# QUALITY CONTROL REPORT

## DUPLICATES

ENSR
740 Pasquinelli Drive
Westmont, IL 60559

11/06/1998

NET Job Number: 98.13082

Mr. Wei-lin Feng

| Analyte | Prep Batch Number | Run Batch Number | Original Analysis | Duplicate Analysis | Units | RPD |
|---|---|---|---|---|---|---|
| pH, Non-Aqueous | | 170 | 8.13 | 8.08 | units | 0.6 |
| pH, Non-Aqueous | | 171 | 8.52 | 8.62 | units | 1.2 |
| Solids, Total | | 2502 | 55.4 | 54.2 | % | 2.2 |
| Solids, Total | | 2502 | 90.8 | 89.3 | % | 1.7 |
| Solids, Total | | 2518 | 88.6 | 85.7 | % | 3.3 |
| Solids, Total | | 2518 | 86.9 | 86.3 | % | 0.7 |
| Solids, Total | | 2518 | 92.3 | 91.6 | % | 0.8 |

NOTE: Spikes and Duplicates may not be samples from this job.

RPD - Relative Percent Difference

Advisory Control Limits for Duplicates - RPD should be less than 20.

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| mg/L | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| ug/g | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| ug/L | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| ug/Kg | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| TCLP | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| Surr: | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Enclosed is the Analytical and Quality Control reports for the following samples submitted to Bartlett Division of NET, Inc. for analysis.

Project Description: ComEd-Joliet #29; 1801-023

| Sample Number | Sample Description | Date Taken | Date Received |
|---|---|---|---|
| 499551 | MW-2 | 10/22/1998 | 10/23/1998 |
| 499552 | MW-3 | 10/22/1998 | 10/23/1998 |
| 499553 | MW-5 | 10/22/1998 | 10/23/1998 |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike
MSD = Matrix Spike Duplicate
RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

# QUALITY CONTROL REPORT

## DUPLICATES

ENSR
740 Pasquinelli Drive
Westmont, IL 60559

11/08/1998

NET Job Number: 98.13758

Mr. Wei-Lin Feng

| Analyte | Prep Batch Number | Run Batch Number | Original Analysis | Duplicate Analysis | Units | RPD |
|---|---|---|---|---|---|---|
| pH | | 1713 | 7.26 | 7.27 | units | 0.1 |

NOTE: Spikes and Duplicates may not be samples from this job.

RPD - Relative Percent Difference

Advisory Control Limits for Duplicates - RPD should be less than 20.

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| mg/L | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| ug/g | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| ug/L | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| ug/Kg | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| TCLP | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| Surr: | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Enclosed is the Analytical and Quality Control reports for the following samples submitted to Bartlett Division of NET, Inc. for analysis.

Project Description: ComEd-Joliet #29; 1801-230

| Sample Number | Sample Description | Date Taken | Date Received |
|---|---|---|---|
| 500229 | MW-1 | 10/27/1998 | 10/28/1998 |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike
MSD = Matrix Spike Duplicate
RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

KEY TO ABBREVIATIONS and METHOD REFERENCES

| | | |
|---|---|---|
| < | : | Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value. |
| mg/L | : | Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm). |
| ug/g | : | Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg. |
| ug/L | : | Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb). |
| ug/Kg | : | Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb). |
| TCLP | : | These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test. |
| Surr: | : | These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements. |
| % | : | Percent; To convert ppm to %, divide the result by 10,000.<br>To convert % to ppm, multiply the result by 10,000. |
| ICP | : | Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy. |
| AA | : | Indicates analysis was performed using Atomic Absorption Spectroscopy. |
| GFAA | : | Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy. |
| PQL | : | Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. |

Enclosed is the Analytical and Quality Control reports for the following samples submitted to Bartlett Division of NET, Inc. for analysis.

Project Description: ComEd-Joliet #29; 1801-~~230~~ 023-410

| Sample Number | Sample Description | Date Taken | Date Received |
|---|---|---|---|
| 500229 | MW-1 | 10/27/1998 | 10/28/1998 |

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike
MSD = Matrix Spike Duplicate
RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

# INSPECTION SUMMARY LETTER

August 27, 2009

Ms. Elsie Briette
Midwest Generation, LLC
1800 Channahon Road
Joliet, IL 60436

VIA E-MAIL and U.S. MAIL KPRG Project No. 15209

Re: Joliet #29 Former Ash Burial Area Runoff Inspection 2009

Dear Ms. Briette:

KPRG and Associates, Inc. (KPRG) completed a walk-over inspection of the former ash burial area on the northeast side of the Joliet #29 property, outside the fenced boundary of the facility. The inspection was performed on August 24th and 25th, 2009. The purpose of the inspection was to identify any erosional features that may expose the underlying buried ash/slag and channel runoff toward the Des Plaines River which is immediately south of this area. It is noted that the ash burial area also extends to the west to within the fenced portion of the Joliet #29 facility. This portion of the former ash burial area was inspected by Midwest Generation and KPRG on July 14, 2009. It is our understanding that the ash burial area is included within the storm water/discharge permit for the facility and this inspection is part of permit compliance requirements.

During the inspection, KPRG identified five areas outside the fenced boundary of the Joliet #29 facility where either sheet wash erosion or rilling has exposed the underlying ash/slag and may transport the material to the Des Plaines River. These are identified as Areas 1 through 5 below. In addition, there was one erosional area identified within the fenced boundary of the Joliet #29 facility. This is identified as Area 6 below.

For each of the six areas, the following observations and recommendations for repair are forwarded:

- Area 1 – Located at coordinates N41° 30.068'/W88° 06.419'. This is an area of sheet wash which has eroded some of the gravel/rock cover and has started to expose some underlying ash/slag. The area of ash exposure is about 30 feet wide and extends from the top of the slope to the river water interface.

The recommended repair should include prepping/grading an approximate 50' x 50' surface area (this will include the subject area and a sufficient buffer around the area) and properly placing 4" to 6" of clayey top soil. The top soil should be seeded with a mix of all purpose seed and annual rye. The annual rye will accommodate germination in the later summer and fall months. This should then be covered with a green wood fiber erosion blanket. A series of straw logs should be placed along the top of the subject area to help reduce sheet runoff erosional effects.

- Area 2 – Located at N41° 29.950/W88° 06.621'. This is an area of a deeply incised, sinuous gully that breaches the existing earthen/rock berm. It is located within a heavily vegetated area. The gully is approximately 50 feet long, up to 4 feet deep and 10 feet wide. There is evidence of ash/slag in the bottom of the gully.

  The recommended repair is to construct a 3 to 4 foot clay berm topped with rip rap to mend the breach in the existing berm. The remainder of the gully will be dressed with clayey top soil and seeded with a mix of all purpose seed and annual rye. The gully will also be grubbed out to allow for sufficient sunlight penetration to accommodate seed germination.

- Area 3 – Located at N41° 29.916'/W88° 06.683'. This is an area at the top of the bank which has ash/slag exposed to sheet runoff. The area is approximately 30' x 30' in size. The side slope of bank itself appears in good condition.

  The recommended repair is to clear the area, place 4" to 6" of top soil and seed with a mix of all purpose seed and annual rye. Cover the area with hay to preclude erosion during germination.

- Area 4 – Located at N41° 29.894'/W88° 06.732'. This area has a small rill that has started to form with some evidence of ash and slag toward the bottom. The rill is about 15 feet long, 2 feet deep and 3 to 4 feet wide. The remainder of the bank side slope appears in good condition.

  The recommended repair is to fill in the rill with clayey top soil and seed with a mix of all purpose seed and annual rye. This should then be covered with an erosion mat. A straw log should be placed along the top of the subject area to help reduce runoff erosional effects.

- Area 5 – Located at N41° 29.889/W88° 06.947'. This is an area of sheet wash which has eroded most of the cover and has exposed ash/slag along the side of the bank. The area of ash exposure is about 50 feet wide and extends from the top of the slope to the river water interface. The slope is fairly steep at this location.

MWG13-15_19443

The recommended repair is to grade the area, place clayey top soil and seed with a mix of all purpose seed and annual rye. Due to the steepness of the slope, the area should then be covered with a properly anchored Eastcoast Erosion Blanket ECC-3 which is a specialty three-layer netting structure that firmly helps secure and promote vegetal growth along slopes. The matting configuration includes a layer of 100% coconut matrix material. The underlying seed will germinate and grow directly through the blanket. The length of the blanket should extend to beyond the area of exposure. The top of the blanket will be additionally anchored into a small excavated trench to preclude underwashing. The top of the area should then be lined with rip-rap to help disperse and reduce sheet runoff effects.

- Area 6 is located within the fenced boundary of the Joliet #29 facility, approximately 500 feet west of Area 5. As noted above, this area was inspected during a site meeting with Midwest Generation on July 14, 2009. Similar to Area 5, this is an area of sheet wash which has eroded most of the cover and has exposed ash/slag along the side of the bank. The area of ash exposure is about 50 feet wide and extends from the top of the slope to the river water interface. The slope is fairly steep at this location.

  The recommended repair is the same as provided for Area 5 above.

KPRG met with Allied Landscaping at the site to show the areas of required repair to facilitate a contractor cost estimate. Upon receipt of Allied's estimate, KPRG will follow-up with a separate cost estimate for implementation of the recommended repairs. The cost for each area will be itemized out in the estimate.

KPRG appreciates the continued opportunity for providing our technical services to Midwest Generation. If there are any questions, please contact me at 262-781-0475.

Sincerely,
KPRG and Associates, Inc.

**Re: Violation Notice: Midwest Generation, LLC, Joliet #29 Generating Station**
**Identification No.: 6284**
**Violation Notice No.: W-2012-00059**

Dear Mr. Constantelos:

This constitutes a Violation Notice pursuant to Section 31(a)(1) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(1), and is based upon a review of available information and an investigation by representatives of the Illinois Environmental Protection Agency ("Illinois EPA").

The Illinois EPA hereby provides notice of alleged violations of environmental laws, regulations, or permits as set forth in Attachment A to this notice. Attachment A includes an explanation of the activities that the Illinois EPA believes may resolve the specified alleged violations. Due to the nature and seriousness of the alleged violations, please be advised that resolution of the violations may also require the involvement of a prosecutorial authority for purposes that may include, among others, the imposition of statutory penalties.

A written response, which may include a request for a meeting with representatives of the Illinois EPA, must be submitted via certified mail to the Illinois EPA within 45 days of receipt of this letter. If a meeting is requested, it shall be held within 60 days of receipt of this notice. The response must include information in rebuttal, explanation, or justification of each alleged violation and a statement indicating whether or not the facility wishes to enter into a Compliance Commitment Agreement ("CCA") pursuant to Section 31(a) of the Act. If the facility wishes to enter into a CCA, the written response must also include proposed terms for the CCA that includes dates for achieving each commitment and may include a statement that compliance has been achieved for some or all of the alleged violations. The proposed terms of the CCA should contain sufficient detail and must include steps to be taken to achieve compliance and the necessary dates by which compliance will be achieved.

The Illinois EPA will review the proposed terms for a CCA provided by the facility and, within 30 days of receipt, will respond with either a proposed CCA or a notice that no CCA will be issued by the Illinois EPA. If the Illinois EPA sends a proposed CCA, the facility must respond in writing by either agreeing to and signing the proposed CCA or by notifying the Illinois EPA that the facility rejects the terms of the proposed CCA.

If a timely written response to this Violation Notice is not provided, it shall be considered a waiver of the opportunity to respond and meet, and the Illinois EPA may proceed with referral to a prosecutorial authority.

Written communications should be directed to:

Illinois EPA – Division of Public Water Supplies
Attn: Andrea Rhodes, CAS #19
P.O. BOX 19276
Springfield, IL 62794-9276

All communications must include reference to this Violation Notice number, W-2012-00059.

Questions regarding this Violation Notice should be directed to Andrea Rhodes at 217/785-0561.

Sincerely,

Michael Crumly

**MIDWEST GENERATION, LLC, JOLIET #29 GENERATING STATION, ID:6284**
**VIOLATION NOTICE NO. W-2012-00059:**

A review of information available to the Illinois EPA indicates the following on-going violations of statutes, regulations, or permits. Included with each type of violation is an explanation of the activities that the Illinois EPA believes may resolve the violation.

**Groundwater Quality**

No person shall cause, threaten or allow the release of any contaminant to a resource groundwater such that: treatment or additional treatment is necessary to continue an existing use or to assure a potential use of such groundwater; or an existing or potential use of such groundwater is precluded. No person shall cause, threaten or allow the release of any contaminant to groundwater so as to cause a groundwater quality standard to be exceeded. Midwest Generation, LLC must take actions to mitigate existing contamination and prevent the continuing release of contaminants into the environment.

**Violation Description**

Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring well MW-2 for the following constituents:

| Parameter | Sample Value | GW Standard | Collection Date |
|---|---|---|---|
| Chloride | 230 mg/l | 200 mg/l | 06/14/2011 |
| Antimony | 0.012 mg/l | 0.006 mg/l | 12/06/2010 |

Rule/Reg. Section 12 of the Act, 415 ILCS 5/12, 35 Ill. Adm. Code 620.115, 620.301, 620.401, 620.405, and 620.410.

**Violation Description**

Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring well MW-3 for the following constituents:

| Parameter | Sample Value | GW Standard | Collection Date |
|---|---|---|---|
| Chloride | 250 mg/l | 200 mg/l | 03/15/2012 |
| Chloride | 260 mg/l | 200 mg/l | 12/07/2011 |
| Chloride | 300 mg/l | 200 mg/l | 06/14/2011 |
| Chloride | 240 mg/l | 200 mg/l | 03/28/2011 |
| Chloride | 260 mg/l | 200 mg/l | 12/07/2010 |

Rule/Reg. Section 12 of the Act, 415 ILCS 5/12, 35 Ill. Adm. Code 620.115, 620.301, 620.401, 620.405, and 620.410.

**Re: Compliance Commitment Acceptance**
**Violation Notice: W-2012-00059**
**Midwest Generation, LLC, Joliet #29 Generating Station; ID Number: 6284**

Dear Mr. Kennedy:

The Illinois Environmental Protection Agency ("Illinois EPA") has approved the Compliance Commitment Agreement ("CCA") for Midwest Generation, LLC, Joliet #29 Generating Station. Please find enclosed an executed copy of the CCA for your records.

Failure to fully comply with the CCA may, at the sole discretion of the Illinois EPA, result in referral of this matter to the Office of the Attorney General, the State's Attorney or the United States Environmental Protection Agency.

The CCA does not constitute a waiver or modification of the terms and conditions of any license or permit issued by the Illinois EPA or any other unit or department of local, state or federal government or of any local, state or federal statute or regulatory requirement.

Questions regarding this matter should be directed to Andrea Rhodes at 217/785-0561. Written communications should be directed to the Illinois Environmental Protection Agency, Bureau of Water, CAS #19, P.O. Box 19276, Springfield, IL 62794-9276, and all communications shall include reference to your Violation Notice Number W-2012-00059.

Sincerely,

Michael Crumly

**COMPLIANCE COMMITMENT AGREEMENT**

## I. Jurisdiction

1. This Compliance Commitment Agreement ("CCA") is entered into voluntarily by the Illinois Environmental Protection Agency ("Illinois EPA") and Midwest Generation, LLC, Joliet Generating Station ("Respondent") (collectively, the "Parties") under the authority vested in the Illinois EPA pursuant to Section 31(a)(7)(i) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(7)(i).

## II. Allegation of Violations

2. Respondent owns and operates Joliet #29 a power generating station in Joliet, Will County, Illinois ("Joliet #29").

3. Pursuant to Violation Notice ("VN") W-2012-00059 issued on June 11, 2012, the Illinois EPA contends that Respondent has violated the following provisions of the Act and Illinois Pollution Control Board ("Board") Regulations:

   a) Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring wells MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, MW-10, and MW-11.
   Section 12 of the Act, 415 ILCS 5/12, 35 Ill. Adm. Code 620.115, 620.301, 620.401, 620.405, and 620.410.

## III. Compliance Activities

4. On August 31, 2012, the Illinois EPA received Respondent's response to VN W-2012-00059, which included proposed terms for a CCA. The Illinois EPA has reviewed Respondent's proposed CCA terms, as well as considered whether any additional terms and conditions are necessary to attain compliance with the alleged violations cited in the VN.

5. Respondent agrees to undertake and complete the following actions, which the Illinois EPA has determined are necessary to attain compliance with the allegations contained in VN W-2012-00059:

   a) The ash ponds at Joliet #29 shall not be used as permanent disposal sites and shall continue to function as treatment ponds to precipitate ash. Ash shall continue to be removed from the ponds on a periodic basis.

   b) The ash treatment ponds shall be maintained and operated in a manner which protects the integrity of the existing liners. During the removal of ash from the ponds, appropriate procedures shall be followed to protect the integrity of the existing liners, including operating the ash removal equipment in a manner which minimizes the risk of any damage to the liner.

   c) During the ash removal process, visual inspections of the ponds shall be conducted to identify any signs of a breach in the integrity of the pond liners. In the event that a breach of the pond liners is detected, Midwest Generation shall promptly notify the Illinois EPA and shall implement a corrective action plan for repair or replacement as necessary, of the liner. Upon the Illinois EPA's approval, and the issuance of any necessary construction permit, Midwest Generation will implement the corrective action plan.

   d) Midwest Generation shall continue quarterly monitoring of the existing eleven groundwater monitoring wells for constituents in 35 Ill. Adm. Code 620.410(a), with the exception of radium 226 and 228, and report its findings to the Illinois EPA within 30 days of the end of each quarter. In addition, Midwest Generation shall record and report groundwater elevation and submit a potentiometric surface map with the above quarterly groundwater monitoring report.

   e) Midwest Generation shall submit an application for a construction permit to re-line Pond #3 with a high density polyethylene ("HDPE") liner within 90 days of the effective date of the CCA. A groundwater monitoring schedule shall be included in the construction permit.

   f) Midwest Generation shall submit an application to establish a Groundwater Management Zone ("GMZ") pursuant to 35 Ill. Adm. Code Part 620.250 within 90 days of the effective date of the CCA.

g) Midwest Generation shall establish a GMZ pursuant to 35 Ill. Adm. Code Part 620.250 within one year of the effective date of the CCA.

h) Once Pond #3 has been re-lined with a HDPE liner and a GMZ has been established, Midwest Generation, shall submit a certification (or a statement) of compliance. Midwest Generation may submit either the attached "Illinois EPA Compliance Statement" or another similar writing to satisfy the statement of compliance within one year of the effective date of the CCA.

## IV. Terms and Conditions

6. Respondent shall comply with all provisions of this CCA, including, but not limited to, any appendices to this CCA and all documents incorporated by reference into this CCA. Pursuant to Section 31(a)(10) of the Act, 415 ILCS 5/31(a)(10), if Respondent complies with the terms of this CCA, the Illinois EPA shall not refer the alleged violations that are the subject of this CCA, as described in Section II above, to the Office of the Illinois Attorney General or the State's Attorney of the county in which the alleged violations occurred. Successful completion of this CCA or an amended CCA shall be a factor to be weighed, in favor of the Respondent, by the Office of the Illinois Attorney General in determining whether to file a complaint on its own motion for the violations cited in VN W-2012-00059.

7. This CCA is solely intended to address the violations alleged in Illinois EPA VN W-2012-00059. The Illinois EPA reserves and this CCA is without prejudice to, all rights of the Illinois EPA against Respondent with respect to noncompliance with any term of this CCA, as well as to all other matters. Nothing in this CCA is intended as a waiver, discharge, release, or covenant not to sue for any claim or cause of action, administrative or judicial, civil or criminal, past or future, in law or in equity, which the Illinois EPA may have against Respondent, or any other person as defined by Section 3.315 of the Act, 415 ILCS 5/3.315. This CCA in no way affects the responsibilities of Respondent to comply with any other federal, state or local laws or regulations, including but not limited to the Act, and the Board Regulations [and Permit, if applicable].

8. Pursuant to Section 42(k) of the Act, 415 ILCS 5/42(k), in addition to any other remedy or penalty that may apply, whether civil or criminal, Respondent shall be liable for an additional civil penalty of $2,000 for violation of any of the terms or conditions of this CCA.

9. This CCA shall apply to and be binding upon the Illinois EPA, and on Respondent and Respondent's officers, directors, employees, agents, successors, assigns, heirs, trustees, receivers, and upon all persons, including but not limited to contractors and consultants, acting on behalf of Respondent, as well as upon subsequent purchasers of Respondent's Joliet #29 in Joliet, Will County, Illinois.

10. In any action by the Illinois EPA to enforce the terms of this CCA, Respondent consents to and agrees not to contest the authority or jurisdiction of the Illinois EPA to enter into or enforce this CCA, and agrees not to contest the validity of this CCA or its terms and conditions.

11. This CCA shall only become effective:

    a) If, within 30 days of receipt, Respondent executes this CCA and submits it, via certified mail, to Illinois EPA, Bureau of Water, Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702. If Respondent fails to execute and submit this CCA within 30 days of receipt, via certified mail, this CCA shall be deemed rejected by operation of law; and

    b) Upon execution by all Parties.

12. Pursuant to Section 31(a)(7.5) of the Act, 415 ILCS 5/31(a)(7.5), this CCA shall not be amended or modified prior to execution by the Parties. Any amendment or modification to this CCA by Respondent prior to execution by all Parties shall be considered a rejection of the CCA by operation of law. This CCA may only be amended subsequent to its effective date, in writing, and by mutual agreement between the Illinois EPA and Respondent's signatory to this CCA, Respondent's legal representative, or Respondent's agent.

Re:

Compliance Commitment Agreement – Groundwater Management Zone Application
Midwest Generation, LLC, Joliet #29 Generating Station; ID No. 6284
Violation Notice W-2012-00059

Dear Ms. Rhodes:

The Compliance Commitment Agreement (CCA) for the above referenced site relative to Violation Notice W-2012-00059 was signed by Midwest Generation on October 15, 2012 and executed by Illinois Environmental Protection Agency (IEPA) signature on October 24, 2012 (effective date). Item 5 (f) of the CCA requires Midwest Generation to submit an application to establish a Groundwater Management Zone (GMZ) pursuant to 35 Ill. Adm. Code Part 620.250 within 90 days of the effective date of the CCA.

Based on previous discussions with IEPA, the proposed areal extent of the GMZ is shown on Figure 1 in Attachment 1. The GMZ Application Forms (Parts I through III) and supporting information/data are provided in Attachment 2. As discussed in the Application Forms support documentation, groundwater flow in the vicinity of the subject ash ponds is in a southerly direction with discharge to the adjoining station water intake channel off of the Des Plaines River. The southern (downgradient) extent of the proposed GMZ corresponds with this hydraulic boundary. The northern (upgradient) boundary is defined by the placement of the three upgradient monitoring wells (MW-8, MW-10 and MW-11). The east and west sides of the proposed GMZ are based on the flow system and location of the three ash ponds. The vertical extent of the GMZ would be the first underlying aquitard/confining unit identified as the Maquoketa Shale, approximate 180 to 200 feet below ground surface. The GMZ would therefore vertically include the unconsolidated overburden and the Silurian dolomite, both of which are hydraulically connected and overlie the Maquoketa Shale.

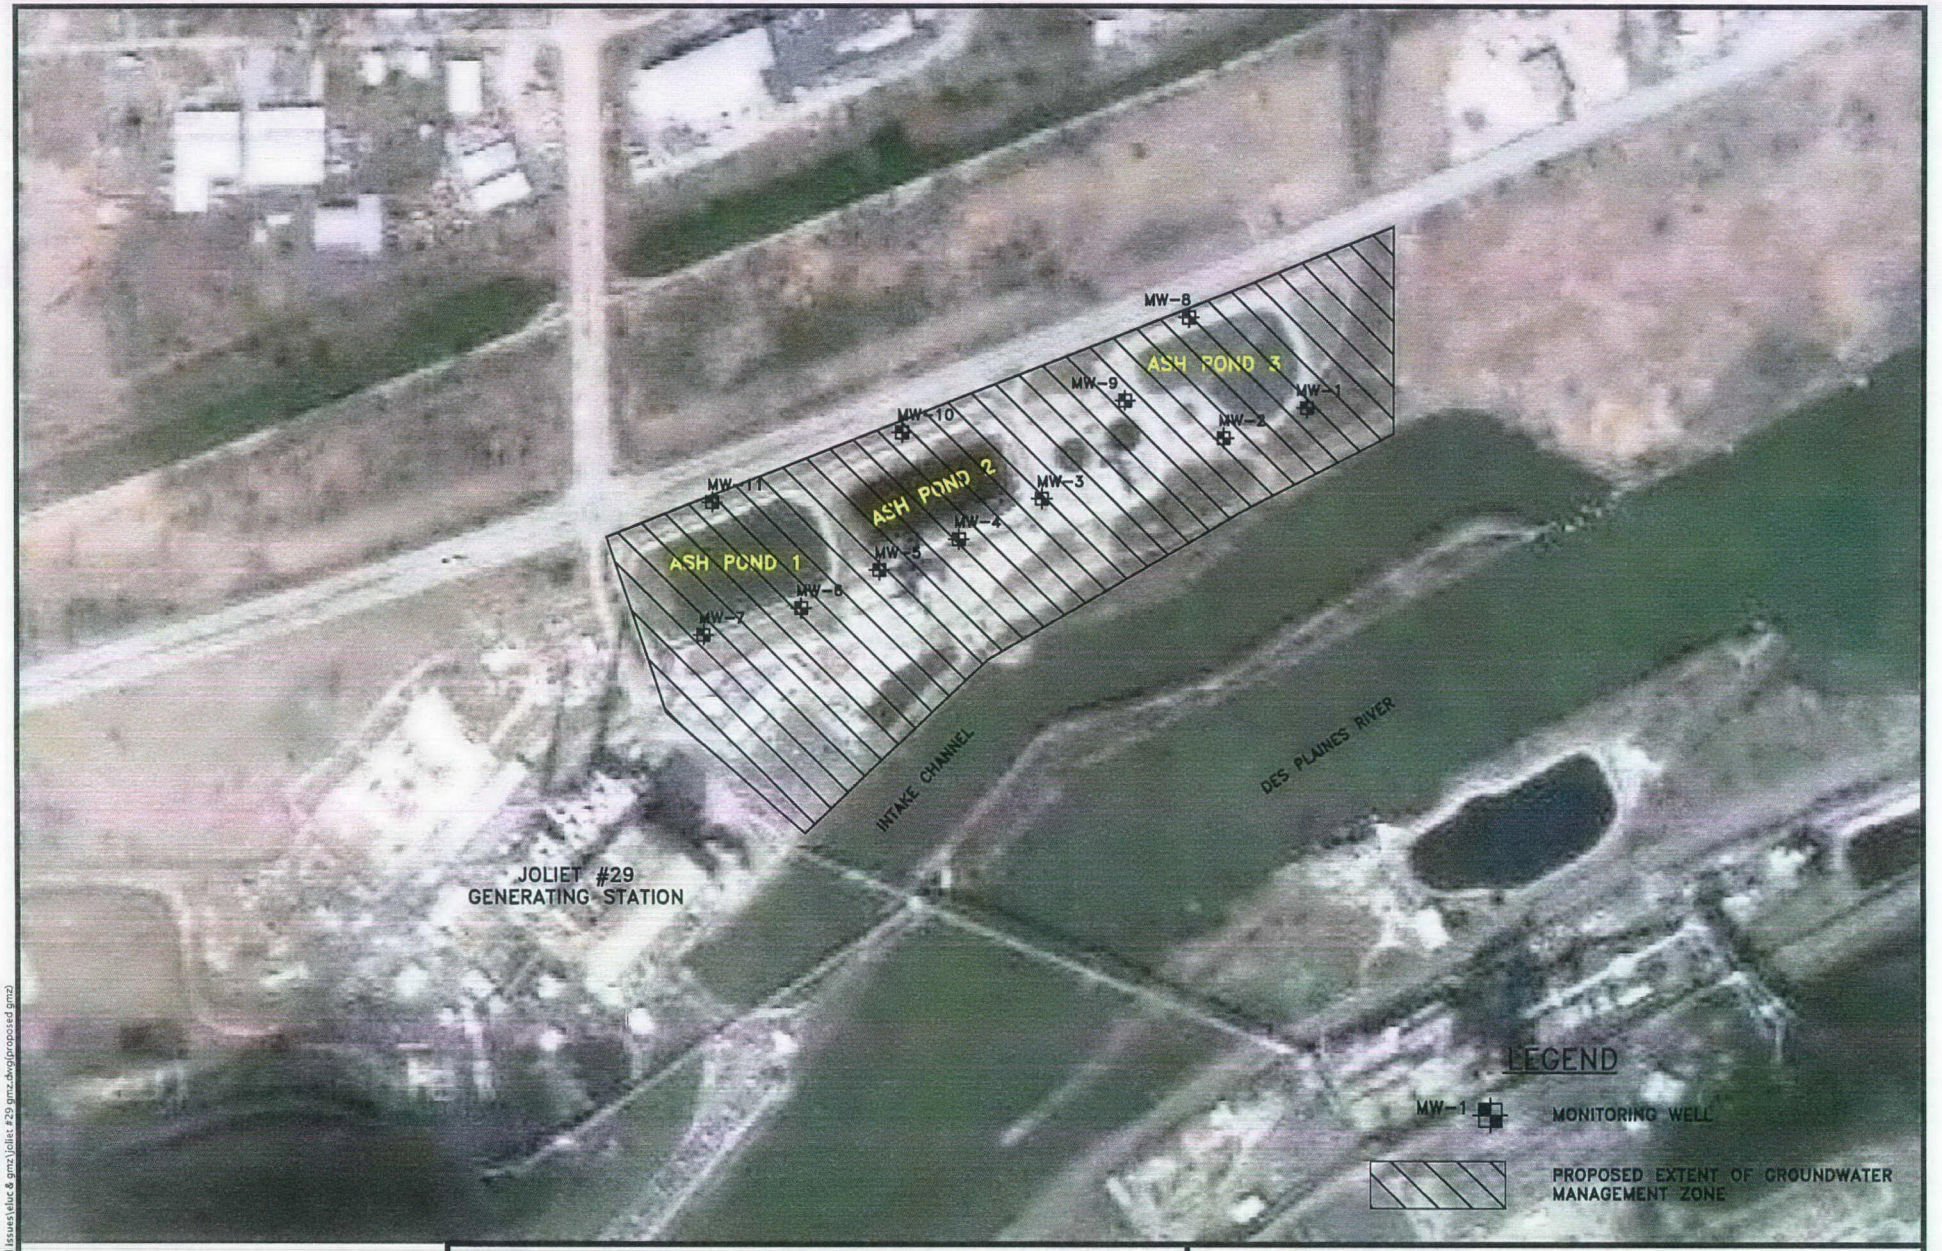
Fax: 949 225 9815
ahanrahan@mwgen.com

MWG13-15_17185

This submittal fulfills the requirements set forth under Item 5 (f) of the signed CCA. Once the application is approved by IEPA and the proposed extent of the GMZ is agreed upon, a formal surveying of the area will be performed and legal description generated. Please call me at 630-771-7863 if there are any questions.

Sincerely,
Midwest Generation, LLC



Amy Hanrahan
Senior Environmental Engineer

**Section 620.APPENDIX D Confirmation of an Adequate Corrective Action Pursuant to 35 Ill. Adm. Code 620.250(a)(2)**

Pursuant to 35 Ill. Adm. Code 620.250(a) if an owner or operator provides a written confirmation to the Agency that an adequate corrective action, equivalent to a corrective action process approved by the Agency, is being undertaken in a timely and appropriate manner, then a groundwater management zone may be established as a three-dimensional region containing groundwater being managed to mitigate impairment caused by the release of contaminants from a site. This document provides the form in which the written confirmation is to be submitted to the Agency.

Note 1. Parts I and II are to be submitted to IEPA at the time that the facility claims the alternative groundwater standards. Part III is to be submitted at the completion of the site investigation. At the completion of the corrective process, a final report is to be filed which includes the confirmation statement included in Part IV.

Note 2. The issuance of a permit by IEPA's Division of Air Pollution Control or Water Pollution Control for a treatment system does not imply that the Agency has approved the corrective action process.

Note 3. If the facility is conducting a cleanup of a unit which is subject to the requirements of the Resource Conservation and Recovery Act (RCRA) or the 35 Ill. Adm. Code 731 regulations for Underground Storage Tanks, this confirmation process is not applicable and cannot be used.

Note 4. If the answers to any of these questions require explanation or clarification, provide such in an attachment to this document.

Part I. Facility Information

Facility Name Joliet #29 Generating Station

Facility Address 1800 Channahon Road
Joliet, IL 60436

County Will County

Standard Industrial Code (SIC) 4911

1. Provide a general description of the type of industry, products manufactured, raw materials used, location and size of the facility.

The Midwest Generation Joliet #29 Station is a coal-fired electrical power generating station in operation since the mid-1960s. The facility is located at 1800 Channahon Road in Joliet, Illinois. The generating station property covers an area of approximately 297 acres.

2. What specific units (operating or closed) are present at the facility which are or were used to manage waste, hazardous waste, hazardous substances or petroleum?

| | YES | NO |
|---|---|---|
| Landfill | | X |
| Surface Impoundment | X | |
| Land Treatment | | X |
| Spray Irrigation | | X |
| Waste Pile | | X |
| Incinerator | | X |
| Storage Tank (above ground) | X | |
| Storage Tank (underground) | X | |
| Container Storage Area | X | |
| Injection Well | | X |
| Water Treatment Units | X | |
| Septic Tanks | | X |
| French Drains | | X |
| Transfer Station | | X |
| Other Units (please describe) | | |
| | | |
| | | |

3. Provide an extract from a USGS topographic or county map showing the location of the site and a more detailed scaled map of the facility with each waste management unit identified in Question 2 or known/suspected source clearly identified. Map scale must be specified and the location of the facility must be provided with respect to Township, Range and Section.

Please see Figures 1 and 2 in Attachment 2A.

4. Has the facility ever conducted operations which involved the generation, manufacture, processing, transportation, treatment, storage or handling of "hazardous substances" as defined by the Illinois Environmental Protection Act? Yes _X_ No ___ If the answer to this question is "yes" generally describe these operations.

Hazardous substances such as mercury debris and debris contaminated with lead are properly labeled and stored at this facility until they are removed for proper transport and disposal.

5. Has the facility generated, stored or treated hazardous waste as defined by the Resource Conservation and Recovery Act? Yes_X__ No ___If the answer to this question is "yes" generally describe these operations.

Hazardous substances such as mercury debris and debris contaminated with lead are properly labeled and stored at this facility until they are removed for proper transport and disposal.

6. Has the facility conducted operations which involved the processing, storage or handling of petroleum? Yes _X__ No ____If the answer to this question is "yes" generally describe these operations.

The facility stores oil for operations in above ground storage tanks and drums. Gasoline is stored in an underground storage tank.

7. Has the facility ever held any of the following permits?

   a. Permits for any waste storage, waste treatment or waste disposal operation. Yes _X__ No ___ If the answer to this question is "yes", identify the IEPA permit numbers.

   The facility utilizes a sewerage treatment system that discharges to the Des Plaines River under NPDES Permit No. IL0064254. The facility also disposes of bottom ash via sluice lines to the Lincoln Stone Quarry which is an IEPA permitted ash landfill (Permit No. 1994-241-LFM, Modification No. 17).

   b. Interim Status under the Resources Conservation and Recovery Act (filing of a RCRA Part A application). Yes ___ No _X__ If the answer to this question is "yes", attach a copy of the last approved Part A application.

   c. RCRA Part B Permits. Yes ___ No _X__ If the answer to this question is "yes", identify the permit log number.

8. Has the facility ever conducted the closure of a RCRA hazardous waste management unit? Yes ___ No _X__

9. Have any of the following State or federal government actions taken place for a release at the facility?

a. Written notification regarding known, suspected or alleged contamination on or emanating from the property (e.g., a Notice pursuant to Section 4(q) of the Environment Protection Act)? Yes _X_ No ___ If the to this question is "yes", identify the caption and date of issuance.

