Inc., a now-defunct coal mining and processing research organization.

"There is evidence that the amount of carbon dioxide in the earth's atmosphere is increasing rapidly as a result of the combustion of fossil fuels," wrote Garvey. "If the future rate of increase continues as it is at the present, it has been predicted that, because the CO2 envelope reduces radiation, the temperature of the earth's atmosphere will increase and that vast changes in the climates of the earth will result."

"Such changes in temperature will cause melting of the polar icecaps, which, in turn, would result in the inundation of many coastal cities, including New York and London," he continued.

Cherry was floored.



"It pretty well described a version of what we know today as climate change," said Cherry. "Increases in average air temperatures, melting of polar ice caps, rising of sea levels. It's all in there."

In a discussion piece immediately following Garvey's article, Peabody Coal combustion engineer James R. Jones noted that the coal industry was merely "buying time" before more air pollution regulations came into effect. "We are in favor of cleaning up our air," he wrote. "Everyone can point to examples in his own community where something should be done. Our aim is to have control that does not precede the technical knowledge for compliance."

Climate change is not Cherry's area of study, but he was struck by how the tone of the articles differed from the way many fossil fuel companies talk about climate change today. Rather than engage in denial, the articles offered a fairly straightforward acknowledgment of the emerging science. (This reporter is also a writer for UT's Tickle College of Engineering, where Cherry teaches.)

As Cherry did some of his own digging, he soon realized his discovery could be the first

evidence that the coal industry was aware of the impending climate crisis more than half a century ago — a finding that could open mining companies to the type of litigation that the oil industry is now facing.

Emission of CO_2 Under Serious Study

Among the gaseous materials discharged from the stack is carbon dioxide. This is not generally considered to be a pollutant inasmuch as it has never been demonstrated to have any adverse effects on plants or animals. However, to illustrate the far-reaching aspects of the air pollution problem, it should be noted that serious studies are underway to determine whether more restrictions should be placed on the emission of carbon dioxide to the atmosphere. There is evidence that the amount of carbon dioxide in the earth's atmosphere is increasing rapidly as a result of the combustion of fossil fuels. If the future rate of increase continues as it is at the present, it has been predicted that, because the CO_2 envelope reduces radiation, the temperature of the earth's atmosphere will increase and that vast changes in the climates of the earth will result. Such changes in temperature will cause melting of the polar icecaps, which, in turn, would result in the inundation of many coastal cities, including New York and London.

The oxides of nitrogen, notably nitrous oxide and nitrogen dioxide, which are produced as a result of the high temperatures of fossil-fuel combustion, are receiving considerable attention by air pollution officials, although at the present time no restrictions have been imposed. The oxides of nitrogen and the subsequent photochemical reactions which take place in the atmosphere have been demonstrated to be principal cause of the smogs which

officials have convinced them

COURTESY OF CHRIS CHERRY

A 1966 issue of the Mining Congress Journal suggested that rising levels of greenhouse gases could lead to "vast changes in the climates of the earth."

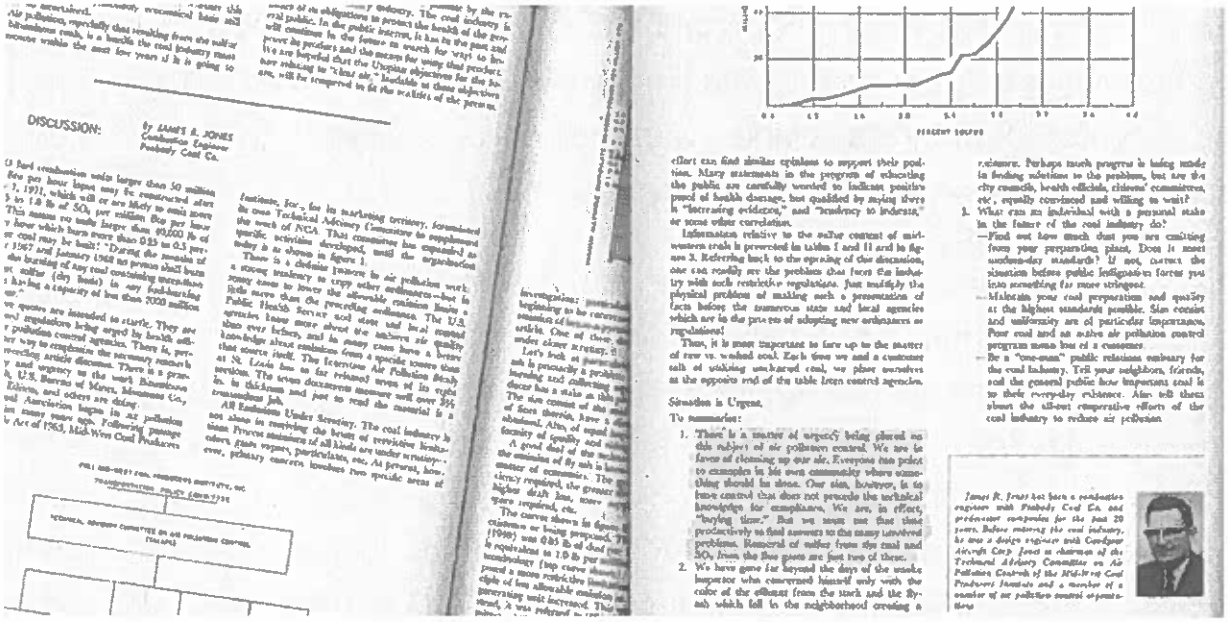
Decades Of Denial

While Peabody Energy, the largest private-sector coal company in the world and the largest producer of coal in the U.S., now acknowledges climate change on its website, it has been directly and indirectly involved in obfuscating climate science for decades. It funded dozens of trade, lobbying and front groups that peddled climate misinformation, as The Guardian reported in 2016.

As recently as 2015, Peabody Energy argued that carbon dioxide was a "benign gas essential for all life."

> **"Increases in average air temperatures,**

melting of polar ice caps, rising of sea levels. It's all in there.



—Chris Cherry, a professor at the University of Tennessee, Knoxville

"While the benefits of carbon dioxide are proven, the alleged risks of climate change are contrary to observed data, are based on admitted speculation, and lack adequate scientific basis," the company wrote in a letter that year to the White House Council on Environmental Quality.

AdChoices

At the heart of big coal's denial campaign was Fred Palmer, who served as Peabody's senior vice president of government relations from 2001 to 2015. In 1997, Palmer founded the Greening Earth Society, a now-defunct industry front group that argued that burning fossil fuels was good for the planet. The group was based in the same office as the Western Fuels Association, a consortium of coal suppliers and coal-fired utilities that Palmer also ran.

"Every time you turn your car on and you burn fossil fuels and you put CO2 into the air, you're doing the work of the Lord," Palmer told a Danish documentary team in 1997. "That's the ecological system we live in."

DISCUSSION:

by JAMES R. JONES
Combustion Engineer
Peabody Coal Co.

COURTESY OF CHRIS CHERRY

A discussion piece in the same 1966 issue of the Mining Congress Journal said the coal industry was merely "buying time" before more air pollution regulations went into effect.

Asked for comment, a Peabody spokesperson told HuffPost: "Peabody recognizes that climate change is occurring and that human activity, including the use of fossil fuels, contributes to greenhouse gas emissions. We also recognize that coal is essential to affordable, reliable energy and will continue to play a significant role in the global energy mix for the foreseeable future. Peabody views technology as vital to advancing global climate change solutions, and the company supports advanced coal technologies to drive continuous improvement toward the ultimate goal of near-zero emissions from coal."

Palmer, who did not respond to HuffPost's request for comment, continues to carry the torch. He now works as an energy policy adviser to The Heartland Institute, a Chicago-based think tank whose climate denial is so severe that even Exxon Mobil abandoned funding it and its climate denial efforts a decade ago. In 2011, leaked memos showed that the institute paid contrarian scientists like Craig Idso, founder of the Center for the Study of Carbon Dioxide and Global Change, $11,600 a month to promote carbon dioxide as beneficial to the environment.

The group sits at the heart of a broader right-wing misinformation network funded in large part by hedge fund billionaire Robert Mercer and his daughter, Rebekah, both Republican

mega-donors who backed President Donald Trump and financed projects such as Breitbart News and Cambridge Analytica, the data firm considered key to Trump's 2016 win. Palmer's daughter, Downey Magallanes, was a top policy adviser at Trump's Interior Department before joining oil giant BP in September 2018.

All of this was taking place well after climate change had become a commonly understood idea in the scientific community. A 1965 report from President Lyndon Johnson's Science Advisory Committee was the first from the White House to address climate change (and is likely what precipitated the Mining Congress Journal article). "The climate changes that may be produced by the increased CO2 content could be deleterious from the point of view of human beings," it warned. In 1988, NASA scientist James Hansen testified to Congress about what was then known as the "greenhouse effect." And in 1992, the United Nations established the Framework Convention on Climate Change, an international treaty to begin addressing the problem.

But as this consensus emerged, so too did a wave of industry-funded climate denial via vast, shadowy networks of front groups, public relations campaigns and scientists for hire.

Pulling Back The Curtain

In 2015, journalists at InsideClimate News, the Los Angeles Times and Columbia University exposed internal Exxon Mobil documents showing that the company's scientists had a deep understanding of climate change even as Exxon worked publicly to downplay that science.

Twenty state attorneys general launched an "Exxon Knew" campaign, which eventually led to communities across the country filing at least 14 legal challenges against Exxon and other fossil fuel companies. One lawsuit, from the New York state attorney general's office, went to trial on Oct. 22 and focuses on how the company accounted for the costs of potential future regulations on climate change. The Massachusetts attorney general filed another suit on Oct. 24, this time claiming the company had engaged in deceptive advertising and misled investors about the systemic financial risks to its business posed by fossil fuel-driven climate change. Earlier this month, two of Hawaii's biggest municipalities sued Exxon and other big oil companies to recoup the costs of adapting to rising seas and more violent storms.

Evidence of what fossil fuel companies knew about climate change and when is critical to

the legal strategy of those seeking damages for carbon dioxide emissions. If fossil fuel companies were aware of their products' harmful effects on the planet, they could be held liable for damages.

> **They fought the hardest because they had the biggest existential threat.**
>
> —Kert Davies, founder and director of the Climate Investigations Center

Legal liability boils down to four factors, said David Bookbinder, chief counsel for the Niskanen Center, which is representing counties in Colorado that have filed suit: one, whether the defendants knew that their products would cause climate change; two, what they told or did not tell the public about the consequences of using their products; three, the extent of injuries caused by climate change; and four, whether the defendants' actions have led to a portion of those injuries. What the plaintiffs in these suits can prove remains to be seen.

