report -- let me see if I can find this.
In the first bullet point near the bottom of that page, you state that, "The liner subgrades were inspected for sharp surfaces prior to installation of the HDPE liner, and protective geotextile was installed below the HDPE liners to avoid the potential for puncture."
Do you see that?
A Yes.
Q Was geotextile installed beneath all the HDPE liners, at all of the ponds for Midwest Generation?
MS. NIJMAN: If you need to look to answer.
THE WITNESS: No, that's okay.
When we put together the Figures 5.1 through whatever it is when we looked at the ponds, it says whether they do or do not have a cushion below it or not. And my recollection is that --
BY MS. CASSEL:
Q Is a cushion the same thing as a geotextile?
A Yes. Let me clarify.
A geotextile is a fabric that is used as a cushion between the geomembrane -- HDPE and the

subgrade. And, from my recollection, Waukegan did not use a bottom cushion, but they also had a smooth prepared subgrade below it, so a cushion was not required.
Q So they did not have a geotextile beneath Waukegan?
A Yes.
Q And it's --
MS. NIJMAN: With your qualification.
BY MS. CASSEL:
Q It's also correct that there was not a geotextile installed beneath Will County Pond 3S, correct?
A I can check. The drawing I have is for Pond 3 for Will County, and it shows Poz-O-Pac in the bottom and a cushion on top of the Poz-O-Pac and below the HDPE.
Q Okay. So there is a cushion.
Is that a geotextile cushion?
A Yes. It's a 16-ounce nonwoven geotextile that acts as a cushion.
Q And what are you referencing right there?
A Figure 5-11 from my report.
Q What is a GeoCell? Do you know what that

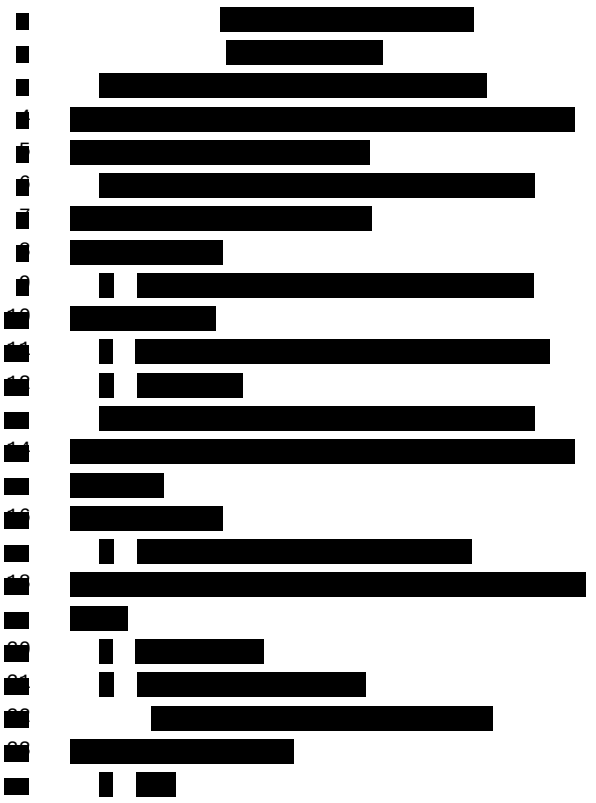
is?
A A GeoCell, if you can envision a honeycomb, that is like one layer of honeycomb. It's made out of plastic. It expands like an accordion into these cells that are like square -- or quasi-square, rounded edges. And it's used when you -- to stabilize a grade.
In the case of Will, they actually had one area where they laid it on the grade and then they filled it with -- I believe they filled it with either grout or concrete.
Q So a GeoCell is not the same thing as a geotextile?
A Correct.
Q Okay. Did you inspect the Poz-O-Pac liners or underlying soil base underneath the geotextiles at the Midwest Generation ponds?
A Did I inspect it?
Q Uh-huh.
A I did not. My recollection is that when I visited the site, they were underwater.
Q And -- just correct me if I'm wrong, I believe you testified earlier -- well, correct me if I'm wrong.

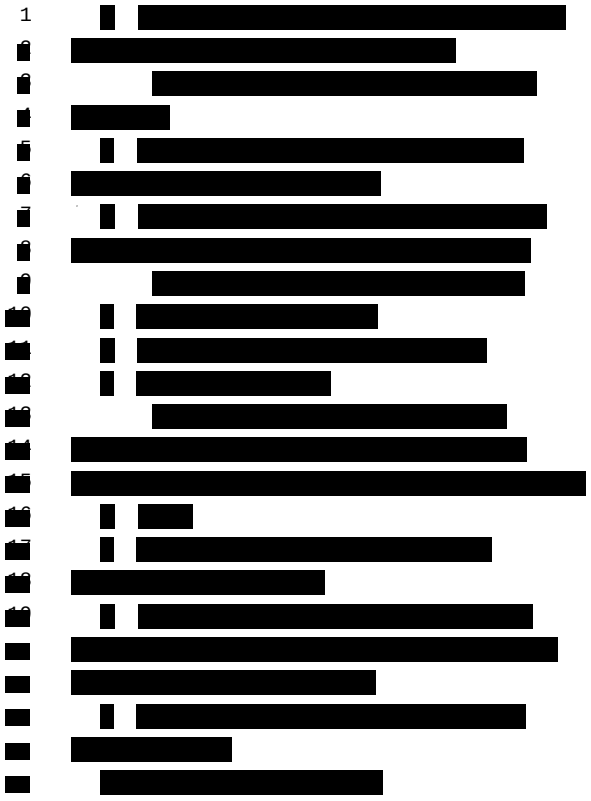
Did you review photos of the Poz-O-Pac or soil underneath the HDPE liners?
A There are a series of photographs that I looked at, and I'm -- the ones I recall looking at was basically when they were being removed. I don't remember looking at photographs of intact Poz-O-Pac.
Q Was all of the Poz-O-Pac removed at the sites, to your knowledge?
A To my knowledge, they were not all removed.
Q So were there any ponds in which it was all removed?
A I believe so, if I remember right. Let me check. I'm trying to recall whether Waukegan -- I think they had originally Poz-O-Pac.
No. I apologize. I don't think Waukegan had Poz-O-Pac. But if you look at my drawings that we prepared, it tells you where the Poz-O-Pac remains.
Q Okay. I'm sorry. So can you --
A Each of these drawings, Drawing 5-1 from my report --
Q And this is your initial report, correct?
A Yes. And Figure 5-2 --
MS. NIJMAN: There's only one report.

THE WITNESS: -- Figure 5-3, Figure 5-4 all have Poz-O-Pac, and that covers Joliet and Powerton with the exception of Figure 5-5, which is the secondary Ash Settling Basin where there is no Poz-O-Pac.
BY MS. CASSEL:
Q Okay. I'm sorry.
So based on these figures that you're referencing, there was Poz-O-Pac that was left under the ash pond, one at Joliet, based on Figure 5-1, correct?
A Correct.
Q There was also Poz-O-Pac left under Joliet Ash Pond 2?
A Figure 5-2, yes.
Q Figure 5-2.
Figure 5-3 shows Poz-O-Pac left under Joliet Ash Pond 3?
A Yes.
Q Okay. Poz-O-Pac was left under the Ash Surge Basin at Powerton based on Figure 5-4?
A Yes.
Q None at the Ash Settling Basin.
Is that because there had never been a

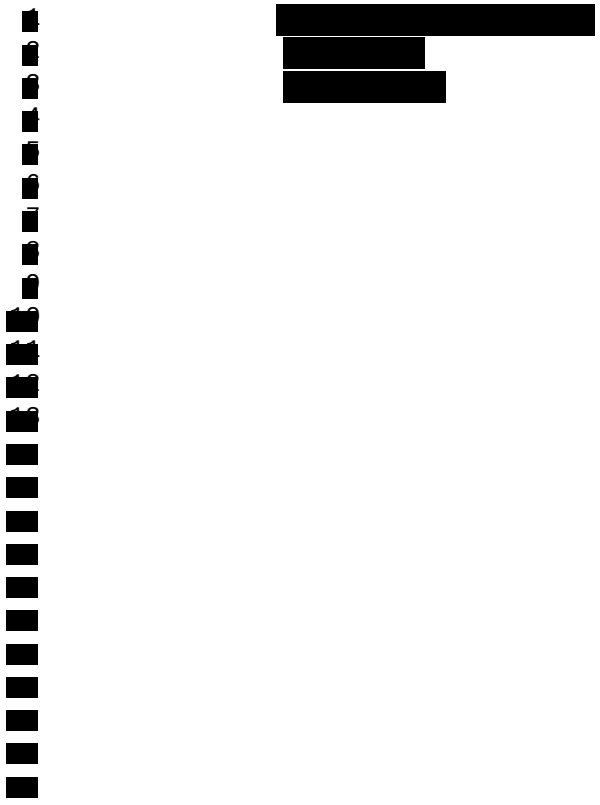
Poz-O-Pac liner there?
A I'd have to look at my list that I made as to whether it had Poz-O-Pac before.
Q Okay.
A And this is Powerton to compare the chart.
Yeah, it did not have Poz-O-Pac before.
Q The Ash Settling Basin?
A The secondary Ash Settling Basin.
Q Secondary. Thank you.
A It had a Hypalon liner. It did not have Poz-O-Pac.
Q Okay. And this is shown in Figure 5-5 -- excuse me. There was Poz-O-Pac that remained under the metal cleaning basin at Powerton based on Figure 5-6, correct?
A Yes.
Q There was also Poz-O-Pac that remained under the Powerton ash bypass basin based on Figure 5-7?
A Yes.
Q This one's a little different here.
So no Poz-O-Pac at Waukegan?
A Correct.

Q And then there is 2.5 feet of Poz-O-Pac that was left under Will County 2 South based on Figure 5-10, correct?
A Yes, South Ash Pond 2. Yes.
Q Okay. And same thing for South Ash Pond 3 --
A Yes.
Q -- based on 5-11?
Okay. Appreciate that. That helps clarify.
Obviously we looked at this impoundment matrix, and I know you referenced other deposition testimony, other documents.
Do you have a specific recollection right now as to specific reports that you reviewed that talked about the condition of the Poz-O-Pac before the liners were placed on -- the HDPE liners were placed on top?
MS. NIJMAN: Again, asked and answered, now, probably four times.
THE WITNESS: Yeah. I did answer the question earlier. I don't want to have to keep --
BY MS. CASSEL:
Q You don't have specific recollection right

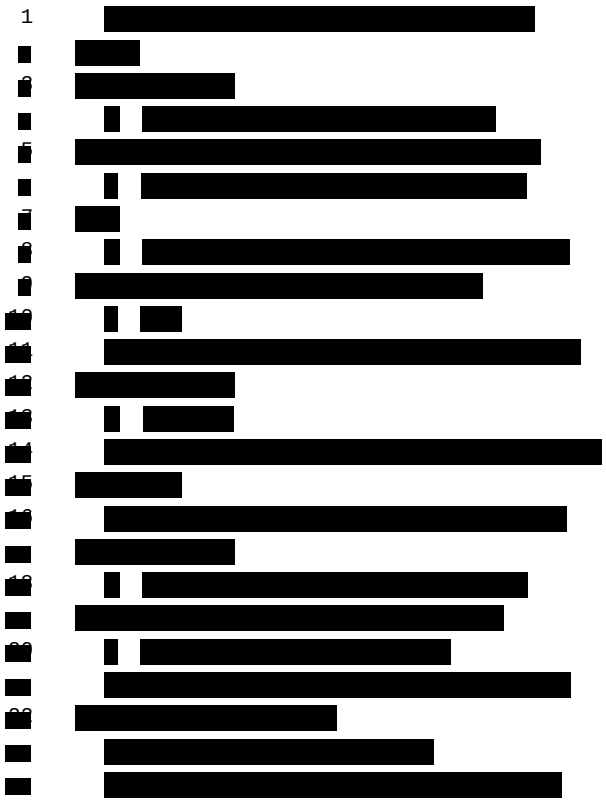




now?
A I do not, not specific of a report.
Q Okay. That's fine. I will stop.
Okay. Now, let's look at page 4 of your report. See under the very last bullet point -- do you see where you state, "All of the active ponds were relined to eliminate a potential exposure pathway"?
A Yes.
Q What is an active pond?
A The active ponds are the ones that at the time they wanted to consider re- -- continue to use. Other ponds they took out of service.
Q Do you know which ponds -- well, let me ask it the other way.
Do you know, were there any ash ponds that were not relined with HDPE?
A The ponds that were relined with HDPE were done in accordance with both the CCAs, the Compliance Commitment Agreements, and previous maintenance activities. The only ponds that I'm aware of off the -- was, as we've discussed earlier, at Will. The 1 North and 1 South were not relined because they were taken out of service.



Q Are you familiar with the former ash basin, which is also known as the old ash basin at Powerton?
A Yes.
Q Do you know if that basin was relined?
A It was not relined.
Q Let's --
MS. CASSEL: This is the massive questionnaire, Steam Electric Questionnaire.
MS. NIJMAN: Do you want to go to a confidential portion of the record?
MS. CASSEL: This is confidential. Okay. So we'll go confidential right here.
(Whereupon the following is confidential:)



(Whereupon the following
is no longer
confidential.)

MS. CASSEL: Can you mark this as the next deposition exhibit.

(Seymour Deposition
Exhibit No. 12 was marked
for identification.)

MS. CASSEL: Okay. If you could turn, please, to page 51 and 52.

And quickly, before we get there, are you familiar with this document, sir?

A Yes.

Q Let's look at page 51 and 52.

A Let me confirm that this is the Mark Kelly deposition, and it's the only deposition that he's provided, I believe.

Q I believe that's correct.

A Then this is the one I'm familiar with.

Q Okay. I apologize. Let me just get this clear. Look on -- please, direct your attention to page 52.

Do you see where the testimony is this:

"Question: Has water ever gotten to the former ash basin from the Ash Surge Basin by any conveyance at all?

Answer: Yes.

Question: How did that happen?

Answer: There's an overflow."

And then a few lines down, it says:

"Question: Do you remember the last time it might have happened?

Answer: Recently. The past couple weeks it happened once."

Do you see that testimony?

A I do.

Q Does that -- were you aware of that information, sir?

A Yes.

Q Does that change your opinion in any way about the extent to which these ash ponds were active at the time of your report?

A Again, when I said "active," maybe I should have clarified that we looked at those ponds that were active in the CCA that required relining. We did not look at the ash -- this Ash Surge Basin, the old ash basin. We did not look at it.

MS. NIJMAN: Except this was dead.

BY MS. CASSEL:

Q Well, can I ask, have you evaluated whether any of the ash ponds at Waukegan, Joliet 29, Powerton, or Will County are underlying -- underlain by at least 2 feet of compacted soil with a hydraulic conductivity of no more than 1 times 10 to the negative 7 centimeters per second?

A My understanding is that they do not have a compacted clay liner of low permeability as you have asked.

And to clarify my last question, they only -- for Powerton, the only way we looked at it was to look at the groundwater quality monitoring data. We did not look at this pond lining.

Q Okay. So -- I'm sorry -- you said your understanding is the ponds, the Midwest Generation ponds that we're discussing, do not have liners with the permeability that I mentioned?

A Correct.

Q What is the basis for your statement?

A That -- the records that we've researched and what has been indicated to us and the -- what I have documented in my report on the figures we just

went through? There's been no report of a compacted clay liner of low permeability as you've requested.

Q Okay. I said "compacted soil," just to be clear.

Do you know about compacted soil with that particular hydraulic conductivity under the liners at the ash ponds?

A I apologize. The only soil that is that low of permeability is clay. It's the same. I'm sorry.

Q Thank you for clarifying.

Okay. And have you evaluated whether any of the ash ponds at Waukegan, Joliet, Powerton, or Will County is underlain by a lower component, which is not a geomembrane and has a liquid flow rate no greater than the liquid flow rate of the clay with the conductivity we just mentioned, the 1 times 10 to the negative 7 centimeters per second?

MS. NIJMAN: Objection to the form of the question and to foundation.

If you can answer the question, you can.

THE WITNESS: Re-read the question, Brad.

MS. CASSEL: I can re-read it.

BY MS. CASSEL:

Q Have you evaluated whether any of the ash ponds at Waukegan, Joliet 29, Powerton, or Will County is underlain by any lower component, which is not a geomembrane, that has a hydraulic conductivity of no more than one by [SIC] 10 to the negative 7 centimeters per second?

A They're -- it's basically the same question, I believe, that the --

Q It isn't. I'm sorry.

I had asked soil before, and now I'm asking if there's a different lower component.

A There is no different lower component other than the Poz-O-Pac, which has a lower permeability, but I don't know if it meets the criterion that you spec- -- requested.

Q Okay. So you haven't specifically evaluated the permeability of the Poz-O-Pac?

A Correct.

Q Okay.

MS. CASSEL: We'll look at that in a second.

BY MS. CASSEL:

Q Let's take a quick look at -- well, would you expect Poz-O-Pac liners that are all 30 plus

years old, as we understand it, to have the permeability of 10 to the negative 7 centimeters per second?

MS. NIJMAN: Object to foundation.

And you can answer, if you can.

THE WITNESS: I believe I've answered the question that I've not looked at the permeability. So I can't tell you whether it meets the low permeability criterion you just mentioned.

BY MS. CASSEL:

Q Right. You said you hadn't actually evaluated that.

But I'm asking whether you think, based on your experience, that 30-year-old-plus Poz-O-Pac layers would have that permeability?

MS. NIJMAN: Foundation. Calls for speculation.

THE WITNESS: My opinion is that if it's intact, it's going to have a low permeability. I don't know how low. If it has been under water, hydrated, protected, if you will, by overlying layers, it would have a low permeability. I don't know how low it would be.

BY MS. CASSEL:

Q Okay. On page 55 of your report -- can you go ahead and look at that again.

A Okay.

Q Let's see. The last sentence of the bullet point near the bottom of the page, the bullet point that begins with "Periodic dredging of settled bottom ash," the last sentence of that, you say, "Based on my review of the --"

A You skipped -- excuse me.

Q I apologize.

A Where is it again?

Q The periodic review. So the sentence at the end of that bullet point says, "Based on my review of the O&M documentation, damage at the HDPE liner below the water level during dredging has not been observed at any ash pond."

Do you see where you write that?

A Yes.

Q Okay. Coal ash is not placed directly on top of the HDPE layers -- liners -- excuse me -- at the ponds that have those liners, correct?

A My understanding of the operation is that it's sloughed into the pond and that it's liquid

dispersant. It's not -- that's how it's placed.

Q But it's not placed directly on top of the liner, correct? There's something else between the liner and that ash?

A For the bottom, they have a protective layer, but on the sides the ash settles on top of the HDPE.

Q Okay. So on the sides, it is directly on top of the liner, but on the bottom, there are cushion warning new layers, right?

A Yes.

Q When coal ash is dredged from the ponds, the bottom of the ponds, the operators don't dredge through that cushion and warning layer, correct?

A My understanding from the deposition is that they do not.

Q Okay. Is it possible to observe --

A Excuse me. We also had follow-up conversation with notes with the different operators. Those notes were provided to you. I don't think it was the depositions, I think it was the notes that we asked them specifically that question as to how they were -- the ash was removed.

Q Is it possible to observe tears or holes in

portions of the liner that remain beneath the cushion or warning layer during dredging?

A It's not possible.

Q You also state in your report, page 56, if you would look at the next page, quote -- this is the first bullet point on that page, the last sentence -- The only tear that was potentially below the water line occurred when no water was in the ash pond and was repaired prior to refilling water to the level in that ash pond.

Do you see that?

A Yes.

MS. CASSEL: Okay. Can you give me the next exhibit, please.

If you could mark this please, sir.

(Seymour Deposition Exhibit No. 13 was marked for identification.)

MS. CASSEL: Thank you.

BY MS. CASSEL:

Q If you take a look at this document, please. It's been marked Deposition Exhibit No. 13; is that correct? 13. Okay.

Once you've had a minute to review,

can you let me know if you've seen this document before, sir.
A I'm familiar with this.
Q Okay. Is this the tear that's referenced in this e-mail, the tear that you refer to in your report as the only tear potentially below the water line?
A I believe so, yes.
Q Did you conduct any evaluation of when this tear occurred?
A There's this message, and I believe there's some follow-up e-mails that clarify when it occurred and also when it was repaired.
Q Did you do any evaluation of how it occurred, the reason for it?
A Only to the extent of what was reported in this e-mail.
Q Did you investigate at all whether it rained on this portion of Pond 3S at Will County with the tear -- the torn liner during the time it was torn?
A I did not, recognizing that this appears to be on the side, on the slope. But -- so I did not evaluate whether there was rain or not.

Q Okay. Did you evaluate at all whether groundwater seeped up into pond 3S at Will County when the liner was torn up?
MS. NIJMAN: I'm sorry. Groundwater?
THE WITNESS: Did you say groundwater?
BY MS. CASSEL:
Q I did.
A Not at this time.
Q You didn't do --
A I mean, I did not specifically do it regarding this event of this tear.
Q Okay. Let's look -- a quick look at the next exhibit, please.
(Seymour Deposition Exhibit No. 14 was marked for identification.)
BY MS. CASSEL:
Q Please take a look at what's been marked as Deposition Exhibit 14. Once you've done that, please let me know if you've seen it before.
A I've seen this before.
Q Okay. Do you see where it says the location is 3S Ash Ponds --
A Yes, I see that.

Q -- Will County, dated October 1st, 2009, correct?
A Yes.
Q Do you see where it says "Water seeping through cracks in 2nd p-o-p layer"?
A Yes.
Q Does that refer to Poz-O-Pac in your understanding?
A I believe so, yes.
Q Do you have any basis to contend that water seeped up through cracks in the Poz-O-Pac layer in Pond 3S in 2009?
A I've looked at this and other documentation, including Rebecca Maddox's (phonetic) deposition, and I have -- I don't know why this water is there. I don't have an opinion that I've researched. I don't even know at this point whether or not that tear was -- how close it was to the groundwater table, so I couldn't say.
Q So you didn't evaluate a specific -- or you don't have a specific opinion as to where that water came from?
A That's correct.
Q Do you have any -- you don't have any

specific basis to contest Ms. Maddox' description here?
A It's her eyewitness account. I have no basis to countermand it.
MS. NIJMAN: We don't know if it's an eyewitness account.
MS. CASSEL: Okay.
MS. NIJMAN: It's what's in this document.
BY MS. CASSEL:
Q Moving to page -- looking back at page 7 of your report, you state at the top -- wait till you get there. It's the first bullet point.
A Okay.
Q Do you see where you state, "The ash ponds do not need to be removed because they are for wastewater treatment purposes and are not landfills for permanent ash disposal"?
A I see that.
Q Can you explain how the pond's purpose affects the likelihood of groundwater contamination from that pond?
A I'm not sure the connection with your question with this bullet.
Q Is there any -- why did you state that the

ash ponds do not need to be removed because they are for ash wastewater purposes and not landfills?

A Well, I believe that part of a complaint was that the material was being placed there as a landfill. And my comment is that it's not a landfill, it's a wastewater treatment pond.

Q And does the purpose for which it is being used determine whether or not the ponds need to be removed to address groundwater contamination there?

A At this point I'd say that the purpose, whether it be wastewater or landfill, they would have similar -- the liners would function similarly. And I would say that neither one would have to be removed based on the information we have right now.

And I do believe that this is specifically in response to a claim that it had to be removed because it was used for ash disposal, and the comment is it's not. It's a wastewater treatment pond.

Q I see.

Okay. Can you tell me, are unfilled landfills for permanent ash -- excuse me. Unlined landfills for permanent ash disposal, is that a safe disposal practice in your opinion?

MS. NIJMAN: I'm sorry. Is this referring to the report again?

MS. CASSEL: It's not.

MS. NIJMAN: Oh. Objection to overbreadth and foundation.

THE WITNESS: The current practice that has evolved over the years is that when you place waste, you have it contained in some form or fashion.

BY MS. CASSEL:

Q So unlined landfills are uncontained, is that correct, as you reference them?

A Unlined landfills can be contained in two ways. They can be covered, for example, if they're closed, and that provides containment. They don't have to be lined per se.

For example, U.S. EPA, in their rulemaking, looked at landfills versus ponds. Where you have a landfill that exists, like a CCR landfill onsite, inactive, not lined, there's no action being taken for it.

So it's many different circumstances, but I can say that the normal technology's to contain it. But it can be contained by covering. It doesn't have to be lined.

Q Is there any circumstances in which containing it by covering it won't actually prevent continued groundwater contamination?

A You're getting into --

MS. NIJMAN: Overbroad. Hypothetical.

THE WITNESS: I'll use the --

MS. NIJMAN: Foundation.

THE WITNESS: -- schoolroom here -- the classroom. It's very broad, and so I don't know --

BY MS. CASSEL:

Q So what circumstances -- are there any circumstances under which that could be the case, that it would not be a safe disposal practice to simply cap a landfill without having a liner under it?

MS. NIJMAN: Same objections. Overbreadth. Foundation.

If you can answer the hypothetical with that amount of information, you can try.

THE WITNESS: I -- it's very -- I apologize. It's very broad. I mean, I've closed landfills by covering the head portion of the waste in the groundwater. And that -- they have groundwater monitoring and other protections to make them safe.

And so --

BY MS. CASSEL:

Q So you --

A -- it can done.

Q I apologize.

A -- and be safe. And if it's not --

Q So what things need to be done to make it safe?

MS. NIJMAN: Again, same objections to overbreadth and lack of any specificity.

THE WITNESS: As I mentioned, cover, containment, things like that. But I'm just saying -- is that there are many. But I'm not here --

BY MS. CASSEL:

Q I understand that. I --

A I'm not here to run down the cafeteria menu.

Q In your opinion, is there any way -- are there either any circum- -- I just -- I recognize it's broad, but it sounds like there are things that need to be done to make something safe if you simply cover it.

Is that an accurate representation of

your testimony?
A No.
Q No? Okay.
A There are many things that can be done to make it safe. That's my -- that's the point of my testimony.
Q Okay.
A There's no one thing.
Q Are there ever situations in which it would not be a safe disposal practice to simply cap a landfill?
MS. NIJMAN: Asked and answered.
THE WITNESS: Are there situ- -- if the pond landfill is unlined, you know -- you know, it's just very -- very vague that you're asking me this.
MS. NIJMAN: If you want to give him a specific hypothetical, then do so.
THE WITNESS: Okay. Well --
MS. NIJMAN: If you can answer, John, without any specifics, you can try.
THE WITNESS: I will give you an opinion that if you had a landfill that was closed that had highly mobile wastes and that the wastes were placed below the groundwater table and they were allowed to

migrate offsite, then I would say that would not be a safe practice --
BY MS. CASSEL:
Q Okay.
A -- as a hypothetical.
Q Understood.
Finally, looking back at page 4 of your report, quickly, I believe you state in the sub-bullet point in the middle of the page -- you state, "IEPA Bureau of Water has not reported any groundwater violations for sites with GMZs."
Do you see that?
A I see that.
Q Do you know what the applicable groundwater standards are within a GMZ?
A The point of the GMZ is established for -- during a remediation process. And what a GMZ does is it removes a violation, so there are no violations. It removes the possibility for a violation.
Q So IEPA could possibly actually report a violation of groundwater changes within the GMZ, could it?
A I don't believe they could based on the rule -- the way they set it up.

MS. CASSEL: If I could take a very, very brief break to see if I have any other questions, and then we will be -- we're very near close.
MS. NIJMAN: Okay.
MS. CASSEL: Thank you.
(After a short recess, the deposition resumed as follows:)
MS. CASSEL: Go back on the record.
Thank you again for taking the time today, Mr. Seymour. We are just about done, get you out of here. Just a few additional questions.
BY MS. CASSEL:
Q I wanted to ask, do you recall testimony earlier that older ash might leach less than more recent ash?
A Yes.
Q Is that an accurate description of your testimony?
A In general, yes. You would expect it to leach less over time.
Q Okay. Why is that the case?
A Because the -- they are dissolving, removing the contaminants, if you will, from the ash.

Q So it's already been leached out, some of the contaminants, or -- I'm sorry.
Can you explain it somewhat.
A Well, theoretically, what you have as time goes on, you're removing mass. You're removing -- you know, the elements. And so you expect over time that there would be less to remove.
Q Because it's already leached out some. And so --
A It's already -- it's already moved --
Q -- there's less to leach out continuously?
A Yes, that's the theory.
Q Okay. Is that the only reason why older ash might potentially or would leach less than newer ash?
A That's one. I don't -- haven't really thought if there are more mechanisms, that it would have less over time, but recognize a lot of the stuff that we have at the site is bottom ash with some fly ash. But it's primarily bottom ash that I've seen, cinders, things called out like that.
I believe they're recycling a lot of their fly ash. And bottom ash is commonly used as fill, and it's less leachable than fly ash, for

example.
Q What makes bottom ash less leachable than fly ash?
A It comes from the bottom of the boiler, and it's more solidified and hardened and it's courser. And so part of what makes something more soluble is the surface area. And so with bottom ash, the surface area is smaller for the same weight. So with fine particles, there's much more surface area to remove the metals from the particle.
Q And can you tell me, again, what the basis was for the statement that a lot of the ash at these sites is bottom ash and not fly ash?
A That's my understanding, is that fly ash is reusable and that they use bottom ash as fill. Now, I'm not saying it's only bottom ash. It's lots of different things if you look at the boring logs.
Q Okay.
A It's not a hundred percent.
Q You've mentioned a few times that Illinois has specifically relied on or approved the ASTM D3987-85 test; is that accurate?
A Yes. There's a code in Illinois that's specific, that says you use this test for beneficial

reuse of coal compression by-products. If it's a by-product, it's reusable.
Q So that's the test that's used to determine whether or not something qualifies for beneficial re- -- ash qualifies for beneficial reuse; is that accurate?
A Yes, in Illinois.
Q Do you know if Illinois has specifically sanctioned the use of this test for any other purpose?
A I'm unaware of that.
Q Okay. And then, finally, I believe earlier you had testified that at Joliet in the historical coal ash -- ash fill, the leachate is below the groundwater standard, so it can't be contributing to the groundwater concentrations being above the standards; is that correct?
MS. NIJMAN: Object to form and --
THE WITNESS: I'd have to go back to check the testimony.
BY MS. CASSEL:
Q Is that --
A To my recollection, it seems that I said that.

Q Okay. In making that statement or that testimony, are you taking into account the different detection levels, thresholds for leachate and groundwater?
THE WITNESS: If you could back up and repeat -- repeat the whole train of thought because we -- I interrupted, and I'd like to go back to the beginning.
MS. CASSEL: Could you read back my question just before this, please.
(The last question was read by the reporter.)
THE WITNESS: I think we -- I didn't say it can't. What I said, from my recollection, is that we ran the test, we looked at the results, and it met the groundwater quality criteria.
So we were saying that we don't believe it's contributing to the -- currently contributing to the groundwater impacts based on that result.
BY MS. CASSEL:
Q And -- I'm sorry -- what results are you referencing?
A The leach -- the leaching results of the of

the ash with ASTM D3987, those results.
Q And in coming to that conclusion, did you take into account the different detection thresholds of the leachate versus the groundwater?
A We took into consideration that the leachate had met the groundwater -- Class 1 groundwater standards, but not the detection between the two -- between the ash extract and the groundwater analysis.
MS. CASSEL: Okay. I believe that completes our questions. Yes. That's it for us for today.
The one thing I want to state quickly on the record is, in light of the production yesterday of the supplement to Mr. Seymour's report as well as the notes that were provided to us in the middle of -- not the middle -- in the beginning of -- relatively near the beginning of today's deposition, we're going to need to hold this deposition open in order to take a closer look and evaluate those documents and determine whether we need to further question Mr. Seymour about those.
MS. NIJMAN: Well -- and, as I mentioned to you yesterday, we don't agree. If you have any questions, you've had plenty of time to present those

questions. I have a couple questions myself.
Would you pass me Exhibit 8?
MS. CASSEL: And Exhibit 8 was those notes; is that correct?
MS. NIJMAN: Uh-huh.
EXAMINATION
BY
MS. NIJMAN:
Q Mr. Seymour, looking at Exhibit 8. Is that a copy of the notes that you provided to Ms. Cassel this morning?
A Yes.
Q When did you prepare those notes?
A Yesterday.
Q And why did you prepare them?
A I was preparing for this deposition, and I wanted to be clear in my ideas that the groundwater quality has not been trending up or down, that it was both trending up or down.
So I wanted to look at the trends for my own knowledge in case it came up as a question in the deposition.
Q And did anything in that -- in those notes change your opinion?

A It did not. It confirmed my opinion.
Q And was there any new data used in those notes?
A No. We used the data from 2014 as -- and I believe then -- and before. It goes from, I think, 2010 to 2014, but does not include 2015, to the best of my recollection.
MS. NIJMAN: Okay. Thank you.
I'd also like to mark as an exhibit The Supplemental to Expert Report of John Seymour.
So will that be 13?
THE REPORTER: That would be 15.
(Seymour Deposition Exhibit No. 15 was marked for identification.)
MS. CASSEL: If you could, give me a copy. Thank you.
BY MS. NIJMAN:
Q You also mentioned to Ms. Cassel several times today that you had prepared a supplement to your report.
Is this Exhibit 15 a copy -- full and correct copy of that supplemental?
A Yes, I believe so. Let me check.

Yes, I believe -- it looks complete.
Q And you already testified today with Ms. Cassel what the math error was.
Does anything in this supplement change your opinions in your report?
A No.
Q And specifically referring to your old report, which has been marked as Exhibit 1 -- Exhibit 2 -- excuse me -- Deposition Exhibit 2 in your deposition, your report with the old section 5.5.2, Ms. Cassel directed you to a statement at the very end of that page 43 of your report.
Do you see that?
A I see that.
Q Has that opinion, at the end of this particular section that has been replaced now -- has your opinion changed --
A No.
Q -- by these corrected --
A No.
Q Excuse me. And has the basis or the method by which you made this opinion changed?
A In general, no.
MS. NIJMAN: That's all I have.

MS. CASSEL: All set.
MS. NIJMAN: Thank you. Reserve signature.

This is to certify that I have read the transcript of my deposition taken on the 1st day of March 2016 in the foregoing cause, and that the foregoing transcript accurately states the questions asked and the answers given by me, with the changes or corrections, if any, made on the Errata Sheet(s) attached hereto.

JOHN PATRICK SEYMOUR, P.E.

Subscribed and sworn to
before me this day
of 2016

Notary Public

STATE OF ILLINOIS )
) SS:
COUNTY OF COOK )

Brad Benjamin, being first duly sworn on oath, says that he is a Certified Shorthand Reporter, that he reported in shorthand the testimony given at the taking of said deposition, and that the foregoing is a true and correct transcript of his shorthand notes so taken as aforesaid and contains all the testimony given by JOHN PATRICK SEYMOUR, P.E., at said deposition. And further, that he is not connected by blood or marriage with any of the parties to this action, nor is he a relative or employee or attorney or counsel of any of the parties, or financially interested directly or indirectly in the matter in controversy.

That the preceding deposition shall be read by said deponent, and any and all corrections which the deponent desires to make shall be duly made by the deponent on the enclosed Errata Sheet(s), indicating page and line to be corrected, and that the explanation, if any, given by the deponent for said corrections, shall be thereon noted.

Brad Benjamin

Certified Shorthand Reporter

**Re: Sierra Club et al. v. Midwest Generation, LLC.**

**Dear Ms. Nijman:**

**Enclosed please find the transcript of the discovery deposition of John Patrick Seymour, P.E., taken on March 1, 2016, in the above-entitled cause.**

**Since signature was reserved, please ask Mr. Seymour to review his transcript from March 1 2016, making any necessary corrections on the Errata Sheets, and sign and notarize the deponent's signature page.**

**Please send the original signed Errata Sheets and signed deponent's certificate to John Patrick Seymour, P.E., keep a copy for yourself, and please send a copy to me for my records.**

**According to Amended Rule 207(a), signature must be obtained within 28 days or the deposition may then be used as fully as though signed.**

**Your cooperation in this matter is greatly appreciated. Thank you.**

**Sincerely,**

**Brad Benjamin, CSR**

Witness sworn.)

FREDRICK VEENBAAS,

called as a witness herein, having been first duly sworn, was examined and testified as follows:

EXAMINATION

BY

MS. CASSEL:

Q Good morning, sir. Thank you again for joining us this morning. Can you for the record please state your name, your place of employment and the address of that place of employment?

A My name is Fredrick Veenbaas, I work for Midwest Generation. I am at the Waukegan station facility at 401 East Greenwood Avenue in Waukegan, Illinois.

Q As Jennifer said, my name is Jennifer Cassel, I'm an attorney with the Environmental Law & Policy Center and I will be asking you some questions today. Have you ever given a deposition before?

A Yes.

Q As you know, in that case this is a formal legal proceeding and as you were sworn in you have a legal obligation to answer the questions truthfully. You understand?

A Yes.

Q For the benefit of the court reporter, please answer out loud. If you don't understand the question, don't answer, you can ask me to clarify that. If you do answer a question, we will assume that you understood it. Okay?

A Yes.

Q If you need a break, let us know and we will take a short break. You will have the opportunity to read over the deposition transcript when this is all done and correct any mistakes in that transcription. You understand that?

A Yes.

Q Sir, did you prepare for this deposition at all?

A I don't understand. When you say prepare, what do you mean?

Q Did you speak to anyone other than counsel about this deposition or review any documents in preparation for this deposition?

A Just my counsel here. I met with my counsel.
MS. NIJMAN: There was one other person that you spoke to for the operations.
THE WITNESS: Chris Lux.
MS. CASSEL: Q You spoke with Chris Lux?
A Right.
Q So as part of your preparation in your conversation with Chris Lux, did you discuss or review any documents pertaining to removal of coal compression waste in Waukegan?
A Yes.
Q Did you speak to anyone or review documents concerning inspection of liners at Waukegan?
A Yes.
Q Did you speak to anyone or review documents concerning identification or repair of liner damage at Waukegan?
A Yes.
Q Did you -- couple more -- did you speak with anyone or review documents pertaining to the identification or need for -- the identification of the need for and process for relining at Waukegan?
A Yes.

Q Finally did you speak with anyone or review documents pertaining to any changes in those operations that took place on or after October 15, 2012?
A Yes.
Q This was all -- the conversations that you had on those issues were all with Chris Lux and he was the only one?
A Yes.
Q Now, you understand, sir, that with regard to those operations that I just listed you will be answering today on behalf of Midwest Generation and not based on your personal knowledge, correct?
A Yes.
Q You did not review any other documents in preparation for this document?
A No.
Q Let's discuss your background a little bit, sir. Can you tell me how long you have worked at Midwest Generation?
A Since 1999, December of 1999.
Q What is your current position right now?
A I am environmental compliance specialist in Waukegan station.

Q How long have you been in that position?
A 2012.
Q What are your responsibilities?
A Basically review and responsible for the compliance activities of the station. That includes reporting, overseeing that the environmental activities go along as they should.
Q Do those responsibilities include anything related to ash management at Waukegan?
A Generally I'm aware of ash management, but it is not my responsibility.
Q When you say you are aware of it, what does that mean?
A I know it goes on, there are people that perform that function. I am not directly responsible for it.
Q Do they report to you?
A No.
Q Are there any situations in which if something goes wrong with an ash pond or any sort of ash management would that be reported to you?
A Generally it would particularly with repairs, but I would not necessarily be in the middle of the process, but I would be made aware of

the process, what is going on.
Q When you are made aware of that, why are they making you aware of that, are you telling anyone else?
A No. They are letting me know something is going on, there is an issue and that's what is going on.
Q Do you direct anyone with regard to those type of issues that you are made aware of?
A No.
Q Now, prior to your current position at Waukegan, what was your prior position?
A I was the chemistry assistant specialist at Will County.
Q What was the time line of that position?
A Basically between '99 when Midwest Generation took over Will County and when I opted to go to Waukegan in 2012.
Q What were your responsibilities as a chemistry assistant specialist?
A I was responsible for the process chemistry of the units, four units at the beginning. I was also the wastewater operator, the class K operator, which is a state license, and I was also responsible

for the process of water production.
Q And with those responsibilities, were you involved in any way in ash management at Will County?
A No.
Q Did you ever speak with anyone while you were at Will County about anything concerning ash ponds or ash management?
MS. NIJMAN: Objection.
THE WITNESS: Rephrase that again.
MS. CASSEL: Q Did you ever have communications with people at Will County while you were there concerning coal ash management?
A Let me clarify. As wastewater operator, I was responsible for the water that was used -- treated the water that was used to convey the ash in the ash ponds. In that context that is how I got involved with the ash management. It was treatment of the water, not the actual conveyance of the ash, or the cleaning of the ponds.
Q So you would be involved in treatment of water in those ponds?
A What we call the sluice water to bring the ash to the ponds.
Q So can you describe a little more what

exactly your roles were, your responsibilities were with regard to that process?
A There was weekly, generally a weekly discharge of water with waste system which is clarifies using coagulating agent, and I was responsible for making sure that that water adhered to the RMPS permit levels.
Q So the clarifiers, where was the water that went to the clarifier, where was that coming from?
A What we call the ash recycle system, which would be the water taken from the ash ponds and then conveyed back to the station, there was a line that teed off that line that went to the waste water system and we would open that valve up and treat water on weekly basis.
Q So the water that went through those clarifiers, did it have ash in it ever?
A No. The water that we treated through the waste water system adhered to the limits that we had for the permit.
Q To your knowledge, did that water ever have ash or any constituents of ash still in the water as it went through that system?
MS. NIJMAN: Objection, asked and answered

and compound.
THE WITNESS: Rephrase it then.
MS. CASSEL: Q You said that the water complied with certain limits of the permit. I am not familiar with that permit. To be honest I am not that interested in that permit.
I am asking you if there was any ash or ash constituents that were in that waste water process that you were overseeing?
A Generally the possibility of that happening the water that went to the ponds contained solids from anywhere in the plant, the floor drains, the roof drains to the area drains in the property. Also the water that was used to convey the slags to the ponds.
Q So the sluice slag?
A Yes.
Q Where did -- after the clarifiers is it correct to say that water could go into the standby pond?
A Yes. The clarifier discharger could go to the standby pond, which is about a million gallons in volume, and then from there it would go through a pipe all the way to the canal.

Q So were you in charge of making sure that the water flow from these various water sources at the plant proceeded through the various processing points?
MS. NIJMAN: Objection, misstates testimony. You can answer.
THE WITNESS: No, those systems are basically passive, they allow the water to flow from one point to another by gravity. I was not responsible for that. I was responsible for treatment of the water once it got to the point.
MS. CASSEL: Q If there was a problem with that flow, for example, if an ash pond was getting stuffed up with drippings like that, would you be made aware, would you have been made aware of that issue?
A Possibly. I mean I want to make sure -- I want to make sure water always proceeded out of the ponds where if we went through an overflow, it would go into a building where there are pumps, I pump it back in the building through the ash recycle system, so possibly.
Q Do you recall an instance where you were informed that there was a problem with one of the ponds being sort of stuffed up with leaves or plants?

A When I first got there, there was some leave issues in the ponds, which we took care of.

Q I think there may have been another -- I will ask about that later. I want to get a general idea. Then let me ask you, sir, I understand you were at -- is it correct to say you were at Commonwealth Edison at a number of plants prior to your position at Will County?

A Yes.

Q Did you have any responsibility relating to ash management when you were at Commonwealth Edison?

A On occasion, yes. Depends on what job you want me to speak to. I have had multiple jobs, and on some jobs strictly the operating side I was responsible for maybe that area.

Q Do you recall any particular duties or responsibilities you had with regard to ash ponds?

A Well, there were no ash ponds at Crawford and there were no ash ponds at FISK. There were hydro bins which they convey the bottom ash to a bin with filters and they would dump the ash in a truck. So as I was operating supervisor, I was responsible for people to make sure that that happened. I also had a job at Kincaid which had ash ponds, but I had

no responsibility in that area.

Q Did you have any similar responsibilities with regard to water, process water management at those facilities?

A I did not hold a license in any of those facilities.

Q Moving into the more recent past, can you tell me if you had any responsibilities relating to responding to the notice of violations that were issued by Illinois EPA to Midwest in 2012?

A Specifically which one?

Q There were multiple ones. I am asking if you had any responsibilities relating to responding to any of them?

A No.

Q Did you have any role in developing the compliance commitment agreement?

A No.

Q Did you have or do you have any responsibilities for complying with the compliance commitment agreement?

A Compliance commitment agreement exists at Waukegan and I am aware of that and most of what it entails, so I have some responsibilities in

those areas.

Q Can you describe to me what some of those are?

A There is a quarterly sampling requirement that is part of the CCA and I coordinate with KPRG, for the sampling of the wells that we have. There are wells that exist as a result of that agreement. We have responsibilities to make sure that ash is only stored temporarily in the ponds. Also, we have responsibility if there are any issues with the ponds that, say, a hole or a tear in the lining below the water line, then we would report that -- we would suspend activity and report that to the IEPA.

Q So you are responsible for making sure that those things take place at Waukegan?

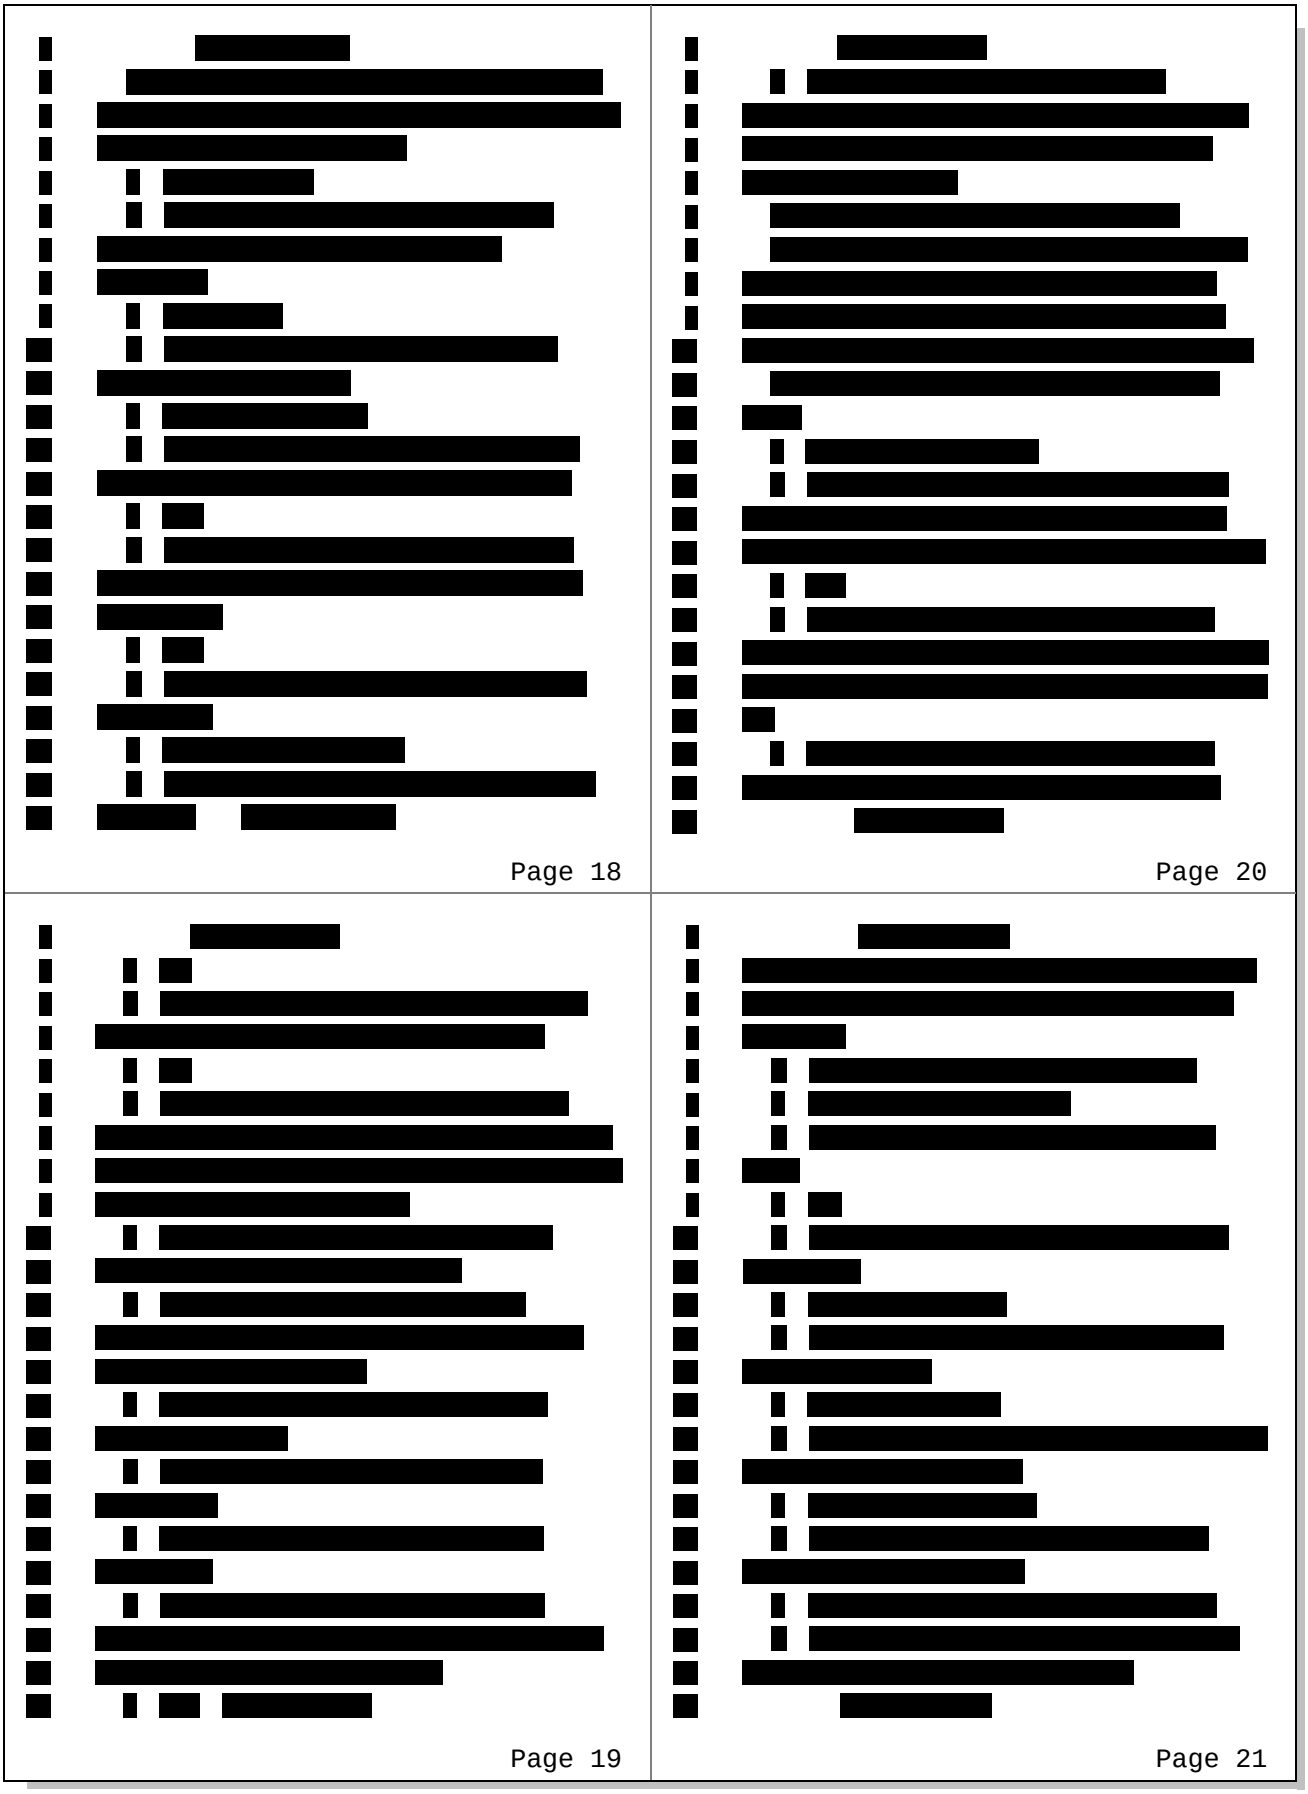
A Among others. Among other things. Among other people.

Q Understood. Let me ask you a couple questions about terminology. Do you have an understanding what slag is?

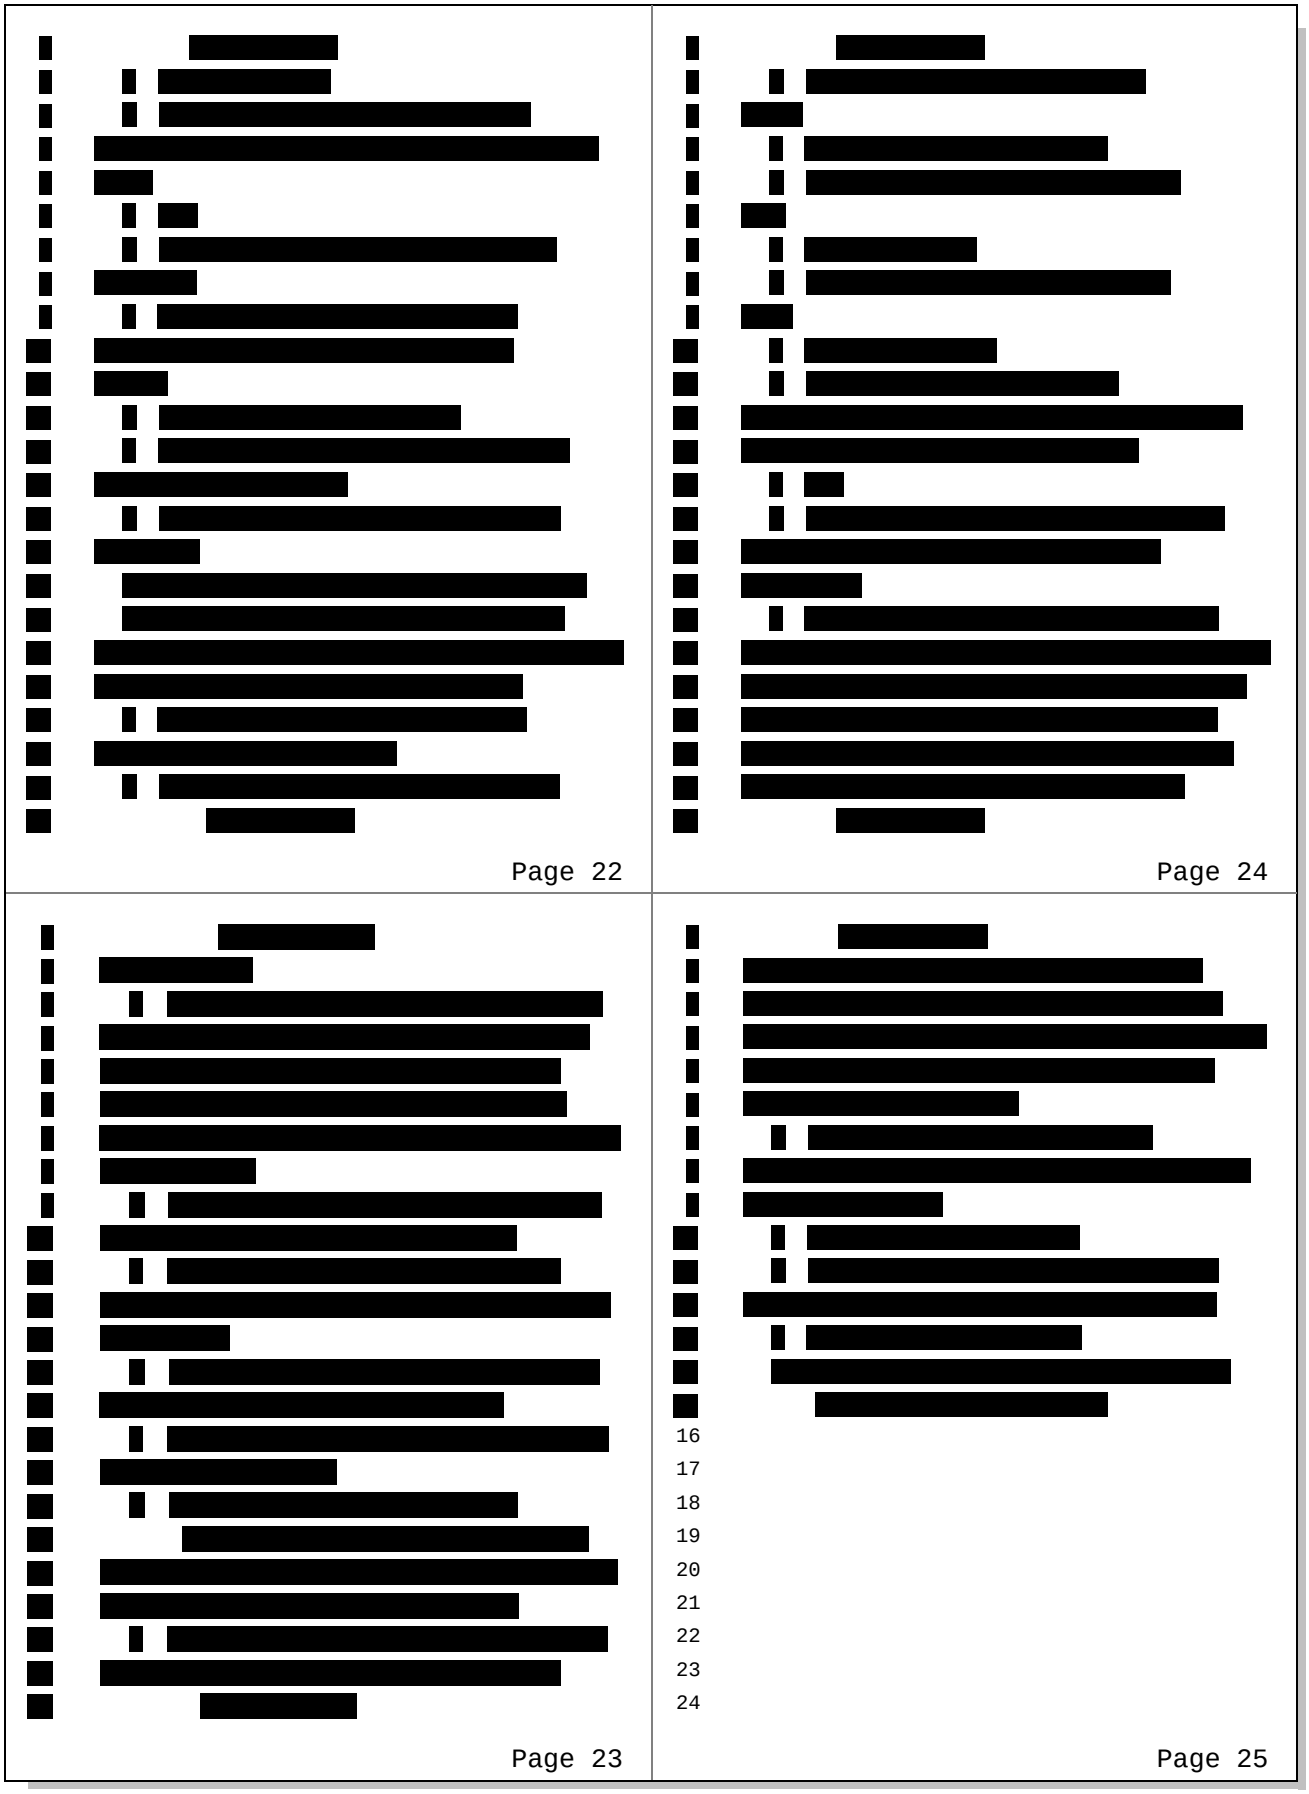
A Yes.

Q Can you tell me what that is?

A Slag is a word that is used for ash that generally comes out of cyclone furnaces.



Q Is that bottom ash?



A It can be used that way and sometimes is used that way, but generally it is more specifically a sign to ash that comes out of cyclone furnaces.

Q Have you ever -- do you ever use the term slag interchangeably with ash?

A It has happened in the past, yes.

Q Now, I want to talk to you a little bit about the Will County facility. If you can open up, we will be in confidential starting right now for a few minutes.

MS. CASSEL: Q Now, I would like to show you what has been already marked as Deposition Exhibit No. 96. Sir, can you tell me if you have seen -- take a second to look at it and tell me if you have seen that document before?

A No, I have not.

Q I want to make use of a map. Sir, just to make sure we are all talking about the same thing here, do you see on that map where it refers to pond one and pond two at the bottom?

A Yes.

Q Those are the ponds that you were stating before were used for flue gas byproduct?

A Yes.

Q Is that a single pond, or is it two ponds, do you know?

A It is hard -- they have a tie between them, a pipe between them. Generally when one rode, the other one rode along with it. But they were physically two distinct ponds with a tie. A pipe between the two.

Q So the pipe ran between them then?

A The pipe was open and they would be kind of one pond, they would rise and fall together, but that

is my understanding.

Q Was the tie generally open to your knowledge when you were there?

A I believe so.

Q Do you know if it continues to be?

A I cannot speak to that.

Q Do you happen to know whether that pond is or those ponds are lined?

A I cannot speak to that either.

Q You said they are no longer in use to your knowledge, is that right?

A Yes.

Q Do you know if those ponds are or were when you were there ever inspected for leaks?

A We had suspicion that possibly they didn't know how to level control especially with those things, so there were suspicions there might have been underground leak between those ponds and the river, but we never confirmed that.

Q So no investigation was ever undertaken to check that out?

A No.

Q Do you know if they were ever inspected for structural integrity issues?

A I don't know that, no.

Q Just to clarify, was it ever inspected -- those ponds were they ever inspected for anything at all that you recall while you were at Will County?

A Not that I know, no.

Q I am guessing you don't know whether or not it is currently leaking, is that correct?

MS. NIJMAN: Objection to misstating prior testimony. No statement that he made it was currently leaking or it was ever leaking.

MS. CASSEL: I prefer I get his testimony.

THE WITNESS: Would you restate.

MS. CASSEL: Q I asked you whether or not do you know if it is currently leaking?

A I cannot speak to that.

Q Is that pond capped to your knowledge?

A I don't know.

Q Anything on top of it?

A I have not been there for two years.

Q Was it capped while you were there?

A What do you mean by capped?

Q Was there anything on top of it to, for example, prevent rain water from entering into

those ponds?

A No, they are open.

Q Now, let's move to the standby pond. Do you see where that identifies the standby pond on this map, sir?

A Yes.

Q You are familiar with that pond?

A Yes.

Q Do you know if that pond is lined?

A May have a lining in it, but I am not totally sure. We cleaned it once when I was there, but I cannot speak to definitively whether that would be.

Q Do you know if the standby pond is inspected for leaks at all?

A The operators when I was there would go to the clarifiers and inspect the clarifiers. They would also inspect the clarity of the standby pond. The standby pond level is actually higher by ten feet anything around it, so any leakage you would see the leakage going in the area around the pond.

Q Did you ever see any leakage around the pond?

A No.

Q Is that the type of inspection that would occur would be the official inspection?
A Most likely, yes.
Q Most likely yes, so you are not sure?
A They would drive around and look at the clarity and they would probably see a leak if there was one.
Q Beyond that are you aware of any other type of inspections that took place?
A No.
Q You said you cleaned that pond at one point when you were there. Can you describe what that entailed?
MS. NIJMAN: I object to the mischaracterization of prior testimony. He didn't clean it.
MS. CASSEL: Q That pond was cleaned once when you were there?
A Yes.
Q Can you describe what that entailed?
A It was drained, pumped down, a front end loader was used and they loaded the contents, the solid contents of the pond in the dump trucks.
Q Do you know where that -- was it all loaded

right next to the pond, or was it loaded into the truck inside the pond?
A There is a ramp that goes into the pond and the truck sits back on the ramp and the excavator or the front end loader would be in the pond itself.
Q Do you recall any damage to the pond at all that took place when that clean-out occurred?
A Actually if I remember it was not quite as full as we thought it would be as far as the solids.
Q Did you leave any solids in place there?
A Yes.
Q Did whoever cleaned out the pond leave solids there?
A Solids were left in place because it was so wet we could not get the solids out.
Q To your knowledge, have those solids been removed since that time?
A I have no knowledge of that.
Q I know you said -- I believe you said that you had never seen any leaks from that pond while you were at Will County, is that a correct statement?
A Yes.
Q Were you aware of any other type of situation in which water escaped from that pond when

you were there?
A No. Not aware of any situation like that.
Q You are not aware of leaching down below?
A I am not aware of that.
Q Is the standby pond covered in any way, or is it open to the sky?
A It is open to the sky.
Q Now, moving on to the south area basin, actually identified there as several south area basins, I believe?
A Yes.
Q This is still on Page 5743 of Deposition Exhibit No. 96 for the record. You are familiar with those south area basins?
A I am aware they exist.
Q Do you know if those are lined?
A I am not aware of that.
Q And you said they are inactive, they are not used right now?
A When I was there, they were not being used.
Q Right now you don't know?
A No.
Q When you were there, were those basins ever inspected for leaks?

A Not that I am aware of.
Q Were they ever inspected for structural integrity?
A Not that I am aware of.
Q Was there any method used to your knowledge to determine if those south area basins were leaking while you were at Will County?
A Not that I am aware of.
Q Again, do you know if water has escaped from those basins through any other mechanism other than leaking?
A Not that I am aware of.
Q Those basins, are they also open to the side?
A Yes.
Q Sir, there are other ponds at Will County. We have talked about some. To your knowledge, ash pond one north, is that retired?
A It was retired while I was there, yes.
Q What was the process used if you recall to retire that pond, was there anything done to the pond to retire it?
A The reason why it was retired, it was Units 1 and 2 that were retired, the slag from those

units didn't exist anymore because they were not being run, so there was no need for those two ponds to exist.

Q Was anything done physically to those ponds when they were ceased being used?

A One south was retired in place with no water going through it. I believe they continued to use one north as a flow-through for ash sluice water. Particularly in the wintertime they didn't want things to freeze up.

Q Do you know how long that one north was continued to be used for ash sluice water?

A It was not ash sluice water, it was ash recycled water.

Q Ash recycled water. Sorry.

A No, I cannot be sure of that, no.

Q Were there any barriers put in place, for example, for one south to halt the flow of any water into that?

A Yes, there is the overflow from that pond that was unnamed, a slag.

Q Does that appear on this map here, sir?

A What does that say? I cannot read it.

MS. NIJMAN: Retention basin.

THE WITNESS: I am not sure if the retention basin, that slag label that we used to pull out of that one report at the same time, but there was a pond right next to the number one north that held the major portion of slag that was sliding down those units. And then the overflow from that went into a trough, you can divert the water to one north or one south based on a slide like a piece of metal that would slightly cover the trough.

MS. CASSEL: Q Does that pond on this map appear to be where the pond that you are recalling is located?

A I thought the slag pond would be more to the east and almost parallel to one north.

Q That does not appear to reflect that?

A No.

Q So going back to one south just for a moment, you said that it was retired in place. Can you describe what you mean it was retired in place?

A They just stopped water flow to it, left it alone.

Q The ash was left in the bottom of the pond?

A Yes.

Q Do you know if that pond has been covered

up with anything?

A I cannot speak to it.

Q Was it covered up with anything when you were there?

A No.

Q Was anything planted in the ash?

A No. I mean there are weeds that probably grew in it, but there was nothing purposely planted, no.

Q To your knowledge, was it full of leaves, or plants?

A You mean full? It had plants in it maybe covering a large percentage of the pond maybe.

Q Do you know if those plants have been removed?

A I cannot speak to that.

Q Going back to one north, was ash also left in place at that pond after it ceased being used?