A Violation Notice was issued by IEPA on June 11, 2012 relative to the three ash impoundments alleging a potential release of coal ash constituents to groundwater (Violation Notice No. W-2012-00059). This was resolved through a Compliance Commitment Agreement (CCA) dated September 28, 2012 and formally executed on October 24, 2012.

There was also a spill of turbine oil at the facility on December 7, 2012 which entered a surface water way. The spill was addressed properly on conjunction with State and Federal oversight. To date no formal violation notice has been issued.

b. Consent Decree or Order under RCRA, CERCLA, EPAct Section 22.2 (State Superfund), or EPAct Section 21(f) (State RCRA). Yes ___ No _X_

c. If either of Items a or b were answered by checking "yes", is the notice, order or decree still in effect? Yes _X_ No ___

10. What groundwater classification will the facility be subject to at the completion of the remediation?

Class I _X_ Class II ___ Class III ___ Class IV ___
If more than one Class applies, please explain.

11. Describe the circumstances which the release to groundwater was identified.

As requested by Illinois Environmental Protection Agency (IEPA), a groundwater monitoring plan was developed and implemented for Ash Ponds 1 through 3 located on the east side of the facility. A total of eleven monitoring wells were installed around the three ash ponds. Quarterly sampling was initiated in December 2010 and has been ongoing since. The data were provided to IEPA on a quarterly basis. Based on the monitoring data, on June 11, 2012, IEPA issued a Violation Notice (W-2012-00059) to Midwest Generation alleging that potential leakage from the ponds has resulted in a violation of Class I groundwater standards for antimony, boron, chloride, iron, manganese, sulfate and total dissolved solids.

Based on my inquiry of those persons directly responsible for gathering the information, I

certify that the information submitted is, to the best of my knowledge and belief, true and accurate.

PART II: Release Information

1. Identify the chemical constituents release to the groundwater. Attach additional documents as necessary.

| Chemical Description | Chemical Abstract No. |
|---|---|
| Antimony | 7440-36-0 |
| Boron | 7440-42-8 |
| Chloride | 16887-00-6 |
| Iron | 7439-89-6 |
| Manganese | 7439-96-5 |
| Sulfate | 18785-72-3 |
| Total Dissolved Solids | C-010 |

2. Describe how the site will be investigated to determine the source or sources of the release.

This work has already been performed. As requested by Illinois Environmental Protection Agency (IEPA), Midwest Generation, LLC (Midwest Generation) prepared and submitted on September 3, 2010 a Hydrogeologic Assessment Plan for three ash ponds located at the Joliet No. 29 Generating Station. The purpose of the hydrogeologic assessment was to: (i) evaluate the potential, if any, for migration of ash related constituents from the ash ponds and conduct monitoring for groundwater constituents regulated by Illinois Part 620 groundwater standards; (ii) characterize the subsurface hydrogeology: and (iii) identify potable well use within 2,500 feet of the ash ponds.

Upon IEPA approval of the Hydrogeologic Assessment Plan, a total of eleven monitoring wells (MW-1 through MW-11) were installed around the three ash ponds identified as Ash Pond 1 through Ash Pond 3 (see Figure 3 in Attachment 2A). The wells were drilled and constructed in October/November 2010 after which point quarterly monitoring was initiated in accordance with approved, low-flow and/or disposable polyethylene bailer sampling procedures. A Hydrogeologic Assessment Report for Joliet Generating Station No. 29 was prepared by Patrick Engineering, Inc. and submitted by Midwest Generation, LLC to IEPA in February 2011. The results of the Hydrogeologic Assessment Report are incorporated into this application submittal by reference.

Since the submittal of the Hydrogeologic Assessment Report in February 2011, quarterly monitoring of the wells has been ongoing. The most recent round of sampling was performed in December 2012. A complete updated data summary is provided in Tables 1 and 2 in Attachment 2B. An updated groundwater flow map using the water level measurements from the most recent round of sampling is provided as Figure 4 in Attachment 2A.

3. Describe how groundwater will be monitored to determine the rate and extent of the release.

As part of the hydrogeologic assessment already performed (see discussion for item 2 above), in-situ hydraulic conductivity tests were performed on four of the monitoring wells (MW-4, MW-6, MW-9 and MW-11) installed around the ash ponds. Based on the results of the testing, hydraulic conductivity values in the vicinity of the well screens were found to range from $1.948 \times 10^{-3}$ to $6.949 \times 10^{-3}$ ft/sec with an average hydraulic conductivity of $3.896 \times 10^{-3}$ ft/sec. Using the average hydraulic conductivity value, an estimated hydraulic gradient of 0.0005 ft/ft based on the most recent groundwater contour map (Figure 4 in Attachment 2A) and an estimated effective porosity of 0.35 yields an estimated groundwater seepage velocity of approximately 0.48 ft/day.

Relative to the extent of impacts, a box-plot map of detections of the constituents identified in Part II - Item 1 above is provided as Figure 5 in Attachment 2A.

4. Has the release been contained on-site at the facility?

Yes. All groundwater monitoring data indicates that the impacts are limited to within the property boundary. Natural groundwater flow is in a southerly direction with discharge to the adjoining plant surface water intake channel off of the Des Plaines River.

5. Describe the groundwater monitoring network and groundwater and soil sampling protocols in place at the facility.

The IEPA approved groundwater monitoring network at the site consists of eleven monitoring wells (MW-1 through MW-11) located around the three existing ash ponds (see Figure 1 in Attachment 2A). Wells MW-8, MW-10 and MW-11 are upgradient monitoring wells. The remaining wells are considered downgradient monitoring points. The well borings were advanced using hollow-stem augers to depths ranging from 27.5 to 42 feet below ground surface (bgs). The depth of a specific boring was terminated approximately 10 feet below the encountered water table. The wells were subsequently constructed using standard, 2-inch diameter PVC casing with 10-feet of 0.010 slot PVC screens. The wells were completed approximately three feet above grade with locking protective steel casings and bumper posts. The boring logs and well construction summaries are included in the above referenced Hydrogeologic Assessment Report (see discussion for item 2 above). The monitoring wells are sampled on a quarterly basis using either low-flow sampling with a peristaltic pump or with disposable polyethylene bailers. Field measurements of pH, specific conductivity, temperature, dissolved oxygen (DO) and oxidation-reduction potential (ORP) are recorded. Once collected, the samples are placed on ice and transported under a completed chain-of-custody to

TestAmerica, Inc. which is an Illinois accredited analytical laboratory. The samples are analyzed for the inorganic compounds listed in 35 IAC 620.410(a) and (d), excluding radium 226/228.

There is no soil sampling that is performed as part of the approved site monitoring program.

6. Provide the schedule for investigation and monitoring.

Groundwater sampling of all existing monitoring wells is performed on a quarterly basis. The general sampling schedule is as follows:

| Event | Sampling Schedule |
|---|---|
| 1st Quarter | March |
| 2nd Quarter | June |
| 3rd Quarter | September |
| 4th Quarter | December |

7. Describe the laboratory quality assurance program utilized for the investigation.

TestAmerica's Quality Assurance Manual (QAM) is a document prepared to define the overall policies, organization objectives and functional responsibilities for achieving the laboratory's data quality goals. The laboratory maintains a local perspective in its scope of services and client relations and maintains a national perspective in terms of quality.

The QAM has been prepared to assure compliance with the NELAC Institute (TNI) Standard, dated 2009, Volume 1 Modules 2 and 4, and ISO/IEC Guide 17025:2005(E). In addition, the policies and procedures outlined in this manual are compliant with TestAmerica's Corporate Quality Management Plan (CQMP) and the various accreditation and certification programs. The CQMP provides a summary of TestAmerica's quality and data integrity system. It contains requirements and general guidelines under which all TestAmerica facilities shall conduct their operations.

The QAM has been prepared to be consistent with the requirements of the following documents:

- EPA 600/4-88/039, *Methods for the Determination of Organic Compounds in Drinking Water,* EPA, Revised July 1991.
- EPA 600/R-95/131, *Methods for the Determination of Organic Compounds in Drinking Water,* Supplement III, EPA, August 1995.
- EPA 600/4-79-019, *Handbook for Analytical Quality Control in Water and Wastewater Laboratories,* EPA, March 1979.

- Test Methods for Evaluating Solid Waste Physical/Chemical Methods (SW846), Third Edition, September 1986, Final Update I, July 1992, Final Update IIA, August 1993, Final Update II, September 1994; Final Update IIB, January 1995; Final Update III, December 1996; Final Update IV, January 2008.
- Federal Register, 40 CFR Parts 136, 141, 172, 173, 178, 179 and 261.
- Statement of Work for Inorganics Analysis, SOM and ISM, current versions, USEPA Contract Laboratory Program Multi-media, Multi-concentration.
- APHA, *Standard Methods for the Examination of Water and Wastewater,* 18th Edition, 19th, 20th, 21st and on-line Editions.
- U.S. Department of Energy Order 414.1C, Quality Assurance, June 17, 2005.
- *U.S. Department of Energy, Quality Systems for Analytical Services*, Revision 3.6, November 2010.
- U.S. Department of Defense, *Quality Systems Manual for Environmental Laboratories*, Final Version 4.2, October 2010.
- U.S. Department of Defense, *Air Force Center for Environmental Excellence Quality Assurance Project Plan (QAPP),* Version 4.0.02, May 2006.
- National Environmental Laboratory Accreditation Conference, Constitution, Bylaws, and Standards, EPA 600/R-04/003, US EPA Office of Research and Development, June 2003
- Toxic Substances Control Act (TSCA).

Copies of TestAmerica's QAM and CQMP can be provided upon request.

8. Provide a summary of the results of available soil testing and groundwater monitoring associated with the release at the facility. The summary or results should provide the following information: dates of sampling; types of samples taken (soil or water); locations and depths of samples; sampling and analytical methods; analytical laboratories used; chemical constituents for which analyses were performed; analytical detection limits; and concentrations of chemical constituents in ppm (levels below detection should be identified as "ND").

The data summary for all groundwater sampling performed to date is provided in Tables 1 and 2 in Attachment 2B.

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of knowledge and belief, true and accurate and confirm that the actions identified herein will be undertaken in accordance

with the schedule set forth herein.

Part III: Remedy Selection Information

1. Describe the selected remedy.

Ash Ponds 1 and 2 were already lined with high density polyethylene (HDPE) and Ash Pond 3 currently has a Poz-o-Pac liner. The agreed upon remedy is specified in Item 5 (a) through (h) of the executed Compliance Commitment Agreement (CCA) which is provided in Attachment 2C. The remedy includes lining of Ash Pond 3 with HDPE. This Groundwater Management Zone (GMZ) application fulfills requirements set forth under Item 5 (f) of the CCA.

2. Describe other remedies which were considered and why they were rejected.

The primary alternate remedy discussed during negotiations with IEPA was to ensure that the ash ponds will not be used as permanent disposal sites, maintain the ash ponds in a manner that will be protective of the integrity of the existing liners, include visual inspections of the liners during ash removal events, implement repairs or replacement of the liners as necessary, establish a GMZ and to continue with the existing quarterly groundwater monitoring program until the federal ash regulation revisions are established. Upon the finalization of the new federal ash storage regulations, retrofit the impoundments, as necessary, to meet the new technical requirements for ash storage impoundments or re-engineer plant processes to maintain compliance and take the impoundments out of service.

This remedy was rejected by IEPA due to the uncertainty of the timeframe within which the new federal regulations will be issued.

3. Will waste, contaminated soil or contaminated groundwater be removed from the site in the course of this remediation? Yes _X_ No ___ If the answer to this question is "yes", where will the contaminated material be taken?

The ash that will be removed from Ash Pond 3 to facilitate new liner construction will be taken to the Lincoln Stone Quarry which is an IEPA permitted ash landfill (Permit No. 1994-241-LFM, Modification No. 17).

4. Describe how the selected remedy will accomplish the maximum practical restoration of beneficial use of groundwater.

Once Ash Pond 3 is relined with a HDPE liner, all three ponds will have been constructed and operated to minimize potential release of ash pond fluids to groundwater. Any residual groundwater impacts potentially associated with prior ash pond leakage will naturally attenuate through the groundwater system under monitored conditions within the established GMZ with discharge to the water intake

channel immediately south of the units.

5. Describe how the selected remedy will minimize any threat to public health or the environment.

The existing conditions do not pose a threat to public health since the impacts are limited to within the property boundary, there are no groundwater use receptors and the ponds are located within a fenced property with 24-hour security controlled access. Any potential impacts to the environment will be minimized and managed as discussed under item 4 above.

6. Describe how the selected remedy will result in compliance with the applicable groundwater standards.

Once Ash Pond 3 is relined with an HDPE liner, all three ponds will have been constructed and operated to minimize potential release of ash pond fluids to groundwater (i.e, the ash ponds as a potential source of groundwater impacts will be eliminated). Any residual groundwater impacts potentially associated with prior ash pond leakage will naturally attenuate through the groundwater system under monitored conditions within the established GMZ and/or discharge to the river water intake channel located immediately north of the ash ponds.

7. Provide a schedule for design, construction and operation of the remedy, including dates for the start and completion.

The construction window for relining Ash Pond 3 is from May 6, 2013 through September 26, 2013. Dredging of the ash will occur between May 6, 2013 and July 25, 2013. At this time liner installation is anticipated to occur in August 2013.

A more detailed schedule is being provided under separate cover with the Application for Construction Permit to reline the two ponds.

8. Describe how the remedy will be operated and maintained.

Upon completion of construction activities, Midwest Generation will develop and submit an Operation and Maintenance (O&M) Plan to the IEPA. The O&M Plan will be based on manufacturer and installer recommendations. It will include procedures for liner system inspections, inspection frequency, documentation requirements and what corrective measure procedures are to be implemented, if necessary.

9. Have any of the following permits been issued for the remediation?

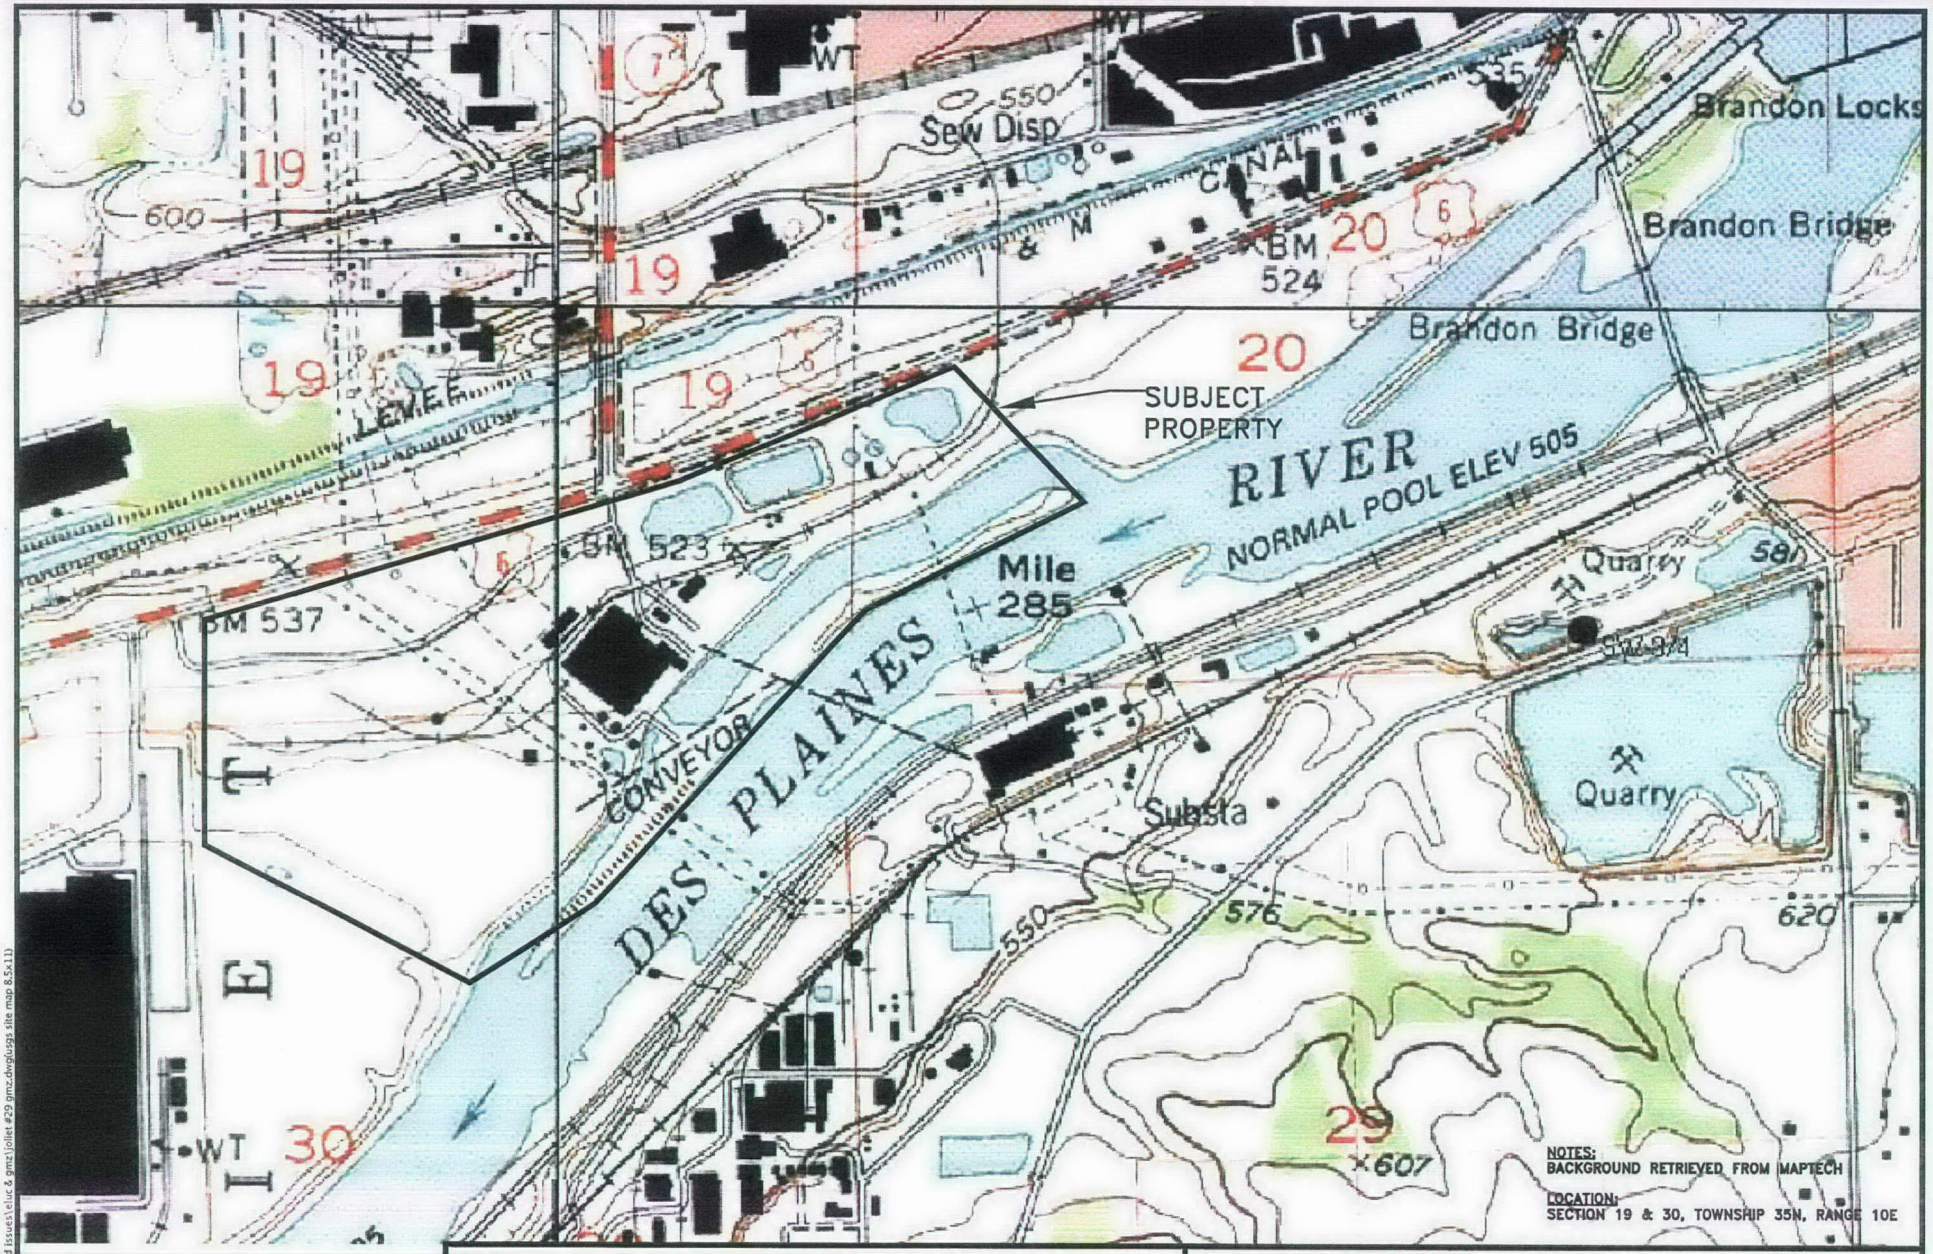
   a. Construction or Operating permit from the Division of Water Pollution Control. Yes _X_ No ___

This permit submittal is currently under review by IEPA.

b. Land treatment permit from the Division of Water Pollution Control. Yes ___ No _X__ If the answer to this question is "yes", identify the permit number.

c. Construction or Operating permit from the Division of Air Pollution Control. Yes ___ No _X__ If the answer to this question is "yes", identify the permit number.

10. How will groundwater at the facility be monitored following completion of the remedy to ensure that the groundwater standards have been attained?



There are currently 11 monitoring wells surrounding Ash Ponds 1 through 3 (see Figure 3 in Attachment 2A). As required under Item 5 (d) of the CCA, these wells will continue to be monitored on a quarterly basis for constituents listed in 35 IAC 620.410(a), with the exception of radium 226/228. The monitoring data will be reported to IEPA within 30 days of the end of each quarter. In addition, an updated groundwater potentiometric surface map will be provided with each quarterly submittal. IEPA, upon written request, may approve a reduction in the frequency and scope of the sampling program in the future. Upon the IEPA's approval, the approved changes in the frequency and scope of the monitoring program shall be implemented.

Based on my inquiry of those persons directly responsible for gathering the information, I certify that the information submitted is, to the best of my knowledge and belief, true and accurate and confirm that the actions identified herein will be undertaken in accordance with the schedule set forth herein.

Notes: Groundwater sample analyzed at TestAmerica laboratory.
Well screen depth is from 8.8 to 18.8 feet below ground surface.
Sample collected using low-flow technique.
All values are in mg/L (ppm).

DL - Detection limit
ND - Non-detect
NA - Not Applicable

NS - Not Sampled
^ - Denotes instrument related QC exceeds the control limits

**Re: Proposed Compliance Commitment Agreement**
**Violation Notice: W-2012-00059**
**Midwest Generation, LLC, Joliet #29 Generating Station; ID Number: 6284**

Dear Mr. Kennedy:

The Illinois Environmental Protection Agency ("Illinois EPA") has reviewed the proposed Compliance Commitment Agreement ("CCA") terms submitted by Midwest Generation, LLC, Joliet #29 Generating Station in a letter dated August 31, 2012, in response to the Violation Notice dated June 11, 2012. Pursuant to the authority vested in the Illinois EPA under Section 31(a)(7)(i) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(7)(i), attached to this letter is a proposed CCA, which contains terms and conditions that the Illinois EPA has determined are necessary in order for you to attain compliance with the Act and Illinois Pollution Control Board Regulations [and conditions of Permit, if applicable].

Pursuant to Section 31(a)(7.5) of the Act, 415, ILCS 5/31(a)(7.5), **within 30 days of your receipt of this proposed CCA,** Midwest Generation, LLC, Joliet #29 Generating Station or its duly authorized representative must either (1) agree to and sign the proposed CCA, and submit the signed and dated CCA by certified mail to Illinois EPA Bureau of Water, Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702; or (2) notify the Illinois EPA by certified mail that you reject the proposed CCA.

The proposed CCA shall only become effective upon your timely submittal of the signed CCA as discussed above, and upon final execution by the Illinois EPA. Failure by you to execute and submit the proposed CCA within 30 days of receipt shall be deemed a rejection of the CCA by operation of law. Upon timely receipt of the signed CCA, the Illinois EPA will send you a fully executed copy of the CCA for your records.

In addition, the proposed CCA is not subject to amendment or modification prior to execution by you and the Illinois EPA. Any amendment or modification to the proposed CCA by Respondent prior to execution by you and the Illinois EPA shall be deemed a rejection of the proposed CCA by operation of law. The proposed CCA may only be amended subsequent to its effective date, in writing, and by mutual agreement between the Illinois EPA and you.

MWG13-15_17223

Questions regarding this matter should be directed to Illinois EPA, Bureau of Water, Andrea Rhodes at 217/785-0561. Written communications should be directed to Illinois EPA – DPWS, Attn: Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702.

Sincerely,

Michael Crumly

**COMPLIANCE COMMITMENT AGREEMENT**

## I. Jurisdiction

1. This Compliance Commitment Agreement ("CCA") is entered into voluntarily by the Illinois Environmental Protection Agency ("Illinois EPA") and Midwest Generation, LLC, Joliet Generating Station ("Respondent") (collectively, the "Parties") under the authority vested in the Illinois EPA pursuant to Section 31(a)(7)(i) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/31(a)(7)(i).

## II. Allegation of Violations

2. Respondent owns and operates Joliet #29 a power generating station in Joliet, Will County, Illinois ("Joliet #29").

3. Pursuant to Violation Notice ("VN") W-2012-00059 issued on June 11, 2012, the Illinois EPA contends that Respondent has violated the following provisions of the Act and Illinois Pollution Control Board ("Board") Regulations:

   a) Operations at ash impoundments have resulted in violations of the Groundwater Quality Standards at monitoring wells MW-2, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-9, MW-10, and MW-11.
   Section 12 of the Act, 415 ILCS 5/12, 35 Ill. Adm. Code 620.115, 620.301, 620.401, 620.405, and 620.410.

## III. Compliance Activities

4. On August 31, 2012, the Illinois EPA received Respondent's response to VN W-2012-00059, which included proposed terms for a CCA. The Illinois EPA has reviewed Respondent's proposed CCA terms, as well as considered whether any additional terms and conditions are necessary to attain compliance with the alleged violations cited in the VN.

5. Respondent agrees to undertake and complete the following actions, which the Illinois EPA has determined are necessary to attain compliance with the allegations contained in VN W-2012-00059:

   a) The ash ponds at Joliet #29 shall not be used as permanent disposal sites and shall continue to function as treatment ponds to precipitate ash. Ash shall continue to be removed from the ponds on a periodic basis.

   b) The ash treatment ponds shall be maintained and operated in a manner which protects the integrity of the existing liners. During the removal of ash from the ponds, appropriate procedures shall be followed to protect the integrity of the existing liners, including operating the ash removal equipment in a manner which minimizes the risk of any damage to the liner.

   c) During the ash removal process, visual inspections of the ponds shall be conducted to identify any signs of a breach in the integrity of the pond liners. In the event that a breach of the pond liners is detected, Midwest Generation shall promptly notify the Illinois EPA and shall implement a corrective action plan for repair or replacement as necessary, of the liner. Upon the Illinois EPA's approval, and the issuance of any necessary construction permit, Midwest Generation will implement the corrective action plan.

   d) Midwest Generation shall continue quarterly monitoring of the existing eleven groundwater monitoring wells for constituents in 35 Ill. Adm. Code 620.410(a), with the exception of radium 226 and 228, and report its findings to the Illinois EPA within 30 days of the end of each quarter. In addition, Midwest Generation shall record and report groundwater elevation and submit a potentiometric surface map with the above quarterly groundwater monitoring report.

   e) Midwest Generation shall submit an application for a construction permit to re-line Pond #3 with a high density polyethylene ("HDPE") liner within 90 days of the effective date of the CCA. A groundwater monitoring schedule shall be included in the construction permit.

   f) Midwest Generation shall submit an application to establish a Groundwater Management Zone ("GMZ") pursuant to 35 Ill. Adm. Code Part 620.250 within 90 days of the effective date of the CCA.

g) Midwest Generation shall establish a GMZ pursuant to 35 Ill. Adm. Code Part 620.250 within one year of the effective date of the CCA.

h) Once Pond #3 has been re-lined with a HDPE liner and a GMZ has been established, Midwest Generation, shall submit a certification (or a statement) of compliance. Midwest Generation may submit either the attached "Illinois EPA Compliance Statement" or another similar writing to satisfy the statement of compliance within one year of the effective date of the CCA.

## IV. Terms and Conditions

6. Respondent shall comply with all provisions of this CCA, including, but not limited to, any appendices to this CCA and all documents incorporated by reference into this CCA. Pursuant to Section 31(a)(10) of the Act, 415 ILCS 5/31(a)(10), if Respondent complies with the terms of this CCA, the Illinois EPA shall not refer the alleged violations that are the subject of this CCA, as described in Section II above, to the Office of the Illinois Attorney General or the State's Attorney of the county in which the alleged violations occurred. Successful completion of this CCA or an amended CCA shall be a factor to be weighed, in favor of the Respondent, by the Office of the Illinois Attorney General in determining whether to file a complaint on its own motion for the violations cited in VN W-2012-00059.

7. This CCA is solely intended to address the violations alleged in Illinois EPA VN W-2012-00059. The Illinois EPA reserves and this CCA is without prejudice to, all rights of the Illinois EPA against Respondent with respect to noncompliance with any term of this CCA, as well as to all other matters. Nothing in this CCA is intended as a waiver, discharge, release, or covenant not to sue for any claim or cause of action, administrative or judicial, civil or criminal, past or future, in law or in equity, which the Illinois EPA may have against Respondent, or any other person as defined by Section 3.315 of the Act, 415 ILCS 5/3.315. This CCA in no way affects the responsibilities of Respondent to comply with any other federal, state or local laws or regulations, including but not limited to the Act, and the Board Regulations [and Permit, if applicable].

8. Pursuant to Section 42(k) of the Act, 415 ILCS 5/42(k), in addition to any other remedy or penalty that may apply, whether civil or criminal, Respondent shall be liable for an additional civil penalty of $2,000 for violation of any of the terms or conditions of this CCA.

9. This CCA shall apply to and be binding upon the Illinois EPA, and on Respondent and Respondent's officers, directors, employees, agents, successors, assigns, heirs, trustees, receivers, and upon all persons, including but not limited to contractors and consultants, acting on behalf of Respondent, as well as upon subsequent purchasers of Respondent's Joliet #29 in Joliet, Will County, Illinois.

10. In any action by the Illinois EPA to enforce the terms of this CCA, Respondent consents to and agrees not to contest the authority or jurisdiction of the Illinois EPA to enter into or enforce this CCA, and agrees not to contest the validity of this CCA or its terms and conditions.

11. This CCA shall only become effective:

    a) If, within 30 days of receipt, Respondent executes this CCA and submits it, via certified mail, to Illinois EPA, Bureau of Water, Andrea Rhodes, MC #19, 1021 North Grand Ave East, Springfield, IL 62702. If Respondent fails to execute and submit this CCA within 30 days of receipt, via certified mail, this CCA shall be deemed rejected by operation of law; and

    b) Upon execution by all Parties.

12. Pursuant to Section 31(a)(7.5) of the Act, 415 ILCS 5/31(a)(7.5), this CCA shall not be amended or modified prior to execution by the Parties. Any amendment or modification to this CCA by Respondent prior to execution by all Parties shall be considered a rejection of the CCA by operation of law. This CCA may only be amended subsequent to its effective date, in writing, and by mutual agreement between the Illinois EPA and Respondent's signatory to this CCA, Respondent's legal representative, or Respondent's agent.

Dear Ms. Hanrahan,

The Agency is in receipt of the January 18, 2013 submittal containing the Groundwater Management Zone application for Joliet #29 Generating Station. The submission of the application is a requirement of the Compliance Commitment Agreement executed on October 24, 2012. After review of the application, the Agency hereby gives approval of the Groundwater Management Zone for the facility. If you have further questions, please do not hesitate to call me.

Subject: Quarterly Groundwater Monitoring Results – Annual Report 2011
Joliet #29 Generating Station- Ash Impoundment

Reference: Patrick Project No. 21153.034

To Whom It May Concern:

Patrick Engineering Inc. (Patrick) has prepared this letter report, on behalf of Midwest Generation, LLC, to provide groundwater monitoring results associated with the on-site ash ponds at the Joliet #29 Generating Station (the Site) located at 1800 Channahon Rd. in Joliet, Illinois (Figure 1). The Site is located along the Des Plaines River just to the south of the city of Joliet and includes three active ash ponds.

Eleven monitoring wells have been installed (MW-1 through MW-a) surrounding the ash impoundments at the Joliet #29 facility. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. Monitoring wells MW-8, MW-10 and MW-11 are installed upgradient of the ash ponds. Monitoring wells M-1 through MW-7 and MW-9 are considered to be downgradient wells. The well locations are shown on Figure 2.

This groundwater monitoring is being performed as part of the long-term monitoring plan described in the Hydrogeologic Assessment Report submitted to the Illinois Environmental Protection Agency (Illinois EPA) in February 2011. Groundwater data has been collected on a quarterly basis starting in December of 2010 is continuing into 2012.

**GROUNDWATER ELEVATIONS**

Water levels in the monitoring wells are taken quarterly prior to sampling. The groundwater levels were compared to levels collected by the USGS stream flow data at Station Number 05539780 located where Route 53 crosses the Des Plaines River in Joliet, IL. Patrick's conceptual model of groundwater flow at the Site shows the groundwater flowing from northwest to southeast towards the Des Plaines River. The fluctuations in the groundwater elevations were compared to the fluctuations in the river levels for each monitoring event; there does not appear to be a correlation between the River levels and groundwater elevations at the site. The monitoring well elevations have seasonal variations which are not seen in the river

MWG13-15_38524

elevation data. Groundwater elevation data is summarized in Table 1 and shown on Figure 3. A chart depicting the groundwater elevations on site as compared to the Des Plaines River is included in Attachment A.

## SAMPLING METHODOLOGY

In accordance with the long-term monitoring plan referenced above, water samples are collected quarterly from eleven monitoring wells (MW-1 through MW-11) surrounding the ash impoundments at the Joliet #29 facility. These wells were most recently sampled on December 7, 2011.

Samples were collected using disposable polyethylene bailers or by using established low-flow sampling techniques with a peristaltic pump. Groundwater samples could not be collected from monitoring well MW-1 in the third or fourth quarter. This well did not contain enough groundwater to collect samples.

Field parameters including, temperature, turbidity, conductivity, dissolved oxygen (DO), oxygen reduction potential (ORP), and pH measurements were taken at each of the wells using a portable meter with a flow through cell. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. Field parameter data is provided in Table 2.

After collection, all samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4° F. The samples were transported to TestAmerica Laboratories, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain sample integrity. Analytes tested included the inorganic compounds listed in 35 Illinois Administrative Code (IAC) 620.410(a), excluding both radium and the poly-aromatic hydrocarbons (PAHs) listed in 35 IAC 620.410(b). Analytical laboratory results are presented in Table 3 (both current and historical). The laboratory analytical reports provided by TestAmerica Laboratories are provided as Attachment C.

## ANALYTICAL RESULTS

Groundwater samples were collected quarterly beginning in March 2011. Both upgradient and downgradient wells indicated Class I Groundwater Quality Standard exceedances. The following compounds exceeded their respective Class I standards: antimony, manganese, boron, sulfate, chloride, and total dissolved solids.

Patrick compared upgradient well concentrations with downgradient well concentrations. Overall the downgradient wells have higher concentrations in compounds with exceedances than the upgradient wells. The compounds in the downgradient wells include, manganese, chloride sulfate. The upgradient wells have higher concentrations in boron and total dissolved solids.