What we do know is that coal, when burned, has by far the biggest climate footprint of any fossil fuel, producing more carbon dioxide per unit than oil or gas. In the U.S. alone, coal produced 65% of the power sector's planet-warming emissions. The 1966 article in the Mining Congress Journal certainly raises questions about what the coal industry knew at the time.

Robert Brulle, a professor emeritus of sociology and environmental science at Drexel University, authored a recent paper that suggests the coal industry must have known quite a bit, given how prominently it positioned itself in the climate denial movement.

AdChoices

Brulle researched 12 major groups and coalitions that argued against mandatory regulation of carbon dioxide from 1989 to 2015 — which he calls the "climate change countermovement." That countermovement included 2,000 different businesses, political or

social groups, as well as other organizations, but Brulle found that 179 core organizations belonged to multiple coalitions. Coal companies and predominantly coal-burning utilities were the most prevalent. He describes oil and gas companies as "more of a marginal player" by comparison.

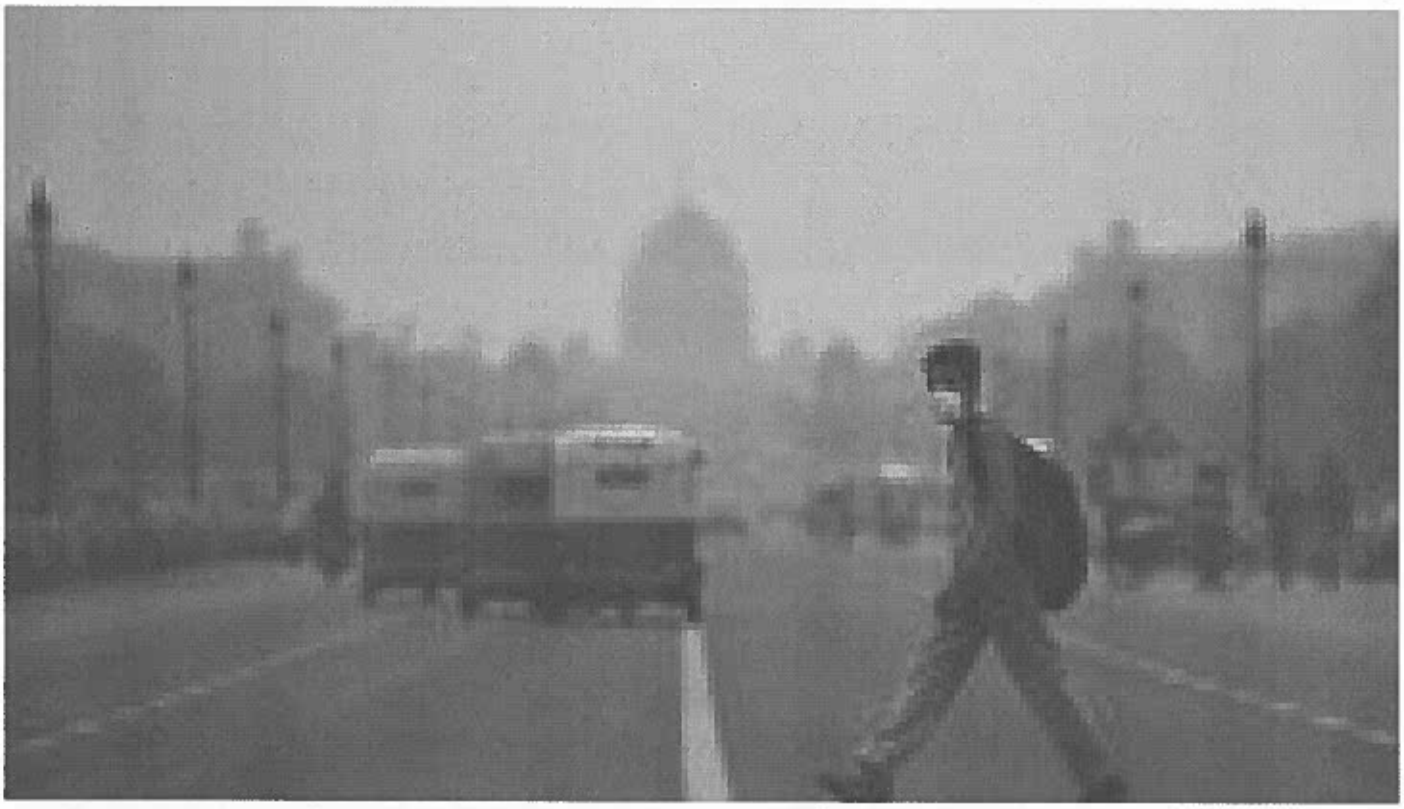
"The coal mining industry — the utilities that were burning it for electricity, along with the railroads who were hauling it — and manufacturing industries like steel were the first corporate forces to become climate deniers and try to block action on climate policy," said Kert Davies, founder and director of the Climate Investigations Center. "They fought the hardest because they had the biggest existential threat."

Where Do We Go From Here?

In the aftermath of the 1973 oil embargo, Exxon and other oil giants leased large parcels of land for coal mining with the goal of manufacturing synthetic fuels and lowering U.S. dependence on the Middle East.

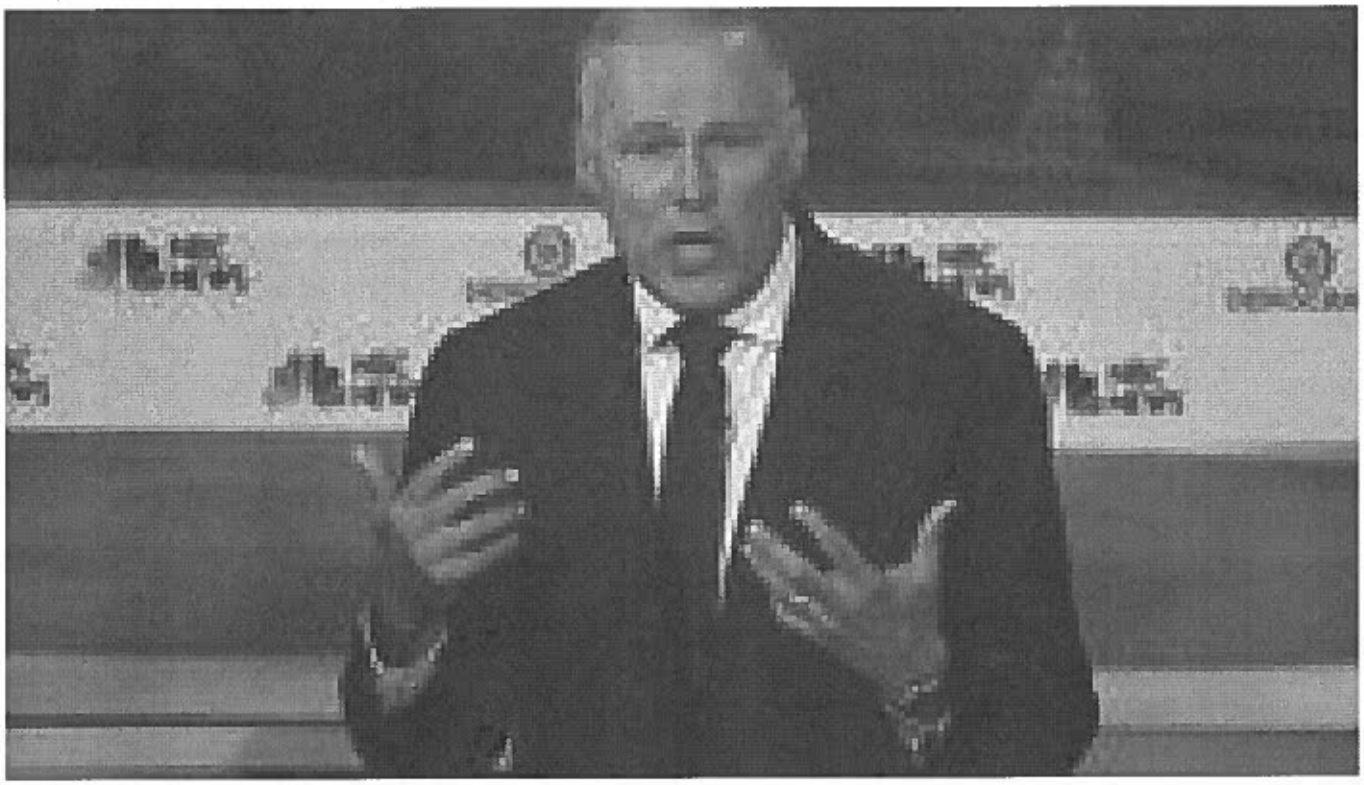
Some previously released documents show that Exxon's scientists began advising that the world phase out coal as a fuel as early as 1979. In one scenario, the Exxon scientists concluded that non-fossil fuels would need to be substituted for coal beginning in the 1990s to keep carbon dioxide levels below atmospheric concentrations of 440 parts per million. In 1999, Exxon merged with Mobil, and by 2002, Exxon Mobil had dumped its coal assets.

Meanwhile, the coal industry tried to reinvent itself with the concept of "clean coal." This as-yet-undelivered promise that carbon capture and other technological advances could lower coal's environmental impact has been around for decades but resurged in the early 2000s as regulations seemed imminent.



The biggest proponent of this idea was the American Coalition for Clean Coal Electricity, a coal front group that spent $35 million on public relations campaigns in 2008 alone, seeking to influence the election. A year later, ACCCE was caught sending Congress fraudulent letters opposing federal climate legislation and pretending to be from veterans, women's and civil rights groups. The incident led many members to leave the organization, but Peabody remains a member to this day.

"Its whole mission was to stop climate regulations but pretend that they were in favor of clean coal, which, of course, doesn't exist," said Davies.



Peabody Energy filed for bankruptcy protection in 2016, the same year carbon dioxide levels hit 400 parts per million. Eight other coal companies have filed for bankruptcy this year. Even as the Trump administration has promised a coal resurgence and rolled back Obama-era regulations, the industry's profitability continues to experience a downward slide. If the slogan "Coal Knew" ever does take off, it's unclear who'll be left to sue.

Murray Energy Holdings Co.

Case No. 19-56885

case info

+ Case Navigation

+ Quick Links

Case Background Important Information & Dates Parties Debtors

Case Background

On October 29, 2019, Murray Energy Holdings Co. and 98 affiliated debtors (collectively, the "Debtors") each filed a voluntary petition for relief under Chapter 11 of the United States Bankruptcy Code in the United States Bankruptcy Court for the Southern District of Ohio, Western Division. The cases are pending before the Honorable John E. Hoffman Jr and are jointly administered under Case No. 19-56885.

