## EXECUTIVE SUMMARY

This report presents the results of the Phase II Environmental Site Assessment (Phase II ESA) conducted by ENSR Corporation (ENSR) in October 1998 at the Commonwealth Edison Company (ComEd) Waukegan Generating Station, located at 10 Greenwood Avenue in Waukegan, Illinois. Phase II ESA activities consisted of advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I Environmental Site Assessment (Phase I ESA).

Based on the results of the Phase I ESA, 20 potential areas of concern were identified for further investigation. These areas of concern are identified in **Section 2.0**. Each of these areas of concern were investigated during the Phase II ESA activities. Twenty-two soil borings were advanced and 5 monitoring wells were installed. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. In addition, 13 surface soil samples and 6 sediment samples were collected at the facility.

These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260; polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310; polychlorinated biphenyls (PCBs) using EPA Method 8081; Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000; and pH using EPA Method 9045.

In addition, the surface soil samples and sediment samples were also submitted for analysis of total petroleum hydrocarbons (TPH) using EPA Method 8015. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

PNA constituents were detected above the Illinois Environmental Protection Agency (IEPA) cleanup objectives primarily in the surface soil samples collected at the facility. These surface soil samples were collected directly from a "stained" location in the identified potential areas of concern. Therefore, it was determined that the impact from these PNA constituents is relatively localized. However, benzo(a)pyrene and dibenzo(a,h)anthracene were detected in soil samples collected from borings at approximately 4 feet below grade.

Arsenic was detected above the IEPA cleanup objective of 3 milligrams per kilogram (mg/kg) in samples collected throughout the facility. However, the majority of concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. Arsenic was detected at concentrations greater than the background range at the western wastewater collection pond, coal runoff pond, the ash settling ponds, transformers on the east side of the southern Crib House, and north of the coal pile. Analytical results from the groundwater samples collected from monitoring wells previously installed to delineate concentrations of arsenic, indicated that arsenic is present in the area adjacent to the former

Tannery property at concentrations above the IEPA cleanup objective of 0.2 milligrams per liter (mg/l). The Tannery property is being investigated by ComEd in cooperation with the IEPA under the Site Remediation Program.

In addition, lead was detected above the IEPA cleanup objective of 400 mg/kg in the samples collected from the western wastewater collection pond and transformers on the east side of the southern Crib House. PCBs were detected above the IEPA cleanup objective of 1 mg/kg in samples collected from the western portion of the facility adjacent to a former tannery. The PCBs were only detected in the first 4 feet of soil.

It should be noted that TPH was detected throughout the site. Although a cleanup objective has not been established by the IEPA, TPH was detected at elevated concentrations (greater than 1,000 mg/kg) and would indicate impact by petroleum hydrocarbon compounds.

Based on the relatively low volatility of the constituents of concern detected above the IEPA cleanup objectives, the soil inhalation exposure pathway is not a likely contaminant exposure pathway. In addition, due to the fact that the City of Waukegan receives its potable water from Lake Michigan and the groundwater beneath the facility is not being used as a potable source of water, the groundwater ingestion is not a potential contaminant exposure pathway. However, the soil ingestion pathway is a potential exposure pathway during construction activities. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

Based on the current land use (industrial) and site conditions (analytical results and soil types), it is judged that the potential for human exposure to the constituents of concern from this facility is low. It should be noted that there is no requirement under Illinois environmental law to further investigate or remediate this property.

MWG13-15_45784

# 1.0 INTRODUCTION

## 1.1 General

ENSR Corporation (ENSR) was retained by Commonwealth Edison Company (ComEd) to conduct Phase II Environmental Site Assessment (Phase II ESA) activities on a "limited" portion of the 234 acre Waukegan Generating Station, located at 10 Greenwood Avenue in Waukegan, Illinois (**Figure 1**, **Site Location Map**).

The scope of the Phase II ESA activities were based on the preliminary results of the Phase I Environmental Site Assessment (Phase I ESA), with concurrence between ENSR and ComEd. Phase II ESA activities were conducted from October 26 to October 30, 1998, and included advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. **Figure 2** illustrates the layout of the facility.

## 1.2 Objectives and Scope

The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I ESA. The Phase II ESA adequately assessed the surface and/or subsurface conditions in the locations where sampling was conducted. The Phase II ESA is a tool for developing a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways in sampled areas. Based upon this and the information gathered during the Phase II ESA, and using the Illinois Environmental Protection Agency (IEPA) Tiered Approach to Cleanup Objectives (TACO) as guidance, it can be determined whether remediation is warranted in the locations sampled. The Phase II ESA alone is not an exhaustive investigation which can be used to determine the extent of contamination, nor the cost of any suggested remediation.

The objective of the Phase II ESA was to develop a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways. To meet this objective, ENSR implemented a "phased" assessment designed to provide increasing levels of information based upon obtained data. Recognizing that existing information for the facility and potential contamination was limited, the principal tasks completed during the Phase II ESA included the following:

- Soil boring advancement and soil sample collection;
- Monitoring well installation and groundwater sample collection;
- Collection of surface soil and sediment samples;
- Laboratory analysis of samples; and,
- Evaluation of analytical results and comparison to the IEPA Tier 1 Industrial/Commercial Soil Cleanup Objectives and IEPA Tier 1 Groundwater Cleanup Objectives.

The investigation consisted of the advancement of 22 soil borings and the installation of 5 monitoring wells at the potential areas of concern identified during the Phase I ESA. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260, polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310, polychlorinated biphenyls (PCBs) using EPA Method 8081, Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000, and pH by EPA Method 9045. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

In addition, 13 surface soil samples were collected from the identified potential areas of concern and 6 sediment samples were collected from selected ash/coal settling ponds or drainage ditches located at the facility. These samples were submitted for analysis of the previously referenced constituents as well as total petroleum hydrocarbons (TPH) using EPA Method 8015.

### 1.3 Report Organization

**Section 1** introduces the principal subjects covered in this report, describes the purpose and scope of the Phase II ESA, and presents limitations of the Phase II ESA. **Section 2** provides information regarding the identified potential areas of concern and the methodologies used during the investigation. **Section 3** presents the results of the Phase II ESA. **Section 4** presents the data assessment of the Phase II ESA. **Tables** summarizing the analytical results and **Figures** illustrating the facility location and layout, as well as sampling locations, have been included under the appropriate headings.

**Appendix A** contains laboratory analytical reports. **Appendix B** contains boring logs and monitoring well construction diagrams. **Appendix C** contains monitoring well gauging and survey data.

### 1.4 Limitations

This report, including all attachments thereto, describes the results of ENSR's Phase II ESA conducted at the Waukegan Generating Station, which took place between October 26 and October 30, 1998. Many of the facts and conditions pertaining to this Phase II ESA are subject to change over time; accordingly, the evaluations and conclusions must be viewed within this context.

ENSR has performed this Phase II ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. ENSR shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase II ESA was performed.

MWG13-15_45786

This report and all field data, notes, and laboratory test data (hereinafter collectively "Information") were prepared by ENSR solely for the benefit of ENSR's Client, ComEd. ENSR's Client may release this Information to third parties, who may use and rely upon the Information at their own discretion. However, any use of or reliance upon this Information by a party other than parties identified shall be solely at the risk of such third party and without legal recourse against ENSR, or its subsidiaries and affiliates, or their respective employees, officers or directors, regardless of whether the action in which recovery of damages is sought is based upon contract, tort (including the sole, concurrent or other negligence and strict liability of ENSR), statute or otherwise. This Information shall not be used or relied upon by a party which does not agree to be bound by the above statement.

## 2.0 INVESTIGATION METHODS

Prior to initiation of field investigations, a site reconnaissance was performed during the Phase I ESA to define the study area. Field investigation activities were subsequently conducted to obtain site specific information and data pertaining to site geology and hydrogeology, groundwater quality, soil properties, and potential contaminant source(s).

The sampling locations were recommended based on the preliminary Phase I ESA findings. A sampling location summary listing is presented in **Table 1**. A summary of the identified potential areas of concern is presented below.

1. **Construction Debris Area.** An area located at the southwestern corner of the facility is used for storing construction debris. Two soil borings (B-1 and B-16) were advanced. In addition, one monitoring well (MW-11) installed during a previous site investigation of the adjacent Tannery property was discovered close to B-1.

2. **Adjacent Properties.** Properties which were located adjacent to the facility have the potential to have impacted the facility. A tannery was located to the west (upgradient) of the facility. Three soil borings (B-13 through B-15) were advanced. In addition, one monitoring well (MW-12) installed during a previous site investigation of the adjacent Tannery property was discovered close to B-15.

3. **Railroad.** A railroad line is located at the western end of the facility. Railroad lines are also located throughout the facility as part of the facility's coal handling system. One soil boring (B-12) was advanced and one monitoring well (MW-3) was installed in the northwest corner of the facility. One surface soil sample (S-1) was collected to the northwest of the construction debris area, and one surface soil sample (S-6) was collected to the south of the former Coal Car Thawing House, which is located to the south of the peaking unit building.

4. **Ash Storage Area.** The ash storage area is located one the southern end of the facility. This area is used to store ash prior to having it transported off-site. One soil boring (B-22) was advanced.

5. **Ash Settling Ponds.** There are 2 ponds at the facility which are used to collect ash wastewater. The ponds are located at the southeastern corner of the facility. One sediment sample (X-5) was collected from the western pond, and one sediment sample (X-6) was collected from the eastern pond.

6. **Coal Handling Area.** Coal is received at the facility via railroad. The coal is unloaded onto conveyors and is transported to the coal pile at the southeastern end of the facility. One soil boring (B-20) was advanced to the north of the coal pile.

7. **Coal Runoff Pond.** There is one pond at the facility which is used for runoff water from the coal pile. The pond is located to the west of the coal pile. One sediment sample (X-4) was collected and one soil boring (B-17) was collected to the west of the pond.

8. **Coal Handling Tractor Buildings.** These buildings house and maintain the coal handling tractors, and are used for the storage of various oils and lubricants. These buildings are located at the northwest end of the coal pile. One surface soil sample (S-13) was collected to the west of the Coal Handling Tractor Maintenance Building, and one surface soil sample (S-14) was collected to the east of the Coal Handling Tractor Maintenance Building.

9. **Peaking Units.** There is one peaking unit building located to the southwest of the main building. These peaking units use jet fuel to generate power. Two surface soil samples (S-4 and S-5) were collected. One soil boring (B-3) was advanced and one monitoring well (MW-2) was installed to the south of the peaking unit building.

10. **Jet Fuel Aboveground Storage Tank.** Two 300,000 gallon aboveground storage tanks (ASTs) are located to the west of the peaking unit building. These ASTs are used for the storage of jet fuel which is pumped via underground piping to the facility's peaking units. One surface soil sample (S-2) was collected adjacent to the fuel regulator building, and one surface soil sample (S-3) was collected to the south of the Pump House.

11. **Wastewater Collection Ponds.** There are 2 ponds at the facility which are used for wastewater collection. One pond is located to the west of the jet fuel ASTs and one pond is located at the northeastern corner of the facility. One sediment sample (X-1) was collected from the western pond. In addition, a drainage ditch is located adjacent to this pond. One sediment sample (X-2) was collected from this ditch. One sediment sample (X-3) was collected from the northeastern pond.

12. **Transformers.** Transformers with oil staining were observed throughout the facility. Soil samples were collected in 3 locations with the most significant staining. The first location contains the transformers on the east side of the southern Crib House, located on the west side of the main building. One surface soil sample (S-11) was collected. The second location contains the transformers to the northeast of the jet fuel ASTs. One soil boring (B-19) was advanced. The third location contains the transformers to the north of the peaking unit building. One soil boring (B-4) was advanced.

13. **Used Oil ASTs.** There are two 7,500 gallon ASTs at the facility which are used for the storage of used oil. One AST is located to the west of the western wastewater collection pond. One soil boring (B-2) was advanced. The second AST is located to the east of the northeastern wastewater collection pond. One surface soil sample (S-9) was collected.

14. **Fire Brigade Area.** A fire brigade area is located to the west of the northeastern wastewater collection pond. This area was used as an area for fire safety training. Two

soil borings (B-6 and B-7) were advanced.

15. **Materials Storage Buildings.** There are two materials storage buildings located at the facility. The storage buildings are located to the west of the fire brigade area. The concern at this storage building was drum storage at the building. One soil boring (B-8) was advanced between the two buildings.

16. **Gasoline/Diesel ASTs.** One 500 gallon gasoline AST and one 500 gallon diesel fuel AST are located to the west of the two materials storage buildings. One soil boring (B-9) was advanced. One 10,000 gallon diesel AST is located to the north of the Coal Handling Tractor Building. One soil boring (B-18) was advanced and one monitoring well (MW-5) was installed adjacent to this AST. In addition, one surface soil sample (S-15) was collected.

17. **Chimneys/Precipitators.** The chimney units are located to the east of the main building. Surface staining from the precipitator equipment was observed. One surface soil sample (S-8) was collected.

18. **Former Underground Storage Tank.** One former underground storage tank (UST) was located at the north end of the facility adjacent to the western gate house. Two soil borings (B-10 and B-11) were advanced.

19. **Former Ignition Oil Pump House.** The former ignition oil pump house was located to the southeast of the peaking unit building. Two ASTs containing ignition oil were previously located adjacent to this building. One surface soil sample (S-7) was collected.

20. **Lakeshore.** Lake Michigan is located at the eastern end of the facility. Cooling water is drawn from and returned to Lake Michigan, and the inferred groundwater flow direction is towards Lake Michigan. Soil and groundwater samples should be collected from facility downgradient locations. One soil boring (B-21) was advanced and one monitoring well (MW-6) was installed to the south of the intake/discharge flume in the northeast end of the facility. One soil boring (B-23) was advanced and one monitoring well (MW-7) was installed to the north of the intake/discharge flume in the northeast end of the facility.

It should be noted that due to heavy concentrations of buried utility lines or other underground obstructions, one planned soil boring (B-5) was not advanced. Surface soil samples were not collected at these locations due to the areas being covered with concrete/asphalt. In addition, monitoring wells, which were installed at the facility during a previous investigation, were discovered in the vicinity of proposed monitoring wells MW-1 and MW-4, and therefore not installed. However, groundwater samples were taken from these two existing monitoring wells.

## 2.1 Sampling Methods

All soil (surface and subsurface), sediment, and groundwater samples collected were submitted for analysis of BTEX and PNA constituents using EPA Methods 8260 and 8310, respectively,

PCBs using EPA Method 8081, RCRA metals using EPA Method series 6000 and 7000, and pH by EPA Method 9045. In addition, surface soil and sediment samples were submitted for TPH using EPA Method 8015. A sample summary listing is presented in **Table 1**.

The sample glassware used to contain the samples retained for laboratory analysis were provided pre-cleaned from National Environmental Laboratories, Inc. (NET) of Bartlett, Illinois. Each sample was labeled with the project number, project location, client, sample number, sample depth, date, time, and requested analysis. The soil samples were stored on ice in the field in a cooler and shipped via courier under chain-of-custody to NET. Standard chain-of-custody procedures were maintained from the time of sample collection until delivery to the analytical laboratory.

### 2.1.1 Sediment Sampling

Six sediment samples (X-1 through X-6) were collected at the facility. The sediment sample locations are illustrated on **Figure 3**. Sediment samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

### 2.1.2 Surface Soil Sampling

Thirteen surface soil samples (S-1 through S-9, S-11, and S-13 through S-15) were collected at the facility. The surface soil sample locations are illustrated on **Figure 4**. Surface soil samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

### 2.1.3 Soil Borings and Subsurface Soil Sampling

Twenty-two soil borings (B-1 through B-4, and B-6 through B-23) were advanced at the facility. The soil borings locations are illustrated on **Figure 5**. It should be noted that due to heavy concentrations of buried utility lines or other underground obstructions, one planned soil boring (B-5) was not advanced. The soil borings were advanced by Fox Drilling, Inc. (Fox) of Itasca, Illinois, utilizing Geoprobe direct-push drilling techniques. The soil borings were advanced to a maximum depth of 8 feet below grade. All soil borings were backfilled with soil cuttings, and completed at surface grade with the appropriate material (i.e., concrete, asphalt). All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

Soil samples were collected by advancing by a hydraulically-driven stainless steel pre-probe. Soil samples were collected using a 2.0-inch diameter acetate lined soil sampler. Soil samples were continuously collected from the surface to the bottom of the soil borings. The soil samples were visually inspected and field classified using the general guidelines of the Unified Soil Classification System (USCS) and the American Society for Testing and Materials (ASTM) Test Method ASTM D2488 for soil classification.

Each soil sample was field screened for the presence of VOCs using a photoionization detector (PID) and standard headspace screening methods. The PID readings indicate relative levels of VOCs in the vapor headspace, but do not represent actual concentrations which may exist in the soil. The PID has a detection range of 1.0 part per million volume (ppmv) to 2,500 ppmv. The soil sample which exhibited the highest PID reading, or if no PID readings were detected, from directly above the field-interpreted groundwater level, was retained from each boring for laboratory analysis.

### 2.1.4 Monitoring Wells and Groundwater Sampling

Five monitoring wells (MW-2, MW-3, and MW-5 through MW-7) were installed at the facility. The monitoring well locations are illustrated on **Figure 5**. It should be noted that monitoring wells MW-1 and MW-4 were not installed due to the discovery of monitoring wells MW-11 and MW-12, which were installed at the facility during a previous investigation. The monitoring wells were installed by Fox utilizing hollow-stem augers and rotary drilling techniques. The monitoring wells were installed to a maximum depth of 15 feet below grade. Fluids generated during monitoring well installation and groundwater sampling were discharged to the ground surface in proximity to each sampling location. All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

The monitoring wells were installed through the working space within hollow stem augers. The monitoring wells were constructed of 2-inch diameter Schedule 40 PVC 0.010-inch slotted continuous wrap well screen and solid riser. A filter pack consisting of clean silica sand was placed surrounding the well screen to filter out fine soil particles from the formation adjacent to the screen. The filter pack extends from the bottom of the soil boring to approximately 1-foot above the top of the well screen. A bentonite pellet seal was placed on top of the sand pack and hydrated with distilled water to prevent surface water infiltration. The annular space above the bentonite seal was filled with a neat bentonite and cement grout to approximately 6-inches below grade. The monitoring wells were completed at grade and an 8-inch diameter steel protective road box was placed over each monitoring well and set in concrete at grade. The monitoring wells were capped with expandable well caps and equipped with locks to prevent unauthorized access. A monitoring well construction diagram is included in **Appendix A**.

After the installation of the monitoring wells, approximately three to five well volumes of groundwater was removed from each monitoring well, or until the groundwater was relatively free from sediment, using a peristaltic pump. One groundwater sample was collected from each monitoring well and submitted for laboratory analysis. In addition, water quality field parameters consisting of pH, specific conductivity, and temperature were measured and recorded during sample collection.

MWG13-15_45792

## 2.2 Monitoring Well Gauging and Survey

Each monitoring well was gauged using an electronic interface probe in order to determine the presence or absence of liquid-phase hydrocarbons (LPHCs) and depth to groundwater. In addition, each monitoring well's top of casing and ground surface location was surveyed relative to an arbitrary benchmark assigned an elevation of 100 feet.

## 2.3 Equipment Decontamination

The drill rig and associated tooling, and sampling equipment were decontaminated prior to mobilization and before leaving the site. To minimize the potential for cross-contamination, drilling and sampling equipment were decontaminated between each use. Decontamination of drilling equipment consisted of steam cleaning. Sampling equipment, including split spoons and stainless steel sampling equipment, were decontaminated before each use by washing with a solution of Alconox (phosphate based detergent) and potable water, and rinsing with distilled water. Decontamination fluids generated during equipment decontamination were discharged to the ground surface in proximity to each sampling location.

## 3.0 INVESTIGATION FINDINGS

The findings of the subsurface investigation, soil and groundwater sampling, monitoring well gauging, survey, and chemical analysis, are presented below. Analytical results are summarized in **Table 2** through **Table 5**. The analytical reports and chain-of-custody forms are included in **Appendix B**.

Analytical results were compared against the cleanup objectives as presented in 35 Illinois Administrative Code (IAC) Section 742.Appendix B: Table B-Tier 1 Soil Remediation Objectives for Commercial/Industrial Properties, and 35 IAC Section 742.Appendix B: Table E-Tier 1 Groundwater Remediation Objectives for the Direct Ingestion of Groundwater Portion of the Groundwater Ingestion Route.

Soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered. In addition, the groundwater beneath the site is classified as Class II, therefore the Class II baseline was used.