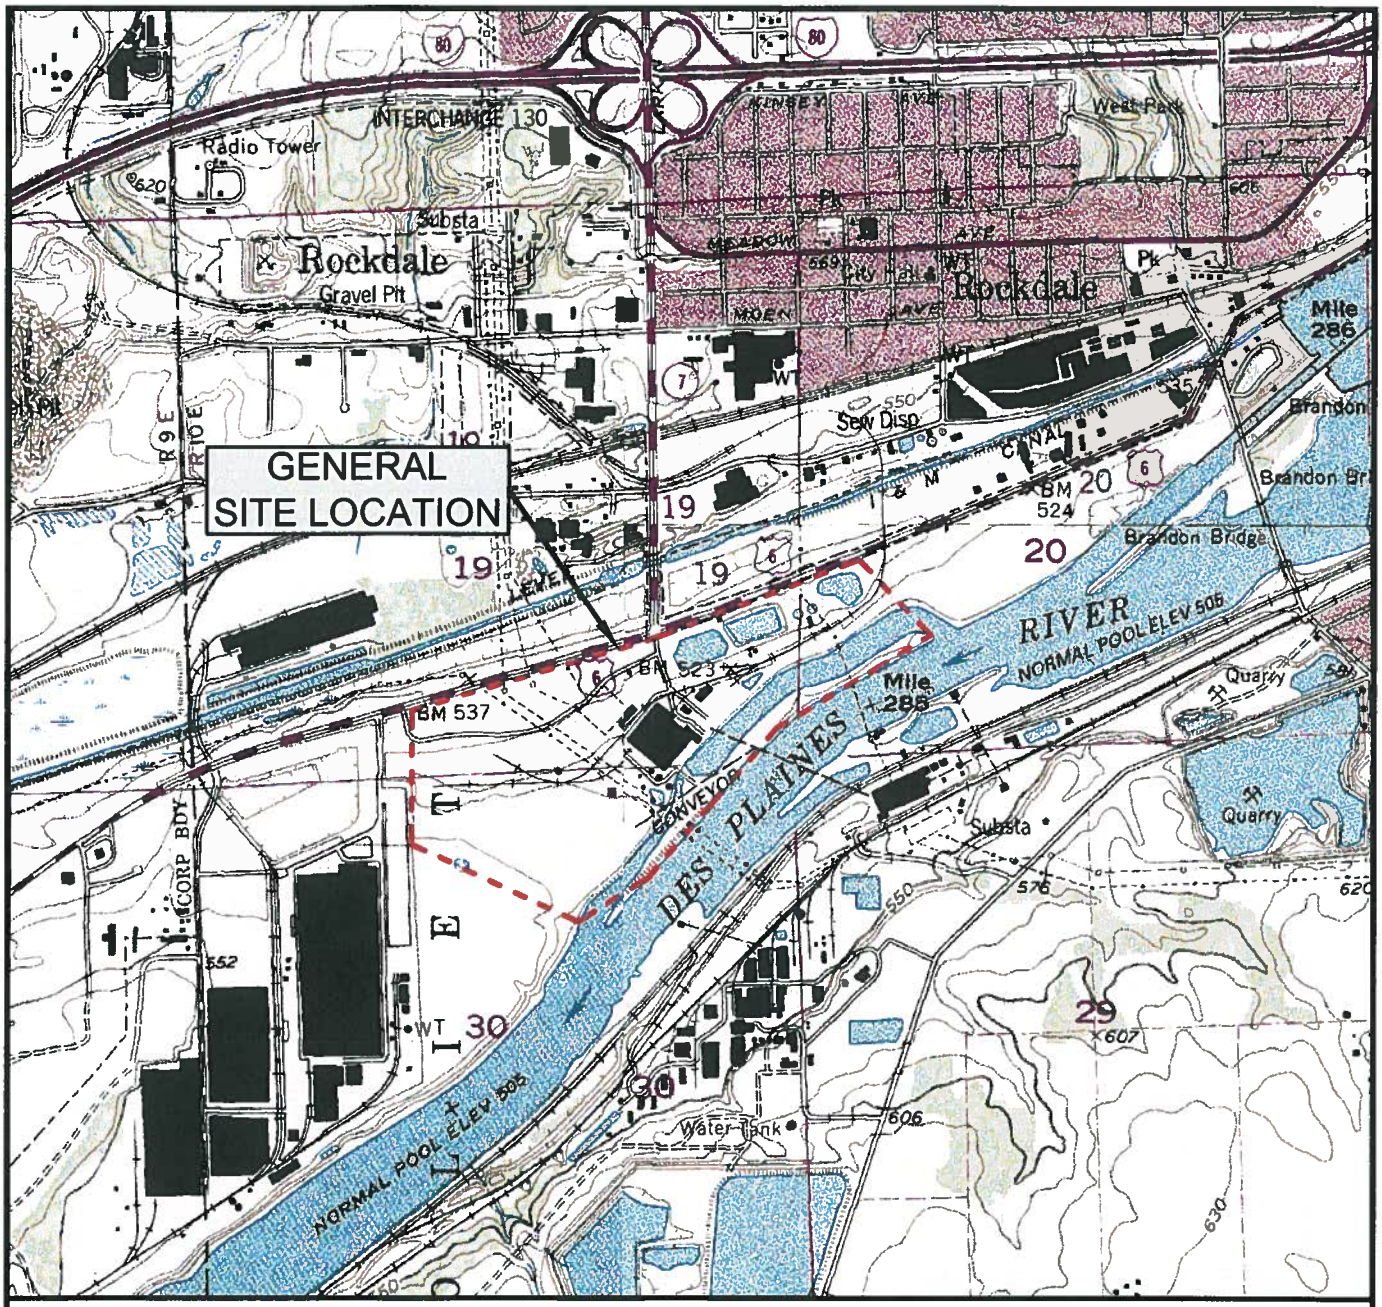
Patrick performed trend analyses on the following parameters (each of these parameters was detected during at least once during each sampling event): antimony, arsenic, barium, cobalt, copper, iron, manganese, nickel, selenium, boron, sulfate, chloride, nitrogen-nitrate, total dissolved solids, fluoride, and nitrogen-nitrate-nitrite. Analytical parameters without any detections were not included in the analysis. There were no statistically significant (at the 95%

confidence level) increasing or decreasing trends for any of the remaining analyzed compounds. Trend analysis charts are included in Attachment B of this report.

In accordance with the long-term monitoring plan, groundwater samples from the ash pond wells at the Joliet #29 facility will continue to be collected, analyzed, and reported to Illinois EPA on a quarterly basis until sufficient statistically-significant data is available to properly assess the groundwater data.

If you have any questions, please contact me at 630-795-7464.

Sincerely,



**PATRICK ENGINEERING INC.**

### Laboratory: TestAmerica Chicago

**Narrative**

**Job Narrative**
**500-43001-1**

**Comments**
No additional comments.

**Receipt**
All samples were received in good condition within temperature requirements.

**Metals**
Method(s) 6020: The matrix spike and matrix spike duplicate (MS/MSD) recoveries for sample 500-43001-1 were outside control limits for As and Se. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 6020: The matrix duplicate %RPD sample 500-43001-1 was outside the control limits for B.

Method(s) 6020: The matrix spike and matrix spike duplicate (MS/MSD) recoveries for sample 500-43001-1 were outside control limits for B. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

**Field Service / Mobile Lab**
No analytical or quality issues were noted.

**General Chemistry**
No analytical or quality issues were noted.

| **Fluoride** | **0.31** | | 0.10 | | mg/L | | | 12/14/11 13:13 | 1 |
| Nitrogen, Nitrite | <0.020 | | 0.020 | | mg/L | | | 12/07/11 16:23 | 1 |

# Definitions/Glossary

Client: Midwest Generation EME LLC
Project/Site: Midwest Generation Joliet Groundwater

TestAmerica Job ID: 500-43001-1

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F | Duplicate RPD exceeds the control limit |
| F | MS or MSD exceeds the control limits |

### General Chemistry

| Qualifier | Qualifier Description |
|---|---|
| ^ | ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ☼ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CNF | Contains no Free Liquid |
| DL, RA, RE, IN | Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| EDL | Estimated Detection Limit |
| EPA | United States Environmental Protection Agency |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RL | Reporting Limit |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

KPRG Project No. 12313.0

Re: Quarterly Groundwater Monitoring Results – Fourth Quarter 2013 and Annual
Joliet #29 Generating Station – Ash Impoundments
Compliance Commitment Agreement VN W-2012-00059; ID# 6284

Dear Ms. Rhodes:

The fourth quarterly groundwater sampling for 2013 has been completed for the ash pond monitoring wells located at the Midwest Generation, LLC (Midwest Generation) Joliet #29 Generating Station in accordance with the signed Compliance Commitment Agreement (CCA) with Illinois Environmental Protection Agency (IEPA) dated October 24, 2012. This quarterly monitoring report is being submitted by KPRG and Associates, Inc. (KPRG), on behalf of Midwest Generation, summarizing the results of the monitoring event. This report is also intended to serve as the Annual Report and includes historical data analysis/summaries.

Well Inspection and Sampling Procedures

The groundwater monitoring network around the ash ponds at this facility consists of eleven wells (MW-1 through MW-11) as shown on Figure 1. As part of sampling procedures, the integrity of all monitoring wells was inspected and water levels obtained using an electronic water level meter (see summary of water level discussion below). All wells were in good condition with locked protector casings and the concrete surface seals were intact with the exception of well MW-11 which was noted to have a cracked hinge on the protector casing which will be scheduled for repair. Otherwise the well is intact and not compromised.

14665 West Lisbon Road, Suite 2B Brookfield, Wisconsin 53005 Telephone 262-781-0475 Facsimile 262-781-0478

MWG13-15_17348

Groundwater samples at well locations MW-3 through MW-11 were collected using the low-flow sampling technique. Based on an evaluation of historical water levels at monitoring well locations MW-1 and MW-2, it was determined that there was not enough water column within these wells (generally less than two feet of water column within each well) to allow for the placement of dedicated pumping systems. Instead, at these two locations, dedicated PVC bailers were used to collect groundwater samples. During this round of sampling, there was insufficient water within well MW-1 to collect a sample.

One duplicate sample was collected at well MW-9. In addition, a deionized water trip blank accompanied the groundwater samples bottles from and back to the laboratory. The groundwater monitoring samples and the duplicate sample were analyzed for the compounds listed in Illinois Administrative Code (IAC) 620.410(a), 620.410(d) and 620.410(e), excluding radium 226/228. The trip blank was analyzed for the volatile organic compounds (VOCs) listed in IAC 620.410(d).

Groundwater Flow Evaluation

Water level data from the most recent round of sampling along with historical water levels obtained from each well are summarized in Table 1. The water levels were used to generate a groundwater flow map which is provided on Figure 2. The water elevation data indicates a general southerly flow. The flow conditions observed during this sampling are consistent with historical conditions reported for the site.

Relative to an annual evaluation of groundwater levels, a historical hydrograph is presented in Attachment 1. The hydrograph indicates generally stable groundwater elevations since the Fall of 2011 with the exception of several spikes of elevated groundwater levels. In 2013, overall water levels in the Spring (2nd Quarter) were elevated due to flooding conditions at that time. The only exception was the water level at well MW-4 which was over a foot lower than would be normally expected. This was either associated with dewatering for liner construction activities in the area which were being initiated or a recording error. Otherwise, the 2013 water level data was very consistent with that previously recorded.

Summary of Analytical Data

A copy of the analytical data package is provided in Attachment 2. The field parameter and analytical data from the most recent sampling, along with the previous eight quarters of data, are summarized in Table 2. The duplicate sample was collected from MW-9. The data are generally consistent with previous data generated for the site. All wells for which the sampling data reports a value above one or more groundwater standards are located within the area of the approved Groundwater Management Zone (GMZ).

At this time a statistical evaluation of background water quality for comparing against downgradient wells has not been completed. The initial anticipated background well installation (MW-11) indicates impacts that are not associated with the ash ponds at the

MWG13-15_17349

site and therefore, IEPA does not recognize the water quality data from this well as representative of background. Relative to an annual evaluation of the water chemistry data, time versus concentration curves are provided for each parameter analyzed in Attachment 3. The curves include the Class I drinking water standard for reference, where appropriate. For 2013, overall, detected concentrations of the monitored parameters are generally stable/consistent relative to historical data with the only exception being at well MW-09 for several parameters (see discussions below) that spiked during the flooding event in the 2nd quarter and have since been decreasing again in concentration. The following noteworthy observations are made for 2013:

- Antimony detections were noted in wells MW-01, MW-04 and MW-06 during the 2nd quarter sampling. These detections were not reproducible during subsequent sampling events and are not believed to be representative of water quality impacts associated with the ash ponds.

- Boron concentrations at all wells are overall decreasing or generally stable. The boron concentrations at well MW-11 have decreased from a maximum concentration of 2.6 mg/l in the 2nd quarter 2011 to 0.490 mg/l in the 4th quarter 2013. There were no detections of boron in any of the wells in 2013 that resulted in an exceedance of the Class I groundwater standard.

- Chloride concentration curves show some scatter. Overall chloride concentrations in the wells have a seasonal/temporal variation, with the highest concentrations usually being detected during the 2nd quarter (Spring) sampling events and the lowest concentrations being recorded in the 3rd or 4th quarter sampling events. This seasonal/temporal variation may be reflective of the impact of road salt spreading which occurs during the winter months.

- There was a spike of dissolved iron at well MW-09 during the 2nd quarter sampling and the concentrations have subsequently shown a decrease to near normal levels based on the historic data for the well.

- Well MW-09 was the only well with detections of dissolved manganese above the groundwater standard since the 1st quarter 2011 sampling. The distribution of the manganese detections indicates seasonal/temporal variation with the highest detections generally occurring the late Winter/Spring sampling events with subsequent sampling quarters showing decreases in manganese concentration. It is noted that overall, the manganese concentration has been decreasing over time since the initial installation and sampling of the well in December 2010.

- Well MW-09 is the only well historically with detections of dissolved sulfate above the groundwater standard. The distribution of the sulfate detections indicates potential seasonal/temporal variation with the highest detections generally occurring in the late Winter/Spring sampling events with subsequent sampling quarters generally showing decreases in sulfate concentration. It is

MWG13-15_17350

noted that overall, the sulfate concentration has been decreasing over time since the initial installation and sampling of the well in December 2010.

- Well MW-09 is the only well historically with detections of Total Dissolved Solids (TDS) above the groundwater standard. The distribution of the TDS detections may indicate potential seasonal/temporal variation generally with the highest detections generally occurring the late Winter/Spring sampling events with subsequent sampling quarters generally showing decreases in TDS concentration. It is noted that this trend was not seen in 2012 which showed the highest TDS concentration in the 3rd quarter sampling event.

As noted previously, all wells for which the sampling data reports a value above one or more applicable groundwater standards are located within the area of the approved GMZ.

If there are any questions, please contact either Maria Race of Midwest Generation at 630-771-7862 or Richard Gnat of KPRG at 262-781-0475.

Sincerely,
KPRG and Associates, Inc.

Notes: Standards obtained from IAC, Title 35, Chapter I, Part 620, Subpart D, Section 620.410 - Groundwater Quality Standards for Class I: Potable Resource Groundwater.
All values are in mg/L (ppm) unless otherwise noted.

DL - Detection limit
NA - Not Applicable
ND - Not Detected
NM - Not Measured

NR - Not Required
NS - Not Sampled
^ - Denotes instrument related QC exceeds the control limits

Temperature in °C degrees Celcius
Conductivity in ms/cm$^c$ millisiemens/centimeters
Dissolved Oxygen in mg/L milligrams/liter
Oxygen Reduction Potential (ORP) in mV millivolts

Notes: Standards obtained from IAC, Title 35, Chapter I, Part 620, Subpart D, Section 620.410 - Groundwater Quality Standards for Class I: Potable Resource Groundwater.
All values are in mg/L (ppm) unless otherwise noted.

DL - Detection limit
NA - Not Applicable
ND - Not Detected
NM - Not Measured

NR - Not Required
NS - Not Sampled
^ - Denotes instrument related QC exceeds the control limits

Temperature in °C degrees Celcius
Conductivity in ms/cm millisiemens/centimeters
Dissolved Oxygen in mg/L milligrams/liter
Oxygen Reduction Potential (ORP) in mV millivolts

Notes: Standards obtained from IAC, Title 35, Chapter I, Part 620, Subpart D, Section 620.410 - Groundwater Quality Standards for Class I: Potable Resource Groundwater.
All values are in mg/L (ppm) unless otherwise noted.

DL - Detection limit
NA - Not Applicable
ND - Not Detected
NM - Not Measured

NR - Not Required
NS - Not Sampled
^ - Denotes instrument related QC exceeds the control limits

Temperature in °C degrees Celcius
Conductivity in ms/cm$^c$ millisiemens/centimeters
Dissolved Oxygen in mg/L milligrams/liter
Oxygen Reduction Potential (ORP) in mV millivolts

## Job ID: 500-65066-1

**Laboratory: TestAmerica Chicago**

**Narrative**

**Job Narrative**
**500-65066-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 10/16/2013 3:25 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 4.2° C, 4.9° C and 5.3° C.

**GC/MS VOA**
No analytical or quality issues were noted.

**Metals**
Method(s) 6020A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for 500-65066-1 were outside control limits for selenium. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 200.8, 6020, 6020A: The internal standard (Rh) was used to report As in batch 208962.

No other analytical or quality issues were noted.

**Field Service / Mobile Lab**
No analytical or quality issues were noted.

**General Chemistry**
Method(s) 9251: The chloride matrix spike (MS) recovery for batch 209102 was outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 353.2, SM 4500 NO3 F: The initial calibration verification (ICV) for nitrate associated with batch 207898 recovered above the upper control limit. The laboratory control standard (LCS), which is made from the same source as the ICV, recovered within acceptance limits and brackets the beginning of the nitrate run. Therefore, the data have been reported.

No other analytical or quality issues were noted.

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F | MS/MSD Recovery and/or RPD exceeds the control limits |

### General Chemistry

| Qualifier | Qualifier Description |
|---|---|
| F | MS/MSD Recovery and/or RPD exceeds the control limits |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

Re: Annual and Quarterly Groundwater Monitoring Results – Fourth Quarter 2015
Joliet #29 Generating Station – Ash Impoundments
Compliance Commitment Agreement VN W-2012-00059; ID# 6284

Dear Ms. Rhodes:

The fourth quarterly groundwater sampling for 2015 has been completed for the ash pond monitoring wells located at the Midwest Generation, LLC (Midwest Generation) Joliet #29 Generating Station in accordance with the signed Compliance Commitment Agreement (CCA) with Illinois Environmental Protection Agency (IEPA) dated October 24, 2012. This Quarterly Monitoring Report is being submitted summarizing the results of the monitoring event. This report is also intended to serve as the Annual Report and includes historical data analysis/summaries.

Well Inspection and Sampling Procedures

The groundwater monitoring network around the ash ponds at this facility consists of eleven wells (MW-01 through MW-11) as shown on Figure 1. As part of sampling procedures, the integrity of all monitoring wells was inspected and water levels obtained using an electronic water level meter (see summary of water level discussion below). All wells were generally found in good condition with locked protector casings and the concrete surface seals were intact. MW-01 appeared to be bent, however, a water level meter noted the well was dry. In addition, the lids on wells MW-08 and MW-11 were noted be to cracked but the well integrity has not been affected. These wells will scheduled for repair in the first quarter of 2016.

Groundwater samples at well locations MW-03 through MW-11 were collected using the low-flow sampling technique. Dedicated PVC bailers were used to collect groundwater samples at monitoring well location MW-2 due to the short water column (generally less than two feet within each well). As noted above, there was no sample collected from MW-01 as it was dry.

One duplicate sample was collected at well MW-03. In addition, a de-ionized water trip blank accompanied the groundwater samples bottles from and back to the laboratory. The groundwater monitoring samples and the duplicate sample were analyzed for the compounds listed in Illinois Administrative Code (IAC) 620.410(a), 620.410(d) and 620.410(e), excluding radium 226/228. The trip blank was analyzed for the volatile organic compounds (VOCs) listed in IAC 620.410(d).

Groundwater Flow Evaluation

Water level data from the most recent round of sampling along with historical water levels obtained from each well are summarized in Table 1. The water levels were used to generate a groundwater flow map which is provided on Figure 2. The water elevation data indicates a general southeasterly flow. The flow conditions observed during this sampling are consistent with historical conditions reported for the site.

Relative to an annual evaluation of groundwater levels, a historical hydrograph is presented in Attachment 1. The hydrograph (Groundwater Elevation vs. Time) indicates a downward trend for the last six quarters with a slight rise between the First and Second Quarters of 2015. This reflects the lack of precipitation over that time (end of 2014 and all of 2015 being relatively dry). With that said, the relative changes are within historical levels.

Summary of Analytical Data

A copy of the analytical data package is provided in Attachment 2. The field parameter and analytical data from the most recent sampling, along with the previous eight quarters of data, are summarized in Table 2.

The data appear to be generally consistent with the historical data. All wells for which the sampling data reports a value above groundwater comparison standards are located within the area of the approved Groundwater Management Zone (GMZ).

At this time, a statistical evaluation of background water quality for comparing against downgradient wells has not been completed. The initial anticipated background well installation (MW-11) indicates impacts that are not believed to be associated with the ash ponds at the site and however, IEPA does not recognize the water quality data from this well as representative of background. Relative to an annual evaluation of the water chemistry data, time versus concentration curves are provided for each parameter analyzed in Attachment 3. The curves include the Class I drinking water standard for reference, where applicable.

As noted previously, all wells for which the sampling data reports a value above one or more applicable groundwater standards are located within the area of the approved GMZ.

If there are any questions, please contact either Sharene Shealey of NRG Energy at 815-372-4625 or Richard Gnat of KPRG and Associates, Inc. at 262-781-0475.

Sincerely,

William Naglosky

Notes: Standards obtained from IAC, Title 35, Chapter I, Part 620, Subpart D, Section 620.410 - Groundwater Quality Standards for Class I: Potable Resource Groundwater
All values are in mg/L (ppm) unless otherwise noted.

DL - Detection limit
NA - Not Applicable
ND - Not Detected
NM - Not Measured

NR - Not Required
NS - Not Sampled
^ - Denotes instrument related QC exceeds the control limits
F1- MS and/or MSD Recovery outside of limits.

| | | |
|---|---|---|
| Temperature | °C | degrees Celcius |
| Conductivity | ms/cm$^c$ | millisiemens/centimeters |
| Dissolved Oxygen | mg/L | milligrams/liter |
| Oxygen Reduction Potential (ORP) | mV | millivolts |

# Case Narrative

Client: KPRG and Associates, Inc.
Project/Site: Joliet #29 Station Ash Ponds

TestAmerica Job ID: 500-103210-1

## Job ID: 500-103210-1

### Laboratory: TestAmerica Chicago

**Narrative**

**Job Narrative**
**500-103210-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 10/29/2015 10:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 0.6º C, 2.6º C, 3.7º C, 3.9º C and 4.8º C.

**GC/MS VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Metals**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Field Service / Mobile Lab**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**General Chemistry**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

# Method Summary

Client: KPRG and Associates, Inc.
Project/Site: Joliet #29 Station Ash Ponds

TestAmerica Job ID: 500-103210-1

| Method | Method Description | Protocol | Laboratory |
|---|---|---|---|
| 8260B | Volatile Organic Compounds (GC/MS) | SW846 | TAL CHI |
| 314.0 | Perchlorate (IC) | EPA | TAL SAC |
| 6020A | Metals (ICP/MS) | SW846 | TAL CHI |
| 7470A | Mercury (CVAA) | SW846 | TAL CHI |
| 9014 | Cyanide | SW846 | TAL CHI |
| 9038 | Sulfate, Turbidimetric | SW846 | TAL CHI |
| 9251 | Chloride | SW846 | TAL CHI |
| Nitrate by calc | Nitrogen, Nitrate-Nitrite | SM | TAL CHI |
| SM 2540C | Solids, Total Dissolved (TDS) | SM | TAL CHI |
| SM 4500 F C | Fluoride | SM | TAL CHI |

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F1 | MS and/or MSD Recovery is outside acceptance limits. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains no Free Liquid |
| DER | Duplicate error ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision level concentration |
| MDA | Minimum detectable activity |
| EDL | Estimated Detection Limit |
| MDC | Minimum detectable concentration |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative error ratio |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

# Memorandum

ComEd

Date: April 4, 1995

To: B. A. Renwick

From: J. P. Smith JPM

Subject: The Abandoned Ash Landfill Area

In 1992, the abandoned ash landfill area located east of Joliet 29 was identified as a possible storm water discharge point, primarily due to exposed ash products. Subsequent sample collection taken during the storm water permitting process indicated that there was, indeed, moderate contamination of the runoff caused by contact with this exposed ash. Ash exposure was initially caused by eroded topsoil. This erosion was accelerated as a result of a grass fire that left the soil unprotected. In the September 29, 1992 storm water permit application, we stated that the portion of the landfill suffering erosion would have topsoil reapplied and would then be reseeded to stabilize the area.

The above mentioned work was completed and the ash landfill area became a separate outfall in the Station's NPDES permit. Recently, it has been observed that further erosion of topsoil has occurred near the previous area, and that ash is again exposed to surface runoff.

Due to commitments made in the initial storm water permit application regarding site stabilization of the ash landfill, as well as the highly acidic runoff that has historically occurred when precipitation is exposed to ash in this area (e.g. pH = 2.38 when measured in 1992), we recommend that the station make provisions to re-stabilize this area as soon as possible. Remedial action should again include application of topsoil and reseeding.

Since we now have terrestrial biologist, Jon Keener, on our staff, we will be happy to provide comments to proposals or provide additional guidance with respect to proposed site stabilization plans at the station.

In the meantime, should you have questions concerning this matter, please contact Max Cole of my staff at G.O. extension 2829.

**Date:** **April 20, 1995**

**To:** **Dave Cohn**

**From:** **Elsie Briette**

**Subject:** **Abandoned Ash Landfill Area**

The abandoned ash landfill area located east of Joliet 29 was identified as an EPA storm water discharge point. Erosion is occurring in the top soil and the ash is exposed, causing highly acidic runoff to the river during precipitation (see Environmental Services letter dated April 4, 1995).

The cost for the remedial action to that area is approximately $27,000.00 (this estimate is based on a proposal that was obtained by the station from Allied Landscaping). Please contact me if you need additional information.

# 1.0 INTRODUCTION

## 1.1 Background

The Illinois Environmental Protection Agency (Illinois EPA) has requested of various owners/operators of facilities which include ash impoundment ponds in Illinois that hydrogeologic conditions associated with these ponds be investigated and reported to the Illinois EPA. Midwest Generation, LLC (MWG) owns and operates several of these facilities in Illinois, including the Joliet Generating Station No. 29 in Rockdale, Illinois.

This document presents the Hydrogeologic Assessment (HA) Plan for the on-site ash impoundment areas at the Joliet No. 29 facility. This Plan was developed as the result of numerous communications between MWG and the Illinois EPA, the most recent being a meeting held at Illinois EPA's offices in Springfield, Illinois on June 10, 2010. During that meeting, a conceptual approach to completing hydrogeologic assessments of MWG's ash ponds at a number of sites (including Joliet No. 29) was presented by MWG and was conceptually agreed to by the parties. MWG subsequently agreed to submit the substance of the proposed investigative plans in written form to the Illinois EPA by mid-July 2010 for each of the relevant sites.

This HA Plan for the Joliet No. 29 facility describes the goals of the assessment, the specific scope items that will achieve this result, and a description of the contents of the final report of the assessment.

## 1.2 Site Location

The Joliet No. 29 facility (the Site) is located in Section 19, Township 35 North, Range 10 East, in the Village of Rockdale, Will County, Illinois. Figure 1 provides a Site Location Map.

Major features of the Site include a coal-fired power plant, coal piles, and three active ash ponds. Two of the ponds are lined with a high-density polyethylene (HDPE) while the third is lined with

12" of geo-composite pavement on the bottom; the total area of the three ash ponds is approximately 10 acres. Figure 2 shows the locations of the various ash ponds.

# 2.0 SCOPE OF WORK

## 2.1 Hydrogeologic Assessment Objectives

The Scope of Work for this HA has been developed based upon the overall objectives of the investigative program. These objectives were defined by the Illinois EPA in their original informational request, and have been incorporated by MWG into the specific scope of work developed for the Site:

1. Identification of Potable Well Use within 2,500 Feet of the Ash Pond Areas
2. Evaluation of the Potential for Contaminant Migration from the Ash Pond Areas
3. Characterization of Subsurface Hydrogeology

Each of these objectives are discussed in more detail below, along with the specific scope of work developed to achieve each of these objectives individually.

## 2.2 Identification of Potable Well Use

An investigation of potable water well use within 2,500 feet of the ash pond areas has already been completed for the Site. MWG submitted a letter to the Illinois EPA with the results of this investigation in July 2009. The results of this investigative effort will also be incorporated in the final report of the HA to be submitted to the Illinois EPA after the assessment of the Site is complete.

## 2.3 Evaluation of Contaminant Migration Potential

Illinois EPA has requested that an evaluation of the potential for contaminant migration from the ash pond areas be performed, in accordance with the groundwater non-degradation standard of IAC Part 620, Subpart C. Evaluation of the non-degration standard will required the installation and sampling of monitoring wells located both up- and downgradient of the relevant ash ponds. These investigative tasks are described briefly below.

2.3.1 Installation of Groundwater Monitoring Wells

MWG will install eleven (11) permanent groundwater monitoring wells spaced approximately 150 feet apart around the perimeter of the ash disposal ponds. The well locations have been selected so that both up and downgradient wells are represented. The spacing of the well locations at the Site has been calculated so that the downgradient well network would be very likely to intercept any groundwater plume emanating from a point source beneath the ash pond. Specific calculations of this well spacing can be found in Attachment A.

Three of the wells will be up-gradient of the ponds; the other eight wells will be down-gradient wells. Figure 3 shows the location of the proposed monitoring wells. The well borings will be advanced using hollow-stem augers to an approximate depth of 20 feet below ground surface, so as to intersect with the groundwater table approximately 10 feet. Soil lithology will be inspected and logged by the geologist/engineer during the boring process. The final depth of the wells will be determined in the field by an experienced geologist/engineer based upon the depth that groundwater is encountered. Upon termination of the borings, a 2-inch diameter, PVC well will be installed in order to collect samples of the groundwater in the uppermost aquifer. The actual depth of the screened interval will be determined in the field. The wells will be completed to approximately 3 feet above grade with PVC casing and covered with a stick-up, steel well protector.

2.3.2 Groundwater Sampling and Analytical Testing

MWG will measure the groundwater elevation in each of the ten wells and collect pH and conductivity measurements using a portable meter. Groundwater samples will be collected from each of the wells with a peristaltic pump, using low-flow sampling techniques. The groundwater samples will be filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples will be immediately placed on ice in a cooler and kept at a temperature of no higher than 4° F. The samples will be transported to

TestAmerica, an Illinois-EPA accredited analytical laboratory, under strict chain-of-custody procedures.

The analytical laboratory will test groundwater samples from each of the wells for the compounds listed in Table 1. Proposed analytes include the inorganic compounds listed in IAC 620.410(a), excluding radium and poly-aromatic hydrocarbons (PAHs) listed in IAC 620.410(b).

## 2.4 Characterization of Subsurface Hydrogeology

The subsurface hydrogeology beneath the ash pond areas will be characterized by determining Site lithology (determined during the installation the wells), and the groundwater flow patterns in the vicinity of the ash ponds. In order to determine the local groundwater flow patterns, information will be collected with respect to local hydraulic gradients and permeability, as described in the sections below.

### 2.4.1 Topographic and Water Elevation Surveys

A survey crew will measure the top-of-casing and ground surface elevations of all installed monitoring wells as well as groundwater elevations within each of the monitoring wells. The survey crew will concurrently measure the water elevation in all of the ash ponds and the Des Plaines River. This data will assist MWG in determining the hydrogeologic flow characteristics of the Site. The survey data will also assist MWG in constructing geologic cross-sections of the Site.

### 2.4.2 Hydraulic Testing of Selected Wells

MWG will develop all wells using either a down-hole or peristaltic pump or by hand bailing until the at least three well volumes have been removed or the removed water appears clear. Five of the eleven wells will be selected for hydraulic conductivity testing using rising- and falling-head slug tests. Each slug test will be performed by inserting a 'slug' into the well, displacing the water in the well. A down-hole water level measuring and recording device will measure the

rate at which the water level returns to its static level. The slug will then be removed from the well, lowering the water level in the well. MWG will again measure the rate at which the water level recovers to its static level. This data will allow MWG to calculate the hydraulic conductivity of the uppermost aquifer at the Site.

## 2.5 Assessment Reporting

MWG will develop a summary report detailing the field methods employed and results of the assessment investigation. This report will include soil boring logs and monitoring well construction diagrams, geologic cross-sections, analytical data tables, hydraulic conductivity testing results, a potentiometric surface map, and a map detailing locations of nearby potable water wells. A proposed Table of Contents for this final report is shown below:

1. Introduction
2. Site Location and Regional Hydrogeology
3. Ash Pond Descriptions
4. Investigation Methodology
5. Investigation Results
    a. Results of Potable Water Use Investigation
    b. Groundwater Elevation Data
    c. Local Lithology
    d. Groundwater Analytical Results
    e. Permeability Testing Data
6. Conclusions of Hydrogeologic Assessment

# ATTCHEMENT A
# WELL SPACING CALCULATIONS

# ATTACHMENT A
# WELL SPACING CALCULATIONS

## Purpose of Calculation

An estimate of the of theoretical contaminant plume widths at the Site was calculated in order to determine the appropriate number and spacing of monitoring wells around the ash pond(s) for the initial hydrogeologic assessments. The objective of this calculation is to determine the approximately well spacing of the downgradient monitoring well network, located 25 feet downgradient edge of the ash pond(s) which would result in the likely detection of a groundwater plume emanating from a point-source beneath the ash pond(s).

## Methodology

The width of a contaminant plume is dependent upon the transverse dispersitivity of the aquifer (the mechanical mixing of a solute perpendicular to the direction of flow due to diverging flow paths at the pore scale). The coefficient of transverse dispersion can be estimated using the average linear velocity and the transverse dispersivity (which is estimated based upon the length of the flow path). The distribution of contamination in an ideal plume will follow a normal distribution; therefore, 99.7% of the mass of contamination should be contained within three standard deviations away from the center of mass, where the standard deviation is a function of the coefficient of transverse dispersion. (Fetter, 1999)

The process of calculating the theoretical plume widths and well spacing is presented below:

1. Determine the Darcy velocity (q) of the aquifer:

   $q = KI$, where:

   K = hydraulic conductivity of aquifer (estimated from soil/rock type)
   I = hydraulic gradient (calculated from groundwater elevations in Phase II reports for each site)

2. Determine the average linear velocity (v) of the aquifer:

   $v = q/n$, where

   q = Darcy velocity (from above)
   n = effective porosity (estimated from soil/rock type)

3. Determine the transverse dispersivity ($\alpha_T$) of the aquifer:

   $\alpha_T = \alpha_X/3$ (from 35 IAC Part 742, Appendix C, Table C) where:

   $\alpha_X$ = longitudinal dispersivity = 0.10 * X, where:

   X = distance along the centerline of the plume from the source (X was measured from the approximate center of the ash pond(s) to a point 25 feet downgradient from the downgradient edge of the ash pond(s).)

4. Determine the coefficient of transverse dispersion ($D_T$):

   $D_T = \alpha_T * v + D^*$, where:

   $\alpha_T$ = transverse dispersivity (from above)

   v = average linear velocity (from above)

   D* = molecular diffusion (insignificant under most conditions, so not included in calculation, see Fetter, 1999)

5. Determine the standard deviation of the contaminant distribution normal to flow ($\sigma_y$):

   $\sigma_y = \sqrt{2D_T t}$, where:

   $D_T$ = coefficient of transverse dispersion (from above)

   t = time for contaminant to travel from source to distance X = X/v

6. Determine the approximate well spacing:

   Spacing = $3\sigma_y$ (distance from center of plume to edge of plume normal to groundwater flow)

All of the equations are taken from *Contaminant Hydrogeology, 2nd Edition* by C.W. Fetter, 1999 except where noted.

**Results**

After applying the above equations using Site-specific input parameters (as shown in the following table), an approximate downgradient well spacing of 150 feet (rounded up from 140

feet) was found to be appropriate for a monitoring well network located 25 feet downgradient of the edge of the ash ponds.