Important Information & Dates

Deadline to File Claims

The Bankruptcy Court has set the following deadlines for filing proofs of claim:

- General Bar Date: March 9, 2020, at 5:00 p.m., prevailing Eastern Time
- Governmental Bar Date: April 27, 2020, at 5:00 p.m., prevailing Eastern

Time

Click on "Submit a Claim" above to download the applicable proof of claim form and for more information regarding filing a claim against the Debtors. Please click here to download the Bar Date Order and here to download the Bar Date Notice.

Sale

On January 9, 2020, the the Bankruptcy Court entered an order approving the bidding procedures in connection with the sale of all or substantially all of the Debtor's assets.

Please take note of the following important dates related to the sale:

- Preliminary Bid Deadline: February 4, 2020, at 4:00 p.m., prevailing Eastern Time
- Final Bid Deadline: March 16, 2020, at 4:00 p.m., prevailing Eastern Time
- Auction (if necessary): March 26, 2020, at 10:00 a.m., prevailing Eastern Time
- Sale Objection Deadline: May 26, 2020, at 4:00 p.m., prevailing Eastern Time
- Sale Hearing: June 2, 2020, at 10:00 a.m., prevailing Eastern Time

Please click below to view all documents related to the sale:

Sale Documents

Plan & Disclosure Statement

On December 3, 2019, the Debtors filed their Joint Plan of Reorganization and the Disclosure Statement related thereto. The Bankruptcy Court will hold a hearing to consider approval of the Disclosure Statement on March 12, 2020 at 10:00 a.m. (prevailing Eastern Time)

Please click below to view all documents related to the Debtors' Plan & Disclosure Statement:

Plan & Disclosure Statement

Meeting of Creditors

The Meeting of Creditors was held on December 20, 2019 at 10:00 a.m. (ET) at the following location:

John Weld Peck Federal
Building
550 Main Street
Room 1-109
Cincinnati, OH 45202

First Day Hearing

A hearing on the Debtors' First Day Motions was held on October 30, 2019 at 3:00 p.m. (ET) before the Honorable John E. Hoffman Jr., United States Bankruptcy Court for the District of Southern District of Ohio, Western Division, in Courtroom 1 at United States Bankruptcy Court, 221 East Fourth Street, Atrium Two, Suite 800, Cincinnati, OH 45202.

COAL GIANT PROVIDED SECRET FINANCING TO GROUP CHALLENGING CLIMATE LAWSUITS

Lee Fang

DONATE 12

The Tennessee Valley Authority Paradise Fossil Plant, a generating station that used to burn coal mined by Murray Energy Holdings Co., the largest privately owned U.S. coal company, in Paradise, Ky., on Oct. 30, 2019. Photo: Luke Sharrett/Bloomberg via Getty Images

IN 2018, a new group appeared seemingly out of nowhere and

immediately took aim at the recent wave of lawsuits filed by state attorneys general designed to hold major fossil fuel companies responsible for allegedly misleading investors and customers about the true risk of carbon pollution.

"The global warming lobby has gone too far this time," declared the innocuously named group, Government Accountability and Oversight, in a video posted on its website. GAO claimed that the lawsuits, which target Exxon Mobil, Shell Oil, and Chevron, among other corporations, represent a form of government overreach and that prosecutors are colluding with activist interest groups in an unethical manner.

GAO, which is run as a for-profit company and foundation, does not disclose its donors nor does it provide much information about its origins. But on Saturday, a bankruptcy court in southern Ohio released a filing revealing that the organization received three donations totaling $300,000 from Murray Energy, the largest privately held coal-mining company in the United States. The first payment was made on June 7, 2018, just one month after GAO announced its intention to "expose" the litigation effort against energy companies.

That a secretive group working to defend the fossil fuel industry is financed by Murray Energy may come as no surprise.

I'm in □

Bob Murray, the billionaire founder of Murray Energy, a prolific GOP donor, and early supporter of President Donald Trump, is an outspoken critic of environmental regulations and activist groups. Murray's influence over the administration, including the push to unravel Environmental Protection Agency rules on carbon emissions and exit the Paris climate accords, is well documented. Even the current chief of the EPA, Andrew Wheeler, is a former lobbyist for Murray.

GAO and Murray Energy did not immediately respond to a request for comment. The company has provided over $3.8 million in campaign contributions to a range of federal politicians over the last five years, according to the Federal Election Commission. That figure, however, appears to be only part of the story in terms of the company's influence over the political debate.

In October, following a precipitous drop in coal demand, Murray's company filed for Chapter 11 bankruptcy protection, forcing the firm to disclose its recent history of payments to outside political entities. As part of the company's restructuring process, it filed a statement of financial affairs, which lists creditors and liabilities, as well as a list of recent charitable donations and grants, which revealed the payments to GAO, among many other new revelations about the coal company's hidden hand in the climate change debate.

Murray Energy showered donations to several think tanks focused on questioning the link between human activity and global warming, providing grants to groups such as the Heartland Institute, which once sponsored billboards comparing those who accept climate change to the Unabomber. The Ohio-based coal giant gave $30,000 to the Heartland Institute in March of last year, shortly after the group announced a campaign to save coal companies on the brink of closure, followed by another $100,00 in contributions in the months that followed.

Other think tanks listed in the filing as having received money from Murray Energy include the Committee for a Constructive Tomorrow, a group that claimed "there is no scientific consensus though that global warming is man-caused"; the Competitive Enterprise

[redacted] Murray Energy showered donations to several think tanks focused on

Institute, which briefs lawmakers on how the science behind climate change is a "hoax"; the Cato Institute, the Charles Koch-founded think tank that has long sponsored prominent climate change deniers; and the Center for the Study of Carbon Dioxide and Global Change, which argues for the "many benefits" of increasing carbon emissions. ("Atmospheric carbon dioxide is the *elixir of life*," one pamphlet reads. Emphasis in the original.)

questioning the link between human activity and global warming.

The filing lists nearly a dozen similar payments to right-wing organizations that do not disclose donors. Murray Energy provided $130,000 to "Hardworking Ohioians Inc.," a mysterious for-profit group, which revealed no information about its donors, tied closely to Ohio House Speaker Larry Householder, and aired advertisements last year to maintain the Republican majority in the legislature. Another $50,000 was spent in support of FreedomWorks, a grassroots group that mobilizes public support for rolling back EPA regulations. Judicial Watch, a GOP-aligned investigative nonprofit, is also a beneficiary of Murray Energy money.

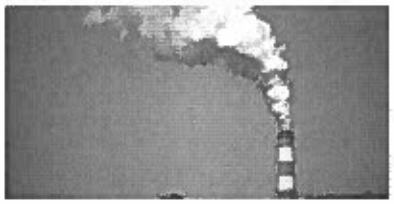
"The bankruptcy filing confirms what environmentalists have long suspected about Murray Energy's connections to a network of special-interest groups that have worked to manufacture doubt about climate change and attack climate scientists and activists," said David Anderson, communications and policy manager for the Energy and Policy Institute, a watchdog group.

Bankruptcy filings have provided a unique opportunity for the public to better understand the political agenda of powerful corporate interests, which typically shroud sensitive donations through nondisclosing entities. The sudden collapse earlier this year of Cloud Peak Energy, a Wyoming-based coal firm, revealed several donations to climate change denial groups. In 2015, The

Intercept reported on another wave of coal bankruptcies, which revealed ties between coal firms to a subterranean network of groups dedicated to blocking environmental reform.

The bankruptcy of Alpha Natural Resources three years ago, for instance, showed secret payments to Chris Horner, a former lobbyist who had hounded climate scientists in an attempt to discredit their work. The disclosure was the first time Horner and his nonprofit, the Free Market Environmental Law Clinic, had been directly tied to the fossil fuel industry.

Horner is now onto new projects. Along with several other lawyers, he is a co-founder of Government Accountability and Oversight.



WAIT! BEFORE YOU GO on about your day, ask yourself: How likely is it that the story you just read would have been produced by a different news outlet if The Intercept hadn't done it?

Consider what the world of media would look like without The Intercept. Who would hold party elites accountable to the values they proclaim to have? How many covert wars, miscarriages of justice, and dystopian technologies would remain hidden if our reporters weren't on the beat?

The kind of reporting we do is essential to democracy, but it is not easy, cheap, or profitable. The Intercept is an independent nonprofit news outlet. We don't have ads, so we depend on our members — 35,000 and counting — to help us hold the powerful to account. Joining is simple and doesn't need to cost a lot: You can become a sustaining member for as little as $3 or $5 a month. That's all it takes to support the journalism you rely on.

WITH JEREMY SCAHILL

IN THE UNITED STATES BANKRUPTCY COURT
FOR THE SOUTHERN DISTRICT OF OHIO
WESTERN DIVISION

In re:	)	Chapter 11
MURRAY ENERGY HOLDINGS CO., *et al.*,[1]	)	Case No. 19-56885 (JEH)
	)	Judge John E. Hoffman, Jr.
Debtors.	)	(Jointly Administered)

GLOBAL NOTES, METHODOLOGY, AND SPECIFIC DISCLOSURES REGARDING THE DEBTORS' SCHEDULES OF ASSETS AND LIABILITIES AND STATEMENTS OF FINANCIAL AFFAIRS

INTRODUCTION

Murray Energy Holdings Co. and its debtor affiliates, as debtors and debtors in possession in the above-captioned chapter 11 cases (collectively, the "Debtors"), with the assistance of their advisors, have filed their respective Schedules of Assets and Liabilities (the "Schedules") and Statements of Financial Affairs (the "Statements," and together with the Schedules, the "Schedules and Statements") with the United States Bankruptcy Court for the Southern District of Ohio (the "Court"), under section 521 of title 11 of the United States Code, 11 U.S.C. §§ 101–1532 (the "Bankruptcy Code"), Rule 1007 of the Federal Rules of Bankruptcy Procedure (the "Bankruptcy Rules"), and Rule 1007-1 of the Bankruptcy Local Rules for the Southern District of Ohio (the "Local Rules").

These *Global Notes, Methodology, and Specific Disclosures Regarding the Debtors' Schedules of Assets and Liabilities and Statements of Financial Affairs* (the "Global Notes") pertain to, are incorporated by reference in, and comprise an integral part of all of the Debtors' Schedules and Statements. The Global Notes should be referred to, considered, and reviewed in connection with any review of the Schedules and Statements.