### 3.1 Sediment

**BTEX.** The analytical results indicated that BTEX constituents were not detected above the laboratory method detection limits.

**TPH.** The analytical results indicated that TPH as diesel was detected at concentrations of 630 milligrams per kilogram (mg/kg) in sample X-2 and 17,800 mg/kg in sample X-1, and TPH as oil was detected at concentrations ranging from 223 mg/kg in sample X-6 to 10,900 mg/kg in sample X-4. However, cleanup objectives for TPH have not been established by the IEPA. TPH as gasoline was not detected above the laboratory method detection limits.

**PNAs.** The analytical results indicated that PNA constituents were detected in the sediment samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PCBs.** The analytical results indicated that PCBs were detected at a concentration of 0.17 mg/kg in sample X-1. However, this concentration was not above the IEPA cleanup objective of 1.0 mg/kg.

**Metals.** The analytical results indicated that arsenic and lead were detected at concentrations above the IEPA cleanup objectives of 3 mg/kg and 400 mg/kg, respectively. Arsenic was detected at concentrations ranging from 9.7 mg/kg in sample X-3 to 69 mg/kg in sample X-1. However, only two of the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Arsenic was detected at concentrations greater than 24 mg/kg in samples X-1 and X-4 through X-6. Lead was detected at a concentration of 415 mg/kg in sample X-1.

MWG13-15_45794

**pH.** pH values ranged from 7.38 in sample X-4 to 8.92 in sample X-5.

Analytical results are summarized in **Table 2**, and sampling locations are illustrated on **Figure 3**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.2 Surface Soil

**BTEX.** The analytical results indicated that BTEX constituents were detected in the surface soil samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**TPH.** The analytical results indicated that TPH as gasoline was detected at a concentration of 472 mg/kg in sample S-5, and TPH as diesel was detected at concentrations ranging from 1,290 mg/kg in sample S-7 to 94,000 mg/kg in sample S-2. TPH as oil was detected at concentrations ranging from 390 mg/kg in sample S-1 to 283,000 mg/kg in sample S-8. However, cleanup objectives for TPH have not been established by the IEPA.

**PNAs.** The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene were detected in sample S-1 at concentrations above the IEPA cleanup objectives. It should be noted that samples S-8 and S-13 through S-15 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 3** for PNA results.

**PCBs.** The analytical results indicated that PCBs were detected at concentrations ranging from 0.063 mg/kg in sample S-1 to 0.79 mg/kg in sample S-11. However, these concentrations were not above the IEPA cleanup objective of 1.0 mg/kg.

**Metals.** The analytical results indicated that arsenic and lead were detected at concentrations above the IEPA cleanup objectives of 3 mg/kg and 400 mg/kg, respectively. Arsenic was detected at concentrations ranging from 3.7 mg/kg in sample S-4 to 29 mg/kg in sample S-11. However, the majority of concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Arsenic was detected at a concentration of 29 mg/kg in sample S-11. Lead was detected at a concentration of 1,340 mg/kg in sample S-11.

**pH.** pH values ranged from 6.20 in sample S-8 to 8.72 in sample S-3.

Analytical results are summarized in **Table 3**, and sampling locations are illustrated on **Figure 4**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.3 Subsurface Soil

Native soil encountered beneath the fill material consisted primarily of a brown to gray fine to medium sand to the maximum depth of the borings at 8 feet below grade. Soil boring logs are included in **Appendix A**.

The PID readings obtained from the soil samples collected ranged from 1.4 ppmv in B-13 and B-14 (0 to 4 feet below grade) to 123 ppmv in B-18 (0 to 4 feet below grade). The PID field screening results are recorded on the boring logs in **Appendix A**.

**BTEX.** The analytical results indicated that BTEX constituents were detected in the subsurface soil samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PNAs.** The analytical results indicated that benzo(a)pyrene and dibenzo(a,h)anthracene were detected in B-9 and B-11 at concentrations above the IEPA cleanup objectives. It should be noted that B-16 had an elevated detection limit due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene and benzo(a)pyrene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 4** for PNA results.

**PCBs.** The analytical results indicated that PCBs were detected at a concentration of 1.02 mg/kg in B-15, which is above the IEPA cleanup objective of 1.0 mg/kg.

**Metals.** The analytical results indicated that arsenic was detected at concentrations above the IEPA cleanup objectives of 3 mg/kg. Arsenic was detected at concentrations ranging from 3.3 mg/kg in B-6 and B-16 to 25 mg/kg in B-20. However, the majority of concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Arsenic was detected at a concentration of 25 mg/kg in B-20.

**pH.** pH values ranged from 7.01 in B-12 to 9.34 in B-21.

Analytical results are summarized in **Table 4**, and soil boring locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.4 Groundwater

The groundwater elevations ranged from 1.30 feet in MW-3 to 7.48 feet in MW-6. LPHC was not detected in any of the monitoring wells. Based on the gauging data, the apparent groundwater flow direction beneath the facility has been calculated to be to the east in the direction of Lake Michigan (**Figure 6**, **Groundwater Elevation Map**). Monitoring well gauging data is included in **Appendix C**.

Water quality field parameters consisting of pH, specific conductivity, and temperature were measured. The recorded measurements are summarized in **Table 5**.

**BTEX.** The analytical results indicated that BTEX constituents were detected in the groundwater samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PNAs.** The analytical results indicated that PNA constituents were detected in the groundwater samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PCBs.** The analytical results indicated that PCBs were not detected above the laboratory method detection limit.

**Metals.** The analytical results indicated that arsenic was detected at concentrations above the IEPA cleanup objectives of 0.2 milligrams per liter (mg/l). Arsenic was detected at a concentration of 1.1 mg/l in MW-11.

Analytical results are summarized in **Table 5**, and monitoring well locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

# 4.0 DATA ASSESSMENT

## 4.1 Extent of Contamination

Based on the results of the subsurface investigation conducted, the following determinations and assessments were made regarding the extent of contamination at the facility. The following conclusions are subject to the Limitations presented in **Section 1.4**. In addition, although arsenic was detected above the IEPA cleanup objective, the majority of concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. However, it should be noted that soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered.

### 4.1.1 Sediment

Arsenic and lead were the constituents of concern detected at concentrations above the IEPA cleanup objective of 3 mg/kg and 400 mg/kg, respectively. In addition, arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 69 mg/kg in all six sediment samples collected.

Lead was detected above the IEPA cleanup objectives, at a maximum concentration of 415 mg/kg in the following locations:

- **Wastewater Collection Ponds.** Western wastewater collection pond (X-1).

### 4.1.2 Surface Soil

Arsenic, lead, and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Railroad.** Railroad line northwest of the construction debris area (S-1).

It should be noted that due to matrix interference in samples S-8 and S-13 through S-15, benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from the chimneys/precipitators (S-8), Coal Handling Tractor Maintenance Building (S-13 and S-14), and diesel AST located north of the Coal Handling Tractor Maintenance Building (S-15).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 29 mg/kg in the following locations:

- **Railroad.** Railroad line northwest of the construction debris area (S-1).
- **Jet Fuel ASTs.** Jet fuel ASTs located west of the peaking units (S-2).
- **Peaking Units.** Peaking units located southwest of the main building (S-4 and S-5).
- **Former Ignition Oil Pump House.** The former ignition oil pump house located southeast of the peaking units (S-7).
- **Chimneys/Precipitators.** Chimney units located east of the main building (S-8).
- **Used Oil ASTs.** The AST located east of the northeastern wastewater collection pond (S-9).
- **Transformers.** The transformers on the east side of the southern Crib House (S-11). It should be noted that lead was also detected above the IEPA cleanup objective of 400 mg/kg in this area (S-11) at a maximum concentration of 1,340 mg/kg.
- **Coal Handling Tractor Buildings.** The Coal Handling Tractor Maintenance Building (S-13 and S-14).
- **Diesel AST.** The diesel AST located north of the Coal Handling Tractor Maintenance Building (S-15).

### 4.1.3 Subsurface Soil

Arsenic, PCBs, and PNA constituents listed as benzo(a)pyrene and dibenzo(a,h)anthracene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Gasoline/Diesel ASTs.** The gasoline and diesel AST located west of the two materials storage buildings on the north side of the facility (B-9).
- **Former UST.** A former UST located at the western gate house (B-11).

It should be noted that due to matrix interference in B-16, benzo(a)anthracene and benzo(a)pyrene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. This sample was collected from the construction debris area at the southwestern corner of the facility (B-16).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 25 mg/kg in the following locations:

- **Construction Debris Area.** A construction debris area at the southwestern corner of the facility (B-1 and B-16).
- **Used Oil ASTs.** The AST west of the western wastewater collection pond (B-2).
- **Peaking Units.** Peaking units located southwest of the main building (B-3).

MWG13-15_45799

- **Transformers.** The transformers to the north of the peaking unit building (B-4) and transformers to the northeast of the jet fuel ASTs (B-19).
- **Fire Brigade Area.** A fire brigade area located west of the northeastern wastewater collection pond (B-6 and B-7).
- **Materials Storage Buildings.** The storage buildings located to the west of the fire brigade area (B-8).
- **Gasoline/Diesel ASTs.** The gasoline and diesel AST located west of the two materials storage buildings on the north side of the facility (B-9) and the diesel AST located north of the Coal Handling Tractor Building (B-18).
- **Former UST.** A former UST located at the western gate house (B-10 and B-11).
- **Railroad.** Railroad line in northwest corner of the facility (B-12).
- **Adjacent Properties.** A former tannery located west of the facility (B-12 through B-15)
- **Coal Runoff Pond.** The coal runoff pond located west of the coal pile (B-17).
- **Coal Handling Area.** North of the coal pile (B-20).
- **Ash Storage Area.** Ash storage area located at the southern end of the facility (B-22).
- **Lakeshore.** North of the intake/discharge flume at the northeast end of the facility (B-23).

PCBs were detected above the IEPA cleanup objective in the following locations:

- **Adjacent Properties.** A former tannery located west of the facility (B-15).

#### 4.1.4 Groundwater

Arsenic was the only constituent of concern detected at concentrations above the IEPA cleanup objectives.

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 1.1 mg/l in the following locations:

- **Construction Debris Area.** A construction debris area at the southwestern corner of the facility (MW-11). This area is adjacent to the former Tannery property owned by ComEd.

### 4.2 Potential Contaminant Exposure Pathways

Based on the above-referenced assessment, potential exposure pathways by which humans may be exposed to the constituents of concern have been identified at the facility. Potential sources, fate and transport mechanisms, and exposure media were considered in determining these potential exposure pathways. An identified potential exposure pathway does not imply that exposure is occurring, only that the potential exists for exposure.

### 4.2.1 Soil Ingestion

The soil ingestion pathway includes the first three feet within ground surface. Therefore, based on the analytical results, soil ingestion is a potential contaminant exposure pathway. Soil ingestion occurs when soil containing elevated concentrations of the constituents of concern are ingested into the body. The facility is an industrial site and direct contact and ultimately ingestion of the impacted soil is not likely to occur. However, construction activities would increase the possibility of exposure. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

### 4.2.2 Soil Inhalation

The soil inhalation pathway includes the first ten feet within ground surface. Therefore, based on the analytical results, soil inhalation is a potential contaminant exposure pathway. Soil inhalation occurs when elevated concentrations of the constituents of concern are inhaled into the body. However, the highly volatile constituents (i.e., BTEX, TPH as gasoline), were not detected at concentrations above the IEPA cleanup objectives. The constituents that were detected at concentrations above the IEPA cleanup objectives (i.e., metals, semi-volatiles, PCBs), are not considered highly volatile. Based on the relatively low volatility of the constituents of concern detected above the IEPA cleanup objectives, the soil inhalation exposure pathway is not a likely contaminant exposure pathway.

### 4.2.3 Groundwater Ingestion

The groundwater ingestion pathway includes groundwater being used as a potable source of water. Therefore, due to the fact that the City of Waukegan receives its potable water from Lake Michigan and the groundwater beneath the facility is not being used as a potable source of water, the groundwater ingestion is not a potential contaminant exposure pathway.

Based on the current land use (industrial) and site conditions (analytical results and soil types), it is judged that the potential for human exposure to the constituents of concern from this facility is low. However, personnel working at the facility could be susceptible to exposure due to accidental soil ingestion or soil inhalation due to activities such as construction. Such exposure may result from contact with contaminated subsurface or surface materials previously located beneath a protective barrier (i.e., concrete cap, building).

There is no requirement under Illinois environmental law to further investigate or remediate this property.

| B-23 | Lakeshore | BTEX, PNAs, PCBs, RCRA metals, pH | 1-3 | 10/27/98 |

**Notes:**

BTEX was analyzed using EPA Method 8260.

PNAs were analyzed using EPA Method 8310

PCBs were analyzed using EPA Method 8081.

RCRA metals were analyzed using EPA Method series 6000 and 7000.

pH was measured using EPA Method 9045.

(1) Sampling locations are referenced in the Phase II Environmental Site Assessment Report in **Section 2.0**.

**Notes:**
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.

(2) Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered.

| 499921 | S1 | 10/26/1998 | 10/27/1998 |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NET Job Number: 98.13879

Mr. Wei-Lin Feng

| Analyte | Prep Batch Number | Run Batch Number | Original Analysis | Duplicate Analysis | Units | RPD |
|---|---|---|---|---|---|---|
| pH, Non-Aqueous | | 188 | 7.55 | 7.46 | units | 1.2 |
| pH, Non-Aqueous | | 189 | 7.50 | 7.48 | units | 0.3 |
| Solids, Total | | 2515 | 66.8 | 69.9 | % | 4.5 |
| Solids, Total | | 2515 | 95.0 | 95.2 | % | 0.2 |
| Solids, Total | | 2515 | 89.0 | 89.7 | % | 0.8 |

NOTE: Spikes and Duplicates may not be samples from this job.

RPD - Relative Percent Difference

Advisory Control Limits for Duplicates - RPD should be less than 20.

NET Midwest, Bartlett Division

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| **mg/L** | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| **ug/g** | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| **ug/L** | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| **ug/Kg** | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| **TCLP** | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| **Surr:** | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Enclosed is the Analytical and Quality Control reports for the following samples submitted to Bartlett Division of NET, Inc. for analysis.

Project Description: ComEd-Waukegan; 1801-023-610

| Sample Number | Sample Description | Date Taken | Date Received |
|---|---|---|---|
| 500692 | MW-1 | 10/29/1998 | 10/30/1998 |
| 500693 | MW-2 | 10/29/1998 | 10/30/1998 |
| 500694 | MW-3 | 10/29/1998 | 10/30/1998 |
| 500695 | MW-4 | 10/29/1998 | 10/30/1998 |
| 500696 | MW-5 | 10/29/1998 | 10/30/1998 |
| 500697 | MW-6 | 10/29/1998 | 10/30/1998 |
| 500698 | MW-7 | 10/29/1998 | 10/30/1998 |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

## DUPLICATES

ENSR
740 Pasquinelli Drive
Westmont, IL 60559

Mr. Wei-Lin Feng

11/10/1998

NET Job Number: 98.14078

| Analyte | Prep Batch Number | Run Batch Number | Original Analysis | Duplicate Analysis | Units | RPD |
|---|---|---|---|---|---|---|
| pH | | 1719 | 4.91 | 4.82 | units | 1.8 |
| pH | | 1719 | 6.91 | 6.86 | units | 0.7 |

NOTE: Spikes and Duplicates may not be samples from this job.

RPD - Relative Percent Difference

Advisory Control Limits for Duplicates - RPD should be less than 20.

NET Midwest, Bartlett Division

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| **mg/L** | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| **ug/g** | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| **ug/L** | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| **ug/Kg** | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| **TCLP** | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| **Surr:** | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Spikes and Duplicates may not be samples from this job.

RPD - Relative Percent Difference

Advisory Control Limits for Duplicates - RPD should be less than 20.

NET Midwest, Bartlett Division

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| **mg/L** | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| **ug/g** | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| **ug/L** | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| **ug/Kg** | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| **TCLP** | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| **Surr:** | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

# 1.0 INTRODUCTION

## 1.1 Background

Pursuant to the request of the Illinois Environmental Protection Agency (Illinois EPA), this document presents the Hydrogeologic Assessment Report for the on-site ash pond areas at the Midwest Generation, LLC (MWG) Waukegan Generating Station in Waukegan, Illinois. This hydrogeologic assessment was performed in accordance with the Hydrogeologic Assessment Plan, approved by the Illinois EPA, dated September 3, 2010.

As defined by the Hydrogeologic Assessment Plan, the purpose of this investigation was to: (i) evaluate the potential, if any, for migration of ash-related constituents from the on-site ash ponds and to conduct monitoring for groundwater constituents regulated by the Illinois Part 620 groundwater standards, as requested by the Illinois EPA; (ii) characterize the subsurface hydrogeology; and (iii) identify potable well use within 2,500 feet of the ash ponds. The results of this investigation are described in this Hydrogeologic Assessment Report.

## 1.2 Site Location and Description

The Waukegan facility (the Site) is located in Section 15, Township 45 North, Range 12 East, in the City of Waukegan, Lake County, Illinois. Figure 1 provides a Site Location Map.

The Site contains two active ash ponds. The ponds are lined with a high-density polyethylene (HDPE); the total area of the two ash ponds is approximately 25 acres. Figure 2 shows the locations of the two ash ponds.

## 1.3 Regional Setting

The Site is located along the shore of Lake Michigan on the northeast side of Waukegan. The surrounding land use consists of undeveloped land to the north, apparently vacant industrial land to the south, residential properties to the west, and Lake Michigan to the east.

Patrick Engineering Inc. (Patrick) conducted a review of publically available geological information from the Illinois State Geological Survey website. Based upon water well logs from the area, the geology beneath the Site consists of approximately 100 feet of sand deposits, underlain by Silurian Dolomite to approximately 360 feet below ground surface, underlain by the Maquoketa shale. The Maquoketa shale is generally considered to be an aquitard that separates the shallow groundwater in the unconsolidated units and the Silurian dolomite from the underlying aquifers.

Groundwater flow in the shallow, unconsolidated aquifer would be expected to flow towards Lake Michigan, to the east. Groundwater flow in the deeper aquifers is controlled by the regional hydraulic gradient in these aquifers, which is to the northeast.

# 2.0 HYDROGEOLOGIC ASSESSMENT METHODOLOGY

The following sections present the methodologies used to evaluate the potential for migration of ash-related constituents from the ash ponds and to monitor for all Part 620-regulated constituents, to characterize the subsurface hydrogeology, and to identify potable well use within 2,500 feet of the Site.

## 2.1 Evaluation of Ash-Related Constituents Migration Potential

The Illinois EPA requested that an evaluation of the potential for migration of ash-related constituents from the ash ponds and that monitoring for all Part 620-regulated constituents be performed in accordance with the groundwater standards included in 35 Illinois Administrative Code (IAC) Part 620, Subparts C and D. Accordingly, groundwater monitoring wells were installed at the Site in locations both upgradient and downgradient of the two ash ponds.

### 2.1.1 Installation of Groundwater Monitoring Wells

Patrick installed five (5) groundwater monitoring wells spaced approximately 150 to 300 feet apart around the perimeter of the ash ponds. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. The spacing of the well locations at the Site along the downgradient edge of the ash ponds was calculated so as to detect a groundwater plume emanating from a point source beneath the ash ponds. Figure 3 shows the location of the five monitoring wells.

One of the installed monitoring wells is located upgradient of the ash ponds; the additional four wells are located downgradient of the ash ponds. The well borings were advanced using hollow-stem augers to depths ranging from 30 to 32 feet below ground surface (bgs). Borings were terminated after the field geologist determined that the boring was installed approximately 10 feet past the first intersection of the groundwater table in order to ensure that a representative

groundwater sample could be obtained. Upon termination of each boring, a 2-inch diameter, PVC well was installed in order to collect samples of the groundwater in the uppermost aquifer. The monitoring wells were completed to approximately 3 feet above grade, with PVC casing, and were covered with a stick-up, steel well protector with a locking cap. Soil lithology was inspected and logged by an experienced geologist during the boring process. Boring logs with well construction information are included as Appendix A.

### 2.1.2 Initial Groundwater Sampling and Analytical Testing

The groundwater sampling event for the Site took place on October 25, 2010. The groundwater elevation in each of the five wells was measured prior to sampling. Groundwater samples were collected from each well with a peristaltic pump, using established low-flow sampling techniques. Temperature, pH, and conductivity measurements were taken using a portable meter in all wells; refer to Table 1 for these field parameter results. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature of no higher than 4º F. The samples were transported to TestAmerica, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain the integrity of the samples.