**Well Spacing Calculations Table**

| Calculations | Result | Units |
|---|---|---|
| $q = KI$ | 0.0001 | ft/day |
| $v = q/n$ | 0.0014 | ft/day |
| $\alpha T = \alpha X/3$ | 5.83 | ft |
| $DT = \alpha T * v + D^*$ | 0.01 | ft2/day |
| $\sigma y = \sqrt{2DTt}$ | 45.18 | ft |
| Approximate well spacing | 140 | ft |

| Variables | Value | Source |
|---|---|---|
| K (ft/day) | 0.456 | literature value for soil type |
| I (ft/ft) | 0.0003 | from Phase II groundwater elevations |
| n (unitless) | 0.1 | estimated from soil type |
| X (feet) | 175 | measured from center of ash pond |
| $3\sigma y$ | 135.55 | calculated |

# 1.0 INTRODUCTION

## 1.1 Background

Pursuant to the request of the Illinois Environmental Protection Agency (Illinois EPA), this document presents the Hydrogeologic Assessment Report for the on-site ash pond areas at the Midwest Generation, LLC (MWG) Joliet Generating Station No. 29 in Joliet, Illinois. This hydrogeologic assessment was performed in accordance with the Hydrogeologic Assessment Plan, approved by the Illinois EPA, dated September 3, 2010.

As defined by the Hydrogeologic Assessment Plan, the purpose of this investigation was to: (i) evaluate the potential, if any, for migration of ash-related constituents from the on-site ash ponds and to conduct monitoring for groundwater constituents regulated by the Illinois Part 620 groundwater standards, as requested by the Illinois EPA; (ii) characterize the subsurface hydrogeology; and (iii) identify potable well use within 2,500 feet of the ash ponds. The results of this investigation are described in this Hydrogeologic Assessment Report.

## 1.2 Site Location and Description

The Joliet No. 29 facility (the Site) is located in Section 19, Township 35 North, Range 10 East, in the City of Joliet, Will County, Illinois. Figure 1 provides a Site Location Map.

The Site includes three active ash ponds (Ash Pond 1, Ash Pond 2, and Ash Pond 3). Two of the ponds are lined with a high-density polyethylene (HDPE), while the third is lined with 12" of geo-composite material on the bottom; the total area of the three ash ponds is approximately 10 acres. Figure 2 shows the locations of the three ash ponds.

## 1.3 Regional Settng

The Site is located along the Des Plaines River just to the south of the city of Joliet. The surrounding land use is almost entirely industrial with some parcels of undeveloped land. It is important to note that industrial properties are located hydraulically upgradient of the Site.

Patrick Engineering Inc. (Patrick) conducted a review of publically available geological information from the Illinois State Geological Survey website. Based upon water well logs from the area, the geology beneath the Site consists of approximately 5-30 feet of sandy loam, underlain by Silurian Dolomite to approximately 176 feet below ground surface, and Maquoketa shale from approximately 176 to 241 feet below ground surface. The Maquoketa shale is generally considered to be an aquitard that separates the shallow groundwater in the unconsolidated units and the Silurian dolomite from the underlying aquifers.

Groundwater flow in the shallow, unconsolidated aquifer should be largely controlled by the Des Plaines River with groundwater flowing towards the river during most periods of the year. Groundwater flow in the deeper aquifers is controlled by the regional hydraulic gradient in these aquifers, which is to the northeast. The Site lies within the Joliet Depression, which is a cone of depression of the groundwater surface caused by the large withdrawals of the groundwater from the deeper aquifers due to industrial and municipal use in the area.

# 2.0 HYDROGEOLOGIC ASSESSMENT METHODOLOGY

The following sections present the methodologies used to evaluate the potential for migration of ash-related constituents from the ash ponds and to monitor for all Part 620-regulated constituents, to characterize the subsurface hydrogeology, and to identify potable well use within 2,500 feet of the Site.

## 2.1 Evaluation of Ash-Related Constituent Migration Potential

The Illinois EPA requested that an evaluation of the potential for migration of ash-related constituents from the ash ponds and that monitoring for all Part 620-regulated constituents be performed in accordance with the groundwater standards included in 35 Illinois Administrative Code (IAC) Part 620, Subparts C and D. Accordingly, groundwater monitoring wells were installed at the Site in locations both upgradient and downgradient of the three ash ponds.

### 2.1.1 Installation of Groundwater Monitoring Wells

Patrick installed eleven (11) groundwater monitoring wells spaced approximately 150 to 300 feet apart around the perimeter of the ash ponds. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. The spacing of the well locations at the Site along the downgradient edge of the ash ponds was calculated so as to detect a groundwater plume emanating from a point source beneath the ash ponds. Figure 3 shows the location of the eleven monitoring wells.

Three of the installed monitoring wells are located upgradient of the ash ponds; the additional eight wells are located downgradient of the ash ponds. The well borings were advanced using hollow-stem augers to depths ranging from 27.5 to 42 feet below ground surface (bgs). Borings were terminated after the field geologist determined that the boring was installed approximately 10 feet past the first intersection of the groundwater table in order to ensure that a representative

groundwater sample could be obtained. Upon termination of each boring, a 2-inch diameter, PVC well was installed in order to collect samples of the groundwater in the uppermost aquifer. The monitoring wells were completed to approximately 3 feet above grade, with PVC casing, and were covered with a stick-up, steel well protector with a locking cap. Soil lithology was inspected and logged by an experienced geologist during the boring process. Boring logs with well construction information are included as Appendix A.

2.1.2 Initial Groundwater Sampling and Analytical Testing

The groundwater sampling event for the Site took place on December 6, 2010. The groundwater elevation in each of the eleven wells was measured prior to sampling. For all but one of the eleven wells, MW-09, the depth to groundwater was outside the effective range of the peristaltic pump. Groundwater samples were collected from MW-09 with a peristaltic pump, using established low-flow sampling techniques. For the remaining ten (10) wells, groundwater samples were collected using a disposable polyethylene bailer; a different bailer was used for each well to prevent cross-contamination. Each well was purged until at least three well volumes had been extracted or until the groundwater was observed to be clear. Groundwater was then baled into a decontaminated, stainless steel container and thereafter transferred to the sampling containers via peristaltic pump. Temperature, pH, and conductivity measurements were taken using a portable meter in all wells; refer to Table 1 for these field parameter results. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4º F. The samples were transported to TestAmerica, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain the integrity of the samples.

The analytical laboratory tested groundwater samples from each of the wells for the compounds listed in Table 2. Analytes tested include the inorganic compounds listed in 35 IAC 620.410(a), excluding both radium and the poly-aromatic hydrocarbons (PAHs) listed in 35 IAC 620.410(b).

## 2.2 Characterization of Subsurface Hydrogeology

The subsurface hydrogeology beneath the ash ponds was characterized by determining Site lithology and the groundwater flow patterns in the vicinity of the ash ponds as described below.

### 2.2.1 Site Lithology

The Site lithology was determined by logging soil samples collected from the soil borings created during the installation of the groundwater monitoring wells. The soil borings were installed under the direction of an experienced geologist. Each boring was sampled at 2-foot intervals using a 2-inch O.D. split-spoon sampler (ASTM D 1586). Each soil sample was inspected and logged by the geologist during the boring process. Boring logs with well construction information are provided as Appendix A.

### 2.2.2 Topographic and Water Elevation Surveys

A survey crew measured both the top-of-casing and ground surface elevations of all installed monitoring wells and the groundwater elevations within each of the monitoring wells on December 6, 2010. The survey crew concurrently measured the water elevation in two of the three of the ash ponds and the Des Plaines River. The water surface of Ash Pond 2 was inaccessible the day of the survey due to a low water elevation in the pond. However, the remaining groundwater elevation data collected from the Site was sufficient in determining groundwater flow characteristics for the purposes of this assessment.

### 2.2.3 Hydraulic Testing of Selected Wells

Patrick conducted four *in situ* hydraulic conductivity tests on wells MW-4, MW-6, MW-9, and MW-11 on December 21, 2010. The testing consisted of one rising-head and one falling-head slug test performed at each well. Using a data-logging pressure transducer, Patrick measured the rate of groundwater level recovery in the wells after either inserting a slug into, or removing a slug from, each monitoring well.

## 2.3 Identification of Potable Well Use

Natural Resource Technology, Inc. (NRT) has previously completed an investigation of potable water well use within 2,500 feet of the Joliet No. 29 ash ponds. MWG submitted the results of this investigation to the Illinois EPA by letter dated July 15, 2009. These results are summarized in Appendix B.

The following databases and sources of information were used in order to identify local community water sources and water well locations in the vicinity of the Site:

- Illinois State Geological Survey (ISGS) -Water Well Database Query;
- Illinois State Water Survey (ISWS) Private Well Database and water well construction report request; and
- Illinois Division of Public Water Supply web-based Geographic System (GIS) files.

# 3.0 HYDROGEOLOGIC ASSESSMENT RESULTS

## 3.1 Evaluation of Ash-Related Constituent Migration Potential

The analytical laboratory results for the hydrogeologic assessment are presented in Table 2. Full laboratory data packages from TestAmerica are provided as Appendix C. Antimony, chloride, manganese, sulfate, and total dissolved solids (TDS) were detected in one or more monitoring wells at concentrations exceeding the Part 620 Class I Groundwater Quality Standards. In some cases, the highest concentrations of a given compound were found in the upgradient wells. Beryllium, cadmium, chromium, cyanide, iron, lead, mercury, silver, thallium, zinc, and nitrogen/nitrite were not detected in any of the groundwater samples.

A determination of the potential for the individual ash ponds to be contributing to the distribution of analytes in the underlying groundwater and the extent, if any, of such contribution cannot be made from the results of this single sampling event alone. To develop a true, statistically-significant upgradient background concentration for the various compounds will require a number of sequential sampling events over time. Based on a statistically-developed background value, downgradient concentrations can be compared to the background value over time to determine the likelihood and extent of any constituent migration from the on-site ash ponds. A plan to develop such an analytical database through additional sampling is presented in the last section of this report.

## 3.2 Characterization of Subsurface Hydrogeology

The lithology of the Site is predominantly sand and gravel with intermittent seams of clay and gravel. Auger refusal was encountered throughout the Site at depths ranging from 35 to 42 feet below ground surface. Split spoon samples from these depth returned fragments of limestone, indicating the top of the bedrock layer. Refer to Figure 4 for a geologic cross-section of the Site.

The results of the topographic and water elevation surveys are presented in Table 3.

The uppermost groundwater unit at the Site is found at depths ranging from 29 to 34 feet bgs. The direction of groundwater flow is to the south towards the Des Plaines River, which runs along the southern boundary of the Site. The hydraulic gradient is approximately 0.0009 based upon the groundwater elevation data collected on December 6, 2010. A potentiometric surface map is provided as Figure 5.

Patrick used the hydraulic testing data to calculate the hydraulic conductivity of the uppermost aquifer using the Bouwer and Rice method. Hydraulic conductivity calculations are provided in Appendix D. The hydraulic conductivity of Site soils ranged from $1.948 \times 10^{-3}$ to $6.949 \times 10^{-3}$ ft/second. The average hydraulic conductivity was $3.896 \times 10^{-3}$ ft/second. Using the highest calculated hydraulic conductivity and the measured hydraulic gradient, Patrick calculated the maximum groundwater velocity to be approximately 0.30 ft/day ($3.896 \times 10^{-3}$ ft/sec x 0.0009 x 60 sec/min x 60 min/hour x 24 hours/day).

## 3.3 Identification of Potable Well Use

As stated above, NRT has previously completed an investigation of potable water well use within 2,500 feet of the Joliet No. 29 ash ponds. MWG submitted the results of this investigation to the Illinois EPA by letter dated July 15, 2009. According to this letter, seventeen potable/industrial use wells are located within a 2,500-foot radius of the Site's ash ponds (refer to Appendix B.) However, most of these wells are screened in much deeper aquifers. Only two of the wells (Numbers 19 and 4) are located downgradient from the ash impoundments. Both of these industrial use wells are owned by MWG, and are drilled at 1,525 feet below ground surface and are screened below the Maquoketa shale, a significant aquitard separating shallower aquifers from the screened interval of the MWG wells.

# 4.0 LONG-TERM MONITORING PLAN

In order to properly assess the groundwater monitoring data collected in this single sampling event, MWG will conduct a quarterly groundwater sampling program in which the same monitoring wells described in this report will be sampled for the identical analyte list employed during this investigation. MWG proposes to begin this quarterly monitoring program in March 2011, and will submit the results of the sampling program to the Illinois EPA on an ongoing, quarterly basis. MWG proposes to continue this program until sufficient statistically-significant data is available to properly assess the groundwater data. If the quarterly sampling results continue to show non-detect results for certain of the analytes, as was the case in this single sampling event, MWG may propose to Illinois EPA that these analytes be eliminated from future sampling events.

Notes:
Class I Groundwater Standards from 35 IAC Part 620
Bold Values areas exceed groundwater objectives
mg/L = Milligrams per Liter
ND-non detect

-Determination of the potential for the individual ash ponds to be contributing to the distribution of analytes in the underlying groundwater cannot be made from the results of this single sampling event alone. To develop a true, statistically-significant upgradient background concentration for the various compounds will require a number of sequential sampling events over time. After a statistically developed background value is available, the downgradient concentrations can be compared to this background value over time to determine the likelihood of contaminant migration from the on-site ash ponds. A plan to develop such an analytical database through additional sampling is discussed in the last section of this report.

# ANALYTICAL REPORT

Job Number: 500-29703-1

Job Description: Joliet Ash Pond Assessments

For:
Midwest Generation EME LLC
1800 Channahon Road
Joliet, IL 60436

Attention: James DiCola

Approved for release.
Cindy R Pritchard
Project Mgmt. Assistant
12/17/2010 1:46 PM

Designee for
Bonnie M Stadelmann
Project Manager II
bonnie.stadelmann@testamericainc.com
12/17/2010

cc: Andrew Gagnon
Ms. Maria Race

These test results meet all the requirements of NELAC for accredited parameters.

The Lab Certification ID#:
TestAmerica Chicago 100201

All questions regarding this test report should be directed to the TestAmerica Project Manager whose signature appears on this report. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

**Job Narrative**
**500-29703-1**

**Comments**
No additional comments.

**Receipt**
All samples were received in good condition within temperature requirements.

**Metals**
The matrix spike / matrix spike duplicate (MS/MSD) recoveries for sample 500-29703-1 were outside control limits for Ag. The MSD was also out for Se. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

**Field Service / Mobile Lab**
No analytical or quality issues were noted.

**General Chemistry**
Method(s) 353.2, SM 4500 NO3 F: The nitrate continuing calibration verification (CCV) for 101888 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. MW-06 (500-29703-6), MW-07 (500-29703-7), MW-09 (500-29703-9)

No other analytical or quality issues were noted.

| Question | T / F/ NA | Comment |
|---|---|---|
| Radioactivity either was not measured or, if measured, is at or below background | True | |
| The cooler's custody seal, if present, is intact. | True | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | True | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the sample IDs on the containers and the COC. | True | |
| Samples are received within Holding Time. | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter. | N/A | |
| If necessary, staff have been informed of any short hold time or quick TAT needs | True | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |

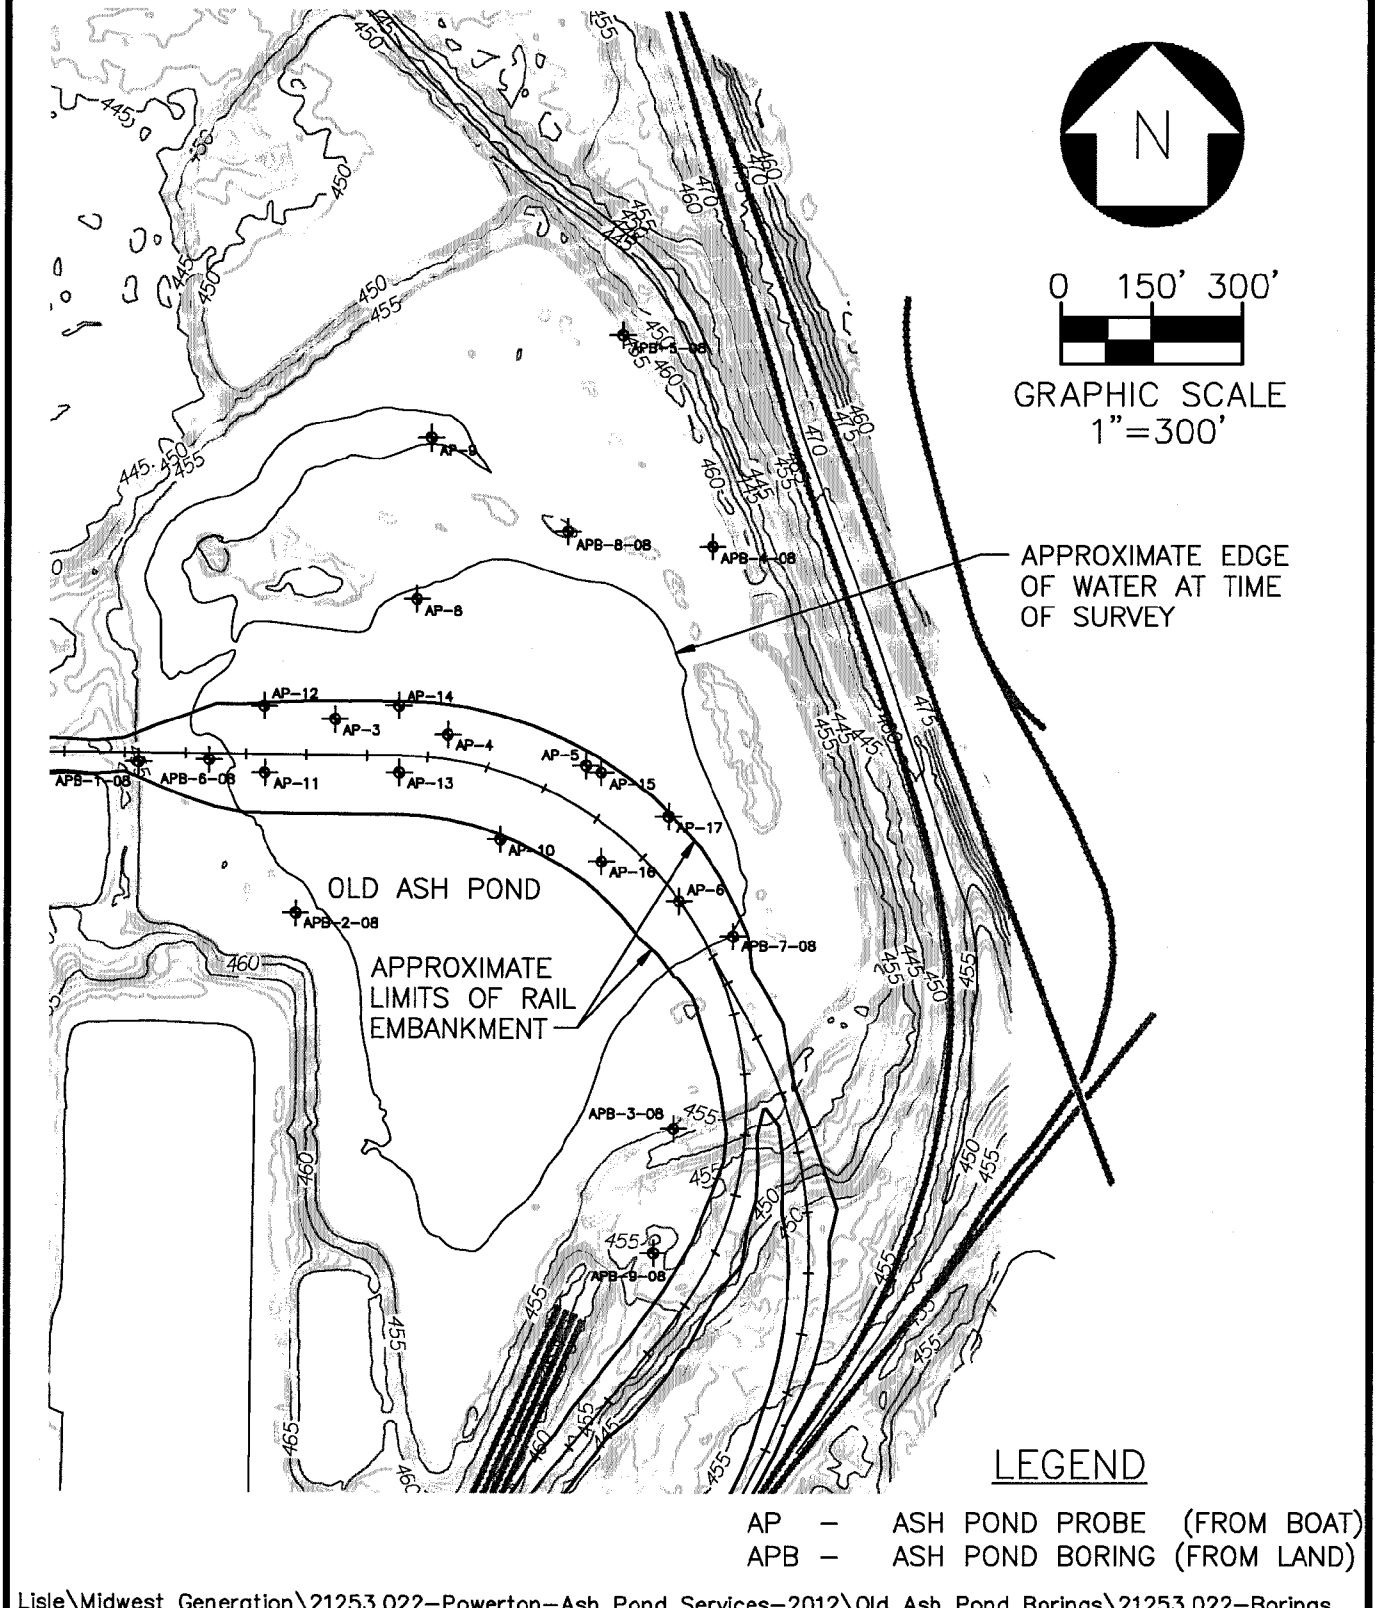
**Former Ash Pond at Powerton**
Frendt, Richard to: Race, Maria 08/09/2012 05:14 PM



Maria:

I am attaching a boring location plan, and the relevant boring logs for the geotechnical work that was done in the vicinity of the former ash pond at Powerton. Overall, it was essentially what I remembered, with ash being found up to around 10 feet thick in places (though not everywhere). Hope this is helpful
---

Regards,
Rick

## EXECUTIVE SUMMARY

This report presents the results of the Phase II Environmental Site Assessment (Phase II ESA) conducted by ENSR Corporation (ENSR) in October 1998 at the Commonwealth Edison Company (ComEd) Powerton Generating Station, located at Route 29 & Mantino Road in Pekin, Illinois. Phase II ESA activities consisted of advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I Environmental Site Assessment (Phase I ESA).

Based on the results of the Phase I ESA, 19 potential areas of concern were identified for further investigation. These areas of concern are identified in **Section 2.0**. Each of these areas of concern were investigated during the Phase II ESA activities. Twenty-eight soil borings were advanced and 6 monitoring wells were installed. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. In addition, 22 surface soil samples and 12 sediment samples were collected at the facility.

These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260; polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310; polychlorinated biphenyls (PCBs) using EPA Method 8081; Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000; and pH using EPA Method 9045.

In addition, the surface soil samples and sediment samples were also submitted for analysis of total petroleum hydrocarbons (TPH) using EPA Method 8015. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

PNA constituents were detected above the Illinois Environmental Protection Agency (IEPA) cleanup objectives primarily in the surface soil samples collected at the facility. These surface soil samples were collected directly from a "stained" location in the identified potential areas of concern. Therefore, it was determined that the impact from these PNA constituents is relatively localized. However, PNA constituents were detected in the soil sample collected from B-5 at approximately 4 feet below grade.

Arsenic was detected above the IEPA cleanup objective of 3 milligrams per kilogram (mg/kg) in samples collected throughout the facility. However, the majority of concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. Arsenic was detected at concentrations greater than the background range in 6 locations at the facility. These locations are at the transformers located on the north side of the western portion of the main building, the Wastewater Treatment Plant, the materials storage area located south of the main building, the area west of the former Car Dumper, the ash/slag disposal area south of the Wastewater Treatment Plant, and the Coal Handling Tractor Repair Building.

In addition, lead was detected above the IEPA cleanup objective of 400 mg/kg in the samples collected from the transformers located on the north and south side of the western portion of the main building.

PCBs were detected above the IEPA cleanup objective of 1 mg/kg in samples collected adjacent to the former Switch Yard and the turbine oil aboveground storage tank (AST) located in the eastern portion of the main building. The PCBs were only detected in the first 2 feet of soil.

It should be noted that TPH was detected throughout the site. Although a cleanup objective has not been established by the IEPA, TPH was detected at elevated concentrations (greater than 1,000 mg/kg) and would indicate impact by petroleum hydrocarbon compounds.

Based on the relatively low volatility of the constituents of concern detected above the IEPA cleanup objectives, the soil inhalation exposure pathway is not a likely contaminant exposure pathway. In addition, due to the fact that no constituents of concern were detected at concentrations above the IEPA cleanup objectives in the groundwater samples collected, the groundwater ingestion is not a potential contaminant exposure pathway. However, the soil ingestion pathway is a potential exposure pathway during construction activities. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

Based on the current land use (industrial) and site conditions (analytical results and soil types), it is judged that the potential for human exposure to the constituents of concern from this facility is low. It should be noted that there is no requirement under Illinois environmental law to further investigate or remediate this property.

# 1.0 INTRODUCTION

## 1.1 General

ENSR Corporation (ENSR) was retained by Commonwealth Edison Company (ComEd) to conduct Phase II Environmental Site Assessment (Phase II ESA) activities on a "limited" portion of the 1,710 acre Powerton Generating Station, located at Route 29 & Mantino Road in Pekin, Illinois (**Figure 1, Site Location Map**).

The scope of the Phase II ESA activities were based on the preliminary results of the Phase I Environmental Site Assessment (Phase I ESA), with concurrence between ENSR and ComEd. Phase II ESA activities were conducted from October 5 to November 3, 1998, and included advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. **Figure 2** illustrates the layout of the facility.

## 1.2 Objectives and Scope

The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I ESA. The Phase II ESA adequately assessed the surface and/or subsurface conditions in the locations where sampling was conducted. The Phase II ESA is a tool for developing a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways in sampled areas. Based upon this and the information gathered during the Phase II ESA, and using the Illinois Environmental Protection Agency (IEPA) Tiered Approach to Cleanup Objectives (TACO) as guidance, it can be determined whether remediation is warranted in the locations sampled. The Phase II ESA alone is not an exhaustive investigation which can be used to determine the extent of contamination, nor the cost of any suggested remediation.

The objective of the Phase II ESA was to develop a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways. To meet this objective, ENSR implemented a "phased" assessment designed to provide increasing levels of information based upon obtained data. Recognizing that existing information for the facility and potential contamination was limited, the principal tasks completed during the Phase II ESA included the following:

- Soil boring advancement and soil sample collection;
- Monitoring well installation and groundwater sample collection;
- Collection of surface soil and sediment samples;
- Laboratory analysis of samples; and,
- Evaluation of analytical results and comparison to the IEPA Tier 1 Industrial/Commercial Soil Cleanup Objectives and IEPA Tier 1 Groundwater Cleanup Objectives.

The investigation consisted of the advancement of 28 soil borings and the installation of 6 monitoring wells at the potential areas of concern identified during the Phase I ESA. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260, polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310, polychlorinated biphenyls (PCBs) using EPA Method 8081, Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000, and pH by EPA Method 9045. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

In addition, 22 surface soil samples were collected from the identified potential areas of concern and 12 sediment samples were collected from selected ash/coal settling ponds or drainage ditches located at the facility. These samples were submitted for analysis of the previously referenced constituents as well as total petroleum hydrocarbons (TPH) using EPA Method 8015.

### 1.3 Report Organization

**Section 1** introduces the principal subjects covered in this report, describes the purpose and scope of the Phase II ESA, and presents limitations of the Phase II ESA. **Section 2** provides information regarding the identified potential areas of concern and the methodologies used during the investigation. **Section 3** presents the results of the Phase II ESA. **Section 4** presents the data assessment of the Phase II ESA. **Tables** summarizing the analytical results and **Figures** illustrating the facility location and layout, as well as sampling locations, have been included under the appropriate headings.

**Appendix A** contains laboratory analytical reports. **Appendix B** contains boring logs and monitoring well construction diagrams. **Appendix C** contains monitoring well gauging and survey data.

### 1.4 Limitations

This report, including all attachments thereto, describes the results of ENSR's Phase II ESA conducted at the Powerton Generating Station, which took place between October 5 and November 3, 1998. Many of the facts and conditions pertaining to this Phase II ESA are subject to change over time; accordingly, the evaluations and conclusions must be viewed within this context.

ENSR has performed this Phase II ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. ENSR shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase II ESA was performed.

This report and all field data, notes, and laboratory test data (hereinafter collectively "Information") were prepared by ENSR solely for the benefit of ENSR's Client, ComEd. ENSR's Client may release this Information to third parties, who may use and rely upon the Information at their own discretion. However, any use of or reliance upon this Information by a party other than parties identified shall be solely at the risk of such third party and without legal recourse against ENSR, or its subsidiaries and affiliates, or their respective employees, officers or directors, regardless of whether the action in which recovery of damages is sought is based upon contract, tort (including the sole, concurrent or other negligence and strict liability of ENSR), statute or otherwise. This Information shall not be used or relied upon by a party which does not agree to be bound by the above statement.

## 2.0 INVESTIGATION METHODS

Prior to initiation of field investigations, a site reconnaissance was performed during the Phase I ESA to define the study area. Field investigation activities were subsequently conducted to obtain site specific information and data pertaining to site geology and hydrogeology, groundwater quality, soil properties, and potential contaminant source(s).

The sampling locations were recommended based on the preliminary Phase I ESA findings. A sampling location summary listing is presented in **Table 1**. A summary of the identified potential areas of concern is presented below.

1. **Yard & Roof Runoff Basins.** Two Yard & Roof Runoff Basins are located at the facility. These ponds collect surface water runoff from the surrounding area. The East Yard & Roof Runoff Basin is located in the northeastern portion of the facility. Two sediment samples (X-2 and X-3) were collected and one monitoring well (MW-1) was installed. In addition, one sediment sample (X-1) was collected from a drainage ditch located east of the East Yard & Roof Runoff Basin. The West Yard & Roof Runoff Basin is located in the southwestern portion of the facility. One sediment sample (X-10) was collected.

2. **Transformers.** Transformers with oil staining were observed throughout the facility. Soil samples were collected in 7 locations with the most significant staining. The first location contains the transformers on the eastern portion of the south side of the main building. One soil boring (B-1) was advanced and one surface soil sample (S-1) was collected. The second location contains the transformers on the western portion of the south side of the main building. Two surface soil samples (S-3 and S-4) were collected. The third location contains the transformers on the western portion of the north side of the main building. One soil boring (B-6) was advanced and three surface soil samples (S-6, S-7, and S-12) were collected. The fourth location contains the transformers on the south side of the former main building. Two surface soil samples (S-5 and S-14) were collected. The fifth location contains the transformers on the north side of the former main building. One soil boring (B-19) was advanced. The sixth location contains the transformers at the Coal Handling Tractor Repair Garage, located on the northeast side of the coal pile. One surface soil sample (S-16) was collected. The seventh location contains the transformers on the east side of the West Yard & Roof Runoff Basin. One surface soil sample (S-20) was collected.

3. **Petroleum Aboveground Storage Tanks.** Two aboveground storage tanks (ASTs), which are used for the storage of diesel fuel, are located at the facility. One diesel AST is located near the southwestern corner of the main building. Two soil borings (B-5 and B-35) were advanced. The second diesel AST is located at the Coal Handling Tractor Repair Garage, located on the northeast side of the coal pile. One surface soil sample (S-19) was collected. One AST, used for the storage of turbine oil, is located in the eastern portion of the main building. One surface soil sample (S-22) was collected. In addition, an abandoned gasoline AST is also located near the southwestern corner of the

main building. Two soil borings (B-4 and B-18) were advanced.

4. **Diesel Underground Storage Tank.** One underground storage tank (UST) is located at the eastern portion of the south side of the main building. One surface soil sample (S-2) was collected.

5. **Used Oil UST.** One used oil UST is located near the Used Oil Shed, which is south of the main building. One soil boring (B-15) was advanced.

6. **Wastewater ASTs.** There are three areas containing wastewater ASTs at the facility. These ASTs are used to store water that has been processed prior to disposal. The first wastewater AST area is located to the north of the eastern portion of the main building. One soil boring (B-9) was advanced. The second wastewater AST area is located to the north of the western portion of the main building. One surface soil sample (S-9) was collected. The third wastewater AST area is located to the northwest of the former main building. One soil boring (B-10) was advanced.

7. **Oil/Water Separators.** Two oil/water separators are located at the facility. The northern oil/water separator is located adjacent to the East Yard & Roof Runoff Basin. One soil boring (B-11) was advanced and one surface soil sample (S-10) was collected. The southern oil/water separator is located adjacent to the West Yard & Roof Runoff Basin. One soil boring (B-33) was advanced and one monitoring well (MW-7) was installed.

8. **Ash/Slag Disposal Area.** Two ash/slag disposal areas are located at the facility. These areas are used to store ash/slag prior to having it transported off-site. One disposal area is at northwestern corner of the facility. One soil boring (B-12) was advanced and one monitoring well (MW-2) was installed. The second disposal area is to the south of the Wastewater Treatment Plant. One soil boring (B-23) was advanced.

9. **Ash/Slag Ponds.** There are 4 ponds at the facility which are used to collect ash/slag wastewater. The ponds are located at the northwestern corner of the facility. One Ash Surge Basin is located to the west of the East Yard & Roof Runoff Basin. One sediment sample (X-4) was collected. Two Ash Settling Basins are located to the west of the Ash Surge Basin. One sediment sample (X-12) was collected from the western pond, and one sediment sample (X-6) was collected from the eastern pond. In addition, two soil borings (B-13 and B-36) were advanced, one monitoring well (MW-3) was installed, and one surface soil sample (S-23) was collected. One Slag Overflow Basin is located to the north of the Ash Surge Basin. One sediment sample (X-5) was collected.

10. **Wastewater Treatment Plant.** A Wastewater Treatment Plant is located to the south of the Ash Surge Basin. One soil boring (B-14) was advanced and one surface soil sample (S-11) was collected.

11. **Metal Cleaning Waste Basin.** There is one pond at the facility which is used to collect metal cleaning wastewater. One sediment sample (X-11) was collected.

12. **Former Switch Yard.** A former Switch Yard is located to the south of the former main building. Three surface soil samples (S-17, S-18, and S-24) were collected.

13. **Coal Handling Area.** Coal is received at the facility via railroad. The coal is unloaded and is transported to the coal pile at the southwestern end of the facility. One soil boring (B-25) was advanced to the northwest of the coal pile, one soil boring (B-27) was advanced to the northeast of the coal pile, and one soil boring (B-26) was advanced to the north of the coal pile. In addition, one monitoring well (MW-5) was installed to the southeast of the coal pile.

14. **Coal Pile Runoff Ponds.** Three coal pile collection basins are located at the northwestern corner of the coal pile. One sediment sample (X-7) was collected from the western pond, one sediment sample (X-8) was collected from the center pond, and one sediment sample (X-9) was collected from the eastern pond.

15. **Coal Handling Area Buildings.** These buildings are associated with the transporting of coal, as well as housing and maintaining the coal handling tractors. These buildings are located at the north end of the coal pile. One soil boring (B-30) was advanced to the north of the Coal Handling Tractor Repair Building. One soil boring (B-21) was advanced to the west of the former Car Dumper, and one soil boring (B-22) was advanced adjacent to a former locomotive house.

16. **Switch Yard.** The Switch Yard is located to the southeast of the coal pile. One soil boring (B-32) was advanced to the north of the Switch Yard.