The Schedules and Statements do not purport to represent financial statements prepared in accordance with Generally Accepted Accounting Principles in the United States ("GAAP"), nor are they intended to be fully reconciled with the financial statements of each Debtor. Additionally, the Schedules and Statements contain unaudited information that is subject to further review and

[1] Due to the large number of Debtors in these chapter 11 cases, a complete list of the Debtors and the last four digits of their federal tax identification numbers is not provided herein. Such information may be obtained on the website of the Debtors' claims and noticing agent at https://cases.primeclerk.com/MurrayEnergy. The location of Debtor Murray Energy Holdings Co.'s principal place of business and the Debtors' service address in these chapter 11 cases is 46226 National Road, St. Clairsville, Ohio 43950.

potential adjustment and reflects the Debtors' reasonable efforts to report the assets and liabilities of each Debtor on an unconsolidated basis.

The Debtors and their agents, attorneys, and advisors do not guarantee or warrant the accuracy or completeness of the data that is provided herein and shall not be liable for any loss or injury arising out of or caused in whole or in part by the acts, errors, or omissions, whether negligent or otherwise, in procuring, compiling, collecting, interpreting, reporting, communicating, or delivering the information contained herein. While reasonable efforts have been made to provide accurate and complete information herein, inadvertent errors or omissions may exist. The Debtors and their agents, attorneys, and advisors expressly do not undertake any obligation to update, modify, revise, or re-categorize the information provided herein, or to notify any third party should the information be updated, modified, revised, or re-categorized. In no event shall the Debtors or their agents, attorneys, and advisors be liable to any third party for any direct, indirect, incidental, consequential, or special damages (including damages arising from the disallowance of a potential claim against the Debtors or damages to business reputation, lost business, or lost profits), whether foreseeable or not and however caused, even if the Debtors or their agents, attorneys, and advisors are advised of the possibility of such damages.

In preparing the Schedules and Statements, the Debtors relied on financial data derived from their books and records that was available at the time of such preparation. Although the Debtors have made reasonable, good faith efforts to collect, compile, and ensure the accuracy and completeness of the Schedules and Statements, subsequent information or discovery may result in material changes to the Schedules and Statements. As a result, inadvertent errors or omissions may exist. For the avoidance of doubt, the Debtors reserve their rights to amend and supplement the Schedules and Statements as may be necessary or appropriate.

Mr. Robert D. Moore, Chief Executive Officer, and Chief Financial Officer of Murray Energy Holdings Co. has signed each of the Schedules and Statements. Mr. Moore is an authorized signatory for each of the Debtors. In reviewing and signing the Schedules and Statements, Mr. Moore necessarily has relied upon the efforts, statements, and representations of various personnel employed by the Debtors and their advisors. Mr. Moore has not (and could not have) personally verified the accuracy of each statement and representation contained in the Schedules and Statements, including statements and representations concerning amounts owed to creditors, classification of such amounts, and creditor addresses.

Global Notes and Overview of Methodology

1. **Description of Cases.** On October 29, 2019 (the "Petition Date"), the Debtors filed voluntary petitions for relief under chapter 11 of the Bankruptcy Code. The Debtors are operating their business and managing their property as debtors-in-possession pursuant to sections 1107(a) and 1108 of the Bankruptcy Code. On November 1, 2019, an order [Docket No. 112] was entered directing joint administration of these chapter 11 cases. Notwithstanding the joint administration of the Debtors' cases for procedural purposes, each Debtor has filed its own Schedules and Statements. On November 7, 2019, the United States Trustee appointed an official committee of unsecured creditors in the Debtors' bankruptcy cases [Docket No. 168]. No request for the appointment of a trustee or examiner has been made in these chapter 11 cases. The liability information provided

herein represents the liability data of the Debtors as of the Petition Date, except as otherwise noted. The asset information provided herein represents the asset data of the Debtors as of September 30, 2019, except as otherwise noted.

2. **Global Notes Control.** These Global Notes pertain to and comprise an integral part of each of the Schedules and Statements and should be referenced in connection with any review thereof. In the event that the Schedules and Statements conflict with these Global Notes, the Global Notes shall control.

3. **Reservation of Rights.** Reasonable efforts have been made to prepare and file complete and accurate Schedules and Statements, but inadvertent errors or omissions may exist. The Debtors reserve all rights to: (i) amend or supplement the Schedules and Statements from time to time, in all respects, as may be necessary or appropriate, including the right to amend the Schedules and Statements with respect to the description, designation, or Debtor against which any claim against a Debtor ("Claim")[2] is asserted; (ii) dispute or otherwise assert offsets or defenses to any Claim reflected in the Schedules and Statements as to amount, liability, priority, status, or classification; (iii) subsequently designate any Claim as "disputed," "contingent," or "unliquidated;" or (iv) object to the extent, validity, enforceability, priority, or avoidability of any Claim (regardless of whether such Claim is designated in the Schedules and Statements as "disputed," "contingent," or "unliquidated"). Any failure to designate a Claim in the Schedules and Statements as "disputed," "contingent," or "unliquidated" does not constitute an admission by the Debtors that such Claim or amount is not "disputed," "contingent," or "unliquidated." Listing a Claim does not constitute an admission of liability by the Debtor against which the Claim is listed or against any of the Debtors. Furthermore, nothing contained in the Schedules and Statements shall constitute a waiver of rights with respect to the Debtors' chapter 11 cases, including, but not limited to, issues involving Claims, substantive consolidation, defenses, equitable subordination, and/or causes of action arising under the provisions of chapter 5 of the Bankruptcy Code and any other relevant non-bankruptcy laws to recover assets or avoid transfers. Any specific reservation or rights contained elsewhere in the Global Notes does not limit in any respect the general reservation of rights contained in this paragraph. Notwithstanding the foregoing, the Debtors shall not be required to update the Schedules and Statements.

   (a) **No Admission.** Nothing contained in the Schedules and Statements is intended or should be construed as an admission or stipulation of the validity of any Claim against the Debtors, any assertion made therein or herein, or a waiver of the Debtors' rights to dispute any Claim or assert any cause of action or defense against any party.

   (b) **Recharacterization.** Notwithstanding the Debtors' reasonable efforts to properly characterize, classify, categorize, or designate certain Claims, assets, executory contracts, unexpired leases, and other items reported in the Schedules and Statements, the Debtors may nevertheless have improperly characterized,

[2] For the purposes of these Global Notes, the term Claim shall have the meaning as defined under section 101(5) of the Bankruptcy Code.

classified, categorized, designated, or omitted certain items due to the complexity and size of the Debtors' businesses. Accordingly, the Debtors reserve all rights to recharacterize, reclassify, recategorize, redesignate, add, or delete items reported in the Schedules and Statements at a later time as is necessary or appropriate as additional information becomes available, including, but not limited to, whether contracts or leases listed herein were deemed executory or unexpired as of the Petition Date and remain executory and unexpired postpetition.

(c) **Classifications.** Listing (i) a Claim on Schedule D as "secured," (ii) a Claim on Schedule E/F as "priority," (iii) a Claim on Schedule E/F as "unsecured," or (iv) a contract on Schedule G as "executory" or "unexpired," does not constitute an admission by the Debtors of the legal rights of the claimant or a waiver of the Debtors' rights to recharacterize or reclassify such Claims or contracts or to setoff of such Claims.

(d) **Claims Description.** Schedules D and E/F permit each of the Debtors to designate a Claim as "disputed," "contingent," and/or "unliquidated." Any failure to designate a Claim on a given Debtor's Schedules and Statements as "disputed," "contingent," or "unliquidated" does not constitute an admission by that Debtor that such amount is not "disputed," "contingent," or "unliquidated," or that such Claim is not subject to objection. The Debtors reserve all of their rights to dispute, or assert offsets or defenses to, any Claim reflected on their respective Schedules and Statements on any grounds, including liability or classification. Additionally, the Debtors expressly reserve all of their rights to subsequently designate such Claims as "disputed," "contingent," or "unliquidated." Moreover, listing a Claim does not constitute an admission of liability by the Debtors. The Debtors reserve all rights to amend their Schedules and Statements as necessary and appropriate, including, but not limited to, with respect to Claim description and designation.

(e) **Estimates and Assumptions.** The preparation of the Schedules and Statements required the Debtors to make reasonable estimates and assumptions with respect to the reported amounts of assets and liabilities, the amount of contingent assets and contingent liabilities on the date of the Schedules and Statements, and the reported amounts of revenues and expenses during the applicable reporting periods. Actual results could differ from such estimates.

(f) **Causes of Action.** Despite their reasonable efforts to identify all known assets, the Debtors may not have listed all of their causes of action or potential causes of action against third parties as assets in the Schedules and Statements, including causes of action that are required to be kept confidential and causes of action arising under the provisions of chapter 5 of the Bankruptcy Code and any other relevant non-bankruptcy laws to recover assets or avoid transfers. The Debtors reserve all of their rights with respect to any cause of action (including avoidance actions), controversy, right of setoff, cross-claim, counterclaim, or recoupment and any claim on contracts or for breaches of duties imposed by law or in equity, demand, right, action, lien, indemnity, guaranty, suit, obligation, liability, damage, judgment, account, defense, power, privilege, license, and franchise of any kind or

character whatsoever, known, unknown, fixed or contingent, matured or unmatured, suspected or unsuspected, liquidated or unliquidated, disputed or undisputed, secured or unsecured, assertable directly or derivatively, whether arising before, on, or after the Petition Date, in contract or in tort, at law or in equity, or pursuant to any other theory of law (collectively, "Causes of Action") they may have, and neither these Global Notes nor the Schedules and Statements shall be deemed a waiver of any claims or Causes of Action or in any way prejudice or impair the assertion of such claims or Causes of Action.

(g) **Intellectual Property Rights.** Exclusion of certain intellectual property shall not be construed as an admission that such intellectual property rights have been abandoned, terminated, assigned, expired by their terms, or otherwise transferred pursuant to a sale, acquisition, or other transaction. Conversely, inclusion of certain intellectual property shall not be construed to be an admission that such intellectual property rights have not been abandoned, have not been terminated or otherwise expired by their terms, or have not been assigned or otherwise transferred pursuant to a sale, acquisition, or other transaction. The Debtors have made every effort to attribute intellectual property to the rightful Debtor owner; however, in some instances intellectual property owned by one Debtor may, in fact, be owned by another. Accordingly, the Debtors reserve all of their rights with respect to the legal status of any and all such intellectual property rights.