The analytical laboratory tested groundwater samples from each of the wells for the compounds listed in Table 2. Analytes tested include the inorganic compounds listed in 35 IAC 620.410(a), excluding both radium and the poly-aromatic hydrocarbons (PAHs) listed in 35 IAC 620.410(b).

## 2.2 Characterization of Subsurface Hydrogeology

The subsurface hydrogeology beneath the ash ponds was characterized by determining Site lithology and the groundwater flow patterns in the vicinity of the ash ponds as described below.

### 2.2.1 Site Lithology

The Site lithology was determined by logging soil samples collected from the soil borings created during the installation of the groundwater monitoring wells. The soil borings were installed under the direction of an experienced geologist. Each boring was sampled at 2-foot intervals using a 2-inch O.D. split-spoon sampler (ASTM D 1586). Each soil sample was inspected and logged by the geologist during the boring process. Boring logs with well construction information are provided as Appendix A.

### 2.2.2 Topographic and Water Elevation Surveys

A survey crew measured both the top-of-casing and ground surface elevations of all installed monitoring wells and the groundwater elevations within each of the monitoring wells on December 6, 2010. The survey crew concurrently measured the water elevation in the two ash ponds. Lake Michigan was inaccessible the day of the survey.

### 2.2.3 Hydraulic Testing of Selected Wells

Patrick conducted three *in situ* hydraulic conductivity tests on wells MW-1, MW-3, and MW-5 on January 4, 2011. The testing consisted of at least one rising-head and one falling-head slug test performed at each well. Using a data-logging pressure transducer, Patrick measured the rate of groundwater level recovery in the wells after either inserting a slug into, or removing a slug from, each monitoring well.

## 2.3 Identification of Potable Well Use

Natural Resource Technology, Inc. (NRT) has previously completed an investigation of potable water well use within 2,500 feet of the Waukegan ash ponds. MWG submitted the results of this investigation to the Illinois EPA by letter dated July 15, 2009. These results are summarized in Appendix B.

The following databases and sources of information were used in order to identify local community water sources and water well locations in the vicinity of the Site:

- Illinois State Geological Survey (ISGS) -Water Well Database Query;
- Illinois State Water Survey (ISWS) Private Well Database and water well construction report request; and
- Illinois Division of Public Water Supply web-based Geographic System (GIS) files.

# 3.0 HYDROGEOLOGIC ASSESSMENT RESULTS

## 3.1 Evaluation of Ash-Related Constituents Migration Potential

The analytical laboratory results for the hydrogeologic assessment are presented in Table 2. Full laboratory data packages from TestAmerica are provided as Appendix C. Antimony, arsenic, boron, sulfate, and total dissolved solids (TDS) were detected in one or more monitoring wells at concentrations exceeding the Part 620 Class I Groundwater Quality Standards. In some cases, the highest concentrations of a given compound were found in the upgradient wells. Beryllium, cadmium, chromium, cobalt, copper, cyanide, lead, mercury, nickel, silver, thallium, zinc, nitrogen/nitrite, and nitrogen/nitrate/nitrite were not detected in any of the groundwater samples.

A determination of the potential for the individual ash ponds to be contributing to the distribution of analytes in the underlying groundwater and the extent, if any, of such contribution cannot be made from the results of this single sampling event alone. To develop a true, statistically-significant upgradient background concentration for the various compounds will require a number of sequential sampling events over time. Based on a statistically developed background value, downgradient concentrations can be compared to the background value over time to determine the likelihood and extent of any constituent migration from the on-site ash ponds. A plan to develop such an analytical database through additional sampling is presented in the last section of this report.

## 3.2 Characterization of Subsurface Hydrogeology

The lithology of the Site is predominantly fine sand and silt fill underlain by sand and gravel. Refer to Figure 4 for a geologic cross-section of the Site.

The results of the topographic and water elevation surveys are presented in Table 3.

The uppermost groundwater unit at the Site is found at depths ranging from 22.4 to 23 feet bgs. The direction of groundwater flow is to the southeast towards Lake Michigan. The hydraulic

gradient is approximately 0.0017 based upon the groundwater elevation data collected on December 6, 2010. A potentiometric surface map is provided as Figure 5.

Patrick used the hydraulic testing data to calculate the hydraulic conductivity of the uppermost aquifer using the Bouwer and Rice method. Hydraulic conductivity calculations are provided in Appendix D. The hydraulic conductivity of Site soils ranged from 3.67 x $10^{-3}$ to 4.41 x $10^{-3}$ ft/second. The average hydraulic conductivity was 4.04 x $10^{-3}$ ft/second. Using the highest calculated hydraulic conductivity and the measured hydraulic gradient, Patrick calculated the maximum groundwater velocity to be approximately 0.59 ft/day (4.04 x $10^{-3}$ ft/sec x 0.0017 x 60 sec/min x 60 min/hour x 24 hours/day).

## 3.3 Identification of Potable Well Use

As stated above, NRT has previously completed an investigation of potable water well use within 2,500 feet of the Waukegan ash ponds. MWG submitted the results of this investigation to the Illinois EPA by letter dated July 15, 2009. According to this letter, eight potable/industrial use wells are located within a 2,500-foot radius of the Site's ash ponds (refer to Appendix B.) There are no potable use wells to the east or south of the ash ponds.

# 4.0 LONG-TERM MONITORING PLAN

In order to properly assess the groundwater monitoring data collected in this single sampling event, MWG will conduct a quarterly groundwater sampling program in which the same monitoring wells described in this report will be sampled for the identical analyte list employed during this investigation. MWG proposes to begin this quarterly monitoring program in March 2011, and will submit the results of the sampling program to the Illinois EPA on an ongoing, quarterly basis. MWG proposes to continue this program until sufficient statistically-significant data is available to properly assess the groundwater data. If the quarterly sampling results continue to show non-detect results for certain of the analytes, as was the case in this single sampling event, MWG may propose to Illinois EPA that these analytes be eliminated from future sampling events.

# ANALYTICAL REPORT

Job Number: 500-28779-1

Job Description: Waukegan GW Sampling

For:
Patrick Engineering
4985 Varsity Drive
Lisle, IL 60532-4144

Attention: Andrew Gagnon

Approved for release.
Bonnie M Stadelmann
Project Manager II
10/28/2010 4:22 PM

Bonnie M Stadelmann
Project Manager II
bonnie.stadelmann@testamericainc.com
10/28/2010

cc: Ms. Maria Race

These test results meet all the requirements of NELAC for accredited parameters.

The Lab Certification ID#:
TestAmerica Chicago 100201

All questions regarding this test report should be directed to the TestAmerica Project Manager whose signature appears on this report. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.

**Job Narrative**
**500-28779-1**

**Comments**
No additional comments.

**Receipt**
All samples were received in good condition within temperature requirements.

**Metals**
Method(s) 6020: The serial dilution performed for the following sample, 500-28779-1, was outside control limits for As.

Method(s) 6020: The matrix duplicate %RPD for 500-28779-1 was outside the control limits for Sb.

No other analytical or quality issues were noted.

**Field Service / Mobile Lab**
No analytical or quality issues were noted.

**General Chemistry**
Method(s) SM 4500 NO3 F: The nitrate matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 98229 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria. MW-04 (500-28779-4)

No other analytical or quality issues were noted.

# DATA REPORTING QUALIFIERS

Client: Patrick Engineering Job Number: 500-28779-1

| Lab Section | Qualifier | Description |
|---|---|---|
| Metals | | |
| | F | Duplicate RPD exceeds the control limit |
| General Chemistry | | |
| | F | MS or MSD exceeds the control limits |

# QUALITY CONTROL RESULTS

Client: Patrick Engineering Job Number: 500-28779-1

Mr. Basil G. Constantelos: Managing Director, Environmental Services
Midwest Generation EME, LLC
2535 Remington Blvd
Suite A
Bolingbrook, IL 60440

**Re: Violation Notice: Midwest Generation, LLC, Waukegan Generating Station**
**Identification No.: 6281**
**Violation Notice No.: W-2012-00056**

Dear Mr. Constantelos:

This constitutes a Violation Notice pursuant to Section 31(a)(1) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(1), and is based upon a review of available information and an investigation by representatives of the Illinois Environmental Protection Agency ("Illinois EPA").

The Illinois EPA hereby provides notice of alleged violations of environmental laws, regulations, or permits as set forth in Attachment A to this notice. Attachment A includes an explanation of the activities that the Illinois EPA believes may resolve the specified alleged violations. Due to the nature and seriousness of the alleged violations, please be advised that resolution of the violations may also require the involvement of a prosecutorial authority for purposes that may include, among others, the imposition of statutory penalties.

A written response, which may include a request for a meeting with representatives of the Illinois EPA, must be submitted via certified mail to the Illinois EPA within 45 days of receipt of this letter. If a meeting is requested, it shall be held within 60 days of receipt of this notice. The response must include information in rebuttal, explanation, or justification of each alleged violation and a statement indicating whether or not the facility wishes to enter into a Compliance Commitment Agreement ("CCA") pursuant to Section 31(a) of the Act. If the facility wishes to enter into a CCA, the written response must also include proposed terms for the CCA that includes dates for achieving each commitment and may include a statement that compliance has been achieved for some or all of the alleged violations. The proposed terms of the CCA should contain sufficient detail and must include steps to be taken to achieve compliance and the necessary dates by which compliance will be achieved.

The Illinois EPA will review the proposed terms for a CCA provided by the facility and, within 30 days of receipt, will respond with either a proposed CCA or a notice that no CCA will be issued by the Illinois EPA. If the Illinois EPA sends a proposed CCA, the facility must respond in writing by either agreeing to and signing the proposed CCA or by notifying the Illinois EPA that the facility rejects the terms of the proposed CCA.

If a timely written response to this Violation Notice is not provided, it shall be considered a waiver of the opportunity to respond and meet, and the Illinois EPA may proceed with referral to a prosecutorial authority.

Written communications should be directed to:

Illinois EPA – Division of Public Water Supplies
Attn: Andrea Rhodes, CAS #19
P.O. BOX 19276
Springfield, IL 62794-9276

All communications must include reference to this Violation Notice number, W-2012-00056.

Questions regarding this Violation Notice should be directed to Andrea Rhodes at 217/785-0561.

Sincerely,

Michael Crumly
Manager, Compliance Assurance Section
Division of Public Water Supplies
Bureau of Water

CASE ID: 2012-006

**ATTACHMENT A**

**MIDWEST GENERATION, LLC, WAUKEGAN GENERATING STATION, ID:6281**
**VIOLATION NOTICE NO. W-2012-00056:**

A review of information available to the Illinois EPA indicates the following on-going violations of statutes, regulations, or permits. Included with each type of violation is an explanation of the activities that the Illinois EPA believes may resolve the violation.

**Groundwater Quality**

No person shall cause, threaten or allow the release of any contaminant to a resource groundwater such that: treatment or additional treatment is necessary to continue an existing use or to assure a potential use of such groundwater; or an existing or potential use of such groundwater is precluded. No person shall cause, threaten or allow the release of any contaminant to groundwater so as to cause a groundwater quality standard to be exceeded. Midwest Generation, LLC must take actions to mitigate existing contamination and prevent the continuing release of contaminants into the environment.

**Violation Description**

Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring well MW-1 for the following constituents:

| Parameter | Sample Value | GW Standard | Collection Date |
|---|---|---|---|
| pH | 9.54 su | 6.5-9.0 su | 3/14/2012 |
| pH | 9.97 su | 6.5-9.0 su | 6/13/2011 |
| pH | 9.92 su | 6.5-9.0 su | 3/24/2011 |
| Antimony | 0.052 mg/l | 0.006 mg/l | 10/25/2010 |
| Arsenic | 0.078 mg/l | 0.05 mg/l | 3/14/2012 |
| Arsenic | 0.057 mg/l | 0.05 mg/l | 12/6/2011 |

**Re: Compliance Commitment Acceptance**
**Violation Notice: W-2012-00057**
**Midwest Generation, LLC, Powerton Generating Station; ID Number: 6282**

Dear Mr. Kennedy:

The Illinois Environmental Protection Agency ("Illinois EPA") has approved the Compliance Commitment Agreement ("CCA") for Midwest Generation, LLC, Powerton Generating Station. Please find enclosed an executed copy of the CCA for your records.

Failure to fully comply with the CCA may, at the sole discretion of the Illinois EPA, result in referral of this matter to the Office of the Attorney General, the State's Attorney or the United States Environmental Protection Agency.

The CCA does not constitute a waiver or modification of the terms and conditions of any license or permit issued by the Illinois EPA or any other unit or department of local, state or federal government or of any local, state or federal statute or regulatory requirement.

Questions regarding this matter should be directed to Andrea Rhodes at 217/785-0561. Written communications should be directed to the Illinois Environmental Protection Agency, Bureau of Water, CAS #19, P.O. Box 19276, Springfield, IL 62794-9276, and all communications shall include reference to your Violation Notice Number W-2012-00057.

Sincerely,

Michael Crumly
Manager, Compliance Assurance Section

**COMPLIANCE COMMITMENT AGREEMENT**

## I. Jurisdiction

1. This Compliance Commitment Agreement ("CCA") is entered into voluntarily by the Illinois Environmental Protection Agency ("Illinois EPA") and Midwest Generation, LLC, Powerton Generating Station ("Respondent") (collectively, the "Parties") under the authority vested in the Illinois EPA pursuant to Section 31(a)(7)(i) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(7)(i).

## II. Allegation of Violations

2. Respondent owns and operates Powerton Generating Station in Pekin, Tazewell County, Illinois ("Powerton").

3. Pursuant to Violation Notice ("VN") W-2012-00057 issued on June 11, 2012, the Illinois EPA contends that Respondent has violated the following provisions of the Act and Illinois Pollution Control Board ("Board") Regulations:

   a) Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring wells MW-1, MW-2, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, MW-10, MW-11, MW-12, MW-13, MW-14, and MW-15. Section 12 of the Act, 415 ILCS 5/12, 35 Ill. Adm. Code 620.115, 620.301, 620.401, 620.405, and 620.410.

## III. Compliance Activities

4. On September 4, 2012, the Illinois EPA received Respondent's response to VN W-2012-00057, which included proposed terms for a CCA. The Illinois EPA has reviewed Respondent's proposed CCA terms, as well as considered whether any additional terms and conditions are necessary to attain compliance with the alleged violations cited in the VN.

5. Respondent agrees to undertake and complete the following actions, which the Illinois EPA has determined are necessary to attain compliance with the allegations contained in VN W-2012-00057:

   a) The ash ponds at Powerton shall not be used as permanent disposal sites and shall continue to function as treatment ponds to precipitate ash. Ash shall continue to be removed from the ponds on a periodic basis.

   b) The ash treatment ponds shall be maintained and operated in a manner which protects the integrity of the existing liners. During the removal of ash from the ponds, appropriate procedures shall be followed to protect the integrity of the existing liners, including operating the ash removal equipment in a manner which minimizes the risk of any damage to the liner.

   c) During the ash removal process, visual inspections of the ponds shall be conducted to identify any signs of a breach in the integrity of the pond liners. In the event that a breach of the pond liners is detected, Midwest Generation shall promptly notify the Illinois EPA and shall implement a corrective action plan for repair or replacement as necessary, of the liner. Upon the Illinois EPA's approval, and the issuance of any necessary construction permit, Midwest Generation will implement the corrective action plan.

   d) Midwest Generation shall monitor the new well as described in 5(f) below and the existing fifteen groundwater monitoring wells quarterly for constituents in 35 Ill. Adm. Code 620.410(a) and (d), with the exception of radium 226 and 228, and report its findings to the Illinois EPA within 30 days of the end of each quarter. In addition, Midwest Generation shall record and report groundwater elevation and submit a potentiometric surface map with the above quarterly groundwater monitoring report.

   e) Within 90 days of the effective date of the CCA, Midwest Generation shall submit an application for a construction permit to re-line the Ash Surge Basin and the Secondary Ash Settling Basin at Powerton with a 60 mil thickness high density polyethylene ("HDPE") liner or an Illinois EPA approved equivalent material.

   f) Midwest Generation shall install an additional groundwater monitoring well south of monitor well 9, in a location approved by the Illinois EPA, to better define up gradient groundwater quality, within 60 days of the effective date of the CCA.

g) Midwest Generation shall submit an application to establish a GMZ pursuant to 35 Ill. Adm. Code Part 620.250 within 90 days of the effective date of the CCA.

h) Midwest Generation shall enter into an Environmental Land Use Control (ELUC) to cover the area of the Powerton Station property which is contained within the GMZ. Midwest Generation shall submit a proposed draft ELUC to the Illinois EPA for review and comment within 90 days of the effective date of the CCA.

i) Midwest Generation shall record the ELUC within 30 days of approval of the ELUC by the Illinois EPA.

j) Midwest Generation shall establish a GMZ pursuant to 35 Ill. Adm. Code Part 620.250 within one year of the effective date of the CCA.

k) Once the Ash Surge Basin and the Secondary Ash Settling Basin have been lined and a GMZ and ELUC have been established at Powerton, Midwest Generation shall submit a certification (or a statement) of compliance. Midwest Generation may submit either the attached "Illinois EPA Compliance Statement" or another similar writing to satisfy the statement of compliance within one year of the effective date of the CCA.

l) Midwest Generation shall not allow the East Yard Run-off Basin to be part of the ash sluicing flow system. Further, Midwest Generation shall submit monitoring results from water contained in the East Yard Run-off Basin proximate to outfall monitoring point 003 within 60 days of the effective date of the CCA. Quarterly monitoring of the East Yard Run-off Basin shall be for the constituents listed in 35 Ill. Adm. Code 620.410(a) and (d) with the exception of radium 226 and radium 228. At the end of four (4) quarters of monitoring, Midwest Generation may request cessation of water monitoring from the East Yard Run-off Basin.

m) Midwest Generation shall not use any unlined areas for permanent or temporary ash storage or ash handling.

## IV. Terms and Conditions

6. Respondent shall comply with all provisions of this CCA, including, but not limited to, any appendices to this CCA and all documents incorporated by reference into this CCA. Pursuant to Section 31(a)(10) of the Act, 415 ILCS 5/31(a)(10), if Respondent complies with the terms of this CCA, the Illinois EPA shall not refer the alleged violations that are the subject of this CCA, as described in Section II above, to the Office of the Illinois Attorney General or the State's Attorney of the county in which the alleged violations occurred. Successful completion of this CCA or an amended CCA shall be a factor to be weighed, in favor of the Respondent, by the Office of the Illinois Attorney General in determining whether to file a complaint on its own motion for the violations cited in VN W-2012-00057.

7. This CCA is solely intended to address the violations alleged in Illinois EPA VN W-2012-00057. The Illinois EPA reserves and this CCA is without prejudice to, all rights of the Illinois EPA against Respondent with respect to noncompliance with any term of this CCA, as well as to all other matters. Nothing in this CCA is intended as a waiver, discharge, release, or covenant not to sue for any claim or cause of action, administrative or judicial, civil or criminal, past or future, in law or in equity, which the Illinois EPA may have against Respondent, or any other person as defined by Section 3.315 of the Act, 415 ILCS 5/3.315. This CCA in no way affects the responsibilities of Respondent to comply with any other federal, state or local laws or regulations, including but not limited to the Act, and the Board Regulations [and Permit, if applicable].

8. Pursuant to Section 42(k) of the Act, 415 ILCS 5/42(k), in addition to any other remedy or penalty that may apply, whether civil or criminal, Respondent shall be liable for an additional civil penalty of $2,000 for violation of any of the terms or conditions of this CCA.

9. This CCA shall apply to and be binding upon the Illinois EPA, and on Respondent and Respondent's officers, directors, employees, agents, successors, assigns, heirs, trustees, receivers, and upon all persons, including but not limited to contractors and consultants, acting on behalf of Respondent, as well as upon subsequent purchasers of Respondent's Powerton in Pekin, Tazewell County, Illinois.

10. In any action by the Illinois EPA to enforce the terms of this CCA, Respondent consents to and agrees not to contest the authority or jurisdiction of the Illinois EPA to enter into or enforce this CCA, and agrees not to contest the validity of this CCA or its terms and conditions.

11. This CCA shall only become effective:

    a) If, within 30 days of receipt, Respondent executes this CCA and submits it, via certified mail, to Illinois EPA, Bureau of Water, Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702. If Respondent fails to execute and submit this CCA within 30 days of receipt, via certified mail, this CCA shall be deemed rejected by operation of law; and

    b) Upon execution by all Parties.

12. Pursuant to Section 31(a)(7.5) of the Act, 415 ILCS 5/31(a)(7.5), this CCA shall not be amended or modified prior to execution by the Parties. Any amendment or modification to this CCA by Respondent prior to execution by all Parties shall be considered a rejection of the CCA by operation of law. This CCA may only be amended subsequent to its effective date, in writing, and by mutual agreement between the Illinois EPA and Respondent's signatory to this CCA, Respondent's legal representative, or Respondent's agent.

Re: Compliance Commitment Agreement – ELUC
Midwest Generation, LLC, Waukegan Station; ID No. 6281
Violation Notice W-2012-00056

Dear Ms. Rhodes:

The Compliance Commitment Agreement (CCA) for the above referenced site relative to Violation Notice W-2012-00056 was signed by Midwest Generation on October 15, 2012 and executed by Illinois Environmental Protection Agency (IEPA) signature on October 24, 2012 (effective date). Item 5 (f) of the CCA requires that Midwest Generation submit a proposed Environmental Land Use Control (ELUC) to cover the remaining Waukegan Station property to the east that is not already included in the existing ComEd Former Tannery Site ELUC. The proposed ELUC extension is to be submitted to IEPA within 90 days of the effective date of the CCA.

The areal extent of the proposed ELUC extension is provided with the attached documentation (Exhibit B Figure B-4). The western boundary of the proposed ELUC extension abuts the boundary of the existing ELUC. The south boundary is defined by the existing property line. The east boundary is Lake Michigan and the north boundary is defined by the northern extent of the ash pond system. The proposed vertical extent of the ELUC is the unconsolidated overburden deposits overlying the Silurian dolomite bedrock beneath the site. The estimated vertical thickness of the unconsolidated deposits is 100 feet below ground surface based on information provided in the Hydrogeologic Assessment Report dated February 2011 that was submitted to the IEPA.

Attached is a proposed ELUC for the Waukegan Station. Please note that the formal legal description that would be included as part of Exhibit A will be completed upon IEPA approval of the proposed ELUC. This submittal fulfills the requirements set forth under Item 5 (f) of the signed CCA. Please call me at 630-771-7863 if there are any questions.

**THE ABOVE SPACE FOR RECORDER'S OFFICE**

**Environmental Land Use Control**

THIS ENVIRONMENTAL LAND USE CONTROL ("ELUC"), is made this _____ day of _____, 2013, by Midwest Generation, LLC, ("Property Owner") of that portion (as identified in Exhibit A) of the real property located at the common address of Waukegan Station, 401 E. Greenwood Avenue, Waukegan, Illinois 60087 ("Property").

WHEREAS, 415 ILCS 5/58.17 and 35 Ill. Adm. Code 742 provide for the use of an ELUC as an institutional control in order to impose land use limitations or requirements related to environmental contamination so that persons conducting remediation can obtain a No Further Remediation determination from the Illinois Environmental Protection Agency ("IEPA"). The reason for an ELUC is to ensure protection of human health and the environment. The limitations and requirements contained herein are necessary in order to protect against exposure to contaminated groundwater that may be present on the property as a result of past industrial activities on or in the vicinity of the property. Under 35 Ill. Adm. Code 742, the use of risk-based, site-specific remediation objectives may require the use of an ELUC on real property, and the ELUC may apply to certain physical features (e.g., engineered barriers, monitoring wells, caps, etc.).

NOW, THEREFORE, the recitals set forth above are incorporated by reference as if fully set forth herein and the Property Owner agrees as follows:

**Section One.** Property Owner does hereby establish an ELUC on the real estate, situated in the County of Lake, State of Illinois and further described in Exhibit A attached hereto and incorporated herein by reference (the "Property").

Attached as Exhibit B are site maps that show the legal boundary of the Property, any physical features to which the ELUC applies, the horizontal and vertical extent of the contaminants of concern above the applicable remediation objectives for groundwater and the nature, location of the source, and direction of movement of the contaminants of concern, as required under 35 Ill. Adm. Code 742.

**Section Two.** Property Owner represents and warrants it is the current owner of the Property and has the authority to record this ELUC on the chain of title for the Property with the Office of the Recorder or Registrar of Titles in Lake County, Illinois.

**Section Three.** The Property Owner hereby agrees, for itself, and its heirs, grantees, successors, assigns, transferees and any other owner, occupant, lessee, possessor or user of the Property or the holder of any portion thereof or interest therein, that the groundwater under the Property shall not be used as a potable supply of water.

**Section Four.** This ELUC is binding on the Property Owner, its heirs, grantees, successors, assigns, transferees and any other owner, occupant, lessee, possessor or user of the Property or the holder of any portion thereof or interest therein. This ELUC shall apply in perpetuity against the Property and shall not be released until the IEPA determines there is no longer a need for this ELUC as an institutional control or until the IEPA, upon written request, issues a no further remediation determination approving modification or removal of the limitation(s) or requirement(s); and until a release or modification of the land use limitation or requirement is filed on the chain of title for the Property.

**Section Five. Future Improvement of Property**: This ELUC does not limit Property Owner's or its successors' or assigns' ability to construct on or otherwise improve the Property or to allow others to use the Property. Property Owner reserves the right to remove contaminated groundwater from the Property and to dispose of it as is appropriate under applicable laws.

**Section Six. Future Monitoring**: Until such time as this ELUC is released or modified pursuant to the terms of Section Four above, Property Owner shall conduct the following groundwater monitoring program on the Property:

> Monitoring wells MW-1 through MW-7 surrounding the East and West Ash Ponds will be sampled as required under Item 5 (d) of the CCA. These wells will continue to be monitored on a quarterly basis for constituents listed in 35 IAC 620.410(a), with the exception of radium 226/228. The monitoring data will be reported to IEPA within 30 days of the end of each quarter. In addition, an updated groundwater potentiometric surface map will be provided with each quarterly submittal. IEPA, upon written request, may approve a reduction in the frequency and scope of the sampling program in the future. Upon the IEPA's approval, the approved changes in the frequency and scope of the monitoring

program shall be implemented. A change in the frequency and scope of the monitoring program does not require the filing of a modification of this ELUC in the chain of title for the Property.

**Section Seven.** The effective date of this ELUC shall be the date that it is officially recorded in the chain of title for the Property to which the ELUC applies.

**Re: Groundwater ELUC**
**Violation Notice: W-2012-00056**
**Midwest Generation, LLC, Waukegan Generating Station; ID Number: 6281**

Dear Mr. Kennedy:

The Illinois Environmental Protection Agency ("Illinois EPA") has received the Environmental Land Use Control ("ELUC") submitted as required by the approved Compliance Commitment Agreement ("CCA"), in response to the Violation Notice dated June 11, 2012.

The Illinois EPA has reviewed the draft environmental land use control ("ELUC") submitted in response to Item 5(f) of the approved CCA. The Illinois EPA has no further comment on the ELUC as drafted. Midwest Generation should proceed with the ELUC as proposed. Please submit a copy of the filed ELUC to the Illinois EPA.

Questions regarding this matter should be directed to Illinois EPA, Bureau of Water, Lynn Dunaway at 217/785-4787. Written communications should be directed to Illinois EPA – DPWS, Attn: Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702.

Sincerely,

William E. Buscher

Subject: Quarterly Groundwater Monitoring Results – Annual Report 2011
Waukegan Generating Station- Ash Impoundment

Reference: Patrick Project No. 21153.033

To Whom It May Concern:

Patrick Engineering Inc. (Patrick) has prepared this letter report, on behalf of Midwest Generation, LLC, to provide the annual report for groundwater monitoring results associated with the on-site ash ponds at the Waukegan Generating Station (the Site) located at 401 E. Greenwood Ave. in Waukegan, Illinois (Figure 1). The Site is located along the shore of Lake Michigan on the northeast side of Waukegan. The surrounding land use consists of undeveloped land to the north, apparently vacant industrial land to the south, residential properties to the west, and Lake Michigan to the east. The Site contains two active ash ponds.

Five monitoring wells have been installed (MW-1 through MW-5) surrounding the ash impoundments at the Waukegan facility. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. Monitoring well MW-5 is installed upgradient of the ash ponds. The well locations are shown on Figure 2.

This groundwater monitoring is being performed as part of the long-term monitoring plan described in the Hydrogeologic Assessment Report submitted to the Illinois Environmental Protection Agency (Illinois EPA) in February 2011. Groundwater data has been collected on a quarterly basis starting in December of 2010 and is continuing into 2012.

**GROUNDWATER ELEVATIONS**

Groundwater levels in the monitoring wells are collected quarterly prior to sampling. The groundwater levels were compared to the Lake Michigan water levels collected by the NOAA Lake Michigan Water Elevation data at stations collected near Milwaukee, Wisconsin and Calumet, Indiana. The data from these two stations were interpolated to calculate an expected elevation near the Waukegan Station. The fluctuations in the groundwater elevations were compared to the fluctuations in the lake water levels for each monitoring event. There appears to be a correlation between Lake levels and the groundwater levels at the Site. The direction of

groundwater flow at the site is west to east, directly towards Lake Michigan. Groundwater elevation data is summarized in Table 1 and shown on Figure 3. A chart depicting the groundwater elevations as compared to the Lake Michigan elevations is included as Attachment A in this report.

## SAMPLING METHODOLOGY

In accordance with the long-term monitoring plan referenced above, water samples are collected quarterly from five monitoring wells (MW-1 through MW-5) surrounding the ash impoundments at the Waukegan facility. These wells were most recently sampled on December 6, 2011.

Groundwater samples were collected from each well with a peristaltic pump, using established low-flow sampling techniques. Temperature, turbidity, conductivity, dissolved oxygen (DO), oxygen reduction potential (ORP), and pH measurements were taken at each of the wells using a portable meter with a flow through cell. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. Field parameter data is provided in Table 2.

After collection, all samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4° F. The samples were transported to TestAmerica Laboratories, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain sample integrity. Analytes tested included the inorganic compounds listed in 35 Illinois Administrative Code (IAC) 620.410(a), excluding both radium and the poly-aromatic hydrocarbons (PAHs) listed in 35 IAC 620.410(b). Analytical laboratory results are presented in Table 3 (both current and historical). The laboratory analytical reports provided by TestAmerica Laboratories are provided as Attachment C.

## ANALYTICAL RESULTS

Groundwater samples were collected from the 5 monitoring wells on site on a quarterly basis beginning in March 2011. Both the upgradient well and downgradient monitoring wells on site have Class I Groundwater Quality Standard exceedances. The following compounds exceeded their respective Class I standards: arsenic, boron, manganese, sulfate, chloride and total dissolved solids.

Patrick compared upgradient well concentrations with downgradient well concentrations. The concentrations of boron, iron, manganese, chloride and total dissolved solids are higher, sometimes significantly higher, in the upgradient well (MW-5) than in the downgradient wells. The downgradient wells, MW-1 through MW-4, have higher concentrations of arsenic, with the highest concentrations found in MW-1 (the northernmost downgradient well).

Patrick performed a trend analysis on the following analytical parameters, (arsenic, barium, cyanide, iron, manganese, selenium, boron, sulfate, chloride, nitrogen-nitrate, total dissolved solids, fluoride, and nitrogen-nitrate-nitrite). Analytical parameters without any detections were not included in the analysis. There were no statistically significant (at the 95% confidence level) increasing or decreasing trends for any of the analyzed compounds. Trend analysis charts are included in Attachment B of this report.

Quarterly Groundwater Monitoring Results – Annual Report 2011
Waukegan Generating Station- Ash Impoundment
March 5, 2012

In accordance with the long-term monitoring plan, groundwater samples from the ash pond wells at the Waukegan facility will continue to be collected, analyzed, and reported to Illinois EPA on a quarterly basis until sufficient statistically-significant data is available to properly assess the groundwater data.

If you have any questions, please contact me at 630-795-7464.

Sincerely,

**PATRICK ENGINEERING INC.**

TestAmerica Job ID: 500-43000-1

## Qualifiers

### General Chemistry

| Qualifier | Qualifier Description |
|---|---|
| ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ☼ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CNF | Contains no Free Liquid |
| DL, RA, RE, IN | Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| EDL | Estimated Detection Limit |
| EPA | United States Environmental Protection Agency |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RL | Reporting Limit |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

KPRG Project No. 12313.2

Re: Quarterly Groundwater Monitoring Results – Fourth Quarter 2013 and Annual
Waukegan Generating Station – Ash Impoundments
Compliance Commitment Agreement VN W-2012-00056; ID# 6281

Dear Ms. Rhodes:

The fourth quarterly groundwater sampling for 2013 has been completed for the ash pond monitoring wells located at the Midwest Generation, LLC (Midwest Generation) Waukegan Generating Station in accordance with the signed Compliance Commitment Agreement (CCA) with Illinois Environmental Protection Agency (IEPA) dated October 24, 2012. This quarterly monitoring report is being submitted by KPRG and Associates, Inc. (KPRG), on behalf of Midwest Generation, summarizing the results of the monitoring event. This report is also intended to serve as the Annual Report and includes historical data analysis/summaries.

Well Inspection and Sampling Procedures

The groundwater monitoring network around the ash ponds at this facility consists of seven wells (MW-01 through MW-07) as shown on Figure 1. As part of sampling procedures, the integrity of all monitoring wells was inspected and water levels obtained using an electronic water level meter (see summary of water level discussion below). Wells MW-01 through MW-04 were completed as flush-mounts at ground surface. The concrete anchors, protector boxes and interior casings were in good condition. Wells MW-05 through MW-07 were completed with stick-up protector casings. These wells were found in good condition with locked protector casings and the concrete surface seals were intact.

MWG13-15_20459

Groundwater samples at well locations MW-01 through MW-07 were collected using the low-flow sampling technique. One duplicate sample (MW-07) was collected for quality assurance purposes. In addition, a deionized water trip blank was placed with the sample bottle shipment by the laboratory and accompanied the groundwater samples bottles from and back to the laboratory. The groundwater monitoring samples and the duplicate sample were analyzed for the inorganic compounds listed in Illinois Administrative Code (IAC) 620.410(a), 620.410(d) and 620.410(e), excluding radium 226/228. The trip blank was analyzed for the volatile organic compounds (VOCs) listed in IAC 620.410(d).

Groundwater Flow Evaluation

Water level data from the most recent round of sampling along with historical water levels obtained from each well are summarized in Table 1. The water levels from the most recent sampling were used to generate a groundwater flow map which is provided on Figure 2. The water elevation data indicates a general southeasterly flow of groundwater. The flow conditions observed during this sampling are consistent with historical conditions reported for the site.

Relative to an annual evaluation of groundwater levels, a historical hydrograph is presented in Attachment 1. The hydrograph indicates that after a groundwater elevation low noted in 4th quarter 2012 sampling, groundwater levels at all wells have recovered approximately 2 feet overall and that water levels have stabilized within the last two quarters of 2014.

Summary of Analytical Data

A copy of the analytical data package is provided in Attachment 2. The field parameter and analytical data from the most recent sampling, along with the previous eight quarters of data, are summarized in Table 2. The duplicate sample was collected from well MW-07. The data are generally consistent with previous data generated for the site. All wells for which the sampling data reports a value above one or more groundwater standards are located within the area of the approved Environmental Land Use Control (ELUC).

At this time a statistical evaluation of background water quality for comparing against downgradient wells has not been completed. The initial anticipated background well installation (MW-05) indicates impacts that are not associated with the ash ponds at the site and therefore, IEPA does not recognize the water quality data from this well as representative of background. A new potential background monitoring well (MW-06) has since been installed and is included within the quarterly sampling. An initial review of the data suggests that this location may provide a representative background water quality with which to perform a statistical evaluation. In general, a minimum of eight quarters of data are required to provide a meaningful statistical analysis of background water quality. The next Annual Report will include this analysis.

MWG13-15_20460

Relative to an annual evaluation of the water chemistry data, time versus concentration curves are provided in Attachment 3 for each parameter analyzed. The curves include the Class I drinking water standard for reference, where appropriate. The following noteworthy observations are made for 2013:

- Arsenic detections at well MW-01 are consistently higher than at the other well locations. The arsenic concentration at this well has been overall decreasing since the 2nd quarter 2011 sampling. Arsenic concentrations at the remaining wells have been overall stable.

- Boron concentrations at wells MW-05 and MW-07 are consistently higher than at the other locations. Well MW-05 is immediately upgradient of the ash ponds and MW-07 is slightly downgradient and to the south. This suggests that the elevated boron concentrations at these locations are not associated with the subject ash ponds.

- Chloride concentration curves are overall stable with the exception of well MW-05 where some temporal scatter is apparent. In 2013, there was spike in chloride concentrations at this well location which have subsequently diminished to below the Class I groundwater standard in the 4th quarter sampling.

- There was a spike of dissolved iron at well MW-06 during the 3rd quarter sampling and the concentration has subsequently shown a decrease to below the Class I groundwater standard. Well MW-07 consistently shows dissolved iron concentrations higher than the remaining wells.

- Well MW-05, MW-06 and MW-07 were the only wells with detections of dissolved manganese above the groundwater standard since the 3rd quarter 2011 sampling. Overall concentrations appear to be stabilized to decreasing in 2013.

- Wells MW-05 and MW-07 are the only wells historically with detections of dissolved sulfate above the groundwater standard. The remaining sulfate concentrations appear to be fairly stable over the last year.

- Wells MW-05 and MW-07 are the only wells historically with detections of Total Dissolved Solids (TDS) above the Class I groundwater standard. The concentrations at these wells and the remaining wells appear overall stable with the exception of a non-reproducible spike in TDS at well MW-05 in the 2nd quarter 2013.

As noted previously, all wells for which the sampling data reports a value above one or more applicable groundwater standards are located within the area of the approved ELUC.

## Job ID: 500-66210-1

**Laboratory: TestAmerica Chicago**

**Narrative**

**Job Narrative**
**500-66210-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 11/5/2013 3:58 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 3.4° C and 3.6° C.

**GC/MS VOA**
No analytical or quality issues were noted.

**Metals**
Method(s) 6020A: The serial dilution performed for the following sample(s) associated with batch 212540 was outside control limits for managnese; however, the duplicate, matrix spike, matrix spike duplicate and all other batch QC were within control limits. data has been qualified and is being reported.: MW 1 (500-66210-1)

No other analytical or quality issues were noted.

**Field Service / Mobile Lab**
No analytical or quality issues were noted.

**General Chemistry**
No analytical or quality issues were noted.

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits. |
| F | MS/MSD Recovery and/or RPD exceeds the control limits |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

# ANNUAL and QUARTERLY GROUNDWATER MONITORING REPORT WAUKEGAN GENERATING STATION

January 22, 2015

VIA FEDERAL EXPRESS

Ms. Andrea Rhodes
Illinois Environmental Protection Agency
Division of Public Water Supplies
MC#19
1021 North Grand Avenue East
Springfield, IL 62794-9276

Re: Annual and Quarterly Groundwater Monitoring Results – Fourth Quarter 2014
Waukegan Generating Station – Ash Impoundments
Compliance Commitment Agreement VN W-2012-00056; ID# 6281

Dear Ms. Rhodes:

The fourth quarterly groundwater sampling for 2014 has been completed for the ash pond monitoring wells located at the Midwest Generation, LLC (Midwest Generation) Waukegan Generating Station in accordance with the Compliance Commitment Agreement (CCA) with Illinois Environmental Protection Agency (IEPA) dated October 24, 2012. This quarterly monitoring report summarizes the results of the monitoring event and is also intended to serve as the Annual Report and includes historical data analysis/summaries.

## Well Inspection and Sampling Procedures

The groundwater monitoring network around the ash ponds at this facility consists of seven wells (MW-01 through MW-07) as shown on Figure 1. As part of sampling procedures, the integrity of all monitoring wells was inspected and water levels were obtained using an electronic water level meter (see summary of water level discussion below). Wells MW-01 through MW-04 are completed as flush-mounts at ground surface. The concrete anchors, protector boxes and interior casings were in good condition. Wells MW-05 through MW-07 are completed with stick-up protector casings. The wells were found in good condition with locked protector casings and the concrete surface seals were intact. Well MW-05 has a slightly damaged hinge on the protective casing lid, but the hinge is still functional and the integrity of the protective casing is intact.

Groundwater samples at well locations MW-01 through MW-07 were collected using the low-flow sampling technique.

One duplicate sample (well MW-07) was collected for quality assurance purposes. In addition, a deionized water trip blank was placed with the sample bottle shipment by the laboratory and accompanied the groundwater sample bottles from and back to the laboratory. The groundwater monitoring samples and the duplicate sample were analyzed for the inorganic compounds listed in Illinois Administrative Code (IAC) 620.410(a), 620.410(d) and 620.410(e), excluding radium 226/228. The trip blank was analyzed for the volatile organic compounds (VOCs) listed in IAC 620.410(d).

Groundwater Flow Evaluation

Water level data from the most recent round of sampling along with historical water levels obtained from each well are summarized in Table 1. The water levels from the most recent sampling were used to generate a groundwater flow map which is provided on Figure 2. The water elevation data indicates a general southeasterly flow of groundwater. The flow conditions observed during this sampling are generally consistent with historical conditions reported for the site.

Relative to an annual evaluation of groundwater levels, a historical hydrograph is presented in Attachment 1. The hydrograph indicates that after a groundwater elevation low noted in 4th quarter 2012 sampling, groundwater levels at all wells have recovered approximately 2 feet overall and that water levels have stabilized. Highest water levels were associated with the spring sampling event (May 2014) and the lowest water levels were associated with the summer sampling event (August 2014) suggesting some seasonal variations on the order of 2 to 2.5 feet.

Summary of Analytical Data

A copy of the analytical data package is provided in Attachment 2. The field parameter and analytical data from the most recent sampling, along with the previous eight quarters of data, are summarized in Table 2. The duplicate sample was collected from well MW-07. The data are generally consistent with previous data generated for the site. Any exceptions are discussed in greater detail below. All wells for which the sampling data reports a value above one or more groundwater standards are located within the area of the approved Environmental Land Use Control (ELUC).

At this time a statistical evaluation of background water quality for comparing against downgradient wells has not been completed. Data from the initial anticipated background well installation (MW-05) indicated impacts that are not associated with the ash ponds at the site and therefore, IEPA does not recognize the water quality data from this well as representative of background. A new potential background monitoring well (MW-06) has been installed and is included within the quarterly sampling. An initial review of the MW-06 data suggests that this well location may provide a representative background water quality with which to perform a statistical evaluation, however there are some detections of boron above the Class I standard which may be originating from off-site. In general, a minimum of eight quarters of data are required to provide a meaningful statistical analysis of background water quality. The exact nature of the statistics that will be required by IEPA is still in the process of being finalized.

Relative to an annual evaluation of the water chemistry data, time versus concentration curves are provided in Attachment 3 for each parameter analyzed. The curves include the Class I drinking water standard for reference, where appropriate. The following noteworthy observations are made for 2014:

- Arsenic detections at well MW-01 are consistently higher than at the other well locations. The arsenic concentration at this well has been overall decreasing since the 2nd quarter 2011 sampling, however a spike in concentration is noted for the 4th quarter 2014. The nature of this spike will be evaluated as additional quarterly data is collected. Arsenic concentrations at the remaining wells have been overall stable.

- Boron concentrations at wells MW-05 and MW-07 are consistently higher than at the other locations. Well MW-05 is immediately upgradient of the ash ponds and MW-07 is slightly sidegradient and to the south. This suggests that the elevated boron concentrations at these locations are not associated with the subject ash ponds.

- Chloride concentration curves are overall stable with the exception of well MW-05 where some temporal scatter is apparent. In 2013, there was spike in chloride concentrations at this well location which have subsequently diminished to below the Class I groundwater standard in the 4th quarter 2013 sampling and throughout 2014.

- There was some variability in iron concentrations at wells MW-05 and MW-06 over 2014 with overall increasing trends at these locations. Both of these wells are upgradient of the ash ponds being monitored. Well MW-07 consistently shows dissolved iron concentrations higher than the remaining wells, however with an overall decreasing trend.

- Wells MW-05, MW-06 and MW-07 were the only wells with detections of dissolved manganese above the groundwater standard since the 3rd quarter 2011 sampling. Manganese concentrations at all other locations appear fairly stable and are generally below the comparison standard.

- Wells MW-05 and MW-07 are the only wells with historic detections of dissolved sulfate above the comparison groundwater standard. The remaining sulfate concentrations appear to be fairly stable over the last year.

- Wells MW-05 and MW-07 are the only wells with historic detections of Total Dissolved Solids (TDS) above the comparison groundwater standard. The concentrations at these wells and the remaining wells appear overall stable with the exception of a non-reproducible spike in TDS at well MW-05 in the 2nd quarter 2013.

- The 4th quarter sampling for vanadium at well MW-01 appears to show a spike in concentration that is not consistent with historical data. Subsequent quarterly sampling will determine the nature of this spike in concentration at this location.

As noted previously, all wells for which the sampling data reports a value above one or more applicable groundwater standards are located within the area of the approved ELUC.

If there are any questions, please contact either James DiCola of NRG Energy at 815-207-5968 or Richard Gnat of KPRG at 262-781-0475.

Sincerely,

Mark Nagel
Station Manager

## Job ID: 500-87368-1

**Laboratory: TestAmerica Chicago**

**Narrative**

**Job Narrative**
**500-87368-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 11/6/2014 10:25 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 2.4° C, 2.8° C, 3.1° C and 4.1° C.

**GC/MS VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Metals**
Method(s) 6020A: The low level calibration check standard (CCVL) at lines 44 and 56 in AD batch 264940 were outside the acceptance criteria for Sb. The associated sample concentrations were non-detect and therefore not affected by a high bias in the CCVL: (500-87368-1 DU), (500-87368-1 MS), (500-87368-1 MSD), (500-87368-1 SD), Duplicate (500-87368-4), MW-01 (500-87368-8), MW-02 (500-87368-9), MW-03 (500-87368-10), MW-05 (500-87368-1), MW-06 (500-87368-2), MW-07 (500-87368-3)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Field Service / Mobile Lab**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**General Chemistry**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits. |
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| F1 | MS and/or MSD Recovery exceeds the control limits |

### General Chemistry

| Qualifier | Qualifier Description |
|---|---|
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

Re: Annual and Quarterly Groundwater Monitoring Results – Fourth Quarter 2015
Waukegan Generating Station – Ash Impoundments
Compliance Commitment Agreement VN W-2012-00056; ID# 6281

Dear Ms. Rhodes:

The fourth quarterly groundwater sampling for 2015 has been completed for the ash pond monitoring wells located at the Midwest Generation, LLC (Midwest Generation) Waukegan Generating Station in accordance with the Compliance Commitment Agreement (CCA) with Illinois Environmental Protection Agency (IEPA) dated October 24, 2012. This quarterly monitoring report summarizes the results of the monitoring event and is also intended to serve as the Annual Report and includes historical data analysis/summaries.

## Well Inspection and Sampling Procedures

The groundwater monitoring network around the ash ponds at this facility consists of seven wells (MW-01 through MW-07) as shown on Figure 1. As part of sampling procedures, the integrity of all monitoring wells was inspected and water levels were obtained using an electronic water level meter (see summary of water level discussion below). Wells MW-01 through MW-04 are completed as flush-mounts at ground surface. The concrete anchors, protector boxes and interior casings were in good condition. Wells MW-05 through MW-07 are completed with stick-up protector casings. The wells were found in good condition with locked protector casings and the concrete surface seals were intact.

Groundwater samples at well locations MW-01 through MW-07 were collected using the low-flow sampling technique.

One duplicate sample (well MW-07) was collected for quality assurance purposes. The groundwater monitoring samples and the duplicate sample were analyzed for the inorganic compounds listed in Illinois Administrative Code (IAC) 620.410(a), 620.410(d) and 620.410(e), excluding radium 226/228.

Groundwater Flow Evaluation

Water level data from the most recent round of sampling along with historical water levels obtained from each well are summarized in Table 1. The water levels from the most recent sampling were used to generate a groundwater flow map which is provided on Figure 2. The water elevation data indicates a general east-southeasterly flow of groundwater in the vicinity of the ash ponds. The flow conditions observed during this sampling are generally consistent with historical conditions reported for the site.

Relative to an annual evaluation of groundwater levels, a historical hydrograph is presented in Attachment 1. The hydrograph indicates a groundwater elevation cycle with the seasons. The higher water levels were associated with the spring sampling event (May 2014 and April 2015) followed by a drop and recovery, suggesting some seasonal variations on the order of 2 to 3 feet. It is also noted that there has been an overall general rise in water levels in all wells since the fourth quarter 2012 sampling.

Summary of Analytical Data

A copy of the analytical data package is provided in Attachment 2. The field parameter and analytical data from the most recent sampling, along with the previous eight quarters of data, are summarized in Table 2. As stated above, a duplicate sample was collected from well MW-07. The data are generally consistent with previous data generated for the site. The duplicate values were within an acceptable range (below +/- 30%) with the exception of benzene which was detected at a trace level in the duplicate but not in the investigative sample. Benzene is not usually considered and indicator parameter for coal ash. Any exceptions are discussed in greater detail below. All wells for which the sampling data reports a value above one or more groundwater standards are located within the area of the approved Environmental Land Use Control (ELUC).

At this time a statistical evaluation of background water quality for comparing against downgradient wells has not been completed. Data from the initial anticipated background well installation (MW-05) indicated impacts that are not associated with the ash ponds at the site and however, IEPA does not recognize the water quality data from this well as representative of background. A new potential background monitoring well (MW-06) has been installed and is included within the quarterly sampling. An initial review of the MW-06 data suggests that this well location may provide a representative background water quality with which to perform a statistical evaluation, however there are some detections of boron above the Class I standard which may be originating from off-site.

Relative to an annual evaluation of the water chemistry data, time versus concentration curves are provided in Attachment 3 for each parameter analyzed. The curves include the Class I drinking water standard for reference, where appropriate.

As noted previously, all wells for which the sampling data reports a value above one or more applicable groundwater standards are located within the area of the approved ELUC.

If there are any questions, please contact either Sharene Shealey of NRG Energy at 815-372-4625 or Richard Gnat of KPRG at 262-781-0475.

Sincerely,

Mark Nagel
Station Manager

Notes: Standards obtained from IAC, Title 35, Chapter I, Part 620, Subpart D, Section 620.410 - Groundwater Quality Standards for Class I: Potable Resource Groundwater
All values are in mg/L (ppm) unless otherwise noted.

DL - Detection limit
NA - Not Applicable
ND - Not Detected
NM - Not Measured

NR - Not Required
NS - Not Sampled
^ - Denotes instrument related QC exceeds the control limits
F1- MS and/or MSD Recovery outside of limits.

| | | |
|---|---|---|
| Temperature | °C | degrees Celcius |
| Conductivity | ms/cm$^c$ | millisiemens/centimeters |
| Dissolved Oxygen | mg/L | milligrams/liter |
| Oxygen Reduction Potential (ORP) | mV | millivolts |

No additional comments.

**Receipt**
The samples were received on 11/3/2015 10:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 3.6º C, 3.8º C, 4.3º C, 5.6º C and 5.9º C.

**GC/MS VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Metals**
Method(s) 6020A: The CRI standard associated with analytical batch 500-312167 was above the control limit for iron (Fe). Associated sample concentrations were non-detect; therefore, results are not affected by a high bias in the CRI. All other batch QC were within control limits. Data has been qualified and reported.

Method(s) 6020A: The continuing calibration verification (CCV) and initial calibration verification (ICV) associated with batch 500-312167 recovered above the upper control limit for silver (Ag). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Field Service / Mobile Lab**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**General Chemistry**
Method(s) 314.0: Due to matrix, the following samples in batch 91890 were passed through cleanup cartridges prior to analysis. Total 5 Ba-Ag-H were used for the project. Dionex OnGuard II Ba/Ag/H , 2.5cc cartridges, Lot No.:150820-2.5-Ba-Ag-H.

MW-05 (500-103417-5), DUPLICATE (500-103417-8), (LCS 320-91890/44), (MB 320-91890/43), (500-103417-M-5 MS) and (500-103417-M-5 MSD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Project/Site: Waukegan Station Ash Ponds

TestAmerica Job ID: 500-103417-1

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

Use this line for the HOLD location address or for continuation of your shipping address.

City State ZIP

HOLD Weekday
FedEx location address REQUIRED. NOT available for FedEx First Overnight.

HOLD Saturday
FedEx location address REQUIRED. Available ONLY for FedEx Priority Overnight and FedEx 2Day to select locations.

**4 Express Package Service** * To most locations.

NOTE: Service order has changed. Please select carefully.

Packages up to 150 lbs.
For packages over 150 lbs., use the new FedEx Express Freight US Airbill.

| Next Business Day | 2 or 3 Business Days |
|---|---|
| ☐ FedEx First Overnight — Earliest next business morning delivery to select locations. Friday shipments will be delivered on Monday unless SATURDAY Delivery is selected. | ☐ FedEx 2Day A.M. — Second business morning.* Saturday Delivery NOT available. |
| ☐ FedEx Priority Overnight — Next business morning.* Friday shipments will be delivered on Monday unless SATURDAY Delivery is selected. | ☐ FedEx 2Day — Second business afternoon.* Thursday shipments will be delivered on Monday unless SATURDAY Delivery is selected. |
| ☑ FedEx Standard Overnight — Next business afternoon.* Saturday Delivery NOT available. | ☐ FedEx Express Saver — Third business day.* Saturday Delivery NOT available. |

**5 Packaging** * Declared value limit $500.

☐ FedEx Envelope* ☐ FedEx Pak* ☐ FedEx Box ☐ FedEx Tube ☑ Other

**6 Special Handling and Delivery Signature Options**

☐ SATURDAY Delivery
NOT available for FedEx Standard Overnight, FedEx 2Day A.M., or FedEx Express Saver.

☐ No Signature Required — Package may be left without obtaining a signature for delivery.

☐ Direct Signature — Someone at recipient's address may sign for delivery. *Fee applies.*

☐ Indirect Signature — If no one is available at recipient's address, someone at a neighboring address may sign for delivery. For residential deliveries only. *Fee applies.*

**Does this shipment contain dangerous goods?**

One box must be checked.

☑ No ☐ Yes — As per attached Shipper's Declaration. ☐ Yes — Shipper's Declaration not required. ☐ Dry Ice — Dry Ice, 9, UN 1845 ____ x ____ kg

Dangerous goods (including dry ice) cannot be shipped in FedEx packaging or placed in a FedEx Express Drop Box.

☐ Cargo Aircraft Only

**7 Payment** *Bill to:*

Enter FedEx Acct. No. or Credit Card No. below. Obtain recip. Acct. No. ☐

☐ Sender Acct. No. in Section 1 will be billed. ☐ Recipient ☐ Third Party ☐ Credit Card ☐ Cash/Check

Total Packages Total Weight lbs. Credit Card Auth.

†Our liability is limited to US$100 unless you declare a higher value. See the current FedEx Service Guide for details.

KPRG Project No. 16714.1

Re: CCB Determination Support, Midwest Generation Will County Station

Dear Ms. Shealey:

KPRG and Associates, Inc. (KPRG) is pleased to provide this summary letter report with regard to evaluating whether coal ash formerly deposited at the Midwest Generation Will County Station can be classified as Coal Combustion Byproduct (CCB). This letter report provides a brief summary of the project objective, documents the work performed by KPRG, and summarizes the analytical data along with statistical analysis and interpretation of the data. Each item is discussed separately below.

## PROJECT OBJECTIVE

The project objective was to develop a data set to evaluate the potential for classifying this material as CCB for beneficial reuse relative to the regulatory criteria set forth in 415 ILSC 5/3.135 (formerly 415 ILSC 5/3.94) a-5(B) which states that: "CCB shall not exceed Class I Groundwater Standards for metals when tested utilizing test method ASTM D3987-85. The sample or samples tested shall be representative of the CCB being considered for use."

## DOCUMENTATION OF FIELD ACTIVITIES

KPRG mobilized technical personnel and a geoprobe contractor to the site. A 4 by 7 grid (each grid was 25 feet square) was established over the study area resulting in the potential for 28 samples. The grid was labeled with A, B, C and D along one side and numbers 1 through 7 along the other, resulting in grid nomenclature of A1, B1, C1 and so on through D7. However, due to the irregular boundary of the material, a subtotal of 20 grids were utilized for sample collection. One geoprobe boring was advanced within the

center of each of these 20 grids. Approximate geoprobe drilling locations are shown on Figure 1.

Geoprobe borings were advanced at each marked location through the ash/slag deposits to the top of bedrock (dolomite). Continuous sample cores were obtained, visually logged and screened in the field for total organic vapors using a photoionization detector (PID). It is noted that no PID readings were measured in any of the borings.

One composite sample was collected from each boring from the entire vertical profile and placed into a plastic bag for mixing. Once thoroughly mixed/composited, an appropriate sample aliquot was placed into a laboratory prepared container for analysis of Neutral Leach Extraction Test (NLET; method ASTM D3987-85) metals and stored on ice for delivery to the laboratory.

Once drilling was completed at a particular location, the boring was backfilled with any remaining sample core along with granular bentonite to the ground surface.

The samples were delivered to TestAmerica Laboratories in University Park, Illinois under a properly completed chain-of-custody for chemical analysis.

## DATA PRESENTATION AND STATISTICAL ANALYSIS

The NLET metals analyses are summarized in Table 1 along with the Class I groundwater standards for comparison. The "non-detects" reported on the lab sheets in Attachment 1 are recorded as "less than the method detection limit" in Table 1. A review of the data set indicates that there were no detections higher than any Class I drinking water standard for these metals.

Statistical analyses were subsequently performed on the entire population of 20 samples. A review of the data indicates that there were no detections of antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, mercury, molybdenum, nickel, potassium, selenium, silver, thallium or zinc in the leachate from any of the samples analyzed. The method detection limits (MDLs) for these compounds were all substantially below the Class I groundwater standards. Therefore, for these compounds, it can be confidently said that there are no exceedances associated with the tested materials.

Relative to the remaining compounds (boron, iron and sodium), the data set was first evaluated for normality by the calculation of the arithmetic mean, standard deviation and the coefficient of variance (CV). For the purposes of this evaluation, all "non-detect" values were assigned a value of one-half the MDL which is an accepted method for handling censored or non-detect values within a data set (Gilbert, 1987). The formulas used for the statistical calculations are provided in Attachment 2 and the initial results are tabulated in Table 2. In general, if CV is less than or equal to 1, then the data set is considered "normal" and as a rule of thumb if the CV is between 1 and 1.2, then the

arithmetic mean and standard deviation is still an adequate estimator for the data set (Gilbert, 1987; Koch and Link, 1980). Any values of CV above 1.2 indicate that the data set is not normal and an alternate statistical evaluation must be considered to estimate the mean and standard deviation.

A review of the initial statistical evaluations in Table 2 indicates that the data set for all metals are normal and that the arithmetic mean is a good estimator of the true mean of the concentration of these compounds in the leachate.

Subsequent calculation of the standard error and the 95% Upper Confidence Limit (UCL; assuming a one-tailed distribution since we are only concerned about a regulatory exceedance) was performed for each parameter. The 95% UCL provides the 95% probability that the true mean of the data set is less than the calculated value. The results are included in Table 2. A review of the table indicates that none of the calculated means and 95% UCLs are above the Class I groundwater standards for those compounds.

The next step in the statistical evaluation process was to determine whether the sample size was sufficient to support the above statistics. This was accomplished by calculating a Lambda (λ) value which is a function of the regulatory threshold concentration (in this case the Class I groundwater standard for each parameter), the mean and the standard deviation (see equation in Attachment 2). The λ value is then entered into the statistical table included in Attachment 2 to estimate the sample size that would be required to assure a valid statistical representation. To obtain the appropriate sample size from the table of λ values, the single-sided value with the α and β errors set at 0.05 was used. The α error is the probability of rejecting a true hypothesis (in this case this probability was set at 5%); the hypothesis being that the true mean is less than the regulatory threshold. The β error is the probability of accepting a false hypothesis. The number of samples obtained from the λ table required for a valid data set for each of the parameters being evaluated is included in Table 2. A review of the results indicate that the existing data set of 20 values is sufficient to adequately characterize the materials sampled.

## CONCLUSIONS

Based on the data and statistical analysis discussed above, the following conclusions are provided:

- The ash deposits are consistent and homogenous consisting bottom ash/slag from the coal combustion process.
- There were no outlier samples, and all samples collected were used in the calculations.
- The NLET metals data from the 20 sample locations indicate with a high degree of statistical certainty that the criteria established in 415 ILSC 5/3.135 (formerly 415 ILSC 5/3.94) a-5(B) are met and that the material may be considered CCB relative to this criterion for engineering/beneficial reuse.
- The data set is sufficiently large to support the statistical evaluations based on the variance and specific regulatory threshold relationships.

KPRG appreciates the opportunity for providing our technical services. If there are any questions, please contact me at 262-781-0475.

Sincerely,
KPRG and Associates, Inc.