17. **Lift Station.** A lift station is located to the north of the Switch Yard. Soil staining from the pumping equipment was observed. One soil boring (B-31) was advanced and one surface soil sample (S-21) was collected.

18. **Crib House.** The Crib House is located south of the main building. The Crib House is used to filter and treat intake cooling water from the Lake Powerton prior to being pumped into the plant. One soil boring (B-34) was advanced and one surface soil sample (S-25) was collected.

19. **Materials Storage Areas.** There are two materials storage area located at the facility. One area is used for the storage of waste solvent and is located to the north of the Crib House. One soil boring (B-16) was advanced. The second area is used for the storage of waste oil and is located to the south of the main building. One soil boring (B-17) was advanced.

It should be noted that due to heavy concentrations of buried utility lines or other underground obstructions, eight planned soil borings (B-2, B-3, B-7, B-8, B-20, B-24, B-28, and B-29) were not advanced and one monitoring well (MW-4) was not installed. Surface soil samples were not collected at these locations due to the areas being covered with concrete/asphalt.

## 2.1 Sampling Methods

All soil (surface and subsurface), sediment, and groundwater samples collected were submitted for analysis of BTEX and PNA constituents using EPA Methods 8260 and 8310, respectively, PCBs using EPA Method 8081, RCRA metals using EPA Method series 6000 and 7000, and pH by EPA Method 9045. In addition, surface soil and sediment samples were submitted for TPH using EPA Method 8015. A sample summary listing is presented in **Table 1**.

The sample glassware used to contain the samples retained for laboratory analysis were provided pre-cleaned from National Environmental Laboratories, Inc. (NET) of Bartlett, Illinois. Each sample was labeled with the project number, project location, client, sample number, sample depth, date, time, and requested analysis. The soil samples were stored on ice in the field in a cooler and shipped via courier under chain-of-custody to NET. Standard chain-of-custody procedures were maintained from the time of sample collection until delivery to the analytical laboratory.

### 2.1.1 Sediment Sampling

Twelve sediment samples (X-1 through X-12) were collected at the facility. The sediment sample locations are illustrated on **Figure 3**. Sediment samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

### 2.1.2 Surface Soil Sampling

Twenty-two surface soil samples (S-1 through S-7, S-9 through S-12, S-14, and S-16 through S-25) were collected at the facility. The surface soil sample locations are illustrated on **Figure 4**. Surface soil samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

### 2.1.3 Soil Borings and Subsurface Soil Sampling

Twenty-eight soil borings (B-1, B-4 through B-6, B-9 through B-19, B-21 through B-23, B-25 through B-27, and B-30 through B-36) were advanced at the facility. It should be noted that due to heavy concentrations of buried utility lines or other underground obstructions, eight planned soil borings (B-2, B-3, B-7, B-8, B-20, B-24, B-28, and B-29) were not advanced. The soil borings locations are illustrated on **Figure 5**. The soil borings were advanced by Fox Drilling, Inc. (Fox) of Itasca, Illinois, utilizing Geoprobe direct-push drilling techniques. The soil borings were advanced to a maximum depth of 20 feet below grade. All soil borings were backfilled with soil cuttings, and completed at surface grade with the appropriate material (i.e., concrete, asphalt). All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

Soil samples were collected by advancing by a hydraulically-driven stainless steel pre-probe. Soil samples were collected using a 2.0-inch diameter acetate lined soil sampler. Soil samples were continuously collected from the surface to the bottom of the soil borings. The soil samples were visually inspected and field classified using the general guidelines of the Unified Soil Classification System (USCS) and the American Society for Testing and Materials (ASTM) Test Method ASTM D2488 for soil classification.

Each soil sample was field screened for the presence of VOCs using a photoionization detector (PID) and standard headspace screening methods. The PID readings indicate relative levels of VOCs in the vapor headspace, but do not represent actual concentrations which may exist in the soil. The PID has a detection range of 1.0 part per million volume (ppmv) to 2,500 ppmv. The soil sample which exhibited the highest PID reading, or if no PID readings were detected, from directly above the field-interpreted groundwater level, was retained from each boring for laboratory analysis.

### 2.1.4 Monitoring Wells and Groundwater Sampling

Six monitoring wells (MW-1 through MW-3, and MW-5 through MW-7) were installed at the facility. The monitoring well locations are illustrated on **Figure 5**. It should be noted that due to heavy concentrations of buried utility lines or other underground obstructions, one monitoring well (MW-4) was not advanced. The monitoring wells were installed by Fox utilizing hollow-stem augers and rotary drilling techniques. The monitoring wells were installed to a maximum depth of 26 feet below grade. Fluids generated during monitoring well installation and groundwater sampling were discharged to the ground surface in proximity to each sampling location. All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

The monitoring wells were installed through the working space within hollow stem augers. The monitoring wells were constructed of 2-inch diameter Schedule 40 PVC 0.010-inch slotted continuous wrap well screen and solid riser. A filter pack consisting of clean silica sand was placed surrounding the well screen to filter out fine soil particles from the formation adjacent to the screen. The filter pack extends from the bottom of the soil boring to approximately 1-foot above the top of the well screen. A bentonite pellet seal was placed on top of the sand pack and hydrated with distilled water to prevent surface water infiltration. The annular space above the bentonite seal was filled with a neat bentonite and cement grout to approximately 6-inches below grade. The monitoring wells were completed at grade and an 8-inch diameter steel protective road box was placed over each monitoring well and set in concrete at grade. The monitoring wells were capped with expandable well caps and equipped with locks to prevent unauthorized access. A monitoring well construction diagram is included in **Appendix A**.

After the installation of the monitoring wells, approximately three to five well volumes of groundwater was removed from each monitoring well, or until the groundwater was relatively free from sediment, using a peristaltic pump. One groundwater sample was

collected from each monitoring well and submitted for laboratory analysis. In addition, water quality field parameters consisting of pH, specific conductivity, and temperature were measured and recorded during sample collection.

## 2.2 Monitoring Well Gauging and Survey

Each monitoring well was gauged using an electronic interface probe in order to determine the presence or absence of liquid-phase hydrocarbons (LPHCs) and depth to groundwater. In addition, each monitoring well's top of casing and ground surface location was surveyed relative to an arbitrary benchmark assigned an elevation of 100 feet.

## 2.3 Equipment Decontamination

The drill rig and associated tooling, and sampling equipment were decontaminated prior to mobilization and before leaving the site. To minimize the potential for cross-contamination, drilling and sampling equipment were decontaminated between each use. Decontamination of drilling equipment consisted of steam cleaning. Sampling equipment, including split spoons and stainless steel sampling equipment, were decontaminated before each use by washing with a solution of Alconox (phosphate based detergent) and potable water, and rinsing with distilled water. Decontamination fluids generated during equipment decontamination were discharged to the ground surface in proximity to each sampling location.

# 3.0 INVESTIGATION FINDINGS

The findings of the subsurface investigation, soil and groundwater sampling, monitoring well gauging, survey, and chemical analysis, are presented below. Analytical results are summarized in **Table 2** through **Table 5**. The analytical reports and chain-of-custody forms are included in **Appendix B**.

Analytical results were compared against the cleanup objectives as presented in 35 Illinois Administrative Code (IAC) Section 742.Appendix B: Table B-Tier 1 Soil Remediation Objectives for Commercial/Industrial Properties, and 35 IAC Section 742.Appendix B: Table E-Tier 1 Groundwater Remediation Objectives for the Direct Ingestion of Groundwater Portion of the Groundwater Ingestion Route.

Soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered. In addition, the groundwater beneath the site is classified as Class I, therefore the Class I baseline was used.

## 3.1 Sediment

**BTEX.** The analytical results indicated that BTEX constituents were not detected above the laboratory method detection limits.

**TPH.** The analytical results indicated that TPH as oil was detected at concentrations ranging from 352 milligrams per kilogram (mg/kg) in sample X-7 to 18,500 mg/kg in sample X-10. However, cleanup objectives for TPH have not been established by the IEPA. TPH as gasoline or diesel was not detected above the laboratory method detection limits.

**PNAs.** The analytical results indicated that benzo(a)pyrene was detected in samples X-2 and X-10 at concentrations of 0.81 mg/kg and 4.8 mg/kg, respectively, which are above the IEPA cleanup objective of 0.8 mg/kg. It should be noted that samples X-1, X-2, and X-7 through X-10 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives.

**PCBs.** The analytical results indicated that PCBs were not detected above the laboratory method detection limits.

**Metals.** The analytical results indicated that arsenic was detected at concentrations above the IEPA cleanup objective of 3 mg/kg. Arsenic was detected at concentrations ranging from 3.2 mg/kg in sample X-5 to 17 mg/kg in sample X-4. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992.

**pH.** pH values ranged from 7.11 in sample X-9 to 8.94 in sample X-5.

Analytical results are summarized in **Table 2**, and sampling locations are illustrated on **Figure 3**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.2 Surface Soil

**BTEX.** The analytical results indicated that BTEX constituents were detected in the surface soil samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**TPH.** The analytical results indicated that TPH as gasoline was detected at concentrations ranging from 232 mg/kg in sample S-18 to 2,360 mg/kg in sample S-23, and TPH as diesel was detected at a concentration of 4,930 mg/kg in sample S-19. TPH as oil was detected at concentrations ranging from 89 mg/kg in sample S-10 to 72,700 mg/kg in sample S-1. However, cleanup objectives for TPH have not been established by the IEPA.

**PNAs.** The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-c,d)pyrene were detected in samples S-2, S-3, S-5, S-9, S-12, and S-16 at concentrations above the IEPA cleanup objectives. It should be noted that sample S-4 had an elevated detection limit due to matrix interference. This elevated detection limit is above the cleanup objective for benzo(a)pyrene, and consequently, there is a possibility that the concentration is actually above the cleanup objective of 0.8 mg/kg. Refer to **Table 3** for PNA results.

**PCBs.** The analytical results indicated that PCBs were detected at concentrations above the IEPA cleanup objective of 1.0 mg/kg. These concentrations were at 1.2 mg/kg in sample S-18 and 1.71 mg/kg in sample S-22. It should be noted that sample S-24 had an elevated detection limit due to matrix interference. This elevated detection limit is above the cleanup objective and consequently there is a possibility that the concentration is actually above the cleanup objective.

**Metals.** The analytical results indicated that arsenic and lead were detected at concentrations above the IEPA cleanup objectives of 3 mg/kg and 400 mg/kg, respectively. Arsenic was detected at concentrations ranging from 3.2 mg/kg in sample S-25 to 11 mg/kg in sample S-14. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Lead was detected at concentrations of 558 mg/kg in sample S-4 and 831 mg/kg in sample S-12.

**pH.** pH values ranged from 5.93 in sample S-4 to 9.42 in sample S-7.

Analytical results are summarized in **Table 3**, and sampling locations are illustrated on **Figure 4**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.3 Subsurface Soil

Native soil encountered beneath the fill material consisted primarily of a brown, fine to medium sand to the maximum depth of the borings at 20 feet below grade, with intermittent 2 to 4 foot silty clay layers. Soil boring logs are included in **Appendix A**.

The PID readings obtained from the soil samples collected ranged from 1.3 ppmv in B-22 (8 to 12 feet below grade) to 708 ppmv in B-15 (0 to 4 feet below grade). The PID field screening results are recorded on the boring logs in **Appendix A**.

**BTEX.** The analytical results indicated that BTEX constituents were not detected above the laboratory method detection limits.

**PNAs.** The analytical results indicated that PNA constituents were detected in only one subsurface soil sample collected. Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene were detected in B-5 at concentrations above the IEPA cleanup objectives. Refer to **Table 4** for PNA results.

**PCBs.** The analytical results indicated that PCBs were detected in the subsurface soil samples collected. However, these concentrations were not above the IEPA cleanup objective of 1.0 mg/kg.

**Metals.** The analytical results indicated that arsenic was detected at concentrations above the IEPA cleanup objectives of 3 mg/kg. Arsenic was detected at concentrations ranging from 3.3 mg/kg in B-34 to 177 mg/kg in B-23. However, the majority of concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Arsenic was detected at concentrations ranging from 25 mg/kg in B-14 to 177 mg/kg in B-23. The majority soil boring locations with elevated concentrations of arsenic were located in the vicinity of the slag and fly ash areas.

**pH.** pH values ranged from 7.79 in B-13 to 9.59 in B-4.

Analytical results are summarized in **Table 4**, and soil boring locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

### 3.4 Groundwater

The groundwater elevations ranged from 8.11 feet in MW-2 to 25.91 feet in MW-3. LPHC was not detected in any of the monitoring wells. Based on the gauging data, the apparent groundwater flow direction beneath the facility has been calculated to be to the northwest (**Figure 6, Groundwater Elevation Map**). Monitoring well gauging data is included in **Appendix C**.

Water quality field parameters consisting of pH, specific conductivity, and temperature were measured. The recorded measurements are summarized in **Table 5**.

**BTEX.** The analytical results indicated that BTEX constituents were not detected above the laboratory method detection limits.

**PNAs.** The analytical results indicated that PNA constituents were detected in the groundwater samples collected. However, these concentrations were not above the IEPA cleanup objectives.

**PCBs.** The analytical results indicated that BTEX constituents were not detected above the laboratory method detection limits.

**Metals.** The analytical results indicated that arsenic and barium were detected in the groundwater samples collected. However, these concentrations were not above the IEPA cleanup objectives. It should be noted that laboratory detection limit for cadmium was at 0.01 mg/l which is above the cleanup objective of 0.005 mg/l. Consequently, there is a possibility that the concentrations are actually above the cleanup objective.

Analytical results are summarized in **Table 5**, and monitoring well locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

# 4.0 DATA ASSESSMENT

## 4.1 Extent of Contamination

Based on the results of the subsurface investigation conducted, the following determinations and assessments were made regarding the extent of contamination at the facility. The following conclusions are subject to the Limitations presented in **Section 1.4**. In addition, although arsenic was detected above the IEPA cleanup objective, the majority of concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. The majority soil boring locations with elevated concentrations of arsenic were located in the vicinity of the slag and fly ash areas. However, it should be noted that soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered.

### 4.1.1 Sediment

Arsenic and benzo(a)pyrene were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

Benzo(a)pyrene was detected above the IEPA cleanup objective in the following locations:

- **Yard & Roof Runoff Basins.** The East Yard & Roof Runoff Basin located in the northeastern portion of the facility (X-2) and the West Yard & Roof Runoff Basin is located in the southwestern portion of the facility (X-10).

It should be noted that due to matrix interference in samples X-1, X-2, and X-7 through X-10 benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from a drainage ditch east of the East Yard & Roof Runoff Basin (X-1), the East Yard & Roof Runoff Basin (X-2), the three Coal Runoff Ponds (X-7 through X-9), and the West Yard & Roof Runoff Basin (X-10).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 17 mg/kg in the following locations:

- **Yard & Roof Runoff Basins.** The drainage ditch east of the East Yard & Roof Runoff Basin (X-1), the East Yard & Roof Runoff Basin (X-2 and X-3), and the West Yard & Roof Runoff Basin is located in the southwestern portion of the facility (X-10).
- **Ash/Slag Ponds.** The Ash Surge Basin located to the west of the East Yard & Roof Runoff Basin (X-4), the Slag Overflow Basin located to the north of the Ash Surge Basin (X-5), the eastern Ash Settling Basin (X-6), and the western Ash Settling Basin (X-12).

- **Coal Runoff Ponds.** The western Coal Runoff Pond (X-7) and the center Coal Runoff Pond (X-8).
- **Metal Cleaning Waste Basin.** The Metal Cleaning Waste Basin (X-4) located south of the Ash Surge Basin.

### 4.1.2 Surface Soil

Arsenic, lead, PCBs, and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-c,d)pyrene were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Diesel UST.** The diesel UST located on the south side of the eastern portion of the main building (S-2).
- **Transformers.** The transformers located on the south side of the western portion of the main building (S-3), transformers located on the south side of the former building (S-5), transformers located on the north side of the western portion of the main building (S-12), and transformers located at the Coal Handling Tractor Repair Garage (S-16).
- **Wastewater ASTs.** The wastewater ASTs located north of the western portion of the main building (S-9).

It should be noted that due to matrix interference in sample S-4, benzo(a)pyrene had an elevated detection limit. Consequently, there is a possibility that the concentration is actually above the cleanup objective of 0.8 mg/kg. This sample was collected from the transformers located on the south side of the western portion of the main building (S-4).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 11 mg/kg in the following locations:

- **Transformers.** The transformers located on the south side of the eastern portion of the main building (S-1), transformers located on the south side of the western portion of the main building (S-3 and S-4), transformers located on the south side of the former building (S-5 and S-14), transformers located on the north side of the western portion of the main building (S-6, S-7, and S-12), transformers located at the Coal Handling Tractor Repair Garage (S-16), and transformers located on the east side of the West Yard & Roof Runoff Basin (S-20).
- **Diesel UST.** The diesel UST located on the south side of the eastern portion of the main building (S-2).
- **Wastewater ASTs.** The wastewater ASTs located north of the western portion of the main building (S-9).
- **Oil/Water Separators.** The northern oil/water separator located east of the Ash Surge Basin (S-10).

- **Wastewater Treatment Plan.** The Wastewater Treatment Plant located south of the Ash Surge Basin (S-11).
- **Former Switch Yard.** The former Switch Yard located south of the former main building (S-17 and S-24).
- **Petroleum ASTs.** The diesel AST located at the Coal Handling Tractor Repair Garage (S-19) and the turbine oil AST located in the eastern portion of the main building (S-22).
- **Lift Station.** The lift station located north of the Switch Yard (S-21).
- **Crib House.** The Crib House located south of the main building (S-25).

Lead was detected above the IEPA cleanup objective, at a maximum concentration of 831 mg/kg in the following locations:

- **Transformers.** The transformers located on the south side of the western portion of the main building (S-4) and transformers located on the north side of the western portion of the main building (S-12).

PCBs were detected above the IEPA cleanup objective in the following locations:

- **Former Switch Yard.** The former Switch Yard located south of the former main building (S-18).
- **Petroleum ASTs.** The turbine oil AST located in the eastern portion of the main building (S-22).

It should be noted that due to matrix interference sample S-24 had an elevated detection limit. Consequently, there is a possibility that the PCB concentration is actually above the cleanup objective of 1.0 mg/kg. This sample was collected from the former Switch Yard located south of the former main building (S-24).

### 4.1.3 Subsurface Soil

Arsenic and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Petroleum ASTs.** The diesel AST located near the southwestern corner of the main building (B-5).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 177 mg/kg in the following locations:

- **Transformers.** The transformers located on the south side of the eastern portion of the main building (B-1), transformers located on the north side of the former main building (B-19), and transformers located on the north side of the western portion of the main building (B-6),
- **Petroleum ASTs.** An abandoned gasoline AST located near the southwestern corner of the main building (B-4 and B-18) and the diesel AST located near the southwestern corner of the main building (B-5 and B-35).
- **Wastewater ASTs.** The wastewater ASTs located north of the eastern portion of the main building (B-9) and the wastewater ASTs located northwest of the main building (B-10).
- **Oil/Water Separators.** The northern oil/water separator located east of the Ash Surge Basin (B-11).
- **Ash/Slag Disposal Areas.** The disposal area located in the northwester corner of the facility (B-12) and the disposal area located to the south of the Wastewater Treatment Plant (B-23).
- **Ash/Slag Ponds.** The Ash Settling Ponds located to the west of the Ash Surge Basin (B-13 and B-36).
- **Wastewater Treatment Plant.** The Wastewater Treatment Plant located south of the Ash Surge Basin (B-14).
- **Used Oil UST.** The used oil UST located near the Used Oil Shed, which is south of the main building (B-15).
- **Material Storage Areas.** The storage area located north of the Crib House (B-16) and the storage area located south of the main building (B-17).
- **Coal Handling Area Buildings.** The area west of the former Car Dumper (B-21), the former locomotive house (B-22), and the Coal Handling Tractor Repair Building (B-30).
- **Coal Handling Area.** The coal pile located at the southwestern corner of the facility (B-25 through B-27)
- **Lift Station.** The lift station located north of the Switch Yard (B-31).
- **Switch Yard.** The Switch Yard located southeast of the coal pile (B-32).
- **Crib House.** The Crib House located south of the main building (B-34).

### 4.1.4 Groundwater

There were no constituents of concern detected at concentrations above the IEPA cleanup objectives in the groundwater samples collected. It should be noted that laboratory detection limit for cadmium was at 0.01 mg/l which is above the cleanup objective of 0.005 mg/l. Consequently, there is a possibility that the concentrations are actually above the cleanup objective.

## 4.2 Potential Contaminant Exposure Pathways

Based on the above-referenced assessment, potential exposure pathways by which humans may be exposed to the constituents of concern have been identified at the facility. Potential sources, fate and transport mechanisms, and exposure media were considered in determining these potential exposure pathways. An identified potential exposure pathway does not imply that exposure is occurring, only that the potential exists for exposure.

### 4.2.1 Soil Ingestion

The soil ingestion pathway includes the first three feet within ground surface. Therefore, based on the analytical results, soil ingestion is a potential contaminant exposure pathway. Soil ingestion occurs when soil containing elevated concentrations of the constituents of concern are ingested into the body. The facility is an industrial site and direct contact and ultimately ingestion of the impacted soil is not likely to occur. However, construction activities would increase the possibility of exposure. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

### 4.2.2 Soil Inhalation

The soil inhalation pathway includes the first ten feet within ground surface. Therefore, based on the analytical results, soil inhalation is a potential contaminant exposure pathway. Soil inhalation occurs when elevated concentrations of the constituents of concern are inhaled into the body. However, the highly volatile constituents (i.e., BTEX, TPH as gasoline), were not detected at concentrations above the IEPA cleanup objectives. The constituents that were detected at concentrations above the IEPA cleanup objectives (i.e., metals, semi-volatiles, PCBs), are not considered highly volatile. Based on the relatively low volatility of the constituents of concern detected above the IEPA cleanup objectives, the soil inhalation exposure pathway is not a likely contaminant exposure pathway.

### 4.2.3 Groundwater Ingestion

The groundwater ingestion pathway includes groundwater being used as a potable source of water. Therefore, due to the fact that the facility receives its potable water from water supply wells located at the facility, the groundwater ingestion is a potential contaminant exposure pathway. However, no constituents of concern were detected at concentrations above the IEPA cleanup objectives in the groundwater samples collected.

Based on the current land use (industrial) and site conditions (analytical results and soil types), it is judged that the potential for human exposure to the constituents of concern from this facility is low. However, personnel working at the facility could be susceptible to exposure due to accidental soil ingestion or soil inhalation due to activities such as construction. Such exposure may result from contact with contaminated subsurface or surface materials previously located beneath a protective barrier (i.e., concrete cap, building).

There is no requirement under Illinois environmental law to further investigate or remediate this property.

Table 1

Sampling Locations and Analyses Summary

Commonwealth Edison Company
Powerton Generating Station
Route 29 Mantino Road
Pekin, Illinois

| Boring Identification | Sampling Locations | Sampling Parameters | Sampling Depth (in feet) | Date Collected |
|---|---|---|---|---|
| B-1 | Transformers | BTEX, PNAs, PCBs, RCRA metals, pH | 16-20 | 10/06/98 |
| B-4 | Petroleum ASTs | BTEX, PNAs, PCBs, RCRA metals, pH | 12-16 | 10/06/98 |
| B-5 | Petroleum ASTs | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/06/98 |
| B-6 | Transformers | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/06/98 |
| B-9 | Wastewater ASTs | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/06/98 |
| B-10 | Wastewater ASTs | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/06/98 |
| B-11 | Oil/Water Separator | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/06/98 |
| B-12 | Ash/Slag Disposal Area | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/06/98 |
| B-13 | Ash/Slag Ponds | BTEX, PNAs, PCBs, RCRA metals, pH | 12-16 | 10/06/98 |
| B-14 | Wastewater Treatment Plant | BTEX, PNAs, PCBs, RCRA metals, pH | 16-20 | 10/06/98 |
| B-15 | Used Oil UST | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-16 | Materials Storage Areas | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-17 | Materials Storage Areas | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-18 | Petroleum ASTs | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/06/98 |
| B-19 | Transformers | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-21 | Coal Handling Area Buildings | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-22 | Coal Handling Area Buildings | BTEX, PNAs, PCBs, RCRA metals, pH | 16-20 | 10/07/98 |
| B-23 | Ash/Slag Disposal Area | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-25 | Coal Handling Area | BTEX, PNAs, PCBs, RCRA metals, pH | 8-12 | 10/07/98 |
| B-26 | Coal Handling Area | BTEX, PNAs, PCBs, RCRA metals, pH | 16-20 | 10/07/98 |
| B-27 | Coal Handling Area | BTEX, PNAs, PCBs, RCRA metals, pH | 12-16 | 10/07/98 |
| B-30 | Coal Handling Area Buildings | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-31 | Lift Station | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-32 | Switch Yard | BTEX, PNAs, PCBs, RCRA metals, pH | 4-8 | 10/07/98 |
| B-33 | Oil/Water Separator | BTEX, PNAs, PCBs, RCRA metals, pH | 16-20 | 10/07/98 |
| B-34 | Crib House | BTEX, PNAs, PCBs, RCRA metals, pH | 0-4 | 10/07/98 |
| B-35 | Petroleum ASTs | BTEX, PNAs, PCBs, RCRA metals, pH | 16-20 | 10/06/98 |
| B-36 | Ash/Slag Ponds | BTEX, PNAs, PCBs, RCRA metals, pH | 12-16 | 10/06/98 |

**Notes:**

BTEX was analyzed using EPA Method 8260.

PNAs were analyzed using EPA Method 8310

PCBs were analyzed using EPA Method 8081.

RCRA metals were analyzed using EPA Method series 6000 and 7000.

pH was measured using EPA Method 9045.

(1) Sampling locations are referenced in the Phase II Environmental Site Assessment Report in Section 2.0.

Notes:
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.
(2) Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered.

Notes:
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.
(2) Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered.

Notes:
Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

(1) NA indicates not applicable, cleanup objectives have not been established for these parameters.
(2) Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered.

# 1.0 INTRODUCTION

## 1.1 Background

Pursuant to the request of the Illinois Environmental Protection Agency (Illinois EPA), this document presents the Hydrogeologic Assessment Report for the on-site ash pond areas at the Midwest Generation, LLC (MWG) Powerton Generating Station in Pekin, Illinois. This hydrogeologic assessment was performed in accordance with the Hydrogeologic Assessment Plan, approved by the Illinois EPA, dated September 3, 2010.

As defined by the Hydrogeologic Assessment Plan, the purpose of this investigation was to: (i) evaluate the potential, if any, for migration of ash-related constituents from the on-site ash ponds and to conduct monitoring for groundwater constituents regulated by the Illinois Part 620 groundwater standards, as requested by the Illinois EPA; (ii) characterize the subsurface hydrogeology; and (iii) identify potable well use within 2,500 feet of the ash ponds. The results of this investigation are described in this Hydrogeologic Assessment Report.

## 1.2 Site Location and Description

The Powerton facility (the Site) is located in Section 9, Township 24 North, Range 5 West, in the City of Pekin, Tazewell County, Illinois. Figure 1 provides a Site Location Map.

The site contains three active ash ponds. Each ash pond is lined with 12" of geo-composite material on the bottom, and a geo-membrane liner on the side slopes; the total area of the three ash ponds is approximately 11 acres. One former ash pond that is no longer used is located east of the current ash ponds; it has been partially filled but still contains some ash. Figure 2 shows the locations of the three active and one former ash ponds.

## 1.3 Regional Setting

The Site is located along the Illinois River south and west of the city of Pekin. The surrounding land use consists of the Illinois River to the north, industrial and residential properties to the east, agricultural land to the south, and Lake Powerton to the west.

Patrick Engineering Inc. (Patrick) conducted a review of publically available geological information from the Illinois State Geological Survey website. Based upon water well logs from the area, the geology beneath the Site consists of approximately 100 to 125 feet of unconsolidated deposits (mainly alluvial sands and gravels with some minor clay), underlain by the Carbondale Formation, which consists of alternating layers of limestone, shale, coal, and underclay.

Groundwater flow in the shallow, unconsolidated aquifer should be largely controlled by the Illinois River with groundwater flowing towards the river during most periods of the year.

# 2.0 HYDROGEOLOGIC ASSESSMENT METHODOLOGY

The following sections present the methodologies used to evaluate the potential for migration of ash-related constituents from the ash ponds and to monitor for all Part 620-regulated constituents, to characterize the subsurface hydrogeology, and to identify potable well use within 2,500 feet of the Site.

## 2.1 Evaluation of Ash-Related Constituents Migration Potential

The Illinois EPA requested that an evaluation of the potential for migration of ash-related constituents from the ash ponds and that monitoring for all Part 620-regulated constituents be performed in accordance with the groundwater standards included in 35 Illinois Administrative Code (IAC) Part 620, Subparts C and D. Accordingly, groundwater monitoring wells were installed at the Site in locations both upgradient and downgradient of the ash ponds.

### 2.1.1 Installation of Groundwater Monitoring Wells

Patrick installed ten (10) groundwater monitoring wells spaced approximately 400 feet apart around the perimeter of the ash ponds. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. The spacing of the well locations at the Site along the downgradient edge of the ash ponds was calculated so as to detect a groundwater plume emanating from a point source beneath the ash ponds. Figure 3 shows the location of the ten monitoring wells.

Two of the installed monitoring wells are located upgradient of the ash ponds; the additional eight wells are located down/side-gradient of the ash ponds. The well borings were advanced using hollow-stem augers to depths ranging from 30 to 45 feet below ground surface (bgs). Borings were terminated after the field geologist determined that the boring was installed approximately 10 feet past the first intersection of the groundwater table in order to ensure that a representative groundwater sample could be obtained. Upon termination of each boring, a 2-inch

diameter, PVC well was installed in order to collect samples of the groundwater in the uppermost aquifer. The monitoring wells were completed to approximately 3 feet above grade, with PVC casing, and were covered with a stick-up, steel well protector with a locking cap. Soil lithology was inspected and logged by an experienced geologist during the boring process. Boring logs with well construction information are included as Appendix A.

### 2.1.2 Initial Groundwater Sampling and Analytical Testing

The groundwater sampling event for the Site took place on December 6, 2010. The groundwater elevation in each of the ten wells was measured prior to sampling. Groundwater samples were collected from each well with a peristaltic pump, using established low-flow sampling techniques. Temperature, pH, and conductivity measurements were taken using a portable meter in all wells; refer to Table 1 for these field parameter results. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature of no higher than 4º F. The samples were transported to PDC Laboratories, Inc. (PDC), an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain the integrity of the samples.

The analytical laboratory tested groundwater samples from each of the wells for the compounds listed in Table 2. Analytes tested include the inorganic compounds listed in 35 IAC 620.410(a), excluding both radium and the poly-aromatic hydrocarbons (PAHs) listed in 35 IAC 620.410(b).

## 2.2 Characterization of Subsurface Hydrogeology

The subsurface hydrogeology beneath the ash ponds was characterized by determining Site lithology and the groundwater flow patterns in the vicinity of the ash ponds as described below.

### 2.2.1 Site Lithology

The Site lithology was determined by logging soil samples collected from the soil borings created during the installation of the groundwater monitoring wells. The soil borings were installed under the direction of an experienced geologist. Each boring was sampled at 2-foot intervals using a 2-inch O.D. split-spoon sampler (ASTM D 1586). Each soil sample was inspected and logged by the geologist during the boring process. Boring logs with well construction information are provided as Appendix A.

### 2.2.2 Topographic and Water Elevation Surveys

A survey crew measured both the top-of-casing and ground surface elevations of all installed monitoring wells and the groundwater elevations within each of the monitoring wells on November 4, 2010. The survey crew concurrently measured the water elevation in all four of the ash ponds, the intake and outfall channels, and the Illinois River.

### 2.2.3 Hydraulic Testing of Selected Wells

Patrick conducted five *in situ* hydraulic conductivity tests on wells MW-2, MW-5, MW-8, MW-9, and MW-10 on December 16, 2010. The testing consisted of one rising-head and one falling-head slug test performed at each well. Using a data-logging pressure transducer, Patrick measured the rate of groundwater level recovery in the wells after either inserting a slug into, or removing a slug from, each monitoring well.

## 2.3 Identification of Potable Well Use

Natural Resource Technology, Inc. (NRT) has previously completed an investigation of potable water well use within 2,500 feet of the Powerton ash ponds. MWG submitted the results of this investigation to the Illinois EPA by letter dated July 15, 2009. These results are summarized in Appendix B.

The following databases and sources of information were used in order to identify local community water sources and water well locations in the vicinity of the Site:

- Illinois State Geological Survey (ISGS) -Water Well Database Query;
- Illinois State Water Survey (ISWS) Private Well Database and water well construction report request; and
- Illinois Division of Public Water Supply web-based Geographic System (GIS) files.

# 3.0 HYDROGEOLOGIC ASSESSMENT RESULTS

## 3.1 Evaluation of Ash-Related Constituent Migration Potential

The analytical laboratory results for the hydrogeologic assessment are presented in Table 2. Full laboratory data packages from PDC are provided as Appendix C. Manganese and boron were detected in one or more monitoring wells at concentrations exceeding the Part 620 Class I Groundwater Quality Standards. In some cases, the highest concentrations of a given compound were found in the upgradient wells. Antimony, beryllium, cadmium, copper, cyanide, lead, mercury, silver, thallium, zinc, nitrogen/nitrite, and nitrogen/nitrate/nitrite were not detected in any of the groundwater samples.

A determination of the potential for the individual ash ponds to be contributing to the distribution of analytes in the underlying groundwater and the extent, if any, of such contribution cannot be made from the results of this single sampling event alone. To develop a true, statistically-significant upgradient background concentration for the various compounds will require a number of sequential sampling events over time. Based on a statistically developed background value, downgradient concentrations can be compared to the background value over time to determine the likelihood and extent of any constituent migration from the on-site ash ponds. A plan to develop such an analytical database through additional sampling is presented in the last section of this report.

## 3.2 Characterization of Subsurface Hydrogeology

The lithology of the Site is predominantly fine sand fill underlain with sand and gravel; a silt seam runs through a portion of the Site. Refer to Figure 4 for a geologic cross-section of the Site.

The results of the topographic and water elevation surveys are presented in Table 3.

The uppermost groundwater unit at the Site is found at depths ranging from 18 to 28 feet bgs. The direction of groundwater flow is to the north/northwest towards the Illinois River, which

runs along the northern boundary of the Site. The hydraulic gradient is approximately 0.0056 based upon the groundwater elevation data collected on November 4, 2010. A potentiometric surface map is provided as Figure 5. Note that several of the wells indicated groundwater elevations either higher or lower than what is indicated by the potentiometric surface (MW-2, MW-6, and MW-8). These apparent anomalies could be due to localized differences in lithology or localized areas of higher recharge. Patrick will continue to refine the potentiometric surface map with the additional groundwater elevation data that will be collected during the proposed quarterly sampling events.

Patrick used the hydraulic testing data to calculate the hydraulic conductivity of the uppermost aquifer using the Bouwer and Rice method. Hydraulic conductivity calculations are provided in Appendix D. The hydraulic conductivity of Site soils ranged from $7.41 \times 10^{-4}$ to $9.24 \times 10^{-3}$ ft/second. The average hydraulic conductivity was $4.7 \times 10^{-3}$ ft/second. Using the highest calculated hydraulic conductivity and the measured hydraulic gradient, Patrick calculated the maximum groundwater velocity to be approximately 2.27 ft/day ($4.7 \times 10^{-3}$ ft/sec x 0.0056 x 60 sec/min x 60 min/hour x 24 hours/day).

## 3.3 Identification of Potable Well Use

As stated above, NRT has previously completed an investigation of potable water well use within 2,500 feet of the Powerton ash ponds. MWG submitted the results of this investigation to the Illinois EPA by letter dated July 15, 2009. According to this letter, six wells are located within a 2,500-foot radius of the ash ponds (see Appendix B), each of which is screened below 50 feet. None of these wells are located downgradient from the ash ponds. Two of these wells supply Powerton Station with water.

