NOTICE OF FILING

To: Service List

PLEASE TAKE NOTICE that I have today electronically filed, with the Office of the Clerk of the Pollution Control Board, **AMEREN'S INDEX OF EXHIBITS AND SECOND HEARING EXHIBITS**, copies of which are herewith served upon you.

Dated: September 28, 2020

Respectfully submitted,
AmerenEnergy Medina Valley Cogen, LLC and Union Electric Company, d/b/a Ameren Missouri.

CERTIFICATE OF SERVICE

The undersigned, an attorney, certifies that a true copy of the foregoing documents were electronically filed on September 28, 2020 with the following:

Don Brown, Clerk of the Board
Illinois Pollution Control Board
James R. Thompson Center, Suite 11-500
100 W. Randolph Street
Chicago, IL 60601
Don.Brown@illinois.gov

and that copies were sent via email on the same date to the parties on the service list.

Respectfully submitted,
AmerenEnergy Medina Valley Cogen, LLC and Union Electric Company, d/b/a Ameren Missouri.

1. Introduction

AmerenEnergy Generating Company, pursuant to Title 35, Ill. Admin. Code, Part 840 [35 IAC 840] (Illinois PCB, 2011), completed closure of the Ash Pond D Coal Combustion Waste (CCW) pond at the Hutsonville Power Station (Site) in January 2013. AmerenEnergy Medina Valley Cogen, L.L.C. (AmerenEnergy Generating Company successor, and hereafter referred to as Ameren), is submitting this Closure Plan for the remaining CCW ponds: Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond. The operation of the remaining ash ponds are regulated under Title 35 Illinois Administrative Code, Part 309 (35 IAC 309), and they will be closed in compliance with the requirements of 35 IAC 620. The proposed Closure Plan for the remaining ash ponds was developed to generally conform with the Ash Pond D site-specific rule 35 IAC 840, and where judged appropriate, elements of the proposed 35 IAC 841 rules, currently under development. Comparison of this closure plan with the elements in 35 IAC 840 and the 35 IAC 841 rulemaking is detailed in Table 1. Concurrently submitted supporting documents are listed in the Reference section of this report.

Upon approval of the Closure Plan by the Illinois Environmental Protection Agency (EPA), Ameren will begin closing these remaining facilities.

1.1 Site Background

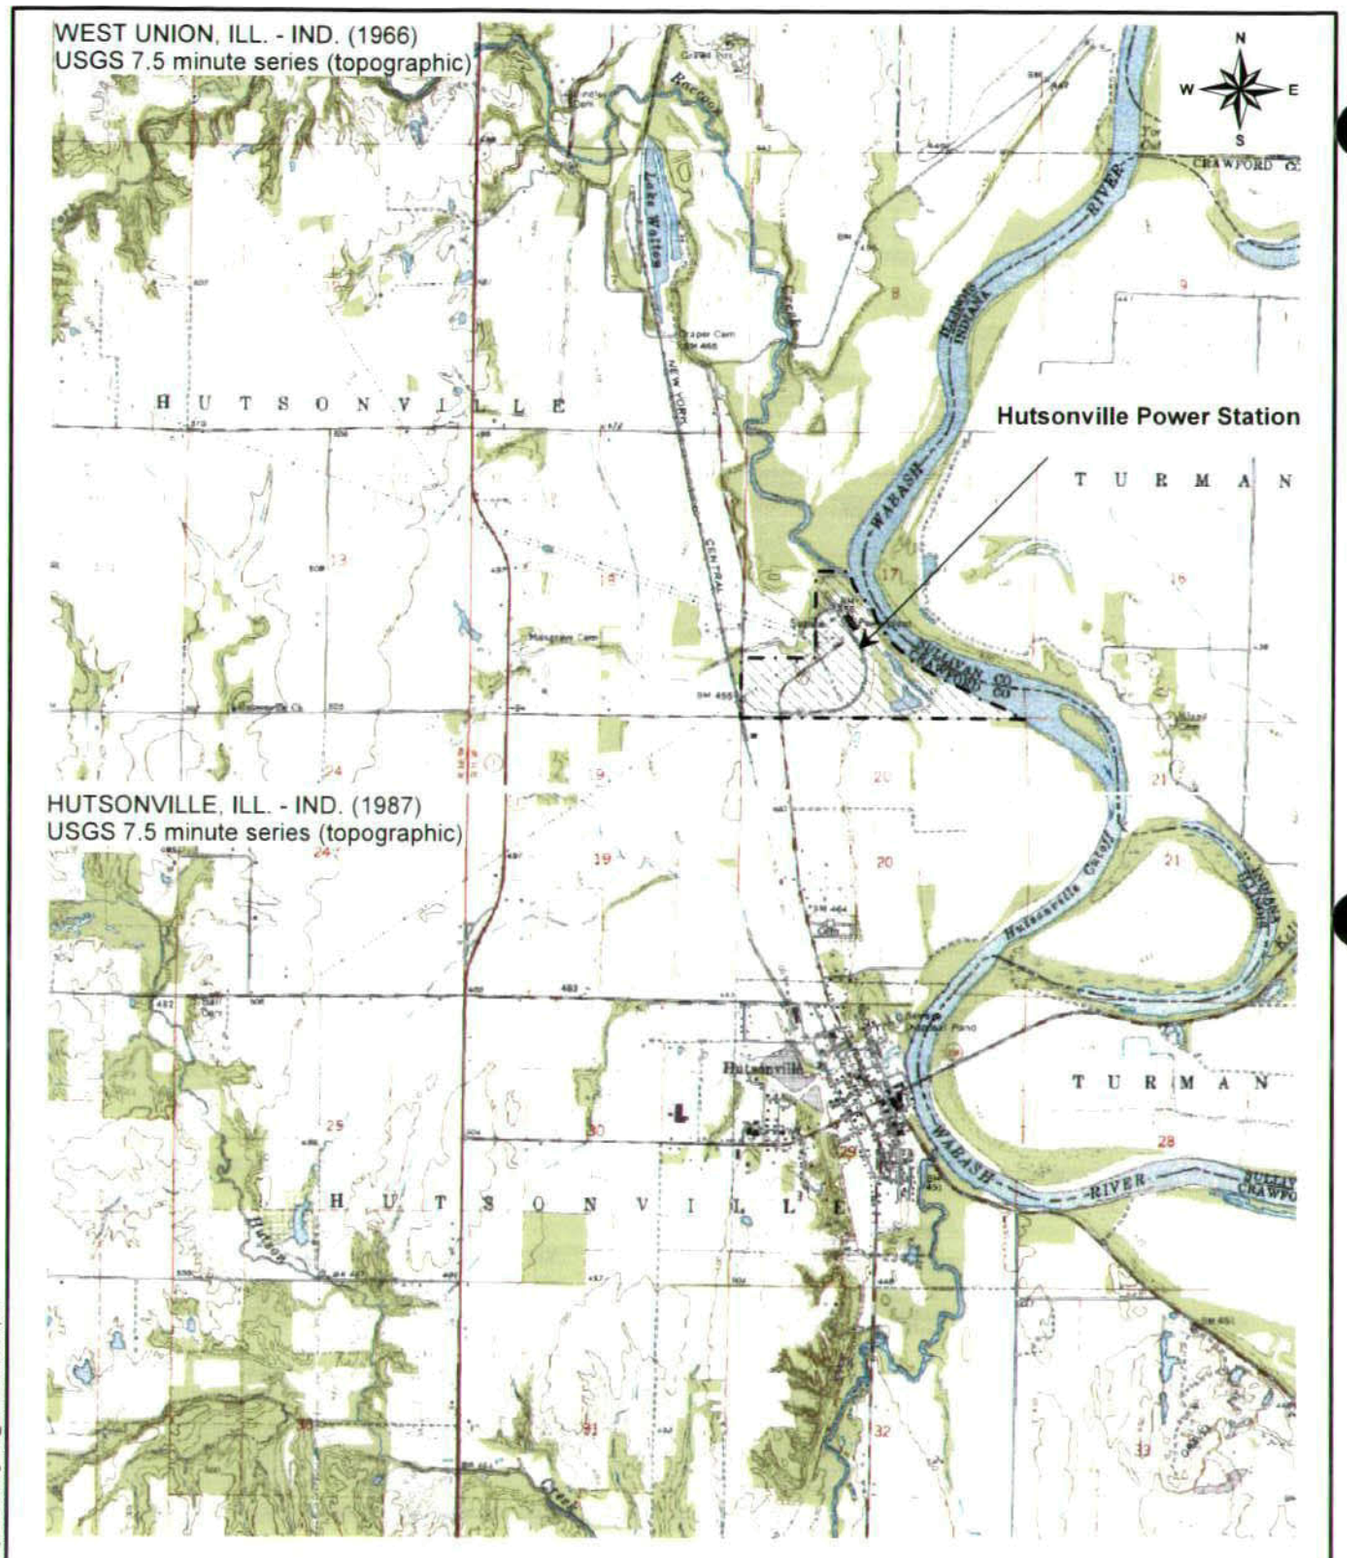
The Site is located on the west bank of the Wabash River, and approximately one and one-half miles north of the Village of Hutsonville in Crawford County, Illinois. The Site is located in the South ½ of Section 17, Township 8 North, Range 11 West of the Second Principal Meridian (see Figure 1).

All ash ponds at the Site (see Figure 2) are out-of-service. Ash Pond D, the largest and oldest of the four ash ponds at the Site, was covered and closed during 2011-2012 under the 35 IAC Part 840 rules. The remaining ponds, including Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond, will be closed following approval of this Closure Plan.

1.2 Summary of Regional and Site Geology

The Site geology consists primarily of Wisconsinan Stage fluvial deposits with some Illinoian Stage diamictons overlying Pennsylvanian bedrock. There are various fill materials along with three surficial (unlithified) units identified at the Site, including fine-grained fluvial deposits classified as Cahokia Alluvium, poorly sorted outwash sand and gravels of the Henry Formation, and silty and clayey diamictons of the Glasford Formation. The details of the Site geology are described in the Hydrogeologic Site Investigation (Hanson, 2014 b).

Earthen Fill is present across the majority of the Site, ranging from less than 2 to more than 10 feet (ft.) thick. Fill consists of sandy silts and silty sands, which has been used to elevate depressions and construct berms around the various ash ponds and structures. CCWs were found in ash pond areas. The thickness of CCWs in Ash Pond D ranges from 12 to 31 ft. The thickness of CCWs in the undeveloped area between Ash Ponds A and D, prior to the construction of Ash Ponds B and C, was up to 12 ft., but all CCWs were excavated during construction of Ash Pond B in 2000.



Electronic Filing: Received, Clerk's Office 09/28/2020

SITE MAP

ASH PONDS CLOSURE
HUTSONVILLE POWER STATION
HUTSONVILLE, CRAWFORD CO., ILLINOIS

HANSON NO. 14E0016 FIGURE NO. 2

Electronic Filing: Received, Clerk's Office 09/28/2020

Two groundwater flow zones are identified at the Site: a shallow groundwater zone and a deep groundwater zone. The shallow groundwater zone consists of sand and gravel with varying thickness, typically 10 to 20 ft., underlain by 15 to more than 30 ft. of the upper, permeable portions of the sandstone. The shallow sand appears to grade to a fine-grained silty clay toward the northern portion of the Site. A thick shale unit underlies the sandstone at an approximate elevation of about 415 to 420 ft. National Geodetic Vertical Datum (NGVD).

The Wabash River valley contains a relatively fine-grained alluvium from land surface to an elevation of about 410 to 415 ft. NGVD, underlain by sand and gravel to an elevation of about 350 ft. The sand and gravel at depth in the Wabash River valley is referred to as the deep groundwater zone.

Groundwater generally flows from west to east towards the Wabash River within the shallow zone and from southwest to northeast, almost perpendicular to the banks of the Wabash River within the deep zone.

1.3 Summary of Groundwater Quality Downgradient of Ash Ponds A, B, and C

Groundwater downgradient of the ash ponds had concentrations of boron, sulfate, iron, manganese, and TDS higher than Class I groundwater quality standards at multiple locations during the period of 2011 through 2013. Boron had the greatest extent of Class I exceedances attributable to coal ash leachate and was used to define the extent of groundwater impacts from Ash Ponds A, B, C and the Bottom Ash Sluice Pond. The extent of impacts attributable to the ash ponds undergoing closure is discussed further in the accompanying modeling report.

Exceedances of Class I groundwater quality standards for the coal ash indicators boron and sulfate were observed in Ash Pond A, B, C monitoring wells MW2, MW3, and MW3D, while wells MW4, MW5, and MW12 did not have boron or sulfate exceedances in 2011 through 2013.

2. Prior Treatment and Control Options

2.1 Description of Ash Pond D Closure

Ash Pond D was formerly the largest and oldest of the four ash ponds at the Site. Ash Pond D was an unlined pond constructed in 1967 – 1968 and was the primary ash management unit until Ash Pond A began operation in 1986. Since then, it was used as a secondary settling pond until 2000 when it was removed from service. Ash Pond D was covered with a 22 acre cap and closed during 2011-2012 under the Title 35, IAC Part 840 rules (Illinois PCB, 2011). Closure activities included placement of a 40-mil thick textured high density polyethylene (HDPE) geomembrane with three foot protective soil cover with a vegetated surface. Surface water management features incorporated into the final cover design included intermediate berms and ditches to direct runoff to rip-rap-lined chutes running off the ash pond to surrounding areas. Details of the closure are provided in the Project Plans and Specifications (Hanson, 2011c).

2.2 Groundwater Collection Trench

A groundwater collection trench (Trench) was installed between the outside south toe of Ash Ponds A, B, and D and the south property line, as shown on Figure 2. Operation of the Trench is anticipated to begin upon approval of the Site's NPDES permit renewal (No. IL0004120) authorizing its use, which was issued for public notice on August 21, 2014. The Trench is designed to intercept groundwater that may migrate to the south from the ash ponds. The Trench is designed to collect groundwater at four separate sumps: a pair in the east portion of the Trench adjacent to Ash Pond D, and a pair in the west

Electronic Filing: Received, Clerk's Office 09/28/2020

portion of the Trench adjacent to Ash Pond A. Details are provided in the Ash Pond D Closure Plan (Hanson, 2011a) and Project Plans and Specifications (Hanson, 2011c).

Water captured by the Trench will be pumped from the four sumps to a central catch basin located adjacent to the existing Ash Pond D outlet structure along the mid-east side of the pond, from which it will then discharge to the Wabash River in accordance with the Station's NPDES permit.

3. Description of Ash Ponds

3.1 Ash Pond A

Ash Pond A was operational from 1986 until the plant ceased generation in December 2011 for disposal of CCWs generated at the Site. Fly ash from the operating units was collected by an electrostatic precipitator and sluiced to Ash Pond A. The pond was constructed with an 80 mil HDPE liner. CCWs were sluiced to the pond where solids were permitted to settle out and supernatant liquids were decanted. The pond contains fly ash within an area of approximately 12 acres, with an average ash thickness of 20.4 feet. It is estimated that Ash Pond A currently has 80,667 cubic yards (yd^3) of ash. The ash pond is contained by a 2,400 ft. long perimeter embankment that has an average height variance between 17 ft. on the southwest side, 15 ft. on the east side, and 18 ft. on the north side.

The exterior embankment slopes are approximately 3H:1V along the southwest and east sides and 2H:1V along the north side. Interior embankment slopes are currently 11H:1V, The mean thickness of ash in the pond is approximately 20.4 feet.

The cap will be constructed on a 20H:1V (5%) slope that will intersect the existing exterior embankment slope no higher than the existing ash surface. Soil embankment materials above that point will be removed and utilized for vegetative cover on the final cap.

Analyses of the structural integrity of Ash Pond A in the proposed closed condition, including slope stability, bearing capacity and settlement, have been completed. The critical sections, selected for slope stability analysis of the perimeter berm and the final cover, are shown on Figure 3. A cross-section of the fully constructed critical section and the critical analyzed potential failure surface are included on Figure 4. Analyses of the proposed final configuration of the pond resulted in the following factors of safety (FOS) and induced settlement with regard to the structural stability of the pond.

Table 2. Structural Stability Analysis Results for Ash Pond A

Structural Stability Criteria	Calculated FOS	Required FOS*
Short Term Slope Stability – Exterior Embankment	2.02	1.5
Long Term Slope Stability – Exterior Embankment	2.18	1.5
Seismic Event Slope Stability – Exterior Embankment	1.96	1.3
Short Term Slope Stability – Cover Materials	12.45	1.5
Long Term Slope Stability – Cover Materials	11.70	1.5
Seismic Event Slope Stability – Cover Materials	6.79	1.3
Bearing Capacity	36.9	2.0
Seismic Event Bearing Capacity	36.2	1.5
Maximum Induced Settlement	2.25	N.A.

*The Required FOS is based on Illinois EPA Landfill Requirements, for comparison purposes.

Electronic Filing: Received, Clerk's Office 09/28/2020

portion of the Trench adjacent to Ash Pond A. Details are provided in the Ash Pond D Closure Plan (Hanson, 2011a) and Project Plans and Specifications (Hanson, 2011c).

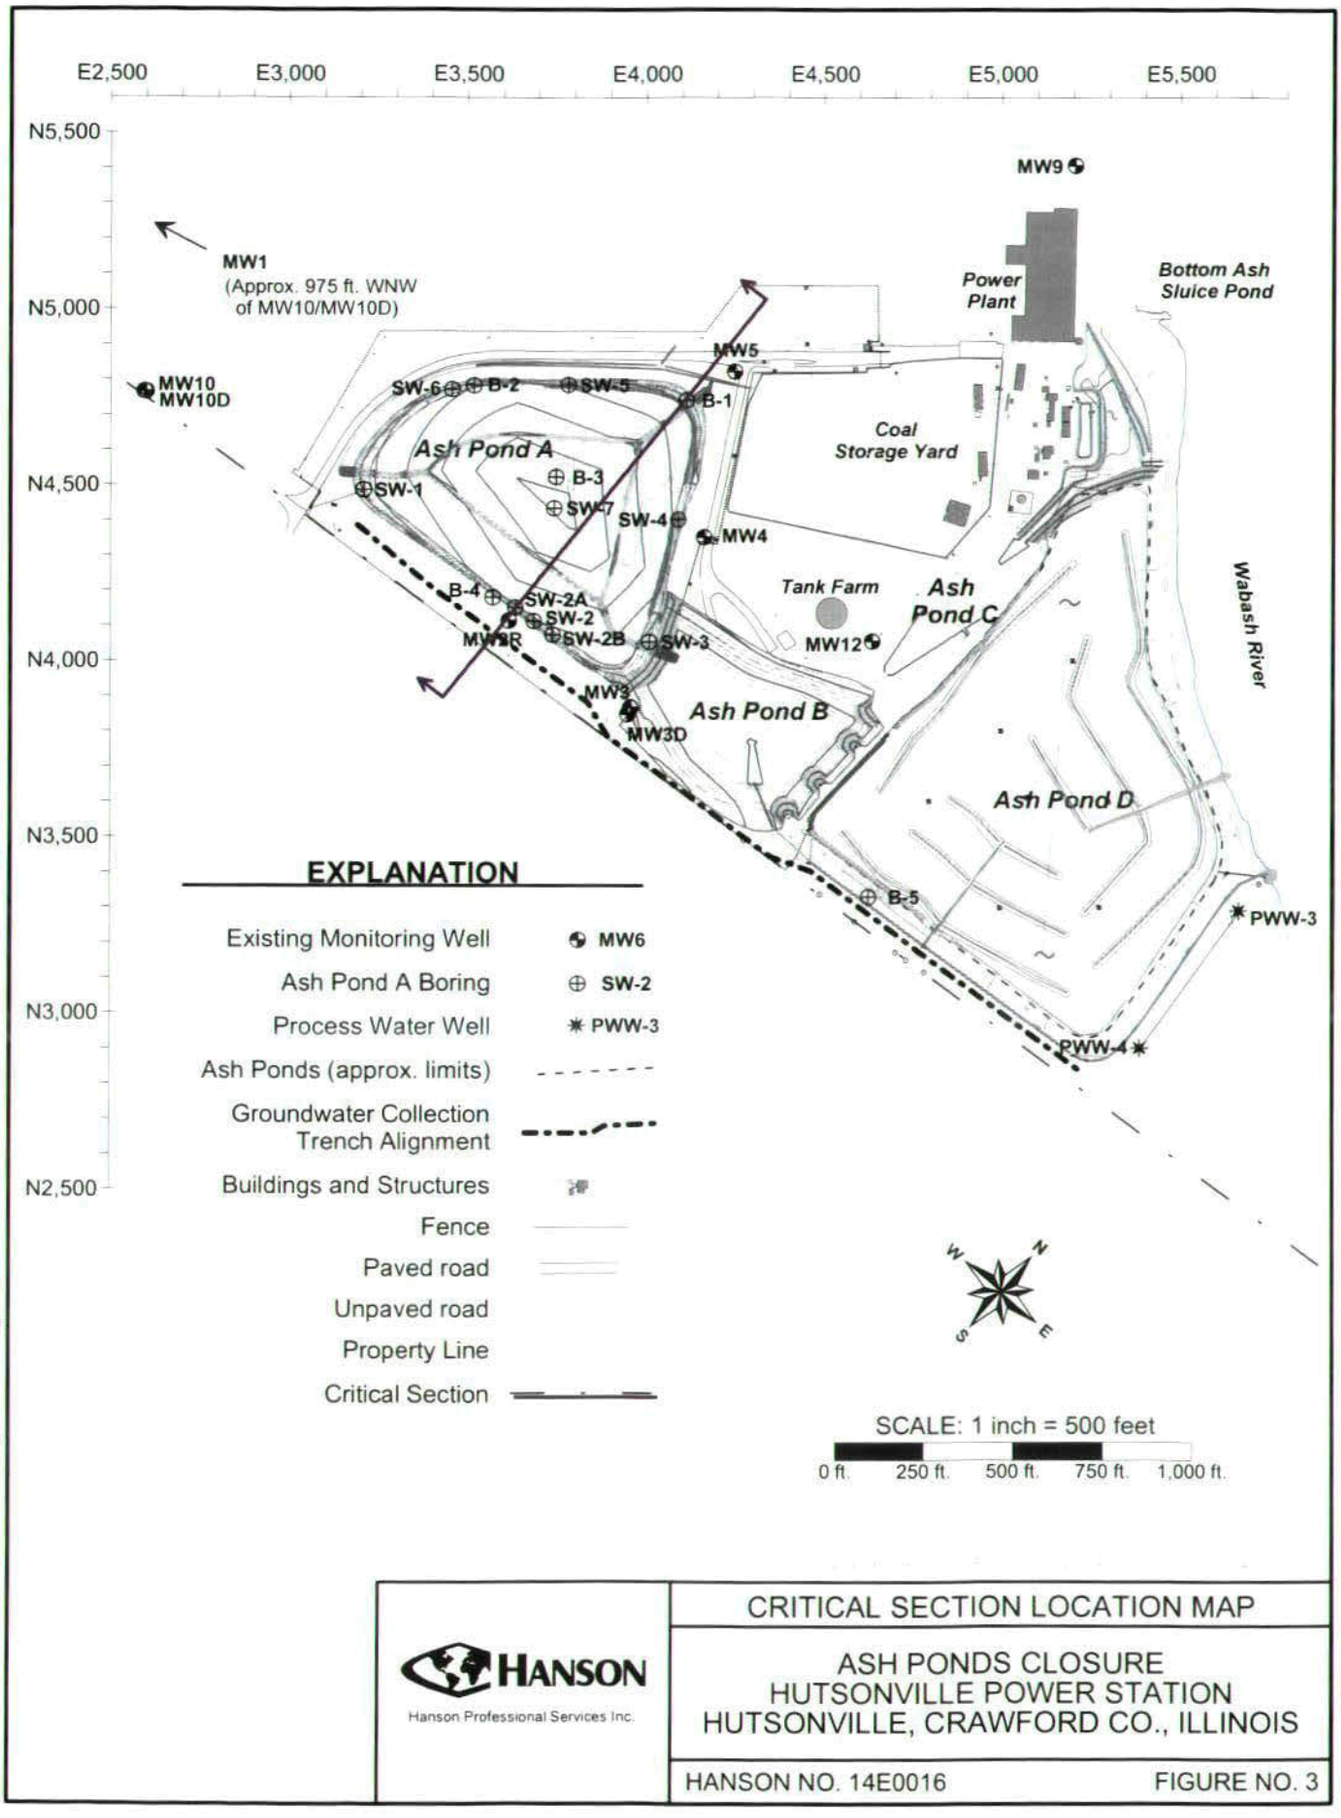
Water captured by the Trench will be pumped from the four sumps to a central catch basin located adjacent to the existing Ash Pond D outlet structure along the mid-east side of the pond, from which it will then discharge to the Wabash River in accordance with the Station's NPDES permit.

3. Description of Ash Ponds

3.1 Ash Pond A

Ash Pond A was operational from 1986 until the plant ceased generation in December 2011 for disposal of CCWs generated at the Site. Fly ash from the operating units was collected by an electrostatic precipitator and sluiced to Ash Pond A. The pond was constructed with an 80 mil HDPE liner. CCWs were sluiced to the pond where solids were permitted to settle out and supernatant liquids were decanted. The pond contains fly ash within an area of approximately 12 acres, with an average ash thickness of 20.4 feet. It is estimated that Ash Pond A currently has 80,667 cubic yards (yd^3) of ash. The ash pond is contained by a 2,400 ft. long perimeter embankment that has an average height variance between 17 ft. on the southwest side, 15 ft. on the east side, and 18 ft. on the north side.

The exterior embankment slopes are approximately 3H:1V along the southwest and east sides and 2H:1V along the north side. Interior embankment slopes are currently 11H:1V, The mean thickness of ash in the pond is approximately 24 feet.



The cap will be constructed on a 20H:1V (5%) slope that will intersect the existing exterior embankment slope no higher than the existing ash surface. Soil embankment materials above that point will be removed and utilized for vegetative cover on the final cap.

Analyses of the structural integrity of Ash Pond A in the proposed closed condition, including slope stability, bearing capacity and settlement, have been completed. The critical sections, selected for slope stability analysis of the perimeter berm and the final cover, are shown on Figure 3. A cross-section of the fully constructed critical section and the critical analyzed potential failure surface are included on Figure 4. Analyses of the proposed final configuration of the pond resulted in the following factors of safety (FOS) and induced settlement with regard to the structural stability of the pond.

Table 2. Structural Stability Analysis Results for Ash Pond A

Structural Stability Criteria	Calculated FOS	Required FOS*
Short Term Slope Stability – Exterior Embankment	2.02	1.5
Long Term Slope Stability – Exterior Embankment	2.18	1.5
Seismic Event Slope Stability – Exterior Embankment	1.96	1.3
Short Term Slope Stability – Cover Materials	12.45	1.5
Long Term Slope Stability – Cover Materials	11.70	1.5
Seismic Event Slope Stability – Cover Materials	6.79	1.3
Bearing Capacity	36.9	2.0
Seismic Event Bearing Capacity	36.2	1.5
Maximum Induced Settlement	2.25	N.A.

*The Required FOS is based on Illinois EPA Landfill Requirements, for comparison purposes.

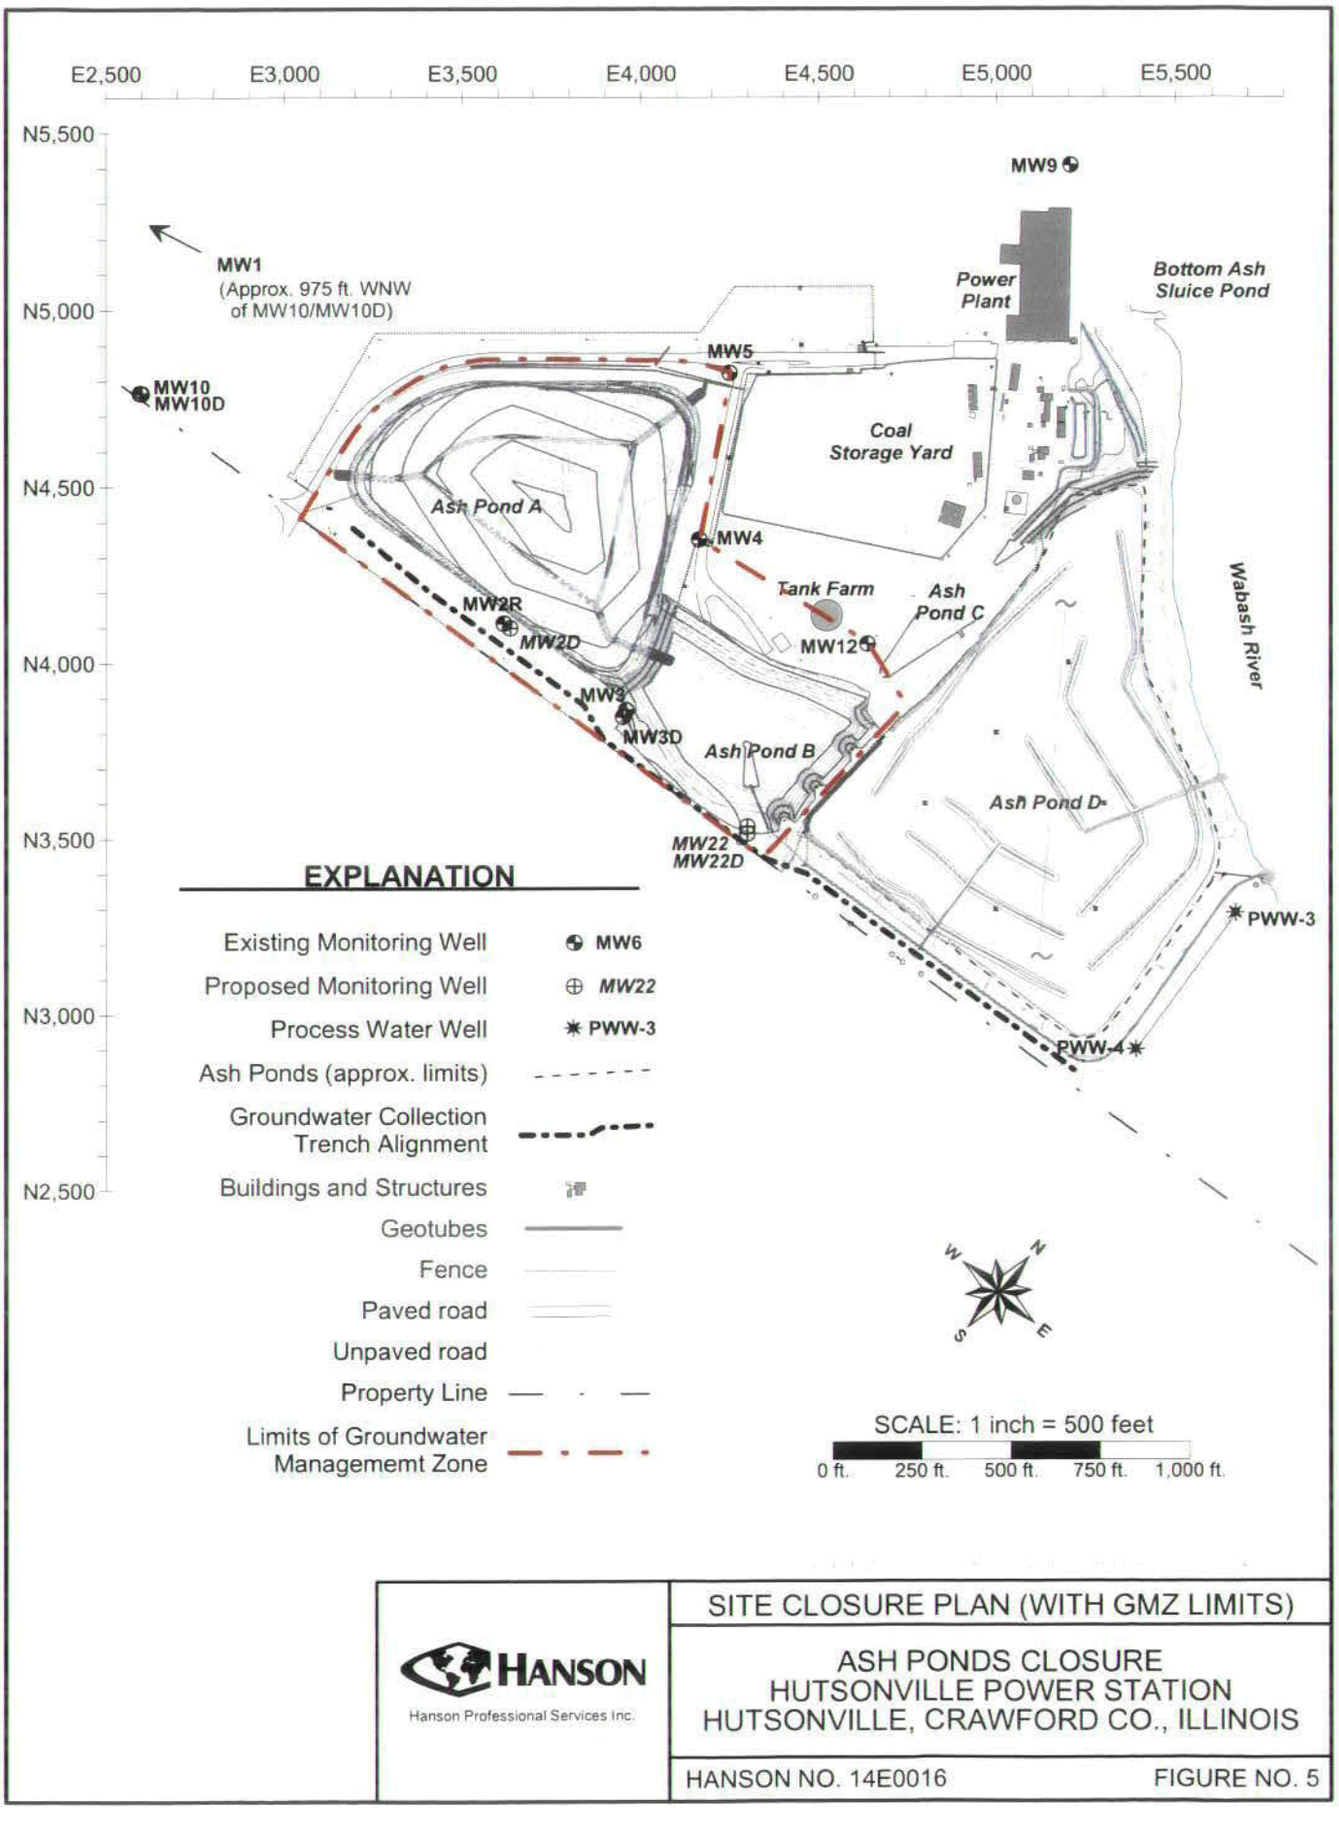
The results of the structural stability analyses indicate adequate slope stability and bearing factors of safety. The slope stability factors of safety above include those from analyses considering seismic events with a 224-year return period, based on United States Geologic Survey mapping. The maximum estimated induced settlement will occur in the middle of the pond area as the ash is graded and the cover system materials are placed, and will not be detrimental to the integrity of the cover system.

3.2 Ash Pond B

Ash Pond B, an HDPE-lined pond, was placed into service in 2000 for disposal of sluiced fly ash and bottom ash, but still receives wastewater and/or storm water for periodic discharge and is permitted under the site's NPDES and Subpart B permits. The ash pond has a surface area of approximately 4.4 acres, with a maximum unit height of 17 feet. It is estimated that Ash Pond B currently has 12,400 yd^3 of ash to an average depth of approximately 1.7 feet. Ash Pond B functioned as a polishing pond, receiving flow via a triplex pump station from Ash Pond C in addition to flow from Ash Pond A before discharging to the Wabash River via NPDES-permitted outfall #002 (IL0000175).

3.3 Ash Pond C

Ash Pond C, an HDPE-lined pond was placed into service from 2000 for disposal of sluiced bottom ash from the Bottom Ash Sluice Pond before discharge to the Wabash River via outfall #002. This pond still receives wastewater and/or storm water for periodic discharge and is permitted under the site's NPDES and Subpart B permits. As discussed above, water from Ash Pond C was discharged to Ash Pond B via a pump station. The ash pond has a surface area of approximately 2 acres, with a maximum unit height of 12 feet. It is estimated that Ash Pond C currently has 10,000 yd^3 of ash to an average depth of approximately 2.9 feet.



3.4 Bottom Ash Sluice Pond and Coal Yard

The Bottom Ash Sluice Pond was operational from 1969 until the plant ceased generation in December 2011 for disposal and reuse of bottom ash. This pond has a surface area of approximately 1.2 acres, with a maximum unit height of 15 feet. It is estimated that the Bottom Ash Sluice Pond contains 23,142 yd^3 of bottom ash to an estimated depth of 10 to 15 feet. This pond still receives wastewater and/or storm water for periodic discharge and is permitted under the site's NPDES and Subpart B permits.

The coal storage yard encompasses an area of approximately 7.9 acres and contains an average depth of 12 inches of spoils. It is estimated that approximately 12,700 yd^3 of material will be removed.

4. Closure Activities

Closure elements for each of the ash ponds are described below. Closure activities will be conducted in accordance with the Construction Quality Assurance (CQA) Plan prepared for this project that generally conforms with the Ash Pond D site-specific rule at 35 IAC 840, and where judged appropriate, elements of the proposed 35 IAC 841 rules, currently under development. The preliminary designs of the closure elements are shown on Figure 5.

SITE CLOSURE PLAN (WITH GMZ LIMITS)

ASH PONDS CLOSURE
HUTSONVILLE POWER STATION
HUTSONVILLE, CRAWFORD CO., ILLINOIS

HANSON NO. 14E0016 FIGURE NO. 5

I:\14jobs\14E0016\Admin\14-Reports\ClosurePlan\FIG_5FinalCondMap.srf

Electronic Filing: Received, Clerk's Office 09/28/2020

4.1 Capping of Ash Pond A

Ash Pond A will be the depository for disposal of materials from Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond, which are all being clean-closed. An estimated 1-foot depth of spoils from the Coal Yard will also be removed and relocated to Ash Pond A. Total material that is being moved to Ash Pond A from other areas of the Site is estimated to be approximately 58,000 yd^3. Ash Pond A is the only pond of the four being closed that will have a constructed cap.

4.11 Backfilling and Grading

Ash and fill materials will be graded to establish the final sloped surface of the cap. Base grading of Ash Pond A will require approximately 32,400 yd^3 of material to be cut and 76,400 yd^3 of fill. Ash will be graded to a maximum slope of 20H:1V to promote surface drainage toward the outside of the berm and prevent ponding of runoff. The final ash grading will intersect the existing exterior embankment slope no higher than the existing ash surface, in accordance with the Rules. Soil embankment materials above that point will be removed and utilized for vegetative cover on the final cap. The final cover design will result in a maximum of about 34 feet of re-graded ash near the center of the pond. The final surface of the ash cap will be rolled smooth prior to the placement of the final cover system.

4.12 Final Cover Placement

Final cover components will include approximately 55,400 yd^2 of low permeability geosynthetic membrane cover and approximately 53,600 yd^3 of final protective soil material. See the closure Plans and Specifications completed for this project (Hanson, 2014d).

The low permeability layer will consist of textured high density polyethylene (HDPE) geomembrane which will have a 40-mil minimum nominal thickness. Geomembrane seams will be continuously fusion or extrusion welded to form one continuous membrane covering the entire area of exposed ash. The perimeter edges of the HDPE geomembrane will be finished in an anchor trench excavated in soil materials. This will serve to keep the membrane anchored in place and prevent any lateral migration of surface water into the cap.

The low permeability geomembrane will be covered with a minimum of three feet of soil materials. These soils will be compacted only to the extent required for equipment traffic and construction of overlying drainage structures.

Soils used for the final protective cover will be fertilized, seeded and mulched to facilitate and support a permanent self-sustaining vegetative cover.

Installation of the low permeability geomembrane and the overlying soils will be conducted in accordance with the CQA program. Required records will be maintained on site during construction.

The acceptance report and certification of final cover placement will be submitted to the Illinois EPA and be maintained at the offices of Ameren Environmental Services in St. Louis, Missouri.

4.13 Ash Pond Dewatering

Dewatering of Ash Pond A will take place to the extent necessary to facilitate construction in accordance with this Plan. Since Ash Pond A has an HDPE bottom liner the water level within the pond may be above the surrounding water table.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.14 Surface Water Management

Surface water management features have been incorporated into the final cover design, which will be graded to drain surface water at a uniform 5% slope toward the outside berm. The cover drainage is split into three collection areas. Drainage off the western-most third of the cover will collect in a rock chute at the northwest corner, where it is free to discharge toward the northeast using the existing roadside ditch and then out through an existing culvert beneath the north Site access road. Drainage from the eastern-most third of the cover will collect in a similar rock chute at the northeast corner, where it also discharges to the north through the same culvert beneath the Site access road. Drainage from the southern-most third of the cover will collect in a rock chute at the southeast corner, where it will discharge into a storm water retention pond in the area where Ash Pond B is currently located.

4.2 Clean Closure of Ash Pond B

Ash Pond B will be clean-closed and the berms removed to be re-used as cover material for Ash Pond A. Ash removal from Ash Pond B and relocation to Ash Pond A is estimated at approximately 12,500 yd^3. The geomembrane liner at Ash Pond B will be removed and the pond bottom graded to 4-ft. below the pond perimeter. The pond bottom will then be graded to drain to the southeast through a culvert and into the existing paved ditch along the south side of Ash Pond D. Storm water tributary to this pond will be detained for intermediate to large rain events to elevation 446.00 by under sizing the outlet culvert.

4.3 Clean Closure of Ash Pond C and Bottom Ash Sluice Pond

Ash Pond C and the Bottom Ash Sluice Pond will be clean-closed and graded to drain to the northeast through an open cut channel through the original east perimeter berm of Ash Pond D and discharged towards the Wabash River. Ash removal from Ash Pond C and relocation to Ash Pond A is estimated at 10,000 yd^3. The geomembrane liner at Ash Pond C will be removed. An estimated depth of 12 feet of bottom ash over the 1.2 acre area of the Bottom Ash Sluice Pond contains approximately 23,000 yd^3, which will be removed and relocated to Ash Pond A. All ash in these areas will be removed to ensure clean closure of these ponds. Any modifications required at the interface between previously closed Ash Pond D and the Bottom Ash Sluice Pond will be constructed in full compliance with the site-specific (Ash Pond D) closure requirements at 35 IAC 840.126. The required documentation will be submitted to the Illinois EPA upon completion of construction.

4.4 Groundwater Model Simulation of Closure

The groundwater model predicts that groundwater quality after Site closure as the following:

- The proposed closure activities, consisting of excavation, capping, and operation of the completed groundwater trench system, will facilitate compliance of the surrounding groundwater to the Class I groundwater standard.
- Monitoring wells for Ash Ponds A, B, and C are predicted to reach the Class I groundwater standard within 10 years.

4.5 Schedule

Completion of the closure activities is dependent on final approval of this Plan by the Illinois EPA. Assuming approval by December 31, 2014, and dependent on weather, the closure will be completed during the 2015 construction season.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.14 Surface Water Management

Surface water management features have been incorporated into the final cover design, which will be graded to drain surface water at a uniform 5% slope toward the outside berm. The cover drainage is split into three collection areas. Drainage off the western-most third of the cover will collect in a rock chute at the northwest corner, where it is free to discharge toward the northeast using the existing roadside ditch and then out through an existing culvert beneath the north Site access road. Drainage from the eastern-most third of the cover will collect in a similar rock chute at the northeast corner, where it also discharges to the north through the same culvert beneath the Site access road. Drainage from the southern-most third of the cover will collect in a rock chute at the southeast corner, where it will discharge into a storm water retention pond in the area where Ash Pond B is currently located.

4.2 Clean Closure of Ash Pond B

Ash Pond B will be clean-closed and the berms removed to be re-used as cover material for Ash Pond A. Ash removal from Ash Pond B and relocation to Ash Pond A is estimated at approximately 12,500 yd^3. The geomembrane liner at Ash Pond B will be removed and the pond bottom graded to 4-ft. below the pond perimeter. The pond bottom will then be graded to drain to the southeast through a culvert and into the existing paved ditch along the south side of Ash Pond D. Storm water tributary to this pond will be detained for intermediate to large rain events to elevation 446.00 by under sizing the outlet culvert.

4.3 Clean Closure of Ash Pond C and Bottom Ash Sluice Pond

Ash Pond C and the Bottom Ash Sluice Pond will be clean-closed and graded to drain to the northeast through an open cut channel through the original east perimeter berm of Ash Pond D and discharged towards the Wabash River. Ash removal from Ash Pond C and relocation to Ash Pond A is estimated at 10,000 yd^3. The geomembrane liner at Ash Pond C will be removed. An estimated 4-foot depth of ash from the Bottom Ash Sluice Pond, or approximately 23,000 yd^3, will be removed and relocated to . Ash Pond A.

4.4 Groundwater Model Simulation of Closure

The groundwater model predicts that groundwater quality after Site closure as the following:

- The proposed closure activities, consisting of excavation, capping, and operation of the completed groundwater trench system, will facilitate compliance of the surrounding groundwater to the Class I groundwater standard.
- Monitoring wells for Ash Ponds A, B, and C are predicted to reach the Class I groundwater standard within 10 years.

4.5 Schedule

Completion of the closure activities is dependent on final approval of this Plan by the Illinois EPA. Assuming approval by December 31, 2014, and dependent on weather, the closure will be completed during the 2015 construction season.

Electronic Filing: Received, Clerk's Office 09/28/2020

5. Groundwater Management Zone Application

See the separate Groundwater Management Zone (GMZ) Application (Hanson and NRT, 2014a) that was prepared for this project. Ameren requested establishment of a GMZ pursuant to 35 IAC 620.250(a)(2) as a three-dimensional region containing groundwater being managed to mitigate impairments caused by a release of leachate from Ash Ponds A, B, and C.

The proposed GMZ covers a larger area than the area of impacted groundwater within the Site. The approximate boundary of the proposed GMZ is depicted in Figure 5. The GMZ will extend vertically through the unlithified deposits and sandstone bedrock, with the base of the GMZ coincident with the bottom of the sandstone, which rests on top of the shale bedrock at an approximate elevation of 405 to 410 feet NGVD within the boundaries of the GMZ.

6. Groundwater Monitoring System

See Sections 2 and 3 in the separate Groundwater Monitoring Plan (Hanson, 2014c) that was prepared for this project. A monitoring system maintenance plan is included at the end of Section 2.2 of that report.

Locations of the (potential) 11 monitoring wells to be used for statistical analysis are identified in Table 3 below and are shown on Figure 2.

Table 3. Ash Pond A Groundwater Monitoring System

Well ID	Well Designation	Monitoring Zone	Install Date	Location[2]		Screen Interval
				Easting	Northing	
MW2R	Downgradient	Shallow	6 Apr 12	3617.43	4112.60	446.0-435.2
MW2D[3]	Downgradient	Deep	*proposed*	3612.	4110.	435.0-430.0
MW3	Downgradient	Shallow	9 Feb 84	3952.03	3860.23	450.9-445.9
MW3D	Downgradient	Deep	6 Oct 98	3952.03	3860.23	433.6-438.6
MW4	Downgradient	Shallow	13 Feb 84	4164.06	4350.55	450.8-443.3
MW5	Downgradient	Shallow	13 Feb 84	4249.98	4821.99	453.5-440.5
MW9	Piezometer	Shallow	14 Oct 84	5202.	5408.	448.2-438.2
MW10	Upgradient	Shallow	7 Oct 98	2559.81	4730.48	447.2-442.2
MW10D	Upgradient	Deep	7 Oct 98	2564.72	4729.43	437.6-433.6
MW12	Downgradient	Shallow	8 Oct 98	4637.98	4053.58	448.6-438.6
MW22[3]	Downgradient	Shallow	*proposed*	4300.	3525.	450.0-445.0
MW22D[3]	Downgradient	Deep	*proposed*	4300.	3525.	435.0-430.0

[2] Well locations based on Plant coordinate system.

[3] Proposed monitoring well to be installed upon approval of this Groundwater Monitoring Plan by Illinois EPA. Deep wells (D suffix) may need to be installed due to shallow zone dewatering from collection trench.

Electronic Filing: Received, Clerk's Office 09/28/2020

7. Groundwater Monitoring Program

Upon approval of the Groundwater Management Zone Application (Hanson and NRT, 2014a), the groundwater monitoring program will be instituted. The requirements of the Groundwater Monitoring Program are found in the accompanying Groundwater Monitoring Plan (Hanson, 2014c).

The elements of the groundwater monitoring plan include:

1. Groundwater monitoring system with background (upgradient) and compliance (downgradient) monitoring wells identified including construction details/depths.
2. Groundwater monitoring for 7 field and 24 inorganic parameters (Table 4 and Table 5).
3. Quarterly groundwater monitoring frequency.
4. Groundwater sample collection protocol with standard operating procedures.
5. Laboratory analysis by a state-certified laboratory and listing of methods and reporting limits.
6. Quality Assurance Program for field collection of samples and laboratory analysis of samples.
7. Groundwater monitoring system maintenance, including schedule of inspections and methods for inspection of monitoring wells.
8. Data reporting schedule and content of reports.
9. Demonstration of compliance (Section 7.1 below). Statistical methods for evaluating groundwater quality data (Section 7.2 below). Included is a notification schedule with actions to be taken in cases of non-compliance.

Groundwater monitoring can be concluded upon successful completion of post-closure activities and approval of the Illinois EPA. All monitoring data and trend analysis data will be maintained at the offices of Ameren Environmental Services in St. Louis, Missouri, for a minimum of ten years following generation of the data.

7.1 Demonstration of Compliance

Compliance will be based on attainment of groundwater quality that meets the numeric standards for Class I potable resource groundwater as set forth in 35 IAC 620.410. Groundwater quality that does not meet the Class I standard will be considered in compliance when no statistically significant increasing trend can be attributed to the ash ponds at the compliance (GMZ) boundary for four (4) consecutive years, which must be approved by the Illinois EPA. Post-closure groundwater compliance monitoring will continue for a minimum of ten years from the Illinois EPA's approval of this Closure Plan.

Table 4. Field Monitoring Parameters

Parameters[2]
pH[3]
Specific Conductance[3]
Elevation of GW Surface[3]
Depth of Well (bls)[3]
Temperature
Depth to Water (bmp)
Elevation of measuring point

Table 5. Routine Monitoring Parameters

Parameters[2]	Parameters[2]
Antimony, dissolved	Iron[3], dissolved
Arsenic, dissolved	Lead, dissolved
Barium, dissolved	Manganese[3], dissolved
Beryllium, dissolved	Mercury, dissolved
Boron[3], dissolved	Nickel, dissolved
Cadmium, dissolved	Nitrate (as N), dissolved
Chloride, dissolved	Selenium, dissolved
Chromium, dissolved	Silver, dissolved
Cobalt, dissolved	Sulfate[3], dissolved
Copper, dissolved	Total Dissolved Solids (TDS)[3]
Cyanide, total	Thallium, dissolved
Fluoride, dissolved	Vanadium, dissolved
	Zinc, dissolved

7.2 Compliance Determination and Mitigation Requirements

Groundwater Management Zone (GMZ) compliance will be demonstrated by performing an annual trend analysis for each downgradient monitoring well for all of the monitored constituents listed in Table 4 and Table 5. The analysis shall be performed on a minimum of four (4) consecutive samples and use Sen's Estimate of Slope for compliance determination. Generally, if analyses for a parameter show an increasing trend at a down-gradient well, a Mann-Kendall analysis must be performed at a 95% confidence limit to determine whether the increasing trend is statistically significant. If there is a statistically significant increase, then an investigation determining that the statistically significant increasing trend is due to a superseding cause will be performed, and the Illinois EPA will be notified in writing, stating the cause of the increasing trend and the rationale used in its determination.

[2] Routine parameters are reported as dissolved (filtered) concentrations with the exception of the Field Monitoring Parameters and Cyanide, which are taken from total (unfiltered) samples.
[3] Mandatory monitoring parameter under 35 IAC 840.114(a).

If a statistically significant increasing trend continues to be observed over two or more consecutive monitoring periods and there is no superseding cause, a hydrogeologic investigation (and additional site investigation(s), if necessary) must be performed.

Based on the outcome of the additional activities, action must be taken to mitigate the statistically significant increasing trends that are causing, threatening or allowing exceedances of the GMZ groundwater quality standards. Any actions must be proposed as a modification to the post-closure care plan within 180 days after completion of the additional hydrogeologic and/or additional site investigations.

8. Time and Cost Estimates

8.1 Time to Complete Closure

Completion of the closure activities is dependent on weather and final approval of the closure plan and accompanying submittals by the Illinois EPA. However, they are expected to be completed during the 2015 construction season.

8.2 Time to Reach Hydrostatic Equilibrium of Groundwater

The Hydrogeologic Evaluation of Landfill Performance model (HELP Version 3.07) was used to estimate the time for groundwater levels within Ash Pond A to reach hydrostatic equilibrium following completion of the cap. Based on model results for four scenarios with initial moisture contents ranging from zero to 180 inches, the minimum and maximum times for hydraulic head to reach equilibrium ranged from 6 to 8 years. Three of the four scenarios resulted in modeled equilibriums ranging from 61 to 69 inches of head occurring in Year 6 following cap completion.

8.3 Model Predicted Time to Attain Groundwater Quality Standards

The number of years following closure for model predicted boron concentrations (NRT, 2014) in Ash Pond A, B, and C monitoring wells to attain the Class I groundwater standard is approximately 10 years (2025). Predicted boron concentrations will stabilize shortly after the closure plan is implemented in monitoring wells with low concentrations (wells MW5 and MW9), while other wells are predicted to take as long as 40 years to stabilize. Stabilization time is greater than time to comply with Class I groundwater standards at some wells because concentrations continue to decline for a period after the standard is attained.

8.4 Cost of Closure and Post-Closure Care (or Cost of Closure Alternative)

The cost for closure activities related to the closure of Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond, as described in Section 4 of this Closure Plan and as detailed in the Plans and Specifications (Hanson, 2014d), is estimated to be $2,600,000. The cost for post-closure care activities related to the closure of Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice

Electronic Filing: Received, Clerk's Office 09/28/2020

2. If there is no superseding cause, and monitoring frequency has been decreased to semi-annual or annual, then sampling must return to a quarterly frequency. If after 4 consecutive quarters no statistically significant increasing trend is observed, then sampling frequency can return to the previous frequency.
3. Notification of statistically significant increasing trends and revision to the sampling frequency must be reported to the Illinois EPA within 30 days of making the determinations.

If a statistically significant increasing trend continues to be observed over two or more consecutive years and there is no superseding cause, a hydrogeologic investigation (and additional site investigation(s), if necessary) must be performed.

Based on the outcome of the additional activities, action must be taken to mitigate the statistically significant increasing trends that are causing, threatening or allowing exceedances of off-site groundwater quality standards. Any actions must be proposed as a modification to the post-closure care plan within 180 days after completion of the additional hydrogeologic and/or additional site investigations.

8. Time and Cost Estimates

8.1 Time to Complete Closure

Completion of the closure activities is dependent on weather and final approval of the closure plan and accompanying submittals by the Illinois EPA. However, they are expected to be completed during the 2015 construction season.

8.2 Time to Reach Hydrostatic Equilibrium of Groundwater

The Hydrogeologic Evaluation of Landfill Performance model (HELP Version 3.07) was used to estimate the time for groundwater levels within Ash Pond A to reach hydrostatic equilibrium following completion of the cap. Based on model results for four scenarios with initial moisture contents ranging from zero to 180 inches, the minimum and maximum times for hydraulic head to reach equilibrium ranged from 6 to 8 years. Three of the four scenarios resulted in modeled equilibriums ranging from 61 to 69 inches of head occurring in Year 6 following cap completion.

8.3 Model Predicted Time to Attain Groundwater Quality Standards

The number of years following closure for model predicted boron concentrations (NRT, 2014) in Ash Pond A, B, and C monitoring wells to attain the Class I groundwater standard is approximately 10 years (2025). Predicted boron concentrations will stabilize shortly after the closure plan is implemented in monitoring wells with low concentrations (wells MW5 and MW9), while other wells are predicted to take as long as 40 years to stabilize. Stabilization time is greater than time to comply with Class I groundwater standards at some wells because concentrations continue to decline for a period after the standard is attained.

8.4 Cost of Closure and Post-Closure Care (or Cost of Closure Alternative)

The cost for closure activities related to the closure of Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond, as described in Section 4 of this Closure Plan and as detailed in the Plans and Specifications (Hanson, 2014d), is estimated to be $2,600,000. The cost for post-closure care activities related to the closure of Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice

Electronic Filing: Received, Clerk's Office 09/28/2020

Pond, as specified in the Post-Closure Care Plan (Hanson, 2014e) completed for this project, is estimated to be $63,000 annually. Total cost for closure and post-closure care under this alternative, which includes capital cost and O&M, is $2,600,000 (closure cost) + $630,000 (10-year post-closure care cost) = $3,230,000 (in 2014 dollars).

For comparison purposes, a clean closure alternative for the Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond at the Site would exceed the $33,000,000 just for the disposal charges (tipping fees) at a permitted disposal facility, and does not include excavation, handling, and transportation to the disposal location. Along with the handling and disposal charges, large volumes of fill could be needed to return the Site to conditions that would promote positive site drainage. Estimated costs are highly dependent on costs associated with disposal of ash in a municipal waste landfill and upon the availability of local fill material. If the material is not suitable for disposal in a solid waste landfill, the disposal cost will be significantly higher than estimated. Due to unfavorable cost and the expected effectiveness of the chosen alternative, this option was not selected.

9. Construction Quality Assurance Program

As previously indicated, see the Construction Quality Assurance (CQA) Plan completed for this project (Hanson, 2014a), which describes the CQA program for the closure of Ash Ponds A, B, C and the Bottom Ash Sluice Pond.

The CQA Plan requires a scheduled program of CQA monitoring, inspection, sampling and testing to verify compliance with project plans and specifications. The goal of the program is to achieve a reasonable degree of certainty that the construction of the facility meets the specified designs.

The elements of the Plan include:

1. Responsibility and authority of project personnel, including: the owner (Ameren); design engineer; CQA personnel, including owner's representative retained as a CQA Officer and a document controller; testing and monitoring firms under the direction of the CQA officer, including the soil/concrete testing lab(s), surveyor, geosynthetics monitor and geosynthetics testing laboratory; and, contractors, suppliers and installers performing their designated portions of the work.
2. Project meetings, including preconstruction meetings, routine progress meetings and as needed, problem or work deficiency meetings.
3. In-progress acceptance of work by the geosynthetic installers and the vegetative cover installers to insure that the geosynthetic is not damaged.
4. Sampling and testing requirements. Prequalification and placement sampling/testing requirements for the various materials and construction activities.
5. Corrective measures. The CQA Officer shall reject and require replacement of all materials for which sampling, testing or inspection show that prequalification requirements are not met. The CQA Officer shall also reject workmanship (and require corrective rework) for which sampling, testing or inspection show that material placement requirements are not met.
6. Documentation of sampling, inspections, and testing, with daily inspection reports and weekly summary reports prepared by the CQA Officer or his designated representative.

Electronic Filing: Received, Clerk's Office 09/28/2020

7. Acceptance report prepared by the CQA Officer upon completion of the construction contract and submitted to the Illinois EPA. The acceptance report shall contain the following:
    - Certification by the CQA Officer that the construction has been prepared and constructed in accordance with the engineering design.
    - "As-built" drawings.
    - Weekly summary reports.
8. Construction management activities, including:
    - Procedures for requests for information (RFIs), clarification or interpretation of contract documents by the General Contractor or installer to the CQA Officer.
    - Review procedures of contractor submitted drawings, product data and samples by the CQA Officer in accordance with the requirements of the project specifications so as not to cause delay in project work.
    - Process by which the contractor shall prepare Field Change Order (FCO) requests to the CQA Officer and responsibilities of the CQA Officer for logging FCOs and updating project costs.
9. Procedures for document control and project records, including revisions of the CQA Plan, as necessary, by the CQA Officer, and issuance and maintenance of the CQA Plan and revisions to the CQA Plan by the Document Controller.

10. Licensed Professional Acknowledgement

I hereby affirm that all information and design contained in this Closure Plan is true and accurate to the best of my knowledge and belief in accordance with good engineering practice.

1. Introduction

The AmerenEnergy Medina Valley Cogen, L.L.C. Hutsonville Power Station (Site) is situated on the west bank of the Wabash River, and approximately one and one-half miles north of the Village of Hutsonville in Crawford County, Illinois. The Site is located generally in the Southwest ¼ of Section 17, Township 8 North, Range 11 West of the Second Principal Meridian (see Figure 1). The focus of this investigation is for the water treatment devices at the Site known as Ash Pond A, Ash Pond B, Ash Pond C and the Bottom Ash Sluice Pond. Ash Pond D, the largest and oldest of the four ash sluice ponds at the Site, was covered and closed in 2012-13 under the Title 35, Illinois Admin. Code (IAC), Part 840 rules (Illinois PCB, 2011). The layout of the Site and the ash ponds are depicted on Figure 2.

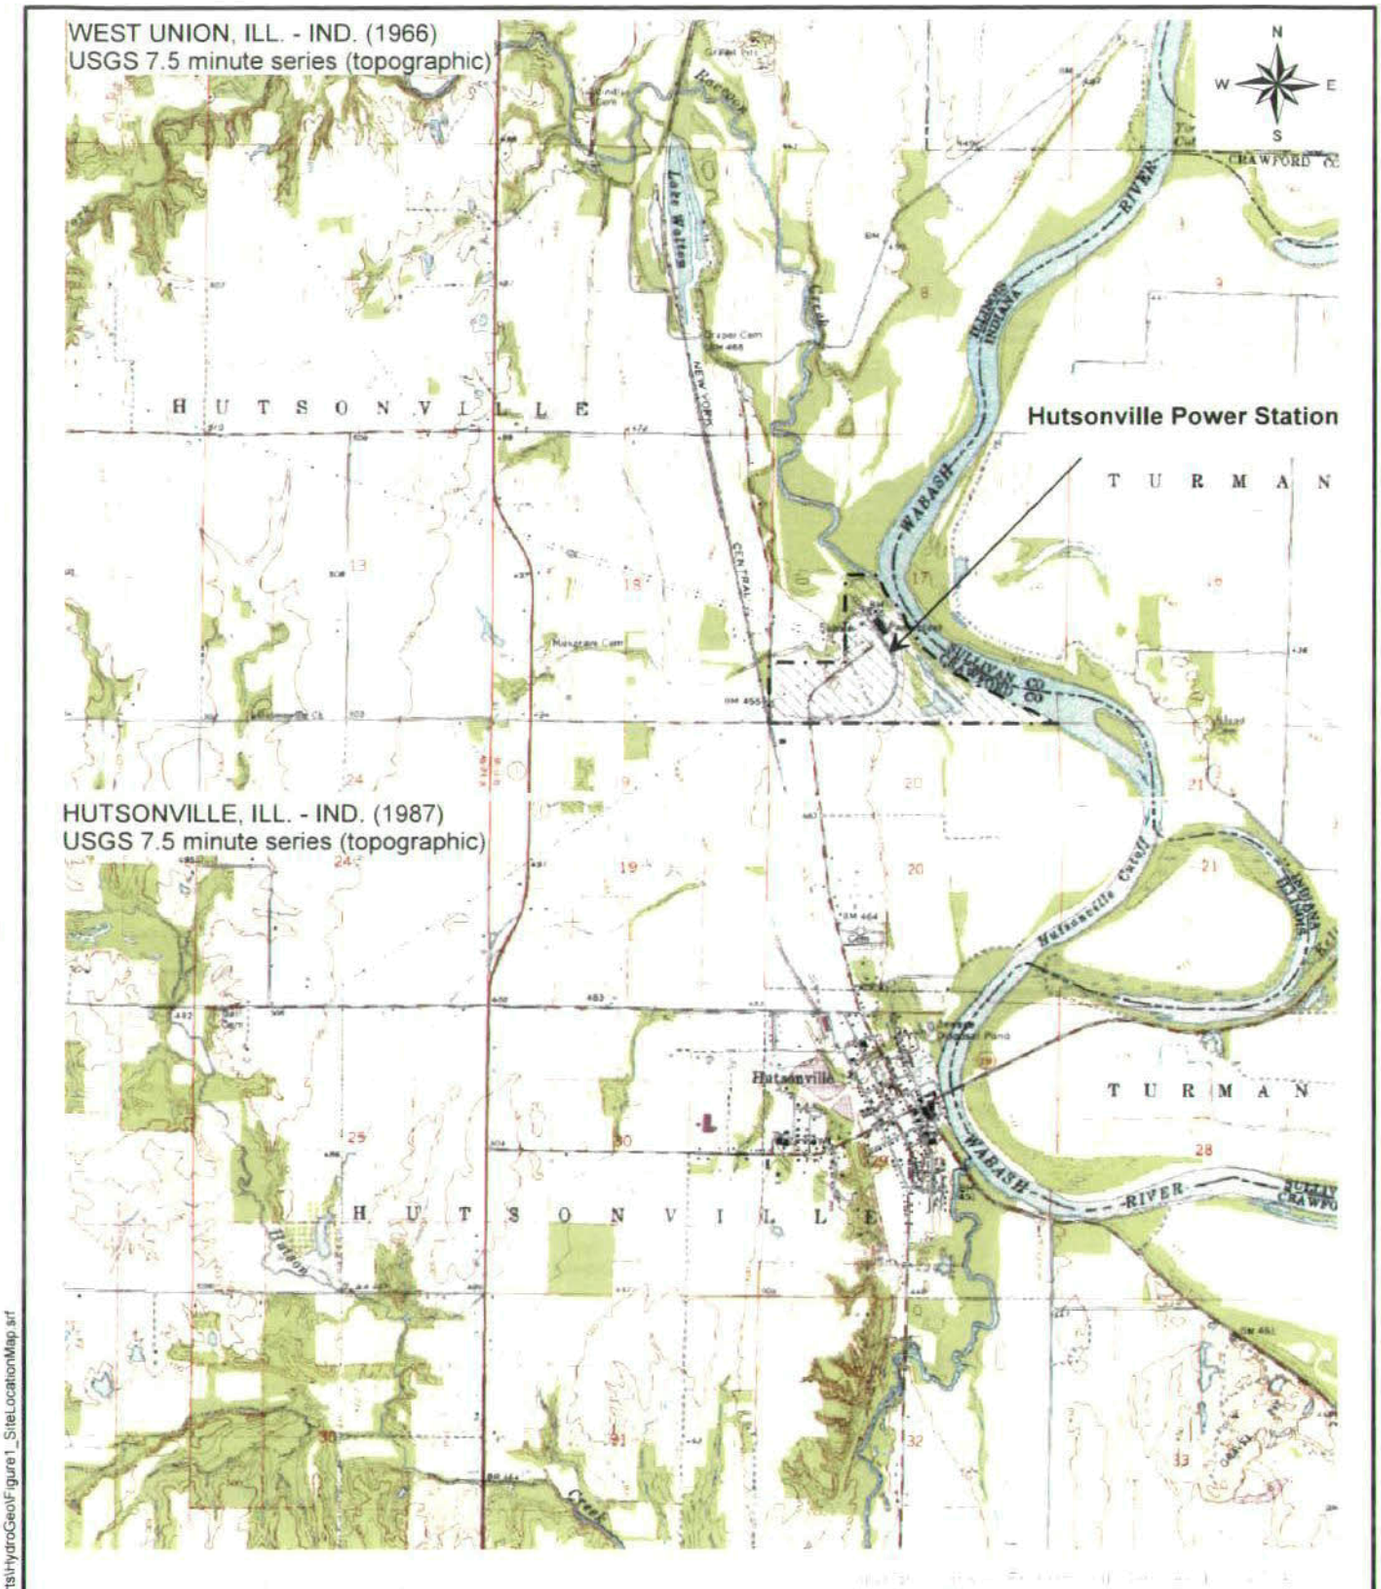
In consultation with the Illinois Environmental Protection Agency (Illinois EPA), Ameren pursued an additional rulemaking before the Illinois Pollution Control Board (IPCB) to provide for sequential corrective actions and/or closure of other Ameren Energy Resources (AER) Company ash ponds. The IPCB issued a stay on AER's proposed rulemaking and in October 2013, Illinois EPA filed a rule of general applicability for coal combustion waste surface impoundments at power generating facilities. It sets forth a process to monitor ash ponds and groundwater, as well as a process for preventive response, corrective action and closure (Illinois PCB, 2013). That rulemaking is continuing.

This Hydrogeologic Site Investigation report generally conforms to 35 IAC 840.110 and the proposed rule at Section 841.200 (when judged appropriate) that is currently under development. This investigation provides information to define the hydrogeology and assess any groundwater impacts associated with the Site, to evaluate a Groundwater Management Zone (GMZ), and to establish a groundwater monitoring system for the Site.

2. Project Background

2.1 Physical Setting

The Site is located at the eastern margin of the Springfield Plain of the Till Plain Section of the Central Lowland (Physiographic) Province (Leighton et al., 1948). The topography consists of generally flat agricultural land with shallow, entrenched drainage.



2.2 Geologic Setting

The Site geology consists primarily of Wisconsinan Stage fluvial deposits with some Illinoian Stage diamictons overlying Pennsylvanian bedrock. The surficial (unlithified) materials consist of the Cahokia Formation (fluvial deposits), Henry Formation (glacial outwash deposits), and diamictons of the Glasford Formation (Willman et al., 1975; Hansel & Johnson, 1996).

Regional bedrock is composed of Pennsylvanian Age shale, sandstone, limestone and coal of the Desmoinesian Stage Modesto Formation of the McLeansboro Group (Willman et al., 1975). There are no active geologic structures or faults in the vicinity of the Site (Nelson, 1995).

2.3 Climate Data

Climatic data was obtained from the Indiana State Climate Office (ISCO, 2014). The data was recorded between 1954 and 2014 in Terre Haute, Indiana, which is located approximately 30 miles northeast of the Site. The average values of the data are summarized in Table 1.

3. Previous Investigations

Several subsurface investigations previously completed at the Site are summarized below. A map, depicting the location of the various borings and wells, is included in Appendix A. Boring logs for the various field investigations are also included in Appendix A. All borings drilled as part of the various investigations would have been abandoned (sealed) to the standard of the day. Monitoring wells and piezometers installed as part of an investigation but have since been abandoned/sealed are noted at the end of each sub-section and highlighted on the Boring Location Map in Appendix A.

3.1 Hanson 1983

Hanson Professional Services Inc. (Hanson) completed a geotechnical evaluation for a proposed lined ash pond (Ash Pond A) in August 1983, when the power plant was owned by Central Illinois Public Service Company (CIPS). This investigation advanced 4 borings around the proposed Ash Pond A, and one boring near the southwest corner of the existing, unlined ash pond (Ash Pond D). All borings were advanced to bedrock using hollow stem augers, and two borings were cored approximately 10 feet into bedrock.

3.2 Hanson 1984a

A series of monitoring wells were installed in February 1984. These wells (MW1 through MW9) continue to be used at the Site, and are located around Ash Ponds A and D. Samples of the coarse-grained materials above the bedrock were collected during the installation of these wells. MW2 was replaced in 2012 by MW2R due to its proximity to the Groundwater Collection Trench.

3.3 Hanson 1984b

The 1983 geotechnical investigation was augmented during July 1984 to provide additional information for the berm design around Ash Pond A. Six borings to bedrock were planned. During the course of the investigation, boring SW-2 encountered bedrock at a much lower elevation than in other borings (31 feet versus less than 10 feet). Two additional borings were drilled on either side of SW-2 (SW-2A and SW-2B) to determine the extent of the bedrock feature. Based on the borings, Hanson interprets the bedrock feature as an erosional cut, likely caused by post-glacial outwash events.

3.4 STMI 1998

Due to elevated readings of boron and sulfate in several monitoring wells at the Site, Ameren* directed that an extensive environmental assessment be performed by Science & Technology Management Inc. (STMI). The first phase was performed during August 1998, when 23 locations were investigated using direct-push sampling methods. Two temporary piezometers were also installed in Ash Pond A and have since been removed.

* In 1995, CIPS merged with Union Electric of St. Louis, Missouri. Ameren Corporation (Ameren) was incorporated in August 1995 to be the holding company for the two merged utilities.

Electronic Filing: Received, Clerk's Office 09/28/2020

The second phase of STMI's investigation was the installation of seven new monitoring wells. One shallow well (MW10) was added to augment the upgradient water quality data. MW11, MW12 and MW13 were added to characterize aquifer properties/groundwater flow and further delineate the extent of impacts that appeared to be associated with the ash ponds. MW3D, MW7D and MW10D (up-gradient well) were added to determine if the sandstone bedrock was a potential pathway for the apparent impacts identified by the shallow monitoring wells. MW13 was sealed shortly after installation to allow construction of the new, lined ash ponds (Ash Pond B and Ash Pond C).

3.5 NRT 2001

Two more wells (MW14 and TW, now called MW121) were installed on the east side of Ash Pond D during October 2001 as part of an investigation completed for Ameren by Natural Resource Technology, Inc. (NRT). These wells were installed to evaluate potential migration pathways to the deep fluvial sands identified in the bedrock valley below the current Wabash River. MW11 was also replaced with MW11R at this time.

3.6 NRT 2004

Seven additional wells were installed to the east and south of Ash Pond D during late-April and early-May of 2004 (TW-115S, TW-115D, and TW-116 through TW-120). These wells were installed to evaluate potential off-site migration pathways in the shallow and the deep fluvial sands.

3.7 Geotechnology 2010

Four borings were advanced and two piezometers were installed near the northeast side of Ash Pond D during June 2010 by Geotechnology, Inc. The data collected during this field investigation was used as part of a global stability evaluation of the perimeter embankment of Ash Pond D.

3.8 Hanson 2011

As part of the activities necessary to implement the closure of Ash Pond D required under the promulgated rules at the Illinois Pollution Control Board [Illinois IPCB, 2011], additional subsurface information was obtained for the final cover and the groundwater collector trench design required by the rulemaking. Four additional borings were advanced on the south-side of the Site to provide additional bedrock elevation and geotechnical data adjacent to Ash Pond D. Two additional borings were drilled in Ash Pond D to evaluate the ash and the subsurface material. A temporary piezometer was installed in the northeast ash pond boring (B11-6) to monitor ash pond water levels before and during the proposed construction activities. B11-6 was removed during Ash Pond D cover construction.

Electronic Filing: Received, Clerk's Office 09/28/2020

4. Site Geology

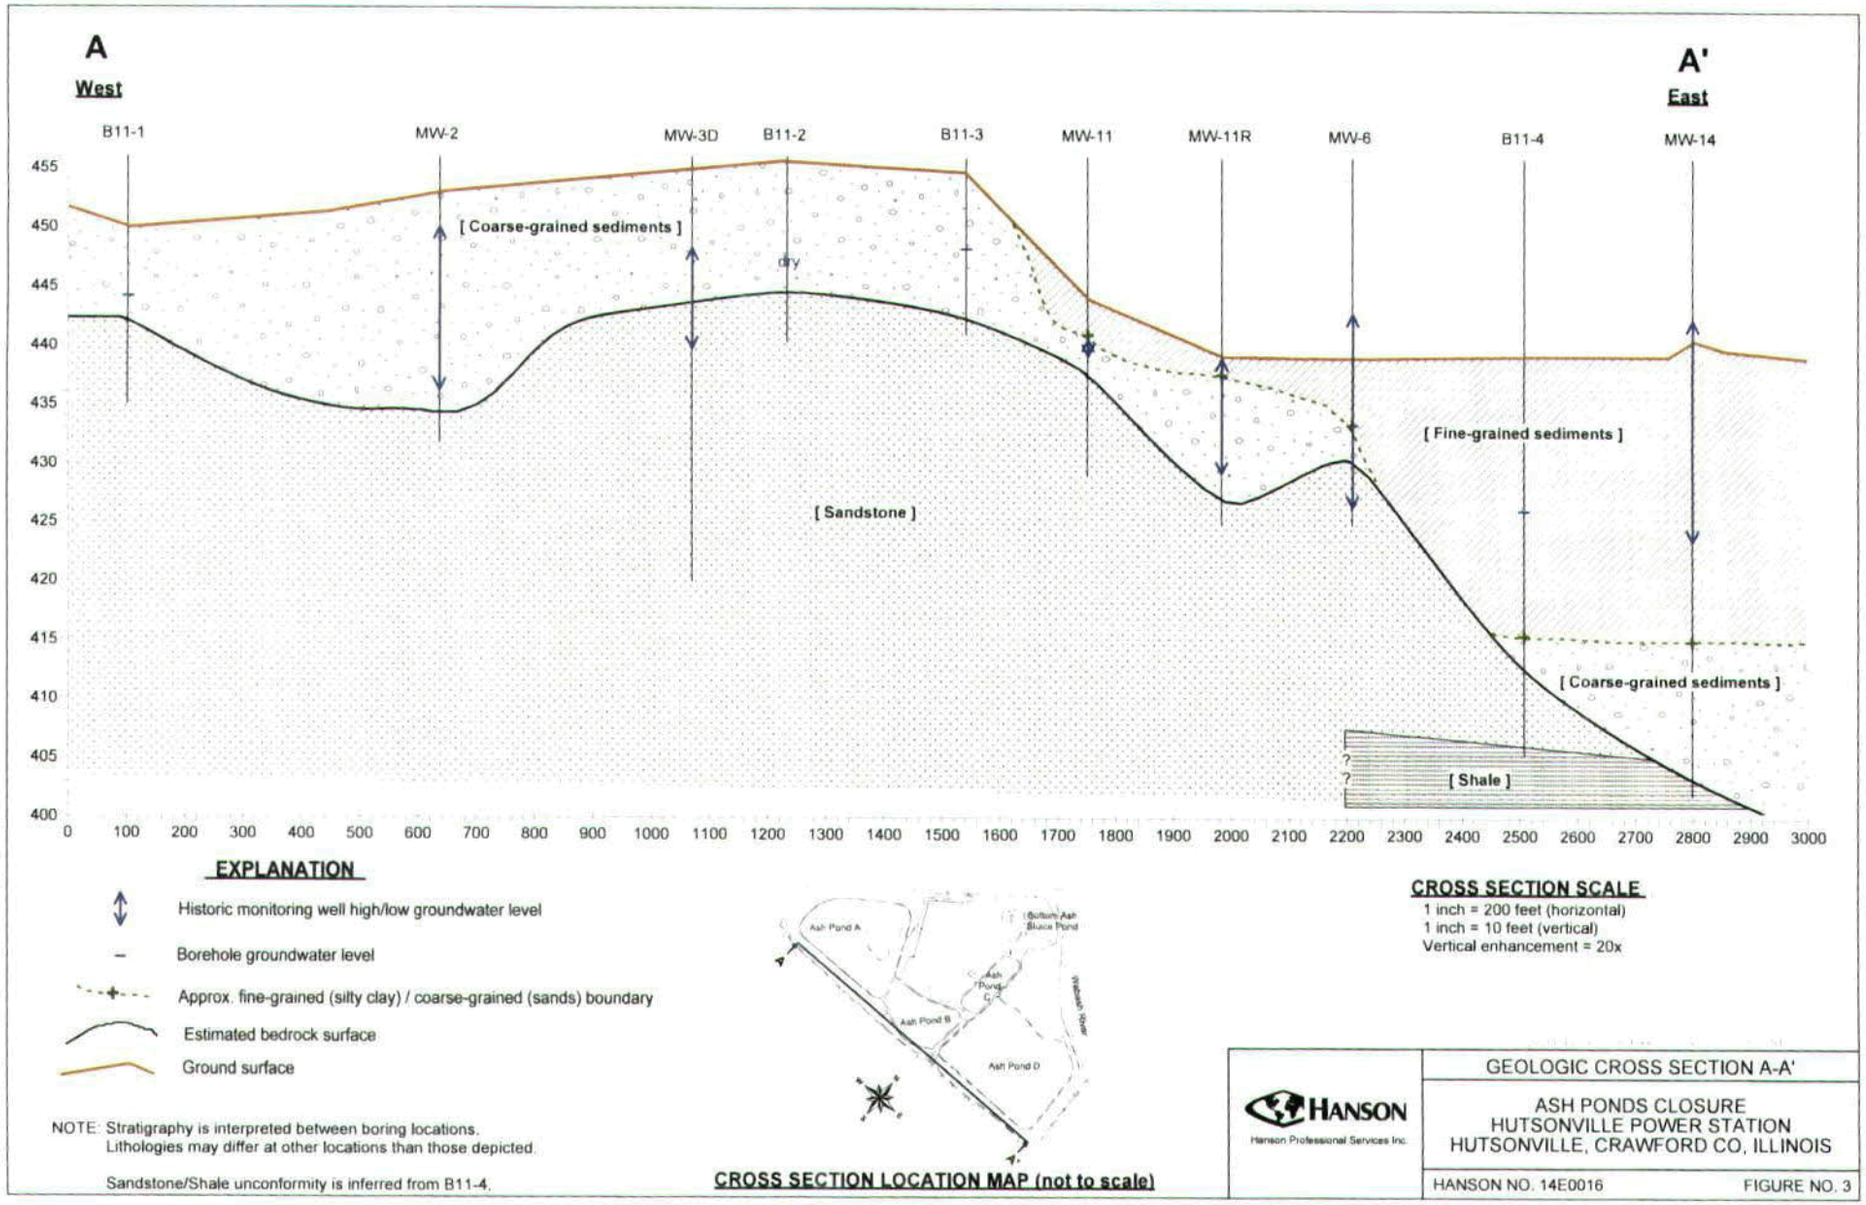
4.1 Stratigraphic Units

Based on information from the Site subsurface investigations summarized above, and published reports, the geology of the Site consists primarily of Wisconsinan Stage fluvial deposits with some Illinoian Stage diamictons overlying Pennsylvanian bedrock. There are various fill materials along with three surficial (unlithified) units identified at the Site (oldest to youngest): silty/clayey diamictons of the Glasford Formation, poorly sorted, outwash sands and gravels of the Henry Formation, and fine-grained fluvial deposits classified as Cahokia Alluvium (Willman et al., 1975; Hansel & Johnson, 1996; Fafalios & Hensel, 1999). Cross sections illustrating the geologic interpretation of the Site are presented in Figure 3, Figure 4, Figure 5, and Figure 6. Site geology was also confirmed using the ISGS ILWATER database and review of nearby water well records (see Appendix A). The Allison (2007) water well log confirms this reports stratigraphic interpretation. Figure 7 depicts the expected Site stratigraphy to a depth of approximately 100 ft.

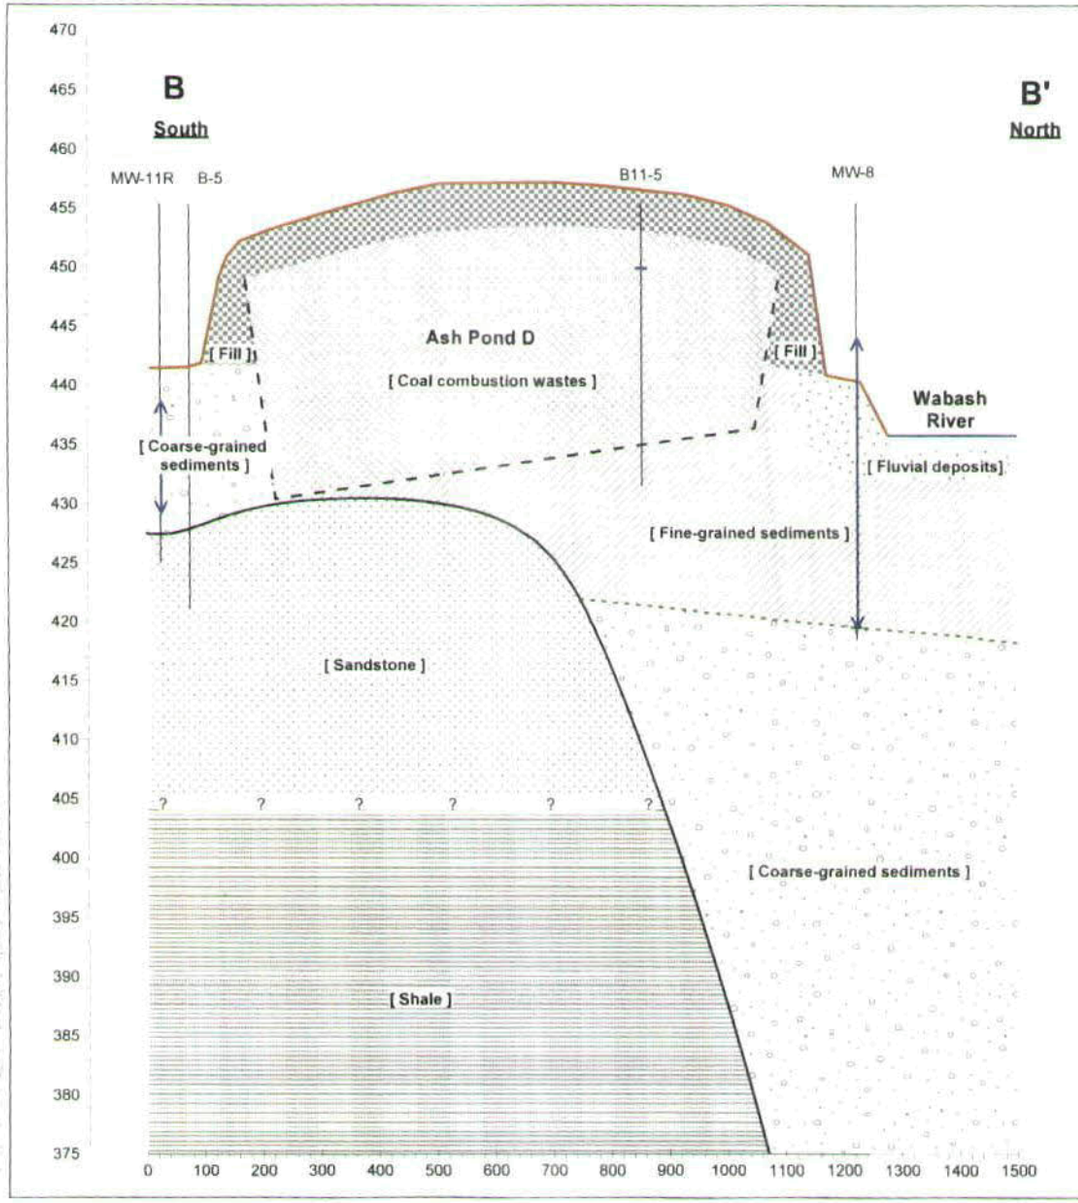
4.2 Bedrock Deposits

Bedrock at the Site is composed of Pennsylvanian Age rock of the Missourian Series Mattoon Formation of the McLeansboro Group. Two lithologies are present at the Site. To the west, the upper bedrock is composed of sandstone of the Merom Sandstone Member (Willman et al., 1975). Closer to the Wabash River, there is a well incised bedrock valley [depths to bedrock vary from 10-15 feet below ground surface (ft. bgs) in the uplands on the western parts of the Site to over 90 ft. bgs in the southeast corner of the Site (Fafalios & Hensel, 1999)]. In the bedrock valley (below elevation 405 ft.), post-glacial erosion has exposed the lithified silts and clays of an undifferentiated shale[†] of the Mattoon Formation. A bedrock surface contour map based on the information from the site boring and monitoring wells is shown on Figure 8.

4.3 Unlithified Materials



4.3.1 Glasford Formation



Several borings contained silty clay with sand and gravel (e.g., MW2, GP-7, GP-8, GP-13, GP-20, and GP-21). This material is interpreted to be Illinoian Stage diamictons of the Glasford Formation (either undifferentiated or part of the Vandalia Till Member). The spotty presence of the till is likely due to post-glacial erosion. It is generally located in the southern portion of the Site, and can be found in excess of 5 feet thick down to a few inches in thickness.

4.3.2 Henry Formation

The Henry Formation is a Wisconsinan Stage glacial outwash sand and gravel, and is the predominant unit in the upland ash pond areas and deep portions of the Wabash River bedrock valley (Berg & Kempton, 1987). These fluvial deposits can range from a few feet to over 65 feet thick. The Henry Formation was not observed in the northern portion of the Site near the Plant.

[†] The sandstone/shale unconformity has been placed at 405 ft. based on information from B11-4. Other borings (e.g., TW-116, TW-117, etc.) encountered the shale at a deeper elevation, but these borings were located in the Wabash River valley. The contact has been eroded at these locations.

4.3.3 Cahokia Formation

The Cahokia Formation was derived from post-glacial erosion of the surficial loess and tills and can be found in the flood plains and channels of modern rivers and streams (Berg & Kempton, 1987; Hansel & Johnson, 1996). At the Site, this alluvium is composed of silts, clays and clayey sands with occasional wood and/or shell fragments. Localized lenses or coarser materials (sands) may occur within the alluvium, but these lenses are not laterally extensive. At the Site, the thickness of the alluvial deposits can range from 0 to 15 feet, but can reach 25 feet in the bedrock valley per the NRT report (Fafalios & Hensel, 1999).

4.3.4 Fill Materials

4.3.4a Earthen Fill

Earthen Fill is present across much of the site, and consists of sandy silts and silty sands that were likely created from on-site or nearby excavations. Fill has been used to elevate depressions and construct the berms surrounding the various ash ponds and structures on Site. Where present, the earthen fill can range from less than 2 to over 10 feet thick.

4.3.4b Coal Combustion Wastes

Coal combustion waste (CCW) is a term for several types of materials, typically bottom ash, fly ash and/or flue gas desulfurization (scrubber) sludge. At the Site, the CCW present are bottom and fly ash. CCW is primarily found in the Site's ash ponds. A total of six borings were completed in Ash Pond D (4 direct push borings by STMI and two recent auger borings by Hanson). The thickness of CCW in these borings ranged from about 12 feet (north-end) to 31 feet (center).

CCW is also stored in the lined Ash Pond A and Ash Pond B. Prior to construction of Ash Pond B, the area was the CCW laydown location, and ash in this area could be up to 12 feet thick at times (Fafalios & Hensel, 1999). It is believed that no CCW remains after construction of the liner for Ash Pond B.

5. Site Hydrogeology

5.1 Hydrogeologic Characteristics

Shallow groundwater in the surficial deposits and the upper bedrock are controlled by the Wabash River, a regional groundwater sink or discharge zone. Groundwater elevations have been measured and recorded at the Site since 1984. Groundwater flow beneath the Site discharges toward and is controlled by the Wabash River within the surficial deposits and upper bedrock in the vicinity of the Site.

5.1.1 Hydraulic Conductivity

Fafalios & Hensel (1999) completed an analysis of hydraulic conductivity for eleven monitoring wells at the Site using the Bouwer and Rice (1976; Bouwer, 1989) slug test analysis method. Results of the slug tests range from a minimum of 2.6×10^{-4} cm/sec to a maximum of 4.8×10^{-2} cm/sec (see Table 2). The calculated geometric mean of the hydraulic conductivity of the sediments is 6.5×10^{-3} cm/sec, and the arithmetic mean of the two sandstone bedrock test results is 4.7×10^{-4} cm/sec.

Electronic Filing: Received, Clerk's Office 09/28/2020

Table 2. Monitoring Well Slug Test Results

Well ID	Hydraulic Conductivity (in cm/sec)	Geologic Material
MW3	2.7×10^{-2}	Silty sand & gravel
MW3D	5.4×10^{-4}	Sandstone
MW5	8.0×10^{-3}	Silty sand & gravel
MW6	3.2×10^{-2}	Clayey gravel, silty sand & sandstone
MW7	2.6×10^{-4}	Sandy silt, sand & gravel
MW7D	4.8×10^{-2}	Silty sand & gravel
MW9	8.3×10^{-4}	Silt, silty sand & gravel
MW10	6.2×10^{-4}	Silty sand & gravel
MW10D	4.0×10^{-4}	Sandstone
MW12	2.6×10^{-4}	Sand
MW13	1.8×10^{-2}	Clayey sand & gravel

5.1.2 Groundwater Flow Direction/Gradient

Groundwater flow was evaluated as part of the NRT study (Fafalios & Hensel, 1999). The NRT study further subdivided the groundwater regime into two zones, the shallow and deep groundwater zones. The shallow groundwater zone is comprised of the surficial and shallow materials and the upper, permeable portions of the sandstone bedrock. The deep groundwater zone was defined as the alluvium found in the Wabash River valley.

Several potentiometric surface maps were included in the NRT report. Five of the more recent, complete potentiometric data sets (5 shallow and 4 deep groundwater zone plots from 2007, 2010, 2012 and 2013) along with 4 potentiometric surface maps using the NRT data sets (2 shallow and 2 deep groundwater zone plots from November 1998 and April 1999) have been plotted for this report and are included in Appendix B.

Groundwater flow within the shallow zone generally flows from west to east, based on the plotted potentiometric surface data included in Appendix B. Groundwater in the deep zone generally flows from southwest to northeast, almost perpendicular to the banks of the Wabash River. From the maps in Appendix B, gradients were calculated in the vicinity of the Ash Ponds. Values for the shallow groundwater zone ranged from 0.0104 to 0.0183, with an average gradient of 0.0156. Gradients in the deep zone range from 0.0067 to 0.0152, with an average gradient of 0.0114. Table 3 lists the flow direction and gradient values calculated for each plotted monitoring event and monitoring zone presented in Appendix B. Groundwater velocities, based on these gradients, are of the same order of magnitude as described in the NRT report (Fafalios & Hensel 1999).

5.2 Groundwater Classification

Illinois EPA requires that groundwater at regulated sites be classified in accordance with 35 IAC 620.210(a)(4)(B)(ii). The groundwater at the Site has been classified as a Class I: Potable Resource Groundwater. This classification is based on:

1. Groundwater is greater than 10 feet bgs;
2. Hydraulic conductivities can exceed 1×10^{-4} cm/sec; and
3. No criteria are met that would classify groundwater as a Special Resource (Class III) or Other (Class IV) Groundwater.

Electronic Filing: Received, Clerk's Office 09/28/2020

Table 3. Flow Direction and Gradients

Monitoring Event	Flow Direction	Gradient	Monitoring Zone
18 Nov 1998	Northeast	0.0106	Shallow
30 Apr 1999	East	0.0104	Shallow
2 July 2007	East	0.0168	Shallow
2 Oct 2007	East	0.0175	Shallow
13 Apr 2010	East	0.0172	Shallow
13 Apr 2012	East	0.0182	Shallow
10 Aug 2013	East	0.0183	Shallow
18 Nov 1998	Northeast	0.0123	Deep
30 Apr 1999	Northeast	0.0067	Deep
2 July 2007	Northeast	0.0116	Deep
2 Oct 2007	Northeast	0.0152	Deep
13 Apr 2010	Northeast	0.0119	Deep
10 Oct 2013	Northeast	0.0106	Deep

5.3 Nearby Groundwater Users

Water well logs for the sections surrounding the Site were previously obtained from the Illinois State Geological Survey and/or Illinois State Water Survey and referenced in the NRT report. The process water wells, PWW-3 and PWW-4[‡], on the Site are located in the Southeast ¼ of Section 17 (depths of 88 and 90 feet bgs, respectively) and just east of Ash Pond D (see Figure 2). The next nearest water supply wells are a trio of irrigation wells, which obtain irrigation water from the coarse-grained sediments located in the bedrock valley. These irrigation wells provide water to the Dement and Wampler farms in Section 20, just south of the Site. A more recent potable water well was installed at the Allison residence, located approximately 1900 ft. northwest of Ash Pond A. These water well records are included in Appendix A.

5.4 Groundwater Quality

Groundwater quality was assessed in NRT's 1999 report (Fafalios & Hensel, 1999), which identified the parameters of concern (POCs): boron, sulfate, iron, manganese, pH and total dissolved solids (TDS), and the wells (MW2, MW3, MW3D, MW6, MW8, MW9, & MW11) with concentrations that exceeded the Class I Potable Resource groundwater standard (35 IAC 620.410). Additional data collected at the Site since 1999 is included in the analysis for this report. The POC data, from 1999 to 2012, is summarized as a series of box-whisker plots in Appendix C. The 1999-2012 monitoring data is overlain by another set of box-whisker plots representing the most recent four quarters of data (July 2013 – June 2014). In general, the 2013-2014 data trend is toward lower median values relative to the older data.[§]

A comparison of Class I standard to the median POC concentrations (1999-2012 data) is presented in Table 4 for the Site monitoring wells. The 16 wells in Table 4 (2 upgradient and 14 downgradient) are the monitoring points that are located to provide early indication of possible impacts by the Ash Ponds, based on the groundwater flow directions and gradients depicted on the potentiometric surface maps in Appendix B, and summarized in Table 3.

[‡] In the previous Hydrogeologic Site Investigation (Hanson, 2011a), PWW-3 and PWW-4 were identified as PWW-1 and PWW-2, respectively. These wells were re-numbered for this report to match the numbering on the ISGS well records located in Appendix A.

[§] The recent (2013-2014) data is limited (typically only 4 data points). As such, the interquartile ranges may be small, misrepresenting any outlier values in the dataset.

Electronic Filing: Received, Clerk's Office 09/28/2020

Table 4. Ash Pond Monitoring Wells – Historic Median Concentrations (1999-2012)

Well ID	Boron [1] (2 mg/L)	Sulfate (400 mg/L)	Iron (5 mg/L)	Manganese (0.15 mg/L)	pH (6.5 < x < 9.0)	TDS (1,200 mg/L)

[1] parameter's name with Class I groundwater standard value below. Median values exceeding the Class I Std. are italic and bold.
[2] data from MW2 / MW2R and MW11 / MW11R may be combined.
[4] upgradient monitoring well.
[3] Ash Pond A Deep Zone monitoring wells not recently sampled.

A similar comparison of median groundwater concentrations to Class I standards are also made in Table 5 for the data from July 2013 through June 2014. The red highlighted median concentrations are those values that exceeded the median values for the long-term concentration presented in Table 4. The limited data for the recent monitoring results (4 quarters) versus the data used to calculate the historic median does slightly skew the data presentation. The percent increase from historic to present median values is generally less than 10% for TDS, Sulfate, and some of the Boron values. The high percent change for the Iron and Manganese median values may be indicative of a change in RedOx (oxidation-reduction) potential in the groundwater as a result of the capping of Ash Pond D. Although the concentrations are increasing, this may actually be a positive sign.

Electronic Filing: Received, Clerk's Office 09/28/2020

[3] Ash Pond A Deep Zone monitoring wells not recently sampled.

5.4.1 Parameters of Concern (POCs)

The following observations have been made for each POC:

Boron – MW2/MW2R, MW3, MW3D, MW6, MW8, and MW11R have concentrations historically above the Class I standard. Recent monitoring indicates that wells along the south property boundary, MW11R, MW6, MW2(R), appear to have improving water quality since the capping of Ash Pond D.

Sulfate – MW3, MW3D, MW8 and MW11R have historically been above the Class I standard, and MW6 had an inter-quartile range that straddle the Class I standard. Sulfate concentrations have displayed improvement in the past 4 quarterly sampling events.

Iron – minimal data available at some wells, but no well has historic concentrations above the Class I standard.

Manganese – minimal data available at some wells. MW1, MW3, MW3D, MW6, MW7D, MW8, MW11R, MW14, MW115D, MW115S, MW117 and MW121 have concentrations historically above the Class I standard. Recent data indicates generally higher Manganese concentration from wells adjacent to the Wabash River (MW7, MW7D, MW8, MW115S, MW115D, and MW121) appear higher than historically observed.

TDS – MW3, MW3D and MW8 are above the Class I standard, and like Sulfate display stable to improving recent concentrations.

Electronic Filing: Received, Clerk's Office 09/28/2020

pH – All wells show at least one pH reading below the lower limit Class I standard, but only MW3D shows consistent readings (3rd quartile and below) less than the lower limit Class I standard.

As shown in Appendix C, Table 4, and Table 5, five of the monitoring wells have had readings of the POCs generally trending above the Class I standards. Wells MW3, MW3D, MW6, MW8, and MW11/MW11R have generally shown elevated levels of boron, sulfate, pH and TDS. However, recent monitoring results indicate that water quality appears to be improving at these wells, especially for Boron, Sulfate and TDS. These wells, and the other Ash Pond monitoring wells, will continue to be evaluated as part of the ongoing Ash Pond monitoring activities (Hanson, 2014).

5.4.2 Other Parameters

Several other parameters have had intermittent exceedances of the Class I groundwater standards over the past several years (monitoring for these parameters began in 2011). These parameters are listed in Table 6.

Table 6. Additional Detections Above Class I Standards

Parameter	Well ID	Comment
dissolved Arsenic	MW1, MW115D, MW115S, MW121 & MW7D	Found in upgradient well Concentrations now below Class I limit
total Cyanide	MW1	Found in upgradient well
dissolved Lead	MW115S, MW121, & MW7	Not confirmed the following period
dissolved Nickel	MW7 & MW7D	Not confirmed the following period
dissolved Nitrate	MW6	Only one detect (Fall 2013)
dissolved Thallium	MW1, MW10, MW115D, MW14, MW7 & MW7D	Found in upgradient wells Not confirmed the following period

The six parameters identified in Table 6 are not considered POCs for purposes of this report. Concentration exceedances are either intermittent or have an upgradient (detection) component.

5.5 Hydrostatic Equilibrium of Ash Ponds

An estimate of the time for the groundwater beneath Ash Pond D to reach hydrostatic equilibrium was required by 35 IAC 840.130(l). However, evaluating hydrostatic equilibrium within the HDPE-lined Ash Pond A is not required. Instead, the groundwater flow model used to evaluate conditions associated with the Groundwater Management Zone will be used to evaluate ash pond to groundwater interactions.

6. Summary and Conclusions

The NRT report (Fafalios & Hensel, 1999) presented several conclusions, including:

- Upland hydro-stratigraphy consists of a thin layer of sand-rich material overlying sandstone and siltstone bedrock;
- There are three areas with CCW, the unlined Ash Pond D, the lined Ash Pond A, and the former ash laydown area now located beneath Ash Pond B;

Electronic Filing: Received, Clerk's Office 09/28/2020

- Water samples collected during the STMI investigation were high in boron, sulfate, manganese, and TDS in ash leachate, but only manganese concentrations were high in Ash Pond D leachate;
- No evidence of impacts was detected in direct push samples south of the impoundments;
- High iron and nickel were observed in locations where coal was present near the ground surface.

Hanson has reviewed the earlier studies, and based on our analyses concur with the NRT conclusions summarized above. In addition, Hanson has the following supplemental conclusions:

- Boron concentrations above the Class I groundwater standard continue to be observed in the shallow wells immediately downgradient of the Ash Ponds (MW2, MW3, MW3D, MW6, MW8, and MW11R), but recent monitoring results show an improving trend;
- Manganese concentrations above the Class I groundwater standard continue to be observed in the Site monitoring wells (MW1, MW3, MW3D, MW6, MW7D, MW8, MW11R, MW115S, MW115D, and MW121). Fafalios & Hensel (1999) indicated that elevated manganese and nickel may be indicative of coal or coal stockpile impacts. Hanson concurs, and also notes that Manganese has been observed above the Class I standard at upgradient well MW1;
- Recent (2013-2014) Iron (median) concentrations appear to be higher than those observed historically (1999-2012). Hanson believes that this increase is groundwater chemistry-related and not an indication of further impairment.
- Concentrations of the other POCs in the deep monitoring zone (monitoring wells MW7D, MW14, and MW115D) continue to be below Class I standards; and
- Based on the hydrogeologic information summarized in this report, the installed groundwater collector trench required under 35 IAC 840.120, the impermeable cap placed on Ash Pond D, the proposed cap for Ash Pond A, and the clean closure of Ash Pond B, Ash Pond C and the Bottom Ash Sluice Pond provide the best alternative for reducing off-site impacts to groundwater in the vicinity of the Site.

A....All borings are plotted to a scale of 1"= 4 ft., using ground surface as a fixed datum.

B....Classifications are made from visual inspection of samples and are our opinion thereof.

C....Water Levels (WL). Figure indicates time of reading (hours) after completion of boring. Water levels indicated are those observed when borings were made, or as noted. Porosity of the soil strata, variations of rainfall, site topography, etc., may cause changes in these levels.

D....Figures in right hand column indicate number of blows required to drive 2" O.D. sampling spoon (6" u.n.o.), using a 140 lb. weight falling 30 inches.

LOG OF BORING: B-4

Project No. J017150.01

BORING LOG: TERMS AND SYMBOLS

GENERAL NOTES

1. *Information on each boring log is a compilation of subsurface conditions based on soil or rock classifications obtained from the field as well as from laboratory testing of samples. The strata lines on the logs may be approximate or the transition between the strata may be gradual rather than distinct. Water level measurements refer only to those ob - served at the times and places indicated, and may vary with time, geologic condition or construction activity.*
2. *Relative composition and Unified Soil Classification designations are based on visual estimates and are approximate only. If laboratory tests were performed to classify the soil, the unified designation is show in parenthesis.*
3. *Value given in Unit Dry Weight/SPT Column is either a unit dry weight in pounds per cubic foot, if adjacent to a ST sample designation, or blows per 6-inch increment if adjacent to a SS sample designation.*

ABBREVIATIONS

UU/2	*Shear Strength from Unconsolidated – Undrained Triaxial Test (ASTM D2850)*
QU/2	*Shear Strength from Unconfined Compression Test (ASTM D2166)*
SV	*Shear Strength from Field Vane (ASTM D2573)*
PL	*Plastic Limit (ASTM D4318)*
LL	*Liquid Limit (ASTM D4318)*

LEGEND

CS	Continuous Sampler
GB	Grab Sample Taken From Auger Cuttings Or Wash Water Return
NX 100/42	NX Rock Core with Percent Recovery/R.Q.D. Given In Adjacent Column
PST	Three Inch Diameter Piston Tube Sample
SS	Split Spoon Sample (Standard Penetration Test)
ST	Three Inch Diameter Shelby Tube Sample
*	Sample Not Recovered
SV	Field Vane Test

SPLIT – BARREL SAMPLER DRIVING RECORD

Blow Per Foot (N-Value)	Description
25	25 blows drove sampler 12 inches after initial 6 inches of seating.
75/10"	75 blows drove sampler 10 inches after initial 6 inches of seating.
50/3"	50 blows drove sampler 3 inches during initial 6 inch seating interval.

NOTES:
1. *To avoid damage to sampling tools, driving is limited to 50 blows during any six inch interval.*
2. *N-Value (Blow Count) is the standard penetration resistance based on the total number of blows, using a 140-lb hammer with 30-inch free fall, required to drive a split spoon the last two of three, 6-inch drive increments. (Example: 4/7/9, N = 7 + 9 = 16). Values are shown as a summation on grid plot and may be shown as 4/7/9 in Unit Dry Weight – SPT column.*

RELATIVE COMPOSITION

Trace	*0-10 %*
With/Some	*11-35 %*
Soil modifier such	*> 35 %*

As silty, clayey, sandy, etc.

DENSITY OF GRANULAR SOILS

Descriptive Term:	N—Value
Very Loose	*0 - 4*
Loose	*5 - 10*
Medium Dense	*11 - 30*
Dense	*31 - 50*
Very Dense	*> 50*

STRENGTH OF COHESIVE SOILS

Consistency	Undrained Shear Strength Tons Per Sq. Ft.	Field Test	Approximate N-Value Range
Very Soft	*less than 0.12*	*Thumb will penetrate soil more than 1"*	*0 - 1*
Soft	*13 to 0.25*	*Thumb will penetrate soil about 1"*	*2 - 4*
Medium Stiff	*0.26 to 0.50*	*Thumb will penetrate soil about ¼"*	*5 – 8*
Stiff	*0.51 to 1.00*	*Thumb hardly indents soil*	*9 – 15*
Very Stiff	*1.01 to 2.00*	*Thumb will not indent soil, but readily indented with thumbnail*	*16 – 30*
Hard	*greater than 2.00*	*Thumbnail will not indent soil*	*> 30*

SOIL GRAIN SIZE

U.S. STANDARD SIEVE

12"	3"	¾"	4	10	40	200	
BOULDERS	COBBLES	GRAVEL		SAND			SILT / CLAY
		COARSE	FINE	COARSE	MEDIUM	FINE	
300	76.2	19.1	4.76	2.00	0.42	0.074	0.002

SOIL GRAIN SIZE IN MILLIMETERS

SOIL STRUCTURE

Calcareous *– Having appreciable quantities of carbonate.*

Fissured *– Containing shrinkage or relief cracks, often filled with sand or silt; usually more or less vertical.*

Slickensided *– Having planes of weakness that appear slick and glossy. The degree of slickensidedness depends upon the spacing of slickensides and the ease of breaking along those planes.*

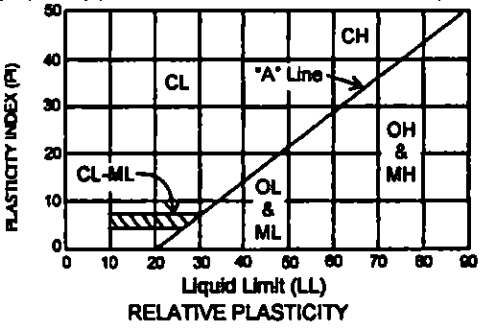
Layer *– Inclusion greater than 3 inches thick.*

Seam *– Inclusion 1/8 inch to 3 inches thick extending through the sample*

Parting *– Inclusion less than 1/8 inch thick.*

Pocket *– Inclusion of material of different texture that is smaller than the diameter of the sample.*

Interlayered *– Soil samples composed of alternating layers of different soil types.*



Intermixed *– Soil samples composed of pockets of different soil types and a layered or laminated structure is not evident.*

Laminated *– Soil sample composed of alternating partings or seams of different soil type.*

UNIFIED SOIL CLASSIFICATION SYSTEM

MAJOR DIVISIONS			SYMBOL	DESCRIPTION
Coarse-Grained Soils (More than 50% Larger than No 200 Sieve Size)	Gravel and Gravelly Soils	Clean Gravels Little or no Fines	GW	Well-Graded Gravel, Gravel-Sand Mixture
			GP	Poorly –Graded Gravel, Gravel-Sand Mixture
		Gravels with Appreciable Fines	GM	Silty Gravel, Gravel-Sand-Silt Mixture
			GC	Clayey-Gravel, Gravel-Sand-Clay Mixture
	Sand and Sandy Soils	Clean Sands Little or no Fines	SW	Well-Graded Sand, Gravelly Sand
			SP	Poorly Graded Sand, Gravelly Sand
		Sands with Appreciable Fines	SM	Silty Sand, Sand-Silt Mixture
			SC	Clayey Sand, Sand-Clay Mixture
Fine-Grained Soils (More than 50% Smaller than No 200 Sieve Size)	Silts and Clays	Liquid Limit Less Than 50	ML	Silt, Clayey Silt, Silty or Clayey Very Fine Sand, Slight Plasticity
			CL	Clay, Sandy Clay, Silty Clay, Low to Medium Plasticity
			OL	Organic Silts, or Silty Clays of Low Plasticity
	Silts and Clays	Liquid Limit More Than 50	MH	Silt, Fine Sandy or Silt Soil with High Plasticity
			CH	Clay, High Plasticity
			OH	Organic Clay of Medium to High Plasticity
	Highly Organic Soils		PT	Peat, Humus, Swamp Soil

PLASTICITY CHART

RELATIVE PLASTICITY

Nonplastic	Cannot Roll Into Ball
Trace Plasticity	Barely Roll Into Ball
Medium Plastic	Can be Rolled Into Ball
Highly Plastic	No Rupture by Kneading

VISUAL DESCRIPTION CRITERIA*

TABLE 1: CRITERIA FOR DESCRIBING ANGULARITY OF COARSE-GRAINED PARTICLES

Description	Criteria
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular	Particles are similar to angular description but have rounded edges
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges
Rounded	Particles have smoothly curved sides and no edges

TABLE 2: CRITERIA FOR DESCRIBING PARTICLE SHAPE

Description	Criteria
Flat	Particles with width/thickness X3
Elongated	Particles with length/width X3
Flat and Elongated	Particles meet criteria for both flat and elongated

TABLE 3: CRITERIA FOR DESCRIBING MOISTURE CONDITION

Description	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp, but no visible water
Wet	Visible free water, usually soil is below the water table

TABLE 4: CRITERIA FOR DESCRIBING REACTION WITH HCL

Description	Criteria
None	No visible reaction
Weak	Some reaction, with bubbles forming slowly
Strong	Violent reaction, with bubbles forming rapidly

TABLE 6: CRITERIA FOR DESCRIBING CEMENTATION

Description	Criteria
Weak	Crumbles or breaks with handling or little finger pressure
Moderate	Crumbles or breaks with considerable finger pressure
Strong	Will not crumble or break with finger pressure

TABLE 8: CRITERIA FOR DESCRIBING DRY STRENGTH

Description	Criteria
None	The dry specimen crumbles into powder with mere pressure of handling
Low	The dry specimen crumbles into powder with some finger pressure
Medium	The dry specimen breaks into pieces or crumbles with considerable finger pressure
High	The dry specimen cannot be broken with finger pressure. Specimen will break into pieces between thumb and a hard surface.
Very High	The dry specimen cannot be broken between the thumb and a hard surface

TABLE 9: CRITERIA FOR DESCRIBING DILATANCY

Description	Criteria
None	No visible change in the specimen
Slow	Water appears slowly on the surface of the specimen during shaking and does not disappear or disappears slowly upon squeezing.
Rapid	Water appears quickly on the surface of the specimen during shaking and disappears quickly upon squeezing.

TABLE 10: CRITERIA FOR DESCRIBING TOUGHNESS

Description	Criteria
Low	Only slight pressure is required to roll the thread near the plastic limit. The thread and the lump are weak and soft.
Medium	Medium pressure is required to roll the thread to near the plastic limit. The thread and the lump have medium stiffness
High	Considerable pressure is required to roll the thread to near the plastic limit. The thread and the lump have very high stiffness

TABLE 12: IDENTIFICATION OF INORGANIC FINE-GRAINED SOILS FROM MANUAL TESTS

Soil Symbol	Dry Strength	Dilatancy	Toughness
ML	None to low	Slow to rapid	Low or thread cannot be formed
CL	Medium to high	None to slow	Medium
MH	Low to medium	None to slow	Low to medium
CH	High to very high	none	High

*NOTES: 1. Tables adapted from ASTM D2488 "Description and Identification of Soils" (Visual-Manual Procedure)
2. Tables 5, 7 and 11 incorporated into other information on this plate.

WATER WELL SEALING FORM

PDF FILLABLE/SAVABLE

RETURN ALL COPIES TO IDPH OR LOCAL HEALTH DEPARTMENT

This form shall be submitted to this Department or the local health department not more than 30 days after a water well, boring or monitoring well is sealed. Such wells are to be sealed not more than 30 days after they are abandoned in accordance with the sealing requirements in the Illinois Water Well Construction Code. THE LOCAL HEALTH DEPARTMENT OR REGIONAL PUBLIC HEALTH DEPARTMENT MUST BE NOTIFIED AT LEAST 48 HOURS PRIOR TO SEALING.

1. Ownership (Name of Controlling Party) Am eren Energy Medina Valley Gogen, LLC

2. Well Location: Well Site Address Hutsonville Power Station City Hutsonville Zip 62433

Lot # N/A Land I.D.# N/A County Crawford Township 08 N

Range 11 W Section 17 Quarter of the NW Quarter of the SW Quarter SW

GPS: North Degrees 39.131 Minutes Seconds West Degrees 87.65[illegible] Minutes Seconds

Report decimal minutes to minutes and seconds by multiplying the decimal part of the minutes by 60, e.g. latitude 38 degrees 46.07 minutes N would be latitude 38 degrees 46 minutes 4.2 seconds (0.07 x 60 = 4.1) N. Report GPS coordinates to the nearest 0.1 second.

3. Year Drilled 1984 4. Drilling Permit Number (and date, if known N/A

5. Type of Well Monitoring 6. Total Depth (ft.) 9.0 Diameter (in.) 2

7. Formation clear of obstruction Yes

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Introduction

The following monitoring program is provided for the AmerenEnergy Medina Valley Cogen, L.L.C. Hutsonville Power Station's Ash Ponds (Site) closure for the purpose of evaluating the performance of the ash pond closure activities, including the Ash Pond D groundwater collection trench required by rule at Title 35, Illinois Administrative Code, Part 840, [35 IAC 840], the pond cover system(s) generally conforming to the existing 35 IAC 840 or, where appropriate, the proposed 35 IAC 841 design criteria, and the Groundwater Management Zone (GMZ), proposed for the Site, under 35 IAC 620.250. The program shall monitor groundwater to evaluate closure and post-closure groundwater quality trends and determine compliance with the applicable standards.

2. Groundwater Monitoring Program

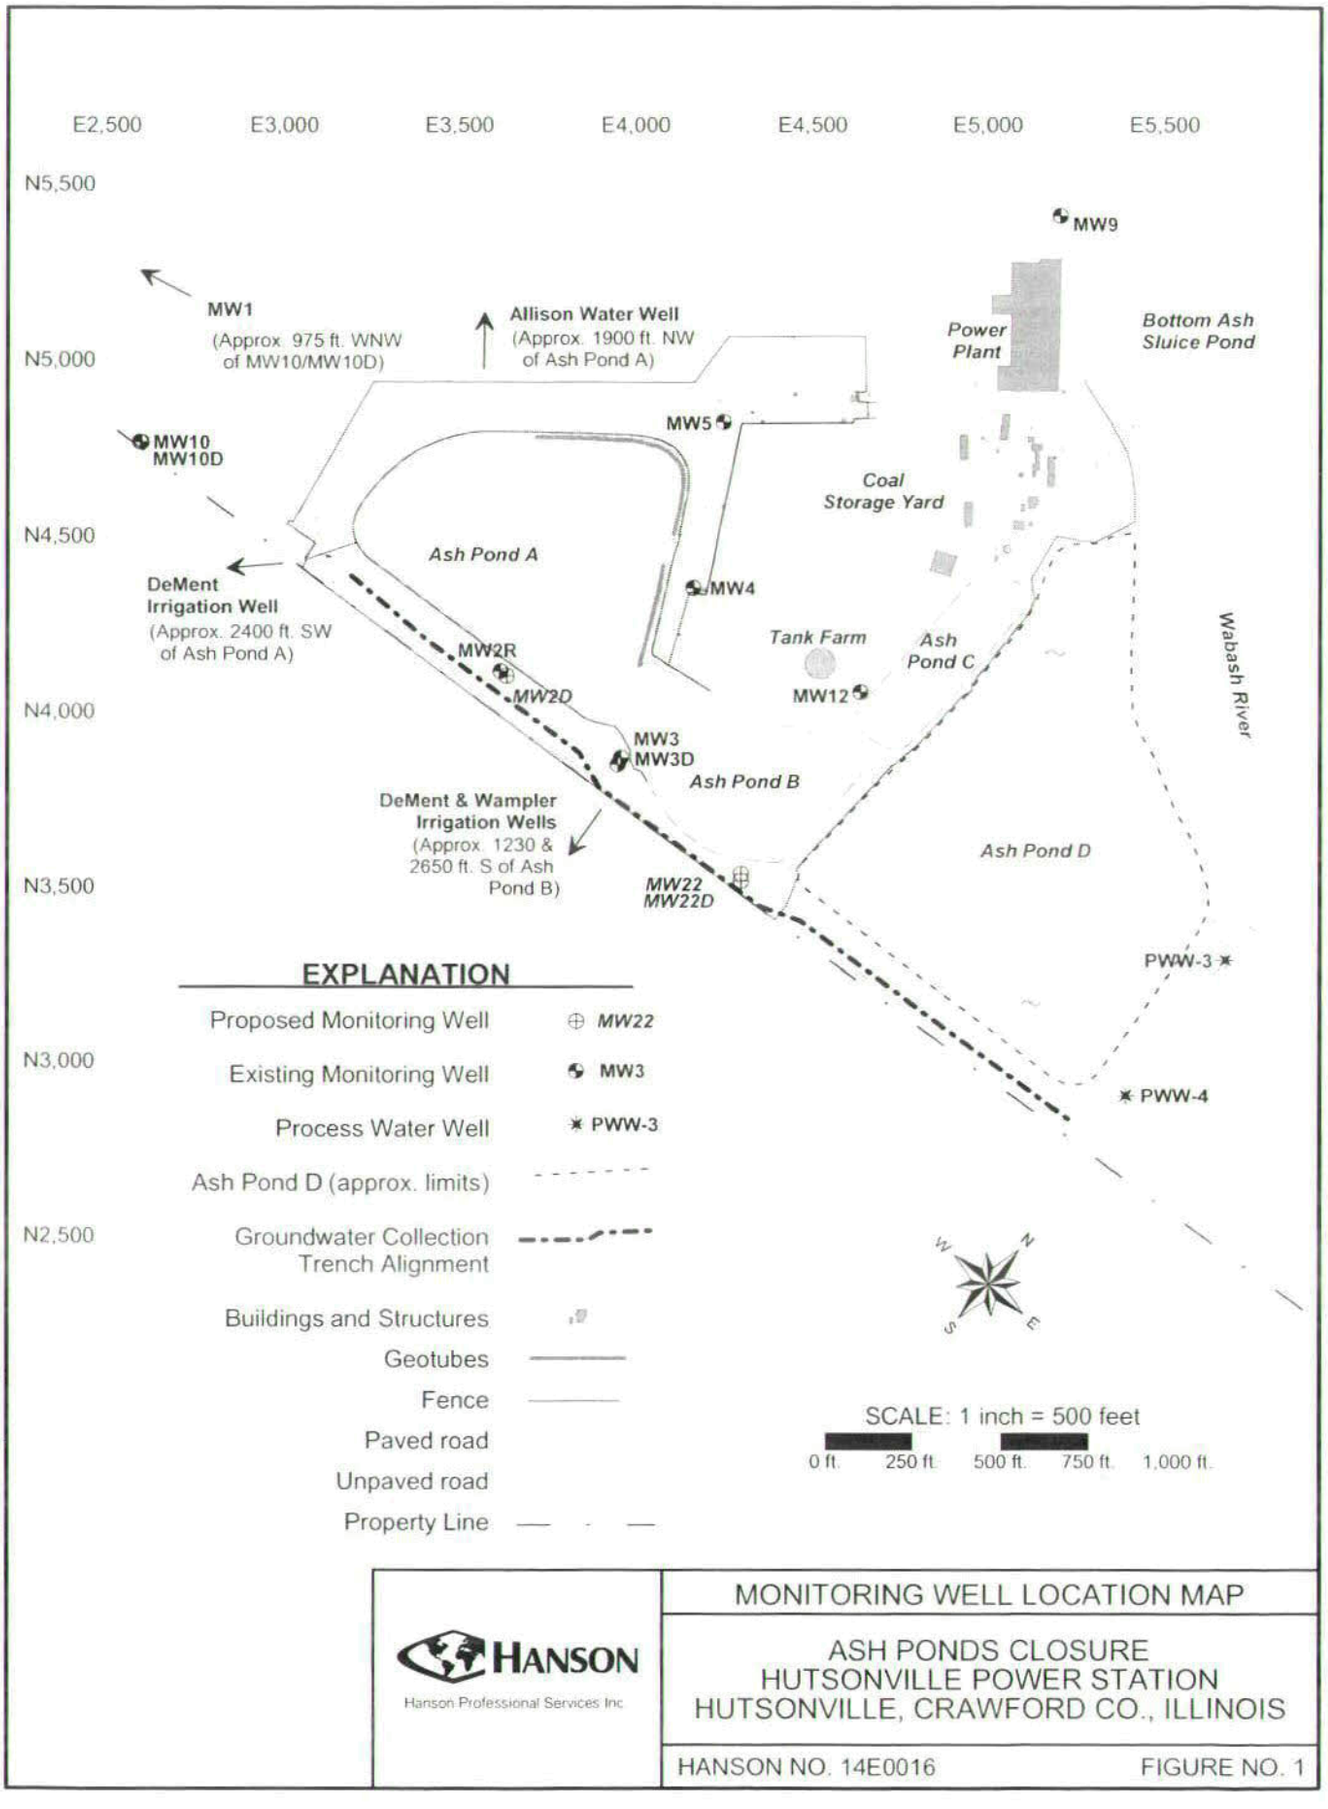
The groundwater monitoring program design basis includes the geology and hydrogeology information presented in the Hydrogeologic Site Investigation. This Monitoring Plan (Plan) outlines groundwater monitoring and sampling procedures; the parameters to be evaluated and analytical methods; and assessment of groundwater quality data. This Plan does not modify or supplant the existing monitoring program required under the Ash Pond System Operating Permit (Permit No. 2005-EO-3689 or its successors) and will not go into effect until the approval of the Closure and Post-Closure Care Plans that this document supports.

2.1 Monitoring Locations

Groundwater samples will be obtained from a set of previously installed groundwater monitoring wells, plus any additional monitoring wells as described in Section 3. Monitoring wells have a well identification number with a "MW" identifier (monitoring well) followed by a 1-, 2-, or 3-place alpha-numeric designation (e.g., MW2, MW7D, etc.). Monitoring wells that were installed to replace previously installed wells are identified with an "R" in the designation (e.g. MW11R).

The monitoring program follows 35 IAC 620 Subpart E by satisfying the following standards for the monitoring system:

1. The monitoring wells are sufficiently located to represent the quality of groundwater at the compliance point(s).
2. The monitoring wells are located within the stratigraphic unit(s) that may serve as potential contaminant migration pathways.
3. And, the groundwater monitoring wells are secure.



2.2 Monitoring Well Installation and Abandonment

Figure 1 depicts the locations of the current monitoring wells at the Site.

Table 1 lists the monitoring wells, identification numbers, and locations of the wells that will be used for closure and post-closure activities at the Site.

The existing groundwater monitoring wells were generally constructed in accordance with:

1. Illinois Department of Public Health (IDPH) standards as cited in 77 IAC 920.170;
2. Regulatory standards as cited in 35 IAC 620.505(a); and
3. Chapter 6 – Monitoring Well Design and Construction, RCRA Groundwater Monitoring Technical Enforcement Guidance Document, U.S. EPA, November 1992.

Electronic Filing: Received, Clerk's Office 09/28/2020

As-built diagrams for the groundwater monitoring wells are included in the Technical Source Documents (TSDs)[1]. The monitoring wells were constructed to yield groundwater samples that represent the quality of groundwater within the geologic formation(s) monitored at the site.

Each existing monitoring well shall be maintained so representative groundwater samples may be collected. Items to observe during routine monitoring include; check concrete pad/seal for cracks, integrity of the protective casing, casing lock, seal of well cap, and integrity of the well riser (cracks, bends, etc.). In the event a monitoring well is damaged, the well shall be repaired or replaced in accordance with regulatory requirements.

Table 1. Hutsonville Ash Pond A Groundwater Monitoring System

Monitoring Well ID	Monitoring Well Designation	Monitoring Zone	Install Date	Location[2]		Screen Interval
				Easting	Northing	
MW2R	Downgradient	Shallow	6 Apr 12	3617.43	4112.60	446.0-435.2

MW5	Downgradient	Shallow	13 Feb 84	4249.98	4821.99	453.5-440.5
MW9	Piezometer	Shallow	14 Oct 84	5202.	5408.	448.2-438.2
MW10	Upgradient	Shallow	7 Oct 98	2559.81	4730.48	447.2-442.2
MW10D	Upgradient	Deep	7 Oct 98	2564.72	4729.43	437.6-433.6
MW12	Downgradient	Shallow	8 Oct 98	4637.98	4053.58	448.6-438.6
MW22[3]	Downgradient	Shallow	*proposed*	4300.	3525.	450.0-445.0
MW-2D[3]	Downgradient	Deep	*proposed*	4300.	3525.	435.0-430.0

[2] Monitoring Well locations based on Plant coordinate system.

[3] Proposed monitoring well to be installed upon approval of this Groundwater Monitoring Plan by Illinois EPA. Deep wells (D suffix) may need to be installed due to shallow zone dewatering from collection trench.

3. Modifications to the Monitoring Well Network

Ash Pond A must currently monitor groundwater as part of Permit No. 2005-EO-3689. This monitoring requires the monthly testing of MW1 through MW5, with the annual reporting of results to the Illinois Environmental Protection Agency (EPA). Per the terms of this permit, additional monitoring wells MW6 through MW9 are required to remain operational, although monitoring is not required. A number of additional wells have been installed as part of prior investigations and associated with the site-specific rulemaking authorizing the in-place closure of Ash Pond D (Illinois PCB, 2011). As described below, three of these monitoring wells will be used in conjunction with this Monitoring Plan.

As part of the Site closure activities, the following recommendations to the monitoring well network are being made as part of this application:

[1] Available at: http://www.ipcb.state.il.us/documents/dsweb/Get/Document-65177 in Chapter 6 of the Rulemaking Technical Support Documents.

Electronic Filing: Received, Clerk's Office 09/28/2020

- MW1 shall be removed upon renewal and/or termination of Permit No. 2005-EO-3689. Closure and post-closure use of this well is unnecessary, because it is too distant (975 ft. from Ash Pond A) for an effective upgradient well and MW10 and MW10D are better positioned for upgradient water quality determination.
- MW9 shall be retained as a piezometer upon completion of the monitoring requirements of Permit No. 2005-EO-3689, and will be used to collect water elevation data only.
- MW10D upgradient deep zone (sandstone) well. This well shall be monitored if the groundwater collection trench causes any of the shallow zone wells (i.e., MW2R, MW3, etc.) to go dry.
- MW2D downgradient deep (sandstone) well. This well shall be installed if the groundwater collection trench causes MW2R to go dry and upon approval of this Plan.
- MW3D downgradient deep (sandstone) well. This well shall be monitored if the groundwater collection trench causes MW3 to go dry.
- MW22 Compliance monitoring well location for GMZ monitoring. This well will be added to the shallow zone monitoring system after approval of this Plan.
- MW22D This monitoring well will be added to the monitoring system only if the groundwater collection trench dewaters the shallow zone and after approval of this Plan.

4. Groundwater Quality Characterization

4.1 Statistical Evaluation of Background Groundwater Data

The groundwater quality data for samples, collected from the monitoring wells installed for the Site, collected from upgradient monitoring well MW10 was evaluated using the Electric Power Research Institute (EPRI) computer database and analysis program, MANAGES™ (Version 3.2). Three US EPA documents were principally used as a guide for the statistical evaluation of the groundwater data: Statistical Analysis of Ground-Water Monitoring Data at RCRA Facilities – Interim Final Guidance (US EPA, 1989), Statistical Analysis of Ground-Water Monitoring at RCRA Facilities – Addendum to Interim Final Guidance (US EPA, 1992), and Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities – Unified Guidance, (US EPA, 2009).

Establishing the tolerance interval(s) for the groundwater constituents was accomplished by using either a parametric or non-parametric procedure based on the percentage of non-detects in the data sets and the distribution of the sample population (see Statistical Methodology in Appendix A). If the statistical data for a constituent had less than 50 percent non-detects and was normally or log-normally distributed, a parametric procedure was used. If the data was not normally or log-normally distributed or had more than 50 percent non-detects, a non-parametric procedure was used. Figure A-1 is a flow chart which illustrates the processes followed to determine the appropriate statistical procedure used for each constituent based on its statistical characteristics. The results of the statistical analyses for the groundwater are located in Appendix B.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.2 Statistical Analysis Results

The results of the statistical analyses for the Site groundwater, completed in accordance with the methodology presented in Appendix A, are presented in Appendix B, and are summarized in Table A-1. For each parameter, the pages of the output file in Appendix B identify the statistical methods used to determine the upper tolerance interval, the percentage of non-detects, the lower tolerance interval (two-tail tests only), and the type of data distribution.

Results of the background water quality evaluation indicate that background groundwater sample results at MW1 (24 monthly or 8 quarterly samples from January 2012 through December 2013) and MW10 (8 quarterly samples from 1st Quarter 2012 through 4th Quarter 2013) contributed to the background water quality values calculated as part of this study and presented in Table 2.

Table 2. Shallow Zone Background Groundwater Quality Values

Parameter	Units	Concentration	Parameter	Units	Concentration
Antimony, dissolved	mg/L	0.010	Lead, dissolved	mg/L	0.010
Arsenic, dissolved	mg/L	0.012	Manganese, dissolved	mg/L	0.395
Barium, dissolved	mg/L	0.028	Mercury, dissolved	mg/L	0.0007
Beryllium, dissolved	mg/L	0.010	Nickel, dissolved	mg/L	0.009
Boron, dissolved	mg/L	0.190	Nitrate (as N), dissolved	mg/L	3.87
Cadmium, dissolved	mg/L	0.010	pH (lower interval)	SU	6.21
Chloride, dissolved	mg/L	83.670	pH (upper interval)	SU	7.870
Chromium, dissolved	mg/L	0.012	Selenium, dissolved	mg/L	0.011
Cobalt, dissolved	mg/L	0.010	Silver, dissolved	mg/L	0.010
Copper, dissolved	mg/L	0.009	Sulfate, dissolved	mg/L	67.37
Cyanide, total	mg/L	0.360	Thallium, dissolved	mg/L	0.007
Fluoride, dissolved	mg/L	0.262	Total Dissolved Solids (TDS)	mg/L	568.57
Iron, dissolved	mg/L	1.109	Zinc, dissolved	mg/L	0.025

5. Groundwater Monitoring/Sampling

5.1 Sampling Schedule

Sampling for routine analysis shall be conducted in a manner similar to the existing Hutsonville "site-specific" rules found at 35 IAC 840.114(a) to provide some consistency between the Ash Pond D and Ash Pond A monitoring programs. The schedule for quarterly groundwater monitoring is listed in Table 3, and is based on the quarterly submittal requirements for Illinois EPA Bureau of Water National Pollutant Discharge Elimination System (NPDES) permits:

Table 3. Quarterly Groundwater Monitoring Schedule

Sampling Quarter	Report Due Date	Sampling List
January - March (1)	May 31	Field & Routine
April - June (2)	August 31	Field & Routine
July - September (3)	November 30	Field & Routine
October - December (4)	February 28	Field & Routine

Electronic Filing: Received, Clerk's Office 09/28/2020

5.2 Parameter List

Routine sample collection will be conducted quarterly on the schedule outlined above, for the constituents listed in Table 4 and Table 5 [per 35 IAC 620.410(a) and 410(e), excluding Radium-226 and Radium-228].

Groundwater monitoring can be concluded upon successful completion of Groundwater Management Zone requirements (35 IAC 620.250) and approval of the Illinois EPA.

Table 4. Field Monitoring Parameters

FEB 26 2015
Div. of Public Water Supplies
Illinois EPA

5.3 Monitoring/Sampling Procedure

Groundwater samples shall be collected following the procedures presented in Appendix C, or equivalent methods developed by Ameren or its contractors.

[1] Routine parameters are reported as dissolved (filtered) concentrations with the exception of the Field Monitoring Parameters and Cyanide, which are taken from total (unfiltered) samples.
[2] Mandatory monitoring parameter under 35 IAC 840.114(a).

Electronic Filing: Received, Clerk's Office 09/28/2020

5.2 Parameter List

Routine sample collection will be conducted quarterly on the schedule outlined above, for the constituents listed in Table 4 and Table 5 [per 35 IAC 620.410(a) and 410(d), excluding Radium-226 and Radium-228].

Ameren may seek future reductions in the monitoring frequency and/or monitored parameters, consistent with criteria in the final 841 regulations, if approved, and found applicable to the closure of these ponds. Furthermore, groundwater monitoring can be concluded upon successful completion of Groundwater Management Zone requirements (35 IAC 620.250) and approval of the Illinois EPA.

Table 4. Field Monitoring Parameters

Parameters[1]	STORET
pH[2]	00400
Specific Conductance[2]	00094
Elevation of GW Surface[2]	71993
Depth of Well (bls)[2]	72008
Temperature	00011

Cyanide, total	00720	Thallium, dissolved	01057
Fluoride, dissolved	00950	Zinc, dissolved	01090

5.3 Monitoring/Sampling Procedure

Groundwater samples shall be collected following the procedures presented in Appendix C, or equivalent methods developed by Ameren or its contractors.

[1] Routine parameters are reported as dissolved (filtered) concentrations with the exception of the Field Monitoring Parameters and Cyanide, which are taken from total (unfiltered) samples.
[2] Mandatory monitoring parameter under 35 IAC 840.114(a).

Electronic Filing: Received, Clerk's Office 09/28/2020

6. Analysis of Site Groundwater Monitoring Samples

6.1 Laboratory Analysis

Laboratory analysis and testing methods shall be in general accordance with those listed in the U.S. EPA publication Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA/530/SW-846, 3rd Edition – Update V, amended October 2013 (U.S. EPA, 2013) or as superseded by future editions. The specific testing method used for analysis shall have Practical Quantitation Limit (PQL) values that are capable of determining if regulatory and/or site groundwater standards are exceeded. [For example, 35 IAC Part 724, Appendix I lists three methods and PQLs for Chromium. Methods 7190, Method 6010, and Method 7191 have QPLs of 500 ppb; 70 ppb; and 10 ppb, respectively. Since 35 IAC 620.410 sets the groundwater standard for Chromium at 100 ppb, the method with the highest PQL that can meet or exceed this standard would be Method 6010.] Specific testing methods shall be referenced in the Laboratory Analysis Report.

Other references (unless superseded) for testing methods may include:

1. Test Method: The Determination of Inorganic Anions in Water by Ion Chromatography – Method 300.0, EPA 600/4-84-017, Revision 2.1, August 1993.
2. Methods for Chemical Analysis of Water and Wastes, EPA 600/4-79/020, 3rd Edition, March 1983.
3. Methods for the Determination of Inorganic Substances in Environmental Samples, EPA 600/R-93/100, August 1993.
4. Methods for the Determination of Metals in Environmental Samples, EPA 600/4-91/010, June 1991.
5. Methods for the Determination of Metals in Environmental Samples; Supplement I, EPA 600/R-94/111, May 1994.
6. Standard Methods for Determination of Organic and Inorganic Compounds in Drinking Water: Volume 1; US EPA, EPA 815/R-00/014, August 2000.

Quality Assurance/Quality Control (QA/QC) programs may vary from laboratory to laboratory, but will contain the same general methodologies. The QA/QC programs are implemented: to evaluate the accuracy and precision of analytical data in order to establish the quality of the data; to provide an indication of the need for corrective actions, when comparison with existing regulatory or program criteria or data trends shows that activities must be changed or monitored to a different degree; and to determine the effect of corrective actions (U.S. EPA SW-846, 2013).

Methodologies used by the laboratory to ensure representative analytical results may vary. Some methodologies that may be used are:

1. Calibration checks, used to enhance instrument reliability. Instrumental calibration curves will be generated in a manner consistent with the instrument and method utilized. Calibration verification shall be conducted on a regular basis;
2. Laboratory control samples and/or quality control check standards that have been spiked with analytes may be used to monitor the performance of the method;

Electronic Filing: Received, Clerk's Office 09/28/2020

3. Matrix spike/matrix spike duplicate analyses are samples in which solutions of specific aliquots are added to a sample matrix prior to sample extraction/digestion and analysis. Samples are split into duplicates, spiked and analyzed. Percent recoveries and relative percent differences are calculated for each of the analyses detected;
4. Replicate samples shall be routinely analyzed to check the precision of the instrumentation and/or methodology employed for all analytical methods; and
5. Where applicable, method blanks are prepared and analyzed each day or sample batch to ensure that the system is free of contamination.

The QA/QC program at the laboratory should generally follow the requirements outlined in the U.S. EPA publication Test Methods for Evaluation Solid Waste, Physical/Chemical Methods, EPA/530/SW-846, 3rd Edition –Update V, amended January 2013 (U.S. EPA, 2013) and which may be periodically revised in the future. However, other published QA/QC methods may be utilized as part of laboratory policy provided the QA/QC methodologies generally follow those numerated above.

7. Site Monitoring Program Evaluation

7.1 Groundwater Quality Standards

Pursuant to 35 IAC 620.450(a), the on-site groundwater quality shall be the greater of either the actual monitoring result, or the Class I Potable Resource Groundwater standard [35 IAC 620.410] prior to the completion of the post-closure care period. If upon completion of the post-closure care period the observed concentrations in the site groundwater still exceed a Class I standard, the on-site standard can be adjusted provided criteria are addressed to the satisfaction of the Illinois EPA:

7.2 Demonstration of Compliance

Compliance will be evaluated against the appropriate groundwater standard included in Section 7.1 , above. On-site groundwater shall be considered to be in compliance when no statistically significant increasing trend can be attributable to Ash Pond A at the compliance boundary and with Illinois EPA concurrence.

7.2.1 Compliance Determination

Groundwater Management Zone (GMZ) compliance will be demonstrated by performing an annual trend analysis for each downgradient monitoring well for all of the monitored constituents listed in Table 4 and Table 5. The analysis shall be performed on a minimum of four (4) consecutive samples and use Sen's Estimate of Slope for compliance determination. Generally, if analyses for a parameter show an increasing trend at a down-gradient well, a Mann-Kendall analysis must be performed at a 95% confidence limit to determine whether the increasing trend is statistically significant. If there is a statistically significant increase, then an investigation determining that the statistically significant increasing trend is due to a superseding cause will be performed, and the Illinois EPA will be notified in writing, stating the cause of the increasing trend and the rationale used in its determination.

Electronic Filing: Received, Clerk's Office 09/28/2020

Electronic Filing: Received, Clerk's Office 09/28/2020

If a statistically significant increasing trend continues to be observed over two or more consecutive years and there is no superseding cause, a hydrogeologic investigation (and additional site investigation(s), if necessary) must be performed.

Based on the outcome of the additional activities, action must be taken to mitigate the statistically significant increasing trends that are causing, threatening or allowing exceedances of off-site groundwater quality standards. Any actions must be proposed as a modification to the post-closure care plan within 180 days after completion of the additional hydrogeologic and/or additional site investigations.

Appendix A

Statistical Methodology

Electronic Filing: Received, Clerk's Office 09/28/2020

A.1 Statistical Methodology

A.1.1 Introduction

The purpose of the statistical calculations documented in this appendix is to determine the maximum background concentrations likely to occur upgradient of the Hutsonville ash ponds. High predicted background concentrations relative to the Class I groundwater quality standards may suggest that downgradient concentrations for those parameters are due to a background source.

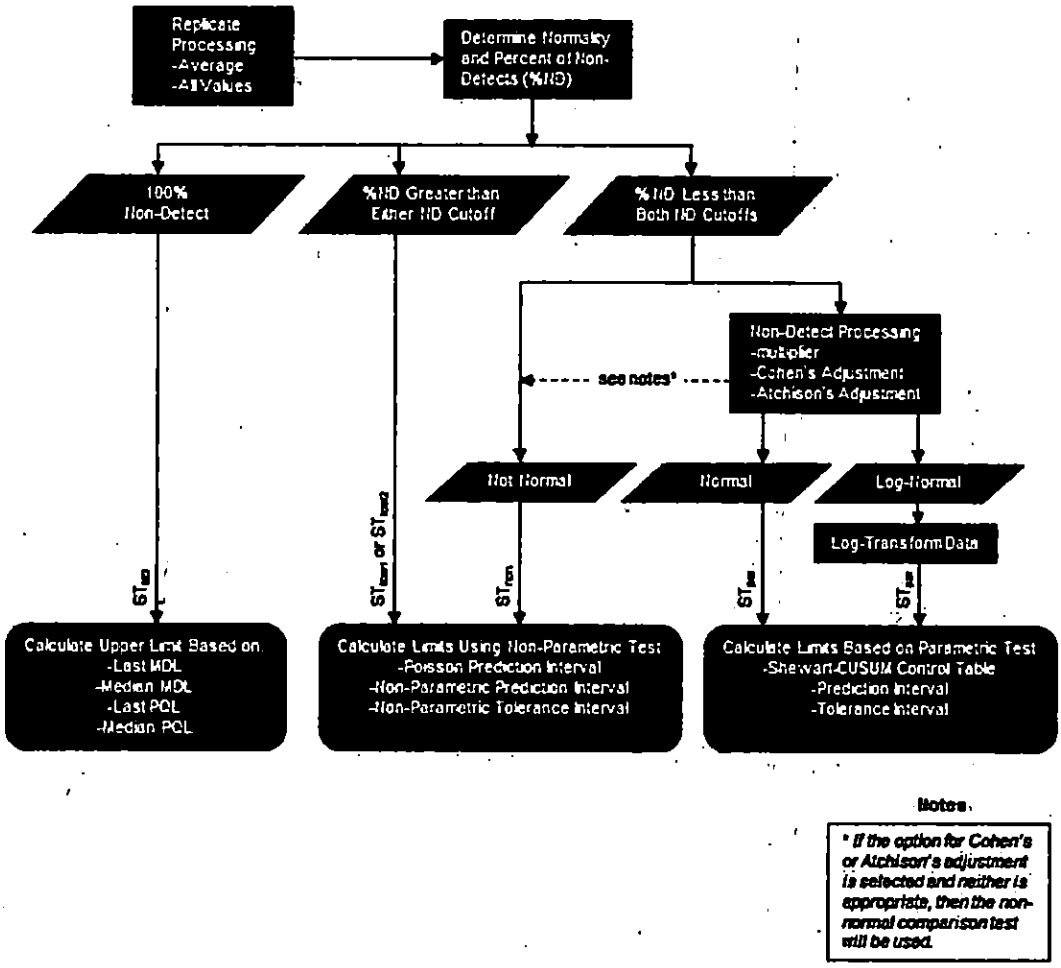
The statistical analysis procedures used here are consistent with procedures described in the document: 2009 Unified Guidance. "Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities—Unified Guidance," March 2009, EPA 530/R-09-2007 (USEPA, 2009).

A.1.2 Compliance Data Operations - Limit Calculations

The range of potential background concentrations was statistically determined using parametric and non-parametric tolerance intervals. Tolerance intervals were chosen rather than prediction intervals because a tolerance interval makes no assumption about the future number of samples, while a prediction interval assumes a finite, and known, future number of samples.

The flow diagram (Figure A-1) outlines the logic flow for calculation of limits. Background values were calculated using parametric tolerance intervals for normally distributed data, and non-parametric tolerance intervals for data with no underlying distribution or with non-detect frequencies greater than 50 percent. Parametric tolerance intervals were calculated at a 95 percent coverage rate and a Type I individual comparison error level of 0.01 (i.e., false positive rate). Parameters with 100 percent non-detects were handled with the upper tolerance limit being set to the last Reporting Limit (RL).

A.1.3 Statistical Data Evaluation and Results



The input dataset (Appendix A.1) for background calculations were evaluated for the quarterly data from monitoring wells MW1 and MW10, collected from 2012 through 2013, for the inorganic parameters listed in 35 IAC 620.410(a) and excluding radium-226, radium-228, and perchlorate. All water quality data were stored, prepared, and statistically analyzed using MANAGES™ Version 3.2.39 software (EPRI, November 2010).

A statistical summary of the background water quality data from MW1 and MW10 is provided in Appendix B, and includes the mean, median, minimum, maximum, standard deviation, Sen Slope trend, normality determination, and percent non-detects for the background dataset. The statistical analysis procedure inputs and results are also provided in Appendix B.

Calculated background values for the tested inorganic constituents and pH are listed in Table A-1 along with the percentage of non-detected parameters, normal or lognormal distribution, test methodology, and confidence level.

Shapiro-Wilk Normality test performed at 0.05 significance level.

Electronic Filing: Receive Clerk's Office 09/28/2020

Hutsonville Ash Impoundment

Statistical Analysis Procedure

Background Date Range: 01/01/2012 to 12/05/2013
Background Locations: MW1,MW10

Compliance Date Range: 01/01/2012 to 12/05/2013
Compliance Locations: MW10

Comparison Method if all Background Results are Non-Detect:	STmdl = Last MDL
Statistical Test for Parametric Background Data Distributions:	STpar = Parametric Tolerance Interval on Background
Statistical Test for Cases with High Percentage of Non-Detect Background Data:	STlow1 = Non-Parametric Tolerance Interval on background (ND Frequency > 50%)
Statistical Test for Cases with High Percentage of Non-Detect Background Data:	STlow2 = Non-Parametric Tolerance Interval on background (ND Frequency > 50%)
Statistical Test for Non-Parametric Background Data Distributions:	STnon = Non-Parametric Tolerance Interval on background
Background Comparison:	Interwell
Number of Verification Samples:	0
Default Type 1 Individual Comparison Error Level (False Positive Rate) for tests other than Prediction Interval	0.01
Non-Detect Processing (Parametric Tests):	<=15% using MDL * 0.5 >15% using MDL * 0.5
Non-Detect Processing (All Other):	<=50% using MDL * 0.5 >50% using MDL * 0.5
Tolerance Interval Coverage:	95%

Electronic Filing: Received, Clerk's Office 09/28/2020

Electronic Filing: Received, Clerk's Office 09/28/2020

Appendix C

Groundwater Sampling Protocol

Electronic Filing: Received, Clerk's Office 09/28/2020

C.1 Sampling Protocol

The following procedures shall be used in sampling groundwater at the site. This sampling protocol shall apply to the routine quarterly (or modified semi-annual or annual) sampling events. A sample collector's worksheet, comparable to the example located in Exhibit A-1, may be used for noting relevant information in regard to each well.

If conditions at the time of sampling could influence the results, sampling should be postponed until a later date. However, under no circumstances will sampling deviate from the schedule in Section 5.1 .

C.1.1 Water Levels

Water levels shall be taken in each well prior to purging and/or sampling. Water levels should be taken as close together as practical, to prevent any time distortion of the water surface data. The following steps shall be followed to obtain accurate water level readings:

1. Note the general condition of the monitoring well on the worksheet. This shall include, but is not limited to the condition of the casing, the lock, evidence of tampering, condition of the pad, and any standing water.
2. Remove the lock and open the monitoring well. Note the condition of the interior of the casing and the condition of the well cap and riser. Open the cap, taking care not to allow dirt or foreign material into the monitoring well.
3. The technician shall rinse the probe and cable of the water level meter with DeCon water.
4. Slowly lower the probe into the monitoring well until the meter indicates the water surface has been reached.
5. Note the depth to water (to the nearest 0.01 ft) and the time on the worksheet.
6. Lower the probe to the bottom of well. (If a dedicated pump is installed in the well, skip this step). Note the well depth on the worksheet. The depth of the well will be measured on an annual basis, at wells that do not contain dedicated pumps. The depth of wells with dedicated pumps will be measured at least once every 5 years, or whenever the pump is removed.
7. Slowly remove the probe from the well. Rinse the probe and line with DeCon water.
8. Replace cap. Close and lock the well. Proceed to the next well, and repeat.

C.1.2 Purging of Monitoring Well – Pump Method

After all water level measurements have been taken, the monitoring wells shall be purged to provide a representative sample. Each groundwater monitoring well shall be purged by using a dedicated pump. The pump construction shall consist of inert materials consistent with the monitoring well construction (e.g., stainless steel pump bodies installed in stainless steel wells).

Purging shall be conducted utilizing a "low-flow" or minimal drawdown technique. Flow rates for this technique will typically fall below 0.5 liters/minutes, with an overall goal of not reducing the water level in the monitoring well by more than 0.3 ft during purging. Water levels should be checked frequently to ensure that the drawdown in the well does not exceed the 0.3-ft limits. Every 3 minutes to 5 minutes, readings shall be taken on the following water quality indicators to determine if a representative water sample is available.

Electronic Filing: Received, Clerk's Office 09/28/2020

- pH (in SU),
- Specific Conductance (in µmhos/cm or µS/cm),
- Temperature (in °F),
- And, it is suggested, at least one of the following:
  - Redox Potential (in mV);
  - Dissolved Oxygen (in mg/L); and/or
  - Turbidity (in NTU).

The water quality indicators will be considered stabilized when the following tolerances are reached after three consecutive readings:

- pH..... ±0.05 SU
- Specific Conductance ..... ±5 percent
- Temperature..... ±0.5°F
- Redox Potential ..... ±10 percent
- Dissolved Oxygen..... ±10 percent
- Turbidity..... ±10 percent

Slow recovering wells require special consideration. If a well is dry, or is purged below the bottom of the pump intake, the well will be allowed to recharge for at least 12 hours. Samples shall be collected until all sample containers have been filled or the well becomes dry. Notes shall be kept on the worksheet with regard to water levels, times, volume of water removed, and any other parameters considered to be relevant.

C.1.3 Purging of Monitoring Well – Bailer Method

Purging and sample collection with a bailer shall be performed in the event of a non-functioning pump or from a well that does not have a dedicated pump installed. A sample shall be collected utilizing a factory packaged, clean, disposable bailer with an appropriate length of new, clean rope attached.

Calculate the number of bailer volumes of water needed to remove one (1) well volume of water.

Well Volume Calculations (2-inch well):

Schedule 40 PVC has an inside diameter of 2.067 inches.

$\therefore$ ((2.067 inches/12 inches/ft)/2)^2 • π • 1 ft of water = 0.0233 ft^3/ft of water.

0.0233 ft^3/ft • 7.48 gallons/ft^3 = 0.174 gallon/ft

Schedule 5 Stainless Steel (304 or 316) has an inside diameter of 2.245 inches.

$\therefore$ ((2.245 inches/12 inches/ft)/2)^2 • π • 1 ft of water = 0.0275 ft^3/ft of water.

0.0275 ft^3/ft • 7.48 gallons/ft^3 = 0.206 gallon/ft

Volume of well (in gallons) = well type gallon/ft • (DTB - DTW);
where, DTB = depth to bottom of well (from measuring point), and
DTW = depth to water (from measuring point)

Bailer Volumes: Disposable bailer volumes will vary by type and manufacturer. Volume information should be obtained before going to the site. For comparison, a 3 ft stainless steel bailer has a volume of approximately 1220 cc or 0.322 gallon and a 5 ft PVC bailer has a volume of approximately 1085 cc or 0.287 gallon.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Open monitoring well, being careful that no potential contaminant enters the well.
2. Remove one (1) bailer volume of water from the monitoring well. Test pH, specific conductance and temperature. Note values on worksheet. (Turbidity, redox potential and dissolved oxygen will vary considerably due to the agitation a bailer will cause in the well. Testing for these parameters is not recommended with this method.)
3. Remove one-half (½) gallon of water from the monitoring well. Test pH, specific conductance and temperature. Note values on worksheet.
4. Remove ½ to 1 gallon of water. Test pH, specific conductance and temperature. Record data on worksheet.
5. Repeat Number 5 until pH, specific conductance and temperature stabilize or three (3) well volumes of water have been removed.
6. If the monitoring well becomes dry, or there is insufficient water to obtain all necessary samples, the monitoring well will be allowed to recharge for 24 hours. Samples shall be collected until all sample containers are filled or the well becomes dry. Notes shall be kept on the worksheet regarding water levels, times, volume of water removed, and any other parameters considered by the technician to be relevant.
7. If there is sufficient water volume in the monitoring well to obtain all samples, sample collection shall begin at this time.

C.1.4 Sample Collection Order

Samples shall be collected starting at the monitoring well with the least likelihood for contamination. Sampling shall proceed from the well with the lowest potential for contamination to the well with the highest potential for contamination.

C.1.5 Field Measurements

C.1.5a General

Upon arrival at each groundwater monitoring well, the technician shall note on the sampler's worksheet or in a field notebook the date, time, ambient air temperature, general weather conditions, and individuals present, including sample team members and any observers. (Note: Any observers shall need at a minimum, the same personal protective gear as the members of the sample team.)

Establish a "clean area" near the monitoring well where the sample containers and equipment can be stored while not in use. Every effort should be made to keep the sampling equipment and containers from contacting the ground surface. If necessary, a disposable, plastic tarp can be used as a ground cover to prevent potential contamination of the sample containers and equipment. Typically, the back of the field vehicle will be used as the "clean area".

Any non-dedicated sampling equipment (meter probes, thermometers, etc.) shall be washed in a commercial, laboratory cleaner (Alconox®, Liqui-nox®, or equivalent), and thoroughly rinsed in DeCon water before each use. Calibration shall be performed at each new monitoring location after the initial decontamination. After use, each device shall be powered down (if necessary) decontaminated, and stored in its manufacturer-approved container.

Electronic Filing: Received, Clerk's Office 09/28/2020

C.1.5b Temperature

Obtain a water sample from the well. Place the sample aliquot in a disposable container, insert the thermometer (or electronic probe), wait until the readings have stabilized, and record the temperature on the worksheet. Temperature for a glass thermometer should be noted to the nearest degree Fahrenheit (1°F). For electronic thermometers (thermocouples), temperature should be noted to the nearest tenth degree Fahrenheit (0.1°F). The thermometer or probe shall be cleaned and rinsed with DeCon water after use.

C.1.5c pH

Confirm calibration of the instrument by comparing with an appropriate buffer solution. Adjust for temperature compensation (if meter is not self-compensating). Rinse probe with DeCon water. Obtain a sample from the well and place the probe in sample aliquot. Note the pH and record on the sample worksheet. Note pH readings to the nearest tenth unit (0.1).

C.1.5d Specific Conductance

Confirm calibration of the instrument by comparing against an appropriate buffer solution. Adjust for temperature compensation (if meter is not self-compensating). Rinse the probe with DeCon water. Obtain a sample from the well and place the probe in sample aliquot. Note the specific conductance and record on the sample worksheet. Specific conductance should be noted to the nearest micromhos per centimeter (µmhos/cm) or microSiemens per centimeter (µS/cm).

C.1.6 Sample Collection Procedures

Jars and vials may ship pre-labeled from the laboratory, identifying the analysis and preservative for each type of sample. Dependent upon circumstances, sample containers may be prepared by non-laboratory personnel. If so, this should be noted on the sample worksheet or in the field notebook.

A technician shall remove a sample container from the cooler, affix a label, and in indelible, waterproof ink write the well number and/or sample I.D., the facility name, the sample collection date and time, the type of sample in the container, and the sample collector's name. A technician shall organize the containers in the following sampling order:

1. Metals and Minerals (dissolved);
2. Anions (dissolved);
3. Total Dissolved Solids (TDS); and
4. Cyanides (total);

Dissolved parameters include dissolved metals and minerals, total dissolved solids (TDS), and nitrogen should be field filtered. Samples should be filtered using a 0.45-micron filter attached to the sample pump line. Other filter apparatus may be utilized as long as Illinois EPA guidelines are followed. Filters should be replaced no less frequently than at each new well, and may need to be replaced more often if flow is restricted due to particulate matter in the sample water.

Electronic Filing: Received, Clerk's Office 09/28/2020

C.2 Transportation of Monitoring Samples

C.2.1 Sample Preservation Techniques

The preservation techniques utilized in the groundwater samples will typically adhere to those listed in Handbook for Sampling and Sample Preservation of Water and Wastewater, U.S. EPA, EPA-600/4-82-029, September 1982 and/or Test Methods for Evaluating Solid Wastes, Physical/Chemical Methods, EPA/530/SW-846, 3rd Edition, Final Update IV (January 2008).

C.2.2 Transportation of Samples

Samples shall be transported to the laboratory in sealed, insulated shipping containers, ice chests, or coolers. The shipping containers should be sturdy, and if samples are contained in glass bottles, dividers and/or bubble wrap should be used to restrict potential breakage. All samples will be packed in ice or a packaged refrigerant as necessary for proper preservation. Samples should be packed to maintain sample temperatures as close to 4°C (degrees Celsius) or 39°F as possible from the time the samples are collected to the time the samples are received by the laboratory. The samples should be shipped/delivered to the laboratory as soon as practical, preferably within 24 hours of sample collection.

All samples shall be accompanied by a chain-of-custody record. The sampler shall retain a copy of the record and forward the original with the samples to the analytical laboratory. Once the laboratory has received the samples, a representative from the laboratory is to complete the record, retain the original and return a copy with the chemical analysis reports to the sampler. The chain-of-custody shall contain the facility name, the wells sampled, time and date of sampling, members of the sampling party, type of samples (i.e. water, soil, leachate, etc.), number of sample bottles, requested analysis, overnight courier, etc. A sample chain-of-custody record is provided in Exhibit A-2.

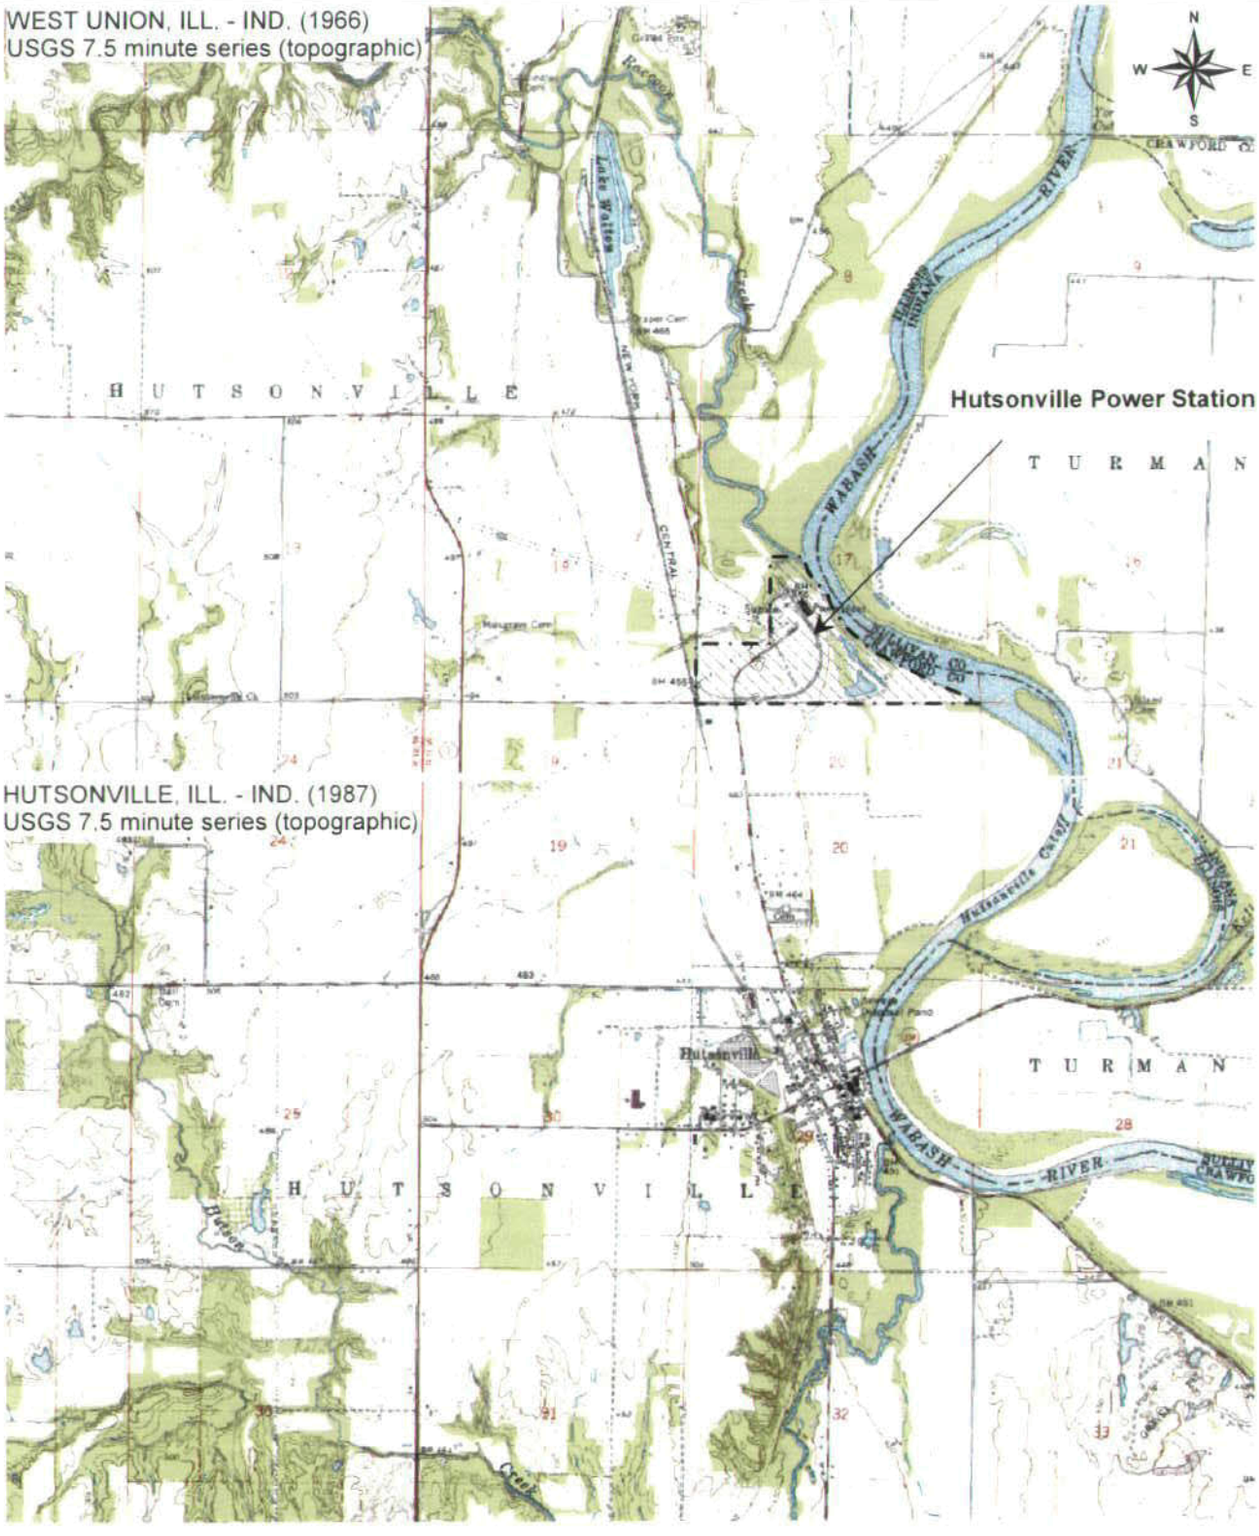
1. Background

1.1 Introduction



This Groundwater Model and Simulation of Closure has been prepared by Natural Resource Technology (NRT) on behalf of AmerenEnergy Medina Valley Cogen, L.L.C. (Ameren) to describe model development and report on simulation results for closure of Ash Ponds A, B, and C, and the Bottom Ash Sluice Pond at the Hutsonville Power Station (Site). The groundwater flow and transport model was derived and updated from a model previously developed for the Site in 2009 (NRT, 2009). The objective of the updated model was to assess the fate and transport of boron, an indicator constituent for coal combustion waste (CCW) in the shallow groundwater zone at the Site, in response to the multi-step closure activities proposed for the Site. This report summarizes development of the groundwater model and describes its use to predict groundwater quality after the proposed closure activities are implemented.

1.2 Site Description

The Site is located on the west bank of the Wabash River, in Crawford County, Illinois, approximately one and one-half miles north of the City of Hutsonville (Figure 1). The coal fired power plant began operation in the 1940s and was removed from service in 2011. The plant had two units with a combined generating capacity of 164 megawatts (MW). The following portions of the site were considered for modeling (Figure 2):

- Ash Pond A (12 acres) – a high density polyethylene (HDPE) lined fly ash pond that began operation in 1986. Fly ash from the operating units was collected by an electrostatic precipitator and sluiced to Ash Pond A.
- Ash Pond B (4.4 acres) – a HDPE lined interim pond constructed in 2000. Sluice water from Ash Pond A and the bottom ash pond was routed through Ash Pond B before discharge to the Wabash River via a NPDES permitted outfall #002 (IL0000175).
- Ash Pond C (2 acres) – a HDPE lined drainage collection pond constructed in 2000. Sluice water from the bottom ash pond was routed through Ash Pond C before discharge to the Wabash River via the outfall #002.
- Ash Pond D (22 acres) – an unlined ash pond that was constructed during 1967 - 1968. Ash Pond D was the primary ash management unit until Ash Pond A was constructed. Since then, it was used as a secondary settling pond until 2000 when it was removed from service. Precipitation and flood backwater accumulated in the pond at times during the inactive period, resulting in ponded conditions. Ash Pond D was capped during 2012 - 2013.
- Bottom Ash Sluice Pond (1.2 acres) – a bottom ash management unit. Bottom ash was sluiced to the pond and recycled.
- Coal Storage Yard (approximately 8.4 acres).

An ash laydown area was formerly located between Ash Pond A and Ash Pond D. The laydown area, covering approximately 6 acres, was removed before Ash Ponds B and C were constructed in 2000.

EXPLANATION

Property limits (approximate)

SCALE: 1 in. = 1,000 ft.

1.3 Site Hydrogeology

Site geology consists primarily of Wisconsinan Stage fluvial deposits with some Illinoian Stage diamictons overlying Pennsylvanian bedrock. There are various fill materials along with three unlithified surficial units identified at the Site, including fine-grained fluvial deposits classified as Cahokia Alluvium, poorly sorted outwash sand and gravels of the Henry Formation, and silty and clayey diamictons of the Glasford Formation. The details of the Site geology are described in the Hydrogeologic Site Investigation Report (Hanson, 2014).

Two groundwater flow zones are identified at the site: a shallow groundwater zone and a deep groundwater zone. The shallow groundwater zone consists of sand and gravel with varying thickness, typically 10 to 20 ft, underlain by 15 to more than 30 ft of the upper, permeable portions of the sandstone. The shallow sand grades to a fine-grained silty clay toward the northern portion of the Site. A thick shale unit underlies the sandstone at an approximate elevation of about 405 to 410 ft National Geodetic Vertical Datum (NGVD). The Wabash River valley contains a relatively fine-grained alluvium from land surface to an elevation of about 410 to 415 ft NGVD, underlain by sand and gravel to an elevation of about 350 ft—the sand and gravel at depth in the Wabash River valley is referred to as the deep groundwater zone. The shale unit beneath the Wabash River valley has been identified at elevations ranging from 345 to 380 ft NGVD.

Groundwater within the shallow zone generally flows from west to east towards the Wabash River. Horizontal hydraulic gradients range from 0.01 to 0.02, with an average of 0.016. Groundwater within the deep zone moves from southwest to northeast, almost perpendicular to the banks of the Wabash River. Horizontal hydraulic gradients for the deep zone range from 0.007 to 0.015, with an average of 0.011. The hydraulic conductivity measured at the site ranges from 2.6×10^{-4} to 4.8×10^{-2} cm/s, with a geometric mean of 6.5×10^{-3} cm/s for the unlithified materials and 4.7×10^{-4} cm/s for the sandstone bedrock unit.

1.4 Groundwater Quality

Per Illinois Administrative Code (IAC) Title 35, Section 620, groundwater at the site meets the definition of a Class I, Potable Resource Groundwater. Therefore, the groundwater quality standards of Class I set forth in Section 620.420 are the applicable groundwater quality standards.

Groundwater quality has been sampled at the site since 1984. The locations of monitoring wells are illustrated in Figure 2, although not all of these wells are currently monitored. Concentrations of boron, sulfate, iron, manganese, and total dissolved solids (TDS) exceeded the Class I groundwater quality standards at multiple locations downgradient of the ash ponds during the period of 2011 through 2013. Boron and sulfate are the primary indicators for coal ash leachate. As documented in the Hydrogeologic Report (Hanson 2014), median boron concentrations, calculated from 1999 to 2013, were higher than the Class I standard at MW2(R), MW3/3D, MW6, MW8, and MW11(R), and median sulfate concentrations exceeded the standard at MW3/3D, MW6, MW8, and MW11(R).

Electronic Filing: Received, Clerk's Office 09/28/2020

1.5 Implemented and Proposed Closure Actions

1.5.1 Implemented Closure Actions

Ash Pond D, the largest and oldest pond at the site, was covered and closed during 2012-2013. Closure activities included placement of a 40-mil textured HDPE geomembrane overlain by a 3-ft protective soil cover with a vegetated surface. Surface water management features incorporated into the final cover design included intermediate berms and ditches to direct runoff to rip-rap-lined chutes running off the ash pond to surrounding areas. Details of the closure are provided in the Project Plans and Specifications (Hanson, 2011a).

In addition, a groundwater collection trench was installed between the outside south toe of Ash Ponds A, B, and D and the south property line, as shown on Figure 2. Ameren intends to begin operation of the trench once the Site's NPDES permit is modified, and this modification is expected to be completed late in 2014 or early 2015. The trench is designed to continuously withdraw groundwater and create a hydraulic barrier to prevent migration south of the property line. Water captured by the Trench will be pumped to a central catch basin located adjacent to the existing Ash Pond D outlet structure along the mid-east side of the pond, from which it will then discharge to the Wabash River in accordance with the Site's NPDES permit. Details are provided in the Ash Pond D closure plan (Hanson, 2011b) and Project Plans and Specifications (Hanson, 2011a).

1.5.2 Proposed Closure Actions

A Closure Plan, for Ash Ponds A, B, C, and the Bottom Ash Sluice Pond, is being submitted simultaneously with this report. The proposed closure actions are:

- Capping Ash Pond A – Ash Pond A is designed to be the depository for disposal of materials excavated from Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond. It will then be graded to drain surface water using a uniform 5% slope toward the outside berm. The proposed cover will include a 40-mil textured HDPE geomembrane overlain by a 3-ft protective soil cover. Surface water management features incorporated into the final cover design include rock chutes to discharge runoff to surrounding areas and a storm water retention pond in the area where Ash Pond B is currently located.
- Clean closure of Ash Pond B – Ash Pond B will be clean-closed and the berms removed to be re-used as cover material for Ash Pond A. The pond bottom will then be graded to a maximum of 9-ft below the pond perimeter. Storm water routed through this pond will be detained for intermediate to large rain events.
- Clean closure of Ash Pond C – Ash Pond C will be clean-closed and graded to drain to the northeast through an open cut channel through the original east perimeter berm of Ash Pond D and discharged towards the Wabash River.
- Clean closure of the Bottom Ash Sluice Pond – The Bottom Ash Sluice Pond will be clean-closed and graded to drain to the northeast through an open cut channel through the original east perimeter berm of Ash Pond D and discharged towards the Wabash River.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.6 Timeline of Ash Pond Actions

An approximate schedule is summarized below that outlines the time for implementation of the Closure Plan elements, as well as the timelines of previous ash pond constructions, removals, and other related operations:

- 1968 - 2000: Ash Pond A and Ash Ash Pond D were the only existing ash ponds operated on Site.
- 2000:
  a. Ash Pond D was removed from service.
  b. The ash laydown area was excavated.
  c. Construction of the interim pond (Ash Pond B) and the drainage collection pond (Ash Pond C) were finished.
- January 2013: Capping of Ash Pond D was completed.
- January 2015 (Expected): The groundwater collection trench will begin operation.
- January 2016 (Expected):
  a. Removal of Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond will be completed.
  b. Capping of Ash Pond A will be completed.

2. Groundwater MODEL Approach

2.1 Overview

This section presents the conceptual model and the overall modeling methodology. The model was established to predict the effect of the proposed closure actions for Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond on groundwater quality at the site. These ponds have limited impact on groundwater flow and quality, so Ash Pond D was included in the modeling for calibration purposes.

2.2 Conceptual Model

The conceptual model for the Site is schematically illustrated in Figure 3, below. Three sources of water are present: natural recharge within the model domain, percolation water from the ash ponds, and groundwater flow from the west. Groundwater in the shallow groundwater zone flows horizontally east, discharging into the Wabash River, a regional groundwater sink. Where coal ash is encountered within the shallow groundwater zone, groundwater flows horizontally through the ash. Only Ash Pond D was deep enough to have horizontal groundwater migration through the coal ash.

Electronic Filing: Received, Clerk's Office 09/28/2020

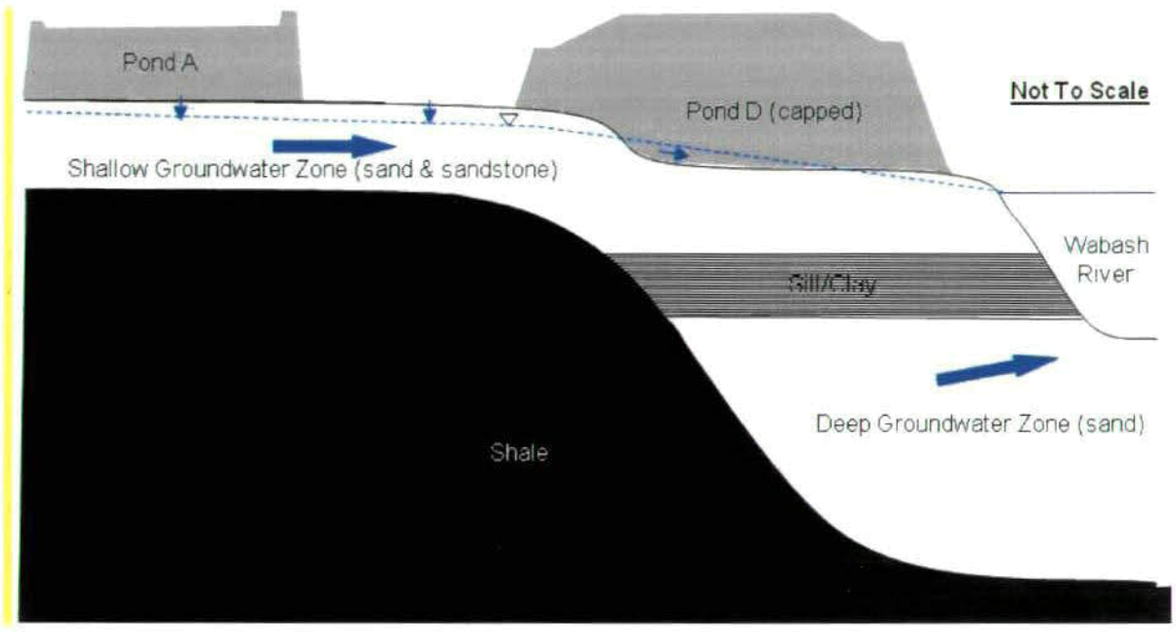

Figure 3. Conceptual Model Schematic

Boron was modeled to simulate migration of CCW leachate because it 1) has concentrations exceeding the Class I standard in a number of on-site monitoring wells, 2) is mobile in groundwater, and 3) is not chemically reactive. The conceptual model for transport assumes two boron sources: boron that leaches to recharge water during percolation through ash above the water table; and boron that leaches to groundwater as it flows through ash below the water table, which is limited to Ash Pond D. Therefore, mass is added to groundwater via vertical recharge through coal ash, and horizontal groundwater flow through coal ash where it lies below the water table. Mass is discharged at the model representation of the Wabash River. It is assumed that boron undergoes reversible adsorption and desorption within the soil matrix along its transport pathways, however no removal of mass occurs with this process. The conceptual transport model also assumes that boron concentration in leachate does not vary as a function of time, although the volume of leachate released decreases over time as a function of pond dewatering and capping.

2.3 Model Approach

Three model codes were used to simulate groundwater flow and boron transport:

- Leachate percolation after Ash Pond D closure was modeled using the Hydrologic Evaluation of Landfill Performance (HELP) model and the leachate percolation rates were applied in MODFLOW to simulate recharge beneath the pond cap.
- Groundwater flow was modeled in three dimensions using MODFLOW.
- Boron transport was modeled in three dimensions using MT3DMS (MODFLOW calculated the flow field that MT3DMS used in the transport calculations).

Electronic Filing: Received, Clerk's Office 09/28/2020

The groundwater flow and transport models were calibrated to the monitoring data observed from 1984 to 2013. Multiple stress periods were set in the models to represent the Site changes during the model period. The descriptions of multiple stress periods applied in the model are listed in Table 1. A total of five stress periods were used in the calibration model to simulate site conditions from the initial construction of the ash pond to the end of the observation period and are summarized as following:

- Stress Period 1 - a steady-state flow model over a period from 1967 to 1985. Ash Pond A, Ash Pond D and the ash laydown area were assumed to be present at the Site during the same period for simplicity of the model.
- Stress Period 2 – a transient flow model over a period from 1986 to 1996. All model inputs were similar to stress period 1 with one exception: a continuous small-area leak was modeled in Ash Pond A to simulate a concentration increase observed in MW3 beginning in 1986.
- Stress Period 3 – a transient flow model over a period from 1997 to 2000. A second continuous leak was modeled in Ash Pond A to simulate an increase in boron concentration observed in MW2 beginning in 1997.
- Stress Period 4 – a transient flow model over a period from 2001 to January 2013. This stress period included changes to recharge and concentration inputs to simulate addition of Ash Pond B and Ash Pond C, and removal of the ash laydown area. It also incorporated a recharge rate modification to simulate discontinuation of sluicing to Ash Pond D.
- Stress Period 5 – a transient flow model over a period from January 2013 to December 2014. Recharge was modified in this stress period to simulate capping of Ash Pond D.

The approach used to calibrate the groundwater flow model and transport model was:

- The flow model was calibrated to approximate head observations measured from 1984 to 2013.
- The transport model was calibrated to approximate boron concentration observations measured from 1984 to 2013.

Multiple iterations of MODFLOW and MT3DMS calibration were performed to achieve an acceptable match to the time-series trends of the observed data. In order to obtain a reliable set of fitting parameters, all available well monitoring data were used for the calibration. The transport model calibration required iterative changes to and recalibration of the flow model. The results provided a representative simulation of groundwater flow and transport conditions in the proximity of the Site.

The calibrated model was then used to simulate proposed closure activities and predict changes in groundwater quality over a period of 90 years. Two additional stress periods were added for the prediction model:

- Stress Period 6 – a transient flow model over a period from January 2015 to December 2015. A MODFLOW drain boundary was added for this stress period to simulate operation of the groundwater collection trench.
- Stress Period 7 – a transient flow model over a period from 2016 to 2105. Recharge rates and concentrations were modified to simulate clean-closure of Ash Ponds B, C, and the bottom ash pond, and recharge rates were modified to simulate capping of Ash Pond A.

Electronic Filing: Received, Clerk's Office 09/28/2020

Table 1. Model Stress Periods

Modeled Year	Stress Period	Category	Flow Model State	Length (days)	Description
11/9/1967 - 12/31/1985	1	Calibration	Steady	6628	–
1/1/1986 - 12/31/1996	2	Calibration	Transient	4018	Initiation of east leak in Ash Pond A liner
1/1/1997 - 12/31/2000	3	Calibration	Transient	1460	Initiation of west leak in Ash Pond A liner
1/1/2001 - 1/17/2013	4	Calibration	Transient	4400	(1) Laydown area ash excavation complete. (2) Interim Ash Pond (B) and drainage collection Ash Pond (C) construction complete. (3) Ash Pond D removed from service - dewatering.
1/18/2013 - 12/31/2014	5	Calibration	Transient	714	Ash Pond D cover system complete.
1/1/2015 - 12/31/2015	6	Prediction	Transient	364	Groundwater trench system operated
1/1/2016 - 1/1/2105	7	Prediction	Transient	32507	(1) Capping of Ash Pond A. (2) Removal of Ash Pond B, Pond C and Bottom Ash Sluice Pond.

The cover system for Ash Pond D, consisting of 3-ft protection soil and a HDPE geomembrane layer, was modeled using HELP to estimate the percolation rate of leachate underneath the cover system. The rate was applied during Stress Periods 5, 6, and 7.

3. Percolation Modeling

3.1 HELP Model Description

The Hydrologic Evaluation of Landfill Performance (HELP) code was developed by the U.S. Army Corps of Engineers for the U.S. Environmental Protection Agency. HELP calculates one-dimensional vertical percolation from a landfill or soil column based on precipitation, evapotranspiration, runoff, and the geometry and hydrogeologic properties of a layered soil and waste profile.

For this investigation, HELP Version 3.07 (Schroeder et al., 1994) was selected to estimate percolation when a cover system was over Ash Pond D. The hydrologic data required by and entered into HELP are listed in Table 2 and described in the following paragraphs.

3.2 HELP Model Set-up

3.2.1 Percolation Model Scenario

The objective of the HELP modeling was to estimate the recharge rate (percolation) through the cap implemented on Ash Pond D since January 2013. The cap consists of 3-ft protection soil and a geomembrane layer (HDPE). This design meets the requirements of 35 IAC 840.126. For the HELP simulation, it was assumed that any standing water in the pond was removed prior to cap construction.

Electronic Filing: Received, Clerk's Office 09/28/2020

Vegetation	3	1, 5	High	HELP Vegetation Codes

[1]Sensitivity Explanation
Negligible - less than 1 percent change in total percolation volume relative to base scenario.
Low - 1 to 2 percent change in total percolation volume.
Moderate - 2 to 10 percent change in total percolation volume.
High - greater than 10 percent change in total percolation volume.

Electronic Filing: Received, Clerk's Office 09/28/2020

3.2.2 Percolation Model Input Data

Table 2 presents all input data to configure the HELP model. Climatic input variables were synthetically generated by the HELP model using default values for Evansville, Indiana, and latitude of 39.13° N for the Site. Rainfall frequency and temperature patterns for more than 100 cities are programmed into HELP. Evansville was selected as the closest city to the Site. The model used Evansville precipitation and temperature patterns with default precipitation and temperature data to generate daily precipitation and temperature data.

Physical input data were based on the configuration of Ash Pond D and a combination of measured and assumed soil properties. Cap materials were chosen from the HELP database to match the conceptual design. The HELP modeling assumed that cap materials and ash had uniform texture and hydraulic properties during the simulation period. Hydraulic properties of the cap materials, including hydraulic conductivity, porosity, field capacity, and wilting point, were the default database values. The initial moisture content in each layer was calculated by assuming constant values via the HELP program. It was also assumed 100% runoff given the condition that capping system was properly constructed and maintained.

The HELP modeling assumed that the geomembrane layer of the cap was constructed with good placement quality, standing water was removed from the capped ponds, no groundwater flowed into the pond, and all flow to groundwater was vertical. Other assumptions inherent in the model are listed in Schroeder et al. (1994).

3.3 HELP Model Approach

Two types of HELP simulations were performed: prediction analysis and sensitivity analysis. The prediction analysis was performed to estimate the percolation rate of the cap, which was later input to the Stress Periods 5 through 7 in the groundwater flow model. Sensitivity analysis was used to determine the contribution of each input parameter to the final percolation rate calculation.

3.4 HELP Model Results

3.4.1 Prediction Analysis

HELP input and output files are included on the attached CD (Appendix C). Predicted percolation rates fluctuated with changes in predicted precipitation and evaporation conditions. Average percolation rate calculated from the HELP simulations was later used in the groundwater flow model. The average percolation rate for Ash Pond D cover was calculated as 1.5 inches/year (in/yr).

3.4.2 Sensitivity Analysis

Sensitivity analyses were performed on selected hydrogeologic and soil parameters and are presented in Table 2. The results showed that percolation rates calculated by HELP were highly sensitive to vegetation assumptions, the thickness and texture of the native soil assumed for the protection layer, and the installation and placement quality of the geomembrane. The model was not sensitive to the simulation of coal ash thickness and the parameters used in the runoff calculation, such as the capping slope and the runoff length.

Electronic Filing: Received, Clerk's Office 09/28/2020

4. Flow and Transport Model SET-UP AND CALIBRATION

4.1 Model Overview

The 2014 model is an update to, and was derived from, a model developed for the Site in 2009 (NRT, 2009). Several changes were made to the 2009 model, specifically:

- The calibration period was extended through December 2013. New wells were included as calibration points (MW115S/D, MW11(R), MW121 and MW14).
- Instead of using ponded and dry portions to represent Ash Pond D before its closure (Stress Periods 1-4), a uniform recharge rate was applied to Ash Pond D to simplify the model.
- Small leaks were simulated in Ash Pond A to simulate increases in boron concentration observed in MW2 and MW3.
- A high recharge zone was added along the Wabash River bank to represent increased infiltration when the Wabash River overflows its banks.
- Recharge rates for the ponds were adjusted to improve matches with the observed data.

4.2 Model Descriptions

MODFLOW uses a finite difference approximation to solve a three-dimensional head distribution in a transient, multi-layer, heterogeneous, anisotropic, variable-gradient, variable-thickness, confined or unconfined flow system - given user-supplied inputs of hydraulic conductivity, aquifer/layer thickness, recharge, wells, and boundary conditions. The program also calculates water balance at wells, rivers, and drains.

MODFLOW was developed by the United States Geological Survey (McDonald and Harbaugh, 1988) and has been updated several times since. Major assumptions of the code are: (1) groundwater flow is governed by Darcy's law; (2) the formation behaves as a continuous porous medium; (3) flow is not affected by chemical, temperature, or density gradients; and (4) hydraulic properties are constant within a grid cell. Other assumptions concerning the finite difference equation can be found in McDonald and Harbaugh (1988).

MT3DMS (Zheng and Wang, 1998) is an update of MT3D. It calculates concentration distribution for a single dissolved solute as a function of time and space. Concentration is distributed over a three-dimensional, non-uniform, transient flow field. Solute mass may be input at discrete points (wells, drains, river nodes, constant head cells), or distributed, evenly or unevenly, over the land surface (recharge).

MT3DMS accounts for advection, dispersion, diffusion, first-order decay, and sorption. Sorption can be calculated using linear, Freundlich, or Langmuir isotherms. First-order decay terms may be differentiated for the adsorbed and dissolved phases.

The program uses the standard finite difference method, the particle-tracking-based Eulerian-Lagrangian methods, and the higher-order finite-volume TVD method for the solution schemes. The finite difference solution is subject to numerical dispersion for low-dispersivity transport scenarios but maintains mass-balance. The particle-tracking method avoids numerical dispersion but is subject to greater mass-balance errors. The TVD solution is not subject to significant numerical distribution and

Electronic Filing: Received, Clerk's Office 09/28/2020

adequately conserves mass-balance, but is numerically intensive, particularly for long-term models. The TVD solution was used for this simulation.

Major assumptions of MT3DMS are: (1) changes in the concentration field do not affect the flow field; (2) changes in the concentration of one solute do not affect the concentration of another solute; (3) chemical and hydraulic properties are constant within a grid cell; and (4) sorption is instantaneous and fully reversible, while decay is not reversible.

4.3 Flow and Transport Model Setup

4.3.1 Grid and Boundary Conditions

A four layer, 56 by 60 node grid was established with variable grid spacing ranging from 100 ft. to 500 ft. in length parallel to the primary flow direction and 100 ft. to 500 ft. perpendicular to the primary flow direction (Figure A-1). The largest node spacings were near the upgradient and lateral model boundaries, and the finest node spacings were along the river and near the ponds.

Flow boundaries for all stress periods are presented on Figure A-1. The upgradient edge of the model was a constant head (Dirichlet) boundary. The input for head was not sensitive to the model hydraulic conditions (Table 3). The lower and lateral boundaries were no-flow (Neumann) boundaries. The downgradient boundaries were either MODFLOW river (Mixed) boundaries (layers 2-4) or no flow (layer 1). The upper boundary was a time-dependent specified flux (Neumann) boundary, with specified flux rates equal to the recharge rate or the rate of percolation from ponds.

Two types of transport boundaries were used. Specified mass flux (Cauchy condition) boundaries were used to simulate downward percolation of solute mass in areas where ash is above the water table, and constant concentration (Dirichlet condition) boundaries were used in areas where ash is below the water table. The former boundary condition assigned a specified concentration to recharge water entering the cell, and in this application the resulting concentration in the cell was a function of the relative rate and concentration of water percolating from the ash compared to the rate and concentration of groundwater flow. The latter boundary type assigned the specified concentration to all water passing through the cell and was only applied to Ash Pond D in the model.

4.3.2 Flow Model Input Values and Sensitivity

Flow model input values and sensitivity analyses results are presented in Table 3 and described below.

4.3.2a Layer Top/Bottom

Groundwater in the shallow groundwater zone is unconfined; therefore, the top of the aquifer was the water table and the elevation of the top model layer (layer 1) was set at 460 ft NGVD, a value slightly higher than the observed water table elevation of 427 to 450 ft NGVD. The top of layers 2-4 was the base of the overlying layer.

The base of the upper sand unit was determined by contouring bedrock elevation and importing the contour data into MODFLOW. The corresponding base elevations for layer 1 were between 424 and 450 ft. NGVD. The base of the second layer corresponded to the base of the sandstone, 418 ft NGVD.

Electronic Filing: Received, Clerk's Office 09/28/2020

Table 3. MODFLOW Input Parameters

Horizontal Hydraulic Conductivity	Applied Stress Period	ft/d	cm/s	Sensitivity[1]
Layer 1 fly ash	1-7	0.14	5.0E-05	Low
Layer 1 silt unit		0.10	3.5E-05	Low

Head (ft)	1-7	451	-	Negligible

[1]Sensitivity Explanation
Negligible - SSR change in one scale
Low - SSR change between one and two scales
Moderate - SSR change between two and three scales
High - SSR change higher than three scales

[2]The sensitivity for Wabash and Trib west is moderate and for Trib east is high.

* The recharge rate for the east leak was set to 0.01 ft/d before 2000 and 2.3e-5 ft/d afterward.

Electronic Filing: Received, Clerk's Office 09/28/2020

The base of the third layer corresponded to the top of the Wabash River valley sand unit, 412 ft NGVD. The base of the bottom layer (deep alluvial aquifer) corresponded to the base of the Wabash River valley sand unit (350 ft NGVD).

Layer 1 of the model included a zone with hydraulic conductivity representing fly ash. This zone was also used as a source area, representing saturated ash, during transport modeling. The base elevation of this zone was determined from contouring, as was the rest of model layer 1. Base elevations of the coal ash were contoured from 424 to 444 ft NGVD. In the model, only the first-layer nodes of Ash Pond D represented saturated ash.

4.3.2b Hydraulic Conductivity

Six hydraulic conductivity zones were established to simulate hydrogeology in the proximity of the Site, including fly ash, silt, sand, alluvium, sandstone and valley fill sand/gravel (Figure A-2). Hydraulic conductivity values were initially derived from field-measured values, and adjusted during calibration.

Vertical anisotropy ratios were set at 2.0 everywhere except the alluvium units in Layers 1, 2 and 3, where a ratio of 10 was set. The Kx/Kz ratios represent expected stratification within the formations.

The shale bedrock underlying the sandstone was not discretely modeled. Rather, cells representing shale, all in layers 3 and 4, were set with no-flow boundary conditions. This setting inherently assumed that groundwater flow in the shale bedrock is negligible.

The model sensitivity to the horizontal hydraulic conductivity ranged from low for fly ash and silt, to high for sand, alluvium, sandstone and valley fill sand/gravel. Sensitivity to vertical hydraulic conductivity also varied, with alluvium being highly sensitive; silt and valley fill sand/gravel having low sensitivity; and ash, sand, and sandstone having negligible sensitivity.

4.3.2c Storage

Representative values were obtained from Smith and Wheatcraft (1993). The storage zones were set consistent with hydraulic conductivity to represent the hydrogeology units as shown on Figure A-3. The storage affects the rate at which groundwater elevation changes as percolation rates changes, such as Ash Pond D closure, capping and construction of new ponds. Overall, the model was insensitive to this parameter.

4.3.2d Recharge

Recharge rates for the ash ponds and surrounding area were established during calibration (Figure A-4). Recharge zones were established for each individual pond at different stress periods as presented in Table 3. Recharge values were modified during the simulation to represent the following changes in Site conditions:

- Recharge representing Ash Pond D was decreased beginning in stress period 4 when sluicing to the pond was discontinued, and again in stress period 5 to simulate the cap.
- Recharge representing the bottom ash pond was discontinued and replaced with the rate for the area between ponds during stress period 7 to represent clean-closure of this facility.

Electronic Filing: Received, Clerk's Office 09/28/2020

- Recharge representing the ash laydown area was discontinued after stress period 3 when this area was removed. Recharge rates for these cells in future stress periods were either the area between ponds rate or Ash Ponds B & C rate, as appropriate.
- Recharge representing Ash Ponds B and C was initiated during stress period 4, and discontinued after stress period 6.
- Recharge representing Ash Pond A was not changed for stress period 7 (when the pond was capped) because the calibrated recharge rate for this HDPE-line pond was already lower than the HELP-determined capped recharge value representing Ash Pond D. However, the recharge rates for the two cells simulating leaks in Ash Pond A were reset to the capped value for Ash Pond A to simulate the effect of capping on the leaks.

The recharge rates for all pond areas had negligible sensitivity on the flow model. The recharge rates for the general site and the river bank had moderate and low sensitivities, respectively.

4.3.2e River and Drain Parameters

The Wabash River and tributaries were represented by head-dependent flux nodes that required inputs for river stage, width, bed thickness, and bed hydraulic conductivity. The latter three parameters were used to calculate a conductance term for the boundary node. River stage for the Wabash River was set near mean stage, and adjusted slightly during calibration. River stage for the tributaries was determined from USGS topographic maps. For model simplicity, it was assumed that stage does not fluctuate in any river and drain boundaries.

Sensitivity analysis showed that the model was moderately to highly sensitive to the conductance term used.

A MODFLOW drain boundary was added to the model to evaluate the effect of a groundwater collection trench on migration south of Ash Ponds A and D (Figure A-5). Drain parameters are listed in Table 4.

Table 4. MODFLOW Drain Construction

Drain	Value
Drain Length (feet)	1000
Drain Pipe Diameter (feet)	3
Drain Bed Thickness (feet)	1
Drain Bed Hydraulic Conductivity (cm/s)	0.10
Drain Bed Hydraulic Conductivity (ft/day)	283
East Drain Base Elevation	440
West Drain Base Elevation	423
MODFLOW Layer Number	1-2*
MODFLOW Drain Reach	1

*- Dependent on the drain elevation

Electronic Filing: Received, Clerk's Office 09/28/2020

4.3.3 Transport Model Input Values and Sensitivity

Transport model input values are listed in Table 5 and described below. The results of sensitivity analyses are presented in Table 5.

4.3.3a Initial Concentration

Initial concentration for the model was set at zero, implicitly implying a background concentration of zero, which is reasonable for boron. Since the prediction model was an extension of the calibration model, it did not have its own initial concentration values.

4.3.3b Source Concentration

Concentration values for the ash cells were held constant throughout the simulation period for all sources. Boron concentrations in leachate were modeled as 2 mg/L for the coal pile, 20 mg/L for Ash Ponds A, B, C, and D, and 30 mg/L for the Ash Laydown Area. The leachate concentrations were applied to the model consistent with the corresponding recharge zones for each stress period as listed in Table 5. The concentrations were set based on previous hydrogeologic assessment (NRT, 2009). Predicted concentrations were highly sensitive to source concentrations.

4.3.3c Effective Porosity

Effective porosity values were based on ranges provided by Mercer and Waddel (1993). Predicted concentrations were moderately sensitive to the effective porosity of Layer 2 sandstone, had low sensitivity to the effective porosity of Layer 4 valley fill sand/gravel, and were negligibly sensitive for the other units.

4.3.3d Dispersivity

Longitudinal dispersivity was set as 30 ft during model calibration. Transverse and vertical dispersion were estimated according to ratios developed by Gelhar et al. (1985). Predicted boron concentrations were highly sensitive to dispersivity values, in all directions.

4.3.3e Retardation

Retardation was calculated by the model based on the distribution coefficient (K_d) (Figure A-6). The model assumed a reversible adsorption and desorption process, which would slow migration of dissolved boron without reducing the total mass. The K_d value used for the sandy materials in this model (0.17 milliliters per gram, or mL/g) was based on testing performed by NRT for similar materials at another site. The K_d value for the silt materials (0.85 mL/g) was assumed a factor of five higher than that for sand. Predicted boron concentrations were highly sensitive to the K_d value of both materials.

4.3.3f Diffusion

Diffusion was assumed to be zero for the entire model domain.

Electronic Filing: Received, Clerk's Office 09/28/2020

Table 5. MT3DMS Input Parameters

Initial Concentration (mg/L)	Value	Alternatives	Sensitivity[1]
Entire Domain	0.0	not tested	–
Source Concentration - Recharge (mg/L)	**Value**	**Alternatives**	**Sensitivity[1]**

Distribution Coefficient - sand (mL/g)	0.17	0, 0.25	High
Distribution Coefficient - silt (mL/g)	0.85	0, 0.5, 1.2	High

[1]Sensitivity Explanation:
Negligible - little effect on concentrations
Low - concentrations at one or two wells changed by 2 to 10%
Moderate - concentrations at one or two wells changed by 10 to 20%
High - concentration at one or two wells changed by more than 20% or concentration at more than two wells changed more than 20%
[2]Determined to be highly sensitive during transport model calibration

4.4 Flow and Transport Model Assumptions and Limitations

Simplifying assumptions are necessary when numerically representing the natural environment in a groundwater flow model. Assumptions specific to this model are listed below. The reader is referred to McDonald and Harbaugh (1988), Zheng and Wang (1998), and Schroeder et al., (1994) for assumptions inherent with the codes used to develop the model.

- Natural recharge is constant over the long term.
- Hydraulic conductivity is consistent within hydrostratigraphic units.
- Fluctuations in surface water elevations are short in duration and do not affect groundwater flow and transport.
- Source concentrations remain constant over the time period modeled.
- Leachate instantaneously migrates to groundwater (e.g., rapid migration through the unsaturated zone).
- Boron undergoes a reversible adsorption and desorption process and does not decay. Dispersion is the primary attenuation mechanism.
- Cap construction has an instantaneous effect on recharge and percolation through the underlying ash fill deposit, relative to the 90 year period of the prediction model.

Electronic Filing: Received, Clerk's Office 09/28/2020

Model predictions of flow and concentration are less reliable with increasing distance from the Site. Furthermore, the reliability of model predictions decreases with increasing time since changes may occur that were not accounted for in the model.

4.5 Calibration Flow and Transport Model Results

Results of the MODFLOW/MT3DMS modeling are presented below. A disk containing the model files is attached to this report (Appendix D).

In Figure B-1, the simulated hydraulic heads are compared with the observed range of heads measured in 19 monitoring wells at or surrounding the Site from 1984 through 2013. Several monitoring wells, including MW3D, MW7D, MW10/10D, MW11(R), MW12, MW14, MW115S/115D and MW121, were installed around 2000; therefore, measurements prior to the installation dates are not available. The observed hydraulic heads fluctuate around a mean value. The simulated values successfully fall within the head data measured for the observation period. In addition, the flow model also predicted successfully the slight decreases of hydraulic heads in 2000 when Ash Pond D was dewatering and 2013 when it was covered. These observations indicate that this model provides a reasonable simulation of groundwater flow at and surrounding the site.

Simulated boron concentrations are compared to the observed data over the sampling period from 1984 through 2013 in Figure B-2. The monitoring wells can be categorized as: (1) wells with observed boron concentrations higher than the Class I standard (2 mg/L), including MW2(R), MW3, MW3D, MW6, MW8, and MW11(R), and 2) wells with observed boron concentrations equal to or below the standard, including MW1, MW4, MW5, MW7/7D, MW12, MW14, MW115S/D, and MW121. The simulated boron concentrations match the observed concentrations and meet the calibration criterion that simulated results for category (1) are all higher than 2 mg/L while the simulated results for category (2) are all equal to or below 2 mg/L. The model also successfully simulates boron concentration changes responding to various hydraulic and transport condition changes, specifically capturing the increasing or decreasing trends observed in category (1) wells. The agreement between modeled and predicted concentrations demonstrates that the transport model adequately simulates contaminant transport in groundwater in the proximity of the site.

5. Simulation of Closure Activities

5.1 Overview

As described in Section 2, the prediction model was established to simulate groundwater quality for a time frame of 90 years. Hydraulic heads and boron concentrations were predicted for monitoring wells in proximity of Ash Ponds A, B, C, and the Bottom Ash Sluice Pond, where closure is proposed. The well network consists of 9 wells: MW2(R), MW3, MW3D, MW4, MW5, MW9, MW10, MW10D, and MW12. Several simplifying assumptions were made during the simulation. Specifically:

- Boron concentrations in leachate were assumed to remain constant as a function of time.
- Construction and removal were completed over a brief period, relative to the length of the flow simulation.

Electronic Filing: Received, Clerk's Office 09/28/2020

Model predictions of flow and concentration are less reliable with increasing distance from the Site. Furthermore, the reliability of model predictions decreases with increasing time since changes may occur that were not accounted for in the model.

4.5 Calibration Flow and Transport Model Results

Results of the MODFLOW/MT3DMS modeling are presented below. A disk containing the model files is attached to this report (Appendix D).

In Figure B-1, the simulated hydraulic heads are compared with the observed range of heads measured in 19 monitoring wells at or surrounding the Site from 1984 through 2013. Several monitoring wells, including MW3D, MW7D, MW10/10D, MW11(R), MW12, MW14, MW115S/115D and MW121, were installed around 2000; therefore, measurements prior to the installation dates are not available. The observed hydraulic heads fluctuate around a mean value. The simulated values successfully fall within the head data measured for the observation period. In addition, the flow model also predicted successfully the slight decreases of hydraulic heads in 2000 when Ash Pond D was dewatering and 2013 when it was covered. These observations indicate that this model provides a reasonable simulation of groundwater flow at and surrounding the site.

Simulated boron concentrations are compared to the observed data over the sampling period from 1984 through 2013 in Figure B-2. The monitoring wells can be categorized as: (1) wells with observed boron concentrations higher than the Class I standard (2 mg/L), including MW2(R), MW3, MW3D, MW6, MW8, and MW11(R), and 2) wells with observed boron concentrations equal to or below the standard, including MW1, MW4, MW5, MW7/7D, MW12, MW14, MW115S/D, and MW121. The simulated boron concentrations match the observed concentrations and meet the calibration criterion that simulated results for category (1) are all higher than 2 mg/L while the simulated results for category (2) are all equal to or below 2 mg/L. The model also successfully simulates boron concentration changes responding to various hydraulic and transport condition changes, specifically capturing the increasing or decreasing trends observed in category (1) wells. The agreement between modeled and measured chemical concentrations demonstrates that the transport model adequately simulates contaminant transport in groundwater in the proximity of the site.

5. Simulation of Closure Activities

5.1 Overview

As described in Section 2, the prediction model was established to simulate groundwater quality for a time frame of 90 years. Hydraulic heads and boron concentrations were predicted for monitoring wells in proximity of Ash Ponds A, B, C, and the Bottom Ash Sluice Pond, where closure is proposed. The well network consists of 9 wells: MW2(R), MW3, MW3D, MW4, MW5, MW9, MW10, MW10D, and MW12. Several simplifying assumptions were made during the simulation. Specifically:

- Boron concentrations in leachate were assumed to remain constant as a function of time.
- Construction and removal were completed over a brief period, relative to the length of the flow simulation.

Electronic Filing: Received, Clerk's Office 09/28/2020

5.2 Simulation of Closure Activities

The implemented and proposed closure activities at the Site include: capping Ash Pond D (completed in 2013), operation of a groundwater collection trench (simulated beginning in January, 2015), clean closure of Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond (simulated as complete by January, 2016), and capping Ash Pond A (simulated as complete by January, 2016). Capping was simulated by modifying recharge rates; the groundwater collection trench was simulated by assigning drainage cells; and clean closure was simulated by modifying recharge rates and setting recharge concentrations to zero.

5.2.1 Predicted Hydraulic Heads

Figure 4 presents the modeled heads at current monitoring wells from calibration through the 90-year prediction period (2015-2105). Significant decreases (as much as 10 feet) are predicted for wells [see MW2(R) and MW3D] when the trench begins operation. The model predicts that some wells will be dry once the trench is operational; although field conditions at the small scale of individual wells may differ from model predictions. The effect on head decreases with distance from the trench.

5.2.2 Predicted Boron Concentrations

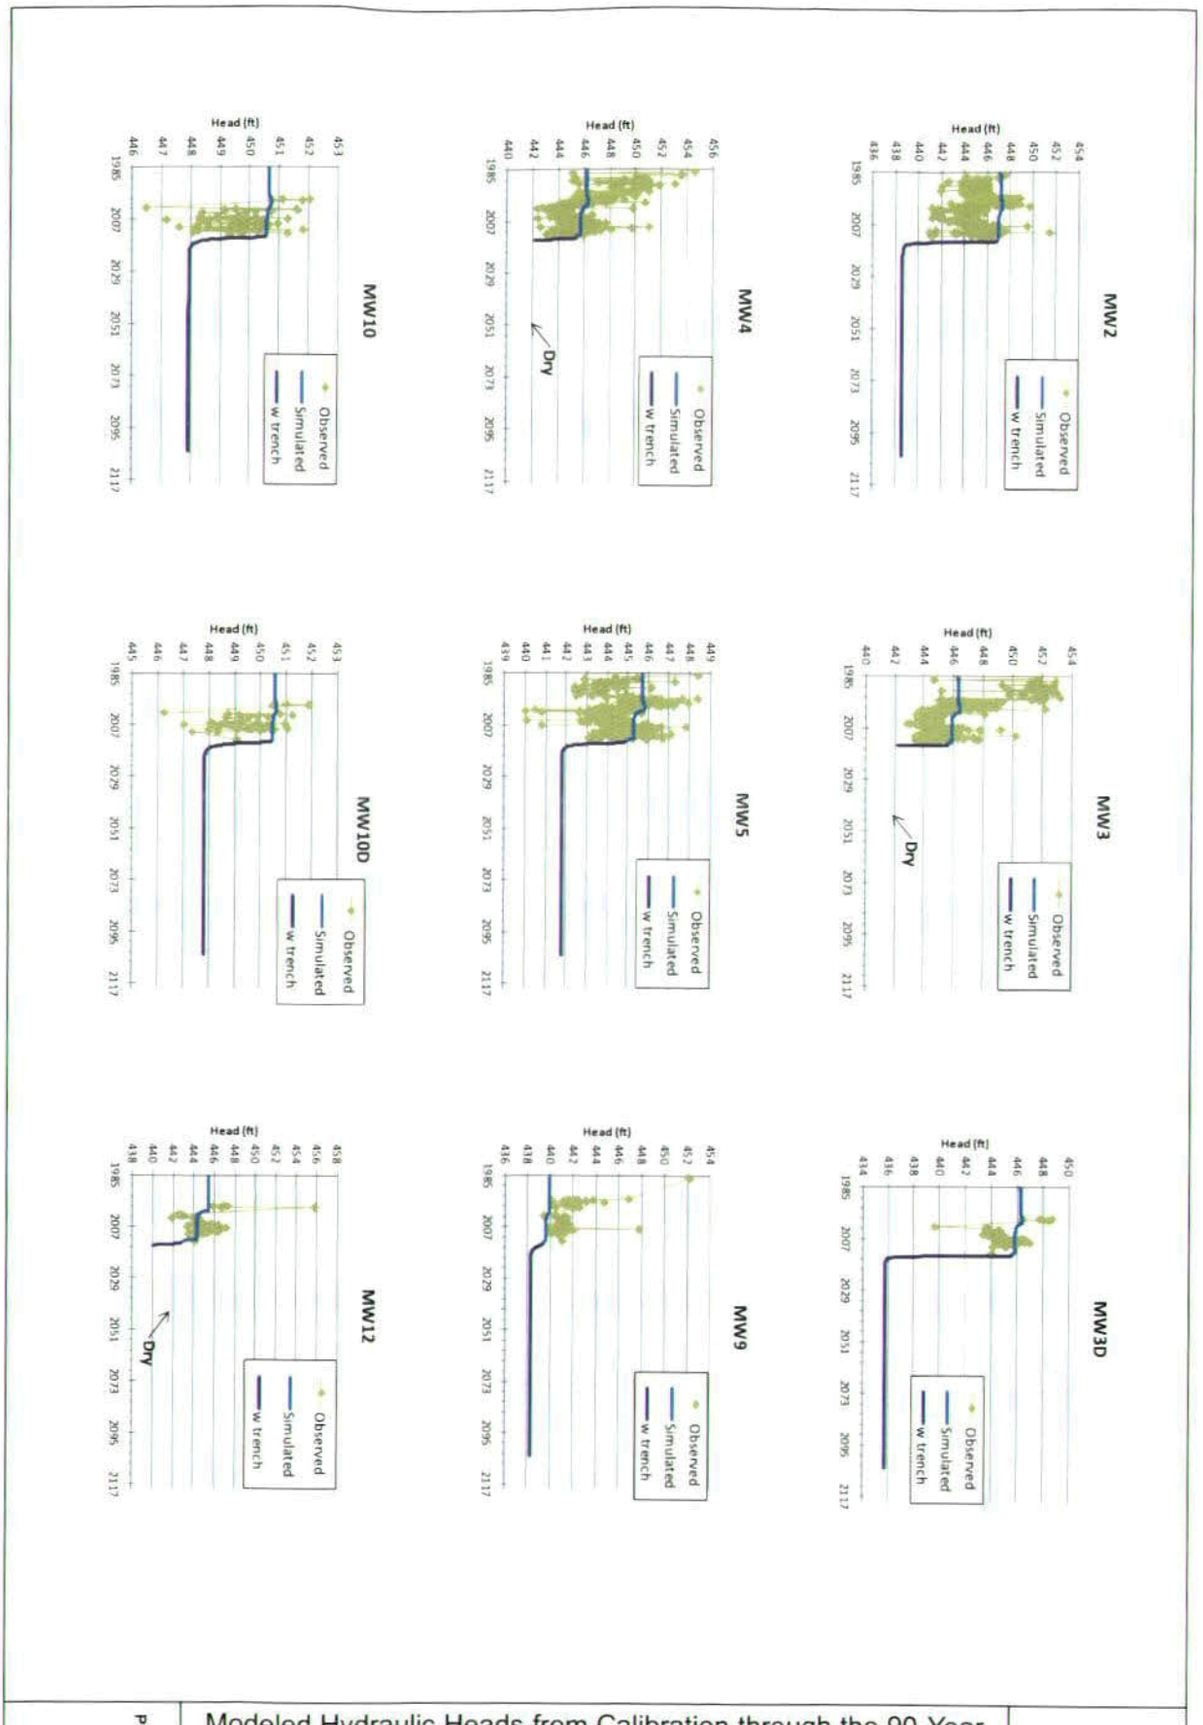

Figure 5 presents predicted boron concentrations from calibration through the 90-year prediction period (2015-2105). The model predicts a decrease in boron concentrations in all category (1) wells in response to the closure activities. All of these wells are predicted to attain compliance with the Class I Groundwater Standard during the simulation period (Table 6). A temporary increase in boron concentration is predicted at MW3D. This occurs because operation of the trench changes groundwater flow direction and higher concentration groundwater, predicted to occur north of this well, is drawn toward the well. However, the concentration predicted in MW3D decreases quickly after the temporary peak.

The number of years for predicted boron concentrations to attain the Class I Groundwater Standard and to stabilize is presented in Table 6. Concentrations in Ash Pond A, B, C monitoring wells are predicted to decrease to levels lower than the Class I Groundwater Standard in approximately 10 years (2025). Correspondingly, the modeled plume upgradient of Ash Pond D is predicted to dissipate by 2030.[1]

Predicted concentrations stabilize shortly after the closure plan is implemented in wells with low concentrations (MW5, MW9), while other wells are predicted to take as long as 40 years to stabilize. Stabilization time is greater than time to comply with Class I Groundwater Standards at some wells because concentrations continue to decrease for a period after the standard is attained.

Figure 6 presents the maximum plume extent.[1] According to the simulation results, the maximum plume extent will occur on 1/1/2015, just before the trench begins operation.

[1] For purposes of this comparison, plume extent is defined as the area where predicted concentrations are higher than the Class I standard.

Table 6. Model-Predicted Milestones

Monitoring Well ID	Concentration less than Class I Std.	Concentration Stabilizes
MW2	2017	2025
MW3	Dry / 2025*	Dry / 2045*
MW3D	2025	2045
MW4	-1-	Dry / 2055*
MW5	-1-	2015
MW9	-1-	2015
MW10	-1-	-2-
MW10D	-1-	-2-
MW12	-1-	Dry / 2025*

*When the cell representing a monitoring well is predicted to go dry during the simulation, concentration less than Class I Standard or stable status is based on the same location in the next layer down in the model.
'concentration not predicted to exceed Class I standard.
'not applicable because well is upgradient and not affected by pond closure.

5.3 Prediction Summary

In summary, the model predicts:

- The proposed closure activities, consisting of capping Ash Pond A and clean closure of ponds B, C, and the bottom ash pond will facilitate attainment of groundwater quality standards in monitoring wells dedicated to these facilities within 10 years. The plume upgradient of Ash Pond D is predicted to dissipate within 15 years.
- Concentrations in these wells are predicted to stabilize within 40 years.

1. Introduction

An evaluation of the liner performance has been requested for the AmerenEnergy Medina Valley Cogen, L.L.C. Hutsonville Power Station (Site) water treatment device known as Ash Pond A, This pond is to be closed in compliance with the requirements of Title 35 Illinois Administrative Code, Part 620 (35 IAC 620), and elements of this Plan have been prepared to generally conform with the Ash Pond D site-specific rule at 35 IAC 840 (Illinois PCB, 2011), and where judged appropriate, elements of the proposed 35 IAC 841 rules, currently under development (Illinois PCB, 2013).

2. Low Permeability Layer Standards

Both 35 IAC 840 (Ash Pond D closure rule) and 35 IAC 841 (proposed Ash Pond closure rules) have performance requirements for the geosynthetic membrane or flexible membrane liner (FML). If a FML is used as a component in the closure of an ash pond, then the FML must, in terms of hydraulic flux, be equivalent or superior to a 3-foot thick layer of soil with a hydraulic conductivity of 1×10^{-7} cm/s.

2.1 Darcy Flux In Soil Liner

Hydraulic flux through a homogeneous and isotropic porous media, like a recompacted soil liner, may be evaluated using Darcy's Law (Freeze & Cherry, 1979):

$$Q = k * i * A$$

Where,
- Q ≡ hydraulic flux (in L^3/T),
- k ≡ hydraulic conductivity (in $L^3/T/L^2$)
- i ≡ hydraulic gradient (dimensionless), and
- A ≡ area (in L^2)

For this evaluation, the Darcy flux is calculated using the following inputs:

$$Q = 1 \times 10^{-9}\ m^3/s/m^2\ (1.833\ m/m)\ 4046.856\ m^2$$
$$Q = 7.42 \times 10^{-6}\ m^3/s$$

Where,
- k = the specified 1×10^{-7} cm/s in SI units
- A = representative area of 1 acre or 4046.856 m^2, and
- i = (h + t)/t
  - Where,
    - t = liner thickness of 3 ft. or 0.915 m, and
    - h = head on liner of 30 inches or 0.762 m.

2.2 Flexible Membrane Liner Darcy Flux

The FML evaluation is done using the Giroud (1997) equations for liner leakage. The Giroud equations calculate flux through a FML/soil liner (composite) system, and evaluate this flux in several types of liner defects, including circular, rectangular and linear defects. The liner defects, in combination with the underlying material hydraulic conductivity, drive the flux through the liner system. The thickness of the FML is independent of this calculation, and for the FML by itself, has little effect on true liner flux.

Electronic Filing: Received, Clerk's Office 09/28/2020

The Giroud equations are empirical derived, and assume that the installation defects are the primary mechanism for flux through the liner system. Complete flux calculations are located in Appendix A. The inputs to the equations are:

n = 5, number of defects per unit area,
A_g = 4046.856 m^2, area of geomembrane,
t_s = 0.305 m, thickness of soil liner (fly ash),
h = 0.762 m, head on liner (from HELP model),
k_s = 3.62 x 10^{-7} m/s, liner hydraulic conductivity (fly ash),
d = 0.01 m^2, circular defect diameter,
b = 0.001 m^2, rectangular defect width,
B = 0.01 m^2, rectangular defect length,
w = 0.01 m^2, long defect width.

The selected hydraulic conductivity for the liner component is taken from a VFL Technology Corporation (VFL) prepared in March 2003 assessing pozzolanic cap options for the closure of Ash Pond D at Hutsonville (a copy of this report is in Appendix B). This hydraulic conductivity value is the average of the most conservative test result (Test 16) at 28 and 56 days, and should be representative of a properly prepared surface prior to placement of the FML during construction. This value is also approximately the same magnitude as the HELP model (Schroeder et al., 1994) default soil value for fly ash.

Results of the Giroud (1997) calculations indicate that the performance of the FML applied on top of fly ash exceed the required flux requirements. The calculation results are summarized in Table 1.

Table 1. Liner Flux Calculation Results

Liner / defect type	Flux (m^3/s)	Flux (gpm)
Soil liner (3 ft. thick)	7.42 x 10^{-8}	0.1176
FML - circular	6.77 x 10^{-8}	0.1074
FML – rectangular	4.42 x 10^{-8}	0.0700
FML – linear	5.34 x 10^{-8}	0.0846

3. Cover versus Bottom Liner Performance

Along with the equivalence evaluation for the cover FML, the proposed regulation (PCB, 2013) also requires that if a bottom liner system exists, that the performance of the two liner system be evaluated and a demonstration made to show that the bottom liner system permeability is greater than the cover system.

3.1 HELP Model Input Parameters

This required evaluation was made using the US Army Corp of Engineer's HELP model (Schroeder et al., 1994). Climate and weather data is either site specific (based on the Site latitude), or based on Indianapolis, Indiana data provided with the HELP model. The model layer input parameters are included in Table 2. As a conservative approach, initial moisture contents at the beginning of the model run were pre-configured for each soil layer with its field capacity value. Lastly, the bottom liner, due to its age and its construction methods is assumed to have twice as many defects per acre than the modern cover and poor versus good placement/quality control.

Electronic Filing: Received, Clerk's Office 09/28/2020

Table 2. HELP Model Layer Inputs

Layer	Thickness (inches)	Porosity (–)	Field Capacity (–)	Wilting Point (–)	Hydraulic Conductivity (cm/s)	Pinhole Density (#/acre)	Installation Defects (#/acre)	Placement
1	36	0.471	0.342	0.210	4.12×10^{-3}			
2	0.04	0.0	0.0	0.0	2.00×10^{-13}	5	1	good
3	360	0.541	0.187	0.047	5.00×10^{-3}			
4	0.08	0.0	0.0	0.0	2.00×10^{-13}	10	2	poor
5	60	0.417	0.045	0.018	1.00×10^{-4}			

3.2 HELP Model Results

The model was evaluated over a 100 year period. This long modeling period allows for evaluation over a wider variation of precipitation event probabilities. Results of the HELP model evaluation show that average annual head on the bottom liner is only 0.042 inches, and the peak daily (average) head 0.059 inches. This clearly indicates that seepage through the cover controls moisture within the ash pond, and the cover out performs the bottom liner.

4. Conclusion

An evaluation of liner performance has been performed for Ash Pond A at the Site. This evaluation was done in two parts, a performance comparison of the designed 40-mil HDPE liner versus a 3-foot thick soil liner with hydraulic conductivity of 1×10^{-7} cm/s, and a determination that the cover system has equal or superior performance to the bottom liner system. The former evaluation was done using a series of Darcy flux calculations and the latter evaluation was performed using the US ACE HELP model. Results of both evaluations indicate that the designed cover system can meet the performance standards expected.

Final Report

Conceptual Development of a Pozzolanic Cap for the Closure of Basin D at the Hutsonville Power Station

1.0 Background

Basin D at the Hutsonville Power Station (Photo #1) is an inactive ash disposal area that will be closed under Illinois Title 35 Part 811. Natural Resource Technology (NRT), Pewaukee, Wisconsin, contracted the services of VFL Technology Corp. (VFL) to determine the feasibility of developing a concept for the creation, manufacture, and placement of a pozzolanic cap for Basin D.

The purpose of this report is to present a final summary of the information, findings and test results that have been generated for the conceptual development of the pozzolanic cap for the closure of Basin D at the Hutsonville Power Station in Hutsonville Illinois.

The Program Goals of this study were to:

- Attempt to develop a pozzolanic cap material that would achieve a permeability of 1×10^{-7} cm/sec, have an unconfined compressive strength of approximately 150 psi, and have minimal cracking after placement.
- Develop a pozzolanic material that is environmentally acceptable and minimizes leaching.
- If the 1×10^{-7} cm/sec permeability goal is unrealistic or unachievable with these materials, estimate the most realistic performance of these materials under field conditions.
- Produce a cost-effective pozzolanic cap material that can be easily handled and placed with common earth moving equipment.

To accomplish these goals, VFL and NRT developed a scope of work for the project. VFL employed the help of GeoSystems Consultants Inc. (GeoSystems) to assist with the geotechnical engineering portion of the program. The scope of work basically included:

- A field assessment of the site (VFL and GeoSystems);
- A review of existing geotechnical data of the site to determine if additional information is needed to finalize the cap design and construction (GeoSystems).

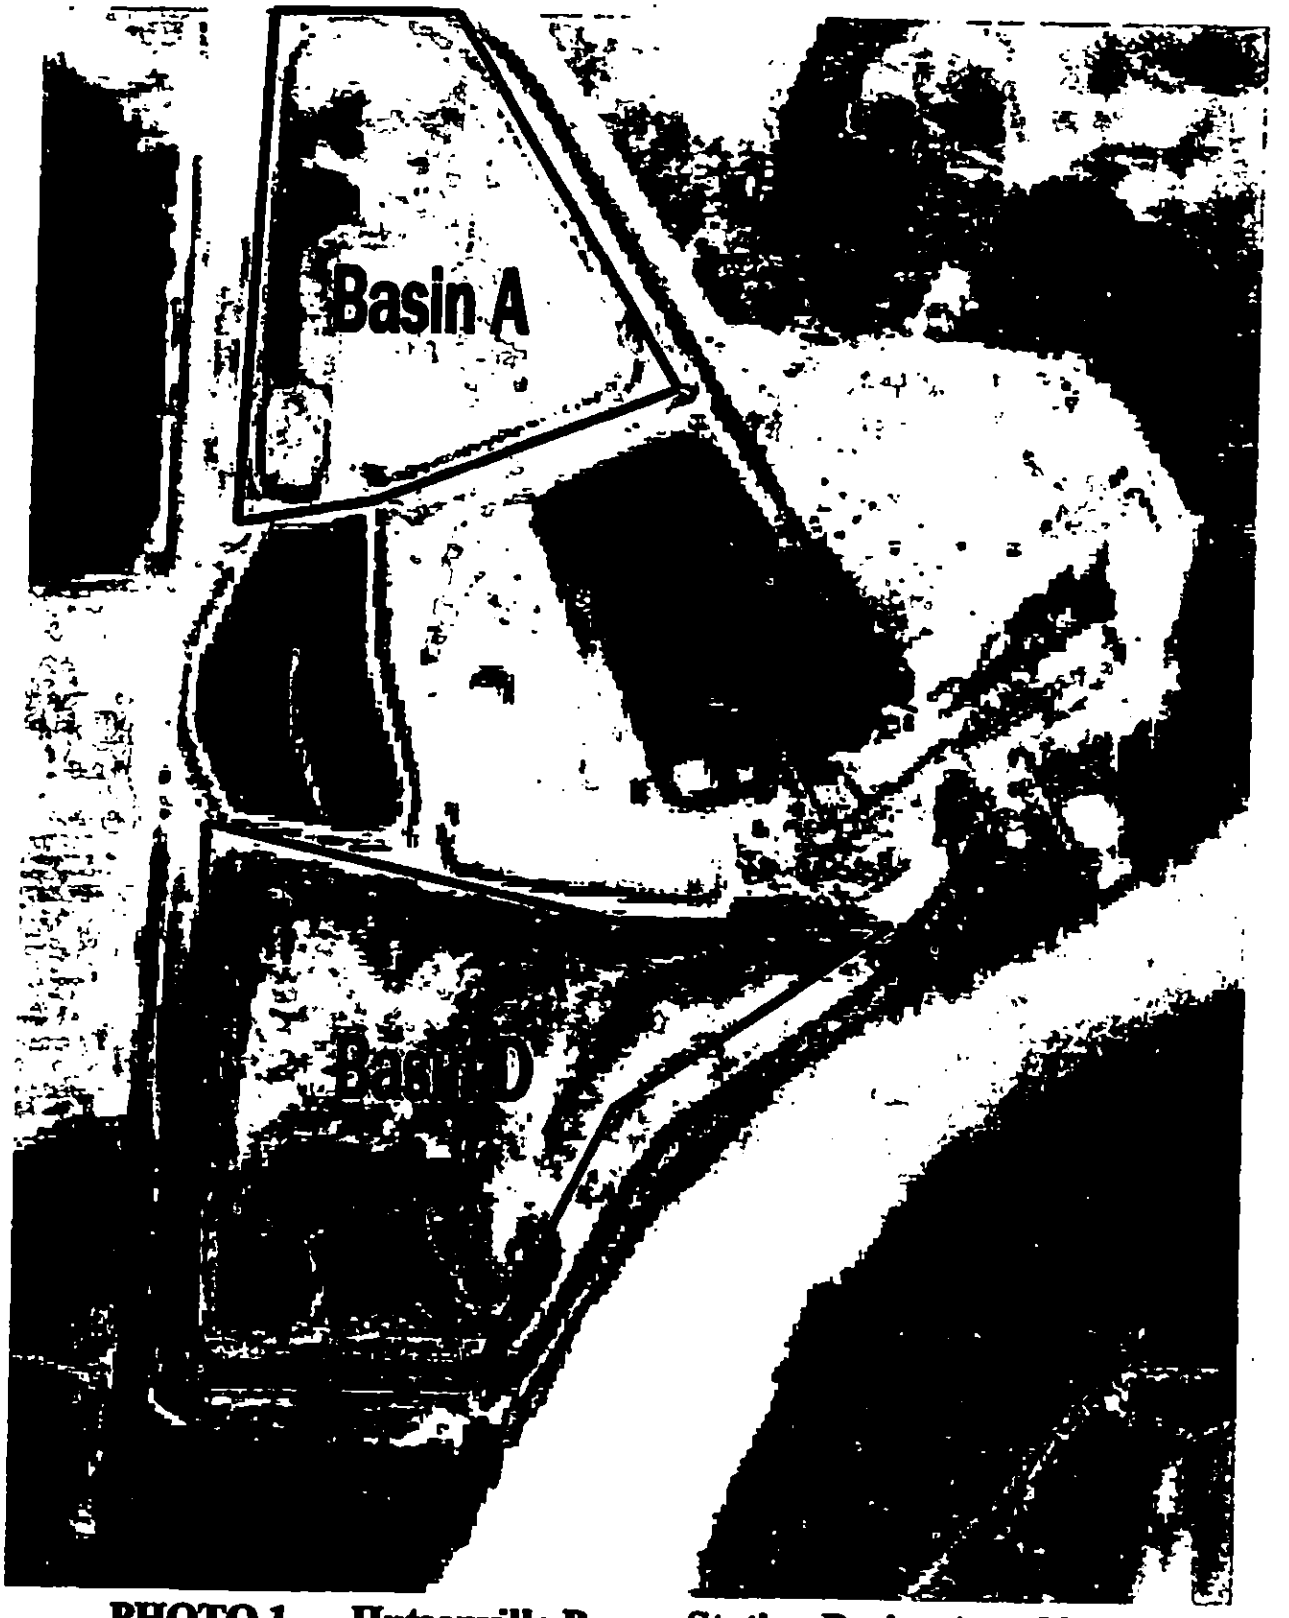

PHOTO 1 Hutsonville Power Station Basins A and D

Electronic Filing: Received, Clerk's Office 09/28/2020

- Collect samples of the Basin materials (VFL);
- Conduct a treatability study to determine if a pozzolanic cap can be developed to meet the current design guidelines for closure cap construction and develop an operational approach to construct the cap (VFL); and
- Conceptual development of the basic cap design, appearance and estimated volumes of material to be used in the cap construction (GeoSystems).

On March 5 and 6, 2002, representatives of VFL and GeoSystems visited the Hutsonville site. Samples from basins A and D were collected, and existing geotechnical data was reviewed. The Hutsonville ash samples were tested at VFL's Corporate laboratory in West Chester Pa. using a variety of locally available stabilization reagents.

2.0 Overall Program Conclusions

- The preliminary geotechnical evaluation indicates that the construction of a pozzolanic cap is feasible; however, some additional, more refined analyses are needed to finalize the engineering and design of the cap system.

- The results of the Treatability Study program show that it is feasible to construct a structurally stable, environmentally acceptable Pozzolanic Cap and use this cap in the final closure of Basin D at the Huntsville Power Station. Although the permeability results do not meet the original goal of 1×10^{-7} cm/sec, the results of several mixes are in the mid to low 10^{-7} cm/sec range.

- By using Basin A ash as a construction material for the pozzolanic cap, approximately 160,000 yds^3 of ash can be utilized; 100,000yd^3 as a pozzolanic final cover and 60,000yd^3 to adjust the Basin A final slopes.

- All of the mixes that were considered potential candidates for cap construction easily met the unconfined compressive strength goal of 150 psi.

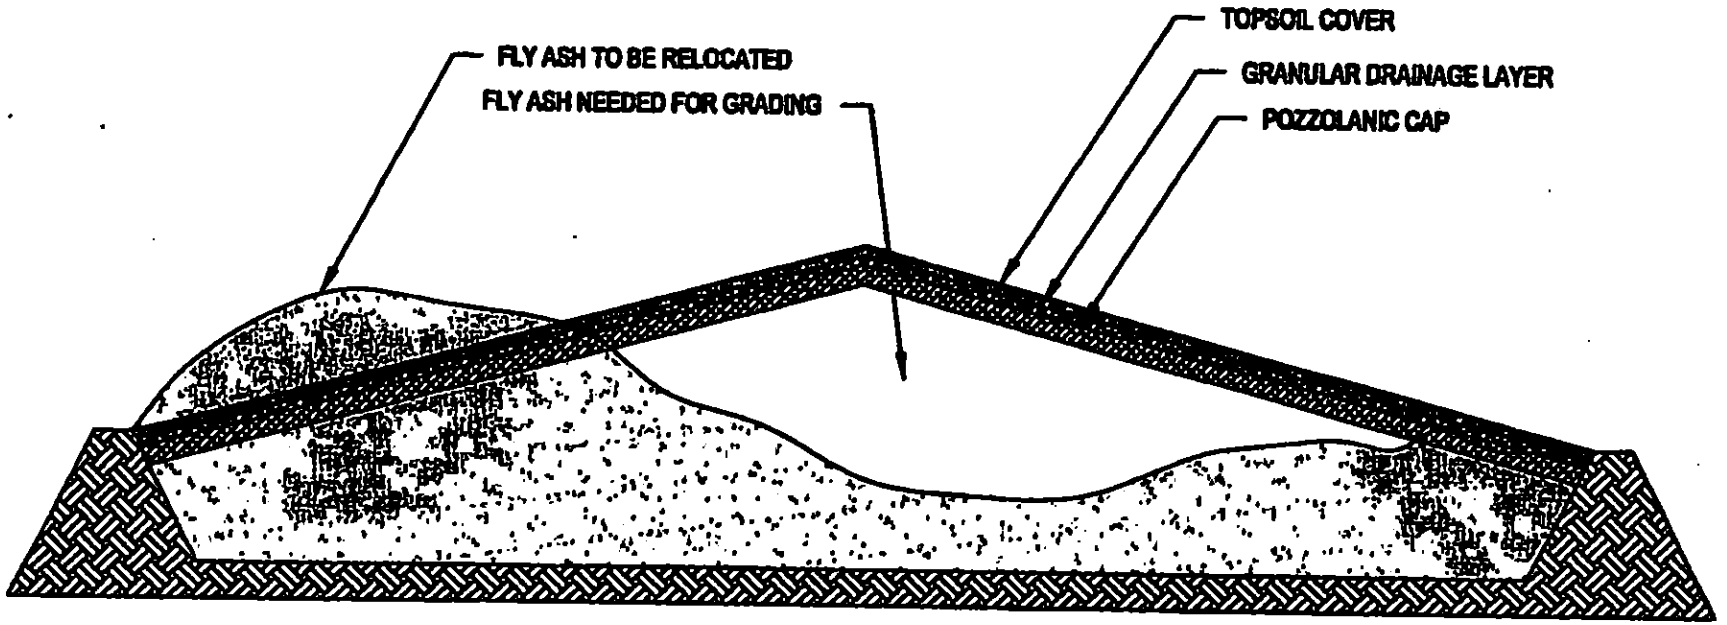
3.0 Geotechnical Investigation

As indicated above, the geotechnical data review, conceptual design, material volume estimates, preliminary settlement and slope stability analyses were conducted by GeoSystems. The report of their findings and analyses has been included in Appendix 1 of this report.

In summary, GeoSystems believes the construction of a pozzolanic cap is feasible and will be an effective system.

An overview of the conclusions of the GeoSystems report indicate:

- .... A parametric analysis varying cap permeability from1 x 10^{-5}cm/sec to 1 x 10^{-7}cm/sec yielded "effectiveness" ranging from 78% to 97%.....
- .....As the slope of the final cover increases from 1% to 5%, the volume of regrading reduces from 110,000yds^3 to 75,000 yds^3 .....
- .....With a 5% slope, the volume of ash fill material needed from Basin A is estimated to be 160,000 yds^3 .....
- .....The volume of the pozzolanic cap (3 feet thick) is estimated to be 100,000 yds^3 and varies little as the slope varies from 1% to 5%.....



A graphical presentation of a conceptual, representative cross section of Basin D showing the cap design, regrading requirements, needed fly ash fill material from Basin A, etc. was developed by GeoSystems (part of GeoSystems report - see Appendix 1) and has been included here as Figure 1 for reference purposes.

4.0 Treatability Study

A few "Performance Goals" were established for the final pozzolanic cap material. The intent was to see if the stabilized materials could meet the existing cap design specifications, and if not, determine how well they performed against these existing specifications. The "Performance Goals" for this project were to:

- Develop a permeability of 1 x 10^{-7}cm/sec, or determine how close the stabilized materials can realistically come to these specifications.
- Develop approximately 150 psi unconfined compressive strength;
- Attempt to develop a cost-effective mix design that can be easily implemented and constructed in the field;
- Minimize cracking; and
- Develop a cap system that was environmentally acceptable (minimizes leaching).

VFL's treatability study can be broken down into four basic areas: Raw Materials Characterization; Reagents; Mix Design Development and Mix Design Performance Testing. Each of these areas is discussed further in the following sections of this report.

REPRESENTATIVE CROSS SECTION
POND D
HUTSONVILLE POWER STATION
HUTSONVILLE, ILLINOIS

GeoSystems Consultants, Inc.

PROJECT NO.: 02G108

APRIL 2002

FIGURE 1

REVISED 12-26-02

Electronic Filing: Received, Clerk's Office 09/28/2020

4.1 Raw Materials Characterization

During the site visit, VFL collected six (6) samples of sluiced ash from different locations in Basin A, and two (2) samples of ash from different locations in Basin D. The six samples from Basin A and two samples from Basin D were individually tested for moisture content, pH, density and Loss on Ignition (LOI).

The solids content of the ash excavated from Basin A ranged from 71.4% to 74.2% solids (40.0% to 34.8% moisture – on a dry weight basis or dwb). The dry weight basis refers to the test that uses the dry weight of the sample in the calculation. Please see the further explanation in this section. The pH values for Basin A ranged from 8.4 to 11.0, while the LOI's for Basin A ranged from 2.1% to 8.9%. All ash samples showed varying degrees of bleeding (draining of free liquids from the material).

As indicated previously, the intent is to use material from Basin A to produce the pozzolanic cap for the closure of Basin D. In order to simulate full-scale operations, the "as received" samples of ash from Basin A were allowed to decant/drain. This was done to estimate the handling and solids content characteristics of the ash that will be used in the full-scale operations. The data showed that some of the ash samples decanted/drained nicely, while others did not decant/drain as well. The decanted/drained solids content of the Basin A materials ranged from 73.9% to 81% solids (35.3% to 23.5% moisture – dwb), or a 11.8% to 32.5% decrease in moisture content.

At this point a more thorough explanation of solids content and moisture content is required. The calculations are:

$$\text{Solids Content \%} = \frac{\text{Dry Weight of Sample}}{\text{Wet Weight of Sample}} \times 100$$

$$\text{Moisture Content \% (dwb)} = \frac{\text{Weight of Water in the Sample}}{\text{Dry Weight of Sample}} \times 100$$

As shown, both calculations are sometimes needed to explain what is happening with certain materials. We have provided both sets of numbers at various points in this text. Generally moisture content is referred to when describing soils. Solids content is required for our purposes when describing mixtures of materials that may not all be soils. The two systems developed independently based on the type of work taking place. In summary, moisture content is generally soil based and solids content is mixed material based.

The two samples of ash collected from Basin D showed a solids content range

Electronic Filing: Received, Clerk's Office 09/28/2020

of 72.9% to 82.6% solids (37.2% to 21.1% moisture – dwb). The sample that showed the high solids content was taken from a stockpile of material that was sitting on the Basin (age unknown). The pH's for the two samples collected from Basin D were 8.8 and 8.2 respectively. The results of the physical analysis of the ash samples can be found on Table 1.

TABLE 1
Physical Characterization of the Hutsonville Ash

In addition to the physical characterization of the ash samples listed above, an elemental analysis and TCLP leachate analysis for the 8 RCRA metals was run on a composite sample of the Hutsonville ash. The composite sample was generated by combining equal portions of ash samples A-1 through A-6. The results of the chemical analyses are listed in Table 2. The actual data reports from Dalare Labs in Philadelphia, Pa. have been included in Appendix A-2.

Electronic Filing: Received, Clerk's Office 09/28/2020

< = Less than

4.2 Reagents

VFL has used numerous reagents in the development of pozzolanic construction materials. VFL reviewed these various reagents and based on previous full-scale experience with similar projects, selected what it believes to be the best performing, commercially available (in large quantities), and most cost-effective reagents for this project, from sources in the vicinity of the job site. These reagents include:

- Portland Cement;
- Class C Fly Ash (self-setting type);
- Fluidized Bed Residue Ash;
- Quicklime;
- FGD Scrubber Sludge (used to make the particle size of the mix design finer, which improves permeability); and
- Native Soils (used to make the particle size of the mix design finer, which improves permeability).

VFL experienced a few minor delays in the treatability study portion of the project. These delays are directly attributed to the delays in receiving some of the samples of reagents from the various vendors. One of the most problematic was the FGD Scrubber Sludge, which was finally received on date *06/06/02*.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.3 Mix Design Preparation

In order to simulate full-scale conditions, VFL combined the six (6) decanted/drained samples of ash from Basin A into one (1) composite ash sample that was used to prepare all of the mixes. The solids content of this composite sample was approximately 79% solids (26.6% moisture – dwb).

All mix designs were prepared in a laboratory mixer and mixed to the consistency expected to be achieved using full-scale processing equipment. All mix designs were damp, granular, soil-like materials that could be easily handled and placed with common earth moving equipment. All of the mixes were prepared on the "wet side of optimum moisture" to assure that there was enough moisture in the mix for reagent hydration and proper compaction. This "wet side of optimum moisture" consistency also minimizes the potential for dusting during full-scale operations. After blending, the mixes were allowed to rest and cure for one hour prior to compaction in the test cylinder molds. This was done to simulate the approximate amount of time the mixed material would need to be moved from the mixing plant spread and compacted. See Table 2 for the mix designs developed in this project.

Solids contents, as well as wet and dry compacted densities were recorded for all mixes. These values will be used as operating specifications during full-scale production and placement operations.

All mixes were compacted into standard size compaction molds, labeled, and stored in sealed plastic bags to insure proper curing and prevent moisture loss during their curing cycle.

4.4 Mix Design Performance Testing

Immediately after mix preparation, all of the mixes were evaluated for consistency, handlability, and constructability. As previously mentioned, all of the mixes had a damp, granular, soil-like consistency. All mixes could be easily handled, transported and placed with common earth moving equipment. All of the mixes could support heavy equipment traffic immediately after placement and compaction. This means that multiple lifts of stabilized material could be sequentially placed on top of each other throughout the day during full-scale operations.

As proposed, all of the mixes were tested for unconfined compressive strength (UCS) in accordance with ASTM C - 39. All compressive strength

Electronic Filing: Received, Clerk's Office 09/28/2020

cylinders were tested in duplicate and capped prior to UCS testing. The mix designs and UCS test results can be found in Table 3.

Overall, the mixes generally performed as expected, with the exception of the quicklime mixes. All mixes showed good solids contents as well as wet and dry compacted densities. Based on the mix densities, costs, UCS results, etc, the best performing mixes were selected for the next phase of permeability testing. These mixes were:

Mix 1 – 10% cement
Mix 2 – 5% cement
Mix 5 – 5% fluidized bed residue
Mix 9 – 6.3% cement + 15% native soils
Mix14 – 30% FGD Filtercake + 10% cement
Mix 16 - 30% FGD Filtercake + 10% quicklime

Triaxial permeability tests were run on the above listed mixes after 28 and 84 days of curing. The results of these tests are listed in Table 3. During the 84 day permeability testing, a problem was discovered in the test results. All of the test specimens showed higher (more permeable) values than the 28 day results. In some cases, it was over an order of magnitude. This data trend is extremely unusual for pozzolanic reaction mechanisms, which are known to improve with time. It was concluded that the entire set of cylinders must have been damaged during transport and handling. Companion cylinders were tested again after curing 84 days and these permeability values fell in the expected range.

The only mix that did not show the normal permeability improvement characteristics was Mix #16. All of the indicator parameters for this Mix looked promising (consistency, compaction characteristics, densities, strength development, etc.), yet the permeability data did not follow the usual trends.

At this point, the mixes prepared in this program are considered to be excellent indicator mixes to examine the feasibility of the program and provide data to determine the basis for a final mix design. Further refinement of the mix design can be assessed to improve performance, permeability, and cost-effectiveness of the pozzolanic cap material as necessary.

After reviewing all of the permeability data listed in Table 3, it appears that the realistic performance range for these types of pozzolanic materials is the low 10^{-6}cm/sec to the mid→low 10^{-7}cm/sec range for materials to be produced under full-scale field conditions. The typical 1 x 10^{-7}cm/sec liner spec means that the material must be in the 10^{-8}cm/sec range so as not to exceed the1 x 10^{-7}cm/sec spec under field conditions. These types of values are extremely difficult to meet with most materials under field conditions.

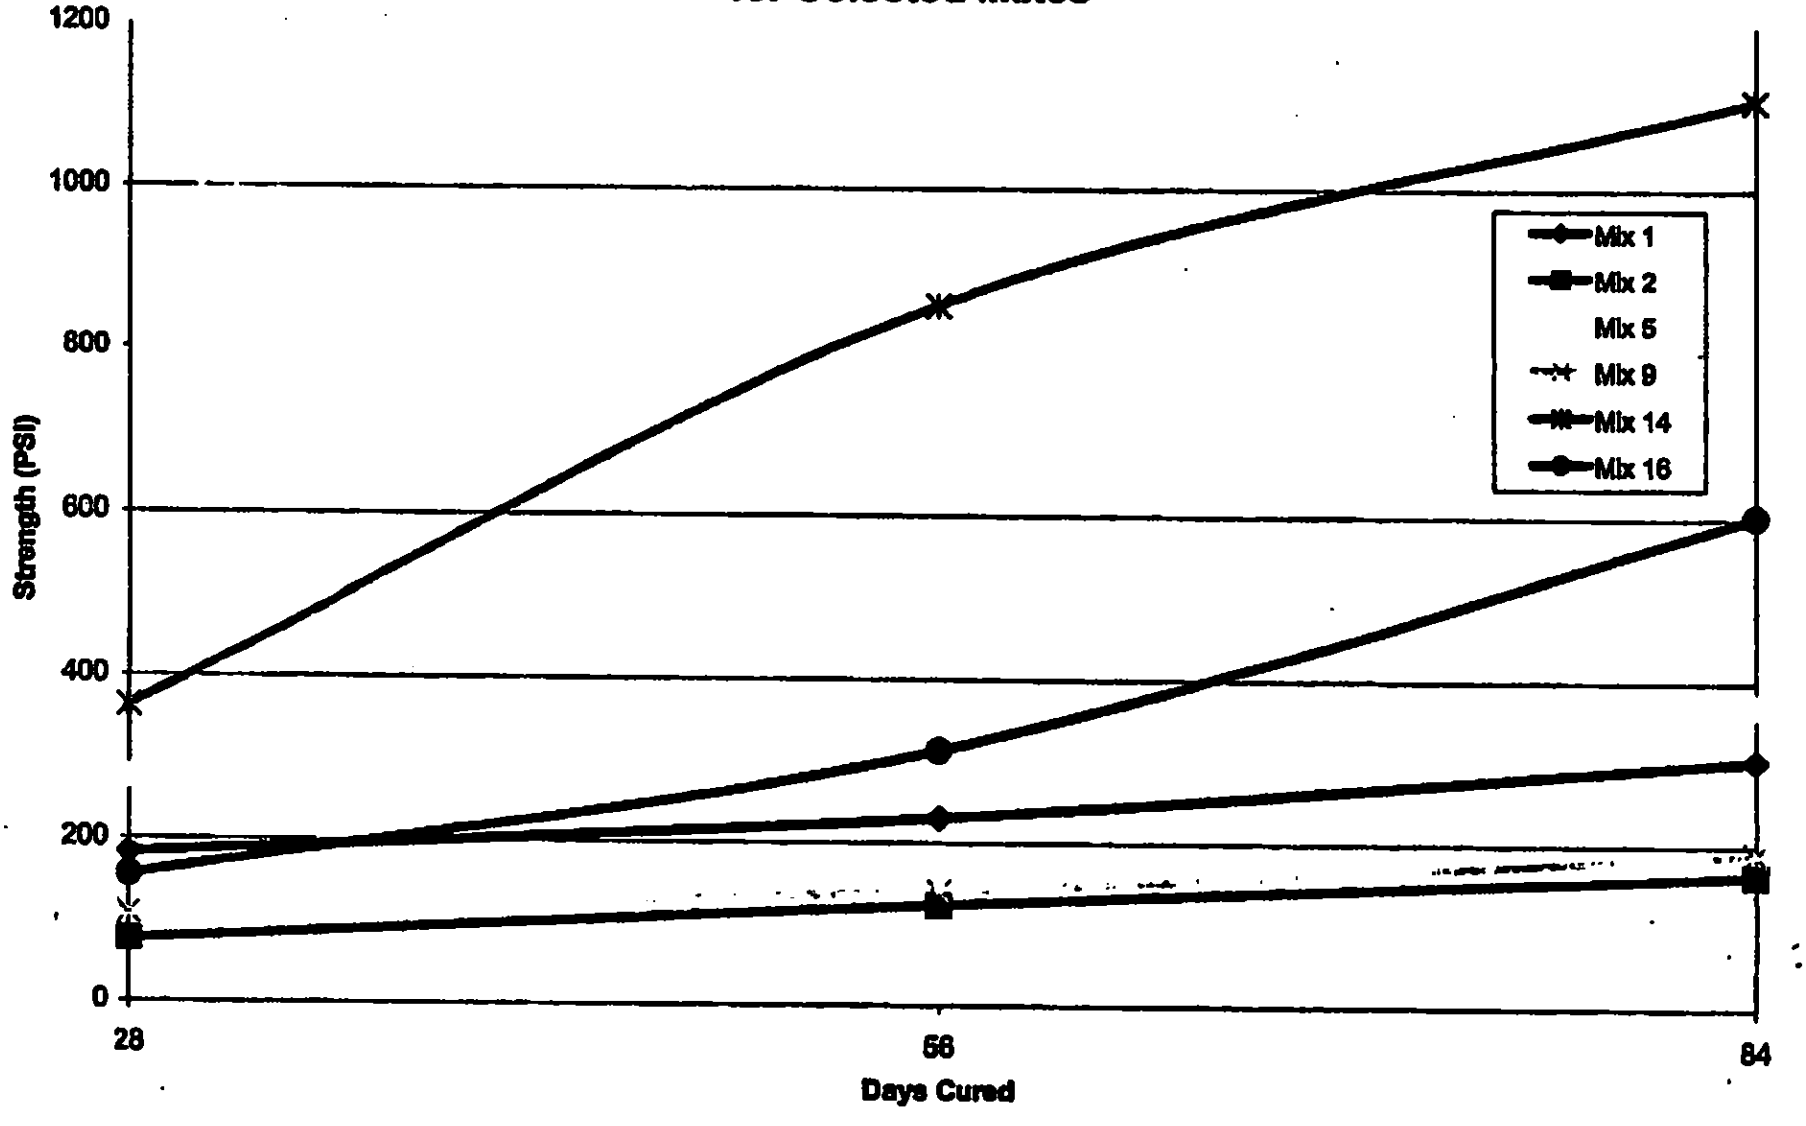

TABLE 3
TREATABILITY STUDY SUMMARY SHEET

Mix	Mix Design %			Reagents[4]				Solids	pH	Density		UCS[1]			Permeability K20 - (cm/sec)

Note: *Reagent added on a dry weight basis to to soil-fly ash blend.*
Stockpile Time for all mixes was 30 minutes

[1] *UCS strength data is average of 2 cylinders.*
[2] *FGD sludge added on a wet weight basis to ash.*
[3] *Soil added on a wet weight basis.*
[4] *Reagents added on a dry weight basis*
[5] *Second set of permeability results for mixes 14 and 16 are at 56-day cures.*

FIGURE 2
Unconfined Compressive Strength Development for Selected Mixes

Electronic Filing: Received, Clerk's Office 09/28/2020

Based on all of the above data, the four (4) best performing mixes in the study were then tested for leachate characteristics using the TCLP leaching procedure. The results of the TCLP leaching tests are presented in Table 4.

TABLE 4
TCLP Leachate Analysis of the Treated Ash

PARAMETER	Untreated Fly Ash	TREATED ASH Mix #2	Mix #5	Mix #9	Mix #14
Arsenic	0.020	< 0.010	< 0.010	< 0.010	< 0.010
Barium	0.56	0.28	0.25	0.14	0.11
Cadmium	0.01	< 0.01	< 0.01	0.01	< 0.01
Chromium	< 0.01	0.06	< 0.01	0.05	< 0.01
Lead	0.12	< 0.02	< 0.02	< 0.02	< 0.02
Mercury	< 0.001	< 0.001	< 0.001	< 0.001	< 0.001
Selenium	0.013	0.019	0.010	< 0.010	< 0.010
Silver	< 0.01	< 0.01	< 0.01	< 0.01	< 0.01

Notes: Treated material cured for 84 days
All results expressed in ppm unless otherwise noted.
ppm = Parts per Million
< = Less than

As shown in Table 4, all of the mixes showed very low leaching potential. One interesting trend to observe is the fact that all of the stabilized mixes reduced the leachable level of arsenic, barium and lead when compared to the original, untreated ash. This is a common trend seen in the leachate characteristics of pozzolanic stabilization matrices.

Upon reviewing all of the data generated in the study, the most promising reagents and material blends to produce a pozzolanic cap under field conditions appear to be:

- Basin A fly ash and cement (Mix 1 and 2)
- Basin A fly ash, onsite soil and cement (Mix 9 and 10)
- Basin A fly ash, FGD Filtercake and cement (Mix 14)

FBR was not included in the final selection for several reasons. FBR has been used in the past for various construction needs including permeability which is why we

have included it in this treatability study. FBR is quite useful when handled properly and used in the correct application. Recently, there have been reports on several construction projects that some FBR's are susceptible to expansion problems. Situations where it should be avoided are employing it where slight expansion is not acceptable.

FGD sludge is a good additive for most mix applications. However, FGD sludge from each power plant can be very different (chemically and physically) based on the coal source and type of boiler used. Another issue that VFL has with FGD sludge, in this specific application, is making sure that it is mixed thoroughly with the other ingredients. FGD sludge is a very sticky material. It is difficult to accurately feed it into a portable processing system because the FGD sludge has a tendency to adhere to the sides of feed hoppers that are used on portable pugmill plants (known as bridging). In most construction applications, where precise mix designs are not required, this is not a problem.

The mixes containing cement tend to be the easiest to quality control in field construction applications. Cement is a manufactured product and varies very little. Further optimization testing is recommended for the final mix design prior to full-scale operations. VFL would recommend that a test pad be constructed with full-scale equipment and sampled in substantial conformance with 35 Illinois Administrative Code (IAC) Part 816 to evaluate the proposed process equipment train and optimized the final mix design.

5.0 Extrapolation to Full-Scale Operations

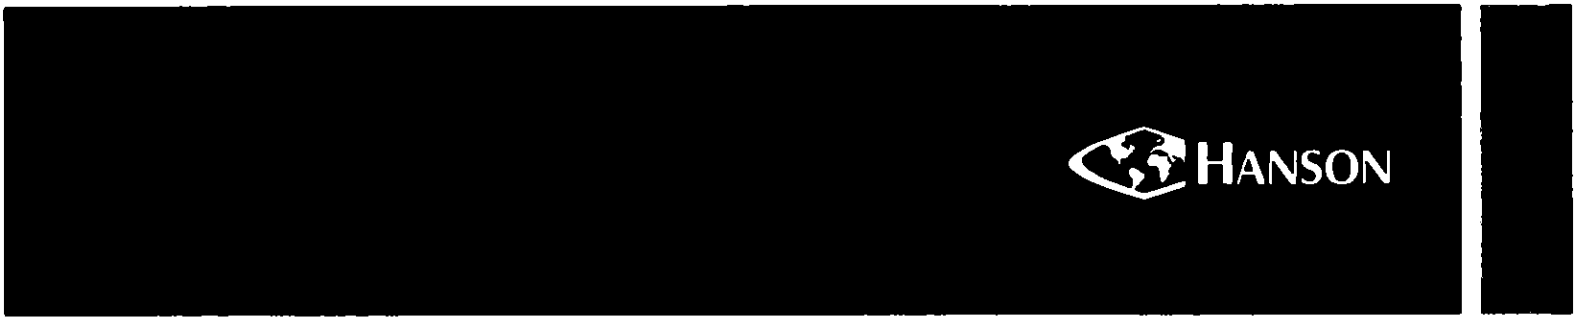
The basic full-scale operational approach that VFL would use to construct the pozzolanic cap for Basin D's closure would conform to the following schedule of events:

- Regrade Basin D to the lines and grades specified by the Engineer.
- Excavate the fly ash from Basin A and allow it to drain to the proper moisture content before using it in the mix design. Run On/Run Off to and from the area will be controlled and water drained from the ash will be routed back through the plants pond system.
- Construct a processing area in the vicinity of the two Basins. Erect the processing plant, silos and any other ancillary processing equipment needed. Construct haul roads to and from the placement area.
- Process the designated mix design.
- Place and compact the stabilized cap mix in a reasonable time frame allowing the material a curing period prior to compaction to the lines and grades established by the Engineer for the final cap design.
- Cover the placed material with the cover soils to protect the pozzolanic cap from severe weather events.

Electronic Filing: Received, Clerk's Office 09/28/2020

- Place the topsoil and vegetate as soon as possible.

To develop the necessary documentation for submittal to the State Regulatory Agencies, the basic Quality Control program for the pozzolanic cap construction would involve:



- Quality Control conformation testing on the materials to be used in the cover system and their placement.
- Process control testing of the mix design during production in substantial conformance with 35 IAC Part 816.
- Quality Control of the cap mix design during placement and compaction in substantial conformance with QA/QC procedures outlined in 35 IAC Part 816.
- Moisture monitoring on the excavated and drained Basin A fly ash. Control and QC confirmation checks on the reagents and any other materials of construction that will be used in the mix design.
- Plant calibration.
- Insure that Basin D has been regraded to the lines and grades specified.
- Insure that the cover system has been installed to the lines and grades specified.

The cap construction activities listed in this section have been used by VFL on several other pozzolanic cap projects. To demonstrate this, the following photos of a pozzolanic cap system that VFL constructed on an industrial landfill in New Jersey have been included for review.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Background

AmerenEnergy Generating Company, pursuant to 35 IAC 840, closed the Ash Pond D Coal Combustion Waste (CCW) pond at the Hutsonville Power Station in 2012. AmerenEnergy Medina Valley Cogen, L.L.C. (AmerenEnergy Generating Company successor, and hereafter referred to as Ameren), is submitting a Closure Plan for the remaining CCW ponds: Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond. The operation of the ash ponds are regulated under Title 35 Illinois Administrative Code, Part 309 (35 IAC 309), and they will be closed in compliance with the requirements of 35 IAC 620. The proposed Closure Plan for the remaining ash ponds at the Hutsonville Power Station was developed to generally conform to the Ash Pond D site-specific rule 35 IAC 840, and where judged appropriate, elements of the proposed 35 IAC 841 rules, currently under development, both of which include provisions for GMZs.

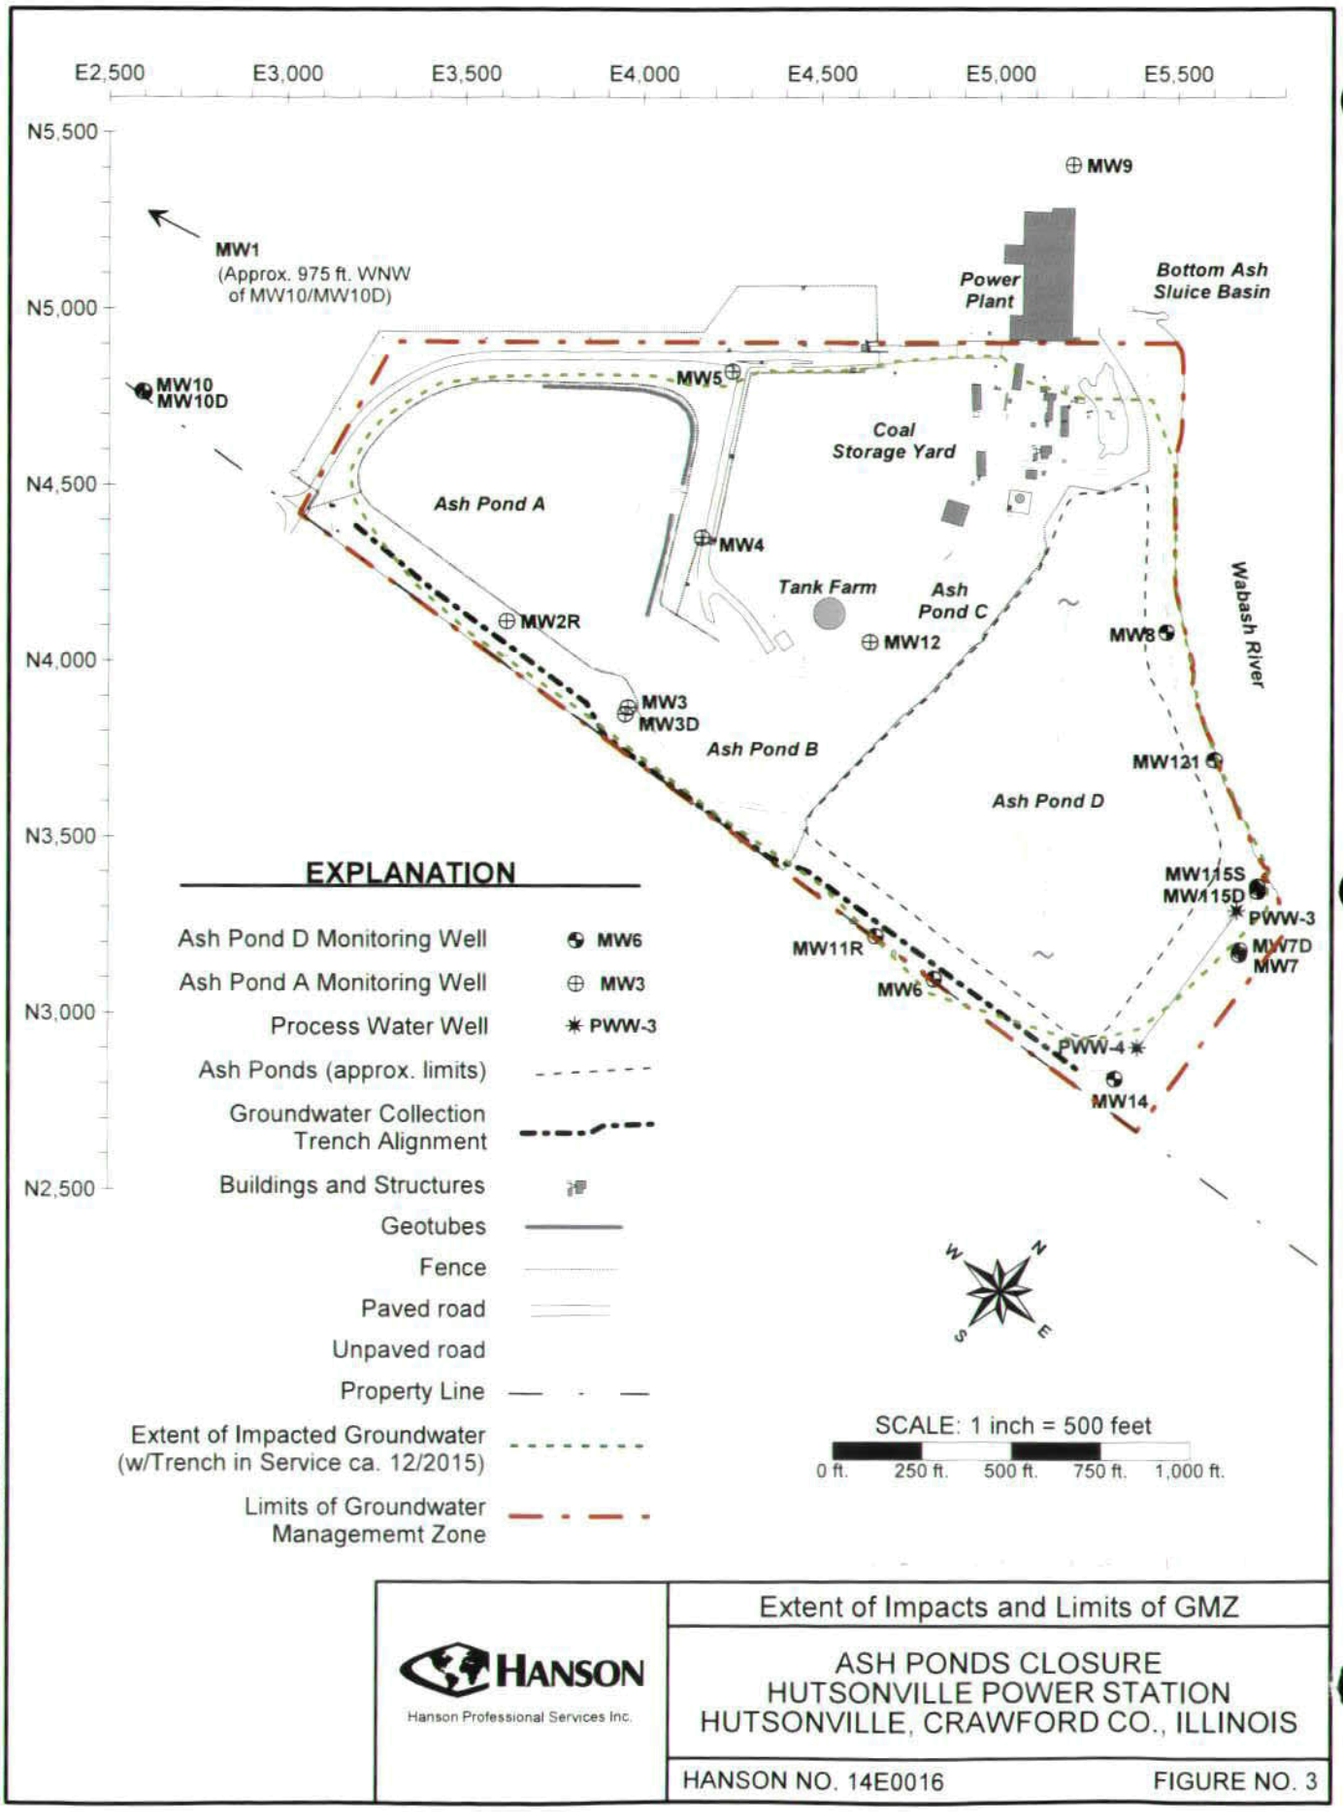
Ameren requests establishment of a Groundwater Management Zone (GMZ) pursuant to 35 IAC 620.250(a)(2) as a three-dimensional region containing groundwater being managed to mitigate impairments caused by a potential release of leachate from the facilities.

The boundary of the GMZ is approximated, in map view, from a starting point at the intersection of the entrance road and the south property line follow the inboard-side (Ash Pond A side) of the entrance road to MW5, then south-southeast to MW4, then east to MW12. From MW12 go east-southeast to a point near the south-side of Ash Pond C and the centerline of the roadway between Ash Pond B and Ash Pond D. Follow the centerline of the roadway south between Ash Pond B and Ash Pond D to a point of intersection with the south property line, and then west, following the property line, to the point of beginning.

A legal description and map of the proposed GMZ is provided in Appendix A. The GMZ will extend vertically through all water-bearing strata to the top of the shale bedrock that underlies the unlithified glacial and alluvial deposits at the site.

1.1 Technical Support Documents

Ameren has prepared, coincident with this document, the Hydrogeologic Site Investigation, Groundwater Model Report, Groundwater Monitoring Plan, and Closure Plan for Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond. Upon approval of the Closure Plan and after receiving any required permits, Ameren will begin closing these facilities.



Ameren submitted the following technical support documents prior to this request:

- Closure Plan, Ash Pond D, Hutsonville Power Station, July 26, 2011 (Hanson, 2011a).
- Groundwater Monitoring Plan, Ash Pond D, Hutsonville Power Station, July 26, 2011 (Hanson, 2011b).

1.2 Site Background

The Hutsonville Power Station (Site) is located on the west bank of the Wabash River, and approximately one and one-half miles north of the Village of Hutsonville in Crawford County, Illinois. The Site is located generally in the Southwest ¼ of Section 17, Township 8 North, Range 11 West of the Second Principal Meridian (see Figure 1).

All ash ponds at the Site (see Figure 2) are now out-of-service. Ash Pond D, the largest and oldest of the four ash ponds at the Site, was covered and closed in 2012 under the 35 IAC Part 840 rules. The remaining impoundments, including Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Pond, will be closed following approval of the Closure Plan.

1.3 Geologic and Hydrogeologic Summaries

1.31 Geology

The Site topography consists of generally flat agricultural land with shallow, entrenched drainage. Based on information from the Site subsurface investigations and published reports (Willman et al., 1975; Hansel & Johnson, 1996; Fafalios & Hensel, 1999) the geology consists primarily of Wisconsinan Stage fluvial deposits with some Illinoian Stage diamictons overlying Pennsylvanian bedrock. There are various fill materials along with three surficial (unlithified) units identified at the Site (youngest to oldest):

- Fine-grained fluvial deposits classified as Cahokia Alluvium. Primarily silts, clays, and clayey sands with localized, and not laterally extensive, sand lenses. Thickness typically ranges from 0 to 15 feet, but can reach 25 feet in the bedrock valley.
- Poorly sorted outwash sand and gravels of the Henry Formation. The predominant unit in the upland ash pond areas and deep portions of the Wabash River bedrock valley. The Henry Formation was not observed in the northern portion of the Site near the Plant.
- Silty and clayey diamictons of the Glasford Formation. Intermittent due to post-glacial erosion. Predominantly located in the southern portion of Site and can be found in excess of 5 feet thick to a few inches in thickness.

Earthen Fill is present across much of the Site and consists of sandy silts and silty sands most likely created from on-site or nearby excavations. Fill has been used to elevate depressions and construct berms around the various ash ponds and structures at the Site. Where present, the earthen fill can range from less than 2 to more than 10 feet thick.

Coal Combustion Wastes (CCW) at Hutsonville consists of bottom ash and fly ash and is primarily found in the Site's ash ponds. Thickness of CCW in Ash Pond D ranges from 12 to 31 feet. CCW is also present in lined Ash Ponds A and B. Prior to construction of Ash Pond B, the area was the CCW laydown location, and ash could have been up to 12 feet thick. However, all CCW was reportedly excavated prior to construction of the liner for Ash Pond B.

Bedrock at the Site is composed of Pennsylvanian Age rock of the Missourian Series Mattoon Group. Two lithologies are present at the Site. To the west, the upper bedrock is composed of sandstone of the Merom Sandstone Member (Willman et al., 1975), with a base elevation that rests on shale at an approximate elevation of 405 to 410 feet National Geodetic Vertical Datum (NGVD). Closer to the Wabash River there is a well-incised bedrock valley. In the bedrock valley (below elevation 405 ft.), post-glacial erosion has exposed the lithified silts and clays of an undifferentiated shale of the Mattoon Formation. Bedrock depths in the uplands on the western portion of the Site are 10 to 15 feet below ground surface (bgs) to over 90 feet bgs in the southeast corner of the Site. There are no active geologic structures or faults in the vicinity of the Site (Nelson, 1995).

1.32 Hydrogeology

Shallow groundwater in the surficial deposits and the upper bedrock are controlled by the Wabash River, a regional groundwater sink or discharge zone. There are two identified groundwater zones at the Site, shallow and deep. The shallow groundwater zone is comprised of the surficial and shallow materials and the upper, permeable portions of the sandstone bedrock. The deep groundwater zone is defined as the outwash found in the Wabash River valley.

Electronic Filing: Received, Clerk's Office 09/28/2020

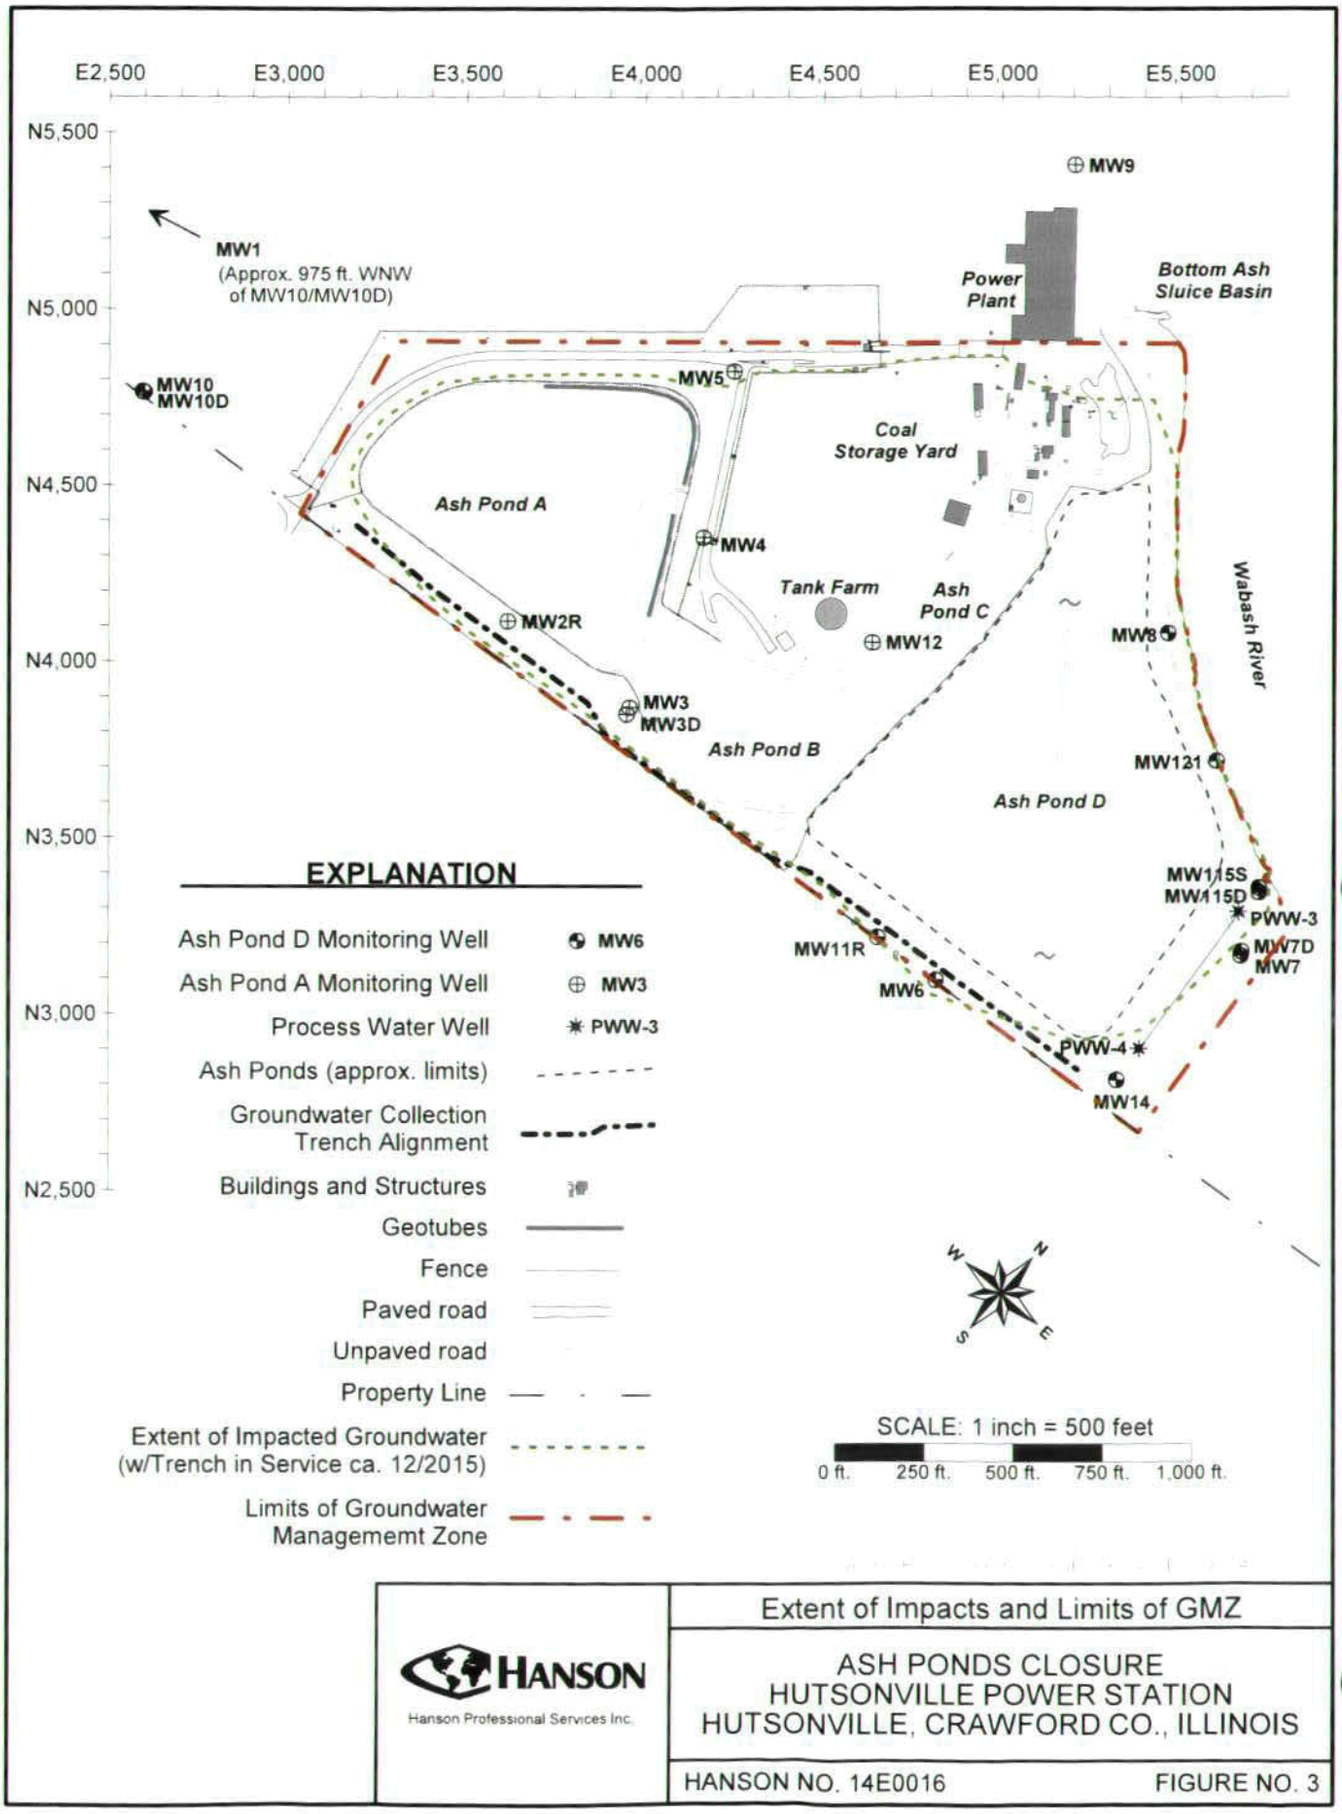
Groundwater flow within the shallow zone generally flows from west to east. Horizontal hydraulic gradients in the shallow zone range from 0.01 to 0.02, with an average gradient of 0.016. Groundwater in the deep zone generally flows from southwest to northeast, almost perpendicular to the banks of the Wabash River. Gradients in the deep zone are from 0.007 to 0.015, with an average gradient of 0.011.

Based on field testing of 11 monitoring wells at the Site, hydraulic conductivity ranges from a minimum of 2.6×10^{-4} cm/sec to a maximum of 4.8×10^{-2} cm/sec (Fafalios & Hensel, 1999). The calculated geometric mean of the hydraulic conductivity of the unlithified materials is 6.5×10^{-3} cm/sec, and the arithmetic mean of the two sandstone bedrock tests is 4.7×10^{-4} cm/sec.

1.33 Groundwater Monitoring Activities

Groundwater monitoring locations for Ponds A, B, C and the Bottom Ash Pond are displayed on Figure 2. Boron and sulfate are the primary indicators for coal ash leachate at this facility; both exceed Part 620 Class I groundwater quality standards at some monitoring points, and both are mobile in most hydrogeologic environments. As documented in the Hydrogeologic Site Investigation (Hanson, 2014), wells MW2(R), MW3, and MW3D have had concentrations of boron and sulfate higher than Class I groundwater quality standards attributed to Ponds A, B, or C, indicating that groundwater quality at the facility has been impacted by leachate from the ash ponds. Iron, manganese, and TDS concentrations are also higher than Class I standards in some monitoring wells, and pH has been less than the lower Class I standard. Other parameters which have had occasional exceedances of their respective Class I standards in downgradient wells since monitoring for them began in 2011 are arsenic, lead, nickel, nitrate, and thallium.

2. Groundwater Impairments and Control Options



2.1 Extent of Groundwater Impairments Associated with Ash Impoundments

Groundwater downgradient of Ponds A, B, and C had concentrations of boron, sulfate, manganese, and TDS higher than Class I groundwater quality standards at multiple locations during the period of 2011 through 2014. The coal ash indicator parameter boron had the greatest extent of Class I exceedances attributable to coal ash leachate, and was used to define the extent of these impacts. The estimated extent of impacts, based on observed concentrations and a calibrated fate and transport model, which will be submitted to IEPA with the Closure Plan for the Ash Ponds, is shown on Figure 3.

Based on the maximum modeled boron plume extent, exceedance of the Class I groundwater quality standard will occur just south of monitoring well MW4 to the north and to the west of MW12, which will continue to meet the Class I standard for boron. Monitoring wells MW2R / MW2D and MW3 / MW3D, located along the property line to the south, are predicted to have boron impacts above the boron standard initially, but eventually decreasing to below the standard by 2017 and 2025, respectively.

2.2 Impairments to Groundwater Usage

There are currently no impairments to groundwater usage at the site, nor will there be impairments to groundwater usage resulting from establishment of the proposed GMZ. A water well survey was performed in conjunction with this application and is being submitted to the IEPA in accordance with the "Right to Know" Potable Water Well Survey procedures of 35 Illinois Administrative Code 1600.210(b)(1) and 1600.210(b)(2). The purpose of this survey was to identify water wells located within 2,500 feet of the Site's ash ponds. This data was included with the Hydrogeologic Site Investigation associated with this application (Hanson, 2014).

Extent of Impacts and Limits of GMZ

ASH PONDS CLOSURE
HUTSONVILLE POWER STATION
HUTSONVILLE, CRAWFORD CO., ILLINOIS

HANSON NO. 14E0016 FIGURE NO. 3

Electronic Filing: Received, Clerk's Office 09/28/2020

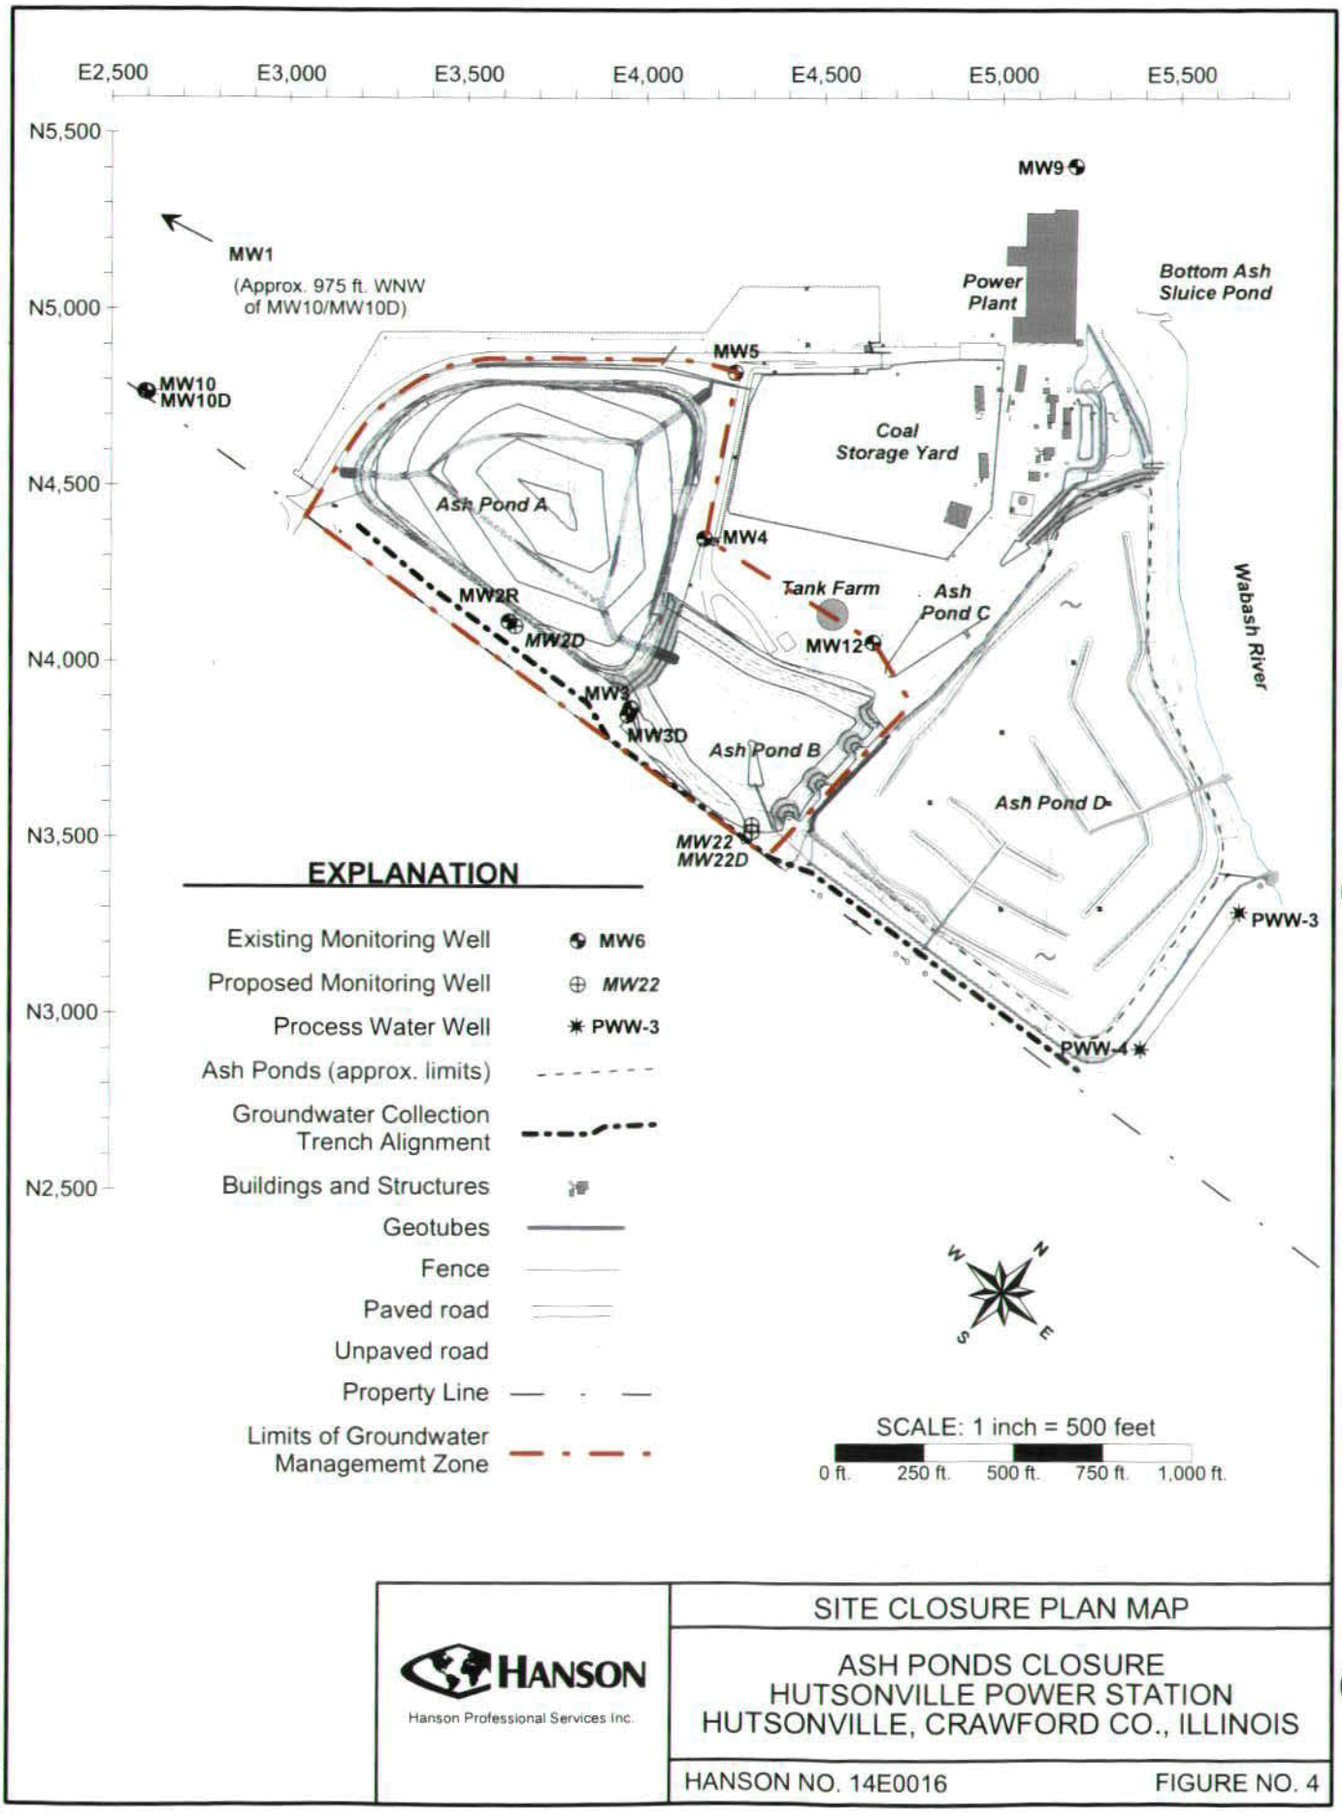
The water well survey was conducted for a 2,500-foot radius around the Site's four ash ponds (Ash Pond A, Ash Pond B, Ash Pond C, Ash Pond D) and Bottom Ash Pond. Based on visual surveys and State of Illinois records obtained from the Illinois EPA, Illinois State Geological Survey (ISGS), and Illinois State Water Survey (ISWS) there were no Community Water System (CWS) or non-Community Water System (non-CWS) wells, 2 industrial/commercial wells (Site's water supply wells), three irrigation wells, and one farm/domestic water well located within the 2,500-foot radius of the Site's ash ponds†. The only known potable well verified to be in existence within a 2,500-foot radius of the ash ponds is the Allison water well located 1,900 feet northwest of Ash Pond A (see Figure 2). This well is located upgradient of the ash ponds. There are no potable-use water wells in the downgradient groundwater flow direction from any of the ash ponds of the Hutsonville Power Station.

2.3 Treatment or Control Options

2.31 Closure of Ash Pond D

Ash Pond D, the largest and oldest of the four ash sluice ponds at the Site, was covered and closed in 2012 under the Title 35, IAC Part 840 rules (Illinois PCB, 2011). Closure activities included placement of a 40-mil thick textured high density polyethylene (HDPE) geomembrane with a three-foot thick protective soil cover with a vegetated surface. Surface water management features incorporated into the final cover design included intermediate berms and ditches to direct runoff to rip-rap-lined chutes running off the ash pond to surrounding areas. Details of the closure are provided in the Project Plans and Specifications (Hanson, 2011c).

2.32 Groundwater Collection Trench



A groundwater collection trench (Trench) was installed between the outside south toe of Ash Ponds A, B, and D and the south property line, as shown on Figure 2. The Trench, which will become operational in late 2014 or early 2015 after a NPDES permit is approved for the discharge, is designed to intercept groundwater that may migrate to the south from the ash ponds. The Trench runs from the southwest corner of Ash Pond A to the southeast corner of Ash Pond D and extends to bedrock for most of its length (except at the extreme east end). The Trench is designed to collect groundwater at four separate sumps: a pair in the east portion of the Trench adjacent to Ash Pond D, and a pair in the west portion of the Trench adjacent to Ash Pond A. Details are provided in the Ash Pond D closure plan (Hanson, 2011a) and Project Plans and Specifications (Hanson, 2011c).

The groundwater collection trench is designed to continuously withdraw groundwater to control the gradient and flow direction of potentially impacted groundwater. Water captured by the Trench will be pumped from the four sumps to a central catch basin located adjacent to the existing Ash Pond D outlet structure along the mid-east side of the pond, from which it will then discharge to the Wabash River in accordance with the Station's NPDES permit.

2.33 Closure of Ash Ponds A, B, C, and Bottom Ash Pond

A Closure Plan is being prepared for the closure of Ash Ponds A, B, C and the Bottom Ash Pond. The Closure Plan, to be submitted by Ameren in the Fall of 2014, will include the following ash pond closure elements, preliminary designs of which are shown on Figure 4:

† Well records were not reviewed for State of Indiana wells. The Wabash River is a groundwater (discharge) divide, and waters from the Site are unlikely to influence groundwater on the opposite bank of the river.

HUTSONVILLE, CRAWFORD CO., ILLINOIS

HANSON NO. 14E0016 FIGURE NO. 4

Electronic Filing: Received, Clerk's Office 09/28/2020

- Ash Pond A will be the depository for disposal of materials from Pond B, Pond C, and the Bottom Ash Pond. It will then be graded to drain surface water using a uniform 5% slope toward the outside berm. The cover drainage is split into three collection areas. Drainage off the western-most third of the cover will collect in a rock chute at the northwest corner, where it is free to discharge toward the northeast using the existing roadside ditch and then out through an existing culvert beneath the north plant access road. Drainage from the eastern-most third of the cover will collect in a similar rock chute at the northeast corner, where it also discharges out through the same culvert. Drainage from the southern-most third of the cover will collect in a rock chute at the southeast corner, where it will discharge into a storm water detention pond in the area where Pond B is currently located.
- Pond B will be clean-closed and the berms removed to be re-used as cover material for Ash Pond A. The pond bottom will then be graded to drain to the southeast through a culvert and into the existing paved ditch along the south side of Ash Pond D. Storm water tributary to this pond will be detained for intermediate to large rain events to elevation 446.00 by under sizing the outlet culvert.
- Pond C and the Bottom Ash Pond will be clean-closed and graded to drain to the northeast through an open cut channel through the original east perimeter berm of Ash Pond D and discharged towards the Wabash River.

3. Application for Groundwater Management Zone

3.1 Environmental Impact of Proposed Groundwater Management Zone

Establishment of this GMZ will have a positive environmental impact. The fate and transport modeling predicted boron concentrations will eventually decrease to levels lower than the Class I standard at all monitoring wells inside of the proposed GMZ boundary. Boron concentrations in groundwater at wells MW2R / MW2D and MW3 / MW3D are predicted to decrease to below groundwater standards by 2020 and 2030, respectively. Approximately 15 years following closure of Ash Ponds A, B, C and the Bottom Ash Pond, all monitoring wells within the GMZ that previously had exceedances of the Class I groundwater standard for boron are predicted to meet the standard. Furthermore, as a result of the cap and closure of Ash Pond A and the clean closure of Ponds B, C and the Bottom Ash Pond, all of the groundwater quality parameters impacted by coal ash leachate will continue to decrease as mass loading of CCW residuals to groundwater continues to dissipate.

3.2 Proposed Groundwater Management Zone

The proposed GMZ covers a larger area than the maximum predicted area of impacted groundwater associated with Ponds A, B, and C. A legal description and map depicting the proposed groundwater management zone is provided in Appendix A. The approximate boundary of the proposed GMZ is depicted in Figure 3. The GMZ will extend vertically through the unlithified deposits and sandstone bedrock, with the base of the GMZ coincident with the bottom of the sandstone, which rests on top of the shale bedrock at an approximate elevation of 405 to 410 feet NGVD within the boundaries of the GMZ. The GMZ does not extend beyond the Station's property boundary to the south, although an agreement[‡] exists between Ameren and Margaret R. DeMent regarding shallow well drilling. This restriction covers the first 25 ft. of the water table and lies within a 500 ft. offset south of the southern property boundary of the Site.

[‡] Available at: http://www.ipcb.state.il.us/documents/dsweb/Get/Document-65177 as Chapter 9 of the Rulemaking Technical Support Documents.

Electronic Filing: Received, Clerk's Office 09/28/2020

4. Proposed Groundwater Monitoring Plan

Upon approval of this GMZ, groundwater monitoring will be performed according to the groundwater monitoring plan, incorporated by reference, in the accompanying report:

- Ash Ponds Closure, Groundwater Monitoring Plan, Hutsonville Power Station, Ameren Energy Generating Company, Crawford County, Illinois. Hanson Professional Services Inc., Springfield, IL; Natural Resource Technology, Inc., Milwaukee, WI (Hanson and NRT, 2014).

The elements of the groundwater monitoring plan include:

- Groundwater monitoring system with designation of background and compliance monitoring wells along with monitoring well depths and construction.
- Groundwater monitoring parameters.
- Groundwater monitoring frequency and sampling schedule, along with statistical basis for reduction of monitoring frequency.
- Groundwater sample collection protocol with standard operating procedures.
- Laboratory analysis by a state-certified laboratory and listing of methods and reporting limits.
- Quality Assurance Program for field collection of samples and laboratory analysis of samples.
- Groundwater monitoring system maintenance, including schedule of inspections and methods for inspection of monitoring wells.
- Data reporting schedule and content of reports.
- Demonstration of compliance. Statistical methods for evaluating groundwater quality data. Included is a notification schedule with actions to be taken in cases of non-compliance.

Appendix B

Section 620.Appendix D – Confirmation of an Adequate Corrective Action, Parts I, II, and III

Electronic Filing: Received, Clerk's Office 09/28/2020

Part I. Facility Information

Facility Name *Hutsonville Power Station*

Facility Address *15142 East 1900th Avenue, Hutsonville, IL 62433*

County *Crawford*

Standard Industry Code (SIC) *formerly 4911*

1. Provide a general description of the type of industry, products manufactured, raw materials used, location and size of the facility. *The Hutsonville Energy Center is a former coal-fired power generating facility.*

2. What specific units (operating or closed) are present at the facility which are or were used to manage waste, hazardous waste, hazardous substances or petroleum?

	YES	NO
Landfill		X
Surface Impoundment	X	
Land Treatment		X
Spray Irrigation		X
Waste Pile		X
Incinerator		X
Storage Tank (above ground)	X	
Storage Tank (underground)		X
Container Storage Area		X
Injection Well		X
Water Treatment Units	X	
Septic Tanks		X
French Drains		X
Transfer Station		X
Other Units (please describe)		

3. Provide an extract from a USGS topographic or county map showing the location of the site and a more detailed scaled map of the facility with each waste management unit identified in Question 2 or known/suspected source clearly identified. Map scale must be specified and the location of the facility must be provided with respect to Township, Range and Section.
See Figure 1 and Figure 2 of the Groundwater Management Zone (GMZ) Application.

4. Has the facility ever conducted operations which involved the generation, manufacture, processing, transportation, treatment, storage or handling of "hazardous substances" as defined by the Illinois Environmental Protection Act? YES ☒ NO ☐ if the answer to this question is "yes" generally describe these operations. *The Hutsonville Energy Center stored and used various hazardous substances as commercial chemical products, including: chlorine gas, hydrazine, nitrogen gas, sodium hydroxide, sulfur, and sulfuric acid.*

Part I. Facility Information (continued)

5. Has the facility generated, stored or treated hazardous waste as defined by the Resource Conservation and Recovery Act? YES ☒ NO ☐ if the answer to this question is "yes" generally describe these operations. *The Hutsonville Energy Center is registered as a Small Quantity Generator.*

Electronic Filing: Received, Clerk's Office 09/28/2020

6. Has the facility conducted operations which involved the processing, storage or handling of petroleum? YES ☒ NO ☐ If the answer to this question is "yes" generally describe these operations. *Fuel oil was used for boilers stored on site at Tank Farm Identified in Figure 2 in the GMZ Application. Tank has since been converted to water storage.*

7. Has the facility ever held any of the following permits?

   a. Permits for any waste storage, waste treatment or waste disposal operation. YES ☐ NO ☒ If the answer to this question is "yes", identify the IEPA permit numbers.

   b. Interim Status under the Resources Conservation and Recovery Act (filing of a RCRA Part A application). YES ☐ NO ☒ If the answer to this question is "yes", attach a copy of the last approved Part A application.

   c. RCRA Part B Permits. YES ☐ NO ☒ If the answer to this question is "yes", identify the permit log number.

8. Has the facility ever conducted the closure of a RCRA hazardous waste management unit? YES ☐ NO ☒

9. Have any of the following State or Federal government actions taken place for a release at the facility?

   a. Written notification regarding known, suspected or alleged contamination on or emanating from the property (e.g., a Notice pursuant to Section 4(q) of the Environment Protection Act)? YES ☐ NO ☒ If the to this question is "yes", identify the caption and date of issuance.

   b. Consent Decree or Order under RCRA, CERCLA, EPAct Section 22.2 (State Superfund), or EPAct Section 21(f) (State RCRA). YES ☐ NO ☒

   c. If either of Items a or b were answered by checking "yes", is the notice, order or decree still in effect? YES ☐ NO ☐

10. What groundwater classification will the facility be subject to at the completion of the remediation? Class I ☒ Class II ☐ Class III ☐ Class IV ☐ If more than one Class applies, please explain.

11. Describe the circumstances which the release to groundwater was identified. *See Section 1.33 in the GMZ Application.*

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of my knowledge and belief, true and accurate.

Hutsonville Energy Center	[signature]
Facility Name	Signature of Owner/Operator
15142 E. 1900th Ave., Hutsonville, IL 62433	*Mark Birk, President of AmerenEnergy Medina Valley Cogen, LLC*
Location of Facility	Name of Owner/Operator
170000066210	2/23/15
EPA Identification Number	Date

Electronic Filing: Received, Clerk's Office 09/28/2020

PART II: Release Information

1. Identify the chemical constituents release to the groundwater. Attach additional documents as necessary.
   See Section 1.33 in the GMZ Application.

Chemical Description	Chemical Abstract No.

2. Describe how the site will be investigated to determine the source or sources of the release.
   The site investigation is complete. See Hydrogeologic Site Investigation document in Appendix A of the Closure Plan.
3. Describe how groundwater will be monitored to determine the rate and extent of the release.
   Quarterly groundwater monitoring is ongoing. See the Groundwater Monitoring Plan in Appendix B of the Closure Plan.
4. Has the release been contained on-site at the facility? *A groundwater collection trench was installed as part of on-site control. The NPDES permit was recently renewed authorizing discharge from the groundwater collection trench. The trench will be placed into service in the near future.*
5. Describe the groundwater monitoring network and groundwater and soil sampling protocols in place at the facility. *The groundwater monitoring network and sampling protocols are described in the Groundwater Monitoring Plan in Appendix B of the Closure Plan.*
6. Provide the schedule for investigation and monitoring. *The groundwater investigation is complete. See the Groundwater Monitoring Plan in Appendix B of the Closure Plan for schedule.*
7. Describe the laboratory quality assurance program utilized for the investigation. *See Groundwater Monitoring Plan in Appendix B of the Closure Plan for laboratory QA.*
8. Provide a summary of the results of available soil testing and groundwater monitoring associated with the release at the facility. The summary or results should provide the following information: dates of sampling; types of samples taken (soil or water); locations and depths of samples; sampling and analytical methods; analytical laboratories used; chemical constituents for which analyses were performed; analytical detection limits; and concentrations of chemical constituents in ppm (levels below detection should be identified as "ND").
   All data is available in the Hydrogeologic Site Investigation document in Appendix A of the Closure Plan.

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of knowledge and belief, true and accurate and confirm that the actions identified herein will be undertaken in accordance with the schedule set forth herein.

Hutsonville Energy Center Facility Name	Mark Birk Signature of Owner/Operator
15142 E. 1900th Ave., Hutsonville, IL 62433 Location of Facility	*Mark Birk, President of AmerenEnergy Medina Valley Cogen, LLC* Name of Owner/Operator
170000066210 EPA Identification Number	2/23/15 Date

Electronic Filing: Received, Clerk's Office 09/28/2020

Part III: Remedy Selection Information

1. Describe the selected remedy. *See 2.3 Treatment or Control Options of the GMZ Application.*
2. Describe other remedies which were considered and why they were rejected. *Various remedies were evaluated as part of the Title 35, Illinois Admin. Code, Part 840 rules for Ash Pond D, but proved to be cost-prohibitive. The same evaluation is appropriate to the Ash Pond A closure.*
3. Will waste, contaminated soil or contaminated groundwater be removed from the site in the course of this remediation? YES ☒ NO ☐ If the answer to this question is "yes", where will the contaminated material be taken? *Groundwater discharge proposed under NPDES permit.*
4. Describe how the selected remedy will accomplish the maximum practical restoration of beneficial use of groundwater. *The remedy is to clean-close Ash Ponds B, C, and Bottom Ash then cap Ash Pond A with a composite liner system. The GW trench will help ensure groundwater standards and prevent off-site migration as described in Section 2.32 of the GMZ Application.*
5. Describe how the selected remedy will minimize any threat to public health or the environment. *The risk assessment is addressed in Section 2.32 of the GMZ Application.*
6. Describe how the selected remedy will result in compliance with the applicable groundwater standards. *The remedy should bring about based on the groundwater model results (Groundwater Modeling Report in Appendix C of the Closure Plan and in Section 2.32 of the GMZ Application).*
7. Provide a schedule for design, construction and operation of the remedy, including dates for the start and completion. *Construction complete, but need approval of NPDES permit for operation.*
8. Describe how the remedy will be operated and maintained. See *Section 2.32 of the GMZ Application and the documents referenced therein.*
9. Have any of the following permits been issued for the remediation?
   a. Construction or Operating permit from the Division of Water Pollution Control. YES ☒ NO ☐
   b. Land treatment permit from the Division of Water Pollution Control. YES ☐ NO ☒
      If the answer to this question is "yes", identify the permit number.
   c. Construction or Operating permit from the Division of Air Pollution Control.
      YES ☐ NO ☒ If the answer to this question is "yes", identify the permit number.
10. How will groundwater at the facility be monitored following completion of the remedy to ensure that the groundwater standards have been attained? *See Groundwater Monitoring Plan (Appendix B of the Closure Plan).*

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of my knowledge and belief, true and accurate and confirm that the actions identified herein will be undertaken in accordance with the schedule set forth herein.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Introduction

The Post-Closure Care Plan (Plan) for the AmerenEnergy Medina Valley Cogen, L.L.C. Hutsonville Power Station (Site) water treatment devices known as Ash Pond A, Ash Pond B, Ash Pond C and the Bottom Ash Sluice Pond, presented herein, are to be closed in compliance with the requirements of Title 35 Illinois Administrative Code, Part 620 (35 IAC 620), and elements of this Plan have been prepared to generally conform with the Ash Pond D site-specific rule at 35 IAC 840, and where judged appropriate, elements of the proposed 35 IAC 841 rules, currently under development (Illinois PCB, 2013). Concurrently submitted supporting documents are cited within this Plan and listed in Section 9 of this report.

2. Post-Closure Maintenance Program

Post-closure activities will continue for a minimum of ten years following the completed closure activities, as defined in the Closure Plan (Hanson and NRT, 2014a) and acceptance of the Site's closure by the Illinois Environmental Protection Agency (EPA). The post-closure maintenance program will include the following:

2.1 Site Inspections

Inspection of the facility will be conducted on a quarterly basis until completion of the post-closure period. Site inspections must also be performed after storm events. For purposes of this Plan, an "Inspection Storm Event", for purposes of this Plan, is defined as a 25-year, 24-hour event (Huff & Angel, 1989), or approximately 5.37 inches of precipitation.

Termination of the site inspections will occur after Illinois EPA approval of the certified Post-Closure Care Report, as discussed herein.

Written record of the inspection(s) will be made and retained at the Site or the Site operator's office. The inspector will assess the condition and need for repair of final cover and vegetation, as well as fencing, monitoring points, and surface water control features.

2.2 Erosion Control Maintenance

During the post-closure care period, repairs and maintenance, including repair of rills and gullies will be undertaken if ponding is observed, or gullies 6-inches or deeper have formed, or if vegetative or vector problems arise. Areas that have been identified by the inspector as particularly susceptible to erosion will be re-contoured and reseeded as necessary.

2.3 Drainage Channel Maintenance

All eroded and scoured drainage channels will be repaired, and the lining material replaced, if necessary. All vegetated areas and associated structures will be inspected as part of the site inspection.

2.4 Final Cover Maintenance

Residual settlement and erosion may require minor final cover repairs. If ponding occurs or depressions appear, the areas will be repaired in order to maintain the integrity of the final cover. Areas of settlement will be repaired with additional cover soils, as required, to maintain drainage.

Electronic Filing: Received, Clerk's Office 09/28/2020

2.5 Vegetation Repair

Areas repaired as noted above will require re-establishment of vegetative cover. Areas of sparse or failed vegetation in-excess of 100 square feet (ft^2) will be re-vegetated.

2.6 Geosynthetic Liner

During the post-closure time period all rips, tears, punctures, or other damage to the geosynthetic liner system will be repaired. Construction Quality Assurance (CQA) methods in accordance with the project CQA Plan (Hanson 2014a) will be followed during the repair process.

2.7 Vegetation Mowing

The vegetation will be mowed annually. During mowing and site inspections, if any woody growth is found in the vegetative areas it will be removed promptly.

2.8 Miscellaneous Repairs

Minor repairs may be required to ensure the integrity and proper function of fencing, surface water drainage structures, monitoring points, and groundwater monitoring wells. Repairs will be made as warranted.

3. Groundwater Monitoring System

See Section 2 in the Groundwater Monitoring Plan Report (Hanson 2014b). A list of monitoring wells/piezometers are shown in Figure 1 and further identified in Table 2 of the Hanson (2014b) report. A monitoring system maintenance plan is included at the end of Section 2.2 of the Hanson (2014b) report.

4. Groundwater Monitoring Program

Requirements for the Groundwater Monitoring Program may be found in Section 3 and Appendix C of the Groundwater Monitoring Plan (Hanson 2014b). Quality Assurance requirements may be found in Section 6 of the Hanson (2014b) report.

5. Annual Statistical Analysis

The statistical methodology for the annual review may be found in Appendix A of the Groundwater Monitoring Plan (Hanson 2014b).

6. Groundwater Management Zone (GMZ)

A proposal for a Groundwater Management Zone pursuant to 35 IAC 620.250 for the Site is included in the Groundwater Management Zone Application (Hanson and NRT, 2014b).

7. Mitigation of Statistically Significant Increasing Concentrations

See Section 7.2 in the Groundwater Monitoring Plan (Hanson 2014b) list the steps to demonstrate compliance with the pertinent regulations.

Electronic Filing: Received, Clerk's Office 09/28/2020

8. Licensed Professional Signature/Seal

I hereby affirm that all information and design contained in this Post-Closure Care Plan is true and accurate to the best of my knowledge and belief in accordance with good engineering practice.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. INTRODUCTION

This document describes the Construction Quality Assurance (CQA) program for the closure of Ash Ponds A, B, C and the Bottom Ash Sluice Pond at the Hutsonville Power Station near Hutsonville, Crawford County, Illinois.

This program includes documentation of CQA monitoring, inspection, sampling and testing to verify compliance with project plans and specifications. The goal of this program is to achieve a reasonable degree of certainty that the construction of the facility meets the specified designs.

Appendix A lists the testing methods, acceptance requirements and testing frequencies that shall guide the implementation of this plan. The plan includes oversight by the CQA Officer for all testing carried out by the geosynthetic installers.

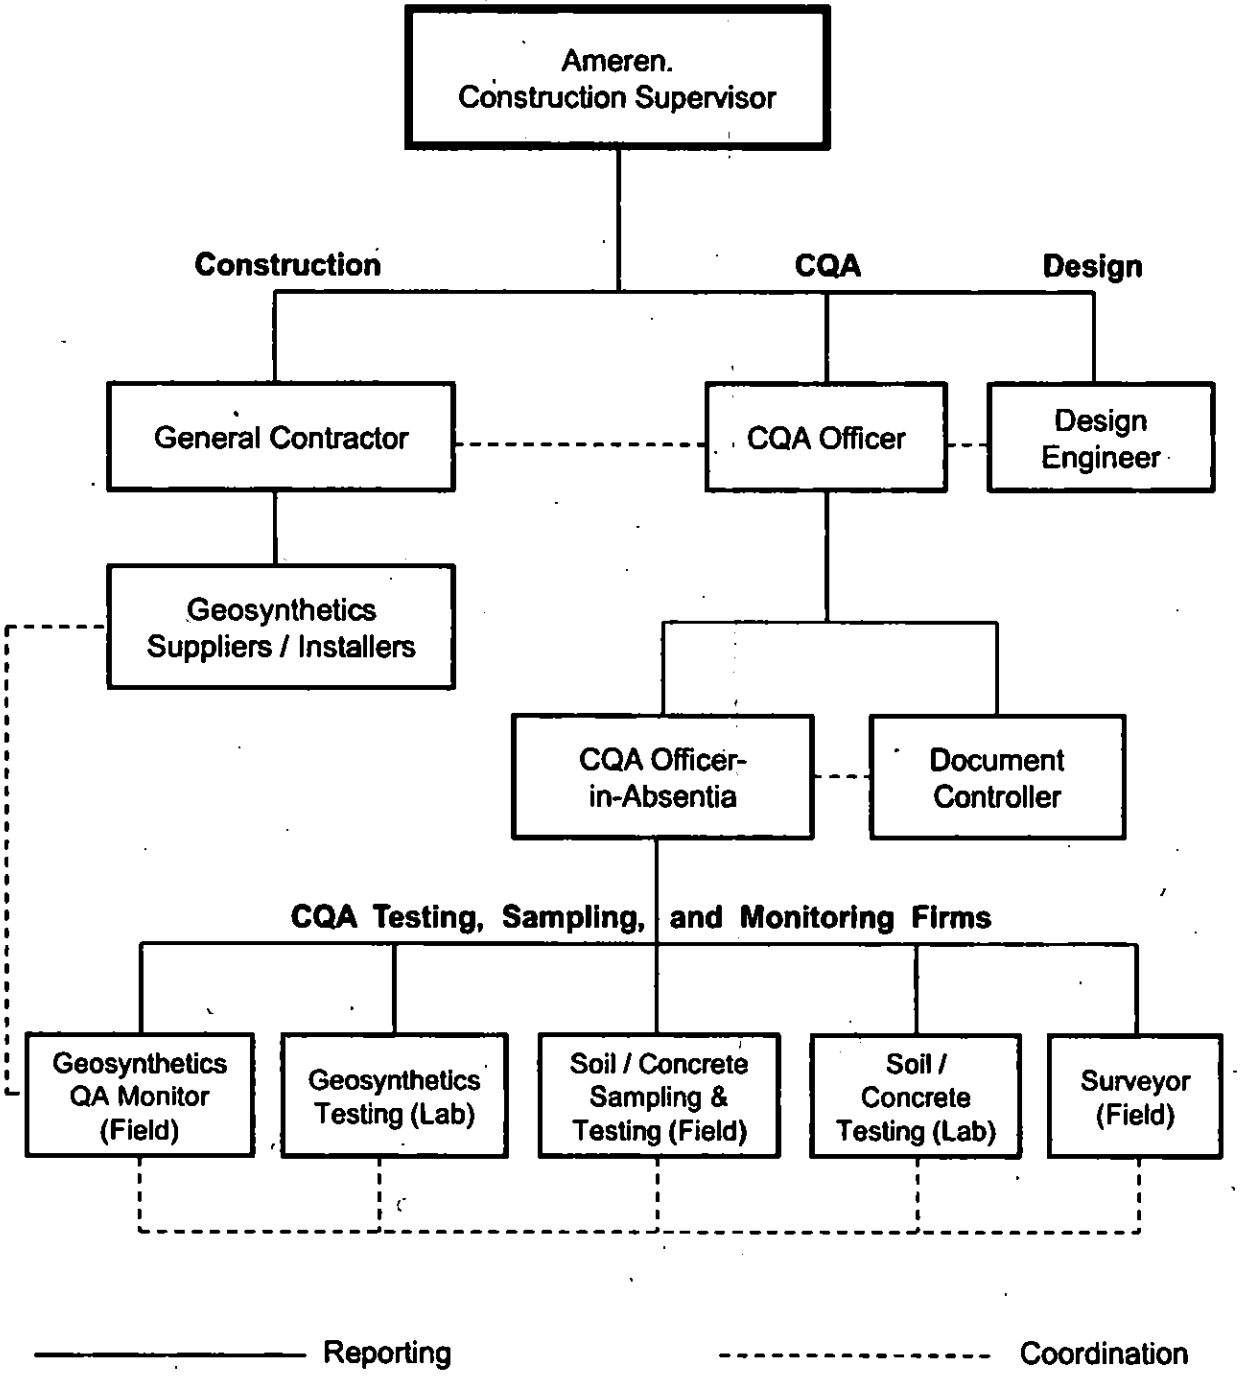
The CQA Plan also requires submittal of an acceptance report that certifies the facility has been constructed in accordance with the construction documents.

This Plan is intended to supplement the project plans and specifications. Where a conflict exists, the approved CQA Plan will govern. Please see Table A-1 for testing methods, acceptance requirements, and testing frequency that guide implementation of this Plan.

2. RESPONSIBILITY AND AUTHORITY OF PROJECT PERSONNEL

The project participants involved in the construction and quality assurance oversight of the construction are shown in Figure 1. The Owner is AmerenEnergy Medina Valley Cogen, L.L.C. (Ameren) who will retain a General Contractor to construct the facility and a CQA Officer to provide the quality assurance oversight services. The following list the responsibilities and authority of each of the participants shown in Figure 1. Table 1 lists the testing/documentation required and the party responsible for generating /maintaining the documentation.

2.1 Owner (Ameren)



Ameren is responsible for obtaining all necessary permits for construction and operation of the facility. Ameren retains under contract all parties for the construction including the General Contractor, the Design Engineer, the CQA Officer, and any CQA testing and monitoring firms.

The Ameren Construction Supervisor will be in charge of coordinating overall construction activities and will act as Ameren's primary interface with the General Contractor. The Construction Supervisor coordinates all matters involving contract issues, including approving field changes to the project plans and specifications.

2.2 Design Engineer

The Design Engineer is responsible for development of plans and specifications that fulfill the needs of the Owner and meet the requirements of the regulatory agencies. The Design Engineer is also responsible for responding to contractor requests for information (RFIs) during the construction process as may be required to clarify the plans and specifications or to address identified conflicts in the documents. The Design Engineer is further responsible for developing any modifications to the plans and specifications as may be required to address changed field conditions, field cost savings, design improvements or other necessary or desired modifications as approved by the Owner.

Photographs	CQA Officer
CQA Certification Form	CQA Officer
CQA Acceptance Report	CQA Officer

Electronic Filing: Received, Clerk's Office 09/28/2020

2.3 CQA Personnel

2.3.1 CQA Officer

Ameren will retain a CQA Officer for the project who will report directly to Ameren's Construction Supervisor (see Figure 1). The CQA Officer shall be a Professional Engineer registered in the State of Illinois, who is a person other than the Owner or an employee of the Owner, and who will supervise and be responsible for all inspection, testing, and other activities required to be implemented as part of the CQA program. The CQA Officer will also be responsible for, and will provide direct supervision to, any testing and monitoring firms shown in Figure 1 who will perform the monitoring, testing, sampling, and inspections required by the CQA program as described more specifically in Section 5. The CQA Officer will be present at the outset of major undertakings and at critical times during the construction. The time that the CQA Officer must be at the project site will be dependent upon the type of construction being conducted. The CQA Officer will exercise his/her own professional judgment to be present at the project site as required to assume full responsibility for the inspection and testing performed by those persons under his/her direct supervision. The CQA Officer shall have sufficient on-site staff to adequately carry out the quality assurance activities specified herein.

If the CQA Officer is unable to be present to perform duties as outlined below, then the CQA Officer will provide a designated CQA Officer-in-Absentia. A signed statement shall be provided and recorded that the CQA Officer assumes full responsibility for all inspections performed and reports prepared by the designated CQA Officer-in-Absentia during any absence of the CQA Officer.

The CQA Officer (or his designated representative), shall provide oversight of the monitoring, inspection, testing and/or sampling of the following construction activities for the facility:

- Compaction of the subgrade and foundation to design parameters,
- Application of final cover, including installation of the geomembrane, and
- Construction of ponds, ditches, lagoons and berms.

The CQA Officer (or his designated representative) must certify that the sampling, inspection and test results for the major elements of the construction are in compliance with established design requirements before subsequent sequential items of the construction can be initiated. The major elements of work requiring compliance certification include:

- Base Grade prior to placement of the geomembrane,
- Geomembrane prior to placement of the protective soil cover,
- Geomembrane installation in anchor trenches prior to backfilling,
- Construction of surface water control features; and
- Placement of the protective soil cover,

Certification will require a review of all inspection, sampling and testing completed for the work item to ensure that all design requirements have been met, a visual inspection of the work item, and the completion and signing of form CQAP-2.1 *CQA Certification* by the CQA Officer (or his designated representative). The contractor or installer for the immediately following item of work shall not be allowed to initiate work until completion of the signed form by the CQA Officer (or his designated representative).

Electronic Filing: Received, Clerk's Office 09/28/2020

The elements of work requiring compliance assurance include:

1. Bedding material contains no undesirable objects;
2. The closure plan has been followed;
3. The anchor trench and backfill are constructed to prevent damage to the geosynthetic membrane;
4. All tears, rips, punctures, and other damage are repaired;
5. All geosynthetic membrane seams are properly constructed and tested in accordance with manufacturer's specifications;

The completed and signed forms CQAP-2.1 shall be filed as project records in accordance with the provisions of Section 10.

2.3.2 Document Controller

The staff of the CQA Officer shall include a Document Controller who will be responsible for: (1) control of the CQA Plan to ensure that only current documents are being employed by the CQA staff and (2) filing of all CQA records related to the monitoring, sampling, inspecting and testing specified in the CQA Plan.

Requirements for control of the CQA Plan and for filing of project records are presented in Section 10.

2.4 Testing and Monitoring Firms

The testing and monitoring firms, under the direction of the CQA Officer (see Figure 1), shall be responsible for conducting the quality assurance sampling (where appropriate), inspection and testing required by Section 5 of the CQA Plan except that only monitoring and limited (independent) sampling and testing shall be required for the geosynthetics (i.e., geomembrane). The suppliers and installers shall be responsible for all the sampling and testing required by Section 5 for the geosynthetics (see Section 2.5).

Testing and monitoring firms may be one or several, as long as each firm (or firms) is qualified in accordance with Section 2.4.

2.4.1 Soil/Concrete Testing (Lab and Field)

One or more soil/concrete testing firms that has been qualified by the Illinois Department of Transporation (IDOT) will be retained to perform the laboratory testing required by the CQA Plan. Materials will be sampled by the testing firm or by persons designated by the CQA Officer. Materials sampled and tested will include fine-grained soils, coarse-grained soils, aggregates, rip rap and concrete.

Each firm shall be required to provide "certificates of calibration" (or other proof of calibration) to the CQA Officer for each of the measuring and/or test equipment used in the laboratory or field; except that such certificates are not required for commercial grade equipment such as rulers, tape measures or other devices that provide adequate accuracy for their intended purpose.

Electronic Filing: Received, Clerk's Office 09/28/2020

Field and laboratory forms proposed for collection of data shall be subject to review by Ameren prior to use. Incomplete or otherwise unacceptable forms will be modified by the testing firm to meet the intent of the CQA Plan.

2.4.2 Surveyor

One or more surveyors will survey specified elevations, slopes and grades as required by the CQA Plan. The firm(s) selected will complete all work by or under the supervision of an Illinois Professional Land Surveyor.

Each surveyor will be required to provide proof of calibration (not more than one (1) year since the last calibration) to the CQA Officer for each surveying device used. Proof of calibration for commercial grade equipment such as rulers, tape measures or other devices that provide adequate accuracy for their intended purpose, is not required.

2.4.3 Geosynthetics Monitor and Geosynthetics Testing Laboratory

A geosynthetic monitoring firm may be retained to conduct oversight of the quality assurance inspections, testing and sampling carried out in the field by the suppliers and installers of the geosynthetic (see Section 2.5) to ensure that the requirements of the CQA Plan are met including directing additional inspection, sampling and testing as may be deemed necessary by the monitoring firm and/or the CQA Officer. The monitoring firm may also collect representative samples of the geosynthetic for independent testing by a geosynthetic testing laboratory as directed by the CQA Officer.

The geosynthetic testing laboratory will be independent of both the manufacturer and the installer of the geosynthetic and will be required to have its own quality assurance (QA) plan for the project work. The QA Plan shall be subject to review by Ameren prior to start of services.

Field and laboratory forms proposed for collection of data shall be subject to review by Ameren prior to use. Incomplete or otherwise unacceptable forms will be modified by the testing firm to meet the intent of the CQA Plan.

2.5 Contractors, Suppliers and Installers

The contractor, subcontractors, suppliers and installers are responsible for completing their portions of the work within specified schedules and in accordance with the requirements of the contract documents. They additionally shall accommodate the monitoring, sampling, inspections and testing that are the responsibility of the CQA Officer under the CQA Plan.

The geosynthetic suppliers and installers shall provide the quality assurance inspection, sampling and testing as required by Section 5 of the CQA Plan. Additionally, the geosynthetic suppliers shall be required to submit "certificates of acceptance" for certain items of work that precede their construction activities. The "certificates of acceptance" are more specifically discussed in Section 4.

Electronic Filing: Received, Clerk's Office 09/28/2020

3. PROJECT MEETINGS

Periodic meetings will be held during the life of the project to enhance coordination among the various parties involved. Meetings will include preconstruction meetings, routine progress meetings and as needed, problem or work deficiency meetings.

3.1 Preconstruction Meetings

Preconstruction meetings shall be held at the site for the major earthwork items and geosynthetic installations. At a minimum, the Ameren Construction Supervisor, the CQA Officer, representatives of the testing firms, and the earthwork contractor or geosynthetic installer shall attend. In addition to the topics for discussion as listed in the project specifications, the following CQA items will be covered:

- Discuss the established protocol for inspections, tests and sampling including use of form CQAP-7.2 *Daily Inspection Report* (see Section 7),
- Discuss items of work requiring CQA Officer certification or installer acceptance before subsequent work items can be initiated (see Section 4), and
- Discuss the established protocol for handling construction deficiencies, corrective measures, and retesting (see Section 6).

The meeting shall be conducted by the Ameren Construction Supervisor or the CQA Officer and will be documented by CQA personnel with distribution to all attendees. Meeting minutes will be filed as project records in accordance with Section 10.

3.2 Progress Meetings

At the discretion of the Ameren Construction Supervisor or the CQA Officer, progress meetings will be scheduled to discuss on-going and up-coming construction activities. The meeting will be attended by the Ameren Construction Supervisor, the CQA Officer, and the appropriate site foreman (i.e. when earthwork is being performed, the earthwork foreman will be present; when geosynthetic are being installed, the installer foreman will be present, etc.). In addition to the topics of discussion regarding progress, the following CQA items shall be reviewed:

- Discuss the established protocol for inspections, tests and sampling including use of form CQAP-7.2 *Daily Inspection Report* (see Section 7),
- Discuss items of work requiring CQA Officer certification or installer acceptance before new work items can be initiated (see Section 4), and
- Discuss the established protocol for handling construction deficiencies, corrective measures, and retesting (see Section 6).

These meetings will be documented by the CQA Officer with distribution to all attendees including the Ameren Construction Supervisor. Meeting minutes will be filed as project records in accordance with Section 10.

3.3 Problem or Work Deficiency Meetings

Special meetings will be convened by the CQA Officer when a problem or work deficiency is present (or anticipated) that is (or could be) of a serious nature. At a minimum, the meeting should be attended by the Ameren Construction Supervisor, earthwork or installer foremen as appropriate, and the CQA

Electronic Filing: Received, Clerk's Office 09/28/2020

Officer. The purpose of these meetings is to define and resolve the problem or work deficiency in the following manner:

- Define the problem or deficiency and its probable causes,
- Discuss alternative actions to address the problem or deficiency,
- Implement the selected action to resolve the problem or deficiency, and
- Verify that the implemented action has been effective.

The meeting will be documented by the CQA Officer with distribution to all attendees including the Ameren Construction Supervisor. Meeting minutes will be filed as project records in accordance with Section 10.

4. IN-PROGRESS ACCEPTANCE OF WORK

4.1 Introduction

It is very important during placement of the geosynthetic not to entrap fugitive clay, stones, sand, etc. that could damage the geosynthetic, cause clogging of drains or filters, or hamper seaming of the geosynthetic. The geosynthetic installers shall accept responsibility for inspecting the substrate (on a daily basis) to ensure such entrapments are not present within the substrate area to be covered each day. When found acceptable, the installer shall complete and sign form CQAP-4.1 Installer Certificate of Acceptance that documents (on a daily basis) acceptance of the substrate for geosynthetic placement. The installer shall provide the original signed document to the CQA Officer (or his designated representative) for his signature of receipt.

Completed and signed forms CQAP-4.1 shall be filed as project records in accordance with the provisions of Section 10.

4.2 Elements of Work Requiring Prior Acceptance

Table 2 cites the elements of work that shall require daily "certificates of acceptance" for the substrate including the installer responsible for providing the certification. Any other areas of geosynthetic installation not included in the table shall still be subject to the requirements of this section.

Table 2. Installer Certifications for Acceptance of Work

Substrate to Be Accepted by Installer	Installer
1. Surface of Base Grade/Subgrade	Geomembrane Installer
2. Surface of Geomembrane	Vegetative Cover Installer

Electronic Filing: Received, Clerk's Office 09/28/2020

5. SAMPLING AND TESTING REQUIREMENTS

5.1 Introduction

Prequalification and placement sampling/testing requirements for the various materials and construction activities are summarized in Table A-1. Frequencies for material placement testing listed in Table A-1 are based on the volume of material used in construction and are to be considered minimums. The CQA Officer shall select the specific locations for testing on a random basis exercising professional judgment to ensure that testing and sampling fairly represent the construction.

The testing firms under the direction of the CQA Officer shall be responsible for the sampling (as applicable) and testing listed in Table A-1 for: (1) the Soils Prequalification and Placement Testing, (2) the Coarse Aggregate Prequalification Testing, and (3) the Other Material Placement Testing. The geosynthetic installers shall be responsible for the sampling listed in Table A-1 for the Geosynthetics Prequalification and Placement Testing. Independent laboratory testing will be coordinated through the geosynthetic monitoring firm and/or the CQA Officer.

Custody of samples and transfer from the sampling location to the test facility shall be established and documented through the use of form CQAP-5.1 *Chain of Custody Record*. The sampling party shall enter sample descriptions (including proposed use), sampling dates and times, and types/quantities of samples on the form, including methods or types of testing to be carried out, and relinquish custody of the samples to the testing firm by signing and dating the form at the bottom. The samples shall be shipped or delivered to the testing firm with the original signed copy of form CQAP-5.1. The sampling party shall retain a copy for its records.

The testing firm shall document receipt of the samples by signing and dating the form at the bottom and retaining a copy for its records. The testing firm shall return the original signed copy of form CQAP-5.1 to the Document Controller with the submittal of test results. The return of any samples by the testing firm shall be documented by signing and dating relinquishment at the bottom of the form and identifying the returned samples in the "Remarks or Observations" column. The Document Controller shall document receipt of any returned samples by signing and dating the form at the bottom. The Document Controller shall retain the original signed copy of the form as a project record in accordance with Section 10.

The results of the sampling and testing shall be documented on a daily basis by each testing firm or installer providing the quality assurance activities, and the originals of the sampling and testing results shall be provided to the CQA Officer. The CQA Officer shall complete form CQAP-7.2 Daily Inspection Report (see Section 7) for each of the testing firms or installer approving results and attach the results to the form. The completed form CQAP-7.2 and attached results shall be incorporated into the form CQAP-7.1 Weekly Summary Report (see Section 7).

5.2 Soils

5.2.1 Base Grade (Subgrade) Materials

Foundation (top ash/fill surface) materials shall be used to develop a stable foundation for the ash pond cover and provide positive drainage. The CQA Officer shall make a foundation inspection with the soil testing firm and identify areas requiring reworking. The CQA Officer shall inform the earthwork contractor of unsuitable areas requiring reworking of the materials. The CQA Officer may direct the

Electronic Filing: Received, Clerk's Office 09/28/2020

surveying firm to determine the locations and extent of areas of unsuitable and reworked material placement and to document all such information on "as built" drawings to be furnished to the CQA Officer.

All fill materials shall be placed in loose lifts no thicker than 12-inches. The material should be placed such that the in-place density limits settlement, and the moisture regime is not so dry as to cause the material to create dust and not so wet as to have obvious (free) moisture or cause the material to pump when driven over. Once grade is reached, the final lift will be smooth rolled using a vibratory, self-propelled roller. The final surface of the ash pond will be inspected for material that could damage the geosynthetic liner. Only ash or fill materials that are free of rock, gravel, or debris (larger than 0.75 inches in any dimension), frozen materials, or other deleterious matter may be placed in the final surface lift. Vegetation may be included in the fill materials, but should be well incorporated into the ash or fill materials placed in Ash Pond A. No large masses of plants or roots should exist that could cause settlement of the cover system.

The CQA Officer shall review the placement and confirm the final grades of the ash/fill and, if found in agreement with the specifications, provide certification for the work using form CQAP 2.1.

5.2.2 Base Grade (Subgrade) Verification

The CQA Officer shall direct the surveyor to verify that actual grades of the Base Grade are in accordance with the plans and specifications. Elevations shall be surveyed on a 100 ft. grid pattern for the surface of the Base Grade. In addition, all breaks in grade at slopes shall be surveyed. Base grading shall meet a control tolerance requirement of 0 ft. to -0.4 ft. or as approved by the CQA Officer. The measured grades shall be documented on "as-built" drawings furnished to the CQA Officer by the surveyor.

The CQA Officer shall review the survey data for conformance to requirements and, if found in agreement with requirements, provide certification for the work using form CQAP-2.1. The Geosynthetic Installer shall accept the subgrade surface as suitable for the geomembrane installation using CQAP-4.1.

5.2.3 Final Cover

5.2.3a Prequalification Testing

Prequalification testing for borrow material sources shall meet the requirements in Table A-1.

Table A-1 requires that prequalification testing for each borrow source being used for the construction of the 3-ft. thick final cover layer include chemical analysis and soil classification testing to determine suitability of the source and to prevent the use of contaminated soil. The results will serve as the major control for material placement during construction.

The laboratory test reports and completed chain of custody records will be filed as a project record in accordance with Section 10.

Electronic Filing: Received, Clerk's Office 09/28/2020

5.2.3b Material Thickness Testing

The CQA Officer shall direct the survey firm to determine elevations at the foundation of the final cover and at the final constructed surface using the same 100 ft. grid pattern as was established in Section 5.2.1 (and the break points in slope) to verify attainment of the plan grades and elevations. To verify thickness, all horizontal survey coordinates shall be the same for the base and final constructed surface.

The measured depths and grades shall be documented on "as-built" drawings furnished to the CQA Officer by the surveyor.

5.3 Geomembrane

5.3.1 Prequalification Testing

The contractor shall direct the geomembrane manufacturer to supply an inventory list of rolls to the Owner's geosynthetic QA monitor firm and/or the CQA Officer, who will select rolls to be prequalified for the type and frequency of prequalification testing listed in Table A-1.

The geomembrane manufacturer shall procure and submit samples from the designated prequalification rolls to the independent geosynthetic laboratory (see Section 2.4.3) for verification of selected manufacturer's guaranteed properties. Such samples shall be 3 ft. long by the entire width of the roll.

In addition, the manufacturer shall submit documentation that the materials supplied have been tested for the parameters listed in the manufacturers list of guaranteed properties at the frequency stated in the list of guaranteed properties. The results of such testing, including identification of all individual rolls tested, shall be submitted to the CQA Officer for review. The manufacturer shall certify that all rolls meet the manufacturer's guaranteed properties, in accordance with the specified testing frequency rate.

Geomembrane prequalification testing shall be completed prior to delivery.

5.3.2 Installer Certification of Placement Surface

Prior to daily geomembrane placement, the installer shall provide to the CQA Officer daily "certificates of acceptance" (form CQAP-4.1) which document the installer's inspection and acceptance of the underlying surface as being suitable for the geomembrane installation (see Section 4).

All daily "certificates of acceptance" (form CQAP-4.1) shall be filed as project records in accordance with Section 10.

5.3.3 Installer Testing for Seam Overlap

The contractor and installer shall arrange geomembrane sections such that the use of field seams is minimized. Seam overlaps shall be field measured by the installer to verify the requirement in Table A-1 is met for all seams within the geomembrane footprint. Seam overlaps shall be "shingled" in the direction of the downslope. The CQA Officer shall direct appropriate personnel to make independent measurements of a representative number of seam overlaps for additional verification of the requirement in Table A-1.

Electronic Filing: Received, Clerk's Office 09/28/2020

At completion of geomembrane placement, the installer shall provide the CQA Officer with "as-built" drawings of the geomembrane installation showing all seam locations and seam measurement locations.

5.3.4 Installer Non-Destructive Testing

The installer shall conduct non-destructive testing of seams. All seams shall be nondestructively tested over their full length using a vacuum test unit, air pressure test, or other method approved by the CQA Officer. Continuity testing shall be completed as the seaming progresses.

The CQA Officer shall direct appropriate personnel to monitor all non-destructive testing carried out by the installer.

The installer shall submit all non-destructive field testing results to the CQA Officer for filing as project records in accordance with Section 10.

5.3.4a Vacuum Testing (Extruded Welds)

The following procedures are applicable to those processes which produce an extruded weld.

Equipment – The following equipment shall be used when conducting vacuum tests:

- A vacuum box assembly consisting of a rigid housing, a transparent viewing window, a soft neoprene gasket attached to the bottom, a port hole or valve assembly, and a vacuum gauge,
- A steel vacuum tank and pump assembly equipped with a pressure controller and pipe connections,
- A rubber pressure/vacuum hose with fittings and connections,
- A bucket, and
- A soapy solution.

Procedures – The following procedures will be followed:

1. Energize the vacuum pump and reduce the tank pressure to approximately 10 in. of Hg (gauge).
2. Wet a strip of geomembrane approximately 12 in. wide by 48 in. long (an area larger than the coverage size of the vacuum box) with the soapy solution.
3. Place the box over the wetted area.
4. Close the bleed valve and open the vacuum valve.
5. Verify that a leak tight seal is created.
6. For a period of not less than 10 seconds, examine the geomembrane through the viewing window for the presence of soap bubbles.
7. If no bubble appears after 10 seconds, close the vacuum valve and open the bleed valve, move the box over the next adjoining area, repeat the process.
8. All areas where soap bubbles appear will be marked and repaired and then retested until passing test results are obtained.

Electronic Filing: Received, Clerk's Office 09/28/2020

5.3.4b Air Pressure Testing (For Double Fusion Seam Only)

The following procedures are applicable to those processes which produce a double seam with an enclosed space.

Equipment – The equipment will be comprised of the following:

- An air pump (manual or motor driven) equipped with pressure gauge capable of generating and sustaining a pressure between 25 psi to 30 psi and mounted on a cushion to protect the geomembrane,
- A rubber hose with fittings and connections, and
- A sharp hollow needle, or other approved pressure feed device.

Procedures – The following procedures will be observed:

1. Both ends of the seam to be tested will be sealed.
2. A needle or other approved pressure feed device will be inserted into the tunnel created by the fusion weld.
3. A protective cushion will be inserted between the air pump and the geomembrane.
4. The air pump will be energized to a pressure between 25 psi and 30 psi. The valve will be closed, and the pressure will be sustained for approximately 5 minutes.
5. If loss of pressure exceeds 3 psi or does not stabilize, the faulty area will be located, then repaired and retested until passing test results are obtained.
6. At the conclusion of a passing air pressure test, the opposite end of the seam will be slit and subsequent drop in pressure will be monitored. This will ensure that the entire seam was completely tested.
7. Remove needle or other approved pressure feed device and seal.

5.3.5 Installer Destructive Testing

5.3.5a General

Destructive seam tests shall be performed at randomly selected geomembrane locations. The purpose of these tests is to evaluate seam strength. Seam strength testing shall be done as the seaming work progresses, not at the completion of all field seaming.

The CQA Officer shall direct appropriate personnel to monitor all destructive testing carried out by the installer.

The installer shall submit the results of all destructive testing to the CQA Officer for filing as project records in accordance with Section 10.

Electronic Filing: Received, Clerk's Office 09/28/2020

5.3.5b Location and Frequency

The installer shall select locations where seam samples will be cut out for testing. Those locations shall be established as follows:

1. One (1) destructive test sample per 500 lin. ft. seam length or another predetermined length in accordance with GRI GM 19 shall be taken by the Geomembrane Installer from a location specified by the Owner's Representative. Where seaming is performed by an International Association of Geosynthetic Installers (IAGI) Certified Welding Technician using an automatic welding device, the spacing may be increased to 750 lin. ft. per GRI GM 29 (Track 2). The Geomembrane Installer shall not be informed in advance of the sample location. In order to obtain test results prior to completion of geomembrane installation, samples shall be cut by the Geomembrane Installer as directed by the Owner's Representative as seaming progresses. This minimum frequency is to be determined as an average taken throughout the entire area of placement.
2. Test locations will be determined during seaming at the installer's discretion. Selection of such locations may be prompted by suspicion of excess crystallinity, contamination, offset welds, or any other potential cause of imperfect welding.
3. All samples obtained for destruction testing shall have a 12 in. x 12 in. sample delivered to the Owner for archive storage.

The CQA Officer shall direct appropriate personnel to select and cut out a representative number of additional samples for independent laboratory testing.

5.3.5c Sampling Procedure

Samples will be cut as the seaming progresses in order to have laboratory test results before the geomembrane is covered by another material. The installer shall:

- Assign a number to each sample, and mark it accordingly,
- Record sample location on layout ("as-built") drawing, and
- Record reason for taking the sample at this location (e.g., statistical routine, suspicious feature of the geomembrane).

All holes in the geomembrane resulting from destructive seam sampling shall be immediately repaired. The continuity of the new seams in the repaired area shall be vacuum tested.

5.3.5d Field Testing

The installer shall test in the field, by tensiometer, ten 1 in. wide sample strips from the samples identified for destructive testing; five for peel and five for shear. This testing shall include the independent samples obtained as directed by the CQA Officer. Successful field testing will prequalify samples for laboratory testing. The requirements and frequency for field testing shall be as provided in Table A-1 and Table 1(a) of GRI GM19.

The installer shall conduct all field tests and mark all samples and portions with their number. The installer shall also log the date, time, ambient temperature, number of seaming unit, name of seamer, welding apparatus temperatures and pressures, and pass or fail description, and attach a copy to each sample portion.

Electronic Filing: Received, Clerk's Office 09/28/2020

5.3.5e Geosynthetic Quality Assurance Laboratory Testing

Successful prequalifying field tests shall identify samples for laboratory testing. The installer's quality assurance laboratory shall be as selected by the installer with concurrence of the CQA Officer.

Testing shall include shear strength and peel adhesion. At least five specimens from each sample shall be tested by the installer's laboratory for each method. Specimens shall be selected alternately by test from the samples (i.e., peel, shear). All laboratory testing shall be accordance with ASTM D 4437. Acceptance shall be based upon the criteria outlined in GRI GM19, using the specified values given in Table 1(a) of GRI GM19.

The CQA Officer shall direct appropriate personnel to have additional samples tested for peel and shear strength by the independent geosynthetic laboratory as deemed necessary.

5.3.5f Procedures for Destructive Test Failure

The following procedures will apply whenever a sample fails a destructive test, whether the test was conducted in the laboratory or by field tensiometer. The installer has two options:

1. The installer may reconstruct the seam between any two passed test locations.
2. The installer may trace the welding path to an intermediate location at least 10 ft. from the point of the failed test in each direction, and take a small sample for an additional field test at each location. If these additional samples pass the tests, then full laboratory samples are taken. If these laboratory samples pass the tests, then the seam is reconstructed between these locations. If either sample fails, then the process is repeated to establish the zone in which the seam should be reconstructed.

All acceptable reconstructed seams must be bounded by two locations from which samples passing laboratory destructive tests have been taken. In cases exceeding 150 ft. of reconstructed seam, a sample taken from the zone in which the seam has been reconstructed must pass destructive testing.

The installer will document all actions taken in conjunction with destructive test failures.

5.4 Other Material Placement Testing

5.4.1 Placement Testing of Concrete

The CQA Officer shall direct the soil test firm to carry out placement testing for concrete in accordance with the requirements and frequency specified in Table A-1.

The contractor shall submit proposed concrete mix designs to the CQA Officer for review prior to ordering of concrete.

The CQA Officer shall review the concrete testing results and, if found in agreement with the placement requirements; provide certification for the work using form CQAP-2.1.

Electronic Filing: Received, Clerk's Office 09/28/2020

5.4.2 Placement Testing of Surface Water Management System

The CQA Officer shall direct the survey firm to determine the elevations and grades of the constructed berms and channels in accordance with the requirements and frequency specified in Table A-1.

The measured elevations and grades shall be documented on "as-built" drawings furnished to the CQA Officer by the surveyor.

5.4.3 Anchor Trench and Geomembrane

The Anchor Trench shall be constructed to prevent uplift and potential damage the geomembrane cover. The trench shall be sufficiently deep and wide to prevent issues with sharp bends in the geomembrane, geomembrane pull-out, and possible tear/punctures to the geomembrane.

The Anchor trench shall be clean of any rock or gravel (larger than 0.75 inches in any dimension), debris, CCW, frozen materials, vegetation, and other deleterious matter. Back fill material shall be of soil classification CL-ML, or other material approved by the CQA Officer and also be free of any rock or gravel (larger than 0.75 inches in any dimension), debris, CCW, frozen materials, vegetation, and other deleterious matter that could damage the Geomembrane.

6. CORRECTIVE MEASURES

The CQA Officer shall reject and require replacement of all materials for which sampling, testing or inspection results show that prequalification requirements are not met. The CQA Officer shall also reject workmanship (and require corrective rework) for which sampling, testing or inspection results show that material placement requirements are not met. The lateral and/or vertical extent of corrective measures for rework shall be based on the frequency of testing and judgment of the CQA Officer.

7. DOCUMENTATION OF SAMPLING, INSPECTIONS AND TESTING

7.1 Weekly Summary Reports

A weekly summary report shall be prepared by the CQA Officer or his designated representative (i.e. CQA Officer-in-Absentia) under the direct supervision of the CQA Officer during each week of activity until construction is complete. Form CQAP-7.1 *Weekly Summary Report* shall serve as the base document to which the daily inspection reports (see Section 7.2) are to be attached.

Each report shall be signed by the CQA Officer or his designated representative (i.e., CQA Officer-in-Absentia). The original report (and attachments) shall be submitted to the Document Controller and filed as a project record in accordance with Section 10.

7.2 Daily Inspection Reports

A daily inspection report shall be prepared by the CQA Officer or his designated representative (i.e., CQA Officer-in-Absentia) under the direct supervision of the CQA Officer for each day that materials, or placement of materials, are being inspected, sampled or tested. Form CQAP-7.2 *Daily Inspection Report* shall serve as the base document to which the test data, photographic records, test results, etc. is to be attached. Such reports shall include the inspector's signature.

Electronic Filing: Received, Clerk's Office 09/28/2020

Each report shall be signed by the CQA Officer or his designated representative (i.e., CQA Officer-in-Absentia). The original report (and attachments) shall be incorporated into the weekly summary report.

7.3 Photographs

Photographs may be incorporated into the daily inspection report or weekly summary report to provide a visual record of work progress, inspection/testing activity, construction work, or other items considered important to the report. The photographs, at a minimum, shall include the following information:

- The location, date and time of the photograph,
- A description of the item photographed including direction of view (N, S, E or W),
- Personnel, testing agencies, installers or contractors present, and
- Name and signature of photographer.

8. Acceptance Report

Within 30 days of final completion of construction, the CQA Officer shall submit the acceptance report to Ameren, for Ameren's submittal to the Illinois Environmental Protection Agency. The acceptance report shall contain the following:

- A certification by the CQA Officer that the construction has been prepared and constructed in accordance with the engineering design,
- "As-built" drawings as specified herein, and
- All weekly summary reports.

9. Construction Management Activities

9.1 Requests for Information (RFIs)

Refer to General and Supplemental Conditions of Contract and Project Manual for submittals of RFIs. The General Contractor or installer shall initiate the RFI in a timely manner using form CQAP-9.1 *Request for Information.*

Additional copies of the completed form shall be distributed as directed by the CQA Officer. All RFIs shall be filed as project records in accordance with Section 10.

9.2 Review of Contractor Submittals

The contractor shall submit shop drawings, product data and samples to the CQA Officer in accordance with the requirements of the project specifications and with such promptness as to cause no delay of the work.

The CQA Officer shall maintain copies of all submittals and a log documenting submittal descriptions, dates of receipt, dates of return, review personnel, and actions taken on the submittals. Copies of submittals and the log shall be filed as project records in accordance with Section 10.

Electronic Filing: Received, Clerk's Office 09/28/2020

9.3 Field Change Order (FCO) Process

The contractor shall be responsible for preparing requests for FCO in accordance with Ameren procedures and submitting the FCO requests on the appropriate form.

The CQA Officer shall be responsible for reviewing the FCO, and submitting the documented decision to the contractor. Agreement to the FCO shall require signature approval of the Ameren Construction Supervisor.

Copies of the FCOs and log of authorized FCOs shall be retained as project records in accordance with Section 10.

10. Document Control and Project Records

10.1 Document Control

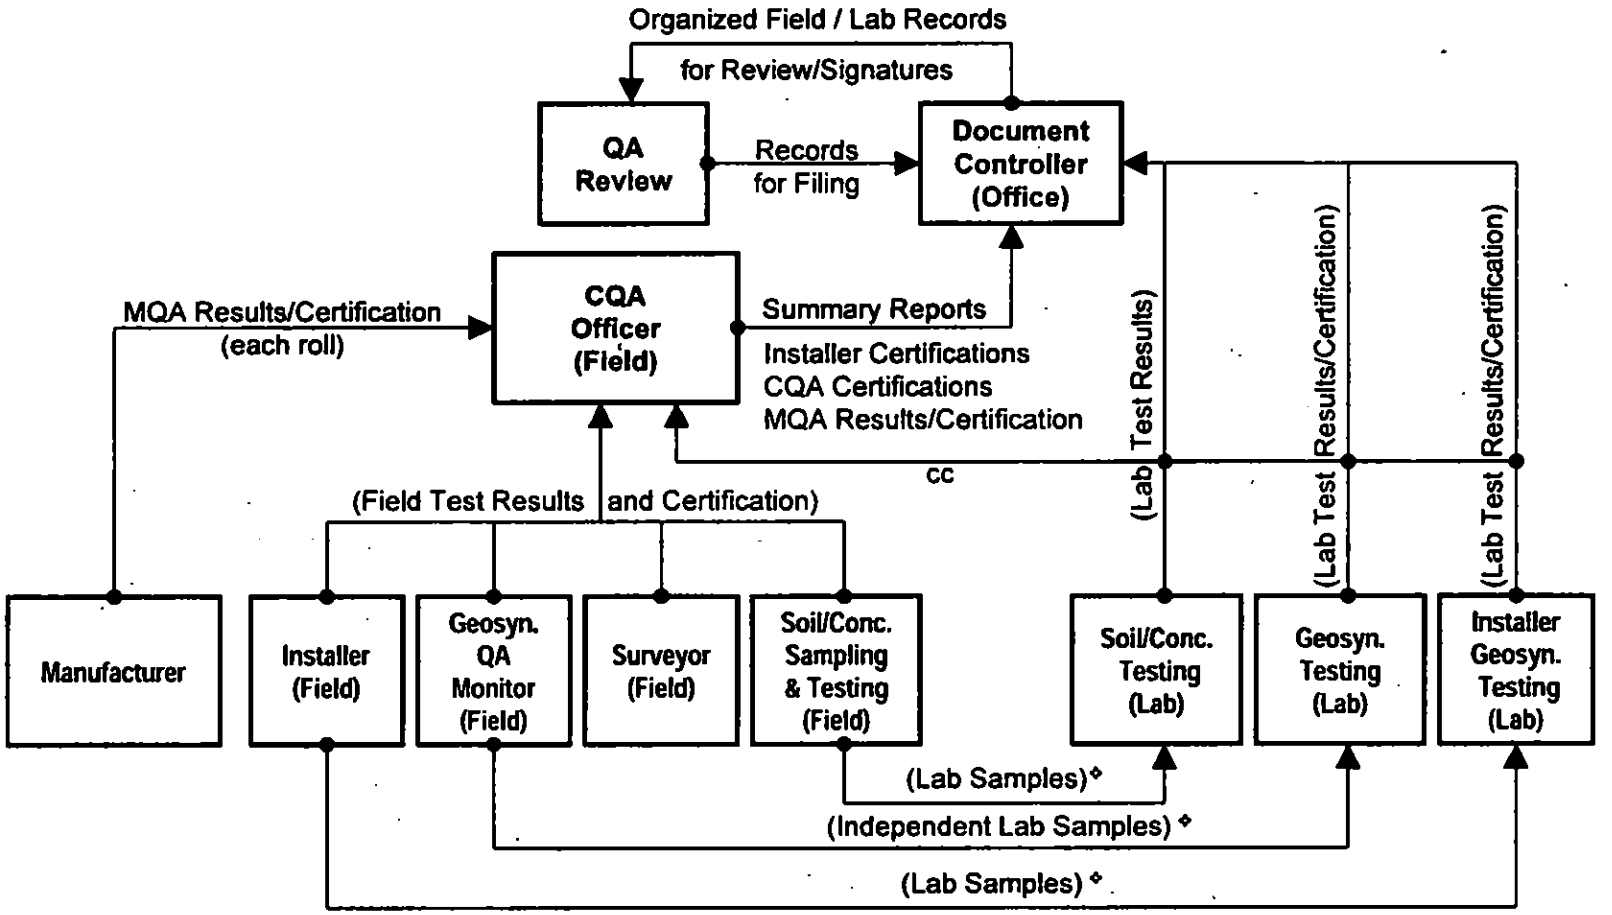
The CQA Officer shall control revisions to the CQA Plan and other project documents, so that correct documents are being employed by the project participants. The CQA Plan, including all changes thereto, shall be reviewed for adequacy and approved for release by Ameren.

The Document Controller shall issue controlled copies of the CQA Plan and maintain all records associated with its preparation, issue and revisions. Control paths for samples and documents falling under this Plan are shown in Figure 2.

10.2 Project Records

The maintenance of project records during construction activities shall be the responsibility of the Document Controller and shall be protected against damage, deterioration, and loss. Records shall be readily identifiable and retrievable.

Project records shall be made available to the Ameren Construction Supervisor as requested during construction and, when requested, shall be turned over to Ameren at completion of the construction contract. Ameren shall retain the weekly summary reports certified by the CQA Officer until the completion of the post-closure care period and must make those reports available at reasonable times for inspection and/or photocopying by Illinois Environmental Protection Agency.



Records shall include, but not be limited to, the following:

- CQA Plan (all revision levels),
- CQA Plan documentation (reviews, issuance and revisions),
- Meeting minutes,
- Weekly summary reports (form CQAP-7.1),
- Daily inspection reports (form CQAP-7.2),
- Manufacturer's QA results/certifications,
- Certificates of acceptance by geosynthetic installers,
- CQA certifications (form CQAP-2.1),

Electronic Filing: Received, Clerk's Office 09/28/2020

- Certificates of calibration for inspection, measuring and test equipment,
- "As-built" drawings,
- Laboratory test results and completed chain of custody records,
- Laboratory certifications of manufacturer's guaranteed properties for geosynthetic,
- Field Change Order Requests,
- Log of Authorized Field Change Orders,
- Shop drawing submittals,
- Log of shop drawing submittals,
- Requests for information (RFI) from contractor/installers,
- Responses to requests for information, and
- Acceptance report.

Figure 2. Control of CQA Documents and Samples

◆ *Transmittal letters shall direct the original lab test results/certifications to be sent to Document Controller with copies to the CQA Officer. All samples subject to chain-of-custody requirements.*

Electronic Filing: Received, Clerk's Office 09/28/2020

Appendix A

Material Testing and Frequency

Electronic Filing: Received, Clerk's Office 09/28/2020

Table A-1. Material Testing and Frequency

Property/Test Method	Requirement/ Specification	Frequency	Responsibility
PREQUALIFICATION TESTING 3-FT. SOIL/FINAL COVER			
Atterberg Limits - ASTM D 4318	USCS Soil Classification (Note 1)	One Test per Borrow Source	Contractor
Grain Size Analysis - ASTM D 422	USCS Soil Classification (Note 1)		
RCRA Metals (as TCLP): SW 846 1311 - Arsenic, Barium, Cadmium, Chromium, Lead, Silver, Selenium SW 846 7478 - Mercury	Below the Class I Groundwater Standards at Title 35 Illinois Administrative Code (IAC) 620.410(a)		
CCW Ions (as total concentrations): SW 846 6010B – Boron SW 846 M4500-CLE – Chloride SW 846 9036- Sulfate	Below the Class I Groundwater Standards at 35 IAC 620.410(a)		
BETX Constituents: SW 846 8260B - Benzene, Ethylbenzene, Toluene, Xylene	Below the Class I Groundwater Standards at 35 IAC 620.410(c)		
pH - SW 846 9045C	Within the Class I Groundwater Standard range at 35 IAC 620.410(d)		
Flash Point (Pensky-Martens Closed Cup) - SW 846 1010	Ignitability characteristic as defined in 35 IAC721.121		

Note 1 - Satisfactory Soils: ASTM D 2487 Soil Classification Groups CL-ML, or as approved by the CQA Officer. Satisfactory soil shall further be free of rock or gravel (larger than 0.75 inches in any dimension), debris, waste, frozen materials, vegetation, and other deleterious matter.

Electronic Filing: Received, Clerk's Office 09/28/2020

CQA CERTIFICATION
(Form CQAP-2.1)

The CQA certification as provided herein is based on a review of available inspection, testing and sampling results for the subject Work and is for the sole purpose of noting compliance of these results with established design parameters and taking no exceptions to initiation of new sequential Work. CQA certification by the Owner's Representative does not relieve the Contractor of its obligations to furnish all Work in accordance with the Contract.

1. LOCATION AND DESCRIPTION OF THE SUBJECT WORK:

2. CONTRACTOR COMPLETING THE SUBJECT WORK:

3. NEW SEQUENTIAL WORK TO BEGIN:

By CQA Officer-In-Absentia: _____ **Date:** _____
(If applicable) (Signature)

By CQA Officer: _____ **Date:** _____

SECTION 1A - SUPPLEMENTAL GENERAL CONDITIONS
FOR AMEREN MISSOURI POWER OPERATIONS

1.0 GENERAL

1.1 This section of the specification clarifies and supplements the Ameren General Conditions of Contract ("GCC") and other Contract documents. Specific duties set forth herein do not constitute an exclusive list of requirements, but complement the Ameren GCC. In the event of a conflict between this specification and the Ameren GCC, this specification shall be controlling.

1.2 Contractor shall assure that all tiers of Subcontractors comply with all requirements of Contract documents.

1.3 For any work performed for Ameren Missouri Power Operations, Contractor agrees to comply with Ameren's Supplemental Terms and Conditions, commonly referred to as Section 1A-Supplemental General Conditions for Ameren Missouri Power Operations.

2.0 DEFINITIONS

2.1 Accident/Incident An incident is defined as a near miss, vehicle accident, or property damage to Company-owned/leased equipment or facilities. Refer to OSHA 29CFR1904 for definitions of reportable incidents and injuries.

2.2 Asbestos Containing Material (ACM) Material that contains asbestos that may become airborne and must be handled according to Ameren procedures and Federal and State regulations.

2.3 Competent Person An individual, who is trained and certified in applicable standards, is capable of identifying workplace hazards relating to specific operations, performs inspections of industrial and construction jobsite equipment, and has authority to take corrective actions when needed.

2.4 Computer Based Training (CBT) Computer Based Training is used for safety and job work rules orientation of new employees before they are permitted unescorted access to Company property.

2.5 Confined Space An enclosed area that may require a permit, specialized training, and/or special equipment to enter because of atmospheric or physical entrapment hazards. See OSHA 29CFR1910.146 and Ameren Management Instruction ES-REG-209.

2.6 Hot Work Work that will generate sparks, such as; cutting, grinding, welding, and brazing. A permit may be required for hot work that is hazardous due to location or other factors.

2.7 Environmental, Safety and Health Ameren's ES&H Department sets standards for environmental, safety and health issues and monitors compliance with Ameren policies, as well as with Federal, State and Local regulations.

2.8 Extra Work is defined in Article 1 of the GCCs.

2.9 Extra Work Order (EWO) is defined in Article 1 of the GCCs.

2.10 Job Working Rules Rules of conduct for Contractors working at Ameren facilities that include various types of prohibited behavior: off-limit areas, driving and parking instructions, and safety information that may be specific for the plant, such as fire alarms and evacuation procedures.

2.11 Single Point of Contact (SPOC) is defined in Article 1 of the GCCs.

2.12 Specifications are defined in Article 1 of the GCCs.

2.13 Work is defined in Article 1 of the GCCs.

2.14 Worker's Protection Assurance (WPA) or Hold Card Procedure Ameren's equipment lock-out procedure that ensures equipment and systems are in a safe state prior to service or testing. Employees must have WPA training and adhere to WPA procedures. Contractor supervisors must have plant-specific training prior to starting jobs requiring WPA protection.

Electronic Filing: Received, Clerk's Office 09/28/2020

3.0 INTENT OF SPECIFICATIONS AND DRAWINGS

3.1 The Contract Documents shall be interpreted as being complementary, requiring a complete Project. Any requirement occurring in any one of the Contract Documents is as binding as though occurring in all Contract Documents. Generally, Specifications address quality, types of materials and Contract conditions, while Plans show placement, sizes, and fabrication details of materials. Reference Article 2.01 of the GCCs.

4.0 BENCH MARKS

4.1 Company will furnish one site bench mark with its assigned elevation. Contractor shall furnish field layouts and shall be responsible for the use of field dimensions and elevations. All such Work shall be subject to approval at the discretion of the SPOC.

5.0 DRAWINGS, DETAILS & INSTRUCTIONS PROVIDED BY CONTRACTOR

5.1 Contractor shall submit to the Company copies of shop drawings, equipment details, installation, operating, and maintenance instructions, wiring diagrams, parts lists, cable termination sign-off sheets, etc. Reference Article 3.02 of the GCCs.

5.1.1 These submittals shall cause no delay in the performance of work. The minimum turn-around time for design changes shall be incorporated on drawings and shall not delay the performance of work. As-built drawings shall be submitted in accordance with Company's schedule.

5.1.2 Contractor shall submit five (5) copies of the above information, four (4) of which Company will retain. One (1) copy will be returned.

5.1.3 In addition to the copies listed above, Contractor shall submit drawings electronically in an approved CAD format. Ameren typically uses Bentley Microstation V7 or V8 (.dgn files).

5.1.4 Company will review submittals for general design features. Contractor is responsible for dimensions, quantities, accuracy, fit, adequacy of details, and coordination with other trades. Contractor must request deviations from contract documents in writing and receive written approval from Company.

5.1.5 Contractor must request field changes in writing and receive written approval from Company. Contractor shall promptly submit as-built drawings to Company.

5.2 Professional Engineering (PE) License Seals

5.2.1 All design documentation meant for fabrication, permitting, erection, or construction such as design drawings, specifications, and calculations shall have a Professional Engineering (PE) seal applied, signed and dated by Contractor's registered professional engineer(s).

5.2.1.1 The license shall be current, valid, and in good standing for the appropriate state where the work is taking place.

5.2.2 Documents where seals are not required include review items (not to be constructed), sketches, samples, design control documents, operations manuals, vendor material design documents, engineered product drawings (not related to permitting) and other documents agreed upon in writing between Ameren and Contractor.

5.2.2.1 Contractor shall be responsible to contact the main Ameren contact up-front to clarify the requirements to seal any project specific documentation.

6.0 LABOR CONDITIONS

6.1 Contractor's Work shall be performed under the National Maintenance Agreement (NMA), unless an exception is agreed upon in writing by the Construction Project Lead or his management, Contractor must furnish a copy of the site extension approval(s) granted by the International Union(s). Site extension requests for the NMA may be filed online at www.nmapc.org.

6.2 There shall be no limit on the work output of any employee, and no restrictions on what tools or equipment may safely be used to increase productivity. There shall be no minimum, other than what may be required by safety regulations, on the number of employees assigned to any crew or to any service.

Electronic Filing: Received, Clerk's Office 09/28/2020

6.3 Featherbedding practices of any kind will not be tolerated.

6.4 Actual work hours will be agreed upon during pre-job conferences; lunch breaks will be an unpaid one-half hour. No additional organized breaks are allowed. There shall be no non-working stewards. If a steward is included in the labor force, the steward must be a qualified worker and shall exercise no supervisory functions.

6.5 Contractors must conform to Construction Users Round Table (CURT) Tripartite Initiative report, dated June 2004, with respect to absenteeism, excessive overtime and work disruptions.

6.6 Contractor employees must be rested and fit for duty when they report to the Company's site. Contractor employees must not work in excess of 16 consecutive hours without prior approval of Contractor's Superintendent and Company, and then only when additional steps have been taken to ensure worker safety.

6.7 Contractor shall provide break/lunch facilities at a location in close proximity to the majority of the Work such locations to be approved by the SPOC or other Ameren Management personnel.

6.8 There shall be no slowdowns, illegal strikes, or unauthorized work stoppages of any kind. Contractor understands that its work must be completed in a timely fashion notwithstanding the presence of a labor strike or any pickets at or around the job site.

6.9 In the event that Company's employees, another contractor's or subcontractor's employees or Contractor's employees engage in a strike or established pickets, Contractor is expected to continue to meet its obligations under the terms of the contract and/or obligations with Company. Any such picketing activity is not an excuse for non-performance or delay in completing the project

6.10 Medical Services provided by Ameren:

On specified projects, contractors are not to include costs within bids associated with the following medical services:

- Random and for-cause substance abuse (SA) testing,
- First-aid expenses that can be addressed by an onsite nurse, if an onsite nurse is provided.

7.0 CONTRACTOR MANAGEMENT REQUIREMENTS

7.1 Prior to mobilization, Contractor shall submit an organizational chart and resumes for the entire management team that will utilize, on or offsite, for the project.

7.2 Contractor should adhere to the Job Working Rules (Appendix B).

7.3 Contractor will be responsible to comply with the training and implementation requirements of the FERC Affiliate Restrictions procedure, AUE-ADM-5476.

7.4 Contractor supervisory employees who will be responsible for requesting and signing the WPA must receive site-specific training before working onsite. The SPOC will arrange for the required WPA supervisor training to be located at the Ameren POS Training Center training facility.

7.5 Contractor supervisor shall comply with the specific plant's WPA procedure which is included as Appendix A, Section 2 of this specification. WPA procedure provides details of program and outlines responsibilities for supervisors.

CAUTION: The presence of WPA process does not relieve workers of the responsibility to verify that equipment is actually de-energized or in the designated state. Instruct employees to walk down the job, check energy sources and isolation points such as: voltages, temperatures, pressures, etc. to confirm status.

7.6 Contractor Site Representative should read, understand, and sign the Contractor Agreement of Understanding Form (Appendix A, Attachment A18), prior to beginning work onsite.

7.7 Contractor supervisors shall instruct employees to observe WPA rules and comply with WPA tags at all times.

7.8 Contractor shall participate in individual Construction Progress meetings. The meetings are typically held weekly, but the SPOC may specify another frequency during the course of the Contract.

Electronic Filing: Received, Clerk's Office 09/28/2020

7.8.1 A Contractor representative with sufficient authority to make binding work and schedule commitments shall attend these meetings.

7.8.2 The individual progress meeting will typically concentrate on safety and housekeeping, schedule and work progress, job related problems, and site coordination.

7.8.3 Contractor should come to the progress meeting with an updated schedule showing actual progress and the critical path of the work. See Contractor Schedule Requirements (Appendix D) for additional schedule requirements.

7.8.4 Contractor shall take and distribute meeting minutes within 2 working days of the meeting.

7.9 A Contractor representative with sufficient authority to make binding commitments may also be required to attend a weekly Outage Coordination Meeting.

7.10 Contractor personnel, Business agents, Vendor/Sales representatives, etc., should use the entrance designated for their Contractor, park in the Construction parking lot, and be escorted onsite unless they have a Contractor badge. Construction badge holders may use Contractor entrance or Ameren employee entrance, and park in the Construction parking lot or main parking lot depending on purpose of visit.

8.0 DELIVERY AND STORAGE

8.1 Contractor shall be responsible for receiving, unloading, inspecting and hauling materials unless otherwise stated in the Contract documents.

8.2 Contractor and the project must be indicated on materials delivered to the site.

8.3 Contractor shall provide facilities to store materials and equipment on the jobsite. The SPOC will designate storage locations that will not interfere with Company's personnel or operations.

8.4 Payment for material or equipment stored onsite will not be made to Contractor until the material or equipment is installed. Contractor may apply for early payment only if early delivery and storage of the material or equipment will benefit Ameren.

8.5 A carrier that is compliant with the Depart of Transportation's (DOT) Hazardous Materials Security Plan must be used for deliveries to Ameren. For a list of approved carriers visit http://vics.keyship.net/Ameren. Fill out the required fields & check the HazMat option. A list of qualified carriers will populate.. Any vehicle carrying hazardous materials onto Company facilities will be refused entry until proof of compliance is provided.

8.6 If materials are provided by Ameren, they will be stored by Ameren until Contractor is onsite. Contractor will be responsible for loss or damage after acceptance of equipment or material provided by Company. Contractor shall inventory and haul excess material retained by Company to designated Company storage location(s) after completion of Work.

8.7 Contractor shall restore construction storage areas to a reasonable condition that satisfies the SPOC.

8.8 Material Receipt

8.8.1 Contractor must resolve all issues with contractor-procured material.

8.8.2 Contractor must identify, inspect, test and store material to purchase order requirements.

8.8.3 Contractor must ensure all receiving quality documentation is supplied to Ameren's SPOC upon receipt.

8.8.4 Contractor must have a program in place to ensure receipted critical plant material and equipment is not relocated or improperly stored without proper authorization from Ameren's SPOC.

8.8.5 Contractor will be provided a list of critical materials and equipment during Pre-Construction Meetings.

8.8.6 Contractor must handle, store, and identify Critical Material in accordance with the paragraph below:

Ameren MISSOURI

MATERIAL HANDLING, STORAGE & IDENTIFICATION INSTRUCTIONS FOR CONTRACTORS

AUE-ADM-4203, Receiving Storage & Handling of Critical Materials

All Ameren purchased critical material received by a contractor or sub-contractor has specific requirements that must be met to comply with Ameren's Quality Management Program in accordance with AUE-ADM-4203. Contractor requirements contained in AUE-ADM-4203 are provided below. Contractors will be evaluated on their quality control and material management. A list of critical materials shall be provided to the contractor during Pre-Construction Meetings.

1) Notify Responsible Engineer (RE) of Ameren material received and the PO number. Ensure receiving documentation remains with the material until clear direction is provided by RE.

NOTE: Steps 2-5 shall be directed by Responsible Engineer (RE)

2) Receiving documentation, number of containers, and intended storage location shall be taken to Storeroom personnel.

3) Storeroom shall create a Receipt Order (RO) number for traceability and provide identification labels for attachment to each container. Information will always include the RO tracking# and may include PO #, Job #, RE, PM, Storage Level, and intended location.

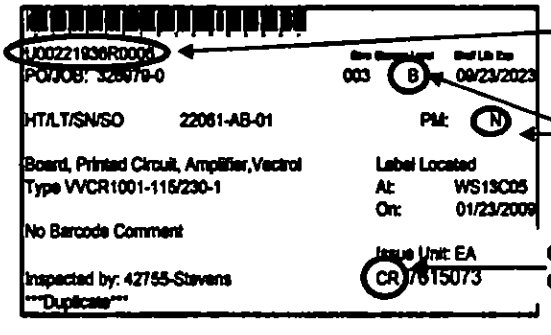
4) The RO number shall be clearly marked on all boxes, containers, equipment, and packing slip(s).

5) An Ameren Material Receipt Inspection Report (MRIR) shall be printed with the inspection requirements and shall be used to document inspection results. Contractors may perform additional inspections as directed by RE.

6) After successful acceptance, MRIR Inspector(s) shall sign the MRIR and each traceable barcode label; and shall attach labels to containers.

7) Hold tags shall be attached to any materials not accepted.

WARNING: Contact Responsible Engineer or Ameren Designee immediately if unidentified material is discovered, labels become unreadable, material needs to be relocated, or if material location or storage level differs from label.



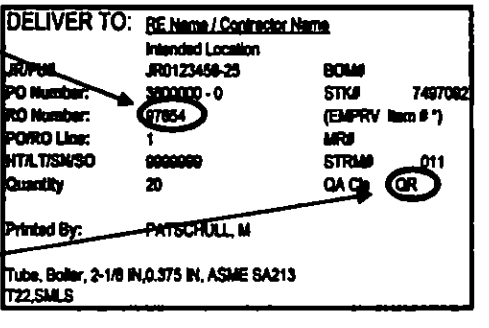
If during staging, prep work, etc., the material is repackaged or removed from labeled containers and the potential for identification or material loss exists, transfer the RO or barcode number, at a minimum, to the materials.

Storage Level B – Indoor storage. Temperatures controlled between 40°F and 140°F. This level includes the storeroom, turbine floor, or any other location inside the plant.

Storage Level C – Covered storage. Temperature control not required. These locations include secondary storerooms, covered parking areas, etc.

Storage Level D – Outside storage. Store in well drained areas in a manner allowing air circulation to minimize trapped water. Provide adequate protection from forces due to rain, wind and storms

CRITICAL MATERIAL BARCODE



RO# (left) can be shortened to U221936R6

Storage Level & PM

Critical classes: CR, CT, EM, QR

DELIVERY MATERIAL TAG

Electronic Filing: Received, Clerk's Office 09/28/2020

9.0 REMOVALS AND PREPARATORY WORK

9.1 Contractor shall cooperate with the SPOC in scheduling removal work so there is no disruption to Company's personnel or operations.

9.2 Contractor shall provide protective enclosures, covers, water stops, etc. to prevent water or other weather-related damage to facilities during construction.

9.3 Before mobilizing tools, material and equipment, Contractor will install appropriate trash cans, cigarette butt receptacles, and dumpsters in designated areas.

9.4 Materials authorized to be removed become the property of Contractor, unless otherwise specified in the Contract documents, and shall be promptly removed from the worksite. An inventory of materials being removed must be submitted to the SPOC. If materials are retained, the SPOC will designate where materials shall be stored. Retained materials shall be neatly stored and protected from the elements.

9.5 Before mobilizing tools, material and equipment, Contractor shall install protection on both sides of all walkways in work area from top rail to toe board. This protection may include, but not limited to, orange fencing, plywood and sheet metal. However, openings in fencing shall be no larger than one inch square. Contractor shall install decking on open floor work areas, seal decking along edges and install toe boards, and install debris nets to further contain fallings objects. All wood subject to ignition sources shall have fire retardant cloth or tarps installed over the wood. Cloth shall be secured to avoid tripping hazards. All safety barriers shall be removed after the completion of the project.

9.6 For additional safety guidelines to be performed prior to working on elevated platforms, walkways and scaffolds above 6 feet, refer to Safety Requirements for Working on Elevated Platforms (Appendix Y).

10.0 CUTTING & PATCHING AND TEMPORARY BUILDINGS, ETC.

10.1 Contractor shall do all cutting, fitting, or patching that may be necessary to make the several parts come together properly and fit to receive the Work of other Contractors and Subcontractors.

10.2 All temporary buildings/structures such as tool rooms, break rooms, lunch rooms, etc., shall be constructed with non-combustible materials.

11.0 TEMPORARY HEAT

11.1 Contractor shall provide temporary heat to protect Work materials against damage from dampness and cold to the satisfaction of the SPOC.

12.0 QUALITY REQUIREMENTS

12.1 The Quality Management System Manual, AUE-MAN-QMS-1001, provides the basis for the Ameren Missouri Power Operations Quality Management System (QMS) and provides the assurance that processes are in place to achieve our business objectives. The QMS performance standards and performance criteria provide requirements to achieve a controlled and systematic approach to quality management activities and promote continuous improvement. Contractors and Sub Contractors can obtain a copy of the QMS from the Ameren Missouri Project Manager.

12.2 The Contractor's quality management program and supportive procedures are subject to Ameren review and audit. Should a gap exist between the QMS, and the Contractor's quality management program and supportive procedures, the Contractor will be required to comply with the QMS.

12.3 Contractors and Sub Contractors agree to comply with the applicable QMS requirements for the work scope included in this Ameren Missouri contract. The Contractor shall provide a copy of the Contractor's quality management program and supportive procedures with the bid submittal, if the Contractor is not on the Ameren Missouri 'Generation Approved Supplier List – Critical (GASLC)'.

12.4 The QMS Application Aid (QMS-AA) per Appendix Q contains the applicable QMS requirements in this Ameren Missouri contract. The Contractor shall complete and return the QMS-AA with the bid submittal, if the Contractor is not on the Ameren Missouri GASLC.

12.5 The Contractor shall upon award develop and provide to Ameren a 'Project-specific Quality Management Plan' which is compliant with the QMS-AA.

12.6 The Contractor's awarded work scope, including that of its Sub Contractors, shall be performed to the requirements of the QMS-AA.

12.7 Ameren will be allowed to make quality inspections at Contractor's and Sub Contractor's facilities at no cost to Ameren. Ameren will be allowed to view applicable Contractor's and Sub Contractor's quality procedures and procedure generated records and documents.

12.8 Design Documents and Calculations:

12.8.1 Contractors and Sub Contractors shall meet the technical requirements included in Section 1D of this specification and the QMS-AA.

13.0 OWNER APPROVAL OF PROCEDURE

13.1 Ameren must consent to deviations from the procedures, methods and materials agreed to in the Contract. Reference Articles 2.01 and 4.01 of the GCCs.

13.2 Ameren reserves the right of approval over all procedures, methods, and materials to be employed by Contractor or its Subcontractors for this Work. Reference Articles 2.01 and 4.01 of the GCCs.

14.0 CONFIDENTIALITY

14.1 Contractor shall hold Ameren's Confidential Information confidential and shall not use or disclose to others during or subsequent to the performance of the Work (except as is necessary to perform the Work). Reference Article 9.02 of the GCCs.

14.2 Publication or advertising of information directly derived from Project or Work or data obtained in connection with services rendered under the Contract must first be approved in writing by Ameren (Ameren personnel need approval from Ameren Corporate Communications). Contractor shall not release any information for publication or advertising purposes relative to the material, equipment and/or services furnished under the Contract Documents without the prior written consent of Ameren. Ameren reserves the right to release all advertising or publicity concerning the Project or Work. Except as to signs required by building department regulations or any other governmental requirements, Contractor shall not display or permit any signs or advertisements to be displayed about the Project site nor publicize in any manner its performance of the Work without the express written permission of Ameren. Reference Article 9.02 of the GCC.

14.3 Contractor shall restrict the knowledge of all confidential information regarding the Work to as few as possible of its employees who are directly connected with performance of the Work and have a definite need for such knowledge. Upon request by Ameren's Representative, Contractor shall cause such persons or groups of persons involved in the Work on Contractor's behalf as Ameren may designate to sign individual secrecy agreements in a form satisfactory to Ameren. Reference Article 9.02 of the GCCs.

15.0 ACCOUNTING / INVOICING REQUIREMENTS / ACIP

15.1 Contractor shall furnish complete accounting information and cooperate with Ameren's accounting practices.

15.2 For Time and Material contracts prior to commencing work, Contractor shall furnish Company with a written estimate for Company approval. Once approved, Contractor shall promptly notify Company of any facts and circumstances that may adversely impact the estimate. Further, Contractor shall not exceed ninety percent (90%) of the time and materials estimate without Company approval. All overtime for Time and Material contracts shall be approved by Company in advance of working. Reference Articles 6 and 8 of the GCCs.

15.3 Company reserves the right not to honor charges associated with timesheets that are not provided daily.

15.4 Material Invoices must be submitted as Work progresses. Total cost updates will be provided on a weekly basis.

15.5 If Work indicated or specified in Contract Documents is increased, Company may have Contractor perform Extra Work.

15.5.1 Contractor must obtain written approval from the SPOC prior to performing any Extra Work. Each Extra Work Order (EWO) shall be invoiced separately and shall reference the EWO number and Purchase Order (PO) number.

Electronic Filing: Received, Clerk's Office 09/28/2020

15.5.2 If work is performed on a time and material basis, then work shall be charged at the rates indicated on the Labor Rate Sheets in the Contract.

15.5.3 Ameren will pay Contractor the cost of extra work as follows:

NOTE:	Subcontractor labor and material charges shall be subject to the provisions of Items 15.5.3.1, 15.5.3.2 and 15.5.3.3 below.

15.5.3.1 Labor:

- Direct cost of payroll labor, including first line foreman, excluding job Superintendent and General Foreman
- Fringe benefits including welfare and pension
- Insurance
- Taxes including FICA, Federal, State and Local tax
- Overhead, including costs for home office, field office, consumables, and small tools with an original value under $1,200, as agreed by Company and Contractor at the award of Contract
- Profit, as agreed by Company and Contractor at the award of Contract

15.5.3.2 Material and third party rental equipment:

- Direct cost of material or rental equipment

Subcontractors:

- Direct cost of Subcontractor

Contractor-Owned Rental Equipment (excluding third party rental equipment):

- Contractor shall submit for approval an equipment rental rate schedule including all equipment, tools, and supplies required to perform the Work specified. These equipment rental rates will be used for extra work.

15.5.3.3 Ameren Coordinated Insurance Program (ACIP)

- If the project is part of the Ameren Coordinated Insurance Program (ACIP) all contractors of all tiers will be required to provide completed enrollment and monthly reporting forms for duration of their work on project. All prime contractors will be responsible for their subcontractors of all tiers with respect to compliance of enrollment and reporting requirements.
- If the project is part of the ACIP, contractors of all tiers must be enrolled and have a copy of ACIP certificate of insurance prior to mobilization onsite. Ameren will not allow non-enrolled contractors to access site prior to enrollment in ACIP.

END OF SECTION 1A

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 1B – SUMMARY OF WORK

1.0 INTRODUCTION

1.1 Definitions

1.1.1 The term "Company" means the entity identified in the Company's Purchase Order, its agents, employees, representatives, successors, and assigns. The terms "Purchaser," "Owner," and "Buyer," if used in the Contract Documents, are considered synonymous and refer to the Company.

1.1.2 The term "Engineer" means the Engineer duly appointed to represent the Company as specified from time to time by the Company who may be employed by the Company or who may be employed by others.

1.1.3 The term "Contractor" means the entity identified in the Company's Purchase Order, and its agents, employees and authorized representatives undertaking the performance of the Work as defined in this Specification. The terms "vendor," "supplier," "manufacturer," or "fabricator" if used in the Contract Documents, are considered synonymous and refer to Contractor.

1.1.4 The term "Sub Contractor" means any individual, partnership, firm, corporation or business entity, other than an employee of Contractor, who contracts or agrees with Contractor (or another Sub Contractor or any tier thereof) to furnish any services, labor, materials or equipment for, or in connection with, the performance of the Work.

1.1.5 The term "Construction Project Lead" means the Company's representative as specified from time to time and located at job site.

1.2 Location

1.2.1 Hutsonville Power Station,15142 East 1900 Avenue, Crawford County, IL 62433

1.3 Contacts

1.3.1 All commercial matters should be directed to the Ameren purchasing agent designated on the Request for Proposal or listed on the purchase order.

1.3.2 All technical and quality questions regarding this specification shall be directed to:

MICHAEL J. WAGSTAFF, P.E., PMP
Consulting Engineer
Dam Safety & Hydro Engineering
Ameren Missouri
3700 S. Lindbergh Blvd.
St. Louis, MO 63127

1.4 Background

1.4.1 All ash ponds at Hutsonville Power Station are out-of-service. Ash Pond D, the largest and oldest of the four ash ponds was covered and closed in 2012 under the 35 IAC Part 840 rules. The remaining ponds, including Ash Pond A, Ash Pond B, Ash Pond C, and the Bottom Ash Sluice Pond, will be closed under this Project.

1.4.2 Description of Ash Pond D Closure

1.4.2.1 Ash Pond D was an unlined pond constructed in 1967 – 1968 and was covered with a 22 acre cap and closed in 2012 under the Title 35, IAC Part 840 rules (Illinois PCB, 2011). Closure activities included placement of a 40-mil thick textured high density polyethylene (HDPE) geomembrane with three foot protective soil cover with a vegetated surface. Surface water management features incorporated into the final cover design included intermediate berms and ditches to direct runoff to rip-rap-lined chutes running off the ash pond to surrounding areas.

1.4.3 Groundwater Collection Trench

1.4.3.1 A groundwater collection trench (trench) was installed south of Ash Ponds A, B, and D along the south property line. Operation of the trench has not yet started. The trench is designed to collect groundwater at four separate sumps. Groundwater collected by the trench will be pumped from the four sumps to a central catch basin located on the east

Electronic Filing: Received, Clerk's Office 09/28/2020

side of Pond D, from which it will then discharge to the Wabash River in accordance with the Station's NPDES permit.

1.4.4 Ash Pond A

1.4.4.1 Ash Pond A was operational from 1986 until the plant ceased operations in December 2011. Fly ash from the operating units was collected by an electrostatic precipitator and sluiced to Ash Pond A. The pond was constructed with an 80 mil HDPE liner. Ash sluiced to the pond where solids were permitted to settle out and supernatant liquids were decanted. The pond contains fly ash within an area of approximately 12 acres, with an average ash depth of approximately 20 feet. It is estimated that Ash Pond A currently contains approximately 81,000 cubic yards of ash. The ash pond is contained by a 2,400 ft. long perimeter embankment approximately 15 feet high.

1.4.5 Ash Pond B

1.4.5.1 Ash Pond B, an HDPE-lined pond, was placed in service in 2000 for disposal of sluiced fly ash and bottom ash. This pond receives wastewater and/or storm water for periodic discharge and is permitted under the site's NPDES and Subpart B permits. The ash pond has a surface area of approximately 4.4 acres, with a maximum embankment height of 17 feet. It is estimated that Ash Pond B currently contains approximately 12,400 cubic yards of ash. Ash Pond B functioned as a secondary settling pond (polishing pond), receiving flow via a triplex pump station in Ash Pond C and flow from Ash Pond A before discharging to the Wabash River via NPDES-permitted outfall #002 (IL0000175).

1.4.6 Ash Pond C

1.4.6.1 Ash Pond C is an HDPE-lined pond placed in service in 2000 for disposal of sluice water from the Bottom Ash Pond. This pond receives stormwater and is permitted under the site's NPDES and Subpart B permits. Stormwater from the Bottom Ash Pond and Ash Pond C is discharged to Ash Pond B via a pump station. Ash Pond C is incised and has a surface area of approximately 2 acres. It is estimated that Ash Pond C currently contains approximately 10,000 cubic yards of ash.

1.4.7 Bottom Ash Pond

1.4.7.1 The Bottom Ash Sluice Pond was put into service in 1969 for disposal and reuse of bottom ash. This pond has a surface area of approximately 1.2 acres, with a maximum embankment height of 15 feet. It is estimated that the Bottom Ash Sluice Pond contains approximately 23,000 cubic yards of bottom ash. This pond receives stormwater for periodic discharge and is permitted under the site's NPDES and Subpart B permits.

1.4.8 Coal Yard Area

1.4.8.1 The coal storage yard encompasses an area of approximately 7.9 acres and contains an average depth of 12 inches of spoils. It is estimated that approximately 12,700 cubic yards of material will be removed.

2.0 SUMMARY OF WORK

2.1 Project Objectives

2.1.1 The intent of this specification is to obtain the services of a General Contractor to "clean close" Ash Ponds B, C and the Bottom Ash Pond and "close" Ash Pond A with a Geosynthetic Cover System at the Medina Valley Cogen, LLC (the Owner) Hutsonville Power Station located in Crawford County, Illinois.

2.1.2 The proposed Closure Plan for the remaining ash ponds was developed to generally conform with the Ash Pond D site-specific rule 35 IAC 840, and where judged appropriate, elements of the proposed 35 IAC 841 rules, currently under development. The following supporting documents were submitted for review to the IEPA on October 24, 2014:

- 2.1.2.1 Closure Plan
- 2.1.2.2 Hydrogeologic Site Investigation
- 2.1.2.3 Groundwater Monitoring Plan
- 2.1.2.4 Groundwater Management Zone Application
- 2.1.2.5 Construction Quality Assurance Plan
- 2.1.2.6 Construction Plans
- 2.1.2.7 Construction Specifications
- 2.1.2.8 Post-Closure Care Plan

2.1.3 Copies of the above documents are available electronically upon request.

2.2 General Requirements and Design Basis

Electronic Filing: Received, Clerk's Office 09/28/2020

(Technical Requirements are provided in General Technical Requirements (Section 1D) of this specification.)

2.2.1 Contractor shall be responsible for furnishing all material (except those items of material specifically stated to be furnished by the Company), tools, equipment, labor, supervision and any other incidental items or services required to perform all of the work described herein.

2.2.2 Contractor shall be responsible for any and all engineering, drafting, field sketches, and field layout required for temporary supports, rigging, removals, and installation of all material.

2.2.3 Contractor shall be responsible for receiving, storage and security of all materials supplied by Contractor and material provided by Company. Contractor will be required to unload material in laydown areas as designated by the Construction Project Lead. Contractor will also be required to obtain items, where specified, from the storeroom. Contractor is responsible for developing an inventory list of material received. Contractor shall provide adequate protection for equipment/material stored outside from forces due to rain, wind and storms. As an example, material such as precipitator collector plates – which would be subject to damage during a high wind event – would require Contractor to perform analysis of potential wind loading and create a detailed storage plan. For this example, Ameren shall review and approve of specific storage plan.

2.2.4 Contractor shall be responsible for moving material supplied by the Company from the Company's storeroom or the adjacent area to the jobsite, and returning unused material back to the storeroom along with an inventory list. Attach Form 4983 "Return Material Tag" to all returned material. Form 4983 will be provided by the Company.

2.2.5 Contractor will be responsible for proper disposal of all material.

2.2.6 Explosives may only be used with written permission from the Company.

2.2.7 Contractor Design shall use the Design for Safety Guide (Appendix C).

2.2.8 Ameren **will not** provide a nurse and first aid trailer for Ameren and contractor personnel during the eight-hour day shift.

2.3 Description of Work

2.3.1 Develop, construct, and maintain a Storm Water Pollution Prevention Program (SWPPP) for the duration of the project.

2.3.2 Dewatering of Ash Ponds A, B, C and the Bottom Ash Pond, as necessary to complete Clean Closure of Ash Ponds B, C and the Bottom Ash Pond and Closure of Ash Pond A. Dewatering of the ponds shall be conducted in a manner to meet effluent guidelines prescribed in the current NPDES permit. See Specifications and the plans for dewatering details. Clean closure of the ponds will be determined and documented by the Owner's Construction Quality Assurance Officer.

2.3.3 Excavation of CCB sediment from Ash Ponds B, C and the Bottom Ash Pond and transportation to Ash Pond A for placement and closure. The sediment may include fly ash, bottom ash, slag, desulfurization by-products, bedding and earthen material, coal, and minor amounts of riprap.

2.3.4 HDPE liner and vegetative cover construction at Ash Pond A.

2.3.5 HDPE liner and vegetative cover construction along the northern end of existing Ash Pond D closure cap after clean closure of the Bottom Ash Pond.

2.3.6 Removal and off-site disposal of the ash pond outlet structures in Ash Ponds A, B, and Bottom Ash Pond.

2.3.7 Disconnecting from power source and removal of pump equipment from the Ash Pond C pump station. Abandon the wetwell structure in place.

2.3.8 Culvert installation, drainage channel excavation, and grading to prevent permanent storm water ponding in the footprint of Ash Ponds A, B, C, Bottom Ash Pond, and Coal Yard area. Seeding and mulching of all areas disturbed by construction activities. When installing the culvert across the plant

Electronic Filing: Received, Clerk's Office 09/28/2020

access road (north of Ash Pond A), at least one lane of roadway access to the site must be maintained at all times. (See Paragraph 2.4 for Concurrent Work at the plant site.)

2.3.9 Construction Quality Assurance (CQA) Procedures have been developed for this project as detailed in the CQA Plan. (See CQA Plan) The testing requirements and frequency of testing in this plan will govern in instances which there may be discrepancies between the CQA Procedures and these specifications.

2.3.10 Except as specified below, CQA testing, sampling, and inspections to verify compliance with the plans and specifications are the responsibility of the Owner. The CQA testing, sampling, and inspection requirements are summarized in the CQA Plan. The General Contractor shall coordinate and cooperate with the Owner's consultant to accommodate such activities at no additional cost to the Owner.

2.3.11 The General Contractor is responsible for any testing, sampling, and inspections described in the technical specifications. The General Contractor may perform additional testing to supplement that required by the Plans and Specification and CQA Procedures to ensure the materials and workmanship comply with the contract documents.

2.3.12 Construction surveying for excavation and grading control shall be the responsibility of the General Contractor. Excavation and final grades may be surveyed by the Owner's surveyor to verify the quantity of materials handled. The General Contractor shall coordinate and cooperate with the Owner's consultant to accommodate Owner's surveyor activities at no additional cost to the Owner.

2.3.13 Sources of borrow material have not been determined by the Owner. The General Contractor shall locate and acquire borrow site(s) with a minimum volume of material as shown on the Drawings. Materials in the borrow sites shall be approved by the Owner's Geotechnical Engineer prior to delivery to the site.

2.3.14 The General Contractor shall be responsible for inspecting the site to note any and all conditions that may affect the work under the contract. The General Contractor shall satisfy himself as to the nature, extent and location of the work; the configuration of the ground; the equipment and facilities needed for construction; the general and local conditions of the area; and all other factors and conditions which can, in any way, affect the work under the contract. Any failure by the General Contractor to do so will not relieve him from responsibility for successfully performing the work without additional expense to the Owner.

2.3.15 Existing roads and traffic-ways used by the General Contractor must be maintained by the General Contractor. All roads and traffic-ways utilized during the course of this project must be returned to pre-existing grade and integrity by the General Contractor at the close of the project. In the case of shared road use by Owner's vehicles and those of the General Contractor, Owner's vehicles shall have the right of way.

2.3.16 Please note that monitoring wells and other environmental devices owned and operated by the Owner are located at or adjacent to the project location. Care must be exercised by the General Contractor to ensure damage does not occur to these items. Any damage caused shall be repaired at the sole expense of the General Contractor.

2.3.17 The General Contractor may be required to work in close harmony with other Contractors or Owner personnel who may be employed at this site. In the event of differences of opinion regarding scheduling of work, the decision of the Owner will be final and binding.

2.3.18 In general, work includes, but is not limited to:

- Erosion Control
- Clearing and Grubbing
- Removal of Fencing
- Removal of Pond Structures
- Dewatering/Surface Water Management
- Excavation, Compaction, and Grading of Ash
- Transfer of On-Site Material to Pond A
- Dust Control
- HDPE Liner

Electronic Filing: Received, Clerk's Office 09/28/2020

- Placement, Compaction, and Grading of Cover Soil
- Contractor Procurement of Borrow Material
- Culvert Pipe
- Cap Vents
- Earthen/Riprap Ditches and Swales
- Chain Link Fencing
- Aggregate Roadway
- Seeding and Mulching

2.4 Concurrent Work

2.4.1 The Owner will execute a separate contract for Construction Quality Assurance (CQA) for this Project. See the CQA Plan for the CQA contractor's roles and responsibilities.

2.4.2 The Owner will execute a separate construction contract to abandon and/or install several monitoring wells located adjacent to the ash ponds during the construction of this Project.

2.4.3 A separate construction contract to remove plant structures will run concurrently with this project. Coordination between contractors is anticipated. Access to the plant structures must be maintained at all times during construction of this project.

2.4.4 An existing electrical substation is located north of the coal yard area. This substation will remain active during the construction of this project. Access to the substation must be maintained at all times during construction.

3.0 PROPOSED CONSTRUCTION SCHEDULE

3.1 Bid Documents available for distribution: **November 10, 2014**

3.2 Mandatory Pre-Bid Meeting at Hutsonville Power Station: **November 20, 2014**

3.3 Contractor shall submit a Lump Sum Firm Fixed Price Bid Proposal: **December 17, 2014.**

3.4 Issue Purchase Order to Contractor: **January 23, 2015**

3.5 Pre-Construction Meeting: **February 18, 2015**

3.6 Contractor Mobilization: **March 2, 2015**

3.7 Receipt of Approval from the Illinois Environmental Protection Agency (IEPA) and other agencies: NO WORK CAN BE STARTED UNTIL CONSTRUCTION IS AUTHORIZED. Plans and specifications were submitted to the agency on October 24, 2014.

3.8 Substantial Completion of Construction: **November 2, 2015**

4.0 COMPANY AND MANUFACTURER'S DRAWINGS

4.1 The following drawings are intended to indicate the scope of the work to be done and details necessary for the items of work set forth in this specification, and are part of this specification. These drawings in general are to scale, but figures shall always be followed and drawings are not to be scaled. Contractor shall make any requests for additional drawings in writing to the Construction Supervisor. Drawings were prepared by Hanson Professional Services, Inc. dated October 1, 2014.

4.1.1	S-XXX	000	Title and Index
4.1.2	S-XXX	001	Existing Conditions Map
4.1.3	S-XXX	002	Overall Site/Location Plan
4.1.4	S-XXX	003	Site Demolition & Dewatering Plan
4.1.5	S-XXX	004	Clean Closure - Ash Moving Plan
4.1.6	S-XXX	005	Ash Pond A Base Grading Plan
4.1.7	S-XXX	006	Ash Pond A Perimeter Profile and Details

4.1.16	S-XXX	015	Temporary Erosion Control Details

Electronic Filing: Received, Clerk's Office 09/28/2020

5.0 WORK, MATERIALS AND EQUIPMENT SUPPLIED BY COMPANY

5.1 None.

6.0 WORK, MATERIALS AND EQUIPMENT FURNISHED BY CONTRACTOR

All supervision, components, labor, materials, equipment, tools, and any incidental items described herein (except those specifically stated above) necessary to completely install each portion or component of the work shall be furnished by Contractor.

7.0 UTILITIES AND FACILITIES

7.1 Contractor shall supply sanitary facilities, drinking water and shower facilities (if needed) equipped with water heaters.

7.2 The Company will provide telephone, fax, and computer connections for Contractor supplied trailers. Electrical hook-up at power pole will be provided. Contractor must provide: account/meter from local utility and conduit/wiring from disconnect at pole to trailer.

7.3 Temporary lighting, wiring, plumbing, globes, guard lights, barricades or any other items required for protection, facility of work, local regulation, or by law for public protection shall be provided by Contractor.

7.4 Lay down areas for equipment and material will be designated as close to work site as possible. Areas for tool, office, and change house trailers will be designated as close to work site as possible. Contractor's lay down area will be as determined by the Construction Project Lead. See Plans for general location of lay down, staging, and trailer areas.

7.5 Non-potable (construction) water will not be provided by Ameren for Contractor for the purposes of dust control.

8.0 RECORDING OF HISTORICAL DATA

8.1 Contractor shall make provisions to record the man-hours expended by each craft on each activity during the course of the work.

8.2 Within three (3) weeks after completing the work, a report shall be submitted by Contractor summarizing the activities completed together with the man-days expended on each activity each week during the project all segregated according to craft.

9.0 CONTRACTOR'S FIELD SAFETY PROGRAM

9.1 Contractor shall comply with the Safety and Housekeeping procedures stated in Safety and Contractor Requirements (Appendix A) Attachment A18 and Attachment A19.

9.2 The Company has computerized the WPA request process. All organizations working on plant site shall be required to use the WPA computers to request WPA tags to be hung. The Company will provide training to one or two individuals per organization.

10.0 PARTICIPATION IN COORDINATION ACTIVITIES

10.1 Contractor shall provide a representative for and participate in coordination and information exchange activities with representatives of the Company and other contractors involved with the plant improvements, including the following activities:

10.1.1 Exchange of information necessary for the work specified herein to interface with other Contractors.

10.1.2 Participation in multi-contact coordination, construction, installation, and startup meetings. One construction meeting per week is anticipated during the majority of the Project

10.1.3 Participation in safety walk-down meetings. The Construction Project Lead will inform Contractor of meeting dates and times as necessary.

Electronic Filing: Received, Clerk's Office 09/28/2020

11.0 GENERAL INFORMATION

11.1 Contractor shall develop and be responsible for all details, which may be required to complete the work, but which are not included in this document. The Company retains the right of approval of all such details.

11.2 Upon completion, all work defined in this document shall be of a uniformly neat and workmanlike appearance. All costs of repair to meet this condition shall be to Contractor's account.

11.3 Contractor shall follow the manufacturer's or fabricator's guidelines and requirements for installation of all materials and equipment, except as modified by this Specification.

11.4 Contractor shall not have any materials, tools, equipment, etc., fall from elevated work areas. Contractor shall be responsible for designing his own means to prevent objects from falling.

11.5 Contractor shall be aware that there will be other contractors onsite during the Work as described in this Specification as well as Company GCMS and Ameren employees. Contractor shall coordinate his work to minimize interferences with the work of other contractors and/or crafts.

11.6 Only Contractor's vehicles permanently marked with Contractor's name and displaying an Ameren Contractor Mirror Tag, shall be permitted on job site. Mirror tags are available from the Construction Project Lead only after verification of auto insurance and other criteria has been met. No personal vehicles be permitted on job site.

11.7 Upon admittance into the Plant, Contractor (including each and every employee or sub-contractor's employees) shall be subjected to a computer based training (CBT) program that describes the Plant Construction Job Work Rules. These work rules are similar to those listed in Supplemental General Conditions Section 1A, Item 2.4. The training lasts approximately ¾ hour for the average worker. Employees cannot begin work until the training is completed.

11.8 Job Working Rules

Contractor must enforce the Ameren Job Working Rules (Appendix B) as well as the Contractor's own work rules. If the rules conflict, then the more restrictive rule applies.

12.0 EXTRA WORK ORDERS

12.1 Extra work will be authorized by an approved Extra Work Order (EWO). Contractor shall not start any additional work without written approval from the Company.

12.2 Extra work may be authorized on a lump sum firm price, time and materials (T&M), or a T&M-not-to-exceed basis. The Company will select the terms of the EWO.

12.2.1 Pricing for lump sum firm price and T&M-not-to-exceed work shall be based on the Engineering Inspection Report supplied by the Construction Project Lead.

12.2.2 The Company may accept or reject Contractor's proposal for any EWO. If an EWO proposal is rejected the Company may try to negotiate the price, reduce or cancel the work scope, or obtaining pricing from another contractor.

12.2.3 If Contractor's submitted EWO proposal is acceptable to the Company an approved EWO will be issued authorizing the work.

12.3 Invoices for all approved Extra Work Orders shall reference the purchase order number of the original contract, the EWO Number, and have a copy of the approved EWO attached.

END OF SECTION 1B

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 1C – INFORMATION REQUIRED FROM BIDDERS

1.0 INFORMATION REQUIRED WITH BID PROPOSAL

1.1 Pricing

1.1.1 Having examined all Bid Documents, including the Contract Drawings and Specifications, visited the Site and examined all conditions affecting work, the undersigned proposes to furnish all labor, materials, equipment and appliances required by said Base Scope of Work summarized in Section 1B-2.3 and as further described in the Specifications and/or depicted on the Drawings for the Stipulated Sum of:

BASE LUMP SUM BID: _____

_____ DOLLARS ($_____)

1.1.2 UNIT PRICE used in BASE LUMP SUM BID (1.1.1) to obtain, haul, place, and compact general fill material (from off-site borrow area) as shown on the Plans and Specifications:

$_____ per cubic yard.

1.1.3 UNIT PRICE used in BASE LUMP SUM BID (1.1.1) to obtain, haul, place, and compact topsoil material (from off-site borrow area) as shown on the Plans and Specifications:

$_____ per cubic yard.

1.2 Offsite Borrow Sources

1.2.1 Identify all off-site borrow sources for the suitable fill material and the top soil fill. Furnish available data to demonstrate that the site(s) are likely to have sufficient quantities of suitable materials. By identifying off-site borrow sources, the Bidder is representing that the Bidder will be able to obtain in a timely manner and at no additional cost to the Company all necessary permissions and permits from all governmental agencies having jurisdiction to utilize the borrow site(s).

1.3 Project Execution Plan

1.3.1 Contractor shall submit with bid proposal a preliminary work plan describing how each individual project will be executed. Included in the work plan shall be items/details such as:

1.3.1.1 Planned access and haul route(s)

1.3.1.2 Dewatering Plan

1.3.1.3 Plan for excavation of ash from Ash Ponds B, C, and Bottom Ash Pond. Include method of ash recovery in Pond B to minimize the release of solids thru the NPDES Outfall #002.

1.3.1.4 Plan for grading and compaction of ash in Ash Pond D. The plan shall include stormwater management, erosion control, safety considerations, equipment, and subcontractors.

1.3.1.5 Method to control fugitive dust at storage site, truck route, and pond work area throughout the duration of project including the prevention of material being tracked or spilled on roadways by trucks.

1.3.1.6 A Stormwater Pollution Prevention Plan per Section 01356

1.3.1.7 Organization chart with resumes

1.3.1.8 List of subcontractors

1.3.1.9 Preliminary Project Schedule in accordance with Appendix D

Electronic Filing: Received, Clerk's Office 09/28/2020

1.3 Exceptions

1.3.1 Any contract award resulting from this Specification will incorporate all provisions specified herein. It is understood that Contractor agrees to all provisions of Specification unless exceptions are specifically listed in bid proposal.

1.4 Environmental, Safety and Health

1.4.1 Contractor shall submit with bid proposal a completed Contractor Environmental, Safety & Health Data Form (Appendix A, Attachment A9).

1.5 Other Information Required with Bids

1.5.1 Contractor shall submit the following with bid:
- Insurance certification statement
- Field Construction Safety Program
- Supplier Diversity Business Plan
- Statement of Qualifications

1.5.2 Copies of the Contractor's quality management program and supportive procedures.

1.6 Diverse Supplier Business Plan

1.6.1 In order to support Ameren's policy on Supplier Diversity, Attachment A22 shall be filled out and submitted with bid. 2nd Tier Supplier shall be defined as work as set forth in bid proposal not being self-performed. Ameren does not certify Diverse Suppliers and relies upon third party certifying organization. Ameren recognizes certification from the National Minority Council (NMSDC) and its affiliate councils, the Women's Business Enterprise National Council (WBENC) and its affiliate councils, and Federal, State and Local government certifying agencies.

Note: editable versions of Attachment A22 with instructions and reporting guidelines will be sent out as part of bid package. Questions on filling out form will be directed towards Ameren Supplier Diversity professionals at (888) 256-1150 or at http://www.ameren.com/BusinessPartners/SupplierDiversity/Pages/SupplierDiversityHome.as.

2.0 INFORMATION REQUIRED AFTER CONTRACT AWARD

2.1 Schedule

2.1.1 Proposed Construction Schedule dates are listed in Section 1B-3.0.

2.2 Revised Project Execution Plan

2.2.1 Contractor shall submit after award of contract a detailed work plan describing how project will be executed. Ameren requires 5 days for review. Included in the work plan shall be items/details such as:

2.2.1.1 Planned access

2.2.1.2 Lifting and rigging, including Critical Lift Plan (Appendix A, Item 4.13.2).

2.2.1.3 Location of tool room, break room, etc.

2.2.1.4 Quality control plan

2.2.1.5 Organization chart with resumes

2.2.1.6 List of subcontractors

2.2.1.7 Site-specific safety plan. At a minimum, Attachment A21 – Site-Specific Safety Plan (SSSP), shall be filled out in its entirety. The SSSP shall be submitted to Ameren for

Electronic Filing: Received, Clerk's Office 09/28/2020

review, comment and approval. Editable version of Attachment A21 is to be supplied after issuance of PO.

2.2.1.8 Site-specific demolition plan (may be incorporated into the Safety Plan)

2.3 Contractor Project Management

2.3.1 Contractor shall provide an organizational chart depicting names and roles of individuals involved with project from Project Manager to Foreman level.

2.3.2 Contractor shall provide necessary resources to provide scheduling information and updates as defined in Contractor Schedule Requirements (Appendix D).

2.3.3 Contractor shall provide a full time Project Manager onsite unless an exemption is provided in writing by the Managing Supervisor of Construction.

2.4 After contract award the Contractor may be responsible for utilizing the Ameren Contractor Cost Tracking Module (CCTM) for all lump sum and T&M work. Ameren Purchasing or Strategic Sourcing will decide whether to require CCTM or Ameren's API invoicing system. If CCTM is utilized, the Contractor's representative(s) will be trained by Ameren on the use of the CCTM program in Ameren's EMPRV computer program. The Contractor shall use the CCTM module frequently to estimate/re-estimate the job scope and record actual billing costs.

2.5 Contractor and subcontractors shall submit a Quality Plan which is in compliance with the Quality Requirement in Supplemental General Conditions Section 1A, Item 12, prior to start of work.

2.6 Contractor will be evaluated utilizing the Safety and Housekeeping Scorecards found in the Safety and Contractor Requirements (Appendix A), Attachment A19 and Attachment A20.

2.7 Diverse Supplier 2nd Tier Report

2.7.1 In accordance with Item 1.6.1 above, Attachment A23 shall be filled out with actual spent cost and issued per timeline agreed upon between Contractor and Ameren. Typical timeline for reporting will be monthly.

Note: editable version of Attachment A23 with instructions and reporting guidelines will be sent out as part of Contract Award. Questions on filling out form will be directed toward Ameren Supplier Diversity professionals at (888) 256-1150 or at http://www.ameren.com/BusinessPartners/SupplierDiversity/Pages/SupplierDiversityHome.as.

END OF SECTION 1C

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 1D – GENERAL TECHNICAL REQUIREMENTS

1.0 TECHNICAL REQUIREMENTS

1.1 This specification technical section together with attached appendices, covers the requirements for "clean closure" of Ash Ponds B, C and the Bottom Ash Pond and "closure" of Ash Pond A with a Geosynthetic Cover System at the Medina Valley Cogen, LLC (the Owner) Hutsonville Power Station.

1.2 Codes, Standards, and Regulations

1.2.1 The Contractor shall, as a minimum, perform the necessary work to meet the requirements of the codes, standards and regulations set forth in this specification. In the exercise of his experience and knowledge of the equipment, materials and work covered by this Contract, the Contractor shall perform all work and provide materials and equipment in accordance with other codes, standards and regulations consistent with providing a safe and reliable product.

1.2.2 Any deviations from this specification shall be documented by the submittal of an alternate proposal. Alternate proposal shall list exception by specification section in numerical order on the first page of the alternate proposal. Alternate proposal shall list breaker data sheets from specification after exception sheet. Manufacturing schedule, delivery date, and price shall follow the proposal data sheets. Individual manufacturer specification technical selling points shall be listed at the end of the proposal along with the terms and conditions.

1.2.3 Contractor shall plan on having one design review meeting conference call with the customer. Contractor shall send five (5) sets of drawings and documents for approval for this meeting. See submittal requirements in Information Required By Bidders (Section 1C), Item 2.0. Contractor is responsible for setting up meeting and coordinating conference call.

1.3 Equipment and materials shall be complete in all respects within the limits herein outlined. Errors or omissions required to be corrected in the field shall be done by the manufacturer or its duly authorized representative at the Vendor's expense.

1.3.1 The latest revisions or addenda to codes, standards and regulations set forth as the date of the Contract shall apply.

1.4 The following codes, standards and regulations, with the issue dates noted, shall be complied with except as modified by this Specification. Materials not specified shall be in accordance with references within the codes and standards listed, or if not listed, with the latest applicable industry standard wherever possible. Conflicts between either the codes, standards, or this Specification shall be brought to the attention of the Engineer for resolution.

a) American Society for Testing and Materials (ASTM)

b) The Basic Building Code of the Building Officials of Code Administrations International, Inc. (BOCA)

c) America Institute of Steel Construction (AISC)

d) American National Standards Institute (ANSI)

e) American Society of Mechanical Engineers (ASME)

f) Environmental Protection Agency (EPA)

g) National Fire Protection Association (NFPA)

h) Occupational Safety and Health Administration (OSHA)

i) American Welding Society (AWS)

j) American Society of Heating, Refrigeration, and Air Conditioning Engineers (ASHRAE)

k) Underwriters Laboratories, (UL)

l) Institute of Electrical and Electronic Engineers (IEEE)

Electronic Filing: Received, Clerk's Office 09/28/2020

2.0 DESIGN AND MATERIAL

2.1 Design change, material change/substitution or information requests require the Contractor to submit request to the Responsible Engineer for approval prior to project changes. Written approval is required from the Responsible Engineer or construction supervisor.

2.1.1 If the Responsible Engineer approves the request, he will issue an FCN (Field Change Notice) per Ameren Design Control process.

2.2 When supplying a skid of pre-assembled equipment containing valves, gauges, and other general instrumentation in addition to the main component (pump, blower, etc.) as part of the Supplier's scope of supply, the Supplier shall label all skid devices for clear identification in the field.

3.0 TECHNICAL SERVICES

3.1 The Vendor shall quote, as a separate price, the services of one or more manufacturer's technical service representative on a per diem basis. Pricing for travel and per diem rates for service time shall be provided in the Bid Forms. The service representatives shall be technically competent; factory trained; experienced in the installation and operation of the equipment; and authorized by the manufacturer to perform any work stipulated.

3.2 The manufacturer's technical service representatives shall furnish written certification to the Owner that the equipment has been field inspected and adjusted by them or under their direction and that it is ready for service, all of which shall be done before initial operation of equipment.

a. Providing technical advice to assist the installation contractor in installing the equipment.

b. Inspecting and testing the equipment after installation and directing any changes or adjustments required to assure proper operation.

c. Providing technical direction during start-up and initial operation of the equipment.

d. Directing the correction of any design or manufacturing errors.

e. Instructing/training the plant personnel in the operation and maintenance of the equipment.

f. Providing services required as a condition to providing the warranties and guarantees specified.

3.3 When, in the judgment of the Owner, a field service representative's time is required under Section 1D, Item 3.1 above, solely and expressly for the purpose of correcting design or manufacturing errors covered under warranty, no payment will be made, nor will the time spent at the site while correcting such errors apply toward the days of service or round trips specified for Section 1D, Item 3.2 (a), (b), (c), (e) and (f) above.

3.4 The per diem rates shall include all costs associated with the service representative's work at the site, including local travel, local travel time wages, and living expenses. The round trip rate shall include all expenses for the travel to and from the manufacturer's facilities and the site, including any salary costs for travel time. The Owner will not reimburse Vendor for air fare costs exceeding tourist class air fare unless unusual circumstances exist. The Vendor shall notify the Owner in advance of such circumstances.

3.5 A day of service (per diem) is defined as 10 man-hours at the site. The total number of days of service shall be defined as the total regular time man-hours at the site divided by eight.

3.6 Contractor shall provide 2 days of training for Fossil Plant personnel and 2 days of training for Callaway Plant personnel at the plant sites.

4.0 TESTING

4.1 The Owner reserves the right to observe the above tests being performed.

4.2 The Vendor shall notify the Owner of all tests not less than 14 days prior to the date of test to allow the Owner to observe testing of the equipment if so desired.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.3 Certified copies of inspection and test reports shall be provided by the Vendor for all test and inspections conducted on the specified equipment. One (1) copy of each report shall be submitted to the Owner within one (1) week after completion of each test or inspection as specified in Item 3.2 above.

4.4 A site acceptance test will be performed to verify voltage, current, and wattage requirements. A performance test will be performed to verify the rating after temperature compensation.

5.0 PRE-SHIPMENT INSPECTION

5.1 The Owner reserves the right to inspect the equipment prior to shipment.

5.2 The Vendor shall notify the Owner of all Shipments not less than 14 days prior to the date of shipment to allow the Owner to inspect the equipment if so desired.

6.0 SHIPPING

6.1 Shipments to the plant site shall be consigned to the shipping address as defined in Summary of Work (Section 1B), Item 1.2.1.

6.2 The vendor shall include costs of shipping all materials and associated equipment together in the price quote.

6.3 The vendor shall be responsible for delivery to the Owner's site F.O.B. This shall include special work required to support delivery of heavy and/or oversized items such as, but not limited to, road repairs, road upgrades or extensions, power line disconnections and reconnections, bridge reinforcements, grade alterations, and the like. The Vendor shall provide and coordinate all special services required to complete all deliveries based on the existing conditions surrounding the site on the Contract Date.

6.4 The Vendor shall discuss with the Owner the routing of shipments and shall reroute the same as indicated by the Owner provided the freight rates and overall costs are no greater than by other routes.

6.5 Truck shipments will be accepted weekdays only between the hours of 8:30 A.M. and 2:30 P.M. (Central time). After-hour deliveries not provided for by contract may be refused until the next regular workday. Cost incurred by the Owner for offloading prior to or after normal working hours shall be back-charged to the Vendor unless prior authorization has been approved by the Owner.

6.6 Packages shall be clearly marked with the Contract Number and Purchase Order Number where applicable. Packing lists shall identify Contract Number, Purchase Order Number and item numbers and quantities, bills of lading shall identify the Contract number and Purchase Order Number.

6.7 Equipment shall be shipped completely factory assembled. Preparation for Shipment shall be in accordance with Manufacturer's standards unless otherwise noted in this specification. The Manufacturer shall be solely responsible for the adequacy of the preparation for shipment to ensure materials are received at their destination in EX-Works (EXW) conditions when handled by commercial carriers.

6.8 Equipment shall be boxed, crated, or otherwise suitably protected during shipment, handling, and storage. Components with moving parts which might be damaged in shipment, shall have all such moving parts securely blocked and braced. All items blocked and braced for shipment must be clearly identified and tagged accordingly. Equipment having antifriction or sleeve bearings shall be protected by weather-tight enclosures.

6.9 Materials required for protection during shipping and storage shall be treated for fire resistance. Wood protection shall be Class A, fire retardant, pressure treated type.

6.10 Coated surfaces shall be protected against impact, abrasion discoloration, and other damages. Surfaces which are damaged shall be repaired.

6.11 Electrical equipment, controls, and insulations shall be protected against moisture and water damage. All external gasket surfaces and flange faces, couplings, rotating equipment shafts, bearings, and like items shall be thoroughly cleaned, coated with rust-preventive compound, and protected with suitable wood, metal, or other substantial type covering to ensure their full protection. Exposed threaded parts shall be greased and protected with metallic or other substantial type protectors. Damages due to insufficient protection shall be repaired by the Vendor.

6.12 Returnable containers and special shipping devices shall be returned by the manufacturer's field representative at the Vendor's expense.

6.13 A weatherproofed itemized list of the contents shall also be attached to the outside of each box.

Electronic Filing: Received, Clerk's Office 09/28/2020

6.14 Spare parts shall be shipped separate in heavily constructed wooden boxes. The boxes shall be designed as permanent storage enclosures. Separate boxes shall be used for the spare parts for each major piece of equipment. Where applicable, boxes shall be designed and constructed for return shipment of damaged or worn components for repair.

6.15 Spare parts shall be protected from damage due to moisture and dirt accumulation during an extended storage period by use of special coatings, airtight membranes, bags of desiccant, or other means acceptable to the Owner.

6.16 All separately packaged accessory items and parts shall be shipped with the equipment. Containers for separately packaged items shall be marked so that they are identified with the main equipment. An itemized packing slip, indicating what is in that container only, shall be attached to the outside of each container used for packing. A similar list shall be inside of each container. A master packing slip, covering all accessory items for a given piece of equipment which are shipped in separate containers, shall be attached to one container.

6.17 Vendor shall provide dimensions (H" x W" x D") and weight for each shipping container with approval drawings.

6.18 If materials require special fixtures or lifting rigs for offloading, such rigs or fixtures shall be provided at no additional cost with shipment.

7.0 RECEIPT INSPECTION

7.1 Materials or equipment purchased under this contract may be inspected at the specified receiving points and there accepted or rejected. Inspection will include the necessary testing for determining compliance with the specifications. All expense of initial acceptance tests will be borne by the Owner. The expense of subsequent test due to failure of materials or equipment first offered will be charged against the Vendor. The Owner may reject damaged materials or equipment at any point along the line of shipment with the return and shipment costs to the Vendor's account.

8.0 WARRANTY

8.1 The Warranty shall be warranted by the contractor against defects in materials, performance, and workmanship for a period of 2 years from the date of acceptance by Ameren. The length of the warranty supersedes the length specified in the GCC's (General Conditions of Contract). Contractor shall include parts, contractor service engineer, and labor to remove and install the necessary parts and equipment.

Note: As used herein "Seller" means Vendor and "Buyer" means Customer.

Seller warrants that its services, including without limitation, its design, inspection, and installation services, and the equipment and materials to be supplied by Seller under this contract, shall be free of defects and shall conform to the requirements of the contract.

END OF SECTION 1D

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01356 - STORM WATER POLLUTION PREVENTION MEASURES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Requirements for Contractor compliance with Phase II of the National Pollutant Discharge Elimination System (NPDES) storm water program.
2. Construction and maintenance of existing and proposed temporary erosion control systems to control erosion and sediment damage to adjacent properties and water resources.

B. Related Sections include the following:

1. Section 02936 "Seeding and Mulching."

1.3 REFERENCES

A. The following reference, or cited portions thereof, governs the work:

Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2012 and Supplemental Specifications adopted January 1, 2014.

1.4 SUBMITTALS

A. Submittals shall follow the provisions of Section 1B – Summary of Work.

B. Preconstruction Submittals: A storm water best management practices (BMP) plan shall be submitted that includes the following items:

1. Inspection and record-keeping procedures; and
2. Maintenance procedures for erosion controls.

C. The Contractor shall obtain all local and/or federal stormwater permits that may be required to perform the work. Development and submission of a site-specific Storm Water Pollution Prevention Plan (SWPPP) to the state EPA, and procurement of the Notice of Intent (NOI) to discharge stormwater from construction activities will be required prior to starting the work. Offsite borrow areas larger than one acre in size will also require a site-specific SWPPP and NOI.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Temporary Erosion Control Systems

1. Materials for temporary erosion control systems shall be in accordance with Article 280.02 of the IDOT Standard Specifications and Supplemental Specifications.

PART 3 – EXECUTION

3.1 EXAMINATION

A. The site shall be examined to determine the extent of new work required.

3.2 PRECONSTRUCTION JOBSITE INSPECTION

A. The person who shall be at the jobsite during construction and who shall be responsible for insuring that erosion control work is completed in a timely manner shall be identified at the preconstruction meeting.

Electronic Filing: Received, Clerk's Office 09/28/2020

B. A jobsite inspection shall be conducted with the Owner's Representative to review and designate the locations and types of erosion protection to be placed. The inspection shall be scheduled at the preconstruction conference and carried out on the job site before beginning any work that will disturb existing drainage or potentially create erodible conditions.

3.3 CONSTRUCTION

A. Temporary erosion control systems shall be constructed in accordance with IDOT Standard 280001-05 and Article 280.04 of the Standard Specifications and as directed by the Owner's Representative. Erosion control devices shall be in place and approved by the Owner's Representative prior to beginning other work.

B. Incorporate permanent erosion control features into the project at the earliest practicable time to minimize the need for temporary erosion controls.

3.4 MAINTENANCE

A. Temporary erosion control systems shall be maintained in accordance with Article 280.05 of the Standard Specifications, except that measurement and payment provisions shall not apply.

B. Temporary erosion control systems for unprotected disturbed areas shall be cleaned of trapped sediment and repaired immediately prior to project close out.

3.5 REMOVAL AND DISPOSAL

A. All temporary erosion control systems shall be removed by the Contractor upon successful completion of permanent seeding and permanent erosion control measures.

END OF SECTION 01356

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02100 - SELECTIVE DEMOLITION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Demolition and removal of selected site elements.
2. Salvage of existing items to be reused or recycled.

1.2 MATERIALS OWNERSHIP

A. Unless otherwise indicated, demolition waste becomes property of Contractor.

B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.

1. Carefully salvage in a manner to prevent damage and promptly return to Owner.

1.3 INFORMATIONAL SUBMITTALS

A. Proposed Protection Measures: Submit report, including Drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, for dust control and for noise control. Indicate proposed locations and construction of barriers.

B. Schedule of selective demolition activities with starting and ending dates for each activity.

1.4 FIELD CONDITIONS

A. The Owner may have Subcontractors conducting demolition of buildings immediately adjacent to selective demolition area. Conduct selective demolition so these operations will not be disrupted.

B. Conditions existing at time of inspection for bidding purpose will be maintained by Owner as far as practical.

C. Notify the Owner's Representative of discrepancies between existing conditions and Drawings before proceeding with selective demolition.

D. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.

1. Hazardous materials will be removed by Owner before start of the Work.
2. If suspected hazardous materials are encountered, do not disturb; immediately notify the Owner. Hazardous materials will be removed by Owner under a separate contract.

E. Sale or retention of removed items is not permitted. All demolished items must be disposed of in a properly licensed landfill facility.

F. Utility Service: Maintain existing utilities indicated to remain in service and protect them against damage during selective demolition operations.

1. Maintain fire-protection facilities in service during selective demolition operations.

G. Arrange selective demolition schedule so as not to interfere with Owner's operations.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.5 WARRANTY

A. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during selective demolition, by methods and with materials and using approved contractors so as not to void existing warranties.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning selective demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.

B. Grout Plugs: Cement-based dry-pack grout conforming to ASTM C1107, Grade B or C.

C. Controlled Low Strength Material (CLSM):

1. Unconfined compressive strength: minimum 75 psi and maximum 150 psi at 28 days.
2. Non-shrink.
3. Self-leveling
4. Air Content: 15-25%
5. Fly Ash is not permitted

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that utilities have been disconnected and capped before starting selective demolition operations.

B. Inventory and record the condition of items to be removed and salvaged.

3.2 UTILITY SERVICES AND MECHANICAL/ELECTRICAL SYSTEMS

A. Existing Services/Systems to Remain: Maintain services/systems indicated to remain and protect them against damage.

B. Existing Services/Systems to Be Removed, Relocated, or Abandoned: Locate, identify, disconnect, and seal or cap off utility services and mechanical/electrical systems serving areas to be selectively demolished.

1. Owner will arrange to shut off indicated services/systems when requested by Contractor.
2. Arrange to shut off utilities with utility companies.
3. If services/systems are required to be removed, relocated, or abandoned, provide temporary services/systems that bypass area of selective demolition and that maintain continuity of services/systems to other parts of building.
4. Disconnect, demolish, and remove piping, equipment, and components indicated on Drawings to be removed.

a. Piping to Be Removed: Remove portion of piping indicated to be removed and plug remaining piping with same or compatible piping material.
b. Piping to Be Abandoned in Place: Drain piping and plug piping with same or compatible piping material and leave in place.
c. Equipment to Be Removed: Disconnect and cap services and remove equipment.
d. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
e. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Owner.

3.3 GEOMEMBRANES

A. Existing geomembranes to be removed:

1. Where shown on the Plans, excavate ash materials over-lying geomembranes designated to be removed
2. Clean the surface of the geomembrane to avoid contamination of the underlying soil materials.
3. Cut and remove the geomembrane in sections. Pull or excavate from anchor trenches completely.

3.4 PROTECTION

A. Temporary Protection: Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.

B. Temporary Shoring: Design, provide, and maintain shoring, bracing, and structural supports as required to preserve stability and prevent movement, settlement, or collapse of construction and finishes to remain, and to prevent unexpected or uncontrolled movement or collapse of construction being demolished.

C. Remove temporary barricades and protections where hazards no longer exist.

3.5 SELECTIVE DEMOLITION

A. General: Demolish and remove existing construction only to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations and as follows:

1. Neatly cut openings and holes plumb, square, and true to dimensions required. Use cutting methods least likely to damage construction to remain or adjoining construction. Use hand tools or small power tools designed for sawing or grinding, not hammering and chopping. Temporarily cover openings to remain.
2. Cut or drill from the exposed or finished side into concealed surfaces to avoid marring existing finished surfaces.
3. Do not use cutting torches until work area is cleared of flammable materials. At concealed spaces, such as duct and pipe interiors, verify condition and contents of hidden space before starting flame-cutting operations. Maintain portable fire-suppression devices during flame-cutting operations.
4. Maintain fire watch during and for at least 1 hour after flame-cutting operations.
5. Locate selective demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.
6. Dispose of demolished items and materials promptly.

B. Site Access and Temporary Controls: Conduct selective demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

C. Removed and Salvaged Items:

1. Clean salvaged items.
2. Pack or crate items after cleaning. Identify contents of containers.
3. Store items in a secure area until delivery to Owner.
4. Transport items to Owner's storage area designated by Owner.
5. Protect items from damage during transport and storage.

D. Removed and Reinstalled Items:

1. Clean and repair items to functional condition adequate for intended reuse.
2. Pack or crate items after cleaning and repairing. Identify contents of containers.
3. Protect items from damage during transport and storage.
4. Reinstall items in locations indicated. Comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make item functional for use indicated.

Electronic Filing: Received, Clerk's Office 09/28/2020

E. Existing Items to Remain: Protect construction indicated to remain against damage and soiling during selective demolition. When permitted by Architect, items may be removed to a suitable, protected storage location during selective demolition and reinstalled in their original locations after selective demolition operations are complete.

3.6 CLEANING

A. Remove demolition waste materials from Project site and dispose of them in an EPA-approved construction and demolition waste landfill acceptable to authorities having jurisdiction.

1. Do not allow demolished materials to accumulate on-site.
2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
3. Remove debris from elevated portions of building by chute, hoist, or other device that will convey debris to grade level in a controlled descent.

B. Burning: Do not burn demolished materials.

C. Clean adjacent structures and improvements of dust, dirt, and debris caused by selective demolition operations. Return adjacent areas to condition existing before selective demolition operations began.

END OF SECTION 02100

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02140 – SURFACE WATER MANAGEMENT

PART 1. GENERAL

1.01 DESCRIPTION

Control of surface water caused by precipitation and infiltration within the construction limits shall be considered as part of the work under this specification.

The Contractor shall employ standard surface water management practices to prevent the ponding of storm water runoff and/or erosion of existing and proposed surfaces, as required to complete the work, and as directed by the Owner's Representative.

A. The work to be completed by the Contractor includes, but is not necessarily limited to, the following:

1. Maintenance of existing and implemented erosion control measures according to Section 01356; and

2. Dewatering excavations of surface water caused by precipitation and infiltration.

3. Implementation of excavation sequencing, surface water dewatering, and erosion control measures to minimize earthen and/or CCB sediment migration between areas where CCB sediment excavation has been completed and those areas where CCB sediment excavation has not been completed.

B. The Contractor shall be responsible for providing all materials, equipment, labor, and services necessary for care of surface water management and erosion control measures.

1.02 RELATED SECTIONS

The following sections contain items which are related to the work in this section:

A. Section 1B - Summary of Work

B. Section 01356 - Storm Water Pollution Prevention Measures

C. Section 02222 - Earthwork

1.03 REFERENCES

No references.

1.04 EXISTING FACILITIES

None.

1.05 SUBMITTALS

A. Submittals - A surface water management plan shall be submitted with the bid proposal that details procedures to minimize earthen and/or CCB sediment migration for each of the following activities:

1. Excavation sequencing;

2. Surface water management plan, including a pumping plan; and

3. Temporary erosion control plan.

PART 2. PRODUCTS

2.01 MATERIALS

Materials and equipment for surface water management shall be reviewed by the Owner's Representative for compatibility with future construction and operation of the facility.

Electronic Filing: Received, Clerk's Office 09/28/2020

PART 3. EXECUTION

3.01 SURFACE WATER MANAGEMENT

A. The Contractor shall be responsible for providing all facilities required to divert, collect, control, and remove water caused by precipitation and infiltration from all construction work areas and excavations.

B. Drainage features shall have sufficient capacity to avoid flooding of work areas.

C. Drainage features shall be so arranged and altered, as required to avoid degradation of the final excavated surface(s).

D. The Contractor shall utilize all necessary erosion and sediment control measures to avoid construction-related sedimentation of existing and proposed facilities.

3.02 WATER DISPOSAL

A. Dispose of water removed from the excavations in such a manner as:

1. Will not endanger portions of work under construction or completed.

2. Will cause no inconvenience to Owner or to others working near site.

3. Will comply with the stipulations of Section 01356.

4. Will control runoff. The Contractor shall be responsible for control of runoff in all work areas, including, but not limited to: excavations, access roads, parking areas, stockpile, laydown, and staging areas. The Contractor shall provide, operate, and maintain all ditches, basins, sumps, culverts, site grading, and pumping facilities to divert, collect, and remove all water from the work areas.

B. Prior to the completion of riprap and CCB sediment excavation, water must be directed to the permitted site NPDES regulated discharge point for disposal. Utilization of a "final decant basin" will be necessary to allow contaminants to settle out prior to final discharge.

1. The Owner will have CQA personnel monitoring the discharge stream for contaminants in compliance with the site NPDES Permit. The Contractor shall allow time and access for testing the "final decant basin" water prior to final discharge.

3.03 DAMAGES

Immediately repair damages to adjacent facilities caused by the surface water management facilities, as constructed by the Contractor.

3.04 CORRECTIVE ACTION

Work shall be performed as necessary for reinstatement of foundation soil and damaged structure resulting from such inadequacy or failure by Contractor to control surface water, at no additional cost to Owner.

END OF SECTION 02140

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02222 - EARTHWORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Division 1 – General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Earth moving required for Base Grade preparation, construction of Vegetative Cover and miscellaneous site grading.

B. Related Sections include the following:

1. Section 01356 - Storm Water Pollution Prevention Measures.

2. Section 02936 - Seeding and Mulching.

1.3 REFERENCES

A. The following references, or cited portions thereof, govern the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2012 and Supplemental Specifications adopted January 1, 2014.

2. ASTM D2487-11 Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)

1.4 MEASUREMENT AND PAYMENT

A. The Contractor shall be responsible for estimating the extent of excavation and fill required to complete the work, including, but not limited to, excavation and fill placement to required elevations; loading, transporting, placing, and compacting the Vegetative Layer; placement of topsoil respread; and miscellaneous site grading. The Contractor shall include the dollar amount associated with all earthwork in his Lump Sum Bid amount.

1.5 REGULATORY REQUIREMENTS

A. Codes and Standards:

1. Perform earthwork in compliance with applicable requirements of governing authorities having Jurisdiction.

1.6 COORDINATION

A. Existing utilities or other plant facilities shall not be interrupted, except when permitted in writing by the Owner's Representative and then only after acceptable temporary services have been provided. A minimum forty-eight (48) hour notice shall be provided prior to proceeding with an approved temporary interruption.

1.7 SURFACE WATER MANAGEMENT

A. Control of surface water caused by precipitation as necessary for completion of the work under this contract is the responsibility of the Contractor and shall be included in the contract lump sum price.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.8 SUBMITTALS

A. Material Test Reports: From a qualified testing agency indicating and interpreting test results for compliance of the following with requirements indicated:

1. Classification according to ASTM D 2487 of each on-site and borrow soil material proposed for fill and backfill.

2. Chemical testing as enumerated in Table A.1 of the CQA Plan for each off-site borrow soil material proposed for fill and backfill.

1.9 QUALITY ASSURANCE

A. Geotechnical Testing Agency Qualifications: An independent testing agency qualified according to ASTM E 329 to conduct soil materials and rock-definition testing, as documented according to ASTM D 3740 and ASTM E 548.

B. Soil Testing Firm: An independent testing agency qualified to perform testing under EPA SW-846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods".

PART 2 - PRODUCTS

2.1 MATERIALS

A. Material intended for import to the site must be approved by the Owner's Representative before hauling to the site. Owner's Representative may conduct chemical analysis and/or soil properties on these materials.

B. Ash Deposits:

1. The Base Grade will be constructed using the existing deposits of ash that currently occupy Ash Ponds A, B, C and Bottom Ash Pond.

C. Soil Materials:

1. The Vegetative Cover soils shall be shall be comprised of local borrow materials or borrow materials hauled in from off-site.

A. Satisfactory Soils: ASTM D 2487 Soil Classification Groups CL & CL-ML; free of rock or gravel larger than 0.75 inches in any dimension, debris, waste, frozen materials, vegetation, and other deleterious matter.

B. Where compacted fill is specified for roadways, Unsatisfactory soils include satisfactory soils not maintained within 2 percent of optimum moisture content at time of compaction.

B. Each borrow source shall be tested to prevent contaminated borrow materials from entering the site. Individual Physical and Chemical tests that are required are listed in the project CQA Plan. Testing shall be done at the following minimum frequencies.

1. One Prequalification Test of each individual borrow source prior to use. The Contractor's Soil Testing Firm shall be responsible for this analysis.

2. One Test per every 25,000 Cubic Yards of borrow material from each source. This testing will be conducted by the CQA Officer through the Owner's Soil Testing Firm.

D. Soil Stabilizers and Moisture Conditioning Agents:

1. Additives to accelerate drying or to improve stability and workability of soil shall not be permitted unless approved in writing by the Owner's Representative.

2.2 EQUIPMENT

A. Compaction Equipment:

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Tamping foot rollers:

   a. Compaction equipment shall consist of tamping foot rollers which have a minimum weight of 40,000 lbs. At least one (1) tamping foot shall be provided for each 110 sq. in. of drum surface. The length of each tamping foot, measured from the outside surface of the drum, shall be at least 1 in. longer than the loose lift thickness.

2. Steel-Wheeled Rollers:

   a. Equipment used to produce a smooth compacted surface shall be a smooth, non-vibratory steel wheeled roller weighing not less than 1,000 lb. per lin. ft.

B. Scarification Equipment:

1. Discs, rotor tillers, or other equipment used to scarify the surface shall be capable of uniformly disturbing at least the upper 6 in. of surface to provide good bonding between lifts.

C. Mixing and Spreading Equipment:

1. Discs, harrows, and motor graders or other similar equipment shall be available at the site for use in spreading, mixing, and drying Soil Materials.

Part 3 - Execution

3.1 Preparation

A. Control of Work:

1. Benchmarks, monuments, and other reference points shall be maintained throughout the work area.

B. Utility Location:

1. Before starting excavation, the location and extent of underground utilities in the work area shall be established.

3.2 Excavation

A. General:

1. Excavation consists of removal and redistribution of material encountered when establishing required grade and subgrade elevations. The Contractor shall be responsible for dewatering, protection, shoring, and disposal of excavated materials as necessary to complete the excavation.

B. Procedures:

1. Excavation may be accomplished by any method and by use of any equipment that is suitable to the work, except that blasting will not be permitted.

3.3 BASE GRADE PREPARATION

A. The Base Grade shall be prepared by grading the existing ash deposits to the lines and grades shown on the Plans.

B. Existing geotubes (ash-filled socks) may be broken and spread as part of the base grade. Geotube fabric may be buried in place.

C. Ash and soil materials used to create the base grade shall be compacted to at least 90 PERCENT of the maximum dry density as determined by the Standard Proctor Test (ASTM D698).

Electronic Filing: Received, Clerk's Office 09/28/2020

D. Following the Base Grading Earthwork, the Construction Quality Assurance (CQA) Officer shall direct the Owner's Field Surveyor to verify that actual Base Grades are in accordance with the plans and specifications. Elevations shall be surveyed on a 100 ft. grid pattern. In addition, all breaks in grade will be surveyed. The measured depths and grades shall be documented on "as built" drawings furnished to the CQA Officer by the surveyor agency. Final grade locations and elevations may be adjusted in the field by the CQA Officer in areas where grading of the ash deposits does not meet the design intent of the Plans. The CQA Officer shall review the final survey data for conformance to requirements and, if found in agreement with requirements, provide certification for the work in accordance with CQA Plan Procedures.

E. The Contractor shall not install Geomembrane until the Base Grade has been examined jointly with the Owner's Representative and a certificate of approval for the Base Grade has been submitted to the Owner's Representative.

3.4 VEGETATIVE COVER

A. Vegetative Cover is to be placed over High Density Polyethylene (HDPE) Geomembrane to the lines and grades shown on the Plans. The Vegetative Cover shall be placed as follows:

1. The Vegetative Cover must be at least 3 ft- thick, consisting of soil material capable of supporting vegetation.

2. Vegetative Cover shall be compacted only to the extent necessary to place and spread uniformly.

3. All drainage channels and diversion berms shown on the plans are to be built monolithically with the vegetative cover and then shaped during final grading.

4. Placement shall begin as soon as possible to protect the HDPE Geomembrane.

5. Following the Base Grading Earthwork, the CQA Officer shall direct the Owner's Field Surveyor to verify that actual Vegetative Cover Grades are in accordance with the plans and specifications. Elevations shall be surveyed on a 100 ft grid pattern. In addition, all breaks in grade will be surveyed. The measured depths and grades shall be documented on "as built" drawings furnished to the CQA Officer by the surveyor agency. Final grade locations and elevations may be adjusted in the field by the CQA Officer in areas where grading does not meet the design intent of the Plans. The CQA Officer shall review the final survey data for conformance to requirements and, if found in agreement with requirements, provide certification for the work in accordance with CQA Plan Procedures.

6. Seeding shall be installed as soon as possible to minimize wind and water erosion.

3.5 FINISH GRADING

A. All excavated and filled areas shall be fine graded and leveled to provide a smooth finish free of debris, foreign matter, objectionable stones, clods, lumps, pockets, or high spots, properly drained and true to indicated elevations. Finish grading shall be conducted only near completion of work or when requested.

3.6 CONSTRUCTION TOLERANCES

A. Elevations will be surveyed at breaks in slopes and on a 100 ft grid pattern on the Base Grade and repeated after Vegetative Cover construction to verify material thickness and to verify that proper drainage slopes are maintained. To verify material thickness, all horizontal survey coordinates will be the same for the bottom and the top of the material that is placed. A test will be considered failed if it does not meet the minimum design requirements. To obtain the specified design thickness, additional soil material will be placed and compacted in failing areas where the as-built thickness is less than the design thickness. Surveying required for verification of final construction tolerances will be performed by the Owner's Land Surveyor.

END OF SECTION 02222

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02225 - TRENCH EXCAVATION

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Division 1-General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Trench excavation and protection, including dewatering, as required to complete the work.

B. Related Sections include the following:

1. Division 2 02322 "Trench Foundation, Bedding and Backfill."

1.3 REFERENCES

A. Standard Specifications for Water and Sewer Main Construction in Illinois, 7th Addition, 2014.

B. OSHA Excavation Standards.

1.4 SUBMITTALS

A. The Contractor shall submit an excavation plan for review and approval by the Owner's Representative, including open cut slopes and depths, shoring types and specifications (trench boxes or other), depths, configurations and materials. This information shall be submitted at least two (2) weeks before start of construction.

1.5 GENERAL REQUIREMENTS

A. Open-cut trenches shall be protected in accordance with applicable rules, laws and regulations of Federal, State and municipal ordinances.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Specifications for trench boxes, sheeting or other, shall be submitted at least one (1) week prior to the work.

PART 3 – EXECUTION

3.1 CONSTRUCTION REQUIREMENTS

A. The trench excavation shall be made to a minimum depth of 1 ft below the design bottom of pipe for the placement of foundation and bedding materials.

3.2 PILING EXCAVATED MATERIAL

A. All excavated material shall be piled in a manner that will not endanger the work. Excavated material suitable for backfilling shall be stockpiled separately on the site. Natural watercourses shall not be obstructed or polluted. Surplus material and excavated material unsuitable for backfilling shall be transported and disposed of in disposal areas directed by the Owner's Representative. Temporary erosion control shall be established around excavated material stockpiles.

3.3 REMOVAL OF WATER

A. The Contractor shall at all times during construction provide and maintain ample means and devices with which to promptly remove and properly dispose of all water entering the excavation until all work to be performed therein has been completed. The proposed method for the control of groundwater shall be submitted to the Owner's Representative for approval prior to implementation.

Electronic Filing: Received, Clerk's Office 09/28/2020

3.4 BARRICADES, GUARDS AND SAFETY PROVISIONS

A. To protect persons from injury and to avoid property damage, adequate barricades, construction signs, lights and guards as required shall be placed and maintained by the Contractor at his expense during the progress of the construction work. The rules and regulations of OSHA and appropriate authorities respecting safety provisions shall be observed.

END OF SECTION 02225

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02275 – RIPRAP

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Division 1-General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Furnishing placing riprap for erosion control.

B. Related Sections include the following:

1. Division 2 02222 "Earthwork."

1.3 REFERENCES

A. Specified references or cited portions thereof, current at date of bidding documents unless otherwise specified, govern the work.

B. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2012 and Supplemental Specifications adopted January 1, 2014.

1.4 SUBMITTALS

A. Product Data: Provide quarry name and material gradation prior to delivery.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Stone Riprap materials according to Article 1005.01 of the Illinois Standard Specifications for Road and Bridge Construction.

B. All Filter Fabric used for Stone Riprap, regardless of riprap gradation, shall meet the IDOT requirements for 8 oz/sq yd. fabric listed in Article 1080.03.

C. Riprap Gradation and Quality as indicated in the drawings. Class designation callouts include both the Gradation and Quality, for Example "Riprap, Class B3" denotes Quality B, Gradation RR3 Riprap Materials.

PART 3 – EXECUTION

3.1 CONSTRUCTION REQUIREMENTS

A. Stone Riprap shall be installed in accordance with Section 281 of the Illinois Standard Specifications for Road and Bridge Construction for the placement of Stone Riprap. Measurement and payment provisions of Section 281 shall not apply.

B. Filter Fabric for Stone Riprap shall be installed in accordance with Section 282 of the Illinois Standard Specifications for Road and Bridge Construction.

C. The Owner's Representative shall be allowed to visually inspect Riprap and Filter Fabric for compliance with specifications prior to placement.

END OF SECTION 02275

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02322 - TRENCH FOUNDATION, BEDDING, HAUNCHING, AND BACKFILL

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Division 1-General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Installation of the trench foundation and bedding for piping installations, as well as the haunching around the pipe and the backfill over the pipe.

B. Related Sections include the following:

1. Division 2 02225 "Trench Excavation."

1.3 REFERENCES

A. Standard Specifications for Water and Sewer Main Construction in Illinois, 7th Addition, 2014.

B. IDOT Standard Specifications for Road and Bridge Construction, January 1, 2012 and Supplemental Specifications adopted January 1, 2014.

1.4 SUBMITTALS

A. Submit 25 lb. sample of foundation, bedding and haunching material to testing laboratory.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Foundation, Bedding and Haunching Material shall be supplied in accordance with Article 1003.04 of the Illinois Standard Specifications for Road and Bridge Construction with gradation FA 1.

B. Detectable Warning Tape: Acid- and alkali-resistant, polyethylene film warning tape manufactured for marking and identifying underground utilities, a minimum of 6 inches wide and 4 mils thick, continuously inscribed with a description of the utility, with metallic core encased in a protective jacket for corrosion protection, detectable by metal detector when tape is buried up to 30 inches deep; colored as follows:

1. Red: Electric.
2. Yellow: Gas, oil, steam, and dangerous materials.
3. Orange: Telephone and other communications.
4. Blue: Water systems.
5. Green: Sewer systems.

PART 3 – EXECUTION

3.1 CONSTRUCTION REQUIREMENTS

A. The trench shall be excavated to an elevation so that the pipe will be at the depth and grade specified after the foundation and bedding are installed. Well compacted, aggregate foundation and bedding material at least 12 in. in depth below the pipe, shall be placed the entire width of the trench and for the length of the pipe. The foundation and bedding shall be placed in 8 in. loose layers. The aggregate shall meet the material requirements and each layer shall be thoroughly compacted by ramming or tamping.

B. When pipe having bells or hubs is used, cross trenches, not more than 2 in. wider than the bell or hub, shall be excavated to provide uniform bearing along the length of the pipe.

C. If the excavation has been made deeper than necessary, the foundation shall be brought to the proper grade by the addition of well compacted bedding material.

D. As soon as the condition of the pipe will permit and testing of the pipe joints completed, the entire width of the trench shall be backfilled with haunching material specified in the material requirements to a height of at least 12 in. above the top of the pipe. The aggregate shall be placed longitudinally along the pipe. The elevation of the haunching material on each side of the pipe shall be the same. Special care shall be taken to completely fill the space under the pipe haunches. The aggregate material shall be placed in maximum 8 in. layers, loose measurement and compacted by ramming or tamping. The aggregate used for haunching shall meet the material requirements.

E. Install warning tape directly above piping, 12 inches below finished grade, except 6 inches below subgrade under pavements and slabs.

F. Final backfill shall consist of backfilling from 12 in. over the top of the pipe to the surrounding existing ground surface line. The remainder of the trench and excavation shall be backfilled to the finished surface as rapidly as the conditions will permit. The backfill material shall consist of trench excavated material, compacted to 92 percent of the maximum dry density as obtained by the Standard Proctor Compaction Test (ASTM D698).

END OF SECTION 02204

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02373 – GEOTEXTILES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Division 1-General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Furnishing and installing geotextile fabrics.

B. Related Sections include the following:

1. Division 2 02222 "Earthwork."
2. Division 2 02508 "Crushed Stone Surfacing."
3. Division 2 02400 "HDPE Geomembrane."

1.3 REFERENCES

A. The following references, or cited portions thereof, govern the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2012 and Supplemental Specifications adopted January 1, 2014.
2. American Society for Testing and Materials (ASTM):

a. ASTM 3776 (1996; R 2002) Standard Test Method for Mass per Unit Area (Weight) of Fabric.
b. ASTM D 3786 (2001) Test Method for Hydraulic Bursting Strength of Textile Fabrics – Diaphragm Bursting Strength Tester Method.
c. ASTM D 4533 (2004) Test Method for Trapezoid Tearing Strength of Geotextiles.
d. ASTM D 4632 (1991; R 2003) Test Method for Grab Breaking Load and Elongation of Geotextiles.
e. ASTM D 4751 (2004) Test Method for Determining Apparent Opening Size of Geotextile.
f. ASTM D 4833 (2000) Test Method for Index Puncture Resistance of Geotextiles, Geomembranes, and Related Products.
g. ASTM D 4873 (2002) Guide for Identification, Storage, and Handling of Geosynthetic Rolls.
h. ASTM D 4884 (1996; R 2003) Test Method for Strength of Sewn or Thermally Bonded Seams of Geotextiles.
i. ASTM D5261-92(2003) Standard Test Method for Measuring Mass per Unit Area of Geotextiles.
j. ASTM D6241-04 Standard Test Method for the Static Puncture Strength of Geotextiles and Geotextile-Related Products Using a 50-mm Probe.

1.4 SUBMITTALS

A. Product Data:

1. The manufacturer's list of guaranteed properties for each geotextile fabric proposed for use on the project shall be submitted to the owner's representative at least fifteen (15) days prior to placement.
2. The manufacturer's installation guidelines shall be submitted.

B. Samples:

1. Samples of geotextile fabrics shall be submitted for Construction Quality Assurance (CQA) prequalification testing. Sample size and sampling frequency are specified in the CQA Plan.

C. Inventory:

Electronic Filing: Received, Clerk's Office 09/28/2020

1. A copy of the roll inventory that identifies, as a minimum, manufacturer or supplier, product or style number, roll number, width, and length of roll as identified on the roll label shall be submitted.

1.5 MEASUREMENT AND PAYMENT

A. The Contractor shall be responsible for estimating the extent of geotextile fabric required to complete the work including fabric for laps, anchorage, repairs, and samples for CQA testing.

1.6 STORAGE AND HANDLING

A. Geotextiles shall be stored and handled according to ASTM D4873.

PART 2 – Products

2.1 MATERIALS

A. Geotechnical Fabric for Ground Stabilization:

1. Geotechnical fabric for ground stabilization shall conform to Article 1080.02 of the IDOT Standard Specifications for Road and Bridge Construction.

B. Securing Devices:

1. Pins, staples, and other devices that project through the geotextile fabric are not permitted for fabrics installed above the geomembrane. Sandbags, stone, or other appropriate means approved by the Owner's Representative shall be used to prevent movement of the geotextile.

2.2 EQUIPMENT

A. Equipment for spreading and compacting granular materials shall be low ground pressure equipment to prevent damage to the underlying geosynthetic liners.

Part 3 – Execution

3.1 SAMPLES FOR CQA TESTING

A. Geotextile fabric samples shall be obtained, identified and packaged from rolls designated by the Owner's Representative according to ASTM D4873.
B. Samples shall be 3 ft- wide by the full roll width.

3.2 BASE PREPARATION

A. Surface on which the geotextile will be placed shall be prepared to a relatively smooth surface condition, and shall be free from obstruction, debris, depressions, erosion features, or any irregularities that would prevent continuous, intimate contact of the geotextile with the entire surface. Rills, gullies, and ruts must be graded out of the surface before geotextile placement. Areas on which geotextile are to be placed shall be graded and/or dressed in accordance with Section 02200 – Earthwork.
B. Do not run heavy vehicle traffic directly on the geotextile. Use vehicles and equipment as specified in paragraph 2.2 to transport and deploy fabric on the linerRoute traffic and personnel over installed cushion fabric and use the installed fabric as a working platform to the greatest extent possible.

3.3 INSTALLATION

A. General Requirements:

1. Geotextile fabric shall be unrolled and laid out following these requirements to the greatest extent practical:

a. Orient panels with the longest dimension parallel to the slope.
b. Minimize the number of seams in corners and odd-shaped areas.
c. Extend panels on slopes a minimum of 5 ft onto a horizontal surface.
d. Geotextile panels shall be unrolled using methods that will not damage the fabric and will protect underlying surface from damage. While unrolling, the geotextile fabric shall be visually

Electronic Filing: Received, Clerk's Office 09/28/2020

Inspected for imperfections and faulty or suspect areas marked. Ballast shall be placed on fabric to prevent wind uplift. Expansion and contraction should be allowed for by leaving slack.

e. Heavy vehicle traffic shall not be run directly on geotextile fabric. Fabric in areas of heavy traffic shall be protected with protective cover over the fabric.

2. Laps:

a. Individual panels of geotextile fabric shall be lapped according to manufacturer's instructions and as specified herein. Provide a minimum overlap of 3 in. unless otherwise specified herein or in the plans. Shingle overlaps so that water or other material cannot run down the slope between the two (2) layers of fabric.

. Defects and Repairs:

a. Examine the installed geotextile fabric for defects, holes discontinuous seams, puckered or separated laps, etc. Repair defective laps and seams. Patch holes and defects according to manufacturer's recommendations and as directed by the Owner's Representative. Do not cover suspect or patched areas until they have been inspected and approved by the Owner's Representative.

B. Geotechnical Fabric for Ground Stabilization:

1. Install Geotechnical Fabric for Ground Stabilization in accordance with Section 210 of the IDOT Standard Specifications for Road and Bridge Construction.
2. If approved by the Owner's Representative, the Contractor may, at his own expense, install geotextile or geogrid for ground stabilization outside the limits designated by the Owner's Representative.
3. Submit as-built drawings that clearly delineate limits and type of ground stabilization.

3.4 PROTECTION

A. Protect installed fabric until it is covered by at least 1 ft. of overlying material.

B. Any damage to the geotextile during its installation or during placement of overlying materials shall be replaced by the Contractor at no cost to the Owner. Unless otherwise noted, the work shall be scheduled so that the covering of the geotextile with a layer of the specified material is accomplished within fourteen (14) calendar days after placement of the geotextile. Failure to comply shall require replacement of geotextile. The geotextile shall be protected from damage prior to and during the placement of overlying materials. Before placement of overlying materials, the Contractor shall demonstrate that the placement technique will not cause damage to the geotextile.

3.5 TESTING AND INSPECTION

A. Prequalification Testing:

1. Geotextiles are subject to CQA testing by the Owner's Testing Consultant to verify conformance with the manufacturer's list of guaranteed properties according to the project Construction Quality Assurance Plan, included in Appendix 2. The Contractor shall provide samples as specified herein. Any fabric that does not conform to the list of guaranteed properties shall be removed from the site.

B. Installed fabric shall be inspected by the Owner's Representative. No material shall be placed on the fabric, other than ballast, until the installation has been approved by the Owner's Representative. Ballast shall not obscure seams or significant length of unseamed laps. The Owner's Representative may require removal of ballast to inspect suspect areas.

B. If the Owner's Representative suspects that completed work has been damaged by construction methods that do not conform to the specifications, he may require removal of completed work to verify theintegrity of the underlying materials. The Contractor shall bear the cost of removal and subsequent repair as directed by the Owner's Representative, If the integrity of the underlying materials was damaged. If no damage was found, the Owner will pay the Contractor for the investigation work on a time and materials basis.

END OF SECTION 02373

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02400 - HDPE GEOMEMBRANE

Part 1. General

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 RELATED SECTIONS

A. This Section includes the following:

1. Manufacturing, furnishing, and installing High Density Polyethylene (HDPE) Geomembranes.
2. Removal and disposal of geomembrane materials.
3. The work includes furnishing all equipment and materials and providing all labor, supervision, administration and management necessary to perform the work as shown on the plans.

B. Related Sections include the following:

1. Division 02 02222 "Earthwork."

1.3 REFERENCES

A. The following references, or cited portions thereof, govern the work:

1. American Society for Testing and Materials (ASTM):

a. D 638, Standard Test Method for Tensile Properties of Plastics.
b. D 751, Standard Test Methods for Coated Fabrics.
c. D 792, Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.

Electronic Filing: Received, Clerk's Office 09/28/2020

2. Geosynthetic Research Institute (GRI), the most current edition of the following specifications shall be used:

   a. GRI Test Method GM6: Pressurized Air Channel Test for Dual Seamed Geomembranes.
   b. GRI Test Method GM9: Cold Weather Seaming of Geomembranes.
   c. GRI Test Method GM10: Specification for Stress Crack Resistance of HDPE Geomembrane Sheet.
   d. GRI Test Method GM13: Test Properties, Testing Frequency and Recommended Warranty for High Density Polyethylene (HDPE) Smooth and Textured Geomembranes.
   e. GRI Test Method GM14: Test Frequencies for Destructive Seam Testing.
   f. GRI Test Method GM19: Seam Strength and Related Properties of Thermally Bonded Polyolefin Geomembranes.
   g. GRI Test Method GM29: Field Integrity Evaluation of Geomembrane Seams (and Sheet) Using Destructive and/or Nondestructive Testing.

1.4 SUBMITTALS

A. Submit the following to the Engineer or Owner, for review and approval, within a reasonable time so as to expedite shipment or installation of the Geomembrane:

1. Documentation of manufacturer's qualifications as specified in subsection 1.5A of this Section.
2. Manufacturer's Quality Control program manual or descriptive documentation.
3. A material properties sheet, including at a minimum all properties specified in GRI GM 13, including test methods used.
4. Sample of the material.
5. Documentation of Installer's qualifications, as specified below and in subsection 1.5B of this Section:
   a. Submit a list of at least ten (10) completed facilities. For each facility: provide name and type of facility; its location; the date of installation; phone number of contact at the facility; type and thickness of geomembrane and; surface area of the installed geomembrane.
   b. Submit resumes or qualifications of the Installation Supervisor, Master Seamer and Technicians to be assigned to this project.
   c. Quality Control Program.
6. Example Material Warranty and Liner Installation Warranty complying with subsections 1.8 and 1.9 of this Section.
7. Resin Supplier's name, resin production plant identification, resin brand name and number, production date of the resin, resin Manufacturer's quality control certificates, and certification that the properties of the resin meet the requirements of these specifications.

B. Shop Drawings:

1. Submit copies of shop drawings for engineer's approval within a reasonable time so as not to delay the start of geomembrane installation. Shop drawings shall show the proposed panel layout identifying seams and details. Seams should generally follow direction of the slope. Butt seams or roll-end seams should not occur on a slope unless approved by the Owner's Representative. Butt seams on a slope, if allowed, should be staggered.
2. Placement of geomembrane will not be allowed to proceed until Owner's Representative has received and approved the shop drawings.

C. Additional Submittals (In-Progress and at Completion):

1. Manufacturer's warranty (refer to subsection 1.8).
2. Geomembrane installation warranty (refer to subsection 1.9).
3. Daily written acceptance of subgrade surface (refer to subsection 3.1.B).
4. Low-temperature seaming procedures if applicable (refer to subsection 3.3.A).
5. Prequalification test seam samples (refer to subsection 3.5.A.1.f).
6. Field seam non-destructive test results (refer to subsection 3.5.B.1).
7. Field seam destructive test results (refer to subsection 3.5.C.6).
8. Daily field installation reports (refer to subsection 3.5.G).
9. Installation record drawing, as discussed in subsection 3.5.G).

Electronic Filing: Received, Clerk's Office 09/28/2020

1.5 QUALITY CONTOL

A. Manufacturer's Qualifications:

1. The manufacturer of geomembrane of the type specified or similar product shall have at least five (5) years experience in the manufacture of such geomembrane. In addition, the geomembrane manufacturer shall have manufactured at least 10,000,000 sq. ft of the specified type of geomembrane or similar product during the last five (5) years.

B. Installer's Qualifications:

1 The Geomembrane Installer shall be the Manufacturer, approved Manufacturer's Installer or a contractor approved by the Owner's Representative to install the geomembrane.

2 The Geomembrane Installer shall have at least three (3) years experience in the installation of the specified geomembrane or similar. The Geomembrane Installer shall have installed at least ten (10) projects involving a total of 5,000,000 sq. ft of the specified type of geomembrane or similar during the last three (3) years.

3 Installation shall be performed under the direction of a Field Installation Supervisor who shall be responsible throughout the geomembrane installation for geomembrane panel layout, seaming, patching, testing, repairs, and all other activities of the Geomembrane Installer. The Field Installation Supervisor shall have installed or supervised the installation and seaming of a minimum of ten (10) projects involving a total of 5,000,000 sq. ft of geomembrane of the type specified or similar product.

4 Seaming shall be performed under the direction of a Master Seamer (who may also be the Field Installation Supervisor or Crew Foreman) who has seamed a minimum of 3,000,000 sq. ft of geomembrane of the type specified or similar product, using the same type of seaming apparatus to be used in the current project. The Field Installation Supervisor and/or Master Seamer shall be present whenever seaming, patching, other welding operations, and testing are performed.

5 All seaming, patching, other welding operations, and testing shall be performed by qualified technicians employed by the Geomembrane Installer.

1.6 DELIVERY, STORAGE AND HANDLING

A. Each roll of geomembrane delivered to the site shall be labeled by the manufacturer. The label shall be firmly affixed and shall clearly state the manufacturer's name, product identification, material thickness, roll number, roll dimensions and roll weight.

B. Geomembrane shall be protected from mud, dirt, dust, puncture, cutting or any other damaging or deleterious conditions.

C. Rolls shall be stored away from high traffic areas. Continuously and uniformly support rolls on a smooth, level prepared surface.

D. Rolls shall not be stacked more than three (3) high.

1.7 PROJECT CONDITIONS

A. Geomembrane shall not be installed in the presence of standing water, while precipitation is occurring, during excessive winds, or when material temperatures are outside the limits specified in Section 3.03.

1.8 MATERIAL WARRANTY

A. Material shall be warranted, on a pro-rata basis against Manufacturer's defects for a period of five (5) years from the date of Geomembrane installation.

1.9 GEOMEMBRANE INSTALLATION WARRANTY

A. The Geomembrane Installer shall guarantee the Geomembrane installation against defects in the installation and workmanship for one (1) year commencing with the date of final acceptance.

1.10 GEOMEMBRANE PRE-CONSTRUCTION MEETING

A. Geomembrane Pre-Construction Meeting shall be held at the site prior to installation of the geomembrane. At a minimum, the meeting shall be attended by the Geomembrane Installer, Owner, Owner's representative (Engineer and/or CQA Firm), and the General Contractor.

Electronic Filing: Received, Clerk's Office 09/28/2020

B. Topics for this meeting shall include:

1. Responsibilities of each party.
2. Lines of authority and communication. Resolution of any project document ambiguity.
3. Methods for documenting, reporting and distributing documents and reports.
4. Procedures for packaging and storing archive samples.
5. Review of time schedule for all installation and testing.
6. Review of panel layout and numbering systems for panels and seams including details for marking on geomembrane.
7. Procedures and responsibilities for preparation and submission of as-built panel and seam drawings.
8. Temperature and weather limitations. Installation procedures for adverse weather conditions. Defining acceptable subgrade, geomembrane, or ambient moisture and temperature conditions for working during liner installation.
9. Subgrade conditions, dewatering responsibilities and subgrade maintenance plan.
10. Deployment techniques including allowable subgrade for the geomembrane.
11. Plan for controlling expansion/contraction and wrinkling of the geomembrane.
12. Covering of the geomembrane and cover soil placement.
13. Measurement and payment schedules.
14. Health and safety.

C. The meeting shall be documented by the Owner's Representative and minutes shall be transmitted to all parties.

Part 2 - Products

2.1 SOURCE QUALITY CONTROL

A. Manufacturing Quality Control:

1. The test methods and frequencies used by the manufacturer for quality control/quality assurance of the above geomembrane prior to delivery, shall be in accordance with GRI GM13, or modified as required for project specific conditions.
2. The manufacturer's geomembrane quality control certifications, including results of quality control testing of the products must be supplied to the Owner's Representative within a reasonable time prior to installation. The certification shall be signed by a responsible party employed by the manufacturer, such as the QA/QC Manager, Production Manager, or Technical Services Manager. Certifications shall include lot and roll numbers and corresponding shipping information.
3. The Manufacturer will provide Certification that the geomembrane and welding rod supplied for the project have the same base resin and material properties.

2.2 GEOMEMBRANE

A. The geomembrane shall consist of new, first quality products designed and manufactured specifically for the purpose of this work which shall have been satisfactorily demonstrated by prior testing to be suitable and durable for such purposes. The geomembrane rolls shall be seamless, high density polyethylene (HDPE-Density >0.94g/cm) containing no plasticizers, fillers or extenders and shall be free of holes, blisters or contaminants, and leak free verified by 100 percent in line spark or equivalent testing. The geomembrane shall be supplied as a continuous sheet with no factory seams in rolls. HDPE Geomembranes shall meet the property requirements shown in Table 2(a) of the GRI GM13 Specifications.

B. Material shall be reviewed for conformance to the project specifications by the Owner's Representative.

Part 3 - Execution

3.1 SUBGRADE PREPARATION

A. The area to be covered with geomembrane shall be prepared in accordance with the Section 02200 – Earthwork. The surface shall be smooth and free of ruts and holes, rocks, stones, sticks, sharp objects and debris of any kind.

B. The Geomembrane installer shall provide daily, a certificate of acceptance for the surface to be covered by the geomembrane in that day's operations. The surface shall be maintained in a manner, during geomembrane installation, to ensure subgrade suitability.

C. All subgrade damaged by construction equipment and deemed unsuitable by the Owner's Representative for geomembrane deployment shall be repaired prior to placement of the geomembrane. All repairs shall be reviewed by the Owner's Representative and approved by the Geomembrane Installer. This damage, repair, and the responsibilities of the contractor and Geomembrane Installer shall be defined in the preconstruction meeting.

3.2 GEOMEMBRANE PLACEMENT

A. No geomembrane shall be deployed until the applicable certifications and quality control certificates listed in subsection 1.4 of this Section are submitted to and approved by the Owner's Representative. Should geomembrane material be deployed prior to approval by the Owner's Representative it will be at the sole risk of the Geomembrane Installer and/or Contractor. If the material does not meet project specifications it shall be removed from the work area at no cost to the owner.

B. The geomembrane shall be installed to the limits shown on the project drawings and essentially as shown on approved panel layout drawings.

C. No geomembrane material shall be unrolled and deployed if the material temperatures are lower than 0°C . Temperature limitations should be defined in the preconstruction meeting. Typically, only the quantity of geomembrane that will be anchored and seamed together in one (1) day should be deployed.

D. No vehicular traffic shall travel on the geomembrane other than an approved low ground pressure All Terrain Vehicle or equivalent.

E. Sand bags or equivalent ballast shall be used as necessary to temporarily hold the geomembrane material in position under the foreseeable and reasonably - expected wind conditions. Sand bag material shall be sufficiently close- knit to prevent soil fines from working through the bags and discharging on the geomembrane.

F. Geomembrane placement shall not be done if moisture prevents proper subgrade preparation, panel placement, or panel seaming. Moisture limitations will be defined in the preconstruction meeting.

G. Damaged panels or portions of the damaged panels which have been rejected shall be marked and their removal from the work area recorded.

H. The geomembrane shall not be allowed to "bridge over" voids or low areas in the subgrade. In these areas, the subgrade shall be prepared to allow the geomembrane to rest in intimate contact with the subgrade.

I. Wrinkles caused by panel placement or thermal expansion should be minimized in accordance with section 1.10 B11.

J. Considerations on Site Geometry: In general, seams shall be oriented parallel to the line of the maximum slope. In corners and odd shaped geometric locations, the total length of field seams shall be minimized. Seams shall not be located at low points in the subgrade.

K. Overlapping: The panels shall be overlapped prior to seaming to whatever extent is necessary to affect a good weld and allow for proper testing. In no case shall this overlap be less than 3 in.

3.3 SEAMING PROCEDURES

No geomembrane material shall be seamed when liner temperatures are less than 0°C.

A. No geomembrane material shall be seamed when the sheet temperature is above 75°C as measured by an infrared thermometer or surface thermocouple.

B. Seaming shall primarily be performed using automatic fusion welding equipment and techniques. Extrusion welding shall be used where fusion welding is not possible such as at pipe penetrations, patches, repairs and short (less than a roll width) runs of seams.

C. Fishmouths or excessive wrinkles at the seam overlaps, shall be minimized and when necessary cut along the ridge of the wrinkles back into the panel so as to effect a flat overlap. The cut shall be terminated with a keyhole cut (nominal 1/2 in.- diameter hole) so as to minimize crack/tear propagation. The overlay shall subsequently be seamed. The key hole cut shall be patched with an oval or round patch of the same base geomembrane material extending a minimum of 6 in. beyond the cut in all directions.

3.4 PIPE AND STRUCTURE PENETRATION SEALING SYSTEM

A. Provide penetration sealing system as shown in the Project Drawings.

B. Penetrations shall be constructed from the base geomembrane material, flat stock, prefabricated boots and accessories as shown on the Project Drawings. The pre-fabricated or field fabricated assembly shall be field welded to the geomembrane as shown on the Project Drawings so as to prevent leakage. This assembly shall be tested as outlined in section 3.5.B. Alternatively, where field non destructive testing cannot be performed, attachments will be field spark tested by standard holiday leak detectors in accordance with

Electronic Filing: Received, Clerk's Office 09/28/2020

ASTM 6365. Spark testing should be done in areas where both air pressure testing and vacuum testing are not possible:

1. Equipment for Spark testing shall be comprised of but not limited to: A hand held holiday spark tester and conductive wand that generates a high voltage.
2. The testing activities shall be performed by the Geomembrane Installer by placing an electrically conductive tape or wire beneath the seam prior to welding. A trial seam containing a non welded segment shall be subject to a calibration test to ensure that such a defect (non welded segment) will be identified under the planned machine settings and procedures. Upon completion of the weld, enable the spark tester and hold approximately 1 in. above the weld moving slowly over the entire length of the weld in accordance with ASTM 6365. If there is no spark the weld is considered to be leak free.
3. A spark indicates a hole in the seam. The faulty area shall be located, repaired and retested by the Geomembrane Installer.
4. Care should be taken if flammable gases are present in the area to be tested.

3.5 FIELD QUALITY CONTROL

A. The Owner's Representative shall be notified prior to all pre qualification and production welding and testing, or as agreed upon in the pre construction meeting:

1. Prequalification Test Seams:

   a. Test seams shall be prepared and tested by the Geomembrane Installer to verify that seaming parameters (speed, temperature and pressure of welding equipment) are adequate.
   b. Test seams shall be made by each welding technician and tested in accordance with ASTM D 4437 at the beginning of each seaming period. Test seaming shall be performed under the same conditions and with the same equipment and operator combination as production seaming. The test seam shall be approximately 10 ft- long for fusion welding and 3 ft- long for extrusion welding with the seam centered lengthwise. At a minimum, tests seams should be made by each technician one (1) time every four to six (4–6) hours; additional tests may be required with changes in environmental conditions.
   c. Two (2) 1 in.- wide specimens shall be die-cut by the Geomembrane Installer from each end of the test seam. These specimens shall be tested by the Geomembrane Installer using a field tensiometer testing both tracks for peel strength and also for shear strength. Each specimen shall fail in the parent material and not in the weld, "Film Tear Bond" (F.T.D. failure). Seam separation equal to or greater than 10 percent of the track width shall be considered a failing test.
   d. The minimum acceptable seam strength values to be obtained for all specimens tested are listed in Subsection 3.5.C.4 of this Section. All four (4) specimens shall pass for the test seam to be a passing seam.
   e. If a test seam fails, an additional test seam shall be immediately conducted. If the additional test seam fails, the seaming apparatus shall be rejected and not used for production seaming until the deficiencies are corrected and a successful test seam can be produced.
   f. A sample from each test seam shall be labeled. The label shall indicate the date, geomembrane temperature, number of the seaming unit, technician performing the test seam and pass or fail description. The sample shall then be given to the Owner's Representative for archiving.

B. Field Seam Non-destructive Testing:

1. All field seams shall be non-destructively tested by the Geomembrane Installer over the full seam length before the seams are covered. Each seam shall be numbered or otherwise designated. The location, date, test unit, name of tester and outcome of all non-destructive testing shall be recorded and submitted to the Owner's Representative.
2. Testing should be done as the seaming work progresses, not at the completion of all field seaming. All defects found during testing shall be numbered and marked immediately after detection. All defects found should be repaired, retested and remarked to indicate acceptable completion of the repair.
3. Non-destructive testing shall be performed using vacuum box, air pressure or spark testing equipment.
4. Non-destructive tests shall be performed by experienced technicians familiar with the specified test methods. The Geomembrane Installer shall demonstrate to the Owner's Representative all test methods to verify the test procedures are valid.
5. Extrusion seams shall be vacuum box tested by the Geomembrane Installer in accordance with

Electronic Filing: Received, Clerk's Office 09/28/2020

ASTM D 4437 and ASTM D 5641 with the following equipment and procedures:

a. Equipment for testing extrusion seams shall be comprised of but not limited to: a vacuum box assembly consisting of a rigid housing, a transparent viewing window, a soft rubber gasket attached to the base, port hole or valve assembly and a vacuum gauge; a vacuum pump assembly equipped with a pressure controller and pipe connections; a rubber pressure/vacuum hose with fittings and connections; a plastic bucket; wide paint brush or mop; and a soapy solution.
b. The vacuum pump shall be charged and the tank pressure adjusted to approximately 5 psig.
c. The Geomembrane Installer shall create a leak tight seal between the gasket and geomembrane interface by wetting a strip of geomembrane approximately 12 in. by 48 in. (length and width of box) with a soapy solution, placing the box over the wetted area, and then compressing the box against the geomembrane. The Geomembrane Installer shall then close the bleed valve, open the vacuum valve, maintain initial pressure of approximately 5 psig for approximately ten (10) seconds. The geomembrane should be continuously examined through the viewing window for the presence of soap bubbles, indicating a leak. If no bubbles appear after ten (10) seconds, the area shall be considered leak free. The box shall be depressurized and moved over the next adjoining area with an appropriate overlap and the process repeated.
d. All areas where soap bubbles appear shall be marked, repaired and then retested.
e. At locations where seams cannot be non destructively tested, such as pipe penetrations, alternate nondestructive spark testing (as outlined in section 3.4.B) or equivalent should be substituted.
f. All seams that are vacuum tested shall be marked with the date tested, the name of the technician performing the test and the results of the test.

6. Double Fusion seams with an enclosed channel shall be air pressure tested by the Geomembrane Installer in accordance with ASTM D 5820 and ASTM D 4437 and the following equipment and procedures:

a. Equipment for testing double fusion seams shall be comprised of but not limited to: an air pump equipped with a pressure gauge capable of generating and sustaining a pressure of 30 psig, mounted on a cushion to protect the geomembrane; and a manometer equipped with a sharp hollow needle or other approved pressure feed device.
b. The Testing activities shall be performed by the Geomembrane Installer. Both ends of the seam to be tested shall be sealed and a needle or other approved pressure feed device inserted into the tunnel created by the double wedge fusion weld. The air pump shall be adjusted to a pressure of 30 psig, and the valve closed. Allow two (2) minutes for the injected air to come to equilibrium in the channel, and sustain pressure for five (5) minutes. If pressure loss does not exceed 3 psig after this five (5) minute period the seam shall be considered leak tight. Release pressure from the opposite end verifying pressure drop on needle to ensure testing of the entire seam. The needle or other approved pressure feed device shall be removed and the feed hole sealed.
c. If loss of pressure exceeds 3 psig during the testing period or pressure does not stabilize, the faulty area shall be located, repaired and retested by the Geomembrane Installer.
d. Results of the pressure testing shall be recorded on the liner at the seam tested and on a pressure testing record.

C. Destructive Field Seam Testing:

1. One (1) destructive test sample per 500 lin. ft seam length or 750 lin. ft., where seaming is performed by an International Association of Geosynthetic Installers (IAGI) Certified Welding Technician using an automatic welding device per GRI GM 29 (Track 2) shall be taken by the Geomembrane Installer from a location specified by the Owner's Representative. The Geomembrane Installer shall not be informed in advance of the sample location. In order to obtain test results prior to completion of geomembrane installation, samples shall be cut by the Geomembrane Installer as directed by the Owner's Representative as seaming progresses.
2. All field samples shall be marked with their sample number and seam number. The sample number, date, time, location, and seam number shall be recorded. The Geomembrane Installer shall repair all holes in the geomembrane resulting from obtaining the seam samples. All patches shall be vacuum box tested or spark tested. If a patch cannot be permanently installed over the test location the same day of sample collection, a temporary patch shall be tack welded or hot air welded over the opening until a permanent patch can be affixed.
3. The destructive sample size shall be 12 in.- wide by 36 in.- long with the seam centered lengthwise. The sample shall be cut into three (3) equal sections and distributed as follows: one (1) section given to the Owner's Representative as an archive sample; one (1) section given to the Owner's Representative for laboratory testing as specified in paragraph 5 below; and one (1) section retained

Electronic Filing: Received, Clerk's Office 09/28/2020

by the Geomembrane Installer for field testing as specified in paragraph 4 below.

4. For field testing, the Geomembrane Installer shall cut ten (10) identical 1 in.- wide replicate specimens from his sample. The Geomembrane Installer shall test five (5) specimens for seam shear strength and five (5) for peel strength. Test results shall be assessed in accordance with Section 6.1 of GRI GM19 to the values shown in Table 1(a) of GRI GM19.
5. If independent seam testing, where required by the specifications, shall be conducted in accordance with ASTM 5820 or ASTM D4437 or GRI GM 6.
6. Reports of the results of examinations and testing shall be prepared and submitted to the Owner's Representative.
7. For field seams, if a laboratory test fails, that shall be considered as an indicator of the possible inadequacy of the entire seamed length corresponding to the test sample. Additional destructive test portions shall then be taken by the Geomembrane Installer at locations indicated by the Engineer, typically 10 ft on either side of the failed sample and laboratory seam tests shall be performed. Passing tests shall be an indicator of adequate seams. Failing tests shall be an indicator of non-adequate seams and all seams represented by the destructive test location shall be repaired with a cap-strip extrusion welded to all sides of the capped area. All cap-strip seams shall be non-destructively vacuum box tested until adequacy of the seams is achieved. Cap strip seams exceeding 150 ft in shall be destructively tested.

D. Identification of Defects:

1. Panels and seams shall be inspected by the Installer and Owner's Representative during and after panel deployment to identify all defects, including holes, blisters, undispersed raw materials and signs of contamination by foreign matter.

E. Evaluation of Defects: Each suspect location on the liner (both in geomembrane seam and non-seam areas) shall be non-destructively tested using one (1) of the methods described in Section 3.05.B. Each location which fails non-destructive testing shall be marked, numbered, measured and posted on the daily "installation" drawings and subsequently repaired:

1. If a destructive sample fails the field or laboratory test, the Geomembrane Installer shall repair the seam between the two (2) nearest passed locations on both sides of the failed destructive sample location.
2. Defective seams, tears or holes shall be repaired by reseaming or applying an extrusion welded cap strip.
3. Reseaming may consist of either:
   a. Removing the defective weld area and rewelding the parent material using the original welding equipment; or
   b. Reseaming by extrusion welding along the overlap at the outside seam edge left by the fusion welding process.
4. Blisters, larger holes, and contamination by foreign matter shall be repaired by patches and/or extrusion weld beads as required. Each patch shall extend a minimum of 6 in. beyond all edges of the defects.
5. All repairs shall be measured, located and recorded.

F. Verification of Repairs on Seams: Each repair shall be non-destructively tested using either vacuum box or spark testing methods. Tests which pass the non-destructive test shall be taken as an indication of a successful repair. Failed tests shall be reseamed and retested until a passing test results. The number, date, location, technician and test outcome of each patch shall be recorded.

G. Daily Field Installation Reports: At the beginning of each day's work, the Installer shall provide the Engineer with daily reports for all work accomplished on the previous work day. Reports shall include the following:
1. Total amount and location of geomembrane placed;
2. Total length and location of seams completed, name of technicians doing seaming and welding unit numbers;
3. Drawings of the previous day's installed geomembrane showing panel numbers, seam numbers and locations of non-destructive and destructive testing;
4. Results of pre-qualification test seams;
5. Results of non-destructive testing; and
6. Results of vacuum testing of repairs.

H. Destructive test results shall be reported prior to covering of liner and within forty-eight (48) hours.

Electronic Filing: Received, Clerk's Office 09/28/2020

3.6 LINER ACCEPTANCE

A. Geomembrane liner will be accepted by the Owner's Representative when:

1. The entire installation is finished or an agreed upon subsection of the installation is finished;
2. All Installer's QC documentation is completed and submitted to the owner
3. Verification of the adequacy of all field seams and repairs and associated geomembrane testing is complete.

3.7 GEOMEMBRANE ANCHOR

A. Construct as specified on the project drawings.

3.8 DISPOSAL OF SCRAP MATERIALS

A. Upon completion of installation, the Geomembrane Installer shall dispose of all trash and scrap material in a location designated by the Owner's Representative, remove equipment used in connection with the work herein, and shall leave the premises in a neat acceptable manner.

END OF SECTION 02400

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02508 – CRUSHED STONE SURFACING

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Division 1-General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Furnishing and installing materials for gravel roadbed construction for proposed access roads and embankment crests.

B. Related Sections include the following:

1. Division 2 02222 "Earthwork."
2. Division 2 02373 "Geotextiles."

1.3 REFERENCES

A. The following references, or cited portions thereof, govern the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2012 and Supplemental Specifications adopted January 1, 2014.
2. American Society for Testing and Materials (ASTM):

a. ASTM D 75 (2003) Practice for Sampling Aggregates.
b. ASTM D 422 (1963; R 2002) Test Method for Particle-Size Analysis of Soils.

3. American Geological Institute (AGI). Geoscience handbook AGIi data sheets, 4th edition.

1.4 SUBMITTALS

A. Product Data:

1. Aggregate source list: submit a list of proposed aggregate sources.
2. Shipping Tickets: Submit shipping tickets for the granular materials delivered to the site. Shipping tickets shall be according to paragraph 1004.01f of the IDOT Standard Specifications.

B. Test Reports.

1. Submit results of grain size analysis (ASTM D422). Test results are required for each proposed source and gradation. Submit test results for each source, demonstrating compliance with aggregate quality requirements specified herein.

C. Samples:

1. Submit one (1) sample per source for each gradation proposed for use on the project. Samples shall be at least 1 lb. and shall be obtained and shipped according to ASTM D75.

1.5 STORAGE AND HANDLING

A. Storage and handling of granular materials shall be according to paragraph 1004.01e of the IDOT Standard Specifications.

Electronic Filing: Received, Clerk's Office 09/28/2020

PART 2 – PRODUCTS

2.1 MATERIALS

A. General:

1. Aggregate Surface Course, Type B:

a. Aggregate Surface Course, Type B used for surface material for all new access roads and impoundment crests shall be IDOT Gradation CA 6, in accordance with Section 1004.04 of the IDOT Standard Specifications for Road and Bridge Construction.

PART 3 – EXECUTION

3.1 ROADWAY CONSTRUCTION

A. Prepare the roadway subgrade as shown on the plans, in accordance with Section 02200 – Earthwork.

B. Furnish and Install Geotechnical Fabric for Ground Stabilization in accordance with Section 02373 – Geotextiles.

C. Furnish and Install Aggregate Surface Course, Type B in accordance with Article 402 of the IDOT Standard Specifications for Road and Bridge Construction.

3.2 TESTING

A. Independent gradation tests will be made by the Owner's Testing Lab during the progress of the work at frequencies as required in the project Construction Quality Assurance (CQA) Plan. The Contractor shall cooperate with the Testing Lab and allow such tests to be performed.

B. If tests indicate that an area of granular material or coarse aggregate does not meet the specified requirements of the project CQA Plan, then the Contractor shall remove the material and replace it with suitable material.

END OF SECTION 02508

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02730 – STORM DRAINAGE

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Division 1-General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Furnishing and installing pipe, manholes and end sections for pipe culverts and storm sewers.
2. Storm Drainage installation shall include incidental related work such as topsoil removal, trench excavation, backfill, compaction, tie-in of existing system, etc..

B. Related Sections include the following:

1. Division 02 02222 "Earthwork."

1.3 REFERENCES

A. The following reference, or cited portions thereof, governs the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2012 and Supplemental Specifications adopted January 1, 2014. Payment provisions shall not apply.

PART 2 - PRODUCTS

2.1 PIPE

A. HDPE Pipe shall be Dual-Wall Corrugated PE (Polyethylene) with a Smooth Interior, in accordance with AASHTO M 294-Type S.

B. Reinforced Concrete Pipe (RCP) shall be constructed in accordance with Article 1042.06(a). All pipe shall be strength Class V per AASHTO M 170.

2.2 PRECAST REINFORCED FLARED END SECTIONS

A. Precast Reinforced Flared End Sections shall be constructed in accordance with Article 1042.07 of the Standard Specifications and IDOT Standard Drawing 542301-03.

2.3 PRECAST CONCRETE MANHOLES

A. Precast Concrete Manholes shall be constructed in accordance with Article 1042.10 of the Standard Specifications and IDOT Standard Drawing 602401-03.

B. Manhole steps shall be copolymer polypropylene plastic with a continuous 1.5-inch steel reinforcement as manufactured by M.A. Industries Inc. or an approved equal.

2.4 CASTINGS

A. Castings are to be made of gray cast iron.

B. Frame & Lids Type 1 shall be cast according to IDOT Standard Drawing 604001-03.

PART 3 – EXECUTION

3.1 STORM DRAINAGE PIPING INSTALLATION

A. Install piping in accordance with the Article 542 of the Standard Specifications. Bedding and Haunching shall be IDOT CA-6 Gradation. Trench excavations are to be backfilled with trench excavated materials.

Electronic Filing: Received, Clerk's Office 09/28/2020

Compact backfill to 95 percent of the maximum dry density as determined by the Standard Proctor test – ASTM D-698.

3.2 END SECTION INSTALLATION

A. End Treatments shall be installed according to Article 542.07 of the Standard Specifications.

3.3 MANHOLE INSTALLATION

A. Manholes shall be installed according to Article 602 of the Standard Specifications.

END OF SECTION 02730

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02831 – CHAIN LINK FENCES AND GATES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, Division 1-General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Fence framework, fabric, and accessories.
2. Gates.
3. Fence post foundations.

B. Related Sections include the following:

2. Division 02 02222 "Earthwork."

PART 2 – PRODUCTS

2.1 MATERIALS

A. Chain Link Fabric: In accordance with ASTM Standard A491, latest revision; 7'-0" high, made of No. 9 gauge steel wire, woven in a 2 inch mesh and coated with a Class II aluminum coating of 0.4 oz/sf. Top and bottom selvages shall have a twisted and barbed finish.

B. Fabric Ties: Fabric shall be fastened to the line posts with aluminum tie wires spaced 24 inches apart. Standard fabric stretcher bars and stretcher bar bands shall be furnished where required.

C. Posts: Posts shall be made of galvanized steel pipe, sized as follows:

Line Posts	2.375" OD (3.65#/ft)
Terminal (end/corner/pull) Posts	2.875" OD (5.79#/ft)
Gate Posts	SEE PLANS

Posts shall be evenly spaced, but in no instance should spacing greater than 10 feet be used.

D. Gates: Gates shall be constructed of 2.0" O.D. (minimum) galvanized steel pipe (2.72#/ft.), 8 feet high overall complete with malleable iron ball and socket hinges, stops, and center rest. The hinges shall permit the gate to swing open over 90 degrees in both directions. Provide latch with integral eye opening for padlocking; padlock accessible from both sides of gate.

E. Braces: Galvanized standard construction braces shall be provided between each terminal and gate posts and the first adjacent post.

F. Top Rails: The top rail shall be made of galvanized steel pipe 1 5/8" O.D. 2.27#/ft., provided with couplings approximately every 20 feet. Couplings shall be outside sleeve type and at least 7" long. One coupling in every five shall have a heavy spring to take up expansion and contraction of the top rail. The rail shall pass through the base of line post tops and form a continuous brace from end to end of each stretch of fence. The top rail shall be securely fastened to terminal posts by means of malleable iron or pressed steel clamps.

G. Barbed Wire: Barbed wire shall be United States Alumoweld Co. "Alumoweld" Four Point Type Light Weight (two 0.080" diameter strands). If Alumoweld barbed wire is not available, two 12.5 gage strands, with an aluminum coating equal to that specified per the fence fabric may be substituted.

H. Extension Arms: For fences with 7 foot fabric, galvanized standard construction extension arms arranged to carry three strands of barbed wire shall be provided for line posts. The topmost strand shall be approximately 12" above the fence. Extension arms shall be 45 degrees to the outside. The three strands of barbed wire on terminal and gate posts and gates shall be attached directly to the vertical post or gate frame.

I. Galvanizing: Galvanized steel pipe for posts, gates, top rail and removable panels shall be in

Electronic Filing: Received, Clerk's Office 09/28/2020

accordance with ASTM Standard A120, latest revision. No used, re-rolled, or open seam material will be permitted. Other fittings and hardware shall be galvanized according to ASTM Standard A153, latest revisions.

J. Bottom Tension Wire: The bottom tension wire should be No. 7 gauge aluminum coated spring coil or crimped wire. Minimum weight of coating shall be 0.40 oz/sf of wire surface. Tension wire shall be stretched taut from terminal post to terminal post and evenly fastened to each intermediate post 6 inches above the grade line. Tension wire shall be attached to the fence fabric with aluminum hog rings every 24 inches.

K. Footing Concrete: Ultimate strength of 3,000 psi at 28 days; 5.5 sacks (minimum) of cement per cubic yard; 6.5 gallons (maximum, including free moisture on aggregate) per sack of cement; 3/4" maximum aggregate size; 3%-5% air entrainment; mixed per ASTM C94.

PART 3 – EXECUTION

3.1 CONSTRUCTION

A. The fence shall follow the ground line unless otherwise specified. It shall be neat, plumb, aligned true, stretched taut, and free from sags and bellies. Sufficient terminal posts must be provided to insure that bottom closure shall be within one inch of the ground surface elevation.

B. Terminal Posts (end, corner, pull, brace) and Gate Posts shall be set in concrete footings as shown on the plans. The top of the footing shall be sloped away from the post to drain moisture. In most instances, fence posts are installed before yard rock is placed. The installer shall make sure that the concrete footing extends above earth subgrade a sufficient amount so that the footing will be 1 inch above finished rock surface after the rock is placed.

C. Line Posts shall be driven to a minimum depth of 60" below the finished earth grade.

D. Provide at least one electrical ground for each 1,000 ft. of fence, located near the center of the run. Provide additional grounds directly under each point where power lines pass over the fence. Vertically drive or drill the grounding rod until the top of the rod is approximately 12 in. below the top of the ground. Connect a No. 8 solid copper conductor to the rod and to the fence by a UL-listed method so that each element of the fence is grounded.

END OF SECTION 02831

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02936 – TOPSOIL, SEEDING AND MULCHING

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Division 1-General Requirements, apply to this Section.

1.2 SECTION INCLUDES

A. This Section includes the following:

1. Seeding and placing mulch, turf reinforcement mat (TRM), or erosion control blanket (ECB) over seeded areas.

B. Related Sections include the following:

2. Division 02 02222 "Earthwork."

1.3 REFERENCES

A. The following reference or cited portions thereof, current at date of bidding documents unless otherwise specified, governs the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2012, and Supplemental Specifications, adopted January 1, 2014.

1.4 SPECIFICATIONS

A. Work shall conform to the applicable requirements of Sections 250 and 251 of Standard Specifications for Road and Bridge Construction and to the requirements hereinafter specified.

B. Exceptions: All references in the IDOT specifications to methods of measurement and payment shall not apply.

1.5 WARRANTY

A. Warranty for one (1) year plus one growing season from date of substantial completion shall be provided.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Topsoil: Topsoil shall be loam texture soils from the A horizon of soil profiles of local soils, as defined in the USDA Soil Texture Triangle. The soil shall have an organic content between one and ten percent according to AASHTO T 194. It shall be relatively free from large roots, sticks, weeds, brush, or stones larger than 3/4 in. in diameter, or other litter and waste products. At least 90 percent shall pass the No. 10 sieve according to Illinois Modified AASHTO T 27, and the pH shall be between 5.0 and 8.0 according to ASTM D 4972. Topsoil shall be capable of supporting and germinating vegetation.

B. Seed: Seed mixture shall IDOT Class 1B Low Maintenance Lawn Mixture per Article 250 of the IDOT Standard Specifications, and composed as follows:

Seed Type	Pounds/Acre
Fine-Leaf Turf-Type Fescue	150
Perennial Ryegrass	20
Red Top	10
Creeping Red Fescue	20

B. Hydraulic Mulch material shall conform to Article 1081.06(a)(2) of the IDOT Standard Specifications.

C. Erosion Control Blanket (ECB) shall be Bionet SC150BN as produced by North American Green or an Engineer approved equal.

Electronic Filing: Received, Clerk's Office 09/28/2020

D. Turf Reinforcement Mat (TRM) shall be VMAX SC250 as produced by North American Green or an Engineer approved equal.

E. Fertilizer and agricultural ground limestone may be used.

PART 3 – EXECUTION

3.1 CONSTRUCTION

A. The upper 6-inches of all earth fill placement, including the vegetative cover, shall be comprised of topsoil.

B. Seed bed preparation and seeding methods shall conform to Section 250 of the IDOT Specifications. Seeding of areas disturbed by construction activities after September 30, 2015 may be deferred until Spring 2016 at no additional cost to the Owner.

B. Seeded areas shall be hydraulically mulched concurrently with seeding at a rate of 1 ton or Hydraulic Mulch per acre.

C. Turf Reinforcement Mat (TRM) and Erosion Control Blanket (ECB) shall be installed per the manufacturers published guidelines at locations shown on the plans.

3.2 MAINTENANCE OF COMPLETED WORK

A. All areas seeded by the Contractor shall be maintained by the Contractor during the period between completion of such work and final completion and acceptance of the Contractor's work by the Owner. This maintenance shall be such that the completed work, at time of acceptance, complies in all respects with the requirements herein specified.

B. The areas seeded will be required to germinate. If the seed does not germinate, the Contractor will be required to regrade and reseed at no additional cost to the Owner.

END OF SECTION 02936

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX A - SAFETY AND CONTRACTOR REQUIREMENTS

1.0 GENERAL CONTRACTOR SAFETY REQUIREMENTS

Contractor and their employees are responsible for their safety.

1.1 Contractor General Requirements

1.1.1 Contractor supervision and personnel shall obtain site-specific training. This will include, but not be limited to:

- Workman's Protection Assurance (WPA) / Hold Tag Equipment Lock-out
- Hot Works
- Confined Spaces
- Commissioning WPA Procedure
- Other Safety Requirements listed in this specification

Note: Contractor employees may be barred from Ameren property for failure to comply with WPA procedures. Contract may be terminated or Contractor may lose future work for failure to enforce WPA. See the following WPA Authorization Form (Attachment A5) for sign-on access to the Ameren automated WPA system at each plant site.

1.1.2 Contractor administers appropriate disciplinary action if their employees violate Job Working Rules.

1.1.3 Contractor must hold daily job briefings.

1.1.4 All rolling equipment must be inspected prior to use.

1.1.5 Ameren reserves the right to bar any individual from Company property.

1.2 Rules to Live By

Rules to Live By is focused on activities that have the potential to produce a fatality or serious injury. While there are many hazards that can produce serious injuries, the items listed below are so significant that a single violation warrants immediate intervention by the Contractor. Actions determined to be in violation of these rules may result in permanent barring from all Ameren facilities. Ameren may conduct an independent investigation as necessary.

- Fall Protection – Failure to use proper fall protection when there is a risk of a fall that is greater than 6 feet
- WPA (Lock Out / Tag Out) – Violation of a tag, lock or tag-out device that is used for employee and contractor protection.
- Electrical Safety – Failure to follow the proper procedures and wear proper personal protective equipment when working on energized equipment.
- Confined Space Entry – Failure to evaluate a confined space and perform air monitoring checks prior to entry.
- Rigging / Hoisting – Walking or working under a suspended load.
- Trenching and Shoring – Entering an excavation greater than 5 feet deep that has not been properly sloped or shored.

1.2.1 It is the expectation that the Contractor will enforce our RTLB program and discipline the RTLB violators. All violators will be removed immediately from the site, after which the Contractor will be required to formally submit on their letterhead a detailed report on the incident, noting internal meeting(s), additional training that was conducted, and what will be done to prevent a reoccurrence, prior to return of the employee.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.2.2 Violations of other safe work practices also may result in permanent barring from all Ameren Facilities.

1.2.3 Contractors will be assessed $2,000 per RTLB violation that Ameren personnel find during the project. Contractor is to donate assessment to a mutually agreed-upon charity.

1.3 Safe Work Practices

1.3.1 Hard hats with bill facing forward, appropriate safety shoes and foam-lined safety glasses with side shields **must be worn at all times in all locations** past the Construction Gate. Safety shoes must be compliant with ANSI Z41 effective January 2008. Safety glasses must be compliant with ANSI Z87.1 or equivalent. Supervisors may permit the removal of hard hats and safety glasses in areas such as trailers, or training rooms.

1.3.2 Wear a hardhat, safety glasses, and a welding hood when welding.

1.3.3 Wear foam-lined safety goggles over non-safety rated prescription eyewear.

1.3.4 Foam-lined safety glasses shall be worn at all times. Contractor employees who wear prescription safety eyewear shall also have the foam-lined feature.

1.3.5 Face shields must be worn over safety glasses when grinding, chipping, jack hammering, power sawing, handling hazardous chemicals, or performing other tasks that could result in a face or eye injury.

1.3.6 Wear appropriate gloves to protect hands from cuts, burns, temperature extremes, chemicals, biological agents or other hazards.

1.3.7 Wear hearing protection when performing noisy work, such as jack-hammering, or where posted.

1.3.8 Hair must be cut or contained above shoulder length and must not interfere with protective headgear.

1.3.9 Shorts, shirts without sleeves or with sleeves rolled up above the shoulder are not permitted.

1.3.10 Gas bottles must be secured to prevent tipping. Gas bottles must be capped or have a regulator installed. Oxy/acetylene bottles must be separated by at least 20-foot or a 5-foot barrier with a one-hour fire rating while in storage.

1.3.11 During welding or "burning":

- Use temporary shielding to protect personnel beside, above and below the work; free falling of sparks below a cutter/welder's feet is not allowed
- Contain slag, sparks, etc.
- Place weld rod stubs in containers after removal from stingers, and place all other trash in appropriate containers.

1.3.12 Safety harnesses are required when working on surfaces over six (6) feet high that do not have guardrails or other fall protection. Attach lanyards and lifelines to structural members capable of supporting the load requirement (5000 lbs. anchor point).

1.3.13 On portable man lifts, fall protection is required per manufacturer's instructions. The lift must be secure and stable prior to use.

1.3.14 For overhead work rolling scaffolds, mechanical lift platforms are preferred over ladders.

1.3.15 If straight or extension ladders must be used, one worker must hold the ladder until another worker has tied the top to a substantial anchor point. Prior to working above 6 feet off the straight or extension ladder, worker is to don fall protection harness with lifeline, using or establishing an anchor point overhead for clip attachment, as required by Rules to Live By.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.3.16 If a step ladder must be used when the worker's feet are on or above the fifth rung, the top of the ladder must be tied to a substantial anchor or a second worker must hold the ladder. Prior to working above 6 feet off the step ladder, worker is to don fall protection harness with lifeline, using or establishing an anchor point overhead for clip attachment, as required by Rules to Live By.

1.3.17 Daily clean-up of the work area is required. Keep stairways and aisles clear at all times. Tie extension cords, welding leads, air hoses, etc., to middle rail of the handrail and/or route overhead.

1.3.18 Barricade at least 6 feet from the hole or edge if grating or handrail sections are being removed or installed.

1.3.19 Barricade below lifting/hoisting activities, including both critical and non-critical lifts.

1.3.20 All electrical junction boxes, duct panels, etc., are to be kept closed whenever possible.

1.3.21 Vent gas-powered equipment, such as welders, generators, compressors or power tools, to the outdoors. Exhaust from equipment near doors must not enter the plant when the doors are opened.

1.3.22 Plant Fire System Equipment is NOT for routine work unless specifically authorized by the Plant.

1.3.23 If the plant allows Contractor employees to use elevators, observe the following rules:

- No equipment on elevators may extend through the roof access opening.
- Transport bulk materials in freight elevators and obey the posted weight limits.
- Only tools and materials that can be carried by hand are allowed on passenger elevators.

1.3.24 Qualified electricians are required to wear fire-retardant (FR) clothing or 100% natural fibers when working on exposed, energized circuits. FR clothing must meet arc flash labels and be appropriate for the tasks being performed.

1.3.25 Reflective safety vests must be worn by all personnel who work on or near active highways, roads, or parking lots. Vests are also required for other work that places personnel near motor vehicles such as flaggers, riggers, survey crews, etc. ANSI/ISEA 107, Class III high-visibility reflective safety vests shall be worn for maximum visibility. Ameren may require vests on other projects.

1.3.26 Ground Fault Circuit Interrupters (GFCI's) shall be used to protect all 120 VAC electrical equipment including electric hand tools and cord sets. The use of 480 VAC GFCI's is required when working in wet locations.

1.3.27 Adding slugs within electrical devices requires written approval by Ameren representative. Equipment rated fuses and/or circuit breakers shall not be removed and replaced with ones of different set parameters without written approval by an Ameren representative

1.3.28 Contractor shall follow safety requirements for working on elevated platforms per Elevated Platform Safety Requirements (Appendix Y).

1.3.29 We want this to be a SAFE job. YOU CAN HELP. Report all unsafe acts and conditions to your Supervisor. Consult a Contractor or Ameren Supervisor if there are any questions about work rules or safety requirements.

1.4 Other Safety Requirements

1.4.1 If outages are required, the Contractor shall coordinate with the SPOC to obtain lock-outs and releases in accordance with the Plant's WPA/Hold Card procedures and operating practices. Equipment with a WPA/Hold Card tag shall never be serviced or removed.

1.4.2 Contractors must comply with all Federal, State and Local laws, regulations and ordinances for work in permit-required confined spaces. Contractors shall obtain information from the plant designee on the location and other pertinent information regarding confined space entry. Any entry involving both Contractor and Ameren employees shall be coordinated through the SPOC. For reference, review

Electronic Filing: Received, Clerk's Office 09/28/2020

Appendix Z for a list of identified confined spaces at the different Energy Centers. Appendix Z shall be used as a guide and not be considered a complete list.

1.4.3 Only qualified and authorized persons should work on energized electrical equipment as per Ameren procedure AUE-ADM-5002, Energized Equipment Electrical Safety Program. If applicable to specified work scope, the SPOC will supply a copy of AUE-ADM-5002.

Contractor shall not work on energized equipment without the express, written consent of the SPOC. In no case shall the Contractor work on or near (within reach of) energized equipment without the use of appropriate insulated tools to perform the work. Violators of this policy will be subject to disciplinary action, including a minimum $10,000 fine, and up to and including termination of employment.

1.4.4 All lifting/hoisting activities near overhead, high tension power lines must include awareness of and observance of the following safe working clearances:

13.8 kV	10 feet
69 kV	11 feet
138 kV	13 feet
161 kV	14 feet
230 kV	16 feet
345 kV	29 feet

1.4.5 Ameren must review contractor qualifications before contractor employees may work in high voltage areas.

1.4.6 Contractor shall coordinate hot work, (i.e., welding, brazing, heating and cutting), with Company personnel to assure that Ameren safety requirements are met as outlined on Hot Work Permit (Attachment A8).

1.4.6.1 A Hot Work Checklist/Permit must be utilized when performing hot work such as welding, cutting, grinding, or any other activity that produces sparks. Contractor may use their own forms or Ameren's but work should be coordinated through the SPOC.

1.4.7 Plant equipment identified with a nuclear radiation symbol (as seen below) is NOT to be serviced by unauthorized personnel):

1.4.8 All equipment on the project shall be used in accordance with Federal, State, and Local ES&H requirements in addition to the manufacturer's instructions and guidelines. Equipment shall not be modified in any way for use other than what the manufacturer intended.

1.4.8.1 Any alterations must be approved by the manufacturer in writing. Only trained and authorized persons shall operate machinery or equipment.

1.4.8.2 Use hand-held power tools only for their intended purpose. Do not use tools that are broken, have dull blades, dull bits, have damaged cords, or have damaged/missing

Electronic Filing: Received, Clerk's Office 09/28/2020

guards. Hand-held power tool switches should not be modified by any means to maintain power without constant trigger pressure. (Ref. OSHA 29CFR1910.243.

1.4.8.3 All Grinders guards/handles must remain on grinders at all times. If a guard or handle is required to be removed because of a tight work area, a permit must be completed and maintained at work location. See Grinder Plan (Attachment A6).

1.4.9 Ameren expects that all Electrical Contractors will follow the common work practice that a check of all wires being demoed is performed to ensure that all wires are dead and de-terminated before wrecking. If wires are found live, verification will be made prior to wires being terminated or cut.

1.4.10 Barricades

NOTE: Do not rely on barricade tape and flags to prevent a fall that is more than 6 feet.

- **When attended, install barricade tape no less than 6 feet from opening.**
- **Use fall protection if personnel are working closer than 6 feet to the opening.**
- **When unattended, cover the floor opening with a temporary cover, or temporary handrails 42 inches in height that include a mid-rail and toe board. Temporary covers must be able to support at least twice the load to which they will be subjected (including people, equipment and/or vehicle traffic).**
- **Temporary covers must be secured when installed in such a way as to prevent accidental movement by wind, traffic, or employees.**

1.4.10.1 Barricades must be used to warn employees about a hazard or restrict employees' access to a hazardous area. Barricades must have an information tag listing the responsible person, date of erection, and purpose. Barricade signs should indicate the Contractor, reason, and expiration date/time. Remove the barricade when work is completed. See Barricade Tag (Attachment A4).

1.4.10.2 Any employee may erect a barricade. The person responsible for the barricade must remove it when the hazard no longer exists.

NOTE: Any time red Barricade tape is to be used, the Contractor must inform the Construction Project Lead/SPOC, who in turn will notify the Shift Supervisor.

- **Red barricade tape** shall be used to warn personnel DO NOT ENTER dangerous areas. These areas may only be entered with authorization from the person who erected the barricade.
- **Yellow and magenta tape** shall be used to warn personnel DO NOT ENTER an area because radiography is creating a radiation hazard.
- **Yellow barricade tape** shall be used to warn personnel of immediate hazards that have the potential to cause injury. Areas barricaded with yellow may be entered once the hazard is identified and can be avoided.
- **Green barricade tape** shall be used to warn personnel of possible exposure to hexavalant chromium. Respiratory protection is required in these areas.

Contractors are responsible for compliance with the OSHA Regulation on Hexavalant Chromium. "Regulated Areas" should be clearly demarcated with Green barricade tape with a caution tag that clearly states the hazard in the work area (e.g., "Hex Chrome Exposure – Respiratory Protection Required"). In general, regulated areas should be established a minimum distance from the activity as described below;

1. 5 Feet – Welding on boiler tubes, steam piping and other materials that contain 2.5% chromium or less

Electronic Filing: Received, Clerk's Office 09/28/2020

2. 10 Feet – Welding on Stainless steel and other materials that contain more than 2.5% chromium.

3. 20 Feet and/or Visible plume – Plasma arc cutting, air arc cutting, chamfer-trodes, cut-trodes and other processes lacking sufficient air monitoring data by Ameren for the protection of our employees.

Contractors are responsible for air monitoring as required for their employee protection and validation of engineering controls. The guidelines for barricading are based on employee exposures based on collection of data by Ameren. These distances are guidelines and may be increased or decreased based on air monitoring data. Ameren Safety Department will request air monitoring data at the beginning of each job, especially if the process is new or not sufficiently monitored in the past.

- A Nuclear Radiation Sign (see Item 1.4.7 above) is used to warn unauthorized personnel not to tamper with or remove instruments or equipment.

- Flashing yellow lights may be used with barricades.

- Other barricades may be used for roadwork and for other special situations.

1.4.10.3 When determining and setting overhead load path barricade boundaries, Contractors shall include within the boundary the potential for dropping load during load swing (failed load path). All elevations affected per this potential 'failed load path' shall be barricaded.

1.4.11 Incident/Accident Reporting

1.4.11.1 In the event of a incident/injury to a Contractor or Subcontractor employee, the SPOC shall be notified ASAP, and a written report provided no later than 24 hours after the incident/injury.

1.4.11.1.1 This notification shall include a detailed description of the accident or injury, including the names of those involved. (Incident/Accident Investigation Report (Attachment A1)) and (Witness Statement (Attachment A2)) must be utilized to provide the required notification.

1.4.11.1.2 OSHA Recordable injuries and minor injuries requiring first aid must be recorded using the First Aid Register (Attachment A3), which must be forwarded to the SPOC.

1.4.11.1.3 On Ameren Coordinated Insurance Program (ACIP) projects, copies of all first reports of injury and supporting investigation information should be faxed to the designated claims manager and ACIP broker (see Ameren Safety Supv. for contact numbers).

1.4.11.2 **For any serious incident or injury:**

- **First — Notify the Plant Shift Supervisor or designee immediately.** The Shift Supervisor will make the Emergency call and implement appropriate Plant Emergency Response procedures.

- **Second — Provide First Aid for the injured** as required until professional Emergency Responders arrive.

- **Third — Secure the area** to ensure safety of other personnel.

- **Fourth — Notify the SPOC** via phone, PA, radio, or in person.

1.4.11.3 The accident scene must be secured for the accident investigation. Equipment or material can only be moved to prevent further injury until a review of the accident is completed.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.4.11.4 Follow up verbal messages to the SPOC with written notifications within 24 hours as directed in Item 1.4.11.1.

1.4.12 Imminent Danger Situations

1.4.12.1 Contractor must suspend work immediately upon discovery of any situation that may, in their opinion, reasonably be expected to cause serious physical harm, illness, death, or significant environmental or equipment damage.

1.4.12.2 ES&H concern(s) must be corrected, to the satisfaction of the Contractor and Company, before work may resume.

1.4.12.3 Examples of "imminent danger" situations may include, but are not limited to the following:

- Falls from elevations
- Excavations not properly sloped or shored
- Radiation hazards
- Electrocution hazards
- Injury to the public
- Unsafe operation of vehicles, machinery or heavy equipment
- Improper or non-existent WPA/Hold Card equipment lockout
- Release of hazardous substances (OSHA 40CFR Part 302) into the environment in excess of the reportable quantity

1.4.13 Abandoned Piping and Demolishing Abandoned Piping

Ameren expects all Contractors to follow the Guidelines for Abandoned Piping and Demolishing Abandoned Piping (Attachment A20), while performing work on piping and/or utilities which are considered to be abandoned or will be abandoned in place.

1.4.14 Excavations

1.4.14.1 Contractor shall non-destructive excavate all underground construction activities, unless given approval by the SPOC to do otherwise.

1.4.14.2 High Suction Vacuum Contractors working at the Ameren site must have a vacuum relief valve located within equipment, a vacuum break at the point of operation, along with equipment that is grounded while operating.

2.0 WORKERS PROTECTION ASSURANCE PROCEDURE FOR OUTSIDE CONTRACT OR CONSTRUCTION PERSONNEL

GENERAL

It is necessary to assure the safety of outside contract personnel and Ameren personnel throughout construction of new system equipment and/or modification of existing system equipment. The following is a brief outline of procedures, to guide outside contract personnel in dealing with Ameren operating authorities to obtain Worker's Protection Assurances (WPA).

2.1 Definition

2.1.1 Worker's Protection Assurance:

WPA is the name given to the process used by Ameren to ensure the safety of those who work on generation, transmission and substation equipment.

2.1.1.1 Its primary purpose is to ensure the SAFETY of the worker.

2.1.1.2 The Ameren WPA system uses a series of Tags and a Sign-On procedure.

2.1.1.3 The reliability and integrity of the WPA process relies upon all persons on the plant site understanding and honoring the WPA Tags and Sign-On procedure.

Electronic Filing: Received, Clerk's Office 09/28/2020

2.1.1.4 WPA is the Operating Authority's assurance to the person obtaining Worker's Protection Assurance that: (see Operating Authority below)

Either 1) The equipment covered by the Worker's Protection Assurance has been completely isolated from energy sources (see Out of Service below)

Or 2) The equipment is placed in a special status requested by the person receiving the Worker's Protection Assurance (see Local Control below)

2.1.2 Types of WPA Authorities

2.1.2.1 Custody Authority

2.1.2.1.2 The Custody Authority is the person who is responsible for and "in charge" of all of the equipment in a system or power plant (usually the Plant Manager).

2.1.2.2 Jurisdictional Authority

2.1.2.2.1 The Jurisdictional Authority is the individual or group of individuals, responsible for the overall direction and coordination of the Ameren system equipment.

2.1.2.2.2 The Jurisdictional Authority of Plant Equipment (coal pile to turbine) is the Plant Operating Supervisor.

2.1.2.2.3 The Jurisdictional Authority (generator to Electrical System) is the Transmission Dispatcher / Power Dispatcher.

2.1.2.3 Functional Authority

2.1.2.3.1 The Functional Authority is the individual or group of individuals, who perform or direct someone else to perform detailed operations, such as switching or valving.

2.1.2.3.2 The Functional Authority of Most Plant Equipment (coal pile to turbine) is the Operating Supervisor.

2.1.2.3.3 The Functional Authority (Electrical System) is the Transmission Dispatcher.

In a power plant, one person, the Operating Supervisor in the Control Room, approves and issues the WPA.

2.1.2.4 Functional Agents

2.1.2.4.1 One type of Functional Agent is the Unit Operating Engineer (UOE) He creates the documentation.

2.1.2.4.2 Another type of Functional Agent is the Plant Operating Engineer (POE). He performs the work and hangs the tags.

The Plant's UOE and the POE always perform the above duties, never Contractor personnel.

2.1.3 WPA Isolation Point:

2.1.3.1 A WPA Isolation Point may be any of the following energy-isolating devices:

- Switch
- Circuit Breaker
- Valve
- Coupling
- Drive Belt

Electronic Filing: Received, Clerk's Office 09/28/2020

- Chain

2.1.4 Boundary:

2.1.4.1 A Boundary is a collection of energy-isolation devices that form a "zone of protection or control" around the equipment to be serviced.

- The status of equipment within a WPA Boundary can only be changed after the Holder has Signed-Off the WPA and the WPA tag(s) have been removed.

2.2 Equipment Covered By Worker's Protection Assurances

2.2.1 All system equipment under the jurisdiction of an Operating Authority must be covered by Worker's Protection Assurance when it is to be worked on or tested.

2.2.2 The only equipment that can be covered by Worker's Protection Assurance is equipment under an Operating Authority's jurisdiction.

2.2.2.1 Equipment connected to energy sources but not released to the jurisdiction of an Operating Authority can only be protected by Worker's Protection Assurance on the isolating device (or devices) between the energy source and the equipment.

In this case it is only possible for the Operating Authority to assure the person receiving Worker's Protection Assurance that the particular isolating device (or devices) connecting the new equipment to his energy sources is protected and he cannot assure the person receiving the Worker's Protection Assurance that the equipment is completely isolated. Therefore, it is better for all new equipment to be released to the jurisdiction of an Operating Authority as soon as possible.

2.3 Description and Purpose of Tags

2.3.1 General Notes:

2.3.1.1 When you see a WPA tag on equipment, it is telling you to stay clear of the equipment and keep hands off (violating WPA tags will result in disciplinary action up to and including termination).

2.3.1.2 Only the Functional Authority of the equipment may order tags to be placed or removed.

2.3.1.3 Tags will ordinarily be executed and attached by an Operator or his agent.

2.3.1.4 Tags, record sheets and WPA sheets will have the equipment name, etc., along with the serial number of the WPA record.

2.3.2 Function Authority's Hold Off Tag

2.3.2.1 Definition:

2.3.2.1.1 The Hold Off is an inviolable order of a Functional Authority that the disconnect device(s) which it is intended to cover must not be closed (or opened in the case of valves) under any circumstances unless definitely ordered or approved by him and then only if the Hold Off tag is first ordered removed.

2.3.2.2 Issued to:

2.3.2.2.1 Only to the Functional Authority (never to a worker).

2.3.2.3 Usage:

2.3.2.3.1 The Hold Off is an Operating Authority's tool which he may choose to use any time he feels it would contribute to a safer working environment.

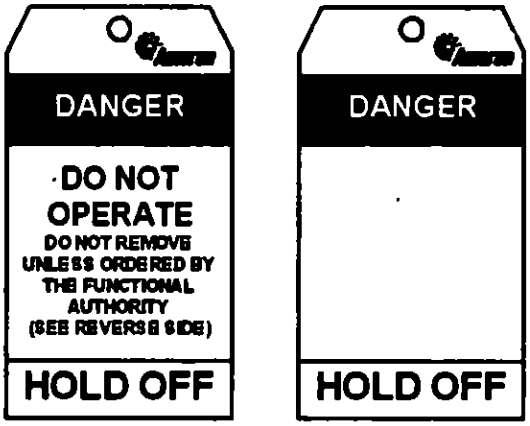
2.3.2.3.2 To properly isolate equipment from all sources of normal energy and tag them with Hold Off tags so the Functional Authority may issue an Out of Service or Restraint to a supervisor or workman so work on designated equipment may proceed.

Electronic Filing: Received, Clerk's Office 09/28/2020

2.3.2.4 Equipment Status:

2.3.2.4.1 Operator must obtain the approval of, or be acting under the orders of, his Functional Authority before changing the status of, or working on any equipment bearing a Hold Off tag.

2.3.3 Worker's Hold Off Tag



2.3.3.1 Definition:

The Worker's Hold Off is the method by which the Holder of a Local Control isolates equipment he is working on under the Local Control.

2.3.3.2 Workers will create their own Worker's Hold Off tag by legibly signing a blank Power Plant Hold Off Tag. If the Holder of a Local Control wants to work on the equipment, it must first be isolated from its energy supplies. The Holder would open the breaker, close the valves, etc. to isolate the equipment. The Holder must then hang a Worker's Hold Off on top of the Local Control to ensure the breaker or valves remain in the de-energized position. A Worker's Hold Off tag when placed has the same meaning as a Functional Authority's Hold Off. The Holder would need to remove the Worker's Hold Off prior to closing the breaker or opening the valves and operating the equipment.

2.3.3.3 A Worker's Hold Off can only be placed over a Local Control Tag. It cannot be placed by itself.

EXAMPLE OF HOLD OFF TAG

EXAMPLE OF WORKER'S HOLD OFF TAG

Worker's Hold Off

Worker's Hold Off tag to be placed over plant-issued Local Control

Electronic Filing: Received, Clerk's Office 09/28/2020

2.4 Types of Worker's Protection Assurances

The following types of Worker's Protection Assurances are issued during construction at power plants:

2.4.1 Out of Service (Issued under Hold Off Tag)

2.4.1.1 Definition:

- The Operating Authority's assurance that the equipment designated is properly isolated from all known energy sources and is appropriately tagged so that it will remain de-energized until the Out of Service is released.

2.4.1.2 Energy Status:

- Isolated from all normal sources and emergency back-up energy sources.
- This does not relieve the person obtaining the protection of the responsibility of making prescribed tests or observations to assure himself that the equipment is safe to work on. Points of isolation and points not to be changed are tagged, where possible, and those points cannot be changed while the Out of Service is in effect. However, equipment inside the zone of protection and not tagged, may be manually operated or tested, since it is in a de-energized state.

2.4.1.3 Usage:

- Maintenance, including complete removal and disassembly.

2.4.1.4 Issued to:

- Supervisors or Workers when authorized by Custody Authority.

2.4.1.5 Persons Covered:

- Holder and anyone working directly for or with the Holder.

2.4.1.6 Physical Location of Holder:

- Does not have to remain on Plant property.

2.4.1.7 Duration:

- No time limitations. Remains in effect until equipment is ready to be restored to service.

2.4.1.8 Predominance:

- Unlimited number of Out of Services may be issued on a single piece of equipment by various people for various reasons. Multiple tags may be required for isolation.

2.4.2 Restraint

2.4.2.1 Definition:

- The Restraint, which is issued on the Functional Authority's Hold Off, is an assurance given by the Functional Authority to the person to whom it is issued that the equipment it covers has been properly isolated from its energy sources and that normal voltage will not be applied while the Restraint is in effect.

2.4.2.2 Energy Status:

- Isolated from all normal sources and emergency back-up energy sources.

2.4.2.3 Usage:

Electronic Filing: Received, Clerk's Office 09/28/2020

- The person to whom the Restraint is issued shall have control of the application of test energy in that his consent must be obtained before applying external energy of any magnitude, and he must be informed when the test is completed. Thus, the person should be familiar with the status of the equipment at all times, and to this extent the person shall be responsible for seeing that other persons working on the equipment with that person or under that person's specific direction are protected against the application of test energy.

- The operator of the high-energy source will direct test and connections required following established standards or procedures or in special cases, specific instructions of the Functional Authority. The operator of the high-energy test source will communicate directly with the person who has the Restraint, but the operator may at no time apply energy until the Holder of the Restraint has given the operator permission to proceed.

2.4.2.4 Issued to:

- Supervisors or Workers when authorized by Custody Authority. In cases where several workers will work on the equipment tested, a qualified worker or supervisor shall be designated to act a coordinator on the job, and that person shall obtain the Restraint.

2.4.2.5 Persons Covered:

- Holder and anyone working directly for and with the Holder.

2.4.2.6 Physical Location of Holder:

- Must remain on Plant property and in control of the job. If the Holder leaves the site of the test, he must remain "on-call." The Holder shall not release the Restraint until all persons are removed from the equipment and informed of the intended release.

- The performance of maintenance will be permitted simultaneously with testing on equipment, provided that adequate safety can be maintained between the two jobs.

- If electrical testing is required, the procedures set forth in the System Operating Manual under Restraint, Item 207, will be followed.

2.4.2.7 Duration:

- Released before Holder goes off duty for the day.

2.4.2.8 Predominance:

- Only one Restraint and no other WPA.

2.4.3 Local Control

2.4.3.1 Definition:

- An authority granted to a person (other than a regular operator) that permits him to operate or direct operation of equipment and gives him the assurance that no operations will be performed on the equipment unless requested or personally approved by him.

2.4.3.2 Energy Status:

- May or may not be de-energized. This is why different tags are used. The Functional Authority's Hold Off is not in place for this type of WPA.

2.4.3.3 Usage:

Electronic Filing: Received, Clerk's Office 09/28/2020

- Short duration maintenance or troubleshooting.

2.4.3.4 Issued to:

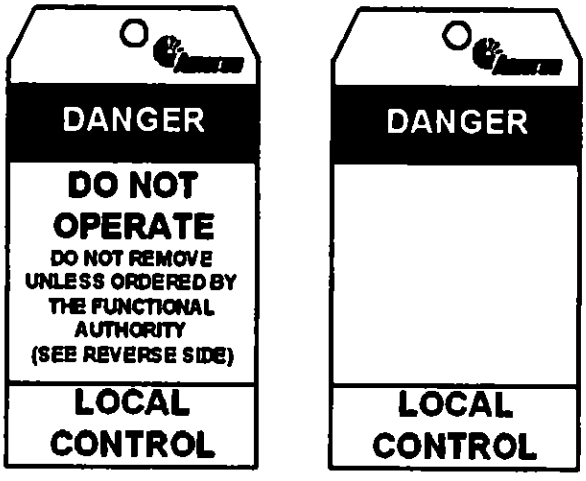
- Supervisors or Workers when authorized by Custody Authority. Worker must give the reason for the request. Worker must specify if equipment is to be energized or isolated for him.

2.4.3.5 Persons Covered:

- Holder and anyone working directly for or with the Holder.

2.4.3.6 Physical Location of Holder:

- Must remain on Plant property and in direct control of the job since he is responsible for the safety of his workers.



2.4.3.7 Duration:

- Released before Holder goes off duty. New equipment before acceptance has no time limit.

2.4.3.8 Predominance:

- Only one Local Control and no other WPA.

EXAMPLE OF LOCAL CONTROL TAG

2.4.4 Clearance

2.4.4.1 Definition:

- A Clearance is the assurance to the Holder that the system or equipment for which it is issued has been properly isolated from its normal energy sources (including any emergency back-up energy sources) and will remain isolated as long as the Clearance is in effect.

2.4.4.2 Usage:

- It is used whenever it is necessary to completely isolate a system or a piece of equipment from its normal energy sources (including any emergency back-up energy sources) to perform the desired work.

2.4.4.3 Issued to:

Electronic Filing: Received, Clerk's Office 09/28/2020

- Supervisors or Workers when authorized by Custody Authority.

2.4.4.4 Persons Covered:

- Holder and anyone working directly for or with the Holder

2.4.4.5 Physical Location of Holder:

- Must remain on Plant property and in direct control of the job since he is responsible for the safety of his workers.

2.4.4.6 Duration:

- Released before Holder goes off duty.

2.4.4.7 Predominance:

- None. An unlimited number of Clearances may be issued concurrently on a system or a piece of equipment. Clearances may also be issued concurrently with Out of Services.

2.5 Exception

2.5.1 If a person holding Worker's Protection Assurance on a piece of equipment is not available and it is necessary because of plant or system emergency to place that piece of equipment in service, the Worker's Protection Assurance can be released to the Operating Authority by a person designated by the Holder of the Worker's Protection Assurance provided:

2.5.1.1 Every attempt has been made to contact the holder of the Worker's Protection Assurance and

2.5.1.2 A thorough examination by the person releasing the equipment reveals the equipment to be in proper operating order.

3.0 COMMISSIONING JURISDICTIONAL CONTROL AND EQUIPMENT TAGGING

3.1 Commissioning Team Leader, Commissioning Engineer and Specialist

3.1.1 Ensure the following once Construction Turnover Acceptance Form is signed by commissioning team leader.

- Any activities on the turned over system not authorized by a member of the Commissioning Team will promptly cease.
- Any Construction Cards within the boundaries of the turnover are promptly removed.

> **NOTE**
>
> Plant based WPA will be used if commissioning an existing system in the plant or if the new system is tied to existing plant systems. The sole WPA authority would be the control room.

3.1.2 Request "System Under Test" card or applicable WPA based on boundaries turned over to commissioning.

> **NOTE**
>
> In case the new system is independent of the existing plant. "System Under Test" card will be used and administered by commissioning.

3.1.3 Maintain GEN-FRM-ADM-2155-07, *System Under Test Card Log.*

3.1.4 In the event that a positive isolation device does not exist in a system being turned over, that system's boundary will be extended into the adjacent system to the first point of positive isolation.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.0 ENVIRONMENTAL, SAFETY AND HEALTH

4.1 Contractor shall ensure worker and public safety during the course of this project.

4.1.1 Contractors must comply with all applicable Company, Federal, State, and Local health, safety and environmental regulations including, but not limited to, those concerning:

- Safety & Contractor Requirements (Appendix A) and Job Working Rules (Appendix B)
- Public and worker health and safety
- Public's "Right to Know"
- Fire safety
- Air and water quality
- Flammable materials storage
- Spill control, response and cleanup
- Hazardous and non-hazardous waste handling, identification and disposal

NOTE: Ameren's policies and procedures applicable to Contractors are available on www.ameren.com under Business Partners Suppliers / Standard Contracts

4.1.2 Refer to Ameren's Contractor's Substance Abuse Policy AUE-07-01 (Attachment A15) for minimum substance abuse testing requirements.

4.2 Contractor must have a full-time company corporate Safety Director who oversees and maintains the site safety program and site safety personnel, unless waived by the Ameren Managing Supervisor of Construction. This person must also be available for safety related questions and concerns. A full time company safety personnel must also be onsite for each shift for the entire duration of the project. The cost for the safety personnel shall be broken out in the bids. Resumés of the safety personnel who will be associated with the project must be submitted with the bid.

4.2.1 Ameren reserves the right to request the safety representative be removed from the project and be replaced with a more competent individual, if they are not fulfilling expectations.

4.3 With contract bid, Contractors shall submit:

- Contractor Environmental, Safety & Health Data Form (Attachment A9) (unless specifically exempted from this provision by Company).
- Their company's ES&H program manual

4.4 After award, Contractor shall submit:

- A project-specific ES&H Action Plan, including an Emergency Response Action Plan that is in accordance with Ameren, Federal, State & Local requirements.
- At a minimum, Attachment A21 – Site-Specific Safety Plan (SSSP), shall be filled out in its entirety. The SSSP shall be submitted to Ameren for review, comment and approval. Editable version of Attachment A21 is to be supplied after issuance of PO.

4.5 At mobilization, Contractor shall:

- Appoint a competent onsite ES&H representative who will coordinate Contractor ES&H activities, hazardous material and waste handling. The ES&H representative will work with Ameren personnel on ES&H related issues, and implement ES&H rules necessary for safe execution of the project.
- Supply to the SPOC the frequencies of all walkie-talkie 2-way radios they intend to use. Frequencies must be listed to four (4) decimal places. Authorization for Two-Way Radios (Attachment A14) must be submitted to the designated SPOC.

4.6 Contractor shall be responsible for tool inspection/maintenance in accordance with the requirements of OSHA standards and manufacturer's recommendations/instructions.

4.7 Handling of Materials and Waste

4.7.1 If project involves use or presence of chemicals or products that are regulated under Section 112 (r) of the Clean Air Act, Sections 302 & 304 of Emergency Planning & Community Right to Know Act, OSHA 29CFR1926.65 or 29CFR1910.120, then Contractor has the choice of adopting the plant's Health and Safety Plan (HSP) or developing a similar plan that is at least as protective and compliant

If Contractor is responsible for arranging to dispose of a hazardous or otherwise regulated waste where Ameren is identified as the generator of the waste, Company shall review, and approve or reject the waste disposal method and/or facility.

Contractor site personnel shall read and acknowledge by signature that they will comply with the applicable HSP.

Certification of individual training is required prior to hazardous waste operations as defined by OSHA 29CFR1910.120 or equivalent applicable state regulations.

4.7.2 Contractor shall identify as part of the bid, and be prepared to discuss upon award of Contract, the quantities, timetables and characterization, of wastes generated during project.

4.7.3 Contractor shall minimize amount of waste generated and shall discuss waste handling, manifest preparation, record keeping, and disposal with the SPOC in advance of these activities. Contractor should coordinate waste handling Vendors/Subcontractors with Company personnel.

4.7.4 Contractor shall handle, package, label and store wastes in accordance with Ameren, Federal, State and Local requirements.

4.7.5 Contractor shall remove such wastes from the premises in a timely manner for treatment, storage, and/or disposal in full compliance with applicable laws, regulations and ordinances, including documentation requirements.

4.7.6 If Contractor is considered the sole generator of waste, then, such waste is sole responsibility of Contractor and Ameren assumes no responsibility for Contractor's compliance with applicable regulations.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.7.7 Contractor shall notify the SPOC before using chemical/material that could create noxious or toxic fumes.

4.7.8 For materials brought onto jobsite, Contractor shall make copies available (upon request) of the Material Data Safety Sheets (MSDS) to the appropriate personnel on the worksite.

Contractor shall provide written notification to the SPOC of any material requiring an MSDS that is brought onsite by Contractor in quantities in excess of that material's Superfund Amendments and Reauthorization Act (SARA) Threshold Planning Quantity. Such notification is required for SARA Tier II reporting purposes. Chemical of Interest Reporting (Appendix I) in this specification must be filled out and submitted to the SPOC.

4.7.9 Contractor shall ensure that hazardous chemicals or materials are properly contained and labeled, and that employees are adequately trained to recognize, handle and use hazardous chemicals safely

Small quantities (i.e., <10 gal.) of hazardous liquids, such as gasoline, diesel fuels or solvents, brought onto site shall be stored in properly labeled safety containers with flame arrestors and self-closing lids. All container labels must include contents information and display hazard symbols clearly on exterior of each container in accordance with NFPA 704M, OSHA 29CFR1910.1200 or other applicable standard.

4.8 Asbestos-Containing Material (ACM) and Lead

4.8.1 In structures built prior to 1981, thermal system insulation, sprayed-on surfacing, and vinyl or asbestos floor tile shall be presumed to be ACM.

- Non-ACM will be labeled as such or otherwise identified by the SPOC and communicated to Contractor.
- Areas containing abatement activities will have warning signs, be barricaded, and access will be limited.

4.8.2 Ameren ES&H Management Instruction Asbestos Exposure Controls and Work Practices, ES-REG-203, specifies policies and procedures for contractors performing asbestos abatement work. Hardcopies may be requested from the SPOC.

Proposals for an ACM abatement project must designate:

- Scaffolding needs
- Glove bag and containment areas
- Potable water and shower requirements and locations
- Methods to protect scaffolding tubing from contamination after containment is removed
- Methods to minimize non-ACM dust outside the containment areas
- Methods to move ACM bags from containment areas to ACM receptacles

4.8.3 Ameren ES&H Lead Management Instruction, ES-REG-211, specifies policies and procedures for Contractors performing lead abatement work. Hardcopies may be requested from the SPOC.

4.9 ES&H Training Requirements

4.9.1 Documentation of OSHA training for Contractor craft workers and supervisors must be maintained onsite and made available to Ameren. Effective September 1, 2006, the minimum training standard is OSHA 10 for Contractor craft workers and OSHA 30 for Contractor supervisors.

4.9.2 Contractor will maintain documentation of ES&H training on project and must provide requested documentation of training to Company. Contractor shall retain verification of satisfactory training for as long as required by law or six months after completion of contract, whichever is greater.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.9.3 Job safety awareness meetings will be held with Company and applicable contractors on a frequency determined by Company. The meetings will address industrial safety issues from Contractor job safety reviews.

4.10 Environmental, Safety & Health Surveys

4.10.1 The SPOC and Ameren ES&H personnel will conduct periodic ES&H surveys of the project. Any discrepancies will be reported to Contractor management for immediate correction.

4.10.2 These ES&H surveys do not relieve Contractors of their responsibility to self-inspect their work and equipment and to conduct their work in a safe and environmentally compliant manner.

4.11 Reporting and Investigating Incidents/Accidents

4.11.1 Contractor shall make an immediate report by telephone to the SPOC of any accident involving injury, death, fire, spill, mishandling of oil, regulated/hazardous waste spill, or any other emergency.

4.11.2 In the event of an emergency, Company has authorized the Plant Shift Supervisor and the SPOC to act as emergency coordinators. Contractor shall proceed with appropriate emergency response measures as directed by Plant Shift Supervisor and the SPOC, and take full responsibility for clean-up and disposal of any wastes or materials.

4.11.3 Contractor shall indemnify Company for all related costs and liabilities.

4.11.4 Contractor shall submit a Monthly Contractor Accident Statistics Report (Attachment A10) by the second day of each month for the preceding month's activities.

4.11.5 Contractor shall investigate all types of events listed in above Item 1.4.11 Incident/Accident Reporting, whether they result in an injury or not, and provide the results of said investigation to Company. An accident investigation does not assign blame; it does determine how to eliminate similar accidents in the future. Company reserves the right to monitor Contractor's investigation, and Contractor shall provide the SPOC with all necessary information to all required Company personnel to perform this monitoring function.

4.11.6 Ameren reserves the right to investigate any accidents that occur on its property or in completing work being performed by a Contractor's employee whether they result in an injury or not. Ameren will conduct further investigations for accidental environmental releases or spills, etc.

4.11.7 A signed Witness Statement (Attachment A2) must be completed by each witness providing factual observations.

4.11.8 An Incident/Accident Investigation Report (Attachment A1) must be submitted to the SPOC within 24 hours to document the investigation. Accident facts, causes, and corrective action should be documented and communicated to employees through ES&H meetings.

4.12 Certifications, Inspections, and Permits

4.12.1 Operations may require a Company permit. Such activities may include but are not limited to: hot work, confined space/vessel entry, excavations, asbestos abatement, lead abatement, etc. Contractor shall determine from the SPOC if any of Contractor's activities require a Company permit or Contractor permit.

4.12.2 Some states and local authorities require permits for activities such as: excavations, heavy lifts, asbestos/lead abatement, air permits, water permits, hazardous waste generation, etc.

4.12.3 Contractors shall be responsible to secure and comply with these permits, unless the SPOC has delegated this to others in writing.

4.12.4 A third-party-certified Competent Person shall make a thorough annual inspection of cranes and powered hoisting equipment. Cranes shall be inspected and have deficiencies corrected prior to being put into service. Documentation of crane inspections must be maintained onsite by Contractor.

Electronic Filing: Received, Clerk's Office 09/28/2020

- Crane hooks should be inspected by a Competent Person prior to use. Rigging should be inspected by a Competent Person before each shift. Defective components shall be removed from service immediately. Anti-Two-Block devices, that automatically disengage crane hoist/boom functions when the hook or block approaches the jib or boom tip, shall be used on all cranes.

- All outriggers on mobile cranes must be fully extended and fully deployed when crane is used to lift or support a load.

- If, due to configuration or physical location, all outriggers cannot be fully deployed, calculations must be made from the "on-rubber" section of the load chart. A certified crane specialist must have written calculations and lift instructions reviewed by Ameren. The SPOC may make an exception for light-weight, lift-and-carry operations.

4.12.5 Operators of forklifts, boom lifts, buses, and other mobile equipment must be trained and certified on the operation of the specific equipment.

4.12.6 Operators of cranes must be trained and certified by National Commission for Certification of Crane Operators (CCO), or Operating Engineers Certification Program (OECP). Crane operators must be qualified on each crane type and rating they operate.

4.12.7 Operators of cranes are responsible for completing the Crane Maintenance Safety Checklist (Attachment A16).

4.12.8 A Competent Person shall design and a Competent Person shall erect scaffolding. Only the authorized scaffolding erector can make changes to scaffolding.

4.12.9 A Competent Person must inspect and tag scaffolding prior to initial use, before each work shift, and after any event that could affect its structural integrity. Untagged scaffolds must not be used.

4.13 Critical Lifts

4.13.1 Critical Determination

Contractor shall submit a Critical Lift Plan for any critical lift. Ameren reserves the right to designate any lift as critical. A lift shall be designated as a critical lift if any one of the following conditions exists:

4.13.1.1 Lifting over 50 tons.

4.13.1.2 Lift exceeds 75% of the rated capacity of the crane.

4.13.1.3 Lift requires the use of more than one crane.

4.13.1.3.1 In no case shall a multiple crane lift be performed in excess of 75% of any one of the crane's individual load rated capacity at the planned radius.

4.13.1.4 Lifting a non-rigid object.

4.13.1.5 Lifting over equipment or material that could cause or result in a release of hazardous material to the environment.

4.13.1.6 The lifted item requires exceptional care in handling because it is being lifted above critical operating equipment or material and/or building structure.

4.13.1.7 The lifted item requires exceptional care in handling because of size, weight, close-tolerance installation, high susceptibility to damage or other unusual factor.

4.13.1.8 Lift performed in proximity of live electrical connections.

4.13.1.9 Lifting of personnel in baskets and/or personnel harnesses.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.13.1.10 Lifting of equipment by helicopter.

Any lifts proposed by the contractor that meet the above criteria or determined to be critical by the Project Engineer will be subject to a Critical Lift Plan. Examples of lifts that are generally considered critical are: boiler tube panels, feedwater heaters, conveyor systems, coolers and pump skids, turbines and generators.

4.13.2 Critical Lift Plan

Contractor shall provide a detailed lifting and rigging plan for all lifts identified as critical. All critical lifts will require a Professional Engineer's seal. Prior to executing lift, lift plans must be submitted to the Project Engineer, reviewed and accepted by a structural engineer in the POS Civil/Structural Group. Ameren will review submittals for general design features. Contractor is responsible for accuracy of calculations. Also prior to executing lift, any changes made in the field to the approved lift plan must be approved by the contractor's engineer and accepted by the Ameren POS Project and Structural engineers. A copy of the lift plan must be onsite during the lift and must have been reviewed with all personnel involved with the lift, including the Ameren Construction Supervisor. Ameren's Construction Supervisor shall be provided sufficient notice to allow him/her to witness the critical lift. A critical lift plan shall contain the following, as applicable:

4.13.2.1 Identify the items to be lifted.

4.13.2.2 Weight of the lifted item and total weight of the load (for mobile cranes, see the manufacturer's instructions regarding components and attachments that must be considered as part of the load).

4.13.2.3 Center of gravity location.

4.13.2.4 Documented step-by-step instructions.

4.13.2.5 Special precautions, if any (such as outrigger or track cribbing for mobile cranes).

4.13.2.6 Evaluation of hazards associated with the lift that include ground support, soil conditions, allowable soil bearing capacity, underground utilities that could be damaged or suddenly collapse, maximum permissible wind speed and any other physical obstruction.

4.13.2.7 A list of each piece of equipment (e.g., crane, hoist, fork truck), accessory, and rigging component (e.g., slings, shackles, spreader bars, yokes) to be used for the lift. (This list shall identify each piece of equipment by type and rated capacity).

4.13.2.8 Designated checkpoints, hold points and estimated instrument readings, as relevant, so that job progress can be checked against the plan.

4.13.2.9 Rigging sketch(es), which include the following:

4.13.2.9.1 Lift point identification

4.13.2.9.2 Method(s) of attachment

4.13.2.9.3 Load vectors

4.13.2.9.4 Sling angles

4.13.2.9.5 Accessories used

4.13.2.9.6 Other factors affecting the equipment capacity

4.13.2.9.7 Rated capacity of equipment in the configuration(s) in which it will be used. (For cranes, many factors affect rated capacity, including boom length, boom angle and work area.)

Electronic Filing: Received, Clerk's Office 09/28/2020

4.13.2.9.8 If rigging points are attached to existing structural steel, it is the responsibility of the contractor's engineer to confirm that the additional loads do not overstress the existing structure, and to design additional bracing/reinforcement if required. Supporting calculations sealed by a Missouri Professional Engineer shall be included with the critical lift plan.

4.13.2.10 A load-path sketch that shows the load path and height at key points in the job. (For lifts with mobile cranes, include the crane position(s) relative to the load and relative to surrounding obstructions.) Where appropriate, include floor-loading diagrams.

4.13.2.11 A sketch indicating lifting and travel speed limitations. (This may be noted on the load path sketch or on a separate sketch.)

4.13.2.12 A sign-off sheet to verify that all inspections/tests required by OSHA are current for all equipment and rigging.

4.13.2.13 The lift plan shall provide specific information for each lift when multiple items of varying weights and/or shapes are included in the lift plan unless an exception is approved by the Ameren structural engineer.

4.13.2.14 With their bid proposal, Contractors shall submit a normal weather lay-down plan for each onsite lattice crane, wherein contractors specifically outline the manner in which the crane will be stored in normal weather conditions.

4.13.2.15 With their bid proposal, Contractors shall submit a severe weather lay-down plan for each onsite lattice crane, wherein contractors specifically outline the manner in which the crane will be stored in severe weather conditions.

4.13.2.16 Before construction begins, the selected Contractor shall meet with Ameren representatives and shall outline the means and methods of the Contractor's crane execution plan for each lattice crane expected to be utilized onsite. Execution plan shall include specifics about transition from normal to severe weather crane lay-down plans and critical wind speed for crane position. Cranes shall not be allowed onsite until after the crane execution plan(s) have been reviewed and approved by Ameren representatives.

4.13.2.17 Crane loading shall typically be based on 2,000 pounds per square foot ground pressure, unless known ground conditions dictate/allow otherwise. Ameren representatives shall review and approve planned crane ground loading.

4.13.2.18 When determining and setting load path barricade boundaries, Contractors shall include within the boundary the potential for dropping load during load swing (failed load path). All elevations affected per this potential 'failed load path' shall be barricaded.

4.14 Respiratory Protection

4.14.2 Contractors must provide a copy of their Respiratory Protection Program to the SPOC before they use respirators. The program must comply current Ameren, Federal, State and local requirements including OSHA 29CFR1910.134. The program must properly address the following:

- Respirator selection
- Respirator training and required test fit procedures
- Respirator cleaning, sanitizing, inspection and maintenance
- Respirator user's medical clearance

4.15 ES&H Adherence Policy

4.15.2 **Action Level One** – The SPOC will issue a written Notice of ES&H Non-Compliance (Attachment A11) and Warning Letter for ES&H Non-Compliance (Attachment A12) to Contractor's management and site ES&H representative if Contractor fails to comply with an applicable ES&H standard.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.15.3 **Action Level Two** – The SPOC will issue a Written Notice of Temporary Job Suspension (Attachment A13) to Contractor if ES&H non-compliance is not corrected by Action Level One, or if Contractor repeatedly fails to comply with applicable ES&H regulations. The appropriate Ameren Manager and Contractor's Division Manager, or equivalent, must meet and agree on corrective actions acceptable to Company before Work may resume. Actions may include, but are not limited to:

- Removal of certain Contractor personnel from project.
- Alteration of Contractor's job procedures.
- Having Ameren implement corrective action and backcharge Contractor.

Contractor shall not resume Work until Ameren accepts the proposed corrective actions. Ameren will retain meeting minutes documenting the agreement.

4.15.4 **Action Level Three** – Ameren Management may terminate the contract for cause, if **Action Level One** and **Action Level Two** do not result in Contractor's ES&H compliance.

Electronic Filing: Received, Clerk's Office 09/28/2020

GRINDER SAFETY PLAN

Grinder Guard and Handle Removal PRE-PLAN

Date:	**Job #:**
Customer/Site:	**Location of Work/Unit:**
Description of Task:	**Equipment Identification:**

SCOPE OF WORK AND SCHEDULE (Please list complete description of task)

HAZARD ASSESSMENT TO DETERMINE ALTERNATE TOOL

procedures require a pre-plan whenever personnel remove the guard and handle on a grinder.

Reason:

- Grinding wheel cannot access point of work with guard and handle attached due to narrow gap for welding.

Alternate Methods to Removing Guard and/or Handle:

- Rotary file and die grinder?
- Conical grind stone and pole grinder?
- Other?

SAFETY PRECAUTIONS

- ☐ Cutting wheel CANNOT be used while guard and handle are detached.
- ☐ Grinder must be unplugged when removing guard and handle and when re-attaching.
- ☐ Guard and handle are only to be removed for this specific point of work. All other grinding in the work area must have safety devices attached.
- ☐ Pre-plan will only apply until the weld depth improves to allow for standard grinding operation, i.e. all safety devices attached.
- ☐ Wear face shield and sealed eyewear.
- ☐ Maintain control of grinder at all times, use two hands when operating the grinder.
- ☐ Keep hands/fingers clear of upper portion of the grinder near the wheel.
- ☐ Be aware of body positioning.

AFFECTED PERSONNEL INVOLVED IN WORK MUST READ AND SIGN THIS PRE-PLAN

POWER OPERATIONS HOT WORK CHECKLIST
(EXAMPLE)

1. DESCRIPTION – JR#

Location _____ Elevation _____
Work to be done: Welding _____ Brazing _____ Open Flame Cutting / Heating _____
Equipment _____

NOTE: Before authorizing welding, cutting, heating, and brazing, this checklist must be completed.

2. PRE-WORK INSPECTION

Hot Work shall not be performed in the following situations:

a. In areas not authorized by Management.

b. In sprinklered buildings while such protection is impaired, unless authorized by Management.

c. In the presence of explosive atmospheres or explosive atmospheres that may develop inside unclean or improperly prepared tanks, pipes or equipment.

d. In areas near the storage of large quantities of exposed, readily ignitable materials.

Prior to welding, cutting heating, and brazing (W/C/H/B), you shall perform these basic precautions:

a. Move the object to be W/C/H/B to an area free of hazards.

b. If the object to be W/C/H/B cannot readily be moved, then you shall remove all movable fire hazards within the vicinity to a safe place.

c. If the object to be W/C/H/B cannot be moved and if all the fire hazards within 35 feet cannot be removed (including cable trays), then, immovable fire hazards shall be shielded and a fire watch provided.

IF THESE BASIC PRECAUTIONS ARE NOT FOLLOWED, WELDING, CUTTING HEATING AND BRAZING SHALL BE PERFORMED. COMPLETE CHECK LIST.

3. ADDITIONAL FIRE WATCH PROVISIONS

N/A	YES	NO		
			a.	Can more than a minor fire develop?
			b.	Are combustible materials closer than 35-ft. to the point of operations?
			c.	Are combustible materials more than 35-ft. but easily ignitable by sparks?
			d.	Do wall or floor openings with a 35-ft. radius expose combustible materials in adjacent areas, including concealed spaces in walls or floors?
			e.	Are combustible materials adjacent to the opposite side of metal partitions, walls, ceilings, or roofs and are they likely to be ignited by conduction or radiation?

NOTE: If you answered yes to any of the above, a fire watch is required. Complete checklist. All of the following conditions must be met, if applicable.

(continued on next page)

Ameren MISSOURI

4. PRECAUTIONS

N/A	YES	NO		
			a.	A fire watch will be provided during and for 30 minutes following welding, cutting, heating and brazing.
			b.	The fire watch shall be supplied with a proper portable fire extinguisher in addition to installed operable plant equipment.
			c.	Cutting and welding equipment is in good condition.
			d.	Combustible materials are protected with covers, guards, or metal shields, or material is removed prior to start of work.
			e.	Nearby workers are suitably protected against heat, sparks, slag and flash.
			f.	Wall or floor openings are covered or enclosures provided. For elevated work, covers are suspended beneath to collect sparks or area below is free of combustibles.
			g.	Enclosed equipment is cleaned of all combustible material and purged of flammable vapors.
			h.	Ducts and /or conveyors are suitably protected or shutdown.
			i.	For work near walls, partitions, ceiling or roofs, proper precautions have been taken to prevent ignition of combustibles inside the barrier of adjacent areas.
			j.	For work on pipes or other metal in contact with combustible walls, partitions, ceilings, or roofs, precautions have been taken to prevent ignition by conduction of heat.
			k.	Other

DEFINITIONS

1. Combustible Material: Any material that, if in the form and under the conditions used, could ignite and burn.

2. Minor Fire: A fire which, if no action is taken to extinguish it, will self-extinguish (burn out), will not propagate (spread to other materials through the continuity of combustibles), and will not damage any permanent plant equipment.

WARNING LETTER OF ENVIRONMENTAL, SAFETY & HEALTH NON-COMPLIANCE

Project Name and Number _____

Your firm, _____, has been found to be in violation of your contract by non-compliance with applicable Federal, State, or Ameren ES&H requirements.

On _____ , in accordance with the Ameren ES&H Adherence Policy, your representative, _____ , was given a Notice of ES&H Non-Compliance (copy attached). This notice specifies areas where your company does not comply with Federal, State, or Ameren ES&H requirements, and requests that these items be corrected immediately. If they are not corrected, more stringent measures will be taken in accordance with Ameren ES&H Adherence Policy.

Thank you for your prompt attention to this matter.

1.0 INTRODUCTION

1.1 In an effort to provide a drug- and alcohol-free workplace, Ameren establishes the following policy for Contractors:

2.0 SCOPE

2.1 Working on an Ameren work site and being under the influence of drugs or alcohol creates safety risks for all personnel who work on our work sites.

2.2 The term Contractor refers to all non-Ameren personnel hired to perform a service for Ameren who will be on Ameren property and includes all Contractors, their subcontractors and all other non-Ameren persons who are employed by them with active badges for site access. Visitors and delivery drivers are excluded from these requirements.

2.3 This Policy supersedes GP-06-01, Contractor Substance Abuse Policy.

3.0 IMPLEMENTATION

3.1 Contractors shall establish and maintain a confidential drug and alcohol testing program for each of their employees assigned to work on Ameren property, which shall meet the following minimum requirements.

3.1.1 All employees of a Contractor who are assigned to an Ameren site shall be subject to Contractor's drug and alcohol testing program. Contractor's program shall prohibit employees from buying, selling, consuming, or distributing alcohol or drugs while working for Ameren or while on Ameren property. The program shall also prohibit Contractor employees from reporting to an Ameren site or being on Ameren property while under the influence of alcohol or drugs.

3.1.1.1 Contractor's program shall provide for drug testing for substances listed in Section 3.1.4 of this Policy under the following circumstances: pre-assignment testing; random testing; testing for reasonable cause based on observations by Ameren or Contractor supervisor; and testing after any accident or incident that involves injury to personnel or damage to property.

3.1.2 Contractor shall require pre-assignment drug testing, or will assure that each person who will be assigned to an Ameren location has been tested for drug use within the 120-day period immediately prior to the start of work on Ameren premises. Contractor shall provide written documentation from the testing authority to Ameren Construction Project Lead or Plant Station Point of Contact that its employees are either compliant or non-compliant with this Policy. Contractor employees, who are not in compliance with this Policy, will be subject to Section 3.1.6 of this Policy. To maintain confidentiality, Ameren will not accept actual test results. A previous random drug test or drug test conducted for another reason is sufficient to satisfy the pre-assignment testing requirement if test was conducted during the 120-day period prior to working on Ameren premises, and otherwise satisfies the drug testing requirement in Section 3.1.4 of this Policy. Contractor employees who have taken a pre-assignment drug test will be allowed to work pending test results for no more than 5 working days. Testing may be waived pending Ameren management approval for Contractor employees who are working less than 40 hours annually providing site labor.

3.1.2.1 In lieu of pre-assignment testing, Contractor may accept a certificate signed by Department of Health and Human Services (DHHS), Substance Abuse Mental Health Service Administration (SAMHSA) DHHS/SAMHSA-certified drug testing laboratory indicating the results of drug test performed within the 120-day period immediately prior to working on Ameren premises. Identification cards, which indicate employee's name and date of his/her most recent drug test, may also be accepted if they are traceable to the certification from the DHHS/SAMHSA -certified drug-testing laboratory, which performed the test, and are attested to by Contractor management.

3.1.3 Contractor shall provide site specific random substance abuse testing for each of its employees and its subcontractors' employees assigned to be on Ameren premises. The random testing shall be conducted at a frequency such that a minimum of one test is performed for hours up to the first 2,000

man-hours worked and one additional test for every 2,000 man-hours worked by Contractor, or any of its subcontractors, on Ameren premises. Contractor shall establish a random selection process to ensure that each individual will have an equal chance of being selected and tested each time a random test is scheduled. The random testing pool will include all crafts under the direction of the prime Contractor, including subcontractors. Employees selected for random testing shall not be informed of test until immediately prior to test and shall be accompanied to testing site by a responsible Contractor supervisor as soon as practical on the same day selected. Contractor shall notify Construction Project Lead or Plant Station Point of Contact of random selection results and an Ameren representative may exercise the option of being present during the selection process.

3.1.4 Samples used to comply with this policy shall be analyzed by a NIDA-certified laboratory or quick cup and/or instant cup method. Tests must screen at a minimum for the following substances and levels, however some labor consortium testing programs will be accepted for initial site access only pending Ameren approval. A confirmed positive drug testing will be considered a violation of this policy.

Substance	Initial Level	Confirmed Level
Amphetamines	500 ng/ml	250 ng/ml
Barbiturates	300 ng/ml	200 ng/ml
Benzodiazepines	300 ng/ml	200 ng/ml
Cocaine	150 ng/ml	100 ng/ml
Marijuana	50 ng/ml	15 ng/ml
Methadone	300 ng/ml	200 ng/ml
Opiates	300 ng/ml	150 ng/ml
Oxycodone	100 ng/ml	100 ng/ml
Propoxyphene	300 ng/ml	200 ng/ml
Methamphetamine	500mg/dl	250mg/dl

3.1.5 Contractor's program shall provide for alcohol testing under the following circumstances: random testing; testing for reasonable cause based on observations by Ameren or Contractor supervisor; and testing after any accident or incident that involves injury to personnel or damage to property. Pre-assignment alcohol testing shall not be required. A test result of .04% blood alcohol concentration or greater as indicated by a breathalyzer or similar test will be considered a violation of this Policy.

3.1.6 Individuals who fail a test, refuse to test or otherwise violate this Policy will be denied site access from all Ameren premises. In addition, Contractor shall notify the applicable consortium to remove employee from the active pool. A Contractor employee who is determined to have violated this policy will be denied site access for a period of one year. After a period of one year, if the individual can demonstrate successful completion of a required treatment program based on Contractor's consortium policy, the individual will be given a last-chance opportunity. However, site access will not be permitted unless the individual has a satisfactory return-to-duty drug test. If at any time an individual is found to have a second violation of this Policy, the individual will be permanently denied site access to all Ameren premises. Contractor shall document all non-compliance on a reduction force report and forward the report to Construction Project Lead or Plant Station Point of Contact. The reduction force report shall include the person's name, craft and reason stated "Non-Compliance with Ameren Substance Abuse Policy."

3.1.7 Contractors shall require all of their subcontractors to comply with all provisions of this Substance Abuse Policy. Failure of Contractor or any of its subcontractors to comply with the requirements of this Policy shall be grounds for removal from consideration for any future work and/or termination of the current contract at the discretion of Ameren. Ameren reserves the right to audit Contractor's drug and alcohol testing program at any time to verify compliance with this policy.

3.1.8 Ameren will not be responsible for any expense or loss of wages due to non-compliance with this Policy.

3.1.9 Ameren retains the right to change or modify this Policy at any time. Ameren also retains the right to waive this Policy for any Contractor that is badged as a visitor.

3.1.10 Any documents relating to this Policy will be maintained in confidence and will not be released without written authorization unless otherwise required by law.

CRANE OPERATOR SAFETY CHECKLIST

DATE: _____ CRANE: _____

JOB NUMBER/ LOCATION: _____

TASK: _____

☐ Has a Total Hazard Analysis (THA) been completed today? YES ☐ NO ☐

Comments: _____

☐ Is access to work area established? YES ☐ NO ☐

Comments: _____

☐ Is all safety equipment on hand and functioning properly? YES ☐ NO ☐

Comments: _____

☐ Have lines of communication between operator and affected employee(s) been established (visual &/or verbal)?

Comments: _____

☐ When servicing the crane (including crane lubrication), the operator must lower all loads to the ground, and move all controls to OFF. The engine MUST be stopped before the crane is serviced. The operator is to attach a WARNING sign to the engine start control to warn personnel that crane is being serviced and must not be started.

Comments: _____

☐ Do not operate crane until all safety guards and covers are securely reinstalled and all maintenance equipment is removed.

Comments: _____

☐ Before operator enters cab of crane, the affected employee(s) must be at a minimum safe distance of two feet from any moving parts.

Comments: _____

CONTRACTOR AGREEMENT OF UNDERSTANDING
(Form CONMGT0)

All Contractors and Subcontractors will be required to sign and submit this form prior to entering and/or starting work on any Ameren property.

- I have been informed of all expectations regarding Ameren Safety / Work rules and ZERO TOLERANCE policies and will immediately investigate and enforce all such rule and policy violations when they are reported or observed.
- I will cooperate to the fullest extent with any Ameren management or security person in investigating ZERO TOLERANCE policy violations.
- I am aware that Ameren plants contain asbestos, lead and flyash. Where necessary, I will abide by all Ameren, OSHA, State and Local policies, procedures and ordinances in all abatement, containment, waste-disposal, employee protection and reporting activities.
- I will obtain and promptly submit all of the required permits to the Ameren-designated Station Point of Contact (SPOC) prior to starting work.
- I will promptly forward all of the required submittals to the Ameren SPOC.
- I will not allow any employee to enter and / or start work on Ameren property before first conducting a Safety / Work Rules orientation and ensuring they have all required personal protective equipment.
- I will report all violations / actions taken to the Ameren SPOC, on form CONMGT1, each Friday before 9:00 AM.
- I will inform the Ameren SPOC of any sub-contractors in my employ and ensure that they are aware of and meet the conditions of this agreement before they enter and / or start work on Ameren property and will have them complete this Contractor Agreement of Understanding Form.
- Any employee found to have violated a ZERO TOLERANCE policy may be removed and barred immediately from Ameren property and will not be allowed to return to any Ameren property in the future.
- I understand that repeated violation of the Work / Safety rules or ZERO TOLERANCE policies may result in my company's removal from Ameren property.

ATTACHMENT A19
SAFETY SCORECARD

SAFETY SCORECARD

Notwithstanding the provisions below, a "work-related fatality" will result in maximum KPI reduction to the contractor regardless of any other safety criteria.

KPI payment will be based on criteria that are equally weighted as follows:	Section 1	OSHA recordable rate	33⅓ %
	Section 2	"Rules to Live By" Observations	33⅓ %
	Section 3	Safety observation cards	33⅓ %

SECTION 1 OSHA RECORDABLES

OSHA rate is calculated by the following:	2 or more =	0%
	less than 2 =	100% of Section 1

Note: Review based on specific job criteria (i.e., duration of project). Ameren POS safety supervisor has final call on OSHA recordable determination.

SECTION 2 "RULES TO LIVE BY" OBSERVATIONS

	1 or more =	$2,000 penalized assessment per Appendix A
	less than 1 =	(add)

Note: Observations that are self-reported by contractor do not apply to this. Only observations by Owner or Owner's representative apply.

SECTION 3 COMPLETED CARDS

An agreed-upon safety observation card program will be developed as part of site safety process. Observations are based on number of fully completed, meaningful cards generated by contractor's employees and submitted to Ameren designated representative. These observation cards may show positive coaching as well as corrective coaching. Observation cards completed by Ameren will not be utilized KPI of this section.	< 70 cards =	(deduction)
	70 - 90 cards =	$0
	> 90 cards =	(add)

ATTACHMENT A20
GUIDELINE FOR ABANDONING PIPING AND DEMOLISHING ABANDONED PIPING

1.0 GENERAL GUIDELINE FOR PROPERLY ABANDONING AND/OR DEMOLISHING PIPING

The division of responsibility for the following actions to be decided at assignment of work:

1.1 A Competent Person shall pre-plan the job prior to the start of the work.

1.2 Determine pipe to be abandoned or demolished. Review P&ID's and piping isometrics to determine isolation points and material conveyed in piping.

1.3 If a JR is not already in EMPRV, Ameren Single Point of Contact (SPOC) shall create a JR in EMPRV.

1.4 Review WPA requirements with the Responsible Engineer listed on the JR. Ensure proper WPA is in place to isolate lines.

1.5 Conduct a pre-job briefing to discuss site specific safety plan and the following:

1.5.1 PPE required

- Chemical Protection
- Eye & Face Protection
- Foot Protection
- Hand Protection
- Head Protection
- Hearing Protection
- Respiratory Protection

1.5.2 Atmospheric conditions if working in enclosed spaces

1.5.3 WPA

1.6 Ensure proper WPA is in place to isolate lines. As part of WPA, drain lines and confirm all low spots have been drained.

1.7 Take special precautions to ensure environmental spills do not occur.

1.8 At extreme ends of pipe, remove at least a one foot section of pipe from equipment or process piping still in use to ensure complete isolation. Cap ends of process piping that will remain in service.

1.9 For piping that will be abandoned in place, permanently tag abandoned pipe in at least three locations (Steel or Brass tag wired to pipe). Tag shall indicate pipe to be "Abandoned in Place," applicable JR number, and material pipe conveyed.

1.10 For piping to be demolished, remove piping and dispose of properly.

1.11 Update P&ID's and piping isometrics as applicable.

Sheet No. A - 48

ATTACHMENT A21
SITE-SPECIFIC SAFETY PLAN (SSSP)

This plan shall be completed and reviewed with the Corporate Safety Department before work commences. Completed plans shall be maintained and kept on site with the project file.

Contractor Company:	
Contractor Address:	
Project Name:	
Project Address:	
Mobilization Date:	

Project Manager			
Superintendent			
Corporate Safety Representative			
General Foreman			
Site Safety Representative(s)			
Shifts working throughout project: 1st ☐ 2nd ☐ 3rd ☐	Maximum number of workers on site per shift: 1st 2nd 3rd	Number of safety representatives on site per shift: 1st 2nd 3rd	

Job Responsibilities:

Titles:	Description of Job Duties

3.1	Identify the nearest medical facility (e.g., hospital, urgent care, occupational clinic etc.): Address: Phone # Note: Location and directions (including maps) to the nearest facility are required to be on this jobsite.	
3.2	List the local Fire & Rescue Squad Phone #	List the Police Phone #
3.3	Describe your emergency action plan for the project (e.g., response to fire, severe weather, etc.):	

Ameren MISSOURI

Section 5 Scope of Work

Describe the activities your company will be performing while on this project. Ensure that all activities are referenced on the AHA of this plan, see Section 13.

Section 6 Subcontractor Information

Will subcontractor(s) be used on this project? ☐ Yes ☐ No

If yes, please provide the information below (add extra copies of this page as needed):

Note: All subcontractors are required to submit a Site Specific Safety Plan.

Subcontractor(s) Name	Point of Person	Scope of Work	Phone	Email

Section 7 Safety Information

7.1	Describe how you will secure your jobsite, equipment, and materials to protect public safety and to prevent theft.
7.2	Will there be persons onsite trained in First Aid and CPR? ☐ Yes ☐ No
7.3	Will there be ANSI Z308.1 compliant First Aid Kit(s) and Bloodborne Pathogens Kit(s) located in strategic areas on this project: ☐ Yes ☐ No
7.4	Will restrooms and wash facilities be brought on site? ☐ Yes ☐ No
7.5	How will housekeeping be managed? Describe the control measures to be used and how often they will be performed.
7.6	Do you have a map of the worksite location that includes roads, waterways, railways, bridges, etc.? ☐ Yes ☐ No *Please provide a copy of the map when submitting this document*

Ameren MISSOURI

Owner shall have the authority to immediately stop contractor's work indefinitely for operations which, in the opinion of owner, constitute a safety concern. It is the responsibility of the contractor to adequately satisfy owner of any remediation necessary to provide a safe and healthful workplace. Contractor must have qualified and competent supervision at the site at all times to direct and observe the work.

8.1	Do you require your supervision to successfully complete the OSHA 30-Hour for Construction Training?
8.2	Do you require your employees to successfully complete the OSHA 10-Hour Construction Training?
8.3	Outline the initial employee orientation on the job site:
8.4	Describe the process that you will use to verify that training within your scope of work has successfully been completed. *Note: Employee training records do not have to be submitted. Ameren reserves the right to review training records which must be readily available upon request.*
8.5	Describe your procedures for Contractor Event Reporting (CER) to Ameren.
8.6	Describe your Job Observation Process in detail:
8.7	Describe your Job Briefing Process in detail:
8.8	Will you have a Hazard Communication Program with a chemical inventory list and Safety Data Sheets (SDS) for chemicals used onsite? ☐ Yes ☐ No NOTE: Chemical inventory list must be onsite at the beginning of the work and Safety Data Sheets (SDS) shall be kept on file at the site by the contractor. SDSs must be available for the contractor and subcontractor employees' review and for review by the owner upon request.

Ameren MISSOURI

Section 9 - Rules to Live By Hazards and Controls	
9.1	Explain how you will communicate Ameren "Rules to Live By" to your employees on this project and describe the procedures you will follow when a violation occurs.
9.2	Explain your company's disciplinary action protocol as it relates to jobsite safety rules:

Section 10 - Employee Engagement and Communication	
10.1	Identify steps your company is going to take to engage your workforce in safety:
10.2	Explain how your company is going to communicate safety information and expectations to your employees?

Section 11 - Personal Protective Equipment (PPE)
List the minimum PPE required to access the job site:

Section 12 - Safety and Health - Please review - Select the applicable hazards that apply to the work being performed			
Will the work scope require any traffic or pedestrian disruptions?	☐ Yes	☐ No	☐ N/A
Will your work require you to penetrate into any surface at any depth?	☐ Yes	☐ No	☐ N/A
Will your work involve any excavations/trenches?	☐ Yes	☐ No	☐ N/A
Will the work scope require work at heights greater than 6 feet?	☐ Yes	☐ No	☐ N/A
Will wire rope guardrail systems be used on this project to protect workers from fall hazards and will an inspection program be implemented to verify safe installation/condition?	☐ Yes	☐ No	☐ N/A
Will the project involve electrical line construction, maintenance or repair activities?	☐ Yes	☐ No	☐ N/A
Will the project involve substation or switchyard construction, maintenance or repair activities?	☐ Yes	☐ No	☐ N/A
Will there be worksite obstructions that may create a hazard to workers such as railroads, bridges, power lines or waterways?	☐ Yes	☐ No	☐ N/A
Will the work scope involve the need to control hazardous energy sources?	☐ Yes	☐ No	☐ N/A
Will the project include work on pressurized vessels or pipes that may affect the integrity of the system such as welding, cutting, brazing, etc.?	☐ Yes	☐ No	☐ N/A
Will steel erection be part of the scope of this project?	☐ Yes	☐ No	☐ N/A

Ameren MISSOURI

Will there be potential impalement hazards such as protruding reinforcing steel (rebar)?	☐ Yes ☐ No ☐ N/A
Will any roofing be performed on this project?	☐ Yes ☐ No ☐ N/A
Will earthmoving or drilling equipment be used on this project?	☐ Yes ☐ No ☐ N/A
Will cranes, derricks, or other equipment be used on this project?	☐ Yes ☐ No ☐ N/A
Will a helicopter be used on this project?	☐ Yes ☐ No ☐ N/A
Will the work scope require the need for a critical lift plan that will include the safe rigging practices and prohibit work under suspended loads?	☐ Yes ☐ No ☐ N/A
Will hoists, elevators or conveyors be used on this project?	☐ Yes ☐ No ☐ N/A
Will employees be involved in erecting, disassembling, moving, operating, repairing, maintaining, or inspecting a scaffold system?	☐ Yes ☐ No ☐ N/A
Will the work scope include diving?	☐ Yes ☐ No ☐ N/A
Will the work scope require you to work in a confined space?	☐ Yes ☐ No ☐ N/A
Will welding, cutting, or brazing be performed on this worksite?	☐ Yes ☐ No ☐ N/A
Will the work involve the use of chemicals such as paints, solvents, adhesives, epoxy coatings, corrosives, fuels or other hazardous materials?	☐ Yes ☐ No ☐ N/A
Will lead based materials be used or disturbed on this project?	☐ Yes ☐ No ☐ N/A
Will asbestos containing materials be disturbed on this project?	☐ Yes ☐ No ☐ N/A
Will you be working in or generating a hazardous atmosphere?	☐ Yes ☐ No ☐ N/A
Will appreciable levels of dust be generated that will require control measures?	☐ Yes ☐ No ☐ N/A
Will abrasive blasting be performed on this project?	☐ Yes ☐ No ☐ N/A
Will the work scope involve any environmental hazards that generate flying debris, excessive noise levels, or any other air contaminants not mentioned above?	☐ Yes ☐ No ☐ N/A
Do you have a heat stress prevention program in place?	☐ Yes ☐ No ☐ N/A
Will radioactive materials/sources be used on this project?	☐ Yes ☐ No ☐ N/A
Will hazardous waste (e.g., lead, asbestos, contaminated soils) be generated and properly disposed of on this project?	☐ Yes ☐ No ☐ N/A

ANTICIPATED HAZARD ANALYSIS (AHA)

Use this form to identify activities that will occur on this project. List all potential hazards associated with that activity. Use the Risk Assessment Code table to determine the risk level of the activity/hazards. Lastly, list all of the controls that will be implemented to control those hazards. When a Job Hazard Analysis is needed, it must be performed, documented, and communicated to workers prior to the start of that activity, see footnote 2.

Contractor Name: ACME Contractor	Project Name/Number: 123456		Project Location: Anywhere, Missouri
	Date Prepared: 1/1/2014	Prepared By: ACME Manager	Reviewed By: John Doe

Risk Assessment Code (RAC) Color Ratings – *include color & numeric alpha characters for rating* Red =Extremely High Risk (Critical), e.g., Red 1A Orange = High Risk (Serious), e.g., Orange 2B Yellow = Moderate Risk (Moderate), e.g., Yellow 3C Blue = Low Risk (Minor), e.g., Blue 3D Green = Extremely Low Risk (Negligible), e.g., Green 3E		PROBABILITY (how often the activity occurs)				
		Frequent (A) Occurs very often, known to happen regularly.	Likely (B) Occurs several times, a common occurrence.	Occasional (C) Occurs sporadically, but is not uncommon.	Seldom (D) Remotely possible, could occur at some time	Unlikely (E) Can assume it will not occur, but it is not impossible
Severity	Catastrophic (1) – Imminent and immediate danger of death or permanent disability to the public, employees or property.	[redacted]	[redacted]	[redacted]	[redacted]	Yellow (1E)
	Critical (2) – Permanent partial disability, hospitalized injury, temporary total disability.	[redacted]	[redacted]	[redacted]	Yellow (2D)	[redacted]
	Significant (3) – Reversible injury that would need ER care, reversible illness.	[redacted]	Yellow (3B)	Yellow (3C)	[redacted]	[redacted]
	Negligible (4) – First aid or minor medical treatment	Yellow (4A)	[redacted]	[redacted]	[redacted]	[redacted]

Activity Category	Potential Hazards	RAC Rating[1]	JHA Required[2]	Controls
Cutting on steam pipe located 15 ft. above ground	Explosion, thermal burns, fire, fall from heights, lacerations, flying debris	1B	Yes	1) Lockout equipment, bleed/cool/drain line, blow air through line 2) Use aerial lift with anchor point, full body harness, lanyard 3) Hot work permit, firewatch, fire extinguisher, no combustibles within 35 ft. 4) PPE (safety glasses, faceshield, leather gloves, hardhat)

1 RAC Rating – Risk Assessment Code Rating. Use the Risk Assessment Matrix to list the color and numeric alpha code

2 JHA required if red or orange RAC color (See sample JHA; JHA is not required to be submitted with this plan)

END OF APPENDIX A

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX B – JOB WORKING RULES AND CONTRACT WORK LIMITATIONS
CONTRACTOR REQUIREMENTS - POWER PLANTS

1.0 JOB WORKING RULES

1.1 Contractor must enforce the Ameren Job Working Rules, included in this specification here as Appendix B, as well as the Contractor's own work rules. If the rules conflict, the more restrictive rule applies.

2.0 PLANT ACCESS, PARKING AND SECURITY

2.1 Contractor employees must enter the plant ***only*** at the entrance where their company name is posted. Security cameras monitor entrances to inform supervisors of violations.

2.2 The speed limit is 10-MPH unless otherwise posted.

2.3 Contractor personnel may not ride in the back of a truck on company property or to/from/between job sites unless properly seated with a seat belt.

2.4 Contractor employee vehicles must park in Construction Parking lot or in areas designated for Contractor use.

2.5 Contractor employees must enter and leave through the designated Construction gate.

2.6 Contractor employees must check in and out of project with their immediate Foreman or General Foreman.

2.7 Security will issue an identification badge to Contractor employees after site orientation training. Badges must be visible at all times while on the site.

2.8 If the site has an electronic badge reader, a green LED light indicates that arrival/departure times have been recorded and the gate is unlocked.

2.8.1 If a badge reader is not available, employees must sign the gate register when arriving or departing.

2.9 Lunch boxes, toolboxes, coolers and other containers are subject to inspection when entering or leaving Ameren premises.

2.10 An Ameren Material Pass (Form 5532NS) signed by the Ameren Station Point of Contact (SPOC) and a Contractor supervisor must be presented to Security when tools or materials are taken off site.

2.11 The Security Guards can:

- De-activate / activate a badge when changing plant locations
- Replace a damaged badge or lost badge
- Update the employee name, Contractor company, or craft.

2.12 Cameras and video recording devices are prohibited unless specifically authorized by Ameren management.

3.0 GENERAL REQUIREMENTS

3.1 The more restrictive rule will govern in the event of any conflict between Ameren and Contractor work rules.

3.2 All Contractor/Subcontractor employees must not leave their work areas during assigned work periods. Any reasonable break periods will be established by the Contractor/Subcontractor.

3.3 Only drink water from drinking fountains or lavatories, other outlets may contain river water.

3.4 Certain plant locations, including cafeterias, locker rooms, and washrooms, may be posted as OFF LIMITS to construction or Contractor personnel.

3.5 Written permission is required before using Ameren equipment or tools, except for public pay phones.

Electronic Filing: Received, Clerk's Office 09/28/2020

3.6 Radios or "boom boxes" are not allowed because they can disrupt communication and distract workers.

3.7 Ameren's Smoking Policy
In keeping with Ameren's corporate values, Ameren strives to provide a work environment that promotes and ensures the health and safety of all employees. Smoking presents known health risks to smokers and non-smokers alike. This policy applies to cigarette, pipe, and cigar smoke, as well as e-cigarettes.

3.7.1 Persons Affected
This policy applies to all Ameren employees, vendors, contractors, and visitors at any Ameren facility.

3.7.2 Policy
Smoking is prohibited in all Ameren buildings and any outside posted areas where hazards may exist. Smoking is prohibited within 25 feet from all entrances, exits, windows that open, and ventilation intakes that serve an enclosed area for all Ameren locations. Smoking is not permitted in a multi-occupant Company vehicle or while operating motorized equipment.

3.7.3 Enforcement
Any violation of this policy may result in the individual being removed or barred from Ameren property.

3.8 Daily cleanup of the work area is required. Ameren reserves the right to clean up Contractor's area if Contractor is not fulfilling their housekeeping requirements. Any and all costs associated with the cleanup will be deducted from Contractor's base contract.

4.0 EVACUATION

4.1 If there is an emergency, an evacuation announcement may be made over the plant's public address system. The evacuation assembly area should be communicated during orientation training.

4.2 In the event of severe weather, an announcement to seek shelter may be made over the public address system. The location of the plant tornado shelter should be communicated during orientation training.

4.3 To report an emergency, contact the Shift Supervisor immediately using the plant's public address system. Do not hang up. Wait for instructions.

5.0 WORKER'S PROTECTION ASSURANCE OR HOLD CARD PROCEDURE

WARNING:	**Violation of Workers Protection Assurance (WPA) procedures can cause serious equipment damage, personal injury or death.** **When WPA is present, verify that equipment is actually de-energized or in the designated state. Always walk down the job, check voltages, temperatures, pressures, etc. to confirm status.**

5.1 WPA is Ameren's procedure to tag equipment or systems that have been de-energized or put in a specified state, to allow for service or testing. The energy in a system may be electrical, mechanical, pneumatic, hydraulic, chemical, kinetic or nuclear.

5.2 All employees should receive site-specific WPA training including descriptions of the tags and their functions. Workers must sign on and off WPA protection as directed by their supervisor.

5.3 Contractor/Subcontractor employees shall observe all WPA rules and comply with WPA tags at all times. Never use an elevator that has a WPA card on the call button.

6.0 SUBSTANCE ABUSE

ATTENTION:	**Employees who refuse to take a drug test or have been found to be non-compliant will be escorted off-site immediately and may be subject to permanent barring from Ameren facilities.**

6.1 Possession, and/or use of alcohol or drugs, is STRICTLY PROHIBITED.

6.1.1 Drugs, stimulants, "pep pills," tranquilizers, and similar substances are allowed only if prescribed by a doctor.

6.2 Ameren's Contractor's Substance Abuse Policy requires pre-employment and random drug testing of Contractor employees.

7.0 HARASSMENT AND WORKPLACE VIOLENCE POLICIES

7.1 Ameren Corporation has a zero-tolerance policy for behavior that is prohibited under Ameren's EEO & Anti-Harassment Policy and Ameren's Workplace Violence Policy Statement. These policies apply to Ameren employees and Contractor/Subcontractor employees.

7.2 Ameren intends that employees, contractors, customers, vendors, and visitors, never feel threatened, intimidated, harassed, offended or demeaned by any individual's actions, presence, conduct, or communication while they are on Ameren property.

7.3 The following behaviors and actions are **STRICTLY PROHIBITED** anywhere on Company property and may result in permanent barring from all Ameren facilities:

- Willful violation of safety rules or safe working practices
- Possession of unauthorized firearms, weapons or explosives and/or materials/components that could be used to make explosive devices
- Damaging, mutilating, or willful abuse of supplies, equipment & tools, vandalism of company property, or property of others
- Gambling or stealing
- Urinating in an undesignated area
- Harassment by anyone and in any form
    - Harassment includes, but is not limited to, unwelcome or unsolicited conduct or hostility based on or directed at a person or group because of race, color, religion, sex, national origin, ethnicity, age, disability, veteran status, pregnancy, marital status, sexual orientation or any other protected factor.
    - Conduct that may be considered offensive, hostile, demeaning, or derogatory, regardless of whether it is physical, verbal, or graphic in nature and whether it is done in person, or delivered via phone, fax, e-mail, text message, over a PA system, company mail, or by any other means.
    - Examples of Prohibited Physical Conduct:
        - → Bullying, wrestling, fighting, horseplay, or spitting on an individual,
        - → Sexual conduct such as rape, sexual battery, molestation, stalking, or attempts to commit such assaults, unwelcome touching, hugging, massaging, etc.
    - Examples of Prohibited Verbal Conduct:
        - → Threatening/intimidating someone (both explicit and implied),
        - → Verbal abuse, jokes, derogatory comments, references, or derogatory slurs of a sexual, racial, ethnic, or religious nature.
    - Examples of Prohibited Non-Verbal Conduct:
        - → Wearing of offensive clothing, hats, patches, etc.
        - → Displaying stickers, drawings, or posters that depict nooses, confederate "Rebel" flags, KKK paraphernalia, swastikas, or magazines, books, pictures or videotapes with sexual content.
        - → Drawing/displaying graffiti, specifically graffiti that is sexual, racial, or otherwise offensive, hostile, demeaning or derogatory to any individual/group or known to incite anger/violence.
        - → Using gestures that are obscene, or known to incite anger/violence.

Electronic Filing: Received, Clerk's Office 09/28/2020

7.4 Other behaviors and actions, not specifically set forth in this list, may violate Ameren zero tolerance policies.

8.0 WORKPLACE HAZARDS

8.1 Work near coal dust, fly ash, lime, or ferric/lead paint removal projects can create airborne contaminates. Do not use compressed air to clean surfaces or clothing. Use properly equipped vacuum, wet methods or other approved methods for cleaning.

8.2 All plants have asbestos-containing insulation and building materials (ACM). Treat all suspect materials as if they are asbestos.

8.3 Asbestos abatement projects may be in progress. Barricades will restrict access to areas with abatement projects. Only trained personnel using Personal Protection Equipment (PPE) may handle asbestos.

8.4 Personnel who are medically required to use syringes should take them home, properly packaged for disposal. Only trained employees using PPE should handle items contaminated with blood or other body fluids. Report any bloodborne related issues to the SPOC.

9.0 FOREIGN MATERIAL EXCLUSION (FME)

9.1 Foreign Material Exclusion protects critical plant components and systems, from contamination or damage. Systems such as feed water, condensate, steam, oil, and electrical controls and motors may suffer significant damage from foreign materials. See Foreign Material Exclusion Requirements (Appendix X) for additional requirements and details.

9.2 Foreign material contamination can come from sources such as:

- Welding and gas cutting debris,
- Metal chips, shavings and filings,
- Corrosion that produces flakes of metallic substances,
- Cleaning materials, such as shot from blasting, rags & lint,
- Forgotten tools or any material that falls out of worker's pockets,
- Water leaks/spills, cutting fluids, solvents, etc.

9.3 To prevent damage from foreign objects follow these work practices:

- Clean dirt, oil and fly ash from around covers, caps and other devices before opening.
- Remove welding electrodes, stubs and broken flux coating material from internal work areas in closed systems.
- Cover openings on turbines, generators, pumps, pipes, tubes, electrical cabinets/motors and other critical components during maintenance activities.
- Track tools, parts and materials allowed in an FME work area.
- Allow only materials necessary for the task into the work area; do not allow personal items such as jewelry or change.
- Secure all tools, safety glasses, badges, gloves and other loose items with lanyards, tape or other means.
- Catch clippings from cable ties, stripped wires, etc.
- Vacuum or wipe out electrical cabinets after repairs/modifications to remove moisture, metal chips, knockouts, clippings, etc.

Electronic Filing: Received, Clerk's Office 09/28/2020

I, the undersigned, have read the Job Working Rules. I have completed site orientation training and I understand:

- The Job Working Rules
- Site-specific instructions, including Worker's Protection Assurance procedures
- Safety requirements

I acknowledge that a violation of any of these provisions will be grounds for immediate removal from Ameren property and I may be subject to permanent barring from all Ameren facilities.

END OF APPENDIX B

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX C
DESIGN FOR SAFETY GUIDE

OBJECTIVE

Develop and maintain design guidelines to ensure engineering designs reduce safety risks for construction, operations, and maintenance of equipment and facilities.

These Guidelines reflect Ameren's commitment to incorporate safety into all designs. The designer of record is ultimately responsible for adherence to all governing Federal, State, and Local code requirements.

While attempts will be made to follow the recommendations in this guideline during the engineering phase there will be occasions where conditions and physical constraints may render some recommendations impractical or unattainable.

Several of the Design for Safety recommendations are subjective and can vary from plant to plant (i.e. serviceable access for equipment, pipe labeling, & color coding). Ameren Engineering and contracted consultants must engage plant stakeholders during the design phase to accommodate plant specific safety and operating requirements.

GENERAL FACILITY SAFETY DESIGN

YES	NO	N/A	
☐	☐	☐	General Arrangement layouts shall provide for adequate serviceable access for operation, maintenance, and replacement; i.e. personnel access, tool access, cart access, vertical lift access, fork truck access.
☐	☐	☐	Stairs shall not be used as access platforms. No valves, controls, equipment, etc., shall be positioned / designed to be accessed by personnel standing on stairs.
☐	☐	☐	Permanent, well identified and load rated fall protection tie-offs, should be incorporated into the building structure at removable handrails and access hatchways.
☐	☐	☐	Self-closing swing gates are to be used instead of chains and clips at all personnel access openings for fall protection guarding where the elevated surface is used as a work platform or walkway.
☐	☐	☐	Non-slip "Mebac" ladder rung covers should be used on all fixed access ladders.

Electronic Filing: Received, Clerk's Office 09/28/2020

☐	☐	☐	All new handrails shall be fabricated utilizing 1 ½" diameter standard pipe rails and posts. Posts shall be spaced a maximum 6'-0 on centers. Rails shall include one (1) top rail (top of top rail shall be 42 inches above walking surface); **two (2) mid rails** *equally spaced to provide increased fall protection*; and a standard 4" high toeboard.
☐	☐	☐	OSHA required clearance to handrails on stairs (3") must be maintained. Structural bracing, electric conduit, or mechanical piping is not located within the required clearance space.
☐	☐	☐	No more than a 3" open gap is maintained between a walking surface and the side of a piece of equipment penetrating the walking surface.
☐	☐	☐	When practical, valves should be located to allow for ergonomically correct operation.
☐	☐	☐	When practical, provide stairs rather than ladders to equipment, valves, etc. that requires routine access for operations and/or maintenance.
☐	☐	☐	Provide chain wheel operators for valves that cannot be accessed from a permanently installed ladder or platform.
☐	☐	☐	When possible, design stairs with lower angle of stairway rise (6½" R, 11" T). Stair landings are provided every 10 to 12 treads.
☐	☐	☐	When possible, no low mounted equipment, piping, ducting, conduit, etc. in travels paths. No "duck-unders". Use a minimum design head clearance of 7'-0".

Electronic Filing: Received, Clerk's Office 09/28/2020

YES	NO	N/A	
☐	☐	☐	All 90 degree corners of structural steel members and plate trimmed / clipped where close to personnel access areas.
☐	☐	☐	Maintenance and replacement access considered when locating lighting fixtures (especially on stairways, over tops of equipment and high overhead locations).
☐	☐	☐	Underground utilities should be designed and installed with warning and location indicators for future excavations in the areas of buried utilities.
☐	☐	☐	Underground utilities should be designed and installed at shallowest depth possible (while maintaining freeze protection and surface surcharge loads) to minimize deep trenching hazards.
☐	☐	☐	Thermal protection guarding incorporated into design where required.
☐	☐	☐	Utilize above ground liquid containments or rigid structural underground containment. Avoid below grade lined pits.
☐	☐	☐	Incorporate seismic shut-off valves for gas service lines entering buildings and at meter locations. (Application mostly at non-power plant, off-site buildings / facilities).
☐	☐	☐	Walkways shall be clear of protruding obstructions and bump hazards. No valves, valve stems, valve handles, controls, equipment, etc. should be positioned / designed within the normal walking path within personnel walkways. If not possible, paint or otherwise safeguard.

YES	NO	N/A	
☐	☐	☐	Utilize yellow warning striping along edges of personnel walkways to guide / warn walking personnel of potential obstructions, ramps, bump hazards, grade / slope changes.
☐	☐	☐	Provide personnel access to all roofs for inspection and maintenance purposes.
☐	☐	☐	Provide permanent fall protection tie-offs that are well identified, load rated, and incorporated into the building structure on roofs where there are no parapets or guard railing. (Review the need for fall protection tie-offs on specific roof areas on a case-by-case basis).
☐	☐	☐	To eliminate the need for fall protection tie-offs, when practical building roof parapets should be designed high enough to meet OSHA fall protection guarding requirements.
☐	☐	☐	Where possible, roof mounted equipment shall not be designed and installed closer than 15' to open, unguarded edge of roof.
☐	☐	☐	Provide fall protection guarding at edge of roof (without parapet) where roof mounted equipment is installed closer than 15' to open edge of roof.
☐	☐	☐	Provide fall protection guarding on both sides of a fixed roof access ladder onto roofs with no parapet or guard railing.
☐	☐	☐	Provide fall protection guarding or tie-off point at all personnel access roof hatches.

Ameren MISSOURI

YES	NO	N/A	
☐	☐	☐	Provide fall protection guarding at roof mounted sky lights (many commercial skylights are available with security grills that will act as fall protection guarding).
☐	☐	☐	Design roof mounted equipment, ducting, and piping with adequate clearance for roof maintenance and replacement. Design clearances shall meet the NRCA recommendations for equipment to roof clearances.
☐	☐	☐	Provide service power for roof mounted equipment.
☐	☐	☐	Eliminate tripping hazards on roofs / floors. No low to roof / floor mounted electric conduits and drain pipes.
☐	☐	☐	Utilize safety balls on lightning protection air terminals. Eliminate impalement hazard of pointed air terminals on roofs.
☐	☐	☐	"Roof slippery when wet" signs shall be installed at all personnel access points onto roofs.
☐	☐	☐	Provide lighting on roofs in areas of personnel access for maintenance of equipment.
☐	☐	☐	Design mechanical / electrical equipment and components to be water tight for wash down cleaning.

Electronic Filing: Received, Clerk's Office 09/28/2020

Yes	No	N/A	
☐	☐	☐	Provide the proper quantity and type of fire extinguishers and hose stations.
☐	☐	☐	Provide proper washdown facilities (hose reels, supply pipes, drains) to allow facility cleaning.
☐	☐	☐	Assure proper safety signage is in place (chemicals, hearing protection, etc.).
☐	☐	☐	Assure roof drains are not placed where water will freeze and become a slipping hazard.
☐	☐	☐	Provide ice dams on sloped roofs above doorways and walkways to prevent and/or break up sliding ice.

COMMENTS TO GENERAL FACILITY SAFETY DESIGN:

Electronic Filing: Received, Clerk's Office 09/28/2020

ELECTRICAL SAFETY DESIGN

YES	NO	N/A	
☐	☐	☐	Walk down conduit and cable tray routes before installation to identify hazards such as tripping, head, thermal, chemical, etc.
☐	☐	☐	The location, cable tray material, and conduit shall be designed for the identified hazards for that specific location.
☐	☐	☐	Place electrical equipment in accessible locations.
☐	☐	☐	Electrical Room Egress: Provide at least two exit paths even if Code allows one exit for "un-occupied space". These spaces frequently become temporary Control Centers during construction, commissioning, and start-up.
☐	☐	☐	Cabinet/enclosures shall be designed to allow sufficient space for maintenance if maintenance to be performed inside the cabinet/enclosure.
☐	☐	☐	Provide sufficient space to allow for cabinet / enclosure access doors to fully open.
☐	☐	☐	Provide sufficient space for electrical equipment as defined by NEC in walkways, area between cabinets, etc. for forklifts, routine maintenance, etc.
☐	☐	☐	All control switches should be accessible from outside of the cabinet.

Electronic Filing: Received, Clerk's Office 09/28/2020

YES	NO	N/A	
☐	☐	☐	Provide the manufacturer's recommended spacing for equipment cooling.
☐	☐	☐	Obtain arc flash incident energy level and labels for any equipment rated 480V and higher or greater than 125KVA at 120VAC & above per NFPA 70E.
☐	☐	☐	Consider extra guarding of high voltages (Plexiglas) in electrical cabinets to reduce PPE requirements.
☐	☐	☐	Switchgear shall be specified to provide "Lock Out" capability.
☐	☐	☐	Equipment shall be designed for the ratings for which it will be subject to (i.e., maximum voltage, short circuit current, continuous current, ambient temperature, etc.).
☐	☐	☐	Equipment, cable, conduit, tray, etc. shall be labeled with the voltage level.
☐	☐	☐	Equipment shall be labeled with normal power feed and backup power feed (if applicable).
☐	☐	☐	Consider backup power feed for systems where failure of normal power feed would result in a hazardous event.

Electronic Filing: Received, Clerk's Office 09/28/2020

YES	NO	NA	
☐	☐	☐	Label all equipment with appropriate equipment description (if applicable).
☐	☐	☐	When possible, critical conduits shall be installed in a duct bank rather than direct buried.
☐	☐	☐	Control cabinets and wiring termination cabinets should be accessible from platforms or at grade level. Ladders should be avoided.
☐	☐	☐	Provide fall protection tie-off points at tops of transformers.

COMMENTS TO ELECTRICAL SAFETY DESIGN:

Electronic Filing: Received, Clerk's Office 09/28/2020

MECHANICAL SAFETY DESIGN

YES	NO	N/A	
☐	☐	☐	Walking or climbing surfaces are sheltered or maintained in a manner to avoid slippery surfaces from rain or ice. (Review on a case-by-case basis).
☐	☐	☐	Emergency drainage systems are provided to direct flammable liquid leakage to a safe location.
☐	☐	☐	Provide eye wash stations at locations where liquids are sampled or "open fluids" are otherwise handled.
☐	☐	☐	Stairs, ladders, or ramps are provided at all locations where equipment design or maintenance actions require personnel to abruptly change elevation by more than 12 inches.
☐	☐	☐	Fixed ladders designed with a slope of 75 degrees or more where practical.
☐	☐	☐	Whenever practical, provide adequate access for maintenance personnel to all mechanical components, small-bore piping, ducts, valves, thermowells, flow meters and other appropriate instrumentation on piping runs and equipment units which require inspecting, testing, servicing, adjusting, greasing, removal, replacement, or repair.
☐	☐	☐	When practical, locate instruments, sample points, valves, etc. that require frequent readings, calibration, operation, etc. to allow for walk-up access.

Electronic Filing: Received, Clerk's Office 09/28/2020

YES	NO	NA	
☐	☐	☐	Specify equipment to include handling features that will aid in grasping, removing, and carrying equipment.
☐	☐	☐	Labeling and coding is provided for service and adjustment points to clearly identify the key aspects of the maintenance activity.
☐	☐	☐	Equipment and components shall be labeled with weights for lifting and removing for later maintenance or replacement. When modifying existing equipment, determine the weight of the existing equipment plus modifications and label or revise the existing labels accordingly. When possible, the label should include references to the calculation, project, and/or drawing number.
☐	☐	☐	Provide lifting devices (lifting lugs, beams, monorail, etc.) for maintenance and replacement of equipment. Lifting devices shall be labeled with the rated lifting capacity.
☐	☐	☐	Provide indicators for convenient and reliable determination of fluid levels.
☐	☐	☐	Drain fittings are provided to support fluid removal readily and safely.
☐	☐	☐	Ensure design basis application for failure modes on all positioned equipment. Example, loss of air, loss of DC, etc.
☐	☐	☐	Standardize parts, maintenance and adjustment points as much as possible. For example, use the same size and type of bolts to eliminate special wrenches/tools. Utilize common rigging points to minimize types of rigging connections, etc. If standardization is not possible, clearly differentiate specialized items with signs, markings, etc.

Ameren MISSOURI

YES	NO	N/A	
☐	☐	☐	Minimize steam hazards, heat hazards, sharp corners, edges, and projections on equipment.
☐	☐	☐	Equipment should be placed on concrete housekeeping pads, especially where standing water might accumulate.
☐	☐	☐	Add equipment protection features to guard against hazards that cannot be removed or designed out of the system.
☐	☐	☐	Specify that equipment vendor technical manuals deal with one specific equipment model rather than with many different equipment models.
☐	☐	☐	Valves shall be provided with "Lock Out" devices.
☐	☐	☐	Provide adequate isolation valving and venting for WPA, maintenance, etc. on piping systems and equipment. Follow applicable code/standard section requirements.

COMMENTS TO MECHANICAL SAFETY DESIGN:

Electronic Filing: Received, Clerk's Office 09/28/2020

CHEMICAL SAFETY DESIGN

YES	NO	N/A	
☐	☐	☐	Insure that bulk chemical tanks have separate containment areas. Containment areas shall be washable and have the ability to be drained.
☐	☐	☐	All materials used to construct storage tanks, containment, piping, etc. must be verified to be compatible for use with the chemicals used in each specific application.
☐	☐	☐	Lengths of chemical piping runs should be minimized. Chemical supply tanks and pumps should be designed to be as close to injection points as possible. Overhead chemical piping runs should be minimized. When used, labels shall be affixed to the floor beneath the piping with proper hazard communication. Chemical lines must be labeled a minimum of every 10 feet. All PVC/CPVC chemical piping must be protected from foot traffic.
☐	☐	☐	Chemical day tanks shall be properly sized to minimize the number of drums in the work area.
☐	☐	☐	Designate storage areas for each type of chemical, taking into account compatibility of each.
☐	☐	☐	Provide sufficient room for servicing instruments around bulk chemical storage tanks.
☐	☐	☐	Drains to sump shall be located around all chemical feed equipment. Local wash down water must be provided in chemical feed area. Include hose and hose reels for local wash down water.

Electronic Filing: Received, Clerk's Office 09/28/2020

☐	☐	☐	All laboratory areas must contain proper first-aid kit(s).
☐	☐	☐	Material for chemical spill control (pigs, pads, soda ash, etc.) shall be located in a designated area close to chemicals.
☐	☐	☐	Personal protective equipment shall be located in a designated area close to chemicals.
☐	☐	☐	Chemicals shall be transferred to equipment (mixing tanks or day tanks) in a way to minimize chances of contacting personnel and avoid manual dumping of bottles and drums.
☐	☐	☐	Chemical containers must be labeled with chemical names and HAZCOM placards.
☐	☐	☐	All safety showers shall be supplied with tepid water. Safety showers located outside shall also be covered and protected from the wind. Safety shower activation shall signal an alarm in the control room.
☐	☐	☐	All concrete and equipment exposed to chemicals shall be coated with an appropriate chemical-resistant coating.
☐	☐	☐	PA shall be located convenient to all chemical use areas, but beyond the area that could be engulfed by a chemical spill.

Electronic Filing: Received, Clerk's Office 09/28/2020

YES	NO	N/A	
☐	☐	☐	Operating and Maintenance personnel shall be isolated from all chemical pumps and feed systems by plastic screens or curtains.

COMMENTS TO CHEMICAL SAFETY DESIGN:

END OF APPENDIX C

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX D
STANDARD CONTRACTOR SCHEDULING REQUIREMENTS

1.0 PRE-BID/AWARD REQUIREMENTS

1.1 Contractor bids shall be rejected if they are not accompanied by a schedule. The scheduling tool shall be Primavera Enterprise (P6) unless otherwise authorized by Ameren Construction managing supervisor in writing.

1.2 Contractor's bid schedule shall reflect sufficient level of detail that effectively communicates the methodology of work/execution plan. The bid schedule shall be defined in compliance with the milestones, project constraints and deliverables required by Ameren.

1.3 Contractor shall indicate the calendar of their work schedule (days/week, shifts/day, hours/day) that is the basis for their schedule.

1.4 Contractor shall identify projected manpower required to execute project and shall also provide an assessment of labor availability based on prevailing market conditions.

1.5 Contractor shall identify the hierarchy of their project management team, including an organization chart of how they report to the Project Manager and how they report into the project management system.

1.6 The individual responsible for updating the Contractor's schedule shall be identified in the bid along with a personal resume.

1.7 Contractor's bid shall list any exceptions to the standard schedule requirements.

2.0 PRE-OUTAGE REQUIREMENTS AFTER AWARD

2.1 Contractor's point of contact for schedule submittals/updates will be the Ameren Project Scheduler. All schedule iterations and revisions shall be coordinated and approved through the Project Scheduler.

2.2 Contractor shall be required to organize the schedule according to requirements specified by Ameren's Project Scheduler, and shall include a work breakdown structure (WBS) that follows the provided sample schedule to facilitate schedule review and reporting.

2.2.1 Contractor shall develop their resource loaded schedule using Ameren's outage planning milestones within two weeks following contract award date. During this time frame, the Contractor and Project Scheduler will collaborate to develop a mutually acceptable schedule. Contractor's schedule will then be installed in the Ameren network to be used as the working schedule during pre-outage, outage execution and post outage.

2.2.2 Contractor is required to provide an onsite scheduler to provide updates to Ameren Project Scheduler for scheduling progress once installed in Ameren network.

2.2.3 Ameren will provide onsite network access to Contractor for scheduling review.

2.2.4 Ameren will make milestone to milestone ties, and other appropriate relationship ties between Contractor schedule and Ameren integrated outage schedule.

2.3 Contractor baseline shall be established after both Contractor and Project Scheduler mutually agree on schedule. This will be completed before the start of the outage. In accordance with outage planning milestones, the baseline schedule shall be compared to the actual schedule during the course of the outage.

3.0 OUTAGE EXECUTION/SUPPORT REQUIREMENTS

3.1 Contractor shall provide an onsite scheduler, unless otherwise authorized by Ameren, to provide updates to the Project Scheduler. Contractor scheduler will provide the following update information:

3.1.1 Activities worked on

Electronic Filing: Received, Clerk's Office 09/28/2020

3.1.2 Actual durations and resources used

3.1.3 Remaining durations

3.1.4 Percent complete

3.1.5 Expected finish dates

3.2 Contractor shall update/analyze the schedule daily. The schedule shall provide accurate reflection of progress throughout the outage. Schedule analysis should include risk management strategies to assure that outage milestones are achieved.

3.3 Contractor shall provide updates to Project Scheduler daily by 8:00 a.m. Several iterations of schedule edits/updates may be required before the Contractor's schedule may be scheduled with the integrated outage schedule. Ameren's Project Scheduler will analyze all schedules together with the integrated outage schedule and will post the updated integrated outage schedule to outage home page by 1:30 p.m.

3.4 Contractor will supply and develop activities, resources and associated project logic for added EWO work within one day of award of contract. Ameren will update Contractor with EWO work.

3.5 Ameren Project scheduler will inform the Contractor scheduler or single point of contact, Ameren engineering and responsible plant personnel of any high-risk activities that may impact the outage schedule and milestones on the Integrated Outage Schedule as required.

3.6 If Contractor progress is not meeting or will not meet the outage milestones, Ameren will require Contractor to participate in a re-evaluation of remaining work to ensure that milestone dates will be met for outage.

4.0 POST-OUTAGE SCHEDULE REQUIREMENTS

4.1 Contractor shall attend post-outage critique meetings that include a review of schedule performance.

END OF APPENDIX D

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX E
MATERIAL SAFETY DATA SHEETS
CONTRACTOR AFFIDAVIT PURCHASE ORDER NO.

As the responsible party for the firm of _____, I do here state that I have requested, received, read, understand, and will abide by and enforce the guidelines and conditions set forth in the Material Safety Data (MSD) Sheets provided by the product manufacturer for each hazardous chemical product delivered to and/or used in connection with the work specified in _____.

I further state that I am aware of, understand, and will fully implement the requirements of the OSHA Hazard Communication Standard (CFR 29, Part 1910.1200) and other workers' right-to-know laws.

I further state that I will maintain copies of the required MSD Sheets for each hazardous chemical in the workplace, including Company's hazardous materials, listed in this Specification; and will insure that the MSD Sheets are readily accessible during each work shift to employees when they are in their work areas.

I further state that the information contained within the MSD sheets has been disseminated to all parties who have a right or need to know; and that all workers and other effected parties have received adequate and appropriate training in the hazards, handling, and use of hazardous chemicals.

_____ _____

Contractor's Representative/Title Date

Notary Public Signature & Seal

END OF APPENDIX E

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX H
FERC STANDARDS OF CONDUCT
POLICY AUE-ADM-5476, REV. 2

Contractor and subcontractors agree to comply with Ameren's FERC Standards of Conduct per procedure AUE-ADM-5476.

This procedure can be obtained from http://www.ameren.com/BusinessPartners/Suppliers/Pages/VendorForms.aspx.

Contractor/Consultants with access to Transmission Information shall complete the appropriate Ameren training requirements related to the Standards of Conduct as determined by the Ameren manager/supervisor responsible for the consultant. Training on the Standards of Conduct is included in the "FERC Compliance Training" module. Applicable training will be identified by Engineer.

No Conduit Rule – The No Conduit rule prohibits all employees, including contractor/consultants, from acting as a conduit to provide Transmission Information to employees that are not otherwise permitted access to that information.

END OF APPENDIX H

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX I
CHEMICAL OF INTEREST REPORTING

Contractor must complete the table below, "Department of Homeland Security Chemicals of Interest to be Brought on Site," which requires Contractor to list any materials being brought onsite which are identified in Appendix A of the DHS Chemical Facility Anti-Terrorism Standard Chemical (Facility Anti-Terrorism Standards (CFATS), 6 CFR Part 27.)

MSDS for all COI must be submitted with Contractor's bid.

During the work, Contractor must inform the SPOC of any additional COI brought onsite or if the maximum amount of any material identified in Sheet I-2 below.

AFFIDAVIT

A. AUTHORIZED REPRESENTATIVE

I HEREBY AFFIRM THAT:

I am the [title]_____ and duly authorized representative of [name of business]_____ and that I possess legal authority to make this Affidavit on behalf of the business for which I am acting.

B. CERTIFICATION OF CORPORATION REGISTRATION

I FURTHER AFFIRM THAT:

1. The business named above is a corporation registered in the state or commonwealth of _____ and is in good standing with said state or commonwealth's Department of Assessments and Taxation, and that the name and address of its resident agent is:

Name _____

Address _____

_____

C. CERTAIN AFFIRMATIONS VALID

I FURTHER AFFIRM THAT:

To the best of my knowledge, information, and belief, each of the affirmations, certifications, or acknowledgments contained in this Chemicals of Interest appendix is true and correct in all respects on the date of this Affidavit and as fully set forth herein.

I DO SOLEMNLY DECLARE AND AFFIRM UNDER THE PENALTIES OF PERJURY THAT THE CONTENTS OF THIS AFFIDAVIT ARE TRUE AND CORRECT TO THE BEST OF MY KNOWLEDGE, INFORMATION, AND BELIEF.

Date_____ By_____
(Authorized Representative and Affiant)

APPENDIX J
VENDOR DRAWING TRANSMITTAL / CAD REQUIREMENTS

The purpose of this document is to specify the procedures and method of transmittal of Computer Aided Drafting (CAD) electronic files and other design file requirements for drawings generated by vendors/architectural engineering firms working for Ameren Missouri.

PROCEDURES FOR TRANSMITTING FILES

A/E-Vendor Originated Drawings:
When engineering a project for Ameren Missouri, the Ameren engineer responsible for the project should contact Kim Jones, Drafting Supervisor of Power Operations Services, at 314-957-3394 or kjones5@ameren.com; to coordinate the transmittal of electronic CAD drawing files for the project.

CAD SOFTWARE DESIGN REQUIREMENTS

Ameren Missouri will provide a workspace to utilize when creating or modifying drawings. This can be obtained by contacting DLMODrawingControl@ameren.com. Ameren Missouri utilizes Microstation and DesCartes to create and modify both vector and hybrid CAD drawings. Ameren Missouri requires the following versions of software:

- Vector design files to be Microstation (.dgn) files.
- Raster design files to be in .tif format. Scanned file compression will be in the CCITT Group 4 format. In order to maintain minimal file size, drawings are scanned at as low a dpi as necessary to produce quality scanned drawings. The dpi is determined by the respective vendor firm in a range of 100-400dpi. The scanned files are to be cleaned-up as necessary prior to transmitting to Ameren Missouri.

DELIVERABLES

Vendor will furnish full size, as-built plots of CAD files for all projects. Quantities of copies for project drawings will be determined by the project engineer.

Ameren Missouri maintains an original of drawings in St. Louis, MO. A/E's and vendors are to furnish Ameren Missouri Power Operations Services with one full size, reproducible, 20# bond plot of all CAD generated drawings in addition to the CAD file. Plots should be transmitted to:

Nancy Underwood
Document Control Supervisor
Ameren Missouri
3700 S. Lindbergh Blvd.
St. Louis, MO 63127

Vendor will enclose all necessary documentation associated with as-built CAD files as applicable (i.e., file names, reference files and any other necessary information). All original drawings sent to vendors, all voided drawings and all manual drawings that have been redrawn are to be returned to Ameren Missouri.

Electronic files for all CAD drawings will be delivered to Kim Jones, Drafting Supervisor, by one of the following transmittal methods:

- Ameren approved file transfer protocol site – Citadon or Sharepoint (BPOS)
- CD-ROM

Virus protection is paramount with any of the above methods. All corporate procedures will be followed to ensure transmittals will be free of viruses. All files supplied to Ameren Missouri should be compatible in format and file structure as outlined in these requirements. Incompatible or incomplete files will be returned for further refinement before acceptance will be granted.

Samples of CAD files in an intermediate state can be submitted for approval of conformance to Ameren Missouri's drafting standards and is encouraged in the early stages of project development. Seed files are available and recommended to ensure compliance to Ameren Missouri drafting standards.

Electronic Filing: Received, Clerk's Office 09/28/2020

RESERVING NUMBERS FOR NEW AMEREN MISSOURI DRAWINGS

Power Operations Services is responsible for reserving numbers for vendors to use for new drawings for construction projects. The drawing class will be necessary to assign new numbers. (see Attachment C) Form GEN-FRM-ADM2105-03, Drawing Number Request, should be completed and submitted to the Ameren Missouri approved File Transfer Site (i.e. Sharepoint, Citadon) One drawing number will be assigned for each class of drawing needed. Sheet numbers will utilized in lieu of additional drawing numbers in the same class up to 999 sheets.

RESERVING FOREIGN PRINT DRAWING AND FOREIGN PRINT MANUAL NUMBERS

Power Operations Services is responsible for reserving numbers for vendors to use for new foreign print drawings and manuals for construction projects. It will be necessary to request the number of foreign prints by class, drawing or manual. Form GEN-FRM-ADM2105-03, Drawing Number Request, should be completed and submitted to the Ameren Missouri approved File Transfer Site (i.e. Sharepoint, Citadon)

FILE NAMING CONVENTIONS

To properly identify files it is necessary to adhere to several rules. Most of the drawing file extensions will be **.dgn, .clt** or **.tif** as the CAD system default file extensions.

The following special characters should not be used in file names:

- ! * / ({ < > }) & ? $ # @ " ' + [ ] ~

Ameren Drawings Numbers

- The CAD file is named the drawing number followed by the sheet number indicated by three characters. Examples:
    - 123456 sh. 1 is indicated as 123456001.dgn
    - 123456 sh. 123 is indicated as 123456123.dgn

Foreign Prints Manuals:

- The CAD file is to be named the 6 digit foreign print number preceded by FPM Example:
    - FPM-123456.pdf

Foreign Prints Drawings:

- The CAD file is to be named the 6 digit foreign print number preceded by the FPD and followed by the sheet number Example:
    - FPD-123456001.dgn, and FPD-123456001.clt

DRAWING REQUIREMENTS:

Titling – The title should begin on the second line since the first line of the drawing title is the drawing classification. Abbreviations when necessary should follow the ANSI standard of abbreviations and Acronyms for Use on Drawings and Related Documents.

Fonts – Ameren Missouri uses Microstation **Fonts 1, 10 and 30 (Ameren user font)** for all CAD drawings. A copy of **uefont.rsc** is included with this procedure document. Font 10 is used for electrical and piping flow diagrams where differentiation is necessary for the letter "I" and the number "1." See Attachment B, Font Library memo, for more font information. All lettering on new drawings should be a minimum of 1/8" when plotted and weight = 0 when plotted with the following exceptions:

a. Title block lettering is TX = 3/16" and WT = 2

b. Date in drawn by block is TX = 3/32" and WT = 0

c. Date in revision block is TH = 1/8" and WT = 0 Do not use dashes between month, day and year.

d. Drawing number is TX = 3/16" and WT = 2

Working units – Microstation drawings are drawn in real-world full size working units of measurement and are scaled when plotted. Borders are scaled to the appropriate size to ensure proper scale when plotted.

Electronic Filing: Received, Clerk's Office 09/28/2020

The working unit parameters in the design file settings for files should be:

	PHYSICAL DRAWINGS	
	FT 12 in	
	12	
	1000	

Fraction display – stacked (i.e., 1½")

Dimension readout – feet and inches (not metric or in decimal form)

Angular Measurement – decimal degrees

Line weight – 1, or to match existing drawing for bold lines and good drafting practice

Patterning – as specified on each drawing

Revision number and date – required in title block area of each drawing. Revisions to existing drawings are numeric and increase by one each revision (i.e., Revision 2 would increase to 3). **All new drawings are issued at zero "0", revision. New drawings when revised increase to "1" for the first revision.** For vendors wanting to do multiple revisions to drawings prior to returning to Ameren Missouri, it is acceptable to use an alphanumeric numbering series (i.e., Drawing is sent to vendor at revision "1". Vendor creates "1A", "2A" , "3A" revisions and then issues final revision of "2" to Ameren Missouri).

Scoping – All revisions to existing drawings will have a revision balloon (scoping) placed around the areas revised. Vendors are to use a stream curve, line code = 7, line weight = 3, level = 63, and color = 7.

Reference files – Vendors are requested to supply any reference file that is attached to the set of Microstation drawings to be delivered to Ameren Missouri. The reference files, except for the border files, are to be numbered in the same fashion as the drawings.

Vendors using raster reference files are required to save active layer and attach active layers in the IRAS command menu before exiting Microstation.

Graphic Scales – All drawings that are drawn to scale should have a graphic scale so that any proportional blow-back from the original can be scaled. All drawings should note the scale in the title block. "NONE" should be indicated if no scale is used.

Drawing Levels – Mechanical/Structural drawings. See Attachment D, Ameren Missouri–Power Operations Services Drafting Manual, Drawing Level Scheme for mechanical and structural drawing level schemes.

Drawing Levels – Electrical drawings. Electrical drawings shall be drawn on level 5 with the exception of the border.

Operating Diagram – See Attachment E Instructions for Operating Diagram Issuance.

BORDER FILES/CELL LIBRARIES/SEED FILES:

Electrical borders are found in the file **EABORDER.DGN** (levels 59-63). Physical drawings shall use the attached level scheme. Physical borders are found in the file **SABORDER.DGN**. Both **EABORDER.DGN** and **SABORDER.DGN** are supplied with this package. Please ensure that all elements in the files are placed between levels 1 and 63 inclusively. Do not place elements, text, cells or any other graphic information on level 0 or any level greater than level 63.

It will be necessary to place vendor proprietary information in each CAD file rather than the border file. Reference the borders to the CAD file using the file names supplied with the files (i.e., **EABORDER.DGN**).

CABLE/CONDUIT/EQUIPMENT AND VALVE INFORMATION

Cable schedule, conduit schedule, equipment and valve numbers are in databases. All new cable and conduit information should be entered into Excel or Access data files and submitted to Drawing Control. Please contact Ameren Missouri Drawing Control at DLMODrawingControl@ameren.com for equipment and valve numbers and additional questions.

Electronic Filing: Received, Clerk's Office 09/28/2020

Questions concerning the transmittal of files should be directed to:

Kim Jones, Drafting Supervisor
Ameren Missouri
3700 S. Lindbergh Blvd.
St. Louis, MO 63127
314-957-3394
kjones5@ameren.com

INSTRUCTIONS FOR OPERATING DIAGRAM ISSUANCE

OPERATING DIAGRAMS (Ameren Drawings and Vendor/Foreign Prints):

After field installation and drawings are corrected to an "As-Built" condition, the following classifications of drawings are designated as "Operating Diagrams."

CLASS NUMBER

09020 One Line Diagrams (Except Maximum Equipment and Relaying and Metering) (Power Plants, Substations and Customer Substations).

09030 Schematic Diagrams (Power Plants, Substations, and Customer Substations).

09010 Block Diagrams (All).

09010 Equipment Options Drawings for Load Dispatch System (LDS)

The drawings are identified with this "Operating Diagrams Sticker"

OPERATING DIAGRAM	
Issued by	Date

OPERATING DIAGRAMS – PREPARATION FOR ISSUING

1. Revise per field marked prints.
2. Add revision if drawing was changed per Note 1. Revision to read "Changed as installed on WO_____."
3. Remove circles from back of drawing for current work order (WO)/construction revision only. Before removing circles for other WO's check with Ameren Project Engineer to verify that work has been completed.

END OF APPENDIX J

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX K
PLANT ACCESS, PARKING & SECURITY

1.0 Plant Access, Parking and Security

1.1 Contractor employees, visitors and vendors must enter the plant *only* at the entrance where their company name is posted. Security cameras monitor entrances to inform supervisors of violations.

1.2 Security will direct contractor employees to work rules training the first time employees report to the site.

1.3 Employees must document their completion of site specific work rules training before they are allowed unescorted access to the site.

1.3.1 Computer Based Training (CBT) is typically used for work rules orientation and to document training.

1.3.2 Contractor employees must read and sign a hard-copy of the Job Working Rules if an orientation video or oral presentation is used for training.

1.3.3 If alternative training has been used due to a temporary CBT malfunction, then employees must take the CBT training when the system is restored.

1.4 Contractor's Employee Identification

1.4.1 Ameren Contractor ID badges containing the Contractor employee's name and Contractor ID number are issued when work rules training is completed.

1.4.2 Security will re-activate an existing badge if the employee has completed the site work rules orientation within the last 12 months.

1.4.3 Security will de-activate badges at the end of each job.

1.4.3.1 The Contractor should inform the Single Point of Contact (SPOC) when employees will complete their work on the site using the Reduction in Force Report (Attachment A7).

1.4.4 Daily gate logs will be used to validate invoices and may be provided to the Contractor upon request. If the plant has electronic badge readers, employee arrival and departure times are automatically recorded.

1.4.5 The Contractor shall provide employees with hard hats of the same color. The hard hats must have the Contractor's name or company logo on either the sides or the front of the hard hat.

1.4.6 Security will apply labels with the employee's first and last names to the front and back of each hard hat.

1.4.7 The Contractor may provide a hard hat storage container at the Construction gate. PPE is required to access the site.

1.5 Contractor Access

1.5.1 Business agents, vendor/sales representatives, contractor executives and other contractor visitors should park in the construction parking lot and be escorted on-site.

1.5.2 Consultant badge holders may park in either the construction parking lot or the Ameren employee parking lot visitor space, depending on the purpose of the visit.

1.5.3 A contractor employee who has completed CBT/Work Rules training may escort visitors and ensure Ameren work rules are followed.

1.5.4 Contractor visitors are issued a Visitor's badge and are required to wear a hard hat and safety glasses.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.6 Vehicles Beyond the Security Gate

1.6.1 Only contractor work vehicles with an Ameren mirror tag are permitted beyond the security gate. The Contractor can request a mirror tag for vehicles necessary to complete the Work by submitting an Authorization for Site Vehicle Pass form.

1.6.1.1 Vehicles must have the Contractor name or Logo on each side and must have an insurance certificate verifying $1,000,000.00 minimum liability coverage.

1.6.1.2 Contractor work vehicles, commercial vehicles, or contract carrier vehicles without a mirror tag will be held at the gate until cleared by the SPOC.

1.6.2 Vehicle drivers and all passengers must swipe/sign-in at the construction gate.

1.6.3 Contractor vehicles leaving the plant will be inspected by Security.

1.6.3.1 Tools and materials being removed on Contractor vehicles must have an Ameren Material Pass (Form 5532NS) signed by the SPOC and a Contractor supervisor for Security to retain.

1.7 Use of Plant Facilities

Note: The policies are on Scholar, the Ameren intranet. Go to *Employee Center, Corporate Policies, Policies by Topic, Technology*.

1.7.1 Contractors who have Ameren computers, phones and fax machines are "Privileged Users" and must comply with the following policies.

- Electronic Mail Policy
- Facsimile Machine Usage Policy
- Information Resources Acceptable Use Policy
- Internet/Intranet Usage Policy
- System Access Control Policy
- Wireless Communication Policy

1.7.2 Work areas must be restored to a condition that is approved by the SPOC.

END OF APPENDIX K

APPENDIX L
INFORMATION ACCESS AND CYBER-SECURITY TERMS & CONDITIONS

These Terms and Conditions ("CyberSecurity Terms") are issued by Ameren and agreed to by Vendor in connection with Vendor's access to one or more of the following:

- Ameren Networks including: internal networks and VPN
- Ameren Systems including: system interfaces, critical systems and SCADA or other industrial control systems
- Sensitive Ameren data including: financial, human resources, confidential or highly confidential, or Privacy Data

In the event a Statement of Work or other Contract Document states a higher standard than that set forth in these Terms and Conditions, such higher standard shall prevail over those set forth herein.

SECTION 1: DEFINITIONS

In addition to the Definitions contained in the Contract Documents governing the performance of the Services to be performed by Vendor, the following terms shall have the meanings assigned below. Unless otherwise specifically defined, those terms, acronyms and phrases in this document that are utilized in the IT services industry or other pertinent business context shall be interpreted in accordance with their generally understood meaning in such industry or business context.

Ameren Cyber Security Vendor Questionnaire – the questionnaire provided by Ameren to Vendor, in the form set forth as Exhibit A to this document, covering Vendor's electronic and other security procedures and practices. Vendor shall not access Ameren systems or data covered by these Terms and Conditions until review and approval of such Questionnaire by Ameren. Once approved, any material changes to the information set forth in the Questionnaire must be approved by Ameren prior to implementation.

Confidential Information has the meaning set forth in the Contract Documents, including, without limitation, as specifically identified in these CyberSecurity Terms.

Continuity of Business (COB) - the establishment of processes necessary to ensure that the Vendor's performance of the Services is not interrupted for an extended period of time due to failure of equipment or other issues.

Contract Documents – means, collectively, the Ameren Purchase Order issued in connection with the performance of Vendor's Services and all other documents identified or incorporated therein as "Contract Documents", including, without limitation, these CyberSecurity Terms.

DeMilitarized Zone (DMZ) – a firewall configuration for securing local area networks (LANs) which uses a physical or logical sub-network to add an additional layer of security so that an external attacker only has access to equipment in the DMZ, rather than any other part of the network.

Factory Acceptance Test (FAT) - A test conducted at the Vendor's premise usually by a third-party to verify operability of a system according to specifications.

Fetch Protection - A system-provided restriction to prevent a program from accessing data in another user's segment of storage.

Malicious Code - Software designed to intentionally infiltrate or damage a computer system, without the owner's consent.

Malware - software used to disrupt computer operation, gather sensitive information, or gain access to computer systems. Malware is commonly taken to include computer viruses, worms, Trojan horses, Root kits, spyware and adware.

Privacy Data – means one or more of the following types of data:

1. **Cardholder data** as defined in the Payment Card Industry (PCI) standards;
2. **Electronic Protected Health Information (ePHI)** – Any protected health information (PHI) which is stored, accessed, transmitted or received electronically
3. **Energy Usage** – Electric and natural gas usage data gathered by Ameren's metering systems;

4. **Personally Identifiable Information (PII)** – Any information that can be used to uniquely identify, contact or locate a single individual. Such data includes, but is not limited to, name, address, telephone number, social security number, tax identification number, resume, financial account information, Ameren account number, birth date, driver's license number, personnel records, personal business, and transaction details;
5. **Non-public Personal Information** as defined in the Gramm-Leach-Bliley Act of 1999; or
6. **Protected Health Information (PHI)** – Any health information, as it relates to the Ameren Group Health Plan, that identifies an individual and relates to an individual's past, present or future physical or mental health, the provision of health care to an individual or the past, present or future payment for health care.

SCADA – Supervisory Control and Data Acquisition. Computer systems that monitor and control processes in electric and gas generation or distribution systems.

Services – The product, deliverables, work or services to be provided by Vendor to Ameren.

Site Acceptance Test (SAT) - A test conducted at the customer location, often by a third-party, to verify operability of a system according to specifications immediately prior to commissioning.

Vendor –The contractor, consultant or supplier identified in Ameren's purchase order which is supplying the Services.

Vendor's Representatives – means the employees, subcontractors, agents and other authorized representatives of Vendor.

Virus - Software used to infect a computer. After the virus code is written, it is buried within an existing program. Once that program is executed, the virus code is activated and attaches copies of itself to other programs in the system. Infected programs copy the virus to other programs. Also see Malware.

VPN – Virtual Private Network.

SECTION 2: VENDOR REQUIREMENTS

Vendors shall comply with the following requirements as applicable to the Services being performed by Vendor:

A. Privacy Data

Vendor may receive or have access to Privacy Data. To any extent that Vendor receives or may have access to Privacy Data, Vendor makes the following commitments:

1. Vendor shall treat all Privacy Data and all other information of a proprietary nature provided to it by Ameren as Confidential Information.

2. Upon written request from Ameren, Vendor shall return (or destroy as set forth below if directed by Ameren) all of Ameren's Confidential Information, including such Privacy Data, within thirty (30) calendar days.

   TYPE OF CONFIDENTIAL INFORMATION STORED OR USED DESTRUCTION METHOD

   Hard Copy Shredding, pulverizing, burning, or other suitable destruction method so that any Confidential Information or Privacy Data is not readable and cannot be reassembled or reconstructed in any way.

   Electronic Tangible Media, such as CDs, Disks or Tapes. Physical destruction or erasure with a standard three-pass DoD grade wipe so that any Confidential Information or Privacy Data is not readable and cannot be reassembled or reconstructed in any way.

   Hard Drive Storage or similar Computer or Device Storage. Physical destruction or erasure with a standard three-pass DoD grade wipe so that any Confidential Information or Privacy Data is not readable at all and cannot be reassembled or reconstructed in any way.

3. **Security.** Vendor will utilize security mechanisms reasonably calculated to protect the confidentiality and integrity of Privacy Data including, without limitation, the use of passwords, encryption technology, access control mechanisms and firewalls. In addition, Vendor shall:

   (i) Hold any and all Privacy Data it obtains in connection with this Contract in strictest confidence and use

and permit use of this Privacy Data solely for the purposes of this Contract;

(ii) Disclose or provide access to Privacy Data only to employees. subcontractors, vendors, service providers, employees, agents and any other third parties ("Vendor's Representatives") who have a need to have access to such information in order to provide Services hereunder and only to the extent reasonably necessary to carry out Vendor's obligations hereunder;

(iii) Have, and in the future maintain in effect and enforce, rules and policies to protect against access to or use or disclosure of Privacy Data other than in accordance with these CyberSecurity Terms including without limitation written instruction to and Contracts with Vendor's Representatives to whom Privacy Data is disclosed to ensure that Vendor's Representatives protect the confidentiality of Privacy Data;

(iv) Have, and in the future maintain in effect and enforce, commercially reasonable and appropriate physical, procedural, administrative and electronic security measures to protect Privacy Data, including encryption, which comply with all applicable legal requirements and are consistent with industry practice and standards;

(v) Immediately notify Ameren upon becoming aware of any unauthorized access to, disclosure or use of, loss or any other potential corruption, compromise or destruction of any Privacy Data and, at Vendor's cost and expense, assist and cooperate with Ameren concerning any investigation, disclosures to affected parties and other remedial measures as requested by Ameren or required under any applicable privacy laws. In the event of any such unauthorized disclosure of Privacy Data by Vendor or Vendor's Representatives, Vendor shall provide notice of such disclosure to the affected parties if required by applicable privacy laws and Vendor shall provide Ameren with a copy of such notice prior to providing it to such affected parties;

(vi) Notwithstanding any other provision of the Contract, indemnify, hold harmless and defend upon request, Ameren and its officers, directors, employees, agents, representatives, subsidiaries, affiliates, successors and assigns ("Ameren Parties") against (a) any third party claims, damages or losses sustained or incurred by Ameren Parties for any breach or nonperformance by Vendor of its obligations under this Section, and (b) claims by governmental authorities for actual or alleged failure of an Ameren Party to comply with any applicable laws, including privacy laws, by reason of any act, omission, conduct, negligence or default by Vendor. Ameren Parties' right to indemnification under this Section shall include reimbursement for reasonable costs and expenses, including without limitation, claims, internal administrative costs, third-party fees and expenses (including attorneys and consultants), and any other costs or losses related to such access, disclosure, use, loss, corruption, compromise or destruction of Privacy Data; and

(vii) Remain responsible for any breach of the obligations set forth in this Section and any violation of any applicable privacy laws by Vendor's Representatives to the same extent as if Vendor caused such breach or violation.

4. **Insurance.** In the event Vendor has use of, or access to, any Privacy Data, Vendor shall, in addition to any other insurance coverage required by the Contract, carry Cyber Liability Insurance with limits of not less than $1 million per occurrence.

B. Integrity.

Vendor shall take reasonable commercial steps to ensure that its systems: (i) do have any system interface that would allow it or a user to bypass storage or Fetch Protection, password checking, system/application security, or obtain control in any authorized state; (ii) there is nothing designed within the systems that would allow it or a user to compromise the host system's operating system; (iii) does not have any back doors to the computer system; (iv) cannot introduce Malware into Ameren's system.

In the event that Malware is introduced to Ameren's system by Vendor provided software or computers, the Vendor will promptly remove or quarantine any malware introduced by Vendor at Vendor's expense.

Vendor will consider industry-standard best practices for hardening device operating systems through a range of techniques such as disabling unqualified remote management and access tools; securing access to storage devices and peripheral ports; securing built-in accounts; configuring login and password policies; securing file system access control lists; configuring data isolation and segmentation; securing protocols, interfaces and ports; configuring necessary network services; implementing an effective anti-virus program; implementing effective patch-management; securing administrative domain trust relationships; implementing file-system integrity monitoring; and/or implementing an intrusion detection/prevention system such as firewalls or "multiple layers" of service-agnostic protection (Zero Day protection technologies).

Electronic Filing: Received, Clerk's Office 09/28/2020

C. Reasonable Safeguards.

As part of its work effort, Vendor may be required to use Ameren data and IT resources in order to fulfill part of its specified tasks. For purposes of this work effort, "Ameren Data" shall mean data provided by Ameren to Vendor, which may physically reside at an Ameren or Vendor location. In connection with such data, Vendor will implement commercially reasonable safeguards necessary to:

- Prevent unauthorized access to Ameren data from any public or private network;
- Prevent unauthorized physical access to any information technology resources involved in the development effort; and
- Prevent interception and manipulation of data during transmission to and from any servers.

Vendor warrants that it has implemented and, throughout the term of these CyberSecurity Terms will maintain security measures designed to: (i) protect the security and confidentiality of Ameren Confidential Information; (ii) protect against any anticipated threats or hazards to the security or integrity of such Ameren Confidential Information; and (iii) protect against unauthorized access to or use of such Confidential Information that could result in substantial harm or inconvenience to Ameren, Ameren employees, shareholders or customers.

D. Breach Notification.

Vendor shall immediately notify Ameren of: (i) any unauthorized possession or use of the data-processing files or other Ameren Confidential Information; (ii) the effect of such use or possession; and (iii) the corrective action taken in response thereto. Vendor acknowledges that Ameren may be required to also notify its customers, regulators and/or employees of such security incidents and agrees to cooperate with Ameren in making such notification to such persons. The costs of such notifications, credit monitoring services or other corrective action provided to affected customers, and any other costs related to such unauthorized possession or use, shall be the sole responsibility of Vendor. The Information Security group will keep a database of vendor breaches and may terminate its outstanding Purchase Orders with those Vendors who experience a breach.

E. Access Control. Check box if Not Applicable: ☐

1. Vendor shall employ such systems and security measures as are reasonably necessary to prevent unauthorized access to electronic Privacy Data. Vendor shall also employ such further methods as are reasonably prudent to also prevent unauthorized physical access to any information technology resources involved in the Services.

2. Vendor will adhere to applicable regulatory requirements as outlined in Nuclear Regulatory Commission (NRC) regulations, and the NERC Cyber Security Policy to include Critical Information Protection (CIP) Standards using an information security standards-based framework such as IEC 62443 or ISO 27001-2.

3. Where applicable, Ameren may require Factory Acceptance Test Measures (FAT) to verify that security features function properly and provide the expected levels of functionality. In addition, Site Acceptance Test Measures (SAT) after system installation with additional integrated functions to validate that the site installation is equivalent to the system tested at the factory.

Network Architecture. Check box if Not Applicable: ☐

1. The Vendor shall provide and document secure network architecture where the higher-security zones originate communication to less-secure zones. The Vendor shall provide and document the design for all communication paths between networks of different security zones through a DMZ. The Vendor shall verify and document that disconnection points are established between the network partitions and provide the methods to isolate subnets to continue limited operations. The Vendor shall provide and document tailored filtering and monitoring rules for all security zones and alarm for unexpected traffic.

2. The Vendor shall provide and document a DMZ that is restricted to communications where all traffic is monitored, alarmed, and filtered. The Vendor shall provide and document outbound filtering and alarms for unexpected traffic through security zones. The Vendor shall define all sources and destinations with enforced communication origination even during restart conditions between security zones. The Vendor shall provide and document duel DMZ architectures using different products performing the same functionality running in parallel. The Vendor shall provide and document a mechanism for patching a single DMZ architecture running in a parallel configuration without disruption to the other DMZ running in parallel. Post-contract award, the Vendor shall provide network architecture documentation.

Security Features. Check box if Not Applicable: ☐

The Vendor shall provide physical and cyber security features, including but not limited to authentication, encryption, access control, event and communication logging, monitoring, and alarming to protect the device and configuration computer from unauthorized modification or use.

F. Availability and Business Continuity. Check box if Not Applicable: ☐

1. Vendor shall establish and maintain policies and procedures relevant to contingency plans, recovery plans and proper risk controls to ensure Vendor's continued performance of Services and the restoration of data. Said policies and procedures must be in place prior to electronic access of Ameren data or operating systems and shall include, but not be limited to, recovery strategy, documented recovery plans covering all areas of operations necessary to delivering Vendor's Services pursuant to this Agreement, vital records protection and recovery and testing plans. The plans shall provide, without limitation, for off-site backup of critical data files, program information, software, documentation, forms and supplies as well as alternative means of transmitting and processing program information.

2. Vendor's recovery strategy shall provide for recovery after both short and long term disruptions in facilities, environmental support and data processing equipment. Although short term outages can be protected with redundant resources and network diversity, the long term strategy must allow for total destruction of Vendor's business operations for a period of six (6) months or longer and set forth a recovery strategy.

3. Vendor shall use commercially reasonable means to establish recovery objectives (time to full restoration and amount of lost data tolerated) that do not exceed twenty-four (24) hours.

4. Vendor shall continue to provide service to Ameren if Ameren activates its contingency plan or moves to an interim site to conduct its business, including during tests of Ameren's contingency operations plans and Vendor shall be reimbursed for any additional reasonable and actual costs incurred as a result.

5. If Vendor provides electronic interchange of data with Ameren, Vendor shall participate, if requested in writing by Ameren, in an annual Ameren data center exercise to validate recovery connectivity.

6. Vendor must provide evidence of capability to meet any applicable regulatory requirements concerning business continuity.

G. Software Design Provisions

1. Code Review.

All Deliverables that include software code or applications shall follow current industry design and best practices, including, but not limited to those published by The National Institute of Standards & Technology (NIST), the SANS (SysAdmin, Audit, Network, Security (SANS) Institute), and other recognized bodies.

Vendor shall cooperate with Ameren's code review of the relevant software or application deliverables. Prior to implementation or acceptance of a deliverable, Vendor shall subject the deliverable, including software code or scripts, to independent application review by Ameren or its delegated reviewer to validate that all applicable enterprise IT standards and security policies have been met as well as other specifications as identified in this Agreement or the relevant Contract. The review shall be performed by individuals other than Vendor or Ameren's staff who developed the deliverables. For purposes of this requirement, "Independent" may include other staff of Ameren provided no direct reporting relationships exist between the development and review organizations.

2. Functionality.

Ameren and Vendor acknowledge and agree that the Software has and shall operate in accordance with the functionality as described in the documentation provided by Vendor. If Vendor: (i) reduces the functionality of the Software as described in the Documentation, or releases an option to license a future product or other release that has substantially similar functionality as a separate or renamed product, or (ii) modifies the specifications or releases a new product that operates on specifications other than as set forth in the Documentation, Ameren shall be entitled to license such product under this Agreement at no additional cost, subject to the terms and conditions of this Agreement.

3. Passwords and Login.

In the event that a login name and password is required to access the any product provided by Vendor, Vendor shall provide Ameren access to the Product using a secure login and password. Vendor shall

Electronic Filing: Received, Clerk's Office 09/28/2020

coordinate with Ameren's representative to provide Ameren with predefined login and passwords, if any, upon delivery of the Product. Ameren shall have the right to assign a login name and password to any and all users in its sole discretion. Ameren shall be responsible for maintaining any and all login names and passwords during the term of the Contract Documents. Unless otherwise specifically provided in the Contract Documents, Ameren and Vendor hereby agree that the number of users permitted to access the Product (whether concurrently or not concurrently) shall be unlimited.

4. Temporary Keys.

If Vendor uses software product authorization codes ("keys") embedded in their product, Vendor agrees that these codes, upon expiration, will not result in the disruption production processing. These codes will be "soft stop" in nature (i.e.: Display warning messages only).

H. Vendor Personnel and Data Exportation.

Background checks - Vendor will conduct or cause to be conducted (by contract or otherwise) criminal background checks on Vendor personnel to be assigned responsibilities which may allow such person to compromise Ameren systems or financial, employee or customer data or as required by law.

Foreign Nationals - Vendor warrants that, in performing its obligations under this Agreement, (i) it will not employ or subcontract with any person who is a "Specially Designated National" as defined from time to time in regulations issued by the Office of Foreign Asset Control of the United States Department of the Treasury; and (ii) Vendor is not a Specially Designated National.

In the performance of the obligations under this Agreement, Vendor shall not export any data provided to it under the terms of this Agreement, to any other country outside of the United States without the prior written consent of Ameren and demonstration to Ameren's satisfaction of Vendor's capability to meet additional prudent policies and/or protocols, including but not limited to, security standards.

I. Audits and Third Party Reviews.

Vendor agrees to provide to Ameren the results of each audit or third party attestation or report of Vendor's security measures with respect to electronic data at all facilities where Ameren data is stored or accessed during the performance of the Services. Vendor shall provide Ameren with a copy of the related report promptly after receipt by Vendor and hereby consents to Ameren providing copies of such report to applicable regulators. The report or attestation shall contain Vendor's management's response to the exception comments, if any are noted, together with appropriate target dates for completion of required changes. In addition to the foregoing, Ameren may also, at Ameren's election and and its cost and expense, require Vendor to have such an audit or third party attestation performed by a mutually agreed independent, recognized accounting or consulting firm.

Vendor shall provide reasonable assistance to Ameren in meeting its audit and regulatory requirements relating to electronic data and system security, including: (i) providing access to relevant books, records and Ameren Confidential Information in Vendor's possession; (ii) permitting auditors and examiners to inspect and audit Vendor's relevant operations; and (iii) permitting auditors and examiners to conduct reviews after any security breach that has or is likely to result in an unauthorized use or disclosure of Confidential Information. All inspections, examinations and audits shall be reasonable in scope and duration, and will be conducted so as to minimize any interference with Vendor's normal business activities.

END OF APPENDIX L

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX M
GENERAL REQUIREMENTS FOR HAULING HEAVY EQUIPMENT
POWER OPERATIONS SERVICES

1.0 INTRODUCTION

This specification outlines the requirements for moving heavy loads more commonly referred to as "Super Loads" by state transportation agencies. The specification will detail Ameren's responsibility as well as those of the hauler and rigger. The terms "bidder," "Hauling Contractor" and "Rigger Contractor" are used interchangeably.

Each bidder shall furnish with his bid the route he proposes to use, the estimated time required, and a complete description of the hauling equipment which he proposes to use for the move, including; age, number of axles and wheels, rated capacity of trailer, number, type and pulling capacity of power units, the overall height above grade of the equipment to be moved as it is carried upon the hauling rig, etc. All work required to be performed for the move must be identified prior to the awarding of the contract.

2.0 AMEREN'S RESPONSIBILITIES

Meet with rigger and hauler to review move and address questions.

Provide detailed information for the equipment to be moved. This will include:

- Complete physical information – height, width, depth, and weight of equipment to be moved. Generally, an equipment outline drawing with dimensions will be provided.
- Miscellaneous materials to be moved (fans, bushings, radiators, turrets, conservator or expansion tank, arresters, piping, hardware, etc.). A list of the miscellaneous material that shall be moved will be provided. Transformer oil will be moved by others.
- Physical drawings of the equipment and special lifting or loading manufacturer's instructions
- Any known conditions that could have an effect on moving the equipment
- Location where the equipment can be picked up
- Final destination for the equipment

Provide impact recorder mounted on equipment.

Arrange for lifting of electric utility wires for the portion of the move that is within Ameren's service territory.

Provide access to beginning and ending locations.

Provide outages to electrical facilities as required to facilitate the work.

Provide the date when the move can begin.

Provide the date the move must be completed.

In some instances the rigger and the hauler will be the same firm, but in others the two will be different. This specification divides specific responsibilities between the rigging and moving. In those cases where the two are different, the rigger and mover will coordinate and work together.

3.0 HAULER / RIGGER RESPONSIBILITIES

3.1 General

Investigate the originating location and final destinations to determine any special situations that may exist. Make Ameren aware of special situations and note any modifications to Ameren facilities that will be required to successfully complete the move.

Contractor shall provide and be responsible for all necessary cargo insurance, services, labor, equipment, trucks, tools, fuel, power, light, heat, telephone, water sanitary facilities, supervision, permits, bonds, permission to cross private property, insurance, payment of taxes and license fees, right-of-way clearances,

Electronic Filing: Received, Clerk's Office 09/28/2020

and other personnel, devices & incidentals necessary to load, transport, unload and set in place the designated transformer or equipment, including accessories.

Where required, provide temporary cribbing for equipment to rest on prior to being moved to the final destination.

Secure all required permits or approvals to complete the move from federal, state, and local authorities. Where specific permitting is not required from a local authority such as a city, county, or township road commission, the Contractor shall still obtain written permission from the local authority prior to the move. A copy of all permitting including written permission from the local authority shall be provided to Ameren upon request.

Clean up as the work progresses from day to day. All litter, debris, packing materials, etc., shall be disposed of off-site at the hauler's expense.

Repair any and all damage to private, public, or Ameren property at no additional cost to Ameren.

CAUTION: Caution must be observed at all times when working in or around the existing substation/switchyard. The existing substation/switchyard is energized with exposed high voltage substation bus and equipment. Also, there are energized high voltage overhead conductors in close proximity around the substation & switchyard. Coordination with the Company Construction Supervisor to have appropriate lines and/or equipment de-energized may be necessary. All outages and releases shall be in accordance with the Company's Workman's Protection Assurance (WPA) Procedure. Personnel shall be trained, wear hard hats, protective clothing, safety glasses with side shields, safety shoes and fall protection in accordance with OSHA requirements. The operating substation shall not be left open and unsupervised, due to the common access to energized and de-energized equipment.

3.2 Hauler Specific

Determine a route and request approval from the appropriate governmental agency or agencies to cover the complete move.

Complete a route survey and contact overhead utility companies as required by the permitting authority.

Investigate all weight limitations that may affect the move. This can include but is not limited to seasonal weight requirements imposed by governmental agencies.

Make all necessary arrangements to complete the move.

Taking super loads over railroad tracks can present unique challenges. The mover will investigate any railroad crossing that can pose a problem and develop a plan that will not cause damage to the track or impede the operation of the railroad.

Coordinate any and all requirements with law officials.

Submit OEM load charts for all equipment used.

Provide a detailed Transport Plan to Ameren for review and approval before continuing with the move including but not limited to:

- The proposed route
- The estimated time required for the move
- A complete description of the proposed hauling equipment
- The overall height above grade of the equipment to be moved as it is carried upon the hauling rig
- Axle loading
- Wheel loading
- Center of Gravity of load and trailer
- Calculation
- DOT permit, if applicable

Provide a detailed Safety Plan to Ameren for review and approval before continuing with the move.

All loads that exceed 85% capacity of the hauling equipment shall be reviewed and stamped by a professional engineer.

The Hauling Contractor shall comply with all requirements prescribed by the manufacturer instruction leaflets & drawings related to moving and supporting of the transformer or equipment. No welding on or to the equipment shall be permitted without written approval by Ameren and the equipment manufacturer.

The Hauling Contractor shall also be responsible for replacing or making prompt repairs to the equipment used by the Hauling Contractor which is damaged for any reason, including, but not limited to, broken axles.

Any temporary rocking or temporary roadways that may be necessary for any portion of the move, including, but not limited to, the substation yard, shall be provided by the Hauling Contractor unless other arrangements have been made in advance and are clearly described in the contract.

Removal of temporary rocking or temporary roadways, at Ameren's discretion, will be the responsibility of the Hauling Contractor.

The Hauling Contractor shall be responsible for making arrangement for raising, removal or relocation of all telephone, TV cables and electric utility wires, traffic lights, and other similar obstructions in accordance with the following:

The Hauling Contractor shall make all arrangements directly with the involved utilities and authorities and the cost of such arrangements shall be included in the bid.

The Hauling Contractor shall, where necessary, allow a reasonable amount of time for raising these obstructions, while the move is in progress.

The Hauling Contractor shall be responsible for repairing or replacing any damaged roads or surfaces, equipment, structures, fences and fields and for the restoration of any other damage to public or private property, caused by the move, to the satisfaction of the Ameren Services Company Construction Supervisor.

Any damage done to the transformer, accessories, oil or other equipment being moved (including paint scratches which expose bare metal) by the Hauling Contractor, his employees, subcontractors, contact with trees or overhead obstructions, or any other cause during the progress of this work, shall be the responsibility of the Hauling Contractor and shall be repaired to the satisfaction of the Ameren Services Company Construction Supervisor.

The Hauling Contractor shall provide adequate cargo insurance to cover the complete replacement of the equipment being hauled.

3.3 Rigger Specific

Provide all necessary material, labor, and supervision to move the load to a place where the load can be placed on the mover's truck or rail car.

Load the item on the truck and assist the mover in securing the load to the truck or rail car.

Off load the item at the final destination and locate it as directed by Ameren personnel.

The Rigging Contractor shall comply with all requirements prescribed by the manufacturer instruction leaflets & drawings related to moving and supporting of the transformer or equipment. No welding on or to the equipment shall be permitted without written approval by Ameren and the equipment manufacturer.

The Rigging Contractor shall be responsible for having an ample supply of cables, jacks, planking and other miscellaneous equipment on hand and in good condition, so that the move can be made safely and without delay.

Unless specifically stated in this specification, no pulling anchors will be available. The equipment to be moved shall be handled and positioned solely by use of the equipment furnished by the Hauling Contractor. At no time shall the equipment to be moved, or the equipment furnished by the Hauling Contractor, make contact with or exert a force on (directly or indirectly) any building, structure, **foundation, oil pit**, other improvement, tree, natural formation or vehicle (except those furnished by the Hauling Contractor).

Electronic Filing: Received, Clerk's Office 09/28/2020

4.0 SCOPE OF WORK

4.1 Ameren Company Representative

An Ameren Company representative will generally observe the move and shall have the authority to immediately stop the work because of hazardous conditions or for any other reason which he deems necessary. This shall in no way relieve the Hauling Contractor of his responsibilities for the proper performance and supervision of the move.

4.2 Inspection of Equipment to be Moved

Prior to the move, Ameren personnel will inspect the equipment. Ameren will furnish all labor and material for this inspection. The Hauling Contractor and Ameren shall coordinate their work so that no unnecessary interference or delays occur during this period.

4.3 Hauling Contractor

The Hauling Contractor shall provide and be responsible for all necessary cargo insurance, services, labor, equipment, trucks, tools, supervision, permits, bonds, permission to cross private property, insurance, payment of taxes and license fees, right-of-way clearances, and other personnel and devices necessary to load, transport, unload and set in place the designated transformer or equipment, including accessories.

END OF APPENDIX M

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX N
PIPE AND FITTINGS: AMEREN APPROVED MANUFACTURER LIST

1.0 SCOPE

1.1 The Scope of the Ameren Approved Manufacturer's List (AML) encompasses pipe and fittings supplied to Ameren Gas and Power Generation locations.

1.2 AML applies to Critical (QR/CR) and non-Critical items.

1.2.1 Items that are "Restricted" will have manufacturers listed and they shall be supplied as stated. In some cases, manufacturers will not be on the AML.

1.2.2 "Generic" items shall be supplied from the AML regardless of what manufacturer is listed.

2.0 AML REQUIREMENTS

2.1 Ameren-AML shall be initially compiled prior to contract award, and be finalized and implemented by 5/1/2012.

2.2 All manufacturers on the Ameren-AML shall have a current/active ISO 9001 registration unless approved by Ameren.

2.3 Any new manufacturers or classes of material added to the AML must be approved by Ameren prior to manufacturer being added to the list.

2.4 Unapproved manufactures may be used in emergency situations; however, contact and approval must be obtained from Ameren end-user prior to material being purchased.

2.5 Manufacturers are classified by the following levels with corresponding QA requirements specified:

QA [illegible]	[illegible] QA Requirements
1	• CMTR required on all shipments. Documentation sent with materials as required. • Destructive and Non-Destructive Independent Testing completed once per year for each category and manufacturer on the AML (CBN Stl Pipe, Fittings, etc.). • Quality Audit performed at manufacturer once every 2 years.
2	• CMTR required on all shipments. Documentation sent with materials as required. • Destructive and Non-Destructive Independent Testing completed once per year for each category and manufacturer on the AML (CBN Stl Pipe, Fittings, etc.). • Subject to Master Import testing as required. If performed, Ameren is to receive copy of testing. • PMI Testing at Ameren on each heat/lot #.
3	• CMTR required on all shipments. Documentation sent with materials as required. • Third Party testing at Factory on each shipment. • Subject to Master Import testing as required. If performed, Ameren is to receive copy of testing. • Destructive and Non-Destructive Independent Testing completed twice per year for each category and manufacturer on the AML (CBN Stl Pipe, Fittings, etc.). • PMI Testing at Ameren on each heat/lot #.

NOTE: A destructive and non-destructive testing plan shall be finalized by 5/1/12 and fully implemented by 9/1/12.

2.6 All Gas materials must be supplied from approved domestic manufacturers.

Electronic Filing: Received, Clerk's Office 09/28/2020

2.7 In cases where material must be shipped from an alternate location that does not have the testing equipment available, approval must be obtained from end-user.

2.8 Ameren will conduct yearly audits of material testing and documentation processes.

2.9 Chinese manufactured product shall be only accepted after written pre-approval per Ameren.

2.10 Receipt inspection standards for each type of material shall be created (i.e., fittings, pipe, flanges, valves). At a minimum these should include:

- Proper Identification/Markings (manufacturers markings are present and they are readable/legible and meet applicable manufacturing standards
- Verify Manufacturer is on AML
- Verify CMTRs are received and acceptable
- Check for damage/cleanliness/workmanship
- Verify material matches stock/PO description
- Any unique inspections specific to the item
- Dimensional inspection to sampling plan (to nominal sizes)

APPENDIX Q
QUALITY MANAGEMENT SERVICES APPLICATION AID FOR CONSTRUCTION SERVICES

This document is an Application Aid for Construction Service organizations to outline the Bidder/Contractor's Quality Management Program and demonstrate how it meets the requirements of Ameren Missouri's Quality Management System (QMS). This Aid is not a substitute for, nor does it replace AUE-MAN-QMS-1001, *Quality Management System* and its requirements.

DO YOU HAVE A WRITTEN QUALITY MANAGEMENT PROGRAM (QMP)?

If NO, how do you intend to meet the QMS requirements?
Click here to enter response.

If YES, what is the basis of your QMP (e.g., ISO 9000, NQA-1) and how does it meet the QMS requirements as outlined below?
Click here to enter QMP Basis.

1.0 GENERAL REQUIREMENTS

1.1 Direct and indirect activities are performed and controlled by written instructions, procedures and drawings, as appropriate. (QMS 1.2.1, 3.2.1, 17.2.4)
Click here to enter response.

1.2 Quality programs of suppliers are approved and audited to ensure they meet applicable QMS requirements. (QMS 1.2.3)
Click here to enter response.

1.3 The roles and responsibilities of supporting organizations are well defined and coordinated to achieve desired results. (QMS 1.2.4, 18.2.5)
Click here to enter response.

1.4 The QMP is revision controlled and approved by Senior Leadership. (QMS 1.2.5)
Click here to enter response.

1.5 Quality expectations are reviewed as part of job briefings. (QMS 17.2.3)
Click here to enter response.

2.0 DESIGN CONTROL

2.1 Field change notices are reviewed and approved with the same level of review as the original design change. (QMS 2.2.8)
Click here to enter response.

3.0 DOCUMENT CONTROL AND RECORDS

3.1 Processes are in place to ensure current revisions of control documents are readily accessible. (QMS 3.2.6, 7.2.9, 13.2.1)
Click here to enter response.

3.2 Records are legible, identifiable, and stored such that they can be retrieved for the durations of the retention time. Record retention times storage requirements are commensurate with importance to safety, quality and regulatory compliance. (QMS 13.2.2)
Click here to enter response.

4.0 INSPECTION AND TESTING

4.1 Inspections and tests are performed by qualified personnel in accordance with written procedures, plans, instructions, or work documents. (QMS 7.2.1, 7.2.2, 7.2.3)
Click here to enter response.

4.2 Test plans and instructions are risk assessed, independently reviewed, and approved prior to use. Changes or deviations to test plans and instructions are documented and receive the same review and approval. Design basis, codes and standards, and regulatory requirements that need to be verified and documented are incorporated into test procedures and instructions. (QMS 7.2.4, 7.2.5, 7.2.6)
Click here to enter response.

Electronic Filing: Received, Clerk's Office 09/28/2020

4.3 Test results are evaluated and approved to ensure the design/project and acceptance criteria have been met before equipment or system is released to operations. Test or inspection results that do not meet acceptance criteria are documented and dispositioned. Records of inspection and tests results are maintained in accordance with approved procedures. (QMS 7.2.7, 7.2.8, 7.2.9)
Click here to enter response.

5.0 MEASURING AND TEST EQUIPMENT (M&TE)

5.1 M&TE is uniquely identified, clearly labeled and controlled in accordance with written procedures. (QMS 8.2.1)
Click here to enter response.

5.2 Calibrations are performed and documented in accordance with written procedures; calibration data is readily retrievable. Calibration standards are traceable to national standards. Where national standards do not exist or are not readily available, the basis for calibration is documented. (QMS 8.2.2, 8.2.3)
Click here to enter response.

5.3 Handling and storage of M&TE is controlled to ensure accuracy is maintained. M&TE is sealed / secured after calibration to prevent unauthorized adjustments. M&TE is checked for calibration whenever damage is suspected. (QMS 8.2.4, 8.2.6, 8.2.7)
Click here to enter response.

5.4 M&TE found outside calibration limits requires affected systems and components to be identified and evaluated for adverse impact. M&TE used on critical components is recorded to provide traceability. (QMS 8.2.8, 8.2.9)
Click here to enter response.

5.5 Inspection and test software is validated prior to use. Process controllers, microprocessors and software, when used as an integral part of the M&TE, are not interchanged without recalibration of the test system. (QMS 8.2.10, 8.2.11)
Click here to enter response.

6.0 CONTROL OF NON-CONFORMANCE

6.1 Procedures are established for identifying, documenting, controlling, and dispositioning non-conformances. (QMS 9.2.1)
Click here to enter response.

7.0 CORRECTIVE ACTION (CAP)

7.1 Procedures provide for the prompt identification and documentation of events and conditions adverse to quality, ensure assigned corrective actions are implemented and trended to identify opportunities for continuous improvement. (QMS 10.2.1, 10.2.3, 10.2.8)
Click here to enter response.

7.2 Lessons learned from internal and external operating experience are captured and evaluated by the corrective action process and communicated to appropriate personnel. (QMS 10.2.7, 18.2.18)
Click here to enter response.

8.0 MATERIAL HANDLING AND STORAGE

8.1 Materials, equipment and components are stored in accordance with specified requirements in an environment that preserves their integrity and usability including any preventive maintenance activities. Materials with shelf life limitations are identified and monitored; expired items are dispositioned. Storage areas are periodically inspected to verify the integrity of the facility and that material storage requirements are being met. (QMS 12.2.7, 12.2.8, 12.2.9, 12.2.12)
Click here to enter response.

8.2 Materials, equipment and components are packaged, shipped, received, handled, stored and issued in accordance with written procedures. (QMS 12.2.1)
Click here to enter response.

8.3 Material handling, rigging and lifting is controlled and performed in a manner to prevent damage or injury. (QMS 12.2.6)
Click here to enter response.

Electronic Filing: Received, Clerk's Office 09/28/2020

8.4 Hazardous materials and chemicals are labeled, stored, maintained, packaged and shipped offsite in accordance with regulatory requirements and manufacturer recommendations. (QMS 12.2.10, 12.2.11)
Click here to enter response.

9.0 INTERNAL ASSESSMENTS

9.1 Internal assessments are performed by qualified personnel to evaluate the effectiveness of implementation of procedures and programs with findings documented in Corrective Action Program. (QMS 14.2.1, 14.2.2)
Click here to enter response.

10.0 TRAINING

10.1 Training standards and requirements are identified and documented for each functional position. (QMS 15.2.1)
Click here to enter response.

10.2 Initial and ongoing training is provided to employees to meet training standards and requirements. Lessons learned and industry best practices are incorporated in the initial and ongoing training programs. (QMS 15.2.2, 15.2.3, 18.2.6)
Click here to enter response.

11.0 SPECIAL PROCESSES

11.1 Special processes are performed using approved procedures, and qualified personnel and equipment to ensure critical process results. (QMS 16.2.1, 16.2.2, 16.2.3)
Click here to enter response.

12.0 PROJECT MANAGEMENT

12.1 Projects are managed in accordance with written policies and procedures. (QMS 18.2.3, 18.2.13, 18.2.14)
Click here to enter response.

12.2 Key stakeholders are identified and involved throughout the development and implementation of projects. Performance metrics for safety, quality, cost, earned value and schedule are established, monitored and communicated to all stakeholders to ensure sufficient resources are provided to complete the project. Project objectives and results are compared to determine the success of each project. (QMS 18.2.7, 18.2.8, 18.2.9, 18.2.12)
Click here to enter response.

12.3 Project risks are identified and evaluated in terms of probability of occurrence and impact; recovery strategies are prepared for significant risks and risks are monitored; and recovery strategies are revised, as necessary, throughout the project. Emergent risks are evaluated and added to the risk management plan. (QMS 18.2.10, 18.2.11)
Click here to enter response.

13.0 PLANT SECURITY

13.1 Supervisors are trained to recognize unusual human behavior and suspicious conditions. (QMS 22.2.4)
Click here to enter response.

13.2 Supervisors are accountable for headcount in the event of an emergency. (QMS 22.2.7)
Click here to enter response.

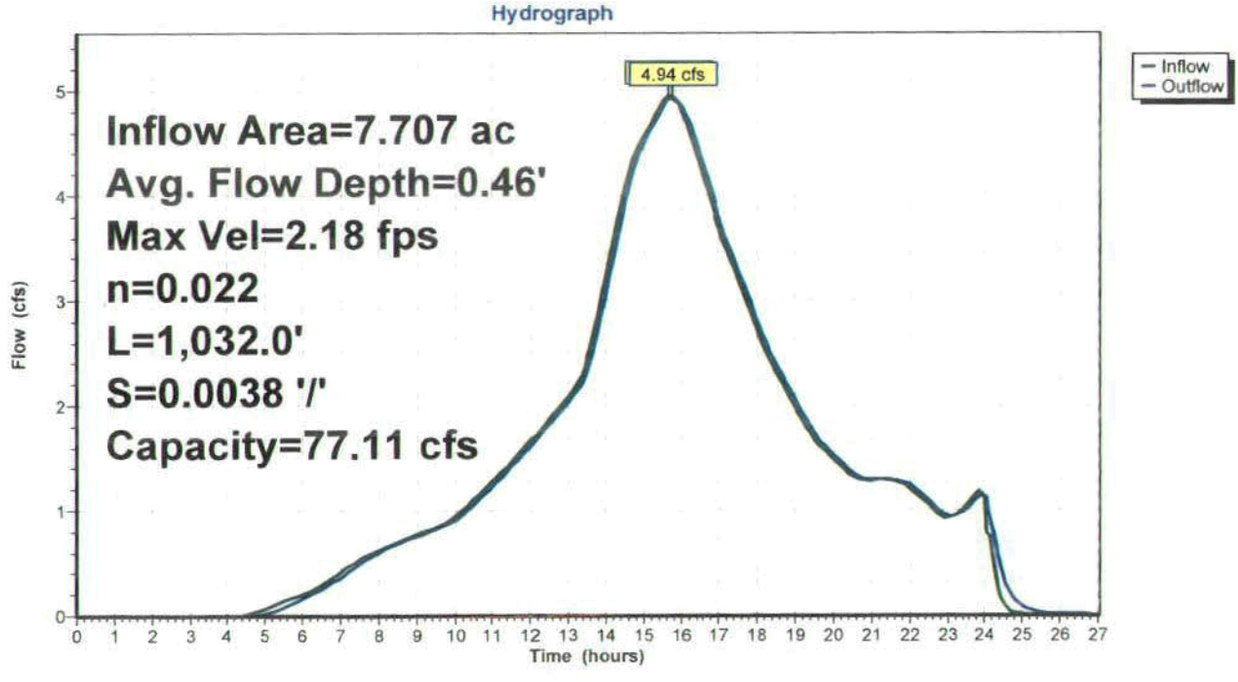
END OF APPENDIX Q

Electronic Filing: Received, Clerk's Office 09/28/2020

Summary for Reach 175R: North Ditch (west)

Inflow Area = 7.707 ac, 0.00% Impervious, Inflow Depth = 4.48" for 100yr-24hr Huff 3Q event
Inflow = 4.96 cfs @ 15.69 hrs, Volume= 2.878 af
Outflow = 4.94 cfs @ 15.79 hrs, Volume= 2.878 af, Atten= 0%, Lag= 6.0 min

Routing by Dyn-Stor-Ind method, Time Span= 0.00-27.00 hrs, dt= 0.05 hrs / 3
Max. Velocity= 2.18 fps, Min. Travel Time= 7.9 min
Avg. Velocity = 1.28 fps, Avg. Travel Time= 13.5 min



Peak Storage= 2,346 cf @ 15.79 hrs
Average Depth at Peak Storage= 0.46'
Bank-Full Depth= 2.00' Flow Area= 16.0 sf, Capacity= 77.11 cfs

4.00' x 2.00' deep channel, n= 0.022 Earth, clean & straight
Side Slope Z-value= 2.0 '/' Top Width= 12.00'
Length= 1,032.0' Slope= 0.0038 '/'
Inlet Invert= 451.96', Outlet Invert= 448.00'

BRUCE RAUNER, GOVERNOR LISA BONNETT, DIRECTOR

April 8, 2015

W0330100003

Mr. Kevin Kersting, Manager Water Quality
Ameren Services
1901 Chouteau Avenue
P.O. Box 66149, MC 606
St. Louis, Missouri 62257

06 L

Dear Mr. Kersting;

This transmittal responds to the Ameren Energy Medina Valley Cogen, LLC (Ameren) Closure Plan: Ash Ponds A, B, C and Bottom Ash Pond Hutsonville Power Station dated October 23, 2014, the Cover-Liner Comparison dated January 14, 2015, and responses, with attachments, to Agency comments dated February 25, 2015 and March 12, 2015, received at the Illinois Environmental Protection Agency ("Agency") headquarters.

The Agency has reviewed the Closure Plan, which includes a section on post-closure care. The Agency finds that the Closure Plan, in conjunction with the supplemental submissions referenced above, represent an appropriate means by which to close Ash Ponds A, B, C and the Bottom Ash Pond at the Hutsonville Power Station.

The Agency notes that the Closure Plan contains a Groundwater Management Zone ("GMZ") application. A letter approving the establishment of a GMZ as described in the GMZ application will be issued upon the Agency's receipt and favorable review of the Acceptance Report and Certification of Final Cover Placement described in Section 4.12 of the Closure Plan.

Thank you for your attention to these matters. If you have any questions or concerns, please contact Lynn Dunaway of my staff or me at the letterhead address or 217/785-4787.

Sincerely,

William S. Buscher

1. Introduction

The closure plan for Ameren Energy Generating Company's Hutsonville Power Station (the Station) Ash Pond D Coal Combustion Waste Surface Impoundment, presented herein, has been prepared in accordance with the requirements of the site0specific rule enumerated at 35 Illinois Administrative Code (IAC) Part 840 (the Rule). Concurrently submitted supporting documents are listed in the Reference Section of this report.

2. Site Map

Figure 1 depicts existing buildings at the Hutsonville Power Station as well as pertinent features around Ash Pond D and the surface impoundments at the site (Ash Ponds A, B, and C and the Bottom Ash Sluice Basin). The proposed groundwater collection trench associated with the closure of Ash Pond D and all existing groundwater monitoring wells are shown as well. (No additional monitoring wells are proposed at this time.)

3. Description of Ash Pond D

Ash Pond D functioned from 1968 to 2000 as the primary disposal location for coal combustion wastes generated from the Hutsonville coal0fired power plant. Coal combustion wastes were generally sluiced to Ash Pond D where solids were permitted to settle out and supernatant liquids were decanted. The pond contains primarily fly ash and bottom ash solids.

It is estimated that Ash Pond D has accumulated between 800,000 and 850,000 cubic yards of ash.

The ash pond is contained by a 4,200 ft long perimeter embankment that varies in height between 3 ft on the west side where the pond is adjacent to other features at the site, and 14 ft along the south and east sides where the pond is situated along the Wabash River. The exterior and interior embankment slopes are approximately 2.7H:1V and the perimeter embankment has a crest width of 20ft. The depth of ash in the pond is currently about 22 feet.

The cap will be constructed on a 20H:1V (5%) slope that will intersect the existing exterior embankment slope no higher than the existing ash surface. Soil embankment materials above that point will be removed and utilized for vegetative cover on the final cap.

Analyses of the structural integrity of the Pond in the proposed closed condition, including slope stability, bearing capacity and settlement, have been completed. The critical sections selected for the slope stability analyses of the perimeter berm and the final cover are shown on Figure 2. Cross0 sections of the fully constructed critical sections and the critical analyzed potential failure surfaces are included on Figures 3 and 4. Analyses of the proposed final configuration of the pond resulted in the following factors of safety (FOS) and induced settlement with regard to the structural stability of the pond:

Table 1. Structural Stability Analyses Results

Structural Stability Criteria	Calculated FOS	Required FOS*
Short Term Slope Stability 0Exterior Embankment	2.85	1.5
Long Term Slope Stability 0Exterior Embankment	2.82	1.5
Seismic Event Slope Stability 0Exterior Embankment	2.48	1.3
Short Term Slope Stability 0Cover Materials	2.86	1.5
Long Term Slope Stability 0Cover Materials	2.37	1.5
Seismic Event Slope Stability 0Cover Materials	1.75	1.3
Bearing Capacity	39.0	2.0
Seismic Event Bearing Capacity	38.4	1.5
Maximum Induced Settlement	16.0 in.	N.A.

*The Required FOS are based on Illinois EPA Landfill Requirements, for comparison purposes.

The results of the structural stability analyses indicate adequate slope stability and bearing capacity factors of safety. The slope stability factors of safety above include those from analyses considering seismic events with a 2240year return period, based on United States Geologic Survey mapping. The maximum estimated induced settlement will occur in the middle of the pond area as the ash is graded and the cover system materials are placed, and will not be detrimental to the integrity of the cover system.

4. Closure Activities

Major closure activities proposed include the placement of the final cover system, establishment of vegetative cover and surface water control features on the surface of Ash Pond D, and installation of a groundwater collection trench and recovery system as described below. Closure activities will be conducted in accordance with the Construction Quality Assurance (CQA) Plan prepared for this project meeting the requirements of the Rule (Hanson 2011A), and will be documented by a Professional Engineer licensed in Illinois.

4.1 Backfilling and Grading

Ash will be graded to establish the final sloped surface of the cap. Ash will be graded to a maximum slope of 20H:1V to promote surface drainage and prevent ponding of runoff. The final ash grading will intersect the existing exterior embankment slope no higher than the existing ash surface, in accordance with the Rule. Soil embankment materials above that point will be removed and utilized for vegetative cover on the final cap. The final cover design will result in a maximum of about 17 ft of regarded ash near the center of the pond. The final surface of the ash cap will be rolled smooth prior to the placement of the final cover system.

4.2 Final Cover Placement

Final cover components will include approximately 992,000 ft^2 of low permeability geosynthetic membrane cover and 106,500 yd3 of final protective soil material.

The low permeability layer will consist of a textured high density polyethylene (HDPE) geomembrane which will have a 400mil minimum nominal thickness. Geomembrane seams will be continuously fusion

or extrusion welded to form one continuous membrane covering the entire area of exposed ash. The perimeter edges of the HDPE geomembrane will be finished in an anchor trench excavated in soil materials. This will serve to keep the membrane anchored in place and prevent any lateral migration of surface water into the cap.

The low permeability geomembrane will be covered with a minimum of three feet of soil materials, as required by the Rule. These soils will be compacted only to the extent required for equipment traffic and construction of overlying drainage structures.

Soils used for the final protective cover will be fertilized, seeded and mulched to facilitate and support a permanent self-sustaining vegetative cover.

Installation of the low permeability geomembrane and the overlying soils will be conducted in accordance with the CQA program. Required records will be maintained on site during construction. The acceptance report and certification of final cover placement will be submitted to the Illinois EPA and be maintained at the offices of Ameren Environmental Services in St. Louis, Missouri.

4.3 Ash Pond Dewatering

No dewatering of the ash pond is proposed during closure activities. However, after the geomembrane and soil cover components are installed, it is expected that the subsurface water level in the ash pond will drop to coincide with the surrounding groundwater table.

4.4 Surface Water Management

Surface water management features have been incorporated into the final cover design. These include intermediate berms and ditches to direct runoff to rip-rap-lined chutes running off the ash pond to surrounding areas. The location of these structures is shown on Figure 5. Additional details are included in the Project Plans and Specifications (Hanson 2011D).

Surface water control features are designed to safely pass runoff from a 1000-year, 24-hour precipitation event without excessive scouring or erosion. Surface water control structures will be installed immediately following installations of the final cover soils.

4.5 Groundwater Collection Trench

A groundwater collection trench (Trench) will be installed between the outside south toe of Ash Ponds A, B, and D and the south Ameren property line, as shown on Figure 1. The Trench will run from the southwest corner of Ash Pond A to the southeast corner of Ash Pond D. The Trench extends to bedrock (except at the extreme east end) and is designed to intercept groundwater that may migrate to the south from the Ash Pond D area. The vertical alignment of the collection pipe along the Trench bottom has been set into bedrock or below the designed bottom elevation of Ash Pond D, and below the recorded minimum groundwater elevations, as shown on Figure 6.

The Trench collection system will consist of a perforated HDPE pipe encased in coarse aggregate and wrapped in non-woven geotextile that will run the full length of the Trench. The bottom slope of the Trench will be constructed to direct collected groundwater to four separate sumps: a pair in the east portion of the Trench adjacent to Ash Pond D, and a pair in the west portion of the Trench adjacent to Ash Pond A, as indicated on Figure 6 and in the Project Plans and Specifications (Hanson 2011D).

The groundwater collection trench is designed to continuously withdraw groundwater to control the gradient and flow direction of potentially impacted groundwater associated with Ash Pond D.

Groundwater collected in the trench flows by gravity to one of the four collection sumps, each equipped with a 50 gallon per minute (gpm) pump system. The estimated average steady state groundwater flows to each of seven segments of the trench draining to the four sumps, as shown on Figure 6, were analyzed using Hooghoudt's equation for drain spacing (Hooghoudt, 1940) and Darcy's Law (flow equals conductivity times gradient times area), based on the collector pipe being placed in an 18 in. wide coarse aggregate envelope with a hydraulic conductivity of $1x10^{01}$ cm/sec. The lengths, formation hydraulic conductivities (based on previous information discussed in the Hydrogeologic Site Investigation Report completed for this project (Hanson 2011B), and on consolidation test results completed for the settlement analysis discussed in Section 3, above, for the east end silty clay materials), along with the resulting radius of influence on the groundwater table and steady state discharge flow for each segment are included on Table 2.

Table 2. Groundwater Collection Trench Flow Analysis Results

Segment	**Length** (ft)	**Formation Material / Hydraulic Conductivity** (cm/sec)	**Average Ground7 water Level Above Pipe** (ft)	**Effective Radius** (ft)	**Average Steady State Formation Discharge** (gpm)
1	300	Alluvial Sand / $1.5x10^{02}$	9	35.2	7.95
2	290	Alluvial Sand / $1.5x10^{02}$	12	45.8	7.69
3	600	Alluvial Sand / $1.5x10^{02}$	5	27.4	9.28
4	670	Alluvial Sand / $1.5x10^{02}$	9	37.9	12.49
5	240	Alluvial Sand / $1.5x10^{02}$	8	26.1	7.45
6	180	Silty Clay / $8.25x10^{06}$	10	29.8	0.004
7	310	Silty Clay / $8.25x10^{06}$	14	56.2	0.006
TOTAL					44.87

Although an estimated average total steady state flow of approximately 45 gallons per minute (gpm) into the Trench has been calculated, four 50 gpm pumps were selected to create and maintain drawdown in the collection trench, resulting in a theoretical maximum discharge from the trench of 200 gpm. The steady state rate is the estimated delivery of groundwater from the formation through the designed 180nch thick gravel pack surrounding the pipe once the anticipated drawdown level is reached. Capture of groundwater within the Trench occurs as soon as pumping begins, as the flow to the pumps induce a groundwater flow gradient toward the Trench from all sides. Therefore, the groundwater contaminants that may migrate across the south property line to adjacent private properties are intercepted. The system was designed with some over0capacity and pumps will cycle on and off as water flows into the collection pipe and accumulates in the sumps. Also, each pair of pumps (east pair and west pair) are designed to act redundantly in the event one pump fails or is out of service for maintenance or replacement. Only one pump on each side needs to be operational to handle the steady state groundwater flows into the Trench. Although the system appears to be oversized relative to the steady state flow, using the same capacity pumps provides both redundancy and uniformity (identical pumps result in ease of repair/replacement due to standardization of replacement parts, etc.).

The pumps are controlled by a pair of float switches (low0water and high0water) that activate or shut down the pump based on the water level in the sump. Water from each sump will be pumped to a

central catch basin located adjacent to the existing Ash Pond D outlet structure along the mid-east side of the pond. It will then discharge to the Wabash River in accordance with the Station's NPDES permit.

To evaluate Trench performance and pump operation, each pump will have a flow meter (for determining the discharge rate and volume) and a pressure transducer (for determining water levels) at each sump or sump discharge. Evaluation of the operation of the Trench will be based on regular readings of the flow rates, flow volumes and water elevations at each sump. For additional security, a warning light will be activated at the pump controller panel in the event that groundwater levels in the Trench exceed the pump's high-water sensor.

The collection sumps will be constructed to prevent surface water infiltration, especially in the Wabash River flood plain (elevations below approximately 450.0 ft msl) where a bentonite seal will be included in the backfill. Water-tight connections are necessary in the flood plain to prevent the collection trench or sumps from being overwhelmed with surface water.

Maintenance of the groundwater collection trench and its components is addressed in the Ash Pond D Post-Closure Care Plan (Hanson 2011E).

4.6 Schedule

Completion of the closure activities is dependent on weather and final approval of the closure plan by the Illinois Environmental Protection Agency. However, they are expected to be completed during the 2012 construction season.

5. Hydrogeologic Site Investigation

Please see the separate Hydrogeologic Site Investigation Report (Hanson 2011B) that was prepared for this project.

6. Groundwater Trend Analysis

Please see Section 5.2 in the separate Groundwater Monitoring Plan Report (Hanson 2011C) that was prepared for this project.

7. Groundwater Monitoring System

Please see Section 2 in the Groundwater Monitoring Plan Report. A monitoring system maintenance plan is included at the end of Section 2.2 of that Report.

8. Groundwater Monitoring Program

Requirements for the Groundwater Monitoring Program may be found in Section 3 and Appendix A of the Groundwater Monitoring Plan Report. Associated Quality Assurance requirements may be found in Appendix A of the that report. All monitoring data and trend analysis data will be maintained at the offices of Ameren Environmental Services in St. Louis, Missouri, for a minimum of ten years following generation of the data.

9. Groundwater Monitoring Well Locations

Locations for the Ash Pond D monitoring wells to be used for the trend analysis are identified in Table 1 in Section 2 of the Groundwater Monitoring Plan Report.

10. Groundwater Collection Trench

Please see the Ash Pond D Closure Plans and Specifications completed for this project (Hanson 2011D).

11. Final Cover System

Please see the Ash Pond D Closure Plans and Specifications, completed for this Project (Hanson 2011D).

12. Time and Cost Estimates

12.1 Time to Complete Closure

Completion of the closure activities is dependent on weather and final approval of the closure plan by the Illinois Environmental Protection Agency. However, they are expected to be completed during the 2012 construction season.

12.2 Time to Reach Hydrostatic Equilibrium of Groundwater

Please see Section 4.5 in the project Hydrogeologic Site Investigation Report.

12.3 Cost of Closure

The cost for closure activities related to the closure of Ash Pond D as described in Section 4 of this Closure Plan and as specified in the drawings and specifications is estimated to be $5,500,000.

12.4 Cost of Post-Closure Care

The cost for post0closure care activities related to the closure of Ash Pond D as specified in the Post0 Closure Care Plan completed for this project (Hanson 2011E) is estimated to be $75,000 annually.

13. Construction Quality Assurance Program

As previously indicated, please see the Construction Quality Assurance Plan completed for this project (Hanson 2011A).

14. Mitigation of Statistically Significant Increasing Trends

Please see Section 5.2.3 in the Groundwater Monitoring Plan Report.

Electronic Filing: Received, Clerk's Office 09/28/2020

RE: Hutsonville, Ash Pond D Closure and Post Closure Care Plans

Dear Mr. Pozzo:

This letter provides a final determination by the Illinois Environmental Protection Agency (Illinois EPA) regarding the Ameren Energy Generating Company (Ameren), Hutsonville Power Station Ash Pond D Closure and Post Closure Care Plans (Plans), submitted pursuant to 35 AIC 840.128 and 840.138, respectively, dated July 26, 2011 and revisions thereto dated February 15, 2012 and March 30, 2012.

The Illinois EPA has reviewed the required elements of the Closure Plan and Post Closure Care Plan pursuant to the requirements of 35 IAC 840.130 and 840.140, respectively. The Illinois EPA finds that the Plans include all of the required elements and approves all elements of the Plans pursuant to 35 IAC 840.148, as submitted or as revised on the dates listed above. Pursuant to 35 IAC 840, implementation of the approved Plans is subject to acquiring all required permits.

Thank you for your attention to this matter. If you have any questions concerning this letter, please contact me or Lynn Dunaway of my staff at 217-785-4787.

Sincerely,

William E. Buscher

CLOSURE PLAN
FLY ASH POND AND BOTTOM ASH POND
MEREDOSIA POWER STATION
800 SOUTH WASHINGTON STREET
MEREDOSIA, ILLINOIS

1.0 INTRODUCTION

This Closure Plan for the AmerenEnergy Medina Valley Cogen, LLC Meredosia Power Station (Meredosia Power Station) Fly Ash Pond and Bottom Ash Pond Coal Combustion Waste Surface Impoundments has been prepared in general accordance with the requirements of the site-specific rule in 35 Illinois Administrative Code (IAC) Part 840.101 through 840.152 and the United States Environmental Protection Agency (USEPA) regulation at 40 Code of Federal Regulations (CFR) Parts 257 and 261. Supporting documents to this Closure Plan are listed in the Reference Section of this report.

2.0 SITE LAYOUT

The Meredosia power Station is located at 800 South Washington Street, Meredosia, Illinois. The Fly Ash and Bottom Ash Ponds are located southwest of the coal pile and plant facilities. The site location and topography are shown on Plate 1. The existing structures, ash ponds, and boring/monitoring wells are shown on Plate 2.

3.0 SITE HISTORY

The Meredosia Power Station is located south of Meredosia in Morgan County, Illinois, which is located in west-central Illinois. The Meredosia Power Station ash ponds are located in the south half of Section 21 and the north half of Section 28, T.16N, R.13W. The plant generated electricity from 1948 until February 2012. The plant is located on the floodplain east of the Illinois River. A third ash pond referred to as the "Old Ash Pond" was reportedly closed, and will not be further discussed in this report. Reportedly, the Bottom Ash and Fly Ash Ponds were constructed of native materials.

The Bottom Ash Pond was constructed in 1972 with a design surface area of 11 acres, a height of 24 feet and a volume of approximately 90 acre-feet. The Bottom Ash Pond had received low-volume wastewater, bottom ash and storm water runoff. The site operates under NPDES Permit IL0000116, Outfall 003, which is for the Bottom Ash Pond. Reportedly, the Bottom Ash Pond did not have standing water within two months of the plant closure.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

The Fly Ash Pond was constructed in 1968. The Fly Ash Pond has a surface area of 34 acres, a height of 24 feet and a volume of approximately 500 acre-feet. The Fly Ash Pond reportedly received fly ash, low-volume wastewater and storm water runoff. The site operates under NPDES Permit IL0000116, Outfall 004, which is for the Fly Ash Pond. The Fly Ash Pond was reportedly dry by October 2012.

A feasibility analysis was performed regarding the closure options for the Fly Ash and Bottom Ash Ponds on the site. The options included no action, complete clean closure, soil/geosynthetic composite cap, and partial clean closure with a ClosureTurf® cap alternatives. The no closure option was not selected due to the known groundwater impacts at the site and facility decommissioning activities. Clean closure of both ponds was cost and time prohibitive due to ash disposal and subsequent backfilling and grading of the site. The soil/geosynthetic composite cap option was not selected due to the long term maintenance issues, lack of personnel on site to perform maintenance activities, cost, and the longer time frame needed to close the ponds. Partial clean closure of the bottom ash pond, moving the bottom ash to the fly ash pond, and capping the fly ash pond and bottom ash pond berm with ClosureTurf® was selected as an effective and efficient option.

4.0 SLOPE STABILITY ANALYSIS

Slope stability analysis consists of comparing the driving forces within a cross-section of slope to the resisting forces and calculating the factor of safety. Per the Illinois Department Natural Resources (IDNR)[1], embankments should have a minimum factor of safety of 1.5 for long-term static stability, and 1.0 for the pseudo-static condition (seismic condition). Major flood conditions and rapid drawdown conditions were also analyzed due to the proximity of the site to the Illinois River. Slope stability analysis discussion, section profiles, and calculated critical failure arcs at selected locations are presented in Appendix A. Global stability analysis results, at current groundwater elevations in relation to mean sea level (MSL) and design grades for the Fly Ash and Bottom Ash Ponds, are summarized in the following table.

[1] *Rules for Construction and Maintenance of Dams*, Illinois Department of Natural Resources, Office of Water Resources, Springfield, Illinois.

printed on recycled paper

SUMMARY OF STABILITY ANALYSES			
Section Location	**Case**	**Calculated Factor of Safety**	**Target Factor of Safety**
Fly Ash Pond West Embankment	Static Condition Normal River Stage	2.1	1.5
	Static Condition Major Flood Stage (447'MSL)	2.5	1.5
	Rapid Drawdown Major Flood Stage (447'MSL)	1.7	1.2
	Seismic Condition	1.3	1.0
Bottom Ash Pond West Embankment	Static Condition Normal River Stage	1.8	1.5
	Static Condition Major Flood Stage (447'MSL)	1.6	1.5
	Rapid Drawdown Major Flood Stage (447'MSL)	1.7	1.2
	Seismic Condition	1.3	1.0

The stability models for each section at the Fly Ash Pond and Bottom Ash Pond closures have calculated factors of safety greater than or equal to the recommended IDNR target factor of safety for the static and seismic conditions.

5.0 CLOSURE ACTIVITIES

Proposed closure activities include grading, installation of high performance high density polyethylene (HDPE) geomembrane, and establishment of surface water control features for the Fly Ash and Bottom Ash Ponds. Closure activities will be performed in accordance with the Closure Plans and Specifications. Quality control will be performed in accordance with the Construction Quality Assurance (CQA) Plan prepared for this project and will be documented by a professional engineer licensed in Illinois.

Refer to the Plans and Specifications completed for this project (CDG, 2016) for details on the closure system.

5.1 Grading. Ash and other material (i.e. embankment soils, bottom ash, and approved demolition debris) will be moved within and between the Fly Ash and Bottom Ash Ponds to achieve design grades. Embankment materials and bottom ash may be used to bring the subgrade to within one foot of design elevations. At least one foot of fly ash will be placed on top of the

printed on recycled paper

bottom ash to provide a good surface for ClosureTurf® installation. Ash will be placed at a maximum slope of 1V:10H (10 percent slope). Slopes are designed to promote surface runoff and reduce ponding. The final subgrade surface will be compacted and drum-rolled to provide a smooth surface prior to placement of the high performance HDPE system.

5.2 ClosureTurf®/HydroTurf® Installation. The ClosureTurf®/HydroTurf® system is a low permeability synthetic liner used to control storm water infiltration and limit exposure of the capped material to humans and vectors (i.e. animals). The design grades facilitate storm water runoff to the surface water management features outside the Fly Ash and Bottom Ash Ponds.

The ClosureTurf®/HydroTurf® is generally installed in the following manner (Refer to the CQA Plan for specific installation guidelines):

- The geomembrane component is installed per the manufacturer's requirements including the use of heat welding for seaming.
- The turf component is installed per the manufacturer's requirements including the use of a sewing machine for seaming.
- Sand or hydrobinder infill is placed and hydrated per the manufacturer's requirements.
- The perimeter of the geomembrane and turf components is secured by an anchor trench.

5.3 Surface Water Management. Surface water management features have been incorporated into the final cover design. Surface water features, such as ditches, will be formed in the subgrade to facilitate runoff. The ClosureTurf®/HydroTurf® will be placed over the berms and into ditches. Additional details are provided in the Plans and Specifications (CDG, 2016).

Surface water features are designed to handle runoff from a 20-year precipitation event without damage to the final cover and water ponding.

5.4 Construction Quality Assurance (CQA) Program. Refer to the CQA Plan (Geotechnology, 2016) for details on the project specific CQA program.

6.0 HYDROGEOLOGIC SITE INVESTIGATION

The Hydrogeologic Site Investigation includes a summary of geologic data, hydrogeologic data, and known impacts to the groundwater for the site. Boron and arsenic are typically the best indicator chemicals for coal combustion waste related impacts at the site. Please refer to the separate Hydrogeologic Site Investigation Report (Geotechnology, 2016) for detailed information.

printed on recycled paper

7.0 GROUNDWATER

7.1 Groundwater Monitoring Program. Requirements for the groundwater monitoring program and associated quality assurance are found in the Groundwater Monitoring Plan (Geotechnology, 2016). Quarterly groundwater sampling of the groundwater monitoring system will occur for the first five years after the CQA acceptance report is submitted, and sampling frequencies may be reduced after that time frame. Monitoring data and trend analysis data will be maintained at the offices of Medina Valley Cogen, LLC until a post-closure completion report is accepted by the IEPA.

7.2 Groundwater Monitoring System. Nine monitoring wells (Groundwater Monitoring Program, Plate 2) have been installed in the vicinity of the Fly Ash and Bottom Ash Ponds. These monitoring wells are used for the groundwater monitoring system. Additional monitoring wells are not planned at this time. The monitoring well network will be evaluated two years after completion of the ash pond closures for effectiveness. One monitoring well (APW-1) will be sampled for background values, and eight monitoring wells will be sampled for groundwater assessment. Please refer to the separate Groundwater Monitoring Plan (Geotechnology, 2016) for additional information.

7.3 Groundwater Trend Analysis. Intrawell analysis will be used to assess groundwater trends over time. Please refer to the separate Groundwater Monitoring Plan (Geotechnology, 2016) for additional information.

7.4 Mitigation of Statistically Significant Trends. If statistically significant increasing trends are noted in the groundwater analysis, additional investigation into the cause of the increasing trends will be needed. Refer to the Groundwater Monitoring Plan (Geotechnology, 2016) for additional information.

8.0 TIME AND COST ESTIMATES

8.1 Time to Complete Closure. Completion of closure activities is dependent on weather and final approval of the closure plan by the IEPA. However, closure activities are anticipated to begin in 2016 and be completed in 2017.

8.2 Time to Reach Class I Groundwater Standards. Boron concentrations for the current ash pond configurations were modeled for 25 years to represent a scenario where the ash ponds were not closed. After 25 years, Monitoring Well APW-3 (the well with historically highest boron concentrations) stabilized at 16.9 mg/L of boron, which exceeds the Class I Groundwater standards. Monitoring Wells APW-2, APW-6, APW-7, and APW-8 also exceeded the Class I Groundwater standards at 25 years with no action.

printed on recycled paper

After the dewatering and closure activities of the Fly Ash and Bottom Ash Ponds are complete, it will take approximately three years for boron concentrations to decrease below the Class I Groundwater standards for each well on site according to the model results.

Refer to the Hydrogeologic Site Investigation Report (Geotechnology, 2016) for more information regarding the groundwater modeling.

8.3 Remediation Time Frame. Once the ClosureTurf® caps for the Fly Ash and Bottom Ash Ponds are in place, precipitation will be diverted away from the ash ponds. Infiltration of precipitation into the ash ponds will be reduced or eliminated and further reductions of the concentrations of COCs are anticipated. Boron exhibited the highest concentration over the largest area and was used as the indicator contaminant for contaminant transport modeling. Based on the modeling results, the length of time required for the concentration of boron to decrease below the Class I Groundwater Standards is approximately three years. Additional contamination transport modeling information is in the Hydrogeologic Site Investigation Report (Geotechnology, 2016).

8.4 Cost of Closure. The cost for closure activities related to the closure of the Fly Ash and Bottom Ash Ponds as specified in the drawings and specifications is estimated to be $10,000,000.

8.5 Cost of Post-Closure Care. The cost for post-closure care activities related to the closure of the Fly Ash and Bottom Ash Ponds as specified in the Post-Closure Plan is estimated to be $20,000 annually while quarterly groundwater sampling is in progress.

APPENDIX A

STABILITY ANALYSIS

J024917.01

APPENDIX A

STABILITY ANALYSIS

1.0 PREVIOUS SLOPE STABILITY STUDY

Geotechnology performed a subsurface exploration and global stability evaluation[2] for the west embankments of the Bottom Ash and Fly Ash Ponds at the subject site in January 2011. Ten borings designated as Borings B-1 through B-10 were drilled during the subsurface exploration. Boring locations are shown on Plate 2. Laboratory testing included moisture contents for cohesive samples and Atterberg limits on selected samples. Also, consolidated-undrained triaxial, unconfined compression and direct shear tests were performed on representative samples. Relevant data from this exploration are incorporated into this report. Copies of the boring logs are presented in Attachment A. Laboratory test results are included in Attachment B.

2.0 SLOPE STABILITY ANALYSIS

Slope stability analysis consists of comparing the driving forces within a cross-section of slope to the resisting forces and determining the factor of safety. Gravity forces tend to move the slope downwards (driving force), while resisting forces, derived from the soil shear strength, tend to keep the slope in place. When the driving force acting on the slope is greater than the resisting force, sliding can occur. The factor of safety of the slope is the ratio of the restraining force divided by the driving force. Generally, when the factor of safety is 1 or less, the slope is considered to be unstable. The accepted standard in local practice and consistent with the Illinois Department of Natural Resources (IDNR) dam safety requirement is a factor of safety of 1.5 for long term static stability of a slope, and 1.0 for pseudo-static conditions (seismic loading).

Slope stability analyses were performed for representative sections of the west embankments of the Bottom Ash and Fly Ash Ponds. We understand that the embankment slopes will remain as-is or will be graded to a slope of 1V:3H (Vertical:Horizontal) or flatter. The locations of the typical cross-sections of the embankments are represented by Sections B-B' and A-A', respectively, and are shown on Plate 2. Soil profile and properties used in the stability analysis were selected based on boring and laboratory test results reported in the 2011 Global Stability Evaluation report and Geotechnology's experience with similar materials. The soil properties used in the models are summarized in the following table:

[2] *Global Stability Evaluation, Meredosia Power Station, Bottom and Fly Ash Ponds, Meredosia, Illinois,* prepared for Ameren Energy Resources by Geotechnology Inc., Report No. J017150.01, and dated January 4, 2011.

printed on recycled paper

2.1 Effective Stress Parameters

Material	Cohesion (psf)	Friction Angle (deg)	Density (pcf)
Embankment Fill	0	28	115
Silty Clay	50	29	115
Sand	0	39	120
Fly Ash	0	25	112
Bottom Ash	0	28	112

2.2 Total Stress Parameters

Material	Cohesion (psf)	Friction Angle (deg)
Embankment Fill	0	0
Silty Clay	500	14
Sand	0	0
Fly Ash	0	0
Bottom Ash	0	0

Geotechnology performed stability analysis for deep seated, global failure of the embankments. Representative cross-sections of the embankments are shown on the plates included in Appendix C. Since the embankments have been in place for 40 years or more, long-term stability of the embankments was analyzed (i.e. effective stress conditions). Both effective and total stress soil properties were used for the rapid drawdown analysis. Groundwater in the Bottom Ash Pond was varied between El 435[3] to 440 for our analyses. Groundwater in the Fly Ash Pond was assumed to be at El 450. For the rapid drawdown case it was assumed that the Illinois River will drain rapidly from its major flood stage of El 447.

A pseudo-static seismic analysis was performed on the embankment sections using a Peak Ground Acceleration (PGA) of 0.1g, which corresponds to a seismic event with a mean return time of 2,500 years. The PGA is based on data provided in Appendix 1 of the dam safety guidelines[4] published by the IDNR. The Morgenstern-Price procedure was used to compute factors of safety. The computer program SLOPE/W was used to perform the computations. The calculated factors of safety are given in the following table.

[3] All elevations herein refer to the mean sea level (msl) datum in feet.
[4] "Procedural Guidelines for Preparation of Technical Data to be included in Application for Permits for Construction and Maintenance of Dams" issued by Illinois Department of Natural Resources.

printed on recycled paper

SLOPE STABILITY ANALYSIS RESULTS				
Analysis Condition	Calculated Factor of Safety		Target Factor of Safety[a]	Reference Plate No.
	Fly Ash Pond Section AA'	Bottom Ash Pond Section BB'		
Steady State Seepage Groundwater Elevation in Ash Pond as noted	2.1 (El 450)	1.8 (El 435)	1.5	1 and 5
Steady State Seepage at Major Flood Stage El 447 Groundwater Elevation in Ash Pond as noted	2.5 (El 450)	1.6 (El 440)	1.5	2 and 6
Rapid Drawdown from Major Flood Stage at El 447 Groundwater Elevation in Ash Pond as noted	1.7 (El 450)	1.7 (El 440)	1.2	3 and 7
Slope with Seismic Forces Mean Return Time 2,500 Years Groundwater Elevation in Ash Pond as noted	1.3 (El 450)	1.3 (El 435)	1.0	4 and 8

[a] "Procedural Guidelines for Preparation of Technical Data to be included in Application for Permits for Construction and Maintenance of Dams" issued by Illinois Department of Natural Resources.

IDNR recommends a minimum factor of safety of 1.5 for long-term stability. During an extreme event, such as an earthquake, a factor of safety of 1.0 or more is recommended. Based on the results of our analyses, the Bottom Ash and Fly Ash Pond embankment slopes have adequate factors of safety for global stability.

BORING LOG: TERMS AND SYMBOLS

GENERAL NOTES

1. *Information on each boring log is a compilation of subsurface conditions based on soil or rock classifications obtained from the field as well as from laboratory testing of samples. The strata lines on the logs may be approximate or the transition between the strata may be gradual rather than distinct. Water level measurements refer only to those ob - served at the times and places indicated, and may vary with time, geologic condition or construction activity.*
2. *Relative composition and Unified Soil Classification designations are based on visual estimates and are approximate only. If laboratory tests were performed to classify the soil, the unified designation is show in parenthesis.*
3. *Value given in Unit Dry Weight/SPT Column is either a unit dry weight in pounds per cubic foot, if adjacent to a ST sample designation, or blows per 6-inch increment if adjacent to a SS sample designation.*

ABBREVIATIONS

UU/2	*Shear Strength from Unconsolidated – Undrained Triaxial Test (ASTM D2850)*
QU/2	*Shear Strength from Unconfined Compression Test (ASTM D2166)*
SV	*Shear Strength from Field Vane (ASTM D2573)*
PL	*Plastic Limit (ASTM D4318)*
LL	*Liquid Limit (ASTM D4318)*

LEGEND

CS	Continuous Sampler
GB	Grab Sample Taken From Auger Cuttings Or Wash Water Return
NX 100/42	NX Rock Core with Percent Recovery/R.Q.D. Given In Adjacent Column
PST	Three Inch Diameter Piston Tube Sample
SS	Split Spoon Sample (Standard Penetration Test)
ST	Three Inch Diameter Shelby Tube Sample
*	Sample Not Recovered
SV	Field Vane Test

SPLIT – BARREL SAMPLER DRIVING RECORD

Blow Per Foot (N-Value)	*Description*
25	*25 blows drove sampler 12 inches after initial 6 inches of seating.*
75/10"	*75 blows drove sampler 10 inches after initial 6 inches of seating.*
50/S3"	*50 blows drove sampler 3 inches during initial 6 inch seating interval.*

NOTES: 1. *To avoid damage to sampling tools, driving is limited to 50 blows during any six inch interval.*
2. *N-Value (Blow Count) is the standard penetration resistance based on the total number of blows, using a 140-lb hammer with 30-inch free fall, required to drive a split spoon the last two of three, 6-inch drive increments. (Example: 4/7/9, N = 7 + 9 = 16). Values are shown as a summation on grid plot and may be shown as 4/7/9 In Unit Dry Weight – SPT column.*

RELATIVE COMPOSITION

Trace.....0-10 %
With/Some.....11-35 %
Soil modifier such..... > 35 %
As silty, clayey, sandy, etc.

DENSITY OF GRANULAR SOILS

Descriptive Term:	*N—Value*
Very Loose	*0 - 4*
Loose	*5 - 10*
Medium Dense	*11 - 30*
Dense	*31 - 50*
Very Dense	*> 50*

STRENGTH OF COHESIVE SOILS

Consistency	Undrained Shear Strength Tons Per Sq. Ft.	Field Test	Approximate N-Value Range
Very Soft	*less than 0.12*	*Thumb will penetrate soil more than 1"*	*0 - 1*
Soft	*13 to 0.25*	*Thumb will penetrate soil about 1"*	*2 - 4*
Medium Stiff	*0.26 to 0.50*	*Thumb will penetrate soil about ¼"*	*5 – 8*
Stiff	*0.51 to 1.00*	*Thumb hardly indents soil*	*9 – 15*
Very Stiff	*1.01 to 2.00*	*Thumb will not indent soil, but readily indented with thumbnail*	*16 – 30*
Hard	*greater than 2.00*	*Thumbnail will not indent soil*	*> 30*

SOIL GRAIN SIZE

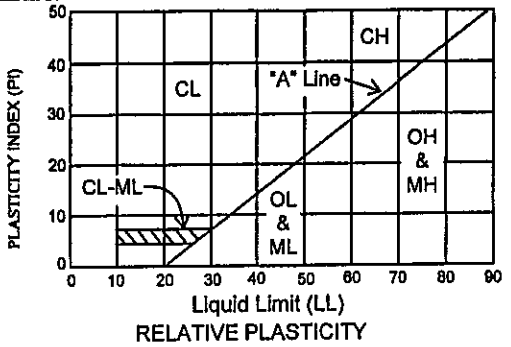
U.S. STANDARD SIEVE

12"	3"	¾"	4	10	40	200		
BOULDERS	COBBLES	GRAVEL		SAND			SILT	CLAY
		COARSE	FINE	COARSE	MEDIUM	FINE		
300	76.2	19.1	4.76	2.00	0.42	0.074	0.002	

SOIL GRAIN SIZE IN MILLIMETERS

SOIL STRUCTURE

Calcareous *– Having appreciable quantities of carbonate.*
Fissured *– Containing shrinkage or relief cracks, often filled with sand or silt; usually more or less vertical.*
Slickensided *– Having planes of weakness that appear slick and glossy. The degree of slickensidedness depends upon the spacing of slickensides and the ease of breaking along those planes.*
Layer *-- Inclusion greater than 3 inches thick.*
Seam *– Inclusion 1/8 inch to 3 inches thick extending through the sample*
Parting *– Inclusion less than 1/8 inch thick.*
Pocket *– Inclusion of material of different texture that is smaller than the diameter of the sample.*
Interlayered *– Soil samples composed of alternating layers of different soil types.*
Intermixed *– Soil samples composed of pockets of different soil types and a layered or laminated structure is not evident.*
Laminated *– Soil sample composed of alternating partings or seams of different soil type.*



GEOTECHNOLOGY INC
FROM THE GROUND UP

Electronic Filing: Received, Clerk's Office 09/28/2020

UNIFIED SOIL CLASSIFICATION SYSTEM

MAJOR DIVISIONS			SYMBOL	DESCRIPTION
Coarse-Grained Soils (More than 50% Larger than No 200 Sieve Size)	Gravel and Gravelly Soils	Clean Gravels Little or no Fines	GW	Well-Graded Gravel, Gravel-Sand Mixture
			GP	Poorly –Graded Gravel, Gravel-Sand Mixture
		Gravels with Appreciable Fines	GM	Silty Gravel, Gravel-Sand-Silt Mixture
			GC	Clayey-Gravel, Gravel-Sand-Clay Mixture
	Sand and Sandy Soils	Clean Sands Little or no Fines	SW	Well-Graded Sand, Gravelly Sand
			SP	Poorly Graded Sand, Gravelly Sand
		Sands with Appreciable Fines	SM	Silty Sand, Sand-Silt Mixture
			SC	Clayey Sand, Sand-Clay Mixture
Fine-Grained Soils (More than 50% Smaller than No 200 Sieve Size)	Silts and Clays	Liquid Limit Less Than 50	ML	Silt, Clayey Silt, Silty or Clayey Very Fine Sand, Slight Plasticity
			CL	Clay, Sandy Clay, Silty Clay, Low to Medium Plasticity
			OL	Organic Silts, or Silty Clays of Low Plasticity
	Silts and Clays	Liquid Limit More Than 50	MH	Silt, Fine Sandy or Silt Soil with High Plasticity
			CH	Clay, High Plasticity
			OH	Organic Clay of Medium to High Plasticity
	Highly Organic Soils		PT	Peat, Humus, Swamp Soil

PLASTICITY CHART

RELATIVE PLASTICITY

Nonplastic	Cannot Roll Into Ball
Trace Plasticity	Barely Roll Into Ball
Medium Plastic	Can be Rolled Into Ball
Highly Plastic	No Rupture by Kneading

VISUAL DESCRIPTION CRITERIA*

TABLE 1: CRITERIA FOR DESCRIBING ANGULARITY OF COARSE-GRAINED PARTICLES

Description	Criteria
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular	Particles are similar to angular description but have rounded edges
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges
Rounded	Particles have smoothly curved sides and no edges

TABLE 2: CRITERIA FOR DESCRIBING PARTICLE SHAPE

Description	Criteria
Flat	Particles with width/thickness X3
Elongated	Particles with length/width X3
Flat and Elongated	Particles meet criteria for both flat and elongated

TABLE 3: CRITERIA FOR DESCRIBING MOISTURE CONDITION

Description	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp, but no visible water
Wet	Visible free water, usually soil is below the water table

TABLE 4: CRITERIA FOR DESCRIBING REACTION WITH HCL

Description	Criteria
None	No visible reaction
Weak	Some reaction, with bubbles forming slowly
Strong	Violent reaction, with bubbles forming rapidly

TABLE 6: CRITERIA FOR DESCRIBING CEMENTATION

Description	Criteria
Weak	Crumbles or breaks with handling or little finger pressure
Moderate	Crumbles or breaks with considerable finger pressure
Strong	Will not crumble or break with finger pressure

TABLE 8: CRITERIA FOR DESCRIBING DRY STRENGTH

Description	Criteria
None	The dry specimen crumbles into powder with mere pressure of handling
Low	The dry specimen crumbles into powder with some finger pressure
Medium	The dry specimen breaks into pieces or crumbles with considerable finger pressure
High	The dry specimen cannot be broken with finger pressure. Specimen will break into pieces between thumb and a hard surface.
Very High	The dry specimen cannot be broken between the thumb and a hard surface

TABLE 9: CRITERIA FOR DESCRIBING DILATANCY

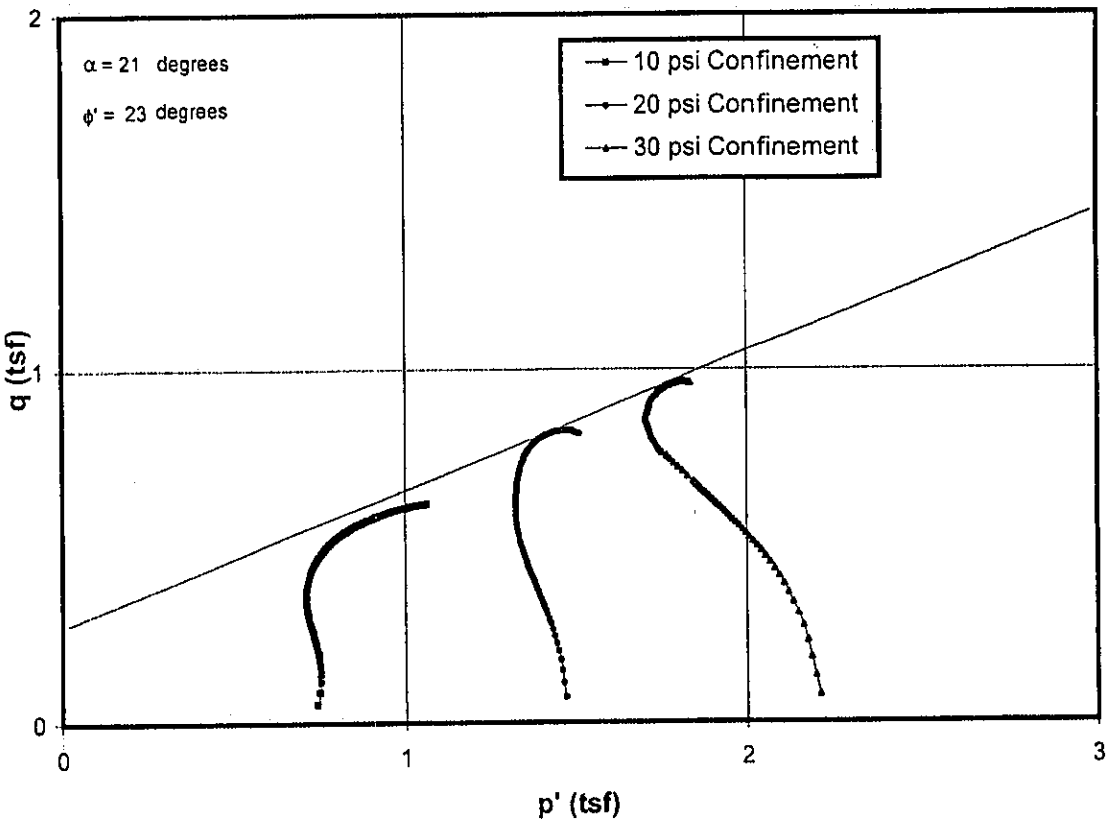
Description	Criteria
None	No visible change in the specimen
Slow	Water appears slowly on the surface of the specimen during shaking and does not disappear or disappears slowly upon squeezing.
Rapid	Water appears quickly on the surface of the specimen during shaking and disappears quickly upon squeezing.

TABLE 10: CRITERIA FOR DESCRIBING TOUGHNESS

Description	Criteria
Low	Only slight pressure is required to roll the thread near the plastic limit. The thread and the lump are weak and soft.
Medium	Medium pressure is required to roll the thread to near the plastic limit. The thread and the lump have medium stiffness
High	Considerable pressure is required to roll the thread to near the plastic limit. The thread and the lump have very high stiffness

TABLE 12: IDENTIFICATION OF INORGANIC FINE-GRAINED SOILS FROM MANUAL TESTS

Soil Symbol	Dry Strength	Dilatancy	Toughness
ML	None to low	Slow to rapid	Low or thread cannot be formed
CL	Medium to high	None to slow	Medium
MH	Low to medium	None to slow	Low to medium
CH	High to very high	none	High



*NOTES: 1. Tables adapted from ASTM D2488 "Description and identification of Soils" (Visual-Manual Procedure)
2. Tables 5, 7 and 11 incorporated into other information on this plate.

HYDROGEOLOGIC ASSESSMENT REPORT
FLY ASH POND AND BOTTOM ASH POND
MEREDOSIA POWER STATION
800 SOUTH WASHINGTON STREET
MEREDOSIA, ILLINOIS

1.0 INTRODUCTION

AmerenEnergy Median Valley Cogen, LLC (Ameren) has retained Geotechnology, Inc. (Geotechnology) to provide design services for the closures of a fly ash pond and a bottom ash pond at their Meredosia, Illinois power station. We understand that the closure rules for the Meredosia ash ponds are similar to those defined for ash pond closures at Ameren's Hutsonville Power Station - Hutsonville, Illinois in January 2011 under Illinois Administrative Code (IAC) Title 35, Part 840, Subpart A: *Closure of Ash Pond D, Hutsonville Power Station.* These rules address the hydrogeologic site investigation, groundwater monitoring, groundwater collection and discharge, final slopes and stabilization, final cover system, closure plan, and post-closure maintenance and care.

The Meredosia Power Station in Morgan County, Illinois is owned by AmerenEnergy Medina Valley Cogen, LLC and operated by the Ameren Energy Generating Company from 1948 to 2011, when the power station was closed. The Meredosia Power Station has three coal combustion product impoundments including: the Bottom Ash Pond, the Fly Ash Pond and the Old Ash Pond. The Old Ash Pond was previously closed.

This document comprises the Hydrogeologic Assessment and includes a review and update of previous hydrogeologic assessment documents prepared by others for the Meredosia Power Station. Additionally, subsurface data collected from the October 2015 subsurface investigation and monitoring well installation activities are incorporated into this assessment. Hydrogeologic assessment data was compiled from previously presented information including the March 2013 Phase I Hydrogeological Assessment Report prepared by Natural Resource Technology Environmental Consultants (NRT)[1] and the November 2009 Site Characterization and Groundwater Monitoring Plan for CCP Impoundments prepared by Rapps Engineering and Applied Science (Rapps)[2].

---

printed on recycled paper

2.0 PHYSICAL SETTING

The Meredosia Power Station is located at 800 South Washington Street, Meredosia, Illinois. The Fly Ash and Bottom Ash Ponds are located southwest of the former coal pile and plant facilities. The site location and topography are shown on Plate 1. An aerial photograph site plan showing existing structures, ash ponds, and monitoring well/boring locations is included as Plate 2. The Meredosia Power Station is located in the floodplain of the Illinois River which borders the site to the west.

The Meredosia Power Station ash ponds are located in the south half of Section 21 and the north half of Section 28, T.16N, R.13W. The Bottom Ash Pond was constructed in 1972 with a design surface area of 11 acres, a height of 24 feet, and a volume of approximately 90 acre-feet. The Fly Ash Pond was constructed in 1968 and has a design surface area of 44.8 acres, a height of 24 feet, and a volume of approximately 500 acre-feet.

3.0 REGIONAL GEOLOGY

The Meredosia Power Station is located near the western edge of the Springfield Plain Subsection of the Till Plains Section, Central Lowland Province, Interior Plains Physiographic Region. The Interior Plains Physiographic Region extends across the Laurentian craton of central North America. It is comprised of the Great Plains and Central Lowland Provinces. The Central Lowlands Province to the east formed from eroded sediments from the topographically-higher Great Plains Province to the west (Fenneman, 1922).

The Till Plains Section of the Central Lowland Province is subdivided into seven areas in Illinois. Four of the subdivisions are in Illinoian-aged drift (Willman et al., 1975). The Springfield Plain comprises the western half of the Illinoian-aged till plain. It is level to undulatory and exhibits relatively shallow drainages. The southern boundary is observed where the drift thins and the underlying bedrock control becomes prominent. It is characterized by smoothed features and glacial landforms. The Illinois River forms the northwestern border of the Springfield Plain.

3.1 Bedrock Stratigraphy. The Meredosia Power Station and surrounding areas within the Illinois River valley are underlain by Mississippian System bedrock of the Lower Valmeyeran Series which consists of the Meppen Limestone, Fern Glen formation, and the Burlington-Keokuk Limestone (Kolata, 2005). A bedrock geology map of the site and surrounding areas is included as Plate 3.

Willman et al. (1975) describe the Meppen Limestone as a tan or buff, very fine-grained dolomitic limestone or calcareous dolomite. The formation is slightly crinoidal and contains calcite geodes up to 2-inches in diameter. The maximum thickness of this formation is

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

approximately 22 feet. The Fern Glen formation consists of calcareous shale, limestone, and dolomite. Dolomitic portions of the formation are partially argillaceous. The limestone portions of the formation contain nodules of greenish-gray chert. The thickness of the formation can range from approximately 50 to 100 feet. The Burlington formation of the Burlington-Keokuk Limestone is described as a "very pure, coarsely crystalline, crinoidal, light gray limestone in medium to thick beds." The Burlington formation also contains beds of fine-grained, brownish-gray, dolomitic limestone. The formation is approximately 100 to 150 feet thick in Illinois. The Keokuk formation of the Burlington-Keokuk Limestone is composed of beds of fossiliferous, crinoidal limestone interbedded with fine-grained limestone, argillaceous dolomite, and calcareous gray shale. The Keokuk formation is approximately 60 to 80 feet thick in Illinois.

3.2 Surficial Geology. The Meredosia Power Station is situated within the Illinois River valley. The overburden soils consist of channel and floodplain deposits of the Cahokia formation underlain by glacial outwash deposits belonging to the Henry formation. Fine-grained lacustrine deposits of the Equality formation are present in the subsurface, but are discontinuous. These formations occur throughout Illinois in valley bottoms and floodplains as channel deposits in present-day rivers and streams.

The Cahokia Alluvium consists mainly of poorly-sorted silt, clay, and silty sand, but locally contains lenses of sand and gravel. The upper part consists of overbank silt and clays. The lower portion consists of coarse-textured sand and lateral accretion deposits. The Cahokia formation may be up to 20 feet thick in the area of the Meredosia Power Station (Berg and Kempton, 1987).

The Henry formation consists of glacial sand and gravel outwash. The Henry formation is subdivided into three members that differ in lithology: the Batavia Member (outwash plains), the Mackinaw Member (valley trains), and the Wasco Member (ice-contact deposits) (Willman and Frye, 1970; Willman et al., 1975). Based on information from well logs, the thickness of the Henry formation ranges from 60 to 84 feet in the area of the Meredosia Power Station.

The Equality formation consists of bedded silt and clay deposits in glacial and post-glacial lakes. Gravel, sand, and organic deposits occur in lenses that intertongue with the Henry formation. In the area of the Meredosia Power Station, the Equality formation overlies the Henry formation and generally occurs as lenses or patches not exceeding 20 feet thick.

Geotechnology has conducted subsurface explorations of the overburden soils at the Meredosia Power Station. The subsurface exploration and laboratory testing efforts are discussed further in Section 4.0.

3.3 Surface Water. The major surface water body in the vicinity of the Meredosia Power Station is the Illinois River, which flows from the north-northeast to the south-southwest, and borders the west side of the site. The normal pool elevation of the Illinois River is approximately

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

421.0 feet[3]. Information from the U.S. Army Corps of Engineers indicates the Illinois River flood stage is 435.0 feet above mean sea level (MSL). The record high stage was 446.69 feet above MSL on May 26, 1943, and the record low stage was 418.40 feet above MSL on January 11, 1940.

Meredosia Lake is a backwater lake located north of the Village of Meredosia within the Illinois River valley and within the Meredosia National Wildlife Refuge. Meredosia Lake is approximately 1.5 miles north of the Meredosia Power Station. Smith Lake is located approximately 1-mile south of the Meredosia Power Station and is connected to Seaman's Pond. Westerly-flowing streams drain the uplands to the east of the Meredosia Power Station. Easterly-flowing streams and drainage channels drain the floodplain across the Illinois River to the west of the Meredosia Power Station.

3.4 Groundwater. Groundwater within and near the Illinois River valley is obtained from the sand and gravel deposits of the Henry formation and to a lesser extent from wells drilled into the Mississippian-age Burlington-Keokuk Limestone and Salem Limestone. A summary of the water supply wells identified within 1-mile of the Meredosia Power Station is presented in Table 1 below. The water supply well information is included as Appendix A. The approximate locations of the water supply wells are depicted on Plate 4.

TABLE 1 – WATER SUPPLY WELL SUMMARY

Owner	Wells	On/Off Site	Type	Status
CIPS*	42	On Site	Water Supply	Abandoned (except 4)
National Starch	15	Off Site	Water Supply	Unknown
Village of Meredosia	6	Off Site	Public Supply	In Use
IDOT	4	Off Site	Test Borings	Not Wells
W.R. Grace	2	Off Site	Water Supply	Unknown
T.A. Terminal	2	Off Site	Water Supply	Unknown
Illinois Road Contractors	1	Off Site	Water Supply	Unknown

*Central Illinois Public Service Company

The water supply wells were located using the Illinois State Geological Survey (ISGS) *Illinois Water Well* (ILWATER) *Internet Map Service,* the Illinois State Water Survey's *Domestic Wells Database*, the Illinois Environmental Protection Agency (IEPA) web-based Geographic Information System (GIS) files, Illinois Department of Health (IDPH) records, and Morgan County Health Department records.

[3] Elevations herein refer to the mean sea level datum in feet (msl-ft).

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

3.4.1 Private Water Supply Wells. Approximately 62 private water supply wells and 4 non-well test borings were identified within 1-mile of the Meredosia Power Station. Twenty of the private water supply wells are off-site. The status of the wells are unknown at this time, but are assumed to be in-use. The twenty off-site private water supply wells are up-gradient or cross-gradient from the site and are not anticipated to be impacted from the site. Groundwater sampling and testing results further support that the twenty off-site water supply wells are not expected to be impacted.

The other 42 private water supply wells are located at the Meredosia Power Station. According to site records, personnel interviews, and field reconnaissance, 38 of the on-site water supply wells have been abandoned. Two wells are no longer used, but have not been abandoned. One well is shut down and one currently supplies water to the restrooms/showers on the site. Once the former power plant is demolished and the ash pond closure activities are complete, these four supply wells will be abandoned. Additional water needs at the Meredosia Power Station are provided by the Village of Meredosia public water supply.

3.4.2 Public Water Supply Wells. According to the mapping sources referenced in Section 3.4.1, public water supply wells are not located within 1-mile of the Meredosia Power Station. The closest public water supply wells to the Meredosia Power Station belong to the Village of Meredosia. The six public water supply wells are situated approximately 1.2 miles to the north-northeast. Although the wells are beyond 1-mile from the facility, the locations are depicted on Plate 4 and the water supply well information is included in Appendix A for reference.

Per the IEPA database, two of the Village of Meredosia public water supply wells have a minimum setback of 400 feet and a second setback of 1,000 feet due to the Phase I Wellhead Protection Area (WHPA). A third Village of Meredosia public water supply well has a Phase II WHPA, which has an extended area of protection that includes the recharge area or geographic area surrounding the well that supplies potable water to a community.

3.4.3 Oil and Gas Wells. Oil and gas wells within a 1-mile radius of the Meredosia Power Station were identified using the Illinois State Geological Survey *Illinois Oil and Gas Resources* (ILOIL) *Internet Map Service*. ILOIL contained records for three wells within the search radius, but the status of the three wells was listed as dry, abandoned and plugged.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

4.0 SUBSURFACE INVESTIGATION

4.1 Subsurface Investigations. From October 19 through October 26, 2010, Geotechnology advanced 15 borings at the Meredosia Power Station. Ten of the borings (B-1 through B-10) were drilled in support of a global stability evaluation, while the remaining five borings were completed as Monitoring Wells APW-1 through APW-5 in support of groundwater monitoring activities. The borings were drilled using a truck-mounted CME 550 rotary drill rig equipped with 4-1/4-inch hollow stem augers. The borings were drilled to depths ranging from 25 to 60 feet below land surface (bls). Standard Penetration Tests (SPT) were performed using an automatic hammer and split spoon sampler. The locations of the borings and monitoring wells are included on Plate 2.

From September 28 through October 1, 2015, Geotechnology advanced four additional borings at the site using a truck-mounted CME 550 rotary drill rig equipped with 4-1/4-inch hollow stem augers. The borings were drilled to depths ranging from 17 to 40 feet bls. SPTs were performed using an automatic hammer and split spoon sampler. Monitoring Wells APW-6 through APW-9 were installed in the borings in support of ongoing groundwater monitoring activities. Copies of the boring logs are included as Appendix B. The locations of the monitoring wells are included on Plate 2.

Monitoring Wells APW-6 through APW-9 were constructed using 10 feet of 2-inch-diameter 0.010-inch slotted PVC screen and riser to the surface. The monitoring wells were completed at the surface with above-ground steel covers set in a concrete pad. The monitoring wells were developed in accordance with industry practice and registered with the IDPH and the IEPA.

An engineer from Geotechnology provided technical direction during field exploration, observed drilling and sampling, assisted in obtaining samples and prepared descriptive logs of the material encountered. The boring logs represent conditions observed at the time of exploration.

Unless noted on the boring logs, the lines designating the changes between various strata represent approximate boundaries. The transition between materials may be gradual or may occur between recovered samples. The stratification given on the boring logs, or described herein, is for use by Geotechnology in its analyses and should not be used as the basis of design or construction cost estimates without realizing that there can be variation from that shown or described.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

4.2 Subsurface Conditions. Native soils consisting of brown and gray, very soft to medium stiff, silt and clay were encountered below the fill in Boring B-1 and Monitoring Well APW-9, and at the ground surface in Boring B-5. Native soils consisting of black, clayey sand with trace gravel were encountered below the fill in Boring B-2.

A stratum of very soft to medium stiff, brown, black, and gray clay with traces of sand and wood was encountered below the fill in Borings B-3 and B-8, below the native soils in Borings B-1, B-2, and B-5, and at the ground surface in Borings B-4, B-9, APW-2, APW-3, APW-4, and APW-7. This soil stratum ranged in thickness from approximately 8 to 17 feet bls.

The clay layer described above was underlain by a stratum of granular and cohesive alluvial soils (except for Boring APW-4). The granular alluvium generally consisted of loose, gray, clayey sand with gravel. The cohesive alluvium generally consisted of very soft to medium stiff, gray and brown, clayey silt, silty clay, and sandy clay. This soil stratum ranges in thickness from approximately 5 to 11 feet bls in borings where it is encountered.

Alluvium was encountered below the fill soils in Borings B-6 and B-7, and at the ground surface in Boring B-10 and Monitoring Wells APW-6 and APW-8. This stratum is interpreted as alluvium placed in a buried valley that had been cut down through the soil stratum described above. The granular portions of this alluvium infill generally consisted of very loose, gray, silty sand. The cohesive portions generally consisted of very soft to very stiff, gray, silty clay with sand and silt seams. This soil stratum was at least 28 feet thick where encountered.

The native soils described above are interpreted as belonging to the Cahokia Alluvium, and were underlain by sand deposits interpreted as belonging to the Henry formation. Generalized east-west and north-south subsurface profiles based on the soil boring data at the Meredosia Power Station are included on Plates 6 and 7, respectively. The plan-view of the subsurface profile orientations is included on Plate 5.

During the subsurface exploration activities, groundwater was observed in Borings B-3, B-4, B-5 and B-6 at depths ranging from approximately 18 to 39 feet bls. Groundwater was observed in Monitoring Wells APW-1 through APW-9 at depths ranging from 6 to 32 feet bls at the time of construction. Groundwater levels might not have stabilized before backfilling or well construction activities. Consequently, the indicated groundwater levels might not represent present or future levels. Groundwater levels could vary over time due to the effects of the Illinois River, seasonal variation in precipitation, or other factors not evident at the time of exploration.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

5.0 SITE HYDROGEOLOGY

5.1 Groundwater Classification. The Illinois Class I groundwater standards are applicable to the Meredosia Power Station. The Illinois Class I groundwater is defined as groundwater that is capable of being potable. As stated in 35 IAC 620.410(a) and (d) the following parameters are required to be monitored with the exception of Radium 226 and 228:

- antimony,
- arsenic,
- barium,
- beryllium,
- boron,
- cadmium,
- chloride,
- chromium,
- cobalt,
- copper,
- cyanide,
- fluoride,
- iron,
- lead,
- manganese,
- mercury,
- nickel,
- nitrate as nitrogen,
- selenium,
- silver,
- sulfate,
- thallium,
- total dissolved solids,
- vanadium, and
- zinc.

5.2 Groundwater Monitoring. The groundwater monitoring network at the Meredosia Power Station consists of one up-gradient monitoring well (APW-1) and eight down-gradient monitoring wells (APW-2 through APW-9). The approximate locations of the monitoring wells are included on Plate 2. The monitoring wells are screened in the uppermost aquifer which generally consists of saturated, fine to coarse sand. The monitoring well depths range from 17 to 40 feet bls. Monitoring well construction diagrams from Monitoring Wells APW-1 through APW-9 are included in Appendix B. A total of 11 groundwater monitoring events have been conducted at the Meredosia Power Station since December 2010. The groundwater monitoring events have been conducted quarterly since the third quarter of 2015. Future groundwater monitoring events are anticipated to be conducted quarterly until trend analysis indicates less frequent monitoring is acceptable. A summary of the monitoring well gauging data is included as Table 2. A summary of the groundwater laboratory analytical results collected to date is included as Table 3.

5.3 Groundwater Flow. Based on the monitoring well gauging data in Table 2, the groundwater flow direction at the Meredosia Power Station is to the west-northwest toward the Illinois River. Groundwater flow direction may be influenced by the stage of the Illinois River. Groundwater elevation contour maps for the 10 groundwater monitoring events are included as

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

Plates 8 through 16. These events include a range of climate conditions including flood and dry timeframes. *Note: Only gauging events with data from at least five monitoring wells are included.*

5.4 Groundwater Geochemistry. A total of 11 groundwater sampling events have been conducted at the Meredosia Power Station since December 2010. The parameters analyzed include those listed in Section 5.1 in addition to field parameters pH, specific conductivity, and temperature. The analytical testing data are summarized in Table 3. The historical groundwater data collected prior to 2015 consists of dissolved parameter concentrations only. During the time these data were collected, laboratory analysis for dissolved concentrations was the applicable standard of care. The use of dissolved parameter concentration results in the statistical analysis for this Hydrogeologic Assessment report was the only historical data available for the site and was based on the precedent set by the Hutsonville Ash Pond D Closure which was approved by the IEPA. The recent three quarterly sampling events (3Q15, 4Q15, and 1Q16) were analyzed for both total and dissolved parameter concentrations. The purpose of the dual analysis was to allow historical data to be compared to current data and to prepare for future statistical analysis using total parameter concentrations. *Note: The historical data provided by others did not contain practical quantitation limits (PQLs) or method detection limits (MDLs). The PQLs and MDLs from the February 2016 groundwater sampling event were substituted for the missing data during statistical analysis.*

The analytical results were compared to the Illinois Class I groundwater standards. Historical concentrations of arsenic exceeded the Class I groundwater standard in Monitoring Wells APW-3 and APW-4. Currently, (as of February 2016) the arsenic concentration exceeded the Class I groundwater standard in APW-3 only. Concentrations of boron exceeded the Class I groundwater standard in Monitoring Wells APW-2, APW-3, APW-4, APW-6, APW-8, and APW-9. Currently, (as of February 2016) the boron concentration exceeded the Class I groundwater standard (2 ppm) in Monitoring Wells APW-2, APW-3, APW-8, and APW-9. Aerial photographs showing the boron concentration contours for September 2015, December 2015, and February 2016 are included as Plates 18 through 20, respectively. Concentrations of manganese exceeded the Class I groundwater standard in Monitoring Wells APW-2, APW-3, and APW-4. Historical concentrations of iron exceeded the Class I groundwater standards in Monitoring Wells APW-3 and APW-4, but the February 2016 results are below the Class I groundwater standard. A single event anomaly associated with flooding in February 2016 resulted in the concentration of sulfate in Monitoring Well APW-9 being above the Class I groundwater standard. The arsenic and manganese exceedances at each monitoring well for the February 2016 sampling event are included on Plate 21. Changes of oxidation/reduction (redox) potential in the subsurface due to fluctuations in pH make evaluation of manganese and iron concentrations unreliable at this facility. Comparison of manganese and iron to the respective Class I groundwater standard may be inappropriate for this site.

printed on recycled paper

Box and whiskers plots of the exceedances, with the exception of sulfate, iron, and manganese are included as Appendix C. Statistical trend analysis plots for arsenic and boron are also included in Appendix C. Statistical trends are decreasing or not significant at a 98% confidence level. The analysis indicates that increasing trends may have been present while the Meredosia Power Station was in operation through 2011, but appear to be decreasing based on the three most recent quarterly monitoring data.

5.5 Contaminants of Concern. Boron is the contaminant of concern for the Meredosia Power Station and is also indicator parameters. Boron is widespread across the site and is generally considered a good indicator chemical for ash pond facilities in Illinois. Due to the elevated levels of boron above background levels in the groundwater near the ash ponds on site, boron will be a primary indicator parameter for the site during remedial actions and ash pond closure activities. Boron is relatively stable in the subsurface and is not prone to attenuation.

Other chemicals and water quality parameters such as iron, manganese, pH, and TDS can be affected by redox conditions in the subsurface and are therefore not reliable as indicator parameters at this site. The concentrations of other chemicals may naturally fluctuate through attenuation.

5.6 Groundwater Modeling.

Both a two-dimensional and three-dimensional transient groundwater flow and transport model was used to describe the site. The models were calibrated to match the groundwater elevation and concentration trends observed between 2009 and 2015. Prediction simulations were then performed for no action and for proposed ash pond closure activities. The existing conditions model was used to calibrate the hydrogeologic flow and transport conditions and to evaluate the need for the ponds to be closed. The proposed closure conditions model was created to evaluate the length of time for the boron concentrations to decrease to below the IEPA Class I Groundwater standards. Boron transport was chosen because it is an indicator contaminant for coal ash leachate, is mobile in groundwater, and impacts are the most widespread across the site.

5.6.1 HELP Model

In order to assess the drainage capabilities of the proposed fly ash and bottom ash pond closures, Geotechnology utilized the USEPA Hydrologic Evaluation of Landfill Performance (HELP) model to simulate conditions at the site. The version of software used was HELP 3.07 (November 1997). A description of inputs and output data is attached in Appendix D of this report. For the purposes of this evaluation, the proposed ash pond cap, ash, and soil cross-section has been divided into six layers.

printed on recycled paper

Model parameters for the layers were the default values for each selected layer type as provided by the HELP software module, or were input by the user (for synthetic materials) with known or manufacturer provided parameters. The model was run without groundwater influx parameters.

The model indicates that steady state conditions (<0.05 inches of head on the sand layer) will be achieved within approximately six months of closure activities at the two ash ponds on site. The data obtained from the HELP model was used as input parameters for MODFLOW and MT3DMS.

5.6.2 MODFLOW and MT3DMS

MODFLOW was developed by the United States Geological Survey (USGS) to solve three-dimensional transient head distributions using finite difference approximations. The model inputs include soil properties, multiple layers, heterogeneities, variable thicknesses, variable gradients, flow boundaries, wells, and can define confined or unconfined flow systems. Assumptions of the program include that groundwater is governed by Darcy's law; the formation behaves as a continuous porous medium; flow is not affected by chemical, temperature, or density gradients; and hydraulic properties are constant within a grid cell.

MT3DMS was developed by the USGS and calculates concentration distributions for a single chemical as a function of time and location using a finite difference solution. Concentration is distributed over a three-dimensional, non-uniform, transient flow field. MT3DMS accounts for advection, diffusion, dispersion, sorption, and first order decay. Assumptions of the module include changes in the concentration field do not affect the flow field; concentrations of solutes do not interact with each other; chemical and hydraulic properties are constant within a cell; sorption is instantaneous and fully reversible; and decay is not reversible.

Flow and transport boundaries, soil properties, and river stage fluctuations were the same for the calibration and prediction scenarios. One prediction scenario was no action and the other included the proposed ash pond closures.

Boron concentrations for the current configuration were modeled for 25 years to represent a scenario where the ash ponds were not closed. After 25 years, monitoring well APW-3 (the well with historically highest boron concentrations) stabilized at 16.9 mg/L of boron, which exceeds the Class I Groundwater standards. APW-2, APW-6, APW-7, and APW-8 also exceeded the Class I Groundwater standards at 25 years with no action.

printed on recycled paper

According to the model results, boron concentrations will be below the Class I Groundwater standards for each well on site within three years after dewatering and closure of the fly ash and bottom ash ponds.

Additional information on the MODFLOW and MT3DMS modeling and modeling results are provided in Appendix E.

5.6.3 Boron and Arsenic Loading to the Illinois River

Groundwater in the vicinity of the fly ash and bottom ash ponds discharges to the Illinois River. A mixing calculation was performed to conservatively estimate the boron and arsenic loading rates to the Illinois River. Calculations are provided in Appendix F.

The loading rate was calculated by multiplying the volume of groundwater flowing into the river by the concentration of boron and arsenic in groundwater.

Loading Rate (L) = Concentration (C) * Groundwater Discharge Volume (Q)

Where Q = Hydraulic Conductivity (K) * Hydraulic Gradient (I) * Area (A)

To be conservative, the highest single concentration in groundwater monitoring wells at the site was initially used in this calculation (Cmax). A second calculation was performed using the average of the four monitoring wells near the river (APW-2, APW-3, APW-4, and APW-9).

The monitoring wells were not tested for hydraulic conductivity; however, Gibbet al. (1979) published hydraulic conductivity values for wells along the Illinois waterway, which included a site-specific value of 1,200 gallons per day/square foot (gpd/ft2). Both a maximum and an average hydraulic gradient were used. The average hydraulic gradient was based on the ten groundwater gauging events. Two groundwater gauging events were not used because of flooding and inaccessibility of the wells. Removing flooding events provides a more conservative value. The cross sectional area was assumed to be over the entire thickness of the aquifer, and along the entire length of the Fly Ash Pond parallel to the river, plus 50 feet north and south of the pond.

The calculated loading rate was divided by: 1) the 7-day 10-year low flow (Q7,10); and 2) the mean of the average annual flow data at the Meredosia gaging station. This calculation estimates the incremental concentration increase (dB) in the river due to discharge from the Fly Ash Pond. Due to the size of the Illinois River, it is unlikely that boron and arsenic concentrations would initially be distributed across the entire width of the river. Therefore, an additional calculation was performed to determine

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

the incremental concentration increase assuming that mixing occurred within 50 feet of the shoreline. This calculation was performed by multiplying dB by 750 feet/50 feet (750 feet being total river width and 50 feet being the assumed mixing width).

The result of the boron calculation is an incremental increase of 0.048 mg/L calculated using average concentration, average hydraulic gradient, and mean annual river discharge. This is near the reporting limit for boron as listed by the USEPA in method SW-846, 6010c and below the Class I Groundwater Standard. The result of the boron calculation; based on maximum concentration, maximum hydraulic gradient, and the Q7,10; is a conservative estimate of the increase in boron loading to the Illinois River. This result (1.92 mg/L) suggests that a measurable boron increase could occur near shore for worst case conditions at low flow. This value is below the IEPA Class I Groundwater standard.

Under typical conditions, arsenic will not have a measurable impact (incremental concentration increase of 0.0022 mg/L) on concentrations within the Illinois River. The calculations for arsenic suggest that it may be measurable in river water under worst case conditions (incremental increase of 0.0129 mg/L), assuming that it does not precipitate or sorb from solution prior to reaching the groundwater/surface water interface.

6.0 CONCLUSIONS

Although up to 11 groundwater monitoring events have been conducted at the Meredosia Power Station since December 2010, only three events have been conducted since the facility ceased operations in 2011. Therefore, statistical analysis of post-closure trends could not be performed. The groundwater analytical and statistical data indicates that the unlined ash ponds are a primary contributor to groundwater impacts based on the location of groundwater exceedances, the types of chemicals common to coals ash exceeding the applicable Class I groundwater standards, gradual reduction of groundwater impacts after plant closure, and contaminant transport modeling. The preliminary data suggests that a reduction in the concentrations of boron and arsenic has occurred since the facility ceased operations. The results of the groundwater modeling further supports this preliminary assessment in that once the ash ponds are capped and a Groundwater Management Zone is put into effect, the primary pathway (storm water infiltration) for contaminants to impact the groundwater at the site will not be complete. Groundwater modeling indicates that within four years of dewatering and closure, boron levels will be below the Class I Groundwater standards.

Additional groundwater monitoring events are planned to further assess the extent of the impacts of ash pond capping activities. Future monitoring events will be sampled for the parameters in accordance with the Meredosia Power Station Groundwater Monitoring Plan (GMP, 2016).

Meredosia, Illinois

BORON CONCENTRATION IN GROUNDWATER - DECEMBER 2015

Project Number J024917.01	PLATE 19

NOTES

1. Plan adapted from drawings based on topography obtained by AeroView in October 2015 and supplied by the client.
2. Monitoring Wells were located by the project surveyor.
3. Monitoring Well APW-1 is located beyond the limits of this map and is approximately 2000-feet east of Monitoring Well APW-5.

APPENDIX D

HELP GROUNDWATER MODEL DATA

Electronic Filing: Received, Clerk's Office 09/28/2020

In order to assess the drainage capabilities of the proposed Meredosia Ash Pond, Geotechnology utilized the USEPA Hydrologic Evaluation of Landfill Performance (HELP) model to simulate conditions at the site. The version of software used was HELP 3.07 (1 November 1997). For the purposes of this evaluation, the ash pond designed cap has been divided into 6 layers as follows:

Layer 1 – Closure Turf (Geotextile/Turf Layer)
Layer 2 – Closure Turf Drainage Layer
Layer 3 – Membrane (50 mil HDPE)
Layer 4 – Fly Ash (at elevations above the piezometric surface of the pond, but 100% saturated to reflect conservative conditions at initial placement)
Layer 5 – Fly Ash (at elevations below the piezometric surface of the pond, at 100% saturation)
Layer 6 – Fine Silty Sand (conservative for the range of sands encountered)

Model parameters for the layers were the default values for each selected layer type as provided by the HELP software module, or were input by the user (for synthetic materials) with manufacturer provided parameters. Geotechnology utilized user-selected variables of 5 pinholes and 1 installation defect per each acre of membrane material as the modeled values, with a "good" initial installation quality. We assumed the Illinois River was at nominal stage and does not affect the drainage. During future flooding events, groundwater elevation may increase to the point where the lower levels of the ash are rewetted. In the case of a 100-year flood, it is not expected that the conditions in the ash will be as saturated as provided in this model due to the limited time of flooding and relatively low permeability of the ash compared to the underlying native sands.

Geotechnology utilized a user-generated Soil Conservations Service (SCS) Curve Number of 95% and an evaporative zone depth of 0.8 inches for the model based on the site location. Evapotranspiration data were calculated using site latitude, an artificial vegetative surface, and a growing season from April 19 to October 10. Average wind speed at the site was chosen from the Springfield, Illinois National Oceanic and Atmospheric Administration (NOAA) Station, and humidity input was calculated from NOAA data provided for Meredosia, Illinois. Precipitation and temperature coefficients were selected from the HELP database-provided site (Columbia, Missouri) and adjusted for site latitude. The model was run without groundwater influx parameters. The model indicates that steady state conditions (<0.05 inches of head on the sand layer) will be achieved within approximately six months of closure activities at the two ash ponds on site.

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX E

MODFLOW AND MT3DMS MODEL DATA

Electronic Filing: Received, Clerk's Office 09/28/2020

MODFLOW was developed by the United States Geological Survey (USGS) to solve three-dimensional transient head distributions using finite difference approximations. The user can input soil properties, multiple layers, heterogeneities, variable thicknesses, variable gradients, flow boundaries, wells, and can define confined or unconfined flow systems. Major assumptions of the program include that groundwater is governed by Darcy's law; the formation behaves as a continuous porous medium; flow is not affected by chemical, temperature, or density gradients; and hydraulic properties are constant within a grid cell.

MT3DMS calculates concentration distributions for a single chemical as a function of time and location using a finite difference solution. Concentration is distributed over a three-dimensional, non-uniform, transient flow field. MT3DMS accounts for advection, diffusion, dispersion, sorption, and first order decay. Major assumptions of the module include changes in the concentration field do not affect the flow field; concentrations of solutes do not interact with each other; chemical and hydraulic properties are constant within a cell; sorption is instantaneous and fully reversible; and decay is not reversible.

The current configuration was calibrated to groundwater elevation data collected between 2009 and 2015 in the MODFLOW program and the boron concentration data was used to calibrate the MT3DMS module. The prediction scenario includes the clean closure and capping of the two ash ponds.

Model Setup

A two layer grid with twelve objects was established with 100-foot grid spacing parallel and perpendicular to the primary flow direction. The grid size was decreased to a 50-foot grid in the vicinity of the ash ponds. Areas adjacent to the flow and transport boundaries, soil properties, and river stage fluctuations were the same for the calibration and prediction scenarios. The upgradient (east) edge of the model was a general head boundary to allow for flow reversals due to the Illinois River fluctuations. The bottom of the aquifer (estimated), north boundary, and south boundary was modeled as no-flow boundaries. The downgradient boundary was a river object to model the Illinois River. The top boundary (land surface) was a specified flux boundary condition to model rainfall infiltration and seepage through the ash ponds.

Simplifying assumptions were made for this model.

- boron instantaneously dissolves into water;
- leachate instantaneously migrates to the groundwater;
- leachate concentrations remain constant over time and the source is not depleted;
- the Illinois River has a consistent annual pattern; and
- the cap has an instantaneous effect on the percolation rate.

Electronic Filing: Received, Clerk's Office 09/28/2020

MODFLOW and MT3DMS Input Values

Layers

The top layer included the two ash pond objects and the topographic surface. This layer was between 2 and 42 feet thick depending on the location of the layer. The bottom layer represented the unconfined sand aquifer and was 50 feet thick.

Soil Parameters

Soil parameters were estimated using published values for the units as observed during drilling activities, from laboratory testing results, or defaults provided within the MODFLOW and MT3DMS program. Soil parameters were refined during model calibration using observed data.

Recharge

Water recharge rates were modeled using results from the HELP model for the proposed closure configuration. Rainfall and infiltration rates were applied across the site using average annual rainfall data from the City of Meredosia.

River Parameters

The Illinois River was represented by a head-dependent flux that required inputs for river stage, width, bed thickness, and bed hydraulic conductivity. River stage data was obtained from the river gauge located adjacent to the site (National Weather Service http://water.weather.gov/) from years 2009 to 2015. River stages were split into high stage (March to July) and low stage (August to February) for each year.

Source Concentration

The source concentration of boron in the Fly Ash and Bottom Ash Ponds was based on calibration results at the end of 25 years. The Fly Ash Pond boron concentration was modeled as a constant source of 25 mg/L. The Bottom Ash Pond boron concentration was modeled as a constant source of 3 mg/L. Boron and other contaminants dissolve slower into water from bottom ash instead of fly ash due to the higher temperatures that form bottom ash stabilizing the chemicals as solids (Cox 1978; Leaching of Boron from Coal Ash). Retardation and decay were not used to be conservative.

Model Results

Boron concentrations for the current configuration were modeled for 25 years to represent a scenario where the ash ponds were not closed. After 25 years, monitoring well APW-3 (the well with historically highest concentrations) stabilized at 16.9 mg/L of boron, which exceeds the Class I Groundwater standards. As shown in the table below, APW-2,

Electronic Filing: Received, Clerk's Office 09/28/2020

APW-6, APW-7, and APW-8 also exceeded the Class I Groundwater standards at 25 years with no action.

Boron Concentration in Groundwater for the No Action Scenario at 25 Years

Well	Boron (mg/l)
APW-1	0.010
APW-2	10.2
APW-3	16.9
APW-4	0.330
APW-5	0.002
APW-6	7.60
APW-7	8.89
APW-8	12.9
APW-9	0.261

Yellow highlighting indicates a prediction exceeding the Class I Groundwater standard of 2 mg/l.

Within three years after dewatering and complete closure of the two ash ponds on site, boron modeling results indicate that boron will be below the Class I Groundwater standards for each well on the site. Boron concentrations at each of the monitoring wells after three years are shown in the table below.

Boron Concentration in Groundwater for the Ash Pond Closure Scenario at at 3 years after Closure and Dewatering

Well	Boron (mg/l)
APW-1	0.056
APW-2	0.124
APW-3	0.955
APW-4	0.011
APW-5	0.033
APW-6	0.067
APW-7	0.030
APW-8	1.17
APW-9	0.014

Electronic Filing: Received, Clerk's Office 09/28/2020

GROUNDWATER MONITORING PLAN
FLY ASH POND AND BOTTOM ASH POND
MEREDOSIA POWER STATION
800 SOUTH WASHINGTON STREET
MEREDOSIA, ILLINOIS

1.0 INTRODUCTION

The following groundwater monitoring plan is provided for the AmerenEnergy Medina Valley Cogen, LLC Meredosia Power Station Fly Ash Pond and Bottom Ash Pond closure project for the purpose of evaluating the performance of the ash pond closure activities. This is done in general accordance with Title 35, Illinois Administrative Code (IAC), Part 840 even though the regulation does not directly apply to this facility. Groundwater will be monitored to evaluate closure and post-closure groundwater quality by conducting statistical trend analysis and assessing compliance with the applicable standards. The site location and topography are shown on Plate 1.

A Groundwater Management Zone (GMZ) is proposed for the site. The purpose of the GMZ will be to remediate groundwater to the level of the Class I groundwater standard. The method of remediation is the closure and capping of the ash ponds which will reduce or eliminate the current primary contaminate infiltration source (precipitation).

2.0 GROUNDWATER MONITORING PROGRAM

The groundwater monitoring program is based on the geology and hydrogeology information presented in the April 2016 Hydrogeologic Assessment Report. This Groundwater Monitoring Plan (GMP) provides groundwater monitoring and sampling procedures; parameter list and analytical methods; and assessment of groundwater quality data.

2.1 Monitoring Locations. Groundwater samples will be obtained from existing groundwater monitoring wells (APW-1 through APW-9). If additional wells are constructed in the future (see Section 2.2), the construction, sampling, and analysis methods described herein will apply to those monitoring wells. Monitoring wells have a well identification number with an "APW" identifier, followed by a 1-, 2-, or 3-place alpha-numeric designation. The approximate locations of the monitoring wells are included on Plate 2. The monitoring program generally follows 35 IAC 620 by satisfying the following standards for the monitoring system:

- The monitoring wells are sufficiently located to represent the quality of groundwater at the compliance point(s);
- The monitoring wells are located within the stratigraphic unit(s) that may serve as potential contaminant migration pathways;

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

- The groundwater monitoring wells are secure; and,
- Monitoring wells are installed to evaluate on-site and off-site groundwater quality.

2.2 Monitoring Well Installation. The current monitoring well network is comprised of five groundwater monitoring wells installed in October 2010 and four groundwater monitoring wells installed in October 2015. The nine groundwater monitoring wells are screened in the uppermost aquifer on the site.

The October 2015 groundwater monitoring wells were installed to better delineate groundwater impacts previously identified at the site. These wells were also installed to provide information on the effects of the ash pond closure activities on the groundwater. The monitoring well network data is included as Table 1 and includes the monitoring well identification numbers, screened intervals, and gradient designation. The groundwater monitoring wells were constructed in accordance with the Illinois Department of Public Health (IDPH) standards as cited in 77 IAC 920.170 and regulatory standards as cited in 35 IAC 620.505(a). As-built diagrams for the groundwater monitoring wells are included in Appendix A.

The current monitoring well network is adequate to design remedial activities, but is not adequate to fully delineate boron groundwater impacts and the future effects of the remedial activities (clean closure and capping) at the site. Installation of three additional monitoring wells is proposed: one to the southwest of the Fly Ash Pond; one to the east of the closed old ash pond, and one to the northeast of the Fly Ash Pond. The three proposed monitoring well locations are illustrated on Plate 3. These three locations will assist boron plume delineation to the southwest, east, and northeast of the ash ponds as well as provide information needed to evaluate the effect of remedial activities at the facility. It is anticipated that monitoring well installation will occur during the clean closure and capping activities on the site.

Monitoring wells will be maintained so representative groundwater samples may be collected. Items to observe during routine monitoring include: checking the concrete pad/seal for cracks, assessing the integrity of the protective casing, casing lock, seal of well cap, and integrity of the well riser. In the event a monitoring well is damaged, the well shall be repaired or replaced in accordance with regulatory requirements.

3.0 GROUNDWATER SAMPLING

3.1 Sampling Schedule. The initial sampling schedule for groundwater monitoring is provided in Table 2. Groundwater monitoring events are anticipated to be conducted quarterly until trend analysis indicates less frequent monitoring is acceptable.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

Table 2 - Quarterly Groundwater Monitoring Schedule

Sampling Quarter	Report Due	Parameter List
1 – January-March	May 31	Per Section 3.2
2 – April-June	August 31	Per Section 3.2
3 – July-September	November 30	Per Section 3.2
4 – October-December	February 28	Per Section 3.2

Five years after approval of the CQA Acceptance Report, a request may be made to modify the post-closure care plan to reduce the frequency of groundwater monitoring to semi-annual sampling by demonstrating the following:

- Monitoring effectiveness will not be compromised by the reduced frequency of monitoring;
- Adequate data has been collected to characterize groundwater; and
- Concentrations of constituents monitored at the downgradient boundaries do not demonstrate statistically significant increasing trends that can be attributed to the former ash ponds.

Five years after reducing the monitoring frequency to semi-annual, a request may be made to modify the post-closure care plan to reduce monitoring frequency to annual sampling by demonstrating the same items above as for the reduction to semi-annual monitoring.

Groundwater monitoring may be discontinued when the IEPA approves the post-closure care completion report. This occurs after statistically significant increasing trends are not detected for five (5) consecutive years after changing to an annual monitoring frequency.

3.2 Parameter List. Routine sample collection will be conducted quarterly on the schedule outlined above, for the constituents listed below. Ameren may seek future reductions in the monitoring frequency and/or monitored parameters, consistent with criteria in the regulations, if approved, and found applicable to the closure of these ponds. Groundwater monitoring will continue until completion of the GMZ.

printed on recycled paper

As stated in 35 IAC 620.410(a) and (d), the following laboratory analysis parameters are required to be monitored:

- Antimony,
- Arsenic,
- Barium,
- Beryllium,
- Boron,
- Cadmium,
- Chloride,
- Chromium,
- Cobalt,
- Copper,
- Cyanide,
- Fluoride,
- Iron,
- Lead,
- Manganese,
- Mercury,
- Nickel,
- Nitrate as nitrogen,
- Selenium,
- Silver,
- Sulfate,
- Thallium,
- Total dissolved solids,
- Vanadium, and
- Zinc.

Prior to 2015, groundwater samples were obtained and tested for dissolved constituents. Current regulatory preferences are to obtain and analyze groundwater samples for total constituents. Both dissolved and total parameters will be obtained for analytical testing for eight quarters after closure activities are completed or until there is enough statistical strength in the total analysis to warrant switching to total constituent analysis only. This provides information that is comparable to data obtained prior to the power station closing operations through the closure process.

Field monitoring parameters will include pH, specific conductance, groundwater surface elevation, well depth, temperature, depth to water, and elevation of measuring point.

3.3 Sampling Procedure. Groundwater samples shall be collected following the procedures presented in Appendix B, or equivalent methods developed by Ameren or its contractors.

4.0 SAMPLE ANALYSIS

Laboratory analysis and testing methods shall be in general accordance with those listed in the U.S. EPA publication Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA/530/SW-846, 3rd Edition – Update V, amended October 2013 (U.S. EPA, 2013) or as superseded by future editions. The specific testing method used for analysis shall have Practical Quantitation Limit (PQL) values that are capable of assessing if regulatory and/or site groundwater standards are exceeded. Specific testing methods shall be referenced in the Laboratory Analysis Report.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

The Quality Assurance/Quality Control (QA/QC) program at the laboratory should generally follow the requirements outlined in the U.S. EPA publication Test Methods for Evaluation Solid Waste, Physical/Chemical Methods, EPA/530/SW-846, 3rd Edition –Update V, amended January 2013 (U.S. EPA, 2013) and which may be periodically revised in the future. However, other published QA/QC methods may be utilized as part of laboratory policy provided the QA/QC methodologies generally follow those numerated above. A copy of the laboratory Quality Assurance Manual is included as Appendix C.

5.0 DATA EVALUATION

5.1 Groundwater Quality Standards. Pursuant to 35 IAC 620.450, the on-site groundwater quality requirements shall be the Class I Potable Resource Groundwater standard (35 IAC 620.410) with the exception of the areas under the GMZ. If upon completion of the post-closure care period the observed concentrations in the site groundwater still exceed a Class I standard, the on-site standard may be adjusted provided criteria are addressed to the satisfaction of the IEPA. If off-site groundwater impacts are detected, the groundwater quality requirements shall be the Class I Potable Resource Groundwater standard or a GMZ will be obtained for those areas during the timeframe of remedial activities.

5.2 Compliance Demonstration. Compliance will be evaluated against the appropriate groundwater standard. On-site groundwater shall be considered to be in compliance when no statistically significant increasing trend can be attributable to the Fly Ash Pond or the Bottom Ash Pond at the compliance boundary for five (5) consecutive years following the change to an annual monitoring frequency and with IEPA concurrence.

Compliance will be demonstrated by performing an annual trend analysis for each downgradient monitoring well for all of the monitored constituents listed in Section 3.2 that exceed the Class I groundwater standards. The analysis shall be performed on a minimum of eight (8) consecutive samples and use Sen's Estimate of Slope for compliance assessment. Generally, if analyses for a parameter show an increasing trend at a down-gradient well, a Mann-Kendall analysis must be performed at a 95% tolerance interval to assess whether the increasing trend is statistically significant. If a statistically significant increase is observed, three (3) alternative statistical methods may be applied:

1. Notification of statistically significant increasing trends and revision to the sampling frequency must be reported to the IEPA within 30 days of making the determinations.

2. If an investigation determines that the statistically significant increasing trend is due to a superseding cause then the IEPA will be notified in writing, stating the cause of the increasing trend and the rationale used in its determination.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

3. If there is no superseding cause, and the monitoring frequency has been decreased to semi-annual or annual, then sampling must return to a quarterly frequency. If after four (4) consecutive quarters and no statistically significant increasing trend is observed, then sampling frequency can return to the previous frequency.

If a statistically significant increasing trend continues to be observed over two or more consecutive years and there is no superseding cause, a hydrogeologic investigation (and additional site investigation(s), if necessary) will be performed.

Based on the outcome of the additional activities, action must be taken to mitigate the statistically significant increasing trends that are causing, threatening or allowing exceedances of off-site groundwater quality standards. Any actions must be proposed as a modification to the post-closure care plan within 180 days after completion of the additional hydrogeologic and/or additional site investigations.

Project No. J024917.01

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX B

GROUNDWATER SAMPLING PROTOCOL

Electronic Filing: Received, Clerk's Office 09/28/2020

Appendix B – Groundwater Sampling Procedure

The following procedure shall be used in sampling groundwater at the site. This sampling procedure applies to the routine quarterly and/or modified semi-annual or annual sampling events. A groundwater sampling field data sheet, comparable to the example located in Exhibit B-1, may be used to document the sampling activities at each well. If site conditions at the time of sampling could influence the results, sampling should be postponed until a later date. However, under no circumstances shall the sampling deviate from the schedule in Section 3.1.

To ensure samples are identified and collected at the correct location, monitoring wells should be marked with the monitoring identification designated in the groundwater monitoring program. Brass monument tags with the well identification stamped into the metal shall be installed on each well.

Wells must have permanently marked reference points from which groundwater levels and well depths will be measured. Elevations of reference points must be established relative to the *North American Vertical Datum of 1929 or 1983*, whichever is available. All sampling points should use the same datum.

Upgradient wells should be sampled first to avoid cross contamination. In general, this procedure is intended to sample the least potentially contaminated monitoring point first, and subsequently sample all other monitoring points with increasing contamination potentials.

The three principal steps in collecting groundwater samples from monitoring wells are measuring static groundwater levels; evacuating or purging well bores and casings; and collecting and preserving samples. Each step must be performed consistently from well to well, and from one sampling event to the next if accurate data and representative samples are to be obtained.

General Procedures

The date, time, ambient air temperature, general weather conditions, and individuals present, including sample team members and any observers shall be recorded on the groundwater sampling sheet for each well. The sampling equipment and containers should be stored so that contact with the ground surface is minimized.

All parts of sampling equipment coming in contact with groundwater must be thoroughly washed with a non-phosphate detergent and triple rinsed with deionized or distilled water before use. Decontamination shall be conducted initially upon arrival at the site and after each monitoring well has been sampled. Sampling equipment shall be calibrated in accordance to the manufacturer's specifications at the start of each day or as required by the manufacturer.

Electronic Filing: Received, Clerk's Office 09/28/2020

Water Level Gauging

Static elevations of groundwater should be measured prior to purging each well. Initially, depths to static groundwater levels should be measured from the specified reference point of each well during each sampling event in order to calculate the initial groundwater volume. Groundwater elevations in wells are obtained by subtracting measured depths to groundwater from the specified reference point elevation. Water levels at all monitoring wells should be collected on the same day to prevent time distortion of the water surface data.

Monitoring well depths should be measured as the distance from the reference point to the well bottom. Record these depths at each sampling event after low-flow purging. A decrease in well depth, from the known installed total depth, may indicate that sediments have been deposited in the well. If accumulated sediment obstructs approximately 10 percent of the screened interval length, then the well should be redeveloped.

The most common device used to measure well depth and groundwater level is an electronic water level meter. Electronic water level meters are battery-powered devices with a probe that is lowered into the well until an audible signal and/or light indicates contact with the water surface has been made.

The difference between installed total well depth and depth to static groundwater level is the stabilized height of the groundwater column in the well. Accumulated sediment is not subtracted when calculating the volume of groundwater in the well, resulting in a greater and more conservative estimate of purge volume. These measurements are used to determine the static well volume (in gallons) of groundwater for each well as follows:

1. In order to obtain the height (H) of the groundwater column, measure the well total depth (TD) and subtract the measured depth to static water level (MSD)

$$H = TD - MSD$$

2. Use the following formula to calculate the static well volume (in gallons) of groundwater:

$$V = 5.875 \times D^2 \times H$$

Where:
V = Well volume (gallons)
D = Inside well diameter (feet)
H = Height of groundwater column (feet)

Electronic Filing: Received, Clerk's Office 09/28/2020

Monitoring Well Purging – Pump Method

Low flow sampling methods will be used to obtain representative samples from the groundwater bearing zone being monitored in wells that demonstrate consistent and sufficient yields. A dedicated pumping device installed permanently in the well or a portable pumping device will be used to conduct low flow sampling. The pump intake must be near the middle of the well screen. Pumping flow rates must be less than natural recovery rate of the well generally less than 0.5 liters per minute. The goal is to minimize drawdown in the well. Drawdown is limited to less than 0.3 feet or 10% of the total water column. Continuous monitoring of water level and water quality indicator parameters for stabilization will be obtained during purging.

Indicator parameters for stabilization will begin to be obtained after one equivalent volume of tubing has been removed from the well. For this facility, the following parameters and stabilization requirements are:

- pH ± 0.05 S.U.
- temperature ± 0.5°F
- specific conductivity ± 5%
- dissolved oxygen ± 10% (optional)
- redox potential ± 10% (optional)
- turbidity ± 10% (optional)

Samples should be directly placed into the appropriate laboratory containers and handled according to the Sample Handling section and laboratory protocols. If a well is dry or exhibits slow recharge, the well will be allowed to recharge for a minimum of 12 hours. Samples shall be collected until all sample containers have been filled or the well becomes dry. The sampling conditions including dry well conditions shall be documented on the groundwater sampling field data sheet.

Monitoring Well Purging – Bailer Method

Bailers shall only be used for sample collection in the event of a non-functioning pump. Only new, disposable bailers with new string attached shall be used for sampling. Stabilization indicator parameter readings will be collected at each 0.5 gallon interval until stabilization is achieved in accordance with the Low Flow sampling method described above. Well volumes will be calculated in accordance with well gauging formulas described above.

Sample Collection Procedures

Sample handling and preservation techniques depend on the parameters to be analyzed. Groundwater samples should be collected, preserved and containerized in their order of sensitivity to volatilization (most sensitive to least sensitive). The purpose of sample preservation is to stabilize parameters of interest by retarding chemical or biological changes. Methods of preservation are generally limited to pH adjustment, chemical addition and cooling.

Electronic Filing: Received, Clerk's Office 09/28/2020

Samples requiring preservation should be preserved immediately upon collection or be placed in sealed containers with preservative added by the laboratory. Proper preservation will help ensure that samples are representative of groundwater.

Every sample must be cooled to 4° C (approximately 39° F) immediately after being containerized and preserved. Every sample must also be maintained at 4° C until analyzed. Laboratory protocol regarding appropriate containers, preservatives, and holding times should be followed.

Groundwater samples that are to be analyzed for total recoverable metals must not be field filtered. However, if dissolved metals analyses are required, then the samples must either be field filtered through a 0.45-micron filter immediately upon collection and prior to preservation and transport to a laboratory or filtered by the laboratory upon receipt.

Field measurements for the indicator parameters of pH, temperature and specific conductivity should be taken on a portion of the sample that has been placed in a separate clean container that will not be analyzed for any other parameters. This procedure avoids cross contamination from field instrument probes.

Sample Documentation and Transportation

Before samples are transported to the laboratory, a chain-of-custody record shall be provided. Chain-of-custody records document in a legally defensible manner the history of collection, transfer and transport of each sample. Every individual, who is responsible for the samples from the time of collection to the time they are received by a laboratory, must be documented in the Chain-of-Custody record. The Chain-of-Custody document records allow tracing the possession and handling of individual samples from the time of field collection through the time of laboratory analyses. The sample labels shall be completed in indelible ink and sample seals (if required) should be applied to each container prior to packing and shipment. Samples shall be transported to the laboratory in sealed, insulated shipping containers, ice chests, or coolers. The samples should be shipped/delivered to the laboratory as soon as practical, preferably within 24 hours of sample collection.

1.0 INTRODUCTION

The Meredosia Power Station in Morgan County, Illinois is owned by AmerenEnergy Medina Valley Cogen, LLC and operated by the Ameren Energy Generating Company from 1948 to 2011, when the power station was closed. The Meredosia Power Station has three coal combustion residual impoundments including: the Bottom Ash Pond, the Fly Ash Pond and the Old Ash Pond. The Old Ash Pond was previously closed. The ash ponds were reportedly constructed of native materials and do not have bottom liners.

The Bottom Ash Pond was constructed in 1972 with a current surface area of approximately 14.8 acres. The Bottom Ash Pond received low-volume wastewater, bottom ash and storm water runoff. The Fly Ash Pond was constructed in 1968 with a current surface area of approximately 44.8 acres. The Fly Ash Pond reportedly received fly ash, low-volume wastewater and storm water runoff.

This document comprises the plan to establish a Groundwater Management Zone (GMZ) for the Meredosia Power Station in accordance with 35 Illinois Administrative Code (IAC) Part 620.250. This GMZ plan includes Parts I, II, and III of the 35 IAC Part 620.250(a)(2) Illinois Bureau of Land Management Confirmation of Adequate Corrective Action forms which are included in Attachment 1. Some of the information contained in this plan was obtained from the April 2016 Hydrogeologic Assessment Report[1] and the Groundwater Monitoring Plan[2] (GMP). The four on-site water supply wells identified in the Hydrogeologic Assessment report will be abandoned during planned demolition activities that are scheduled to occur in 2016-2018. The four on-site water supply wells should not be considered when assessing the adequacy of this GMZ request.

---

[2] *Groundwater Management Plan, Fly Ash and Bottom Ash Ponds Meredosia Power Station, Meredosia, Illinois;* prepared for Ameren Energy Medina Valley Cogen, LLC; prepared by Geotechnology, Inc.; Report No. J024917.01, dated April 2016.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

Sections 2.0 through 6.0 below contain the text of the requirements specified in the Confirmation of Corrective Action forms in italics followed by the required information and/or response.

2.0 GENERAL FACILITY INFORMATION

a. Facility Name

The facility name is the Meredosia Power Station.

b. Facility Address

The facility address is 800 South Washington Street, Meredosia, Illinois 62665.

c. County in which facility is located

The facility is located in Morgan County, Illinois.

d. Illinois EPA, Bureau of Land, and USEPA Identification Numbers

The Illinois Bureau of Land identification number is 1370305002. The United States Environmental Protection Agency (USEPA) identification number is ILD065236226.

e. A general description of the type of industry, products manufactured, raw materials used, location and size of the facility, including SIC codes

The Meredosia Power Station was a coal-fired electricity-generating power plant. Coal was shipped by rail and barge to the facility, burned, and the CCR deposited on-site in storage ponds. The Bottom Ash Pond was constructed in 1972 with a current surface area of approximately 14.8 acres. The Bottom Ash Pond received low-volume wastewater, bottom ash and storm water runoff. The Fly Ash Pond was constructed in 1968 with a current surface area of approximately 44.8 acres. The Fly Ash Pond reportedly received fly ash, low-volume wastewater and storm water runoff. The SIC code for the facility is 4911.

f. An identification of special units (operating or closed) present at the facility for which the GMZ is proposed

The Bottom Ash Pond and the Fly Ash Pond are the units for which the GMZ is proposed. Due to their proximity and relative positioning on the site, the two ash ponds will be treated as a single unit for purposes of groundwater monitoring and this GMZ.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

g. A USGS topographic or county map showing the location of the site and a more detailed scaled map of the facility with each waste management unit identified in Item 2.0 (f) above. Map scale must be specific and the location of the facility must be provided with respect to Township, Section, and Range.

A United States Geologic Survey (USGS) topographic map with the site location is attached in Plate 1. A scaled site plan of the facility including the surveyed area of the proposed aerial extent of the GMZ is included in Plate 2. The ash ponds are located in the south half of Section 21 and the north half of Section 28, Township 16 North, Range 13 West.

h. A description of the geology and hydrogeology within the proposed GMZ and the surrounding area

The following is a summary of the information provided in the Hydrogeologic Assessment Report.

The Meredosia Power Station is located near the western edge of the Springfield Plain Subsection of the Till Plains Section, Central Lowland Province, Interior Plains Physiographic Region. The Interior Plains Physiographic Region extends across the Laurentian craton of central North America. It is comprised of the Great Plains and Central Lowland Provinces. The Central Lowlands Province to the east formed from eroded sediments from the topographically-higher Great Plains Province to the west.

Bedrock Stratigraphy. The Meredosia Power Station and surrounding areas within the Illinois River valley are underlain by Mississippian System bedrock of the Lower Valmeyeran Series which consists of the Meppen Limestone, Fern Glen formation, and the Burlington-Keokuk Limestone (Kolata, 2005).

Willman et al. (1975) describe the Meppen Limestone as a tan or buff, very fine-grained dolomitic limestone or calcareous dolomite. The formation is slightly crinoidal and contains calcite geodes up to 2-inches in diameter. The maximum thickness of this formation is approximately 22 feet. The Fern Glen formation consists of calcareous shale, limestone, and dolomite. Dolomitic portions of the formation are partially argillaceous. The limestone portions of the formation contain nodules of greenish-gray chert. The thickness of the formation can range from approximately 50 to 100 feet. The Burlington formation of the Burlington-Keokuk Limestone is described as a "very pure, coarsely crystalline, crinoidal, light gray limestone in medium to thick beds." The Burlington formation also contains beds of fine-grained, brownish-gray, dolomitic limestone. The formation is approximately 100 to 150 feet thick in Illinois. The Keokuk formation of the Burlington-Keokuk Limestone is composed of beds of fossiliferous, crinoidal limestone interbedded with fine-grained limestone, argillaceous dolomite, and calcareous gray shale. The Keokuk formation is approximately 60 to 80 feet thick in Illinois.

Electronic Filing: Received, Clerk's Office 09/28/2020

Surficial Geology. The Meredosia Power Station is situated within the Illinois River valley. The overburden soils consist of channel and floodplain deposits of the Cahokia formation underlain by glacial outwash deposits belonging to the Henry formation. Fine-grained lacustrine deposits of the Equality formation are present in the subsurface, but are discontinuous. These formations occur throughout Illinois in valley bottoms and floodplains as channel deposits in present-day rivers and streams.

The Cahokia Alluvium consists mainly of poorly-sorted silt, clay, and silty sand, but locally contains lenses of sand and gravel. The upper part consists of overbank silt and clays. The lower portion consists of coarse-textured sand and lateral accretion deposits. The Cahokia formation may be up to 20 feet thick in the area of the Meredosia Power Station (Berg and Kempton, 1987).

The Henry formation consists of glacial sand and gravel outwash. The Henry formation is subdivided into three members that differ in lithology: the Batavia Member (outwash plains), the Mackinaw Member (valley trains), and the Wasco Member (ice-contact deposits) (Willman and Frye, 1970; Willman et al., 1975). Based on information from well logs, the thickness of the Henry formation ranges from 60 to 84 feet in the area of the Meredosia Power Station.

The Equality formation consists of bedded silt and clay deposits in glacial and post-glacial lakes. Gravel, sand, and organic deposits occur in lenses that intertongue with the Henry formation. In the area of the Meredosia Power Station, the Equality formation overlies the Henry formation and generally occurs as lenses or patches not exceeding 20 feet thick.

Subsurface Conditions. Geotechnology has conducted subsurface explorations of the overburden soils at the Meredosia Power Station. The subsurface exploration and laboratory testing efforts are discussed further in the Hydrogeologic Assessment Report and the following is a summary of the site conditions.

Native soils consisting of brown and gray, very soft to medium stiff, silt and clay were encountered below the fill in Boring B-1 and Monitoring Well APW-9, and at the ground surface in Boring B-5. Native soils consisting of black, clayey sand with trace gravel were encountered below the fill in Boring B-2.

A stratum of very soft to medium stiff, brown, black, and gray clay with traces of sand and wood was encountered below the fill in Borings B-3 and B-8, below the native soils in Borings B-1, B-2, and B-5, and at the ground surface in Borings B-4, B-9, APW-2, APW-3, APW-4, and APW-7. This soil stratum ranged in thickness from approximately 8 to 17 feet bls.

printed on recycled paper

The clay layer described above was underlain by a stratum of granular and cohesive alluvial soils (except for Boring APW-4). The granular alluvium generally consisted of loose, gray, clayey sand with gravel. The cohesive alluvium generally consisted of very soft to medium stiff, gray and brown, clayey silt, silty clay, and sandy clay. This soil stratum ranges in thickness from approximately 5 to 11 feet bls in borings where it is encountered.

Alluvium was encountered below the fill soils in Borings B-6 and B-7, and at the ground surface in Boring B-10 and Monitoring Wells APW-6 and APW-8. This stratum is interpreted as alluvium placed in a buried valley that had been cut down through the soil stratum described above. The granular portions of this alluvium infill generally consisted of very loose, gray, silty sand. The cohesive portions generally consisted of very soft to very stiff, gray, silty clay with sand and silt seams. This soil stratum was at least 28 feet thick where encountered.

The native soils described above are interpreted as belonging to the Cahokia Alluvium, and were underlain by sand deposits interpreted as belonging to the Henry formation. Generalized east-west and north-south subsurface profiles based on the soil boring data at the Meredosia Power Station.

Surface Water. The major surface water body in the vicinity of the Meredosia Power Station is the Illinois River, which flows from the north-northeast to the south-southwest, and borders the west side of the site. The normal pool elevation of the Illinois River is approximately 421.0 feet[3]. Information from the U.S. Army Corps of Engineers indicates the Illinois River flood stage is 435.0 feet above mean sea level (MSL). The record high stage was 446.69 feet above MSL on May 26, 1943, and the record low stage was 418.40 feet above MSL on January 11, 1940.

Meredosia Lake is approximately 1.5 miles north of the Meredosia Power Station. Smith Lake is located approximately 1-mile south of the site. Westerly-flowing streams drain the uplands east of the site to the Illinois River located west of the site.

Groundwater Flow. Based on the monitoring well gauging data, the groundwater flow direction at the Meredosia Power Station is to the west-northwest toward the Illinois River. Groundwater flow direction may be influenced by the stage of the Illinois River.

i. Groundwater classification at the site

Groundwater at the site is classified as Class I Groundwater per 35 Illinois Administrative Code (IAC) Part 620.

[3] Elevations herein refer to the mean sea level datum in feet (msl-ft).

printed on recycled paper

j. A description of the circumstances under which the release from each waste management unit identified in Item 2.0 (f) above, to groundwater was identified

Five groundwater wells were installed near the facility Fly Ash and Bottom Ash Ponds at the request of the IEPA in 2010. A release was detected during routine groundwater monitoring at the site.

3.0 RELEASE INFORMATION

a. The chemical constituents released to groundwater

The analytical results from 11 groundwater sampling and testing events were compared to the Illinois Class I groundwater standards. Boron, arsenic, iron, manganese, and sulfate were identified in at least one sampling event as exceeding the Class I groundwater standards. Changes of oxidation/reduction (redox) potential in the subsurface due to fluctuations in pH make evaluation of manganese and iron concentrations unreliable at this facility. Comparison of manganese and iron to the respective Class I groundwater standard may be inappropriate for this site.

The chemical constituents released to groundwater are described in detail in the Hydrogeologic Assessment Report. In summary, boron is the chemical constituents of concern due to the extent of impacts. These are consistent with typical CCR residual releases.

b. Identification of the chemical constituents detected in groundwater that are above the applicable standard in 35 Ill. Adm. Code Part 620

The analytical results from 11 groundwater sampling and testing events were compared to the Illinois Class I groundwater standards. As of the February 2016 sampling event, the boron concentration exceeded the Class I groundwater standard (2 ppm) in Monitoring Wells APW-2, APW-3, APW-8, and APW-9. As of the February 2016 sampling event, the arsenic concentration exceeded the Class I groundwater standard in Monitoring Well APW-3. Concentrations of manganese exceeded the Class I groundwater standard in Monitoring Wells APW-2, APW-3, and APW-4. Historical concentrations of iron exceeded the Class I groundwater standards in Monitoring Wells APW-3 and APW-4, but the February 2016 results are below the Class I groundwater standard. A single event anomaly associated with flooding in February 2016 resulted in the concentration of sulfate in Monitoring Well APW-9 being above the Class I groundwater standard. Changes of oxidation/reduction (redox) potential in the subsurface due to fluctuations in pH make evaluation of manganese and iron concentrations unreliable at this facility. Comparison of manganese and iron to the respective Class I groundwater standard may be inappropriate for this site.

printed on recycled paper

c. *A description of how the site has been investigated to determine the source or sources of the release*

A detailed description of site investigation activities to date is included in the Hydrogeologic Assessment Report. A summary of the site investigation activities follows.

From October 19 through October 26, 2010, Geotechnology advanced 15 borings at the Meredosia Power Station. Ten of the borings (B-1 through B-10) were drilled in support of a global stability evaluation, while the remaining five borings were completed as Monitoring Wells APW-1 through APW-5 in support of groundwater monitoring activities. The borings were drilled to depths ranging from 25 to 60 feet below land surface (bls). Standard Penetration Tests (SPT) were performed using an automatic hammer and split spoon sampler.

From September 28 through October 1, 2015, Geotechnology advanced four additional borings at the site. The borings were drilled to depths ranging from 17 to 40 feet bls. SPTs were performed using an automatic hammer and split spoon sampler. Monitoring Wells APW-6 through APW-9 were installed in the borings in support of ongoing groundwater monitoring activities.

d. *A description of the groundwater monitoring network and groundwater sampling protocols in place at the facility*

Groundwater samples will be obtained from existing groundwater monitoring wells (APW-1 through APW-9). If additional wells are constructed in the future, the construction, sampling, and analysis methods described in the Groundwater Monitoring Plan will apply to those monitoring wells. Monitoring wells have a well identification number with an "APW" identifier, followed by a 1-, 2-, or 3-place alpha-numeric designation. The approximate locations of the monitoring wells are included on Plate 2. The monitoring program generally follows 35 IAC 620 by satisfying the following standards for the monitoring system:

- The monitoring wells are sufficiently located to represent the quality of groundwater at the compliance point(s);
- The monitoring wells are located within the stratigraphic unit(s) that may serve as potential contaminant migration pathways;
- The groundwater monitoring wells are secure; and,
- Monitoring wells are installed to evaluate on-site and off-site groundwater quality.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

The groundwater sampling protocols are provided in Appendix B of the Groundwater Monitoring Plan and a copy has been provided in Appendix B of this plan.

e. The schedule for monitoring of the groundwater

Groundwater monitoring events are anticipated to be conducted quarterly until trend analysis indicates less frequent monitoring is acceptable.

Five years after approval of the CQA Acceptance Report, a request may be made to modify the post-closure care plan to reduce the frequency of groundwater monitoring to semi-annual sampling by demonstrating the following:

- Monitoring effectiveness will not be compromised by the reduced frequency of monitoring;
- Adequate data has been collected to characterize groundwater; and
- Concentrations of constituents monitored at the downgradient boundaries do not demonstrate statistically significant increasing trends that can be attributed to the former ash ponds.

Five years after reducing the monitoring frequency to semi-annual, a request may be made to modify the post-closure care plan to reduce monitoring frequency to annual sampling by demonstrating the same items above as for the reduction to semi-annual monitoring.

Groundwater monitoring may be discontinued when the IEPA approves the post-closure care completion report. This occurs after statistically significant increasing trends are not detected for five (5) consecutive years after changing to an annual monitoring frequency.

4.0 PROPOSED GMZ BOUNDARIES

The horizontal boundaries of the proposed GMZ are illustrated on Plate 2. The vertical component of the proposed GMZ will extend to 60 feet below the ground surface within the horizontal boundaries of the GMZ, concurrent with the bottom of the Henry Formation at the site.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

5.0 APPROVED REMEDIAL ACTION INFORMATION

a. A description of the approved remedial action

The remedial action for the facility is the relocation and clean closing of the east ash storage pile, capping of the Fly Ash Pond, and the partial clean closure and capping of the Bottom Ash Pond. The Bottom Ash Pond will be closed by the removal of most coal combustion residuals (CCR) to the Fly Ash Pond. The remaining CCR under the roadway and pipeline will be capped in-place. Because the groundwater contamination is a result of leaching inorganics from the CCR, this will effectively remove the majority of the contamination source material from the Bottom Ash Pond, and protect the remaining material from storm water infiltration.

The Fly Ash Pond will be closed by the installation of a cap. A capped closure will redirect precipitation that may otherwise pass through the CCR. The capped closure will reduce further leaching of inorganics into the groundwater.

b. A description of how the approved remedial action has impacted the release

It is anticipated that the closure of the ash ponds will reduce the concentrations of contaminants below the Illinois Class I groundwater standards in approximately 3 years after dewatering and closure. This is based on the general reduction of chemicals in groundwater since the plant was closed and modeling of the cap system using the HELP model, MODFLOW and MT3DMS models, and river concentration calculations. The remedial action will occur concurrently with the implementation of this proposed GMZ.

c. A description of how the approved remedial action is operated and maintained

Subject to IEPA approval, the remedial action is the closure of the Bottom Ash Pond and the Fly Ash Pond. Proposed ash pond closure activities include reducing the aerial extent of the Fly Ash Pond to 41.9 acres, moving approximately 12.3 acres of the Bottom Ash Pond to the Fly Ash Pond, grading the ash for storm water runoff, installing ClosureTurf (meets the performance requirements of Subtitle D) cover over the 41.9 acres of the Fly Ash Pond and the 2.5 acres of Bottom Ash Pond that is being closed-in-place. These activities will address the source of the impacts by directing storm water away from the CCR and reduce future infiltration of impacted water into the groundwater.

d. A projected schedule for completion of remediation

The completion of remediation activities are anticipated to be performed during the 2016 and 2017 construction seasons. Groundwater monitoring will continue in accordance with the schedule described in Section 3.0(e).

printed on recycled paper

e. An identification of any and all permits obtained from the Illinois EPA for the remedial action

An NPDES permit is pending renewal.

f. A description of how groundwater at the facility will be monitored following the future completion of the remedy to ensure that the groundwater quality standards have been attained

Groundwater will be monitored using the groundwater monitoring network of nine wells described in Section 3.0(d) in the GMP.

Compliance will be demonstrated by performing an annual trend analysis for each downgradient monitoring well for the monitored constituents listed in the Groundwater Monitoring Plan that exceed the Class I groundwater standards. The analysis shall be performed on a minimum of eight (8) consecutive samples and use Sen's Estimate of Slope for compliance assessment. Generally, if analyses for a parameter show an increasing trend at a down-gradient well, a Mann-Kendall analysis must be performed at a 95% tolerance interval to assess whether the increasing trend is statistically significant. If a statistically significant increase is observed, three (3) alternative statistical methods may be applied:

1. Notification of statistically significant increasing trends and revision to the sampling frequency must be reported to the IEPA within 30 days of making the determinations.

2. If an investigation determines that the statistically significant increasing trend is due to a superseding cause then the IEPA will be notified in writing, stating the cause of the increasing trend and the rationale used in its determination.

3. If there is no superseding cause, and the monitoring frequency has been decreased to semi-annual or annual, then sampling must return to a quarterly frequency. If after four (4) consecutive quarters and no statistically significant increasing trend is observed, then sampling frequency can return to the previous frequency.

If a statistically significant increasing trend continues to be observed over two or more consecutive years and there is no superseding cause, a hydrogeologic investigation (and additional site investigation(s), if necessary) will be performed.

Electronic Filing: Received, Clerk's Office 09/28/2020

g. A discussion addressing the adequacy of the controls and management of the proposed GMZ at the site

The controls and management of the GMZ are common practice in the industry and adequate to reduce the concentrations of contaminants below the Class I groundwater standards over time.

h. Course of action for future activities and/or request for modification in regards to the proposed GMZ at the site

Requests for future action or changes to the GMZ will be submitted in writing to the IEPA.

6.0 POINT OF COMPLIANCE

In any GMZ, the goal is remediation of the groundwater to the level of the standards applicable to that class of groundwater. This goal does not mean all groundwater within the GMZ must be returned to the groundwater standard. On the other hand, groundwater within the GMZ that is beyond the point of compliance as established under 35 Ill. Adm. Code part 620.505(a) is to be remediated to the level applicable to that groundwater class. However, groundwater contamination within the three-dimensional zone between the compliance point wells and the waste management unit could still exceed the applicable standards at completion of the corrective action. If this is the case, post-remediation monitoring may be necessary.

The point of compliance wells for the subject property will be APW-2 and APW-3. These wells are located adjacent to the Illinois River, and are located downgradient relative to the site. If remedial activities do not reduce the contaminant concentrations to levels below the Class I groundwater standards, a plan for post-remediation monitoring will be submitted to the IEPA.

Part of the Northwest Quarter (NW 1/4) of Section Twenty-seven (27), part of the Northeast Quarter (NE 1/4) of Section Twenty-eight (28), and part of the Southeast Quarter (SE 1/4) of Section Twenty-One (21), all in Township Sixteen (16) North, Range Thirteen (13) of the Third Principal Meridian, Morgan County, Illinois, being more particularly described as follows; Beginning at the Southeast corner of the North Half (N 1/2) of the Northeast Quarter (NE 1/4) of said Section Twenty-eight (28); thence South 89°11'27" East (all bearings referenced to the Illinois State Plane Coordinate System, NAD 83, Illinois West Zone), 874.74 feet; thence North 00°23'32" West 1297.08 feet; thence North 89°02'55" West 1418.74 feet; thence North 07°18'23" West, 487.01 feet; thence North 44°46'00" East, 391.08 feet; thence North 58°53'16" West, 1658.73 feet; thence South 54°18'23" West 924.04 feet; thence South 48°53'44" West, 478.06 feet; thence South 40°26'07" West, 882.11 feet; thence South 27°15'47" West 1552.69 feet; thence South 89°40'31" East, 1015.01 feet; thence South 89°44'19" East, 496.63 feet; thence South 89°43'05" East 2641.92 feet to the point of beginning, except the following described parcel:

Part of the Northeast Quarter of Section 28, Township 16 North, Range 13 West of the Third Principal Meridian, Morgan County, Illinois, being more particularly described as follows:

Commencing at the Northeast corner of Section 28 (Southwest corner Section 22), Township 16 North, Range 13 West of the Third Principal Meridian, Morgan County, Illinois; thence South 89° 02' 55" East (basis of bearing is the Illinois State Plane Coordinate System, NAD 83, Illinois West Zone) along the South line of said Section 22, a distance of 19.06 feet; thence South 48° 18' 27" West a distance of 29.52 feet; thence North 89° 02' 55" West a distance of 19.76 feet; thence South 00° 09' 41" West a distance of 449.00 feet to the true point of beginning;

Thence continuing South 00° 09' 41" West a distance of 780.26 feet to a point on the now vacated North R.O.W. line of T.R. 59; thence North 89° 43' 05" West a distance of 250.00 feet; thence North 00° 09' 41" East a distance of 780.26 feet; thence South 89° 43' 05" East a distance of 250.00 feet to the true point of beginning.

Excepted parcel containing 4.478 acres, more or less.

Said Groundwater Management Zone tract containing 211.94 acres, more or less.

ATTACHMENT 1

CONFIRMATON OF CORRECTIVE ACTION FORM

Electronic Filing: Received, Clerk's Office 09/28/2020

Joint Committee on Administrative Rules

ADMINISTRATIVE CODE

TITLE 35: ENVIRONMENTAL PROTECTION
SUBTITLE F: PUBLIC WATER SUPPLIES
CHAPTER I: POLLUTION CONTROL BOARD
PART 620 GROUNDWATER QUALITY
SECTION 620.APPENDIX D CONFIRMATION OF AN ADEQUATE CORRECTIVE ACTION PURSUANT TO 35 ILL. ADM. CODE 620.250(A)(2)

Section 620.APPENDIX D Confirmation of an Adequate Corrective Action Pursuant to 35 Ill. Adm. Code 620.250(a)(2)

Pursuant to 35 Ill. Adm. Code 620.250(a) if an owner or operator provides a written confirmation to the Agency that an adequate corrective action, equivalent to a corrective action process approved by the Agency, is being undertaken in a timely and appropriate manner, then a groundwater management zone may be established as a three-dimensional region containing groundwater being managed to mitigate impairment caused by the release of contaminants from a site. This document provides the form in which the written confirmation is to be submitted to the Agency.

Note 1. Parts I and II are to be submitted to IEPA at the time that the facility claims the alternative groundwater standards. Part III is to be submitted at the completion of the site investigation. At the completion of the corrective process, a final report is to be filed which includes the confirmation statement included in Part IV.

Note 2. The issuance of a permit by IEPA's Division of Air Pollution Control or Water Pollution Control for a treatment system does not imply that the Agency has approved the corrective action process.

Note 3. If the facility is conducting a cleanup of a unit which is subject to the requirements of the Resource Conservation and Recovery Act (RCRA) or the 35 Ill. Adm. Code 731 regulations for Underground Storage Tanks, this confirmation process is not applicable and cannot be used.

Note 4. If the answers to any of these questions require explanation or clarification, provide such in an attachment to this document.

Part I. Facility Information

Facility Name Meredosia Power Station

Facility Address 800 South Washington Street; Meredosia, Illinois

County Morgan

Standard Industrial Code (SIC) 4911

1. Provide a general description of the type of industry, products manufactured, raw materials used, location and size of the facility. See Section 2.0(e.) of the GMZ Plan.

2. What specific units (operating or closed) are present at the facility which are or were used to manage waste, hazardous waste, hazardous substances or petroleum?

	YES	NO
Landfill		X
Surface Impoundment	X	
Land Treatment		X
Spray Irrigation		X
Waste Pile		X
Incinerator		X
Storage Tank (above ground)		X
Storage Tank (underground)		X
Container Storage Area		X
Injection Well		X
Water Treatment Units		X
Septic Tanks		X
French Drains		X
Transfer Station		X
Other Units (please describe)		

3. Provide an extract from a USGS topographic or county map showing the location of the site and a more detailed scaled map of the facility with each waste management unit identified in Question 2 or known/suspected source clearly identified. Map scale must be specified and the location of the facility must be provided with respect to Township, Range and Section. See Section 2.0(g.) of the GMZ Plan.

4. Has the facility ever conducted operations which involved the generation, manufacture, processing, transportation, treatment, storage or handling of "hazardous substances" as defined by the Illinois Environmental Protection Act? Yes ___ No X If the answer to this question is "yes" generally describe these operations.

5. Has the facility generated, stored or treated hazardous waste as defined by the Resource Conservation and Recovery Act? Yes___ No X If the answer to this question is "yes" generally describe these operations.

6. Has the facility conducted operations which involved the processing, storage or handling of petroleum? Yes ___ No X If the answer to this question is "yes" generally describe these operations.

7. Has the facility ever held any of the following permits?

Electronic Filing: Received, Clerk's Office 09/28/2020

a. Permits for any waste storage, waste treatment or waste disposal operation. Yes ___ No X If the answer to this question is "yes", identify the IEPA permit numbers.

b. Interim Status under the Resources Conservation and Recovery Act (filing of a RCRA Part A application). Yes ___ No X If the answer to this question is "yes", attach a copy of the last approved Part A application.

c. RCRA Part B Permits. Yes ___ No X If the answer to this question is "yes", identify the permit log number.

8. Has the facility ever conducted the closure of a RCRA hazardous waste management unit? Yes ___ No X

9. Have any of the following State or federal government actions taken place for a release at the facility?

a. Written notification regarding known, suspected or alleged contamination on or emanating from the property (e.g., a Notice pursuant to Section 4(q) of the Environment Protection Act)? Yes ___ No X If the to this question is "yes", identify the caption and date of issuance.

b. Consent Decree or Order under RCRA, CERCLA, EPAct Section 22.2 (State Superfund), or EPAct Section 21(f) (State RCRA). Yes ___ No X

c. If either of Items a or b were answered by checking "yes", is the notice, order or decree still in effect? Yes ___ No X

10. What groundwater classification will the facility be subject to at the completion of the remediation?

Class I X Class II ___ Class III ____ Class IV ____
If more than one Class applies, please explain.

11. Describe the circumstances which the release to groundwater was identified.
See Section 2.0(j.) of the GMZ Plan.

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of my knowledge and belief, true and accurate.

Facility Name	Signature of Owner/Operator
Location of Facility	Name of Owner/Operator
EPA Identification Number	Date

PART II: Release Information

1. Identify the chemical constituents release to the groundwater. Attach additional documents as necessary. See Section 3.0(a.) of GMZ Plan.

Chemical Description	Chemical Abstract No.
-	-
-	-
-	-

2. Describe how the site will be investigated to determine the source or sources of the release. See Section 3.0(c.) of the GMZ Plan.

3. Describe how groundwater will be monitored to determine the rate and extent of the release. See Section 3.0(d.) of the GMZ Plan.

4. Has the release been contained on-site at the facility? Yes

5. Describe the groundwater monitoring network and groundwater and soil sampling protocols in place at the facility. See Section 3.0(d.) of the GMZ Plan.

6. Provide the schedule for investigation and monitoring. See Section 3.0(e.) of the GMZ Plan.

7. Describe the laboratory quality assurance program utilized for the investigation. The laboratory quality assurance program is attached to this form.

8. Provide a summary of the results of available soil testing and groundwater monitoring associated with the release at the facility. The summary or results should provide the following information: dates of sampling; types of samples taken (soil or water); locations and depths of samples; sampling and analytical methods; analytical laboratories used; chemical constituents for which analyses were performed; analytical detection limits; and concentrations of chemical constituents in ppm (levels below detection should be identified as "ND"). A summary of the results of available groundwater testing data is included in Appendix B of the GMZ Plan.

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of knowledge and belief, true and accurate and confirm that the actions identified herein will be undertaken in accordance with the schedule set forth herein.

Facility Name	Signature of Owner/Operator
Location of Facility	Name of Owner/Operator
EPA Identification Number	Date

Part III: Remedy Selection Information

1. Describe the selected remedy. The ash ponds will be clean closed.

2. Describe other remedies which were considered and why they were rejected. Other remedies were not considered.

3. Will waste, contaminated soil or contaminated groundwater be removed from the site in the course of this remediation? Yes ___ No _X_ If the answer to this question is "yes", where will the contaminated material be taken?

4. Describe how the selected remedy will accomplish the maximum practical restoration of beneficial use of groundwater. See Section 5.0 of the GMZ Plan. 5a + C

5. Describe how the selected remedy will minimize any threat to public health or the environment. See Section 5.0 of the GMZ Plan. 5b add Tl. & Effective @ 3yrs

6. Describe how the selected remedy will result in compliance with the applicable groundwater standards. See Section 5.0 of the GMZ Plan. 5b refer Attachment B

7. Provide a schedule for design, construction and operation of the remedy, including dates for the start and completion. See Section 5.0 of the GMZ Plan. 5d. table 9 refer me

8. Describe how the remedy will be operated and maintained. See Section 5.0 of the GMZ Plan. refer to Attachment 5 D+E

9. Have any of the following permits been issued for the remediation?

   a. Construction or Operating permit from the Division of Water Pollution Control. Yes __ No ___ deferred for approval of plan

   b. Land treatment permit from the Division of Water Pollution Control. Yes ___ No ___ If the answer to this question is "yes", identify the permit number. deferred

   c. Construction or Operating permit from the Division of Air Pollution Control. Yes ___ No ___ If the answer to this question is "yes", identify the permit number. deferred

10. How will groundwater at the facility be monitored following completion of the remedy to ensure that the groundwater standards have been attained? See Appendix C of the GMZ Plan. refer to Attachment B

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of my knowledge and belief, true and accurate and confirm that the actions identified herein will be undertaken in accordance with the schedule set forth herein.

ATTACHMENT 2

GROUNDWATER SAMPLING PROCEDURES

Electronic Filing: Received, Clerk's Office 09/28/2020

Appendix B – Groundwater Sampling Procedure

The following procedure shall be used in sampling groundwater at the site. This sampling procedure applies to the routine quarterly and/or modified semi-annual or annual sampling events. A groundwater sampling field data sheet, comparable to the example located in Exhibit B-1, may be used to document the sampling activities at each well. If site conditions at the time of sampling could influence the results, sampling should be postponed until a later date. However, under no circumstances shall the sampling deviate from the schedule in Section 3.1.

To ensure samples are identified and collected at the correct location, monitoring wells should be marked with the monitoring identification designated in the groundwater monitoring program. Brass monument tags with the well identification stamped into the metal shall be installed on each well.

Wells must have permanently marked reference points from which groundwater levels and well depths will be measured. Elevations of reference points must be established relative to the *North American Vertical Datum of 1929 or 1983*, whichever is available. All sampling points should use the same datum.

Upgradient wells should be sampled first to avoid cross contamination. In general, this procedure is intended to sample the least potentially contaminated monitoring point first, and subsequently sample all other monitoring points with increasing contamination potentials.

The three principal steps in collecting groundwater samples from monitoring wells are measuring static groundwater levels; evacuating or purging well bores and casings; and collecting and preserving samples. Each step must be performed consistently from well to well, and from one sampling event to the next if accurate data and representative samples are to be obtained.

General Procedures

The date, time, ambient air temperature, general weather conditions, and individuals present, including sample team members and any observers shall be recorded on the groundwater sampling sheet for each well. The sampling equipment and containers should be stored so that contact with the ground surface is minimized.

All parts of sampling equipment coming in contact with groundwater must be thoroughly washed with a non-phosphate detergent and triple rinsed with deionized or distilled water before use. Decontamination shall be conducted initially upon arrival at the site and after each monitoring well has been sampled. Sampling equipment shall be calibrated in accordance to the manufacturer's specifications at the start of each day or as required by the manufacturer.

Electronic Filing: Received, Clerk's Office 09/28/2020

Water Level Gauging

Static elevations of groundwater should be measured prior to purging each well. Initially, depths to static groundwater levels should be measured from the specified reference point of each well during each sampling event in order to calculate the initial groundwater volume. Groundwater elevations in wells are obtained by subtracting measured depths to groundwater from the specified reference point elevation. Water levels at all monitoring wells should be collected on the same day to prevent time distortion of the water surface data.

Monitoring well depths should be measured as the distance from the reference point to the well bottom. Record these depths at each sampling event after low-flow purging. A decrease in well depth, from the known installed total depth, may indicate that sediments have been deposited in the well. If accumulated sediment obstructs approximately 10 percent of the screened interval length, then the well should be redeveloped.

The most common device used to measure well depth and groundwater level is an electronic water level meter. Electronic water level meters are battery-powered devices with a probe that is lowered into the well until an audible signal and/or light indicates contact with the water surface has been made.

The difference between installed total well depth and depth to static groundwater level is the stabilized height of the groundwater column in the well. Accumulated sediment is not subtracted when calculating the volume of groundwater in the well, resulting in a greater and more conservative estimate of purge volume. These measurements are used to determine the static well volume (in gallons) of groundwater for each well as follows:

1. In order to obtain the height (H) of the groundwater column, measure the well total depth (TD) and subtract the measured depth to static water level (MSD)

$$H = TD - MSD$$

2. Use the following formula to calculate the static well volume (in gallons) of groundwater:

$$V = 5.875 \times D^2 \times H$$

Where:
V = Well volume (gallons)
D = Inside well diameter (feet)
H = Height of groundwater column (feet)

Electronic Filing: Received, Clerk's Office 09/28/2020

Monitoring Well Purging – Pump Method

Low flow sampling methods will be used to obtain representative samples from the groundwater bearing zone being monitored in wells that demonstrate consistent and sufficient yields. A dedicated pumping device installed permanently in the well or a portable pumping device will be used to conduct low flow sampling. The pump intake must be near the middle of the well screen. Pumping flow rates must be less than natural recovery rate of the well generally less than 0.5 liters per minute. The goal is to minimize drawdown in the well. Drawdown is limited to less than 0.3 feet or 10% of the total water column. Continuous monitoring of water level and water quality indicator parameters for stabilization will be obtained during purging.

Indicator parameters for stabilization will begin to be obtained after one equivalent volume of tubing has been removed from the well. For this facility, the following parameters and stabilization requirements are:

- pH ± 0.05 S.U.
- temperature ± 0.5°F
- specific conductivity ± 5%
- dissolved oxygen ± 10% (optional)
- redox potential ± 10% (optional)
- turbidity ± 10% (optional)

Samples should be directly placed into the appropriate laboratory containers and handled according to the Sample Handling section and laboratory protocols. If a well is dry or exhibits slow recharge, the well will be allowed to recharge for a minimum of 12 hours. Samples shall be collected until all sample containers have been filled or the well becomes dry. The sampling conditions including dry well conditions shall be documented on the groundwater sampling field data sheet.

Monitoring Well Purging – Bailer Method

Bailers shall only be used for sample collection in the event of a non-functioning pump. Only new, disposable bailers with new string attached shall be used for sampling. Stabilization indicator parameter readings will be collected at each 0.5 gallon interval until stabilization is achieved in accordance with the Low Flow sampling method described above. Well volumes will be calculated in accordance with well gauging formulas described above.

Sample Collection Procedures

Sample handling and preservation techniques depend on the parameters to be analyzed. Groundwater samples should be collected, preserved and containerized in their order of sensitivity to volatilization (most sensitive to least sensitive). The purpose of sample preservation is to stabilize parameters of interest by retarding chemical or biological changes. Methods of preservation are generally limited to pH adjustment, chemical addition and cooling.

Electronic Filing: Received, Clerk's Office 09/28/2020

Samples requiring preservation should be preserved immediately upon collection or be placed in sealed containers with preservative added by the laboratory. Proper preservation will help ensure that samples are representative of groundwater.

Every sample must be cooled to 4° C (approximately 39° F) immediately after being containerized and preserved. Every sample must also be maintained at 4° C until analyzed. Laboratory protocol regarding appropriate containers, preservatives, and holding times should be followed.

Groundwater samples that are to be analyzed for total recoverable metals must not be field filtered. However, if dissolved metals analyses are required, then the samples must either be field filtered through a 0.45-micron filter immediately upon collection and prior to preservation and transport to a laboratory or filtered by the laboratory upon receipt.

Field measurements for the indicator parameters of pH, temperature and specific conductivity should be taken on a portion of the sample that has been placed in a separate clean container that will not be analyzed for any other parameters. This procedure avoids cross contamination from field instrument probes.

Sample Documentation and Transportation

Before samples are transported to the laboratory, a chain-of-custody record shall be provided. Chain-of-custody records document in a legally defensible manner the history of collection, transfer and transport of each sample. Every individual, who is responsible for the samples from the time of collection to the time they are received by a laboratory, must be documented in the Chain-of-Custody record. The Chain-of-Custody document records allow tracing the possession and handling of individual samples from the time of field collection through the time of laboratory analyses. The sample labels shall be completed in indelible ink and sample seals (if required) should be applied to each container prior to packing and shipment. Samples shall be transported to the laboratory in sealed, insulated shipping containers, ice chests, or coolers. The samples should be shipped/delivered to the laboratory as soon as practical, preferably within 24 hours of sample collection.

POST-CLOSURE CARE PLAN
FLY ASH POND AND BOTTOM ASH POND
MEREDOSIA POWER STATION
800 SOUTH WASHINGTON STREET
MEREDOSIA, ILLINOIS

1.0 INTRODUCTION

This Post-Closure Care Plan for the AmerenEnergy Medina Valley Cogen, LLC, Meredosia Power Station Fly Ash and Bottom Ash Ponds Coal Combustion Waste Surface Impoundments (Meredosia) has been prepared in general accordance with the requirements of the site-specific rule in 35 Illinois Administrative Code (IAC) Part 840. Supporting documents are listed in Section 6.0 of this report and are being submitted concurrently with the Post-Closure Care Plan.

A written record of monitoring will be made and retained at the main office of the owner since the site is in the process of being decommissioned and demolished. This written record typically includes completed standard inspection forms and photographs. The inspector will assess the condition and need for repair of cover components, embankments, monitoring wells, and surface water control features.

2.0 SITE LAYOUT

The Meredosia Power Station is located at 800 South Washington Street, Meredosia, Illinois. The facility is currently being decommissioned and will be demolished. The Fly Ash and Bottom Ash Ponds are located southwest of the coal pile and plant facilities. The site location and topography are shown on Plate 1. The structures and ash ponds are shown on Plate 2.

3.0 POST-CLOSURE MAINTENANCE PROGRAM

The post-closure operation and maintenance program includes site inspections of surface disturbances, failures, adequacy of sand infill, storm water drainage channel maintenance, and repairs as required. This Post-Closure Plan applies the Fly Ash Pond, the Bottom Ash Berm, groundwater monitoring wells associated with the former ash ponds, and surface water drainage from the former ash ponds.

Site monitoring and repair records will be created and retained at the main office of the owner until the Illinois Environmental Protection Agency (IEPA) approves a certified Post-Closure Completion Report.

printed on recycled paper

3.1 Frequency of Inspections

Quarterly site inspections of the Fly Ash Pond, the Bottom Ash Berm, and associated features will be performed for the first five (5) years after completion of closure activities and submittal of the Construction Quality Assurance (CQA) Acceptance Report. After the five year period, site inspections will be performed at the same rate as groundwater sampling (Groundwater Monitoring Plan, Geotechnology, 2016), with a minimum frequency of once per year. Site inspections will occur until the IEPA approves a Post-Closure Completion Report.

3.2 Erosion Control Maintenance

The embankments for both ash ponds will be capped with ClosureTurf® and HydroTurf®, which do not require vegetation. Ash pond embankments below the 100-year flood elevation will also have rip-rap protection. Some areas that are currently vegetated near the ash ponds may be impacted during construction activities. These areas will be regraded and vegetated.

3.3 Drainage Channel Maintenance

Drainage channels on the cover and along the ash pond embankments will be lined with HydroTurf®, which minimizes erosion and sedimentation issues. Drainage channels outside of the ash pond will be natural or rock-lined. Metal culverts will be installed under roads as needed. However, soil or sand at the connections from the HydroTurf® to the drainage channels outside the ash ponds may erode due to the sudden change in gradient at connections with other drainage ways. Repair of energy dissipaters at the connections or localized material infill may be required. The repair material will consist of material similar to the infill and will be capped with a liner material or vegetated.

Storm water from the cap will exit the surface water control system into existing waterways onsite. These waterways will be monitored and repaired as necessary to reduce pooling and erosion. Eroded areas will be infilled with material similar to that which was eroded and capped with like material or vegetated.

3.4 Final Cover Maintenance

The ash in the Fly Ash Pond and the Bottom Ash Pond has consolidated for a minimum of four years. The ClosureTurf® and HydroTurf® systems are not sensitive to settlement, but if post-closure cover settlement occurs, localized repairs to maintain the integrity of the cover may be needed.

printed on recycled paper

3.5 Vegetative Repair and Mowing

Vegetation and mowing is not required on the capped areas due to the use of ClosureTurf® and HydroTurf® to cover the ash ponds instead of vegetative cover.

3.6 Miscellaneous Repairs

Minor repairs may be required to maintain the integrity and proper function of fencing, surface water drainage structures, monitoring points, and groundwater monitoring wells. Repairs will be made as warranted.

4.0 GROUNDWATER MONITORING SYSTEM

The groundwater monitoring well locations, system, maintenance program, and monitoring program are provided under a separate cover titled the Groundwater Monitoring Plan (Geotechnology, 2016). Groundwater trend statistical analysis and mitigation of statistically significant increasing trends are addressed in the Groundwater Monitoring Plan. Two years after the ash ponds have been closed, the groundwater monitoring network will be re-evaluated based on the changes in the groundwater impacts.

5.0 OPERATION AND MAINTENANCE PLAN FOR STRUCTURES AND DEVICES

Operation and maintenance plans for currently planned structures are addressed in the associated sections of this report and the referenced reports. Operation and maintenance plans for future structures, if needed, will be prepared at the time those structures are installed.

CONSTRUCTION QUALITY ASSURANCE PLAN
FLY ASH POND AND BOTTOM ASH POND
MEREDOSIA POWER STATION
800 SOUTH WASHINGTON STREET
MEREDOSIA, ILLINOIS

1.0 INTRODUCTION

Geotechnology, Inc. prepared this Construction Quality Assurance (CQA) plan for the Fly and Bottom Ash Ponds closure at the Meredosia Power Station in Meredosia, Morgan County, Illinois. The CQA Plan was prepared in general accordance with the Coal Combustion Waste (CCW) surface impoundment closure guidance of 35 Illinois Administrative Code (IAC) 840.146 entitled Site-Specific Closures of Coal Combustion Waste Surface Impoundments Subpart A: Closure of Ash Pond D, Hutsonville Power Station Construction Quality Assurance Program.

This CQA plan includes information related to responsible personnel, project activities, monitoring, sampling, and testing of the coal combustion residual (CCR) cap. The purpose of the CQA plan is to achieve a reasonable degree of certainty that the construction of the CCR surface impoundment cap achieves the specified design parameters.

The CQA Plan requires preparation of an acceptance report at the end of construction by the CQA Officer. The acceptance report includes CQA documentation and a certification by the CQA Officer that the CQA Plan for the facility was followed. This CQA Plan is intended to supplement the project plans and specifications. Where a conflict exists, the current approved CQA Plan will govern.

The testing methods, acceptance requirements, and testing frequencies that guide the implementation of this plan are listed in Table 1. Appendix A includes example testing and observation forms. Alternative forms approved by the Ameren Missouri (Ameren) Project Manager that include the same information are acceptable. Appendix B includes the Watershed Geosynthetics ClosureTurf® and HydroTurf® reference material.

2.0 PROJECT PERSONNEL RESPONSIBILITY AND AUTHORITY

The project organization chart (Figure 1) illustrates the project personnel involved in the Fly and Bottom Ash Ponds closure activities. Project personnel responsibility and authority are presented below.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

2.1 Owner. AmerenEnergy Medina Valley Cogen, LLC (Owner) currently holds permits for National Pollutant Discharge Elimination System (NPDES) and operation of the Fly and Bottom Ash Ponds. The Owner has an agreement with Ameren Missouri (Ameren) to complete this work. Ameren will submit the project closure plan, construction plan, specifications, CQA plan, groundwater monitoring plan, and post-closure care plan to the Illinois Environmental Protection Agency (IEPA) and Illinois Department of Natural Resources (IDNR) for approval prior to construction.

The Ameren designated representative is the Ameren Project Manager. The Ameren Project Manager coordinates overall construction and acts as the Owner's primary point of contact with the General Contractor. The Ameren Project Manager coordinates all matters involving contract issues, including approving changes to the project plans and specifications.

2.2 Design Engineer. The Design Engineer is responsible for development of plans and specifications that fulfill the requirements of the Owner and regulatory agencies. The Design Engineer is responsible for:

- responding to the Contractor requests for information (RFIs) during construction;
- addressing identified conflicts in the project plans and specifications; and
- developing modifications to the plans and specifications that may be required to address changed field conditions, field cost savings, design improvements, or other necessary or desired modifications as approved by the Owner.

2.3 Site Supervisor. The Site Supervisor is the field representative for the Owner that observes contractor activities and reports to the Owner. The Site Supervisor is responsible for:

- maintaining records of Contractor personnel on-site, equipment on-site, and material deliveries, as provided by contractors and suppliers;
- recording closure activity progress in daily reports;
- obtaining photographs of closure activities;
- attending progress and/or deficiency meetings;
- developing and maintaining a submittal log;
- coordinating schedules with the Owner, General Contractor, and CQA Personnel;
- assisting the Owner by reviewing work orders and field changes;

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

- coordinating with the Owner, General Contractor, and CQA Personnel regarding Owner-approved additional work and/or field changes; and

- observing construction activities, and reporting to the Owner if discrepancies between the activities and the project plans and/or specifications occur.

2.4 CQA Personnel.

2.4.1 CQA Officer. Ameren will retain a CQA Officer for the project who will report directly to the Ameren Project Manager. The CQA Officer will be a Professional Engineer registered in the State of Illinois, who is a person other than the Owner or an employee of the Owner. The CQA Officer will supervise and be responsible for monitoring, testing, and other activities required in the CQA plan. The CQA Officer will also supervise firms who will perform the monitoring, testing, and sampling required by the CQA plan.

The CQA Officer will be present at the beginning of primary project tasks and at various times during construction. The time that the CQA Officer must be at the project site will depend on the construction methods used by the contractors. The CQA Officer will exercise professional judgment to be present at the project site as required to assume responsibility for the monitoring and testing performed by those persons under his/her direct supervision. The CQA Officer will have enough on-site staff (CQA Representatives) to adequately perform the quality assurance activities in the CQA Plan. If the CQA Officer cannot perform a required duty, a CQA Officer-In-Absentia, qualified for that portion of the work, may be designated by the CQA Officer.

The CQA Officer, with on-site support personnel as required, will provide observation of the monitoring, testing, and/or sampling of the following construction activities for the facility:

- placement and compaction of the subgrade to specified parameters;
- placement of final cover, including installation of the geosynthetics; and
- construction of surface water control features.

The CQA Officer will verify that the sampling, monitoring, and testing for the major elements of the construction are in compliance with the established design requirements before the next sequential item for construction is initiated. The elements of work requiring compliance verification include:

- the subgrade prior to placement of the ClosureTurf® and other geosynthetic materials; and

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

- the geomembrane components of the ClosureTurf® and HydroTurf® have completed and passed testing prior to installation of the geotextile/turf component.

The CQA Officer will review the monitoring, sampling, and testing completed for the work item to assess compliance with design requirements. The CQA Officer will also visually observe the work item before completing and signing the CQA Certification form (Appendix A). The contractor or installer for the subsequent construction activity will not be allowed to initiate work for the next task until the forms are completed and signed by the CQA Officer.

The completed and signed CQA Certification forms will be filed as project records in accordance with the provisions of Section 9.0.

2.4.2 Document Controller. The Document Controller files all CQA records related to the monitoring, sampling, and testing specified in the CQA Plan. In addition, the Document Controller will control the CQA Plan distribution so that current documents are being used by the CQA staff. The duties of the Document Controller may be performed by other members of the CQA team.

Requirements for control of the CQA Plan and for filing of the project records are discussed in Section 9.0.

2.5 Testing and Monitoring Firms. The CQA Officer will provide guidance to the testing and monitoring firms during quality assurance sampling, monitoring, and/or testing discussed in the CQA Plan. Limited monitoring and independent sampling and testing are required for the geosynthetic liner installation. Product suppliers and installers of geosynthetic materials are responsible for the sampling and testing required.

2.5.1 Soil Testing (Laboratory and Field). One or more soil testing firms qualified by the IDOT or IEPA (as appropriate) will be retained to perform the field and laboratory testing outlined in CQA Plan. Materials will be sampled by the testing firm or persons designated by the CQA Officer.

Each firm will provide proof of calibration to the CQA Officer for measuring and/or testing equipment used in the field or laboratory. Proof of calibration for commercial grade equipment, such as rulers and tape measures that provide adequate accuracy for the intended purpose is not required.

Field and laboratory forms proposed for data collection will be subject to review by Ameren prior to use. Incomplete or otherwise unacceptable forms will be modified by the testing firm to meet the intent of the CQA Plan.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

2.5.2 Surveyor. One or more surveyors will survey specified elevations, slopes, and grades as required in the CQA Plan. The firm(s) selected will complete the work using or under the supervision of an Illinois Professional Land Surveyor.

Each surveyor will be required to provide proof of calibration to the CQA Officer for each surveying device that will be used. Proof of calibration for commercial grade equipment, such as rulers, tape measures or other devices that provide adequate accuracy for their intended purpose is not needed.

2.5.3 Geosynthetic Testing. A geosynthetic monitoring firm may be retained to perform quality assurance observations for geosynthetic monitoring, testing, and sampling performed by the suppliers and installers. Additional geosynthetic samples may be collected for independent testing.

The geosynthetic testing laboratory will be independent of both the manufacturer and the installer of the geosynthetics. The Ameren Project Manager and CQA Officer will review and approve the geosynthetic testing laboratory quality assurance (QA) plan prior to start of services.

Field and laboratory forms proposed for data collection will be subject to review by Ameren prior to use. Incomplete or otherwise unacceptable forms will be modified by the testing firm to meet the requirements of the CQA Plan.

2.6 Contractors, Suppliers, and Installers. The General Contractor is responsible for obtaining all necessary construction permits and the appropriate subcontractors, suppliers, and installers to complete the work in accordance with the contract. Acceptance of work by the CQA Officer does not relieve the General Contractor of obligations to furnish all work in accordance with the contract.

Contractors, subcontractors, suppliers, and installers are responsible for completing their portions of the work within specified schedules and in accordance with the requirements of the plans and specifications. The contractors, subcontractors, suppliers, and installers will accommodate the monitoring, sampling, and testing outlined in the CQA Plan. At least 7 days of notice is required to schedule CQA personnel and to review testing results.

The geosynthetic suppliers and installers will provide the quality assurance monitoring, sampling, and testing as required in the CQA Plan. The geosynthetic installers will be required to submit "certificates of acceptance" for certain items of work that precede their construction activities. The "certificates of acceptance" are discussed in Section 4.3.2.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

3.0 PROJECT MEETINGS

Periodic meetings will be held to provide coordination among the involved personnel. Descriptions of pre-construction meetings, routine progress meetings and work deficiency meetings are presented in the following paragraphs.

3.1 Pre-Construction Meetings. Pre-construction meetings will occur before site grading and geosynthetic installations. The Ameren Project Manager, CQA Officer, Site Supervisor, General Contractor, and the appropriate subcontractors will attend.

At a minimum, project plans, specifications, and CQA items that will be discussed during the pre-construction meeting will include:

- protocols for monitoring, testing, and sampling;
- items of work requiring CQA Officer certification or installer acceptance before subsequent work items can be initiated (see Section 4.0); and
- established protocol for handling construction deficiencies, corrective measures, and retesting (see Section 6.0).

The General Contractor's Project Manager shall coordinate meeting times, provide an agenda, and provide meeting minutes as required in the Project Specifications. The meeting documentation review by attendees will occur before documents are filed as project records in accordance with Section 9.0.

3.2 Progress Meetings. The Ameren Project Manager or CQA Officer will schedule progress meetings to discuss on-going and up-coming construction activities. Attendees will include the Ameren Project Manager, CQA Officer, Site Supervisor, General Contractor, and appropriate subcontractors. At a minimum, topics regarding progress and the following CQA items will be reviewed:

- protocol for monitoring, testing, and sampling;
- items of work requiring CQA Officer certification or installer acceptance before subsequent work items can be initiated (see Section 4.0);
- established protocol for handling construction deficiencies, corrective measures, and retesting (see Section 6.0); and
- upcoming scheduled activities and appropriate personnel.

The General Contractor's Project Manager shall coordinate meeting times, provide an agenda, and provide meeting minutes as required in the Project Specifications. The meeting documentation review by attendees will occur before documents are filed as project records in accordance with Section 9.0.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

3.3 Work Deficiency Meetings. The CQA Officer will require special meetings when a project issue or work deficiency is anticipated or encountered. Attendees will include the Ameren Project Manager, Site Supervisor, General Contractor, and appropriate subcontractors. The purpose of these meetings is to define and resolve the project issue or work deficiency in the following manner:

- define the project issue or work deficiency and its probable causes or influence on the project;
- discuss alternative actions to address the project issue or work deficiency;
- assign parties to implement the selected action;
- implement the selected action to resolve the project issue or work deficiency; and
- verify the implemented action has been effective through appropriate monitoring.

The General Contractor's Project Manager shall coordinate meeting times, provide an agenda, and provide meeting minutes as required in the Project Specifications. The meeting documentation review by attendees will occur before documents are filed as project records in accordance with Section 9.0.

4.0 SAMPLING AND TESTING REQUIREMENTS

4.1 Introduction. Prequalification and placement sampling and testing requirements for the various materials and construction activities are summarized in Table 1. Frequencies for the material placement testing listed in Table 1 are based on the volume of material used in construction and are recommended minimums. The CQA Officer will select the specific testing locations by exercising professional judgment. The testing and sampling locations will represent the construction activity.

The geosynthetic installers will be responsible for the required sampling for the Geosynthetic Prequalification and Placement Testing presented in Table 1. Independent laboratory testing will be coordinated through the CQA Officer.

Custody of samples and transfer from the sampling location to the testing facility will be established and documented through the use of a Chain of Custody Record. The sampling party will document sample description, date, time, material type, and testing method, then relinquish sample custody to the testing firm by signing and dating the form. The sampling party will retain a copy for their records. The samples will be shipped or delivered to the testing firm with the signed Chain of Custody Record.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

The testing firm will document sample receipt by signing and dating the Chain of Custody Record. The testing firm will return the original signed Chain of Custody Record to the Document Controller with the corresponding test results. The Document Controller will retain the signed original Chain of Custody form as a project record in accordance with Section 9.0.

The sampling and testing results will be documented on a daily basis by each testing firm or installer providing the quality assurance activities. The original copies of the sampling and testing results will be provided to the CQA Officer.

4.2 Subgrade.

4.2.1 Fly Ash Pond Subgrade. The CQA Officer will direct the sample collection and laboratory testing for the standard Proctor test in accordance with the American Standard of Testing and Materials (ASTM) Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (ASTM D698-12). The subgrade material will be coal combustion residuals, but embankment material and other fill material may be included. A separate standard Proctor test for each material type will be required. The CQA Officer will direct field moisture/density testing of the top one foot of subgrade in accordance with Table 1.

4.2.2 Bottom Ash Road Subgrade. The CQA Officer will direct the sample collection and laboratory testing for the standard Proctor test in accordance with the ASTM Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (ASTM D698-12). The subgrade material will be coal combustion residuals, but embankment material and other fill material may be included. A separate standard Proctor test for each material type will be required. The CQA Officer will direct field moisture/density testing of each 6-inch lift of subgrade in accordance with Table 1.

Since the berm will be widened to account for heavy vehicle traffic, lifts will be placed horizontally, compacted, tested, then graded. Additional material will be blended into the current berm to reduce the chance of slope failure.

4.2.3 Bottom Ash Pond Backfill. The CQA Officer will direct the sample collection and laboratory testing of backfill material for the Bottom Ash Pond. One pre-qualification sample will be required per source for testing in accordance with Table 1. One confirmation sample will be required per 20,000 cubic yards of backfill placed in the Bottom Ash Pond per source in accordance with Table 1. If non-virgin material is being used, full IEPA Tiered Approach to Corrective Action (TACO) contaminants of concern will be tested.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

The CQA Officer will direct the sample collection and laboratory testing for the standard Proctor test in accordance with the ASTM Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (ASTM D698-12). The CQA Officer will direct field moisture/density testing of each 1-foot lift of subgrade in accordance with Table 1.

4.2.4 Subgrade Survey. The prepared subgrade will be surveyed on a 100-foot grid pattern and at breaks in grade. Prepared subgrade not within the control tolerance requirement of 0.0 to +0.4 feet of design grade (or as accepted by the CQA Officer and Ameren Project Manager) will be corrected. The maximum grade for the slopes is 10-percent. The surveyor will document the measured grades on "as-built" drawings furnished to the CQA Officer.

The CQA Officer will review the survey data for conformance to the requirements, and, if in agreement with design requirements, will provide approval for the work using the CQA Certification Form.

4.2.5 Post-Placement. Prior to placing geosynthetics, the entire subgrade will be proofrolled using a smooth drum roller. CQA Representatives will provide visual observation during proofrolling. Soft or pumping areas will be removed and replaced with acceptable material. Subgrade completion observation activities may include additional testing of subgrade material, observing subgrade surfaces, and additional surveys to measure elevations, slopes, and subgrade boundaries where discrepancies with the construction drawings are suspected.

4.3 ClosureTurf® and HydroTurf®. Where not otherwise specified, Geosythetic procedures shall be in accordance with the September 2015 Watershed Geosynthetics ClosureTurf® and HydroTurf® Installation Guidance Documents (Appendix B). Installers will be certified by Watershed Geosynthetics on both ClosureTurf® and HydroTurf® installation and CQA procedures. ClosureTurf® and HydroTurf® are composed of three main components:

1. The geomembrane liner component is 50-mil structured high-density polyethylene (HDPE) Agru Super Grip Net with the spikes placed on subgrade;

2. The synthetic turf component is made of woven polypropylene geotextiles tufted with polyethylene yarn; and

3. Infill is Sand (ClosureTurf®) or HydroBinder (HydroTurf®).

printed on recycled paper

4.3.1 Manufacturer Guaranteed Properties for Geosynthetics. The manufacturer will submit documentation that the materials have been tested for the parameters listed in the manufacturers list of guaranteed properties. The test results, including identification of all individual geomembrane rolls tested will be submitted to the CQA Officer for review. The manufacturer will certify that all geomembrane rolls meet the manufacturer's guaranteed properties.

4.3.2 Prequalification Testing for Geosynthetics. The geosynthetic manufacturer will supply an inventory list of geomembrane rolls to the Owner's geosynthetics QA monitoring firm and/or CQA Officer, who will select geomembrane rolls to be prequalified for the type and frequency of prequalification testing in Table 1.

The geomembrane manufacturer will procure and submit samples from the designated prequalification geomembrane rolls to the independent geosynthetic laboratory for verification of selected manufacturer's guaranteed properties. Submitted samples will be 2 feet long by the entire width of the geomembrane roll. The machine direction, manufacturer's roll identification number, and date the sample was obtained will be marked on the sample by the geosynthetic laboratory prior to shipment.

Geomembrane prequalification testing shall be completed prior to delivery. If prequalification testing is not completed prior to delivery, the Contractor takes responsibility for any failed prequalification testing and the additional costs associated with having it delivered prior to acceptance.

4.3.3 Installer Certification of Placement Surface. The prepared subgrade surface shall be cleared of stones, sand, and similar materials that could damage the geosynthetics, cause clogging of drains or filters, or hamper seaming of geosynthetics. The geosynthetic installer accepts responsibility for inspecting the subgrade (on a daily basis) to verify unsuitable materials are not present within the prepared subgrade area to be covered each day. The geosynthetic installer will complete and sign the Installer Certificate of Acceptance form, which documents acceptance of the prepared subgrade for geosynthetic placement. The geosynthetic installer will provide the original signed document to the CQA Officer for signature of receipt.

Completed and signed forms will be filed as project records in accordance with the provisions in Section 9.0.

4.3.4 Placement Testing For Seam Overlap. The contractor and geosynthetic installer will arrange geomembrane sections to minimize field seams. A preliminary drawing illustrating the panel layout will be provided to the Ameren Project Manager and CQA Officer prior to placement for approval.

Electronic Filing: Received, Clerk's Office 09/28/2020

Seam overlaps will be field-measured by the geosynthetic installer to verify the requirements in Table 1 are met for the seams. Seam overlap will be "shingled" in the downslope direction. The CQA Officer will provide appropriate personnel to obtain independent measurements of a representative number of seam overlaps.

The geosynthetic installer will provide the CQA Officer with "as-built" drawings of the geomembrane installation showing the panels, seam locations, and destruct locations, at a minimum.

4.3.5 Trial Weld Seams. Trial weld sample seams will be required before membrane seams can be welded. Trial weld sample seams must be 3 feet long and 12 inches wide, with the seam centered lengthwise. Both wedge and extrusion welder are required to produce a trial weld sample seam at daily startup, immediately after any break, anytime the machine is turned off for more than 30 minutes, and anytime the machine is operating for more than five hours. If at any time the CQA Officer or approved representative believes that an operator or welding apparatus is not functioning properly, an additional trial seam must be produced and tested.

Trial weld sample seams will be tested in the field for peel and shear using a field tensiometer. Four 1-inch coupons will be required for testing: two to be tested for peel and two to be tested for shear. The requirements for field testing are located in Table 1 and Geosynthetics Research Institute (GRI) Test Method GM-19 Table 1(a) (Appendix B)

4.3.6 Placement Non-Destructive Testing. The geosynthetic installer will conduct non-destructive testing as seaming progresses (Table 1). Seams will be non-destructively tested over the full length using an air pressure test, vacuum test unit, spark test, or other method approved by the CQA Officer.

The CQA Officer will provide appropriate personnel to monitor non-destructive testing performed by the installer.

The geosynthetic installer will submit all non-destructive field testing results to the CQA Officer for filing as project records in accordance with Section 9.0.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

Air Pressure Testing (For Double Fusion Seams Only)

Equipment

The air pressure test equipment includes:

- an air pump (manual or motor driven) equipped with pressure gauge, accurate to 1 pounds per square inch (psi), capable of generating and sustaining a pressure between 25 psi and 30 psi and mounted on a cushion to protect the geomembrane;
- a rubber hose with fittings and connections; and
- a sharp hollow needle, or other approved pressure feed device.

Procedure

The air pressure test procedure is as follows:

1. Seal both ends of the seam.
2. Insert a needle or other approved pressure feed device into the air channel created by the fusion weld.
3. Insert a protective cushion between the air pump and the geomembrane.
4. Pressurize the seam to between 25 psi and 30 psi. Close the valve and sustain the pressure for at least five minutes.
5. A pressure loss of 2 psi or less is a passing test.
6. A pressure loss of more than 2 psi is a failing test. Locate the faulty area, then repair and retest.
7. At the conclusion of the passing air pressure test, slit the opposite end of the seam and monitor the drop in pressure. This indicates that the entire seam was tested.
8. Remove needle or other approved pressure feed device and seal.

Vacuum Testing (Extruded Welds)

Equipment

The vacuum test equipment includes:

- a vacuum box assembly consisting of a rigid housing, a transparent viewing window, a soft neoprene gasket on the bottom, a valve assembly, and a vacuum gauge;

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

- a vacuum tank and pump assembly equipped with a pressure controller and pipe connections or equipment capable of performing the same function;
- a rubber pressure or vacuum hose with fittings and connections;
- a bucket; and
- a soapy solution.

Procedure

The vacuum test procedure is as follows:

1. Energize the vacuum pump to approximately 5 psi.
2. Wet the extrusion weld area with the soapy solution.
3. Place the vacuum box over the wetted area.
4. Close the bleed valve and open the vacuum valve.
5. Check that a leak-tight seal is created.
6. Examine the geomembrane through the viewing window for the presence of soap bubbles for at least 10 seconds.
7. If no bubbles appear after 10 seconds, close the vacuum valve and open the bleed valve. Move the box over the next adjoining area and repeat the procedures in steps 1 through 6.
8. Mark, repair, and retest areas where soap bubbles appear.

Spark Testing (Extrusion Welds at Penetrations)

Equipment

The spark test equipment includes:

- an electrically conductive tape or wire placed beneath the seam prior to welding;
- a hand-held holiday spark tester; and
- a conductive wand that generates a high voltage.

Procedure

The spark test procedure is as follows:

1. Place the electrically conductive tape or wire beneath the seam prior to welding.

printed on recycled paper

2. A trial seam containing a non-welded segment shall be subject to a calibration test to ensure that such a defect will be identified under the planned machine settings and procedures (i.e., exposed wire will cause a spark to occur).
3. Upon completion of the weld, enable the spark tester and hold approximately 1 inch above the weld, moving slowly over the entire length of the weld in accordance with ASTM 6365.
4. If there is no spark, the weld is a passing test. A spark indicates a hole in the seam.
5. Mark, repair, and retest areas where sparks occur.
6. Care should be taken if flammable gases may be present in the area of testing.

4.3.7 Placement Destructive Testing. Destructive testing is used to evaluate seam strength. Destructive samples will be collected and field tested by the geosynthetic installer at randomly selected geomembrane locations as seaming work progresses at the direction of the CQA Representative. The remaining destructive sample will be sent to the independent geosynthetic testing laboratory for analysis.

The geosynthetic installer will submit results of destructive testing to the CQA Officer for filing as project records in accordance with Section 9.0.

Destructive samples will be collected within 24 hours of being chosen by the CQA Representative unless extenuating circumstances, previously approved by the Ameren Project Manager and CQA Officer, occur.

Location and Frequency

The CQA Representative shall select destructive testing locations based on:

1. Selected destructive testing will be at minimum frequency of one test location per 500 feet of seam length. This minimum frequency is the average taken throughout the entire area of placement and does not include retests.
2. A destructive test will be completed for each welding machine used per day.
3. A destructive test will be completed for individual repairs that are more than 150 feet long.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

4. Additional test locations will be chosen during seaming at the CQA Representative's discretion. Selection of such locations may be prompted by suspicion of excess crystallinity, contamination, offset welds, or any other potential cause of imperfect welding.
5. All samples obtained for destructive testing will include a 12-inch by 12-inch sample provided to the Owner for archive storage.

Destructive Sampling Procedure

The destructive sampling procedure is as follows:

1. Assign a number and label each sample (12 inches by 48 inches with the seam centered lengthwise).
2. Collect the sample within 24 hours of being marked.
3. Record the sample location(s) on layout ("as-built") drawing.
4. Record the reason for taking the sample(s) at this location.
5. Repair the sample location(s) the same day.
6. Vacuum test each repair.

Field Testing

The geosynthetic installer shall use a tensiometer to field-test a minimum of four 1-inch wide strips from the samples: two for peel and two for shear. The geosynthetic installer shall log the date, time, ambient temperature, number of seaming unit, name of seamer, welding apparatus temperature, and pass or fail description. The requirements and frequency for field testing is located in Table 1 and GRI Test Method GM-19 Table 2(a) (Appendix B).

Quality Assurance Laboratory Testing.

Field testing prequalifies destructive samples for independent laboratory testing. The quality assurance laboratory shall be selected by the CQA Officer with approval from the Ameren Project Manager.

Laboratory testing will include five tests each of shear strength and peel adhesion. Laboratory testing methods will be in accordance with ASTM D 4437 "Standard Practice for Non-destructive Testing (NDT) for Determining the Integrity of Seams Used in Joining Flexible Polymeric Sheet Geomembranes". Acceptance will be based upon the criteria in GRI Test Method GM-19 Table 1(a) (Appendix B).

printed on recycled paper

Procedures For Destructive Test Failure.

Failed destructive tests, in the field or quality assurance laboratory, will be remedied by either of the following options:

1. The geosynthetic installer may reconstruct the seam between two passed test locations; or
2. The geosynthetic installer may trace the welding path to an intermediate location at least 10 feet beyond the point of the failed test in each direction, and take a sample for an additional field test at each location. If these additional samples pass, then the seam shall be reconstructed between these locations. If either sample fails, then the process shall be repeated to establish the zone in which the seam should be reconstructed.

Acceptable reconstructed seams must be bounded by two locations with passing laboratory destructive tests. In cases where the reconstructed seam exceeds 150 feet, an additional destructive sample of the repaired area shall be obtained. The geosynthetic installer shall document all actions taken regarding destructive test failures.

4.3.8 Manufacturer Guaranteed Properties for the Turf Component. The manufacturer will submit documentation that the materials have been tested for the parameters listed in the manufacturer's list of guaranteed properties. The test results including identification of all individual geomembrane rolls tested will be submitted to the CQA Officer for review. The manufacturer will certify that all geomembrane rolls meet the manufacturer's guaranteed properties.

4.3.9 Prequalification Testing for the Turf Component. The geomembrane manufacturer will supply an inventory list of turf rolls to the Owner's geosynthetics QA monitoring firm and/or CQA Officer, who will select geomembrane rolls to be prequalified for the type and frequency of prequalification testing in Table 1.

The geosynthetic manufacturer will procure and submit samples from the designated prequalification turf rolls to the independent geosynthetic laboratory for verification of selected manufacturer's guaranteed properties. Submitted samples will be 2 feet long by the entire width of the turf roll.

Turf prequalification testing shall be completed prior to delivery.

4.3.10 Field Monitoring of the Turf Component. The CQA Officer or designated representative will observe the turf as it is placed and sewn. Vehicles and equipment are not permitted on slopes exceeding 15 percent until the infill (sand for ClosureTurf® and pozzolanic mixture for HydroTurf®) is in place. In flatter slopes, all-terrain vehicles

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

(ATVs) and similar vehicles will be allowed prior to infill placement if the tire pressure is less than 5 psi. After infill placement, tire pressures should be limited on slopes to 35 psi or less.

Wrinkles will be smoothed out or removed to the extent possible prior to field seaming. Wrinkles that can fold over must be repaired either by cutting out excess material, or by allowing the liner to contract by temperature reduction. The CQA Officer or designated representative will observe geomembrane for wrinkles and notify the Contractor if wrinkles are being formed that may fold over or are above the vertical 4-inch maximum tolerance level on slopes, or above the 2-inch maximum tolerance level in ditches. The CQA Representative is then responsible for documenting corrective action to remove the wrinkles.

4.3.11 Sand Prequalification Testing for ClosureTurf®. One sand prequalification sample and testing results will be provided by the contractor to the CQA Officer at least one week prior to sand delivery on site. Laboratory testing will occur in accordance with the testing listed in Table 1.

4.3.12 Sand Conformance Testing for ClosureTurf®. Sand conformance samples will be obtained by the CQA Officer or designated representative. Laboratory testing will occur in accordance with the type and frequency of testing listed in Table 1.

During placement, the geosynthetics will be observed to verify that they are not damaged. The average thickness of the sand layer will be measured and recorded at the frequency listed in Table 1. Sand thickness will be measured with a digital caliper. A standard washer will be used as a plate for the point of entry into the sand infill for consistent depth control.

4.3.13 Hydrobinder Prequalification Testing for HydroTurf®. The cement-sand mixture will be a brand of Portland Cement conforming to ASTM C 150 (AASHTO M 85) and shall be Type I or Type II. The contractor will provide information to the CQA Officer on which mix will be used at least one week prior to delivery on site.

4.3.14 Hydrobinder Conformance Testing for HydroTurf®. The CQA Officer or Representative will observe that the hydrobinder infill is placed in a method that does not damage the underlying geosynthetics in dry conditions. After the mixture is worked into the turf, the average thickness of the layer will be measured and recorded at the frequency listed in Table 1. The mixture will be observed by a CQA Representative during hydration, which must occur the same day as infill placement.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

4.4 Anchor Trench. The anchor trench shall be excavated in accordance with the project plans and specifications prior to geosynthetic placement in that area. The corners of the anchor trench shall be slightly rounded where the geosynthetic enters the trench to minimize sharp bends in the geosynthetic. Fill placed on the geosynthetic shall adhere to the same standards as the subgrade, and must be free of debris, rocks, sand, or other material which could damage the geosynthetic.

4.5 Surface Water Management System. The surveyor shall document the elevations and grades of the constructed berms and channels on an "as-built" drawing. The surveyor will provide this data to the CQA Officer. The CQA Officer shall check the information against the requirements and frequency provided in Table 1.

5.0 CORRECTIVE MEASURES

The CQA Officer will reject and require replacement of material that fails prequalification or material placement requirements (Table 1). The lateral and/or vertical extent of corrective measures will be based on the frequency of testing and CQA Officer's professional judgment.

6.0 DOCUMENTATION

6.1 Daily Reports. The CQA Officer, or designated representative, shall prepare and sign a daily report for each day that materials or placement of materials are being observed, sampled, or tested.

6.2 Weekly Summary Reports. The CQA Officer or designated representative shall prepare and sign a weekly summary report for each week that materials or placement of materials are being observed, sampled, or tested. The daily reports, test data, photographic records, and test results will be included in the weekly summary report. The weekly report will be filed by the Document Controller in accordance with Section 9.0.

6.3 Photographs. Photographs will be included in the weekly summary report to provide a visual record of work progress, testing activity, and construction work. The photographs shall include:

- general location, date and time of the photograph;
- description of the item photographed;
- direction of view (north, south, east, or west); and
- name of photographer.

printed on recycled paper

7.0 ACCEPTANCE REPORT

The CQA Officer shall prepare and submit an acceptance report to the IEPA. The acceptance report shall contain:

- material testing results;
- geosynthetic quality assurance and an "as-built" drawing including panel placement, seams, destructive sample locations, and repairs;
- "as-built" drawings as specified herein;
- weekly summary reports;
- certification by the CQA Officer that the CQA Plan has been followed during construction; and
- signature of the CQA Officer.

8.0 CONSTRUCTION MANAGEMENT ACTIVITIES

8.1 Request For Information (RFI). The General Contractor or subcontractor may, after exercising due diligence to locate required information, request from the CQA Officer or Design Engineer clarification or interpretation of the contract documents. The General Contractor or subcontractor will initiate the RFI in a timely manner using the Request for Information form (Appendix A) in accordance with project specifications. RFIs will be filed as project records in accordance with Section 9.0.

8.2 Review of Contractor Submittals. The General Contractor will submit shop drawings, product data, and samples (Table 2) to the CQA Officer or Ameren Project Manager in accordance with the project specifications and the CQA Plan in a timely manner to reduce work delays. Copies of submittals and the log will be filed as project records in accordance with Section 9.0.

8.3 Field Change Order. The contractor shall prepare requests for Field Change Order (FCO) in accordance with the project specifications and submit the FCO requests to the Ameren Project Manager. Copies of the FCO and logs of authorized FCOs will be retained as project records in accordance with Section 9.0.

9.0 DOCUMENT CONTROL AND PROJECT RECORDS

9.1 CQA Plan. The CQA Officer shall control the preparation, issue, and revision of CQA Plan. The CQA Plan, including all changes, will be reviewed for adequacy and approved for release by the Ameren Project Manager. The Document Controller will issue current copies of the CQA Plan and maintain records associated with its preparation.

printed on recycled paper

Electronic Filing: Received, Clerk's Office 09/28/2020

9.2 Project Records. The Document Controller shall maintain and protect documents during construction activities against damage, deterioration, and loss. Records will be readily identifiable and retrievable. Original CQA documents from the field and laboratories will be furnished to the Document Controller for filing and maintenance.

Project records will be made available to the Ameren Project Manager as requested during construction and, when requested, will be turned over to Ameren at completion of the construction contract. Ameren will retain the weekly summary reports provided by the CQA Officer until the completion of the post-closure care period and must make those reports available at reasonable times for viewing and photocopying by the IEPA.

Records include, but are not limited to, the following:

- CQA Plan;
- CQA Plan documentation;
- meeting minutes;
- weekly summary reports;
- daily reports;
- manufacturer's QA results and certifications;
- certificates of acceptance by geosynthetic installers;
- CQA certifications;
- certificates of calibration for monitoring, measuring and test equipment;
- "as-built" drawings;
- laboratory test results and chain of custody records;
- laboratory certifications of manufacturer's guaranteed properties for geosynthetics;
- Field Change Order requests;
- Log of Authorized Field Change Orders;
- shop drawing submittals;
- log of shop drawing submittals;
- RFI from contractor/installer;
- RFI responses; and
- acceptance reports.

TABLE 1
SUMMARY OF TESTING FREQUENCY
MEREDOSIA POWER STATION - FLY ASH AND BOTTOM ASH PONDS

Test	Test Frequency[1]	Specification Criteria	Responsible Party
FLY ASH POND SUBGRADE			
Standard Proctor	1 per 10,000 cubic yard (minimum 1 per material type)	ASTM D 1557	CQA Officer
Field Moisture/Density	5 per acre per 6-inch compacted lift, top 1 foot of subgrade (on approximately 100-foot grid)	>90% maximum dry density from appropriate standard Proctor	
Survey[2]	CQA survey locations provided in project specifications. In general, survey points include 100-foot spacing along grade breaks and 200-foot grid between slope breaks.	>2% and ≤10% grade, positive drainage, no sharp changes in slope	
BOTTOM ASH BERM/ROAD SUBGRADE			
Standard Proctor	1 per 10,000 cubic yard (minimum 1 per material type)	ASTM D 1557	CQA Officer
Field Moisture/Density	5 per acre per 6-inch compacted lift (on approximately 100-foot grid)	>90% maximum dry density from appropriate standard Proctor	
vey[2]	CQA survey locations provided in project specifications. In general, survey points include 100-foot spacing along grade breaks and 200-foot grid between slope breaks.	>2% and ≤10% grade, positive drainage, no sharp changes in slope	
SURFACE WATER MANAGEMENT SYSTEM			
Survey[2]	CQA survey locations provided in project specifications. In general, survey points include inlets, outlets, grade breaks, and every 100 or 200 linear feet along channel (based on channel grade)	Field established for positive drainage	CQA Officer

Notes:

[1] Based on project plans, specifications, and CQA Plan.

[2] CQA survey locations are not intended to be sufficient for as-built surveys or construction staking. Electronic files of the design surface are available for use from Ameren Missouri.

[3] This is in addition to the manufacturer's internal QC testing to be provided to the CQA officer before delivery of the product.

[4] Sample 2 feet long by the full roll width.

[5] For Class 1 High Survivability.

TABLE 1 - CONTINUED
SUMMARY OF TESTING FREQUENCY
MEREDOSIA POWER STATION - FLY ASH AND BOTTOM ASH PONDS

Test	Test Frequency[1]	Specification Criteria	Responsible Party
BOTTOM ASH POND BACKFILL - PREQUALIFICATION			
Grain Size Analysis - ASTM C-33-03	1 per source	Sand or Gravel	Contractor
RCRA Metals and CCW Ions as TCLP: SW 846 1311 - Arsenic, Barium, Cadmium, Chromium, Lead, Silver, Selenium SW 846 7478 - Mercury SW 846 6010B - Boron SW 846 M4500-CLE - Chloride SW 846 9036 - Sulfate	1 per source (virgin material)	Below the Class I Groundwater Standards at Title 35 Illinois Administrative Code (IAC) 620.410(a).	
BTEX Constituents as TCLP: SW846 6260B - Benzene, Ethylbenzene, Toluene, Xylene	1 per source (virgin material)	Below the Class I Groundwater Standards at 35 IAC 620.410(b).	
pH - SW846 9045C	1 per source (virgin material)	Below the Class I Groundwater Standards at 35 IAC 620.410(e).	
IEPA TACO COCs	1 per source (non-virgin material)	Below the Class I Groundwater Standards at 35 IAC 620.410(e).	
BOTTOM ASH POND BACKFILL - MATERIAL PLACEMENT TESTING			
ndard Proctor	1 per 10,000 cubic yards (minimum 1 per material type)	ASTM D 1557	CQA Officer
Field Moisture/Density	5 per acre per 1-foot compacted lift (on approximately 100-foot grid)	>85% maximum dry density from appropriate standard Proctor	
Grain Size Analysis - ASTM C-33-03	1 per 20,000 cubic yards	Sand or Gravel	
RCRA Metals and CCW Ions as TCLP: SW 846 1311 - Arsenic, Barium, Cadmium, Chromium, Lead, Silver, Selenium SW 846 7478 - Mercury SW 846 6010B - Boron SW 846 M4500-CLE - Chloride SW 846 9036 - Sulfate	1 per 20,000 cubic yards	Below the Class I Groundwater Standards at Title 35 Illinois Administrative Code (IAC) 620.410(a).	
BTEX Constituents as TCLP: SW846 6260B - Benzene, Ethylbenzene, Toluene, Xylene	1 per 20,000 cubic yards	Below the Class I Groundwater Standards at 35 IAC 620.410(b).	
pH - SW846 9045C	1 per 20,000 cubic yards	Below the Class I Groundwater Standards at 35 IAC 620.410(e).	
Applied Sand Thickness	Approximately 100 foot grid intervals	Between 0.50 inches and 0.75 inches.	

Notes:

[1] Based on project plans, specifications, and CQA Plan.

QA survey locations are not intended to be sufficient for as-built surveys or construction staking. Electronic files of the design face are available for use from Ameren Missouri.

[3] This is in addition to the manufacturer's internal QC testing to be provided to the CQA officer before delivery of the product.

[4] Sample 2 feet long by the full roll width.

[5] For Class 1 High Survivability.

TABLE 1 - CONTINUED
SUMMARY OF TESTING FREQUENCY
MEREDOSIA POWER STATION - FLY ASH AND BOTTOM ASH PONDS

Test	Test Frequency[1]	Specification Criteria	Responsible Party
50-MIL HDPE SUPERGRIPNET - PREQUALIFICATION[3]			
Density - ASTM D792	1 per 100,000 square feet per resin lot, with a minimum of 1 per resin lot.[4]	GRI Test Method GM13 (Appendix B)	The contractor and/or manufactuter shall provide samples to the independent laboratory chosen by the CQA officer for testing (testing cost to owner).
Carbon Black Content - ASTM D4218	1 per 100,000 square feet per resin lot, with a minimum of 1 per resin lot.[4]	GRI Test Method GM13 (Appendix B)	
Carbon Black Dispersion - ASTM D5596	1 per 100,000 square feet per resin lot, with a minimum of 1 per resin lot.[4]	GRI Test Method GM13 (Appendix B)	
Thickness - ASTM D5994	1 per 100,000 square feet per resin lot, with a minimum of 1 per resin lot.[4]	GRI Test Method GM13 (Appendix B)	
Tensile Strength and Elongation - ASTM D6693/Type IV Specimen	1 per 100,000 square feet per resin lot, with a minimum of 1 per resin lot.[4]	GRI Test Method GM13 (Appendix B)	
50-MIL HDPE SUPERGRIPNET - MATERIAL PLACEMENT TESTING			
Seam Overlap	All Seams	3-inch (Minimum)	Testing and sampling performed by installer. Destructive samples provided to CQA Officer for third party testing.
Wrinkle Height	All Panels	May Not Fold 4-inch (Maximum) on Slopes 2-inch (Maximum) on Ditches	
Non-Destructive Testing	All Seams	As per Section 4.4.4 of CQA Plan	
Destructive Testing	Minimum One Every 500 Feet (not including retesting)	As per Section 4.4.5 of CQA Plan	

Notes:

[1] Based on project plans, specifications, and CQA Plan.

[2] CQA survey locations are not intended to be sufficient for as-built surveys or construction staking. Electronic files of the design surface are available for use from Ameren Missouri.

[3] This is in addition to the manufacturer's internal QC testing to be provided to the CQA officer before delivery of the product.

[4] Sample 2 feet long by the full roll width.

1.0 Introduction

ClosureTurf® is a patented, 3 Component System* that serves as the final cover system on landfills. The 3 components of this unique system are:

Component 1 - An Agru Super Gripnet® LLDPE (or HDPE) geomembrane liner, or other liner approved for use by WatershedGeo.

Component 2 - An Engineered Turf

Component 3 - A sand infill (and/or alternatively, Hydrobinder®, or AmorFill™ -E infill)

*A Watershed Geosynthetics® patented (patent no. 8,585,322) gas collection system is a separate component to be utilized on sites that produce gas emissions. Malfunction Relief Valves are provided at one per acre of ClosureTurf® on landfills where gas emissions are expected.

1.1 Purpose and Scope

The ClosureTurf® Installation Guidelines document has been prepared to provide the Engineer / Contractor / Installer general guidance to the proper installation of the ClosureTurf® System. This document should be used in conjunction with the ClosureTurf® CSI (Construction Standards Institute) Specifications for the proper installation of the product.

2.0 Disclaimer

This manual is meant as a guideline only. Watershed Geosynthetics LLC cannot anticipate the many ways this product may be applied either in design or installation. Varying site conditions will require close coordination between the engineer and the installer to account for site conditions and adjust accordingly. When required by state and/or local regulations, a licensed professional engineer or architect will be required.

ClosureTurf® (US Patent No. 7,682,105, 8,585,322, 9,163,375 and 9,199, 287; Canadian Patent No. 2,663,170; and other Patents Pending) and trademark are the property of Watershed Geosynthetics LLC. All information, recommendations and suggestions appearing in this literature concerning the use of our products are based upon tests and data believed to be reliable; however, this information should not be used or relied upon for any specific application without independent professional examination and verification of its accuracy, suitability and applicability. Since the actual use by others is beyond our control, no guarantee or warranty of any kind,

expressed or implied, is made by Watershed Geosynthetics LLC as to the effects of such use or the results to be obtained, nor does Watershed Geosynthetics LLC assume any liability in connection herewith. Any statement made herein may not be absolutely complete since additional information may be necessary or desirable when particular or exceptional conditions or circumstances exist or because of applicable laws or government regulations. Nothing herein is to be construed as permission or as a recommendation to infringe any patent.

3.0 Definitions

Whenever the terms listed below are used, the intent and meaning will be interpreted as indicated.

Acclimation

Physiological/thermal adjustment. Required in the geomembrane deployment process.

ArmorFill™

Armor-Fill™ Liquid Emulsion is a proprietary Polymer Emulsion product used to bind the ASTM-C33 sand infill component of the ClosureTurf® System.

ASTM

ASTM International, known until 2001 as the American Society for Testing and Materials, is an international standards organization that develops and publishes voluntary consensus technical standards for a wide range of materials, products, systems, and services.

ClosureTurf®

A patented 4 component system consisting of a Watershed Geosynthetics specific Gas Management System (if applicable), a Structured Geomembrane (LLDPE or HDPE), an Engineered Turf, and a specific grade of sand infill (or alternatively a HydroBinder® infill material).

Construction Quality Assurance (CQA)

Construction Quality Assurance includes but is not limited to observations and documentation of materials and workmanship necessary to show that a particular project is being constructed according to site-specific specifications and within regulatory guidelines.

Construction Quality Assurance (CQA) Personnel

Construction Quality Assurance (CQA) personnel are representatives of the Professional of Record (POR) who work under direct supervision of the POR. The CQA personnel are responsible for quality assurance monitoring, applicable conformance sampling and performing onsite tests and observations.

Construction Quality Assurance Professional of Record (POR)

The POR is an authorized representative of the Owner and has overall responsibility for CQA efforts and to confirm the project was constructed in general accordance with site-specific specifications approved by the regulatory authority and contract documents. The POR must be

licensed as a Professional Engineer in the State the project is located and experienced in geosynthetics.

Construction Quality Control (CQC) Personnel

CQC Personnel are representatives of the Geosynthetics Installer who work under direct supervision of the Geosynthetics Installer. The Geosynthetics Installers' CQC Personnel are responsible for construction quality control, applicable conformance sampling and performing onsite tests and observations.

Contract Documents

Written, printed, or electronic matter that provides information or evidence that serves as an official record and are issued by the owner or operator. The documents include bidding requirements that include but are not limited to, contract forms, contract conditions, contract specifications, CQA plan, contract drawings, addenda, and contract modifications.

Contract Specifications

The requirements which are to be followed in the construction of the ClosureTurf® System. The standard specifications, supplemental specifications, special provisions, and all written or printed agreements and instructions that pertain to the method and manner of performing the work.

Contractor

One that agrees to furnish materials or perform services at a specified price, especially for construction work.

Design Engineer

An individual licensed to practice as a Professional Engineer or a Professional Service Firm that is responsible for the preparation of the project construction drawings and specifications.

Earthwork

A general engineering term relating to the relocation and utilization of soil during the process of construction.

Engineered Turf

A component of the ClosureTurf® System. A synthetic structured material consisting of one or more geotextiles tufted with polyethylene yarns that resemble grass blades.

Final Cover System Evaluation Report (FCSER)

Upon substantial completion of closure activities, the POR is responsible for the documentation of construction activities relating to the project, and any other inspections or verifications required by the regulatory authority. The FCSER will be signed and stamped by the POR and include documentation necessary for certification closure.

Fish Mouth

A semi-conical opening of the seam that is formed by an edge wrinkle in one sheet of the geomembrane component.

Geomembrane

A synthetic lining material that is a component of the ClosureTurf® System. Used as the primary barrier to infiltration and exfiltration of covered materials.

GSI

Geosynthetic Institute

475 Kedron Avenue

Folsom, PA 19033-1208 USA

TEL (610) 522-8440

FAX (610) 522-8441

HydroTurf®

A patented 3 component system consisting of a Structured Geomembrane Liner, a specialized Engineered Turf, and HydroBinder® infill material.

HydroBinder®

A proprietary pozzolanic infill utilized where higher surface water velocities may occur as well as in anchor trenches where specified.

Geosynthetics Contractor / Installer

The entity responsible for geosynthetic installation.

Independent Testing Laboratory

An organization, person, or company that tests products and materials, etc. according to agreed requirements. The entity shall be independent of ownership or control by the Owner or any party to the construction of the final cover or the manufacturer of the final cover products used. The entity shall also have proper legal authority where required to issue opinions and document the results of tests requested by the Owner.

Installation Supervisor

The person on-site who works for the Geosynthetics Installer and is in charge of the Geosynthetics Personnel and following the site specifications for the installation of the geosynthetics.

Manufacturing Quality Control (MQC)

A planned system of inspection and verification to ensure the quality of the final product.

Nonconformance

A deficiency in characteristics, documentation, or procedures that render the quality of an item or activity unacceptable or indeterminate. Examples of non-conformances include, but are not limited to, physical defects, test failures, and inadequate documentation.

Operator

The entity in control and responsible for the facility.

Owner

The entity that owns facility and land.

Owner's or Operators Representative

An official representative of the Owner or Operator responsible for planning, organizing, and controlling construction activities.

Panel

A general reference to a unit area of either the Structured Geomembrane (LLDPE or HDPE), or the Engineered Turf component of the ClosureTurf® System.

Quality Assurance

A planned and systematic pattern of procedures and documentation to ensure that items of work or services meet the requirements of the contract documents.

Quality Control

These actions provide a means to measure and regulate the characteristics of an item or service to comply with the requirements of the contract documents.

Relief Valve

A mechanical device used specifically to relieve gas buildup pressure underneath the ClosureTurf® system.

Representative Sample

(With respect to geomembrane destructive testing) - A random specimen of either the Structured Geomembrane (LLDPE or HDPE) or the Engineered Turf component consisting of 1 or more cut pieces (commonly referred to as coupons) from the same rectangular portion of material, oriented along a seam that is removed for field or laboratory testing purposes.

Ripple

Smaller in nature than a wrinkle. A result of thermal/or manufacturing that cannot be folded over.

Snapping

A manual method to an open ended seam to remove tenting as a result of the welding of the geomembrane seams.

Spike

A systematic design for interface friction located on the bottom of the Super Gripnet®.

Specimen

(With respect to geomembrane destructive testing) - A specimen is the individual test strip (sometimes called coupon) from a sample location. A sample location can consist of many specimens.

Studs

A systematic design for drainage located on the top side of the Super Gripnet®.

Surficial Collection Foot

A manufactured device utilized specifically for collection of gas beneath the Super Gripnet®.

Surficial Strip

A strip of Super Gripnet® used for gas conveyance below the ClosureTurf® system.

Tenting

A vertical ridge that is caused by wedge welding geomembrane.

Wrinkle

A portion of the geomembrane that does not lay relatively flat and is not a result of subgrade irregularity and which can be folded over.

4.0 Subgrade Preparation

Prior to ClosureTurf® system installation, the subgrade (e.g., protective cover soil) will be inspected. Observe the following:

- The protective cover soil is substantially free of surface irregularities and protrusions.
- The protective cover soil surface does not contain stones or other objects that could damage any of the ClosureTurf® components.
- The surface will be substantially smooth and free of foreign and organic material, sharp objects, particles or other deleterious material.

- Maximum particle size (e.g. rocks) will be specified by the by the design and contract specifications.
- The anchor trench dimensions have been checked, and the trenches are free of sharp objects and other deleterious material.
- Construction stakes and hubs have been removed and the resultant holes have been backfilled.
- The geosynthetics contractor, POR or his representative, and the permittee or his representatives have certified in writing that the surface on which the ClosureTurf® System will be installed is acceptable.
- Final grades on the slopes as well as benches dimensions and grades conform to the design grades.
- Survey shots and as-built drawings will be carefully reviewed and evaluated to insure the surface grades will drain as intended in the design drawings.

5.0 Installation - Surficial Gas Management System

5.1 Minimum Requirements

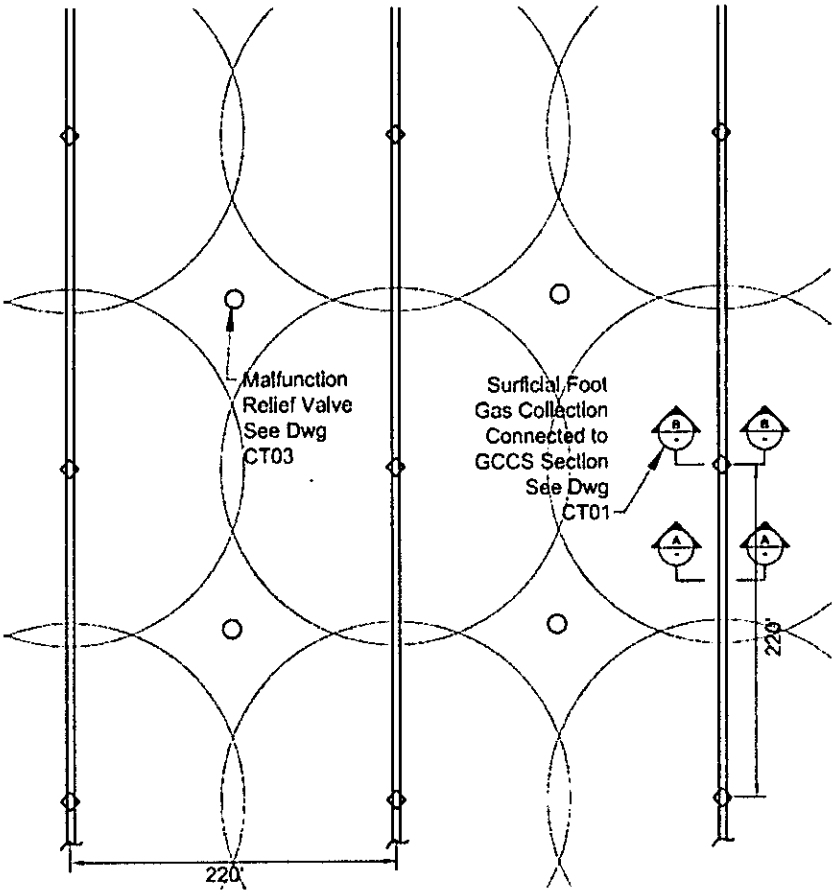
The gas management plan will include at a minimum, the use of provided ClosureTurf® Malfunction Relief Valves, (See Figure 3) to meet the specific needs of the intended site. The minimum required gas emission venting device will be installed at a rate of at least one vent per acre of installed ClosureTurf® (See Figure 1). Watershed Geosynthetics LLC supplies the minimum number of Malfunction Relief Valves with delivery of the ClosureTurf® product.

5.2 Surficial Collection Design (Where Applicable)

While it should be noted that not all projects will incorporate a surficial collection design, the ClosureTurf® system serves as an effective tool for control of fugitive emissions and can be incorporated into a conventional gas collection system or in some cases as a standalone gas collection and control system. A ClosureTurf® surficial collection design will incorporate the use of surficial collection strips (See Figure 1) that provide high flow capacity (See Figure 2) and a larger radius of influence. The system design will also incorporate the surficial collection foot (See Figure 4) that serves as a wellhead base, geomembrane interface and gas conveyance path from the strips to the collection wellhead (not provided).

5.2.1 Surficial Strips (Where Applicable)

Surficial strips are to be placed prior to the placement of geomembrane. Surficial Strips may consist of SuperGripnet®, single sided geocomposite or other techniques that will allow for the proper flow of gas without causing ballooning. The placement of the strips will be determined by the design engineer and included in the gas management plan.



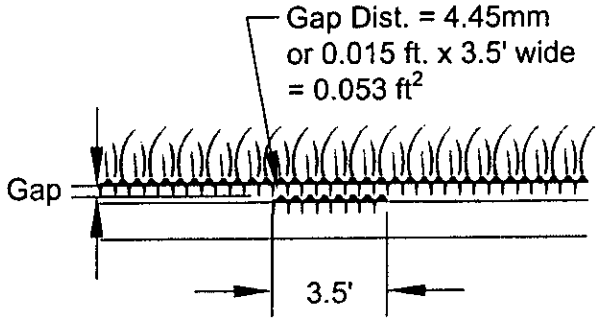


Figure 1: Typical Surficial Collection Strip Placement

Use Super Gripnet or Single Sided Geocomposite for Strips

Figure 2: Effective Cross Sectional Area: Surficial Strips

5.2.2 ClosureTurf® Malfunction Relief Valve

The Malfunction Relief Valve is a mandatory component of the ClosureTurf® System. The primary purpose of this component is to provide for necessary release of pressure in the event the gas collection system malfunctions. The Malfunction Relief Valves will be placed at one per acre as indicated by the site's gas management plan and installed during construction of the ClosureTurf® system.

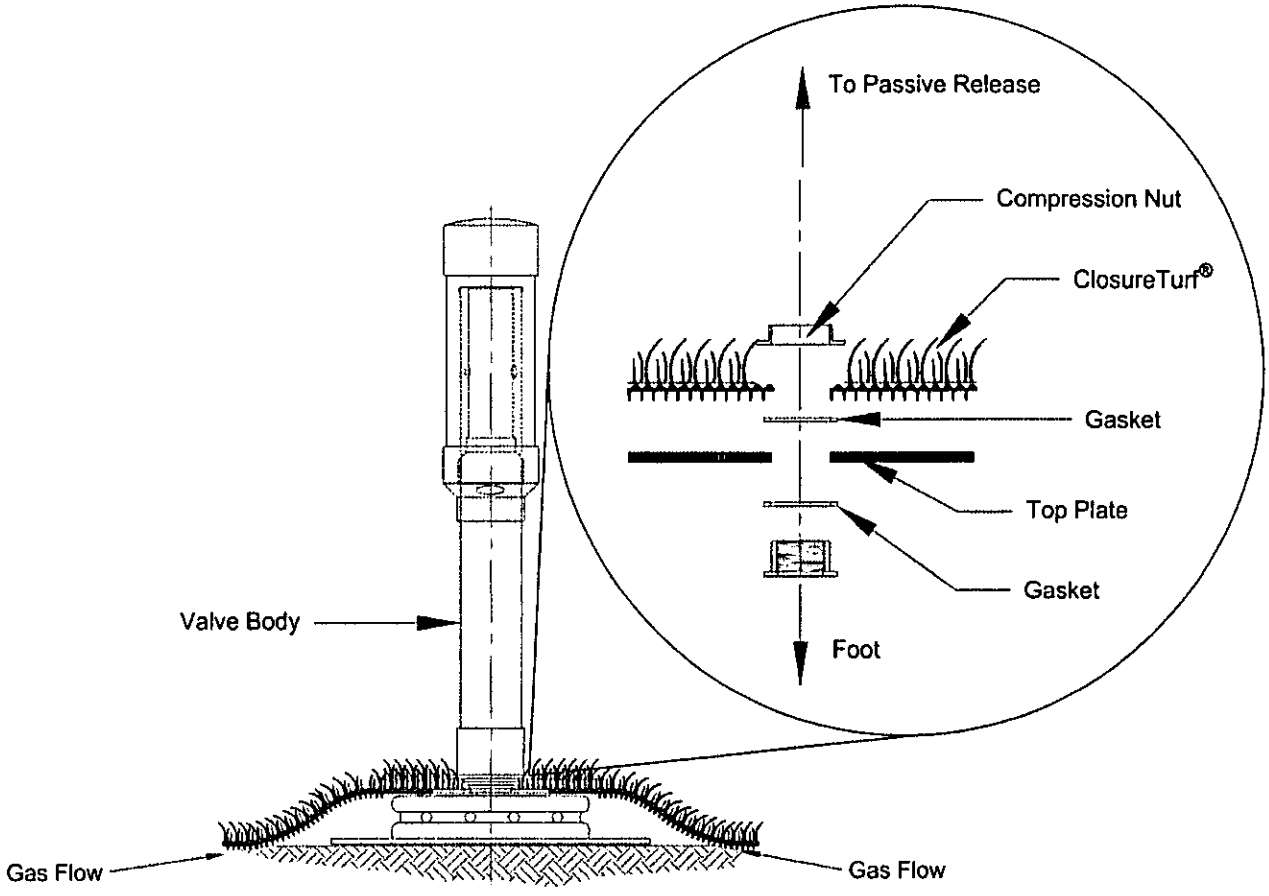

Figure 3: ClosureTurf® Malfunction Relief Valve (Patent Pending)

5.2.3 ClosureTurf® Collection Foot

This device is designed to be the interface between the surficial collection strips, the geomembrane and a gas collection wellhead (not provided). The unit allows vacuum to flow in from beneath the geomembrane and from the surficial collection strips to create a larger radius of influence for gas collection. Placement will be determined by the gas collection system design.

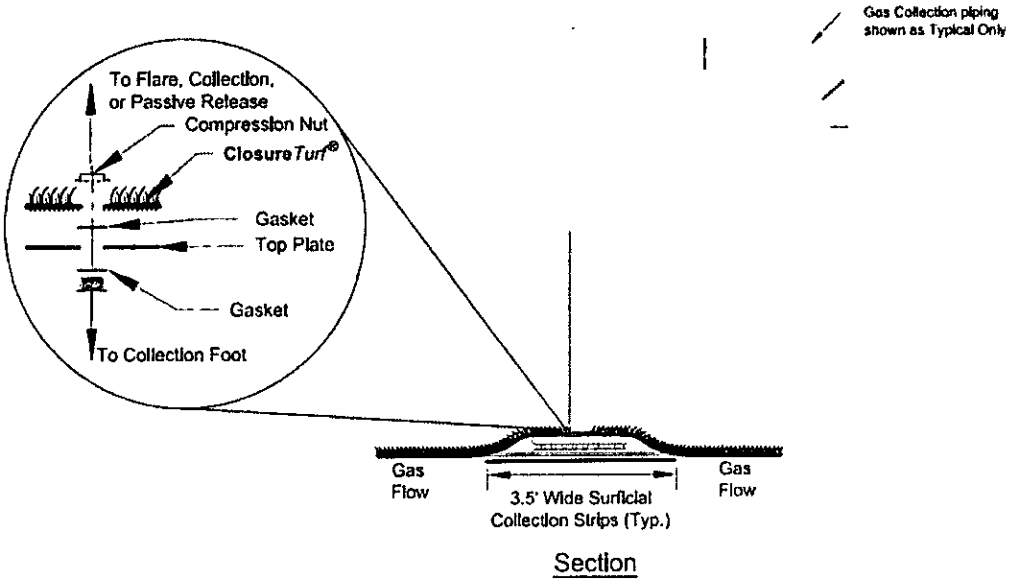

Figure 4: ClosureTurf® Surficial Collection Foot Connection to GCCS System

6.0 Installation - Geomembrane Liner

Installation of the Geomembrane Liner must be completed by a geosynthetics contractor approved by Watershed Geosynthetics. Qualification requirements for geosynthetics personnel are shown in WatershedGeo Installation Specification 01 73 19. Each component of the ClosureTurf® system will require specific testing and submittals before, during and after installation of the component. For information concerning submittals, see contract specifications. It is the responsibility of the contractor to ensure that each prior component installation has been approved by the POR before continuing with installation of the next ClosureTurf® component.

6.1 Delivery – Geomembrane Liner

Upon delivery of the geomembrane, observe that:

- The geomembrane is delivered in rolls and not folded. Any evidence of folding or other shipping damage is cause for rejection of the material.
- Equipment used to unload and store the rolls or pallets does not damage the geomembrane component.
- The geomembrane is stored in an acceptable location in accordance with the specifications and stacked no more than five rolls high.
- The geomembrane component is protected from puncture, dirt, grease, water, moisture, mud, mechanical abrasions, excessive heat, or other damage.
- Manufacturing documentation required by the specifications has been received and reviewed for compliance with the technical specifications. This documentation will be included in the FCSER.
- The geosynthetics receipt log form has been completed for materials received.
- Geomembrane component that is damaged or has been rejected due to improper manufacturer documentation will be removed from the site or stored at a location separate from the accepted geomembrane component.

6.2 Installation - Panel Deployment and Field Seaming

ClosureTurf® installation requires some additional care and techniques beyond those of the typical geomembrane installation. General panel deployment techniques as well as special techniques are listed below.

General

- Observe that the geomembrane component is placed in direct and uniform contact with underlying protective cover soil or subgrade soil.
- Observe the sheet surface as it is deployed and record panel defects and repair of the defects (e.g. panel rejected, patch installed, etc.) on the repair sheet. Repairs must be made in accordance with the contract specifications and located on a repair drawing.
- Observe that support equipment is not allowed on the geomembrane component during handling (See Section 6.4).
- Observe that the subgrade beneath the geomembrane component has not deteriorated since previous acceptance.
- Observe that there are no stones, construction debris, soil clogs or other deleterious items on the subgrade that could cause damage to the geomembrane component.
- The geomembrane component will not be deployed during inclement weather conditions as defined in the site specific specifications.
- Observe that people working on the geomembrane component do not smoke, wear boots/shoes that could damage the ClosureTurf® system components, or engage in activities that could damage the ClosureTurf® system components.
- Observe that the method used to deploy the sheet reduces wrinkles but does not cause bridging and that the sheets are anchored to prevent lifting or movement by the wind (geosynthetics contractor is responsible for any damage to or from windblown geomembrane).
- Observe that horizontal or cross seams on the side slopes are staggered so that long horizontal seams across the slope are not produced.
- The POR shall be responsible for approving the integrity of horizontal seams.

Acclimation and Adjustments

- The geomembrane component requires acclimation to ambient temperature after being deployed and before seaming operations begin.
- Acclimation time is dependent on the current weather conditions.
- By allowing the panels to acclimate, excessive wrinkling can be avoided.
- Final panel adjustments can be completed after the panel has properly acclimated to ambient temperature.
- After the panel has acclimated and before seaming operations begin, wrinkles will be worked toward the toe of slope.
- Once the above items are addressed, a final adjustment is required to pull the liner at the bottom of the slope.

Wedge Welding

- After proper acclimation and final adjustments/wrinkle removal, wedge welding may proceed.
- Wedge welding machines are a low profile machine with a vertical height (wedge height) not to exceed 3 inches, measured from flat surface to top of heating wedge.
- Wedge welding will be completed in accordance with the contract specifications.
- Sand bags will be applied as the wedge welding progresses to reduce tenting.

Snapping

- As a result of wedge welding, "ridges" or "tenting" of the seams may occur. A process called "snapping" must be employed to remove the excess slack caused by the welding process.
- Normally, this technique requires several people lined up along the open seam at the edge of the geomembrane and applying clamps to the edge. The panel is then "snapped" into positon and when applied properly, the excess slack is removed.
- The snapping technique will be applied while the welding seam is still warm.
- Previously applied sand bags along the wedge welded seam will reduce rebound tenting.

6.3 Anchor Trench Backfill

ClosureTurf® only relies on the anchor trenches to serve as a termination point. Top anchor trenches should be backfilled as quickly as practical after Engineered Turf Component is installed (prior to sand infill placement).

Vertical anchor trenches as well as anchor trenches along the toe will not be backfilled until sand infill of the engineered turf is in place. Anchor trench dimensions will be shown in the drawings.

Backfilling or sand bag loading the bottom and side anchor trenches should be considered and applied when cool temperatures are anticipated to assist with creep reduction.

6.4 Equipment on ClosureTurf® Geomembrane

Construction equipment on the ClosureTurf® geomembrane component will be limited to reduce the potential for geosynthetics damage. Observe/provide the following:

- Use power source generators capable of providing constant voltage to all required equipment under combined-line load.
- Secondary containment to catch spilled fuel under equipment where applicable.
- No equipment with tire or track pressures exceeding 5 psi will be allowed on the partially constructed ClosureTurf® system until after the completed installation of the sand infill component.
- No equipment will be left running and unattended over the constructed geomembrane component.
- Equipment operators shall check for sharp edges, embedded rocks, or other foreign materials stuck into or protruding from tires prior to operating equipment on the geomembrane component.
- Path driven on geomembrane component will be as straight as possible with no sharp turns, sudden stops or quick starts.

6.5 Wrinkles

Wrinkles occur during the geomembrane installation due to changes in geomembrane temperatures and deployment methods. The wrinkles may interfere with the installation of the engineered turf layer as well as the final appearance of the ClosureTurf® system. Observe that:

- Snapping procedures are followed.
- Wrinkles are repaired if they can be folded over as defined the morning after the seam is developed and the liner is in a cool state.

7.0 Installation – Engineered Turf

Qualification requirements for the personnel who the Engineered Turf component are shown in WatershedGeo Installation Specification 01 73 19.

7.1 Delivery – Engineered Turf

Box trucks will deliver 27 rolls per truck. Rolls will be strapped in groups of 9 allowing equipment (i.e. pick-up truck, skid steer) to pull the grouped rolls to the front of the truck. Rolls can be pulled directly to the ground or carpet stingers can move the rolls to a designated area. Observe the following:

Observe the following:

- The engineered turf is wrapped in rolls with protective covering.
- The rolls are not stacked more than 3 high.
- The rolls are not damaged during unloading.
- Protect the engineered turf from mud, soil, dirt, dust, debris, cutting, or impact forces.
- Each roll must be marked or tagged with proper identification.
- Rolls that have been rejected due to damage are be removed from the site or stored at a location separate from accepted rolls, designated by the Owner/Operator.
- Rolls that do not have proper manufacturer's documentation will be stored at a separate location until documentation has been received and approved.

7.2 Installation – Engineered Turf - Surface Preparation

Prior to installation of Engineered Turf, observe the following:

- ClosureTurf® geomembrane has been installed in accordance with the contract specifications.
- The geomembrane installation documentation has been completed and approved by the POR for areas were the Engineered Turf is to be installed.
- The supporting surface (i.e., the geomembrane) does not contain stones, debris, membrane grindings or large scraps left over from the installation process that could damage or impede surface water flow through the Engineered Turf.

7.2.1 Installation – Engineered Turf – Deployment & Field Seaming

During deployment of Engineered Turf, observe the following:

- Observe the turf as it is deployed.
- Verify that equipment used does not damage the turf or underlying geomembrane by handling, trafficking, leakage of hydrocarbons, or by other means.
- Verify that during deployment, the Engineered Turf filaments point upslope a majority of the time.
- Verify that the turf is anchored to prevent movement by the wind (the contractor is responsible for any damage resulting to or from windblown Engineered Turf).
- Verify that the turf remains free of contaminants such as soil, grease, fuel, etc.
- Observe that the turf is laid substantially smooth and substantially free of tension, stress, folds, wrinkles, or creases.
- Observe the deployment of the panels to insure proper flipping in order to expose the turf surface up after seaming operations. After the first panel of the project is deployed, deployment will be done on the adjacent turf panel to avoid damage.

7.2.1.1 Installation – Engineered Turf – Sewn Seam Method

- A single stitch prayer type seam is constructed using an American Newlong sewing machine or equivalent.
- The thread will be Polyester or equivalent.
- Sewing will occur between the 1st and 2nd row of tufts from the edge.

7.2.1.2 Installation – Engineered Turf – Fusion Seaming Method

- Engineered Turf fusion seaming device will be a DemTech VM20/4/A fusion welder only.
- Fusion seams require a minimum of 5 inches of overlap.
- Frayed or loose geotextile strands will be cut off or removed.
- Prior to starting the production fusion seaming, trial seams must be performed as outlined in Section 7.2.1.3 below.
- Demonstrate the preparation methods and equipment utilized for removal of the salvage from the outside edge of the rolls of turf (i.e. trimming & cutting devices).
- Mechanical trimming and cutting devices will be utilized for salvage trimming.
- Demonstrate and control the fraying of geotextile strands when performing the removal of salvage.
- Any damage that occurs due to production seaming will be repaired as outlined in WG Installation Guidance Documents.
- Any defects will be repaired as outlined in 7.2.2.

7.2.1.3 Installation – Engineered Turf – Fusion Seaming Method Trial Seam Requirements

1. Prior to turf component welding, CQA personnel shall observe and document the following:
    a. Turf welding apparatus are tested;
    b. at daily start-up; and
    c. immediately after any break; or

d. anytime the machine is turned off for more than 30 minutes.

2. Procedures:

a. The turf trial weld will be completed under conditions similar to those under the panels that will be welded.

b. If at any time, the CQA Personnel believe that an operator or fusion welding apparatus is not functioning properly, a Field Trial Seam Test must be performed.

c. Any dispute concerning proper installation techniques or the proper function of fusion welding equipment will be resolved by the OWNER'S REPRESENTATIVE.

d. The trial weld must be allowed to cool to ambient temperature before seam snapping or panel adjustments are applied.

3. Trial Sample Test Results:

a. Trial weld samples must comply with "VISUAL PASSING CRITERIA" Visual passing criteria is verified when a manual peel/pull test is performed and the top turf panel tufts transfer to the bottom turf panel. The transfer of approx. 75% of the tufts constitutes a passing trial weld.

4. Field Seam Test Failure:

a. Less than approx.75% of the top turf panel tufts do not transfer to the bottom turf panel.

5. Additional Trial Sample Testing Requirements:

a. Two consecutive trial welds meet the visual passing criteria.

6. The trial weld sample must be a minimum of 3 feet long and 12 inches wide, with the seam centered lengthwise.

7. If a welding apparatus exceeds 5 hours in the second half of the day, another trial seam must be performed.

8. CQA documentation of trial seam procedures will include the following:

a. The names of the seaming personnel;

b. The name of the fusion seaming technician;

c. the welding apparatus number, time, date;

d. ambient air temperature; and

e. welding apparatus temperature & speed setting.

7.2.2 Installation – Engineered Turf Repairs and Tie-In Procedures

When Repairs and Tie-Ins to Engineered Turf occur, observe the following:

- Tie-In's to Engineered Turf will be completed by using a fusion seam.
- Seaming equipment for Engineered Turf will be a DemTech VM 20/4/A welder.
- A hand held heat gun should be used in smaller/concentrated areas.

7.2.3 Installation – Equipment on Engineered Turf

No equipment will be allowed on slopes exceeding 15% until Sand Infill is in place. On slopes less than 15%, such as top decks, ATV type vehicles will be allowed prior to infill placement if the rubber tire or track pressure is less than 5 psi. Post construction (full specified sand infill thickness) drivability tire pressures on slopes greater than 10% should be limited on the ClosureTurf® system to less than 35 psi.

Allowable rubber tire or track pressures on top decks may increase to as much as 120 psi as long as sustained traffic load is not expected.
In all phases of construction, equipment used on the ClosureTurf® product will not be allowed to change speed or direction in a manner that could displace or damage the ClosureTurf® system.
High traffic areas will require sand to be placed at the full height of the turf. ArmorFill may also be utilized in high traffic areas to reduce sand migration due to the increased sand thickness.

8.0 Installation - Sand Infill

This component of the ClosureTurf® system is a specialized mixture of sand infill that is placed between the tufts of the Engineered Turf component.

Observe that the following general requirements regarding Sand Infill are met:

- Sand Infill will meet ASTM C-33 specifications.
- Areas that are to receive sand infill must be inspected and accepted by the POR or CQA Personnel before placement of sand infill takes place.

8.1 Submittals and Testing - Sand Infill

See contract specifications for Sand Infill MQC Submittals and submittal/testing requirements regarding the Sand Infill.

8.2 Installation - Sand Infill Deployment

Observe that the following installation guidelines regarding the Sand Infill:

- Sand infill thickness will be verified at a frequency of 20 measurements per acre of final cover installed.
- The sand infill layer will be placed to a ½ inch minimum thickness not to exceed ¾ inch thick.
- The sand infill will be worked into Engineered Turf as infill between the synthetic yarn blades.
- No equipment will be allowed on slopes exceeding 15% until the sand infill is in place.
- Conveyor systems and/or Express Blowers are the preferred method to spread and place the sand infill.
- Contractor shall explain in detail in the pre-construction meeting the method of sand infill deployment to be used.
- The sand infill deployment method will be approved prior to installation of the sand infill.
- For slopes 3H: 1V or steeper the sand infill shall be placed using long reach conveyor belts or using water or air express blower methods that demonstrate achievable results.
- The sand infill placement will be done in front of the deployment equipment to improve the bearing capacity of the previously installed ClosureTurf® components.
- Sand infill placement cannot occur with snow or ice on the Engineered Turf component.
- Verify that underlying geosynthetics installations are not damaged during placement operations. Mark damaged geosynthetics and verify that damage is repaired.

The method for measuring the Sand Infill thickness will be performed utilizing a digital caliper with depth rod capabilities, or a POR approved alternate measuring device.

8.3 - Alternate Infill - ClosureTurf® with HydroBinder® Infill for Ditches and Downslope Channels

Alternate Infill - HydroBinder® is provided by Watershed Geosynthetics or approved supplier. When the ClosureTurf® system is installed and HydroBinder® infill is placed in lieu of sand infill, it creates a ditch/downslope lining armor that will allow high flow velocities to convey without damage or maintenance to the underlying ClosureTurf® components. Typical ClosureTurf® installation procedures are used for the first three ClosureTurf® components, and then the HydroBinder® infill is placed dry and hydrated after placement. Figure 4 shows a typical ClosureTurf® with HydroBinder® infilled ditch section.

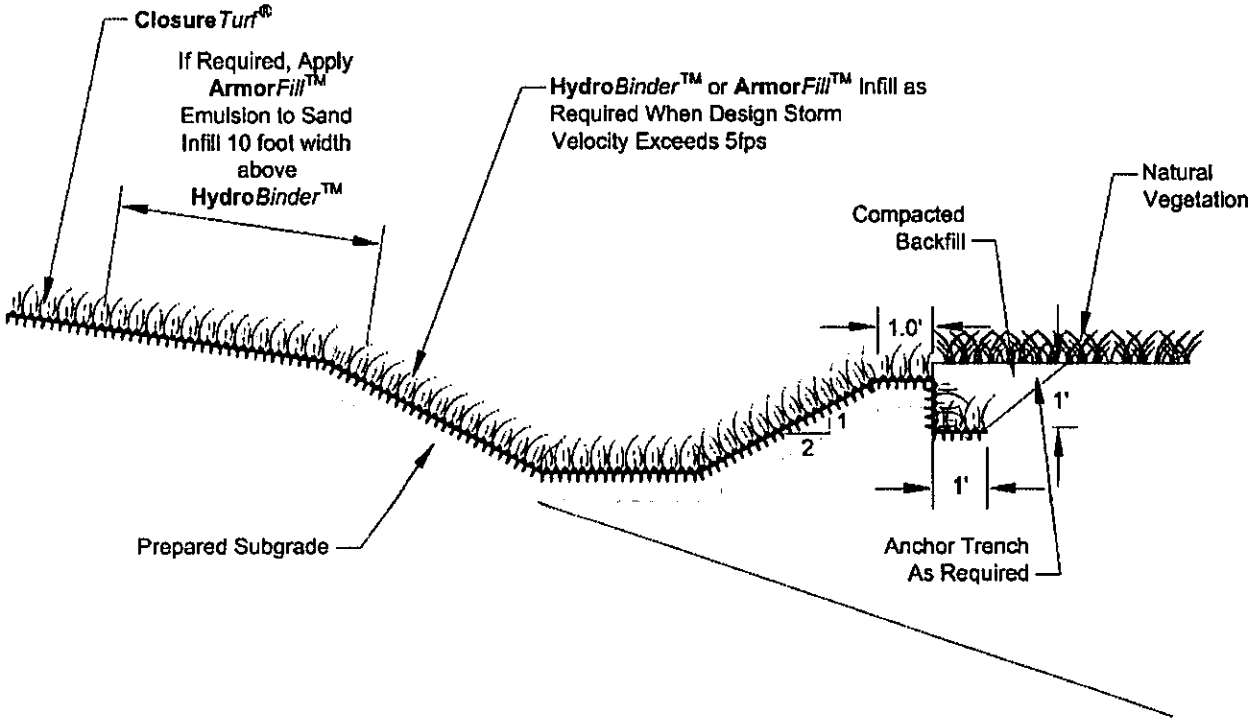

Figure 4: Typical ClosureTurf® with HydroBinder® Infilled Ditch Section

8.4.1 Installation – Alternate Infill - HydroBinder®

Verify the following regarding installation of HydroBinder® Infill:

- The HydroBinder® infill layer may be placed using any appropriate equipment capable of completing the work while meeting loading requirements specified herein.
- Manual hand spreading is acceptable when equipment isn't practical.
- Contractor / Installer will explain in detail in the pre-construction meeting the method of HydroBinder® infill deployment.
- Installation of HydroBinder® infill will only be performed by a Watershed Geosynthetics' licensed and approved installer using techniques and equipment approved by Watershed Geosynthetics.
- The HydroBinder® will be installed into the turf while it is in a dry state.
- The HydroBinder® will be worked into the tufts so the tufts are in an upright position.
- The HydroBinder® infill layer will be placed to a ¾ inch minimum thickness not to exceed 1 inch thick.

- Do not backfill anchor trenches until turf has been installed with HydroBinder® infill.
- The hydration process must occur the day of the HydroBinder® infill placement.
- The desired HydroBinder® infill thickness will be achieved prior to the hydration process.
- The cemented infill is hydrated thoroughly however care must be taken to avoid displacement of the non-hydrated infill.
- The objective is to soak the area to start the hydration process but not to inundate with water beyond saturation.
- Once hydration is completed as described, backfill and compaction of the vertical anchor trenches should take place.
- The HydroBinder® will be at minimum performance levels within 24 hours.

8.4.2 Installation – Alternate Infill - ArmorFill™

Verify the following regarding installation of ArmorFill™ Infill:

- Installation of ArmorFill™ will be completed by an installer certified by Watershed Geosynthetics.
- Apply ArmorFill™ under dry weather conditions and when precipitation is not expected for at least 24 hours after installation.
- Apply ArmorFill™ on a previously installed ClosureTurf® system that is free of leaves and other material that may inhibit the penetration of the ArmorFill™ into the sand component.
- Apply ArmorFill™ only after approval of the finished ClosureTurf® product installation.
- Verify ArmorFill™ and water mix ratio by logging volume mixed of each component.
- Verify that ArmorFill™ has saturated the sand by inserting a probe and displacing a 1 inch area of sand.
- Check saturation randomly at a rate of 20 probes per acre.
- Verify proper application rate by marking a known area and applying the proper volume to that area.
- Adjust delivery rate to match the delivery volume per area.
- Mix in a hydraulic conveyance system such as a water truck or portable tank.
- Utilize a small agitation pump to mix and recirculate the ArmorFill™ within the tank to impede separation of the mix.
- Place ½ of the water component in the tank, then add the full strength ArmorFill™ and complete the mix by then adding the other ½ of the water into the tank.
- ArmorFill™ application equipment will have a 2 inch diameter hose with a spray adjustment nozzle and cut off function in the nozzle head.
- Reduce the number of equipment set-ups required and take care with the application hose so as

previously applied ArmorFill™ is not displaced by dragging of the hose.

- Spray product evenly.
- Apply ArmorFill™ at a rate of approximately 2600 gallons of the mixed product per acre (Approx. 0.06 gallons per square foot)
- Do not apply ArmorFill™ in inclement weather or in freezing temperatures.
- At the completion of ArmorFill™ placement activities, clean the equipment thoroughly and purge the tank and hoses of the product.
- All waste product will be disposed of in accordance to site regulations
- Avoid unnecessary foot traffic on the applied product for 24 hours.
- No vehicle traffic is allowed on the applied product for 7 calendar days.

8.5 Installation – Coverage - ArmorFill™

For most applications, use a 6:1 mix ratio unless otherwise stated by the Engineer.

8.5.1 Installation – Coverage - HydroBinder®

Table 1

Approximate Coverage Area for HydroBinder™ Infill

Product	Bag Size	Yield (Cubic Feet)	Coverage in Sq. Ft. for 3/4 in. Thick[1]	Coverage in Sq. Ft. for 1 in. Thick[1]	Amount of Water to Mix per Bag (gal)	Amount of Water (gal) to Apply per Sq. Ft. (3/4 in. Thick)[1]	Amount of Water (gal) to Apply per Sq. Ft. (1 in. Thick)[1]
HydroBinder Infill	40 lbs.	0.3	4.8	3.6	0.6	0.12	0.16
	60 lbs.	0.45	7.2	5.4	0.9	0.12	0.16
	80 lbs.	0.6	9.6	7.2	1.2	0.12	0.16
	1 Cubic Yard (Super Sack)	27	432	324	55	0.13	0.17

[1] - Values are approximate

8.6 Post Installation - Maintenance and Monitoring

The ClosureTurf® System is designed to be a very low maintenance final cover. If maintenance issues or damage occurs to the ClosureTurf® System, please refer to the following guidelines.

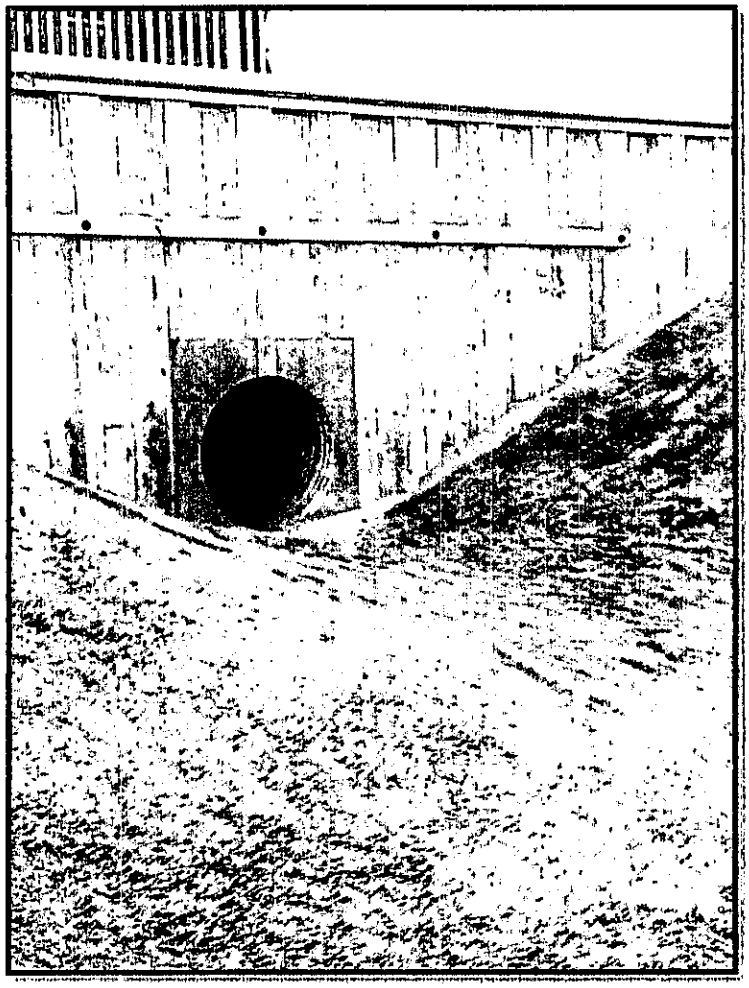
8.6.1 Exposed Geotextiles

If the engineered turf backing becomes exposed, then the ASTM C-33 graded infill is to be placed and brushed into the exposed turf backing areas. WG suggested guidance is to evaluate the closure system at a frequency of no less than once every 5 years.

Additionally, UV resistant coating can be applied to the exposed area and sand immediately applied onto the coating material, this provides a flexible UV barrier for the underlying geotextiles. The UV coating product is manufactured by Quikrete, product number 8640 and Sakrete, product number 60205006, concrete sealants and can be purchased at most Lowes & Home Depot Home Improvement stores. ArmorFill™ can also be utilized for this purpose.

8.6.2 Damage to the Geomembrane or Engineered Turf Components

If damage occurs to the geomembrane or geotextile Components, call an approved ClosureTurf® installer for repairs. Contact WatershedGeo® at 770 777 0386 for a list of qualified installers.



Electronic Filing: Received, Clerk's Office 09/28/2020

HydroTurf®

INSTALLATION GUIDELINES MANUAL

March 2015, Revision 2.1

Before utilizing this document as an installation tool, Installer should download the latest version of the Installation Guidelines Manual from the website at www.watershedgeo.com.

7.0 BACKFILLING OF THE ANCHOR TRENCHES (HYDROTURF® CS AND Z) 14

1.0 Introduction

HydroTurf® Advanced Revetment Technology is a patented system which is used as a hardened armoring for protection against erosion from hydraulic forces. There are two HydroTurf® Systems. These systems are as follows:

HydroTurf® CS is shown in Figure 1. The components of this system are as follows:

- Structured LLDPE (or HDPE) Geomembrane Liner
- Engineered Synthetic Turf
- HydroBinder® Infill
- Penetrating Colloidal Concrete Treatment (PCCT) -Optional for Freeze / Thaw Protection

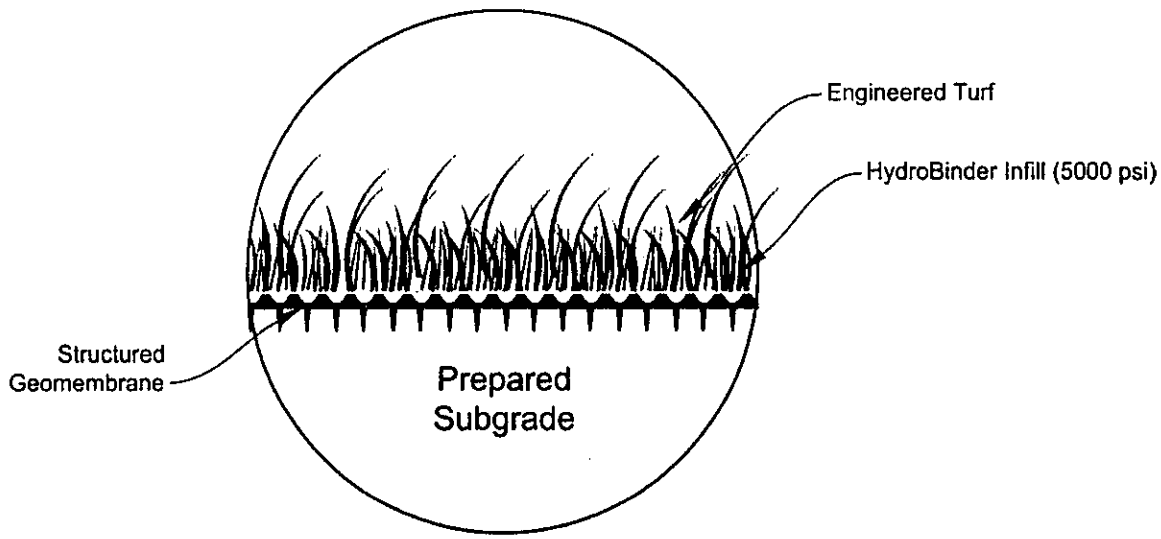

Figure 1 – Section of HydroTurf® CS

HydroTurf® Z is shown in Figure 2. The components of this system are as follows:

- Engineered Synthetic Turf with Integrated Polyethylene Backing
- HydroBinder® Infill
- Penetrating Colloidal Concrete Treatment (PCCT) -Optional for Freeze / Thaw Protection

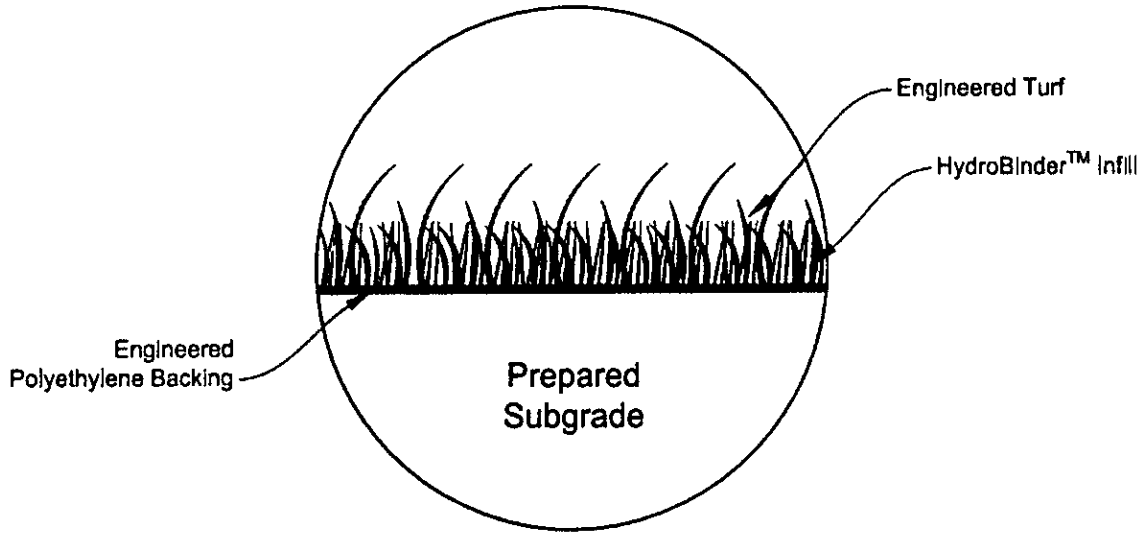

Figure 2 – Section of HydroTurf® Z

2.0 Limitations

This manual is meant as a guideline only. Watershed Geosynthetics LLC cannot anticipate the many ways this product may be applied either in design or installation. Varying site conditions will require close coordination between the engineer and the installer to account for site conditions and adjust accordingly. When required by state and/or local regulations, a licensed professional engineer or architect will be required.

HydroTurf® (US Patent Nos. 7,682,105, 8,585,322; Canadian Patent No. 2,663,170; and other Patents Pending) and registered trademark are the property of Watershed Geosynthetics LLC. All information, recommendations and suggestions appearing in this literature concerning the use of our products are based upon tests and data believed to be reliable; however, this information should not be used or relied upon for any specific application without independent professional examination and verification of its accuracy, suitability and applicability. Since the actual use by others is beyond our control, no guarantee or warranty of any kind, expressed or implied, is made by Watershed Geosynthetics LLC as to the effects of such use or the results to be obtained, nor does Watershed Geosynthetics LLC assume any liability in connection herewith. Any statement made herein may not be absolutely complete since additional information may be necessary or desirable when particular or exceptional conditions or circumstances exist or because of applicable laws or government regulations. Nothing herein is to be construed as permission or as a recommendation to infringe any patent.

3.0 Subgrade Preparation (HydroTurf® CS and Z)

Prior to HydroTurf® system installation, the soil subgrade shall be inspected by the Engineer and geosynthetics contractor. The following shall be observed:

- The soil subgrade shall be compacted to the requirements as specified by the engineer. The subgrade shall be firm and unyielding.
- The soil subgrade shall be smooth and uniform, and shall be substantially free of surface irregularities and protrusions.
- The soil surface shall be free of foreign and organic material, sharp objects, particles or other deleterious material, and shall not contain stones or other objects that could damage any of the HydroTurf® components.
- Maximum particle size (e.g. stones) shall be specified by the design and site-specific specifications.
- The anchor trench dimensions have been checked, and the trenches are free of sharp objects and other deleterious material.
- Construction stakes and hubs have been removed and the resultant holes have been backfilled.
- Final grades on the slopes as well as benches dimensions and grades conform to the design grades.
- Survey shots and as-built drawings shall be carefully reviewed and evaluated to ensure the surface grades will drain as intended in the design drawings.

4.0 Structured Geomembrane Liner Component (HydroTurf® CS only)

Installation of the Structured Geomembrane LLDPE (or equivalent HDPE) Liner must be completed by an approved geosynthetics contractor who can demonstrate significant experience with installation of structured geomembranes. Each component of the HydroTurf® system will require specific testing and submittals before, during or after installation of the component. It is the responsibility of the contractor to ensure that each prior component installation has been approved by the owner's representative before continuing with installation of the next HydroTurf® component.

4.1 Geomembrane Panel Deployment

Engineer shall ensure that all Pre-Installation procedures have been followed before proceeding with deployment of geomembrane. As geomembrane component panel deployment proceeds, the Engineer and the Geosynthetics Contractor shall:

- Ensure the geomembrane component is placed in direct and uniform contact with underlying protective cover soil or subgrade soil.
- Observe the geomembrane surface as it is deployed and record panel defects and repair of the defects (e.g. panel rejected, patch installed, etc.) on the repair sheet. Repairs must be made in accordance with the technical specifications and located on a repair drawing.
- Support equipment is not allowed on the geomembrane component during handling.
- Confirm that the surface beneath the geomembrane component has not deteriorated since previous acceptance.
- Confirm that there are no stones, construction debris, soil clogs or other deleterious items on the subgrade that could cause damage to the geomembrane component.
- The geomembrane component shall not be dragged across a surface that could damage the material. If the geomembrane component is dragged across an unprotected surface, it must be inspected for scratches and repaired or rejected, as necessary.

- The geomembrane component shall not be deployed during inclement weather conditions as defined in the project specific specifications.
- Personnel working on the geomembrane component shall not smoke, wear boots/shoes that could damage the HydroTurf® system components, or engage in activities that could damage the HydroTurf® system components.
- The method used to deploy the geomembrane shall minimize ripples and eliminate wrinkles but does not cause bridging, and that the geomembrane is anchored to prevent lifting or movement by the wind (geosynthetics contractor is responsible for any damage to or from windblown geomembrane). A wrinkle is a portion of the geomembrane that does not lay relatively flat and is not the result of a subgrade irregularity. A wrinkle is large enough that it can be folded over. A ripple is the result of manufacturing or thermal expansion. It is smaller in nature than a wrinkle and cannot be folded over.
- Excess geomembrane materials should be walked-out or removed to the extent practical.
- The geosynthetics contractor shall apply tension techniques to pull out excess material / slack prior to seaming.
- The geomembrane component shall acclimate to the ambient temperature prior to welding. The ambient temperature is defined as the temperature of previously deployed and welded geomembrane panels.
- Additional acclimation time will be required when temperatures drop below 50 degrees Fahrenheit and when solar heating is reduced.
- The horizontal or cross seams on the side slopes shall be staggered so that long horizontal seams across the slope are not produced.

4.2 Geomembrane Field Seaming/Welding

Geomembrane field seaming and welding operations shall be performed as follows:

- Wedge welding machines shall be a low profile machine with a vertical height to not exceed 3 inches to the highest point of the wedge. Installer shall demonstrate that each wedge welding machine meets this requirement.
- The geosynthetics contractor shall have the number of welding apparatuses and spare parts necessary to perform the work.
- Equipment used for welding will not damage any HydroTurf® system components.
- The extrusion welding machine is purged prior to beginning a weld until the heat degraded extrudate is removed.
- The ambient temperature, measured 6 inches above the geomembrane surface, is between 35°F and 104°F, or geomembrane manufacturer's recommended temperature limits if they are more stringent.
- The contact surfaces of the sheets are clean, free of dust, grease, dirt, debris, and moisture prior to welding.
- The weld is substantially free of dust, soil / mud, rocks, and other debris.
- The seams are overlapped a minimum of 3 inches for extrusion and hot wedge welding, or in accordance with geomembrane manufacturer's recommendations, whichever is more stringent.
- Panels shall be overlapped (shingled) in the downgrade direction.
- No solvents or adhesives are present in the seam area.

- The procedure used to temporarily hold the panels together does not damage the panels and does not preclude CQA testing.
- The panels are being welded in accordance with the plans and site specific specifications.
- There is no obvious free moisture in the weld area.
- Observe that at the end of each day or installation segment, unseamed edges are anchored with sandbags or other approved anchoring device.
- Penetration anchors shall not be used to secure the geomembrane.
- Once two panels have been seamed together or at the approx. 1/3 seaming process a seam "snapping" process should be applied. This method is performed with manual labor by utilizing 3-4 technicians on the open side of the panel applying a pulling pressure to snap out the tented welded seam.
- The "snapping" requirement is important in that it allows the engineered turf component to lie more evenly over the geomembrane component.

4.3 Defects

Any portion of the geomembrane with a detected flaw, must be repaired in accordance with the project specifications (e.g., material requirements, installation, testing, etc.).

5.0 Engineered Turf Component (HydroTurf® CS and Z)

The installation of HydroTurf® engineered turf consists of the placement and seaming of the engineered turf component over the structured geomembrane liner (HydroTurf® CS) or over the soil subgrade (HydroTurf® Z).

Box trucks will deliver up to 27 rolls engineered turf per truck. Nine (9) rolls will be strapped together allowing equipment (i.e. pick-up truck, skid steer) to pull the strapped rolls to the front of the truck. Rolls can be moved to a designated area by using a carpet stinger or lifted by straps.

During unloading, the contractor and / or CQA personnel shall confirm that the following is practiced and performed:

- The engineered turf is wrapped in rolls with protective covering.
- The rolls are not stacked more than 3 high.
- The rolls are not damaged during unloading.
- Protect the engineered turf from damage (i.e., mud, soil, dirt, dust, debris, cutting, impact forces, etc.).
- Each roll must be marked or tagged with proper identification.
- Rolls that have been rejected due to damage are to be removed from the site or stored at a location separate from accepted rolls, designated by the Owner/Operator.

5.1 Surface Preparation (HydroTurf® CS)

Prior to installation of Engineered Turf, the following shall be completed:

- The geomembrane component of the HydroTurf® CS has been installed in accordance with the site specific specifications.
- The required geomembrane installation documentation has been completed and approved by the Engineer prior to installation of the Engineered Turf.
- The surface of the geomembrane does not contain soil / mud, stones, debris or large scraps left over from the installation process.

5.2 Engineered Turf Deployment (HydroTurf® CS and Z)

Engineered Turf shall be deployed as follows:

- Observe the engineered turf as it is deployed and record defects and disposition of the defects (panel rejected, patch installed, etc.). Repairs are to be made in accordance with the specifications.
- Equipment used shall not damage the engineered turf, underlying geomembrane or subgrade by handling, trafficking, leakage of hydrocarbons, or by other means.
- The panels shall be deployed from the top of the slope in a way that the leading edge of the roll stays at the top of the slope with the Engineered Turf filaments pointing upwards. Also, the turf has colored marker fibers (yellow) on one side of the roll. These colored fibers shall be lined up on the same side of every panel. This will ensure that the turf filaments are pointing in the same direction.
- The turf shall be ballasted to prevent movement by the wind or other means (the contractor is responsible for any resulting damage).
- The turf shall remain free of contaminants such as soil / mud, debris, grease, fuel, etc.
- The turf shall be laid smooth and substantially free of tension (but not loose), stress, folds, ripples / wrinkles, or creases. The geomembrane (for HydroTurf® CS) or the turf (for HydroTurf® Z) shall be in intimate contact with the underlying subgrade
- On slopes, the turf shall be secured with sandbag anchoring at the top of the slope and then rolled down the slope.

5.3 Engineered Turf Seaming

5.3.1 Sewing (HydroTurf® CS)

Seaming of the engineered turf component of HydroTurf® CS may be performed by sewing. This is described as follows:

- The panels shall be deployed to ensure proper flipping in order to expose the turf surface up after seaming (sewing) operations. After the first panel of the project is deployed, deployment shall be done on the adjacent turf panel to avoid damage.
- The panels shall be deployed in a manner to ensure that the turf filaments are pointing upslope and in the same direction as the adjacent panel.
- The adjacent panels are sewn together with a single stitch prayer type seam. This is constructed using a heavy-duty textile stitching machine (i.e., Nulong sewing machine or equivalent).

- The thread shall be 207 Polyester or equivalent.
- Sewing shall occur between the 1st and 2nd row of tuft stiches of the engineered turf in order to avoid exposure of the black geotextile backing after flipping the panel. Incorrect sewing, which creates "fishmouths" and / or exposed geotextile backing, shall be repaired.

5.3.2 Heat-Bond Welding (HydroTurf® Z)

Seaming of the engineered turf component of HydroTurf® Z may be performed by heat-bond welding. This is described as follows:

- Panels shall be deployed such that the seam overlaps are shingled with the flow of water. The panel on the up-flow / upstream side shall have the overlap placed on top of the down-flow / downstream panel.
- The panels shall be deployed in a manner to ensure that the turf filaments are pointing upslope and in the same direction as the adjacent panel.
- The DemTech 4-inch, single-wedge welder (Model No. VM-20/4/A Pro-Wedge Welder 120V, VM20 Outfitted with 100-KIT/4S/VC/A.2 Welding Kit, 4-in, 220V, S.S.) shall be used to heat-bond the seams for the engineered synthetic turf.
- Since the temperature and speed controls of the DemTech VM-20 machine are variable and can be increased / decreased depending on weather and environment conditions, the temperature and speed shall be confirmed with a trial seam. This trial seam shall be field tested. Trial seams shall be performed at the being of each day and during the day when the weather (i.e., temperature) conditions change.
- Field testing of this trial seam consists of the following:
  - Observe the weld and confirm that the geotextile backings are not melting. If they are melting, then the machine is too hot.
  - Observe and feel the welded seam in order to confirm that there is a stiff, inner core which is continuous along the weld.
  - Observe and confirm that the welds may not be pulled or peeled apart. If it can, there was not enough heat during the welding process. Pulled or peeled seams shall be re-seamed or patched with a cap.
  - All seams shall be continuous. These seams shall be verified by the installer that they are continuous by running their fingers along the seam. If there is any penetration of their fingers into the seam, the installer will need to use a hand-held Leister at the location of the penetration in the seam in order to weld it continuously. The seam will need to be re-inspected by the installer.
- Production field seams shall be performed in the same manner as trial seams. The field seams shall be inspected every hour at a minimum. This inspection of the field seams shall be the same as the inspection for the trial seams.
- Burnouts shall be patched.
- All seams not passing the visual inspection shall be repaired.
- After seaming operations, the edges of the synthetic turf panels shall be sufficiently anchored with sandbags in the top of slope perimeter anchor trenches unless otherwise noted on the construction drawings.

5.3.3 Repairs and Tie-Ins Procedures for Engineered Turf (HydroTurf® CS and Z)

When Repairs, caps and tie-ins of engineered turf are needed, the following shall be performed:

- Repairs to engineered turf shall be completed by using a heat-bonded seam.
- All tie-in seams along flatter slope (i.e. 15% or less) with length greater than 25 feet shall use the DemTech VM-20 single wedge welder (outfitted with the synthetic turf welding kit) so a continuous, consistent pressure is achieved throughout the seam.
- A hand-held heat gun (i.e. Leister) with a pressure wheel should be used in shorter or smaller concentrated areas (i.e., butt seams, caps or patches). The hand leister shall be immediately followed by a press wheel providing a constant pressure.
- Hand leistering shall be field tested with a trial seam to confirm proper seaming.
- The quality of these trial and field welds shall be confirmed by the following visual observations:
  - Observe the weld and confirm that the geotextile backings are not melting. If they are melting, then the machine is too hot.
  - Observe and feel the welded seam in order to confirm that there is a stiff, inner core which is continuous along the weld.
  - Observe and confirm that the welds may not be pulled or peeled apart. If it can, there was not enough heat during the welding process. Pulled or peeled seams shall be re-seamed or patched with a cap.
  - All hand-leistered seams shall be continuous. These seams shall be verified by the installer that they are continuous by running their fingers along the seam. If there is any penetration of their fingers into the seam, the installer will need to use a hand-held Leister at the location of the penetration in order to weld the seam continuously. The seam will need to be re-inspected by the installer.

5.4 Equipment on Engineered Turf (HydroTurf® CS and Z)

No equipment shall be allowed on slopes exceeding 15% until HydroBinder® Infill is in place. On flatter slopes, ATV type vehicles and / or rubber tracked skid steer machines will be allowed prior to infill placement if their ground pressure is less than 5 psi. Post construction and after 28 days of curing of the HydroBinder®, vehicle (ground) tire pressures should be limited on the HydroTurf® system to less than 35 psi. Driving should be limited to areas where the subgrade under the HydroTurf® is well-compacted, firm and unyielding.

6.0 HydroBinder® Infill (HydroTurf® CS and Z)

HydroBinder® Infill is a dry, high-strength cementitious mix. It is provided by Watershed Geosynthetics with the HydroTurf™ system. When the HydroTurf™ system is installed and HydroBinder® infill is placed, it creates a hardened revetment armoring that can resist the forces from high hydraulic flow velocities. The HydroBinder® infill is placed dry, groomed into the engineered synthetic turf and hydrated after placement.

6.1 Placement of HydroBinder™ Infill (HydroTurf™ CS and Z)

HydroBinder® Infill shall be placed as follows:

- HydroBinder® is delivered to the jobsite on pallets in either 3000# bulk bags (1 per pallet) or 80# bags (42 per pallet). It is delivered on a flatbed with 16 pallets (typical) per truckload.
- The HydroBinder® shall be installed into the turf while it is in a dry state.
- Prior to placing the HydroBinder®, the engineered turf shall be dry. If the turf is wet from rain or dew, the installer shall wait until it is dry. The installer may attempt to speed up the drying process by using a blower (i.e., leaf blower, industrial blower, etc.).
- HydroBinder™ shall not be installed in inclement, wet or rainy weather, or the threat of inclement weather. Also, the HydroBinder® shall not be installed in freezing temperatures.
- The HydroBinder® infill shall be placed at a minimum thickness of ¾-in. This thickness is achieved by placing approximately 6 to 7 lbs/sf of the dry HydroBinder® over the engineered turf.
- The infill is to be placed / spread using a manual drop spreader, top-dresser and/or drop spreader attached to low ground pressure equipment with adequate dust control.
- Manual hand spreading is acceptable when equipment is not practical.
- If weep holes are required for draining the internal drainage layer through the engineered turf (HydroTurf® CS), remove the HydroBinder® in the areas of the weep holes prior to hydration or block the weep hole locations prior to infilling. Blocks may consist of pipe, dowels, etc. Weep holes are typically ½ to ¾-in diameter and are located at the toe of slope on 2-ft centers.

6.2 Brushing of the HydroBinder™ Infill (HydroTurf® CS and Z)

The HydroBinder® infill will need to be worked into the tufted fibers of the engineered turf such that the turf fibers are in an upright position. This can be achieved as follows:

- The infill shall be worked into the tuft fibers so the tuft fibers are in an upright position with the infill at a measurable ¾ inch minimum depth. This is achieved with common mechanical turf broom, power broom, shop broom, yard rakes, or greens groomer rakes.
- Brushing should be performed in all four directions starting with the direction against the lay of the fibers. Multiple passes may be required.
- The HydroBinder® may need to be placed in 2 to 4 lifts with brushing in between lifts to effectively work the material into the tufts and achieve fibers that are upright.
- The engineered turf shall be visually inspected to confirm that the turf fibers are upright and that there are no trapped fibers.
- Thickness measurements of the HydroBinder® infill shall be taken using a caliper or equivalent device. Measurements shall be taken at a minimum frequency of 5 measurements per 1,000 sf (for smaller projects) or 20 per acre (for larger projects) of installed area.
- The desired HydroBinder® infill thickness shall be achieved prior to the hydration process.

6.3 Hydration of the HydroBinder® Infill (HydroTurf® CS and Z)

The HydroBinder® infill shall be hydrated in place as follows:

- The hydration process shall occur on the same day as the HydroBinder® infill placement.
- The infill shall be hydrated thoroughly with a light and consistent spray of water to avoid displacement of the non-hydrated infill. Estimated application rate is between 0.12 and 0.20 gallons per square foot of area.
- The installer shall not overhydrate the infill so that water begins to runoff and cause loss of cement infill during the process. The general objective is to soak the area to start the hydration process but not to inundate with water beyond saturation of the infill.
- Visual verification can be performed that the HydroBinder® infill has been fully hydrated, and not over hydrated. Visually observe that the top of the HydroBinder has a wet sheen (denoting saturation) but that water is not ponding on top. Also, excavate (with finger or small tool) into the HydroBinder® to confirm full hydration of the section has been achieved.
- To improve curing, the hydrated area may be covered with plastic sheeting.
- If freezing temperatures are expected during the night, the hydrated area should be covered with burlap and / or plastic sheeting.
- The HydroBinder® infill shall harden within 24 hours following hydration, and shall reach its maximum compressive strength at 28 days. If the HydroBinder has not hardened in 24 hours, it will need to be removed and replaced.
- Personnel access on the HydroTurf® shall be prohibited for 24-hr following the hydration of the HydroBinder®.
- Once hydration is completed and the HydroBinder® has set up, backfill and compaction of the anchor trenches may be performed.

6.4 Cold Weather Placement and Curing of the HydroBinder® Infill (HydroTurf® CS and Z)

Cold weather placement and curing techniques for HydroBinder® shall be consistent with industry standard techniques used for concrete and cement products. The following guidelines are suggested:

- Follow the procedures in American Concrete Institute (ACI) 306 – Guide to Cold Weather Concreting.
- ACI 306 defines cold weather as three consecutive days of the following:
  - Average daily temperature falls below 40 dg F; or
  - The air temperature does not rise above 50 deg F for more than half of a day in one 24 hour period.
- At the time of HydroBinder® placement, the subgrade and surface of the engineered turf shall be at a temperature of at least 36 deg F and rising.
- Ensure that frost or frozen surfaces are thawed with no standing water.
- If the temperature can fall below 32 °F within 24 hours of application, heated tarps and/or insulated blankets are required to maintain the temperature above 50 deg F.
- Heated tarps and/or insulated blankets are required to maintain the temperature above 50 deg F for a period of at least 7 days.

- Heated tarps may dry out the HydroBinder®. Do not allow it to dry out. You may need to add moisture and use impermeable covers.

The project design engineer and/or resident engineer shall provide technical specifications and guidance for cold weather concreting based upon your specific project particulars (i.e., geographical location, weather, and time of year), and the engineer should review and approve all proposed installation methods.

6.5 Penetrating Colloidal Concrete Treatment for the HydroBinder® Infill (Optional for HydroTurf® CS and Z)

Penetrating colloidal concrete treatment (PCCT) is an optional liquid application and treatment for the freeze / thaw protection of the HydroBinder® infill. It should be applied to the HydroBinder® when specified. The PCCT shall be applied as follows:

- PCCT shall ideally be stored in a location that is dry and between 35 °F to 100 °F (2 °C to 38 °C) ambient temperature. Optimal storage is at the middle of the temperature range. Protect the PCCT from freezing.
  - The following shall be followed when applying the PCCT:
    - The PCCT product and the HydroBinder® surface shall be at temperature of at least 36 deg F (2 deg C) and rising.
    - Do not apply on frozen substrate or when temperature can fall below 32 °F within 24 hours of application.
    - Ensure that frost or frozen surfaces are thawed with no standing water.
    - Areas of standing water shall be removed prior to application.
    - Do not apply unprotected during periods of high winds.
    - PCCT shall not be applied in inclement, wet or rainy weather, or the threat of inclement weather.
    - Do not apply when substrate is 90°F (32°C) or higher. If surface temperature is higher than 90°F (32°C) then pre-wetting with water is required. Be sure to remove any puddles before applying of SCP.
    - When hot temperature and direct sunlight conditions exist, apply a fine mist spray of water on the surface after application of PCCT.
  - Apply PCCT as soon as the HydroBinder® infill is hard enough to walk on without damage to the surface.
  - Use a 1,500-psi (10.5 MPa) airless sprayer set at a pressure that will not damage the surface [i.e., approximately 400 to 900 psi (2.5 to 6.5 MPa)].
  - Hold wand and spray the PCCT 6 inches (15 cm) from the surface of the HydroBinder® at a 90º angle.
  - PCCT must be applied using an overlapping spray pattern of 50% on the previous run.
  - Any area that absorbs product faster than 10 minutes will need to be reapplied until the product no longer absorbs faster than 15 minutes.
  - If PCCT has absorbed thoroughly in the majority of the area, but there is pooling in the low areas, use a broom to spread additional PCCT into the areas already penetrated. Do not allow PCCT to dry in pools. Remove excess PCCT with a damp mop. Apply at a rate of approximately 160 ft^2 per gallon of PCCT. If necessary, spray a second application of PCCT.

- For sloped applications, work from lowest to highest elevation. Very light and repeated spray passes should be made on the same area until the concrete surface no longer accepts PCCT. Move onto next area after achieving "point of rejection".

7.0 Backfilling of the Anchor Trenches (HydroTurf® CS and Z)

Backfilling of the anchor trenches for the HydroTurf® CS shall be performed as follows:

- The structured geomembrane component shall be in intimate contact with the anchor trench inside wall and bottom. Wrinkles, ripples, fish mouths, and/or bunching shall be removed and properly patched.
- The structured geomembrane shall not extend up the outside wall of the anchor trench. It shall be trimmed short of the outside wall and shall extend a minimum of ¾ of the width of the anchor trench.
- The engineered synthetic turf component shall be in intimate contact with the structured geomembrane. Wrinkles, ripples, fish mouths, and/or bunching shall be removed and properly patched.
- The engineered synthetic turf shall be trimmed so that it does not extend onto the bottom of the anchor trench. It shall be trimmed just short of the bottom and shall extend a minimum of ¾ of the depth of the anchor trench.
- During filling of the anchor trench with compacted soil or concrete backfill, the contractor shall maintain that the geomembrane is in intimate contact with the trench wall and bottom and that the engineered synthetic turf is in intimate contact with the structured geomembrane.
- Soil backfill shall be compacted in accordance with the specifications for engineered fill. Concrete backfill shall be vibrated in place in accordance with standard industry techniques.

Backfilling of the anchor trenches for the HydroTurf® Z shall be performed as follows:

- The engineered synthetic turf component shall be in intimate contact with the anchor trench inside wall and bottom. Wrinkles, ripples, fish mouths, and/or bunching shall be removed and properly patched.
- The engineered synthetic turf shall not extend up the outside wall of the anchor trench. It shall be trimmed short of the outside wall and shall extend a minimum of ¾ of the width of the anchor trench.
- During filling of the anchor trench with compacted soil or concrete backfill, the contractor shall maintain that the geomembrane is in intimate contact with the trench wall and bottom and that the engineered synthetic turf is in intimate contact with the structured geomembrane.
- Soil backfill shall be compacted in accordance with the specifications for engineered fill. Concrete backfill shall be vibrated in place in accordance with standard industry techniques.

Revision 3: December 19, 2012
Revision Schedule on pg. 9

GRI GT13(a) – ASTM Version*

Standard Specification for

"Test Methods and Properties for Geotextiles Used as Separation Between Subgrade Soil and Aggregate"

This specification was developed by the Geosynthetic Research Institute (GRI) with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

1. Scope

1.1 This specification covers geotextile test methods properties for subsequent use as separation between subgrade soil and aggregate predominantly in pavement systems.

Note 1: While separation occurs in every geotextile application, this pavement-related specification focuses on subgrade soils being "firm" as indicated by CBR values in ASTM D1883 higher than 3.0 (soaked) or 8.0 (unsoaked).

1.2 This specification sets forth a set of physical, mechanical and endurance properties that must be met, or exceeded, by the geotextile being manufactured.

1.3 In the context of quality systems and management, this specification represents a manufacturing quality control (MQC) document. However, its general use is essentially as a recommended design document.

1.4 This specification is intended to assure both good quality and performance of fabrics used as geotextile separators but is possibly not adequate for the complete

*This GRI standard is developed by the Geosynthetic Research Institute through consultation and review by the member organizations. This specification will be reviewed at least every 2-years, or on an as-required basis. In this regard it is subject to change at any time. The most recent revision date is the effective version.

specification in a specific situation. Additional tests, or more restrictive values for the tests indicated, may be necessary under conditions of a particular application.

1.5 This standard specification does not address installation practice. This item is addressed in the geosynthetics literature dealing with this particular application and under unique situations might require modifications, e.g., higher values and/or additional test properties.

2.2 AASHTO Specification

M288-05 Geotextile Specification for Highway Applications

3. Definitions

3.1 Formulation - The mixture of a unique combination of ingredients identified by type, properties and quantity. For geotextiles, a formulation is defined as the exact percentages and types of resin(s), additives and/or carbon black.

3.2 Manufacturing Quality Control (MQC) - A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of geosynthetic materials and is necessary to ensure minimum (or maximum) specified values in the manufactured product. MQC refers to measures taken by the manufacturer to determine compliance with the requirements for materials and workmanship as stated in certification documents and contract specifications [ref. EPA/600/R-93/182].

3.3 Minimum Average Roll Value (MARV) – For geosynthetics, a manufacturing quality control tool used to allow manufacturers to establish published values such that the user/purchaser will have a 97.7% confidence that the property in question will meet published values. For normally distributed data, "MARV" is calculated

as the typical value minus two (2) standard deviations from documented quality control test results for a defined population from one specific test method associated with one specific property.

3.4 Minimum Value -- The lowest sample value from documented manufacturing quality control test results for a defined population from one test method associated with one specific property.

3.5 Maximum Value -- The highest sample value from documented manufacturing quality control test results for a defined population from one test method associated with one specific property.

3.6 Separation – The placement of a flexible porous geosynthetic between dissimilar materials so the integrity and functioning of both materials can remain intact or be improved.

Note 2: For separation of stone base courses overlying soil subgrades this primary function simultaneously prevents the stone from intruding down into the soil and the soil from pumping up into the stone.

4. Material Classification and Formulation

4.1 This specification covers geotextiles used as separation materials.

4.2 The polymer types are mainly polypropylene, but also polyester or polyethylene. Other polymers are also possible in this regard.

4.3 The type of geotextile style is not designated. However a distinction can be made based on the elongation criteria of 50%.

Note 3: It is assumed that nonwoven fabrics break at elongations higher than 50%. Woven fabrics always break at elongations significantly lower than 50%.

5. Specification Requirements

5.1 The geotextiles for use as separator shall conform to Tables 1or 2. Table 1 is given in English units and Table 2 is in SI (Metric) units. The conversion from English to SI units is "soft", i.e., rounded off to an approximate value. All test methods are based on ASTM Standards.

Note 4: The numeric relationships between this specification based on ASTM Test Methods and GRI –GT13(b) based on ISO Test Methods have been developed at the Geosynthetic Institute.

5.2 The required values for most properties in Tables 1 and 2 are to be minimum average roll values (MARV). The exceptions are AOS which is a maximum average roll value (MaxARV), and UV stability which is a minimum average value.

5.3 The required class is determined by the severity of installation conditions (i.e., size of equipment, condition of subgrade, thickness of covering lift, etc.). Table 3 gives guidance in this respect.

6. Workmanship and Appearance

6.1 The finished geotextile shall have good appearance qualities. It shall be free from such defects that would affect the specific properties of the geotextile, or its proper functioning.

6.2 General manufacturing procedures shall be performed in accordance with the manufacturer's internal quality control guide and/or documents.

7. MQC Sampling, Testing, and Acceptance

7.1 Geotextiles shall be subject to sampling and testing to verify conformance with this specification. Sampling shall be in accordance with the most current modification of ASTM Standard D 4354, using the section titled, "Procedure for Sampling for Purchaser's Specification Conformance Testing." In the absence of purchaser's testing, verification may be based on manufacturer's certifications as a result of testing by the manufacturer of quality assurance samples obtained using the procedure for Sampling for Manufacturer's Quality Assurance (MQA) Testing. A lot size shall be considered to be the shipment quantity of the given product or a truckload of the given product, whichever is smaller.

7.2 Testing shall be performed in accordance with the method referenced in this specification for the indicated application. The number of specimens to test per sample is specified by each test method. Geotextile product acceptance shall be based on ASTM D4759. Product acceptance is determined by comparing the average test results of all specimens within a given sample to the specification MARV. Refer to ASTM D 4759 for more details regarding geotextile acceptance procedures.

8. MQC Retest and Rejection

8.1 If the results of any test do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the manufacturing protocol as set forth in the manufacturer's quality manual.

9. Shipment and Storage

9.1 Geotextile labeling, shipment, and storage shall follow ASTM D 4873. Product labels shall clearly show the manufacturer or supplier name, style, and roll number. Each shipping document shall include a notation certifying that the material is in accordance with the manufacturer's certificate.

9.2 Each geotextile roll shall be wrapped with a material that will protect the geotextile, including the ends of the roll, from damage due to shipment, water, sunlight and

contaminants. The protective wrapping shall be maintained during periods of shipment and storage.

Note 5: The project specification shall be very explicit as to the maximum exposure time between the geotextile being removed from the wrapper and being backfilled with soil or covered with another geosynthetic.

9.3 During storage, geotextile rolls shall be elevated off the ground and adequately covered to protect them from the following: site construction damage, precipitation, extended ultraviolet radiation including sunlight, chemicals that are strong acids or strong bases, flames including welding sparks, temperatures in excess of 160°F (71°C), and any other environmental condition that may damage the property values of the geotextile.

10. Certification

10.1 The contractor shall provide to the engineer a certificate stating the name of the manufacturer, product name, style number, chemical composition of the filaments or yarns, and other pertinent information to fully describe the geotextile.

10.2 The manufacturer is responsible for establishing and maintaining a quality control program to assure compliance with the requirements of the specification. Documentation describing the quality control program shall be made available upon request.

10.3 The manufacturer's certificate shall state that the finished geotextile meets the requirements of the specification as evaluated under the manufacturer's quality control program. A person having legal authority to bind the manufacturer shall attest to the certificate.

10.4 Either mislabeling or misrepresentation of materials shall be reason to reject those geotextile products.

English Units

Table 1(a) – Geotextile Properties Class 1 (High Survivability)

Property[1]	ASTM Test	Unit	Elongation < 50%	Elongation ≥ 50%
Grab Tensile Strength	D 4632	lb	315	203
Trapezoid Tear Strength	D 4533	lb	112	79
CBR Puncture Strength	D 6241	lb	630	440

Permittivity	D 4491	sec-1	0.02	0.02
Apparent Opening Size	D 4751	mm	0.60	0.60
Ultraviolet Stability[2]	D 7238	% Str. Ret. @ 500 lt. hrs.	50	50

Notes:

(1) All values are minimum average roll values (MARV) except AOS which is a maximum average roll value (MaxARV) and UV stability which is a minimum average value.

(2) Evaluation to be on 50 mm strip tensile specimens after 500 hours exposure.

Table 3 - Required Degree of Survivability as a Function of Subgrade Conditions, Construction Equipment and Lift Thickness
(Class 1, 2 and 3 Properties are Given in Table 1 and 2; Class 1 + Properties are Higher than Class 1 but Not Defined at this Time)

	Low ground-pressure equipment ≤ 25 kPa (3.6 psi)	Medium ground-pressure equipment > 25 to ≤ 50 kPa (>3.6 to ≤ 7.3 psi)	High ground-pressure equipment > 50 kPa (> 7.3 psi)
Subgrade has been cleared of all obstacles except grass, weeds, leaves, and fine wood debris. Surface is smooth and level so that any shallow depressions and humps do not exceed 450 mm (18 in.) in depth or height. All larger depressions are filled. Alternatively, a smooth working table may be placed.	Low (Class 3)	Moderate (Class 2)	High (Class 1)
Subgrade has been cleared of obstacles larger than small to moderate-sized tree limbs and rocks. Tree trunks and stumps should be removed or covered with a partial working table. Depressions and humps should not exceed 450 mm (18 in.) in depth or height. Larger depressions should be filled.	Moderate (Class 2)	High (Class 1)	Very High (Class 1+)
Minimal site preparation is required. Trees may be felled, delimbed, and left in place. Stumps should be cut to project not more than ± 150 mm (6 in.) above subgrade. Fabric may be draped directly over the tree trunks, stumps, large depressions and humps, holes, stream channels, and large boulders. Items should be removed only if placing the fabric and cover material over them will distort the finished road surface.	High (Class 1)	Very high (Class 1+)	Not recommended

*Recommendations are for 150 to 300 mm (6 to 12 in.) initial lift thickness. For other initial lift thicknesses:
300 to 450 mm (12 to 18 in.): reduce survivability requirement one level;
450 to 600 mm (18 to 24 in.): reduce survivability requirement two levels;
> 600 mm (24 in.): reduce survivability requirement three levels

Note 1: While separation occurs in every geotextile application, this pavement-related specification focuses on subgrade soils being "firm" as indicated by CBR values higher than 3.0 (soaked) or 8.0 (unsoaked).

GRI Test Method GM13*

Standard Specification for

"Test Methods, Test Properties and Testing Frequency for
High Density Polyethylene (HDPE) Smooth and Textured Geomembranes"

This specification was developed by the Geosynthetic Research Institute (GRI), with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

1. Scope

1.1 This specification covers high density polyethylene (HDPE) geomembranes with a formulated sheet density of 0.940 g/ml, or higher, in the thickness range of 0.75 mm (30 mils) to 3.0 mm (120 mils). Both smooth and textured geomembrane surfaces are included.

1.2 This specification sets forth a set of minimum, physical, mechanical and chemical properties that must be met, or exceeded by the geomembrane being manufactured. In a few cases a range is specified.

1.3 In the context of quality systems and management, this specification represents manufacturing quality control (MQC).

Note 1: Manufacturing quality control represents those actions taken by a manufacturer to ensure that the product represents the stated objective and properties set forth in this specification.

1.4 This standard specification is intended to ensure good quality and performance of HDPE geomembranes in general applications, but is possibly not adequate for the complete specification in a specific situation. Additional tests, or more restrictive

*This GRI standard is developed by the Geosynthetic Research Institute through consultation and review by the member organizations. This specification will be reviewed at least every 2-years, or on an as-required basis. In this regard it is subject to change at any time. The most recent revision date is the effective version.

Copyright © 1997, 1998, 1999, 2000, 2003, 2006 Geosynthetic Institute
All rights reserved

values for test indicated, may be necessary under conditions of a particular application.

Note 2: For information on installation techniques, users of this standard are referred to the geosynthetics literature, which is abundant on the subject.

2.3 U. S. Environmental Protection Agency Technical Guidance Document "Quality Control Assurance and Quality Control for Waste Containment Facilities," EPA/600/R-93/182, September 1993, 305 pgs.

3. Definitions

Manufacturing Quality Control (MQC) - A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of geosynthetic materials and is necessary to ensure minimum (or maximum) specified values in the manufactured product. MQC refers to measures taken by the manufacturer to determine compliance with the requirements for materials and workmanship as stated in certification documents and contract specifications.
ref. EPA/600/R-93/182

Manufacturing Quality Assurance (MQA) - A planned system of activities that provides assurance that the materials were constructed as specified in the certification documents and contract specifications. MQA includes manufacturing facility inspections, verifications, audits and evaluation of the raw materials (resins and additives) and geosynthetic products to assess the quality of the manufactured materials. MQA refers to measures taken by the MQA organization to determine if the manufacturer is in compliance with the product certification and contract specifications for the project.
ref. EPA/600/R-93/182

Formulation, n - The mixture of a unique combination of ingredients identified by type, properties and quantity. For HDPE polyethylene geomembranes, a formulation is defined as the exact percentages and types of resin(s), additives and carbon black.

4. Material Classification and Formulation

4.1 This specification covers high density polyethylene geomembranes with a formulated sheet density of 0.940 g/ml, or higher. Density can be measured by ASTM D1505 or ASTM D792. If the latter, Method B is recommended.

4.2 The polyethylene resin from which the geomembrane is made will generally be in the density range of 0.932 g/ml or higher, and have a melt index value per ASTM D1238 of less than 1.0 g/10 min.

4.3 The resin shall be virgin material with no more than 10% rework. If rework is used, it must be a similar HDPE as the parent material.

4.4 No post consumer resin (PCR) of any type shall be added to the formulation.

5. Physical, Mechanical and Chemical Property Requirements

5.1 The geomembrane shall conform to the test property requirements prescribed in Tables 1 and 2. Table 1 is for smooth HDPE geomembranes and Table 2 is for single and double sided textured HDPE geomembranes. Each of the tables are given in English and SI (metric) units. The conversion from English to SI (metric) is soft.

Note 3: The tensile strength properties in this specification were originally based on ASTM D 638 which uses a laboratory testing temperature of 23°C ± 2°C. Since ASTM Committee D35 on Geosynthetics adopted ASTM D 6693 (in place of D 638), this GRI Specification followed accordingly. The difference is that D 6693 uses a testing temperature of 21°C ± 2°C. The numeric values of strength and elongation were not changed in this specification. If a dispute arises in this regard, the original temperature of 23°C ± 2°C should be utilized for testing purposes.

Note 4: There are several tests often included in other HDPE specifications which are omitted from this standard because they are outdated, irrelevant or generate information that is not necessary to evaluate on a routine MQC basis. The following tests have been purposely omitted:

- Volatile Loss
- Dimensional Stability
- Coeff. of Linear Expansion
- Resistance to Soil Burial
- Low Temperature Impact
- ESCR Test (D 1693)
- Wide Width Tensile
- Water Vapor Transmission
- Water Absorption
- Ozone Resistance
- Modulus of Elasticity
- Hydrostatic Resistance
- Tensile Impact
- Field Seam Strength
- Multi-Axial Burst
- Various Toxicity Tests

Note 5: There are several tests which are included in this standard (that are not customarily required in other HDPE specifications) because they are relevant and important in the context of current manufacturing processes. The following tests have been purposely added:

- Oxidative Induction Time
- Oven Aging
- Ultraviolet Resistance
- Asperity Height of Textured Sheet (see Note 6)
- Trouser Tear (see Note 7)

Note 6: The minimum average value of asperity height does not represent an expected value of interface shear strength. Shear strength associated with geomembranes is both site-specific and product-specific and should be determined by direct shear testing using ASTM D5321/ASTM D6243 as prescribed. This testing should be included in the particular site's CQA conformance testing protocol for the geosynthetic materials involved, or formally waived by the Design Engineer, with concurrence from the Owner prior to the deployment of the geosynthetic materials.

Note 7: There are other tests in this standard, focused on a particular property, which are updated to current standards. The following are in this category:

- Thickness of Textured Sheet
- Puncture Resistance
- Stress Crack Resistance
- Carbon Black Dispersion (In the viewing and subsequent quantitative interpretation of ASTM D 5596 only near spherical agglomerates shall be included in the assessment).

Note 8: There is a GRI test currently included in this standard. Since this topic is not covered in ASTM standards, this is necessary. It is the following:

- UV Fluorescent Light Exposure

5.2 The values listed in the tables of this specification are to be interpreted according to the designated test method. In this respect they are neither minimum average roll values (MARV) nor maximum average roll values (MaxARV).

5.3 The properties of the HDPE geomembrane shall be tested at the minimum frequencies shown in Tables 1 and 2. If the specific manufacturer's quality control guide is more stringent and is certified accordingly, it must be followed in like manner.

Note 9: This specification is focused on manufacturing quality control (MQC). Conformance testing and manufacturing quality assurance (MQA) testing are at the discretion of the purchaser and/or quality assurance engineer, respectively.

6. Workmanship and Appearance

6.1 Smooth geomembrane shall have good appearance qualities. It shall be free from such defects that would affect the specified properties of the geomembrane.

6.2 Textured geomembrane shall generally have uniform texturing appearance. It shall be free from agglomerated texturing material and such defects that would affect the specified properties of the geomembrane.

6.3 General manufacturing procedures shall be performed in accordance with the manufacturer's internal quality control guide and/or documents.

7. MQC Sampling

7.1 Sampling shall be in accordance with the specific test methods listed in Tables 1 and 2. If no sampling protocol is stipulated in the particular test method, then test specimens shall be taken evenly spaced across the entire roll width.

7.2 The number of tests shall be in accordance with the appropriate test methods listed in Tables 1 and 2.

7.3 The average of the test results should be calculated per the particular standard cited and compared to the minimum value listed in these tables, hence the values listed are the minimum average values and are designated as "min. ave."

8. MQC Retest and Rejection

8.1 If the results of any test do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the manufacturing protocol as set forth in the manufacturer's quality manual.

9. Packaging and Marketing

9.1 The geomembrane shall be rolled onto a substantial core or core segments and held firm by dedicated straps/slings, or other suitable means. The rolls must be adequate for safe transportation to the point of delivery, unless otherwise specified in the contract or order.

10. Certification

10.1 Upon request of the purchaser in the contract or order, a manufacturer's certification that the material was manufactured and tested in accordance with this specification, together with a report of the test results, shall be furnished at the time of shipment.

— or —									
(b) High Pressure OIT	D 5885	400 min.	400 min.	400 min.	400 min.	400 min.	400 min.	400 min.	
Oven Aging at 85°C *(5), (6)*	D 5721								
(a) Standard OIT (min. ave.) - % retained after 90 days	D 3895	55%	55%	55%	55%	55%	55%	55%	per each formulation
— or —									
(b) High Pressure OIT (min. ave.) - % retained after 90 days	D 5885	80%	80%	80%	80%	80%	80%	80%	
UV Resistance *(7)*	GM 11								
(a) Standard OIT (min. ave.)	D 3895	N.R. *(8)*	N.R. *(8)*	N.R. *(8)*	N.R. *(8)*	N.R. *(8)*	N.R. *(8)*	N.R. *(8)*	per each formulation
— or —									
(b) High Pressure OIT (min. ave.) - % retained after 1600 hrs *(9)*	D 5885	50%	50%	50%	50%	50%	50%	50%	

(1) Machine direction (MD) and cross machine direction (XMD) average values should be on the basis of 5 test specimens each direction.
Yield elongation is calculated using a gage length of 1.3 inches
Break elongation is calculated using a gage length of 2.0 in.

(2) The yield stress used to calculate the applied load for the SP-NCTL test should be the manufacturer's mean value via MQC testing.

(3) Other methods such as D 1603 (tube furnace) or D 6370 (TGA) are acceptable if an appropriate correlation to D 4218 (muffle furnace) can be established.

(4) Carbon black dispersion (only near spherical agglomerates) for 10 different views:
9 in Categories 1 or 2 and 1 in Category 3

(5) The manufacturer has the option to select either one of the OIT methods listed to evaluate the antioxidant content in the geomembrane.

(6) It is also recommended to evaluate samples at 30 and 60 days to compare with the 90 day response.

(7) The condition of the test should be 20 hr. UV cycle at 75°C followed by 4 hr. condensation at 60°C.

(8) Not recommended since the high temperature of the Std-OIT test produces an unrealistic result for some of the antioxidants in the UV exposed samples.

(9) UV resistance is based on percent retained value regardless of the original HP-OIT value.

Electronic Filing: Received, Clerk's Office 09/28/2020

UV Resistance *(9)* (a) Standard OIT (min. ave.) — or — (b) High Pressure OIT (min. ave.) - % retained after 1600 hrs *(11)*	GM11 D 3895 D 5885	N.R. *(10)* 50%	N.R. *(10)* 50%	N.R. *(10)* 50%	N.R. *(10)* 50%	N.R. *(10)* 50%	N.R. *(10)* 50%	N.R. *(10)* 50%	per each formulation

(1) Of 10 readings; 8 out of 10 must be ≥ 0.18 mm, and lowest individual reading must be ≥ 0.13 mm; also see Note 6.

(2) Alternate the measurement side for double sided textured sheet

(3) Machine direction (MD) and cross machine direction (XMD) average values should be on the basis of 5 test specimens each direction.
Yield elongation is calculated using a gage length of 33 mm
Break elongation is calculated using a gage length of 50 mm

(4) The SP-NCTL test is not appropriate for testing geomembranes with textured or irregular rough surfaces. Test should be conducted on smooth edges of textured rolls or on smooth sheets made from the same formulation as being used for the textured sheet materials.
The yield stress used to calculate the applied load for the SP-NCTL test should be the manufacturer's mean value via MQC testing.

(5) Other methods such as D 1603 (tube furnace) or D 6370 (TGA) are acceptable if an appropriate correlation to D 4218 (muffle furnace) can be established.

(6) Carbon black dispersion (only near spherical agglomerates) for 10 different views:
9 in Categories 1 or 2 and 1 in Category 3

(7) The manufacturer has the option to select either one of the OIT methods listed to evaluate the antioxidant content in the geomembrane.

(8) It is also recommended to evaluate samples at 30 and 60 days to compare with the 90 day response.

(9) The condition of the test should be 20 hr. UV cycle at 75°C followed by 4 hr. condensation at 60°C.

(10) Not recommended since the high temperature of the Std-OIT test produces an unrealistic result for some of the antioxidants in the UV exposed samples.

(11) UV resistance is based on percent retained value regardless of the original HP-OIT value.

Electronic Filing: Received, Clerk's Office 09/28/2020

Adoption and Revision Schedule
for
HDPE Specification per GRI-GM13

"Test Methods, Test Properties, Testing Frequency for
High Density Polyethylene (HDPE) Smooth and Textured Geomembranes"

Adopted:	June 17, 1997
Revision 1:	November 20, 1998; changed CB dispersion from allowing 2 views to be in Category 3 to requiring all 10 views to be in Category 1 or 2. Also reduced UV percent retained from 60% to 50%.
Revision 2:	April 29, 1999: added to Note 5 after the listing of Carbon Black Dispersion the following: "(In the viewing and subsequent quantitative interpretation of ASTM D5596 only near spherical agglomerates shall be included in the assessment)" and to Note (4) in the property tables.
Revision 3:	June 28, 2000: added a new Section 5.2 that the numeric table values are neither MARV or MaxARV. They are to be interpreted per the the designated test method.
Revision 4:	December 13, 2000: added one Category 3 is allowed for carbon black dispersion. Also, unified terminology to "strength" and "elongation".
Revision 5:	May 15, 2003: Increased minimum acceptable stress crack resistance time from 200 hrs to 300 hrs.
Revision 6:	June 23, 2003: Adopted ASTM D 6693, in place of ASTM D 638, for tensile strength testing. Also, added Note 2.
Revision 7:	February 20, 2006: Added Note 6 on Asperity Height clarification with respect to shear strength.
Revision 8:	Removed recommended warranty from specification.
Revision 9:	June 1, 2009: Replaced GRI-GM12 test for asperity height of textured geomembranes with ASTM D 7466.
Revision 10	April 11, 2011: Added alternative carbon black content test methods

GRI Test Method GM19*

Standard Specification for

Seam Strength and Related Properties of Thermally Bonded Polyolefin Geomembranes

This specification was developed by the Geosynthetic Research Institute (GRI), with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

1. Scope

1.1 This specification addresses the required seam strength and related properties of thermally bonded polyolefin geomembranes; in particular, high density polyethylene (HDPE), linear low density polyethylene both nonreinforced (LLDPE) and scrim reinforced (LLDPE-R) and flexible polypropylene both nonreinforced (fPP) and scrim reinforced (fPP-R).

1.2 Numeric values of seam strength and related properties are specified in both shear and peel modes.

Note 1: This specification does not address the test method details or specific testing procedures. It refers to the relevant ASTM test methods where applicable.

1.3 The thermal bonding methods focused upon are hot wedge (single and dual track) and extrusion fillet.

*This GRI standard is developed by the Geosynthetic Research Institute through consultation and review by the member organizations. This specification will be reviewed at least every 5-years, or on an as-required basis. In this regard it is subject to change at any time. The most recent revision date is the effective version.

Copyright © 2002, 2003, 2005, 2013 Geosynthetic Institute
All rights reserved

Note 2: Other acceptable, but less frequently used, methods of seaming are hot air and ultrasonic methods. They are inferred as being a subcategory of hot wedge seaming.

1.4 This specification does not suggest a specific distance between destructive seam samples to be taken in the field, i.e., the sampling interval. A separate GRI Standard Practice is focused on this issue, see GRI-GM29.

1.5 This specification is only applicable to laboratory testing.

1.6 This specification does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3. Definition

3.1 Geomembrane, n – An essentially impermeable geosynthetic composed of one or more synthetic sheets used for the purpose of liquid, gas or solid containment.

3.2 Hot Wedge Seaming – A thermal technique which melts the two opposing geomembrane surfaces to be seamed by running a hot metal wedge or knife between them. Pressure is applied to the top or bottom geomembrane, or both, to form a continuous bond. Seams of this type can be made with dual bond tracks separated by a nonbonded gap. These seams are referred to as dual hot wedge seams or double-track seams.

3.3 Hot Air Seaming – This seaming technique introduces high-temperature air or gas between two geomembrane surfaces to facilitate localized surface melting. Pressure is applied to the top or bottom geomembrane, forcing together the two surfaces to form a continuous bond.

3.4 Ultrasonic Seaming - A thermal technique which melts the two opposing geomembrane surfaces to be seamed by running a ultrasonically vibrated metal wedge or knife between them. Pressure is applied to the top or bottom geomembrane, or both, to form a continuous bond. Some seams of this type are made with dual bond tracks separated by a nonbonded gap. These seams are referred to as dual-track seams or double-track seams.

3.5 Extrusion Fillet Seaming – This seaming technique involves extruding molten resin at the edge of an overlapped geomembrane on another to form a continuous bond. A depreciated method called "extrusion flat" seaming extrudes the molten resin between the two overlapped sheets. In all types of extrusion seaming the surfaces upon which the molten resin is applied must be suitably prepared, usually by a slight grinding or buffing.

4. Significance and Use

4.1 The various methods of field fabrication of seams in polyolefin geomembranes are covered in existing ASTM standards mentioned in the referenced document section. What is not covered in those documents is the numeric values of strength and related properties that the completed seam must meet, or exceed. This specification provides this information insofar as minimum, or maximum, property values are concerned when the field fabricated seams are sampled and laboratory tested in shear and peel. A separate GRI standard, GRI-GM29 (DRAFT), provides guidance as to the spacing that destructive samples should be taken in typical field installation projects.

5. Sample and Specimen Preparation

5.1 The spacing for taking field seam samples for destructive testing is provided in GRI-GM29 (DRAFT), a standard-of-practice. The process describes a progression from the most restrictive interval of 1 per 500 feet (1 per 150 m) to the complete use and reliance of the electrical leak location survey (ELLS) method. Intermediate between these extremes are variations depending upon the installers experience and performance.

5.2 The size of field seam samples is to be according to the referenced test method, e.g., ASTM D6392 or site-specific CQA plan.

5.3 The individual test specimens taken from the field seam samples are to be tested according to the referenced test method, i.e., ASTM D6392 for HDPE, LLDPE and fPP, and ASTM D751 (modified to a 150 mm + seam width gage length) for fPP-R. The specimens are to be conditioned prior to testing according to these same test methods and evaluated accordingly.

6. Assessment of Seam Test Results

6.1 HDPE seams – For HDPE seams (both smooth and textured), the strength of four out of five 1.0 inch (25 mm) wide strip specimens in shear should meet or exceed the values given in Tables 1(a) and 1(b). The fifth must meet or exceed 80% of the given values. In addition, five out five specimens should meet the shear percent elongation, calculated as follows, and exceed the values given in Tables 1(a) and 1(b):

$$E = \frac{L}{L_o}(100) \qquad (1)$$

where

E = elongation (%)
L = extension at end of test (in. or mm)
L_o = original average length (usually 1.0 in. or 25 mm)

Note 3: The assumed gage length is considered to be the unseamed sheet material on either side of the welded area. It generally will be 1.0 in. (25 mm) from the edge of the seam to the grip face.

For HDPE seams (both smooth and textured), the strength of four out of five 1.0 in. (25 mm) wide strip specimens tested in peel should meet or exceed the values given in Tables 1(a) and 1(b). The fifth must meet or exceed 80% of the given values.

In addition, the peel separation (or incursion) should not exceed the values given in Tables 1(a) and 1(b) for all five out of five specimens. The value shall be based on

the proportion of area of separated bond to the area of the original bonding as follows:

$$S = \frac{A}{A_o}(100) \qquad (2)$$

where

S = separation (%)
A = average area of separation, or incursion (in^2 or mm^2)
A_0 = original bonding area (in^2 or mm^2)

Note 4: The area of peel separation can occur in a number of nonuniform patterns across the seam width. The estimated dimensions of this separated area is visual and must be done with care and concern. The area must not include squeeze-out which is part of the welding process.

Regarding the locus-of-break patterns of the different seaming methods in shear and peel, the following are unacceptable break codes per their description in ASTM D6392 (in this regard, SIP is an acceptable break code);

Hot Wedge: AD and AD-Brk > 25%
Extrusion Fillet: AD1, AD2
Exception: AD-WLD (unless strength is achieved)

Note 5: Separation-in-plane (SIP) is a locus-of-break where the failure surface propagates within one of the seamed sheets during destructive testing (usually in the peel mode). It is not merely a surface skin effect producing a few ductile fibrils (sometimes called ductile drawdown). SIP is acceptable if the required strength, shear elongation and peel separation criteria are met.

In this regard, five out of five specimens shall result in acceptable break patterns.

6.2 LLDPE seams – For LLDPE seams (smooth, textured and scrim reinforced), the strength of four out of five 1.0 in. (25 mm) wide strip specimens in shear should meet or exceed the values given in Tables 2(a) through 2(d). The fifth must meet or exceed 80% of the given values. Note that the unreinforced specimens are 1.0 in. (25 mm) wide strips and the scrim reinforced specimens are 4.0 in. (100 mm) wide grab tests. In addition, the shear percent elongation, calculated as follows, should exceed the values given in Tables 2(a) through 2(d). All five out of five should meet the shear elongation requirement.

$$E = \frac{L}{L_o}(100) \qquad (1)$$

where
E = elongation (%)
L = extension at end of test (in. or mm)
L_o = original average length (usually 1.0 in. or 25 mm)

Note 3 (Repeated): The assumed gage length is considered to be the unseamed sheet material on either side of the welded area. It generally will be 1.0 in. (25 mm) from the edge of the seam to the grip face.

Shear elongation is not relevant to scrim reinforced geomembranes and as such is listed as "not applicable" in Tables 2 (c) and (d).

For LLDPE seams (smooth, textured and scrim reinforced), the strength of four out of five 1.0 in. (25 mm) wide strip specimens tested in peel should meet or exceed the values given in Tables 2(a) through 2(d). The fifth must meet or exceed 80% of the given values.

In addition, the peel separation (or incursion) should not exceed the values given in Tables 2(a) through 2(d). All five out of five specimens shall meet the peel separation value. The value shall be based on the proportion of area of separated bond to the area of the original bonding as follows:

$$S = \frac{A}{A_o}(100) \qquad (2)$$

where

S = separation (%)
A = average depth of separation, or incursion ($in.^2$ or mm^2)
A_0 = original bonding distance ($in.^2$ or mm^2)

Note 4 (Repeated): The area of peel separation can occur in a number of nonuniform patterns across the seam width. The estimated dimensions of this separated area is visual and must be done with care and concern. The area must not include squeeze-out which is part of the welding process.

Regarding the locus-of-break patterns of the different seaming methods in shear and peel, the following are unacceptable break codes per their description in ASTM D6392 (in this regard, SIP is an acceptable break code);

Hot Wedge: AD and AD-Brk > 25%
Extrusion Fillet: AD1, AD2
Exception: AD-WLD (unless strength is achieved)

Note 5 (Repeated): Separation-in-plane (SIP) is a locus-of-break where the failure surface propagates within one of the seamed sheets during destructive testing (usually in the peel mode). It is not merely a surface skin effect producing a few ductile fibrils (sometimes called ductile drawdown). SIP is acceptable if the required strength, shear elongation and peel separation criteria are met.

In this regard, five out of five specimens shall result in acceptable break patterns.

6.3 fPP Seams – For fPP seams (both nonreinforced and scrim reinforced), the strength of four out of five specimens in shear should meet or exceed the values given in Tables 3(a) and 3(b). The fifth must meet or exceed 80% of the given values. Note that the unreinforced specimens are 1.0 in. (25 mm) wide strips and the scrim reinforced specimens are 4.0 in. (100 mm) wide grab tests. In addition, the shear percent elongation on the unreinforced specimens, calculated as follows, should exceed the values given in Tables 3(a) and 3(b). All five out of five specimens should meet the shear elongation requirement.

$$E = \frac{L}{L_o}(100) \quad (1)$$

where
E = elongation (%)
L = extension at end of test (in. or mm)
L_o = original gauge length (usually 1.0 in. or 25 mm)

Note 3 (Repeated): The assumed gage length is considered to be the unseamed sheet material on either side of the welded area. It generally will be 1.0 in. (25 mm) from the edge of the seam to the grip face.

Shear elongation is not relevant to scrim reinforced geomembranes and as such is listed as "not applicable" in Tables 3(a) and 3(b).

For fPP seams (both nonreinforced and scrim reinforced), the strength of four out of five specimens in peel should meet or exceed the values given in Tables 3(a) and 3(b). The fifth must meet or exceed 80% of the given values. Note that the unreinforced specimens are 1.0 in. (25 mm) wide strips and the scrim reinforced specimens are grab tests. In addition, the peel percent separation (or incursion) should not exceed the values given in Tables 3(a) and 3(b). All five out of five specimens should meet the peel separation value. The values should be based on the proportion of area of separated bond to the area of the original bonding as follows.

$$S = \frac{A}{A_o}(100) \quad (2)$$

where

S = separation in (%)
A = average depth of separation, or incursion (in.^{2} or mm^2)
A_o = original bonding distance (in.^{2} or mm^2)

Note 4 (Repeated): The area of peel separation can occur in a number of nonuniform patterns across the seam width. The estimated dimensions of this separated area is visual and must be done with care and concern. The area must not include squeeze-out which is part of the welding process.

Regarding the locus-of-break patterns of the different seaming methods in shear and peel, the following are unacceptable break codes per their description in ASTM D6392 (in this regard, SIP is an acceptable break code);

Hot Wedge: AD and AD-Brk > 25%
Extrusion Fillet: AD1, AD2
Exception: AD-WLD (unless strength is achieved)

Note 5 (Repeated): Separation-in-plane (SIP) is a locus-of-break where the failure surface propagates within one of the seamed sheets during destructive testing (usually in the peel mode). It is not merely a surface skin effect producing a few ductile fibrils (sometimes called ductile drawdown). SIP is acceptable if the required strength, shear elongation and peel separation criteria are met.

In this regard, five out of five specimens shall result in acceptable break patterns.

7. Retest and Rejection

7.1 If the results of the testing of a sample do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the construction quality control or construction quality assurance plan for the particular site under construction.

8. Certification

8.1 Upon request of the construction quality assurance officer or certification engineer, an installer's certification that the geomembrane was installed and tested in accordance with this specification, together with a report of the test results, shall be furnished at the completion of the installation.

Table 1(a) – Seam Strength and Related Properties of Thermally Bonded **Smooth and Textured** High Density Polyethylene (HDPE) Geomembranes **(English Units)**

Geomembrane Nominal Thickness	30 mils	40 mils	50 mils	60 mils	80 mils	100 mils	120 mils

Electronic Filing: Received, Clerk's Office 09/28/2020

Adoption and Revision Schedule
for
Seam Specification per GRI-GM19

"Seam Strength and Related Properties of Thermally Bonded Polyolefin Geomembranes"

Adopted: February 18, 2002

Revision 1: May 15, 2003; Increased selected shear and peel test requirements, per the following:

Material	Test	Seam Type	Current GM19	Proposed GM19	Difference
HDPE	Shear	Hot Wedge	95% yield	95% yield	no change
		Extrusion	95% yield	95% yield	no change
	Peel	Hot Wedge	62% yield	72% yield	16% increase
		Extrusion	62% yield	62% yield	no change
LLDPE	Shear	Hot Wedge	1300 psi break	1500 psi break	15% increase
		Extrusion	1300 psi break	1500 psi break	15% increase
	Peel	Hot Wedge	1100 psi break	1250 psi break	14% increase
		Extrusion	1100 psi break	1100 psi break	no change

Revision 2: January 28, 2005; added Note 6 (in three locations) stating that incursion is measured on an area basis and not depth as in ASTM D6392.

Revision 3: June 4, 2010; Removed Note 6 on peel incursion since ASTM D6392 (2008) now uses area of incursion whereas previously they used linear length of incursion. Thus ASTM is now in agreement with GM19 in this regard.

Revision 4: November 15, 2010; Added Note 6 (in three locations) stating what separation-in-plane (SIP) is, and is not, and that it is acceptable if the required strength, shear elongation and peel separation criteria are met.

Revision 5: July 12, 2011; AD1 and AD2 breaks are now unacceptable even if strength is achieved.

Revision 6: October 3, 2011; Added LLDPE-R to the various geomembrane types, in particular, Tables 2(c) and 2(d) and made editorial changes.

Revision 7: November 3, 2013; clarified issues of 4 out of 5 passing strength and 5 out of 5 passing locus-of-break, shear elongation and peel separation.

Revision 8: February 12, 2015; upgraded standards and terminology

SECTION 1A - SUPPLEMENTAL GENERAL CONDITIONS
FOR AMEREN MISSOURI POWER OPERATIONS

For General Conditions of Contract – Construction:

http://www.ameren.com/BusinessPartners/Suppliers/Documents/GCCconstruction.pdf

For Supplemental General Conditions of Contract:

http://www.ameren.com/BusinessPartners/Suppliers/Documents/SupplementalGCCs.pdf

In addition to the above Contract Conditions, the following requirements apply:

1.0 GENERAL

1.1 This section of the specification clarifies and supplements the Ameren General Conditions of Contract (GCC) and other Contract documents. Specific duties set forth herein do not constitute an exclusive list of requirements, but complement the Ameren GCC. In the event of a conflict between this specification and the Ameren GCC, this specification shall be controlling.

1.2 Contractor shall assure that all tiers of Subcontractors comply with all requirements of Contract documents.

1.3 For any work performed for Ameren Missouri Power Operations, Contractor agrees to comply with Ameren's Supplemental Terms and Conditions, commonly referred to as Section 1A-Supplemental General Conditions for Ameren Missouri Power Operations.

2.0 DEFINITIONS

2.1 Accident/Incident An incident is defined as a near miss, vehicle accident, or property damage to Company-owned/leased equipment or facilities. Refer to Occupational Safety and Health Administration (OSHA) 29CFR1904 for definitions of reportable incidents and injuries.

2.2 Asbestos Containing Material (ACM) Material that contains asbestos in concentration greater than 1% and must be handled according to Ameren procedures and Federal and State regulations.

2.3 Barricade A physical obstruction such as barricade tape, chains, cones, concrete barriers, fencing, or "A" frame type wood and/or metal structures intended to warn and limit access to a work area. Barricade tape alone cannot be used to protect certain hazards such as unattended floor openings or fall hazards.

2.4 Competent Person An individual, who is trained and certified in applicable standards, is capable of identifying workplace hazards relating to specific operations, performs inspections of industrial and construction jobsite equipment, and has authority to take corrective actions when needed.

2.5 Computer Based Training (CBT) Computer Based Training is used for safety and job work rules orientation of new employees before they are permitted unescorted access to Company property.

2.6 Confined Space An enclosed area that is not normally designed or intended for human occupancy, has a restricted entrance or exit by way of location or size, and can represent a risk for the health and safety of anyone who enters, due to atmospheric, engulfment, entrapment, mechanical, electrical, or any other recognized hazard. See OSHA 29CFR1910.146 and Power Operations Administrative Procedure AUE-ADM-2415.

2.7 Hot Work Work that will generate sparks, such as; cutting, grinding, welding, and brazing. A permit may be required for hot work that is hazardous due to location or other factors.

2.8 Corporate Safety Department Ameren's Corporate Safety Department sets standards for safety and health issues and monitors compliance with Ameren policies, as well as with Federal, State and Local regulations.

2.9 Extra Work is defined in Article 1 of the GCCs.

Electronic Filing: Received, Clerk's Office 09/28/2020

2.10 Extra Work Order (EWO) is defined in Article 1 of the GCCs.

2.11 Job Working Rules Rules of conduct for Contractors working at Ameren facilities that include various types of prohibited behavior: off-limit areas, driving and parking instructions, and safety information that may be specific for the plant, such as fire alarms and evacuation procedures.

2.12 Single Point of Contact (SPOC) is defined in Article 1 of the GCCs.

2.13 Specifications are defined in Article 1 of the GCCs.

2.14 Work is defined in Article 1 of the GCCs.

2.15 Worker's Protection Assurance (WPA) or Hold Card Procedure Ameren's equipment lock-out procedure that ensures equipment and systems are in a safe state prior to service or testing. Employees must have WPA training and adhere to WPA procedures. Contractor supervisors must have plant-specific training prior to starting jobs requiring WPA protection.

3.0 INTENT OF SPECIFICATIONS AND DRAWINGS

3.1 The Contract Documents shall be interpreted as being complementary, requiring a complete Project. Any requirement occurring in any one of the Contract Documents is as binding as though occurring in all Contract Documents. Generally, Specifications address quality, types of materials and Contract conditions, while Plans show placement, sizes, and fabrication details of materials. Reference Article 2.01 of the GCCs.

4.0 BENCH MARKS

4.1 Company will furnish one site bench mark with its assigned elevation. Contractor shall furnish field layouts and shall be responsible for the use of field dimensions and elevations. All such Work shall be subject to approval at the discretion of the SPOC.

5.0 DRAWINGS, DETAILS & INSTRUCTIONS PROVIDED BY CONTRACTOR

5.1 Contractor shall submit to the Company copies of shop drawings, equipment details; installation, operating, and maintenance instructions, wiring diagrams, parts lists, cable termination sign-off sheets, etc. Reference Article 3.02 of the GCCs.

5.1.1 These submittals shall cause no delay in the performance of work. The minimum turn-around time for design changes shall be incorporated on drawings and shall not delay the performance of work. As-built drawings shall be submitted in accordance with Company's schedule.

5.1.2 Contractor shall submit five (5) copies of the above information, four (4) of which Company will retain. One (1) copy will be returned.

5.1.3 In addition to the copies listed above, Contractor shall submit drawings electronically in an approved CAD format. Ameren typically uses Bentley Microstation V7 or V8 (.dgn files).

5.1.4 Company will review submittals for general design features. Contractor is responsible for dimensions, quantities, accuracy, fit, adequacy of details, and coordination with other trades. Contractor must request deviations from contract documents in writing and receive written approval from Company.

5.1.5 Contractor must request field changes in writing and receive written approval from Company. Contractor shall promptly submit as-built drawings to Company.

5.2 Professional Engineering (PE) License Seals

5.2.1 All design documentation meant for fabrication, permitting, erection, or construction such as design drawings, specifications, and calculations shall have a Professional Engineering (PE) seal applied, signed and dated by Contractor's registered professional engineer(s).

5.2.1.1 The license shall be current, valid, and in good standing for the appropriate state where the work is taking place.

Electronic Filing: Received, Clerk's Office 09/28/2020

5.2.2 Documents where seals are not required include review items (not to be constructed), sketches, samples, design control documents, operations manuals, vendor material design documents, engineered product drawings (not related to permitting) and other documents agreed upon in writing between Ameren and Contractor.

5.2.2.1 Contractor shall be responsible to contact the main Ameren contact up-front to clarify the requirements to seal any project specific documentation.

6.0 LABOR CONDITIONS

6.1 Contractor's Work shall be performed under the National Maintenance Agreement (NMA), unless an exception is agreed upon in writing by the Construction Project Lead or his management, Contractor must furnish a copy of the site extension approval(s) granted by the International Union(s). Site extension requests for the NMA may be filed online at www.nmapc.org.

6.2 There shall be no limit on the work output of any employee, and no restrictions on what tools or equipment may safely be used to increase productivity. There shall be no minimum, other than what may be required by safety regulations, on the number of employees assigned to any crew or to any service.

6.3 Featherbedding practices of any kind will not be tolerated.

6.4 Actual work hours will be agreed upon during pre-job conferences; lunch breaks will be an unpaid one-half hour. No additional organized breaks are allowed. There shall be no non-working stewards. If a steward is included in the labor force, the steward must be a qualified worker and shall exercise no supervisory functions.

6.5 Contractors must conform to Construction Users Round Table (CURT) Tripartite Initiative report, dated June 2004, with respect to absenteeism, excessive overtime and work disruptions.

6.6 Contractor employees must be rested and fit for duty when they report to the Company's site. Contractor employees must not work in excess of 16 consecutive hours without prior approval of Contractor's Superintendent and Company, and then only when additional steps have been taken to ensure worker safety.

6.7 Contractor shall provide break/lunch facilities at a location in close proximity to the majority of the Work such locations to be approved by the SPOC or other Ameren Management personnel.

6.8 There shall be no slowdowns, illegal strikes, or unauthorized work stoppages of any kind. Contractor understands that its work must be completed in a timely fashion notwithstanding the presence of a labor strike or any pickets at or around the job site.

6.9 In the event that Company's employees, another contractor's or subcontractor's employees or Contractor's employees engage in a strike or established pickets, Contractor is expected to continue to meet its obligations under the terms of the contract and/or obligations with Company. Any such picketing activity is not an excuse for non-performance or delay in completing the project

6.10 Medical services provided by Ameren: On specified projects, contractors are not to include costs within bids associated with the following medical services:

- Random and for-cause substance abuse (SA) testing,
- First-aid expenses that can be addressed by an onsite nurse, if an onsite nurse is provided.

7.0 CONTRACTOR MANAGEMENT REQUIREMENTS

7.1 Prior to mobilization, Contractor shall submit an organizational chart and resumes for the entire management team that will utilize, on or offsite, for the project.

7.2 Contractor shall adhere to the Job Working Rules (Appendix B).

7.3 Contractor supervisory employees who will be responsible for requesting and signing the WPA must receive site-specific training before working onsite. The SPOC will arrange for the required WPA supervisor training to be located at the Ameren POS Training Center training facility.

7.4 Contractor supervisor shall comply with the specific plant's WPA procedure which is included as Appendix A, Section 2 of this specification. WPA procedure provides details of program and outlines responsibilities for supervisors.

Electronic Filing: Received, Clerk's Office 09/28/2020

CAUTION: The presence of WPA process does not relieve workers of the responsibility to verify that equipment is actually de-energized or in the designated state. Instruct employees to walk down the job, check energy sources and isolation points such as: voltages, temperatures, pressures, etc. to confirm status.

7.5 Contractor Site Representative shall read, understand, and sign the Contractor Agreement of Understanding Form (Appendix A, Attachment A18), prior to beginning work onsite.

7.6 Contractor supervisors shall instruct employees to observe WPA rules and comply with WPA tags at all times.

7.7 Contractor shall participate in individual Construction Progress meetings. The meetings are typically held weekly, but the SPOC may specify another frequency during the course of the Contract.

7.8.1 A Contractor representative with sufficient authority to make binding work and schedule commitments shall attend these meetings.

7.8.2 The individual progress meeting will typically concentrate on safety and housekeeping, schedule and work progress, job related problems, and site coordination.

7.8.3 Contractor shall come to the progress meeting with an updated schedule showing actual progress and the critical path of the work. See Contractor Schedule Requirements (Appendix D) for additional schedule requirements.

7.8.4 Contractor shall take and distribute meeting minutes within two (2) working days of the meeting.

7.9 A Contractor representative with sufficient authority to make binding commitments may also be required to attend a weekly Outage Coordination Meeting.

7.10 Contractor personnel, Business agents, Vendor/Sales representatives, etc., shall use the entrance designated for their Contractor, park in the Construction parking lot, and be escorted onsite unless they have a Contractor badge. Construction badge holders may use Contractor entrance or Ameren employee entrance, and park in the Construction parking lot or main parking lot depending on purpose of visit.

8.0 DELIVERY AND STORAGE

8.1 Contractor shall be responsible for receiving, unloading, inspecting and hauling materials unless otherwise stated in the Contract documents.

8.2 Contractor and the name of the project must be indicated on materials delivered to the site.

8.3 Contractor shall provide facilities to store materials and equipment on the jobsite. The SPOC will designate storage locations that will not interfere with Company's personnel or operations.

8.4 Payment for material or equipment stored onsite will not be made to Contractor until the material or equipment is installed. Contractor may apply for early payment only if early delivery and storage of the material or equipment will benefit Ameren.

8.5 A carrier that is compliant with the Depart of Transportation's (DOT) Hazardous Materials Security Plan must be used for deliveries of hazardous materials to Ameren. For a list of approved carriers visit http://vics.keyship.net/Ameren. Fill out the required fields & check the HazMat option. A list of qualified carriers will populate. Any vehicle carrying hazardous materials onto Company facilities will be refused entry until proof of compliance is provided.

8.6 If materials are provided by Ameren, they will be stored by Ameren until Contractor is onsite. Contractor will be responsible for loss or damage after acceptance of equipment or material provided by Company. Contractor shall inventory and haul excess material retained by Company to designated Company storage location(s) after completion of Work.

8.7 Contractor shall restore construction storage areas to a reasonable condition that satisfies the SPOC.

8.8 Material Receipt

8.8.1 Contractor must resolve all issues with contractor-procured material.

8.8.2 Contractor must identify, inspect, test and store material to purchase order requirements.

Electronic Filing: Received, Clerk's Office 09/28/2020

8.8.3 Contractor must ensure all receiving quality documentation is supplied to Ameren's SPOC upon receipt.

8.8.4 Contractor must have a program in place to ensure receipted critical plant material and equipment is not relocated or improperly stored without proper authorization from Ameren's SPOC.

8.8.5 Contractor will be provided a list of critical materials and equipment during pre-construction meetings.

8.8.6 Contractor must handle, store, and identify Critical Material in accordance with the paragraph below:

Electronic Filing: Received, Clerk's Office 09/28/2020

MATERIAL HANDLING, STORAGE & IDENTIFICATION INSTRUCTIONS FOR CONTRACTORS

AUE-ADM-4203, Receiving Storage & Handling of Critical Materials

All Ameren purchased critical material received by a contractor or sub-contractor has specific requirements that must be met to comply with Ameren's Quality Management Program in accordance with AUE-ADM-4203. Contractor requirements contained in AUE-ADM-4203 are provided below. Contractors will be evaluated on their quality control and material management. A list of critical materials shall be provided to the contractor during Pre-Construction Meetings.

1) Notify Responsible Engineer (RE) of Ameren material received and the PO number. Ensure receiving documentation remains with the material until clear direction is provided by RE.

   NOTE: Steps 2-5 shall be directed by Responsible Engineer (RE)

2) Receiving documentation, number of containers, and intended storage location shall be taken to Storeroom personnel.

3) Storeroom shall create a Receipt Order (RO) number for traceability and provide identification labels for attachment to each container. Information will always include the RO tracking# and may include PO #, Job #, RE, PM, Storage Level, and intended location.

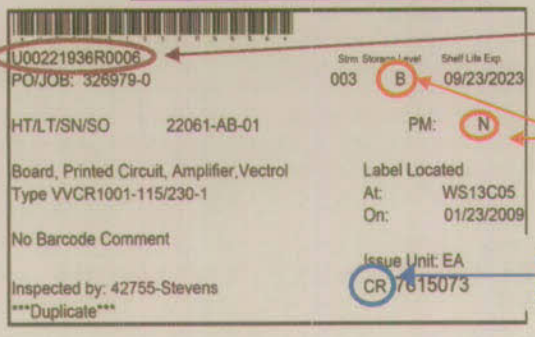
4) The RO number shall be clearly marked on all boxes, containers, equipment, and packing slip(s).

5) An Ameren Material Receipt Inspection Report (MRIR) shall be printed with the inspection requirements and shall be used to document inspection results. Contractors may perform additional inspections as directed by RE.

6) After successful acceptance, MRIR Inspector(s) shall sign the MRIR and each traceable barcode label; and shall attach labels to containers.

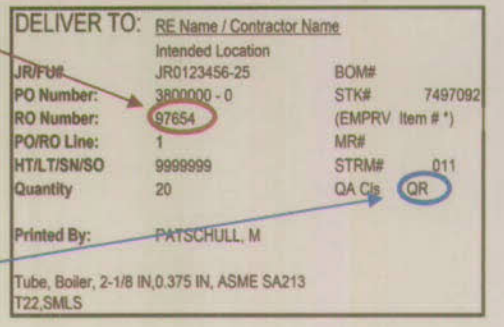
7) Hold tags shall be attached to any materials not accepted.

WARNING: Contact Responsible Engineer or Ameren Designee immediately if unidentified material is discovered, labels become unreadable, material needs to be relocated, or if material location or storage level differs from label.



If during staging, prep work, etc., the material is repackaged or removed from labeled containers and the potential for identification or material loss exists, transfer the RO or barcode number, at a minimum, to the materials.

Storage Level B – Indoor storage. Temperatures controlled between 40°F and 140°F. This level includes the storeroom, turbine floor, or any other location inside the plant.



Storage Level C – Covered storage. Temperature control not required. These locations include secondary storerooms, covered parking areas, etc.

Storage Level D – Outside storage. Store in well drained areas in a manner allowing air circulation to minimize trapped water. Provide adequate protection from forces due to rain, wind and storms

CRITICAL MATERIAL BARCODE

DELIVERY MATERIAL TAG

Electronic Filing: Received, Clerk's Office 09/28/2020

9.0 REMOVALS AND PREPARATORY WORK

9.1 Contractor shall cooperate with the SPOC in scheduling removal work so there is no disruption to Company's personnel or operations.

9.2 Contractor shall provide protective enclosures, covers, water stops, etc. to prevent water or other weather-related damage to facilities during construction.

9.3 Before mobilizing tools, material and equipment, Contractor will install appropriate trash cans, cigarette butt receptacles, and dumpsters in designated areas.

9.4 Materials authorized to be removed become the property of Contractor, unless otherwise specified in the Contract documents, and shall be promptly removed from the worksite. An inventory of materials being removed must be submitted to the SPOC. If materials are retained, the SPOC will designate where materials shall be stored. Retained materials shall be neatly stored and protected from the elements.

9.5 Before mobilizing tools, material and equipment, Contractor shall install protection on both sides of all walkways in work area from top rail to toe board. This protection may include, but not limited to, orange fencing, plywood and sheet metal. However, openings in fencing shall be no larger than one inch square. Contractor shall install decking on open floor work areas, seal decking along edges and install toe boards, and install debris nets to further contain fallings objects. All wood subject to ignition sources shall have fire retardant cloth or tarps installed over the wood. Cloth shall be secured to avoid tripping hazards. All safety barriers shall be removed after the completion of the project.

9.6 For additional safety requirements to be performed prior to working on elevated platforms, walkways and scaffolds above 6 feet, refer to Safety Requirements for Working on Elevated Platforms (Appendix Y).

10.0 CUTTING& PATCHING AND TEMPORARY BUILDINGS, ETC.

10.1 Contractor shall do all cutting, fitting, or patching that may be necessary to make the several parts come together properly and fit to receive the Work of other Contractors and Subcontractors.

10.2 All temporary buildings/structures such as tool rooms, break rooms, lunch rooms, etc., shall be constructed with non-combustible materials.

11.0 TEMPORARY HEAT

11.1 Contractor shall provide temporary heat to protect Work materials against damage from dampness and cold to the satisfaction of the SPOC.

12.0 QUALITY REQUIREMENTS

12.1 The Quality Management System Manual, AUE-MAN-QMS-1001, provides the basis for the Ameren Missouri Power Operations Quality Management System (QMS) and provides the assurance that processes are in place to achieve our business objectives. The QMS performance standards and performance criteria provide requirements to achieve a controlled and systematic approach to quality management activities and promote continuous improvement. Contractors and Subcontractors can obtain a copy of the QMS from the Ameren Missouri Project Manager.

12.2 The Contractor's quality management program and supportive procedures are subject to Ameren review and audit. If a gap exists between the QMS, and the Contractor's quality management program and supportive procedures, the Contractor will be required to comply with the QMS.

12.3 Contractors and Subcontractors agree to comply with the applicable QMS requirements for the work scope included in this Ameren Missouri contract. The Contractor shall provide a copy of the Contractor's quality management program and supportive procedures with the bid submittal, if the Contractor is not on the Ameren Missouri 'Generation Approved Supplier List – Critical (GASLC)'.

12.4 The QMS Application Aid (QMS-AA) per Appendix Q contains the applicable QMS requirements in this Ameren Missouri contract. The Contractor shall complete and return the QMS-AA with the bid submittal, if the Contractor is not on the Ameren Missouri GASLC.

12.5 The Contractor shall upon award develop and provide to Ameren a 'Project-specific Quality Management Plan' which is compliant with the QMS-AA.

Electronic Filing: Received, Clerk's Office 09/28/2020

12.6 The Contractor's awarded work scope, including that of its Subcontractors, shall be performed to the requirements of the QMS-AA.

12.7 Ameren will be allowed to make quality inspections at Contractor's and Subcontractor's facilities at no cost to Ameren. Ameren will be allowed to view applicable Contractor's and Subcontractor's quality procedures and procedure generated records and documents.

12.8 Design Documents and Calculations:

12.8.1 Contractors and Sub Contractors shall meet the technical requirements included in Section 1D of this specification and the QMS-AA.

13.0 OWNER APPROVAL OF PROCEDURE

13.1 Ameren must consent to deviations from the procedures, methods and materials agreed to in the Contract. Reference Articles 2.01 and 4.01 of the GCCs.

13.2 Ameren reserves the right of approval over all procedures, methods, and materials to be employed by Contractor or its Subcontractors for this Work. Reference Articles 2.01 and 4.01 of the GCCs.

14.0 CONFIDENTIALITY

14.1 Contractor shall hold Ameren's Confidential Information confidential and shall not use or disclose to others during or subsequent to the performance of the Work (except as is necessary to perform the Work). Reference Article 9.02 of the GCCs.

14.2 Publication or advertising of information directly derived from Project or Work or data obtained in connection with services rendered under the Contract must first be approved in writing by Ameren (Ameren personnel need approval from Ameren Corporate Communications). Contractor shall not release any information for publication or advertising purposes relative to the material, equipment and/or services furnished under the Contract Documents without the prior written consent of Ameren. Ameren reserves the right to release all advertising or publicity concerning the Project or Work. Except as to signs required by building department regulations or any other governmental requirements, Contractor shall not display or permit any signs or advertisements to be displayed about the Project site nor publicize in any manner its performance of the Work without the express written permission of Ameren. Reference Article 9.02 of the GCC.

14.3 Contractor shall restrict the knowledge of all confidential information regarding the Work to as few as possible of its employees who are directly connected with performance of the Work and have a definite need for such knowledge. Upon request by Ameren's Representative, Contractor shall cause such persons or groups of persons involved in the Work on Contractor's behalf as Ameren may designate to sign individual secrecy agreements in a form satisfactory to Ameren. Reference Article 9.02 of the GCCs.

15.0 ACCOUNTING / INVOICING REQUIREMENTS / ACIP

15.1 Contractor shall furnish complete accounting information and cooperate with Ameren's accounting practices.

15.2 For Time and Material contracts prior to commencing work, Contractor shall furnish Company with a written estimate for Company approval. Once approved, Contractor shall promptly notify Company of any facts and circumstances that may adversely impact the estimate. Further, Contractor shall not exceed ninety percent (90%) of the time and materials estimate without Company approval. All overtime for Time and Material contracts shall be approved by Company in advance of working. Reference Articles 6 and 8 of the GCCs.

15.3 Company reserves the right not to honor charges associated with timesheets that are not provided daily.

15.4 Material invoices must be submitted as Work progresses. Total cost updates will be provided on a weekly basis.

15.5 If Work indicated or specified in Contract Documents is increased, Company may have Contractor perform Extra Work.

15.5.1 Contractor must obtain written approval from the SPOC prior to performing any Extra Work. Each Extra Work Order (EWO) shall be invoiced separately and shall reference the EWO number and Purchase Order (PO) number.

Electronic Filing: Received, Clerk's Office 09/28/2020

15.5.2 If work is performed on a time and material basis, then work shall be charged at the rates indicated on the Labor Rate Sheets in the Contract.

15.5.3 Ameren will pay Contractor the cost of extra work as follows:

NOTE:	Subcontractor labor and material charges shall be subject to the provisions of Items 15.5.3.1, 15.5.3.2 and 15.5.3.3 below.

15.5.3.1 Labor:

- Direct cost of payroll labor, including first line foreman, excluding job Superintendent and General Foreman
- Fringe benefits including welfare and pension
- Insurance
- Taxes including FICA, Federal, State and Local tax
- Overhead, including costs for home office, field office, consumables, and small tools with an original value under $1,200, as agreed by Company and Contractor at the award of Contract
- Profit, as agreed by Company and Contractor at the award of Contract

15.5.3.2 Material and third party rental equipment:

- Direct cost of material or rental equipment

Subcontractors:

- Direct cost of Subcontractor

Contractor-Owned Rental Equipment (excluding third party rental equipment):

- Contractor shall submit for approval an equipment rental rate schedule including all equipment, tools, and supplies required to perform the Work specified. These equipment rental rates will be used for extra work.

15.5.3.3 Ameren Coordinated Insurance Program (ACIP)

- If the project is part of the Ameren Coordinated Insurance Program (ACIP), all contractors of all tiers will be required to provide completed enrollment and monthly reporting forms for duration of their work on project. All prime contractors will be responsible for their subcontractors of all tiers with respect to compliance of enrollment and reporting requirements.
- If the project is part of the ACIP, contractors of all tiers must be enrolled and have a copy of ACIP certificate of insurance prior to mobilization onsite. Ameren will not allow non-enrolled contractors to access site prior to enrollment in ACIP.

END OF SECTION 1A

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 1B – SUMMARY OF WORK

1.0 INTRODUCTION

1.1 Definitions

1.1.1 The term "Company" means the entity identified in the Company's Purchase Order, its agents, employees, representatives, successors, and assigns. The terms "Purchaser," "Owner," and "Buyer," if used in the Contract Documents, are considered synonymous and refer to the Company.

1.1.2 The term "Engineer" means the Engineer duly appointed to represent the Company as specified from time to time by the Company who may be employed by the Company or who may be employed by others.

1.1.3 The term "Contractor" means the entity identified in the Company's Purchase Order, and its agents, employees and authorized representatives undertaking the performance of the Work as defined in this Specification. The terms "vendor," "supplier," "manufacturer," or "fabricator" if used in the Contract Documents, are considered synonymous and refer to Contractor.

1.1.4 The term "Sub Contractor" means any individual, partnership, firm, corporation or business entity, other than an employee of Contractor, who contracts or agrees with Contractor (or another Sub Contractor or any tier thereof) to furnish any services, labor, materials or equipment for, or in connection with, the performance of the Work.

1.1.5 The term "Construction Project Lead" means the Company's representative as specified from time to time and located at job site.

1.2 Location

1.2.1 The Meredosia Energy Center is located at:

800 South Washington Street
Meredosia, IL 62665

1.2.2 This project is located at the Meredosia Energy Center in Morgan County, Illinois. The Bottom Ash Pond and the Fly Ash Pond are located on the western side of the site adjacent to the Illinois River. See figure on sheet 1B-7 for a location map showing the Bottom Ash Pond and the Fly Ash Pond.

1.3 Contacts

1.3.1 All commercial matters shall be directed to the Ameren purchasing agent designated on the Request for Proposal or listed on the purchase order.

1.3.2 All technical questions regarding this specification shall be directed to:

Ameren Energy Missouri
Michael Wagstaff, P.E.
3750 S. Lindbergh Blvd.
Sunset Hills, MO 63127

2.0 SUMMARY OF WORK

2.1 Project Objectives – The Project Objective is the closure of the Bottom Ash Pond and Fly Ash Pond at the Meredosia Energy Center. Material will be removed from the Bottom Ash Pond, including the southern berm and the top three feet of the northern berm, and will be placed in the larger Fly Ash Pond. Existing steam line piping, light poles, culverts, fencing and outfall structure associated with the Bottom Ash Pond will be demolished and removed in an approved manner. Electric power poles will be removed and relocated. All of these components are located either within the ash pond or along the berms.

2.2 The Closure documents for Ameren Energy Medina Valley Cogen's Meredosia Ash Pond Closures at Meredosia Energy Center has been prepared in accordance with the requirements of the site specific Rule in 35 Illinois Administrative Code Part 840, Subpart A. The following supporting documents will be submitted to the IEPA.

Electronic Filing: Received, Clerk's Office 09/28/2020

2.2.1 Closure Work Plan
2.2.2 Closure Plan
2.2.3 Hydrogeologic Report
2.2.4 Construction Quality Assurance Plan
2.2.5 Groundwater Monitoring Plan
2.2.6 Post-Closure Care Plan

2.3 Copies of the above documents, including IAC Part 840, Subpart A, are available upon request.

2.4 General Requirements

2.4.1 Contractor shall be responsible for furnishing all material (except those items of material specifically stated to be furnished by the Company), tools, equipment, labor, supervision and any other incidental items or services required to perform all of the work described herein.

2.4.2 Contractor shall be responsible for any and all engineering, drafting, field sketches, and field layout required for temporary supports, rigging, removals, and installation of all material.

2.4.3 Contractor shall be responsible for receiving, storage and security of all materials supplied by Contractor and material provided by Company. Contractor will be required to unload material in Construction Staging Area as shown on the plan (Sheet T-002) and/or designated by the Construction Project Lead. Contractor will also be required to obtain items, where specified, from the storeroom. Contractor is responsible for developing an inventory list of material received. Contractor shall provide adequate protection for equipment/material stored outside from forces due to rain, wind and storms. As an example, material such as precipitator collector plates – which would be subject to damage during a high wind event – would require Contractor to perform analysis of potential wind loading and create a detailed storage plan. For this example, Ameren shall review and provide approval of specific storage plan.

2.4.4 Contractor will be responsible for proper disposal of all demolition or surplus construction materials.

2.4.5 Contractor Design shall use the Design for Safety Guide (Appendix C).

2.4.6 Ameren **will not** provide a nurse and first aid trailer for Ameren and Contractor personnel.

2.5 Description of Work

2.5.1 The description of work, in general, includes but is not limited to:

- Installation and maintenance of a Stormwater Pollution Prevention Plan (SWPPP)
- Erosion control fences and blankets
- Clearing and Grubbing
- Removal of Improvements (Demolition)
- Excavation, Compaction and Grading of Ash
- Excavation, Compaction and Grading of Soil Materials
- Electric Poles relocated and dusk to dawn lights installed by local utility company
- Dust Control
- Installation of ClosureTurf™ and HydroTurf™
- Installation of Rip Rap and Energy Dissipators
- Installation of Crushed Stone Access Road
- Seeding and Mulching

2.5.2 Other Requirements:

- In order to facilitate procurement of a Construction Quality Assurance (CQA) contractor by a separate contract, a Level 2/3 construction schedule will be requested to be submitted by the apparent low bidder(s) within two weeks of receipt of bids. This schedule will be used as the basis for the CQA contractor whose scope is defined in the attached Construction Quality Assurance Plan and specifications. Please see "Appendix D - Contractor Schedule Requirements".
- A Construction Staging Area has been shown on the plans. This area shall be returned to original condition at the end of construction activities.

Electronic Filing: Received, Clerk's Office 09/28/2020

- Ameren's Construction Project Lead will have an office in the Ameren trailer. A meeting room for weekly team meetings is also available in this building.
- Contractor's trailer location (proposed) shall be located in the Staging Area as shown on the plan. See sheet T-002. This area shall be returned to original condition at the end of construction activities.
- Existing monitoring wells shall be protected with snow fences. In the event a monitoring well is impacted by construction activities the Owner shall be notified immediately.
- Contractor is responsible for keeping as-built plan markups during construction. All markups shall be provided to the Owner at substantial completion of the project.

3.0 COMPANY AND MANUFACTURER'S DRAWINGS

3.1 The following drawings are intended to indicate the scope of the work to be done and details necessary for the items of work set forth in this specification, and are part of this specification. These drawings in general are to scale, but figures shall always be followed and drawings are not to be scaled. Contractor shall make any requests for additional drawings in writing to the Engineer.

3.1.1 Drawings prepared by CDG Engineers, Inc. dated August 12, 2016, include the following:

T-001	TITLE SHEET
T-002	PLANT VICINITY MAP
T-003	GENERAL NOTES
C-101	SITE INDEX MAP
C-102	SITE PLAN
C-103	SITE PLAN
C-104	SITE PLAN
C-105	SITE PLAN
C-106	SITE PLAN
C-107	SITE PLAN
C-108	NOT USED
C-109	NOT USED
C-110	SITE PROFILE
C-111	PROFILES
C-301	DETAILS
C-302	DETAILS
C-303	DETAILS
C-304	DETAILS
C-305	DETAILS
C-601	DRAINAGE AREA MAP
C-602	SWPPP PLAN
C-603	SWPPP DETAILS

3.1.2 The following drawings are intended as references and will be on a cd/dvd prepared by Ameren and included in back of the project manual:

B-331-O-E	Plan Ash Storage Pond
B-332-O-D	Bottom Ash Storage Pond Details
B-333-O-C	Fly Ash Storage Pond Details
K-584-A	Rev. 1 Meredosia closed ash ponds
K-584-A	Rev. 2 Meredosia closed ash ponds

4.0 WORK, MATERIALS AND EQUIPMENT SUPPLIED BY COMPANY

4.1 Not applicable.

5.0 WORK, MATERIALS AND EQUIPMENT FURNISHED BY CONTRACTOR

5.1 All supervision, components, labor, materials, equipment, tools, and any incidental items described herein (except those specifically stated above) necessary to completely install each portion or component of the work shall be furnished by Contractor.

6.0 UTILITIES AND FACILITIES

Electronic Filing: Received, Clerk's Office 09/28/2020

6.1 Contractor shall supply sanitary facilities, drinking water and shower facilities (if needed) equipped with water heaters.

6.2 The Company will provide telephone, fax, computer, and power hook-up connections for Contractor supplied trailers.

6.3 Temporary lighting, wiring, plumbing, globes, guard lights, barricades or any other items required for protection, facility of work, local regulation, or by law for public protection shall be provided by Contractor.

6.4 The Company shall furnish one source of 480 volt, three phase electric power per major work area as directed by the Construction Project Lead. Contractor shall furnish the tie-in and any extensions required. Contractor shall not use the Company's 120-volt outlets, unless directed otherwise by the Construction Project Lead. Contractor shall provide 480/120-volt transformers as required.

6.4.1 Contractor shall provide with bid proposal a list of his estimated temporary (construction) power requirements.

6.5 Non-potable (construction) water will be provided by the Company for Contractor for the purposes of clean up/wash down. Potable water for drinking will be provided by the Contractor.

6.6 Construction Staging Area/Lay down areas for equipment and material will be designated as close to work site as possible. Areas for tool, office, and change house trailers will be designated as close to work site as possible. Contractor's lay down area will be as determined by the Construction Project Lead.

7.0 RECORDING OF HISTORICAL DATA

7.1 Contractor shall make revisions to plans and specifications (red lines) during the course of the work. Plans and specifications shall be turned over to the Owner at Substantial Completion of the project.

8.0 CONTRACTOR'S FIELD SAFETY PROGRAM

8.1 Contractor shall comply with the Safety and Housekeeping procedures stated in Safety and Contractor Requirements (Appendix A), Attachment A18 and Attachment A19.

8.2 The Company has computerized the WPA request process. All organizations working on plant site shall be required to use the WPA computers to request WPA tags to be hung. The Company will provide training to one or two individuals per organization with training to be located at the Ameren POS Training Center.

9.0 TRANSFER OF INFORMATION (OSHA Safety Requirement)

9.1 Ameren shall inform the Contractor of known characteristics and conditions as it relates to the safety of the work being performed on all equipment associated with generation of electricity. This will be accomplished before work begins, after the contract is awarded during Ameren's pre-construction meeting.

9.2 The transfer of information will be shared with the primary contractor awarded the work. That primary contractor will share the same information with any sub-contractors hired by the primary contractor.

9.3 If any unique and/or hazardous conditions exist which were not mentioned by Ameren, Contractors must inform Ameren of those conditions in a timely manner.

10.0 PARTICIPATION IN COORDINATION ACTIVITIES

10.1 Contractor shall provide a representative for and participate in coordination and information exchange activities with representatives of the Company and other contractors involved with the plant improvements, including the following activities:

10.1.1 Exchange of information necessary for the work specified herein to interface with other Contractors.

10.1.2 Participation in multi-contact coordination, construction, installation, and startup meetings. One construction meeting per week and one multi-contractor outage coordination meeting per week is anticipated during the majority of the outage. Initial shutdown and startup meetings are on a more frequent basis; often daily.

Electronic Filing: Received, Clerk's Office 09/28/2020

10.1.3 Participation in safety walk-down meetings. Safety meetings may occur bi-weekly. The Construction Project Lead will inform Contractor of meeting dates and times as necessary.

10.1.4 Contractor shall electronically track safety findings from safety walk-downs and document corrective actions taken.

10.2 Contractor shall provide daily schedule updates to the designated Company representative (Project Scheduler) for inclusion into the integrated outage schedule.

11.0 CONTRACTOR'S COST TRACKING PROGRAM

11.1 In addition to daily timesheets, Contractor shall furnish manpower and cost information to the Construction Project Lead for all "time & material" work on a weekly basis. Time & Material information is to be submitted on Contractor-supplied forms.

12.0 GENERAL INFORMATION

12.1 Upon completion, all work defined in this document shall be of a uniformly neat and workmanlike appearance. All costs of repair to meet this condition shall be to Contractor's account.

12.2 Contractor shall follow the manufacturer's or fabricator's guidelines and requirements for installation of all materials and equipment, except as modified by this Specification.

12.3 Contractor shall be aware that there may be other contractors onsite during the Work as described in this Specification as well as Company GCMS and Plant forces. Contractor shall coordinate his work to minimize interferences with the work of other contractors and/or crafts.

12.4 Contractor's employees shall park in designated parking areas only. Employees shall observe Ameren site requirements for driving and parking on-site. Employees are to report to the main entrance prior to proceeding to parking area.

12.5 Upon admittance into the Plant, Contractor (including each and every employee or sub-contractor's employees) shall be subjected to a computer based training (CBT) program that describes the Plant Construction Job Work Rules. These work rules are similar to those listed in Supplemental General Conditions Section 1A, Item 2.4. The training lasts approximately ¾ hour for the average worker. Employees cannot begin work until the training is completed.

12.6 Contractors must recognize the difference between special instrument air connections and service air connections and shall not use instrument air for their air supply needs.

12.7 Job Working Rules

Contractor must enforce the Ameren Job Working Rules (Appendix B) as well as the Contractor's own work rules. If the rules conflict, then the more restrictive rule applies.

Equipment skids supplied by the contractor shall have a P&ID diagram with equipment identifications, critical settings and pressure ratings identified. The skid pumps, blowers, motors, valves, instruments and other equipment shall have labels attached with the device number shown on the P&ID. The device numbers will be provided by Ameren and be compatible with plant equipment labels and numbering schemes.

13.0 EXTRA WORK ORDERS

13.1 Extra work will be authorized by an approved Extra Work Order (EWO). Contractor shall not start any additional work without written approval from the Company.

13.2 Extra work may be authorized on a lump sum firm price, time and materials (T&M), or a T&M-not-to-exceed basis. The Company will select the terms of the EWO.

13.2.1 Pricing for lump sum firm price and T&M-not-to-exceed work shall be based on the Engineering Inspection Report supplied by the Construction Project Lead.

Electronic Filing: Received, Clerk's Office 09/28/2020

13.2.2 The Company may accept or reject Contractor's proposal for any EWO. If an EWO proposal is rejected the Company may try to negotiate the price, reduce or cancel the work scope, or obtaining pricing from another contractor.

13.2.3 If Contractor's submitted EWO proposal is acceptable to the Company an approved EWO will be issued authorizing the work.

13.3 Invoices for all approved Extra Work Orders shall reference the purchase order number of the original contract, the EWO Number, and have a copy of the approved EWO attached.

END OF SECTION 1B

Ameren MISSOURI

Specification #000167
Sheet No. 1B - 7

Meredosia Energy Center Location Map

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 1C – INFORMATION REQUIRED FROM BIDDERS

1.0 INFORMATION REQUIRED WITH BID PROPOSAL

1.1 Proposed Construction Schedule

- Contractor shall attend a mandatory **Pre-Bid Conference** at the Meredosia Energy Center on _____.
- Contractor shall submit a **Lump Sum Firm Price Bid Proposal** by _____.
- Contractor shall submit **Level 3 Schedule** by _____.
- Anticipated **Contract Award** for construction is _____.
- **Contractor shall complete all work by** _____.

1.2 Contractor shall submit the following items with the Bid Proposal:

- Pricing
- Project Schedule
- Preliminary Project Execution Plan
- Insurance Certification Statement
- Field Construction Safety Program
- Laydown and access requirements
- Diverse Supplier Business Plan
- Statement of Qualifications
- Contractor Safety & Health Data Form
- Bid Form

1.3 Pricing

1.3.1 Contractor to submit a Lump Sum Firm Price Bid Proposal

1.3.2 Contractor shall submit with bid proposal a schedule of time and material (T&M) rates as well as T&M rates for all planned subcontractors. The submitted schedules of T&M rates will be used for any additional work the Company may request or approve during the course of the specified work.

1.3.3 Break out cost for safety personnel per Safety and Contractor Requirements Appendix A, Item 4.2.

1.4 Project Schedule

1.4.1 A Level 2/3 Schedule shall be prepared.

1.5 Preliminary Project Execution Plan

1.5.1 Contractor shall submit with bid proposal a preliminary work plan describing how the project will be executed.

1.6 Insurance Certification Statement

1.6.1 Contractor shall submit acceptable Insurance Certification.

1.7 Field Construction Safety Program

1.7.1 Safety Program for Field Operations shall be submitted.

1.8 Laydown and Access requirements

1.8.1 A Staging Area is shown on the plans. (See sheet T-002) Contractor to address the adequacy of this area for their operations.

1.9 Diverse Supplier Business Plan

1.9.1 In order to support Ameren's policy on Supplier Diversity, Attachment A22 shall be filled out and submitted with bid. 2nd Tier Supplier shall be defined as work as set forth in bid proposal not being

Electronic Filing: Received, Clerk's Office 09/28/2020

self-performed. Ameren does not certify Diverse Suppliers and relies upon third party certifying organization. Ameren recognizes certification from the National Minority Council (NMSDC) and its affiliate councils, the Women's Business Enterprise National Council (WBENC) and its affiliate councils, and Federal, State and Local government certifying agencies.

Note: editable versions of Attachment A22 with instructions and reporting guidelines will be sent out as part of bid package. Questions on filling out form will be directed towards Ameren Supplier Diversity professionals at (888) 256-1150 or at http://www.ameren.com/BusinessPartners/SupplierDiversity/Pages/SupplierDiversityHome.as.

1.10 Statement of Qualifications

1.11 Contractor Safety & Health Data Form

1.11.1 Contractor shall submit with bid proposal a completed Contractor Safety & Health Data Form (Appendix A, Attachment A9).

1.12 Bid Form

1.12.1 Contractor shall submit the Bid Form found in Appendix AA of this specification.

1.13 Exceptions

1.13.1 Any contract award resulting from this Specification will incorporate all provisions specified herein. It is understood that Contractor agrees to all provisions of Specification unless exceptions are specifically listed in bid proposal.

1.14 Quality

1.14.1 Copies of the Contractor's quality management program and supportive procedures.

2.0 INFORMATION REQUIRED AFTER CONTRACT AWARD

2.1 Schedule

2.1.1 Contractor shall submit a construction schedule as described in Contractor Schedule Requirements (Appendix D). Failure to provide a schedule may result in rejection of the bid.

2.1.2 Contractor shall provide continuous (daily) updates of his project work schedule beginning after he mobilized at jobsite and continuing through completion of work. Failure to provide a schedule may result in charges to Contractor.

2.2 Revised Project Execution Plan

2.2.1 Contractor shall submit after award of contract a detailed work plan describing how the project will be executed. Included in the work plan shall be items/details such as:

2.2.1.1 Method of construction of the dewatering system.

2.2.1.3 Location of Contractor's proposed borrow area.

2.2.1.4 Quality control plan

2.2.1.6 List of subcontractors

2.2.1.7 Site-specific safety plan. At a minimum, Attachment A21 – Site-Specific Safety Plan (SSSP), shall be filled out in its entirety. The SSSP shall be submitted to Ameren for review, comment and approval. Editable version of Attachment A21 is to be supplied after issuance of PO.

2.2.1.8 Site-specific demolition plan (may be incorporated into the Safety Plan)

Electronic Filing: Received, Clerk's Office 09/28/2020

2.3 Contractor Project Management

2.3.1 Contractor shall provide an organizational chart depicting names and roles of individuals involved with project from Project Manager to Foreman level.

2.3.2 Contractor shall provide necessary resources to provide scheduling information and updates as defined in Contractor Schedule Requirements (Appendix D).

2.3.3 Contractor shall provide a full time Project Manager onsite unless an exemption is provided in writing by the Managing Supervisor of Construction.

2.6 Contractor and subcontractors shall submit a Quality Plan which is in compliance with the Quality Requirement in Supplemental General Conditions Section 1A, Item 12, prior to start of work. .

2.7 Diverse Supplier 2nd Tier Report

2.7.1 In accordance with Item 1.6.1 above, Attachment A23 shall be filled out with actual spent cost and issued per timeline agreed upon between Contractor and Ameren. Typical timeline for reporting will be monthly.

Note: editable version of Attachment A23 with instructions and reporting guidelines will be sent out as part of Contract Award. Questions on filling out form will be directed toward Ameren Supplier Diversity professionals at (888) 256-1150 or at http://www.ameren.com/BusinessPartners/SupplierDiversity/Pages/SupplierDiversityHome.as.

END OF SECTION 1C

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01310 - PROJECT MANAGEMENT AND COORDINATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative provisions for coordinating construction operations on the Project including, but not limited to, the following:

1. Coordination drawings
2. Requests for Information (RFIs)
3. Project meetings

B. Related Requirements:

1. Section 01700 "Execution Requirements" for procedures for coordinating general installation and field-engineering services shall be followed, including establishment of benchmarks and control points.

1.2 DEFINITIONS

A. REQUEST FOR INFORMATION (RFI): An RFI is a request from Owner, Engineer, or Contractor seeking information required by or clarifications of the Contract Documents.

1.3 INFORMATIONAL SUBMITTALS

A. Subcontract List: The Contractor will prepare a written summary identifying individuals or firms proposed for each portion of the Work, including those who are to furnish products or equipment fabricated to a special design. Include the following information in tabular form:

1. Name, address, and telephone number of entity performing subcontract or supplying products,
2. Number and title of related Specification Section(s) covered by subcontract, and
3. Drawing number and detail references, as appropriate, covered by subcontract.

1.4 GENERAL COORDINATION PROCEDURES

A. Coordination: The Contractor will coordinate construction operations included in different Sections of the Specifications to ensure efficient and orderly installation of each part of the Work. Additionally, the Contractor shall coordinate construction operations, included in different Sections that depend on each other for proper installation, connection, and operation as indicated below.

1. Schedule construction operations in the sequence required to obtain the best results where installation of one part of the Work depends on installation of other components, before or after its own installation.
2. Coordinate installation of different components to ensure maximum performance and accessibility for required maintenance, service, and repair.
3. Make adequate provisions to accommodate items scheduled for later installation.

B. The Contractor shall prepare memoranda for distribution to each party involved that outlines special procedures required for coordination. Include such items as required notices, reports, and list of attendees at meetings.

1. Prepare similar memoranda for Owner and separate contractors if coordination of their Work is required.

C. Administrative Procedures: The Contractor shall coordinate scheduling and timing of required administrative procedures with other construction activities and activities of other contractors to avoid conflicts and to ensure orderly progress of the Work. Such administrative activities include, but are not limited to, the following:

1. Preparation of Contractor's construction schedule,
2. Preparation of the schedule of values,

Electronic Filing: Received, Clerk's Office 09/28/2020

3. Installation and removal of temporary facilities and controls,
4. Delivery and processing of submittals,
5. Progress meetings,
6. Preinstallation conferences,
7. Project closeout activities, and
8. Startup and adjustment of systems.

1.5 COORDINATION DRAWINGS

A. General Coordination Drawings: The Contractor shall prepare coordination drawings according to requirements in individual Sections, where installation is not completely shown on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one entity.

1. Content: Project-specific information should be drawn accurately to a scale large enough to indicate and resolve conflicts. Do not base coordination drawings on standard printed data. Include the following information, as applicable:

   a. Indicate functional and spatial relationships of components of architectural, structural, civil, mechanical, and electrical systems.
   b. Indicate dimensions shown on the Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternate sketches to the Engineer indicating the proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.

1.6 REQUESTS FOR INFORMATION (RFIs)

A. General: Immediately on discovery of the need for additional information or interpretation of the Contract Documents, the Contractor shall prepare and submit an RFI in the form specified below:

1. All RFIs to be submitted by the Contractor; Engineer will not reply to RFIs submitted by subcontractors, vendors or suppliers.
2. Coordinate and submit RFIs in a prompt manner so as to avoid delays in the Work or work of subcontractors.
3. Submit separate RFIs for each item requiring information or interpretation.

B. The Contractor will prepare RFIs on forms supplied by Owner.

C. The Content of the RFI should include a detailed, legible description of item needing information or interpretation and the following:

1. Project name,
2. Project number,
3. Date,
4. Name of Contractor,
5. Name of Engineer,
6. RFI number, numbered sequentially,
7. RFI subject,
8. Specification Section number and title and related paragraphs, as appropriate,
9. Drawing number and detail references, as appropriate,
10. Field dimensions and conditions, as appropriate,
11. Contractor's suggested resolution. (If Contractor's resolutions impact the Contract Time or the Contract Sum, Contractor shall state impact in the RFI.
12. Contractor's signature, and
13. Attachments: Include sketches, descriptions, measurements, photos, product data, shop drawings, coordination drawings, and other information necessary to adequately describe items needing interpretation.

D. Engineer's Action: The Engineer will review each RFI, determine action required, and respond. Allow seven working days for Engineer's response for each RFI. RFIs received by Engineer after 1:00 p.m. will be considered as received the following working day.

1. The following RFIs will be returned without action:

Electronic Filing: Received, Clerk's Office 09/28/2020

a. Requests for approval of submittals,
b. Requests for approval of substitutions,
c. Requests for coordination information already indicated in the Contract Documents,
d. Requests for adjustments in the Contract Time or the Contract Sum,
e. Requests for interpretation of Engineer's actions on submittals, and
f. Incomplete RFIs or inaccurately prepared RFIs.

2. The Engineer's action may include a request for additional information, in which case Engineer's time for response will date from the time of receipt of additional information.

a. If Contractor believes the RFI response warrants a change in the Contract Time or the Contract Sum, the Engineer must be notified in writing within 10 days of receipt of the RFI response.

E. RFI Log: The Contractor will prepare, maintain, and submit a tabular log of RFIs organized by the RFI number. The log will be submitted monthly and will include the following:

1. Project name,
2. Name and address of Contractor,
3. Name and address of Engineer,
4. RFI number including RFIs that were dropped and not submitted,
5. RFI description,
6. Date the RFI was submitted, and
7. Date the Engineer's and Construction Manager's response was received.

F. On receipt of the Engineer's action, update the RFI log and immediately distribute the RFI response to the affected parties. Review the response and notify the Engineer within seven (7) days if Contractor disagrees with the response.

1. Identification of related Minor Change in the Work, Construction Change Directive, and Proposal Request, as appropriate.
2. Identification of related Field Order, Work Change Directive, and Proposal Request, as appropriate.

1.7 PROJECT MEETINGS

A. General: The Contractor will schedule and conduct meetings and conferences at Project site unless otherwise indicated.

1. Attendees: Inform participants and others involved, and individuals whose presence is required, of date and time of each meeting. Notify the Owner and Engineer of scheduled meeting dates and times.
2. Agenda: Prepare the meeting agenda and distribute the agenda to all invited attendees.
3. Minutes: The Entity responsible for conducting meeting will record significant discussions and agreements achieved. The meeting minutes will be distributed to everyone concerned, including the Owner, and Engineer, within three (3) days of the meeting.

B. Preconstruction Conference: The Contractor will schedule and conduct a preconstruction conference before starting construction, at a time convenient to the Owner and Engineer, but no later than 15 days after execution of the Contract.

1. Attendees: Authorized representatives of the Owner, Contractor and/or Contractor superintendent; major subcontractors; suppliers; and other concerned parties shall attend the conference. Participants at the conference shall be familiar with the Project and authorized to conclude matters relating to the Work.
2. Agenda: Items of significance will be discussed that could affect progress, and may include the following:

a. Tentative construction schedule,
b. Critical work sequencing and long-lead items,
c. Designation of key personnel and their duties,
d. Procedures for processing field decisions and Extra Work Orders,
e. Procedures for RFIs,
f. Procedures for testing and inspecting,
g. Procedures for processing Applications for Payment,

Electronic Filing: Received, Clerk's Office 09/28/2020

h. Distribution of the Contract Documents,
i. Submittal procedures,
j. Preparation of record documents,
k. Use of the premises and existing building,
l. Work restrictions,
m. Working hours,
n. Owner occupancy requirements,
o. Responsibility for temporary facilities and controls,
p. Procedures for disruptions and shutdowns,
q. Construction waste management and recycling,
r. Parking availability,
s. Office, work, and storage areas,
t. Equipment deliveries and priorities,
u. First aid, and
v. Security,

3. Minutes: The Contractor will record and distribute meeting minutes.

C. Progress Meetings: The Contractor will conduct progress meetings at monthly intervals.

1. Attendees: In addition to representatives of the Owner, Contractor, and Engineer, each contractor, subcontractor, supplier, and other entity concerned with current progress or involved in planning, coordination, or performance of future activities shall be represented at these meetings. All participants at the meeting shall be familiar with the Project and authorized to conclude matters relating to the Work.

2. Agenda: Review and correct or approve minutes of previous progress meeting. Review other items of significance that could affect progress. Include topics for discussion as appropriate to status of Project.

a. Contractor's Construction Schedule: Review progress since the last meeting. Determine whether each activity is on time, ahead of schedule, or behind schedule, in relation to Contractor's construction schedule. Determine how construction behind schedule will be expedited; secure commitments from parties involved to do so. Discuss whether schedule revisions are required to ensure that current and subsequent activities will be completed within the Contract Time.

1) Review schedule for next period.

b. The Contractor shall review present and future needs of each entity present, including the following:

1) Interface requirements,
2) Sequence of operations,
3) Status of submittals,
4) Deliveries,
5) Access,
6) Site utilization,
7) Temporary facilities and controls,
8) Quality and work standards,
9) Status of correction of deficient items,
10) Field observations,
11) Status of RFIs,
12) Status of proposal requests,
13) Pending changes,
14) Status of Change Orders and Extra Work Orders,
15) Pending claims and disputes, and
16) Documentation of information for payment requests.

3. Minutes: The Contractor will record and distribute the meeting minutes to each party present and to the parties requiring information.

Electronic Filing: Received, Clerk's Office 09/28/2020

a. Schedule Updating: The Contractor's construction schedule will be revised after each progress meeting where revisions to the schedule have been made or recognized. The revised schedule will be issued concurrently with the report of each meeting.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION (Not Used)

END OF SECTION 01310

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01322 - PHOTOGRAPHIC DOCUMENTATION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes administrative and procedural requirements for the following:

1. Preconstruction photographs, and
2. Periodic construction photographs.

B. Related Requirements:

1. Section 01770 "Closeout Procedures" for submitting photographic documentation as Project Record Documents at Project closeout.

1.2 INFORMATIONAL SUBMITTALS

A. Key Plan: The Contractor shall submit key plan of Project site with notation of vantage points marked for location and direction of each photograph. Include same information as corresponding photographic documentation.

B. Digital Photographs: The Contractor shall submit unaltered, original, full-size image files as attachment to weekly reports.

1. Digital camera should have a minimum sensor resolution of 8 megapixels.
2. Identification: Provide the following information with each image description in the file metadata tag:

a. Name of Project,
b. Date photograph was taken, and
c. Description of vantage point, indicating location, and direction (by compass point).

C. Include date photograph was taken if not date stamped by camera.

D. Description of vantage point, indicating location, direction (by compass point), and elevation or story of construction.

E. Unique sequential identifier keyed to accompanying key plan.

PART 2 - PRODUCTS

2.1 PHOTOGRAPHIC MEDIA

A. Digital Images: Provide images in JPG format, with minimum size of 8 megapixels.

PART 3 - EXECUTION

3.1 CONSTRUCTION PHOTOGRAPHS

A. The Contractor shall have a camera on site at all times for Ameren's Construction Project Lead's use. Camera should have a date stamp feature and software to download photos to computer.

B. General: Photographs should be taken using the maximum range of depth of field, and in focus, to clearly show the Work. Photographs with blurry or out-of-focus areas will not be accepted.

1. The Contractor shall maintain key plan with each set of construction photographs that identifies each photographic location.

Electronic Filing: Received, Clerk's Office 09/28/2020

C. Digital Images: The Contractor shall submit digital images exactly as originally recorded in the digital camera, without alteration, manipulation, editing, or modifications using image-editing software.

1. Date and Time: The date and time will be included in file name for each image.
2. Field Office Images: One set of images will be maintained accessible in the field office at Project site, available at all times for reference. The images should be identified in the same manner as those submitted to Engineer and Owner.

D. Preconstruction Photographs: Before commencement of excavation, commencement of selective demolition, and starting construction, take photographs of Project site and surrounding properties, including existing items to remain during construction, from different vantage points.

1. Flag construction limits before taking construction photographs.
2. Take 20 photographs to show existing conditions adjacent to property before starting the Work.
3. Special attention should be given to existing pipeline foundations that are to remain undisturbed.

E. Periodic Construction Photographs: Take 20 photographs monthly, coinciding with the cutoff date associated with each Application for Payment. Select vantage points to show status of construction and progress since last photographs were taken.

F. Project Closeout Photographs: After construction has been completed, the Contractor shall document the condition of the existing oil pipeline foundations. The same vantage points should be utilized for the photographs.

G. Additional Photographs: The Engineer may request photographs in addition to periodic photographs specified.

1. Five (5) day notice will be given, where feasible.

2. In emergency situations, take additional photographs within 24 hours of request.

3. Circumstances that could require additional photographs include, but are not limited to, the following:

a. Immediate follow-up when on-site events result in construction damage or losses,
b. Photographs to be taken at fabrication locations away from Project site,
c. Substantial Completion of a major phase or component of the Work, or
d. Extra record photographs at time of final acceptance.

END OF SECTION 01322

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01330 - SUBMITTAL PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for the submittal schedule and administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals.

B. Related Requirements:

1. Section 01781 "Project Record Documents" for submitting record Drawings, record Specifications, and record Product Data.

1.2 DEFINITIONS

A. Action Submittals: Written and graphic information and physical samples that require Engineer's responsive action.

B. Informational Submittals: Written and graphic information and physical samples that do not require Engineer's responsive action. Submittals may be rejected for not complying with requirements.

1.3 ACTION SUBMITTALS

A. Submittal Schedule: The Contractor shall submit a schedule of submittals, arranged in chronological order by dates required by construction schedule. Include time required for review, ordering, manufacturing, fabrication, and delivery when establishing dates. Include additional time required for making corrections or revisions to submittals noted by Engineer and Construction Manager and additional time for handling and reviewing submittals required by those corrections.

1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Engineer's Digital Data Files: Electronic copies of digital data files of the Contract Drawings will be provided by Engineer for Contractor's use in preparing submittals.

1. The Engineer will furnish Contractor one set of digital data drawing files of the Contract Drawings for use in preparing Shop Drawings and Project record drawings.

a. The Engineer makes no representations as to the accuracy or completeness of digital data drawing files as they relate to the Contract Drawings.

B. Refer to Submittal Requirement chart at the end of this section for the submittal required for each section.

C. Coordination: The Contractor shall coordinate preparation and processing of submittals with performance of construction activities.

1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
2. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.

a. Engineer reserves the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Engineer's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Initial Review: Allow 15 days for initial review of each submittal. Allow additional time if coordination with subsequent submittals is required. Engineer will advise Contractor when a submittal being processed must be delayed for coordination.
2. Intermediate Review: If intermediate submittal is necessary, process it in same manner as initial submittal.
3. Resubmittal Review: Allow 15 days for review of each resubmittal.

E. Paper Submittals: Place a permanent label or title block on each submittal item for identification.

1. Indicate name of firm or entity that prepared each submittal on label or title block.
2. Provide a space approximately 6 by 8 inches on label or beside title block to record Contractor's review and approval markings and action taken by Engineer and Construction Manager.
3. Include the following information for processing and recording action taken:

    a. Project name.
    b. Date.
    c. Name of Engineer.
    d. Name of Contractor.
    e. Name of subcontractor.
    f. Name of supplier.
    g. Name of manufacturer.
    h. Submittal number or other unique identifier, including revision identifier.

        1) Submittal number shall use Specification Section number followed by a decimal point and then a sequential number (e.g., 06100.01). Resubmittals shall include an alphabetic suffix after another decimal point (e.g., 06100.01.A).

    i. Number and title of appropriate Specification Section.
    j. Drawing number and detail references, as appropriate.
    k. Location(s) where product is to be installed, as appropriate.
    l. Other necessary identification.

4. Additional Paper Copies: Unless additional copies are required for final submittal, and unless Engineer or Construction Manager observes noncompliance with provisions in the Contract Documents, initial submittal may serve as final submittal.

    a. Contractor to submit one copy of submittal to concurrent reviewer in addition to specified number of copies to Engineer and Construction Manager.

5. Transmittal for Paper Submittals: Assemble each submittal individually and appropriately for transmittal and handling. Transmit each submittal using a transmittal form. Engineer and Construction Manager will return without review submittals received from sources other than Contractor.

    a. Transmittal Form for Paper Submittals: Provide locations on form for the following information:

        1) Project name.
        2) Date.
        3) Destination (To:).
        4) Source (From:).
        5) Name and address of Engineer.
        6) Name of Contractor.
        7) Name of firm or entity that prepared submittal.
        8) Names of subcontractor, manufacturer, and supplier.
        9) Category and type of submittal.
        10) Submittal purpose and description.
        11) Specification Section number and title.
        12) Specification paragraph number or drawing designation and generic name for each of multiple items.
        13) Drawing number and detail references, as appropriate.
        14) Indication of full or partial submittal.
        15) Transmittal number, numbered consecutively.
        16) Submittal and transmittal distribution record.

Electronic Filing: Received, Clerk's Office 09/28/2020

17) Remarks.
18) Signature of transmitter.

F. Electronic Submittals: Identify and incorporate information in each electronic submittal file as follows:

1. Assemble complete submittal package into a single indexed file incorporating submittal requirements of a single Specification Section and transmittal form with links enabling navigation to each item.
2. Name file with submittal number or other unique identifier, including revision identifier.

   a. File name shall use project identifier and Specification Section number followed by a decimal point and then a sequential number (e.g., LNHS-06100.01). Resubmittals shall include an alphabetic suffix after another decimal point (e.g., LNHS-06100.01.A).

3. Provide means for insertion to permanently record Contractor's review and approval markings and action taken by Engineer.
4. Transmittal Form for Electronic Submittals: Use electronic form acceptable to Owner, containing the following information:

   a. Project name.
   b. Date.
   c. Name and address of Engineer.
   d. Name of Contractor.
   e. Name of firm or entity that prepared submittal.
   f. Names of subcontractor, manufacturer, and supplier.
   g. Category and type of submittal.
   h. Submittal purpose and description.
   i. Specification Section number and title.
   j. Specification paragraph number or drawing designation and generic name for each of multiple items.
   k. Drawing number and detail references, as appropriate.
   l. Location(s) where product is to be installed, as appropriate.
   m. Related physical samples submitted directly.
   n. Indication of full or partial submittal.
   o. Transmittal number, numbered consecutively.
   p. Submittal and transmittal distribution record.
   q. Other necessary identification.
   r. Remarks.

5. Metadata: Include the following information as keywords in the electronic submittal file metadata:

   a. Project name.
   b. Number and title of appropriate Specification Section.
   c. Manufacturer name.
   d. Product name.

G. Options: Identify options requiring selection by Engineer.

H. Deviations: Identify deviations from the Contract Documents on submittals.

I. Resubmittals: Make resubmittals in same form and number of copies as initial submittal.

1. Note date and content of previous submittal.
2. Note date and content of revision in label or title block and clearly indicate extent of revision.
3. Resubmit submittals until they are marked with approval notation from Engineer's and Construction Manager's action stamp.

J. Distribution: The Contractor shall furnish copies of final submittals to manufacturers, subcontractors, suppliers, fabricators, installers, authorities having jurisdiction, and others as necessary for performance of construction activities. Show distribution on transmittal forms.

K. Use for Construction: The Contractor shall retain complete copies of submittals on Project site. Use only final action submittals that are marked with approval notation from Engineer's and Construction Manager's action stamp.

Electronic Filing: Received, Clerk's Office 09/28/2020

PART 2 - PRODUCTS

2.1 SUBMITTAL PROCEDURES

A. General Submittal Procedure Requirements:

1. Submit electronic submittals via email as PDF electronic files.

    a. Engineer will return annotated file. Annotate and retain one copy of file as an electronic Project record document file.

2. Action Submittals: Submit three paper copies of each submittal unless otherwise indicated. Engineer, through Construction Manager, will return two copies.
3. Informational Submittals: Submit two paper copies of each submittal unless otherwise indicated. Engineer and Construction Manager will not return copies.

B. Product Data: Collect information into a single submittal for each element of construction and type of product or equipment.

1. If information must be specially prepared for submittal because standard published data are not suitable for use, submit as Shop Drawings, not as Product Data.
2. Mark each copy of each submittal to show which products and options are applicable.
3. Include the following information, as applicable:

    a. Manufacturer's catalog cuts.
    b. Manufacturer's product specifications.
    c. Statement of compliance with specified referenced standards.
    d. Testing by recognized testing agency.
    e. Application of testing agency labels and seals.
    f. Notation of coordination requirements.
    g. Availability and delivery time information.

4. Submit Product Data before or concurrent with Samples.
5. Submit Product Data in the following format:

    a. PDF electronic file.

C. Shop Drawings: Prepare Project-specific information, drawn accurately to scale. Do not base Shop Drawings on reproductions of the Contract Documents or standard printed data, unless submittal based on Engineer's digital data drawing files is otherwise permitted.

1. Preparation: Fully illustrate requirements in the Contract Documents. Include the following information, as applicable:

    a. Identification of products.
    b. Schedules.
    c. Compliance with specified standards.
    d. Notation of coordination requirements.
    e. Notation of dimensions established by field measurement.
    f. Relationship and attachment to adjoining construction clearly indicated.
    g. Seal and signature of professional engineer if specified.

2. Sheet Size: Except for templates, patterns, and similar full-size drawings, submit Shop Drawings on sheets at least 8-1/2 by 11 inches, but no larger than 22 by 34 inches.
3. Submit Shop Drawings in the following format:

    a. PDF electronic file.

D. Product Schedule: As required in individual Specification Sections, prepare a written summary indicating types of products required for the Work and their intended location. Include the following information in tabular form:

1. Submit product schedule in the following format:

Electronic Filing: Received, Clerk's Office 09/28/2020

a. PDF electronic file.

E. Test and Inspection Reports and Schedule of Tests and Inspections Submittals: Comply with requirements specified in Construction Quality Assurance Plan.

F. Closeout Submittals and Maintenance Material Submittals: Comply with requirements specified in Section 01770 "Closeout Procedures."

G. Qualification Data: Prepare written information that demonstrates capabilities and experience of firm or person. Include lists of completed projects with project names and addresses, contact information of Engineers and owners, and other information specified.

H. Welding Certificates: Prepare written certification that welding procedures and personnel comply with requirements in the Contract Documents. Submit record of Welding Procedure Specification and Procedure Qualification Record on American Welding Society (AWS) forms. Include names of firms and personnel certified.

I. Installer Certificates: Submit written statements on manufacturer's letterhead certifying that Installer complies with requirements in the Contract Documents and, where required, is authorized by manufacturer for this specific Project.

J. Product Certificates: Submit written statements on manufacturer's letterhead certifying that product complies with requirements in the Contract Documents.

K. Material Certificates: Submit written statements on manufacturer's letterhead certifying that material complies with requirements in the Contract Documents.

L. Material Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting test results of material for compliance with requirements in the Contract Documents.

M. Product Test Reports: Submit written reports indicating that current product produced by manufacturer complies with requirements in the Contract Documents. Base reports on evaluation of tests performed by manufacturer and witnessed by a qualified testing agency, or on comprehensive tests performed by a qualified testing agency.

N. Schedule of Tests and Inspections: Comply with requirements specified in Section 01400 "Quality Requirements."

O. Field Test Reports: Submit written reports indicating and interpreting results of field tests performed either during installation of product or after product is installed in its final location, for compliance with requirements in the Contract Documents.

P. Design Data: Prepare and submit written and graphic information, including, but not limited to, performance and design criteria, list of applicable codes and regulations, and calculations. Include list of assumptions and other performance and design criteria and a summary of loads. Include load diagrams if applicable. Provide name and version of software, if any, used for calculations. Include page numbers.

2.2 DELEGATED-DESIGN SERVICES

A. Delegated-Design Services Certification: In addition to Shop Drawings, Product Data, and other required submittals, submit digitally signed PDF electronic file and three paper copies of certificate, signed and sealed by the responsible design professional, for each product and system specifically assigned to Contractor to be designed or certified by a design professional.

1. Indicate that products and systems comply with performance and design criteria in the Contract Documents. Include list of codes, loads, and other factors used in performing these services.

Electronic Filing: Received, Clerk's Office 09/28/2020

PART 3 - EXECUTION

3.1 CONTRACTOR'S REVIEW

A. Action and Informational Submittals: Review each submittal and check for coordination with other Work of the Contract and for compliance with the Contract Documents. Note corrections and field dimensions. Mark with approval stamp before submitting to Engineer.

B. Project Closeout and Maintenance Material Submittals: See requirements in Section 01770 "Closeout Procedures."

C. Approval Stamp: The Contractor shall stamp each submittal with a uniform, approval stamp. Include Project name and location, submittal number, Specification Section title and number, name of reviewer, date of Contractor's approval, and statement certifying that submittal has been reviewed, checked, and approved for compliance with the Contract Documents.

3.2 ENGINEER'S ACTION

A. General: The Engineer will not review submittals that do not bear Contractor's approval stamp and will return them without action.

B. Action Submittals: The Engineer will review each submittal, make marks to indicate corrections or revisions required, and return it. Engineer will stamp each submittal with an action stamp and will mark stamp appropriately to indicate action.

C. Informational Submittals: Engineer will review each submittal and will not return it, or will return it if it does not comply with requirements. Engineer will forward each submittal to appropriate party.

D. Incomplete submittals are unacceptable, will be considered nonresponsive, and will be returned for resubmittal without review.

E. Submittals not required by the Contract Documents may not be reviewed and may be discarded.

Ameren Energy Generating

SECTION 01356 - SWPPP DESIGN, INSTALLATION, MAINTENANCE AND REMOVAL

PART 1 - GENERAL

1.1 DESCRIPTION

A. A Stormwater Pollution Prevention Plan (SWPPP) has been provided by Ameren. A copy of these plans have been provided, see drawings C-602 and C-603.

B. Refer to Appendix CC for the SWPPP report.

C. Implement, maintain and remove SWPPP. Maintenance of the SWPPP includes adjustments to the SWPPP as deemed necessary by Ameren and any adjustments necessary to control stormwater pollution.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide all equipment and materials, suitable and in adequate quantity, required to accomplish the work as specified herein.

PART 3 - EXECUTION

3.1 CONSTRUCTION REQUIREMENTS

A. Contractor shall install and maintain SWPPP BMP's during construction as necessary to control and prevent pollution of stormwater runoff leaving the site. Adjust SWPPP as directed and as necessary to prevent stormwater pollution. At an appropriate time after project completion, and only after all disturbed areas are fully vegetated or otherwise protected from erosion in a permanent fashion, remove SWPPP BMPs.

B. Contractor to provide and maintain a proper washdown station.

C. All BMPs shall be inspected weekly by the Contractor and after rainfall events of 1 inch or more. Contractor inspections must be scheduled at least once per week and no later than 48 hours after a rainfall that causes stormwater runoff to occur on-site. A typed inspection report must be delivered to the Engineer after each Contractor inspection.

END OF SECTION 01356

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01400 - QUALITY REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for quality assurance and quality control.

B. Testing and inspecting services are required to verify compliance with requirements specified or indicated. These services do not relieve Contractor of responsibility for compliance with the Contract Document requirements.

1. Specified tests, inspections, and related actions do not limit Contractor's other quality-assurance and -control procedures that facilitate compliance with the Contract Document requirements.
2. Requirements for Contractor to provide quality-assurance and -control services required by Engineer, Owner, Construction Manager, or authorities having jurisdiction are not limited by provisions of this Section.
3. Specific test and inspection requirements are not specified in this Section.

1.2 DEFINITIONS

A. Quality-Control Services: Tests, inspections, procedures, and related actions during and after execution of the Work to evaluate that actual products incorporated into the Work and completed construction comply with requirements. Services do not include contract enforcement activities performed by Engineer or Construction Manager.

B. Product Testing: Tests and inspections that are performed by an NRTL, an NVLAP, or a testing agency qualified to conduct product testing and acceptable to authorities having jurisdiction, to establish product performance and compliance with specified requirements.

C. Construction Quality Assurance (CQA) contractor hired under separate contract by the owner to implement the Construction Quality Assurance Plan.

D. Source Quality-Control Testing: Tests and inspections that are performed at the source, e.g., plant, mill, factory, or shop.

E. Field Quality-Control Testing: Tests and inspections that are performed on-site for installation of the Work and for completed Work.

F. Testing Agency: An entity engaged to perform specific tests, inspections, or both. Testing laboratory shall mean the same as testing agency.

G. Installer/Applicator/Erector: Contractor or another entity engaged by Contractor as an employee, Subcontractor, or Sub-subcontractor, to perform a particular construction operation, including installation, erection, application, and similar operations.

1. Use of trade-specific terminology in referring to a trade or entity does not require that certain construction activities be performed by accredited or unionized individuals, or that requirements specified apply exclusively to specific trade(s).

H. Experienced: When used with an entity or individual, "experienced" means having successfully completed a minimum of five previous projects similar in nature, size, and extent to this Project; being familiar with special requirements indicated; and having complied with requirements of authorities having jurisdiction.

1.3 CONFLICTING REQUIREMENTS

A. Referenced Standards: If compliance with two or more standards is specified and the standards establish different or conflicting requirements for minimum quantities or quality levels, comply with the most stringent requirement. Refer conflicting requirements that are different, but apparently equal, to Engineer for a decision before proceeding.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.4 REPORTS AND DOCUMENTS

A. Test and Inspection Reports: Prepare and submit certified written reports specified in other Sections. Include the following:

1. Date of issue.
2. Project title and number.
3. Name, address, and telephone number of testing agency.
4. Dates and locations of samples and tests or inspections.
5. Description of the Work and test and inspection method.
6. Identification of product and Specification Section.
7. Complete test or inspection data.
8. Test and inspection results and an interpretation of test results.
9. Record of temperature and weather conditions at time of sample taking and testing and inspecting.
10. Comments or professional opinion on whether tested or inspected Work complies with the Contract Document requirements.
11. Name and signature of laboratory inspector.

B. Manufacturer's Field Reports: Prepare written information documenting tests and inspections specified in other Sections. Include the following:

1. Name, address, and telephone number of representative making report.
2. Statement on condition of substrates and their acceptability for installation of product.
3. Summary of installation procedures being followed, whether they comply with requirements and, if not, what corrective action was taken.
4. Results of operational and other tests and a statement of whether observed performance complies with requirements.
5. Other required items indicated in individual Specification Sections.

1.5 QUALITY ASSURANCE

A. General: Qualifications paragraphs in this article establish the minimum qualification levels required; individual Specification Sections specify additional requirements.

B. Installer Qualifications: A firm or individual experienced in installing, erecting, or assembling work similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful in-service performance.

C. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of the system, assembly, or product that are similar in material, design, and extent to those indicated for this Project.

D. Specialists: Certain Specification Sections require that specific construction activities shall be performed by entities who are recognized experts in those operations. Specialists shall satisfy qualification requirements indicated and shall be engaged for the activities indicated.

E. Testing Agency Qualifications: An NRTL, an NVLAP, or an independent agency with the experience and capability to conduct testing and inspecting indicated, as documented according to ASTM E 329; and with additional qualifications specified in individual Sections; and, where required by authorities having jurisdiction, that is acceptable to authorities.

1. NRTL: A nationally recognized testing laboratory according to 29 CFR 1910.7.
2. NVLAP: A testing agency accredited according to NIST's National Voluntary Laboratory Accreditation Program.

F. Manufacturer's Representative Qualifications: An authorized representative of manufacturer who is trained and approved by manufacturer to observe and inspect installation of manufacturer's products that are similar in material, design, and extent to those indicated for this Project.

1.6 QUALITY CONTROL

A. Contractor Responsibilities: Check the CQA plan for responsibilities concerning all tests and inspections.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Where services are indicated as Contractor's responsibility, engage a qualified testing agency to perform these quality-control services.
2. Notify testing agencies and/or CQA Contractor at least three (3) working days in advance of time when Work that requires testing or inspecting will be performed.
3. Where quality-control services are indicated as Contractor's responsibility, submit a certified written report, in duplicate, of each quality-control service.
4. Testing and inspecting requested by Contractor and not required by the Contract Documents are Contractor's responsibility.

B. Manufacturer's Field Services: Where indicated, engage a manufacturer's representative to observe and inspect the Work. Manufacturer's representative's services include examination of substrates and conditions, verification of materials, inspection of completed portions of the Work, and submittal of written reports.

C. Retesting/Reinspecting: Regardless of whether original tests or inspections were Contractor's responsibility, provide quality-control services, including retesting and reinspecting, for construction that replaced Work that failed to comply with the Contract Documents.

D. CQA Responsibilities: Cooperate with Engineer and Contractor in performance of duties. Provide qualified personnel to perform required tests and inspections.

1. Notify Engineer and Contractor promptly of irregularities or deficiencies observed in the Work during performance of its services.
2. Determine the location from which test samples will be taken and in which in-situ tests are conducted.
3. Conduct and interpret tests and inspections and state in each report whether tested and inspected work complies with or deviates from requirements.
4. Submit a certified written report, in duplicate, of each test, inspection, and similar quality-control service through Contractor.
5. Do not release, revoke, alter, or increase the Contract Document requirements or approve or accept any portion of the Work.
6. Do not perform any duties of Contractor.

E. Coordination: Coordinate sequence of activities to accommodate required quality-assurance and -control services with a minimum of delay and to avoid necessity of removing and replacing construction to accommodate testing and inspecting.

1. Schedule times for tests, inspections, obtaining samples, and similar activities.

1.7 SPECIAL TESTS AND INSPECTIONS

A. Special Tests and Inspections: Conducted by a qualified special inspector as required by authorities having jurisdiction, as indicated in individual Specification Sections, and as follows:

1. Verifying that manufacturer maintains detailed fabrication and quality-control procedures and reviews the completeness and adequacy of those procedures to perform the Work.
2. Notifying Engineer and Contractor promptly of irregularities and deficiencies observed in the Work during performance of its services.
3. Submitting a certified written report of each test, inspection, and similar quality-control service to Engineer, through the Contractor and to authorities having jurisdiction.
4. Submitting a final report of special tests and inspections at Substantial Completion, this includes a list of unresolved deficiencies.
5. Interpreting tests and inspections and stating in each report whether tested and inspected work complies with or deviates from the Contract Documents.
6. Retesting and reinspecting corrected work.

Electronic Filing: Received, Clerk's Office 09/28/2020

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 TEST AND INSPECTION LOG

A. Test and Inspection Log: Prepare a record of tests and inspections. Include the following:

1. Date test or inspection was conducted.
2. Description of the Work tested or inspected.
3. Date test or inspection results were transmitted to Engineer.
4. Identification of testing agency or special inspector conducting test or inspection.

B. Maintain log at Project site. Post changes and revisions as they occur. Provide access to test and inspection log for Engineer's reference during normal working hours.

3.2 REPAIR AND PROTECTION

A. General: On completion of testing, inspecting, sample taking, and similar services, repair damaged construction and restore substrates and finishes.

1. Provide materials and comply with installation requirements specified in other Specification Sections or matching existing substrates and finishes. Restore patched areas and extend restoration into adjoining areas with durable seams that are as invisible as possible. Comply with the Contract Document requirements for cutting and patching in Section 01700 "Execution Requirements."

B. Protect construction exposed by or for quality-control service activities.

C. Repair and protection are Contractor's responsibility, regardless of the assignment of responsibility for quality-control services.

END OF SECTION 01400

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01500 - TEMPORARY FACILITIES AND CONTROLS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for temporary utilities, support facilities, and security and protection facilities.

B. Related Requirements:

1. Section 1B "Summary of Work" for limitations on work restrictions and utility interruptions.

1.2 USE CHARGES

A. General: Installation and removal of and use charges for temporary facilities shall be included in the Contract Sum unless otherwise indicated. Allow other entities to use temporary services and facilities without cost, including, but not limited to, Owner's construction forces, Engineer, testing agencies, and authorities having jurisdiction.

B. Water and Sewer Service from Existing System: Water from Owner's existing water system is available for use without metering and without payment of use charges. Provide connections and extensions of services as required for construction operations.

C. Electric Power Service from Existing System: Electric power from Owner's existing system is available for use without metering and without payment of use charges. Provide connections and extensions of services as required for construction operations.

1.3 INFORMATIONAL SUBMITTALS

A. Site Plan: Show temporary facilities, utility hookups, staging areas, and parking areas for construction personnel.

B. Erosion- and Sedimentation-Control Plan: Show compliance with requirements of EPA Construction General Permit or authorities having jurisdiction, whichever is more stringent.

C. Fire-Safety Program: Show compliance with requirements of NFPA 241 and authorities having jurisdiction. Indicate Contractor personnel responsible for management of fire prevention program.

1.4 QUALITY ASSURANCE

A. Electric Service: Comply with NECA, NEMA, and UL standards and regulations for temporary electric service. Install service to comply with NFPA 70.

B. Tests and Inspections: Arrange for authorities having jurisdiction to test and inspect each temporary utility before use. Obtain required certifications and permits.

1.5 PROJECT CONDITIONS

A. Temporary Use of Permanent Facilities: Engage Installer of each permanent service to assume responsibility for operation, maintenance, and protection of each permanent service during its use as a construction facility before Owner's acceptance, regardless of previously assigned responsibilities.

PART 2 - PRODUCTS

2.1 TEMPORARY FACILITIES

A. Field Offices, General: Prefabricated or mobile units with serviceable finishes, temperature controls, and foundations adequate for normal loading.

Electronic Filing: Received, Clerk's Office 09/28/2020

B. Common-Use Field Office: Of sufficient size to accommodate needs of Owner, Engineer, and construction personnel office activities and to accommodate Project meetings specified in other Division 01 Sections. Keep office clean and orderly.

C. Storage and Fabrication Sheds: Provide sheds sized, furnished, and equipped to accommodate materials and equipment for construction operations.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Locate facilities where they will serve Project adequately and result in minimum interference with performance of the Work. Relocate and modify facilities as required by progress of the Work.

1. Locate facilities to limit site disturbance as specified in Section 1B "Summary of Work."

B. Provide each facility ready for use when needed to avoid delay. Do not remove until facilities are no longer needed.

3.2 TEMPORARY UTILITY INSTALLATION

A. General: Install temporary service or connect to existing service.

1. Arrange with utility company, Owner, and existing users for time when service can be interrupted, if necessary, to make connections for temporary services.

B. Sewers and Drainage: Provide temporary utilities to remove effluent lawfully.

C. Sanitary Facilities: Provide temporary toilets, wash facilities, and drinking water for use of construction personnel.

D. Electric Power Service: Connect to Owner's existing electric power service. Maintain equipment in a condition acceptable to Owner.

E. Electric Power Service: Provide electric power service and distribution system of sufficient size, capacity, and power characteristics required for construction operations.

1. Install electric power service overhead unless otherwise indicated.

F. Telephone Service: Owner will provide telephone, fax, and computer connections for Contractor supplied construction trailers.

1. At each telephone, post a list of important telephone numbers.

a. Police and fire departments.
b. Ambulance service.
c. Contractor's home office.
d. Contractor's emergency after-hours telephone number.
e. Engineers' offices.
f. Owner's office.
g. Principal subcontractors' field and home offices.

2. Provide superintendent with cellular telephone.

3.3 SUPPORT FACILITIES INSTALLATION

A. Temporary Use of Permanent Roads and Paved Areas: Locate temporary roads and paved areas in same location as permanent roads and paved areas. Construct and maintain temporary roads and paved areas adequate for construction operations. Extend temporary roads and paved areas, within construction limits indicated, as necessary for construction operations.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Coordinate elevations of temporary roads and paved areas with permanent roads and paved areas.
2. Prepare subgrade and install subbase and base for temporary roads and paved areas according to Section 02200 "Earthwork."

B. Traffic Controls: Comply with requirements of authorities having jurisdiction.

1. Protect existing site improvements to remain including curbs, pavement, and utilities.
2. Maintain access for fire-fighting equipment and access to fire hydrants.

C. Parking: Use designated areas of Owner's existing parking areas for construction personnel.

D. Dewatering Facilities and Drains: Comply with requirements of authorities having jurisdiction. Maintain Project site, excavations, and construction free of water.

1. Dispose of rainwater in a lawful manner that will not result in flooding Project or adjoining properties or endanger permanent Work or temporary facilities.
2. Remove snow and ice as required to minimize accumulations.

E. Waste Disposal Facilities: Paper waster form construction office trailers and waste from installation of new materials to be hauled off by licensed trash haulers. No paper or cardboard waster to be left on site or buried in designated disposal area.

3.4 SECURITY AND PROTECTION FACILITIES INSTALLATION

A. Protection of Existing Facilities: Protect existing vegetation, equipment, structures, utilities, and other improvements at Project site and on adjacent properties, except those indicated to be removed or altered. Repair damage to existing facilities.

B. Environmental Protection: Provide protection, operate temporary facilities, and conduct construction as required to comply with environmental regulations and that minimize possible air, waterway, and subsoil contamination or pollution or other undesirable effects.

C. Temporary Erosion and Sedimentation Control: Provide measures to prevent soil erosion and discharge of soil-bearing water runoff and airborne dust to undisturbed areas and to adjacent properties and walkways, according to the SWPPP.

D. Stormwater Control: Comply with requirements of authorities having jurisdiction. Provide barriers in and around excavations and subgrade construction to prevent flooding by runoff of stormwater from heavy rains.

END OF SECTION 01500

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01600 - PRODUCT REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for selection of products for use in Project; product delivery, storage, and handling; manufacturers' standard warranties on products; special warranties; and comparable products.

1.2 DEFINITIONS

A. Products: Items obtained for incorporating into the Work, whether purchased for Project or taken from previously purchased stock. The term "product" includes the terms "material," "equipment," "system," and terms of similar intent.

1. Named Products: Items identified by manufacturer's product name, including make or model number or other designation shown or listed in manufacturer's published product literature that is current as of date of the Contract Documents.
2. New Products: Items that have not previously been incorporated into another project or facility. Products salvaged or recycled from other projects are not considered new products.
3. Comparable Product: Product that is demonstrated and approved through submittal process to have the indicated qualities related to type, function, dimension, in-service performance, physical properties, appearance, and other characteristics that equal or exceed those of specified product.

B. Basis-of-Design Product Specification: A specification in which a specific manufacturer's product is named and accompanied by the words "basis-of-design product," including make or model number or other designation, to establish the significant qualities related to type, function, dimension, in-service performance, physical properties, appearance, and other characteristics for purposes of evaluating comparable products of additional manufacturers named in the specification.

1.3 ACTION SUBMITTALS

A. Comparable Product Requests: Submit request for consideration of each comparable product. Identify product or fabrication or installation method to be replaced. Include Specification Section number and title and Drawing numbers and titles.

1. Engineer's Action: If necessary, Engineer will request additional information or documentation for evaluation within one week of receipt of a comparable product request. Engineer will notify Contractor of approval or rejection of proposed comparable product request within 15 days of receipt of request, or seven days of receipt of additional information or documentation, whichever is later.

    a. Form of Approval: As specified in Section 01330 "Submittal Procedures."
    b. Use product specified if Engineer does not issue a decision on use of a comparable product request within time allocated.

B. Basis-of-Design Product Specification Submittal: Comply with requirements in Section 01330 "Submittal Procedures." Show compliance with requirements.

1.4 QUALITY ASSURANCE

A. Compatibility of Options: If Contractor is given option of selecting between two or more products for use on Project, select product compatible with products previously selected, even if previously selected products were also options.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle products using means and methods that will prevent damage, deterioration, and loss, including theft and vandalism. Comply with manufacturer's written instructions.

B. Delivery and Handling:

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Schedule delivery to minimize long-term storage at Project site and to prevent overcrowding of construction spaces.
2. Coordinate delivery with installation time to ensure minimum holding time for items that are flammable, hazardous, easily damaged, or sensitive to deterioration, theft, and other losses.
3. Deliver products to Project site in an undamaged condition in manufacturer's original sealed container or other packaging system, complete with labels and instructions for handling, storing, unpacking, protecting, and installing.
4. Inspect products on delivery to determine compliance with the Contract Documents and to determine that products are undamaged and properly protected.

C. Storage:

1. Store products to allow for inspection and measurement of quantity or counting of units.
2. Store products that are subject to damage by the elements, under cover in a weathertight enclosure above ground, with ventilation adequate to prevent condensation.
3. Comply with product manufacturer's written instructions for temperature, humidity, ventilation, and weather-protection requirements for storage.
4. Protect stored products from damage.

1.6 PRODUCT WARRANTIES

A. Warranties specified in other Sections shall be in addition to, and run concurrent with, other warranties required by the Contract Documents. Manufacturer's disclaimers and limitations on product warranties do not relieve Contractor of obligations under requirements of the Contract Documents.

1. Manufacturer's Warranty: Written warranty furnished by individual manufacturer for a particular product and specifically endorsed by manufacturer to Owner.
2. Special Warranty: Written warranty required by the Contract Documents to provide specific rights for Owner.

B. Special Warranties: Prepare a written document that contains appropriate terms and identification, ready for execution.

1. Manufacturer's Standard Form: Modified to include Project-specific information and properly executed.
2. Specified Form: When specified forms are included with the Specifications, prepare a written document using indicated form properly executed.
3. Refer to other Sections for specific content requirements and particular requirements for submitting special warranties.

C. Submittal Time: Comply with requirements in Section 01770 "Closeout Procedures."

PART 2 - PRODUCTS

2.1 PRODUCT SELECTION PROCEDURES

A. General Product Requirements: Provide products that comply with the Contract Documents, are undamaged and, unless otherwise indicated, are new at time of installation.

1. Provide products complete with accessories, trim, finish, fasteners, and other items needed for a complete installation and indicated use and effect.
2. Standard Products: If available, and unless custom products or nonstandard options are specified, provide standard products of types that have been produced and used successfully in similar situations on other projects.
3. Owner reserves the right to limit selection to products with warranties not in conflict with requirements of the Contract Documents.
4. Where products are accompanied by the term "as selected," Engineer will make selection.
5. Descriptive, performance, and reference standard requirements in the Specifications establish salient characteristics of products.

B. Product Selection Procedures:

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Product: Where Specifications name a single manufacturer and product, provide the named product that complies with requirements. Comparable products or substitutions for Contractor's convenience will not be considered.

2. Manufacturers:

   a. Restricted List: Where Specifications include a list of manufacturers' names, provide a product by one of the manufacturers listed that complies with requirements. Comparable products or substitutions for Contractor's convenience will not be considered unless otherwise indicated.

C. Visual Selection Specification: Where Specifications include the phrase "as selected by Engineer from manufacturer's full range" or similar phrase, select a product that complies with requirements.

2.2 COMPARABLE PRODUCTS

A. Conditions for Consideration: Engineer will consider Contractor's request for comparable product when the following conditions are satisfied. If the following conditions are not satisfied, Engineer may return requests without action, except to record noncompliance with these requirements:

1. Evidence that the proposed product does not require revisions to the Contract Documents, that it is consistent with the Contract Documents and will produce the indicated results, and that it is compatible with other portions of the Work.
2. Detailed comparison of significant qualities of proposed product with those named in the Specifications. Significant qualities include attributes such as performance, weight, size, durability, visual effect, and specific features and requirements indicated.
3. Evidence that proposed product provides specified warranty.
4. List of similar installations for completed projects with project names and addresses and names and addresses of engineers and owners, if requested.
5. Samples, if requested.

PART 3 - EXECUTION (Not Used)

END OF SECTION 01600

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01700 - EXECUTION REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes general administrative and procedural requirements governing execution of the Work including, but not limited to, the following:

1. Construction layout.
2. Field engineering and surveying.
3. Installation of the Work.
4. Cutting and patching.
5. Correction of the Work.

B. Related Requirements:

1. Division 1 Section 01770 "Closeout Procedures" for submitting final property survey with Project Record Documents, recording of Owner-accepted deviations from indicated lines and levels, and final cleaning.

1.2 INFORMATIONAL SUBMITTALS

A. Certificates: Submit certificate signed by Illinois licensed land surveyor certifying that location and elevation of improvements comply with requirements.

1.3 QUALITY ASSURANCE

A. Land Surveyor Qualifications: A professional land surveyor who is legally qualified to practice in the State of Illinois and who is experienced in providing land-surveying services of the kind indicated.

PART 2 - PRODUCTS

2.1 MATERIALS

A. In-Place Materials: Use materials for patching identical to in-place materials. For exposed surfaces, use materials that visually match in-place adjacent surfaces to the fullest extent possible.

1. If identical materials are unavailable or cannot be used, use materials that, when installed, will provide a match acceptable to Engineer for the visual and functional performance of in-place materials.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Existing Conditions: The existence and location of underground and other utilities and construction indicated as existing are not guaranteed. Before beginning sitework, investigate and verify the existence and location of underground utilities, and other construction affecting the Work.

1. Before construction, verify the location and invert elevation at points of connection of sanitary sewer, storm sewer, and water-service piping; underground electrical services, and other utilities.

3.2 PREPARATION

A. Existing Utility Information: Furnish information to Owner that is necessary to adjust, move, or relocate existing utility structures, utility poles, lines, services, or other utility appurtenances located in or affected by construction. Coordinate with authorities having jurisdiction.

Electronic Filing: Received, Clerk's Office 09/28/2020

B. Field Measurements: Take field measurements as required to fit the Work properly. Recheck measurements before installing each product. Where portions of the Work are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

C. Space Requirements: Verify space requirements and dimensions of items shown diagrammatically on Drawings.

D. Review of Contract Documents and Field Conditions: Immediately on discovery of the need for clarification of the Contract Documents caused by differing field conditions outside the control of Contractor, submit a request for information to Engineer according to requirements in Section 01310 "Project Management and Coordination."

3.3 CONSTRUCTION LAYOUT

A. Verification: Before proceeding to lay out the Work, verify layout information shown on Drawings, in relation to the property survey and existing benchmarks. If discrepancies are discovered, notify Owner or Engineer promptly.

B. General: Engage a land surveyor to lay out the Work using accepted surveying practices.

1. Establish benchmarks and control points to set lines and levels at each story of construction and elsewhere as needed to locate each element of Project.
2. Establish limits on use of Project site.
3. Establish dimensions within tolerances indicated. Do not scale Drawings to obtain required dimensions.
4. Inform installers of lines and levels to which they must comply.
5. Check the location, level and plumb, of every major element as the Work progresses.
6. Notify Construction Manager when deviations from required lines and levels exceed allowable tolerances.
7. Close site surveys with an error of closure equal to or less than the standard established by authorities having jurisdiction.

C. Site Improvements: Locate and lay out site improvements, including grading, fill and topsoil placement, and utility slopes.

D. Record Log: Maintain a log of layout control work. Record deviations from required lines and levels. Include beginning and ending dates and times of surveys, weather conditions, name and duty of each survey party member, and types of instruments and tapes used. Make the log available for reference by Contractor.

3.4 FIELD ENGINEERING

A. Reference Points: Locate existing permanent benchmarks, control points, and similar reference points before beginning the Work. Preserve and protect permanent benchmarks and control points during construction operations.

B. Survey Control Points: Survey Control points have been established for this project, but are not limited by the established list. Contractor may establish additional control points as deemed necessary during construction.

C. Benchmarks: Establish and maintain a minimum of two (2) permanent benchmarks on Project site, referenced to data established by survey control points. Comply with authorities having jurisdiction for type and size of benchmark.

1. Record benchmark locations, with horizontal and vertical data, on Project Record Documents.

D. Final Property Survey: Engage a land surveyor to prepare a final property survey showing significant features (real property) for Project. Include on the survey a certification, signed by land surveyor, that principal metes, bounds, lines, and levels of Project are accurately positioned as shown on the survey.

1. Recording: At Substantial Completion, have the final property survey recorded by or with authorities having jurisdiction as the official "property survey."

Electronic Filing: Received, Clerk's Office 09/28/2020

3.5 INSTALLATION

A. Comply with manufacturer's written instructions and recommendations for installing products in applications indicated.

B. Install products at the time and under conditions that will ensure the best possible results. Maintain conditions required for product performance until Substantial Completion.

C. Conduct construction operations so no part of the Work is subjected to damaging operations or loading in excess of that expected during normal conditions of occupancy.

3.6 CUTTING AND PATCHING

A. Cutting and Patching, General: Employ skilled workers to perform cutting and patching. Proceed with cutting and patching at the earliest feasible time, and complete without delay.

1. Cut in-place construction to provide for installation of other components or performance of other construction, and subsequently patch as required to restore surfaces to their original condition.

B. Protection: Protect in-place construction during cutting and patching to prevent damage. Provide protection from adverse weather conditions for portions of Project that might be exposed during cutting and patching operations.

C. Existing Utility Services and Mechanical/Electrical Systems: Where existing services/systems are required to be removed, relocated, or abandoned, bypass such services/systems before cutting to minimize interruption to occupied areas.

D. Cutting: Cut in-place construction by sawing, drilling, breaking, chipping, grinding, and similar operations, including excavation, using methods least likely to damage elements retained or adjoining construction. If possible, review proposed procedures with original Installer; comply with original Installer's written recommendations.

1. Excavating and Backfilling: Comply with requirements in applicable Sections where required by cutting and patching operations.
2. Proceed with patching after construction operations requiring cutting are complete.

E. Patching: Patch construction by filling, closing up, and similar operations following performance of other work. Patch with durable seams that are as invisible as practicable. Provide materials and comply with installation requirements specified in other Sections, where applicable.

1. Inspection: Where feasible, test and inspect patched areas after completion to demonstrate physical integrity of installation.
2. Exposed Finishes: Restore exposed finishes of patched areas and extend finish restoration into retained adjoining construction in a manner that will minimize evidence of patching and refinishing.

3.7 PROGRESS CLEANING

A. Site: Maintain Project site free of waste materials and debris.

B. Waste Disposal: Do not bury or burn waste materials on-site. Do not wash waste materials down sewers or into waterways.

C. During handling and installation, clean and protect construction in progress and adjoining materials already in place. Apply protective covering where required to ensure protection from damage or deterioration at Substantial Completion.

3.8 PROTECTION OF INSTALLED CONSTRUCTION

A. Provide final protection and maintain conditions that ensure installed Work is without damage or deterioration at time of Substantial Completion.

B. Comply with manufacturer's written instructions for temperature and relative humidity.

Electronic Filing: Received, Clerk's Office 09/28/2020

3.9 CORRECTION OF THE WORK

A. Repair or remove and replace defective construction. Restore damaged substrates and finishes.

1. Repairing includes replacing defective parts, refinishing damaged surfaces, touching up with matching materials, and property adjusting operating equipment.

B. Restore permanent facilities used during construction to their specified condition.

C. Remove and replace damaged surfaces that are exposed to view if surfaces cannot be repaired without visible evidence of repair.

END OF SECTION 01700

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01770 - CLOSEOUT PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for contract closeout, including, but not limited to, the following:

1. Substantial Completion procedures.
2. Final completion procedures.
3. Warranties.
4. Final cleaning.
5. Repair of the Work.

B. Related Requirements:

1. Section 01781 "Project Record Documents" for submitting record Drawings, record Specifications, and record Product Data.

1.2 ACTION SUBMITTALS

A. Product Data: For cleaning agents.

B. Contractor's List of Incomplete Items: Initial submittal at Substantial Completion.

C. Certified List of Incomplete Items: Final submittal at Final Completion.

1.3 CLOSEOUT SUBMITTALS

A. Certificates of Release: From authorities having jurisdiction.

B. Certificate of Insurance: For continuing coverage.

1.4 MAINTENANCE MATERIAL SUBMITTALS

A. Schedule of Maintenance Material Items: For maintenance material submittal items specified in other Sections.

1.5 SUBSTANTIAL COMPLETION PROCEDURES

A. Contractor's List of Incomplete Items: Prepare and submit a list of items to be completed and corrected (Contractor's punch list), indicating the value of each item on the list and reasons why the Work is incomplete.

B. Submittals Prior to Substantial Completion: Complete the following a minimum of 10 days prior to requesting inspection for determining date of Substantial Completion. List items below that are incomplete at time of request.

1. Certificates of Release: Obtain and submit releases from authorities having jurisdiction permitting Owner unrestricted use of the Work and access to services and utilities. Include occupancy permits, operating certificates, and similar releases.
2. Submit closeout submittals specified in other Division 01 Sections, including project record documents, operation and maintenance manuals, final completion construction photographic documentation, damage or settlement surveys, property surveys, and similar final record information.
3. Submit closeout submittals specified in individual Sections, including specific warranties, workmanship bonds, maintenance service agreements, final certifications, and similar documents.
4. Submit maintenance material submittals specified in individual Sections, including extra materials, and similar items, and deliver to location designated by Construction Manager. Label with manufacturer's name where applicable.

Electronic Filing: Received, Clerk's Office 09/28/2020

C. Procedures Prior to Substantial Completion: Complete the following a minimum of 10 days prior to requesting inspection for determining date of Substantial Completion. List items below that are incomplete at time of request.

1. Advise Owner of pending insurance changeover requirements.
2. Instruct Owner's personnel in maintenance of products.
3. Complete final cleaning requirements.

D. Inspection: Submit a written request for inspection to determine Substantial Completion a minimum of 10 days prior to date the work will be completed and ready for final inspection and tests. On receipt of request, Engineer and Owner will either proceed with inspection or notify Contractor of unfulfilled requirements. Engineer will prepare the Certificate of Substantial Completion after inspection or will notify Contractor of items, either on Contractor's list or additional items identified by SPOC that must be completed or corrected before certificate will be issued.

1. Reinspection: Request reinspection when the Work identified in previous inspections as incomplete is completed or corrected.
2. Results of completed inspection will form the basis of requirements for final completion.

1.6 FINAL COMPLETION PROCEDURES

A. Preliminary Procedures: Before requesting final inspection for determining final completion, complete the following:

1. Submit a final Application for Payment according to Company requirements.
2. Certified List of Incomplete Items: Submit certified copy of Engineer's Substantial Completion inspection list of items to be completed or corrected (punch list), endorsed and dated by Engineer. Certified copy of the list shall state that each item has been completed or otherwise resolved for acceptance.
3. Certificate of Insurance: Submit evidence of final, continuing insurance coverage complying with insurance requirements.
4. Instruct Owner's personnel in maintenance of products.

B. Inspection: Submit a written request for final inspection to determine acceptance. On receipt of request, Engineer and Owner will either proceed with inspection or notify Contractor of unfulfilled requirements. Engineer will prepare a final Certificate for Payment after inspection or will notify Contractor of construction that must be completed or corrected before certificate will be issued.

1. Reinspection: Request reinspection when the Work identified in previous inspections as incomplete is completed or corrected.

1.7 LIST OF INCOMPLETE ITEMS (PUNCH LIST)

A. Organization of List: Include area affected by construction operations for incomplete items and items needing correction including, if necessary, areas disturbed by Contractor that are outside the limits of construction.

1. Submit list of incomplete items in the following format:

a. PDF electronic file. Engineer, through Contractor, will return annotated copy.

1.8 SUBMITTAL OF PROJECT WARRANTIES

A. Time of Submittal: Submit written warranties on request of Engineer for designated portions of the Work where commencement of warranties other than date of Substantial Completion is indicated, or when delay in submittal of warranties might limit Owner's rights under warranty.

B. Organize warranty documents into an orderly sequence based on the table of contents of the Project Manual.

1. Bind warranties and bonds in heavy-duty, three-ring, vinyl-covered, loose-leaf binders, thickness as necessary to accommodate contents, and sized to receive 8-1/2-by-11-inch paper.

Electronic Filing: Received, Clerk's Office 09/28/2020

2. Provide heavy paper dividers with plastic-covered tabs for each separate warranty. Mark tab to identify the product or installation. Provide a typed description of the product or installation, including the name of the product and the name, address, and telephone number of Installer.
3. Identify each binder on the front and spine with the typed or printed title "WARRANTIES," Project name, and name of Contractor.
4. Warranty Electronic File: Scan warranties and bonds and assemble complete warranty and bond submittal package into a single indexed electronic PDF file with links enabling navigation to each item. Provide bookmarked table of contents at beginning of document.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 FINAL CLEANING

A. General: Perform final cleaning. Conduct cleaning and waste-removal operations to comply with local laws and ordinances and Federal and local environmental and antipollution regulations.

B. Complete the following cleaning operations before requesting inspection for certification of Substantial Completion for entire Project or for a designated portion of Project:

1. Clean Project site, yard, and grounds, in areas disturbed by construction activities, including landscape development areas, of rubbish, waste material, litter, and other foreign substances.
2. Sweep paved areas broom clean. Remove petrochemical spills, stains, and other foreign deposits.
3. Rake grounds that are neither planted nor paved to a smooth, even-textured surface.
4. Remove tools, construction equipment, machinery, and surplus material from Project site.
5. Remove labels that are not permanent.

3.2 REPAIR OF THE WORK

A. Complete repair and restoration operations before requesting inspection for determination of Substantial Completion.

B. Repair or remove and replace defective construction. Repairing includes replacing defective materials, refinishing damaged surfaces. Where damaged or worn items cannot be repaired or restored, provide replacements. Remove and replace operating components that cannot be repaired. Restore damaged construction and permanent facilities used during construction to specified condition.

END OF SECTION 01770

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 01781 - PROJECT RECORD DOCUMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for project record documents, including the following:

1. Record Drawings.
2. Record Specifications.
3. Record Product Data.

1.2 CLOSEOUT SUBMITTALS

A. Record Drawings: Comply with the following:

1. Number of Copies: Submit one set(s) of marked-up record prints.
2. Number of Copies: Submit copies of record Drawings as follows:

a. Initial Submittal:

1) Submit PDF electronic files of scanned record prints and one set(s) of file prints.

b. Final Submittal:

1) Submit record digital data files and three set(s) of record digital data file plots.

B. Record Specifications: Submit one paper copy of Project's Specifications, including addenda and contract modifications.

C. Record Product Data: Submit one paper copy of each submittal.

D. Photographs of the oil pipeline foundations after construction.

PART 2 - PRODUCTS

2.1 RECORD DRAWINGS

A. Record Prints: Maintain one set of marked-up paper copies of the Contract Drawings and Shop Drawings, incorporating new and revised Drawings as modifications are issued.

1. Preparation: Mark record prints to show the actual installation where installation varies from that shown originally. Require individual or entity who obtained record data, whether individual or entity is Installer, subcontractor, or similar entity, to provide information for preparation of corresponding marked-up record prints.

a. Give particular attention to information on concealed elements that would be difficult to identify or measure and record later.
b. Record data as soon as possible after obtaining it.

2. Mark the Contract Drawings and Shop Drawings completely and accurately. Use personnel proficient at recording graphic information in production of marked-up record prints.
3. Mark record sets with erasable, red-colored pencil. Use other colors to distinguish between changes for different categories of the Work at same location.
4. Note Construction Change Directive numbers, alternate numbers, Change Order numbers, and similar identification, where applicable.

2.2 RECORD SPECIFICATIONS

Electronic Filing: Received, Clerk's Office 09/28/2020

A. Preparation: Mark Specifications to indicate the actual product installation where installation varies from that indicated in Specifications, addenda, and contract modifications.

1. Give particular attention to information on concealed products and installations that cannot be readily identified and recorded later.
2. Mark copy with the proprietary name and model number of products, materials, and equipment furnished, including substitutions and product options selected.
3. Record the name of manufacturer, supplier, Installer, and other information necessary to provide a record of selections made.
4. Note related Change Orders, record Product Data, and record Drawings where applicable.

B. Format: Submit record Specifications as paper copy.

2.3 RECORD PRODUCT DATA

A. Preparation: Mark Product Data to indicate the actual product installation where installation varies substantially from that indicated in Product Data submittal.

1. Give particular attention to information on concealed products and installations that cannot be readily identified and recorded later.
2. Include significant changes in the product delivered to Project site and changes in manufacturer's written instructions for installation.
3. Note related Change Orders and record Drawings where applicable.

B. Format: Submit record Product Data as paper copy.

2.4 MISCELLANEOUS RECORD SUBMITTALS

A. Assemble miscellaneous records required by other Specification Sections for miscellaneous record keeping and submittal in connection with actual performance of the Work. Bind or file miscellaneous records and identify each, ready for continued use and reference.

B. Format: Submit miscellaneous record submittals as paper copy.

PART 3 - EXECUTION

3.1 RECORDING AND MAINTENANCE

A. Recording: Maintain one copy of each submittal during the construction period for project record document purposes. Post changes and revisions to project record documents as they occur; do not wait until end of Project.

B. Maintenance of Record Documents and Samples: Store record documents and Samples in the field office apart from the Contract Documents used for construction. Do not use project record documents for construction purposes. Maintain record documents in good order and in a clean, dry, legible condition, protected from deterioration and loss. Provide access to project record documents for Engineer's and Construction Manager's reference during normal working hours.

END OF SECTION 01781

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02060 - SELECTIVE DEMOLITION

PART 1 - GENERAL

1.1 SUMMARY

A. Work includes all items described in these specifications and as shown on Site Plan drawings C-101 through C-107.

B. Section Includes:

1. Demolition, removal, and disposal of selected site elements as indicated on drawings:
   a. Above grade steam line and foundations,
   b. Chain link fencing, including but not limited to the mesh, posts, supports, barbed wire, foundations, etc.
   c. Sluice piping and inflow structure at Bottom Ash Pond,
   d. Light poles and wiring around Bottom Ash Pond,
   e. Underground electric lines, boxes, panels, components and monitoring equipment on Berm of Fly Ash Pond,
   f. Other piping and miscellaneous items.
2. Salvage of existing items to be reused or recycled.
3. Temporary removal and replacement.
4. Removal and disposal of Outflow structure and pipe from Bottom Ash Pond.
5. Removal and disposal of Inflow structure, concrete vault structure and inlet pipe(s) from Bottom Ash Pond.
6. Removal and disposal of Outflow structure and plug outlet pipe with flowable fill in the Fly Ash Pond.
7. Removal of underground electric service and utility poles at dock and along north edge of Bottom Ash Pond.

1.2 DEFINITIONS

A. Demolish: Remove existing construction items and legally dispose of.

B. Existing to Remain: Existing items of construction that are not to be permanently removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

1.3 PREINSTALLATION MEETINGS

A. Pre-demolition Conference: Conduct conference at Project site.

1.4 INFORMATIONAL SUBMITTALS

A. Pre-demolition Photographs or Video: Submit before Work begins.

B. Schedule of selective demolition activities with starting and ending dates for each activity.

C. Submittals shall be as outlined in Section 01330 Submittals.

1.5 FIELD CONDITIONS

A. Conditions existing at time of inspection for bidding purpose will be maintained by Owner as far as practical.

B. Notify Engineer of discrepancies between existing conditions and Drawings before proceeding with selective demolition.

C. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.

1. If suspected hazardous materials are encountered, do not disturb; immediately notify Engineer and Owner. Hazardous materials will be removed by Owner under a separate contract.

D. Storage or sale of removed items or materials on-site is not permitted.

Electronic Filing: Received, Clerk's Office 09/28/2020

E. Utility Service: Maintain existing utilities indicated to remain in service and protect them against damage during selective demolition operations.

1.6 SALVAGE

A. Contractor may salvage any materials within the scope of demolition, such as, metal piping, chain-link fencing, rock blanket, power poles, light poles, etc.

B. Salvage materials must be approved by Ameren personnel before leaving project site.

1.7 SUBMITTALS

A. Submit design mixture and testing certification of Flowable Fill.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning selective demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.

B. Standards: Comply with ANSI/ASSE A10.6 and NFPA 241.

C. Flowable Fill: Density in place shall be 65 to 100 psi for non-air-entrained or conventionally air-entrained mixtures. Mixture to meet ASTM C403 standards. Provide mix design and specifications to engineers for review prior to beginning work.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that utilities have been disconnected and capped before starting selective demolition operations.

B. Survey existing conditions and correlate with requirements indicated to determine extent of selective demolition required.

C. When unanticipated electrical or structural elements that conflict with intended function or design are encountered, investigate and measure the nature and extent of conflict. Promptly submit a written report to Engineer.

D. Survey of Existing Conditions: Record existing conditions by use of measured drawings and preconstruction photographs.

1. Comply with requirements specified in Section 01322 "Photographic Documentation."

3.2 UTILITY SERVICES AND MECHANICAL/ELECTRICAL SYSTEMS

A. Existing Services/Systems to Remain: Maintain services/systems indicated to remain and protect them against damage.

1. Comply with requirements for existing services/systems interruptions specified in Section 1B "Summary of Work."

B. Existing Services/Systems To Be Removed, Relocated, or Abandoned: Locate, identify, disconnect, and seal or cap off indicated utility services and mechanical/electrical systems serving areas to be selectively demolished.

1. Owner will arrange to shut off indicated services/systems when requested by Contractor.
2. Arrange to shut off indicated utilities with utility companies.

Electronic Filing: Received, Clerk's Office 09/28/2020

3. If systems are required to be removed, relocated, or abandoned, provide temporary systems that bypass area of selective demolition and that maintain continuity of systems to other parts of building.
4. Contractor to coordinate with local utility to remove and relocate the utility poles along the north side of the Bottom Ash Pond. New dusk to dawn lights and underground service to dock will be installed.

3.3 PREPARATION

A. Site Access and Temporary Controls: Conduct selective demolition and debris-removal operations to ensure minimum interference with roads and other adjacent occupied and used facilities.

1. Comply with requirements for access and protection specified in Section 01500 "Temporary Facilities and Controls."

B. Temporary Facilities: Provide temporary barricades and other protection required to prevent injury to people and damage to facilities to remain.

3.4 SELECTIVE DEMOLITION, GENERAL

A. General: Demolish and remove existing construction only to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations and as follows:

1. Do not use cutting torches until work area is cleared of flammable materials. Maintain fire watch and portable fire-suppression devices during flame-cutting operations.
2. Dispose of demolished items and materials promptly.

B. Existing Items to Remain: Protect construction indicated to remain against damage and soiling during demolition.

3.5 DISPOSAL OF DEMOLISHED MATERIALS

A. General: All demolished materials from the site are to stay on-site and/or be disposed of in an approved manner.

1. Demolished materials remaining on-site shall be disposed of within the Fly Ash Pond as approved by Owner.
2. Do not allow demolished materials to accumulate on-site.
3. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.

B. Burning: Do not burn demolished materials.

C. The Contractor can salvage any materials within the scope of the demolition.

3.6 CLEANING

A. Clean adjacent areas, on-site or off-site, of debris caused by selective demolition operations. Return adjacent areas to condition existing before demolition operations began.

END OF SECTION 02060

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02200 - EARTH WORK

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Moving and shaping ash to the grading shown on the drawings.
2. Excavate the Bottom Ash Pond to elevation 424 and deposit into Fly Ash Pond and backfill with off-site borrow soil to elevation 430.
3. Excavating and shaping Eastern Fly Ash Stockpile area with off-site borrow soil as shown on drawings.
4. Moving, filling, and shaping of materials deposited into Fly Ash Pond.
5. Preparing subgrades for synthetic turf, turf, grasses and roadway.
6. Excavating and backfilling for synthetic turf, turfs, ditches and structures.
7. Excavating and backfilling for anchor trenches.
8. Shaping proposed ditches.
9. Scraping coal pile and removing approximately 18-24 inches and depositing into the Fly Ash Pond.
10. Hauling in and filling with off-site borrow soil.

1.2 DEFINITIONS

A. Ash Material: Consists of Coal Fines, Bottom Ash, Fly Ash, Ash/Soil/Rock mixture.

B. Backfill: Ash or Soil material used as fill.

C. Bedding Course: Aggregate layer placed over the excavated subgrade in a trench before laying pipe.

D. Borrow Soil: Satisfactory soil imported from off-site for use as fill or backfill.

E. Excavation: Removal of material encountered above subgrade elevations and to lines and dimensions indicated.

1. Authorized Additional Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions as directed by Engineer. Authorized additional excavation and replacement material will be paid for according to Contract provisions for changes in the Work.
2. Unauthorized Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions without direction by Engineer. Unauthorized excavation, as well as remedial work directed by Engineer, shall be without additional compensation.

F. Fill: Soil materials used to raise existing grades.

G. Structures: Buildings, footings, foundations, retaining walls, slabs, tanks, curbs, mechanical and electrical appurtenances, or other man-made stationary features constructed above or below the ground surface.

H. Subgrade: Uppermost surface of an excavation or the top surface of a fill or backfill immediately below subbase, drainage fill, drainage course, or topsoil materials.

I. Synthetic Turf: A synthetic grass system for closure of mine spoils and landfills; turf is a combination of polypropylene grass tufts underlain by impermeable HDPE geomembrane, i.e. "Closureturf™" or "Hydroturf™".

J. Utilities: On-site underground pipes, conduits, ducts, and cables, as well as underground services within buildings.

1.3 QUALITY ASSURANCE

A. Pre-excavation Conference: Conduct conference at Project site.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.4 PROJECT CONDITIONS

A. Utility Locator Service: Notify utility locator service for area where Project is located before beginning earth moving operations.

1.5 SUBMITTALS

A. Submit soil material samples as required by CQA Plan and as outlined in Section 01330 Submittals.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS

A. Satisfactory Soils:

1. General Fill: Soil Classification Groups CL, ML, GW, GP, GM, SC, SW, SP, and SM according to ASTM D 2487, or a combination of these groups; free of rock or gravel larger than 2 inches in any dimension, debris, waste, frozen materials, vegetation, and other deleterious matter.
2. Ash Pond Subgrade within 1 foot of design grade - Soil Classification Groups CL, ML, SC, SW, SP, and SM according to ASTM D 2487, or a combination of these groups; no bottom ash; free of rock or gravel larger than 2 inches in any dimension, debris, waste, frozen materials, vegetation, and other deleterious matter.
3. Bottom Ash Pond Backfill: Soil Classification Groups GW, GM, GP, GC, SC, SW, SP, SM according to ASTM D 2487, or a combination of these groups; free of rock or gravel larger than 2 inches in any dimension, debris, waste, frozen materials, vegetation, and other deleterious matter.
4. Access Road on Bottom Ash Berm: Bottom Ash Berm Widening under ClosureTurf™ shall be constructed with Bottom Ash Material only.

B. Unsatisfactory Soils:

1. Unsatisfactory soils also include satisfactory soils not maintained within 4 percent of optimum moisture content at time of compaction.

C. Sand Infill for ClosureTurf™: Natural or manufactured sand material, fine aggregate meeting grain size distribution ASTM C 33 and Specification No. 02800-2.4C.

D. Hydrobinder Infill for HydroTurf™: Proprietary blended material manufactured by Agru America or approved equivalent.

E. Bedding Course: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; except with 100 percent passing a 1-inch sieve and not more than 8 percent passing a No. 200 sieve.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect structures, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earth moving operations.

B. Protect and maintain erosion and sedimentation controls during earth moving operations.

C. Protect subgrades and foundation soils from freezing temperatures and frost.

3.2 EXCAVATION, GENERAL

A. Unclassified Excavation: Excavate to subgrade elevations regardless of the character of surface and subsurface conditions encountered. Unclassified excavated materials may include rock, soil materials, and obstructions. No changes in the Contract Sum or the Contract Time will be authorized for rock excavation or removal of obstructions.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. If excavated materials intended for fill and backfill include unsatisfactory soil materials and rock, replace with satisfactory soil materials.

3.3 EXCAVATION OF BOTTOM ASH POND

A. Excavate to elevation 424.0 and deposit material into the Fly Ash Pond.

B. Backfill Bottom Ash Pond with approved materials.

3.4 REMOVAL OF MATERIAL FROM COAL PILE

A. Remove material from top 18" – 24" of Coal Pile.

B. Deposit material into Fly Ash Pond.

C. Grade Coal Pile to drain.

3.5 MOVING, FILLING, AND SHAPING FLY ASH POND

A. Deposit on-site Ash Materials into Fly Ash Pond.

B. Demolition items, as approved by Owner, shall be disposed of within the Fly Ash Pond.

1. Allow a minimum of 3 feet of Ash Material cover over demolition items to ensure HDPE Geomembrane is protected from possible punctures, etc.

C. Grade and shape Ash Material as shown on drawings

D. Encapsulate Fly Ash Pond with ClosureTurf™ product, see specification section 02800.

3.6 SUBGRADE INSPECTION

A. Proof-roll subgrade with a loaded pneumatic-tired dump truck or equivalent to identify soft areas and areas of excess yielding. Do not proof-roll wet or saturated subgrades.

B. Reconstruct subgrades damaged by freezing temperatures, frost, rain, accumulated water, or construction activities, as directed by Engineer, without additional compensation.

3.7 STORAGE OF SOIL MATERIALS

A. Stockpile borrow soil materials and excavated satisfactory soil materials without intermixing. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.

1. Stockpile soil materials away from edge of excavations. Do not store within drip line of remaining trees.

3.8 SOIL MOISTURE CONTROL

A. Uniformly moisten or aerate subgrade and each subsequent fill or backfill soil layer before compaction.

1. Do not place backfill or fill soil material on surfaces that are muddy, frozen, or contain frost or ice.
2. Remove and replace, or scarify and air dry, otherwise satisfactory soil material that is too wet to compact to specified dry unit weight.

3.9 COMPACTION OF SOIL BACKFILLS AND FILLS

A. Place backfill and fill soil materials in layers not more than 8 inches in loose depth for material compacted by heavy compaction equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.

B. Place backfill and fill soil materials evenly on all sides of structures to required elevations, and uniformly along the full length of each structure.

Electronic Filing: Received, Clerk's Office 09/28/2020

C. Compact soil materials to not less than the following percentages of maximum dry unit weight according to ASTM D1557:

1. Under turf or unpaved areas, scarify and re-compact top 6 inches below subgrade and compact each layer of backfill or fill soil material at 90 percent.
2. For trench backfill, compact each layer of initial and final backfill soil material at 90 percent.
3. For crushed rock backfill, compact each layer of initial and final backfill material to 95 percent.

3.10 GRADING

A. General: Uniformly grade areas to a smooth surface, free of irregular surface changes. Comply with compaction requirements and grade to cross sections, lines, and elevations indicated.

B. Site Rough Grading: Slope grades to direct water away to prevent ponding. Finish subgrades to required elevations as shown on the drawings.

C. In order to accommodate a final balanced cut and fill, the Contractor may adjust the final grade elevations provided that the profile slopes of the ditches are not reduced less that the minimum slopes as shown on the drawings.

D. Any additional cut shall be distributed evenly throughout the grading area of the Fly Ash Pond so as to produce a balance. There shall be no haul-off of material from this site.

3.11 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified geotechnical engineering testing agency to perform tests and inspections.

B. Allow testing agency to inspect and test subgrades and each fill or backfill layer. Proceed with subsequent earth moving only after test results for previously completed work comply with requirements.

C. When testing agency reports that subgrades, fills, or backfills have not achieved degree of compaction specified, scarify and moisten or aerate, or remove and replace soil materials to depth required; recompact and retest until specified compaction is obtained.

3.12 PROTECTION

A. Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.

B. Repair and reestablish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions.

C. Where settling occurs before Project correction period elapses, remove finished surfacing, backfill with additional soil material, compact, and reconstruct surfacing.

1. Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.13 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. All waste materials, including trash and debris will be disposed of off-site in an approved manner.

END OF SECTION 02200

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02230 - SITE CLEARING AND GRUBBING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Removing existing vegetation.
2. Clearing and grubbing.
3. Stripping and stockpiling topsoil.
4. Removing above- and below-grade site improvements.
5. Disconnecting, capping or sealing site utilities.
6. Temporary erosion- and sedimentation-control measures.
7. Cleaning and shaping existing ditches.

1.2 MATERIAL OWNERSHIP

A. Except for stripped topsoil and other materials indicated to be stockpiled or otherwise remain Owner's property; cleared materials shall be disposed of on-site in the designated disposal area.

1.3 PROJECT CONDITIONS

A. Traffic: Minimize interference with adjoining roads and other adjacent occupied or used facilities during site-clearing operations.

B. Salvable Improvements: Carefully remove items indicated to be salvaged and store on Owner's premises.

C. Do not commence site clearing operations until temporary erosion- and sedimentation-control measures are in place.

D. The following practices are prohibited within protection zones:

1. Storage of construction materials, debris, or excavated material.
2. Parking vehicles or equipment.
3. Foot traffic.
4. Erection of sheds or structures.
5. Impoundment of water.
6. Excavation or other diggings unless otherwise indicated.
7. Attachment of signs to or wrapping materials around trees or plants unless otherwise indicated.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Satisfactory Soil Material: Requirements for satisfactory soil material are specified in Section 02200 "Earth Work."

1. Obtain approved borrow soil material off-site when satisfactory soil material is not available on-site.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect and maintain benchmarks and survey control points from disturbance during construction.

B. Locate and clearly identify trees, shrubs, and other vegetation to remain or to be relocated.

C. Protect existing site improvements from damage during construction.

Electronic Filing: Received, Clerk's Office 09/28/2020

1. Restore damaged improvements to their original condition, as acceptable to Owner.

3.2 TEMPORARY EROSION AND SEDIMENTATION CONTROL

A. Provide temporary erosion- and sedimentation-control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to erosion- and sedimentation-control Drawings and requirements of authorities having jurisdiction.

B. Verify that flows of water redirected from construction areas or generated by construction activity do not enter or cross protection zones.

C. Inspect, maintain, and repair erosion- and sedimentation-control measures during construction until permanent vegetation has been established.

D. Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.

E. Refer to Section 01356 for the SWPPP requirements for soil and sedimentation control.

3.3 TREE AND PLANT PROTECTION

A. General: Protect trees and plants remaining on-site.

B. Repair or replace trees, shrubs, and other vegetation indicated to remain or be relocated that are damaged by construction operations, in a manner approved by Engineer.

3.4 EXISTING UTILITIES

A. Locate, identify, disconnect, and seal or cap utilities indicated to be removed or abandoned in place.

B. Interrupting Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Engineer not less than two days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Engineer's written permission.
3. Should any underground utilities be encountered, stop work immediately and notify SPOC.

3.5 CLEARING AND GRUBBING

A. Remove obstructions, trees, shrubs, and other vegetation to permit installation of new construction.

1. Remove top 6 inches of topsoil. Store topsoil for later use.
2. Grind down stumps and remove roots, obstructions, and debris to a depth of 18 inches below exposed subgrade.
3. Use only hand methods for grubbing within protection zones.

B. Fill depressions caused by clearing and grubbing operations with satisfactory soil material unless further excavation or earthwork is indicated.

1. Place fill material in horizontal layers not exceeding a loose depth of 8 inches, and compact each layer to a density equal to adjacent original ground.

3.6 TOPSOIL STRIPPING

A. Remove sod and grass before stripping topsoil.

B. Strip topsoil to depth of 6 inches in a manner to prevent intermingling with underlying subsoil or other waste materials.

C. Stockpile topsoil away from edge of excavations without intermixing with subsoil or other waste materials. Remove subsoil and non-subsoil materials including clay lumps, gravel and other objects more than 2 inches in diameter.

Electronic Filing: Received, Clerk's Office 09/28/2020

D. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust and erosion by water.

3.7 SITE IMPROVEMENTS

A. Remove existing above- and below-grade improvements as indicated and necessary to facilitate new construction.

3.8 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Remove surplus soil material, unsuitable topsoil, obstructions, demolished materials, and waste materials including debris, and dispose of them in the designated on-site location.

END OF SECTION 02230

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02240 - DEWATERING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes dewatering of the Ash Ponds and water disposal, which is Contractor's responsibility, if needed.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 FIELD CONDITIONS

A. Survey Work: Engage a qualified land surveyor or professional engineer to survey adjacent existing buildings, structures, and site improvements; establish exact elevations at fixed points to act as benchmarks. Clearly identify benchmarks and record existing elevations.

1.4 SUBMITTAL

A. Informational: Dewatering Plan

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Dewatering Performance: Design, furnish, install, test, operate, monitor, and maintain dewatering system of sufficient scope, size, and capacity to control hydrostatic pressures and to lower, control, remove, and dispose of ground water and permit excavation and construction to proceed on dry, stable subgrades.

2.2 DEWATERING PLAN

A. The Contractor shall prepare a dewatering plan and submit it to Ameren. The plan must be approved by Ameren prior to implementation.

B. The Contractor shall dewater and monitor settlement of the ash as necessary in order to achieve final placement of the ash in accordance with the plans.

C. Geotechnical studies indicate known supersaturated and liquefiable materials on-site.

D. Dewatering well points within the Bottom Ash Pond need to be pumped and drained to a settling basin within the Fly Ash Pond prior to being discharged to the regulated NPDES Outfall 004 location in the Fly Ash Pond (shown on T-002).

E. There is a standing pond of water located at the southwest end of the Fly Ash Pond. This pond is equipped with an existing NPDES outflow structure. The structure is used to control the overflow elevation of the standing water. The Contractor may utilize this water for dust control during grading operations.

F. Water that is removed from Ash Ponds, from dewatering operations, must be discharged in an approved manner under the direction of Ameren personnel.

G. Water conditioning by Ameren personnel (Or contractor hired by Ameren) is available in order to balance pH and remove suspended solids (TSS).

PART 3 - EXECUTION

3.1 PREPARATION

A. Provide temporary grading to facilitate dewatering and control of surface water.

Electronic Filing: Received, Clerk's Office 09/28/2020

B. Protect and maintain temporary erosion and sedimentation controls, which are specified in Section 02230 "Site Clearing," during dewatering operations.

3.2 INSTALLATION

A. Install dewatering system utilizing wells, well points, or similar methods complete with pump equipment, standby power and pumps, filter material gradation, valves, appurtenances, water disposal, and surface-water controls.

1. Space well points or wells at intervals required to provide sufficient dewatering.
2. Use filters or other means to prevent pumping of fine sands or silts from the subsurface.

B. Place dewatering system into operation to lower water to specified levels before excavating below ground-water level.

C. Provide standby equipment on-site, installed and available for immediate operation, to maintain dewatering on continuous basis if any part of system becomes inadequate or fails.

3.3 WATER DISPOSAL

A. Dispose of water removed from excavations in such a manner as:

1. Will not endanger portions of work under construction or completed.
2. Will cause no inconvenience to Owner or to others working near site.

B. The Contractor shall provide, operate, and maintain all ditches, basins, sumps, culverts, site grading, and pumping facilities to divert, collect, and remove all water from the work areas.

C. Disposal water must be directed to the permitted site NPDES regulated discharge point for disposal. The southwest corner of the Fly Ash Pond shall be utilized to allow contaminants to settle out prior to discharge.

1. The Owner will have CQA personnel monitoring the discharge stream for contaminants in compliance with the site NPDES Permit. The Contractor shall allow time and access for testing the water prior to final discharge.
2. At no time shall dewatering be discharged to the Illinois River without going through the regulated NPDES Outfall 004 at the southwest corner of the Fly Ash Pond.

3.4 OPERATION

A. Operate system to control groundwater to permit excavation, installation of materials, and placement of fill materials on dry subgrades.

1. Do not permit open-sump pumping that leads to loss of fines, soil piping, subgrade softening, and slope instability.

3.5 FIELD QUALITY CONTROL

A. Survey-Work Benchmarks: Resurvey benchmarks regularly during dewatering and maintain an accurate log of surveyed elevations for comparison with original elevations. Promptly notify Engineer if changes in elevations occur or if cracks, sags, or other damage is evident in adjacent construction.

END OF SECTION 02240

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02250 – SITE DRAINAGE

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes:

1. Rock Blanket lining ditches and embankments,
2. Energy Dissipators, and
3. Geotextile Filter.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 SUBMITTALS

A. Product Data: Provide quarry name and material gradation prior to delivery. Provide manufacturer's certification for Geotextile Filter.

B. Product Sample: Geotextile Filter (18" x 18")

PART 2 - PRODUCTS

2.1 ROCK BLANKET

A. Rock Blanket shall meet the requirements of IDOT Specification Section 1005.01.

B. Material shall be stone, quarried from undisturbed consolidated deposits of rock reasonably free of shale. Ledges shall be sufficiently thick to produce the desired dimensions.

C. IDOT Gradation: RR-6, Equivalent Diameter of 24 inches.

2.2 ENERGY DISSIPATOR

A. Energy Dissipator shall meet the requirements of IDOT Specification Section 1005.01.

B. Material shall be stone, quarried from undisturbed consolidated deposits of rock reasonably free of shale. Ledges shall be sufficiently thick to produce the desired dimensions.

C. IDOT Gradation: RR-4, Equivalent Diameter of 15 inches.

2.3 GEOTEXTILE FILTER

A. Geotextile Filter Fabric shall meet IDOT spec. sect. 1080.03. Material shall be a nonwoven material not less than six (6) ft. wide, weighing no less than 8 oz./sq.yd.

PART 3 - EXECUTION

3.1 PREPARATION OF DITCH OR EMBANKMENT FOR GEOTEXTILE FILTER

A. Grade and compact to a relatively smooth surface free from sharp objects and large stones.

B. Unroll geotextile as smoothly as possible overlapping edges a minimum of 18 inches.

C. Staple or pin geotextile in place.

Electronic Filing: Received, Clerk's Office 09/28/2020

3.2 INSTALLATION OF ROCK BLANKET AND ENERGY DISSIPATORS

A. Place rock blanket/rip rap immediately after installing filter.

B. Install rock in one operation. Do not dump through chutes or use any method that causes segregation of stone sizes.

C. Be careful not to dislodge the underlying filter when placing the stones.

D. If fabric is damaged, remove rock blanket/energy dissipator and repair fabric by adding another layer, overlapping the damaged area by 12 inches.

E. Where rip rap is used for outlet protection, the rip rap should be placed before or in conjunction with the construction of the ditch so that it is in place when the channel begins to operate.

3.3 FIELD QUALITY CONTROL

A. Contractor to ensure a dense, well-graded mass of stone with a minimum of voids present.

END OF SECTION 02250

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02511 CRUSHED STONE PAVING

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes Roadways and drives; IDOT CA6 limestone.
B. This Section includes the geotextile filter located under the crushed stone roadway.

1.2 RELATED WORK

A. Section 02200 - Earthwork.

1.3 REFERENCES

A. ASTM C136- Sieve Analysis of Fine and Coarse Aggregates.
B. American Association of State Highway and Transportation Officials (AASHTO) T27.

1.4 TESTS

A. Gradation of stone material will be performed in accordance with ASTM C136.
B. Gradation of stone material will be performed in accordance with AASHTO No. T2

1.3 SUBMITTALS

A. Product Data:
1. Aggregate source list: submit a list of proposed aggregate sources.
2. Shipping Tickets for granular material delivered to site.

B. Samples:
1. Submit one (1) sample per source for each aggregate for use on the project. Samples shall be at least 1 lb. and shall be obtained and shipped according to ASTM D75.

PART 2 PRODUCTS

2.1 MATERIALS

A. IDOT CA6. Limestone, clean, tough, and durable, free of thin and elongated pieces of soft and objectionable material, graded in accordance with ASTM C136. The aggregate shall be in accordance with the following gradation:

Sieve Size	Percent Passing
1-1/2 inch	100
1 inch	95 +/- 5
1/2 inch	75 +/- 15
No.4	43 +/- 13
No. 16	25 +/- 15
No. 200	8 +/- 4

B. Water: Clean and free of injurious amounts of oil, acid, alkali, salt, organic matter, vegetable matter, or other deleterious substances.

C. Compacted subgrade as defined in section Earthwork 02200.

2.2 GEOTEXTILE FILTER

A. Geotextile Filter Fabric shall meet IDOT sec. 1080.03, it shall be a nonwoven material not less than 6

Electronic Filing: Received, Clerk's Office 09/28/2020

ft. wide, weighing no less than 8 oz/sq.yd.

PART 3 EXECUTION

3.1 INSPECTION

A. Verify compacted subgrade is dry and ready to receive the work of this Section. Remove and replace or repair all soft or unstable areas to the satisfaction of the Construction Supervisor.

B. Verify gradients and elevations of sub-base are correct.

C. Beginning of installation means acceptance of existing condition

3.2 PREPARE 12" THICK SUBGRADE

A. Prepare subgrade as directed in section 02200 Earthwork.

3.3 INSTALLING GEOTEXTILE FILTER

A. Place the geotextile on the smooth and level subgrade. All depressions, humps, sharp objects, and large stones should be removed.

B. Fabric shall be laid out and stretched as flat as possible.

C. Overlap adjacent rolls a minimum of 18 inches or as specified by manufacturer.

D. Secure fabric with staples, pins, or other suitable methods. Fabric should be secured along the edges and then at overlapping portions.

3.4 PLACING IDOT CA6,

A. Spread the top layer of stone directly from trucks equipped with hydraulic hoists and adjustable tailgates, or with mechanical spreaders, or with spreader boxes to achieve a compacted thickness of 3 inches unless otherwise shown on the plans. If a mechanical spreader is not used, blade the material a sufficient number of times to form the required gradation. Spread stone to a uniform distribution of sizes throughout, remove any segregated areas, and replace with suitable materials.

B. Rolling shall be performed utilizing a self-propelled (10) ton roller.

C. Begin rolling at edges and progress gradually toward the center.

D. Uniformly overlap each preceding track and thoroughly cover the entire surface. A minimum of FOUR (4) complete passes with the roller is required in all areas accessible by the roller.

E. Check the stone for humps, hollows, or other irregularities. Loosen defective areas, remove surplus or add new material as required, re-roll, and treat as necessary to completely eliminate the defects

F. Where access restraints do not permit the use of the rolling equipment specified above, roll to levels specified above using appropriately sized mechanical rolling/vibrating-plate equipment.

3.5 COORDINATION

A. No paving work shall be done or paving materials placed until all excavation and backfill for all utilities and storm water drainage (under the roads and/or drives) is installed, inspected, and has been allowed to settle.

END OF SECTION 02511

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02800 – HDPE GEOMEMBRANES AND POLYPROPYLENE TURF GRASS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes geosynthetic cover system for ash ponds.

B. Section also includes "batten" and/or "flashing" requirements for sealing penetrations in the geomembrane.

1.2 PERFORMANCE REQUIREMENTS

A. Provide geosynthetic cover system that prevents the passage of water.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Show fabrication and installation details for geomembrane liners. Show panel layout, seams, penetrations, perimeter anchorage, and methods of attachment and sealing to other construction (batten and flashing). Differentiate between factory and field seams and joints.

C. Samples: Refer to CQA Plan for sample requirements. These samples will be used as control samples for the type of seams to be installed.

1.4 INFORMATIONAL SUBMITTALS

A. Product certificates.

B. Product test reports.

C. Source quality-control reports.

D. Field quality-control reports.

E. Sample warranty.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: An employer of workers trained and approved by manufacturer.

B. Preinstallation Conference: Conduct conference at Project site.

1.7 WARRANTY

A. Special Warranty: Specified form in which geomembrane manufacturer, geomembrane liner fabricator, and geomembrane liner Installer agree to repair or replace geomembrane liner that fails in material or workmanship or that deteriorates under conditions of normal weather within specified warranty period. Warranty does not include deterioration or failure of geomembrane liner due to exposure to harmful chemicals, gases or vapors, abnormal and severe weather phenomena, fire, earthquakes, floods, vandalism, or abuse by persons, animals, or equipment.

1. Failures include, but are not limited to, the following:

   a. Leaks in geomembrane liner.
   b. Defects in seams.
   c. Cracks and holes in floating cover.

Electronic Filing: Received, Clerk's Office 09/28/2020

2. Warranty Period: One year from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 CLOSURETURF™

A. Basis of Design: The intent of the documents and specifications for the product is that the closure geosynthetic cover system shall be "ClosureTurf™" as manufactured by Agru America, Inc.

B. Manufacturers of similar types of material may be submitted for approval of the Engineer prior to bidding.

2.2 HYDROTURF™

A. Basis of Design: The intent of the documents and specifications for the product is that "HydroTurf™" as manufactured by Agru-America, Inc. be used for swales and drainage ways.

B. Manufacturers of similar types of material may be submitted for approval of the Engineer prior to bidding.

2.3 HDPE GEOMEMBRANE

A. Basis of Design: The intent of the documents and specifications for the geomembrane shall be "Super Grip Net Liner" as manufactured by Agru America, Inc.

B. Manufacturers of similar type of material may be submitted for approval by the Engineer prior to bidding.

2.4 MISCELLANEOUS MATERIALS

A. Provide types of adhesive primers, compounds, solvents, and tapes recommended in writing by geomembrane liner manufacturer.

B. Provide manufacturer's standard factory-fabricated assemblies for sealing penetrations. Include joint sealant recommended in writing by geomembrane liner manufacturer and compatible with geomembrane liner, containment conditions, and materials.

C. SAND INFIFLL COMPONENT of the ClosureTurf™ System will meet ASTM C 33; fine aggregate, natural or manufactured sand, gradation shown below:

ASTM C-33-03	
Sieve	Percent Passing
9.5 mm (3/8 in.)	100
4.75 mm (No. 4)	95 to100
2.36 mm (No. 8)	80 to 100
1.18 mm (No. 16)	50 to 85
600 µm (No. 30)	25 to 60
300 µm (No. 50)	5 to 30
150 µm (No. 100)	0 to 10

D. HydroTurf™ HYDROBINDER INFILL COMPONENT is a proprietary cementitious product used as the infill component of the HydroTurf™ system.

Electronic Filing: Received, Clerk's Office 09/28/2020

E. Cement: brand of Portland Cement, meeting ASTM C150 and will be Type I or Type II, one brand throughout the duration of the contract, conforming to ASTM C387 for high strength mortars, cementitious infill will have a minimum 28 day compressive strength of 5000psi.

2.5 FABRICATION

A. Fabricate geomembrane liner panels from sheets in sizes as large as possible with factory-sealed seams, consistent with limitations of weight and installation procedures. Minimize field seaming.

2.6 SOURCE QUALITY CONTROL

A. See Construction Quality Assurance Plan.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install per manufacturers recommended installation procedures.

B. Examine substrates, with Installer present, for compliance with requirements for soil compaction and grading; for subgrade free from angular rocks, rubble, roots, vegetation, debris, voids, protrusions, and ground water; and for other conditions affecting performance of geomembrane liner.

C. Examine perimeter anchor trench, where geomembrane liner will be secured, for substrate conditions indicated above and for correct location and configuration.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

E. Provide temporary ballast, until edges are permanently secured, that does not damage geomembrane liner or substrate, to prevent uplift of geomembrane liner in areas with prevailing winds.

F. Prepare surfaces of construction penetrating through geomembrane liner according to geomembrane liner manufacturer's written instructions.

G. Place geomembrane liner over prepared surfaces to ensure minimum handling. Install according to Shop Drawings and in compliance with geomembrane liner manufacturer's written instructions. Begin placing geomembrane liner at Project's upwind direction and proceed downwind. Install geomembrane liner in a relaxed condition, free from stress and with minimum wrinkles, and in full contact with subgrade. Do not bridge over voids or low areas in the subgrade. Fit closely and seal around inlets, outlets, and other projections through geomembrane liner. Permanently secure edges.

H. Install battens and/or flashing on required footings and/or utility/power poles.

I. Field Seams: Comply with geomembrane liner manufacturer's written instructions.

J. Installation in Anchor Trench: Install geomembrane liner in trench according to manufacturer's written instructions. Backfill and compact to lock liner into trench.

K. Protect installed geomembrane liner according to manufacturer's written instructions. Repair or replace areas of geomembrane liner damaged by scuffing, punctures, traffic, rough subgrade, or other unacceptable conditions.

L. Before initial placement of turf cover, inspect seams and patched areas to ensure tight, continuously bonded installation. Repair damaged geomembrane and seams and re-inspect repaired work.

3.2 FIELD QUALITY CONTROL

A. See Construction Quality Assurance Plan.

END OF SECTION 02800

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02821 CHAIN-LINK FENCES AND GATES

PART 1 GENERAL

1.1 SUMMARY

A. Section includes chain-link fences and swing gates.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

C. Samples: For each polymer-coated product and for each color and texture specified, in 6-inch lengths for components and on full-sized units for accessories.

1.3 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each type of chain-link fence and gate, from manufacturer.

B. Product Test Reports: For framing strength according to ASTM F 1043.

C. Sample of special warranty.

1.4 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

1.5 WARRANTY

A. Special Warranty: Manufacturer's standard form in which Installer agrees to repair or replace components of chain-link fences and gates that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, deterioration of metals, metal finishes, and other materials beyond normal weathering.

2. Warranty Period: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 CHAIN-LINK FENCE FABRIC

A. General: Provide fabric in one-piece heights measured between top and bottom of outer edge of selvage knuckle or twist. Comply with CLFMI Product Manual and with requirements indicated below:

1. Fabric Height: Seven (7) feet plus embedment length into the ground.

2. Steel Wire Fabric: Wire with a diameter of 9 gauge steel wire.

a. Mesh Size: 1 inch

b. Aluminum-Coated Fabric: ASTM A 491, Type II aluminum coating of 0.4 oz/sf

3. Selvage: Twisted top and knuckled bottom.

2.2 FENCE FRAMING

A. Posts and Rails: Comply with ASTM F 1043 for framing, including rails, braces, and line; terminal; and corner posts. Provide members with minimum dimensions and wall thickness according to ASTM F 1043 based on the following:

1. Fence Height: Seven (7) feet.

2. Heavy Industrial Strength: Material, post shall be made of Allied SS-40 or Wheatland WT-40, sized as follows

Electronic Filing: Received, Clerk's Office 09/28/2020

a. Line Post: 2.375" OD

b. End, Corner and Pull Post: 4.00" OD

3. Horizontal Framework Members: Intermediate, top and bottom rails complying with ASTM F 1043.

4. Brace Rails: Comply with ASTM F 1043.

5. Metallic Coating for Steel Framing:

a. Type A zinc coating.

2.3 TENSION WIRE

A. Metallic-Coated Steel Wire: 0.177-inch diameter, marcelled tension wire complying with ASTM A 817 and ASTM A 824, with the following metallic coating:

1. Type I, aluminum coated (aluminized).

2.4 SWING GATES

A. General: Comply with ASTM F 900 for gate posts and double swing gate types.

1. Gate Fabric Height: As indicated.

B. Pipe and Tubing:

1. Zinc-Coated Steel: Comply with ASTM F 1043 and ASTM F 1083; protective coating and finish to match fence framing.

C. Frame Corner Construction: Assembled with corner fittings.

D. Hardware:

1. Hinges: 180-degree outward swing.

2. Latches for drive gates shall be Pioneer Latch Model No. 2507 as manufactured by Merchant Metals, Minneapolis, MN

2.5 FITTINGS

A. General: Comply with ASTM F 626.

B. Barbed Wire Arms: Pressed steel, with clips, slots, or other means for attaching strands of barbed wire, integral with post cap; for each post unless otherwise indicated, and as follows:

1. Provide line posts with arms that accommodate top rail or tension wire.

2. Provide corner arms at fence corner posts.

3. Type I, single slanted arm.

C. Finish:

1. Metallic Coating for Pressed Steel or Cast Iron: Not less than 1.2 oz./ sq. ft. zinc.

2.6 BARBED WIRE

A. Steel Barbed Wire: Shall be Copperweld Steel Co. "Alumoweld" Four Point Type Light Weight (three 0.080" diameter strands)

2.7 CEMENT

A. Ultimate strength of 3,000 psi at 28 days; 5.5 sack (minimum) of cement per cubic yard; 6.5 gallons per sack of cement; ¾" maximum aggregate size/ 3%-5% air entrainment; mixed per ASTM C94.

Electronic Filing: Received, Clerk's Office 09/28/2020

PART 3 EXECUTION

3.1 INSTALLATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for site clearing, earthwork, pavement work, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Stake locations of fence lines, gates, and terminal posts. Do not exceed intervals of 500 feet or line of sight between stakes. Indicate locations of utilities, lawn sprinkler system, underground structures, benchmarks, and property monuments.

D. Install chain-link fencing to comply with ASTM F 567 and more stringent requirements indicated.

E. Post Excavation: Drill or hand-excavate holes for posts to diameters and spacings indicated, in firm, undisturbed soil.

F. Post Setting: Set posts in concrete at indicated spacing into firm, undisturbed soil.

1. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during setting with concrete or mechanical devices.

2. Concrete Fill: Place concrete around posts to dimensions indicated and vibrate or tamp for consolidation. Protect aboveground portion of posts from concrete splatter.

a. Exposed Concrete: Extend 1 inch above grade; shape and smooth to shed water.

G. Terminal Posts: Locate terminal end, corner, and gate posts per ASTM F 567 and terminal pull posts at changes in horizontal or vertical alignment of 30 degrees or more.

H. Line Posts: Space line posts uniformly at 96 inches o.c.

I. Tension Wire: Install according to ASTM F 567, maintaining plumb position and alignment of fencing. Provide horizontal tension wire at the following locations:

1. Extended along top and bottom of fence fabric.

J. Chain-Link Fabric: Apply fabric to outside of enclosing framework. No gap shall remain between the finish grade and the fence fabric itself. Install edge of fencing fabric into the proposed grades 4-6 inches.

K. Barbed Wire: Install barbed wire uniformly spaced, angled toward security side of fence. Pull wire taut, install securely to extension arms, and secure to end post or terminal arms.

L. Install gates according to manufacturer's written instructions, level, plumb, and secure for full opening without interference. Attach fabric as for fencing. Attach hardware using tamper-resistant or concealed means. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary.

M. Gates: Adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

END OF SECTION 02821

Electronic Filing: Received, Clerk's Office 09/28/2020

SECTION 02936 - SEEDING AND MULCHING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Seeding and mulching.

1.2 DEFINITIONS

A. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.

B. Planting Soil: Existing, on-site soil; imported soil; or manufactured soil that has been modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 INFORMATIONAL SUBMITTALS

A. Certification of grass seed.

1. Certification of each seed mixture for grass.

B. Product certificates.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful turf establishment.

1. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Seed and Other Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and Federal laws, as applicable.

1.7 SEEDING AND MULCHING LOCATIONS

A. Seeding and mulching shall occur in all areas within the limits of disturbance outside of ClosureTurf™ limits, rock blanket limits and energy dissipator limits. These areas include but not limited to:

1. Coal Pile
2. Bottom Ash Pond
3. Eastern Fly Ash Stockpile
4. Construction Staging Area

B. Contractor shall obtain approval from Owner prior to Seeding and Mulching.

Electronic Filing: Received, Clerk's Office 09/28/2020

PART 2 - PRODUCTS

2.1 SEED

A. Grass Seed: Fresh, clean, dry, new-crop seed complying with AOSA's "Rules for Testing Seeds" for purity and germination tolerances.

B. Seed Species:

1. Quality: State-certified seed of grass species as listed below for solar exposure.
2. Quality: Seed of grass species as listed below for solar exposure, with not less than 85 percent germination, not less than 95 percent pure seed, and not more than 0.5 percent weed seed:
3. Full Sun:

a. 50 percent Tall (fine blade) Fescue – 4 lbs/1000 sf
b. 50 percent Perennial Rye – 4 lbs/1000 sf

2.2 FERTILIZERS

A. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:

1. Composition: 1 lb/1000 sq. ft. of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.

B. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:

1. Composition: 20 percent nitrogen, 10 percent phosphorous, and 10 percent potassium, by weight.

2.3 MULCHES

A. Straw Mulch: Provide air-dry, clean, mildew- and seed-free, salt hay or threshed straw of wheat, rye, oats, or barley.

PART 3 - EXECUTION

3.1 SEEDING

A. Sow seed with spreader or seeding machine. Do not broadcast or drop seed when wind velocity exceeds 5 mph.

1. Evenly distribute seed by sowing equal quantities in two directions at right angles to each other.
2. Do not use wet seed or seed that is moldy or otherwise damaged.
3. Do not seed against existing trees. Limit extent of seed to outside edge of planting saucer.

B. Sow seed at a total rate of 4 lb/1000 sq. ft.

C. Rake seed lightly into top 1/8 inch of soil, roll lightly, and water with fine spray.

D. Protect seeded areas with slopes not exceeding 1:6 by spreading straw mulch. Spread uniformly at a minimum rate of 2 tons/acre to form a continuous blanket 1-1/2 inches in loose thickness over seeded areas.

1. Anchor straw mulch by crimping into soil with suitable mechanical equipment.

E. Protect seeded areas from hot, dry weather or drying winds by applying planting soil within 24 hours after completing seeding operations. Soak areas, scatter mulch uniformly to a thickness of 3/16 inch, and roll surface smooth.

END OF SECTION 02936

Electronic Filing: Received, Clerk's Office 09/28/2020

APPENDIX A – SAFETY AND CONTRACTOR REQUIREMENTS

1.0 GENERAL CONTRACTOR SAFETY REQUIREMENTS

Contractor and their employees are responsible for their safety.

1.1 Contractor General Requirements

1.1.1 Contractor supervision and personnel shall obtain site-specific training. This will include, but not be limited to:

- Workman's Protection Assurance (WPA) / Hold Tag Equipment Lock-out
- Hot Works
- Confined Spaces
- Commissioning WPA Procedure
- Other Safety Requirements listed in this specification

Note: Contractor employees may be barred from Ameren property for failure to comply with WPA procedures. Contract may be terminated or Contractor may lose future work for failure to enforce WPA. See the following WPA Authorization Form (Attachment A5) for sign-on access to the Ameren automated WPA system at each plant site.

1.1.2 Contractor administers appropriate disciplinary action if their employees violate Job Working Rules.

1.1.3 Contractor must hold daily job briefings.

1.1.4 All rolling equipment must be inspected prior to use.

1.1.5 Ameren reserves the right to bar any individual from Company property.

1.2 Rules to Live By (RTLB)

Rules to Live By (RTLB) is focused on activities that have the potential to produce a fatality or serious injury. While there are many hazards that can produce serious injuries, the items listed below are so significant that a single violation warrants immediate intervention by the Contractor. Actions determined to be in violation of these rules may result in permanent barring from all Ameren facilities. Ameren may conduct an independent investigation as necessary.

- Fall Protection – Failure to use proper fall protection when there is a risk of a fall that is greater than 6 feet
- WPA (Lock Out / Tag Out) – Violation of a tag, lock or tag-out device that is used for employee and contractor protection.
- Electrical Safety – Failure to follow proper procedures and wear proper personal protective equipment when working on energized equipment.
- Confined Space Entry – Failure to evaluate confined space and perform air monitoring checks prior to entry.
- Rigging / Hoisting – Walking or working under a suspended load.
- Trenching and Shoring – Entering excavation greater than 5 feet deep that has not been properly sloped or shored.

1.2.1 It is the expectation that the Contractor will enforce our RTLB program and discipline the RTLB violators. All violators will be removed immediately from the site, after which the Contractor will be required to formally submit on their letterhead a detailed report on the incident, noting internal meeting(s), additional training that was conducted, and what will be done to prevent a recurrence, prior to return of the employee.

1.2.2 Violations of other safe work practices may result in permanent barring from all Ameren Facilities.

1.2.3 Contractors will be assessed $2,000 per RTLB violation that Ameren personnel find during project. Contractor is to donate assessment to a mutually agreed-upon charity.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.3 Safe Work Practices

1.3.1 Hard hats with bill facing forward, safety shoes and foam-lined safety glasses with side shields or wrap-around safety glasses **must be worn at all times in all locations** past the Construction Gate. Safety shoes must be compliant with ANSI Z41-1999. Safety glasses must be compliant with ANSI Z87.1-2003 or equivalent.

1.3.2 Wear a hardhat, safety glasses, leather gloves, and a welding helmet when welding.

1.3.3 Wear foam-lined safety goggles over non-safety rated prescription eyewear.

1.3.4 Foam-lined safety glasses shall be worn at all times. Contractor employees who wear prescription safety eyewear shall also have the foam-lined feature.

1.3.5 Face shields must be worn over safety glasses when grinding, chipping, jack hammering, power sawing, handling hazardous chemicals, or performing other tasks that could result in face or eye injury.

1.3.6 Wear appropriate gloves to protect hands from cuts, burns, temperature extremes, chemicals, biological agents or other hazards.

1.3.7 Wear hearing protection when performing noisy work, such as jack-hammering, or where posted.

1.3.8 Hair must be cut or contained above shoulder length and must not interfere with protective headgear.

1.3.9 Shorts, shirts without sleeves or with sleeves rolled up above the shoulder are not permitted.

1.3.10 Gas bottles must be secured to prevent tipping. Gas bottles must be capped or have a regulator installed. Oxy/acetylene bottles must be separated by at least 20-foot or a 5-foot barrier with a one-hour fire rating while in storage.

1.3.11 During welding or "burning":

- Use temporary shielding to protect personnel beside, above and below the work; free falling of sparks below a cutter/welder's feet is not allowed.
- Contain slag, sparks, etc.
- Place weld rod stubs in containers after removal from stingers, and place all other trash in appropriate containers.

1.3.12 Safety harnesses are required when working on surfaces over six (6) feet high that do not have guardrails or other fall protection. Attach lanyards and lifelines to structural members capable of supporting the load requirement (5000 lbs. anchor point).

1.3.13 On portable articulating man lifts, fall arrest is required per manufacturer's specifications. Fall arrest is not required on scissor-type man lifts unless recommended by manufacturer. The lift must be secure and stable prior to use.

1.3.14 For overhead work, rolling scaffolds and mechanical lift platforms are preferred over ladders.

1.3.15 If straight or extension ladders must be used, one worker must hold the ladder until another worker has tied the top to a substantial anchor point. Prior to working above 6 feet off the straight or extension ladder, and leaning beyond the side rails of the ladder, the worker is to don fall protection harness with lifeline, using or establishing an anchor point overhead for clip attachment.

1.3.16 If a step ladder must be used when worker's feet are on or above the fifth rung, then top of ladder must be tied to a substantial anchor or a second worker must hold ladder. When working on step ladder adjacent to and above guard/handrail where there is risk of significant fall over the rail, worker is to don fall protection harness with lifeline, using or establishing an anchor point overhead for clip attachment.

1.3.17 Daily clean-up of the work area is required. Keep stairways and aisles clear at all times. Tie extension cords, welding leads, air hoses, etc., to middle rail of the handrail and/or route overhead.

1.3.18 Barricade at least 6 feet from hole or edge if grating or handrail sections are being removed or installed.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.3.19 Barricade below lifting/hoisting activities, including both critical and non-critical lifts.

1.3.20 All electrical junction boxes, duct panels, etc., are to be kept closed whenever possible.

1.3.21 All fuel-powered equipment such as welders, generators, compressors and power tools must be used so that the engine exhaust does not present a hazard to personnel inside the building; if this is not possible, then the equipment must be exhausted outside of the facility. Equipment near doors must be positioned so the exhaust will not enter the facility when the doors are open. In areas where fuel-powered equipment is being used, verify that carbon monoxide levels are safe by using a direct reading instrument that is capable of monitoring for carbon monoxide.

1.3.22 Plant fire hose stations and fire hydrants shall NOT be used for routine work unless specifically authorized by the Plant.

1.3.23 If the plant allows Contractor employees to use elevators, observe the following rules:

- No equipment on elevators may extend through the roof access opening.
- Transport bulk materials in freight elevators and obey the posted weight limits.
- Only tools and materials that can be carried by hand are allowed on passenger elevators.
- Contractor shall coordinate with Site Contact before any plant elevator is used to transport asbestos.
- Construction elevator (when available) is the preferred transport system for asbestos.
- All asbestos shall be double bagged before transported.
- No plant personnel other than asbestos workers shall be on elevators when asbestos is transported.

1.3.24 Qualified electricians are required to wear fire-retardant (FR) PPE when working on exposed, energized circuits. FR PPE must meet arc flash labels and be appropriate for tasks being performed.

1.3.25 Reflective safety vests must be worn by all personnel who work on or near active highways, roads, or parking lots. Vests are also required for other work that places personnel near motor vehicles such as flaggers, riggers, survey crews, etc. ANSI/ISEA 107, Class III high-visibility reflective safety vests shall be worn for maximum visibility. Ameren may require vests on other projects.

1.3.26 Ground Fault Circuit Interrupters (GFCI) shall be used to protect all 120 VAC electrical equipment including electric hand tools & cord sets. Use of 480 VAC GFCI is required when working in wet locations.

1.3.27 Adding slugs within electrical devices requires written approval by Ameren representative. Equipment rated fuses and/or circuit breakers shall not be removed and replaced with ones of different set parameters without written approval by an Ameren representative

1.3.28 Contractor shall follow safety requirements for working on elevated platforms per Elevated Platform Safety Requirements (Appendix Y).

1.3.29 We want this to be a SAFE job. YOU CAN HELP. Report all unsafe acts and conditions to your Supervisor. Consult a Contractor or Ameren Supervisor if there are any questions about work rules or safety requirements.

1.4 Other Safety Requirements

1.4.1 If outages are required, the Contractor shall coordinate with the SPOC to obtain lock-outs and releases in accordance with the Plant's WPA/Hold Card procedures and operating practices. Equipment with a WPA/Hold Card tag shall never be serviced or removed.

1.4.2 Contractors shall comply with all OSHA requirements for work in permit-required confined spaces. Contractors shall obtain information from the SPOC on the location and other pertinent information regarding confined space entry. Any entry involving both Contractor and Ameren employees shall be coordinated through the SPOC. For reference, review Appendix Z for a representative list of identified confined spaces at Ameren Energy Centers. Appendix Z shall be used as a guide and not be considered a complete list.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.4.3 Only qualified and authorized persons shall work on energized electrical equipment as per Ameren procedure AUE-ADM-5002, Energized Equipment Electrical Safety Program. If applicable to specified work scope, the SPOC will supply a copy of AUE-ADM-5002.

Contractor shall not work on energized equipment without the express, written consent of the SPOC. In no case shall Contractor work on or near (within reach of) energized equipment without the use of appropriate insulated tools to perform the work. Violators of this policy will be subject to disciplinary action, including a minimum $10,000 fine, and up to and including termination of employment.

1.4.4 All lifting/hoisting activities near overhead, high tension power lines must include awareness of and observance of the following safe working clearances:

Minimum Clearance Distance	
Voltage (kV)	Clearance (feet)
Up to 50	10
Over 50 to 200	15
Over 200 to 350	20
Over 350 to 500	25
Over 500 to 750	35
Over 750 to 1,000	45

1.4.5 Ameren must review contractor qualifications before contractor employees may work in areas with high voltage equipment (over 600 volts).

1.4.6 Contractor shall coordinate hot work, (i.e., welding, brazing, heating and cutting), with Company personnel to assure that Ameren safety requirements are met as outlined on Hot Work Permit (Attachment A8).

1.4.6.1 Hot Work Checklist/Permit must be utilized when performing hot work such as welding, cutting, grinding, or any other activity that produces sparks. Contractor may use their own forms or Ameren's but work shall be coordinated through the SPOC.

1.4.7 Plant equipment identified with a nuclear radiation symbol (as seen below) is NOT to be serviced by unauthorized personnel):

1.4.8 All equipment on the project shall be used in accordance with Federal, State, and Local S&H requirements in addition to the manufacturer's instructions and guidelines. Equipment shall not be modified in any way for use other than what the manufacturer intended.

1.4.8.1 Any alterations must be approved by the manufacturer in writing. Only trained and authorized persons shall operate machinery or equipment.

1.4.8.2 Use hand-held power tools only for their intended purpose. Do not use tools that are broken, have dull blades, dull bits, have damaged cords, or have damaged/missing guards. Hand-held power tool switches shall not be modified by any means to maintain power without constant trigger pressure. (Ref. OSHA 29CFR1910.243.

1.4.8.3 All Grinders guards/handles must remain on grinders at all times. If a guard or handle is required to be removed because of a tight work area, a permit must be completed and maintained at work location. See Grinder Plan (Attachment A6).

1.4.9 Ameren expects that all Electrical Contractors will follow the common work practice that a check of all wires being demoed is performed to ensure that all wires are dead and de-terminated before wrecking. If wires are found live, they will be de-energized and re-verification will be made prior to wires being terminated or cut.

Electronic Filing: Received, Clerk's Office 09/28/2020

1.4.10 Barricade Tape

NOTE: Do not rely on barricade tape and flags to prevent a fall that is more than 6 feet.

- **When attended, install barricade tape no less than 6 feet from opening.**
- **Use fall protection if personnel are working closer than 6 feet to the opening.**
- **When unattended, cover the floor opening with a temporary cover, or temporary handrails 42 inches in height that include a mid-rail and toe board. Temporary covers must be able to support at least twice the load to which they will be subjected (including people, equipment and/or vehicle traffic).**
- **Temporary covers must be secured when installed in such a way as to prevent accidental movement by wind, traffic, or employees.**

1.4.10.1 Barricade tape must be used to warn employees about a hazard or restrict employees' access to a hazardous area. Barricade tape must have an information tag listing the responsible person, date of erection, and purpose. Barricade signs shall indicate the Contractor, reason, and expiration date/time. Remove the barricade when work is completed. See Barricade Tag (Attachment A4).

1.4.10.2 Any employee may erect barricade tape. The person responsible for the barricade tape must remove it when the hazard no longer exists.

NOTE: Any time red barricade tape is to be used, the Contractor must inform the Construction Project Lead/SPOC, who in turn will notify the Shift Supervisor.

- **Red barricade tape** shall be used to warn personnel DO NOT ENTER dangerous areas. These areas may only be entered with authorization from the person who erected the barricade.
- **Yellow and magenta barricade tape** shall be used to warn personnel DO NOT ENTER an area because radiography is creating a radiation hazard.
- **Yellow barricade tape** shall be used to warn personnel of immediate hazards that have the potential to cause injury. Areas barricaded with yellow may be entered once the hazard is identified and can be avoided.
- **Green barricade tape** shall be used to warn personnel of possible exposure to hexavalant chromium. Respiratory protection is required in these areas.

Contractors are responsible for compliance with the OSHA Regulation on Hexavalant Chromium. "Regulated Areas" shall be clearly demarcated with **Green** barricade tape with a caution tag that clearly states the hazard in the work area (e.g., "Hex Chrome Exposure – Respiratory Protection Required"). In general, regulated areas shall be established a minimum distance from the activity as described below:

1. 5 Feet – Welding on boiler tubes, steam piping and other materials that contain 2.5% chromium or less
2. 10 Feet – Welding on Stainless steel and other materials that contain more than 2.5% chromium.
3. 20 Feet and/or Visible plume – Plasma arc cutting, air arc cutting, chamfer-trodes, cut-trodes and other processes lacking sufficient air monitoring data by Ameren for the protection of our employees.

Contractors are responsible for air monitoring as required for their employee protection and validation of engineering controls. The guidelines for barricading are based on employee exposures based on collection of data by Ameren. These distances are guidelines and may be increased or decreased based on air monitoring data. Air monitoring data for each job shall be furnished to the Industrial Hygienist in the Ameren Corporate Safety Department.

Electronic Filing: Received, Clerk's Office 09/28/2020

- A Nuclear Radiation Sign (see Item 1.4.7 above) is used to warn unauthorized personnel not to tamper with or remove instruments or equipment.
- Flashing yellow lights may be used with barricades.
- Other barricades may be used for roadwork and for other special situations.

1.4.10.3 When determining and setting overhead load path barricade boundaries, Contractors shall include within the boundary the potential for dropping load during load swing (failed load path). All elevations affected per this potential 'failed load path' shall be barricaded.

1.4.11 Incident/Accident Reporting

1.4.11.1 In the event of incident/injury to a Contractor or Subcontractor employee, the SPOC shall be notified ASAP and a written report provided no later than 24 hours after incident/injury.

1.4.11.1.1 This notification shall include a detailed description of the accident or injury, including the names of those involved. (Incident/Accident Investigation Report (Attachment A1)) and (Witness Statement (Attachment A2)) must be utilized to provide the required notification.

1.4.11.1.2 OSHA Recordable injuries and minor injuries requiring first aid must be recorded using the First Aid Register (Attachment A3), which must be forwarded to the SPOC.

1.4.11.1.3 On Ameren Coordinated Insurance Program (ACIP) projects, copies of all first reports of injury and supporting investigation information shall be faxed to the designated claims manager and ACIP broker (see Ameren Safety Supervisor for contact numbers).

1.4.11.2 **For any serious incident or injury:**

- **First — Notify the Plant Shift Supervisor or designee immediately**. The Shift Supervisor will make the Emergency call and implement appropriate Plant Emergency Response procedures.
- **Second — Provide First Aid for the injured** as required until professional Emergency Responders arrive.
- **Third — Secure the area** to ensure safety of other personnel.
- **Fourth — Notify the SPOC** via phone, PA, radio, or in person.

1.4.11.3 The accident scene must be secured for accident investigation. Equipment or material can only be moved to prevent further injury until a review of the accident is completed.

1.4.11.4 Follow up verbal messages to the SPOC with written notifications within 24 hours as directed in Item 1.4.11.1.

1.4.12 Imminent Danger Situations

1.4.12.1 Contractor must suspend work immediately upon discovery of any situation that may, in their opinion, reasonably be expected to cause serious physical harm, illness, death, or significant environmental or equipment damage.

1.4.12.2 S&H concern(s) must be corrected, to the satisfaction of the Contractor and Company, before work may resume.

1.4.12.3 Examples of "imminent danger" situations may include, but are not limited to the following:

- Falls from elevations
- Excavations not properly sloped or shored
- Radiation hazards

Electronic Filing: Received, Clerk's Office 09/28/2020

- Electrocution hazards
- Injury to the public
- Unsafe operation of vehicles, machinery or heavy equipment
- Improper or non-existent WPA/Hold Card equipment lockout
- Release of hazardous substances (OSHA 40CFR Part 302) into the environment in excess of the reportable quantity
- Release of asbestos outside of containment work areas

1.4.13 Abandoned Piping and Demolishing Abandoned Piping

Ameren expects all Contractors to follow the Guidelines for Abandoned Piping and Demolishing Abandoned Piping (Attachment A20) while performing work on piping and/or utilities which are considered to be abandoned or will be abandoned in place.

1.4.14 Excavations

1.4.14.1 Contractor shall non-destructive excavate all underground construction activities, unless given approval by the SPOC to do otherwise.

1.4.14.2 High Suction Vacuum Contractors working at the Ameren site must have a vacuum relief valve located within equipment, a vacuum break at the point of operation, along with equipment that is grounded while operating.

2.0 WORKERS PROTECTION ASSURANCE PROCEDURE FOR OUTSIDE CONTRACT OR CONSTRUCTION PERSONNEL

GENERAL

It is necessary to assure the safety of outside contract personnel and Ameren personnel throughout construction of new system equipment and/or modification of existing system equipment. The following is a brief outline of procedures, to guide outside contract personnel in dealing with Ameren operating authorities to obtain Worker's Protection Assurances (WPA).

2.1 Definition

2.1.1 Worker's Protection Assurance

WPA is the name given to the process used by Ameren to ensure the safety of those who work on generation, transmission and substation equipment.

2.1.1.1 Its primary purpose is to ensure the SAFETY of the worker.

2.1.1.2 The Ameren WPA system uses a series of Tags and a Sign-On procedure.

2.1.1.3 The reliability and integrity of the WPA process relies upon all persons on the plant site understanding and honoring the WPA Tags and Sign-On procedure.

2.1.1.4 WPA is the Operating Authority's assurance to the person obtaining Worker's Protection Assurance that (see Operating Authority below):

Either 1) The equipment covered by the Worker's Protection Assurance has been completely isolated from energy sources (see Out of Service below).

Or 2) The equipment is placed in a special status requested by the person receiving the Worker's Protection Assurance (see Local Control below).

2.1.2 Types of WPA Authorities

2.1.2.1 Custody Authority

2.1.2.1.2 Custody Authority is the person responsible for and "in charge" of all of the equipment in a system or power plant (usually the Plant Manager).

Electronic Filing: Received, Clerk's Office 09/28/2020

2.1.2.2 Jurisdictional Authority

2.1.2.2.1 Jurisdictional Authority is the individual or group of individuals responsible for the overall direction and coordination of Ameren system equipment.

2.1.2.2.2 Jurisdictional Authority of Plant Equipment (coal pile to turbine) is the Plant Operating Supervisor.

2.1.2.2.3 Jurisdictional Authority (generator to Electrical System) is the Transmission Dispatcher / Power Dispatcher.

2.1.2.3 Functional Authority

2.1.2.3.1 Functional Authority is the individual or group of individuals who perform or direct someone else to perform detailed operations, such as switching or valving.

2.1.2.3.2 Functional Authority of Most Plant Equipment (coal pile to turbine) is the Operating Supervisor.

2.1.2.3.3 Functional Authority (Electrical System) is the Transmission Dispatcher.

In a power plant, one person, the Operating Supervisor in the Control Room, approves and issues the WPA.

2.1.2.4 Functional Agents

2.1.2.4.1 One type of Functional Agent is the Unit Operating Engineer (UOE) who creates the documentation.

2.1.2.4.2 Another type of Functional Agent is the Plant Operating Engineer (POE) who performs the work and hangs the tags.

The Plant's UOE and POE always perform the above duties – never Contractor personnel.

2.1.3 WPA Isolation Point

2.1.3.1 A WPA Isolation Point may be any of the following energy-isolating devices:

- Switch
- Circuit Breaker
- Valve
- Coupling
- Drive Belt
- Chain

2.1.4 Boundary

2.1.4.1 A Boundary is a collection of energy-isolation devices that form a "zone of protection or control" around the equipment to be serviced.

- The status of equipment within a WPA Boundary can only be changed after the Holder has Signed-Off the WPA and the WPA tag(s) have been removed.

2.2 Equipment Covered By Worker's Protection Assurance

2.2.1 All system equipment under the jurisdiction of an Operating Authority must be covered by Worker's Protection Assurance when it is to be worked on or tested.

2.2.2 The only equipment that can be covered by Worker's Protection Assurance is equipment under an Operating Authority's jurisdiction.

Electronic Filing: Received, Clerk's Office 09/28/2020

2.2.2.1 Equipment connected to energy sources but not released to the jurisdiction of an Operating Authority can only be protected by Worker's Protection Assurance on the isolating device (or devices) between the energy source and the equipment.

In this case it is only possible for the Operating Authority to assure the person receiving Worker's Protection Assurance that the particular isolating device(s) connecting the new equipment to his/her energy sources is protected and he/she cannot assure the person receiving the Worker's Protection Assurance that the equipment is completely isolated. Therefore, it is better for all new equipment to be released to the jurisdiction of an Operating Authority as soon as possible.

2.3 Description and Purpose of Tags

2.3.1 General Notes

2.3.1.1 When you see a WPA tag on equipment, it is telling you to stay clear of the equipment and keep hands off (violating WPA tags will result in disciplinary action up to and including termination).

2.3.1.2 Only the Functional Authority of the equipment may order tags to be placed or removed.

2.3.1.3 Tags will ordinarily be executed and attached by an Operator or his agent.

2.3.1.4 Tags, record sheets and WPA sheets will have the equipment name, etc., along with the serial number of the WPA record.

2.3.2 Function Authority's Hold Off Tag

2.3.2.1 Definition

2.3.2.1.1 The Hold Off is an inviolable order of a Functional Authority that the disconnect device(s) which it is intended to cover must not be closed (or opened in the case of valves) under any circumstances unless definitely ordered or approved by the Functional Authority and then only if the Hold Off tag is first ordered removed.

2.3.2.2 Issued to

2.3.2.2.1 Only to the Functional Authority (never to a worker).

2.3.2.3 Usage

2.3.2.3.1 The Hold Off is an Operating Authority's tool which he may choose to use any time he feels it would contribute to a safer working environment.

2.3.2.3.2 To properly isolate equipment from all sources of normal energy and tag them with Hold Off tags so the Functional Authority may issue an Out of Service or Restraint to a supervisor or workman so work on designated equipment may proceed.

2.3.2.4 Equipment Status

2.3.2.4.1 Operator must obtain the approval of, or be acting under the orders of, his Functional Authority before changing the status of, or working on any equipment bearing a Hold Off tag.

2.3.3 Worker's Hold Off Tag

2.3.3.1 Definition

The Worker's Hold Off is the method by which the Holder of a Local Control isolates equipment he is working on under the Local Control.

2.3.3.2 Workers will create their own Worker's Hold Off tag by legibly signing a blank Power Plant Hold Off Tag. If the Holder of a Local Control wants to work on the equipment, it must first be isolated from its energy supplies. The Holder would open the breaker, close the valves, etc. to isolate the equipment. The Holder must then hang a Worker's Hold Off on

Electronic Filing: Received, Clerk's Office 09/28/2020

top of the Local Control to ensure the breaker or valves remain in the de-energized position. A Worker's Hold Off tag when placed has the same meaning as a Functional Authority's Hold Off. The Holder would need to remove the Worker's Hold Off prior to closing the breaker or opening the valves and operating the equipment.

2.3.3.3 A Worker's Hold Off can only be placed over a Local Control Tag. It cannot be placed by itself.

EXAMPLE OF HOLD OFF TAG

EXAMPLE OF WORKER'S HOLD OFF TAG

Worker's Hold Off

Worker's Hold Off tag to be placed over plant-issued Local Control

2.4 Types of Worker's Protection Assurances

The following types of Worker's Protection Assurances are issued during construction at power plants:

2.4.1 Out of Service (Issued under Hold Off Tag)

2.4.1.1 Definition

- The Operating Authority's assurance that the equipment designated is properly isolated from all known energy sources and is appropriately tagged so that it will remain de-energized until the Out of Service is released.

2.4.1.2 Energy Status

- Isolated from all normal sources and emergency back-up energy sources.
- This does not relieve the person obtaining the protection of the responsibility of making prescribed tests or observations to assure himself that the equipment is safe

Electronic Filing: Received, Clerk's Office 09/28/2020

to work on. Points of isolation and points not to be changed are tagged, where possible, and those points cannot be changed while the Out of Service is in effect. However, equipment inside the zone of protection and not tagged, may be manually operated or tested, since it is in a de-energized state.

2.4.1.3 Usage

- Maintenance, including complete removal and disassembly.

2.4.1.4 Issued to

- Supervisors or Workers when authorized by Custody Authority.

2.4.1.5 Persons Covered

- Holder and anyone working directly for or with the Holder.

2.4.1.6 Physical Location of Holder

- Does not have to remain on Plant property.

2.4.1.7 Duration

- No time limitations. Remains in effect until equipment is ready to be restored to service.

2.4.1.8 Predominance

- Unlimited number of Out of Services may be issued on a single piece of equipment by various people for various reasons. Multiple tags may be required for isolation.

2.4.2 Restraint

2.4.2.1 Definition

- The Restraint, which is issued on the Functional Authority's Hold Off, is an assurance given by the Functional Authority to the person to whom it is issued that the equipment it covers has been properly isolated from its energy sources and that normal voltage will not be applied while the Restraint is in effect.

2.4.2.2 Energy Status

- Isolated from all normal sources and emergency back-up energy sources.

2.4.2.3 Usage

- The person to whom the Restraint is issued shall have control of the application of test energy in that his/her consent must be obtained before applying external energy of any magnitude, and he/she must be informed when the test is completed. Thus, the person shall be familiar with the status of the equipment at all times, and to this extent the person shall be responsible for seeing that other persons working on equipment with that person or under that person's specific direction are protected against the application of test energy.

- The operator of the high-energy source will direct test and connections required, following established standards or procedures or in special cases, specific instructions of the Functional Authority. The operator of the high-energy test source will communicate directly with the person who has the Restraint, but the operator may at no time apply energy until the Holder of the Restraint has given the operator permission to proceed.

2.4.2.4 Issued to

- Supervisors or Workers when authorized by Custody Authority. In cases where several workers will work on the equipment tested, a qualified worker or supervisor shall be designated to act coordinator on the job, and that person shall obtain the Restraint.

Electronic Filing: Received, Clerk's Office 09/28/2020

2.4.2.5 Persons Covered

- Holder and anyone working directly for and with the Holder.

2.4.2.6 Physical Location of Holder

- Must remain on Plant property and in control of the job. If the Holder leaves the site of the test, he/she must remain "on-call." The Holder shall not release the Restraint until all persons are removed from the equipment and informed of the intended release.
- The performance of maintenance will be permitted simultaneously with testing on equipment, provided that adequate safety can be maintained between the two jobs.
- If electrical testing is required, the procedures set forth in the System Operating Manual under Restraint, Item 207, will be followed.

2.4.2.7 Duration

- Released before Holder goes off duty for the day.

2.4.2.8 Predominance

- Only one Restraint and no other WPA.

2.4.3 Local Control

2.4.3.1 Definition

- An authority granted to a person (other than a regular operator) that permits him/her to operate or direct operation of equipment and gives him/her the assurance that no operations will be performed on the equipment unless requested or personally approved by him/her.

2.4.3.2 Energy Status

- May or may not be de-energized. This is why different tags are used. The Functional Authority's Hold Off is not in place for this type of WPA.

2.4.3.3 Usage

- Short duration maintenance or troubleshooting.

2.4.3.4 Issued to

- Supervisors or Workers when authorized by Custody Authority. Worker must give the reason for the request. Worker must specify if equipment is to be energized or isolated for him/her.

2.4.3.5 Persons Covered

- Holder and anyone working directly for or with the Holder.

2.4.3.6 Physical Location of Holder

- Must remain on Plant property and in direct control of the job since he/she is responsible for the safety of his/her workers.

2.4.3.7 Duration

- Released before Holder goes off duty. New equipment before acceptance has no time limit.

2.4.3.8 Predominance

- Only one Local Control and no other WPA.

Electronic Filing: Received, Clerk's Office 09/28/2020

EXAMPLE OF LOCAL CONTROL TAG

2.4.4 Clearance

2.4.4.1 Definition

- A Clearance is the assurance to Holder that system or equipment for which it is issued has been properly isolated from its normal energy sources (including any emergency back-up energy sources) and will remain isolated as long as Clearance is in effect.

2.4.4.2 Usage

- Used whenever it is necessary to completely isolate a system or piece of equipment from its normal energy sources (including any emergency back-up energy sources) to perform the desired work.

2.4.4.3 Issued to

- Supervisors or Workers when authorized by Custody Authority.

2.4.4.4 Persons Covered

- Holder and anyone working directly for or with the Holder.

2.4.4.5 Physical Location of Holder

- Must remain on Plant property and in direct control of the job since he/she is responsible for the safety of his/her workers.

2.4.4.6 Duration

- Released before Holder goes off duty.

2.4.4.7 Predominance

- None. An unlimited number of Clearances may be issued concurrently on a system or piece of equipment. Clearances may also be issued concurrently with Out of Services.

2.5 Exception

2.5.1 If a person holding Worker's Protection Assurance on a piece of equipment is not available and it is necessary because of plant or system emergency to place that piece of equipment in service, the Worker's Protection Assurance can be released to the Operating Authority by a person designated by the Holder of the Worker's Protection Assurance provided that:

2.5.1.1 Every attempt has been made to contact the holder of the Worker's Protection Assurance

and

2.5.1.2 A thorough examination by the person releasing the equipment reveals the equipment to be in proper operating order.

Electronic Filing: Received, Clerk's Office 09/28/2020

3.0 COMMISSIONING JURISDICTIONAL CONTROL AND EQUIPMENT TAGGING

3.1 Commissioning Team Leader, Commissioning Engineer and Specialist

3.1.1 Ensure the following, once a Construction Turnover Acceptance Form is signed by commissioning team leader:

- Any activities on the turned over system not authorized by a member of the Commissioning Team will promptly cease.
- Any Construction Cards within the boundaries of the turnover are promptly removed.

> **NOTE**
> Plant based WPA will be used if commissioning an existing system in the plant or if the new system is tied to existing plant systems. The sole WPA authority would be the control room.

3.1.2 Request "System Under Test" card or applicable WPA based on boundaries turned over to commissioning.

> **NOTE**
> In case the new system is independent of the existing plant. "System Under Test" card will be used and administered by commissioning.

3.1.3 Maintain AUE-FRM-ADM-2155-07, *System Under Test Card Log.*

3.1.4 In the event that a positive isolation device does not exist in a system being turned over, that system's boundary will be extended into the adjacent system to the first point of positive isolation.

4.0 SAFETY AND HEALTH

4.1 Contractor shall ensure worker and public safety during the course of this project.

4.1.1 Contractors must comply with all applicable Company, Federal, State, and Local health, safety and environmental regulations including, but not limited to, those concerning:

- Safety & Contractor Requirements (Appendix A) and Job Working Rules (Appendix B)
- Public and worker health and safety
- Public's "Right to Know"

Electronic Filing: Received, Clerk's Office 09/28/2020

- Fire safety
- Air and water quality
- Flammable materials storage
- Spill control, response and cleanup
- Hazardous and non-hazardous waste handling, identification and disposal

NOTE: Ameren's policies and procedures applicable to Contractors are available on www.ameren.com under Business Partners Suppliers / Standard Contracts

4.1.2 Refer to Ameren's Contractor's Substance Abuse Policy AUE-07-01 (Attachment A15) for minimum substance abuse testing requirements.

4.2 Contractor must have a full-time company corporate Safety Director who oversees and maintains the site safety program and site safety person, unless waived by the Ameren Manager of Construction. This person must also be available for safety-related questions and concerns. A full-time company safety person must also be onsite for each shift for the entire duration of the project. The cost for the safety person shall be broken out in the bids. Resumés of the safety person who will be associated with the project must be submitted with the bid.

4.2.1 Ameren reserves the right to request the safety representative be removed from the project and be replaced with a more competent individual, if they are not fulfilling expectations.

4.3 With contract bid, Contractors shall submit:

- Contractor Safety & Health Data Form (Attachment A9) (unless specifically exempted from this provision by Company).
- Their company's S&H program manual

4.4 After award, Contractor shall submit:

- A project-specific S&H Action Plan, including an Emergency Response Action Plan that is in accordance with Ameren, Federal, State & Local requirements.
- At a minimum, Attachment A21 – Site-Specific Safety Plan (SSSP), shall be filled out in its entirety. The SSSP shall be submitted to Ameren for review, comment and approval. Editable version of Attachment A21 is to be supplied after issuance of PO.

4.5 At mobilization, Contractor shall:

- Appoint a competent onsite S&H representative who will coordinate Contractor S&H activities, hazardous material and waste handling. The S&H representative will work with Ameren personnel on S&H related issues, and implement S&H rules necessary for safe execution of the project.
- Supply to the SPOC the frequencies of all walkie-talkie 2-way radios they intend to use. Frequencies must be listed to four (4) decimal places. Authorization for Two-Way Radios (Attachment A14) must be submitted to the designated SPOC.

4.6 Contractor shall be responsible for tool inspection/maintenance in accordance with the requirements of OSHA standards and manufacturer's recommendations/instructions.

4.7 Handling of Materials and Waste

4.7.1 If project involves use or presence of chemicals or products that are regulated under Section 112 (r) of the Clean Air Act, Sections 302 & 304 of Emergency Planning & Community Right to Know Act, OSHA 29CFR1926.65 or 29CFR1910.120, then Contractor has the choice of adopting the plant's Health and Safety Plan (HSP) or developing a similar plan that is at least as protective and compliant

Electronic Filing: Received, Clerk's Office 09/28/2020

If Contractor is responsible for arranging to dispose of a hazardous or otherwise regulated waste where Ameren is identified as the generator of the waste, Company shall review, and approve or reject the waste disposal method and/or facility.

Contractor site personnel shall read and acknowledge by signature that they will comply with the applicable HSP.

Certification of individual training is required prior to hazardous waste operations as defined by OSHA 29CFR1910.120 or equivalent applicable state regulations.

4.7.2 Contractor shall identify as part of the bid, and be prepared to discuss upon award of Contract, the quantities, timetables and characterization, of wastes generated during project.

4.7.3 Contractor shall minimize amount of waste generated and shall discuss waste handling, manifest preparation, record keeping, and disposal with the SPOC in advance of these activities. Contractor should coordinate waste handling Vendors/Subcontractors with Company personnel.

4.7.4 Contractor shall handle, package, label and store wastes in accordance with Ameren, Federal, State and Local requirements.

4.7.5 Contractor shall remove such wastes from the premises in a timely manner for treatment, storage and/or disposal in full compliance with applicable laws, regulations and ordinances, including documentation requirements.

4.7.6 If Contractor is considered the sole generator of waste, then, such waste is sole responsibility of Contractor, and Ameren assumes no responsibility for Contractor's compliance with applicable regulations.

4.7.7 Contractor shall notify the SPOC before using chemical/material that could create noxious or toxic vapors/fumes.

4.7.8 For materials brought onto jobsite, Contractor shall make copies available (upon request) of the Safety Data Sheets (SDS) to the appropriate personnel on the worksite.