A Yes, it had ash left in it.

Q And has that pond been covered over with anything?

A No.

Q Do you know if that --

A Not that I know of.

Q And was that pond planted or seeded with anything while you were there?

A Not while I was there, no.

Q Did it also have things just growing in it?

A Yes.

Q Do you know if those have been removed?

A I cannot speak to that.

Q So other than the ponds we have already discussed and the ponds identified as one north, one south, two south and three south, do you know of any other ponds at the Will County facility that contained coal ash?

A No.

Q So now, sir, I would like to ask you a couple questions about a few other sites on that map. Do you see where right smack in the middle of the map there is a little oval -- and I apologize, I know it's a small map -- where it says slag dumping area, are you familiar with that area, sir?

A No.

Q Do you know whether it was used for slag dumping when you were at Will County?

A I don't recall that happening, no.

Q Do you know what it was used for?

A No.
Q To your knowledge, are there any pathways by which coal ash or slag would get to that area?
MS. NIJMAN: Objection, vague.
THE WITNESS: Do you want to restate the question?
MS. CASSEL: Q If you can understand it, then please go ahead and answer.
MS. NIJMAN: He just asked you to restate it.
MS. CASSEL: He asked if I wanted to.
THE WITNESS: Would you restate the question.
MS. CASSEL: Q Is there any mechanism by which ash would be transported to that particular area, slag dumping area?
A Not that I know of. Not part of the ash recycling system.
Q Do you know if what is located or what is called on that map called slag dumping area, do you know if that was lined?
A I cannot speak to it. I didn't even know it existed.
Q I am assuming that you also don't know that it was covered over or capped?
A No.

Q Now, moving on to a different area at the bottom or the right-hand corner of slag and bottom ash dumping area. Do you see where they identify that, sir?
A Yes.
Q Are you familiar with that area?
A Yes.
Q Do you know if slag or bottom ash were ever placed there during your time at Will County?
A That I can recall, no.
Q Do you know if they were ever placed prior to your time at Will County?
A I cannot speak to that.
Q Or subsequent to your time at Will County?
A I don't know.
Q Do you recall any individual instance where coal ash or slag either were placed or arrived in that area?
A No, the fly ash silo is nearby, but other than that, no.
Q Do you know whether or not there is slag or bottom ash in that area?
A No.
Q Do you know whether or not that area is

lined?
A I don't know that, no.
Q Do you know whether that area is capped?
A No, I don't know that.
Q Now, can you tell me to your knowledge are there any other ash storage or disposal areas located on the Will County property?
A I told you the fly ash silos are right near there. That is an ash storage device.
Q Are those ash silos, do they have -- are they lined on the bottom?
A They are actually above the ground, they are actually a metal silo, it's a dry system. The trucks go underneath them and they transfer the ash into the trucks.
Q So the ash isn't in contact with the ground?
A No.
Q When ash is transferred to the trucks, is it ever dumped onto the ground or -- I'll leave it there.
A Well, there's a possibility of some small amount of ash hitting the ground, but it is pneumatic system with a vacuum on it, there's a pipe that goes

into the truck and just dumps the ash. There is a vacuum device that is supposed to preclude dusting if that happens.
Q Do you recall that ever happening, where ash fell into the ground?
A Very small amounts, but it was over concrete. It was very small. It was usually cleaned up.
Q It was usually picked up. Do you recall an instance where it was not cleaned up?
A No.
Q Going back quickly to the slag and bottom ash dumping area on that map there, you said you were familiar with that area?
A Yes.
Q How are you familiar with that area?
A The road, the south road on the property goes by that area, so if I was to travel look at the discharge, including water discharges, I would have to take that route.
Q Is there anything else that that area is used for at the moment other than that road?
A They may have used it over time I think for laydown of equipment, different piece of equipment.

Q Had you heard that area previously described as the slag or bottom ash dumping area?
A No.
Q Now, you just told me about the fly ash silos. Are you familiar with any other locations on the Will County property where ash has been placed?
A No.
Q Now, I would like to ask you some questions about the liners at Will County. Are you familiar with the relining project at Will County pond three south?
MS. NIJMAN: I am just going to clarify for the record that the discussions he had with Mr. Lux concerned Waukegan and he will only be speaking to his knowledge of Will County.
MS. CASSEL: Understood.
Q Sir, I will restate. Are you familiar with the relining project of Will County pond 3S?
A I believe a plant relining project happened, yes.
Q Do you know when that happened?
A I believe in late 2000's.
Q Do you know what it was relined with?
A Not specifically. I would assume a plastic

liner.
Q Do you know the thickness of that liner?
A I don't.
Q Do you know if -- do you know anything about the preparation that went into the relining of pond 3S?
A Of which one?
Q Three south. We are talking pond three south.
A I know that they had to excavate the pond to get to the bottom of it to expose the lining, the existing lining. I know that the lining -- the previous lining was called Poz-O-Pac because I did some looking around to see what that was at one time. And one day when they were finished excavating the pond, out of curiosity I walked into it just to see what the Poz-O-Pac looked like. It basically looked like concrete. It was very good shape.
Q Do you know if any of that Poz-O-Pac was removed when they put in that new liner?
A I don't know.
Q Do you know if there was any fill between -- do you know if there were multiple layers of Poz-O-Pac used in that pond?

A I cannot speak to that. I just saw what was exposed when they were done. That's all I can speak to.
Q In your recollection it was fairly intact?
A It was in great shape. There was no cracks. It was in really good shape.
Q Now, do you know if there was any fill layer installed above that Poz-O-Pac when the new liner was installed?
A No. Let me say I was not involved in that project at all. I was aware it existed and going on. I was not involved in it.
Q I will ask you a few more questions to close the loop. I understand you probably won't know the answer. Do you know if any ash was left under the new liner when they put that in?
A I cannot speak to it.
Q Do you know if there was any cushion layer put over the new liner?
A I cannot speak to that.
Q Any warning layer, are you aware of that?
A I cannot speak to that.
Q Last question, do you know if there was any geotextile installed above the liner when they put

that in?
A I am aware they put a plastic liner in there. I couldn't tell you what the terminology was. I know when they were done there was a liner in that pond.
Q Moving to the relining of pond two south, sir, are you familiar at all with the relining project of Will County pond two south?
A I am aware it happened.
Q Do you know when that was?
A Again, early 2000's.
Q Did that take place when you were at Will County, to your recollection?
A I cannot remember. I remember three south. It might have happened after I left.
Q Do you know anything about the preparations that went into installing the liner there?
A No.
Q Did you go observe that pond as you had with three south?
A I cannot recall observing that one, so it is a possibility it might have happened after I left. I don't remember much about that pond at all.
Q Do you know anything about what was put

under or on top of the liner, the new liner at two south?

A Not aware of that.

Q Now, I am going to ask you a little bit about your recollection of dredging operation at Will County. Do you know what company conducted the dredging operations at Will County when you worked there?

A Could you be more specific about what you mean by dredging and where it occurred?

Q Sure. My understanding -- please correct me if I am wrong -- is that a company would come in and drain the pond and then remove at least some portion of the ash from those ponds. Is that a correct description?

A Yes. That's LaFarge, which is our contractor, and they had a responsibility as part of their contract to clean those ponds.

Q Do you know what equipment that they used to clean those ponds?

A As I recall, there was front end loader and dump trucks.

Q And dump trucks?

A Yes.

Q Were they the company that conducted the cleaning out of the ponds the whole time you were at Will County, to your knowledge?

A I believe so. I think they might have changed their name somewhere in the process, but the same basic group did that, yes.

Q Do you happen to know if that is the same company that was used to conduct the cleaning out after 2012?

A I know they hold a contract for the whole company, but that is an assumption on my part.

Q You don't know for sure?

A I don't know for sure.

Q Do you know whether LaFarge has changed the equipment that it uses to clean out those ponds?

A I don't know that.

Q Do you know exactly what they did when they cleaned out the ponds, would you be able to describe the process?

A I would assume that the front end loader --

MS. NIJMAN: Only if you saw it or no.

THE WITNESS: On occasion I would drive by and see it going on. I was not intimately involved with it. I was a passerby more than anything else. They

fill the front end loader bucket and dump it into a truck.

MS. CASSEL: Q Do you know if there was ash left on the ground when they would clean out the ponds?

A I cannot speak to that. I don't know.

Q To your knowledge, which I understand may not be complete, are there any differences between the current way they clean out the ponds at Will County and how they cleaned out the ponds when you were there?

A I cannot speak to that either.

Q Now, talk to you a little about inspections of liners at Will County. I understand based on your personal knowledge. To your knowledge, were the liners at Will County ponds inspected when you were there?

A I have no knowledge of that.

Q Of any type of inspection?

A No knowledge.

Q Were there any methods used to your knowledge to determine whether those ponds were leaking?

A I cannot speak to that.

Q Are you aware of any instances of damage to the liners at the Will County ash ponds?

A I am not aware of that, no.

Q Any of the ponds that we have discussed you are not aware of?

A I am not aware of any damage to the ponds. It was not my area.

Q Now, other than the suspicion of leak that you discussed earlier with regard to one of the ponds, are you aware of any other instance in which any of the ponds at Will County was leaking?

A No.

Q Do you know if any water in any of the ponds has escaped from those ponds in any other way other than a leak?

MS. NIJMAN: Objection, vague.

THE WITNESS: I am trying to remember. One north might have overflowed at one time.

MS. CASSEL: Q Do you recall any of the details of that circumstance?

A It might have -- I think it went over the road, went towards the Des Plaines River.

Q Was there any action taken when that overflow occurred?

A I think they added more so it would not overflow.
Q Was there any report generated of any sort when that took place?
A If it was water from that pond, it would probably be an unpermitted discharge because the water normally would go through the wastewater system with the clarifiers to the standby pond and out to the canal.
Q So would that have been reported to the Illinois Environmental Protection Agency?
A Most likely.
Q Do you recall at all when that happened?
A No.
Q You don't know for sure whether it was reported to IEPA?
A It probably did because that was not a permitted discharge, yes.
Q Any other instances?
A I cannot recall.
Q Sir, when a company dredges the ash, to your knowledge, is the ash pond drained prior to taking out that ash?
A There is a process called dewatering where

they do the best they can to pump down the water, the water that would normally go to it, and then they would open up the drain valve that goes to the overflow trough, we are talking about Will County now, and after that they will put pumps in various spots of the pond to get as much water as they could out.
Q Now, was there ever a time at Will County to your recollection that you saw water getting into the ash ponds after those ponds had been drained, dewatered?
A What kind of water? If it rained, it would be water going to it.
Q Was there any instance that you recall where ground water got into those ponds after they had been drained?
A I cannot speak to it. I don't remember that at all.
Q Do you know whether there were any protocols in place at Will County regarding how to remove water if water were to get into a pond after it has been drained?
A I don't see any reason why you want to worry about that if the ponds were tight.

Q For example, if it rains, you described that could be a situation in which water can get into a pond?
A Why would you want to remove the water? Makes no sense. They are designed to hold water.
Q So was the ash then -- so if they drain the ponds but not yet remove the ash and it rains, what would be done then?
A We would start the pump up again and remove the water with the pump.
Q Start the pump again?
A Yes.
Q Is there any other way that you recall in which water was taken out of those ponds other than through pumping?
A We pump and drain it. There's a drain valve that went to the overflow trough and we would drain it that way, and then we would put the pumps in and pump the water to the same trough.
Q The overflow trough, that is the pond that we have been discussing that was between one north and one south, is that correct?
A Each pond on the west end of the pond has an overflow trough. That is how the water it would

left the pond and flow over and then it would go in the trough and the trough would drain to the basement of the ash recycle building where there were ash recycle pumps. The pumps would pump the contents of that basement tank and go back in the building as ash recycled water.
Q Was there ever a time that you recall that that H trough overflowed?
A No, I mean it is designed for overflow. It is designed for overflow.
Q It drains down to it?
A It drains down to it, yes.
Q In terms of the pumping of the water, when those pumps were dewatered, was there any instruction manual concerning how to do that?
A Not that I am aware of, no.
Q Do you recall any instance where ground water was trapped under a liner in any of the pumps?
A I cannot speak to that, no.
Q Do you know if there are any mechanisms in place at Will County to detect if water is trapped under a liner?
A I cannot speak to that.
Q Do you know if those were in place when you

were there?
A No, I cannot speak to it. Not that I recall, that we never worried about that, so it was not an issue.
Q I think we are ready to move on unless you think it is time for a break. Why don't we keep going for a little bit longer and take a short break.
I would like to show you a document that has been marked as Deposition Exhibit No. 300. This appears to be an e-mail to you from Rebecca Maddox dated October 4, 2011 with a couple additional e-mails down the chain. Do you recall receiving this e-mail, sir?
A I am trying to recall right now.
I don't remember much of this. I do remember we used some ash to solidify some sewage treatment sludge. That is about all I can remember with this.
Q Do you remember -- you don't remember receiving this e-mail?
A No, I don't.
Q You have now reviewed it, is that right?
A Yes.
Q Does it appear that the bottom two e-mails

were forwarded to you as part of this chain?
MS. NIJMAN: Calls for speculation.
If you know.
THE WITNESS: I mean it appears to be the case.
MS. CASSEL: Q Can you tell me -- and if you cannot, you cannot -- can you tell me whether this appears to be a true and accurate copy of an e-mail?
A It appears to be.
Q Sir, do you see on the top e-mail that is directed to you where it says that LaFarge will remove the dewatered bottom ash sitting in the area we put the roll off boxes tomorrow, do you see that?
A Yes.
Q Are you familiar with the area where the, quote, "roll off boxes," were put at Will County at that time?
A No, I am not. I don't remember this at all. The only thing I remember about any kind of thing with LaFarge was using their fly ash to treat the sewage treatment sludge, solidify the sludge. We talked to Margaret Ruane to make arrangements for that sludge. I am not remembering anything about the bottom ash.
Q Just even aside from this e-mail, do you

know if there is an area at Will County where roll off boxes are based?
A We use roll off boxes for sewage sludge solidification. That is out there on the property.
Q Could you kindly identify on No. 96 where I think it is actually this page, 1574, could you identify where on the map you are saying the roll off boxes were kept.
MS. NIJMAN: To be clear, the roll off boxes he is aware of for his purposes.
MS. CASSEL: Q The roll off boxes you are aware of for your purpose.
A Probably right off the road here, right in this area. (Indicating.)
Q What does it state there, can you see?
A I was going to ask you for your glasses. No. It is not labeled anything.
MS. NIJMAN: It is where the words south tank farm are, not where the tank farm is, but where the actual letters appear.
MS. CASSEL: This is Page 5743.
Q So that is not in a pond?
A No.
Q Do you know if that area is lined?

A No. Just to give you process, we vacuumed out sewage sludge from the sewage sludge treatment plant which is located on the west end of the property. We move the boxes that we place the sludge in to that area, and then we brought in fly ash which we loaded from the fly ash silo, and then we by use of excavator move that fly ash from the truck into the box. We wanted to do this, but we couldn't dispose of the fly ash sludge in a wet state, we had to solidify the sewage sludge to get it to be -- to put it enough of a solid state that we can legally get rid of it.
Q Where was it taken to after that was done?
A I cannot recall, but I think maybe Dixon, but I am not sure.
Q Did that happen more than one time?
A Yes, but we solidified sewage sludge probably three or four times.
Q During your --
A During my time there.
Q The 13 years you were there. Do you know if those -- strike that.
I would like to just point your attention to a little further down this e-mail chain,

if you would. Going back to the first e-mail which presumably was directed to you, it appears to be directed to you, it says that LaFarge -- you see where it says LaFarge will remove the dewatered bottom ash 10-5. Do you know whether that, in fact, happened?

A Again, I don't remember this at all. I cannot speak to it.

Q During your tenure at Will County, where was dewatered bottom ash stored after it was removed from the ash ponds to your recollection?

A It was removed right from the ash ponds to wherever it was being taken for disposal.

Q You don't recall it ever being placed anywhere other than the ponds?

A No. Basically directly taken off the property.

Q Were you the person that worked directly with LaFarge at Will County concerning their clean-out at this point?

A No, I had nothing to do with them. I was aware they existed and was aware it was going on, but didn't deal with them too much at all.

Q Do you know who their main contact at the

facility was when you were there?

A Probably a shift supervisor that did that.

Q So it would have varied, the specific person would have changed over time?

A Yes.

Q Do you know if that person or those persons ever gave written or oral instructions to LaFarge regarding where to store dewatered ash?

A I cannot speak to it, no.

Q Are you aware of any written materials directing contractors as to where they should store dewatered ash?

A I am not aware of any of those.

Q Looking at the second e-mail in the chain, which is the e-mail apparently from Margaret Ruane to Beckie Maddox, it states that -- you see where it states, quote, "he has ordered five trucks to arrive 10/5 for the removal of all the material in the laydown area," the second sentence there?

A Yes.

Q Do you know -- are you familiar with the laydown area --

A No.

Q -- at Will County?

A No, I'm not.

Q Sir, did you have any other responsibilities or duties with regard to fly ash handling at the site?

A Not directly. I was aware it existed, the removal of fly ash existed. I remember the process using LaFarge trucks to remove the ash from -- the fly ash off the property. Occasionally would drive there and see that process occurring.

Q Were you involved with the sludge solidification process that you described earlier?

A It was part of the sewage treatment sludge solidification, I was involved with, yes.

Q Was that the only circumstance in which you were sort of directly overseeing management of fly ash?

A I wouldn't even call it management. I basically arranged for a truck through the contractor to receive some ash and they would take it and use it on the project. It was not really management. It was use of a byproduct.

Q Are you aware of any of the times, those four times, you said three or four times that it happened that any of the fly ash fell to the ground

or did not get into the trucks?

A No. Again, it was a process by which if it did fall it was cleaned up immediately, that I know of anyway. When we use the solidification, we usually cleaned up the sludge or cleaned up the ash on the ground and put it in the boxes.

Q Thank you. We can move on.

Now I would like to show you what has been marked as Deposition Exhibit No. 301. Please take a look at that. Can you tell me after you looked at it if you are familiar with this e-mail, sir?

A This looks like -- again I am not familiar with it. I don't remember. It looks like it is related to the last one, same time period. Other than that, no.

Q Does your name appear on that first e-mail as a recipient?

A Yes.

Q Do you remember if you read this e-mail at the time you received it?

A I cannot speak to that. I don't remember the e-mail. Hard for me to say.

Q Let's take a look if you would at the

second e-mail, appears to be the second e-mail in the chain, it appears to have been forwarded to you, sir, the e-mail that says "sorry for the delay in responding"?

A Yes.

Q Do you see where it says in the second sentence in that e-mail or third that it says they have to wait for the site to dry out after all the rain last week?

MS. NIJMAN: I just object to this exhibit. My understanding is that it actually is a two-page document. You don't have a second page.

MS. CASSEL: The second page, sorry, I don't know how that happened.

THE WITNESS: Would you restate what you were asking.

MS. CASSEL: Q I am actually asking about the second e-mail on the chain which is on the first page. Do you see where it says in the e-mail that begins with "sorry for the delay in responding"?

A Yes.

Q Do you see where it says they had to wait for the site to dry out after all the rain last week?

A I see that, yes.

Q Do you have an understanding of why they would have to wait?

A No, I don't.

Q Now, moving down to what appears to be the last e-mail in the chain, the one on the back.

A The one on the back of the page?

Q The one on the back of the page dated September 23, 2011 at 11:32 a.m. Do you see where it states in the second sentence that the 2S, the delivery of the sludge roll off boxes is scheduled for October 5, 2011 in the area where the 2S bottom ash is currently dewatering?

A Yes.

Q Can you describe to me or do you have an understanding of what dewatering means?

A Dewatering means reducing the moisture content of the materials so it can more easily be handled or disposed of.

Q Do you know where dewatering would take place or did take place?

A I still think this has something to do with my sewage sludge. They keep saying solidify fly ash. That is my best assessment of that.

Q That is fair. Do you have an understanding

a little further down the very last sentence in there, where it says -- you see where it says the status of the unlined 2S bottom ash pond?

A Yes, I see the sentence.

Q To your knowledge, was 2S lined at the time of this e-mail?

MS. NIJMAN: Asked and answered.

THE WITNESS: I cannot speak to it.

MS. CASSEL: Q Do you know of any instance at Will County where coal ash, whether it be bottom ash or fly ash, was placed on the ground?

MS. NIJMAN: Asked and answered.

THE WITNESS: I cannot think of any specific, no. It is possible, but I can't remember. To the best of my recollection, no.

MS. CASSEL: Q The few times that you do recall it being on the ground, to your recollection, it was cleaned up shortly thereafter?

A Yes. For example, in the sludge solidification that we did, whenever we did that, it was cleaned up right away.

MS. CASSEL: I think we are going to take a very brief break if that is okay. Five minutes. We will be back and get started again.

(Whereupon, a recess was taken.)

MS. CASSEL: Back on the record. I am now going to ask you some questions about the Waukegan facility. I would like to go back to confidential.

Page 66

Page 68

Page 67

Page 69

Page 70

MS. CASSEL: Q We are going to go to a newly marked exhibit which is Exhibit No. 302. Why don't you a take a second to take a peek at that and tell me if you are familiar with that document?

A I know the document existed because they did these at all the plants when they were sold in '98, '99, I have never looked at this document.

Q Never looked at it before, okay.

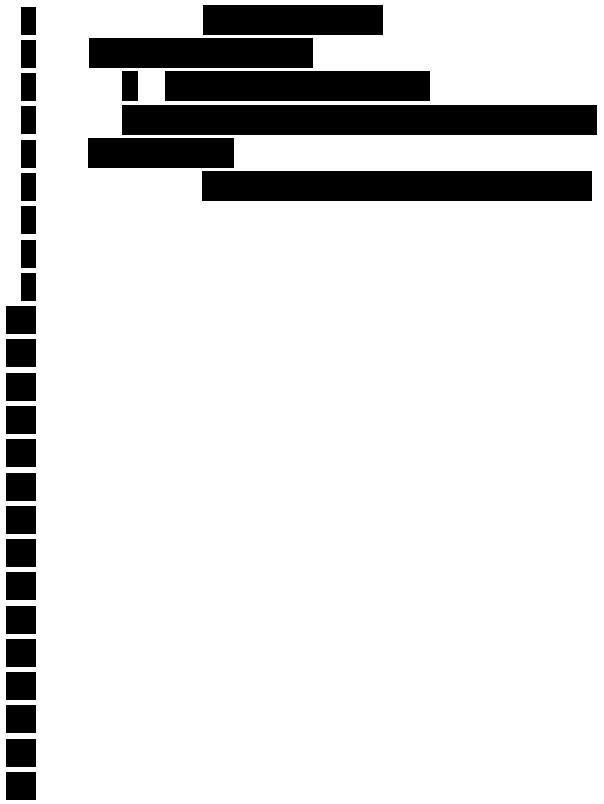
Now, 48718 I believe it is that one. Now, sir, do you see where on this map near the bottom left-hand corner it states -- it identifies the rectangular area of the former slag/fly ash storage area?

A Yes.

Q Are you familiar with that area at all?

A I know the area exists as far as where it is on the map, yes.

Q Have you heard anything about coal ash or slag being stored there?



A Nothing there. I have seen old pictures of that happening, yes.

Q Old pictures of that happening, okay.

A Right now it is nice grassy field.

Q So to your knowledge, there is no longer

Page 72

Page 71

coal ash or slag?

A No.

Q Stored there. It is your understanding that it was stored there in the past?

A I have seen that location with ash on it from pictures of the 1960's.

Q Is there anything else you have seen, or do you know where those pictures are located, do you know where you saw them?

A We have them on the site.

MS. CASSEL: Can we have those pictures produced?

MS. NIJMAN: I have given you all the pictures that we have.

MS. CASSEL: If we can identify what they are, that would be great.

Q Sir, is there any other -- other than those pictures, do you have any other basis for knowing there was ash stored on that site?

A No.

Q You said you thought it was in the sixties. Do you have any idea what the exact time frame is?

A I think 1963.

Q Do you know if that lasted for any longer

Page 73

than that single year?
A I cannot speak to that.
Q To your knowledge, is the ash or slag still there?
A I cannot speak to that either.
Q So you said at this point it's a grassy field?
A Yes.
Q Do you happen to know if there is a liner underneath where the ash is?
A I cannot speak to that.
Q Other than grass do you know if there is anything else covering that area at this point?
A That is all I know. It is a grass field.
Q So it is open to the sky?
A Yes.
Q Now, take a look if you would at top left-hand corner of this map. Do you see where it says former fly ash storage area?
A Yes.
Q Are you familiar with that area at all, sir?
MS. NIJMAN: Objection. You may not have been at these prior depositions, but an objection we have

to these reports is that it is not clear that the property boundary identified in any of these maps is the existing property boundary of the Midwest Gen facility, although I do note the area you are asking about is outside the Commonwealth Edison boundary here on this map.
MS. CASSEL: That is fair. I am still going to ask him about it.
THE WITNESS: I am not aware about fly ash being in that area.
MS. CASSEL: Q You are not aware of fly ash being in that area?
A Not aware.
Q Never in the past or in the present?
A I cannot speak to the past. I cannot speak to the present either. I have not seen any.
Q Have you heard anything at all relating to ash in that area?
A No.
Q Do you happen to know if that area is lined?
A No, I have no input about that at all.
Q Do you know if that area right now, do you know if that area is covered, or open to the sky?

A Open to the sky. It is actually a wetlands. Now not a listed wetlands, just water weeds.
Q Not formal wetland. Now, in the middle of the map let's see if I can find this, near the top right-hand corner it says ash dewatering AST, do you see where it says that near where it says former fire brigade training area.
MS. NIJMAN: What direction?
MS. CASSEL: Top right.
MS. NIJMAN: Ash dewatering AST, is what you are looking for?
MS. CASSEL: Yes.
Q Are you familiar with that area at all?
A I know where it is. I don't know what those are, though.
Q You don't know what AST stands for?
A No. AST normally means a storage tank, I think, but I don't think that exists any more. It is kind of hard to figure this out because some of the things don't exist. We have fly ash silos in that area right now, though.
Q In those fly ash silos would ash be in contact with the ground?

A No, it is in a silo that is transferred to a truck pneumatically.
Q Is that the same process as you described before where it might occasionally fall out?
A Same vendor, same everything.
Q Do you know whether there is ash on the ground in that area where the AST ash dewatering is identified?
A I think there may be some incidental ash spillage that is cleaned up. But the ground is gravel and the area underneath is pavement. So, no, I don't think there is any ash there. Speculation on my part.
Q Fair. Sir, do you see where it says former slag field basically right next to where it says ash dewatering?
A Yes.
Q Are you familiar with that area at all?
A I know where it is relative in your map. I am not familiar with the fact that it was used for a former ash field.
Q You have never heard that referred to as former ash field or, excuse me, slag field before?
A No.

Q You have no knowledge of slagging?
A No. I believe it's a parking lot now.
Q Do you happen to know if there are any other former ash storage areas at Waukegan other than those that we have already discussed?
A I am not aware of any.
Q Now, I would like to ask you a few questions about liner damage. Has the liner of the east pond been damaged since it was relined?
A I believe so. I have been told that there was some damage, I believe, in the one corner of the ash pond where the ramp is, there is some damage caused by a vehicle or a tractor.
Q Do you know when that took place?
A Guessing 2013, I believe.
Q Was that damage repaired?
A Yes, it was.
Q Do you -- you said it was caused by a vehicle?
A I have been told it was caused by a vehicle. Also talking about location of this is at very top of the pond well away from ash from the water lines.
Q And the liner itself was repaired?

A Yes.
Q Was anything done to prevent that type of damage from occurring in the future?
A I cannot speak to that. I think Chris Lux has been mainly in charge of that area. I assume he may have spoken to the vendor that was involved.
Q You don't have --
A I don't have that knowledge, no.
Q Are you aware of any other instances of damage to the east pond since it was relined?
A Currently we have a couple small holes, maybe less three inches in diameter that exist in the east pond.
Q Where in the east pond are those located?
A I was told they exist. I have never seen them. I was also told they are above the water line again. I have been told they have vegetation growing on them.
Q Over the water lines?
A Above the water lines.
Q Vegetation growing out?
A Yes.
Q Do you have any idea how long those had existed?

A No. Again, Chris Lux speculated to me we thought -- I spoke to you before about the process of dewatering -- they thought maybe a pump was placed there and damaged the lining.
Q When is the last time that a pump would have been placed there?
A I cannot speak to that. Maybe in the last few years. I cannot speak to that directly.
Q Do you know -- those have not yet been repaired, is that correct?
A No. We are having -- probably looking at repairing them in the middle of March. The issue is we have to be above a certain temperature to perform repairs. The chemicals that they use for this kind of repair only work above a certain temperature.
Q When were those holes discovered?
A I cannot speak to that.
Q Are there any protocols in use at Waukegan as to how to place pumps so as to avoid damage to the liners?
A I cannot speak to that. First of all, it was his speculation that was the cause. We don't think holes puncture like that would occur after normal use of the pond, so it is our speculation that

the pond -- it's a possibility that the pump -- replacement of the pump caused it, or the vibration of the pump running caused that.
Q To your knowledge, there is no protocol about where to place the pump in regard to avoid liner damage?
A No.
Q Or how to run a pump to avoid liner damage?
A Not that I am aware of.
Q When there is damage to a liner, are there any protocols regarding investigations or examinations of how that damage occurred?
A Leaks or damage to the liner are usually discovered via our inspection programs, and we have daily inspection by operators who circle the ponds. It could happen more than one time of the day, depending on the time of the year and the amount of daylight that exists. So they are the first line and they look daily, drive around the ponds and look, and then after they are cleaned there is usually an inspection that occurs, look around to see what is going on with the ponds. Obviously when they are cleaned and the operator is doing his daily round, the more of the pond that is exposed the more he

can see.
Q You cannot see the liner when it is covered with ash, is that correct?
A Correct.
Q Portions of the liner that are covered with ash?
A That is correct.
Q Is it fair to say that most of the time there is ash on at least some portions of the liner?
A The bottom part of the pond is actually lined with 12-inch layer of sand and six-inch layer of limestone so that would -- no, the ash does not exactly contact the bottom of the pond, the materials do that first and then the ash above that.
Q Are you aware of any instance in which the clean-out process has gone into or through the warning layer?
A I am unaware, but I do know we have been told that LaFarge received instructions they are to discontinue activity in the area where they actually get in the sand and limestone there.
Q Can you explain that?
A LaFarge has been told and instructed that their operators when they encounter the limestone or

sand that they discontinue their operation in that area.
Q So when they hit the warning layer, they are to stop dredging?
A Yes.
Q You are not aware at the time that they did?
A No.
Q Now, aside from the current damage that exists in the east pond and the 2013 instance that you mentioned, are you aware of any other instances where the east pond -- or not are you aware -- has there been any other damage to the east pond liner since the 2003 relining?
A I just told you what I know about the two things, the holes, the rips in the corner.
Q Do you know when LaFarge was instructed to stop dredging when they hit the warning layer?
A I believe -- actually I cannot speak to that, no. I just know as a general procedure when they conduct their activity in this pond they are told that.
Q You were not the person that told them that?

A No.
Q Do you know who was?
A No.
Q You spoke a little bit about the inspections, we discussed a little bit visual inspections. You said those are done every day, sometimes multiple times a day depending on the daylight. Who does those inspections?
A Operators.
Q They are only inspecting the part of the liner that they can see, is that correct?
A Yes.
Q Are there any other types of inspections of the liners that take place at Waukegan?
MS. NIJMAN: Other than what he testified to during dredging?
MS. CASSEL: Q Other than what you -- describe a little more to me what you said takes place in terms of the inspections?
A It is my understanding that at the end of the dredging, or I call it cleaning of the ponds, there is a visual inspection made to see if there are any issues.
Q That visual inspection, do they actually

remove the warning layer and the cushion layer, are they inspecting the liner directly?
A No. They are looking at mainly the sides and the areas that were cleaned.
Q So in addition to the daily visual inspection and the type of inspection that takes place when they are dredging the ponds or they dredged the pond, are you aware of any other type of inspection?
A I am not aware of anything else.
Q Do you know at other facilities other types of inspections used to investigate the integrity of the liner?
MS. NIJMAN: Like at Will County you mean?
MS. CASSEL: Or any of the other sites whether he knows that.
A I don't know that.
Q Have you ever heard of something called the continuity method?
A No.
Q Now, let's go to Deposition Exhibit 303, take a look at that, sir. The top one appears to be -- is this an e-mail from Chris Lux to Wayne Ollila?

A Yes.
Q Are you copied on that e-mail, sir?
A Yes, I am.
Q Are you familiar with this e-mail?
A I am aware this e-mail existed.
Q Do you recall receiving it?
A No.
Q Does it appear to be a true and accurate copy?
A Appears to be.
Q The e-mail that is down below that from Wayne Ollila to Chris Lux, was that forwarded to or were you copied on that e-mail?
A It does not appear to be. It looks like it was sent right to Christopher Lux. Do you agree?
Q Right. What I am asking you is in that top e-mail --
A It was part of the forwarded e-mail?
Q Exactly.
A I assume so. Appears to be, yes.
Q Do you see where in the below e-mail in the chain from Christopher Lux he says, "In a safety meeting with Todd, we discussed some possible rips in east ash pond and two rips in the ash pond liner."

Now, the damage in the east ash pond, possible rip in the east ash pond, is that the damage you were just discussing?
A I'm not sure. I do know there were holes there, that's what Chris told me about. I cannot speak to whether these rips were in the east pond. I can speak to the ones in the west pond.
Q Just quickly to close out on the east pond, is it possible that these are different rips from the ones you are discussing right now?
A I cannot speak to that.
Q Let's go to the two rips in the west ash pond. Can you tell me a little more about those?
A It is my understanding that there are two rips, one is about five-feet long and the other one is two-feet long. They are again visual and above the water line. Though the pond right now is out of service, so there is no ash contact in this area.
Q I'm sorry, there's no?
A There's no ash contact with these because they are well above the water line and the side of the pond. These also will be repaired by LaFarge when the weather is okay.
Q Do you know what caused those two rips in

the west pond?
A I am not aware.
Q Do you know when those two rips were discovered?
A I can assume it might be this e-mail.
Q You don't know?
A Categorically, no, I don't know that.
Q Do you know who discovered them?
A Wayne Ollila did here.
Q Appears to. You don't have an independent knowledge of that?
A No.
Q Those have not yet been repaired.
Do you know if any steps had been taken at this point to avoid that kind of liner damage in the future?
A Because I don't know the mechanism, I cannot speak to it.
Q Do you know if any additional steps had been taken to immediately identify that kind of liner damage in the future?
MS. NIJMAN: Other than the daily inspections?
THE WITNESS: Daily inspections and visual inspections.

MS. CASSEL: Q Above and beyond anything we have already discussed about how inspections take place in Waukegan?
A Restate that again.
Q Above and beyond the various types of inspections that we have discussed at Waukegan, the visual inspections on a daily basis and the one that is stretched out, are you aware of any other mechanisms that are in place to immediately identify liner damage?
A I am not aware of any.
Q Do you know if any steps had been taken to change the response to liner damage since these two rips occurred?
A No, I think multiple daily inspections, there are mechanisms that they usually talk to their supervisor or shift supervisor. In this case he actually went to Lux. Normally the supervisor would go right to Lux and make the same communication. They must be friends and he went directly to Lux. Lux is kind of the guy in charge of doing this.
Q So are you as part of your environmental compliance activities at Waukegan these type of liner rips get reported to you?

A Yes, I am made aware of them by copy of the e-mail.
Q That happens to your knowledge in any instance when there is a liner rip?
A Yes.
Q Is this a protocol in place to inform you of liner rips at Waukegan?
A I don't know if protocol. Understanding if it has anything to do with the ponds, Lux will usually always tell me.
Q Have you ever specifically asked Mr. Lux to tell you there is a problem?
A No, the management of the ponds is his responsibility.
Q In addition to these two rips from 2014 in the west ash pond, are you aware of any other instances of damage?
A No, just the holes I spoke to previously in the east pond.
Q For the west pond you are not aware of any other damage or rips?
A No.
Q Now I would like to take out Deposition Exhibit No. 304. Are you familiar with this document

at all, sir? You can take more time to review it if you need that.
A No.
Q Sir, if you would turn to the second page of this letter, which I believe is 12823. Do you see where under Item 2 it says in the last couple sentences of that "The relative stability of the sand and limestone layers should be examined by hand excavation of a portion of an exposed pond floor in the east pond while the area is accessible during current maintenance activities. It should also be checked when the west pond is dewatered and the sediment excavated as part of the routine maintenance." Do you see where it says that?
A Yes.
Q Are you familiar with whether or not those sand and limestone layers were examined by hand excavation of the exposed pond floors of those ponds at any time?
A I cannot speak to a specific instance of it, but the next sentence does speak to what I told you before about an inspection occurs after the pond is dewatered and cleaned out, so I have been told that does occur.

Q In terms of the stability of the pond walls -- excuse me -- the sand and limestone layers?
A Yes.
Q Is there any investigation of whether, for example, any limestone has migrated through the sand that you are aware of?
A Not that I am aware of.
Q Now, moving down to Item 4, I believe, the next page, Page 3 of that letter, still under Item 4, the last couple sentences in there, do you see where it says "adjoining pieces of batten should also be butted together to prevent gapping and subsequent leakage. The batten was not aligned or butted together at the change in plane on the sloped portion of the weir wall of the east pond sump."
Do you see where it says that?
A Yes.
Q Do you know whether or not the batten has been butted together at the change of plane in the sloped portion of the weir wall of the east pond sump?
A I cannot speak to it. Again, you know this is 2005, long before I was ever there.
Q Understand. Just asking about your

knowledge. Now, in Item 6 the last sentence of Item 6, do you see where it says the slope should be visually monitored to ensure the slope subgrade remains stable?
A Yes.
Q Do you know if the slopes are monitored to ensure that the slope subgrade remains stable?
A The slopes are visually monitored every day by the operators. I think any kind of substantial change they would report that. Also, again at the end of the cleaning, they would probably be looked at as well to see if there was any change.
Q You are saying they would probably be looked at?
A I think they would. That is part of the visual inspection to see if there is any kind of change or issue with the slopes. The slopes of the pond are probably the largest part of the visual inspection to a person driving by.
Q Do you know for sure if the operators were looking at that or looking specifically for any issues with the slope subgrade?
A I am not sure of that.
Q Have you ever been made aware of any

instance of any erosion of the slopes of the ponds?
A No.
Q Or any instability in the slopes of the ponds?
A No. Not that I can recall anyway. We had a tree growing up on the road. It was not part of the pond. But we had the tree removed.
Q And that is the only instance you can recall?
A Yeah.
Q Now, taking a look at where it says conclusions and recommendations, a bit below that, I am going to run through these and see whether you know these had been or continue to be taken care of. You see where it says under the first bullet point have the liner breach noted in Item 7, so there is a liner tear referred to in Item No. 7, was noted on the south side of the east pond.
Do you happen to know whether that liner tear was repaired?
A I cannot speak to it, no.
Q Now, in I believe this is bullet point two, it says during the above noted repair -- which we don't know what happened -- have the contractor

extend vertical batten near the structure on the north side of the pond to below grade at the anchor trenches. Do you know whether that took place?
A No, I cannot speak to that at all.
Q Do you know -- do you see where in Item 8 just above conclusions and recommendations it says "A wedge weld pressure test seam cut in the southwest corner of the west pond was not patched."
Do you see where it says that?
A Yes.
Q Do you happen to know --
MS. NIJMAN: It continues on, "this does not constitute a breach of the main portion of the liner."
MS. CASSEL: Q "But should be addressed by the repair crew when on site."
The question is whether it was addressed by the repair crew?
A I cannot speak to it.
Q Do you know whether looking at the next bullet point, do you see where it says "The access ramps should be reconstructed to ensure there is no future mechanical damage to the liner."
Do you know whether the access ramps

were reconstructed?
A I don't know. I cannot speak to it.
Q Do you see where it says "as a practice, no material should be dumped directly on the liner without a protective course on the liner. This protective course can be compromised of a heavy geotextile installed under a layer of clean fill or a suitable thickness concrete mattress constructed on top of the liner."
Do you know if there is either a concrete mattress on top of the liner or a geotextile under clean fill on top of the liner?
A No, I don't.
Q At either of the ponds?
A Cannot speak to it.
Q Do you know whether any material is dumped directly on the liner without any fill or concrete mattress or geotextile between the ash and the liner?
A We are told that the ash only contact the bottom part of the pond. That is where the limestone and sand is.
Q So ash does not ever contact the areas; it is never directly in contact with the liner, is that what you are saying?

A Yes. It's a possibility on the sides, I suppose. My understanding is that it is mainly contact the bottom, the weight of the ash contacts the bottom, vertical weight of it.
Q Has there ever been an instance to your knowledge where the ash was on the side slopes of the liner?
A As the pond fills, going from clean, as it fills I would assume -- I have seen where the ash maybe it is several feet thick and it does spread towards the sides of the liner. That's why we line the sides.
Q Do any of those -- does that fill, the sand or the cushion -- the cushioning layer or the warning layer does that go up the sides of the slopes of the pond?
A I cannot speak to that. I do know we have pylons to denote the start of the slope of the edges, and they would indicate to the person cleaning where those slopes are.
Q You are not aware of whether ash has ever gone beyond those pylon points up onto the slopes?
A I said as it fills they spread sideways, it contacts the sides, but again the weight of the ash

is basically on the bottom.
Q So you don't have a specific recollection as to whether or not it did or not?
A No.
Q Fair. Do you see where it says under the next bullet point on Bates Page 12825 Page 4 of the letter "perform regular inspections (semi-annual) of the anchor trench, particularly on the west pond, to monitor any additional settling that may occur."
A I see that.
Q Do you know whether those regular inspections --
A I cannot speak to it.
Q -- take place. Now, the next bullet point you see where it says, quote, "future design considerations should include geotextile between the sand base and overlying crushed limestone to preclude aggregate migration through the sand due to pressure, (i.e., from equipment traffic during pond clean out) which may cause the aggregate to be in direct contact with the underlying liner."
I think you already said you are not aware of any geotextile being placed between the sand and warning layer, is that correct?

A I am not aware that have.
Q Do you know if there is anything else between the sand and the aggregate warning layer above the liners?
A I have been told that the two layers exist, only two layers exist, the sand 12 inches of sand and six inches of limestone.
Q You may have already answered this, your counsel will object if you have, to your knowledge, are there any inspections to determine whether any of the aggregate warning layer is migrating down through the sand layer?
A Not that I know of.
Q I think we will move on from there. We have talked a little bit about the dredging at Waukegan -- Will County. I would like to ask you a little bit about the dredging practices at Waukegan. Can you tell me who does the dredging at Waukegan?
A LaFarge, same contractor for Will County.
Q And do you know if LaFarge is also the company that did the dredging at Waukegan prior to 2012?
A I really cannot speak to that. They have been the contractor for quite a long time for ash

handling, ash disposal, so I would say yes, I guess. I was not in Waukegan before. I cannot specifically say that. I just know they have a contract with the whole company to do the work.
Q For Midwest Gen, they have been the contractor?
A Yes.
Q Are you familiar with current -- can you tell me about current dredging practices at Waukegan?
A Yes. Like Will County, LaFarge uses heavy equipment, usually hydraulic excavator or front end loader, they load the ash on the trucks, the trucks take the ash off the property, and during the course of the -- during the course of the removal, we use those pumps I spoke of before to dewater various areas. A lot of time when you remove ash, the water will fill in, you need to pump that water away, so you can remove a drier product.
Q So is the ash moved around within the pond when they are draining them to clean them out?
A The pond is drained first and then they go in and get the driest portion first, and then as they expose, they go down they expose weathered ash and they attempt to dewater that by placing pumps in

strategic spots to get to the water.
Q The ash is dewatered inside the pumps?
A Yes.
Q How frequently are the ponds, the two ash ponds at Waukegan, cleaned out?
A I have been told 16 to 24 months.
Q Have they been cleaned out while you have been there?
A I think there was one being cleaned out right when I got there, in '12 I guess.
Q Do you know the volume of ash that is removed from those ponds?
A I don't.
Q Do you know whether ash is left in the ponds when they are dredging them?
A Specify amount. You cannot eat off the floor. There is always something left behind, it is incidental.
Q So there is a little bit of ash?
A 99 percent of the ash is gone.
Q Is there any particular area of the ash pond where there is more ash left in than others?
A I don't know if you see it on the maps, they are basically U-shaped and in the leg of the U

is usually where most of the ash drops out, so as you are flowing, as you have an U like this. (Indicating.)

Q Upside U?

A You have an U and the ash coming in on the one leg of the U.

Q The open part of the U?

A The open part. The ash is dropped out quicker because the velocity of the fluid it is getting less, that is when things drop out. You don't see a lot of ash going at the top of the U going back in the next leg. Usually we clean it out before that leg is filled.

Q So if there is ash left, it is generally left --

A On the inlet leg of the U.

Q Inlet side. Are you familiar at all or can you tell me about the dredging practices at Waukegan prior to 2012?

A Cannot speak to that. Cannot do it. I was not there. I have not seen it.

Q Did you speak with Chris Lux at all about that?

A I don't remember if he told me about that.

I have to tell you the practices that I have seen both at Will County and Waukegan are done exactly the same. We use front end loaders, excavators and dump trucks.

Q And the processes that you saw at Will County when you were at Will County are the same processes that you see currently at Waukegan?

A Yes.

Q The same contractor?

A The same company is responsible for it.

Q LaFarge. Is it generally the same equipment used to dredge?

A Same type of equipment, yes. An excavator, usually a tractor and front end loaders and dump trucks.

Q That equipment was used when you were at Will County and it is used now, that type of equipment?

A Yes.

Q Now, to your knowledge, is there anything different; has there been any changes in the dredging practices at all?

A I did speak before about the instructions that we give, I have been told we give to the

contractor, to stop or suspend his activity the warning layer at the bottom, so I don't know if it is different. That is an instruction that they have to serve.

Q Do you recall whether that instruction was given when you were at Will County?

A I cannot speak to that.

Q So you don't know how long they have been getting that instruction?

A No.

Q Let me move on to Exhibit No. 305. Take a few minutes to review that and then if you would let me know if you are familiar with that e-mail chain?

A I am familiar.

Q Is it true that you wrote the top e-mail on the chain?

A The first e-mail?

Q The 9:21 a.m., the first e-mail, the one that begins with "All: We discovered several piles of fly ash"?

A I wrote that.

Q This appears to be a true and accurate copy of that?

A It appears to be.

Q The top e-mail on this says, last of the chain, "thanks for following up on this matter"?

A I did that, yes.

Q His appears to be a true and accurate copy of that?

A Appears to be so.

Q Is it true that you were forwarded -- you received an e-mail from Chris Lux, the second e-mail in the chain that says "I sent this e-mail this morning." Did you receive that e-mail from Chris?

A Appears to be so, yes.

Q Do you recall -- was the e-mail that he sent, that Mr. Lux sent to you by Bob Segiet, Jerry Wade, McLaughlin, is that an e-mail that was forwarded to you by Chris Lux in the chain?

A Yes.

Q This appears to be -- all four of these e-mails in the chain appear to be true and accurate copies?

A Appears to be so, yes.

Q Now, let's look at the last e-mail from -- actually the first e-mail in the chain I should say.

A The one I wrote?

Q The one you wrote at 8:18 a.m. on September 12, 2014. You reference several piles of fly ash dumped on the ground, right?
A Yes.
Q Who discovered the piles that you referenced there?
A I believe an operator did and he called me and I went out and looked.
Q So you personally saw those piles?
A Yes.
Q How big were the piles?
A Probably six, eight feet in diameter, about four-feet high.
Q How many piles were there?
A Half a dozen.
Q What was in the piles, was there anything other than fly ash in the piles?
A Probably fly ash. As he said in this e-mail, that at the time we were having a big outage, we were rerouting ductwork and they removed the ductwork in order to do that. When they did the ductwork removal, they found ash inside the ductwork which they vacuumed, and they weren't probably given good instructions to where to put that and they just

dumped it in that area on their own.
Q So can you describe a little more this ductwork that was on the actual plant?
A Unit 7, which was in overhaul at the time, was undergoing an environmental improvement overhaul where we were rerouting the duct with the flue gas ductwork from hot side precipitator to a cold side precipitator, and we were saving a lot of money by leaving the precipitator alone and actually rerouting all the ductwork. We removed a lot of the old stuff and replace it with new ductwork.
Inside the old ductwork were accumulations of fly ash that had to be cleaned out before it was moved out of the way.
Q So this is the ductwork that had gone --
A By vacuuming it out and the vac truck probably went to this area and dumped this stuff out. Once again, they were not given good instruction on how to do that or where to do it. His e-mail points their responsibilities.
Q In terms of your finding out how this happened was the cause of that, did you personally investigate that, or how do you know that is what occurred in terms of the vacuum trucks?

A Well, actually I prompted it. I sent the employees, including Chris, because Chris being one of the people, one of the persons responsible as you already know and he took it from there and handled the contractors. I wanted to make sure I sent to all the employees because it was an understanding throughout the station to our employees that it is unacceptable to leave fly ash around.
Q Understood. In terms of the description you just gave me of how this occurred where it came from, I am trying to understand how you know that, did you yourself personally see vacuum trucks dumping it there, or how do you know that is what happened?
A Chris Lux told me.
Q He did that investigation?
A Yes.
Q Now, in addition to this e-mail to all employees, have you had any further discussions with any Waukegan employees about this incident?
A No.
Q Have you had any further discussions with them about what to do with fly ash?
A As you see in Chris' e-mail there, we have a lined dumpster to put flying ash in. It is taken

out to a landfill near Joliet called Laraway Road.
Q So have you personally discussed with employees the need to --
A I don't have direct contact. I don't manage employees, so it is done through my contact with their supervision.
Q Your contact with what?
A With their supervision. Again, this e-mail basically went to all management and union people.
Q So you told the management to put them in the dumpsters. Do you know whether the managers have talked to the employees, the operators?
A As a practice, we don't do that in Waukegan.
Q You don't do what? I'm sorry.
A Dump fly ash on the ground.
Q I am just trying to --
A This was -- a better word -- this was an aberration because we were doing this special work, this overhaul.
Q I appreciate you saying that. Right now what I'm trying to understand is whether or not you told the managers to talk to the employees about that. Do you know whether or not the managers did

have further discussions with the employees?
A I cannot speak to that.
Q You have not had any discussions with operators directly about why it was dumped in that particular location, the fly ash?
A No, I have not.
Q Do you know if Chris Lux or any managers have?
A I cannot speak to that.
Q Have you discussed this incident of the fly ash piles with anyone else at Midwest Generation?
A I cannot recall.
Q Do you know how long those piles had been there?
A No, I don't.
MS. NIJMAN: How long they were there?
THE WITNESS: I can tell you within the framework of the outage, probably one or two weeks, maybe three weeks.
MS. CASSEL: Q Prior to that?
A Prior to the discovery.
Q So you think they may have been around about two or three weeks?
A That is what I was told by Chris Lux, they

had done that work in the previous two to three weeks. I cannot say the date or time it actually happened.
Q Now, looking at the e-mail that Chris Lux sent at 9:01 a.m. that day, the third e-mail down, do you see where he says on the top of that, the next page on top of 44589, quote, "It is obvious that NRG Waukegan Station employees are still learning the do's and dont's of the fly ash disposal, so if anyone observes our station employees violating this guideline, please let me know ASAP."
Do you see where it says that?
A I do see that.
Q Did you agree at the time of this e-mail with his statement that it is obvious that the NRG station employees are still learning the do's and dont's of fly ash removal?
A "Agree' is not quite the word for it, but obviously an operator told me about that, so I thought it was indicative of a sense that it was the wrong thing to do.
Q So you did not necessarily agree with that statement, that they are still learning the do's and dont's of fly ash disposal?

A I cannot speak to the employees, each one knowing whether they do the right thing or not. My sense was I thought I had a good indication that an operator did tell me about them, so I thought that was a good thing for me to know he was sensitive to it.
Q That someone noticed it?
A Yes.
Q Do you think that is still -- do you think it is still the case, or do you think it was ever the case that Waukegan station employees were still learning the do's and dont's of the fly ash disposal at the station?
MS. NIJMAN: Calls for speculation.
THE WITNESS: I cannot speak to what is on their minds. I mean I sent the mail out to let people know, to recommunicate the fact it is unacceptable to do that.
MS. CASSEL: Q Going back to the same e-mail that Mr. Lux wrote on the page before, do you see where it says "the Hayes yard crew in the back forty by the coal pile runoff basin must be informed not to utilize the WM dumpsters at the west end of the gravel laydown area adjacent to the coal pile runoff

basin as regular garbage."
A Yes.
Q Are you aware of anyone ever using those designated dumpsters that were supposed to be for coal ash or any other garbage?
A At the time they had done that. We did discover some garbage. Pipefitters were doing welding back there for the same project I spoke of before, and in the power plant world if you see an open dumpster it's usually an open invitation to put something in.
Q Is there anything on the dumpster that indicates it is going to be for fly ash?
A It is put up against a ramp with a truck would come up and dump backwards in the dumpster. It would take a little bit of effort to do it. Again, an open dumpster is an invitation sometimes. We have to let them know it should not be done.
Q Do you know what they dump in there?
A No idea.
Q Do you know if it was Midwest employees, or just outside contractors?
A They were the ones out there working, so the assumption was they were the ones doing it. For

a Midwest employee to be doing it he would be going way out of his way to do it. Usually the proximity is the motivator for this kind of thing.

Q The e-mail you sent was to all Midwest Gen all Waukegan employees. Do you know if the outside contractors you were working with were also informed of where to dispose fly ash or any information?

A I would assume this e-mail covered it because he sent it to the people running the project.

Q So they were told not to use it as garbage bins and told only for fly ash?

A Right.

Q Did those contractors have anything to do with fly ash disposal?

A No. They were pipefitters doing welding on pipes for the project.

Q Do you know if the use of those dumpsters that were as I understand supposed to be used for fly ash, do you know if that interfered in any way with the ability to dump the fly ash there, did they run out of room, for example?

A No, not that I know of. I don't think so.

Q Did anyone tell you either way?

A No.

Q Those dumpsters that are designated for ash, are those lined dumpsters?

A Yes.

Q Are you aware of anyone using unlined dumpsters for coal ash in Waukegan?

A Not aware of that.

Q Have you ever been aware of coal ash being dumped on the ground at Waukegan before the instance that you described here in this September 12, 2014 e-mail?

A No. That area was clear when I first arrived.

Q So on that particular ground you are not. Anywhere else on the ground in the Waukegan facility?

A Nowhere else.

Q Have you ever heard of ash dumped on the ground subsequent to that action?

A No.

Q That September period?

A I was aware of these ones there.

Q But since that time?

A Not that I'm aware of.

Q Now, we have talked about you sent an e-mail to the operators or to the managers. Did you

take any other steps to prevent ash being dumped on the ground other than --

A Again, Waukegan employees are management and union, so that e-mail heading goes to all employees, including management.

Q So in addition to this e-mail that went out to all employees -- and thank you for clarifying that -- is there anything else that has been done?

A No.

Q Now, let's take a look at Deposition Exhibit No. 306. Are you familiar with this e-mail, sir?

A Yes.

Q You were the author of this e-mail?

A Yes.

Q Does this appear to be a true and accurate copy of that e-mail?

A Appears to be so.

Q You are referring in this e-mail to fly ash being transported to a landfill, is that correct?

A Yes.

Q What fly ash is getting transported?

A That would be the fly ash in the roll off boxes that we have been talking about.

Q In the roll off boxes, okay. This was not the fly ash that was on the ground?

A The ground, I brought in roll off boxes, that we put the stuff from the ground in the roll off boxes and took it to Laraway Road near Joliet.

Q It was on the ground and then put in roll off boxes and then taken off?

A Yes. Lined roll off boxes.

Q Lined. Do you know how many truckloads it took to haul away that ash?

A I can't remember.

Q Do you know how big the --go ahead.

A It was several. I think there were 20 yard boxes, I cannot recall, so I shouldn't speculate.

Q You don't remember the size of the boxes?

A No.

Q Do you know how big the trucks were?

A No.

Q Now, moving along I would like you to take a look at another e-mail, which is Exhibit No. 307. Take a minute to look at that. Once you do that, let me know if you are familiar with this e-mail?

A Yes.

Q Did you write this e-mail, sir?

A Yes.
Q Does it appear to be a true and accurate copy of the e-mail?
A Yes.
Q Here you state "I have scheduled three trucks from Kirschhoffer Truck Service to arrive Monday to start removal of the waste fly ash pile." Do you see where you say that?
A Yes.
Q Where was this waste fly ash pile that you are referring to?
A When I first got there, there was an old pile of junk, it had metal in it, some bottom ash, maybe some fly ash. That is the stuff I got rid of.
Q Bottom ash, fly ash?
A It is hard to say what it was, but we basically took the conservative route and labeled it a fly ash and took it down to Joliet.
Q Where on the property was it located? Maybe we can pull out the map again, that was 45817. This is Deposition Exhibit 302.
A Right here. Between right here. (Indicating.)
Q Which direction?

A To the west of the coal power runoff pond.
Q How big was that pile?
A About 20-foot diameter, maybe, six, seven feet high.
Q Was it near where it says construction debris?
A It was to the east of that.
Q You said it was 20?
A About 20 feet in diameter, six, seven feet high. Been there a long time.
Q You are not aware how long it had been there for?
A No.
Q How did you know it was there a long time?
A It looked rather weathered.
Q So from the looks of it?
A Right. It is my responsibility to get that stuff out of the pile and get it out and we did.
Q It had been there prior to your --
A It had been there for a while and I became aware of it and got rid of it.
Q Did anyone tell you how long it had been there?
A No.

Q Or just based on what you saw it looked old. Okay.
Was that pile located on any sort of tarp or liner, or was it on the ground?
A It was on the ground.
Q Do you know how many trucks it actually ended up taking to get rid of that pile?
A I don't recall that.
Q Do you know how many days that actually took?
A I don't recall that either.
Q This is a different pile of stuff than was discussed in September 2014?
A Yes.
Q Was it you that discovered this pile, or just operators knew it?
A I discovered it.
Q Did you say if it was just one single pile?
A It was. Again, it unfortunately had other debris in it besides ash. Had some steel in it and some other things.
Q Do you know how it got there?
A No.
Q Did you discuss the issue with any of the

Waukegan employees?
A No.
Q You never asked anybody why or how it got dumped there?
A No.
Q Did you discuss this pile or the removal of the pile with anyone else other than in this e-mail?
A No, that I can remember anyway.
Q Now, we talked about some fly ash, mixed fly ash and other things, piles on the ground that you found in March 2014.
MS. NIJMAN: I object to the characterization because he said they labeled it fly ash to be conservative.
MS. CASSEL: Q Were you aware --
A I couldn't speak to the actual content or constituents of it. More to be conservative, we took it out as fly ash because it's a different kind of landfill.
Q Did it appear to be fly ash to you?
A It was hard to say.
Q You did not have any tests done?
A There are no tests to differentiate between the two. Very difficult to differentiate between the

two ashes.
Q What you thought is bottom ash and fly ash?
A Yes.
Q So aside from these two incidents we talked about in March 2014 and September 2014, are you aware of any other instance where any sort of ash or slag was on the ground?
A No.
Q Are you -- other than observation, your conclusion or description of it as ash, is that based on observation alone?
A Right, visual.
Q To your eye it looked like ash?
A Yes.
Q Now, I would like you to take a look at another exhibit which is Exhibit 308. This is marked as Deposition Exhibit No. 308. Are you familiar with this e-mail, sir?
A Yes.
Q You authored this e-mail?
A Yes.
Q Does this appear to be a true and accurate copy of this e-mail?
A Yes.

Q If you can describe to me a little better what is being discussed in this e-mail?
A We had some fly ash that they had -- this was a spill from a fly ash hopper. They had a vac truck that wanted to dump it somewhere. I did not want them dumping on the ground. I rather have them dump in a lined pond, so I asked them to put it in with the bottom ash, one corner of the lined pond.
Q So where was the ash taken from?
A It was vacuumed off the floor from a roomful of fly ash hoppers.
Q Then once it was vacuumed it was in a vacuum truck?
A Vacuum truck and I didn't want them dumping it on the ground, so I had them dumping in a lined area.
Q So was it actually dumped into one of the lined areas?
A Yes. The pond was out of service.
Q So it was dumped into --
A The idea being you didn't want water to contact the fly ash.
Q So do you know which pond it was dumped into?

A I don't know. I don't remember. It was out of service pond.
Q Is it true that one of them is out of service at any time?
A Yes.
Q Only one is receiving --
A Right.
Q -- sluice?
A Yes.
Q When you refer -- you mentioned someone named Maria here. Who are you talking about?
A Maria Race.
Q Did you have conversation with Maria Race about this?
A Yes.
Q Did Maria make the suggestion about dumping it in an inactive pond?
A Yes.
Q Did you say anything to Maria prompting that suggestion?
MS. NIJMAN: Objection, vague.
THE WITNESS: I mean I called her to ask her for advice on how to handle it and that is what she gave me.

MS. CASSEL: Q Where did fly ash from Unit 7 go prior to this instance?
MS. NIJMAN: Objection, misstates prior testimony.
MS. CASSEL: Q Or what is U-7, what is that referring to?
A Unit 7.
Q It is Unit 7. So where does fly ash when you send it normally go?
A It goes to the fly ash silos now.
Q Are there other instances where there has been fly ash vacuumed up from hoppers?
A I cannot speak to that.
Q This is the only instance that you were aware of?
A The one instance I was aware of, yes. Again, as you go forward in the year we would start to use lined boxes to do this.
Q To remove the ash?
A To get the ash out of the property.
Q So this is prior to when those lined boxes were used?
A Yes, this is.
Q So were there any other instances in which

ash was dumped into ponds?
A Not that I know of. This is what I know about here.
Q How do you keep water from contacting the ash if it's in the inactive pond?
A We don't use the pond again until it is clean.
Q If it rains, wouldn't the water contact the ash?
A It is possible, yes.
Q I mean when those ponds are inactive, they are not covered over?
A No.
Q Now, we will move to Deposition Exhibit No. 309. Are you familiar with this e-mail, sir?
A Yes.
Q You recall receiving it?
A I do, yes.
Q Does it appear to be a true and accurate copy of the e-mail?
A Appears to be so, yes.
Q Sir, there is a report attached to the e-mails that were forwarded to you, is that right?
A Yes.

Q Did you review that report when you received it?
A I did, but I don't remember much of the particulars about it. I did see this report.
Q Does it appear to you as far as you recall to be a true and accurate copy of the report?
A Appears to be so, yes.
Q Do you know who arranged for the Valdes Engineering Company to do this ash pond berm visual assessment that is described in this report?
A Yes. It's addressed to Chris Lux. Since Chris Lux is on the e-mail, I would assume Chris Lux did it. He is the engineering manager. He has responsibility for dealing with engineering companies to do this kind of work.
Q So based on the name on here, but not based on independent knowledge, you think he's the one who did it?
A Yes.
Q Now, do you know why he would have or he did schedule this inspection?
A I don't.
Q Do you know whether prior to this inspection any inspections of the berms at the ponds

had been performed?
A No, I don't know that.
Q Now, taking a look at second page of the report, 44602, the inspection report do you see where it says "We reviewed our records on the ash ponds. Previous maintenance recommendations include installing a plank and rod soil stabilization system in 2002 and a recommendation for a similar repair in 2008 near station 14 plus 50."
Do you see where it says that?
A Yes.
Q Do you know whether or not a plank and rod soil stabilization system was installed?
A No, I don't.
MS. NIJMAN: I just object to the extent that two sentences later it says the location of the 2002 repair. It seems to discuss the same thing.
MS. CASSEL: I am asking about his knowledge, though.
Q A recommendation for a similar repair in 2008. Do you know whether a similar repair was made in 2008?
A No, I don't.
Q Do you know what station 14 plus 50 refers

to?
A No.
Q Now, on the next page, 44603, under recommendations, do you see where it states "We recommend performing annual inspections of the berm. We suggest performing the inspections in March or April before the trees and bushes leaf out."
Do you see that?
A Yes.
Q Do you know if those annual inspections are planned to take place? I am assuming -- well, has one taken place since this report?
A It's an annual inspection. It happened in '14. We are due for one in '15.
Q I wanted to ask if you plan to have annual inspections performed?
A Yes. That is the reason why the first part of the e-mail is for me to put that task in our environmental task tracking system to follow-up on that.
Q Is that INTELLECT Task?
A That is what we do, that is our tracking system. So I will get an e-mail and somebody tells me to schedule that, or I will get an e-mail and tell

somebody to do it.
Q You will get a reminder to make sure that is done?
A Yes.
Q Due by May 1st. So you should receive that by May 1st of next year?
A Yes.
Q I want to ask you a little bit about the liners at Waukegan. Are you familiar with the liner at Waukegan west pond predating its new lining, did you say it was 2004, or 2005?
A They were both, one was '03 and '05, I believe. East was first and west was second.
Q So do you know or are you familiar with the form of liner that was in place in Waukegan prior to that?
A I know it was called Hypalon. Beyond that, I don't know. I know it was replaced because the Hypalon was weathered.
Q Do you know whether it was Pox-O-Pac as well, or just Hypalon?
A I know it was Hypalon there. That is all I know about the lining there.
Q You don't know the composition or

thickness? I'm sorry, the composition you told me was Hypalon. Do you know about the thickness?
A Of the Hypalon, no.
Q Anything about the permeability of the Hypalon?
A No.
Q Do you know whether there was a warning layer above that Hypalon?
A I am not aware of that.
Q Or cushion layer?
A I do not know.
Q You don't know whether there was geotextile installed above that liner?
A I don't know.
Q Now, some questions about the current liner. Are you familiar with the current liner of the west pond?
A I am aware it was installed, yes.
Q Can you describe what you know about the liner?
A Polypropylene 60 millimeters thickness.
Q Polypropylene, is that known as HDP?
A High density polypropylene.
Q Do you know anything about the permeability

of that liner?
MS. NIJMAN: Only if you know. I object to the extent the witness is a layperson.
THE WITNESS: I am not an expert on the liner. We use because it is impermeable. That is just logic.
MS. CASSEL: Q Do you know whether or not the HDP liner has a warning layer above it?
MS. NIJMAN: I believe this was asked and answered.
THE WITNESS: Yes, we spoke before about the 12-inch sand layer and six-inch limestone.
MS. CASSEL: Q The sand is the cushion layer and the limestone is the warning layer?
A Yes.
Q And I believe we also discussed before that you don't know whether there is geotextile, is that correct, above either of those liners -- excuse me -- above the HDP liner?
A I don't know if there is. I was told only those two layers exist. That is my testimony.
Q I appreciate that. I recall that conversation now. I don't recall if I asked this about Waukegan, or Will County, your counsel will

remind me if I already asked it, do you know if there was ash left under the HDP liner at Waukegan west pond?
A I was told by Mr. Lux that there was soil underneath the liner, no ash. Just soil.
Q Is that for both west pond and east pond, or just the west pond?
A That is my understanding, both.
Q Have you participated in any conversation about relining the west pond in the future?
MS. NIJMAN: Objection to the extent it calls for a conversation with counsel, or in-house counsel with Midwest Generation.
MS. CASSEL: Q So outside of counsel, have you had any conversation?
A No, I have not.
Q Do you know does Midwest Gen have any process for determining whether or not if the pond should be relined?
MS. NIJMAN: Same objection.
THE WITNESS: Do I answer?
MS. NIJMAN: You can answer to the extent it does not involve conversation with counsel or in-house counsel.

THE WITNESS: Mr. Lux has spoken to me about this and said that we probably look at the frequency of failure of rips or tears to determine whether or not there would be relining.

MS. CASSEL: Q Has any analysis of the frequency of damage or repairs of this liner started?