# 4.0 LONG-TERM MONITORING PLAN

In order to properly assess the groundwater monitoring data collected in this single sampling event, MWG will conduct a quarterly groundwater sampling program in which the same monitoring wells described in this report will be sampled for the identical analyte list employed during this investigation. MWG proposes to begin this quarterly monitoring program in March 2011, and will submit the results of the sampling program to the Illinois EPA on an ongoing, quarterly basis. MWG proposes to continue this program until sufficient statistically-significant data is available to properly assess the groundwater data. If the quarterly sampling results continue to show non-detect results for certain of the analytes, as was the case in this single sampling event, MWG may propose to Illinois EPA that these analytes be eliminated from future sampling events.

Notes:
*Class I Groundwater Standards from 35 IAC Part 620
Bold values show exceedences of 35 IAC Part 620
ND-non detect
Determinations of upgradient and downgradient wells are prelim
mg/L = milligrams per liter

-Determination of the potential for the individual ash ponds to be contributing to the distribution of analytes in the underlying groundwater cannot be made from the results of this single sampling event alone. To develop a true, statistically-significant upgradient background concentration for the various compounds will require a number of sequential sampling events over time. After a statistically developed background value is available, the downgradient concentrations can be compared to this background value over time to determine the likelihood of contaminant migration from the on-site ash ponds. A plan to develop such an analytical database through additional sampling is discussed in the last section of this report.

# PDC Laboratories

DATA QUALIFIERS APPLICABLE TO THE "STANDARD QC" PROGRAM

**A** The presence of this analyte was confirmed using a second column but there was a disparity (> 40% RPD) between the two sets of results with no apparent chromatographic anomalies. The lower of the two results was reported.

**B** _____ present in the method blank at _____.

**C** The batch control sample failed to meet the required acceptance criteria.

**D** Result obtained through analysis of a sample dilution.

**E** Concentration exceeds the instrument calibration range.

**F** Internal standard area failed to meet the required acceptance criteria in repeat instrumental analyses. Results should be interpreted as estimated concentrations.

**G** The Method of Standard Additions (MSA) was used to quantify the concentration.

**H** Test performed after the expiration of the appropriate regulatory/advisory maximum allowable hold time.

**J** Estimated value; value between the MDL and the RDL.

**M** Analyte failed to meet the required acceptance criteria for duplicate analysis.

**P** Chemical preservation discrepancy noted at the time of analysis.

**Q** Analyte failed to meet the required acceptance criteria for spike recovery in the Matrix Spike (MS) and Matrix Spike Duplicate (MSD) due to apparent matrix effects.

**R** Analyte failed to meet the required acceptance criteria for relative percent difference (RPD) between the Matrix Spike and Matrix Spike Duplicate (MS/MSD).

**S** Surrogate compound diluted below a reliable quantitation level.

**T** Surrogate recovery failed to meet the required acceptance criteria in initial analysis. Sample was re-extracted (if applicable) and re-analyzed, and the surrogate recovery was outside of the required acceptance criteria on the second analysis, also. Results should be interpreted as estimated concentrations.

**U** Parameter was analyzed for, but not detected above the reporting limit.

**V** Verification standard recovery failed to meet the required acceptance criteria on repeat instrumental analyses.

**W** Surrogate recovery failed to meet the required acceptance criteria in initial analysis. Sample was re-extracted (if applicable) beyond the maximum allowable hold time, and re-analyzed. The surrogate recovery was within the required acceptance criteria on this second analysis.

**NA** Not analyzed.

**NR** Not requested.

**X** Miscellaneous; see comments.

# PDC Laboratories

DATA QUALIFIERS APPLICABLE TO THE "STANDARD QC" PROGRAM

**A** The presence of this analyte was confirmed using a second column but there was a disparity (> 40% RPD) between the two sets of results with no apparent chromatographic anomalies. The lower of the two results was reported.

**B** _____ present in the method blank at _____.

**C** The batch control sample failed to meet the required acceptance criteria.

**D** Result obtained through analysis of a sample dilution.

**E** Concentration exceeds the instrument calibration range.

**F** Internal standard area failed to meet the required acceptance criteria in repeat instrumental analyses. Results should be interpreted as estimated concentrations.

**G** The Method of Standard Additions (MSA) was used to quantify the concentration.

**H** Test performed after the expiration of the appropriate regulatory/advisory maximum allowable hold time.

**J** Estimated value; value between the MDL and the RDL.

**M** Analyte failed to meet the required acceptance criteria for duplicate analysis.

**P** Chemical preservation discrepancy noted at the time of analysis.

**Q** Analyte failed to meet the required acceptance criteria for spike recovery in the Matrix Spike (MS) and Matrix Spike Duplicate (MSD) due to apparent matrix effects.

**R** Analyte failed to meet the required acceptance criteria for relative percent difference (RPD) between the Matrix Spike and Matrix Spike Duplicate (MS/MSD).

**S** Surrogate compound diluted below a reliable quantitation level.

**T** Surrogate recovery failed to meet the required acceptance criteria in initial analysis. Sample was re-extracted (if applicable) and re-analyzed, and the surrogate recovery was outside of the required acceptance criteria on the second analysis, also. Results should be interpreted as estimated concentrations.

**U** Parameter was analyzed for, but not detected above the reporting limit.

**V** Verification standard recovery failed to meet the required acceptance criteria on repeat instrumental analyses.

**W** Surrogate recovery failed to meet the required acceptance criteria in initial analysis. Sample was re-extracted (if applicable) beyond the maximum allowable hold time, and re-analyzed. The surrogate recovery was within the required acceptance criteria on this second analysis.

**NA** Not analyzed.

**NR** Not requested.

**X** Miscellaneous; see comments.

PATRICK
ENGINEERING

October 21, 2011

Illinois Environmental Protection Agency
Division of Water Pollution Control
Compliance Assurance Section
1021 North Grand Avenue East
P.O. Box 19276
Springfield, Illinois 62794-9276

Subject: Quarterly Groundwater Monitoring Results – Third Quarter 2011
Powerton Generating Station – Bypass Cleaning Basin
Water Pollution Control Permit No. 2010-EB-0664

Reference: Patrick Project No. 21153.018

To Whom It May Concern:

Patrick Engineering Inc. (Patrick) has prepared this letter report, on behalf of Midwest Generation, LLC, to provide groundwater monitoring results associated with the Powerton Generating Facility located at 13082 East Manito Road in Pekin, Illinois. Groundwater is monitored quarterly in the vicinity of the bypass cleaning basin at this facility in three monitoring wells in accordance with requirements of Illinois Environmental Protection Agency (Illinois EPA) Water Pollution Control Permit No. 2010-EB-0664.

**MONITORING WELL INSTALLATION**

In accordance with the permit referenced above, three monitoring wells (MW-9, MW-11, and MW-12) have been installed in the vicinity of the bypass cleaning basin. The locations of these wells were selected so that at least one of the monitoring wells (MW-09) was installed downgradient of the basin, based upon available data regarding the expected groundwater flow direction. Figure 1 shows the location of the three monitoring wells. Drilling logs and well completion reports have been included as Attachment A.

**GROUNDWATER SAMPLING**

Prior to collecting groundwater samples from the three wells noted above, a number of field measurements were collected from each well location, including groundwater elevation, temperature, conductivity, and pH. Groundwater elevation data is summarized in Table 1. Other field parameter data is provided in Table 2.

On September 19, 2011, groundwater samples were collected from each of the three on-site monitoring wells, either using disposable polyethylene bailers (MW-11), or by the direct use of a peristaltic pump (for MW-9 and MW-12). Each well was purged until at least three well volumes had been extracted, or until the groundwater was observed to be clear. Groundwater was pumped or bailed into a decontaminated, stainless steel container and thereafter transferred to sample containers via peristaltic pump. All groundwater samples were filtered in the field using

a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4° F. The samples were transported to PDC Laboratories, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain sample integrity.

**ANALYTICAL RESULTS**

The groundwater samples were analyzed for all of the inorganic compounds listed in 35 Illinois Administrative Code (IAC) 620.410(a) and 620.410(d), including radium 226/228. Analytical results (both current and historical) are summarized in Table 3. Laboratory analytical reports provided by PDC Laboratories are provided as Attachment B.

In accordance with Water Pollution Control Permit No. 2010-EB-0664, these three wells will continue to be sampled and reported on a quarterly basis for at least one year to establish a statistically valid representation of existing background conditions.

If you have any questions, please contact me at 630-795-7464.

Sincerely,

**PATRICK ENGINEERING INC.**

Revised 6/09

IMPORTANCE NOTICE: This state agency is requesting disclosure of information that is necessary to accomplish the statutory purpose as outlined under Public Act-0863. Disclosure of this information is Mandatory. This form has been approved by the Forms Management Center.

13. Property Owner: Midwest Generation LLC Well # PEI-MW-09

14. Driller: _____ License # _____

15. Name of Drilling Company : Groff Testing Corporation 16. Permit Number: _____

Date Issued: _____ 17. Date Drilling Started Sep 28, 2010

18. Well Site Address: 13082 E. Manito Road, Pekin, IL 61554

19. Township Name: Cincinnati Land I.D. # _____

20. Subdivision Name: _____ Lot # _____

21. Location: a. County Tazewell b. Site Elevation 470 ft. (above msl)

c. Township: 24N Range: 5W Section: 9

d. NE Quarter of the SE Quarter of the SW Quarter

e. GPS: Lat: Degrees 40 Minutes 32 Seconds 32.3 N

Lon: Degrees 89 Minutes 40 Seconds 34.4 W

Survey use only

22. Casing and Liner Information

| Diameter (in.) | Material, Joint Type | From (ft.) | To (ft.) |
|---|---|---|---|
| 2 | PVC, threaded | 0 | 22 |
| | | | |
| | | | |

23. Is the well screened? Yes If yes

| Diameter (in.) | Length (ft.) | Slot Size (in.) | From (ft.) | To (ft.) |
|---|---|---|---|---|
| 2 | 10 | 0.01 | 22 | 32 |

24. Water from sand at a depth of (ft.) 19 To (ft.) 32

a. Static water level (ft.) below top of casing 21.6 which is (in.) above ground 3

b. pumping level is (ft.) _____ pumping (gpm) _____ for (hours) _____

25.

| Earth Materials Passed Through | From (ft.) | To (ft.) |
|---|---|---|
| gravel, crushed rock, cinders | 0 | 10 |
| cinders, sand, brick | 10 | 17 |
| clayey silt | 17 | 19 |
| sand | 19 | 32 |
| | | |
| | | |

RE: Project: 1091955
Pace Project No.: 3054614

Dear Ms. Clutters:
Enclosed are the analytical results for sample(s) received by the laboratory on September 28, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Carin A. Ferris

## PROJECT NARRATIVE

Project: 1091955
Pace Project No.: 3054614

**Method:** **EPA 903.1**
**Description:** 903.1 Radium 226
**Client:** PDC Laboratories, Inc.
**Date:** October 17, 2011

**General Information:**
3 samples were analyzed for EPA 903.1. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**
The samples were analyzed within the method required hold times with any exceptions noted below.

**Method Blank:**
All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**
All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Duplicate Sample:**
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

**Additional Comments:**

## QUALIFIERS

Project: 1091955
Pace Project No.: 3054614

**DEFINITIONS**

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

P.O. Box 19276
Springfield, Illinois 62794-9276

Subject: Bi-Monthly Groundwater Monitoring Results – April 2011
Powerton Generating Station – Metal Cleaning Basin
Water Pollution Control Permit No. 2009-EB-2748

Reference: Patrick Project No. 21153.018

To Whom It May Concern:

Patrick Engineering Inc. (Patrick) has prepared this letter report, on behalf of Midwest Generation, LLC, to provide groundwater monitoring results associated with the Powerton Generating Facility located at 13082 East Manito Road in Pekin, Illinois. Groundwater is monitored bi-monthly in the vicinity of the metal cleaning basin at this facility in three monitoring wells in accordance with requirements of Illinois Environmental Protection Agency (Illinois EPA) Water Pollution Control Permit No. 2009-EB-2748.

**MONITORING WELL INSTALLATION**

In accordance with the permit referenced above, three monitoring wells (MW-13, MW-14, and MW-15) have been installed in the vicinity of the metal cleaning basin. The locations of these wells were selected so that at least one of the monitoring wells (MW-15) was installed downgradient of the basin, based upon available data regarding the expected groundwater flow direction. Figure 1 shows the location of the three monitoring wells. Drilling logs and well completion reports have been included as Attachment A.

**GROUNDWATER SAMPLING**

Prior to collecting groundwater samples from the three wells noted above, a number of field measurements were collected from each well location, including groundwater elevation, temperature, conductivity, and pH. Groundwater elevation data is summarized in Table 1. Other field parameter data is provided in Table 2.

On April 25, 2011, groundwater samples were collected from each of the three on-site monitoring wells, either using disposable polyethylene bailers (for MW-13 and MW-14), or by the direct use of a peristaltic pump (for MW-15). Each well was purged until at least three well volumes had been extracted, or until the groundwater was observed to be clear. Groundwater was pumped or bailed into a decontaminated, stainless steel container and thereafter transferred to

sample containers via peristaltic pump. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4° F. The samples were transported to PDC Laboratories, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain sample integrity.

**ANALYTICAL RESULTS**

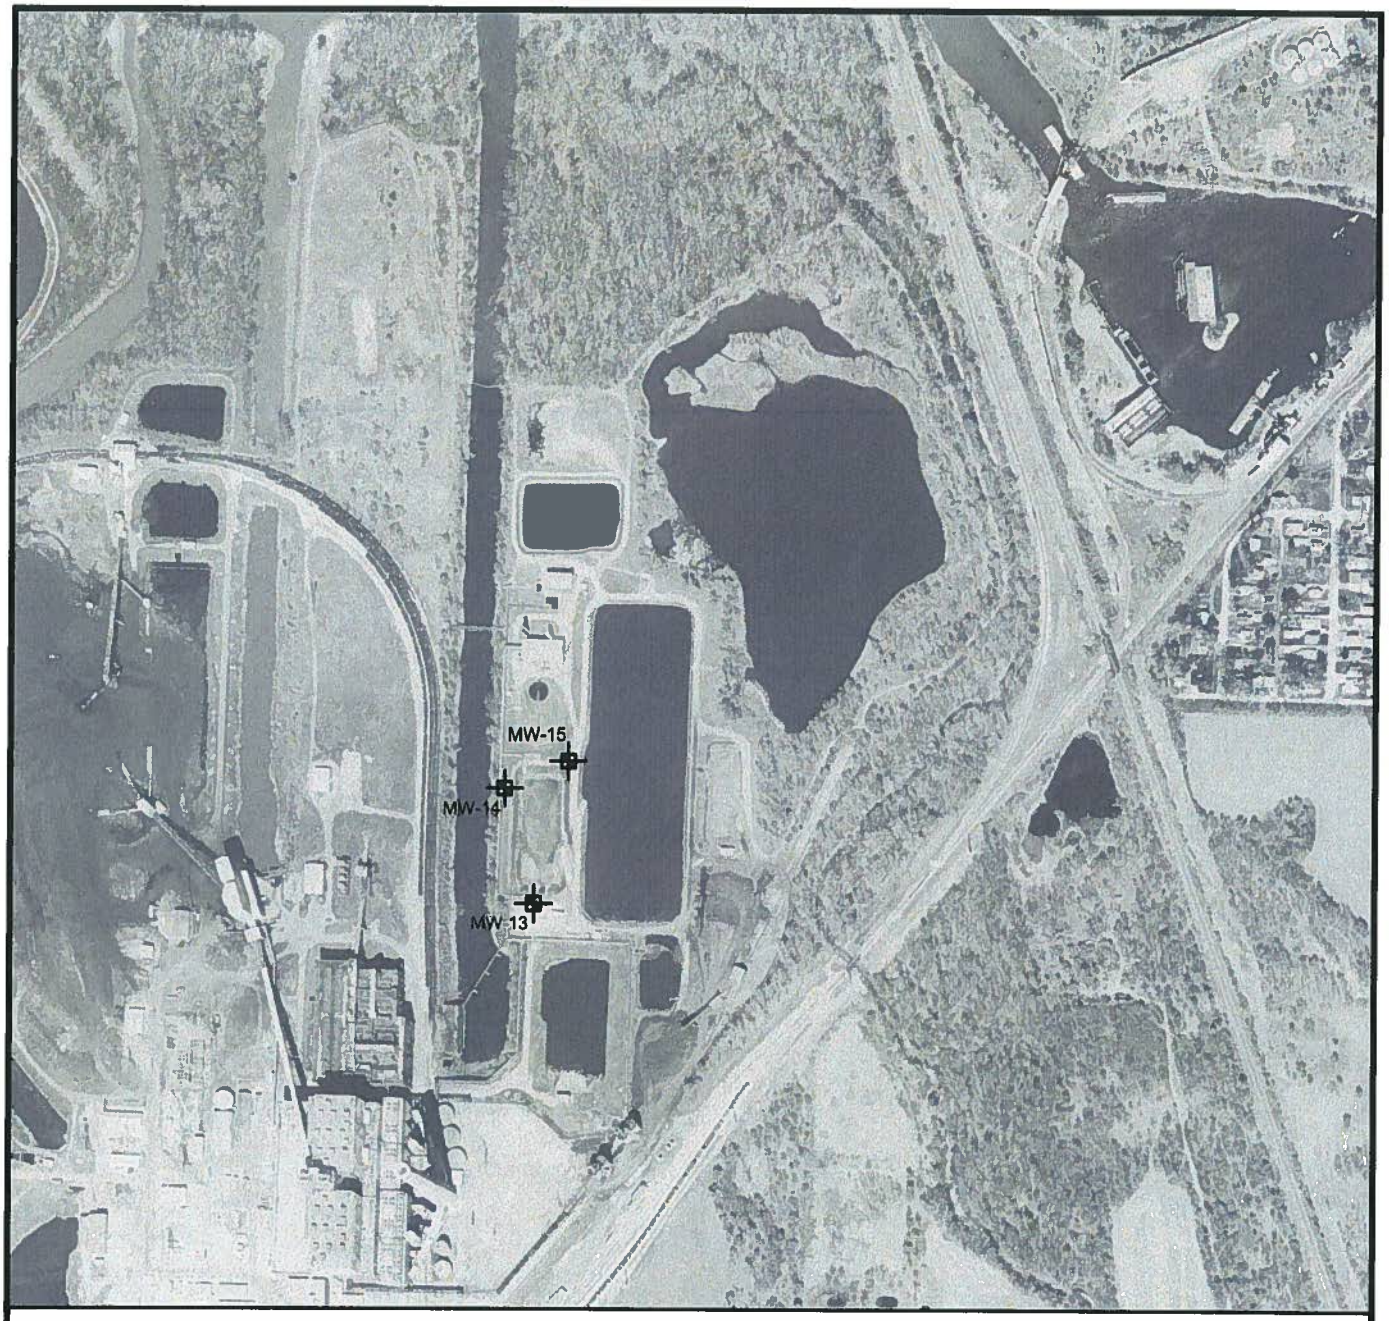
The groundwater samples were analyzed for all of the inorganic compounds listed in 35 Illinois Administrative Code (IAC) 620.410(a) and 620.410(d), including radium 226/228. Analytical results (both current and historical) are summarized in Table 3. Due to a lab analysis error, no results for radium 226 were reported. Samples for radium 226 will be analyzed during the following monitoring events. Laboratory analytical reports provided by PDC Laboratories are provided as Attachment B.

In accordance with Water Pollution Control Permit No. 2009-EB-2748, these three wells will continue to be sampled and reported on a bi-monthly basis for at least one year to establish a statistically valid representation of existing background conditions.

If you have any questions, please contact me at 630-795-7464.

Sincerely,

**PATRICK ENGINEERING INC.**



Richard M. Frendt, P.E

## PROJECT NARRATIVE

Project: 1042531
Pace Project No.: 3045949

**Method:** **EPA 904.0**
**Description:** 904.0 Radium 228
**Client:** PDC Laboratories, Inc.
**Date:** May 23, 2011

**General Information:**
3 samples were analyzed for EPA 904.0. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**
The samples were analyzed within the method required hold times with any exceptions noted below.

**Method Blank:**
All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**
All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Duplicate Sample:**
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

**Additional Comments:**

Workorder Comments:

Insuffiicient sample volume was received to analyze for the radium-226.

This data package has been reviewed for quality and completeness and is approved for release.

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc..

## QUALIFIERS

Project: 1042531
Pace Project No.: 3045949

**DEFINITIONS**

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

PATRICK
ENGINEERING

April 18, 2011

Illinois Environmental Protection Agency
Division of Water Pollution Control
Compliance Assurance Section
1021 North Grand Avenue East
P.O. Box 19276
Springfield, Illinois 62794-9276

Subject: Bi-Monthly Groundwater Monitoring Results – February 2011
Powerton Generating Station – Metal Cleaning Basin
Water Pollution Control Permit No. 2009-EB-2748

Reference: Patrick Project No. 21153.018

To Whom It May Concern:

Patrick Engineering Inc. (Patrick) has prepared this letter report, on behalf of Midwest Generation, LLC, to provide groundwater monitoring results associated with the Powerton Generating Facility located at 13082 East Manito Road in Pekin, Illinois. Groundwater is monitored bi-monthly in the vicinity of the metal cleaning basin at this facility in three monitoring wells in accordance with requirements of Illinois Environmental Protection Agency (Illinois EPA) Water Pollution Control Permit No. 2009-EB-2748.

**MONITORING WELL INSTALLATION**

In accordance with the permit referenced above, three monitoring wells (MW-13, MW-14, and MW-15) have been installed in the vicinity of the metal cleaning basin. The locations of these wells were selected so that at least one of the monitoring wells (MW-15) was installed downgradient of the basin, based upon available data regarding the expected groundwater flow direction. Figure 1 shows the location of the three monitoring wells. Drilling logs and well completion reports have been included as Attachment A.

**GROUNDWATER SAMPLING**

Prior to collecting groundwater samples from the three wells noted above, a number of field measurements were collected from each well location, including groundwater elevation, temperature, conductivity, and pH. Groundwater elevation data is summarized in Table 1. Other field parameter data is provided in Table 2.

On February 15, 2011, groundwater samples were collected from each of the three on-site monitoring wells, either using disposable polyethylene bailers (for MW-13 and MW-14), or by the direct use of a peristaltic pump (for MW-15). Each well was purged until at least three well volumes had been extracted, or until the groundwater was observed to be clear. Groundwater was pumped or baled into a decontaminated, stainless steel container and thereafter transferred to

MWG13-15_4784

sample containers via peristaltic pump. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4° F. The samples were transported to PDC Laboratories, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain sample integrity.

**ANALYTICAL RESULTS**

The groundwater samples were analyzed for all of the inorganic compounds listed in 35 Illinois Administrative Code (IAC) 620.410(a) and 620.410(d), including radium 226/228. Analytical results (both current and historical) are summarized in Table 3. Laboratory analytical reports provided by PDC Laboratories are provided as Attachment B.

In accordance with Water Pollution Control Permit No. 2009-EB-2748, these three wells will continue to be sampled and reported on a bi-monthly basis for at least one year to establish a statistically valid representation of existing background conditions.

If you have any questions, please contact me at 630-795-7464.

Sincerely,

**PATRICK ENGINEERING INC.**

## BORING LOGS / WELL COMPLETION REPORTS

State of Illinois
Department of Public Health

# WATER WELL CONSTRUCTION REPORT

Complete within 30 days of well completion and send to the appropriate Health Department

Print Form

1. Type of Well

a. **Driven Well**: Casing Diameter (in.) _____ Depth (ft.) _____

b. **Bored Well**: Casing Diameter (in.) _____ Buried Slab? _____

c. **Drilled Well**: PVC Casing Formation Packer Set at Depth of (ft.) 40

d. **Drilled Well**: Steel Casing Mechanically Driven _____

e. Hole Diameter (in.) 8.5 to (ft.) 40 ; (in.) ___ to (ft.) ___ ; (in.) ___ to (ft.) ___

f.

| Type of Grout | # of bags | Grout Weight | From (ft.) | To (ft.) | Tremie Depth (ft.) |
|---|---|---|---|---|---|
| Bentonite | 10 | | 3 | 28 | |
| | | | | | |

g. Well Finished within Unconsolidated Materials

h.

| Kind of Gravel/Sand Pack | Grain Size/Supplier # | From (ft.) | To (ft.) |
|---|---|---|---|
| Washed quartz sand | #5 | 28 | 40 |
| | | | |

2. Well Use: Monitoring Well Disinfected? No

3. Date Well Completed: Sep 29, 2010 Driller's Estimated Well Yield (gpm): _____

4. Date Permanent Pump Installed: _____ Set at Depth (ft.): _____

5. Pump Capacity (gpm): _____

6. Pitless Adapter Model and Manufacturer: _____ Attachment to Casing: _____

7. Well Cap Type & Manufacturer: _____

8. Pressure Tank Working Cycle (gals.): _____ Captive Air? _____ 9. Pump System Disinfected: _____

10. Name of Pump Company _____

11. Pump Installer: _____ License # _____

12. _____ Date _____

Licensed Pump Installation Contractor Signature

Illinois Department of Public Health
Division of Environmental Health
525 West Jefferson Street
Springfield, IL 62761

IL 482-0126
Revised 6/09

IMPORTANCE NOTICE: This state agency is requesting disclosure of information that is necessary to accomplish the statutory purpose as outlined under Public Act-0863. Disclosure of this information is Mandatory. This form has been approved by the Forms Management Center.

13. Property Owner: Midwest Generation LLC Well # PEI-MW-13

14. Driller: _____ License # _____

15. Name of Drilling Company : Groff Testing Corporation 16. Permit Number: _____

Date Issued: _____ 17. Date Drilling Started Sep 29, 2010

18. Well Site Address: 13082 E. Manito Road, Pekin, IL 61554

19. Township Name: Cincinnati Land I.D. # _____

20. Subdivision Name: _____ Lot # _____

21. Location: a. County Tazewell b. Site Elevation 470 ft. (above msl)

c. Township: 24N Range: 5W Section: 9

d. SW Quarter of the NE Quarter of the SW Quarter

e. GPS: Lat: Degrees 40 Minutes 32 Seconds 35.6 N

Lon: Degrees 89 Minutes 40 Seconds 39.7 W

Survey use only

22. Casing and Liner Information

| Diameter (in.) | Material, Joint Type | From (ft.) | To (ft.) |
|---|---|---|---|
| 2 | PVC, threaded | 0 | 30 |
| | | | |
| | | | |

23. Is the well screened? Yes If yes

| Diameter (in.) | Length (ft.) | Slot Size (in.) | From (ft.) | To (ft.) |
|---|---|---|---|---|
| 2 | 10 | 0.01 | 30 | 40 |

24. Water from gravel at a depth of (ft.) 34 To (ft.) 40

a. Static water level (ft.) below top of casing 29.5 which is (in.) above ground 3

b. pumping level is (ft.) _____ pumping (gpm) _____ for (hours) _____

25.

| Earth Materials Passed Through | From (ft.) | To (ft.) |
|---|---|---|
| cinders, gravel, clay | 0 | 10 |
| cinders and sand | 10 | 17.5 |
| organic silt | 17.5 | 31.5 |
| silty clay, sand | 31.5 | 34 |
| gravel | 34 | 40 |
| | | |

RE: Project: 11022668
Pace Project No.: 3041909

Dear Ms. Kaufmann:
Enclosed are the analytical results for sample(s) received by the laboratory on February 21, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Carin A. Ferris

## PROJECT NARRATIVE

Project: 11022668
Pace Project No.: 3041909

**Method:** EPA 903.1
**Description:** 903.1 Radium 226
**Client:** PDC Laboratories, Inc.
**Date:** March 09, 2011

**General Information:**
6 samples were analyzed for EPA 903.1. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**
The samples were analyzed within the method required hold times with any exceptions noted below.

**Method Blank:**
All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**
All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Duplicate Sample:**
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

**Additional Comments:**

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc..

## PROJECT NARRATIVE

Project: 11022668
Pace Project No.: 3041909

**Method:** EPA 904.0
**Description:** 904.0 Radium 228
**Client:** PDC Laboratories, Inc.
**Date:** March 09, 2011

**General Information:**
6 samples were analyzed for EPA 904.0. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**
The samples were analyzed within the method required hold times with any exceptions noted below.

**Method Blank:**
All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**
All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Duplicate Sample:**
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

**Additional Comments:**

This data package has been reviewed for quality and completeness and is approved for release.

## QUALIFIERS

Project: 11022668
Pace Project No.: 3041909

**DEFINITIONS**

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

re: Report of Sampling the Limestone Runoff Basin,
Dredge Spoil Area and Coal Combustion Waste

Dear Mr. Reed:

Andrews Environmental Engineering, Inc. (AEEI) is pleased to provide Midwest Generation with a draft Sampling Plan Report for the Limestone Runoff Basin, the Dredge Spoil Area and the Coal Combustion Waste currently generated at the Midwest Generation, Powerton Generating Station.

Please review the enclosed report and contact me if you have any questions or comments. Thank you.

Sincerely,

Sean C. Chisek

APPENDIX C: ANALYTICAL RESULTS

MWG13-15_11304

## 1.0 Introduction

Midwest Generation, LLC (Midwest Generation) contracted with Andrews Environmental Engineering, Inc. (AEEI) to provide a sampling plan for the Limestone Runoff Basin (the Basin), the Dredge Spoils Area and Coal Combustion Waste (CCW) currently generated at the Powerton Generating Station.

The Midwest Generation, Powerton Generating Station is a coal-fired electric power plant. The plant is located at 13082 East Manito Road in Pekin, Tazewell County, Illinois. The facility occupies approximately 568 acres, with Powerton Lake covering approximately 1,426 additional acres.

The original plant was built in 1928 and the two active generating units, Units 5 and 6, began operations in 1972 and 1975, respectively. The plant has a capacity of 1,538 MW, which is enough electricity to meet the needs of approximately 1.8 million households.

This document contains a discussion of the sampling performed in the Limestone Runoff Basin (the Basin), the Dredge Spoil Area, and CCW currently generated at the Station. AEEI personnel collected the samples and the samples were analyzed by Severn Trent Laboratories, Inc. (STL) and SET Environmental, Inc. (SET).

## 2.0 Limestone Runoff Basin

Prior to obtaining samples from the Basin, the locations of test pits were surveyed and marked with stakes. Test pits were then excavated in 9 locations. Figure 1 indicates the locations test pits were excavated. Samples were analyzed for total metals using test method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water, also known as the Neutral Leach method. Samples were also analyzed for disposal parameters in the event the material is disposed of at a landfill.

### 2.1 Basin Survey

Prior to excavating test pits and obtaining samples, AEEI staff surveyed the Basin. The Basin was surveyed on April 9, 2004. The purpose of the survey was to stake the locations where test pits were to be dug (i.e., grid off the Basin), and to obtain topographic information of the Basin. Section 3.2 of the February 2004 sampling plan indicated the Basin would be surveyed using Global Positioning System (GPS) survey equipment. During the Basin survey, a Pentax total station, and not GPS survey equipment, was utilized. A project specific coordinate system was established. The Basin coordinate system has not been tied into an established benchmark or coordinate system. If desired by Midwest Generation, the survey can be tied into an established benchmark or coordinate system. Figure 1 shows the locations staked during the April 9, 2004 survey.

### 2.2 Test Pit Excavation and Sampling

Test pits were excavated, and samples obtained on Thursday, May 6, 2004. During test pit excavation, the weather was sunny, with temperatures in the mid to upper 80s

MWG13-15_11305

Fahrenheit. The following personnel were present during test pit excavation and sampling:

Sean Chisek, Andrews Environmental Engineering, Inc.
Bob Howes, Iron Hustler Excavating, Inc.
Michael Reed, Midwest Generation, LLC, Powerton
Maria Race, Midwest Generation, LLC, Chicago

Test pits were excavated from locations TP-03, TP-12, TP-15, TP-16, TP-19, TP-23, TP-25, TP-27 and TP-29. Samples of material excavated from the test pits were obtained from locations TP-03, TP-12, TP-15, TP-16, TP-19, TP-23, TP-27 and TP-29. Samples of material that appeared to be ash from a fire (FS-01 and FS-02) were obtained, as well as a sample of what appeared to be set up and compressed fly ash (SFA-1).

The following is a discussion of the test pit excavation and sampling results. Figure 2 is a drawing highlighting the results of the test pit excavation and sampling. Photographs taken during test pit excavation and sampling are contained in Appendix A. A summary of the sampling results is contained in Appendix B, Tables 1 and 2, and the full analytical results are contained in Appendix C.

TP-03

| | |
|---|---|
| **Begin Excavation** | 1440 |
| **End Excavation** | 1506 |
| **Total Depth of Excavation (feet)** | 6.8 |
| **Sample Obtained (Yes/No)** | Yes |
| **Approx. Depth of Sample (feet)** | 2.9 |
| **Time Sampled** | 1450 |
| **Free Liquids Observed in Test Pit (Yes/No)** | No |
| **Non-CCW Observed in Test Pit (Yes/No)** | No |

The surficial material at test pit TP-03 was flakey, crusty and set up. The surficial material appeared to be fly ash. Material over 3 feet deep was dark brown/black and appeared to be bottom ash. Material excavated was loose and sandy in texture. Some of the light brown fly ash was mixed with bottom ash. As the excavation proceeded, the material was dark brown/black and was very firm and set up. This material was difficult to excavate. When brought to the surface, the material was moist.

Sampling results indicate the CCW in TP-03 exceeds the Class 1 Groundwater Quality Standard for selenium when tested using method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water. Therefore, the CCW in the grid section containing test pit TP-03 could not be used as CCB in accordance with Section 3.135 of the Illinois Environmental Protection Act.

TP-12

| | |
|---|---|
| **Begin Excavation** | 0845 |
| **End Excavation** | 0855 |

MWG13-15_11306

| | |
|---|---|
| **Total Depth of Excavation (feet)** | 3.0 |
| **Sample Obtained (Yes/No)** | Yes |
| **Approx. Depth of Sample (feet)** | 3.0 |
| **Time Sampled** | 0905 |
| **Free Liquids Observed in Test Pit (Yes/No)** | No |
| **Non-CCW Observed in Test Pit (Yes/No)** | No |

The surficial material, consisting of approximately the top 6 inches, at TP-12 was loose and light brown in color, and appeared to by fly ash. Approximately 6 inches below grade, the material was dark brown/black in color and was set up and firm. The dark brown/black material appeared to be a mixture of fly ash and bottom ash. Excavation of this test pit was not easy as the material was set up and very firm. The top 6 inches was brown, loose material. From 6 inches to 1 foot, the material was dark brown/black. Below 1 foot, the material was brown in color. The material sampled had a loose/sandy texture with some gravel size pieces. Larger flakes of material would break under hand pressure while smaller pieces would not. The materials in the test pit appeared to be fly ash and bottom ash. Non-CCW was not observed in test pit TP-12.

Sampling results indicate the CCW in TP-12 does not exceed the Class 1 Groundwater Quality Standards for metals when tested using method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water. In addition, non-CCW was not encountered in test pit TP-12. Therefore, the material in the grid section containing test pit TP-12 could be used as CCB in accordance with Section 3.135 of the Illinois Environmental Protection Act.

TP-15

| | |
|---|---|
| **Begin Excavation** | 1106 |
| **End Excavation** | |
| **Total Depth of Excavation (feet)** | 7.7 |
| **Sample Obtained (Yes/No)** | Yes |
| **Approx. Depth of Sample (feet)** | 5.4 |
| **Time Sampled** | 1117 |
| **Free Liquids Observed in Test Pit (Yes/No)** | No |
| **Non-CCW Observed in Test Pit (Yes/No)** | No |

The surficial material was light brown and loose, and appeared to be fly ash. At approximately 8 inches in depth, the material was more set up and had a light brown color with a sand and gravel consistency. Some of the excavated material, when initially excavated, had a crystalline appearance to it. After this material was out of the test pit for some time, the crystalline appearance gave way to a white color. It is unknown what the material with the crystalline appearance is, though it is believed to be set up and compressed fly ash. This material is similar to the material observed in test pits TP-25 and TP-27. As the material sat in the ground, it was set up and very firm. As it was excavated, the material had a gravel consistency. Moist, light brown, clayey material was observed near the bottom of the test pit.