**Comments**
No additional comments.

**Receipt**
The samples were received on 6/11/2015 10:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 9.4° C.

**Receipt Exceptions**

The following sample(s) was received at the laboratory outside the required temperature criteria: 9.4C.

6-11-2015 Per client, proceed with analysis.

**GC/MS VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC/MS Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Metals**
Method(s) 6010B: The continuing calibration verifications (CCV's) associated with batch 500-292053 recovered above the upper control limit for Zinc. The samples associated with these CCV's were non-detects for the affected analyte; therefore, the data have been reported. The following samples are impacted: A2 (500-97217-1), A3 (500-97217-2), A4 (500-97217-3), A5 (500-97217-4), C2 (500-97217-5), C3 (500-97217-6), C4 (500-97217-7), C5 (500-97217-8), C6 (500-97217-9), C7 (500-97217-10), D5 (500-97217-11), D6 (500-97217-12), D7 (500-97217-13), B1 (500-97217-14), Protocol 1 (500-97217-15), (500-97217-A-1-C DU), (500-97217-A-1-D MS) and (500-97217-A-1-B SD ^).

Method(s) 6010B: The continuing calibration verification (CCV) at line 57 associated with batch 500-292053 recovered above the upper control limit for Nickel. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported. The following samples are impacted: C6 (500-97217-9), C7 (500-97217-10), D5 (500-97217-11), D6 (500-97217-12), D7 (500-97217-13) and B1 (500-97217-14).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**General Chemistry**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Organic Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Qualifiers

### GC/MS Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| X | Surrogate is outside control limits |

### Metals

| Qualifier | Qualifier Description |
|---|---|
| ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### General Chemistry

| Qualifier | Qualifier Description |
|---|---|
| F1 | MS and/or MSD Recovery is outside acceptance limits. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

# Surrogate Summary

Client: KPRG and Associates, Inc.
Project/Site: Confidential

TestAmerica Job ID: 500-97217-1

## Method: 8260B - Volatile Organic Compounds (GC/MS)

**Matrix: Solid** — **Prep Type: Total/NA**

| | | Percent Surrogate Recovery (Acceptance Limits) | | | |
|---|---|---|---|---|---|
| | | BFB | DBFM | 12DCE | TOL |
| Lab Sample ID | Client Sample ID | (75-120) | (75-120) | (75-125) | (75-120) |
| LCS 500-292410/3 | Lab Control Sample | 100 | 97 | 103 | 103 |
| MB 500-292410/5 | Method Blank | 100 | 96 | 98 | 101 |

**Surrogate Legend**

BFB = 4-Bromofluorobenzene (Surr)
DBFM = Dibromofluoromethane
12DCE = 1,2-Dichloroethane-d4 (Surr)
TOL = Toluene-d8 (Surr)

## Method: 8260B - Volatile Organic Compounds (GC/MS)

**Matrix: Solid** — **Prep Type: TCLP**

| | | Percent Surrogate Recovery (Acceptance Limits) | | | |
|---|---|---|---|---|---|
| | | BFB | DBFM | 12DCE | TOL |
| Lab Sample ID | Client Sample ID | (75-120) | (75-120) | (75-125) | (75-120) |
| 500-97217-15 | Protocol 1 | 104 | 93 | 102 | 100 |
| LB 500-291830/1-A | Method Blank | 99 | 97 | 103 | 100 |

**Surrogate Legend**

BFB = 4-Bromofluorobenzene (Surr)
DBFM = Dibromofluoromethane
12DCE = 1,2-Dichloroethane-d4 (Surr)
TOL = Toluene-d8 (Surr)

## Method: 8270D - Semivolatile Organic Compounds (GC/MS)

**Matrix: Solid** — **Prep Type: Total/NA**

| | | Percent Surrogate Recovery (Acceptance Limits) | | | | | |
|---|---|---|---|---|---|---|---|
| | | FBP | 2FP | NBZ | PHL | TPH | TBP |
| Lab Sample ID | Client Sample ID | (48-110) | (20-100) | (41-110) | (20-100) | (44-132) | (50-129) |
| LCS 500-292097/2-A | Lab Control Sample | 84 | 45 | 81 | 34 | 98 | 92 |
| MB 500-292097/1-A | Method Blank | 43 X | 31 | 53 | 20 | 89 | 50 |

**Surrogate Legend**

FBP = 2-Fluorobiphenyl
2FP = 2-Fluorophenol (Surr)
NBZ = Nitrobenzene-d5 (Surr)
PHL = Phenol-d5 (Surr)
TPH = Terphenyl-d14 (Surr)
TBP = 2,4,6-Tribromophenol (Surr)

## Method: 8270D - Semivolatile Organic Compounds (GC/MS)

**Matrix: Solid** — **Prep Type: TCLP**

| | | Percent Surrogate Recovery (Acceptance Limits) | | | | | |
|---|---|---|---|---|---|---|---|
| | | FBP | 2FP | NBZ | PHL | TPH | TBP |
| Lab Sample ID | Client Sample ID | (48-110) | (20-100) | (41-110) | (20-100) | (44-132) | (50-129) |
| 500-97217-15 | Protocol 1 | 76 | 39 | 85 | 29 | 104 | 80 |
| LB 500-291829/1-D | Method Blank | 83 | 45 | 87 | 28 | 106 | 98 |

**Surrogate Legend**

Client: KPRG and Associates, Inc.
Project/Site: Confidential

TestAmerica Job ID: 500-97217-1

FBP = 2-Fluorobiphenyl
2FP = 2-Fluorophenol (Surr)
NBZ = Nitrobenzene-d5 (Surr)
PHL = Phenol-d5 (Surr)
TPH = Terphenyl-d14 (Surr)
TBP = 2,4,6-Tribromophenol (Surr)

## Method: 8082A - Polychlorinated Biphenyls (PCBs) by Gas Chromatography

**Matrix: Solid** **Prep Type: Total/NA**

| | | Percent Surrogate Recovery (Acceptance Limits) | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | TCX1 | DCB1 | | | | | | | | |
| Lab Sample ID | Client Sample ID | (50-116) | (48-142) | | | | | | | | |

# Certification Summary

Client: KPRG and Associates, Inc.
Project/Site: Confidential

TestAmerica Job ID: 500-97217-1

## Laboratory: TestAmerica Chicago

Unless otherwise noted, all analytes for this laboratory were covered under each certification below.

| Authority | Program | EPA Region | Certification ID | Expiration Date |
|---|---|---|---|---|
| Illinois | NELAP | 5 | 100201 | 04-30-16 |

The following analytes are included in this report, but certification is not offered by the governing authority:

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 7470A | 7470A | Solid | Mercury |
| Moisture | | Solid | Percent Moisture |
| Moisture | | Solid | Percent Solids |
| SM 2710F | | Solid | Specific Gravity |

## Laboratory: TestAmerica Savannah

All certifications held by this laboratory are listed. Not all certifications are applicable to this report.

| Authority | Program | EPA Region | Certification ID | Expiration Date |
|---|---|---|---|---|
| | AFCEE | | SAVLAB | |
| A2LA | DoD ELAP | | 399.01 | 02-28-17 |

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

## Metals

### Leach Batch: 301047

| Lab Sample ID | Client Sample ID | Prep Type | Matrix | Method | Prep Batch |
|---|---|---|---|---|---|
| 500-99434-1 | B2 | ASTM Leach | Solid | D3987-85 | |
| 500-99434-1 DU | B2 | ASTM Leach | Solid | D3987-85 | |
| 500-99434-1 MS | B2 | ASTM Leach | Solid | D3987-85 | |
| 500-99434-2 | B3 | ASTM Leach | Solid | D3987-85 | |
| 500-99434-2 DU | B3 | ASTM Leach | Solid | D3987-85 | |

Project/Site: Confidential

TestAmerica Job ID: 500-99434-1

## Laboratory: TestAmerica Chicago

Unless otherwise noted, all analytes for this laboratory were covered under each certification below.

| Authority | Program | EPA Region | Certification ID | Expiration Date |
|---|---|---|---|---|
| Illinois | NELAP | 5 | 100201 | 04-30-16 |

The following analytes are included in this report, but certification is not offered by the governing authority:

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 7470A | 7470A | Solid | Mercury |

| Question | Answer | Comment |
|---|---|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | True | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | False | metals only - acceptable |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | Unchilled |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time. | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | N/A | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

# ATTACHMENT 2

## Statistical Equations Used

## STATISTICAL EQUATIONS USED

1) Mean ($\mu$) = $1/n$ ( $\sum\mu_i$), where n is the number of samples

2) Variance ($s^2$) = $1/(n-1)$ ( $\sum(\mu_i - \mu)^2$

3) Standard Deviation (s) = $\sqrt{}$Variance

4) Coefficient of Variance (CV) = $s/\mu$

5) Standard Error ($s_\mu$) = $s/\sqrt{n}$

6) 95% Upper Confidence Limit ($UCL_{95}$) = $\mu$ + ($t_{0.95(n-1)}$)( $s_\mu$), where $t_{0.95(n-1)}$ is obtained from the one-tailed Student's *t* Distribution table

7) $\lambda = (RT - \mu)/s$, where RT is the regulatory threshold concentration

8) Mean of the Lognormal Distribution ($\mu_{Ln}$) = $\exp[y_i+(s^2_y/2)]$, where $y_i$ is the mean of the natural logs of $\mu_i$ and $s^2_y$ is the variance of the natural logs of $\mu_i$

9) Standard Deviation of the Lognormal Distribution ($s_{Ln}$) = $\sqrt{\{(\mu_{Ln})^2[\exp(s^2_y)-1]\}}$

10) Winsorized Standard Deviation ($s_w$) = $[s(n-1)/(v-1)]$, where s is the standard deviation of the Winsorized data set and v is the number of data not adjusted during Winzorization.

# TABLE 4-3

# 1.0 INTRODUCTION

## 1.1 Background

Pursuant to the request of the Illinois Environmental Protection Agency (Illinois EPA), this document presents the Hydrogeologic Assessment Report for the on-site ash pond areas at the Midwest Generation, LLC (MWG) Will County in Romeoville, Illinois. This hydrogeologic assessment was performed in accordance with the Hydrogeologic Assessment Plan, approved by the Illinois EPA, dated September 3, 2010.

As defined by the Hydrogeologic Assessment Plan, the purpose of this investigation was to: (i) evaluate the potential, if any, for migration of ash-related constituents from the on-site ash ponds and to conduct monitoring for groundwater constituents regulated by the Illinois Part 620 groundwater standards, as requested by the Illinois EPA; (ii) characterize the subsurface hydrogeology; and (iii) identify potable well use within 2,500 feet of the ash ponds. The results of this investigation are described in this Hydrogeologic Assessment Report.

## 1.2 Site Location and Description

The Will County facility (the Site) is located in Section 2, Township 36 North, Range 10 East, in the City of Romeoville, Will County, Illinois. Figure 1 provides a Site Location Map.

The Site includes four active ash ponds. The ponds are lined with 36" of geo-composite material; the total area of the four ash ponds is approximately 8 acres. Figure 2 shows the locations of the four ash ponds.

## 1.3 Regional Setting

The Site is located between the Chicago Sanitary and Ship Canal and the Des Plaines River east of the city of Romeoville. The surrounding land use consists of undeveloped land to the north, the Chicago Sanitary and Ship Canal to the east, a quarry to the south, and the Des Plaines River to the west.

Patrick Engineering Inc. (Patrick) conducted a review of publically available geological information from the Illinois State Geological Survey website. Based upon water well logs from the area, the geology beneath the Site consists of approximately 1 to 5 feet of unconsolidated deposits or fill, underlain by Silurian Dolomite to approximately 140 feet below ground surface, underlain by the Maquoketa shale. The Maquoketa shale is generally considered to be an aquitard that separates the shallow groundwater in the unconsolidated units and the Silurian dolomite from the underlying aquifers.

Groundwater flow in the shallow aquifer should be largely controlled by the Des Plaines River and the Chicago Sanitary and Ship Canal with groundwater likely flowing towards either of the rivers during most periods of the year. Groundwater flow in the deeper aquifers is controlled by the regional hydraulic gradient in these aquifers, which is to the southeast. The Site lies within the Joliet Depression, which is a cone of depression of the groundwater surface caused by the large withdrawals of the groundwater from the deeper aquifers due to industrial and municipal use in the area.

.

# 2.0 HYDROGEOLOGIC ASSESSMENT METHODOLOGY

The following sections present the methodologies used to evaluate the potential for migration of ash-related constituents from the ash ponds and to monitor for all Part 620-regulated constituents, to characterize the subsurface hydrogeology, and to identify potable well use within 2,500 feet of the Site.

## 2.1 Evaluation of Ash-Related Constituents Migration Potential

The Illinois EPA requested that an evaluation of the potential for migration of ash-related constituents from the ash ponds and that monitoring for all Part 620-regulated constituents be performed in accordance with the groundwater standards included in 35 Illinois Administrative Code (IAC) Part 620, Subparts C and D. Accordingly, groundwater monitoring wells were installed at the Site in locations both upgradient and downgradient of the four ash ponds.

### 2.1.1 Installation of Groundwater Monitoring Wells

Patrick installed ten (10) groundwater monitoring wells spaced approximately 150 to 300 feet apart around the perimeter of the ash ponds. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. The spacing of the well locations at the Site along the downgradient edge of the ash ponds was calculated so as to detect a groundwater plume emanating from a point source beneath the ash ponds. Figure 3 shows the location of the ten monitoring wells.

The well borings were advanced using hollow-stem augers to depths ranging from 10 to 20 feet below ground surface (bgs). Borings were terminated after the field geologist determined that the boring was installed approximately 10 feet past the first intersection of the groundwater table in order to ensure that a representative groundwater sample could be obtained. Upon termination of each boring, a 2-inch diameter, PVC well was installed in order to collect samples of the

groundwater in the uppermost aquifer. The monitoring wells were completed to approximately 3 feet above grade, with PVC casing, and were covered with a stick-up, steel well protector with a locking cap. Soil lithology was inspected and logged by an experienced geologist during the boring process. Boring logs with well construction information are included as Appendix A.

### 2.1.2 Initial Groundwater Sampling and Analytical Testing

The groundwater sampling event for the Site took place on December 13, 2010. The groundwater elevation in each of the ten wells was measured prior to sampling. Groundwater samples were collected from each well with a peristaltic pump, using established low-flow sampling techniques. Temperature, pH, and conductivity measurements were taken using a portable meter in all wells; refer to Table 1 for these field parameter results. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature of no higher than 4° F. The samples were transported to TestAmerica, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain the integrity of the samples.

The analytical laboratory tested groundwater samples from each of the wells for the compounds listed in Table 2. Analytes tested include the inorganic compounds listed in 35 IAC 620.410(a), excluding both radium and the poly-aromatic hydrocarbons (PAHs) listed in 35 IAC 620.410(b).

## 2.2 Characterization of Subsurface Hydrogeology

The subsurface hydrogeology beneath the ash ponds was characterized by determining Site lithology and the groundwater flow patterns in the vicinity of the ash ponds as described below.

### 2.2.1 Site Lithology

The Site lithology was determined by logging soil samples collected from the soil borings created during the installation of the groundwater monitoring wells. The soil borings were

installed under the direction of an experienced geologist. Each boring was sampled at 2-foot intervals using a 2-inch O.D. split-spoon sampler (ASTM D 1586). Each soil sample was inspected and logged by the geologist during the boring process. Boring logs with well construction information are provided as Appendix A.

### 2.2.2 Topographic and Water Elevation Surveys

A survey crew measured both the top-of-casing and ground surface elevations of all installed monitoring wells and the groundwater elevations within each of the monitoring wells on December 13, 2010. The survey crew concurrently measured the water elevation in each of the ash ponds, the Chicago Sanitary and Ship Canal, and the Des Plaines River; Ash Pond 2 was inaccessible the day of the survey.

### 2.2.3 Hydraulic Testing of Selected Wells

Patrick conducted five *in situ* hydraulic conductivity tests on wells MW-1, MW-4, MW-6, MW-7, and MW-9 on December 22, 2010. The testing consisted of one rising-head and one falling-head slug test performed at each well. Using a data-logging pressure transducer, Patrick measured the rate of groundwater level recovery in the wells after either inserting a slug into, or removing a slug from, each monitoring well.

## 2.3 Identification of Potable Well Use

Natural Resource Technology, Inc. (NRT) has previously completed an investigation of potable water well use within 2,500 feet of the Will County ash ponds. MWG submitted the results of this investigation to the Illinois EPA by letter dated July 15, 2009. These results are summarized in Appendix B.

The following databases and sources of information were used in order to identify local community water sources and water well locations in the vicinity of the Site:

- Illinois State Geological Survey (ISGS) -Water Well Database Query;

• Illinois State Water Survey (ISWS) Private Well Database and water well construction report request; and

• Illinois Division of Public Water Supply web-based Geographic System (GIS) files.

# 3.0 HYDROGEOLOGIC ASSESSMENT RESULTS

## 3.1 Evaluation of Ash-Related Constituents Migration Potential

The analytical laboratory results for the hydrogeologic assessment are presented in Table 2. Full laboratory data packages from TestAmerica are provided as Appendix C. Manganese, boron, sulfate, and total dissolved solids (TDS) were detected in one or more monitoring wells at concentrations exceeding the Part 620 Class I Groundwater Quality Standards. In some cases, the highest concentrations of a given compound were found in the upgradient wells. Antimony, beryllium, cadmium, chromium, copper, cyanide, lead, mercury, silver, thallium, zinc, and nitrogen/nitrite were not detected in any of the groundwater samples.

A determination of the potential for the individual ash ponds to be contributing to the distribution of analytes in the underlying groundwater and the extent, if any, of such contribution cannot be made from the results of this single sampling event alone. To develop a true, statistically-significant upgradient background concentration for the various compounds will require a number of sequential sampling events over time. Based on a statistically developed background value, downgradient concentrations can be compared to the background value over time to determine the likelihood and extent of any constituent migration from the on-site ash ponds. A plan to develop such an analytical database through additional sampling is presented in the last section of this report.

## 3.2 Characterization of Subsurface Hydrogeology

The lithology of the Site is predominantly fine sand with fine to coarse gravel underlain by limestone bedrock at approximately 10 to 15 feet below ground surface. Refer to Figure 4 for a geologic cross-section of the Site.

The results of the topographic and water elevation surveys are presented in Table 3.

The uppermost groundwater unit at the Site is found at depths ranging from 8 to 11 feet bgs. The direction of groundwater flow appears to be variable; in the northern part of the ash pond area, groundwater appears to flow to the southeast, in the southern part of the ash pond area, groundwater appears to flow to the southwest. Patrick was unable to calculate a hydraulic gradient for the Site, due to the apparent complexity of the shallow flow system. The variability in the groundwater elevation data could be due to the fractured nature of the bedrock surface. The collected groundwater elevation data do not allow for a clear understanding of the potentiometric surface in the uppermost aquifer, therefore a groundwater elevation map is provided as Figure 5.

Patrick used the hydraulic testing data to calculate the hydraulic conductivity of the uppermost aquifer using the Bouwer and Rice method. Hydraulic conductivity calculations are provided in Appendix D. The hydraulic conductivity of Site soils ranged from $6.38 \times 10^{-5}$ to $2.07 \times 10^{-4}$ ft/second. The average hydraulic conductivity was $4.32 \times 10^{-4}$ ft/second. Patrick was unable to calculate the groundwater velocity because a reliable hydraulic gradient could not be calculated (see previous paragraph).

## 3.3 Identification of Potable Well Use

As stated above, NRT has previously completed an investigation of potable water well use within 2,500 feet of the Site's ash ponds. MWG submitted the results of this investigation to the Illinois EPA by letter dated July 15, 2009. According to this letter, the only identified potable wells, with associated structures, are located between the Des Plaines River and the Chicago Sanitary and Ship Canal. These wells are more than 1,500 feet deep (see wells 8 and 9 in Appendix B.). Both of these wells are drilled more than 1,500 feet below ground surface and are screened below the Maquoketa shale, a significant aquitard separating shallower aquifers from the screened interval of the wells.

# 4.0 LONG-TERM MONITORING PLAN

In order to properly assess the groundwater monitoring data collected in this single sampling event, MWG will conduct a quarterly groundwater sampling program in which the same monitoring wells described in this report will be sampled for the identical analyte list employed during this investigation. MWG proposes to begin this quarterly monitoring program in March 2011, and will submit the results of the sampling program to the Illinois EPA on an ongoing, quarterly basis. MWG proposes to continue this program until sufficient statistically-significant data is available to properly assess the groundwater data. If the quarterly sampling results continue to show non-detect results for certain of the analytes, as was the case in this single sampling event, MWG may propose to Illinois EPA that these analytes be eliminated from future sampling events.

mg/L = milligrams per liter

-Determination of the potential for the individual ash ponds to be contributing to the distribution of analytes in the underlying groundwater cannot be made from the results of this single sampling event alone. To develop a true, statistically-significant upgradient background concentration for the various compounds will require a number of sequential sampling events over time. After a statistically developed background value is available, the downgradient concentrations can be compared to this background value over time to determine the likelihood of contaminant migration from the on-site ash ponds. A plan to develop such an analytical database through additional sampling is discussed in the last section of this report.

# ANALYTICAL REPORT

Job Number: 500-29848-1

Job Description: Will County Ash Pond Assessments

For:
Midwest Generation EME LLC
529 E 135th Street
Romeoville, IL 60446-1538

Attention: Beckie Maddox

Approved for release.
Bonnie M Stadelmann
Project Manager II
12/28/2010 4:14 PM

Bonnie M Stadelmann
Project Manager II
bonnie.stadelmann@testamericainc.com
12/28/2010

cc: Andrew Gagnon
Ms. Maria Race

These test results meet all the requirements of NELAC for accredited parameters.

The Lab Certification ID#:
TestAmerica Chicago 100201

All questions regarding this test report should be directed to the TestAmerica Project Manager whose signature appears on this report. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.

ACCREDITED IN ACCORDANCE WITH nelac

**Job Narrative**
**500-29848-1**

**Comments**
No additional comments.

**Receipt**
All samples were received in good condition within temperature requirements.

**Metals**
Method(s) 6020: The continuing calibration verification (CCV) and continuing calibration blank (CCB) at lines 91 and 92 in AD batch 102214 recovered above the upper control limit for Sb. The samples associated with this CCV and CCB were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 6020: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for 500-29848-2 were outside control limits for Se. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

**Field Service / Mobile Lab**
No analytical or quality issues were noted.

**General Chemistry**
Method(s) SM 4500 NO3 F: The nitrate continuing calibration verification (CCV) for 102133 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. MW-10 (500-29848-10)

No other analytical or quality issues were noted.

# DATA REPORTING QUALIFIERS

Client: Midwest Generation EME LLC Job Number: 500-29848-1

| Lab Section | Qualifier | Description |
|---|---|---|
| Metals | | |
| | ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits. |
| | F | MS or MSD exceeds the control limits |
| General Chemistry | | |
| | ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits. |
| | 4 | MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable. |

# Login Sample Receipt Check List

Client: Midwest Generation EME LLC

Job Number: 500-29848-1

**Login Number: 29848**
**List Source: TestAmerica Chicago**
**Creator: Lunt, Jeff T**
**List Number: 1**

| Question | T / F/ NA | Comment |
|---|---|---|
| Radioactivity either was not measured or, if measured, is at or below background | True | |
| The cooler's custody seal, if present, is intact. | N/A | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | 3.3,3.5 |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the sample IDs on the containers and the COC. | True | |
| Samples are received within Holding Time. | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter. | N/A | |
| If necessary, staff have been informed of any short hold time or quick TAT needs | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |

## WELL TEST ANALYSIS

## EXECUTIVE SUMMARY

This report presents the results of the Phase II Environmental Site Assessment (Phase II ESA) conducted by ENSR Corporation (ENSR) in October 1998 at the Commonwealth Edison Company (ComEd) Will County Generating Station, located at 529 East Romeo Road in Romeoville, Illinois. Phase II ESA activities consisted of advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I Environmental Site Assessment (Phase I ESA).

Based on the results of the Phase I ESA, 15 potential areas of concern were identified for further investigation. These areas of concern are identified in **Section 2.0**. Each of these areas of concern were investigated during the Phase II ESA activities. Eighteen soil borings were advanced and 5 monitoring wells were installed. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. In addition, 23 surface soil samples and 14 sediment samples were collected at the facility.

These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260; polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310; polychlorinated biphenyls (PCBs) using EPA Method 8081; Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000; and pH using EPA Method 9045.

In addition, the surface soil samples and sediment samples were also submitted for analysis of total petroleum hydrocarbons (TPH) using EPA Method 8015. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

PNA constituents were detected above the Illinois Environmental Protection Agency (IEPA) cleanup objectives primarily in the surface soil samples collected at the facility. These surface soil samples were collected directly from a "stained" location in the identified potential areas of concern. Therefore, it was determined that the impact from these PNA constituents is relatively localized. However, PNA constituents were detected in soil samples collected from borings at approximately 3 feet below grade.

Arsenic was detected above the IEPA cleanup objective of 3 milligrams per kilogram (mg/kg) in samples collected throughout the facility. However, the concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. Lead was detected above the IEPA cleanup objective of 400 mg/kg in the sediment sample collected from the northern coal pile runoff pond, and in the surface soil samples collected from the surge hopper, areas surrounding the chimneys/precipitators, and stained transformers. In addition, chromium was detected above the IEPA cleanup objective of 420 mg/kg in the sediment sample collected from the northern coal pile runoff pond.

PCBs were detected above the IEPA cleanup objective of 1 mg/kg in samples collected from stained transformers, ash disposal area, coal handling area, and materials storage areas on the west side of the main building. The PCBs were only detected in the first 3 feet of soil.

It should be noted that TPH was detected throughout the site. Although a cleanup objective has not been established by the IEPA, TPH was detected at elevated concentrations (greater than 1,000 mg/kg) and would indicate impact by petroleum hydrocarbon compounds.

Based on the relatively low volatility of the constituents of concern detected above the IEPA cleanup objectives, the soil inhalation exposure pathway is not a likely contaminant exposure pathway. In addition, based on the facility's location immediately adjacent to two bodies of water, it is unlikely that the impacted groundwater beneath the facility would have any impact on these wells. Therefore, the groundwater ingestion is not a potential contaminant exposure pathway. However, emulsified oil droplets and an oil sheen were encountered during groundwater sampling activities in the vicinity of the ignition fuel and diesel fuel aboveground storage tanks (ASTs) located to the south of the coal pile.

The soil ingestion pathway is a potential exposure pathway during construction activities. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

Based on the current land use (industrial) and site conditions (analytical results and near surface bedrock), it is judged that the potential for human exposure to the constituents of concern from this facility is low. It should be noted that there is no requirement under Illinois environmental law to further investigate or remediate this property.

# 1.0 INTRODUCTION

## 1.1 General

ENSR Corporation (ENSR) was retained by Commonwealth Edison Company (ComEd) to conduct Phase II Environmental Site Assessment (Phase II ESA) activities on a "limited" portion of the 216 acre Will County Generating Station, located at 529 East Romeo Road in Romeoville, Illinois (**Figure 1, Site Location Map**).

The scope of the Phase II ESA activities were based on the preliminary results of the Phase I Environmental Site Assessment (Phase I ESA), with concurrence between ENSR and ComEd. Phase II ESA activities were conducted from October 15 to October 26, 1998, and included advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. **Figure 2** illustrates the layout of the facility.

## 1.2 Objectives and Scope

The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I ESA. The Phase II ESA adequately assessed the surface and/or subsurface conditions in the locations where sampling was conducted. The Phase II ESA is a tool for developing a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways in sampled areas. Based upon this and the information gathered during the Phase II ESA, and using the Illinois Environmental Protection Agency (IEPA) Tiered Approach to Cleanup Objectives (TACO) as guidance, it can be determined whether remediation is warranted in the locations sampled. The Phase II ESA alone is not an exhaustive investigation which can be used to determine the extent of contamination, nor the cost of any suggested remediation.

The objective of the Phase II ESA was to develop a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways. To meet this objective, ENSR implemented a "phased" assessment designed to provide increasing levels of information based upon obtained data. Recognizing that existing information for the facility and potential contamination was limited, the principal tasks completed during the Phase II ESA included the following:

- Soil boring advancement and soil sample collection;
- Monitoring well installation and groundwater sample collection;
- Collection of surface soil and sediment samples;
- Laboratory analysis of samples; and,
- Evaluation of analytical results and comparison to the IEPA Tier 1 Industrial/Commercial Soil Cleanup Objectives and IEPA Tier 1 Groundwater Cleanup Objectives.

The investigation consisted of the advancement of 18 soil borings and the installation of 5 monitoring wells at the potential areas of concern identified during the Phase I ESA. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260, polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310, polychlorinated biphenyls (PCBs) using EPA Method 8081, Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000, and pH by EPA Method 9045. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

In addition, 23 surface soil samples were collected from the identified potential areas of concern and 14 sediment samples were collected from selected ash/coal settling ponds or drainage ditches located at the facility. These samples were submitted for analysis of the previously referenced constituents as well as total petroleum hydrocarbons (TPH) using EPA Method 8015.

## 1.3 Report Organization

**Section 1** introduces the principal subjects covered in this report, describes the purpose and scope of the Phase II ESA, and presents limitations of the Phase II ESA. **Section 2** provides information regarding the identified potential areas of concern and the methodologies used during the investigation. **Section 3** presents the results of the Phase II ESA. **Section 4** presents the data assessment of the Phase II ESA. **Tables** summarizing the analytical results and **Figures** illustrating the facility location and layout, as well as sampling locations, have been included under the appropriate headings.

**Appendix A** contains laboratory analytical reports. **Appendix B** contains boring logs and monitoring well construction diagrams. **Appendix C** contains monitoring well gauging and survey data.

## 1.4 Limitations

This report, including all attachments thereto, describes the results of ENSR's Phase II ESA conducted at the Will County Generating Station, which took place between October 15 and October 26, 1998. Many of the facts and conditions pertaining to this Phase II ESA are subject to change over time; accordingly, the evaluations and conclusions must be viewed within this context.

ENSR has performed this Phase II ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. ENSR shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase II ESA was performed.

This report and all field data, notes, and laboratory test data (hereinafter collectively "Information") were prepared by ENSR solely for the benefit of ENSR's Client, ComEd. ENSR's Client may release this Information to third parties, who may use and rely upon the Information at their own discretion. However, any use of or reliance upon this Information by a party other than parties identified shall be solely at the risk of such third party and without legal recourse against ENSR, or its subsidiaries and affiliates, or their respective employees, officers or directors, regardless of whether the action in which recovery of damages is sought is based upon contract, tort (including the sole, concurrent or other negligence and strict liability of ENSR), statute or otherwise. This Information shall not be used or relied upon by a party which does not agree to be bound by the above statement.

## 2.0 INVESTIGATION METHODS

Prior to initiation of field investigations, a site reconnaissance was performed during the Phase I ESA to define the study area. Field investigation activities were subsequently conducted to obtain site specific information and data pertaining to site geology and hydrogeology, groundwater quality, soil properties, and potential contaminant source(s).

The sampling locations were recommended based on the preliminary Phase I ESA findings. A sampling location summary listing is presented in **Table 1**. A summary of the identified potential areas of concern is presented below.

1. **Ash Disposal Areas.** Three ash disposal areas are located on the southern portion of the facility. These areas are used to store ash prior to having it transported off-site. Two soil borings (B-1 and B-2) were advanced and one monitoring well (MW-1) was installed in the southeastern ash disposal area. Two soil borings were (B-3 and B-4) were advanced in the southwestern ash disposal area. One surface soil sample (S-1) was collected in the western ash disposal area by the Ash Settling Ponds.

2. **Stormwater Runoff Ponds.** There are 3 ponds at the facility which collect surface stormwater runoff. The ponds are located to the south of the main building and construction offices. One sediment sample (X-6) was collected from the pond located to the southwest of the construction offices. One sediment sample (X-7) was collected from the pond located to the south of the construction offices. One sediment sample (X-13) was collected from the pond located to the west of the construction offices.

3. **Ash Settling Ponds.** There are 4 ponds at the facility which are used to collect ash wastewater. The ponds are located on the western portion of the facility. One sediment sample (X-3) was collected from the southern pond, and one sediment sample (X-4) was collected from the pond directly north of the southern pond. In addition, one soil boring (B-5) was advanced and one monitoring well (MW-2) was installed between these two southern ponds. One sediment sample (X-5) was collected from the northern pond. One sediment sample (X-8) was collected from the pond located to the north of the Sluice Water Pump Building.

4. **Former Sulfur Dioxide Scrubber Ponds.** A former sulfur dioxide scrubber system was previously located in the southwestern corner of the facility. Two ponds associated with this former system are located to the south of the Ash Settling Ponds. One sediment sample (X-1) was collected from the western pond, and one sediment sample (X-2) was collected from the eastern pond.

5. **Sluice Water Pumping Area.** A Sluice Water Pump Building and Sluice Water Retention Pond, which are used to recycle sluice water back into the system, are located to the north of the southern Ash Settling Ponds. One surface soil sample (S-24) was collected on the west side of the building, and one sediment sample (X-14) was collected

from the pond.

6. **Sewage Treatment Plant.** A Sewage Treatment Plant is located to the north of the northern Ash Settling Pond. One soil boring (B-6) was advanced.

7. **Coal Handling Equipment.** Coal is received at the facility via barges on the Chicago Sanitary & Ship Canal located on the eastern end of the facility. The coal is stored at the coal pile at the northeastern corner of the facility. One soil boring (B-7) was advanced at the Car Dumper, which is located to the northeast of the Sewage Treatment Plant. One soil boring (B-9) was advanced to the southwest of the coal pile beneath an overhead conveyor from the Car Dumper. One surface soil sample (S-8) was collected at the Surge Hopper, which is located adjacent to the Chicago Sanitary & Ship Canal.

8. **Coal Pile Runoff Ponds/Ditches.** Two coal pile runoff ponds are located to the west of the coal pile. One sediment sample (X-9) was collected from the southern pond, and one sediment sample (X-10) was collected from the northern pond. In addition, one soil boring (B-8) was advanced and one monitoring well (MW-3) was installed. Two coal pile runoff ditches are also located to the west of the coal pile. One sediment sample (X-11) was collected from the western ditch and one sediment sample (X-12) was collected from the eastern ditch.

9. **Demineralized Water Aboveground Storage Tanks.** Two aboveground storage tanks (ASTs), used for the storage of demineralized water, are located at the northwestern corner of the facility. One soil boring (B-18) was advanced.

10. **Materials Storage Areas.** There are four materials storage areas located at the facility. One storage area is located to the north of the Coal Handling Tractor Garage, which is south of the coal pile. The primary concern at this storage area was drum storage. One surface soil sample (S-5) was collected and one soil boring (B-11) was installed. The second storage area is located near the southeast corner of the Switch Yard. The primary concern at this storage area was former drum storage. One soil boring (B-15) was advanced. The third storage area is located to the west of the Electric Shop, which is located on the west side of the main building. The primary concern at this storage area was drum storage. One soil boring (B-16) was advanced. The fourth storage area is located at the northeastern corner of the Switch Yard. The primary concern at this storage area was drum storage. One soil boring (B-17) was advanced and one surface soil sample (S-22) was collected.

11. **Oil/Water Separator.** One oil/water separator is located to the west of the main building and to the south of the fourth identified Materials Storage Area. One surface soil sample (S-21) was collected.

12. **Transformers.** Transformers with oil staining were observed throughout the facility. Soil samples were collected in 5 locations with the most significant staining. The first location contains the transformers on the west side of the Wastewater Treatment Plant,

which is located to the south of the coal runoff ponds. One surface soil sample (S-2) was collected. The second location contains the transformers on the north side of the Breaker House, which is located to the south of the coal pile. One surface soil sample (S-6) was collected. The third location contains the transformers to the north of the northern Crib House, which is located to the east of the main building. Two surface soil samples (S-9 and S-10) were collected. The fourth location contains the transformers to the south of the northern Crib House. One surface soil sample (S-11) was collected. The fifth location contains the transformers to the south of the Electric Shop, which is on the west side of the main building. Three surface soil samples (S-18 through S-20) were collected.

13. **Chimneys/Precipitators.** Two chimney units are located on the east side of the main building. Surface staining from the precipitator equipment was observed. Five surface soil samples (S-12 through S-16) were collected. In addition, one soil boring (B-13) was advanced and one monitoring well (MW-4) was installed to the south of the southern chimney.

14. **Gasoline Underground Storage Tank.** One 1,500 gallon underground storage tank (UST) is located at the northeast corner of the main building. This UST is used for the storage of gasoline. One soil boring (B-12) was advanced.

15. **Petroleum ASTs.** There are six ASTs located at the facility, which are used for the storage of petroleum products. Two of these ASTs have capacities of 12,500 gallons and are used for the storage of ignition fuel, and the third AST has a 15,000 gallon capacity is used for the storage of diesel fuel. A diesel fuel dispenser system is also located adjacent to these ASTs. One soil boring (B-10) was advanced and one monitoring well (MW-5) was installed. In addition, two surface samples (S-3 and S-4) were collected adjacent to the diesel fuel dispenser system Two diesel ASTs are located to the west of the construction offices. One soil boring (B-14) was advanced and one surface soil sample (S-17) was collected. One diesel AST is located at the Emergency Diesel Generator Building, which is located to the south of the coal pile. One surface soil sample (S-7) was collected.

## 2.1 Sampling Methods

All soil (surface and subsurface), sediment, and groundwater samples collected were submitted for analysis of BTEX and PNA constituents using EPA Methods 8260 and 8310, respectively, PCBs using EPA Method 8081, RCRA metals using EPA Method series 6000 and 7000, and pH by EPA Method 9045. In addition, surface soil and sediment samples were submitted for TPH using EPA Method 8015. A sample summary listing is presented in **Table 1**.

The sample glassware used to contain the samples retained for laboratory analysis were provided pre-cleaned from National Environmental Laboratories, Inc. (NET) of Bartlett, Illinois. Each sample was labeled with the project number, project location, client, sample number, sample depth, date, time, and requested analysis. The soil samples were stored on ice in the

field in a cooler and shipped via courier under chain-of-custody to NET. Standard chain-of-custody procedures were maintained from the time of sample collection until delivery to the analytical laboratory.

### 2.1.1 Sediment Sampling

Fourteen sediment samples (X-1 through X-14) were collected at the facility. The sediment sample locations are illustrated on **Figure 3**. Sediment samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

### 2.1.2 Surface Soil Sampling

Twenty-three surface soil samples (S-1 through S-22 and S-24) were collected at the facility. The surface soil sample locations are illustrated on **Figure 4**. Surface soil samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

### 2.1.3 Soil Borings and Subsurface Soil Sampling

Eighteen soil borings (B-1 through B-18) were advanced at the facility. The soil borings locations are illustrated on **Figure 5**. The soil borings were advanced by Fox Drilling, Inc. (Fox) of Itasca, Illinois, utilizing Geoprobe direct-push drilling techniques. The soil borings were advanced to a maximum depth of 3 feet below grade. All soil borings were backfilled with soil cuttings, and completed at surface grade with the appropriate material (i.e., concrete, asphalt). All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

Soil samples were collected by advancing by a hydraulically-driven stainless steel pre-probe. Soil samples were collected using a 2.0-inch diameter acetate lined soil sampler. Soil samples were continuously collected from the surface to the bottom of the soil borings. The soil samples were visually inspected and field classified using the general guidelines of the Unified Soil Classification System (USCS) and the American Society for Testing and Materials (ASTM) Test Method ASTM D2488 for soil classification.

Each soil sample was field screened for the presence of VOCs using a photoionization detector (PID) and standard headspace screening methods. The PID readings indicate relative levels of VOCs in the vapor headspace, but do not represent actual concentrations which may exist in the soil. The PID has a detection range of 1.0 part per million volume (ppmv) to 2,500 ppmv. The soil sample which exhibited the highest PID reading, or if no PID readings were detected, from directly above the field-interpreted groundwater level, was retained from each boring for laboratory analysis.

### 2.1.4 Monitoring Wells and Groundwater Sampling

Five monitoring wells (MW-1 through MW-5) were installed at the facility. The monitoring well locations are illustrated on **Figure 5**. The monitoring wells were installed by Fox utilizing hollow-stem augers and rotary drilling techniques. When bedrock was encountered, the monitoring wells were completed using rotary wash rock coring techniques. The monitoring wells were installed to a maximum depth of 12 feet below grade. Fluids generated during monitoring well installation and groundwater sampling were discharged to the ground surface in proximity to each sampling location. All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

The monitoring wells were installed through the working space within hollow stem augers. The monitoring wells were constructed of 2-inch diameter Schedule 40 PVC 0.010-inch slotted continuous wrap well screen and solid riser. A filter pack consisting of clean silica sand was placed surrounding the well screen to filter out fine soil particles from the formation adjacent to the screen. The filter pack extends from the bottom of the soil boring to approximately 1-foot above the top of the well screen. A bentonite pellet seal was placed on top of the sand pack and hydrated with distilled water to prevent surface water infiltration. The annular space above the bentonite seal was filled with a neat bentonite and cement grout to approximately 6-inches below grade. The monitoring wells were completed at grade and an 8-inch diameter steel protective road box was placed over each monitoring well and set in concrete at grade. The monitoring wells were capped with expandable well caps and equipped with locks to prevent unauthorized access. A monitoring well construction diagram is included in **Appendix A**.

After the installation of the monitoring wells, approximately three to five well volumes of groundwater was removed from each monitoring well, or until the groundwater was relatively free from sediment, using a peristaltic pump. One groundwater sample was collected from each monitoring well and submitted for laboratory analysis. In addition, water quality field parameters consisting of pH, specific conductivity, and temperature were measured and recorded during sample collection.

## 2.2 Monitoring Well Gauging and Survey

Each monitoring well was gauged using an electronic interface probe in order to determine the presence or absence of liquid-phase hydrocarbons (LPHCs) and depth to groundwater. In addition, each monitoring well's top of casing and ground surface location was surveyed relative to an arbitrary benchmark assigned an elevation of 100 feet.

## 2.3 Equipment Decontamination

The drill rig and associated tooling, and sampling equipment were decontaminated prior to mobilization and before leaving the site. To minimize the potential for cross-

contamination, drilling and sampling equipment were decontaminated between each use. Decontamination of drilling equipment consisted of steam cleaning. Sampling equipment, including split spoons and stainless steel sampling equipment, were decontaminated before each use by washing with a solution of Alconox (phosphate based detergent) and potable water, and rinsing with distilled water. Decontamination fluids generated during equipment decontamination were discharged to the ground surface in proximity to each sampling location.

# 3.0 INVESTIGATION FINDINGS

The findings of the subsurface investigation, soil and groundwater sampling, monitoring well gauging, survey, and chemical analysis, are presented below. Analytical results are summarized in **Table 2** through **Table 5**. The analytical reports and chain-of-custody forms are included in **Appendix B**.

Analytical results were compared against the cleanup objectives as presented in 35 Illinois Administrative Code (IAC) Section 742.Appendix B: Table B-Tier 1 Soil Remediation Objectives for Commercial/Industrial Properties, and 35 IAC Section 742.Appendix B: Table E-Tier 1 Groundwater Remediation Objectives for the Direct Ingestion of Groundwater Portion of the Groundwater Ingestion Route.

Soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered. In addition, the groundwater beneath the site is classified as Class I, therefore the Class I baseline was used.

## 3.1 Sediment

**BTEX.** The analytical results indicated that BTEX constituents were not detected above the laboratory method detection limits.

**TPH.** The analytical results indicated that TPH as diesel was detected at concentrations ranging from 475 milligrams per kilogram (mg/kg) in sample X-12 to 16,700 mg/kg in sample X-11. TPH as oil was detected at concentrations of 434 mg/kg in sample X-8 and 2,750 mg/kg in sample X-7. However, cleanup objectives for TPH have not been established by the IEPA. TPH as gasoline was not detected above the laboratory method detection limits.

**PNAs.** The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, and benzo(b)fluoranthene were detected in samples X-9 and X-12 at concentrations above the IEPA cleanup objectives. It should be noted that samples X-9, X-11, and X-12 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 2** for PNA results.

**PCBs.** The analytical results indicated that PCBs were detected in the sediment samples collected. However, these concentrations were not above the IEPA cleanup objective of 1.0 mg/kg.

**Metals.** The analytical results indicated that arsenic, chromium, and lead were detected at concentrations above the IEPA cleanup objective of 3 mg/kg, 420 mg/kg, and 400 mg/kg, respectively. Arsenic was detected at concentrations ranging from 3.4 mg/kg in sample X-6 to 24 mg/kg in sample X-1. However, the concentrations of arsenic are within the range of arsenic

(0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Chromium and lead were detected in sample X-9 at a concentration of 680 mg/kg and 874 mg/kg, respectively.

**pH.** pH values ranged from 7.32 in sample X-7 to 10.22 in sample X-4.

Analytical results are summarized in **Table 2**, and sampling locations are illustrated on **Figure 3**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.2 Surface Soil

**BTEX.** The analytical results indicated that BTEX constituents were detected in the surface soil samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**TPH.** The analytical results indicated that TPH as gasoline was detected at concentrations ranging from 224 mg/kg in sample S-15 to 292 mg/kg in sample S-14, and TPH as diesel was detected at concentrations ranging from 1,090 mg/kg in sample S-10 to 188,000 mg/kg in sample S-4. TPH as oil was detected at concentrations ranging from 110 mg/kg in sample S-1 to 933,000 mg/kg in sample S-5. However, cleanup objectives for TPH have not been established by the IEPA.

**PNAs.** The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-c,d)pyrene were detected in samples S-5, S-9 through S-12, S-14 through S-16, S-18 through S-20, and S-22 at concentrations above the IEPA cleanup objectives. It should be noted that samples S-1 through S-8, S-13, and S-17 through S-19 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo (a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 3** for PNA results.

**PCBs.** The analytical results indicated that PCBs were detected at concentrations above the IEPA cleanup objective of 1.0 mg/kg. These concentrations ranged from 1.48 mg/kg in sample S-6 to 7.52 mg/kg in sample S-2.

**Metals.** The analytical results indicated that arsenic and lead were detected at concentrations above the IEPA cleanup objectives of 3 mg/kg and 400 mg/kg, respectively. Arsenic was detected at concentrations ranging from 3.8 mg/kg in sample S-17 to 23 mg/kg in sample S-18. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Lead was detected at concentrations ranging from 496 mg/kg in sample S-16 to 1,130 mg/kg in sample S-8 and S-10.

**pH.** pH values ranged from 5.78 in sample S-2 to 9.94 in sample S-3.

Analytical results are summarized in **Table 3**, and sampling locations are illustrated on **Figure 4**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.3 Subsurface Soil

Bedrock was encountered at approximately 1 foot to 3 feet below grade. Fill material, consisting of coal ash and gravel, was the primary material encountered above the bedrock. Native soil was encountered in B-18 and consisted of a light brown silty clay to bedrock at 3 feet below grade. Soil boring logs are included in **Appendix A**.

The PID readings obtained from the soil samples collected ranged from 1.1 ppmv in B-5 (0 to 1 feet below grade) to 51.8 ppmv in B-10 (0 to 1 feet below grade). The PID field screening results are recorded on the boring logs in **Appendix A**.

**BTEX.** The analytical results indicated that BTEX constituents were detected in the subsurface soil samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PNAs.** The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene were detected in B-2, B-12, B-13, and B-15 through B-17 at concentrations above the IEPA cleanup objectives. It should be noted that B-7, B-9 through B-11, B-13, and B-16 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 4** for PNA results.

**PCBs.** The analytical results indicated that PCBs were detected at concentrations above the IEPA cleanup objective of 1.0 mg/kg. These concentrations ranged from 1.1 mg/kg in B-1 to 41.3 mg/kg in B-11.

**Metals.** The analytical results indicated that arsenic was detected at concentrations above the IEPA cleanup objective of 3 mg/kg. Arsenic was detected at concentrations ranging from 3.9 mg/kg in B-11 to 11 mg/kg in B-17. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992.

**pH.** pH values ranged from 7.79 in B-9 to 9.44 in B-8.

Analytical results are summarized in **Table 4**, and soil boring locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.4 Groundwater

The groundwater elevations ranged from 3.6 feet in MW-3 to 8.95 feet in MW-4. LPHC was not detected in any of the monitoring wells. However, emulsified oil droplets and an oil sheen were

encountered in MW-5 during groundwater sampling activities. Based on the gauging data, the apparent groundwater flow direction beneath the facility has been calculated to be to the east (**Figure 6**, **Groundwater Elevation Map**). Monitoring well gauging data is included in **Appendix C**.

Water quality field parameters consisting of pH, specific conductivity, and temperature were measured. The recorded measurements are summarized in **Table 5**.

**BTEX.** The analytical results indicated that benzene was detected at a concentration above the IEPA cleanup objective of 0.005 milligrams per liter (mg/l) in MW-5. Benzene was detected at a concentration of 0.031 mg/l.

**PNAs.** The analytical results indicated that naphthalene was detected at a concentration above the IEPA cleanup objective of 0.025 mg/l in MW-5. Naphthalene was detected at a concentration of 0.46 mg/l. It should be noted that MW-5 had an elevated detection limit due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(b)fluoranthene, chrysene, and pyrene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives.

**PCBs.** The analytical results indicated that PCBs were not detected above the laboratory method detection limits.

**Metals.** The analytical results indicated that lead was detected at a concentration above the IEPA cleanup objective of 0.0075 milligrams per liter (mg/l). Lead was detected at a concentration of 0.0148 mg/l in MW-2. It should be noted that laboratory detection limit for cadmium was at 0.01 mg/l which is above the cleanup objective of 0.005 mg/l. Consequently, there is a possibility that the concentrations are actually above the cleanup objective.

Analytical results are summarized in **Table 5**, and monitoring well locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

# 4.0 DATA ASSESSMENT

## 4.1 Extent of Contamination

Based on the results of the subsurface investigation conducted, the following determinations and assessments were made regarding the extent of contamination at the facility. The following conclusions are subject to the Limitations presented in **Section 1.4**. In addition, although arsenic was detected above the IEPA cleanup objective, the concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. However, it should be noted that soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered.

### 4.1.1 Sediment

Arsenic, chromium, lead, and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, and benzo(b)fluoranthene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Coal Pile Runoff Ponds.** The southern pond located west of the coal pile (X-9).
- **Coal Pile Runoff Ditches.** The western ditch located west of the coal pile (X-12).

It should be noted that due to matrix interference in samples X-9, X-11, and X-12, benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from the southern coal pile runoff pond (X-9), the eastern coal pile runoff ditch (X-11), and the western coal pile runoff ditch (X-12).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 24 mg/kg in the following locations:

- **Former Sulfur Dioxide Scrubber Ponds.** The western Former Sulfur Dioxide Scrubber Pond (X-1).
- **Ash Settling Ponds.** The three Ash Settling Ponds (X-3 through X-4) located south of the Sluice Water Pump Building and the one Ash Settling Pond (X-8) located north of the Sluice Water Pump Building.
- **Stormwater Runoff Ponds.** The Stormwater Runoff Ponds (X-6 and X-7) located south and southwest of the construction offices.
- **Coal Pile Runoff Ponds.** The southern pond located west of the coal pile (X-9) and the northern pond (X-10). It should be noted that chromium and lead were also

detected above the IEPA cleanup objectives of 420 mg/kg and 400 mg/kg, respectively, in this area (X-10) at a maximum concentration of 680 mg/kg and 874 mg/kg, respectively.

- **Sluice Water Pumping Area.** The pond located at the Sluice Water Pumping Building (X-14).

### 4.1.2 Surface Soil

Arsenic, lead, PCBs, and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-c,d)pyrene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Materials Storage Areas.** Storage area located to the north of the Coal Handling Tractor Garage (S-5).
- **Transformers.** Transformers to the north of the northern Crib House (S-9 and S-10), transformers to the south of the northern Crib House (S-11), and transformers to the south of the Electric Shop, which is on the west side of the main building (S-18 through S-20).
- **Chimney/Precipitators.** Chimney unit located on the east side of the main building (S-12, and S-14 through S-16).

It should be noted that due to matrix interference in samples S-1 through S-8, S-13, and S-17 through S-19, benzo (a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from the Ash Disposal Area (S-1), transformers located on the west side of the Wastewater Treatment Plant (S-2), diesel AST dispenser system on the south side of the coal pile (S-3 and S-4), storage area north of the Coal Handling Tractor Garage (S-5), Emergency Diesel Generator Building (S-7), Surge Hopper (S-8), chimneys/precipitators (S-13), diesel ASTs located west of the construction offices (S-17), transformers to the south of the Electric Shop on the west side of the main building (S-18 and S-19).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 23 mg/kg in the following locations:

- **Ash Disposal Areas.** Western ash disposal area by the Ash Settling Ponds (S-1).
- **Transformers.** Transformers to the north of the northern Crib House (S-10), transformers to the south of the northern Crib House (S-11), and transformers to the south of the Electric Shop, which is on the west side of the main building (S-18 and S-20).
- **Chimney/Precipitators.** Chimney unit located on the east side of the main building (S-12 through S-16).

- **Petroleum ASTs.** Diesel ASTs located west of the construction offices (S-17).
- **Oil/Water Separator.** Oil/water separator is located to the west of the main building (S-21).
- **Materials Storage Areas.** Storage area is located at the northeastern corner of the Switch Yard. (S-22).

Lead was detected above the IEPA cleanup objective, at a maximum concentration of 1,130 mg/kg in the following locations:

- **Coal Handling Equipment.** Surge Hopper located adjacent to the Chicago Sanitary & Ship Canal (S-8).
- **Transformers.** Transformers to the north of the northern Crib House (S-10) and transformers to the south of the Electric Shop, which is on the west side of the main building (S-20).
- **Chimney/Precipitators.** Chimney unit located on the east side of the main building (S-14 and S-16).

PCBs were detected above the IEPA cleanup objective in the following locations:

- **Transformers.** Transformers located on the west side of the Wastewater Treatment Plant (S-2), transformers on the north side of the Breaker House, which is located to the south of the coal pile (S-6), and transformers to the south of the Electric Shop, which is on the west side of the main building (S-18).

It should be noted that due to matrix interference, samples S-5 and S-19 had elevated detection limits. Consequently, there is a possibility that PCB concentrations are actually above the cleanup objective of 1.0 mg/kg. These samples were collected from the storage area north of the Coal Handling Tractor Garage (S-5) and the transformers to the south of the Electric Shop on the west side of the main building (S-19).

### 4.1.3 Subsurface Soil

Arsenic, PCBs, and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Ash Disposal Areas.** The southeastern ash disposal area (B-2).
- **Gasoline UST.** The gasoline UST system (B-12).
- **Chimneys/Precipitators.** South of the southern chimney (B-13).
- **Materials Storage Areas.** The storage area located near the southeast corner of the Switch Yard (B-15), the storage area located west of the Electric Shop (B-16), and the storage area located at the northeastern corner of the Switch Yard (B-17).

It should be noted that due to matrix interference in samples B-7, B-9 through B-11, B-13, and B-16, benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from the Car Dumper (B-7), beneath the overhead Car Dumper conveyor southwest of the coal pile (B-9), diesel fuel dispenser system south of the coal pile (B-10), storage area north of the Coal Handling Tractor Garage (B-11), south of the southern chimney (B-13), and storage area located west of the Electric Shop (B-16).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 11 mg/kg in the following locations:

- **Ash Disposal Areas.** The southeastern ash disposal area (B-1 and B-2) and the southwestern ash disposal area (B-3 and B-4).
- **Ash Settling Ponds.** The Ash Settling Ponds south of the Sluice Water Pump Building (B-5).
- **Sewage Treatment Plant.** The Sewage Treatment Plant north of the northern Ash Settling Pond (B-6).
- **Coal Handling Equipment.** The Car Dumper (B-7) and beneath the overhead Car Dumper conveyor southwest of the coal pile (B-9).
- **Coal Pile Runoff Ponds.** The northern coal pile runoff pond (B-8).
- **Materials Storage Areas.** Storage area north of the Coal Handling Tractor Garage (B-11), the storage area located west of the Electric Shop (B-16), and the storage area located at the northeastern corner of the Switch Yard (B-17).
- **Gasoline UST.** The gasoline UST system (B-12).
- **Chimneys/Precipitators.** South of the southern chimney (B-13).
- **Demineralized Water ASTs.** The demineralized water ASTs at the northwestern corner of the facility (B-18).

PCBs were detected above the IEPA cleanup objective in the following locations:

- **Ash Disposal Areas.** The southeastern ash disposal area (B-1).
- **Coal Handling Equipment.** Beneath the overhead Car Dumper conveyor southwest of the coal pile (B-9).
- **Materials Storage Areas.** Storage area north of the Coal Handling Tractor Garage (B-11) and the storage area located west of the Electric Shop (B-16).

### 4.1.4 Groundwater

Lead, benzene, and naphthalene were the constituents of concern detected at concentrations above the IEPA cleanup objectives. In addition, emulsified oil droplets and an oil sheen were encountered in MW-5 during groundwater sampling activities.

Benzene and naphthalene were detected above the IEPA cleanup objectives in the following locations:

- **Petroleum ASTs.** Diesel AST and dispenser system south of the coal pile (MW-5).

Lead was detected above the IEPA cleanup objective, at a maximum concentration of 0.0148 mg/l in the following locations:

- **Ash Settling Ponds.** The three Ash Settling Ponds located south of the Sluice Water Pump Building (MW-2).

It should be noted that laboratory detection limit for cadmium was at 0.01 mg/l which is above the cleanup objective of 0.005 mg/l. Consequently, there is a possibility that the concentrations are actually above the cleanup objective.

## 4.2 Potential Contaminant Exposure Pathways

Based on the above-referenced assessment, potential exposure pathways by which humans may be exposed to the constituents of concern have been identified at the facility. Potential sources, fate and transport mechanisms, and exposure media were considered in determining these potential exposure pathways. An identified potential exposure pathway does not imply that exposure is occurring, only that the potential exists for exposure.

### 4.2.1 Soil Ingestion

The soil ingestion pathway includes the first three feet within ground surface. Therefore, based on the analytical results, soil ingestion is a potential contaminant exposure pathway. Soil ingestion occurs when soil containing elevated concentrations of the constituents of concern are ingested into the body. The facility is an industrial site and direct contact and ultimately ingestion of the impacted soil is not likely to occur. However, construction activities would increase the possibility of exposure. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

### 4.2.2 Soil Inhalation

The soil inhalation pathway includes the first ten feet within ground surface. However, bedrock was encountered at approximately 4 feet below grade. Therefore, based on the analytical results, soil inhalation is a potential contaminant exposure pathway. Soil inhalation occurs when elevated concentrations of the constituents of concern are inhaled into the body. However, the highly volatile constituents (i.e., BTEX, TPH as gasoline), were not detected at concentrations above the IEPA cleanup objectives. The constituents that were detected at concentrations above the IEPA cleanup objectives (i.e., metals, semi-volatiles, PCBs), are not considered highly volatile. Based on the relatively low volatility of the detected constituents of concern, this pathway would not likely be an effective exposure pathway.

### 4.2.3 Groundwater Ingestion

The groundwater ingestion pathway includes groundwater being used as a potable source of water. The Village of Romeoville receives its potable water via 10 municipal potable water supply wells. Based on the facility's location immediately adjacent to two bodies of water, it is unlikely that the impacted groundwater beneath the facility would have any impact on these wells.

Based on the current land use (industrial) and site conditions (analytical results and soil types), it is judged that the potential for human exposure to the constituents of concern from this facility is low. However, personnel working at the facility could be susceptible to exposure due to accidental soil ingestion due to activities such as construction. Such exposure may result from contact with contaminated subsurface or surface materials previously located beneath a protective barrier (i.e., concrete cap, building). Additionally, emulsified oil droplets and an oil sheen were encountered in MW-5 during groundwater sampling activities.

There is no requirement under Illinois environmental law to further investigate or remediate this property.

| **Monitoring Well Sample Identification** | | | | |
| MW-1 (B-2) | Ash Disposal Areas | BTEX, PNAs, PCBs, RCRA metals | NA | 10/26/98 |
| MW-2 (B-5) | Ash Settling Ponds | BTEX, PNAs, PCBs, RCRA metals | NA | 10/26/98 |
| MW-3 (B-8) | Coal Pile Runoff Ponds | BTEX, PNAs, PCBs, RCRA metals | NA | 10/26/98 |
| MW-4 (B-13) | Chimneys/Precipitators | BTEX, PNAs, PCBs, RCRA metals | NA | 10/26/98 |
| MW-5 (B-10) | Petroleum ASTs | BTEX, PNAs, PCBs, RCRA metals | NA | 10/26/98 |

**Notes:**

BTEX was analyzed using EPA Method 8260.

PNAs were analyzed using EPA Method 8310

PCBs were analyzed using EPA Method 8081.

RCRA metals were analyzed using EPA Method series 6000 and 7000.

pH was measured using EPA Method 9045.

(1) Sampling locations are referenced in the Phase II Environmental Site Assessment Report in Section 2.0.

Notes:
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.
(2) Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered

Notes:
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.

(2) Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered

Notes:
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.
(2) Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered.

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.
