COMPREHENSIVE SITE INVESTIGATION REPORT AND REMEDIATION OBJECTIVES REPORT

ARNOLD MAGNETIC TECHNOLOGIES

300 NORTH WEST STREET
MARENGO, ILLINOIS 60152

LPC# 1110650003

Prepared For:

300 West, LLC
9450 West Bryn Mawr Avenue
Suite 750
Rosemont, Illinois 60018

PREPARED BY

Weaver Consultants Group

EXECUTIVE SUMMARY

On behalf of 300 West, LLC, the Remediation Applicant (RA), **Weaver Consultants Group North Central, LLC** (WCG) is submitting this Comprehensive Site Investigation/Remediation Objectives Report (CSI-ROR) pursuant to the Third Agreed Preliminary Injunction Order filed on December 14, 2015, in McHenry County Circuit Court. The CSI-ROR was also completed pursuant to the requirements of 35 Illinois Administrative Code (IAC) 740.425 and 740.445 for the property located at 300 North West Street, Marengo, Illinois (the Remediation Site). It is the intention of the RA to secure a Comprehensive No Further Remediation (NFR) Letter from the Illinois Environmental Protection Agency (IEPA) Site Remediation Program (SRP) demonstrating the Site is compliant with remediation objectives under the industrial/commercial land use scenario. The DRM-2 Form for document review has been provided with this report.

The Remediation Site is generally located in a commercial, industrial, residential, and agricultural area in Marengo, Illinois and is comprised of as many as 19 individual parcels situated on approximately 92.5 acres of land. The Remediation Site is situated at the northwest side of the City of Marengo at an elevation of approximately 830 feet mean sea level (msl). The land surface in this area generally slopes from east to west and southeast to northwest.

The Remediation Site is generally bounded by the Union Pacific (UP) railroad followed by Railroad Street to the north, US Highway 20 (also known as West Grant Highway) to the south, Ritz Road to the west, and North West Street to the east. To the north and west of the Remediation Site is a Commonwealth Edison (ComEd) electrical substation. A ComEd utility easement is located along the north side of the northwestern portion of the Site. A McHenry County Conservation District (MCCD) easement is located on the north side of the northeastern portion of the Site and on the north and south sides of the UP Railroad. Multiple single-family residences, row-crop farmland, farming operation buildings, a transportation facility, and a grain storage facility are located to the north of the Site on the north side of Railroad Street. Multiple single family residences are situated to the east and southeast of the Remediation Site. Multiple commercial properties, including a bank, an auto repair facility, an auto sales facility, a liquor store, a former tool/equipment rental and sales facility, and a hotel are located to the south of the Remediation Site. Row-crop farmland is located to the west of the Remediation Site. For purposes of this CSI-ROR, the "Remediation Site", also referenced herein as the "Site", consists of the Site as depicted on **Figures 1** and **2**.

The Site is currently owned by 300 West, LLC and occupied by the Arnold Magnetic Technologies Company (Arnold), which has been in existence since the early 1900s. It is our understanding that the Site was originally developed in the late 1890s and was first utilized as a rail yard and railroad engine manufacturing/maintenance facility. The Site was reportedly purchased by Arnold in the early 1900s, with their magnetic operations/manufacturing beginning in the 1950s and continuing to the present. It is our understanding that Arnold historically used chlorinated solvents in the manufacturing process. According to representatives of Arnold, chlorinated solvents have not been used on the Site since at least 2001.

The Site is generally comprised of multiple office, storage and manufacturing buildings; remnants of former building floors and foundations; four wastewater treatment ponds (Ponds 1 through 4); a private water supply well; various asphalt-paved parking and driveway areas; a former grass-covered airplane landing strip; a tract of row-crop farmland, undeveloped wooded areas, and a naturally vegetated wetland/depressional area on the southwest portion of the Site, which is commonly referred to as a percolation field in historical documents. A man-made overspill ditch also transects the southern portion of the Site and extends from the four wastewater treatment ponds to a settling pond (Pond 5). Pond 5 is located on the west-central portion of the Site and generally receives stormwater runoff from the Site, as well as effluent from Pond 4, which receives treated wastewater from Ponds 1 through 3 prior to draining into the overspill ditch (**Figure 2 – Site Layout Map**). According to representatives of Arnold, Pond 5 is not a treatment pond, but rather primarily a pond used to capture site stormwater runoff. It is our understanding that Pond 4 effluent and stormwater that cannot be contained within Pond 5 overspills the southern and eastern banks of Pond 5 and flows over the surface into the southern adjoining percolation field.

The on-site features specifically include combined manufacturing Building 2/3/4/7 (vacant manufacturing building), Building 8 (pump house), Building 10 (former drum cleaning area), former manufacturing Buildings 1 and 6 (demolished), additional manufacturing and support buildings (Building 11/14, Building 5, and Building 12), asphalt/concrete pavements, four wastewater treatment ponds (Ponds 1 through 4), a waste water treatment plant building located north of Pond 4, fire system pump house located west of Pond 1, and a former Pond 6 located in the northwestern corner of the Site. According to representatives of Arnold, former Pond 6 consisted of a holding pond that served to capture site stormwater runoff, which was subsequently filled in with soil.

Based on our review of select historical environmental documents prepared by Environmental Group Services Limited (EGSL), EGSL has performed multiple soil and groundwater

investigations dating back to 2006 in an attempt to assess contaminants of concern present on the Site. Since 2006, EGSL has advanced a total of 125 soil borings throughout the Site. In addition, 46 groundwater monitoring wells were installed in stages on and offsite and sampled for chlorinated solvents. In addition, certain soil and groundwater investigations performed by EGSL during this time included soil and groundwater analyses for Target Compound List (TCL) parameters. The depths of the wells varied from 20 feet below ground surface (bgs) to 90 feet bgs based on the identification of contaminants of concern in surrounding wells.

The results of EGSL's investigations indicated that two areas (i.e., former Building 1 and Building 2/3/4/7) exhibited soil with exceedances of soil remediation objectives (SROs) for chlorinated solvents. The vertical extent of the impacted soil in these areas was not determined as part of EGSL's investigations. Additionally, EGSL's investigation revealed that a majority of the Site groundwater has been impacted by chlorinated solvents. A total of 24 of the 41 onsite groundwater monitoring wells contained chlorinated solvents above the IEPA Class I groundwater remediation objectives (GROs). EGSL noted that many of the wells without exceedances were wells installed deeper and adjacent to wells with exceedances. EGSL also indicated that chlorinated solvent-impacted groundwater exceeding the GROs for Class I groundwater appeared to extend across the northern portion of the Site with the exception of the eastern property boundary. EGSL stated that several source areas are likely and include former Building 1, Building 2/3/4/7, the settling ponds, former Building 6 and/or buildings/structures located on the southern section of the Site. Specifically, a Focused Site Investigation Report (FSI Report) prepared by EGSL and dated November 18, 2013 noted that tetrachloroethene (syn. perchloroethene or PCE), 1,1-dichloroethene (1,1-DCE), 1,1,1-trichloroethane (1,1,1-TCA), trichloroethene (TCE), 1,1,2 Trichloroethane (1,1,2 TCA), 1,2-dichloroethene (1,2 DCE), carbon tetrachloride, chloroform, bromodichloromethane, and bromomethane have been detected across the northern portions of the Site at concentrations above the GROs.

As indicated above, the extent of several of the contaminants of concern in the groundwater were not characterized during EGSL's FSI activities. In light of this, EGSL subsequently prepared a Proposed Site Investigation Work Plan dated December 24, 2014 (Work Plan). The Work Plan proposed additional subsurface soil and groundwater investigation activities based on the presence of impacted soil and groundwater previously detected at the Site in order to further characterize the nature and extent of soil and groundwater impacts both on-site and off-site. The EGSL Work Plan was subsequently approved by the IEPA in a comment letter to the RA dated December 31, 2014. The IEPA's approval of the Work Plan was contingent on responses to comments and questions contained in the December 31, 2014 IEPA Letter, which were provided in a response letter prepared by EGSL and dated January 6, 2015.

In February 2015, WCG was subsequently retained by the RA to implement the EGSL Site investigation Work Plan consisting of soil and groundwater investigations on the Site and on certain off-site properties. Site investigation activities were conducted by WCG during the periods of February through May 2015 and August through December 2015, as well as additional activities performed by the RA in January/February 2016. In addition, certain supplemental on-site soil investigation activities and off-site supplemental groundwater investigation activities were completed by Cabeno Environmental Services (Cabeno) in October 2015 and January 2016, respectively.

The 2015/2016 field activities generally included soil and groundwater sample collection and analysis and drinking water sampling and analysis. The initial soil and groundwater activities were based upon on the EGSL Work Plan. Pursuant to the direction of the RA, WCG implemented the field activities in multiple phases. WCG initially commenced with the off-site field activities followed by the on-site field activities. Specifically, WCG first implemented the off-site soil and groundwater assessment activities as summarized in the EGSL Work Plan and subsequent EGSL correspondences to the IEPA. The initial off-site soil and groundwater assessment field activities (e.g., soil drilling, soil sampling, monitoring well installation and development, and groundwater sampling) were completed from February 26, 2015 through April 1, 2015.

After installing the off-site monitoring wells, WCG implemented the on-site groundwater assessment activities pursuant to the Work Plan and the subsequent EGSL correspondences with the IEPA. The on-site groundwater assessment initially consisted of the installation of 24 monitoring wells and the laboratory analyses of groundwater collected from six previously installed groundwater monitoring wells. The on-site groundwater assessment field activities (e.g., monitoring well installation and development, and groundwater sampling) were completed from March 16, 2015 through April 8, 2015.

During the on-site groundwater assessment activities, WCG implemented portions of the on-site soil assessment activities, which consisted of the completion of 79 soil probes. The on-site soil assessment field activities (e.g., soil drilling and soil sampling) were completed from March 16, 2015 through May 27, 2015.

Based on results of the laboratory analyses from the initial off-site and on-site soil and ground water assessment activities, WCG proposed a supplemental off-site groundwater assessment and a supplemental on-site soil and groundwater assessment. The proposed supplemental off-site groundwater assessment was summarized in our *Revised Summary of Proposed Supplemental Off-Site Investigation* dated May 8, 2015, which was approved by the IEPA in a letter dated May 18, 2015. A WCG *Proposed Supplemental Off-Site Investigation Response to*

Comments letter dated June 10, 2015 provided comments to the May 18, 2015 IEPA letter concerning the proposed supplemental off-site investigation, which was subsequently approved by the IEPA on June 11, 2015. Based on the initial findings of the on-site soil and groundwater assessment activities, a *Proposed Revised Supplemental Off-Site Groundwater Investigation* dated July 31, 2015 was submitted to the IEPA and subsequently approved on August 14, 2015. A WCG Proposed *Revised Supplemental Off-Site Investigation Response to Comments* letter dated September 14, 2015 provided comments to the August 14, 2015 IEPA letter concerning the proposed revised supplemental off-site investigation.

The proposed supplemental on-site groundwater assessment was summarized in our *On-Site Groundwater Assessment Summary* dated May 11, 2015 and approved by the IEPA on May 22, 2015. A WCG *On-Site Groundwater Assessment Summary Response to Comments* letter dated June 10, 2015 provided comments to the May 22, 2015 IEPA letter concerning the proposed supplemental on-site groundwater investigation, which was subsequently approved by the IEPA on July 2, 2015. A *Supplemental On-Site Groundwater Assessment Summary* provides additional proposed on-site groundwater assessment activities, which was subsequently approved by the IEPA on October 29, 2015.

The proposed supplemental on-site soil assessment was summarized in our *On-Site Soil Assessment Summary* dated June 30, 2015 and approved by the IEPA on July 27, 2015 with a request for additional information. A WCG *On-Site Soil Assessment Summary Response to Comments* letter dated August 19, 2015 provided comments to the July 27, 2015 IEPA letter and proposed additional supplemental on-site soil investigation activities, which was subsequently approved by the IEPA on September 2, 2015.

The off-site supplemental groundwater investigation included the installation of eleven (11) additional groundwater monitoring wells at varying depths in select locations off-site to further assess the nature and extent of identified groundwater impacts. The supplemental off-site groundwater assessment activities were implemented in September and October 2015. Due to property access authorization issues onto the property owned by the MCCD, portions of the off-site supplemental groundwater investigation were implemented in November and December 2015 with the groundwater sampling of the monitoring wells on the MCCD property occurring in January 2016.

The proposed on-site supplemental groundwater assessment activities included the re-sampling and laboratory analyses of at least three monitoring wells that were installed in March 2015 and exhibited insufficient volume of groundwater for sampling at the time of installation. The on-site supplemental groundwater assessment activities also included the collection and laboratory analyses of groundwater collected from thirteen (13) previously installed monitoring

wells along the northern portion of the Site. The supplemental on-site groundwater assessment activities were implemented in May, June, and September 2015.

The proposed on-site supplemental soil assessment activities included the completion of a total of 49 soil probes. Of the 49 soil probes, 11 soil probes were completed to deeper sample intervals at soil probe locations that were previously completed in May 2015 in order to evaluate the vertical extent of identified impacts. Additionally, the on-site supplemental soil assessment activities included the completion of thirty-eight (38) soil probes that were completed, sampled and logged by Cabeno in select locations to further evaluate the extent of identified soil impacts. Of the 38 soil probes, the RA directed that 12 soil probes be completed along the northern site boundary north of Building 2/3/4/7 to depths of 65 feet with continuous sampling in 5-foot intervals to further characterize the site geology. The supplemental on-site soil assessment activities were implemented in October 2015.

During the periods of February 2015 through May 2015 and August 2015 through December 2015, a total of 145 soil probes were completed with the collection and laboratory analyses of 391 soil samples in support of characterizing subsurface environmental conditions. The on-site and off-site groundwater assessment activities included the installation of 53 permanent monitoring wells and the collection of 89 groundwater samples during the periods of February through May 2015, August through December 2015, and January 2016. The October 2015 soil sampling activities, along with the January 2016 groundwater sampling activities were performed by Cabeno. In addition, a total of 54 off-site private water supply well samples were collected by WCG for the second, third and fourth quarters of 2015. EGSL collected a total of 19 off-site private water supply well samples during the first quarter 2015 (i.e., January 2015).

Soil and groundwater samples were submitted for laboratory analysis of certain Target Compound List (TCL) parameters as presented in 35 IAC 740 Appendix A, Table A-D, which are the Contaminants of Concern (COCs) for this Site. Laboratory analytical results were compared to TACO Tier 1 SROs for Industrial/Commercial Properties for soil samples collected from the Site, for SROs for Residential Properties for soil samples collected from off-site locations, and TACO Tier 1 GROs for Class I Groundwater, described further in **Section 2.0** of this report. The results were consistent with the findings of the historical EGSL site investigation activities. Soil and groundwater conditions have been identified with COC impacts exceeding applicable SROs for the Soil Ingestion Exposure Route (Commercial/Industrial Properties, and Construction Worker scenario), Soil Inhalation Exposure Route (Commercial/Industrial Properties and Construction Worker scenario), and the Soil Component of the Class I Groundwater Ingestion Exposure Route, and the Tier 1 GROs for the Groundwater Ingestion Exposure Route for Class I Groundwater.

As presented above, the Site has undergone multiple investigations for purposes of characterizing the nature and extent of the COCs in accordance with the Comprehensive Site Investigation requirements set forth within 35 IAC 740.425. Based on our review, certain chlorinated volatile organic compounds (VOCs) have impacted the soil beneath Building 2/3/4/7, former Building 1, and Building 5 above the Tier 1 Soil Component of the Class I Groundwater Ingestion Exposure Route. Analytical data suggests that certain chlorinated VOCs may have migrated offsite to the north of Building 2/3/4/7. Additionally, the vertical extent of impacts beneath Building 2/3/4/7 has not been fully determined.

Similar chlorinated VOCs were also noted in groundwater on the Site and on off-site properties. Chlorinated VOCs in the Site groundwater occur at the highest concentrations in the areas of Ponds 1, 2, 3, and 4, Former Building 1, and Building 2/3/4/7. Groundwater flow beneath the Site is mainly northwesterly towards the Kishwaukee River, and the VOCs appear to be migrating northwesterly with groundwater flow. The primary products used in processes like those historically performed at the Site include PCE, TCE, and carbon tetrachloride and are, therefore, regarded as original or parent compounds. Less chlorinated compounds such as 1,1-DCE, vinyl chloride, 1,2-DCA, and chloroform, are typically daughter products of abiotic and biotic degradation processes. With respect for 1,1,1-TCA, the abiotic dechlorination is to 1,1-DCE. Anaerobic biodegradation to 1,1-DCA is also indicated.

Given the observed presence of parent and degradation products, natural attenuation by degradation appears to be occurring. The distribution of the VOCs in the Site and off-site aquifer provide additional evidence of degradation in that the parent compounds appear to have migrated the shortest distance, and the degradation products appear to have migrated further, with their distance corresponding approximately to their position on the degradation chain. Since 1,4-dioxane is typically a stabilizer for 1,1,1-TCA during storage and transportation, and so is expected to originate with it. Unlike 1,1,1-TCA, 1,4-dioxane is miscible in water and tends to migrate with flowing groundwater at a greater velocity. Analytical data and the figures support this, illustrating shallow zone migration as far as Ritz Road and intermediate and deep migration considerably farther to downgradient monitoring wells MW-98, MW-99, and MW126 located on the MCCD property. The vertical extent of 1,4-dioxante was not fully determined offsite on the MCCD property due to a silty clay and hard clay confining layer encountered at depths of 54 to 64 feet bgs. In light of the chlorinated VOC results, it appears the vertical extent of certain chlorinate VOCs have not been fully determined onsite or offsite.

In addition, soil was identified with certain metals that exceed the Tier 1 Soil Component of the Groundwater Ingestion Exposure Route beneath former Building 1, Building 2/3/4/7, Building 5, former Building 6, Building 16, and in a widely distributed area offsite. The vertical extent of

these metals is generally defined at varying depths of 1 to 14 feet bgs on the Site and at varying depths of 1 to 8 feet bgs offsite. Generally, the detected metals that exceed the Tier 1 Soil Component of the Groundwater Ingestion Exposure Route on the Site and offsite were not observed in the groundwater on the Site or offsite, with the exception of dissolved manganese and lead, which either do not migrate offsite or are believed to be naturally occurring.

Soil was also identified with certain semi-volatile organic compounds (SVOCs) and polynuclear aromatic hydrocarbons (PNAs) exceeded the Tier 1 Soil Ingestion Exposure Route for Commercial/Industrial Properties and the Soil Component of the Groundwater Ingestion Exposure Route primarily beneath former Building 1 with a 2,4-Dinitrotoluene concentration isolated to an area beneath Building 5 . The vertical and horizontal extents of certain SVOCs and PNAs are generally defined to depths of approximately three feet bgs and within the aforementioned areas. Generally, the detected SVOCs and PNAs that exceed the Tier 1 Soil Component of the Groundwater Ingestion Exposure Route were not observed in the groundwater on the Site or offsite,

One soil sample exhibited a polychlorinated biphenyl (PCB) concentration that exceeds the Tier 1 Soil Ingestion Exposure Route for Commercial/Industrial Properties east of Building 11/14. This impact appears to be isolated to a depth of 1 to 8 feet bgs and does not extend offsite. Finally, certain total metals exceed the Tier 1 Soil Ingestion and Inhalation Exposure Routes for Commercial/Industrial Properties and/or the Construction Worker Scenario in isolated areas beneath the former Building 1. The vertical extents of certain total metals are generally defined to depths of approximately three feet bgs.

In summary, concentrations of select COCs have been detected at the Site above applicable Tier 1 SROs and GROs. As detailed in this report, the following is proposed to address COC impacts at the Site:

- Concentrations of select PNAs, Aroclor 1248, and arsenic in excess of the Soil Ingestion Exposure Route are proposed to be addressed through the use of hot spot removal remedial action and/or site-specific averaging.
- The concentration of nickel exceeding the Soil Inhalation Exposure Route is proposed to be addressed through site-specific averaging .
- The Groundwater Ingestion Exposure Route (both components) is proposed to be addressed through active remediation to be presented in a future Remedial Action Plan for chlorinated VOCs and 1,4-dioxane. This will also include the installation of a municipal water main to the off-site residences that exhibited impacts to private

water supplies and the potential abandonment of private water supply wells at those locations, as necessary.

- The Soil Component of the Groundwater Ingestion Exposure Route is proposed to be addressed by demonstrating compliance with 35 IAC 742.925 for a Tier 3 Evaluation for concentrations of total aluminum, iron, antimony, arsenic, lead, manganese, nickel, and vanadium, along with benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene. The Tier 3 Evaluation will be completed and presented in a future addendum to this ROR.
- The Groundwater Component of the Groundwater Ingestion Exposure Route was demonstrated to be in compliance with 35 IAC 742.925 for a Tier 3 Evaluation for concentrations of total lead identified in water located south of Pond 3 on the Site.
- The Groundwater Ingestion Exposure Route (both components) will be addressed for the manganese concentrations in soil and groundwater within multiple areas throughout the Site and off-site through a review of regional background groundwater conditions in the area of the Site.
- Groundwater sample data meets Tier 1 GROs for the Indoor Inhalation Exposure Route. Institutional controls will be used in support of relying on the TACO table for the Indoor Inhalation Exposure Route. Use of the table requires that existing or potential buildings have full concrete slab-on-grade or a full concrete basement floor and walls and institutional controls are in place for these requirements.
- COC impacts exceeding Tier 1 SROs for the Soil Inhalation and/or Ingestion Exposure Route for the Construction Worker Scenario will be addressed through construction worker safety provisions.

The Comprehensive SI Report, **Section 2.0**, identifies the recognized environmental conditions (RECs) and COCs at the Site, summarizes the site investigation activities, and characterizes the horizontal and vertical extent of observed impacts. The RO Report, **Section 3.0**, describes the evaluation completed to establish the appropriate remediation objectives for the COCs. **Section 4.0** provides conclusions and **Section 5.0** includes sources consulted or reviewed in connection with this report. **Section 6.0** includes the Signatures and Certifications of the RA and the Professional Engineer.

1.0 INTRODUCTION

On behalf of 300 West, LLC, the Remediation Applicant (RA), **Weaver Consultants Group North Central, LLC** (WCG) presents the following information required pursuant to the Third Agreed Preliminary Injunction Order filed on December 14, 2015, in McHenry County Circuit Court. The CSI-ROR was also completed pursuant and as required by 35 IAC 740.425 and 740.445[1] for submission of a Comprehensive Site Investigation (CSI)/Remediation Objectives (RO) Report (CSI-ROR). It is the intention of 300 West, LLC, the Remediation Applicant (RA), to secure a Comprehensive No Further Remediation (NFR) Letter from the Illinois Environmental Protection Agency (IEPA) Site Remediation Program (SRP) demonstrating the Site is compliant with remediation objectives under an Industrial/Commercial land use scenario. The required IEPA SRP DRM-2 form has been included with this report.

The Remediation Site is generally located in a commercial, industrial, residential, and agricultural area in Marengo, Illinois and is comprised of as many as 19 individual parcels situated on approximately 92.5 acres of land. The Remediation Site is situated at the northwest side of the City of Marengo at an elevation of approximately 830 feet mean sea level (msl). The land surface in this area generally slopes from east to west and southeast to northwest. The Site is generally bounded by the Union Pacific (UP) railroad followed by Railroad Street to the north, US Highway 20 (also known as West Grant Highway) to the south, Ritz Road to the west, and North West Street to the east. To the north and west of the Remediation Site is a Commonwealth Edison (ComEd) electrical substation. A ComEd utility easement is located along the north side of the northwestern portion of the Site. A McHenry County Conservation District (MCCD) easement is located on the north side of the northeastern portion of the Remediation Site and on the north and south sides of the UP Railroad. Multiple single-family residences, row-crop farmland, farming operation buildings, a transportation facility, and a grain storage facility are located to the north of the Site on the north side of Railroad Street. Multiple single family residences are situated to the east and southeast of the Site. Multiple commercial properties, including a bank, an auto repair facility, an auto sales facility, a liquor store, a former tool/equipment rental and sales facility, and a hotel are located to the south of the Remediation Site. Row-crop farmland is located to the west of the Site. For purposes of this CSI-ROR, the "Remediation Site", also referenced herein as the "Site", consists of the Site as depicted on **Figures 1** through **3**.

[1] Title 35, Illinois Administrative Code (IAC), Part 740 titled Site Remediation Program (SRP)

The Site is currently owned by 300 West, LLC and occupied by the Arnold Magnetic Technologies Company (Arnold), which has been in existence since the early 1900s. It is our understanding that the Site was originally developed in the late 1890s and was first utilized as a rail yard and railroad engine manufacturing/maintenance facility. The Site was reportedly purchased by Arnold in the early 1900s, with their magnetic operations/manufacturing beginning in the 1950s and continuing to the present.

The Site is generally comprised of multiple office, storage and manufacturing buildings; remnants of former building floors and foundations; four wastewater treatment ponds (Ponds 1 through 4); a private water supply well; various asphalt-paved parking and driveway areas; a former grass-covered airplane landing strip; a tract of row-crop farmland, undeveloped wooded areas, a settling pond (Pond 5), and a naturally vegetated wetland/depressional area on the southwest portion of the Site, which is commonly referred to as a percolation field in historical documents. A man-made overspill ditch also transects the southern portion of the Site and extends from the four wastewater treatment ponds to Pond 5. Pond 5 is located on the west-central portion of the Site and generally receives stormwater runoff from the Site, as well as effluent from Pond 4, which receives treated wastewater from Ponds 1 through 3 prior to draining into the overspill ditch (**Figures 2** and **3**). According to representatives of Arnold, Pond 5 is not a treatment pond, but rather primarily a pond used to capture site stormwater runoff. It is our understanding that Pond 4 effluent and stormwater that cannot be contained within Pond 5 overspills the southern and eastern banks of Pond 5 and flows over the surface into the southern adjoining percolation field.

The on-site features specifically include combined manufacturing Building 2/3/4/7 (vacant manufacturing building), Building 8 (pump house), Building 10 (former drum cleaning area), former manufacturing Buildings 1 and 6 (demolished), additional manufacturing and support buildings (Building 11/14, Building 5, and Building 12), asphalt/concrete pavements, four wastewater treatment ponds (Ponds 1 through 4), a waste water treatment plant building located north of Pond 4, fire system pump house located west of Pond 1, and a former Pond 6 located in the northwestern corner of the Site. According to representatives of Arnold, former Pond 6 consisted of a holding pond that served to capture site stormwater runoff, which was subsequently filled in with soil.

Previous environmental site investigations performed by Environmental Group Services Limited (EGSL) have been conducted as summarized in a Focused Site Investigation Report (FSI Report) prepared by EGSL and dated November 18, 2013 (**Appendix A**). In preparation of the FSI

Report, EGSL reviewed numerous documents, including environmental reports prepared by EGSL and others. A summary of EGSL's FSI Report is included in **Section 1.3**.

According to EGSL's FSI Report, a total of 17 underground storage tanks (USTs) have been documented as being present at the Site. EGSL confirmed the presence of six of these USTs and identified three possible excavation areas that may have contained USTs at one time but have since been removed.

EGSL performed several Phase II investigations dating back to 2006 in an attempt to identify and quantify contaminants of concern present on the Site. In 2013, the State of Illinois Attorney General (AG) Injunction modified the investigation approach to include chlorinated solvents that have been identified in on and offsite groundwater.

Since 2006, EGSL advanced a total of 125 soil borings throughout the Site. Soil samples were collected from each of the borings and submitted to a laboratory for quantitative chemical analysis for certain contaminants of concern. In 2013, the sampling and analysis focused on chlorinated solvents identified as being used in the historical manufacturing processes, which were used at the Site prior to at least 2001. In addition, EGSL installed 46 groundwater monitoring wells in stages on and offsite and sampled for chlorinated solvents. Furthermore, certain soil and groundwater investigations performed by EGSL during this period included soil and groundwater analyses for Target Compound List (TCL) parameters. The depths of the wells varied from 20 feet below ground surface (bgs) to 90 feet bgs based on the identification of contaminants of concern (COCs) in surrounding wells.

The results of EGSL's 2013 investigation indicated that two areas (i.e., former Building 1 and Building 2/3/4/7) exhibited chlorinated solvent concentrations in soil that exceeded the TACO[2] Tier 1 soil remediation objectives (SROs). Based on EGSL's 2013 investigations, EGSL noted that the vertical extent of the impacted soil in the areas of former Building 1 and Building 2/3/4/7 was not determined.

The EGSL 2013 investigation revealed that a majority of the on-site groundwater has been impacted by chlorinated solvents. A total of 24 of the 41 onsite groundwater monitoring wells contained chlorinated solvents above the TACO Tier 1 groundwater remediation objectives (GROs) for Class I groundwater. According to EGSL's FSI Report, many of the monitoring wells without exceedances of the GROs consisted of monitoring wells that were installed deeper and adjacent to the monitoring wells with exceedances. EGSL noted that the groundwater at the

[2] Title 35, Illinois Administrative Code, Part 742 titled Tiered Approach to Corrective Action Objectives (TACO)

eastern limits of the Site appeared to be unaffected by the release of chlorinated solvents. EGSL noted that several source areas are likely and include the former Building 1, Building 2/3/4/7, the settling ponds, former Building 6 and/or buildings/structures located on the southern section of the Site, which were not included as part of EGSL's 2013 investigation. Below is a brief summary of the findings of EGSL's 2013 FSI activities.

- PCE[3] was detected in groundwater across the Site at concentrations above the TACO Tier 1 GROs. EGSL noted PCE concentrations at a depth of 20 feet bgs at the northwest corner of the Site to a depth greater than 50 feet north of Building 2/3/4/7 and south of Pond 3, respectively. EGSL noted potential PCE source areas that included Building 2/3/4/7, former Building 6 and the wastewater treatment ponds. EGSL also noted that the vertical extent of PCE impacts was not defined north of Building 2/3/4/7.
- 1,1-DCE[4] was detected across the Site at concentrations that exceed the TACO Tier 1 GROs. EGSL noted 1,1-DCE concentrations at a depth of less than 50 feet at the eastern end of the Site, to a depth greater than 50 feet north of Building 2/3/4/7, and less than 90 feet at the northwest corner of the Site. EGSL indicated that more than one source area may be associated with the presence of 1,1-DCE in groundwater that may include former Building 1, Building 2/3/4/7, the wastewater treatment ponds, and former Building 6. EGSL also noted that the vertical extent of 1,1-DCE impacts was not defined north of Building 2/3/4/7.
- 1,1,1-TCA[5] was detected at concentration that exceed the TACO Tier 1 GROs in several monitoring wells located across the Site associated with former Building 1, Building 2/3/4/7, Pond 3 and former Pond 6. EGSL observed 1,1,1-TCA concentrations at depths of 30 feet to 50 feet bgs (north of Building 2/3/4/7). The vertical extent of 1,1,1-TCA impacts in groundwater was not defined north of Building 2/3/4/7.
- TCE[6] was detected at concentrations that exceed the TACO Tier 1 GRO in several wells across the Site associated with Building 2/3/4/7, Pond 3 and possibly former Building 6. EGSL noted TCE impacts at depths of 30 and 50 feet bgs associated with Building 2/3/4/7, less than 50 feet at Pond 3, and less than 50 feet northeast of former Building 6.

[3] Tetrachloroethene
[4] 1, 1-Dichloroethene
[5] 1, 1, 1-Trichloroethane
[6] Trichloroethene

- 1,1,2-TCA[7] and 1,2-DCE[8] have been reported above the TACO Tier 1 GROs beneath Building 2/3/4/7 at a depth of 30 feet bgs. EGSL noted that the vertical extent of 1,1,2-TCA and 1,2-DCE does not appear to have been defined.
- Carbon Tetrachloride was detected at a concentration slightly above the TACO Tier 1 GRO in one monitoring well at a depth of 30 feet in Building 2/3/4/7. The GRO for carbon tetrachloride is 0.005 mg/L. The laboratory reported a concentration of 0.0066 mg/L[9] from groundwater collected and analyzed from beneath Building 2/3/4/7.
- Chloroform was detected at concentrations above the TACO Tier 1 GROs at locations associated with Building 2/3/4/7, the wastewater treatment pond system and at the southeast corner of former Building 6. EGSL noted chloroform impacts at a depth of 30 feet bgs; however, EGSL indicated that chloroform concentrations may be present at greater depths south of Pond 1 and in Building 2/3/4/7. EGSL noted that the vertical extent of this contaminant does not appear to be defined at these two locations.
- Bromodichloromethane was detected at a concentration that exceeds the TACO Tier 1 GRO at one location south of Pond 4 at a depth of 30 feet bgs. The laboratory reported a bromodichloromethane concentration of 0.0017 mg/L, which is slightly above the GRO of 0.0002mg/L. EGSL noted that the extent of bromodichloromethane was not defined in an area south of Pond 4.
- Bromomethane was detected at concentrations that exceed the TACO Tier 1 GRO at the northwest corner of the Site at the former Pond 6 location. EGSL noted that bromomethane was detected in groundwater at a depth of 50 feet bgs but absent from groundwater collected from a depth of 70 feet bgs. EGSL indicated that the vertical and horizontal extent of bromomethane was defined onsite.

As indicated above, the extent of several of the COCs in the groundwater were not characterized during EGSL's FSI activities. In light of this, EGSL subsequently prepared a Proposed Site Investigation Work Plan dated December 24, 2014 (Work Plan). The Work Plan proposed additional subsurface soil and groundwater investigation activities based on the presence of impacted soil and groundwater previously detected at the Site in order to further characterize the nature and extent of soil and groundwater impacts both on-site and off-site. The EGSL Work Plan was subsequently approved by the IEPA in a comment letter to the RA dated December 31, 2014 (IEPA Work

[7] 1,1,2-Trichloroethane
[8] 1,2-Dichloroethene
[9] Milligrams per Liter

Plan Comment Letter). The IEPA's approval of the Work Plan was contingent on responses to comments and questions contained in the December 31, 2014 IEPA Letter, which were provided in a response letter prepared by EGSL and dated January 6, 2015 (EGSL Work Plan Response Letter). Copies of the aforementioned Work Plan and subsequent correspondences are included in **Appendix B**.

In February 2015, WCG was subsequently retained by the RA to implement the EGSL Site investigation Work Plan consisting of soil and groundwater investigations on the Site and on certain off-site properties. The soil and groundwater investigation activities summarized in this CSI-ROR were conducted to characterize the extent of horizontal and vertical subsurface impacts in accordance with SRP Comprehensive Site Investigation requirements (35 IAC 740.415, 740.420, and 740.425). Soil and groundwater are considered the media of concern for this Site. During the soil and groundwater assessment activities completed in 2015 and January 2016, soil and groundwater samples were initially submitted for laboratory analysis of certain Target Compound List (TCL) parameters as presented in 35 IAC 740, Appendix A, Table A-D, which are the COCs for this Site. Additionally, soil samples were analyzed for TCL Synthetic Precipitation Leaching Procedure (SPLP) Metals (including cyanide) to evaluate for the potential for TCL total metals to leach from the soil into the groundwater.

During the 2015/2016 investigation activities, soil analytical results for soil samples collected from the Site were compared to TACO Tier 1 SROs for Industrial/Commercial Properties and soil analytical results for soil samples collected from offsite were compared to TACO Tier 1 SROs for Residential Properties. The soil results for soil samples collected from the Site and offsite were also compared to TACO Tier 1 SROs for Concentrations of Inorganic and PNA[10] Chemicals in Background Soils within Metropolitan Statistical Areas (MSAs), the TACO Tier 1 SROs for the Construction Worker scenario exposure routes, and the SROs for the Soil Component of the Groundwater Ingestion Exposure Route for Class I Groundwater. Groundwater sample analytical results were compared to TACO Tier 1 GROs for the Class I Groundwater Ingestion Exposure Route and the Indoor Inhalation Exposure Route for Industrial/Commercial Properties.

1.1 REPORT PURPOSE

It is the intention of the RA to secure a Comprehensive NFR Letter for the Site. This Report is being submitted to address the following SRP requirements:

[10] Polynuclear aromatic hydrocarbons.

1. Submission of a Comprehensive Site Investigation Report for a Comprehensive Site Investigation in accordance with 35 IAC Section 740.425.
2. Submission of a Remediation Objectives Report in accordance with 35 IAC Section 740.445.

The Comprehensive Site Investigation Report, **Section 2.0**, identifies the COCs at the Site associated with the identified recognized environmental conditions. The Comprehensive Site Investigation Report summarizes the Site investigation activities, and includes a characterization of the horizontal and vertical extent of observed impacts. The Remediation Objectives Report, **Section 3.0**, describes the evaluation completed to establish the appropriate remediation objectives for the COCs. **Section 4.0** provides Conclusions and **Section 5.0** includes Sources Consulted or Reviewed in support of the development of this report. **Section 6.0** includes the Signatures and Certifications of the RA and Professional Engineer.

1.2 USER RELIANCE

This report has been prepared on behalf of the Remediation Applicant, 300 West, LLC, for submission to the IEPA SRP. The Arnold Engineering Co. and Arnold Magnetic Technologies, LLC may rely on the information contained in this report. No additional parties may use the information contained in this report without obtaining the written permission of WCG and 300 West, LLC. WCG's duties and obligations extend only to 300 West, LLC. WCG's duties and obligations to such parties are not transferable to any person, corporation, or organization without the express written consent of WCG and 300 West, LLC.

1.3 PROJECT BACKGROUND

The following presents a general summary of the available information concerning historical site assessments/investigations from the reports identified below. This summary is intended to provide a general understanding of the timing, scope and findings of the historical documents and site investigation activities as well as providing information from relevant government agencies. Copies of the historical environmental reports and documents have been provided within certain appendices of this CSI-ROR as indicated throughout the report. Due to the volume of certain historical environmental documents, electronic copies of those historical documents are provided on compact disc in the appendices indicated in this report.

The following historical environmental documents were reviewed in support of SRP activities:

1. Focused Site Investigation Report (FSI Report), dated November 18, 2013 and prepared by EGSL (electronic copy provided in **Appendix A**).

2. Focused Site Investigation Report Response to Comments Letter to the IEPA, dated February 20, 2014 and prepared by EGSL (**Appendix C**).
3. A Response to an April 22, 2014 IEPA Comment Letter submitted to the IEPA, dated June 3, 2014 and prepared by EGSL (**Appendix D**).
4. Proposed Site Investigation Work Plan, (Work Plan) dated December 24, 2014 and prepared by EGSL (**Appendix B**).
5. IEPA Comment Letter, Proposed Site Investigation Work Plan, dated December 31, 2014(**Appendix B**).
6. An EGSL Response to a December 31, 2014 IEPA Comment Letter (EGSL Work Plan Response Letter) dated January 6, 2015 (**Appendix B**).

According to the above documents, EGSL was contracted by 300 West, LLC to perform a Focused Site Investigation (FSI) under the IEPA Site Remediation Program (SRP). The purpose of the FSI Report was to compile EGSL's subsurface soil and groundwater investigations as of the date of the FSI Report, and to present areas of concern that contain contaminants above TACO Tier 1 SROs and GROs within the boundaries of the northern half of the Site.

The FSI was performed at the Arnold Magnetic Technologies property located at 300 North West Street in Marengo, Illinois. The FSI was performed pursuant to a Violation Notice issued to the owner and former owner of the property on or about February 28, 2008 with subsequent April 29, 2008 Memorandum, and in compliance with a Verified Complaint for Injunction and Civil Penalties suit filed by the Attorney General of the State of Illinois dated June 14, 2013 and the Agreed Preliminary Injunction Order filed by the Attorney General of the State of Illinois dated August 23, 2013.

According to the FSI Report, the northern portion of the Site was the focus of EGSL's Site Investigation. On-site features incorporated in EGSL's FSI included combined manufacturing Building 2/3/4/7 (vacant manufacturing building), Building 8 (pump house), Building 10 (former drum disposal area), former manufacturing Buildings 1 and 6 (demolished), asphalt/concrete pavement, the waste water treatment plant building (located north of Pond 4), fire system pump house (located west of Pond 1), former Pond 6 (located in the northwestern corner of the Site), and wastewater settling Ponds 1 thru 4.

Additional manufacturing and support buildings (Building 11/14, Building 5, and Building 12), Pond 5 and open vegetated land (including a percolation field) are located onsite on the southern portion of the Site. A stream extending from the settling ponds to Pond 5 transects the southern portion of the Site. These areas were outside the scope of EGSL's investigation.

According to EGSL's FSI Report, a search of the Office of the Illinois State Fire Marshal (OSFM) documents identified 17 underground storage tanks (USTs) currently or formerly located at the Site. The aggregate capacity of the tanks is 60,000 gallons. The contents are identified as unknown (7), cutting oil (2), solvent (2), kerosene (1), gasoline (1) and hazardous substance (4). Six tanks are listed as "abandoned in place." Five tanks are listed as "removed," and six are listed as "exempt from registration." According to historical environmental reports as summarized within EGSL's FSI Report, the contents of the tanks were reported to be mineral oil, acetone, methanol, TCA, kerosene and gasoline. A copy of the OSFM database search result is included in Appendix B of EGSL's FSI Report (**Appendix A**).

During an August 1989 sampling event required in accordance with Arnold's wastewater facility operation permit, a chlorinated solvent was identified in the wastewater influent settling ponds. Based on this finding, the IEPA required the installation of groundwater monitoring wells as a requirement for the renewal of their Water Pollution Control Permit number 1989-EO-3870. Roux Associates supervised the installation of three groundwater monitoring wells in February 1990. The wells were installed along the western third of the property with primary focus on the potential impacts that the wastewater ponds and percolation field were having on the local groundwater.

According to EGSL's FSI Report, certain chlorinated solvents have been identified in the groundwater beneath the Site dating back to before 1999. A Phase I Environmental Site Assessment (ESA) and other Environmental Assessment Reports (EAs) prepared by Environ and dating back to 2004, identified chlorinated solvents, including trichloroethane (TCA), trichloroethylene (TCE), methylene chloride and perchloroethene (PCE), as being used as a degreasing agent for parts washing. The prior environmental reports also identified a total of 16 USTs located or formerly located on the Site. A prior Environ report stated that four of the tanks were removed from the ground, seven were abandoned in place, and one is empty in place. The Environ report indicated that the contents of the tanks were reported to be mineral oil, acetone, methanol, TCA, kerosene and gasoline. Many of the tanks were reportedly installed in the 1950s and 1960s. A majority of the tanks were taken out of service in 1990 with the last tank reportedly taken out of service before 2004. Four additional USTs were identified in an Environ 2008 Phase I ESA report with contents reportedly listed as "hazardous substance" and lube oil and heating oil. The status of these tanks is unknown. Copies of the 2004, 2006, and 2008 Environ environmental reports are included in Appendix C of EGSL's FSI Report (**Appendix A**).

In light of the historical and current presence of multiple USTs on the Site, EGSL performed a Ground Penetrating Radar (GPR) Survey in 2006. EGSL performed the GPR Survey to assess for the presence of 12 possible USTs on the Site. The GPR results indicated the possible presence of four USTs and four possible excavation areas. Specifically, the results of the investigation indicated the presence of disturbed soils consistent with UST excavation activities. EGSL identified nine areas suspected of containing or previously containing USTs. One of the areas, Area 9, is located adjacent to Building 11/14. EGSL identified four USTs suspected of still being in place. Three of the tanks are known to be properly abandoned in place (Areas 3 and 4). One believed improperly abandoned tank is suspected to be present in Area 5. Since 2004, EGSL is aware of two of the tanks being removed from the ground. In 2007, two tanks located in Area 8 were removed, and three other tanks in Areas 3 and 4 were properly abandoned. EGSL was unable to confirm the total number of tanks present and/or removed, their size, their location and/or former contents of the 17 tanks identified by the OSFM. EGSL identified the number, size and former contents of the tanks listed in the GPR report through a review of historical site drawings. A copy of the EGSL GPR report is included in Appendix D of the EGSL FSI Report.

Based on the findings of the EGSL GPR Survey, EGSL conducted a Limited Phase II Subsurface Soil investigation on March 3, 2006. EGSL completed a total of 27 soil borings around the Site. Eighteen of the soil borings were advanced within the boundaries of the FSI. A total of 18 soil samples were collected from the borings and submitted to a laboratory for analysis of the IEPA Target Compound List (TCL). Total Arsenic was detected at a concentration of 450 milligrams per kilogram (mg/Kg) along the northern portion of the Site, between the pump house and Building 2/3/4. Chlorinated solvents were reported above SROs in soil from five boring locations (GP-3, 5, 20, 21 and 22 situated near Pond 5, near the southeast corner of the electrical substation, northeast of Pond 4, south of Building 16, and south of Ponds 1 and 2, respectively). EGSL collected groundwater samples from monitoring wells MW-3, 6 and A7 (previously installed by others) situated northwest, northeast, and north of Building 6, respectively. Chlorinated solvents were reported by the laboratory above the GROs in the groundwater samples collected from the monitoring wells. A copy of the EGSL 2006 Phase II report is included in Appendix E of the EGSL FSI Report (**Appendix A**).

According to EGSL's FSI Report, on November 16, 2007, two, 8,000-gallon USTs (contents unknown) were removed from the immediate vicinity of an area of concern located to the east of Building 2/3/4. Both USTs were reported in poor condition at the time of removal, and olfactory and visual observations indicated that the subsurface soil had been impacted; as such, OSFM personnel determined that the USTs had leaked. The incident was subsequently reported to the Illinois Emergency Management Agency (IEMA) and the IEPA Leaking

Underground Storage Tank (LUST) section. LUST Incident number 20071279 was assigned to the Site.

On April 24, 2008, EGSL advanced nine additional soil borings (SP-1 through SP-9) in the area of the two, 8,000-gallon USTs. A total of 13 soil samples were submitted to *STAT Analysis Corporation* for analyses of BTEX/PNAs and/or Total Arsenic/TCLP Arsenic. According to the laboratory results, none of the samples exhibited chemicals of concern above the TACO Tier 1 SROs, with the exception of total arsenic that was detected at SP-7 along the northern site boundary east of Building 2/3/4 at a concentration of 14.0 mg/Kg, which is slightly above the TACO Tier 1 RO of 13.0 mg/Kg for the ingestion exposure route. A copy of the EGSL 2008 Phase II report is included in Appendix F of the EGSL FSI Report (**Appendix A**).

Additionally, the EGSL FSI Report indicated that EGSL conducted a Phase I ESA at the Site in 2009. The purpose of the Phase I ESA was to identify recognized environmental conditions associated with the Site. A copy of the EGSL 2009 Phase I ESA report is included in Appendix G of the EGSL FSI Report (**Appendix A**). According to the FSI Report, the 2009 EGSL Phase I ESA noted the following recognized environmental conditions:

- Based on the age of the Subject Buildings, suspect lead based paint and suspect asbestos containing building materials are considered environmental concerns; as such, EGSL recommends performing an Asbestos Survey prior to any type of disturbance to the building materials via renovation or demolition. A Lead Based Paint Survey is recommended prior to renovation within the Subject Buildings. Continue with maintaining the painted surfaces, and avoid sanding, chipping, or scraping any painted surfaces until a Lead Based Paint Survey is conducted.
- The Subject Property has been utilized for major industrial purposes for over 100 years. It has been confirmed that operations, activities, and chemicals associated with the historical manufacturing procedures have negatively impacted the subsurface soil and groundwater.
- The Subject Property is currently enrolled into the IEPA's Site Remediation Program. The Subject Property is currently seeking a Comprehensive No Further Remediation Letter for Residential Properties from the SRP.
- The Subject Property is associated with LUST Incident 20071279. This incident is being addressed within the SRP.

In May 2010, EGSL completed a Phase II Subsurface Investigation at the Site. EGSL's investigation was performed in accordance with the regulations set forth in 35 IAC 740 Site

Remediation Program (SRP) and 35 IAC 742 Tiered Approach to Corrective Action Objectives (TACO) Tier 1, remediation objectives for Industrial/Commercial and Residential properties. A copy of the EGSL 2010 Phase II report is included in Appendix H of the EGSL FSI Report (**Appendix A**).

According to the EGSL FSI Report, the 2010 EGSL Phase II Subsurface Investigation included the completion of a total of 40 soil borings throughout the Site (GP-1 through GP-40). EGSL indicated that soil boring nomenclature had been inadvertently repeated from the 2006 sampling event and that care should be exercised when evaluating data from borings GP-1 through GP-27 throughout the Phase II Subsurface Investigation. The FSI Report indicated that EGSL submitted 49 soil samples for analysis to assess for the presence and concentration of the contaminants of concern in the areas of concern. Additionally, a total of 16 groundwater monitoring wells (MW-1 through MW-16) were installed at the Site. The results of the Phase II Subsurface Investigation identified the presence of chlorinated solvents above TACO Tier 1 SROs in soil at two locations (GP-34 and GP-35) situated in the area of former Building 1. Chlorinated solvents were also reported above TACO Tier 1 GROs in the groundwater collected from eight monitoring wells (i.e., monitoring wells MW-1, 2, 4, 5, 6, 7, 8 and 13) situated along the northern Site boundary in the area of former Building 6 and north of Pond 3.

On October 28-29, 2010, EGSL installed five additional monitoring wells (MW-17, 18, 19, 20, and 21). EGSL installed one deep well (MW-17, screened from 60-70 feet) along the northwestern-most nest of wells to assess the vertical extent of VOC impacts in the northwestern corner of the Site and northwest of former Building 6. The four remaining permanent monitoring wells were installed off-site directly north of Railroad Street to assess the horizontal extent of groundwater impacts along the northwestern portion of the Subject Property. Analytical results indicated that these wells contained contaminants of concern above TACO Tier 1 GROs for Class I Groundwater. A memorandum was issued to *300 West LLC* on December 13, 2010, which is included in Appendix I of the EGSL FSI Report.

As summarized in the EGSL FSI Report, two additional monitoring wells (MW-22 and MW-23) were installed in the monitoring well clusters situated in the northwest corner of the Site and on the north side of Railroad Street on February 23-24, 2011. Monitoring well MW-22 was installed on-site within the northwestern nest of wells and screened from a depth of 80 to 90 feet to assess the vertical extent of groundwater impacts in that area. Monitoring well MW-23 was installed within the off-site nest of wells and screened from a depth of 60 to 70 feet in order to assess the vertical extent of groundwater impacts in that area. Both of the monitoring

wells were sampled on March 31, 2011. Neither of the monitoring wells exhibited contaminants of concern above TACO Tier 1 GROs for Class I Groundwater.

According to the EGSL FSI Report, on March 31, 2011, EGSL accessed the private, potable water supply wells from three residential properties located northwest of the Site. With permission from the homeowners, EGSL sampled each private water supply well and submitted for analysis of VOCs. The addresses of the homes, and approximate depths of the wells, are as follows: 22100 Railroad Street (>60 feet deep), 22104 Railroad Street (~107 feet deep), 22012 Railroad Street (>120 feet deep). Analytical results indicated that no VOCs were detected above laboratory detection limits.

On December 2, 2011, EGSL advanced an additional 11 soil borings (GP-40 through GP-50) at the Site to delineate previous detections of contaminants of concern. EGSL indicated that soil boring GP-40 nomenclature was inadvertently repeated from the May 2010 Phase II Subsurface Investigation event. The purpose of the delineation was to obtain more accurate source widths and depths for future TACO Tier 2 analysis. The laboratory reported that none of the soil samples analyzed for chlorinated solvents exhibited detections above the TACO Tier 1 SROs. EGSL submitted a Site Investigation Report dated March 23, 2012 documenting the activities performed in 2010 and 2011, which is included in Appendix J of the EGSL FSI Report (**Appendix A**).

The EGSL FSI Report indicated that In January 2013, EGSL addressed comments by the IEPA dated November 20, 2012 regarding the fate and transport of on and offsite contaminants of concern related to the Arnold facility. The report provided information on groundwater flow direction and hydraulic gradient, well setback zones, concentrations of contaminants of concern, maps of onsite monitoring wells with contaminants of concern and the sampling of private water supply wells within 1,500 feet of the Site in the direction of groundwater flow. A copy of the report is included in Appendix K of the EGSL FSI Report (**Appendix A**).

According to the FSI Report, the focus of the EGSL's site investigation was modified in 2013 as a result of the litigation filed by the IEPA. Activities performed and analysis requested focused on chlorinated solvents identified in soil and/or groundwater both on and off-site, as Arnold historically used chlorinated solvents in the manufacturing process. According to representatives of Arnold, chlorinated solvents have not been used on the Site since at least 2001.

On May 14, 2013, EGSL collected groundwater from 13 private, residential, water supply wells on properties located northwest of the Site. Analysis of the groundwater revealed the presence of chlorinated solvents present in six of the private water supply wells. Two of the water supply

wells contained concentrations of chlorinated solvents above the IEPA drinking water standards. As a result, the residents in the area affected or potentially affected by the release of chlorinated solvents into the groundwater are being supplied with bottled drinking water.

EGSL's FSI Report indicated that in September and October 2013, EGSL advanced an additional 38 soil borings (GP-100 through GP-132 and GP-201 through GP-205) and installed an additional 23 groundwater monitoring wells (MW-24 through MW-46) at the Site in an attempt to further define and refine the vertical and horizontal extent of contaminants of concern exceeding TACO Tier 1 SROs and GROs. Fifteen of the monitoring wells (MW-24 through MW-37) installed were seated at a depth of 30 feet and the remaining 9 monitoring wells were seated at a depth of 50 feet into the till aquifer to further assess the vertical extent of the migration of the contaminants of concern. EGSL installed the 50-foot deep monitoring wells in locations based on the analytical results of the 30-foot deep monitoring wells. The laboratory reported that soil analyzed from seven of the soil borings (GP-34, GP-35, GP-118, GP-120, GP-121, GP-203 and GP-204) in and east and north of Building 2/3/4/7 contained contaminants of concern exceeding TACO Tier 1 SROs for chlorinated solvents. The laboratory analyses identified 10 monitoring wells (MW-20, MW-24, MW-25, MW-27, MW-28, MW-29, MW-31, MW-32, MW-36 and MW-37) that exhibited groundwater concentrations that exceeded the TACO Tier 1 GROs for Class I Groundwater.

On October 17, 2013, the Attorney General requested that chloroform and bromodichloromethane be added to the list of groundwater contaminants of concern to be analyzed for the private water supply wells. This request was made as a result of the discovery of these two compounds in the settling pond water and groundwater adjacent to the settling ponds on the Site.

According to EGSL, the results of the FSI have identified soil and groundwater contamination associated with chlorinated solvents at the Site. Soil concentrations exceeding the TACO Tier 1 SROs appear to be limited to two source areas; former Building 1 and Building 2/3/4/7. Below are the findings included in EGSL's FSI Report related to the contaminants of concern noted in soil.

- PCE concentrations have been identified in two source areas in soil beneath former Building 1 and Building 2/3/4/7 to depths of at least 20 feet below ground surface (bgs) north of Building 2/3/4/7, and 6 feet below former Building 1.
- 1,1,1-TCA and 1,1-DCE concentrations appear to be associated with former Building 1. However, EGSL stated that they did not have data from soil samples beneath the

identified impacted depths and therefore had not identified the vertical extent of VOC contaminants of concern in these areas.

EGSL's FSI Report also indicated that chlorinated solvent-impacted groundwater exceeding TACO Tier I GROs for Class I groundwater appears to extend across the northern portion of the Site assessed as part of the FSI with the exception of the eastern property boundary. Based on the EGSL FSI Report, the monitoring well depths ranged from 20 feet bgs to 90 feet bgs across the Site. EGSL stated that several source areas are likely and include: former Building 1, Building 2/3/4/7, the settling ponds, former Building 6 and/or buildings/structures located on the southern section of the Site that were outside the scope of their FSI.

Specifically, the EGSL FSI Report noted that PCE, 1,1-DCE, 1,1,1-TCA, TCE, 1,1,2 TCA, 1,2 DCE, carbon tetrachloride, chloroform, bromodichloromethane, and bromomethane have been detected across the northern portions of the Site at concentrations above the TACO Tier 1 GROs. Below are the findings included in EGSL's FSI Report related to each of the aforementioned contaminants of concern noted in groundwater.

- PCE has been reported at a depth of 20 feet bgs at the northwest corner of the Site to greater than 50 feet north of Building 2/3/4/7 and south of Pond 3, respectively. EGSL's FSI Report noted that at a minimum, the possible source areas for PCE include Building 2/3/4/7, former Building 6 and the wastewater treatment ponds. The vertical extent of PCE contamination does not appear to be defined north of Building 2/3/4/7.
- 1,1-DCE has been reported at a depth of less than 50 feet at the eastern end of the Site, at depth of greater than 50 feet north of Building 2/3/4/7, and at a depth less than 90 feet at the northwest corner of the property. EGSL mentions that there is more than one source area associated with this contaminant and at a minimum, could include former Building 1, Building 2/3/4/7, the wastewater treatment ponds, and former Building 6. The vertical extent of 1,1-DCE does not appear to be defined north of Building 2/3/4/7.
- 1,1,1-TCA has been detected above the TACO Tier 1 GROs in several monitoring wells situated across the northern portions of the Site associated with former Building 1, Building 2/3/4/7, Pond 3 and former Pond 6. EGSL indicated that the depths of the contaminant have been reported at 30 feet to 50 feet bgs (north of Building 2/3/4/7). The vertical extent of 1,1,1-TCA does not appear to be defined north of building 2/3/4/7.

- TCE has been detected above the TACO Tier 1 GRO in several monitoring wells across the northern portions of the Site associated with, at a minimum, Building 2/3/4/7, Pond 3, and possibly former Building 6. The FSI Report notes that the depths of the contaminant have been reported at 30 and 50 feet bgs associated with Building 2/3/4/7, less than 50 feet bgs at Pond 3, and less than 50 feet northeast of former Building 6.
- 1,1,2 TCA and 1,2 DCE have been reported above the TACO Tier 1 GRO beneath Building 2/3/4/7 at a depth of 30 feet bgs. EGSL indicates that the vertical extent of 1,1,2-TCA and DCE does not appear to be defined.
- Carbon Tetrachloride was detected slightly above the TACO Tier 1 GRO in one monitoring well at a depth of 30 feet in Building 2/3/4/7. The TACO Tire 1 GRO for carbon tetrachloride is 0.005 mg/L. The laboratory reported a concentration of 0.0066 mg/L for groundwater analyzed at this location.
- Chloroform was detected above the TACO Tier 1 GRO at locations associated with Building 2/3/4/7, the wastewater treatment pond system and at the southeast corner of former Building 6. The FSI Report notes that this contaminant was noted at a depth of 30 feet bgs and may be present at greater depths south of Pond 1 and beneath Building 2/3/4/7. The vertical extent of this contaminant does not appear to be defined at these two locations.
- Bromodichloromethane was detected above the TACO Tier 1 GRO at one location south of Pond 4 at a depth of 30 feet bgs. According to the FSI Report, the laboratory reported the contaminant at a concentration of 0.0017mg/L, slightly above the TACO Tier 1 GRO of 0.0002mg/L. The contaminant does not appear to be defined at this location.
- Bromomethane was detected above the TACO Tier 1 GRO at the northwest corner of the Site at the former Pond 6 location. The laboratory reported the contaminant present in a sample collected from 50 feet bgs but absent from a sample collected from a depth of 70 feet bgs. EGSL indicated that the vertical and horizontal extent of this contaminant has been defined onsite.

According to the EGSL FSI Report, certain VOCs were detected in soil and groundwater as concentrations exceed the TACO Tier 1 SROs and GROs. EGSL indicated that the horizontal and vertical extent was not fully defined during the FSI. In light of this, EGSL proposed to complete additional on-site and off-site soil and groundwater assessments to characterize the nature and extent of soil and groundwater contamination both on-site and off-site as summarized in a

Work Plan dated December 24, 2014 (**Appendix B**). The EGSL Work Plan was subsequently approved by the IEPA in a comment letter to the RA and dated December 31, 2014 (IEPA Work Plan Comment Letter). The IEPA's approval of the Work Plan was contingent on responses to comments and questions contained in the December 31, 2014 IEPA Letter, which were provided in a response letter prepared by EGSL and dated January 6, 2015 (EGSL Work Plan Response Letter).

As summarized in the Work Plan, EGSL subdivided the Site into ten separate areas of concern. The ten subdivisions are described as follows (and identified in **Figures 4** and **5**):

- Area 1: Former Building 6, former Pond 6, and their immediate surrounding vicinity.
- Area 2: Ponds 1, 2, 3, and 4, their associated structures (sewage treatment shed, pond treatment shed), and their immediate surrounding vicinity.
- Area 3: Building 2/3/4/7, Building 10, and their immediate surrounding vicinity.
- Area 4: Former Building 1, Building 8, and their immediate surrounding vicinity.
- Area 5: Building 5, its associated parking lots, and their immediate surrounding vicinity.
- Area 6: Building 12, Building 16, and their immediate surrounding vicinity.
- Area 7: Building 11/14, Pond 5, and their immediate surrounding vicinity.
- Area 8: Percolation Field
- Area 9: Southern undeveloped portion of the Site, former Building 9 (airplane hangar), and the southeastern 20 acres of farmland.
- Area 10: Off-site areas located north of Railroad Street and west of Ritz Road.

As summarized in the Work Plan, EGSL considered all current and historical operational areas of the Arnold Magnetics facility an area of concern for all practical purposes. To delineate previously detected areas of impacted soil and/or groundwater, and to address additional areas of the Site that have not been thoroughly investigated, EGSL proposed to advance an additional 87 soil borings throughout the Site in addition to six soil borings off-site. EGSL also proposed to install an additional 24 on-site and 12 off-site groundwater monitoring wells. EGSL proposed to advance the soil borings to approximate depths of 15 feet bgs. EGSL also proposed to collect two soil samples from each boring for analysis (one from 1-3 feet deep, and one from below 3 feet and/or a noticeably impacted area).

The EGSL Work Plan also proposed installing two nested groundwater monitoring wells at each location. One of the monitoring wells was proposed to be advanced to a depth of 30 feet bgs, and the adjacent monitoring well advanced to a depth of 50 feet bgs. In addition to the above-

referenced subsurface soil and groundwater assessment activities, EGSL proposed to re-sample the groundwater from 11 previously installed wells.

In summary, the Work Plan proposed approximately 186 additional soil samples and 41 additional groundwater samples for laboratory analyses of full Target Compound List (TCL) and SPLP Metals analysis. In addition, EGSL proposed to assess the groundwater flow direction, and hydraulic conductivity and groundwater gradient as part of the proposed soil and groundwater assessment activities. EGSL further proposed to update and compile a summary of the off-site private water supply wells analytical data.

On February 20, 2015, WCG was retained by 300 West, LLC to implement the proposed scope of work as summarized in the Work Plan. The report contained herein documents implementation of the off-site and on-site soil and groundwater assessments pursuant to IEPA SRP Comprehensive Site Investigation requirements (**Section 2.0**). The Remediation Objectives section of the report (**Section 3.0**) describes the evaluation completed to establish the appropriate remediation objectives for the contaminants of concern. The following section provides additional detail with regard to the comprehensive site investigation activities completed at the Site and offsite.

2.0 COMPREHENSIVE SITE INVESTIGATION

2.1 SITE CHARACTERIZATION

2.1.1 SOURCES CONSULTED OR REVIEWED

Sources consulted or reviewed in preparation of this report are included in **Section 6.0**. This section includes select information on historical site assessment and investigation activities as summarized in the above **Section 1.3**.

2.1.2 SITE HISTORICAL USES

WCG reviewed the FSI Report prepared by EGSL (**Appendix A**), which included a summary of the historical uses of the Site. In summary, and in accordance with information presented in the EGSL FSI Report, the Site was originally developed in the late 1890s and was first utilized as a rail yard and railroad engine manufacturing/maintenance facility. The Site was reportedly purchased by Arnold in the early 1900s, with their magnetic operations/manufacturing beginning in the 1950s. It is our understanding that Arnold historically used chlorinated solvents in the manufacturing process. According to representatives of Arnold, chlorinated solvents have not been used on the Site since at least 2001.

According to EGSL, the following buildings are currently, or have been historically, located on the Site (**Figures 2** and **3**):

- Building 1: Built in the late 1890s and demolished around 2002. The building was approximately 40,000 square feet in size and was originally utilized for railroad engine manufacturing and repair. Arnold later utilized Building 1 for magnet production, pressing operations, and heat treating.
- Building 2/3/4/7: The original portion of the building (Building 2) was constructed in the 1950s, with subsequent additions (Buildings 3, 4, and 7) added later. The entire building is approximately 135,000 square feet in size and was formerly utilized for office space, maintenance, shipping, and miscellaneous storage. Building 2/3/4/7 was historically utilized for tape-core, powder-core and winding operations associated with magnetic manufacturing. The manufacturing operations ceased in this building in approximately 2002, and the building is currently unused.
- Building 5: Constructed in the 1950s/1960s, Building 5 is approximately 74,000 square feet in size. Currently and historically, Building 5 has been utilized by Arnold

for their Alnico Products Division, which manufactures magnetic components by molting, melting, and finishing Aluminum, Nickel, and Cobalt.

- Building 6: Constructed in the 1950s/1960s and demolished in the 1990s. Building 6 was approximately 42,000 square feet in size and was historically occupied by the Strontium Ferrite Department, which conducted wet processing, mixed metal sludge pressing, iron powder compressing, and baking/grinding operations associated with motor-arc manufacturing.
- Building 8: Constructed between 1950 and 1970 and is approximately 3,000 square feet in size. Building 8 is utilized for the storage of landscaping and maintenance equipment, and also contains an approximately 850-foot deep water supply well that is utilized for potable water for the Site. Additionally, an associated 100,000-gallon above-ground water holding tank is located directly south of Building 8.
- Building 9: Constructed at an unknown date and demolished in the 1990s, Building 9 was approximately 5,000 square feet in size and was utilized as an airplane hangar associated with an adjacent former private airplane landing strip.
- Building 10: Constructed at an unknown date, Building 10 is approximately 3,000 square feet in size and is currently/has historically been utilized for miscellaneous storage, 55-gallon drum storage, and drum cleaning.
- Building 11/14: The original portion of Building 11 was constructed in the 1950s with a subsequent addition (Building 14) added later. The entire building is approximately 54,000 square feet in size and has been utilized by Arnold's Rolled Products Division since the late 1960s. Operations that currently exist within Building 11/14 involve the rolling and finishing operations associated with the production of thin-gauge rolled steel products.
- Building 12: Constructed by 1970, Building 12 is approximately 14,000 square feet in size. Building 12 is currently and was historically utilized as a parts/storage warehouse.
- Building 16: Constructed after 1987 and is approximately 3,200 square feet in size. Building 16 is currently and was historically utilized as a hazardous and non-hazardous waste/material storage shed.

Other buildings associated with the Site include a security booth located by the main entrance, a pump house associated with the wastewater treatment system and pond system and a pump house associated with the fire suppression system.

2.1.3 SITE DESCRIPTION

2.1.3.1 General Site Features

The Site is generally located in a commercial, industrial, residential, and agricultural area in Marengo, Illinois and is comprised of as many as 19 individual parcels situated on approximately 92.5 acres of land. The Site is situated at the northwest side of the City of Marengo at an elevation of approximately 830 feet mean sea level (msl). The land surface in this area generally slopes from east to west. The Site is generally bounded by the Union Pacific (UP) railroad followed by Railroad Street to the north, US Highway 20 (also known as West Grant Highway) to the south, Ritz Road to the west, and North West Street to the east. The Site is situated within the northwest quarter of Section 35, Township 44 North, Range 5 East of the Third Principal Meridian in McHenry County, Illinois (**Figure 1**).

The Site is improved with multiple industrial buildings as summarized in **Section 2.1.2**. The Site is generally comprised of multiple office, storage and manufacturing buildings; remnants of former building floors and foundations; four wastewater treatment ponds; a private water supply well; various asphalt-paved parking and driveway areas; a former grass-covered airplane landing strip; a tract of row-crop farmland, undeveloped wooded areas, and a naturally vegetated wetland/depressional area on the southwest portion of the Site, which is commonly referred to as a percolation field in historical documents. A man-made overspill ditch also transects the southern portion of the Site and extends from the four wastewater treatment ponds (Ponds 1 through 4) to a settling pond (Pond 5). Pond 5 is located on the west-central portion of the Site and generally receives stormwater runoff from the Site, as well as effluent from Pond 4, which receives treated wastewater from Ponds 1 through 3 prior to draining into the overspill ditch (**Figure 2 – Site Layout Map**). According to representatives of Arnold, Pond 5 is not a treatment pond, but rather primarily a pond used to capture site stormwater runoff. It is our understanding that Pond 4 effluent and stormwater that cannot be contained within Pond 5 overspills the southern and eastern banks of Pond 5 and flows over the surface into the southern adjoining percolation field.

The on-site features specifically include combined manufacturing Building 2/3/4/7 (vacant manufacturing building), Building 8 (pump house), Building 10 (former drum cleaning area), former manufacturing Buildings 1 and 6 (demolished), additional manufacturing and support buildings (Building 11/14, Building 5, and Building 12), asphalt/concrete pavements, four wastewater treatment ponds (Ponds 1 through 4), a waste water treatment plant building located north of Pond 4, fire system pump house located west of Pond 1, and a former Pond 6

located in the northwestern corner of the Site. A private water supply well is located in Building 8, with a 100,000-gallon water tower located to the south of Building 8 (**Figures 2** and **3**).

In addition, as mentioned above, the Site includes a wastewater treatment pond system consisting of four ponds, and a 16-acre diked percolation field is also located at the Site. Ponds 1 through 4 are located along the northwestern portion of the Site and are utilized for overflow associated with sanitary sewage, drain returns, well water, and process wastewater utilized in the manufacturing operations conducted on-site. The sanitary sewer and process water incoming to the ponds is treated within the wastewater treatment system pump house. Treated wastewater from the four ponds is either recycled back to plant operations or discharged via a man-made overspill ditch that extends from the four wastewater treatment ponds to a settling pond (Pond 5), which generally receives stormwater runoff from the Site, as well as treated wastewater effluent from Pond 4, and the 16-acre diked percolation field located at the southwestern portion of the Site. On-site utilities include electricity provided by Commonwealth Edison (ComEd) and natural gas supplied by Nicor Gas. The Site contains an on-site sewage treatment system.

2.1.3.2 Surrounding Land Uses

The Site is generally located within a commercial, industrial, residential, and agricultural area in Marengo, Illinois. The surrounding area generally consists of undeveloped land, a railroad, a public roadway, and agricultural, residential, and commercial land uses to the north. Undeveloped land, and agricultural, residential, and commercial land uses are located to the south of the Site. An electrical substation, and agricultural and commercial land uses are located to the west, and residential land uses are located to the east of the Site. Based upon historical and current development practices at and near the Site, the current land uses are not anticipated to undergo significant change in the future (see **Figure 2 – Site Layout Map**).

The following table includes a summary of the uses of adjoining properties:

CURRENT ADJOINING AND SURROUNDING PROPERTIES			
Site Name/Occupant	**Address**	**Operation/Use**	**Direction from the Site**
ComEd Electrical Substation	Along Ritz Road Marengo, Illinois	Electrical Substation	North and West
ComEd Utility Easement	Along South Side of UP Railroad Tracks Marengo, Illinois	Electrical Utility Easement (Aboveground Electrical Power Lines)	North

CURRENT ADJOINING AND SURROUNDING PROPERTIES			
Site Name/Occupant	**Address**	**Operation/Use**	**Direction from the Site**
McHenry County Conservation District (MCCD)	Along North and South Sides of UP Railroad Tracks Marengo, Illinois	Undeveloped Land	North
UP Railroad Tracks	Along South Side of Railroad Street Marengo, Illinois	Railroad Tracks	North
Single-Family Residence	22012 Railroad Street Marengo, Illinois	Residence	North of Railroad Street
Row-Crop Farmland	Along North Side of Railroad Street Marengo, Illinois	Agricultural	North of Railroad Street
Single-Family Residence and Farm Buildings	21602 Railroad Street Marengo, Illinois	Residence and Agricultural Structure	North of Railroad Street
Stark Services, Inc.	21816 Railroad Street Marengo, Illinois	Commercial (Trucking Company Office, Garage, and Storage Yard)	North of Railroad Street
Single-Family Residences	21820-21822 Railroad Street Marengo, Illinois	Residences	North of Railroad Street
Commercial Building	21618 Railroad Street Marengo, Illinois	Commercial	North of Railroad Street
Farm Service and Supplies, Inc.	21606 Railroad Street Marengo, Illinois	Commercial (Transportation, Trucking, and Warehousing)	North of Railroad Street
The DeLong Company, Inc.	21602 Railroad Street Marengo, Illinois	Commercial/Agricultural (Grain Elevator/Storage)	North of Railroad Street

2.1.3.3 Physiography

A review of the 1988 Garden Prairie, Illinois, 7.5-minute quadrangle, topographic map published by the United States Geological Survey (USGS) (see **Figure 1**) suggests that the Site is at an elevation of approximately 840 feet above mean sea level (msl) on the south-central portion of the Site and at an elevation of approximately 810 feet in the northwestern portion of the Site. According to the USGS topographic map, the Site generally slopes gently to the north, northwest and west. Based on our on-site observations, a steep change in elevation of approximately 10 feet was noted south of Building 5. The remaining areas of the Site were observed to be generally flat. Additionally, the topography of the surrounding areas to the north, northwest and west were observed to be generally flat.

2.1.3.4 Regional Geology/Hydrogeology

The major soil formation at the Site consists of the Pleistocene Wisconsinan Stage glacial till. The till in the Marengo area consists of sands and gravels up to 200 feet thick with a silt/clay cap. The till in this area is the major source of private potable water for residents outside of the city limits. Groundwater elevations in this aquifer are generally 20 to 40 feet below ground surface (bgs). This static water level tends to correspond with static water levels on well driller logs from surrounding private property wells. The logs were viewed on the Illinois State Geologic Survey (ISGS) web-based water well interactive map (http://www.isgs.illinois.edu/?q=ilwater).

Based on WCG's review of certain ISGS documents (Berg et al. 1987 and Curry et al. 1997), the Site lies in the Kishwaukee River lowland, a channel that bisects the Marengo Moraine and is underlain by unconsolidated sediments consisting of glacial outwash plains and terraces of sand and gravel with lenses of clay and silt of the Henry Formation approximately 40 feet thick. The

glacial outwash in this area was deposited along the edge of the Wisconsinan-age Marengo Moraine in discontinuous sheet-like deposits approximately 25,000 to 14,000 years ago.

The Henry Formation in this area overlies the clay loam diamicton of the Tiskilwa Formation which is part of the Wedron Group, with discontinuous beds and lenses of gravel and sand. The diamicton of the Tiskilwa Formation in this area ranges in thickness, but extends from approximately 40 feet bgs to 200 feet bgs.

These sediments overlie Ordovician Age dolomitic bedrock. The bedrock stratigraphy in the vicinity of the Site is composed of a thick sequence of Paleozoic sedimentary rocks that generally consist of carbonate rocks. Published information and ISGS well logs suggest bedrock is encountered at depths approximately 200 feet below ground surface (bgs) in the vicinity of the Site.

The regional near-surface hydrostratigraphic units can be generalized into two aquifers: a shallow aquifer zone in more permeable soil that is present in the glacial outwash, and a deep aquifer in the underlying bedrock aquifers.

The ISGS documents also indicate that the potential for groundwater contamination is high and is classified as “A1” in the Kishwaukee River valley due to the presence of sand and gravel deposits more than 50 feet thick occur at the land surface.

Meyer et al. (2013) group the surficial sand and gravel of the Henry formation into what they designate the Haeger-Beverly Unit. Where saturated, as in valley-fill deposits, this unit forms an aquifer that can provide large yields. The Kishwaukee River lowland is such an instance where the Haeger-Beverly Unit is mapped as up to 120 feet thick. The potentiometric surface of the Haeger-Beverly Unit mapped by Meyer et al. (2013) shows that the Kishwaukee River is a receiving stream and that groundwater flows from the surrounding upland areas towards the river. Insomuch as the Site is located little more than a mile south of the river, the regional hydrogeologic information indicates that groundwater beneath the Site should flow generally northerly towards the river.

2.1.3.5 Site Geology/Hydrogeology

Site soils generally consist of sands, sandy silts and silty clay overlying the major sand and gravel aquifer. The thickness of silt and clay layer is generally approximately 40 feet bgs. The static onsite groundwater depth is approximately 20 feet bgs. The Site obtains potable water from an on-site well seated in the Ordovician sandstone formation approximately 850 bgs.

The following interpretation of the subsurface conditions is based upon 145 soil borings advanced on and off-site as part of the 2015/2016 site investigation activities, as well as ISGS

water supply well logs. Specifically, the water supply well log for the on-site water supply well indicates the on-site water supply well is approximately 846 feet in depth with ISGS API number 121110088900. **Appendix E** contains the soil boring logs for each of the soil borings as well as the monitoring well logs for each of the monitoring wells completed during the 2015/2016 soil and groundwater assessment activities. **Appendix F** contains the ISGS water supply well log for the on-site water supply well as well as **Figure A** that depicts the locations of the ISGS water supply wells in the vicinity of the Site.

Generally, the following stratigraphic units were observed within the subsurface at the Site:

- Unconsolidated soils consisting of alternating layers of till, silt, sand and gravel were encountered from the ground surface to approximately 205 feet bgs. The unconsolidated sediments consist of at least six of the following separate layers encountered over a range of depths:
    - Brown to black sandy soil was encountered from the ground surface to approximately 20 (0 to 20) feet bgs, and 80 to 85 feet bgs;
    - Light brown, calcareous till was encountered from 20 to 35 feet bgs, 45 to 50 feet, 85 to 90 feet bgs, 125 to 145 feet bgs, 180 to 185 feet bgs, and 195 to 205 feet;
    - Light brown, fine to coarse sand with silt and gravel was encountered from 35 to 45 feet bgs, 50 to 80 feet bgs, and 185 to 195 feet bgs;
    - Light grayish brown silt was encountered from 90 to 125 feet bgs, and
    - Dolomitic gravel was encountered from 145 to 180 feet bgs.
- Dolomitic bedrock was encountered from approximately 205 to 520 feet bgs;
- Sandstone bedrock was encountered from approximately 520 to 775 feet bgs;
- Dolomitic bedrock was again encountered at 775 to approximately 846 feet bgs.

The following stratigraphic units were generally observed within the subsurface on the off-site properties situated to the north and northwest of the Site:

- A brown silty to sandy clay with topsoil, gravel and organics was encountered from the ground surface to approximately three (0-3) feet bgs;
- A light gray to brown medium, poorly-sorted sand with gravel was encountered from approximately three (3) to 35 feet bgs;

- A gray fine to medium, well-sorted sand with gravel was encountered from approximately 35 to 75 feet bgs; and
- A brown/tan silty clay and hard clay (a confining layer) was encountered at depths of 54 to 64 feet bgs in the boring completed for monitoring wells MW-98, MW-99, and MW-126 situated on the MCCD property.

Based upon the information collected during the soil investigation activities, saturated sands were generally first encountered between twelve and fifteen (12-15) feet bgs on the off-site properties and generally between 20 and 30 feet bgs on the Site during the WCG site investigation. Based on the consistent depth of the wet zones in the majority of the soil borings both on and off-site, it is believed that these zones are hydraulically interconnected. Therefore, these wet zones represent a continuous water bearing unit. **Figures 4**, **5A** through **5C,** and **6A** and **6B** depict the Site and off-site geologic profiles based on the 2015 soil and groundwater investigations, along with select water supply well logs for water supply wells located on the Site and off-site properties (see **Section 2.1.5**).

Consistent with the regional hydrogeologic information, the site-specific groundwater level elevations measured by WCG during April and October 2015 and by the RA in January/February 2016 indicates that groundwater beneath the Site flows northwesterly towards the Kishwaukee River, in the downstream direction. Off-site to the north of Railroad Street, groundwater level measurements by WCG indicate that groundwater continues to flow northwesterly towards the Kishwaukee River. **Figures 14** through **21** show the estimated potentiometric surface contours from each of the groundwater zones during the aforementioned monitoring events. The on-site flow gradient (*i*) from MW-105 towards MW-3 during April 2015 is estimated at approximately (794.11 feet – 792.33 feet) / 730 feet = 0.0023 feet/foot. Further downgradient in the off-site area, the groundwater flow gradient from MW-3 towards MW-75 is estimated at approximately (792.33 feet – 788.97 feet) / 2,640 feet = 0.0013 feet/foot. A summary of the groundwater depth measurements and elevations are summarized in **Table 21**.

The in-situ hydraulic conductivity (K) of the upper reach of the sand and gravel aquifer was estimated by WCG by slug testing five groundwater monitoring wells representative of on-site conditions (MW-100 and MW-120) and three monitoring wells representative of off-site conditions further downgradient (MW-23, MW-75, and MW-76). The data and results are provided in **Appendix G** and summarized in the following table.

Summary of WCG In-Situ Hydraulic Conductivity Measurements					
Monitoring Well I.D.	**Date of Slug Test**	**Aquifer Model**	**Solution Method**	**Horizontal Hydraulic Conductivity, K_h, (cm/s)[a]**	**Horizontal Hydraulic Conductivity, K_h, (feet/day)**
On-Site Monitoring Wells					
MW-100	10/23/2015	Unconfined	Bouwer-Rice	9.14E-04	3
MW-120	10/23/2015	Unconfined	Bouwer-Rice	3.92E-03	11
ON-SITE GEOMETRIC MEAN:				**1.89E-03**	**5**
Off-Site Monitoring Wells					
MW-23	10/21/2015	Unconfined	Springer-Gelhar	4.80E-02	136
MW-75	10/21/2015	Unconfined	Springer-Gelhar	4.80E-02	136
MW-76	10/21/2015	Unconfined	Springer-Gelhar	4.80E-02	136
OFF-SITE GEOMETRIC MEAN:				**4.80E-02**	**136**

[a] centimeters per second

The results provided above are similar to slug test results obtained by EGSL (January 15, 2013), when in-situ hydraulic conductivity measurements were reported for four on-site monitoring wells (MW-10, MW-13, MW-14, and MW-16) in the narrow range of 4.9×10^{-2} cm/s to 6.0×10^{-2} cm/s. Given that the majority of our tests indicated 4.8×10^{-2} cm/s, WCG considers this value to be representative for a majority of the on-site and off-site downgradient area.

Groundwater flow velocity (*V*), which is the average speed of groundwater travel through the unconsolidated aquifer, is estimated based on a representative values of the effective porosity (*n*) of the sand and gravel aquifer (*n = 0.35*) using Darcy's law expressed as:

$$V = (Ki)/n$$

With consideration for the variability of the on-site versus off-site flow gradients (0.0023 feet/foot vs. 0.0013 feet/foot), a range of flow velocities is estimated as follows:

V = (136 feet/day)(0.0023 feet/foot) / 0.35
V = 0.89 feet/day

V = (136 feet/day)(0.0013 feet/foot) / 0.35
V = 0.51 feet/day

2.1.3.6 Groundwater Classification

Pursuant to 35 Ill. Adm. Code 620.220, the shallow subsurface groundwater in the unconsolidated soils is considered to be Class I Groundwater. This determination was made because the conditions observed at the Site meet the following provisions of Section 620.210 for Class I Potable Resource Groundwater:

a) Groundwater located 10 feet or more below the land surface and within:

1) The minimum setback zone of a well which serves as a potable water supply and to the bottom of such well;

2) Unconsolidated sand, gravel or sand and gravel which is 5 feet or more in thickness and that contains 12 percent or less of fines (i.e. fines which pass through a No. 200 sieve tested according to ASTM Standard Practice D2488-84, incorporated by reference at Section 620.125);

3) Sandstone which is 10 feet or more in thickness, or fractured carbonate which is 15 feet or more in thickness; or

4) Any geologic material which is capable of a:

A) Sustained groundwater yield, from up to a 12 inch borehole, of 150 gallons per day or more from a thickness of 15 feet or less; or

B) Hydraulic conductivity of 1 x 10(-4) cm/sec or greater using one of the following test methods or its equivalent:

i. Permeameter;

ii. Slug test; or

iii. Pump test.

As presented below, the shallow groundwater conditions at the Site are believed to be Class I Groundwater based on the following:

1. As described in **Section 2.1.5**, the Site is located within a minimum or maximum setback zone of a water supply well located within Building 8 on the eastern portion of the Site.
2. Based on the soil probe logs (see **Appendix E**) and the information provided above in **Section 2.1.3.5**, a consistent water bearing unit consisting of sand that is more than five feet in thickness occurs at multiple depths greater than 10 feet bgs. Much of the sand is expected to contain less than 12 percent fines.
3. Bedrock beneath the Site comprised largely of fractured carbonate and sandstone layers between 205 feet bgs and 846 feet bgs were noted in the water supply well log for the

on-site water supply well (see **Appendix F** for water well logs including the on-site well, County No. 00889).

4. Based on the granular characteristic of subsurface soils and WCG's experience with this type of soil, it is likely that the soil at the Site could sustain a groundwater yield from a 12 inch borehole of 150 gallons per day or more from a thickness of 15 feet or less. As discussed in **Section 2.1.3.5**, a representative hydraulic conductivity for the sand and gravel aquifer is within a narrow range of 4.9 x 10^{-2} cm/s to 6.0 x 10^{-2} cm/s based on slug testing.

As a result, subsurface soil and bedrock conditions beneath the Site meet the above criteria for Class I Potable Resource Groundwater and the groundwater classification for the Site is considered to be Class I Groundwater.

2.1.4 *Site Base Map*

Attached as **Figure 3** is the Site Base Map denoting the following information as required by 35 IAC 740.435(b)(2)(C):

1. The sources or potential sources of COCs, spill areas, and other suspected areas for COCs.
2. On-site and off-site injection and withdrawal wells.
3. All buildings, tanks, piles, utilities, paved areas, easements, rights-of-way and other features, including all known past and current product and waste underground tanks or piping.

2.1.5 WATER WELL SEARCH

WCG has contacted each of the below referenced sources to assess the location of wells within a 2,500 foot radius of the Site. WCG also obtained water well information from the Illinois State Geological Survey (ISGS) online database using their "Illinois Water Well (ILWATER) Interactive Map" website, the Illinois State Water Survey (ISWS) online Domestic Wells Database, and the IEPA Source Water Assessment Program (SWAP) online database using their "ArcIMS Online Mapping Tool." Based on the information reviewed using the ISGS, ISWS, and SWAP websites, approximately thirty-two wells were identified within 2,500 feet of the Site (see **Figure A, Appendix F – Water Supply Well Data**). The following includes a summary of well information based on the below listed sources:

- Illinois State Geological Survey (ISGS): Weaver Consultants obtained water supply well information from the ISGS online ILWATER database. According to the online ISGS well

data, there are 33 water wells within a 2,500 foot radius of the Site, as shown on **Figure A** in **Appendix F**. Of the 33 water supply wells, 30 of the wells are listed as private and commercially operated wells ranging in depth from 40 to 1,028 feet bgs.

One of the private water wells identified by ISGS API number 121110088900 is located on the Site. It is approximately 846 feet in depth and is owned by Arnold Engineering Co. Two additional wells identified with API Numbers 121112193400 and 121113916500 are shown on the Site (**Figure A**, **Appendix F**). The well with API Number 121113916500, owned by the Sunset Motel, is actually located within approximately 200 feet south of the Site. The other well has not been observed on Site during field activities conducted by WCG. It is possible that these two wells were plotted incorrectly on the ISGS map.

In addition to the 30 private and commercially operated wells identified by the ILWATER database, three non-community public water wells were also identified within a 2,500 foot radius of the Site. As discussed above, one is owned by the Sunset Motel with API number 121113916500 and is approximately 200 feet south of the Site. The well log does not have a recorded total depth. A second, owned by the Marengo Center with API number 121113916400, is located approximately 100 feet southwest of the Site, and also does not have a recorded total depth. The third, owned by John W. Hellyer with API number 121113953200, is located approximately 1,600 feet west of the Site and is 55 feet in depth. Copies of the information from the ISGS online database, including a map showing the approximate location of the water wells and the well logs are included in **Appendix F**.

- Source Water Assessment Program Database: WCG searched the SWAP database on the IEPA website to obtain further information on water wells within a 2,500 foot radius of the Site. The SWAP database identified the same wells as the ISGS database as well as a minimum setback zone approximately 400 feet in diameter for the well owned by the Sunset Motel with API number 121113916500, approximately 200 feet south of the Site. The SWAP database also identified a 400 foot radius minimum setback zone for the onsite well owned by Arnold Engineering Co (API number 121110088900). In addition, two irrigation wells with API numbers 1211100887 and 1211100888 were identified on the ArcGIS Map (see **Appendix F**). These wells are located to the northwest of the Site, one near the 2,500 foot radius shown on **Figure A** in **Appendix F** and one beyond the radius. The SWAP database also identified a groundwater use restriction ordinance number 00083007 generally located around 536 North State Street, 600 North State

Street, and 602 North State Street that prohibits the installation or use of potable water supply wells with a 2,500 radius that overlaps with the 2,500 foot search radius around the Site. Additional information acquired from the database is provided in **Appendix F**.

- Illinois State Water Survey (ISWS) Domestic Wells Database: WCG also searched the ISWS online Domestic Wells Database for water well information within a 2,500 foot radius of the Site. The Domestic Wells Database identified the same wells as the ISGS and SWAP databases, as well as some shallow domestic wells between 18 and 23 feet deep in Section 34, Township 44N, Range 5E that were drilled in the 1970s. Four additional wells were identified in Section 35 ranging in depth from 33 to 95 feet in depth. The current status of these domestic wells is not listed. A copy of the information collected from the database is provided in **Appendix F**.
- Illinois Department of Public Health (IDPH) Division of Environmental Health: WCG submitted a FOIA request dated March 2, 2016 to the IDPH to obtain any water well information within a 2,500 foot radius of the Site. WCG received the FOIA response from the IDPH on March 7, 2016. The IDPH formally had no responsive documents to provide regarding non-community public water supply wells. A copy of the FOIA request and IDPH response is provided in **Appendix F**.
- McHenry County Department of Health (MCDH): WCG submitted a Freedom of Information Act (FOIA) request dated March 2, 2016 to the MCDH to obtain any water well information within a 2,500 foot radius of the Site. On March 11, 2016, MCDH informed WCG that they do not have the capability to search records within a specific distance from a property. However, MCDH could provide documents associated with the Site as well as recent sampling data for private wells on properties located on Ritz Road and Railroad Street. WCG received the FOIA response on March 16, 2016. A copy of the FOIA request and response is provided in **Appendix F**. The information provided is summarized below.
    - The FOIA information includes reports and analytical data related to the routine testing required by MCDH for the onsite non-community water supply well identified as PWS No. IL3 127209 and owned by Arnold Engineering Co. The routine testing generally includes analysis for E. Coli, total coliform, nitrates, and nitrites. In addition, periodic testing of this well for select VOCs, pesticides and synthetic organic chemicals (SOCs), inorganic chemicals (IOCs), lead, copper, arsenic, trihalomethanes, and haloacetic acids is required by the Illinois Department of Public Health (IDPH). Analytical data provided for December

1993, November 1999, February 2000, June 2000, June 2003, and October 2003 indicates concentrations of constituents analyzed were below laboratory reporting limits or action levels with the exception of a lead exceedance in October 2003.

- Non-Community Public Water Supply On-Site Inspection Summary reports from 1991 through 2015 were also provided with the FOIA information. These reports document bi-annual sanitary surveys/inspections related to the onsite well. No violations were noted in the inspection reports provided. The inspection reports indicate the depth of the onsite well is 300 feet.
- A letter from the City of Marengo to the IEPA dated November 29, 1990 indicates Arnold Engineering was disconnected from the City of Marengo public water supply on November 28, 1990.
- A record review of the Site was conducted by IEPA on February 26, 2008. Based on elevated levels of chlorinated compounds in onsite groundwater that have reportedly been present for approximately 20 years and the presence of private water wells located downgradient of the Site, Violation Notices were issued to Arnold Magnetic Technologies on February 28, 2008 and to 300 West LLC on April 15, 2008.
- The FOIA information includes an email correspondence dated April 9, 2014 from IDPH in response to a citizen's inquiry regarding the potential sources of sodium in private wells. The correspondence indicates the sources of sodium may be water softeners used on the area, road salt, the wastewater ponds at Arnold Engineering, or natural sources. The IDPH believes the private well data suggests that water softeners may be the primary source of sodium. The potential effect of the elevated sodium to someone on a low sodium diet is also discussed in the email.
- There is an email correspondence from the IEPA SRP Project Manager for the Site to MCDH dated November 13, 2013 regarding the sampling of private wells on seventeen properties north of the Site. The chemicals of concern detected in the private wells include primarily chlorinated VOCs, which were detected above MCLs in some of the wells. High levels of sodium detected in some of the private well samples were also noted. The correspondence indicates the Attorney General's Office (AG) is involved with the Site and a complaint has been filed. At

the time, the AGO was involved in discussions with the defendants regarding treatment systems for the impacted residences.

- A letter from IDPH to IEPA dated December 10, 2013 provides background information and an analysis of the private water well samples collected downgradient and cross-gradient from the Site. In samples collected on May 14 and July 8, 2013, four wells had a least one VOC that exceeded an MCL[11]. VOCs that exceeded an MCL in at least one well were 1,1-DCE, TCE, and vinyl chloride. IDPH provided a discussion of the risk associated with these constituents and recommended that water with exceedances of MCLs not be used for drinking or cooking. The letter indicates bottled water was being provided by Arnold Engineering to property owners with impacted wells. IDPH sent letters to the private well owners providing an interpretation of the sampling results.
- A Groundwater Contamination Resolution was adopted by Marengo Township on July 20, 2015.
- Fact Sheet #1 dated June 2013 and Fact Sheet #2 dated August 31, 2015 outlining the history and status of the Site were prepared by the IEPA to provide Site information to interested parties. The Fact Sheets include information regarding the contaminants found at the Site and off-site. Fact Sheet #1 indicates chlorinated solvents and their breakdown products have been detected in groundwater at the Site and in off-site wells. According to Fact Sheet #2, chlorinated solvents and their breakdown products were detected in groundwater associated with the Site. Additionally, 1,4-dioxane, chloroform, MTBE, lead, iron, and manganese were detected in off-site wells.
- An email from MCDH to IEPA indicates that arsenic is naturally occurring in groundwater throughout the County, ranging from 1 part per billion (ppb) to greater than 40 ppb.
- Laboratory analytical results for soil and groundwater sampling conducted by WCG in March and April 2015 are included with the FOIA response. These results are discussed in **Sections 2.5** and **2.6** of this report.
- Groundwater analytical results for private/non-community water well sampling conducted by WCG on November 30, 2015 are included in the FOIA response. In

[11] Maximum Contaminant Level

addition, the FOIA information includes letters prepared by IDPH to the individual property owners summarizing the analytical results. These results are discussed in **Section 2.7** of this report.

- Analytical data for samples collected from two irrigation wells on March 31, 2015 by WCG are provided in the FOIA response. These results are discussed in **Section 2.7** of this report.
- Legal documents including the Second Agreed Preliminary Injunction Order, the First Agreed Modification, and the Second Agreed Modification to the Second Agreed Preliminary Injunction Order are included in the FOIA response documents. These documents generally outline the investigation/remediation work required to be conducted by 300 West LLC and Arnold Engineering Co. and deadlines associated with the work. The requirement for continuing to supply bottled water to impacted residents is also outlined in these documents.

Based on the information presented above, there are three possible non-community public water supply wells and 30 other private and commercial water wells within approximately 2,500 feet of the Site. In addition, there are two irrigation wells located to the northwest of the site, one within the 2500-foot radius and one outside of the radius. One onsite well approximately 846 feet in depth has been identified as a source of water to the Site (refer to **Figure A** in **Appendix F**). The municipality of Marengo also maintains a groundwater ordinance prohibiting the installation and use of potable water supply wells near 536 North State Street, 600 North State Street, and 602 North State Street (Ordinance #00083007) in the vicinity of the Site. The 2,500-foot radius of the groundwater ordinance overlaps with the 2,500-foot search radius of the Site.

The City of Marengo obtains its municipal water supply from three water supply wells located east of Illinois 23 and north of U.S. Highway 20. Based on review of the ArcGIS mapping information included in **Appendix F**, the Site is not located within the minimum or maximum setback zones established for the three municipal water supply wells.

2.1.6 LEGAL DESCRIPTION

As of the date of this report, a site survey, legal description, and Parcel Index Numbers (PINs) have not been provided by the RA. However, according to the on-line McHenry County GIS parcel information, the Site is comprised of 19 parcels, which are listed below.

- 11-34-200-018
- 11-34-200-019
- 11-35-100-019
- 11-35-100-020
- 11-35-100-022
- 11-35-100-023

- 11-35-100-024
- 11-35-100-025
- 11-35-100-026
- 11-35-100-027
- 11-35-100-029
- 11-35-100-030
- 11-35-100-036
- 11-35-100-037

A formal site survey, a legal description and the PINs that comprise the remediation site boundary will be provided as they become available.

2.2 FIELD ACTIVITIES

The following sections describe the site investigation activities conducted by WCG during the periods of February through May 2015 and August through December 2015, as well as additional activities performed by 300 West, LLC in January/February 2016. The 2015/2016 field activities generally included soil and groundwater sample collection and analysis and drinking water sampling and analysis. The initial soil and groundwater sampling locations were based upon the EGSL Work Plan dated December 24, 2014, which was subsequently approved by the IEPA Work Plan Comment Letter dated December 31, 2014. The IEPA's approval of the Work Plan was contingent on responses to comments and questions contained in the December 31, 2014 IEPA Letter, which were provided in the EGSL Work Plan Response Letter dated January 6, 2015 (included as **Appendix B**).

Pursuant to the direction of the RA, WCG implemented the field activities in multiple phases. WCG initially commenced with the off-site field activities followed by the on-site field activities. Photographs documenting our field activities are included in **Appendix H**.

Initially, WCG implemented the off-site soil and groundwater assessment activities as presented in the EGSL Work Plan and the EGSL Work Plan Response Letter. The initial off-site soil and groundwater assessment field activities (e.g., soil drilling, soil sampling, monitoring well installation and development, and groundwater sampling) were completed from February 26, 2015 through April 1, 2015.

After installing the off-site monitoring wells, WCG implemented the on-site groundwater assessment activities pursuant to the Work Plan and the EGSL Work Plan Response Letter. The on-site groundwater assessment initially consisted of the installation of 24 monitoring wells and the laboratory analyses of groundwater collected from the 24 installed monitoring wells and from six previously installed groundwater monitoring wells. The on-site groundwater

assessment field activities (e.g., monitoring well installation and development, and groundwater sampling) were completed from March 16, 2015 through April 8, 2015.

During the on-site groundwater assessment activities, WCG implemented portions of the on-site soil assessment activities, which consisted of the completion of 79 soil probes. The on-site soil assessment field activities (e.g., soil drilling and soil sampling) were completed from March 16, 2015 through May 27, 2015.

Based on laboratory analyses from the off-site and on-site soil and ground water assessment activities, WCG proposed a supplemental off-site groundwater assessment and a supplemental on-site soil and groundwater assessment. The proposed off-site supplemental groundwater assessment activities were summarized in WCG's *Revised Summary of Proposed Supplemental Off-Site Investigation* dated May 8, 2015, which was approved by the IEPA in a letter dated May 18, 2015. A WCG *Proposed Supplemental Off-Site Investigation Response to Comments* letter dated June 10, 2015 provided comments to the May 18, 2015 IEPA letter concerning the proposed supplemental off-site investigation, which was subsequently approved by the IEPA on June 11, 2015. Based on the initial findings of the on-site soil and groundwater assessment activities, a *Proposed Revised Supplemental Off-Site Groundwater Investigation* dated July 31, 2015 was submitted to the IEPA and subsequently approved on August 14, 2015. A WCG Proposed *Revised Supplemental Off-Site Investigation Response to Comments* letter dated September 14, 2015 provided comments to the August 14, 2015 IEPA letter concerning the proposed revised supplemental off-site investigation. For the purpose of this report, the aforementioned WCG documents are collectively referred to as the "Off-Site Supplemental Groundwater Investigation Plan." Copies of the aforementioned WCG and IEPA correspondences are located in **Appendix I**.

The Off-Site Supplemental Groundwater Investigation Plan proposed the installation of at least 15 additional groundwater monitoring wells at varying depths in select locations off-site to further assess the nature and extent of identified groundwater impacts. The supplemental off-site groundwater assessment activities were implemented in September and October 2015. Due to property access authorization issues onto the property owned by the MCCD, portions of the off-site supplemental groundwater investigation were implemented in November and December 2015 with the groundwater sampling of the monitoring wells on the MCCD property occurring in January 2016.

The proposed on-site supplemental groundwater assessment activities were presented in WCG's *On-Site Groundwater Assessment Summary* dated May 11, 2015 (On-Site Groundwater Assessment) and approved by the IEPA on May 22, 2015. A WCG *On-Site Groundwater Assessment Summary Response to Comments* letter dated June 10, 2015 provided comments to

the May 22, 2015 IEPA letter concerning the proposed supplemental on-site groundwater investigation, which was subsequently approved by the IEPA on July 2, 2015. A *Supplemental On-Site Groundwater Assessment Summary* provides additional proposed on-site groundwater assessment activities, which was subsequently approved by the IEPA on October 29, 2015. For the purpose of this report, the aforementioned WCG documents are collectively referred to as the "On-Site Supplemental Groundwater Investigation Plan." Copies of the aforementioned WCG and IEPA correspondences are located in **Appendix J**.

The on-site supplemental groundwater assessment activities included the re-sampling and laboratory analyses of at least three monitoring wells that were installed in March 2015 that had exhibited insufficient volume of groundwater for sampling at the time of installation. The on-site supplemental groundwater assessment activities also included the collection and laboratory analyses of groundwater from 13 previously installed monitoring wells along the northern portion of the Site. The supplemental on-site groundwater assessment activities were implemented in May, June, and September 2015.

The proposed on-site supplemental soil assessment activities were summarized in a sampling plan summarized in WCG's *On-Site Soil Assessment Summary* dated June 30, 2015 and approved by the IEPA on July 27, 2015 with a request for additional information. A WCG *On-Site Soil Assessment Summary Response to Comments* letter dated August 19, 2015 provided comments to the July 27, 2015 IEPA letter and proposed additional supplemental on-site soil investigation activities, which was subsequently approved by the IEPA on September 2, 2015. For the purpose of this report, the aforementioned WCG documents are collectively referred to as the "On-Site Supplemental Soil Investigation Plan." Copies of the aforementioned WCG and IEPA correspondences are located in **Appendix K**.

The on-site supplemental soil assessment activities included the completion of a total of 49 soil probes, which were implemented, sampled and logged by Cabeno Environmental Field Services, LLC (Cabeno) of New Lenox, Illinois. During the supplemental soil assessment activities, 11 of the 49 soil probes were completed to deeper sample intervals at soil probe locations that were previously completed in May 2015 in order to evaluate the vertical extent of identified impacts. Additionally, the on-site supplemental soil assessment activities included the completion of 38 soil probes that were completed in select locations to further evaluate the extent of identified soil impacts. Of the 38 soil probes, 12 soil probes were completed at the direction of the RA along the northern site boundary north of Building 2/3/4/7 to depths of 65 feet with continuous sampling in 5-foot intervals to further characterize the site geology and to assess

the nature and extent of identified soil impacts in this area of the Site. The supplemental on-site soil assessment activities were implemented in October 2015.

In summary, during the periods of February 2015 through May 2015 and August 2015 through December 2015, a total of 145 soil probes were completed with the collection and laboratory analyses of 391 soil samples in support of characterizing subsurface environmental conditions. The on-site and off-site groundwater assessment activities included the installation of 53 permanent monitoring wells and the collection of 89 groundwater samples during the periods of February through May 2015, August through December 2015, and January 2016. The October 2015 soil sampling activities, along with the January 2016 groundwater sampling activities were performed by Cabeno.

In addition, a total of 54 off-site private water supply well samples were collected by WCG for the second, third and fourth quarters of 2015. EGSL collected a total of 19 off-site private water supply well samples (including duplicates) during the first quarter 2015 (i.e., January 2015). The following sections further summarize the soil and groundwater assessment field activities completed off-site and on the Site.

2.2.1 AREAS OF EXPLORATION

WCG conducted site investigation activities for purposes of evaluating current subsurface soil and groundwater conditions at the Site (On-Site) and Off-Site.

As shown on **Figures 7** through **13**, soil probe and monitoring well locations were advanced within the following general areas:

AREAS OF EXPLORATION – ONSITE AND OFFSITE				
SAMPLE ID NUMBER	**DEPTH (Feet bgs)**	**DRILLING METHOD**	**DATE COMPLETED**	**TASKS COMPLETED BY**
ONSITE				
AREA 1				
GP-301 through GP-310	15	Track-Mounted Geoprobe	5/13/2015	Cabeno[a] installed and WCG sampled

[b] Geoprobe Drill Rig equipped with Hollow-Stem Augers
[c] Date monitoring well sampled by WCG.

2.2.2 ON-SITE ACTIVITIES

2.2.2.1 Soil-Probe Sampling Activities

Soil probes were advanced by Cabeno utilizing Geoprobe® drilling rigs (e.g. direct-push technology). Soil probes were advanced by Cabeno using Geoprobe® 6610 and a Geoprobe® 7822 track-mounted drill rigs and a hand cart Geoprobe® sampling system. Prior to drilling activities, Cabeno contacted USIC to locate private and public utilities at the Site and off-site.

A WCG representative was present during soil probing activities to observe and document field conditions and collect the soil samples, with the exception of during the October 2015 supplemental on-site soil assessment activities that were implemented, sampled, and logged by Cabeno. Soil samples were obtained by the direct push of four-foot or five-foot long, two-inch diameter probe rods into the undisturbed subsurface. Soil samples were continuously collected via individual four-foot or five-foot long, two-inch diameter acrylic liners.

The drilling subcontractor, Cabeno, decontaminated the Geoprobe® sampler between soil probe locations. In addition, Cabeno decontaminated the re-usable soil sampling equipment between the collection of each soil sample interval and prior to commencing the drilling of each soil probe. The decontamination process consisted of an initial wash with a Liquinox/water solution, followed by a clean water rinse. Cabeno also utilized a high-pressure power spray washer to decontaminate the hollow-stem auger sampling and drilling equipment after the completion of the hollow-stem auger drilling activities.

Upon retrieval, a split sample was placed into a zip-locked bag for field screening by a RAE Systems™ Mini-Rae 2000 photo-ionization detector (PID) with an 10.7 eV lamp or a Mini-Rae

3000 PID with an 11.4 eV lamp. According to manufacturer specifications, this device is capable of detecting up to 15,000 parts per million (ppm) of VOCs[12]. The PID provides a qualitative field measurement of VOCs contained in the sample. The field screening process involved placing a portion of the soil sample in a zip-lock plastic bag. The headspace was then sampled and soil-gas VOC concentrations were measured and recorded. In addition to PID screening, visual and olfactory observations were used to assess the presence of impacted soil and the selection of the appropriate sample interval for laboratory analysis as described further below. Each soil sample was described and logged by a WCG representative. The color, soil type, moisture content, and other applicable characteristics for each soil sample were recorded, and the data was then used to construct a log of the subsurface conditions encountered at each probe location (refer to **Appendix E**).

2.2.2.2 Soil Sample Collection

A total of 117 soil probes were advanced to depths of approximately 15 to 65 feet bgs (refer to **Figures 9** through **13**). Of the 117 soil probes completed on the Site, 49 soil probes were advanced, sampled and logged by Cabeno. A summary of the on-site soil analytical results are included as **Tables 1** through **5** and discussed in **Section 2.5.1**.

Sample selection was based on the following methodology to characterize subsurface environmental conditions:

1. One discrete soil sample was collected for laboratory analysis from the one-foot to three-foot sample interval and then from the two-foot sample interval situated below three feet bgs and above the depth to groundwater encountered during drilling, which exhibited the greatest indication of environmental impact, based on field screening results (i.e., visual/olfactory observations, PID results) as described in **Section 2.2.1**. If there were no indications of environmental impacts in the field, then a soil sample was submitted from the approximate depth that would be expected to exhibit impacts (i.e. directly above the water table, etc.). For the 12 soil probes that were completed to a depth of 65 feet along the northern site boundary north of Building 2/3/4/7, discrete soil samples were collected from a two-foot sample interval within each five-foot Geoprobe® sampling liner to the depth of each soil probe.
2. To characterize the horizontal extent of impacts, soil samples were collected from soil probes surrounding previously identified impacts at the Site. One discrete soil sample

[12] Volatile organic compounds

was collected for laboratory analysis from the two-foot interval (i.e., one-foot to three-foot interval) exhibiting the greatest indication of environmental impact, based on field screening results (i.e., visual/olfactory observations, PID results) and/or at a consistent depth interval of previously identified impacts.

3. To characterize the vertical extent of COC migration, at select soil probe locations exhibiting impacts in the field, a second sample was collected from a deeper interval appearing free of impacts.

Based on the above criteria, select soil samples from probes were placed into pre-cleaned, laboratory supplied sample containers preserved as necessary for subsequent laboratory analysis. Soil samples were obtained as quickly as practicable upon opening the Geoprobe® sample liner. The sample containers with chemical preservative were used to collect soil samples for VOC analysis, which were collected using SW-846 Method 5035. The sample containers were tightly capped, labeled, and placed in a cooler and surrounded with ice in order to maintain their temperature near 4^{o} C.

Each sample was logged onto a chain of custody form, which is used to track the samples from the point of collection to receipt by the laboratory. The chain of custody is included with the laboratory analytical reports included in **Appendix L**. After completion of sampling at each probe location, the probe hole was backfilled to the ground surface with bentonite chips and patched with similar surficial material.

2.2.2.3 Groundwater Sampling Activities

Monitoring wells were installed at the Site by Cabeno utilizing a Geoprobe® drilling rig (e.g., direct-push technology). During the period of March, September, and November/December 2015, Cabeno representatives utilized a Geoprobe® 6600 track-mounted drill rig equipped with a 8.25-inch outside diameter (OD) hollow-stem auger to install 56 permanent wells at the Site (refer to **Figure 7** and **Figure 8**) to depth of approximately 30 feet bgs to 50 feet bgs. During drilling activities, Cabeno utilized varying volumes of water to aid in the drilling process. The source of the water used during drilling was obtained from the Village of New Lenox municipal water supply and transported to the Site. Prior to using the water for drilling purposes, WCG collected a sample of the water for laboratory analyses of the COCs.

The monitoring wells were intended to assess the shallow (i.e., less than 30 feet bgs) and intermediate (i.e., between 30 and 50 feet bgs) subsurface groundwater conditions at the Site, as well as to assess for potential impacts associated with the recognized environmental conditions (RECs) and areas of concern (AOC), as discussed in **Section 2.8.1**. A summary of the

on-site groundwater analytical results are included in **Tables 6** through **10** and described further in **Sections 2.5.2**.

Prior to drilling activities, Cabeno contacted USIC to locate private and public utilities. Finally, WCG also discussed the monitoring well locations with Site tenants and owner representatives prior to drilling activities to further assess the locations of private utility locations.

The permanent monitoring wells installed on the Site were constructed of two-inch diameter Schedule 40 PVC[13] risers and a 0.010-inch slotted ten-foot PVC well screens. The permanent monitoring wells were generally screened at the deepest 10-foot interval of each monitoring well (e.g., 20 to 30 feet bgs for the 30-foot monitoring wells and 40 to 50 feet bgs for the 50-foot monitoring wells). The PVC screen and riser were inserted into completed 8.25-inch OD auger holes. The annular space of the monitoring wells were backfilled with Global #5 quartz sand from the bottom of the borings to approximately two feet above the well screen. The annulus space from the ground surface to the sand pack was backfilled with ¾-inch bentonite pellets. The monitoring well risers for the monitoring wells installed on the Site extended approximately 2 to 3 feet from the ground surface and were completed as stick-up monitoring wells with protective steel well-casings and locked.

The monitoring wells were allowed to remain open for a period of at least 24 hours following installation prior to assessing the groundwater levels utilizing a Solinst™ or Heron™ water level meter. After the monitoring wells were installed, Cabeno developed the monitoring wells by using an inertia pump to pump each monitoring well of approximately ten well volumes plus the volume of water used to drill each well borehole or until the monitoring well was pumped dry. Cabeno's monitoring well development lots are included in **Appendix M**. The monitoring wells were allowed to recharge at least 48 hours prior to groundwater sampling activities. Groundwater monitoring well development water was collected in 55-gallon drums that were located adjacent to each monitoring well cluster. The drums were left at the locations adjacent to each monitoring well cluster pending off-site disposal arranged by the RA.

After the installation of the monitoring wells, the RA retained a licensed land surveyor to survey the monitoring well elevations relative to an established USGS bench mark. In addition, during two groundwater monitoring events performed after the installation of the monitoring wells and during groundwater sampling activities (i.e., April and October 2015), WCG gauged the groundwater depths. A third groundwater monitoring event was completed by the RA in

[13] Poly vinyl chloride

January/February 2016. A summary of the monitoring well elevations and groundwater depths measured during the three groundwater monitoring events is included in **Table 21**.

2.2.2.4 Groundwater Sample Collection

After developing the monitoring wells that were installed in March 2015, WCG allowed the monitoring wells to recharge and groundwater samples were collected from each of the monitoring wells for laboratory analysis of the applicable COCs. Groundwater samples were collected from select previously installed EGSL monitoring wells, as well as the monitoring wells installed in 2015. The groundwater samples were collected on April 1, April 3, May 18, June 15, September 18, October 16, and October 20, 2015.

Groundwater samples were collected from the permanent monitoring wells using disposable polyethylene, 1.5-inch diameter, 36-inch length weighted bailers. In addition, the existing EGSL flush-mounted monitoring wells on the northwest portion of the Site were purged and sampled using a Generac GP3250 generator attached to a Honda Powermate one-inch diameter dewatering pump.

Prior to sampling, depth to groundwater water measurements were recorded and the wells were purged of a minimum of three well volumes, or until the purge water exhibited stable conditions based upon field measurements of pH, specific conductivity, and temperature (refer to **Appendix M**). Groundwater monitoring well purge water was collected in 55-gallon drums that were located adjacent to each monitoring well cluster. The drums were left at the locations adjacent to each monitoring well cluster pending off-site disposal arranged by the RA.

To assess particulate effect on groundwater quality, unfiltered groundwater samples were collected for laboratory analysis. Collection of groundwater samples in this manner was designed to represent a complete characterization of shallow, intermediate, and deep groundwater conditions. Groundwater samples were collected in containers provided by the laboratory and preserved as necessary for their respective analyses. Samples were sealed in their respective containers, labeled, placed on ice, documented using chain of custody forms, and delivered to the analytical laboratory.

2.2.3 OFF-SITE ACTIVITIES

2.2.3.1 Soil-Probe Sampling Activities

Soil probes were advanced by Cabeno utilizing Geoprobe® drilling rigs (e.g. direct-push technology). Soil probes were advanced by Cabeno using Geoprobe® 6610 and a Geoprobe® 7822 track-mounted drill rigs. Prior to drilling activities, Cabeno contacted USIC to locate off-

site private and public utilities. Finally, WCG also discussed the soil probe locations with Site tenants and owner representatives prior to drilling activities to further assess the locations of private utilities.

A WCG representative was present during soil probing activities to observe and document field conditions and collect the soil samples. Soil samples were obtained by the direct push of four-foot long, two-inch diameter probe rods into the undisturbed subsurface. Soil samples were continuously collected via individual four-foot long, two-inch diameter acrylic liners.

The drilling subcontractor, Cabeno, decontaminated the Geoprobe® sampler between soil probe locations. In addition, Cabeno decontaminated the re-usable soil sampling equipment between the collection of each soil sample interval and prior to commencing the drilling of each soil probe. The decontamination process consisted of an initial wash with a Liquinox/water solution, followed by a clean water rinse. Cabeno decontaminated the Geoprobe® drilling equipment prior to the start of each monitoring well location.

Upon retrieval, split samples were placed into a zip-locked bag for field screening by a RAE Systems™ Mini-Rae 2000 PID with an 10.7 eV lamp or a Mini-Rae 3000 PID with an 11.4 eV lamp. According to manufacturer specifications, this device is capable of detecting up to 15,000 ppm of VOCs. The PID provides a qualitative field measurement of VOCs contained in the sample. The field screening process involved placing a portion of the soil sample in a zip-lock plastic bag. The headspace was then sampled and soil-gas VOC concentrations were measured and recorded. In addition to PID screening, visual and olfactory observations were used to assess the presence of impacted soil and selection of the appropriate sample interval for laboratory analysis as described further below. Each soil sample was described and logged by a WCG representative. The color, soil type, moisture content, and other applicable characteristics for each soil sample were recorded, and the data was then used to construct a log of the subsurface conditions encountered at each probe location (**Appendix E**).

2.2.3.2 Soil Sample Collection

Seven soil probes were advanced by Cabeno to a depth of approximately 50 feet bgs (refer to **Figure 7**). A summary of the off-site soil analytical results are included as **Tables 11** through **15** and discussed in **Section 2.6.1**.

Sample selection was based on the following methodology to characterize subsurface environmental conditions:

1. One discrete soil sample was collected for laboratory analysis from the one-foot to three-foot interval and then from the two-foot sample interval situated below three

feet bgs and above the depth to groundwater encountered during drilling, which exhibited the greatest indication of environmental impact, based on field screening results (i.e., visual/olfactory observations, PID results) as described in **Section 2.2.1**. If there were no indications of environmental impacts in the field, then a soil sample was submitted from the approximate depth that would be expected to exhibit impacts (i.e. directly above the water table, etc.).

Based on the above criteria, select soil samples from the soil probes were placed into pre-cleaned, laboratory supplied sample containers preserved as necessary for subsequent laboratory analysis. Soil samples were obtained as quickly as practicable upon opening the Geoprobe® sample liner. The sample containers with chemical preservative were used to collect soil samples for VOC analysis, which were collected using SW-846 Method 5035. The sample containers were tightly capped, labeled, and placed in a cooler and surrounded with ice in order to maintain their temperature near 4^{o} C.

Each sample was logged onto a chain of custody form, which is used to track the samples from the point of collection to receipt by the laboratory. The chain of custody is included with the laboratory analysis reports in **Appendix L**. After completion of sampling at each probe location, the probe hole was backfilled to the ground surface with bentonite chips and patched with similar surficial material.

2.2.3.3 Groundwater Sampling Activities

Monitoring wells were installed off-site of the Site by Cabeno utilizing a Geoprobe® drilling rig (e.g., direct-push technology) equipped with hollow-stem augers. During the periods of February, March, September and November/December 2015, Cabeno representatives utilized a Geoprobe® 6600 track-mounted drill rig with a 8.25-inch outside diameter (OD) hollow stem auger to install 33 permanent wells off-site from the Site (refer to **Figure 7**) to depths ranging from approximately 30 feet bgs to 80 feet bgs. During drilling activities, Cabeno utilized varying volumes of water to aid in the drilling process. The source of the water used during drilling was obtained from the Village of New Lenox municipal water supply and transported to the Site. Prior to using the water for drilling purposes, WCG collected a sample of the water for laboratory analyses of the COCs.

The monitoring wells were intended to assess the shallow, intermediate, and deep subsurface groundwater conditions off-site of the Site, as well as to assess for potential impacts associated with the RECs and AOCs noted on the Site, as discussed in **Section 2.8.1**. A summary of the off-site groundwater analytical results are included as **Tables 16** through **20** and described further in **Section 2.6.2**.

Prior to drilling activities, Cabeno contacted USIC to locate private and public utilities. Finally, WCG also discussed the monitoring well locations with Site tenants and owner representatives prior to drilling activities to further assess the locations of private utilities.

The permanent monitoring wells were constructed of two-inch diameter Schedule 40 PVC risers and a 0.010-inch slotted ten (10) foot PVC well screen. The permanent monitoring wells were generally screened at the deepest 10-foot interval of each monitoring well (e.g., 20 to 30 feet bgs for the 30-foot monitoring wells and 40 to 50 feet bgs for the 50-foot monitoring wells). The PVC screen and riser were inserted into completed 8.25-inch OD auger holes. The annular space of the monitoring wells were backfilled with Global #5 quartz sand from the bottom of the borings to approximately two feet above the well screen. The annulus space from the ground surface to the sand pack was backfilled with ¾-inch bentonite pellets. The monitoring well risers for the monitoring wells located along the Railroad Street right-of-way were cut flush with the ground surface and covered with a flush-mounted protective steel cover and concrete pad. The monitoring well risers for the monitoring wells installed in the remaining off-site areas extended approximately 2 to 3 feet from the ground surface and were completed as stick-up monitoring wells with protective steel well-casings and locked.

The monitoring wells were allowed to remain open for a period of at least 24 hours following installation prior to assessing the groundwater levels utilizing a Heron™ water level meter. After the monitoring wells were installed, Cabeno developed the monitoring wells by using an inertia pump to pump each monitoring well of approximately ten well volumes plus the volume of water used to drill the monitoring well borehole or until the monitoring well was pumped dry. Cabeno's monitoring well development lots are included in **Appendix M**. The monitoring wells were allowed to recharge at least 48 hours prior to groundwater sampling activities. Groundwater monitoring well development water was collected in 55-gallon drums that were located adjacent to each monitoring well cluster. The drums were left at the locations adjacent to each monitoring well cluster pending off-site disposal arranged by the RA.

After the installation of the monitoring wells, the RA retained a licensed land surveyor to survey the monitoring well elevations relative to an established USGS bench mark. In addition, during two groundwater monitoring events performed after the installation of the monitoring wells and during groundwater sampling activities (i.e., April and October 2015), WCG gauged the groundwater depths. A third groundwater monitoring event was completed by the RA in January/February 2016. A summary of the monitoring well elevations and groundwater depths measured during the three groundwater monitoring events is included in **Table 21**.

2.2.3.4 Groundwater Sample Collection

After developing the monitoring wells that were installed in March 2015, WCG allowed the monitoring wells to recharge, and groundwater samples were collected from each of the monitoring wells for laboratory analysis of the applicable COCs. Groundwater samples were collected from the previously installed EGSL monitoring wells located on the north side of Railroad Street, as well as the monitoring wells installed in 2015. The groundwater samples were collected from the monitoring wells on March 5, March 6, March 8, March 10, March 19, March 20, March 31, October 16, October 19, December 11, 2015; and January 29, 2016. The January 2016 groundwater sampling event was completed by Cabeno, while the remaining groundwater sampling events were completed by WCG.

During WCG's groundwater sampling activities, groundwater samples were collected from the permanent monitoring wells using disposable, polyethylene 1.5-inch diameter, 36-inch length weighted bailers. During the January 2016 groundwater sampling event, groundwater samples were collected from the permanent monitoring wells by Cabeno. No information was available concerning the sampling methods utilized by Cabeno. In addition, in March 2015, the existing MCCD irrigation wells on the western portion of the off-site area were purged by the RA and sampled using a Honda Powermate two-inch trash pump utilizing designated polyethylene tubing. Prior to sampling the MCCD irrigation wells, an equipment blank sample was collected from the polyethylene tubing.

Prior to sampling the monitoring wells and the MCCD irrigation wells, depth to water measurements were recorded, and the wells were purged of a minimum of three well volumes, or until the purge water exhibited stable conditions based upon field measurements of pH, specific conductivity, and temperature (refer to **Appendix M**). Groundwater monitoring well purge water was collected in 55-gallon drums that were located adjacent to each monitoring well cluster with the exception of the MCCD irrigation wells, which were purged to the ground surface. The drums were left at the locations adjacent to each monitoring well cluster pending off-site disposal arranged by the RA.

Collection of groundwater samples in this manner was designed to represent a complete characterization of shallow, intermediate, and deep groundwater conditions. Groundwater samples were collected in containers provided by the laboratory and preserved as necessary for their respective analyses. Samples were sealed in their respective containers, labeled, placed on ice, documented using chain of custody forms, and delivered to the analytical laboratory.

2.2.4 PRIVATE WATER SUPPLY WELL SAMPLING ACTIVITIES

Private water supply well samples were collected from the residential and commercial properties located along Railroad Street and Ritz Road, which are situated to the north and northwest (i.e., down groundwater gradient) from the Site. On January 21, 2015, EGSL conducted the private water supply well sampling activities, while on May 5, 2015; August 12, 2015; and November 30, 2015; WCG conducted the private water supply well sampling activities. Mr. Thomas Rivera, Field Operations Bureau of Land for the IEPA, was present at each private water supply well sampling event to monitor the sampling activities.

During the quarterly sampling events performed by WCG, each private water supply well was sampled from a discharge point (e.g., spigot) located in close proximity to the water supply well head. The locations of the private water supply wells are presented in **Figure 22**. Water was allowed to flow from the collection point for approximately 15 minutes as a purging process of the water supply well. During this time, the water was monitored using a YSI 556 water quality meter to measure the pH, dissolved oxygen, conductivity, and temperature. When the water quality measurements of the purged water reached a stable measurement (i.e., within 0.1 of the previous measurement) of pH, dissolved oxygen, conductivity, and temperature, a water sample was collected in containers provided by the laboratory (i.e., Suburban Laboratories, Inc.) and preserved as necessary for their respective analyses. In addition, duplicate water samples were collected at one private water supply well during the August 12, 2015 and November 30, 2015 sampling events. Water supply well samples were sealed in their respective containers, labeled, placed on ice, documented using chain of custody forms, and delivered to the analytical laboratory. The private water supply well analytical results are presented in **Appendix N** and shown in **Figures 23** through **26**.

2.3 PROJECT QUALITY ASSURANCE

During the initial on-site and off-site soil and groundwater investigations, WCG implemented the EGSL Work Plan. The Work Plan did not include the collection of QA/QC samples; however, equipment blank samples were collected from the water used for the drilling activities as well as the polyethylene tubing used during the purging activities for the MCCD irrigation wells (i.e., Equipment Blank Samples 002 and 003). In addition, at least two duplicate samples were collected during the first-, third- and fourth-quarter private drinking water well sampling events.

Sample collection and laboratory analysis procedures were conducted in accordance with appropriate SRP requirements to enhance project data quality. Samples were submitted to

STAT Analysis Corporation in Chicago, Illinois, a National Environmental Laboratory Accreditation Program (NELAP) approved laboratory as required by the IEPA SRP (see **Appendix L**). Sampling and laboratory analysis were performed in general accordance with approved techniques and methods as outlined in *USEPA SW-846, Test Methods For Evaluating Solid Waste, Third Edition*, and other published sources.

2.4 SAMPLE ANALYSIS

2.4.1 SOIL SAMPLE ANALYSIS

During the soil assessment activities, select soil samples were submitted to STAT Analysis Corporation for analysis using standard chain-of-custody documentation and handling procedures. STAT Analysis Corporation analyzed select soil samples (391 soil samples total) for certain COCs, which included the following:

- Target Compound List Parameters (including 1,4-Dioxane and total Cyanide) – 230 soil samples;
- VOCs (Method 5035/8260B) – 107 soil samples;
- SVOCs (Method 8270C) – 2 soil samples;
- PNAs (Method 3540C/8270C) – 12 soil samples;
- Target Compound List (TCL) Metals (Methods 6010B/7470A/7421/7041/7841) – 6 soil samples;
- Synthetic Precipitate Leaching Procedure (SPLP) Target Compound List Metals – (Methods 1312/6020/3005A) – 254 soil samples;
- Total Arsenic (Methods 6020 / 3050B) – 12 soil samples;
- Total Mercury (Method 7471A**)** – 8 soil samples ;
- PCBs (Method 8081) – 4 soil samples; and
- Soil pH – 189 soil samples.

STAT Analysis Corporation analyzed the selected soil samples from each soil probe for the COCs listed in the following table.

On-Site and Off-Site Soil Assessment Summary					
Soil Probe Identification	**Depth (feet)**	**Number of Samples**	**Sample Interval (feet bgs)**	**Laboratory Analyses**	**Purpose**
Off-Site					
GP-400 through GP-411	15	2	1 to 3 and a sample below the 1 to 3 interval but above the water table	TCL 1,4-Dioxane SPLP TCL Metals	1 to 3 interval: Evaluate for potential near surface impacts Deeper interval: Evaluate for potential deeper impacts. Based on field screening in an interval above the groundwater table
On-Site					
GP-388 through GP-391 GP-393 through GP-395	50	2	1 to 3 and a sample below the 1 to 3 interval but above the water table	TCL 1,4-Dioxane SPLP TCL Metals	1 to 3 interval: Evaluate for potential near surface impacts Deeper interval: Evaluate for potential deeper impacts. Based on field screening in an interval above the groundwater table
GP-301 through GP-379	15	2	1 to 3 and a sample below the 1 to 3 interval but above the water table	TCL 1,4-Dioxane SPLP TCL Metals	1 to 3 interval: Evaluate for potential near surface impacts Deeper interval: Evaluate for potential deeper impacts. Based on field screening in an interval above the groundwater table
GP-312(D)	20	1	18 to 20	VOCs	Evaluate the vertical extent of VOCs noted at shallow and intermediate depths for previously completed soil probes in Area 3. Note: Soil probe SP-315D was not completed due to surface conditions.
GP-314(D)	20	1	18 to 20	VOCs	
GP-315(D)	20	1	18 to 20	VOCs	
GP-316(D)	20	1	18 to 20	VOCs	
GP-317(D)	20	1	18 to 20	VOCs	
GP-321(D)	20	1	18 to 20	VOCs	Evaluate the vertical extent of VOCs noted at shallow and intermediate depths for previously completed soil probes in Area 3.
GP-322(D)	20	1	18 to 20	VOCs	

On-Site and Off-Site Soil Assessment Summary					
Soil Probe Identification	**Depth (feet)**	**Number of Samples**	**Sample Interval (feet bgs)**	**Laboratory Analyses**	**Purpose**
GP-327(D)	20	1	18 to 20	VOCs	Note: Soil probe SP-315D was not completed due to surface conditions.
GP-333(D)	20	1	18 to 20	VOCs	Evaluate the vertical extent of VOCs noted at shallow and intermediate depths for previously completed soil probe in Area 4.
GP-341(D)	20	1	18 to 20	VOCs	Evaluate the vertical extent of VOCs noted at shallow and intermediate depths for previously completed soil probes in Area 5.
GP-348(D)	20	1	18 to 20	VOCs	
GP-374(D)	15	1	13 to 15	PCBs	Evaluate the vertical extent of PCBs noted at shallow and intermediate depths for previously completed soil probe on the east side of Building 11/14 in Area 7.
GP-380	15	3	1 to 3 6 to 8 13 to 15	Target Compound List SPLP Metals (Various)	Evaluate the horizontal and vertical extent of PCBs noted at shallow and intermediate depths for soil probe GP-374 on the east side of Building 11/14 in Area 7. This probe also served to evaluate the potential migration of contaminants of concern below and beyond the depths of the building footings.
GP-381	15	3	1 to 3 6 to 8 13 to 15	PCBs	Evaluate the horizontal and vertical extent of PCBs noted at shallow and intermediate depths for soil probe GP-374 on the east side of Building 11/14 in Area 7.

On-Site and Off-Site Soil Assessment Summary					
Soil Probe Identification	**Depth (feet)**	**Number of Samples**	**Sample Interval (feet bgs)**	**Laboratory Analyses**	**Purpose**
GP-382	15	3	1 to 3 6 to 8 13 to 15	Target Compound List SPLP Metals (Various)	Evaluate the horizontal and vertical extent of PCBs noted at shallow and intermediate depths for soil probe GP-374 on the east side of Building 11/14 in Area 7. This probe also served to evaluate the potential migration of contaminants of concern below and beyond the depths of the building footings.
GP-383	20	3	1 to 3 8 to 10 18 to 20	VOCs	Evaluate the horizontal and vertical extent of VOCs noted in previously completed soil probe GP-314 in Area 3.
GP-384	65	13	1 to 3 5 to 7, and within each 5-foot Interval thereafter	VOCs (13) Total Arsenic (2)	Evaluate the environmental conditions along the northern property boundary and north of soil probe GP-312 in Area 3, which exhibited elevated concentrations of VOCs. Evaluate the horizontal/vertical extent of total arsenic noted in soil probe GP-312 in Area 3. Samples selected from the 1 to 3- and 5 to 7-foot intervals for VOCs and total arsenic analyses. The soil samples collected from the remaining sample intervals were analyzed for VOCs.

On-Site and Off-Site Soil Assessment Summary					
Soil Probe Identification	**Depth (feet)**	**Number of Samples**	**Sample Interval (feet bgs)**	**Laboratory Analyses**	**Purpose**
GP-385	20	3	1 to 3 6 to 8 18 to 20	VOCs	Initially proposed to evaluate the horizontal/vertical extent of VOCs noted in soil probes GP-315 and GP-312 in Area 3. Due to laboratory analytical results for soil collected from surrounding soil probes, soil probe SP-385 was not completed.
GP-386	65	13	Within each 5-foot interval	VOCs	Evaluate the environmental conditions along the northern property boundary and north of soil probe GP-316 in Area 3, which exhibited elevated concentrations of VOCs.
GP-387	20	3	1 to 3 5 to 9 18 to 20	VOCs	Evaluate the horizontal and vertical extent of VOCs noted in the area of soil probes GP-315, GP-316 and GP-317 in Area 3.
GP-396	15	2	1 to 3 5 to 7	Total Arsenic	Evaluate the horizontal and vertical extent of total arsenic noted in soil probe GP-331 in Area 4.

On-Site and Off-Site Soil Assessment Summary					
Soil Probe Identification	**Depth (feet)**	**Number of Samples**	**Sample Interval (feet bgs)**	**Laboratory Analyses**	**Purpose**
GP-397	20	4	1 to 3 4 to 6 6 to 8 18 to 20	VOCs (3) Total Arsenic (2) Total Mercury (2)	Evaluate the horizontal and vertical extent of VOCs and total arsenic noted in previously completed soil probe GP-333 in Area 4 and total mercury noted in soil probe GP-334 in Area 4. Samples selected from the 1 to 3-foot interval were analyzed for VOCs and total arsenic and mercury analyses. Samples selected from the 4 to 6-foot interval were analyzed for total arsenic and mercury analyses. The soil samples collected from the remaining sample intervals were analyzed for VOCs.
GP-398	20	4	1 to 3 4 to 6 6 to 8 18 to 20	VOCs (3) Total Arsenic (2) Total Mercury (2)	Evaluate the horizontal and vertical extent of VOCs and total arsenic noted in previously completed soil probe GP-333 in Area 4 and total mercury noted in soil probe GP-334 in Area 4. Samples selected from the 1 to 3-foot interval were analyzed for VOCs and total arsenic and mercury. Samples selected from the 4 to 6-foot interval were analyzed for total arsenic and total mercury analyses. The soil samples collected from the remaining sample intervals were analyzed for VOCs.

On-Site and Off-Site Soil Assessment Summary					
Soil Probe Identification	**Depth (feet)**	**Number of Samples**	**Sample Interval (feet bgs)**	**Laboratory Analyses**	**Purpose**
GP-399	15	2	1 to 3 4 to 8	PNAs (2) Total Mercury (2)	Evaluate the horizontal and vertical extent of PNAs noted in soil probe GP-332 and total mercury noted in soil probe GP-334 in Area 4.
GP-412	20	3	1 to 3 4 to 8 18 to 20	VOCs	Evaluate the horizontal and vertical extent of VOCs noted in soil probe GP-348 in Area 5.
GP-413	20	3	1 to 3 7 to 9 18 to 20	VOCs	Evaluate the horizontal and vertical extent of VOCs noted in soil probe GP-327 in Area 3.
GP-414	20	3	1 to 3 6 to 8 18 to 20	VOCs	Evaluate the horizontal and vertical extent of VOCs noted in soil probe GP-322 in Area 3.
GP-415	20	4	1 to 3 4 to 6 6 to 8 18 to 20	VOCs (3) PNAs (2) Total Arsenic (2) Total Mercury (2)	Evaluate the horizontal and vertical extent of VOCs and total arsenic noted in soil probe GP-333, PNAs noted in soil probe GP-332, and total mercury noted in soil probe GP-334 in Area 4. Samples selected from the 1 to 3-foot interval were analyzed for VOCs, PNAs, total arsenic and total mercury. Samples selected from the 4 to 6-foot interval were analyzed for PNAs, total arsenic and total mercury. The soil samples collected from the 6 to 8 and 18 to 20-foot interval were analyzed for VOCs.
GP-416	15	2	1 to 3 6 to 8	SVOCs	Evaluate the horizontal and vertical extent of 2,4-Dinitrotoluene noted in soil probe GP-346 in Area 5.

On-Site and Off-Site Soil Assessment Summary					
Soil Probe Identification	**Depth (feet)**	**Number of Samples**	**Sample Interval (feet bgs)**	**Laboratory Analyses**	**Purpose**
GP-417	20	3	1 to 3 7 to 9 18 to 20	VOCs	Evaluate the horizontal and vertical extent of VOCs noted in soil probe GP-316 in Area 3.
GP-418	15	2	1 to 3 5 to 7	Target Compound List Metals	Evaluate the horizontal/vertical extent of certain total metals, including total mercury, noted in soil probe GP-329 in Area 4.
GP-419	20	3	1 to 3 7 to 9 18 to 20	VOCs	Evaluate the horizontal and vertical extent of VOCs noted in soil probes GP-316 and GP-317 in Area 3.
GP-420	65	13	Within Each 5-foot Interval	VOCs	Evaluate the environmental conditions along the northern property boundary north of Area 3 and Area 4, which previously exhibited elevated concentrations of VOCs.
GP-421	65	13	1 to 3 5 to 7, and within each 5-foot Interval thereafter	VOCs (13) PNAs (2)	Evaluate the horizontal and vertical extent of PNAs noted in soil probes GP-328 and GP-332 in Area 4. Evaluate the environmental conditions along the northern property boundary and north of Area 3 and Area 4, which previously exhibited elevated concentrations of VOCs. Samples selected from the 1 to 3- and 5 to 7-foot intervals were analyzed for VOCs and PNAs. The soil samples collected from the remaining sample intervals were analyzed for VOCs.
GP-422	65	13	1 to 3 5 to 7, and within each 5-foot Interval thereafter	VOCs (13) PNAs (2)	

On-Site and Off-Site Soil Assessment Summary					
Soil Probe Identification	**Depth (feet)**	**Number of Samples**	**Sample Interval (feet bgs)**	**Laboratory Analyses**	**Purpose**
GP-423	65	13	1 to 3 5 to 7, and within each 5-foot Interval thereafter	VOCs (13) Total Arsenic (2)	Evaluate the environmental conditions along the northern property boundary and north of Area 3 and Area 4, which previously exhibited elevated concentrations of VOCs. Evaluate the horizontal and vertical extent of total arsenic noted in soil probe GP-331 in Area 4. Samples selected from the 1 to 3- and 5 to 7-foot intervals were analyzed for VOCs and total arsenic analyses. Soil samples collected from the remaining intervals were analyzed for VOCs.
GP-424	65	13	Within Each 5-foot Interval	VOCs	Evaluate the environmental conditions along the northern property boundary and north of Area 3 and Area 4, which previously exhibited elevated concentrations of VOCs.

GP-437	15	2	6 to 8 12 to 14		
GP-438	15	2	1 to 3 5 to 7	PNAs (2) TCL Metals (2) SPLP Metals (Various)	Evaluate the horizontal and vertical extent of PNAs noted in soil probe GP-332 and certain total metals noted in soil probe GP-329 in Area 4.

The laboratory analytical reports for the above-listed laboratory analyses, including the chain-of-custody records, are provided in **Appendix L**. **Tables 1** through **5** and **11** through **15** summarize the soil analytical results collected during the soil assessment and compare them to TACO Tier 1 SROs as summarized in **Sections 2.5.1** and **2.6.1**.

2.4.1 GROUNDWATER SAMPLE ANALYSIS

During the groundwater assessment activities, select groundwater samples were submitted to STAT Analysis Corporation for analysis using standard chain-of-custody documentation and handling procedures. STAT Analysis Corporation analyzed the groundwater samples (391 soil samples total) for the following:

- Target Compound List Parameters (including 1,4-Dioxane) – 230 soil samples; and
- Dissolved metals (Methods 6010B/7470A/7421/7041/7841) – 230 groundwater samples and three equipment blank samples.

STAT Analysis Corporation analyzed the groundwater samples for the COCs listed in the following table.

On-Site and Off-Site Groundwater Assessment Summary

Monitoring Well Location	Depth (feet bgs)	Number of Samples	Laboratory Analyses
MW-71 MW-73 MW-75 MW-77 MW-79 MW-81 MW-83 MW-85 MW-94 MW-97 MW-20	30	1	Target Compound List 1,4 – Dioxane

On-Site and Off-Site Groundwater Assessment Summary			
Monitoring Well Location	**Depth (feet bgs)**	**Number of Samples**	**Laboratory Analyses**
MW-101 MW-103 MW-105 MW-107 MW-109 MW-111 MW-113 MW-115 MW-117 MW-119 MW-121 MW-123 MW-03 MW-07 MW-24 MW-25 MW-26 through MW-37	30	1	Target Compound List 1,4 – Dioxane
MW-72 MW-74 MW-76 MW-78 MW-80 MW-82 MW-84 MW-86 MW-90 MW-125 MW-18	50	1	Target Compound List 1,4 – Dioxane

On-Site and Off-Site Groundwater Assessment Summary			
Monitoring Well Location	**Depth (feet bgs)**	**Number of Samples**	**Laboratory Analyses**
MW-102 MW-104 MW-106 MW-108 MW-110 MW-112 MW-114 MW-116 MW-120 MW-122 MW-01 MW-05 MW-38 through MW-44, MW-46	50	1	Target Compound List 1,4 – Dioxane

The laboratory analytical reports for the above-listed laboratory analyses, including the chain-of-custody records, are provided in **Appendix L**. **Tables 6** through **10** and **16** through **20** summarize the soil analytical results collected during the soil assessment and compare them to TACO Tier 1 GROs as summarized in **Sections 2.5.2** and **2.6.2**.

2.4.2 PRIVATE WATER SUPPLY WELL SAMPLE ANALYSIS

Private water supply well samples were collected and submitted for laboratory analysis to Suburban Laboratories, Inc. using standard chain-of-custody documentation and handling procedures. The private water supply well analytical results are presented in **Appendix N** and shown in **Figures 23** through **26**. Suburban Laboratories, Inc. analyzed the private water supply well samples for the COCs in the following table:

Private Water Supply Well Assessment Summary		
Property Addresses	**Dates Sampled**	**Laboratory Analyses**
4501 Ritz Road 4106 Ritz Road 4210 Ritz Road 4805 Ritz Road 4907 Ritz Road 4913 Ritz Road 5011 Ritz Road (north) 5011 Ritz Road (south) 5017 Ritz Road 5010 Ritz Road 22110 Railroad Street 22104 Railroad Street 22012 Railroad Street 21902 Railroad Street 21816 Railroad Street 21820 Railroad Street 21606 Railroad Street 20602 Railroad Street	1/21/2015 5/5/2015 8/12/2015 11/30/2015	VOCs Bromodichloromethane and Bromomethane 1,4-Dioxane PCBs

2.5 ON-SITE ANALYTICAL RESULTS

2.5.1 SOIL ANALYTICAL RESULTS

Soil sample analytical results collected during the WCG February through December 2015 site investigation activities have been tabulated and presented in **Tables 1** through **5**. Soil sample results were compared to the Tier 1 SROs for Industrial/Commercial Properties, Backgrounds within Chicago-MSAs, and pH-Specific Values for Inorganics for the Soil Component of the Groundwater Ingestion Exposure Route for Class I Groundwater, where applicable. Concentrations of COCs observed above applicable SROs are denoted on the tables. Laboratory analytical reports are included in **Appendix L**. The following presents a summary of the soil analytical results for each parameter analyzed as part of the site investigation activities. **Figures 27** through **35** depict the concentrations of COCs that exceed the applicable SROs on the tables.

2.5.1.1 Target Compound List (TCL) and 1,4-Dioxane

One hundred and fifty-five (155) soil samples were submitted for TCL laboratory analysis. Concentrations of TCL parameters were below laboratory reporting limits and/or Tier 1 SROs

for Industrial/Commercial Properties and Construction Worker, with the exception of the following VOCs, SVOCs, Total Metals, PCBs, and Pesticides.

2.5.1.1.1 Volatile Organic Compounds (VOCs)

- Soil samples GP-312, GP-312D, GP-314, GP-314D, GP-315, GP-316, GP-317, GP-320, GP-321, GP-321D, GP-322, GP-322D, GP-333, GP-341, GP-348, GP-384, GP-387, GP-420 through GP-422, and GP-425 through GP-427 exhibited PCE concentrations (ranging from 0.061mg/kg to 20mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil samples GP-321, GP-321D, GP-327, GP-327D, GP-333D, GP-348D, GP-415, and GP-421 exhibited 1,1-Dichlororethene concentrations (ranging from 0.062mg/kg to 0.75mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater; and

- Soil samples GP-321D, GP-387, and GP-425 exhibited 1,4-Dioxane concentrations (ranging from 0.24mg/kg to 0.75mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater.

2.5.1.1.2 Semi-Volatile Organic Compounds (SVOCs)

- Soil sample GP-328 exhibited benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene concentrations (e.g., 2.6mg/kg, 3.1mg/kg, 1.3mg/kg, and 2.7mg/kg, respectively) in excess of the Tier 1 SRO for the Soil Ingestion Route for Industrial/Commercial Properties;

- Soil samples GP-328 exhibited a benzo(a)anthracene concentration (e.g., 4.7mg/kg) in excess of the Tier 1 SRO Soil Ingestion Route for Residential and Industrial/Commercial Properties and the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil sample GP-328 exhibited a carbazole concentration (1.1mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil sample GP-332 exhibited a dibenzo(a,h)anthracene concentration (0.48mg/kg) in excess of the Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties;

- Soil sample GP-346 exhibited a 2,4-Dinitrotoluene concentration (0.51mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil sample GP-422 exhibited benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene concentrations (e.g., 25mg/kg, 24mg/kg, 27mg/kg, 18mg/kg, 6.7mg/kg, and 14mg/kg, respectively) in excess of the Tier 1 SRO Soil Ingestion Route for Residential Properties, Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties, and the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater; and

2.5.1.1.3 Total Metals

- Soil samples GP-312, GP-329, GP-331, GP-333, GP-396, and GP-431 exhibited arsenic concentrations (ranging from 14 mg/kg to 310 mg/kg) in excess of the Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties;

- Soil samples GP329 and GP-334 exhibited mercury concentrations e.g., 1.0mg/kg and 0.55mg/kg, respectively) in excess of the Tier 1 SRO Soil Ingestion Route for Construction Worker; and

- Soil sample GP-329 also exhibited chromium, cobalt, copper, lead, nickel, and thallium concentrations (e.g., 350mg/kg, 66,000mg/kg, 16,000mg/kg, 630mg/kg, 57,000mg/kg, and less than 7.8mg/kg, respectively) in excess of the Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties.

2.5.1.1.4 PCBs and Pesticides

- Soil sample GP-374 exhibited Aroclor 1248 at concentrations (e.g., 17 mg/kg and 2.7 mg/kg) in excess of the Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties.

2.5.1.2 SPLP Target Compound List Metals

One hundred and fifty-five (155) soil samples were submitted for TCL SPLP laboratory analysis. Concentrations of TCL SPLP parameters were below laboratory reporting limits and/or Tier 1 SROs for Industrial/Commercial Properties, and Construction Worker, with the exception of the following soil samples:

- Soil samples GP-401 through GP-410, GP-301 through GP-312, GP-317, GP-319, GP-323, GP-325, GP-326, GP-329, GP-332 through GP-341, GP-343, GP-344, GP-346 through GP-351, GP-354 through GP-357, GP-359, GP-360, GP-362, GP-363, GP-367, GP-373, GP-374, GP-379, GP-418, GP-430, GP-435, and GP-438 exhibited SPLP aluminum concentrations (ranging from 3.6mg/L to 25 mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil samples GP-331 and GP-333 exhibited SPLP arsenic concentrations (e.g., 0.066mg/L and 0.49mg/L, respectively) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil samples GP-401, GP-402, GP-403, GP-407, GP-408, GP-410, GP-310 through GP-308, GP-310, GP-312, GP-319, GP-323, GP-328, GP-332, GP-333, GP-334, GP-336, GP-338, GP-340, GP-341, GP-343, GP-344, GP-347 through GP-349, and GP-438 exhibited SPLP iron concentrations (ranging from 5.2mg/L to 31mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil samples GP-328, GP-329, and GP-346 exhibited SPLP antimony concentrations (ranging from 0.0064mg/L to 0.012mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I and Class II Groundwater, the Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties, and the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil samples GP-303, GP-305, GP-306, GP-308, GP-319, GP-332, GP-333, GP-334, GP-348, GP-373, GP-374, and GP-438 exhibited SPLP lead concentrations (ranging from 0.0078mg/L to 0.44mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I and Class II Groundwater;

- Soil samples GP-302 through GP-304, GP-307, GP-348, and GP-356 exhibited SPLP manganese concentrations (e.g., 0.41mg/L and 0.24mg/L, respectively) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil samples GP-313 and GP-330 exhibited SPLP nickel concentrations (e.g., 0.18mg/L and 0.21mg/L, respectively) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater; and

- Soil sample GP-348 exhibited a SPLP vanadium concentration (e.g., 0.050mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater.

2.5.1.3 pH

One hundred and fifty-five (155) soil samples were submitted for pH analysis. Analytical results from the soil samples exhibited pH values ranging from 6.5 to 12.0 standard units (s.u.).

2.5.2 GROUNDWATER ANALYTICAL RESULTS

Groundwater sample analytical results collected during the March through December 2015 site investigation activities have been tabulated and presented in **Tables 6** through **10.** Groundwater sample analytical results were compared to the Tier 1 GROs for the Groundwater Ingestion Exposure Route for Class I Groundwater and the Indoor Inhalation Exposure Route for Industrial/Commercial Properties. Laboratory analytical reports from the site investigation activities are included in **Appendix L**. The following presents a summary of the groundwater analytical results for each parameter analyzed as part of the March through December 2015 site investigation activities. **Figures 36**, **37** and **38** depict the concentrations of COCs that exceed the applicable GROs on the tables.

2.5.2.1 Target Compound List (TCL) and 1,4-Dioxane

Fifty-six (56) groundwater samples were submitted for TCL and 1,4-Dioxane laboratory analysis. Concentrations of TCL and 1,4-Dioxane were below laboratory reporting limits and/or Tier 1 SROs for Industrial/Commercial Properties, with the exception of the following VOCs, SVOCs, and Total Metals.

2.5.2.1.1 Volatile Organic Compounds (VOCs)

- Groundwater samples MW-120, MW-121, MW-31, MW-32, MW-35, MW-41, MW-46, MW-5, MW-6, MW-7, MW-44, MW-37, and MW-24 exhibited concentrations of 1,1-DCE (ranging from 0.0076mg/L to 0.29mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-31, MW-32, MW-35, MW-46, and MW-37 exhibited concentrations of 1,1,1-TCA (ranging from 0.28mg/L to 7.9mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater sample MW-37 exhibited a concentration of 1,1,2-TCA (e.g., 0.018mg/L) in excess of the Tier 1 GRO for Class I Groundwater;

- Groundwater sample MW-37 exhibited a concentration of 1,2-DCA (e.g., 0.020mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-36 and MW-34 exhibited concentrations of carbon tetrachloride (e.g., 0.0071mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-27 and MW-37 exhibited concentrations of chloroform (e.g., 0.020mg/L and 0.013mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-03, MW-04, MW-30, MW-31, MW-32, MW-35, MW-41, MW-26, MW-27, MW-7, MW-36, MW-37, and MW-34 exhibited concentrations of PCE (ranging from 0.0088mg/L to 1.3mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-41, MW-26, MW-5, MW-6, MW-7, and MW-37 exhibited concentrations of TCE (ranging from 0.0075mg/L to 0.036mg/L) in excess of the Tier 1 GRO for Class I Groundwater; and
- Groundwater sample MW-41 exhibited concentrations of vinyl chloride (e.g., 0.0022mg/L) in excess of the Tier 1 GRO for Class I Groundwater.

2.5.2.1.2 Semivolatile Organic Compounds (SVOCs)

- Groundwater samples MW-120, MW-121, MW-41, MW-7, MW-36, and MW-37 exhibited concentrations of 1,4-Dioxane (ranging from 0.0096mg/L to 0.36mg/L) in excess of the Tier 1 GRO for Class I Groundwater; and
- Groundwater sample MW-39 exhibited a concentration of bis(2-ethylhexyl)phthalate (e.g., 0.012mg/L) in excess of the Tier 1 GRO for Class I Groundwater.

2.5.2.1.3 Total Metals and Cyanide

- Groundwater samples MW-100, MW-102, MW-105, MW-107, MW-109, MW-111, MW-113, MW-115, MW-117 through MW-123, MW-03, MW-04, MW-30 through MW-35, MW-38 through MW-41, MW-46, MW-26, MW-27, MW-5, MW-6, MW-25, MW-28, MW-29, MW-44, MW-36, and MW-37 exhibited concentrations of aluminum (ranging from 4.9mg/L to 160mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater sample MW-100 exhibited a concentration of antimony (e.g., 0.0062mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-123, MW-25, and MW-29 (e.g., 0.056mg/L, 0.11mg/L, and 0.46mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;

- Groundwater samples MW-03, MW-04, and MW-29 exhibited concentrations of barium (e.g., 4.3mg/L, 4.1mg/L, and 3.2mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-30 through MW-33, MW-26, MW-25, and MW-29 exhibited concentrations of beryllium (ranging from 0.0041mg/L to 0.020mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-30 and MW-31 exhibited concentrations of cadmium (e.g., 0.0057mg/L and 0.0069mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-115, MW-121, MW-03, MW-04, MW-30 through MW-35, MW-26, MW-25, MW-29, and MW-36 exhibited concentrations of chromium (ranging from 0.11mg/L to 0.53mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-100, MW-102, MW-105, MW-107, MW-109, MW-111, MW-113 through MW-115, MW-117 through MW-123, MW-02 through MW-04, MW-30 through MW-33, MW-35, MW-38 through MW-43, MW-46, MW-26, MW-27, MW-5, MW-6, MW-7, MW-25, MW-28, MW-29, MW-44, MW-36, and MW-37 exhibited concentrations of iron (ranging from 5.3mg/L to 1,400mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-100, MW-102, MW-105, MW-107, MW-109, MW-111, MW-113 through MW-115, MW-117 through MW-123, MW-03 through MW-04, MW-30 through MW-33, MW-35, MW-39 through MW-43, MW-46, MW-26, MW-27, MW-5, MW-6, MW-25, MW-28, MW-29, MW-44, MW-36, and MW-37 exhibited concentrations of lead (ranging from 0.0077mg/L to 0.75mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-100, MW-102, MW-104 through MW-109, MW-111 through MW-123, MW-01 through MW-04, MW-17, MW-30 through MW-33, MW-35, MW-38, MW-39 through MW-43, MW-46, MW-26, MW-27, MW-5 through MW-7, MW-25, MW-28, MW-29, MW-44, MW-36, and MW-37 exhibited concentrations of manganese (ranging from 0.16mg/L to 28mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-109, MW-115, MW-121, MW-123, MW-03, MW-04, MW-30 through MW-33, MW-35, MW-41, MW-42, MW-26, MW-25, MW-29, MW-36, and MW-37 exhibited concentrations of nickel (ranging from 0.11mg/L to 30mg/L) in excess of the Tier 1 GRO for Class I Groundwater;

- Groundwater samples MW-115, MW-123, MW-30, and MW-25 exhibited concentrations of thallium (ranging from 0.0027mg/L to 0.0051mg/L) in excess of the Tier 1 GRO for Class I Groundwater; and
- Groundwater samples MW-100, MW-102, MW-105, MW-107, MW-109, MW-111, MW-115, MW-117, MW-119, MW-121, MW-123, MW-03, MW-04, MW-30 through MW-33, MW-35, MW-38, MW-41, MW-26, MW-27, MW-5, MW-6, MW-25, MW-28, MW-29, and MW-36 exhibited concentrations of vanadium (ranging from 0.055mg/L to 0.59mg/L) in excess of the Tier 1 GRO for Class I Groundwater.

2.5.2.2 Dissolved Metals

In addition, a total of thirty-two (32) of the above fifty-six (56) groundwater samples were analyzed for dissolved metals. Concentrations of dissolved metals were below laboratory reporting limits and/or Tier 1 GROs for Industrial/Commercial Properties, with the exception of the following dissolved metals:

- Groundwater sample MW-46 exhibited a concentration of dissolved lead (e.g., 0.015mg/L) in excess of the Tier 1 GRO for Class I Groundwater; and
- Groundwater samples MW-104 through MW-106, MW-108, MW-111, MW-112, MW-115 through MW-118, MW-03, and MW-04 exhibited concentrations of dissolved manganese (ranging from 0.18mg/L to 0.49mg/L) in excess of the Tier 1 GRO for Class I Groundwater.

2.6 OFF-SITE ANALYTICAL RESULTS

2.6.1 SOIL ANALYTICAL RESULTS

Soil sample analytical results collected during the WCG March 2015 site investigation activities have been tabulated and presented in **Tables 11** through **15**. Soil sample results were compared to the Tier 1 SROs for Industrial/Commercial Properties, Backgrounds within Chicago-MSAs, and pH-Specific Values for Inorganics for the Soil Component of the Groundwater Ingestion Exposure Route for Class I Groundwater, where applicable. Concentrations of COCs observed above applicable SROs are denoted on the tables. Laboratory analytical reports are included in **Appendix L**. **Figure 39** depicts the concentrations of COCs that exceed the applicable SROs on the tables. The following presents a summary of the soil analytical results for each parameter analyzed as part of the site investigation activities.

2.6.1.1 Target Compound List (TCL) and 1,4-Dioxane

Fourteen (14) soil samples were submitted for TCL laboratory analysis. Concentrations of TCL parameters were below laboratory reporting limits and/or Tier 1 SROs for Residential and Industrial/Commercial Properties, and Construction Worker, with the exception of the following VOCs, SVOCs, Total Metals, and PCBs and Pesticides.

2.6.1.1.1 Volatile Organic Compounds (VOCs)

Soil sample GP-395, collected from 1 to 3 feet bgs from the northern edge of the farm field approximately 1,200 feet north of the terminus of the paved extent of Ritz Road exhibited a concentration of benzene (e.g., 0.079 mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 11**. This data suggests that the benzene concentration may potentially leach from the soil and migrate to the groundwater. However, the deeper soil sample collected from soil probe GP-395 (11 to 13 feet) along with groundwater samples collected from the corresponding monitoring wells (i.e., monitoring wells MW-85 and MW-86) did not exhibit detectable benzene concentrations, which suggests that the detected benzene did not leach from the soil and migrate to the groundwater at that location. The source of the aforementioned detected benzene concentration is not known. Due to the shallow nature and the distance of the detected benzene concentration from the Site (approximately 4,100 feet northwest), WCG believes that the detected benzene concentration is not associated with the Site. Benzene was not detected in any of the samples collected from the onsite soil probes.

2.6.1.2 SPLP TCL Metals

Fourteen (14) soil samples were submitted for SPLP TCL laboratory analysis. Concentrations of SPLP TCL parameters were below laboratory reporting limits and/or Tier 1 SROs for Residential and Industrial/Commercial Properties, and Construction Worker, with the exception of the following:

- Soil samples GP-388 through GP-391, GP-393, GP-394, and GP-395 exhibited concentrations of SPLP aluminum (ranging from 3.6mg/L to 8.4mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil sample GP-390 exhibited a concentration of SPLP antimony (e.g., 0.0075mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater;

- Soil samples GP-388 through GP-391, GP-393, GP-394, and GP-395 exhibited concentrations of SPLP iron (ranging from 5.1mg/L to 7.3mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater; and

- Soil sample GP-390 exhibited a concentration of SPLP manganese (e.g., 0.28mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater.

2.6.2 GROUNDWATER ANALYTICAL RESULTS

Groundwater sample analytical results collected during the WCG March through December 2015 site investigation activities by Cabeno during the January 2016 site investigation activities have been tabulated and presented in **Tables 16** through **20.** Groundwater sample analytical results were compared to the Tier 1 GROs for the Groundwater Ingestion Exposure Route for Class I Groundwater and the Indoor Inhalation Exposure Route for Industrial/Commercial Properties. Laboratory analytical reports from the site investigation activities are included in **Appendix L**. **Figure 39** depicts the concentrations of COCs that exceed the applicable GROs on the tables. The following presents a summary of the groundwater analytical results for each parameter analyzed as part of the May 2015 site investigation activities.

2.6.2.1 Target Compound List (TCL) and 1,4-Dioxane

Thirty-three (33) groundwater samples were submitted for TCL and 1,4-Dioxane laboratory analysis. Concentrations of TCL and 1,4-Dioxane were below laboratory reporting limits and/or Tier 1 SROs for Industrial/Commercial Properties, with the exception of the following VOCs, SVOCs, and Total Metals.

2.6.2.1.1 Volatile Organic Compounds (VOCs)

- Groundwater samples MW-83 and MW-84 exhibited concentrations of 1,1,1-TCA (e.g., 1.5mg/L and 0.28mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;

- Groundwater samples MW-74, MW-76, MW-83, MW-84, MW-90, MW-97, and MCCD-IR-S exhibited concentrations of 1,1-DCE (ranging from 0.013mg/L to 0.24mg/L) in excess of the Tier 1 GRO for Class I Groundwater;

- Groundwater sample MW-84 exhibited a concentration of 1,4-Dioxane (e.g., 0.29mg/L) in excess of the Tier 1 GRO for Class I Groundwater;

- Groundwater samples MW-83, MW-84, and MW-97 exhibited concentrations of PCE (e.g., 0.19mg/L, 0.0074mg/L, and 0.028mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-83, MW-84, MW-89, MW-90, and MW-97 exhibited concentrations of TCE (ranging from 0.0057mg/L to 0.031mg/L) in excess of the Tier 1 GRO for Class I Groundwater; and
- Groundwater samples MW-74, MW-90, MW-97, MCCD-IR-S, and MW-18 exhibited concentrations of vinyl chloride (ranging from 0.0023mg/L to 0.0078mg/L) in excess of the Tier 1 GRO for Class I Groundwater.

2.6.2.1.2 Semivolatile Organic Compounds (SVOCs)

- Groundwater samples MW-74, MW-76, MW-83, MW-84, MW-90, MW-97, MCCD-IR-N, and MCCD-IR-S exhibited concentrations of 1,4-Dioxane (ranging from 0.0093mg/L to 0.062mg/L) in excess of the Tier 1 GRO for Class I Groundwater.

2.6.2.1.3 Total Metals and Cyanide

- Groundwater samples MW-71, MW-75, MW-77, MW-79, MW-80, MW-83, MW-89, MW-90, MW-94, MW-97, SW-1, MW-18 through MW-21, and MW-25 exhibited concentrations of aluminum (ranging from 5.5mg/L to 670mg/L) in excess of Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-79, MW-83, MW-97, SW-1, MW-20, and MW-21 exhibited concentrations of arsenic (ranging from 0.053mg/L to 0.67mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater sample SW-1 exhibited a concentration of barium (e.g., 7.2mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-94 and SW-1 exhibited concentrations of beryllium (e.g., 0.0063mg/L and 0.036mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater sample MW-83 exhibited a concentration of chromium (e.g., 0.22mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater sample SW-1 exhibited a concentration of cobalt (e.g., 1.2mg/L) in excess of the Tier 1 GRO for Class I Groundwater;

- Groundwater samples MW-83, SW-1, and MW-21 exhibited concentrations of copper (e.g., 0.81mg/L, 9.6mg/L, and 1.7mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-71 through MW-75, MW-77, MW-79, MW-80, MW-83, MW-89, MW-90, MW-94, MW-97, MW-98, MW-126, SW-1, MW-18 through MW-21, and MW-25 exhibited concentrations of iron (ranging from 5.2mg/L to 3,300mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-71 through MW-75, MW-77, MW-79, MW-80, MW-83, MW-89, MW-90, MW-94, MW-97, SW-1, MW-18 through MW-21, and MW-25 exhibited concentrations of lead (ranging from 0.0090mg/L to 3.9mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-71 through MW-77, MW-79 through MW-81, MW-83, MW-86, MW-90, MW-94, MW-97, MW-98, MW-125, SW-1, MW-18 through MW-21, and MW-125 exhibited concentrations of manganese (ranging from 0.17mg/L to 59mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-83, MW-94, MW-97, SW-1, MW-20, and MW-21 exhibited concentrations of nickel (ranging from 0.13mg/L to 3.7mg/L) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-80 and MW-21 exhibited concentrations of selenium (e.g., 0.11mg/L and 0.062mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples SW-1, MW-20, and MW-21 exhibited concentrations of thallium (e.g., 0.043mg/L, 0.0036mg/L, and 0.011mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater;
- Groundwater samples MW-80, MW-81, MW-83, MW-94, MW-97, SW-1, MW-20, MW-21, and MW-25 (ranging from 0.059mg/L to 3.5mg/L) in excess of the Tier 1 GRO for Class I Groundwater; and
- Groundwater sample SW-1 (e.g., 17mg/L) in excess of the Tier 1 GRO for Class I Groundwater.

2.6.2.2 Dissolved Metals

In addition, a total of twelve (12) of the above thirty-three (33) groundwater samples were analyzed for dissolved metal laboratory analysis. Concentrations of dissolved metals were

below laboratory reporting limits and/or Tier 1 SROs for Industrial/Commercial Properties, with the exception of the following dissolved metals:

- Groundwater samples MW-76 and MW-83 exhibited concentrations of dissolved manganese (e.g., 0.28mg/L and 1.7mg/L, respectively) in excess of the Tier 1 GRO for Class I Groundwater.

2.7 PRIVATE WATER SUPPLY WELLS ANALYTICAL RESULTS

Figures 22 through **26** depict the locations of the private water supply wells as well as the analytical results for each quarter of 2015.

2.7.1 FIRST QUARTER 2015 RESULTS

On January 21, 2015, the following properties exhibited the following Maximum Contaminant Limit (MCL) exceedances.

- 4907 Ritz Road – Exhibited exceedances of 1,4-Dioxane (0.0318 ug/L) and 1,1-DCE (0.072 ug/L).
- 4913 Ritz Road – Exhibited exceedances of 1,4-Dioxane (0.01407 ug/L), 1,1-Dichlororethene (0.056 ug/L), and TCE (0.013 ug/L).
- 5011 Ritz Road (north well) – Exhibited exceedances of 1,1-DCE (0.0091 ug/L), PCE (0.0064 ug/L), and TCE (0.0054 ug/L).
- 5017 Ritz Road – Exhibited an exceedance of 1,4-Dioxane (0.03288 ug/L).
- 5010 Ritz Road – Exhibited an exceedance of 1,4-Dioxane (0.01572 ug/L).
- 21816 Railroad Street – Exhibited an exceedance of TCE (0.0051 ug/L).

2.7.2 SECOND QUARTER 2015 RESULTS

On May 5, 2015, the following properties exhibited the following Maximum Contaminant Limit (MCL) exceedances:

- 4907 Ritz Road – Exhibited exceedances of 1,4-Dioxane (0.01741 ug/L) and 1,1-DCE (0.054 ug/L).
- 4913 Ritz Road – Exhibited exceedances of 1,4-Dioxane (0.01441 ug/L), 1,1-Dichlororethene (0.029 ug/L), PCE (0.0052 ug/L), and TCE (0.013 ug/L).

- 5011 Ritz Road (north well) – Exhibited exceedances of 1,1-DCE (0.012 ug/L), PCE (0.0076 ug/L), and TCE (0.0054 ug/L).
- 5017 Ritz Road – Exhibited an exceedance of 1,4-Dioxane (0.02684 ug/L).
- 5010 Ritz Road – Exhibited an exceedance of 1,4-Dioxane (0.01146 ug/L).
- 21816 Railroad Street – Exhibited an exceedance of TCE (0.0057 ug/L).

2.7.3 THIRD QUARTER 2015 RESULTS

On August 12, 2015, the following properties exhibited the following Maximum Contaminant Limit (MCL) exceedances:

- 4907 Ritz Road – Exhibited exceedances of 1,4-Dioxane (0.023 ug/L) and 1,1-DCE (0.055 ug/L).
- 4913 Ritz Road – Exhibited exceedances of 1,1-Dichlororethene (0.023 ug/L) and TCE (0.015 ug/L).
- 5011 Ritz Road (north well) – Exhibited exceedances of 1,4-Dioxane (0.014 ug/L), 1,1-DCE (0.012 ug/L), PCE (0.0061 ug/L), and TCE (0.0057 ug/L).
- 5017 Ritz Road – Exhibited an exceedance of 1,4-Dioxane (0.029 ug/L).
- 5010 Ritz Road – Exhibited an exceedance of 1,4-Dioxane (0.015 ug/L).

2.7.4 FOURTH QUARTER 2015 RESULTS

On November 30, 2015, the following properties exhibited the following Maximum Contaminant Limit (MCL) exceedances:

- 4907 Ritz Road – Exhibited exceedances of 1,4-Dioxane (0.015 ug/L) and 1,1-DCE (0.036 ug/L).
- 4913 Ritz Road – Exhibited exceedances of 1,1-Dichlororethene (0.024 ug/L), PCE (0.006 ug/L), and TCE (0.016 ug/L).
- 5011 Ritz Road (north well) – Exhibited exceedances of 1,4-Dioxane (0.015 ug/L), 1,1-DCE (0.015 ug/L), PCE (0.0068 ug/L), and TCE (0.0049 ug/L).
- 5017 Ritz Road – Exhibited an exceedance of 1,4-Dioxane (0.031 ug/L).
- 5010 Ritz Road – Exhibited an exceedance of 1,4-Dioxane (0.015 ug/L).

2.8 ENDANGERMENT ASSESSMENT

2.8.1 RECOGNIZED ENVIRONMENTAL CONDITIONS

ASTM E 1527-13 defines a recognized environmental condition as follows:

> *The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.*

As summarized in **Section 2.1.2**, the Site was originally developed in the late 1890s and was first utilized as a rail yard and railroad engine manufacturing/maintenance facility. The Site was reportedly purchased by Arnold in the early 1900s, with their magnetic operations/manufacturing beginning in the 1950s. A total of 12 USTs, several ASTs PCB-containing transformers and hazardous waste storage areas have been identified at the Site. EGSL indicated in the FSI Report that current and former UST locations are considered an area of concern; however, while the identification of many closed in place and removed USTs is known, the location of all such USTs has not been fully defined at this time.

In addition, based on the information contained in a February 20, 2014 letter from EGSL to the IEPA that provided a response to the IEPA's FSI Report comment letter dated January 21, 2014, EGSL indicated that given the history of the Site and a review of previous uses of specific buildings and areas, EGSL evaluated the following areas on the Site and classified some of these areas as recognized environmental conditions (RECs) and or areas of concern (AOC) as summarized below.

- Building 1: Built in the late 1890s and demolished around 2002. Building was approximately 40,000 square feet in size and was originally utilized for railroad engine manufacturing and repair. Arnold later utilized Building 1 for magnet production, pressing operations, and heat treating. Historical usage has been reported to include the generation of spent mineral spirits, TCE and 1,1,1-TCA and possible PCB usage. As such, Building 1 is classified as an REC.
- Building 2/3/4/7: Original portion of the building (Building 2) constructed in the 1950s, with subsequent additions (Buildings 3, 4, and 7) later constructed. The entire building is approximately 135,000 square feet in size and was formerly utilized for office space, maintenance, shipping, and miscellaneous storage. Building 2/3/4/7 was historically utilized for tape-core, powder-core, and winding operations associated with magnetic

manufacturing; all manufacturing operations ceased in this building in approximately 2002 and the building is currently unused. Underground storage tanks have been associated with this building complex and at least one tank is believed to be in place under the building slab. As such, Building 2/3/4/7 is classified as an REC.

- Building 5: Constructed in the 1950s/1960s and is approximately 74,000 square feet in size. Building 5 is currently and historically has been utilized by Arnold for their Alnico Products Division, which manufactures magnetic components by molting, melting, and finishing Aluminum, Nickel, and Cobalt. This building reportedly generated spent chlorinated solvents prior to 2001, and according to representatives of Arnold, chlorinated solvents have not been used on the Site since at least 2001. As such, this building is classified as an REC.
- Building 6: Constructed in the 1950s/1960s and demolished in the 1990s. Building 6 was approximately 42,000 square feet in size and was historically occupied by the Strontium Ferrite Department, which conducted wet processing, mixed metal sludge pressing, iron powder compressing, and baking/grinding operations associated with motor-arc manufacturing. Pond 6 was formerly located to the northwest of this building. According to representatives of Arnold, former Pond 6 consisted of a holding pond that served to capture site stormwater runoff, which was subsequently filled in with soil. Chlorinated solvent impacted soil and groundwater have been identified within or next to the footprint of this building. While no use of chlorinated solvents have been associated with this building, the discovery of chlorinated solvents in or adjacent to the former structure warrants this area to be classified as an REC.
- Building 8: Constructed between 1950 and 1970 and is approximately 3,000 square feet in size. Building 8 is utilized for the storage of landscaping and maintenance equipment, and also contains an approximately 850-foot deep water supply well that is utilized for potable water for the Site. An associated 100,000-gallon above-ground water holding tank is located directly south of Building 8. Chemicals for treating the well water prior to pumping into the storage tank are stored in this building. This building is considered a REC.
- Building 9: Constructed at an unknown date and demolished in the 1990s. Building 9 was approximately 5,000-square feet in size and was utilized as an airplane hangar associated with an adjacent private airplane landing strip (no longer present). This building formerly had a 1,500 gallon aviation fuel UST associated with it. As such, this building is a REC.

- Building 10: Constructed at an unknown date. Building 10 is approximately 3,000 square feet in size and is currently/has historically been utilized for miscellaneous storage, 55-gallon drum storage, and drum cleaning. Based on the former activity in this area, Building 10 is a REC.
- Building 11/14. Original portion of the building (Building 11) was constructed in the 1950s with subsequent addition (Building 14) later constructed. The entire building is approximately 54,000 square feet in size and has been utilized by Arnold's Rolled Products Division since the late 1960s. Operations that currently exist within Building 11/14 involve the rolling and finishing operations associated with the production of thin-gauge rolled steel products. Operations conducted in this building reportedly generated spent chlorinated solvents during cleaning and degreasing operations. As such, this building is classified as an REC.
- Building 12: Constructed by 1970 and is approximately 14,000 square feet in size. Currently and historically utilized as a parts/storage warehouse. This building is not considered a REC at this time.
- Building 16: Constructed after 1987 and is approximately 3,200 square feet in size. Currently and historically utilized as hazardous and non-hazardous waste/materials storage shed. The storage of hazardous waste in this building classifies it as a REC.
- Treatment Ponds: The wastewater treatment ponds are reportedly lined with polyethylene and rest on a bed of bentonite. Groundwater analysis from wells installed adjacent to the ponds has been reported to contain chlorinated solvents and volatile organic compounds used in the processing of wastewater. Water samples collected from the treatment ponds were analyzed for VOCs. The laboratory reported the presence of VOCs. As such, the treatment ponds are a REC.
- The cooling ponds contain water discharged from all onsite operations. Water flows from the terminus of the cooling ponds to drainage ditches located north and south of the cooling ponds. Water exiting the cooling ponds to the south flows to a percolation field located southeast of building 11/14 via an unlined drainage ditch. Water exiting the north end of the cooling ponds flows offsite toward the railroad right-of-way via an unlined drainage ditch. The final receptor of this water is unknown. Based on the analytical results confirming the presence of VOCs present in the cooling pond water, the cooling ponds, overflow ditches, and percolation field are considered Areas of Concern.

Other buildings associated with the Site include a security booth located by the main entrance, a pump house associated with the wastewater treatment system and pond system and a pump house associated with the fire suppression system. EGSL indicated that these areas are not considered RECs at this time.

In an EGSL June 3, 2014 response letter to the IEPA concerning comments provided by the IEPA in a comment letter dated April 22, 2014 (June 2014 EGSL Response Letter), EGSL stated that the RECs are generally entire buildings, and other AOCs include the "cooling ponds" and related areas that receive discharges from the ponds. Based on the general information provided by EGSL, the IEPA requested additional detailed information concerning the RECs at the Site. Pursuant to the IEPA's request, EGSL obtained and reviewed historical plant drawings depicting certain historical site features. Based on EGSL's review of the historical plant drawings, EGSL identified numerous RECs and AOCs, which were summarized in the June 2014 EGSL Response Letter. Below is a summary of EGSL's additional information concerning the RECs and AOCs as identified by EGSL in each of the figures that were attached to the June 2014 EGSL Response Letter to the IEPA, which is included in **Appendix D** of this report.

Figure 1

- In a 1952 drawing of Building 2 and the surrounding areas (Figure 1 of the June 2014 EGSL Response Letter), an oil tank with assumed underground piping were noted at the southeast corner of Building 2. The historical presence of the tank and ancillary piping is considered a REC for oils including PCBs.
- Based on the absence of any wastewater treatment system or city sewer line connections illustrated on the 1952 drawing, ESGL assumed that plant waste waters were discharged to the septic field and sewer lines as illustrated along the northern site boundary north of Building 2. Given the historical nature of the manufacturing at the facility, any of the contaminants of concern included on the IEPA target compound list (TCL) may have been discharged through these utility lines and into the septic field. EGSL classified the septic and sewer lines and outfalls as areas of concern (AOC) for TCL.

Figure 2

- In a 1961 drawing of the Site (Figure 2 of the June 2014 EGSL Response Letter), Building 1 is the oldest building and is illustrated with a large transformer station along the southern façade of the building. Historical uses of this building appear to have included use as a power plant and a transformer manufacturing plant. PCBs are suspected of being associated with the features of this building. An untitled document dated

September 30, 1993 states that these transformers do not contain PCBs. Based on the age and prior use of Building 1, EGSL considered Building 1 an AOC.

- Two tanks containing "methanol" and "chlorothine" are noted along the north side of Building 4. These tanks have reportedly been removed. No excavation sampling is believed to have been performed upon removal of these tanks. EGSL classified these tanks as a REC for VOCs.
- An acetone tank is reported to have been removed from an area situated east of Building 4. EGSL indicated that it is believed that no excavation sampling was performed upon removal of the tank. EGSL classified the historical presence of an acetone tank as a REC for VOCs.
- A vegetable oil tank was illustrated along the northern side of Building 5. EGSL indicated that vegetable oil is an unregulated substance, but the use of the tank may have changed over the years. EGSL classified the vegetable oil tank as a REC for oils, including PCBs.
- A 10,000-gallon gasoline tank was illustrated east of Building 9 (former airplane hangar). EGSL indicated the tank has been removed. EGSL indicated that upon removal, it was discovered that the gasoline tank was a 1,500-gallon tank. Limited sampling was performed associated with this tank removal. In light of this, EGSL classified the historical 1,500-gallon gasoline tank as a REC for aviation fuel (gasoline and lead).
- A waste tank was noted between Buildings 12 and 16. The waste tank is illustrated as a double wall 300-gallon tank. The tank is not labeled as an AST or UST. In light of this, EGSL classified the waste tank as a REC for TCL.
- A fuel oil tank is located beneath the foundation of Building 7. EGSL classified the fuel oil tank as a REC for fuel oil.
- Historic ditch lines are illustrated on Figure 2 of the June 2014 EGSL Response Letter. These ditches are historical figures that may have been used to convey plant process water to what is considered Pond 5. According to representatives of Arnold, Pond 5 is not a treatment pond, but rather primarily a pond used to capture site stormwater runoff. EGSL classified these ditches as an AOC for TCL.
- A potential sewer outflow is illustrated at the north end of the Site between the ponds and Building 2/3/4/7. EGSL indicated that water "continues to flow offsite to the north through this outflow." EGSL also indicated that historical plant process water could

have been released through this outflow. EGSL classified the sewer outflow as an AOC for TCL.

- Two 8,000-gallon USTs were removed in 2007 from an area reportedly located behind former Building 1. The former contents of the tanks are unknown. EGSL classified the area in and around the two former 8,000-gallon USTs as a REC for VOCs, SVOCs and PCBs.

Figure 3

- Figure 3 of the June 2014 EGSL Response Letter illustrates Building 2/3/4/7. Previously discussed features depicted in this figure include the oil tank beneath Building 7 foundation, a fuel oil tank east of Building 7 and south of Building 2, an acetone tank situated east of Building 4, and the two tanks (alcohol and chlorothine tanks) located north of Building 4.
- Building 10 was illustrated as a paint storage building. EGSL indicated that numerous historical paint spills are associated with Building 10. EGSL classified Building 10 as a REC for VOCs, oils, including PCBs and metals.
- Transformers are located along the north side of Building 4. Given the age of these transformers, PCB-containing oil is suspect. EGSL classified the presence of transformers north of Building 10 as a REC.
- A 1,500-gallon oil tank is depicted east of the transformers on the north side of Building 4. EGSL classified the presence of a 1,500-gallon oil as a REC for oils, including PCBs.
- Two mill oil tanks located beneath the floor along the eastern edge of Building 4. EGSL classified the presence of two mill oil tanks as a REC for oils, including PCBs.
- Generators are depicted in Room 99 of Building 4. Generators at the Site have been identified as both electric and diesel powered. EGSL classified the presence of generators in Building 4 as an AOC for diesel fuel.
- Building 4 is illustrated with a paint room and "MPP office and stores". The paint used in this building has been identified as containing organic solvents. EGSL classified this area as a REC for VOCs, metals and oils, including PCBs.
- Electrical Transformers are depicted along the south walls of Buildings 2 and 7 and along the north wall of Building 5. Given the age of these transformers, EGSL classified the presence of electrical transformers as a REC for PCBs.

- An emergency generator is illustrated at the south wall of Building 2 and west of Building 7. The small square object adjacent to the generator is assumed to be a fuel tank. EGSL classified the presence of an emergency generator and suspect tank as a REC for fuel oils.
- A 1,500-gallon core oil tank is depicted on the north wall of Building 5. EGSL classified the presence of a 1,500-gallon core oil tank as a REC for oils, including PCBs.

Figure 4

- Etching tanks are shown at the north wall of Building 4. EGSL indicated that these features may be an AOC for acids.
- Hydraulic equipment is depicted near the central portion of Building 4. It is unclear if this feature is a stand-alone piece of equipment or a source of hydraulic oil for surrounding equipment. EGSL indicated that the hydraulic equipment is an AOC for oils, including PCBs.
- Room 68 is shown as an old paint room. Given the nature of paints used at the facility, EGSL indicated that the old paint room is considered an AOC for VOCs, metals and PCBs.
- A boiler is illustrated at the western wall of Building 4. A pump is depicted to the north of the boiler. It is unclear if this pump is powered by electricity or diesel fuel. EGSL indicated that the noted pump north of the boiler is an AOC.
- Dust collection systems are illustrated at the western exterior wall of Building 4. Given the types of metals used at the facility, including cobalt, EGSL indicated that the dust collection systems are an AOC.
- A hydraulic reservoir is present at the southwest corner of Building 2. EGSL indicated that the hydraulic reservoir is considered a REC for oils, including PCBs.
- An acid table is illustrated in the western portion of Building 2. EGSL lists this feature as an AOC.
- A rinse table is also depicted in the western portion of Building 2. Given the solvents used at the plant, EGSL lists the rinse table as an AOC.

Figure 5

- Three electrical transformers are illustrated along the north and south walls of Building 5. EGSL classified the presence of electrical transformers as a REC for PCBs.

- A degreaser station (possible solvents) is depicted at the northwest corner of Building 5. EGSL classified the presence of a degreaser station as a REC.
- A production machine shop is located near the northwest corner of Building 5. EGSL indicated that the production of cuttings and use of oils is suspect with this room. EGSL classified the presence of a production machine shop as an AOC for metals and oils, including PCBs.
- Metals storage is located at the northwest corner of Building 5. EGSL considers the metal storage area as a possible AOC for cobalt.
- An attritor room is located at the west end of Building 5. Lubricants are generally used in this process. EGSL considers the attritor room area as an AOC for possible VOCs.
- A washer is shown at the southwest corner of Building 5. It is unclear if this is a water or solvent washer. EGSL considers this feature as an AOC for solvents.

Figure 6

- Mineral oil pumping and staging tanks are illustrated at the southeast corner of Building 11. EGSL classified the presence of mineral oil pumping and staging tanks as a REC for oils.
- A pump house is located west of Pond 1. A detail of this pump house illustrates one diesel pump. EGSL classified the presence of a pump house as a REC for diesel fuel.

Figure 7

- Acetone and methanol aboveground tanks are illustrated northwest of Building 4. These tanks contain underground piping to Building 4. EGSL classified the presence of the underground piping as a REC for VOCs.
- Building 16 has been identified as a liquid waste storage Building. EGSL considers Building 16 as an AOC for TCL.

Figure 8

- Four pump stations are depicted throughout the Site. Pump Stations 1 and 2 are referenced with a tank at each location. Pumping Stations 3 and 4 have no tanks referenced with them. EGSL considers the presence of four pumping stations as AOCs for fuel oil.

Figure 9

- Figure 9 illustrates the construction of the settling ponds (i.e., Ponds 1 through 3). The ponds are illustrated with a note stating the ponds to be sealed with bentonite. According to EGSL, visual inspection of the ponds revealed that they are also lined with a membrane material. The liner was observed with joints that are not sealed providing direct contact between the pond water and the earthen material below. Also depicted in the figure are distribution pipes apparently protruding at the bottom of each pond connecting one with another. According to EGSL, these protrusions can act as a manmade migration pathway allowing seepage from the pond to the subsurface. EGSL considers the ponds as a REC for TCL.

Figure 10

- Pits are depicted in Building 14, which are approximately 10 feet below grade. The pits illustrated along the north wall are labeled as acid pits. The other three pits are not labeled. Even if the pits are lined, the cold joints can act as migration pathways of contaminants of concern. EGSL considers the presence of the pits as an AOC for VOCs and oils, including PCBs.

Figure 11

- A septic system is shown at the southwest corner of former Building 6. According to EGSL, the origin of the septic lines is unknown and may have conveyed plant process waste to the septic field. EGSL considers the septic system adjacent to the former Building 6 as an AOC for TCL.
- A “mud line” is depicted extending to a “mud pond” located at the northwest corner of former Building 6. In addition, an overflow line is illustrated along the north side of former Building 6 connecting the mud pond to the settling ponds. EGSL indicated that this line is believed to convey process water from Building 6 to either the mud pond or the settling ponds. EGSL considers the mud line as an AOC for TCL.
- The former Building 6 is illustrated with a generator on the north wall of the former building. The power source for this generator is unclear. EGSL considers the generator along the north wall as an AOC for fuel oil.
- A 1000 KVA electrical transformer bank is located along the north wall of former Building 6. Based on the date of the drawing (i.e., 1966, electrical transformers of this era are known to have contained PCB oils. EGSL considers the former transformer location as a REC for PCBs.

- According to EGSL, Former Building 6 is believed to be used for painting finished product. The painting process may have involved powder coating processes. Cleaning prior to powder coating may have occurred and may have involved solvents in the cleaning process. Specific locations of the work stations and processes are not identified. EGSL considers the entire former Building 6 as an AOC for VOCs and possibly oils and metals, depending on the finish coating applied.

Figure 12

- Figure 12 illustrates the layout of the plant in 1961. Of note on this figure consisting of a hand drawn inclusion of apparent additional parking south and southeast of Building 5, appears to answer the question of an apparent building foundation on historical aerial photographs and other overhead views of the site. EGSL does not consider this area to represent a REC or AOC.

As described in **Section 2.2.1**, soil and groundwater samples were collected to assess the general subsurface environmental condition of the Site as well as the nature and extent of previously identified subsurface impacts associated with certain above-listed RECs. The subsurface soil and groundwater exhibited COCs exceeding Tier 1 SROs and GROs.

The COCs exceeding applicable Tier 1 SROs for Residential and/or Industrial/Commercial Properties include several VOCs, PNAs, SVOCs, or certain metals. A single soil sample indicated PCB Aroclor 1248 at a concentration above a TACO Tier 1 SRO. In addition, on-site COCs exceeding TACO Tier 1 GROs for Class I Groundwater include several VOCs, 1,4-dioxane, or dissolved metals.

Based on EGSL's FSI Report and soil and groundwater assessment activities documented as part of this CSI, chlorinated solvent-impacted groundwater exceeding TACO Tier I GROs for Class I groundwater appears to extend across the northern portion of the Site and extend offsite onto the northern and northwestern adjoining properties. According to EGSL's FSI Report and soil and groundwater assessment activities documented as part of this CSI, several source areas are likely and include: former Building 1, Building 2/3/4/7, the settling ponds, and former Building 6.

The COCs exceeding applicable Tier 1 GROs for Class I Groundwater include certain total inorganics (see **Tables 9** and **19**). However, groundwater samples submitted for laboratory analysis of dissolved inorganics were below laboratory reporting limits and/or Tier 1 GROs for Class I groundwater. As addressed above, based on the published IEPA documents, the total

inorganic groundwater impacts are believed to be associated with particulates in the soil material and not the result of a release from historical use of the Site.

The IEPA has identified certain potential exposure routes to be evaluated at sites for which TACO remediation objectives are established. These exposure routes include Outdoor Soil Inhalation, Soil Ingestion, Indoor Soil Inhalation, and the Soil and Groundwater Components of Groundwater Ingestion for Class I Groundwater. The applicability of these exposure routes was undertaken by evaluating physical site conditions encountered during the site investigation.

2.8.2 DE MINIMIS CONDITIONS

No specific de minimis conditions were identified during the course of the soil and groundwater assessment activities summarized in this report.

2.8.3 NATURE, CONCENTRATION, AND EXTENT OF CONTAMINANTS OF CONCERN

As described in **Section 2.2.1**, soil and groundwater samples were collected to assess the general subsurface environmental condition of the Site and off-site area as well as the nature and extent of previously identified subsurface impacts associated with certain above-listed RECs. The subsurface soil or groundwater exhibited COCs exceeding applicable TACO Tier 1 SROs or GROs in both on-Site and off-site areas.

On-site the COCs exceeding applicable Tier 1 SROs include several VOCs, PNAs, SVOCs, or certain metals. A single soil sample was detected with Aroclor 1248 (a PCB) at a concentration above a TACO Tier 1 SRO. The nature and extent of on-site soil impacts are illustrated in **Figures 40** through **Figure 53**.

On-site COCs exceeding applicable Tier 1 GROs for Class I Groundwater include PCE, TCE, 1,1,1-TCA, carbon tetrachloride, 1,4-dioxane, or total metals. The concentration, nature, and extent of these impacts are illustrated in **Figure 54** through **Figure 73**. Except for lead in one sample and manganese in several, groundwater samples submitted for laboratory analysis of dissolved metals were below laboratory reporting limits and/or Tier 1 GROs for Class I Groundwater.

The IEPA has identified certain potential exposure routes to be evaluated at sites for which TACO remediation objectives are established. These exposure routes include:

1. Outdoor Soil Inhalation;
2. Soil Ingestion;
3. Soil Component of the Groundwater Ingestion exposure route (Class I Groundwater);
4. Groundwater Ingestion (Class I Groundwater); and,

5. Indoor Inhalation from VOC-impacted groundwater.

The applicability of these exposure routes was evaluated by considering the physical site conditions encountered during the site investigation.

The following presents a summary of the COCs observed at the Site and off-site areas potentially associated with the recognized environmental conditions. COCs are defined under 35 IAC 740.120 as:

> "*any contaminant that is expected to be present at the site based upon past and current land uses and associated releases that are known to the remediation applicant based upon reasonable inquiry.*"

The COCs have been assessed from the results of analytical testing of soil and groundwater samples collected at the Site and in off-site areas. The COCs consist of the IEPA SRP Target Compound List. Soil, groundwater, outdoor air, and indoor air are the media potentially affected.

The nature and extent of COC impacts is based on the data gathered during the WCG site investigation activities as well as the historical data gathered by EGSL in 2013 and 2014. As a result, COCs exhibiting concentrations above Tier 1 Remediation Objectives at the Site and offsite are discussed in the following sections.

2.8.4 ON-SITE EXPOSURE ROUTE EVALUATION SUMMARY

COCs exhibiting concentrations above Tier 1 Remediation Objectives at the Site are discussed in the following sections.

2.8.4.1 Outdoor Soil Inhalation Exposure Route (Industrial/Commercial)

The following subsections describe the occurrence, nature, concentration, and extent of COCs detected in soil samples from the Site at concentrations above their respective Tier 1 SROs for the Outdoor Soil Inhalation exposure route.

2.8.4.1.1 Area of Building 2/3/4/7

Tetrachloroethene (PCE) was detected in a single soil sample at a concentration of 20 mg/kg, which is equal to the Tier I SRO for the Outdoor Inhalation exposure route. This sample was collected from a depth of 15 to 17 feet bgs in soil probe GP-425 advanced just north of Building 2/3/4/7 as shown on **Figure 46**. Lesser soil concentrations detected in soil probes GP-316, GP-385, GP-386, and GP-426 indicated a limited horizontal extent to the east, south, and west. The absence of soil concentration data directly to the north is a data gap because the northerly

extent of soil impact is not yet defined. Results for additional soil samples collected from GP-425 indicated lesser concentrations of PCE at shallower and deeper intervals as listed in **Table 1**. Insomuch as there is more than 10 feet of soil above this interval exhibiting concentrations of PCE below the Tier 1 SRO for Outdoor Soil Inhalation, this single occurrence is not regarded as a significant concern.

2.8.4.1.2 Area of Former Building 1

Total mercury was detected in a single soil sample from soil probe GP-334 from 1 to 3 feet bgs, which potentially exceeds the Tier I SRO Soil Inhalation by construction workers as listed in **Table 4**. Surrounding soil probes (GP-333, GP-397, GP-398, GP-399, and GP-415) did not exhibit similarly elevated mercury concentrations, indicating that the horizontal extent is limited to a small area of the Building 1 footprint. A deeper soil sample collected from GP-334 collected from a depth of 4 to 6 feet bgs exhibited a total mercury concentration of <0.021 mg/kg, indicating the mercury impact extends no deeper than approximately 4 feet bgs. Additionally, elemental mercury is typically oxidized or otherwise reacted into less inhalable forms, suggesting that the single elevated concentration of total mercury is not likely to comprise a significant actual exposure risk.

Total nickel was detected in a single soil sample from soil probe GP-329 from 1 to 3 feet bgs, which exceeds the Tier I SRO Soil Inhalation for Commercial/Industrial Properties and the construction worker scenario as listed in **Table 4**. Surrounding soil probes (GP-332, GP-418, GP-430, GP-328, and GP-330) did not exhibit similarly elevated nickel concentrations, indicating that the horizontal extent is limited to a small area of the Building 1 footprint. A deeper soil sample collected from GP-329 collected from a depth of 8 to 10 feet bgs exhibited a total nickel concentration of 390 mg/kg, indicating the nickel impact extends no deeper than approximately 8 feet bgs.

Other COCs were not detected in on-Site soil at concentrations above the Tier I SRO for Outdoor Soil Inhalation.

2.8.4.2 Soil Ingestion Exposure Route (On-Site Industrial/Commercial)

The following subsections describe the occurrence, nature, concentration, and extent of COCs detected in soil samples from the Site at concentrations above their respective Tier 1 SROs for Soil Ingestion.

2.8.4.3 Area of Former Building 1

Soil sample GP-328 from 1 to 3 feet bgs exhibited benzo(a)anthracene, benzo(a)pyrene and dibenzo(a,h)anthracene concentrations (i.e., 4.7 mg/kg, 2.6 mg/kg, and 1.3 mg/kg, respectively) in excess of the Tier 1 SRO for the Soil Ingestion Exposure Route. Soil sample GP-422 from 1 to 3 feet bgs exhibited benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene concentrations (i.e., 25 mg/kg, 24 mg/kg, 27 mg/kg, 6.7 mg/kg, and 14 mg/kg, respectively) in excess of the Tier 1 SRO for the Soil Ingestion Exposure Route for Industrial/Commercial Properties. These soil probes are located in the area of former Building 1 as shown on **Figures 47** and **48**. Results for deeper soil samples collected from these same soil probes as listed in **Table 3** indicate concentrations well below their respective Tier I SROs for Soil Ingestion, indicating that the vertical extent of contamination beneath the former Building 1 area extend no deeper than approximately 3 feet bgs.

Soil samples GP-329 (1 to 3 feet bgs), GP-331 (5 to 7 feet bgs), GP-333 (1 to 3 feet bgs), GP-396 (1 to 3 feet and 5 to 7 feet bgs), and GP-431 (1 to 3 feet bgs) exhibited arsenic concentrations (ranging from 14 mg/kg to 310 mg/kg) in excess of the Tier 1 SRO for the Soil Ingestion Exposure Route. Soil samples GP-329 (1 to 3 feet bgs) and GP-334 (1 to 3 feet bgs) exhibited mercury concentrations (i.e., 1.0 mg/kg and 0.55 mg/kg, respectively) in excess of the Tier 1 SRO for the Soil Ingestion Route for Construction Workers. Soil sample GP-329 (1 to 3 feet bgs) also exhibited cobalt, copper, and nickel concentrations (i.e., 66,000 mg/kg, 16,000 mg/kg, and 57,000 mg/kg, respectively) in excess of the Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties, or the Construction Worker scenario. These soil probes are located in the area of former Building 1 as shown on **Figures 50** and **52**. Results for deeper soil samples collected from these same soil probes as listed in **Table 4** typically indicate concentrations well below their respective Tier I SROs for Soil Ingestion, indicating that the vertical extent of contamination beneath the former Building 1 area extend no deeper than approximately 3 feet bgs. Soil probe GP-396 is an exception as indicated above, where arsenic impact extends to at least 7 feet bgs. Results for soil samples collected from the surrounding soil probes suggest that the horizontal extent of the metals impact is localized to the area of former Building 1.

2.8.4.3.1 Area of Building 2/3/4/7

Soil sample GP-312 (1 to 3 feet bgs) exhibited an arsenic concentration of 36 mg/kg, exceeding the Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties. However; results for

surrounding soil probes (GP-313, GP-315, GP-318, GP-384, GP-385, GP-426, and GP-427) did not exhibit similarly elevated concentrations of arsenic as shown on **Table 4**, indicating that the horizontal extent is limited (**Figure 52**). Additionally, the deeper sample collected from GP-312 from 5 to 7 feet bgs exhibited arsenic at 9.0 mg/kg, suggesting that the elevated soil arsenic concentration at soil probe GP-312 just north of Building 2/3/4/7 extends no deeper than approximately 5 feet.

2.8.4.3.2 Area of Building 11/14

Soil samples GP-374 (1 to 3 feet and 6 to 8 feet) collected immediately east of Building 11/14 exhibited Aroclor 1248 concentrations of 17 mg/kg and 2.7 mg/kg, respectively, in excess of the Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties as shown on **Figure 53**. However; results for surrounding soil probes (GP-373, GP-380, GP-381, GP-382, and others), did not exhibit similar concentrations of Aroclor 1248 as shown in **Table 5**. Additionally, a deeper soil sample collected from co-located soil probe GP-374D exhibited no detectable concentration of Aroclor 1248 at 13 to 15 feet bgs, suggesting that the vertical extent of PCB impact is limited to a shallower depth.

2.8.4.4 Soil Component of Groundwater Ingestion (On-Site, Class I Groundwater)

The following subsections describe the occurrence, nature, concentration, and extent of COCs detected in soil samples from the Site at concentrations above their respective Tier 1 SROs for the Soil Component of the Groundwater Ingestion exposure route for Class I Groundwater. For the metals, the assessment considers results for SPLP analyses of 155 separate soil samples as previously discussed in **Section 2.5.1.2**.

2.8.4.5 VOCs – Migration to Groundwater

2.8.4.5.1 Area of Former Building 1

Soil samples GP-333 from 1 to 3 feet bgs and 3 to 5 feet bgs, GP-421 from 25 to 27 feet bgs (below the water table), and GP-422 from 18 to 20 feet and 23 to 25 feet bgs, advanced at the location for Former Building 1, exhibited PCE concentrations ranging from 0.084 to 1.0 mg/kg, in excess of the Tier 1 SRO for the Soil Component of the Groundwater Ingestion Exposure Route for Class I Groundwater as shown on **Table 1**.

2.8.4.5.2 Area of Building 2/3/4/7

Soil samples GP-312, GP-312D, GP-314, GP-314D, GP-315, GP-316, GP-317, GP-320, GP-321, GP-321D, GP-322, GP-322D, GP-348, GP-384, GP-387, GP-420, and GP-425 through GP-427 all

advanced either through the floor slab or just north of Building 2/3/4/7 to certain depths exhibited PCE concentrations (ranging from 0.061mg/kg to 20mg/kg) which are in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 1**. The estimated extent of PCE impacts in soil are shown in **Figures 43** to **46**.

Soil samples GP-321, GP-321D, GP-327, GP-327D, GP-415, and GP-421 exhibited 1,1-DCE concentrations (ranging from 0.062mg/kg to 0.75mg/kg) which are in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 1**. The estimated extent of 1,1-DCE impacts in soil are shown in **Figures 40** to **42**.

Soil samples GP-321D, GP-387, and GP-425 exhibited 1,4-Dioxane concentrations (ranging from 0.24mg/kg to 0.75mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I.

2.8.4.5.3 Area of Building 5

Soil Sample GP-341 from 8 to 10 feet bgs, advanced through the floor of Building 5, exhibited PCE at 0.13 mg/kg, which is in excess of the Tier 1 SRO for the Soil Component of the Groundwater Ingestion Exposure Route for Class I Groundwater as shown on **Table 1**. The estimated extent of PCE impacts in soil are shown in **Figures 43** to **46**.

Soil sample GP-348D from 18 to 20 feet bgs exhibited 1,1-DCE at 0.20 mg/kg, which is in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 1**. The estimated extent of 1,1-DCE impacts in soil are shown in **Figures 40** to **42**.

2.8.4.6 SVOCs – Migration to Groundwater

2.8.4.6.1 Area of Former Building 1

Soil samples GP-328 from 1 to 3 feet bgs exhibited a benzo(a)anthracene concentrations (4.7mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater and a carbazole concentration (1.1mg/kg) in excess of their respective Tier 1 SROs for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 3**. This appears to be an isolated condition, with surrounding soil probes GP-329, GP330, GP421, GP-422, GP430, and GP-431 exhibiting lower concentrations.

Soil sample GP-422 from 1 to 3 feet bgs exhibited benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthreacene, and indeno(1,2,3-

cd)pyrene concentrations (i.e., 25mg/kg, 24mg/kg, 27mg/kg, 18mg/kg, 6.7mg/kg, and 14mg/kg, respectively) in excess of the Tier 1 SRO Soil Ingestion Route for Residential Properties, Tier 1 SRO Soil Ingestion Route for Industrial/Commercial Properties, and the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 3**. This appears to be an isolated condition, with surrounding soil probes GP-328, GP-331, GP-421, and GP-423 exhibiting lower concentrations to the east, south, and west. The northerly extent beyond the Property boundary is not currently defined, but is not expected to extend beyond the adjoining railroad right-of-way. The estimated extent of PNA impacts in soil are shown in **Figures 47** and **48**.

2.8.4.6.2 Area of Building 5

Soil sample GP-346 from 1 to 3 feet bgs exhibited a 2,4-Dinitrotoluene concentration (0.51mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 2**.

2.8.4.7 Metals – Migration to Groundwater

The following subsections describe the occurrence, nature, concentration, and extent of certain metals detected in soil samples from the Site at concentrations above their respective Tier 1 SROs for the Soil Component of the Groundwater Ingestion exposure route for Class I Groundwater. The estimated extent of metal impacts in soil are shown in **Figure 49**.

2.8.4.7.1 SPLP Aluminum – Migration to Groundwater

The majority of soil samples collected from the Site exhibited SPLP concentrations of aluminum at concentrations generally ranging from 3.6 mg/L to 25 mg/L, which are above the Tier 1 SRO for the Soil Component of the Groundwater Ingestion exposure route for Class I Groundwater as listed on **Table 4**. Aluminum is one of the 10 most abundant elements in the earth's crust at 8.23 percent by weight according to the CRC Handbook of Chemistry and Physics, 77th Edition (referenced after http://education.jlab.org/glossary/abund_ele.html). The high abundance of aluminum notwithstanding; dissolved aluminum was not detected in any of the groundwater samples collected from the Site at concentrations above its Class I GRO as previously discussed in **Section 2.5.2.2**. The occurrence of aluminum in soil is not; therefore, regarded as significant.

2.8.4.7.2 SPLP Antimony – Migration to Groundwater

Four soil samples, GP-328 and GP-329 collected from the area of former Building 1 and GP-340 and GP-346 collected through the floor of Building 5 (all collected from 1 to 3 feet bgs), exhibited SPLP antimony concentrations (ranging from 0.0064 mg/L to 0.012 mg/L) in excess of

the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. Soil samples collected from deeper depths in these soil probes and also from numerous surrounding soil probes did not exhibit similar concentrations of SPLP antimony, indicating a limited horizontal and vertical extent. Moreover, dissolved antimony was not detected in any of the 32 groundwater samples collected from the Site at concentrations above the Tier I GRO as discussed in **Section 2.5.2.2**. No significant antimony impact to groundwater therefore is indicated.

2.8.4.7.3 SPLP Arsenic – Migration to Groundwater

Two soil samples, GP-331 (5 to 7 feet bgs) and GP-333 (1 to 3 feet bgs), collected in the area of former Building 1 exhibited SPLP arsenic concentrations (i.e., 0.066 mg/L and 0.49 mg/L, respectively) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 4**. Both of these samples were collected from the area of former Building 1 and the horizontal extent is limited by lesser concentrations detected in numerous surrounding soil samples. Dissolved arsenic, moreover, was not detected in any of the groundwater samples collected from the Site at concentrations above the Class I GRO as previously discussed in **Section 2.5.2.2**. No significant arsenic impact to groundwater is therefore indicated.

2.8.4.7.4 SPLP Iron – Migration to Groundwater

Soil samples collected from the Site commonly exhibited SPLP concentrations of iron at concentrations ranging from 5.2 mg/L to 31 mg/L, which are above the Tier 1 SRO for the Soil Component of the Groundwater Ingestion exposure route for Class I Groundwater as listed on **Table 4**. Iron is one of the 10 most abundant elements in the earth's crust at 5.63 percent by weight according to the CRC Handbook of Chemistry and Physics, 77th Edition (referenced after http://education.jlab.org/glossary/abund_ele.html). The high abundance of iron notwithstanding; dissolved iron was not detected in any of the groundwater samples collected from the Site at concentrations above its Class I GRO as previously discussed in **Section 2.5.2.2**. The occurrence of iron in soil is not; therefore, regarded as significant.

2.8.4.7.5 SPLP Lead – Migration to Groundwater

Soil samples collected from soil probes GP-303, GP-305, GP-306, and GP-308, collected directly east of former Building 6; from GP-319 collected through the floor of Building 2/3/4/7; from GP-332, GP-333, GP-334, and GP-438 collected from the area of former Building 1; from GP-348, collected through the floor of Building 5; and from GP-373 and GP-374 collected east and

west of Building 11/14 exhibited SPLP lead concentrations (ranging from 0.0078 mg/L to 0.44 mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. The generally limited horizontal and vertical extent of SPLP lead impact to soil is; however, indicated by results from numerous surrounding soil probes samples as listed in **Table 4** Dissolved lead, moreover, was only detected in a single groundwater sample (MW-46) at a concentration above its Class I GRO as previously discussed in **Section 2.5.2.2**. No significant lead impact to groundwater is therefore indicated.

2.8.4.7.6 SPLP Manganese – Migration to Groundwater

Soil samples GP-302 through GP-304, and GP-307 collected directly east of former Building 6; GP-348, collected through the floor of Building 5; and GP-356 exhibited SPLP manganese concentrations (0.16 mg/L to 0.24 mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. The generally limited horizontal and vertical extent of SPLP manganese impact to soil is; however, indicated by results from numerous surrounding soil probes samples as listed in **Table 4**. Dissolved manganese was detected in 12 on-Site monitoring wells at concentrations above the Class I GRO as previously discussed in **Section 2.5.2.2**, but two of these (MW-108 and MW-111) are located upgradient from the on-Site facilities. Manganese in the groundwater is therefore considered a background condition characteristic of the Site setting.

2.8.4.7.7 SPLP Nickel – Migration to Groundwater

Soil samples GP-313 collected just north of Building 2/3/4/7 and GP-330 collected in the area of former Building 1 exhibited SPLP nickel concentrations (i.e., 0.18 mg/L and 0.21 mg/L, respectively) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. The generally limited horizontal and vertical extent of SPLP manganese impact to soil is; however, indicated by results from numerous surrounding soil probes samples as listed in **Table 4**. Dissolved nickel, moreover, was not detected in any of the groundwater samples collected from the Site at concentrations above the Class I GRO as previously discussed in **Section 2.5.2.2**. No significant nickel impact to groundwater is therefore indicated.

2.8.4.7.8 SPLP Vanadium – Migration to Groundwater

One soil sample GP-348 collected through the floor of Building 5 exhibited a SPLP vanadium concentration (i.e., 0.050 mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. The limited horizontal and vertical

extent of SPLP vanadium impact to soil is; however, indicated by results from numerous surrounding soil probes samples at listed in **Table 4**. Dissolved vanadium, moreover, was not detected in any of the groundwater samples collected from the Site at concentrations above the Class I GRO as previously discussed in **Section 2.5.2.2**. No significant vanadium impact to groundwater is therefore indicated.

2.8.4.8 Groundwater Ingestion (Class I Groundwater)

The following subsections describe the occurrence, nature, concentration, and extent of COCs detected in groundwater samples collected from the Site at concentrations above their respective Tier 1 SROs for Soil Ingestion.

As previously listed in **Section 2.5.2.1**, several COCs were detected in the Site groundwater at concentrations above Tier 1 GROs Groundwater Ingestion. Groundwater beneath the Site is considered Class I groundwater as previously discussed in **Section 2.1.3.6**. Groundwater COCs beneath the Site include constituents detected at concentrations above Class I GROs for ingestion.

2.8.4.8.1 Chlorinated VOCs in Groundwater

Volatile compound test results for on-Site groundwater are listed in **Table 6**. Concentrations above Tier 1 Groundwater Ingestion GROs are listed below:

- PCE detected in 13 groundwater monitoring wells (ranging from 0.0088 mg/L to 1.3 mg/L);
- TCE detected in six groundwater monitoring wells (ranging from 0.0075 mg/L to 0.036 mg/L);
- 1,1-DCE in 13 groundwater monitoring wells (ranging from 0.0076 mg/L to 0.29 mg/L);
- Vinyl Chloride detected in one groundwater monitoring well (MW-41 at 0.0022 mg/L)
- 1,1,1-TCA in five groundwater monitoring wells (ranging from 0.28 mg/L to 7.9 mg/L);
- 1,1,2-TCA in one groundwater monitoring well (MW-37 at 0.018 mg/L);
- 1,2-DCA detected in one groundwater monitoring well (MW-37 at 0.020 mg/L);
- Carbon Tetrachloride detected in two groundwater monitoring wells (MW-34 and MW-36 at 0.0071 mg/L); and,
- Chloroform detected in two groundwater monitoring wells (MW-27 and MW-37 at 0.020 mg/L and 0.013 mg/L, respectively).

Chlorinated VOCs in the Site groundwater occur at the highest concentrations in the areas of Ponds 1, 2, 3, and 4, Former Building 1, and Building 2/3/4/7. Groundwater flow beneath the Site is mainly northwesterly towards the Kishwaukee River as previously discussed, and the VOCs appear to be migrating northwesterly with groundwater flow. PCE, TCE, and carbon tetrachloride are primary products used in processes like those historically performed at the Site and are therefore regarded as original, or parent compounds. Less chlorinated compounds such as 1,1-DCE, vinyl chloride, 1,2-DCA, and chloroform, are typically daughter products of abiotic and biotic degradation processes. The USGS (2006) reviews the scientific literature and describes several biological degradation mechanisms.

With respect for PCE, USGS (2006) described the anaerobic biodegradation first to TCE, then to 1,2-DCE, then to vinyl chloride, and finally to ethene. With respect for 1,1,1-TCA, the abiotic dechlorination is to 1,1-DCE. Anaerobic biodegradation to 1,1-DCA is also indicated. As discussed with regard for metals, total and dissolved manganese are also commonly detected in the Site groundwater, suggesting the existence of partially anaerobic conditions. Given the observed presence of parent and degradation products, natural attenuation by degradation appears to be occurring. The distribution of the VOCs in the Site and off-site aquifer provide additional evidence of degradation in that the parent compounds appear to have migrated the shortest distance and the degradation products appear to have migrated further, with their distance corresponding approximately to their position on the degradation chain. The following paragraphs discuss the occurrence and extent of chlorinated VOCs in the groundwater without separately considering on-Site and off-site positions.

Figure 56 illustrates the observed extent of PCE in the shallow groundwater zone (30 feet bgs). None was observed in the deeper zone (55+ feet bgs). In both zones, a plume of PCE appears to originate beneath Building 2/3/4/7. In the shallow zone, the plume appears to partially originate beneath Ponds 1, 2, 3, 4 as well.

Figure 64 illustrates the observed extent of TCE in the shallow groundwater zone (30 feet bgs). **Figure 65** illustrates the observed extent of TCE in the intermediate groundwater zone (50 feet bgs). In the shallow zone, TCE appears to originate mainly just to the northwest of Pond 1. In the intermediate zone, conversely, the plume appears to originate just north of Building 2/3/4/7. In both instances the plume appears to begin migrating northward and then turn westerly. This may result from the Site's location at the tip of the incised Marengo Ridge, from which groundwater in the Kishwaukee River alluvial plain flows more westerly. In the deep zone as shown on **Figure 66**, TCE is limited to a single location about off-site monitoring well MW-89.

Figure 68 illustrates the observed extent of 1,1-DCE in the shallow zone. **Figure 69** illustrates the observed extent of 1,1-DCE in the intermediate zone. The distributions are generally similar to those for TCE. **Figure 70** illustrates 1,1-DCE in the deep zone, suggesting further downgradient migration to irrigation well MCCS-IR-S, with no connection to the Site. The lack of connections may suggest that the VOC plume is "diving" to deeper depths as it is transported in the downgradient direction. This inference would be consistent with recharge from precipitation driving flowing groundwater to deeper depths in an alluvial plain as it flows downgradient. When the river is reached, the direction of groundwater flow typically reverses and it move upward instead of to deeper depths.

Figure 71 illustrates the extent of vinyl chloride in the shallow zone. **Figure 72** illustrates the extent of vinyl chloride in the intermediate zone. The shallow zone extent appears to be limited to a single downgradient off-site well, MW-97. The intermediate zone extent includes well MW-97, but also includes MW-74, which is considerably further downgradient. **Figure 73** illustrates the extent of vinyl chloride in the deep zone, indicating presence even further downgradient. Insomuch as vinyl chloride occurs later on the degradation chain for TCE, its distribution supports the occurrence of degradation in off-site areas

Figure 57 illustrates the extent of 1,1,1-TCA in the shallow zone. **Figure 58** illustrates the extent of 1,1,1-TCA in the intermediate zone. In the shallow zone, the area just north of Building 2/3/4/7 appears to be the area of plume origination. The intermediate zone suggests downgradient migration from the Building 2/3/4/7 shallow zone to the limited area of monitoring well MW-84. In the deep zone, the extent of 1,1,1-TCE migration appears to be limited to the area directly beneath Building 2/3/4/7. Downgradient migration of 1,1,1-TCA appears to be more limited than for PCE or TCE, possibly because it is more degradable. **Figure 67** illustrates the extent of 1,2-DCA, which originates and appears limited to the area beneath Building 2/3/4/7. This compound is also therefore suspected to be more degradable than PCE or TCE based on its limited apparent migration.

Figure 59 illustrates the extent of carbon tetrachloride in the shallow zone. Its extent appears to be limited to two small areas, suggesting higher degradation. **Figure 55** illustrates the extent of chloroform in the shallow zone. Although a degradation product of carbon tetrachloride, chloroform's occurrence is not completely correlated. The highest concentrations are immediately beneath Building 2/3/4/7 and west of that location where little or no chloroform was detected. Regardless, the extent of both chemicals appears to be limited to the Property, indicating high degradability and little or no off-site migration.

2.8.4.8.2 Semi-volatile Organic Compounds (SVOCs) in Groundwater

Semivolatile compound test results for groundwater are listed in **Table 7**. Concentrations above Tier 1 Groundwater Ingestion GROs are listed below:

- 1,4-Dioxane was detected in seven groundwater monitoring wells (ranging from 0.0096 mg/L to 0.36 mg/L).

Figure 61 illustrates the extent of 1,4-dioxane in the shallow zone. **Figure 62** illustrates its extent in the intermediate zone. Finally, **Figure 63** illustrates its extent in the deep zone. 1,4-Dioxane is primarily used as a stabilizer for 1,1,1-TCA during storage and transportation, and so is expected to originate with it. Unlike 1,1,1-TCA, 1,4-dioxane is miscible in water and tends to migrate with flowing groundwater at a greater velocity. The figures support this, illustrating shallow zone migration as far as Ritz Road and intermediate and deep migration considerably further to downgradient monitoring wells MW-98, MW-99, and MW-126.

- Groundwater sample MW-39 exhibited a concentration of bis(2-ethylhexyl)phthalate (i.e., 0.012 mg/L) in excess of the Tier 1 GRO for Class I and Class II Groundwater.

The bis(2-ethylhexyl)phthalate is not mobile in the groundwater, and it was not detected in the surrounding groundwater monitoring wells (e.g., MW-38, MW-40, MW-41, MW-84, MW-89, and MW-125); therefore, this isolated detection is not regarded as a significant concern. Additionally, it is a common sampling and analytical artifact, further suggesting that it is not a significant concern.

2.8.4.8.3 Total Metals and Cyanide

As previously discussed in **Section 2.5.2.1.3**, several total metals were detected in several groundwater monitoring wells at concentrations above their respective Class I Groundwater Ingestion GROs as listed in **Table 9**. Such total metals include the following:

- Total aluminum in more than 27 groundwater monitoring wells (ranging from 4.9 mg/L to 160 mg/L);
- Total antimony in one groundwater monitoring well (MW-100 at 0.0062 mg/L) (This well is upgradient from all facilities);
- Total arsenic in three groundwater monitoring wells (MW-123, MW-25, and MW-29 at 0.056 mg/L, 0.11 mg/L, and 0.46 mg/L), respectively;
- Total barium in three groundwater monitoring wells (MW-03, MW-04, and MW-29 at 4.3 mg/L, 4.1 mg/L, and 3.2 mg/L), respectively;

- Total beryllium in five groundwater monitoring wells (ranging from 0.0041 mg/L to 0.020 mg/L);
- Total cadmium in two groundwater monitoring wells (MW-30 and MW-31 at 0.0057 mg/L and 0.0069 mg/L), respectively;
- Total chromium in more than 10 groundwater monitoring wells (ranging from 0.11 mg/L to 0.53 mg/L);
- Total iron in more than 29 groundwater monitoring wells (ranging from 5.3 mg/L to 1,400 mg/L);
- Total lead in more than 28 groundwater monitoring wells (ranging from 0.0077 mg/L to 0.75 mg/L);
- Total manganese in more than 26 groundwater monitoring wells (ranging from 0.16mg/L to 28 mg/L);
- Total nickel in more than 16 groundwater monitoring wells (ranging from 0.11 mg/L to 30 mg/L);
- Total thallium in groundwater monitoring wells MW-115, MW-123, MW-30, and MW-25 (ranging from 0.0027 mg/L to 0.0051 mg/L); and,
- Total vanadium in more than 26 groundwater monitoring wells (ranging from 0.055 mg/L to 0.59 mg/L).
- Total cyanide was not detected in the groundwater samples.

2.8.4.8.4 Dissolved Metals

Subsequent sampling and analysis for dissolved concentrations of total metals detected above Class I GROs indicated that the majority of such detections are attributable to suspended sediments in the samples that released such metals on preservation with nitric acid. As discussed in the next section, 32 such groundwater samples were filtered and analyzed for dissolved metals, indicating far fewer exceedances of Tier 1 Groundwater Ingestion GROs.

- Groundwater sample MW-46 exhibited a concentration of dissolved lead (i.e., 0.015 mg/L) in excess of the Tier 1 GRO for Class I Groundwater (**Figure 54**); and,
- Groundwater samples MW-104 through MW-106, MW-108, MW-111, MW-112, MW-115 through MW-118, MW-03, and MW-04 exhibited concentrations of dissolved manganese (ranging from 0.18 mg/L to 0.49 mg/L) in excess of the Tier 1 GRO for Class I Groundwater. Two of these (MW-108 and MW-111) are located upgradient from the

on-Site facilities. Manganese in the groundwater is therefore considered a background condition characteristic of the Site setting (**Section 3.3.7**).

Insomuch as re-testing for dissolved metals indicated a single lead result above the Tier 1 Groundwater Ingestion GRO, this isolated detection is not expected to be mobile and is therefore not regarded as a significant concern (**Section 3.3.7**). Dissolved manganese is attributed to background and is therefore not considered a significant concern.

2.8.4.9 Indoor Inhalation Exposure Route

Volatile organic compound concentrations for on-site groundwater are listed on **Table 6**. No VOC concentrations exceed their respective Tier 1 GROs for the Groundwater Component of the Indoor Inhalation Exposure Route for Residential or Industrial/Commercial land use. On-Site soil gas was not sampled or characterized during the site investigation.

2.8.5 OFF-SITE EXPOSURE ROUTE EVALUATION SUMMARY

COCs exhibiting concentrations above Tier 1 Remediation Objectives at off-site locations are discussed in the following sections.

2.8.5.1 Outdoor Soil Inhalation (Residential)

No off-site soil samples exhibited COC concentrations above Tier 1 Outdoor Soil Inhalation SROs as listed on **Table 11**.

2.8.5.2 Soil Ingestion (Residential)

No off-site soil samples exhibited COC concentrations above Tier 1 Soil Ingestion SROs as listed on **Tables 11** through **15**.

2.8.5.3 Soil Component of the Groundwater Ingestion Exposure Route (Class I Groundwater)

Soil sample GP-395, collected from 1 to 3 feet bgs from the northern edge of the farm field approximately 1,200 feet north of the terminus of the paved extent of Ritz Road exhibited a concentration of benzene (i.e., 0.079 mg/kg) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater as shown on **Table 11**. This data suggests that the benzene concentration may potentially leach from the soil and migrate to the groundwater. However, the deeper soil sample collected from soil probe GP-395 (11 to 13 feet) along with groundwater samples collected from the corresponding monitoring wells (i.e., monitoring wells MW-85 and MW-86) did not exhibited detectable benzene concentrations, which suggests that the detected benzene did not leach from the soil and migrate to the

groundwater at that location. The source of the aforementioned detected benzene concentration is not known. Due to the shallow nature and the distance of the detected benzene concentration from the Site (approximately 4,100 feet northwest), WCG believes that the detected benzene concentration is not associated with the Site. Benzene was not detected in any of the samples collected from the onsite soil probes.

With respect for metals, the following SPLP results are noted as exceeding Tier 1 SROs for the Soil Component of the Groundwater Ingestion Exposure Route:

- Soil samples GP-388 through GP-391, GP-393, GP-394, and GP-395 exhibited concentrations of SPLP aluminum (ranging from 3.6mg/L to 8.4mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. This is not regarded as significant for the same reasons discussed for the on-Site area in **Section 2.8.6.1**.
- Soil sample GP-390 exhibited a concentration of SPLP antimony (i.e., 0.0075mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. This is not regarded as significant for the same reasons discussed for the on-Site area in **Section 2.8.6.2**. No antimony was detected in off-site groundwater samples as shown on **Table 19**.
- Soil samples GP-388 through GP-391, GP-393, GP-394, and GP-395 exhibited concentrations of SPLP iron (ranging from 5.1 mg/L to 7.3 mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. This is not regarded as significant for the same reasons discussed in **Section 2.8.6.4**.
- Soil sample GP-390 exhibited a concentration of SPLP manganese (i.e., 0.28mg/L) in excess of the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater. This is not regarded as significant for the same reasons discussed in **Section 2.8.6.6**.

2.8.5.4 Groundwater Ingestion (Class I Groundwater)

Volatile compound test results for off-site groundwater are listed in **Table 16**. Concentrations above Tier 1 Groundwater Ingestion GROs are listed below:

- 1,1,1-TCA in two off-site groundwater samples (MW-83 and MW-84) exhibited concentrations of 1,1,1-TCA (i.e., 1.5 mg/L and 0.28 mg/L, respectively);

- 1,2-DCA in seven off-site groundwater samples (MW-74, MW-76, MW-83, MW-84, MW-90, MW-97, and MCCD-IR-S) exhibited concentrations of 1,1-DCA (ranging from 0.013 mg/L to 0.24 mg/L);
- 1,4-Dioxane in 11 off-site groundwater samples (i.e., MW-74, MW-76, MW-83, MW-84, MW-90, MW-97, MW-98, MW-99, MW-126, and irrigation wells MCCD-IR-N and MCCD-IR-S) exhibited a concentration of 1,4-Dioxane ranging from 0.0092 mg/L in monitoring well MW-126 in the northern portion of the MCCD property to 0.29 mg/L located in MW-84 situated along the north side of Railroad Street;
- PCE in three off-site groundwater samples (MW-83, MW-84, and MW-97) exhibited concentrations of PCE (i.e., 0.19 mg/L, 0.0074 mg/L, and 0.028 mg/L, respectively);
- TCE in five off-site groundwater samples MW-83, MW-84, MW-89, MW-90, and MW-97 exhibited concentrations of TCE (ranging from 0.0057 mg/L to 0.031 mg/L); and,
- Vinyl Chloride in five off-site groundwater samples (MW-74, MW-90, MW-97, MCCD-IR-S, and MW-18) exhibited concentrations of vinyl chloride (ranging from 0.0023 mg/L to 0.0078 mg/L).

Off-site groundwater concentrations of VOCs and 1,4-dioxane have been mapped and are discussed in **Section 2.8.4.8.1**.

2.8.5.5 Indoor Inhalation Exposure Route

Volatile organic compound concentrations for off-site groundwater are listed on **Table 16** No VOC concentrations exceed their respective TACO Tier 1 GROs for the Groundwater Component of the Indoor Inhalation Exposure Route for Residential or Industrial/Commercial land use. Off-site soil gas was not sampled or characterized during the site investigation.

2.9 SIGNIFICANT PHYSICAL FEATURES OF REMEDIATION SITE

The Site is generally located in a commercial, industrial, residential, and agricultural area in Marengo, Illinois. The Site is currently owned by 300 West, LLC and occupied by Arnold, which has been in existence since the early 1900s. It is our understanding that the Site was reportedly purchased by Arnold in the early 1900s, with their magnetic operations/manufacturing beginning in the 1950s and continuing to the present.

The Site is comprised of as many as 19 individual parcels situated on approximately 92.5 acres of land. The Remediation Site is situated at the northwest side of the City of Marengo. The Site is generally bounded by the UP Railroad followed by Railroad Street to the north, US Highway 20 to the south, Ritz Road to the west, and North West Street to the east. To the north and

west of the Site is a ComEd electrical substation with a ComEd utility easement extending from the substation along the north side of the northwestern portion of the Site. An MCCD easement is located on the north side of the northeastern portion of the Site and on the north and south sides of the UP Railroad. Multiple single-family residences, row-crop farmland, farming operation buildings, a transportation facility, and a grain storage facility are located to the north of the Site on the north side of Railroad Street. Multiple single family residences are situated to the east and southeast of the Site. Multiple commercial properties are located to the south of the Remediation Site. Row-crop farmland is located to the west of the Site (**Figures 2** and **3**).

The Site is improved with multiple industrial buildings as summarized in **Section 2.1.2**. The Site is generally comprised of multiple office, storage and manufacturing buildings; remnants of former building floors and foundations; four wastewater treatment ponds; a private water supply well; various asphalt-paved parking and driveway areas; a former grass-covered airplane landing strip; a tract of row-crop farmland, undeveloped wooded areas, a settling pond, and a naturally vegetated wetland/depressional area on the southwest portion of the Site, which is commonly referred to as a percolation field in historical documents. A man-made overspill ditch also transects the southern portion of the Site and extends from the four wastewater treatment ponds to Pond 5. According to representatives of Arnold, Pond 5 is not a treatment pond, but rather primarily a pond used to capture site stormwater runoff.

As previously mentioned, the on-site geology consists of unconsolidated soils comprised of alternating layers of till, silt, sand and gravel from the ground surface to approximately 205 feet bgs. The following unconsolidated sediments were noted onsite in separate layers encountered over a range of depths:

- Sandy soil from the ground surface to approximately 20 (0 to 20) feet bgs, and 80 to 85 feet bgs;
- Calcareous till was encountered from 20 to 35 feet bgs, 45 to 50 feet, 85 to 90 feet bgs, 125 to 145 feet bgs, 180 to 185 feet bgs, and 195 to 205 feet;
- Fine to coarse sand with silt and gravel was encountered from 35 to 45 feet bgs, 50 to 80 feet bgs, and 185 to 195 feet bgs;
- Silt was encountered from 90 to 125 feet bgs, and
- Dolomitic gravel was encountered from 145 to 180 feet bgs.
- Dolomitic bedrock was encountered from approximately 205 to 520 feet bgs;

- Sandstone bedrock was encountered from approximately 520 to 775 feet bgs;
- Dolomitic bedrock was again encountered at 775 to approximately 846 feet bgs.

The off-site geology consists of unconsolidated soils comprised of the following stratigraphic units situated to the north and northwest of the Site:

- Sandy clay with topsoil, gravel and organics from the ground surface to approximately three (0-3) feet bgs;
- Medium, poorly-sorted sand with gravel from approximately 3 to 35 feet bgs;
- Fine to medium, well-sorted sand with gravel from approximately 35 to 75 feet bgs, the maximum depth explored by WCG; and
- A brown/tan silty clay and hard clay (a confining layer) was encountered at depths of 54 to 64 feet bgs in the boring completed for monitoring wells MW-98, MW-99, and MW-126 situated on the MCCD property.

Based upon the information collected during the soil assessment activities, saturated sands were generally first encountered between 12-15 feet bgs in offsite locations and at depths of generally 20 to 30 feet bgs on the Site during the WCG site investigation. Based on the consistent depth of the wet zones in the majority of the soil borings both on and off-site, it is believed that these zones are hydraulically interconnected. Therefore, these wet zones represent a continuous water bearing unit that was characterized during the groundwater assessment activities as Class I groundwater.

2.10 COMPARISONS TO REMEDIATION OBJECTIVES

Analytical data from the site investigation activities has been compared to baseline remediation objectives for each applicable exposure route contained in 35 IAC 742, Appendix B, Table B, and other relevant sources. **Table 1** through **Table 20** present soil and groundwater analytical results derived from completed site investigation activities performed by WCG and the RA with comparisons to the following:

- Tier 1 Soil Remediation Objectives for Residential Properties for the samples collected from the off-site areas (35 IAC 742, Appendix B, Table A);
- Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties for the samples collected from the Site (35 IAC 742, Appendix B, Table B);
- Tier 1 Soil Remediation Objectives for the Construction Worker Scenario (35 IAC 742, Appendix B, Table B);

- Tier 1 Groundwater Remediation Objectives for the Groundwater Component of the Groundwater Ingestion Exposure Route (35 IAC 742, Appendix B, Table E);
- Tier 1 Groundwater Remediation Objectives for the Indoor Inhalation Exposure Route – Diffusion & Advection (35 IAC 742, Appendix B, Table H); and
- Soil Background Concentrations for Metropolitan Statistical Areas (35 IAC 742, Appendix A, Tables G and H.

In summary, based upon these comparisons, soil and groundwater conditions have been identified with COC impacts exceeding applicable TACO Tier 1 SROs for the Soil Ingestion Exposure Route (Commercial/Industrial Properties, and Construction Worker scenario), Soil Inhalation Exposure Route (Commercial/Industrial Properties and Construction Worker scenario), and the Soil Component of the Class I Groundwater Ingestion Exposure Route, and the Tier 1 GROs for the Groundwater Ingestion Exposure Route for Class I Groundwater. The following table summarizes the exposure routes of concern, the COCs, and the locations of identified impacts on the Site and on the off-site properties.

ENDANGERMENT ASSESSMENT SUMMARY			
Exposure Route	**COC**	**Location**	**Depth (feet)**
On-Site			
Soil Ingestion	Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Dibenzo(a,h)anthracene Indeno(1,2,3-cd)pyrene	<u>Building 1:</u> GP-328 GP-332 GP-422	1 to 3
	Arsenic	<u>Building 1:</u> GP-329 GP-331 GP-333 GP-396 GP-431 <u>Building 2/3/4/7:</u> GP-312	1 to 3 5 to 7

ENDANGERMENT ASSESSMENT SUMMARY			
Exposure Route	**COC**	**Location**	**Depth (feet)**
Soil Ingestion	Nickel	Building 1: GP-329	1 to 3
	Aroclor 1248	Building 11/14: GP-374	1 to 3 6 to 8
Soil Ingestion (Construction Worker)	Copper Nickel Cobalt Benzo(a)pyrene	Building 1: GP-329 GP-422	1 to 3
Soil Inhalation	Nickel	Building 1: GP-329	1 to 3
Soil Inhalation (Construction Worker)	Mercury	Building 1: GP-329 GP-334	1 to 3
Soil Component of the Groundwater Ingestion	Aluminum Iron	Throughout the Site	Varying from 1 to 14
	Antimony	Building 1: GP-328 GP-329 Building 5: GP-340 GP-346	1 to 3
	Arsenic	Building 1: GP-333 GP-331	1 to 3 5 to 7

ENDANGERMENT ASSESSMENT SUMMARY			
Exposure Route	**COC**	**Location**	**Depth (feet)**

As presented above, the Site has undergone multiple investigations for purposes of characterizing the nature and extent of the COCs in accordance with the Comprehensive Site Investigation requirements set forth within 35 IAC 740.425.

Based on our review, certain chlorinated VOCs have impacted the soil beneath Building 2/3/4/7, former Building 1, and Building 5 above the Tier 1 Soil Component of the Class I Groundwater Ingestion Exposure Route. Analytical data suggests that certain chlorinated VOCs may have migrated offsite to the north of Building 2/3/4/7. Additionally, the vertical extent of impacts beneath Building 2/3/4/7 has not been fully determined.

Similar chlorinated VOCs were also noted in groundwater on the Site and on off-site properties. Chlorinated VOCs in the Site groundwater occur at the highest concentrations in the areas of Ponds 1, 2, 3, and 4, Former Building 1, and Building 2/3/4/7. Groundwater flow beneath the Site is mainly northwesterly towards the Kishwaukee River as previously discussed, and the VOCs appear to be migrating northwesterly with groundwater flow. PCE, TCE, and carbon tetrachloride are primary products used in processes like those historically performed at the Site and are therefore regarded as original, or parent compounds. Less chlorinated compounds such as 1,1-DCE, vinyl chloride, 1,2-DCA, and chloroform, are typically daughter products of abiotic and biotic degradation processes. With respect for 1,1,1-TCA, the abiotic dechlorination is to 1,1-DCE. Anaerobic biodegradation to 1,1-DCA is also indicated.

Given the observed presence of parent and degradation products, natural attenuation by degradation appears to be occurring. The distribution of the VOCs in the Site and off-site aquifer provide additional evidence of degradation in that the parent compounds appear to have migrated the shortest distance and the degradation products appear to have migrated further, with their distance corresponding approximately to their position on the degradation chain. Since 1,4-dioxane is typically a stabilizer for 1,1,1-TCA during storage and transportation, and so is expected to originate with it. Unlike 1,1,1-TCA, 1,4-dioxane is miscible in water and tends to migrate with flowing groundwater at a greater velocity. Analytical data and the figures support this, illustrating shallow zone migration as far as Ritz Road and intermediate and deep migration considerably farther to downgradient monitoring wells MW-98, MW-99, and MW-126 located on the MCCD property. The vertical extent of 1,4-dioxante was not fully determined offsite on the MCCD property due to a silty clay and hard clay confining layer encountered at depths of 54 to 64 feet bgs. In light of the chlorinated VOC results, it appears the vertical extent of certain chlorinate VOCs have not been fully determined onsite or offsite.

In addition, soil was identified with certain metals that exceed the Tier 1 Soil Component of the Groundwater Ingestion Exposure beneath former Building 1, Building 2/3/4/7, Building 5,

former Building 6, Building 16, and in a widely distributed area offsite. The vertical extent of these metals is generally defined at varying depths of 1 to 14 feet bgs on the Site and at varying depth of 1 to 8 feet bgs offsite. Generally, the detected metals that exceed the Tier 1 Soil Component of the Groundwater Ingestion Exposure Route on the Site and offsite were not observed in the groundwater on the Site or offsite, with the exception of dissolved manganese and lead, which either do not migrate offsite or are believed to be naturally occurring.

Soil was also identified with certain SVOCs and PNAs exceeded the Tier 1 Soil Ingestion Exposure for Commercial/Industrial Properties and the Soil Component of the Groundwater Ingestion Exposure Route primarily beneath former Building 1with a 2,4-Dinitrotoluene concentration isolated to an area beneath Building 5 . The vertical and horizontal extents of certain SVOCs and PNAs are generally defined to depths of approximately three feet bgs and within the aforementioned areas. Generally, the detected SVOCs and PNAs that exceed the Tier 1 Soil Component of the Groundwater Ingestion Exposure Route were not observed in the groundwater on the Site or offsite,

One soil sample exhibited PCB concentrations that exceed the Tier 1 Soil Ingestion Exposure Route for Commercial/Industrial Properties east of Building 11/14. This impact appears to be isolated to a depth of 1 to 8 feet bgs and does not extend offsite. Finally, certain total metals exceed the Tier 1 Soil Ingestion and Inhalation Exposure Routes for Commercial/Industrial Properties and/or the Construction Worker Scenario in isolated areas beneath the former Building 1. The vertical extents of certain total metals are generally defined to depths of approximately three feet bgs.

3.0 REMEDIATION OBJECTIVES REPORT

3.1 INTRODUCTION

The following presents the proposed remediation objectives for the Site developed in accordance with the procedures outlined at 35 IAC 740.440 and 740.445. Analytical data has been compared to TACO Tier 1 SROs for Industrial/Commercial Properties for samples collected from the Site and TACO Tier 1 SROs for Residential Properties for samples collected from off-site locations and contained in tables listed in 35 IAC 742, Appendix B, Tables A and B. Analytical data has also been compared to TACO Tier 1 GROs for Class I Groundwater contained in tables listed in 35 IAC 742, Appendix B, Table E and Table H, as well as Tier 1 GROs for the Indoor Inhalation Exposure Route for Residential and Industrial/Commercial Properties.

3.2 TACO EXPOSURE ROUTE EVALUATION

The IEPA has identified five potential exposure routes to be evaluated under TACO. These routes are as follows:

a) Outdoor Soil Inhalation Exposure Route;

b) Indoor Inhalation Exposure Route;

c) Soil Ingestion Exposure Route;

d) Soil Component of the Groundwater Ingestion Exposure Route for Class I or II Groundwater; and

e) Groundwater Ingestion Exposure Route for Class I or Class II Groundwater.

TACO allows the evaluation of each of the exposure routes for potential exclusion from consideration. If institutional controls are used to exclude exposure routes, then the institutional controls will be maintained and recorded onto the Site deed. Within this document, support is being provided demonstrating that the Outdoor Soil Inhalation Exposure Route and the Indoor Inhalation Exposure Route can be excluded from consideration at the Site. The remaining exposure routes will be addressed through a combination of active remediation and exclusion from consideration.

3.3 REMEDIATION OBJECTIVES

Soil and groundwater remediation objectives were developed in accordance with IEPA's TACO regulations (35 IAC 742). These remediation objectives are designed to protect human health

and take into account site conditions and land use. Remediation objectives generated by TACO are risk-based and site-specific. TACO provides flexibility to site owners and operators in developing site-specific remediation objectives.

The following options are available under TACO:

- Exclusion of exposure routes,
- Use of area background concentrations as screening tools or remediation objectives, and
- Three tiers for developing remediation objectives.

The following includes a comparison of analytical data to Tier 1 SROs and GROs, and a risk-based evaluation for those COCs that exhibited concentrations in excess of TACO Tier 1 remediation objectives.

3.3.1 TIER 1 EVALUATION

Tables 1 through **20** present analytical results of the WCG site investigation activities, with comparisons to:

1. Tier 1 Soil Remediation Objectives for Residential Properties for the samples collected from the off-site areas (35 IAC 742, Appendix B, Table A);
2. Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties for the samples collected from the Site (35 IAC 742, Appendix B, Table B);
3. Tier 1 Soil Remediation Objectives for the Construction Worker Scenario (35 IAC 742, Appendix B, Table B);
4. Tier 1 Groundwater Remediation Objectives for the Groundwater Component of the Groundwater Ingestion Exposure Route (35 IAC 742, Appendix B, Table E);
5. Tier 1 Groundwater Remediation Objectives for the Indoor Inhalation Exposure Route – Diffusion & Advection (35 IAC 742, Appendix B, Table H); and
6. Soil Background Concentrations for Metropolitan Statistical Areas (35 IAC 742, Appendix A, Tables G and H).

3.3.1.1 Soil

Under Tier 1, available soil analytical data have been compared to baseline remediation objectives, contained in tables listed in 35 IAC 742, Appendix B. As presented above, **Tables 1** through **5** and **Tables 11** through **15** for the soil samples collected from the Site and from off-

site locations, respectively, present analytical data for the COCs with comparisons to the Tier 1 SROs for Residential Properties, Industrial/Commercial Properties, the Construction Worker scenario, and the Soil Component of the Groundwater Ingestion Exposure Route (35 IAC 742, Appendix B, Tables A and B). Based on these comparisons, a summary of the COCs that exceed the aforementioned TACO Tier 1 SROs is provided in the following table.

TIER 1 SOIL EVALUATION SUMMARY		
Location	**COC**	**Exposure Route**
On-Site		
Building 1	Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Dibenzo(a,h)anthracene Indeno(1,2,3-cd)pyrene	Soil Ingestion
	Arsenic	
	Chromium Lead Thallium	
	Copper Nickel Cobalt Benzo(a)pyrene	Soil Ingestion (Construction Worker)
	Mercury	Soil Inhalation (Construction Worker)
	Antimony Arsenic Lead Nickel PCE 1,1-DCE 1,1,1-TCA Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Dibenzo(a,h)anthracene Indeno(1,2,3-cd)pyrene Carbazole	Soil Component of the Groundwater Ingestion

TIER 1 SOIL EVALUATION SUMMARY		
Location	**COC**	**Exposure Route**
Building 2/3/4/7	Arsenic	Soil Ingestion
	PCE	Soil Inhalation (Commercial/Industrial)
	Lead Nickel PCE 1,1-DCE 1,4-Dioxane	Soil Component of the Groundwater Ingestion
Building 5	Antimony Lead Manganese Vanadium PCE 2,4-Dinitrotoluene	Soil Component of the Groundwater Ingestion
Building 6	Lead Manganese	Soil Component of the Groundwater Ingestion
Building 11/14	Aroclor 1248	Soil Ingestion
	Lead	Soil Component of the Groundwater Ingestion
Building 16	Manganese	Soil Component of the Groundwater Ingestion
Throughout the Site	Aluminum Iron	Soil Component of the Groundwater Ingestion
Off-Site		
Throughout the Off-Site Areas	Aluminum Iron Antimony Manganese	Soil Component of the Groundwater Ingestion

Based on these comparisons to Tier 1 SROs, concentrations of certain PNAs, total arsenic, and total nickel that exceed the TACO Tier 1 SROs for the Ingestion and/or Inhalation Exposure

Route for Industrial Commercial Properties will be further evaluated by calculating site-specific averages for comparison to the TACO soil background concentrations for metropolitan statistical areas (**Section 3.3.4**).

For total arsenic and certain PNA concentrations that exceed the TACO background concentrations after calculating site-specific averages, "Hot Spot" removal is proposed to be undertaken. Soil exhibiting elevated concentrations of total arsenic and certain PNA concentrations in excess of TACO Tier 1 SROs in the area of Building 1 will be removed, and a reevaluation of the site-specific averages will be performed. The goal will be to demonstrate that following removal of these soils, the average concentration will be compliant with the SROs for the ingestion exposure routes for Industrial/Commercial Properties. In addition, concentrations of Aroclor 1248 in soil probe GP-374 adjacent to Building 11/14 that exceeds the Tier 1 SRO for the Soil Inhalation Exposure Route for Industrial/Commercial Properties are proposed for Hot Spot removal activities.

Concentrations of copper, nickel, cobalt, mercury, and benzo(a)pyrene in excess of Tier 1 SROs for the Soil Ingestion Exposure Route and the Soil Inhalation Exposure Route for the Construction Worker Scenario in soil probes GP-329, GP-422 and/or GP-334 in the area of Building 1 will be addressed through a Construction Worker Safety Precaution (**Section 3.3.6**).

In addition, the inorganic soil impacts noted generally in the northern half of the Site, certain PNAs noted in the area of Building 1, carbazole noted in the area of Building 1, and 2,4-dinitrotoluene soil impacts noted in the area of Building 5 are proposed to be addressed through a Tier 3 Evaluation – Exposure Routes **(Section 3.3.7.1)**.

Furthermore, it is anticipated that the chlorinated VOCs and 1,4-dioxane soil and groundwater impacts that exceed the Soil and Groundwater Components of the Groundwater Ingestion Exposure Route will be addressed through active remediation to be presented in a future Remedial Action Plan. It is expected that active remediation will address the source areas coupled with natural attenuation. It is anticipated that the remediation objectives for these COCs will be the applicable TACO Tier 1 SROs and GROs. In addition, off-site water supply wells will likely be abandoned and private properties will be supplied through a municipal water supply. Finally, the manganese concentration that exceeds the Tier 1 SROs for the Soil Component of the Groundwater Ingestion Exposure Route will be evaluated through a review of local background groundwater conditions in the area of the Site (**Section 3.3.7.2**).

3.3.1.2 Groundwater

Under Tier 1, available groundwater analytical data have been compared to baseline remediation objectives, contained in tables listed in 35 IAC 742, Appendix B. As presented above, **Tables 6** through **10** and **Tables 16** through **20** presents analytical data for the COCs with comparisons to the Tier 1 GROs for Class I Groundwater (35 IAC 742, Appendix B, Table E) and the Tier 1 Indoor Inhalation GROs for Residential and Industrial/Commercial Properties (35 IAC 742, Appendix B, Table H). Based on these comparisons, the COC concentrations are below Tier 1 GROs for Class I Groundwater with the exception of the COCs listed in the following table.

TIER 1 GROUNDWATER EVALUATION SUMMARY		
Location	**COC**	**Exposure Route**
On-Site		
Building 1	1,1-DCE 1,1,1-TCA PCE Carbon Tetrachloride	Groundwater Component of Groundwater Ingestion
Building 2/3/4/7	1,1-DCE 1,1,2-TCA 1,1,1-TCA PCE 1,2-DCA Carbon Tetrachloride Chloroform TCE Vinyl Chloride 1,4-Dioxane	Groundwater Component of Groundwater Ingestion
Building 6	1,1-DCE PCE TCE 1,4-Dioxane Manganese (Dissolved)	Groundwater Component of Groundwater Ingestion
Building 11/14	Manganese (Dissolved)	Groundwater Component of Groundwater Ingestion

TIER 1 GROUNDWATER EVALUATION SUMMARY		
Location	**COC**	**Exposure Route**
Building 12	Manganese (Dissolved)	Groundwater Component of Groundwater Ingestion
Building 16	1,1-DCE 1,4-Dioxane	Groundwater Component of Groundwater Ingestion
Pond 1 (North)	1,1-DCE	Groundwater Component of Groundwater Ingestion
Pond 3 (South)	1,1-DCE 1,1,1-TCA PCE TCE 1,4-Dioxane Lead (Dissolved)	Groundwater Component of Groundwater Ingestion
Pond 4 (South):	PCE Chloroform	Groundwater Component of Groundwater Ingestion
Pond 5	Manganese (Dissolved)	Groundwater Component of Groundwater Ingestion
Percolation Field	Manganese (Dissolved)	Groundwater Component of Groundwater Ingestion
Off-Site		
MW-83 (30') MW-84 (50')	1,1,1-TCA	Groundwater Component of Groundwater Ingestion
MW-83 (30') MW-84 (50') MW-97 (30')	PCE	

TIER 1 GROUNDWATER EVALUATION SUMMARY		
Location	**COC**	**Exposure Route**
MW-74 (50') MW-76 (50') MW-83 (30') MW-84 (50') MW-90 (50') MW-97 (30') MCCD-IR-S	1,2-DCA	Groundwater Component of Groundwater Ingestion
MW-83 (30') MW-84 (50') MW-89 (80') MW-90 (50') MW-97 (30')	TCE	
MW-18 (50') MW-74 (50') MW-90 (50') MW-97 (30') MCCD-IR-S	Vinyl Chloride	
MW-74 (50') MW-76 (50') MW-83 (30') MW-84 (50') MW-90 (50') MW-97 (30') MCCD-IR-S MCCD-IR-N MW-98 (55') MW-99 (60') MW-126 (65')	1,4-Dioxane	
MW-23 (70') MW-76 (50') MW-83 (30') MW-86 (50')	Manganese (Dissolved)	

3.3.1.3 Indoor Inhalation

Under Tier 1, available groundwater analytical data have been compared to baseline remediation objectives, contained in tables listed in 35 IAC 742, Appendix B, Table H. As

presented above, **Tables 6** and **16** presents analytical data for the COCs with comparisons to the Tier 1 Indoor Inhalation Exposure Route for Residential Properties (i.e., offsite) and Industrial/Commercial Properties (i.e., onsite). Based on these comparisons, COC concentrations are below TACO Tier 1 GROs for the Indoor Inhalation Exposure Route for Residential and Commercial/Industrial Properties.

3.3.2 REMEDIATION STRATEGY

As discussed previously, soil samples collected at the Site have exhibited impacts of select PNAs, chlorinated VOCs, select SVOCs including 1,4-dioxane, one PCB, and inorganics exceeding applicable Tier 1 SROs for the Soil Ingestion Exposure Route, Outdoor Soil Inhalation Exposure Route, the Soil Inhalation/Ingestion Exposure Route for the Construction Worker Scenario, and/or the Soil Component of the Groundwater Ingestion Exposure Route for Class I Groundwater. In addition, chlorinated VOCs, 1,4-dioxane, and select inorganics have been detected in groundwater samples exceeding applicable Tier 1 GROs for the Groundwater Ingestion Exposure Route for Class I Groundwater.

The following is being proposed in accordance with TACO requirements to address COCs exceeding Tier 1 SROs for Industrial/Commercial Properties and GROs for Class I Groundwater:

- Concentrations of select PNAs[14], Aroclor 1248, and arsenic in excess of the Soil Ingestion Exposure Route are proposed to be addressed through the use of hot spot removal remedial action and/or site-specific averaging (**Section 3.3.4**).
- The concentration of nickel exceeding the Soil Inhalation Exposure Route is proposed to be addressed through site-specific averaging (**Section 3.3.4**).
- The Groundwater Ingestion Exposure Route (both components) is proposed to be addressed through active remediation to be presented in a future Remedial Action Plan for chlorinated VOCs and 1,4-dioxane.
- The Soil Component of the Groundwater Ingestion Exposure Route is proposed to be addressed by demonstrating compliance with 35 IAC 742.925 for a Tier 3 Evaluation for concentrations of total aluminum, iron, antimony, arsenic, lead, manganese, nickel, and vanadium, along with benzo(a)anthracene, benzo(a)pyrene,

[14] Benzo(a)pyrene, dibenzo(a,h)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene

benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene. The Tier 3 Evaluation will be completed and presented in a future addendum to this ROR.

- The Groundwater Component of the Groundwater Ingestion Exposure Route is proposed to be addressed by demonstrating compliance with 35 IAC 742.925 for a Tier 3 Evaluation for concentrations of total lead identified in water located south of Pond 3 on the Site (**Section 3.3.7.1**).
- The Groundwater Ingestion Exposure Route (both components) will be addressed for the manganese concentrations in soil and groundwater within multiple areas throughout the Site and off-site through a review of regional background groundwater conditions in the area of the Site (**Section 3.3.7.2**).
- Groundwater sample data meets Tier 1 GROs for the Indoor Inhalation Exposure Route, as presented in **Section 2.8** (refer to **Tables 6** through **10** and **Tables 16** through **20**). Institutional controls will be used in support of relying on the TACO table for the Indoor Inhalation Exposure Route. Use of the table requires that existing or potential buildings have full concrete slab-on-grade or a full concrete basement floor and walls and institutional controls are in place for these requirements.
- COC impacts exceeding Tier 1 SROs for the Soil Inhalation and/or Ingestion Exposure Route for the Construction Worker Scenario will be addressed through construction worker safety provisions (**Section 3.3.6**).

3.3.3 EXCLUSION OF EXPOSURE ROUTES

To exclude the above applicable exposure routes (i.e., the exposure routes for the non-chlorinated VOC COCs), the general requirements listed in 35 IAC 742.300 and 742.305 must be satisfied. The following presents these general requirements, followed by an explanation of how the applicable criteria have been satisfied.

35 IAC Section 742.300(b): "No exposure route may be excluded from consideration until characterization of the extent and concentrations of contaminants of concern at the site have been performed. The actual steps and methods taken to characterize a site shall be determined by the specific program requirements under which the site remediation is being addressed."

As detailed in the Comprehensive Site Investigation Report in **Section 2.0**, the Site has undergone certain investigations by WCG and others for purposes of characterizing the nature

and extent of the COC impacts on the Site and in off-site areas in excess of Tier 1 SROs. The comprehensive site investigation activities resulted in analysis of the TCL parameters as presented in 35 IAC 740, Appendix A, Tables A-D, which are the COCs for this Site. Soil impacts exceeding Tier 1 SROs for Industrial/Commercial Properties, the Construction Worker Scenario, and Class I Groundwater were detected in the subsurface soil present at the Site. Based upon the scope and analytical results of the completed site and supplemental investigations, it is believed that non-chlorinated VOC COC concentrations exceeding Tier 1 SROs are isolated to the shallow subsurface soil in the areas of former Building 1, Building 2/3/4/7, Building 5, former Building 6, Building 11/14, and Building 16 on the Site as described in **Sections 2.5**, **2.6**, and **2.8**. Non-chlorinated VOCs were not detected at concentrations exceeding Tier 1 SROs in off-site soil samples. Therefore, Section 742.300(b) has been satisfied for the non-chlorinated VOC COCs that exceed the Tier 1 SROs for the Ingestion and Inhalation Exposure Routes for Industrial/Commercial Properties, the Construction Worker Scenario, and the Soil Component of the Class I Groundwater.

35 IAC Section 742.305(a): "The sum of the concentrations of all organic contaminants of concern shall not exceed the attenuation capacity of the soil as determined under Section 742.215."

Section 742.215(b) states that the soil attenuation capacity will not be exceeded if:

1. *The sum of the organic contaminant residual concentrations analyzed for the purposes of the remediation program for which the analysis is performed, at each discrete sampling point, is less than the natural organic carbon fraction (f_{oc}) of the soil.*
    A. *A default value of 6,000 mg/kg for soils within the top meter and 2,000 mg/kg for soils below one meter of the surface; or*
    B. *A site-specific value as measured by the analytical method referenced in Appendix C, Table F, multiplied by 0.58 to estimate the fraction of organic carbon, as stated in Nelson and Sommers (1982), as incorporated by reference in Section 742.210;*
2. *The total petroleum hydrocarbon concentration is less than the natural organic carbon fraction of the soil as demonstrated using a method approved by the Agency. The method selected shall be appropriate for the contaminants of concern to be addressed; or*

3. *Another method, approved by the Agency, shows that the soil attenuation capacity is not exceeded.*

As shown on **Tables 1**, **6**, **11** and **16**, organic constituents were detected during the site investigation activities. WCG added the organic contaminant residual concentrations from the soil probe exhibiting the highest level of impacts (soil probe GP-425 / collected from select intervals from 1 to 65 feet bgs). The sum of the residual organic concentrations for soil sample GP-425 totaled 58.34 mg/kg, which is below the TACO default soil attenuation capacity for soils below 1 meter (2,000 mg/kg). Therefore, Section 742.305(a) has been satisfied.

35 IAC Section 742.305(b): "The concentrations of any organic contaminants of concern remaining in the soil shall not exceed the soil saturation limit as determined under Section 742.220."

Section 742.220 – Determination of Soil Saturation Limit states:

a) *For any organic contaminant that has a melting point below 30°C, the remediation objective for the outdoor inhalation exposure route developed under Tier 2 shall not exceed the soil saturation limit, as determined under subsection (c).*

b) *For any organic contaminant that has a melting point below 30°C, the remediation objective under Tier 2 for the soil component of the groundwater ingestion exposure route shall not exceed the soil saturation limit, as determined under subsection (c).*

c) *The soil saturation limit shall be:*

    1. *The value listed in Appendix A, Table A (of the TACO regulations) for that specific contaminant;*

    2. *A value derived from Equation S29 in Appendix C, Table A (of the TACO regulations); or*

    3. *A value derived from another method approved by the Agency.*

As shown on **Table 1**, soil samples exhibited concentrations of COCs below their respective default soil saturation limits as listed in TACO Section 742, Appendix A, Table A. Therefore, Section 742.305(b) has been satisfied.

35 IAC Section 742.305(c): "Any soil which contains contaminants of concern shall not exhibit any of the characteristics of reactivity for hazardous waste as determined under 35 Ill. Adm Code 721.123."

None of the soil samples collected are anticipated to exhibit characteristics of reactivity for hazardous waste based on the relatively measured low concentrations and stable nature of the compounds of concern. Therefore, Section 742.305(c) has been satisfied.

35 IAC Section 742.305(d): Any soil which contains contaminants of concern shall not exhibit a pH less than or equal to 2.0 or greater than or equal to 12.5, as determined by SW-846 Method 9040B: pH Electrometric for soils with 20% or greater aqueous (moisture) content or by SW-846 Method 9045C: Soil pH for soils with less than 20% aqueous (moisture) content as incorporated by reference in Section 742.210."

As shown on **Table 4**, 189 soil samples collected from the soil probes advanced at the Site were analyzed for pH, as presented above in **Section 2.4.1**. Based on these results, soil samples exhibited pH ranges from 6.5 s.u. to 12.0 s.u. and did not exhibit a pH of less than or equal to 2.0 s.u., or greater than or equal to 12.5 s.u. Therefore, Section 742.305(d) has been satisfied.

35 IAC Section 742.305(e): "Any soil which contains contaminants of concern in the following list of inorganic chemicals or their salts shall not exhibit any of the characteristics of toxicity for hazardous waste as determined by 35 Ill. Adm. Code 721.124: arsenic, barium, cadmium, chromium, lead, mercury, selenium, or silver."

Soil samples collected during the site investigation activities did not exhibit characteristics of a hazardous waste based on measured low, and likely background, concentrations of total metals. Therefore, Section 742.305(e) has been satisfied.

35 IAC Section 742.305(f): "If contaminants of concern include polychlorinated biphenyls (PCBs), the concentration of any PCBs in the soil shall not exceed 50 parts per million as determined by SW-846 Methods."

As shown on **Table 5** and **Table 15**, the results of the soil samples submitted for PCB laboratory analysis from the soil samples collected from the Site and off-site areas during the 2015 soil investigation activities were below laboratory detection limits or below 17 mg/kg. Therefore, Section 742.305(f) has been met.

35 IAC Section 742.305(g): "The concentration of any contaminant of concern in soil-gas shall not exceed 10% of its Lower Explosive Limit (LEL) as measured by a hand held combustible gas indicator that has been calibrated to manufacturer specifications."

As discussed in **Section 2.0**, PID measurements were taken during soil probing activities performed by WCG. The PID was calibrated in the field on a daily basis before use in accordance with the manufacturer's specifications. For most VOCs, the toxic exposure limit (in

parts per million) as measured by a PID would be exceeded before a concentration sufficient to reach the LEL (in parts per hundred). As shown in **Appendix E**, PID measurements obtained during soil probing activities did not reach the instrument measurement ceiling (15,000 ppm). Therefore, Section 742.305(g) has been met.

The information presented above demonstrates that the above generic requirements for exclusion of an exposure route have been met. In addition to the above generic requirements, specific requirements must also be achieved for each individual exposure route that is proposed for exclusion. The following sections describe how each of these specific requirements has been met.

3.3.4 SOIL INGESTION EXPOSURE ROUTE

In accordance with 35 IAC 742.225(d), TACO allows for the site-specific averaging of COCs in excess of Tier 1 SROs for comparison to applicable Tier 1 remediation objectives. Based on the incorporated guidance documents, at least eight discrete sample concentrations collected from similar geologic units or media that comprise a data set can be utilized to calculate a site-specific average concentration for COCs. Soil samples collected from the Site were not composited.

As discussed above in **Section 3.3.2**, hot spot removal remedial action is proposed to address certain COC impacts in excess of Tier 1 SROs for Industrial/Commercial Properties. Hot spot removal and off-site disposal is proposed for soils generally located in proximity to samples GP-374/1-3'and 6-8', GP-331/5-7', GP-333/1-3', GP-396/5-7', and GP-422/1-3'. Assuming the above samples have been removed, site-specific averages for benzo(a)pyrene, dibenzo(a,h)anthracene, nickel, and arsenic have been calculated in accordance with the USEPA Office of Emergency and Remedial Response publication "Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites" (OSWER 9285.6-10 December 2002). As referenced by the guidance document and 35 IAC 742.225(d), the USEPA's Statistical Software ProUCL 5.0.00 for Environmental Applications for Data Sets with and without Non-Detect Observations was used to calculate the site-specific average benzo(a)pyrene, dibenzo(a,h)anthracene, nickel, and arsenic concentrations based on soil samples collected from a depth of one to three feet.

Upon inputting the data set within ProUCL 5.0.00, Shapiro-Wilk and Lilliefors Normality Testing was performed to evaluate the data set for the appropriate statistical methodology to be applied. As shown on ProUCL Averaging Summary Table included in **Appendix O**, the normality

testing for the benzo(a)pyrene and dibenzo(a,h)anthracene concentrations included eleven (11) data points, the arsenic concentrations included twelve (12) data points, and the nickel concentrations included 32 data points as represented by the soil samples and the analytical summary tables (**Tables 3** and **4**). Data points in the general area of soil samples exceeding applicable Tier 1 SROs for PNAs and arsenic were selected for the testing. An adequate number of data points were not available in the area of the sample with nickel exceedances (GP-329). Therefore, data points were selected from an expanded area around GP-329. The results of the normality testing indicated that the data sets for benzo(a)pyrene and dibenzo(a,h)anthracene appear normal at a 5% significance level. The arsenic and nickel data sets are not normal at a 5% significance level. As a result, guidance indicates either the Kaplan Meier (KM) (t) or KM (Percentile Bootstrap) Methods could be used to calculate an Upper Confidence Limit (UCL) at 95% confidence for the benzo(a)pyrene and dibenzo(a,h)anthracene data sets. WCG utilized the KM (t) Method, the most conservative statistical evaluation method and subsequently averaged site-specific benzo(a)pyrene and dibenzo(a,h)anthracene concentrations at a 95% UCL. The guidance also indicated that the Adjusted Gamma Method could be used to calculate a UCL at 95% confidence for the arsenic data set and the 99% KM (Chebyshev) Method could be used for the nickel data set.

According to the ProUCL site-specific averaging results, the average site-specific COC concentrations for benzo(a)pyrene, dibenzo(a,h)anthracene, nickel, and arsenic are below the Tier 1 SROs for the Soil Ingestion Exposure Route for Industrial/Commercial Properties and/or Backgrounds within MSAs. In addition to the ProUCL Averaging Summary Table included in **Appendix O** the following summary table presents the calculated site-specific COC averages compared to the applicable Tier 1 SROs and/or Backgrounds within MSAs:

Site-Specific Averaging Summary				
Parameter	**Distribution**	**UCL Statistical Method**	**Tier 1 SRO/ Background within MSAs (mg/kg)**	**UCL Results (mg/kg)**
Benzo(a)pyrene	Normal	95% KM (t)	2.1	0.982
Dibenzo(a,h)anthracene	Normal	95% KM (t)	0.8	0.441
Nickel	Not Normal	99% KM (Chebyshev)	41,000	19,550
Arsenic	Not Normal	Adjusted Gamma	13.0	10.66

Based on the above results, it is calculated that benzo(a)pyrene, dibenzo(a,h)anthracene, nickel, and arsenic with the proposed site-specific average concentrations are below Tier 1 SROs and/or Backgrounds within MSAs, as presented on the ProUCL Averaging Summary Table and supporting information included in **Appendix O**. Therefore, no additional evaluation is necessary for these COCs for the Soil Ingestion Exposure Route. Plans for removal of soils from the locations noted above will be addressed in a future Remedial Action Plan. The ProUCL data output and calculations are included in **Appendix O**.

3.3.5 OUTDOOR SOIL INHALATION EXPOSURE ROUTE

As discussed above in **Section 2.7.3.1**, total nickel was detected in one soil sample (GP-329 / 1-3') in excess of the Tier 1 SRO for the Soil Inhalation Exposure Route for Industrial/Commercial Properties. As a result, in accordance with 35 IAC 742.225(d), TACO allows for the site-specific averaging of COCs in excess of Tier 1 SROs for comparison to applicable Tier 1 remediation objectives. Based on the incorporated guidance documents, at least eight discrete sample concentrations collected from similar geologic units or media that comprise a data set can be utilized to calculate a site-specific average concentration for COCs. Soil samples collected from the Site were not composited.

As referenced by the guidance document and 35 IAC 742.225(d), the USEPA's Statistical Software ProUCL 5.0.00 for Environmental Applications for Data Sets with and without Non-Detect Observations was used to calculate the site-specific average nickel concentration based on soil samples collected from a depth of one to three feet as summarized in **Section 3.3.4**. Upon inputting the data set within ProUCL 5.0.00, Shapiro-Wilk and Lilliefors Normality Testing was performed to evaluate the data set for the appropriate statistical methodology to be applied. As shown on **Appendix O**, the normality testing for the nickel concentrations included thirty-two (32) data points as represented by the soil samples and the analytical summary tables (**Tables 3** and **4**).

An adequate number of data points were not available in the area of the sample with nickel exceedances (GP-329). Therefore, data points were selected from an expanded area around GP-329. The results of the normality testing indicated that the data sets for nickel are not normal at a 5% significance level. As a result, guidance indicated that the 99% KM (Chebyshev) Method could be used for the nickel data set.

According to the ProUCL site-specific averaging results, the average site-specific COC concentration for nickel is below the Tier 1 SROs for the Soil Inhalation Exposure Route for

Industrial/Commercial Properties and/or Backgrounds within MSAs. In addition to ProUCL Averaging Summary Table included in **Appendix O,** the summary table included in **Section 3.3.4** presents the calculated site-specific COC averages compared to the applicable Tier 1 SROs and/or Backgrounds within MSAs. Therefore, no additional evaluation is necessary for the nickel concentration for the Soil Inhalation Exposure Route. The ProUCL data output and calculations are included in **Appendix O**.

3.3.6 CONSTRUCTION WORKER SCENARIO

Total copper, nickel, cobalt and benzo(a)pyrene were detected on site at concentrations in excess of the Soil Ingestion Exposure Route for the Construction Worker Scenario. Additionally, total mercury was detected on site at a concentration in excess of the Soil Inhalation Exposure Route for the Construction Worker Scenario. These concentrations are proposed to be addressed with construction worker safety provisions as follows:

- The construction workers will be notified by the Site owner/operator in advance of intrusive activities in areas where COCs exceed the Tier 1 SROs for the Construction Worker Scenario. Such notification will enumerate the COCs known to be present; and
- The site owner/operator will require construction workers to implement protective measures consistent with good industrial hygiene practice.

Construction worker safety precautions will only be required for work involving excavation or contact with soils at the location and observed depth of impacts exceeding the Tier 1 SROs for the Soil Inhalation/Ingestion Exposure Route for the Construction Worker Scenario.

3.3.7 GROUNDWATER INGESTION EXPOSURE ROUTE (BOTH COMPONENTS)

To address the COCs exceeding the Soil and Groundwater Components of the Groundwater Ingestion Exposure Route for Class I Groundwater, it is proposed that the Groundwater Ingestion Exposure Route (both components) be addressed through the following approaches.

- The Groundwater Ingestion Exposure Route (both components) is proposed to be addressed through active remediation to be presented in a future Remedial Action Plan for chlorinated VOCs and 1,4-dioxane.
- The Soil Component of the Groundwater Ingestion Exposure Route is proposed to be addressed by demonstrating compliance with 35 IAC 742.925 for a Tier 3 Evaluation for concentrations of total aluminum, iron, antimony, arsenic, lead, manganese,

nickel, and vanadium, along with benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene. The Tier 3 Evaluation will be completed and presented in a future addendum to this ROR.

- The Groundwater Component of the Groundwater Ingestion Exposure Route is proposed to be addressed by demonstrating compliance with 35 IAC 742.925 for a Tier 3 Evaluation for concentrations of total lead identified in water located south of Pond 3 on the Site (**Section 3.3.7.3**).
- The Groundwater Ingestion Exposure Route (both components) will be addressed for the manganese concentrations in soil and groundwater within multiple areas throughout the Site and off-site through a review of local background groundwater conditions in the area of the Site (**Section 3.3.7.4**).

In support of satisfying the 35 IAC 742.320 exclusion requirements, COCs exceeding the Soil and Groundwater Components of the Groundwater Ingestion Exposure Route for Class I Groundwater were evaluated using the appropriate RBCA Equations and/or local background groundwater conditions. The following sections summarize the proposed Tier 3 evaluations.

3.3.7.1 Tier 3 Evaluation Summary

Under Tier 1, available soil and groundwater analytical data have been compared to baseline remediation objectives, contained in tables listed in 35 IAC 742, Appendix B. Based on these comparisons, certain COC concentrations exceed the Tier 1 remediation objectives for the Groundwater Ingestion Exposure Route (one and/or both components), which are proposed to be addressed through a Tier 3 Evaluation.

As presented in **Section 2.1.5** of the Comprehensive Site Investigation Report, the eastern portion of the Site lies within a 400-foot radius minimum setback zone of the on-site water supply well. The area of former Building 1, which is situated within the 400-foot setback zone, was identified with total aluminum, iron, antimony, arsenic, lead, manganese, nickel, and vanadium, along with benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene in soil that exceeds the Tier 1 Soil Component of the Class I Groundwater Ingestion Exposure Route. Since metals- and PNA-impacted soil are situated within portions of the Site that lie within a minimum 400-foot setback zone, the decision to exclude the exposure route in accordance with Section 742.320 has been forgone for a Tier 3 demonstration in the event that future setback zones are increased. Therefore, in an effort to demonstrate that observed impacts at the Site do not pose

a significant risk to human receptors, a Tier 3 Evaluation is proposed to be completed and presented in an addendum to ROR in accordance with Section 742.925.

In addition, as presented in **Section 2.8.4**, dissolved lead was noted in groundwater collected from monitoring well MW-46 located south of Pond 3 and outside of the aforementioned 400-foot setback zone of the on-site water supply well that exceeded the Tier 1 GRO for Class I Groundwater. To exclude the Tier 1 GRO, a Tier 3 evaluation was completed for the dissolved lead concentration detected in MW-46. The following has been prepared in accordance with 35 IAC 742.925 for a Tier 3 Evaluation to address the dissolved lead concentrations that exceeds the Groundwater Component of the Groundwater Ingestion Exposure Route.

The following provides a listing of the specific requirements for the exclusion of the Groundwater Ingestion Exposure Route for dissolved lead detected at monitoring well MW-46, along with an explanation of how each requirement has been satisfied.

The groundwater ingestion exposure route may be excluded from consideration if:

a) The requirements of Sections 742.300 and 742.305 are met;

The requirements of Sections 742.300 and 742.305 have been met, as discussed in **Section 3.3.3**, which satisfies Section 742.320(a) above.

b) The corrective action measures have been completed to remove any free product to the maximum extent practicable;

Free product was not encountered during the site investigation activities conducted at the Property. Therefore, Section 742.320(b) has been satisfied.

c) The source of the release is not located within the minimum or designated maximum setback zone or within a regulated recharge area of a potable water supply well;

The dissolved lead concentration was detected in monitoring well MW-46, which is located approximately 1,400 feet west of the on-site water supply well and approximately 1,000 feet outside of the 400-foot setback radius. In addition, the Property is not located within a regulated recharge area of a potable supply well. Therefore, Section 742.320(c) has been satisfied.

d) As demonstrated in accordance with Section 742.1015, for any area within the measured and modeled extent of groundwater contamination above what would otherwise be the applicable Tier 1 groundwater remediation objectives, an ordinance adopted by a unit of

local government is in place that effectively prohibits the installation of potable water supply wells (and the use of such wells);

The Groundwater Ingesting Exposure Route is not anticipated to be a concern upon the proposed connection of a municipal water main to the Site, and the discontinued use of the current on-site water supply well. A groundwater use restriction is proposed to be placed on the Site as an institutional control for the Site. In addition, the dissolved lead concentration identified on the Site has been demonstrated to be below Tier 1 GROs for Class I Groundwater prior to reaching the nearest down gradient boundary, as discussed in **Section 3.3.7.1.4.** Therefore, Section 742.320(d) has been satisfied.

e) As demonstrated using Equation R26 in Appendix C, Table C, in accordance with Section 742.810, the concentration of any contaminant of concern in groundwater within the minimum or designated maximum setback zone of an existing potable water supply will meet the applicable Tier 1 groundwater remediation objective

The location of the dissolved lead that exceeds the Tier 1 Groundwater Component of the Groundwater Ingestion Exposure Route is not located within a minimum or designated maximum setback zone of an existing potable water supply well. As shown below in **Section 3.3.7.1.4**, RBCA equation R26 demonstrates that the dissolved lead concentration in the groundwater at MW-46 will meet Tier 1 GROs at the closest Site boundary. Therefore, Section 742.320(e) has been satisfied.

f) As demonstrated using Equation R26, in Appendix C, Table C, in accordance with Section 742.810, the concentration of any contaminant of concern in groundwater discharging into a surface water will meet the applicable surface water quality standard under 35 Ill. Adm. Code 302.

The nearest down gradient surface water feature includes the Kishwaukee River, which is located approximately 0.9 miles northwest of the Site. Other water features include Pond 5 and an associated drainage swale, which are located on the Site approximately 270 feet to 1,000 feet south and southwest of MW-46 (i.e., up and cross gradient of MW-46). RBCA equation R26 has been used to demonstrate that COC concentrations meet applicable surface water standards prior to reaching the nearest downgradient surface water boundary. Therefore, Section 742.320(f) has been satisfied.

3.3.7.1.1 Description of the Route Evaluated

The exposure route subject of this Tier 3 Evaluation is the Groundwater Component of the Groundwater Ingestion Exposure Route for the dissolved lead noted in the sampled collected from monitoring well MW-46. As mentioned previously, COCs exceed the Tier 1 GRO for Class I Groundwater in the area located immediately south of the wastewater treatment Pond 3. Consequently, this exposure route is being evaluated to assess the risk to human receptors.

3.3.7.1.2 Description of the Site and Physical Site Characteristics Geology

The following provides a summary of the Site physical characteristics as described in detail in **Section 2.0** of the Comprehensive Site Investigation.

- The Site is generally comprised of multiple office, storage and manufacturing buildings; remnants of former building floors and foundations; four wastewater treatment ponds; a private water supply well; various asphalt-paved parking and driveway areas; a former grass-covered airplane landing strip; a tract of row-crop farmland, undeveloped wooded areas, a settling pond, and a naturally vegetated wetland/depressional area on the southwest portion of the Site, which is commonly referred to as a percolation field in historical documents. A man-made overspill ditch also transects the southern portion of the Site and extends from the four wastewater treatment ponds to Pond 5. According to representatives of Arnold, Pond 5 is not a treatment pond, but rather primarily a pond used to capture site stormwater runoff.
- The on-site features specifically include combined manufacturing Building 2/3/4/7 (vacant manufacturing building), Building 8 (pump house), Building 10 (former cleaning area), former manufacturing Buildings 1 and 6 (demolished), additional manufacturing and support buildings (Building 11/14, Building 5, and Building 12), asphalt/concrete pavements, four wastewater treatment ponds (Ponds 1 through 4), a waste water treatment plant building located north of Pond 4, fire system pump house located west of Pond 1, and a former Pond 6 located in the northwestern corner of the Site. According to representatives of Arnold, former Pond 6 consisted of a holding pond that served to capture site stormwater runoff, which was subsequently filled in with soil.

As previously mentioned, the on-site geology consists of unconsolidated soils comprised of alternating layers of till, silt, sand and gravel from the ground surface to approximately 205 feet bgs. The following unconsolidated sediments were noted onsite in separate layers encountered over a range of depths:

- Sandy soil from the ground surface to approximately 20 (0 to 20) feet bgs, and 80 to 85 feet bgs;
- Calcareous till was encountered from 20 to 35 feet bgs, 45 to 50 feet, 85 to 90 feet bgs, 125 to 145 feet bgs, 180 to 185 feet bgs, and 195 to 205 feet;
- Fine to coarse sand with silt and gravel was encountered from 35 to 45 feet bgs, 50 to 80 feet bgs, and 185 to 195 feet bgs;
- Silt was encountered from 90 to 125 feet bgs, and
- Dolomitic gravel was encountered from 145 to 180 feet bgs.
- Dolomitic bedrock was encountered from approximately 205 to 520 feet bgs;
- Sandstone bedrock was encountered from approximately 520 to 775 feet bgs;
- Dolomitic bedrock was again encountered at 775 to approximately 846 feet bgs.

The off-site geology consists of unconsolidated soils comprised of the following stratigraphic units situated to the north and northwest of the Site:

- Sandy clay with topsoil, gravel and organics from the ground surface to approximately three (0-3) feet bgs;
- Medium, poorly-sorted sand with gravel from approximately 3 to 35 feet bgs; and
- Fine to medium, well-sorted sand with gravel from approximately 35 to 75 feet bgs, the maximum depth explored by WCG.
- Based upon the information collected during the soil assessment activities, saturated sands were generally first encountered between 12-15 feet bgs in offsite locations and at depths of generally 20 to 30 feet bgs on the Site during the WCG site investigation.
- A representative hydraulic conductivity for the sand and gravel aquifer is within a narrow range of 4.9×10^{-2} cm/s to 6.0×10^{-2} cm/s.

Based on the historic information provided in **Section 1.1**, prior environmental investigations were completed to evaluate the on-site wastewater treatment ponds and other areas of concern. During the 2015 CSI, previously installed monitoring wells were sampled and analyzed to further evaluate the current condition of the Site. As a result, the analytical data from monitoring wells situated on the Site and around the wastewater treatment ponds demonstrate that horizontal migration of non-VOC COC impacts from the source has not occurred. Non-VOC COC impacts observed during the 2015 investigations within the

groundwater do not appear to be migrating off-site and have not been observed in the off-site residential water supply wells.

3.3.7.1.3 Calculations and Modeling

For purposes of this Tier 3 Evaluation calculations and modeling were performed on dissolved lead that exhibited concentrations above Tier 1 Groundwater Ingestion Exposure Route for Class I Groundwater.

3.3.7.1.4 RBCA Evaluation

Although lead was detected in exceedance of the Soil Component of the Groundwater Ingestion Route in multiple soil samples, dissolved lead was only detected in one monitoring well, MW-46, in exceedance of the Groundwater Component of the Groundwater Ingestion Route. WCG proposes to address these exceedances through a Tier 3 Evaluation to be discussed in the RAP; however, RBCA equation R26 listed in 35 IAC 742, Appendix C, Table C was used to assess migration of the lead in groundwater. Equation R26 was utilized to model the extent of the actual impacts in the groundwater. For select parameters where site specific data was not available, allowable conservative default values were utilized.

Based on the site subsurface physical soil conditions, the following parameters were used for the RBCA calculations presented in **Appendix P**:

- As described in **Section 2.1.3.5**, an in-situ hydraulic conductivity test was performed at well MW-120, which is approximately 157 feet to the southeast of monitoring well MW-46. The hydraulic conductivity was found to be 3.92E-03 cm/sec.
- A hydraulic gradient was calculated based on water level measurements and subsequent groundwater elevations collected during the April 2015 investigation. For this calculation the groundwater elevation differences between monitoring well MW-120 and MW-18 were assessed in relation to the horizontal distance from one another. As shown on **Table 21**, the difference in elevation between these wells is 1.19 feet over a horizontal distance of approximately 1,190 feet. The resultant hydraulic gradient equals 0.001 feet/foot.
- Based on the limited extent of lead impacts in groundwater, a conservative value of 610 centimeters was used for source width (S_d) perpendicular to the groundwater flow direction in the vertical plane.

- Based on our interpretation of the groundwater flow characteristics of beneath the Site, groundwater appears to flow to the northwest towards the Kishwaukee River. However, to be conservative, constituent concentrations were modeled to the nearest Site boundary as the point of compliance. In this case, the northern boundary was utilized as the point of compliance.
- The maximum source width (S_w) perpendicular to the groundwater flow direction in the horizontal plane was estimated based upon the groundwater analytical results. Constituent concentration source widths were interpolated using approximately one-half the distance between the impacted sample location and a sample location appearing free of impacts. The resulting plume width was 12,405 centimeters or 407 feet around MW-46. The results of the R26 RBCA evaluation are provided on **Appendix P** and are summarized below:

R26 RBCA Evaluation Summary					
Sample Location	**Constituent**	**Actual Groundwater Concentration (mg/L)**	**Class I Groundwater Remediation Objective**	**Distance to Nearest Site Boundary (Centimeters)**	**Theoretical Concentration at Point of Compliance**
MW-46	Lead	0.015	0.0075	10,040	6.73E-03

Please be aware that a first order degradation constant was not available for lead. As a result, zero (0) was entered for this value resulting in a very minimal theoretical degradation in the R26 equation.

Based on the calculation above, the actual groundwater concentration- for dissolved lead observed at MW-46 met the Class I GRO at the northern Site boundary. This is consistent with the actual dissolved lead concentrations (below the laboratory reporting limit) in wells near the Site boundary installed at 50 feet bgs including MW-44 and MW-5.

3.3.7.2 Manganese Background Review Summary

As summarized in **Section 2.8**, off-site groundwater samples from monitoring wells MW-23 (70'), MW-76 (50'), MW-83 (30'), and MW-86 (50') exhibited concentrations of dissolved manganese (ranging from 0.22 mg/L to 1.7 mg/L); and on-site groundwater samples from monitoring wells MW-104 through MW-106, MW-108, MW-111, MW-112, MW-115 through MW-118, MW-03, and MW-04 exhibited concentrations of dissolved manganese (ranging from

0.18 mg/L to 0.49 mg/L) in excess of the Tier 1 GRO for Class I Groundwater (0.15 mg/L). The detected manganese concentrations appear to be present widespread throughout the Site, including in portions of the Site and off-site areas that are located at anticipated cross and up groundwater gradient locations from the manufacturing buildings and wastewater treatment ponds on the Site.

Specifically, two of the on-site groundwater samples that exhibited dissolved manganese (MW-108 and MW-111) are located south of the diked percolation field and are situated up and cross gradient from the on-Site facilities. In addition, 6 of the 8 detected manganese concentrations in groundwater are located around the area of the percolation field, which appears to consist of a natural wetland area. In addition, similar manganese concentrations were noted offsite. One of the off-site groundwater samples was collected in a natural potential wetland area adjacent to the Kishwaukee River and cross groundwater gradient from the Site.

It should be noted that manganese is found naturally in groundwater. The concentration of manganese in groundwater can fluctuate seasonally and vary with the depth and the geology of an area. Manganese naturally occurs in groundwater that has little or no oxygen, typically in deeper wells (but not always), in areas where groundwater flow is slow, and in areas where groundwater flows through soils rich in organic matter. It should be noted that 7 of the detected manganese concentrations are located in or adjacent to natural wetland locations, which are comprised of hydric soils that generally contain higher levels of organic matter. According to the Natural Resources Conservation Service (NRCS) online Web Soil Survey for McHenry County, the aforementioned wetland areas contain higher levels of organic matter than the surrounding upland areas.

In addition, according to the City of Marengo Annual Drinking Water Quality Reports, potential sources of inorganic constituents, which would be applicable to the Site and off-site areas, can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges (i.e., sanitary discharges), and farming (i.e., use of various pesticides). Two of the four off-site monitoring wells are located in close proximity to Railroad Street or the adjacent road-side stormwater drainage swale. In addition, a third off-site monitoring well was located immediately adjacent to a row-crop farm field, which could be subject to pesticide applications.

In addition, to further evaluate the presence of manganese that may be naturally occurring in the area of the City of Marengo, historical municipal water supply analytical data were reviewed. Based on our review of the City of Marengo Annual Drinking Water Quality Reports

for 2010, 2011, 2013, and 2014, levels of detected manganese ranged from 0.157 ppm to 0.212 ppm (**Appendix Q**). This information suggests that the local water quality exhibits naturally occurring manganese concentrations above the TACO Tier I GRO for Class I Groundwater.

In light of the aforementioned, WCG believes that the detected manganese concentrations may be naturally occurring or a result of other sources not related to the operations at the Site. The detected manganese concentrations exhibited a wide areal distribution, and multiple manganese concentrations were observed in groundwater monitoring wells located adjacent to natural wetlands, row-crop farmland, and road-side drainage swales, which are potential source locations for manganese in groundwater due to the presence of higher organic matter, pesticide applications, and the accumulation of stormwater surface runoff from Railroad Street and adjoining commercial properties. In addition, local water quality reports for the City of Marengo suggest that elevated manganese concentrations in groundwater are naturally occurring in the area. Therefore, manganese in the groundwater is considered a background condition characteristic of the Site and off-site setting.

3.4 RECOMMENDED DEED RESTRICTIONS/INSTITUTIONAL CONTROLS

In accordance with 35 IAC 742.1010, institutional controls will be applied to the Site in the form of deed restrictions, which include the following:

- Restricting the Site to industrial/commercial land use in accordance with 35 IAC 742.1010;
- Construction worker safety precaution to provide measures be taken for the safety of construction workers during intrusive activities in areas where concentrations of COCs in soil exceed the construction worker remediation objectives; and
- Reliance on a proposed City of Marengo ordinance prohibiting the installation and use of new potable groundwater wells on the Site.

4.0 CONCLUSION

On behalf of the RA, 300 West, LLC, WCG has prepared this Comprehensive SI/RO Report in accordance with applicable SRP requirements listed in 35 IAC 740.425 and 740.445. It is the intention of the RA to secure a Comprehensive NFR Letter from the IEPA SRP demonstrating the Site is compliant with remediation objectives under the Industrial/Commercial land use scenario.

As detailed in the Comprehensive Site Investigation section (**Section 2.0**) of this document, appropriate assessment and subsurface investigations of environmental conditions at the Site have been undertaken. The scope of these investigations included soil and groundwater sample collection and analysis for the various COCs at the Site, which include the TCL constituents. The site investigations were performed to assess the horizontal and vertical distribution of detected constituents. The number of samples collected and analyzed in the vicinity of the impacted areas onsite and in offsite areas located down gradient from the Site is believed to be sufficient to characterize the vertical and horizontal extent of non-chlorinated VOC COCs above Tier 1 SROs on the Site and on off-site properties with the exception of certain metals that exceed the Tier 1 SRO for the Soil Component of the Class I Groundwater Ingestion Exposure Route. Generally, the detected metals that exceed the Tier 1 Soil Component of the Groundwater Ingestion Exposure Route on the Site and offsite were not observed in the groundwater onsite or offsite, with the exception of dissolved manganese and lead, which either do not migrate offsite or are believed to be naturally occurring. In light of the chlorinated VOC results, it appears the vertical extent of certain chlorinate VOCs have not been fully determined in soil and groundwater onsite or offsite.

In summary, concentrations of select COCs have been detected at the Site above applicable Tier 1 SROs for Industrial/Commercial Properties and/or Backgrounds within MSAs. As detailed in **Section 3.0**, the following is proposed to address COC impacts at the Site:

- Concentrations of select PNAs, Aroclor 1248, and arsenic in excess of the Soil Ingestion Exposure Route are proposed to be addressed through the use of hot spot removal remedial action and/or site-specific averaging (**Section 3.3.4**).
- The concentration of nickel exceeding the Soil Inhalation Exposure Route is proposed to be addressed through site-specific averaging (**Section 3.3.4**).
- The Groundwater Ingestion Exposure Route (both components) is proposed to be addressed through active remediation to be presented in a future Remedial Action Plan for chlorinated VOCs and 1,4-dioxane. This will also include the installation of a municipal water main to the off-site residences that exhibited impacts to private

water supplies and the potential abandonment of private water supply wells at those locations, as necessary.

- The Soil Component of the Groundwater Ingestion Exposure Route is proposed to be addressed by demonstrating compliance with 35 IAC 742.925 for a Tier 3 Evaluation for concentrations of total aluminum, iron, antimony, arsenic, lead, manganese, nickel, and vanadium, along with benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene. The Tier 3 Evaluation will be completed and presented in a future addendum to this ROR.
- The Groundwater Component of the Groundwater Ingestion Exposure Route was demonstrated to be in compliance with 35 IAC 742.925 for a Tier 3 Evaluation for concentrations of total lead identified in water located south of Pond 3 on the Site.
- The Groundwater Ingestion Exposure Route (both components) will be addressed for the manganese concentrations in soil and groundwater within multiple areas throughout the Site and off-site through a review of regional background groundwater conditions in the area of the Site (**Section 3.3.7.2**).
- Groundwater sample data meets Tier 1 GROs for the Indoor Inhalation Exposure Route. Institutional controls will be used in support of relying on the TACO table for the Indoor Inhalation Exposure Route. Use of the table requires that existing or potential buildings have full concrete slab-on-grade or a full concrete basement floor and walls and institutional controls are in place for these requirements.
- COC impacts exceeding Tier 1 SROs for the Soil Inhalation and/or Ingestion Exposure Route for the Construction Worker Scenario will be addressed through construction worker safety provisions (**Section 3.3.6**).

As a result, WCG respectfully requests on behalf of the RA the issuance of a Comprehensive NFR Letter, with the following restrictions:

- Restricting the Site to industrial/commercial land use in accordance with 35 IAC 742.1010;
- Use of a construction worker safety precaution to provide measures be taken to ensure safety for construction workers during intrusive activities in areas where concentrations of COCs in soil exceed the construction worker remediation objectives; and
- Reliance on a proposed City of Marengo ordinance prohibiting the installation and use of new potable groundwater wells on the Site.

5.0 SIGNATORIES AND CERTIFICATIONS

Pursuant to 35 IAC Section 740.410, the following presents the information required concerning the Remediation Applicant, to whom inquiries may be addressed; the Remediation Applicant signature; and the affirmation and signature of the Licensed Professional Engineer responsible for preparation of this Report.

Remediation Applicant

Mr. John Daley
300 West, LLC
2340 South River Road
Suite 310
Des Plaines, Illinois 60018

Licensed Professional Engineer Affirmation

I attest that the investigation presented herein relies in part upon investigations or remedial activities conducted before my assuming responsibility for site activities. Based upon my review of the documentation of prior investigations or remedial activities, I believe that such information is suitable for use in complying with 35 Illinois Administrative Code (IAC) Part 740 and Part 742. I further attest that certain site investigations or remedial activities that are the subject of the Report were performed under my direction or reviewed by me, and, to the best of my knowledge and belief, the work described in the plan or report has been designed or completed in accordance with the Act, 35 IAC Part 740, and generally accepted engineering practices, and the information presented is accurate and complete.

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:
0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[c] Soil probe identification number
[d] Soil probe sampling date
[e] Soil sample depth below ground surface (bgs)
[f] Milligrams per kilogram (mg/kg)
[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.
< 0.0048 - Below laboratory detection limits
---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:
0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[c] Soil probe identification number
[d] Soil probe sampling date
[e] Soil sample depth below ground surface (bgs)
[f] Milligrams per kilogram (mg/kg)
[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.
< 0.0048 - Below laboratory detection limits
---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:
0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[c] Soil probe identification number
[d] Soil probe sampling date
[e] Soil sample depth below ground surface (bgs)
[f] Milligrams per kilogram (mg/kg)
[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.
< 0.0048 - Below laboratory detection limits
---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Table 1 (continued)
VOCs Soil Analytical Summary
Comprehensive Site Investigation (On Site)
300 North West Street
Marengo, Illinois

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:
0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[c] Soil probe identification number
[d] Soil probe sampling date
[e] Soil sample depth below ground surface (bgs)
[f] Milligrams per kilogram (mg/kg)
[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.
< 0.0048 - Below laboratory detection limits
---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:
0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[c] Soil probe identification number
[d] Soil probe sampling date
[e] Soil sample depth below ground surface (bgs)
[f] Milligrams per kilogram (mg/kg)
[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.
< 0.0048 - Below laboratory detection limits
---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:
0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[c] Soil probe identification number
[d] Soil probe sampling date
[e] Soil sample depth below ground surface (bgs)
[f] Milligrams per kilogram (mg/kg)
[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.
< 0.0048 - Below laboratory detection limits
---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Table 1 (continued)

Legend:
0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[c] Soil probe identification number
[d] Soil probe sampling date
[e] Soil sample depth below ground surface (bgs)
[f] Milligrams per kilogram (mg/kg)
[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.
< 0.0048 - Below laboratory detection limits
---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Table 1 (continued)

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identification number

[d] Soil probe sampling date

[e] Soil sample depth below ground surface (bgs)

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.0048 - Below laboratory detection limits

---- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below gorund surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

< 0.039 - Below laboratory detection limits

--- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below gorund surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

< 0.039 - Below laboratory detection limits
NA - Not analyzed
N/A - Not applicable
--- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below gorund surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

< 0.039 - Below laboratory detection limits

NA - Not analyzed

--- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below gorund surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

[g] Duplicate soil probe GP-409 sample taken on 5/14/2015.

[h] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

< 0.039 - Below laboratory detection limits

--- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

2.6	Concentration exceeds the Tier 1 SRO Ingestion Route for Industrial/Commercial
4.7	Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater and the Tier 1 SRO Ingestion Route for Industrial/Commercial

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below gorund surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

[g] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

< 0.039 - Below laboratory detection limits

--- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

25	Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I and the Tier 1 SRO Ingestion Route for Industrial/Commercial
24	Concentration exceeds the Tier 1 SRO Ingestion Route for Industrial/Commercial and Construction Work

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below gorund surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

[g] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

< 0.039 - Below laboratory detection limits

NA - Not analyzed

--- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office, 06/27/2016 - PCB 2016-097***

Legend:

4.5 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below ground surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

[g] Milligrams per liter (mg/L)

[h] Duplicate soil probe GP-409 sample taken on 5/14/2015.

[i] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

< 0.34 - Below laboratory detection limits

--- No SRO or Background Concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.16	Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater.
32	Concentration exceeds the Tier 1 SRO for Industrial/Commercial

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below ground surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

[g] Milligrams per liter (mg/L)

[h] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

< 0.34 - Below laboratory detection limits

--- No SRO or Background Concentration for MSAs available.

NA - Not analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53	Concentration exceeds the Tier 1 SRO for Ingestion and Inhilation for Industrial/Commercial and Ingestion for Construction Worker
2.6	Concentration exceeds the Tier 1 SRO Ingestion Route for Industrial/Commercial and/or ConstructionWorker
4.6	Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater.
1.0	Concentration exceeds the Tier 1 SRO Inhalation Route for Construction Worker

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Soil probe identification number
[c] Soil probe sampling date
[d] Soil sample depth below ground surface (bgs)
[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[f] Milligrams per kilogram (mg/kg)
[g] Milligrams per liter (mg/L)

[h] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

< 0.34 - Below laboratory detection limits
--- No SRO or Background Concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

3.8	Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater
310	Concentration exceeds the Tier 1 SRO Ingestion Route for Industrial/Commercial
0.55	Concentration exceeds the Tier 1 SRO Inhalation Route for Construction Route

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below ground surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

[g] Milligrams per liter (mg/L)

[h] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

< 0.34 - Below laboratory detection limits

--- No SRO or Background Concentration for MSAs available.

NA - Not analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Table 4 (continued)
Total Metals Soil Analytical Summary
Comprehensive Site Investigation (On Site)
300 North West Street
Marengo, Illinois

Legend:

4.6 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater.

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Soil probe identification number

[c] Soil probe sampling date

[d] Soil sample depth below ground surface (bgs)

[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[f] Milligrams per kilogram (mg/kg)

[g] Milligrams per liter (mg/L)

[h] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

< 0.34 - Below laboratory detection limits

--- No SRO or Background Concentration for MSAs available.

NA - Not analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

310	Concentration exceeds the Tier 1 SRO Ingestion Route for Industrial/Commercial
94	Concentration exceeds the Tier 1 SRO Ingestion Route for Industrial/Commercial and Construction Worker
4.6	Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater.

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Soil probe identification number
[c] Soil probe sampling date
[d] Soil sample depth below ground surface (bgs)
[e] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[f] Milligrams per kilogram (mg/kg)
[g] Milligrams per liter (mg/L)
[h] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.
< 0.34 - Below laboratory detection limits
--- No SRO or Background Concentration for MSAs available.

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Soil probe identification number and/or soil sample identification
[c] Sample collection date
[d] Soil sample depths below ground surface (bgs)
[e] Result does not exceed Acceptable Detection Limit (ADL) per Title 35 Part 620 and Part 742.
[f] Milligrams per kilogram (mg/kg)
[g] Duplicate soil probe GP-409 sample taken on 5/14/2015. Results compared to prior GP-409 soil samples.
< 0.0018 - Below laboratory detection limits
--- No Remediation Objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Soil probe identification number and/or soil sample identification
[c] Sample collection date
[d] Soil sample depths below ground surface (bgs)
[e] Result does not exceed Acceptable Detection Limit (ADL) per Title 35 Part 620 and Part 742.
[f] Milligrams per kilogram (mg/kg)
< 0.0018 - Below laboratory detection limits
--- No Remediation Objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Soil probe identification number and/or soil sample identification
[c] Sample collection date
[d] Soil sample depths below ground surface (bgs)
[e] Result does not exceed Acceptable Detection Limit (ADL) per Title 35 Part 620 and Part 742.
[f] Milligrams per kilogram (mg/kg)
< 0.0018 - Below laboratory detection limits
--- No Remediation Objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Soil probe identification number and/or soil sample identification
[c] Sample collection date
[d] Soil sample depths below ground surface (bgs)
[e] The Acceptable Detection Limit (ADL) is the RO per Title 35 Part 620 and Part 742.
[f] Milligrams per kilogram (mg/kg)
< 0.0018 - Below laboratory detection limits
--- No Remediation Objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:
2.7 Concentration exceeds the Tier 1 SRO Ingestion Route for Industrial/Commercial

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Soil probe identification number and/or soil sample identification
[c] Sample collection date
[d] Soil sample depths below ground surface (bgs)
[e] Result does not exceed Acceptable Detection Limit (ADL) per Title 35 Part 620 and Part 742.
[f] Milligrams per kilogram (mg/kg)
NA - Not analyzed
< 0.0018 - Below laboratory detection limits
--- No Remediation Ojective available.

Notes:
[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Soil probe identification number and/or soil sample identification
[c] Sample collection date
[d] Soil sample depths below ground surface (bgs)
[e] Result does not exceed Acceptable Detection Limit (ADL) per Title 35 Part 620 and Part 742.
[f] Milligrams per kilogram (mg/kg)
NA - Not analyzed
< 0.0018 - Below laboratory detection limits
--- No Remediation Ojective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

47 Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] The GRO is equal to the Acceptable Detection Limit (ADL) per Title 35, IAC, Part 620 and Part 742.

[d] Groundwater Sample Identification Number

[e] Depth of Groundwater Sampling Well

[f] Groundwater Sampling Date

[g] Milligrams per Liter mg/L

* Insufficient volume, no sample collected

< 0.0050 - Below laboratory detection limits

--- No GRO available.

NA - Not Analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

47 Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] The GRO is equal to the Acceptable Detection Limit (ADL) per Title 35, IAC, Part 620 and Part 742.

[d] Groundwater Sample Identification Number

[e] Depth of Groundwater Sampling Well

[f] Groundwater Sampling Date

[g] Milligrams per Liter mg/L

* Insufficient volume, no sample collected

< 0.0050 - Below laboratory detection limits

--- No GRO available.

NA - Not Analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

47 — Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated Oct. 30, 2012

[c] Groundwater Sample Identification Number

[d] Depth of Groundwater Monitoring Well

[e] Groundwater Sampling Date

[f] Milligrams per Liter (mg/L)

[g] The most-stringent pH-specific remediation objective is listed.

* Insufficient volume, no sample collected

< 0.0050 - Below laboratory detection limits

--- No GRO available.

NA - Not Analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:
[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated Oct. 30, 2012
[c] Groundwater Sample Identification Number
[d] Depth of Groundwater Monitoring Well
[e] Groundwater Sampling Date
[f] Milligrams per Liter (mg/L)
[g] The most-stringent pH-specific remediation objective is listed.
* Insufficient volume, no sample collected
< 0.0050 - Below laboratory detection limits
--- No GRO available.
NA - Not Analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

47 — Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective (July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Monitoring well identification number and/or groundwater sample identifier.

[d] Depth of Groundwater Monitoring Wells

[e] Groundwater Sampling Date

[f] Milligrams per Liter (mg/L)

* Insufficient volume, no sample collected

< 0.34 - Below laboratory detection limits

--- No GRO available.

NA - Not Analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Table 9
Total Metals and Dissolved Metals Groundwater Analytical Summary
Comprehensive Site Investigation (On Site)
300 North West Street
Marengo, Illinois

Legend:

47 — Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Monitoring well identification number and/or groundwater sample identifier.

[d] Depth of Groundwater Monitoring Wells

[e] Groundwater Sampling Date

[f] Milligrams per Liter (mg/L)

* Insufficient volume, no sample collected

< 0.34 - Below laboratory detection limits

--- No GRO available.

NA - Not Analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I Groundwater

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Soil probe identfication number

[d] Soil sample depth below ground surface (bgs)

[e] Soil sampling date

[f] Milligrams per kilogram (mg/kg)

< 0.0048 - Below laboratory detection limits

---- No remedial objective available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

[c] Soil probe identification number

[d] Soil sample depth below ground surface (bgs)

[e] Soil sampling date

[f] Milligrams per kilogram (mg/kg)

[g] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Protection Agency Toxicity Assessment Unit dated October 30, 2012

[h] Result does not exceed Acceptable Detection Limit (ADL) per Title 35, IAC, Part 620 and Part 742.

< 0.039 - Below laboratory detection limits

--- No remedial objective or background concentration for MSAs available.

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from "Urban Area Polycyclic Aromatic Hydrocarbons Study", TACO 35 IAC 742, Appendix A, Table H.

[c] Soil probe identification number

[d] Soil sample depth below ground surface (bgs)

[e] Soil sampling date

[f] Milligrams per kilogram (mg/kg)

[g] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Protection Agency Toxicity Assessment Unit dated October 30, 2012

< 0.039 - Below laboratory detection limits

--- No remedial objective or background concentration for MSAs available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Table 1.4

Legend:

0.53 Concentration exceeds the Tier 1 SRO for the Soil Component of Groundwater Ingestion Route for Class I

Notes:

[a] Tier 1 Soil Remediation Objective (SROs) from Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Background concentrations for Metropolitan Statistical Areas (MSAs) obtained from TACO 35 IAC 742, Appendix A, Table G.

[c] Soil probe identification number

[d] Soil sample depth below ground surface (bgs)

[e] Milligrams per kilogram (mg/kg)

[f] Remediation objectives as listed in the Illinois Environmental Protection Agency's summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[g] Soil sampling date

[h] Milligrams per Liter (mg/L)

< 0.34 - Below laboratory detection limits

--- No SRO or Background Concentration for MSAs available.

Electronic Filing - Received, Clerk's Office: 06/27/2016 - PCB 2016-097***

Legend:

47 Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Appendix B, Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] The GRO is equal to the Acceptable Detection Limit (ADL) per Title 35 Part 620 and Part 742.

[d] Water Sample Identification Number

[e] Depth of Groundwater Monitoring/Irrigation Well

[f] Groundwater Sampling Date

[h] Screening Well Identification Number

[i] Milligrams per Liter (mg/L)

< 0.0050 - Below laboratory detection limits

--- No GRO available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

47 — Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Appendix B, Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] The GRO is equal to the Acceptable Detection Limit (ADL) per Title 35 Part 620 and Part 742.

[d] Water Sample Identification Number

[e] Depth of Groundwater Monitoring/Irrigation Well

[f] Groundwater Sampling Date

[h] Screening Well Identification Number

[i] Milligrams per Liter (mg/L)

< 0.0050 - Below laboratory detection limits

--- No GRO available.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Notes:
[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Appendix B, Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2013)
[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012
[c] The GRO is equal to the Acceptable Detection Limit (ADL) per Title 35 IAC, Part 620 and Part 742.
[d] Water Sample Identification Number
[e] Depth of Groundwater Monitoring Well
[f] Groundwater Sampling Date
[g] Milligrams per Liter (mg/L)
[h] Screening Well Identification Number
* The most-stringent pH-specific remediation objective is listed
< 0.0050 - Below laboratory detection limits
--- No GRO available.
NA - Not analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

47 Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Appendix B, Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2015).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Monitoring well identification number and/or water sample identifier.

[d] Depth of Groundwater Monitoring Wells

[e] Groundwater Sampling Date

[f] Screening Well Identification Number

[g] Milligrams per Liter (mg/L)

< 0.34 - Below laboratory detection limits

--- No GRO available.

NA - Not analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Legend:

47 Concentration exceeds the Tier 1 GROs for Class I Groundwater

Notes:

[a] Tier 1 Groundwater Remediation Objectives (GROs) obtained from Appendix B, Table E of Tiered Approach to Corrective Action Objectives (TACO) 35 IAC 742 (effective July 15, 2015).

[b] Remediation objectives as listed in the Illinois Environmental Protection Agency's Non-TACO Summary table as prepared by the Illinois Environmental Protection Agency Toxicity Assessment Unit dated October 30, 2012

[c] Monitoring well identification number and/or water sample identifier.

[d] Depth of Groundwater Monitoring Wells

[e] Groundwater Sampling Date

[f] Screening Well Identification Number

[g] Milligrams per Liter (mg/L)

< 0.34 - Below laboratory detection limits

--- No GRO available.

NA - Not analyzed

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

1. EXECUTIVE SUMMARY

Environmental Group Services, Limited (EGSL) was contracted by *300 West LLC* to perform a Focused Site Investigation (FSI) under the Illinois Environmental Protection Agency (IEPA) Site Remediation Program (SRP). The FSI was performed at the Arnold Magnetic Technologies property located at 300 N. West Street in Marengo, Illinois (Site). The FSI was performed pursuant to a Violation Notice issued to the owner and former owner of the property on or about February 28, 2008 with subsequent April 29, 2008 Memorandum, and in compliance with a Verified Complaint for Injunction and Civil Penalties suit filed by the Attorney General of the State of Illinois dated June 14, 2013 and the Agreed Preliminary Injunction Order filed by the Attorney General of the State of Illinois dated August 23, 2013. Copies of these documents are presented in Appendix A.

The purpose of this report is to compile all of EGSL's subsurface soil and groundwater investigations to-date, and to present all areas of concern that contain contaminants above Tier 1 Remediation Objectives within the boundaries of the northern half of the site. Upon concurrence that the vertical and horizontal extent of subsurface VOC impacted soil and groundwater has been adequately defined, EGSL will begin a Tier 2 analysis and shall develop remediation objectives for the contaminants of concern. A Remediation Objectives Report will be prepared stating the applicable remediation objectives for the contaminants of concern and the methods utilized to determine them.

The Site is geographically located in McHenry County in northeast Illinois, see Figure 1. The site is situated at the northwest side of Marengo an elevation of approximately 830 feet msl (see Figure 2). The land surface in this area generally slopes from east to west. The northern portion of the Site is the focus of this Site Investigation (see Figure 3). Onsite features included in this FSI include combined manufacturing Building 2/3/4/7 (vacant manufacturing building), Building 8 (pump house), Building 10 (former drum disposal area), former manufacturing Buildings 1 and 6 (demolished), asphalt/concrete pavement, the waste water treatment plant building (located north of Pond 4), fire system pump house (located west of Pond 1), former pond 6 (located in the northwestern corner of the Subject Property), and wastewater settling Ponds 1 thru 4.

Additional manufacturing and support buildings (Building 11/14, Building 5, and Building 12), pond 5 and open vegetated land (including a percolation field) are located onsite on the southern portion of the property. A stream leading from the settling ponds to pond 5 transects the southern portion of the property. These areas are outside the scope of this investigation.

A search of the Office of the Illinois State Fire Marshal documents 17 underground storage tanks currently or formerly located at the Site. The aggregate capacity of all of the tanks is 60,000 gallons. The contents are identified as unknown (7), cutting oil (2), solvent (2), kerosene (1), gasoline (1) and hazardous substance (4). Six tanks are listed as "abandoned in place", 5 are listed as "removed" and 6 are listed as "exempt from registration". A copy of the OSFM database search result is included in Appendix B.

A chlorinated solvent was identified in the wastewater influent settling ponds in August 1989 during a sampling event required in accordance with Arnold's wastewater facility operation permit. Based on this finding, the IEPA required the installation of groundwater monitoring wells as a requirement for the renewal of their Water Pollution Control Permit number 1989-EO-3870. *Roux Associates* supervised the installation of three groundwater monitoring wells in February 1990. The wells were installed along the western third of the property with primary focus on the potential impacts that the wastewater ponds and percolation field were having on the local groundwater (Roux, 1990, contained in the EGSL 2013 Right to Know report).

Various chlorinated solvents have been identified in the groundwater under the site dating back to before 1999 (Arnold, 2001, Appendix B). Phase I and other Environmental Assessment Reports (ESAs) prepared by *Environ* dating back to 2004 identified chlorinated solvents including trichloroethane (TCA), trichloroethylene (TCE), methylene chloride and perchloroethylene (PEC) as being used as a degreasing agent for parts washing. The reports also identify a total of 16 underground storage tanks located or formerly located on the site. The content of one of the tanks was identified as trichloroethane (TCA). The Environ 2008 ESA states that all use of chlorinated solvents ceased in September 2001. The Environ: 2004 Environmental Review of Nine Arnold Magnetics Facilities, 2006 Updated Environmental Review of Six Facilities of Arnold Magnetics, and 2008 Phase I Environmental Site Assessment and Limited Environmental Compliance Review of Arnold Magnetic Technologies Corporation reports are included in Appendix C.

EGSL performed a Ground Penetrating Radar Survey, in 2006. The purpose of this investigation was to confirm or deny the presence of 12 possible USTs at nine separate areas of the site. GPR results indicated the possible presence of four USTs and four possible excavation areas. A copy of the EGSL GRP report is included as Appendix D.

EGSL conducted a Limited Phase II Subsurface Soil investigation on March 3, 2006. A total of 27 soil borings were advanced around the Site. Eighteen of the soil borings were advanced within the boundaries of this investigation. A total of 18 soil samples were collected from the borings and submitted to a laboratory for analysis of the IEPA Target Compound List (TCL). Arsenic was detected at a concentration of 450 mg/Kg along the northern portion of the Subject Property, between the pump house and Building 2/3/4. Chlorinated solvents were reported above IEPA ROs in soil from 5 boring locations (GP-3, 5, 20, 21 and 22). Groundwater samples were collected from monitoring wells MW-3, 6 and A7 (previously installed by others). Chlorinated solvents were reported by the laboratory above IEPA ROs in all the groundwater samples collected from the wells.

Two, 8,000-gallon underground storage tanks (contents unknown) were removed in the immediate vicinity of this area of concern on November 16, 2007. Both tanks were reported in poor condition at the time of removal, and olfactory and visual observations indicated that the subsurface soil had been impacted; as such, OSFM personnel determined that the USTs had been leaking. The incident was subsequently reported to the Illinois Emergency Management Agency (IEMA) and the IEPA Leaking Underground Storage Tank (LUST) section. LUST Incident number 20071279 was assigned to the site. A copy of the EGSL 2006 Phase II report is included in Appendix E.

On April 24, 2008, EGSL personnel advanced nine additional soil borings (SP-1 thru 9) in the above-referenced areas of concern. A total of 13 soil samples were submitted to *STAT Analysis Corporation* for analyses of BTEX/PNAs and/or Total Arsenic/TCLP Arsenic. According to the laboratory results, none of the samples contained chemicals of concern above IEPA Tier 1 Remediation Objectives (ROs), with the exception of arsenic, which was detected at SP-7 at a concentration of 14.0 mg/Kg, which is slightly above the Tier 1 RO of 13.0 mg/Kg for the ingestion exposure route. A copy of the EGSL 2008 Phase II report is included in Appendix F.

EGSL conducted a Phase I Environmental Site Assessment (ESA) at the Site in 2009. The purpose of the assessment was to identify recognized environmental concerns associated with the subject property. A copy of the EGSL 2009 Phase I ESA report is included in Appendix G.

In May 2010, EGSL personnel completed a Phase II Subsurface Investigation at the Site. This investigation was performed in accordance with the regulations set forth in 35 IAC 740 Site Remediation Program, (SRP) and 35 IAC 742 Tiered Approach to Corrective Action Objectives (TACO), Tier 1, for Industrial/Commercial and Residential properties. A copy of the EGSL 2010 Phase II report is included in Appendix H.

A total of 40 soil borings were advanced throughout the Subject Property (GP-1 thru GP-40). Soil boring nomenclature has been inadvertently repeated from the 2006 sampling event. Care should be exercised when evaluating data from borings GP-1 thru GP-27 throughout this report. Forty-nine soil samples were submitted for analysis in order to determine the presence and concentration of COC in the areas of concern. Additionally, a total of 16 groundwater monitoring wells (MW-1 thru MW-16) were installed at the Subject Property. The results of the investigation revealed the presence of chlorinated solvents above IEPA RO's in soils at two locations (GP-34 and 35). Chlorinated solvents were also reported above IEPA RO's in the groundwater collected from 8 wells (MW-1, 2, 4, 5, 6, 7, 8 and 13).

On October 28-29, 2010, five additional monitoring wells were installed (MW-17, 18, 19, 20, and 21). One deep well (MW-17, screened from 60-70 feet) was installed along the northwestern-most nest of wells in order to delineate the vertical extent of VOC impaction in that area. The four remaining permanent monitoring wells were installed off-site directly north of Railroad Street in order to delineate the horizontal extent of groundwater impaction along the northwestern portion of the Subject Property. Analytical results indicated that these wells still contained contaminants of concern above Tier 1 Remediation Objectives for Class I Groundwater. A memorandum was issued to *300 West LLC* on December 13, 2010. A copy of the EGSL memorandum report is included in Appendix I.

On February 23-24, 2011, two additional monitoring wells were installed (MW-22 and MW-23). MW-22 was installed on-site within the northwestern nest of wells and screened from a depth of 80-90 feet in order to delineate the vertical extent of groundwater impaction in that area. MW-23 was installed within the off-site nest of wells and screened from a depth of 60-70 feet in order to delineate the vertical extent of groundwater impaction in that area. Both of these wells were sampled on March 31, 2011. Neither of the wells contained any contaminants of concern above Tier 1 Remediation Objectives for Class I Groundwater.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Document Description: FOCUSED SITE INVESTIGATION REPORT - VOL. 1 PAGES 8 AND 25

Category ID: 31A **Category Description:** SITE REMEDIATION - TECHNICAL **Exempt Type:** Redaction

Permit ID: **Date of Determination:** 11/26/2013

On March 31, 2011, EGSL was able to access the private, potable water wells from three residential properties located northwest of the Site. With permission from the homeowners, each well was sampled and submitted for analysis of VOCs. The addresses of the homes, and approximate depths of the wells, are as follows: [redacted] 60 feet deep), [redacted] (~107 feet deep), [redacted] >120 feet deep). Analytical results indicated that no VOCs were detected above laboratory detection limits.

On December 2, 2011, EGSL advanced an additional 11 soil borings (GP-40 thru 50) at the Subject Property in order to delineate previous detections of elevated contaminants of concern. GP-40 nomenclature has been inadvertently repeated from the May 2010 investigation event. The purpose of the delineation was to obtain more accurate source widths and depths for future Tier 2 analysis. The laboratory reported that none of the soil samples analyzed for chlorinated solvents contained detections above the SRO. EGSL submitted a Site Investigation Report dated March 23, 2012 documenting the activities performed in 2010 and 2011. A copy of the report is included in Appendix J.

In January 2013 EGSL addressed comments by the IEPA dated November 20, 2012 regarding the fate and transport of on and offsite contaminants of concern related to the Arnold facility. The report provided information on groundwater flow direction and hydraulic gradient, well setback zones, concentrations of contaminants of concern, maps of onsite wells with contaminants of concern and the sampling of private wells within 1500 feet of the property in the direction of groundwater flow. A copy of the report is included in Appendix K.

The focus of the site investigation was modified in 2013 as a result of the litigation filed by the IEPA. Activities performed and analysis requested focused on chlorinated solvents identified in soil and/or groundwater both on and off-site.

On May 14, 2013, EGSL personnel collected groundwater from 13 private residential wells on properties located northwest of the Site. Analysis of the groundwater revealed the presence of chlorinated solvents present in six wells. Two of the wells contained concentrations of chlorinated solvents above the IEPA drinking water standards. As a result, the residents in the area affected or potentially affected by the release of chlorinated solvents into the groundwater are being supplied with bottled drinking water.

In September and October 2013 EGSL advanced an additional 38 soil borings (GP-100 thru 132 and GP-201 thru 205) and installed an additional 23 groundwater monitoring wells (MW-24 thru 46) at the Site in an attempt to further define and refine the vertical and horizontal extent of COCs exceeding IEPA SROs and GROs. Fifteen of the wells (MW-24 thru 37) were seated at 30 feet and the remaining 9 monitoring wells were seated at 50 feet into the till aquifer to further delineate the vertical extent of the migration of the COCs. The 50 foot deep wells were located based on the analytical results of the 30 foot deep wells. The laboratory reported that soil analyzed from seven soil borings (GP-34, 35, 118, 120, 121, 203 and 204) in, east and north of Building 2/3/4/7 contained COCs exceeding IEPA SROs for

chlorinated solvents. The laboratory reported that 10 monitoring wells (MW-20, 24, 25, 27, 28, 29, 31, 32, 36 and 37) contained groundwater above Class I GROs.

On October 17, 2013, the Attorney General requested that chloroform and bromodichloromethane be added to the list of groundwater COCs to be analyzed for at the private resident's wells. This request was made as a result of the discovery of these two compounds in the settling pond water and groundwater adjacent to the settling ponds.

The results of the Focused Site Investigation have identified soil and groundwater contamination associated with chlorinated solvents at the site. Soil contamination exceeding IEPA Tier 1 SROs appears to be limited to two source areas; former building one and building 2/3/4/7 (See Figure, 5, 6 and 7 and their associated subsets). Concentrations of PCE have been identified in soils beneath both areas to depths of at least 20 feet below ground surface north of building 2/3/4/7 and 6 feet below former building 1. 1,1,1-TCA and 1,1-DCE appear to be associated with former building 1. However, EGSL does not have data from soil samples beneath the identified impacted depths and therefore has not identified the vertical extent of VOC contaminants of concern in these areas. As such, EGSL cannot infer that the soil impacts in these areas are the source of groundwater contamination discussed below.

Chlorinated solvent impacted groundwater exceeding IEPA GROs for Class I groundwater appears to extend across virtually the entire limits of this investigation site with the exception of the eastern property boundary (see Figure 9 and their associated subsets). Well depths range from 20 feet below ground surface to 90 feet below ground surface across the site. Several source areas are likely and include: former building 1, building 2/3/4/7, the settling ponds, former building 6 and/or buildings/structures located on the southern section of the site that are currently outside the scope of this investigation.

PCE has been detected across the site in concentrations above the GRO. The contaminant has been reported at a depth of 20 feet below ground surface at the northwest corner of the property to >50 feet north of building 2/3/4/7 and south of pond 3 respectively. It appears that possible source areas for this contaminant include building 2/3/4/7, former building 6 and the ponds at a minimum. The vertical extent of PCE contamination does not appear to be defined north of building 2/3/4/7.

1,1-DCE has been detected across the site in concentrations above the GRO. The contaminant has been reported at a depth of <50 feet at the eastern end of the property, >50 feet north of building 2/3/4/7 and <90 feet at the northwest corner of the property. It appears that there is more than one source area associated with this contaminant and could include former building 1, building 2/3/4/7, the ponds and former building 6 at a minimum. The vertical extent of 1,1-DCE does not appear to be defined north of building 2/3/4/7.

1,1,1-TCA has been detected above the GRO in several wells across the site associated with former building 1, building 2/3/4/7, pond 3 and former pond 6. Depths of the contaminant have been reported at 30 feet to 50 feet bgs (north of building 2/3/4/7). The vertical extent of 1,1,1-TCA does not appear to be defined north of building 2/3/4/7.

TCE has been detected above the GRO in several wells across the site associated with building 2/3/4/7, Pond 3 and possibly former building 6 at a minimum. Depths of the contaminant have been reported at 30 and 50 feet bgs associated with building 2/3/4/7, <50 feet at Pond 3 and <50 feet northeast of former building 6.

1,1,2 TCA and 1,2 DCE has been reported above the GRO under building 2/3/4/7 at a depth of 30 feet bgs. The vertical extent of 1,1,2-TCA and DCE does not appear to be defined at this time as a deeper well at this location has currently not been installed and sampled.

Carbon Tetrachloride was detected slightly above the GRO in one well at 30 feet deep in building 2/3/4/7. The GRO for carbon tetrachloride is 0.005 mg/L. The laboratory reported a concentration of 0.0066 mg/L from groundwater analyzed at this location.

Chloroform has been detected above the GRO at locations associated with building 2/3/4/7, the pond system and at the southeast corner of former building 6. The depth of this contaminant is currently identified to be 30 feet bgs however this contaminant by be present at greater depths south of Pond 1 and in building 2/3/4/7. The vertical extent of this contaminant does not appear to be defined at these two locations.

Bromodichloromethane has been detected above the GRO at one location south of Pond 4 at a depth of 30 feet bgs. The laboratory reported the contaminant at a concentration of 0.0017mg/L, slightly above the GRO of 0.0002mg/L. The contaminant does not appear to be defined at this location.

Bromomethane has been detected above the GRO at the northwest corner of the property at the former Pond 6 location. The laboratory reported the contaminant present in a sample collected from 50 feet bgs but absent from a sample collected from a depth of 70 feet bgs. It appears that the vertical and horizontal extent of this contaminant has been defined onsite.

2. SITE CHARACTERIZATION

A number of sources were consulted in the preparation of this Focused Site Investigation Report. These sources include but are not limited to state government agencies and previous environmental reports prepared by environmental consulting firms including EGSL. Information and data collected from these sources was used to identify contaminants of concern and evaluate the site fate and transport mechanism to determine the vertical and horizontal extents of contaminants of concern present in the soil and groundwater under the site.

2.1 SOURCES REVIEWED

The sources consulted in the preparation of this report include but are not limited to:

- *Monitoring Well Network Installation and Ground-Water Flow Assessment* prepared by Roux Associates, Inc. dated May 17, 1990.

- *The Arnold Engineering Co, Marengo, IL, Permit No. 1999-EO-4027* dated August 30, 2001.
- *Environmental Review of Nine Arnold Magnetics Facilities* prepared by ENVIRON International Corporation, dated December 2004.
- *Unidentified Document: Monthly Summary of Groundwater Sampling Results; Arnold Magnetic Technologies, Marengo, IL.*
- *Updated Environmental Review of six facilities of Arnold Magnetics* prepared by ENVIRON International Corporation, dated March 2006. This document was severely redacted.
- *Phase I Environmental Site Assessment and Limited Environmental Compliance Review of Arnold Magnetic Technologies Corporation, 300 N. West Street, Marengo, Illinois* prepared by ENVIRON International Corporation, dated April 2008.
- *Phase I Environmental Assessment* prepared by EGSL, dated September 30, 2009.
- *Limited Phase II Subsurface Soil and Groundwater Investigation Report* prepared by EGSL, dated March 3, 2006.
- *Limited Phase II Subsurface Soil Investigation Report* prepared by EGSL, dated May 27, 2008.
- *Phase II Subsurface Soil Investigation Report* prepared by EGSL, dated July 15, 2010.
- *Illinois State Geological Survey web site.* www.isgs.illinois.edu.
- *United States Department of Agriculture web site.* www.websoilsurvey.sc.egov.usda.gov.
- *Illinois State Water Survey web site.* www.sws.uiuc.edu.
- *Verified Complaint for Injunction and Civil Penalties No. 13CH1046* dated June 14, 2013.
- *Agreed Preliminary Injunction Order No. 13CH1046* dated August 23, 2013.

2.2 SITE HISTORY

The Subject Property was originally developed in the late 1890s and was first utilized as a rail yard and railroad engine manufacturing/maintenance facility. The Subject Property was reportedly purchased by Arnold in the early 1900s, with their magnetic operations/manufacturing beginning in the 1950s.

The following buildings are currently, or have been historically, located on the Subject Property (see Site map, Figure 3):

- Building 1: Built in the late 1890s and demolished around 2002. The building was approximately 40,000-square-feet in size and was originally utilized for railroad engine manufacturing and repair. Arnold later utilized Building 1 for magnet production, pressing operations, and heat treating.

- Building 2/3/4/7: The original portion of the building (Bldg. 2) was constructed in the 1950s, with subsequent additions (Bldgs. 3, 4, and 7) added later. The entire building is approximately 135,000-square-feet in size and was formerly utilized for office space, maintenance, shipping, and miscellaneous storage. Building 2/3/4/7 was historically utilized for tape-core, powder-core and winding operations associated with magnetic manufacturing; all manufacturing operations ceased in this building in approximately 2002 and the building is currently unused.

- Building 5: Constructed in the 1950s-1960s and is approximately 74,000-square-feet in size. Currently and historically has been utilized by Arnold for their Alnico Products Division, which manufactures magnetic components by molting, melting, and finishing Aluminum, Nickel, and Cobalt. This building is currently outside the scope of this investigation.

- Building 6: Constructed in the 1950s-1960s and demolished in the 1990s. Building 6 was approximately 42,000-square-feet in size and was historically occupied by the Strontium Ferrite Department, which conducted wet processing, mixed metal sludge pressing, iron powder compressing, and baking/grinding operations associated with motor-arc manufacturing.
- Building 8: Constructed between 1950-1970 and is approximately 3,000-square-feet in size. Building 8 is utilized for the storage of landscaping and maintenance equipment, and also contains an approximately 850-foot deep water well that is utilized for potable water for the Subject Property; an associated 100,000-gallon above-ground water holding tank is located directly south of Building 8.
- Building 9: Constructed at an unknown date and demolished in the 1990s. Building 9 was approximately 5,000-square-feet in size and was utilized as an airplane hangar associated with an adjacent private runway (no longer present). This building location is currently outside the scope of this investigation.
- Building 10: Constructed at an unknown date. Building 10 is approximately 3,000-square-feet in size is currently/has historically been utilized for miscellaneous storage, 55-gallon drum storage, and drum cleaning.
- Building 11/14. Original portion of the building (Bldg. 11) constructed in the 1950s, with subsequent addition (Bldg. 14) added later. The entire building is approximately 54,000-square-feet in size and has been utilized by Arnold's Rolled Products Division since the late 1960s. Operations that currently exist within Building 11/14 involve the rolling and finishing operations associated with the production of thin-gauge rolled steel products. This building is currently outside the scope of this investigation.
- Building 12: Constructed by 1970 and is approximately 14,000-square-feet in size. Currently and historically utilized as a parts/storage warehouse. This building is currently outside the scope of this investigation.
- Building 16: Constructed after 1987 and is approximately 3,200-square-feet in size. Currently and historically utilized as a hazardous and non-hazardous storage shed. This building is currently outside the scope of this investigation.

Other buildings associated with the Subject Property include a security booth (outside the scope of this investigation) located by the main entrance, a pump house associated with the wastewater treatment system and pond system and a pump house associated with the fire suppression system.

2.3 SITE DESCRIPTION

The Site is located at 300 N. West Street, northwest of the Town of Marengo in McHenry County on 72 acres of land. The property is currently owned by 300 West LLC and occupied by the Arnold Magnetic Technologies Company which has been in existence since around the turn of the 20th century.

The site is located at an elevation of approximately 830 feet msl. The land surface in this area generally slopes from east to west. The northern portion of the site (as identified on the Site Base Map) is the focus of this Site Investigation. Onsite features included in this focus site investigation include combined manufacturing buildings 2/3/4/7, 8 and 10, former manufacturing building 1 and asphalt/concrete pavement on the eastern half of the property and the waste water treatment plant building, fire system pump house, former pond 6, former building 6 and wastewater settling ponds 1 thru 4.

Additional manufacturing buildings, pond 5 and open vegetated and agricultural land (including the percolation field) are located onsite on the southern portion of the property. A stream leading from the settling ponds to pond 5 transects the southern portion of the property. These areas are outside the scope of this investigation.

The site is bound by West Street and residential properties to the east, the Union Pacific (UP) railroad to the north, Commonwealth Edison substation to the west and the southern portion of the Site. Residential and commercial properties and IL Route 20 are located at the southern property boundary. Additional residential and commercial properties are located north and northwest of the UP railroad and Railroad Drive.

The major soil formation at the Site consists of the Pleistocene Wisconsinan Stage glacial till. The till in the Marengo area consists of sands and gravels up to 200 feet thick with a silt/clay cap. The till in this area is the major source of private potable water for residents outside of the city limits. Groundwater elevations in this aquifer are generally 20 to 40 feet below ground surface (bgs). The Site obtains potable water from an onsite well seated in the Ordovician sandstone formation approximately 850 bgs.

Site soils consist of sands, sandy silts and silty clay overlying the major sand and gravel aquifer. The thickness of silt and clay layer is generally approximately 40 feet bgs. Static onsite groundwater elevation is approximately 20 feet bgs. This static water level tends to correspond with static water levels on well driller logs from surrounding private property wells. The logs were viewed on the Illinois State Geologic Survey web based water well interactive map (http://www.isgs.illinois.edu/?q=ilwater).

Onsite utilities include electricity provided by Commonwealth Edison, natural gas supplied by Nicor. The site contains an onsite sewage treatment system.

Previous Phase I Environmental Assessment (ESA) report dated December 2004 indicate the presence of 12 underground storage tanks (USTs) that are or were located on the property (Environ). The report states that 4 of the tanks were removed from the ground, seven were abandoned in place and one is empty in place. Contents of the tanks were reported to be mineral oil, acetone, methanol, TCA, Kerosene and gasoline. Many of the tanks were reportedly installed in the 1950's - 1960's. A majority of the tanks were taken out of service in 1990 with the last tank reportedly taken out of service before 2004. Four additional USTs were identified in an Environ 2008 Phase I ESA report. The contents were reportedly "hazardous substance" and lube oil and heating oil. The status of these tanks is unknown.

A search of the Office of the Illinois State Fire Marshal documents 17 underground storage tanks currently or formerly located at the Site. The total aggregate capacity of the tanks is 60,000 gallons. The contents are identified as unknown (7), cutting oil (2), solvent (2), kerosene (1), gasoline (1) and hazardous substance (4). Six tanks are listed as "abandoned in place", 5 are listed as "removed" and 6 are listed as "exempt from registration".

EGSL performed a Ground Penetrating Radar (GPR) investigation of suspect areas of the Site in 2006 in an attempt to determine if USTs are still present. The results of the investigation indicated the presence of disturbed soils consistent with UST excavation activities. EGSL identified nine areas suspected of containing or previously containing USTs. One of the areas, area 9, is located adjacent to building 11/14 which is outside the scope of this investigation. EGSL identified four USTs suspected of still being in place. Three of the tanks are known to be properly abandoned in place, (areas 3 and 4). One suspected improperly abandoned tank is suspected to be present in area 5. Since 2004 EGSL is aware of two of the tanks being removed from the ground. RW Collins was contracted to remove two tanks (area 8) in 2007 and properly abandoned three others in areas 3 and 4.

EGSL is unable to confirm the total number of tanks present and/or removed, their size, their location and/or former contents of the 17 tanks identified by the OSFM. EGSL identified the number, size and former contents of the tanks listed in the GPR report through a review of historical site drawings.

3. PHASE II SUBSURFACE INVESTIGATION ACTIVITIES

A Phase II Subsurface Investigation was performed in order to assess the potential for the presence of contaminants of concern (COC) in the subsurface soil and groundwater at the site. The investigation was performed in accordance with Part 740.430 Focused Site Investigation with analysis of soil and groundwater samples for contaminants identified on Target Compound List (TCL) indicator contaminants identified in Appendix A of Part 740. The contaminants of concern specific to this project as identified in Count 1)16 of the Verified Complaint for Injunction and Civil Penalties dated June 14, 2013 are included in the IEPA TLC and include the following:

- I,I-Dichloroethylene (1,1-DCE)
- Cis-1,2-Dichloroethylene (cis-1,2-DCE)
- 1,2-Dichloroethane (DCA)
- Trans-1,2-Dichloroethylene (trans-1,2-DCE)
- Trichloroethylene (TCE)
- Tetrachloroethylene (PCE)
- Vinyl Chloride
- Chloroform*
- Bromodichloromethane*

Additional COCs* were added, via email, from the Assistant Attorney General on October 17, 2013 based on the discovery of chloroform and bromodichloromethane in the water from the settling ponds and groundwater adjacent to the settling ponds. Site investigations performed prior to 2013 may not have focused on these COCs as in injunction was not in force at that time and tank contents were

identified as products not associated with chlorinated solvents.

In the past, Arnold personnel used 1,1,1-trichloroethane and tetrachloroethylene as degreasers during the manufacturing process of products produced at the Arnold facility. The pathway by which these contaminants entered the environment is unclear, however; they and their associate byproducts have been detected in the site soils and groundwater. Subsequent to their discovery, offsite investigations have confirmed that these chemicals have migrated offsite and are currently being reported, by laboratory analysis, to be present in potable water wells located to the north and northwest of the Site in concentrations above IEPA Class I groundwater standards. Figure 4 illustrates the soil boring and groundwater monitoring well locations advanced or installed by EGSL to date.

Site investigation activities have been performed in various stages by EGSL from 2006 before the issuance of the injunction order to the presence. As such, many of the soil and groundwater samples were analyzed for COCs other than those stipulated in the Injunction Order issued in 2013. A brief history of each phase of the investigation activities and results is presented below.

3.1 2006 INVESTIGATION

On February 15, 2006, EGSL completed a Phase II Subsurface Soil and Groundwater Investigation at the Site. This investigation was performed in accordance with the regulations set forth in 35 IAC 740 SRP and 35 IAC 742 TACO Tier 1, for Residential properties. The purpose of this investigation was to confirm or deny the presence of subsurface soil and/or groundwater contamination that may be present at the Subject Property. A copy of the report is included in Appendix E.

EGSL advanced a total of 27 soil borings (GP-1 thru 27) from suspect areas throughout the Subject Property. A total of 27 soil samples were submitted for analysis of Target Compound List (TCL) indicator contaminants in order to analytically determine the presence and concentration of COCs in the areas of concern. The depth and the type of analysis requested of the samples submitted to STAT Laboratory are listed below:

Boring Number	Depth	Location	TCL
GP-1	7.5-8.5	Adjacent to the northeast exterior of the footprint of former Building #1	X
GP-2	4-5	Northwest interior of former Building #1	X
GP-3	5-6	Central interior portion of Building #2	X
GP-4	4-5	Northwestern interior of Building #2	X
GP-5	6-7	Western interior of Building #2	X
GP-6	4-5	Northeastern interior of Building #5	X
GP-7	6-7	Northwestern interior of Building #5	X
GP-8	5-6	Western interior of Building #5	X
GP-9	5-6	Northern interior of Building #14	X
GP-10	7.5-8.5	Adjacent to western exterior of former Building #6	X
GP-11	9-10	Adjacent to northern exterior of former Building #6	X

Boring Number	Depth	Location	TCL
GP-12	8-9	North of Pond #4	X
GP-13	4-5	Adjacent to northern exterior of former Building #1	X
GP-14	4-6	Northeast exterior of Building #2	X
GP-15	5-7	Southeast exterior of Building #2	X
GP-16	6-8	Northern exterior of Building #5	X
GP-17	5-6	Northeast interior of Building #2	X
GP-18	6-8	Southern interior of Building #2	X
GP-19	5-7	Southeast interior of Building #2	X
GP-20	4-5	Northwest exterior of Building #2	X
GP-21	5-6	Northern exterior of Building #2	X
GP-22	4-6	Northern exterior of Building #2	X
GP-23	4-5	Central portion of the Subject Property	X
GP-24	5-6	Central portion of the Subject Property	X
GP-25	4-5	Western interior of former Building #6	X
GP-26	5-6	Southeastern vacant portion of the Subject Property	X
GP-27	5-6	Southwestern vacant portion of the Subject Property	X

The analytical test results of the soil samples were compared to the SROs derived from the IEPA "adopted" IAC 742, TACO, Tier I for Industrial/Commercial properties and for Soil Component of the Groundwater Ingestion Route (SCGIR) (Class I Groundwater).

Listed below are the soil contaminants of concern that were detected above IEPA Tier 1 Soil Remediation Objectives:

Chemical	Sample Number (Depth)	Concentration Detected (mg/Kg)	TACO Tier 1 RO (mg/Kg)	Exposure Pathway
Tetrachloroethene (PCE)	GP-3 (5-6) GP-5 (6-7) GP-20 (4-5) GP-21 (5-6) GP-22 (4-6)	1.3 0.092 0.13 1.5 9.7	0.06 0.3	SCGIR Class I Groundwater SCGIR Class II Groundwater
TCLP Arsenic	GP-2 (4-5)	2.0	0.05 0.2	SCGIR Class I Groundwater SCGIR Class II Groundwater
Arsenic	GP-2 (4-5)	450	13.0 13.0 29 120	Residential Ingestion Background Concentration* SCGIR Class I Groundwater SCGIR Class II Groundwater
Chromium	GP-13 (4-5) GP-17 (5-6) GP-21 (5-6) GP-26 (5-6)	19.0 18.0 22.0 24.0	16.2	Background Concentration*

Cobalt	GP-14 (4-6) GP-15 (5-7) GP-20 (4-5) GP-25 (4-5)	170.0 51.0 40.0 22.0	8.9	Background Concentration*
Copper	GP-14 (4-6) GP-19 (5-7)	36.0 20.0	19.6	Background Concentration*
Iron	GP-13 (4-5) GP-21 (5-6) GP-26 (5-6)	17,000 20,000 19,000	15,900	Background Concentration*
Manganese	GP-13 (4-5)	660	636	Background Concentration*
Nickel	GP-14 (4-6) GP-15 (5-7)	160 210	18.0	Background Concentration*
Vanadium	GP-2 (4-5) GP-13 (4-5) GP-17 (5-6) GP-21 (5-6) GP-26 (5-6)	28.0 28.0 33.0 34.0 32.0	25.2	Background Concentration*

EGSL collected three groundwater samples from the groundwater monitoring wells, located along the northwestern portion of the Subject Property (MW-3, MW-A6, MW-A7), using a new dedicated disposable polyethylene bailer. The groundwater samples were then transferred to the appropriate glass vials and containers for the analysis of TCL indicator contaminants. The groundwater samples were kept on ice in coolers and sent to the laboratory for analysis. Proper chain-of-custody procedures were followed.

The analytical test results of the groundwater samples were compared to the GRO derived from the IEPA IAC 742, TACO Tier I for Class I Groundwater.

Listed below are the groundwater contaminants of concern that were detected above IEPA Tier 1 Remediation Objectives:

Chemical	Monitoring Well Number	Concentration Detected (mg/L)	TACO Tier 1 RO (mg/L)	Exposure Pathway
1,1-Dichlorethene	MW-A7	0.13	0.007 0.035	Class I Groundwater Class II Groundwater
Tetrachloroethene	MW-3	0.011	0.005	Class I Groundwater
1,1,1-Trichloroethane	MW-A7	0.46	0.2	Class I Groundwater
Iron	MW-A6	5.5	5.0 5.0	Class I Groundwater Class II Groundwater
Manganese	MW-3 MW-A6 MW-A7	0.3 1.8 0.54	0.15	Class I Groundwater

On February 15, 2006, EGSL performed an in-situ hydraulic conductivity test (slug test) at MW-3. Slug tests are a method of obtaining approximate values for the hydraulic conductivity of the water-bearing formations in the vicinity of each respective well screen. This field procedure consists of displacing a volume of water in the well with a solid "slug" of known volume and recording the change in water level as it recovers to static hydraulic conditions over time. The data collected was input into the Aqtesolv® Hydraulic Conductivity program.

The site-specific hydraulic conductivity results, as concluded from the hydraulic conductivity testing, was **6.812E-04 cm/sec**. Based on these results, the Subject Property groundwater is classified as Class I groundwater as per 35 IAC 620, Subpart B.

The Subject Property groundwater flow direction, as previously determined by site-specific survey data, was determined to be towards the **north-northwest**.

3.2 2008 INVESTIGATION

EGSL performed a Limited Phase II Subsurface Soil investigation on March 3, 2006. According to the report, arsenic was detected at a concentration of 450 mg/Kg along the northern portion of the Subject Property, between the pump house and Building 2/3/4. Additionally, two, 8,000-gallon underground storage tanks were removed in the immediate vicinity of this area of concern on November 16, 2007. Both tanks were in poor condition at the time of removal, and olfactory and visual observations indicated that the subsurface soil had been negatively impacted; as such, Office of the State Fire Marshal (OSFM) personnel identified that the USTs had been leaking. The incident was subsequently reported to the Illinois Emergency Management Agency (IEMA) and the IEPA Leaking Underground Storage Tank (LUST) section (LUST Incident number 20071279).

EGSL conducted a Limited Phase II Subsurface Soil investigation in April 24, 2008. EGSL advanced a total of nine soil borings (SP-1 thru SP-9) surrounding previously referenced areas of concern. See Appendix F for a copy of the report.

A total of 13 soil samples were submitted for analysis in order to analytically determine the presence and concentration of COC in the areas of concern. The depth and the type of analysis requested of the samples submitted to *STAT Analysis* are listed below:

Boring Number	Depth (feet)	BTEX/PNAs	Total Arsenic/ TCLP Arsenic
SP-1	5-7	X	
SP-1	13-15	X	
SP-2	4-6	X	
SP-3	4-6	X	
SP-4	5-7	X	

Boring Number	Depth (feet)	BTEX/PNAs	Total Arsenic/ TCLP Arsenic
SP-5	6-8	X	
SP-5	8-10		X
SP-6	13-15		X
SP-7	8-10		X
SP-7	4-6		X
SP-8	8-10		X
SP-9	4-6		X
SP-9	8-10		X

The analytical test results of the soil samples were compared to the IEPA SROs Tier I for Industrial/Commercial and Residential properties and for Soil Component of the Groundwater Ingestion Route (SCGIR) (Class I Groundwater).

Listed below are the soil contaminants of concern that were detected above IEPA Tier 1 Remediation Objectives:

Chemical	Sample Number (Depth)	Concentration Detected (mg/Kg)	TACO Tier 1 RO (mg/Kg)	Exposure Pathway
Arsenic	GP-7 (4-6)	14.0	13.0	Residential Ingestion Industrial/Commercial Ingestion

3.3 2010 INVESTIGATION

In May 2010, EGSL completed a Phase II Subsurface Investigation at the Site. The basis of the investigation was the findings of EGSL personnel in the performance of a Phase I ESA performed in 2009. The ESA identified several areas of concern and recommended additional investigation and sampling activities be performed at the site to identify the nature and extent of contaminants of concern identified during the site assessment. Areas of concern identified included the industrial nature of business conducted at the site and the anticipated contaminants associated with those activities. A copy of the text of the Phase I ESA is included in Appendix G. This investigation was performed in accordance with the regulations set forth in 35 IAC 740 and 35 IAC 742, Tier 1, for Industrial/Commercial and Residential properties. A copy of the report is included in Appendix H.

A total of 40 soil borings (GP-1 thru 40) were advanced throughout the Subject Property. Forty-nine soil samples were submitted for analysis in order to analytically determine the presence and concentration of COCs in the areas of concern (nine of the boring locations had two soil samples submitted). The soil

sample locations, sampling date, depth, and the type of analysis requested of the samples are listed below:

Boring Number	Date Obtained	Depth of Sample Submitted for Analysis (feet)	TCL	VOCs	SVOCs	RCRA Metals (+pH)
GP-1	5/10/2010	6-8	X			
GP-2	5/10/2010	4-6		X		
GP-3	5/10/2010	4-6		X

GP-38	5/11/2010	1-3	X			
GP-38	5/11/2010	5-7		X	X	X
GP-39	5/11/2010	2-4	X			
GP-40	5/11/2010	1-3		X	X	X
GP-40	5/11/2010	6-8		X		

Additionally, a total of 16 groundwater monitoring wells (MW-1 thru 16) were installed at the Subject Property. On May 3-5, 2010, *Earth Solutions, Inc.* installed two nests of four wells (eight total wells) in the northwestern portion of the Subject Property. On May 10-12, 2010, EGSL installed an additional eight wells throughout the Subject Property. The depth of the wells and screen intervals are as follows:

Well Number	Date Installed	Company	Well Depth (feet below ground surface)	Screen Interval (feet below ground surface)
MW-1	5/3/2010	Earth Solutions	50	40-50
MW-2	5/3/2010	Earth Solutions	40	30-40
MW-3	5/3/2010	Earth Solutions	30	20-30
MW-4	5/4/2010	Earth Solutions	20	10-20
MW-5	5/4/2010	Earth Solutions	50	40-50
MW-6	5/4/2010	Earth Solutions	40	30-40
MW-7	5/5/2010	Earth Solutions	30	20-30
MW-8	5/5/2010	Earth Solutions	20	10-20

MW-10	5/10/2010	EGSL	20	10-20
MW-11	5/10/2010	EGSL	20	10-20
MW-12	5/10/2010	EGSL	20	10-20
MW-13	5/10/2010	EGSL	20	10-20
MW-14	5/10/2010	EGSL	20	10-20
MW-15	5/10/2010	EGSL	20	10-20
MW-16	5/10/2010	EGSL	20	10-20

All groundwater samples were submitted for Target Compound List indicator contaminants.

The analytical results of the soil and groundwater samples were compared to the SROs and GROs Tier I for Industrial/Commercial and Residential properties and for Soil Component of the Groundwater Ingestion Route (SCGIR) Class I Groundwater and Class I Groundwater. Analytical results indicate that the following contaminants of concern were detected above IEPA Tier 1 Remediation Objectives:

Soil

Chemical	Sample Number (Depth)	Concentration Detected (mg/Kg)	Remediation Objective (mg/Kg)	Exposure Route

3.4 2010-12 INVESTIGATION

EGSL performed additional Site Investigation activities from 2010 thru 2012 at the Site. The purpose of the investigation was to further delineate the vertical and horizontal extent of subsurface soil and groundwater COCs at the site.

Subsequent to the performance of the 2010 Phase II Subsurface Investigation, EGSL performed the following additional activities on and offsite.

On October 28-29, 2010, five additional monitoring wells were installed (MW-17, 18, 19, 20, and 21). One deep well (MW-17, screened from 60-70 feet) was installed along the northwestern-most nest of wells in order to delineate the vertical extent of VOC impaction in that area. The remaining four permanent monitoring wells were installed off-site directly north of Railroad Street in order to delineate the horizontal extent of groundwater impaction along the northwestern portion of the Subject Property. Analytical results indicated that groundwater collected from these wells contained COCs above Tier 1 Remediation Objectives for Class I Groundwater. A memorandum was issued to *300 West LLC* on December 13, 2010. A copy of this report is included in Appendix I.

On February 23-24, 2011, two additional monitoring wells were installed (MW-22 and MW-23). MW-22 was installed on-site within the northwestern nest of wells and screened from a depth of 80-90 feet in order to delineate the vertical extent of groundwater impaction in that area. MW-23 was installed within the off-site nest of wells and screened from a depth of 60-70 feet in order to delineate the vertical extent of groundwater impaction in that area. Both of these wells were sampled on March 31, 2011. The laboratory reported that groundwater collected from these wells did not contain any COCs above Tier 1 GRO for Class I Groundwater.

On March 31, 2011, EGSL was able to access the private, potable wells of the three northern residential properties. With the permission from the homeowners, each well was sampled and submitted for analysis of VOCs. The addresses of the homes, and approximate depths of the wells, are as follows: [redacted] (>60 feet deep), [redacted] (~107 feet deep), [redacted] (>120 feet deep). Analytical results indicated that no VOCs were detected above laboratory detection limits.

On December 2, 2011, EGSL advanced an additional 11 soil borings (GP-40 thru 50) at the Site in order to delineate previous detections of elevated chemicals of concern. The purpose of the delineation was to obtain more accurate source widths and depths for future Tier 2 analysis. GP-40 was inadvertently repeated from the previous investigation activities.

Sixty soil samples were submitted for analysis in order to analytically determine the presence and concentration of COC in the areas of concern (several of the boring locations had two soil samples

submitted). The soil sample locations, sampling date, depth, and the type of analysis requested of the samples are listed below:

Boring Number	Date Obtained	Depth of Sample Submitted for Analysis (feet)	TCL	VOCs	SVOCs	RCRA Metals (+pH)	PCBs
GP-40*	12/02/2011	5-7				Cr/Pb	
GP-41	12/02/2011	5-7				Cr/Pb	
GP-42	12/02/2011	5-7				Cr/Pb	
GP-43	12/02/2011	9-10				Cr/Pb	
GP-44	12/02/2011	4-6					X
GP-45	12/02/2011	4-6					X
GP-46	12/02/2011	4-6					X
GP-47	12/02/2011	9-10					X
GP-48	12/02/2011	5-6		PCE 11-DCE 111-TCA		Pb/Mn	
GP-49	12/02/2011	5-6		PCE 11-DCE 111-TCA		Pb/Mn	
GP-50	12/02/2011	8-10		PCE 11-DCE 111-TCA		Pb/Mn	

An additional seven groundwater monitoring wells (MW-17 thru 23) were installed at the Site (2 onsite and 5 off-site). The depth of the wells and screen intervals are as follows:

Well Number	Date Installed	Company	Well Depth (feet below ground surface)	Screen Interval (feet below ground surface)
MW-17	10/28/2010	Earth Solutions	70	60-70
MW-18 (off-site)	10/28/2010	Earth Solutions	50	40-50
MW-19 (off-site)	10/29/2010	Earth Solutions	40	30-40
MW-20 (off-site)	10/29/2010	Earth Solutions	30	20-30
MW-21 (off-site)	10/29/2010	Earth Solutions	20	10-20
MW-22	02/23/2011	Earth Solutions	90	80-90
MW-23 (off-site)	02/23/2011	Earth Solutions	70	60-70

The analytical test results of the soil and groundwater samples were compared to the SROs/GROs derived from the IEPA adopted IAC 742, TACO Tier I for Industrial/Commercial and Residential properties and for Soil Component of the Groundwater Ingestion Route (SCGIR) Class I Groundwater and

Class 1 Groundwater. Analytical results confirm the following COCs were detected in the following submitted samples above the RO:

Soil

Chemical	Sample Number (Depth)	Concentration Detected (mg/Kg)	Remediation Objective (mg/Kg)	Exposure Route
INORGANIC				
Chromium	GP-40 (5-7) GP-43 (9-10)	298 705	28 230 270 420 690	pH Specific SCGIR Class I Residential Ingestion Residential Inhalation Industrial/Commercial Inhalation Construction Worker Inhalation
Lead	GP-40 (5-7)	292	107	pH Specific SCGIR Class I

3.5 2013 INVESTIGATION

In June 2013 the State Attorney of Illinois issued an injunction order naming *300 West LLC* and *The Arnold Engineering Co.* as defendants on two counts: for substantial danger to the environment, public health and welfare and water pollution. As a result, the site investigation was modified from a Comprehensive Site Investigation to a Focused Site Investigation to include only those COCs identified in the injunction order identified in section 3.0.

In September and October 2013 EGSL performed additional Phase II subsurface investigation activities to further define and delineate VOC COCs identified during the previous investigation activities. The focus of this investigation is the chlorinated solvents identified in the Injunction Order.

In September and October 2013 EGSL personnel directed the advancement of 38 additional soil borings (GP-100 thru 132, Discharge (a shallow grab sample from the drainage ditch located southeast of Pond 4) and GP-201 thru 205), and the installation of an additional 23 groundwater monitoring wells (MW-24 thru 46). The soil borings and groundwater monitoring wells were placed to further refine the vertical and horizontal extent of soil and groundwater exceedances previously identified. Grab samples of the water from Ponds 1-4 and the discharge from Pond 4 were also obtained.

3.5.1 FIELD SAMPLING PROCEDURES-SOIL SAMPLES

EGSL contracted Earth Solutions to provide personnel and equipment required to advance additional soil borings at the Site. Earth Solutions utilized a Geoprobe® 6610DT to advance an acetate lined 5-foot soil sampler through the depth of the boring. EGSL personnel logged each borehole in the field. A copy of the boring logs are included in Appendix L.

A soil sample from each boring interval was placed into a sealed plastic bag for volatile organic vapor headspace analysis. The headspace in the bagged samples were analyzed in the field with Photo-Ionization Detector (PID). The PID was used to screen each soil interval from each boring location for relative concentrations of VOCs but does not provide separation of the contaminants into individual constituents. The utilization of this field-screening device provided immediate on-site data for use in the assessment of the site and identifying suspect soil for laboratory analysis.

Soil samples were selected for laboratory analysis based on the presence of elevated PID deflections or, in the absence of PID deflections, intervals were the contaminants of concern are most likely to be present. The soil samples were placed in laboratory provided containers, labeled and placed in a cooler for transport to the laboratory. A chain of custody was prepared tracking the sample from time of collection through analysis.

The soil samples targeted for laboratory analysis of VOCs were collected utilizing a 10 gramTerra Core sampler. The sample was placed into new laboratory supplied 40-milliliter glass vials, pre-preserved with sodium bisulfate or methanol in accordance with *US EPA SW-846* Method 5035. Additional soil from each sample collected was placed into a non-preserved 4 or 8-ounce wide-mouth jar with a Teflon-lined cap for soil moisture analysis. STAT Analytical supplied all glass vials and jars. All soil samples were stored on ice during soil sample collection activities and while being transported to either STAT Analysis or First Environmental Laboratory.

Cross-contamination during soil sampling was minimized by using a Liquinox detergent wash and tap water rinse to decontaminate the sampling tools between each sampling interval and location. Soil sample collection equipment (steel trowels) were hand washed with a Liquinox detergent wash and rinsed with potable water between soil sample intervals. The tools were then placed on clean, decontaminated surfaces to air dry. Disposable latex gloves were worn during the collection of soil samples and were changed between each sample interval.

3.5.2 SOIL SAMPLING ANALYSIS

In September and October 2013 an additional 38 soil borings (GP-100 thru GP-132, Discharge and GP-201 thru GP-205) were advanced to 15-20 feet bgs throughout the site to further delineate the vertical and horizontal extent of COCs previously identified. Seventy-seven soil samples were submitted for analysis in order to refine the extent of COCs in the areas of concern. The soil samples were submitted

to either STAT Analysis Corporation or First Environmental Laboratories, Inc. for quantitative chemical analysis. The soil sample locations, sampling date, depth, and the type of analysis requested for the 2013 investigation are listed on below:

Boring Number	Date Obtained	Depth of Sample Submitted for Analysis (feet)	VOCs	PCBs
GP-100	9/3/2013	5-7, 15-17	X	
GP-101	9/3/2013	7-9, 13-15	X	
GP-102	9/3/2013	7-9, 13-15	X	
GP-103	9/4/2013	1-3, 8-10	X

Discharge	9/18/2013	1-2	X	
GP-201	10/18/2013	6-8, 12-14	X	
GP-202	10/18/2013	5-7, 12-14	X	
GP-203	10/18/2013	1-3, 7-8, 17-18	X	X
GP-204	10/18/2013	1-3, 16-17	X	
GP-205	10/18/2013	7-8, 18-19	X	

3.5.3 GROUNDWATER MONITORING WELLS INSTALLATION

A groundwater investigation was performed in order to assess the potential for the presence of contaminants of concern (COC) in the subsurface groundwater present at the site. The investigation was performed in accordance with Part 740 (SRP) with analysis of groundwater samples for contaminants identified on the from the Target Compound List (TCL) indicator contaminants identified in Appendix A of Part 740. The contaminants of concern specific to this project as identified in Count 1)16 of the Verified Complaint for Injunction and Civil Penalties are included in the IEPA TCL.

Earth Solutions was contracted by EGSL to provide personnel and equipment necessary to install 23 additional groundwater monitoring wells (MW-24 thru 46) throughout the site. Fourteen of the wells (MW-24 thru 37) were installed in September and seated 30 feet bgs. The wells were screened from 10 to 30 feet bgs to evaluate the shallow groundwater column in these areas. Analytical results of groundwater collected confirmed the presence of COCs above the GROs from several of these wells. As a result, in October monitoring wells MW-38 thru 46 were installed adjacent to above referenced wells and were seated 50 feet bgs. The wells were screened from 45-50 feet bgs and were used to evaluate the water column at this depth.

Earth Solution utilized a rotary drill rig complete with hollow stem augers to drill each well to the desired depth. Soil cuttings were placed in labeled drums for future offsite disposal. PVC threaded well construction materials consisting of solid riser and 0.010" slotted screen were used in the construction of each well. The completed well was lowered through the well string and seated at the bottom of the borehole. Sand filter pack was emplaced around the well screen as the rods were extracted from the borehole. The sand filter pack extended two feet above the top of the screen. Bentonite slurry was pumped into the borehole to within 10 feet of the surface. Bentonite chips were placed on top of the slurry to within one foot of the surface. Each well was completed with a flush mount steel cap set in a concrete mix to grade. A copy of the well completion logs is included as Appendix M. The wells were allowed to stabilize prior to development. Each well was developed by removing water and sediment from the water column until groundwater ran clear.

The depth of the groundwater monitoring wells and screen intervals of each well are as follows:

Well Number	Date Installed	Company	Well Depth (feet below ground surface)	Screen Interval (feet below ground surface)
MW-24	9/03/2013	Earth Solutions	30	10-30
MW-25	9/03/2013	Earth Solutions	30	10-30
MW-26	9/04/2013	Earth Solutions	30	10-30
MW-27	9/04/2013	Earth Solutions	30	10-30
MW-28	9/05/2013	Earth Solutions	30	10-30
MW-29	9/35/2013	Earth Solutions	30	10-30
MW-30	9/06/2013	Earth Solutions	30	10-30
MW-31	9/06/2013	Earth Solutions	30	10-30
MW-32	9/18/2013	Earth Solutions	30	10-30
MW-33	9/18/2013	Earth Solutions	30	10-30

Well Number	Date Installed	Company	Well Depth (feet below ground surface)	Screen Interval (feet below ground surface)
MW-34	9/18/2013	Earth Solutions	30	10-30
MW-35	9/18/2013	Earth Solutions	30	10-30

MW-46	10/24/2013	Earth Solutions	50	45-50

3.5.4 FIELD SAMPLING PROCEDURES-GROUNDWATER

Groundwater samples were collected utilizing one of 2 methods. Dedicated disposable poly bailers were used to purge the wells prior to sampling. Purge water was placed into labeled drums temporally being stored in a designated place onsite. Once purged, the bailer was used to collect a water sample from the well. Samples were transferred into laboratory supplied 40 ml VOA vials complete with hydrochloric acid. The sample was labeled and placed in a cooler on ice for transport to the laboratory for quantitative chemical analysis. A chain of custody was prepared tracking the samples from collection through analysis.

The second method of collection consisted of the use of a Grunfos pump and poly tubing. The pump was used to purge each well prior to sampling. Upon completion of purging, the velocity of the pump was reduced to allow for low flow sampling for VOCs. The groundwater was pumped into laboratory supplied containers, labeled and transported as described above. The groundwater samples were transported to either STAT Analysis or First Environmental for analysis under chain of custody control.

3.5.5 Soil Sample Analytical Result Exceedances

The exceedances of the COCs as reported by the laboratory are presented below. Tabulated soil sample results and laboratory analytical reports are presented in Appendix N.

The analytical test results of the soil samples were compared to the SROs derived from the IEPA IAC 742, TACO Tier I for Industrial/Commercial and Residential properties and for Soil Component of the Groundwater Ingestion Route (SCGIR) Class I Groundwater. Figure 5 illustrates estimated soil contaminant plume extents for each chlorinated COC. Analytical results indicate that the following contaminants of concern were detected above IEPA Tier 1 Soil Remediation Objectives:

Chemical	Sample Number (Depth)	Concentration Detected (mg/Kg)	Remediation Objective (mg/Kg)	Exposure Route
VOC				
1,1,1-Trichloroethane	GP-118 (9-10) (11-13)	28.1 19.5	2.0	SCGIR Class I Groundwater
1,1-Dichloroethene	GP-118 (9-10) (11-13)	4.42 3.4	0.06	SCGIR Class I Groundwater
Tetrachloroethene	GP-118 (9-10) (11-13) GP-120 (4-6) (8-10) GP-121 (8-9) (13-14) GP-203 (1-3) (7-8) (17-18) GP-204 (1-3) (16-17)	3.67 2.11 0.081 0.089 3.5 7.01 26.4 0.769 19.3 1.55 3.78	0.06	SCGIR Class I Groundwater

3.5.6 Groundwater Sample Analytical Result Exceedances

The analytical test results of the groundwater samples were compared to the IEPA IAC 742, TACO, Tier I Groundwater Remediation Objectives for Class I Groundwater. Figure 9 illustrates estimated groundwater contaminant plume extents for each COC. Tabulated groundwater sample results and laboratory analytical reports are presented in Appendix O. Analytical results indicate that the following contaminants of concern were detected above IEPA Tier 1 Groundwater Remediation Objective:

Groundwater Sampled 10/01/ and 11/05/2013

4. CONCLUSIONS

EGSL has performed a Focused Site Investigation at the 300 West LLC/Arnold Magnetic Technologies site under the IEPA SRP program. The investigation was performed pursuant to an Injunction Order filed by the Illinois Attorney General. EGSL reviewed numerous documents in the preparation of this report including environmental reports prepared by EGSL and others.

A total of 17 USTs have been documented as being present at the site at one time or another. EGSL has been able to confirm the presence of 6 of these tanks and have identified three possible excavation areas that may have contained USTs at one time but have since been removed.

EGSL performed several Phase II investigations dating back to 2006 in an attempt to identify and quantify contaminants of concern present on the property. In 2013 the AG Injunction modified the investigation to include chlorinated solvents that have been identified in on and offsite groundwater.

Since 2006 EGSL personnel have advanced a total of 125 soil borings throughout the site. Soil samples were collected from each of the borings and submitted to a laboratory for quantitative chemical analysis for various contaminants of concern. In 2013 the sampling and analysis focused on chlorinated solvents identified as being used in historical manufacturing processes. In addition, 46 groundwater monitoring wells were installed in stages on and offsite and sampled for chlorinated solvents. The depths of the wells varied from 20 feet bgs to 90 feet bgs based on the identification of COCs in surrounding wells.

The results of the investigation indicate that two areas (former building 1 and building 2/3/4/7) contained soil with exceedances of SROs for chlorinated solvents. The vertical extent of the impacted soil in these areas has not been determined to date. Since these areas are limited it is unclear if these areas are the source of on and offsite impacted groundwater.

The investigation revealed that a majority of the site groundwater has been impacted by chlorinated solvents. A total of 24 of the 41 onsite groundwater monitoring wells contained chlorinated solvents above the IEPA Class I GROs. Many of the wells without exceedances were wells installed deeper and adjacent to wells with exceedances. The groundwater at the eastern limits of the site appeared to be unaffected by the release of chlorinated solvents.

Well depths range from 20 feet below ground surface to 90 feet below ground surface across the site. Several source areas are likely and include: former building 1, building 2/3/4/7, the settling ponds, former building 6 and/or buildings/structures located on the southern section of the site that are currently outside the scope of this investigation.

PCE has been detected across the site in concentrations above the GRO. The contaminant has been reported at a depth of 20 feet below ground surface at the northwest corner of the property to >50 feet north of building 2/3/4/7 and south of pond 3 respectively. It appears that possible source areas for this contaminant include building 2/3/4/7, former building 6 and the ponds at a minimum. The vertical extent of PCE contamination does not appear to be defined north of building 2/3/4/7.

1,1-DCE has been detected across the site in concentrations above the GRO. The contaminant has been reported at a depth of <50 feet at the eastern end of the property, >50 feet north of building 2/3/4/7 and <90 feet at the northwest corner of the property. It appears that there is more than one source area associated with this contaminant and could include former building 1, building 2/3/4/7, the ponds and former building 6 at a minimum. The vertical extent of 1,1-DCE does not appear to be defined north of building 2/3/4/7.

1,1,1-TCA has been detected above the GRO in several wells across the site associated with former building 1, building 2/3/4/7, pond 3 and former pond 6. Depths of the contaminant have been reported at 30 feet to 50 feet bgs (north of building 2/3/4/7). The vertical extent of 1,1,1-TCA does not appear to be defined north of building 2/3/4/7.

TCE has been detected above the GRO in several wells across the site associated with building 2/3/4/7, Pond 3 and possibly former building 6 at a minimum. Depths of the contaminant have been reported at 30 and 50 feet bgs associated with building 2/3/4/7, <50 feet at Pond 3 and <50 feet northeast of former building 6.

1,1,2 TCA and 1,2 DCE has been reported above the GRO under building 2/3/4/7 at a depth of 30 feet bgs. The vertical extent of 1,1,2-TCA and DCE does not appear to be defined at this time as a deeper well at this location has currently not been installed and sampled.

Carbon Tetrachloride was detected slightly above the GRO in one well at 30 feet deep in building 2/3/4/7. The GRO for carbon tetrachloride is 0.005 mg/L. The laboratory reported a concentration of 0.0066 mg/L from groundwater analyzed at this location.

Chloroform has been detected above the GRO at locations associated with building 2/3/4/7, the pond system and at the southeast corner of former building 6. The depth of this contaminant is currently identified to be 30 feet bgs however this contaminant by be present at greater depths south of Pond 1 and in building 2/3/4/7. The vertical extent of this contaminant does not appear to be defined at these two locations.

Bromodichloromethane has been detected above the GRO at one location south of Pond 4 at a depth of 30 feet bgs. The laboratory reported the contaminant at a concentration of 0.0017mg/L, slightly above the GRO of 0.0002mg/L. The contaminant does not appear to be defined at this location.

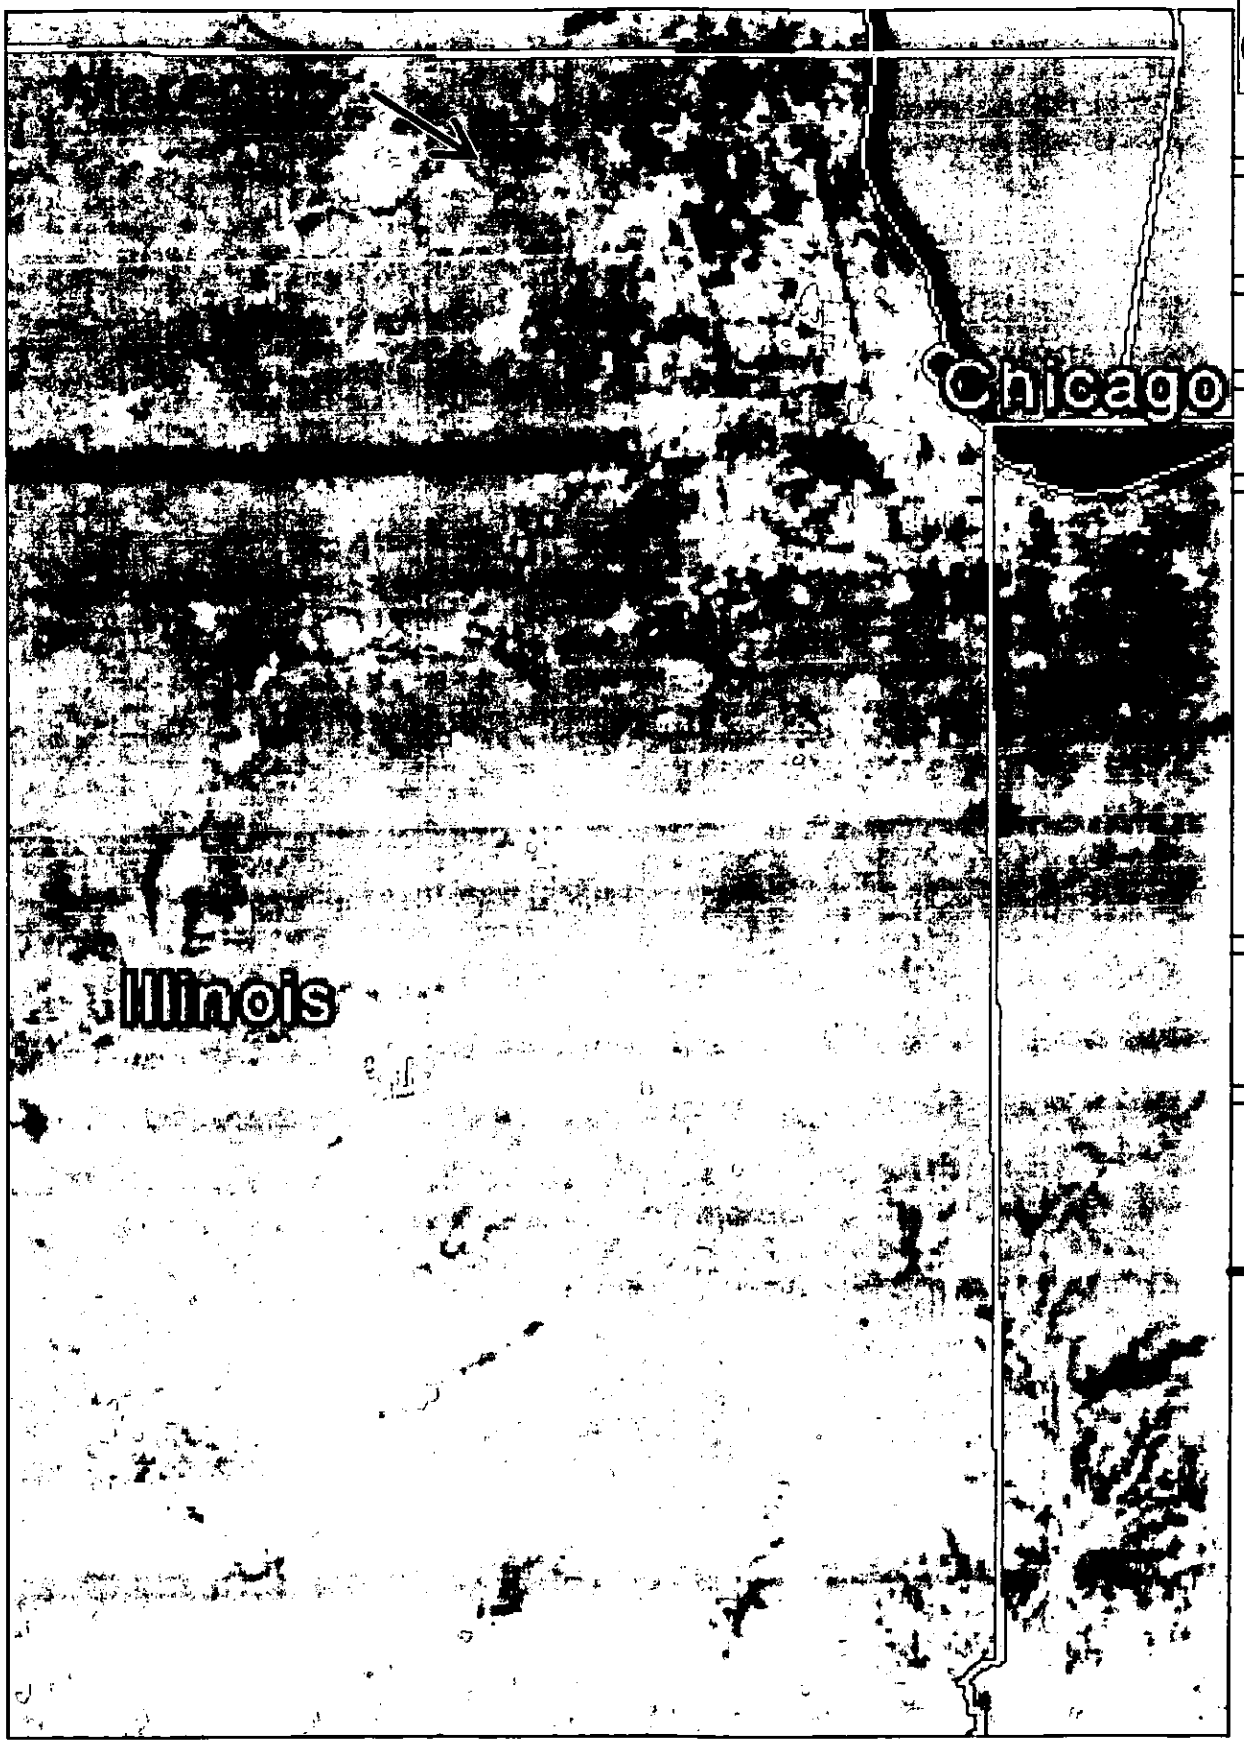
Bromomethane has been detected above the GRO at the northwest corner of the property at the former Pond 6 location. The laboratory reported the contaminant present in a sample collected from 50 feet bgs but absent from a sample collected from a depth of 70 feet bgs. It appears that the vertical and horizontal extent of this contaminant has been defined onsite.

As indicated above the vertical extent of several of the COCs in the groundwater have not been delineated. The installation of five additional groundwater monitoring wells adjacent to MW-36, 37, 41, 44 and 46, and sampling and analysis of the groundwater in these areas to a depth of 100 feet bgs is warranted as a next phase of the investigation.

5. SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

This report pertains to the property located at 300 West Street, Marengo, Illinois. Our professional services have been performed using the degree of care and skill ordinarily exercised under similar circumstances by environmental professionals practicing in this field. The representations made in this report are accurate and true to the best knowledge of the undersigned.

Sincerely,



ENVIRONMENTAL GROUP SERVICES, LIMITED

Re: **Violation Notice, L-2008-01057**
LPC #1110650003 – McHenry County
Marengo/Arnold Magnetic Technologies
Compliance File

Dear Mr. Kalaczinski:

This constitutes a Violation Notice pursuant to Section 31(a)(1) of the [Illinois] Environmental Protection Act, 415 ILCS 5/31(a)(1), and is based on a record review completed on February 26, 2008 by representatives of the Illinois Environmental Protection Agency (Illinois EPA).

The Illinois EPA hereby provides notice of violations of environmental statutes, regulations, or permits as set forth in Attachment A to this letter. Attachment A includes an explanation of the activities that the Illinois EPA believes may resolve the specified violations, including an estimate of a reasonable time period to complete the necessary activities. However, due to the nature and seriousness of the violations cited, please be advised that resolution of the violations may require the involvement of a prosecutorial authority for purposes that may include, among others, the imposition of statutory penalties.

A written response which may include a request for a meeting with representatives of the Illinois EPA, must be submitted via certified mail to the Illinois EPA within 45 days of receipt of this letter. The response must address each violation specified in Attachment A and include for each an explanation of the activities that will be implemented and the time schedule for the completion of that activity. The written response will constitute a proposed Compliance Commitment Agreement (CCA) pursuant to Section 31 of the Act. The Illinois EPA will review the proposed CCA and will accept or reject it within 30 days of receipt.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

If a timely written response to this Violation Notice is not provided, it shall be considered to be a waiver of the opportunity to respond and to meet provided by Section 31(a) of the Act, and the Illinois EPA may proceed with a referral to the prosecutorial authority.

Written communications should be directed to:

Illinois EPA – Bureau of Land
Attn: Charles Grigalauski
9511 West Harrison Street, 3rd Floor
Des Plaines, Illinois 60016

All communications must include reference to this **Violation Notice Number, L-2008-01057.**

The text of the Act referenced herein is available at www.ipcb.state.il.us. If you have questions regarding this matter, please contact Thomas Rivera at 847/294-4079.

Sincerely,

Charles T. Grigalauski, Regional Manager

ATTACHMENT A

1. Pursuant to Section 12(a) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(a)), no person shall cause, threaten or allow the discharge of any contaminants into the environment in any State so as to cause or tend to cause water pollution in Illinois, either alone or in combination with matter from other sources, or so as to violate regulations or standards adopted by the Pollution Control under this Act.

   A violation of Section 12(a) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(a)) is alleged for the following reason: **The discharge of contaminants was caused and allowed in a way that caused water pollution. Chlorinated solvent contamination above the Class I groundwater objectives is present in on site groundwater. The groundwater contamination has been present for approximately 20 years. Shallow groundwater flow under the site is to the north-northwest, towards the nearby Kishwaukee River. Residential/nonresidential private water wells are located to the north-northwest, directly down gradient of the site. The private wells are within ½ mile of the site and its unknown at this time if the private wells have been impacted by the chlorinated solvent groundwater contamination.**

   1,1,1-Trichloroethane (1,1,1-TCA) was detected as high as 4,900 ppb, in 1999, in on site groundwater monitoring well MW-3. More recently in 2007, 1,1,1-TCA was detected as high as 501 ppb in on site groundwater monitoring well MW-A7. Tetrachloroethene (PCE) was detected as high as 18.8 ppb, in 2007, in onsite groundwater monitoring well MW-3. PCE contamination in MW-3 has steadily increased over the past approximately 6 years. Other on site groundwater monitoring wells have chlorinated solvent detections as well, but MW-3 and MW-A7 have shown the highest concentrations of 1,1,1-TCA and PCE.

2. Pursuant to Section 12(d) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(d)), no person shall deposit any contaminants upon the land in such place and manner so as to create a water pollution hazard.

   A violation of Section 12(d) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(d)) is alleged for the following reason: **Contaminants were deposited upon the land in such a place and manner that created a water pollution hazard. Chlorinated solvent contamination above the Class I groundwater objectives is present in on site groundwater. The groundwater contamination has been present for approximately 20 years. Shallow groundwater flow under the site is to the north-northwest, towards the nearby Kishwaukee River. Residential/nonresidential private water wells are located to the north-northwest, directly down gradient of the site. The private wells are within ½ mile of the site and its unknown at this time if the private wells have been impacted by the chlorinated solvent groundwater contamination.**

   1,1,1-TCA was detected as high as 4,900 ppb, in 1999, in on site groundwater monitoring well MW-3. More recently in 2007, 1,1,1-TCA was detected as high as 501 ppb in on site groundwater monitoring well MW-A7. PCE was detected as high as 18.8 ppb, in 2007, in on site groundwater monitoring well MW-3. PCE contamination in MW-3 has steadily increased over the past approximately 6 years. Other on site groundwater monitoring wells have chlorinated solvent detections as well, but MW-3 and MW-A7 have shown the highest concentrations of 1,1,1-TCA and PCE.

SUGGESTED RESOLUTIONS

1. Immediately determine the source(s) of 1,1,1-TCA, PCE and other related contaminants that are present in groundwater under the subject site by conducting an Investigation.

2. Immediately determine the extent of 1,1,1-TCA, PCE and other related contaminants in soil and groundwater, both on site and off site, by conducting an Investigation.

3. Collect representative groundwater samples from all down gradient residential/nonresidential private water wells (approximately 16) located within approximately ½ mile of the site, see the attached map. The private water well samples shall be collected from an unfiltered and unsoftened spigot, after an appropriate water system purge is conducted. The samples shall be analyzed for Volatile Organic Compounds at an Illinois EPA approved laboratory. Illinois EPA would like to oversee the sampling event.

4. Remediate, if necessary, to meet all applicable remediation objectives for soil and groundwater.

* Immediately manage the groundwater to mitigate impairment caused by the release of volatile organic compounds.

* All copies of receipts/manifests, and analytical reports must be submitted to the Illinois EPA that document the proper disposal of any waste (i.e. impacted soil, contaminated groundwater). The receipts/manifests must be submitted within 10 days after the off-site shipment.

* Within 45 days from the receipt of this letter, enroll in the Site Remediation Program.

* A Site Investigation Work Plan shall be submitted within 30 days of the Illinois EPA approval of the Site Remediation application.

* The Site Investigation shall be implemented within 30 days of the Illinois EPA approval of the Site Investigation Work Plan.

* The Site Investigation Report shall be submitted within 180 days of approval of the Site Investigation Work Plan.

* The Remediation Objectives Report shall be submitted within 30 days of approval of the Site Investigation Report.

* The Remedial Action Plan shall be submitted within 30 days of Illinois EPA approval of the Remedial Objectives Report.

* The remedial action shall be implemented within 30 days of Illinois EPA approval of the Remediation Action Plan.

* **The Remedial Action Completion Report shall be submitted within 365 days of Illinois EPA approval of the Remedial Action Plan.**

The written response to this Violation Notice must include information in rebuttal, explanation, or justification of each alleged violation and must be submitted to the Illinois EPA by certified mail, within 45 days of receipt of this Violation Notice. The written response must also include a proposed Compliance Commitment Agreement that commits to specific remedial actions, includes specified times for achieving each commitment, and may include a statement that compliance has been achieved.

Attention: Thomas Rivera

Re: Violation Notice Number, L-2008-01123

Dear Mr. Rivera:

This letter shall serve as a written response to Violation Notice Number L-2008-01057 on behalf of 300 West LLC, owner of the property at 300 N. West Street, Marengo.

1. The source of 1,1,1-TCA and PCE detected in the groundwater monitoring wells along the northwestern portion of the subject property was reportedly related to historical operations conducted in that area. A historical subject building ("Building #6") was located at the northwestern corner of the subject property and was reportedly demolished approximately 10-20 years ago. Historical industrial operations conducted within Building #6 reportedly utilized chlorinated solvents in production processes. The historical utilization of chlorinated solvents in this area is believed to be the source of elevated levels of 1,1,1-TCA and PCE in the groundwater.

2. 300 West LLC has engaged Environmental Group Services Limited ("EGSL"), and EGSL currently is working with Mr. Thomas Rivera of the IEPA regarding off-site groundwater sampling. Addresses were obtained from all of the northern, western, and northwestern properties that are possibly utilizing groundwater wells for potable purposes. Mr. Rivera sent letters to all of the neighboring addresses requesting access to the properties in order to sample the groundwater wells for each of the sites. At this time, Mr. Rivera and EGSL are awaiting for responses from the neighboring properties. Upon receipt of any and all responses, neighboring wells will be sampled, and all groundwater samples will be submitted to an accredited laboratory of analysis of VOCs. It is anticipated that the on-site sampling will be complete in approximately one month.

3. The subject property has been enrolled into the IEPA's Site Remediation Program (SRP). Tim Zook has been assigned as the project manager for the site. Upon submittal of the Remedial Action Completion Report (RACR), a Comprehensive NFR for residential properties will be requested for the entire subject property. The RACR is anticipated to be complete by December 2008.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Do not hesitate to call me (312.420.6046) with any questions.

Very truly yours,

John M. Daley

Re: **Compliance Proposal dated June 17, 2008**
Violation Notice L-2008-01123 and L-2008-01057
BOL # 1110650003 – McHenry County
Marengo/Arnold Magnetic Technologies
Compliance File

RECEIVED
JUL 18 2008
IEPA-BOL
DES PLAINES OFFICE

Dear Mr. Daley:

On June 17, 2008 the Illinois Environmental Protection Agency ("Illinois EPA") received your transmittal concerning Arnold Magnetic Technologies in response to the Febraury 28, 2008 and April 15, 2008 Violation Notice. This transmittal proposed certain steps and initiatives, whose purpose was to bring Arnold Magnetic Technologies into compliance with State law and regulations remedying the violations alleged in the Violation Notice, **L-2008-01123 and L-2008-01057**. Unfortunately, the Illinois EPA cannot consider this transmittal as a Compliance Commitment Agreement ("CCA") under the Illinois Environmental Protection Act, Section 31(a)(2) [415 ILCS 5/31(a)(2) (1996)], because the transmittal was received after the 45-day deadline.

Nonetheless, the Illinois EPA evaluated your proposal and we are pleased to inform you that the timely implementation of the proposal will allow the resolution of this matter short of formal enforcement at this time. However, this matter remains open to formal enforcement if necessary. The failure to achieve compliance as proposed will result in the reconsideration of this matter including referral to the Office of the Attorney General, the State's Attorney of McHenry County, or the United States Environmental Protection Agency for formal enforcement and the imposition of penalties.

Further, if any of the alleged violations remain the subject of disagreement between the Illinois EPA and Arnold Magnetic Technologies, this matter may be considered for referral to the Office of the Attorney General, the State's Attorney of McHenry County, or the United States Environmental Protection Agency for formal enforcement action and the imposition of penalties.

ATTORNEY GENERAL

AGREED PRELININARY INJUNCTION ORDER

FILED
McHenry County, Illinois
AUG 23 2013
KATHERINE M. KEEFE
Clerk of the Circuit Court

IN THE CIRCUIT COURT OF THE TWENTY-SECOND JUDICIAL CIRCUIT
McHENRY COUNTY, ILLINOIS
CHANCERY DIVISION

PEOPLE OF THE STATE OF ILLINOIS, *ex rel.* LISA MADIGAN, Attorney General of the State Illinois,	)	
Plaintiff,	)	
v.	)	No. 13 CH 1046
300 WEST LLC, an Illinois corporation, and THE ARNOLD ENGINEERING CO., an Illinois corporation a/k/a Arnold Magnetic Technologies Corporation,	)	
Defendants.	)	

AGREED PRELIMINARY INJUNCTION ORDER

This cause coming before this Court on Plaintiff's Motion for Preliminary Injunction; due notice having been given; the Court having jurisdiction over the parties and the subject matter herein; and the Court otherwise being duly advised in the premises;

NOW THEREFORE, Plaintiff having alleged that a substantial danger to the environment or to the health and welfare of persons exists pursuant to the Illinois Environmental Protection Act, 415 ILCS 5/1 *et seq.* (2012) ("Act"), and the parties having agreed to the entry of this Agreed Preliminary Injunction Order, the Court enters the following preliminary injunction pursuant to Section 43(a) of the Act, 415 ILCS 5/43(a) (2012), which shall remain in effect until further order of this Court. IT IS HEREBY ORDERED THAT:

I. BACKGROUND

1. Plaintiff incorporates by reference herein the allegations in its Verified Complaint for Injunction and Civil Penalties filed on June 14, 2013 (the "Verified Complaint"), which allegations are neither admitted nor denied by the Defendants.

2. On June 14, 2013, this Court entered the Agreed Immediate Injunction Order. This Agreed Preliminary Injunction Order supersedes the Agreed Immediate Injunction Order entered on June 14, 2013.

II. GENERAL PROVISIONS

3. This Order is not a final resolution of the merits of Plaintiff's Verified Complaint, but rather addresses current concerns regarding the groundwater contamination alleged in the Verified Complaint. This Order does not, nor is it intended to, determine the liability of the Defendants for the subject matter of the Verified Complaint, except as to their compliance with the requirements of the Agreed Preliminary Injunction Order itself.

4. By entering into this Agreed Preliminary Injunction Order and complying with its terms, the Defendants do not affirmatively admit, and at this time deny, the allegations of violation within the Verified Complaint and referenced above, and this Agreed Preliminary Injunction Order and compliance therewith shall not be interpreted as including such admission

5. This Order shall apply to and bind the Plaintiff and the Defendants.

III. CONTINUED ACTION

6. Bottled Water Delivery. The Defendants are currently providing bottled water to certain private water well owners and shall continue to provide an alternative source of drinking water to the owners of the private water wells located at 4907 Ritz Road, 4913 Ritz Road, 4805 Ritz Road, 5010 Ritz Road, 5011 Ritz Road, 21902 Railroad St. and 22104 Railroad St. in

Marengo, McHenry County, Illinois (collectively, the "Private Well Properties") by replenishing the water consumed by the residents in each Private Well Property so as to provide at least 2 gallons per person per day at each Private Well Property, on a weekly basis or such other schedule as agreed to in writing by the resident.

a. The Defendants shall continue distributing potable drinking water to the owners of the Private Well Properties until the Defendants receive written authorization from the Illinois Attorney General's Office and the Illinois EPA that they may cease such drinking water distribution or until such further Order of the Court.

b. The Defendants may submit a written request to the Illinois EPA to modify this Paragraph III.6. To the extent the Illinois EPA approves such written request, the parties may modify this Paragraph III.6. without further Order of the Court.

7. Well Water Sampling. The Defendants shall conduct water sampling at the private water wells as follows:

a. Subject to Paragraph III.7.g. herein, the Defendants shall cause water sampling to be conducted from the drinking water wells at the following properties in Marengo, McHenry County, Illinois (the "Water Sampling Properties"):

4501 Ritz Road	4106 Ritz Road
4210 Ritz Road	4805 Ritz Road
4907 Ritz Road	4913 Ritz Road
5011 Ritz Road	5017 Ritz Road
5010 Ritz Road	22110 Railroad St.
22104 Railroad St.	22012 Railroad St.
21902 Railroad St.	21816 Railroad St.
21820 Railroad St.	21606 Railroad St.
21602 Railroad St.	

b. The Defendants shall test each water sample for 1,1-Dichloroethylene, 1,1,1-Trichloroethane, cis-1,2-Dichloroethylene, 1,2-Dichloroethane, trans-1,2-

Dichloroethylene, Trichloroethylene, Tetrachloroethylene and Vinyl Chloride (collectively referred to herein as the "Chlorinated VOCs").

c. Commencing with the quarter beginning October 1, 2013, the Defendants shall conduct the water sampling on a date within the first 30 days of each quarter beginning January 1, April 1, July 1, and October 1 of each year.

d. Samples must be analyzed by a laboratory certified by the Illinois EPA for analysis.

e. The Defendants shall submit the results of such water sampling to the Illinois EPA within thirty (30) days of the date that each water sampling event occurs.

f. The Defendants shall continue to conduct water sampling at the Water Sampling Properties until the Defendants receive written authorization from the Illinois EPA that they may cease conducting such sampling or until such further Order of the Court.

g. The Defendants shall promptly notify the Illinois EPA if they are unable to obtain access to any of the Water Sampling Properties to conduct the water sampling. To the extent an owner of a Water Sampling Property refuses to provide access for water sampling on such property, within five (5) days after the scheduled sampling date, the Defendants shall provide the Illinois EPA with a notarized affidavit attesting as such.

IV. PRELIMINARY REMEDIAL ACTION BY DEFENDANTS

8. For purposes of Section IV of this Agreed Preliminary Injunction Order, the term "Northern Portion of the Site" shall mean the northern one-half of the property located at 300 North West Street, Marengo, McHenry County, Illinois, as set forth on Exhibit A attached hereto.

9. On August 12, 2013, the Defendants submitted a "Site Investigation Work Plan" to the Plaintiff (as identified in Section V.14. below entitled "Notices") regarding the Northern Portion of the Site for review and approval in accordance with the requirements detailed in Attachments A and B, attached hereto and incorporated herein.

10. Within fourteen (14) business days of the Plaintiff's written approval of the Site Investigation Work Plan, the Defendants shall commence the implementation of the Site Investigation Work Plan.

11. Within ninety (90) calendar days of the Plaintiff's approval of the Site Investigation Work Plan, the Defendants shall submit to the Plaintiff a Focused Site Investigation Report regarding the Northern Portion of the Site for review and approval in accordance with the requirements detailed in Attachments A and B, attached hereto and incorporated herein. In the Focused Site Investigation Report, the Defendants may propose to the Plaintiffs for review and approval, a new definition of the term "Northern Portion of the Site" for purposes of future reporting and remediation requirements.

12. The Site Investigation Report shall be signed and sealed by an Illinois Licensed Professional Engineer or Geologist.

13. The Defendants shall submit the Site Investigation Report within the timeframes indicated in this Agreed Preliminary Injunction Order. If the Plaintiff approves with conditions or disapproves of the Site Investigation Work Plan or the Site Investigation Report, the Defendants shall, within fourteen (14) business days after receiving Plaintiff's written notice of such approval with conditions or disapproval, unless otherwise specifically provided herein or unless the Plaintiff grants, in writing, a longer time period, submit a proposal to the persons identified in Section V (Notices), that addresses all conditions or deficiencies identified by the

Plaintiff in its approval with conditions or disapproval.

V. NOTICES

VI. DUTY TO COOPERATE

15. The Parties shall cooperate with each other in implementation of this Order.

VII. COMPLIANCE WITH OTHER LAWS AND REGULATIONS

16. This Order in no way affects the responsibilities of the Defendants to comply with any other federal, state or local laws or regulations, including but not limited to the Act.

VIII. STIPULATED PENALTIES

17. If the Defendants fail to complete any activity or fail to comply with any of the reporting requirements by the dates specified in this Order, the Defendants shall pay to Plaintiff stipulated penalties in the amount of $250.00 per day, per violation, until such time that compliance is achieved. To the extent an owner of a Water Sampling Property refuses to grant access to the Defendants to conduct water sampling, this Section VII shall not apply solely to the extent the Defendants comply with Paragraph III.7.g.

18. In the event Plaintiff determines that a violation that could be subject to stipulated penalties has occurred, Plaintiff will provide written notification of such violation to the Defendants and their representatives identified in Paragraph 14 of this Order. Failure by Plaintiff to provide such written notification shall not be construed as a waiver of Plaintiff's right to seek stipulated penalties under this Order.

19. All stipulated penalties owed shall be payable within forty-five (45) calendar days of the receipt of written demand from Plaintiff, unless such penalties, or any portion thereof, are disputed by the Defendants, which dispute shall be resolved pursuant to Paragraph 23 of this Order. All penalties shall be paid by certified check or money order payable to the "Illinois EPA" for deposit in the Environmental Protection Trust Fund and delivered to:

Illinois Environmental Protection Agency
Fiscal Services Division
1021 North Grand Avenue East
P.O. Box 19276
Springfield, Illinois 62794-9276

The case name and case number shall appear on the face of the certified check or money order. A copy of the certified check or money order and any transmittal letter shall be sent to:

Kathryn A. Pamenter
Environmental Bureau
Illinois Attorney General's Office
69 W. Washington St, 18th Flr.
Chicago, Illinois 60602

IX. COST RECOVERY

20. The Defendants shall reimburse the Illinois EPA for all reasonable and necessary future costs incurred and documented by the Illinois EPA in its oversight of the investigation of the Northern Portion of the Site, and its review and evaluation of documents and reports submitted to it pursuant to the Agreed Preliminary Injunction Order consistent with the

reimbursement of project costs incurred by the Illinois EPA under the Site Remediation Program, including, but not limited to, all costs associated with Community Relations activities ("Future Response Costs"). Future Response Costs shall mean all unpaid, reasonable and necessary costs incurred by the Illinois EPA on and after July 1, 2013. Future Response Costs shall include direct program costs, allocated program costs and indirect costs.

a. Direct program costs shall include, but are not limited to, all related payroll costs for all applicable organizational units, outside contractor/consultants fees, travel costs, and costs associated with photographs, maps, and laboratory services.

b. Allocated program costs represent program costs that are related to the overall program operations, including but not limited to, fiscal services, bill preparation and clerical duties, Division of Legal Counsel program meetings and regulatory preparation and implementation, and staff program meetings and management oversight for the Bureau of Land, Bureau of Water, Office of Emergency Response, Toxicity Assessment Unit, and Office of Community Relations.

c. Indirect costs are those costs incurred by the Illinois EPA in day-to-day operations, including but not limited to, the operation and maintenance of buildings, utilities and administrative costs.

21. The Illinois EPA will submit to the Defendant on a quarterly basis invoices for Future Response Costs incurred during the billing period.

a. Within forty-five (45) days of the receipt of each invoice, the Defendant shall pay, unless contested pursuant to Section X (Dispute Resolution) of this Agreed Preliminary Injunction Order, the Future Response Costs detailed therein by means of a check or

checks made payable to the Illinois Environmental Protection Agency for deposit into the Hazardous Waste Fund.

b. The case name, case number, LPC # 1110650003, LP52-62W, and the Defendants' FEIN numbers shall appear on the face of the check. The Defendants shall send each check and a copy of the Illinois EPA invoice to:

Division of Administration
Fiscal Services Section
Illinois EPA
1021 North Grand Avenue East
P. O. Box 19276
Springfield, Illinois 62794-9276

c. If the Defendants do not receive an invoice in the time frame indicated in paragraph 21, this does not waive the Illinois EPA's right to submit an invoice or receive cost reimbursement for Future Response Costs.

d. A copy of the check(s) and the transmittal letter shall be sent to:

Kathryn A. Pamenter
Assistant Attorney General
Environmental Bureau
Illinois Attorney General's Office
69 W. Washington Street, Suite 1800
Chicago, Illinois 60602

22. The dispute resolution procedures set forth in Section X of this Agreed Preliminary Injunction Order shall be the exclusive mechanism for resolving disputes regarding the Defendants' obligation to reimburse the Illinois EPA for its Future Response Costs; except that for purposes of this Section IX only, the informal negotiation period shall be extended to twenty-one (21) days after written initiation of dispute resolution proceedings.

X. DISPUTE RESOLUTION

23. The parties shall use their best efforts to resolve any and all disputes or

differences of opinion arising with regard to this Order, informally and in good faith, within seven (7) days of a party providing notice to the other parties of such a dispute. If, however, a dispute arises concerning this Order that the parties are unable to resolve informally, either party may, by written motion, within three (3) days of conclusion of the informal resolution efforts, request that an evidentiary hearing be held before the Circuit Court for the Twenty-Second Judicial Circuit, McHenry County, Illinois, to resolve the dispute between the parties. Upon Plaintiff's establishment of a prima facie violation of the Order, the Defendants shall bear the burden of proving that it did not violate this Order. Stipulated penalties shall not attach if the Defendants prevail in a dispute resolution.

XI. FORCE MAJEURE

24. The Defendants may declare *force majeure* in appropriate circumstances as follows:

a. A *force majeure* event is an event arising solely beyond the control of the Defendants, which prevents the timely performance of any of the requirements of this Order. For the purposes of this Order, *force majeure* shall include, but is not limited to, events such as, floods, fires, tornadoes, other natural disasters, labor disputes beyond the reasonable control of the Defendants, or prohibitions imposed by any court having jurisdiction over the Defendants.

b. When, in the opinion of the Defendants, a *force majeure* event occurs which causes or may cause a delay in the performance of any of the requirements of this Order, the Defendants shall orally notify the Plaintiff within forty-eight (48) hours of the occurrence. Written notice shall be given to the Plaintiff as soon as practicable, but no later than ten (10) business days after the claimed occurrence.

c. Failure by the Defendants to comply with the notice requirements of the preceding paragraph shall render this *force majeure* provision voidable by Plaintiff as to the specific event for which the Defendants have failed to comply with the notice requirement. If voided, this section shall be of no effect as to the particular event involved.

d. An increase in costs associated with implementing any requirement of this Order shall not, by itself, excuse the Defendants under the provisions of this Order from a failure to comply with such a requirement.

XII. RIGHT OF ENTRY

25. In addition to any other authority, the Illinois EPA, its employees and representatives, and the Attorney General, her agents and representatives, shall have the right of entry into and upon the portions of the Site owned by or under control of the Defendants and which are the subject of this Order, at all reasonable times for the purpose of carrying out inspections of the Site. Plaintiff agrees to comply with any safety regulations in effect at the Site at the time of inspection. In conducting such inspections, the Illinois EPA, its employees and representatives, and the Attorney General, her employees and representatives, may take photographs, samples, and collect information, as they deem necessary. Plaintiff shall provide upon the Defendants' written request copies of any photographs, files, records, data or information collected during said inspection.

XIII. EXTENSIONS AND MODIFICATIONS

26. The parties may, by mutual consent, extend any compliance dates or modify the terms of this Order without leave of court. Any such agreed modification shall be in writing, signed by authorized representatives of each party and incorporated into this Order by reference.

Any request for modification shall be made by the Defendants in writing and shall be independent of any other submittal made pursuant to this Order. Moreover, notice of a request for any proposed modification shall be provided to the Plaintiff's representatives listed in Paragraph 14 of this Order.

XIV. RESERVATION OF RIGHTS

27. Nothing contained herein shall be deemed at this time, and compliance with this order by the Defendants shall not be deemed, an admission of any wrongful conduct or violation of any applicable statute, law or regulations thereunder by the Defendants, nor a finding of fact or adjudication by this Court of any of the facts or claims contained in the Verified Complaint. Plaintiff reserves the right to seek additional technical relief and civil penalties in this matter.

28. This Order is without prejudice to and shall not act as a waiver of any right of contribution the Defendants may now or in the future have against any other person or entity.

XV. RETENTION OF JURISDICTION

29. This Court shall retain jurisdiction of this matter and shall consider any motion by Plaintiff or the Defendants for the purposes of interpreting and enforcing the terms and conditions of this Order.

XVI. SIGNATURE

30. This Order may be signed in counterparts, all of which shall be considered one agreement.

XVII. STATUS CONFERENCE WITH THE COURT

31. This Agreed Preliminary Injunction Order resolves Plaintiff's Motion for preliminary injunction. This matter is set for a status conference on December 4, 2013, at 9:15 a.m. without further notice.

[Remainder of Page Blank; Continued on Page 14]

WHEREFORE the parties, by their representatives, enter into this Agreed Preliminary Injunction Order and submit it to the Court that it may be approved and entered.

ATTORNEY GENERAL

VERFIFIED COMPLINAT FOR

INJUNCTION AND CIVIL PENALTIES

IN THE CIRCUIT COURT OF THE TWENTY-SECOND JUDICIAL CIRCUIT
McHENRY COUNTY, ILLINOIS
CHANCERY DIVISION

COPY
FILED
JUN 14 2013
KATHERINE M. KEEFE
McHENRY CTY. CIR. CLK.

PEOPLE OF THE STATE OF ILLINOIS, *ex rel.* LISA MADIGAN, Attorney General of the State Illinois, Plaintiff,	)	
v.	)	No. 13CH1046
300 WEST LLC, an Illinois corporation, and THE ARNOLD ENGINEERING CO., an Illinois corporation a/k/a Arnold Magnetic Technologies Corporation, Defendants.	)	

VERIFIED COMPLAINT FOR INJUNCTION AND CIVIL PENALTIES

Plaintiff, PEOPLE OF THE STATE OF ILLINOIS, *ex rel.* LISA MADIGAN, Attorney General of the State of Illinois, on her own motion and at the request of the Illinois Environmental Protection Agency ("Illinois EPA"), complains of the Defendants, 300 WEST LLC, an Illinois corporation ("300 West"), and THE ARNOLD ENGINEERING CO., an Illinois corporation also known as Arnold Magnetic Technologies Corporation, a Delaware corporation not authorized to do business in Illinois ("Arnold" and together with 300 West, the "Defendants"), as follows:

COUNT I

SUBSTANTIAL DANGER TO THE ENVIRONMENT, PUBLIC HEALTH AND WELFARE

1. This Count is brought on behalf of the PEOPLE OF THE STATE OF ILLINOIS, *ex rel.* LISA MADIGAN, the Attorney General of the State of Illinois, on her own motion and at the request of the Illinois EPA, against the Defendants, 300 West and Arnold, pursuant to the

NOTICE
BY LOCAL RULE 3.10
THIS CASE IS HEREBY SET FOR SCHEDULING CONFERENCE IN COURTROOM 202 ON 7-23-2013 AT 9:00 AM PM
FAILURE TO APPEAR MAY RESULT IN THE CASE BEING DISMISSED OR AN ORDER OF DEFAULT BEING ENTERED.

terms and provisions of Section 43(a) of the Illinois Environmental Protection Act (the "Act"), 415 ILCS 5/43(a) (2012), and is an action to restrain a substantial danger to public health and welfare and to the environment.

2. The Illinois EPA is an administrative agency of the State of Illinois created pursuant to Section 4 of the Act, 415 ILCS 5/4 (2012), and charged, *inter alia*, with the duty of enforcing the Act.

3. At all times relevant to this Complaint, Defendant 300 West LLC was and is an Illinois corporation in good standing.

4. At all times relevant to this Complaint, Defendant The Arnold Engineering Co. was and is an Illinois corporation in good standing and also known as Arnold Magnetic Technologies Corporation, a Delaware corporation not authorized to do business in Illinois.

5. For approximately 100 years, Arnold owned, and operated a manufacturing facility at, the property located at 300 North West Street, Marengo, McHenry County, Illinois (the "Site"). Upon information and belief, Arnold historically utilized chlorinated solvents in its production processes in a building located at the northwestern corner of the Site, commonly known as "Building #6." On such dates better known to the Defendants, operations at Building #6 ceased, and the building was demolished. Wastewater treatment ponds have been, and are currently, located at the north side of the Site, adjacent to the former Building #6 area.

6. In or about June 2003, and on such dates better known to the Defendants, Arnold sold the Site to 300 West, who has since owned, and continues to own, the Site. Since selling the Site to 300 West, Arnold has leased the Site from 300 West and conducted manufacturing operations at the Site.

7. Shallow groundwater flow under the Site is to the north-northwest.

8. Seventeen private and non-community water wells are located within an area to the north-northwest, approximately one mile downgradient of the Site. The Kishwaukee River is located approximately 1.5 miles north-northwest of the Site.

9. On February 28, 2008, the Illinois EPA issued a Violation Notice numbered L-2008-01057 to Arnold due to chlorinated solvent groundwater contamination existing on-Site (the "February 28, 2008 Violation Notice"). A true and correct copy of the February 28, 2008 Violation Notice is attached hereto as Exhibit 1.

10. On April 15, 2008, the Illinois EPA issued a Violation Notice numbered L-2008-01123 to 300 West due to chlorinated solvent groundwater contamination existing on-Site (the "April 15, 2008 Violation Notice"). A true and correct copy of the April 15, 2008 Violation Notice is attached hereto as Exhibit 2.

11. In or about May 2008, and on such date better known to the Defendants, the Site entered the Illinois EPA's "Site Remediation Program."

12. Since entering the Site Remediation Program, and on such dates better known to the Defendants, the Defendants have conducted limited on-Site and off-Site groundwater sampling from monitoring wells which were installed as follows: (a) Monitoring Wells 1-16 installed on-Site in May 2010; (b) Monitoring Well 17 installed on-Site in October 2010; (c) Monitoring Wells 18-21 installed off-Site in October 2010; (d) Monitoring Well 22 installed on-Site in February 2011; and (e) Monitoring Well 23 installed off-Site in February 2011.

13. Pursuant to the authority granted in Section 8(a) of the Illinois Groundwater Protection Act, 415 ILCS 55/8(a) (2012), the Illinois Pollution Control Board ("Board") has promulgated rules and regulations to establish comprehensive water quality standards which are

specifically for the protection of groundwater and which are codified as 35 Ill. Adm. Code 620: Groundwater Quality Standards ("Board Groundwater Quality Regulations").

14. Class I groundwater is defined in Section 620.210(a) of the Board Groundwater Quality Regulations, 35 Ill. Adm. Code 620.210(a), as follows:

a) Groundwater located 10 feet or more below the land surface and within:

1) The minimum setback zone of a well which serves as a potable water supply and to the bottom of such well;

15. The groundwater underlying the Site is within the minimum setback zone of a number of private and non-community potable water wells, and is "Class I Groundwater" as that term is defined in Section 620.210(a) of the Board Groundwater Quality Regulations, 35 Ill. Adm. Code 620.210(a).

16. Section 620.410(b) of the Board Groundwater Quality Regulations, 35 Ill. Adm. Code 620.410(b), provides as follows:

b) Organic Chemical Constituents

Except due to natural causes or as provided in Section 620.450 or subsection (d), concentrations of the following organic chemical constituents shall not be exceeded in Class I groundwater:

Constituent	**Standard** (1 mg/L = 1ppm = 0.001 ppb)
1,1-Dichloroethylene ("1,1-DCE")	7ppb
cis-1,2-Dichloroethylene ("cis-1,2-DCE")	70ppb
1,2-Dichloroethane ("DCA")	5ppb
trans-1,2-Dichloroethylene ("trans-1,2-DCE")	100ppb
Trichloroethylene ("TCE")	5ppb
Tetrachloroethylene ("PCE")	5ppb
Vinyl Chloride	2ppb

(1,1-DCE, cis-1,2-DCE, DCA, trans-1,2-DCE, TCE, PCE and Vinyl Chloride are chlorinated volatile organic compounds and are collectively referred to herein as the "Chlorinated VOCs.")

17. 1,1-DCE, cis-1,2-DCE, DCA, trans-1,2-DCE, TCE and PCE degrade chemically over time into Vinyl Chloride, which can dissolve in water and migrate through groundwater.

18. Vinyl Chloride is recognized by the United States Department of Health and Human Services, the United States Environmental Protection Agency ("U.S. EPA") and the International Agency for Research on Cancer as a known human carcinogen. Short term exposure to high levels of Vinyl Chloride can cause damage to the nervous system. Long term exposure can cause cancer and may damage the liver.

19. TCE has recently been recognized as a known human carcinogen by the U.S. EPA and is reasonably anticipated to be a human carcinogen by the Agency for Toxic Substances and Disease Registries. Short term exposure to high levels of TCE can cause liver effects, and exposure during pregnancy may cause heart defects in the offspring. Long term exposure to lower levels of TCE can cause cancer, nervous and immune system effects and developmental effects.

20. PCE is reasonably anticipated to be a human carcinogen by the Agency for Toxic Substances and Disease Registries, probably carcinogenic by the International Agency for Research on Cancer, and likely to be a human carcinogen by the U.S. EPA. Short term exposure to high levels of PCE can cause damage to the nervous system. Long term exposure to lower levels of PCE may cause cancer, nervous and respiratory system effects and developmental effects.

21. Short term exposure to high levels of 1,1-DCE can cause damage to the liver and kidneys. Long term exposure to lower levels of 1,1-DCE can cause damage to the liver and kidneys, cardiovascular and nervous system effects and developmental effects.

22. After May 2010, and on such dates better known to the Defendants, Environmental Group Services Limited ("EGSL"), an environmental consultant retained by or on behalf of one or both of the Defendants, collected samples of groundwater from monitoring wells located on-Site. Analytical testing of the samples revealed the highest concentrations of 1,1-DCE, PCE and TCE to be as follows:

Constituent	Sample Location	Constituent Concentration	Class I Groundwater Standards in ppb (1 mg/L = 1ppm = 0.001 ppb)
1,1-DCE	Monitoring Well-1	17 ppb	7 ppb
	Monitoring Well-2	44 ppb	
	Monitoring Well-4	36 ppb	
	Monitoring Well-5	13 ppb	
	Monitoring Well-6	12 ppb	
	Monitoring Well-7	31 ppb	
	Monitoring Well-13	12 ppb	
	Monitoring Well-17	10 ppb	
PCE	Monitoring Well-4	14 ppb	5 ppb
	Monitoring Well-7	12 ppb	
	Monitoring Well-8	10 ppb	
TCE	Monitoring Well-7	7.8 ppb	5 ppb

23. After May 2010, and on such dates better known to the Defendants, EGSL collected samples of groundwater from monitoring wells located approximately fifty feet away from the northwest portion of the Site. Analytical testing of the samples revealed the highest concentrations of 1,1-DCE, PCE and Vinyl Chloride to be as follows:

Constituent	Sample Location	Constituent Concentration	Class I Groundwater Standards in ppb (1 mg/L = 1ppm = 0.001 ppb)
1,1-DCE	Monitoring Well-19	16 ppb	7 ppb
PCE	Monitoring Well-19	9.2 ppb	5 ppb
Vinyl Chloride	Monitoring Well-18	2.5 ppb	2 ppb

24. On May 14, 2013, EGSL, with oversight by the Illinois EPA, collected water samples from thirteen private wells located north-northwest and within one mile of the Site.

Analytical testing of the samples revealed the presence of the Chlorinated VOCs in six of the private wells as follows:

Sample Location	Constituent Concentration (in ppb): (1 mg/L = 1ppm = 0.001 ppb)							
	1,1-DCE	cis-1,2-DCE	DCA	Trans-1,2-DCE	TCE	PCE	Vinyl Chloride	
4907 Ritz Road	39.6*	19	1.34	5.84	2.37	-	1.52	
4913 Ritz Road	22*	13.6	-	5.26	6.47**	1.28	-	
4805 Ritz Road	3.05	1.48	-	-	-	-	-	
5010 Ritz Road	2.62	-	-	-	-	-	0.54

21816 Railroad St.	2.01	2.23	-	-	4.47	-	-	

*Denotes a class 1 groundwater exceedance above the 7ppb standard
**Denotes a class 1 groundwater exceedance above the 5ppb standard

25. Section 43(a) of the Act, 415 ILCS 5/43(a) (2012), provides in pertinent part as follows:

> (a) In circumstances of substantial danger to the environment or to the public health of persons or to the welfare of persons where such danger is to the livelihood of such persons, the State's Attorney or Attorney General, upon request of the Agency or on his own motion, may institute a civil action for an immediate injunction to halt any discharge or other activity causing or contributing to the danger or to require such other action as may be necessary. The court may issue an ex parte order and shall schedule a hearing on the matter not later than 3 working days from the date of injunction.

26. The Chlorinated VOCs released at the Site have migrated through the groundwater and impacted residential potable water wells. The Chlorinated VOCs have exceeded the Board's Class I Groundwater Quality Regulations in at least two drinking water wells, thereby threatening the health and safety of the public.

27. Defendants 300 West and Arnold, by their actions or omissions as alleged herein, have created circumstances of substantial danger to the environment and the public health and

the Defendants, 300 WEST LLC and THE ARNOLD ENGINEERING CO. a/k/a Arnold Magnetic Technologies Corporation:

1. Finding that the Defendants created and are maintaining a substantial danger to the environment and public health and welfare;

2. Enjoining the Defendants from creating any further substantial endangerment pursuant to Section 43(a) of the Act, 415 ILCS 5/43(a) (2012);

3. Ordering the Defendants to (a) immediately provide an alternative source of drinking water to the owners of the private water wells located at 4907 Ritz Road, 4913 Ritz Road, 4805 Ritz Road, 5010 Ritz Road, 21902 Railroad St. and 21816 Railroad St. in Marengo, McHenry County, Illinois, and (b) conduct water sampling at the private water wells located at 4501 Ritz Road, 4106 Ritz Road, 4210 Ritz Road, 4805 Ritz Road, 4907 Ritz Road, 4913 Ritz Road, 5011 Ritz Road, 5017 Ritz Road, 5010 Ritz Road, 22110 Railroad St., 22104 Railroad St., 22012 Railroad St., 21902 Railroad St., 21816 Railroad St., 21820 Railroad St., 21606 Railroad St. and 21602 Railroad St. in accordance with a schedule approved by Plaintiff to monitor the Chlorinated VOCs downgradient of the Site.

4. Ordering the Defendants to immediately delineate the nature and extent of groundwater contamination of the Chlorinated VOCs, and to remediate such groundwater contamination, both on-Site and off-Site;

5. Assessing against the Defendants, pursuant to Section 42(a) of the Act, 415 ILCS 5/42(a) (2012), a civil penalty of Fifty Thousand Dollars ($50,000.00) for each and every violation of the Act, and an additional Ten Thousand Dollars ($10,000.00) for each day of violation;

6. Ordering the Defendants, pursuant to 415 ILCS 5/42(f) (2012), to pay all costs, including oversight, sampling and clean-up costs, and attorney, expert witness and consultant fees expended by the Plaintiff in its pursuit of this action; and

7. Granting such other relief as this Court deems appropriate and just.

COUNT II

WATER POLLUTION

1. This count is brought on behalf of the People of the State of Illinois, *ex rel.* Lisa Madigan, Attorney General of the State of Illinois, on her own motion, pursuant to Sections 42(d) and (e) of the Act, 415 ILCS 5/42(d) and (e) (2012).

2-29. Plaintiff realleges and incorporates herein by reference paragraphs 2 through 26 and 28 through 31 of Count I as paragraphs 2 through 29 of this Count II.

30. Section 12(a) of the Act, 415 ILCS 5/12(a) (2012), provides, as follows:

No person shall:

a. Cause or threaten or allow the discharge of any contaminants into the environment in any State so as to cause or tend to cause water pollution in Illinois, either alone or in combination with matter from other sources, or so as to violate regulations or standards adopted by the Pollution Control Board under this Act.

31. Section 3.165 of the Act, 415 ILCS 5/3.165 (2012), provides the following definition:

"CONTAMINANT" is any solid, liquid, or gaseous matter, any odor, or any form of energy, from whatever source.

32. The Chlorinated VOCs both on- and off-Site are "contaminants," as that term is defined in Section 3.165 of the Act, 415 ILCS 5/3.165 (2012).

33. Section 3.550 of the Act, 415 ILCS 5/3.550 (2012), provides the following definition:

> "WATERS" means all accumulations of water, surface and underground, natural, and artificial, public and private, or parts thereof, which are wholly or partially within, flow through, or border upon this State.

34. The groundwater underlying the Site and located off-Site constitutes "water[s]" of the State of Illinois, as that term is defined in Section 3.550 of the Act, 415 ILCS 5/3.550 (2012).

35. Section 3.545 of the Act, 415 ILCS 5/3.545 (2012), provides the following definition:

> "WATER POLLUTION" is such alteration of the physical, thermal, chemical, biological or radioactive properties of any waters of the State, or such discharge of any contaminant into any waters of the State, as will or is likely to create a nuisance or render such waters harmful or detrimental or injurious to public health, safety or welfare, or to domestic, commercial, industrial, agricultural, recreational, or other legitimate uses, or to livestock, wild animals, birds, fish, or other aquatic life.

36. On such dates better known to the Defendants, the Defendants caused, threatened or allowed the discharge and migration of the Chlorinated VOCs into groundwater at the Site. The Chlorinated VOCs were allowed to migrate into groundwater underlying the Site and into off-Site groundwater, including into private water wells located in close proximity to the north-northwest boundary of the Site, impacting drinking water.

37. The Chlorinated VOCs migrating to groundwater at and near the Site created, or threatened to create, a nuisance and rendered the groundwater harmful to human health and the environment, which constitutes water pollution as that term is defined by Section 3.545 of the Act, 415 ILCS 5/3.545 (2012).

38. The Defendants, by their actions as alleged herein, caused, threatened or allowed water pollution, and thereby violated and continue to violate Section 12(a) of the Act, 415 ILCS 5/12(a) (2012).

39. Plaintiff is without an adequate remedy at law. Plaintiff will be irreparably injured and violations of the pertinent environmental statutes and regulations will continue unless and until this Court grants equitable relief in the form of preliminary and, after trial, permanent injunctive relief.

WHEREFORE, Plaintiff, PEOPLE OF THE STATE OF ILLINOIS, respectfully requests that this Court enter an Order granting a preliminary injunction and, after trial, a permanent injunction in favor of Plaintiff, and against the Defendants, 300 WEST LLC and THE ARNOLD ENGINEERING CO. a/k/a Arnold Magnetic Technologies Corporation:

1. Finding that the Defendants violated Section 12(a) of the Act, 415 ILCS 5/12(a) (2012);

2. Enjoining the Defendants from any further violation of Section 12(a) of the Act, 415 ILCS 5/12(a) (2012);

3. Ordering the Defendants to immediately delineate the nature and extent of the groundwater contamination of the Chlorinated VOCs, and to remediate such groundwater contamination, both on-Site and off-Site;

4. Assessing a civil penalty of Fifty Thousand Dollars ($50,000.00) against the Defendants for each violation of the Act and pertinent regulations, and an additional civil penalty of Ten Thousand Dollars ($10,000.00) for each day of violation;

5. Ordering the Defendants, pursuant to 415 ILCS 5/42(f) (2012), to pay all costs, including oversight, sampling and clean-up costs, and attorney, expert witness and consultant fees expended by the Plaintiff in its pursuit of this action; and

6. Granting such other relief as this Court deems appropriate and just.

PEOPLE OF THE STATE OF ILLINOIS,

McHENRY COUNTY, ILLINOIS
CHANCERY DIVISION

PEOPLE OF THE STATE OF ILLINOIS, *ex rel.* LISA MADIGAN, Attorney General of the State Illinois,	)	
Plaintiff,	)	
v.	)	No.
300 WEST LLC, an Illinois corporation, and THE ARNOLD ENGINEERING CO., an Illinois corporation a/k/a Arnold Magnetic Technologies Corporation,	)	
Defendants.	)	

VERIFICATION

I, Thomas Rivera, being duly sworn, on oath state as follows:

1. I am currently employed by the Illinois Environmental Protection Agency ("Illinois EPA") in Des Plaines, Illinois as an Environmental Protection Specialist 3.

2. I have been employed by the Illinois EPA for the past 13 years with the last 11 years in my current position.

3. The duties and responsibilities of my current position include: conducting regulatory/complaint inspections and soil/groundwater sampling, overseeing consultants perform sampling and environmental investigation work, and assisting with conducting soil and groundwater investigations.

4. I have read the foregoing Verified Complaint for Injunction and Civil Penalties (the "Complaint"), and am aware of the contents thereof.

5. The factual matters set forth in Paragraphs 5-12, 17 and 22-25 of Count I of the Complaint are true in substance and in fact, to the best of my knowledge, information and belief.

Thomas Rivera

Re: Violation Notice, L-2008-01057
LPC #1110650003 – McHenry County
Marengo/Arnold Magnetic Technologies
Compliance File

Dear Mr. Kalaczinski:

This constitutes a Violation Notice pursuant to Section 31(a)(1) of the [Illinois] Environmental Protection Act, 415 ILCS 5/31(a)(1), and is based on a record review completed on February 26, 2008 by representatives of the Illinois Environmental Protection Agency (Illinois EPA).

The Illinois EPA hereby provides notice of violations of environmental statutes, regulations, or permits as set forth in Attachment A to this letter. Attachment A includes an explanation of the activities that the Illinois EPA believes may resolve the specified violations, including an estimate of a reasonable time period to complete the necessary activities. However, due to the nature and seriousness of the violations cited, please be advised that resolution of the violations may require the involvement of a prosecutorial authority for purposes that may include, among others, the imposition of statutory penalties.

A written response which may include a request for a meeting with representatives of the Illinois EPA, must be submitted via certified mail to the Illinois EPA within 45 days of receipt of this letter. The response must address each violation specified in Attachment A and include for each an explanation of the activities that will be implemented and the time schedule for the completion of that activity. The written response will constitute a proposed Compliance Commitment Agreement (CCA) pursuant to Section 31 of the Act. The Illinois EPA will review the proposed CCA and will accept or reject it within 30 days of receipt.

RELEASABLE
MAY 14 2008
REVIEWER MD

If a timely written response to this Violation Notice is not provided, it shall be considered to be a waiver of the opportunity to respond and to meet provided by Section 31(a) of the Act, and the Illinois EPA may proceed with a referral to the prosecutorial authority.

Written communications should be directed to:

Illinois EPA – Bureau of Land

ATTACHMENT A

1. Pursuant to Section 12(a) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(a)), no person shall cause, threaten or allow the discharge of any contaminants into the environment in any State so as to cause or tend to cause water pollution in Illinois, either alone or in combination with matter from other sources, or so as to violate regulations or standards adopted by the Pollution Control under this Act.

   A violation of Section 12(a) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(a)) is alleged for the following reason: **The discharge of contaminants was caused and allowed in a way that caused water pollution. Chlorinated solvent contamination above the Class 1 groundwater objectives is present in on site groundwater. The groundwater contamination has been present for approximately 20 years. Shallow groundwater flow under the site is to the north-northwest, towards the nearby Kishwaukee River. Residential/nonresidential private water wells are located to the north-northwest, directly down gradient of the site. The private wells are within ½ mile of the site and its unknown at this time if the private wells have been impacted by the chlorinated solvent groundwater contamination.**

   1,1,1-Trichloroethane (1,1,1-TCA) was detected as high as 4,900 ppb, in 1999, in on site groundwater monitoring well MW-3. More recently in 2007, 1,1,1-TCA was detected as high as 501 ppb in on site groundwater monitoring well MW-A7. Tetrachloroethene (PCE) was detected as high as 18.8 ppb, in 2007, in onsite groundwater monitoring well MW-3. PCE contamination in MW-3 has steadily increased over the past approximately 6 years. Other on site groundwater monitoring wells have chlorinated solvent detections as well, but MW-3 and MW-A7 have shown the highest concentrations of 1,1,1-TCA and PCE.

2. Pursuant to Section 12(d) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(d)), no person shall deposit any contaminants upon the land in such place and manner so as to create a water pollution hazard.

   A violation of Section 12(d) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(d)) is alleged for the following reason: **Contaminants were deposited upon the land in such a place and manner that created a water pollution hazard. Chlorinated solvent contamination above the Class 1 groundwater objectives is present in on site groundwater. The groundwater contamination has been present for approximately 20 years. Shallow groundwater flow under the site is to the north-northwest, towards the nearby Kishwaukee River. Residential/nonresidential private water wells are located to the north-northwest, directly down gradient of the site. The private wells are within ½ mile of the site and its unknown at this time if the private wells have been impacted by the chlorinated solvent groundwater contamination.**

   1,1,1-TCA was detected as high as 4,900 ppb, in 1999, in on site groundwater monitoring well MW-3. More recently in 2007, 1,1,1-TCA was detected as high as 501 ppb in on site groundwater monitoring well MW-A7. PCE was detected as high as 18.8 ppb, in 2007, in on site groundwater monitoring well MW-3. PCE contamination in MW-3 has steadily increased over the past approximately 6 years. Other on site groundwater monitoring wells have chlorinated solvent detections as well, but MW-3 and MW-A7 have shown the highest concentrations of 1,1,1-TCA and PCE.

SUGGESTED RESOLUTIONS

1. Immediately determine the source(s) of 1,1,1-TCA, PCE and other related contaminants that are present in groundwater under the subject site by conducting an Investigation.

2. Immediately determine the extent of 1,1,1-TCA, PCE and other related contaminants in soil and groundwater, both on site and off site, by conducting an Investigation.

3. Collect representative groundwater samples from all down gradient residential/nonresidential private water wells (approximately 16) located within approximately ½ mile of the site, see the attached map. The private water well samples shall be collected from an unfiltered and unsoftened spigot, after an appropriate water system purge is conducted. The samples shall be analyzed for Volatile Organic Compounds at an Illinois EPA approved laboratory. Illinois EPA would like to oversee the sampling event.

4. Remediate, if necessary, to meet all applicable remediation objectives for soil and groundwater.

* Immediately manage the groundwater to mitigate impairment caused by the release of volatile organic compounds.

* All copies of receipts/manifests, and analytical reports must be submitted to the Illinois EPA that document the proper disposal of any waste (i.e. impacted soil, contaminated groundwater). The receipts/manifests must be submitted within 10 days after the off-site shipment.

* Within 45 days from the receipt of this letter, enroll in the Site Remediation Program.

* A Site Investigation Work Plan shall be submitted within 30 days of the Illinois EPA approval of the Site Remediation application.

* The Site Investigation shall be implemented within 30 days of the Illinois EPA approval of the Site Investigation Work Plan.

* The Site Investigation Report shall be submitted within 180 days of approval of the Site Investigation Work Plan.

* The Remediation Objectives Report shall be submitted within 30 days of approval of the Site Investigation Report.

* The Remedial Action Plan shall be submitted within 30 days of Illinois EPA approval of the Remedial Objectives Report.

* The remedial action shall be implemented within 30 days of Illinois EPA approval of the Remediation Action Plan.

* **The Remedial Action Completion Report shall be submitted within 365 days of Illinois EPA approval of the Remedial Action Plan.**

The written response to this Violation Notice must include information in rebuttal, explanation, or justification of each alleged violation and must be submitted to the Illinois EPA by certified mail, within 45 days of receipt of this Violation Notice. The written response must also include a proposed Compliance Commitment Agreement that commits to specific remedial actions, includes specified times for achieving each commitment, and may include a statement that compliance has been achieved.

REVIEWER MD

Dear Mr. Daley and Mr. Mandarino:

This constitutes a Violation Notice pursuant to Section 31(a)(1) of the [Illinois] Environmental Protection Act, 415 ILCS 5/31(a)(1), and is based on a record review completed on February 26, 2008 by representatives of the Illinois Environmental Protection Agency (Illinois EPA).

The Illinois EPA hereby provides notice of violations of environmental statutes, regulations, or permits as set forth in Attachment A to this letter. Attachment A includes an explanation of the activities that the Illinois EPA believes may resolve the specified violations, including an estimate of a reasonable time period to complete the necessary activities. However, due to the nature and seriousness of the violations cited, please be advised that resolution of the violations may require the involvement of a prosecutorial authority for purposes that may include, among others, the imposition of statutory penalties.

A written response which may include a request for a meeting with representatives of the Illinois EPA, must be submitted via certified mail to the Illinois EPA within 45 days of receipt of this letter. The response must address each violation specified in Attachment A and include for each an explanation of the activities that will be implemented and the time schedule for the completion of that activity. The written response will constitute a proposed Compliance Commitment Agreement (CCA) pursuant to Section 31 of the Act. The Illinois EPA will review the proposed CCA and will accept or reject it within 30 days of receipt.

If a timely written response to this Violation Notice is not provided, it shall be considered to be a waiver of the opportunity to respond and to meet provided by Section 31(a) of the Act, and the Illinois EPA may proceed with a referral to the prosecutorial authority.

Written communications should be directed to:

Illinois EPA – Bureau of Land

ATTACHMENT A

1. Pursuant to Section 12(a) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(a)), no person shall cause, threaten or allow the discharge of any contaminants into the environment in any State so as to cause or tend to cause water pollution in Illinois, either alone or in combination with matter from other sources; or so as to violate regulations or standards adopted by the Pollution Control under this Act.

   A violation of Section 12(a) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(a)) is alleged for the following reason: **The discharge of contaminants was caused and allowed in a way that caused water pollution. Chlorinated solvent contamination above the Class 1 groundwater objectives is present in on site groundwater. The groundwater contamination has been present for approximately 20 years. Shallow groundwater flow under the site is to the north-northwest, towards the nearby Kishwaukee River. Residential/nonresidential private water wells are located to the north-northwest, directly down gradient of the site. The private wells are within ½ mile of the site and its unknown at this time if the private wells have been impacted by the chlorinated solvent groundwater contamination.**

   1,1,1-Trichloroethane (1,1,1-TCA) was detected as high as 4,900 ppb, in 1999, in on site groundwater monitoring well MW-3. More recently in 2007, 1,1,1-TCA was detected as high as 501 ppb in on site groundwater monitoring well MW-A7. Tetrachloroethene (PCE) was detected as high as 18.8 ppb, in 2007, in onsite groundwater monitoring well MW-3. PCE contamination in MW-3 has steadily increased over the past approximately 6 years. Other on site groundwater monitoring wells have chlorinated solvent detections as well, but MW-3 and MW-A7 have shown the highest concentrations of 1,1,1-TCA and PCE.

2. Pursuant to Section 12(d) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(d)), no person shall deposit any contaminants upon the land in such place and manner so as to create a water pollution hazard.

   A violation of Section 12(d) of the {Illinois} Environmental Protection Act (415 ILCS 5/12(d)) is alleged for the following reason: **Contaminants were deposited upon the land in such a place and manner that created a water pollution hazard. Chlorinated solvent contamination above the Class 1 groundwater objectives is present in on site groundwater. The groundwater contamination has been present for approximately 20 years. Shallow groundwater flow under the site is to the north-northwest, towards the nearby Kishwaukee River. Residential/nonresidential private water wells are located to the north-northwest, directly down gradient of the site. The private wells are within ½ mile of the site and its unknown at this time if the private wells have been impacted by the chlorinated solvent groundwater contamination.**

   1,1,1-TCA was detected as high as 4,900 ppb, in 1999, in on site groundwater monitoring well MW-3. More recently in 2007, 1,1,1-TCA was detected as high as 501 ppb in on site groundwater monitoring well MW-A7. PCE was detected as high as 18.8 ppb, in 2007, in on site groundwater monitoring well MW-3. PCE contamination in MW-3 has steadily increased over the past approximately 6 years. Other on site groundwater monitoring wells have chlorinated solvent detections as well, but MW-3 and MW-A7 have shown the highest concentrations of 1,1,1-TCA and PCE.

SUGGESTED RESOLUTIONS

1. Immediately determine the source(s) of 1,1,1-TCA, PCE and other related contaminants that are present in groundwater under the subject site by conducting an Investigation.

2. Immediately determine the extent of 1,1,1-TCA, PCE and other related contaminants in soil and groundwater, both on site and off site, by conducting an Investigation.

3. Collect representative groundwater samples from all down gradient residential/nonresidential private water wells (approximately 16) located within approximately ½ mile of the site, see the attached map. The private water well samples shall be collected from an unfiltered and unsoftened spigot, after an appropriate water system purge is conducted. The samples shall be analyzed for Volatile Organic Compounds at an Illinois EPA approved laboratory. Illinois EPA would like to oversee the sampling event.

4. Remediate, if necessary, to meet all applicable remediation objectives for soil and groundwater.

* Immediately manage the groundwater to mitigate impairment caused by the release of volatile organic compounds.

* All copies of receipts/manifests, and analytical reports must be submitted to the Illinois EPA that document the proper disposal of any waste (i.e. impacted soil, contaminated groundwater). The receipts/manifests must be submitted within 10 days after the off-site shipment.

* Within 45 days from the receipt of this letter, enroll in the Site Remediation Program.

* A Site Investigation Work Plan shall be submitted within 30 days of the Illinois EPA approval of the Site Remediation application.

* The Site Investigation shall be implemented within 30 days of the Illinois EPA approval of the Site Investigation Work Plan.

* The Site Investigation Report shall be submitted within 180 days of approval of the Site Investigation Work Plan.

* The Remediation Objectives Report shall be submitted within 30 days of approval of the Site Investigation Report.

* The Remedial Action Plan shall be submitted within 30 days of Illinois EPA approval of the Remedial Objectives Report.

* The remedial action shall be implemented within 30 days of Illinois EPA approval of the Remediation Action Plan.

* The Remedial Action Completion Report shall be submitted within 365 days of Illinois EPA approval of the Remedial Action Plan.

The written response to this Violation Notice must include information in rebuttal, explanation, or justification of each alleged violation and must be submitted to the Illinois EPA by certified mail, within 45 days of receipt of this Violation Notice. The written response must also include a proposed Compliance Commitment Agreement that commits to specific remedial actions, includes specified times for achieving each commitment, and may include a statement that compliance has been achieved.

Attachment A

Site Investigation -- General

A site investigation shall be performed to identify all or specified recognized environmental conditions existing at the remediation site, the related contaminants of concern, and associated factors that will aid in the identification of risks to human health, safety and the environment, the determination of remediation objectives, and the design and implementation of a Remedial Action Plan.

a) If the Defendants have elected under the application for review and evaluation services to obtain a No Further Remediation Letter covering all recognized environmental conditions and related contaminants of concern for the remediation site, then the procedures provided under 35 Ill. Adm. Code 740.420 and 740.425 shall be followed.

b) If the Defendants have elected under the application for review and evaluation services to obtain a No Further Remediation Letter covering a limited number of recognized environmental conditions and related contaminants of concern as specified by the RA, then the procedures provided under 35 Ill. Adm. Code Sections 740.430 and 740.435 shall be followed.

c) The Defendants may revise an election at any time by initiating a modification of the Review and Evaluation Services Agreement under 35 Ill. Adm. Code 740.220 and performing the appropriate site investigation, if necessary.

d) Site investigations shall satisfy the following data quality objectives for field and laboratory operations to ensure that all data is scientifically valid and of known precision and accuracy:

1) All field sampling activities relative to sample collection, documentation, preparation, labeling, storage, shipment and security, quality assurance and quality control, acceptance criteria, corrective action, and decontamination procedures shall be conducted in accordance with "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846), Vol. One, Ch. One (Quality Control) and Vol. Two (Field Manual), incorporated by reference at 35 Ill. Adm. Code 740.125. If approved by the Agency, such activities also may be conducted in accordance with ASTM standards, methods identified in "A Compendium of Superfund Field Operations Methods" (EPA/540/0-87-001, OSWER Directive 9355.0-14, December 1987), "Subsurface Characterization and Monitoring Techniques: A Desk Reference Guide, Volume I: Solids and Ground Water, Appendices A and B" (EPA/625/R-93/003a, May 1993),

"Subsurface Characterization and Monitoring Techniques: A Desk Reference Guide, Volume II: The Vadose Zone, Field Screening and Analytical Methods, Appendices C and D" (EPA/625/R-93/003b, May 1993), incorporated by reference at 35 Ill. Adm. Code 740.125, or other procedures.

2) All field measurement activities relative to equipment and instrument operation, calibration and maintenance, corrective action, and data handling shall be conducted in accordance with "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846), Vol. One, Ch. One (Quality Control), incorporated by reference at 35 Ill. Adm. Code 740.125, or with an equipment or instrument manufacturer's or vendor's published standard operating procedures.

3) All laboratory quantitative analysis of samples to determine concentrations of regulated substances or pesticides shall be conducted fully in accordance with "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846), incorporated by reference at 35 Ill. Adm. Code 740.125, relative to all facilities, equipment and instrumentation, operating procedures, sample management, test methods, equipment calibration and maintenance, quality assurance and quality control, corrective action, data reduction and validation, reporting, and records management. The practical quantitation limit (PQL) of the test methods selected must be less than or equal to the most protective Tier 1 soil remediation objectives in 35 Ill. Adm. Code 742 Appendix B, applicable groundwater remediation objectives under 35 Ill. Adm. Code 742 Appendix B, or, if already determined, the remediation objective concentrations for the site. If a contaminant of concern is not identified in 35 Ill. Adm. Code Part 742 or the remediation objectives for the site have not been determined, the PQL shall equal the lowest concentration that reliably can be achieved within specified limits of precision and accuracy during routine laboratory operating conditions but shall not be greater than ten times the method detection limit.

4) All field or laboratory measurements of samples to determine physical or geophysical characteristics shall be conducted in accordance with ASTM standards or other procedures as approved by the Agency.

5) All laboratory quantitative analyses of samples to determine concentrations of any regulated substances or pesticides that require more exacting detection limits or cannot be analyzed by standard methods identified in "Test Methods for Evaluating Solid

Waste, Physical/Chemical Methods" (SW-846), incorporated by reference at 35 Ill. Adm. Code 740.125, shall be conducted in accordance with analytical protocols developed in consultation with and approved by the Agency.

6) Effective January 1, 2003, all quantitative analyses of samples collected on or after that date and utilizing any of the approved test methods identified in 35 Ill. Adm. Code 186.180 shall be completed by an accredited laboratory in accordance with the requirements of 35 Ill. Adm. Code 186. Quantitative analyses not utilizing an accredited laboratory in accordance with Part 186 shall be deemed invalid.

Focused Site Investigation

The focused site investigation shall be performed where the Defendants have specified limitations on the recognized environmental conditions or contaminants of concern to be covered by the No Further Remediation Letter. At a minimum the focused site investigation shall include:

a) A remediation site evaluation to identify the following features as relevant to the focus of the investigation:

1) Current and post-remediation use(s) of the remediation site and surrounding areas that are immediately adjacent to the remediation site;
2) Physical setting including features relevant to geologic, hydrogeologic, hydrologic, and topographic conditions; structures or other improvements on the remediation site; public thoroughfares adjoining the remediation site, as well any roads, streets, and parking facilities on the remediation site; utilities located on or adjacent to the remediation site; source of potable water supply; and sewage disposal system;
3) The presence of containers and storage tanks containing the selected contaminants of concern, including contents, and assessment of leakage or potential for leakage; and
4) Any other environmental, geologic, geographic, hydrologic or physical conditions of concern at the remediation site and surrounding areas immediately adjacent to the remediation site;

b) Review of reasonably obtainable records relevant to the recognized environmental conditions and the related contaminants of concern for the remediation site and areas immediately adjacent to the remediation site, records of environmental enforcement actions and their subsequent responses, any previous response actions conducted by either local, State, federal or private parties, and a list of documents and studies prepared for the remediation site;

c) Characterization of sources and potential sources of recognized environmental conditions and the related contaminants of concern, identifying:

1) The sources or potential sources of the contaminants of concern;
2) The sampling, analyses, and field screening measurements indicating the concentrations of the contaminants of concern; and
3) The statutory or regulatory classification of the contaminants of concern and contaminated materials (e.g., hazardous waste, hazardous substance, special waste);

d) Characterization of the extent of the contaminants of concern, identifying:

1) The actual contaminated medium or media of concern;
2) The three-dimensional configuration of the contaminants of concern with concentrations delineated; and
3) The nature, direction, and rate of movement of the contaminants of concern and degradation products;

e) Characterization of current and post-remediation exposure routes, identifying:

1) All natural and man-made pathways that are on the remediation site, in rights-of-way attached to the remediation site, or in any areas surrounding the remediation site that may be adversely affected as a result of a release from the recognized environmental conditions and whether there is evidence of migration of contaminants of concern, in either solution or vapors, along such pathways that may potentially threaten human or environmental receptors or that may cause explosions in basements, crawl spaces, utility conduits, storm or sanitary sewers, vaults or other spaces;
2) The locations of any human and environmental receptors and receptor exposure routes; and
3) Current and post-remediation uses of affected or potentially affected land, groundwater, surface water, and sensitive habitats; and

f) Characterization of significant physical features of the site and vicinity that may affect contaminant transport and risk to human health, safety and the environment.

Attachment B

1. General

All plans and reports required by the Agreed Preliminary Injunction Order shall be submitted to the Plaintiff with attachments and accompanying documentation as necessary. Plans and reports shall be mailed or delivered to the address designated by the Order. Plans and reports that are hand-delivered to the Plaintiff shall be delivered during the Plaintiff's normal business hours.

All plans and reports submitted to the Plaintiff shall include:

a) The full legal name, address and telephone number of the Defendant or any authorized agent acting on behalf of the Defendant, and any contact persons to whom inquiries and correspondence must be addressed;

b) The original signature of the Defendant or of any authorized agent acting on behalf of the Defendant;

c) The name of the Licensed Professional Engineer (LPE) or Geologist responsible for site activities and preparation of the plan or report, the date of preparation, registration number, license expiration date, and professional seal; and

d) The LPE or Geologist responsible for the site investigations, remedial activities, and preparation of the plans or reports shall affirm by original signature as follows:

"I attest that all site investigations or remedial activities, including review of laboratory data, that are the subject of this plan or report were performed under my direction and this document and all attachments were prepared under my direction or reviewed by me, and, to the best of my knowledge and belief, the work described in the plan or report has been designed or completed in accordance with the Act, and generally accepted engineering practices, and the information presented, including any qualified laboratory data, is accurate and complete."

2. Site Investigation Report -- Focused Site Investigation

a) Data and results from the focused site investigation shall be combined into one Site Investigation Report.

b) A Site Investigation Report for the focused site investigation shall include the results and methodologies of the investigation performed pursuant to 35 Ill. Adm. Code 740.430 and the following chapters:

1) Executive summary. This chapter shall identify the objectives of the site investigation and the technical approach utilized to meet such objectives. It shall state the recognized environmental conditions and related

contaminants of concern specified by the Defendants and the data limitations in the assessment;

2) Site description.

A) If a phase I environmental site assessment has been completed in accordance with 35 Ill. Adm. Code 740.420(a), then the results may be submitted in accordance with 35 Ill. Adm. Code 740.425;

B) This subchapter shall state the method used for the evaluation of the remediation site and areas immediately adjacent to the remediation site and document the observations obtained (e.g., grid patterns or other systematic approaches used for large properties). It shall describe the regional location, pertinent boundary features, general facility physiography, geology, hydrogeology, and current and post-remediation uses of the remediation site and areas immediately adjacent to the remediation site;

C) Site base map(s) meeting the requirements of 35 Ill. Adm. Code 740.210(a)(7) and including the following:

i) The sources or potential sources of the contaminants of concern, spill areas, and other suspected areas for the specified contaminants of concern;

ii) On-site and off-site injection and withdrawal wells; and

iii) All buildings, tanks, piles, utilities, paved areas, easements, rights-of-way and other features, including all known past and current product and waste underground tanks or piping;

D) A legal description or reference to a plat showing the boundaries of the remediation site, or, for a Federal Landholding Entity, a common address, notations in any available facility master land use plan, site specific GIS or GPS coordinates, plat maps, or any other means that identifies the site in question with particularity;

3) Enforcement or response actions. This chapter shall include the following information as relevant to the recognized environmental conditions:

A) A summary of environmental enforcement actions for the remediation site and areas immediately adjacent to the remediation site and their subsequent responses;

B) Any previous response actions conducted by either local, State, federal or private parties at those sites; and

C) A list of documents and studies prepared for those sites;

4) Site-specific sampling plan. This chapter shall indicate those applicable physical and chemical methods utilized for contaminant source investigations, soil and sediment investigations, hydrogeological

investigations, surface water investigations, and potential receptor investigations;

5) Documentation of field activities. This chapter shall include the results of the field activities to determine physical characteristics. At a minimum, this chapter shall include the following elements:

A) Narrative description of the field activities conducted during the investigation;

B) The quality assurance project plan utilized to document all monitoring procedures (e.g., sampling, field measurements and sample analysis) performed during the investigation, so as to ensure that all information, data and resulting decisions are technically sound, statistically valid, and properly documented; and

C) Presentation of the data in an appropriate format (e.g., tabular and graphical displays) such that all information is organized and presented logically and that relationships between the different investigations for each medium are apparent;

6) Endangerment assessment. This chapter shall analyze the results of the field activities and characterize the extent of contamination (qualitative and quantitative) for contaminants of concern related to the recognized environmental conditions and compare the site information with the applicable provisions of 35 Ill. Adm. Code 742. This chapter shall:

A) Describe any recognized environmental conditions, evaluate exposure routes, including threatened releases, and evaluate exposure routes excluded under 35 Ill. Adm. Code 742;

B) Describe the nature, concentration and extent of contaminants of concern within all environmental media at the remediation site and assess the observed and potential contaminant fate and transport;

C) Describe the significant physical features of the remediation site and vicinity that may affect contaminant transport and risk to human health, safety and the environment; and

D) Compare the concentrations of the contaminants of concern with the corresponding Tier 1 remediation objectives under 35 Ill. Adm. Code 742;

7) Conclusion. This chapter shall assess the sufficiency of the data in the report and recommend future steps;

8) Appendices. Supporting documentation, references and data sources, including, but not limited to, field logs, well logs, and reports of laboratory analyses, shall be incorporated into the appendices with reports containing laboratory analyses of samples collected on or after January 1, 2003,

including the following:

A) Accreditation status of the laboratory performing the quantitative analyses;

B) Certification by an authorized agent of the laboratory that all analyses have been performed in accordance with the requirements of 35 Ill. Adm. Code 186 and the scope of accreditation; and

9) Licensed Professional Engineer or Geologist affirmation in accordance with 35 Ill. Adm. Code 740.410.

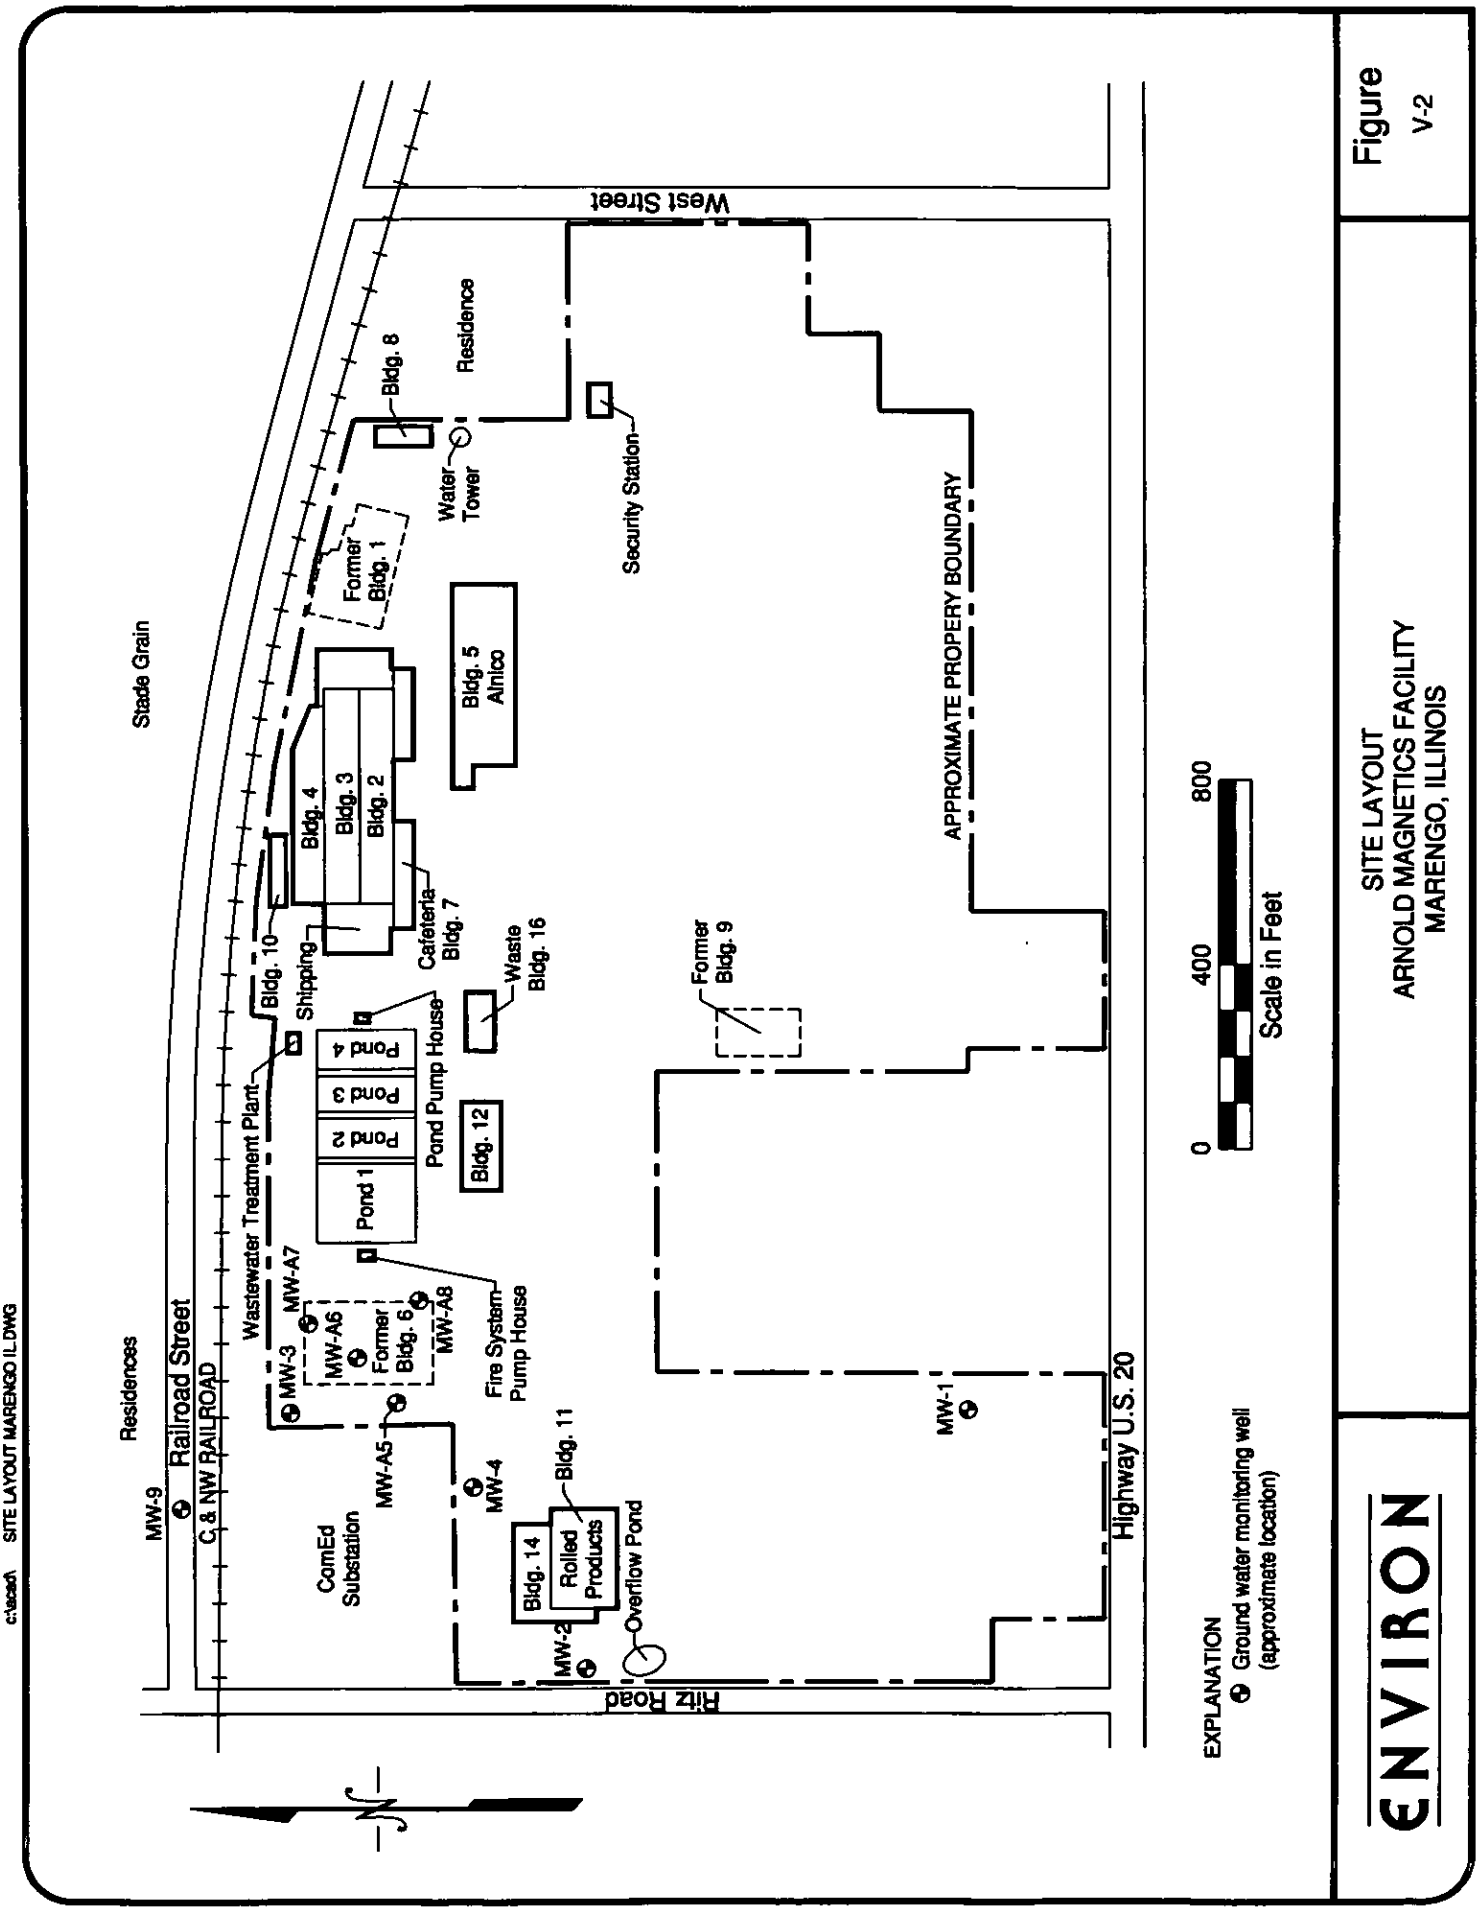
V. MARENGO, ILLINOIS

A. Site Setting

Arnold owns and operates a magnet and related components manufacturing facility located at 300 North West Street in Marengo, McHenry County, Illinois (the "site," or "facility") (Figure V-1). The site consists of an approximately 94-acre property located in a relatively rural setting. The site is developed with three primary operations buildings and a number of ancillary structures on the northern portion of the site (Figure V-2). Building 2/3/4/7 (comprised of several attached buildings), likely built during the mid-1900s, is an approximately 120,000-square foot building that currently houses the facility's Magnetic Technology Center Division, which includes QA/QC testing, environmental services including wastewater treatment and a wet chemistry laboratory, equipment maintenance and machining, miscellaneous storage, shipping, and other ancillary operations. Building 5, likely built during the mid-1900s, comprises approximately 60,000 square feet and houses the Alnico Products Division, which manufactures magnet components primarily by molting, melting, and finishing aluminum, nickel, and cobalt materials. Building 11/14, built in approximately 1970, comprises approximately 45,000-square feet and houses the Rolled Products Division, which conducts rolling mill and finishing operations to produce a thin gauge rolled steel product.

Ancillary structures include Building 12, a parts and miscellaneous storage warehouse; Building 16, a hazardous and nonhazardous waste storage warehouse; Building 10, used for storage and drum cleaning; Building 8, which houses a landscape and building maintenance shed and the facility's ground water supply well; a small pump house associated with the wastewater treatment system and collection ponds; a small building encompassing the wastewater treatment system; a small pump house associated with the facility's fire suppression system; and a small security station located at the facility entrance. Paved and gravel-covered driveways and parking areas are present surrounding the primary buildings and primarily in the northeastern portion of the site. A series of four wastewater collection ponds are present on the northern portion of the site, west of Building 2/3/4/7. The remainder of the northern portion of the site consists primarily of grass-covered land. An overflow pond is present on the southwestern portion of the site, southwest of Building 11/14. The remainder of the southern portion of the property consists of undeveloped, vegetated land. Table V-1 provides an overview of physical setting information for the site.



The facility is located in a relatively rural area of mixed residential, commercial, and agricultural land use. The site is bordered to the north by a railroad right-of-way owned (or formerly owned) by Chicago and Northwest Railroad, beyond which is Railroad Street, which is bordered to the north by several commercial and light industrial facilities, including a grain

Table V-1
Physical Setting Information for Arnold Magnetics in Marengo, Illinois

Conditions	Source	Description
	Topographic Conditions	
Elevation (above mean sea level)	1975 and 1970 USGS topographic map (Marengo North and Garden Prairie, Illinois, respectively); EDR Radius Map with GeoCheck	Approx. 820 feet
Topographic Gradient	1975 and 1970 USGS topographic map; EDR Radius Map with GeoCheck; visual observations	Relatively flat, with a gentle downward slope towards the north/northwest at the site and in the site vicinity toward the Kishwaukee River. Regional topography is generally flat, with a slight downward slope north toward the Kishwaukee River.
	Hydrologic Conditions	
Storm Water Discharge	Facility personnel; visual observations	All storm drains from facility ditches, paved-areas, and building roofs reportedly discharge to the wastewater treatment system prior to discharging to the collection ponds. Storm water landing on grass-covered areas may infiltrate to the ground, discharge as runoff to the overflow pond, or discharge as runoff off-site.
Nearest Surface Water Body	1975 USGS topographic map; visual observations	Kishwaukee River, is located approximately one mile north of the site. The Kishwaukee River flows west/northwestward to the Rock River, which ultimately flows into the Mississippi River.
Flood Plain	EDR data base report; facility personnel	Not located within 500-year or 100-year flood zones. Facility personnel reported no known occurrences of flooding.
Wetlands	EDR data base report	No on-site federally-designated wetlands. The on-site ponds may possibly be considered wetlands.
	Geologic and Hydrogeologic Conditions	
Presumed Direction of Shallow Ground Water Flow	Inference from topographic gradient; 1993 PRC report; facility personnel	North/northwest
Depth to Ground Water	1993 PRC report; ground water monitoring data	Approximately 15 feet bgs
On-site Wells	Facility personnel; 1993 PRC report; Facility permits and documentation	One production well on-site, drawing from a depth of approximately 750 to 850 feet bgs, supplies potable and process water to facility. There are seven existing shallow monitoring wells at the site. Ground water monitoring began with the installation of wells MW-1, MW-2, and MW-3 in 1990 as a condition of the facility's Water Pollution Control Permit. Additional monitoring wells may have been installed on-site, but have since been abandoned.
Nearest Ground Water Supply Wells	1993 PRC report; EDR data base report	According to the 1993 PRC report, there are seven domestic water supply wells downgradient of and bordering the site – the nearest located 100 yards north and downgradient of the site. The depth of these wells ranges from 45 to 218 feet bgs. The EDR report identified 66 water supply and monitoring wells within a one mile radius of the site, in all directions.
Geologic Conditions	EDR data base report; 1993 PRC report	Surficial and shallow soil types primarily consist of well drained silt loams underlain by glacial till to 200 feet bgs, which comprises the regional sand and gravel aquifer (15 to 200 ft bgs). Underlying the till are a series of rock formations of Ordovician and Cambrian age to a depth of 1,500 ft bgs. The facility's water supply well likely draws from a limestone and dolomite or a sandstone layer.

PRIVILEGED AND CONFIDENTIAL

processing facility operated by Stade Grain, a farm services and supplies facility, G.E. Johnson Construction, and Stark Services, and residential properties to the north/northwest. The site is bound to the east by a residence and West Street, beyond which is residential and undeveloped land. The site is bound to the south by commercial facilities and Route 20. The site is bound to the west by a ComEd substation at the northwestern site boundary and Ritz Road to the west, beyond which is undeveloped and agricultural land.

Potable water at the site is provided by a facility-owned and operated ground water supply well, located at the northeastern site boundary in Building 8, and by recirculation from the facility's wastewater treatment plant. In addition, a water tower is present on the eastern portion of the site, adjacent to Building 8, for storage of the facility's water supply. The facility's sanitary wastewater is treated on-site in the facility's wastewater treatment system and associated collection ponds. Facility personnel were not aware of any current or former septic systems at the site. Electricity and natural gas are provided by ComEd and Nicor, respectively. No heating oil or other fuel sources for building heat are used at the facility.

B. Historical Use of the Property and Surrounding Area

Based on ENVIRON's review of limited historical information sources available (Table V-2) and discussions with facility personnel, the site was first developed for industrial use during the late 1800s or early 1900s for use as a rail yard and railroad engine maintenance facility. The Arnold family reportedly purchased the property during the early 1900s and built transformers at the site until the 1950s, when Arnold began manufacturing magnets and related components at the facility. The facility employed up to 500 people at its peak of magnetic component manufacturing operations during the 1960s through 1980s, but has since downsized to approximately 50 to 75 employees as operations have been moved off-site to other Arnold locations.

According to facility personnel, Building 1, which was demolished in 2002, was the first known structure developed at the site, likely in the late 1800s or early 1900s. Building 1 was reportedly present when the facility was operated as a rail yard and engine maintenance facility. A railroad spur was observed on the ground surface within the footprint of the former building at the time of the site visit. During Arnold's occupancy of the site, Building 1 was used for most of the magnetic component manufacturing operations conducted at the site at some point in its history, including current operations and Sintered Alnico magnet production (powdered aluminum, nickel and cobalt blending and pressing operations), Molypermalloy operations, maintenance and tool shops, and office operations. According to the 1993 PRC report, spent mineral spirits, trichloroethylene (TCE), and 1,1,1-trichloroethane (TCA) were generated at Building 1 during its history. In addition, facility personnel reported that the Arnold family built electrical transformers on-site in Building 1 prior to beginning magnetic components manufacturing in the 1950s.

The exact construction dates of the additional site buildings are generally unknown; however, based on a review of historical topographic maps, it appears that Building 2/3/4/7, or a

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

TABLE V-2
Review of Historical Reference Sources for Arnold Magnetics in Marengo, Illinois

Time Period	Reference Source	Description
1900s – 1920s	No readily available historical sources.	
1930s	1932 topographic map (Harvard, Illinois [1:62,500 scale])	The site is depicted on the topographic map as developed with Building 2/3/4/7 (or a portion of the building). Based on the scale of the map, the depicted structure may also include Building 1. The Chicago and Northwestern Railroad right-of-way and Railroad Street are depicted to the north of the property, beyond which are residences bordering the street. A residence is depicted to the east of the property, as is West Street. No development is shown to the immediate south or west of the site, with the exception of Route 20 and Ritz Road, which border the site to the south and west, respectively.
1950s – 1960s	No readily available historical sources.	
1970s	1970 and 1975 topographic map (Marengo North, Illinois) 1970 topographic map (Garden Prairie, Illinois)	The eastern portion of the site is depicted on the Marengo North topographic map. Buildings 1, 2/3/4/7, 5, 8, and 12, the water tower, the wastewater treatment facility, and the collection ponds are depicted on both the 1970 and 1975 maps. Development to the north and east of the site appears generally the same as in the 1932 topographic map, with the exception of the addition of one larger structure to the north of the site. One structure, likely the former airplane hanger, is depicted on the southern portion of the site, south of Building 12, and an additional small structure is depicted on either the southern portion or to the south of the site. The western portion of the site is depicted on the Garden Prairie topographic map. Buildings 6 and 11/14 are depicted on the site. An electrical substation is depicted and identified to the west of the site, west of Building 6. Residences are depicted to the north and northwest of the site. No development is depicted west of Ritz Road.
1980s	1987 Remcor Revised Closure Plan, Drum Waste Storage Facility report.	Site sketch depicts all of the building depicted on the 1970s topographic maps, plus Building 10, north of Building 2/3/4/7, which was likely too small to be depicted separately on the previous topographic maps. No additional structures are depicted.
1990s	1998 aerial photograph	The site appears generally as it did during the site visit, with the exception of Building 1, which is also present in the 2001 aerial photograph. According to facility personnel, Building 1 was demolished in 2002. Building 16 has been developed since the time of the previous photograph.
2000s	2001 aerial photograph	The site appears generally the same as in the 1998 aerial photograph.

portion of it, had been developed by 1932, and Buildings 5, 8, and 12, the water tower, the wastewater treatment facility, the collection ponds, a former airplane hangar (Building 9), Building 6, and Building 11/14 had been developed by 1970. Building 6, an operations building which formerly housed a Strontium Ferrite Department (wet processing and pressing of mixed metal sludges and iron powder, and baking and grinding operations), and Building 9, an airplane hangar built and used by the Arnold family, were reportedly demolished in approximately 1991 or 1992. Building 16, used for hazardous and nonhazardous waste storage, was apparently constructed after 1987 and before the time of the 1993 PRC report.

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

Based on information provided by facility personnel and documents reviewed, including the 1993 PRC report, hazardous waste manifests, and former UST information obtained from the Office of the State Fire Marshal, the facility formerly used tetrachloroethylene (PCE), TCE, and TCA for degreasing and parts washing operations. TCA had reportedly been stored in two 6,000-gallon USTs (Underground Storage Tanks). The approximately 30-year old USTs were reportedly removed in 1990. One of the former USTs was located adjacent to the southern exterior wall of Building 11/14. The location of the second former TCA UST is not specifically known. These and additional USTs formerly present at the site are discussed in Section D.1 of this chapter. According to the report, spent TCA had been stored in satellite accumulation areas in Building 1, 2/3/4/7, 5, and 11/14, in Building 16, and in a former drum storage area, located east of the wastewater treatment system. According to the PRC report, the facility discontinued the use of TCA in 1991. The facility has since discontinued the use of both TCE and PCE; TCE use was discontinued prior to 2001, and PCE was discontinued in September 2001. Arnold now uses Leksol, a brominated (non-chlorinated) solvent, in the facility's degreasers, and mineral spirits, a petroleum distillate, in the facility's parts washers.

Based on ENVIRON's review, no indications of additional development or uses of the site were identified. The historical documents also indicate that the uses of the properties in the general vicinity of the site have not changed significantly since the 1930s, other than an increasing level of development to the present condition. Site history information obtained from facility personnel is in general agreement with historical information obtained from a review of readily available historical sources, with one exception. The 1993 PRC report indicates that the facility was developed in 1958 for magnetic component manufacturing by Allegheny Ludlum Steel, and that the site was previously undeveloped; however, historical sources prior to a 1968 topographic map are not identified in the reference list provided in the report. The 1993 PRC historical information is not consistent with historical sources reviewed by ENVIRON, including a 1932 topographic map, information provided by facility personnel, and site observations. Additional discussion of the historical uses of the site is presented in Section E of this Chapter.

C. Data Base Review for the Site and Surrounding Properties

ENVIRON reviewed the results of the state and federal environmental data base searches performed by EDR (Environmental Data Resources; see Appendix A), as well as the USEPA's Envirofacts and ECHO (Enforcement and Compliance History Online) data bases.
The site is listed on several environmental data bases, as discussed below:

- The site, identified as Arnold Engineering Company, is listed on the CERCLIS-NFRAP (Comprehensive Environmental Response, Compensation, and Liability Information System-No Further Remedial Action Planned) data base. According to the EDR report, the CERCLIS-NFRAP listing indicates that discovery was made in 1992, and a

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

preliminary assessment was conducted in 1993. It appears that the discovery and preliminary assessment were conducted as a routine inspection for former or current treatment, storage, or disposal (TSD) facilities[1]. ENVIRON has reviewed the 1993 Preliminary Assessment report, prepared by PRC, which did not identify areas of concern except for the known ground water contamination issue, discussed in Section E of this chapter. In 1995, the site was granted NFRAP status and archived. No further details regarding the site's listing in the CERCLIS-NFRAP data base are provided in the EDR report or from facility personnel.

- The site, identified as Arnold Engineering Company, is listed on the CORRACTS (Corrective Action Report) data base, which indicates that the site was assigned a medium corrective action priority in 1993. Further, the data base listing indicates that the facility was deemed not amenable to stabilization due to lack of technical data, and the status should be changed when data becomes available. No further details are provided in the EDR report. The listing may be related to the known on-site ground water contamination issue (discussed in Section E of this chapter), which is currently under the oversight of the IEPA (Illinois Environmental Protection Agency) Division of Water Pollution Control.

- The site, identified as Arnold Engineering Company, is listed on the UST data base. According to the EDR report, 12 USTs have been removed or closed-in-place at the site. The former USTs are discussed in D.1 of this chapter.

- The site, identified as Arnold Engineering Company, is listed on the Illinois Surface Impoundment (IMPDMENT) data base, which identifies impoundments based on a one time statewide survey conducted in the late 1970s. The site's listing on the IMPDMENT data base is associated with the facility's wastewater treatment system and collection ponds, operated for the treatment and recycling of the facility's process and sanitary wastewater, as discussed in Chapter XIII of this report.

- The site, identified as Arnold Engineering Company, is listed on the RCRIS (Resource Conservation and Recovery Information System) data base as a SQG (Small Quantity Generator) of hazardous waste. Violations were reported in 1985, and the facility subsequently achieved compliance within three months of the reported violations. A

[1] The site was designated a TSD facility after being issued a RCRA Part A permit in approximately 1980/1981 for hazardous waste treatment and storage within a neutralization tank, waste acid tank, and drum storage area. The units were approved for closure and the Part A permit was withdrawn by the IEPA in 1987.

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

discussion of the facility's hazardous waste management practices is presented in Chapter XIII of this report.

- The site, identified as Arnold Engineering Company, is identified on the FINDS (Facility Index System) data base as being listed on several regulatory compliance data bases, including AIRS (Aerometric Information Retrieval System), National Emissions Inventory, Permit Compliance System, RCRIS, and TRI (Toxic Release Inventory). Relevant issues relating to these listings are discussed in Chapter XIII.

In addition to the site, there are several other listings in the EDR report for off-site sources within applicable ASTM (American Society for Testing and Materials) search radii. Several of these listings (registered UST sites), by themselves, are not necessarily indicative of an environmental concern, and these listings are therefore not discussed herein. Two sites appear on the LUST (Leaking Underground Storage Tank) data base, which may indicate potential contamination concerns. Of these LUST facilities, only one is located adjacent to or upgradient of the property and is discussed in the section below. This facility was selected for further discussion based on the assumption that a hazardous material released to the subsurface generally does not migrate laterally within the unsaturated soil for a significant distance, but a hazardous material can migrate in the ground water in a generally downgradient direction; however, there are limitations to this interpretation.

- Floit Sand and Gravel Company, located between one-eight and one-quarter mile east/southeast (likely upgradient) of the site, is identified on the LUST data base. According to a representative of the IEPA, in March 1991 Floit sent IEPA a closure report for a 1,000-gallon diesel UST that was removed. The closure report indicated that one soil sample from the area surrounding the tank had been analyzed for contaminants, and none were found above the limit of detection. IEPA responded with a letter stating that more soil testing was required in order for IEPA to accept the closure report. Although Floit has not provided IEPA with the results of further soil analysis to date, there is no indication that there was a release from the diesel UST that could adversely affect the subject site.

The EDR data base search identified a number of unmapped sites. ENVIRON reviewed the list of unmapped sites and verified that none were adjacent to the subject site; however, it was beyond the scope of this review to accurately locate each of the unmapped sites identified by EDR.

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

D. Chemical Use and Storage

1. Underground Storage Tanks

According to facility personnel, there are no current USTs at the site, nor was evidence of such (e.g., vent pipes, fill ports, or dispensing equipment) observed by ENVIRON during the site visit or in the review of records pertaining to the site. The site is not listed on the state UST data base for any registered USTs currently in use at the facility.

According to the EDR report and the 1993 PRC report, there were formerly 12 USTs present at the facility. Details regarding the former USTs are presented in Table V-3.

Table V-3
Former USTs at the Marengo, Illinois Facility

Tank ID	Contents	Size (gallons)	Approximate Year Installed	Approximate Year Removed/Closed in Place	Comments
USTs 1-6	Mineral oil	1,500	1961	1988-1990	Filled with sand and closed in place
UST 7	Acetone	6,000	1954	1988-1990	Filled with sand and closed in place
UST 8	Methanol	6,000	1959	1988-1990	Removed from ground
UST 9	TCA	6,000	1959	1988-1990	Removed from ground
UST 10	TCA	6,000	1962	1988-1990	Removed from ground; 3 soil samples collected and analyzed for TCA
UST 11	Kerosene	1,500	1956	After 1993; before 2004	Removed from ground
UST 12	Gasoline	1,500	1950	1968	As of 1993, empty and in place, last used 1968

The locations of the former USTs are generally unknown. ENVIRON observed a site figure that depicts the 6,000-gallon acetone and methanol USTs (USTs 7 and 8) adjacent to the northwest corner of Building 2/3/4/7, west of Building 10. In addition, ENVIRON obtained a partial site figure from the Office of the State Fire Marshal's Division of Petroleum and Chemical Safety that depicts one of the 6,000-gallon TCA tanks (Tank 10) adjacent to the southern exterior wall of Building 11/14. No other USTs are depicted on any site figures reviewed by ENVIRON. According to the 1993 PRC report, three soil samples were collected from the excavation pit following the removal of UST 10 and analyzed for TCA. TCA concentrations detected were 0.02 ppm, 0.09 ppm, and 0.003 ppm, respectively. No soil samples were documented during the removal of UST 9. The 1993 PRC report does not indicate whether any soil sampling was conducted or documented during the removal or closure of USTs 1 through 8, 11, or 12, and no sampling information was available from the Office of the State Fire Marshal's Division of Petroleum and Chemical Safety, which maintains registered UST information for the state. The facility is not identified on the state

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

LUST data base.

Although not considered to be a UST, site figures observed by ENVIRON depict an underground double-walled paint transfer line, labeled as "inactive" between Building 10, formerly a paint and drum storage area, and Building 2/3/4/7. Facility personnel had no information regarding the operation or decommissioning of this underground piping system.

2. Aboveground Storage Tanks

The facility maintains a number of ASTs (Aboveground Storage Tanks) at the site, including four approximately 300-gallon double-walled steel diesel fuel tanks located outside Building 2/3/4/7, the pond pump house, the fire suppression pump house, and west of Building 16, respectively. A 300-gallon, double-walled gasoline tank is also located west of Building 16. A number of large liquid argon, liquid nitrogen, and hydrogen tanks ranging in capacity from 3,000 to 9,300 gallons are located outdoors at the site, adjacent to Building 2/3/4/7, 5, and 11/14. A propane tank is located outside Building 2/3/4/7, to the south, adjacent to a liquid argon tank. Three silos containing foundry sand are located outside the southeastern wall of Building 5. Two inactive approximately 8,000-gallons tanks, formerly used for storage of hydrochloric and waste acid, are located outside the northern side of Building 11/14, within a concrete secondary containment structure. The waste acid tank was formerly permitted under the RCRA (Resource Conservation and Recovery Act) Part A permit program for TSD facilities, and was approved for closure in 1987. Two 1,500-gallon ASTs used for the bulk storage of rolling mill oil are present within an oil storage and filter room at the southern side of Building 11/14. Secondary containment for these ASTs consists of a prefabricated metal floor pan.

Facility personnel were not aware of any leaks or spills relating to the ASTs, and ENVIRON did not observe evidence of staining or past releases at the time of the site visit. Rolling mill oil was observed in the secondary containment pan provided for the bulk rolling mill ASTs; however, the oil appeared to be contained within the provided floor pan.

A 1,800-gallon neutralization tank was formerly present to the north of Building 2/3/4/7 for the treatment of caustic process wastewater prior to discharge to the wastewater treatment system. The tank was reportedly decommissioned as part of the 1987 RCRA Part A permit closure and withdrawal, and had been removed by the time of ENVIRON's site visit. In addition, a 5,000-gallon phosphoric acid tank was formerly located inside the northeastern section of Building 11/14 within a concrete secondary containment structure. Facility personnel did not know the exact date the tank was removed, but based on ENVIRON's review of a 1994 site figure and observations during the site visit, the tank was removed after 1994 and before 2004. Facility personnel were not aware of the presence of other historical ASTs at the site, nor did ENVIRON observe any evidence of other current or former ASTs (e.g., piping, stands, pads) during the site visit.

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

3. Drums and Container Storage

Drum storage areas are present within each of the active facility operations buildings (Buildings 2/3/4/7, 5, and 11/14) and Building 8, Building 10, and Building 16. In addition, individual drums of chemicals (primarily oils) are kept at or near their points of use. Drummed materials used on-site include 55-gallon drums of lubricating oils, hydraulic fluid, motor oil, other petroleum products, phosphoric acid, muriatic acid, alcohol, Leksol solvent, mineral spirits, chlorine bleach, and other specialty chemicals related to site operations and maintenance. Plastic totes, ranging from approximately 100- to 300-gallons, containing acids, are also stored in Building 11/14. The facility's operations have changed such that the quantity of acid used has significantly decreased. Many of the totes observed at the time of the site visit were empty. Drums of waste materials, including waste solvents and waste oils, are stored within Building 16. Building 16 is a self-contained building, provided with a concrete-bermed floor. All of the drum storage areas observed by ENVIRON were indoors primarily on concrete-paved surfaces. Some of the drum storage areas are located near floor drains, which reportedly discharge to the facility's collection ponds.

Historically, drum storage, including paints, solvents, and petroleum products, was also present in Building 10. Historically and currently, empty drums have been rinsed and crushed within Building 10 prior to removal for off-site management. Rinse water from the drum cleaning operations discharges to the facility's collection ponds. Drum cleaning was also historically conducted on an outdoor pad to the west of Building 10.

Facility personnel were not aware of significant spills or releases of materials from drum and container storage areas. At the time of the site visit, ENVIRON did not observe evidence of spills or uncontrolled releases from these storage areas, other than minor staining in some interior areas.

E. On-site Soil and Ground Water Conditions

The following known and potential soil and ground water contamination issues were identified:

1. Existing Chlorinated Solvent Ground Water Contamination

The facility has a history of significant chlorinated solvent use, including degreasers utilizing TCA, PCE, and TCE, and two former 6,000-gallon USTs for the storage of TCA. In 1990, the facility began monitoring ground water at the property as a condition of the facility's Water Pollution Control Permit. Elevated levels of chlorinated solvents, including TCA, PCE, and TCE have been detected in the northwestern corner of the property, in the vicinity of former Building 6. Both TCA and PCE have been detected at concentrations exceeding their federal Maximum Contaminant Levels (MCLs, 200 parts per billion [ppb]

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

and 5 ppb, respectively). Based on ground water data reviewed, the highest concentration of TCA was 3,000 ppb, detected in MW-3, located at the northwestern property boundary, in 2001. The most recent data (November 2004) indicated concentrations ranging from 9 to 41 ppb for TCA. The highest concentration of PCE was 9 ppb, detected in MW-3 during the most recent sampling (November 2004).

Lower concentrations of TCA have been detected in other on-site monitoring wells located upgradient of MW-3 but downgradient of current and former facility operations, including MW-A4, MW-A6, MW-A7, and MW-A8. All of the monitoring wells at the site, including MW-3, are installed to a depth of approximately 25 feet bgs and screened from 15 to 25 feet bgs. The monitoring wells are installed within the region's most important aquifer, the sand and gravel aquifer, which is present at a depth of approximately 15 to 200 feet bgs in the site vicinity. A source area for the contamination has not been identified; however, the contamination has been detected downgradient of former Building 6, where a former TCA UST may have been located. MW-3 is also located downgradient of the wastewater collection ponds and Building 16, which is used for hazardous and nonhazardous waste storage, formerly including waste TCA.

Potential downgradient receptors include nearby residences, which use private ground water wells that draw water from the same aquifer in which the contamination has been detected (the sand and gravel aquifer). According to the 1993 PRC report, approximately seven domestic water supply wells are located downgradient of and bordering the site, the nearest of which is located 100 yards north and downgradient of the site. The depth of these domestic wells reportedly ranges from 45 to 218 feet bgs. Facility personnel did not believe that testing of the nearby residential wells has been conducted (the Company has not been required to do this). The facility has its own ground water supply well, which draws from a deeper aquifer at a depth of approximately 750 to 850 feet bgs to supply both potable and process water to the facility.

As a condition of the facility's permit renewal, issued in July 2003, IEPA requested that the facility conduct additional investigation of ground water conditions at the site to determine the source and extent of contamination and evaluate the possibility that contamination has migrated off-site. In response, the facility installed an off-site downgradient monitoring well (MW-9) at a location approximately 300 feet northwest of MW-3, and sampled the new and existing monitoring wells during the most recent sampling event (November 2004). None of the analyzed volatile organic compounds (TCA, PCE, and TCE) were detected above laboratory detection limits (5 ppb) in the off-site well, which was installed to a depth of 20 feet below ground surface (bgs). Based on the analytical data, it appears that shallow

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

ground water has not been impacted at this off-site location, which may suggest that chlorinated solvents detected in shallow ground water beneath the site are attenuating prior to migrating to potential off-site receptors; however, it should be noted that this off-site well represents only one downgradient data point, and the potential presence of chlorinated solvents in deeper ground water has not been investigated. It can be argued that, based on the sampling data collected to date, the vertical and lateral extent of the contaminant plume have not yet been delineated and a source area for the contamination has not been identified. Because the facility's Water Pollution Control Permit requires that the facility determine the source and extent of the contamination and pursue options to address elevated levels (i.e., levels exceeding MCLs) of PCE in the ground water, the IEPA may require further investigation and action at the site to delineate, determine the source of, and mitigate the chlorinated solvent contaminant plume.

[redacted]

2. Potential Undiscovered Contamination

The site has reportedly been used for industrial operations since the late 1800s or early 1900s. Former operations conducted at the site, including railroad engine maintenance, transformer manufacturing, metal working and ancillary operations including degreasing and drum cleaning, have likely involved the use of petroleum products, chlorinated solvents,

[2] ENVIRON was not provided with a breakdown of the reserve amount.

PRIVILEGED AND CONFIDENTIAL
PREPARED AT THE REQUEST OF COUNSEL

metals, and polychlorinated biphenyls (PCBs). Ground water sampling conducted at the site to date has been limited primarily to one portion of the property (west of the collection ponds) and to analysis for volatile organic compounds (VOCs) and metals. No ground water sampling appears to have been conducted immediately downgradient (north/northwest) of the manufacturing buildings, Building 2/3/4/7, Building 5, Building 11/14, or former Building 1. In addition, no soil sampling has been conducted in the immediate vicinity of these current and former manufacturing and operations areas. Given the long history of industrial operations and use and storage of numerous hazardous materials at the property, the presence of soil and ground water contamination at portions of the site not investigated cannot be ruled out.

3. Staining Noted on Pad Beneath PCB-containing Transformers.

Evidence of minor leaks or stains was noted on a concrete pad beneath transformers located outside Building 5, some of which contain PCBs in concentrations between 50 ppm and 500 ppm. The staining did not appear to extent onto unpaved ground.

IV. MARENGO, ILLINOIS

A. Facility Overview

Arnold owns and operates a magnet and related components manufacturing facility located at 300 North West Street in Marengo, McHenry County, Illinois (the "site," or "facility"). The 94-acre site is developed with three primary operations buildings (totaling 225,000 square feet), a number of ancillary structures, and a series of four wastewater collection ponds. The site has a long history of industrial operations, including a rail yard and railroad engine maintenance (from the late 1800s or early 1900s) and transformer manufacturing (early 1900s to 1950s). The manufacturing of magnets and related components at the facility began in 1958.

Arnold employs approximately 75 individuals in the manufacture of magnetic product components. Major operations consist of the rolling, milling, cutting, and finishing of steel and other metals, and major chemicals used in the process include phosphoric acid, muriatic acid, a brominated degreasing solvent (Leksol), mineral spirits, propylene glycol, and diesel fuel. Chlorinated solvents were formerly used in degreasing and parts washing operations.

The facility and its operations have generally remained the same since ENVIRON's previous review in 2004.

B. Data Base Review for the Site and Surrounding Properties

ENVIRON reviewed the results of the state and federal environmental data base searches performed by EDR (see Appendix B), as well as the USEPA's Envirofacts and ECHO data bases. As discussed in ENVIRON's 2004 report, the site is listed on numerous federal and state environmental data bases including CERCLIS-NFRAP, CORRACTS, UST, IMPDMENT, RCRIS-SQG, AIRS, PCS, TRI, and FINDS. There do not appear to be any entries in the data base subsequent to ENVIRON's 2004 review, and there are no violations listed in the ECHO data base.

ENVIRON's 2004 report identified one potentially upgradient property within one-quarter mile of the site listed with active status on a data base indicative of potential environmental concern (Floit Sand and Gravel Company, listed on the LUST data base). According to the 2006 EDR report, this site still has open status, and there are no new listings for potentially upgradient properties within one-quarter mile of the site listed on a data base indicative of potential environmental concern.

C. On-site Soil and Ground Water Conditions

In its 2004 report, ENVIRON identified three known and potential soil and ground water contamination issues, which are summarized in italics below. A discussion on the current status of

the issues based on ENVIRON's February 2006 site visit follows the italicized summary. No new issues were identified as a result of ENVIRON's 2006 assessment.

III. PHASE I ENVIRONMENTAL SITE ASSESSMENT

A. Site Setting

Arnold operates a magnet and related components manufacturing facility located at 300 North West Street in Marengo, McHenry County, Illinois (the "site," or the "facility") (Figure III-1). Arnold leases the site from 300 West LLC. The site consists of an approximately 94-acre property located in a relatively rural setting. The site is developed with three primary operations buildings and a number of ancillary structures on the northern portion of the site (Figure III-2). Building 2/3/4/7 (comprised of several attached buildings), likely built during the mid-1900s, is an approximately 120,000-square foot building that houses offices, a maintenance area, and miscellaneous storage, shipping, and other ancillary operations.[1] Building 5, likely built during the mid-1900s, comprises approximately 60,000 square feet and houses the Alnico Products Division, which manufactures magnet components primarily by molting, melting, and finishing aluminum, nickel, and cobalt materials. Building 11/14, built in approximately 1970, comprises approximately 45,000-square feet and houses the Rolled Products Division, which conducts rolling mill and finishing operations to produce a thin-gauge rolled steel product.

Ancillary structures include Building 12, a parts and miscellaneous storage warehouse; Building 16, a hazardous and nonhazardous waste storage building; Building 10, used for storage and drum cleaning; Building 8, which houses a landscape and building maintenance shed and the facility's ground water supply well; a small pump house associated with the wastewater treatment system and collection ponds; a small building encompassing the wastewater treatment system; a small pump house associated with the facility's fire suppression system; and a small security station located at the facility entrance. Paved and gravel-covered driveways and parking areas are present surrounding the primary buildings and primarily in the northeastern portion of the site. A series of four wastewater collection ponds are present on the northern portion of the site, west of Building 2/3/4/7. The remainder of the northern portion of the site consists primarily of grass-covered land. An overflow pond is present on the southwestern portion of the site, southwest of Building 11/14. The remainder of the southern portion of the property consists of undeveloped, vegetated land. Table III-1 provides an overview of physical setting information for the site.

[1] Facility personnel reported that the site owner leases a portion of Building 2/3/4/7 to a separate entity that uses the space to store inventories obtained from companies that have gone out of business.

TABLE III-1
Physical Setting and Utility Information for Arnold in Marengo, Illinois

Conditions	Source	Description
Topography		
Elevation (above mean sea level)	1975 and 1970 USGS topographic map (Marengo North and Garden Prairie, Illinois, respectively); EDR Radius Map with GeoCheck	Approximately 820 feet.
Topographic Gradient	1975 and 1970 USGS topographic map; EDR Radius Map with GeoCheck; visual observations	Relatively flat, with a gentle downward slope towards the north/northwest at the site and in the site vicinity toward the Kishwaukee River. Regional topography is generally flat, with a slight downward slope north toward the Kishwaukee River.
Hydrology		
Surface Water Runoff	Facility personnel; visual observations	All storm drains from facility ditches, paved areas, and building roofs reportedly discharge to the wastewater treatment system prior to discharging to the collection ponds. The one exception is a storm drain on the western side of Building 8 that discharges off-site along the northern boundary of the site. Storm water falling on grass-covered areas may infiltrate to the ground, discharge as runoff to the overflow pond, or discharge as runoff off-site.
Nearest Surface Water Body	1975 USGS topographic map; visual observations	The Kishwaukee River, which is located approximately one mile north of the site. The Kishwaukee River flows west/northwestward to the Rock River, which ultimately flows into the Mississippi River.
Flood Plain	FEMA*; facility personnel	Not located within 500-year or 100-year flood zones. Facility personnel reported no known occurrences of flooding.
Wetlands	NWI*	No on-site federally-designated wetlands.
Geology and Hydrogeology		
Presumed Direction of Shallow Ground Water Flow	Inference from topographic gradient; 1993 PRC report; facility personnel	North/northwest
Depth to Ground Water	1993 PRC report; ground water monitoring data	Approximately 15 feet bgs.
On-site Wells	Facility personnel; 1993 PRC report; facility permits and documentation	One production well on-site, drawing from a depth of approximately 750 to 850 feet bgs, supplies potable and process water to facility. There are eight shallow monitoring wells at the site which are monitored pursuant to the facility's Water Pollution Control Permit. There is also one off-site ground water monitoring well located within the Railroad Street right-of-way off of the northwestern side of the site.
Nearest Ground Water Supply Wells	1993 PRC report; EDR database report	According to the 1993 PRC report, there are seven domestic water supply wells downgradient of the site – the nearest located 100 yards north of the site. The depth of these wells ranges from 45 to 218 feet bgs. The EDR report identified 66 water supply and monitoring wells within a one mile radius of the site, in all directions.

~~CONFIDENTIAL~~ MEF

TABLE III-1 Physical Setting and Utility Information for Arnold in Marengo, Illinois		
Conditions	**Source**	**Description**
Geologic Conditions	NCSS; 1993 PRC report	Surficial and shallow soil types primarily consist of well drained silt loams underlain by glacial till to 200 feet bgs, which comprises the regional sand and gravel aquifer (15 to 200 ft bgs). Underlying the till are a series of rock formations of Ordovician and Cambrian age to a depth of 1,500 ft bgs. The facility's water supply well likely draws from a limestone/dolomite or a sandstone layer.
Site Utility Information		
Electricity Supplier	Facility Personnel	ComEd
Natural Gas Supplier	Facility Personnel	Nicor
Use of Fuel Oil	Facility Personnel	There is no use of fuel oil on-site. Propane is stored on-site for a backup fuel source for fire pumps and office heating units.
Water Supplier	Facility Personnel	On-site water supply well located in Building 8. Water is also recirculated from the on-site wastewater treatment system for reuse in the production process. There is an on-site water tower for water storage. Records obtained from the MCDPD indicate that a well located on the western portion of the site (possibly adjacent to former Building 6) was abandoned in 1994.
Sanitary Sewer	Facility Personnel	No connection to the local sanitary sewer system. Domestic and process wastewater is treated on-site and then discharged to a percolation field located on the southwestern portion of the site.
Septic Systems	Facility Personnel	Facility personnel were not aware of current or former on-site septic systems. Documentation obtained from the MCDPD indicates that a temporary below-grade waste disposition unit for the "foundry building" (believed to be Building 5) was used for a brief period of time in 1964. No further information was available.
Notes: FEMA = Federal Emergency Management Agency; NCSS = National Cooperative Soil Survey; NWI = National Wetlands Inventory * - Source was provided in the EDR database report.		

The facility is located in a relatively rural area of mixed residential, commercial, and agricultural land use. The nearest residential areas are located adjacent to the east side (residential homes) of the site. Based on discussions with facility personnel, ENVIRON's visual observations from the property boundary and public rights-of-way, and a limited review of publicly available information, a general determination of the current use of adjacent properties was developed, as described Table III-2.

~~CONFIDENTIAL~~

TABLE III-2
Current Use of Properties Adjacent to Arnold in Marengo, Illinois

Direction	Property/Land Use	ENVIRON's Observations*
North	Railroad right-of-way owned (or formerly owned) by Chicago and Northwest Railroad, beyond which is Railroad Street. North of Railroad Street are several commercial and light industrial facilities, including a grain processing facility operated by Stade Grain, a farm services and supplies facility, G.E. Johnson Construction, and Stark Services, and residential properties to the north/northwest.	No apparent exterior manufacturing or storage operations were noted during ENVIRON's reconnaissance.
East	Residence and West Street, beyond which is residential and undeveloped land.	No apparent exterior manufacturing or storage operations were noted during ENVIRON's reconnaissance.
South	Commercial businesses and Route 20.	No apparent exterior manufacturing or storage operations were noted during ENVIRON's reconnaissance.
West	ComEd substation at the northwestern site boundary and Ritz Road to the west, beyond which is undeveloped and agricultural land	No apparent exterior manufacturing or storage operations were noted during ENVIRON's reconnaissance.

* Observations were made by ENVIRON during the site visit. ENVIRON walked or drove by the borders of these properties that are shared with the subject site. ENVIRON did not enter the neighboring properties and was therefore unable to observe the rear and sides of the properties.

B. Historical Uses of the Site and Adjacent Properties

Based on ENVIRON's review of limited historical information sources available (Table III-3) and discussions with facility personnel, the site was first developed for industrial use during the late 1800s or early 1900s and was purchased by the Arnold family in the early 1900s. The exact construction dates of the site buildings are generally unknown. According to facility personnel, Building 1 was the first known structure developed at the site, likely in the late 1800s or early 1900s and was used as a rail yard and engine maintenance facility and for the manufacture of transformers (possibly for railroad engines) prior to its use by Arnold Engineering Company for magnetic component manufacturing operations beginning in the 1950s. Buildings 5, 8, and 12, the water tower, the wastewater treatment facility, the collection ponds, a former airplane hangar (Building 9), Building 6, and Building 11 had been developed by 1970. Building 6, an operations building which formerly housed a Strontium Ferrite Department (wet processing and pressing of mixed metal sludges and iron powder, and baking and grinding operations), and Building 9, an airplane hangar built and used by the Arnold family, were reportedly demolished in approximately 1991 or 1992. Building 16, used for hazardous and nonhazardous waste storage, was apparently constructed after 1987.

~~CONFIDENTIAL~~ MED

TABLE III-3
Review of Historical Reference Sources for Arnold in Marengo, Illinois

Time Period	Reference Source	Description of Site	Description of Surrounding Properties
Late 1800s – early 1900s	Facility personnel	The site was first developed for industrial use. Building 1 likely constructed around this timeframe.	NA
1930s	1932* and 1937 topographic map (Harvard, Illinois [1:62,500 scale])	One building that is in the general location of where Building 1 (and/or possibly a portion of Building 2/3/3/7) is depicted on the 1932 map. The Chicago and Northwestern Railroad right-of-way and Railroad Street are depicted to the north of the property, beyond which are residences bordering the street. A residence is depicted to the east of the property, as is West Street. No development is shown to the immediate south or west of the site, with the exception of Route 20 and Ritz Road, which border the site to the south and west, respectively. The 1937 map shows conditions similar to the 1932 map.	The general area surrounding the site appears relatively undeveloped, with the exception of the Town of Marengo, which is located east of the site.
1950s – 1960s	McHenry County Department of Planning and Development; 1993 PRC PA report	Building permit information indicates that a number of new constructions and additions to existing structures occurred at the site during this time period. The wastewater treatment system including the wastewater ponds began operation in 1965.	NA
1970s	1970 and 1975 topographic map (Marengo North, Illinois) 1970 topographic map* (Garden Prairie, Illinois) 1975 aerial photograph	The eastern portion of the site is depicted on the Marengo North topographic map. Buildings 1, 2/3/4/7, 5, 8, the water tower, the wastewater treatment facility, the collection ponds, and possibly Building 9 are depicted on both the 1970 and 1975 maps. Building 12 is depicted on the 1975 map. Development to the north and east of the site appears generally the same as in the 1932 and 1937 topographic maps The western portion of the site is depicted on the Garden Prairie topographic map. Buildings 6 and 11 are depicted on the site. An electrical substation is depicted and identified to the west of the site, west of Building 6. Residences are depicted to the north and northwest of the site. No development is depicted west of Ritz Road. On the 1975 photograph, all structures noted on the 1970 and 1975 maps are visible. A rectangular light colored area is visible to the south of Building 5 in the	Development around the site is primarily present along major roads and within the Town of Marengo, east of the site. The rest of the surrounding area is generally undeveloped, although relatively large buildings are present south of the site on the western fringe of Marengo.

~~CONFIDENTIAL~~ mbd

TABLE III-3
Review of Historical Reference Sources for Arnold in Marengo, Illinois

Time Period	Reference Source	Description of Site	Description of Surrounding Properties
		general vicinity of where facility personnel reported the historical presence of an on-site air strip.	
1980s	1986 aerial photograph and 1987 Remcor Revised Closure Plan, Drum Waste Storage Facility report.*	The poor quality of the aerial photograph prevents the identification of site details, although the main facility buildings are visible. A site sketch from the 1987 report depicts all of the building depicted on the 1970s topographic maps, plus Building 10, north of Building 2/3/4/7, which was likely too small to be depicted separately on the previous topographic maps. No additional structures are depicted.	The surrounding area appears to be similar to conditions noted on the previous sources.
1990s	1998 aerial photograph	The site appears generally as it did during the site visit, with the exception that Building 1 is present (Building 6 is not present).	The surrounding area appears to be similar to conditions noted on the previous sources, although more residential development is evident to the south of the site.
2000s	2001 aerial photograph;* facility personnel 2001 and 2006 City Directories	On the 2001 photograph, the site appears generally the same as in the 1998 aerial photograph. Building 1 was demolished in 2002. City directory information indicates the site address was occupied by Arnold Engineering.	During the site visit, the surrounding area was generally rural with residences and small businesses located along roads surrounding the site location.

* = Reference source was reviewed and described in the 2004 environmental review.
Historical fire insurance maps and City Directory information for the site were not available from EDR. According to the City Directory Abstract provided by EDR, the subject site address was not listed in directories searched between 1971 and 1996.

Building permit information obtained from the MCDPD indicates that permits for building construction/additions were issued between 1951 and 2001. Many of the building permit records provided by the MCDPD are not readable or do not clearly indicate the dates of construction, the location of the new construction, or what specifically the permit was issued for. Some of the more notable constructions identified from a review of the building permit information include a 1951 construction of a residence, a 1957 construction of a 77,000-square foot building, a 1960 construction of a 43,000-square foot warehouse identified as Building 6, a 1960 construction of a 7,200-square foot addition for heat treating, a 1968 construction of a 34,000-square foot building, a 1968 construction of a 1,836-square foot coolant storage building, a 1980 construction of Building 14 (26,312 square feet), and a 2002 demolition of a residence.

Site history information obtained from facility personnel is in general agreement with historical information obtained from a review of readily available historical sources. It is noted that according to the 1993 PRC PA report, the facility was developed in 1958 for magnetic component manufacturing by Allegheny Ludlum Steel. It is ENVIRON's understanding that Arnold

CONFIDENTIAL

Engineering Company was a wholly-owned subsidiary of the Allegheny Ludlum Steel Corporation. SPS Technologies purchased Arnold Engineering Company from Allegheny in 1986, and the Company acquired Arnold Engineering Company from SPS Technologies in 2004.

C. Current Use of Site

Manufacturing operations conducted at the site are associated with two main divisions: the Alnico Products Division, which is housed in Building 5; and the Rolled Products Division, which is housed in Building 11/14. Arnold employs approximately 140 individuals at the site and operates three shifts. The Alnico Products Division's primary Standard Industrial Classification (SIC) code is 3499 (Fabricated Metal Products, Not Elsewhere Classified), and the applicable SIC codes for the Rolled Products Division are 3316 (Cold Finishing of Steel Shapes), 3351 (Copper Rolling and Drawing), 3353 (Aluminum Sheet, Plate, and Foil), and 3356 (Nonferrous Rolling and Drawing, Note Elsewhere Classified). A summary of facility operations are provided below.

Alnico Products Division

- Receiving – The facility receives aluminum, cobalt, nickel, brass, and copper in various forms (e.g., scrap, parts). Cleaning of the received raw materials is not conducted as it is not necessary.
- Melting – The raw materials are mixed according to product recipes and are melted in one of three induction furnaces (two 150-pound furnaces and one 1,000-pound furnace).
- Mold Preparation – Sand molds are produced using foundry sand, binders, and dimethyl ethyl amine (DMEA). Sand is blown into the core-making equipment, and the binders and hardener are added which results in the hardening of the mold. Emissions from core making operations are controlled by a baghouse and sulfuric acid scrubber.
- Casting and Shakeout – The molten metals are poured into the sand molds. Swarf and slag are removed and sent off-site for reclamation. Reverb is collected for reuse. The filled molds sit for a day to cool and then placed in shakeout machines that separate the sand molds from the casted parts. The sand is not reclaimed, but is collected for off-site disposal as a nonhazardous waste. Sandblasting is conducted to smooth out the casted parts.
- Magnetizing – The parts are heated in ovens to activate their molecular structures. Using a solenoid, the molecular structures are reoriented to magnetize the parts.
- Finishing – Magnetized parts are undergo fine grinding and cutting (using a water-based cutting fluid) to finish the parts.
- Sintered Alnico – In addition to casting operations, Arnold has a smaller sintered process where alloys are crushed and mixed with powdered ingredients. The powdered mix is pressed to harden into a desired shape, and then is heat treated for finishing.

~~CONFIDENTIAL~~
MED

Rolled Products Division

- Receiving – The facility receives stainless steel, titanium, and nickel coils.
- Size Reduction/Slitting – The coils are processed through mills to reduce their thickness (down to foil) and are slit to specifications.
- Cleaning and Surface Preparation – The coils are cleaned in a dip tank utilizing a brominated solvent (Leksol). The surfaces of the coils are prepared using a phosphoric acid cleaning lines. Fumes are controlled by an acid scrubber system.
- Annealing/Heat Treating – Nine annealing furnaces are used to prepare the coils for magnetizing.
- Magnetizing – The coils are energized to create a magnetic property in the metal.

According to facility personnel, operations and chemical usage have not changed substantially since ENVIRON conducted its 2006 review, with the exception that the Magnetic Technology Center Division operations that were conducted in portions of Building 2/3/4/7 were moved to Arnold's Rochester, New York facility. The facility does not currently use chlorinated solvents; however, based on information provided by facility personnel and documents reviewed, the facility formerly used tetrachloroethene (PCE), TCE, TCA, and methylene chloride for degreasing and parts washing operations. According to the PRC report, the facility discontinued the use of TCA in 1991. Facility personnel reported that TCE use was discontinued prior to 2001, and PCE was discontinued in September 2001. Arnold now uses Leksol, a brominated (non-chlorinated) solvent, in the facility's degreasers, and mineral spirits, a petroleum distillate, in the facility's parts washers.

D. Database Review for the Site and Surrounding Properties

ENVIRON reviewed the results of the state and federal environmental database searches performed by EDR (see Appendix C). The site is listed on several environmental databases, as discussed in Table III-4.

~~CONFIDENTIAL~~
MED

Table III-4
Summary of Environmental Database Listings for Arnold in Marengo, Illinois

Listing Name or Address	Database	Comments	Reference for Further Discussion
		Databases Related to Potential Releases	
Arnold Engineering Co.	CORRACTS CERC-NFRAP	The CORRACTS listing indicates that the site was assigned a medium corrective action priority in 1993, the facility was deemed not amenable to stabilization due to lack of technical data, and the status should be changed when data becomes available. The CERCLIS-NFRAP listing indicates that discovery was made in 1992, and a preliminary assessment was conducted in 1993. It appears that the discovery and preliminary assessment were conducted as a routine inspection for former or current treatment, storage, or disposal (TSD) facilities[2]. In 1995, the site was granted NFRAP status and archived.	III.G.
300 West Street, Marengo, IL	SPILLS	No details associated with the SPILLS listing is provided in the EDR database report. Facility personnel believed that the listing may be associated with a May 17, 2004 fire in Building 14 that was reported to IEPA. The fire involved phosphoric acid tanks, and was contained within the building (i.e., no release of chemicals to the ground occurred).	NA
300 West LLC	LUST	The listing identifies incident number 111065003 with a date of September 24, 2007. The substance involved is identified as "other petro."	III.G
		Databases Related to Regulatory Compliance	
Arnold Engineering Co.	UST RCRA-SQG FINDS TRIS WI MANIFEST	Twelve USTs are indicated as having been removed or closed in-place. These are discussed further below. The site is listed on the RCRIS (Resource Conservation and Recovery Information System) database as a SQG (Small Quantity Generator) of hazardous waste. Violations were reported in 1985, and the facility subsequently achieved compliance within three months of the reported violations. The FINDS (Facility Index System) database as being listed on several regulatory compliance databases, including AIRS (Aerometric Information Retrieval System), National Emissions Inventory, Permit Compliance System, RCRIS, and TRI (Toxic Release Inventory). The WI MANIFEST listing shows the transfer of wastes generated at the facility to disposal locations in Wisconsin during 2006.	III.E.1 (USTs) Table IV-2
Arnold Magnetic Technologies	FINDS AIRS	Under the FINDS listing, the site is indicated as being included under the Illinois Agency Compliance and Enforcement System (ACES) database, which is associated	Table IV-2

[2] The site was designated a TSD facility after being issued a RCRA Part A permit in approximately 1980/1981 for hazardous waste treatment and storage within a neutralization tank, waste acid tank, and drum storage area. The units were approved for closure and the Part A permit was withdrawn by the IEPA in 1987.

~~CONFIDENTIAL~~ MEA

Table III-4 Summary of Environmental Database Listings for Arnold in Marengo, Illinois			
Listing Name or Address	**Database**	**Comments**	**Reference for Further Discussion**
		with permitting activities in the state. The AIRS listing provides emission information submitted to IEPA over several years.	
300 West LLC	UST	The listing includes four USTs that are indicated as being exempt from regulation.	III.E.1
Arnold Engineering Company	IMPDMENT	The database identifies impoundments based on a one time statewide survey conducted in the late 1970s. The site's listing is associated with the facility's wastewater treatment system and collection ponds, operated for the treatment and recycling of the facility's process and sanitary wastewater.	Table IV-2

In addition to the site, there are several other listings in the EDR report for off-site sources within applicable ASTM search radii. Several of these listings (registered UST, AIRS, SW/LF), by themselves, are not necessarily indicative of an environmental concern, and these listings are therefore not discussed herein. Two sites appear on the LUST (Leaking Underground Storage Tank) database, which may indicate potential contamination concerns. One of the LUST sites was selected for further discussion below based on the assumption that a hazardous material released to the subsurface generally does not migrate laterally within the unsaturated soil for a significant distance, but a hazardous material can migrate in the ground water in a generally downgradient direction. The other LUST site appears to be located approximately one-half mile hydraulically crossgradient from the subject site, is not considered to represent a potential concern, and is not discussed further. One site is listed on the state Site Remedial Program (SRP) database that is located north of the site across West Railroad Street. Due to the proximity of this site to the subject site, it is discussed further below.

- Floit Sand and Gravel Company, located between one-eight and one-quarter mile east/southeast (likely upgradient) of the site, is identified on the LUST database. Information obtained by ENVIRON during previous reviews indicates that according to a representative of IEPA, in March 1991 Floit sent IEPA a closure report for a 1,000-gallon diesel UST that was removed. The closure report indicated that one soil sample from the area surrounding the tank had been analyzed for contaminants, and none were found above the limit of detection. IEPA responded with a letter stating that more soil testing was required in order for IEPA to accept the closure report. Although Floit has not provided IEPA with the results of further soil analysis to date, there is no indication that there was a release from the diesel UST that could adversely affect the subject site.

- The Stade Property, located at 21600 West Railroad Street and less than one-eighth mile north of the site, is listed on the SRP database, which is a state database of sites being

D

~~CONFIDENTIAL~~

addressed voluntarily by responsible parties. No specific information regarding contamination at this site or the status of remediation activities is provided. This site appears to be located downgradient of the subject site, and is therefore not expected to represent a concern to the subject site.

The EDR database search identified a number of unmapped sites. ENVIRON reviewed the list of unmapped sites and verified that none were adjacent to the subject site; however, it was beyond the scope of this review to accurately locate each of the unmapped sites identified by EDR.

E. Materials Storage

1. Underground Storage Tanks

According to facility personnel, there are no current USTs at the site, nor was evidence of such (e.g., vent pipes, fill ports, or dispensing equipment) observed by ENVIRON during the site visit or in the review of records pertaining to the site. The site is listed on the state UST database for a total of 16 USTs. 12 of the tanks are indicated as having been abandoned in place or removed. The listings for the remaining four tanks (listed under the name 300 West LLC) do not indicate if the tanks were removed or are still present. Facility personnel were not aware of these four USTs, but indicated they may be associated with USTs removed from the site in 2007 by the current site owner (300 West LLC). Details regarding the former USTs are presented in Table III-5.

Table III-5
Former USTs at the Marengo, Illinois Facility

Tank ID	Contents	Size (gallons)	Approximate Year Installed	Approximate Year Removed/Closed in Place	Comments
USTs 1-6	Mineral oil	1,500	1961	1988-1990	Filled with sand and closed in place
UST 7	Acetone	6,000	1954	1988-1990	Filled with sand and closed in place
UST 8	Methanol	6,000	1959	1988-1990	Removed from ground
UST 9	TCA	6,000	1959	1988-1990	Removed from ground
UST 10	TCA	6,000	1962	1988-1990	Removed from ground; 3 soil samples collected and analyzed for TCA
UST 11	Kerosene	1,500	1956	After 1993; before 2004	Removed from ground
UST 12	Gasoline	1,500	1950	1968	As of 1993, empty and in place, last used 1968
UST 13	"Hazardous Substance"	8,000	Unknown	Unknown	Indicated in the EDR report as being exempt from regulation
UST 14	Lube Oil	1,000	Unknown	Unknown	Indicated in the EDR report

CONFIDENTIAL

Table III-5
Former USTs at the Marengo, Illinois Facility

Tank ID	Contents	Size (gallons)	Approximate Year Installed	Approximate Year Removed/Closed in Place	Comments
					as being exempt from regulation
UST 15	Fuel Oil	2,000	Unknown	Unknown	Indicated in the EDR report as being exempt from regulation
UST 16	Fuel Oil	2,000	Unknown	Unknown	Indicated in the EDR report as being exempt from regulation

The locations of the former USTs are generally unknown. During ENVIRON's 2004 review, a site figure was reviewed that depicted the 6,000-gallon acetone and methanol USTs (USTs 7 and 8) adjacent to the northwest corner of Building 2/3/4/7, west of Building 10. In addition, ENVIRON had obtained a partial site figure from the Office of the State Fire Marshal's Division of Petroleum and Chemical Safety that depicted one of the 6,000-gallon TCA tanks (Tank 10) adjacent to the southern exterior wall of Building 11/14. No other USTs were depicted on any site figures reviewed by ENVIRON.

According to the 1993 PRC report, three soil samples were collected from the excavation pit following the removal of UST 10 and analyzed for TCA. TCA concentrations detected were 0.02 parts per million (ppm), 0.09 ppm, and 0.003 ppm, respectively. No soil samples were documented during the removal of UST 9. The 1993 PRC report does not indicate whether any soil sampling was conducted or documented during the removal or closure of USTs 1 through 8, 11, or 12, and no sampling information was available from the Office of the State Fire Marshal's Division of Petroleum and Chemical Safety, which maintains registered UST information for the state. Facility personnel reported that during 2007, the current site owner removed at least two and possibly three USTs from the site including one located within the footprint of former Building 1 and one from the northern side of Building 2/3/4/7. Facility personnel were not aware of the contents of the tanks and had no documentation related to the removal of the tanks, but reported that soil excavation was conducted as part of the tank removal activities.

The site is listed on the LUST database (as indicated in Table III-4) for an incident occurring in September 2007. Facility personnel were not aware of this incident, but believed that it may be associated with the removal of USTs by the current site owner.

Although not considered to be a UST, site figures reviewed by ENVIRON during the 2004 review depicted an underground double-walled paint transfer line (labeled as "inactive") between Building 10, formerly a paint and drum storage area, and Building 2/3/4/7. Facility personnel had no information regarding the operation or decommissioning of this underground piping system. In addition, the facility utilizes a below grade pit located on the southern side of Building 2/3/4/7 that is used as a machining coolant reservoir. Facility personnel indicated that the pit holds

~~CONFIDENTIAL~~
NED

approximately 200 gallons of coolant, that approximately half of the pit was blocked off years ago, and that the pit is cleaned of swarf approximately once every two years. Facility personnel were not aware of any leaks from the pit.

2. Aboveground Storage Tanks

The facility maintains a number of ASTs (aboveground storage tanks) at the site, including four approximately 300-gallon double-walled steel diesel fuel tanks located outside Building 2/3/4/7, the pond pump house, the fire suppression pump house, and west of Building 16, respectively. A 300-gallon, double-walled gasoline tank is also located west of Building 16. A number of large liquid argon, liquid nitrogen, and hydrogen tanks ranging in capacity from 3,000 to 9,300 gallons are located outdoors at the site, adjacent to Building 2/3/4/7, 5, and 11/14. A propane tank is located outside Building 2/3/4/7, to the south, adjacent to a liquid argon tank. Three silos containing foundry sand are located outside the southeastern wall of Building 5. Two inactive approximately 8,000-gallons tanks, formerly used for storage of hydrochloric and waste acid, are located outside the northern side of Building 11/14, within a concrete secondary containment structure. The waste acid tank was formerly permitted under the RCRA (Resource Conservation and Recovery Act) Part A permit program for TSD facilities, and was approved for closure in 1987. Two 1,500-gallon ASTs used for the bulk storage of rolling mill oil are present within an oil storage and filter room at the southern side of Building 11/14. Secondary containment for these ASTs consists of a prefabricated metal floor pan, and during the site visit, oil was observed to be present within the floor pan. Facility personnel were not aware of any leaks or spills relating to the ASTs, and ENVIRON did not observe evidence of releases or significant staining at the time of the site visit.

A 1,800-gallon neutralization tank was formerly present to the north of Building 2/3/4/7 for the treatment of caustic process wastewater prior to discharge to the wastewater treatment system. The tank was reportedly decommissioned as part of the 1987 RCRA Part A permit closure and withdrawal, and had been removed by the time of ENVIRON's site visit. In addition, a 5,000-gallon phosphoric acid tank was formerly located inside the northeastern section of Building 11/14 within a concrete secondary containment structure. Facility personnel did not know the exact date the tank was removed, but based on ENVIRON's review of a 1994 site figure and observations during the site visit, the tank was removed after 1994 and before 2004. Facility personnel were not aware of the presence of other historical ASTs at the site, nor did ENVIRON observe any evidence of other current or former ASTs (e.g., piping, stands, pads) during the site visit.

3. Drums and Container Storage

Storage of chemicals in drums and containers occurs inside each of the active facility operations buildings (Buildings 2/3/4/7, 5, and 11/14) and Building 8, Building 10, and Building 16. In addition, individual drums of chemicals (primarily oils) are kept at or near their points of use.

CONFIDENTIAL

Drummed materials used on-site include 55-gallon drums of lubricating oils, hydraulic fluid, motor oil, other petroleum products, phosphoric acid, muriatic acid, alcohol, Leksol solvent, mineral spirits, chlorine bleach, and other specialty chemicals related to site operations and maintenance. Plastic totes, ranging from approximately 100- to 300-gallons, containing acids, are also stored in Building 11/14. The facility's operations have changed such that the quantity of acid used has significantly decreased. Many of the totes observed at the time of the site visit were empty. Drums of waste materials, including waste solvents and waste oils, are stored within Building 16. Building 16 is a self-contained building, provided with a concrete-bermed floor. Facility personnel were not aware of any significant spills or releases of materials from drum and container storage areas. At the time of the site visit, ENVIRON did not observe evidence of spills or uncontrolled releases from these storage areas, other than minor staining in some interior areas.

Several drums were noted in exterior areas of the site including empty drums outside of Building 10, two drums containing purge water from monitoring wells situated west of the fire system pump house, and two drums of DMEA situated on the eastern side of Building 5. No spills or staining were noted around these drums.

Historically, paints, solvents, and petroleum products were stored in drums in Building 10. The eastern section of Building 10 is currently used for records storage. The western portion is used for drum rinsing activities. Drums are manually rinsed and the rinsate is discharged to a floor trench drain that discharges to the facility's wastewater treatment system. Cleaned drums are crushed inside Building 10 and are collected for off-site disposal. Solids collected from the drums (e.g., tool room grinding fines) are collected for off-site disposal. During ENVIRON's 2004 review, facility personnel reported that drum cleaning was also historically conducted on an outdoor pad to the west of Building 10.

F. Polychlorinated Biphenyls

Facility personnel were not aware of any equipment on-site containing polychlorinated biphenyls (PCBs). A number of pad-mounted, facility-owned transformers are located on-site. Facility personnel reported that in 2006, Arnold retrofilled any transformer that was known to contain oil containing PCBs in a concentration greater than 50 ppm, and that all transformers at the site (even transformers that are not in use) contain PCBs at concentrations less than 50 ppm with the exception of one unit located off of the northwestern wall of Building 5. According to facility personnel, transformers are tested on an annual basis and such testing includes PCB analyses. Facility personnel reported that the one remaining unit that contains PCBs in excess of 50 ppm is scheduled to be retrofilled during 2008. During the site visit, staining was not noted around exterior pad-mounted transformer units with the exception of staining noted on the concrete pad beneath one of the transformers located on the northeastern side of Building 5. This unit was labeled as a non-PCB transformer.

~~CONFIDENTIAL~~

Facility personnel were not aware of the presence of PCBs in other electrical equipment or hydraulic equipment at the site. Because portions of the building were constructed prior to the 1976 federal ban on the manufacture of PCBs, it is possible that hydraulic oils, light ballasts, or other types of electrical equipment, such as capacitors, could contain PCBs.

G. Soil and Ground Water Conditions (Findings and Opinions)

ENVIRON conducted a Phase I ESA of the Arnold facility located at 300 N. West Street, Marengo, Illinois. The objective of the ESA was to identify RECs, which the ASTM Standard defines as follows:

> "The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not recognized environmental conditions."

Based on the historical information reviewed, the site was first developed for industrial use during the late 1800s or early 1900s and was purchased by the Arnold family in the early 1900s. Building 1 was the first known structure developed at the site, likely in the late 1800s or early 1900s and was used as a rail yard and engine maintenance facility and for the manufacture of transformers prior to its use by Arnold Engineering Company for magnetic component manufacturing operations beginning in the 1950s. Historical activities conducted at the site involved the use of chlorinated solvents as well as on-site wastewater treatment ponds, which are still in use.

ENVIRON has identified two RECs associated with the site, as described below. Both of these RECs are considered to be only noteworthy from a business risk perspective.

Existing Chlorinated Solvent Ground Water Contamination and IEPA Violation Notice

In 1990, the facility began monitoring ground water at the property as a condition of the facility's Water Pollution Control (WPC) Permit, and Arnold continues to conduct monthly ground water monitoring at eight on-site monitoring wells as well as monthly sampling of the outfall from wastewater treatment Pond 4. The monitoring wells are all located on the western portion of the site, with most located around the location of former Building 6.

~~CONFIDENTIAL~~

Over the period of monitoring, chlorinated solvents including 1,1,1-trichloroethane (1,1,1-TCA), tetrachloroethene (PCE), and trichloroethene (TCE) as well as nickel have been detected in certain wells above permit limitations/Maximum Contaminant Levels (MCLs). The most recent ground water results[3] indicate two wells with concentrations of chlorinated solvents above MCLs. In MW-3, PCE was detected at 13.0 ug/L, which is above its MCL of 5.0 ug/L. This concentration has remained relatively steady for the past several years. In MW-A7, 1,1,1-TCA was detected at 247 ug/L, which is above its MCL of 200 ug/L. Results for 1,1,1-TCA in MW-A7 had been below the MCL for several months during 2007, but again exceeded the MCL in November 2007. 1,1,1-TCA was detected at 11.4 ug/L and 2.2 ug/L in MW-3 and MW-A8, respectively. These concentrations are well below the MCL of 200 ug/L. Nickel has not been detected above its permit limit in any well since 2004 when it was detected in MW-3 at 0.110 mg/l, which is only slightly above the permit limitation of 0.1 mg/l. Wells MW-3, MW-A7, and MW-A8 are located in the northwestern portion of the site near former Building 6.

Potential downgradient receptors include nearby residences, which use private ground water wells that draw water from the same aquifer in which the contamination has been detected (the sand and gravel aquifer). The depth of these domestic wells ranges from 45 to 218 feet bgs. The closest downgradient residences are located across Railroad Street to the north-northwest of the Arnold site. To address potential contamination migration concerns, IEPA required Arnold (as a condition of its WPC permit issued in 2004) to install an off-site downgradient monitoring well (MW-A9), which was installed at a depth of 20 feet bgs in November 2004 within the right-of-way of Railroad Street, approximately 300 feet northwest of MW-3. MW-A9 was sampled several times between November 2004 and April 2006, and 1,1,1-TCA, PCE, and TCE were not detected during any sampling event. IEPA also required Arnold to obtain water samples from the three residences located across Railroad Street from the Arnold site. In November 2005, Arnold collected well water samples from two of the three residences and analyzed the samples for PCE, 1,1,1-TCA, and TCE. None of the contaminants were detected in the samples obtained from the residences.

The current WPC permit, which was issued in April 2006, does not require Arnold to monitor MW-A9, which has not been sampled since April 2006. Arnold is required to submit the ground water sampling results to IEPA on a semi-annual basis. The current WPC permit also does not include certain "Special Conditions" included in the previous version of

[3] The most recent sampling was conducted on February 18, 2008; however, during that sampling event, samples were not collected from two monitoring wells (MW-A6 and MW-A7) due to weather conditions. The most recent results for these two wells were obtained from samples collected on January 18, 2008.

~~CONFIDENTIAL~~

the WPC permit that required Arnold to investigate/address the elevated levels of specific contaminants (i.e., 1,1,1-TCA, PCE, and nickel) in ground water at the site. Based on a review of available documentation, the source(s) of the ground water contamination at the site has not yet been identified, and the presence of chlorinated solvents in ground water above permit limitations/MCLs is identified as a REC.

In January 2008, IEPA conducted a site inspection of the Arnold facility to evaluate compliance with Arnold's WPC permit and its NPDES permit (storm water). Subsequent to the inspection, IEPA issued a Violation Notice to Arnold dated February 28, 2008 (received by Arnold on March 5, 2008) that concluded that the existing chlorinated solvent ground water contamination above Class 1 ground water objectives represents a violation of certain Illinois statutes. The Violation Notice alleges that the discharge of contaminants was "caused and allowed in a way that caused water pollution," and contaminants were "deposited on the land in such a place and manner that created a water pollution hazard." IEPA included in the Violation Notice a list of "Suggested Resolutions" including 1) immediately determine the source(s) of 1,1,1-TCA, PCE, and other related contaminants that are present in ground water under the site by conducting an investigation, 2) immediately determine the extent of 1,1,1-TCA, PCE, and other related contaminants in soil and ground water, both on-site and off-site by conducting an investigation, 3) collect ground water samples from all downgradient residential/nonresidential private water wells located within approximately one-half mile of the site, 4) remediate, if necessary, to meet all applicable remediation objectives for soil and ground water, and 5) enroll in the voluntary Site Remediation Program (SRP) within 45 days from the receipt of the Violation Notice. IEPA required Arnold to provide a written response within 45 days of receipt of the Violation Notice.

ENVIRON cannot rule out the possibility that any future site investigation activities conducted pursuant to the IEPA Violation Notice may identify additional contamination concerns. However, by entering the site in the SRP, a degree of flexibility can be achieved with respect to the scope and timing of the investigation and the remediation objectives.

The facility has also been identified as subject to the RCRA Corrective Action Program and was assigned a "medium priority" designation under the program in 1993. USEPA sent a letter to Arnold dated April 3, 2007 notifying Arnold that the facility had been identified as being part of the "2020 Corrective Action Universe," and that all facilities in this universe will be expected to have implemented a final remedy by 2020. USEPA further indicated that it plans to work with all such facilities to develop plans and schedules that achieve this goal before 2020. No further correspondence has been received by Arnold from USEPA

~~CONFIDENTIAL~~

since then.

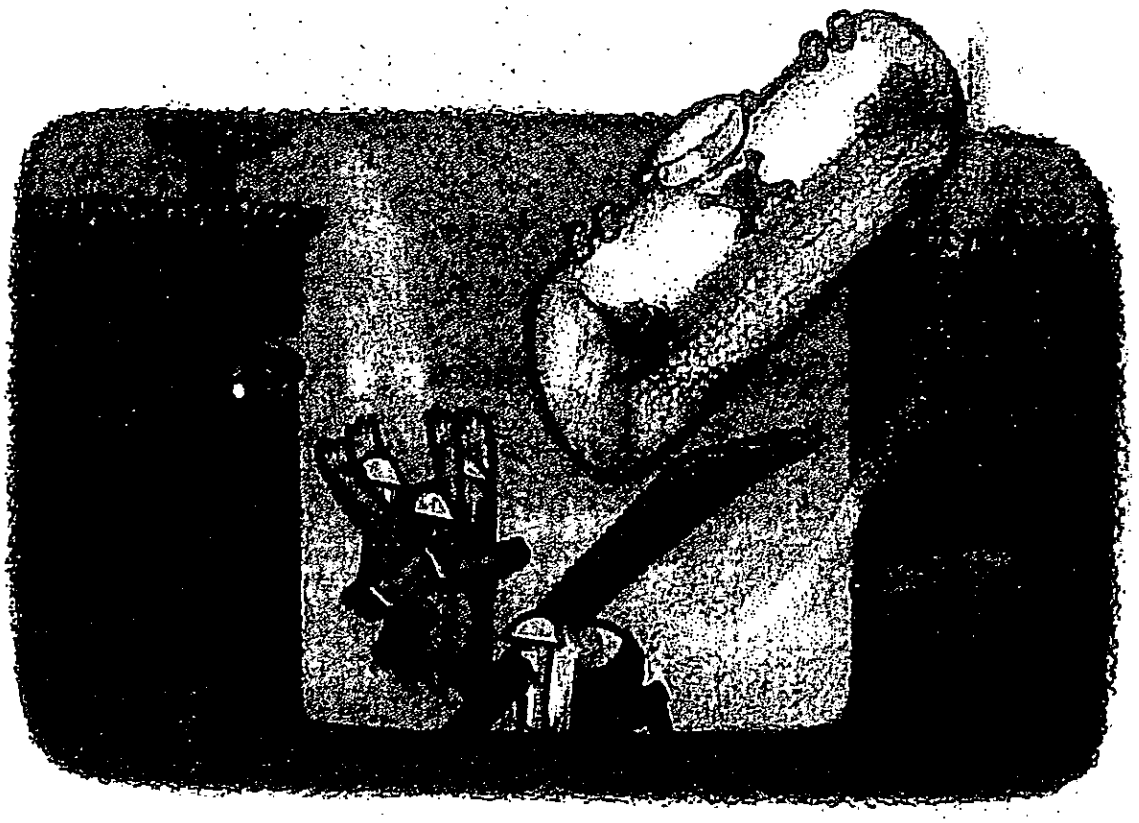
[redacted]

LUST Listing

The site is listed on the LUST database under the name 300 West LLC for an incident involving a petroleum product occurring in September 2007. Facility personnel reported that Arnold did not remove any USTs during 2007 and believed that the LUST listing may be associated with the removal of several USTs by the current site owner (300 West LLC) during 2007, which Arnold was not involved with. Facility personnel reported that the current site owner conducted site investigation activities around the time it acquired the subject site and subsequently removed/closed at least two and possibly three USTs from the site including one located within the footprint of former Building 1 and one from the northern side of Building 2/3/4/7. Facility personnel were not aware of the contents of the tanks, but reported that soil excavation was conducted as part of the tank removal activities. Arnold has not been provided with any documentation related to site investigation activities, UST closures, or remediation activities conducted by the current site owner. It appears the current site owner may have transferred this LUST incident to the SRP in December 2007, , and therefore ENVIRON characterizes this issue as a REC. However, it also appears the current owner of the site has accepted the responsibility for any remediation required in connection with this incident under the SRP.

ENVIRON identified the following *de minimis* condition:

Staining on Pad Beneath Transformer



During the site inspection, ENVIRON noted dark staining on the concrete pad underlying one of three transformer units on the exterior northeastern wall of Building 5. The transformer around which the staining was present was labeled as a non-PCB transformer (i.e., contains oil with PCBs at a concentration of less than 50 ppm). The noted staining did not appear to extend onto unpaved ground. Facility personnel reported that when testing of site transformers for PCBs was initiated in 2004, this unit was determined to not contain PCBs in excess of 50 ppm. At the time of ENVIRON's 2004 and 2006 site visits, staining was not identified in this area suggesting the staining occurred after the 2006 inspection.

~~CONFIDENTIAL~~

H. Conclusions and Analysis of Data Gaps

ENVIRON performed a Phase I Environmental Site Assessment of 300 N. West Street in Marengo, Illinois in conformance with the scope and limitations of ASTM Practice E 1527-05. Any exceptions to, or deletions from, this practice are described in Section I.C of this report. This assessment has revealed two recognized environmental condition in connection with the property: the presence of chlorinated solvent ground water contamination; and the listing of the site on the state LUST data base related to a release incident involving a petroleum product reported in September 2007 and apparently transferred to the SRP by the site owner in December 2007. ENVIRON did not identify any significant data gaps during this assessment.

APPENDIX D – EGSL 2006 GPR REPORT

Ground Penetrating Radar Survey

Subject Property
Arnold Technologies
300 North West Street
Marengo, Illinois 60152

Prepared For

1 EXECUTIVE SUMMARY

Environmental Group Services, Limited (EGSL) of Chicago, Illinois was contracted by *John Daley and Associates* to perform a Ground Penetrating Radar (GPR) Survey of the property known as Arnold Technologies, located at 300 North West Street, Marengo, Illinois (herein referred to as the Subject Property or the Site).

The GPR Survey consisted of utilizing a USRADAR Seeker SPR Subsurface Imaging System equipped with a 500 MHz antenna. All areas of concern were scanned utilizing a 3-foot interval grid pattern in North-South and East-West directions. Maximum penetration depth of the GPR system at the Subject Property was approximately 8-feet below ground surface.

A GPR is typically utilized to detect subsurface objects. The GPR system sends a series of radar pulses into the subsurface and then calibrates and processes the information. Any reflected signals showing different characteristics from its surrounding media will represent an anomaly. The anomalies can then be displayed on-screen in order to determine its relative shape and depth. It should be noted that the subsurface anomalies represent the general shape, size and location of subsurface objects, and is in no way fully signifying a specific object and/or excavation.

The purpose of this GPR Survey was to confirm or deny the presence of multiple underground storage tank (UST) systems reported to be located at the Subject Property. Listed below are the areas of concern scanned and GPR Survey results:

Area of Concern	Reported USTs	GPR Results	Scan Number
1	One, 10,000-gallon fuel oil	Anomaly representative of the excavation of an area the could have contained a 10,000-gallon UST	SVY_8
2	One, 1,500-gallon core oil	Anomaly representative of the excavation of an area the could have contained a 1,500-gallon UST	SVY_9
3	One, 6,000-gallon acetone	Anomaly representative of an underground storage tank	SVY_12
4	Two, 1,000-gallon rolling oil	Anomaly representative of two underground storage tanks lying side-by-side	SVY_7
5	One, 20,000-gallon oil	No significant anomalies detected. It should be noted that this area was located within a fenced-in storage area with machinery and equipment present. EGSL was unable to achieve full maneuverability in order to fully depict any subsurface scans in this area.	N/A
6	One, 6,000-gallon menthol alcohol One, 6,000-gallon chlorophine	Anomaly representative of the excavation of an area the could have contained two, 6,000-gallon USTs lying end-to-end	SVY_13

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Area of Concern	Reported USTs	GPR Results	Scan Number
7	One, 3,500-gallon coolant	No significant UST anomalies detected. It should be noted that this area contained a historical building that was demolished. GPR scans in the reported tank area resulted in numerous shallow anomalies of large debris that may be representative of the remains of the former building; as such, any scans for the UST system were inconclusive.	N/A
8	Two fuel oil tanks of unknown size	Anomaly representative of two underground storage tanks lying side-by-side	SVY_11
9	One, 10,000-gallon gasoline	Anomaly representative of the excavation of an area the could have contained a 10,000-gallon UST	SVY_6

See Appendix A for Area of Concern Locations.
See Appendix B for GPR Scans and Photographic Documentation.

2 CONCLUSIONS AND RECOMMENDATIONS

The Ground Penetrating Radar Survey conducted at nine areas of concern revealed the following:

- GPR Scans in Areas 3, 4 and 8 indicated the possible presence of UST systems in each area. As such, EGSL recommends that subsurface sampling be conducted along all four walls and the floor of each tank system in order to determine if any of the USTs have negatively impacted the subsurface soil.

- GPR Scans in Areas 1, 2, 6 and 9 indicated anomalies characteristic of possible excavations in each area. The locations and dimensions of each possible excavation were representative of the reported UST system for each area. EGSL recommends that subsurface sampling be conducted along all four walls and the floor of each excavation in order to determine if any of the reported former USTs have negatively impacted the subsurface soil.

- GPR Scans in Area 5 were inconclusive to the possible presence of a UST system due to surface debris. EGSL was able to perform limited scans in the area; however, none of the scans indicated any anomalies representative of a UST system. One subsurface soil sample was obtained from this area during a previous subsurface investigation conducted by EGSL; analytical results indicated no chemicals of concern above IEPA Tier 1 Remediation Objectives. EGSL believes that this UST system may still be present; as such, it is recommended that the tank be removed in accordance with all federal, state and, local regulation if encountered during any future demolition activities.

- GPR Scans in Area 7 were inconclusive to the possible presence of a UST system due to subsurface debris related to the historical demolition of the former building. EGSL

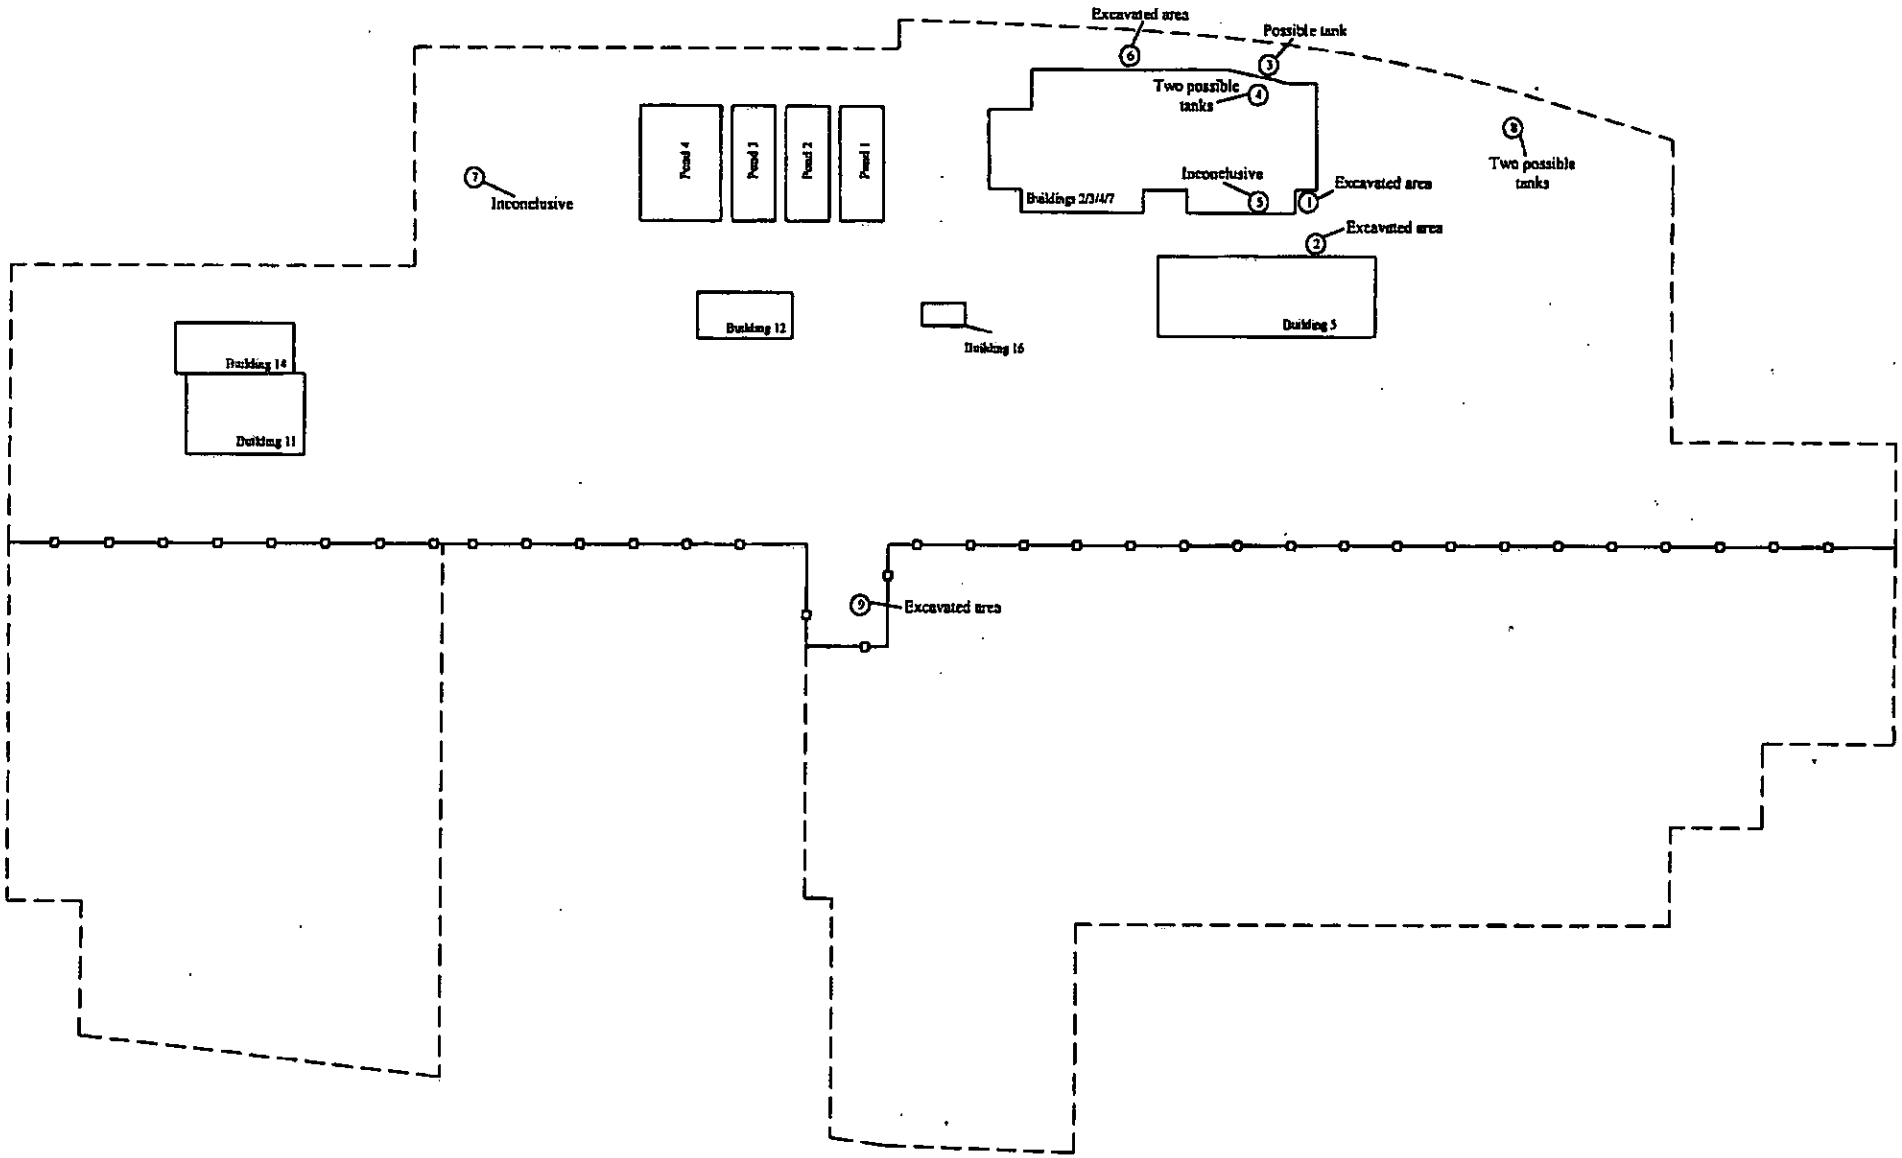
Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

recommends that a test pit be excavated in the reported area of the UST system in order to confirm or deny its presence.

3 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

This report pertains to the property known as Arnold Technologies, located at 300 North West Street, Marengo, Illinois. Our professional services have been performed using the degree of care and skill ordinarily exercised under similar circumstances by environmental professionals practicing in this field. The representations made in this report are accurate and true to the best knowledge of the undersigned.

Sincerely,



ENVIRONMENTAL GROUP SERVICES, LIMITED

Vahooman Mirkhaef
President

Bill Lennon
Project Manager

1 EXECUTIVE SUMMARY

On February 15, 2006, Environmental Group Services, Ltd. (EGSL) completed a Phase II Subsurface Soil and Groundwater Investigation at the property located at 300 N. West Street, Marengo, Illinois, hereinafter referred to as the "Subject Property". This investigation was performed in accordance with the regulations set forth in 35 IAC 740 (Site Remediation Program) and 35 IAC 742 (Tiered Approach to Corrective Action Objectives), Tier 1, for Residential properties. The purpose of this investigation was to confirm or deny the presence of subsurface soil and/or groundwater contamination that may be present at the Subject Property.

The Subject Property is located at 300 N. West Street, in a residential/industrial area of Marengo, Illinois and is approximately 90-acres in size. The Subject Property is currently occupied by Arnold Magnetic Technologies, which utilizes the site for the manufacturing of magnets and the production of rolled metal products.

Prior to the Phase II Investigation, EGSL was provided with the following reporting:

- Monitoring Well Network Installation and Groundwater Flow Assessment, prepared by *Roux Associates, Inc.*, dated May 17, 1990.
- Draft Subsurface Investigation Report, prepared by Environmental Strategies Corporation, dated December 2, 1999.
- Interoffice Memorandum from Thomas Koralewski of Arnold Engineering to Dennis Shea of SPS Technologies, dated July 20, 2000, regarding subsurface soil sampling around MW-3.
- Correspondence from Thomas Koralewski of Arnold Engineering to Thomas McSwiggin of the IEPA Division of Water Pollution Control, dated August 30, 2001, regarding Water Pollution Control Permit 1999-EO-4027.
- Correspondence from Thomas Koralewski of Arnold Engineering to the IEPA Division of Water Pollution Control, dated May 22, 2003, regarding Water Pollution Control Permit 1999-EO-4027.
- Correspondence from Alan Kalaczinski of Arnold Technologies to the Illinois Emergency Management Agency (IEMA), dated July 20, 2004, regarding IEMA Incident number H20040698.
- Analytical data from STAT Analysis Corporation to Don Smith of URS, dated November 26, 2004, December 1, 2004 and December 2, 2004.
- Correspondence from Bill Buscher of the IEPA Bureau of Water to Stephen Brisson of Arnold Technologies, dated May 17, 2005, regarding Water Pollution Control Permit 2004-EO-0971.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Arnold Technologies currently and historically has utilized four wastewater treatment ponds to hold and treat wastewater produced in the manufacturing process. As such, Water Pollution Control Permit numbers 1999-EO-4027 and 2004-EO-0971 were issued for the Subject Property. In order to comply with the Terms and Conditions as stated in the permits, 14 on-site groundwater monitoring wells and one off-site groundwater monitoring wells were installed. Groundwater sampling was conducted in select wells at approximately 1-month intervals. EGSL was provided with groundwater analytical results dating from January 10, 2001 to December 19, 2005. According to analytical data, 1,1,1-Trichloroethane and Tetrachloroethene had been detected in the groundwater above IEPA Tier 1 Remediation Objectives for Class I Groundwater.

It should also be noted that FOIA information was received from the Office of the State Fire Marshal pertaining to the statuses of 12 underground storage tanks that have been historically, or are currently, located on site.

Based on the above-mentioned environmental concerns, EGSL collected 27 soil borings throughout the Subject Property. Additionally, three of the on-site groundwater monitoring wells were sampled (see Site Diagram in Appendix A). All soil and groundwater samples were submitted to STAT Analytical Corporation for analyses of Target Compound List Indicator Contaminants. According to the laboratory results:

- Tetrachloroethene (PCE) was detected at GP-3, GP-5, GP-20, GP-21 and GP-22 at concentrations that exceeded IEPA Tier 1 Remediation Objectives (ROs) for residential Properties.
- Arsenic was detected at GP-2 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- Several inorganic metals were detected throughout the Subject Property at concentrations above metropolitan background concentrations.
- 1,1-Dichloroethene was detected at MW-A7 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- Tetrachloroethene was detected at MW-3 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- 1,1,1-Trichloroethane was detected at MW-A6 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- Iron was detected at MW-A6 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- Manganese was detected at MW-3, MW-A6 and MW-A7 at concentrations that exceeded IEPA Tier 1 ROs for residential Properties.

Based on the above-mentioned analytical results, a Tier 2 Risk-Based Site Assessment was performed in regards to the chemicals of concern that exceeded Tier 1 Remediation Objectives. According to Tier 2 site-specific calculations, it has been determined that:

- The Tier 2 site-specific soil RO for Tetrachloroethene (PCE) was above all detected concentrations from the soil samples.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

- Arsenic detected in GP-2 will travel approximately 145 feet before reaching its Tier 2 RO.
- 1,1-Dichloroethene detected in MW-A7 will travel approximately 5 feet before reaching its Tier 2 RO.
- Tetrachloroethene detected in MW-3 will travel approximately 7 feet before reaching its Tier 2 RO.
- 1,1,1-Trichloroethane detected in MW-A6 will travel approximately 5 feet before reaching its Tier 2 RO.
- Iron detected in MW-A6 will travel approximately 27 feet before reaching its Tier 2 RO.
- Manganese detected in MW-3 will travel approximately 53 feet before reaching its Tier 2 RO.
- Manganese detected in MW-A6 will travel approximately 148 feet before reaching its Tier 2 RO.
- Manganese detected in MW-A7 will travel approximately 72 feet before reaching its Tier 2 RO.

Based on the above-mentioned results, EGSL recommends that the Subject Property enroll into the IEPA's Site Remediation Program (SRP) in order to receive a Comprehensive No Further Remediation (NFR) letter for Residential Properties. In order to receive a NFR for the Subject Property, additional soil and groundwater sampling/modeling will be needed, as per the IEPA's discretion. It is anticipated that area of Arsenic above Tier 1 ROs will have to excavated and disposed of in accordance with federal, state and local regulations. Additionally, since the Subject Property is not located in an area with an approved groundwater ordinance, it is also anticipated that a groundwater use restriction, prohibiting the use of on-site groundwater for potable purposes, will have to be implemented for the Subject Property and/or any affected adjacent properties.

2 BACKGROUND INFORMATION

2.1 Site Location and Description

The Subject Property is located at 300 North West Street, in a residential/industrial area of Marengo, Illinois and is approximately 90-acres in size. The Subject Property is currently occupied by Arnold Magnetic Technologies, which utilizes the site for the manufacturing of magnets and the production of rolled metal products.

2.2 Previous Site Investigations

Prior to the Limited Phase II Investigation, EGSL was provided with the following reporting:

- Monitoring Well Network Installation and Groundwater Flow Assessment, prepared by *Roux Associates, Inc.*, dated May 17, 1990.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

- Draft Subsurface Investigation Report, prepared by Environmental Strategies Corporation, dated December 2, 1999.

- Interoffice Memorandum from Thomas Koralewski of Arnold Engineering to Dennis Shea of SPS Technologies, dated July 20, 2000, regarding subsurface soil sampling around MW-3.

- Correspondence from Thomas Koralewski of Arnold Engineering to Thomas McSwiggin of the IEPA Division of Water Pollution Control, dated August 30, 2001, regarding Water Pollution Control Permit 1999-EO-4027.

- Correspondence from Thomas Koralewski of Arnold Engineering to the IEPA Division of Water Pollution Control, dated May 22, 2003, regarding Water Pollution Control Permit 1999-EO-4027.

- Correspondence from Alan Kalaczinski of Arnold Technologies to the Illinois Emergency Management Agency (IEMA), dated July 20, 2004, regarding IEMA Incident number H20040698.

- Analytical data from STAT Analysis Corporation to Don Smith of URS, dated November 26, 2004, December 1, 2004 and December 2, 2004.

- Correspondence from Bill Buscher of the IEPA Bureau of Water to Stephen Brisson of Arnold Technologies, dated May 17, 2005, regarding Water Pollution Control Permit 2004-EO-0971.

According to the above-mentioned reports, Arnold Technologies currently and historically has utilized four wastewater treatment ponds to hold and treat wastewater produced in the manufacturing process. As such, Water Pollution Control Permit numbers 1999-EO-4027 and 2004-EO-0971 were issued for the Subject Property. In order to comply with the Terms and Conditions as stated in the permits, 14 on-site groundwater monitoring wells and one off-site groundwater monitoring wells were installed. Groundwater sampling was conducted in select wells at approximately 1-month intervals. EGSL was provided with groundwater analytical results dating from January 10, 2001 to December 19, 2005. According to analytical data, 1,1,1-Trichloroethane and Tetrachloroethene had been detected in the groundwater above IEPA Tier 1 Remediation Objectives for Class I Groundwater.

It should also be noted that FOIA information was received from the Office of the State Fire Marshal pertaining to the statuses of 12 underground storage tanks that have been historically, or are currently, located on site.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

3 PHASE II SUBSURFACE SOIL INVESTIGATION ACTIVITIES

A Phase II Subsurface Soil Investigation was conducted in order to assess the potential for the presence of chemicals of concern (COC) in the subsurface soil present at the site. The investigation was conducted in accordance with 35 IAC 740 (SRP) and the COC were chosen from the Target Compound List (TCL) indicator contaminants identified in Appendix A of Part 740.

3.1 Field Sampling Procedures

EGSL utilized a Geoprobe® 6610DT track-mounted direct-push probe to advance a 5-foot by 2-inch soil sampler in order to retrieve continuous soil samples around the Subject Building. Soil samples were continuously collected to depths of 10 to 15-feet below ground surface (bgs). All soil samplers were lined with acetate tubes.

EGSL collected a total of 27 soil samples (GP-1...GP-27) from throughout the Subject Property. See Appendix A for boring locations.

All soil samples were split into two parts: one to be placed into a sealed plastic bag for headspace analysis of volatile organic vapors and the other to be placed in laboratory supplied containers for potential analysis. The bagged samples were tested in the field with Photo-Ionization Detector (PID). The PID was used to screen each soil sample from each boring location for relative concentration of VOCs and does not provide separation of the contaminants into individual constituents. The utilization of this field-screening device provided immediate on-site data for use in the assessment of the site.

A total of 27 soil samples were submitted for analysis of Target Compound List (TCL) indicator contaminants in order to analytically determine the presence and concentration of COC in the areas of concern. The depth and the type of analysis requested of the samples submitted to STAT Laboratory are listed below:

Boring Number	Depth	Location	TCL
GP-1	7.5-8.5	Adjacent to the northeast exterior of the footprint of former Building #1	X
GP-2	4-5	Northwest interior of former Building #1	X
GP-3	5-6	Central interior portion of Building #2	X
GP-4	4-5	Northwestern interior of Building #2	X
GP-5	6-7	Western interior of Building #2	X
GP-6	4-5	Northeastern interior of Building #5	X
GP-7	6-7	Northwestern interior of Building #5	X
GP-8	5-6	Western interior of Building #5	X
GP-9	5-6	Northern interior of Building #14	X

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Boring Number	Depth	Location	TCL
GP-10	7.5-8.5	Adjacent to western exterior of former Building #6	X
GP-11	9-10	Adjacent to northern exterior of former Building #6	X
GP-12	8-9	North of Pond #4	X
GP-13	4-5	Adjacent to northern exterior of former Building #1	X
GP-14	4-6	Northeast exterior of Building #2	X
GP-15	5-7	Southeast exterior of Building #2	X
GP-16	6-8	Northern exterior of Building #5	X
GP-17	5-6	Northeast interior of Building #2	X
GP-18	6-8	Southern interior of Building #2	X
GP-19	5-7	Southeast interior of Building #2	X
GP-20	4-5	Northwest exterior of Building #2	X
GP-21	5-6	Northern exterior of Building #2	X
GP-22	4-6	Northern exterior of Building #2	X
GP-23	4-5	Central portion of the Subject Property	X
GP-24	5-6	Central portion of the Subject Property	X
GP-25	4-5	Western interior of former Building #6	X
GP-26	5-6	Southeastern vacant portion of the Subject Property	X
GP-27	5-6	Southwestern vacant portion of the Subject Property	X

The soil samples targeted for laboratory analysis of VOCs were packed into new 40-milliliter glass vials, pre-preserved in sodium bisulfate and methanol in accordance with EPA Method 5035. STAT Laboratory supplied all the glass vials and jars. All soil samples were stored on ice during soil sample collection activities and while being transported to STAT. Standard Chain-of-Custody procedures were followed to track the samples.

Cross-contamination during soil sampling was minimized by using an Alconox detergent wash and tap water rinse to decontaminate the sampling tools between each probe. Also, other sampling equipment and measurement tools were hand washed with an Alconox detergent wash and rinsed three times with distilled water between soil sample intervals. The tools were then placed on clean and decontaminated surfaces. Disposable latex gloves were worn during the collection of soil sampling events and were changed between each sample.

3.2 Monitoring Well Water Sampling

EGSL collected three groundwater samples from the groundwater monitoring wells, located along the northwestern portion of the Subject Property (MW-3, MW-A6, MW-A7), using a new dedicated

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

disposable polyethylene bailer. The groundwater samples were then transferred to the appropriate glass vials and containers for the analysis of TCL indicator contaminants. The groundwater samples were kept on ice in coolers and sent to the laboratory for analysis. Proper chain-of-custody procedures were followed.

3.3 Hydraulic Conductivity Testing

On February 15, 2006, EGSL conducted an in-situ hydraulic conductivity test (slug test) at MW-3. Slug tests are a method of obtaining approximate values for the hydraulic conductivity of the water-bearing materials in the vicinity of each respective well screen. This field procedure consists of displacing a volume of water in the well with a solid PVC "slug" of known volume and recording the change in water level as it recovers to static hydraulic conditions over time. The data collected was input into the Aqtesolv® Hydraulic Conductivity program.

The site-specific hydraulic conductivity results, as concluded from the hydraulic conductivity testing, was **6.812E-04 cm/sec**. Based on these results, the Subject Property groundwater is classified as Class I groundwater as per 35 IAC 620, Subpart B.

See Appendix D for Slug Test Field Data and Aqtesolv® Results.

4 PHASE II SUBSURFACE INVESTIGATION RESULTS

The following section presents the physical and chemical results of the Phase II investigation, which include a description of the site subsurface and regional geology and the chemical findings in the soil and groundwater samples submitted to the laboratory.

4.1 Groundwater Data

The Subject Property groundwater flow direction, as previously determined by site-specific survey data, was determined to be towards the **north-northwest**.

The Subject Property groundwater hydraulic conductivity, as determined by site-specific slug test data, was calculated to be **6.812E-04 cm/sec**. Based on these results, the Subject Property groundwater is classified as Class I groundwater as per 35 IAC 620.

4.2 Subsurface Soil Chemical Results

The analytical test results of the soil samples were compared to the Soil Remediation Objectives (SROs) derived from the Illinois Environmental Protection Agency (IEPA) "adopted" IAC 742, Tiered Approach to Corrective Action Objectives (TACO), Tier I for Industrial/Commercial

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

properties and for Soil Component of the Groundwater Ingestion Route (SCGIR) (Class I Groundwater).

Listed below are all chemicals of concern that were detected above IEPA Tier 1 Remediation Objectives:

Chemical	Sample Number (Depth)	Concentration Detected (mg/Kg)	TACO Tier I RO (mg/Kg)	Exposure Pathway
Tetrachloroethene (PCE)	GP-3 (5-6) GP-5 (6-7) GP-20 (4-5) GP-21 (5-6) GP-22 (4-6)	1.3 0.092 0.13 1.5 9.7	0.06 0.3	SCGIR Class I Groundwater SCGIR Class II Groundwater
TCLP Arsenic	GP-2 (4-5)	2.0	0.05 0.2	SCGIR Class I Groundwater SCGIR Class II Groundwater
Arsenic	GP-2 (4-5)	450	13.0 13.0 29 120	Residential Ingestion Background Concentration* SCGIR Class I Groundwater SCGIR Class II Groundwater
Chromium	GP-13 (4-5) GP-17 (5-6) GP-21 (5-6) GP-26 (5-6)	19.0 18.0 22.0 24.0	16.2	Background Concentration*
Cobalt	GP-14 (4-6) GP-15 (5-7) GP-20 (4-5) GP-25 (4-5)	170.0 51.0 40.0 22.0	8.9	Background Concentration*
Copper	GP-14 (4-6) GP-19 (5-7)	36.0 20.0	19.6	Background Concentration*
Iron	GP-13 (4-5) GP-21 (5-6) GP-26 (5-6)	17,000 20,000 19,000	15,900	Background Concentration*
Manganese	GP-13 (4-5)	660	636	Background Concentration*
Nickel	GP-14 (4-6) GP-15 (5-7)	160 210	18.0	Background Concentration*
Vanadium	GP-2 (4-5) GP-13 (4-5) GP-17 (5-6) GP-21 (5-6) GP-26 (5-6)	28.0 28.0 33.0 34.0 32.0	25.2	Background Concentration*

* Exceedences were compared to "Concentrations of Inorganic Chemicals in Background Soils for Counties Within Metropolitan Statistical Areas" (IAC 742: Appendix A, Table G).

4.3 Groundwater Chemical Results

The analytical test results of the groundwater samples were compared to the Groundwater Remediation Objectives (GROs) derived from the Illinois Environmental Protection Agency (IEPA) "adopted" IAC 742, Tiered Approach to Corrective Action Objectives (TACO), Tier I for Class I Groundwater.

Listed below are all chemicals of concern that were detected above IEPA Tier 1 Remediation Objectives:

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

Chemical	Sample Number (Depth)	Concentration Detected (mg/Kg)	TACO Tier I RO (mg/Kg)	Exposure Pathway
1,1-Dichloroethene	MW-A7	0.13	0.007 0.035	Class I Groundwater Class II Groundwater
Tetrachloroethene	MW-3	0.011	0.005	Class I Groundwater
1,1,1-Trichloroethane	MW-A6	0.46	0.2	Class I Groundwater
Iron	MW-A6	5.5	5.0 5.0	Class I Groundwater Class II Groundwater
Manganese	MW-3 MW-A6 MW-A7	0.3 1.8 0.54	0.15	Class I Groundwater

4.4 Tier 2 Analysis

Tier 2 analysis was conducted in order to determine site specific Remediation Objectives and/or the horizontal extent of chemicals of concern that exceeded Tier 1 Objectives. Site-specific parameters, in order to represent the most stringent ROs, were determined as follows:

Soil Type: Silt (3)
Class of Groundwater: Class I
Type of Environment: Residential (1)
Hydraulic Gradient (i): 1.22E-03 m/m
Hydraulic Conductivity (k): 214 m/yr
Thickness of Aquifer (da): 1.9 meters

R-15 and R-26 calculations resulted in the following observations:

- The Tier 2 site-specific soil RO for Tetrachloroethene (PCE) was determined to be 70.0 ppm, which is above all detected concentrations from the soil samples.
- Arsenic detected in GP-2 will travel approximately 145 feet before reaching its Tier 2 RO.
- 1,1-Dichloroethene detected in MW-A7 will travel approximately 5 feet before reaching its Tier 2 RO.
- Tetrachloroethene detected in MW-A3 will travel approximately 7 feet before reaching its Tier 2 RO.
- 1,1,1-Trichloroethane detected in MW-A6 will travel approximately 5 feet before reaching its Tier 2 RO.
- Iron detected in MW-A6 will travel approximately 27 feet before reaching its Tier 2 RO.
- Manganese detected in MW-3 will travel approximately 53 feet before reaching its Tier 2 RO.
- Manganese detected in MW-A6 will travel approximately 148 feet before reaching its Tier 2 RO.
- Manganese detected in MW-A7 will travel approximately 72 feet before reaching its Tier 2 RO.

See Appendix E for Tier 2 Analysis Tables.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

5 CONCLUSIONS AND RECOMMENDATIONS

Based on the field and analytical test data, the following conclusions have been formulated:

- Tetrachloroethene (PCE) was detected at GP-3, GP-5, GP-20, GP-21 and GP-22 at concentrations that exceeded IEPA Tier 1 Remediation Objectives (ROs) for residential Properties.
- Arsenic was detected at GP-2 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- Several inorganic metals were detected throughout the Subject Property at concentrations above metropolitan background concentrations.
- 1,1-Dichloroethene was detected at MW-A7 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- Tetrachloroethene was detected at MW-3 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- 1,1,1-Trichloroethane was detected at MW-A6 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- Iron was detected at MW-A6 at a concentration that exceeded IEPA Tier 1 ROs for residential Properties.
- Manganese was detected at MW-3, MW-A6 and MW-A7 at concentrations that exceeded IEPA Tier 1 ROs for residential Properties.

Based on the above-mentioned analytical results, a Tier 2 Risk-Based Site Assessment was performed in regards to the chemicals of concern that exceeded Tier 1 Remediation Objectives. According to Tier 2 site-specific calculations, it has been determined that:

- The Tier 2 site-specific soil RO for Tetrachloroethene (PCE) was above all detected concentrations from the soil samples.
- Arsenic detected in GP-2 will travel approximately 145 feet before reaching its Tier 2 RO.
- 1,1-Dichloroethene detected in MW-A7 will travel approximately 5 feet before reaching its Tier 2 RO.
- Tetrachloroethene detected in MW-3 will travel approximately 7 feet before reaching its Tier 2 RO.
- 1,1,1-Trichloroethane detected in MW-A6 will travel approximately 5 feet before reaching its Tier 2 RO.
- Iron detected in MW-A6 will travel approximately 27 feet before reaching its Tier 2 RO.
- Manganese detected in MW-3 will travel approximately 53 feet before reaching its Tier 2 RO.
- Manganese detected in MW-A6 will travel approximately 148 feet before reaching its Tier 2 RO.
- Manganese detected in MW-A7 will travel approximately 72 feet before reaching its Tier 2 RO.

Based on the above-mentioned results, EGSL recommends that the Subject Property enroll into the

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

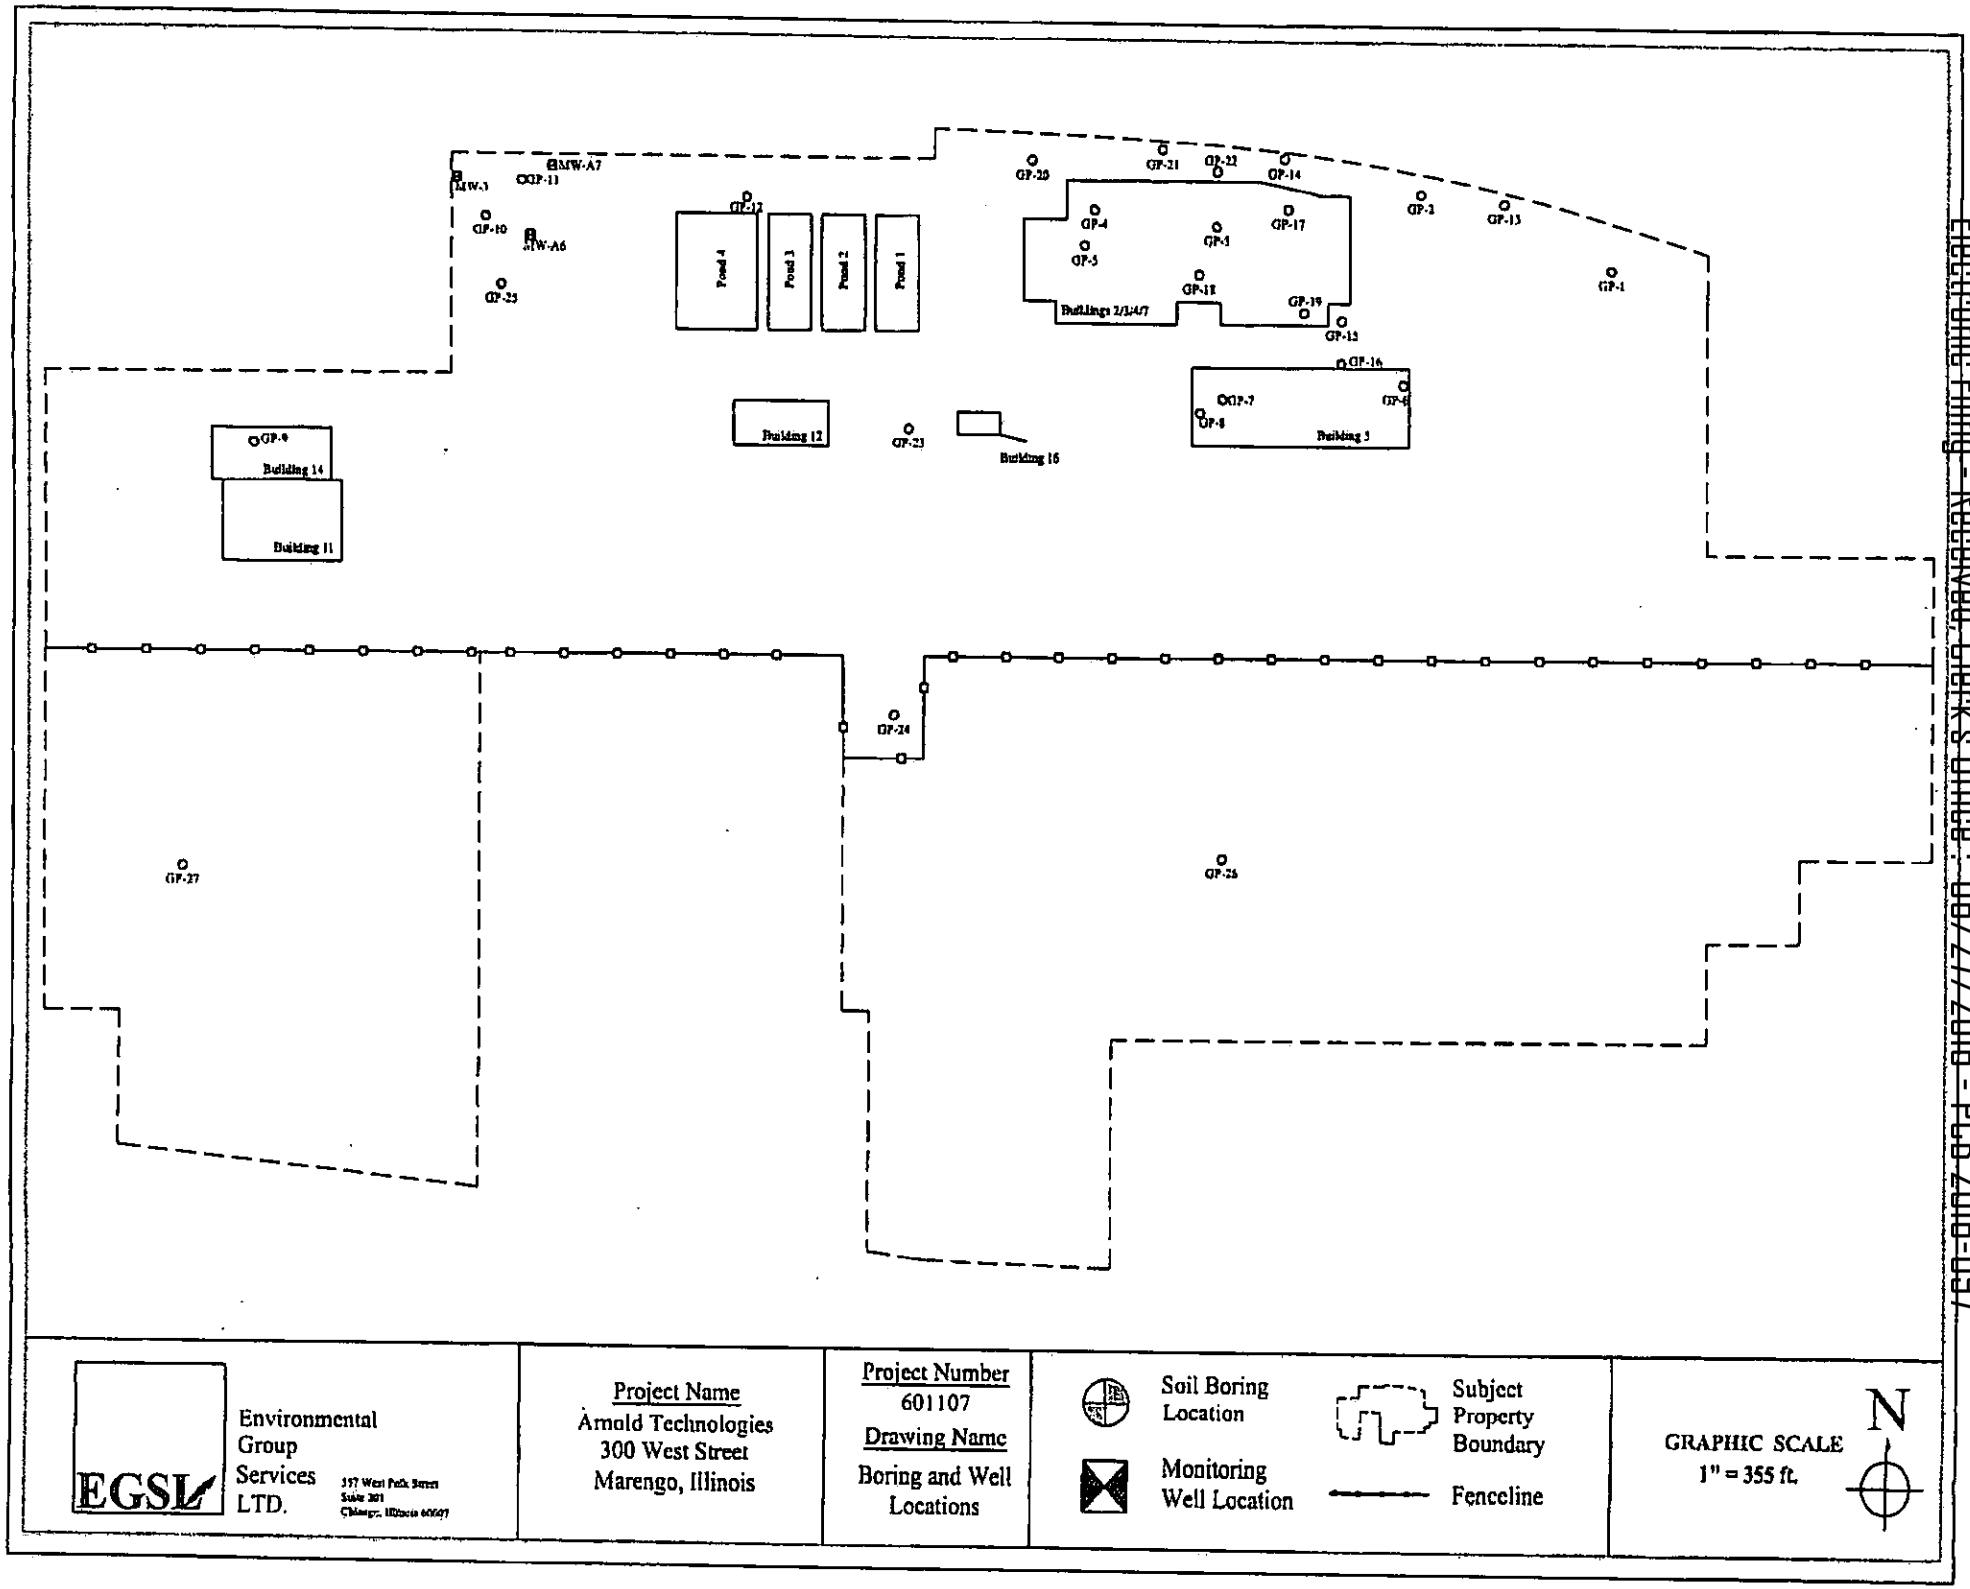
IEPA's Site Remediation Program (SRP) in order to receive a Comprehensive No Further Remediation (NFR) letter for Residential Properties. In order to receive a NFR for the Subject Property, additional soil and groundwater sampling/modeling will be needed, as per the IEPA's discretion. It is anticipated that area of Arsenic above Tier 1 ROs will have to excavated and disposed of in accordance with federal, state and local regulations. Additionally, since the Subject Property is not located in an area with an approved groundwater ordinance, it is also anticipated that a groundwater use restriction, prohibiting the use of on-site groundwater for potable purposes, will have to be implemented for the Subject Property and/or any affected adjacent properties.

Electronic Filing - Received, Clerk's Office : 06/27/2016 - PCB 2016-097***

6 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

This report pertains to the property located at 300 N West Street, Marengo, Illinois. Our professional services have been performed using the degree of care and skill ordinarily exercised under similar circumstances by environmental professionals practicing in this field. The representations made in this report are accurate and true to the best knowledge of the undersigned.

Sincerely,



ENVIRONMENTAL GROUP SERVICES, LIMITED

Vahooman Mirkhaef
President

Bill Lennon
Project Manager

RE: Marengo STAT Project No: 06010357

Dear Bill Lennon:

STAT Analysis received 15 samples for the referenced project on 1/19/2006. The analytical results are presented in the following report.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAC standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 563-0371.

Sincerely,

Craig Chawla
Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory.

CASE NARRATIVE

Sample GP-2 (4-5) (06010357-002) has 1,1,1-Trichloroethane reported with an "E" flag, exceeded the calibration curve range. The medium level dilution was below the reporting level, "J". The more conservative value is reported.

In VOC soil LCS/LCSD analyzed 01/26/06, Carbon Disulfide has high recovery in LCS (132% recovery, QC Limits 70-130%).

Sample MW3 (06010357-013) had low PNA water surrogate recovery for 2-Fluorobiphenyl (42% recovery, QC limits 43-116%).

The metals MS/MSD prepared from sample GP-10 (7.5-8.5) (06010357-010) had Antimony recovery outside control limits (52%/49% recovery, QC limits 75-125%).

1,2,4-Trichlorobenzene	ND	0.18		mg/Kg-dry	1	1/24/2006

Qualifiers:
- ND - Not Detected at the Reporting Limit
- J - Analyte detected below quantitation limits
- B - Analyte detected in the associated Method Blank
- HT - Sample received past holding time
- * - Non-accredited parameter
- RL - Reporting / Quantitation Limit for the analysis
- S - Spike Recovery outside accepted recovery limits
- R - RPD outside accepted recovery limits
- E - Value above quantitation range
- H - Holding time exceeded

RE: Marengo 2 STAT Project No: 06020309

Dear Bill Lennon:

STAT Analysis received 15 samples for the referenced project on 2/15/2006. The analytical results are presented in the following report.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAC standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 563-0371.

Sincerely,

Craig Chawla
Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory.

CASE NARRATIVE

The metals MS/MSD prepared from sample GP-20 (4-5) (06020309-008) had the following outside control limits:
Antimony: 196%/197% (MS/MSD) recovery, QC limits 75-125%
Cobalt: 185% (MS) recovery, QC limits 75-125%; RPD 33%, QC limit <20%
Manganese: 142% (MS) recovery, QC limits 75-125%; RPD 57%, QC limit <20%
Nickel: 196% (MS) recovery, QC limits 75-125%
Iron: RPD 157%, QC limit <20%

- * - Non-accredited parameter
- RL - Reporting / Quantitation Limit for the analysis
- S - Spike Recovery outside accepted recovery limits
- R - RPD outside accepted recovery limits
- E - Value above quantitation range
- H - Holding time exceeded

Report Date: February 21, 2006
Print Date: February 21, 2006

Client:	Environmental Group Services, Ltd.	**Client Sample ID:**	GP-19 (5-7)
Lab Order:	06020309	**Tag Number:**	
Project:	Marengo 2	**Collection Date:**	2/15/2006 9:00:00 AM
Lab ID:	06020309-007A	**Matrix:**	Soil

Analyses	Result	RL	Qualifier	Units	DF	Date Analyzed
Volatile Organic Compounds by GC/MS	**SW5035/8260B**			**Prep Date: 2/16/2006**		**Analyst: PS**
Acetone	ND	0.043		mg/Kg-dry	1	2/18/2006
Benzene	ND	0.0043		mg/Kg-dry	1	2/18/2006
Bromodichloromethane	ND	0.0043		mg/Kg-dry	1	2/18/2006
Bromoform	ND	0.0043		mg/Kg-dry	1	2/18/2006
Bromomethane	ND	0.0087		mg/Kg-dry	1	2/18/2006
2-Butanone	ND	0.0087		mg/Kg-dry	1	2/18/2006
Carbon disulfide	ND	0.0043		mg/Kg-dry	1	2/18/2006
Carbon tetrachloride	ND	0.0043		mg/Kg-dry	1	2/18/2006
Chlorobenzene	ND	0.0043		mg/Kg-dry	1	2/18/2006
Dibromochloromethane	ND	0.0043		mg/Kg-dry	1	2/18/2006
Chloroethane	ND	0.0087		mg/Kg-dry	1	2/18/2006
Chloroform	ND	0.0043		mg/Kg-dry	1	2/18/2006
Chloromethane	ND	0.0087		mg/Kg-dry	1	2/18/2006
1,1-Dichloroethane	ND	0.0043		mg/Kg-dry	1	2/18/2006
1,2-Dichloroethane	ND	0.0043		mg/Kg-dry	1	2/18/2006
1,1-Dichloroethene	ND	0.0043		mg/Kg-dry	1	2/18/2006
cis-1,2-Dichloroethene	ND	0.0043		mg/Kg-dry	1	2/18/2006
trans-1,2-Dichloroethene	ND	0.0043		mg/Kg-dry	1	2/18/2006
1,2-Dichloropropane	ND	0.0043		mg/Kg-dry	1	2/18/2006
cis-1,3-Dichloropropene	ND	0.0043		mg/Kg-dry	1	2/18/2006
trans-1,3-Dichloropropene	ND	0.0043		mg/Kg-dry	1	2/18/2006
Ethylbenzene	ND	0.0043		mg/Kg-dry	1	2/18/2006
2-Hexanone	ND	0.0087		mg/Kg-dry	1	2/18/2006
4-Methyl-2-pentanone	ND	0.0087		mg/Kg-dry	1	2/18/2006
Methylene chloride	ND	0.0087		mg/Kg-dry	1	2/18/2006
Methyl tert-butyl ether	ND	0.0043		mg/Kg-dry	1	2/18/2006
Styrene	ND	0.0043		mg/Kg-dry	1	2/18/2006
1,1,2,2-Tetrachloroethane	ND	0.0043		mg/Kg-dry	1	2/18/2006
Tetrachloroethene	ND	0.0043		mg/Kg-dry	1	2/18/2006
Toluene	0.0076	0.0043		mg/Kg-dry	1	2/18/2006
1,1,1-Trichloroethane	ND	0.0043		mg/Kg-dry	1	2/18/2006
1,1,2-Trichloroethane	ND	0.0043		mg/Kg-dry	1	2/18/2006
Trichloroethene	ND	0.0043		mg/Kg-dry	1	2/18/2006
Vinyl chloride	ND	0.0043		mg/Kg-dry	1	2/18/2006
Xylenes, Total	ND	0.013		mg/Kg-dry	1	2/18/2006

Qualifiers:
- ND - Not Detected at the Reporting Limit
- J - Analyte detected below quantitation limits
- B - Analyte detected in the associated Method Blank
- HT - Sample received past holding time
- * - Non-accredited parameter
- RL - Reporting / Quantitation Limit for the analysis
- S - Spike Recovery outside accepted recovery limits
- R - RPD outside accepted recovery limits
- E - Value above quantitation range
- H - Holding time exceeded