MWG13-15_11307

Two samples were obtained from test pit TP-15. One sample of CCW (TP-15) was obtained and one sample of the material with the crystalline appearance (SFA-1) was obtained. Identification testing of sample SFA-1 indicated it consists of clay, calcium sulfate, calcium phosphate, iron oxide, alumina and silica. Analytical testing results indicate both samples obtained from test pit TP-15 exceed the Class 1 Groundwater Quality Standard for chromium and selenium when tested using method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water. Therefore, the CCW in the grid section containing test pit TP-15 could not be used as CCB in accordance with Section 3.135 of the Illinois Environmental Protection Act.

TP-16

| | |
|---|---|
| **Begin Excavation** | 1247 |
| **End Excavation** | |
| **Total Depth of Excavation (feet)** | 9 |
| **Sample Obtained (Yes/No)** | Yes |
| **Approx. Depth of Sample (feet)** | 6.6 |
| **Time Sampled** | 1257 |
| **Free Liquids Observed in Test Pit (Yes/No)** | No |
| **Non-CCW Observed in Test Pit (Yes/No)** | Yes |

The surficial material in test pit TP-16 was light brown and loose, and appeared to be fly ash. As the excavation proceeded, the material was more set up and firm. Bottom ash was observed deep in the test pit. Excavation stopped at 9 feet for stability and safety reasons, due to the backhoe being so close to TP-15. A fabric hose was observed at approximately 2 feet in depth. Small rags were observed in the test pit. A small, crushed, blue, metal container was excavated. This container appeared to be 1-3 gallons in size. It is unknown what this container held.

Sampling results indicate the CCW in TP-16 does not exceed the Class 1 Groundwater Quality Standards for metals when tested using method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water. Small amounts of non-CCW was encountered in test pit TP-16. If the CCW in the grid section containing test pit TP-16 is to be used as CCB, the non-CCW must be separated from the CCB.

TP-19

| | |
|---|---|
| **Begin Excavation** | 1522 |
| **End Excavation** | |
| **Total Depth of Excavation (feet)** | 2.7 |
| **Sample Obtained (Yes/No)** | Yes |
| **Approx. Depth of Sample (feet)** | 2.7 |
| **Time Sampled** | 1531 |
| **Free Liquids Observed in Test Pit (Yes/No)** | No |
| **Non-CCW Observed in Test Pit (Yes/No)** | No |

MWG13-15_11308

The surface material at test pit TP-19 was vegetated. The surficial material was black and sparkly and appeared to be bottom ash. Approximately 8 inches below the surface, light brown material was encountered. This light brown material appeared to be sand. The Hypalon liner was broken at this location. The Hypalon liner was approximately 2.7 feet below grade. Non-CCW (excluding the sand), was not observed in test pit TP-19.

Sampling results indicate the CCW in TP-19 does not exceed the Class 1 Groundwater Quality Standards for metals when tested using method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water. In addition, non-CCW was not observed in test pit TP-19. Therefore, the material in TP-19 could be used as CCB in accordance with Section 3.135 of the Illinois Environmental Protection Act.

TP-23

| | |
|---|---|
| **Begin Excavation** | 0822 |
| **End Excavation** | |
| **Total Depth of Excavation (feet)** | 4.8 |
| **Sample Obtained (Yes/No)** | Yes |
| **Approx. Depth of Sample (feet)** | 4.8 |
| **Time Sampled** | 0838 |
| **Free Liquids Observed in Test Pit (Yes/No)** | Yes |
| **Non-CCW Observed in Test Pit (Yes/No)** | No |

Surficial material at TP-23 was orange/rusty in color and somewhat loose. The surficial material appeared to be fly ash. As excavation proceeded, the material was set up and firm. Material towards the bottom of the test pit was dark brown and appeared to consist of fly ash and bottom ash. Free liquid was observed in the bottom of the test pit and the sampled material was moist. Non-CCW was not observed in test pit TP-23.

Sampling results indicate the CCW in TP-23 does not exceed the Class 1 Groundwater Quality Standards for metals when tested using method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water. In addition, non-CCW was not observed in test pit TP-23. Therefore, the material in the grid section containing test pit TP-23 could be used as CCB in accordance with Section 3.135 of the Illinois Environmental Protection Act.

TP-25

| | |
|---|---|
| **Begin Excavation** | 0917 |
| **End Excavation** | 1031 |
| **Total Depth of Excavation (feet)** | 9.6 |
| **Sample Obtained (Yes/No)** | No |
| **Approx. Depth of Sample (feet)** | N.A. |
| **Time Sampled** | N.A. |
| **Free Liquids Observed in Test Pit (Yes/No)** | No |
| **Non-CCW Observed in Test Pit (Yes/No)** | Yes |

MWG13-15_11309

Surficial material (approximately the top 8 inches) was light brown and very loose and appeared to be fly ash. Below 8 inches, the material was set up and firm. When scraped, the material had a sandy texture with some gravel size and larger pieces. The material was difficult to excavate due to its firmness. The western and eastern slopes of the test pit were not very stable, with the surficial material periodically falling into the test pit. On the test pit walls, approximately 2.5 feet in depth, dark brown material was observed. Deep material was very hard and set up, making excavation difficult. This set up material had a sandy consistency with scraped with the hand but appeared to be very firm while in place, as judged by the difficulty it was to excavate. Some of the excavated material, when initially excavated, had a crystalline appearance to it. After this material was out of the test pit for some time, the crystalline appearance gave way to a white color. It is unknown what the material with the crystalline appearance is, though it is believed to be set up and compressed fly ash. This material is similar to the crystalline appearing material in test pits TP-15 and TP-27. Material in this test pit appeared to be set up fly ash. The only material in the test pit that appeared not to be CCW was one metal wire. The one piece of wire was observed at approximately 3 feet in depth. The wire was dark brown/black in color. The one piece of wire was the only non-CCW observed in the test pit. Material deep in the pit appeared light brown and had the color of clay, this material was very brittle.

No sample was obtained from test pit TP-25.

TP-27

| | |
|---|---|
| **Begin Excavation** | 1037 |
| **End Excavation** | |
| **Total Depth of Excavation (feet)** | 9.0 |
| **Sample Obtained (Yes/No)** | Yes |
| **Approx. Depth of Sample (feet)** | 7.2 |
| **Time Sampled** | 1055 |
| **Free Liquids Observed in Test Pit (Yes/No)** | No |
| **Non-CCW Observed in Test Pit (Yes/No)** | Yes |

The surficial material in test pit TP-27 was light brown and loose, and appeared to be fly ash. Below the loose surficial material, the material was dark brown/black and appeared to be weathered fly ash and bottom ash. Some of the excavated material, when initially excavated, had a crystalline appearance to it. After this material was out of the test pit for some time, the crystalline appearance gave way to a white color. It is unknown what the material with the crystalline appearance is, though it is believed to be set up and compressed fly ash. This material is similar to the crystalline appearing material in test pits TP-15 and TP-25. Bottom ash was observed at the sampled depth, and the sample consisted of bottom ash and fly ash. At the bottom of the test pit, clay was observed. Pieces of red wire were observed in the test pit and one piece of steel ribbon was observed at approximately 1 foot in depth.

Sampling results indicate the CCW in TP-27 does not exceed the Class 1 Groundwater Quality Standards for metals when tested using method ASTM

MWG13-15_11310

D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water. Small amounts of non-CCW was encountered in test pit TP-27. If the material in the grid section containing test pit TP-27 is to be used as CCB, the non-CCW must be separated from the CCB.

TP-29

| | |
|---|---|
| **Begin Excavation** | 1337 |
| **End Excavation** | |
| **Total Depth of Excavation (feet)** | 12.2 |
| **Sample Obtained (Yes/No)** | Yes |
| **Approx. Depth of Sample (feet)** | 8 |
| **Time Sampled** | 1353 |
| **Free Liquids Observed in Test Pit (Yes/No)** | No |
| **Non-CCW Observed in Test Pit (Yes/No)** | Yes |

Material that appeared to be ash from a fire was present at the surface near test pit TP-29. The sampling of this material is discussed on Page 8, Fire Spoils. Material under the fire spoils is light brown and had a sandy texture. A rubber coil was excavated from test pit TP-29. Excavated material was moist with a sandy texture. A plastic soda bottle was excavated from test pit TP-29. Material close to the toe of the slope (deeper material as measured from the start of the test pit) was dark brown to black in color and appeared to by bottom ash. At depths over 8 feet, bottom ash was the most prevalent material. The bottom ash material was moist. Materials in test pit TP-29 that did not appear to be CCW include the fire spoils, the rubber coil and the soda bottle.

Sampling results indicate the CCW in TP-29 does not exceed the Class 1 Groundwater Quality Standards for metals when tested using method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water. The non-CCW encountered at test pit TP-29 includes the material believed to be ash from a fire, a rubber coil and a plastic soda bottle. If the ash material, rubber coil and plastic soda bottle are removed from the area of test pit TP-29, the CCW in test pit TP-29 could be used as CCB.

Fire Spoils

Material that appeared to be ash from a fire, or fire spoils, was observed near test pit TP-29. At the time of test pit excavation, it was not known what the material was, though it appeared to be ash material from a fire. Two samples of the fire spoils material (FS-01 and FS-02) were obtained. Both samples were analyzed by STL and one sample will be sent to SET for identification testing. The fire spoils was present as a surficial material and was not present beyond a few inches in depth.

The identification testing indicated the material believed to be fire spoils consisted of alumina, silica, iron oxide, calcium carbonate and calcium sulfate. The analytical testing indicated the material believed to be fire spoils contained selenium in concentrations exceeding the Tiered Approach to Corrective Action (TACO), Tier 1 Residential and Industrial/Commercial, clean up objectives

MWG13-15_11311

presented in 35 Ill. Adm. Code 742, Appendix A, Tables A and B, respectively. It should be noted the material believed to be fire spoils was not analyzed for all the TACO inorganics, but only the waste disposal parameters.

## 2.3 Discussion of Results

This section discusses possible options for managing the Basin.

### *2.3.1 Disposal of Material in the Basin*

This option includes excavating all material in the basin and disposing of the material and Hypalon® liner at a solid waste landfill. Based on information obtained during the survey of the Basin and the location of the Hypalon® liner in test pit TP-19, there is approximately 8,250 cubic yards of material in the Basin.

Free liquid was observed in test pit TP-23. Materials with free liquids, that fail the paint filter test (SW-846, Method 9095A), must have the free liquids removed prior to disposal at a landfill. The free liquids could be removed by drying, or mixing the material with free liquids with dry material.

The advantage of this option is future environmental liability associated with the Basin would be eliminated as the material would no longer be on-site at the Station.

The disadvantage of this option is the cost associated with disposing of 8,250 cubic yards of material.

Based on previous discussions with Midwest Generation personnel, the Tazewell Recycling and Disposal Facility is the landfill used by the Station. If this option is pursued, it is recommended the Station contact the Tazewell Recycling and Disposal Facility to discuss whether or not the landfill would require additional waste characterization sampling prior to disposal. It is believed the sampling already performed is adequate to characterize the material for disposal purposes. If the material is disposed of, it is believed the material could be used as an alternate daily cover material for the landfill. If the landfill can use the material as alternate daily cover, the disposal cost may be reduced.

If material in the Basin is disposed of, the Basin should be filled with soil and vegetated. The Basin could also be filled with the dredge spoils from the Dredge Spoil Area, discussed in Section 3.0. In any case, once the Basin has been emptied, it should be backfilled to discourage future dumping of waste material.

### *2.3.2 Enroll the Basin in the Illinois EPA's Site Remediation Program*

This option involves enrolling the Basin in Illinois EPA's Site Remediation Program (SRP), with the goal of obtaining a No Further Remediation (NFR) letter for the Basin. This option would involve using the TACO regulations to demonstrate the material in the Basin does not pose a threat to human health and the environment.

Typically, clean ups performed under the TACO regulations require the source of contamination (for example, a leaking underground storage tank) be removed prior to

MWG13-15_11312

receiving an NFR letter. In this case, the source of contamination is the waste material in the Basin. Some of the material in the test pits had constituents present in concentrations exceeding the TACO, Tier 1 Residential and Industrial/Commercial clean up objectives presented in 35 Ill. Adm. Code 742, Appendix A, Tables A and B (it should be noted for metals, the Tier 1 Residential and Industrial/Commercial clean up objectives are the same). Appendix B, Table 3 contains a summary of the TCLP analytical results compared to the TACO, Tier 1 Residential clean up objectives.

Based on the TCLP testing of material in the Basin, material from the test pits below had concentrations exceeding the TACO, Tier 1 Residential and Industrial/Commercial clean up objectives.

| Test Pit | Constituent |
|---|---|
| TP-03 | Selenium |
| TP-12 | Selenium |
| TP-15 | Chromium, Selenium |
| TP-16 | Selenium |
| TP-19 | Cadmium |
| TP-29 | Selenium |
| SFA-1 | Chromium, Selenium |
| FS-01 | Selenium |
| FS-02 | Selenium |

It is not known if the Illinois EPA would issue a NFR letter to a site in which the source of contamination remains in place. In this case, the source of contamination would include the coal combustion waste material. Based on discussion with Greg Dunn of the Illinois EPA's SRP, it is possible to obtain an NFR letter while leaving waste in place. Mr. Dunn stated some sites have received NFR letters while leaving clean construction and demolition debris in place. If leaving the CCW in place is the desired option, Mr. Dunn suggested obtaining specific information about the waste (i.e., analytical results) and then meeting with the Illinois EPA to discuss the possibility of leaving the waste in place. If this option is pursued, it is recommended a meeting be scheduled with the Illinois EPA to discuss the possibility of leaving the material in place.

If an NFR letter from the SRP is possible, the Basin would need to be covered with an engineered barrier. Possible cover configuration include 3 feet of clay overlain with 6 inches of vegetative material, or a geomembrane overlain by 2 feet of protective soil.

The advantage of enrolling the Basin in the SRP would be that an NFR letter could be obtained for the Basin, thus reducing the environmental liability associated with the Basin.

The disadvantage of enrolling the Basin in the SRP is that it is unknown if Illinois EPA would consider issuing an NFR letter to the Basin as there would be waste remaining in place. If the Illinois EPA would not be willing to consider the Basin in the SRP program, then an alternative method of managing the material in the Basin would need to be used.

MWG13-15_11313

*2.3.3 Use the Material as Coal Combustion By-Product*

Section 3.135 of the Illinois Environmental Protection Act contains the definition of Coal Combustion By-Product (CCB), and documents how CCB can be used. One possible use of CCB is in concrete blocks or other precast/prestressed concrete components. If the CCB is adequately ground, it may be possible to use the CCB as a raw material in the production of concrete products. Grinding the material would require a permit from the Illinois EPA, Bureau of Air, for the particulate emissions from the grinding unit.

CCB can also be used as structural fill, pavement base, pipe bedding, or foundation backfill, if the conditions in Section 3.135(10) of the Illinois Environmental Protection Act are met. Section 3.135(10)(c) of the Illinois Environmental Protection Act requires the CCB meet the Class 1 Groundwater Quality Standards for metals when tested using method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water, also known as the Neutral Leach method.

Materials within test pits TP-03 and TP-15 did not meet the Class 1 Groundwater Quality Standards for metals. Materials from these test pits can not be used as CCB in accordance with Section 3.135(7) through (10) of the Illinois Environmental Protection Act. If material from the Basin is to be used as CCB in accordance with Section 3.135(7) through (10) of the Illinois Environmental Protection Act, the material in the grid sections containing test pits TP-03 and TP-15 would need to be disposed of at a permitted landfill.

Material that was not CCW was present in test pits TP-25, TP-16 and TP-29. If material in these test pits are to be used as CCB, the non-CCW must be removed from these test pits.

The advantage of using the material as CCB is the reduced cost associated with the management of the Basin.

The disadvantage of using the material as CCB, and leaving the material in place is material in the grid sections containing test pits TP-03 and TP-15 would require disposal. Another disadvantage is the non-CCW observed in test pits TP-16, TP-25 and TP-29 would also require disposal. It is also not known if there is non-CCW in other grid sections.

## 3.0 Dredge Spoil Area

### 3.1 Background

The primary goal sampling the dredge spoil material was to verify the cadmium content of the dredged material. Previous analysis of the dredged material did not use a reporting limit for cadmium below the TACO Tier 1, Residential, Class 1 Groundwater standard. The dredge spoil area was sampled on Friday, May 7, 2004. The weather was cloudy with temperatures in the low to mid 80s Fahrenheit. Two samples of the dredge spoils (DS-01N and DS-02S) were obtained. Figure 3 contains a drawing indicating the approximate location samples were obtained. Appendix A contains photographs of the locations dredge spoil samples were obtained.

MWG13-15_11314

Samples were excavated with a hand auger. The hand auger was decontaminated with deionized water and alconox between sampling points.

### 3.2 Analytical Results

The table below summarizes the sampling of the dredge spoil area.

| Sample ID | DS-01N | DS-02S |
|---|---|---|
| Begin Excavation | 0921 | 1020 |
| Total Depth of Excavation | 3'-8" | 4'-1" |
| Approx. Depth of Sample | 3'-8" | 4'-1" |
| Time Sampled | 0946 | 1047 |

The dredge spoil samples were analyzed for the Toxicity Characteristic Leaching Procedure (TCLP) metals. Analytical results were compared to the TACO, Tier 1 Residential clean up objectives presented in 35 Ill. Adm. Code 742, Appendix B, Table A. A summary of the analytical results from the dredge spoil sampling is contained in Appendix B, Table 3, and the full analytical results for the dredged material are presented in Appendix C. The analytical results indicate the metals analyzed were not present in concentrations exceeding the TACO Tier 1 Residential, Class 1 Groundwater, clean up objectives.

### 3.3 Discussion of Results

The Illinois EPA typically regulates dredged material as a waste. However, as the dredged material did not contain metals above the TACO Tier 1 Residential, Class 1 Groundwater, clean up objectives, it is believed the dredged material could be used as fill, or in other grading applications. Prior to using the dredge material as fill, or in grading applications, Midwest Generation should obtain written authorization from the Illinois EPA to document the dredged material is not considered a waste.

## 4.0 Coal Combustion Waste

### 4.1 Background

The goal of sampling the CCW currently generated at the Station, is to determine if the CCW could be used as CCB. Three samples of CCW were obtained on Friday, May 7, 2004. Two samples of fly ash were obtained, one from Boiler 51 (51-BLR) and one from Boiler 52 (520BLR). In addition to the samples of fly ash, one sample of bottom ash (BA-01), was obtained. Samples were analyzed for total metals using test method ASTM D3987-85, Standard Test Method for Shake Extraction of Solid Waste With Water, also known as the Neutral Leach method.

### 4.2 Analytical Results

A summary of the analytical results from the CCW sampling is contained in Appendix B, Table 4, and the full analytical results are contained in Appendix C.

MWG13-15_11315

The analytical results indicate samples 51-BLR and 52-BLR had concentrations of chromium and selenium exceeding the Class 1 Groundwater Quality Standard.

The analytical results indicate the bottom ash did not contain metals in concentrations exceeding the Class 1 Groundwater Quality Standard.

### 4.3 Discussion of Results

Because the samples of fly ash had concentrations of chromium and selenium exceeding the Class 1 Groundwater Quality Standard, at the present time, fly ash from Boilers 51 and 52 can not be used as CCB in accordance with Section 3.135 of the Illinois Environmental Protection Act.

Because the sample of bottom ash did not contain metals at a concentration above the Class 1 Groundwater Quality Standard, the bottom ash could be used as CCB in accordance with Section 3.135 of the Illinois Environmental Protection Act.

Customer: Midwest Generation

# Unknown Identification Report

| Sample Number | Approx. Qty. | Chemical Name |
|---|---|---|
| SFA-1 | 8 oz. | Clay / Calcium sulfate /Calcium phosphate / Iron oxide / Alumina / Silica / traces: Calcium carbonate / Calcium hydroxide / Sodium phosphate |

Characteristics

Physical Appearance : brown solid ( chunks )

| | | | |
|---|---|---|---|
| Solubility in water | : slightly | Reducer | : no |
| Approximate pH | : 11.7 | Flammability potential | : no |
| Oxidizer | : no | Reactive | : no |
| Polymerizable | : no | Unstable | : no |

| Sample Number | Approx. Qty. | Chemical Name |
|---|---|---|
| SF-02 | 8 oz. | Alumina / Silica / Carbon / Iron oxide / Calcium carbonate / Calcium sulfate / residual: Calcium hydroxide |

Characteristics

Physical Appearance : black solid

| | | | |
|---|---|---|---|
| Solubility in water | : slightly | Reducer | : no |
| Approximate pH | : 10.9 | Flammability potential | : no |
| Oxidizer | : no | Reactive | : no |
| Polymerizable | : no | Unstable | : no |

- END OF REPORT -

Note: Due to the heterogeneous nature of the samples, other components may be present at trace levels.

RE: Powerton Sampling
Revised Data Packages
Job# 226535 & 226578

Dear Mr. Chisek:

The enclosed revised analytical reports are for the project and job numbers listed above. Per your request, selenium was added to the neutral leach samples. If you have any questions, please contact me at 708-534-5200.

Sincerely,

Severn Trent Laboratories

Linda S. Mackley
Project Manager

Severn Trent Laboratories Chicago
METALS CASE NARRATIVE

Client: Midwest Generation EME, LLC
Project ID: Powerton Sampling
STL Job #: 226578

Date Rec'd: 05/10/04

1. This narrative covers the Metals analysis of Samples in the above STL Job.

   Method Refs: USEPA, SW-846

2. All analyses were performed within the required holding times.

3. All Initial and Continuing Calibration Verification (ICV/CCV's) were within control limits.

4. All Initial and Continuing Calibration Blanks (ICB/CCB's) within control limits.

5. All Preparation/Method Blanks were below the Reporting Limits.

6. Laboratory Control Sample (LCS) recoveries were within control limits.

7. Matrix QC was performed on Sample 2.

   All Serial dilution analysis were within control limits.

   Matrix spike recoveries were within the 50-150% TCLP control limits (control limits are not applicable when the sample concentration exceeds the Spike concentration by a factor of 4 or more) except for Ba. Method of Standard addition was performed for Ba and the result was unchanged.

   Duplicate results were within the 20% RPD control limits for sample concentration greater than 5X the RL or +\- the RL for sample concentration less than 5X the RL.

Jodi L. Wojcik

REPORT COMMENTS

1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 100201
5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviations (any number of which may appear in the report)

Inorganic Qualifiers (Q-Column)

| | |
|---|---|
| U | Analyte was not detected at or above the stated limit. |
| < | Not detected at or above the reporting limit. |
| J | Result is less than the RL, but greater than or equal to the method detection limit. |
| B | Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL. |
| S | Result was determined by the Method of Standard Additions. |
| F | AFCEE: Result is less than the RL, but greater than or equal to the method detection limit. |

Inorganic Flags (Flag Column)

| | |
|---|---|
| ^ | ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits. |
| * | LCS, LCD, MD: Batch QC exceeds the upper or lower control limits. |
| + | MSA correlation coefficient is less than 0.995. |
| 4 | MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable. |
| E | SD: Serial dilution exceeds the control limits. |
| H | MB, EB1, EB2, EB3: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit. |
| N | MS, MSD: Spike recovery exceeds the upper or lower control limits. |
| W | AS(GFAA) Post-digestion spike was outside 85-115% control limits. |

Organic Qualifiers (Q - Column)

| | |
|---|---|
| U | Analyte was not detected at or above the stated limit. |
| ND | Compound not detected. |
| J | Result is an estimated value below the reporting limit or a tentatively identified compound (TIC). |
| Q | Result was qualitatively confirmed, but not quantified. |
| C | Pesticide identification was confirmed by GC/MS. |
| Y | The chromatographic response resembles a typical fuel pattern. |
| Z | The chromatographic response does not resemble a typical fuel pattern. |
| E | Result exceeded calibration range, secondary dilution required. |
| F | AFCEE:Result is an estimated value below the reporting limit or a tentatively identified compound (TIC) |

Organic Flags (Flags Column)

| | |
|---|---|
| B | MB: Batch QC is greater than reporting limit. |
| * | LCS, LCD, ELC, ELD, CV, MS, MSD, Surrogate: Batch QC exceeds the upper or lower control limits. |
| ^ | EB1, EB2, EB3, MLE: Batch QC is greater than reporting Limit |
| A | Concentration exceeds the instrument calibration range |
| a | Concentration is below the method Reporting Limit (RL) |
| B | Compound was found in the blank and sample. |
| D | Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D. |
| H | Alternate peak selection upon analytical review |
| I | Indicates the presence of an interfence, recovery is not calculated. |
| M | Manually integrated compound. |
| P | The lower of the two values is reported when the % difference between the results of two GC columns is |

MWG13-15_11371

greater than 25%.

Abbreviations

| | |
|---|---|
| AS | Post Digestion Spike (GFAA Samples - See Note 1 below) |

| MDPH | pH Sample Duplicate |
| MDFP | Flashpoint Sample Duplicate |
| LCFP | Flashpoint LCS |
| G1 | Gelex Check Standard Range 0-1 |
| G2 | Gelex Check Standard Range 1-10 |
| G3 | Gelex Check Standard Range 10-100 |
| G4 | Gelex Check Standard Range 100-1000 |

Note 1: The Post Spike Designation on Batch QC for GFAA is designated with an "S" added to the current abbreviation used. EX. LCS S=LCS Post Spike (GFAA); MSS=MS Post Spike (GFAA)

Note 2: The MD calculates an absolute difference (A) when the sample concentration is less than 5 times the reporting limit. The control limit is represented as +/- the RL.

Severn Trent Laboratories Chicago
METALS CASE NARRATIVE

Client: Midwest Generation EME, LLC
Project ID: Powerton Sampling
STL Job #: 226535

Date Rec'd: 05/07/04

1. This narrative covers the Metals analysis of Samples in the above STL Job.

   Method Refs: USEPA, SW-846

2. All analyses were performed within the required holding times.

3. All Initial and Continuing Calibration Verification (ICV/CCV's) were within control limits.

4. All Initial and Continuing Calibration Blanks (ICB/CCB's) within control limits.

5. All Preparation/Method Blanks were below the Reporting Limits.

6. Laboratory Control Sample (LCS) recoveries were within control limits.

7. Matrix QC was performed on Samples 1 (TCLP) and Samples 3, 4 (TCLP/Neutral Leach).

   All Serial dilution analysis were within control limits.

   Matrix spike recoveries were within the 50-150% TCLP control limits (control limits are not applicable when the sample concentration exceeds the Spike concentration by a factor of 4 or more) except for Sample 1 Ba and Pb and Samples 3 and 4 for Ba. Method of Standard addition was performed on these samples for the out of control Spikes and the results were unchanged.

   Duplicate results were within the 20% RPD control limits for sample concentration greater than 5X the RL or +\- the RL for sample concentration less than 5X the RL.

Jodi L. Wojcik
Metals Section Manager

**Severn Trent Laboratories Chicago**
**GC/MS VOA Case Narrative**

Midwest Generation EME, LLC
Powerton Sampling
Job Number: 226535
VOA DATA:

1. All samples were prepared and analyzed within the recommended hold times from the date of collection.

2. All Method Blank target compounds were below reporting limits

3. The LCS (Laboratory Control Sample) samples had all controlled spike recoveries within the in-house generated QC limits.

4. Matrix Spike/Matrix Spike Duplicate analyses were performed on sample 5. All controlled recoveries were within QC limits.

5. All of the volatile samples had surrogate recoveries within the in-house generated QC limits.

6. The TCLP sample was prepared using Method 5030. The samples were analyzed following SW846 Method 8260B and 8000B. All initial and continuing calibration criteria were met per method or SOP (for minimum R values for certain compounds). The low point in the initial calibration verifies the base reporting limits. The target compounds were quantitated using the initial calibration.

7. All of the volatile samples had internal standard areas and retention times within the acceptance limits as compared to the corresponding continuing calibration.

8. The TCLP samples were analyzed using a 10ml purge volume at a 1/20 dilution.

Jennifer S. O'Gorman

**Severn Trent Laboratories - Chicago**
**GC/MS BNA Case Narrative**

Midwest Generation EME, LLC/Powerton Sampling
Job Number: 226535
BNA DATA: TCLP

1. The TCLP extraction, organic extraction, and all analyses were performed within recommended hold times.

2. The MB (Method Blank) and the EB (TCLP Blank) samples had all analytes below the reporting limits.

3. In-house recovery limits and three method-control compounds were used as QC evaluation for the LCS (Laboratory Control Sample). All method-control spike recoveries were within the QC limits in the LCS.

4. In-house recovery limits and three method-control compounds were used as QC evaluation for the MS (Matrix Spike). All method-control spike recoveries were within the QC limits in the MS.

5. All samples had all surrogate recoveries within in-house QC limits.

6. All analyses were performed following USEPA SW846 method 8270C protocol. All samples had all internal standard areas and retention times within acceptance limits as compared to the corresponding calibration verification standard.

7. The samples and the TCLP Blank were extracted using 100 mL of the TCLP leachate. The MB and LCS were extracted using 1000 mL of deionized water. All samples were analyzed without dilution.

Gary Rynkar
GC/MS Section Manager

STL Chicago
Pesticide Case Narrative

Midwest Generation EME, LLC
Analytical Testing
Job #: 226535-1 through 11
TCLP Pesticides

1. STL Chicago used the following Gas Chromatographic system for the analysis of these pesticides:

| ID# | INSTRUMENT | COLUMN TYPE | DETECTOR |
|---|---|---|---|
| 06 | Varian 3400 | Rtx-Clp1 | Electron Capture |

2. These TCLP extracts were extracted based on SW846 method 3520. The extracts were analyzed for TCLP pesticides based on SW846 method 8081A.

3. All required holding times were met for the original extractions. However, the matrix spike for the single response pesticides for sample 226535-3 (TP-27) was inadvertently not spiked, and was re-extracted 2 days beyond the required holding time. All required holding times were met for the analyses.

4. The method blanks was below the reporting limits for all target compounds.

5. The surrogate compounds used for this analysis were Decachlorobiphenyl (DCB) and Tetrachloro-m-xylene (TCX). All TCX recoveries were biased high and samples 226535-2 (TP-12), 226535-5 (TP-16) and 226535-9 (SFA-1) also had DCB biased high. The sample results were not impacted by the high surrogate recoveries because no target compounds were detected in the associated samples.

6. All blank spike recoveries were within statistical control limits except Heptachlor epoxide, which had 116% recovery.

7. A matrix spike was performed on sample 226535-3 (TP-27). All matrix spike recoveries were within statistical control limits.

8. All initial and continuing standard calibrations associated with these samples were in control.

9. Target compounds were not detected in the primary analysis. Therefore, a second column confirmation was not required.

Marilyn Krueding
QA Department

REPORT COMMENTS

1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 100201
5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviations (any number of which may appear in the report)

Inorganic Qualifiers (Q-Column)

| | |
|---|---|
| U | Analyte was not detected at or above the stated limit. |
| < | Not detected at or above the reporting limit. |
| J | Result is less than the RL, but greater than or equal to the method detection limit. |
| B | Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL. |
| S | Result was determined by the Method of Standard Additions. |
| F | AFCEE: Result is less than the RL, but greater than or equal to the method detection limit. |

Inorganic Flags (Flag Column)

| | |
|---|---|
| - | ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits. |
| * | LCS, LCD, MD: Batch QC exceeds the upper or lower control limits. |
| + | MSA correlation coefficient is less than 0.995. |
| 4 | MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable. |
| E | SD: Serial dilution exceeds the control limits. |
| H | MB, EB1, EB2, EB3: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit. |
| N | MS, MSD: Spike recovery exceeds the upper or lower control limits. |
| W | AS(GFAA) Post-digestion spike was outside 85-115% control limits. |

Organic Qualifiers (Q - Column)

| | |
|---|---|
| U | Analyte was not detected at or above the stated limit. |
| ND | Compound not detected. |
| J | Result is an estimated value below the reporting limit or a tentatively identified compound (TIC). |
| Q | Result was qualitatively confirmed, but not quantified. |
| C | Pesticide identification was confirmed by GC/MS. |
| Y | The chromatographic response resembles a typical fuel pattern. |
| Z | The chromatographic response does not resemble a typical fuel pattern. |
| E | Result exceeded calibration range, secondary dilution required. |
| F | AFCEE:Result is an estimated value below the reporting limit or a tentatively identified compound (TIC) |

Organic Flags (Flags Column)

| | |
|---|---|
| B | MB: Batch QC is greater than reporting limit. |
| * | LCS, LCD, ELC, ELD, CV, MS, MSD, Surrogate: Batch QC exceeds the upper or lower control limits. |
| - | EB1, EB2, EB3, MLE: Batch QC is greater than reporting Limit |
| A | Concentration exceeds the instrument calibration range |
| a | Concentration is below the method Reporting Limit (RL) |
| B | Compound was found in the blank and sample. |
| D | Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D. |
| H | Alternate peak selection upon analytical review |
| I | Indicates the presence of an interfence, recovery is not calculated. |
| M | Manually integrated compound. |
| P | The lower of the two values is reported when the % difference between the results of two GC columns is |

MWG13-15_11488

greater than 25%.

Abbreviations

| | |

PATRICK
ENGINEERING

October 21, 2011

Illinois Environmental Protection Agency
Division of Water Pollution Control
Compliance Assurance Section
1021 North Grand Avenue East
P.O. Box 19276
Springfield, Illinois 62794-9276

Subject: Quarterly Groundwater Monitoring Results – Third Quarter 2011
Powerton Generating Station – Bypass Cleaning Basin
Water Pollution Control Permit No. 2010-EB-0664

Reference: Patrick Project No. 21153.018

To Whom It May Concern:

Patrick Engineering Inc. (Patrick) has prepared this letter report, on behalf of Midwest Generation, LLC, to provide groundwater monitoring results associated with the Powerton Generating Facility located at 13082 East Manito Road in Pekin, Illinois. Groundwater is monitored quarterly in the vicinity of the bypass cleaning basin at this facility in three monitoring wells in accordance with requirements of Illinois Environmental Protection Agency (Illinois EPA) Water Pollution Control Permit No. 2010-EB-0664.

**MONITORING WELL INSTALLATION**

In accordance with the permit referenced above, three monitoring wells (MW-9, MW-11, and MW-12) have been installed in the vicinity of the bypass cleaning basin. The locations of these wells were selected so that at least one of the monitoring wells (MW-09) was installed downgradient of the basin, based upon available data regarding the expected groundwater flow direction. Figure 1 shows the location of the three monitoring wells. Drilling logs and well completion reports have been included as Attachment A.

**GROUNDWATER SAMPLING**

Prior to collecting groundwater samples from the three wells noted above, a number of field measurements were collected from each well location, including groundwater elevation, temperature, conductivity, and pH. Groundwater elevation data is summarized in Table 1. Other field parameter data is provided in Table 2.

On September 19, 2011, groundwater samples were collected from each of the three on-site monitoring wells, either using disposable polyethylene bailers (MW-11), or by the direct use of a peristaltic pump (for MW-9 and MW-12). Each well was purged until at least three well volumes had been extracted, or until the groundwater was observed to be clear. Groundwater was pumped or bailed into a decontaminated, stainless steel container and thereafter transferred to sample containers via peristaltic pump. All groundwater samples were filtered in the field using

a disposable, 0.45µm, in-line filter to allow for the analytical testing of dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4° F. The samples were transported to PDC Laboratories, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain sample integrity.

**ANALYTICAL RESULTS**

The groundwater samples were analyzed for all of the inorganic compounds listed in 35 Illinois Administrative Code (IAC) 620.410(a) and 620.410(d), including radium 226/228. Analytical results (both current and historical) are summarized in Table 3. Laboratory analytical reports provided by PDC Laboratories are provided as Attachment B.

In accordance with Water Pollution Control Permit No. 2010-EB-0664, these three wells will continue to be sampled and reported on a quarterly basis for at least one year to establish a statistically valid representation of existing background conditions.

If you have any questions, please contact me at 630-795-7464.