(h) **Insiders.** For purposes of the Schedules and Statements, the Debtors defined "insiders" pursuant to section 101(31) of the Bankruptcy Code as: (i) directors; (ii) officers; (iii) persons in control of the Debtors; (iv) relatives of the Debtors' directors, officers, or persons in control of the Debtors; and (v) Debtor affiliates of the foregoing. Persons listed as "insiders" have been included for informational purposes only and, by including them in the Schedules and Statements, shall not constitute an admission that those persons are insiders for purposes of section 101(31) of the Bankruptcy Code. Moreover, the Debtors do not take any position with respect to: (i) any insider's control of the Debtors; (ii) the management responsibilities or functions of any such insider; (iii) the decision making or corporate authority of any such insider; or (iv) whether the Debtors or any such insider could successfully argue that he or she is not an "insider" under applicable law or with respect to any theories of liability or for any other purpose.

In the circumstance where the Schedules and Statements require information regarding "insiders," the Debtors have included information with respect to certain individuals who served as officers and directors, as the case may be, during the relevant time periods. Such individuals may no longer serve in such capacities. For purposes of the Schedules and Statements, the listing of a person as an "insider," including by virtue of any such party serving as an officer or director of the Debtors, is not intended to be, nor should it be, construed as an admission of any fact that any such person is in fact an "insider," and all rights, claims, and defenses are hereby expressly reserved. Information regarding the individuals listed as "insiders" in the Schedules and Statements has been included for informational purposes only and such information may not be used for the purposes

of determining control of the Debtors, the extent to which any individual exercised management responsibilities or functions, corporate decision-making authority over the Debtors, whether such individual is in fact an insider for purposes of the Bankruptcy Code, or whether such individual could successfully argue that he or she is not an insider under applicable law, including the Bankruptcy Code and federal securities laws, or with respect to any theories of liability or any other purpose.

4. **Methodology.**

(a) **Confidential Information.** There may be instances in the Schedules and Statements where the Debtors deemed it necessary and appropriate to redact from the public record information such as names, addresses, or amounts. Typically, the Debtors have used this approach because of a confidentiality agreement between the Debtors and a third party, for the protection of sensitive commercial information, or for the privacy of an individual. In addition, the Court has authorized the filing of employee addresses under seal. *See* [Docket No. 110]

(b) **Umbrella or Master Agreements.** Contracts and leases listed in the Schedules and Statements may be umbrella or master agreements that cover relationships with some or all of the Debtors. Where relevant, such agreements have been listed in the Schedules and Statements only of the Debtor entity that signed the original umbrella or master agreement. Other Debtors, however, may be liable together with such Debtor on account of such agreements and the Debtors reserve all rights to amend the Schedules and Statements to reflect changes regarding the liability of the Debtors with respect to such agreements, if appropriate.

(c) **Executory Contracts.** Although the Debtors have made reasonable efforts to attribute an executory contract to its rightful Debtor, in certain instances, the Debtors may have inadvertently failed to do so due to the complexity and size of the Debtors' businesses. Accordingly, the Debtors reserve all rights with respect to the named parties of any and all executory contracts, including the right to amend Schedule G for any Debtor.

(d) **Duplication.** Certain of the Debtors' assets, liabilities, and prepetition payments may properly be disclosed in multiple parts of the Statements and Schedules. To the extent these disclosures would be duplicative, the Debtors have determined to only list such assets, liabilities, and prepetition payments once.

(e) **Net Book Value of Assets and Liabilities.** Unless otherwise indicated, liabilities on the Debtors' Schedules and Statements reflect net book values as of the Petition Date and assets reflect net book values as of September 30, 2019. The book values of certain assets may materially differ from their fair market values and/or the Debtors' enterprise valuation, if any, that may be prepared in connection with the disclosure statement to the Debtors' chapter 11 plan. For the avoidance of doubt, nothing contained in the Schedules and Statements is indicative of the Debtors' enterprise value.

Book values of assets prepared in accordance with GAAP generally do not reflect the current performance of the assets or the impact of the industry environment and may differ materially from the actual value and/or performance of the underlying assets.

(f) **Undetermined Amounts.** The description of an amount as "undetermined" is not intended to reflect upon the materiality of such amount.

(g) **Unliquidated Amounts.** Amounts that could not be fairly quantified by the Debtors are scheduled as "unliquidated."

(h) **Totals.** All totals that are included in the Schedules and Statements represent totals of all known amounts. To the extent there are unknown or undetermined amounts, the actual total may be different than the listed total.

(i) **Inventories; Property and Equipment.** Inventories consist of materials, supplies, and coal inventory. These inventories are valued at the lower of cost or market. Coal inventory costs include labor, supplies, equipment, operating overhead, and transportation costs incurred prior to the transfer of title to customers. Property, plant, equipment, and mine development are recorded at cost or at fair value at the date of acquisition in the case of acquired businesses, and are presented net of accumulated depreciation and amortization. Property, plant, and equipment are aggregated in the Debtors' books and records and cannot be segregated easily into the categories required by the Schedules and Statements. All inventories, as well as all property and equipment, are presented without consideration of any statutory or consensual liens.

(j) **Coal Reserves.** The Debtors have not analyzed the current market value of their owned or leased coal reserves. Except where otherwise noted, the Debtors have reported the book value of all owned pieces of real property, including coal reserves, in Schedule A/B. Certain unexpired coal reserve leases of the Debtors as of the Petition Date that may constitute executory contracts or unexpired leases within the meaning of Bankruptcy Code section 365 are also included in Schedule G, and to the extent that there was an amount outstanding under a coal reserve lease, such as royalties payable, as of the Petition Date, the amount owed to the lessor of the coal reserves has been listed on Schedule E/F.

(k) **Liabilities.** The Debtors have sought to allocate liabilities between the prepetition and postpetition periods based on the information and research conducted in connection with the preparation of the Schedules and Statements. As additional information becomes available and further research is conducted, the allocation of liabilities between the prepetition and postpetition periods may change. Accordingly, the Debtors reserve all of their rights to amend, supplement, or otherwise modify the Schedules and Statements as is necessary or appropriate.

(l) **Paid Claims.** The Debtors were authorized (but not directed) to pay certain outstanding prepetition Claims pursuant to various orders entered by the Court.

Accordingly, certain outstanding liabilities that have been reduced by postpetition payments made on account of prepetition liabilities have been designated as either contingent or unliquidated. To the extent the Debtors pay any of the Claims listed in the Schedules and Statements pursuant to any orders entered by the Court, the Debtors reserve all of their rights to amend or supplement the Schedules and Statements or take other action as is necessary or appropriate to avoid over-payment of or duplicate payments for any such liabilities.

(m) **Intercompany Payables and Receivables.** Intercompany payables and receivables between the Debtors are reported as of October 31, 2019, and are set forth on Schedule E/F or Schedule A/B, Part 11, Questions 71 and 77, as applicable.

As described more fully in the Debtor's *Motion for Entry of Interim and Final Orders (I) Authorizing the Debtors to (A) Continue to Operate their Cash Management System, (B) Maintain Existing Business Forms, (C) Perform Intercompany Transactions and Pay Prepetition Obligations Related Thereto, and (II) Granting Related Relief* [Docket No. 13] (the "Cash Management Motion"), the Debtors engage in a range of intercompany transactions in the ordinary course of business. Pursuant to the final order granting the relief requested in the Cash Management Motion [Docket No. 389] (the "Cash Management Order"), the Court has granted the Debtors authority to continue the intercompany transactions in the ordinary course of business. Thus, intercompany balances as of the Petition Date, as set forth in Schedule E/F or Schedule A/B, Part 11, Question 71 or 77 may not accurately reflect current positions.

The listing by the Debtors of any account between a Debtor and another Debtor is a statement of what appears in a particular Debtor's books and records and does not reflect any admission or conclusion of the Debtors regarding the allowance, classification, characterization, validity, or priority of such account. The Debtors take no position in these Schedules and Statements as to whether such accounts would be allowed as a Claim, an Interest, or not allowed at all. The Debtors reserve all rights with respect to such accounts.

(n) **Guarantees and Other Secondary Liability Claims.** The Debtors have exercised reasonable efforts to locate and identify guarantees of their executory contracts, unexpired leases, secured financings, and other such agreements. Where guarantees have been identified, they have been included in the relevant Schedules E/F, G, and H for the affected Debtor. The Debtors may have inadvertently omitted guarantees embedded in their contractual agreements and may identify additional guarantees as they continue to review their books and records and contractual agreements. The Debtors reserve their rights, but are not required, to amend the Schedules and Statements if additional guarantees are identified.

(o) **Excluded Assets and Liabilities.** The Debtors have excluded certain categories of assets, tax accruals, and liabilities from the Schedules and Statements, including

goodwill, accrued salaries, employee benefit accruals, and accrued accounts payable. The Debtors also have excluded rejection damage for Claims of counterparties to executory contracts and unexpired leases that may or may not be rejected, to the extent such damage Claims exist. The Debtors have also excluded certain unbilled receivables and allowances for doubtful accounts. The Debtors also have excluded potential pneumoconiosis and worker's compensation claims to maintain the privacy of the claimants. In addition, certain immaterial assets and liabilities may have been excluded.

The Court has authorized (but not directed) the Debtors to pay, in their discretion, certain outstanding Claims on a postpetition basis. As discussed below, prepetition liabilities that the Debtors have paid postpetition or those which the Debtors plan to pay in accordance this authorization may not be listed in the Schedules and Statements.

Liabilities for which the Debtors are attempting to determine creditor information, including approximately $4.5 million of royalty liabilities held in suspense, may be excluded from the Schedules.

(p) **Liens.** Property and equipment listed in the Schedules and Statements are presented without consideration of any liens that may attach (or have attached) to such property and equipment.

(q) **Currency.** Unless otherwise indicated, all amounts are reflected in U.S. Dollars. Currency conversions are generally as of the Petition Date.

(r) **Setoffs.** The Debtors periodically incur certain setoffs in the ordinary course of business.

Setoffs in the ordinary course can result from various items including, but not limited to, intercompany transactions, pricing discrepancies, returns, warranties, credits, refunds, negotiations, and/or disputes between Debtors and their vendors or customers regarding regulatory or governmental impositions costs incurred by Debtors, and other disputes between the Debtors and their customers and/or suppliers. These normal setoffs are consistent with the ordinary course of business in the Debtors' industry and can be particularly voluminous, making it unduly burdensome and costly for the Debtors to list such ordinary course setoffs. Therefore, although such setoffs and other similar rights may have been accounted for when scheduling certain amounts, these ordinary course setoffs are not independently accounted for, and as such, are or may be excluded from the Debtors' Schedules and Statements.

In addition, some amounts listed in the Schedules and Statements may have been affected by setoffs or nettings by third parties of which the Debtors are not yet aware and/or of which the Debtors have approved to effectuate in the claims process of their chapter 11 cases. The Debtors reserve all rights to challenge any setoff and/or recoupment rights that may be asserted.

(s) **Unknown Debtors.** In certain instances, certain contracts or other relevant documents may not specify a particular Debtor or Debtors or may include the incorrect legal entity as the contractual counterparty. In these instances, responses have been listed in the appropriate Statement or Schedule at Murray Energy Corporation out of an abundance of caution.

5. **Specific Schedules Disclosures.**

Schedules Summary. Except as otherwise noted, the asset and liability information provided herein represents the Debtors' liabilities as of the Petition Date and the Debtors' assets as of September 30, 2019.

For financial reporting purposes, the Debtors ordinarily prepare consolidated financial statements. Unlike the consolidated financial statements, the Schedules reflect the assets and liabilities of each Debtor on a nonconsolidated basis, except where otherwise indicated. Accordingly, the totals listed in the Schedules will likely differ, at times materially, from the consolidated financial reports prepared by the Debtors for financial reporting purposes or otherwise.

The Schedules do not purport to represent financial statements prepared in accordance with GAAP, nor are they intended to be fully reconciled with the financial statements of each Debtor. Certain write-downs, impairments, and other accounting adjustments may not be reflected in the Schedules. Additionally, the Schedules contain unaudited information that is subject to further review and potential adjustment, and reflect the Debtors' reasonable best efforts to report the assets and liabilities of each Debtor on an unconsolidated basis. Moreover, given, among other things, the uncertainty surrounding the collection and ownership of certain assets and the valuation and nature of certain liabilities, to the extent that a Debtor shows more assets than liabilities, this is not an admission that the Debtor was solvent as of the Petition Date or at any time before the Petition Date. Likewise, to the extent a Debtor shows more liabilities than assets, this is not an admission that the Debtor was insolvent as of the Petition Date or at any time before the Petition Date.

(a) **Schedule A/B, Parts 1 and 2 – Cash and Cash Equivalents; Deposits and Prepayments.** Details with respect to the Debtors' cash management system and bank accounts are provided in the Cash Management Motion and the Cash Management Order. Bank account balances listed are as of end of day on October 28, 2019, and may vary from book balances.

(a) **Schedule A/B, Part 3 – Accounts Receivable.** Accounts receivable detail may include credit balances with customers, as maintained in the Debtors' books and records.

(b) **Schedule A/B, Part 4 – Investments; Non-Publicly Traded Stock and Interests in Incorporated and Unincorporated Businesses, Including Any Interest in an LLC, Partnership, or Joint Venture**. Equity interests in subsidiaries and affiliates primarily arise from common stock ownership or member or partnership interests. For purposes of these Schedules, the Debtors have listed an undetermined value for the equity interests of all subsidiaries and affiliates. Nothing in these Schedules is an admission or conclusion of the Debtors regarding the value of such

subsidiary and affiliate equity interests, which, under certain fair market or enterprise valuation analyses, may have value. The book values of certain assets may materially differ from their fair market values and/or the Debtors' enterprise valuation that may be prepared in connection with a disclosure statement.

Book values of assets prepared in accordance with GAAP generally do not reflect the current performance of the assets or the impact of the industry environment and may differ materially from the actual value and/or performance of the underlying assets. As such, the value listed in these Schedules and Statements cannot be, and was not, used to determine the Debtors' enterprise valuation.

(c) **Schedule A/B, Part 7 – Office Furniture, Fixtures, and Equipment; and Collectibles.** Due to volume, individual fixed asset schedules have not been included in Part 7. However, those fixed asset schedules are available upon request.

(d) **Schedule A/B, Part 8 – Machinery, Equipment, and Vehicles; Automobiles, vans, trucks, motorcycles, trailers, and titled farm vehicles.** Certain *de minimis* amounts related to automobiles may be reported in Question 50. Due to volume, individual fixed asset schedules have not been included in Part 8; however, those fixed asset schedules are available upon request.

(e) **Schedule A/B, Part 9 – Real Property.** The Debtors may have listed certain assets as real property when such assets are in fact personal property, or the Debtors may have listed certain assets as personal property when such assets are in fact real property. Buildings and land improvements are listed on Schedule A/B, Part 9, independent of whether the real property to which the building or land improvement is connected is Debtor-owned property. The Debtors reserve all of their rights to re-categorize and/or recharacterize such asset holdings to the extent the Debtors determine that such holdings were improperly listed.

(f) **Schedule A/B, Part 11 – All Other Assets.**

Interests in Insurance Policies or Annuities. The Debtors have listed all of their insurance policies in Question 73 at each Debtor, irrespective of whether each Debtor is specifically named in any given policy. The Debtors believe that there is little or no cash value to the vast majority of such insurance policies. Such policies have all been included on Schedule A/B, Part 11, with values listed as "undetermined."

Other Property of Any Kind Not Already Listed. The listing by the Debtors of any account between a Debtor and another Debtor is a statement of what appears in a particular Debtor's books and records and does not reflect any admission or conclusion of the Debtors regarding the allowance, classification, characterization, validity, or priority of such account. The Debtors take no position in these Schedules and Statements as to whether such accounts would be allowed as a Claim, an Interest, or not allowed at all. The Debtors and all parties in interest reserve all rights with respect to such accounts.

(g) **Schedule D – Creditors Who Have Claims Secured by Property.** Except as otherwise agreed pursuant to a stipulation or order entered by the Court, the Debtors reserve their rights to dispute or challenge the validity, perfection, or immunity from avoidance of any lien purported to be granted or perfected in any specific asset to a secured creditor listed on Schedule D. Moreover, although the Debtors have scheduled Claims of various creditors as secured Claims, the Debtors reserve all rights to dispute or challenge the secured nature of any such creditor's Claim or the characterization of the structure of any such transaction or any document or instrument related to such creditor's Claim. The Debtors have not included parties that may believe their Claims are secured through setoff rights, inchoate statutory lien rights, or other lien rights created by the laws of the various jurisdictions in which the Debtors operate. Various Debtors are borrowers, and certain of the other Debtors are guarantors, under prepetition secured funded debt obligations. Although there are numerous beneficial holders of such debt, only the administrative agents have been listed for purposes of Schedule D, where applicable. The amounts outstanding under the Debtors' prepetition secured debt reflect approximate amounts as of the Petition Date.

Descriptions provided on Schedule D are intended only to be a summary. Reference to the applicable loan agreements and related documents is necessary for a complete description of the collateral and the nature, extent, and priority of any liens.

After the Petition Date, the Debtors have obtained court approval to enter into a senior secured, superpriority postpetition financing facility in the aggregate principal amount of up to $440 million (the "DIP Facility"), consisting of (a) $350 million of new money term loans and (b) a $90 million last-out incremental term loan facility pursuant to the Superpriority Secured Debtor-in-Possession Credit and Guaranty Agreement. Certain of the Debtors' prepetition debt was refinanced or converted into the DIP Facility.

(h) **Schedule E/F – Creditors Who Have Unsecured Claims.**

Part 1 – Creditors with Priority Unsecured Claims. Under the *Final Order (I) Authorizing the Payment of Certain Prepetition and Postpetition Taxes and Fees and (II) Granting Related Relief* [Docket No. 329] (the "Tax Order"), the Court granted the Debtors authority to pay the prepetition Claims of regulatory authorities on account of taxes and fees. The amounts accrued and payable on account of such Claims may not be reflected on Schedule E/F.

Under the *Final Order (I) Authorizing the Debtors to Pay Certain Prepetition Claims of (A) Critical Vendors, (B) Lien Claimants, (C) Shippers, (D) 503(B)(9) Claimants, and (E) Royalty and Leasehold Claimants, (II) Confirming Administrative Expense Priority Status of Outstanding Orders, and (III) Granting Related Relief* [Docket No. 358] (the "Vendor Order"), the Court granted the Debtors authority to pay the prepetition Claims of certain Trade Claimants, as defined in the Vendor Order. To the extent the Claim of a Trade Claimant may be

paid under the Vendor Order, but remains outstanding at the time of the filing of the Schedules, such Claim may be listed in the Schedules as a contingent Claim.

Under the *Final Order (I) Authorizing the Debtors to (A) Pay Prepetition Wages, Salaries, Other Compensation, and Reimbursable Expenses and (B) Continue Employee Benefits Programs, and (II) Granting Related Relief* [Docket No. 334] (the "Wages Order"), the Court granted the Debtors authority to pay or honor certain prepetition obligations for employee wages, salaries, and other compensation, reimbursable employee expenses, and employee medical and similar benefits. The Debtors have not listed on Schedule E/F any wage or wage-related obligations for which the Debtors have been granted authority to pay pursuant to any order that has been entered by the Court. The Debtors believe that all such Claims have been, or will be, satisfied in the ordinary course during their chapter 11 cases pursuant to the authority granted in the Wages Order.

The listing of a claim on Schedule E/F, Part 1, does not constitute an admission by the Debtors that such claim or any portion thereof is entitled to priority status.

Part 2 – Creditors with Nonpriority Unsecured Claims. The listing by the Debtors of any account between a Debtor and another Debtor is a statement of what appears in a particular Debtor's books and records and does not reflect any admission or conclusion of the Debtors regarding the allowance, classification, characterization, validity, or priority of such account. The Debtors take no position in these Schedules and Statements as to whether such accounts would be allowed as a Claim, an Interest, or not allowed at all. The Debtors and all parties in interest reserve all rights with respect to such accounts.

Various Debtors are borrowers, and certain of the other Debtors are guarantors, under prepetition funded obligations. Although the Debtors generally allocate individual liabilities to particular Debtors, in certain cases, it would be a time-consuming and inefficient use of estate resources, or impracticable, to assign a given liability to a particular Debtor. To the extent the liability could not be attributed to a specific Debtor, the liability has been listed on Schedule E/F, Part 2, of Murray Energy Corporation. Although there are numerous beneficial holders of such debt, only the administrative agents and indenture trustees, as applicable, have been listed for purposes of Schedule E/F, where applicable.

The Claims of individual creditors for, among other things, goods, products, services, or taxes are listed as the amounts entered on the Debtors' books and records and may not reflect credits, allowances, or other adjustments due from such creditors to the Debtors. The Debtors reserve all of their rights with regard to such credits, allowances, and other adjustments, including the right to assert Claims objections and/or setoffs with respect to the same. The Claims identified in these Schedules and Statements arose or were incurred on various dates. In certain instances, the date on which a Claim arose is an open issue of fact. Although reasonable efforts have been made to identify the date each Claim was incurred or arose, determining the date upon which each Claim in these Schedules and

Statements was incurred or arose would be unduly burdensome and cost prohibitive. In addition, Claims listed in these Schedules and Statements have been aggregated by creditor and may include several dates of incurrence for the aggregate balance listed. As such, Schedule E/F, where applicable, may not include the date that each Claim arose or was incurred for every Claim listed thereon.

Schedule E/F does not include certain deferred charges, deferred liabilities, accruals, or general reserves. Such amounts are, however, reflected on the Debtors' books and records as required in accordance with GAAP. Such accruals are general estimates of liabilities and do not represent specific Claims as of the Petition Date. The Debtors have made every effort to include as contingent, unliquidated, or disputed the Claim of any vendor not included on the Debtors' open accounts payable that is associated with an account that has an accrual or receipt not invoiced.

Schedule E/F reflects certain prepetition amounts owing to counterparties to executory contracts and unexpired leases. Such prepetition amounts, however, may be paid in connection with the assumption or assumption and assignment of an executory contract or unexpired lease. In addition, Schedule E/F does not include claims that may arise in connection with the rejection of any executory contracts and unexpired leases, if any, that may be or have been rejected.

Where applicable, the amounts listed in Schedule F take into account credits and overpayments owed to the Debtors.

As of the time of filing of the Schedules and Statements, the Debtors have not received all invoices for payables, expenses, and other liabilities that may have accrued prior to the Petition Date. Accordingly, the information contained in Schedules D and E/F may be incomplete. The Debtors reserve their rights, but undertakes no obligations, to amend Schedules D and E/F if, or when, the Debtors receive such invoices.

(i) **Schedule G – Executory Contracts and Unexpired Leases.** Although reasonable efforts have been made to ensure the accuracy of Schedule G regarding executory contracts and unexpired leases, inadvertent errors, omissions, or over-inclusion may have occurred in preparing Schedule G. Certain of the instruments reflected on Schedule G may contain renewal options, guarantees of payments, options to purchase, rights of first refusal, and other miscellaneous rights. Such rights, powers, duties, and obligations are not separately set forth on Schedule G. In the ordinary course of business, the Debtors may have issued numerous purchase orders for goods, supplies, product, services, and related items which, to the extent that such purchase orders constitute executory contracts, may not be listed individually on Schedule G. Omission of a contract or agreement from Schedule G does not constitute an admission that such omitted contract or agreement is not an executory contract or unexpired lease. The Debtors hereby expressly reserve the right to assert that any instrument listed on Schedule G is an executory contract within the meaning of section 365 of the Bankruptcy Code. The Debtors reserve

all of their rights, claims, and causes of action with respect to Claims associated with any contracts and agreements listed on Schedule G, including their right to dispute or challenge the characterization or the structure of any transaction, document, or instrument (including any intercompany agreement) related to a creditor's Claim. The Debtors further reserve all of their rights to alter or amend these Schedules to the extent that additional information regarding the Debtor obligor to such executory contracts or unexpired leases becomes available.

Certain confidentiality, hold harmless, and non-compete agreements may not be listed on Schedule G. In addition, agreements and underlying documentation related to the Debtors' prepetition debt are not included in Schedule G. The Debtors reserve all of their rights with respect to such agreements.

Certain of the contracts and agreements listed on Schedule G may consist of several parts, including, purchase orders, amendments, restatements, waivers, letters, and other documents that may not be listed on Schedule G or that may be listed as a single entry.

Certain confidential settlement agreements with individual counterparties have been excluded from Schedule G in order to maintain the privacy of those counterparties.

The contracts, agreements, and leases listed on Schedule G may have expired or may have been modified, amended, or supplemented from time to time by various amendments, restatements, waivers, estoppel certificates, letters, memoranda, and other documents, instruments, and agreements that may not be listed therein despite the Debtors' use of reasonable efforts to identify such documents. Further, unless otherwise specified on Schedule G, the Debtors have made reasonable efforts to ensure that each executory contract or unexpired lease listed thereon shall include all exhibits, schedules, riders, modifications, declarations, amendments, supplements, attachments, restatements, or other agreements made directly or indirectly by any agreement, instrument, or other document that in any manner affects such executory contract or unexpired lease, without respect to whether such agreement, instrument, or other document is listed thereon. In some cases, the same supplier or provider appears multiple times on Schedule G. This multiple listing is intended to reflect distinct agreements between the applicable Debtor and such supplier or provider.

(j) **Schedule H – Co-Debtors.** For purposes of Schedule H, only the administrative agents and indenture trustees are listed as co-Debtors on Schedule H. The Debtors have not listed any litigation-related co-Debtors on Schedule H. Instead, all such listings can be found on the Debtors' Schedules E/F.

6. **Specific Statements Disclosures**.

(a) **Statements, Part 1, Question 1 – Gross Revenue from Business.** Revenue reported for purposes of disclosing gross revenue from business in Question 1 is through October 31, 2019.

(b) **Statements, Part 1, Question 2 – Non-Business Revenue.** Revenue reported for purposes of disclosing non-business revenue in Question 2 is through October 31, 2019.

(c) **Statements, Part 2, Question 3 – Certain Payments or Transfers of Property Made within 90 days.** In Question 3, disbursements made on account of multiple invoices may be reflected as a single payment. In addition, certain disbursements in Question 3, including, but not limited to, disbursements made on account of legal services, may have provided a benefit to an insider of the Debtors.

All disbursements listed in Question 3 are made through the Debtors' cash management system, more fully described in the Cash Management Motion. Dates listed in Question 3 reflect the dates upon which the Debtor transferred funds to the relevant payee or disbursing agent. Certain disbursements may be excluded from Question 3, including regular payroll, expense reimbursements to employees, payroll funding, payments to benefits providers, payments on behalf of non-affiliate companies, disbursement to retained professionals (reported elsewhere), and certain *de minimis* regional disbursements.

(d) **Statements, Part 2, Question 4 – Payments and Transfers to Insiders.** Individual payments to Debtor affiliates are not reflected in Question 4 due to their complexity and voluminous nature. The Debtors have reported net annual intercompany positions in Question 4, while intercompany payables and receivables as of the Petition Date can be found on Schedule E/F and Schedule A/B. In addition, certain disbursements in Question 4, including, but not limited to, the disbursements to Corporate Aviation Services, Inc., are over inclusive as such disbursements may also be general business expenses.

As described more fully in the Cash Management Motion, the Murray Energy Corporation concentration account directly funds disbursement accounts utilized to pay payroll and employee obligations. All employee-related disbursements in Question 4 are listed under Murray Energy Corporation.

(e) **Statements, Part 6, Question 11 – Payments Related to Bankruptcy.** All disbursements listed in Question 11 were initiated and disbursed by Murray Energy Corporation but were for the benefit of all Debtors. Entities listed in Question 11 may also have payments not related to bankruptcy work listed in Question 3.

(f) **Statements, Part 6, Question 13 – Transfers Not Already Listed on This Statement.** The Debtors do not take any position with respect to whether transfers identified in the response to Question 13 in the Statements are made in the ordinary

course of business. Certain transfers listed in this response are included solely out of an abundance of caution.

Transfers pursuant to confidential settlement agreements with individual counterparties have been excluded from Statement 13 to protect the privacy of those individual counterparties.

(g) **Statements, Part 7, Question 14 – Previous Addresses.** The Debtors have listed previous addresses of office locations only in Question 14.

(h) **Statements, Part 9, Question 17 – Employees' Participation in Pension or Profit-Sharing Plans.** The Debtors have provided details about their 401(k) plan in Question 17 for Debtor entities that have employee participants. Murray Energy Corporation is the plan administrator for the Debtors' 401(k) plan but does not employ any individuals.

(i) **Statements, Part 10, Question 20 – Off-premises Storage.** The Debtors have listed their primary off-premises storage facilities in Question 20. Additional facilities storing *de minimis* property may have been inadvertently omitted from Question 20.

(j) **Statements, Part 11, Question 21 – Property the Debtor Holds or Controls That the Debtor Does Not Own.** Property owned by affiliates or insiders is excluded from responses to Question 21.

(k) **Statements, Part 12, Question 23 – Notices of Potential Environmental Liabilities.** The Debtors historically have operated in several locations across Ohio, Pennsylvania, West Virginia, Kentucky, Alabama, Illinois, and Utah. At some locations, the Debtors no longer have any active operations and may no longer have relevant records, or the records may no longer be complete or reasonably accessible or reviewable. In some cases, statutory document retention periods have passed. Further, some individuals who once possessed responsive information are no longer employed by the Debtors. For all these reasons, it may not be possible to identify and supply the requested information for all of the requested information that is responsive to Questions 22–24. The Debtors have generally provided responsive information for matters and issues that have arisen during the period January 2016 through October 2019, including matters and issues that the Debtors consider to have been resolved. This timeframe is generally consistent with requirements in state and federal coal mining regulations to include environmental violations from the previous three-year period in Surface Mining Control and Reclamation Act coal mining permit applications, revisions, and renewals. This response does not include sites or proceedings related to non-environmental laws, such as mining or occupational safety and health laws or transportation laws. This response also does not include notices issued to previous owners of property now owned by the Debtors. Finally, this response is also limited to identifying circumstances in which governmental agencies have alleged in writing that particular operations of the Debtors are in violation of environmental laws and

proceedings that have resulted from alleged violations of environmental laws. This response also does not cover (i) periodic information requests, investigations, or inspections from governmental units concerning compliance with environmental laws or (ii) routine reports and submissions concerning permitted discharges resulting from routine operations where such reports and submissions were made in compliance with regulatory requirements, such as monthly discharge monitoring reports. This response assumes that any responsive information provided in response to Statements, Part 12, Question 22, is also deemed to have been provided in response to Statements, Part 12, Questions 23–24, as appropriate.

The United States Environmental Protection Agency, Region 4 (the "EPA") has provided notices to the Debtors regarding their compliance with the Consent Agreement and Final Order, Docket No. SDWA-04-2012-1007(b) (the "CA/FO"). Such notices are not listed in Question 23. On June 15, 2017, the EPA provided notice to the Debtors that it was closing the CA/FO based on the Debtors' compliance with the CA/FO.

(l) **Statements, Part 13, Question 26(b) – Books, Records, and Financial Statements.** The Debtors have listed Ernst and Young, LLP, the external auditor of their financial statements, in response to Question 26(b). Firms that may have performed other audits (e.g. royalty audits) are not listed in response to Question 26(b).

(m) **Statements, Part 13, Question 26(d) – Books, Records, and Financial Statements.** The Debtors financials have historically been reported on a consolidated basis at Murray Energy Corporation, so their response to Question 26(d) is listed at that Debtor. The Debtors have attempted to list parties that have had access to the Debtors' financial statements through diligence processes in Question 26(d); however, some such parties may have been omitted.

(n) **Statements, Part 13, Question 27 – Inventories.** Responses to Question 27 are limited to supplies inventory and exclude periodic coal inventories, shop inventories, and other *de minimis* inventories.

14.2.	_____ Street _____ _____ City State ZIP Code	From _____ To _____

Debtor Murray Energy Corporation (Name) Case number (if known) 19-57017 (JEH)

Part 8: Health Care Bankruptcies

15. Health Care bankruptcies

Is the debtor primarily engaged in offering services and facilities for:

— diagnosing or treating injury, deformity, or disease, or

— providing any surgical, psychiatric, drug treatment, or obstetric care?

☒ No. Go to Part 9.

☐ Yes. Fill in the information below.

	Facility name and address	Nature of the business operation, including type of services the debtor provides	If debtor provides meals and housing, number of patients in debtor's care
15.1.	Facility name Street City State ZIP Code	Location where patient records are maintained (if different from facility address). If electronic, identify any service provider. How are records kept? *Check all that apply:* ☐ Electronically ☐ Paper	
15.2.	Facility name Street City State ZIP Code	Location where patient records are maintained (if different from facility address). If electronic, identify any service provider. How are records kept? *Check all that apply:* ☐ Electronically ☐ Paper	

Part 9: Personally Identifiable Information

16. Does the debtor collect and retain personally identifiable information of customers?

☒ No.

☐ Yes. State the nature of the information collected and retained. _____

Does the debtor have a privacy policy about that information?

☐ No

☐ Yes

17. Within 6 years before filing this case, have any employees of the debtor been participants in any ERISA, 401(k), 403(b), or other pension or profit-sharing plan made available by the debtor as an employee benefit?

☐ No. Go to Part 10.

Yes. Does the debtor serve as plan administrator?

☒ No. Go to Part 10.

☐ Yes. Fill in below:

Name of plan	Employer Identification number of the plan
Murray Energy Corporation Savings and Security Plan	EIN: 34-1956752

Has the plan been terminated?

☒ No

☐ Yes

Debtor Murray Energy Corporation (Name) Case number (if known) 19-57017 (JEH)

Part 10: Certain Financial Accounts, Safe Deposit Boxes, and Storage Units

18. Closed financial accounts

Within 1 year before filing this case, were any financial accounts or instruments held in the debtor's name, or for the debtor's benefit, closed, sold, moved, or transferred?

Include checking, savings, money market, or other financial accounts; certificates of deposit; and shares in banks, credit unions, brokerage houses, cooperatives, associations, and other financial institutions.

☒ None

	Financial institution name and address	Last 4 digits of account number	Type of account	Date account was closed, sold, moved, or transferred	Last balance before closing or transfer
18.1.	Name Street City State ZIP Code	XXXX–___ ___ ___ ___	☐ Checking ☐ Savings ☐ Money market ☐ Brokerage ☐ Other_____	_____	$_____
18.2.	Name Street City State ZIP Code	XXXX–___ ___ ___ ___	☐ Checking ☐ Savings ☐ Money market ☐ Brokerage ☐ Other_____	_____	$_____

19. Safe deposit boxes

List any safe deposit box or other depository for securities, cash, or other valuables the debtor now has or did have within 1 year before filing this case.

☒ None

Depository institution name and address	Names of anyone with access to it	Description of the contents	Does debtor still have it?
Name Street City State ZIP Code	Address		☐ No ☐ Yes

20. Off-premises storage

List any property kept in storage units or warehouses within 1 year before filing this case. Do not include facilities that are in a part of a building in which the debtor does business.

☒ None

Facility name and address	Names of anyone with access to it	Description of the contents	Does debtor still have it?
Name Street City State ZIP Code	Address		☐ No ☐ Yes

Debtor Murray Energy Corporation (Name) Case number (if known) 19-57017 (JEH)

Part 11: Property the Debtor Holds or Controls That the Debtor Does Not Own

21. Property held for another

List any property that the debtor holds or controls that another entity owns. Include any property borrowed from, being stored for, or held in trust. Do not list leased or rented property.

☒ None

Owner's name and address	Location of the property	Description of the property	Value
Name Street City State ZIP Code			$

Part 12: Details About Environmental Information

For the purpose of Part 12, the following definitions apply:

- *Environmental law* means any statute or governmental regulation that concerns pollution, contamination, or hazardous material, regardless of the medium affected (air, land, water, or any other medium).
- *Site* means any location, facility, or property, including disposal sites, that the debtor now owns, operates, or utilizes or that the debtor formerly owned, operated, or utilized.
- *Hazardous material* means anything that an environmental law defines as hazardous or toxic, or describes as a pollutant, contaminant, or a similarly harmful substance.

Report all notices, releases, and proceedings known, regardless of when they occurred.

22. Has the debtor been a party in any judicial or administrative proceeding under any environmental law? Include settlements and orders.

☒ No
☐ Yes. Provide details below.

Case title Case number	Court or agency name and address	Nature of the case	Status of case
	Name Street City State ZIP Code		☐ Pending ☐ On appeal ☐ Concluded

23. Has any governmental unit otherwise notified the debtor that the debtor may be liable or potentially liable under or in violation of an environmental law?

☒ No
☐ Yes. Provide details below.

Site name and address	Governmental unit name and address	Environmental law, if known	Date of notice
Name Street City State ZIP Code	Name Street City State ZIP Code		

Debtor Murray Energy Corporation (Name) Case number (if known) 19-57017 (JEH)

24. **Has the debtor notified any governmental unit of any release of hazardous material?**

☒ No

☐ Yes. Provide details below.

Site name and address	Governmental unit name and address	Environmental law, if known	Date of notice
Name Street City State ZIP Code	Name Street City State ZIP Code		

Part 13: Details About the Debtor's Business or Connections to Any Business

25. **Other businesses in which the debtor has or has had an interest**

List any business for which the debtor was an owner, partner, member, or otherwise a person in control within 6 years before filing this case. Include this information even if already listed in the Schedules.

☐ None

	Business name and address	Describe the nature of the business	Employer Identification number Do not include Social Security number or ITIN.
25.1.	See Attached Rider Name Street City State ZIP Code		EIN: __ __ – __ __ __ __ __ __ __ Dates business existed From _____ To _____
25.2.	Name Street City State ZIP Code		EIN: __ __ – __ __ __ __ __ __ __ Dates business existed From _____ To _____
25.3.	Name Street City State ZIP Code		EIN: __ __ – __ __ __ __ __ __ __ Dates business existed From _____ To _____

Debtor Murray Energy Corporation (Name) Case number (if known) 19-57017 (JEH)

26. Books, records, and financial statements

26a. List all accountants and bookkeepers who maintained the debtor's books and records within 2 years before filing this case.

☐ None

	Name and address	Dates of service
26a.1.	See Attached Rider	From _____ To _____
26a.2.	Name Street City State ZIP Code	From _____ To _____

26b. List all firms or individuals who have audited, compiled, or reviewed debtor's books of account and records or prepared a financial statement within 2 years before filing this case.

☐ None

	Name and address	Dates of service
26b.1.	ERNST & YOUNG LLP 950 MAIN AVENUE SUITE 1800 CLEVELAND, OH 44113	From 12/31/2008 To Present
26b.2.	Name Street City State ZIP Code	From _____ To _____

26c. List all firms or individuals who were in possession of the debtor's books of account and records when this case is filed.

☐ None

	Name and address	If any books of account and records are unavailable, explain why
26c.1.	See Attached Rider	

Debtor Murray Energy Corporation Case number (if known) 19-57017 (JEH)

	Name and address	If any books of account and records are unavailable, explain why
26c.2.	Name Street City State ZIP Code	

26d. List all financial institutions, creditors, and other parties, including mercantile and trade agencies, to whom the debtor issued a financial statement within 2 years before filing this case.

☐ None

	Name and address
26d.1.	See Attached Rider

	Name and address
26d.2.	Name Street City State ZIP Code

27. **Inventories**

Have any inventories of the debtor's property been taken within 2 years before filing this case?

☒ No

☐ Yes. Give the details about the two most recent inventories.

Name of the person who supervised the taking of the inventory	Date of inventory	The dollar amount and basis (cost, market, or other basis) of each inventory
		$

	Name and address of the person who has possession of inventory records
27.1	Name Street City State ZIP Code

Debtor Murray Energy Corporation (Name) Case number (if known) 19-57017 (JEH)

Name of the person who supervised the taking of the inventory	Date of inventory	The dollar amount and basis (cost, market, or other basis) of each inventory
		$

Name and address of the person who has possession of inventory records

27.2. Name
Street
City State ZIP Code

28. **List the debtor's officers, directors, managing members, general partners, members in control, controlling shareholders, or other people in control of the debtor at the time of the filing of this case.**

Name	Address	Position and nature of any interest	% of interest, if any
See Attached Rider			

29. **Within 1 year before the filing of this case, did the debtor have officers, directors, managing members, general partners, members in control of the debtor, or shareholders in control of the debtor who no longer hold these positions?**

☐ No
☒ Yes. Identify below.

Name	Address	Position and nature of any interest	Period during which position or interest was held
See Attached Rider			From ____ To ____
			From ____ To ____
			From ____ To ____
			From ____ To ____

30. **Payments, distributions, or withdrawals credited or given to insiders**

Within 1 year before filing this case, did the debtor provide an insider with value in any form, including salary, other compensation, draws, bonuses, loans, credits on loans, stock redemptions, and options exercised?

☐ No
☒ Yes. Identify below.

Name and address of recipient	Amount of money or description and value of property	Dates	Reason for providing the value
30.1. See Attached Rider (Name) Street City State ZIP Code Relationship to debtor			

Debtor Murray Energy Corporation (Name) Case number (if known) 19-57017 (JEH)

	Name and address of recipient			
30.2	Name Street City State ZIP Code Relationship to debtor			

31. **Within 6 years before filing this case, has the debtor been a member of any consolidated group for tax purposes?**

☒ No

☐ Yes. Identify below.

Name of the parent corporation	Employer Identification number of the parent corporation
	EIN: __ __ - __ __ __ __ __ __ __

32. **Within 6 years before filing this case, has the debtor as an employer been responsible for contributing to a pension fund?**

☒ No

☐ Yes. Identify below.

Name of the pension fund	Employer Identification number of the pension fund
	EIN: __ __ - __ __ __ __ __ __ __

Part 14: Signature and Declaration

WARNING – Bankruptcy fraud is a serious crime. Making a false statement, concealing property, or obtaining money or property by fraud in connection with a bankruptcy case can result in fines up to $500,000 or imprisonment for up to 20 years, or both. 18 U.S.C. §§ 152, 1341, 1519, and 3571.

I have examined the information in this *Statement of Financial Affairs* and any attachments and have a reasonable belief that the information is true and correct.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on 12/13/2019 (MM / DD / YYYY)