A Again, I have been told it has not been an issue so far.

Q As I recall, all of our discussions about the liners at Will County those pertain to both the east and west pond in terms of there being a cushion layer and warning layer and you not knowing whether or not there is a geotextile layer there on top of the liner?

A You want to just ask about Waukegan?

Q I will go ahead and ask the same questions and I may have misspoken and said Will County instead of Waukegan. I will ask you the same questions and again counsel will remind i me if I have.

Now, the liner of the east pond prior to its relining, are you familiar with that old liner at the east pond?

A That is the Hypalon.

Q Do you know the thickness of that Hypalon

on the east pond?

A No.

Q Do you know the permeability?

A I do not.

Q Do you know whether there was a warning layer above the Hypalon?

A I do not.

Q Do you know whether there was a cushion layer above the Hypalon?

A I don't know.

Q Do you know whether there was any geotextile installed above the liner?

A I don't know.

Q Are you familiar with the current liner at the Waukegan east pond?

A Yes.

Q Is this an HDP liner?

A Yes. High density polyethylene.

Q And was this also 60 millimeters?

A That is my understanding, I was told 60 millimeters, and they are both lined with the same material.

Q Does that also apply to also having the sand layer and then the warning layer?

A Of limestone, yes.

Q That is at the east pond as well?

A Yes.

Q The warning layer is of limestone you said?

A Yes, 12 inches of sand and six inches of limestone.

Q Does the liner -- the current liner at the east pond, does it have a geotextile installed above it?

A No, it does not. All I know is the two layers we have are sand and limestone above the liner.

Q Again, aside from conversations you had with counsel, have you participated in any conversations about relining the east pond in the future?

A No.

Q Do you know if Midwest Generation has a process for determining if and when the east pond should be relined?

MS. NIJMAN: Same objection.

THE WITNESS: Just the frequency of incidents of repairs.

MS. CASSEL: Q Has that evaluation been done to

your knowledge?

A No. Mainly caused by man, not by the failure of the liner.

Q I am going to ask you a few questions, a couple other things on -- first I want to ask you about ground water monitoring. You said earlier -- correct me if I am wrong -- that you received or -- I'm sorry -- you are in charge of scheduling the sampling with the experts?

A KPRG is our contractor that does the sampling and sends the samples out for analysis. Once they get the analysis results, they do a report.

Q Do you receive the reports that they generate?

A Yes.

Q Do you review those reports?

A I go through them. I don't go through the data. I go through some of the cover letter normally.

Q So do you have any responsibilities related to those reports, what to do with them?

A No, I don't.

Q You don't have any responsibility related to the results or interpreting the results of those

reports?
A No.
Q Do you pass those reports on to anyone else at Midwest Generation?
A I think KPRG copies the people that need to see the report. I can't recall who is on the distribution list, but I am on the list.
Q You yourself don't forward them?
A No, I don't.
Q When you look at the cover letters, what are you looking for in the cover letters?
A To make sure the dates correspond to when this occurred, and that's about it.
Q You have not performed any analysis of the results of those ground water monitoring?
A No.
Q You have not interpreted that data at all?
A No.
Q Now I am going to ask you a few more questions about the Will County facility. We are getting close to it. We are almost there.
Now, we had discussed an area in the Will County site called the slag or what was identified on the map as the slag and bottom ash

dumping area. Do you recall that discussion?
A Yes.
Q You said you were familiar with that area, is that right?
A I knew where the area was that you pointed on.
Q Had you ever heard the term slag and bottom ash dumping area before?
MS. NIJMAN: Asked and answered.
THE WITNESS: No.
MS. CASSEL: Q We were discussing I believe it was termed a primary slag settling basin?
A Yes.
Q Correct me if I'm wrong, you described that as a pond next to between one north and one south?
A It's basically just east of one north, extends a bit further to the south of the end of that pond.
Q Can you describe to me again, did that receive only the overflow water from one north or one south, or did that also receive slag?
A The other way around. The initial -- the inlet to that pond was the water, the sluice water containing slag in Units 1 and 2, so as it hits the

pond, like I said before, the velocity slows down, the stuff settles out, and the overflow of that pond goes to the one north and one south.
Q So that is the primary place where the sluice goes, the first place where it goes?
A Right, yes.
Q And then is that settling basin also cleaned out as well?
A This primary one you just spoke of?
Q This one that we are talking about.
A Yes.
Q Do you know how frequently it is cleaned out?
MS. NIJMAN: You mean historically?
THE WITNESS: Those units have been retired for many years. Several years. Mid-2000's.
MS. CASSEL: Q Does it continue to be used?
A No.
Q When it was used, do you know how frequently it was cleaned out?
MS. NIJMAN: Calls for speculation.
THE WITNESS: Every other week.
MS. CASSEL: Q To your recollection, when was the last time it was used?

A I don't remember. It was mid-2000 it was retired.
Q Do you ever recall any leaks or leaches from the primary slag settling basin?
A No.
Q Do you recall any overflow knot into one end?
A No. That pond was designed for overflow to go to the trough and the trough would be diverted to the two ponds.
Q Was the trough lined?
A Concrete trough.
Q So it was not lined with anything?
A No.
Q So that trough would receive the overflow water after the initial bottom ash sluice had settled in that first pond and it went from that trough into --
A I make a distinction between slag and bottom ash here because in those days Units 1 and 2 grew slag. Slag is more saleable and has more commercial reuse than normal bottom ash.
Q You are saying it was called slag because it came from the cyclone boiler?

A Right. In those days they used to use it for roofing material, composite roofing material.
Q Do you know if there has ever been any soil boring taken of the area where that trough, the concrete trough was?
A No, I don't know that.
Q Do you know if there are any ground water monitoring wells in the area where the trough is?
A I cannot speak to that. I know those wells exist. I don't know where their locations are.
Q Is that trough still used for anything?
A I'm going to take a step back and say I have not been there in two years, so I can't speak to it.
Q When you were there, was that trough still being used?
A Once the units were retired, the trough was not used any longer.
Q When you were there last -- when you were there last, did that trough still exist, was it still there?
A Physically?
Q Yes.
A Yes.

Q The primary slag settling basin, was that lined?
A It was concrete basin.
Q Were you aware if it had any HDPE or Hypalon or Poz-o-Pac liner?
A Concrete basin.
Q Was that covered over after it ceased being used?
A I cannot speak to that.
MS. CASSEL: I think we have got one more. Do you mind if we take a quick break for three minutes.
(Whereupon, a recess was taken.)
MS. CASSEL: Q Sir, you discussed sort of a method for determining when the pond in Waukegan might need to be relined, and you said that would turn on the frequency of repairs.
Is there a certain threshold that would trigger the need to reline a pond?
A Not that we have determined yet.
Q Is there any other type of threshold that would trigger the need to?
A I have been told by the people who install the lining -- actually Chris told me that the people that install the lining, the lining was good for

50 years.
Q You are laughing about that?
A No. That's what they said.
Q They said it is good for 50 years.
There is no threshold of number of repairs or anything to your knowledge that would trigger the need to reline?
A As I spoke before, I believe -- I think Chris believes that the things we have seen so far are man-made and not inherent to the stability of the liner.
Q Now, final question about that primary slag settling basin that is no longer in use. Do you know if there is still slag in that basin?
A I cannot speak to that. I can tell you since it's saleable they probably got rid of it pretty quickly because it was worth something.
Q You don't know that as a fact?
A I don't know that.
MS. CASSEL: I think we are all set.
MS. NIJMAN: Reserve signature, please.

FURTHER DEPONENT SAITH NOT . . .

BEFORE THE ILLINOIS POLLUTION CONTROL BOARD

IN THE MATTER OF: )

**DEPOSITION OF FREDRICK VEENBAAS**

**Dear Ms. Nijman:**

**Enclosed is your copy of the deposition of FREDRICK VEENBAAS which was taken on February 20, 2015.**

**As signature was reserved, please arrange for the deponent to review his transcript making any necessary corrections on the errata sheets. Then have him sign the deponent's signature page and have the signature notarized.**

**Please send the original errata sheets and signed deponent's certificate to MS. JENNIFER CASSEL , keep a copy for yourself, and please send a copy to me.**

**According to Illinois Supreme Court Rule 207(a), signature must be obtained within 28 days or the deposition may then be used fully as though signed. Therefore, your prompt attention in this matter is greatly appreciated.**

**Sincerely,**

**Linda McMahon, CSR**
**Sullivan Reporting Company**

(The witness was duly sworn.)

MS. BUGEL: I apologize. Off the record for a second.

(Discussion had off the record.)

RICHARD FRENDT,

called as a witness herein, having been first duly sworn, was examined upon oral interrogatories, and testified as follows:

EXAMINATION

BY MS. BUGEL:

Q. Mr. Frendt, could you please state your name for the record.

A. Richard Frendt.

Q. And would you please spell that for the court reporter?

A. Frendt is F-r-e-n-d-t.

Q. Okay. And your place of employment?

A. Patrick Engineering.

Q. And the address of Patrick Engineering for the record?

A. 4970 Varsity Drive in Lisle, Illinois.

Q. And as I stated, my name is Faith Bugel. I'm a senior attorney with ELPC. I obviously am going to be asking you some questions today.

Have you ever given a deposition before?

A. I have.

Q. Okay. So you know this is a formal legal proceeding. You are under a legal obligation to answer the questions truthfully.

A. I do.

Q. And for the benefit of the court reporter, please answer out loud. Nods cannot be transcribed obviously. If you don't understand a question, please let me know, and I will rephrase the question. If you answer a question, we will assume you have understood it. Is that fair?

A. I understand.

Q. If you need a break, please let us know. We'll be happy to take as many breaks as people need.

And also, you will have an opportunity to read over the transcript at the end of the deposition and correct anything that was transcribed incorrectly. Okay?

A. All right.

Q. You understand all these directions?

A. I do.

Q. How long have you worked at Patrick

Engineering?
A. For ten years.
(Exhibit No. 163 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. And I am handing you what has been premarked as Exhibit 163. Are you familiar with that document?
A. Yes.
Q. And for the record, it is your -- would you call it your bio?
A. Yes.
Q. And you were involved in the preparation of this bio?
A. Yes.
Q. Okay. And does this appear to be a true and accurate copy of your bio?
A. I believe all of the statements on this are accurate, yes.
Q. Okay. And does this indicate you've been with Patrick Engineering since 2004?
A. Yes.
Q. Okay. Can you tell me, have you been in your current position, senior project manager, the

whole time you have been at Patrick Engineering?
A. I have always been a senior project manager with Patrick. In later years, I took on a larger role in which I manage all of the environmental projects for Patrick.
Q. What are your responsibilities?
A. I manage the environmental program at Patrick Engineering.
Q. And can you let us know about the project Patrick did for Midwest Generation? More specifically, how many years did that project go on?
MS. NIJMAN: Objection; vague.
BY THE WITNESS:
A. Can you specify the project you're referring to?
BY MS. BUGEL:
Q. I'll lay some foundation.
Were you involved in a Patrick project for Midwest Generation?
A. Yes.
Q. More than one?
A. Yes.
Q. Was there one specific project related to groundwater monitoring at multiple Midwest Gen

facilities?
A. Yes.
Q. Can you describe how long that project lasted?
A. I believe we began that project in late 2010 and continued that project through 2012.
Q. And were there additional projects -- strike that.
You've already indicated that Patrick had additional projects with Midwest Generation, correct?
A. Yes.
Q. Can you identify those additional projects?
A. One of the projects that we did for Midwest Generation was to assist them in the preparation of responses to draft NPDES permits that were issued at a number of their power stations.
Another project was to assist Midwest Generation in the development of a collection request by the USEPA.
There were a number of fairly small, very narrowly-defined projects in which we may have helped design and upgrade for one or more pieces of equipment at a particular power station.
Q. The USEPA collection request, was that

related to coal ash ponds?
A. That was the focus of the collection request, yes.
Q. Was Patrick Engineering involved in any additional -- any additional projects with Midwest Generation related to coal ash ponds?
A. I don't believe so, although I may be forgetting a small related project.
Q. I understand.
And you yourself were involved in the Patrick Engineering groundwater monitoring project for Midwest Generation; is that correct?
A. Yes.
Q. What role was -- I'm sorry. What role did you have in that project?
A. I managed that project for Patrick Engineering.
Q. Can you describe the type of activities that went with managing the project?
A. We developed a set of work plans to be implemented during the project. I staffed the implementation of those work plans which was primarily the installation and monitor- -- and monitoring of a series of monitoring wells.

And then I oversaw the development of reports which summarized the data that we got from that effort.

Q. You mentioned the development of reports. What information would be contained in those reports?

MS. NIJMAN: Objection; vague, overbroad.

BY THE WITNESS:

A. Are you talking about specifically data that was generated or historical information?

BY MS. BUGEL:

Q. Let's start with data.

A. Resulting -- the resulting data that would have been collected during those efforts would have included analytical laboratory data, groundwater elevation data, and some other ancillary data such as weather conditions, for example, when the data was collected.

Q. For the purposes of these reports, did that data need to be analyzed in any way?

A. All of the samples that we collected were sent to an analytical laboratory and, yes, analysis needed to be made on those samples.

Q. And did the analytical laboratory develop

a report of its analysis?

A. Yes.

Q. And did that report or those -- is it fair to call those lab results?

A. Yes.

Q. Did those lab results need to be analyzed for purposes of the report that Patrick was generating?

A. Yes. Those results were summarized and included in the text of the reports that we would generate. The original lab data report was also included in those reports.

Q. Did you play a role in summarizing those lab results and including that -- that analysis of the lab results in the reports that Patrick generated?

A. Yes.

Q. What role did you play?

A. I managed the effort.

Q. Could you be more specific in describing the tasks that would be involved in managing the effort that you just talked about?

A. I would generally have a staff engineer or geologist develop a draft of the report in which

they would summarize the data that came from the laboratory. I would review their reports. If I had comments or amendments to be made, I would make those amendments.

Q. Would you review their report for accuracy?

A. Yes. In terms of broad conclusion, yes.

Q. Would you review the report to ensure that you agreed with their analysis?

A. Yes.

Q. Did the analysis that was included in these reports include a comparison of the results of upgradient and downgradient wells?

MS. NIJMAN: I'm just going to object to the -- what reports again we're talking about. Are you just talking about the data monitoring reports?

MS. BUGEL: I'm talking about the reports that Patrick Engineering prepared for Midwest Gen that contained the groundwater monitoring results.

BY THE WITNESS:

A. I'm not sure that the text of the report specifically addressed up and downgradient issues, although that was a larger, long-term objective of the project.

Most of the data reports, especially the

early ones for which we had very few sampling events to rely upon, I don't think drew large conclusions as to what was up and downgradient.

BY MS. BUGEL:

Q. Patrick Engineering prepared quarterly reports containing the results of groundwater monitoring; is that correct?

A. That's correct.

Q. Did you also -- let me strike that.

Did Patrick Engineering also prepare annual reports?

A. Yes, we did.

Q. Would the annual reports contain any analysis of comparing results from upgradient and downgradient wells?

A. If such a comparison could be made, that was included. The only other thing different from the annual reports is a summary over time of results.

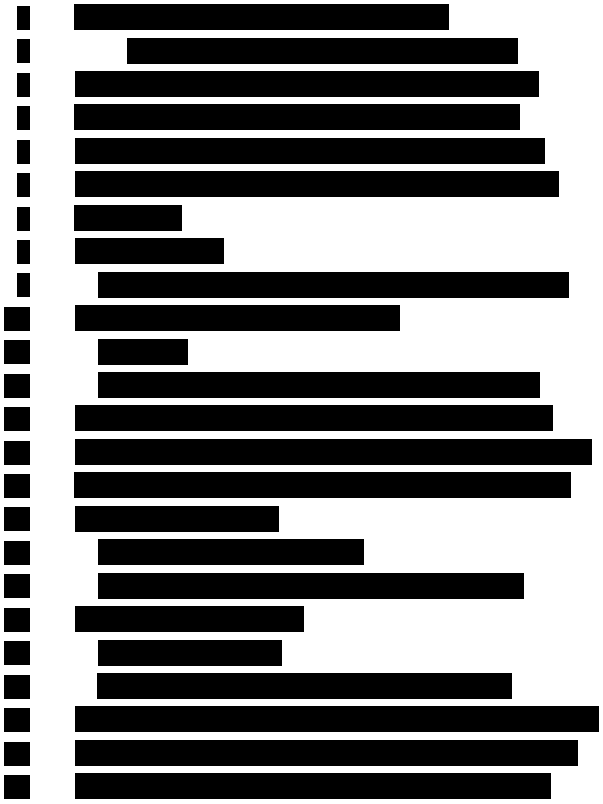
Q. And if a report did include a comparison of upgradient and downgradient wells, understanding that that was only select reports later in the process, were you involved in the comparison of the results from upgradient and downgradient monitoring

wells?
A. To the extent that those comparisons were made, I was involved, yes.
Q. Can you describe your role in that?
A. I would have reviewed that data.
Q. Would you have reviewed it for accuracy?
A. I would have reviewed the conclusions of up and downgradient wells drawn in the draft report.
Q. Would you have reviewed the conclusions to ensure that you agreed with them?
A. Yes. It's fair to say I agreed with the results that were included in the reports.
Q. Could you repeat that answer, please?
MS. NIJMAN: You can read it back.
(Record read.)
MS. BUGEL: Thank you.
BY MS. BUGEL:
Q. Do you know if Patrick Engineering ever performed a rigorous statistical analysis of upgradient groundwater quality for any of the facilities?
MS. NIJMAN: Object to vague and terminology.

BY THE WITNESS:
A. Can you be specific as to what you mean by "statistical?"
BY MS. BUGEL:
Q. We'll strike that question and we'll come back to it later.
You can set aside the exhibits that you're done with. We'll pile them here for the court reporter.
(Exhibit No. 134 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I am handing you what has previously been marked as Exhibit 134. For the record, it is Bates numbers 8286 to 8287 -- I'm sorry -- through 8293. Are you familiar with this document?
A. Yes.
Q. And I realize it is unsigned, but do you see where your name appears on this document?
A. I do.
Q. And was this a proposal for -- it's a June 2010 USEPA Information Collection Request. Was this a proposal to perform a project for Midwest Generation?

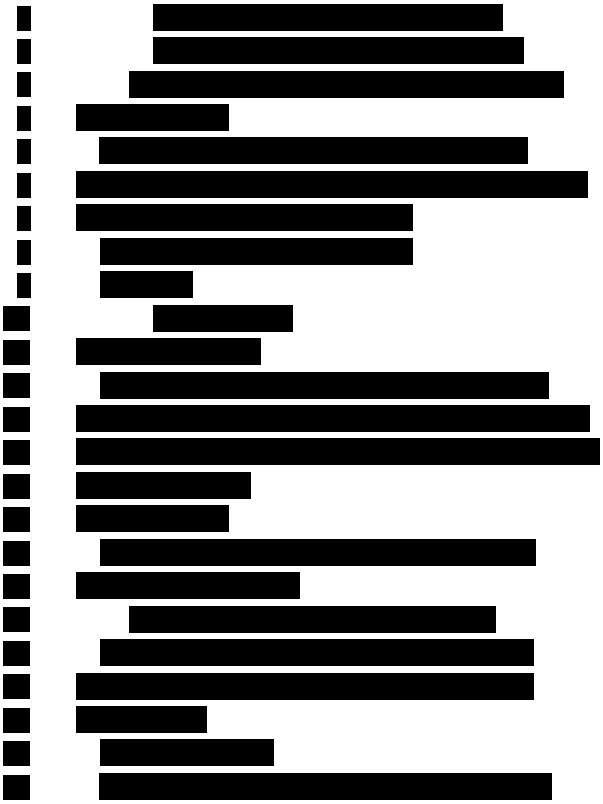
A. Yes.
Q. And were you involved in developing this proposal?
A. I was.
Q. So is it accurate to say you've previously reviewed this document?
A. Yes, it is.
Q. Okay. And did Midwest Generation accept this proposal?
A. They accepted either this proposal or one very similar. Because this isn't signed, there may have been some adjustments to this draft, but it's fair to say they accepted one similar to it.
Q. And does that -- would it be accurate to conclude that Patrick Engineering then went on to perform the work for the June 2010 USEPA Information Collection Request for Midwest Generation?
A. Yes.
Q. Okay. Do you recall what tasks that involved?
A. I do. Those tasks differed, to some degree, from what is included in this proposal, though, since it changed dramatically over time as that project progressed.

MS. NIJMAN: Can I just note for the record, Faith, that the attachments appear to be dated after the date of the letter, so I'm not sure they're part of the document.
MS. BUGEL: Okay. So we actually -- this was really just to lay foundation and we're not going to refer to anything else in this document.
MS. NIJMAN: Okay. But I don't want his statement that this is a true and accurate copy to include the attachments.
MS. BUGEL: Okay.
MS. NIJMAN: So if you're saying -- can you just clarify in the record which pages you were stating you have --
THE WITNESS: Yes. I'm only looking at the proposal page 1 and 2 of this document.
MS. BUGEL: Okay.
BY MS. BUGEL:
Q. And I don't think I ever even -- I asked if you -- this appeared to be a true and accurate copy, but just for the record now then, disregarding the attachments to this proposal, do pages 1 and 2, which is just the letter portion of the proposal, appear to be a true and accurate copy of the



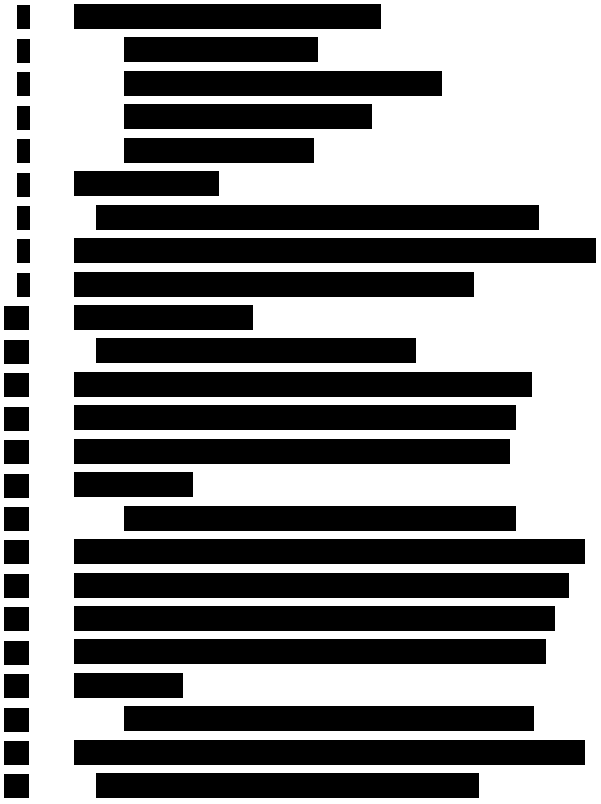
June 22nd document understanding that Midwest Gen -- that this may have been amended and updated and there may be a signed version?

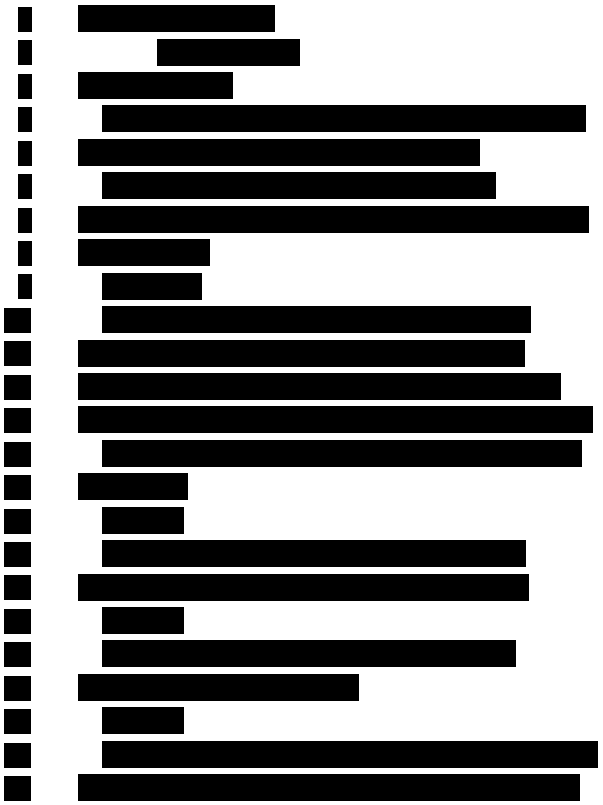
A. This appears to be a true and accurate version of a draft of the proposal, yes.

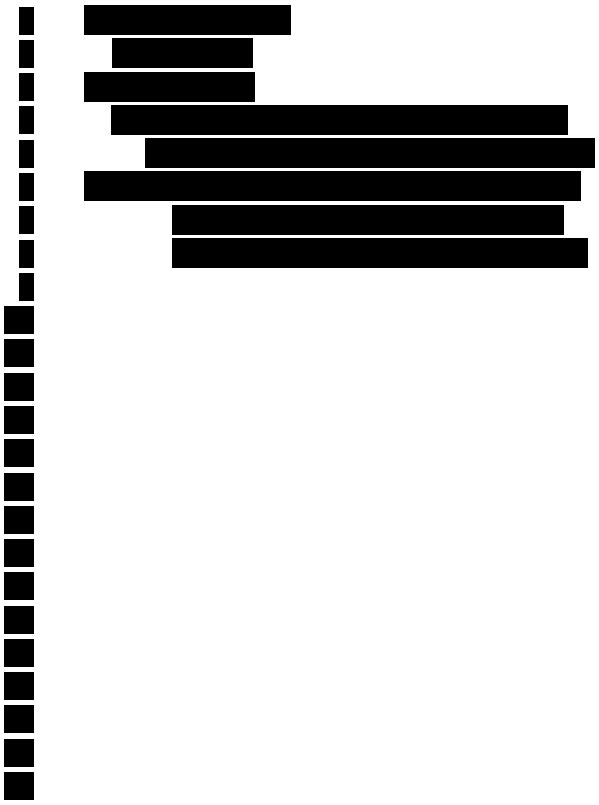


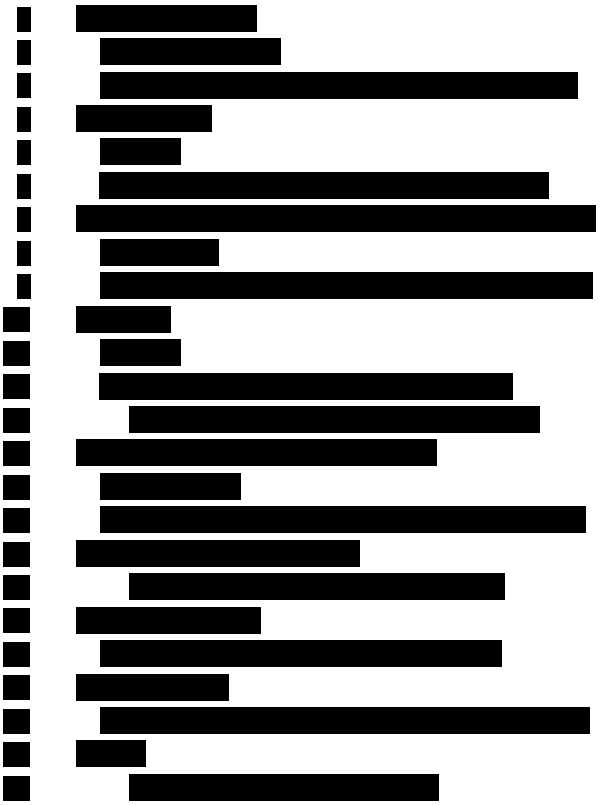
Q. Thank you.

(Pursuant to agreement, pages 19 through 24 were placed under seal.)









(Pursuant to agreement, pages 19 through 24 were placed under seal.)
(Exhibit No. 130 marked for identification, 12-11-14.)

BY MS. BUGEL:

Q. I am placing in front of you what has been previously marked as Exhibit 130. Are you familiar with this document?

A. Vaguely, yes. It appears to be an email that I sent to Maria Race.

Q. So you see where your name appears on this document?

A. Yes.

Q. And for the record, it's dated 1-7-2011 and begins on Bates number 14096. Do you see that?

A. Yes.

Q. Okay. Do you recall this document?

A. Generally, yes.

Q. And in the second paragraph, second sentence -- I'm sorry. Second paragraph, first sentence, do you see where it discusses the non-degradation standard?

A. Yes.

Q. And do you see the second sentence that

says: We want to maintain as much flexibility as possible in how we define that standard so that we can avoid an anomalous exceedance which isn't really statistically valid?
A. Yes.
Q. Do you see that?
A. Yes.
Q. Do you recall what you meant by that?
A. I think so.
Q. Can you explain, please?
A. Well, to explain, I'll have to explain what I mean by "non-degradation standard."
Q. Okay.
A. In general, our goal for these projects was to determine whether or not an ash pond was likely to be leaking or not. This was the focus of our investigation.
To determine that, we have to decide, in advance before we collect data, what would be a relevant set of parameters to base conclusions on. One possible approach to that problem is to install upgradient monitoring wells and downgradient monitoring wells up and downgradient of the ash pond in question and compare the analytical results

between those two sets of wells.
In a very simplistic system, if there's no difference between the upgradient well and the downgradient well, then we might be able to conclude, in a hypothetical case, that no impact from the ash ponds was determined.
In this particular case, I'm reflecting the confusing data that was actually generated by the investigations that we did perform insofar as up and downgradient were very difficult to define from site to site based upon the well information that we gathered so that something that may look upgradient may, in fact, be downgradient to the well and we wouldn't want to draw a conclusion on whether or not an ash pond is likely to be leaking on erroneous conclusions like that.
So that's why I mentioned that I want to make sure that these results would be statistically valid.
Q. Were you -- strike that.
Did you go on to define the standard as discussed in this second sentence?
A. We never ultimately reached a consensus on what a standard should be, nor did we refer to one

in the work plans or any of the reports we generated.
(Exhibit No. 131 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I am passing you what has previously been marked as Exhibit 131. So if you turn to the attachments, it is those attachments that I would like to discuss with you. And I'm -- I do not believe your name appears on the email, so our focus is going to be on the attachments.
In looking at the attachments, are you familiar with those documents?
A. Generally, yes.
Q. And does your name appear on the attachments?
A. Yes.
Q. And it appears on the first one that somebody else signed for you?
A. Yes.
Q. Was that with your permission?
A. Yes.
Q. In the second one somebody else signed for you and the third. Is it fair to say that where

the attachments -- where someone signed for you, that was with your permission for all of them?
A. Yes.
Q. Okay. And you have reviewed these attachments before today?
A. Yes.
Q. Okay. And is it accurate to say that these are Patrick Engineering proposals for ash pond investigations at the four facilities which are Joliet and Will County and Waukegan and Powerton?
A. Yes.
Q. Okay. And do these appear to be true and accurate copies of those four proposals for those four facilities?
A. To the extent that I've reviewed them, yes.
Q. And because they are signed by both parties, would it -- does that mean these are the final proposals that were accepted?
A. It wasn't signed by both parties. It was simply signed by Patrick.
Q. Oh, okay.
A. But I do believe that they were accepted by Midwest Generation.
Q. Thank you for the correction.

Okay. So can we please turn towards Bates page 21481. In the middle of the second paragraph, do you see where it says: During that meeting, a conceptual approach to completing hydrogeologic assessments of MWG's ash ponds at a number of sites, including Joliet number 29, was presented by MWG and agreed to by the Illinois EPA?

A. Yes.

Q. Do you have any understanding of what that conceptual approach was?

A. Yes.

Q. Can you please explain?

A. It's essentially the conceptual approach that's presented in each of these proposals, but basically, to simplify, it included the installation of monitoring wells and some subsequent testing of those wells.

Q. Did you recommend any changes to Midwest Gen's conceptual approach in your proposal?

A. Can you tell me what Midwest Gen's conceptual approach was that I would be comparing this to?

Q. In the letter it says Midwest Gen presented a conceptual approach to IEPA in a

meeting, and what I'm wondering is if you recommended any changes from what they proposed in that meeting to what you proposed to Midwest Gen in this document.

MS. NIJMAN: Object to foundation and to form.

BY THE WITNESS:

A. I should clarify that the meeting you're referring to, those conceptual plans that had been prepared for IEPA were also prepared by Patrick, and I was present at that meeting.

MS. NIJMAN: There's the foundation.

BY THE WITNESS:

A. So -- and comparing those two things, yes, this reflects what we presented in the meeting and what IEPA conceptually agreed to in the meeting.

MS. NIJMAN: Thank you for helping them.

BY THE WITNESS:

A. If there are any differences, they would have been fairly minor. And there may be some minor differences that I'm forgetting, but generally the process was reached.

BY MS. BUGEL:

Q. And can you please turn to page 21485?

And do you see in this table where boron, sulfate, iron, manganese, and total dissolved solids are designated as coal combustion waste indicators?

A. Yes.

Q. Were you involved in selecting those constituents as coal combustion waste indicators?

A. I was involved to the extent that we wanted to match, as much as possible, the precedent that had been set at the Hudsonville site which is why at the top of this table it says "Hudsonville consistent" where the EPA had agreed on a parameter list with another power producer. This is a list that was designed to be consistent with what was agreed to by that power producer and the Illinois EPA at the Hudsonville site.

BY MS. BUGEL:

Q. Why did you want to match, as much as possible, the precedent set at Hudsonville?

A. We felt that because the Illinois EPA had already agreed to that parameter list that it would be likely that they would agree to this list at this site in a similar circumstance.

Q. Did you intend to do any comparison of these parameters -- these five parameters that we

just identified to Illinois groundwater protection standards?

A. Can you be specific as to what standards you're referring?

Q. Class I.

A. Class I drinking water standards in Illinois?

Q. Class I groundwater standards.

A. Groundwater standards...

At the time we wrote this document or what we eventually ultimately compared them to?

Q. Let's start with at the time you wrote this document.

A. I can't recall whether we specified a standard in this proposal. It appears we do -- we do mention those standards in -- at the bottom of page 2, so yes.

Q. Where at the bottom of page 2 did you see those standards?

A. The last sentence: Proposed analytes include the inorganic compounds listed in the Illinois Administrative Code, Title 35: Environmental Protection, part 620, Groundwater Quality, et cetera.

Q. And in your last response, you mentioned what you ultimately did. Can you explain what you ultimately did with those five parameters?
A. We ultimately did compare them to the 620 standards.
Q. Okay. Do you know if boron is an indicator parameter for any other kind of waste?
A. Other than what?
Q. Other than coal combustion waste.
A. I couldn't say.
Q. Do you know if sulfate is an indicator parameter for any other kind of waste?
A. Yes.
Q. If so, what?
A. A whole number of inorganic compounds; sulfuric acid, for example, some agricultural amendments that contain sulfur. I'm sure there are others.
Q. Do you know if manganese is an indicator parameter for any other kind of waste?
A. Yes, a very wide range, including simple petroleum hydrocarbons since manganese has an unusual redox potential reaction presence of a carbon substrate.

Q. You said a wide range. Anything else that you can identify?
A. Not that comes to mind, but carbon substrate would include literally thousands of compounds.
Q. And do you know if iron is an indicator parameter for any other kind of waste?
A. Many of the same indicators that manganese is an indicator for, especially with respect to its oxidation potential.
Q. And do you know if total dissolved solids are an indicator parameter for any other kind of waste?
A. Yes, many, many kinds of waste. municipal-treated sewage waste, for example, is a common example.
Q. In your experience, does groundwater affected by coal ash show elevated concentrations of all of these parameters?
MS. NIJMAN: Object to foundation and vague.
BY THE WITNESS:
A. I can't speak hypothetically on such a broad question. Can you be specific as to what

parameter you might be focusing on?
BY MS. BUGEL:
Q. The five parameters that we just talked about. Did you have experience doing groundwater monitoring for coal combustion waste contamination prior to this project, prior to working with Midwest Gen?
A. Yes.
Q. And in that experience, if -- did you ever detect coal combustion waste impacts to groundwater?
A. Could you repeat that question, please?
MS. BUGEL: Can you read the question back, please?
(Record read.)
BY THE WITNESS:
A. We detected what we theorized may be coal combustion waste products in groundwater, yes.
BY MS. BUGEL:
Q. And did you use the five parameters that we just identified from page 21485 as coal combustion waste indicators in that previous work?
A. I can't say 100 percent for sure. I believe that we would have used sulfate. And in the specific case I'm thinking of, it would have been

arsenic that were relevant to our investigations.
Q. In your previous work, have you ever used all five of these constituents together as coal combustion waste indicators?
A. We have sampled for all five of those previously. Are you asking whether we detected them?
Q. When you sampled for them previously, was that in groundwater that -- where there was a question as to whether it was impacted by coal combustion waste?
A. Yes.
Q. And when you sampled, did you detect all five in that groundwater?
A. We did not.
Q. Can you describe that project, please?
A. Not in detail since I don't recall the exact figures. I do believe that we found elevated sulfate and arsenic in downgradient locations at at least one specific site that I can recall in my career that weren't easily explainable other than as indicators of coal combustion waste.
Q. Were there any conclusions drawn in that project as to whether the groundwater was impacted

by coal combustion waste?
A. I believe there were at least tentative conclusions. And I believe our tentative conclusion was that it appeared likely that there had been impact in that one case.
Q. Can you name the case?
MS. NIJMAN: Not any client -- object to privileged and confidentiality for his purposes.
MS. BUGEL: Okay.
BY THE WITNESS:
A. Yes. I would prefer not to.
BY MS. BUGEL:
Q. I understand.
Aside from the project you just described, can you recall any other projects where you monitored -- I'm sorry -- where you were reviewing groundwater monitoring results for coal combustion waste impacts?
A. The current project in question, the Midwest Generation project.
Q. Any other projects than the current project and the one you just described with the arsenic and the sulfate?
A. None that I can recall.

Q. Can you please turn to page 21482. Looking at task three, the second sentence, do you see where it says: The survey crew will also concurrently measure the water elevation in all of the ash ponds and the Des Plaines River? Do you see where it says that?
A. Yes.
Q. Can you explain why this task was included?
A. Yes. This goes to determining groundwater flow direction and patterns at the site.
Q. How does ash pond and surface water elevation go to groundwater flow?
A. All of the monitoring wells that are installed as part of this project are measured for groundwater elevation on the same day that they are sampled.
To the extent possible, we like to compare that elevation to the elevation of the nearby river to determine the direction of groundwater flow.
In general, if we have higher elevations in monitoring wells, that generally means, all other things being simple and equal, that the groundwater is flowing from a higher elevation to a lower one. This isn't always the case, but given no other

data, this was a reasonable proposal.
Q. Is it accurate -- let me go back a second.
You indicated that on the same day that the sample is taken, the water elevations are measured at all of the monitoring wells; is that correct?
A. Generally, yes.
Q. How often is surface water elevation measured?
A. According to this proposal, we would have done that just once during the investigative process. And this may well be one of those minor deviations to the scope that we later made given that groundwater elevation in the river is also available from other sources, though maybe not exactly on the same days.
So I think in some cases for some sites, we actually relied on Illinois water survey data that's automatically collected in river gauges that are located along the river.
Q. And was the elevation data from the groundwater wells collected every time samples were taken?
A. From the wells themselves, yes.

Q. And how often were samples taken from the wells?
A. Quarterly generally, unless there was some reason a particular well couldn't be sampled.
Q. And how was that elevation data from the wells then used?
A. In our report, a table was generated which included the groundwater elevation data at each sampling location and was reported in the final report.
MS. BUGEL: Do we want to stop now?
MS. LAUGHRIDGE GALE: Yes. We've got five minutes.
(A recess was taken.)
(Mr. Zaharoff entered the deposition room.)
MS. BUGEL: Back on the record.
(Exhibit No. 133 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I am placing in front of you what has previously been marked as Exhibit 133. Are you familiar with this document? The first page is obviously an email but also the attachment.

A. Generally, yes.
Q. And if we look at the attachment, Patrick Engineering prepared this Hydrogeologic Assessment Plan for Joliet Generating Station Number 29 --
A. Yes.
Q. -- is that correct?
A. Yes.
Q. And if you turn back to Bates page 13869, Rick, you forwarded this report to Maria Race by email?
A. Yes.
MS. BUGEL: And for the record, the date on the email is July 9th, 2010.
BY MS. BUGEL:
Q. And have you reviewed this Hydrogeologic Assessment Plan before today?
A. During its preparation, yes.
Q. And does this appear to be a true and accurate copy of that plan?
A. To the extent that I recall it, yes.
Q. And can you please turn to Bates page 13882. Does this show the proposed monitoring well locations for the Joliet station 29?
A. Yes.

Q. And do you know if all of the wells identified on this figure were, in fact, installed?
A. I believe they were installed, although there may have been some minor variation in what exactly their final placement would have been.
Q. Do you know if any additional wells, beyond the ones generally identified on this map, were installed?
A. I don't recall.
Q. And do you know if there were any other groundwater monitoring wells active or inactive on this property?
A. I'm unaware of any.
Q. And if you turn back to Bates page 13875, do you see the very first sentence on that page: MWG will install (11) -- the number eleven in parens -- permanent groundwater monitoring wells spaced approximately 150 feet apart around the perimeter of the ash disposal ponds? Do you see where it says that?
A. Yes.
Q. And then it goes on to say: The well locations have been selected so that both up and downgradient wells are represented. Do you see

where it says that?
A. Yes.
Q. Can you identify on Bates page 13882 the upgradient and downgradient wells?
MS. NIJMAN: From the time of this report?
MS. BUGEL: From the -- if -- let's start with from the time of this report.
BY THE WITNESS:
A. I should clarify that what we expected to find to be upgradient wasn't always what we found to be upgradient and downgradient.
I think in this case, we were anticipating the wells that are located to the northwest of each pond to be upgradient wells. The wells located on the southern line we expected to be downgradient wells.
There is a well that was installed just to the southwest of the northeastern pond that I think was in some question. That's generally what we expected to find, though, yes, given that our estimation -- and again, it was only an estimation at the time that we prepared this report. Our estimation of the groundwater flow direction was simply that it was generally to the southeast

towards the river.
BY MS. BUGEL:
Q. So can you explain -- I'm sorry. Strike that.
Did you then find the groundwater flow to be different from your estimation?
A. I haven't reviewed the elevations in years, and so the details may escape me, but I think in general, yes, we found some anomalies with the groundwater flow direction at the site.
(Exhibit No. 135 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I'm placing what has been marked as Exhibit 135 in front of you beginning on Bates page 6964. Are you familiar with this document?
A. Generally, yes.
Q. And it was prepared by Patrick Engineering; is that correct?
A. Yes.
Q. And does it -- do you see where it says: A Hydrogeologic Assessment Report, Joliet Generating Station Number 29?
A. Yes.

Q. And do you see where it is dated February 2011 at the bottom of the page?
A. Yes.
Q. Were you involved in preparing this report?
A. I was.
Q. And have you previously reviewed this report?
A. At the time of its development, yes.
Q. Okay. Let's -- and does it appear to be a true and accurate copy?
A. To the extent that I have reviewed it, yes.
Q. Okay. Let's turn to page 6983. Do you have that page in front of you?
A. I do.
Q. And does this provide more information as to groundwater elevations?
A. Yes. Specific elevations during this one event, yes.
Q. And does it indicate groundwater flow?
A. It indicates the -- the elevations of groundwater during the event in which this took place which I believe was during the fall of 2010.
Q. Is there a blue arrow on this document?
A. Yes.

Q. What does that blue arrow indicate?
A. The blue arrow is to simplify, for the reader in general terms, which way the groundwater flows at the site, although it certainly is an oversimplification given the amount of data that we have at the site. But in general, groundwater flows towards the Des Plaines river which isn't much of a surprise.

Some slight surprise for us is that it has more of a southwesterly component than we might have otherwise expected.

Q. So did your understanding of which wells were upgradient change over time?
A. I would say our overall understanding of up and downgradient flow did change over time. And I don't think I would ever characterize our categorization of any given well as up or downgradient as definitive in any of those times.

So it wasn't as if in March I thought, well, ten was upgradient and in April I thought it was a different direction. It was simply that given the totality of the data, it was clear that the flow patterns at the site were much more complex than could be summarized by a blue arrow on

a figure.

So for a good example in this case, well one located on the same image that you have shown me I would reasonably have expected to be a downgradient well at the time we wrote the plan, but in point of fact, the data would imply that it's at least upgradient of the most northeasterly pond, at least during this one sampling event. And not all the same gradients were found in all of the same sampling events.

So that's just one example of some of the complexity of the flow patterns at the site.

Q. Were there any other wells that you excepted to be upgradient similar to Midwest -- MW 1 that you just pointed out that you later determined were not upgradient?

MS. NIJMAN: I'm going to object to the mischaracterization of his testimony. You can answer, if you understand.

BY THE WITNESS:

A. Yeah. We -- we originally thought well one would have been downgradient and not upgradient.

BY MS. BUGEL:

Q. Thank you.

A. And on the basis of this one event, we might reasonably conclude that it's upgradient. But I don't believe, even at the time of this report, we were comfortable saying that well one was an upgradient well either given that we know that the flow patterns in that river change; that flooding sometimes occurs. Sometimes gradients can be reversed.

So on the basis of one snapshot of data, I don't think we would have been comfortable saying anything yet about these wells.

Q. And we've talked a little bit about the reasons for having an upgradient/downgradient comparison. Is -- would it be accurate to say that the purpose for having upgradient wells is to develop background?
A. Not precisely. I'm not so much interested in background. Background implies a level of a particular compound which might be reasonably found everywhere. I'm not interested in background in this particular case.

I'm interested in what is directly upgradient of the ash ponds so that it can be compared to what might be found directly

downgradient to the ash pond, not necessarily compared to what the regional number of, say, arsenic might be which would be a more accurate description of what background is.

So although I might slip into that terminology accidentally, background is somewhat different than upgradient.

Q. Okay. Can you please turn to page 6972. Looking at the first full paragraph on that page -- the first paragraph on that page, the third sentence, do you see where it says -- and I don't know how to pronounce this -- antimony? Antimony?

A. Uh-huh.

Q. Antimony chloride, manganese sulfate, and total dissolved solids, paren, TDS, end paren, were detected in one or more monitoring wells at concentrations exceeding the part 620 class I groundwater quality standards.

Do you see where it says that?

A. Yes.

Q. And are some of these coal combustion waste indicators?

A. Well, some could be under certain

circumstances.

Q. Can you explain?

MS. NIJMAN: I'll object just to the extent that we've asked and answered. We've been through all these constituents and what the other causes might be of each of them. You can answer.

BY THE WITNESS:

A. When we look at indicator compounds for any sort of impact, we don't look at just the concentration of that one compound. We would also look at its presence in relationship to other compounds which might be also considered indicators. We might look at the ratio of those things.

We might look at the ratio of those things as it might be affected by the pH in the geochemistry at the site.

And in all cases, we would be looking at these things with the assumption that we have a decent understanding of hydrogeologic flow of the system.

So all of those things being generally true at this hypothetical site we're talking about, yes, some of these could be considered, but not all of them would be, no.

BY MS. BUGEL:

Q. But these results are not a hypothetical site, correct?

A. That's correct.

Q. Okay. These results are for the Joliet 29 site, correct?

A. Correct.

Q. So the -- did the presence of those five constituents -- did you draw any conclusion from the presence of those five constituents?

A. Not in February of 2011. I did not, no.

Q. And this goes to say: In some cases the highest concentrations of a given compound were found in upgradient wells.

Were you involved in the decision to include that sentence in this report?

A. I'm sure I was, yes.

Q. Do you have an understanding of why that sentence is there?

A. I'm sure that it's based on some piece of data that I reviewed, although I can't recall which wells I may have been referring to in this specific case now today.

Q. What relevance is there that the highest

concentrations of a given compound were found in upgradient wells?

A. Well, it shows that the system is much more complex than you might hope if you expect to find a simple answer from simply analyzing compounds in wells.

If you have a higher concentration upgradient of the ash ponds than you do in the downgradient wells, it's difficult to draw any strong conclusion about the ash ponds themselves and their relative contribution to groundwater.

Q. So that the presence of a higher concentration of a compound upgradient than downgradient did not lead you to the conclusion that the ash pond was not contributing to that concentration?

A. At the point that we reviewed this specific set of data, I don't think we drew any conclusions at all other than our system is complex and it's going to take more work than we thought, as very frequently happens in our business.

Q. Okay. And moving on to the second paragraph, second sentence of that paragraph, do you see where it says: To develop a

true statistically significant upgradient background concentration for the various compounds will require a number of sequential sampling events over time?

A. Yes.

Q. Did Patrick Engineering go on to do a number of sequential sampling events?

A. Yes.

Q. Enough to develop a true statistically significant upgradient background concentration?

A. For Joliet specifically, I don't believe we ever did develop a hard set of background numbers to be compared to. I don't believe that was ever done.

Q. Do you know if it was -- if Patrick did it for any of the other facilities?

A. I don't believe it was done for any of the facilities, but there may be some exceptions to that that I'm not recalling. But as I sit here today, I don't recall of any.

Q. Do you know if anyone else did this for those sites?

A. I don't know that.

Q. Okay. We can turn to the next exhibit.

You can set that aside.

I'm passing you an exhibit that's been previously marked as Exhibit 24. Referring -- let's just flip to the attachment first. I'm sorry. There are four attachments.

Starting on page 14158, Ash Pond Data Evaluation and Summary, are you familiar with that report -- I'm sorry -- that document?

A. Generally, yes.

Q. And turning to Bates 14162, Ash Pond Data Evaluation and Summary, Powerton Station, are you familiar with that document?

A. Generally, yes.

Q. And turning to Bates 14166, Ash Pond Data Evaluation and Summary for Waukegan Station, are you familiar with that document?

A. Generally, yes.

Q. Last one: Bates 14170, Ash Pond Data Evaluation and Summary, Will County Station, are you familiar with that document?

A. Generally, yes.

Q. And have you reviewed these documents previously?

A. Yes.

Q. And Patrick Engineering prepared these documents?

A. Yes.

Q. And you emailed these documents to Maria Race on February 10th, 2012; is that correct?

A. That's correct.

Q. And does this appear to be a true and accurate copy of that email and those attachments?

A. To the extent that I've reviewed it, yes.

Q. And the Ash Pond Data Evaluation and Summaries, were these draft documents as indicated by the "draft" stamp across the page?

A. Yes, they were.

Q. What were they drafts of?

A. I don't believe final versions of these were ultimately ever created. I believe these were the final -- well, they were the most recent and last versions of these documents.

But these documents were generated as a summary for Midwest Generation to facilitate a discussion about each of its sites.

Q. Okay. Let's turn to Bates page 14158. I'm looking at the heading Groundwater Evaluations and the second paragraph about halfway through that

paragraph: During the September and December 2011 sampling events, comma, groundwater elevations were slightly lower than the recorded river level, parenthetical, as compared to the other events, comma, where groundwater was higher than the river, close parenthetical. Do you see where it says that?

A. Yes.

Q. Okay. And it goes on to say: This appears to indicate that when the groundwater elevations are higher, groundwater at the site is discharging to the river, semi colon, when groundwater elevations are lower, comma, the river is recharging to the shallow aquifer. Do you see where it says that?

A. Yes.

Q. So when the river is recharging to the shallow aquifer, does it affect groundwater flow as monitored by the -- or as indicated by the groundwater monitoring wells?

MS. NIJMAN: Vague.

MS. BUGEL: I think I phrased that poorly.

THE WITNESS: Yeah. Could you restate that?

MS. BUGEL: Okay.

BY MS. BUGEL:
Q. When the river is recharging to the shallow aquifer, does this affect groundwater flow in the parts of the aquifer where there are groundwater monitoring wells?
A. Well, first, let me state that -- that we drew no firm conclusion as to whether or not that recharge to the shallow aquifer was happening.
In the hypothetical case that it does happen, it certainly affects flow on the site since it means the flow was from the river to the site.
But I think I say it appears to indicate that to acknowledge the fact that we may not have enough data to determine that and that especially if that's the case because of reg- -- I'm sorry -- seasonal fluctuations, four quarters of data is generally not enough to make a conclusion with respect to regional -- I'm sorry -- seasonal fluctuations since we're only looking at one year.
Q. Right. Okay.
Can you look at the very last sentence of the next paragraph which is on 14159. The direction of groundwater flow remains unchanged regardless of the elevation of the river and to the

groundwater table; do you see where it says that?
A. Yes.
Q. And did you agree with this sentence?
A. I did agree, yes.
Q. And can you explain how the groundwater flow would remain unchanged?
A. Yes. I admit I was probably somewhat unclear here. I'm trying to say that the wells to the farthest north at the site, I believe, were always found to be higher in elevation than the river.
So at least some flow across the site didn't change. And it may well be that just the wells in the shallow aquifer closer to the river actually undergo a reversal over time.
Q. And can you -- on the same page -- let's see. The very last paragraph under Analytical Results, can you take a minute to review that paragraph?
(Brief pause.)
BY THE WITNESS:
A. Yes.
BY MS. BUGEL:
Q. And -- I'm sorry. Let's just go up

one sentence. Do you see where it says: Boron exceeded the class I standard only in MW 11, an upgradient well?
A. Yes.
Q. And again, comma, the distribution of boron does not allow a strong conclusion to be drawn with respect to the integrity of the ash pond?
A. Yes.
Q. Can you explain why the distribution of boron did not allow a conclusion to be -- a strong conclusion to be drawn on that?
A. Well, I think a strong conclusion would require more than one compound result found in one well. To draw a strong conclusion of any degree, you would expect supporting data or multiple lines of evidence.
So although boron exceeded the standard only on one well, an upgradient one, we can't really draw any conclusion from that alone.
Q. And go up one paragraph, please. Do you see where it discusses monitoring well MW 9 located between two ash ponds?
A. Uh-huh.

Q. And it also contains the larger number of exceedances?
A. Yes.
Q. Why was it difficult to draw strong conclusions regarding the concentrations in that well?
A. Simply because we don't have a strong understanding of the hydrogeologic flow patterns at that location.
Q. Was this affected by that well's location between the two ash ponds?
A. I don't know what's affecting it other than the flow seemed to change over time.
(Exhibit No. 164 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I am placing a document in front of you that has been
marked as Exhibit 164. If you just -- again, we'll only be talking about -- we'll start by talking about the text version of this. And I won't ask you to do a side-by-side comparison, but these two documents appear to be very similar in terms of the text. And what I'm wondering is having this

document in front of you, does that change your recollection about whether the Exhibit 24 was a draft of any other report?

A. I'm quite sure that the first document I reviewed was not a draft of this document or any groundwater monitoring report.

Q. Okay.

A. The format of all of our groundwater reports is, I think, exactly the same from quarter to quarter while the format and the types of conclusions drawn in that document is somewhat different.

Q. Okay. And would it surprise you then if the text of this document was in places verbatim repeated in Exhibit 164?

A. No.

Q. Okay. Okay. So with Exhibit 164 in front of you, are you familiar with this document?

A. Generally, yes.

Q. And does it contain your name and signature on it?

A. Yes.

Q. And it was drafted by Patrick Engineering?

A. Yes.

Q. And you were involved in the drafting of this document?

A. Yes.

Q. And does it appear to be a true and accurate copy?

A. To the extent I've reviewed it, yes.

Q. Okay. Does this document -- okay. Let's turn to page 2657 which contains -- do you see table 3 on Bates page 2675?

A. Yes.

Q. And does this indicate the exceedances that were found in well MW 9 during that sampling period?

A. Yes, over a number of sampling periods.

Q. Over a number. Thank you.

And generally what exceedances -- what constituents were there exceedances of?

A. According to this table, there were exceedances of manganese, sulfate, and total dissolved solids.

Q. Are you aware of any other industrial source that would produce exceedances of those parameters together?

A. In any situation? That's a very broad

statement. I -- I'm not specifically aware of any, but certainly they could exist.

Q. And again, these two documents, while one is not a draft of the other, were they generally discussing the same results over the same time period, do you know?

A. I can't recall if all of the sampling periods matched. I believe the first document was generated sometime in early 2012.

Q. It's dated -- it states January 2012 on it.

A. So generally, I would say yes.

Q. Okay. Can you turn to page 14159 of Exhibit 24 again.

MS. NIJMAN: Exhibit 24?

MS. BUGEL: Twenty-four, yeah.

THE WITNESS: Could you repeat the page?

MS. BUGEL: 14159.

BY MS. BUGEL:

Q. And the very last bullet on that page stated: Patrick could not find any statistically significant trends in the data which indicate that the exceedances are either historical in nature, comma, or more likely naturally occurring.

Do you see where it says that?

A. Yes.

Q. What did you mean -- I'm sorry. Do you have an understanding of what it meant by "historical in nature?"

A. I'm not quite sure, to be honest, what I meant by that. I'm assuming that means historical events at the site, but I can't say for sure.

Q. And is MW 11 an upgradient well?

A. I would need to review the document more to make that conclusion. It certainly -- we expected it to be on the basis of the data that we would collect, yes, but I haven't reviewed all of the hydrogeologic elevation data as I sit here, so I can't say for sure.

Q. And for -- to refresh your recollection, could you turn to Bates page 2664 of Exhibit 164?

A. Yes.

Q. Okay. And in looking at that page, would this indicate that MW 11 is upgradient?

A. It would indicate that it was during the fall 2010 event, at any rate. I'm sorry. The fall 2011.

Q. Thank you.

And is it fair to say that use of the term "upgradient" is relative to other wells?

A. In this case, that's true because the only elevation data we collected was from other wells.

Q. And do you have any idea of how far MW 11 is from the nearest ash pond?

A. I believe all of the wells were designed to be no more than 25 feet away from a boundary, although I may have that figure wrong. But during the development of the installation plans, we followed a similar protocol that's used for analyzing landfills where that is the requirement that the wells are installed no further than 25 feet away from the boundary.

So in some cases we may not have been able to practically reach that limit, but they're close to that, I believe.

Q. And is -- in this figure for this event, which was December 2011, is MW 11 upgradient of the ash pond that it's adjacent to?

A. Well, as you said earlier, I can only tell you whether it's upgradient of another well. It's -- it appears to be upgradient of all the other wells in the vicinity.

The yellow lines on this map are extrapolated given that we don't have data from those locations. So we don't actually have an elevation of groundwater beneath the ash pond, but I do agree that it's upgradient of the other wells in the vicinity.

Q. Did you draw any conclusion, based on the information you had at this time and included in this report, as to whether MW 11 could be impacted by the ash pond?

A. I don't think we drew any specific conclusion during this report, no.

Q. Okay. And I think we can set those aside and turn to -- let's turn to -- okay. Let's turn to Exhibit 130. Turning back to Exhibit 130, there's a discussion of the Powerton facility at the very end of the first paragraph. Do you see that sentence?

A. Yes.

Q. Do you have an understanding of which of the groundwater monitoring wells at Powerton are always upgradient?

A. As I sit here, I can't recall, no.

Q. And gradients need to be determined using

multiple wells; is that correct?

A. Yes.

Q. And one well by itself cannot have a gradient; is that correct?

A. That's correct.

Q. All right. Do you recall whether the gradients at Powerton changed over time?

A. They certainly changed over time.

Q. And do you recall of the wells at Powerton that you had predicted to be upgradient whether you found any evidence that they were, in fact, not upgradient?

MS. NIJMAN: We went through this discussion already.

MS. BUGEL: Not about Powerton.

MS. NIJMAN: Okay. I thought it was general. It was at the beginning when you were asking generally, but anyway, go ahead.

BY THE WITNESS:

A. Let me preface this by saying that Powerton we found to be the most complex hydrogeologic site of the ones that we analyzed, so it was certainly true that that occurred. Again, I don't think there was any particular time where we

said today we think this is an upgradient well and then three months later we changed our mind. I think we simply looked at the data over time which we expected, by the way, to be very complex knowing, as we did, how close it was to the river and knowing that some available information, before we even started this investigation, indicated that there were significant seasonal variations in gradients.

(Exhibit No. 140 marked for identification, 12-11-14.)

BY MS. BUGEL:

Q. I'm placing an exhibit in front of you that's previously been marked as Exhibit 140. Do you see the first page which is an email -- do you see your name on that document?

A. I do.

Q. And this is to Maria Race with a date of August 9th, 2012. Are you -- do you recall this email?

A. Generally, yes.

Q. Are you familiar with this email and the document attached to it?

A. Generally, yes.

Q. And in glancing -- I'm sorry. In glancing at the document attached to it, this was prepared by Patrick Engineering; is that correct?
A. Yes, though I should point out not by me.
Q. Okay. Thank you.
And even though it was not prepared by you, did you review this attachment?
A. At the time I sent it to Maria, yes.
Q. Okay. And does this appear to be a true and accurate copy of the email and attachment?
A. To the extent that I'm familiar with it, yes.
Q. Is it accurate to say that this is a figure showing where borings were done and a boring log?
A. Boring logs were included for investigation of the locations shown in the figure that leads this section, yes.
Q. Do you know why this investigation was being done?
A. Yes.
Q. Can you explain?
A. Yes. Quite apart from the environmental work that we have done for Midwest Generation, we do a good deal of civil and transportation design

work. This report was generated as part of an effort to install a railroad loop that is shown on the figure here. It's shown theoretically on the figure here, although it has since been installed. And there is a rail line running directly through the middle of what this figure shows today.
In order to determine how to construct a structural subbase for the rail line that would be sufficient to support railway traffic, we undertake what's called a geotechnical investigation which is an investigation of the subsurface materials to determine whether or not they'll compress or sheer to determine how best to design the subbase.
This is a summary of some of the information that was collected during that geotechnical investigation. It was not actually done with an environmental purpose in mind.
Q. And turning back to the email, can you look at the second sentence in the email where it says: Overall, comma, it was essentially what I remembered with ash being found up to around ten feet thick in places, paren, though not everywhere. Do you see that?
A. Yes.

Q. What were you remembering?
A. I was remembering that our company had worked on this project while I was doing other work. And although I wasn't directly involved, I was simply remembering that the results of this geotechnical investigation that were being performed with some of the staff that I occasionally use for my investigations. So I was peripherally aware of it, and that's what I'm referring to here.
Q. Was there any relevance to ash being ten feet thick in places?
A. Only --
MS. NIJMAN: Objection to vague. Relevance to what?
MS. BUGEL: I'll rephrase.
BY MS. BUGEL:
Q. Why did you include that statement in the email that ash was around ten feet thick in places?
A. I believe that it was on the basis of a conversation that I had with Maria relevant to the fact that we had done this geotechnical investigation and that it might be relevant for her. And I believe, although I can't remember specifically, that she asked generally what we

found. And I think in that first conversation, I related the fact that I think we found some places that had as much as ten foot thickness of ash present, but I wasn't sure.
So when I went back and actually found the report and forwarded it to her, I'm simply saying it is about what I recalled peripherally.
Q. And do you know if the train track was installed along the curving line with the dashes in it on this diagram?
MS. NIJMAN: Asked and answered.
BY THE WITNESS:
A. I can say that it was installed. Whether it follows the exact profile shown in this figure, I'm not sure. But it's generally according to the figure shown, yes.
BY MS. BUGEL:
Q. Was it installed -- okay. Sorry. Strike that.
And looking at page -- beginning on page 14227, the -- there's an entry that has the letters SP by it and it says: Black medium sand, trace coarse, trace fine, loose, poorly graded, angular, saturated, coal cinders. Do you see where

it says that?
A. Yes.
Q. Do you know what "coal cinders" means there?
A. I don't know what it's referring to. These would have been the notations taken by the geologist on site. As they log a boring, they use a standardized set of language to describe what they see. I'm not a geologist or a geotechnical engineer, so I can't speak to directly what that means.
Q. And would your answer be the same for cinders?
A. Yes.
Q. And slag?
A. Yes.
Q. Do you have any knowledge as to how thick the ash fill was where the train track was ultimately installed?
A. I do not.
Q. Okay. All right. We can put that aside.
MS. BUGEL: And let me just ask, do people want to stop for a break or for lunch or...
THE WITNESS: I'm fine. If you want to

follow --
MS. NIJMAN: It's up to you.
THE WITNESS: -- through, I'm fine to keep going.
MS. BUGEL: Okay.
(Exhibit No. 141 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I'm placing in front of you what has previously been marked as Exhibit 141. And again, are you familiar with this report?
A. Yes, generally.
Q. And Patrick Engineering prepared this report?
A. Yes.
Q. And you were involved in the preparation of this report?
A. Yes.
Q. And did you review this whole report?
A. At the time we were developing it, yes.
Q. Does it appear to be a true and accurate copy?
A. To the extent I can see, yes.
Q. Okay. And turning to Bates page 7089 --

I'm actually -- wait a minute.
(Brief pause.)
BY MS. BUGEL:
Q. This is another where I'm going to ask you to get out Exhibit 24 again. I'm actually going to skip part of this and go to Exhibit 24 again.
MS. NIJMAN: Is there a page?
MS. BUGEL: I'm just skipping some questions here, so bear with me a second.
MS. NIJMAN: Okay.
BY MS. BUGEL:
Q. Can you turn to Bates page 14162.
MS. BUGEL: And that is, for the record, the Ash Pond Data Evaluation and Summary for Powerton Station.
BY MS. BUGEL:
Q. And this -- can you please look at the section titled Groundwater Elevations and the last sentence of the first paragraph: The water elevations in all of the ash ponds, excluding the large former ash pond to the east, are significantly higher than the surrounding groundwater elevations. Do you see where it says that?
A. Yes.

Q. Why did you include this statement in this report?
A. Primarily because we knew this to be a very complex site, especially with regard to water flow. We wanted to compare where the elevations of the ponds themselves were compared to groundwater, compared to other discharging bodies. It's just a way for us to understand better what we call the conceptual model of the site, how things may be flowing.
Q. And can you turn to page 14163. The very top of that page, first sentence: It is Patrick's opinion that both the topography and geology of this area create a localized groundwater high that is not necessarily attributable to leakage from the nearby wells; do you see where it says that?
A. Yes.
Q. Did you mean to say "leakage from the nearby ponds?"
A. Possibly. Let me review the first part of that paragraph.
(Witness reviewing.)
BY THE WITNESS:
A. Yes. It appears to refer to the area

around monitor wells six and eight which, I believe, are in the area that's referred to at the top of page 14163.

So I think I meant leakage from the nearby ash ponds since wells don't really leak --

BY MS. BUGEL:

Q. And can you --

A. -- usually.

Q. Anything can happen, right?

What did you base that conclusion on?

A. It appears that, to begin with, we based it on the geological material that was found in six and eight which were quite a bit different than what we found elsewhere on site. It appeared to be fill material and that very often if you have more permeable fill material surrounded by tighter clay soils, they can act as a sponge and draw water towards them.

So it's not unusual, in fill depression surrounded by tighter clays, to see higher groundwater elevations that are not actually representative of the direction of groundwater flow.

In the specific instance with regard to

Powerton, although I don't believe it was data that was generated at the time, we later determined that there's more than one groundwater unit at the site and that there are shallow units and deeper units and that analyzing flow patterns doesn't make any sense if you try to look at all of the wells together. We need to separate them into these different units to make sense of it.

This was something we didn't know at the time that I think actually would later more modify the opinion that we show here at the top of 163.

(Exhibit No. 142 marked for identification, 12-11-14.)

BY MS. BUGEL:

Q. Okay. And turning -- I'm passing you what's been marked as Exhibit 142. Can you turn to Bates -- well, let's just quickly ask, are you familiar with this report?

A. Generally, yes.

Q. And your signature and name appear on this report at page 3945?

A. Yes.

Q. And this document was prepared by Patrick Engineering?

A. Yes.

Q. And you were involved in the preparation of this?

A. Yes.

Q. And you've previously reviewed this document?

A. Yes.

Q. Okay. Does it appear to be a true and accurate copy?

A. To the extent I've reviewed it, yes.

Q. Okay. Can you please turn to Bates page 3951. I'm assuming, based on what you just said about the groundwater units at Powerton being slightly -- being separate units, that this depiction of groundwater flow with the blue arrow would not be accurate based on your current knowledge or knowledge since then?

A. I would need to review the text to see whether we excluded any wells from this analysis. If you give me a moment --

Q. Sure.

A. -- I might be able to answer the question.

(Witness reviewing.)

BY THE WITNESS:

A. Yes. On page 3944 of the text in the second paragraph of that report, we say that if wells six and eight are excluded from the analysis, the direction of groundwater flow is clearly found to be from south to north.

So the figure that you're looking at on page 3951 excludes the data collected from those wells which more appropriately would be looked at as a separate unit with potentially a different gradient.

The gradients make much more sense if those are eliminated which is another reason we considered them anomalies.

BY MS. BUGEL:

Q. Are there any other separate units besides the two you just mentioned at Powerton?

A. I'm not aware of any as I sit here today, but could there be other hydrogeologic units present at the site? That's certainly possible. It's a very complex site.

MS. BUGEL: Bear with me a second.

(Brief pause.)

BY MS. BUGEL:

Q. Can you please turn back to Exhibit 24 and page 14163. And looking -- looking at Analytical Results, the third paragraph down, beginning with manganese and chloride: Manganese and chloride parenthetical, both naturally-occurring compounds, close parentheses, were the only compounds that exceeded class I standards in MW 6 and MW 8, comma, providing further evidence that the ash ponds near these wells are not leaking. Parenthetical, no other more traditional coal constituent indicator compounds exceeded standards in these two wells, close parentheses. Do you see where it says that?

A. Yes.

Q. What was the basis for that statement?

A. Well, I haven't reviewed the data, but I -- I'm assuming that we did not see exceedances of other indicator compounds other than just manganese and chloride in those wells.

And given that manganese and chloride are both -- I would consider them somewhat weak indicators for coal combustion waste. Given that those are the only two things we found, at the time we wrote this, I found it unlikely that it was due

to coal constituents.

Q. And what did you mean when you said "leaking?"

A. Well, I think I'm just generally using a terminology that I was -- that was employed when we developed the objective for the project which was to determine whether or not it was likely that ash ponds were having an impact on local groundwater.

If they were, regardless of the particular mechanism which might be causing it, I think I just generally caused -- said that it was leaking.

Q. Do you -- this says "further evidence." Was there something you -- that that -- I'm sorry. This says "further evidence." Did that imply that there was previous evidence that the ash ponds near these wells were not leaking?

MS. NIJMAN: Other than the two paragraphs above that?

MS. BUGEL: He can answer. I mean, if it's the two paragraphs above it, it's the --

BY THE WITNESS:

A. I would certainly include those two paragraphs as well, yes. And there may have been other things. I don't discuss a great deal

hydrogeologic conditions here. So back in the section where we discussed groundwater elevations, there's data there as well.

So taking the totality of what we know about groundwater flow, what we know about contaminant or constituent concentrations at the site, and their relative concentrations as found in the wells, the totality of it would indicate to us that that was not leaking at that point.

Q. And can you please turn to Bates 14164. And the very first bullet point on this page: There does not appear to be any notable downgradient groundwater impact expect potentially at MW 7, period. Further evaluation of the nature and extent of any downgradient groundwater impact will be possible upon completion of the sixth sampling event and a statistical analysis of upgradient groundwater quality. Do you see where it says that?

A. Yes.

Q. What impact were you referring to there starting on the first sentence?

A. Well, the sentence refers to downgradient groundwater impact at well seven.

Q. Okay.

A. So I'm assuming it's restricted to that, although I don't recall the data that led us to that conclusion and what it said.

Q. And did you go on to draw -- did you go on to get any additional evidence regarding MW 7 and the potential that you mentioned there?

A. Yes. There was further sampling done at the site, yes. I believe we -- we went as far as the first quarter of 2013, I believe, yes.

Q. Do you recall whether that went on to clarify whether there was an impact at well seven?

A. I can't recall specifically, with respect to well seven, whether that conclusion was drawn.

Q. Did you go on to do the sixth sampling event that you mention here?

A. I believe we did. I think we did an early -- I believe we did a spring 2013 sampling event.

Q. But you did not do a statistical analysis of upgradient groundwater quality; is that correct, at Powerton?

A. We may have done that analysis. I don't recall whether we did a statistical analysis of that or not.

Q. And looking under Next Steps, the first bullet point mentions surveying the ash ponds. Do you know if that survey was done?
A. I know that we did not do it.
Q. Do you know --
A. Whether or not someone else did I don't have any knowledge of.
Q. Do you know if there was anything done to determine the ash pond elevations?
A. Yes. The ash pond elevations have been, for some time at Powerton or were at the point that we put this together, estimated on some periodic frequency by the plant personnel using a variety of methods, some of them involving a staff located in the pond itself; not quite as accurate as you may get from a survey and yet maybe accurate enough to draw conclusions from.
So I believe that the ash pond elevations that the plant would take as a normal, routine operational process continued to take place, but that was outside the scope of Patrick Engineering.
Q. We were discussing MW 6 and MW 8 earlier and the fact that they were an independent unit -- or I'm sorry -- a groundwater unit. What data did

you get that led you to that conclusion besides what's in this report?
A. The conclusion drawn in this report was only based on the data in this report, so that was all of the data that was used. It was a combination of the elevation data, the boring log constituent data, and what we know about regional groundwater flow.
Q. The last bullet point mentions groundwater level transducers. Do you know if they were installed?
A. They were not installed by Patrick.
Q. Do you know if they were installed by anyone?
A. I don't.
Q. And the tracer test, was that performed, to your knowledge?
A. It wasn't performed by Patrick. And again, I don't know whether any other tracer tests were done outside of Patrick.
Q. Okay. I think we can set aside Powerton. You can set those exhibits aside.
We can grab Exhibit 24 again. Let's turn to page 14167. This is the Ash Pond Data Evaluation

and Summary for Waukegan Station. Do you see where it says that at the top?
A. Yes.
Q. Okay. And --
MS. NIJMAN: On top of 14166.
THE WITNESS: 166 is where the top is...
MS. BUGEL: Oh, thank you. 14166.
MS. NIJMAN: What page do you want him to look at?
MS. BUGEL: I'm turning just to 14166 --
MS. NIJMAN: Okay.
MS. BUGEL: -- where it says Ash Pond Data Evaluation. I just want to confirm, for the record, that is where that title appears. Okay.
BY MS. BUGEL:
Q. And under groundwater elevations, the second-to-last sentence, do you see where it says: Similarly, the non-active pond is maintained at an elevation well below the natural groundwater elevation?
MS. NIJMAN: I'm sorry. You're on which paragraph?
MS. BUGEL: The very last paragraph.
MS. NIJMAN: Okay.

BY MS. BUGEL:
Q. The parenthetical: Less than eight feet, comma, with no observable leakage into the pond, do you see where it says that?
A. Yes.
Q. Do you have experience with ponds in the non-active state?
MS. NIJMAN: Generally?
BY THE WITNESS:
A. I'm not sure what you mean by that question. I've seen this pond.
BY MS. BUGEL:
Q. Okay.
MS. NIJMAN: Are you talking about other than Midwest Gen, just generally?
MS. BUGEL: I'll rephrase the question.
BY MS. BUGEL:
Q. Do you -- let me rephrase that.
Do you know what pond at Midwest Gen this was referring to?
A. At the time this was written, no. They -- they alternate -- there's two ponds. One is always active. One is not. I don't recall which one was active the day this was written.

Q. And did you observe the ponds at Waukegan when they were in a non-active state?
A. Yes. Well, one of them, at any rate, yes.
Q. Okay. How many visits did you make to Waukegan?
A. I've probably been there a dozen times or so.
Q. And how often did you observe the ponds when you were visiting?
A. On most occasions, I think I observed the ponds.
Q. Okay. And when you observed the ponds, was there always one pond in a non-active state?
A. Always.
Q. Okay.
A. And maybe to further clarify, when I say there was no observable leakage, that wasn't just by observation I was referring to. I was also indicating the plant personnel whom we would interview at all of these sites also indicated to us that they didn't see any leakage into the pond.
Q. What -- what evidence would you look for to determine whether there was observable leakage?
A. If the non-active pond had any active

leakage in it, the non-active pond is actually located below the natural groundwater elevation at the site, so you would expect to see it start to fill in without anyone pumping anything to it. This did not occur.

So when sluice was not being directed to the non-active pond, the elevation of those ponds always remained low and never needed to be pumped out. This condition is unique to Waukegan.

Q. Was there any ash left in the non-active pond at any time when you observed them?
A. Yes. The purpose of making one of the ponds non-active is so that it can be dredged, but there's always some degree of ash left in the bottom of the pond thicker in some areas that are harder to access than others.

So yes, I did see some level of ash.

Q. And the very last sentence says -- can you review the last paragraph? I want to just give you an opportunity to review that whole paragraph.

(Witness reviewing.)

BY THE WITNESS:
A. Yes.
BY MS. BUGEL:

Q. The very last sentence says: Both of these observations are consistent with the fact that these ponds are lined with an HDPE liner, comma, and do not appear to be hydraulically reconnected with groundwater at the site. Do you see where it says that?
A. Yes.
Q. And if there was leakage into the non-active ponds, would you then assume that the pond was hydraulically connected to the groundwater?
A. Yes. In other words, if you saw the elevation in the pond which has nothing being pumped to it rise consistent with the level of the lake, for example, then you would make an assumption that they're hydraulically connected.

And the same would be true of the active pond which generally is maintained at a much higher level than groundwater. Without pumping out of the pond, if that level were to drop or responding with a drop in lake elevations, you would say those were inactive.

We didn't see either of those conditions, and yet we did see a very strong correlation with groundwater elevations and the lake telling us

those are very clearly hydraulically connected but not to the ponds themselves.

So because of the unique situation that Waukegan has, some of the strongest evidence that they are, in fact, not leaking is provided not by analytical data but the hydraulic data.

Q. Can you turn to page 14167 and the third bullet on that page under Conclusions. This bullet says: The groundwater elevation data show that MW 5 is an upgradient well. The elevated concentrations of compounds of interest in MW 5 appear to be the result of the well being installed in a former ash disposal area and not a result of the leakage from the current ash ponds. Do you see where it says that?
A. Yes.
Q. What was the basis for this statement?
A. Well, there's a number of lines of evidence that led us to this conclusion.

The first, very strong line of evidence is the hydraulic data that we just discussed.

A second would be the age of the liners installed in those ponds which they contained the newest and most technologically advanced liners

available.
In addition to that, there's the analytical data. Analytical data clearly showed a much higher concentration upgradient than downgradient of any constituent. And although the geologic and hydrogeologic conditions are complicated at some of Midwest Gen's sites, this isn't one of them. This is a very straightforward site hydrogeologically.
So water does flow from the west side of that site towards the lake in a fairly consistent manner. The exact direction might fluctuate a little bit, but generally that is the flow.
So we're very confident here in knowing that well five is definitely an upgradient well and one through four are definitely downgradient wells.
So comparing those analytical results would give us further information that it's not an ash pond and not an active ash pond problem that's causing it.
Q. Do you recall the elevated concentrations of compounds of interest mentioned here?
A. The specific concentrations I do not.
Q. And were more recent groundwater monitoring

reports consistent with your conclusion that the elevated concentrations at MW 5 are a result of the former ash disposal area?
A. Are you asking me whether the 2013 data was consistent with that conclusion?
Q. Well, this was in -- I think it might be the 2012 data --
A. Oh, I'm sorry. The 2012 data.
Q. -- because this is -- this was January 2012 and I believe based on 2011 data.
A. I can't recall all of the exact data, but I -- I -- I would be willing to say that I believe that the data that we found in MW 5 was virtually always considerably higher than what we found downgradient. I don't recall an event that that did not occur. Maybe one did that I don't recall, but I don't recall some.
Q. And how did you come to know about this former ash disposal area?
A. When we saw the concentrations that we found in well five, they were elevated enough -- and, in fact, I think they're elevated higher than most of the other wells that we have at any of the sites -- that we asked a little bit further

questions about why we would expect that here given that we knew what the flow pattern was.
And some investigation -- maybe it's -- it's not right to call it an investigation, but we had some conversations with Midwest Gen personnel to say is there anything else that could be causing a result like this.
And there were a couple of recollections of at least some documents which showed a former disposal area, although I don't think we ever talked to anybody who had actually observed it or knew where it was.
So we don't know the boundaries and I don't know for sure we're even experiencing a result of that here, but that's why we wrote this conclusion the way we did.
Q. Do you know anything else about the former ash disposal area?
A. I do not.
Q. Did anyone tell you when it was used?
A. No. To the best of my recollection, no one had any specific knowledge of it at all other than the fact that it may have existed and someone, I think, recalled seeing it in a former document.

But past that, I don't think there was any specific information.
Q. Do you know if there's any ash remaining in the former ash disposal area?
A. I don't even know if there is a former disposal area.
Q. Are you aware of any other source that could have caused the elevated concentrations of compounds of interest in well five?
A. I'm not aware of any specific source.
Q. And well five is upgradient of MW 1 through MW 4; is that correct?
A. Yes.
Q. And well five is upgradient of the west ash pond?
A. Yes.
Q. And if the west ash pond were leaking, would you expect to see the impact at well five?
A. No.
Q. Do you know if -- okay.
(Exhibit No. 143 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I'm handing you a document that has been

previously marked as Exhibit 143. Are you familiar with this document?
A. Yes.
Q. And Patrick Engineering prepared it?
A. Yes.
Q. And your name and signature appear on it?
A. Yes.
Q. And you were involved in the preparation of this document?
A. Yes.
Q. Does it appear to be a true and accurate copy?
A. Yes.
Q. Okay. Can you please turn to Bates page 5271. Does this indicate where the monitoring wells were installed at the Waukegan site?
A. Generally, yes.
Q. Do you know if any wells were installed after these well -- monitoring wells one through five?
A. I believe another well was installed but not by Patrick. And I can't tell you the exact location, but I believe that another -- at least one other well has been installed.

(Exhibit No. 149 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I'm passing you an exhibit that has been previously marked Exhibit 149. The first page is an email from you to Andrea Rhodes and Bill Buscher with Maria Race cc'd. Do you see that?
A. Yes.
Q. It's dated 4-29-2013. Your name appears on this email; is that correct?
A. Yes.
Q. And you were forwarding a report to Illinois EPA; is that correct?
A. Yes.
Q. And if you turn to the attachment, there is a letter and it is -- your name and signature appear on this. Do you see that?
MS. NIJMAN: On the letter?
BY THE WITNESS:
A. Yes.
BY MS. BUGEL:
Q. And this was prepared by Patrick Engineering; is that correct?
A. Yes.

Q. Are you familiar with these documents?
A. Generally, yes.
Q. And you've reviewed them prior to today?
A. At the time of its development, yes.
Q. And they appear to be true and accurate copies?
A. They appear to be.
Q. Okay. Can you please turn to page 6 -- well, let's -- starting at 16433, there's a monitoring well location map. Do you see that?
A. Yes.
Q. And does that document additional wells at Waukegan?
A. Yes.
Q. And are those -- they're MW 6 and 7; is that correct?
A. Yes.
Q. Do you know who installed them?
A. I think KPRG installed those two wells.
Q. All right.
A. But -- I might be mistaken, but I believe that that's the case.
Q. And did you review the groundwater monitoring results from wells one through seven?

A. Yes.
Q. Specifically the groundwater monitoring results contained in this report?
A. Yes, at the time.
Q. And did you compare the results of MW 6 and 7 to MW 5?
A. I don't know if we did it as a part of the report, but I'm sure we looked at all of the data, yes.
Q. Did it have any effect on your conclusion that the impacts seen at MW 5 were a result of it being located in the former ash disposal area?
A. Well, I should say, first of all, I'm not sure that that was my firm conclusion. I think I concluded it may have been.
Q. Okay.
A. And I don't know that the data would have changed my mind on that at all.
Q. We can set that aside. 124 we always -- I'm sorry. Exhibit 24 we go back to, so keep that handy.
(Exhibit No. 151 marked for identification, 12-11-14.)
BY MS. BUGEL:

Q. I'm passing you an exhibit that has previously been marked as Exhibit 151. Are you familiar with this report?
A. Yes.
Q. This plan, more aptly.
And Patrick Engineering prepared it?
A. Yes.
Q. And you were involved in the preparation of this?
A. Yes.
Q. Okay. And you've reviewed it prior to today?
A. Yes.
Q. And does it appear to be a true and accurate copy?
A. Yes.
Q. Okay. And looking at Bates page 13934, does this accurately depict -- and I realize this is really -- after -- the copying in black and white didn't do it any favors, but does this accurately depict the groundwater monitoring wells that were installed at Will County?
A. I think it's close. I'm not sure that all wells, again, were placed exactly where they're

shown in this plan document, but generally I think, yes.
Q. But wells -- and I think it only goes as high as MW 10. Wells MW 1 through MW 10 were, in fact, installed?
A. I believe they were, yes.
Q. And do you know if any wells were installed after 2010?
A. I don't recall any additional wells, but I can't say with certainty.
Q. And we've talked a lot about upgradient and downgradient, so I will try to be brief, but do you know if the arrow depicting groundwater flow accurately depicts groundwater flow at the site?
A. I think it does not.
Q. Can you explain why?
A. The groundwater flow direction shown on this document was based on, in absence of all site data, simply the elevation of the Des Plaines River which flows past the site to the west and the sanitary canal which passes the site on the east. And in general, the Des Plaines River has a higher elevation than the canal.
So given no other information, we made a

guess that groundwater flow probably follows that pattern and simply goes beneath that strip of land to the east. That's not at all what we found during the investigations.
Q. Can you explain what you did find?
A. The elevations -- well, one moment. I don't want to...
(Brief pause.)
BY THE WITNESS:
A. The groundwater elevations that we observed in many of the wells that we installed on site were higher than either the Des Plaines River or the canal which leaves us with a very, very complex set of questions on what's actually happening at the site.
BY MS. BUGEL:
Q. Okay. And then I'm going to pass you something that might help out with this discussion. Wait a minute. Wrong one. You get the fancy yellow sticker.
(Exhibit No. 152 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. I'm passing you an exhibit that has been

previously marked as Exhibit 152. Are you familiar with this document?
A. Yes, I think so.
Q. And if you turn the page, did Patrick Engineering prepare this document and attachments?
A. Yes.
Q. And your name appears as a signature on Bates page 16687?
A. Yes.
Q. And you were involved in the preparation of this document?
A. Yes.
Q. And you've reviewed it prior to today?
A. Yes.
Q. Does it appear to be a true and accurate copy?
A. Yes.
Q. Let's turn to Bates page 16693. Acknowledging that this is a snapshot of an event, can you explain what this shows as to the groundwater flow at the site?
A. Yes. This shows one possible interpretation of the groundwater elevation data that we collected at the site. And I should point

out that it's one of many possible interpretations.
But just looking at this one, you can see it's a very complex set of flow patterns for such a narrow strip of land.
So whenever I see something this complex, I'm immediately somewhat skeptical that we actually know what's happening here. But on the basis of just one set of data and trying to show a flow pattern which is what we represented to the Illinois EPA we would do for each event, this was the best interpretation we could come up with.
Q. And do you recall if the flow pattern varied from sampling event to sampling event?
A. It certainly did, yes.
Q. And can you generally describe how it varied?
A. I can generally say that this picture looks very, very different in a lot of the other reports.
Q. How does it look different?
A. You know, I can't recall specifically which wells flipped back and forth, but a good number of them did.
Q. Okay. So does that mean some wells that

were upgradient wells for some sampling events could be downgradient wells for other sampling events?
A. I think what it means more generally is that the concept of up and downgradient doesn't apply to Will County; that it's not reasonable to look at up and downgradient even in an instant of time. It's just far too complex to do that.
Q. Today we've talked about other complex sites in terms of groundwater flow. Not Waukegan. Waukegan is not complex; is that correct?
A. Right.
Q. You just said the concept of up and downgradient doesn't apply to Will County. Are there other facilities where that's true for -- among the four Midwest Gen facilities?
A. I don't think that's true for Waukegan. I think that there may be places at Powerton where it's not applicable, but I think, depending on which water unit you look at at Powerton, it can still be true.
So, for example, in at least one groundwater unit, there does appear to be fairly consistent southerly to northerly flow at

Powerton, but in some localities, it may not make sense to think about up and downgradient.
For Joliet, I think it generally makes sense to talk about up and downgradient understanding the caveat that sometimes the river actually flows towards the site and that those conditions change over time.
Will County I place in a different category altogether; one, because the hydrogeologic conditions are so complex but also because the strip of land we have to analyze is so narrow that there really aren't many other places we can put wells near the ash ponds to analyze them.
And given that that's the best we can do, I'm not sure we can say a whole lot definitively upon the basis of hydrogeologic data alone.
Q. And is there any well at Will County that was upgradient and always upgradient?
MS. NIJMAN: We're talking about -- based on this report?
MS. BUGEL: Over time.
BY THE WITNESS:
A. Always.
MS. NIJMAN: Over his time?

MS. BUGEL: Yes.
BY THE WITNESS:
A. I don't recall.
BY MS. BUGEL:
Q. Okay. Turning back to Exhibit 24, could you please turn to Bates page 14170. On that page referring to the very last sentence -- second-to-the-last sentence on the page, last full sentence, do you see where it says in the second half of that sentence: The groundwater elevations are all higher than either of the surface waters as the direction of groundwater is generally found to be from the northeast to the southwest.
I understand we may need to put that aside, but going on to the next sentence, do you see where you say: It is unknown whether the presence of this groundwater mound between the river and the CSSC is due simply to natural mounding due to recharge or is partially related to leakage from the ash ponds themselves.
Do you see where you said that?
A. Yes.
Q. And I realize your understanding of what was going on at Will County evolved over time.

Would you still say that there's a groundwater mound there?

MS. NIJMAN: At the time of this?

MS. BUGEL: No. Now.

MS. NIJMAN: He has not looked at this.

MS. BUGEL: Sorry. Okay.

MS. NIJMAN: He's no longer involved.

MS. BUGEL: Okay.

BY MS. BUGEL:

Q. Based on what you learned while you were involved, is it your -- was it your understanding that there was a groundwater mound?

A. Based upon the data that had been generated up to this point, I couldn't say is the best way to phrase it. I didn't know which is exactly what I would say here.

No other information has come into my possession that would change that opinion, but at the time that this was written, no, I would say I don't know. Because it's so complex, that kind of condition could be due to several different things, and I have no way of knowing which one it is.

Q. And turning to the Bates page 14172, do you see the second bullet point? It comes right

before Next Steps. Do you see that?

A. Yes.

Q. And do you see where it discusses boron and sulfate concentrations are higher in nearly all of the downgradient wells when compared to MW 1 indicating that the ash ponds are potentially impacting downgradient water? Do you see where it says that?

A. Yes.

Q. And then you go on to say: However, given the limited number of upgradient wells at the site; (one, if mounding is considered), no firm conclusion can be drawn with respect to groundwater analyzed at the site. Do you see that?

A. Yes.

Q. Did -- okay. Going back to the first sentence, your conclusion that the ash ponds are potentially impacting downgradient groundwater, based on subsequent sampling that Patrick Engineering conducted, did your understanding of that change?

A. Based upon sampling results, no. My -- my recollection is that generally the analytes that we found in the various wells generally were

consistently found in the same wells from event to event. And while groundwater elevations changed considerably, the presence of specific compounds didn't really change very much. That was a finding that we found at, in fact, all of the sites.

Q. And did you form any more determinative conclusion as to whether the ash ponds were impacting downgradient groundwater?

MS. NIJMAN: At this time?

MS. BUGEL: Subsequent to this report based on the data and testing and analysis that Patrick Engineering was involved in.

MS. NIJMAN: I'm going to object only if it involves a discussion with counsel if it was an opinion for counsel based on the CCA. So if you have a separate opinion, you can answer at this time.

THE WITNESS: Okay.

BY THE WITNESS:

A. The -- any opinions I had subsequent to an opinion put in this document would have been just had with counsel and Midwest Gen, so -- I understand that to be privileged, so I would have to restrict my answer just to what my opinion was at the time

that this had been generated.

BY MS. BUGEL:

Q. Okay. And in Next Steps, the very last bullet point you discuss definitive data and a tracer test using bromide. Do you see where it mentions that?

A. Yes.

Q. Was any tracer test performed by Patrick Engineering?

A. No.

Q. Can you turn back to page 14171. Analytical results, second paragraph, second sentence in that paragraph: Based upon the current model of groundwater flow at the site, only MW 1 appears to be a true upgradient well; do you see where it says that?

A. Yes.

Q. And did MW 1, in your understanding, consistently be a true upgradient?

A. I can't remember the specific data. I would assume that the reason I put this sentence in the report is that it probably was. It appeared to be anyway.

Q. At --

A. At the time that we put this together.
Q. At the time of this report.
But you can't recall whether MW 1 in subsequent groundwater flow models was not upgradient?
A. I can't recall that, no.
Q. And for this site, did you ever do a statistical analysis of upgradient groundwater quality?
A. No. I know that we did not on this one.
MS. BUGEL: I have two pages of questions left which is --
MS. NIJMAN: You have four minutes.
MS. BUGEL: Okay.
BY MS. BUGEL:
Q. And do you recall -- boron concentrations...
Middle of the second paragraph: Compared to MW 1, concentrations of boron were higher --
MS. NIJMAN: I'm sorry. What page are you on?
MS. BUGEL: 14171. And when counsel has to ask, I think I should get a little extra time.
MS. NIJMAN: Not if you're not clear on

the record to the witness. He didn't have the document open either.
MS. BUGEL: It was right where we left off.
BY MS. BUGEL:
Q. Compared to MW 1, concentrations of boron were higher in all of the other wells. Concentrations of sulfate were higher in seven of the other wells. TDS was higher in five out of nine of the other wells. Manganese was higher in four out of -- in four out of the other wells. And chloride was higher in only two of the other wells.
Starting with boron, do you recall what the boron concentrations in the downgradient wells were?
A. No, I don't.
(Exhibit No. 144 marked for identification, 12-11-14.)
BY MS. BUGEL:
Q. Okay. I'm placing what has previously been marked as Exhibit 144. Turning to Bates page 6225 -- that's the first page. Let's see. Bates page 6244 through 6248 contain the lab results in the event that that refreshes your recollection.

A. You want me to review --
MS. NIJMAN: What would you like him to look at?
MS. BUGEL: Boron concentrations in wells MW 2.
BY MS. BUGEL:
Q. Do you see the boron concentrations on that page?
A. In well two?
Q. Yes, in well two.
A. Yes.
Q. They range from 1.6 to 2.3. And turning the page, I think we will go -- why don't we look at MW well seven? Do you see the boron concentrations on that page?
A. Yes.
Q. And some of them are as high as 4.7, five, 5.7, 5.0. Do you see those ranges?
A. Yes.
Q. Do you have an understanding of whether concentrations that high can occur naturally?
MS. NIJMAN: I'll object to the characterization of them being high.

BY THE WITNESS:
A. I'm not an expert in sources of boron and how they occur naturally, although I know that they do occur naturally. I can't speak to -- to whether that would be consistent or not.
BY MS. BUGEL:
Q. And turning back to the paragraph on page -- in Exhibit 24 on page 14171, you focused your comparison on boron, sulfate, TDS, manganese, and chloride; is that correct?
A. Yes.
Q. Why did you focus on these five constituents for the comparison?
A. I imagine I focused on them because we had found actual constituents in the wells and exceedances for those compounds.
Q. And do you see where you say in the second-to-last sentence: The results of these comparisons could be used to argue that the ash ponds are potentially impacting downgradient groundwater at the site?
A. Yes.
Q. Do you see that?
A. Yes.

Q. What was the basis for this statement?
A. The levels of concentrations taken just by themselves.
Q. And did you focus on these also because they are coal combustion waste indicators?
A. They all can be.
Q. And subsequent to this report, did you get any other evidence -- did you see any other evidence that went to -- that indicated that ash ponds were impacting downgradient groundwater at the site?
A. Well, again, any other opinions I would have formed past this point, I would say, were made in conjunction with Midwest Gen's counsel.
Q. And turning to page 14172, second bullet point on that page, midway through that paragraph: Boron and sulfate concentrations are higher in nearly all of the downgradient wells when compared to MW 1 indicating that the ash ponds are potentially impacting downgradient water; do you see where it says that?
A. Yes.
Q. What was the basis for this statement?
A. Just the fact that boron and sulfate in certain circumstances can be used as indicators of

combustion waste. And if all the other conditions hold true; for example, we understand the hydrogeologic conditions in the site and the downgradient concentrations are higher than the upgradient concentrations and we have a likely source for these compounds between those two points, then you may be able to draw that conclusion.

I don't draw the conclusion specifically here only because I think we don't have a very good understanding of what the hydrogeologic conditions are here.

MS. BUGEL: I have one very brief -- five questions remaining.

MS. NIJMAN: Okay. We will extend the time period as a courtesy.

MS. BUGEL: Thank you. I appreciate that.

BY MS. BUGEL:

Q. Did -- is it correct that after the first quarter of 2013, Patrick no longer prepared groundwater -- quarterly groundwater reports for Midwest Gen?
A. I think 2013 was the last time we sampled it, yes.

Q. And at the same time, did your involvement in any groundwater sampling and analysis end with Midwest Gen?
A. Of those four sites, yes.
Q. And do you know the reason for your work with Midwest Gen ending?
A. Well, our contract expired, for one thing, so we -- in fact, I think our contract expired at the end of 2012, so we put in a -- I think a proposal. In fact, I'm quite sure we did a proposal for one quarterly sampling to be done in 2013.
Q. And did you do a proposal for any other work subsequent to the first quarter of 2013?
A. To Midwest Generation?
Q. Yes.
A. Yes. We continue to work for them in a number of different areas.
Q. Did you do a proposal to continue to do the groundwater sampling for them subsequent to the first quarter of 2013?
A. No. I think that was the last proposal we did.
Q. Why did you not do any additional proposals?
A. Because after that, KPRG had won that work.

Q. KPRG what?
A. I believe KPRG took over the sampling to the extent that it was done after that.
Q. Do you have an understanding of why they took over?
A. No, not specifically, other than that our contract ended.

MS. BUGEL: Okay. I have no further questions.

MS. NIJMAN: Thank you.

Reserve.

**RESPONDENT, MIDWEST GENERATION, LLC'S SUPPLEMENTAL RESPONSE TO COMPLAINANTS' FIRST SET OF INTERROGATORIES**

Respondent, Midwest Generation, LLC, ("Midwest Generation"), through its attorneys Nijman Franzetti, LLP, issues its supplemental response to Complainants', Sierra Club, Environmental Law and Policy Center, Prairie Rivers Network, and Citizens Against Ruining the Environment, First Set of Interrogatories, (the "Requests"), as follows:

**GENERAL OBJECTIONS**

Each of the Answers and Responses is made subject to and incorporates the following objections. Respondent reserves the right to object to the admissibility of any of the documents produced pursuant to the Responses, in whole or in part, at trial in this action on any grounds including but not limited to materiality, relevance, confidential business information and privilege.

1. Midwest Generation objects to the "Coal ash" definition to the extent it includes coal ash that is not stored or transferred to the Coal ash units at the Joliet 29, Powerton, Waukegan, and Will County Stations.

2. Midwest Generation objects to the Requests to the extent that they seek information that is subject to the attorney-client privilege or the work product privilege. To the extent that any privileged information is inadvertently provided in these responses or any documents produced, such provision shall not constitute waiver of the privilege or immunity as to any such information and Complainants shall return any such information upon request.

3. Midwest Generation objects to any Instruction that seeks to impose a duty or burden on Midwest Generation beyond that required by the Illinois Pollution Control Board ("Board") Rules, the Illinois Code of Civil Procedure.

## ANSWERS TO INTERROGATORIES

**INTERROGATORY NO. 7**: Identify all known Coal ash units, including but not limited to ponds, impoundments, or landfills, that have ever been used to store or dispose of Coal ash at each plant, including both active and inactive or abandoned coal ash units, and for each Coal ash unit:

a. State whether the unit was or is lined, and if so, when the original liner and any replacement liners were installed and the type of the original and any replacement liners;

b. State whether all Coal ash has been removed from that unit, and if so, when and by whom that removal was performed; and

c. State whether MWG has ever become aware of any Breach of, or damage to, any liner, and if so, what actions were taken to address those breaches or damage.

**ANSWER**: Midwest Generation objects to Interrogatory No. 7 because it is overly broad, unduly burdensome, is not limited in time, and seeks material covered by the work product and attorney-client privilege. Additionally, Midwest Generation objects to this interrogatory as requesting information already provided in the responses to the document

requests and in the depositions. Without waiving its objections and subject to a protective order, Midwest Generation states the following:

Joliet 29 Station has three active ash ponds and, based on information and belief, there are two historical ash areas. The three active ash ponds, Ash Ponds 1, 2, and 3, are lined with a High Density Polyethylene (HDPE) liner. They were originally constructed in 1978 with a poz-o-pac liner. MWG installed HDPE liners in Ash Ponds 1 & 2 in 2008 and installed an HDPE liner in Ash Pond 3 in 2013. Coal ash is removed from Ash Ponds 1 & 2 approximately every one to two years. Ash Pond 3 is a finishing pond, and coal ash was removed from Pond 3 in 2013. Coal ash is removed from the ponds by Beemsterboer. A breach in the liner in Ash Pond 3 above the water line occurred in February 2015, and was repaired as soon as the weather allowed in 2015. MWG has no knowledge of lining under the historical ash areas, or if there is a breach or damage to any liner under the historical areas. Coal ash was removed from the historical area on the southwest side of the property by KPRG in 2005 and 2007. Other than the two removals in 2005 and 2007, MWG has no knowledge of any removals of coal ash from the historical areas.

Powerton Station has three active ash ponds (the Ash Surge Basin, the Ash Bypass Basin, and the Secondary Ash Settling Basin), and uses one basin as a temporary holding spot (the Metal Cleaning Basin). The three ash ponds, and the basin are lined with a HDPE liner. The Ash Surge Basin and the Metal Cleaning Basin were originally constructed in 1978 with a poz-o-pac and hypolon liner. MWG has no knowledge of the original construction date of the Ash Bypass Basin or the Secondary Ash Settling Basin. Both the Secondary Ash Settling Basin and the Ash Bypass Basin originally had a hypalon liner. In 2010, the Metal Clean Basin and the Ash Bypass Basin were relined with HDPE liners. In 2013, the Ash Surge Basin and the Secondary Ash Settling Basin were relined with HDPE liners. Coal ash is removed from the Ash Surge Basin,

the Ash Bypass Basin and the Secondary Ash Settling Basin approximately every six to eight years. Coal Ash is removed from the Metal Cleaning Basin approximately annually. The Coal Ash is removed by Harsco Minerals, Capital Minerals and the Station. There were periodic tears at the top of the hypalon liners, above the water line, in the Ash Settling Basin Ash Bypass Basin, Metal Cleaning Basin, all of which were promptly repaired. On information and belief, the Powerton Station also has three areas that historically contained ash: the limestone basin, an area south of the ash bypass basin, and the former ash pond. The limestone basin is lined on the bottom with a poz-o-pac liner and a hypolan liner on the sides. Coal ash was temporarily stored in the limestone basin in the past, and it is not presently used for storage of coal ash. On information and belief, ash was removed from the limestone basin in 2004, but MWG been unable to locate information regarding the removal. On information and belief, there were breaches at the top of the hypalon liner on the sides of the limestone basin. On one occasion, between approximately 2002 and 2004, MWG installed temporary plastic lining in the limestone basin. Coal ash was also temporarily stored in an area south of the ash bypass basin in the winter of 2001, but has not been stored at that location since and no ash is at that location now. On information and belief, in 2001 Reed Minerals removed the ash in that area for beneficial use. Additionally, MWG has no knowledge of the lining under the area south of the ash bypass basin or if there was a breach any lining underneath the area. On information and belief, the former ash pond area is a historical ash area and there is no liner below the former ash pond. MWG has no knowledge if there is a breach or damage to any liner under the former ash pond, or if ash has been removed from the former ash pond.

Waukegan Station has two active ash ponds, both of which are lined with a HDPE liner, and, based on information and belief, a historical ash area. The ash ponds were originally

constructed in 1978 and lined with a hypalon liner. In 2003, the East Pond was relined with an HDPE liner, and in 2005, the West Pond was relined with an HDPE liner. Coal ash is removed approximately annually from the ash ponds by Lafarge North America. Minor breeches in the upper portions of the liners, due to equipment use above the water line, have occurred and have been promptly repaired. Recently, there was a tear in the top of the East Ash Pond in 2013 and a tear in the East and West Ponds in 2014. On information and belief, both tears were promptly repaired as soon as weather allowed. MWG has no knowledge of the lining under the historical ash area, whether coal ash was removed from the historical ash area, or if there is a breach or damage to any liner in the historical ash area.

Will County Station has two active ash ponds (Ponds 2S and 3S) and two inactive ash ponds (Ponds 1N and 1S). All four ash ponds were originally constructed in 1977 with a poz-o-pac liner. In 2009, Pond 3S was relined with an HDPE liner, and in 2013, Pond 2S was relined with an HDPE liner. Coal ash is removed from the ash ponds by Lafarge North America approximately annually. MWG is aware of a tear in the HDPE liner in 3S in 2012, which was promptly repaired in 2012, and there was also a crack in the second layer of poz-o-pac under Pond 3S in 2009. The Retention Basin, a concrete basin, also historically contained ash, and on information and belief the ash was removed approximately daily. The Retention Basin is no longer used for any processes related to ash, and no longer contains any ash. There is also a historical slag stockpile near the Retention Basin. In 2015, MWG removed approximately 1,800 tons of slag from the stockpile. Currently, the area contains an ash pile. A 1999 Phase II Report, conducted for a previous site owner, identified historic areas including a slag and bottom ash dumping area and a slag dumping area. MWG has no knowledge whether such areas were lined,

whether coal ash was removed from the areas, or if there is a breach or damage to any liner in the areas.

Under penalties as provided by law pursuant to Section 1-109 of the Code of Civil Procedure, the undersigned certifies that the statements set forth in the Midwest Generation, LLP Responses to Complainants' Interrogatories and Requests to Admit dated September 2, 2014 and March 31, 2015 and supplemented on June 10, 2015, except as to matters therein stated to be on information and belief and as to such matters the undersigned certifies as aforesaid that it verily believes the same to be true.

I have personal knowledge of the facts stated herein.

**FURTHER AFFIANT SAYETH NOT.**

Maria Race

# Exhibit G

# Expert Report of John Seymour, P.E.

I have prepared this Expert Report on behalf of Midwest Generation, LLC (MWG) to present my opinions and to address the two expert reports issued by M. James R. Kunkel in the Matter of:

SIERRA CLUB, ENVIRONMENTAL LAW AND POLICY CENTER, PRAIRIE RIVERS NETWORK, and CITIZENS AGAINST RUINING THE ENVIRONMENT
Complainants,
v
MIDWEST GENERATION, LLC,
Respondent
PCB 2013-0015

## Section 1: INTRODUCTION

### 1.1. Background

Since 1999, MWG has operated four electric generating stations at issue in this matter: the Joliet #29 Generating Station ("Joliet #29") located in Joliet, Will County, Illinois; the Powerton Generating Station ("Powerton") located in Pekin, Tazewell County, Illinois; the Waukegan Generating Station ("Waukegan") located in Waukegan, Lake County, Illinois; and the Will County Generating Station ("Will County") located in Romeoville, Will County, Illinois. Prior to 1999, the stations were operated by other entities and pre-1999 documents identify historic areas where ash was placed.[1]

Each of the generating stations includes active ash ponds as an integral part of the generating stations' wastewater treatment systems (MWG Facility NPDES Permits).[2] All of the ash ponds are permitted pursuant to MWG's NPDES permits (IL0064254, IL0002232, IL0002259, and IL0002208) and operate pursuant to the limits, terms, and conditions of the permits. All of the active ash ponds at the MWG facilities are fully lined with 60 mil-thick high density polyethylene (HDPE) liners.

In 2010, MWG voluntarily agreed to Illinois EPA's request to perform hydrogeological assessments around the ash ponds at its generating stations.[3] On June 11, 2012, based on the results of the hydrogeological assessments, Illinois EPA issued Violation Notices (VN) to MWG alleging violations of

[1] MWG13-15_8502-8536, MWG13-15_11966-12040, MWG13-15_29502-29532, MWG13-15_25139-25167
[2] MWG's Answer and Defenses to Second Complaint, Answers to Complaint ¶¶1, 3, 5, 7
[3] MWG13-15_364; MWG13-15_384; MWG13-15_407; MWG13-15_421

groundwater quality standards purportedly caused by the ash ponds.[4] The VNs listed exceedances of the groundwater quality standards for specific constituents at each station, such as chloride, antimony, and boron.[5]

MWG responded to the VNs, disputing that the ponds were the cause of groundwater exceedances.[6] MWG explained that the ash ponds are not disposal sites because the ash is routinely removed and that the alleged groundwater exceedances were inconsistent and did not show a connection to the ash ponds. Illinois EPA and MWG agreed on a Compliance Commitment Agreement (CCA) for each MWG station to resolve the VNs.[7]

As the CCAs were finalized,[8] Complainants filed a Complaint against MWG alleging open dumping violations, violations of Section 12 of the Illinois Environmental Protection Act, and violations of the Pollution Control Board groundwater regulations (35 Ill. Adm. Code 620.115, 620.301(a), and 620.405). Complainants later amended their Complaint to include historic filled areas on the sites. In support of their Complaint, Complainants presented two reports by James R. Kunkel.[9]

## 1.2. Contents of Opinion

I have reviewed the Kunkel reports and provide my assessment and opinions, below. In addition, I reviewed operational information, monitoring data, construction data and other documents for each of the stations to develop my opinions. Each of my opinions is supported by a reasonable degree of scientific certainty. The following outlines my approach to support my opinion:

- Section 2: Overview of Opinions
- Section 3: Credentials of John Seymour, P.E.
- Section 4: Summary of Current Conditions and Conceptual Site Models (CSM)
- Section 5: Opinion 1—MWG's Actions are Appropriate for the Sites and are Protective of Human Health and the Environment
- Section 6: Opinion 2—The Remedial Approach Provided in the Kunkel Remedy Report is Not Warranted

[8] MWG13-15_795-806
[9] Kunkel, 2015a and 2015b

- Section 7: Opinion 3—Kunkel Underestimates the Costs to Implement the Unwarranted Cleanup
- Section 8: Reservation
- Section 9: Signature
- Section 10: Acronyms
- Section 11: Works Cited
- Figures and Tables
- Appendix A: John Seymour Curriculum Vitae
- Appendix B: Surface Water Risk Characterization

## Section 2: Overview of Opinions

**Opinion 1: MWG's Actions are Appropriate for the Sites and are Protective of Human Health and the Environment.**

It is my opinion that MWG's actions at each plant site are appropriate for the measured groundwater impacts and are protective of human health and the environment. This opinion is based on the following:

- An approach that eliminates the exposure pathways to address the potential groundwater impacts is appropriate.
- Establishment of administrative controls such as Groundwater Management Zones (GMZ) and/or Environmental Land Use Controls (ELUC) are effective remedial approaches to reduce the exposure of potential groundwater impacts, are remediation industry-accepted approaches, and are approved State of Illinois methods.
    - GMZs are specified for sites undergoing corrective actions under Title 35, IAC Sections 620 (Bureau of Water) and 740 (Bureau of Land).
    - A minimum of 10 sites in Illinois currently have GMZs established by the IEPA Bureau of Water. IEPA Bureau of Water has not reported any groundwater violations for sites with GMZs.
    - The IEPA Bureau of Land has implemented on the order of 100 ELUCs.[10]
    - ELUCs and GMZs allow control of groundwater use along the exposure pathways by eliminating the ingestion pathway and dermal contact pathway while corrective action is underway.
        - The groundwater ingestion pathway is eliminated by restricting the installation of potable water wells in the area of the GMZs and ELUCs.
        - The dermal contact pathway is eliminated by restricting the access of the industrial properties to only trained workers.
- All of the active ponds were relined to eliminate a potential exposure pathway.
    - The relining of the CCR Ponds with 60-mil thick HDPE is an industry-accepted remediation approach to reduce the potential for groundwater impacts.

[10] The IEPA Bureau of Land also has approved GMZs for many sites.

- The relining of the CCR Ponds was completed and inspected by an independent third party under construction quality assurance protocols and documented to be completed in accordance with the design documents or subsequently inspected by a qualified third party.

- The lined ponds are properly operated and maintained, which is the industry-accepted standard approach to preclude groundwater impacts. The operation and maintenance is being completed under consistent protocols.
- Groundwater monitoring is an accepted method to assess a remedial approach.
- I reviewed recent groundwater monitoring data and literature on liners to identify if liner defects were likely and if leaks of leachate through alleged liner defects could be impacting groundwater at the subject sites. It is my opinion that groundwater concentrations are not the result of leaks of leachate from the ash currently stored in lined ponds, as outlined below.
    - The leachate from bottom ash currently stored in ash ponds contains constituents at levels that do not exceed IEPA Class I groundwater standards based on neutral leaching analyses of site-specific samples, indicating that the bottom ash in the ponds is not a source of impact to groundwater.
    - The characteristics of ash leachate were identified based on site-specific impounded ash data or on published leachate data from ponds of subbituminous CCR sourced from the Powder River Basin (PRB) in Wyoming that is the source of coal ash from the Plants.
    - The profiles of the constituents in the groundwater do not match the profiles of leachate constituent indicators in the ponds at all four plant sites. This is based on a comparison of the occurrence of groundwater constituents detected in 2014 compared to minimum and maximum sets of indicators of leachate from ash stored in ponds.
- Groundwater conditions do not pose risks to surface water based on Illinois Water Quality Standards and Illinois Water Quality Criteria that are issued by the State of Illinois to be protective of human health and the environment. An assessment of human and ecological receptors in surface water indicates that there is no risk to the surface water environment at each site based on regulatory risk standards and standards of practice for risk assessments. The potential surface water risks were evaluated using a screening level

approach that compared concentrations in groundwater to Illinois Water Quality Standards (WQS) or Water Quality Criteria (WQC).

- Historical ash in fill materials outside of the ponds is not a source and is not a risk to human health and the environment.
    - Ash generated by coal combustion may be classified as CCB when there is beneficial use determined by IEPA as established in 415 Illinois Compiled Statutes 5/3.135. It is analogous to compare the current condition of CCB to the current IEPA criteria. In my opinion, the presence of CCB outside of the pond areas is acceptable for engineering considerations when compared to Illinois requirements.
    - Data obtained from recent samples of ash used as fill from multiple sites show that leachate from the ash meets IEPA Class I standards based on leaching from a soil-like environment.

**Opinion 2: The Remedial Approach Provided in the Kunkel Remedy Report is Not Warranted.**

It is my opinion that the remedial approach in the Kunkel Remedy Report, which is removal of all CCRs and the ash ponds, is not warranted. In addition to Opinion 1, removal is unwarranted because:

1. based on the concentrations of COIs that have been observed in groundwater around the ponds, MWG's remedial approach is protective of human health and the environment;
2. the concentrations of bottom ash indicator constituents from leachate do not match the groundwater chemistry. This shows that the constituents in groundwater are not from the ponds, the ponds are functioning in accordance with the design, and the ponds do not need to be removed;
3. there is no evidence that historical coal ash outside of the ash ponds is a current source of groundwater impact that needs to be removed; and
4. Kunkel did not follow the Illinois procedures for investigations and remedial activities.

Further, there are many inaccuracies in the Kunkel Expert Report on Ground-Water Contamination that, in general, incorrectly imply that groundwater is more threatened than supported by the data.

The following is provided to demonstrate this opinion:

- The ash ponds do not need to be removed because they are for wastewater treatment purposes and are not landfills for permanent ash disposal.
- The ash ponds are not a source of groundwater impacts because they are lined with 60-mil high density polyethylene (HDPE), which was the accepted standard of the ash pond lining industry, and there is no evidence that the liners are leaking. The liner construction quality is consistent with the ash pond lining quality management standards for long-term use.
    - The liner subgrade was inspected for sharp surfaces prior to installation of the HDPE liner and a protective geotextile was installed below the HDPE liner to avoid the potential for puncture.
    - Available literature on liners concludes that tears usually occur upon placement of overlying cushion and warning materials. MWG avoided this issue by inspecting the HDPE liner for leaks typically after installation of a protective sand cushion layer using the state of the practice electronic leak detection survey technologies.
    - Warning and cushion layers are installed above the HDPE liners to protect them from accidental contact and damage during future dredging operations.
    - The quality of construction was documented by an independent engineering firm that attested that the construction met the project drawings and specifications and manufacturer's recommendations, or subsequently inspected by a qualified third party.
- Operation and maintenance (O&M) of the ash ponds will avoid future leaks because O&M are conducted in accordance with consistent operating procedures that include:
    - Periodic dredging of settled bottom ash is carefully performed using excavators. If the excavator bucket were to encounter the stone warning layer, which is located over the protective layer, which in turn is located over the HDPE liner, it would be obvious to the operator who is instructed to stop excavating. If the HDPE liner was encountered, white HDPE material would be visually observed in the bucket by the excavator operator who would stop work.
    - Previous tears observed in the ash pond liners have been above the impounded water surface with one exception. Tears above impounded water would not be expected to result in leaks. Only one tear was discovered in a pond liner that was below the level of impounded ash and water at the Will County Ash Pond 3S; this

tear occurred when no water was in Ash Pond 3S and was repaired prior to refilling water to the level of the tear in the ash pond. All observed tears were repaired.

- Kunkel incorrectly concludes that all of the former ash ponds leaked and the current ash ponds are leaking. He asserts that the groundwater elevations are above the bottom of the ponds or pond water surface and in turn causing bottom heave. He is incorrect on several bases. First, an uplift pressure argument is relative to the top of the bottom liner. Second, an uplift argument is an issue for soil liners, not geomembrane liners that are at all of the ponds. Third, groundwater levels are not often above the top of the bottom liners and when they are above the bottom liner there are other opposing forces or controls to eliminate uplift.
- Kunkel incorrectly asserts that hydrostatic uplift is causing liner failure for multiple ash ponds. Kunkel does not account for the fact that the hydrostatic uplift pressures at the two ponds where the groundwater levels are above the bottoms of the ponds are resisted by the weight of the sand and protective layers and the weight of overlying pond water.
- Kunkel is incorrect by alleging that there is groundwater mounding at Joliet #29. Kunkel alleges that mounding is occurring by selecting the single highest water level value at MW-9. Yet, the years of data shows the average water level in MW-9 is lower than MW-8, rebutting any notion of a groundwater mound.
- Kunkel is incorrect by alleging that there is groundwater mounding at Waukegan. Kunkel alleges that mounding is occurring based on high groundwater elevations below the pond. My analysis of groundwater contours indicates that the contours reflect the surrounding surface topography.
- Kunkel incorrectly portrays background concentrations by using state-wide data for groundwater at the Joliet #29, Waukegan, and Will County sites. It is my opinion that this approach is inappropriate and also fails to account for those sites where upgradient groundwater is impacted prior to migrating on-site.

**Opinion 3: In Addition to Being an Unwarranted Remedy, Kunkel's Remedy Cost Opinion Underestimates the Costs to Implement the Unwarranted Cleanup.**

Even if the unwarranted remedy recommended by Kunkel were to be implemented, the Kunkel Remedy Report significantly underestimates the cost of his proposed cleanup.

- Kunkel's proposed remedy fails to incorporate the costs of disposal at a permitted landfill. I estimated the disposal costs associated with Kunkel's proposed remedy to be on the order of $178,000,000 in total for all four sites. This increases the total estimated cost of the unwarranted remedy by 68 percent.
- Kunkel's proposed remedy, consisting of removal of ash-impacted soil and backfilling, results in significant disruptions of the electricity generation facilities. As examples:
    - Kunkel's estimates include areas below equipment such as switchyards, coal handling and transfer equipment, and cooling water conveyance and treatment equipment. Given Kunkel's estimates of the areas and thicknesses of coal ash in these areas, equipment would be down on the order of years at each plant, during which time the plants will experience significant outages and extensive costs to dismantle and reassemble equipment and underground utilities, roadways, etc. and would cause lost service to public and industrial users.
    - The cost to remove and replace the equipment is not included in the cost estimate.
- Kunkel's proposed remedy results in significant impacts to the surrounding communities, including dust, noise, and traffic. Of particular concern is the increased risk of vehicle crashes involving large trucks.
    - Based on Kunkel's estimates of volume of ash-impacted soils, off-site disposal is anticipated to create on the order of 17,000,000 miles of large truck traffic for the four sites.
    - The large amount of truck traffic would be a significant nuisance to the neighboring communities from:
        - The increased road dust and increased road traffic; and
        - The human health risk of large truck crashes (1.42 fatalities per 100,000,000 miles). Based on the above mileage estimate, the human health risk of Kunkel's proposed remedy is on the order of ¼ fatalities and 4.6 injuries based on large traffic crashes alone.

- Therefore, the risk of removal of all coal ash and trucking to an offsite facility is not supported by the risk of leaving the existing materials in place, which is essentially no risk to human health and the environment.

- Kunkel's proposed remedy also fails to consider the impact of vehicle carbon dioxide emissions on climate change. I estimate the carbon dioxide emissions from the large truck traffic and excavation equipment to be on the order of 30,000 tons.

# Section 3: Credentials of John Seymour, P.E.

## 3.1. Introduction

I am a geotechnical engineer with nearly three decades of experience in the U.S., Canada, Spain, Guatemala and Korea in the areas of site remediation, high-rise building deep foundations, and construction management. I have focused on waste management and remediation (Superfund (CERCLA) and RCRA) projects for 25 years, with significant involvement in 17 sites providing professional services in the areas of project management, project coordination (client representative), site characterization, feasibility studies, bench/pilot studies, civil/geotechnical design, construction quality assurance (CQA), and operation and maintenance.

I have completed field studies including geologic and hydrogeologic studies, aquifer testing, seismic surveys, landfill settlement tests, and the characterization of volatile organic compounds (TCE and by-products), semi-volatile organic compounds, PCBs, metals, and saline groundwater intrusion. In addition, I have geotechnical engineering experience with the design and construction of deep foundations, including drilled piers, tie backs, foundation grouting and soil improvement programs, and diaphragm (slurry) walls.

My full curriculum vita is attached as Appendix A.

## 3.2. My relevant experience

I have provided coal combustion residuals (CCRs) engineering services, regarding management of fly ash, bottom ash and flue gas desulfurization (FGD) waste for ponds and landfills. These services have included geotechnical and environmental evaluations of waste disposal expansions, operations and closure, disposal permit application preparation, for eight U.S coal power generation clients. Overall I have provided relevant consulting engineering services for 7 CCRs ponds and 14 CCR landfills and provided records review, evaluation and engineering scope of work development for 4 additional CCR ponds. I have translated some of this experience into 11 technical papers and completed 2 research guidance documents on CCR ponds (co-investigator), and provided 10 technical presentations at conferences including at conferences focusing on CCR management. The specific types of services I have provided are: investigation of the subsurface soils and bedrock (geology) at CCR disposal sites; CCR waste characterizations in various settings; characterization of site hydrogeology through use of monitoring wells and piezometers and conducting aquifer hydraulic testing; engineering feasibility

studies of potential configurations of new ash disposal facilities and expansion of existing ash disposal facilities, including economic evaluations; design engineering management for geotechnical, stormwater, wastewater treatment, and remediation projects; characterization of the nature and extent of contamination and associated risks; construction quality assurance/quality control (QA/QC) plans and implementation; and project management and construction management.

## 3.3. Materials Reviewed

In order to develop my opinions in this matter, with the assistance of my staff, I reviewed site histories, analyzed facts, reviewed monitoring data, conducted assessments and calculations of risks, and assessed potential impacts. The documents I relied upon are cited within this report.

# Section 4: Summary of Current Conditions and Conceptual Site Models

## 4.1. Joliet #29

### 4.1.1. Site Description, Site History, and Neighboring Properties

The Joliet #29 site is located along the Des Plaines River in Section 19, Township 35 North, Range 10 East, in the City of Joliet, Will County, Illinois.[11] The Joliet #29 site encompasses approximately 271 acres.[12] The current land use is for coal-fired steam electric power generation.[13] The facility has two generating units each consisting of two boilers and twin turbines that were installed in 1965 to 1966.[14] The Joliet #29 site is in an industrial area; the former Caterpillar, Inc. manufacturing facility is adjacent to the west and there are additional industrial facilities to the north and east.

### 4.1.2. Description of CCR Management

Fly ash generated by coal combustion is collected using electrostatic precipitators and then transported off-site for beneficial reuse.[15] Bottom ash from the boilers is mainly conveyed automatically by an enclosed pipe system across the Des Plaines River to a permitted landfill.[16] Prior to October 12, 2015, a small fraction of the bottom ash slurry (approximately 5 to 10 percent) was pumped to Ash Pond 1 or Ash Pond 2 for settling when the conveyor system is offline.[17] Subsequently, Ash Pond 1 has been taken out of service and all ash has been removed.[18] Ash Pond 3 is used as a finishing pond for the effluent and is considered to receive a *de minimus* amount of ash.[19] Bottom ash is collected from ash ponds and is transported off-site for disposal in a permitted landfill. Treated water is either recycled or discharged to the Des Plaines River under a National Pollutant Discharge Elimination System (NPDES) Permit.[20]

The following summarizes the approximate dimensions and capacities of Joliet #29 ash ponds[21]:

- Ash Pond 2: 168 feet by 419 feet with a depth of 19 feet; capacity is approximately 2,000,000 $ft^3$
- Ash Pond 3: Non-rectangular shape with length 340 feet and widths varying between 80 feet and 220 feet; capacity is approximately 1,100,000 $ft^3$

Construction history and information is provided in Section 5.3.2.1.

### 4.1.3. Geological Setting

The regional geology beneath the Joliet #29 site consists of approximately 5 to 30 feet of sandy loam, underlain by Silurian Dolomite to approximately 176 feet below ground surface, and Maquoketa shale from approximately 176 to 241 feet below ground surface based on water well logs. The Maquoketa shale is an aquitard that separates the shallow groundwater in the unconsolidated units and the Silurian dolomite from the underlying aquifers.[22]

MWG submitted the results of a potable water well investigation to the Illinois EPA by letter dated July 15, 2009 that identified 17 potable/industrial use wells located within a 2,500-foot radius of the Joliet #29 ash ponds. [23] Only two of the wells (Numbers 19 and 4) are located downgradient from the ash ponds. Both of these industrial use wells are owned by MWG, are drilled at 1,525 feet below ground surface, and are screened below the Maquoketa shale, the primary aquitard separating shallower aquifers from the screened interval of the MWG wells. [24] These wells have consistently been in compliance with the potable water regulations.[25]

Groundwater flow in the shallow, unconsolidated aquifer is mainly controlled by the Des Plaines River with groundwater flowing towards the river during most periods of the year. [26] Groundwater flow in the deeper aquifers is controlled by the regional hydraulic gradient in these aquifers, which is to the northeast. [27]

### 4.1.4. Site-Specific Lithology

I reviewed boring logs and summarize the following lithology generally observed at Joliet #29: fill of varying soil materials was observed near the surface at most locations; at certain borings, ash or cinders were observed in fill materials. Within the vadose zone, unsaturated soils included fine to coarse sand and gravel, limestone fragments, clay, silty clay, and sandy silt. In the shallow aquifer, saturated soils included fine to coarse sand and gravel, limestone fragments, and silty clay. Limestone bedrock was recorded at one boring (B-MW-6) at a depth of 38.5 feet bgs.[28]

### 4.1.5. Site-Specific Groundwater Elevations

Groundwater elevations at the 11 monitoring wells at the Joliet #29 site (see Figure 4-1) during the period of record varied between 503.94 feet above MSL (at monitoring well MW-4 in May 2013) to 512.33 feet above MSL (at monitoring well MW-2 in September 2012) as summarized in Table 4-1. The highest groundwater elevation is typically found at monitoring well MW-11 during the period of record. The lowest groundwater elevation is typically found at either monitoring well MW-1 or MW-5.[29] Based on my review of the groundwater elevations, groundwater generally flows south to the Des Plaines River.

### 4.1.6. Site-Specific Groundwater Conditions

I reviewed groundwater concentrations at monitoring wells at the Joliet #29 site, and it is my opinion that there is no groundwater plume. Constituents of interest (COI) that were observed at concentrations exceeding IEPA Class I groundwater standards are listed in Table 4-2. The data shows that there is no spatial trend in COI concentrations in the direction of the groundwater flow. Furthermore, the observed COI concentrations intermittently exceed IEPA Class I groundwater standards. Without evidence that there is spatial or temporal consistency in groundwater impacts, it is my opinion that there is no plume at the Joliet #29 site. Without the existence of a plume, there is no support that there is a source area remaining at the site that could be remediated to reduce groundwater concentrations.

Groundwater conditions at Joliet #29 are impacted by upgradient off-site sources; for example, chloride was found upgradient away from the Joliet ash pond area. See Section 6.5.7.

## 4.2. Powerton

### 4.2.1. Site Description, Site History, and Neighboring Properties

The Powerton site is located along the Illinois River in Section 9, Township 24 North, Range 5 West in the City of Pekin, Tazewell County, Illinois.[30] The Powerton site encompasses approximately 1,710 acres, which includes 1,440 acres of Powerton Lake.[31] The current land use is for coal-fired steam electric power generation. The facility has two active electric generating units (Units 5 and 6) that were installed in 1971 to 1973.[32]

Neighboring properties include a cabinetry manufacturer and railroad to the east and wooded and agricultural areas to the north, west, and south.[33]

### 4.2.2. Description of CCR Management

Fly ash generated by coal combustion is collected using electrostatic precipitators and then transported off-site for mine reclamation.[34] Bottom ash from the boilers is mixed with water to form a slurry that is pumped to dewatering bins where the water is decanted and sent to the Ash Surge Basin for settling.[35] Bottom ash is collected from ash ponds and is sold and transported off-site by a third-party.[36] Treated wastewater is either recycled or discharged under an NPDES permit.

The following summarizes the approximate dimensions and capacities of Powerton ash ponds[37]:

- Ash Surge Basin: 960 feet by 250 feet with a depth of 14 feet; capacity is approximately 4,100,000 $ft^3$
- Secondary Ash Settling Basin: approximately 320 feet by 220 feet with an estimated depth of 10 feet; capacity is approximately 590,000 $ft^3$
- Ash Bypass Basin: approximately 256.5 feet by 135 feet; capacity is approximately 264,900 $ft^3$

---

[30] Patrick, 2011b
[31] MWG13-15_8509
[32] MWG13-15_8516
[33] MWG13-15_8517
[34] MWG13-15_49655
[35] MWG13-15_7401
[36] Deposition of Mark Kelly, p. 41
[37] MWG13-15_20-23; MWG13-15_10983

- Metal Cleaning Basin: 350 feet by 120 feet with a depth of 12 feet; capacity is approximately 720,000 $ft^3$

Construction history and information is provided in Section 5.3.2.2.

### 4.2.3. Geological Setting

The regional geology beneath the Powerton site consists of approximately 100 to 125 feet of unconsolidated deposits (mainly alluvial sands and gravels with some minor clay), underlain by the Carbondale Formation, which consists of alternating layers of limestone, shale, coal, and underclay. Groundwater flow in the shallow, unconsolidated aquifer is largely controlled by the Illinois River with groundwater flowing towards the river during most periods of the year.[38]

MWG submitted the results of a potable water well investigation to the Illinois EPA by letter dated July 15, 2009 that identified six wells located within a 2,500-foot radius of the Powerton ash ponds. None of these wells are located downgradient from the ash ponds. Two of these wells supply Powerton with water, which have consistently been in compliance with the potable water regulations.[39]

### 4.2.4. Site-Specific Lithology

I reviewed boring logs and summarize the following lithology generally observed at Powerton: fill materials consisting of fine to coarse sand, gravel, silty clay, and topsoil were observed near the surface; in certain borings, coal cinders were also observed in fill materials. Within the vadose zone, unsaturated soils included the fill materials previously described, fine to coarse sand and gravel, clayey silt, silty clay, silt, and clay. In the shallow aquifer, saturated soils included fine to coarse sand and gravel, trace silt, and clay.[40]

### 4.2.5. Site-Specific Groundwater Elevations

Groundwater elevations at the 16 monitoring wells at Powerton (see Figure 4-2) during the period of record have varied between 429.94 feet above MSL (at monitoring well MW-3 in December 2012) to 451.84 feet above MSL (at monitoring well MW-12 in May 2013) as summarized in Table 4-3. The highest groundwater elevations are typically found at either monitoring well MW-6 or MW-12 in a shallow, localized saturated clay/silt unit during the period of record. The lowest groundwater elevations are typically found at either monitoring well MW-3 or MW-4 in a more

[38] Patrick, 2011b
[39] Patrick, 2011b; MWG13-15_293-305
[40] Patrick, 2011b

extensive sand unit underlying the clay/silt unit.[41] Based on my review of the groundwater elevations, there are two groundwater units at the site that are hydraulically connected: 1) groundwater in the sand unit generally flows north to the Illinois River, and 2) groundwater in the clay/silt unit flows west toward Powerton Lake.

#### 4.2.6. Site-Specific Groundwater Conditions

I reviewed groundwater concentrations at monitoring wells at the Powerton site, and it is my opinion that there is no groundwater plume. COI that were observed at concentrations exceeding IEPA Class I groundwater standards are listed in Table 4-4. The data show that there is no spatial trend in COI concentrations in the direction of the groundwater flow in either the sand unit or the clay/silt unit. Furthermore, the observed COI concentrations intermittently exceed IEPA Class I groundwater standards. Without evidence that there is spatial or temporal consistency in groundwater impacts, it is my opinion that there is no plume at the Powerton site. Without the existence of a plume, there is no support that there is a source area remaining at the site that could be remediated to reduce groundwater concentrations.

Groundwater conditions at Powerton are impacted by upgradient off-site sources; for example, nitrate is found upgradient, which is not related to COIs found on the Powerton site. See Section 6.5.7.

### 4.3. Waukegan

#### 4.3.1. Site Description, Site History, and Neighboring Properties

The Waukegan site is located in Section 15, Township 45 North, Range 12 East in the City of Waukegan, Lake County, Illinois. The Waukegan site encompasses approximately 194 acres. The current land use is for coal-fired steam electric power generation. The facility has two active electric generating units (Units 7 and 8) constructed in 1958, and 1962, respectively.[42]

Neighboring properties include the Johns Mansville Company, which is an active Superfund site, to the north, the former site of the General Boiler Company, and the former site of the

[41] MWG13-15_48722-25
[42] MWG13-15_12003-12018

Greiss-Pfleger Leather Tanning Facility to the west, and the North Shore Water Reclamation District publicly owned treatment works to the south.[43]

The Greiss-Pfleger Leather Tanning Facility operated on land hydraulically upgradient of the Waukegan Generation Station. In 2003, at the neighboring property owner's request, MWG established an Environmental Land Use Control (ELUC) on the western side of its property as an institutional control to prevent against exposure to historically contaminated soil and groundwater that has migrated onto MWG's Waukegan site as the result of past industrial activities on the former Greiss-Pfleger Tannery Site.[44] The Greiss-Pfleger Tannery utilized the chromium tanning process, which consisted of nine steps and involved numerous chemicals including sodium sulfate, diethylamine, sulfhydrate, cyanide salts, sulfuric acid, and borax.[45] Analytical results of the groundwater at/from the tannery indicate that certain inorganic constituents, including arsenic, boron, chromium, lead, and mercury, have migrated onto the Waukegan property.[46] Presently there is a switchyard and substation at the former Greiss-Pfleger Tannery site.

### 4.3.2. Description of CCR Management

Fly ash generated by coal combustion is collected using electrostatic precipitators and then transported off-site for beneficial reuse.[47] Bottom ash from the boilers is mixed with water to form a slurry that is pumped to ash ponds to be treated by settling.[48] Bottom ash is collected from ash ponds and is transported off-site for beneficial reuse.[49] Treated water is either recycled or discharged to a wastewater treatment plant.[50]

The following summarizes the approximate dimensions and capacities of Waukegan ash ponds[51]:

- West Ash Pond: Non-rectangular with length of 972.5 feet and width up to 437.5 feet with a depth of 22.5 feet; capacity is approximately 7,700,000 $ft^3$

---

[43] MWG13-15_12003-12018, MWG13-15_48644
[44] MWG13-15_12713–12738
[45] MWG13-15_47089
[46] MWG13-15_217-222, MWG13-15_46600, MWG13-15_45512 and MWG13-15_50086-50092
[47] MWG13-15_12017
[48] MWG13-15_12017
[49] MWG13-15_49679-49700
[50] MWG13-15_7392
[51] MWG13-15_13-15

- East Ash Pond: Non-rectangular with length of 972.5 feet and width up to 437.5 feet with a depth of 22.5 feet; capacity is approximately 6,500,000 $ft^3$

Construction history and information is provided in Section 5.3.2.3.

### 4.3.3. Geological Setting

The regional geology beneath the Waukegan consists of approximately 100 feet of sand deposits, underlain by Silurian Dolomite to approximately 360 feet below ground surface, underlain by the Maquoketa shale. The Maquoketa shale is an aquitard that separates the shallow groundwater in the unconsolidated units and the Silurian dolomite from the underlying aquifers. Groundwater in the shallow, unconsolidated aquifer flows towards Lake Michigan, located primarily to the east. Groundwater flow in the deeper aquifers is controlled by the regional hydraulic gradient in these aquifers, which is to the northeast.[52]

MWG submitted the results of a potable water well investigation to the Illinois EPA by letter dated July 15, 2009 that identified eight potable/industrial use wells located within a 2,500-foot radius of the Waukegan ash ponds. There are no potable use wells downgradient of the ash ponds.[53]

### 4.3.4. Site-Specific Lithology

I reviewed boring logs and summarize the following lithology generally observed at Waukegan. Fill materials consisting of silty clay, clayey silt, gravely clay, silt, sand, fine to coarse gravel, crushed rock, crushed limestone, and cobbles were observed near the surface; in certain borings, coal cinders and ash was observed in fill materials. Within the vadose zone, unsaturated soils included the fill materials previously noted, and fine to coarse sand. In the shallow aquifer, saturated soils included fine to coarse sand and gravel. [54]

### 4.3.5. Site-Specific Groundwater Elevations

Groundwater elevations at the seven monitoring wells at Waukegan (see Figure 4-3) varied between 579.27 feet above MSL (at monitoring well MW-2 in December 2012) to 584.56 feet above MSL (at monitoring well MW-6 in May 2014) as summarized in Table 4-5. The highest groundwater elevation is typically found at either monitoring well MW-5 or MW-6 during the period of record. The lowest groundwater elevation during each quarterly monitoring event varied between the

[52] Patrick, 2011c
[53] Patrick, 2011c; MWG13-15_293-305
[54] Patrick, 2011c

following monitoring wells: MW-1, MW-2, MW-4, or MW-7.[55] Additional upgradient monitoring wells have been installed and monitored at the Waukegan Site in response to the migration of inorganic constituents from the former Greiss-Pfleger Tannery site. Based on my review of the groundwater elevations, groundwater generally flows east to Lake Michigan. Site-wide groundwater contours for the Waukegan site are provided on Figure 4-4. See Section 6.5.7.

#### 4.3.6. Site-Specific Groundwater Conditions

I reviewed groundwater concentrations at monitoring wells at the Waukegan site, and it is my opinion that there is no groundwater plume. COI that were observed at concentrations exceeding IEPA Class I groundwater standards are listed in Table 4-6. Furthermore, the observed COI concentrations intermittently exceed IEPA Class I groundwater standards.

Groundwater conditions at Waukegan are impacted by upgradient and off-site sources; for example, boron was detected exceeding IEPA Class I groundwater standards in upgradient wells from the former Greiss-Pfleger Tannery site. See Section 6.5.7.

### 4.4. Will County

#### 4.4.1. Site Description, Site History, and Neighboring Properties

The Will County site is located between the Chicago Sanitary and Ship Canal and the Des Plaines River in Section 2, Township 36 North, Range 10 East, in the City of Romeoville, Will County, Illinois. The Will County site encompasses approximately 215 acres and is used for coal-fired steam electric power generation.[56] The facility has one active electric generating unit (Unit 4) constructed in 1963. Neighboring properties include a former drum restoration operation to the northwest,[57] the Citgo Lemont Refinery to the northeast, Hanson Materials (f/k/a Material Service Corp.) to the south, and a ComEd switchyard to the west. [58]

#### 4.4.2. Description of CCR Management

Fly ash generated by coal combustion is collected using electrostatic precipitators and then transported off-site for beneficial reuse.[59] Bottom ash from the boilers is mixed with water to form

---

[55] MWG13-15_48908-09
[56] MWG13-15_29509
[57] MWG13-15_13242- 13421
[58] MWG13-15_29509
[59] MWG13-15_29516

a slurry that is pumped to Ash Ponds 2S or 3S for settling.[60] Bottom ash is collected from ash ponds and is transported off-site for beneficial reuse. The slurry water is recycled back into the Station for treatment. In 2010, Midwest Generation ceased using Ash Ponds 1N and 1S, and no additional ash or ash slurry is deposited in those ponds; furthermore, the water levels of Ash Ponds 1N and 1S are not allowed to exceed one foot above the base.

The following summarizes the approximate dimensions and capacities of Will County ash ponds:[61]

- Ash Pond 2S: 350 feet by 178 feet with a depth of 7 feet; capacity is 510,000 $ft^3$; and
- Ash Pond 3S: 322 feet by 234 feet with a depth of 7 feet; capacity is 530,000 $ft^3$.

Construction history and information is provided in Section 5.3.2.4.

### 4.4.3. Geological Setting

The regional geology beneath the Will County site consists of approximately 1 to 5 feet of unconsolidated deposits or fill, underlain by Silurian Dolomite to approximately 140 feet below ground surface; the Silurian Dolomite is underlain by the Maquoketa shale. The Maquoketa shale is an aquitard that separates the shallow groundwater in the unconsolidated units and the Silurian dolomite from the underlying aquifers. Groundwater flow in the shallow aquifer is largely controlled by the Des Plaines River and the Chicago Sanitary and Ship Canal with groundwater flowing towards either of the surface water channels during most periods of the year. Groundwater flow in the deeper aquifers is controlled by the regional hydraulic gradient in these aquifers, which is to the southeast.[62]

MWG submitted the results of a potable water well investigation to the Illinois EPA by letter dated July 15, 2009 that identified nine potable wells within a 2,500-foot radius of the Will County Station ash ponds, seven of which are upgradient of the Station. Two of these wells are located between the Des Plaines River and the Chicago Sanitary and Ship Canal. Both of these wells are drilled more than 1,500 feet below ground surface and are screened below the Maquoketa shale, the primary aquitard separating shallower aquifers from the screened interval of the wells.[63]

---

[60] MWG13-15_29516
[61] Schwartz, 2005
[62] Patrick, 2011d
[63] Patrick, 2011d; MWG13-15_293-305

### 4.4.4. Site-Specific Lithology

I reviewed boring logs and summarize the following lithology generally observed at Will County. Fill materials consisting of fine to coarse sand, gravel, silt, and silty sand were observed near the surface; in certain borings, coal cinders and ash were also observed in fill materials. Within the vadose zone, unsaturated soils included the fill materials previously noted, coarse sand, fine to coarse gravel, clayey gravel, clay, silty clay, and silt. In the shallow aquifer, saturated soils included fine to coarse gravel, coal cinders, coal dust, weathered limestone, sand, silt, silty clay, and clay. Weathered limestone bedrock was encountered between 7 and 12 feet bgs.[64]

### 4.4.5. Site-Specific Groundwater Elevations

Groundwater elevations at the 10 monitoring wells at Will County (see Figure 4-5) have varied between 579.13 feet above MSL (at monitoring well MW-10 in August 2013) to 583.87 feet above MSL (at monitoring well MW-2 in June 2011) as summarized in Table 4-7. The highest groundwater elevation during each quarterly monitoring event varied between the following monitoring wells: MW-1, MW-2, MW-3, MW-5, and MW-9. The lowest groundwater elevation during each quarterly monitoring event for the period of record was found at monitoring well MW-10.[65]

Based on a review of the groundwater elevations, groundwater generally flows west to the Des Plaines River on the western portion of the site and is understood to flow east to the Chicago Sanitary and Ship Canal on the eastern portion of the site.

### 4.4.6. Site-Specific Groundwater Conditions

I reviewed groundwater concentrations at monitoring wells at the Will County site, and it is my opinion that there is no groundwater plume. COI that were observed at concentrations exceeding IEPA Class I groundwater standards are listed in Table 4-8. The data show there is no spatial trend in COI concentrations in the direction of the groundwater flow. Furthermore, the observed COI concentrations intermittently exceed IEPA Class I groundwater standards. Without evidence that there is spatial or temporal consistency in groundwater impacts, it is my opinion that there is no plume at the Will County site. Without the existence of a plume, there is no support that there is a source area remaining at the site that could be remediated to reduce groundwater concentrations.

---

[64] Patrick, 2011d
[65] MWG13-15_48850-2

Shallow groundwater conditions at the Will County site are impacted by surface water elevation fluctuations of the Des Plaines River and the Chicago Sanitary and Ship Canal. See Section 6.5.7.

# Section 5: Opinion 1—MWG's Actions are Appropriate for the Sites and are Protective of Human Health and the Environment

It is my opinion that MWG's actions for the sites are appropriate for the measured groundwater impacts and are protective of human health and the environment.

## 5.1. An Elimination of Exposure Pathways is Appropriate

A standard approach that accounts for receptors to address the potential groundwater impacts at the sites is appropriate. An approach that eliminates the exposure pathways has been implemented by completion of a site characterization, comparison of groundwater analytes with State of Illinois water quality standards, and evaluation of the potential exposure routes. This resulted in a decision to reline the ash ponds and implement administrative controls of groundwater use to preclude the exposure to groundwater. Groundwater monitoring is conducted to assess changes in groundwater quality.

The following sections elaborate on the key points associated with the exposure pathways approach:

Section 5.2: Establishment of Administrative Controls is an Effective Remedial Approach

Section 5.3: Active Ponds are Lined to Eliminate a Potential Exposure Pathway

Section 5.4: Groundwater Monitoring is Appropriate to Demonstrate that Groundwater Exposure Pathways are Mitigated

Section 5.5: Recent Groundwater Concentrations are Not the Result of Ash Stored in Lined Ponds

Section 5.6: Groundwater Conditions Do Not Pose Risks to Surface Water Receptors Based on a Risk Screening Assessment

Section 5.7: Historical Ash in Fill Materials Outside of the Ponds is Not Adversely Impacting Groundwater

Section 5.8: Bottom Ash in Inactive Ponds is Not a Source of Groundwater Concentrations

## 5.2. Establishment of Administrative Controls is an Effective Remedial Approach

### 5.2.1. Summary of Implementation of Administrative Controls at the Four Sites

A remedial approach has been implemented that includes administrative controls to eliminate the groundwater exposure pathway for ingestion and dermal contact for specific areas. MWG has completed establishing GMZs and/or ELUCs at the four sites as summarized below.

- At Joliet #29, a GMZ has been established over the portion of the site containing the ash ponds extending from the north to the limit of a road and south to the intake canal. Additionally, there is an ELUC on the western side of the property, which MWG installed at the request of Caterpillar to address soil and groundwater contamination originating on Caterpillar property.[66]
- At Powerton, a GMZ has been established over the portion of the site containing the ash ponds extending to the east and south to the limits of a railroad, west to a canal and north to the Illinois River. Furthermore, an ELUC has been implemented to cover the area of the Powerton property that is contained by the GMZ.
- At Waukegan, the Former Tannery Site ELUC was established in a portion of the property, and an additional ELUC has been implemented to cover the remaining Waukegan property to the east that includes the ash ponds.
- At Will County, a GMZ has been established over the portion of the site containing the ash ponds extending west to the Des Plaines River and east to the Chicago Sanitary and Ship Canal. Furthermore, an ELUC has been implemented to cover the area of the Will County Station property that is contained within the GMZ, except for that portion of the GMZ area which is owned by the former property owner.

### 5.2.2. Demonstration that Administrative Controls are Effective

ELUCs and GMZs are used to eliminate groundwater exposure pathways by eliminating groundwater ingestion pathway and dermal contact pathways while corrective actions are underway. The groundwater ingestion pathway is eliminated by restricting the installation of potable water wells near the ash ponds. The dermal contact pathway is eliminated by restricting the access of the industrial properties to qualified workers.

[66] Carlson, 2010

Administrative controls, including GMZs and ELUCs, are remediation-industry accepted approaches. IEPA has the authority for establishing GMZs as specified in Title 35, Illinois Administrative Code (IAC) Sections 620 and 740.

IEPA has the authority for establishing ELUCs as specified in Title 35, IAC Section 742. The significance of the GMZ with respect to groundwater quality standards is described in 35 IAC Section 620.450 Alternative Groundwater Quality Standards: "Prior to completion of a corrective action described in Section 620.250(a), the standards as specified in Sections 620.410, 620.420, 620.430, and 620.440 are not applicable to such released chemical constituent, provided that the initiated action proceeds in a timely and appropriate manner." In other words, the concentrations of COIs constituents of interest can be higher than the groundwater quality standards within the GMZ.

Within Illinois, a minimum of 10 sites currently have GMZs established by the IEPA Bureau of Water.[67] IEPA Bureau of Water has not reported any groundwater violations for sites with GMZs.[68] Within Illinois, a minimum of 100 sites currently have ELUCs established by the IEPA Bureau of Land.[69]

Thus, it is my opinion that establishment of a GMZ or an ELUC is an effective method to reduce the potential risk for groundwater impacts, are remediation-industry-accepted approaches, and are approved by State of Illinois environmental protection procedures.

## 5.3. Active Ponds are Lined to Eliminate a Potential Exposure Pathway

A remedial approach has been implemented to address the ponds as a potential source of groundwater impacts that includes the installation of HDPE liners, decommissioning some ash ponds and properly operating and maintaining active ponds.

### 5.3.1. Summary of Pond Relining and Pond Decommissioning Actions

Midwest Generation has completed remedial actions that include liner installation or pond decommissioning at the four sites as summarized below. It is my opinion that MWG's actions are a reasonable and appropriate remedial approach for addressing groundwater conditions.

[67] Telecommunication with IEPA Groundwater Protection Program Hydrogeology Unit Manager
[68] Telecommunication with IEPA Groundwater Protection Program Hydrogeology Unit Manager
[69] Telecommunication with IEPA Site Remediation Program staff member

- At Joliet #29, construction permits were obtained to reline Ash Ponds 1, 2, and 3 with 60-mil thick, high density polyethylene ("HDPE") liners, and the work has been completed. Ash Pond 1 was taken out of service on October 12, 2015.
- At Powerton, construction permits were obtained to reline the Ash Surge Basin, the Secondary Ash Settling Basin, Metal Cleaning Basin, and Bypass Basin, with 60-mil thick, HDPE liners, and the work has been completed.
- The Powerton East Yard Run-off Basin is not part of the ash sluicing flow system and is not used for ash storage.[70]
- At Waukegan, the East Ash Pond and West Ash Pond were relined with HDPE liners in 2003 and 2004, respectively.
- At Will County, Ash Ponds 1 North (1N) and 1 South (1S) were removed from service in 2010.[71] All process water has been diverted from ponds 1N and 1S to existing Ash Ponds 2 South (2S) and 3 South (3S). A dewatering system was implemented in 2013 that is designed to not allow water to exceed a depth of one foot above the bottom of Ponds 1N and 1S.[72]
- Construction permits were obtained to reline Will County Station Ash Ponds 2S and 3S with 60 mil thick, HDPE liners, and the work has been completed.

### 5.3.2. Pond Liners are Effective at Precluding Groundwater Impacts

I reviewed the design specifications and construction documentation for current pond liners used for active ash ponds at the sites, as summarized in Sections 5.3.2.1 through 5.3.2.4. The current pond liners are consistent with remediation-industry-accepted approaches, which are further described in Section 5.3.2.5. I reviewed the construction quality assurance and quality control (QA/QC) documentation in Section 5.3.2.6. Properly operating and maintaining lined ponds are the industry-accepted approach to preclude groundwater impacts; based on my review of site-specific records in Section 5.3.2.7, operation and maintenance is being conducted under appropriate and consistent protocols. It is my opinion that the current pond liners are effective to preclude quantifiable groundwater impacts, as described further below.

[70] Mark Kelly Deposition pp 113-4

#### *5.3.2.1. Joliet #29 Active Ash Pond Liners*

The following summarizes information regarding ash pond history and construction elements:

- Ash Pond 1 (see Figure 5-1 for a typical construction cross-section)[73]
  - Originally constructed in 1978 with the following layers (from top to bottom):[74]
    - Bituminous seal coat
    - Poz-o-Pac[75]—12 inches thick
    - Compacted granular material—12 inches thick
  - Relined in 2007 under IEPA Water Pollution Control Permit (WPCP) No. 2007-EB-4091 with following layers (from top to bottom):[76]
    - New crushed limestone warning layer—6 inches thick
    - New sand cushion layer—12 inches thick
    - New geotextile cushion—12 ounces per square yard
    - New HDPE liner—60 mil thick
    - New geotextile cushion—16 ounces per square yard
    - Existing Poz-o-Pac—12 inches thick
- Ash Pond 2 (see Figure 5-2 for a typical construction cross-section)
  - Originally constructed in 1978 with the following layers (from top to bottom)[77]
    - Bituminous seal coat
    - Poz-o-Pac—12 inches thick
    - Compacted granular material—12 inches thick
  - Relined in 2008 under IEPA WPCP No. 2007-EB-4091 with following layers (from top to bottom):[78]
    - New crushed limestone warning layer—6 inches thick
    - New sand cushion layer—12 inches thick
    - New geotextile—12 ounces per square yard
    - New HDPE liner—60 mil thick
    - New geotextile cushion—16 ounces per square yard

[73] "Typical" is a term of engineering practice that identifies the construction features that are most commonly observed; in this case, throughout the pond.

[74] Schwartz, 2005

[75] The density of Poz-o-Pac is 136.9 pounds per cubic foot. (MWG13-15_30-32)

        - Existing Poz-o-Pac—12 inches thick

- Ash Pond 3 (see Figure 5-3 for a typical construction cross-section)
    - Originally constructed in 1978 with the following layers (from top to bottom):[79]
        - Bituminous seal coat
        - Poz-o-Pac—12 inches thick
        - Compacted granular material—12 inches thick
    - Relined in 2013 under IEPA WPCP No. 2013-EB-1191 with following layers (from top to bottom):[80]
        - New crushed limestone warning layer—12 inches thick
        - New sand cushion layer—24 inches thick
        - New geotextile cushion—16 ounces per square yard
        - New HDPE liner—60 mil thick
        - New geotextile cushion—16 ounces per square yard
        - Existing Poz-o-Pac—12 inches thick
- Generally, bottom ash is conveyed across the Des Plaines River to a permitted landfill on the south side of the Des Plaines River.[81] Prior to October 12, 2015, a small fraction of the bottom ash (approximately 5 to 10 percent) was pumped into Ash Pond 1 or 2 for settling when the conveyor system requires maintenance.[82] Ash Ponds 1 and 2 were dredged every one to two years, and the ash is disposed off-site.[83] Ash Pond 1 was taken out of service as of October 12, 2015; Ash Pond 2 is still in service.[84] Ash Pond 3 is used as a finishing pond for the effluent and is considered to receive a *de minimus* amount of ash.[85] (See Section 4.1.2.)
- Joliet #29 is planned to be converted to natural gas fuel combustion. Ash Pond 1 has been emptied of ash as of October 12, 2015 and is no longer in service.[86] Ash Pond 2 will remain

in service until the station is converted to natural gas fuel combustion in Spring 2016.[87] Thereafter, it is anticipated that Ash Pond 2 will be decommissioned.[88]

#### *5.3.2.2. Powerton Active Ash Pond Liners*

The following summarizes information regarding ash pond history and construction elements:

- Ash Surge Basin (see Figure 5-4 for a typical construction cross-section)
  - Originally constructed in 1978 with the following layers (from top to bottom)[89]
    - Bituminous seal coat
    - Poz-o-Pac—12 inches thick on the bottom
    - Compacted granular material—thickness not specified
    - Additionally, a Hypalon® liner was installed on the sides[90]
  - Relined in 2013 under IEPA WPCP No. 2013-EB-1213 with following layers (from top to bottom):[91]
    - New crushed limestone warning layer—6 inches thick
    - New sand cushion layer—12 inches thick
    - New geotextile—16 ounces per square yard
    - New HDPE liner—60 mil thick
    - New geotextile cushion—16 ounces per square yard
    - Existing Poz-o-Pac—12 inches thick
  - The Ash Surge Basin is the primary ash basin for Powerton. Ash is removed from the basin every six to eight years.[92]
- Secondary Ash Settling Basin (see Figure 5-5 for a typical construction cross-section)
  - Prior to the 2013 relining, the Secondary Ash Settling Basin had a Hypalon® liner.[93]
  - Relined in 2013 under IEPA WPCP No. 2013-EB-1065 with following layers (from top to bottom):[94]

---

[93] Mark Kelly Deposition, p. 26-27
[94] MWG13-15_34158-34267

        - New crushed limestone warning layer—6 inches thick
        - New sand cushion layer—12 inches thick
        - New HDPE liner—60 mil thick
        - New geotextile—16 ounces per square yard
        - New sand layer—12 inches thick
        - Underdrain system that removed groundwater during construction and can be used during pond cleanout.
    - The Secondary Ash Settling Basin is considered a low volume ash pond because historically it received approximately 3 feet of ash in approximately 30 years.[95]
- Metal Cleaning Basin (see Figure 5-6 for a typical construction cross-section)
    - Originally constructed in 1978 with the following layers (from top to bottom):[96]
        - Bituminous seal coat
        - Poz-o-Pac—12 inches thick
        - Hypalon® liner along the sloped sides[97]
        - Compacted granular material—12 inches thick
    - Relined in 2010 under IEPA WPCP No. 2009-EB-2748 with following layers (from top to bottom):[98]
        - New crushed limestone warning layer—6 inches thick
        - New sand cushion layer—12 inches thick
        - New geotextile—12 ounces per square yard
        - New HDPE liner—60 mil thick
        - New geotextile—16 ounces per square yard
        - Existing Poz-o-Pac—12 inches thick
    - The Metal Cleaning Basin is not a part of the ash sluice system. It is used during outages for collection of fly ash from high-pressure blasting on the external part of tubes, and as a temporary lay-down area during cleanouts at Powerton. The ash is removed annually.[99]
- Bypass Basin (see Figure 5-7 for a typical construction cross-section)

- Prior to the 2010 relining, the Bypass Basin was lined on the sides with Hypalon® and lined on the bottom with Poz-o-Pac.[100]
- Relined in 2010 under IEPA WPCP No. 2010-EB-0664 with following layers (from top to bottom):[101]
  - New crushed limestone warning layer—6 inches thick
  - New sand cushion layer—12 inches thick
  - New geotextile—12 ounces per square yard
  - New HDPE liner—60 mil thick
  - New geotextile—16 ounces per square yard
  - Prepared subgrade—thickness not specified
- The Bypass Basin only receives ash when Powerton is emptying the Ash Surge Basin.[102] The Bypass Basin is emptied every six to eight years. [103]

#### *5.3.2.3. Waukegan Active Ash Pond Liners*

The following summarizes information regarding ash pond history and construction elements:

- West Ash Pond (see Figure 5-9 for a typical construction cross-section)
  - Originally constructed in 1977 with a Hypalon® liner.[104]
  - Relined in 2004 with following layers (from top to bottom):[105]
    - New crushed limestone warning layer—6 inches thick
    - New sand cushion layer—12 inches thick
    - New HDPE liner—60 mil thick
    - Prepared subgrade—thickness not specified
- East Ash Pond (see Figure 5-8 for a typical construction cross-section)
  - Originally constructed in 1977 with a Hypalon® liner.[106]
  - Relined in 2003 with following layers (from top to bottom):[107]

---

- New crushed limestone warning layer—6 inches thick
- New sand cushion layer—12 inches thick
- New HDPE liner—60 mil thick
- Prepared subgrade—thickness not specified

#### *5.3.2.4. Will County Active Ash Pond Liners*

The following summarizes information regarding ash pond history and construction elements:

- Ash Pond 2S (see Figure 5-10 for a typical construction cross-section)
  - Originally constructed in 1977 with the following layers (from top to bottom):[108]
    - Bituminous seal coat
    - Poz-o-Pac—36 inches thick
  - Relined in 2013 under IEPA WPCP 2008-EB-1166 with following layers (from top to bottom):[109]
    - New crushed limestone warning layer—6 inches thick
    - New sand cushion layer—12 inches thick
    - New geotextile—12 ounces per square yard
    - New HDPE liner—60 mil thick
    - New geotextile cushion—16 ounces per square yard
    - Existing Poz-o-Pac—30 inches thick
    - Additionally, the sides of the basin have a concrete geocell to further protect the liner.
- Ash Pond 3S (see Figure 5-11 for a typical construction cross-section)
  - Originally constructed in 1977 with the following layers (from top to bottom):[110]
    - Bituminous seal coat
    - Poz-o-Pac—36 inches thick
  - Relined in 2009 under IEPA WPCP 2008-EB-1166 with following layers (from top to bottom):[111]
    - New crushed limestone warning layer—6 inches thick

- New sand cushion layer—12 inches thick
- New geotextile—12 ounces per square yard
- New HDPE liner—60 mil thick
- New geotextile cushion—16 ounces per square yard
- Existing Poz-o-Pac—30 inches thick

- Ash Pond 2S and 3S alternate receiving bottom ash (only one pond is in ash service at a time).[112]

#### *5.3.2.5. The Pond Liners are Consistent with Remediation-Industry-Accepted Approaches*

I reviewed the pond construction information and compared it to remediation-industry guidance documents for liners. It is my opinion that the current pond liners are consistent with remediation-industry-accepted approaches.

USEPA's Guide for Industrial Waste Management (2012) provides technical considerations for employing liner systems where needed to protect groundwater from contamination and includes the selection of geomembranes, such as HDPE liners, to ensure that the liner system will function as designed. Liners have been studied extensively for purposes of designing landfills and ponds and evaluating leaching rates through the liners. Use of numerical models is common practice for estimating the rates of infiltration through soils, waste and liners, and a 60-mil thick HDPE is appropriate for the design of ash ponds (USEPA, 2012).

Overlying fill layers are typically a material that drains like sand, such that placement of materials over the liner avoids puncturing or tearing (USEPA, 2012). Cushion geotextiles are also often used to protect geomembranes against puncture (NAS, 2007). Thus, for purposes of potentially coarser subgrade materials where a composite liner is not constructed, my opinion is that a subgrade cushion, as used by MWG, is an appropriate method to protect against subgrade punctures.

Basin maintenance activities are anticipated to have potential loads and stresses associated with heavy construction equipment above the HDPE liners. Evaluation of the overburden stress on a geomembrane can be calculated using the methods and equations of Narejo and Corcoran

[112] Rebecca Maddox Deposition p. 18

(1996). NRT calculated the overburden stresses on behalf of MWG and found that the resulting stress on HDPE with 18 inches of soil cover would be within the range of conservative design standards.[113]

#### *5.3.2.6. Construction Quality Assurance and Quality Control*

Construction quality assurance (CQA) for HDPE geomembrane liners follows two classes of protocols: (1) material testing, installation quality control, and finished product destructive testing; and (2) non-destructive electrical leak location surveys after liners have been installed and covered with a protective material (Darilek and Laine, 2001). Electrical leak location surveys at the completion of liner installation discover more leaks than testing-based protocols because they are conducted after all potential construction damage has occurred but also prior to placement of overlying materials such as protective materials or waste layers. When the electrical leak location survey is conducted after liner installation, the density of leaks discovered in 2.0 millimeter (approximately 79 mil) HDPE was 0.2 leaks per hectare (approximately 0.08 leaks per acre, or 1 leak per 12 acres) based on 170,190 square meters (approximately 42 acres) of liners that had CQA with electrical leak location surveys (Forget et al., 2005). The electrical leak location surveys identify leaks prior to the completion of all liner construction project, so identified leaks are repaired prior to completion of the liner construction project. In summary, when HDPE liners are installed with CQA, the numbers of liner defects or tears are significantly reduced from values cited by Kunkel. Furthermore, there was no correlation between the number of leaks and geomembrane thickness for liner systems (Forget, et al., 2005).

I reviewed the CQA documentation or a third party inspection report for the installation of HDPE liners for the following ash ponds:

- Joliet #29 Ash Ponds No. 1[114], No. 2[115], and No. 3[116]
- Powerton Ash Surge Basin[117], Secondary Ash Settling Basin[118], Metal Cleaning Basin[119], and Bypass Basin[120]
- Waukegan East and West Ash Ponds[121]

---

[114] MWG13-15_49362-49507
[115] MWG13-15_49362-49507
[116] MWG13-15_33867-33997
[117] MWG13-15_33998-34157
[118] MWG13-15_34158-34267
[119] MWG13-15_49099-49256
[120] MWG13-15_49099-49256
[121] MWG13-15_12827-12845

- Will County Ash Ponds 2S[122] ; additionally, I reviewed the specifications and construction notes for the Will County Ash Pond 3S relining project.[123]

The CQA for the above liner installations demonstrate a high level of quality because of the following reasons:

- The pond linings were designed by Natural Resource Technology, Inc., and inspected by Natural Resource Technology, Inc. for Joliet #29, Powerton, and Will County Stations, and inspected by KPRG for Waukegan.
- All relining construction was completed under a construction quality assurance protocol that included inspections by an independent third party.
- The liner installer inspected the subgrade and certified that it was acceptable for installation of the HDPE liner as discussed below.
- The inspections included traditional leak detection tests of welds and seams as the liner was installed.
- After completion of seaming and covering the liner with a sand cushion layer, the liner had an additional electronic leak detection survey of the surface conducted by a third party (Leak Location Services, Inc.).[124]
- Any defects that were discovered were repaired before ponds were placed in service.
- Each relining construction project was certified by the installer (CAAW Systems, LLC) as complying with the project drawings and specifications and manufacturer recommendations.
- At the Waukegan East and West Ash Ponds, an independent review of the liner quality assurance documentation was performed and found no evidence that leaks would be present below the surface water line of the pond. [125]

---

[122] MWG13-15_34268-34427

[123] MWG13-15_29165-29259; MWG13-15_34517-34550; MWG13-15_29023-29081; MWG13-15_29102-29104

[124] At the Powerton Secondary Settling Basin, an electronic leak detection survey was conducted prior to the placement of the sand cushion layer. At the Waukegan East and West Ash Ponds, an independent review of the liner quality assurance documentation was performed and found no evidence that leaks would be present below the surface water line of the pond.

[125] MWG13-15_12827-12845

#### *5.3.2.7. Operation and Maintenance is Being Conducted under Appropriate and Consistent Protocols*

I reviewed operation and maintenance activities for MWG's ash ponds and noted the following that demonstrate that these activities are being conducted under appropriate and consistent protocols.

- The operation of the ponds primarily includes maintaining water level controls in the ponds, daily inspections, groundwater monitoring, discharge monitoring, and removal of bottom ash. Weekly inspections of the ash ponds are now recorded by personnel.[126]
- Protocols are in place to conduct the daily operations that include utilization of experienced plant and corporate operations, engineering, and environmental management personnel. Depositions of Mr. Lux[127], Mr. Kelly[128], Ms. Maddox[129], Mr. DiCola,[130] and Mr. Veenbaas[131] indicated that, in summary, daily inspections of the ponds are completed and if any unusual conditions are observed, the shift supervisor is notified and the repairs are implemented.
- Protocols are in place with the ash cleanout contractors.
    - LaFarge North America, Inc. removes the ash from the Will County and Waukegan ash ponds. Pursuant to the contract, LaFarge must perform all services in a competent manner, in compliance with all standards for the services, and comply with all rules, policies, and procedures.[132] Moreover, in the recently executed contract, LaFarge employees and subcontractors must comply with all policies, procedures, and directives, to remove ash using methods to avoid damage to the liner and to make timely repairs when damage is observed. Thus, before every removal, LaFarge meets with its employees and subcontractors to discuss the best practices to remove the ash, identify all of the markers for the bottoms and edges of the basins, and describe the color of the warning layer. Moreover, equipment is used to remove ash primarily on and near the bottom where the liner is protected by the crushed stone and sand cushion layers and not on the side slopes where the geomembrane liner is exposed. Operators are instructed to stop excavating should

[126] MWG13-15_49756-49760; MWG13-15_50095-50148
[127] Christopher Lux Deposition, p. 41
[128] Mark Kelly Deposition, p. 87
[129] Rebecca Maddox Deposition, pp. 73, 145
[130] James DiCola Deposition, p. 114
[131] Frederick Veenbaas Deposition, p. 81
[132] MWG13-15_13032; MWG13-15_49679-49700

a hard layer be encountered that would indicate the protective layer. Additionally, LaFarge managers are onsite continuously during the removal to supervise work to avoid any damage to the liner systems. The protocol for managing incidents includes reporting to LaFarge supervisors followed by reporting to a supervisor at the station and to the station administration.[133]

- The Powerton personnel remove the ash from its ponds with its equipment and deposits the ash into trucks owned and operated by Capital Sales.[134] Prior to ash removal, the Powerton shift supervisor has a pre-work meeting to discuss the proper process of removing ash. In the meeting, the personnel supervisor reminds the personnel of the locations of the warning posts, the warning layer below the ash, and a description of the liner. Additionally, the personnel supervisor reminds each operator not to tear or damage the liner during removal. The protocol for managing incidents includes reporting to the personnel supervisor and to the Powerton Chemical Specialist who is responsible for conducting liner repairs.[135]
- The Joliet #29 contracts with an ash removal contractor on an as-needed basis using a competitive bidding process. The Joliet #29 ash removal project manager holds a kick-off meeting prior to starting work to discuss protocols for proper removal of ash. The meeting includes a description of the ponds, identification of the warning posts, the warning layer, and a description of the liner. The Station project manager inspects work throughout the ash removal process to confirm the work is acceptable. The protocol for managing incidents includes reporting to the Station project manager who would stop work that could cause damage to the liner. Ash would be removed from the vicinity of the damaged location. The Station project manager is responsible for conducting liner repairs.[136]

A demonstration of the effectiveness of the operations protocols is the fact that tears or damages to the HDPE liners have been detected based on inspections and promptly repaired as soon as weather conditions allowed. I reviewed tears or damages that have occurred as of September 2015, and observed that all tears were above the water line of the pond or occurred when the water had been

[133] Teleconference with Mitch Nowicki
[134] Deposition of Mark Kelly, p. 61
[135] Teleconference with Mark Kelly; MWG13-15_48636-48639
[136] Teleconference with Harrison Estepp

drained from the pond.[137] Tears above the water line occurred more frequently because of exposure to mechanical equipment at the facilities. Tears below the water line were not observed are not likely given the documented longevity of HDPE liners and because the areas are protected from exposure to equipment. There is no evidence that the liners are deficient or that infrequent liner tears are a source of groundwater impacts.

## 5.4. Groundwater Monitoring is Appropriate to Demonstrate that Groundwater Exposure Pathways are Mitigated

Groundwater monitoring is appropriate to demonstrate that groundwater exposure pathways are mitigated and to assess the remedial approach. MWG has specified groundwater monitoring programs for each facility. Groundwater monitoring consulting professionals at KPRG are regularly tracking groundwater conditions, and the results are reported to the IEPA. The results during the period of record show that the groundwater exposure pathways are consistently mitigated, and there is no evidence that further remedial action is required.

## 5.5. Recent Groundwater Concentrations are Not the Result of Ash Stored in Lined Ponds

I reviewed recent groundwater monitoring data to identify if theoretical leaks of leachate through possible liner defects (as posited by Mr. Kunkel) could be impacting groundwater at the subject sites. It is my opinion that the groundwater concentrations are not the result of leakage from the HDPE-lined ponds.

### 5.5.1. Typical Characteristics of Leachate for the Ash Stored in Ponds at the Sites

I reviewed the characteristics of leachate that are typical for the ash currently stored in ponds at the sites and selected appropriate constituent indicators. The characteristics of ash leachate are based on site-specific impounded ash data (Section 5.5.1.1) or on published leachate data from ponds of subbituminous CCR sourced from the Powder River Basin (PRB) in Wyoming that is the source of coal for the Plants (Section 5.5.1.2). I reviewed the data, and constituent indicators for leachate from ash currently stored in ponds include at a minimum: barium, boron, and sulfate, and at a maximum: antimony, arsenic, barium, boron, cadmium, chromium, cobalt, copper, manganese, nickel, selenium, silver, sulfate, and zinc (Section 5.5.1.3).

[137] MWG13-15_48563, KPRG 2005c, MWG13-15_11574, 11581, Veenbaas Deposition, p. 78-79,87-90, MWG13-15_14177, Maddox Deposition, p. 94-95, MWG13-15_48636-48639

#### 5.5.1.1. Site-Specific Data and Discussion of Leachate Characteristics for Ash Stored in Site Ponds

Four samples of bottom ash from ponds at Powerton, Waukegan, and Will County were collected between 2004 and 2010 and characterized for leaching under neutral pH conditions (see Table 5-1). ASTM D3987-85 provides a standard test method for the leaching of materials to obtain an aqueous solution under specified testing conditions, including neutral pH of 7 (ASTM, 1985). Analytical neutral leachable procedure (NLET) results for these four bottom ash ponds show metals, sulfate, and total dissolved solids. The following analytes have been detected in bottom ash neutral leaching samples from the ponds:

- barium at concentrations up to 0.27 mg/L, which are less than the IEPA Class I groundwater standard of 2.0 mg/L;
- boron at concentrations up to 2.0 mg/L, which are equal to or less than the IEPA Class I groundwater standard of 2.0 mg/L;
- sulfate at a concentration of 49 mg/L, which is less than the IEPA Class I groundwater standard of 400 mg/L; and
- total dissolved solids at a concentration of 200 mg/L, which is less than the IEPA Class I groundwater standard of 1,200 mg/L.

The analytical results for bottom ash neutral leaching samples from the ponds can be extended to all the site ponds because all bottom ash at all of the four MWG generating stations is from the combustion of coal sourced from the PRB in Wyoming. The analytical results for bottom ash neutral leaching samples show that the leachate in ponds does not have the potential to cause groundwater impacts above IEPA Class I groundwater standards.

#### 5.5.1.2. Published Leachate Data from CCR Ponds for Subbituminous Coal

I identified a report that published leachate data from CCR ponds for subbituminous coal, which is characteristic of coal sourced from the PRB in Wyoming that is the source of coal for the Plants.[138] Analyses for leachate samples from existing CCR facilities were characterized in an Electric Power Research Institute (EPRI) report (EPRI, 2006). The EPRI leachate results for leachate from other facility ponds containing CCR from subbituminous/lignite coal sources are summarized in Table 5-2.

[138]MWG13-15_12847

#### *5.5.1.3. Constituent Indicators for Leachate from Ash Stored in Ponds*

Because there are differences between the set of constituents that leach based on site-specific data and published leachate data, I developed two sets of constituent indicators for leachate from ash currently stored in ponds. The first set is the minimum set of constituent indicators that would be expected under neutral conditions. This minimum set of constituent indicators is defined as the constituents that were observed in NLET analyses of bottom ash stored in site ponds. The second set is the maximum set of constituent indicators that may be expected based on other facility leachate data published by EPRI (2006). This maximum set of constituent indicators is defined as all constituents observed in analyses of leachate samples from other facility ponds containing CCR from subbituminous/lignite coal sources (see Table 5-2).

I reviewed the summary of leachate data in Table 5-3, and constituent indicators for leachate from ash currently stored in ponds include at a minimum: barium, boron, and sulfate, and at a maximum: antimony, arsenic, barium, boron, cadmium, chromium, cobalt, copper, lead, manganese, mercury, nickel, selenium, sulfate, and zinc.

### 5.5.2. Recent Groundwater Concentrations do Not Match Constituent Indicators for Leachate from Ash Stored in Ponds

I compared the occurrence of constituents during groundwater monitoring events in the most recent year, 2014, to the minimum and maximum sets of constituent indicators of leachate from ash currently stored in ponds. Conceptually, if all the constituents detected in groundwater samples from a monitoring well match the constituents detected in leachate from ash currently stored in ponds, and if constituents *not* detected in groundwater samples match the constituents *not* detected in leachate from ash currently stored in ponds, then it would be probable that leachate from ash currently stored in ponds is impacting groundwater. To evaluate whether or not groundwater concentrations match leachate constituent indicators, I calculated the percentage of constituents detected at each groundwater monitoring well that match constituent indicators of leachate from ash currently stored in the ponds ("matching percentages"). I restricted my analysis to the most recent full year of groundwater monitoring, 2014, to account for seasonal variations in constituent concentrations and to reflect groundwater concentrations after MWG's pond relining and pond decommissioning had been completed.

In summary, if the constituents match then it is likely that the leachate from the ash is impacting the groundwater. If the constituents *do not* match then it is likely that the leachate *is not* impacting the groundwater.

My results are tabulated in Tables 5-4 and 5-5 and are summarized as follows:

- At Joliet #29, the percentage of constituents at groundwater monitoring wells that match constituent indicators of leachate from ash currently stored in the ponds ranges from
    - 11 percent to 37 percent based on the minimum set of indicators, and
    - 37 percent to 53 percent based on the maximum set of indicators.
- At Powerton, the percentage of constituents at groundwater monitoring wells that match constituent indicators of leachate from ash currently stored in the ponds ranges from
    - 5 percent to 37 percent based on the minimum set of indicators, and
    - 32 percent to 58 percent based on the maximum set of indicators.
- At Waukegan, the percentage of constituents at groundwater monitoring wells that match constituent indicators of leachate from ash currently stored in the ponds ranges from
    - 16 percent to 26 percent based on the minimum set of indicators, and
    - 42 percent to 58 percent based on the maximum set of indicators.
- At Will County, the percentage of constituents at groundwater monitoring wells that match constituent indicators of leachate from ash currently stored in the ponds ranges from
    - 21 percent to 37 percent based on the minimum set of indicators, and
    - 37 percent to 53 percent based on the maximum set of indicators.

The low matching percentages demonstrate that there are substantial and widespread mismatches between the characteristics of recent groundwater analyzed near the ash ponds and the characteristics of leachate from ash currently stored in the ash basins. Thus, it is my opinion that the recent groundwater impacts are not a result of the ash currently stored in ponds at the sites, but instead are more likely than not a result of historical uses at the sites and the surrounding industrial companies and conditions.[139]

[139] IEPA, 2015 and MWG13-15_29975-29776.

## 5.6. Groundwater Conditions Do Not Pose Risks to Surface Water Receptors Based on a Risk Screening Assessment

### 5.6.1. Overview

I worked with my staff to develop an appropriate methodology to assess the exposure to surface waters from groundwater impacts at the sites. We assessed the potential for human health and ecological risks from an assumed exposure to constituents of interest (COIs) in groundwater associated with each of the four sites that may migrate to surface water. These evaluations are conservative as they assume a complete exposure pathway exists between groundwater COIs and receptors in the adjacent surface water bodies, and do not fully analyze attenuation or dilution mechanisms. The screening assessment also considers background and upgradient source COIs that are not from the ponds, thereby overestimating the risk from the pond operations. It is my opinion that groundwater conditions do not pose risks to surface water receptors based on the risk characterization included in Appendix B and described below.

### 5.6.2. Definition of Risk

"No unacceptable risks" means that the site-specific groundwater concentrations are less than Illinois Water Quality Standards (WQS) or Water Quality Criteria (WQC), which are considered to be protective of human health and the environment in surface water.[140] These WQS/WQC incorporate toxicological (i.e., cause-and-effect) data as well policy-based assumptions, including the state-determined acceptable risk level.

This evaluation includes a refinement step that considers the exceedance location (relative to other wells and receiving water bodies), magnitude, and frequency. If these lines of evidence support that "no unacceptable risks" are likely at the point-of-exposure (i.e., the lake or river), then it is concluded that there is an unlikely potential for risk.

### 5.6.3. Results of Risk Evaluation

The following summarizes the results of the evaluation. A complete evaluation is in Appendix B attached to this opinion.

Joliet #29: antimony, boron, manganese, and TDS do not pose unacceptable risks because concentrations are lower than WQS/WQC. Concentrations of chloride, sulfate, and iron

[140] WQS are defined in 35 IAC 302, Subpart B (Joliet #29, Powerton, and Will County) and E (Waukegan). WQC are derived by the IEPA under authority of 35 IAC 302, Subpart B.

exceeded WQS/WQC on occasion; however, further evaluation of site-specific conditions indicated an unlikely potential for risk from these COIs.

Powerton: boron, chloride, nitrate, selenium, sulfate, and TDS do not pose unacceptable risks because concentrations are lower than WQS/WQC. Concentrations of arsenic, iron, lead, manganese, thallium, and pH exceeded WQS/WQC on occasion; however, further evaluation of site-specific conditions indicated an unlikely potential for risk from these COIs.

Waukegan: the results of the risk evaluation are complicated by groundwater impacts at the Waukegan site, including groundwater impacts resulting from the migration of inorganic constituents from upgradient and offsite sources. Antimony and manganese do not pose unacceptable risks because concentrations are lower than WQS/WQC. Concentrations of arsenic, chloride, and pH exceeded WQS/WQC on occasion; however, further evaluation of site-specific conditions indicated an unlikely potential for risk from these COIs. Concentrations of boron, iron, sulfate, and TDS exceeded WQS/WQC in wells to the west and southwest of the ponds (MW-05 through MW-09). Importantly, there are no unacceptable risks for boron, iron, sulfate, and TDS in wells MW-01 through MW-04, which represent the most downgradient wells at the site (see Figure 4-4). MW-01 through MW-04 appear to be downgradient of MW-05, MW-06, MW-08, and MW-09, indicating attenuation is occurring. Although no wells are directly downgradient of MW-07, there is no data to indicate that similar attenuation is not occurring in this area.

Will County: antimony, boron, chloride, manganese, and TDS do not pose unacceptable risks because concentrations are lower than WQS/WQC. Concentrations of sulfate and pH exceeded WQS/WQC on occasion; however, further evaluation of site-specific conditions indicated an unlikely potential for risk from these COIs.

## 5.7. Historical Ash in Fill Materials Outside of the Ponds is Not Adversely Impacting Groundwater

Ash generated by coal combustion may be classified as coal combustion by-product (CCB) and used for purposes of fill material when there is beneficial use determined by IEPA (see Section 5.7.1). Current data obtained from recent ash samples and groundwater collected from multiple sites show that leachate from the historical ash in fill materials meets IEPA Class I groundwater standards based on leaching from a soil- like environment (see Section 5.7.2). It is my opinion that the current

conditions of the existing weathered ash are not contributing to groundwater exceedances at the four sites based on leaching analyses of actual ash fill at the sites.

### 5.7.1. Coal Ash may be Classified as Coal Combustion Byproducts to Allow Beneficial Use

Structural fill and import fill ("fill") at the sites was placed historically, as long as 38 years ago. Ash generated by coal combustion may be classified as CCB when there is beneficial use determined by IEPA as established in 415 Illinois Compiled Statutes 5/3.135. Although the current IEPA criteria were not applicable when the CCB was placed, it is analogous to compare the current condition of CCB to the current IEPA criteria. Additionally, the design and construction of coal ash structural fills is a standard practice, and procedures for using coal combustion products, including fly ash, bottom ash, and boiler slag, to achieve desired geotechnical properties are described in ASTM E2277-14 (2014). In my opinion, the presence of CCB outside of the pond areas is considered an acceptable use when compared to Illinois requirements and the standard ASTM practice.

### 5.7.2. Investigations of Potential Leaching Characteristics of Historical Ash in Fill Materials at Sites

Data obtained from recent samples of ash used as fill from multiple sites show that leachate from the ash in its current condition meets IEPA Class I standards based on leaching from a soil-like environment (NLET method). These data were obtained during a 2004 investigation at Powerton, a 2005 investigation at Joliet #29, and a 2015 investigation at Will County, as discussed further below. Based on these data, it is reasonable to conclude that historical ash areas at all four MWG sites are not a source of groundwater impacts. Significantly, there is no evidence to conclude, as Kunkel does, that the ash areas are a source.

#### *5.7.2.1. Joliet #29 Investigation*

On behalf of Midwest Generation, in June 2005 KPRG performed an investigation of historical ash in fill materials at the Joliet #29 site. This investigation included the collection of historical ash samples from 15 soil borings at the Joliet #29 site. Historical ash samples were analyzed using a neutral leachable procedure (NLET) for metals. KPRG's report found the following conclusions:[141]

- "The ash deposits are consistent and homogenous consisting of interlayered fly ash and bottom ash/slag from the coal combustion process."

[141] KPRG, 2005a

- "The NLET metals data from sample location GP-14A displayed elevated levels of lead and copper at concentrations at least two times higher than the Class I groundwater standard." This area was later further delineated and excavated (see below).
- "The NLET metals data from the remaining 16 sample locations indicate with a high degree of statistical certainty that the criteria established in 415 ILCS 5/3.135 (formerly 415 ILCS 5/3.94) a-5(B) are met and that the material may be considered CCB relative to this criterion...."[142]

A supplemental investigation was performed in the vicinity of GP-14A in November 2005. Eight additional historical ash samples were collected from soil borings and analyzed using NLET for metals. The June 2005 and November 2005 samples were used to delineate the extent of excavation in the vicinity of GP-14A. Approximately 1,062.88 tons of fill material containing historical ash was excavated and disposed off-site at a landfill during the week of November 21, 2005. The excavation was backfilled using surficial materials near the excavation area. Following the excavation, the historic ash in the area met the CCB criteria under 415 ILCS 5/3.135.[143]

Thus, it is my opinion that leachate from historical ash in fill materials at Joliet #29 is not adversely impacting the groundwater.

#### *5.7.2.2. Powerton Investigation*

On behalf of MWG, Andrews Environmental Engineering, Inc. (AEEI) performed an investigation in May 2004 of historical ash in fill materials at Powerton[144]. A total of eight historical ash samples were collected from test pits in the Limestone Runoff Basin. Samples were analyzed for NLET metals using ASTM D3987-85. Selenium was detected in two NLET samples and chromium was detected in one NLET sample at concentrations greater than the IEPA Class I groundwater standards. All other metals in the NLET results from the eight ash samples were less than the IEPA Class I groundwater standards.

I reviewed selenium and chromium concentrations in groundwater at Powerton, and only selenium was detected at one location (MW-14) above IEPA Class I groundwater standards during the period of record.[145] Groundwater concentrations measured during the most recent full year of

[142] Of the remaining 16 sample locations, 14 sample locations were located at Joliet #29.
[143] KPRG, 2005c
[144] AEEI, 2004
[145] MWG13-15_48711-48843

quarterly groundwater monitoring in 2014 were all below IEPA Class I groundwater standards, indicating no impacts of selenium or chromium. Thus, it is my opinion based on this analysis, that leachate from historical ash in fill materials at Powerton is not adversely impacting the groundwater.

#### *5.7.2.3. Will County Investigation*

On behalf of MWG, KPRG performed an investigation in June and August 2015 of historical ash in fill materials at Will County.[146] This investigation included the collection of 20 historical ash samples from 20 soil borings at the Will County site. Historical ash samples were analyzed using a neutral leachable procedure (NLET) for metals. KPRG's report documented the following conclusions:

- "The ash deposits are consistent and homogenous consisting bottom ash/slag from the coal combustion process."
- "There were no outlier samples, and all samples collected were used in the calculations."
- "The NLET metals data from the 20 sample locations indicate with a high degree of statistical certainty that the criteria established in 415 ILCS 5/3.135 (formerly 415 ILCS 5/3.94) a-5(B) are met and that the material may be considered CCB relative to this criterion for engineering/beneficial reuse."
- "The data set is sufficiently large to support the statistical evaluations based on the variance and specific regulatory threshold relationships."

Thus, it is my opinion that leachate from historical ash in fill materials at Will County is not adversely impacting the groundwater.

## 5.8. Bottom Ash in Inactive Ponds is Not a Source of Groundwater Concentrations

Data obtained from recent samples of bottom ash accumulated in ash ponds from multiple sites show that leachate from the bottom ash meets IEPA Class I standards based on leaching from the pond environment (NLET) (see Section 5.5.1.1). Based on these data, it is reasonable to conclude that bottom ash accumulated in inactive ash ponds are not a source of groundwater concentrations.[147]

---

[146] KPRG, 2015

[147] The Will County inactive ash ponds 1N and 1S have been modified to prevent more than one foot of standing water. This pond modification will reduce the volume of potential leachate at the Will County inactive ash ponds.

## Section 6: Opinion 2—The Remedial Approach Provided in the Kunkel Remedy Report is Not Warranted

It is my opinion that the remedial approach in the Kunkel Remedy Report, which is removal of all CCRs and the ash ponds, is not warranted because:

1. the concentrations of COIs that have been observed in groundwater around the ponds are low, such that MWG's remedial approach to protect human health and the environment is in accordance with Illinois standards (Section 6.1);
2. the bottom ash indicator constituents from leachate do not match the groundwater chemistry, indicating that the constituents in groundwater are not from the ponds, the ponds are functioning in accordance with the design, and the ponds do not need to be removed (Section 6.2), and
3. there is no evidence that coal ash currently outside of the ash ponds is a source of groundwater impacts (Section 6.3).

Further, Kunkel did not follow the Illinois procedures his opinions concerning remedial activities. After the completion of a site investigation, groundwater and soil remediation objectives would need to be developed that consider exposure routes and would be protective of human health and the environment. The selection of remedial technologies needs to consider the feasibility of implementation, whether the technologies will perform satisfactorily and reliably, and whether remediation objectives will be achieved within a reasonable period of time (Section 6.4).

I also found many inaccuracies in the Kunkel Report on Ground-Water Contamination that, in general, portray conditions that imply that groundwater is more threatened than is actually supported by the data.

The following is provided in support of Opinion 2:

- Ash ponds are for wastewater treatment purposes and are not landfills for permanent ash disposal (Section 6.5.1).
- Ash ponds are lined with 60-mil HDPE, which is the accepted standard of the ash pond lining industry. Further, the liner construction quality is consistent with the ash pond lining quality management standards for long-term use based on available construction documentation. (Section 6.5.2)

- O&M of the ash ponds are conducted in accordance with consistent operating protocols. (Section 6.5.3)
- Kunkel incorrectly concludes that all of the former ash ponds leaked and the current ash ponds are leaking. He asserts that the groundwater elevations are above the bottom of the ponds or pond water surface and in turn causing bottom heave. His analysis is incorrect on several bases. First, an uplift pressure argument is relative to the top of the bottom liner. Second, an uplift argument is an issue for soil liners, not geomembrane liners that are at all of the ponds. Third, groundwater levels are rarely above the top of the bottom liners and when they are above the bottom liner there are other opposing forces or controls to eliminate uplift. (Section 6.5.4)
- In addition to errors in Kunkel's groundwater elevation analysis, Kunkel fails to consider the weight of the Poz-o-Pac liner (where present), sand cushion, and limestone warning layers. An appropriate hydrostatic uplift calculation should include at a minimum the weight of sand cushion layers and limestone warning layers that provide downward forces that counteract the upward hydrostatic uplift force. The presence of bottom ash and pond water provide further downward forces that counteract the upward hydrostatic uplift force. (Section 6.5.5)
- Groundwater mounding that the Kunkel Groundwater Contamination Report concluded was an indication of an ongoing leak has not been observed at Joliet #29 monitoring well MW-9. Kunkel alleges that mounding is occurring at Joliet 29 because the groundwater elevation in downgradient MW-9 is higher than upgradient MW-8. However, the majority of the data show that the average water level in MW-9 is lower than MW-8. (Section 6.5.6)
- Kunkel incorrectly portrays background concentrations by using state-wide data for groundwater at the Joliet #29, Waukegan, and Will County sites. It is my opinion that this approach is inappropriate and fails to account for those sites where upgradient groundwater is impacted prior to migrating on-site. (Section 6.5.7)

## 6.1. MWG's Remedial Approach to Protect Human Health and the Environment is in Accordance with Illinois Standards

Kunkel states that his professional analyses and opinions have an "emphasis on remedy options which, if implemented, would stop or minimize the continuing ground-water contamination

from MWG's ash ponds and/or other coal ash disposal areas at the four power plant sites."[148] Kunkel alleges that "[t]he remedy for continued long-term ground-water contamination at the four power plant sites is removal of the leaking ash ponds as well as all or a portion of the coal ash which has been deposited outside the ash ponds. The conclusions in my previous report ([Kunkel Groundwater Contamination Report]) form the bases for this remedy report."[149]

I conclude that further source remediation is not warranted. Observed COI concentrations in groundwater around the ponds are low, such that MWG's remedial approach to protect human health and the environment is in accordance with Illinois standards.

- Bottom ash indicator constituents from leachate do not match the groundwater chemistry (see Section 5.5).
- There is no evidence that historical ash in fill materials outside of the ash ponds is a source of groundwater impacts based on leaching analyses of the existing weathered ash in fill materials and observed groundwater concentrations (see Section 5.7.2).
- Administrative controls eliminate the completion of the groundwater ingestion pathway and dermal exposure pathway (see Section 5.2).
- Groundwater conditions do not pose unacceptable risks to surface water receptors (see Section 5.6).

## 6.2. Bottom Ash Indicator Constituents from Leachate Do Not Match the Groundwater Chemistry

Kunkel alleges that boron, sulfate, and manganese are valid indicators of groundwater contamination because "EPRI and IEPA deem them to be of concern at all four of the power plant sites and they are typically present in high concentrations in coal ash leachate...." However, the sources cited by Kunkel (EPRI, 2012; Kosson, 2009; and IEPA, 2010) are not specific to the four MWG sites. As demonstrated in Section 5.5.1.3, constituent indicators for leachate from ash currently stored in ponds include at a minimum: barium, boron, and sulfate, and at a maximum: antimony, arsenic, barium, boron, cadmium, chromium, cobalt, copper, manganese, nickel, selenium, silver, sulfate, and zinc. In order to compare the constituents in the ponds with the groundwater conditions, a more complete selection of constituent indicators should be used.

[148] Kunkel Remediation Report, Page 2
[149] Kunkel Remediation Report, Page 2

Kunkel includes removal of the ash ponds as part of his remedy and alleges that "[p]oor liner construction is an initial cause of liner defects which results in leaking ponds and release of contaminated fluids into the underlying ground water."[150] This allegation would imply that recent groundwater concentrations would be substantially impacted by the leachate from bottom ash currently stored in ash ponds. If this were true, constituents that are indicator chemicals for the ash currently stored in ash ponds would match the constituents actually observed in groundwater near the ponds. However, bottom ash indicator constituents from leachate do not match the groundwater chemistry (see Section 5.5). Thus, constituents in groundwater are not from the ponds and the ponds are functioning in accordance with the design.

I conclude that the ponds do not need to be removed.

## 6.3. There is No Evidence That Historical Coal Ash Outside of the Ash Ponds is a Source of Groundwater Impacts

Kunkel's proposed remedy includes removal of coal ash historically deposited outside the ash ponds, which includes coal ash "utilized in the construction of roadways, pond dikes and also for general land leveling at all four power plants."[151] He further states, without supporting data, that "[t]his coal ash is subject to leaching by rainfall and snowmelt, rising and falling ground-water levels, and this leachate is transported downward causing contamination of the ground water."[152] However, Kunkel's remediation approach is inconsistent with construction practices in Illinois and ASTM standards. The appropriate approach in Illinois for the evaluation of ash used beneficially as fill is to conduct leaching evaluations on actual fill at the sites (see Section 5.7.1). There is no evidence that historical ash in fill materials outside of the ash ponds is a source of groundwater impacts based on leaching analyses of the existing weathered ash in fill materials and observed groundwater concentrations (see Section 5.7.2). I conclude that there is no evidence supporting Kunkel's allegation that leachate from ash used as fill is causing groundwater contamination.

[150] Kunkel Remediation Report, Page 2
[151] Kunkel Remediation Report, Page 2
[152] Kunkel Remediation Report, Page 2

## 6.4. Kunkel did Not Follow the Illinois Procedures for Investigative and Remedial Activities

Kunkel alleges that "adequately addressing the contamination at the four sites requires the complete removal of the existing ash ponds and selected areas of coal ash deposited outside the ash ponds as the remedy. Coal ash from the ash ponds, coal ash used in construction activities at each site and the coal ash deposited on the ground surface outside the existing ash ponds must be placed in an appropriate landfill for the four MWG power plant sites."[153] However, Kunkel did not follow the Illinois procedures for the investigative and remedial activities. After the completion of a site investigation, groundwater and soil remediation objectives would need to be developed that consider exposure pathways and would be protective of human health and the environment. The selection of remedial technologies needs to consider the feasibility of implementation, whether the technologies will perform satisfactorily and reliably, and whether remediation objectives will be achieved within a reasonable period of time. Kunkel did not demonstrate that any of these steps were followed when he alleged that his proposed remedy is required.

- Removal of all ash from the sites is not feasible when all costs and site disruptions are considered (Section 7), and
- Ponds and historical ash are not sources of groundwater impacts (see Sections 5.3 and 5.5); thus removal of all ash will not achieve groundwater remediation objectives.

It is my opinion that Kunkel's remedy is inappropriate based on the Illinois procedures for investigative and remedial activities.

## 6.5. Responses to Specific Inaccuracies in Kunkel's report on Groundwater Contamination

I noted various inaccuracies in Kunkel's report on Ground-Water Contamination that imply that groundwater is more threatened than supported by the data. The following presents my responses to specific inaccuracies.

[153] Kunkel Remediation Report, Page 3

### 6.5.1. Ash Ponds are for Wastewater Treatment Purposes and are not Landfills for Permanent Ash Disposal

Kunkel alleges that there "has been and continues to be ground-water contamination from MWG's ash ponds and/or other coal ash disposal areas at the four power plant sites."[154] However, the ash ponds are not coal ash disposal areas as implied by Kunkel. The ash ponds are integral components of the wastewater treatment process for the generating facilities.[155] Furthermore, ash is routinely excavated and beneficially used off-site as evidenced in billing records from waste removal contractors, such as Lafarge.[156] It is my opinion that the vast majority of the potential for leachate from ash generated by the generating stations is appropriately managed by wastewater treatment using lined ash ponds and off-site disposal or beneficial reuse of the separated ash.

### 6.5.2. Ash Ponds are not Leaking and Construction Quality is Consistent with the Ash Pond Lining Quality Management Standards for Long-Term Use

Kunkel broadly alleges that at all four generating stations have "ash ponds whose liners have leaked and continue to leak due to poor liner construction techniques...."[157] However, Kunkel fails to provide evidence of the leaking for any of the ash ponds at any of the sites. Instead, Kunkel relies on an inapplicable study of other sites to assume leaks are occurring at the MWG ponds.[158] It is my opinion that the MWG ash ponds are not leaking because they are lined with 60-mil HDPE, which is the accepted standard of the ash pond industry. Further, the liner construction quality is consistent with the ash pond lining quality management standards for long-term use based on my review of construction quality assurance documentation. Specifically:

- The liner subgrades were inspected for sharp surfaces prior to installation of the HDPE liner and protective geotextile was installed below the HDPE liners to avoid the potential for puncture (see Section 5.3.2.5 and 5.3.2.6).
- The HDPE liners were inspected for leaks after installation of a protective sand cushion layer using the state of the practice electronic leak detection survey technologies (see Section 5.3.2.5 and 5.3.2.6).

---

[154] Kunkel Ground-Water Contamination Report, page 2.

[155] MWG13-15_16907-63; MWG13-15_18115-31; MWG13-15_24935-54; MWG13-15_10926-10947

[156] MWG13-15_36-65

[157] Kunkel Ground-Water Contamination Report, page 2.

[158] Kunkel cites Schroeder (1994), which does not consider the frequency of leaks when certain construction quality assurance protocols are followed. See Section 5.3.2.6 for applicable studies.

- Warning and cushion layers are installed above the HDPE liners to protect them from accidental contact and damage during future dredging operations (see Sections 5.3.2.1 through 5.3.2.5).
- The quality of construction was documented by an independent engineering firm that attested that the construction met the project drawings and specifications and manufacturer's recommendations (see Section 5.3.2.6).

Thus, I conclude that it is inaccurate to portray ash ponds as "continuing to leak" when there is no evidence that the current HDPE liners are leaking. Additionally, in my opinion, the CQA documentation indicates the HDPE liner construction is of high quality.

### 6.5.3. O&M of the Ash Ponds are Not Expected to Cause Leaks and O&M are Conducted in Accordance with Consistent Operating Procedures

Kunkel alleges that at all of the generating stations, ash pond have liners that "have leaked and continued to leak due to ... poor coal ash removal/maintenance practices...."[159] Furthermore, Kunkel alleges that "[r]elining the ash ponds will not reduce the potential for liner damage and subsequent liner leakage as long as dredging of coal ash continues as in the past."[160] However, I conclude that ash removal and maintenance practices are good, and O&M of the ash ponds are not expected to cause leaks based on my review of O&M documentation and practices. Specifically:

- Periodic dredging of settled bottom ash is carefully performed using excavators. If the excavator bucket were to encounter the stone warning layer, which is located over the protective layer, which in turn is located over the HDPE liner, it would be obvious to the operator who is expected to stop excavating. If the HDPE liner were encountered, white HDPE material would be visually observed in the bucket by the excavator operator who would stop work. Based on my review of the O&M documentation, damage of the HDPE liner below the water level during dredging has not been observed at any ash pond (see Section 5.3.2.7).
- Kunkel specifically alleges that "[a]sh pond dredging using heavy equipment likely will damage the plastic liners given the thin (1 ft thick) protective sand layer and 6-in thick warning layer on top of the liners. Typically, at least two feet or more of protective layer is

[159] Kunkel Ground-Water Contamination Report, page 2
[160] Kunkel Ground-Water Contamination Report, page 2

required on top HDPE if heavy equipment is utilized." However, Kunkel did not provide any load bearing analysis that the protective and warning layers would be insufficient for heavy equipment traffic loads. It is my opinion that the protective and warning layers are sufficient based on my review of the overburden stress analysis conducted by NRT for 18 inches of soil cover over the liner (see Section 5.3.2.5).

- Most tears observed in the ash pond liners have been above the impounded water surface (see Section 5.3.2.7). All tears were promptly repaired as allowed by favorable weather conditions. Tears above impounded water would not be expected to result in leaks. The only tear that was potentially below the water line occurred when no water was in the ash pond and was repaired prior to refilling water to the level of the tear in the ash pond.

### 6.5.4. Groundwater Elevations above the Bottoms of Ash Ponds are Temporary or Seasonal Conditions

Kunkel alleges that at Powerton, "...ash pond water surface elevations are periodically below ground-water table elevations..."[161]; at Waukegan, "...ash pond bottom liners are always below the surface-water elevations in Lake Michigan and also the ground-water table..."[162]; and at Will County, "Ground-water and Des Plaines River surface-water elevations are always above the bottom of the liners..."[163] These statements are misleading and inaccurate. First, an uplift pressure argument is relative to the top of the bottom liner. Second, an uplift argument is a potential issue for soil liners, not geomembrane liners that are at all of the ponds. Third, groundwater levels are not often above the top of the bottom liners and when they are above the bottom liner there are other opposing forces or controls to eliminate uplift.

Uplift pressure under a geomembrane liner is not an indication of failure. In the event that uplift pressures were to occur, the geomembrane would lift vertically out of position and would have to be inspected and repaired prior to service. This would only occur absent weight and pressure from pond materials (section 6.5.5), and has never been reported at any of the ponds.

To demonstrate the inaccuracy of Kunkel's uplift proposition, I evaluated the groundwater elevation and pond bottom data. The data show the following:

---

[161] Kunkel Ground-Water Contamination Report, page 3
[162] Kunkel Ground-Water Contamination Report, page 3
[163] Kunkel Ground-Water Contamination Report, page 4

- Joliet #29 Ash Ponds 1, 2, and 3—groundwater elevations in nearby monitoring wells have always been below the ash pond bottom elevations during the period of record.
- Powerton Ash Surge Basin: The groundwater elevations during the entire period of record at nearby monitoring wells MW-8, MW-11, MW-12, and MW-15 have been below the bottom liner elevation of 452.0 feet above MSL (see Figure 5-2).
- Powerton Secondary Ash Settling Basin: The groundwater elevations during the entire period of record at nearby monitoring well MW-6 have been below the bottom liner elevation of 440.0 feet above MSL (see Figure 5-3). The groundwater elevations at nearby monitoring well MW-7 have been above the bottom of the pond during only 2 of 16 quarterly groundwater monitoring events. However, the groundwater in this area can be controlled by the underdrain system that can relieve uplift pressures when the pond is dewatered and groundwater elevations are high.
- Powerton Metal Cleaning Basin: Groundwater elevations during the entire period of record at nearby monitoring wells MW-13, MW-14, and MW-15 have been below the bottom liner elevation is 457.5 feet above MSL (see Figure 5-4).
- Powerton Ash Bypass Basin: The groundwater elevations during the entire period of record at nearby monitoring wells MW-9 and MW-12 have been below the bottom liner elevation of 459.0 feet above MSL (see Figure 5-5)..
- Waukegan West and East Ash Ponds: Design documentation[164] has demonstrated that the bottom of the ponds is at approximately elevation 585.5 feet above MSL (see Figure 5-6). Groundwater elevations during the entire period of record at nearby downgradient monitoring wells MW-1 through MW- 4 and in upgradient monitoring well MW-5 were a minimum of 579.3 up to a maximum of 584.5 ft MSL which are all below the bottom of the ponds.
- Will County Ash Ponds 2 South and 3 South: The bottom liner elevation is 580.5 feet above MSL (see Figure 5-7). Groundwater elevations have been above the bottom of the pond during the period of record at nearby monitoring wells MW-5, MW-6, and MW-9, and monitoring well MW-10 during 6 of 16 quarterly groundwater monitoring events.

Therefore, groundwater levels are above the bottom liner at only three of the eight ponds which Kunkel claims have uplift pressures. However, for all ponds, the uplift pressures are offset

[164] MWG13-15_49285

by the weight of water in the ponds when they are full. For two ponds, uplift pressures are offset by the weight of overlying cushion and protective layers (See Section 6.5.5), and one pond has a groundwater underdrain to offset uplift pressures.

### 6.5.5. An Appropriate Analysis of Hydrostatic Uplift Involves Consideration of Counteracting Downward Forces

Kunkel alleges that at Powerton, "[a]sh pond water surface elevations are periodically below ground-water table elevations which likely has resulted, and will likely result in the future, in hydrostatic uplift and liner failure...."[165] Similarly, Kunkel alleges that at Waukegan, "ash pond bottom liners are always below ... the ground-water table which results in hydrostatic uplift pressures which likely has caused, and will likely cause in the future, liner leaks..."[166] Additionally, Kunkel alleges at Will County, "[g]round-water ... elevations are always above the bottom of the liners which likely has caused, and likely will cause in the future, hydrostatic uplift and liner failure." However, Kunkel does not support his allegations with any site-specific calculations or analysis.

In addition to errors in Kunkel's analysis (see Section 6.5.4), Kunkel fails to consider the weight of the Poz-O-Pac, sand cushion, and limestone warning layers. An appropriate hydrostatic uplift calculation should include at a minimum the weight of Poz-O-Pac, sand cushion layers, and limestone warning layers that provide downward forces that counteract the upward hydrostatic uplift force. The presence of bottom ash and wastewater provide further downward forces that counteract the upward hydrostatic uplift force. I calculated the following net resultant hydrostatic uplift forces present when only the pond liner system is present and nearby groundwater elevations are at a maximum. These calculations are for the three ash ponds where groundwater elevations are temporarily or seasonally higher than the bottom elevations and are summarized as follows:

- Powerton Secondary Ash Settling Basin: There is a net resultant uplift force when the pond is empty. This was demonstrated during pond relining when the Illinois River was at an unusually high level causing groundwater levels to rise, and in turn causing inflow into the excavations. The inflow was controlled by a drainage system. During cleanout, the drainage system is available to eliminate hydrostatic uplift. While the ponds are full, however, there

[165] Kunkel Ground-Water Contamination Report, page 3
[166] Kunkel Ground-Water Contamination Report, page 3

is no hydrostatic uplift because of the downward force of water which is 180 to 700 pounds per square foot (psf)[167], depending on the groundwater level.

- Will County Ash Pond 2S: Uplift force is entirely counteracted by the weight of the Poz-O-Pac, sand cushion, and limestone warning layers, with a net resultant downward force of 195 psf.
- Will County Ash Pond 3S: Uplift force is entirely counteracted by the weight of the Poz-O-Pac, sand cushion, and limestone warning layers, with a net resultant downward force of 195 psf.

### 6.5.6. Kunkel's Conclusion of Groundwater Mounding at Joliet #29 Monitoring Misrepresents Actual Groundwater Elevations

Kunkel alleges that at Joliet #29 "ash Pond 3 must have been leaking because the ground-water elevation in MW-9 was higher (505.66) than that in MW-8 (505.22) which is generally up-gradient from MW-9." However, I reviewed groundwater elevations measured at Joliet #29 monitoring wells MW-8 and MW-9 during the period of record between 2010 and 2014. Groundwater elevations at MW-8 were higher than groundwater elevations at MW-9 during 11 of 16 quarterly groundwater monitoring events (69 percent). Furthermore, the average groundwater elevation at MW-8, 505.67 feet above MSL, was higher than the average groundwater elevation at MW-9, 505.65 feet above MSL, during the period of record. Kunkel selected the largest value for the difference in groundwater elevations between MW-9 and MW-8 to prove a conclusion, yet the overall data do not support the conclusion.

The groundwater elevations across the approximately 18 acres of the site covered by the monitoring well network vary by 0.5 ft on average (see Table 4-1). The measurement accuracy of a typical groundwater level monitor is approximately 0.05 ft. It is my opinion that the accuracy of the readings combined with the narrow differences and variations of groundwater elevations indicate that any mounding would be too subtle to detect.

Therefore, it is my conclusion that the data do not show any mounding.

[167] Calculated based on normal pool elevation of 453 ft, average groundwater elevation of 441.5 ft and maximum groundwater elevation of 450 ft.

### 6.5.7. Kunkel's Conclusion of a Liner Leak at Waukegan is Actually an Expression of Surface Topography

Kunkel prepared groundwater contour maps and concluded that "The "ridge" in the ground-water contours at the ash ponds may indicate a liner leak in the west ash pond,...". I prepared a groundwater contour map (Figure 4-4) of data from May and June 2014 using the information from the Waukegan monitoring wells and ELUC wells. I conclude that the area where a "ridge" was shown in Kunkel's maps is more muted and simply a reflection of the ground surface topography which dips to the north, east and south from the area of the ash ponds. This groundwater "mirroring" of ground surface topography would be expected in an aquifer that is primarily granular (more permeable) material that responds relatively quickly to infiltration and lateral migration. The groundwater mirroring is consistent with the additional information that the ponds are not leaking.[168] (See 5.5.2).

### 6.5.8. Background Constituent Concentrations Should be Based on Contemporary Data from Upgradient Wells

Kunkel alleges that he compared measured groundwater quality concentrations to "site background water quality."[169] However, Kunkel instead relies on "specific Illinois ground-water quality data which are representative of background on a state-wide level" for Joliet #29, Waukegan, and Will County. It is my opinion that this approach is inappropriate and misrepresentative for sites where upgradient groundwater is impacted prior to migrating on-site (see Sections 4.2.1 and 4.3.1). In particular, Kunkel claims that "indicator pollutants in [Powerton] MW-16 are similar to the IEPA (2013) background network wells for sand and gravel aquifers." However, Kunkel limits his assessment to boron, manganese, and sulfate as the "indicator pollutants" and does not consider other constituents that also comprise background concentrations. It is my opinion that it is inaccurate to portray background concentrations at a state-wide level as representative of background at the sites where there are upgradient monitoring data.

An appropriate approach would be to evaluate background concentrations based on site specific data such as monitoring wells installed at the upgradient site boundaries in locations without the presence of ash materials in fill.

---

[168] IEPA, 2015 and MWG13-15_29775-29776

[169] Kunkel Ground-Water Contamination Report, page 7.

- Joliet #29—monitoring wells MW-8, MW-10, and MW-11 are near the upgradient site boundary, and the boring logs show that these three wells are not installed in ash fill. Groundwater quality at these three locations are not consistent:
    - MW-8 has historical exceedances of chloride and sulfate above IEPA Class I groundwater standards.[170]
    - MW-10 has historical exceedances of chloride above the IEPA Class I groundwater goal. [171]
    - MW-11 has historical exceedances of boron and chloride above IEPA Class I groundwater standards. [172]

  Thus, background groundwater concentrations at Joliet #29 reflect sources other than the ponds and historical ash fill based on site-specific data because monitoring wells near the upgradient site boundary exceed IEPA Class I groundwater standards prior to migrating below the ponds.

- Powerton—monitoring wells MW-1, MW-9, and MW-16 are near the upgradient site boundary, and the boring logs show that MW-1 and MW-16 are not installed within ash fill. The groundwater concentrations at MW-1 and MW-16 have historical exceedances for nitrate above the IEPA Class I goal and pH has historical exceedances that are both above and below the acceptable IEPA Class I range of goals. [173] MW-16 groundwater also detected barium, boron, chloride, and sulfate. MW-1 groundwater also detected barium, boron, chloride, fluoride, manganese, nitrate, and sulfate. MW-9 groundwater also detected barium, boron, chloride, fluoride, manganese, selenium, and sulfate. Thus, background concentrations at Powerton reflect sources other than the ponds and historical fill areas based on site-specific data because monitoring wells near the upgradient site boundary detect or exceed IEPA Class I groundwater standards prior to migrating below the ponds.
- Waukegan—monitoring wells MW-6 and MW-8 are near the upgradient site boundary, and the boring logs show that MW-6 is not installed within ash fill. An estimate of site-wide groundwater contours for the Waukegan site are provided on Figure 4-4. Groundwater concentrations at MW-6 have several historical exceedances for boron and manganese

[170] MWG13-15_48647-48710
[171] MWG13-15_48647-48710
[172] MWG13-15_48647-48710
[173] MWG13-15_48711-48843

above IEPA Class I groundwater standards.[174] Additionally, wells installed for the neighboring and upgradient ELUC, including ELUC MW-10, ELUC MW-11, ELUC MW-12, ELUC MW-14, and ELUC MW-15, show elevated levels for boron and manganese above IEPA Class I groundwater standards.[175] Thus, background concentrations at Waukegan reflect sources other than the ponds and historical fill areas based on site-specific data because monitoring wells near the upgradient site boundary exceed IEPA Class I groundwater standards prior to migrating below the ponds.

- Will County—shallow groundwater conditions at the Will County site are impacted by the Des Plaines River and the Chicago Sanitary and Ship Canal. Groundwater hydraulic gradients are confounded by surface water influences with some groundwater migrating toward the Des Plaines River and some groundwater understood to be migrating toward the Chicago Sanitary and Ship Canal. Thus, background concentrations at Will County cannot be established based on site-specific data. Additionally, due to the unique groundwater conditions at the Will County site, it is not appropriate to use background groundwater quality based on a state-wide level for the Will County site.

[175] MWG13-15_50086-50092

## Section 7: Opinion 3—Kunkel Underestimates the Costs to Implement the Unwarranted Cleanup

It is my opinion that the Kunkel Remedy Report significantly underestimates the cost of Kunkel's proposed cleanup to remove all ash ponds and all CCRs in fill at the plants.

- Kunkel's proposed remedy fails to incorporate the costs of disposal at a permitted landfill (see Section 7.1).
- Kunkel's proposed remedy does not account for significant and costly disruption at the generating plants (see Section 7.2).
- Kunkel's proposed remedy results in significant impacts to the surrounding communities, including dust, noise, and traffic (see Section 7.3). Of particular concern is the increased risk of vehicle crashes involving large trucks.
- Kunkel's proposed remedy fails to consider the impact of vehicle carbon dioxide emissions. I estimate the emissions from the large truck traffic to be on the order of 203,840,000 kilograms of carbon dioxide (see Section 7.4).

### 7.1. Costs of Soil Disposal at a Permitted Landfill

Kunkel's cost estimate for his proposed remedy includes the costs associated with excavation, hauling, and backfill. However, Kunkel fails to include the cost of soil disposal at a permitted landfill, which is essential to his proposed remedy. In my experience, the disposal cost for impacted soil has a unit price of approximately $20 per ton. Assuming a disposal cost of $20 per ton, and using the unit tonnage estimates provided by Kunkel, I estimated the disposal costs associated with Kunkel's proposed remedy as follows:

- Joliet #29—$14,000,000 (708,657 tons)
- Powerton—$93,000,000 (4,645,190 tons)
- Waukegan—$53,000,000 (2,661,395 tons)
- Will County—$18,000,000 (910,525 tons)
- Total Disposal Costs: $178,000,000

Thus, the disposal costs for his proposed remedy increases his estimated cost for excavation, hauling, and backfilling (approximately $260,000,000 total of all four sites site-wide) by 68 percent.

## 7.2. Kunkel's Proposed Remedy Results in Significant and Costly Disruptions of the Electricity Generation Plants

Kunkel includes estimates of the areas and volumes of ash-impacted soils that he asserts should be removed from the four sites (see Kunkel's Table 6 and Figures 1 through 4 in the Remedy Report). The data are summarized as follows:

- Joliet #29—Top 1.4 feet of soil over 251 acres (566,925 cubic yards of ash-impacted soil)
- Powerton—Top 6.6 feet of soil over 349 acres (3,716,152 cubic yards of ash-impacted soil)
- Waukegan—Top 5.3 feet of soil over 249 acres (2,129,116 cubic yards of ash-impacted soil)
- Will County—Top 2.1 feet of soil over 215 acres (728,420 cubic yards of ash-impacted soil)

As shown on figures within Kunkel' report, the cost estimates include areas below equipment such as switchyards and coal handling and transfer equipment. Removing soil from these areas of the sites would cause substantial operational disruptions, including extended temporary shutdowns, of the generating stations. Before any excavation could occur, MWG would need to decommission and remove or bypass all of the overlying equipment. Power generating stations are fixed structures, and it is not simple to remove and replace equipment.

Following disassembly of equipment, excavation of the soil would require additional time. I identified the allegedly impacted areas with critical generating equipment, and I estimated the acreages so that I could in turn estimate the duration of excavation activities in those areas. The estimates of the durations of excavation activities are as follows:

- Joliet #29 (see Figure 7-1):
    - Electrical switchyard—approximately 3.2 acres
    - Coal handling and transfer equipment—approximately 2.8 acres
    - Depth of soil excavation proposed by Kunkel—1.4 feet
    - I estimate once the equipment are decommissioned or removed or bypassed, that each of these areas could be excavated within one week based on a typical soil excavation production rate of 5,000 cubic yards per day for large projects.

- Powerton (see Figure 7-2):
    - Electrical switchyard—approximately 11.2 acres
    - Coal handling and transfer equipment—approximately 2.2 acres
    - Depth of soil excavation proposed by Kunkel—6.6 feet
    - I estimate that once the equipment are decommissioned or removed or bypassed, the electrical switchyard area and coal handling and transfer equipment area could be excavated within four weeks and one week, respectively, based on a typical soil excavation production rate of 5,000 cubic yards per day for large projects.
- Waukegan (see Figure 7-3):
    - Electrical switchyard—approximately 6.8 acres
    - Coal handling and transfer equipment—approximately 3.9 acres
    - Depth of soil excavation proposed by Kunkel—5.3 feet
    - I estimate that once the equipment are decommissioned or removed or bypassed, the electrical switchyard area and coal handling and transfer equipment area could be excavated within two weeks and one week, respectively, based on a typical soil excavation production rate of 5,000 cubic yards per day for large projects.
- Will County (see Figure 7-4):
    - Electrical switchyard—approximately 9.6 acres
    - Coal handling and transfer equipment—approximately 13.3 acres
    - Depth of soil excavation proposed by Kunkel—5.3 feet
    - I estimate that once the equipment are decommissioned or removed or bypassed, the electrical switchyard area and coal handling and transfer equipment area could be excavated within three weeks and four weeks, respectively, based on a typical soil excavation production rate of 5,000 cubic yards per day for large projects.

Following excavation, the equipment would also need to be reassembled and tested. In some cases, disassembled equipment may not be of sufficient quality to reassemble. For these parts, disassembled parts would need to be demolished and disposed or recycled off-site, and the parts would need to be replaced.

Importantly, Kunkel fails to account for the additional and significant costs to disassemble, reassemble, and test the switchyards and coal handling and transfer equipment. Those

costs include the additional personnel and contractors to safely disassemble and reassemble the equipment and additional material costs to safely store the equipment during excavation.

Moreover, the generating units cannot be operated without being supplied coal, and the electrical switchyard is necessary for distributing power. The generating stations would be offline for an extended period of time and would in turn incur significant costs associated with the loss of revenue from the offline generation units. These equipment cannot be practicably bypassed to continue to operate the generating units; furthermore, there is not sufficient space at the sites to disassemble electrical switchyard equipment and the coal handling and transfer equipment simultaneously. Fully disassembling, reassembling, and testing the electrical switchyard equipment and the coal handling and transfer equipment would be on the order of two to five years for each site.[176]

Kunkel's estimation entirely fails to consider the outage costs and loss of revenue during the extended period required to conduct his proposed remediation. During this time, many people, such as plant workers and coal producers, will be out of employment suffering a loss of income that has a trickle-down effect on the local communities.

## 7.3. Additional Impacts to the Surrounding Communities

In addition to the substantial disruptions to operations of the generating units, the surrounding community would be adversely impacted by the increased risk of vehicle crashes involving large trucks, increased travel times, reduced air quality from diesel exhaust, increased noise, and increased dust.

Protection of the community from adverse effects during implementation of the alternative is a factor that bears upon assessing the reasonableness of Kunkel's proposed remedy. Of particular relevance for these subject sites and the remedy proposed by Kunkel is the increased risk of vehicle accidents involving large trucks.

The U.S. Department of Transportation, National Highway Traffic Safety Administration (NHTSA) reports traffic data for large trucks that are involved in crashes resulting in fatalities or injuries. Based on traffic data for 2013, which is the most recent year of data reported by NHTSA, large trucks accounted for 4 percent of all registered vehicles but accounted for 9 percent of all vehicles involved in fatal crashes (NHTSA, 2015). In 2013, 3,964 people were killed and 95,000 people were injured in

[176] Teleconference with Mark Kelly and Rachel Maddox; teleconference with Fred Veenbaas; teleconference with Pete O'Day

crashes involving large trucks; 71 percent of these fatalities were occupants of other vehicles involved in the crash (NHTSA, 2015). The Insurance Institute for Highway Safety (IIHS) identified the main problem of large truck fatalities as the vulnerability of people traveling in smaller vehicles (IIHS, 2015).

In 2013, 0.73 percent (36.86 fatalities and 690 injuries per 100,000) of registered trucks were involved in a crash resulting in fatalities or injuries (NHTSA, 2015). The involvement rate in 2013 based on the mileage traveled by large trucks was 1.42 fatalities and 27 injuries per 100,000,000 miles (NHTSA, 2015).

I estimated the transportation requirements for hauling ash-impacted soil and import fill based on typical remediation practices for transportation and disposal.

- Trucks for hauling soil and fill have 20-cubic yard capacities;
- One truckload of clean import fill is needed for each truckload of ash-impacted soil disposal;
- Trucks used for disposing ash-impacted soil should not be used for importing clean fill, so trucks return empty after disposing or importing fill;[177]
- Assuming a disposal site for ash-impacted soil is 15 miles away from each site, the round-trip distance is 30 miles per trip;
- Assuming the source of clean import fill to replace the removed soil is 10 miles away from each site, the round-trip distance is 20 miles per trip; and
- For each cubic yard of ash-impacted soil to be excavated, the resulting transportation requirements for the project work is on the order of 2.5 miles per cubic yard ([30 miles per round-trip of ash-impacted soil disposal + [20 miles per round-trip of fill imported] / [20 cubic yards per round trip].

Based on the number of weeks for soil hauling activities developed for the hypothetical scenario, this results in the following total mileage:

- Joliet #29—More than 1,400,000 miles of large truck travel
- Powerton—More than 9,300,000 miles of large truck travel
- Waukegan—More than 5,300,000 miles of large truck travel
- Will County—More than 1,800,000 miles of large truck travel

[177] If trucks were lined with disposal plastic liners or were decontaminated at disposal facilities, trucks could transport soil for disposal and import fill in a single round trip. If these additional costs to the project were incurred to eliminate one leg of the truck route, the mileage may be reduced by approximately 30 percent.

Using Kunkel's proposed remedial approach results in more than 17,000,000 miles of large truck travel for the four sites in total. Using the 2013 mileage-based probability of a fatality involving a large truck based (1.42 fatalities and 27 injuries per 100,000,000 miles), a risk of 0.25 traffic fatalities and 4.6 injuries would be expected for the large truck traffic generated by Kunkel's proposed remedial approach under the hypothetical scenario.

Therefore, I conclude the risk of removal of all coal ash and trucking to an offsite facility is not supported by the risk of leaving the existing materials in place, which is essentially no risk to human health and the environment.

## 7.4. Estimate of Carbon Dioxide Emissions Associated with Kunkel's Proposed Remedy

Large trucks and heavy construction equipment generate emissions of carbon dioxide from the combustion of fossil fuels (typically diesel for large trucks and heavy construction equipment). Kunkel's assessment of his proposed remedy fails to include this significant impact of vehicle carbon dioxide emissions. The mass of carbon dioxide emitted from large trucks can be easily estimated using emissions factors and the total miles of large trucks as demonstrated below.

USEPA recently developed emissions factors based on Table 2-15 from the *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2012*, and based on vehicle-miles data for highway vehicles from Table VM-1 of the Federal Highway Administration Highway Statistics 2012 (USEPA, 2014). The transportation emissions factor for medium- and heavy-duty trucks is 1.456 kilograms per vehicle-mile. Based on the estimated large truck mileage in Section 7.2 (17,000,000 miles), the resulting carbon dioxide emissions are approximately 24,800,000 kilograms (equivalent to approximately 27,000 tons).

USEPA estimated the rate of carbon dioxide emissions from a large excavator at 440 pounds per hour. Kunkel estimated the total volume of excavated soil site-wide for the four sites as 7,140,613 cubic yards. Assuming a typical soil excavation production rate of 500 cubic yards per hour for large projects, the total hours of excavation is approximately 14,000 hours of operation for an excavator. This resulting carbon dioxide emissions are approximately 6,160,000 pounds (equivalent to approximately 3,080 tons).

The total carbon dioxide emissions for Kunkel's proposed remedy is approximately 30,000 tons, which is conservative because it does not include emissions from other heavy construction equipment used at the sites, disposal facilities, and import fill sources.

## Section 8: Reservation

Due to the delay in the production of documents relied upon by Dr. Kunkel, I am reserving the ability to supplement my opinions in response to any documents or bases for Dr. Kunkel's reports that are presented by the Complainants. In addition, my opinions may be supplemented based on future changes in the construction or operation of the generating stations and in response to any future changes in groundwater conditions observed at the sites.

## Section 9: Signature

This report contains 165 pages, including figures, tables, and appendices.

**Abbreviations:**
"MSL" = mean sea level
"NM" = not measured

**Notes:**
1. Groundwater elevations were reported in the First Quarter 2015 groundwater monitoring reports submitted by MWG to IEPA (MWG, 2015a).

**Table 4-2**
**Summary of Joliet #29 Constituents of Interest**

| Constituent of Interest |
|---|
| Antimony |
| Boron |
| Chloride |
| Iron |
| Manganese |
| pH |
| Sulfate |
| TDS |

**Note:**

1. Constituents of Interest are based on concentrations reported in the First Quarter 2015 groundwater monitoring reports submitted by MWG to IEPA (MWG, 2015a).

**Abbreviations:**
"MSL" = mean sea level

**Notes:**
1. Groundwater elevations were reported in the First Quarter 2015 groundwater monitoring reports submitted by MWG to IEPA (MWG, 2015d).

**Table 4-8**
**Summary of Will County Constituents of Interest**

| Constituent of Interest |
|---|
| Antimony |
| Arsenic |
| Boron |
| Chloride |
| Manganese |
| pH |
| Selenium |
| Sulfate |
| TDS |

**Note:**

1. Constituents of Interest are based on concentrations reported in the First Quarter 2015 groundwater monitoring reports submitted by MWG to IEPA (MWG, 2015d).

**Abbreviations:**

"mg/L" = milligrams per liter
"NA" = not analyzed by the laboratory
"<" = less than the indicated analytical detection limit
"MWG" = Midwest Generation
"NLET" = Neutral Leaching Extraction Test (ASTM D3987-85)
"PRB" = Powder River Basin

**Notes:**

**Bold font** indicates a detection above IEPA Class I Groundwater Standards.
Underlined values indicate detections relevant to Section 5.5.1.3 of the report text.

**Abbreviations:**
"TCLP" = Toxicity Characteristic Leaching Procedure (USEPA Method 1311)
"x" = constituent was detected above analytical detection limits during at least one quarterly groundwater monitoring event in 2014

**Table 5-4**
**Summary of Constituents Detected during Most Recent Year (2014) of Quarterly Groundwater Monitoring Compared to Indicators of Leachate from Ash Currently Stored in Impoundments**
**Based on Site-Specific NLET Results for Bottom Ash and Actual Leachate Sample Results for Bituminous Ash Stored in Impoundments**

**Notes:**

1. Indicators of leachate from ash currently stored in impoundments are based on leachate sample results for bituminous ash stored in impoundments (Table 5-2 as denoted in this table as "Y TCLP)", and actual leachate sample results for bituminous ash stored in imp
2. Shading of cells is described below.
   - Green shading indicates that a constituent that is an indicator of leachate from ash currently stored in the impoundments was not detected during quarterly groundwater monitoring in 2014.
   - Blue shading indicates that a constituent that is not an indicator of leachate from ash currently stored in the impoundments was detected during at least one quarterly groundwater monitoring event in 2014.
   - No shading indicates that either (1) a constituent that is an indicator of leachate from ash currently stored in the impoundments was detected during at least one quarterly groundwater monitoring event in 2014, or (2) a constituent that is not an indicator of leachate from ash currently stored in the impoundments was not detected during quarterly groundwater monitoring in 2014.
3. Green and blue shading (see Note 2) demonstrate observed constituents that are not consistent with indicators of leachate from ash currently stored in impoundments.

**Abbreviations:**
"NLET" = neutral leaching extraction test (ASTM D3987-85)
"x" = constituent was detected above analytical detection limits during at least one quarterly groundwater monitoring event in 2014

**Table 5-5**
**Summary of Constituents Detected during Most Recent Year (2014) of Quarterly Groundwater Monitoring Compared to Indicators of Leachate from Ash Currently Stored in Impoundments**
**Based on Site-Specific NLET Results for Bottom Ash**

**Notes:**

1. Indicators of leachate from ash currently stored in impoundments is based on site-specific NLET results for bottom ash (Table 5-1).
2. Shading of cells is described below.

   Green shading, which is not applicable ot this Table 2-6, would indicate that a constituent that is an indicator of leachate from ash currently stored in the impoundments was not detected during quarterly groundwater monitoring in 2014.

   Blue shading indicates that a constituent that is not an indicator of leachate from ash currently stored in the impoundments was detected during at least one quarterly groundwater monitoring event in 2014.

   No shading indicates that either (1) a constituent that is an indicator of leachate from ash currently stored in the impoundments was detected during at least one quarterly groundwater monitoring event in 2014, or (2) a constituent that is not an indicator of leachate from ash currently stored in the impoundments was not detected during quarterly groundwater monitoring in 2014.
3. Green and blue shading (see Note 2) demonstrate observed constituents that are not consistent with indicators of leachate from ash currently stored in impoundments.

## CAREER SUMMARY

Mr. Seymour is a geotechnical engineer with nearly three decades of experience in the U.S., Canada, Spain, Guatemala and Korea in the areas of site remediation, deep foundations, and construction management. He has focused on waste management and remediation (Superfund (CERCLA) and RCRA) projects for 25 years, having had significant involvement in 17 sites providing professional services in the areas of project management, project coordination (client representative), site characterization, feasibility studies, bench/pilot studies, civil/geotechnical design, construction quality assurance (CQA), and operation and maintenance.

He has completed field studies including geologic and hydrogeologic studies, aquifer testing, seismic surveys, landfill settlement tests, and the characterization of volatile organic compounds (TCE and by-products), semivolatile organic compounds, PCBs, lead, and saline groundwater intrusion.

He has provided coal combustion residuals (CCRs) engineering services, regarding waste management of fly ash, bottom ash and flue gas desulfurization (FGD) waste for impoundments and landfills. These services have included geotechnical and environmental evaluations of waste disposal expansions, operations and closure, disposal permit application preparation for eight U.S coal power generation clients. Overall he has provided relevant consulting engineering services for 7 CCRs impoundments and 14 CCR landfills and provided records review, evaluation and engineering scope of work development for 4 additional CCR impoundments. He has

translated some of his experience into 11 technical papers and recently submitted two final draft research guidance documents on CCR impoundments (co-investigator), and provided 10 technical presentations at conferences including at conferences focusing on CCR management.

His clients have primarily included major industrial manufacturers (utilities, automotive, tools, appliances) and waste management/disposal companies. He has been the lead in the design of 11 landfills. He has been the project lead for several major (multi-million dollar) remediation sites. He also has assisted in remedy negotiations with state and federal agencies at many sites.

In addition, he has geotechnical engineering experience with the design and construction of deep foundations, including drilled piers, tie backs, foundation grouting and soil improvement programs, and diaphragm (slurry) walls.

Highlights of Mr. Seymour's representative experience include:

**Geoenvironmental**

***J. C. Weadock Plant CCR Facility Engineering Study, Consumers Energy Company,*** *Michigan*. Mr. Seymour is the project director and senior technical reviewer for a study of the existing CCR facility. The study is to assess the future use and closure of the facility considering current regulations and future proposed federal regulations regarding CCRs under RCRA and the effluent limitation guidelines and standards for the steam electric power generating industry under the Clean Water Act.

***Rivesville and Albright Power Plants,*** *FirstEnergy, West Virginia.* Engineer of Record for the design of the closure of two CCR landfills.

***Coal Combustion Residuals Pond Closure Guidance Documents, Electric Power Research Institute,*** *Nationwide*. Mr. Seymour is a co-investigator/author and project manager for the completion of two guidance documents relating to CCR pond closures. They include: (i) "Coal Combustion Residuals Pond Closure- Dewatering and Capping Guidance", and (ii) "Coal Combustion Residuals Pond Closure- Construction over Closed Ponds".

***Confidential Power Plant,*** *Southern Ohio*. Mr. Seymour is the project manager for the conceptual design of a 300-acre fly ash disposal pond closure.

***General James M. Gavin Power Plant***, *American Electric Power, Cheshire, Ohio.* He managed the design of and the Permit to Install (PTI) application for a 50,000,000 cuyd residual waste landfill for the solid waste permit application under existing OEPA rules which incorporated relevant portions of the U.S. EPA proposed RCRA Subtitle D regulations.

***General James M. Gavin Power Plant,*** *American Electric Power, Cheshire, Ohio.* Mr. Seymour was the project manager for the focused feasibility evaluation (FFE) for a coal combustion residuals (CCR) landfill expansion and the resulting design and permit application for a landfill expansion.

***Monroe Power Plant,*** *DTE Energy, Monroe, MI.* Mr. Seymour managed the FGD Gypsum Disposal Facility Preliminary Engineering Study and was the project manager to assess disposal options for new flue gas desulphurization (FGD) gypsum that will be generated at this coal fired electrical generating station. Mr. Seymour is the project director and engineer of record to conduct an evaluation of the earthen containment dike around the ash basin and to assess the potential for a failure due to operating issues.

***Planta Las Palmas CCB Landfill Development Studies,*** *Duke Energy International Guatemala, Guatemala.* Mr. Seymour completed studies to optimize the development of a new coal ash landfill and prepare site investigation bid specifications. He was the project manager to prepare the detailed design and construction bid documents for the coal storage area, ash landfill, leachate treatment pond with discharge structure, and the power plant water intake structure.

***Wauconda Landfill Superfund Site Cover Evaluation,*** *Wauconda Task Force, Wauconda, IL.* Mr. Seymour was the project manager for the evaluation of the existing soil cover over Superfund site.

***R. Paul Smith CCB Landfill Expansion,*** *Allegheny Energy Supply, Berkeley County, WV.* Mr. Seymour was the project manager for the design and construction quality assurance of a coal combustion byproducts landfill at a coal-fired power plant in Maryland with the landfill located in adjacent West Virginia.

***MIG/DeWane Landfill Superfund Site Remedial Design,*** *Allied Waste Industries, Belvidere, IL.* Assisted the client with negotiations of a Statement of Work with the Illinois EPA for this CERCLA site. He is conducting a remedial design of a new cover system and gas collection system over the 50 acre landfill.

***Confidential Landfill Remedial Action Support Services,*** *Republic Services, north-central IL.* Providing technical support to legal counsel for the remedy selection process at a 40-acre solid waste facility closed in the 1970s and developed into a park.

***Planta Arizona, CCB Landfill Design Consulting,*** *Duke Energy International Guatemala, Guatemala.* Mr. Seymour provided consulting to DEIG to layout a new coal ash disposal facility for a coal-fired electrical generating station.

***Cardinal Plant Landfill Studies,*** *American Electric Power, Brilliant, OH.* Completed a feasibility study to assess the potential to develop a new flue gas desulphurization (FGD) waste landfill over an existing fly ash disposal area at a coal-fired power plant.

***Yeoman Creek Landfill Superfund Site,*** *PRP Group, Waukegan, IL.* Mr. Seymour was the project manager and Project Coordinator for this CERCLA site closure.

***Utility Company,*** *Multiple Sites, WI.* Contaminated site consulting services and ash landfill design, construction inspection/management services. Mr. Seymour was the Contract Manager and project manager for multiple sites, including evaluation of existing groundwater remediation system to improve performance and evaluate alternate technologies in Wisconsin, and development of an approach to address existing environmental impacts at an MGP site along the Fox River in Wisconsin

***Albion-Sheridan Township Landfill,*** *Cooper Industries and Corning, Inc., Albion, MI.* Project Coordinator, at CERCLA site. Provided solid and hazardous waste closure, construction management, remedial design, QA officer, closure certification, solid and hazardous waste remediation.

***McGraw-Edison Facility,*** *Cooper Industries, Centerville, IA.* Project manager for CERCLA Site that was a manufacturing facility in Iowa to remediate TCE in soil and groundwater. Provided design review and engineering oversight for the installation of an iron reactive permeable barrier wall for treatment of TCE in groundwater and a hydro-fracture enhanced vapor extraction system, including over one year of performance monitoring and evaluation, and fate and transport modeling of the TCE.

***J&L Landfill,*** *LTV Steel Company, Rochester Hills, MI.* Project Coordinator at this CERCLA site. Provided solid and hazardous waste landfill closure, construction management, remedy negotiation, closure design, QA officer, closure P.E. certification, solid and hazardous waste.

***Monroe Stamping Plant Lagoon Closure,*** *Ford Motor Company, Monroe, MI.* Project manager for the resident engineering services for this facility where 55 acres of lagoons were closed as a hazardous waste landfill under a RCRA corrective action.

***Rasmussen Landfill,*** *PRP Group, Green Oak Township, MI.* Project coordinator at CERCLA solid and hazardous waste site. Provided work plans, pre-design and remedial design, construction management for a hazardous waste landfill cover and groundwater pump and treat system, and closure P.E. certification. The project included: removal of hazardous waste drums; preload program to estimate waste consolidation; groundwater aquifer testing; and groundwater modeling.

***Motor Wheel Disposal Site,*** *WR Grace, Inc., Lansing, MI.* Project manager for cost allocation arbitration case among potentially responsible parties at CERCLA landfill.

***Brownfield Redevelopment Site,*** *WEPCo, Racine, WI.* Project manager and remediation design engineer for brownfield development with manufactured gas plant wastes (organic and inorganic compounds) in groundwater and soil, and VOCs in soil gas;

included groundwater aquifer testing, site investigation, aquifer modeling, remedial design, construction engineering/resident engineering, operation monitoring for a groundwater extraction system, and soil gas collection system for commercial and residential development at a former manufactured gas plant site.

***Janesville Disposal Facility,*** *City of Janesville, Janesville, WI.* Groundwater design task manager for this CERCLA site. The site had several landfills that required RCRA cap design and a groundwater extraction system design to prevent groundwater discharge to the Rock River. Based upon the reports, aquifer testing and groundwater modeling, developed the concept to eliminate the groundwater extraction and treatment system because the surface water discharge criteria would not be exceeded and there were no receptors between the landfill and the river.

***National Industrial Environmental Services,*** *Chemical Waste Management, Inc., near Wichita, KS.* Project engineering, design and project management for CERCLA/RCRA facility corrective action. The project included remediation of VOC groundwater contamination, treatment of sludges containing acids and metals and organics (SVOCs and VOCs) and sludge disposal into two new hazardous waste landfill cells and litigation support. The project also included aquifer tests, groundwater modeling, air monitoring, geophysical surveys, agency reporting, two RCRA Part B permit applications, and technical support for two trials.

***Equilon (Shell Oil) Wood River Facility,*** *Shell Oil Company, Roxana, IL.* RCRA Corrective Action project management for a refinery along the Mississippi River that had numerous disposal areas. This project included: i) preparation of a RCRA Facility Investigation (RFI) investigation work plan; ii) conduct of the RFI; iii) certification of closure of one RCRA management unit; and iv) RCRA Part B submittal.

***Berlin & Farro Liquid Incineration Site,*** *PRP Group, Swartz Creek, MI.* Conducted a CERCLA RI/FS, baseline risk assessment, negotiations with Region V EPA and MDEQ for cleanup, and litigation support. The RI included investigation of soil, soil gas, groundwater, surface water and sediment, and included seismic reflection and resistivity geophysical investigations.

***Butterworth Landfill,*** *PRP Group, Grand Rapids, MI.* Completion of a remedial design work plan that included predesign sampling of soil, groundwater, river sediment, and fish in the Grand River at this 180 acre solid and hazardous waste landfill under CERCLA.

***Bailey Dump Superfund Site,*** *Texas Water Commission, Bridge City, TX.* Site manager to perform a remedial investigation over a two-month period to characterize uncontrolled hazardous waste landfill under CERCLA.

***Salt Intrusion Groundwater Modeling and Feasibility Study,*** *Morton Salt/Rohm & Haas, Inc., Manistee, MI.* Project manager for conduct of a feasibility study and groundwater transport model to assess methods to mitigate salt intrusion into an unconfined aquifer in Manistee.

***Hartley & Hartley Landfill,*** *Joint Defense Group, Bay City, MI.* Project manager for site regulated by the NRC as an SDMP site regarding licensing, leachate management system design, and MDEQ/MDNR interface. The site contained low-level radiological thorium-bearing slag and hazardous and solid waste.

***LUST Sites.*** Management and/or director for over 10 leaking underground storage tank projects in Michigan and Illinois.

**Litigation Assignments**

***Confidential Client, 2014***. Mr. Seymour was retained as an expert in the field of CCR landfill design over a closed coal ash pond.

***Confidential Client, 2013.*** Mr. Seymour was retained as an expert in the field of CCR ponds for the arbitration of a major insurance claim.

***AmForge Site Expert Witness,*** *Arvin-Meritor, Chicago, IL, 2006.* Provided engineering support in the areas of contaminant fate and transport, risk assessment, and site characterization in cost recovery case. The cost recovery was undertaken by private parties brought under CERCLA.

**Geotechnical**

***Baby Creek Overflow Treatment Facility,*** *Detroit Water and Sewerage Department, Detroit, MI.* Project manager for the geotechnical investigation and foundation design for a combined sewer treatment system.

***Co-generation Power Facility,*** *Sarnia, Canada.* Project manager for geotechnical site investigation for a co-generation (steam and electricity) facility.

***Vila Olympica Building,*** *Bovis International, Barcelona, Spain.* Project manager to provide deep foundation geotechnical engineering at this 50 story high rise building along the Mediterranean coast.

***Lucky-Goldstar Building,*** *Lucky Development Company, Seoul, South Korea.* Resident engineer and quality control manager for construction of the deep foundation and foundation grouting program.

***Phase I Dam Safety Inspections,*** *U.S. Army Corps of Engineers, Multiple Sites, MO.* Field inspection of five dams and reporting writing for approximately 15 dams undergoing Phase I (non-intrusive) safety inspections.

Geosyntec consultants

***Ann Arbor Wastewater Treatment Plant***, *City of Ann Arbor, MI.* Field resident engineering support for construction of this new facility. His responsibilities included oversight of groundwater dewatering to avoid "bottom heave" of the excavation, compaction control and QC inspection of civil construction.

***Beaver Valley Power Station,*** *Duquesne Light, Shippingport, PA.* Field resident engineering for foundation construction of an 888 megawatt nuclear fuel power plant.

# J.SEYMOUR EXPERT REPORT

# APPENDIX B
# SURFACE WATER RISK CHARACTERIZATION

# Appendix B to Expert Report of John Seymour, P.E.
# Surface Water Risk Characterization

## Section 1: Introduction

This focused risk characterization evaluates the potential for human health and ecological risks from an assumed exposure to constituents of interest (COIs) in groundwater associated with each of the four sites that may migrate to surface water. COIs are defined as described in Sections 4.1.6, 4.2.6, 4.3.6, and 4.4.6 of the Expert Report of John Seymour. These evaluations are conservative as they assume a complete exposure pathway exists between groundwater COIs and receptors in the adjacent surface water bodies, and do not fully analyze attenuation or dilution mechanisms. The screening assessment also considers background and upgradient source COIs that are not from the ponds, thereby overestimating the risk from the ponds.

## Section 2: Risk Evaluation Methods

### 2.1. Methods Overview

For this evaluation, potential risks to human health and the environment from COIs that could possibly migrate to surface water were evaluated using a screening-level approach that compared estimates of exposure to estimates of effect. This approach is commonly used to screen for the potential for risk and determine if additional assessment is required.

### 2.2. Definition of Risk

It is assumed that there are "no unacceptable risks" if site-specific groundwater concentrations are less than Illinois Water Quality Standards (WQS) or Water Quality Criteria (WQC) for surface water, which are considered to be protective of human health and the environment. These WQS/WQC incorporate toxicological (i.e., does-response) data as well policy-based assumptions, including the state-determined acceptable risk level. Therefore, a conclusion of "no unacceptable risk" is a conclusion based upon regulatory processes. If a site concentration is greater than a WQS/WQC, it cannot be concluded that a risk exists, only that further evaluation may be warranted or necessary. At this step, site-specific conditions are typically evaluated in a quantitative and/or qualitative manner to refine preliminary conclusions of the screening step. For this evaluation, the refinement step considers the exceedance location (relative to other wells and receiving water bodies), magnitude, and frequency. If these lines of evidence support that "no unacceptable risks" are likely at the point-of-exposure (i.e., the lake or river), then it is concluded that there is an unlikely potential for risk.

### 2.3. Risk Evaluation Inputs

Exposure and effect estimates used in this screening-level approach are discussed below.

Exposure: COI concentrations reported for onsite groundwater monitoring wells were conservatively assumed to represent exposure point concentrations (EPCs) for human and ecological receptors. This overestimates risk as human and ecological exposure to groundwater within these sites represents an incomplete exposure pathway. In other words, there are no onsite exposures and, therefore, no onsite risks. Human and ecological receptors may be present in the adjacent surface water bodies; however, groundwater is expected to undergo dilution and attenuation as it migrates through the subsurface and

then mixes with surface water. Thus, this assumption overestimates risks to potential off-site receptors by overestimating the exposure concentration.

Effect: Effects values for this evaluation were Illinois chronic WQS or, if a WQS was not available, Illinois chronic WQC. Surface water effects values and their sources are provided in Table B-1. The Illinois Environmental Protection Agency (IEPA) specifies that acute WQS "*...shall not be exceeded at any time except for those waters for which a zone of initial dilution (ZID) has been approved by the Agency...*" For this evaluation, it was assumed that a ZID has not been approved and, thus, chronic values would be applicable. However, given the conservative assumptions about exposure, acute values could provide a secondary line of evidence for evaluating risk.

# Section 3: Site-Specific Risk Evaluations

## 3.1. Risk Evaluation – Joliet #29 Generating Station

### 3.1.1. Estimates of Exposure and Effect

Groundwater in the vicinity of the Joliet #29 Power Generating Station ash ponds discharges south to the Des Plaines River via the adjoining intake channel. Based on groundwater data collected between December 2010 and February 2015 from onsite monitoring wells (MW-01 through MW-11), COIs for this site are: antimony, boron, chloride, iron, manganese, sulfate, and total dissolved solids (TDS).

Analytical data used in this evaluation is provided in Table B-2-1. Well-specific summary statistics calculated for COIs are provided in Table B-2-2 (average concentrations) and Table B-2-3 (maximum concentrations). Additionally, the mean of averages and the mean of maximums are calculated to provide a preliminary estimate of area-wide EPCs. Monitoring well locations are shown in Figure 4-1.

### 3.1.2. Results of Risk Evaluation

Based on comparisons of maximum detected concentrations at the site to WQS/WQC, there are no unacceptable risks from antimony, boron, manganese, and TDS.

Maximum detected concentrations of chloride and sulfate exceeded chronic WQS in one well each (MW-08 and MW-09, respectively); however, the magnitude of exceedance was low and average concentrations within these wells were below chronic WQS. Therefore, there is an unlikely potential for risk from chloride and sulfate.

Maximum and average iron concentrations in well MW-09 exceeded the WQS. Maximum iron concentrations in MW-07 and MW-08 also exceeded the WQS; however, iron was infrequently detected (1 detection in 18 samples) in these wells and average iron concentrations were less than the WQS. Notably, in wells nearer to the river and downgradient of MW-09 (e.g., MW-03 and MW-04), iron has not been detected. Therefore there is an unlikely potential for risk from iron.

## 3.2. Risk Evaluation – Powerton Generating Station

### 3.2.1. Estimates of Exposure and Effect

The site area has two groundwater flow regimes. Groundwater in the vicinity of the Powerton Generating Station ash ponds that is within the silt/clay unit discharges in a westerly direction to the adjoining intake channel; groundwater that is within the gravelly sand unit discharges in a northerly direction to the Illinois River. Based on groundwater analytical data collected between December 2010 and February 2015 from onsite monitoring wells (MW0-01 through MW-16), COIs for this site are: arsenic, boron, chloride, iron, lead, manganese, nitrate, selenium, sulfate, thallium, pH, and TDS.

Analytical data used in this evaluation is provided in Table B-3-1. Well-specific summary statistics calculated for each COI are from this data are provided in Table B-3-2 (average concentrations) and Table B-3-3 (maximum concentrations). Additionally, the mean of averages and the mean of maximums are calculated to provide a preliminary estimate of area-wide EPCs. Monitoring well locations are shown in Figure 4-2.

### 3.2.2. Results of Risk Evaluation

Based on comparisons of maximum detected concentrations at the site to WQS/WQC, there are no unacceptable risks from boron, chloride, nitrate, selenium, sulfate, and TDS.

Maximum detected concentrations of arsenic exceeded the chronic WQS in wells MW-07 and MW-06; however, the magnitude of exceedance was low (<2x) and average concentrations within these wells were below the chronic WQS. The maximum detected concentration of lead exceeded the chronic WQS in well MW-12; however, the magnitude of exceedance was low (<4x) and the average concentration within this well was below the chronic WQS. The maximum detected concentration of thallium exceed the chronic WQC in well MW-14; however, the magnitude of exceedance was low (<2x) and the average concentration within this well was below the chronic WQC. Field-measured pH levels were periodically less than or greater than the WQS range; however, on average, pH levels were well within the range. Therefore, based on the screening-level comparisons and site-specific conditions, there is an unlikely potential for risk form arsenic, lead, thallium, and pH.

Maximum and average manganese concentrations in in wells MW-07, MW-11, and MW-13 exceeded the WQS. These wells are reported to be screened within the gravelly-sand unit where

groundwater flows in a northerly direction toward the Illinois River (i.e., the receiving water body). However, maximum and average manganese concentrations reported in several downgradient wells located nearer to the river (MW-03, MW-04, and MW-05) were below the chronic WQS, indicating attenuation is occurring. Maximum manganese concentrations in wells MW-06 and MW-10 also exceeded the WQS at least once. MW-10 is reported to be screened within the gravelly-sand unit and is also upgradient of wells MW-03, MW-04, and MW-05. Exceedances within this well were of low magnitude (<2x) and the well-specific average concentration was less than the WQS. MW-06 exceedances were infrequent (1 in 18 samples), of low magnitude (<3x), and occurred in a monitoring well located adjacent to the intake channel, which conveys water from the river to the Site. Therefore, the transport of manganese via the channel to the river is not probable and there is an unlikely potential for risk from manganese.

Within the northerly-flowing gravelly-sand unit, maximum iron concentrations in wells MW-07, MW-10, MW-11, and MW-13 exceeded the chronic WQS. Importantly, however, maximum and average iron concentrations reported in several downgradient wells located nearer to the river (MW-03, MW-04, and MW-05) were below the chronic WQS. Within each of the five wells within the westerly-flowing silt-clay later, average and maximum iron concentrations exceeded the chronic WQS. These wells with exceedances are located adjacent to and flow westerly toward the intake channel, which conveys water from the river to the site. Thus, transport of iron via the channel to the river is not probable. Therefore, there is an unlikely potential for risk from iron.

## 3.3. Risk Evaluation – Waukegan Generating Station

### 3.3.1. Estimates of Exposure and Effect

Groundwater in the vicinity of the Waukegan Generating Station ash ponds discharges in an easterly direction to adjacent Lake Michigan. Based on the groundwater data collected between October 2010 and February 2015 from onsite monitoring wells (MW-01 through MW-09), COIs for this site are: antimony, arsenic, boron, chloride, iron, manganese, sulfate, pH, and TDS. Note that these COIs include inorganic constituents from upgradient and offsite sources, such as boron, which is migrating on to the Waukegan site from the former Greiss-Pfleger Tannery site.

Analytical data used in this evaluation is provided in Table B-4-1. Well-specific summary statistics calculated for COIs are provided in Table B-4-2 (average concentrations) and Table B-4-3 (maximum concentrations). Additionally, the mean of averages and the mean of maximums are

calculated to provide a preliminary estimate of area-wide EPCs. Monitoring well locations are shown in Figure 4-3.

### 3.3.2. Results of Risk Evaluation

Based on comparisons of maximum detected concentrations to WQS/WQC, there are no unacceptable risks from antimony and manganese.

Maximum detected concentrations of the remaining COIs exceeded WQS/WQC in at least one well. Arsenic exceedances were limited to two samples from MW-01, are of low magnitude (<2x), and the average concentration in MW-01 was less than the WQS. Chloride exceedances were limited to two samples from MW-05, are of low magnitude (<2x), and the average concentration was less than the WQS. Elevated pH levels were limited to wells MW-01, MW-02, and MW-03; however, on average, pH levels were within the WQS range. Therefore, there is an unlikely potential for risk form arsenic, chloride, and pH.

In individual wells MW-05 through MW-09, which are west and southwest of the ponds, average concentrations of boron, iron, sulfate, and TDS exceeded chronic WQS on one or more occasions. Importantly, there are no unacceptable risks for boron, iron, sulfate, and TDS in wells MW-01 through MW-04, which represent the most downgradient wells at the site. MW-01 through MW-04 appear to be downgradient of MW-05, MW-06, MW-08, and MW-09, indicating attenuation is occurring. Although no wells are directly downgradient of MW-07, there is no data to indicate that similar attenuation is not occurring in this area.

## 3.4. Risk Evaluation – Will County Generating Station

### 3.4.1. Estimates of Exposure and Effect

Groundwater in the vicinity of the Will County Generating Station ash ponds discharges in a westerly direction to the adjacent Des Plaines River. Based on the groundwater data collected between December 2010 and February 2015 from onsite monitoring wells (MW-01 through MW-10), COIs for this site are: antimony, boron, chloride, manganese, sulfate, pH, and TDS.

Analytical data used in this evaluation is provided in Table B-5-1. Well-specific summary statistics calculated for COIs are provided in Table B-5-2 (average concentrations) and Table B-5-3 (maximum concentrations). Additionally, the mean of averages and the mean of maximums are

calculated to provide a preliminary estimate of area-wide EPCs. Monitoring well locations are shown in Figure 4-5.

### 3.4.2. Results of Risk Evaluation

Based on comparisons of maximum detected concentrations to WQS/WQC, there are no unacceptable risks from antimony, boron, chloride, manganese, and TDS.

Maximum detected concentrations of sulfate exceeded the chronic WQS in two wells (MW-04 and MW-05). These two wells are located east (upgradient) of the ponds and are not adjacent to the river; no sulfate exceedances have occurred in those wells that are adjacent to the river (MW-07, MW-08, MW-09, and MW-10). Therefore, there is an unlikely potential for risk from sulfate.

Field-measured pH levels in individual wells were variable and periodically were less than or greater than the WQS range; however, with the exception of one well (MW-09), average pH levels were well within the range. For MW-09, pH levels exceeded the range in the majority of samples evaluated herein. MW-09 is located adjacent to the Des Plaines River; however, given that average pH concentrations in the remaining nine wells, including wells adjacent to the river, were within the acceptable range, there is an unlikely potential for risk from pH.

Table B-1
Surface Water Effects Values
Midwest Generation

| Constituent | CAS | Units | Surface Water Effects Values[1] | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | General Use[2] | | | | Lake Michigan Basin[3] | | | |
| | | | Chronic | | Acute[4] | | Chronic | | Acute[4] | |
| Antimony | 7440-36-0 | mg/L | 0.32 | (2e) | 1.2 | (2e) | 0.32 | (3d) | 1.2 | (3d) |

**Notes**

(1) Illinois Water Quality Standards (WQS) are used as surface water effects values for evaluating hypothetical human and ecological exposure scenarios. In the absence of a WQS, Illinois Water Quality Criteria (WQC) are used. Values are applicable to total (rather than dissolved) concentrations.

(2) Concentration represents an Illinois General Use WQS as defined in 35 IAC 302, Subpart B or an Illinois WQC (lower of aquatic life and human health WQC):

(a) 35 IAC 302.208(e), Numerical Water Quality Standards for the Protection of Aquatic Life
(i) Standard for total lead is a hardness (H)-dependent value, calculated as follows (see also footnote 5):
Chronic = exp[-2.863+1.273*ln(H)]*1E-3 mg/µg
Acute = exp[-1.301+1.273*ln(H)]*1E-3 mg/µg
(ii) Standard for total manganese is a hardness (H)-dependent value, calculated as follows (see also footnote 5):
Chronic = exp[4.0635+0.7467*ln(H)]*1E-3 mg/µg
Acute = exp[4.9187+0.7467*ln(H)]*1E-3 mg/µg
(b) 35 IAC 302.208(g), Single-Value Standards
(c) 35 IAC 302.208(h)(2)(A), Water Quality Standard for Sulfate; standard is hardness (H) and chloride (Cl) dependent, and calculated as follows (see also footnotes 5 and 6):
Chronic = exp[1276.7+5.508*(H)-1.457(Cl)]*0.65
(d) 35 IAC 302.204, pH
(e) Illinois WQC for the protection of aquatic life.
(f) Illinois WQC for the protection of human health (applicable to chronic values only).

(3) Concentration represents an Illinois Lake Michigan Basin WQS as defined in 35 IAC 302, Subpart E. Note that of the four subject sites, Lake Michigan Basin WQS are only applicable to the Waukegan Power Generating Station. "n/a" indicates a constituent is not of interest at the Waukegan Power Generating Station.

(a) 35 IAC 302.504(a), Lake Michigan Basin Water Quality Standards for Chemical Constituents. WQS for manganese and lead are calculated using the hardness-dependent GU equations.
(b) 35 IAC 302.504(b)
(c) IAC 302.503, pH
(d) If a Lake Michigan Basin WQS was not available, the General Use WQS was assumed to be applicable.

(4) Chronic values are used as the primary effects values for this evaluation; however, acute values are also presented for discussion purposes.

(5) Site-specific hardness data is not available. However, based on data from the Illinois Water Quality Database (http://ilrdss.isws.illinois.edu/WQ/), a value of 200 mg/L is considered a conservative estimate for the Site.

(6) Sulfate WQS calculated using the average chloride concentration for available data, which are as follows:
Joliet #29 212
Powerton 121
Waukegan 141
Will County 72.3

**Definitions**

"--" = value not available
n/a = not applicable
mg/L = milligram per liter
s.u. = standard unit

**Notes**
(1) Illinois General Use Water Quality Standards (WQS) and Illinois Water Quality Criteria (WQC) are used as surface water effects values.
(2) Manganese results for March 2012 for wells MW-02, MW-03, and MW-04 were qualified as "^" by the laboratory, which denotes instrument-related QC exceeds the control limits.
(3) Boron results for September 2012 were qualified as "^" by the laboratory, which denotes instrument-related QC exceeds the control limits.
(4) Boron results for May 2013 for well MW-03 were qualified as "V" by the laboratory. A qualifier definition was not identified.

mg/L = milligrams per liter
"--" = value not available
"<" = constituent was not detected; the reporting limit is presented
bold/shading = concentration exceeds effects value

Table B-2-2
Comparison Of Average Groundwater Analytical Results To Surface Water Effects Values
Midwest Generation -- Joliet #29 Generating Station - Joliet, Will County, Illinois

| Constituent | Units | Effects Value [1] | Groundwater Analytical Results - Average Concentrations [2] | | | | | | | | | | | Average [3] |

**Notes**
(1) Illinois General Use Water Quality Standards (WQS) and Illinois Water Quality Criteria (WQC) are used as surface water effects values.
(2) Average of concentrations reported between December 2010 and February 2015. If a constituent was not detected during this timeframe, the average reporting limit is presented in the table, indicated with a "U" qualifier. Otherwise, non-detect results were included in the average calculation assuming one-half the reporting limit.
(3) Average of concentrations (averages) presented in the table, assuming one-half the reporting limit for non-detect results.

mg/L = milligram per liter
s.u. = standard units
"--" = value not available
U = constituent not detected above its reporting limit; reporting limit presented
bold/shading = concentration exceeds effects value

Table B-2-3
Comparison Of Maximum Groundwater Analytical Results To Surface Water Effects Values
Midwest Generation -- Joliet #29 Generating Station - Joliet, Will County, Illinois

**Notes**
(1) Illinois General Use Water Quality Standards (WQS) and Illinois Water Quality Criteria (WQC) are used as surface water effects values
(2) The manganese result for March 2014 for MW-07 was qualified as "E" by the laboratory. A qualifier definition was not identified
(3) The total dissolved solids result for May 2014 for MW-12 was qualified as "H" by the laboratory. A qualifier definition was not identified.
(4) Chloride results for August 2014 for wells MW-02, MW-06, MW-07, and MW-12 were qualified as "^^" by the laboratory, which denotes instrument-related QC exceeds the control limits

mg/l = milligrams per liter
s u = standard units
"--" = value was not available
"<" = constituent was not detected; the reporting limit is presented
bold/shading = concentration exceeds effects value

**Notes**
(1) Illinois General Use Water Quality Standards (WQS) and Illinois Water Quality Criteria (WQC) are used as surface water effects values.
(2) Average of concentrations reported between December 2010 and February 2015. If a constituent was not detected during this timeframe, the average reporting limit is presented in the table, indicated with a "U" qualifier. Otherwise, non-detect results were included in the average calculation assuming one-half the reporting limit.
(3) Average of concentrations (averages) presented in the table, assuming one-half the reporting limit for non-detect results.
(4) Groundwater in the gravelly sand unit flows in a northerly direction. Groundwater in the localized silt/clay units flows in a westerly direction. Summary statistics do not distinguish between these two units.

mg/L = milligram per liter
s.u. = standard units
"--" = value not available
U = constituent not detected above its reporting limit
bold/shading = concentration exceeds effects value

Notes
(1) Illinois General Use Water Quality Standards (WQS) and Illinois Water Quality Criteria (WQC) are used as surface water effects values.
(2) Maximum detected concentrations reported between December 2010 and February 2015. If a constituent was not detected during this timeframe, the maximum reporting limit is presented in the table, indicated with a "U" qualifier. For pH, the range is presented.
(3) Average of well-specific concentrations (maximums) presented in the table. If the maximum is a non-detect result, one-half the reporting limit was used as a surrogate concentration in the calculation. For pH, the range presented in the "average" column is the average minimum and average maximum.
(4) Groundwater in the gravelly sand unit flows in a northerly direction. Groundwater in the localized silt/clay units flows in a westerly direction. Summary statistics (averages) do not distinguish between these two units.

mg/L = milligram per liter
s.u. = standard units
"--" = value not available
U = constituent not detected above its reporting limit
bold/shading = concentration exceeds effects value

Table 15-4-1
Groundwater Analytical Results for Constituents of Interest December 2010 to May 2014
Midwest Generation -- Waukegan Generating Station - Waukegan, Lake County, Illinois

**Notes**
(1) Illinois Lake Michigan (LM) Basin Water Quality Standards (WQS) and Illinois LM Basin Water Quality Criteria (WQC) are used as surface water effects values
(2) Manganese results for March 2012 for wells MW-01 through MW-05 were qualified as "^" by the laboratory, which denotes instrument-related QC exceeds the control limits
(3) Iron results for September 2012 for wells MW-01 through MW-05 were qualified as "^" by the laboratory, which denotes instrument-related QC exceeds the control limits
(2) Antimony results for November 2014 for wells MW-01 through MW-03 and MW-05 through MW-09 were qualified as "^" by the laboratory, which denotes instrument-related QC exceeds the control limits

$mg/l$ = milligrams per liter
NS = not sampled
"–" = value not available
"<" = constituent was not detected; the reporting limit is presented
bold/shading = concentration exceeds effects value

Table B-4-2
Comparison Of Average Groundwater Analytical Results To Surface Water Effects Values
Midwest Generation -- Waukegan Generating Station - Waukegan, Lake County, Illinois

| Constituent | Units | Effects Value [1] | Groundwater Analytical Results - Average Concentrations [2] | | | | | | | | | Average [3] |

**Notes**
(1) Illinois Lake Michigan (LM) Basin Water Quality Standards (WQS) and Illinois LM Basin Water Quality Criteria (WQC) are used as surface water effects values.
(2) Average of concentrations reported between December 2010 and February 2015. If a constituent was not detected during this timeframe, the average reporting limit is presented in the table, indicated with a "U" qualifier. Otherwise, non-detect results were included in the average calculation assuming one-half the reporting limit.
(3) Average of concentrations (averages) presented in the table, assuming one-half the reporting limit for non-detect results.

mg/L = milligram per liter
s.u. = standard units
"--" = value not available
U = constituent not detected above its reporting limit
bold/shading = concentration exceeds effects value

Table B-4-3
Comparison Of Maximum Groundwater Analytical Results To Surface Water Effects Values
Midwest Generation -- Waukegan Generating Station - Waukegan, Lake County, Illinois

| Constituent | Units | Effects Value [1] | Groundwater Analytical Results - Maximum Concentrations [2] | | | | | | | | | Average [3] |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | MW-01 | MW-02 | MW-03 | MW-04 | MW-05 | MW-06 | MW-07 | MW-08 | MW-09 | |

| Iron | mg/L | 1.0 | 0.1 U | 0.16 | 0.1 U | 0.1 U | **8.6** | **16** | **13** | **7** | 0.81 | **5.08** |
| Manganese | mg/L | 3.04 | 0.026 | 0.16 | 0.015 | 0.36 | 0.99 | 0.75 | 0.6 | 0.33 | 0.14 | 0.375 |
| Sulfate | mg/L | 500 | 390 | 370 | 290 | 360 | **1200** | 390 | **880** | 500 | 430 | **534** |
| pH | s.u. | 6.5 - 9.0 | **7.92-10.78** | **7.61-9.98** | **6.95-9.21** | 7.18-8.93 | 6.61-7.64 | 6.83-7.94 | 6.89-8.24 | 6.92-7.16 | 6.9-7.2 | 7.09-8.56 |
| Total Dissolved Solids | mg/L | 1000 | 750 | 770 | 860 | 680 | **3500** | **1200** | **1800** | **1200** | **1600** | **1370** |

**Notes**
(1) Illinois Lake Michigan (LM) Basin Water Quality Standards (WQS) and Illinois LM Basin Water Quality Criteria (WQC) are used as surface water effects values.
(2) Maximum detected concentrations reported between December 2010 and February 2015. If a constituent was not detected during this timeframe, the maximum reporting limit is presented in the table, indicated with a "U" qualifier. For pH, the range is presented.
(3) Average of well-specific concentrations (maximums) presented in the table. If the maximum is a non-detect result, one-half the reporting limit was used as a surrogate concentration in the calculation. For pH, the range presented in the "average" column is the average minimum and average maximum.

mg/L = milligram per liter
s.u. = standard units
"--" = value not available
U = constituent not detected above its reporting limit; reporting limit presented
bold/shading = concentration exceeds effects value

**Notes**
(1) Illinois General Use Water Quality Standards (WQS) and Illinois Water Quality Criteria (WQC) are used as surface water effects values
(2) Antimony results (all non-detects) for December 2012 for wells MW-01 through MW-10 were qualified as "^" by the laboratory, which denotes instrument-related QC exceeds the control limits

mg/l = milligrams per liter
s.u. = standard units
"--" = value not available
"<" = constituent was not detected, the reporting limit is presented
bold/shading = concentration exceeds effects value

Table B-5-2
Comparison Of Average Groundwater Analytical Results To Surface Water Effects Values
Midwest Generation -- Will County Generating Station - Romeoville, Will County, Illinois

| Constituent | Units | Effects Value [1] | Groundwater Analytical Results - Average Concentrations [2] | | | | | | | | | | Average [3] |

| Total Dissolved Solids | mg/L | -- | 942 | 897 | 1100 | 3250 | 1250 | 869 | 1280 | 1190 | 798 | 1000 | 1260 |

**Notes**
(1) Illinois General Use Water Quality Standards (WQS) and Illinois Water Quality Criteria (WQC) are used as surface water effects values.
(2) Average of concentrations reported between December 2010 and February 2015. If a constituent was not detected during this timeframe, the average reporting limit is presented in the table, indicated with a "U" qualifier. Otherwise, non-detect results were included in the average calculation assuming one-half the reporting limit.
(3) Average of concentrations (averages) presented in the table, assuming one-half the reporting limit for non-detect results.

mg/L = milligram per liter
s.u. = standard units
"--" = value not available
U = constituent not detected above its reporting limit
bold/shading = concentration exceeds effects value

**Notes**
(1) Illinois General Use Water Quality Standards (WQS) and Illinois Water Quality Criteria (WQC) are used as surface water effects values.
(2) Maximum detected concentrations reported between December 2010 and February 2015. If a constituent was not detected during this timeframe, the maximum reporting limit is presented in the table, indicated with a "U" qualifier. For pH, the range is presented.
(3) Average of well-specific concentrations (maximums) presented in the table. If the maximum is a non-detect result, one-half the reporting limit was used as a surrogate concentration in the calculation. For pH, the range presented in the "average" column is the average minimum and average maximum.

mg/L = milligram per liter
s.u. = standard units
"--" = value not available
U = constituent not detected above its reporting limit
bold/shading = concentration exceeds effects value

**SUMMARY LETTER**

October 13, 2005

Ms. Maria L. Race
Midwest Generation EME, LLC
One Financial Place
440 South LaSalle Street, Suite 3500
Chicago, Illinois 60605

VIA FEDERAL EXPRESS KPRG Project No. 15805

Re: Geotechnical Analysis of Soil Surrounding Settling Basins/Ponds

Dear Ms. Race:

KPRG and Associates, Inc. (KPRG) has recently received the geotechnical testing results from the soil boring program implemented in the vicinity of various ponds located at six of the Midwest Generation stations. Specifically, these stations and the number of borings advanced at each were:

- Waukegan Station (5 borings)
- 
- Will County Station (5 borings)
- Joliet #29 Station (6 borings)
- 
- Powerton Station (9 borings)

This letter report provides a project objective, documents the field procedures, identifies the geotechnical laboratory specifications and summarizes the geotechnical testing results. Each item is discussed separately below.

PROJECT OBJECTIVE

Based on discussions with Midwest Generation, the objective of the project was to obtain stratigraphic and geotechnical data from the vicinity of specific ponds at the various station locations. The results of the investigation would provide a physical characteristic data base for subsequent engineering evaluations, planning and decision analysis. The soil sample collection for geotechnical analysis was targeted for the approximate equivalent base elevation of each pond as specified by Midwest Generation.

MWG13-15_24264

## FIELD PROCEDURES

Prior to mobilizing for drilling activities, Midwest Generation contracted Lucky Locators, Inc. to provide utility clearance at each pre-established drilling location. Once the utility clearance was provided, KPRG mobilized a geoprobe rig which utilizes a direct hydraulic push technology for collecting soil cores. Continuous 5-foot core samples were collected during drilling at each location. The core samples were screened in the filed for total organic vapors with a photoionization detector (PID) and where appropriate, compressive strength readings were taken using a hand penetrometer. At the approximate base elevation of the adjoining pond, an attempt was made to push a Shelby Tube for collection of an undisturbed sample for subsequent geotechnical analysis. If the subsurface conditions did not allow for sample collection by pushing a Shelby Tube, an acetate core sample was collected for submittal for geotechnical analysis. If the targeted interval consisted of sufficiently coarse material that would not allow for either proper Shelby Tube or acetate core sampling, a representative volume of retrieved sample was placed into a plastic baggie for submittal for geotechnical analysis. Table 1 summarizes the overall results of the geotechnical sampling effort relative to station, sample identification number, sample collection type and depth.

Upon completion of sampling at each location, the boring was abandoned by placing unsampled core material back into the hole and filling the remainder of the boring with granular bentonite. A surface patch was then placed to match the surrounding surficial material.

## GEOTECHNICAL LABORATORY SPECIFICATIONS

KPRG subcontracted Terracon Consulting Engineers (Terracon) to perform the geotechnical laboratory analyses. The following geotechnical testing methods were run by Terracon:

- Grain Size with Hydrometer (ASTM Method D 422)
- Atterberg Limits (ASTM Method D 4318)
- Bulk Density (ASTM Method D 2937)
- Specific Gravity (ASTM Method D 854)
- Moisture Content (ASTM Method D 2216)
- Permeability (ASTM Method D 5084)
- USCS Soil Classification

In accordance with KPRG's proposal, Terracon was instructed to first run the Grain Size Distribution and Atterberg Limits testing. Based on these results, permeability testing was only performed if the Plasticity Index (PI) was less than 11 or if there was less than a 30% fraction passing the 200 mesh sieve. If both of these criteria were met (i.e., a PI of greater than 11 and greater than 30% fraction passing the 200 mesh sieve), the material should have a permeability in the order of $10^{-7}$ cm/sec which should provide sufficient

MWG13-15_24265

information for most desk-top engineering evaluations. As noted further below, only a few of the samples actually met these criteria.

It is noted that geoprobe acetate tube and/or baggie samples are not considered "undisturbed" samples and that some remolding/recompaction was required for completing permeability tests.

RESULTS

Table 1 summarizes the various samples collected for geotechnical analysis by station location and depth interval. The table notes whether the sample sent to the laboratory was a Shelby Tube, acetate tube or baggie sample.

The results of the geotechnical investigation program are organized separately for specific stations and provided in Attachments 1 through 6 along with sample location maps. A brief summary for each station is provided below. The complete geotechnical laboratory report is provided in Attachment 7.

Waukegan Station

A total of five borings were drilled and sampled at the Waukegan Station (WS-GT-1 through WS-GT-5). The approximate sample locations are provided on Figure 1-1 in Attachment 1 along with the results of the geotechnical testing in Table 1-1 and the associated soil boring logs.

A review of the boring logs indicates that the subsurface materials were generally sandy with some gravel and/or silts and clays. Some areas were noted to containing fill material generally consisting of ash/slag.

The geotechnical data in Table 1-1 from samples collected at elevations approximately equivalent to the base of the various adjacent ponds (as determined by Midwest Generation) also document these materials to be classified as sands with some gravel, silt and/or clay. Permeabilities were found to range from $1.0 \times 10^{-3}$ cm/sec to $2.3 \times 10^{-2}$ cm/sec. These permeabilities are consistent with sandy/gravelly materials.

MWG13-15_24266

Redacted

Will County Station

A total of five borings were drilled and sampled at the Will County Station (WC-GT-1 through WC-GT-5). The approximate sample locations are provided on Figure 3-1 in Attachment 3 along with the results of the geotechnical testing in Table 3-1 and the associated soil boring logs.

A review of the boring logs indicates that the subsurface stratigraphy varied across the site. The northern most boring (WC-GT-1) has a sandy/gravelly unit overlying a clay unit with weathered bedrock being encountered between 4.5 and 5 feet below ground surface (bgs). Borings WC-GT-2 through WC-GT-4 located on the west central portion of the property generally had a 1.5 to 2.5 foot thick fill layer with ash/slag and underlying sandy and gravelly units. Bedrock was generally encountered at around 10 feet bgs. The southern most boring (WC-GT-5) had a silty/sandy/gravelly layer overlaying weathered bedrock which was encountered at about 2.5 feet bgs.

The geotechnical data in Table 3-1 from samples collected at elevations approximately equivalent to the base of the various adjacent ponds (as determined by Midwest Generation) also document these materials to be classified as sands with some gravel or silts/clays. Permeabilities for the clayey and silty materials at borings WC-GT-4 and WC-GT-3 were estimated to range from $3.65 \times 10^{-7}$ cm/sec to $1.86 \times 10^{-6}$ cm/sec, respectively. It is noted, however, that the remolding for these samples could not meet the analytical method standard requirements due to the coarse fractions and that the values provided a verbal estimates. The true values could not be quantified due to the noted remolding issue and, therefore, are not included in the formal quantified results table provided by the geotechnical laboratory in Attachment 7. The coarser sandy and/or gravelly materials at locations WC-GT-2 and WC-GT-1 showed permeabilities at $4.02 \times 10^{-3}$ and $1.35 \times 10^{-1}$ cm/sec, respectively. The permeability for sample WC-GT-5 could not be run due to the relative amount of gravel which precluded being able to properly

MWG13-15_24267

remold a sample for the permeability analysis. This of itself suggests a relatively high permeability layer.

Joliet Station #29

A total of six borings were drilled and sampled at Joliet Station #29 (JS29-GT-1, through JS29-GT-6). The approximate sample locations are provided on Figure 4-1 in Attachment 4 along with the results of the geotechnical testing in Table 4-1 and the associated soil boring logs.

A review of the boring logs indicates that the subsurface stratigraphy varied across the site from primarily sand/gravel at location JS29-GT-1 to primarily clay at locations JS29-GT-3, JS29-GT-5 and JS29-GT-6. The boring logs for the remaining locations indicate an interlayering of the coarse and fine materials. Some minor amounts of ash/slag were noted at some locations within the upper foot of material. Bedrock was definitively encountered only at location JS29-GT-6 at a depth of approximately 15 feet bgs.

The geotechnical data in Table 4-1 from samples collected at elevations approximately equivalent to the base of the various adjacent ponds (as determined by Midwest Generation) indicates that the sample from location JS29-GT-6 met the previously defined criteria of a high PI (greater than 11) and greater than a 30% fraction passing the 200 mesh sieve. Therefore, it can be generally assumed that the materials are of low permeability as previously discussed and no further permeability testing was performed on this sample. The results of the permeability tests for locations JS29-GT-1, JS29-GT-3 and JS29-GT-5 ranged from $4.7 \times 10^{-4}$ to $2.96 \times 10^{-2}$ cm/sec. The permeabilities for samples JS29-GT-2 and JS29-GT-4 could not be run due to the relative amount of gravel which precluded being able to properly remold a sample for the permeability analysis. This of itself suggests relatively high permeability layers at those locations.

Redacted

Powerton Station

A total of nine borings were drilled and sampled at Powerton Station (PS-GT-1, through PS-GT-9). The approximate sample locations are provided on Figure 6-1 in Attachment 6 along with the results of the geotechnical testing in Table 6-1 and the associated soil boring logs.

A review of the boring logs indicates a varied stratigraphy from primarily clayey at locations PS-GT-1 and PS-GT-5 to an interlayering of sandy and clayey units at the other locations. It is noted that at locations PS-GT-7 through PS-GT-9, a slag/ash unit was logged starting at between 2 and 3 feet bgs and extending to approximately 15 feet bgs. A two foot ash layer was also logged between 2 and 4 feet bgs at location PS-GT-5.

The geotechnical data from samples collected at elevations approximately equivalent to the base of the various adjacent ponds (as determined by Midwest Generation) indicates that the sample from location PS-GT-5 met the previously defined criteria of a high PI (greater than 11) and greater than a 30% fraction passing the 200 mesh sieve. Therefore, it can be generally assumed that the materials are of low permeability as previously discussed and no further permeability testing was performed on this sample. The remaining permeabilities ranged from $1.6 \times 10^{-7}$ cm/sec to $2.31 \times 10^{-2}$ cm/sec; the lower permeabilities associated with clayey and silty soils and the higher values associated with sandier soils.

KPRG appreciates the opportunity for providing our technical services to Midwest Generation on this project. If there are any questions, please contact me at 262-781-0475.

Sincerely,
KPRG and Associates, Inc.

Richard R. Gnat

## PERMEABILITY TEST ON GRANULAR SOIL
ASTM D 2434

Project Number 58055075 Project Name KPRG Laboratory Testing

Test Number _____ Date 9/12/2005

Location of Sample JS-9-GT-2 Sampled _____ Report _____

Boring- _____ Sample- _____ Depth- 7 to 11.5'

Description of Soil Clayey Sand, with organics, trace gravel, dark brown

Materials Used: _____

Unit Weight Determination:

Diameter, D, cm 7.62 Wt. Soil (lb.) 1.150

Area, A, $cm^2$ 45.60 Moisture Content 23.7

Length, L, cm 6.350000 Volume ($ft^3$) 0.01022

Dry Density 91.0

Degree of Compactness Unknown- No proctor available

Re: Re-Issuance of Figure 4-1 for Geotechnical Summary Report

Dear Ms. Race:

As requested, enclosed are five copies of Figure 4-1 for the above referenced document with the boring location titles enlarged for clarity. KPRG and Associates, Inc. (KPRG) appreciates the continued opportunity for providing our technical services to Midwest Generation. If there are any questions, please contact me at 262-781-0475.

Sincerely,
KPRG and Associates, Inc.

**MIDWEST GENERATION, LLC'S RESPONSE TO COMPLAINANTS' FOURTH SET OF DOCUMENT REQUESTS, SECOND SET OF INTERROGATORIES, AND SECOND SET OF REQUESTS FOR ADMISSION TO RESPONDENTS**

Respondent, Midwest Generation, LLC, ("Midwest Generation"), through its undersigned attorneys, responds to Complainants' Fourth Set of Document Requests, Second Set of Interrogatories, and Second Set of Requests for Admission, ("Requests"), as follows:

**GENERAL OBJECTIONS**

Each of the Responses is made subject to and incorporates by reference the objections made in Midwest Generation's Responses to Complainants' First Set of Interrogatories, Requests for Documents and Request for Admission provided on September 2, 2014. Additionally, Midwest Generation makes the following objections:

1. Midwest Generation objects to the "Coal ash" definition to the extent that it includes other waste streams resulting from the operation of pollution controls.

2. Midwest Generation objects to the "Coal ash units" definition to the extent that it includes areas in which coal ash is not purposely directed to or placed on and to the extent it includes *de minimis* collections of coal ash due to the operations of the Station.

3. Midwest Generation objects to the "Joliet 29" definition to the extent it states that the Station is located in Kendall County.

4. Midwest Generation objects to the "Uppermost aquifer" definition as vague, ambiguous and capable of varying interpretations. Additionally, Midwest Generation objects to the definition to the extent it depends upon a coal ash unit to identify any aquifer's location.

5. Midwest Generation objects to Instruction No. 6 as overly broad and unduly burdensome.

6. Midwest Generation objects to the Number of Requests to Admit as in excess of the number of requests allowed under the Ill. Sup. Ct. Rule 216(f) and the additional requests for admission agreed to in the Agreed Motion to Extend the Discovery Schedule and Modify the Discovery Order filed with the Board on February 4, 2015. Illinois Supreme Court Rule 216(f) allows each party to issue a maximum of 30 requests for admission, and each subpart counts as a separate request. Ill. Sup. Ct. Rule 216(f). On June 16, 2014, Complainants submitted to Midwest Generation three Requests for Admission of Genuineness of Documents, attaching fifty-eight documents. Each of the fifty eight documents is a subpart of the request for admission. On February 4, 2015, the parties agreed that each may propound 20 additional requests for admission. On March 2, 2015, Complainants propounded a total of forty requests to admit to Complainants in their Second and Third Set of Requests for Admission. Because the requests to admit are in excess of the agreed extension and the limits under Ill. Sup. Ct. Rule 216(f), Midwest Generation has answered twenty of the forty propounded requests for admission.

7. Respondent reserves the right to object to the admissibility of any of the documents produced pursuant to the Responses, in whole or in part, at hearing in this action on any grounds including but not limited to materiality, relevance, confidential business information and privilege.

## REQUEST FOR PRODUCTION OF DOCUMENTS

1. Provide any Documents related to each refusal to admit any requests for admission herein.

**ANSWER**:

Without waiving its objections, responsive documents include Bates #MWG13-15_18824-19428, and Bates #MWG13-15_4-9, 69, 73, 77, 81, 85, 89, 93, 97 and 101.

2. Provide all Documents that evidence or relate to your Interrogatory responses.

**ANSWER**:

Midwest Generation incorporates and includes the objections stated in response to each Interrogatory Request. Without waiving its objections, responsive documents are set forth in the interrogatory answers and have already been provided or are attached.

3. Provide all maps that accurately show which portions of the Joliet 29 site are owned or operated by MWG.

**ANSWER**:

Without waiving its objections, responsive documents are available for review; see Bates No. MWG13-15_48403 - 48414.

4. Provide all maps that accurately show which portions of the Powerton site are owned or operated by MWG.

**ANSWER**:

Without waiving its objections, responsive documents are available for review; see Bates No. MWG13-15_4815 - 48426.

5. Provide all maps that accurately show which portions of the Waukegan site are owned by MWG.

**ANSWER**:

Without waiving its objections, responsive documents are available for review; see Bates No. MWG13-15_48427 - 48432.

6. Provide all maps that accurately show which portions of the Will County site are owned by MWG.

**ANSWER**:

Without waiving its objections, responsive documents are available for review; see Bates No. MWG13-15_48433-48438.

7. Provide all Documents pertaining to boron or borax use at the Tannery site.

**ANSWER**:

Midwest Generation objects to Document Request No. 7 as overly broad and unduly burdensome and seeks documents or information not within Midwest Generation's possession, custody or control. Without waiving its objections, responsive and non-privileged documents currently in Midwest Generation's control include Bates MWG13-15_43754-43862.

8. Provide all Documents pertaining to boron or borax use at the General Boiler site.

**ANSWER**:

See Answer to Document Request No. 7, incorporated by reference. .

9. Provide all Documents related to groundwater elevations at Waukegan Groundwater Monitoring Wells MW-8 and MW-9.

**ANSWER**:

Without waiving its objections, responsive documents are available for review; see Bates MWG13-15_48439.

10. Provide all Documents related to groundwater elevation at all monitoring wells at the former General Boiler site, including but not limited to monitoring wells GB-1 through GB-7.

**ANSWER**:

Midwest Generation objects to Document Request No. 10 as overly broad and unduly burdensome and seeks documents and information not within Midwest Generation's possession, custody or control. Without waiving its objections, Midwest Generation states that no responsive documents within its custody or control are currently available.

11. Provide all Documents related to groundwater elevation at monitoring wells 1 through 9 at the Tannery site.

**ANSWER**:

Midwest Generation objects to Document Request No. 11 as overly broad and unduly burdensome and seeks documents and information not within Midwest Generation's possession, custody or control. Without waiving its objections, Midwest Generation states that responsive documents were previously provided and include Bates #MWG13-15_46211-MWG13-15_48402.

12. Provide all groundwater quality data from all monitoring wells at the former General Boiler site, including but not limited to monitoring wells GB-1 through GB-7.

**ANSWER**:

See Answer to Document Request No. 10, incorporated by reference.

13. Provide all groundwater quality data from monitoring wells 1 through 9 at the Tannery site.

**ANSWER**:

See Answer to Document Request No. 11, incorporated by reference.

14. Provide all Documents evidencing or related to the contents of soil borings taken when ELUC wells MW-10, MW-11, MW-12, and MW-14 were drilled, including but not limited to boring logs.

**ANSWER**:

Midwest Generation objects to Document Request No. 14 as vague as to the "contents of soil borings." Additionally, see Answer to Document Request No. 10, incorporated by reference.

15. Provide all Documents evidencing or related to the contents of soil borings taken when groundwater monitoring wells 1 through 14 at the Tannery site were drilled, including but not limited to boring logs.

**ANSWER**:

Midwest Generation objects to Document Request No. 15 as vague as to the "contents of soil borings." Additionally, see Answer to Document Request No. 11, incorporated by reference.

16. Provide all Documents evidencing or related to the contents of soil borings taken when all monitoring wells at the former General Boiler site, including but limited to monitoring wells GB-1 through GB-7, were drilled, including but not limited to boring logs.

**ANSWER**:

See Answer to Document Request No. 14, incorporated by reference.

17. Provide any and all groundwater quality data from the first quarter of 2015 from all groundwater monitoring wells at Joliet 29, Will County, Powerton, and Waukegan, including but not limited to all Waukegan Groundwater Monitoring Wells, all monitoring wells at the Tannery Site, all monitoring wells at the General Boiler site, and ELUC wells MW-10, MW-11, MW-12, MW-14 and MW-15.

**ANSWER**:

Midwest Generation objects to Document Request No. 17 as overly broad and unduly burdensome and seeks documents and information not within Midwest Generation's possession, custody or control. Without waiving its objections, Midwest Generation states that responsive documents are not currently available.

18. Provide a complete Phase II Environmental Site Assessment for Joliet 29, including all boring logs.

**ANSWER**:

Without waiving its objections, Midwest Generation states that responsive documents are included at Bates No. MWG13-15_48440-48492.

## INTERROGATORIES

1. Identify any and all methods, other than visual inspection, that MWG uses to inspect ash pond liners for Damage, weakness or leaks at Joliet 29, Will County, Waukegan and Powerton, and state:

a. How each method of inspection identifies weakness or damage to liners;
b. When the use of each method of inspection began at each pond; and
c. The frequency with which each method of inspection is used at each pond.

**ANSWER**:

Midwest Generation objects to Interrogatory No. 1 because it is overly broad, unduly burdensome, and seeks material covered by the work product and attorney-client privilege. Without waiving its objections, Midwest Generation states that the other method to inspect the liners for damage or leaks is the electrical leak location method. The electrical leak location method detects paths through the geomembrane caused by water or moisture in the leaks. The electrical leak location method has been used on HDPE liners since mid-2000s and takes place when HDPE lining is installed at impoundments.

2. State whether MWG has ever monitored groundwater at Joliet 29, Waukegan, Will County and Powerton aside from the monitoring it currently performs at groundwater monitoring wells installed on or after 2010. If MWG has conducted such monitoring, state:

a. The specific locations at each site where groundwater was monitored; and
b. Over what time period that monitoring took place.

**ANSWER**:

Midwest Generation objects to Interrogatory No. 2 as overly broad and unduly burdensome and seeks documents or information not within Midwest Generation's possession, custody or control. Midwest Generation further objects to Interrogatory No. 2 to the extent it seeks materials that are

not relevant to the subject matter involved in the pending action or not reasonably calculated to lead to relevant, discoverable evidence. Finally, Midwest Generation further objects to this interrogatory as overly broad and limits its answer to monitoring for coal ash constituents. Without waiving its objections, Midwest Generation states that it provided all relevant groundwater monitoring results to Complainants in response to Document Request No. 8 of Complainants First Set of Document Requests, including Bates Nos. 2,459-6,822, 34716-36799, 43695-43862, 43871-44121, 44983-45769, and the documents provided at the offices of Nijman Franzetti. Additionally, see Midwest Generation response to Interrogatory No. 8 in Complainant's first Set of Interrogatories.

3. State whether MWG has ever removed Coal ash from any part of the Powerton site aside from the active ash ponds and, if MWG has done so, identify where the Coal ash were removed from and when that removal took place.

**ANSWER**:

Midwest Generation objects to Interrogatory No. 3 as overly broad and unduly burdensome and seeks documents or information not within Midwest Generation's possession, custody or control. Additionally, Midwest Generation objects to this interrogatory as requesting information already provided in the document requests and in the deposition of Mr. Mark Kelly. Without waiving its objections, Midwest Generation states that coal ash is removed from the silos and various ducts at the Station work during cleanouts. The coal ash is temporarily stored in the metal cleaning basin, until Midwest Generation removes the coal ash and hauls it offsite. The coal ash is removed from the metal cleaning basin approximately two to three times per year. Also, historically the limestone basin and areas around the coal piles were used for temporary placement of coal ash before off site removal. The coal ash was removed from these locations on a periodic basis before 2012.

## REQUESTS FOR ADMISSION

1. Admit that Ash Landfill SW is within the current property boundaries of the portion of the Joliet 29 site that is operated by MWG.

**ANSWER**:

Midwest Generation objects to this request as calling for a legal conclusion. Without waiving its objections, Midwest Generation admits that it leases the Joliet 29 Station which includes the area defined here as the Ash Landfill SW.

2. Admit that Ash Landfill NE is within the current property boundaries of the portion of the Joliet 29 site that is operated by MWG.

**ANSWER**:

Midwest Generation objects to this request as calling for a legal conclusion. Without waiving its objections, Midwest Generation admits that it leases the Joliet 29 Station which includes the area defined here as the Ash Landfill NE.

3. Admit that, prior to approval of the Joliet 29 Groundwater Monitoring Zone ("GMZ"), all of the groundwater underlying Joliet 29 was classified as Class I: Potable Resource Groundwater pursuant to 35 Ill. Adm. Code Part 620.

**ANSWER**:

Midwest Generation objects to this request as calling for a legal conclusion. Midwest Generation further objects to this request pursuant to its sixth General Objection set forth above, that this request is in excess of the number of requests allowed under Ill. Sup. Ct. Rule 216(f) and the additional requests for admission agreed to in the Agreed Motion to Extend the Discovery Schedule and Modify the Discovery Order filed with the Board on February 4, 2015.

4. Admit that, prior to approval of the Will County Groundwater Monitoring Zone ("GMZ"), all of the groundwater underlying Will County was classified as Class I: Potable Resource Groundwater pursuant to 35 Ill. Adm. Code Part 620.

**ANSWER**:

See Answer to Request No. 3, incorporated by reference.

5. Admit that, prior to approval of the Powerton Groundwater Monitoring Zone ("GMZ"), all of the groundwater underlying Powerton was classified as Class I: Potable Resource Groundwater pursuant to 35 Ill. Adm. Code Part 620.

**ANSWER**:

See Answer to Request No. 3, incorporated by reference.

6. Admit that the groundwater underlying Waukegan is classified as Class I: Potable Resource Groundwater pursuant to 35 Ill. Adm. Code Part 620.

**ANSWER**:

See Answer to Request No. 3, incorporated by reference.

7. Admit that Ash Landfill NE at Joliet 29 is not lined.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "lined" is vague, ambiguous, and capable of varying interpretations. Subject to its objection, Midwest Generation states that after reasonable inquiry, the information known or readily obtainable is insufficient to allow Midwest Generation to admit or deny the request.

8. Admit that Ash Landfill NE has not been lined or relined since MWG began operating Joliet 29.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the terms "lined" and "relined" are vague, ambiguous, and capable of varying interpretations. Midwest Generation further objects to this request pursuant to its sixth General Objection set forth above, that this request is in excess of the number of requests allowed under Ill. Sup. Ct. Rule 216(f) and the

additional requests for admission agreed to in the Agreed Motion to Extend the Discovery Schedule and Modify the Discovery Order filed with the Board on February 4, 2015.

9. Admit that there is Coal ash in the ground within the boundary of the Ash Landfill NE at Joliet 29.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the phrase "Coal ash in the ground" is vague, ambiguous, and capable of varying interpretations. Subject to its objection, Midwest Generation states that after reasonable inquiry, the information known or readily obtainable is insufficient to allow Midwest Generation to admit or deny the request.

10. Admit that MWG has not removed Coal ash from Ash Landfill NE at Joliet 29.

**ANSWER**:

See Answer to Request No. 8, incorporated by reference.

11. Admit that there is no impermeable cap over Ash Landfill NE at Joliet 29.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "impermeable cap" is vague, ambiguous, and capable of varying interpretations. Subject to its objection, Midwest Generation admits the request.

12. Admit that Ash Landfill SW at Joliet 29 is not lined.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "lined" is vague, ambiguous, and capable of varying interpretations. Subject to its objection, Midwest Generation

states that after reasonable inquiry, the information known or readily obtainable is insufficient to allow Midwest Generation to admit or deny the request. .

13. Admit that Ash Landfill SW has not been lined or relined since MWG began operating Joliet 29.

**ANSWER**:

See Answer to Request No. 8, incorporated by reference.

14. Admit that there is Coal ash in the ground within the boundary of the Ash Landfill SW at Joliet 29.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the phrase "Coal ash in the ground" is vague, ambiguous, and capable of varying interpretations. Midwest Generation further objects to this request pursuant to its sixth General Objection set forth above, that this request is in excess of the number of requests allowed under Ill. Sup. Ct. Rule 216(f) and the additional requests for admission agreed to in the Agreed Motion to Extend the Discovery Schedule and Modify the Discovery Order filed with the Board on February 4, 2015.

15. Admit that MWG has not removed Coal ash from Ash Landfill SW at Joliet 29.

**ANSWER**:

Denied.

16. Admit that there is no impermeable cap over Ash Landfill SW at Joliet 29.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "impermeable cap" is vague, ambiguous, and capable of varying interpretations. Midwest Generation further

objects to this request pursuant to its sixth General Objection set forth above, that this request is in excess of the number of requests allowed under Ill. Sup. Ct. Rule 216(f) and the additional requests for admission agreed to in the Agreed Motion to Extend the Discovery Schedule and Modify the Discovery Order filed with the Board on February 4, 2015.

17. Admit that the Former Slag/Fly Ash Storage Area at Waukegan is not lined.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "lined" is vague, ambiguous, and capable of varying interpretations. Subject to its objection, Midwest Generation states that after reasonable inquiry, the information known or readily obtainable is insufficient to allow Midwest Generation to admit or deny the request.

18. Admit that the Former Slag/Fly Ash Storage Area at Waukegan has not been lined or relined since MWG began operating Waukegan.

**ANSWER**:

See Answer to Request No. 8, incorporated by reference.

19. Admit that there is Coal ash in the ground within the boundary of the Former Slag/Fly Ash Storage Area at Waukegan.

**ANSWER**:

See Answer to Request No. 14, incorporated by reference.

20. Admit that Coal ash has not been removed from the Former Slag/Fly Ash Storage Area at Waukegan since MWG began operating Waukegan.

**ANSWER**:

Midwest Generation objects to this request pursuant to its sixth General Objection set forth above, that this request is in excess of the number of requests allowed under Ill. Sup. Ct. Rule

216(f) and the additional requests for admission agreed to in the Agreed Motion to Extend the Discovery Schedule and Modify the Discovery Order filed with the Board on February 4, 2015.

21. Admit that there is no impermeable cap over the Former Slag/Fly Ash Storage Area at Waukegan.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "impermeable cap" is vague, ambiguous, and capable of varying interpretations. Subject to its objection, Midwest Generation admits the request.

22. Admit that, other than any borings taken when drilling Waukegan Groundwater Monitoring Wells MW-1 through MW-5 at Waukegan, MWG has not removed any Coal ash from the ground in the vicinity of Waukegan Groundwater Monitoring Wells MW-1 through MW-4.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "vicinity" and the phrase "Coal ash from the ground" are vague, ambiguous, and capable of varying interpretations. Midwest Generation further objects to this request on the grounds that it is vague because it presumes that there is Coal ash on or in the soil in the vicinity of the Waukegan Groundwater Monitoring Wells MW-1 through MW-4. Subject to its objection, Midwest Generation denies this request.

23. Admit that, other than any borings taken when drilling Waukegan Groundwater Monitoring Wells MW-7 through MW-9, MWG has not removed any Coal ash from the ground in the vicinity of Waukegan Groundwater Monitoring Wells MW-7 through MW- 9 at Waukegan.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "vicinity" and the phrase "Coal ash from the ground" are vague, ambiguous, and capable of varying interpretations. Midwest Generation further objects to this request as vague because it presumes that there is Coal

ash on or in the ground in the vicinity of the Waukegan Groundwater Monitoring Wells MW-7 through MW-9. Subject to its objection, Midwest Generation denies this request.

24. Admit that the Retention Basin at Will County is not lined.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "lined" is vague, ambiguous, and capable of varying interpretations. Without waiving its objection, Midwest Generation denies this request.

25. Admit that the Retention Basin at Will County has not been lined or relined since MWG began operating Waukegan.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the terms "lined" and "relined" are vague, ambiguous, and capable of varying interpretations. Midwest Generation further objects that this request is vague because operations at Will County did not depend upon operations at Waukegan. Without waiving its objection, Midwest Generation denies this request.

26. Admit that the Retention Basin at Will County currently contains Coal ash.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "contains" is vague, ambiguous, and capable of varying interpretations because it does not account for *de minimis* amounts that may inadvertently land in the Retention Basin due to the nature of the operations at the Will County Station. Without waiving its objections, Midwest Generation denies this request.

27. Admit that Coal ash has not been removed from the Retention Basin at Will County since MWG began operating Will County.

**ANSWER**:

Denied.

28. Admit that there is no impermeable cap over the Retention Basin at Will County.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "impermeable cap" is vague, ambiguous, and capable of varying interpretations. Without waiving its objection, Midwest Generation admits this request.

29. Admit that the Standby Pond at Will County is not lined.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "lined" is vague, ambiguous, and capable of varying interpretations. See Answer to request No. 8, incorporated by reference.

30. Admit that the Standby Pond at Will County has not been lined or relined since MWG began operating Waukegan.

**ANSWER**:

See Answer to request No. 8, incorporated by reference.

31. Admit that Coal ash has not been removed from the Standby Pond at Will County since MWG began operating Will County.

**ANSWER**:

See Answer to request No. 20, incorporated by reference.

32. Admit that there is no impermeable cap over the Standby Pond at Will County.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "impermeable cap" is vague, ambiguous, and capable of varying interpretations. Without waiving its objection, Midwest Generation admits this request.

33. Please admit you have no information that boron was used at the General Boiler site.

**ANSWER**:

See Answer to request No. 20, incorporated by reference.

34. Please admit you have no information that anything containing boron was used at the General Boiler site.

**ANSWER**:

See Answer to request No. 20, incorporated by reference.

Respectfully submitted,

Midwest Generation, LLC

**MIDWEST GENERATION, LLC'S RESPONSE TO COMPLAINANTS' FIFTH SET OF DOCUMENT REQUESTS AND REQUESTS FOR ADMISSION TO RESPONDENTS**

Respondent, Midwest Generation, LLC, ("Midwest Generation"), through its undersigned attorneys, responds to Complainants' Fifth Set of Document Requests, and Third Set of Requests for Admission ("Requests"), as follows:

**GENERAL OBJECTIONS**

Each of the Responses is made subject to and incorporates by reference the objections made in Midwest Generation's Responses to Complainants' First Set of Interrogatories, Requests for Documents and Request for Admission provided on September 2, 2014 and its Responses to Complainants' Fourth Set of Document Requests, Second Set of Interrogatories, and Second Set of Requests Request for Admission. Respondent reserves the right to object to the admissibility of any of the documents produced pursuant to the Responses, in whole or in part, at hearing in this action on any grounds including but not limited to materiality, relevance, confidential business information and privilege.

## REQUEST FOR PRODUCTION OF DOCUMENTS

1. Provide any Documents related to each refusal to admit any requests for admission herein.

**ANSWER**:

See Answer to Request No. 1 of Complainant's Fourth Set of Document Requests.

2. In light of Rebecca Maddox's identification of the Retention Basin as containing Coal ash (*see* Rebecca Maddox Deposition Tr. 45-2 – 45-3), please remove redactions related to the Retention Basin at Will County in, and provide un-redacted copies of, the following documents:

   - Bates MW 13-15_4 – 12
   - Bates MW 13-15_69
   - Bates MW 13-15_73
   - Bates MW 13-15_77
   - Bates MW 13-15_81
   - Bates MW 13-15_85
   - Bates MW 13-15_89
   - Bates MW 13-15_93
   - Bates MW 13-15_97
   - Bates MW 13-15_101
   - Bates MW 13-15_102 – 176

**ANSWER**:

See attached updated documents.

3. In light of the identification of the South Area Runoff Basin as containing Coal ash (*see* Bates MWG13-15_2017 in "Questionnaire for the Steam Electric Power Generating Effluent Guidelines" by MWG), please remove redactions related to the South Area Runoff Basin at Will County in, and provide un-redacted copies of, the following documents:

   - Bates MW 13-15_4 – 12
   - Bates MW 13-15_69
   - Bates MW 13-15_73
   - Bates MW 13-15_77
   - Bates MW 13-15_81
   - Bates MW 13-15_85
   - Bates MW 13-15_89

•Bates MW 13-15_93
•Bates MW 13-15_97
•Bates MW 13-15_101
•Bates MW 13-15_102 – 176

**ANSWER**:

MWG objects to this request as overbroad and unduly burdensome and seeks materials that are not relevant to the subject matter involved in the pending action. Coal ash is not placed in nor transferred to the South Area Runoff Basin. (See Rebecca Maddox Deposition p. 34 ln. 23 – p. 35 ln. 18).

4. In light of the identification of the Coal Pile Runoff Basin at Waukegan as containing Coal ash (*see* Bates MWG13-15_1674 in "Questionnaire for the Steam Electric Power Generating Effluent Guidelines" by MWG), please remove redactions related to the Coal Pile Runoff Basin at Waukegan in, and provide un-redacted copies of, the following documents:

•Bates MW 13-15_13 – 18
•Bates MW 13-15_67
•Bates MW 13-15_71
•Bates MW 13-15_75
•Bates MW 13-15_79
•Bates MW 13-15_83
•Bates MW 13-15_87
•Bates MW 13-15_91
•Bates MW 13-15_95
•Bates MW 13-15_99
•Bates MW 13-15_102 – 176

**ANSWER**:

MWG objects to this request as overbroad and unduly burdensome and seeks materials that are not relevant to the subject matter involved in the pending action. Coal ash is not placed in nor transferred to the Coal Pile Runoff Basin. (See Maria Race Deposition p. 67 ln. 10 – p. 68 ln. 3 and Frederick Veenbaas Deposition, p. 68, ln 15-17 and p. 70, ln. 22- p. 71 ln. 3).

5. In light of the identification of the East Yard Runoff Basin at Powerton as containing Coal ash (*see* Bates MWG13-15_1276 in "Questionnaire for the Steam Electric Power Generating Effluent Guidelines" by MWG), please remove redactions related to the East Yard Runoff Basin at Powerton in, and provide un-redacted copies of, the following documents:

- Bates MW 13-15_19 – 28
- Bates MW 13-15_68
- Bates MW 13-15_72
- Bates MW 13-15_76
- Bates MW 13-15_80
- Bates MW 13-15_84
- Bates MW 13-15_88
- Bates MW 13-15_92
- Bates MW 13-15_96
- Bates MW 13-15_100
- Bates MW 13-15_102 – 176

**ANSWER**:

MWG objects to this request as overbroad and unduly burdensome and seeks materials that are not relevant to the subject matter involved in the pending action. Coal ash is not placed in nor transferred to the East Yard Runoff Basin. (See Mark Kelly Deposition, p. 69, ln 11- p. 71 ln 7 and p. 113 ln 18 – p. 114 ln 2).

6. Please remove all redactions related to all Coal ash units that have ever been used to store or dispose of Coal ash at each plant, including both active and inactive or abandoned Coal ash units, and provide un-redacted copies of, the following documents: Bates MW 13-15_1 and Bates MW 13-15_176.

**ANSWER**:

Midwest Generation objects to this request as overbroad and unduly burdensome and seeks materials that are not relevant to the subject matter involved in the pending action. Without waiving its objections, responsive documents are attached.

## REQUESTS FOR ADMISSION

Respondent, Midwest Generation, LLC, ("Midwest Generation"), through its undersigned attorneys, responds to Complainants' Requests for Admission, ("Admission"), as follows:

1. Admit that the Boiler Slag Stockpile at Will County is not lined.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "lined" is vague, ambiguous, and capable of varying interpretations. Midwest Generation further objects pursuant to its sixth General Objection set forth in its Response to Complainants Second Set of Requests for Admission, that this request is in excess of the number of requests allowed under Ill. Sup. Ct. Rule 216(f) and the additional requests for admission agreed to in the Agreed Motion to Extend the Discovery Schedule and Modify the Discovery Order filed with the Board on February 4, 2015.

2. Admit that the Boiler Slag Stockpile at Will County has not been lined or relined since MWG began operating Will County.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the terms "lined" and "relined" are vague, ambiguous, and capable of varying interpretations. Additionally, see Answer to Request No. 1, incorporated by reference.

3. Admit that there is no impermeable cap over the Boiler Slag Stockpile at Will County.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "impermeable cap" is vague, ambiguous, and capable of varying interpretations. Additionally, see Answer to Request No. 1, incorporated by reference.

4. Admit that there is Coal ash in the ground within the boundary of the Primary Slag Settling Basin at Will County.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the terms "Primary Slag Settling Basin" and "Coal Ash in the ground" are vague. Subject to its objection, Midwest Generation states that after reasonable inquiry, the information known or readily obtainable is insufficient to allow Midwest Generation to admit or deny the request.

5. Admit that MWG has not removed Coal ash from the ground within the boundary of the Primary Slag Settling Basin at Will County.

**ANSWER**:

See Answer to Request No. 4, incorporated by reference.

6. Admit that there is no impermeable cap over the Primary Slag Settling Basin at Will County.

**ANSWER**:

Midwest Generation objects to this request on the grounds that the term "impermeable cap" is vague, ambiguous, and capable of varying interpretations. Additionally, see Answer to Request No. 4, incorporated by reference.

## ANSWER AND DEFENSES TO SECOND COMPLAINT

Respondent, Midwest Generation, LLC ("MWG"), by its undersigned counsel, submits its Answer, Defenses and Affirmative Defenses to the Complaint as follows:

## FACTUAL BACKGROUND

1. Midwest Generation, LLC ("MWG") owns and operates the Joliet 29 Generating Station ("Joliet 29") in Joliet, Illinois in Will and Kendall Counties, on the north side of the Des Plaines River. MWG has historically stored and disposed of coal ash and other coal combustion waste in repositories that include, but are not limited to, two or more landfills and three ash ponds (two HDPE-lined, one geocomposite-lined) on the same side of the river, and continues to dispose of coal ash and other coal combustion waste in these ponds or repositories..

ANSWER: Respondent admits that it operates the Joliet 29 Electric Generating Station ("Joliet 29") in Joliet, Will County, Illinois. Respondent admits that Joliet 29 has three, high density polyethylene ("HDPE") lined, ash ponds as a part of the wastewater treatment system permitted under Joliet 29's NPDES permit. Respondent denies the remaining allegations contained in paragraph 1.

2. MWG installed eleven groundwater monitoring wells (MW-1 through MW-11) around the Joliet 29 ash ponds in 2010, as depicted in the well map included in MWG groundwater monitoring reports for Joliet 29, attached hereto as Exhibit A. Since monitoring

began in late 2010, groundwater monitoring results have shown levels of antimony, boron, chloride, iron, manganese, sulfate, and Total Dissolved Solids ("TDS") which exceed Illinois Groundwater Quality Standards ("GQSs"). *See* violations of Class I and Class II GQSs and MWG groundwater monitoring data for Joliet 29, attached hereto as Exhibits B, C, and D, respectively.

ANSWER: Respondent admits that it installed eleven groundwater monitoring wells (MW-1 through MW-11) at Joliet 29 in 2010. Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and D and therefore denies same. Respondent denies the remaining allegations contained in paragraph 2.

3. MWG owns and operates the Powerton Generating Station ("Powerton") in Pekin, Illinois in Tazewell County. MWG has historically stored and disposed of coal ash and other coal combustion waste in repositories that include, but are not limited to three active ash ponds on the site, two of them lined; one less active ash pond on the site; up to two additional ponds or basins containing coal ash and other coal combustion waste; and a former slag dumping area. MWG continues to store or dispose of coal ash and other coal combustion waste in these ponds or repositories.

ANSWER: Respondent admits that it operates the Powerton Electric Generating Station ("Powerton") in Pekin, Tazewell County, Illinois. Respondent admits that Powerton has three ash ponds, lined with HDPE-liners, as a part of the wastewater treatment system permitted under Powerton's NPDES permit, and a metal cleaning basin lined with an HDPE liner. Respondent denies the remaining allegations contained in paragraph 3.

4. MWG monitors groundwater at Powerton with a network of 15 wells (MW-1 through MW-15, depicted in the well map included in MWG groundwater monitoring reports for Powerton, attached hereto as Exhibit E). Since monitoring began in late 2010, groundwater monitoring results have shown levels of antimony, arsenic, boron, chloride, iron, lead, manganese, nitrate, selenium, sulfate, thallium, and TDS which exceed Illinois GQS and/or open dumping standards. *See* violations of Class I and Class II GQSs and MWG groundwater monitoring data for Powerton, attached hereto as Exhibits B, C, and F, respectively.

ANSWER: Respondent admits that it installed fifteen groundwater monitoring wells (MW-1 through MW-15) at Powerton in 2010. Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and F and therefore denies same. Respondent denies the remaining allegations contained in paragraph 4.

5. MWG owns and operates the Waukegan Generating Station ("Waukegan") in Waukegan, Illinois in Lake County. There are two active HDPE-lined ponds at this site. MWG has stored and disposed of coal ash and other coal combustion waste in repositories that include, but are not limited to, these two ponds and one former ash landfill or disposal area and continues to do so.

ANSWER: Respondent admits that it owns and operates the Waukegan Electric Generating Station ("Waukegan") in Waukegan, Lake County, Illinois. Respondent further admits that Waukegan has two ash ponds which are lined with HDPE-liners and states that the ash ponds are a part of the wastewater treatment system permitted by Waukegan's NDPES permit. Respondent denies the remaining allegations contained in paragraph 5.

6. MWG installed 5 wells (MW-1 through MW-5) around the Waukegan ash ponds in 2010, as depicted in the well map included in MWG groundwater monitoring reports for Waukegan, attached hereto as Exhibit G. Groundwater monitoring results from Waukegan show levels of antimony, arsenic, boron, chloride, iron, manganese, nitrate, selenium, pH, sulfate, and TDS which exceed Illinois GQS and/or open dumping standards. *See* violations of Class I and Class II GQSs and MWG groundwater monitoring data for Waukegan, attached hereto as Exhibits B, C, and H, respectively.

ANSWER: Respondent admits that it installed five groundwater monitoring wells (MW-1 through MW-5) at Waukegan. Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and H and therefore denies same. Respondent denies the remaining allegations contained in paragraph 6.

7. MWG owns and operates the Will County Generating Station ("Will County") in Romeoville, Illinois in Will County. MWG has stored and disposed of coal ash and other coal combustion waste at the site in repositories that include four geocomposite-lined ponds and two or more additional ponds. MWG continues to store and dispose of coal ash and other coal combustion waste in one or more of these ponds.

ANSWER: Respondent admits that it owns and operates the Will County Electric Generating Station ("Will County") in Romeoville, Will County, Illinois. Respondent admits that Will County has two ash ponds, lined with HDPE-liners, which are a part of the wastewater treatment system and permitted by Will County's NDPES permit. Respondent further states that in 2013,

Respondent took two ash ponds at Will County out of service. Respondent denies the remaining allegations contained in paragraph 7.

8. MWG installed 10 wells around the Will County plant's ponds in 2010 (MW-1 through MW-10; *see* the well map included in MWG groundwater monitoring reports for Will County, attached hereto as Exhibit I.) Groundwater monitoring results from Will County show levels of antimony, arsenic, boron, chloride, manganese, pH, selenium, sulfate, and TDS which exceed Illinois GQS and/or open dumping standards. *See* violations of Class I and Class II GQSs and MWG groundwater monitoring data for Will County, attached hereto as Exhibits B, C, and J, respectively.

ANSWER: Respondent admits that it installed ten groundwater monitoring wells (MW-1 through MW-10) at Will County. Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and J and therefore denies same. Respondent denies the remaining allegations contained in paragraph 8.

9. On June 11, 2012, the Illinois Environmental Protection Agency ("IEPA") sent MWG Violation Notices describing violations of Section 12 of the Illinois Environmental Protection Act, 415 ILCS 5/12, and Groundwater Quality regulations at Joliet 29, Powerton, Waukegan, and Will County. *See* Violation Notices for Powerton, Joliet 29, Waukegan, and Will County, attached hereto as Exhibits K–N. In the Violation Notices IEPA identified groundwater monitoring results that exceeded Illinois Class I GQS, which are found at 35 IAC 620.410.

ANSWER: Respondent admits that on June 11, 2012 the Illinois Environmental Protection Agency sent Violation Notices to Respondent and states that the Violation Notices speak for themselves. Respondent denies the remaining allegations contained in paragraph 9.

## THE POLLUTANTS

10. As set forth in detail in Exhibit B, groundwater monitoring results at Joliet 29, Powerton, Waukegan, and/or Will County have exceeded Illinois Class I GQS, 35 Ill. Admin. Code § 620.410, for the following pollutants: Antimony, arsenic, boron, chloride, iron, lead, manganese, mercury, nitrate, selenium, sulfate, total dissolved solids, and thallium.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibit B, and therefore denies same. Respondent denies the remaining allegations contained in paragraph 10.

11. Many of the pollutants found at elevated concentrations in the groundwater monitoring results at Joliet 29, Powerton, Waukegan, and/or Will County are constituents of coal ash.[1]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 11 and therefore denies same

12. As MWG recognizes, boron is a primary indicator of potential coal ash impacts to groundwater.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 12 and therefore denies same.

13. The pollutants listed in this complaint, when present at the concentrations found in MWG's groundwater wells, make the groundwater unusable. Many of these pollutants are toxic and have been found at concentrations that present a human health risk. Others are dangerous to aquatic ecosystems; this is a significant concern to the extent that contaminated groundwater is migrating into adjacent surface water bodies.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 13 and therefore denies same.

14. Antimony is associated with reduced lifespan, decreased blood glucose, and altered cholesterol in rodents, and with vomiting and cardiac and respiratory effects in humans.[2] To protect public health, the U.S. EPA has established a Maximum Contaminant Level (MCL) of 0.006 mg/L. The Illinois Class I GQS for antimony is also 0.006 mg/L. Even this level may be unsafe; the California EPA, for example, has proposed a much lower Public Health Goal of 0.0007 mg/L.[3]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 14 and therefore denies same.

15. Arsenic is known to cause multiple forms of cancer in humans and is also associated with non-cancer health effects of the skin and the nervous system.[4] Groundwater that

[1] *See, e.g.*, U.S. EPA, Human and Ecological Risk Assessment of Coal Combustion Wastes at 2-4 (Draft, April 2000) (listing Coal Combustion Waste constituents), *available at* http://earthjustice.org/sites/default/files/library/reports/epa-coal-combustion-waste-risk-assessment.pdf (last visited October 2, 2012).
[2] *See, e.g.*, U.S. EPA, Integrated Risk Information System: Antimony, http://www.epa.gov/iris/subst/0006.htm; California EPA, Draft Public Health Goal for Antimony in Drinking Water (July 2009).
[3] *See* California EPA, *supra* note 2.
[4] *See, e.g.*, U.S. EPA, Integrated Risk Information System: Arsenic, inorganic, http://www.epa.gov/iris/subst/0278.htm; U.S. Agency for Toxic Substances and Disease Registry (ATSDR),Toxicological Profile for Arsenic (Aug. 2007).

exceeds Illinois GQSs for arsenic is highly toxic; based on current U.S. EPA risk estimates, the cancer risk associated with drinking water at 0.05 mg/L, the Illinois Class I GQS for arsenic, is greater than 2 in 1,000.[5] The risk at 0.2 mg/L, the Class II GQS, is 1 in 100.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 15 and therefore denies same.

16. Oral exposure to boron has led to developmental and reproductive toxicity in multiple species. Specific effects include testicular degeneration, reduced sperm count, reduced birth weight, and birth defects.[6] The EPA has established a child health advisory of 3 mg/L for boron, close to the Illinois Class I and Class II GQS of 2 mg/L.[7]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 16 and therefore denies same.

17. Chloride renders water unusable by imparting a salty taste; to prevent this the EPA has set a secondary drinking water regulation of 250 mg/L, close to the Illinois Class I and Class II GQS of 200 mg/L.[8]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 17 and therefore denies same.

18. Iron renders water unusable by imparting a rusty color and a metallic taste and causing sedimentation and staining; to prevent these effects the EPA has set a secondary drinking water regulation of 0.3 mg/L.[9] The Illinois Class I and II GQS for iron, at 5 mg/L, is much higher than the EPA secondary drinking water regulation, suggesting that violations of the GQS represent concentrations of iron far higher than what would be usable.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 18 and therefore denies same.

19. Lead is known to be toxic to the nervous system, and is particularly associated with effects on childhood neurobehavioral development at very low doses. Lead is also classified by the EPA as a "probable human carcinogen."[10] The EPA Action Level for lead in drinking water is 0.015 mg/L.[11] This is unlikely to represent a "safe" level of exposure—the

[5] Derived from the U.S. EPA drinking water unit risk of 5E-5 per ug/L. U.S. EPA, *supra* note 8.
[6] *See, e.g.*, U.S. EPA, Toxicological Profile of Boron and Compounds 60-61 (June 2004).
[7] U.S. EPA, 2012 Edition of the Drinking Water Standards and Health Advisories (April, 2012
[8] U.S. EPA, Secondary Drinking Water Regulations: Guidance for Nuisance Chemicals, http://water.epa.gov/drink/contaminants/secondarystandards.cfm.
[9] *Id*.
[10] U.S. EPA, Integrated Risk Information System: Lead and Compounds, http://www.epa.gov/iris/subst/0277.htm.

[11] U.S. EPA drinking water standards, *supra* note 7.

EPA has noted, for example, that there may be no threshold for lead toxicity.[12] Groundwater concentrations of lead above the Illinois Class I GQS, 0.0075 mg/L, are thus unsafe to drink.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 19 and therefore denies same.

20. Manganese is also known to be toxic to the nervous system.[13] The EPA has not updated its assessment of manganese toxicity in 16 years, so EPA standards and advisories may not reflect the latest scientific knowledge concerning effects on childhood neurological development,[14] and the EPA Lifetime Health Advisory for manganese – 0.3 mg/L – may not be adequately health-protective. In any event, manganese concentrations greater than 0.05 mg/L render water unusable by discoloring the water, giving it a metallic taste, and causing black staining.[15] Groundwater with manganese above the Illinois Class I GQS – 0.15 mg/L – is clearly not usable and is likely to be toxic.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 20 and therefore denies same.

21. Inorganic mercury is toxic to the kidneys, and has also been associated with developmental toxicity.[16] The California EPA Public Health Goal for inorganic mercury is 0.0012 mg/L; the U.S. EPA MCL, like the Illinois Class I GQS, is 0.002 mg/L.[17]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 21 and therefore denies same.

22. Nitrate is known to cause methemoglobinemia in infants, a condition that impairs oxygen delivery to tissues and can cause bluish skin coloration. The U.S. EPA MCL, the California EPA Public Health Goal, and the Illinois Class I and II GQSs are all 10 mg/L, a level at which infant methemoglobinemia is not expected to occur.[18]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 22 and therefore denies same.

[18] *See* U.S. EPA, Integrated Risk Information System: Nitrate, http://www.epa.gov/iris/subst/0076.htm.; California EPA, Public Health Goals for Nitrate and Nitrite (Dec. 1997).

23. Selenium is an essential element, but excess exposure can cause a chemical-specific condition known as selenosis, with symptoms that include hair and nail loss. Various agencies have derived health-protective values between 0.01 and 0.05 mg/L, but are in agreement that selenium concentrations above 0.05 mg/L, the Illinois Class I and II GQS, are unsafe to drink.[19]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 23 and therefore denies same.

24. High concentrations of sulfates in drinking water impart a salty taste and can cause diarrhea; to protect against these effects, the U.S. EPA has established a secondary MCL of 250 mg/L and a health-based advisory of 500 mg/L.[20] Groundwater with sulfate concentrations above the Illinois Cass I and Class II GQS of 400 mg/L is therefore unusable and potentially unsafe.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 24 and therefore denies same.

25. Total Dissolved Solids (TDS) is a measure of multiple dissolved chemicals, but because high TDS is generally associated with hardness, staining, salty taste, and deposits, the U.S. EPA has established a secondary MCL of 500 mg/L.[21] Groundwater with TDS above the Illinois Class I and Class II GQS, 1,200 mg/L, is clearly unusable.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 25 and therefore denies same.

26. Thallium is known to cause neurotoxicity, and is also associated with developmental and reproductive toxicity and other adverse health effects. The Illinois Class I GQS and the U.S. EPA MCL are both 0.002 mg/L.[22]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 26 and therefore denies same.

27. Finally, many of the pollutants associated with coal ash, including but not limited to selenium, are known to bioaccumulate in aquatic ecosystems causing tissue damage and other effects in fish and amphibians. One review, for example, noted that "the combined effects of

[19] *See, e.g.*, California EPA, Public Health Goal for Selenium (Dec. 2010) (Setting a Public Health Goal of 0.03 mg/L); World Health Organization, Guidelines for Drinking Water Quality, 4th Ed., 413 (2011) (Setting a provisional guideline of 0.04 mg/L); U.S. EPA drinking water standards, *supra* note 11 (setting forth a MCL of 0.05 mg/L).
[20] U.S. EPA, Drinking Water Advisory: Consumer Acceptability Advice and Health Effects Analysis on Sulfate (Feb. 2003).
[21] *See* U.S. EPA secondary drinking water regulations, *supra* note 8.
[22] *See* U.S. EPA drinking water standards, *supra* note 7.

multiple accumulated elements may lead to numerous changes in individuals that could compromise individual fitness or health," and provided several examples of coal ash-contaminated sites where the health of individuals and communities in aquatic ecosystems had been severely impaired.[23]

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 27 and therefore denies same.

**PARTIES**

28. Citizens Against Ruining the Environment ("CARE") is located at 230 E. 6th Street, Lockport, IL 60441. CARE is an incorporated, not-for-profit community organization with members in the Lockport area, including Will County. CARE was organized for the purpose of preserving and protecting Illinois's land, air, water, and other natural resources, and protecting the organization's members and other residents of the state from threats of pollution.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 28 and therefore denies same.

29. The Environmental Law and Policy Center ("ELPC") is an Illinois not-for-profit corporation with its principal office located at 35 East Wacker Drive, Suite 1600, Chicago, IL 60601. ELPC's mission includes advocating for the protection of water quality, and protection of public health related to water quality, throughout the Midwest.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 29 and therefore denies same.

30. Prairie Rivers Network, a nonprofit organization and a state affiliate of the National Wildlife Federation, is Illinois' statewide leader in river protection, conservation, and restoration. Prairie Rivers Network has a membership of over 700 in Illinois.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 30 and therefore denies same.

31. Sierra Club is the nation's oldest and largest grassroots environmental organization. Sierra Club is an incorporated, not-for-profit organization with headquarters located at 85 Second Street, 2nd Floor, San Francisco, CA, 94105. Sierra Club's Illinois Chapter office is located at 70 E. Lake St., Suite 1500, Chicago, IL, 60601. Sierra Club's mission is to

[23] C.L. Rowe et al., Ecotoxicological implications of aquatic disposal of coal combustion residues in the United States: A review, 80 ENVTL. MONITORING AND ASSESSMENT 207, 242 (2002); see also A.D. Lemly and J.P. Skorupa, Wildlife and the coal waste policy debate: Proposed rules or coal waste disposal ignore lessons from 45 years of wildlife poisoning, 46 ENVTL. SCI. TECH. 46 (2012).

preserve, protect, and enhance the natural environment. Sierra Club has 641,000 members, including approximately 23,000 members in Illinois.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in paragraph 31 and therefore denies same.

32. Midwest Generation, LLC (MWG), is a Delaware Corporation doing business in Illinois with principal executive offices at 235 Remington Boulevard, Suite A, Bolingbrook, Illinois 60440. MWG's registered agent is C T Corporation System, 208 S. LaSalle St., Suite 814, Chicago, Illinois 60604. MWG is a subsidiary of Edison Mission Energy ("EME"), of Santa Ana, California. EME is a subsidiary of Edison International, 2244 Walnut Grove Avenue, (P.O. Box 976), Rosemead, California, 91770.

ANSWER: Respondent admits that it is a Delaware Corporation duly authorized and doing business in Illinois and its principal offices are located at 211 Carnegie Center in Princeton, New Jersey. Respondent further admits that its registered agent is C T Corporation System, 208 S. LaSalle St., Suite 814, Chicago, Illinois 60604. Respondent states that on December 17, 2012, Edison Mission Energy and certain of its subsidiaries and affiliates, including Respondent, filed voluntary petitions for relief under chapter 11 of title 11 of the United States Code in the United States Bankruptcy Court for the Northern District of Illinois (the "Bankruptcy Court"). On March 11, 2014, the Bankruptcy Court approved the purchase of certain assets and operating companies of Edison Mission Energy, including Respondent, by NRG Energy, Inc.

**LEGAL BACKGROUND: OPEN DUMPING**

33. The Illinois Environmental Protection Act prohibits "the open dumping of any waste." 415 ILCS 5/21(a). "Open dumping" is defined as "the consolidation of refuse from one or more sources at a disposal site that does not fulfill the requirements of a sanitary landfill." 415 ILCS 5/3.305. "Refuse" is defined as "waste." 415 ILCS 5/3.385. "Waste" is defined to include "any garbage, sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility or other discarded material, including solid, liquid, semi-solid, or contained gaseous material resulting from industrial, commercial, mining and agricultural operations" at 415 ILCS 5/3.535. "Sanitary landfills" are defined as "facilit[ies] permitted by the Agency for the disposal waste on land meeting the requirements of the Resource Conservation and Recovery Act [42 USCA § 6901 et seq.]." 415 ILCS 5/3.445. The requirements of the Resource Conservation and Recovery Act include criteria for distinguishing between sanitary landfills and open dumps. 42 USCA § 6944(a). These criteria are found in federal regulations at 40 CFR

Part 257. According to 40 CFR § 257.1, facilities failing to meet, inter alia, the criterion at 40 CFR § 257.3-4 are considered prohibited open dumps.

ANSWER: Respondent admits that there are statutory provisions 415 ILCS §§ 5/21(a), 3.305, 3.385, 3.535, 3.445, 42 USCA § 6944(a), and 40 CFR Part 257 and states that the statutes and regulations speak for themselves. Respondent denies the allegations to the extent that they are inconsistent with the statutes and regulations as cited and to the extent a response is required.

34. 40 CFR § 257.3-4 establishes a criterion for identifying open dumps based on groundwater contamination. 40 CFR § 257.3-4 prohibits "contaminat[ion of] an underground drinking water source beyond the solid waste boundary or beyond an alternative compliance boundary." The contamination must exist beyond either the perimeter of the solid waste disposal area or beyond an alternative boundary established by the state or the courts after finding that establishing such a boundary will not result in the contamination of groundwater that may be used for drinking. 40 C.F.R. § 257.3-4.

ANSWER: Respondent admits that there is a regulatory provision 40 CFR § 257.3-4 and states that the regulation speaks for itself. Respondent denies the allegations to the extent that they are inconsistent with the regulation as cited and to the extent a response is required.

35. Groundwater contamination for purposes of RCRA open dumping is demonstrated by an exceedance of one of the Maximum Contaminant Levels (MCLs) set forth in 40 CFR pt. 257 Appendix I (hereinafter "Appendix I MCLs"),[24] in either an actual drinking water source, or in an aquifer with less than 10,000 mg/L total dissolved solids. 40 CFR § 257.3-4. The Appendix I MCLs for the pollutants identified in this complaint are as follows:

| Chemical | Appendix I MCL<br>(40 C.F.R. Pt. 257, App. I) |
|---|---|
| Arsenic | 0.05 mg/L |
| Mercury | 0.002 mg/L |
| Nitrate | 10 mg/L |
| Selenium | 0.01 mg/L |

[24] The open dumping MCLs in 40 CFR pt. 257 Appendix I are in some cases different from the most recent Maximum Contaminant Levels promulgated by the U.S. Environmental Protection Agency. For example, the Appendix I MCL for arsenic is 50 ug/L while the current MCL for arsenic is 10 ug/L. *See* U.S. EPA drinking water standards, *supra* note 7.

ANSWER: Respondent admits that there is a regulatory provision 40 C.F.R. Pt. 257, App. I and states that the regulation speaks for itself. Respondent denies the allegations to the extent that they are inconsistent with the regulation as cited and to the extent a response is required.

**LEGAL BACKGROUND: WATER POLLUTION**

36. The Illinois Environmental Protection Act prohibits "the discharge of any contaminants into the environment . . . so as to cause or tend to cause water pollution in Illinois, either alone or in combination with matter from other sources," 415 ILCS 5/12(a), and prohibits the deposition of "any contaminants upon the land in such place and manner so as to create a water pollution hazard." 415 ILCS 5/12(d). "Water pollution" is defined as the "alteration" or "discharge of any contaminant into any waters of the State, as will or is likely to create a nuisance or render such waters harmful or detrimental or injurious to public health, safety or welfare, or to domestic, commercial, industrial, agricultural, recreational, or other legitimate uses, or to livestock, wild animals, birds, fish, or other aquatic life." 415 ILCS 5/3.545. "Waters" of the State is defined to include "all accumulations of water, surface and underground, natural, and artificial, public and private, or parts thereof, which are wholly or partially within, flow through, or border upon this State." 415 ILCS 5/3.550.

ANSWER: Respondent admits that there are statutory provisions 415 ILCS §§ 5/12(a), 12(d), 3.545, 3.550 and states that the statutes speak for themselves. Respondent denies the allegations to the extent that they are inconsistent with the statutes as cited and to the extent a response is required.

37. 35 Ill. Admin. Code § 620.405 prohibits "the release of any contaminant to groundwater so as to cause a groundwater quality standard set forth in this Subpart to be exceeded." 35 Ill. Admin. Code § 620.405. The Illinois Administrative Code establishes different groundwater quality standards for Class I and Class II groundwater.

ANSWER: Respondent admits that there is a regulatory provision 35 Ill. Adm. Code §620.405 and states that the regulation speaks for itself. Respondent denies the allegations to the extent that they are inconsistent with the regulation as cited and to the extent a response is required.

38. 35 Ill. Admin. Code § 620.410 establishes Class I GQSs that cannot be exceeded in potable resource groundwater. "Potable resource groundwater" is defined as:

> Groundwater located 10 feet or more below the land surface and within: (1) The minimum setback zone of a well which serves as a potable water supply and to the bottom of such well; (2) Unconsolidated sand, gravel or sand and gravel which is 5 feet or more in thickness and that contains 12 percent or less of fines . .

> . ; (3) Sandstone which is 10 feet or more in thickness, or fractured carbonate which is 15 feet or more in thickness; or (4) Any geologic material which is capable of a: (A) sustained groundwater yield , from up to a 12 inch borehole, of 150 gallons per day or more from a thickness of 15 feet or less; or (B) Hydraulic conductivity of 1 x 10(-4) cm/sec or greater using one of the following test methods or its equivalent: (i) Permeameter; (ii) Slug test; or (iii) Pump test. 35 Ill. Admin. Code § 620.210(a).

ANSWER: Respondent admits that there are regulatory provisions 35 Ill. Admin. Code §§620.410, 620.210 and states that the regulations speaks for themselves. Respondent denies the allegations to the extent that they are inconsistent with the regulations as cited and to the extent a response is required.

39. The definition of Class I groundwater specifically excludes: Class III "special resource groundwater," Class IV "other groundwater," which includes groundwater in a zone of attenuation; and groundwater in a "groundwater management zone." 35 Ill. Admin. Code § 620.210; *see also* 35 Ill. Admin. Code §§ 620.230, 620.240, 620.250.35 Ill. Admin. Code § 620.115 provides that "No person shall cause, threaten or allow a violation of the Act, the [Illinois Groundwater Protection Act] or regulations adopted by the Board thereunder, including but not limited to this part." 35 Ill. Admin. Code § 620.301(a) provides that "No person shall cause, threaten or allow the release of any contaminant to a resource groundwater such that: 1) Treatment or additional treatment is necessary to continue an existing use or to assure a potential use of such groundwater; or 2) An existing or potential use of such groundwater is precluded."

ANSWER: Respondent admits that there are regulatory provisions 35 Ill. Admin. Code §§620.115, 620.210, 620.230, 620.240, 620.250, 620.301(a) and states that the regulations speak for themselves. Respondent denies the allegations to the extent that they are inconsistent with the regulations as cited and to the extent a response is required.

40. 35 Ill. Admin. Code § 620.420 establishes Class II GQSs that cannot be exceeded in general resource groundwater. "General resource groundwater" is defined as "groundwater which does not meet the provisions of . . . Class I . . . Class III . . . or . . . Class IV" and "groundwater which is found by the Board, pursuant to the petition procedures set forth in Section 620.260, to be capable of agricultural, industrial, recreational or other beneficial uses." 35 Ill. Admin. Code § 620.220. Groundwater in a zone of attenuation must meet Class II GQSs. 35 Ill. Admin. Code § 620.440(b).

The Illinois Class I and Class II GQSs for pollutants identified in this report are as follows:

| Chemical | Class I GQS (mg/L) (35 Ill. Admin. Code § 620.410) | Class II GQS (mg/L) (35 IAC § 620.420) |
|---|---|---|
| Antimony | 0.006 | 0.024 |
| Arsenic | 0.01 | 0.2 |
| Boron | 2 | 2 |
| Chloride | 200 | 200 |
| Iron | 5 | 5 |
| Lead | 0.0075 | 0.10 |
| Manganese | 0.15 | 10 |
| Mercury | 0.002 | 0.01 |
| Nitrate | 10 | 100 |
| pH | 6.5 – 9.0 | 6.5 – 9.0 |
| Selenium | 0.05 | 0.05 |
| Sulfate | 400 | 400 |
| Thallium | 0.002 | 0.020 |
| Total Dissolved Solids | 1,200 | 1,200 |

ANSWER: Respondent admits that there are regulatory provisions 35 Ill. Admin. Code §§620.220, 620.410, 620.420, 620.440(b) and states that the regulations speak for themselves. Respondent denies the allegations to the extent that they are inconsistent with the regulations as cited and to the extent a response is required.

**COUNT I**

**OPEN DUMPING VIOLATIONS AT POWERTON**

41. Paragraphs 1-40 are realleged and incorporated herein by reference.

ANSWER: Respondent incorporates herein, as if restated, its answers to paragraphs 1 through 40 of the Complaint.

42. MWG, through the coal ash disposal ponds, landfills, unconsolidated coal ash fill, and/or other coal ash and coal combustion waste repositories at Powerton, has caused or contributed to contamination of the groundwater beneath Powerton in violation of 415 ILCS 5/21(a), as shown in Table 1.

**Table 1: Open dumping violations at Powerton.**

| | Well | Pollutant | Sample value (mg/L) | Appendix I MCL (mg/L) | Collection date |
|---|---|---|---|---|---|

| | | | | | |
|---|---|---|---|---|---|
| 1 | MW-1 | Nitrate | 11 | 10 | 9/20/11 |
| 2 | MW-4 | Selenium | 0.013 | 0.010 | 9/27/13 |
| 3 | MW-6 | Arsenic | 0.200 | 0.050 | 5/29/14 |
| 4 | MW-7 | Arsenic | 0.085 | 0.050 | 3/25/11 |
| 5 | MW-7 | Arsenic | 0.120 | 0.050 | 6/16/11 |
| 6 | MW-7 | Arsenic | 0.180 | 0.050 | 9/20/11 |
| 7 | MW-7 | Arsenic | 0.230 | 0.050 | 12/12/11 |
| 8 | MW-7 | Arsenic | 0.230 | 0.050 | 3/19/12 |
| 9 | MW-7 | Arsenic | 150 | 0.050 | 6/25/12 |
| 10 | MW-7 | Arsenic | 180 | 0.050 | 9/18/12 |
| 11 | MW-7 | Arsenic | 260 | 0.050 | 12/12/12 |
| 12 | MW-7 | Arsenic | 170 | 0.050 | 2/27/13 |
| 13 | MW-7 | Arsenic | 120 | 0.050 | 5/31/13 |
| 14 | MW-7 | Arsenic | 220 | 0.050 | 7/31/13 |
| 15 | MW-7 | Arsenic | 200 | 0.050 | 10/23/13 |
| 16 | MW-7 | Arsenic | 150 | 0.050 | 3/5/14 |
| 17 | MW-7 | Arsenic | 190 | 0.050 | 8/27/14 |
| 18 | MW-9 | Selenium | 0.072[25] | 0.010 | 3/25/11 |
| 19 | MW-9 | Selenium | 0.015 | 0.010 | 2/27/13 |
| 20 | MW-9 | Selenium | 0.016 | 0.010 | 5/30/13 |
| 21 | MW-9 | Selenium | 0.014 | 0.010 | 7/30/13 |
| 22 | MW-9 | Nitrate | 12 | 10 | 2/27/13 |
| 23 | MW-9 | Nitrate | 11 | 10 | 5/30/13 |
| 24 | MW-9 | Nitrate | 11 | 10 | 5/29/14 |
| 25 | MW-11 | Arsenic | 0.057 | 0.050 | 3/4/14 |
| 26 | MW-11 | Arsenic | 0.068 | 0.050 | 8/26/14 |
| 27 | MW-12 | Mercury | 0.0096[26] | 0.002 | 12/15/10 |
| 28 | MW-14 | Selenium | 0.065 | 0.010 | 4/25/11 |
| 29 | MW-14 | Selenium | 0.022 | 0.010 | 4/10/12 |
| 30 | MW-14 | Selenium | 0.150 | 0.010 | 2/27/13 |
| 31 | MW-14 | Selenium | 0.020 | 0.010 | 3/4/14 |
| 32 | MW-14 | Selenium | 0.014 | 0.010 | 5/28/14 |
| 33 | MW-15 | Selenium | 0.017 | 0.010 | 4/25/11 |
| 34 | MW-15 | Selenium | 0.025 | 0.010 | 4/10/12 |
| 35 | MW-15 | Selenium | 0.013 | 0.010 | 10/23/13 |
| 36 | MW-15 | Selenium | 0.033 | 0.010 | 5/28/14 |

ANSWER: Respondent denies the allegations in paragraph 42.

[25] This value was originally reported as 0.072 mg/L. *See* letter from Richard M. Frendt, Patrick Engineering, to IEPA, Attachment A (July 30, 2012) (transmitting amended groundwater monitoring report for Midwest generation's Powerton Generating Station). MidGen has since revised the value to 0.072 mg/L. *Id*. at Attachments B and C.
[26] This value was originally reported as 0.0096 ug/L. *Id*. at Attachment A. MidGen has since revised the value to nondetect. *Id*. at Attachments B and C.

43. Groundwater samples from nine different wells at Powerton have exceeded the Appendix I MCLs on the thirty-six occasions delineated in Table 1.

ANSWER: Respondent denies the allegations in paragraph 43.

**COUNT 2**

**OPEN DUMPING VIOLATIONS AT WAUKEGAN**

44. Paragraphs 1-43 are realleged and incorporated herein by reference.

ANSWER: Respondent incorporates herein, as if restated, its answers to paragraphs 1 through 43 of the Complaint.

45. MWG, through the coal ash disposal ponds, landfills, unconsolidated coal ash fill, and/or other coal ash and coal combustion waste repositories at Waukegan, has caused or contributed to contamination of the groundwater beneath Waukegan in violation of 415 ILCS 5/21(a), as shown in Table 2.

**Table 2: Open dumping violations at Waukegan**

| | Well | Pollutant | Sample value (mg/L) | Appendix I MCL (mg/L) | Collection date |
|---|---|---|---|---|---|
| 1 | MW-1 | Arsenic | 0.054 | 0.050 | 10/25/10 |
| 2 | MW-1 | Arsenic | 0.170 | 0.050 | 6/13/11 |
| 3 | MW-1 | Arsenic | 0.077 | 0.050 | 9/13/11 |
| 4 | MW-1 | Arsenic | 0.057 | 0.050 | 12/6/11 |

| 29 | MW-4 | Selenium | 0.025 | 0.010 | 9/13/11 |
| 30 | MW-4 | Selenium | 0.015 | 0.010 | 12/6/11 |
| 31 | MW-4 | Selenium | 0.028 | 0.010 | 6/6/13 |
| 32 | MW-4 | Selenium | 0.050 | 0.010 | 7/25/13 |
| 33 | MW-4 | Selenium | 0.011 | 0.010 | 11/4/13 |

ANSWER: Respondent denies the allegations in paragraph 45.

46. Groundwater samples at four of five wells monitored showed exceedances of the Appendix I MCLs on the thirty-three occasions delineated in Table 2.

ANSWER: Respondent denies the allegations in paragraph 46.

**COUNT 3**

**OPEN DUMPING VIOLATIONS AT WILL COUNTY**

47. Paragraphs 1-46 are realleged and incorporated herein by reference.

ANSWER: Respondent incorporates herein, as if restated, its answers to paragraphs 1 through 46 of the Complaint.

48. MWG, through coal ash disposal ponds, landfills, unconsolidated coal ash fill, and/or other coal ash and other coal combustion waste repositories at Will County, has caused or contributed to contamination of the groundwater beneath Will County in violation of 415 ILCS 5/21(a), as shown in Table 3.

**Table 3: Open dumping violations at Will County**

| | Well | Pollutant | Sample value (mg/L) | Appendix I MCL (mg/L) | Collection date |
|---|---|---|---|---|---|
| 1 | MW-4 | Selenium | 0.015 | 0.010 | 3/5/13 |
| 2 | MW-5 | Selenium | 0.017 | 0.010 | 12/13/10 |
| 3 | MW-5 | Selenium | 0.014 | 0.010 | 3/28/11 |
| 4 | MW-5 | Selenium | 0.016 | 0.010 | 6/15/11 |
| 5 | MW-5 | Selenium | 0.017 | 0.010 | 9/24/12 |
| 6 | MW-5 | Selenium | 0.026 | 0.010 | 6/5/13 |
| 7 | MW-5 | Selenium | 0.170 | 0.010 | 10/28/13 |
| 8 | MW-5 | Selenium | 0.024 | 0.010 | 2/13/14 |
| 9 | MW-6 | Selenium | 0.011 | 0.010 | 9/15/11 |
| 10 | MW-6 | Selenium | 0.014 | 0.010 | 9/24/12 |
| 11 | MW-8 | Selenium | 0.015 | 0.010 | 10/28/13 |

ANSWER: Respondent denies the allegations in paragraph 48.

49. As Table 3 shows, there have been eleven exceedances of the open dumping MCL for selenium since monitoring began in late 2010.

ANSWER: Respondent denies the allegations in paragraph 49.

**COUNT 4**

**WATER POLLUTION AT JOLIET 29**

50. Paragraphs 1-49 are realleged and incorporated herein by reference.

ANSWER: Respondent incorporates herein, as if restated, its answers to paragraphs 1 through 49 of the Complaint.

51. MWG, through the coal ash disposal ponds, landfills, unconsolidated coal ash fill, and/or other coal ash and coal combustion waste repositories at Joliet 29, has discharged contaminants into the environment at Joliet 29 and thereby caused water pollution in violation of 415 ILCS 5/12(a) and (d), and 35 Ill. Admin. Code §§ 620.115, 620.301(a), and 620.405. As shown in Exhibits B, C, and D, there have been at least 156 violations of Illinois Class I Groundwater Quality Standards and at least 132 violations of Illinois Class II Groundwater Quality Standards since monitoring began in late 2010.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and D and therefore denies same. Respondent denies the remaining allegations contained in paragraph 51.

52. Since 2010, the groundwater at Joliet 29 has exceeded the Class I GQSs for antimony, boron, chloride, iron, manganese, sulfate, and TDS, and the Class II GQSs for boron, chloride, iron, sulfate, and TDS. *See* Exhibits B, C, and D.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and D and therefore denies same. Respondent denies the remaining allegations contained in paragraph 52.

**COUNT 5**

**WATER POLLUTION AT POWERTON**

53. Paragraphs 1-52 are realleged and incorporated herein by reference.

ANSWER: Respondent incorporates herein, as if restated, its answers to paragraphs 1 through 52 of the Complaint.

54. MWG, through the coal ash disposal ponds, landfills, unconsolidated coal ash fill, and/or other coal ash and coal combustion waste repositories at Powerton, has discharged contaminants into the environment at Powerton and thereby caused water pollution in violation of 415 ILCS 5/12(a) and (d), and 35 Ill. Admin. Code §§ 620.115, 620.301(a), and 620.405. As shown in Exhibits B, C, and F, there have been at least 445 violations of Illinois Class I Groundwater Quality Standards and at least 216 violations of Illinois Class II Groundwater Quality Standards since monitoring began in late 2010.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and F and therefore denies same. Respondent denies the remaining allegations contained in paragraph 54.

55. Since 2010, the groundwater at Powerton has exceeded the Class I GQSs for antimony, arsenic, boron, chloride, iron, manganese, nitrate, selenium, sulfate, thallium, and TDS, and the Class II GQSs for arsenic, boron, chloride, iron, manganese, selenium, sulfate, and TDS. *See* Exhibits B, C, and F.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and F and therefore denies same. Respondent denies the remaining allegations contained in paragraph 55.

**COUNT 6**

**WATER POLLUTION AT WAUKEGAN**

56. Paragraphs 1-55 are realleged and incorporated herein by reference.

ANSWER: Respondent incorporates herein, as if restated, its answers to paragraphs 1 through 55 of the Complaint.

57. MWG, through the coal ash disposal ponds, landfills, unconsolidated coal ash fill, and/or other coal ash and coal combustion waste repositories at Waukegan, has discharged contaminants into the environment at Waukegan and thereby caused water pollution in violation of 415 ILCS 5/12(a) and (d), and 35 Ill. Admin. Code §§ 620.115, 620.301(a), and 620.405. As shown in Exhibits B, C, and H, there have been at least 155 violations of Illinois Class I Groundwater Quality Standards and 105 violations of Illinois Class II Groundwater Quality Standards since monitoring began in late 2010.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and H and therefore denies same. Respondent denies the remaining allegations contained in paragraph 57.

58. Since 2010, the groundwater at Waukegan has exceeded the Class I GQSs for antimony, arsenic, boron, chloride, iron, manganese, nitrate, selenium, pH, sulfate, and TDS, and the Class II GQSs for boron, chloride, iron, pH, selenium, sulfate, and TDS. *See* Exhibits B, C, and H.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and H and therefore denies same. Respondent denies the remaining allegations contained in paragraph 58.

**COUNT 7**

**WATER POLLUTION AT WILL COUNTY**

59. Paragraphs 1-58 are realleged and incorporated herein by reference.

ANSWER: Respondent incorporates herein, as if restated, its answers to paragraphs 1 through 59 of the Complaint.

60. MWG, through the coal ash disposal ponds, landfills, unconsolidated coal ash fill, and/or other coal ash and coal combustion waste repositories at Will County, has discharged contaminants into the environment at Will County and thereby caused water pollution in

violation of 415 ILCS 5/12(a) and (d), and 35 Ill. Admin. Code §§ 620.115, 620.301(a), and 620.405. As shown in Exhibits B, C, and J, there have been at least 297 violations of Illinois Class I Groundwater Quality Standards and at least 214 violations of Illinois Class II Groundwater Quality Standards since monitoring began in late 2010.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and J and therefore denies same. Respondent denies the remaining allegations contained in paragraph 60.

61. Since 2010, the groundwater at Will County has exceeded the Class I GQSs for antimony, arsenic, boron, chloride, manganese, pH, sulfate, and TDS, and the Class II GQSs for boron, chloride, pH, selenium, sulfate, and TDS. *See* Exhibits B, C, and J.

ANSWER: Respondent is without sufficient information to admit or deny the allegations in Exhibits B, C, and J and therefore denies same. Respondent denies the remaining allegations contained in paragraph 61.

## MIDWEST GENERATION, L.L.C.'S DEFENSES TO THE COMPLAINT

Respondent, Midwest Generation, L.L.C. ("MWG") asserts the following defenses without waiving Complainants' obligation to meets its burden of proof and without assuming any burden of proof not otherwise imposed by law.

### I. MWG DID NOT CAUSE OR ALLOW OPEN DUMPING

62. The ash ponds at the Joliet 29 Station, the Powerton Station, the Waukegan Station, and the Will County Station (collectively "the Stations") are surface impoundments and operate as a part of each Stations' wastewater treatment plants pursuant to the Stations' respective NDPES permits.

63. The active ash ponds at the Stations are lined with HDPE liners, a synthetic liner designed to prevent releases to the soil and groundwater.

64. MWG routinely removes the ash from the ash ponds.

65. Because the ash ponds are classified as surface impoundments, which are permitted and regulated as water pollution treatment units, and because MWG routinely removes the ash from the ponds, the ash ponds are not disposal sites.

66. Complainants also allege other "landfills" and "coal ash and coal combustion waste repositories" may contain coal ash at the Stations.

67. Any other locations at the Stations that may contain historical coal ash combustion debris were not created by MWG, nor used or filled with any coal combustion material, or any other material, by MWG.

68. MWG did not cause or allow open dumping because the ash ponds are not disposal sites and the historical areas were not created, filled, or used by MWG for any storage or disposal or any coal combustion material, or any other material.

## II. MWG DID NOT CAUSE OR ALLOW WATER POLLUTION

69. Paragraphs 62-68 are realleged and incorporated herein by reference.

70. In 2010, MWG voluntarily agreed to the Illinois Environmental Protection Agency's ("Illinois EPA's") request to perform a hydrogeological assessment around the ash ponds at the Stations.

71. On June 11, 2012, Illinois EPA issued Violation Notices ("VNs") to MWG alleging violations of groundwater quality standards purportedly caused by the ash ponds at the Stations. (Complaint ¶9).

72. In response to the hydrogeological assessments and the VNs, MWG evaluated the distribution of the sample results as it relates to the ash ponds at each Station.

73. The alleged exceedances in the groundwater underlying the Stations, including the ash ponds, are random, inconsistent, historic and do not show a connection to the MWG Stations or ash ponds.

74. Because there is no connection between the alleged groundwater exceedances and MWG Stations or the ash ponds, MWG has not caused or allowed the discharge of contaminants into the groundwater.

## III. COMPLAINANTS MAY NOT BE GRANTED INJUNCTIVE RELIEF

75. Paragraphs 62-74 are realleged and incorporated herein by reference.

76. Complainants request that the Board order MWG to "… modify its coal ash disposal practices so as to avoid future groundwater contamination and remediate the contaminated groundwater so that it meets applicable Illinois groundwater standards." (Complainant, Relief Requested, ¶3).

77. As a creature of statute, the Illinois Pollution Control Board may only operate within the bounds of its powers set out by the statute by which it was created. *County of Knox ex rel. Masterson v. Highlands, L.L.C.,* 188 Ill.2d 546, 554, 723 N.E.2d 256, 262 (1999).

78. Under Section 33(b) of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/33(b), the Board is limited to:

> …a direction to cease and desist from violations of this Act, any rule or regulation adopted under this Act, any permit or term or condition of a permit, or any Board order, and/or the imposition by the Board of civil penalties in accord with Section 42 of this Act." 415 ILCS 5/33(b)

79. The Board has no enforcement power, *People of the State of Illinois v. NL Industries, et al,* 152 Ill.2d 82, 99, 604 N.E.2d 349, 356 (1992), and does not have the authority to grant injunctive relief. *Janson v. Illinois Pollution Control Bd.,* 69 Ill.App.3d 324, 328, 387

N.E.2d 404, 408 (3rd Dist., 1979), *Clean the Uniform Company-Highland v. Aramark Uniform & Career Apparel, Inc.,* PCB 03-21, Nov. 7, 2002 slip op. at 1 & 3.

80. Complainants' requests that the Board order MWG to "modify its coal ash disposal practice" and to "remediate the contaminated groundwater so that it meets applicable Illinois groundwater standards" are demands for mandatory injunctive relief.

81. As the Board does not have the authority to order mandatory injunctive relief, Complainant's request for such relief cannot be granted.

**MWG'S AFFIRMATIVE DEFENSES TO THE COMPLAINT**

Respondent, MWG asserts the following affirmative defenses without waiving Complainants' obligation to meets its burden of proof and without assuming any burden of proof not otherwise imposed by law.

I. RESPONDENT IS NOT IN VIOLATION OF THE GROUNDWATER STANDARDS BECAUSE THE GROUNDWATER UNDERLYING THE STATIONS IS WITHIN A GROUNDWATER MANAGEMENT ZONE

82. Paragraphs 62-81 are realleged and incorporated herein by reference.

83. On October 24, 2012, MWG resolved the violations alleged in the VNs by entering into a Compliance Commitment Agreement ("CCA") for the ash ponds at the Stations. (Illinois EPA CCAs for the Stations, attached as Exs. 1-4)

84. From the date the CCAs were issued, MWG executed and completed all the terms of the CCAs. In October 2013, MWG submitted Completion Statements for the Stations certifying that the corrective actions in the CCAs were completed. (Illinois EPA Compliance Statements for the Stations, attached as Exs. 5-8).

85. Pursuant to the CCAs, MWG established a Groundwater Management Zone ("GMZ") for the areas underneath the Joliet 29 Station, Powerton Station, and the Will County Station.

86. Upon establishment of a GMZ, the standards specified in 35 Ill. Adm. Code §§620.410, 620.420, 620.430, and 620.440 are not applicable. 35 Ill. Adm. Code 620.450(a)(3).

87. Upon the establishment of the GMZs, the Joliet 29 Station, Powerton Station, and the Will County Station are not in violation of the groundwater standards alleged in the Complaint.

88. As Respondent is not in violation of the groundwater standards, Respondent is not in violation of 35 Ill. Adm. Code 620.301(a) and 620.405.

## II. RESPONDENT DID NOT CAUSE WATER POLLUTION BECAUSE THERE IS NO RISK TO PUBLIC HEALTH AND NO RISK OF ENVIRONMENTAL HARM

89. Paragraphs 62-88 are realleged and incorporated herein by reference.

90. Pursuant to the CCAs, MWG entered into Environmental Land Use Controls ("ELUCs") for the areas of the Powerton Station, Waukegan Station, and the Will County Station.

91. MWG did not enter into an ELUC at the Joliet 29 Station because Illinois EPA determined that there were no potential groundwater receptors in the area.

92. An ELUC is an institutional control that is used to impose land use limitations, and prevent the use or consumption of the groundwater. 35 Ill. Adm. Code 742.1010.

93. By establishing an ELUC at the Stations and the absence of groundwater receptors, there is no risk or harm to public health.

94. Pursuant to the CCAs, MWG has instituted corrective actions that address any alleged environmental harms.

95. In addition to the previously stated corrective actions taken, including lining the ash ponds with HDPE liners (Complaint ¶5, Answer ¶¶1, 3, and 7), establishing GMZs (¶82), and establishing ELUCs (¶¶87, 88), MWG is conducting ongoing groundwater monitoring at the ash ponds on a quarterly basis.

96. MWG did not fill or place coal ash in historic landfilled areas at or near the Stations.

97. Based on the low levels of constituents in the groundwater and the absence of human and environmental receptors, there is no nuisance, harm or injury to public health, safety or welfare at or around the Stations.

WHEREFORE, Respondent, Midwest Generation, LLC, respectfully requests that the Board dismiss Complainants' Complaint with prejudice and issue such further relief as the Board deems just and proper.

Respectfully submitted,

Midwest Generation, LLC

History: This message has been forwarded.

Maria:

Nearly forgot to send these to you – Here are some brief summaries of the data for each of the five ash pond sites. I haven't attached data tables to these, since those have already been sent out to everyone with the quarterly reports. The purpose of these documents is just to explain, on a high-level, the overall situation at each site. We can discuss our next steps at some point in the future, when it's convenient for you.

Regards,
Rick

# ASH POND DATA EVAULATION & SUMMARY

**JOLIET #29 STATION**
**Midwest Generation, LLC**
**Joliet, Illinois**
**January 2012**

## SITE DESCRIPTION

The Joliet 29 Generating Station (the Site) is located in the City of Joliet, Will County, Illinois. The Site is located along the Des Plaines River just to the south of the city of Joliet. The Site includes three active ash ponds (Ash Pond 1, Ash Pond 2, and Ash Pond 3). Two of the ponds are lined with a high-density polyethylene (HDPE), while the third is lined with 12" of geo-composite material on the bottom; the total area of the three ash ponds is approximately 10 acres.

## MONITORING WELLS

Eleven monitoring wells have been installed (MW-1 through MW-11) surrounding the ash impoundments at the Joliet 29 facility. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. Monitoring wells MW-8, MW-10, and MW-11 are installed upgradient of the ash ponds. MW-9 is installed in a location that could be considered either up- or downgradient depending upon which ash pond is considered. Monitoring wells MW-1 through MW-7 are considered to be downgradient wells. The wells are monitored quarterly in accordance with the long-term monitoring plan. Groundwater data has been collected on a quarterly basis starting in December of 2010 and continues to be generated into 2012. A Monitoring Well Location Map is included in this summary

## GROUNDWATER ELEVATIONS

Water levels in the monitoring wells are taken quarterly prior to sampling. The groundwater levels were compared to levels collected by the USGS stream flow data at Station Number 05539780 located where Route 53 crosses the Des Plaines River in Joliet, Illinois. The fluctuations in the groundwater elevations were compared to the fluctuations in the river levels for each monitoring event; there does not appear to be a correlation between the River levels and groundwater elevations at the site. The monitoring well elevations have seasonal variations which were not apparent in the river elevation data.

The overall groundwater elevation at the Site increased by 2 to 3 feet during the June 2011 sampling event as compared to the other three quarterly sampling events. This is not unexpected, as periods of high precipitation will recharge the shallow aquifer. During the September and December 2011 sampling events, groundwater elevations were slightly lower than the recorded River level (as compared to the other events, where groundwater was higher than the River). This appears to indicate that when the groundwater elevations are higher, groundwater at the Site is discharging to the River; when groundwater elevations are lower, the River is recharging the shallow aquifer.

DRAFT

Based upon the groundwater elevation data collected to date, the direction of groundwater flow is from the northwest to the southeast, generally toward the Des Plaines River. The direction of groundwater flow remains unchanged regardless of the elevation of the River and the groundwater table.

## ANALYTICAL RESULTS

Groundwater samples were collected from the 11 monitoring wells on site on a quarterly basis in 2011. Both upgradient and downgradient wells indicated Class I Groundwater Quality Standard exceedances. The following compounds exceeded their respective Class I standards: antimony, manganese, boron, sulfate, chloride, and total dissolved solids.

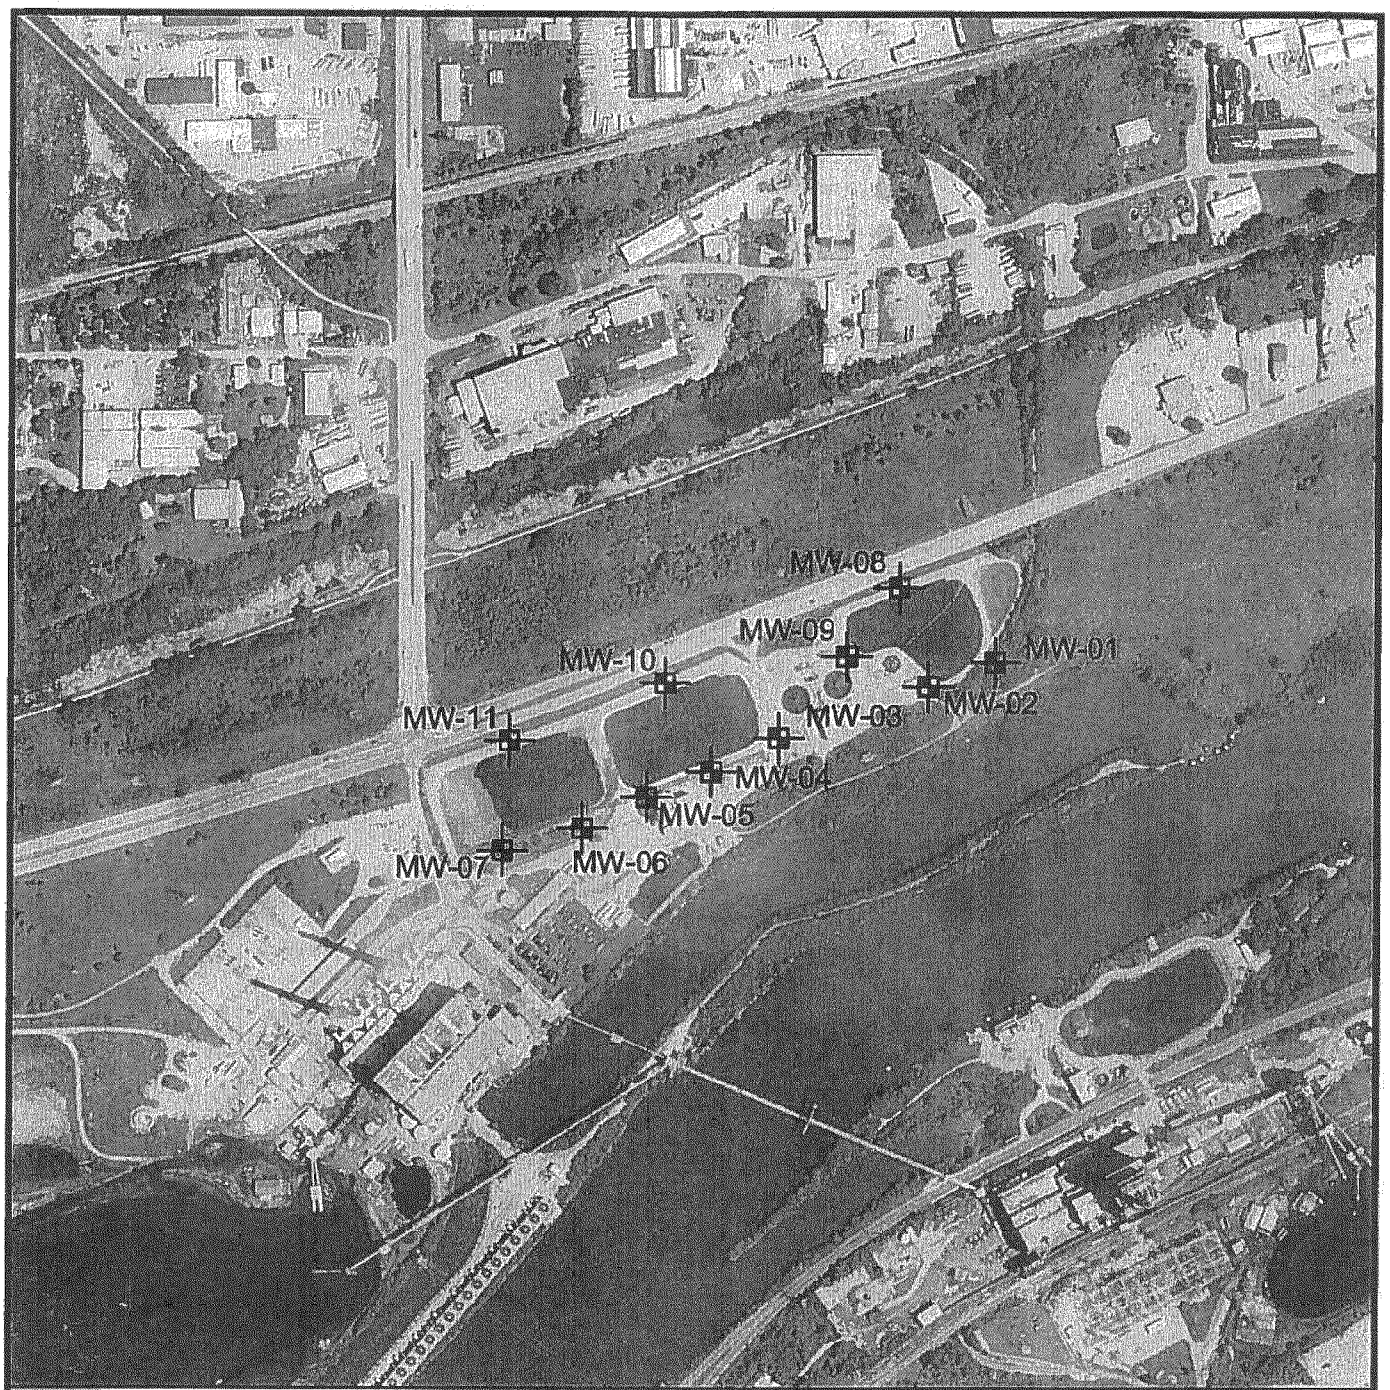
Monitoring well MW-9 contains the largest number of exceedances; given that this well is located between two of the ash ponds, it is difficult to draw strong conclusions regarding the concentrations in this well (i.e., analytes due to the ash ponds versus other industrial sources). Other than chloride (often associated with runoff), very few exceedances were found in the on-site wells, indicating that the ash ponds are not likely contributing to the groundwater concentrations. Chlorides were found throughout the site (MW-1 is the only well that has no detection of this chloride), indicating that another (possibly road-related) source is more likely for this compound.

Boron exceeded the Class I standard only in MW-11, an upgradient well. Again, the distribution of boron does not allow a strong conclusion to be drawn with respect to the integrity of the ash ponds.

Patrick performed trend analyses on the following parameters (each of these parameters was detected during at least once during each sampling event): antimony, arsenic, barium, cobalt, copper, iron, manganese, nickel, selenium, boron, sulfate, chloride, nitrogen-nitrate, total dissolved solids, fluoride, and nitrogen-nitrate-nitrite. Analytical parameters without any detections were not included in the analysis. There were no statistically significant (at the 95% confidence level) increasing or decreasing trends for any of the analyzed compounds.

## CONCLUSIONS

- Generally, the groundwater was found to be relatively un-impacted at the Joliet 29 site, with the exception of chloride, that is more likely caused by road runoff. No clear pattern of contaminants was found; MW-9, located between two of the ash ponds, next to the clarifiers, contained the highest number of exceedances. It is not clear whether the source of the contaminants found in this well is due to the ash ponds, or some other industrial source or process.



- Patrick could not find any statistically significant trends in the data which indicate that the exceedances are either historical in nature, or more likely naturally occurring.

DRAFT

## NEXT STEPS

The monitoring wells on site will continue to be monitored on a quarterly basis through 2012. After six quarters of data have been collected, a statistical analysis will be performed to compare upgradient well results with downgradient well results.

# ASH POND DATA EVAULATION & SUMMARY

**POWERTON STATION**
**Midwest Generation, LLC**
**Pekin, Illinois**
**January 2012**

## SITE DESCRIPTION

The Powerton facility (the Site) is located in Pekin, Tazewell County, Illinois. The Site is located along the Illinois River, south and west of the city of Pekin. The surrounding land use consists of the Illinois River to the north, industrial and residential properties to the east, agricultural land to the south, and Lake Powerton to the west.

The site contains three active ash ponds. Each ash pond is lined with 12" of geo-composite material on the bottom, and a geo-membrane liner on the side slopes; the total area of the three ash ponds is approximately 11 acres. One former ash pond that is no longer used is located east of the current ash ponds; it has been partially filled, and has been bisected by a rail loop, but still contains some ash.

## MONITORING WELLS

Ten monitoring wells have been installed (MW-1 through MW-10) surrounding the ash impoundments (both former and current) at the Powerton facility. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction (north, toward the Illinois River). Monitoring wells MW-1, MW-9 and MW-10 are installed upgradient of the ash ponds. The wells are monitored quarterly in accordance with the long-term monitoring plan. Groundwater data has been collected on a quarterly basis starting in December of 2010 and is continuing into 2012. A monitoring well location map is included in this summary.

## GROUNDWATER ELEVATIONS

Groundwater elevations in each monitoring well are collected quarterly prior to sampling. The groundwater levels were compared to levels collected by the USGS stream flow data at Station Number 05568500 located on the Illinois River at Kingston Mines, Illinois. Fluctuations in the groundwater elevations correlated to fluctuations in the River, indicating the groundwater at the site has a direct hydraulic connection to the surface water. The water elevations in all of the ash ponds, excluding the large, former ash pond to the east, are significantly higher than the surrounding groundwater elevations.

If wells MW-6 and MW-8 are excluded from the analysis, the direction of groundwater flow is clearly found to be from south to north, towards the River, as expected. The groundwater elevations in MW-6 and MW-8 are approximately 12 feet higher than in surrounding wells; the ground surface elevation in this area is also significantly higher than in the surrounding area. Boring logs from these wells also indicate the geology of this area consists of almost entirely fill

MWG13-15_14162

material. It is Patrick's opinion that both the topography and geology of this area create a localized groundwater high that is not necessarily attributable to leakage from the nearby wells. This conclusion is also supported by analytical data presented later in this report.

The correlation between groundwater elevations and the Illinois River elevations was weaker in the vicinity of wells MW-1, MW-9 and MW-10, which are the three wells furthest from the River and therefore the three wells that would be expected to be the least affected by changes in River elevation.

**ANALYTICAL RESULTS**

Groundwater samples were collected from the 10 monitoring wells on site on a quarterly basis in 2011. Both upgradient and downgradient wells on site have Class I Groundwater Quality Standard exceedances. These exceedances include: arsenic, iron, manganese, boron, chloride, nitrogen-nitrate, and total dissolved solids.

Concentrations of constituents exceeding Class I Groundwater Standards in downgradient wells (MW-2 through MW-8) were compared with upgradient well (MW-1, MW-9 and MW-10) concentrations. Average downgradient concentrations of manganese, chloride, total dissolved solids, arsenic and iron were higher than in the upgradient wells. Upgradient concentrations of boron and nitrogen-nitrate were higher than in the downgradient wells. Note that, excluding manganese, chloride, and nitrate, all of the exceedances of Class I standards were detected in only one well (MW-7).

Manganese and chloride (both naturally occurring compounds) were the only compounds that exceeded Class I standards in MW-6 and MW-8, providing further evidence that the ash ponds near these wells are not leaking (no other more traditional coal constituent indicator compounds exceeded standards in these two wells).

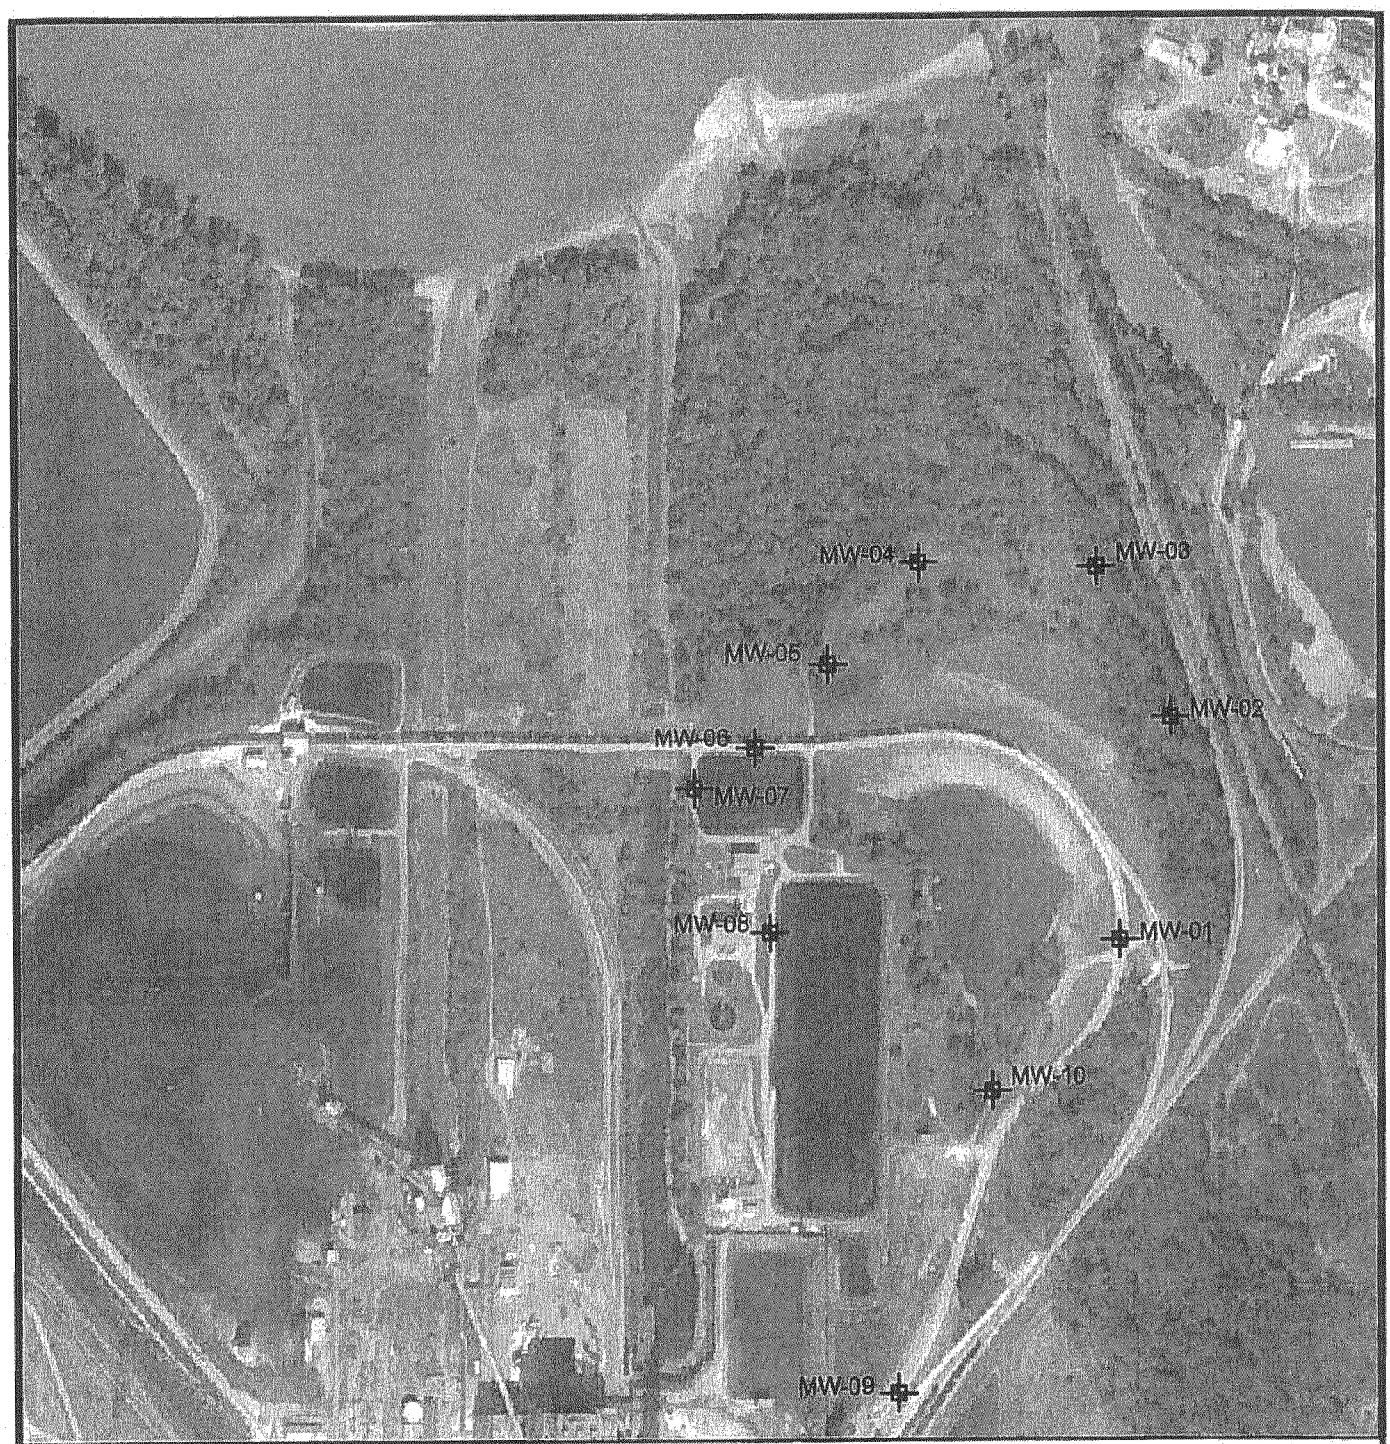
Patrick performed trend analyses on the following parameters (arsenic, barium, chromium, cobalt, iron, manganese, nickel, selenium, boron, sulfate, chloride, nitrogen-nitrate, total dissolved solids, and fluoride). Analytical parameters without any detections were not included in the analysis.

The increasing trend in arsenic concentrations in MW-7 was the only statistically significant increase of any constituent in any well. There were no statistically significant (at the 95% confidence level) increasing or decreasing trends for any of the remaining analyzed compounds.

**CONCLUSIONS**

- The groundwater underlying the Site appears to be in direct hydraulic connection to the Illinois River, except for the groundwater underlying the area near MW-6 and MW-8. There appears to a localized groundwater high in the vicinity of these wells that appears to be caused by local changes in topography and lithology.

- There does not appear to be any notable downgradient groundwater impact except potentially at well MW-7. Further evaluation of the nature and extent of any downgradient groundwater impact will be possible upon completion of the sixth sampling event and a statistical analysis of upgradient groundwater quality.



**NEXT STEPS**

The monitoring wells on site continue to be monitored on a quarterly basis. Possible modifications to the current sampling program that may provide useful data with respect to demonstrating the competency of the ash ponds could include:

- Surveying the ash ponds is an additional task for 2012 as listed in an Illinois EPA comment letter response to the initial Hydrogeologic Assessment. The purpose is to compare groundwater levels in the monitoring wells with the ash pond elevations. The additional surveying may provide data that will be useful in clarifying the nature of the groundwater high in the vicinity of MW-6 and MW-8.

- While not necessary at this time, additional investigations into the nature of the groundwater elevations at MW-6 and MW-8 could include the installation of groundwater level transducers or the performance of a tracer test in the ponds closest to MW-7.

# ASH POND DATA EVAULATION & SUMMARY

**WAUKEGAN STATION**
**Midwest Generation, LLC**
**Waukegan, Illinois**
**January 2012**

## SITE DESCRIPTION

The Waukegan facility (the Site) is located in the City of Waukegan, Lake County, Illinois. The Site is located along the shore of Lake Michigan on the northeast side of Waukegan. The surrounding land use consists of undeveloped land to the north, apparently vacant industrial land to the south, residential properties to the west, and Lake Michigan to the east. The Site contains two active ash ponds. The ponds are lined with a high-density polyethylene (HDPE) liner; the total area of the two ash ponds is approximately 25 acres.

## MONITORING WELLS

Five monitoring wells have been installed (MW-1 through MW-5) surrounding the ash impoundments at the Waukegan facility. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. Monitoring well MW-5 is installed upgradient of the ash ponds. The wells are monitored quarterly in accordance with the long-term monitoring plan. Groundwater data has been collected on a quarterly basis starting in December of 2010 and is continuing into 2012. A Monitoring Well Location Map is included in this summary.

## GROUNDWATER ELEVATIONS

Groundwater levels in the monitoring wells are collected quarterly prior to sampling. The groundwater levels were compared to the Lake Michigan water levels collected by the NOAA Lake Michigan Water Elevation data at stations collected near Milwaukee, Wisconsin and Calumet, Indiana. The data from these two stations were interpolated to calculate an expected elevation near the Waukegan Station. The fluctuations in the groundwater elevations were compared to the fluctuations in the lake water levels for each monitoring event. There appears to be a correlation between Lake levels and the groundwater levels at the Site.

The direction of groundwater flow at the site is west to east, directly towards Lake Michigan.

Waukegan Station operates two ash ponds at the Site. Only one of the ponds is active at any given time. When a given pond is active, its water elevation can be significantly higher (>10') than the natural groundwater elevation at the Site. Yet these levels tend to be maintained for an extended period, indicating that there is no significant leakage through the liner of the pond. Similarly, the non-active pond is maintained at an elevation well below the natural groundwater elevation (<8'), with no observable leakage into the pond. Both of these observations are consistent with the fact that these ponds are lined with an HPDE liner, and do not appear to be hydraulically connected with groundwater at the site.

MWG13-15_14166

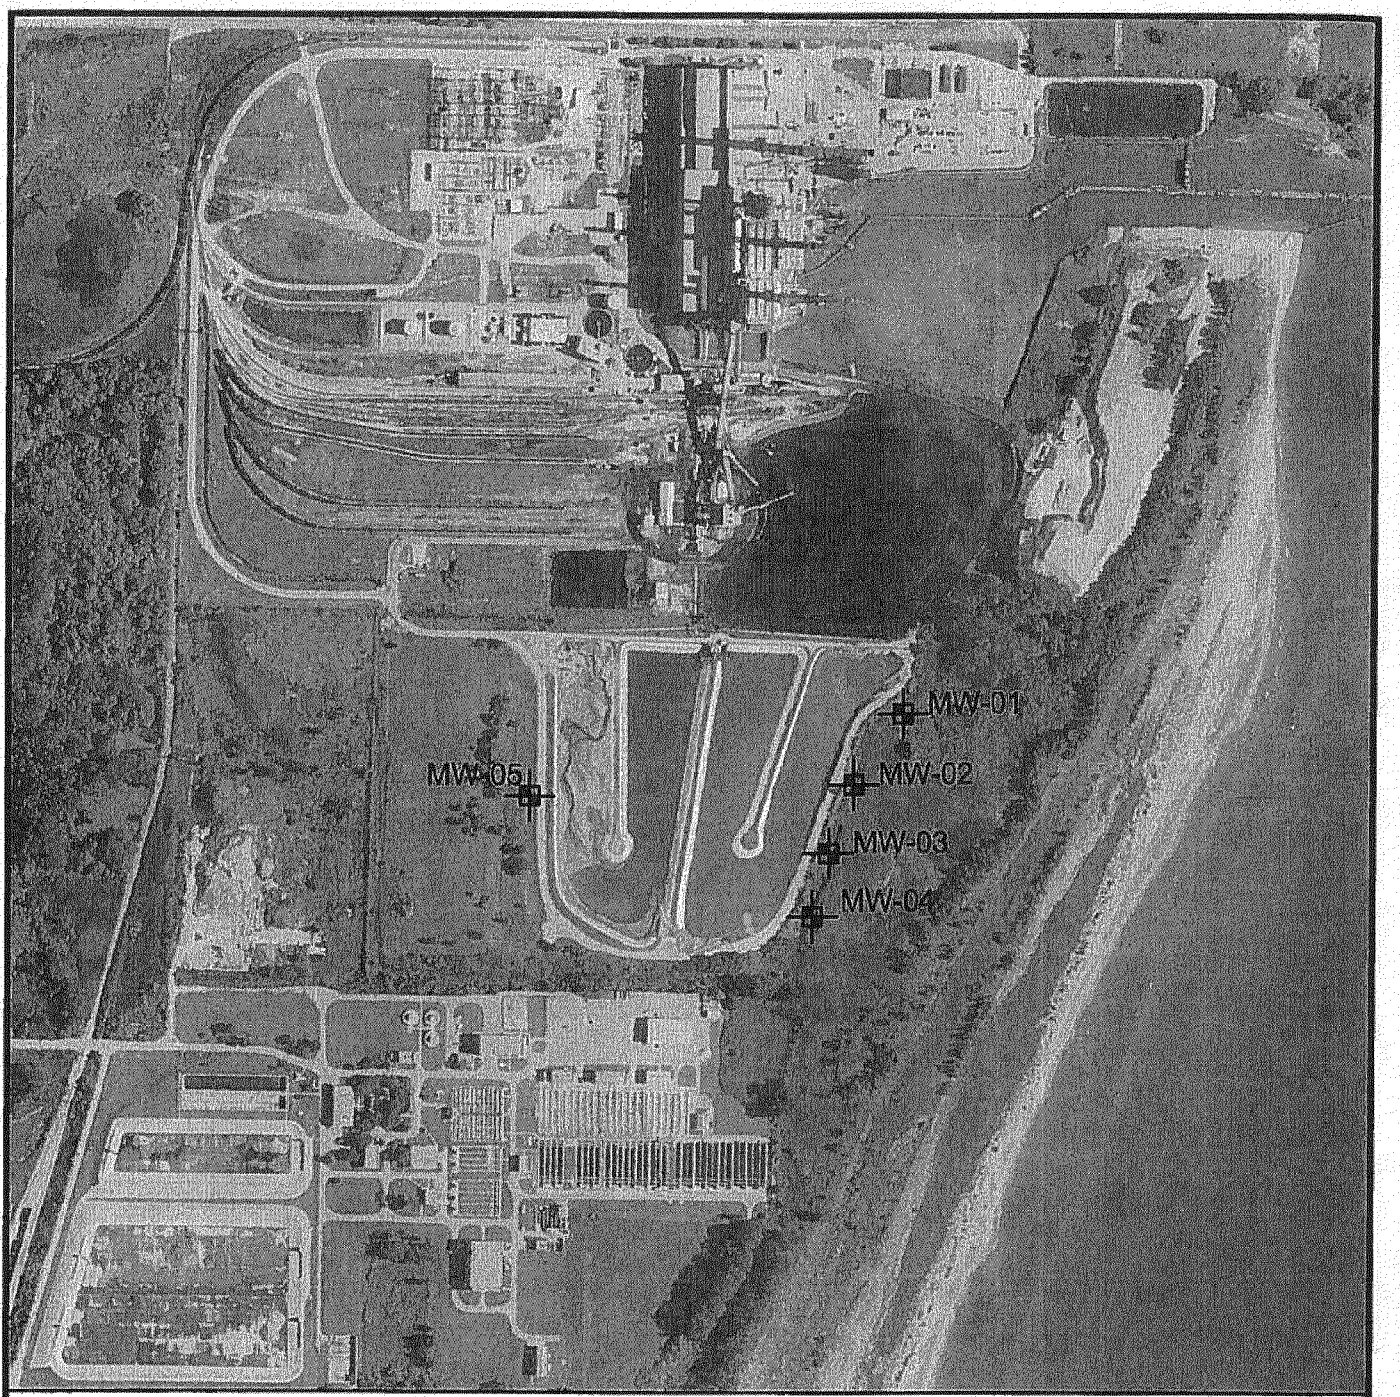
## ANALYTICAL RESULTS

Groundwater samples were collected from the 5 monitoring wells on site on a quarterly basis in 2011. Both the upgradient well and downgradient monitoring wells on site have Class I Groundwater Quality Standard exceedances. The following compounds exceeded their respective Class I standards: arsenic, boron, manganese, sulfate, chloride and total dissolved solids.

Patrick compared upgradient well concentrations with downgradient well concentrations. The concentrations of boron, iron, manganese, chloride and total dissolved solids are higher, sometimes significantly higher, in the upgradient well (MW-5) than in the downgradient wells. The downgradient wells, MW-1 through MW-4, have higher concentrations of arsenic, with the highest concentrations found in MW-1 (the northernmost downgradient well).

Patrick performed a trend analysis on the following analytical parameters, (arsenic, barium, cyanide, iron, manganese, selenium, boron, sulfate, chloride, nitrogen-nitrate, total dissolved solids, fluoride, and nitrogen-nitrate-nitrite). Analytical parameters without any detections were not included in the analysis. There were no statistically significant (at the 95% confidence level) increasing or decreasing trends for any of the analyzed compounds.

## CONCLUSIONS



- There is a strong correlation between Lake Michigan elevations and the groundwater levels in the monitoring wells on site. The groundwater levels collected on site consistently fluctuated on a similar scale with water levels in Lake Michigan which indicate that the groundwater on site is hydraulically connected to the Lake, as expected.
- The pond elevation data when compared with the natural groundwater elevation at the Site provide strong evidence that there is no hydraulic connection between these units; the ponds do not appear to be leaking.
- The groundwater elevation data show that MW-5 is an upgradient well. The elevated concentrations of compounds of interest in MW-5 appear to be the result of the well being installed in a former ash disposal area and not a result of leakage from the current ash ponds.
- The relatively low concentrations of compounds of interest in the downgradient wells, as compared to those found in the upgradient well, appear to indicate that the current ash ponds are not leaking. The source of the elevated concentration of arsenic in MW-1 is unknown, but could be related to the nearby coal pile. The Waukegan Site data appear to support the conclusion that the ash ponds do not appear to be the source of groundwater contamination at the Site.

**NEXT STEPS**

- The monitoring wells on site will continue to be monitored on a quarterly basis through 2012. Monitoring wells that contain detections will continue to be monitored in order to observe any trend that may be occurring whether the compounds may be increasing or decreasing.

- An additional well was requested by the Illinois EPA in a comment letter in response to the Waukegan Hydrogeologic Assessment. The well was proposed to be installed at the southern edge of the property to assess the potential for off-site migration. No definitive decision regarding the installation of this requested well has yet been made.

# ASH POND DATA EVAULATION & SUMMARY

**WILL COUNTY STATION**
**Midwest Generation, LLC**
**Romeoville, Illinois**
**January 2012**

## SITE DESCRIPTION

The Will County Generating Station (the Site) is located in Romeoville, Will County, Illinois. The Site is located between the Chicago Sanitary and Ship Canal (CSSC) and the Des Plaines River east of the city of Romeoville. The surrounding land use consists of undeveloped land to the north, the Chicago Sanitary and Ship Canal to the east, a quarry to the south, and the Des Plaines River to the west. The Site includes four active ash ponds. The ponds are lined with 36" of geo-composite material; the total area of the four ash ponds is approximately 8 acres.

## MONITORING WELLS

Ten monitoring wells have been installed (MW-1 through MW-10) surrounding the ash impoundments at the Will County facility. The well locations were selected so that both upgradient and downgradient wells were represented, based upon available data regarding the expected groundwater flow direction. Monitoring wells MW-1 through MW-6 were intended to be installed downgradient of the ash ponds. The wells are monitored quarterly in accordance with the long-term monitoring plan. Groundwater data has been collected on a quarterly basis starting in December of 2010 is continuing into 2012. A monitoring well location map is attached to this summary.

## GROUNDWATER ELEVATIONS

The groundwater elevation in each of the ten wells was measured prior to sampling. The groundwater levels were compared to levels collected by the USGS stream flow data at Station Number 05536998 located in the CSSC at the Lockport Controlling Works in Lockport, Illinois and at Station Number 05534000 located in the Des Plaines River at Romeoville Road. Fluctuations in the groundwater elevations correlated to fluctuations in the CSSC and the River, indicating the groundwater at the site has a direct hydraulic connection to the surface waters. The elevation of the Des Plaines River is normally higher than the elevation of the CSSC (Wells MW-7 through MW-10 were installed to be the upgradient wells based on this observation). The surface water elevations in the ash ponds were also measured during the initial investigation; the water elevations in the ash ponds were 3 to 6 feet higher than the groundwater elevations in the nearby wells.

Patrick's initial conceptual model of groundwater flow at the Site was that the groundwater was hydraulically connected to both the River and the CSSC with groundwater flowing from west to east. The data collected to date indicates that the groundwater is in direct hydraulic connection to the River and the CSSC; however, the groundwater elevations are all higher than either of the surface waters and the direction of groundwater is generally found to be from the northeast to southwest. It is unknown whether the presence of this groundwater 'mound' between the River

and the CSSC is due simply to natural mounding due to recharge, or is partially related to leakage from the ash ponds themselves. The groundwater elevation in MW-5 has periodically been higher than either MW-4 to the north and MW-6 to the south, which could conceivably be due to a leakage contribution from the South Pond (directly west of MW-5), but it is difficult to make such a conclusion on the basis of the existing data. The collection of additional ash pond elevation data (this was only collected during the first sampling event) may help in further defining the relationships between groundwater and surface water at the Site. Definitive demonstration that the ponds are not leaking could really only be supplied by something like a bromide tracer test, but these are expensive, and even these tests are not guaranteed to settle the matter one way or another.

**ANALYTICAL RESULTS**

Groundwater samples were collected from the 10 monitoring wells on site on a quarterly basis in 2011. Both upgradient and downgradient wells indicated Class I Groundwater Quality Standard exceedances. The following compounds exceeded their respective Class I standards: manganese, boron, sulfate, chloride, and total dissolved solids (TDS).

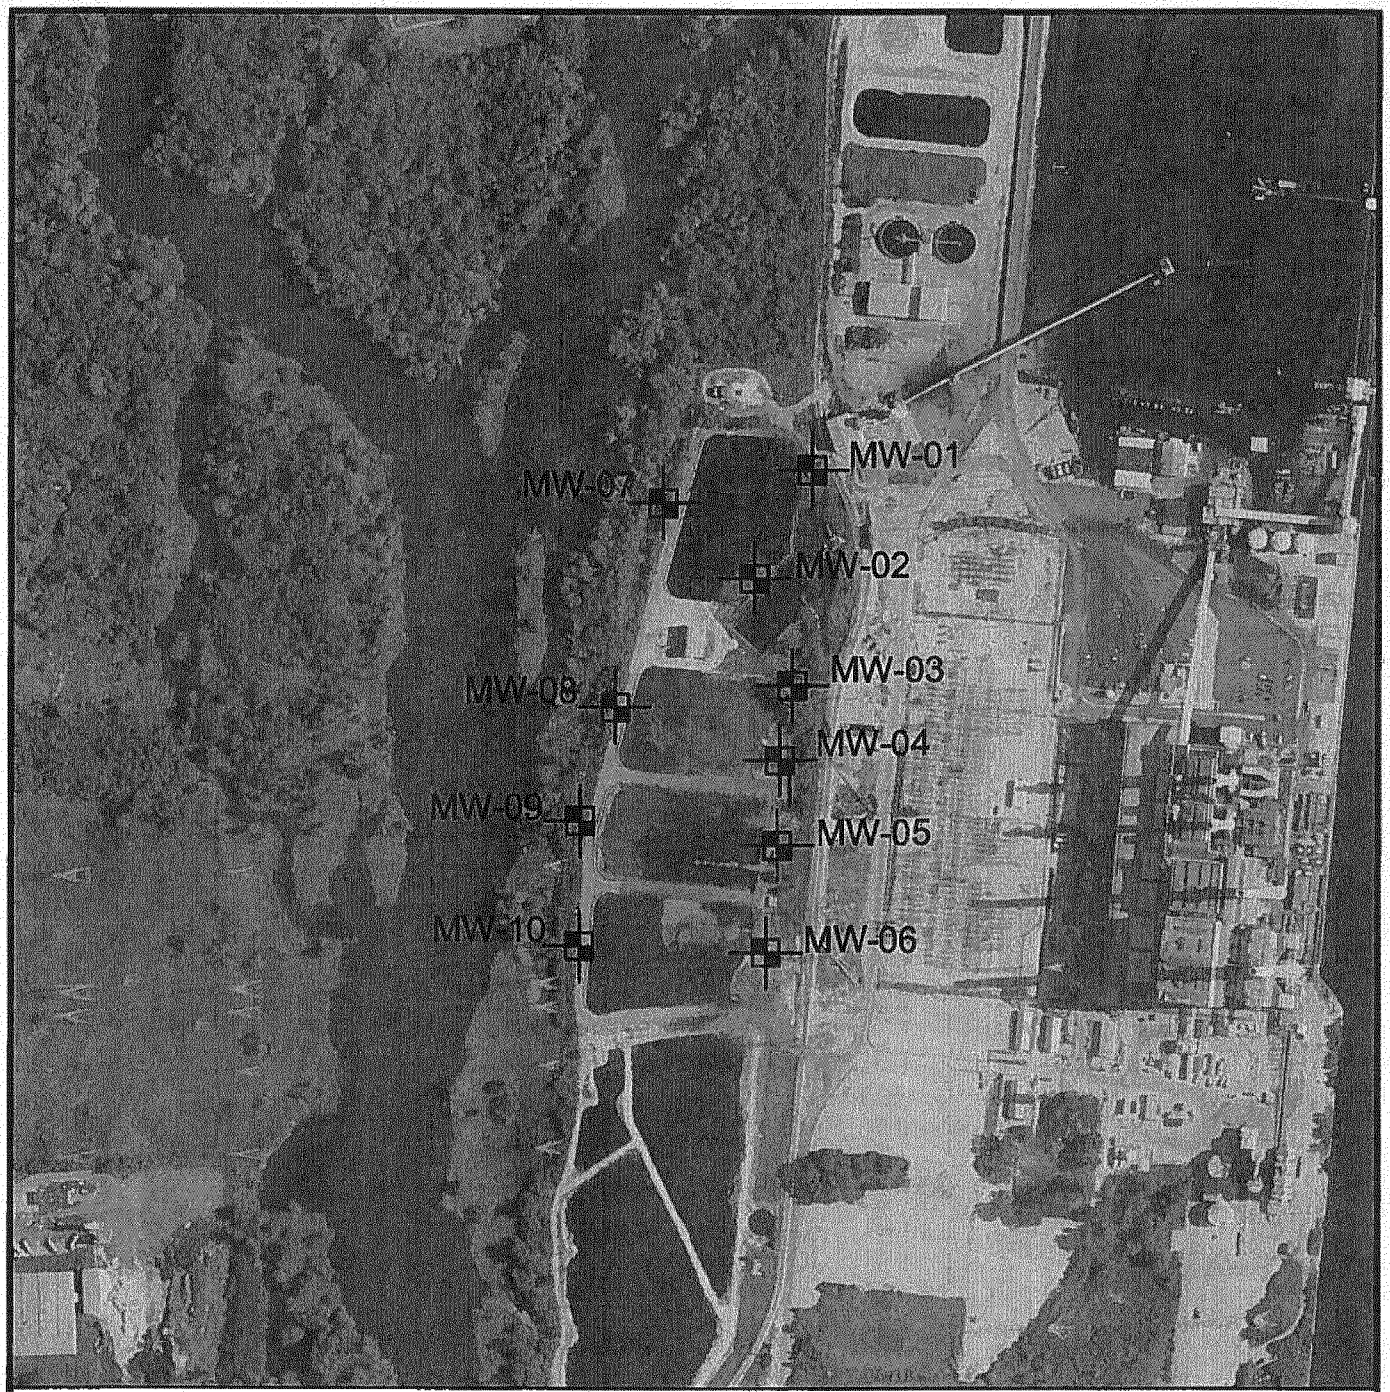
Patrick compared the concentrations of those compounds that exceeded the Class I standards in the upgradient and downgradient wells. Based upon the current model of groundwater flow at the Site, only MW-1 appears to be a true upgradient well (MW-2 through MW-6 are considered side-gradient and MW-7 through MW-10 are downgradient). Compared to MW-1, concentrations of boron were higher in all of the other wells; concentrations of sulfate were higher in 7 of the other wells; TDS was higher in 5 out of 9 wells; manganese was higher in 4 out the other wells; and chloride was higher in only 2 of the other wells. The results of these comparisons could be used to argue that the ash ponds are potentially impacting downgradient groundwater at the Site. However, there is still uncertainty regarding the groundwater flow paths and Patrick has not yet performed a rigorous statistical analysis of upgradient groundwater quality.

Patrick performed trend analyses on the following parameters (each of these parameters was detected during at least once during each sampling event): arsenic, barium, cobalt, iron, manganese, nickel, selenium, boron, sulfate, chloride, total dissolved solids, fluoride, nitrogen-nitrite, and nitrogen-nitrate-nitrite. There were no statistically significant (at the 95% confidence level) increasing or decreasing trends for any of the analyzed compounds.

**CONCLUSIONS**

- The groundwater and surface water elevation data indicate that the groundwater at the site is in direct hydraulic connection with both the CSSC and the Des Plaines River. This conclusion is also supported by the increase in chloride concentrations in the spring of 2011 (chloride concentrations in surface water generally peak in the spring as snow melt and precipitation runoff transport dissolved road salt).

- The groundwater elevations are generally higher than either the CSSC or the River, indicating that there is a groundwater 'mound' underlying the Site. Since the ash pond water elevations are significantly higher than the groundwater elevations and the potentiometric surface maps do not indicate a clear radial flow pattern away from the ash ponds, it is possible that the groundwater mounding is a natural occurrence due to recharge.



- The results of the groundwater sampling indicate that there are exceedances of the Class I groundwater quality standards for compounds that can be associated with coal ash, most notably boron. Boron and sulfate concentrations are higher in nearly all of the downgradient wells, when compared to MW-1, indicating that the ash ponds are potentially impacting downgradient groundwater. However, given the limited number of upgradient wells at the Site (one, if the mounding is considered), no firm conclusion can be drawn with respect to groundwater analytes at the Site.

**NEXT STEPS**

The monitoring wells on site continue to be monitored on a quarterly basis. Possible modifications to the current sampling program that may provide useful data with respect to demonstrating the competency of the ash ponds could include:

- Patrick could collect the water elevations of the ash ponds during each quarterly sampling event. While this could provide additional useful data, the ponds elevations experience such frequent fluctuation based solely on the station operations elevation fluctuations in the ash ponds that quarterly pond elevation data may not yield any useful data.

- Given the complicated nature of hydraulic flow and contaminant distribution at the Site, it is difficult to draw any strong conclusions regarding the nature of the ash ponds at the Will County Site. It may be that definitive data on whether or not these ponds are contributing to groundwater contamination would only be provided by a tracer test, using bromide, or some other conservative tracer.