Sincerely,

**PATRICK ENGINEERING INC.**

# WATER WELL CONSTRUCTION REPORT

Complete within 30 days of well completion and send to the appropriate Health Department

Print Form

1. Type of Well

a. **Driven Well**: Casing Diameter (in.) _____ Depth (ft.) _____

b. **Bored Well**: Casing Diameter (in.) _____ Buried Slab? _____

c. **Drilled Well**: PVC Casing Formation Packer Set at Depth of (ft.) 32

d. **Drilled Well**: Steel Casing Mechanically Driven _____

e. Hole Diameter (in.) 8.5 to (ft.) 32 ; (in.) ___ to (ft.) ___ ; (in.) ___ to (ft.) ___

f.

| Type of Grout | # of bags | Grout Weight | From (ft.) | To (ft.) | Tremie Depth (ft.) |
|---|---|---|---|---|---|
| Bentonite | 9 | | 3 | 20 | |
| | | | | | |

g. Well Finished within Unconsolidated Materials

h.

| Kind of Gravel/Sand Pack | Grain Size/Supplier # | From (ft.) | To (ft.) |
|---|---|---|---|
| Washed quartz sand | #5 | 20 | 32 |
| | | | |

2. Well Use: Monitoring Well Disinfected? No

3. Date Well Completed: Sep 28, 2010 Driller's Estimated Well Yield (gpm): _____

4. Date Permanent Pump Installed: _____ Set at Depth (ft.): _____

5. Pump Capacity (gpm): _____

6. Pitless Adapter Model and Manufacturer: _____ Attachment to Casing: _____

7. Well Cap Type & Manufacturer: _____

8. Pressure Tank Working Cycle (gals.): _____ Captive Air? _____ 9. Pump System Disinfected: _____

10. Name of Pump Company _____

11. Pump Installer: _____ License # _____

12. _____ Date _____
Licensed Pump Installation Contractor Signature

Illinois Department of Public Health
Division of Environmental Health

RE: Project: 1091955
Pace Project No.: 3054614

Dear Ms. Clutters:
Enclosed are the analytical results for sample(s) received by the laboratory on September 28, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Carin A. Ferris

## PROJECT NARRATIVE

Project: 1091955
Pace Project No.: 3054614

**Method:** EPA 903.1
**Description:** 903.1 Radium 226
**Client:** PDC Laboratories, Inc.
**Date:** October 17, 2011

**General Information:**
3 samples were analyzed for EPA 903.1. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**
The samples were analyzed within the method required hold times with any exceptions noted below.

**Method Blank:**
All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**
All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Duplicate Sample:**
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

**Additional Comments:**

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc..

## PROJECT NARRATIVE

Project: 1091955
Pace Project No.: 3054614

**Method:** EPA 904.0
**Description:** 904.0 Radium 228
**Client:** PDC Laboratories, Inc.
**Date:** October 17, 2011

**General Information:**
3 samples were analyzed for EPA 904.0. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**
The samples were analyzed within the method required hold times with any exceptions noted below.

**Method Blank:**
All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**
All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Duplicate Sample:**
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

**Additional Comments:**

This data package has been reviewed for quality and completeness and is approved for release.

## QUALIFIERS

Project: 1091955
Pace Project No.: 3054614

**DEFINITIONS**

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

Subject: Quarterly Groundwater Monitoring Results –Fourth Quarter 2011
Powerton Generating Station – Bypass Cleaning Basin
Water Pollution Control Permit No. 2010-EB-0664

Reference: Patrick Project No. 21153.018

To Whom It May Concern:

Patrick Engineering Inc. (Patrick) has prepared this letter report, on behalf of Midwest Generation, LLC, to provide groundwater monitoring results associated with the Powerton Generating Facility located at 13082 East Manito Road in Pekin, Illinois. Groundwater is monitored quarterly in the vicinity of the bypass cleaning basin at this facility in three monitoring wells in accordance with requirements of Illinois Environmental Protection Agency (Illinois EPA) Water Pollution Control Permit No. 2010-EB-0664.

**MONITORING WELL INSTALLATION**

In accordance with the permit referenced above, three monitoring wells (MW-9, MW-11, and MW-12) have been installed in the vicinity of the bypass cleaning basin. The locations of these wells were selected so that at least one of the monitoring wells (MW-09) was installed downgradient of the basin, based upon available data regarding the expected groundwater flow direction. Figure 1 shows the location of the three monitoring wells. Drilling logs and well completion reports have been included as Attachment A.

**GROUNDWATER SAMPLING**

Prior to collecting groundwater samples from the three wells noted above, a number of field measurements were collected from each well location, including groundwater elevation, temperature, conductivity, and pH. Groundwater elevation data is summarized in Table 1. Other field parameter data is provided in Table 2.

On December 12, 2011, groundwater samples were collected from each of the three on-site monitoring wells, by the direct use of a peristaltic pump. Each well was purged until at least three well volumes had been extracted, or until the groundwater was observed to be clear. Groundwater was pumped or bailed into a decontaminated, stainless steel container and thereafter transferred to sample containers via peristaltic pump. All groundwater samples were filtered in the field using a disposable, 0.45µm, in-line filter to allow for the analytical testing of

dissolved compounds. The samples were immediately placed on ice in a cooler and kept at a temperature no higher than 4° F. The samples were transported to PDC Laboratories, an Illinois-EPA accredited analytical laboratory, in accordance with chain-of-custody procedures to maintain sample integrity.

**ANALYTICAL RESULTS**

The groundwater samples were analyzed for all of the inorganic compounds listed in 35 Illinois Administrative Code (IAC) 620.410(a) and 620.410(d), including radium 226/228. Analytical results (both current and historical) are summarized in Table 3. Laboratory analytical reports provided by PDC Laboratories are provided as Attachment B.

In accordance with Water Pollution Control Permit No. 2010-EB-0664, these three wells will continue to be sampled and reported on a quarterly basis for at least one year to establish a statistically valid representation of existing background conditions.

If you have any questions, please contact me at 630-795-7464.

Sincerely,

**PATRICK ENGINEERING INC.**

## Notes

This report shall not be reproduced, except in full, without the written approval of the laboratory.

PDC Laboratories participates in the following accreditation/certification and proficiency programs at the following locations. Endorsement by Federal or State Governments or their agencies is not implied.

PIA PDC Laboratories - Peoria, IL
NELAC Accreditation for Drinking Water, Wastewater, Hazardous and Solid Wastes Fields of Testing through IL EPA Lab No. 100230
Illinois Department of Public Health Bacteriological Analysis in Drinking Water Approved Laboratory Registry No. 17553
Drinking Water Certifications: Kansas (E-10338); Missouri (870); Wisconsin (998284430); Indiana (C-IL-040); Iowa (240)
Wastewater Certifications: Arkansas (88-0677); Wisconsin (998284430); Iowa (240); Kansas (E-10335)
Hazardous/Solid Waste Certifications; Arkansas (88-0677); Wisconsin (998284430); Iowa (240); Kansas (E-10335)
UST Certification; Iowa (240)
SPM PDC Laboratories - Springfield, MO
EPA DMR-QA Program
STL PDC Laboratories - St. Louis, MO

RE: Project: 1121476
Pace Project No.: 3059493

Dear Ms. Clutters:
Enclosed are the analytical results for sample(s) received by the laboratory on December 16, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jacquelyn Collins for
Carin Ferris

## PROJECT NARRATIVE

Project: 1121476
Pace Project No.: 3059493

**Method:** **EPA 903.1**
**Description:** 903.1 Radium 226
**Client:** PDC Laboratories, Inc.
**Date:** January 17, 2012

**General Information:**
6 samples were analyzed for EPA 903.1. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**
The samples were analyzed within the method required hold times with any exceptions noted below.

**Method Blank:**
All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**
All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Duplicate Sample:**
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

**Additional Comments:**

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc..

## PROJECT NARRATIVE

Project: 1121476
Pace Project No.: 3059493

**Method:** **EPA 904.0**
**Description:** 904.0 Radium 228
**Client:** PDC Laboratories, Inc.
**Date:** January 17, 2012

**General Information:**
6 samples were analyzed for EPA 904.0. All samples were received in acceptable condition with any exceptions noted below.

**Hold Time:**
The samples were analyzed within the method required hold times with any exceptions noted below.

**Method Blank:**
All analytes were below the report limit in the method blank with any exceptions noted below.

**Laboratory Control Spike:**
All laboratory control spike compounds were within QC limits with any exceptions noted below.

**Matrix Spikes:**
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

**Duplicate Sample:**
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

**Additional Comments:**

This data package has been reviewed for quality and completeness and is approved for release.

This report shall not be reproduced, except in full,

# QUALIFIERS

Project: 1121476
Pace Project No.: 3059493

**DEFINITIONS**

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

VIA OVERNIGHT MAIL

Illinois EPA
Division of Public Water Supplies
Attn: Andrea Rhodes, CAS #19
P.O. Box 19276
Springfield, IL 62794-9276

Re: Violation Notice: Midwest Generation, LLC, Powerton Generating Station
Identification No.: 6282
Violation Notice No.: W-2012-00057

Dear Ms. Rhodes:

In response to the above-referenced June 11, 2012 Violation Notice ("VN"), received on June 14, 2012, this written response is timely submitted on behalf of the Midwest Generation, LLC ("MWG"), Powerton Generating Station ("Powerton"). MWG also requests a meeting with the Illinois Environmental Protection Agency ("Illinois EPA" or the "Agency") to discuss the VN and information provided in this response.

MWG regrets that the Illinois EPA decided to issue the VN because MWG has tried to work cooperatively with the Agency concerning the hydrogeologic assessment of the coal ash ponds at Powerton even though it had significant concerns and objections to how the VN has proceeded in this matter.[1] Nevertheless, MWG complied with the Agency's request that it conduct a hydrogeologic assessment of the area around the coal ash ponds and followed its requirements and comments for how the hydrogeologic assessment should be conducted, even though it was under no legal obligation to do so.[2] At no time however did MWG agree that the scope and nature of the hydrological assessment the Agency required it to perform would provide any basis for concluding that the ash ponds were impacting groundwater. The alleged

[1] *See, e.g.*, MWG (B. Constantelos) letter to Illinois EPA (A. Keller) dated July 15, 2009. MWG is also working cooperatively with the USEPA with regards to the Coal Combustion Residuals Proposed Rules, EPA-HQ-RCRA-2009-0640, and is trying to coordinate the responses and requirements of both Agencies. USEPA first issued the proposed rules on June 21, 2010, and requested additional comments and information on Oct. 12, 2011. The additional information comment period closed on November 14, 2011, and MWG is now waiting for the USEPA to issue the final rule.

[2] MWG continues to reserve its objection that the Illinois EPA did not have the legal authority to require the hydrological assessments of the ash ponds under Sections 4 or 12 of the Illinois Environmental Protection Act (the "Act") or the Groundwater Quality Regulations, 35 Ill. Adm. Code Part 620.

Printed on 100% post-consumer waste.

violations in the VN are based solely on the results of the hydrogeologic assessment MWG performed at the Agency's request. The results of the hydrogeologic assessment do not show that the coal ash ponds at the Powerton Station are impacting the groundwater and do not provide the necessary evidence to support the alleged violations contained in the VN.

Well prior to the issuance of this VN, MWG met with the Agency to discuss the groundwater monitoring results and to discuss cooperatively how to proceed based on those results, including what additional actions, if any, the Agency believed were necessary. The Agency told MWG that it had not yet decided how to proceed. The next development was the issuance of the VN. The VN itself provides no information concerning the basis for the Agency's apparent conclusion that the ash impoundments are the cause of the alleged groundwater impacts, other than the conclusory statement that "[o]perations at ash impoundments [sic] have resulted in violations of the Groundwater Quality Standards." The VN also provides no information concerning the nature or type of corrective action which the Agency may deem acceptable to address the alleged violations. The Agency is not pursuing this matter in a way that allows MWG to prepare an effective response or a Compliance Commitment Agreement.

This letter provides a detailed response to each of the alleged violations in Attachment A of the VN to the extent possible given the lack of information provided in the VN. It also advances MWG's general objection to the legal sufficiency of the notice of the alleged violations contained in the VN. MWG maintains that the Illinois EPA cannot prove the alleged violations in the VN, and does not, by submitting this response, make any admissions of fact or law, or waive any of its defenses to those alleged violations.

## I. General Objection to the Legal Sufficiency of the Violation Notice

The VN does not comply with the requirements of Section 31 of the Act. Section 31(a)(1)(B) of the Act requires the Illinois EPA to provide a detailed explanation of the violations alleged. 415 ILCS 5/31(a)(1)(B). Under the Act, MWG is entitled to notice of the specific violation charged against it and notice of the specific conduct constituting the violation.[3] The VN fails to provide adequate notice to MWG of either the alleged violations or the activities which the Agency believes are necessary to address them. The VN states that "[o]perations at ash impoundments have resulted in violations of the Groundwater Quality Standards...." (Violation Notice, Attachment A, page 1, 1st paragraph) No further description of the alleged "ash impoundments" is provided in the VN. Multiple ash impoundments exist at the Powerton Station. It is impossible to identify from the contents of the VN what operations or activities at the Powerton Station the Agency is claiming are the cause of the alleged violations, including whether it is the Agency's position that each of the Station's ash ponds, or only certain ones,

[3] *Citizens Utilities Co., v. IPCB*, 9 Ill.App.3d 158, 164, 289 N.E.2d 642, 648 (2nd Dist., 1972) (a person is entitled to notice of the specific violation charged against it and notice of the specific conduct constituting the violation). *See also, City of Pekin v. Environmental Protection Agency*, 47 Ill.App.3d 187, 192, 361 N.E.2d 889, 893 (3rd Dist., 1977.

have caused the alleged violations. Absent an accurate or complete description of the activities or operations that the Agency is alleging caused the violations, it is also not possible to identify what action might be necessary to resolve them. Attachment A to the VN states: "Included with each type of violation is an explanation of the activities that the Illinois EPA believes may resolve the violation." However, no such explanation is provided in the VN. In sum, the VN fails to comply with the legal requirement that it include a detailed explanation of the violations alleged, does not inform MWG of the specific conduct constituting the alleged violations and provides no notice of what is necessary to resolve the alleged violations. The Section 31 process is based on fundamental principles of due process. MWG should not have to speculate about what activities it allegedly engaged in that caused the violations and how to address them to resolve the alleged violations. In the absence of this material, statutorily-required information, the Agency also has effectively denied MWG's statutory right to formulate an acceptable Compliance Commitment Agreement to submit for the Agency's approval.

The VN is also deficient regarding its explanation of what laws MWG has allegedly violated. The VN solely alleges that MWG violated "Section 12" of the Act. 415 ILCS 5/12. It does not provide any further specification as to which of the provisions of Section 12 MWG has allegedly violated.

Section 12 of the Act has nine subsections, consecutively numbered (a) through (i). Each of these subsections describes a different and distinct water pollution prohibition. 415 ILCS 5/12(a)-(i). However, the VN issued to MWG does not identify which of the nine subsections the Agency is alleging MWG violated. Based on the contents of Section 12 of the Act, the Agency is taking the position that MWG violated each and every one of the provisions of Section 12. Based on the relevant facts, it is highly unlikely that this is the intent of the VN. Therefore, the VN's general reference to Section 12 of the Act, without any other explanation, is not a "detailed explanation of the violations." This is yet another example of how the VN fails to provide MWG with adequate notice as a matter of law and thereby violates MWG's due process rights.[4]

By failing to provide a detailed explanation of the violations and any explanation of the activities that the Illinois EPA believes may resolve the violations, the Illinois EPA has effectively denied MWG the opportunity to properly and thoroughly respond to the alleged violations and to make an acceptable offer to resolve them. The VN's deficiencies conflict with the intent and purpose of Section 31 of the Act, which is to avoid unnecessary litigation. Therefore, MWG respectfully requests that the Agency rescind the VN and suspend any further enforcement action unless and until it has taken the necessary actions to correct and cure the legal deficiencies in the notice of the alleged violations by following the statutory requirements under Section 31(a)(1)(B) of the Act. 415 ILCS 5/31(a)(1)(B)

[4] *See, e.g., Grigoleit Co. v. Illinois EPA*, PCB 89-184, slip op at p. 11 (November 29, 1990) (Failure to notify permit applicant of alleged violations and provide an opportunity to provide information in response was a violation of applicant's due process rights).

## II. Response to Alleged Violations in the VN

Subject to and without waiving its objections to the legal sufficiency of the VN, MWG nevertheless has attempted to discern the legal basis for the alleged violations and to prepare this response in defense to those allegations based on various assumptions. MWG reserves the right to supplement this response, including by submitting a separate response should the Agency provide the legally required notice under Section 31 of the Act.

The VN alleges "[o]perations at ash impoundments" at MWG's Powerton Station have resulted in violations of certain of the Groundwater Quality Standards at the respective monitoring wells identified in the VN. (Violation Notice at Attachment A) MWG believes the Agency's use of the term "ash impoundments" is intended to refer to the structures which the Powerton Station commonly refers to as "ash ponds;" that is how they will be referred to here. The Agency further alleges that the alleged violations of the groundwater quality standards in 35 Ill. Admin. Code Part 620 also constitute violations of Section 12 of the Act and the underlying groundwater regulations in 35 Ill. Admin. Code Part 620. It is undisputable that the Agency has the burden to prove these alleged violations both in proceedings before the Illinois Pollution Control Board ("Board") and in the courts.[5] However, the groundwater monitoring data on which the Agency primarily, if not solely, relies to assert these violations is not sufficient, legally or technically, to prove that any "ash impoundments" is the source of the alleged groundwater impacts. Further, based on the existing condition of the ash ponds, it is not likely that they are a source of the alleged impacts.

To support its defense to the alleged violations, MWG has set forth below a description of: (1) the condition and use of the ash ponds at Powerton; (2) the hydrogeologic assessment performed at the Powerton Station; (3) the site hydrology; and (4) why the analytical data from the monitoring wells does not establish that the ash ponds are the source of the alleged exceedances of the groundwater standards.[6] In addition, for certain of the alleged exceedances, additional information not considered by the Agency shows that it is either more likely, or at least as likely, that the source of the alleged exceedance is something other than the ash ponds. In either case, the Agency cannot sustain its burden to prove the alleged violations.

---

[5] Section 31(e) of the Act provides in relevant part: "In hearings before the Board under this Title, the burden shall be on the Agency...to show either that the respondent has caused or threatened to cause...water pollution or that the respondent has violated or threatens to violate any provision of this Act or any rule or regulation of the Board or permit or term or condition thereof." 415 ILCS 5/31(e); *Citizens Utilities v. IPCB*, 9 Ill. App. 3d 158, 164, 289 N.E.2d 642, 646 (1972) (the Agency has the burden of proof in enforcement actions).

[6] In preparing this response, MWG closely reviewed the groundwater monitoring reports previously submitted to the Agency for the monitoring wells which are identified in the VN. In the course of this review, some data transcription errors were found in the previously submitted data tables included in the groundwater monitoring reports. Copies of the corrected data tables are enclosed. The tables are annotated to identify the nature of the corrections made to the previously submitted reports. The most significant changes are: (i) consistent with previous data for MW-1, there was no boron exceedance at monitoring well MW-1 in the first quarter 2012 sampling event; (ii) there was no exceedance of selenium at wells MW-7 (4th quarter 2011), MW-9 (1st quarter 2011) and MW-13 (August 2011); and (iii) there was no exceedance of mercury at well MW-12 (4th quarter 2010).

### A. The Condition of the Ash Ponds

For several reasons, the construction and operation of the Powerton ash ponds makes it unlikely that they are the cause of the alleged violations. The construction and operation of the ponds minimizes the potential for leakage from the ash ponds to groundwater.

First, the Powerton ash ponds are not disposal sites. The ash that enters the ponds is routinely removed. This operating condition limits the amount of ash accumulated over time which serves to minimize the potential for the release of ash constituents to the groundwater.

Second, unlike many other ash ponds in Illinois, two of the ash ponds at Powerton, the Ash Surge Pond and the Ash Bypass Basin are lined to prevent releases to groundwater. The third pond, the Secondary Ash Settling Basin, is not presently lined. However, as described below, there are no groundwater exceedances of coal ash constituents downgradient of the Secondary Ash Settling Basin, thus supporting the conclusion that it is not a source. When the final federal Coal Combustion Residual Rules are issued, MWG will rely on those rules to make a decision regarding any further modifications to, or the continued use of, the Secondary Ash Settling Basin.

The Ash Surge Pond at Powerton is constructed of Poz-o-Pac material which meets accepted standards for preventing the migration of constituents to the environment.[7] The permeability of the Poz-o-Pac liner is $10^{-7}$ cm/sec. Notably, this is the same degree of permeability that is required in the Board Regulations for constructing a new solid waste landfill where, unlike the ash ponds, waste materials are to be disposed of on a permanent basis. *See* 35 IAC 811.306(d). Pursuant to a construction permit issued by the Agency, the second ash pond, called the Ash Bypass Basin, was relined in 2010 with a high-density polypropylene (HDPE) liner.[8] The HDPE liner provides an even greater degree of protection against leakage with a permeability of approximately $10^{-13}$ cm/sec. The liners in the two ash ponds achieve and exceed the level of permeability which the Illinois regulations expressly recognize is sufficient to prevent the release of constituents to the environment. Hence, the facts regarding the liners in place for these two ash ponds also support the conclusion that the ash ponds are not the source of the exceedances of groundwater standards alleged in the VN.

The VN contains no facts concerning the condition of the liners in the Powerton ash ponds that would indicate that they are allowing ash constituents to escape from the ponds. For example, the Agency does not contend that there are any breaches in the integrity of the ash pond liners that are allowing ash constituents to be released to the groundwater. The Agency similarly does not claim that the materials used for the existing liners are inadequate to prevent the migration of constituents, and it would be hard pressed to do so given that the materials either meet or exceed the analogous requirements for Illinois landfills. In the absence of such

[7] Poz-o-Pac is an aggregate liner similar to concrete.
[8] *See* Illinois EPA Water Pollution Control Permit No. 2010-EP-0664 for the Bypass Basin Expansion and Liner Upgrade

evidence, it is certainly far more likely than not that the existing ash ponds at the Powerton Station are not the source of the groundwater impacts alleged in the VN.

### B. Hydrogeologic Assessment and Site Hydrology

The VN appears to be based on the flawed premise that the hydrogeologic assessment which the Agency directed MWG to perform in the vicinity of the ash ponds would be sufficient to identify the ash ponds as the source of any elevated levels of constituents in the groundwater. This is simply not the case. The results of the hydrogeologic assessment at best give rise to more questions about the source of the alleged groundwater impacts, and do not prove that the existing ash ponds are the source of those impacts.

The results of the hydrogeologic assessment show that there is some complexity to the site hydrology at Powerton. The complexity of the groundwater flow system arises from the existence of two distinct, though connected, groundwater units underlying the Powerton Station. The first unit is a localized, saturated silt and clay layer and the lower unit is a more extensive sand layer. When the groundwater elevations from all fifteen of the existing monitoring wells are plotted and analyzed for a single monitoring event (*i.e.,* the silt/clay unit wells and the sand unit wells), the groundwater flow system appears very complex. It shows a general groundwater flow direction of south to north, but with very unusual, localized groundwater highs, making a reasonable interpretation of groundwater flow difficult and suggests the presence of some localized, divergent flow. However, when the five monitoring wells that are screened in the silt/clay unit and the ten wells that are screened in the sand unit are plotted separately, it becomes evident that there are two distinct, though connected, groundwater units beneath this portion of the Site. In both units, the groundwater flows from the south/southeast to the north/northwest, toward the adjoining outlet channel west of the ponds. The elevation of the groundwater surface is approximately 10 feet higher in the silt/clay unit than in the sand unit. Because both units flow in the same direction and are in direct physical contact with each other, it is likely that they share some degree of hydraulic connection. Given this groundwater flow system, the data provides no indication of divergent or radial flow associated with the ash ponds.

The VN's allegations fail to make any distinctions among the fifteen monitoring wells that have been installed at the Powerton Station. There is no apparent attempt to evaluate the quarterly groundwater monitoring results, whether on a parameter-by-parameter basis or relative to each of the ash ponds themselves. When these evaluations are performed, the results show that the monitoring data does not support the VN's allegations that the operations of the ash impoundments have caused these groundwater impacts. The results of the evaluations are set forth below, beginning with the parameter-by-parameter evaluation.

Boron and sulfate are constituents known to be associated with coal ash. However, the monitoring data does not support a finding that the alleged boron and sulfate exceedances are due to the operations of the ash ponds. There are no exceedances of boron concentrations in any of the wells within the clay unit (*i.e.,* MW-6, MW-8, MW-12, MW-14 and MW-15) and boron is generally considered a reliable tracer of potential ash leachate impacts. Further, in the course of

this review, a transcription error was discovered in the previously reported first quarter 2012 groundwater sampling results for monitoring well MW-1. There was no exceedance of boron at monitoring well MW-1 in the first quarter 2012 sampling event, which is consistent with previous monitoring results for this well. Corrected data tables for the Powerton groundwater monitoring wells quarterly monitoring results are included with this response.

In addition, of all of the clay unit wells, only MW-14 had reproducible exceedances of sulfate. MW-15 had only one exceedance of sulfate, which did not occur again in any of the subsequent quarterly monitoring results. The remaining groundwater monitoring wells sampling results have reported no sulfate exceedances. Of the monitoring wells located in the underlying sand unit, only wells MW-9 and MW-13 had reproducible exceedances for either boron or sulfate.

As further discussed below, monitoring well MW-9 is the furthest upgradient well within the overall monitoring network. It has the highest detections of boron relative to all the other wells, with the exception of well MW-13. However, monitoring well MW-13 was not installed as part of the hydrogeologic assessment of the ash ponds. It was installed as an upgradient monitoring point pursuant to the construction permit requirements for the Metals Cleaning Basin, which as its name implies, does not receive or store any coal ash. The Metals Cleaning Basin is not associated in any way with the ash storage pond system. Thus, boron present in MW-13 is not evidence of any impact caused by the operation of the ash ponds.

Turning to the alleged pH exceedances, all nine pH exceedances noted in the VN were from a single sampling event - the December 2011 sampling event. They were not detected in the previous quarterly sampling events and have not been repeated since the December 2011 sampling event. Moreover, for MW-2, the alleged pH exceedance reported from this December 2011 sampling event is the only exceedance detected for any parameter over all of the six consecutive quarters of sampling. Given that pH is a field parameter, and no other pH exceedances were detected in any of the wells in any of the other quarterly sampling events, it is far more likely that the December 2011 pH measurements were associated with a malfunctioning field meter. Therefore, the December 2011 pH monitoring results are not indicative of alleged impacts from the ash ponds or that the groundwater in the vicinity of the subject monitoring wells is actually exceeding the pH standard.

A review of the chloride groundwater monitoring results also shows that they are not associated with the operations of the ash impoundments, as alleged in the VN. There were alleged chloride exceedances at monitoring well locations MW-8, MW-12, MW-14 and MW-15. Except for well MW-8, each of these was a single non-reproducible exceedance at each location. At monitoring well MW-8, the chloride exceedances are from only the last two rounds of the six consecutive quarters of groundwater sampling. Chloride is not an indicator of potential coal ash impacts. There are various other potential non-ash related sources of this compound. None of the wells where these alleged chloride exceedances were found had any exceedances of the boron standard.

The only exceedance detected for thallium in all six, consecutive sampling events is an isolated exceedance recorded for a single monitoring well, MW-14. Monitoring well MW-14 was not installed as part of the hydrogeologic assessment of the ash ponds. It instead was installed as a downgradient monitoring well for the Metals Cleaning Basin, which is not associated with the ash storage pond system. Thallium is not a constituent typically associated with ash storage facilities. It was not detected in any of the other fourteen monitoring wells at the Powerton Station in any of six consecutive quarters of groundwater monitoring. Hence, the isolated and unique detection of thallium is not evidence of a release from the ash ponds.

The alleged selenium and mercury exceedances alleged in the VN are almost exclusively the result of transcription errors which occurred in the previous reporting of these results to the Agency. There was no exceedance of selenium detected at monitoring wells MW-7 (4$^{th}$ Quarter 2011), MW-9 (1$^{st}$ Quarter 2011) and MW-13 (3 $^{rd}$ Quarter 2011). The original laboratory data package shows selenium concentrations at ten times lower than what was reported in the monitoring results submitted to the Agency. In the quarterly reports submitted to the Agency, the decimal point was erroneously placed in the reported monitoring values, resulting in the reporting of values ten times higher than the actual laboratory results. The single selenium exceedance in monitoring well MW-14 is an isolated event, which occurred over a year ago. No subsequent selenium exceedances have been reported in the quarterly sampling events to date. Like thallium, the isolated detection of selenium is not evidence of a release from an ash pond. There also was no exceedance of mercury at well MW-12 (4$^{th}$ Quarter 2010). The previously reported elevated mercury level was also due to a transcription error. The corrected selenium and mercury groundwater monitoring results are included in the enclosed, corrected Tables.

In summary, a parameter-by-parameter evaluation shows that the monitoring data does not support the VN's allegation that the operation of the ash ponds has caused the alleged exceedances. Isolated monitoring well results showing exceedances of a given parameter that are not seen in any of the other fourteen monitoring wells (*e.g.,* thallium, selenium) do not support the VN's allegations. Multiple pH exceedances from a single sampling event are more indicative of an equipment error than actual groundwater conditions. Similarly, the chloride exceedances, most of which were not reproducible in subsequent sampling events and none are which are associated with boron and sulfate exceedances, also are not consistent with the ash ponds being the source of the exceedances. For other parameters, such as arsenic, manganese and iron, the monitoring results are far more consistent with the presence of a reducing environment in the area of groundwater where these elevated levels were detected. Finally, the alleged exceedances for selenium are not real. They are the result of transcription errors which occurred in the preparation of its quarterly reporting to the Agency due to the incorrect placement of a decimal point in the monitoring results values. This is now corrected in the enclosed Tables.

The separate evaluation of the groundwater monitoring results relative to each of the three active ash ponds and the former ash pond individually also reveals several deficiencies in the alleged violations. Each of these ash ponds is discussed separately below.

**Ash Bypass Basin:**

The furthest south (upgradient) pond is known as the "Ash Bypass Basin." As previously stated, the Ash Bypass Basin was relined with a HDPE liner in 2010. Monitoring well MW-9 is the upgradient monitoring well for the Ash Bypass Basin and wells MW-11 and MW-12 are the two immediately downgradient wells. Monitoring well MW-12 is screened within the silt/clay unit and monitoring wells MW-9 and MW-11 are screened within the underlying sand unit. For upgradient well MW-9, multiple exceedances of boron and manganese were detected. Monitoring well MW-11 had one exceedance of boron, but this occurred during the last round of quarterly sampling and hence, additional monitoring data is not yet available to determine whether this is an isolated event. While there were multiple exceedances of manganese in monitoring well MW-12, it did not have any reported exceedances of boron. The highest boron concentrations were reported in upgradient well MW-9. This indicates that the boron source is not associated with the operation of the Ash Bypass Basin. Further, the manganese concentrations in well MW-12 are similar to the concentrations measured at upgradient well location MW-9; however, the manganese concentrations at MW-11 (ranging from 2.2 mg/l to 3.6 mg/l) are higher than in the upgradient well which ranges from 0.19 mg/l to 0.48 mg/l. Elevated manganese concentrations can be associated with sources other that ash ponds and can be reflective of localized mineralogy and reduction-oxidation (redox) conditions, especially when elevated levels of both boron and sulfate are absent. Similarly, the alleged iron exceedances in well MW-12 can also be reflective of localized mineralogy and redox conditions especially in the absence of elevated concentrations of boron and sulfate, as is the case here.

The conclusion that the elevated manganese and iron levels are not due to the operation of the ash ponds is further supported by analytical testing performed in August 2008 of plant bottom ash, fly ash and fines. The analytical testing, which included Toxic Characteristic Leaching Procedure (TCLP) analyses, provides relevant information concerning the leaching nature of the ash compounds. The analytical data shows no detections of manganese in TCLP leachate from any of the samples. The leached iron detections range from non-detect to 0.044 mg/l, which is substantially lower than the iron exceedances in monitoring well MW-12. The analytical data does not support the VN's allegations that the source of the alleged exceedances in these monitoring wells is associated with the operation of the Ash Bypass Basin.

The weight of the evidence shows that the Ash Bypass Basin is not causing the alleged groundwater impacts. Moreover, even if a case could be made that it was, MWG has already taken the necessary steps to address it. As described above, the Ash Bypass Basin was relined in 2010 with a state of the art HDPE liner.

**Ash Surge Pond:**

The Ash Surge Pond is located north (*i.e.*, downgradient) of the Ash Bypass Basin. It is the largest of the ash ponds and is lined. Monitoring wells upgradient of the Ash Surge Pond are MW-12, MW-11 (previously discussed above because they are also downgradient of the Ash Bypass Basin) and monitoring well MW-10. Wells MW-15 and MW-8 are immediately

downgradient of the Ash Surge Pond.[9] Monitoring wells MW-8 and MW-15 are screened within the silt/clay unit and well MW-10 is within the underlying sand unit.

Upgradient well MW-10 had multiple reported exceedances of manganese, ranging from 2.1 mg/l to 3.8 mg/l.[10] (Downgradient well MW-15 has six exceedances of manganese ranging from 0.25 mg/l to 0.60 mg/l and well MW-8 has five exceedances of manganese ranging from 0.18 to 0.28 mg/l. The downgradient concentrations of manganese are clearly lower than in the upgradient wells suggesting that the manganese is not associated with operation of the Ash Surge Basin. It is also noted that neither wells MW-8 nor MW-15 have exceedances of boron, an ash impact indicator. There is also only one reported exceedance of sulfate in monitoring well MW-15 (650 mg/l), which was not reproducible during subsequent, consecutive sampling events. This alleged, isolated sulfate exceedance also was anomalously and significantly higher than all other sulfate detections at this monitoring well location, which ranged from 140 mg/l to 300 mg/l. Hence, the level of the single, alleged sulfate exceedance at MW-15 is more than twice that of any other reported value for this monitoring well.

Monitoring well MW-13 is slightly side gradient of the Ash Surge Basin (located just west of the southwest corner of the basin). As discussed previously, the boron and sulfate detections at this location were the highest of any monitoring well. These levels do not support a finding that that they are caused by the Ash Surge Basin's operations because none of the downgradient monitoring wells from this basin had any similar boron and sulfate levels detected throughout numerous, consecutive sampling events.

**Ash Settling Pond:**

The Ash Settling Pond is located to the north (downgradient) of the Ash Surge Basin. Monitoring well MW-8's location is considered upgradient of this pond. Monitoring wells MW-6 and MW-7 are immediately downgradient of the Ash Settling Pond. MW-6 is screened within the silt/clay unit and MW-7 is screened within the underlying sand unit. None of these three wells (MWs 6, 7 or 8) had reported exceedances of boron or sulfate. The range of boron detections at MW-6 (0.35 mg/l to 0.63 mg/l) and at MW-7 (0.34 mg/l to 0.61 mg/l) are significantly lower than the range of boron detections in the upgradient monitoring well MW-8 (0.57 mg/l to 0.93 mg/l). Hence, the monitoring data indicates that the concentrations of boron are lower on the downgradient side of the Ash Settling Pond. The same observation is true for the sulfate levels among these same monitoring wells. These findings support the conclusion that the alleged groundwater impacts in the vicinity of the Ash Settling Pond are not associated with its operation.

---

[9] Monitoring well MW-15 is also adjacent to the northwest corner of the Metals Cleaning Basin, which is not part of the ash pond system.

[10] The manganese levels are similar to the elevated detections in monitoring well MW-11. Hence, these results are further evidence that the elevated manganese at MW-11 is not associated with the operation of the Ash Bypass Basin because monitoring well MW-10 is approximately 600 feet away from the Ash Bypass Basin and is not downgradient of it.

There were other alleged exceedances in MW-6 and/or MW-7, including a single alleged exceedance of chloride (MW-6) and one for lead (MW-7), as well as manganese, arsenic, iron, and Total Dissolved Solids (TDS)[11], as discussed above regarding iron and manganese, in the absence of elevated concentrations of the coal ash indicators such as boron and sulfate, these alleged exceedances are as likely due to other sources that are unrelated to the Ash Settling Pond or any of the other Powerton ash ponds.

**Former Ash Pond**:
