KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| mg/L | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| ug/g | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| ug/L | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| ug/Kg | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| TCLP | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| Surr: | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike
MSD = Matrix Spike Duplicate
RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| mg/L | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| ug/g | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| ug/L | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| ug/Kg | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| TCLP | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| Surr: | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Enclosed is the Analytical and Quality Control reports for the following samples submitted to Bartlett Division of NET, Inc. for analysis.

Project Description: ComEd-Will County 1801-230

| Sample Number | Sample Description | Date Taken | Date Received |
|---|---|---|---|
| 499952 | MW-1 | 10/26/1998 | 10/27/1998 |
| 499953 | MW-2 | 10/26/1998 | 10/27/1998 |
| 499954 | MW-3 | 10/26/1998 | 10/27/1998 |
| 499955 | MW-4 | 10/26/1998 | 10/27/1998 |
| 499956 | MW-5 | 10/26/1998 | 10/27/1998 |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike
MSD = Matrix Spike Duplicate
RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

NET Midwest, Bartlett Division

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| mg/L | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| ug/g | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| ug/L | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| ug/Kg | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| TCLP | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| Surr: | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike
MSD = Matrix Spike Duplicate
RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| **mg/L** | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| **ug/g** | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| **ug/L** | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| **ug/Kg** | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| **TCLP** | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| **Surr:** | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| **%** | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

**Re: Violation Notice: Midwest Generation, LLC, Will County Generating Station**
**Identification No.: 6283**
**Violation Notice No.: W-2012-00058**

Dear Mr. Constantelos:

This constitutes a Violation Notice pursuant to Section 31(a)(1) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(1), and is based upon a review of available information and an investigation by representatives of the Illinois Environmental Protection Agency ("Illinois EPA").

The Illinois EPA hereby provides notice of alleged violations of environmental laws, regulations, or permits as set forth in Attachment A to this notice. Attachment A includes an explanation of the activities that the Illinois EPA believes may resolve the specified alleged violations. Due to the nature and seriousness of the alleged violations, please be advised that resolution of the violations may also require the involvement of a prosecutorial authority for purposes that may include, among others, the imposition of statutory penalties.

A written response, which may include a request for a meeting with representatives of the Illinois EPA, must be submitted via certified mail to the Illinois EPA within 45 days of receipt of this letter. If a meeting is requested, it shall be held within 60 days of receipt of this notice. The response must include information in rebuttal, explanation, or justification of each alleged violation and a statement indicating whether or not the facility wishes to enter into a Compliance Commitment Agreement ("CCA") pursuant to Section 31(a) of the Act. If the facility wishes to enter into a CCA, the written response must also include proposed terms for the CCA that includes dates for achieving each commitment and may include a statement that compliance has been achieved for some or all of the alleged violations. The proposed terms of the CCA should contain sufficient detail and must include steps to be taken to achieve compliance and the necessary dates by which compliance will be achieved.

The Illinois EPA will review the proposed terms for a CCA provided by the facility and, within 30 days of receipt, will respond with either a proposed CCA or a notice that no CCA will be issued by the Illinois EPA. If the Illinois EPA sends a proposed CCA, the facility must respond in writing by either agreeing to and signing the proposed CCA or by notifying the Illinois EPA that the facility rejects the terms of the proposed CCA.

If a timely written response to this Violation Notice is not provided, it shall be considered a waiver of the opportunity to respond and meet, and the Illinois EPA may proceed with referral to a prosecutorial authority.

Written communications should be directed to:

Illinois EPA – Division of Public Water Supplies
Attn: Andrea Rhodes, CAS #19
P.O. BOX 19276
Springfield, IL 62794-9276

All communications must include reference to this Violation Notice number, W-2012-00058.

Questions regarding this Violation Notice should be directed to Andrea Rhodes at 217/785-0561.

Sincerely,

Michael Crumly
Manager, Compliance Assurance Section
Division of Public Water Supplies
Bureau of Water

CASE ID: 2012-006

**ATTACHMENT A**

**MIDWEST GENERATION, LLC, WILL COUNTY GENERATING STATION, ID:6283**
**VIOLATION NOTICE NO. W-2012-00058:**

A review of information available to the Illinois EPA indicates the following on-going violations of statutes, regulations, or permits. Included with each type of violation is an explanation of the activities that the Illinois EPA believes may resolve the violation.

**Groundwater Quality**

No person shall cause, threaten or allow the release of any contaminant to a resource groundwater such that: treatment or additional treatment is necessary to continue an existing use or to assure a potential use of such groundwater; or an existing or potential use of such groundwater is precluded. No person shall cause, threaten or allow the release of any contaminant to groundwater so as to cause a groundwater quality standard to be exceeded. Midwest Generation, LLC must take actions to mitigate existing contamination and prevent the continuing release of contaminants into the environment.

**Violation Description**

Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring well MW-1 for the following constituents:

| Parameter | Sample Value | GW Standard | Collection Date |
|---|---|---|---|
| Antimony | 0.0063 mg/l | 0.006 mg/l | 12/08/2011 |
| Manganese | 0.16 mg/l | 0.15 mg/l | 03/16/2012 |
| Manganese | 0.17 mg/l | 0.15 mg/l | 12/08/2011 |
| Manganese | 0.16 mg/l | 0.15 mg/l | 09/15/2011 |
| Manganese | 0.22 mg/l | 0.15 mg/l | 06/15/2011 |
| Manganese | 0.20 mg/l | 0.15 mg/l | 12/13/2010 |
| Sulfate | 430 mg/l | 400 mg/l | 03/16/2012 |
| Sulfate | 530 mg/l | 400 mg/l | 12/13/2010 |
| Chloride | 210 mg/l | 200 mg/l | 03/28/2011 |

**MIDWEST GENERATION, LLC, WILL COUNTY GENERATING STATION, ID:6283**
**VIOLATION NOTICE NO. W-2012-00058:**

**Violation Description**

Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring well MW-10 for the following constituents:

| Parameter | Sample Value | GW Standard | Collection Date |
|---|---|---|---|
| Boron | 2.1 mg/l | 2.0 mg/l | 03/16/2012 |
| Boron | 2.5 mg/l | 2.0 mg/l | 12/08/2011 |
| Boron | 2.8 mg/l | 2.0 mg/l | 09/15/2011 |
| Boron | 2.2 mg/l | 2.0 mg/l | 06/15/2011 |
| Boron | 2.1 mg/l | 2.0 mg/l | 12/13/2010 |
| Manganese | 0.25 mg/l | 0.15 mg/l | 03/16/2012 |
| Manganese | 0.29 mg/l | 0.15 mg/l | 12/08/2011 |
| Manganese | 0.27 mg/l | 0.15 mg/l | 09/15/2011 |
| Manganese | 0.25 mg/l | 0.15 mg/l | 06/15/2011 |
| Manganese | 0.22 mg/l | 0.15 mg/l | 03/28/2011 |
| Manganese | 0.25 mg/l | 0.15 mg/l | 12/13/2010 |
| Sulfate | 420 mg/l | 400 mg/l | 09/15/2011 |

**Re: Compliance Commitment Acceptance**
**Violation Notice: W-2012-00058**
**Midwest Generation, LLC, Will County Generating Station; ID Number: 6283**

Dear Mr. Kennedy:

The Illinois Environmental Protection Agency ("Illinois EPA") has approved the Compliance Commitment Agreement ("CCA") for Midwest Generation, LLC, Will County Generating Station. Please find enclosed an executed copy of the CCA for your records.

Failure to fully comply with the CCA may, at the sole discretion of the Illinois EPA, result in referral of this matter to the Office of the Attorney General, the State's Attorney or the United States Environmental Protection Agency.

The CCA does not constitute a waiver or modification of the terms and conditions of any license or permit issued by the Illinois EPA or any other unit or department of local, state or federal government or of any local, state or federal statute or regulatory requirement.

Questions regarding this matter should be directed to Andrea Rhodes at 217/785-0561. Written communications should be directed to the Illinois Environmental Protection Agency, Bureau of Water, CAS #19, P.O. Box 19276, Springfield, IL 62794-9276, and all communications shall include reference to your Violation Notice Number W-2012-00058.

Sincerely,

Michael Crumly
Manager, Compliance Assurance Section
Division of Public Water Supplies
Bureau of Water

**COMPLIANCE COMMITMENT AGREEMENT**

## I. Jurisdiction

1. This Compliance Commitment Agreement ("CCA") is entered into voluntarily by the Illinois Environmental Protection Agency ("Illinois EPA") and Midwest Generation, LLC, Will County Generating Station ("Respondent") (collectively, the "Parties") under the authority vested in the Illinois EPA pursuant to Section 31(a)(7)(i) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(7)(i).

## II. Allegation of Violations

2. Respondent owns and operates Will County Generating Station in Romeoville, Will County, Illinois ("Will County Station").

3. Pursuant to Violation Notice ("VN") W-2012-00058 issued on June 11, 2012, the Illinois EPA contends that Respondent has violated the following provisions of the Act and Illinois Pollution Control Board ("Board") Regulations:

   a) Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring wells MW-1, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, and MW-10.
   Section 12 of the Act, 415 ILCS 5/12, 35 Ill. Adm. Code 620.115, 620.301, 620.401, 620.405, and 620.410.

## III. Compliance Activities

4. On September 4, 2012, and September 27, 2012, the Illinois EPA received Respondent's response and supplemental e-mail response to VN W-2012-00058, which included proposed terms for a CCA. The Illinois EPA has reviewed Respondent's proposed CCA terms, as well as considered whether any additional terms and conditions are necessary to attain compliance with the alleged violations cited in the VN.

5. Respondent agrees to undertake and complete the following actions, which the Illinois EPA has determined are necessary to attain compliance with the allegations contained in VN W-2012-00058:

   a) The ash ponds at Will County Station shall not be used as permanent disposal sites and shall continue to function as treatment ponds to precipitate ash. Ash shall continue to be removed from the ponds on a periodic basis.

   b) The ash treatment ponds shall be maintained and operated in a manner which protects the integrity of the existing liners. During the removal of ash from the ponds, appropriate procedures shall be followed to protect the integrity of the existing liners, including operating the ash removal equipment in a manner which minimizes the risk of any damage to the liner.

   c) During the ash removal process, visual inspections of the ponds shall be conducted to identify any signs of a breach in the integrity of the pond liners. In the event that a breach of the pond liners is detected, Midwest Generation shall promptly notify the Illinois EPA and shall implement a corrective action plan for repair or replacement as necessary, of the liner. Upon the Illinois EPA's approval, and the issuance of any necessary construction permit, Midwest Generation will implement the corrective action plan.

   d) Midwest Generation shall continue quarterly monitoring of the existing ten groundwater monitoring wells for constituents in 35 Ill. Adm. Code 620.410(a) and (d), with the exception of radium 226 and 228, and report its findings to the Illinois EPA within 30 days of the end of each quarter. In addition, Midwest Generation shall record and report groundwater elevation and submit a potentiometric surface map with the above quarterly groundwater monitoring report.

   e) Ponds 1 North (1N) and 1 South (1S) shall be removed from service at Will County Station. All process water shall be diverted from ponds 1N and 1S to existing ponds 2 South (2S) and 3 South (3S). A dewatering system shall be developed and implemented which will not allow water to exceed a depth of one foot above the bottom of Ponds 1N and 1S.

   f) Within 90 days of the effective date of the CCA, Midwest Generation shall submit an application for a construction permit to re-line pond 2S at Will County Station with a 60 mil thickness high density polyethylene ("HDPE") liner or an Illinois EPA approved equivalent material.

g) Midwest Generation shall submit an application to establish a Groundwater Management Zone (GMZ) pursuant to 35 Ill. Adm. Code Part 620.250 within 90 days of the effective date of the CCA.

h) Midwest Generation shall enter into an Environmental Land Use Control (ELUC) to cover the area of the Will County Station property which is contained within the GMZ, except for that portion of the GMZ area which is owned by ComEd. Midwest Generation shall submit a proposed draft ELUC to the Illinois EPA for review and comment within 90 days of the effective date of the CCA.

i) Midwest Generation shall establish a GMZ pursuant to 35 Ill. Adm. Code Part 620.250 and submit a final proposed ELUC, incorporating the completed delineation of the GMZ boundaries, within one year of the effective date of the CCA.

j) Once ponds 1N and 1S have been taken out of service, a dewatering system has been implemented, pond 2S has been relined with a HDPE liner, and a GMZ and ELUC have been established, Midwest Generation shall submit a certification (or a statement) of compliance. Midwest Generation may submit either the attached "Illinois EPA Compliance Statement" or another similar writing to satisfy the statement of compliance within one year of the effective date of the CCA.

## IV. Terms and Conditions

6. Respondent shall comply with all provisions of this CCA, including, but not limited to, any appendices to this CCA and all documents incorporated by reference into this CCA. Pursuant to Section 31(a)(10) of the Act, 415 ILCS 5/31(a)(10), if Respondent complies with the terms of this CCA, the Illinois EPA shall not refer the alleged violations that are the subject of this CCA, as described in Section II above, to the Office of the Illinois Attorney General or the State's Attorney of the county in which the alleged violations occurred. Successful completion of this CCA or an amended CCA shall be a factor to be weighed, in favor of the Respondent, by the Office of the Illinois Attorney General in determining whether to file a complaint on its own motion for the violations cited in VN W-2012-00058.

7. This CCA is solely intended to address the violations alleged in Illinois EPA VN W-2012-00058. The Illinois EPA reserves and this CCA is without prejudice to, all rights of the Illinois EPA against Respondent with respect to noncompliance with any term of this CCA, as well as to all other matters. Nothing in this CCA is intended as a waiver, discharge, release, or covenant not to sue for any claim or cause of action, administrative or judicial, civil or criminal, past or future, in law or in equity, which the Illinois EPA may have against Respondent, or any other person as defined by Section 3.315 of the Act, 415 ILCS 5/3.315. This CCA in no way affects the responsibilities of Respondent to comply with any other federal, state or local laws or regulations, including but not limited to the Act, and the Board Regulations [and Permit, if applicable].

8. Pursuant to Section 42(k) of the Act, 415 ILCS 5/42(k), in addition to any other remedy or penalty that may apply, whether civil or criminal, Respondent shall be liable for an additional civil penalty of $2,000 for violation of any of the terms or conditions of this CCA.

9. This CCA shall apply to and be binding upon the Illinois EPA, and on Respondent and Respondent's officers, directors, employees, agents, successors, assigns, heirs, trustees, receivers, and upon all persons, including but not limited to contractors and consultants, acting on behalf of Respondent, as well as upon subsequent purchasers of Respondent's Will County Station in Romeoville, Will County, Illinois.

10. In any action by the Illinois EPA to enforce the terms of this CCA, Respondent consents to and agrees not to contest the authority or jurisdiction of the Illinois EPA to enter into or enforce this CCA, and agrees not to contest the validity of this CCA or its terms and conditions.

11. This CCA shall only become effective:

    a) If, within 30 days of receipt, Respondent executes this CCA and submits it, via certified mail, to Illinois EPA, Bureau of Water, Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702. If Respondent fails to execute and submit this CCA within 30 days of receipt, via certified mail, this CCA shall be deemed rejected by operation of law; and

    b) Upon execution by all Parties.

12. Pursuant to Section 31(a)(7.5) of the Act, 415 ILCS 5/31(a)(7.5), this CCA shall not be amended or modified prior to execution by the Parties. Any amendment or modification to this CCA by Respondent prior to execution by all Parties shall be considered a rejection of the CCA by operation of law. This CCA may only be amended subsequent to its effective date, in writing, and by mutual agreement between the Illinois EPA and Respondent's signatory to this CCA, Respondent's legal representative, or Respondent's agent.

Re:

Compliance Commitment Agreement – Groundwater Management Zone Application
Midwest Generation, LLC, Will County Generating Station; ID No. 6283
Violation Notice W-2012-0058

Dear Ms. Rhodes:

The Compliance Commitment Agreement (CCA) for the above referenced site relative to Violation Notice W-2012-00058 was signed by Midwest Generation on October 15, 2012 and executed by Illinois Environmental Protection Agency (IEPA) signature on October 24, 2012 (effective date). Item 5 (g) of the CCA requires Midwest Generation to submit an application to establish a Groundwater Management Zone (GMZ) pursuant to 35 Ill. Adm. Code Part 620.250 within 90 days of the effective date of the CCA.

Based on previous discussions with IEPA, the proposed areal extent of the GMZ is shown on Figure 1 in Attachment 1. The GMZ Application Forms (Parts I through III) and supporting information/data are provided in Attachment 2. As discussed in the Application Forms support documentation, groundwater flow in the vicinity of the subject ash ponds is in a westerly direction with discharge to the adjoining Des Plaines River. The western (downgradient) extent of the proposed GMZ corresponds with this hydraulic boundary. The eastern boundary is defined by the Chicago Sanitary and Ship Canal (CSSC) which forms a hydraulic boundary on the east side of the facility. The north and south sides of the proposed GMZ are based on the flow system and location of the four ash ponds. The vertical extent of the GMZ would be the first underlying aquitard identified as the Maquoketa Shale, approximately 140 feet below ground surface. The GMZ would therefore vertically include the unconsolidated overburden and the Silurian dolomite, both of which are hydraulically connected and overlie the Maquoketa Shale.

Tel: 630 771 7863
Fax: 949 225 0813
ahanrahan@mwgen.com

This submittal fulfills the requirements set forth under Item 5 (g) of the signed CCA. Once the application is approved by IEPA and the proposed extent of the GMZ is agreed upon, a formal surveying of the area will be performed and legal description generated. Please call me at 630-771-7863 if there are any questions.

Sincerely,
Midwest Generation, LLC

## Completed GMZ Application Forms (Parts I through III)

**Section 620.APPENDIX D Confirmation of an Adequate Corrective Action Pursuant to 35 Ill. Adm. Code 620.250(a)(2)**

Pursuant to 35 Ill. Adm. Code 620.250(a) if an owner or operator provides a written confirmation to the Agency that an adequate corrective action, equivalent to a corrective action process approved by the Agency, is being undertaken in a timely and appropriate manner, then a groundwater management zone may be established as a three-dimensional region containing groundwater being managed to mitigate impairment caused by the release of contaminants from a site. This document provides the form in which the written confirmation is to be submitted to the Agency.

Note 1. Parts I and II are to be submitted to IEPA at the time that the facility claims the alternative groundwater standards. Part III is to be submitted at the completion of the site investigation. At the completion of the corrective process, a final report is to be filed which includes the confirmation statement included in Part IV.

Note 2. The issuance of a permit by IEPA's Division of Air Pollution Control or Water Pollution Control for a treatment system does not imply that the Agency has approved the corrective action process.

Note 3. If the facility is conducting a cleanup of a unit which is subject to the requirements of the Resource Conservation and Recovery Act (RCRA) or the 35 Ill. Adm. Code 731 regulations for Underground Storage Tanks, this confirmation process is not applicable and cannot be used.

Note 4. If the answers to any of these questions require explanation or clarification, provide such in an attachment to this document.

Part I. Facility Information

Facility Name Will County Generating Station

Facility Address 529 East 135th Street
Romeoville, IL

County Will County

Standard Industrial Code (SIC) 4911

1. Provide a general description of the type of industry, products manufactured, raw materials used, location and size of the facility.

The Midwest Generation Will County Station is a coal-fired electrical power generating station in operation since the mid-1950s. The facility is located at 529 E. 135th Street in Romeoville, Illinois. The generating station property covers an area of approximately 200 acres.

2. What specific units (operating or closed) are present at the facility which are or were used to manage waste, hazardous waste, hazardous substances or petroleum?

| | YES | NO |
|---|---|---|
| Landfill | | X |
| Surface Impoundment | X | |
| Land Treatment | | X |
| Spray Irrigation | | X |
| Waste Pile | X | |
| Incinerator | | X |
| Storage Tank (above ground) | X | |
| Storage Tank (underground) | | X |
| Container Storage Area | X | |
| Injection Well | | X |
| Water Treatment Units | X | |
| Septic Tanks | | X |
| French Drains | | X |
| Transfer Station | | X |
| Other Units (please describe) | | |
| _____ | | |
| _____ | | |

3. Provide an extract from a USGS topographic or county map showing the location of the site and a more detailed scaled map of the facility with each waste management unit identified in Question 2 or known/suspected source clearly identified. Map scale must be specified and the location of the facility must be provided with respect to Township, Range and Section.

Please see Figures 1 and 2 in Attachment 2A.

4. Has the facility ever conducted operations which involved the generation, manufacture, processing, transportation, treatment, storage or handling of "hazardous substances" as defined by the Illinois Environmental Protection

Act? Yes _X__ No ___ If the answer to this question is "yes" generally describe these operations.

Will County Generating Station generates typical hazardous and non-hazardous substance wastes associated with coal-fired electrical power generation. A full list of hazardous substances can be provided upon request.

5. Has the facility generated, stored or treated hazardous waste as defined by the Resource Conservation and Recovery Act? Yes_X__ No ___If the answer to this question is "yes" generally describe these operations.

The station's hazardous wastes have typically been lead paint chip debris associated with lead paint removal, empty aerosol cans, spent laboratory chemicals (hydrazine, monoethylamine, formic acid), etc. Complete logs of wastes generated and disposed of can be provided upon request.

6. Has the facility conducted operations which involved the processing, storage or handling of petroleum? Yes _X__ No ____If the answer to this question is "yes" generally describe these operations.

The facility stores oil for operations in above ground storage tanks for start-up operations and for heavy equipment fueling and other diesel powered equipment. There is also an above ground gasoline storage tank and two used oil storage tanks.

7. Has the facility ever held any of the following permits?

   a. Permits for any waste storage, waste treatment or waste disposal operation. Yes _X__ No ___ If the answer to this question is "yes", identify the IEPA permit numbers.

   The facility utilizes a sewerage treatment system that discharges to the Des Plaines River under NPDES Permit No. IL0002208.

   b. Interim Status under the Resources Conservation and Recovery Act (filing of a RCRA Part A application). Yes ___ No _X__ If the answer to this question is "yes", attach a copy of the last approved Part A application.

   c. RCRA Part B Permits. Yes ___ No _X__ If the answer to this question is "yes", identify the permit log number.

8. Has the facility ever conducted the closure of a RCRA hazardous waste management unit? Yes ___ No _X__

9. Have any of the following State or federal government actions taken place for a release at the facility?

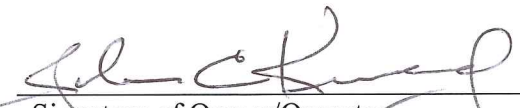
   a. Written notification regarding known, suspected or alleged contamination on or emanating from the property (e.g., a Notice pursuant to Section 4(q) of the Environment Protection Act)? Yes _X_ No ___ If the to this question is "yes", identify the caption and date of issuance.

   A Violation Notice was issued by IEPA on June 11, 2012 relative to the four ash impoundments alleging a potential release of coal ash constituents to groundwater (Violation Notice No. W-2012-00058). This was resolved through a Compliance Commitment Agreement (CCA) dated October 4, 2012 and formally executed on October 24, 2012. This submittal is part of the CCA compliance.

   b. Consent Decree or Order under RCRA, CERCLA, EPAct Section 22.2 (State Superfund), or EPAct Section 21(f) (State RCRA). Yes ___ No _X_

   c. If either of Items a or b were answered by checking "yes", is the notice, order or decree still in effect? Yes _X_ No ___

   The CCA is currently in effect.



10. What groundwater classification will the facility be subject to at the completion of the remediation?

    Class I _X_ Class II ___ Class III ____ Class IV ____
    If more than one Class applies, please explain.

11. Describe the circumstances which the release to groundwater was identified.

As requested by Illinois Environmental Protection Agency (IEPA), a groundwater monitoring plan was developed and implemented for Ash Pond 1N, 1S, 2S and 3S located on the west side of the facility. A total of ten monitoring wells were installed around the four ash ponds. Quarterly sampling was initiated in December 2010 and has been ongoing since. The data were provided to IEPA on a quarterly basis. Based on the monitoring data, on June 11, 2012, IEPA issued a Violation Notice (W-2012-00058) to Midwest Generation alleging that potential leakage from the ponds has resulted in a violation of Class I groundwater standards for antimony, boron, chloride, manganese, pH, sulfate and total dissolved solids.

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of my knowledge and belief, true and accurate.

| Location of Facility | Name of Owner/Operator |
| ID No. 6283 | January 17, 2013 |
| EPA Identification Number | Date |

PART II: Release Information

1. Identify the chemical constituents release to the groundwater. Attach additional documents as necessary.

| Chemical Description | Chemical Abstract No. |
|---|---|
| Antimony | 7440-36-0 |
| Boron | 7440-42-8 |
| Chloride | 16887-00-6 |
| pH | Not Applicable |
| Manganese | 7439-96-5 |
| Sulfate | 18785-72-3 |
| Total Dissolved Solids | C-010 |

2. Describe how the site will be investigated to determine the source or sources of the release.

This work has already been performed. As requested by Illinois Environmental Protection Agency (IEPA), Midwest Generation, LLC (Midwest Generation) prepared and submitted on September 3, 2010 a Hydrogeologic Assessment Plan for four ash ponds located at the Will County Generating Station. The purpose of the hydrogeologic assessment was to: (i) evaluate the potential, if any, for migration of ash related constituents from the ash ponds and conduct monitoring for groundwater constituents regulated by Illinois Part 620 groundwater standards; (ii) characterize the subsurface hydrogeology: and (iii) identify potable well use within 2,500 feet of the ash ponds.

Upon IEPA approval of the Hydrogeologic Assessment Plan, a total of ten monitoring wells (MW-1 through MW-10) were installed around the four ash ponds identified as Ash Ponds 1N, 1S, 2S and 3S (see Figure 3 in Attachment 2A). The wells were drilled and constructed in October 2010 after which point quarterly monitoring was initiated in accordance with approved, low-flow sampling procedures. A Hydrogeologic Assessment Report for Will County Generating Station was prepared by Patrick Engineering, Inc. and submitted by Midwest Generation, LLC to IEPA in February 2011. The results of the Hydrogeologic Assessment Report are incorporated into this application submittal by reference.

Since the submittal of the Hydrogeologic Assessment Report in February 2011, quarterly monitoring of the wells has been ongoing. The most recent round of sampling was performed in December 2012. A complete updated data summary table is provided in Attachment 2B. An updated groundwater flow map using the water level measurements from the most recent round of sampling is provided as Figure 4 in Attachment 2A.

3. Describe how groundwater will be monitored to determine the rate and extent of the release.

As part of the hydrogeologic assessment already performed (see discussion for item 2 above), in-situ hydraulic conductivity tests were performed on five of the monitoring wells (MW-1, MW-4, MW-6, MW-7 and MW-9) installed around the ash ponds. Based on the results of the testing, hydraulic conductivity values in the vicinity of the well screens were found to range from $6.38 \times 10^{-5}$ to $2.07 \times 10^{-4}$ ft/sec with an average hydraulic conductivity of $4.32 \times 10^{-4}$ ft/sec. Using the average hydraulic conductivity value, an estimated hydraulic gradient of 0.015 ft/ft based on the most recent groundwater contour map (Figure 4 in Attachment 2A) and an estimated effective porosity of 0.20 yields an estimated groundwater seepage velocity of approximately 2.8 ft/day.

Relative to the extent of impacts, a box-plot map of detections of the constituents identified in Part II - Item 1 above is provided as Figure 5 in Attachment 2A.

4. Has the release been contained on-site at the facility?

Yes. All groundwater monitoring data indicates that the impacts are limited to within the property boundary. Natural groundwater flow is generally to the west with discharge into the adjacent Des Plaines River. There are some instances when there could be flow to the east from the river onto the property at times of higher river stage.

5. Describe the groundwater monitoring network and groundwater and soil sampling protocols in place at the facility.

The IEPA approved groundwater monitoring network at the site consists of ten monitoring wells (MW-1 through MW-10) located around the four existing ash ponds (see Figure 1 in Attachment 2A). Wells MW-1 through MW-6 are generally upgradient monitoring wells. The remaining wells are considered downgradient monitoring points. The well borings were advanced using hollow-stem augers to depths ranging from approximately 18 to 22 feet below ground surface (bgs). The depth of a specific boring was terminated approximately 10 feet below the encountered water table. The wells were subsequently constructed using standard, 2-inch diameter PVC casing with 10-feet of 0.010 slot PVC screens. The wells were completed approximately three feet above grade with locking protective steel casings and bumper posts. The boring logs and well construction summaries are included in the above referenced Hydrogeologic Assessment Report (see discussion for item 2 above). The monitoring wells are sampled on a quarterly basis using low-flow sampling with a peristaltic pump. Field measurements of pH, specific conductivity, temperature, dissolved oxygen (DO) and oxidation-reduction potential (ORP) are recorded. Once collected, the samples are placed on ice and transported under a completed chain-of-custody to TestAmerica, Inc. which is an Illinois

accredited analytical laboratory. The samples are analyzed for the inorganic compounds listed in 35 IAC 620.410(a) and (d), excluding radium 226/228.

There is no soil sampling that is performed as part of the approved site monitoring program.

6. Provide the schedule for investigation and monitoring.

Groundwater sampling of all existing monitoring wells is performed on a quarterly basis. The general sampling schedule is as follows:

| Event | Sampling Schedule |
|---|---|
| 1st Quarter | March |
| 2nd Quarter | June |
| 3rd Quarter | September |
| 4th Quarter | December |

7. Describe the laboratory quality assurance program utilized for the investigation.

TestAmerica's Quality Assurance Manual (QAM) is a document prepared to define the overall policies, organization objectives and functional responsibilities for achieving the laboratory's data quality goals. The laboratory maintains a local perspective in its scope of services and client relations and maintains a national perspective in terms of quality.

The QAM has been prepared to assure compliance with the NELAC Institute (TNI) Standard, dated 2009, Volume 1 Modules 2 and 4, and ISO/IEC Guide 17025:2005(E). In addition, the policies and procedures outlined in this manual are compliant with TestAmerica's Corporate Quality Management Plan (CQMP) and the various accreditation and certification programs. The CQMP provides a summary of TestAmerica's quality and data integrity system. It contains requirements and general guidelines under which all TestAmerica facilities shall conduct their operations.

The QAM has been prepared to be consistent with the requirements of the following documents:

- EPA 600/4-88/039, *Methods for the Determination of Organic Compounds in Drinking Water,* EPA, Revised July 1991.
- EPA 600/R-95/131, *Methods for the Determination of Organic Compounds in Drinking Water,* Supplement III, EPA, August 1995.
- EPA 600/4-79-019, *Handbook for Analytical Quality Control in Water and Wastewater Laboratories,* EPA, March 1979.

- Test Methods for Evaluating Solid Waste Physical/Chemical Methods (SW846), Third Edition, September 1986, Final Update I, July 1992, Final Update IIA, August 1993, Final Update II, September 1994; Final Update IIB, January 1995; Final Update III, December 1996; Final Update IV, January 2008.
- Federal Register, 40 CFR Parts 136, 141, 172, 173, 178, 179 and 261.
- Statement of Work for Inorganics Analysis, SOM and ISM, current versions, USEPA Contract Laboratory Program Multi-media, Multi-concentration.
- APHA, *Standard Methods for the Examination of Water and Wastewater,* 18th Edition, 19th, 20th, 21st and on-line Editions.
- U.S. Department of Energy Order 414.1C, Quality Assurance, June 17, 2005.
- *U.S. Department of Energy, Quality Systems for Analytical Services*, Revision 3.6, November 2010.
- U.S. Department of Defense, *Quality Systems Manual for Environmental Laboratories*, Final Version 4.2, October 2010.
- U.S. Department of Defense, *Air Force Center for Environmental Excellence Quality Assurance Project Plan (QAPP),* Version 4.0.02, May 2006.
- National Environmental Laboratory Accreditation Conference, Constitution, Bylaws, and Standards, EPA 600/R-04/003, US EPA Office of Research and Development, June 2003
- Toxic Substances Control Act (TSCA).

Copies of TestAmerica's QAM and CQMP can be provided upon request.

8. Provide a summary of the results of available soil testing and groundwater monitoring associated with the release at the facility. The summary or results should provide the following information: dates of sampling; types of samples taken (soil or water); locations and depths of samples; sampling and analytical methods; analytical laboratories used; chemical constituents for which analyses were performed; analytical detection limits; and concentrations of chemical constituents in ppm (levels below detection should be identified as "ND").

The data summary for all groundwater sampling performed to date are provided in Tables 1 and 2 in Attachment 2B.

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of knowledge and belief, true and

accurate and confirm that the actions identified herein will be undertaken in accordance with the schedule set forth herein.

Part III: Remedy Selection Information

1. Describe the selected remedy.

Ash Pond 1S is already lined with high density polyethylene (HDPE) and the remaining three ash ponds have a Poz-o-Pac liner. The agreed upon remedy is specified in Item 5 (a) through (j) of the executed Compliance Commitment Agreement (CCA) which is provided in Attachment 2C. The remedy includes relining of Ash Pond 2S with HDPE, removing Ash Ponds 1S and 1N from service and installing a dewatering system within those ponds to keep liquid levels to within no more than one foot of the bottoms of those units. This Groundwater Management Zone (GMZ) application fulfills requirements set forth under Item 5 (g) of the CCA.

2. Describe other remedies which were considered and why they were rejected.

The primary alternate remedy discussed during negotiations with IEPA was to ensure that the ash ponds will not be used as permanent disposal sites, maintain the ash ponds in a manner that will be protective of the integrity of the existing liners, include visual inspections of the liners during ash removal events, implement repairs or replacement of the liners as necessary, establish a GMZ and to continue with the existing quarterly groundwater monitoring program until the federal ash regulation revisions are established. Upon the finalization of the new federal ash storage regulations, retrofit the impoundments, as necessary, to meet the new technical requirements for ash storage impoundments or re-engineer plant processes to maintain compliance and take the impoundments out of service.

This remedy was rejected by IEPA due to the uncertainty of the timeframe within which the new federal regulations will be issued.

3. Will waste, contaminated soil or contaminated groundwater be removed from the site in the course of this remediation? Yes _X_ No ___ If the answer to this question is "yes", where will the contaminated material be taken?

The ash that will be removed from Ash Pond 2S to facilitate new liner construction will be taken by Lafarge NA for beneficial reuse.

4. Describe how the selected remedy will accomplish the maximum practical restoration of beneficial use of groundwater.

Once Ash Pond 2S is relined with a HDPE liner, the two ponds that will remain in service for active ash accumulation will have been constructed and operated to minimize potential release of ash pond fluids to groundwater. In addition, the fluid accumulation within Ash Ponds 1S and 1N, which will no longer accumulate ash,

will be managed to within one foot of the bottom of each pond to further minimize potential release of ash pond fluids from these units. Any residual groundwater impacts potentially associated with prior ash pond leakage will naturally attenuate through the groundwater system under monitored conditions within the established GMZ with eventual discharge to the adjoining Des Plaines River.

5. Describe how the selected remedy will minimize any threat to public health or the environment.

The existing conditions do not pose a threat to public health since the impacts are limited to within the property boundary, there are no groundwater use receptors and the ponds are located within a fenced property with 24-hour security controlled access. Any potential impacts to the environment will be minimized and managed as discussed under item 4 above.

6. Describe how the selected remedy will result in compliance with the applicable groundwater standards.

Once Ash Pond 2S is relined with an HDPE liner and the fluid level within Ash Ponds 1S and 1N is reduced to within no more than one foot of the pond bottoms, the ash collection system will have been constructed and operated to minimize potential release of ash pond fluids to groundwater (i.e, the ash ponds as a potential source of groundwater impacts will be eliminated). Any residual groundwater impacts potentially associated with prior ash pond leakage will naturally attenuate through the groundwater system under monitored conditions within the established GMZ and/or discharge to the adjoining Des Plaines River immediately west of the ash ponds.

7. Provide a schedule for design, construction and operation of the remedy, including dates for the start and completion.

The construction window for relining of Ash Pond 2S will occur from June 14, 2013 through September 2, 2013. Dredging will occur from June 14, 2013 through July 28, 2013. At this time liner installation is anticipated to occur in August 2013.

The dewatering system for Ash Ponds 1S and 1N is anticipated to be completed between July 14, 2013 and September 2, 2013.

A more detailed schedule is being provided under separate cover with the Application for Construction Permit to implement the remedy.

8. Describe how the remedy will be operated and maintained.

Upon completion of construction activities, Midwest Generation will develop and submit an Operation and Maintenance (O&M) Plan to the IEPA. The O&M Plan

will be based on manufacturer and installer recommendations. It will include procedures for liner and dewatering system inspections, inspection frequency, documentation requirements and what corrective measure procedures are to be implemented, if necessary.

9. Have any of the following permits been issued for the remediation?

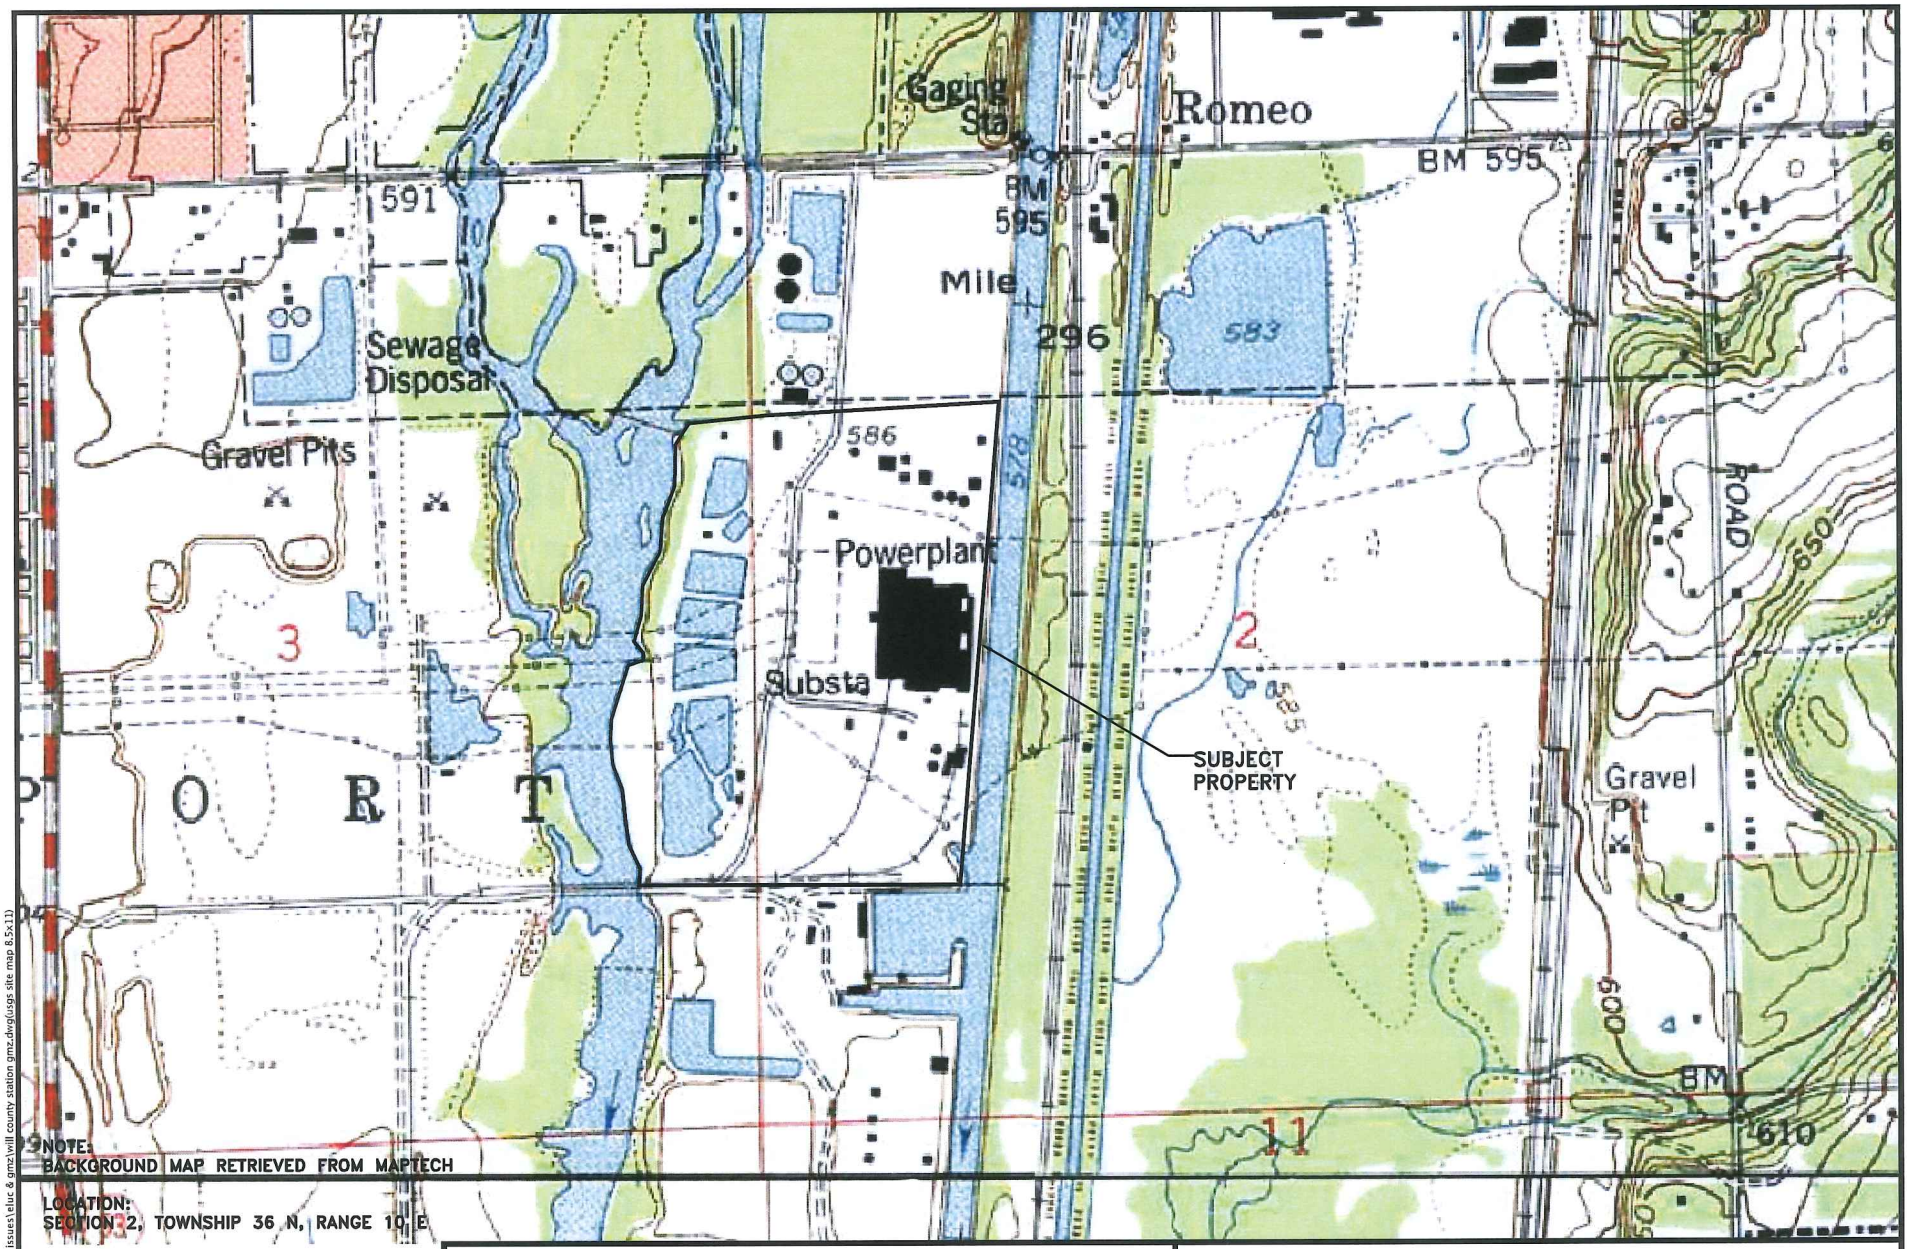
   a. Construction or Operating permit from the Division of Water Pollution Control. Yes _X_ No ___

   This permit submittal is currently under review by IEPA.

   b. Land treatment permit from the Division of Water Pollution Control. Yes ___ No _X__ If the answer to this question is "yes", identify the permit number.

   c. Construction or Operating permit from the Division of Air Pollution Control. Yes ___ No _X__ If the answer to this question is "yes", identify the permit number.

10. How will groundwater at the facility be monitored following completion of the remedy to ensure that the groundwater standards have been attained?



There are currently 10 monitoring wells surrounding Ash Ponds 1S, 2S, 3S and 1N (see Figure 3 in Attachment 2A). As required under Item 5 (d) of the CCA, these wells will continue to be monitored on a quarterly basis for constituents listed in 35 IAC 620.410(a) and (d), with the exception of radium 226/228. The monitoring data will be reported to IEPA within 30 days of the end of each quarter. In addition, an updated groundwater potentiometric surface map will be provided with each quarterly submittal. IEPA, upon written request, may approve a reduction in the frequency and scope of the sampling program in the future. Upon the IEPA's approval, the approved changes in the frequency and scope of the monitoring program shall be implemented.

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of my knowledge and belief, true and accurate and confirm that the actions identified herein will be undertaken in accordance with the schedule set forth herein.

Notes: Groundwater sample analyzed at TestAmerica laboratory.
Well screen depth is from 9.5 to 19.5 feet below ground surface.
Sample collected using low-flow technique.
All values are in mg/L (ppm).

DL - Detection limit
ND - Non-detect
NA - Not Applicable

^ - Denotes instrument related QC exceeds the control limits

**Re: Proposed Compliance Commitment Agreement**
**Violation Notice: W-2012-00058**
**Midwest Generation, LLC, Will County Generating Station; ID Number: 6283**

Dear Mr. Kennedy:

The Illinois Environmental Protection Agency ("Illinois EPA") has reviewed the proposed Compliance Commitment Agreement ("CCA") terms submitted by Midwest Generation, LLC, Will County Generating Station in a letter dated September 4, 2012 and a supplemental e-mail received September 27, 2012, in response to the Violation Notice dated June 11, 2012. Pursuant to the authority vested in the Illinois EPA under Section 31(a)(7)(i) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(7)(i), attached to this letter is a proposed CCA, which contains terms and conditions that the Illinois EPA has determined are necessary in order for you to attain compliance with the Act and Illinois Pollution Control Board Regulations.

Pursuant to Section 31(a)(7.5) of the Act, 415, ILCS 5/31(a)(7.5), **within 30 days of your receipt of this proposed CCA**, Midwest Generation, LLC, Will County Generating Station or its duly authorized representative must either (1) agree to and sign the proposed CCA, and submit the signed and dated CCA by certified mail to Illinois EPA Bureau of Water, Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702; or (2) notify the Illinois EPA by certified mail that you reject the proposed CCA.

The proposed CCA shall only become effective upon your timely submittal of the signed CCA as discussed above, and upon final execution by the Illinois EPA. Failure by you to execute and submit the proposed CCA within 30 days of receipt shall be deemed a rejection of the CCA by operation of law. Upon timely receipt of the signed CCA, the Illinois EPA will send you a fully executed copy of the CCA for your records.

In addition, the proposed CCA is not subject to amendment or modification prior to execution by you and the Illinois EPA. Any amendment or modification to the proposed CCA by Respondent prior to execution by you and the Illinois EPA shall be deemed a rejection of the proposed CCA by operation of law. The proposed CCA may only be amended subsequent to its effective date, in writing, and by mutual agreement between the Illinois EPA and you.

**COMPLIANCE COMMITMENT AGREEMENT**

## I. Jurisdiction

1. This Compliance Commitment Agreement ("CCA") is entered into voluntarily by the Illinois Environmental Protection Agency ("Illinois EPA") and Midwest Generation, LLC, Will County Generating Station ("Respondent") (collectively, the "Parties") under the authority vested in the Illinois EPA pursuant to Section 31(a)(7)(i) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(7)(i).

## II. Allegation of Violations

2. Respondent owns and operates Will County Generating Station in Romeoville, Will County, Illinois ("Will County Station").

3. Pursuant to Violation Notice ("VN") W-2012-00058 issued on June 11, 2012, the Illinois EPA contends that Respondent has violated the following provisions of the Act and Illinois Pollution Control Board ("Board") Regulations:

   a) Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring wells MW-1, MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, and MW-10.
   Section 12 of the Act, 415 ILCS 5/12, 35 Ill. Adm. Code 620.115, 620.301, 620.401, 620.405, and 620.410.

## III. Compliance Activities

4. On September 4, 2012, and September 27, 2012, the Illinois EPA received Respondent's response and supplemental e-mail response to VN W-2012-00058, which included proposed terms for a CCA. The Illinois EPA has reviewed Respondent's proposed CCA terms, as well as considered whether any additional terms and conditions are necessary to attain compliance with the alleged violations cited in the VN.

5. Respondent agrees to undertake and complete the following actions, which the Illinois EPA has determined are necessary to attain compliance with the allegations contained in VN W-2012-00058:

   a) The ash ponds at Will County Station shall not be used as permanent disposal sites and shall continue to function as treatment ponds to precipitate ash. Ash shall continue to be removed from the ponds on a periodic basis.

   b) The ash treatment ponds shall be maintained and operated in a manner which protects the integrity of the existing liners. During the removal of ash from the ponds, appropriate procedures shall be followed to protect the integrity of the existing liners, including operating the ash removal equipment in a manner which minimizes the risk of any damage to the liner.

   c) During the ash removal process, visual inspections of the ponds shall be conducted to identify any signs of a breach in the integrity of the pond liners. In the event that a breach of the pond liners is detected, Midwest Generation shall promptly notify the Illinois EPA and shall implement a corrective action plan for repair or replacement as necessary, of the liner. Upon the Illinois EPA's approval, and the issuance of any necessary construction permit, Midwest Generation will implement the corrective action plan.

   d) Midwest Generation shall continue quarterly monitoring of the existing ten groundwater monitoring wells for constituents in 35 Ill. Adm. Code 620.410(a) and (d), with the exception of radium 226 and 228, and report its findings to the Illinois EPA within 30 days of the end of each quarter. In addition, Midwest Generation shall record and report groundwater elevation and submit a potentiometric surface map with the above quarterly groundwater monitoring report.

   e) Ponds 1 North (1N) and 1 South (1S) shall be removed from service at Will County Station. All process water shall be diverted from ponds 1N and 1S to existing ponds 2 South (2S) and 3 South (3S). A dewatering system shall be developed and implemented which will not allow water to exceed a depth of one foot above the bottom of Ponds 1N and 1S.

   f) Within 90 days of the effective date of the CCA, Midwest Generation shall submit an application for a construction permit to re-line pond 2S at Will County Station with a 60 mil thickness high density polyethylene ("HDPE") liner or an Illinois EPA approved equivalent material.

g) Midwest Generation shall submit an application to establish a Groundwater Management Zone (GMZ) pursuant to 35 Ill. Adm. Code Part 620.250 within 90 days of the effective date of the CCA.

h) Midwest Generation shall enter into an Environmental Land Use Control (ELUC) to cover the area of the Will County Station property which is contained within the GMZ, except for that portion of the GMZ area which is owned by ComEd. Midwest Generation shall submit a proposed draft ELUC to the Illinois EPA for review and comment within 90 days of the effective date of the CCA.

i) Midwest Generation shall establish a GMZ pursuant to 35 Ill. Adm. Code Part 620.250 and submit a final proposed ELUC, incorporating the completed delineation of the GMZ boundaries, within one year of the effective date of the CCA.

j) Once ponds 1N and 1S have been taken out of service, a dewatering system has been implemented, pond 2S has been relined with a HDPE liner, and a GMZ and ELUC have been established, Midwest Generation shall submit a certification (or a statement) of compliance. Midwest Generation may submit either the attached "Illinois EPA Compliance Statement" or another similar writing to satisfy the statement of compliance within one year of the effective date of the CCA.

## IV. Terms and Conditions

6. Respondent shall comply with all provisions of this CCA, including, but not limited to, any appendices to this CCA and all documents incorporated by reference into this CCA. Pursuant to Section 31(a)(10) of the Act, 415 ILCS 5/31(a)(10), if Respondent complies with the terms of this CCA, the Illinois EPA shall not refer the alleged violations that are the subject of this CCA, as described in Section II above, to the Office of the Illinois Attorney General or the State's Attorney of the county in which the alleged violations occurred. Successful completion of this CCA or an amended CCA shall be a factor to be weighed, in favor of the Respondent, by the Office of the Illinois Attorney General in determining whether to file a complaint on its own motion for the violations cited in VN W-2012-00058.

7. This CCA is solely intended to address the violations alleged in Illinois EPA VN W-2012-00058. The Illinois EPA reserves and this CCA is without prejudice to, all rights of the Illinois EPA against Respondent with respect to noncompliance with any term of this CCA, as well as to all other matters. Nothing in this CCA is intended as a waiver, discharge, release, or covenant not to sue for any claim or cause of action, administrative or judicial, civil or criminal, past or future, in law or in equity, which the Illinois EPA may have against Respondent, or any other person as defined by Section 3.315 of the Act, 415 ILCS 5/3.315. This CCA in no way affects the responsibilities of Respondent to comply with any other federal, state or local laws or regulations, including but not limited to the Act, and the Board Regulations [and Permit, if applicable].

8. Pursuant to Section 42(k) of the Act, 415 ILCS 5/42(k), in addition to any other remedy or penalty that may apply, whether civil or criminal, Respondent shall be liable for an additional civil penalty of $2,000 for violation of any of the terms or conditions of this CCA.

9. This CCA shall apply to and be binding upon the Illinois EPA, and on Respondent and Respondent's officers, directors, employees, agents, successors, assigns, heirs, trustees, receivers, and upon all persons, including but not limited to contractors and consultants, acting on behalf of Respondent, as well as upon subsequent purchasers of Respondent's Will County Station in Romeoville, Will County, Illinois.

10. In any action by the Illinois EPA to enforce the terms of this CCA, Respondent consents to and agrees not to contest the authority or jurisdiction of the Illinois EPA to enter into or enforce this CCA, and agrees not to contest the validity of this CCA or its terms and conditions.

11. This CCA shall only become effective:

    a) If, within 30 days of receipt, Respondent executes this CCA and submits it, via certified mail, to Illinois EPA, Bureau of Water, Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702. If Respondent fails to execute and submit this CCA within 30 days of receipt, via certified mail, this CCA shall be deemed rejected by operation of law; and

    b) Upon execution by all Parties.

12. Pursuant to Section 31(a)(7.5) of the Act, 415 ILCS 5/31(a)(7.5), this CCA shall not be amended or modified prior to execution by the Parties. Any amendment or modification to this CCA by Respondent prior to execution by all Parties shall be considered a rejection of the CCA by operation of law. This CCA may only be amended subsequent to its effective date, in writing, and by mutual agreement between the Illinois EPA and Respondent's signatory to this CCA, Respondent's legal representative, or Respondent's agent.

Re: Midwest Generation, LLC. – Will County Power Station - Ash Pond Groundwater Management Zone Application

Dear Mr. Kennedy:

The Illinois Environmental Protection Agency (Illinois EPA) has reviewed the Will County Power Station - Ash Pond Groundwater Management Zone Application (GMZ) and attached proposed Environmental Land Use Control (ELUC) document, dated January 18, 2013. The Illinois EPA has approves the GMZ with the following additions.

1. The Will County Power Station non-community wells cannot be located within the ELUC area. Provide a revised ELUC to the Illinois EPA.

2. Provide the well logs and construction reports for the non-community wells.

3. Any on-site non-community wells that are no longer being used should be properly abandoned in accordance with 415 ILCS 30/9 Section 930.120 (a) (1) of the Illinois Water Well Construction Code.

Thank you for your attention to these matters. Send the revised ELUC, the non-community well drillers logs and construction reports to: Carl Kamp, Illinois EPA, Bureau of Water, PWS #13, P.O. Box 19276, Springfield, Illinois, 62794-9276. If you have any additional questions regarding this correspondence, or need any additional information concerning Illinois EPA requirements, please contact Carl Kamp or me at 217-785-4787.

Sincerely,

Re: Compliance Commitment Agreement – ELUC
Midwest Generation, LLC, Will County Station; ID No. 6283
Violation Notice W-2012-00058

Dear Ms. Rhodes:

The Compliance Commitment Agreement (CCA) for the above referenced site relative to Violation Notice W-2012-00058 was signed by Midwest Generation on October 15, 2012 and executed by Illinois Environmental Protection Agency (IEPA) signature on October 24, 2012 (effective date). Item 5 (h) of the CCA requires that Midwest Generation submit a proposed Environmental Land Use Control (ELUC) to cover the area of the proposed Groundwater Management Zone (GMZ; application provided under separate cover) with the exception of that portion of the GMZ which is owned by ComEd. The proposed ELUC is to be submitted to IEPA within 90 days of the effective date of the CCA.

Attached is a proposed ELUC for the Will County Station. Please note that the formal legal description that would be included as part of Exhibit A will be completed upon IEPA approval of the proposed ELUC.

The areal extent of the proposed ELUC is provided with the attached documentation (Exhibit B Figure B-4). Groundwater flow in the vicinity of the subject ash ponds is in a westerly direction with discharge to the adjoining Des Plaines River. The western (downgradient) extent of the proposed ELUC corresponds with this hydraulic boundary. The eastern boundary is defined by the Chicago Sanitary and Ship Canal (CSSC) which forms a hydraulic boundary on the east side of the facility. The north and south sides of the proposed ELUC are based on the flow system and location of the four ash ponds. The vertical extent of the ELUC would be the first underlying aquitard identified as the Maquoketa Shale, approximately 140 feet below ground surface. The ELUC would

Fax: 949 225 0813
ahanrahan@mwgen.com

therefore vertically include the unconsolidated overburden and the Silurian dolomite, both of which are hydraulically connected and overlie the Maquoketa Shale.

This submittal fulfills the requirements set forth under Item 5 (h) of the signed CCA. Please call me at 630-771-7863 if there are any questions.

Sincerely,
Midwest Generation, LLC

**THE ABOVE SPACE FOR RECORDER'S OFFICE**

**Environmental Land Use Control**

THIS ENVIRONMENTAL LAND USE CONTROL ("ELUC"), is made this _____ day of _____, 2013, by Midwest Generation, LLC, ("Property Owner") of that portion (as identified in Exhibit A) of the real property located at the common address of Will County Station, 529 E. 135th Street, Romeoville, Illinois 60446 ("Property").

WHEREAS, 415 ILCS 5/58.17 and 35 Ill. Adm. Code 742 provide for the use of an ELUC as an institutional control in order to impose land use limitations or requirements related to environmental contamination so that persons conducting remediation can obtain a No Further Remediation determination from the Illinois Environmental Protection Agency ("IEPA"). The reason for an ELUC is to ensure protection of human health and the environment. The limitations and requirements contained herein are necessary in order to protect against exposure to contaminated groundwater that may be present on the property as a result of past industrial activities on or in the vicinity of the property.

NOW, THEREFORE, the recitals set forth above are incorporated by reference as if fully set forth herein and the Property Owner agrees as follows:

**Section One.** Property Owner does hereby establish an ELUC on the real estate, situated in the County of Will, State of Illinois and further described in Exhibit A attached hereto and incorporated herein by reference (the "Property").

Attached as Exhibit B are site maps that show the legal boundary of the Property, any physical features to which the ELUC applies, the horizontal and vertical extent of the contaminants of concern above the applicable remediation objectives for groundwater and the nature, location of the source, and direction of movement of the contaminants of concern, as required under 35 Ill. Adm. Code 742.

**Section Two.** Property Owner represents and warrants it is the current owner of the Property and has the authority to record this ELUC on the chain of title for the Property with the Office of the Recorder or Registrar of Titles in Will County, Illinois.

**Section Three.** The Property Owner hereby agrees, for itself, and its heirs, grantees, successors, assigns, transferees and any other owner, occupant, lessee, possessor or user of the Property or the holder of any portion thereof or interest therein, that the groundwater under the Property shall not be used as a potable supply of water.

**Section Four.** This ELUC is binding on the Property Owner, its heirs, grantees, successors, assigns, transferees and any other owner, occupant, lessee, possessor or user of the Property or the holder of any portion thereof or interest therein. This ELUC shall apply in perpetuity against the Property and shall not be released until the IEPA determines there is no longer a need for this ELUC as an institutional control; or until the IEPA, upon written request, issues a new no further remediation determination approving modification or removal of the limitation(s) or requirement(s); and until a release or modification of the land use limitation or requirement is filed on the chain of title for the Property.

**Section Five.** **Future Improvement of Property**: This ELUC does not limit Property Owner's or its successors' or assigns' ability to construct on or otherwise improve the Property or to allow others to use the Property. Property Owner reserves the right to remove contaminated groundwater from the Property and to dispose of it as is appropriate under applicable laws.

**Section Six.** The effective date of this ELUC shall be the date that it is officially recorded in the chain of title for the Property to which the ELUC applies.

WITNESS the following signatures:

Subject: Quarterly Groundwater Monitoring Results – Annual Report 2011
Will County Generating Station- Ash Impoundment

Reference: Patrick Project No. 21153.033

To Whom It May Concern:

Patrick Engineering Inc. (Patrick) has prepared this letter report, on behalf of Midwest Generation, LLC, to provide the 2011 Annual Report for groundwater monitoring results associated with the on-site ash ponds at the Will County Generating Station (The Site) located at 529 East 135th Street in Romeoville, Illinois (Figure 1). The Site is located between the Chicago Sanitary and Ship Canal (CSSC) and the Des Plaines River east of the city of Romeoville. The surrounding land use consists of undeveloped land to the north, the CSSC to the east, a quarry to the south, and the Des Plaines River to the west. The Site includes four active ash ponds. This groundwater monitoring is being performed as part of the long-term monitoring plan described in the Hydrogeologic Assessment Report submitted to the Illinois Environmental Protection Agency (Illinois EPA) in February 2011.

Ten monitoring wells have been installed (MW-1 through MW-10) surrounding the ash impoundments at the Will County facility. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. The well locations are shown on Figure 2.

**GROUNDWATER ELEVATIONS**

Quarterly groundwater elevations were measured beginning in March 2011 in each of the ten wells prior to sampling. The groundwater levels were compared to levels collected by the USGS stream flow data at Station Number 05536998 located in the CSSC at the Lockport Controlling Works in Lockport, Illinois and at Station Number 05534000 located in the Des Plaines River at Romeoville Road. Fluctuations in the groundwater elevations correlated to fluctuations in the CSSC and the River, indicating the groundwater at the site has a direct hydraulic connection to the surface waters. The elevation of the Des Plaines River is normally higher than the elevation of the CSSC (Wells MW-7 through MW-10 were installed to be the upgradient wells based on this observation). The surface water elevations in the ash ponds were also measured during the

initial investigation; the water elevations in the ash ponds were 3 to 6 feet higher than the groundwater elevations in the nearby wells. Groundwater elevation data is summarized in Table 1 and shown on Figure 3.

Patrick's conceptual model of groundwater flow at the Site was that the groundwater was hydraulically connected to both the River and the CSSC with groundwater flowing from west to east. The data collected to date indicates that the groundwater is in direct hydraulic connection to the River and the CSSC; however, the groundwater elevations are all higher than either of the surface waters and the direction of groundwater is generally found to be from the northeast to southwest. A chart depicting the groundwater elevations as compared to the Des Plaines River and CSSC elevations is included as Attachment A in this report.

**SAMPLING METHODOLOGY**

In accordance with the long-term monitoring plan referenced above, water samples are collected quarterly from ten monitoring wells (MW-1 through MW-10) surrounding the ash impoundments at the Will County facility. These wells were most recently sampled on December 8, 2011.

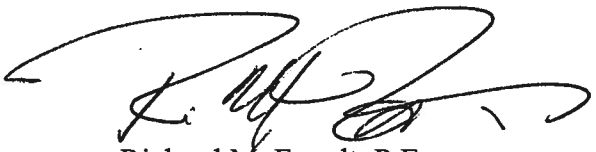
Samples were collected from each well with a peristaltic pump, using established low-flow sampling techniques. Temperature, turbidity, conductivity, dissolved oxygen (DO), oxygen reduction potential (ORP), and pH measurements were taken at each of the wells using a portable meter with a flow through cell. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. Field parameter data is provided in Table 2.

After collection, all samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4° F. The samples were transported to TestAmerica Laboratories, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain sample integrity. Analytes tested included the inorganic compounds listed in 35 Illinois Administrative Code (IAC) 620.410(a), excluding both radium and the poly-aromatic hydrocarbons (PAHs) listed in 35 IAC 620.410(b). Analytical laboratory results are presented in Table 3 (both current and historical). The laboratory analytical report provided by TestAmerica Laboratories is provided as Attachment C.

**ANALYTICAL RESULTS**

Both upgradient and downgradient wells indicated Class I Groundwater Quality Standard exceedances. The following compounds exceeded their respective Class I standards: manganese, boron, sulfate, chloride, and total dissolved solids (TDS).

Patrick compared the concentrations of those compounds that exceeded the Class I standards in the upgradient and downgradient wells. Based upon the current model of groundwater flow at the Site, only MW-1 appears to be a true upgradient well (MW-2 through MW-6 are considered side-gradient and MW-7 through MW-10 are downgradient). Compared to MW-1, concentrations of boron were higher in all of the other wells; concentrations of sulfate were higher in 7 of the other wells; TDS was higher in 5 out of 9 wells; manganese was higher in 4 out the other wells; and chloride was higher in only 2 of the other wells. However, there is still



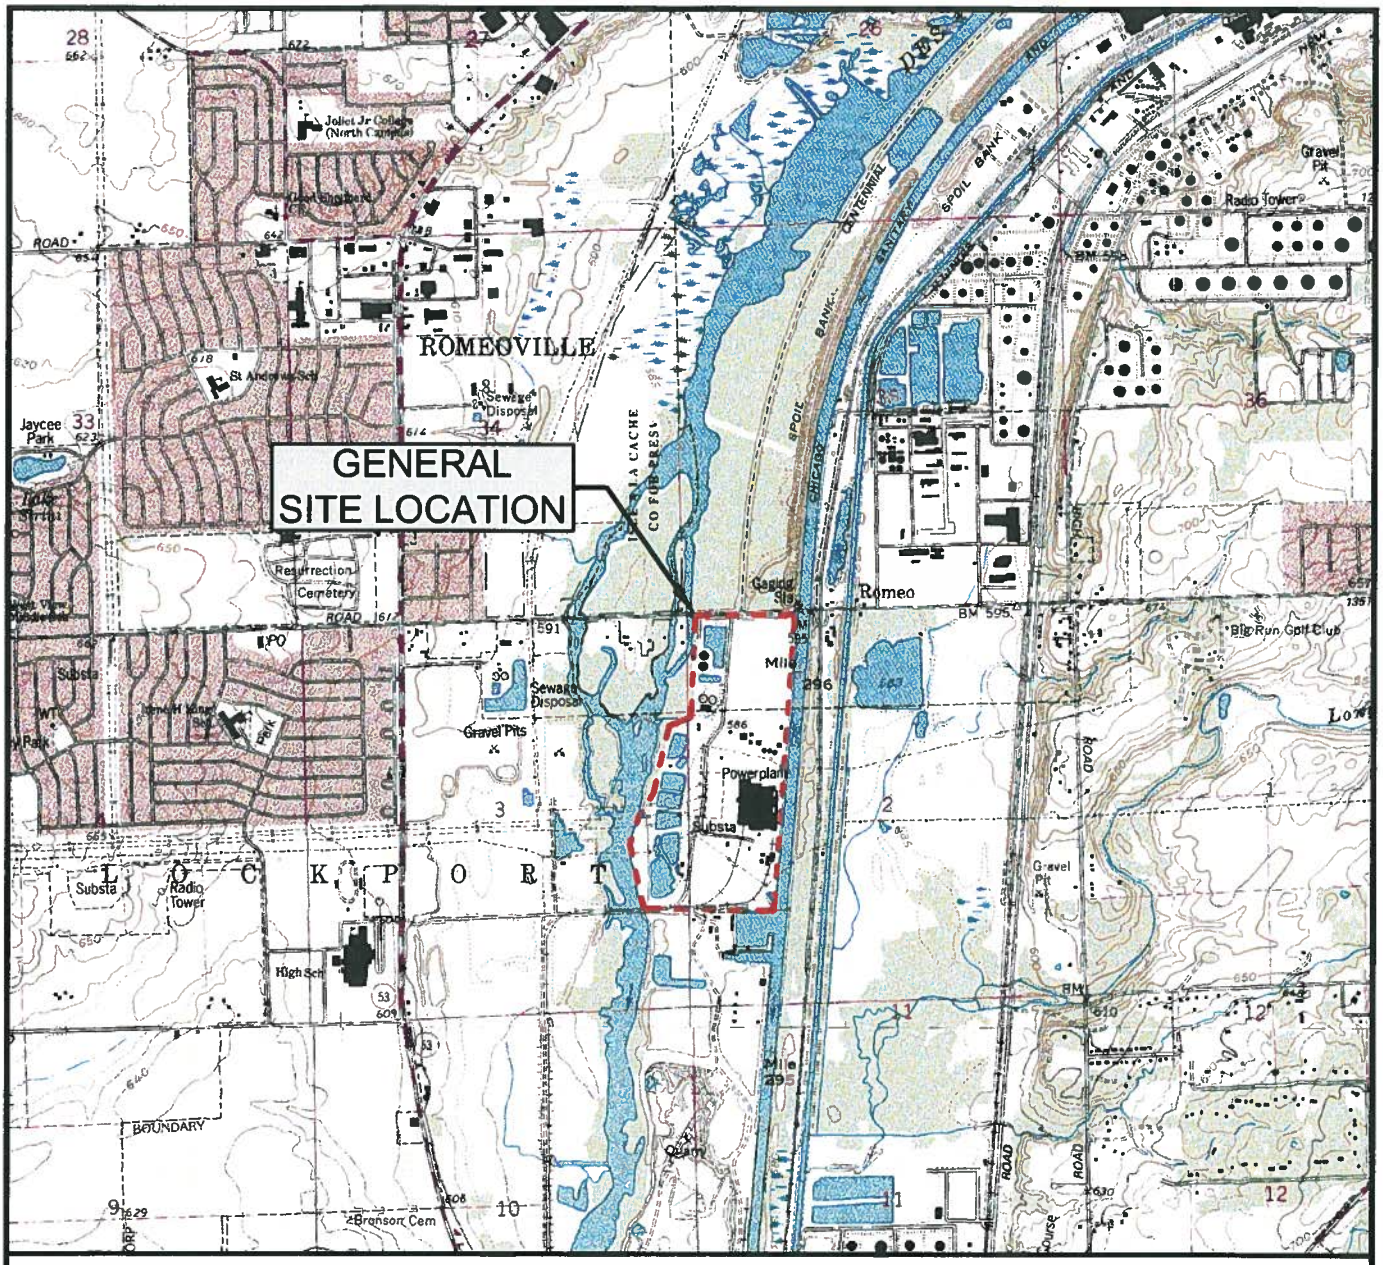
uncertainty regarding the groundwater flow paths and Patrick has not yet performed a rigorous statistical analysis of upgradient groundwater quality.

Patrick performed trend analyses on the following parameters (each of these parameters was detected during at least once during each sampling event): arsenic, barium, cobalt, iron, manganese, nickel, selenium, boron, sulfate, chloride, total dissolved solids, fluoride, nitrogen-nitrite, and nitrogen-nitrate-nitrite. There were no statistically significant (at the 95% confidence level) increasing or decreasing trends for any of the analyzed compounds. The trend analysis charts are provided in Attachment B.

If you have any questions, please contact me at 630-795-7464.

Sincerely,

**PATRICK ENGINEERING INC.**



Richard M. Frendt, P.E

### Laboratory: TestAmerica Chicago

**Narrative**

**Job Narrative**
**500-43089-1**

**Comments**
No additional comments.

**Receipt**
All samples were received in good condition within temperature requirements.

**Metals**
Method(s) 6020: The matrix spike and matrix spike duplicate (MS/MSD) recoveries for sample 500-43089-1 were outside control limits for As and Se. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 6020: The Method Blank for prep batch 135687 and the Continuing Calibration Blank (CCB) at line 24 in AD batch 136145 had internal standard recoveries slightly outside of control limits. The elemental recoveries were within less than the reporting limit and the samples were reported.

No other analytical or quality issues were noted.

**Field Service / Mobile Lab**
No analytical or quality issues were noted.

**General Chemistry**
No analytical or quality issues were noted.

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F | MS or MSD exceeds the control limits |
| ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits. |

### General Chemistry

| Qualifier | Qualifier Description |
|---|---|
| ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ☼ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CNF | Contains no Free Liquid |
| DL, RA, RE, IN | Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| EDL | Estimated Detection Limit |
| EPA | United States Environmental Protection Agency |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RL | Reporting Limit |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

Re: Annual and Quarterly Groundwater Monitoring Results – Fourth Quarter 2015
Will County Generating Station – Ash Impoundments
Compliance Commitment Agreement VN W-2012-00058; ID# 6283

Dear Ms. Rhodes:

The fourth quarterly groundwater sampling for 2015 has been completed for the ash pond monitoring wells located at the Midwest Generation, LLC (Midwest Generation) Will County Generating Station in accordance with the signed Compliance Commitment Agreement (CCA) with Illinois Environmental Protection Agency (IEPA) dated October 24, 2012. This quarterly monitoring report summarizes the results of the sampling. This report is also intended to serve as the Annual Report and includes historical data analysis/summaries.

Well Inspection and Sampling Procedures

The groundwater monitoring network around the ash ponds at the Will County facility consists of ten wells (MW-01 through MW-10) as shown on Figure 1. As part of sampling procedures, the integrity of all monitoring wells was inspected and water levels obtained using an electronic water level meter (see summary of water level discussion below). The wells were found in good condition with locked protector casings and the concrete surface seals were intact.

Groundwater samples were collected using the low-flow sampling technique. One duplicate sample from MW-01 was collected for quality assurance purposes. In addition, a deionized water trip blank was placed with the sample bottle shipment by the laboratory and accompanied the groundwater samples bottles from and back to the laboratory. The groundwater monitoring samples and the duplicate sample were analyzed for the inorganic compounds listed in Illinois Administrative Code (IAC) 620.410(a), 620.410(d) and

620.410(e), other than radium 226/228. The trip blank was analyzed for the volatile organic compounds (VOCs) listed in IAC 620.410(d).

Groundwater Flow Evaluation

Water level data from the most recent round of sampling along with historical water levels obtained from each well are summarized in Table 1. The water levels from the most recent sampling were used to generate a groundwater flow map which is provided on Figure 2. The water elevation data indicates a general westerly flow of groundwater. The flow conditions observed during this sampling are consistent with historical conditions reported for the site.

Relative to an annual evaluation of groundwater levels, a historical hydrograph is presented in Attachment 1. The hydrograph indicates generally stable groundwater elevations since the second quarter of 2013 and appear generally consistent with historical data. Well MW-06 had a slight off-trend increase in the water level recorded for the fourth quarter sampling.

Summary of Analytical Data

A copy of the analytical data package is provided in Attachment 1. The field parameter and analytical data from the most recent sampling, along with the previous eight quarters of data, are summarized in Table 2. As stated above, the duplicate sample was collected from well MW-01. The data are generally consistent with previous data generated for the Will County site with any exceptions discussed below. The duplicate values were within an acceptable range (below +/- 30%). All wells for which the sampling data reports a value above one or more groundwater standards are located within the area of the IEPA approved Groundwater Management Zone (GMZ) and Environmental Land Use Control (ELUC) areas.

At this time a statistical evaluation of background water quality for comparing against downgradient wells has not been completed. The upgradient wells MW-01 through MW-06, indicate impacts that are not associated with the ash ponds at the site, however, IEPA does not recognize the water quality data from these wells as representative of background.

Relative to an annual evaluation of the water chemistry data, time versus concentration curves are provided for each parameter analyzed in Attachment 3. The curves include the IEPA drinking water standard for reference, where appropriate.

As noted previously, all wells for which the sampling data reports a value above one or more applicable groundwater standards are located within the area of the IEPA approved GMZ and ELUC.

If there are any questions, please contact either Sharene Shealey of NRG Energy at 815-372-4625 or Richard Gnat of KPRG at 262-781-0475.

Sincerely,

Scott Perry
Station Manager

## Job ID: 500-103774-1

### Laboratory: TestAmerica Chicago

**Narrative**

**Job Narrative**
**500-103774-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 11/10/2015 10:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 3.9º C, 4.3º C, 4.4º C and 5.5º C.

**GC/MS VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Metals**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Field Service / Mobile Lab**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**General Chemistry**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

KPRG Project No. 12313.3

Re: Quarterly Groundwater Monitoring Results – Fourth Quarter 2013 and Annual
Will County Generating Station – Ash Impoundments
Compliance Commitment Agreement VN W-2012-00058; ID# 6283

Dear Ms. Rhodes:

The fourth quarterly groundwater sampling for 2013 has been completed for the ash pond monitoring wells located at the Midwest Generation, LLC (Midwest Generation) Will County Generating Station in accordance with the signed Compliance Commitment Agreement (CCA) with Illinois Environmental Protection Agency (IEPA) dated October 24, 2012. This quarterly monitoring report is being submitted by KPRG and Associates, Inc. (KPRG), on behalf of Midwest Generation, summarizing the results of the monitoring event. This report is also intended to serve as the Annual Report and includes historical data analysis/summaries.

Well Inspection and Sampling Procedures

The groundwater monitoring network around the ash ponds at this facility consists of ten wells (MW-1 through MW-10) as shown on Figure 1. As part of sampling procedures, the integrity of all monitoring wells was inspected and water levels obtained using an electronic water level meter (see summary of water level discussion below). Wells MW-1 through MW-9 were completed with stick-up protector casings. All wells were found in good condition with locked protector casings and the concrete surface seals were intact.

MWG13-15_26405

Well MW-10 was found to be damaged with the flush mount collar apparently hit by road grading work. The well itself was intact for sampling. Since the sampling, the well has been repaired and the new survey data for the top of well casing is included in Table 1.

Groundwater samples were collected using the low-flow sampling technique. One duplicate sample (well MW-09) was collected for quality assurance purposes. In addition, a deionized water trip blank was placed with the sample bottle shipment by the laboratory and accompanied the groundwater samples bottles from and back to the laboratory. The groundwater monitoring samples and the duplicate sample were analyzed for the inorganic compounds listed in Illinois Administrative Code (IAC) 620.410(a), 620.410(d) and 620.410(e), excluding radium 226/228. The trip blank was analyzed for the volatile organic compounds (VOCs) listed in IAC 620.410(d).

Groundwater Flow Evaluation

Water level data from the most recent round of sampling along with historical water levels obtained from each well are summarized in Table 1. The water levels from the most recent sampling were used to generate a groundwater flow map which is provided on Figure 2. The water elevation data indicates a general westerly flow of groundwater. The flow conditions observed during this sampling are consistent with historical conditions reported for the site.

Relative to an annual evaluation of groundwater levels, a historical hydrograph is presented in Attachment 1. The hydrograph indicates generally stable groundwater elevations since the Fall of 2011 with a drop in overall water levels by up to two feet in the 3rd and 4th quarters of 2013. Data from the nearby Lockport, Illinois gauge for Des Plaines River water levels also shows a slight drop in river water levels during this period. Ongoing liner replacement/construction work during that time can also account for some of the water level drop due to dewatering activities.

Summary of Analytical Data

A copy of the analytical data package is provided in Attachment 2. The field parameter and analytical data from the most recent sampling, along with the previous eight quarters of data, are summarized in Table 2. The duplicate sample was collected from well MW-MW-2. The data are generally consistent with previous data generated for the site. All wells for which the sampling data reports a value above one or more groundwater standards are located within the area of the approved Groundwater Management Zone (GMZ) and Environmental Land Use Control (ELUC) areas.

At this time a statistical evaluation of background water quality for comparing against downgradient wells has not been completed. The upgradient well installations (wells MW-01 through MW-06) indicate impacts that are not associated with the ash ponds at the site and therefore, IEPA does not recognize the water quality data from these wells as representative of background. Relative to an annual evaluation of the water chemistry

MWG13-15_26406

data, time versus concentration curves are provided for each parameter analyzed in Attachment 3. The curves include the Class I drinking water standard for reference, where appropriate. The following noteworthy observations are made for 2013:

- The only arsenic concentration exceedances above the Class I groundwater standard were for well MW-08 in the 3rd quarter and MW-10 in the fourth quarter. Overall arsenic concentrations appear to be stable.

- Boron concentrations at wells are overall decreasing or generally stable with the exception of boron at wells MW-01, MW-02, MW-06, MW-08, and MW-09 where there is a slight potential increasing concentration trend (wells MW-01, MW-02 and MW-06 are upgradient wells and MW-08 and MW-09 are downgradient wells). Subsequent monitoring will determine the actual nature of the trends.

- Chloride concentration curves show some scatter. Overall chloride concentrations in the wells have a seasonal/temporal variation, with the highest concentrations usually being detected during the 2nd quarter (Spring) sampling events and the lowest concentrations being recorded in the 3rd or 4th quarter sampling events. This seasonal/temporal variation may be reflective of the impact of road salt spreading which occurs during the winter months.

- Wells MW-01, MW-03, MW-04, MW-08 and MW-10 had detections of dissolved manganese above the groundwater standard in 2013. The concentrations were within general historic ranges. The trend at well MW-03 appears to be decreasing.

- Well MW-09 has consistently an overall higher pH than other wells.

- Well MW-05 indicated a spike in selenium concentration in the 4th quarter 2014 sampling. Subsequent sampling events will determine whether this increase in concentration is reproducible or whether it represents an uncharacteristic spike. All other selenium data are consistent with historical values.

- Well MW-04 has an overall sulfate concentration higher than the other wells but with a decreasing trend since the 3rd quarter 2012 sampling. Overall sulfate concentrations were stable in 2013 relative to historical data.

- Well MW-04 has an overall total dissolved solids (TDS) concentration higher than the other wells but with a decreasing trend since the 3rd quarter 2012 sampling. Overall sulfate concentrations were stable in 2013 relative to historical data.

MWG13-15_26407

As noted previously, all wells for which the sampling data reports a value above one or more applicable groundwater standards are located within the area of the approved GMZ and ELUC.

If there are any questions, please contact either Maria Race of Midwest Generation at 630-771-7862 or Richard Gnat of KPRG at 262-781-0475.

Sincerely,
KPRG and Associates, Inc.

**Laboratory: TestAmerica Chicago**

**Narrative**

**Job Narrative**
**500-65786-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 10/29/2013 3:55 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 3.9° C, 4.1° C and 4.3° C.

**GC/MS VOA**
No analytical or quality issues were noted.

**Metals**
Method(s) 6020A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for sample 500-65786-2 were outside control limits for Se and B-. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

**Field Service / Mobile Lab**
No analytical or quality issues were noted.

**General Chemistry**
Method(s) 314.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following samples: (500-65786-1 MS), (500-65786-1 MSD) in batch 29592 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

## Qualifiers

### HPLC/IC

| Qualifier | Qualifier Description |
|---|---|
| F | MS/MSD Recovery and/or RPD exceeds the control limits |

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F | MS/MSD Recovery and/or RPD exceeds the control limits |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

Re: Annual and Quarterly Groundwater Monitoring Results – Fourth Quarter 2015
Will County Generating Station – Ash Impoundments
Compliance Commitment Agreement VN W-2012-00058; ID# 6283

Dear Ms. Rhodes:

The fourth quarterly groundwater sampling for 2015 has been completed for the ash pond monitoring wells located at the Midwest Generation, LLC (Midwest Generation) Will County Generating Station in accordance with the signed Compliance Commitment Agreement (CCA) with Illinois Environmental Protection Agency (IEPA) dated October 24, 2012. This quarterly monitoring report summarizes the results of the sampling. This report is also intended to serve as the Annual Report and includes historical data analysis/summaries.

Well Inspection and Sampling Procedures

The groundwater monitoring network around the ash ponds at the Will County facility consists of ten wells (MW-01 through MW-10) as shown on Figure 1. As part of sampling procedures, the integrity of all monitoring wells was inspected and water levels obtained using an electronic water level meter (see summary of water level discussion below). The wells were found in good condition with locked protector casings and the concrete surface seals were intact.

Groundwater samples were collected using the low-flow sampling technique. One duplicate sample from MW-01 was collected for quality assurance purposes. In addition, a deionized water trip blank was placed with the sample bottle shipment by the laboratory and accompanied the groundwater samples bottles from and back to the laboratory. The groundwater monitoring samples and the duplicate sample were analyzed for the inorganic compounds listed in Illinois Administrative Code (IAC) 620.410(a), 620.410(d) and

620.410(e), other than radium 226/228. The trip blank was analyzed for the volatile organic compounds (VOCs) listed in IAC 620.410(d).

Groundwater Flow Evaluation

Water level data from the most recent round of sampling along with historical water levels obtained from each well are summarized in Table 1. The water levels from the most recent sampling were used to generate a groundwater flow map which is provided on Figure 2. The water elevation data indicates a general westerly flow of groundwater. The flow conditions observed during this sampling are consistent with historical conditions reported for the site.

Relative to an annual evaluation of groundwater levels, a historical hydrograph is presented in Attachment 1. The hydrograph indicates generally stable groundwater elevations since the second quarter of 2013 and appear generally consistent with historical data. Well MW-06 had a slight off-trend increase in the water level recorded for the fourth quarter sampling.

Summary of Analytical Data

A copy of the analytical data package is provided in Attachment 1. The field parameter and analytical data from the most recent sampling, along with the previous eight quarters of data, are summarized in Table 2. As stated above, the duplicate sample was collected from well MW-01. The data are generally consistent with previous data generated for the Will County site with any exceptions discussed below. The duplicate values were within an acceptable range (below +/- 30%). All wells for which the sampling data reports a value above one or more groundwater standards are located within the area of the IEPA approved Groundwater Management Zone (GMZ) and Environmental Land Use Control (ELUC) areas.

At this time a statistical evaluation of background water quality for comparing against downgradient wells has not been completed. The upgradient wells MW-01 through MW-06, indicate impacts that are not associated with the ash ponds at the site, however, IEPA does not recognize the water quality data from these wells as representative of background.

Relative to an annual evaluation of the water chemistry data, time versus concentration curves are provided for each parameter analyzed in Attachment 3. The curves include the IEPA drinking water standard for reference, where appropriate.

As noted previously, all wells for which the sampling data reports a value above one or more applicable groundwater standards are located within the area of the IEPA approved GMZ and ELUC.

If there are any questions, please contact either Sharene Shealey of NRG Energy at 815-372-4625 or Richard Gnat of KPRG at 262-781-0475.

Sincerely,

Scott Perry
Station Manager

Notes: Standards obtained from IAC, Title 35, Chapter I, Part 620, Subpart D, Section 620.410 - Groundwater Quality Standards for Class I: Potable Resource Groundwater
All values are in mg/L (ppm) unless otherwise noted.

DL - Detection limit
NA - Not Applicable
ND - Not Detected
NM - Not Measured

NR - Not Required
NS - Not Sampled
^ - Denotes instrument related QC exceeds the control limits
F1- MS and/or MSD Recovery outside of limits.

| | | |
|---|---|---|
| Temperature | °C | degrees Celcius |
| Conductivity | ms/cm$^c$ | millisiemens/centimeters |
| Dissolved Oxygen | mg/L | milligrams/liter |
| Oxygen Reduction Potential (ORP) | mV | millivolts |

Notes: Standards obtained from IAC, Title 35, Chapter I, Part 620, Subpart D, Section 620.410 - Groundwater Quality Standards for Class I: Potable Resource Groundwater
All values are in mg/L (ppm) unless otherwise noted.

DL - Detection limit
NA - Not Applicable
ND - Not Detected
NM - Not Measured

NR - Not Required
NS - Not Sampled
^ - Denotes instrument related QC exceeds the control limits
F1- MS and/or MSD Recovery outside of limits.

## Job ID: 500-103774-1

### Laboratory: TestAmerica Chicago

**Narrative**

**Job Narrative**
**500-103774-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 11/10/2015 10:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 3.9º C, 4.3º C, 4.4º C and 5.5º C.

**GC/MS VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Metals**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Field Service / Mobile Lab**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**General Chemistry**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

## Richmond, Maria

**From:** Maddox, Rebecca
**Sent:** Wednesday, September 01, 2010 4:52 PM
**To:** Yvonne Dedrickson
**Cc:** mrace@mwgen.com; THiebert@mostardiplattenv.com
**Subject:** Re: ICR - Will County pond information

**Categories:** Folder: Rebecca Maddox ARCHIVED\~SENT

Yvonne:

Information I have on the ponds based on drawings and write-ups:

**Water Capacities:**
Standby Pond - 1.9 million gallons
1N and 1S - 3.88 million gallons
2S and 3S - 3.55 million gallons (3S may have changed after the liner install but our thought was we did not lose any capacity)
My conversion into cubic feet is not what you have in your spreadsheet

**Dredging**
Only 2S and 3S have been dredged. 1N and 1S have NEVER been dredged. Standby pond and spent slurry ponds never dredged.

This capacities are based on the circa 1979 operations manual/engineering descriptions by Harza - the engineering company that designed the system

**Standby Pond**
The standby pond has not been dredged outside of removing rock on the outer portion of the pond. This is not what you have in your spreadsheet I would not consider that dredging. It was a cleanup initiated since the rocks were oil stained.

I did find a drawing that showed the standby pond to be lined with poz-o-pac. 12" (30.48 cm).
Standby pond bottom elev = 586.0
Max water level = 593.0
Solids placed in pond - the only solids that are in this standby pond are the small fines that did not fall out in the clarifier. I would have no idea on the amt. IT would be very small as far as the current state.

**3S**
The liner numbering guidance states from inner (#1) to outer. I would think the outer liner is the one closest to the surface - which would be the HDPE. That should be #2. The inner liner is the one closest to the inside of the pond - the remaining 12" of poz-o-pac. I think you have this reversed. I believe you provided me guidance on how the numbering scheme for 3S but can you revisit this again.

**Dredging for 3S and 2S**
There is no information readily available on when the dredging of 2S or 3S occurred (or concurrently when 2S or 3S was in service.) I've reviewed our operations log going back to 2005 and cannot find anything helpful. 2009 we dredged both ponds in anticipation of the liner project. As a conservative estimate, I am going with 3 weeks of dredging (i.e. 15 days) for each. Corporate fuels provided me with a spreadsheet for the amount of bottom ash they received in the yr. However, it is not broken out by pond. So I am equally splitting it up between 2S and 3S for 2009.

For the 5-yr look back, I am estimating that 20 days of dredging occurred each yr for both 2S and 3S and then dividing the total amount of bottom ash from the corp fuels spreadsheet equally between the 2. There really isn't any better way to estimate.

Estimate that each pond was dredged 1 time/yr for 20 days of dredging.

I do not have any permeability information on poz-o-pac so I will agree with what you have.

Re: Midwest Generation, LLC. – Will County Power Station Ash Pond Groundwater Management Zone Application Modification

Dear Mr. Kennedy:

This letter is in response to the transmittal letter dated September 4, 2013, which was sent by Richard Gnat, P.G. of KPRG and Associates, Inc. on behalf of Midwest Generation. The document contained requested onsite potable well information, and modifications to the Proposed ELUC Boundary Map, which is part of the Will County Power Station Ash Pond Groundwater Management Zone Application (GMZ). The Illinois Environmental Protection Agency has reviewed information and approves the modifications to the GMZ.

Thank you for your attention to these matters. If you have any questions concerning this letter, please contact me or Carl Kamp at 217-785-4787.

Sincerely,

William E. Buscher, P.G.

KPRG Project No. 11205

Re: CCB Determination Support, Joliet, Illinois

Dear Ms. Race:

KPRG and Associates, Inc. (KPRG) is pleased to provide this summary letter report to Midwest Generation, EME, LLC (Midwest Generation) for the coal combustion by-product sampling performed at the Joliet Stations #29 This letter report provides a brief summary of the project history and previous work performed, a statement of the project objective, documents the additional work performed by KPRG, and summarizes the new analytical data along with statistical analysis and interpretation of the data. Each item is discussed separately below.

PROJECT HISTORY AND PREVIOUS WORK

Midwest Generation Joliet Stations #29 include areas where ash and slag resulting from the combustion of coal were formerly placed on the ground surface. The ash placement area at Station #29 is approximately 13.2 acres in size. Midwest Generation is interested in classifying the material as coal combustion by-product (CCB) as opposed to a coal combustion waste (CCW) to facilitate the potential beneficial reuse of the material in the construction of a wind break along the existing coal storage piles. In 2004, Midwest Generation contracted Andrews Environmental Engineering, Inc.(AEE) to perform an initial site assessment of the two areas to determine whether the CCB classification is feasible based on a preliminary composite sampling of the areas. A total of 20 borings within the Station #29 area. Approximate locations of the initial borings are provided on Figures 1 . AEE determined that the deposited materials were generally homogenous consisting of interlayered fly ash and bottom ash/slag from the coal combustion process. Some minor

MWG13-15_19486

amounts of debris (i.e., wood, concrete, wire, etc.) were noted at the surface at some locations

A total of 20 samples were collected from 20 borings across the 13.2 acre area at Station #29. These 20 samples were also composited into one representative sample and analyzed for NLET metals. In addition, each composite sample was analyzed for Code R disposal parameters. The borings were also field screened for total organic vapors using a photoionization detector (PID). The sample from each area showing the highest PID measurement was analyzed for Toxicity Characteristic Leaching Procedure (TCLP) metals, semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), ignitability, reactive cyanide and reactive sulfide.

The borings indicated that the depth of ash ranged from 2.5 to 18 feet in thickness within the two areas. A comparison of the analytical results indicated none of the leachable metals analyzed using the NLET exceeded the guidelines for CCB classification set forth in 415 ILCS 5/3.94 (Public Act 89-93). The disposal parameter analyses indicated that the material would be classified as non-hazardous for off-site disposal purposes. The SVOC analyses detected a full suite of polynuclear aromatic hydrocarbons as would be expected considering the source of the ash (i.e., coal combustion). The only VOCs detected were tetrachloroethene (72 ug/kg) from the Station #29 sample. These concentrations are below the Illinois Environmental Protection Agency (IEPA) Tiered Approach to Corrective Action Objectives (TACO) Tier 1 direct contact/ingestion criteria (either industrial/commercial or residential). The tetrachloroethene detections, however, are slightly above the Soil Component of the Groundwater Ingestion Exposure Route (SCGIER) for a Class I groundwater but below the SCGIER for a Class II groundwater. Based on discussions with Midwest Generation personnel, the tetrachloroethene detections are somewhat suspect since it was noted by Midwest Generation technical personnel in the field that the contractor allowed the use of degreasing compounds on some of the downhole equipment and the fact that Midwest Generation has not historically used chlorinated hydrocarbon solvents/degreasers at their facilities.

## PROJECT OBJECTIVE

The project objective was to develop an expanded data set to further evaluate the potential for classifying this material as CCB for beneficial reuse relative to the regulatory criteria set forth in 415 ILSC 5/3.135 (formerly 415 ILSC 5/3.94) a-5(B) which states that: "CCB shall not exceed Class I Groundwater Standards for metals when tested utilizing test method ASTM D3987-85. The sample or samples tested shall be representative of the CCB being considered for use."

MWG13-15_19487

In addition, a VOC grab sample was to be collected from the area of highest PID readings noted during the previous site work to evaluate the potential presence of the above noted low level VOCs. Any other area with elevated PID readings during this additional work was also to be sampled for VOCs.

DOCUMENTATION OF FIELD ACTIVITIES

On June 13, 2005 KPRG marked all proposed drilling locations relative to the benchmark established during previous site assessment work. The locations were approved for drilling by Midwest Generation. A total of 15 locations (GP-1 through GP-15) were established over the 13.2 acre study area at Station #29 . Approximate geoprobe drilling locations are shown on Figures 1 & . It is noted that during the drilling of geoprobe borings at Station #29, locations GP-12, GP-14 and GP-15 were noted to primarily consist of coal/coal residue as opposed to ash/slag. Therefore, to facilitate obtaining more representative ash/slag samples, these locations were moved from the original sites to locations GP-12A, GP-14A and GP-15A as shown on Figure 1.

On June 14, 2005, KPRG mobilized technical personnel and a geoprobe contractor to the site. Geoprobe borings were advanced at each marked location through the ash/slag deposits to the top of bedrock (dolomite). Continuous sample cores were obtained and visually logged and screened in the field for total organic vapors using a PID. It is noted that no PID readings were measured in any of the borings. Copies of all boring logs and PID field screening measurements are provided in Attachment 1.

One composite sample was collected from each boring from the entire vertical profile. The sample was collected by taking the entire top half of each soil core and placing it into a plastic bag for mixing. Once thoroughly mixed/composited, an appropriate sample aliquot was placed into a laboratory prepared container for analysis of NLET metals and stored on ice for delivery to the laboratory.

One grab sample was also collected for VOC analysis from geoprobe location GP-9 which was in the vicinity of the highest PID readings noted during the previous site assessment (during the time which Midwest Generation noted that the drillers were using a degreaser on their downhole equipment). No other VOC samples were collected since, as noted above, KPRG did not observe any measured PID readings during drilling activities.

Once drilling was completed at a particular location, the boring was backfilled with any remaining sample core along with granular bentonite to the ground surface.

The samples were delivered to Severn Trent Laboratories (STL) in University Park, Illinois under a properly completed chain-of-custody for chemical analysis.

MWG13-15_19488

## DATA PRESENTATION AND STATISTICAL ANALYSIS

A total of 17 composite samples were analyzed for NLET metals and one sample was analyzed for VOCs. The results for each are discussed separately below.

### NLET Metals Analyses

The NLET metals analyses are summarized in Table 1 along with the Class I groundwater standards for comparison. The "non-detects" reported on the lab sheets in Attachment 2 are recorded as "less than the method detection limit" in Table 1. A review of the data set indicates that two of the metals (copper and lead) from location GP-14A were detected at concentrations at least two times higher than the Class I drinking water standard for each of these metals. Due to these detections and the probability of these points acting as outliers in subsequent statistical evaluations, a conservative decision was made by Midwest Generation to eliminate this sample from the subsequent statistical analysis with the understanding that the materials from the vicinity of this boring as noted on Figure 1 will not be included in any potential beneficial reuse as CCB.

Statistical analysis was subsequently performed on the remaining population of 16 samples. A review of the data indicates that there were no detections of arsenic, beryllium, cadmium, cobalt, iron, mercury and nickel in the leachate from any of the samples analyzed. The method detection limits (MDLs) for these compounds were all substantially below the Class I groundwater standards. Therefore, for these compounds, it can be confidently said that there are no exceedances associated with the tested materials. Relative to the remaining compounds, the data set was first evaluated for normality by the calculation of the arithmetic mean, standard deviation and the coefficient of variance (CV). For the purposes of this evaluation, all "non-detect" values were assigned a value of one-half the MDL. The formulas used for the statistical calculations are provided in Attachment 3 and the initial results are tabulated in Table 2. In general, if CV is less than or equal to 1, then the data set is considered "normal" and as a rule of thumb if the CV is between 1 and 1.2, then the arithmetic mean and standard deviation is still an adequate estimator for the data set (Gilbert, 1987; Koch and Link, 1980). Any values of CV above 1.2 indicate that the data set is not normal and an alternate statistical evaluation must be considered to estimate the mean and standard deviation.

A review of the initial statistical evaluations in Table 2 indicates that the data set for all metals except copper and zinc are normal or close to normal distribution and that the arithmetic mean is a good estimator of the true mean of the concentration of these compounds in the leachate. Copper and zinc are addressed in further detail below after completion of the calculation discussions for the other normally distributed parameters.

MWG13-15_19489

Subsequent calculation of the standard error and the 95% Upper Confidence Limit (UCL; assuming a one-tailed distribution since we are only concerned about a regulatory exceedance) was performed for each parameter (see Attachment 3 for formula used). The 95% UCL provides the 95% probability that the true mean of the data set is less than the calculated value. The results are included in Table 2. A review of the table indicates that none of the calculated means and 95% UCLs are above the Class I groundwater standards for those compounds.

The next step in the statistical evaluation process was to determine whether the sample size was sufficient to support the above statistics. This was accomplished by calculating a Lambda ($\lambda$) value which is a function of the regulatory threshold concentration (in this case the Class I groundwater standard for each parameter), the mean and the standard deviation (see equation in Attachment 3). The $\lambda$ value is then entered into the statistical table included in Attachment 3 to estimate the sample size that would be required to assure a valid statistical representation. To obtain the appropriate sample size from the table of $\lambda$ values, the single-sided value with the $\alpha$ and $\beta$ errors set at 0.05 was used. The $\alpha$ error is the probability of rejecting a true hypothesis (in this case this probability was set at 5%); the hypothesis being that the true mean is less than the regulatory threshold. The $\beta$ error is the probability of accepting a false hypothesis. The number of samples obtained from the $\lambda$ table required for a valid data set for each of the parameters being evaluated is included in Table 2. A review of the results indicate that the existing data set of 16 values is sufficient to adequately characterize the materials sampled.

Copper and Zinc

As noted above, the initial statistical evaluations for copper and zinc indicate that the noted concentrations do not fit a normal distribution. The data for these compounds were then evaluated to determine whether they may be log-normally distributed. To facilitate this analysis, the natural logarithm of each value is taken and the lognormal mean and standard deviation (also referred to as the geometric mean and standard deviation) are calculated using the equations provided in Attachment 3. The CV is then calculated from these two values and if it is below 1 then the distribution is believed to be lognormal (i.e., the underlying distribution of the logarithms is normal) and the geometric mean and standard deviation can be used as estimators of the true mean and standard deviation. These calculated values are summarized in Table 3. A review of the table indicates that the zinc data set is log-normally distributed and, therefore, the geometric mean and standard deviation can be used to calculate the standard error, 95% UCL and $\lambda$ values using the same methods as discussed above. These values are included in Table 3. A review of these values indicates that the estimated mean and 95% UCL for the zinc data set is below the Class I groundwater standard and that the sample size is sufficient to support the statistical analysis.

MWG13-15_19490

The calculated CV for copper, however, was indicative that the underlying distribution of the logarithms of the concentrations was not normal and, therefore, the data set can not be considered lognormal. This situation in environmental data sets is generally indicative of an outlier value, either high or low, which is skewing the overall data set. A review of the copper data set indicates that the outlier is associated with the 0.43 mg/l concentration from sample location GP-12A. This value would act to skew the data set in a manner that the calculated mean would be greater than the true mean of the data set. Considering that the calculated arithmetic mean and the calculated geometric mean of this data set were both below the regulatory threshold, it can be confidently assumed that the true mean of the data set is also below the regulatory threshold. Regardless of this observation, KPRG performed an additional statistical analysis on the copper data set to address the outlier issue. Three simple but robust methods to address outliers in censored data sets (i.e., data sets with numerous non-detect values) are the median, trimmed mean and Winsorized mean (Gilbert, 1987). Calculation of the median for the copper data set was deemed inappropriate because the asymmetric distribution would skew the median to the left and potentially underestimate the true mean of the data set. The trimmed mean calculation would include omitting the outlier completely (but also omitting the lowest value in the data set), however, completely eliminating a data point could be viewed negatively by a regulatory reviewer. Therefore, calculation of a Winsorized mean was selected as the method for addressing the outlier. The subject copper data set was Winsorized by replacing the suspect outlier concentration of 0.43 mg/l with the next lowest value in the data set which is 0.048 mg/l. In addition, one of the non-detect values was replaced by the next lowest detected concentration in the data set which is 0.015 mg/l. The Winsorized data set was then used to calculate a Winsorized mean and standard deviation in accordance with the equations provided in Attachment 3. These values were then used in the previously discussed statistical evaluations. The results of the evaluations determined that the Winsorized data set is lognormal with an estimated mean of ~~0.053~~ 0.0133 mg/l, a standard deviation of ~~0.051~~ 0.0134 mg/l, a coefficient of variance of ~~0.975~~ 0.0003 and a 95% UCL of ~~0.075~~ 0.0206 mg/l. The calculated λ value is ~~1.618~~ 2,324 indicating that the existing data set of 16 values is sufficient to adequately characterize the materials sampled.

Volatile Organic Compound Data

As noted above, there were no PID detections measured in any of the soil cores. KPRG did collect one grab sample from geoprobe location GP-9 which was located in the vicinity of the highest PID measurements recorded during the site assessment work performed by AEE (while the drillers were using a degreasing compound on down-hole equipment). The grab sample was collected from a moist black slag interval at a depth of 16 to 17 feet below ground surface (bgs). The analytical results are provided in Attachment 2. A review of the data indicates that only a trace of acetone was detected at a concentration of 9.4 ug/kg. No other VOCs were detected in the sample. Acetone is a common laboratory introduced

MWG13-15_19491

contaminant (U.S. EPA Data Validation Guidelines) and the result was flagged by the laboratory that the batch quality control sample exceeded the method control limits for acetone. Based on these observations and the fact that Midwest Generation does not, and has not used acetone, the noted trace detection is believed to be a laboratory artifact and not representative to actual site conditions.

## CONCLUSIONS

Based on the data and statistical analysis discussed above, the following conclusions are provided:

- The ash deposits are consistent and homogenous consisting of interlayered fly ash and bottom ash/slag from the coal combustion process.
- The NLET metals data from sample location GP-14A displayed elevated levels of lead and copper at concentrations at least two times higher than the Class I groundwater standard. The ash from this portion of the site should not be considered for potential beneficial reuse (see Figure 2).
- The NLET metals data from the remaining 16 sample locations indicate with a high degree of statistical certainty that the criteria established in 415 ILSC 5/3.135 (formerly 415 ILSC 5/3.94) a-5(B) are met and that the material may be considered CCB relative to this criterion.
- The data set is sufficiently large to support the statistical evaluations based on the variance and specific regulatory threshold relationships.
- There is no indication that the materials are impacted with VOCs and the previously detected VOCs may in fact be associated with the contractor's use of a degreaser during drilling and sampling operations.

KPRG appreciates the opportunity for providing our technical services to Midwest generation on this project. If there are any questions, please contact me at 262-781-0475.

Sincerely,
KPRG and Associates, Inc.

Richard R. Gnat, P.G.
Principal

This Report Contains (56) Pages

Severn Trent Laboratories - Chicago
METALS CASE NARRATIVE

Client: KPRG & Associates, Inc. Date Recd: 06/09/05
Project: Joliet Station
STL Job#: 237342

1. This narrative covers the Metals analysis of samples in the above Job# 237342.

   Method Refs: USEPA SW-846

2. All analyses were performed within the required holding times.

3. All Initial and Continuing Calibration Verification (ICV/CCV's) were within control limits.

4. All Initial and Continuing Calibration Blanks (ICB/CCB's) were within control limits.

5. All Preparation/Method Blanks were below Reporting Limits except for the Neutral Leach Extraction Blank #3 in Prep Batch 152037 for Fe (0.10 mg/L). Please note: The Fe concentration in all of the samples was less than the reporting limit, therefore reanalysis was not required.

6. All ICP Interference Check Samples (ICSA and ICSAB) were within control limits.

7. Laboratory Control Sample (LCS) recoveries were within the 80-120% control limits.

8. Matrix QC analysis was performed on Sample 1.

   All Serial dilution analysis were within control limits except for B.

   All Matrix spike recoveries were within the 75-125% control limits. Please note: Control limits are not applicable when the sample concentration exceeds the spike added concentration by a factor of 4 or more).

   All Duplicate results were within the 20% RPD control limits for sample concentrations greater than 5X the Reporting limit or +\- the Reporting limit for sample concentration less than 5X the Reporting Limit.

Jodi L. Gromala
Metals Section Manager

6-22-05
Date

**Severn Trent Laboratories Chicago**
**GC/MS Case Narrative**

KPRG & Associates, Inc.
Joliet Station
Job Number: 237342
VOA DATA:

1. All sample analyses were performed within the required hold time from the date of collection.

2. Methylene Chloride and Acetone were detected above the reporting limit in Method Blank 152019. Associated samples have been flagged. The remaining compounds in the Method Blanks were below reporting limits.

3. The LCS/LCD (Laboratory Control Samples) had the five-controlled spike recoveries within the in-house generated QC limits.

4. Matrix Spike/Matrix Spike Duplicate analyses were not performed on this sample set.

5. All volatile samples had surrogate recoveries within the in-house generated QC limits.

6. The soil sample was prepared using the low-level Method 5035. The water sample was prepared using Method 5030 (10mL purge). All of the samples were analyzed following SW846 Method 8260B and 8000B. All calibration criteria were met per method or SOP (for minimum R values for certain compounds). The low point in the initial calibration verifies the base reporting limits. The target compounds were quantitated using the initial calibration.

7. Sample 17 had one low internal standard area. The sample was reanalyzed with similar results. The original analysis has been reported. All other volatile samples had internal standard areas and retention times within the SOP acceptance limits as compared to the corresponding calibration verification standard.

8. The soil sample was analyzed using the low level soil method. The soil results and reporting limits were adjusted to account for the sample weight, the analytical procedure, and reported on a dry weight basis. The water sample was analyzed using a 10mL purge volume.

REPORT COMMENTS

1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 100201
5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviations (any number of which may appear in the report)

Inorganic Qualifiers (Q-Column)

| | |
|---|---|
| U | Analyte was not detected at or above the stated limit. |
| < | Not detected at or above the reporting limit. |
| J | Result is less than the RL, but greater than or equal to the method detection limit. |
| B | Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL. |
| S | Result was determined by the Method of Standard Additions. |
| F | AFCEE: Result is less than the RL, but greater than or equal to the method detection limit. |

Inorganic Flags (Flag Column)

| | |
|---|---|
| ^ | ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits. |
| * | LCS, LCD, MD: Batch QC exceeds the upper or lower control limits. |
| + | MSA correlation coefficient is less than 0.995. |
| 4 | MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable. |
| E | SD: Serial dilution exceeds the control limits. |
| H | MB, EB1, EB2, EB3: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit. |
| N | MS, MSD: Spike recovery exceeds the upper or lower control limits. |
| W | AS(GFAA) Post-digestion spike was outside 85-115% control limits. |

Organic Qualifiers (Q - Column)

| | |
|---|---|
| U | Analyte was not detected at or above the stated limit. |
| ND | Compound not detected. |
| J | Result is an estimated value below the reporting limit or a tentatively identified compound (TIC). |
| Q | Result was qualitatively confirmed, but not quantified. |
| C | Pesticide identification was confirmed by GC/MS. |
| Y | The chromatographic response resembles a typical fuel pattern. |
| Z | The chromatographic response does not resemble a typical fuel pattern. |
| E | Result exceeded calibration range, secondary dilution required. |
| F | AFCEE:Result is an estimated value below the reporting limit or a tentatively identified compound (TIC) |

Organic Flags (Flags Column)

| | |
|---|---|
| B | MB: Batch QC is greater than reporting limit. |
| * | LCS, LCD, ELC, ELD, CV, MS, MSD, Surrogate: Batch QC exceeds the upper or lower control limits. |
| ^ | EB1, EB2, EB3, MLE: Batch QC is greater than reporting Limit |
| A | Concentration exceeds the instrument calibration range |
| a | Concentration is below the method Reporting Limit (RL) |
| B | Compound was found in the blank and sample. |
| D | Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D. |
| H | Alternate peak selection upon analytical review |
| I | Indicates the presence of an interfence, recovery is not calculated. |
| M | Manually integrated compound. |
| P | The lower of the two values is reported when the % difference between the results of two GC columns is |

MWG13-15_19566

greater than 25%.

Abbreviations

| | |
|---|---|
| AS | Post Digestion Spike (GFAA Samples - See Note 1 below) |
| Batch | Designation given to identify a specific extraction, digestion, preparation set, or analysis set |
| CAP | Capillary Column CCB Continuing Calibration Blank |
| CCV | Continuing Calibration Verification |
| CF | Confirmation analysis of original |
| C1 | Confirmation analysis of A1 or D1 |
| C2 | Confirmation analysis of A2 or D2 |
| C3 | Confirmation analysis of A3 or D3 |
| CRA | Low Level Standard Check - GFAA; Mercury |
| CRI | Low Level Standard Check - ICP |
| CV | Calilbration Verification Standard |
| Dil Fac | Dilution Factor - Secondary dilution analysis |
| D1 | Dilution 1 |
| D2 | Dilution 2 |
| D3 | Dilution 3 |
| DLFac | Detection Limit Factor |
| DSH | Distilled Standard - High Level |
| DSL | Distilled Standard - Low Level |
| DSM | Distilled Standard - Medium Level |
| EB1 | Extraction Blank 1 |
| EB2 | Extraction Blank 2 |
| EB3 | DI Blank |
| ELC | Method Extracted LCS |
| ELD | Method Extracted LCD |
| ICAL | Initial calibration |
| ICB | Initial Calibration Blank |
| ICV | Initial Calibration Verification |
| IDL | Instrument Detection Limit |
| ISA | Interference Check Sample A - ICAP |
| ISB | Interference Check Sample B - ICAP |
| Job No. | The first six digits of the sample ID which refers to a specific client, project and sample group |
| | Lab ID An 8 number unique laboratory identification |
| LCD | Laboratory Control Standard Duplicate |
| LCS | Laboratory Control Standard with reagent grade water or a matrix free from the analyte of interest |
| MB | Method Blank or (PB) Preparation Blank |
| MD | Method Duplicate |
| MDL | Method Detection Limit |
| MLE | Medium Level Extraction Blank |
| MRL | Method Reporting Limit Standard |
| MSA | Method of Standard Additions |
| MS | Matrix Spike |
| MSD | Matrix Spike Duplicate |
| ND | Not Detected |
| PREPF | Preparation factor used by the Laboratory's Information Management System (LIMS) |
| PDS | Post Digestion Spike (ICAP) |
| RA | Re-analysis of original |
| A1 | Re-analysis of D1 |
| A2 | Re-analysis of D2 |
| A3 | Re-analysis of D3 |
| RD | Re-extraction of dilution |
| RE | Re-extraction of original |
| RC | Re-extraction Confirmation |
| RL | Reporting Limit |
| RPD | Relative Percent Difference of duplicate (unrounded) analyses |
| RRF | Relative Response Factor |
| RT | Retention Time |

MWG13-15_19567

| | |
|---|---|
| RTW | Retention Time Window Sample ID A 9 digit number unique for each sample, the first six digits are referred as the job number |
| SCB | Seeded Control Blank |
| SD | Serial Dilution (Calculated when sample concentration exceeds 50 times the MDL) |
| UCB | Unseeded Control Blank |
| SSV | Second Source Verification Standard |
| SLCS | Solid Laboratory Control Standard(LCS) |
| PHC | pH Calibration Check LCSP pH Laboratory Control Sample |
| LCDP | pH Laboratory Control Sample Duplicate |
| MDPH | pH Sample Duplicate |
| MDFP | Flashpoint Sample Duplicate |
| LCFP | Flashpoint LCS |
| G1 | Gelex Check Standard Range 0-1 |
| G2 | Gelex Check Standard Range 1-10 |
| G3 | Gelex Check Standard Range 10-100 |
| G4 | Gelex Check Standard Range 100-1000 |

Note 1: The Post Spike Designation on Batch QC for GFAA is designated with an "S" added to the current abbreviation used. EX. LCS S=LCS Post Spike (GFAA); MSS=MS Post Spike (GFAA)
Note 2: The MD calculates an absolute difference (A) when the sample concentration is less than 5 times the reporting limit. The control limit is represented as +/- the RL.

> DID NOT RECEIVE SAMPLES GP-16,GP-17 .

Per Rich Gnat and Patrick Allenstein, these two samples were not collected at this time.

Please include this SDR with the final report.

# ATTACHMENT 3
## Statistical Formulas and Tables

## STATISTICAL EQUATIONS USED

1) Mean ($\mu$) = 1/n ( $\sum\mu_i$), where n is the number of samples

2) Variance ($s^2$) = 1/(n-1) ( $\sum(\mu_i - \mu)^2$

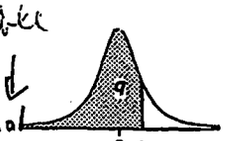
3) Standard Deviation (s) = $\sqrt{}$Variance

4) Coefficient of Variance (CV) = s/$\mu$

5) Standard Error ($s_\mu$) = s/$\sqrt{n}$

6) 95% Upper Confidence Limit ($UCL_{95}$) = $\mu$ + ($t_{0.95(n-1)}$)( $s_\mu$), where $t_{0.95(n-1)}$ is obtained from the one-tailed Student's *t* Distribution table

7) $\lambda$ = (RT - $\mu$)/s, where RT is the regulatory threshold concentration



8) Mean of the Lognormal Distribution ($\mu_{Ln}$) = exp[$y_i$+($s^2_y$/2)], where $y_i$ is the mean of the natural logs of $\mu_i$ and $s^2_y$ is the variance of the natural logs of $\mu_i$

9) Standard Deviation of the Lognormal Distribution ($s_{Ln}$) = $\sqrt{\{(\mu_{Ln})^2[\exp(s^2_y)-1]\}}$

10) Winsorized Standard Deviation ($s_w$) = [s(n-1)/(v-1)], where s is the standard deviation of the Winsorized data set and v is the number of data not adjusted during Winzorization.

# 3·1 the Student $t$ distribution

one-tailed table

## EXECUTIVE SUMMARY

This report presents the results of the Phase II Environmental Site Assessment (Phase II ESA) conducted by ENSR Corporation (ENSR) in October 1998 at the Commonwealth Edison Company (ComEd) Joliet #29 Generating Station, located at 1800 Channahon Road in Joliet, Illinois. Phase II ESA activities consisted of advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I Environmental Site Assessment (Phase I ESA).

Based on the results of the Phase I ESA, 15 potential areas of concern were identified for further investigation. These areas of concern are identified in **Section 2.0**. Each of these areas of concern were investigated during the Phase II ESA activities. Seventeen soil borings were advanced and 5 monitoring wells were installed. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. In addition, 23 surface soil samples and 6 sediment samples were collected at the facility.

These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260; polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310; polychlorinated biphenyls (PCBs) using EPA Method 8081; Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000; and pH using EPA Method 9045.

In addition, the surface soil samples and sediment samples were also submitted for analysis of total petroleum hydrocarbons (TPH) using EPA Method 8015. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

PNA constituents were detected above the Illinois Environmental Protection Agency (IEPA) cleanup objectives primarily in the surface soil samples collected at the facility. These surface soil samples were collected directly from a "stained" location in the identified potential areas of concern. Therefore, it was determined that the impact from these PNA constituents is relatively localized. However, benzo(a)pyrene and benzo(b)fluoranthene were detected in soil samples collected from borings at approximately 2 feet below grade.

Toluene, ethyl benzene, and total xylenes were detected above the IEPA cleanup objectives of in only one surface soil sample (S-2). This sample was collected from the storage area located to the east of the Roof and Yard Runoff Basin. In addition, sample S-2 had an elevated detection limit for benzene, and consequently, there is a possibility that the concentration is actually above the cleanup objective.

Arsenic was detected above the IEPA cleanup objective of 3 mg/kg in samples collected throughout the facility. However, the concentrations of arsenic are within the range of arsenic

detected by the EPA during a state wide soil survey in 1992. In addition, lead was detected above the IEPA cleanup objective in the surface soil sample collected from the chimney/precipitator area, as well as the groundwater sample collected from the storage area located to the east of the Roof and Yard Runoff Basin.

PCBs were detected above the IEPA cleanup objective of 1.0 milligram per kilogram (mg/kg) in one surface soil sample collected adjacent to stained transformers on the east side of the southern portion of the main building.

It should be noted that TPH was detected throughout the site. Although a cleanup objective has not been established by the IEPA, TPH was detected at elevated concentrations (greater than 1,000 mg/kg) and would indicate impact by petroleum hydrocarbon compounds.

Based on the relatively low volatility of the constituents of concern detected above the IEPA cleanup objectives, the soil inhalation exposure pathway is not a likely contaminant exposure pathway in the areas other than the storage area located to the east of the Roof and Yard Runoff Basin. Construction activities in this area of concern would increase the possibility of exposure. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

In addition, based on the depths of the wells the City of Joliet uses to provide potable water to its residents, it is unlikely that the impacted groundwater beneath the facility would have any impact on these wells. Therefore, the groundwater ingestion is not a potential contaminant exposure pathway.

The soil ingestion pathway is a potential exposure pathway during construction activities. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario. In addition, based on surface soil sampling results, the storage area located to the east of the Roof and Yard Runoff Basin has been impacted by volatile constituents of concern (benzene, toluene, ethyl benzene, and total xylenes). This area has a greater potential risk for human exposure than the remainder of the facility.

Based on the current land use (industrial) and site conditions (analytical results and near surface bedrock), it is judged that the potential for human exposure to the constituents of concern from this facility is low. It should be noted that there is no requirement under Illinois environmental law to further investigate or remediate this property.

# 1.0 INTRODUCTION

## 1.1 General

ENSR Corporation (ENSR) was retained by Commonwealth Edison Company (ComEd) to conduct Phase II Environmental Site Assessment (Phase II ESA) activities on a "limited" portion of the 300 acre Joliet #29 Generating Station, located at 1800 Channahon Road in Joliet, Illinois (**Figure 1, Site Location Map**).

The scope of the Phase II ESA activities were based on the preliminary results of the Phase I Environmental Site Assessment (Phase I ESA), with concurrence between ENSR and ComEd. Phase II ESA activities were conducted from October 7 to October 27, 1998, and included advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. **Figure 2** illustrates the layout of the facility.

## 1.2 Objectives and Scope

The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I ESA. The Phase II ESA adequately assessed the surface and/or subsurface conditions in the locations where sampling was conducted. The Phase II ESA is a tool for developing a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways in sampled areas. Based upon this and the information gathered during the Phase II ESA, and using the Illinois Environmental Protection Agency (IEPA) Tiered Approach to Cleanup Objectives (TACO) as guidance, it can be determined whether remediation is warranted in the locations sampled. The Phase II ESA alone is not an exhaustive investigation which can be used to determine the extent of contamination, nor the cost of any suggested remediation.

The objective of the Phase II ESA was to develop a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways. To meet this objective, ENSR implemented a "phased" assessment designed to provide increasing levels of information based upon obtained data. Recognizing that existing information for the facility and potential contamination was limited, the principal tasks completed during the Phase II ESA included the following:

- Soil boring advancement and soil sample collection;
- Monitoring well installation and groundwater sample collection;
- Collection of surface soil and sediment samples;
- Laboratory analysis of samples; and,
- Evaluation of analytical results and comparison to the IEPA Tier 1 Industrial/Commercial Soil Cleanup Objectives and IEPA Tier 1 Groundwater Cleanup Objectives.

The investigation consisted of the advancement of 17 soil borings and the installation of 5 monitoring wells at the potential areas of concern identified during the Phase I ESA. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260, polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310, polychlorinated biphenyls (PCBs) using EPA Method 8081, Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000, and pH by EPA Method 9045. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

In addition, 23 surface soil samples were collected from the identified potential areas of concern and 6 sediment samples were collected from selected ash/coal settling ponds or drainage ditches located at the facility. These samples were submitted for analysis of the previously referenced constituents as well as total petroleum hydrocarbons (TPH) using EPA Method 8015.

### 1.3 *Report Organization*

**Section 1** introduces the principal subjects covered in this report, describes the purpose and scope of the Phase II ESA, and presents limitations of the Phase II ESA. **Section 2** provides information regarding the identified potential areas of concern and the methodologies used during the investigation. **Section 3** presents the results of the Phase II ESA. **Section 4** presents the data assessment of the Phase II ESA. **Tables** summarizing the analytical results and **Figures** illustrating the facility location and layout, as well as sampling locations, have been included under the appropriate headings.

**Appendix A** contains laboratory analytical reports. **Appendix B** contains boring logs and monitoring well construction diagrams. **Appendix C** contains monitoring well gauging and survey data.

### 1.4 Limitations

This report, including all attachments thereto, describes the results of ENSR's Phase II ESA conducted at the Joliet #29 Generating Station, which took place between October 7 and October 27, 1998. Many of the facts and conditions pertaining to this Phase II ESA are subject to change over time; accordingly, the evaluations and conclusions must be viewed within this context.

ENSR has performed this Phase II ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. ENSR shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase II ESA was performed.

This report and all field data, notes, and laboratory test data (hereinafter collectively "Information") were prepared by ENSR solely for the benefit of ENSR's Client, ComEd. ENSR's Client may release this Information to third parties, who may use and rely upon the Information at their own discretion. However, any use of or reliance upon this Information by a party other than parties identified shall be solely at the risk of such third party and without legal recourse against ENSR, or its subsidiaries and affiliates, or their respective employees, officers or directors, regardless of whether the action in which recovery of damages is sought is based upon contract, tort (including the sole, concurrent or other negligence and strict liability of ENSR), statute or otherwise. This Information shall not be used or relied upon by a party which does not agree to be bound by the above statement.

## 2.0 INVESTIGATION METHODS

Prior to initiation of field investigations, a site reconnaissance was performed during the Phase I ESA to define the study area. Field investigation activities were subsequently conducted to obtain site specific information and data pertaining to site geology and hydrogeology, groundwater quality, soil properties, and potential contaminant source(s).

The sampling locations were recommended based on the preliminary Phase I ESA findings. A sampling location summary listing is presented in **Table 1**. A summary of the identified potential areas of concern is presented below.

1. **Roof and Yard Runoff Basin.** One pond, which collects surface water runoff, is located on the eastern portion of the facility. One sediment sample (X-1) was collected.

2. **Gasoline Underground Storage Tank.** One 1,500 gallon underground storage tank (UST) is located at the northwest corner of the Roof and Yard Runoff Basin. This UST is used for the storage of gasoline. One soil boring (B-1) was advanced.

3. **Materials Storage Areas.** There are three materials storage areas located at the facility. One storage area is located to the east of the Roof and Yard Runoff Basin. The concern at this storage area was used equipment and parts. One surface soil sample (S-2) was collected and one monitoring well (MW-1) was installed. The second storage area is located to the west of the Roof and Yard Runoff Basin. The primary concern at this storage area was drum storage. One surface soil sample (S-5) was collected. The third storage area is located to the west of the chimneys and precipitators. The primary concern at this storage area was drum storage. One surface soil sample (S-19) was collected.

4. **Ash Disposal Silos.** Two ash disposal silos are located to the north of the Roof and Yard Runoff Basin. These silos are used to store ash prior to having it transported off-site. One surface soil sample (S-1) was collected.

5. **Former Wastewater Treatment Plant.** A former Wastewater Treatment Plant is located on the eastern portion of the facility. Two surface soil samples (S-3 and S-23) were collected.

6. **Ash Settling Ponds.** Three ash settling ponds are located on the northwestern portion of the facility. Two of these ponds are located to the west of the former Wastewater Treatment Plant. One sediment sample (X-2) was collected from the eastern pond and one sediment sample (X-3) was collected from the western pond. In addition, one soil boring (B-3) was advanced and one monitoring well (MW-2) was installed between these two ponds. The third pond is located to the east of the former Wastewater Treatment Plan. One sediment sample (X-4) was collected.

7. **Transformers.** Transformers with oil staining were observed throughout the facility. Soil samples were collected in 6 locations with the most significant staining. The first location contains the transformers on the east side of the former Wastewater Treatment Plant. One soil boring (B-4) was advanced and one surface soil sample (S-4) was collected. The second location contains the transformers on the east side of the southern portion of the main building. One surface soil sample (S-6) was collected. The third location contains the transformers on the south side of the eastern portion of the main building. One soil boring (B-6) was advanced and one surface soil sample (S-7) was collected. The fourth location contains the transformers on the south side of the western portion of the main building. One surface soil sample (S-8) was collected. The fifth location contains the transformers on the west side of the main building. One soil boring (B-20) was advanced and two surface soil samples (S-20 and S-21) were collected. The sixth location contains the transformers adjacent to the Ash Disposal Silos. One surface soil sample (S-22) was collected.

8. **Chimneys/Precipitators.** Two chimney units are located to the north of the main building. Surface staining from the precipitator equipment was observed. Two soil borings (B-9 and B-10) were advanced and five surface soil samples (S-10 through S-14) were collected.

9. **Switch Yard.** The Switch Yard is located to the north of the main building. One soil boring (B-11) was advanced to the south of the Switch Yard.

10. **Coal Handling Area.** Coal is received at the facility via overhead conveyors from the Joliet #9 facility located south of the DesPlaines River. The coal is stored at the coal pile at the west end of the facility. Two soil borings were advanced and two monitoring wells were installed adjacent to the coal pile. Soil boring B-17 was advanced and monitoring well MW-3 was installed at the eastern end of the southern side of the coal pile. Soil boring B-18 was advanced and monitoring well MW-4 was installed at the western end of the southern side of the coal pile. Two coal pile runoff ponds are located adjacent to the coal pile. One coal pile runoff pond is located to the southeast of the coal pile and the other coal pile runoff pond is located to the northeast of the coal pile. Sediment sample X-6 was collected at the southeastern pond and sediment sample X-5 was collected at the northeastern pond. In addition, one surface soil sample (S-15) was collected adjacent to the northeastern pond.

11. **Coal Handling Area Buildings.** These buildings are associated with the transporting of coal and are located to the east of the coal pile. These buildings are located at the southeast end of the coal pile. One soil boring (B-16) was advanced to the south of the southern Drive Tower, and one soil boring (B-15) was advanced to the south of the Breaker House. One surface soil sample (S-17) was collected to the south of the Conveyor House.

12. **Coal Handling Tractor Building.** This building houses and maintains the coal handling tractors, and are used for the storage of various oils and lubricants. This building is located to the west of the Breaker House. One soil boring (B-14) was advanced.

13. **Diesel Aboveground Storage Tanks.** There are three diesel aboveground storage tanks (ASTs) located at the facility. One AST is located adjacent to the east side of the coal pile. This AST is 950,000 gallons in capacity, however, is no longer in use. One soil boring (B-12) was advanced. The second diesel AST is located in the coal handling area and south of the abandoned 950,000 gallon AST. One soil boring (B-13) was advanced and one monitoring well (MW-5) was installed by the western dispenser station and one surface sample (S-16) was collected adjacent to the AST. The third diesel AST is located to the south of the main building. One surface soil sample (S-9) was collected.

14. **Oil/Water Separator.** One oil/water separator is located to the west of the Crib House, which is located to the south of the main building. One soil boring (B-8) was advanced.

15. **Natural Gas Regulator House/Piping.** Natural gas is used at the facility as a supplemental fuel source for the boilers. The natural gas regulator house and natural gas pipes (which are located aboveground) are located to the west of the main building. One soil boring (B-19) was advanced at the natural gas regulator house and one surface soil sample (S-18) was collected adjacent to the piping.

It should be noted that due to heavy concentrations of buried utility lines or other underground obstructions, three planned soil borings (B-2, B-5, and B-7) were not advanced. Surface soil samples were not collected at these locations due to the areas being covered with concrete/asphalt.

## 2.1 Sampling Methods

All soil (surface and subsurface), sediment, and groundwater samples collected were submitted for analysis of BTEX and PNA constituents using EPA Methods 8260 and 8310, respectively, PCBs using EPA Method 8081, RCRA metals using EPA Method series 6000 and 7000, and pH by EPA Method 9045. In addition, surface soil and sediment samples were submitted for TPH using EPA Method 8015. A sample summary listing is presented in **Table 1**.

The sample glassware used to contain the samples retained for laboratory analysis were provided pre-cleaned from National Environmental Laboratories, Inc. (NET) of Bartlett, Illinois. Each sample was labeled with the project number, project location, client, sample number, sample depth, date, time, and requested analysis. The soil samples were stored on ice in the field in a cooler and shipped via courier under chain-of-custody to NET. Standard chain-of-custody procedures were maintained from the time of sample collection until delivery to the analytical laboratory.

### 2.1.1 Sediment Sampling

Six sediment samples (X-1 through X-6) were collected at the facility. The sediment sample locations are illustrated on **Figure 3**. Sediment samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

### 2.1.2 Surface Soil Sampling

Twenty-three surface soil samples (S-1 through S-23) were collected at the facility. The surface soil sample locations are illustrated on **Figure 4**. Surface soil samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

### 2.1.3 Soil Borings and Subsurface Soil Sampling

Seventeen soil borings (B-1, B-3, B-4, B-6, and B-8 through B-20) were advanced at the facility. It should be noted that due to heavy concentrations of buried utility lines or other underground obstructions, three planned soil borings (B-2, B-5, and B-7) were not advanced. The soil borings locations are illustrated on **Figure 5**. The soil borings were advanced by Fox Drilling, Inc. (Fox) of Itasca, Illinois, utilizing Geoprobe direct-push drilling techniques. The soil borings were advanced to a maximum depth of 4 feet below grade. All soil borings were backfilled with soil cuttings, and completed at surface grade with the appropriate material (i.e., concrete, asphalt). All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

Soil samples were collected by advancing by a hydraulically-driven stainless steel pre-probe. Soil samples were collected using a 2.0-inch diameter acetate lined soil sampler. Soil samples were continuously collected from the surface to the bottom of the soil borings. The soil samples were visually inspected and field classified using the general guidelines of the Unified Soil Classification System (USCS) and the American Society for Testing and Materials (ASTM) Test Method ASTM D2488 for soil classification.

Each soil sample was field screened for the presence of VOCs using a photoionization detector (PID) and standard headspace screening methods. The PID readings indicate relative levels of VOCs in the vapor headspace, but do not represent actual concentrations which may exist in the soil. The PID has a detection range of 1.0 part per million volume (ppmv) to 2,500 ppmv. The soil sample which exhibited the highest PID reading, or if no PID readings were detected, from directly above the field-interpreted groundwater level, was retained from each boring for laboratory analysis.

### 2.1.4 Monitoring Wells and Groundwater Sampling

Five monitoring wells (MW-1 through MW-5) were installed at the facility. The monitoring well locations are illustrated on **Figure 5**. The monitoring wells were installed by Fox utilizing hollow-stem augers and rotary drilling techniques. When bedrock was encountered, the monitoring wells were completed using rotary wash rock coring techniques. The monitoring wells were installed to a maximum depth of 37 feet below grade. Fluids generated during monitoring well installation and groundwater sampling were discharged to the ground surface in proximity to each sampling location. All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

The monitoring wells were installed through the working space within hollow stem augers. The monitoring wells were constructed of 2-inch diameter Schedule 40 PVC 0.010-inch slotted continuous wrap well screen and solid riser. A filter pack consisting of clean silica sand was placed surrounding the well screen to filter out fine soil particles from the formation adjacent to the screen. The filter pack extends from the bottom of the soil boring to approximately 1-foot above the top of the well screen. A bentonite pellet seal was placed on top of the sand pack and hydrated with distilled water to prevent surface water infiltration. The annular space above the bentonite seal was filled with a neat bentonite and cement grout to approximately 6-inches below grade. The monitoring wells were completed at grade and an 8-inch diameter steel protective road box was placed over each monitoring well and set in concrete at grade. The monitoring wells were capped with expandable well caps and equipped with locks to prevent unauthorized access. A monitoring well construction diagram is included in **Appendix A**.

After the installation of the monitoring wells, approximately three to five well volumes of groundwater was removed from each monitoring well, or until the groundwater was relatively free from sediment, using a peristaltic pump. One groundwater sample was collected from each monitoring well and submitted for laboratory analysis. It should be noted that due to the lack of sufficient water within the monitoring wells, groundwater samples could not be collected from MW-4. In addition, water quality field parameters consisting of pH, specific conductivity, and temperature were measured and recorded during sample collection.

## 2.2 Monitoring Well Gauging and Survey

Each monitoring well was gauged using an electronic interface probe in order to determine the presence or absence of liquid-phase hydrocarbons (LPHCs) and depth to groundwater. In addition, each monitoring well's top of casing and ground surface location was surveyed relative to an arbitrary benchmark assigned an elevation of 100 feet.

## 2.3 Equipment Decontamination

The drill rig and associated tooling, and sampling equipment were decontaminated prior to mobilization and before leaving the site. To minimize the potential for cross-contamination, drilling and sampling equipment were decontaminated between each use. Decontamination of drilling equipment consisted of steam cleaning. Sampling equipment, including split spoons and stainless steel sampling equipment, were decontaminated before each use by washing with a solution of Alconox (phosphate based detergent) and potable water, and rinsing with distilled water. Decontamination fluids generated during equipment decontamination were discharged to the ground surface in proximity to each sampling location.

## 3.0 INVESTIGATION FINDINGS

The findings of the subsurface investigation, soil and groundwater sampling, monitoring well gauging, survey, and chemical analysis, are presented below. Analytical results are summarized in **Table 2** through **Table 5**. The analytical reports and chain-of-custody forms are included in **Appendix B**.

Analytical results were compared against the cleanup objectives as presented in 35 Illinois Administrative Code (IAC) Section 742.Appendix B: Table B-Tier 1 Soil Remediation Objectives for Commercial/Industrial Properties, and 35 IAC Section 742.Appendix B: Table E-Tier 1 Groundwater Remediation Objectives for the Direct Ingestion of Groundwater Portion of the Groundwater Ingestion Route.

Soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered. In addition, the groundwater beneath the site is classified as Class I, therefore the Class I baseline was used.

### 3.1 Sediment

**BTEX.** The analytical results indicated that BTEX constituents were not detected above the laboratory method detection limits.

**TPH.** The analytical results indicated that TPH as oil was detected at concentrations ranging from 112 milligrams per kilogram (mg/kg) in sample X-4 to 193,000 mg/kg in sample X-1. However, cleanup objectives for TPH have not been established by the IEPA. TPH as gasoline or diesel was not detected above the laboratory method detection limits.

**PNAs.** The analytical results indicated that PNA constituents were detected in the sediment samples collected. However, these concentrations were not above the IEPA cleanup objectives. It should be noted that samples X-1, X-5, and X-6 had elevated detection limits due to matrix interference for benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene. These elevated detection limits are above the cleanup objectives, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives.

**PCBs.** The analytical results indicated that PCBs were not detected above the laboratory method detection limits.

**Metals.** The analytical results indicated that arsenic was detected at concentrations above the IEPA cleanup objective of 3 mg/kg. Arsenic was detected at concentrations ranging from 3.5 mg/kg in sample X-6 to 12 mg/kg in sample X-3. In addition, sample X-1 had an elevated detection limit due to matrix interference. This elevated detection limit is above the cleanup objective, and consequently, there is a possibility that the concentration is actually above the cleanup objective of 3 mg/kg. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992.

**pH.** pH values ranged from 7.66 in sample X-1 to 10.47 in sample X-3.

Analytical results are summarized in **Table 2**, and sampling locations are illustrated on **Figure 3**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.2 Surface Soil

**BTEX.** The analytical results indicated that toluene, ethyl benzene, and total xylenes were detected in sample S-2 at concentrations above the IEPA cleanup objectives. It should be noted that sample S-2 had an elevated detection limit due to matrix interference. This elevated detection limit is above the cleanup objective for benzene, and consequently, there is a possibility that the concentration is actually above the cleanup objective of 0.03 mg/kg.

**TPH.** The analytical results indicated that TPH as gasoline was detected at a concentration of 136,000 mg/kg in sample S-2, and TPH as diesel was detected at concentrations ranging from 1,170 mg/kg in sample S-9 to 40,500 mg/kg in sample S-16. TPH as oil was detected at concentrations ranging from 489 mg/kg in sample S-5 to 135,000 mg/kg in sample S-14. However, cleanup objectives for TPH have not been established by the IEPA.

**PNAs.** The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, ideno(1,2,3-c,d)pyrene, and naphthalene were detected in samples S-2 and S-5 through S-8 at concentrations above the IEPA cleanup objectives. It should be noted that samples S-2 and S-8 through S-22 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 3** for PNA results.

**PCBs.** The analytical results indicated that PCBs were detected at a concentration of 1.3 mg/kg in sample S-6, which is above the IEPA cleanup objective of 1.0 mg/kg.

**Metals.** The analytical results indicated that arsenic and lead were detected at concentrations above the IEPA cleanup objectives of 3 mg/kg and 400 mg/kg, respectively. Arsenic was detected at concentrations ranging from 3.3 mg/kg in sample S-5 and S-21 to 8.9 mg/kg in sample S-10. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Lead was detected at a concentration of 721 mg/kg in sample S-10.

**pH.** pH values ranged from 6.71 in sample S-12 to 10.09 in sample S-17.

Analytical results are summarized in **Table 3**, and sampling locations are illustrated on **Figure 4**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.3 Subsurface Soil

Bedrock was encountered at approximately 1 foot to 4 feet below grade. Fill material, consisting of clay, sand, and gravel, was the primary material encountered above the bedrock. Soil boring logs are included in **Appendix A**.

The PID readings obtained from the soil samples collected ranged from 1.5 ppmv in B-3 (0 to 4 feet below grade) and B-17 (0 to 2 feet below grade) to 120 ppmv in B-13 (0 to 4 feet below grade). The PID field screening results are recorded on the boring logs in **Appendix A**.

**BTEX.** The analytical results indicated that BTEX constituents were detected in the subsurface soil samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PNAs.** The analytical results indicated that benzo(a)pyrene and benzo(b)fluoranthene were detected at concentrations above the IEPA cleanup objectives of 0.8 mg/kg and 5 mg/kg, respectively, in B-6. Benzo(a)pyrene was detected at a concentration of 6.8 mg/kg and benzo(b)fluoranthene was detected at a concentration of 6.4 mg/kg. It should be noted that B-6, B-10, B-11, B-13, B-14, and B-16 through B-20 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives.

**PCBs.** The analytical results indicated that PCBs were detected in the subsurface soil samples collected. However, these concentrations were not above the IEPA cleanup objective of 1.0 mg/kg.

**Metals.** The analytical results indicated that arsenic was detected at concentrations above the IEPA cleanup objective of 3 mg/kg. Arsenic was detected at concentrations ranging from 3.1 mg/kg in B-13 to 11 mg/kg in B-35. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992.

**pH.** pH values ranged from 7.20 in B-17 to 9.62 in B-12.

Analytical results are summarized in **Table 4**, and soil boring locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.4 Groundwater

The groundwater elevations ranged from 10.40 feet in MW-3 to 29.68 feet in MW-2. Groundwater was not detected in monitoring well MW-4. LPHC was not detected in any of the monitoring wells. Based on the gauging data, the apparent groundwater flow direction beneath

the facility has been calculated to be to the south (**Figure 6, Groundwater Elevation Map**). Monitoring well gauging data is included in **Appendix C**.

Water quality field parameters consisting of pH, specific conductivity, and temperature were measured. The recorded measurements are summarized in **Table 5**.

**BTEX.** The analytical results indicated that BTEX constituents were detected in the groundwater samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PNAs.** The analytical results indicated that PNA constituents were detected in the groundwater samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PCBs.** The analytical results indicated that PCBs were not detected above the laboratory method detection limits.

**Metals.** The analytical results indicated that lead was detected at a concentration above the IEPA cleanup objective of 0.0075 milligrams per liter (mg/l). Lead was detected at a concentration of 0.0124 mg/l in MW-1. It should be noted that laboratory detection limit for cadmium was at 0.01 mg/l which is above the cleanup objective of 0.005 mg/l. Consequently, there is a possibility that the concentrations are actually above the cleanup objective.

Analytical results are summarized in **Table 5**, and monitoring well locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

# 4.0 DATA ASSESSMENT

## 4.1 Extent of Contamination

Based on the results of the subsurface investigation conducted, the following determinations and assessments were made regarding the extent of contamination at the facility. The following conclusions are subject to the Limitations presented in **Section 1.4**. In addition, although arsenic was detected above the IEPA cleanup objective, the concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. However, it should be noted that soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered.

### 4.1.1 Sediment

Arsenic was the only constituent of concern detected at concentrations above the IEPA cleanup objective of 3 mg/kg, at a maximum concentration of 12 mg/kg. In addition, arsenic was detected above the IEPA cleanup objective in five out of six sediment samples collected.

Due to matrix interference in sample X-1, X-5, and X-6, benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits, which are above the cleanup objectives. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives.

### 4.1.2 Surface Soil

Arsenic, lead, PCBs, BTEX constituents (toluene, ethyl benzene, and total xylenes) and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, ideno(1,2,3-c,d)pyrene, and naphthalene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Materials Storage Buildings.** Storage area located to the east of the Roof and Yard Runoff Basin (S-2) and the storage area located to the west of the Roof and Yard Runoff Basin (S-5).
- **Transformers.** Transformers on the east side of the southern portion of the main building (S-6), transformers on the south side of the eastern portion of the main building (S-7), and transformers on the south side of the western portion of the main building (S-8).

It should be noted that due to matrix interference in samples S-2 and S-8 through S-22, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from the storage area located to the east of the Roof and Yard Runoff Basin (S-2), transformers on the south side of the western portion of the main building (S-8), diesel AST located to the south of the main building (S-9), chimneys/precipitators (S-10 through S-14), northeastern coal pile runoff pond (S-15), diesel AST located in the coal handling area (S-16), Conveyor House (S-17), natural gas aboveground piping (S-18), storage area located to the west of the chimney/ precipitators (S-19), transformers on the west side of the main building (S-20 and S-21), and transformers adjacent to the Ash Disposal Silos (S-22).

BTEX constituents were detected above the IEPA cleanup objectives in the following locations:

- **Materials Storage Buildings.** Storage area located to the east of the Roof and Yard Runoff Basin (S-2).

It should be noted that due to matrix interference in sample S-2, benzene had an elevated detection limit. Consequently, there is a possibility that the concentration is actually above the cleanup objective. This sample was collected from the storage area located to the east of the Roof and Yard Runoff Basin (S-2).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 8.9 mg/kg in the following locations:

- **Ash Disposal Silos.** The Ash Disposal Silos are located to the north of the Roof and Yard Runoff Basin (S-1).
- **Transformers.** Transformers on the east side of the former Wastewater Treatment Plant (S-4), transformers on the east side of the southern portion of the main building (S-6), transformers on the south side of the eastern portion of the main building (S-7), transformers on the west side of the main building (S-20 and S-21), and transformers adjacent to the Ash Disposal Silos (S-22).
- **Materials Storage Buildings.** Storage area is located to the west of the Roof and Yard Runoff Basin (S-5).
- **Chimneys/Precipitators.** The chimneys and precipitators are located to the north of the main building (S-10 through S-14). It should be noted that lead was also detected above the IEPA cleanup objective of 400 mg/kg in this area (S-10) at a maximum concentration of 721 mg/kg.
- **Coal Handling Area.** The northeastern coal pile runoff pond (S-15).
- **Former Wastewater Treatment Plant.** The former Wastewater Treatment Plant (S-23).

PCBs were detected above the IEPA cleanup objective in the following locations:

- **Transformers.** Transformers east side of the southern portion of the main building (S-6).

### 4.1.3 Subsurface Soil

Arsenic and PNA constituents listed as benzo(a)pyrene and benzo(b)fluoranthene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Transformers.** Transformers on the south side of the eastern portion of the main building (B-6).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 11 mg/kg in the following locations:

- **Gasoline UST.** The gasoline UST system located at the northwest corner of the Roof and Yard Runoff Basin (B-1).
- **Ash Settling Ponds.** The ash settling ponds located to the west of the former Wastewater Treatment Plant (B-3).
- **Transformers.** Transformers on the east side of the former Wastewater Treatment Plant (B-4) and transformers on the south side of the eastern portion of the main building (B-6).
- **Chimneys/Precipitators.** The chimneys and precipitators are located to the north of the main building (B-9 and B-10).
- **Switch Yard.** The Switch Yard located to the north of the main building (B-11).
- **Diesel ASTs.** The diesel AST located in the coal handling area (B-13).
- **Coal Handling Area Buildings.** The southern Drive Tower (B-16).
- **Coal Handling Area.** The eastern end of the southern side of the coal pile (B-17).
- **Natural Gas Regulator House/Piping.** The natural gas regulator house located to the west of the main building (B-19).

### 4.1.4 Groundwater

Lead was the constituent of concern detected at concentrations above the IEPA cleanup objectives. Lead was detected above the IEPA cleanup objective, at a maximum concentration of 0.0124 mg/l in the following locations:

- **Materials Storage Buildings.** Storage area is located to the east of the Roof and Yard Runoff Basin (MW-1).

It should be noted that laboratory detection limit for cadmium was at 0.01 mg/l which is above the cleanup objective of 0.005 mg/l. Consequently, there is a possibility that the concentrations are actually above the cleanup objective.

## 4.2 Potential Contaminant Exposure Pathways

Based on the above-referenced assessment, potential exposure pathways by which humans may be exposed to the constituents of concern have been identified at the facility. Potential sources, fate and transport mechanisms, and exposure media were considered in determining these potential exposure pathways. An identified potential exposure pathway does not imply that exposure is occurring, only that the potential exists for exposure.

### 4.2.1 Soil Ingestion

The soil ingestion pathway includes the first three feet within ground surface. Therefore, based on the analytical results, soil ingestion is a potential contaminant exposure pathway. Soil ingestion occurs when soil containing elevated concentrations of the constituents of concern are ingested into the body. The facility is an industrial site and direct contact and ultimately ingestion of the impacted soil is not likely to occur. However, construction activities would increase the possibility of exposure. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

### 4.2.2 Soil Inhalation

The soil inhalation pathway includes the first ten feet within ground surface. However, bedrock was encountered at approximately 4 feet below grade. Therefore, based on the analytical results, soil inhalation is a potential contaminant exposure pathway. Soil inhalation occurs when elevated concentrations of the constituents of concern are inhaled into the body. The constituents that were detected at concentrations above the IEPA cleanup objectives (i.e., metals, semi-volatiles, PCBs), are not considered highly volatile. However, the highly volatile constituents (i.e., BTEX, TPH as gasoline), were only detected at concentrations above the IEPA cleanup objectives at the storage area located to the east of the Roof and Yard Runoff Basin.

Based on the relatively low volatility of the detected constituents of concern, this pathway would not likely be an effective exposure pathway in the areas other than the storage area located to the east of the Roof and Yard Runoff Basin. Construction activities in this area of concern would increase the possibility of exposure. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

### 4.2.3 Groundwater Ingestion

The groundwater ingestion pathway includes groundwater being used as a potable source of water. The City of Joliet receives its potable water via 16 municipal potable water supply wells. These wells were drilled to approximately 1,600 feet below grade, and are cased to

approximately 300 feet below grade. Based on the depths of these wells, it is unlikely that the impacted groundwater beneath the facility would have any impact on these wells. Therefore, the groundwater ingestion is not a potential contaminant exposure pathway.

Based on the current land use (industrial) and site conditions (analytical results and soil types), it is judged that the potential for human exposure to the constituents of concern from this facility is low. However, personnel working at the facility could be susceptible to exposure due to accidental soil ingestion or soil inhalation due to activities such as construction. Such exposure may result from contact with contaminated subsurface or surface materials previously located beneath a protective barrier (i.e., concrete cap, building).

There is no requirement under Illinois environmental law to further investigate or remediate this property.

| MW-2 (B-3) | Ash Settling Ponds | BTEX, PNAs, PCBs, RCRA metals | NA | 10/22/98 |
| MW-3 (B-17) | Coal Handling Area | BTEX, PNAs, PCBs, RCRA metals | NA | 10/22/98 |
| MW-4 (B-18) | Coal Handling Area | BTEX, PNAs, PCBs, RCRA metals | NA | not sampled |
| MW-5 (B-13) | Diesel ASTs | BTEX, PNAs, PCBs, RCRA metals | NA | 10/22/98 |

Notes:

BTEX was analyzed using EPA Method 8260.

PNAs were analyzed using EPA Method 8310

PCBs were analyzed using EPA Method 8081.

RCRA metals were analyzed using EPA Method series 6000 and 7000.

pH was measured using EPA Method 9045.

(1) Sampling locations are referenced in the Phase II Environmental Site Assessment Report in **Section 2.0**.

Notes:
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.

(2) Results are shown as total [illegible] from all [illegible]

Notes:
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.
(2) Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered.

| 497459 | B-10 (0-2) | 10/09/1998 | 10/09/1998 |
| 497460 | B-9 (0-3) | 10/09/1998 | 10/09/1998 |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike
MSD = Matrix Spike Duplicate
RPD = Relative Percent Difference

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| **mg/L** | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| **ug/g** | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| **ug/L** | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| **ug/Kg** | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| **TCLP** | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| **Surr:** | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| **%** | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| mg/L | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| ug/g | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| ug/L | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| ug/Kg | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| TCLP | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| Surr: | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000. To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

PT : Pattern does not match the calibration standard; however, hydrocarbons are present in the oil range
M+ : Analyte quantified by MSA due to low spike recovery.
