Bob, in follow-up of our conversation last week, I am trying to determine how much information you need for the FESOP application. It seems that the 200 and 210 with the 210 covering the parts of the 2008 Title V renewal application still valid, each construction permit issued since the 2008 TV application and a current emissions spreadsheet would suffice. What am I missing?

Bob,

You will need to provide the following to convert this application to a FESOP:

CAAPP-200 form;
CAAPP-292 form;
CAAPP-296 form;
CAAPP-299 form or a listing of emission units to be included in the permit;
Proposed emission limits and the corresponding production, throughput, material usage, or fuel usage limits.

In addition, according to the source's CAAPP permit, this source is currently subject to the MACT for Solvent Extraction for Vegetable Oil Production (40 CFR 63 Subpart GGGG). In order for us to be able to issue a FESOP to this source, you will have to certify to us that operation of the oil production processes has ceased.

Bob Bernoteit
FESOP Unit Manager,
Illinois EPA, Division of Air Pollution Control - Permit Section

CONSTRUCTION PERMIT

PERMITTEE

Bunge North America, Inc.
Attn: Dean Hughes
321 East North Street
Danville, Illinois 61832

Application No.: 11070017 I.D. No.: 183020ABT
Applicant's Designation: Date Received: July 13, 2011
Subject: Whole Grain Flour Project
Date Issued: October 11, 2011
Location: 321 East North Street, Danville, Vermillion County

Permit is hereby granted to the above-designated Permittee to CONSTRUCT emission source(s) and/or air pollution control equipment consisting of a whole grain flour project, including new and existing milling, sifting, and drying equipment as described in the above-referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1. This permit authorizes a whole grain flour project (affected project), as follows, in the dry corn mill (the affected mill), with the installation of assorted equipment and use of certain existing equipment to manufacture a new whole grain flour product from materials already handled at the mill:

   a. The project would involve new emission units including FTS/TAS Pneumatic Transfer, 105-03 Flour Pneumatic Transfer, and Pneumatic Transfer to Sifters, all controlled by the existing Blended Foods Baghouse; Pneumatic Transfer to Storage controlled by the existing North Roof Baghouse; and a Hammermill and Collection Hopper controlled by a new Hammermill Dust Collector.

   b. The project would involve new equipment that is enclosed and will have no direct emissions, including a new Mixer and Conditioner and Sifters.

   c. The project would use the existing 8-Grit Steam Tube Dryer, which would be modified to process the new product as emissions would be controlled by a new cyclone, rather than the existing baghouse.

   d. The project would also use existing emission units, including the 8-Grit Cooler, which would continue to be controlled by the existing Blended Foods Baghouse, and existing Final Product Storage Bins, which would continue to be controlled by the North Roof Baghouse.

e. There will also be an increase in operation of existing boilers with the project due to the increased steam demand for conditioning and drying the new product.

2a. This permit does not revise or relax any requirements for the affected mill, including applicable emission standards and associated requirements for monitoring, recordkeeping and reporting as identified in the Clean Air Act Permit Program (CAAPP) permit for the source, Permit 96020027, which shall continue to apply after construction of the affected project is completed.

b. The requirements that apply to the affected mill shall also apply to the new emission units and equipment that are part of the affected project.

3. This permit does not authorize an increase in the design capacity of the affected mill, i.e., the amount of material that can be processed by the mill, as a result of the affected project.

4a. i. This permit is issued based on negligible emissions from the FTS/TAS Pneumatic Transfer, 105-03 Flour Pneumatic Transfer, and Pneumatic Transfer to Silos. For this purpose, PM/PM_{10} emissions from these units, in total, shall not exceed 0.1 lbs/hour and 0.44 tons/year.

ii. This permit is issued based on negligible emissions from the Hammermill and Collection Hopper. For this purpose, PM/PM_{10} emissions from these units, in total, shall not exceed 0.1 lbs/hour and 0.44 tons/year.

iii. This permit is issued based on minimal emissions from the Pneumatic Transfer to Storage. For this purpose, PM/PM_{10} emissions shall not exceed 0.25 lbs/hour and 1.1 tons/year.

b. This permit is issued based on increases in annual emissions of from existing emission units (i.e., emission units that are not addressed by Conditions 4(a)) as determined in accordance with 40 CFR 52.21(r)(6) due to the affected project that are less than significant.

Note: The application indicates that the PM/PM_{10} emissions from the modified 8-Grit Dryer will not exceed 0.45 lbs/hour and 2.0 tons/year and the increases in emissions from the boilers at the source due to the affected project will not exceed 2.2 tons/year of NO_x and CO and 1,500 tons/year of CO_2e.

5. At all times, the Permittee shall maintain and operate the affected project, including associated control devices, in a manner consistent with good air pollution control practice for minimizing emissions.

6. Upon written request by the Illinois EPA, the Permittee shall promptly have testing for PM/PM_{10} emissions of the modified 8-Grit Dryer performed in accordance with Condition 7.3.7 of CAAPP Permit 96020027.

7. The Permittee shall fulfill the recordkeeping and reporting requirements of 40 CFR 52.21(r)(6) for the modified 8-Grit Dryer.

8. The Permittee may operate the affected project under this permit until its CAAPP permit is reissued to address this project.

If you have any questions on this, please call Kevin Hecht at 217/785-1705.

Bob,

You will need to provide the following to convert this application to a FESOP:

CAAPP-200 form;
CAAPP-292 form;
CAAPP-296 form;
CAAPP-299 form or a listing of emission units to be included in the permit;
Proposed emission limits and the corresponding production, throughput, material usage, or fuel usage limits.

In addition, according to the source's CAAPP permit, this source is currently subject to the MACT for Solvent Extraction for Vegetable Oil Production (40 CFR 63 Subpart GGGG). In order for us to be able to issue a FESOP to this source, you will have to certify to us that operation of the oil production processes has ceased.

Re: FESOP Application
Bunge – Danville Facility
Source ID No. 183020ABT

Dear Mr. Bernoteit:

Please find enclosed two copies of our FESOP application. The issued FESOP will replace the current Title V permit. This application pertains to the current grain elevator and corn mill.

As was documented in the application for and in approval 10050056, the corn and soybean oil extraction facilities have ceased as has the operation of the COGEN (coal fired boiler with backup) facility. The undersigned certifies that the statements contained in this application are true, correct and current.

If you have any questions or require any further information please do not hesitate to contact Robert Henricks at (314) 292-2342 or by email at robert.henricks@bunge.com.

Sincerely,

Dean Hughes
Eastern Regional Manager – Milling

Enclosure: FESOP application in duplicate

SUPPLEMENTAL INFORMATION

APC 200

In response to question 20 of APC 200, as of the submittal of this application there are three projects undergoing or pending construction for which approvals have been issued by the Bureau of Air. The projects are Whole Grain, Bran System Improvements and the Thru Stock Project. It is anticipated construction will be completed before the end of 2012. Therefore, the sources related to these projects are included in this application.

Limits:

Facility Total Emissions:

Emissions from and of operation of grain and dry bulk material handling and processing and support boiler operations shall not exceed the following limits:

Pollutant	Emissions - Tons/12 month rolling total
Particulate matter (PM)	82.7
Particulate matter (PM10)	58.8
Carbon Monoxide (CO)	63.4
Nitrogen Oxides (NOx)	39.0
Volatile Organic Material (VOM)	2.3

These limits are based on maximum material throughputs, standard emission factors (Table 9.9.1-1, AP-42, Fifth Edition, Volume I, Update 2003, May 2003 & Table 9.11.1-1, Ap-42, Fifth Edition, Volume I, Supplement A, November 1995 & Table 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998 & Tables 1.3-1 and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E Corrected, May 2010, design or measured exhaust flow rates of baghouses and cyclones and typical capture efficiencies for the fugitive source designs.

Support boiler Emissions:

i. Pursuant to 35 IAC, Chapter B, Subchapter c, emissions from the affected primary boiler shall not exceed the following standards, which apply on an hourly basis:

Pollutant	Standard	Limit
PM	35 IAC 212.206	0.10 lb/mmBtu*
SO_2	35 IAC 214.161(b)	0.3 lb/mmBtu*
CO	35 IAC 216.121	200 ppm, @ 50% excess air

ii. The short-term emissions of NO_X from the affected primary boiler shall not exceed the following limits:

	Limits			
	Gaseous Fuels		Liquid Fuels	
Pollutant	Lbs/Hr	Lbs/mmBtu	Lbs/Hr	lbs/mmBtu
NO_x	7.7	0.080	16.3	0.171

iii. Short-term emissions from the affected primary boiler shall not exceed the following limits:

Pollutant	Limits Lbs/Hour
CO	14.9
VOM	0.5
PM/PM_{10}	1.4
SO_2	2.9
Individual HAP[1]	0.25
Total HAP	0.5

[1] Individual HAP refers to individual pollutants, such as formaldehyde, benzene, toluene, hexane.

iv. Annual emissions from the affected primary boiler shall not exceed the following limits. These limits reflect information in the permit application.

Pollutant	Limits (Tons/Year)
NO_X	39.0
CO	63.4
VOM	2.4
PM/PM_{10}	1.5
SO_2	2.3
Individual HAP	1.2
Total HAP	2.4

v. Pursuant to 35 IAC, Chapter B, Subchapter c, emissions from the affected backup boiler shall not exceed the following standards, which apply on an hourly basis:

Pollutant	Standard	Limit
PM	35 IAC 212.206	0.10 lb/mmBtu*
SO_2	35 IAC 214.122(b)(2)	0.3 lb/mmBtu*
CO	35 IAC 216.121	200 ppm, @ 50% excess air

* Limit is applicable to emissions attributable to burning of liquid fuel.

vi. The short-term emissions of NO_x from the affected backup boiler shall not exceed the following limits:

	Limits			
	Gaseous Fuels		Liquid Fuels	
Pollutant	Lbs/Hr	Lbs/mmBtu	Lbs/Hr	Lbs/mmBtu
NO_x	2.7	0.097	4.0	0.144

vii. Short-term emissions from the affected backup boiler shall not exceed the following limits.

Pollutant	Limits Lbs/Hour
CO	2.3
VOM	0.2
PM/PM_{10}	0.7
SO_2	0.9
Individual HAP[1]	0.1
Total HAP	0.2

[1] Individual HAP refers to individual pollutants, such as formaldehyde, benzene, toluene, hexane.

viii. Annual emissions from the affected backup boiler shall not exceed the following limits.

Pollutant	Limits (ton/yr)
NO_x	14.6
CO	10.1
VOM	0.7
PM/PM_{10}	3.1
SO_2	1.9
Individual HAP	0.4
Total HAP	0.9

Production:

1. The throughput of the dry corn mill shall not exceed 100,000 bushels/day, monthly average.
2. The Permittee shall keep the following operation records for the dry corn mill:
   a. Throughput (bushels/day monthly average) based on the daily corn mill production input.
3. The combined usage of liquid fuels in the affected primary boiler and the associated backup boiler (PEU 7) shall not exceed 850,000 gallons per year.

Primary boiler:

Emission Unit	Description	Emission Control
Primary Boiler	Gas and liquid fuel-fired boiler, 96.6 mmBtu/hour rated heat input capacity B&W Model FM 1556, manufactured in 1967	Low-NO_x burner

Backup boiler:

Emission Unit	Description	Emission Control
Backup Boiler	Gas and liquid fuel-fired boiler 27.9 mmBtu/hour rated heat input capacity manufactured by Clayton in 2006	Low-NO_x Burner

(A) THIS FORM IS TO PROVIDE THE ILLINOIS EPA WITH GENERAL INFORMATION ABOUT THE EQUIPMENT TO BE CONSTRUCTED OR OPERATED. THIS FORM MAY BE USED TO REQUEST A CONSTRUCTION PERMIT, AN OPERATING PERMIT, OR A JOINT CONSTRUCTION AND OPERATING PERMIT.

(B) ENTER THE GENERIC NAME OF THE EQUIPMENT TO BE CONSTRUCTED OR OPERATED. THIS NAME WILL APPEAR ON THE PERMIT WHICH MAY BE ISSUED PURSUANT TO THIS APPLICATION. THIS FORM MUST BE ACCOMPANIED BY OTHER APPLICABLE FORMS AND INFORMATION.

(C) PROVIDE A DESIGNATION IN ITEM 5 ABOVE WHICH YOU WOULD LIKE THE ILLINOIS EPA TO USE FOR IDENTIFICATION OF YOUR EQUIPMENT. YOUR DESIGNATION WILL BE REFERENCED IN CORRESPONDENCE FROM THIS AGENCY RELATIVE TO THIS APPLICATION. YOUR DESIGNATION MUST NOT EXCEED TEN (10) CHARACTERS. (*OPTIONAL*)

(D) THIS APPLICATION MUST BE SIGNED IN ACCORDANCE WITH 35 ILL. ADM. CODE 201.154 OR 201.159 WHICH STATES: "ALL APPLICATIONS AND SUPPLEMENTS THERETO SHALL BE SIGNED BY THE OWNER AND OPERATOR OF THE EMISSION SOURCE OR AIR POLLUTION CONTROL EQUIPMENT, OR THEIR AUTHORIZED AGENT, AND SHALL BE ACCOMPANIED BY EVIDENCE OF AUTHORITY TO SIGN THE APPLICATION."

IF THE OWNER OR OPERATOR IS A CORPORATION, SUCH CORPORATION MUST HAVE ON FILE WITH THE ILLINOIS EPA A CERTIFIED COPY OF A RESOLUTION OF THE CORPORATION'S BOARD OF DIRECTORS AUTHORIZING THE PERSONS SIGNING THIS APPLICATION TO CAUSE OR ALLOW THE CONSTRUCTION OR OPERATION OF THE EQUIPMENT TO BE COVERED BY THE PERMIT.

FEE DETERMINATION FOR CAAPP SOURCE

FOR AGENCY USE ONLY
ID NO.:
PERMIT NO.:
DATE:

SECTION ONE — SOURCE INFORMATION

1) SOURCE NAME: Bunge Milling, Inc.

2) SOURCE ID NO.: 183020ABT

3) DATE FORM PREPARED: 10/28/2011

SECTION TWO — INSTRUCTIONS IN BRIEF

1) COMPLETE THIS FORM TO DETERMINE THE PERMIT FEE ESTABLISHED BY THE CAAPP PERMIT.

2) THE EMISSION LEVELS STATED IN SECTION FOUR, WHICH ARE ONLY USED FOR THE PURPOSE OF PERMIT FEE DETERMINATION, WILL BECOME PERMIT SPECIAL CONDITIONS IN THE CAAPP PERMIT.

3) THE ILLINOIS EPA DOES NOT REQUIRE PAYMENT WITH THIS APPLICATION. WHEN YOU ARE BILLED MAKE CHECK OR MONEY ORDER PAYABLE TO THE ILLINOIS ENVIRONMENTAL PROTECTION AGENCY. SEND TO THE ADDRESS AT THE TOP OF THIS FORM. **DO NOT SEND CASH**. ON THE CHECK MEMO LINE, PLEASE LIST "CAAPP OPERATING PERMIT FEE: ID NO. XXXXXXXXX", REPLACE THE Xs WITH YOUR SOURCE ID NUMBER.

SECTION THREE — FEE RATIONALE

WHAT IS THE PERMIT STATUS AT THE TIME OF THIS REQUEST? CHECK ONLY ONE BELOW.

1) ☐ INITIAL CAAPP PERMIT ☐ RENEWAL CAAPP PERMIT X FESOP INITIAL/RENEWAL
☐ SIGNIFICANT MODIFICATION ☐ MINOR MODIFICATION ☐ ADMINISTRATIVE AMENDMENT

2) COMPLETE THE BELOW TABLE FOR A NON-INITIAL CAAPP PERMIT. IF THERE IS AN INCREASE/DECREASE IN EMISSIONS, ENTER THE NUMBER(S) FOR THE EMISSIONS CHANGE RATIONALE AS APPROPRIATE.

POLLUTANT	INCREASE	DECREASE	NO CHANGE	EMISSIONS CHANGE RATIONALE(S)
NITROGEN OXIDES (NO_X)	☐	X	☐	
PARTICULATE MATTER (PART) PM10	☐	X	☐	
SULFUR DIOXIDE (SO_2)	☐	X	☐	
VOLATILE ORGANIC MATERIAL (VOM)	☐	X	☐	
OTHER (SPECIFY) n-Hexane	☐	X	☐	
OTHER (SPECIFY)	☐	☐	☐	

Removal of Processes at the Source

CHANGE RATIONALE:
1 BUSINESS DECISION (E.G., OPERATING NEEDS, BANKRUPTCY, ETC.).
2 REMOVAL OR ADDITION OF PROCESSES AT THE SOURCE.
3 INCLUSION OR REMOVAL OF A CONTROL DEVICE.
4 CHEMICAL REFORMULATION (E.G., REFORMULATING A COATING FROM HIGH VOM TO LOW VOM).
5 FUEL SWITCHING (E.G., COAL TO NATURAL GAS, ETC.).
6 METHODOLOGY CHANGE (E.G., SWITCHING A PETROLEUM SOLVENT TO AQUEOUS SOLUTION).
7 CHANGES IN METHOD USED FOR CALCULATIONS (E.G., EMISSION FACTOR CHANGE).
8 OTHER (DESCRIBE): _____

EMISSION UNITS COMPLIANCE INFORMATION

9a) THE FOLLOWING EMISSION UNITS ARE IN COMPLIANCE WITH APPLICABLE REQUIREMENTS SUCH AS EMISSION STANDARDS, EMISSION CONTROL REQUIREMENTS, EMISSION TESTING, COURT REQUIREMENTS, WORK PRACTICES, OR ENHANCED MONITORING, BASED ON THE COMPLIANCE METHODS SPECIFIED BELOW (IF ADDITIONAL SPACE IS NEEDED, ATTACH AND LABEL AS EXHIBIT 296-1):

EMISSION UNIT	APPLICABLE RULE	COMPLIANCE DETERMINATION METHOD
PEUG 1, 2 & 6	IAC212 Subpart A, B, K & S	Emission testing, housekee-
		ping and maintenance
PEUG 1	40 CFR Subpart A & DD	Initial compliance testing
PEUG 7 (boilers)	IAC212 Subpart A, B & E	Maintanance
	40 CFR Subpart A & Dc	Maintanance

9b) LIST THE EMISSION UNITS THAT WERE NOT IN CONTINUOUS COMPLIANCE SINCE THE LAST REPORTING PERIOD, AND THE REASON(S) FOR NONCOMPLIANCE (IF ADDITIONAL SPACE IS NEEDED, ATTACH AND LABEL AS EXHIBIT 296-2.):

EMISSION UNIT	REASON(S) FOR NONCOMPLIANCE
None	

COMPLIANCE INFORMATION

10) SUMMARY OF METHODS USED TO DETERMINE COMPLIANCE:

a) DESCRIPTION OF TESTING METHODS USED TO DEMONSTRATE COMPLIANCE (IF ADDITIONAL SPACE IS NEEDED, ATTACH AND LABEL AS EXHIBIT 296-3.):

Initial compliance demonstrations as applicable per 40 CFR Subpart DD.

10b) DESCRIPTION OF MONITORING PROCEDURES USED TO DEMONSTRATE COMPLIANCE, INCLUDING ANY ENHANCED MONITORING REQUIREMENTS OF THE ACT (IF ADDITIONAL SPACE IS NEEDED, ATTACH AND LABEL AS EXHIBIT 296-4.):

1. Operations, inspections & maintanance program for process units and pollution control systems.
2. Monitor production throughput.

c) DESCRIPTION OF RECORDKEEPING USED TO DEMONSTRATE COMPLIANCE (IF ADDITIONAL SPACE IS NEEDED, ATTACH AND LABEL AS EXHIBIT 296-5.):

1. Operations, inspections & maintanance program for process units and pollution control systems.
2. Monitor production throughput.

10d) DESCRIPTION OF REPORTING USED TO DEMONSTRATE COMPLIANCE (IF ADDITIONAL SPACE IS NEEDED, ATTACH AND LABEL AS EXHIBIT 296-6.):

1. Annual emissions report.
2. Deviation and certification reports.
3. Initial compliance test reports.

SIGNATURE BLOCK

NOTE: THIS CERTIFICATION MUST BE SIGNED BY A RESPONSIBLE OFFICIAL. APPLICATIONS WITHOUT A SIGNED CERTIFICATION WILL BE RETURNED AS INCOMPLETE.

11) I CERTIFY UNDER PENALTY OF LAW THAT, BASED ON INFORMATION AND BELIEF FORMED AFTER REASONABLE INQUIRY, THE STATEMENTS AND INFORMATION CONTAINED IN THIS APPLICATION ARE TRUE, ACCURATE AND COMPLETE.

CAAPP/TITLE V FESOP COMPLETENESS REVIEW SHEET

Source Name: **Bunge North America, Inc.**

Source I.D.#: **183 020 ABT**

Application #: **96020027**

Date Received: **11-14-11**

Completeness Review Due Date: **12-27-11**

Previous Permit Expiration Date: _____

Type of Application: Initial New Renewal

1. Are questions 8-10 in Section 4 of CAAPP 200 all marked "yes"? YES NO
   No GAAPP 200 form – See notes on next page
   If yes, the only forms needed are 200, 292, 296 and 299

2. Does the source name on the application match the name in ICEMAN? YES NO
   If no, request forms 272 and 273 for ownership change

3. Does the signature in the certification blocks match the Responsible Official on the previous permit? If no, request a 273 or 500 if delegating authority. YES NO

4. Are there any VNs pending (search VN tracking database)? YES NO
   If yes, forward to CAAPP unit manager for review.

5. Is there trade secret/confidentiality claims made on the application? YES NO
   (Form 200, section 5, question27) If yes, forward to CAAPP unit manager for review.

6. Check for the following forms:
   - ☒ 200
   - ☐ 286
   - ☒ 299 (FESOP only)
   - ☒ 292
   - ☒ 296
   - ☐ 293
   - ☐ 464 (if a new application or first time renewal)
   - ☐ 287 (only if anything in Form 200, section 5 is marked "Incorporate by Reference" marked)

7. Are questions 1-6 in Section 5 of CAAPP 200 all marked "yes" or "Incorporate by Reference"? YES NO
   If no, information must be requested, see 9-15 of this sheet.

8. Is additional information needed? YES NO
   For CAAPPs - If yes, continue to #9-15. If no, skip to #16. If no, skip to #16.
   For FESOPs – Forward the entire application to the unit manager for additional review

9. Company contact person: **Robert Henricks**

10. Contact Email or Phone: **314/292-2342**

11. How was the source contacted? ☐ EMAIL ☐ PHONE Date of request? _____

12. Date forms are due back: _____ Date forms were received: _____
    If additional info not rec'd by the due date, send NOI

13. Date NOI sent: 11-30-11 Due Date: 12-15-11 (allow 15 days for response)

14. Date NOI response received: 12-5-11 Response not rec'd by completeness due date _____

15. Date renewal due: _____ Is the application timely? YES NO
    If no, send an email to CES and the CAAPP unit manager

16. If fees are due, send file to Lori Pennington for invoice. Date: _____

NOTICE OF INCOMPLETENESS FOR CAAPP APPLICATION

APPLICANT

Bunge North America, Inc.
Attn: Dean Hughes
321 East North Street
Danville, Illinois 61832

Date of Determination:	November 30, 2011
Application/Permit No.:	96020027
I.D. Number:	183020ABT
Date Received:	November 14, 2011
Source Name:	Bunge Milling, Inc
Location of Source:	321 East North Street, Danville, Vermilion County

Dear Mr. Hughes:

This letter provides notification that your Clean Air Act Permit Program (CAAPP) application received on the date indicated above, has been determined by the Agency to be incomplete because it does not contain sufficient information pursuant to Section 39.5(5) of the Illinois Environmental Protection Act (Act) and 35 Ill. Adm. Code 270.303. The following information is needed before the application can be reevaluated for completeness:

- 200 CAAPP Form

Upon receipt of the requisite information, the Illinois EPA will resume processing the CAAPP application. The timeframe for processing the CAAPP application for this source based on any further submittals will begin on the date such information is received by the Illinois EPA. Please reference the application and I.D. numbers assigned above on all correspondence concerning this matter. Note that application forms may be obtained from our website at http://www.epa.state.il.us/air/forms.html.

If the owner or operator of the above-referenced source fails to submit a timely and complete CAAPP application by the date such application is due, as specified in 35 Ill. Adm. Code 270.201, such source shall lose the protection of the application shield.

If you have any questions regarding this matter, please contact the Division of Air Pollution Control Permit Section at 217/782-2113.

Sincerely,

Edwin C. Bakowski, P.E.

Subject: Bunge FESOP Application

Expires: Monday, May 14, 2012 12:00 AM

I've received a FESOP application from the above company (ID#183020ABT). The Title V is currently open for renewal and assigned to Leeanne Kinsella. They've submitted a APC-200 form and a CAAPP-292 form.

Just to confirm.....I need to close out the renewal, and reopen the same permit # as a TV FESOP, correct? Please advise. Thanks!

Subject: RE: Bunge FESOP Application

Lori,

I will defer your question to Mike about whether the Title V renewal needs to be closed. However, if they only submitted an APC-200 form and a 292-CAAPP form to request a FESOP, then I would like to have a Completeness Review done and have this application deemed to be incomplete.

I was contacted by this company regarding a FESOP application and I specifically advised them as to which forms to submit. It seems like they did not follow my instructions.

Lori,

Once a FESOP application has been deemed complete, then we can close out the renewal for a CAAPP and open the FESOP under the same permit#.

However, until the application is complete, it must remain a CAAPP application.

I will defer to Bob on the completeness of the application.

Subject: FESOP fee

Bob, what is the annual fee for a FESOP facility? 251.201 says for a plant emission rate of 100 to <194 tpy the fee is $18/ton. Correct?

Re: FESOP Application
Bunge – Danville Facility
Source ID No. 183020ABT

Dear Mr. Bernoteit:

Please find enclosed two copies of the 200CAAPP form as requested by the enclosed incompleteness letter for our FESOP application. The issued FESOP will replace the current Title V permit. This application pertains to the current grain elevator and corn mill.

If you have any questions or require any further information please do not hesitate to contact Robert Henricks at (314) 292-2342 or by email at robert.henricks@bunge.com.

Sincerely,

Dean Hughes
Eastern Regional Manager – Milling

SUMMARY OF APPLICATION CONTENTS

NOTE: ITEMS 43 TO 62 WILL BE USED FOR APPLICATION COMPLETENESS DETERMINATION.

43) DOES THE APPLICATION INCLUDE A TABLE OF CONTENTS?	☒ YES ☐ NO
44) DOES THE APPLICATION INCLUDE A LIST OF ALL ITEMS AND ACTIVITIES FOR WHICH A PERMIT IS BEING SOUGHT?	☒ YES ☐ NO
45) DOES THE APPLICATION INCLUDE A PLOT PLAN AND/OR MAP DEPICTING THE AREA WITHIN ONE-QUARTER MILE OF THE SOURCE?	☐ YES ☒ NO
46) DOES THE APPLICATION INCLUDE A PROCESS FLOW DIAGRAM(S) SHOWING ALL EMISSION UNITS AND CONTROL EQUIPMENT, AND THEIR RELATIONSHIP?	☐ YES ☒ NO
47) DOES THE APPLICATION INCLUDE A COMPLETE PROCESS DESCRIPTION FOR THE SOURCE?	☒ YES ☐ NO
48a) DOES THE APPLICATION INCLUDE THE APPROPRIATE, COMPLETED FORMS FOR ALL INDIVIDUAL EMSSION UNITS AND AIR POLLUTION CONTROL EQUIPMENT, LISTING ALL APPLICABLE REQUIREMENTS AND PROPOSED EXEMPTIONS FROM OTHERWISE APPLICABLE REQUIREMENTS?	☐ YES ☒ NO
b) DOES THE APPLICATION ADDRESS OTHER MODES OF OPERATION FOR WHICH A PERMIT IS BEING SOUGHT?	☒ *NA ☐ YES ☐ NO *NOTE: NOT APPLICABLE
c) DOES THE APPLICATION INCLUDE ALL REASONABLY ANTICIPATED OPERATING SCENARIOS FOR WHICH A PERMIT IS BEING SOUGHT?	☒ *NA ☐ YES ☐ NO *NOTE: NOT APPLICABLE
49) DOES THE APPLICATION INCLUDE A COMPLETED "FUGITIVE EMISSION" FORM 391-CAAPP?	☐ YES ☒ NO
50) DOES THE APPLICATION INCLUDE A COMPLETED "FEE DETERMINATION FOR CAAPP PERMIT" FORM 292-CAAPP? (NOTE: ANNUAL FEES WILL BE BASED UPON INFORMATION CONTAINED IN THIS FORM.)	☒ YES ☐ NO
51) DOES THE APPLICATION INCLUDE A COMPLETED "HAZARDOUS AIR POLLUTANT EMISSION SUMMARY" FORM 215-CAAPP?	☐ YES ☒ NO
52) DOES THE APPLICATION INCLUDE THE CALCULATIONS ON WHICH THE FOLLOWING, TO THE EXTENT THEY ARE RELATED TO AIR EMISSIONS, WERE BASED: • POLLUTANT EMISSION RATES, • FUELS AND RAW MATERIALS USAGE, AND • CONTROL EQUIPMENT EFFICIENCY?	☒ YES ☐ NO
53) DOES THE APPLICATION INCLUDE A COMPLETED "COMPLIANCE PLAN/SCHEDULE OF COMPLIANCE FOR CAAPP PERMIT" FORM 293-CAAPP?	☐ YES ☒ NO
54) DOES THE APPLICATION INCLUDE A COMPLETED "COMPLIANCE CERTIFICATION" FORM 296-CAAPP?	☐ YES ☒ NO
55) DOES THE APPLICATION INCLUDE A COMPLETED "COMPLIANCE PLAN/SCHEDULE OF COMPLIANCE-ADDENDUM FOR NONCOMPLYING EMISSION UNITS" FORM 294-CAAPP FOR ONE OR MORE NONCOMPLIANT EMISSION UNITS FOR WHICH ISSUANCE OF A CAAPP PERMIT IS REQUESTED?	☒ *NA ☐ YES ☐ NO *NOTE: NOT APPLICABLE

56) HAS THE APPLICANT RETAINED A COPY OF THIS APPLICATION AT THE SOURCE? (NOTE: IF TRADE SECRET INFORMATION IS NOT BEING SUBMITTED, THEN ONLY THE ORIGINAL APPLICATION NEED BE INITIALLY SUBMITTED, HOWEVER, THE ILLINOIS EPA MAY REQUEST UP TO 4 COPIES OF THE FINAL APPLICATION PRIOR TO PUBLIC NOTICE.)	☒ YES ☐ NO
57a) DOES THE APPLICATION CONTAIN TRADE SECRET INFORMATION?	☐ YES ☒ NO
b) IF YES, HAS SUCH INFORMATION BEEN PROPERLY MARKED AND CLAIMED, AND TWO SEPARATE COPIES OF THE APPLICATION SUITABLE FOR PUBLIC INSPECTION BEEN SUBMITTED, IN ACCORDANCE WITH APPLICABLE REGULATIONS?	☐ YES ☐ NO
58) DOES THE APPLICATION INCLUDE AN EARLY REDUCTION DEMONSTRATION FOR HAZARDOUS AIR POLLUTANTS (HAP) PURSUANT TO SECTION 112(i)(5) OF THE CLEAN AIR ACT AS AMENDED IN 1990?	☒ *NA ☐ YES ☐ NO *NOTE: NOT APPLICABLE
59) DOES THE APPLICATION INCLUDE A PROPOSED DETERMINATION OF MAXIMUM ACHIEVABLE CONTROL TECHNOLOGY (MACT) FOR HAZARDOUS AIR POLLUTANTS PURSUANT TO SECTION 112 OF THE CLEAN AIR ACT AS AMENDED IN 1990?	☒ *NA ☐ YES ☐ NO *NOTE: NOT APPLICABLE
60) HAS THE APPLICANT REGISTERED A RISK MANAGEMENT PROGRAM FOR ACCIDENTAL RELEASES PURSUANT TO SECTION 112(r) OF THE CLEAN AIR ACT AS AMENDED IN 1990 OR INTENDS TO COMPLY WITH THIS REQUIREMENT IN ACCORDANCE WITH ITS COMPLIANCE PLAN/SCHEDULE OF COMPLIANCE?	☒ *NA ☐ YES ☐ NO *NOTE: NOT APPLICABLE
61a) FOR CAAPP PERMIT RENEWALS, DOES THE APPLICATION INCLUDE A COMPLIANCE ASSURANCE MONITORING PLAN (FORM 464-CAAPP) PURSUANT TO 40 CFR PART 64?	☒ *NA ☐ YES ☐ NO *NOTE: NOT APPLICABLE
b) FOR SIGNIFICANT MODIFICATIONS AND INITIAL CAAPP APPLICATIONS SUBMITTED AFTER APRIL 20, 1998, DOES THE APPLICATION INCLUDE A COMPLIANCE ASSURANCE MONITORING PLAN (FORM 464-CAAPP) PURSUANT TO 40 CFR PART 64 FOR EMISSION UNITS WITH POST-CONTROL EMISSIONS GREATER THAN OR EQUAL TO THE MAJOR SOURCE THRESHOLD?	☒ *NA ☐ YES ☐ NO *NOTE: NOT APPLICABLE
62) FOR SIGNIFICANT MODIFICATIONS, DOES THE APPLICATION INCLUDE A DESCRIPTION OF THE PROPOSED CHANGE(S), INCLUDING ALL PHYSICAL CHANGES IN EQUIPMENT, CHANGES IN THE METHOD OF OPERATION, CHANGES IN EMISSIONS, AND ANY NEW APPLICABLE REQUIREMENTS WHICH WILL APPLY AS A RESULT OF THE PROPOSED CHANGE?	☒ YES ☐ NO

NOTE: ANSWERING "NO" TO ANY OF THE ABOVE (ITEMS 43-62, EXCEPT ITEM 57a) MAY RESULT IN THE APPLICATION BEING DEEMED INCOMPLETE.

63) DOES THE APPLICATION REQUEST TO UTILIZE THE OPERATIONAL FLEXIBILITY PROVISIONS AND INCLUDE THE INFORMATION REQUIRED FOR SUCH USE?	☐ YES ☒ NO
64a) DOES THE APPLICANT HEREBY REQUEST A PERMIT SHIELD FOR THE ENTIRE SOURCE?	☐ YES ☒ NO
b) IF NO, DOES THE APPLICATION CONTAIN A REQUEST FOR A PERMIT SHIELD FOR SPECIFIC ITEMS ONLY, IN ACCORDANCE WITH THE INSTRUCTIONS FOR A CAAPP PERMIT?	☐ YES ☒ NO
65) DOES THE APPLICATION INCLUDE A COMPLETED "LISTING OF INSIGNIFICANT ACTIVITIES" FORM 297-CAAPP?	☐ YES ☒ NO
66) DOES THE APPLICATION INCLUDE A DRAWING PROVIDING THE SOURCE LAYOUT? IF NO, PLEASE NOTE THAT THE ILLINOIS EPA MAY REQUEST SUCH A DRAWING UPON DETAILED REVIEW OF THE APPLICATION.	☐ YES ☒ NO

67) WHY IS THE APPLICANT APPLYING FOR A CAAPP PERMIT (CHECK ALL THAT APPLY)?

☐ THE POTENTIAL TO EMIT ONE OR MORE AIR POLLUTANTS FOR THE SOURCE IS 100 TONS/YEAR OR GREATER.

☐ THE SOURCE IS AN AFFECTED SOURCE FOR ACID RAIN DEPOSITION.

☐ THE POTENTIAL TO EMIT VOM IS 25 TONS/YEAR OR MORE AND THE SOURCE IS LOCATED IN ONE OF THE FOLLOWING CHICAGO AREA COUNTIES OR TOWNSHIPS:

- COOK COUNTY
- DUPAGE COUNTY
- KANE COUNTY
- LAKE COUNTY
- McHENRY COUNTY
- WILL COUNTY
- AUX SABLE TOWNSHIP, GRUNDY COUNTY
- GOOSE LAKE TOWNSHIP, GRUNDY COUNTY
- OSWEGO TOWNSHIP, KENDALL COUNTY

NOTE: THE U. S. EPA HAS APPROVED AN EXEMPTION ON NITROGEN OXIDES (NOx) EMISSIONS AS AN OZONE PRECURSOR IN THE CHICAGO OZONE NON-ATTAINMENT AREA. THEREFORE THE MAJOR SOURCE THRESHOLD FOR NOx EMISSIONS IS 100 TONS/YEAR UNTIL THIS EXEMPTION IS NO LONGER EFFECTIVE. SHOULD THE CURRENT NOx EXEMPTION BE NO LONGER EFFECTIVE, THE MAJOR SOURCE THRESHOLD FOR NOx EMISSIONS WILL BE 25 TONS/YEAR IN THE ABOVE CHICAGO AREA COUNTIES AND TOWNSHIPS.

☐ THE POTENTIAL TO EMIT AN INDIVIDUAL HAZARDOUS AIR POLLUTANT IS 10 TONS/YEAR OR MORE, OR THE POTENTIAL TO EMIT ALL SOURCE WIDE HAZARDOUS AIR POLLUTANTS IS 25 TONS/YEAR OR MORE, OR MEETS AN APPLICABLE LOWER THRESHOLD.

☐ THE SOURCE CONTAINS EQUIPMENT OR OPERATIONS SUBJECT TO CERTAIN USEPA EMISSION STANDARDS (NSPS AND NESHAP) FOR WHICH USEPA REQUIRES A CAAPP PERMIT.

68a) ARE ACTUAL EMISSIONS OF THE SOURCE BELOW THE APPLICABILITY LEVELS FOR A CAAPP PERMIT?	☒ YES	☐ NO
b) DOES THE APPLICATION CONTAIN PROPOSED PERMIT LIMITATIONS THAT WILL CONSTRAIN THE EMISSIONS AND PRODUCTION OR OPERATION OF THE SOURCE SUCH THAT POTENTIAL EMISSIONS OF THE SOURCE WILL FALL BELOW THE LEVELS FOR WHICH A CAAPP PERMIT IS REQUIRED?	☒ YES	☐ NO
c) DOES THE APPLICANT HEREBY REQUEST A FEDERALLY ENFORCEABLE STATE OPERATING PERMIT (FESOP) CONSTRAINING THE EMISSIONS AND PRODUCTION OR OPERATION OF THE SOURCE SUCH THAT POTENTIAL EMISSIONS WOULD FALL BELOW APPLICABILITY LEVELS AND THEREBY EXCLUDE THE SOURCE FROM REQUIRING A CAAPP PERMIT?	☒ YES	☐ NO

SIGNATURE BLOCK

NOTE: THIS CERTIFICATION MUST BE SIGNED BY A RESPONSIBLE OFFICIAL. APPLICATIONS WITHOUT A SIGNED CERTIFICATION WILL BE RETURNED AS INCOMPLETE.

69) I CERTIFY UNDER PENALTY OF LAW THAT, BASED ON INFORMATION AND BELIEF FORMED AFTER REASONABLE INQUIRY, THE STATEMENTS AND INFORMATION CONTAINED IN THIS APPLICATION ARE TRUE, ACCURATE AND COMPLETE.

9/10 Pulvocron Grinder Surge Bin (4990-0004-0011) controlled by Baghouse Filters APM 16104.4;
7/8 Pulvocron Grinder Surge Bin (4990-0003-0008) controlled by Baghouse Filters APM 16104.4;
1/2 Flour Surge Bin (4990-0005-0028) controlled by Baghouse Filters MICROPUL 2 1/2B;
3/4 Flour Surge Bin (4990-0002-0026) controlled by Baghouse Filters MICROPUL 2 1/2B;
7/8 Flour Surge Bin (4990-0003-0026) controlled by Baghouse Filters APM 16104.4;
9/10 Flour Surge Bin (4990-0004-0029) controlled by Baghouse Filters APM 16104.4;
HIBOND Visc. Flake Roller Mill (4990-0006-0024) controlled by Baghouse Filters APM 15066.8;
CSM Blended Food Receiver (4820-0001-0029) controlled by Baghouse Filters APM 40070.7;
Blended Food Packaging (4820-0001-0052) controlled by Baghouse Filters APM 16150.6;
ALLBOND Visc. Flour General Aspiration (4900-0001-0068) controlled by Baghouse Filters BUHLER 16-8-100;
Milk Bins (4820-0003-0007) controlled by Baghouse Filters MICROPUL 6B;
300 Series Binning (4990-0007-0049) controlled by Baghouse Filters MICROPUL 1F1;
Soy Meal General Aspiration (4990-0001-0002) controlled by Baghouse Filters APM 16022.4;
Soy Meal Surge Bin (4990-0001-0006) controlled by Baghouse Filters MICROPUL 6B;
Meal Bin Cooler (4990-0001-0025) controlled by Baghouse Filters APM 400072.10;
3/4 Soy Flour Receiver (4990-0002-0043) controlled by Baghouse Filters APM16014.8;
Tri Cal Bins (4820-0003-0072) controlled by Baghouse Filters APM 16009.8;
5/6 Allond Receiver (4900-0001-0058) controlled by Baghouse Filters APM 16014.8;
7/8 Soy Flour Receiver (4990-0003-0032) controlled by Baghouse Filters APM 16014.8;
Five (5) Bins (Bin 308 (4990-0002-0033), 309 (4990-0002-0036), 310 (4820-0003-0038), 508 (4820-0002-0068), and 509 (4820-0002-0072)) controlled by Baghouse Filters MICROPUL 6B;
9/10 Pulvicron Receiver (4990-0004-0037) controlled by Baghouse Filters BUHLER 16-6-220;
Milk Bins (4820-0002-0038) controlled by Baghouse Filters MICROPUL 21-6-220;

Milk Bin Bag Dump (4820-0002-0035) controlled by Baghouse Filters APM 14048.6;
Blending Batch Bin General Aspiration (4990-0007-0029) controlled by Baghouse Filters BUHLER 25S-6-30;
Blender General Aspiration (4990-0007-0036) controlled by Baghouse Filters BUHLER 16S-6-30;
Blender General Aspiration (4990-0007-0032) controlled by Baghouse Filters MICROPUL 36S-8-30;
Two (2) CSB Binning General Aspiration (4820-0003-0063 and 4820-0003-0059) controlled by Baghouse Filters BUHLER 64S-6-20;
General Aspiration (4990-0006-0040) controlled by Baghouse Filters BUHLER 9-8-220;
#5 SL General Aspiration & #5 Expander (4900-0001-0091) controlled by Baghouse Filters APM 14024.6;
Fiber Receiver General Aspiration (4990-0011-0001) controlled by Baghouse Filters BUHLER 9-8-220;
PCM Binning (4820-0002-0011) controlled by Baghouse Filters MICROPUL 1F1;
CF Bran Packing Binning (4870-0010-0005) controlled by Baghouse Filters MICROPUL 25-8-220;
Bldg 111 Vacuum (4900-0005-0035) controlled by Baghouse Filters HOFFMAN 60X120;
110/210 Receiver General Aspiration (4870-0006-0006) controlled by Baghouse Filters APM 16030.4;
Fiber Receiver General Aspiration (4990-0011-0029) controlled by Baghouse Filters APM 16019.4;
Cooling Tower (4990-0001-0029) controlled by Baghouse Filters APM 40072.10;
Two (2) Ingredient Bins (601 (4820-0003-0022) and 602 (4820-0003-0026)) controlled by Baghouse Filters MICROPUL 4B;
Ingredient Bin 603 (4820-0003-0030) controlled by Baghouse Filters MICROPUL 2 1/2 B;
Ingredient Bin 604 (4820-0003-0034) controlled by Baghouse Filters APM 15105.4;
Micro Ingredient Dump Filter (4820-0003-0018) controlled by Baghouse Filters APM 15105.4;
Mixer General Aspiration (4820-0003-0004) controlled by Baghouse Filters BUHLER 25S-6-30;
3/4 Hammermill (4900-0001-0065) controlled by Baghouse Filters APM 16009.6;
#3 & #4 Expanders (4900-0001-0006) controlled by Baghouse Filters APM 16009.6;
Reprocess General Cooler Dryer Roof (4900-0005-0001) controlled by Baghouse Filters CD 376RF10;
#6 Pulverizer Grinder (4900-0001-0042) controlled by Baghouse Filters BUHLER 37-8-220;
5/6 Pulverizer AB Finished Product Surge Bin (4900-0001-0046) controlled by Baghouse Filters MICROPUL 4B;
Pellet Bins (4900-0002-0032) controlled by Baghouse Filters BUHLER 16S-6-30;
Viscosity Flour Receiver (4990-0006-0027) controlled by Baghouse Filters APM 16022.8;
Conditioning Receiver/Soy Meal Grinder (4990-0011-0010) controlled by Baghouse Filters APM 16014.8;
Grind Reject/Scrap Bin (4900-0005-0007) controlled by Baghouse Filters MICROPUL 2 1/2B;
Bldg 112 Vacuum (4900-0005-0029) controlled by Baghouse Filters HOFFMAN 36X96;

AB Grinder Surge Bin (4900-0001-0030) controlled by Baghouse Filters BUHLER 37-8-220;
N CD General Aspiration & #5 Expander (4900-0005-0006) controlled by Baghouse Filters CD 484RF12;
South Hominy Feed Bin General Aspiration (4860-0018-0003) controlled by Baghouse Filters MICROPUL 1F2;
Secondary Clean Grinding (4860-0022-0017) controlled by Baghouse Filters APM 15030.8;
Bran Dryer (4860-0024-0003) controlled by Corona Cyclone;
Track 16 Rail Loadout (4912-0006-0017) controlled by Baghouse Filters WEIDENMAN LFT 2X7;
Germ Dust Aspiration (4860-0017-0073) controlled by Baghouse Filters APM 40120.8;
Feed Mill General Aspiration (4860-0023-0001) controlled by Baghouse Filters APM 40120.8;
Germ Dryer (4860-0017-0003) controlled by DAY CYCLONE HV56;
FTS Dryer Aspiration (4860-0019-0003) controlled by CORONA 15 CYCLONE;
Pet Bran Kice Lites Aspiration (4860-0024-0037) controlled by Baghouse Filters MICROPUL;
Pneumatic Lift Receiver for Coarse Whole Grain transfer (WG260);
PCM Hammermill controlled by Filter System (78-03:11);
USG Hammermill controlled by Filter System (78-03:27);
USG Extruder Pellet Transfer controlled by Collection Cyclone (78-08:22);
One (1) #1 Coarse Gravity Table Aspiration Cyclone Collector (05:68) (17,000 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #3 Fine Gravity Table Aspiration Cyclone Collector (06:88) (17,000 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #1 Satake Degerminator Cyclone Collector (45:07) (1,400 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #1 Satake Aspiration Cyclone Collector (45:12) (1,400 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #2 Satake Degerminator Cyclone Collector (45:09) (1,400 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #2 Satake Aspiration Cyclone Collector (45:24) (1,400 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
Satake Sifter and Sifter Air Locks controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) Pneumatic Transfer Line and Cyclone Receiver (45:20) controlled by 8th Floor Donaldson Filter (34:27) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) Pneumatic Transfer Line and Cyclone Receiver (23:102) controlled by West MAC Filter (34:01) controlled by the S 105 Roof Carter-Day Filter (334:86);

<u>Corn Mill Products Storage:</u>
Bldg 201/202 Vacuum (4912-0008-0006) controlled by Baghouse Filters HOFFMAN 36X96;
Bldg 208 Vacuum (4912-0009-0005) controlled by Baghouse Filters HOFFMAN 36X96;
Hominy Feed Bins Aspiration (4750-0029-0074) controlled by Baghouse Filters DONALDSON 276RFW12;

<u>Corn Mill Products Milling and Handling:</u>
Hominy Binning (4750-0029-0032) controlled by Baghouse Filters APM 40240.8;

Hominy Grinder General Aspiration (4750-0029-0001) controlled by Baghouse Filters APM 40224.4;
Truck Hominy Loadout (4912-0004-0022) controlled by Baghouse Filters 376RF8;
Rail Hominy/Grain Loadout #1 (4912-0003-0011) controlled by Baghouse Filters 376RF12;
Long Term Meal System (LTMS) & Rail Meal/Grain Transfer (4750-0033-0001) controlled by Baghouse Filters 376RF8;
LTMS & Rail Meal/Grain Loadout (4750-0033-0011) controlled by Baghouse Filters MAC 144MCF416;
Hominy Screener General Aspiration (4750-0029-0045) controlled by Baghouse Filters MICROPUL 100S-6-20;

Boiler House/Grounds:
One (1) 96.55 mmBtu/hour Natural Gas-Fired Boiler with Low NO_x Burner (Boiler #1);
One (1) 27.90 mmBtu/hour Natural Gas-Fired Boiler (Clayton Boiler); and

Fugitive PM and PM_{10} emissions

pursuant to the above referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This Federally Enforceable State Operating Permit (FESOP) is issued to limit the emissions of air pollutants from the source to less than major source thresholds (i.e., 100 tons/year for Carbon Monoxide (CO), Nitrogen Oxides (NO_x), and Particulate Matter less than 10 microns (PM_{10})). As a result, the source is excluded from the requirements to obtain a Clean Air Act Permit Program (CAAPP) permit. The maximum emissions of this source, as limited by the conditions of this permit, are described in Attachment A.

b. Prior to issuance, a draft of this permit has undergone a public notice and comment period.

c. This permit supersedes all operating permit(s) for this location.

2. The Clayton Boiler is subject to the New Source Performance Standard (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR Part 60 Subparts A and Dc. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States Environmental Protection Agency (USEPA) under a delegation agreement. Pursuant to 40 CFR 60.40c(a), except as provided in 40 CFR 60.40c(d), (e), (f), and (g), the affected facility to which 40 CFR 60 Subpart Dc applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (mmBtu/hr)) or less, but greater than or equal to 2.9 MW (10 mmBtu/hr).

3a. The Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) are subject to the NSPS for Grain Elevators, 40 CFR Part 60 Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 60. 300(a), the provisions of 40 CFR 60 Subpart DD apply to each affected

facility at any grain terminal elevator or any grain storage elevator, except as provided under 40 CFR 60.304(b). The affected facilities are each truck unloading station, truck loading station, barge and ship unloading station, barge and ship loading station, railcar loading station, railcar unloading station, grain dryer, and all grain handling operations.

b. Pursuant to 40 CFR 60.300(b), any facility under 40 CFR 60.300(a) which commences construction, modification or reconstructed after August 3, 1978 is subject to the requirements of 40 CFR 60 Subpart DD.

c. Pursuant to 40 CFR 60.302(b), on and after the date on which the performance test required to be conducted by 40 CFR 60.8 is completed, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere from any affected facility except a grain dryer any process emission which:

i. Contains particulate matter in excess of 0.023 g/dscm (ca. 0.01 gr/dscf).

ii. Exhibits greater than 0 percent opacity.

d. Pursuant to 40 CFR 60.302(c), on and after the 60th day of achieving the maximum production rate at which the affected facility will be operated, but no later than 180 days after initial startup, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere any fugitive emission from:

i. Any individual truck unloading station, railcar unloading station, or railcar loading station, which exhibits greater than 5 percent opacity.

ii. Any grain handling operation, which exhibits greater than 0 percent opacity.

iii. Any truck loading station which exhibits greater than 10 percent opacity.

4a. The Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; Corn Mill Products Milling and Handling; Boiler #1, and Clayton Boiler are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions). Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute

period shall occur from only one such emission unit located within a 305 m (1000 ft) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. This source is subject to 35 Ill. Adm. Code Part 212 Subpart K (Fugitive Particulate Matter). Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

d. When processing and handling processed materials, the emission units constructed on or after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

e. Pursuant to 35 Ill. Adm. Code 212.321(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.321(c) shall be determined by using the equation:

$$E = A(P)^B$$

where:

P = Process weight rate; and
E = Allowable emission rate; and,

i. Up to process weight rates of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.214	2.54
B	0.534	0.534

ii. For process weight rate greater than or equal to 408 Mg/hr (450 T/hr):

	Metric	English

P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	11.42	24.8
B	0.16	0.16

f. Pursuant to 35 Ill. Adm. Code 212.321(c), Limits for Process Emission Units for Which Construction or Modification Commenced on or After April 14, 1972:

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lbs/hr
0.05	0.25	0.05	0.55
0.1	0.29	0.10	0.77
0.2	0.42	0.20	1.10
0.3	0.64	0.30	1.35
0.4	0.74	0.40	1.58
0.5	0.84	0.50	1.75
0.7	1.00	0.75	2.40
0.9	1.15	1.00	2.60
1.8	1.66	2.00	3.70
2.7	2.1	3.00	4.60
3.6	2.4	4.00	5.35
4.5	2.7	5.00	6.00
9.	3.9	10.00	8.70
13.	4.8	15.00	10.80
18.	5.7	20.00	12.50
23.	6.5	25.00	14.00
27.	7.1	30.00	15.60
32.	7.7	35.00	17.00
36.	8.2	40.00	18.20
41.	8.8	45.00	19.20
45.	9.3	50.00	20.50
90.	13.4	100.00	29.50
140.	17.0	150.00	37.00
180.	19.4	200.00	43.00
230.	22.	250.00	48.50
270.	24.	300.00	53.00
320.	26.	350.00	58.00
360.	28.	400.00	62.00
408.	30.1	450.00	66.00
454.	30.4	500.00	67.00

where:

P = Process weight rate in metric or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

g. When processing and handling processed materials, the emission units constructed before April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.322(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause

or allow the emission of particulate matter into the atmosphere in any one hour period from any process emission unit for which construction or modification commenced prior to April 14, 1972, which, either alone or in combination with the emission of particulate matter from all other similar process emission units at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.322(c).

h. Pursuant to 35 Ill. Adm. Code 212.322(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.322(c) shall be determined by using the equation:

$$E = C + A(P)^B$$

where:

P = process weight rate; and,
E = allowable emission rate; and,

i. For process weight rates up to 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.985	4.10
B	0.67	0.67
C	0	0

ii. For process weight rates in excess or 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	25.21	55.0
B	0.11	0.11
C	-18.4	-40.0

i. Pursuant to 35 Ill. Adm. Code 212.322(c), Limits for Process Emission Units For Which Construction or Modification Commenced Prior to April 14, 1972:

Metric		English	
P Mg/hr	E kg/hr	P T/hr	E lbs/hr

400.0	30.6	450.00	67.70
454.0	31.3	500.00	69.00

where:

P = Process weight rate in Mg/hr or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

j. The handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations are subject to 35 Ill. Adm. Code Part 212 Subpart S (Agriculture). Pursuant to 35 Ill. Adm. Code 212.462, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d), or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), existing grain-handling operations with a total annual grain through-put of 300,000 bushels or more shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall demonstrate compliance with the following:

i. Cleaning and Separating Operations.

A. Particulate matter generated during cleaning and separating operations shall be captured to the extent necessary to prevent visible particulate matter emissions directly into the atmosphere.

B. For grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area, air contaminants collected from cleaning and separating operations shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

ii. Major Dump-Pit Area.

Induced Draft.

A. Induced draft shall be applied to major dump pits and their associated equipment (including, but not limited to, boots, hoppers and legs) to such an extent that a minimum face velocity is maintained, at the effective grate surface, sufficient to contain particulate emissions generated in unloading operations. The minimum face velocity at the effective grate surface shall be at least 200 fpm, which shall be determined by using the equation:

$$V = Q/A$$

where:
V = face velocity; and
Q = induced draft volume in scfm; and
A = effective grate area in ft^2; and

B. The induced draft air stream for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be confined and conveyed through air pollution control equipment which has an overall rated and actual particulate collection efficiency of not less than 90 percent by weight;

C. Means or devices (including, but not limited to, quick-closing doors, air curtains or wind deflectors) shall be employed to prevent a wind velocity in excess of 50 percent of the induced draft face velocity at the pit; provided, however, that such means or devices do not have to achieve the same degree of prevention when the ambient air wind exceeds 25 mph. The wind velocity shall be measured, with the induced draft system not operating, at a point midway between the dump-pit area walls at the point where the wind exits the dump-pit area, and at a height above the dump-pit area floor of approximately 2 ft; or

iii. Internal Transferring Area.

A. Internal transferring area shall be enclosed to the extent necessary to prohibit visible particulate matter emissions directly into the atmosphere.

B. Air contaminants collected from internal transfer operations for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

iv. Load-Out Area.

A. Truck and hopper car loading shall employ socks, sleeves or equivalent devices which extend 6 inches below the sides of the receiving vehicle, except for topping off. Choke loading shall be considered an equivalent method as long as the discharge is no more than 12 inches above the sides of the receiving vehicle.

B. Box car loading shall employ means or devices to prevent the emission of particulate matter into the atmosphere to the fullest extent which is technologically and economically feasible.

k. Pursuant to 35 Ill. Adm. Code 212.463, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d) or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), grain-drying operations for which construction or modification commenced prior to June 30, 1975, with a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity (using the American Society of Agricultural Engineers Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers) shall be operated in such a fashion as to preclude the emission of particulate matter larger than 300 microns mean particle diameter, shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the following:

i. Column Dryers. The largest effective circular diameter of transverse perforations in the external sheeting of a column dryer shall not exceed 0.094 inch, and the grain inlet and outlet shall be enclosed.

ii. Rack Dryers. No portion of the exhaust air of rack dryers shall be emitted to the ambient atmosphere without having passed through a particulate collection screen having a maximum opening of 50 mesh, U.S. Sieve Series.

A. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling facilities having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 90 percent by weight prior to release into the atmosphere.

B. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling sources having a grain through-put exceeding 2 million bushels per year and located in a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency

of 98 percent by weight prior to release into the atmosphere.

iii. Other Types of Dryers. All other types of dryers shall be controlled in a manner which shall result in the same degree of control required for rack dryers pursuant to 35 Ill. Adm. Code 212.463(b).

iv. New and Modified Grain-Drying Operations. Grain-drying operations constructed or modified on or after June 30, 1975, shall file applications for construction and operating permits pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the control equipment requirements of 35 Ill. Adm. Code 212.463, except for new and modified grain-drying operations which do not result in a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity, using the American Society of Agricultural Engineer Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers.

5. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 216 Subpart B (Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 216.121, no person shall cause or allow the emission of carbon monoxide (CO) into the atmosphere from any fuel combustion emission source with actual heat input greater than 2.9 MW (10 mmBtu/hr) to exceed 200 ppm, corrected to 50 percent excess air.

6a. This permit is issued based on the Cooling Tower at this source not being subject to the NESHAP for Process Cooling Towers, 40 CFR 63 Subpart Q because the cooling tower is not operated with chromium-based water treatment chemicals and is not either major sources or is an integral part of a facility that is a major source.

b. This permit is issued based on the source no longer being subject to the NESHAP for Solvent Extraction for Vegetable Oil Production, 40 CFR 63 Subpart GGGG, because the source no longer operates a vegetable oil production process and is no longer a major source of HAP emissions.

c. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters, 40 CFR 63 Subpart DDDDD because this source is not or is part of, a major source of Hazardous Air Pollutant (HAP) emissions as defined in 40 CFR 63.2.

d. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the requirements of the NESHAP for Industrial, Commercial, and Institutional Boilers Area Sources, 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11195(e), gas-fired boilers are not subject to 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11237, gas-fired boiler includes any boiler that burns gaseous fuels not combined with any solid fuels, burns liquid fuel only during periods of gas curtailment, gas supply emergencies, or periodic testing on liquid fuel. Periodic testing of liquid fuel shall not exceed a combined total of 48 hours during any calendar year.

e. This permit is issued based on the source not being subject to the National Emission Standards (NESHAP) for Area Sources: Prepared Feeds Manufacturing, 40 CFR 63 Subpart DDDDDDD because the source does not use a material containing chromium or a material containing manganese in the manufacturing of prepared feeds.

7a. Pursuant to 35 Ill. Adm. Code 212.314, 35 Ill. Adm. Code 212.301 shall not apply and spraying pursuant to 35 Ill. Adm. Code 212.304 through 212.310 and 35 Ill. Adm. Code 212.312 shall not be required when the wind speed is greater than 40.2 km/hr (25 mph). Determination of wind speed for the purposes of 35 Ill. Adm. Code 212.314 shall be by a one-hour average or hourly recorded value at the nearest official station of the U.S. Weather Bureau or by wind speed instruments operated on the site. In cases where the duration of operations subject to 35 Ill. Adm. Code 212.314 is less than one hour, wind speed may be averaged over the duration of the operations on the basis of on-site wind speed instrument measurements.

b. This permit is issued based on the handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations not being subject to 35 Ill. Adm. Code Part 212 Subpart L while handling grain. Pursuant to 35 Ill. Adm. Code 212.461(a), 35 Ill. Adm. Code 212.302(a), 212.321, and 212.322 shall not apply to grain-handling and grain-drying operations, portable grain-handling equipment and one-turn storage space.

8. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to 35 Ill. Adm. Code Part 215 Subpart K. Pursuant to 35 Ill. Adm. Code 215.303, the provisions of 35 Ill. Adm. Code 215.301 and 215.302 shall not apply to fuel combustion emission sources.

9a. Pursuant to 40 CFR 60.11(b), compliance with opacity standards in 40 CFR Part 60 shall be determined by conducting observations in accordance with Method 9 in appendix A of 40 CFR Part 60, any alternative method that is approved by the Illinois EPA or USEPA, or as provided in 40 CFR 60.11(e)(5). For purposes of determining initial compliance, the minimum total time of observations shall be 3 hours (30 6-minute averages) for the performance test or other set of observations (meaning those fugitive-type emission sources subject only to an opacity standard).

b. Pursuant to 40 CFR 60.11(c), the opacity standards set forth in 40 CFR Part 60 shall apply at all times except during periods of startup, shutdown, malfunction, and as otherwise provided in the applicable standard.

c. Pursuant to 40 CFR 60.11(d), at all times, including periods of startup, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate any affected facility

including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

10a. Housekeeping Practices. Pursuant to 35 Ill. Adm. Code 212.461(b), all grain-handling and grain-drying operations, regardless of size, must implement and use the following housekeeping practices:

i. Air pollution control devices shall be checked daily and cleaned as necessary to insure proper operation.

ii. Cleaning and Maintenance.

A. Floors shall be kept swept and cleaned from boot pit to cupola floor. Roof or bin decks and other exposed flat surfaces shall be kept clean of grain and dust that would tend to rot or become airborne.

B. Cleaning shall be handled in such a manner as not to permit dust to escape to the atmosphere.

C. The yard and surrounding open area, including but not limited to ditches and curbs, shall be cleaned to prevent the accumulation of rotting grain.

iii. Dump Pit.

A. Aspiration equipment shall be maintained and operated.

B. Dust control devices shall be maintained and operated.

iv. Head House. The head house shall be maintained in such a fashion that visible quantities of dust or dirt are not allowed to escape to the atmosphere.

v. Property. The yard and driveway of any source shall be asphalted, oiled or equivalently treated to control dust.

vi. Housekeeping Check List. Housekeeping check lists shall be completed by the manager and maintained on the premises for inspection by Illinois EPA personnel.

11a. In the event that the operation of this source results in an odor nuisance, the Permittee shall take appropriate and necessary actions to minimize odors, including but not limited to, changes in raw material or installation of controls, in order to eliminate the odor nuisance.

b. The baghouse filters and cyclones shall be in operation at all times when the associated emission units are in operation and emitting air contaminants.

c. The Permittee shall, in accordance with the manufacturer(s) and/or vendor(s) recommendations, perform periodic maintenance on the baghouse filters and cyclones such that the baghouse filters and cyclones are kept in proper working condition and not cause a violation of the Illinois Environmental Protection Act or regulations promulgated therein.

d. Each receiving dump pit shall be inspected for proper operation while receiving is occurring, at least once each week (Monday through Sunday) when grain is received.

e. The source shall be inspected for presence of visible emissions from internal transfer and cleaning, while such activity is occurring, at least once each week when such activity is performed.

f. Boiler #1 and Clayton Boiler shall only be operated with natural gas as the fuel. The use of any other fuel in Boiler #1 or Clayton Boiler may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable requirements.

g. Organic liquid by-products or waste materials shall not be used in any emission unit at this source without written approval from the Illinois EPA.

h. The Illinois EPA shall be allowed to sample all fuels stored at the above location.

i. All normal traffic pattern access areas and all normal traffic pattern roads and parking facilities which are located on Ag Transload Facility property shall be paved or treated with water, oils or chemical dust suppressants. All paved areas shall be cleaned on a regular basis. All areas treated with water, oils or chemical dust suppressants shall have the treatment applied on a regular basis, as needed, in accordance with the operating program required by Condition 11(l).

j. All unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods.

k. Grinding mills, screening operations, bucket elevators, conveyor transfer points, conveyors, bagging operations, storage bins and fine product truck and railcar loading operations shall be sprayed with water or a surfactant solution, utilize choke-feeding or be treated by an equivalent method in accordance with an operating program.

l. The emission units described in Conditions 11(i), (j), and (k) shall be operated under the provisions of an operating program, consistent with 35 Ill. Adm. Code 212.310 and 212.312, and prepared by the owner or operator and submitted to the Illinois EPA for its review. Such operating program shall be designed to significantly reduce fugitive particulate matter emissions.

m. As a minimum the operating program shall include the following:

i. The name and address of the source;

ii. The name and address of the owner or operator responsible for execution of the operating program;

iii. A map or diagram of the source showing approximate locations of storage piles, conveyor loading operations, normal traffic pattern access areas surrounding storage piles and all normal traffic patterns within the source;

iv. Location of unloading and transporting operations with pollution control equipment;

v. A detailed description of the best management practices utilized to achieve compliance with 35 Ill. Adm. Code 212.301, including an engineering specification of particulate collection equipment, application systems for water, oil, chemicals and dust suppressants utilized and equivalent methods utilized;

vi. Estimated frequency of application of dust suppressants by location of materials; and

vii. Such other information as may be necessary to facilitate the Illinois EPA's review of the operating program.

n. Within 90 days from date of issuance of this permit a Fugitive Particulate Operating Program must be submitted by the Permittee and is incorporated herein by reference. The source shall be operated under and shall comply with the provisions of this Fugitive Particulate Operating Program and any amendments to the Fugitive Particulate Operating Program submitted pursuant to Condition 11(l) and (m).

o. The operating program shall be amended from time to time by the owner or operator so that the operating program is current. Such amendments shall be consistent with Condition 11(l) and (m) and shall be submitted to the Illinois EPA within thirty (30) days of any such amendment. Any future amendment to the Fugitive Particulate Operating Program made by the Permittee during the permit term is automatically incorporated by reference provided the revision is not expressly disapproved, in writing, by the Illinois EPA. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the Fugitive Particulate Operating Program, the Permittee shall be required to revise and resubmit the Fugitive Particulate Operating Program within thirty (30) days of receipt of the notification to address the deficiency.

12a. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS) shall not exceed the following limits:

	PM Grain Loading	PM_{10} Grain Loading	Total Flow Rate	E M I S S I O N S			
				PM		PM_{10}	
Emission Unit	(gr/dscf)	(gr/dscf)	(scfm)	(lbs/Hr)	(Tons/Yr)	(lbs/Hr)	(Tons/Yr)

Truck Dump #1	0.002	0.0015	18,500	0.32	1.39	0.24	1.04
Hoffman Bldg 301 Vacuum	0.001	0.001	1,000	0.01	0.04	0.01	0.04
West Headhouse General Aspiration	0.0015	0.0015	55,000	0.71	3.10	0.71	3.10
Railcar Dump Pit and Section D&E General Aspiration	0.0015	0.0015	21,600	0.28	1.22	0.28	1.22
Track 6 Vacuum	0.001	0.001	700	0.01	0.03	0.01	0.03
Cleanings Discharge	0.002	0.0015	1,900	0.03	0.14	0.02	0.11
Grain Receiving Fugitives					3.01		3.01
				Total:	8.93		8.55

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

b. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) shall not exceed the following limits:

Emission Unit	PM Grain Loading (gr/dscf)	PM_{10} Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM (lbs/Hr)	PM (Tons/Yr)	PM_{10} (lbs/Hr)	PM_{10} (Tons/Yr)
Truck Dump #4 & W. Gallery Aspiration	0.002	0.002	36,017	0.62	2.70	0.62	2.70
Cleaning North APM	0.002	0.0015	41,000	0.70	3.08	0.53	2.31
Bldg. 115 Corn Cleaning	0.002	0.0015	57,372	0.98	4.31	0.74	3.23

Hominy Loadout Fugitive					6.90		1.02
Grain Loadout Fugitive					0.10	0.27	0.10
				Total:	16.64		9.01

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

f. Compliance with the annual limits in Conditions 12(a) through 12(e) of this permit shall be determined on a daily basis from the sum of the data for the current day plus the preceding 364 days (running 365 days total).

g. Emissions from and operation of Boiler #1 shall not exceed the following limits:

i. Natural Gas Usage: 84.58 mmscf/month, 845.78 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	3.55	35.52
Nitrogen Oxides (NO_x)	50.0	2.11	21.14
Particulate Matter (PM)	7.6	0.32	3.21
Sulfur Dioxide (SO_2)	0.6	0.02	0.25
Volatile Organic Material (VOM)	5.5	0.23	2.33

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

h. Emissions from and operation of Clayton Boiler shall not exceed the following limits:

i. Natural Gas Usage: 24.44 mmscf/month, 244.40 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	1.03	10.26
Nitrogen Oxides (NO_x)	100.0	1.22	12.22
Particulate Matter (PM)	7.6	0.09	0.93
Sulfur Dioxide (SO_2)	0.6	0.01	0.07
Volatile Organic Material (VOM)	5.5	0.07	0.67

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

i. Compliance with the annual limits in Condition 12(g) and (h) of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total).

13. This permit is issued based on the Potential to Emit (PTE) for Hazardous Air Pollutants (HAPs) as listed in Section 112(b) of the Clean Air Act from this source being less than 10 tons/year of any single HAP and 25 tons/year of any combination of such HAPs. As a result, this permit is issued based on the emissions of all HAPs from this source not triggering the requirements to obtain a CAAPP Permit from the Illinois EPA.

14a. Pursuant to 40 CFR 60.8(a), except as specified in 40 CFR 60.8(a)(1), (a)(2), (a)(3), and (a)(4), at such other times as may be required by the Illinois EPA or USEPA under section 114 of the Clean Air Act, the owner or operator of such facility shall conduct performance test(s) and furnish the Illinois EPA or USEPA a written report of the results of such performance test(s).

b. Pursuant to 40 CFR 60.8(b), performance tests shall be conducted and data reduced in accordance with the test methods and procedures contained in each applicable subpart of 40 CFR Part 60 unless the Illinois EPA or USEPA:

i. Specifies or approves, in specific cases, the use of a reference method with minor changes in methodology;

ii. Approves the use of an equivalent method;

iii. Approves the use of an alternative method the results of which the Illinois EPA or USEPA has determined to be adequate for indicating whether a specific source is in compliance;

iv. Waives the requirement for performance tests because the owner or operator of a source has demonstrated by other means to the Illinois EPA's or USEPA's satisfaction that the affected facility is in compliance with the standard; or

v. Approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors. Nothing in this paragraph shall be construed to abrogate the Illinois EPA's or USEPA's authority to require testing under section 114 of the Clean Air Act.

c. Pursuant to 40 CFR 60.8(c), performance tests shall be conducted under such conditions as the Illinois EPA or USEPA shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Illinois EPA or USEPA such records as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test nor shall emissions in excess of the level of the applicable emission limit during periods of startup, shutdown, and malfunction be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

d. Pursuant to 40 CFR 60.8(d), the owner or operator of an affected facility shall provide the Illinois EPA or USEPA at least 30 days prior notice of any performance test, except as specified under other subparts of 40 CFR Part 60, to afford the Illinois EPA or USEPA the opportunity to have an observer present. If after 30 days notice for an initially scheduled performance test, there is a delay (due to operational problems, etc.) in conducting the scheduled performance test, the owner or operator of an affected facility shall notify the Illinois EPA or USEPA as soon as possible of any delay in the original test date, either by providing at least 7 days prior notice of the rescheduled date of the performance test, or by arranging a rescheduled date with the Illinois EPA or USEPA by mutual agreement.

e. Pursuant to 40 CFR 60.8(e), the owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

i. Sampling ports adequate for test methods applicable to such facility. This includes:

A. Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures; and

B. Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures.

ii. Safe sampling platform(s).

iii. Safe access to sampling platform(s).

iv. Utilities for sampling and testing equipment.

f. Pursuant to 40 CFR 60.8(f), unless otherwise specified in the applicable subpart of 40 CFR Part 60, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the applicable standard under 40 CFR Part 60. For the purpose of determining compliance with an applicable standard under 40 CFR Part 60, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Illinois EPA's or USEPA's approval, be determined using the arithmetic mean of the results of the two other runs.

g. Pursuant to 40 CFR 60.11(e)(2), except as provided in 40 CFR 60.11(e)(3), the owner or operator of an affected facility to which an opacity standard in 40 CFR Part 60 applies shall conduct opacity observations in accordance with 40 CFR 60.11(b), shall record the opacity of emissions, and shall report to the Illinois EPA or USEPA the opacity results along with the results of the initial performance test required under 40 CFR 60.8. The inability of an owner or operator to secure a visible emissions observer shall not be considered a reason for not conducting the opacity observations concurrent with the initial performance test.

15a. Pursuant to 40 CFR 60.303(a), in conducting the performance tests required in 40 CFR 60.8, the owner or operator shall use as reference methods and procedures the test methods in appendix A of 40 CFR Part 60 or other methods and procedures as specified in 40 CFR 60.303, except as provided in 40 CFR 60.8(b). Acceptable alternative methods and procedures are given in 40 CFR 60.303(c).

b. Pursuant to 40 CFR 60.303(b), the owner or operator shall determine compliance with the particulate matter standards in 40 CFR 60.302 as follows:

i. Method 5 shall be used to determine the particulate matter concentration and the volumetric flow rate of the effluent gas. The sampling time and sample volume for each run shall be at least 60 minutes and 1.70 dscm (60 dscf). The probe and filter holder shall be operated without heaters.

ii. Method 2 shall be used to determine the ventilation volumetric flow rate.

iii. Method 9 and the procedures in 40 CFR 60.11 shall be used to determine opacity.

c. Pursuant to 40 CFR 60.303(c)(1), the owner or operator may use the following as alternatives to the reference methods and procedures specified in 40 CFR 60.303: For Method 5, Method 17 may be used.

16a. Pursuant to 35 Ill. Adm. Code 201.282, every emission source or air pollution control equipment shall be subject to the following testing requirements for the purpose of determining the nature and quantities of specified air contaminant emissions and for the purpose of determining ground level and ambient air concentrations of such air contaminants:

i. Testing by Owner or Operator. The Illinois EPA may require the owner or operator of the emission source or air pollution control equipment to conduct such tests in accordance with procedures adopted by the Illinois EPA, at such reasonable times as may be specified by the Illinois EPA and at the expense of the owner or operator of the emission source or air pollution control equipment. The Illinois EPA may adopt procedures detailing methods of testing and formats for reporting results of testing. Such procedures and revisions thereto, shall not become effective until filed with the Secretary of State, as required by the APA Act. All such tests shall be made by or under the direction of a person qualified by training and/or experience in the field of air pollution testing. The Illinois EPA shall have the right to observe all aspects of such tests.

ii. Testing by the Illinois EPA. The Illinois EPA shall have the right to conduct such tests at any time at its own expense. Upon request of the Illinois EPA, the owner or operator of the emission source or air pollution control equipment shall provide, without charge to the Illinois EPA, necessary holes in stacks or ducts and other safe and proper testing facilities, including scaffolding, but excluding instruments and sensing devices, as may be necessary.

b. Testing required by Conditions 17 and 18 shall be performed upon a written request from the Illinois EPA by a qualified independent testing service.

17a. Pursuant to 35 Ill. Adm. Code 212.107, for both fugitive and nonfugitive particulate matter emissions, a determination as to the

presence or absence of visible emissions from emission units shall be conducted in accordance with Method 22, 40 CFR part 60, Appendix A, except that the length of the observing period shall be at the discretion of the observer, but not less than one minute. 35 Ill. Adm. Code Part 212 Subpart A shall not apply to 35 Ill. Adm. Code 212.301.

b. Pursuant to 35 Ill. Adm. Code 212.109, except as otherwise provided in 35 Ill. Adm. Code Part 212, and except for the methods of data reduction when applied to 35 Ill. Adm. Code 212.122 and 212.123, measurements of opacity shall be conducted in accordance with Method 9, 40 CFR Part 60, Appendix A, and the procedures in 40 CFR 60.675(c) and (d), if applicable, except that for roadways and parking areas the number of readings required for each vehicle pass will be three taken at 5-second intervals. The first reading shall be at the point of maximum opacity and second and third readings shall be made at the same point, the observer standing at right angles to the plume at least 15 feet away from the plume and observing 4 feet above the surface of the roadway or parking area. After four vehicles have passed, the 12 readings will be averaged.

c. Pursuant to 35 Ill. Adm. Code 212.110(a), measurement of particulate matter emissions from stationary emission units subject to 35 Ill. Adm. Code Part 212 shall be conducted in accordance with 40 CFR Part 60, Appendix A, Methods 5, 5A, 5D, or 5E.

d. Pursuant to 35 Ill. Adm. Code 212.110(b), the volumetric flow rate and gas velocity shall be determined in accordance with 40 CFR Part 60, Appendix A, Methods 1, 1A, 2, 2A, 2C, 2D, 3, and 4.

e. Pursuant to 35 Ill. Adm. Code 212.110(c), upon a written notification by the Illinois EPA, the owner or operator of a particulate matter emission unit subject to 35 Ill. Adm. Code Part 212 shall conduct the applicable testing for particulate matter emissions, opacity, or visible emissions at such person's own expense, to demonstrate compliance. Such test results shall be submitted to the Illinois EPA within thirty (30) days after conducting the test unless an alternative time for submittal is agreed to by the Illinois EPA.

18a. Within ninety (90) days after the issuance of this permit, the Permittee shall:

i. Conduct observations to determine visual emissions using USEPA Method 22 from the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling during conditions which are representative of maximum emissions in order to demonstrate compliance with 35 Ill. Adm. Code 212.123. Thereafter, this testing shall be conducted on a quarterly basis no later than 30 days after the end of the preceding calendar quarter.

ii. Measure and quantify the emissions of PM (gr/dscf and lb/hr) and PM_{10} (gr/dscf and lb/hr) emissions from the Corn, Soybean &

Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling during conditions which are representative of maximum emissions in order to demonstrate compliance with 35 Ill. Adm. Code 212.321 and Condition 13(b) of this permit. Thereafter, this testing shall be conducted at least once every (5) five years from the preceding testing date.

b. The following methods and procedures shall be used for testing of emissions, unless another method is approved by the Illinois EPA:(refer to 40 CFR 60, Appendix A for USEPA test methods).

Sample and Velocity Traverses for Stationary Sources	USEPA Method 1
Sample and Velocity Traverses for Stationary Sources with Small Stacks or Ducts	USEPA Method 1A
Determination of Stack Gas Velocity and Volumetric Flow Rate (Type S Pitot Tube)	USEPA Method 2
Direct Measurement of Gas Volume through Pipes and Small Ducts	USEPA Method 2A
Determination of Gas Velocity and Volumetric Flow Rate in Small Stacks or Ducts (Standard Pitot Tube)	USEPA Method 2C
Measurement of Gas Volume Flow Rates in Small Pipes and Ducts	USEPA Method 2D
Gas Analysis for the Determination of Dry Molecular Weight	USEPA Method 3
Determination of Moisture Content in Stack Gases	USEPA Method 4
Determination of Particulate Matter from Stationary Sources	USEPA Method 5
Determination of Particulate Matter Emissions from Positive Pressure Fabric Filters	USEPA Method 5D
Visual Determination of the Opacity of Emissions from Stationary Sources	USEPA Method 9
Visual Determination of Fugitive Emissions from Material Sources	USEPA Method 22

c. Within sixty (60) days prior to the actual date of testing, the Permittee shall submit a written test plan to the Illinois EPA, Bureau of Air, Compliance Section Manager. This plan shall include at a minimum:

i. The name (or other identification) of the emission unit(s) to be tested and the name and address of the facility at which they are located;

ii. The name and address of the independent testing service(s) performing the tests, with the names of the individuals who may be performing sampling and analysis and their experience with similar tests;

iii. The specific determinations of emissions and/or performance which are intended to be made, including the site(s) in the ductwork or stack at which sampling will occur;

iv. The specific conditions under which testing will be performed, including a discussion of why these conditions will be representative of the maximum emissions, maximum operating rate, minimum control performance, the levels of operating parameters for the emission unit, including associated control equipment, at or within which compliance is intended to be shown, and the means by which the operating parameters will be determined;

v. The test method(s) which will be used, with the specific analysis method, if the method can be used with different analysis methods. The specific sampling, analytical and quality control procedures which will be used, with an identification of the standard methods upon which they are based;

vi. Any minor changes in standard methodology proposed to accommodate the specific circumstances of testing, with justification;

vii. Any proposed use of an alternative test method, with detailed justification; and

viii. The format and content of the Source Test Report.

d. The Permittee shall provide the Illinois EPA with written notification of testing at least thirty (30) days prior to testing and again five (5) days prior to the testing to enable the Illinois EPA to have an observer present. This notification shall include the name of emission unit(s) to be tested, scheduled date and time, and contact person with telephone number.

e. If testing is delayed, the Permittee shall promptly notify the Illinois EPA by e-mail or facsimile, at least five (5) days prior to the scheduled date of testing or immediately, if the delay occurs in the five (5) days prior to the scheduled date. This notification shall also include the new date and time for testing, if set, or a separate notification shall be sent with this information when it is set.

f. The Permittee shall submit the Final Source Test Report(s) for these tests accompanied by a cover letter stating whether or not compliance was shown, to the Illinois EPA, Bureau of Air, Compliance Section Manager within thirty (30) days after the test results are compiled, but no later than sixty (60) days after the date of testing or sampling. The Final Source Test Report shall include as a minimum:

i. General information describing the test, including the name and identification of the emission source, which was tested, date of testing, names of personnel performing the tests, and Illinois EPA observers, if any;

ii. A summary of results;

iii. Description of test procedures and method(s), including description and map of emission units and sampling points,

sampling train, testing and analysis equipment, and test schedule;

iv. Detailed description of test conditions, including:

A. List and description of the equipment (including serial numbers or other equipment specific identifiers) tested and process information (i.e., mode(s) of operation, process rate or throughput, fuel or raw material consumption rate, and heat content of the fuels);

B. Control equipment information (i.e., equipment condition and operating parameters) during testing; and

C. A discussion of any preparatory actions taken (i.e., inspections, maintenance and repair).

v. Data and calculations, including copies of all raw data sheets and records of laboratory analyses, sample calculations, and data on equipment calibration. Identification of the applicable regulatory standards and permit conditions that the testing was performed to demonstrate compliance with, a comparison of the test results to the applicable regulatory standards and permit conditions, and a statement whether the test(s) demonstrated compliance with the applicable standards and permit conditions;

vi. An explanation of any discrepancies among individual tests, failed tests or anomalous data;

vii. The results and discussion of all quality control evaluation data, including a copy of all quality control data; and

viii. The applicable operating parameters of the pollution control device(s) during testing (temperature, pressure drop, flow rate, etc.), if any.

19a. Pursuant to 40 CFR 60.7(b), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of an affected facility; any malfunction of the air pollution control equipment; or any periods during which a continuous monitoring system or monitoring device is inoperative.

b. Pursuant to 40 CFR 60.7(f), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain a file of all measurements, including continuous monitoring system, monitoring device, and performance testing measurements; all continuous monitoring system performance evaluations; all continuous monitoring system or monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by 40 CFR Part 60 recorded in a permanent form suitable for inspection. The file shall be retained for at least two years following the date of such measurements, maintenance, reports, and records, except as follows:

The Illinois EPA or USEPA, upon notification to the source, may require the owner or operator to maintain all measurements as required by 40 CFR 60.7(f), if the Illinois EPA or USEPA determines these records are required to more accurately assess the compliance status of the affected source.

20a. i. Pursuant to 40 CFR 60.48c(g)(1), except as provided under 40 CFR 60.48c(g)(2) and (g)(3), the owner or operator of each affected facility shall record and maintain records of the amounts of each fuel combusted during each operating day.

ii. Pursuant to 40 CFR 60.48c(g)(2), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility that combusts only natural gas, wood, fuels using fuel certification in 40 CFR 60.48c(f) to demonstrate compliance with the SO_2 standard, fuels not subject to an emissions standard (excluding opacity), or a mixture of these fuels may elect to record and maintain records of the amount of each fuel combusted during each calendar month.

iii. Pursuant to 40 CFR 60.48c(g)(3), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility or multiple affected facilities located on a contiguous property unit where the only fuels combusted in any steam generating unit (including steam generating units not subject to 40 CFR 60 Subpart Dc) at that property are natural gas, wood, distillate oil meeting the most current requirements in 40 CFR 60.42c to use fuel certification to demonstrate compliance with the SO_2 standard, and/or fuels, excluding coal and residual oil, not subject to an emissions standard (excluding opacity) may elect to record and maintain records of the total amount of each steam generating unit fuel delivered to that property during each calendar month.

b. Pursuant to 40 CFR 60.48c(i), all records required under 40 CFR 60.48c shall be maintained by the owner or operator of the affected facility for a period of two years following the date of such record.

21. Pursuant to 40 CFR 63.10(b)(3), if an owner or operator determines that his or her stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants regulated by any standard established pursuant to Section 112(d) or (f) of the Clean Air Act, and that stationary source is in the source category regulated by the relevant standard, but that source is not subject to the relevant standard (or other requirement established under 40 CFR Part 63) because of limitations on the source's potential to emit or an exclusion, the owner or operator must keep a record of the applicability determination on site at the source for a period of 5 years after the determination, or until the source changes its operations to become an affected source, whichever comes first. The record of the applicability determination must be signed by the person making the determination and include an analysis (or other information) that demonstrates why the owner or operator believes the source is unaffected (e.g., because the source is an area source). The analysis

(or other information) must be sufficiently detailed to allow the USEPA and/or Illinois EPA to make a finding about the source's applicability status with regard to the relevant standard or other requirement. If relevant, the analysis must be performed in accordance with requirements established in relevant subparts of 40 CFR Part 63 for this purpose for particular categories of stationary sources. If relevant, the analysis should be performed in accordance with USEPA guidance materials published to assist sources in making applicability determinations under Section 112 of the Clean Air Act, if any. The requirements to determine applicability of a standard under 40 CFR 63.1(b)(3) and to record the results of that determination under 40 CFR 63.10(b)(3) shall not by themselves create an obligation for the owner or operator to obtain a Title V permit.

22. Pursuant to 35 Ill. Adm. Code 212.110(e), the owner or operator of an emission unit subject to 35 Ill. Adm. Code Part 212 shall retain records of all tests which are performed. These records shall be retained for at least three (3) years after the date a test is performed.

23a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the baghouse filters and cyclones:

A. Records for periodic inspection of the baghouse filters and cyclones with date, individual performing the inspection, and nature of inspection; and

B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The Permittee shall keep a copy of the Fugitive Particulate Operating Program, any amendments or revisions to the Fugitive Particulate Operating Program, and the Permittee shall also keep a record of activities completed according to the Fugitive Particulate Operating Program.

iii. Records of housekeeping check lists;

iv. Records for the inspections required by Conditions 11(d) and (e), with date, time and observations if such information is not incorporated in the housekeeping check list.

v. Total flow rate for each baghouse blower (scfm);

vi. Total grain loading for each process (gr/dscf);

vii. Total hours of operation of each baghouse (hours/day and hours/year);

viii. Daily and annual emissions of PM, and PM_{10} from the source with supporting calculations (tons/month and tons/year).

ix. Natural gas usage for Boiler #1 (mmscf/month and mmscf/year);

x. Natural gas usage for the Clayton Boiler (mmscf/month and mmscf/year); and

xi. Monthly and annual emissions of CO, NO_x, PM, PM_{10}, SO_2, and VOM from the combustion of natural gas, with supporting calculations (tons/month and tons/year).

b. All records and logs required by Condition 23(a) of this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be made available for inspection and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

24. Pursuant to 40 CFR 60.7(a)(4), any owner or operator subject to the provisions of 40 CFR Part 60 shall furnish the Illinois EPA or USEPA written notification or, if acceptable to both the Illinois EPA and USEPA and the owner or operator of a source, electronic notification, as follows:

A notification of any physical or operational change to an existing facility which may increase the emission rate of any air pollutant to which a standard applies, unless that change is specifically exempted under an applicable subpart or in 40 CFR 60.14(e). This notice shall be postmarked 60 days or as soon as practicable before the change is commenced and shall include information describing the precise nature of the change, present and proposed emission control systems, productive capacity of the facility before and after the change, and the expected completion date of the change. The Illinois EPA or USEPA may request additional relevant information subsequent to this notice.

25. Pursuant to 35 Ill. Adm. Code 212.110(d), a person planning to conduct testing for particulate matter emissions to demonstrate compliance shall give written notice to the Illinois EPA of that intent. Such notification shall be given at least thirty (30) days prior to the initiation of the test unless a shorter period is agreed to by the Illinois EPA. Such notification shall state the specific test methods from 35 Ill. Adm. Code 212.110 that will be used.

26a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit or otherwise, the Permittee shall submit a report to the Illinois EPA's Bureau of Air Compliance Section in Springfield, Illinois within thirty (30) days after the exceedance or deviation. The report shall identify the duration and the emissions impact of the exceedance or deviation, a copy of the relevant records and information to resolve the exceedance

or deviation, and a description of the efforts to reduce emissions from, and the duration of exceedance or deviation, and to prevent future occurrences of any such exceedance or deviation.

b. One (1) copy of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

It should be noted that the two (2) 193 Diesel Fire-Pump Engines are exempt from permitting, pursuant to 35 Ill. Adm. Code 201.146(i) and the 150,000 gallon fuel oil storage tank is exempt from permitting, pursuant to 35 Ill. Adm. Code 201.146(n)(3)

If you have any questions on this permit, please call German Barria at 217/785-1705.

Sincerely,

William D. Marr
Manager, Permit Section
Bureau of Air

Attachment A - Emission Summary

This attachment provides a summary of the maximum emissions from the Corn Mill & Grain Elevator operating in compliance with the requirements of this federally enforceable permit. In preparing this summary, the Illinois EPA used the annual operating scenario which results in maximum emissions from such a plant. The resulting maximum emissions are below the levels, (e.g., 100 tons/year for CO, NO_x, and PM_{10}) at which this source would be considered a major source for purposes of the Clean Air Act Permit Program. Actual emissions from this source will be less than predicted in this summary to the extent that less material is handled, and control measures are more effective than required in this permit.

	E M I S S I O N S (Tons/Year)					
Emission Unit	CO	NO_x	PM	PM_{10}	SO_2	VOM
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS)			8.93	8.55		
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS)			11.98	9.65		
Dry Corn Milling, Processing and Products Handling			116.69	62.80		
Corn Mill Products Storage			1.64	1.24		
Corn Mill Products Milling and Handling			16.64	9.01		
Boiler #1, Natural Gas	35.52	21.14	3.21	3.21	0.25	2.33
Clayton Boiler NG	10.26	12.22	0.93	0.93	0.07	0.67
Totals	45.78	33.36	160.02	95.39	0.32	3.00

STATE OF ILLINOIS
ENVIRONMENTAL PROTECTION AGENCY
DIVISION OF AIR POLLUTION CONTROL
P. O. BOX 19506
SPRINGFIELD, ILLINOIS 62794-9506

STANDARD CONDITIONS FOR OPERATING PERMITS

May, 1993

The Illinois Environmental Protection Act (Illinois Revised Statutes, Chapter 111-1/2, Section 1039) grants the Environmental Protection Agency authority to impose conditions on permits which it issues.

The following conditions are applicable unless superseded by special condition(s).

1. The issuance of this permit does not release the Permittee from compliance with state and federal regulations which are part of the Illinois State Implementation Plan, as well as with other applicable statutes and regulations of the Unites States or the State of Illinois or with applicable local laws, ordinances and regulations.

2. The Illinois EPA has issued this permit based upon the information submitted by the Permittee in the permit application. Any misinformation, false statement or misrepresentation in the application shall be grounds for revocation under 35 Ill. Adm. Code 201.166.

3. a. The Permittee shall not authorize, cause, direct or allow any modification, as defined in 35 Ill. Adm. Code 201.102, of equipment, operations or practices which are reflected in the permit application as submitted unless a new application or request for revision of the existing permit is filed with the Illinois EPA and unless a new permit or revision of the existing permit(s) is issued for such modification.

   b. This permit only covers emission sources and control equipment while physically present at the indicated plant location(s). Unless the permit specifically provides for equipment relocation, this permit is void for an item of equipment on the day it is removed from the permitted location(s) or if all equipment is removed, notwithstanding the expiration date specified on the permit.

4. The Permittee shall allow any duly authorized agent of the Illinois EPA, upon the presentation of credentials, at reasonable times:

   a. To enter the Permittee's property where actual or potential effluent, emission or noise sources are located or where any activity is to be conducted pursuant to this permit;

   b. To have access to and to copy any records required to be kept under the terms and conditions of this permit;

   c. To inspect, including during any hours of operation of equipment constructed or operated under this permit, such equipment and any equipment required to be kept, used, operated, calibrated and maintained under this permit;

   d. To obtain and remove samples of any discharge or emission of pollutants; and

   e. To enter and utilize any photographic, recording, testing, monitoring or other equipment for the purpose of preserving, testing, monitoring or recording any activity, discharge or emission authorized by this permit.

5. The issuance of this permit:

   a. Shall not be considered as in any manner affecting the title of the premises upon which the permitted facilities are located;

b. Does not release the Permittee from any liability for damage to person or property caused by or resulting from the construction, maintenance, or operation of the facilities;

c. Does not take into consideration or attest to the structural stability of any unit or part of the project; and

d. In no manner implies or suggests that the Illinois EPA (or its officers, agents, or employees) assumes any liability, directly or indirectly, for any loss due to damage, installation, maintenance, or operation of the proposed equipment or facility.

6. The facilities covered by this permit shall be operated in such a manner that the disposal of air contaminants collected by the equipment shall not cause a violation of the Environmental Protection Act or regulations promulgated thereunder.

7. The Permittee shall maintain all equipment covered under this permit in such a manner that the performance of such equipment shall not cause a violation of the Environmental Protection Act or regulations promulgated thereunder.

8. The Permittee shall maintain a maintenance record on the premises for each item of air pollution control equipment. These records shall be made available to any agent of the Environmental Protection Agency at any time during normal working hours and/or operating hours. At a minimum, this record shall show the dates of performance and nature of preventative maintenance activities.

9. No person shall cause or allow continued operation during malfunction, breakdown or startup of any emission source or related air pollution control equipment if such operation would cause a violation of an applicable emission standard or permit limitation. Should a malfunction, breakdown or startup occur, which results in emissions in excess of any applicable standard or permit limitation, the Permittee shall:

a. Immediately report the incident to the Illinois EPA's Regional Field Operations Section Office by telephone, telegraph or other method as constitutes the fastest available alternative, and shall comply with all reasonable directives of the Illinois EPA with respect to the incident;

b. Maintain the following records for a period of no less than two (2) years:

i. Date and duration of malfunction, breakdown, or startup,

ii. Full and detailed explanation of the cause,

iii. Contaminants emitted and an estimate of quantity of emissions,

iv. Measures taken to minimize the amount of emissions during the malfunction, breakdown or startup, and

v. Measures taken to reduce future occurrences and frequency of incidents.

10. If the permit application contains a compliance program and project completion schedule, the Permittee shall submit a project completion status report within thirty (30) days of any date specified in the compliance program and project completion schedule or at six month intervals, whichever is more frequent.

11. The Permittee shall submit an Annual Emission Report as required by 35 Ill. Adm. Code 201.302 and 35 Ill. Adm. Code Part 254.

217/785-1705

CONSTRUCTION PERMIT

PERMITTEE

Bunge North America, Inc.
Attn: Dean Hughes
321 East North Street
Danville, Illinois 61832

Application No.: 11110009 I.D. No.: 183020ABT
Applicant's Designation: Date Received: November 7, 2011
Subject: Thrustock Flow Upgrade
Date Issued: December 5, 2011
Location: 321 East North Street, Danville, Vermillion County

Permit is hereby granted to the above-designated Permittee to CONSTRUCT emission source(s) and/or air pollution control equipment consisting an upgrade to the thru stock portion of the corn mill (the affected mill), as described in the above-referenced application. This permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This permit authorizes an upgrade to the thru stock portion of the affected mill, including the installation of the following units. The Permittee plans to improve the quality of the products and the efficiency of the process through the system upgrade.

i. The installation of one new aspirator/cyclone in the Thru Stock 3rd Germ Stream System with emissions controlled by the existing S. Lunchroom Screening Baghouse;

ii. The installation of three Carter Day Duo Type aspirators in the existing Coarse Thru Stock System with emissions controlled by the existing Camas/Bran Baghouse; and

iii. The installation of three Carter Day Duo Type aspirators in the existing Fine Thru Stock System with emissions also controlled by Camas/Bran Baghouse.

b. This permit does not authorize any increase in the production or capacity of the affected mill as a result of the proposed system upgrade.

2a. The affected mill shall comply with the applicable emission standards and other requirements as set forth in unit-specific Condition 7.3 in the Clean Air Permit Program (CAAPP) Permit No. 96020027.

b. This permit does not revise or relax requirements for testing, recordkeeping, and reporting associated with existing emissions units at the plant, as established in CAAPP Permit No. 96020027.

3. This permit is issued based on minimal emission increase as a result of the proposed system upgrade. For this purpose, the increase in PM/PM_{10} emissions from the upgrade to the Germ Stream System (S. Lunchroom Screening Baghouse), and the upgrade to the Thru Stock Systems (Filter Camas/Bran Baghouse) shall each not exceed 0.25 lbs/hour and 1.10 tons/year.

4. At all times, the Permittee shall maintain and operate the new equipment and associated control equipment, in a manner consistent with good air pollution control practice for minimizing emissions.

5. The Permittee may operate the new equipment pursuant to this construction permit until renew or reissuance of its CAAPP permit to address this equipment. This condition supersedes Standard Condition 6.

If you have any questions on this, please call Wei Han or Minesh Patel at 217/785-1705.

Source Name: **Bunge North America, Inc.**

Source I.D.#: **183 020 ABT**

Application #: **96020027**

Date Received: **12-05-11**

Completeness Review Due Date: **12-27-11**

Previous Permit Expiration Date: **01-13-12**

Type of Application: Initial New Renewal

1. Are questions 8-10 in Section 4 of CAAPP 200 all marked "yes"? YES NO
   Company sent the old 200 form.
   If yes, the only forms needed are 200, 292, 296 and 299

2. Does the source name on the application match the name in ICEMAN? YES NO
   If no, request forms 272 and 273 for ownership change

3. Does the signature in the certification blocks match the Responsible Official on the previous permit? If no, request a 273 or 500 if delegating authority. YES NO

4. Are there any VNs pending (search VN tracking database)? YES NO
   If yes, forward to CAAPP unit manager for review.

5. Is there trade secret/confidentiality claims made on the application? YES NO
   (Form 200, section 5, question27) If yes, forward to CAAPP unit manager for review.

6. Check for the following forms:
   - ☒ 200
   - ☐ 286
   - ☒ 299 (FESOP only)
   - ☒ 292
   - ☒ 296
   - ☐ 293
   - ☐ 464 (if a new application or first time renewal)
   - ☐ 287 (only if anything in Form 200, section 5 is marked "Incorporate by Reference" marked)

7. Are questions 1-6 in Section 5 of CAAPP 200 all marked "yes" or "Incorporate by Reference"? YES NO
   If no, information must be requested, see 9-15 of this sheet.

8. Is additional information needed? YES (NO)
   For CAAPPs - If yes, continue to #9-15. If no, skip to #16. If no, skip to #16.
   For FESOPs – Forward the entire application to the unit manager for additional review

9. Company contact person: **Robert Henricks**

CAAPP APPLICATION COMPLETENESS DETERMINATION

APPLICANT

Bunge North America, Inc.
Attn: Dean Hughes
321 East North Street
Danville, Illinois 61832

Date of Determination:	December 6, 2011
Application/Permit No.:	96020027
I.D. Number:	183020ABT
Date Received:	December 5, 2011
Source Name:	Bunge Milling, Inc.
Location of Source:	321 East North Street, Danville, Vermilion County

Dear Mr. Hughes:

This letter provides notification that your Clean Air Act Permit Program (CAAPP) application received on the date indicated above, has been determined by the Illinois EPA to be complete pursuant to Section 39.5(5) of the Illinois Environmental Protection Act (Act).

Based on the completeness determination, the owner or operator of the CAAPP source is not required to renew existing state operating permits for emission units at the CAAPP source. The owner or operator of the CAAPP source is not, however, relieved of any obligation to obtain state operating permits for emission units at the CAAPP source for which no current state operating permit exists.

Notwithstanding the completeness determination, the Illinois EPA may request additional information necessary to evaluate or take final action on the CAAPP application. If such additional information affects your allowable emission limits, a revised form 292-CAAPP-FEE DETERMINATION FOR CAAPP PERMIT must be submitted with the requested information. The failure to submit to the Illinois EPA the requested information within the time frame specified by the Illinois EPA, may force the Illinois EPA to deny your CAAPP application pursuant to Section 39.5 of the Act.

If you have any questions concerning this matter, please contact the Division of Air Pollution Control Permit Section at 217/782-2113.

Mike,

As you may be aware Bob Henricks has retired and I will be taking over the Kankakee FESOP project. I think you were close to issuing a final permit. Please let me know the status of the permit and I would like to have one review of a final draft before the permit is issued.

As for the Danville FESOP, I will be sending you a revised permit application. After reviewing all emission sources with the plant I discovered a number of errors in the original application.

Please let me know if you have any questions.

Thank you,

Mike, as discussed this morning we discovered one source previously missing from the list. Accordingly, I have updated the permit and our supporting spreadsheet. You indicated that the earliest you will get to this is July, 2013. Therefore, Jim Burris is copied as he will take over Bunge responsibility for this matter as of July 1, 2013.

Mike, I do not see why we need any limits beyond 1.a, where you limit emissions below major. But, here are our comments and recommendations. I did not replace/update the Attachment a table, which needs updating. I have included the spreadsheet which includes all of the calculations. Will be out all next week. Can discuss details the following week - week of April 15. Maybe a review of the draft before it goes public will be in order, with all of the changes we request.

PERMITTEE

Bunge North America, Inc.
Attn: Kenny Head
321 East North Street
Danville, Illinois 61832

Application No.: 15100009 I.D. No.: 183020ABT
Applicant's Designation: Date Received: October 7, 2015
Subject: Cyclone Receivers
Date Issued: December 21, 2015
Location: 321 East North Street, Danville, Vermillion County

Permit is hereby granted to the above-designated Permittee to CONSTRUCT emission source(s) and/or air pollution control equipment consisting of two (2) cyclone receivers (Extrusion Receiver; 108 A-Bin Receiver controlled by existing baghouse) as described in the above-referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This permit is issued based on the construction of the emission units listed above not constituting a new major source or major modification pursuant to Title I of the Clean Air Act, specifically 40 CFR 52.21, Prevention of Significant Deterioration (PSD). The source has requested that the Illinois EPA establish emission limitations and other appropriate terms and conditions in this permit that limit the emissions of Particulate Matter (PM) and Particulate Matter less than 10 microns (PM_{10}) from the above-listed equipment below the levels that would trigger the applicability of these rules.

b. Operation of the equipment listed above is allowed under this permit until final action is taken on the Federally Enforceable State Operating Permit (FESOP) application for this source.

2a. Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute period shall occur from only one such emission unit located within a 305 meter (1000 foot) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

d. Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

3. In the event that the operation of this emission unit results in an odor nuisance, the Permittee shall take appropriate and necessary actions to minimize odors, including but not limited to, changes in material or installation of controls, in order to eliminate the odor nuisance.

4a. Emissions and operation of the emission units of the flour handling system shall not exceed the following limits:

Item of Equipment	(scfm)	(gr/dscf)	Emissions PM/PM_{10} (Lb/Hr)	(Tons/Yr)
Extrusion Receiver	4,000	0.02	0.69	3.00
108 A-Bin Receiver	500	0.02	0.09	0.38
			Total:	3.38

These limits are based on exhaust air flow rate, grain loading, and information in the application. The limits on PM_{10} also limit the emissions of $PM_{2.5}$.

b. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 months total).

5a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the air pollution control equipment:

A. Records for periodic inspection of the pollution control equipment with date, individual performing the inspection, and nature of inspection; and

B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The maximum blower rate in scfm each month for the extrusion system; and

iii. Monthly and annual PM and PM_{10} emissions from the source with supporting calculations (tons/month and tons/year).

b. All records and logs required by this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be available for inspections and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

6a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit, the Permittee shall submit a report to the Illinois EPA's Compliance Section in Springfield, Illinois within 30 days after the exceedance/deviation. The report shall include the emissions released in accordance with the recordkeeping requirements, a copy of the relevant records, and a description of the exceedance or deviation and efforts to reduce emissions and future occurrences.

b. Two (2) copies of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Division of Air Pollution Control
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

If you have any questions on this, please call Mike Dragovich at 217/785-1705.

STANDARD CONDITIONS FOR CONSTRUCTION/DEVELOPMENT PERMITS ISSUED BY THE ILLINOIS ENVIRONMENTAL PROTECTION AGENCY

July 1, 1985

The Illinois Environmental Protection Act (Illinois Revised Statutes, Chapter 111-1/2, Section 1039) authorizes the Environmental Protection Agency to impose conditions on permits which it issues.

The following conditions are applicable unless superseded by special condition(s).

1. Unless this permit has been extended or it has been voided by a newly issued permit, this permit will expire one year from the date of issuance, unless a continuous program of construction or development on this project has started by such time.

2. The construction or development covered by this permit shall be done in compliance with applicable provisions of the Illinois Environmental Protection Act, and Regulations adopted by the Illinois Pollution Control Board.

3. There shall be no deviations from the approved plans and specifications unless a written request for modification, along with plans and specifications as required, shall have been submitted to the Agency and a supplemental written permit issued.

4. The Permittee shall allow any duly authorized agent of the Agency upon the presentation of credentials, at reasonable times:

   a. to enter the Permittee's property where actual or potential effluent, emission or noise sources are located or where any activity is to be conducted pursuant to this permit,

   b. to have access to and copy any records required to be kept under the terms and conditions of this permit,

   c. to inspect, including during any hours of operation of equipment constructed or operated under this permit, such equipment and any equipment required to be kept, used, operated, calibrated and maintained under this permit,

   d. to obtain and remove samples of any discharge or emission of pollutants, and

   e. to enter and utilize any photographic, recording, testing, monitoring or other equipment for the purpose of preserving, testing, monitoring, or recording any activity, discharge, or emission authorized by this permit.

5. The issuance of this permit:

   a. shall not be considered as in any manner affecting the title of the premises upon which the permitted facilities are to be located,

   b. does not release the Permittee from any liability for damage to person or property caused by or resulting from the construction, maintenance, or operation of the proposed facilities,

   c. does not release the Permittee from compliance with the other applicable statues and regulations of the United States, of the State of Illinois, or with applicable local laws, ordinances and regulations,

   d. does not take into consideration or attest to the structural stability of any units or parts of the project, and

e. in no manner implies or suggests that the Agency (or its officers, agents or employees) assumes any liability directly or indirectly, for any loss due to damage, installation, maintenance, or operation of the propose equipment or facility.

6. a. Unless a joint construction/operation permit has been issued, a permit for operation shall be obtained from th Agency before the equipment covered by this permit is placed into operation.

b. For purposes of shakedown and testing, unless otherwise specified by a special permit condition, the equipmen covered under this permit may be operated for a period not to exceed thirty (30) days.

7. The Agency may file a complaint with the Board for modification, suspension or revocation of a permit:

a. upon discovery that the permit application contained misrepresentations, misinformation or false statements o that all relevant facts were not disclosed, or

b. upon finding that any standard or special conditions have been violated, or

c. upon any violations of the Environmental Protection Act or any regulation effective thereunder as a result c the construction or development authorized by this permit.

Re: Construction Permit Application (FESOP Source)
Bunge – Danville Facility
Source ID No. 183020ABT

Dear Mr. Pilapil:

Please find enclosed two copies of our construction permit application to install a new cyclone receiver at our facility in Danville, Illinois. After the project is complete a separate application will be submitted to update our FESOP application.

A check for $4,000 is enclosed with this application package. The application package includes the following:

- A project description
- A summary of emission calculations
- A Form 197-FEE, Fee Determination Form
- A Permit Application Fee of $4,000 (Check made payable to Illinois EPA, Division of Air Pollution Control-Permit Section)
- A Form APC628, Construction Permit Application for a FESOP Source,
- Two Form APC220, Emission Source Information (one form for each cyclone receiver), and
- A process flow diagram

Please review the enclosed construction permit application. If you have any questions or require any further information please contact Jim Burris at (314) 292-2937 or by email at james.burris@bunge.com.

Sincerely,

Kenny Head
Plant Manager

Bunge North America

Whole Grain Upgrade – Danville

Project Description

The Bunge corn mill at Danville plans to upgrade its Whole Grain Process through the addition of a coarse whole grain transfer line (WG260). The proposed project involves a new pneumatic product transfer receiver which will discharge to the atmosphere.

New Unit – Description and Emission Calculations

This project will involve installing a new pneumatic transfer receiver, the WG260 Lift receiver. Table 1 below lists the maximum uncontrolled potential emissions from this unit. Since cyclones efficiency nears 100% for larger sized particulate matter, all PM emitted is assumed to be PM2.5. That is, PM, PM10 and PM2.5 emissions are assumed to be equal. Maximum emissions assumes 8,760 hour of operation annually.

Table 1. Maximum (8,760 hr/year) Uncontrolled Potential Emissions.

Emission Unit	Grain Loading (grain /cf)	Air Flow Rate (cfm)	PM (lb/hr)	PM10 (lb/hr)	PM2.5 (lb/hr)	PM (tpy)	PM10 (tpy)	PM2.5 (tpy)
WG260 Lift Receiver	0.020	682	0.117	0.117	0.117	0.512	0.512	0.512

The process is not expected to operate 8,760 hours per year. Realistically, it will operate closer to 7,200 hours per year (300 days/year). Table 2 below shows the expected emissions from the receiver operating 7,200 hours/year. It uses the same assumption that PM, PM10 and PM2.5 emissions are equal.

Table 2. Average (7,200 hr/year) Actual Expected Emissions.

Emission Unit	Grain Loading (grain /cf)	Air Flow Rate (cfm)	PM (lb/hr)	PM10 (lb/hr)	PM2.5 (lb/hr)	PM (tpy)	PM10 (tpy)	PM2.5 (tpy)
WG260 Lift Receiver	0.020	682	0.117	0.117	0.117	0.421	0.421	0.421

Source Information

1. Source Name: Bunge North America, Inc.
2. Project Name: Coarse Whole Grain Transfer
3. Source ID #: (if applicable) 183020ABT
4. Contact Name: Jim Burris
5. Contact Phone #: 314-292-2937

Fee Determination

6. The boxes below are automatically calculated.

Section 1 Subtotal $0.00 + Section 2, 3 or 4 Subtotal $4,000.00 = $4,000.00 Grand Total

Section 1: Status of Source/Purpose of Submittal

7. Your application will fall under only one of the following five categories described below. Check the box that applies. Proceed to applicable sections. For purposes of this form:

- **Major Source** is a source that is required to obtain a CAAPP permit.
- **Synthetic Minor Source** is a source that has taken limits on potential to emit in a permit to avoid CAAPP permit requirements (e.g.,FESOP).
- **Non-Major Source** is a source that is not a major or synthetic minor source.

☑ Existing source without status change or with status change from synthetic minor to major source or vice versa. Proceed to Section 2.

☐ Existing non-major source that will become synthetic minor to major source. Proceed to Section 4.

☐ New major or synthetic minor source. Proceed to Section 4.

☐ New non-major source. Proceed to Section 3.

☐ AGENCY ERROR. If this is a timely request to correct an issued permit that involves only an agency error and if the request is received within the deadline for a permit appeal to the Pollution Control Board. Skip Sections 2, 3 and 4. Proceed directly to Section 5.

$0.00 Section 1 Subtotal

This agency is authorized to require and you must disclose this information under 415 ILCS 5/39. Failure to do so could result in the application being denied and penalties under 415 ILCS 5 ET SEQ. It is not necessary to use this form in providing this information. This form has been approved by the forms management center.

Section 2: Special Case Filing Fee

8. **Filing Fee**. If the application only addresses one or more of the following, check the appropriate boxes, skip Sections 3 and 4 and proceed directly to Section 5. Otherwise, proceed to Section 3 or 4 as appropriate.

Addition or replacement of control devices on permitted units.

Pilot projects/trial burns by a permitted unit

Land remediation projects

Revisions related to methodology or timing for emission testing

Minor administrative-type change to a permit

Section 3: Fees for Current or Projected Non-Major Sources

9.	This application consists of a single new emission unit or no more than two modified emission units. ($500 fee)	9. _____
10.	This application consists of more than one new emission unit or more than two modified units. ($1,000 fee)	10. _____
11.	This application consists of a new source or emission unit subject to Section 39.2 of the Act (i.e., Local Siting Review), a commercial incinerator or a municipal waste, hazardous waste, or waste tire incinerator; a commercial power generator; or an emission unit designated as a complex source by agency rulemaking. ($15,000 fee)	11. _____
12.	A public hearing is held (see instructions). ($10,000 fee)	12. _____
13.	Section 3 subtotal. (lines 9 through 12 - entered on page 1)	13. $0.00

Section 4: Fees for Current or Projected Major or Synthetic Minor Sources

Application contains modified emission units only	14. For the first modified emission unit, enter $2,000.	
	15. Number of additional modified emission units = x $1,000.	15. $0.00
	16. Line 14 plus line 15, or $5,000, whichever is less.	16. $0.00
Application contains new and/or modified emission units	17. For the first new emission unit, enter $4,000.	17. $4,000.00
	18. Number of additional new and/or modified emission units = 0 x $1,000.	18. $0.00
	19. Line 17 plus line 18, or $10,000, whichever is less.	19. $4,000.00
Application contains netting exercise	20. Number of individual pollutants that rely on a netting exercise or contemporaneous emissions decrease to avoid application of PSD or nonattainment area NSR = _____ x $3,000.	20. $0.00
Additional Supplemental Fees	21. If the new source or emission unit is subject to Section 39.2 of the Act (i.e. siting); a commercial incinerator or other municipal waste, hazardous waste, or waste tire incinerator; a commercial power generator; or one or more other emission units designated as a complex source by Agency rulemaking, enter $25,000.	21. _____
	22. If the source is a new major source subject to PSD, enter $12,000.	22. _____
	23. If the project is a major modification subject to PSD, enter $6,000.	23. _____
	24. If this is a new major source subject to nonattainment area (NAA) NSR, enter $20,000.	24. _____
	25. If this is a major modification subject to NAA NSR, enter $12,000.	25. _____
	26. If the application involves a determination of MACT for a pollutant and the project is not subject to BACT or LAER for the related pollutant under PSD or NSR (e.g., VOM for organic HAP), enter $5,000 per unit for which a determination is requested or otherwise required. _____ x $5,000.	26. $0.00
	27. If a public hearing is held (see instructions), enter $10,000.	27. _____
28. Section 4 subtotal (line 16 and lines 19 through 28) to be entered on page1		28. $4,000.00

Section 5: Certification

NOTE: Applications without a signed certification will be deemed incomplete.

29. I certify under penalty of law that, based on information and belief formed after reasonable inquiry, the information contained in this fee application form is true, accurate and complete.

Construction Permit Application For a FESOP Source (FORM APC628)

For Illinois EPA use only	
BOA ID No.:	183020ABT
Application No.:	16D 30026
Date Received:	3-15-16

This form is to be used to supply information to obtain a construction permit for a proposed project involving a Federally Enforceable State Operating Permit (FESOP) or Synthetic Minor source, including construction of a new FESOP source. Other necessary information must accompany this form as discussed in the "General Instructions For Permit Applications," Form APC-201.

Proposed Project

1. Working Name of Proposed Project:
   Coarse Whole Grain Transfer
2. Is the project occurring at a source that already has a permit from the Bureau of Air (BOA)?
   ☐ No ☒ Yes If Yes, provide BOA ID Number: 183020ABT
3. Does this application request a revision to an existing construction permit issued by the BOA?
   ☒ No ☐ Yes If Yes, provide Permit Number:
4. Does this application request that the new/modified emission units be incorporated into an existing FESOP issued by the BOA?
   ☐ No ☒ Yes If Yes, provide Permit Number: Not Yet Issued

Source Information

5. Source name:*
   Bunge North America, Inc.
6. Source street address:*
   321 E. North Street

7. City:	8. County:	9. Zip code:
Danville	Vermillion	61832

ONLY COMPLETE THE FOLLOWING FOR A SOURCE WITHOUT AN ID NUMBER.

10. Is the source located within city limits? ☐ Yes ☐ No
    If no, provide Township Name:

11. Description of source and product(s) produced:	12. Primary Classification Code of source: SIC: ____ or NAICS: ____
13. Latitude (DD:MM:SS.SSSS):	14. Longitude (DD:MM:SS.SSSS):

* If this information different than previous information, then complete a new Form 200-CAAPP to change the source name in initial FESOP application for the source or Form APC-620 for Air Permit Name and/or Ownership Change if the FESOP has been previously issued.

Applicant Information

15. Who is the applicant?	16. All correspondence to: (check one)
☒ Owner ☐ Operator	☐ Owner ☐ Operator ☒ Source
17. Applicant's FEIN:	18. Attention name and/or title for written correspondence:

Review Of Contents of the Application		
36. Is the emission unit covered by this application already constructed? If "yes", provide the date construction was completed: Note: The Illinois EPA is unable to issue a construction permit for a emission unit that has already been constructed.	☐ Yes	☒ No
37. Does the application include a narrative description of the proposed project?	☒ Yes	☐ No
38. Does the application contain a list or summary that clearly identifies the emission units and air pollution control equipment that are part of the project?	☒ Yes	☐ No
39. Does the application include process flow diagram(s) for the project showing new and modified emission units and control equipment and related existing equipment and their relationships?	☒ Yes	☐ No
40. If the project is at a source that has not previously received a permit from the BOA, does the application include a source description, plot plan and site map?	☒ Yes	☐ No

Review Of Contents of the Application (continued)	
41. Does the application include relevant information for the proposed project as requested on Illinois EPA, BOA application forms (or otherwise contain all the relevant information)?	☒ Yes ☐ No
42. Does the application identify and address all applicable or potentially applicable emissions standards, including: a. State emission standards (35 IAC Chapter I, Subtitle B); b. Federal New Source Performance Standards (40 CFR Part 60); c. Federal standards for HAPs (40 CFR Parts 61 and 63)?	☒ Yes ☐ No
43. Does the application address whether the proposed project or the source could be a major project for Prevention of Significant Deterioration (PSD), 40 CFR 52.21?	☐ Yes ☐ No ☒ N/A
44. Does the application address for which pollutant(s) the proposed project or the source could be a major project for PSD, 40 CFR 52.21?	☐ Yes ☐ No ☒ N/A
45. Does the application address whether the proposed project or the source could be a major project for "Nonattainment New Source Review," (NA NSR), 35 IAC Part 203?	☐ Yes ☐ No ☒ N/A
46. Does the application address for which pollutant(s) the proposed project or the source could be a major project for NA NSR, 35 IAC Part 203?	☐ Yes ☐ No ☒ N/A
47. Does the application address whether the proposed project or the source could potentially be subject to federal Maximum Achievable Control Technology (MACT) standard under 40 CFR Part 63 for Hazardous Air Pollutants (HAP) and identify the standard that could be applicable?	☐ Yes ☐ No ☒ N/A* * Source not major ☒ Project not major ☐
48. Does the application identify the HAP(s) from the proposed project or the source that would trigger the applicability of a MACT standard under 40 CFR Part 63?	☐ Yes ☐ No ☒ N/A
49. Does the application include a summary of the current and the future potential emissions of the source after the proposed project has been completed for each criteria air pollutant and/or HAP (tons/year)?	☐ Yes ☐ No ☒ N/A* * Applicability of PSD, NA NSR or 40 CFR 63 not applicable to the source's emissions.
50. Does the application include a summary of the requested permitted annual emissions of the proposed project for the new and modified emission units (tons/year)?	☒ Yes ☐ No ☐ N/A* * Project does not involve an increase in emissions from new or modified emission units.
51. Does the application include a summary of the requested permitted production, throughput, fuel, or raw material usage limits that correspond to the annual emissions limits of the proposed project for the new and modified emission units?	☒ Yes ☐ No ☐ N/A* * Project does not involve an increase in emissions from new or modified emission units.
52. Does the application include sample calculations or methodology for the emission estimations and the requested emission limits?	☒ Yes ☐ No
53. Does the application address the relationships with and implications of the proposed project for the source's FESOP?	☐ Yes ☐ No ☒ N/A* *FESOP not yet issued.
54. If the application contains information that is considered a TRADE SECRET, has such information been properly marked and claimed and other requirements to perfect such a claim been satisfied in accordance with 35 IAC Part 130? Note: *Claimed information will not be legally protected from disclosure to the public if it is not properly claimed or does not qualify as trade secret information.	☐ Yes ☐ No ☒ N/A* * No information in the application is claimed to be a TRADE SECRET

Review Of Contents of the Application (continued)		
55. If the source is located in a county other than Cook County, are two separate copies of this application being submitted?	☒ Yes	☐ No
56. If the source is located in Cook County, are three separate copies of this application being submitted?	☒ Yes	☐ No
57. Does the application include a completed "FEE DETERMINATION FOR CONSTRUCTION PERMIT APPLICATION," Form 197-FEE, for the emission units and control equipment for which a permit for construction or modification is being sought?	☒ Yes	☐ No
58. Does the application include a check in the proper amount for payment of the Construction permit fee?	☒ Yes	☐ No

Note: Answering "No" to Items 36 through 58 may result in the application being deemed incomplete.

Signature Block

Pursuant to 35 IAC 201.159, all applications and supplements thereto shall be signed by the owner and operator of the source, or their authorized agent, and shall be accompanied by evidence of authority to sign the application. Applications without a signed certification will be deemed incomplete.

59. Authorized Signature:

I certify under penalty of law that, based on information and belief formed after reasonable inquiry, the statements and information contained in this application are true, accurate and complete and that I am a responsible official for the source, as defined by Section 39.5(1) of the Environmental Protection Act. In addition, the technical contact person identified above is authorized to submit (by hard copy and/or by electronic copy) any supplemental information related to this application that may be requested by the Illinois EPA.

* DATA AND INFORMATION PROCESS EMISSION SOURCE	

* THIS INFORMATION FORM IS TO BE COMPLETED FOR AN EMISSION SOURCE OTHER THAN A FUEL COMBUSTION EMISSION SOURCE OR AN INCINERATOR. A FUEL COMBUSTION EMISSION SOURCE IS A FURNACE, BOILER, OR SIMILAR EQUIPMENT USED PRIMARILY FOR PRODUCING HEAT OR POWER BY INDIRECT HEAT TRANSFER. AN INCINERATOR IS AN APPARATUS IN WHICH REFUSE IS BURNED.

1. NAME OF PLANT OWNER: Bunge North America	2. NAME OF CORPORATE DIVISION OR PLANT (IF DIFFERENT FROM OWNER):
3. STREET ADDRESS OF EMISSION SOURCE: 321 E. North Street	4. CITY OF EMISSION SOURCE: Danville

GENERAL INFORMATION		
5. NAME OF PROCESS: Coarse Whole Grain Transfer	6. NAME OF EMISSION SOURCE EQUIPMENT: WG260 Lift Receiver	
7. EMISSION SOURCE EQUIPMENT MANUFACTURER:	8. MODEL NUMBER:	9. SERIAL NUMBER: NA
10. FLOW DIAGRAM DESIGNATION(S) OF EMISSION SOURCE: WG260 Lift Receiver		
11. IDENTITY(S) OF ANY SIMILAR SOURCE(S) AT THE PLANT OR PREMISES NOT COVERED BY THE FORM (IF THE SOURCE IS COVERED BY ANOTHER APPLICATION, IDENTIFY THE APPLICATION):		
12. AVERAGE OPERATING TIME OF EMISSION SOURCE: 24 HRS/DAY 6 DAYS/WK 50 WKS/YR	13. MAXIMUM OPERATING TIME OF EMISSION SOURCE: 24 HRS/DAY 7 DAYS/WK 52 WKS/YR	
14. PERCENT OF ANNUAL THROUGHPUT: DEC-FEB 25 % MAR-MAY 25 % JUN-AUG 25 % SEPT-NOV 25 %		

INSTRUCTIONS
1. COMPLETE THE ABOVE IDENTIFICATION AND GENERAL INFORMATION SECTION.
2. COMPLETE THE RAW MATERIAL, PRODUCT, WASTE MATERIAL, AND FUEL USAGE SECTIONS FOR THE PARTICULAR SOURCE EQUIPMENT. COMPOSITIONS OF MATERIALS MUST BE SUFFICIENTLY DETAILED TO ALLOW DETERMINATION OF THE NATURE AND QUANTITY OF POTENTIAL EMISSIONS. IN PARTICULAR, THE COMPOSITION OF PAINTS, INKS, ETC., AND ANY SOLVENTS MUST BE FULLY DETAILED.
3. EMISSION AND EXHAUST POINT INFORMATION MUST BE COMPLETED, UNLESS EMISSIONS ARE EXHAUSTED THROUGH AIR POLLUTION CONTROL EQUIPMENT.
4. OPERATION TIME AND CERTAIN OTHER ITEMS REQUIRE BOTH AVERAGE AND MAXIMUM VALUES
5. FOR GENERAL INFORMATION REFER TO "GENERAL INSTRUCTIONS FOR PERMIT APPLICATIONS," APC-201.

DEFINITIONS
AVERAGE - THE VALUE THAT SUMMARIZES OR REPRESENTS THE GENERAL CONDITION OF THE EMISSION SOURCE, OR THE GENERAL STATE OF PRODUCTION OF THE EMISSION SOURCE. SPECIFICALLY: AVERAGE OPERATING TIME - ACTUAL TOTAL HOURS OF OPERATION FOR THE PRECEDING TWELVE MONTH PERIOD. AVERAGE RATE - ACTUAL TOTAL QUANTITY OF "MATERIAL" FOR THE PRECEDING TWELVE MONTH PERIOD, DIVIDED BY THE AVERAGE OPERATING TIME. AVERAGE OPERATION - OPERATION TYPICAL OF THE PRECEDING TWELVE MONTH PERIOD, AS REPRESENTED BY AVERAGE OPERATING TIME AND AVERAGE RATES.
MAXIMUM - THE GREATEST VALUE ATTAINABLE OR ATTAINED FOR THE EMISSION SOURCE, OR THE PERIOD OF GREATEST OR UTMOST PRODUCTION OF THE EMISSION SOURCE. SPECIFICALLY: MAXIMUM OPERATING TIME - GREATEST EXPECTED TOTAL HOURS OF OPERATIONS FOR ANY TWELVE MONTH PERIOD MAXIMUM RATE - GREATEST QUANTITY OF "MATERIAL" EXPECTED PER ANY ONE HOUR OF OPERATION MAXIMUM OPERATION - GREATEST EXPECTED OPERATION, AS REPRESENTED BY MAXIMUM OPERATING TIME AND MAXIMUM RATES.

This Agency is authorized to require this information under Illinois Revised Statutes, 1979, Chapter 111 1/2, Section 1039. Disclosure of this information is required under that Section. Failure to do so may prevent this form from being processed and could result in your application being denied. This form has been approved by the Forms Management Center.

CONSTRUCTION PERMIT

PERMITTEE

Bunge North America, Inc.
Attn: Kenny Head
321 East North Street
Danville, Illinois 61832

Application No.: 16030026 I.D. No.: 183020ABT
Applicant's Designation: Date Received: March 15, 2016
Subject: Lift Receiver for Coarse Whole Grain Transfer
Date Issued: May 19, 2016
Location: 321 East North Street, Danville, Vermilion County

Permit is hereby granted to the above-designated Permittee to CONSTRUCT emission source(s) and/or air pollution control equipment consisting of one (1) pneumatic transfer receiver as described in the above-referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This permit is issued based on the construction of the emission units listed above not constituting a new major source or major modification pursuant to Title I of the Clean Air Act, specifically 40 CFR 52.21, Prevention of Significant Deterioration (PSD). The source has requested that the Illinois EPA establish emission limitations and other appropriate terms and conditions in this permit that limit the emissions of Particulate Matter (PM) and Particulate Matter less than 10 microns (PM_{10}) from the above-listed equipment below the levels that would trigger the applicability of these rules.

b. Operation of the equipment listed above is allowed under this permit until final action is taken on the Federally Enforceable State Operating Permit (FESOP) application for this source.

2a. Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute period shall occur from only one such emission unit located within a 305 meter (1000 foot) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

d. Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

3. In the event that the operation of this emission unit results in an odor nuisance, the Permittee shall take appropriate and necessary actions to minimize odors, including but not limited to, changes in material or installation of controls, in order to eliminate the odor nuisance.

4a. Emissions and operation of the emission units of the flour handling system shall not exceed the following limits:

			Emissions	
Item of Equipment	(scfm)	(gr/dscf)	PM/PM_{10} (Lb/Hr)	(Tons/Yr)
Whole Grain Pneumatic Product Transfer Receiver	682	0.02	0.12	0.53

These limits are based on exhaust air flow rate, grain loading, and information in the application. The limits on PM_{10} also limit the emissions of $PM_{2.5}$.

b. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 months total).

5a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the emission units and air pollution control equipment:

A. Records for periodic inspection of the emission units and pollution control equipment with date, individual performing the inspection, and nature of inspection; and

B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The maximum blower rate in scfm each month for the pneumatic transfer receiver; and

iii. Monthly and annual PM and PM_{10} emissions from the source with supporting calculations (tons/month and tons/year).

b. All records and logs required by this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be available for inspections and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

6a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit, the Permittee shall submit a report to the Illinois EPA's Compliance Section in Springfield, Illinois within 30 days after the exceedance/deviation. The report shall include the emissions released in accordance with the recordkeeping requirements, a copy of the relevant records, and a description of the exceedance or deviation and efforts to reduce emissions and future occurrences.

b. One (1) copy of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Division of Air Pollution Control
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

If you have any questions on this, please call Mike Dragovich at 217/785-1705.

DIVISION OF AIR POLLUTION CONTROL
P. O. BOX 19506
SPRINGFIELD, ILLINOIS 62794-9506

STANDARD CONDITIONS FOR CONSTRUCTION/DEVELOPMENT PERMITS ISSUED BY THE ILLINOIS ENVIRONMENTAL PROTECTION AGENCY

July 1, 1985

The Illinois Environmental Protection Act (Illinois Revised Statutes, Chapter 111-1/2, Section 1039) authorizes the Environmental Protection Agency to impose conditions on permits which it issues.

The following conditions are applicable unless superseded by special condition(s).

1. Unless this permit has been extended or it has been voided by a newly issued permit, this permit will expire one year from the date of issuance, unless a continuous program of construction or development on this project has started by such time.

2. The construction or development covered by this permit shall be done in compliance with applicable provisions of the Illinois Environmental Protection Act, and Regulations adopted by the Illinois Pollution Control Board.

3. There shall be no deviations from the approved plans and specifications unless a written request for modification, along with plans and specifications as required, shall have been submitted to the Agency and a supplemental written permit issued.

4. The Permittee shall allow any duly authorized agent of the Agency upon the presentation of credentials, at reasonable times:

   a. to enter the Permittee's property where actual or potential effluent, emission or noise sources are located or where any activity is to be conducted pursuant to this permit,

   b. to have access to and copy any records required to be kept under the terms and conditions of this permit,

   c. to inspect, including during any hours of operation of equipment constructed or operated under this permit, such equipment and any equipment required to be kept, used, operated, calibrated and maintained under this permit,

   d. to obtain and remove samples of any discharge or emission of pollutants, and

   e. to enter and utilize any photographic, recording, testing, monitoring or other equipment for the purpose of preserving, testing, monitoring, or recording any activity, discharge, or emission authorized by this permit.

5. The issuance of this permit:

   a. shall not be considered as in any manner affecting the title of the premises upon which the permitted facilities are to be located,

   b. does not release the Permittee from any liability for damage to person or property caused by or resulting from the construction, maintenance, or operation of the proposed facilities,

   c. does not release the Permittee from compliance with the other applicable statues and regulations of the United States, of the State of Illinois, or with applicable local laws, ordinances and regulations,

   d. does not take into consideration or attest to the structural stability of any units or parts of the project, and

e. in no manner implies or suggests that the Agency (or its officers, agents or employees) assumes any liability, directly or indirectly, for any loss due to damage, installation, maintenance, or operation of the proposed equipment or facility.

6. a. Unless a joint construction/operation permit has been issued, a permit for operation shall be obtained from the Agency before the equipment covered by this permit is placed into operation.

b. For purposes of shakedown and testing, unless otherwise specified by a special permit condition, the equipment covered under this permit may be operated for a period not to exceed thirty (30) days.

7. The Agency may file a complaint with the Board for modification, suspension or revocation of a permit:

a. upon discovery that the permit application contained misrepresentations, misinformation or false statements or that all relevant facts were not disclosed, or

b. upon finding that any standard or special conditions have been violated, or

c. upon any violations of the Environmental Protection Act or any regulation effective thereunder as a result of the construction or development authorized by this permit.

Re: Construction Permit Application (FESOP Source)
Bunge – Danville Facility
Source ID No. 183020ABT

Dear Sir or Madame:

Please find enclosed two copies of our construction permit application to install a three new emission sources at our facility in Danville, Illinois. After the project is complete a separate application will be submitted to update our FESOP application.

A check for $6,000 is enclosed with this application package. The application package includes the following:

- A project description
- A summary of emission calculations
- A Form 197-FEE, Fee Determination Form
- A Permit Application Fee of $6,000 (Check made payable to Illinois EPA, Division of Air Pollution Control-Permit Section)
- A Form APC628, Construction Permit Application for a FESOP Source,
- Three Form APC220, Emission Source Information (one form for each new emission source), and
- Three process flow diagrams

Please review the enclosed construction permit application. If you have any questions or require any further information please contact Jim Burris at (314) 292-2937 or by email at james.burris@bunge.com.

Sincerely,

Kenny Head
Plant Manager

Bunge North America
Extrusion System Upgrade - Danville

Project Description

Currently the facility has an extrusion system which blends low concentration acid with corn flour or meal and processes it via an extruder to modify the starch. The extrusion pellets are ground to the desired size starch powder and then transferred to storage. The end product is a specialty starch binder which is sold to wallboard fabricators to aid in bonding the paper to the gypsum. This specialty starch binder is called USG. Bunge expects an increase in demand for this product and needs to upgrade the extrusion system by adding a second extrusion line to accommodate to the increase in demand. The project has two parts.

The first part involves making room for the new USG equipment. To do this, two existing PCM hammermills and their four lift line filters will be removed and replaced with a single, new combined PCM hammermill and filter system. The two existing PCM hammermills have throughput capacity of 5,000 lb/hr each (10,000 lb/hr combined) and the new hammermill will have a capacity of 10,000 lb/hr. PCM is another specialty starch product produced at the mill and unrelated to the USG product. There is no increase in throughput. This is essentially a replacement in kind.

The second part involves installing a second USG extrusion line. The second line is designed to have a throughput capacity of 13,000 lb/hr. It will include two new emission sources, a USG hammermill and filter system and a USG extruder pellet transfer collection cyclone.

New and Removed Emission Units – Description and Emission Calculations

As mentioned above this project involves removing four existing emission sources and replacing them with a single emission source to make room for a second USG extrusion line. The four emission sources that will be removed are the four hammermill lift line filters. The new emission source is the new hammermill product collection filter. The four lift filters have an air flow rate of 2,143 cfm each (8,572 cfm total). The new hammermill filter will have an air flow rate of 7,200 cfm.

The new USG line will add two new emission sources, a USG hammermill product collection filter and a USG extruder pellet transfer collection cyclone.

Emissions from this project are summarized in the table below.

Table 1. Maximum (8,760 hr/year) Actual Expected Emissions.

Emission Unit	Emission Unit ID No.	New or Removed	PM (lb/hr)	PM10 (lb/hr)	PM2.5 (lb/hr)	PM (tpy)	PM10 (tpy)	PM2.5 (tpy)

FEE DETERMINATION FOR CONSTRUCTION PERMIT APPLICATION

FOR AGENCY USE ONLY

ID Number: 183 020 ABT
Permit #: 18 05 0016
$ 60000
☑ Complete ☐ Incomplete
Date Complete: 5-10-18
Check Number: 35213287
Account Name: Bunge

This form is to be used to supply fee information that must accompany all construction permit applications. This application must include payment in full to be deemed complete. Make check or money order payable to the Illinois Environmental Protection Agency, Division of Air Pollution Control - Permit Section at the above address. Do NOT send cash. Refer to instructions (197-INST) for assistance.

Source Information

1. Source Name: Bunge North America, Inc.
2. Project Name: Extrusion System Upgrade
3. Source ID #: (if applicable) 183020ABT
4. Contact Name: Jim Burris
5. Contact Phone #: 314 292-2937

Fee Determination

6. The boxes below are automatically calculated.

Section 1 Subtotal $0.00 + Section 2, 3 or 4 Subtotal $6,000.00 = $6,000.00 Grand Total

Section 1: Status of Source/Purpose of Submittal

7. Your application will fall under only one of the following five categories described below. Check the box that applies. Proceed to applicable sections. For purposes of this form:

- **Major Source** is a source that is required to obtain a CAAPP permit.
- **Synthetic Minor Source** is a source that has taken limits on potential to emit in a permit to avoid CAAPP permit requirements (e.g.,FESOP).
- **Non-Major Source** is a source that is not a major or synthetic minor source.

☑ Existing source without status change or with status change from synthetic minor to major source or vice versa. Proceed to Section 2.

☐ Existing non-major source that will become synthetic minor to major source. Proceed to Section 4.

☐ New major or synthetic minor source. Proceed to Section 4.

☐ New non-major source. Proceed to Section 3.

☐ AGENCY ERROR. If this is a timely request to correct an issued permit that involves only an agency error and if the request is received within the deadline for a permit appeal to the Pollution Control Board. Skip Sections 2, 3 and 4. Proceed directly to Section 5.

$0.00
Section 1 Subtotal

This agency is authorized to require and you must disclose this information under 415 ILCS 5/39. Failure to do so could result in the application being denied and penalties under 415 ILCS 5 ET SEQ. It is not necessary to use this form in providing this information. This form has been approved by the forms management center.

Section 2: Special Case Filing Fee

8. **Filing Fee.** If the application only addresses one or more of the following, check the appropriate boxes, skip Sections 3 and 4 and proceed directly to Section 5. Otherwise, proceed to Section 3 or 4 as appropriate.

Addition or replacement of control devices on permitted units.
Pilot projects/trial burns by a permitted unit
Land remediation projects
Revisions related to methodology or timing for emission testing
Minor administrative-type change to a permit

Section 3: Fees for Current or Projected Non-Major Sources

9.	This application consists of a single new emission unit or no more than two modified emission units. ($500 fee)	9.
10.	This application consists of more than one new emission unit or more than two modified units. ($1,000 fee)	10.
11.	This application consists of a new source or emission unit subject to Section 39.2 of the Act (i.e., Local Siting Review); a commercial incinerator or a municipal waste, hazardous waste, or waste tire incinerator; a commercial power generator; or an emission unit designated as a complex source by agency rulemaking. ($15,000 fee)	11.
12.	A public hearing is held (see instructions). ($10,000 fee)	12.
13.	Section 3 subtotal. (lines 9 through 12 - entered on page 1)	13. $0.00

Section 4: Fees for Current or Projected Major or Synthetic Minor Sources

Application contains modified emission units only	14. For the first modified emission unit, enter $2,000.	
	15. Number of additional modified emission units = x $1,000.	15. $0.00
	16. Line 14 plus line 15, or $5,000, whichever is less.	16. $0.00
Application contains new and/or modified emission units	17. For the first new emission unit, enter $4,000.	17. $4,000.00
	18. Number of additional new and/or modified emission units = 2 x $1,000.	18. $2,000.00
	19. Line 17 plus line 18, or $10,000, whichever is less.	19. $6,000.00
Application contains netting exercise	20. Number of individual pollutants that rely on a netting exercise or contemporaneous emissions decrease to avoid application of PSD or nonattainment area NSR = _____ x $3,000.	20. $0.00
Additional Supplemental Fees	21. If the new source or emission unit is subject to Section 39.2 of the Act (i.e. siting); a commercial incinerator or other municipal waste, hazardous waste, or waste tire incinerator; a commercial power generator; or one or more other emission units designated as a complex source by Agency rulemaking, enter $25,000.	21.
	22. If the source is a new major source subject to PSD, enter $12,000.	22.
	23. If the project is a major modification subject to PSD, enter $6,000.	23.
	24. If this is a new major source subject to nonattainment area (NAA) NSR, enter $20,000.	24.
	25. If this is a major modification subject to NAA NSR, enter $12,000.	25.
	26. If the application involves a determination of MACT for a pollutant and the project is not subject to BACT or LAER for the related pollutant under PSD or NSR (e.g., VOM for organic HAP), enter $5,000 per unit for which a determination is requested or otherwise required. _____ x $5,000.	26. $0.00
	27. If a public hearing is held (see instructions), enter $10,000.	27.
28. Section 4 subtotal (line 16 and lines 19 through 28) to be entered on page1		28. $6,000.00

Section 5: Certification

NOTE: Applications without a signed certification will be deemed incomplete.

29. I certify under penalty of law that, based on information and belief formed after reasonable inquiry, the information contained in this fee application form is true, accurate and complete.

Construction Permit Application For a FESOP Source (FORM APC628)

For Illinois EPA Use only
BOA ID No.: 183020ABT
Application No.:
Date Received: 5-14-18

This form is to be used to supply information to obtain a construction permit for a proposed project involving a Federally Enforceable State Operating Permit (FESOP) or Synthetic Minor source, including construction of a new FESOP source. Other necessary information must accompany this form as discussed in the "General Instructions For Permit Applications," Form APC-201.

Proposed Project

1. Working Name of Proposed Project:
   Extrusion System Upgrade
2. Is the project occurring at a source that already has a permit from the Bureau of Air (BOA)?
   ☐ No ☒ Yes If Yes, provide BOA ID Number: 183020ABT
3. Does this application request a revision to an existing construction permit issued by the BOA?
   ☒ No ☐ Yes If Yes, provide Permit Number: __ __ __ __ __ __ __ __
4. Does this application request that the new/modified emission units be incorporated into an existing FESOP issued by the BOA?
   ☐ No ☒ Yes If Yes, provide Permit Number: Not Yet Issued

Source Information

5. Source name:*
   Bunge North America, Inc.
6. Source street address:*
   321 E. North Street

7. City:	8. County:	9. Zip code:
Danville	Vermillion	61832

ONLY COMPLETE THE FOLLOWING FOR A SOURCE WITHOUT AN ID NUMBER.

10. Is the source located within city limits? ☐ Yes ☐ No
    If no, provide Township Name:

11. Description of source and product(s) produced:	12. Primary Classification Code of source: SIC: __ __ __ __ or NAICS: __ __ __ __ __ __
13. Latitude (DD:MM:SS.SSSS):	14. Longitude (DD:MM:SS.SSSS):

* If this information different than previous information, then complete a new Form 200-CAAPP to change the source name in initial FESOP application for the source or Form APC-620 for Air Permit Name and/or Ownership Change if the FESOP has been previously issued.

Applicant Information

15. Who is the applicant? ☒ Owner ☐ Operator	16. All correspondence to: (check one) ☐ Owner ☐ Operator ☒ Source
17. Applicant's FEIN: 37-0614689	18. Attention name and/or title for written correspondence: Kenny Head

This Agency is authorized to require and you must disclose this information under 415 ILCS 5/39. Failure to do so could result in the application being denied and penalties under 415 ILCS 5 et seq. It is not necessary to use this form in providing this information. This form has been approved by the forms management center.

Owner Information*		
19. Name: Bunge North America, Inc.		
20. Address: 11720 Borman Drive		
21. City: St Louis	22. State: MO	23. Zip code: 63146

* If this information different than previous information, then complete Form 272-CAAPP for a Request for Ownership Change for CAAPP Permit for an initial FESOP application for the source or Form APC-620 for Air Permit Name and/or Ownership Change if the FESOP has been previously issued.

Operator Information (If Different from Owner)*		
24. Name Bunge North America, Inc.		
25. Address: 321 E. North Street		
26. City: Danville	27. State: IL	28. Zip code: 61832

* If this information different than previous information, then complete a new Form 200-CAAPP to change the source name in initial FESOP application for the source or Form APC-620 for Air Permit Name and/or Ownership Change if the FESOP has been previously issued.

Technical Contacts for Application	
29. Preferred technical contact: (check one) ☒ Applicant's contact ☐ Consultant	
30. Applicant's technical contact person for application: Jim Burris	
31. Contact person's telephone number 314 292-2937	32. Contact person's email address: james.burris@bunge.com
33. Applicant's consultant for application:	
34. Consultant's telephone number:	35. Consultant's email address:

Review Of Contents of the Application		
36. Is the emission unit covered by this application already constructed? If "yes", provide the date construction was completed: Note: The Illinois EPA is unable to issue a construction permit for a emission unit that has already been constructed.	☐ Yes	☒ No
37. Does the application include a narrative description of the proposed project?	☒ Yes	☐ No
38. Does the application contain a list or summary that clearly identifies the emission units and air pollution control equipment that are part of the project?	☒ Yes	☐ No
39. Does the application include process flow diagram(s) for the project showing new and modified emission units and control equipment and related existing equipment and their relationships?	☒ Yes	☐ No
40. If the project is at a source that has not previously received a permit from the BOA, does the application include a source description, plot plan and site map?	☒ Yes	☐ No

Review Of Contents of the Application (continued)	
41. Does the application include relevant information for the proposed project as requested on Illinois EPA, BOA application forms (or otherwise contain all the relevant information)?	☒ Yes ☐ No
42. Does the application identify and address all applicable or potentially applicable emissions standards, including: a. State emission standards (35 IAC Chapter I, Subtitle B); b. Federal New Source Performance Standards (40 CFR Part 60); c. Federal standards for HAPs (40 CFR Parts 61 and 63)?	☒ Yes ☐ No
43. Does the application address whether the proposed project or the source could be a major project for Prevention of Significant Deterioration (PSD), 40 CFR 52.21?	☐ Yes ☐ No ☒ N/A
44. Does the application address for which pollutant(s) the proposed project or the source could be a major project for PSD, 40 CFR 52.21?	☐ Yes ☐ No ☒ N/A
45. Does the application address whether the proposed project or the source could be a major project for "Nonattainment New Source Review," (NA NSR), 35 IAC Part 203?	☐ Yes ☐ No ☒ N/A
46. Does the application address for which pollutant(s) the proposed project or the source could be a major project for NA NSR, 35 IAC Part 203?	☐ Yes ☐ No ☒ N/A
47. Does the application address whether the proposed project or the source could potentially be subject to federal Maximum Achievable Control Technology (MACT) standard under 40 CFR Part 63 for Hazardous Air Pollutants (HAP) and identify the standard that could be applicable?	☐ Yes ☐ No ☒ N/A* * Source not major ☒ Project not major ☐
48. Does the application identify the HAP(s) from the proposed project or the source that would trigger the applicability of a MACT standard under 40 CFR Part 63?	☐ Yes ☐ No ☒ N/A
49. Does the application include a summary of the current and the future potential emissions of the source after the proposed project has been completed for each criteria air pollutant and/or HAP (tons/year)?	☐ Yes ☐ No ☒ N/A* * Applicability of PSD, NA NSR or 40 CFR 63 not applicable to the source's emissions.
50. Does the application include a summary of the requested permitted annual emissions of the proposed project for the new and modified emission units (tons/year)?	☒ Yes ☐ No ☐ N/A* * Project does not involve an increase in emissions from new or modified emission units.
51. Does the application include a summary of the requested permitted production, throughput, fuel, or raw material usage limits that correspond to the annual emissions limits of the proposed project for the new and modified emission units?	☒ Yes ☐ No ☐ N/A* * Project does not involve an increase in emissions from new or modified emission units.
52. Does the application include sample calculations or methodology for the emission estimations and the requested emission limits?	☒ Yes ☐ No
53. Does the application address the relationships with and implications of the proposed project for the source's FESOP?	☐ Yes ☐ No ☒ N/A* *FESOP not yet issued.
54. If the application contains information that is considered a TRADE SECRET, has such information been properly marked and claimed and other requirements to perfect such a claim been satisfied in accordance with 35 IAC Part 130? Note: "Claimed information will not be legally protected from disclosure to the public if it is not properly claimed or does not qualify as trade secret information.	☐ Yes ☐ No ☒ N/A* * No information in the application is claimed to be a TRADE SECRET

Review Of Contents of the Application (continued)		
55. If the source is located in a county other than Cook County, are two separate copies of this application being submitted?	☒ Yes	☐ No
56. If the source is located in Cook County, are three separate copies of this application being submitted?	☒ Yes	☐ No
57. Does the application include a completed "FEE DETERMINATION FOR CONSTRUCTION PERMIT APPLICATION," Form 197-FEE, for the emission units and control equipment for which a permit for construction or modification is being sought?	☒ Yes	☐ No
58. Does the application include a check in the proper amount for payment of the Construction permit fee?	☒ Yes	☐ No

Note: Answering "No" to Items 36 through 58 may result in the application being deemed incomplete.

Signature Block

Pursuant to 35 IAC 201.159, all applications and supplements thereto shall be signed by the owner and operator of the source, or their authorized agent, and shall be accompanied by evidence of authority to sign the application. Applications without a signed certification will be deemed incomplete.

59. Authorized Signature:

I certify under penalty of law that, based on information and belief formed after reasonable inquiry, the statements and information contained in this application are true, accurate and complete and that I am a responsible official for the source, as defined by Section 39.5(1) of the Environmental Protection Act. In addition, the technical contact person identified above is authorized to submit (by hard copy and/or by electronic copy) any supplemental information related to this application that may be requested by the Illinois EPA.

* DATA AND INFORMATION PROCESS EMISSION SOURCE	

* THIS INFORMATION FORM IS TO BE COMPLETED FOR AN EMISSION SOURCE OTHER THAN A FUEL COMBUSTION EMISSION SOURCE OR AN INCINERATOR. A FUEL COMBUSTION EMISSION SOURCE IS A FURNACE, BOILER, OR SIMILAR EQUIPMENT USED PRIMARILY FOR PRODUCING HEAT OR POWER BY INDIRECT HEAT TRANSFER. AN INCINERATOR IS AN APPARATUS IN WHICH REFUSE IS BURNED

1. NAME OF PLANT OWNER Bunge North America, Inc.	2. NAME OF CORPORATE DIVISION OR PLANT (IF DIFFERENT FROM OWNER)
3. STREET ADDRESS OF EMISSION SOURCE: 321 E. North Street	4. CITY OF EMISSION SOURCE: Danville

GENERAL INFORMATION		
5. NAME OF PROCESS: Extrusion Process	6. NAME OF EMISSION SOURCE EQUIPMENT: PCM Hammermill Collection Filter	
7. EMISSION SOURCE EQUIPMENT MANUFACTURER: KICE	8. MODEL NUMBER VS64-8	9. SERIAL NUMBER NA
10. FLOW DIAGRAM DESIGNATION(S) OF EMISSION SOURCE: KICE VS64-8 03:11		
11. IDENTITY(S) OF ANY SIMILAR SOURCE(S) AT THE PLANT OR PREMISES NOT COVERED BY THE FORM (IF THE SOURCE IS COVERED BY ANOTHER APPLICATION, IDENTIFY THE APPLICATION):		
12. AVERAGE OPERATING TIME OF EMISSION SOURCE: 24 HRS/DAY 6.5 DAYS/WK 52 WKS/YR	13. MAXIMUM OPERATING TIME OF EMISSION SOURCE: 24 HRS/DAY 7 DAYS/WK 52 WKS/YR	
14. PERCENT OF ANNUAL THROUGHPUT: DEC-FEB 25 % MAR-MAY 25 % JUN-AUG 25 % SEPT-NOV 25 %		

INSTRUCTIONS
1. COMPLETE THE ABOVE IDENTIFICATION AND GENERAL INFORMATION SECTION.
2. COMPLETE THE RAW MATERIAL, PRODUCT, WASTE MATERIAL, AND FUEL USAGE SECTIONS FOR THE PARTICULAR SOURCE EQUIPMENT. COMPOSITIONS OF MATERIALS MUST BE SUFFICIENTLY DETAILED TO ALLOW DETERMINATION OF THE NATURE AND QUANTITY OF POTENTIAL EMISSIONS. IN PARTICULAR, THE COMPOSITION OF PAINTS, INKS, ETC., AND ANY SOLVENTS MUST BE FULLY DETAILED.
3. EMISSION AND EXHAUST POINT INFORMATION MUST BE COMPLETED, UNLESS EMISSIONS ARE EXHAUSTED THROUGH AIR POLLUTION CONTROL EQUIPMENT.
4. OPERATION TIME AND CERTAIN OTHER ITEMS REQUIRE BOTH AVERAGE AND MAXIMUM VALUES
5. FOR GENERAL INFORMATION REFER TO "GENERAL INSTRUCTIONS FOR PERMIT APPLICATIONS," APC-201

DEFINITIONS
AVERAGE - THE VALUE THAT SUMMARIZES OR REPRESENTS THE GENERAL CONDITION OF THE EMISSION SOURCE, OR THE GENERAL STATE OF PRODUCTION OF THE EMISSION SOURCE. SPECIFICALLY: AVERAGE OPERATING TIME - ACTUAL TOTAL HOURS OF OPERATION FOR THE PRECEDING TWELVE MONTH PERIOD AVERAGE RATE - ACTUAL TOTAL QUANTITY OF "MATERIAL" FOR THE PRECEDING TWELVE MONTH PERIOD, DIVIDED BY THE AVERAGE OPERATING TIME. AVERAGE OPERATION - OPERATION TYPICAL OF THE PRECEDING TWELVE MONTH PERIOD, AS REPRESENTED BY AVERAGE OPERATING TIME AND AVERAGE RATES.
MAXIMUM - THE GREATEST VALUE ATTAINABLE OR ATTAINED FOR THE EMISSION SOURCE, OR THE PERIOD OF GREATEST OR UTMOST PRODUCTION OF THE EMISSION SOURCE. SPECIFICALLY: MAXIMUM OPERATING TIME - GREATEST EXPECTED TOTAL HOURS OF OPERATIONS FOR ANY TWELVE MONTH PERIOD. MAXIMUM RATE - GREATEST QUANTITY OF "MATERIAL" EXPECTED PER ANY ONE HOUR OF OPERATION. MAXIMUM OPERATION - GREATEST EXPECTED OPERATION, AS REPRESENTED BY MAXIMUM OPERATING TIME AND MAXIMUM RATES

This Agency is authorized to require this information under Illinois Revised Statutes, 1979, Chapter 111 1/2, Section 1039. Disclosure of this information is required under that Section. Failure to do so may prevent this form from being processed and could result in your application being denied. This form has been approved by the Forms Management Center.

RAW MATERIAL INFORMATION		
NAME OF RAW MATERIAL	AVERAGE RATE PER IDENTICAL SOURCE	MAXIMUM RATE PER IDENTICAL SOURCE
20a. Corn Flour/Meal	b. 10,000 LB/HR	c. 10,000 LB/HR
21a.	b. LB/HR	c. LB/HR
22a.	b. LB/HR	c. LB/HR
23a.	b. LB/HR	c. LB/HR

Subject: RE: [External] Re: Bunge North America Inc.

Jim,

We can move forward to issue the construction permit #18050016 within the original 90-day (8/12/18), but we will required the submittal of a fugitive dust control plan before we move forward with the FESOP #96020027, which that is in the process of developing a draft.
Please provide me any comments you may have on the draft construction permit, so as to complete the review and issuance of that construction permit.

Thank you.

German,

Thank you for sending a draft copy of the construction permit. I will review it and send you my comments.

Regarding the request for an extension of time necessary to submit and review a fugitive dust plan, I talked to the plant and they are ready to install the equipment and would rather not undergo a 30 day delay. If it is important for the plant to submit a fugitive dust plan I suggest making it a condition of the permit. I can add suggested language to my comments on the draft permit.

Hi James,

First of, I would like to apologize for the late notification of the need that Bunge N. A. , ID #183020ABY submit a fugitive dust plant. This facility is located in an Environmental Justice area, and IEPA upper-management has adopted this procedure that a fugitive dust plan, be submitted, it need to be reviewed, prior to issuing a construction permit for such sources, either in an E.J area and/or subject the rule (35 Ill. Adm. Code 212.302 - Fugitive particulate matter geographic areas of application.) On that note, I also will be needing an extension of the 90th day review (8/12/18), until 9/12/18, the review of such fugitive dust plant required about 30 days. And lastly, please find attached a draft of the construction permit #18050016, for your review. Please note, that the sooner a fugitive dust plant is received, it can be review and permit can be issued.

Thank you for your understanding.

CONSTRUCTION PERMIT

PERMITTEE

Bunge North America, Inc.
Attn: Kenny Head
321 East North Street
Danville, Illinois 61832

Application No.: 18050016 I.D. No.: 183020ABT
Applicant's Designation: Date Received: May 14, 2018
Subject: Extrusion System Upgrade
Date Issued: August 8, 2018
Location: 321 East North Street, Danville, Vermilion County

Permit is hereby granted to the above-designated Permittee to CONSTRUCT emission source(s) and/or air pollution control equipment consisting of one (1) USG Extrusion Line comprised of one (1) USG Hammermill and Filter System and one (1) USG Extruder Pellet Transfer Collection Cyclone and the replacement of two (2) existing PCM Hammermills and associated #2, #3, #4, and #5 Filters with one (1) PCM Hammermill and Filter System as described in the above-referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This permit is issued based on the construction of the USG Hammermill and Filter System, USG Extruder Pellet Transfer Collection Cyclone, and PCM Hammermill and Filter System not constituting a new major source or major modification pursuant to Title I of the Clean Air Act, specifically 40 CFR 52.21, Prevention of Significant Deterioration (PSD). The source has requested that the Illinois EPA establish emission limitations and other appropriate terms and conditions in this permit that limit the emissions of Particulate Matter (PM) and Particulate Matter less than 10 microns (PM_{10}) from the above-listed equipment below the levels that would trigger the applicability of these rules.

b. Operation of the equipment listed above is allowed under this permit until final action is taken on the Federally Enforceable State Operating Permit (FESOP) application for this source.

2a. The USG Hammermill and Filter System, USG Extruder Pellet Transfer Collection Cyclone, and PCM Hammermill and Filter System are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions). Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a

period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute period shall occur from only one such emission unit located within a 305 m (1000 ft) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. This source is subject to 35 Ill. Adm. Code Part 212 Subpart K (Fugitive Particulate Matter). Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

d. The USG Hammermill and Filter System, USG Extruder Pellet Transfer Collection Cyclone, and PCM Hammermill and Filter System are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

e. Pursuant to 35 Ill. Adm. Code 212.321(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.321(c) shall be determined by using the equation:

$$E = A(P)^B$$

where:

P = Process weight rate; and
E = Allowable emission rate; and,

i. Up to process weight rates of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.214	2.54
B	0.534	0.534

ii. For process weight rate greater than or equal to 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	11.42	24.8
B	0.16	0.16

f. Pursuant to 35 Ill. Adm. Code 212.321(c), Limits for Process Emission Units for Which Construction of Modification Commenced On or After April 14, 1972:

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lbs/hr
0.05	0.25	0.05	0.55
0.1	0.29	0.10	0.77
0.2	0.42	0.20	1.10
0.3	0.64	0.30	1.35
0.4	0.74	0.40	1.58
0.5	0.84	0.50	1.75
0.7	1.00	0.75	2.40
0.9	1.15	1.00	2.60
1.8	1.66	2.00	3.70
2.7	2.1	3.00	4.60
3.6	2.4	4.00	5.35
4.5	2.7	5.00	6.00
9.	3.9	10.00	8.70
13.	4.8	15.00	10.80
18.	5.7	20.00	12.50
23.	6.5	25.00	14.00
27.	7.1	30.00	15.60
32.	7.7	35.00	17.00
36.	8.2	40.00	18.20
41.	8.8	45.00	19.20
45.	9.3	50.00	20.50
90.	13.4	100.00	29.50
140.	17.0	150.00	37.00
180.	19.4	200.00	43.00
230.	22.	250.00	48.50
270.	24.	300.00	53.00
320.	26.	350.00	58.00
360.	28.	400.00	62.00
408.	30.1	450.00	66.00
454.	30.4	500.00	67.00

where:

P = Process weight rate in metric or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

3. This permit is issued based on the USG Hammermill and Filter System, USG Extruder Pellet Transfer Collection Cyclone, and PCM Hammermill and Filter System at this source not being subject to the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Area Sources: Prepared Feeds Manufacturing, 40 CFR 63 Subpart DDDDDDD because these emission units do not use a material containing chromium or a material containing manganese and are not primarily engaged in manufacturing of animal feed.

4. Pursuant to 35 Ill. Adm. Code 212.314, 35 Ill. Adm. Code 212.301 shall not apply and spraying pursuant to 35 Ill. Adm. Code 212.304 through 212.310 and 35 Ill. Adm. Code 212.312 shall not be required when the wind speed is greater than 40.2 km/hr (25 mph). Determination of wind speed for the purposes of 35 Ill. Adm. Code 212.314 shall be by a one-hour average or hourly recorded value at the nearest official station

of the U.S. Weather Bureau or by wind speed instruments operated on the site. In cases where the duration of operations subject to 35 Ill. Adm. Code 212.314 is less than one hour, wind speed may be averaged over the duration of the operations on the basis of on-site wind speed instrument measurements.

5. All unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods

6a. In the event that the operation of this emission unit results in an odor nuisance, the Permittee shall take appropriate and necessary actions to minimize odors, including but not limited to, changes in material or installation of controls, in order to eliminate the odor nuisance.

b. The filter systems shall be in operation at all times when the associated USG Hammermill and PCM Hammermill are in operation and emitting air contaminants.

c. The Permittee shall, in accordance with the manufacturer(s) and/or vendor(s) recommendations, perform periodic maintenance on the filter systems associated with the USG Hammermill and PCM Hammermill such that the filters are kept in proper working condition and not cause a violation of the Illinois Environmental Protection Act or regulations promulgated therein.

7a. Emissions from and operation of the emission units of the flour handling system shall not exceed the following limits:

Item of Equipment	(scfm)	(gr/dscf)	PM/PM_{10} Emissions (b/Hr)	(Tons/Yr)
PCM Hammermill	7,200	0.002	0.12	0.54
USG Hammermill	7,200	0.002	0.12	0.54
USG Extruder Transfer Collection Cyclone	4,000	0.02	0.69	3.00
		Total:	0.77	3.44

These limits are based on the maximum exhaust air flow rate, maximum grain loading, and 8,760 hours/year of operation.

b. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 months total).

8a. Pursuant to 35 Ill. Adm. Code 201.282, every emission source or air pollution control equipment shall be subject to the following testing requirements for the purpose of determining the nature and quantities of specified air contaminant emissions and for the purpose of determining ground level and ambient air concentrations of such air contaminants:

i. Testing by Owner or Operator. The Illinois EPA may require the owner or operator of the emission source or air pollution control equipment to conduct such tests in accordance with procedures

adopted by the Illinois EPA, at such reasonable times as may be specified by the Illinois EPA and at the expense of the owner or operator of the emission source or air pollution control equipment. The Illinois EPA may adopt procedures detailing methods of testing and formats for reporting results of testing. Such procedures and revisions thereto, shall not become effective until filed with the Secretary of State, as required by the APA Act. All such tests shall be made by or under the direction of a person qualified by training and/or experience in the field of air pollution testing. The Illinois EPA shall have the right to observe all aspects of such tests.

ii. Testing by the Illinois EPA. The Illinois EPA shall have the right to conduct such tests at any time at its own expense. Upon request of the Illinois EPA, the owner or operator of the emission source or air pollution control equipment shall provide, without charge to the Illinois EPA, necessary holes in stacks or ducts and other safe and proper testing facilities, including scaffolding, but excluding instruments and sensing devices, as may be necessary.

b. Testing required by Condition 9 shall be performed upon a written request from the Illinois EPA by a qualified independent testing service.

9. Pursuant to 35 Ill. Adm. Code 212.110(c), upon a written notification by the Illinois EPA, the owner or operator of a particulate matter emission unit subject to 35 Ill. Adm. Code Part 212 shall conduct the applicable testing for particulate matter emissions, opacity, or visible emissions at such person's own expense, to demonstrate compliance. Such test results shall be submitted to the Illinois EPA within thirty (30) days after conducting the test unless an alternative time for submittal is agreed to by the Illinois EPA.

10. Pursuant to 35 Ill. Adm. Code 212.110(e), the owner or operator of an emission unit subject to 35 Ill. Adm. Code Part 212 shall retain records of all tests which are performed. These records shall be retained for at least three (3) years after the date a test is performed.

11a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the filter systems associated with the USG Hammermill and PCM Hammermill:

A. Records for periodic inspection of the filters with date, individual performing the inspection, and nature of inspection; and

B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The hours of operation for the USG Hammermill, USG Extruder Pellet Transfer Collection Cyclone, and the PCM Hammermill; and

iii. Monthly and annual PM and PM_{10} emissions from the USG Hammermill, USG Extruder Pellet Transfer Collection Cyclone, and the PCM Hammermill Filter, with supporting calculations (tons/month and tons/year).

b. All records and logs required by Condition 11(a) of this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be made available for inspections and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

12. Pursuant to 35 Ill. Adm. Code 212.110(d), a person planning to conduct testing for particulate matter emissions to demonstrate compliance shall give written notice to the Illinois EPA of that intent. Such notification shall be given at least thirty (30) days prior to the initiation of the test unless a shorter period is agreed to by the Illinois EPA. Such notification shall state the specific test methods from 35 Ill. Adm. Code 212.110 that will be used.

13a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit or otherwise, the Permittee shall submit a report to the Illinois EPA's Bureau of Air Compliance Section in Springfield, Illinois within thirty (30) days after the exceedance or deviation. The report shall identify the duration and the emissions impact of the exceedance or deviation, a copy of the relevant records and information to resolve the exceedance or deviation, and a description of the efforts to reduce emissions from, and the duration of exceedance or deviation, and to prevent future occurrences of any such exceedance or deviation.

b. One (1) copy of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

If you have any questions on this, please call German Barria at 217/785-1705.

STATE OF ILLINOIS
ENVIRONMENTAL PROTECTION AGENCY
DIVISION OF AIR POLLUTION CONTROL
P. O. BOX 19506
SPRINGFIELD, ILLINOIS 62794-9506

STANDARD CONDITIONS FOR CONSTRUCTION/DEVELOPMENT PERMITS ISSUED BY THE ILLINOIS ENVIRONMENTAL PROTECTION AGENCY

July 1, 1985

The Illinois Environmental Protection Act (Illinois Revised Statutes, Chapter 111-1/2, Section 1039) authorizes the Environmental Protection Agency to impose conditions on permits which it issues.

The following conditions are applicable unless superseded by special condition(s).

1. Unless this permit has been extended or it has been voided by a newly issued permit, this permit will expire one year from the date of issuance, unless a continuous program of construction or development on this project has started by such time.

2. The construction or development covered by this permit shall be done in compliance with applicable provisions of the Illinois Environmental Protection Act, and Regulations adopted by the Illinois Pollution Control Board.

3. There shall be no deviations from the approved plans and specifications unless a written request for modification, along with plans and specifications as required, shall have been submitted to the Agency and a supplemental written permit issued.

4. The Permittee shall allow any duly authorized agent of the Agency upon the presentation of credentials, at reasonable times:

   a. to enter the Permittee's property where actual or potential effluent, emission or noise sources are located or where any activity is to be conducted pursuant to this permit,

   b. to have access to and copy any records required to be kept under the terms and conditions of this permit,

   c. to inspect, including during any hours of operation of equipment constructed or operated under this permit, such equipment and any equipment required to be kept, used, operated, calibrated and maintained under this permit,

   d. to obtain and remove samples of any discharge or emission of pollutants, and

   e. to enter and utilize any photographic, recording, testing, monitoring or other equipment for the purpose of preserving, testing, monitoring, or recording any activity, discharge, or emission authorized by this permit.

5. The issuance of this permit:

   a. shall not be considered as in any manner affecting the title of the premises upon which the permitted facilities are to be located,

   b. does not release the Permittee from any liability for damage to person or property caused by or resulting from the construction, maintenance, or operation of the proposed facilities,

   c. does not release the Permittee from compliance with the other applicable statues and regulations of the United States, of the State of Illinois, or with applicable local laws, ordinances and regulations,

   d. does not take into consideration or attest to the structural stability of any units or parts of the project, and

e. in no manner implies or suggests that the Agency (or its officers, agents or employees) assumes any liability, directly or indirectly, for any loss due to damage, installation, maintenance, or operation of the proposed equipment or facility.

6. a. Unless a joint construction/operation permit has been issued, a permit for operation shall be obtained from the Agency before the equipment covered by this permit is placed into operation.

b. For purposes of shakedown and testing, unless otherwise specified by a special permit condition, the equipment covered under this permit may be operated for a period not to exceed thirty (30) days.

7. The Agency may file a complaint with the Board for modification, suspension or revocation of a permit:

a. upon discovery that the permit application contained misrepresentations, misinformation or false statements or that all relevant facts were not disclosed, or

b. upon finding that any standard or special conditions have been violated, or

c. upon any violations of the Environmental Protection Act or any regulation effective thereunder as a result of the construction or development authorized by this permit.

I. INTRODUCTION

Bunge North America, Inc. has applied for a Federally Enforceable State Operating Permit (FESOP) for its plant located at 321 E. North Street in Danville. This plant requires an air pollution control operating permit because it is a source of emissions. The Illinois EPA has prepared a draft of the renewed permit that it would propose to issue for the plant. However, before renewing the permit, the Illinois EPA is holding a public comment period to receive comments on this proposed action and the terms and conditions of the draft permit that it would propose to issue.

II. SOURCE DESCRIPTION

Bunge North America, Inc. is a corn mill and grain elevator. The emission units at this plant that require an operating permit are shown in Table 1, below.

Table 1. Listing of Non-Exempt Emission Units Located at the Source.

Emission Unit and Description	Construction Date (and Date Last Modified)
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):	
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10	Prior to 1978
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96	Prior to 1970
West Headhouse Transfer General Aspiration (5012-0005-0029) controlled by Baghouse Filters DD 484RF12	Prior to 1978
RHOMBO Truck Dump Pit #3 (5012-0003-0013) controlled by Baghouse Filters APM SJL156-6	1973
Railcar Dump Pit (5012-0004-0016) controlled by Baghouse Filters APM 41120.12	Prior to 1978
RHOMBO West General Aspiration (5012-0009-0009) controlled by Baghouse Filters APM SJL72-6	1973
RHOMBO Gallery Aspiration (5012-0003-0018) controlled by Baghouse Filters APM SJL72-6	1973
Track 6 Vacuum (5012-0010-0047) controlled by Baghouse Filters HOFFMAN 48X96	Prior to 1970
Cleanings Discharge (4870-0013-0015) controlled by Baghouse Filters BUHLER 16S-6-30	Prior to 1978
Conveying General Aspiration (4750-0029-0015) controlled by Baghouse Filters MICROPUL 100S-6-20	Prior to 1978
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS):	
Truck Dump #4 & W. Gallery Aspiration (5012-0005-0021) controlled by Baghouse Filters DD 484RF12	1985

One (1) 2,168 engine Hp Diesel-Powered Emergency Generator Set (DG-100)	Prior to 2006

These units are sources of emissions because Particulate Matter (PM) and Particulate Matter less than 10 microns (PM_{10}) is generated from the receiving, handling, and milling of grain at the facility. This source is also a source of Carbon Monoxide (CO) and Nitrogen Oxides (NO_x) from the combustion of fuel in the boilers and generator at this facility. NO_x is formed thermally by the combination of oxygen and nitrogen in the air at the temperatures at which fuel is burned. Thermal NO_x is formed during all common high temperature combustion processes. CO is formed from incomplete combustion of the fuel.

The following table lists annual emissions (tons) of pollutants emitted from this source, as reported in the last three Annual Emission Reports (AER) sent to the Illinois EPA:

Table 2. Actual and Potential (as limited by permit) Emissions of the Source.

Pollutant	Actual Emissions			PTE
	2018 (tons)	2019 (tons)	2020 (tons)	as limited by permit (tons/year)
Carbon Monoxide (CO)	16.5000	16.3400	17.3000	49.40
Nitrogen Oxides (NO_x)	11.9000	11.6000	11.9000	52.06
Particulate Matter (PM)	67.8000	65.8000	65.5000	66.66

Pollutant	Actual Emissions 2018 (tons)	Actual Emissions 2019 (tons)	Actual Emissions 2020 (tons)	PTE as limited by permit (tons/year)
Particulate Matter less than 10 Microns (PM_{10})	27.8000	28.0000	32.9000	65.49
Sulfur Dioxide (SO_2)	0.1100	0.1100	0.1300	0.51
Volatile Organic Material (VOM)	1.1900	1.1700	1.5800	3.16

This source also contains emission units and activities that are exempt from permitting under 35 Ill. Adm. Code 201.146 and the emissions from such units are not limited by the conditions of the draft permit. These emission units include:

150,000 gallon fuel oil storage tank

Based on a review of the estimated potential emissions from the exempt emission units as included in the permit application, the Illinois EPA has determined that the emissions from such exempt emission units are trivial and will not contribute to this source being a major source of emissions for any regulated pollutants emitted from any such exempt emission unit. This is because the emission limits for CO, NO_x, and PM_{10} in the draft FESOP are 90% or less of the applicable major source thresholds, and the combined PTE of the exempt emission units are less than 5% of the applicable major source thresholds, In other words, the emission limits for CO, NO_x, and PM_{10} have been limited to 90% or less of the applicable threshold (or 100 tons/year) by the draft FESOP and the combined potential to emit of the CO, NO_x, and PM_{10} from the exempt units is estimated to be less than 5% of 100 tons/year. In addition, as shown in Table 2, above, the margin of compliance between the actual emissions reported by the source during the last three years and the potential emissions as limited in the draft FESOP is more than 66% for CO, 77% for NO_x, and 54% for PM_{10}, which further minimizes the likelihood of the source exceeding its permit limits or the applicable major source thresholds.

In cases where the potential emissions of exempt emission units may contribute to the source exceeding major source thresholds (for example, if the emission limits in the FESOP are 90% or more of the applicable major source thresholds and the exempt units' PTE is 5% or more of the threshold) the Illinois EPA has established limits on such emission units in the draft FESOP that would normally be exempt from permitting. The permitting exemptions in 35 Ill. Adm. Code 201.146 do not relieve the owner or operator of any source from any obligation to comply with any other applicable requirements.

III. GENERAL DISCUSSION

FESOPs are federally enforceable, that is, the terms and conditions of the permits can be enforced by the United States Environmental Protection Agency (USEPA) under federal law, as well as by Illinois government and the public under state law. These permits can establish federally enforceable limitations on the operation and emissions of a source that restrict the potential emissions of the source.

The source may operate this plant under a FESOP because the actual emissions of the plant are below the levels at which the plant would be considered a major source under Title V of the federal Clean Air Act. However, in the absence of federally enforceable limitations, the plant's potential emissions would be such that the plant would be considered a major source. The permit acts to restrict the plant potential emissions so that it need not be considered a major source. As a result, the source does not need to

obtain a Clean Air Act Permit Program (CAAPP) permit for the plant, as would otherwise be required.

The FESOP limits the operation and annual emissions of the plant to below the major-source-thresholds of 100 tons for CO, NO_x, and PM_{10}. The potential emissions of other pollutants (e.g., SO_2, VOM, and Hazardous Air Pollutants) from the plant are small enough that no restrictions are needed to avoid being a major source of these pollutants.

IV. APPLICABLE EMISSION STANDARDS

All emission units in Illinois must comply with state emission standards adopted by the Illinois Pollution Control Board (Board). These emission standards represent the basic requirements for sources in Illinois. The Board has specific standards for particulate matter under 35 Ill. Adm. Code Part 212. The processing and milling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions), which limits the opacity of emissions to 30 percent, and 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units), which limits PM emissions based on each units process weight rate. The receipt and handling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions) and 35 Ill. Adm. Code Part 212 Subpart S (Agriculture), which requires the source to implement and use certain housekeeping practices to reduce particulate matter emissions and to equip the sources receiving dump pits with air pollution control equipment that is capable of at least 90% collection efficiency for PM emissions. The boilers are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions) and 35 Ill. Adm. Code Part 212 Subpart E (Particulate Matter Emissions From Fuel Combustion Emission Units), which limits the emissions of PM from the combustion of liquid fuel to 0.10 lb/mmBtu.

The Clayton Boiler is at this source are subject to the New Source Performance Standards (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR 60, Subparts A and Dc. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States EPA under a delegation agreement. The source also has another boiler that was constructed prior to June 9, 1989 and as result will not be subject the NSPS standards.

Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) at this source are subject to the New Source Performance Standards (NSPS) for Grain Elevators, 40 CFR 60, Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States EPA under a delegation agreement. The source also has other grain receiving, cleaning and storage operations that were constructed prior to August 3, 1978 and as result will not be subject the NSPS standards.

Emergency Generator Set DG-100 at this source are subject to the National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR 63, Subparts A and ZZZZ. The Illinois EPA is administering the NESHAP in Illinois on behalf of the United States EPA under a delegation agreement.

The application shows that the plant is in compliance with applicable state and federal emission standards.

V. CONTENTS OF THE PERMIT

The permit that the Illinois EPA is proposing to issue will identify the specific emission standards that apply to the emission units at the plant. As explained, the processing

and milling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B, which limits the opacity of emissions to 30 percent, and 35 Ill. Adm. Code Part 212 Subpart L, which limits PM emissions based on each units process weight rate. The receipt and handling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B and 35 Ill. Adm. Code Part 212 Subpart S, which requires the source to implement and use certain housekeeping practices to reduce particulate matter emissions and to equip the sources receiving dump pits with air pollution control equipment that is capable of at least 90% collection efficiency for PM emissions. The boilers are subject to 35 Ill. Adm. Code Part 212 Subpart B and 35 Ill. Adm. Code Part 212 Subpart E, which limits the emissions of PM from the combustion of liquid fuel to 0.10 lb/mmBtu. The conditions of this permit are intended to ensure that the source continues to comply with applicable emission standards.

The permit would also contain limitations and requirements to assure that this plant is operated as a non-major source. The permit would limit the operation and annual emissions of the plant to below the major-source-thresholds of 100 tons for CO, NO_x, and PM_{10}. (Annual emissions of other pollutants from the plant are well below the 100 ton major source threshold.)

The permit would also set limitations on PM_{10} emissions based on the air flow to the baghouses and cyclones and the grain loading of these control devices determine by stack testing conducted at the source. The boilers are to be limited based on the types of fuel combusted and the amount of each fuel usage. These limitations are consistent with the historical operation of emission units at the plant.

The permit conditions would also continue to require appropriate compliance procedures, including inspection practices as well as recordkeeping and reporting requirements. The source must carry out these procedures on an on-going basis to demonstrate that the plant is being operated within the limitations set by the permit and the plant's emissions are being properly controlled.

VI. REQUEST FOR COMMENTS

It is the Illinois EPA's preliminary determination that the source has met the requirements for issuance of its permit. The Illinois EPA is therefore proposing to issue the permit.

Comments are requested on this proposed action by the Illinois EPA and the proposed conditions on the draft permit. If substantial public interest is shown in this matter, the Illinois EPA will consider holding a public hearing in accordance with 35 IAC Part 166.

FEDERALLY ENFORCEABLE STATE OPERATING PERMIT -- NSPS and NESHAP SOURCE

PERMITTEE

Bunge North America, Inc.
Attn: Dean Hughes
11720 Borman Drive
St. Louis, Missouri 63146-1000

Application No.: 96020027 I.D. No.: 183020ABT
Applicant's Designation: Date Received: December 5, 2011
Operation of: Corn Mill & Grain Elevator
Date Issued: Expiration Date:
Source Location: 321 E. North Street, Danville, Vermilion County

This permit is hereby granted to the above-designated Permittee to OPERATE emission unit(s) and/or air pollution control equipment consisting of:

Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10;
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96;
West Headhouse Transfer General Aspiration (5012-0005-0029) controlled by Baghouse Filters DD 484RF12;

LTMS Truck Loadout (4750-0033-0000B);

Boiler House/Grounds:
One (1) 96.55 mmBtu/hour Natural Gas/Distillate Fuel-Oil Fired Boiler with Low NO_x Burner (Boiler #1);
One (1) 27.90 mmBtu/hour Natural Gas-Fired/Distillate Fuel-Oil Fired Boiler (Clayton Boiler);
One (1) 2,168 engine Hp Diesel-Powered Emergency Generator Set (DG-100); and

Fugitive PM and PM_{10} emissions

pursuant to the above referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This Federally Enforceable State Operating Permit (FESOP) is issued to limit the emissions of air pollutants from the source to less than major source thresholds (i.e., 100 tons/year for Carbon Monoxide (CO), Nitrogen Oxides (NO_x), and Particulate Matter less than 10 microns (PM_{10})). As a result, the source is excluded from the requirements to obtain a Clean Air Act Permit Program (CAAPP) permit. The maximum emissions of this source, as limited by the conditions of this permit, are described in Attachment A.

b. Prior to issuance, a draft of this permit has undergone a public notice and comment period.

c. This permit supersedes all operating permit(s) for this location.

2a. The Clayton Boiler is subject to the New Source Performance Standard (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR Part 60 Subparts A and Dc. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States Environmental Protection Agency (USEPA) under a delegation agreement. Pursuant to 40 CFR 60.40c(a), except as provided in 40 CFR 60.40c(d), (e), (f), and (g), the affected facility to which 40 CFR 60 Subpart Dc applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (mmBtu/hr)) or less, but greater than or equal to 2.9 MW (10 mmBtu/hr).

b. Pursuant to 40 CFR 60.42c(d), on and after the date on which the initial performance test is completed or required to be completed under 40 CFR 60.8, whichever date comes first, no owner or operator of an affected facility that combusts oil shall cause to be discharged into the atmosphere from that affected facility any gases that contain SO_2 in excess of 215 ng/J (0.50 lb/mmBtu) heat input from oil; or, as an alternative, no owner or operator of an affected facility that combusts oil shall combust oil in the affected facility that contains greater than 0.5 weight percent sulfur. The percent reduction requirements are not applicable to affected facilities under this paragraph.

c. Pursuant to 40 CFR 60.42c(h)(1), for distillate oil-fired affected facilities with heat input capacities between 2.9 and 29 MW (10 and 100 mmBtu/hour), compliance with the emission limits or fuel oil sulfur limits under 40 CFR 60.42c may be determined based on a certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

d. Pursuant to 40 CFR 60.42c(i), the SO_2 emission limits, fuel oil sulfur limits, and percent reduction requirements under 40 CFR 60.42c apply at all times, including periods of startup, shutdown, and malfunction.

3a. The Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) are subject to the NSPS for Grain Elevators, 40 CFR Part 60 Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 60.300(a), the provisions of 40 CFR 60 Subpart DD apply to each affected facility at any grain terminal elevator or any grain storage elevator, except as provided under 40 CFR 60.304(b). The affected facilities are each truck unloading station, truck loading station, barge and ship unloading station, barge and ship loading station, railcar loading station, railcar unloading station, grain dryer, and all grain handling operations.

b. Pursuant to 40 CFR 60.300(b), any facility under 40 CFR 60.300(a) which commences construction, modification or reconstructed after August 3, 1978 is subject to the requirements of 40 CFR 60 Subpart DD.

c. Pursuant to 40 CFR 60.302(b), on and after the date on which the performance test required to be conducted by 40 CFR 60.8 is completed,

no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere from any affected facility except a grain dryer any process emission which:

i. Contains particulate matter in excess of 0.023 g/dscm (ca. 0.01 gr/dscf).

ii. Exhibits greater than 0 percent opacity.

d. Pursuant to 40 CFR 60.302(c), on and after the 60th day of achieving the maximum production rate at which the affected facility will be operated, but no later than 180 days after initial startup, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere any fugitive emission from:

i. Any individual truck unloading station, railcar unloading station, or railcar loading station, which exhibits greater than 5 percent opacity.

ii. Any grain handling operation, which exhibits greater than 0 percent opacity.

iii. Any truck loading station which exhibits greater than 10 percent opacity.

4a. Emergency Generator Set DG-100 is subject to the National Emission Standard for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR Part 63 Subparts A and ZZZZ. The Illinois EPA is administering the NESHAP in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 63.6590(a), an affected source is any existing, new, or reconstructed stationary RICE located at a major or area source of HAP emissions, excluding stationary RICE being tested at a stationary RICE test cell/stand.

b. Pursuant to 40 CFR 63.6595(a)(1), if you have an existing stationary RICE, excluding existing non-emergency CI stationary RICE, with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the applicable emission limitations, operating limitations and other requirements no later than June 15, 2007. If you have an existing non-emergency CI stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, an existing stationary CI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary CI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than May 3, 2013. If you have an existing stationary SI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary SI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than October 19, 2013.

c. Pursuant to 40 CFR 63.6603(a), if you own or operate an existing stationary RICE located at an area source of HAP emissions, you must comply with the requirements in Table 2d to 40 CFR 63 Subpart ZZZZ and the operating limitations in Table 2b to 40 CFR 63 Subpart ZZZZ that apply to you.

Table 2d to Subpart ZZZZ of Part 63—Requirements for Existing Stationary RICE Located at Area Sources of HAP Emissions

As stated in 40 CFR 63.6600 and 63.6640, you must comply with the following requirements for existing stationary RICE located at area sources of HAP emissions:

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
4. Emergency stationary CI RICE and black start stationary CI RICE.[2]	a. Change oil and filter every 500 hours of operation or annually, whichever comes first;[1]	
	b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first; and	
	c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.	

[1]Sources have the option to utilize an oil analysis program as described in 40 CFR 63.6625(i) or (j) in order to extend the specified oil change requirement in Table 2d of 40 CFR 63 Subpart ZZZZ.

[2]If an emergency engine is operating during an emergency and it is not possible to shut down the engine in order to perform the management practice requirements on the schedule required in Table 2d of 40 CFR 63 Subpart ZZZZ, or if performing the management practice on the required schedule would otherwise pose an unacceptable risk under federal, state, or local law, the management practice can be delayed until the emergency is over or the unacceptable risk under federal, state, or local law has abated. The management practice should be performed as soon as practicable after the emergency has ended or the unacceptable risk under Federal, State, or local law has abated. Sources must report any failure to perform the management practice on the schedule required and the Federal, State or local law under which the risk was deemed unacceptable.

5a. The Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; Corn Mill Products Milling and Handling; Boiler #1, Clayton Boiler, and Emergency Generator Set DG-100 are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions). Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent,

into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute period shall occur from only one such emission unit located within a 305 m (1000 ft) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 212 Subpart E (Particulate Matter Emissions From Fuel Combustion Emission Units). Pursuant to 35 Ill. Adm. Code 212.206, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period to exceed 0.15 kg of particulate matter per MW-hr of actual heat input from any fuel combustion emission unit using liquid fuel exclusively (0.10 lbs/mmBtu).

d. This source is subject to 35 Ill. Adm. Code Part 212 Subpart K (Fugitive Particulate Matter). Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

e. When processing and handling processed materials, the emission units constructed on or after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

f. Pursuant to 35 Ill. Adm. Code 212.321(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.321(c) shall be determined by using the equation:

$$E = A(P)^B$$

where:

P = Process weight rate; and
E = Allowable emission rate; and,

i. Up to process weight rates of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.214	2.54
B	0.534	0.534

ii. For process weight rate greater than or equal to 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	11.42	24.8
B	0.16	0.16

g. Pursuant to 35 Ill. Adm. Code 212.321(c), Limits for Process Emission Units for Which Construction or Modification Commenced on or After April 14, 1972:

Metric		English	
P	E	P	E

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lbs/hr
454.	30.4	500.00	67.00

where:

P = Process weight rate in metric or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

h. When processing and handling processed materials, the emission units constructed before after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.322(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any process emission unit for which construction or modification commenced prior to April 14, 1972, which, either alone or in combination with the emission of particulate matter from all other similar process emission units at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.322(c).

i. Pursuant to 35 Ill. Adm. Code 212.322(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.322(c) shall be determined by using the equation:

$$E = C + A(P)^B$$

where:

P = process weight rate; and,
E = allowable emission rate; and,

i. For process weight rates up to 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.985	4.10
B	0.67	0.67
C	0	0

ii. For process weight rates in excess or 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	25.21	55.0

	Metric	English
B	0.11	0.11
C	-18.4	-40.0

j. Pursuant to 35 Ill. Adm. Code 212.322(c), Limits for Process Emission Units For Which Construction or Modification Commenced Prior to April 14, 1972:

Metric		English	
P Mg/hr	E kg/hr	P T/hr	E lbs/hr

400.0	30.6	450.00	67.70
454.0	31.3	500.00	69.00

where:

P = Process weight rate in Mg/hr or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

k. The handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations are subject to 35 Ill. Adm. Code Part 212 Subpart S (Agriculture). Pursuant to 35 Ill. Adm. Code 212.462, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d), or allowed to use alternate control according to 35 Ill. Adm. Code

212.461(g), existing grain-handling operations with a total annual grain through-put of 300,000 bushels or more shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall demonstrate compliance with the following:

i. Cleaning and Separating Operations.

A. Particulate matter generated during cleaning and separating operations shall be captured to the extent necessary to prevent visible particulate matter emissions directly into the atmosphere.

B. For grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area, air contaminants collected from cleaning and separating operations shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

ii. Major Dump-Pit Area.

Induced Draft.

A. Induced draft shall be applied to major dump pits and their associated equipment (including, but not limited to, boots, hoppers and legs) to such an extent that a minimum face velocity is maintained, at the effective grate surface, sufficient to contain particulate emissions generated in unloading operations. The minimum face velocity at the effective grate surface shall be at least 200 fpm, which shall be determined by using the equation:

$$V = Q/A$$

where:
V = face velocity; and
Q = induced draft volume in scfm; and
A = effective grate area in ft^2; and

B. The induced draft air stream for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be confined and conveyed through air pollution control equipment which has an overall rated and actual particulate collection efficiency of not less than 90 percent by weight;

C. Means or devices (including, but not limited to, quick-closing doors, air curtains or wind deflectors) shall be employed to prevent a wind velocity in excess of 50 percent of the induced draft face velocity at the pit; provided, however, that such means or devices do not have to achieve

the same degree of prevention when the ambient air wind exceeds 25 mph. The wind velocity shall be measured, with the induced draft system not operating, at a point midway between the dump-pit area walls at the point where the wind exits the dump-pit area, and at a height above the dump-pit area floor of approximately 2 ft; or

iii. Internal Transferring Area.

A. Internal transferring area shall be enclosed to the extent necessary to prohibit visible particulate matter emissions directly into the atmosphere.

B. Air contaminants collected from internal transfer operations for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

iv. Load-Out Area.

A. Truck and hopper car loading shall employ socks, sleeves or equivalent devices which extend 6 inches below the sides of the receiving vehicle, except for topping off. Choke loading shall be considered an equivalent method as long as the discharge is no more than 12 inches above the sides of the receiving vehicle.

B. Box car loading shall employ means or devices to prevent the emission of particulate matter into the atmosphere to the fullest extent which is technologically and economically feasible.

l. Pursuant to 35 Ill. Adm. Code 212.463, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d) or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), grain-drying operations for which construction or modification commenced prior to June 30, 1975, with a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity (using the American Society of Agricultural Engineers Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers) shall be operated in such a fashion as to preclude the emission of particulate matter larger than 300 microns mean particle diameter, shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the following:

i. Column Dryers. The largest effective circular diameter of transverse perforations in the external sheeting of a column dryer shall not exceed 0.094 inch, and the grain inlet and outlet shall be enclosed.

ii. Rack Dryers. No portion of the exhaust air of rack dryers shall be emitted to the ambient atmosphere without having passed through a particulate collection screen having a maximum opening of 50 mesh, U.S. Sieve Series.

A. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling facilities having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 90 percent by weight prior to release into the atmosphere.

B. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling sources having a grain through-put exceeding 2 million bushels per year and located in a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 98 percent by weight prior to release into the atmosphere.

iii. Other Types of Dryers. All other types of dryers shall be controlled in a manner which shall result in the same degree of control required for rack dryers pursuant to 35 Ill. Adm. Code 212.463(b).

iv. New and Modified Grain-Drying Operations. Grain-drying operations constructed or modified on or after June 30, 1975, shall file applications for construction and operating permits pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the control equipment requirements of 35 Ill. Adm. Code 212.463, except for new and modified grain-drying operations which do not result in a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity, using the American Society of Agricultural Engineer Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers.

6a. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 214 Subpart B (New Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 214.122(b)(2), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The sulfur content of all distillate fuel oil used by the fuel combustion emission source must not exceed 15 ppm;

b. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 214 Subpart K (Process Emission Sources). Pursuant to 35 Ill. Adm. Code

214.301, except as further provided by 35 Ill. Adm. Code Part 214, no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm.

c. Pursuant to 35 Ill. Adm. Code 214.305(a)(2), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The sulfur content of all distillate fuel oil used by the process emission source must not exceed 15 ppm;

7. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 215 Subpart K (Use of Organic Material). Pursuant to 35 Ill. Adm. Code 215.301, no person shall cause or allow the discharge of more than 3.6 kg/hr (8 lbs/hr) of organic material into the atmosphere from any emission source, except as provided in 35 Ill. Adm. Code 215.302, 215.303, 215.304 and the following exception: If no odor nuisance exists the limitation of 35 Ill. Adm. Code Part 215 Subpart K shall apply only to photochemically reactive material.

8. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 216 Subpart B (Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 216.121, no person shall cause or allow the emission of carbon monoxide (CO) into the atmosphere from any fuel combustion emission source with actual heat input greater than 2.9 MW (10 mmBtu/hr) to exceed 200 ppm, corrected to 50 percent excess air.

9a. This permit is issued based on the Cooling Tower at this source not being subject to the NESHAP for Process Cooling Towers, 40 CFR 63 Subpart Q because the cooling tower is not operated with chromium-based water treatment chemicals and is not either major sources or is an integral part of a facility that is a major source.

b. This permit is issued based on the source no longer being subject to the NESHAP for Solvent Extraction for Vegetable Oil Production, 40 CFR 63 Subpart GGGG, because the source no longer operates a vegetable oil production process and is no longer a major source of HAP emissions.

c. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters, 40 CFR 63 Subpart DDDDD because this source is not or is part of, a major source of Hazardous Air Pollutant (HAP) emissions as defined in 40 CFR 63.2.

d. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the requirements of the NESHAP for Industrial, Commercial, and Institutional Boilers Area Sources, 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11195(e), gas-fired boilers are not subject to 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11237, gas-fired boiler includes any boiler that burns gaseous fuels not combined with any solid fuels, burns liquid fuel only during periods of gas curtailment, gas supply emergencies, or periodic testing

on liquid fuel. Periodic testing of liquid fuel shall not exceed a combined total of 48 hours during any calendar year.

e. This permit is issued based on the source not being subject to the National Emission Standards (NESHAP) for Area Sources: Prepared Feeds Manufacturing, 40 CFR 63 Subpart DDDDDDD because the source does not use a material containing chromium or a material containing manganese in the manufacturing of prepared feeds.

10a. Pursuant to 35 Ill. Adm. Code 212.314, 35 Ill. Adm. Code 212.301 shall not apply and spraying pursuant to 35 Ill. Adm. Code 212.304 through 212.310 and 35 Ill. Adm. Code 212.312 shall not be required when the wind speed is greater than 40.2 km/hr (25 mph). Determination of wind speed for the purposes of 35 Ill. Adm. Code 212.314 shall be by a one-hour average or hourly recorded value at the nearest official station of the U.S. Weather Bureau or by wind speed instruments operated on the site. In cases where the duration of operations subject to 35 Ill. Adm. Code 212.314 is less than one hour, wind speed may be averaged over the duration of the operations on the basis of on-site wind speed instrument measurements.

b. This permit is issued based on the handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations not being subject to 35 Ill. Adm. Code Part 212 Subpart L while handling grain. Pursuant to 35 Ill. Adm. Code 212.461(a), 35 Ill. Adm. Code 212.302(a), 212.321, and 212.322 shall not apply to grain-handling and grain-drying operations, portable grain-handling equipment and one-turn storage space.

11. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to 35 Ill. Adm. Code Part 215 Subpart K. Pursuant to 35 Ill. Adm. Code 215.303, the provisions of 35 Ill. Adm. Code 215.301 and 215.302 shall not apply to fuel combustion emission sources.

12a. Pursuant to 40 CFR 60.11(b), compliance with opacity standards in 40 CFR Part 60 shall be determined by conducting observations in accordance with Method 9 in appendix A of 40 CFR Part 60, any alternative method that is approved by the Illinois EPA or USEPA, or as provided in 40 CFR 60.11(e)(5). For purposes of determining initial compliance, the minimum total time of observations shall be 3 hours (30 6-minute averages) for the performance test or other set of observations (meaning those fugitive-type emission sources subject only to an opacity standard).

b. Pursuant to 40 CFR 60.11(c), the opacity standards set forth in 40 CFR Part 60 shall apply at all times except during periods of startup, shutdown, malfunction, and as otherwise provided in the applicable standard.

c. Pursuant to 40 CFR 60.11(d), at all times, including periods of startup, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

13a. Pursuant to 40 CFR 63.6595(c), if you own or operate an affected source, you must meet the applicable notification requirements in 40 CFR 63.6645 and in 40 CFR Part 63, Subpart A.

b. Pursuant to 40 CFR 63.6604(b), beginning January 1, 2015, if you own or operate an existing emergency CI stationary RICE with a site rating of more than 100 brake HP and a displacement of less than 30 liters per cylinder that uses diesel fuel and operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must use diesel fuel that meets the requirements in 40 CFR 80.510(b) for nonroad diesel fuel, except that any existing diesel fuel purchased (or otherwise obtained) prior to January 1, 2015, may be used until depleted.

c. Pursuant to 40 CFR 63.6605(a), you must be in compliance with the emission limitations and operating limitations in 40 CFR 63 Subpart ZZZZ that apply to you at all times.

d. Pursuant to 40 CFR 63.6605(b), at all times you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by 40 CFR 63 Subpart ZZZZ have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

e. Pursuant to 40 CFR 63.6625(e)(3), if you own or operate any of the following stationary RICE, you must operate and maintain the stationary RICE and after-treatment control device (if any) according to the manufacturer's emission-related written instructions or develop your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions:

An existing emergency or black start stationary RICE located at an area source of HAP emissions;

f. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

g. Pursuant to 40 CFR 63.6625(h), if you operate a new, reconstructed, or existing stationary engine, you must minimize the engine's time spent at idle during startup and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the emission standards applicable to all times other than startup in Tables 1a, 2a, 2c, and 2d to 40 CFR 63 Subpart ZZZZ apply.

h. Pursuant to 40 CFR 63.6625(i), if you own or operate a stationary CI engine that is subject to the work, operation or management practices in items 1 or 2 of Table 2c to 40 CFR 63 Subpart ZZZZ or in items 1 or 4 of Table 2d to 40 CFR 63 Subpart ZZZZ, you have the option of utilizing an oil analysis program in order to extend the specified oil change requirement in Tables 2c and 2d to 40 CFR 63 Subpart ZZZZ. The oil analysis must be performed at the same frequency specified for changing the oil in Table 2c or 2d to 40 CFR 63 Subpart ZZZZ. The analysis program must at a minimum analyze the following three parameters: Total Base Number, viscosity, and percent water content. The condemning limits for these parameters are as follows: Total Base Number is less than 30 percent of the Total Base Number of the oil when new; viscosity of the oil has changed by more than 20 percent from the viscosity of the oil when new; or percent water content (by volume) is greater than 0.5. If all of these condemning limits are not exceeded, the engine owner or operator is not required to change the oil. If any of the limits are exceeded, the engine owner or operator must change the oil within 2 business days of receiving the results of the analysis; if the engine is not in operation when the results of the analysis are received, the engine owner or operator must change the oil within 2 business days or before commencing operation, whichever is later. The owner or operator must keep records of the parameters that are analyzed as part of the program, the results of the analysis, and the oil changes for the engine. The analysis program must be part of the maintenance plan for the engine.

i. Pursuant to 40 CFR 63.6640(a), you must demonstrate continuous compliance with each emission limitation, operating limitation, and other requirements in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you according to methods specified in Table 6 to 40 CFR 63 Subpart ZZZZ.

Table 6 to Subpart ZZZZ of Part 63– Continuous Compliance With Emission Limitations, Operating Limitations, Work Practices, and Management Practices

As stated in 40 CFR 63.6640, you must continuously comply with the emissions and operating limitations and work or management practices as required by the following:

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
9. Existing emergency and black start stationary RICE ≤500 HP located at a major source of HAP, existing non-emergency stationary RICE <100 HP located at a major source of HAP, existing emergency and black start stationary RICE located at an area source of HAP, existing non-emergency stationary CI RICE ≤300 HP located at an area source of HAP, existing non-emergency 2SLB stationary RICE located at an area source of HAP, existing non-emergency landfill or digester gas stationary SI RICE located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE ≤500 HP located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE >500 HP located at an area source of HAP that operate 24 hours or less per calendar year	a. Work or Management practices	i. Operating and maintaining the stationary RICE according to the manufacturer's emission-related operation and maintenance instructions; or ii. Develop and follow your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions.

j. Pursuant to 40 CFR 63.6640(f), if you own or operate an emergency stationary RICE, you must operate the emergency stationary RICE according to the requirements in 40 CFR 63.6640 (f)(1) through (4). In order for the engine to be considered an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ, any operation other than emergency operation, maintenance and testing, emergency demand response, and operation in non-emergency situations for 50 hours per year, as described in 40 CFR 63.6640(f)(1) through (4), is prohibited. If you do not operate the engine according to the requirements in 40 CFR 63.6640(f)(1) through (4), the engine will not be considered an emergency engine under 40 CFR 63 Subpart ZZZZ and must meet all requirements for non-emergency engines.

i. There is no time limit on the use of emergency stationary RICE in emergency situations.

ii. You may operate your emergency stationary RICE for any combination of the purposes specified in 40 CFR 63.6640(f)(2)(i) for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by 40 CFR 63.6640(f)(3) and (4) counts as part of the 100 hours per calendar year allowed by this paragraph (40 CFR 63.6640(f)(2)).

Emergency stationary RICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by Federal, State or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company

associated with the engine. The owner or operator may petition the Illinois EPA or USEPA for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that Federal, State, or local standards require maintenance and testing of emergency RICE beyond 100 hours per calendar year.

iii. Emergency stationary RICE located at area sources of HAP may be operated for up to 50 hours per calendar year in non-emergency situations. The 50 hours of operation in non-emergency situations are counted towards the 100 hours per calendar year provided in 40 CFR 63.6640(f)(2). Except as provided in 40 CFR 63.6640(f)(4)(i) and (ii), the 50 hours per year for non-emergency situations cannot be used for peak shaving or non-emergency demand response, or to generate income for a facility to an electric grid or otherwise supply power as part of a financial arrangement with another entity.

The 50 hours per year for non-emergency situations can be used to supply power as part of a financial arrangement with another entity if all of the following conditions are met:

A. The engine is dispatched by the local balancing authority or local transmission and distribution system operator.

B. The dispatch is intended to mitigate local transmission and/or distribution limitations so as to avert potential voltage collapse or line overloads that could lead to the interruption of power supply in a local area or region.

C. The dispatch follows reliability, emergency operation or similar protocols that follow specific NERC, regional, state, public utility commission or local standards or guidelines.

D. The power is power provided only to the facility itself or to support the local transmission and distribution system.

E. The owner or operator identifies and records the entity that dispatches the engine and the specific NERC, regional, state, public utility commission or local standards or guidelines that are being followed for dispatching the engine. The local balancing authority or local transmission and distribution system operator may keep these records on behalf of the engine owner or operator.

k. Pursuant to 40 CFR 63.6665, Table 8 to 40 CFR 63 Subpart ZZZZ (see Attachment B) shows which parts of the General Provisions in 40 CFR 63.1 through 63.15 apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less

than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with any of the requirements of the General Provisions specified in Table 8: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing stationary RICE that combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, an existing emergency stationary RICE, or an existing limited use stationary RICE. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in the General Provisions specified in Table 8 except for the initial notification requirements: A new stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new emergency stationary RICE, or a new limited use stationary RICE.

1. Pursuant to 40 CFR 63.6675, emergency stationary RICE means any stationary reciprocating internal combustion engine that meets all of the criteria in paragraphs (1) through (3) of this definition. All emergency stationary RICE must comply with the requirements specified in 40 CFR 63.6640(f) in order to be considered emergency stationary RICE. If the engine does not comply with the requirements specified in 40 CFR 63.6640(f), then it is not considered to be an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ:

   i. The stationary RICE is operated to provide electrical power or mechanical work during an emergency situation. Examples include stationary RICE used to produce power for critical networks or equipment (including power supplied to portions of a facility) when electric power from the local utility (or the normal power source, if the facility runs on its own power production) is interrupted, or stationary RICE used to pump water in the case of fire or flood, etc.

   ii. The stationary RICE is operated under limited circumstances for situations not included in paragraph (1) of this definition, as specified in 40 CFR 63.6640(f).

   iii. The stationary RICE operates as part of a financial arrangement with another entity in situations not included in paragraph (1) of this definition only as allowed in 40 CFR 63.6640(f)(2)(ii) or (iii) and 40 CFR 63.6640(f)(4)(i) or (ii).

14a. Pursuant to 40 CFR 80.510(b), beginning June 1, 2010. Except as otherwise specifically provided in 40 CFR 80 Subpart I, all nonroad (NR) and locomotive (LM) diesel fuel is subject to the following per-gallon standards:

   i. Sulfur content 15 ppm maximum for NR diesel fuel.

   ii. Cetane index or aromatic content, as follows:

A. A minimum cetane index of 40; or

B. A maximum aromatic content of 35 volume percent.

15a. Housekeeping Practices. Pursuant to 35 Ill. Adm. Code 212.461(b), all grain-handling and grain-drying operations, regardless of size, must implement and use the following housekeeping practices:

i. Air pollution control devices shall be checked daily and cleaned as necessary to insure proper operation.

ii. Cleaning and Maintenance.

A. Floors shall be kept swept and cleaned from boot pit to cupola floor. Roof or bin decks and other exposed flat surfaces shall be kept clean of grain and dust that would tend to rot or become airborne.

B. Cleaning shall be handled in such a manner as not to permit dust to escape to the atmosphere.

C. The yard and surrounding open area, including but not limited to ditches and curbs, shall be cleaned to prevent the accumulation of rotting grain.

iii. Dump Pit.

A. Aspiration equipment shall be maintained and operated.

B. Dust control devices shall be maintained and operated.

iv. Head House. The head house shall be maintained in such a fashion that visible quantities of dust or dirt are not allowed to escape to the atmosphere.

v. Property. The yard and driveway of any source shall be asphalted, oiled or equivalently treated to control dust.

vi. Housekeeping Check List. Housekeeping check lists shall be completed by the manager and maintained on the premises for inspection by Illinois EPA personnel.

16á. In the event that the operation of this source results in an odor nuisance, the Permittee shall take appropriate and necessary actions to minimize odors, including but not limited to, changes in raw material or installation of controls, in order to eliminate the odor nuisance.

b. The baghouse filters and cyclones shall be in operation at all times when the associated emission units are in operation and emitting air contaminants.

c. The Permittee shall, in accordance with the manufacturer(s) and/or vendor(s) recommendations, perform periodic maintenance on the baghouse filters and cyclones such that the baghouse filters and cyclones are kept in proper working condition and not cause a violation of the Illinois Environmental Protection Act or regulations promulgated therein.

d. Each receiving dump pit shall be inspected for proper operation while receiving is occurring, at least once each week (Monday through Sunday) when grain is received.

e. The source shall be inspected for presence of visible emissions from internal transfer and cleaning, while such activity is occurring, at least once each week when such activity is performed.

f. Boiler #1 and Clayton Boiler shall only be operated with natural gas or distillate fuel oil (Grades No. 1 and 2) as the fuel. The use of any other fuel in Boiler #1 or Clayton Boiler may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable requirements.

g. Emergency Generator Set DG-100 shall only be operated with distillate fuel oil (Grades No. 1 and 2) as the fuel. The use of any other fuel in Emergency Generator Set DG-100 may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable requirements.

h. Organic liquid by-products or waste materials shall not be used in any emission unit at this source without written approval from the Illinois EPA.

i. The Illinois EPA shall be allowed to sample all fuels stored at the above location.

j. All normal traffic pattern access areas and all normal traffic pattern roads and parking facilities which are located on Ag Transload Facility property shall be paved or treated with water, oils or chemical dust suppressants. All paved areas shall be cleaned on a regular basis. All areas treated with water, oils or chemical dust suppressants shall have the treatment applied on a regular basis, as needed, in accordance with the operating program required by Condition 16(m).

k. All unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods.

l. Grinding mills, screening operations, bucket elevators, conveyor transfer points, conveyors, bagging operations, storage bins and fine product truck and railcar loading operations shall be sprayed with water or a surfactant solution, utilize choke-feeding or be treated by an equivalent method in accordance with an operating program.

m. The emission units described in Conditions 16(j), (k), and (l) shall be operated under the provisions of an operating program, consistent with 35 Ill. Adm. Code 212.310 and 212.312, and prepared by the owner or operator and submitted to the Illinois EPA for its review. Such operating program shall be designed to significantly reduce fugitive particulate matter emissions.

n. As a minimum the operating program shall include the following:

i. The name and address of the source;

ii. The name and address of the owner or operator responsible for execution of the operating program;

iii. A map or diagram of the source showing approximate locations of storage piles, conveyor loading operations, normal traffic pattern access areas surrounding storage piles and all normal traffic patterns within the source;

iv. Location of unloading and transporting operations with pollution control equipment;

v. A detailed description of the best management practices utilized to achieve compliance with 35 Ill. Adm. Code 212.301, including an engineering specification of particulate collection equipment, application systems for water, oil, chemicals and dust suppressants utilized and equivalent methods utilized;

vi. Estimated frequency of application of dust suppressants by location of materials; and

vii. Such other information as may be necessary to facilitate the Illinois EPA's review of the operating program.

o. The Fugitive Particulate Operating Program, as submitted by the Permittee on DATE PROGRAM APPROVED BY FOS WAS RECEIVED is incorporated herein by reference. The source shall be operated under and shall comply with the provisions of this Fugitive Particulate Operating Program and any amendments to the Fugitive Particulate Operating Program submitted pursuant to Condition 16(m) and (n).

p. The operating program shall be amended from time to time by the owner or operator so that the operating program is current. Such amendments shall be consistent with Condition 16(m) and (n) and shall be submitted to the Illinois EPA within thirty (30) days of any such amendment. Any future amendment to the Fugitive Particulate Operating Program made by the Permittee during the permit term is automatically incorporated by reference provided the revision is not expressly disapproved, in writing, by the Illinois EPA. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the Fugitive Particulate Operating Program, the Permittee shall be required to revise and resubmit the Fugitive Particulate Operating Program

within thirty (30) days of receipt of the notification to address the deficiency.

17a. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #1	0.0017	18,500	0.30	1.20
Hoffman Bldg 301 Vacuum	0.0017	1,000	0.02	0.10
West Headhouse Transfer General Aspiration	0.0017	55,000	0.78	3.40
RHOMBO Truck Dump Pit #3	0.0017	14,500	0.21	0.90
Railcar Dump Pit	0.0017	27,000	0.39	1.70
RHOMBO West General Aspiration	0.0017	6,800	0.09	0.40
RHOMBO Gallery Aspiration	0.0017	9,200	0.14	0.60
Track 6 Vacuum	0.0017	700	0.01	0.04
Cleanings Discharge	0.0006	1,900	0.01	0.04
Conveying General Aspiration	0.00085	7,600	0.05	0.24
Grain Receiving Fugitives				5.40
			Total:	14.02

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

b. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #4 & W. Gallery Aspiration	0.0017	36,017	0.52	2.30
Cleaning North APM	0.00085	41,000	0.30	1.31
Corn Cleaning Bldg 115 #2	0.00085	57,372	0.42	1.83
North St Grain/Meal Truck Dump Pit #2	0.0017	20,000	0.29	1.28
			Total:	6.71

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

c. Emissions from and operation of the Dry Corn Milling, Processing and Products Handling shall not exceed the following limits:

Hominy Screener General Aspiration	0.0006	7,600	0.04	0.17
Hominy Loadout Fugitives				1.90
Grain Loadout Fugitives				0.10
			Total:	7.78

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

ii. LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

Emission Unit	Throughput (T/Mo)	(T/Yr)	E M I S S I O N S (lb/T)	PM (T/Mo)	(T/Yr)	(lb/T)	PM_{10} (T/Mo)	(T/Yr)
LTMS Truck/Rail Dump Pit	12,500	75,000	0.035	0.02	0.13	0.0078	0.00	0.03
LTMS Truck Loadout	12,500	75,000	0.086	0.27	1.61	0.029	0.09	0.54
				Total:	1.74			0.57

These limits are based on the maximum throughput, standard AP-42 emission factors (Table 9.9-1, AP-42, Fifth Edition, Volume I, Update May 2003), 90% control efficiency for baghouse controlled for truck/rail dump pits, and 50% capture efficiency for loadout enclosure.

f. Emissions from and operation of Boiler #1 shall not exceed the following limits:

i. Natural Gas Usage: 82.274 mmscf/month, 822.741 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	3.46	34.56
Nitrogen Oxides (NO_x)	50.0	2.06	20.57
Particulate Matter (PM)	7.6	0.31	3.13
Sulfur Dioxide (SO_2)	0.6	0.02	0.25
Volatile Organic Material (VOM)	5.5	0.23	2.26

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions (lbs/10^3 Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

g. Emissions from and operation of Clayton Boiler shall not exceed the following limits:

i. Natural Gas Usage: 23.771 mmscf/month, 237.712 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	1.00	9.98
Nitrogen Oxides (NO_x)	100.0	1.19	11.89
Particulate Matter (PM)	7.6	0.09	0.90
Sulfur Dioxide (SO_2)	0.6	0.01	0.07
Volatile Organic Material (VOM)	5.5	0.07	0.65

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions (lbs/10^3 Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

h. Emissions from and operation of Emergency Generator Set DG-100 shall not exceed the following limits:

i. Hours of Operation: 100 hours/year;

ii. Emissions from the combustion of fuel oil in the Generator Sets:

Pollutant	Emission Factor (lb/hp hr)	Emissions (lbs/Hr)	(Tons/Year)
Carbon Monoxide (CO)	0.0055	11.92	0.60
Nitrogen Oxides (NO_x)	0.024	52.03	2.60
Particulate Matter (PM)	0.0007	1.52	0.08
Sulfur Dioxide (SO_2)	0.0000121	0.03	0.01
Volatile Organic Material (VOM)	0.000642	1.39	0.07

These limits are based on the rated output of the engine powering the generator set (2,168 engine hp), 100 hours/year of operation, standard emission factors (Table 3.4-1, AP-42, Fifth Edition, Volume 1, Supplement B, October 1996), and a sulfur content of 15 ppm.

i. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total).

17. This permit is issued based on the Potential to Emit (PTE) for Hazardous Air Pollutants (HAPs) as listed in Section 112(b) of the Clean Air Act from this source being less than 10 tons/year of any single HAP and 25 tons/year of any combination of such HAPs. As a result, this permit is issued based on the emissions of all HAPs from this source not triggering the requirements to obtain a CAAPP Permit from the Illinois EPA.

18a. Pursuant to 40 CFR 60.8(a), except as specified in 40 CFR 60.8(a)(1), (a)(2), (a)(3), and (a)(4), at such other times as may be required by the Illinois EPA or USEPA under section 114 of the Clean Air Act, the owner or operator of such facility shall conduct performance test(s) and furnish the Illinois EPA or USEPA a written report of the results of such performance test(s).

b. Pursuant to 40 CFR 60.8(b), performance tests shall be conducted and data reduced in accordance with the test methods and procedures contained in each applicable subpart of 40 CFR Part 60 unless the Illinois EPA or USEPA:

i. Specifies or approves, in specific cases, the use of a reference method with minor changes in methodology;

ii. Approves the use of an equivalent method;

iii. Approves the use of an alternative method the results of which the Illinois EPA or USEPA has determined to be adequate for indicating whether a specific source is in compliance;

iv. Waives the requirement for performance tests because the owner or operator of a source has demonstrated by other means to the Illinois EPA's or USEPA's satisfaction that the affected facility is in compliance with the standard; or

v. Approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors. Nothing in this paragraph shall be construed to abrogate the Illinois EPA's or USEPA's authority to require testing under section 114 of the Clean Air Act.

c. Pursuant to 40 CFR 60.8(c), performance tests shall be conducted under such conditions as the Illinois EPA or USEPA shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Illinois EPA or USEPA such records as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test nor shall emissions in excess of the level of the applicable emission limit during periods of startup, shutdown, and malfunction be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

d. Pursuant to 40 CFR 60.8(d), the owner or operator of an affected facility shall provide the Illinois EPA or USEPA at least 30 days prior notice of any performance test, except as specified under other subparts of 40 CFR Part 60, to afford the Illinois EPA or USEPA the opportunity to have an observer present. If after 30 days notice for an initially scheduled performance test, there is a delay (due to operational problems, etc.) in conducting the scheduled performance test, the owner or operator of an affected facility shall notify the Illinois EPA or USEPA as soon as possible of any delay in the original

test date, either by providing at least 7 days prior notice of the rescheduled date of the performance test, or by arranging a rescheduled date with the Illinois EPA or USEPA by mutual agreement.

e. Pursuant to 40 CFR 60.8(e), the owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

i. Sampling ports adequate for test methods applicable to such facility. This includes:

A. Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures; and

B. Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures.

ii. Safe sampling platform(s).

iii. Safe access to sampling platform(s).

iv. Utilities for sampling and testing equipment.

f. Pursuant to 40 CFR 60.8(f), unless otherwise specified in the applicable subpart of 40 CFR Part 60, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the applicable standard under 40 CFR Part 60. For the purpose of determining compliance with an applicable standard under 40 CFR Part 60, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Illinois EPA's or USEPA's approval, be determined using the arithmetic mean of the results of the two other runs.

g. Pursuant to 40 CFR 60.11(e)(2), except as provided in 40 CFR 60.11(e)(3), the owner or operator of an affected facility to which an opacity standard in 40 CFR Part 60 applies shall conduct opacity observations in accordance with 40 CFR 60.11(b), shall record the opacity of emissions, and shall report to the Illinois EPA or USEPA the opacity results along with the results of the initial performance test required under 40 CFR 60.8. The inability of an owner or operator to secure a visible emissions observer shall not be considered a reason for not conducting the opacity observations concurrent with the initial performance test.

19a. Pursuant to 40 CFR 60.303(a), in conducting the performance tests required in 40 CFR 60.8, the owner or operator shall use as reference methods and procedures the test methods in appendix A of 40 CFR Part 60 or other methods and procedures as specified in 40 CFR 60.303, except as provided in 40 CFR 60.8(b). Acceptable alternative methods and procedures are given in 40 CFR 60.303(c).

b. Pursuant to 40 CFR 60.303(b), the owner or operator shall determine compliance with the particulate matter standards in 40 CFR 60.302 as follows:

i. Method 5 shall be used to determine the particulate matter concentration and the volumetric flow rate of the effluent gas. The sampling time and sample volume for each run shall be at least 60 minutes and 1.70 dscm (60 dscf). The probe and filter holder shall be operated without heaters.

ii. Method 2 shall be used to determine the ventilation volumetric flow rate.

iii. Method 9 and the procedures in 40 CFR 60.11 shall be used to determine opacity.

c. Pursuant to 40 CFR 60.303(c)(1), the owner or operator may use the following as alternatives to the reference methods and procedures specified in 40 CFR 60.303: For Method 5, Method 17 may be used.

20a. Pursuant to 40 CFR 60.44c(g), for oil-fired affected facilities where the owner or operator seeks to demonstrate compliance with the fuel oil sulfur limits under 40 CFR 60.42c based on shipment fuel sampling, the initial performance test shall consist of sampling and analyzing the oil in the initial tank of oil to be fired in the steam generating unit to demonstrate that the oil contains 0.5 weight percent sulfur or less. Thereafter, the owner or operator of the affected facility shall sample the oil in the fuel tank after each new shipment of oil is received, as described under 40 CFR 60.46c(d)(2).

b. Pursuant to 40 CFR 60.44c(h), for affected facilities subject to 40 CFR 60.42c(h)(1), (2), or (3) where the owner or operator seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, the performance test shall consist of the certification, the certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

21a. Pursuant to 35 Ill. Adm. Code 201.282, every emission source or air pollution control equipment shall be subject to the following testing requirements for the purpose of determining the nature and quantities of specified air contaminant emissions and for the purpose of determining ground level and ambient air concentrations of such air contaminants:

i. Testing by Owner or Operator. The Illinois EPA may require the owner or operator of the emission source or air pollution control

equipment to conduct such tests in accordance with procedures adopted by the Illinois EPA, at such reasonable times as may be specified by the Illinois EPA and at the expense of the owner or operator of the emission source or air pollution control equipment. The Illinois EPA may adopt procedures detailing methods of testing and formats for reporting results of testing. Such procedures and revisions thereto, shall not become effective until filed with the Secretary of State, as required by the APA Act. All such tests shall be made by or under the direction of a person qualified by training and/or experience in the field of air pollution testing. The Illinois EPA shall have the right to observe all aspects of such tests.

ii. Testing by the Illinois EPA. The Illinois EPA shall have the right to conduct such tests at any time at its own expense. Upon request of the Illinois EPA, the owner or operator of the emission source or air pollution control equipment shall provide, without charge to the Illinois EPA, necessary holes in stacks or ducts and other safe and proper testing facilities, including scaffolding, but excluding instruments and sensing devices, as may be necessary.

b. Testing required by Condition 22 shall be performed upon a written request from the Illinois EPA by a qualified independent testing service.

22. Pursuant to 35 Ill. Adm. Code 212.110(c), upon a written notification by the Illinois EPA, the owner or operator of a particulate matter emission unit subject to 35 Ill. Adm. Code Part 212 shall conduct the applicable testing for particulate matter emissions, opacity, or visible emissions at such person's own expense, to demonstrate compliance. Such test results shall be submitted to the Illinois EPA within thirty (30) days after conducting the test unless an alternative time for submittal is agreed to by the Illinois EPA.

23a. Pursuant to 40 CFR 60.46c(d)(2), as an alternative fuel sampling procedure for affected facilities combusting oil, oil samples may be collected from the fuel tank for each steam generating unit immediately after the fuel tank is filled and before any oil is combusted. The owner or operator of the affected facility shall analyze the oil sample to determine the sulfur content of the oil. If a partially empty fuel tank is refilled, a new sample and analysis of the fuel in the tank would be required upon filling. Results of the fuel analysis taken after each new shipment of oil is received shall be used as the daily value when calculating the 30-day rolling average until the next shipment is received. If the fuel analysis shows that the sulfur content in the fuel tank is greater than 0.5 weight percent sulfur, the owner or operator shall ensure that the sulfur content of subsequent oil shipments is low enough to cause the 30-day rolling average sulfur content to be 0.5 weight percent sulfur or less.

b. Pursuant to 40 CFR 60.46c(e), the monitoring requirements of 40 CFR 60.46c(a) and (d) shall not apply to affected facilities subject to 40

CFR 60.42c(h)(1), (2), or (3) where the owner or operator of the affected facility seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, as described under 40 CFR 60.48c(f), as applicable.

24. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

25a. Pursuant to 40 CFR 60.7(b), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of an affected facility; any malfunction of the air pollution control equipment; or any periods during which a continuous monitoring system or monitoring device is inoperative.

b. Pursuant to 40 CFR 60.7(f), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain a file of all measurements, including continuous monitoring system, monitoring device, and performance testing measurements; all continuous monitoring system performance evaluations; all continuous monitoring system or monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by 40 CFR Part 60 recorded in a permanent form suitable for inspection. The file shall be retained for at least two years following the date of such measurements, maintenance, reports, and records, except as follows:

The Illinois EPA or USEPA, upon notification to the source, may require the owner or operator to maintain all measurements as required by 40 CFR 60.7(f), if the Illinois EPA or USEPA determines these records are required to more accurately assess the compliance status of the affected source.

26a. Pursuant to 40 CFR 60.48c(c)(1), in addition to the applicable requirements in 40 CFR 60.7, the owner or operator of an affected facility subject to the opacity limits in 40 CFR 60.43c(c) shall submit excess emission reports for any excess emissions from the affected facility that occur during the reporting period and maintain records according to the requirements specified in 40 CFR 60.48c(c)(1) through (3), as applicable to the visible emissions monitoring method used.

For each performance test conducted using Method 9 of appendix A-4 of 40 CFR Part 60, the owner or operator shall keep the records including the information specified in 40 CFR 60.48c(c)(1)(i) through (iii).

i. Dates and time intervals of all opacity observation periods;

ii. Name, affiliation, and copy of current visible emission reading certification for each visible emission observer participating in the performance test; and

iii. Copies of all visible emission observer opacity field data sheets;

b. Pursuant to 40 CFR 60.48c(e), the owner or operator of each affected facility subject to the SO_2 emission limits, fuel oil sulfur limits, or percent reduction requirements under 40 CFR 60.42c shall keep records and submit reports as required under 40 CFR 60.48c(d), including the following information, as applicable.

i. Calendar dates covered in the reporting period.

ii. Identification of the F factor used in calculations, method of determination, and type of fuel combusted.

iii. If fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification as described under 40 CFR 60.48c(f)(1), (2), (3), or (4), as applicable. In addition to records of fuel supplier certifications, the report shall include a certified statement signed by the owner or operator of the affected facility that the records of fuel supplier certifications submitted represent all of the fuel combusted during the reporting period.

c. Pursuant to 40 CFR 60.48c(f)(1), fuel supplier certification shall include the following information for distillate oil:

i. The name of the oil supplier;

ii. A statement from the oil supplier that the oil complies with the specifications under the definition of distillate oil in 40 CFR 60.41c; and

iii. The sulfur content of the oil.

d. i. Pursuant to 40 CFR 60.48c(g)(1), except as provided under 40 CFR 60.48c(g)(2) and (g)(3), the owner or operator of each affected facility shall record and maintain records of the amounts of each fuel combusted during each operating day.

ii. Pursuant to 40 CFR 60.48c(g)(2), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility that combusts only natural gas, wood, fuels using fuel certification in 40 CFR 60.48c(f) to demonstrate compliance with the SO_2 standard, fuels not subject to an emissions standard (excluding opacity), or a mixture of these fuels may elect to record and maintain records of the amount of each fuel combusted during each calendar month.

iii. Pursuant to 40 CFR 60.48c(g)(3), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility or multiple affected facilities located on a

contiguous property unit where the only fuels combusted in any steam generating unit (including steam generating units not subject to 40 CFR 60 Subpart Dc) at that property are natural gas, wood, distillate oil meeting the most current requirements in 40 CFR 60.42c to use fuel certification to demonstrate compliance with the SO_2 standard, and/or fuels, excluding coal and residual oil, not subject to an emissions standard (excluding opacity) may elect to record and maintain records of the total amount of each steam generating unit fuel delivered to that property during each calendar month.

e. Pursuant to 40 CFR 60.48c(i), all records required under 40 CFR 60.48c shall be maintained by the owner or operator of the affected facility for a period of two years following the date of such record.

27. Pursuant to 40 CFR 63.10(b)(3), if an owner or operator determines that his or her stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants regulated by any standard established pursuant to Section 112(d) or (f) of the Clean Air Act, and that stationary source is in the source category regulated by the relevant standard, but that source is not subject to the relevant standard (or other requirement established under 40 CFR Part 63) because of limitations on the source's potential to emit or an exclusion, the owner or operator must keep a record of the applicability determination on site at the source for a period of 5 years after the determination, or until the source changes its operations to become an affected source, whichever comes first. The record of the applicability determination must be signed by the person making the determination and include an analysis (or other information) that demonstrates why the owner or operator believes the source is unaffected (e.g., because the source is an area source). The analysis (or other information) must be sufficiently detailed to allow the USEPA and/or Illinois EPA to make a finding about the source's applicability status with regard to the relevant standard or other requirement. If relevant, the analysis must be performed in accordance with requirements established in relevant subparts of 40 CFR Part 63 for this purpose for particular categories of stationary sources. If relevant, the analysis should be performed in accordance with USEPA guidance materials published to assist sources in making applicability determinations under Section 112 of the Clean Air Act, if any. The requirements to determine applicability of a standard under 40 CFR 63.1(b)(3) and to record the results of that determination under 40 CFR 63.10(b)(3) shall not by themselves create an obligation for the owner or operator to obtain a Title V permit.

28a. Pursuant to 40 CFR 63.6655(a), if you must comply with the emission and operating limitations, you must keep the records described in 40 CFR 63.6655(a)(1) through (a)(5), (b)(1) through (b)(3) and (c).

i. A copy of each notification and report that you submitted to comply with 40 CFR 63 Subpart ZZZZ, including all documentation supporting any Initial Notification or Notification of Compliance

Status that you submitted, according to the requirement in 40 CFR 63.10(b)(2)(xiv).

ii. Records of the occurrence and duration of each malfunction of operation (i.e., process equipment) or the air pollution control and monitoring equipment.

iii. Records of performance tests and performance evaluations as required in 40 CFR 63.10(b)(2)(viii).

iv. Records of all required maintenance performed on the air pollution control and monitoring equipment.

v. Records of actions taken during periods of malfunction to minimize emissions in accordance with 40 CFR 63.6605(b), including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation.

b. Pursuant to 40 CFR 63.6655(d), you must keep the records required in Table 6 of 40 CFR 63 Subpart ZZZZ to show continuous compliance with each emission or operating limitation that applies to you.

c. Pursuant to 40 CFR 63.6655(e), you must keep records of the maintenance conducted on the stationary RICE in order to demonstrate that you operated and maintained the stationary RICE and after-treatment control device (if any) according to your own maintenance plan if you own or operate any of the following stationary RICE.

i. An existing stationary emergency RICE.

ii. An existing stationary CI RICE located at an area source of HAP emissions subject to management practices as shown in Table 2d to 40 CFR 63 Subpart ZZZZ.

d. Pursuant to 40 CFR 63.6655(f)(2), If you own or operate an existing emergency stationary CI RICE located at an area source of HAP emissions that does not meet the standards applicable to non-emergency engines, you must keep records of the hours of operation of the engine that is recorded through the non-resettable hour meter. The owner or operator must document how many hours are spent for emergency operation, including what classified the operation as emergency and how many hours are spent for non-emergency operation. If the engines are used for the purposes specified in 40 CFR 63.6640(f)(2)(ii) or (iii) or 40 CFR 63.6640(f)(4)(ii), the owner or operator must keep records of the notification of the emergency situation, and the date, start time, and end time of engine operation for these purposes.

e. Pursuant to 40 CFR 63.6660(a), your records must be in a form suitable and readily available for expeditious review according to 40 CFR 63.10(b)(1).

f. Pursuant to 40 CFR 63.6660(b), as specified in 40 CFR 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

g. Pursuant to 40 CFR 63.6660(c), you must keep each record readily accessible in hard copy or electronic form for at least 5 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to 40 CFR 63.10(b)(1).

29. Pursuant to 35 Ill. Adm. Code 212.110(e), the owner or operator of an emission unit subject to 35 Ill. Adm. Code Part 212 shall retain records of all tests which are performed. These records shall be retained for at least three (3) years after the date a test is performed.

30a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C), On and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the fuel combustion emission source complies with the requirements in 35 Ill. Adm. Code 214.122(b)(2)(A) and (b)(2)(B), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the process emission source complies with the requirements in 35 Ill. Adm. Code 214.305(a)(1) and (a)(2), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA;

31a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the baghouse filters and cyclones:

   A. Records for periodic inspection of the baghouse filters and cyclones with date, individual performing the inspection, and nature of inspection; and

   B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The Permittee shall keep a copy of the Fugitive Particulate Operating Program, any amendments or revisions to the Fugitive Particulate Operating Program, and the Permittee shall also keep a record of activities completed according to the Fugitive Particulate Operating Program.

iii. Records of housekeeping check lists;

iv. Records for the inspections required by Conditions 16(d) and (e), with date, time and observations if such information is not incorporated in the housekeeping check list.

v. Total flow rate for each baghouse blower (scfm);

vi. Total grain loading for each process (gr/dscf);

vii. Total hours of operation of each baghouse (hours/month and hours/year);

viii. The amount of grain received in LTMS Truck/Rail Dump Pit (tons/month and tons/year);

ix. The amount of grain shipped from the LTMS Truck Loadout (tons/month and tons/year);

x. Natural gas usage for Boiler #1 (mmscf/month and mmscf/year);

xi. Distillate fuel oil usage for Boiler #1 (gallons/month and gallons/year);

xii. Natural gas usage for the Clayton Boiler (mmscf/month and mmscf/year);

xiii. Distillate fuel oil usage for the Clayton Boiler (gallons/month and gallons/year);

xiv. Operating hours of Emergency Generator Set DG-100 (hours/month and hours/year);

xv. An inspection, maintenance and repair log of Emergency Generator Set DG-100 listing each activity performed with date; and

xvi. Monthly and annual emissions of CO, NO_x, PM, PM_{10}, SO_2, and VOM from the source with supporting calculations (tons/month and tons/year).

b. All records and logs required by Condition 31(a) of this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be made available for inspection and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

32. Pursuant to 40 CFR 60.7(a)(4), any owner or operator subject to the provisions of 40 CFR Part 60 shall furnish the Illinois EPA or USEPA written notification or, if acceptable to both the Illinois EPA and USEPA and the owner or operator of a source, electronic notification, as follows:

A notification of any physical or operational change to an existing facility which may increase the emission rate of any air pollutant to which a standard applies, unless that change is specifically exempted under an applicable subpart or in 40 CFR 60.14(e). This notice shall be postmarked 60 days or as soon as practicable before the change is commenced and shall include information describing the precise nature of the change, present and proposed emission control systems, productive capacity of the facility before and after the change, and the expected completion date of the change. The Illinois EPA or USEPA may request additional relevant information subsequent to this notice.

33a. Pursuant to 40 CFR 63.6640(b), you must report each instance in which you did not meet each emission limitation or operating limitation in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you. These instances are deviations from the emission and operating limitations in 40 CFR 63 Subpart ZZZZ. These deviations must be reported according to the requirements in 40 CFR 63.6650. If you change your catalyst, you must reestablish the values of the operating parameters measured during the initial performance test. When you reestablish the values of your operating parameters, you must also conduct a performance test to demonstrate that you are meeting the required emission limitation applicable to your stationary RICE.

b. Pursuant to 40 CFR 63.6640(e), you must also report each instance in which you did not meet the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ that apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major

source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing emergency stationary RICE, an existing limited use stationary RICE, or an existing stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ, except for the initial notification requirements: a new or reconstructed stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new or reconstructed emergency stationary RICE, or a new or reconstructed limited use stationary RICE.

c. Pursuant to 40 CFR 63.6645(a), you must submit all of the notifications in 40 CFR 63.7(b) and (c), 63.8(e), (f)(4) and (f)(6), 63.9(b) through (e), and (g) and (h) that apply to you by the dates specified if you own or operate any of the following;

   i. An existing stationary CI RICE located at an area source of HAP emissions.

   ii. This requirement does not apply if you own or operate an existing stationary RICE less than 100 HP, an existing stationary emergency RICE, or an existing stationary RICE that is not subject to any numerical emission standards.

d. Pursuant to 40 CFR 63.6650(a), you must submit each report in Table 7 of 40 CFR 63 Subpart ZZZZ that applies to you.

Table 7 to Subpart ZZZZ of Part 63—Requirements for Reports

As stated in 40 CFR 63.6650, you must comply with the following requirements for reports:

For each . . .	You must submit a . . .	The report must contain . . .	You must submit the report . . .
4. Emergency stationary RICE that operate or are contractually obligated to be available for more than 15 hours per year for the purposes specified 40 CFR 63.6640(f)(4)(ii)	Report	a. The information in 40 CFR 63.6650(h)(1)	i. annually according to the requirements in 40 CFR 63.6650(h)(2)-(3).

e. Pursuant to 40 CFR 63.6650(b), unless the Illinois EPA or USEPA has approved a different schedule for submission of reports under 40 CFR 63.10(a), you must submit each report by the date in Table 7 of 40 CFR 63 Subpart ZZZZ and according to the requirements in 40 CFR 63.6650(b)(1) through (b)(9).

   i. For semiannual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is

specified for your affected source in 40 CFR 63.6595 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in 40 CFR 63.6595.

ii. For semiannual Compliance reports, the first Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in 40 CFR 63.6595.

iii. For semiannual Compliance reports, each subsequent Compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

iv. For semiannual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

v. For annual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in 40 CFR 63.6595 and ending on December 31.

vi. For annual Compliance reports, the first Compliance report must be postmarked or delivered no later than January 31 following the end of the first calendar year after the compliance date that is specified for your affected source in 40 CFR 63.6595.

vii. For annual Compliance reports, each subsequent Compliance report must cover the annual reporting period from January 1 through December 31.

viii. For annual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than January 31.

f. Pursuant to 40 CFR 63.6650(c), the Compliance report must contain the information in 40 CFR 63.6650(c)(1) through (6).

i. Company name and address.

ii. Statement by a responsible official, with that official's name, title, and signature, certifying the accuracy of the content of the report.

iii. Date of report and beginning and ending dates of the reporting period.

iv. If you had a malfunction during the reporting period, the compliance report must include the number, duration, and a brief description for each type of malfunction which occurred during

the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by an owner or operator during a malfunction of an affected source to minimize emissions in accordance with 40 CFR 63.6605(b), including actions taken to correct a malfunction.

v. If there are no deviations from any emission or operating limitations that apply to you, a statement that there were no deviations from the emission or operating limitations during the reporting period.

g. Pursuant to 40 CFR 63.6650(h), if you own or operate an emergency stationary RICE with a site rating of more than 100 brake HP that operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must submit an annual report according to the requirements in 40 CFR 63.6650(h)(1) through (3).

i. The report must contain the following information:

A. Company name and address where the engine is located.

B. Date of the report and beginning and ending dates of the reporting period.

C. Engine site rating and model year.

D. Latitude and longitude of the engine in decimal degrees reported to the fifth decimal place.

E. Hours spent for operation for the purpose specified in 40 CFR 63.6640(f)(4)(ii), including the date, start time, and end time for engine operation for the purposes specified in 40 CFR 63.6640(f)(4)(ii). The report must also identify the entity that dispatched the engine and the situation that necessitated the dispatch of the engine.

F. If there were no deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), a statement that there were no deviations from the fuel requirements during the reporting period.

G. If there were deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), information on the number, duration, and cause of deviations, and the corrective action taken.

ii. The first annual report must cover the calendar year 2015 and must be submitted no later than March 31, 2016. Subsequent annual reports for each calendar year must be submitted no later than March 31 of the following calendar year.

iii. The annual report must be submitted electronically using the subpart specific reporting form in the Compliance and Emissions Data Reporting Interface (CEDRI) that is accessed through EPA's Central Data Exchange (CDX) (www.epa.gov/cdx). However, if the reporting form specific to 40 CFR 63 Subpart ZZZZ is not available in CEDRI at the time that the report is due, the written report must be submitted to the Illinois EPA or USEPA at the appropriate address listed in 40 CFR 63.13.

34. Pursuant to 35 Ill. Adm. Code 212.110(d), a person planning to conduct testing for particulate matter emissions to demonstrate compliance shall give written notice to the Illinois EPA of that intent. Such notification shall be given at least thirty (30) days prior to the initiation of the test unless a shorter period is agreed to by the Illinois EPA. Such notification shall state the specific test methods from 35 Ill. Adm. Code 212.110 that will be used.

35a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C)(iii), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in this 35 Ill. Adm. Code 214.122(b)(2). At minimum, and in addition to any permitting obligations, the notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3)(C), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in 35 Ill. Adm. Code 214.305(a). At minimum, and in addition to any permitting obligations, such notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

36a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit or otherwise, the Permittee shall submit a report to the Illinois EPA's Bureau of Air Compliance Section in Springfield, Illinois within thirty (30) days after the exceedance or deviation. The report shall identify the duration and the emissions impact of the exceedance or deviation, a copy of the relevant records and information to resolve the exceedance or deviation, and a description of the efforts to reduce emissions from, and the duration of exceedance or deviation, and to prevent future occurrences of any such exceedance or deviation.

b. One (1) copy of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

It should be noted that the 150,000 gallon fuel oil storage tank is exempt from permitting, pursuant to 35 Ill. Adm. Code 201.146(n)(3).

If you have any questions on this permit, please call German Barria at 217/785-1705.

Sincerely,

William D. Marr
Manager, Permit Section
Bureau of Air

Attachment A - Emission Summary

This attachment provides a summary of the maximum emissions from the Corn Mill & Grain Elevator operating in compliance with the requirements of this federally enforceable permit. In preparing this summary, the Illinois EPA used the annual operating scenario which results in maximum emissions from such a plant. The resulting maximum emissions are below the levels, (e.g., 100 tons/year for CO, NO_x, and PM_{10}) at which this source would be considered a major source for purposes of the Clean Air Act Permit Program. Actual emissions from this source will be less than predicted in this summary to the extent that less material is handled, and control measures are more effective than required in this permit.

	E M I S S I O N S (Tons/Year)					
Emission Unit	CO	NO_x	PM	PM_{10}	SO_2	VOM
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS)			14.02	14.02		
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS)			6.71	6.71		
Dry Corn Milling, Processing and Products Handling			29.00	29.00		
Corn Mill Products Storage			0.50	0.50		
Corn Mill Products Milling and Handling			9.52	8.35		
Boiler #1						
Natural Gas	34.56	20.57	3.13	3.13	0.25	2.26
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Clayton Boiler					0	0
Natural Gas	9.98	11.89	0.90	0.90	0.07	0.65
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Emergency Generator Set DG-100	0.60	2.60	0.08	0.08	0.01	0.07
Totals	49.40	52.06	66.66	65.49	0.51	3.16

Attachment B - Table 8 to Subpart ZZZZ of Part 63—Applicability of General Provisions to Subpart ZZZZ.

As stated in 40 CFR 63.6665, you must comply with the following applicable general provisions.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.1	General applicability of the General Provisions	Yes.	
§63.2	Definitions	Yes	Additional terms defined in 40 CFR 63.6675.
§63.3	Units and abbreviations	Yes.	
§63.4	Prohibited activities and circumvention	Yes.	
§63.5	Construction and reconstruction	Yes.	
§63.6(a)	Applicability	Yes.	
§63.6(b)(1)-(4)	Compliance dates for new and reconstructed sources	Yes.	
§63.6(b)(5)	Notification	Yes.	
§63.6(b)(6)	[Reserved]		
§63.6(b)(7)	Compliance dates for new and reconstructed area sources that become major sources	Yes.	
§63.6(c)(1)-(2)	Compliance dates for existing sources	Yes.	
§63.6(c)(3)-(4)	[Reserved]		
§63.6(c)(5)	Compliance dates for existing area sources that become major sources	Yes.	
§63.6(d)	[Reserved]		
§63.6(e)	Operation and maintenance	No.	
§63.6(f)(1)	Applicability of standards	No.	
§63.6(f)(2)	Methods for determining compliance	Yes.	
§63.6(f)(3)	Finding of compliance	Yes.	
§63.6(g)(1)-(3)	Use of alternate standard	Yes.	
§63.6(h)	Opacity and visible emission standards	No	Subpart ZZZZ does not contain opacity or visible emission standards.
§63.6(i)	Compliance extension procedures and criteria	Yes.	
§63.6(j)	Presidential compliance exemption	Yes.	
§63.7(a)(1)-(2)	Performance test dates	Yes	Subpart ZZZZ contains performance test dates at 40 CFR 63.6610, 63.6611, and 63.6612.
§63.7(a)(3)	CAA section 114 authority	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.7(b)(1)	Notification of performance test	Yes	Except that 40 CFR 63.7(b)(1) only applies as specified in 40 CFR 63.6645.
§63.7(b)(2)	Notification of rescheduling	Yes	Except that 40 CFR 63.7(b)(2) only applies as specified in 40 CFR 63.6645.
§63.7(c)	Quality assurance/test plan	Yes	Except that 40 CFR 63.7(c) only applies as specified in 40 CFR 63.6645.
§63.7(d)	Testing facilities	Yes.	
§63.7(e)(1)	Conditions for conducting performance tests	No.	Subpart ZZZZ specifies conditions for conducting performance tests at 40 CFR 63.6620.
§63.7(e)(2)	Conduct of performance tests and reduction of data	Yes	Subpart ZZZZ specifies test methods at 40 CFR 63.6620.
§63.7(e)(3)	Test run duration	Yes.	
§63.7(e)(4)	Administrator may require other testing under section 114 of the CAA	Yes.	
§63.7(f)	Alternative test method provisions	Yes.	
§63.7(g)	Performance test data analysis, recordkeeping, and reporting	Yes.	
§63.7(h)	Waiver of tests	Yes.	
§63.8(a)(1)	Applicability of monitoring requirements	Yes	Subpart ZZZZ contains specific requirements for monitoring at 40 CFR 63.6625.
§63.8(a)(2)	Performance specifications	Yes.	
§63.8(a)(3)	[Reserved]		
§63.8(a)(4)	Monitoring for control devices	No.	
§63.8(b)(1)	Monitoring	Yes.	
§63.8(b)(2)-(3)	Multiple effluents and multiple monitoring systems	Yes.	
§63.8(c)(1)	Monitoring system operation and maintenance	Yes.	
§63.8(c)(1)(i)	Routine and predictable SSM	No	
§63.8(c)(1)(ii)	SSM not in Startup Shutdown Malfunction Plan	Yes.	
§63.8(c)(1)(iii)	Compliance with operation and maintenance requirements	No	
§63.8(c)(2)-(3)	Monitoring system installation	Yes.	
§63.8(c)(4)	Continuous monitoring system (CMS) requirements	Yes	Except that subpart ZZZZ does not require Continuous Opacity Monitoring System (COMS).
§63.8(c)(5)	COMS minimum procedures	No	Subpart ZZZZ does not require COMS.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.8(c)(6)-(8)	CMS requirements	Yes	Except that subpart ZZZZ does not require COMS.
§63.8(d)	CMS quality control	Yes.	
§63.8(e)	CMS performance evaluation	Yes	Except for 40 CFR 63.8(e)(5)(ii), which applies to COMS.
		Except that 40 CFR 63.8(e) only applies as specified in 40 CFR 63.6645.	
§63.8(f)(1)-(5)	Alternative monitoring method	Yes	Except that 40 CFR 63.8(f)(4) only applies as specified in 40 CFR 63.6645.
§63.8(f)(6)	Alternative to relative accuracy test	Yes	Except that 40 CFR 63.8(f)(6) only applies as specified in 40 CFR 63.6645.
§63.8(g)	Data reduction	Yes	Except that provisions for COMS are not applicable. Averaging periods for demonstrating compliance are specified at 40 CFR 63.6635 and 63.6640.
§63.9(a)	Applicability and State delegation of notification requirements	Yes.	
§63.9(b)(1)-(5)	Initial notifications	Yes	Except that 40 CFR 63.9(b)(3) is reserved.
		Except that 40 CFR 63.9(b) only applies as specified in 40 CFR 63.6645.	
§63.9(c)	Request for compliance extension	Yes	Except that 40 CFR 63.9(c) only applies as specified in 40 CFR 63.6645.
§63.9(d)	Notification of special compliance requirements for new sources	Yes	Except that 40 CFR 63.9(d) only applies as specified in 40 CFR 63.6645.
§63.9(e)	Notification of performance test	Yes	Except that 40 CFR 63.9(e) only applies as specified in 40 CFR 63.6645.
§63.9(f)	Notification of visible emission (VE)/opacity test	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.9(g)(1)	Notification of performance evaluation	Yes	Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.
§63.9(g)(2)	Notification of use of COMS data	No	Subpart ZZZZ does not contain opacity or VE standards.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.9(g)(3)	Notification that criterion for alternative to RATA is exceeded	Yes	If alternative is in use.
		Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.	
§63.9(h)(1)-(6)	Notification of compliance status	Yes	Except that notifications for sources using a CEMS are due 30 days after completion of performance evaluations. 40 CFR 63.9(h)(4) is reserved.
			Except that 40 CFR 63.9(h) only applies as specified in 40 CFR 63.6645.
§63.9(i)	Adjustment of submittal deadlines	Yes.	
§63.9(j)	Change in previous information	Yes.	
§63.10(a)	Administrative provisions for recordkeeping/reporting	Yes.	
§63.10(b)(1)	Record retention	Yes	Except that the most recent 2 years of data do not have to be retained on site.
§63.10(b)(2)(i)-(v)	Records related to SSM	No.	
§63.10(b)(2)(vi)-(xi)	Records	Yes.	
§63.10(b)(2)(xii)	Record when under waiver	Yes.	
§63.10(b)(2)(xiii)	Records when using alternative to RATA	Yes	For CO standard if using RATA alternative.
§63.10(b)(2)(xiv)	Records of supporting documentation	Yes.	
§63.10(b)(3)	Records of applicability determination	Yes.	
§63.10(c)	Additional records for sources using CEMS	Yes	Except that 40 CFR 63.10(c)(2)-(4) and (9) are reserved.
§63.10(d)(1)	General reporting requirements	Yes.	
§63.10(d)(2)	Report of performance test results	Yes.	
§63.10(d)(3)	Reporting opacity or VE observations	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.10(d)(4)	Progress reports	Yes.	
§63.10(d)(5)	Startup, shutdown, and malfunction reports	No.	
§63.10(e)(1) and (2)(i)	Additional CMS Reports	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.10(e)(2)(ii)	COMS-related report	No	Subpart ZZZZ does not require COMS.
§63.10(e)(3)	Excess emission and parameter exceedances reports	Yes.	Except that 40 CFR 63.10(e)(3)(i) (C) is reserved.
§63.10(e)(4)	Reporting COMS data	No	Subpart ZZZZ does not require COMS.
§63.10(f)	Waiver for recordkeeping/reporting	Yes.	
§63.11	Flares	No.	
§63.12	State authority and delegations	Yes.	
§63.13	Addresses	Yes.	
§63.14	Incorporation by reference	Yes.	
§63.15	Availability of information	Yes.

Hello Mr. Burris,
I'm contacting you in regard to the Permit application for federally enforceable state operating permit (FESOP) For Bunge North America, Inc., located at 321 E. North Street, Danville, Vermilion County, ID #183020ABT, permit application #96020027, a draft of the permit has been developed, see attached file. Further, to continue with de review of these permit , we need the following

1. A fugitive dust plant for the source.
2. Bunge to review the draft permit and provide us with their comments.

Attached are also documents that will help with the development of a source Fugitive Particulate Operating Program (FPOP).

Don't hesitate to contact me if you have any questions.

Thank you.

Process Materials Loadout - Rail #1

PM Emission Factor	0.27	lb/ton	(AP-42, Section 9.11.1, Table 4.5)			
PM10 Emission Factor	0.04	lb/ton	(Vegetable Oil Processing)		SCC 3-02-007-91	
PM10/PM ratio	0.15	AIRS Mar 1990				
PM2.5/PM10 ratio	0.067					
Rate/hour	336,000	pounds	% of scale weight	0.0%	soy meal/soy bean	**Operation Schedule**
	168	tons		10.1%	BPMOE/corn	8 hr/day
Rate/year	940,999	tons hominy		82.0%	germ/corn	7 days/week
Capture efficiency	90	% aspirated loadout hood				51 weeks/yr
Operation	2801	hours/year - increased by 100% to reflect actual loadout rate				

Potential PM emissions, excluding fugitives = Emission factor * process rate* capture effy/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture effy/100)
= 40.8 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)/(2000 lb/ton)*(capture effy/100)
= 114.3 tons/year

Potential PM10 emissions, excluding fugitives = Emission factor * process rate*(capture eff/100)

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture eff/100)
= 6.0 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year/(2000 lb/ton)*(capture effy/100)
= 16.9 tons/year

Potential fugitive PM emissions = Emission factor * process rate * (100-Capture efficiency)/100

a. Max Hourly
= 4.5 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)*((100-eff'y)/100)/(2000 lb/ton)
= 12.7 tons/year

Potential fugitive PM10 emissions = Emission factor * process rate * (100-Capture efficiency)/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
= 0.7 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)*((100-eff'y/100))/(2000 lb/ton)
= 1.9 tons/year

Potential fugitive PM2.5 emissions = Emission factor * process rate * (100-Capture efficiency)/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
= 0.045 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)*((100-eff'y/100))/(2000 lb/ton)
= 0.13 tons/year

Grain Loadout - Rail #1

PM Emission Factor	0.027	lb/ton	(AP-42, Section 9.9.1.1, Table 9.9.1-1)

Capture efficiency	90	% aspirated loadout hood		50	51	weeks/yr
Operation	5867	hours/year		2000	5867	

Potential PM emissions, excluding fugitives = Emission factor * process rate* capture effy/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture effy/100)
= 3.6 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)/(2000 lb/ton)*(capture effy/100)
= 10.7 tons/year

Potential PM10 emissions, excluding fugitives = Emission factor * process rate*(capture eff/100)

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture eff/100)
= 0.30 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)/(2000 lb/ton)*(capture effy/100)
= 0.87 tons/year

Potential PM2.5 emissions, excluding fugitives = Emission factor * process rate*(capture eff/100)

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture eff/100)
= 0.050 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)/(2000 lb/ton)*(capture effy/100)
= 0.15 tons/year

Potential fugitive PM emissions = Emission factor * process rate * (100-Capture efficiency)/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
= 0.41 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)*((100-eff'y)/100)/(2000 lb/ton)
= 1.2 tons/year

Potential fugitive PM10 emissions = Emission factor * process rate * (100-Capture efficiency)/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
= 0.033 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)*((100-eff'y/100))/(2000 lb/ton)
= 0.10 tons/year

Potential fugitive PM2.5 emissions = Emission factor * process rate * (100-Capture efficiency)/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
= 0.0056 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)*((100-eff'y/100))/(2000 lb/ton)
= 0.016 tons/year

Rail Loadout #1 Baghouse

Filter	34,960	dscfm	
Outlet loading	0.000596	gr/dscfm	Basis: Emissions of 2000 PM10 test on 101-05 filter exhaust.
Operation	8760	hours/year	
PM:PM10 ratio	1:01	worst case	
PM2.5: PM10 ratio	0.5:1	Basis: Delphos, Ohio tests of bean receiving baghouse filter	

Maximum controlled PM emissions from filter = baghouse outlet grain loading * gas flow rate

a. Max Hourly

= (outlet loading gr/scf)*(air flow cfm)*(60 min/hour)/(7000 grains/lb)
= 0.18 pounds/hour

b. Max Yearly

= max hourly * hrs/yr / 2000 lb/ton
0.78 tons/year

Maximum controlled PM10 emissions from filter

= baghouse outlet grain loading * gas flow rate

a. Max Hourly

= (outlet loading gr/scf)*(air flow cfm)*(60 min/hour)/(7000 grains/lb)
= 0.18 pounds/hour

b. Max Yearly

= max hourly * (hrs/yr) /(2000 lb/ton)
0.78 tons/year

Maximum controlled PM2.5 emissions from filter

= baghouse outlet grain loading * gas flow rate

a. Max Hourly

= (outlet loading gr/scf)*(air flow cfm)*(60 min/hour)/(7000 grains/lb)
= 0.09 pounds/hour

b. Max Yearly

= max hourly * (hrs/yr) /(2000 lb/ton)
0.39 tons/year

LTMS Grain Handling

Revised: 2-Sep-04

The Long Term Meal System (LTMS) was permitted, constructed and initially operated in 1985 (approval 85010031). The approval was for a pneimatic conveying system from existing meal and grain storage to LTMS, a meal bulk storage building, conveying from LTMS storage to rail loadout, a meal rail loadout system and an associated dust control RJ baghouse. Subsequently approval 01070073 was granted for the construction of 24 elevated meal loadout bins, replacement of the pneumatic conveying system with totally enclosed belt conveyors and a second dust control filter - MAC. The aspiration system was revised for improved dust control. See attached flow diagrams. EU 4750-0033-0001 applies to the operations associated with the LTMS RJ filter; EU 4750-033-0011 to those asociated with the LTMS MAC filter.

The existing LTMS system includes a receiving pit aspirated to the LTMS MAC filter, as documented in the application for the MAC filter, etc. The pit has historically been used to off-load meal from rail cars due either to quality or gross weight concerns. The drag conveyor below the pit feeds the conveying system normally used to elevate meal into the LTMS storage building. The conveying system is aspirated to the LTMS RJ filter. This application requests approval to receive grain from either hopper rail cars or hopper trucks at the LTMS aspirated pit for storage in LTMS. After temporary storage the grain will be loaded into hopper bottom trucks and received at the grain elevator. Therefore, additional handling versus grain normally handled at the elevator includes the LTMS receiving and loadout operation. Filter emissions are curently permitted. Any handling of grain will subtract from time available for the handling of meal, and associated operation of the two aspiration systems.

New emissions associated with grain receiving and loadout at LTMS (August 2004).

LTMS TRUCK/RAIL DUMP
4750-0033-0011

PM Emission Factor	0.035	lb/ton	(Table 9.9.1-1, Hopper Truck Receiving AP-42, 3/03)	
PM10 Emission Factor	0.0078	lb/ton	SCC30200552 & 30200553	
PM10/PM ratio	0.22		Operation at capacity	
Unloading rate/hour	300	tons		20 hours/day
Unloading rate/year	75,000	tons	maximum limit requested	12.5 days/year

Pit area	21.8	sq ft		
Pit aspiration	4364	ACFM		
Pit aspiration face velocity	200	fpm		
Operation	250	hours/year	at capacity	250 hours/year

Potential PM emissions due to grain unloading, excluding fugitives = Emission factor * process rate * capture effy/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture effy/100)
= 10.0 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)/(2000 lb/ton)*(capture effy/100)
= 1.2 tons/year

Potential PM10 emissions due to grain unloading, excluding fugitives = Emission factor * process rate *(capture eff/100)

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture eff/100)
= 2.2 lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year/(2000 lb/ton)*(capture effy/100)
= 0.3 tons/year

Potential fugitive PM emissions due to grain unloading	=	Emission factor * process rate * (100-Capture efficiency)/100
a. Max Hourly	=	(lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
	=	0.53 lbs/hour
b. Max Yearly	=	(lb/ton)*(unload rate ton/year)*((100-eff'y)/100)/(2000 lb/ton)
	=	0.1 tons/year
Potential fugitive PM10 emissions due to grain unloading	=	Emission factor * process rate * (100-Capture efficiency)/100
a. Max Hourly	=	(lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
	=	0.1 lbs/hour
b. Max Yearly	=	(lb/ton)*(unload rate ton/year)*((100-eff'y/100))/(2000 lb/ton)
	=	0.01 tons/year

All grain handling systems except for the receiving pit are totally enclosed with no potential emissions. Emisions of the LTMS MAC filter are currently permited at 8760 hours of operation per year.

LTMS GRAIN HANDLING
4750-0033-0001
All grain handling systems are totally enclosed or inside the LTMS building with no potential emissions. Emisions of the LTMS RJ filter are currently permited at 8760 hours of operation per year.

LTMS TRUCK LOADOUT
4750-0033-0000
Grain loadout will be conducted by endloader operating inside the LTMS building loading the hopper of a belt style truck loader, also located inside the building, which will discharge the grain into the transfer haul hopper trucks.

PM Emission Factor	0.086	lb/ton	(Table 9.9.1-1, Truck Loadout AP-42, 3/03)		
PM10 Emission Factor	0.029	lb/ton	SCC30200560		
PM10/PM ratio	0.34		Operation at capacity		
Unloading rate/hour	300	tons		20	hours/day
Unloading rate/year	75,000	tons maximum limit requested		12.5	days/year
Capture efficiency	60	% due to shed enclosure		~2	week/year
Operation	250	hours/year at capacity		250	hours/year

Potential PM emissions due to grain loadout, excluding fugitives	=	Emission factor * process rate * capture effy/100
a. Max Hourly	=	(lb/ton)*(unload rate ton/hour)*(capture effy/100)
	=	15.5 lbs/hour
b. Max Yearly	=	(lb/ton)*(unload rate ton/year)/(2000 lb/ton)*(capture effy/100)
	=	1.9 tons/year
Potential PM10 emissions due to grain loadout, excluding fugitives	=	Emission factor * process rate *(capture eff/100)
a. Max Hourly	=	(lb/ton)*(unload rate ton/hour)*(capture eff/100)
	=	5.2 lbs/hour
b. Max Yearly	=	(lb/ton)*(unload rate ton/year/(2000 lb/ton)*(capture effy/100)
	=	0.7 tons/year

Potential fugitive PM emissions due to grain loadout	=	Emission factor * process rate * (100-Capture efficiency)/100
a. Max Hourly	=	(lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
	=	10.3 lbs/hour
b. Max Yearly	=	(lb/ton)*(unload rate ton/year)*((100-eff'y)/100)/(2000 lb/ton)
	=	1.3 tons/year
Potential fugitive PM10 emissions due to grain loadout	=	Emission factor * process rate * (100-Capture efficiency)/100
a. Max Hourly	=	(lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
	=	3.5 lbs/hour
b. Max Yearly	=	(lb/ton)*(unload rate ton/year)*((100-eff'y/100))/(2000 lb/ton)
	=	0.44 tons/year

EMISSIONS PTE REPORT
WORKSHEET

YEAR- max

All grain receiving operations

PM Emission Factor	0.18	lb/ton	(Table 9.9.1-1, Straignht Truck Receiving AP-42, 5/98)		
PM10 Emission Factor	0.059	lb/ton	SCC30200551		
PM10/PM ratio	0.33		Operation		
Unloading rate/hour		tons		16	hours/day
Bushels processed	bushels	tons			
corn	36,500,000	1,022,000			
beans/wheat	27,000,000	810,000			
Unloading rate/year	1,832,000	tons		340	days/year
Capture efficiency	90	% due to shed enclosure and aspiration			week/year
Operation	5,440	hours/year		5,440	hours/year

Potential PM emissions due to grain unloading, excluding fugitives = Emission factor * process rate * capture effy/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture effy/100)
= lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)/(2000 lb/ton)*(capture effy/100)
= 148.4 tons/year

Potential PM10 emissions due to grain unloading, excluding fugitives = Emission factor * process rate *(capture eff/100)

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*(capture eff/100)
= lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year/(2000 lb/ton)*(capture effy/100)
= 48.6 tons/year

Potential fugitive PM emissions due to grain unloading = Emission factor * process rate * (100-Capture efficiency)/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
= lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)*((100-eff'y)/100)/(2000 lb/ton)
= 16.5 tons/year

Potential fugitive PM10 emissions due to grain unloading = Emission factor * process rate * (100-Capture efficiency)/100

a. Max Hourly = (lb/ton)*(unload rate ton/hour)*((100-eff'y)/100)
= lbs/hour

b. Max Yearly = (lb/ton)*(unload rate ton/year)*((100-eff'y/100))/(2000 lb/ton)
= 5.4 tons/year

Subject: Bunge North America, Inc., - ID #183020ABT

Hello Mr. Burris,
I'm contacting you in regard to the Permit application for federally enforceable state operating permit (FESOP)
For Bunge North America, Inc., located at 321 E. North Street, Danville, Vermilion County,
ID #183020ABT, permit application #96020027, a draft of the permit has been developed, see attached file.
Further, to continue with de review of these permit , we need the following

1. A fugitive dust plant for the source.
2. Bunge to review the draft permit and provide us with their comments.

Attached are also documents that will help with the development of a source Fugitive Particulate Operating Program (FPOP).

Don't hesitate to contact me if you have any questions.

Thank you.

Hello Mr. Burris,
I'm contacting you in regard to the Permit application for federally enforceable state operating permit (FESOP)
For Bunge North America, Inc., located at 321 E. North Street, Danville, Vermilion County,
ID #183020ABT, permit application #96020027, a draft of the permit has been developed, see attached file.
Further, to continue with de review of these permit , we need the following

1. A fugitive dust plant for the source.
2. Bunge to review the draft permit and provide us with their comments.

Attached are also documents that will help with the development of a source Fugitive Particulate Operating Program (FPOP).

Don't hesitate to contact me if you have any questions.

Thank you.

German Barria

Good morning Mr. Burris,
We received an application for a construction permit (App No. 22040008) on April 8, 2022. We also sent Bunge a draft of their FESOP back in June 1, 2021 for their review, as well as we requested a fugitive dust plan.
We will need a fugitive dust plan in order to process this application for construction.
Further, this source is located in an Environmental Justice Area (E.J), as so, IEPA has been requesting applicant for construction permit to what emission limits they request in construction permit, to offset them in their source overall operating permit limits. In this application Bunge proposes a permit limit for the S 105 Roof Carter-Day Filter of PM/PM10: 3.05 tons/year, PM2.5: 1.52 tons/year, we will like to see that been reduced in some where else in the limits that are proposed in the draft FESOP.

Please don't hesitate to contact me if you have any questions.

Thank you.

OPERATING PROGRAM FOR FUGITIVE PARTICULATE CONTROL

1. THIS FORM IS USED TO APPLY FOR A FUGITIVE DUST OPERATING PROGRAM AS REQUIRED BY 35 IAC 212.309. COMPLETE THE FORM, KEEP ONE COPY FOR YOUR RECORDS, AND RETURN TWO COPIES TO THE ATTENTION OF BUREAU OF AIR PERMIT SECTION MANAGER AT THE ADDRESS LISTED ABOVE.

2a. NAME OF OWNER:		3a. NAME OF OPERATOR:	
2b. STREET ADDRESS OF OWNER:		3b. STREET ADDRESS OF OPERATOR:	
2c. CITY OF OWNER:		3c. CITY OF OPERATOR:	
2d. STATE OF OWNER:	2e. ZIP CODE:	3d. STATE OF OPERATOR:	3e. ZIP CODE:

4a. NAME OF CORPORATE DIVISION OR PLANT:		4b. STREET ADDRESS OF EMISSION SOURCE:		
4c. CITY OF EMISSION SOURCE:	4d. LOCATED WITHIN CITY LIMITS: ☐ YES ☐ NO	4e. TOWNSHIP:	4f. COUNTY:	4g. ZIP CODE:

5. SUBMIT A SCALE MAP SHOWING ALL STORAGE PILES, CONVEYOR LOADING OPERATIONS, STORAGE PILE ACCESS ROADS, NORMAL TRAFFIC ROADS, PARKING FACILITIES, LOCATION OF UNLOADING AND TRANSPORTING OPERATIONS WITH POLLUTION CONTROL EQUIPMENT.

6a. DO STORAGE PILES CONTAIN A TOTAL OF MORE THAN 260,000 TONS OF MATERIAL IN A CALENDER YEAR? ☐ YES ☐ NO

6b. IF THE ANSWER TO 6a WAS YES, PLEASE SUBMIT THE FOLLOWING INFORMATION.

TOTAL AMOUNT OF MATERIAL IN THE STORAGE PILES: TONS/YEAR

AND SUBMIT AN ATTACHED SHEET DESCRIBING:

I) DETAILED OPERATING PROCEDURES AND CONTROL METHODS BY WHICH FUGITIVE PARTICULATES FROM THESE STORAGE PILES WILL BE MINIMIZED DURING LOADING, UNLOADING, PILE MAINTENANCE, AND WIND EROSION. HOW OFTEN WILL THESE PILES BE TREATED WITH SURFACTING AGENT? NAME THE TYPE AND CONCENTRATION OF SURFACTANT THAT WILL BE USED.

II) TYPE OF CONTROL METHODS USED FOR FUGITIVE PARTICULATE EMISSIONS FROM CONVEYOR LOADING OPERATIONS AND NORMAL TRAFFIC PATTERN ROADS SERVING THESE STORAGE PILES. IF SURFACTING AGENT IS USED STATE TYPE AND CONCENTRATION OF SURFACTING AGENT AND FREQUENCY OF ITS USE.

III) TYPE OF CONTROL METHODS USED FOR FUGITIVE PARTICULATE EMISSIONS FROM ALL PAVED OR UNPAVED PARKING LOTS AND NORMAL TRAFFIC PATTERN ROADS AT THIS FACILITY. IF ROADS ARE PAVED INDICATE FOOTAGE OF ROADS THAT WILL BE PAVED AND HOW FREQUENTLY THESE ROADS WILL BE CLEANED.

7. DOES THIS FACILITY HAVE ANY OF THE FOLLOWING SOURCES?	
a.) CRUSHERS	☐ YES ☐ NO
b.) GRINDING MILLS	☐ YES ☐ NO
c.) SCREENING OPERATIONS	☐ YES ☐ NO
d.) BUCKET ELEVATORS	☐ YES ☐ NO
e.) CONVEYORS	☐ YES ☐ NO
f.) CONVEYOR TRANSFER POINTS	☐ YES ☐ NO

g.) BAGGING OPERATIONS	☐ YES ☐ NO
h.) STORAGE BINS	☐ YES ☐ NO
i.) FINE PRODUCT TRUCK AND TRAILER LOADING OPERATIONS	☐ YES ☐ NO
j.) UNLOADING AND TRANSPORTING OPERATIONS OF MATERIAL COLLECTED BY POLLUTION CONTROL EQUIPMENT	☐ YES ☐ NO
k.) UNPAVED NORMAL TRAFFIC ROADS	☐ YES ☐ NO
l.) PAVED NORMAL TRAFFIC ROADS	☐ YES ☐ NO
m.) INPAVED PARKING LOTS	☐ YES ☐ NO
n.) PAVED PARKING LOTS	☐ YES ☐ NO

7b. FOR EACH SOURCE MARKED YES, ATTACH AN ADDITIONAL SHEET DESCRIBING THE TYPE OF CONTROL METHODS THAT WILL BE USED TO CONTROL FUGITIVE PARTICULATE EMISSIONS. IF SURFACTANT IS USED, STATE THE TYPE AND CONCENTRATION OF SURFACTANT AND FREQUENCY OF ITS APPLICATION. IF THE ROADS AND PARKING LOTS ARE PAVED, STATE THE FREQUENCY OF CLEANING.

8. VEHICULAR MILES TRAVEL INFORMATION:
THIS INFORMATION IS TO BE DETERMINED BY THE NUMBER OF CARS MULTIPLIED BY THE DISTANCE TRAVELED FOR THE FOLLOWING ROADS.

I) TRAFFIC ON UNPAVED NORMAL TRAFFIC ROADS IN	MILES PER YEAR
II) TRAFFIC ON PAVED NORMAL TRAFFIC ROADS IN	MILES PER YEAR
III) TRAFFIC ON UNPAVED PARKING LOTS IN	MILES PER YEAR
IV) TRAFFIC ON PAVED PARKING LOTS IN	MILES PER YEAR

9. IS THIS FUGITIVE PARTICULATE CONTROL PROGRAM IMPLEMENTED AT THE PRESENT? ☐ YES ☐ NO

10.

FEDERALLY ENFORCEABLE STATE OPERATING PERMIT -- NSPS and NESHAP SOURCE

PERMITTEE

Bunge North America, Inc.
Attn: Dean Hughes
11720 Borman Drive
St. Louis, Missouri 63146-1000

Application No.: 96020027 I.D. No.: 183020ABT
Applicant's Designation: Date Received: December 5, 2011
Operation of: Corn Mill & Grain Elevator
Date Issued: Expiration Date:
Source Location: 321 E. North Street, Danville, Vermilion County

This permit is hereby granted to the above-designated Permittee to OPERATE emission unit(s) and/or air pollution control equipment consisting of:

Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10;
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96;
West Headhouse Transfer General Aspiration (5012-0005-0029) controlled by Baghouse Filters DD 484RF12;
RHOMBO Truck Dump Pit #3 (5012-0003-0013) controlled by Baghouse Filters APM SJL156-6;
Railcar Dump Pit (5012-0004-0016) controlled by Baghouse Filters APM 41120.12;
RHOMBO West General Aspiration (5012-0009-0009) controlled by Baghouse Filters APM SJL72-6;
RHOMBO Gallery Aspiration (5012-0003-0018) controlled by Baghouse Filters APM SJL72-6;
Track 6 Vacuum (5012-0010-0047) controlled by Baghouse Filters HOFFMAN 48X96;
Cleanings Discharge (4870-0013-0015) controlled by Baghouse Filters BUHLER 16S-6-30;
Conveying General Aspiration (4750-0029-0015) controlled by Baghouse Filters MICROPUL 100S-6-20;

Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS):
Truck Dump #4 & W. Gallery Aspiration (5012-0005-0021) controlled by Baghouse Filters DD 484RF12;
Cleaning North APM (4870-0013-0001) controlled by Baghouse Filters APM 41216.12;
Corn Cleaning Bldg 115 #2 (4880-0034-0069) controlled by Baghouse Filters TD 484RF12;
North St Grain/Meal Truck Dump Pit #2 (5012-0002-0012) controlled by Baghouse Filters DD 48RF12;

Dry Corn Milling, Processing and Products Handling:

LTMS Truck Loadout (4750-0033-0000B);

Boiler House/Grounds:
One (1) 96.55 mmBtu/hour Natural Gas/Distillate Fuel-Oil Fired Boiler with Low NO_x Burner (Boiler #1);
One (1) 27.90 mmBtu/hour Natural Gas-Fired/Distillate Fuel-Oil Fired Boiler (Clayton Boiler);
One (1) 2,168 engine Hp Diesel-Powered Emergency Generator Set (DG-100); and

Fugitive PM and PM_{10} emissions

pursuant to the above referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This Federally Enforceable State Operating Permit (FESOP) is issued to limit the emissions of air pollutants from the source to less than major source thresholds (i.e., 100 tons/year for Carbon Monoxide (CO), Nitrogen Oxides (NO_x), and Particulate Matter less than 10 microns (PM_{10})). As a result, the source is excluded from the requirements to obtain a Clean Air Act Permit Program (CAAPP) permit. The maximum emissions of this source, as limited by the conditions of this permit, are described in Attachment A.

b. Prior to issuance, a draft of this permit has undergone a public notice and comment period.

c. This permit supersedes all operating permit(s) for this location.

2a. The Clayton Boiler is subject to the New Source Performance Standard (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR Part 60 Subparts A and Dc. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States Environmental Protection Agency (USEPA) under a delegation agreement. Pursuant to 40 CFR 60.40c(a), except as provided in 40 CFR 60.40c(d), (e), (f), and (g), the affected facility to which 40 CFR 60 Subpart Dc applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (mmBtu/hr)) or less, but greater than or equal to 2.9 MW (10 mmBtu/hr).

b. Pursuant to 40 CFR 60.42c(d), on and after the date on which the initial performance test is completed or required to be completed under 40 CFR 60.8, whichever date comes first, no owner or operator of an affected facility that combusts oil shall cause to be discharged into the atmosphere from that affected facility any gases that contain SO_2 in excess of 215 ng/J (0.50 lb/mmBtu) heat input from oil; or, as an alternative, no owner or operator of an affected facility that combusts oil shall combust oil in the affected facility that contains greater than 0.5 weight percent sulfur. The percent reduction requirements are not applicable to affected facilities under this paragraph.

c. Pursuant to 40 CFR 60.42c(h)(1), for distillate oil-fired affected facilities with heat input capacities between 2.9 and 29 MW (10 and 100 mmBtu/hour), compliance with the emission limits or fuel oil sulfur limits under 40 CFR 60.42c may be determined based on a certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

d. Pursuant to 40 CFR 60.42c(i), the SO_2 emission limits, fuel oil sulfur limits, and percent reduction requirements under 40 CFR 60.42c apply at all times, including periods of startup, shutdown, and malfunction.

3a. The Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) are subject to the NSPS for Grain Elevators, 40 CFR Part 60 Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 60.300(a), the provisions of 40 CFR 60 Subpart DD apply to each affected facility at any grain terminal elevator or any grain storage elevator, except as provided under 40 CFR 60.304(b). The affected facilities are each truck unloading station, truck loading station, barge and ship unloading station, barge and ship loading station, railcar loading station, railcar unloading station, grain dryer, and all grain handling operations.

b. Pursuant to 40 CFR 60.300(b), any facility under 40 CFR 60.300(a) which commences construction, modification or reconstructed after August 3, 1978 is subject to the requirements of 40 CFR 60 Subpart DD.

c. Pursuant to 40 CFR 60.302(b), on and after the date on which the performance test required to be conducted by 40 CFR 60.8 is completed,

no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere from any affected facility except a grain dryer any process emission which:

i. Contains particulate matter in excess of 0.023 g/dscm (ca. 0.01 gr/dscf).

ii. Exhibits greater than 0 percent opacity.

d. Pursuant to 40 CFR 60.302(c), on and after the 60th day of achieving the maximum production rate at which the affected facility will be operated, but no later than 180 days after initial startup, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere any fugitive emission from:

i. Any individual truck unloading station, railcar unloading station, or railcar loading station, which exhibits greater than 5 percent opacity.

ii. Any grain handling operation, which exhibits greater than 0 percent opacity.

iii. Any truck loading station which exhibits greater than 10 percent opacity.

4a. Emergency Generator Set DG-100 is subject to the National Emission Standard for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR Part 63 Subparts A and ZZZZ. The Illinois EPA is administering the NESHAP in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 63.6590(a), an affected source is any existing, new, or reconstructed stationary RICE located at a major or area source of HAP emissions, excluding stationary RICE being tested at a stationary RICE test cell/stand.

b. Pursuant to 40 CFR 63.6595(a)(1), if you have an existing stationary RICE, excluding existing non-emergency CI stationary RICE, with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the applicable emission limitations, operating limitations and other requirements no later than June 15, 2007. If you have an existing non-emergency CI stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, an existing stationary CI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary CI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than May 3, 2013. If you have an existing stationary SI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary SI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than October 19, 2013.

c. Pursuant to 40 CFR 63.6603(a), if you own or operate an existing stationary RICE located at an area source of HAP emissions, you must comply with the requirements in Table 2d to 40 CFR 63 Subpart ZZZZ and the operating limitations in Table 2b to 40 CFR 63 Subpart ZZZZ that apply to you.

Table 2d to Subpart ZZZZ of Part 63—Requirements for Existing Stationary RICE Located at Area Sources of HAP Emissions

As stated in 40 CFR 63.6600 and 63.6640, you must comply with the following requirements for existing stationary RICE located at area sources of HAP emissions:

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
4. Emergency stationary CI RICE and black start stationary CI RICE.[2]	a. Change oil and filter every 500 hours of operation or annually, whichever comes first;[1]	
	b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first; and	
	c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.	

[1]Sources have the option to utilize an oil analysis program as described in 40 CFR 63.6625(i) or (j) in order to extend the specified oil change requirement in Table 2d of 40 CFR 63 Subpart ZZZZ.

[2]If an emergency engine is operating during an emergency and it is not possible to shut down the engine in order to perform the management practice requirements on the schedule required in Table 2d of 40 CFR 63 Subpart ZZZZ, or if performing the management practice on the required schedule would otherwise pose an unacceptable risk under federal, state, or local law, the management practice can be delayed until the emergency is over or the unacceptable risk under federal, state, or local law has abated. The management practice should be performed as soon as practicable after the emergency has ended or the unacceptable risk under Federal, State, or local law has abated. Sources must report any failure to perform the management practice on the schedule required and the Federal, State or local law under which the risk was deemed unacceptable.

5a. The Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; Corn Mill Products Milling and Handling; Boiler #1, Clayton Boiler, and Emergency Generator Set DG-100 are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions). Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent,

into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute period shall occur from only one such emission unit located within a 305 m (1000 ft) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 212 Subpart E (Particulate Matter Emissions From Fuel Combustion Emission Units). Pursuant to 35 Ill. Adm. Code 212.206, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period to exceed 0.15 kg of particulate matter per MW-hr of actual heat input from any fuel combustion emission unit using liquid fuel exclusively (0.10 lbs/mmBtu).

d. This source is subject to 35 Ill. Adm. Code Part 212 Subpart K (Fugitive Particulate Matter). Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

e. When processing and handling processed materials, the emission units constructed on or after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

f. Pursuant to 35 Ill. Adm. Code 212.321(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.321(c) shall be determined by using the equation:

$$E = A(P)^B$$

where:

P = Process weight rate; and
E = Allowable emission rate; and,

i. Up to process weight rates of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.214	2.54
B	0.534	0.534

ii. For process weight rate greater than or equal to 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	11.42	24.8
B	0.16	0.16

g. Pursuant to 35 Ill. Adm. Code 212.321(c), Limits for Process Emission Units for Which Construction or Modification Commenced on or After April 14, 1972:

Metric		English

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lbs/hr
454.	30.4	500.00	67.00

where:

P = Process weight rate in metric or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

h. When processing and handling processed materials, the emission units constructed before after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.322(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any process emission unit for which construction or modification commenced prior to April 14, 1972, which, either alone or in combination with the emission of particulate matter from all other similar process emission units at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.322(c).

i. Pursuant to 35 Ill. Adm. Code 212.322(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.322(c) shall be determined by using the equation:

$$E = C + A(P)^B$$

where:

P = process weight rate; and,
E = allowable emission rate; and,

i. For process weight rates up to 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.985	4.10
B	0.67	0.67
C	0	0

ii. For process weight rates in excess or 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	25.21	55.0

	Metric	English
B	0.11	0.11
C	-18.4	-40.0

j. Pursuant to 35 Ill. Adm. Code 212.322(c), Limits for Process Emission Units For Which Construction or Modification Commenced Prior to April 14, 1972:

Metric		English	
P Mg/hr	E kg/hr	P T/hr	E lbs/hr
0.05	0.27	0.05	0.55
0.1	0.42	0.10	0.87
0.2	0.68	0.20	1.40

320.0	29.4	350.00	64.90
360.0	30.0	400.00	66.20
400.0	30.6	450.00	67.70
454.0	31.3	500.00	69.00

where:

P = Process weight rate in Mg/hr or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

k. The handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations are subject to 35 Ill. Adm. Code Part 212 Subpart S (Agriculture). Pursuant to 35 Ill. Adm. Code 212.462, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d), or allowed to use alternate control according to 35 Ill. Adm. Code

212.461(g), existing grain-handling operations with a total annual grain through-put of 300,000 bushels or more shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall demonstrate compliance with the following:

i. Cleaning and Separating Operations.

A. Particulate matter generated during cleaning and separating operations shall be captured to the extent necessary to prevent visible particulate matter emissions directly into the atmosphere.

B. For grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area, air contaminants collected from cleaning and separating operations shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

ii. Major Dump-Pit Area.

Induced Draft.

A. Induced draft shall be applied to major dump pits and their associated equipment (including, but not limited to, boots, hoppers and legs) to such an extent that a minimum face velocity is maintained, at the effective grate surface, sufficient to contain particulate emissions generated in unloading operations. The minimum face velocity at the effective grate surface shall be at least 200 fpm, which shall be determined by using the equation:

$$V = Q/A$$

where:
V = face velocity; and
Q = induced draft volume in scfm; and
A = effective grate area in ft^2; and

B. The induced draft air stream for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be confined and conveyed through air pollution control equipment which has an overall rated and actual particulate collection efficiency of not less than 90 percent by weight;

C. Means or devices (including, but not limited to, quick-closing doors, air curtains or wind deflectors) shall be employed to prevent a wind velocity in excess of 50 percent of the induced draft face velocity at the pit; provided, however, that such means or devices do not have to achieve

the same degree of prevention when the ambient air wind exceeds 25 mph. The wind velocity shall be measured, with the induced draft system not operating, at a point midway between the dump-pit area walls at the point where the wind exits the dump-pit area, and at a height above the dump-pit area floor of approximately 2 ft; or

iii. Internal Transferring Area.

A. Internal transferring area shall be enclosed to the extent necessary to prohibit visible particulate matter emissions directly into the atmosphere.

B. Air contaminants collected from internal transfer operations for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

iv. Load-Out Area.

A. Truck and hopper car loading shall employ socks, sleeves or equivalent devices which extend 6 inches below the sides of the receiving vehicle, except for topping off. Choke loading shall be considered an equivalent method as long as the discharge is no more than 12 inches above the sides of the receiving vehicle.

B. Box car loading shall employ means or devices to prevent the emission of particulate matter into the atmosphere to the fullest extent which is technologically and economically feasible.

l. Pursuant to 35 Ill. Adm. Code 212.463, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d) or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), grain-drying operations for which construction or modification commenced prior to June 30, 1975, with a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity (using the American Society of Agricultural Engineers Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers) shall be operated in such a fashion as to preclude the emission of particulate matter larger than 300 microns mean particle diameter, shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the following:

i. Column Dryers. The largest effective circular diameter of transverse perforations in the external sheeting of a column dryer shall not exceed 0.094 inch, and the grain inlet and outlet shall be enclosed.

ii. Rack Dryers. No portion of the exhaust air of rack dryers shall be emitted to the ambient atmosphere without having passed through a particulate collection screen having a maximum opening of 50 mesh, U.S. Sieve Series.

A. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling facilities having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 90 percent by weight prior to release into the atmosphere.

B. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling sources having a grain through-put exceeding 2 million bushels per year and located in a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 98 percent by weight prior to release into the atmosphere.

iii. Other Types of Dryers. All other types of dryers shall be controlled in a manner which shall result in the same degree of control required for rack dryers pursuant to 35 Ill. Adm. Code 212.463(b).

iv. New and Modified Grain-Drying Operations. Grain-drying operations constructed or modified on or after June 30, 1975, shall file applications for construction and operating permits pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the control equipment requirements of 35 Ill. Adm. Code 212.463, except for new and modified grain-drying operations which do not result in a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity, using the American Society of Agricultural Engineer Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers.

6a. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 214 Subpart B (New Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 214.122(b)(2), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The sulfur content of all distillate fuel oil used by the fuel combustion emission source must not exceed 15 ppm;

b. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 214 Subpart K (Process Emission Sources). Pursuant to 35 Ill. Adm. Code

214.301, except as further provided by 35 Ill. Adm. Code Part 214, no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm.

c. Pursuant to 35 Ill. Adm. Code 214.305(a)(2), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The sulfur content of all distillate fuel oil used by the process emission source must not exceed 15 ppm;

7. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 215 Subpart K (Use of Organic Material). Pursuant to 35 Ill. Adm. Code 215.301, no person shall cause or allow the discharge of more than 3.6 kg/hr (8 lbs/hr) of organic material into the atmosphere from any emission source, except as provided in 35 Ill. Adm. Code 215.302, 215.303, 215.304 and the following exception: If no odor nuisance exists the limitation of 35 Ill. Adm. Code Part 215 Subpart K shall apply only to photochemically reactive material.

8. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 216 Subpart B (Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 216.121, no person shall cause or allow the emission of carbon monoxide (CO) into the atmosphere from any fuel combustion emission source with actual heat input greater than 2.9 MW (10 mmBtu/hr) to exceed 200 ppm, corrected to 50 percent excess air.

9a. This permit is issued based on the Cooling Tower at this source not being subject to the NESHAP for Process Cooling Towers, 40 CFR 63 Subpart Q because the cooling tower is not operated with chromium-based water treatment chemicals and is not either major sources or is an integral part of a facility that is a major source.

b. This permit is issued based on the source no longer being subject to the NESHAP for Solvent Extraction for Vegetable Oil Production, 40 CFR 63 Subpart GGGG, because the source no longer operates a vegetable oil production process and is no longer a major source of HAP emissions.

c. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters, 40 CFR 63 Subpart DDDDD because this source is not or is part of, a major source of Hazardous Air Pollutant (HAP) emissions as defined in 40 CFR 63.2.

d. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the requirements of the NESHAP for Industrial, Commercial, and Institutional Boilers Area Sources, 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11195(e), gas-fired boilers are not subject to 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11237, gas-fired boiler includes any boiler that burns gaseous fuels not combined with any solid fuels, burns liquid fuel only during periods of gas curtailment, gas supply emergencies, or periodic testing

on liquid fuel. Periodic testing of liquid fuel shall not exceed a combined total of 48 hours during any calendar year.

e. This permit is issued based on the source not being subject to the National Emission Standards (NESHAP) for Area Sources: Prepared Feeds Manufacturing, 40 CFR 63 Subpart DDDDDDD because the source does not use a material containing chromium or a material containing manganese in the manufacturing of prepared feeds.

10a. Pursuant to 35 Ill. Adm. Code 212.314, 35 Ill. Adm. Code 212.301 shall not apply and spraying pursuant to 35 Ill. Adm. Code 212.304 through 212.310 and 35 Ill. Adm. Code 212.312 shall not be required when the wind speed is greater than 40.2 km/hr (25 mph). Determination of wind speed for the purposes of 35 Ill. Adm. Code 212.314 shall be by a one-hour average or hourly recorded value at the nearest official station of the U.S. Weather Bureau or by wind speed instruments operated on the site. In cases where the duration of operations subject to 35 Ill. Adm. Code 212.314 is less than one hour, wind speed may be averaged over the duration of the operations on the basis of on-site wind speed instrument measurements.

b. This permit is issued based on the handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations not being subject to 35 Ill. Adm. Code Part 212 Subpart L while handling grain. Pursuant to 35 Ill. Adm. Code 212.461(a), 35 Ill. Adm. Code 212.302(a), 212.321, and 212.322 shall not apply to grain-handling and grain-drying operations, portable grain-handling equipment and one-turn storage space.

11. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to 35 Ill. Adm. Code Part 215 Subpart K. Pursuant to 35 Ill. Adm. Code 215.303, the provisions of 35 Ill. Adm. Code 215.301 and 215.302 shall not apply to fuel combustion emission sources.

12a. Pursuant to 40 CFR 60.11(b), compliance with opacity standards in 40 CFR Part 60 shall be determined by conducting observations in accordance with Method 9 in appendix A of 40 CFR Part 60, any alternative method that is approved by the Illinois EPA or USEPA, or as provided in 40 CFR 60.11(e)(5). For purposes of determining initial compliance, the minimum total time of observations shall be 3 hours (30 6-minute averages) for the performance test or other set of observations (meaning those fugitive-type emission sources subject only to an opacity standard).

b. Pursuant to 40 CFR 60.11(c), the opacity standards set forth in 40 CFR Part 60 shall apply at all times except during periods of startup, shutdown, malfunction, and as otherwise provided in the applicable standard.

c. Pursuant to 40 CFR 60.11(d), at all times, including periods of startup, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

13a. Pursuant to 40 CFR 63.6595(c), if you own or operate an affected source, you must meet the applicable notification requirements in 40 CFR 63.6645 and in 40 CFR Part 63, Subpart A.

b. Pursuant to 40 CFR 63.6604(b), beginning January 1, 2015, if you own or operate an existing emergency CI stationary RICE with a site rating of more than 100 brake HP and a displacement of less than 30 liters per cylinder that uses diesel fuel and operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must use diesel fuel that meets the requirements in 40 CFR 80.510(b) for nonroad diesel fuel, except that any existing diesel fuel purchased (or otherwise obtained) prior to January 1, 2015, may be used until depleted.

c. Pursuant to 40 CFR 63.6605(a), you must be in compliance with the emission limitations and operating limitations in 40 CFR 63 Subpart ZZZZ that apply to you at all times.

d. Pursuant to 40 CFR 63.6605(b), at all times you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by 40 CFR 63 Subpart ZZZZ have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

e. Pursuant to 40 CFR 63.6625(e)(3), if you own or operate any of the following stationary RICE, you must operate and maintain the stationary RICE and after-treatment control device (if any) according to the manufacturer's emission-related written instructions or develop your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions:

An existing emergency or black start stationary RICE located at an area source of HAP emissions;

f. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

g. Pursuant to 40 CFR 63.6625(h), if you operate a new, reconstructed, or existing stationary engine, you must minimize the engine's time spent at idle during startup and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the emission standards applicable to all times other than startup in Tables 1a, 2a, 2c, and 2d to 40 CFR 63 Subpart ZZZZ apply.

h. Pursuant to 40 CFR 63.6625(i), if you own or operate a stationary CI engine that is subject to the work, operation or management practices in items 1 or 2 of Table 2c to 40 CFR 63 Subpart ZZZZ or in items 1 or 4 of Table 2d to 40 CFR 63 Subpart ZZZZ, you have the option of utilizing an oil analysis program in order to extend the specified oil change requirement in Tables 2c and 2d to 40 CFR 63 Subpart ZZZZ. The oil analysis must be performed at the same frequency specified for changing the oil in Table 2c or 2d to 40 CFR 63 Subpart ZZZZ. The analysis program must at a minimum analyze the following three parameters: Total Base Number, viscosity, and percent water content. The condemning limits for these parameters are as follows: Total Base Number is less than 30 percent of the Total Base Number of the oil when new; viscosity of the oil has changed by more than 20 percent from the viscosity of the oil when new; or percent water content (by volume) is greater than 0.5. If all of these condemning limits are not exceeded, the engine owner or operator is not required to change the oil. If any of the limits are exceeded, the engine owner or operator must change the oil within 2 business days of receiving the results of the analysis; if the engine is not in operation when the results of the analysis are received, the engine owner or operator must change the oil within 2 business days or before commencing operation, whichever is later. The owner or operator must keep records of the parameters that are analyzed as part of the program, the results of the analysis, and the oil changes for the engine. The analysis program must be part of the maintenance plan for the engine.

i. Pursuant to 40 CFR 63.6640(a), you must demonstrate continuous compliance with each emission limitation, operating limitation, and other requirements in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you according to methods specified in Table 6 to 40 CFR 63 Subpart ZZZZ.

Table 6 to Subpart ZZZZ of Part 63– Continuous Compliance With Emission Limitations, Operating Limitations, Work Practices, and Management Practices

As stated in 40 CFR 63.6640, you must continuously comply with the emissions and operating limitations and work or management practices as required by the following:

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
9. Existing emergency and black start stationary RICE ≤500 HP located at a major source of HAP, existing non-emergency stationary RICE <100 HP located at a major source of HAP, existing emergency and black start stationary RICE located at an area source of HAP, existing non-emergency stationary CI RICE ≤300 HP located at an area source of HAP, existing non-emergency 2SLB stationary RICE located at an area source of HAP, existing non-emergency landfill or digester gas stationary SI RICE located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE ≤500 HP located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE >500 HP located at an area source of HAP that operate 24 hours or less per calendar year	a. Work or Management practices	i. Operating and maintaining the stationary RICE according to the manufacturer's emission-related operation and maintenance instructions; or ii. Develop and follow your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions.

j. Pursuant to 40 CFR 63.6640(f), if you own or operate an emergency stationary RICE, you must operate the emergency stationary RICE according to the requirements in 40 CFR 63.6640 (f)(1) through (4). In order for the engine to be considered an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ, any operation other than emergency operation, maintenance and testing, emergency demand response, and operation in non-emergency situations for 50 hours per year, as described in 40 CFR 63.6640(f)(1) through (4), is prohibited. If you do not operate the engine according to the requirements in 40 CFR 63.6640(f)(1) through (4), the engine will not be considered an emergency engine under 40 CFR 63 Subpart ZZZZ and must meet all requirements for non-emergency engines.

i. There is no time limit on the use of emergency stationary RICE in emergency situations.

ii. You may operate your emergency stationary RICE for any combination of the purposes specified in 40 CFR 63.6640(f)(2)(i) for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by 40 CFR 63.6640(f)(3) and (4) counts as part of the 100 hours per calendar year allowed by this paragraph (40 CFR 63.6640(f)(2)).

Emergency stationary RICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by Federal, State or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company

associated with the engine. The owner or operator may petition the Illinois EPA or USEPA for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that Federal, State, or local standards require maintenance and testing of emergency RICE beyond 100 hours per calendar year.

iii. Emergency stationary RICE located at area sources of HAP may be operated for up to 50 hours per calendar year in non-emergency situations. The 50 hours of operation in non-emergency situations are counted towards the 100 hours per calendar year provided in 40 CFR 63.6640(f)(2). Except as provided in 40 CFR 63.6640(f)(4)(i) and (ii), the 50 hours per year for non-emergency situations cannot be used for peak shaving or non-emergency demand response, or to generate income for a facility to an electric grid or otherwise supply power as part of a financial arrangement with another entity.

The 50 hours per year for non-emergency situations can be used to supply power as part of a financial arrangement with another entity if all of the following conditions are met:

A. The engine is dispatched by the local balancing authority or local transmission and distribution system operator.

B. The dispatch is intended to mitigate local transmission and/or distribution limitations so as to avert potential voltage collapse or line overloads that could lead to the interruption of power supply in a local area or region.

C. The dispatch follows reliability, emergency operation or similar protocols that follow specific NERC, regional, state, public utility commission or local standards or guidelines.

D. The power is power provided only to the facility itself or to support the local transmission and distribution system.

E. The owner or operator identifies and records the entity that dispatches the engine and the specific NERC, regional, state, public utility commission or local standards or guidelines that are being followed for dispatching the engine. The local balancing authority or local transmission and distribution system operator may keep these records on behalf of the engine owner or operator.

k. Pursuant to 40 CFR 63.6665, Table 8 to 40 CFR 63 Subpart ZZZZ (see Attachment B) shows which parts of the General Provisions in 40 CFR 63.1 through 63.15 apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less

than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with any of the requirements of the General Provisions specified in Table 8: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing stationary RICE that combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, an existing emergency stationary RICE, or an existing limited use stationary RICE. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in the General Provisions specified in Table 8 except for the initial notification requirements: A new stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new emergency stationary RICE, or a new limited use stationary RICE.

l. Pursuant to 40 CFR 63.6675, emergency stationary RICE means any stationary reciprocating internal combustion engine that meets all of the criteria in paragraphs (1) through (3) of this definition. All emergency stationary RICE must comply with the requirements specified in 40 CFR 63.6640(f) in order to be considered emergency stationary RICE. If the engine does not comply with the requirements specified in 40 CFR 63.6640(f), then it is not considered to be an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ:

i. The stationary RICE is operated to provide electrical power or mechanical work during an emergency situation. Examples include stationary RICE used to produce power for critical networks or equipment (including power supplied to portions of a facility) when electric power from the local utility (or the normal power source, if the facility runs on its own power production) is interrupted, or stationary RICE used to pump water in the case of fire or flood, etc.

ii. The stationary RICE is operated under limited circumstances for situations not included in paragraph (1) of this definition, as specified in 40 CFR 63.6640(f).

iii. The stationary RICE operates as part of a financial arrangement with another entity in situations not included in paragraph (1) of this definition only as allowed in 40 CFR 63.6640(f)(2)(ii) or (iii) and 40 CFR 63.6640(f)(4)(i) or (ii).

14a. Pursuant to 40 CFR 80.510(b), beginning June 1, 2010. Except as otherwise specifically provided in 40 CFR 80 Subpart I, all nonroad (NR) and locomotive (LM) diesel fuel is subject to the following per-gallon standards:

i. Sulfur content 15 ppm maximum for NR diesel fuel.

ii. Cetane index or aromatic content, as follows:

A. A minimum cetane index of 40; or

B. A maximum aromatic content of 35 volume percent.

15a. Housekeeping Practices. Pursuant to 35 Ill. Adm. Code 212.461(b), all grain-handling and grain-drying operations, regardless of size, must implement and use the following housekeeping practices:

i. Air pollution control devices shall be checked daily and cleaned as necessary to insure proper operation.

ii. Cleaning and Maintenance.

A. Floors shall be kept swept and cleaned from boot pit to cupola floor. Roof or bin decks and other exposed flat surfaces shall be kept clean of grain and dust that would tend to rot or become airborne.

B. Cleaning shall be handled in such a manner as not to permit dust to escape to the atmosphere.

C. The yard and surrounding open area, including but not limited to ditches and curbs, shall be cleaned to prevent the accumulation of rotting grain.

iii. Dump Pit.

A. Aspiration equipment shall be maintained and operated.

B. Dust control devices shall be maintained and operated.

iv. Head House. The head house shall be maintained in such a fashion that visible quantities of dust or dirt are not allowed to escape to the atmosphere.

v. Property. The yard and driveway of any source shall be asphalted, oiled or equivalently treated to control dust.

vi. Housekeeping Check List. Housekeeping check lists shall be completed by the manager and maintained on the premises for inspection by Illinois EPA personnel.

16a. In the event that the operation of this source results in an odor nuisance, the Permittee shall take appropriate and necessary actions to minimize odors, including but not limited to, changes in raw material or installation of controls, in order to eliminate the odor nuisance.

b. The baghouse filters and cyclones shall be in operation at all times when the associated emission units are in operation and emitting air contaminants.

c. The Permittee shall, in accordance with the manufacturer(s) and/or vendor(s) recommendations, perform periodic maintenance on the baghouse filters and cyclones such that the baghouse filters and cyclones are kept in proper working condition and not cause a violation of the Illinois Environmental Protection Act or regulations promulgated therein.

d. Each receiving dump pit shall be inspected for proper operation while receiving is occurring, at least once each week (Monday through Sunday) when grain is received.

e. The source shall be inspected for presence of visible emissions from internal transfer and cleaning, while such activity is occurring, at least once each week when such activity is performed.

f. Boiler #1 and Clayton Boiler shall only be operated with natural gas or distillate fuel oil (Grades No. 1 and 2) as the fuel. The use of any other fuel in Boiler #1 or Clayton Boiler may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable requirements.

g. Emergency Generator Set DG-100 shall only be operated with distillate fuel oil (Grades No. 1 and 2) as the fuel. The use of any other fuel in Emergency Generator Set DG-100 may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable requirements.

h. Organic liquid by-products or waste materials shall not be used in any emission unit at this source without written approval from the Illinois EPA.

i. The Illinois EPA shall be allowed to sample all fuels stored at the above location.

j. All normal traffic pattern access areas and all normal traffic pattern roads and parking facilities which are located on Ag Transload Facility property shall be paved or treated with water, oils or chemical dust suppressants. All paved areas shall be cleaned on a regular basis. All areas treated with water, oils or chemical dust suppressants shall have the treatment applied on a regular basis, as needed, in accordance with the operating program required by Condition 16(m).

k. All unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods.

l. Grinding mills, screening operations, bucket elevators, conveyor transfer points, conveyors, bagging operations, storage bins and fine product truck and railcar loading operations shall be sprayed with water or a surfactant solution, utilize choke-feeding or be treated by an equivalent method in accordance with an operating program.

m. The emission units described in Conditions 16(j), (k), and (l) shall be operated under the provisions of an operating program, consistent with 35 Ill. Adm. Code 212.310 and 212.312, and prepared by the owner or operator and submitted to the Illinois EPA for its review. Such operating program shall be designed to significantly reduce fugitive particulate matter emissions.

n. As a minimum the operating program shall include the following:

i. The name and address of the source;

ii. The name and address of the owner or operator responsible for execution of the operating program;

iii. A map or diagram of the source showing approximate locations of storage piles, conveyor loading operations, normal traffic pattern access areas surrounding storage piles and all normal traffic patterns within the source;

iv. Location of unloading and transporting operations with pollution control equipment;

v. A detailed description of the best management practices utilized to achieve compliance with 35 Ill. Adm. Code 212.301, including an engineering specification of particulate collection equipment, application systems for water, oil, chemicals and dust suppressants utilized and equivalent methods utilized;

vi. Estimated frequency of application of dust suppressants by location of materials; and

vii. Such other information as may be necessary to facilitate the Illinois EPA's review of the operating program.

o. The Fugitive Particulate Operating Program, as submitted by the Permittee on DATE PROGRAM APPROVED BY FOS WAS RECEIVED is incorporated herein by reference. The source shall be operated under and shall comply with the provisions of this Fugitive Particulate Operating Program and any amendments to the Fugitive Particulate Operating Program submitted pursuant to Condition 16(m) and (n).

p. The operating program shall be amended from time to time by the owner or operator so that the operating program is current. Such amendments shall be consistent with Condition 16(m) and (n) and shall be submitted to the Illinois EPA within thirty (30) days of any such amendment. Any future amendment to the Fugitive Particulate Operating Program made by the Permittee during the permit term is automatically incorporated by reference provided the revision is not expressly disapproved, in writing, by the Illinois EPA. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the Fugitive Particulate Operating Program, the Permittee shall be required to revise and resubmit the Fugitive Particulate Operating Program

within thirty (30) days of receipt of the notification to address the deficiency.

17a. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #1	0.0017	18,500	0.30	1.20
Hoffman Bldg 301 Vacuum	0.0017	1,000	0.02	0.10
West Headhouse Transfer General Aspiration	0.0017	55,000	0.78	3.40
RHOMBO Truck Dump Pit #3	0.0017	14,500	0.21	0.90
Railcar Dump Pit	0.0017	27,000	0.39	1.70
RHOMBO West General Aspiration	0.0017	6,800	0.09	0.40
RHOMBO Gallery Aspiration	0.0017	9,200	0.14	0.60
Track 6 Vacuum	0.0017	700	0.01	0.04
Cleanings Discharge	0.0006	1,900	0.01	0.04
Conveying General Aspiration	0.00085	7,600	0.05	0.24
Grain Receiving Fugitives				5.40
			Total:	14.02

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

b. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #4 & W. Gallery Aspiration	0.0017	36,017	0.52	2.30
Cleaning North APM	0.00085	41,000	0.30	1.31
Corn Cleaning Bldg 115 #2	0.00085	57,372	0.42	1.83
North St Grain/Meal Truck Dump Pit #2	0.0017	20,000	0.29	1.28
			Total:	6.71

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

c. Emissions from and operation of the Dry Corn Milling, Processing and Products Handling shall not exceed the following limits:

Hominy Loadout Fugitives				1.90
Grain Loadout Fugitives				0.10
			Total:	7.78

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

ii. LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

	Throughput			E M I S S I O N S PM			PM_{10}	
Emission Unit	(T/Mo)	(T/Yr)	(lb/T)	(T/Mo)	(T/Yr)	(lb/T)	(T/Mo)	(T/Yr)
LTMS Truck/Rail Dump Pit	12,500	75,000	0.035	0.02	0.13	0.0078	0.00	0.03
LTMS Truck Loadout	12,500	75,000	0.086	0.27	1.61	0.029	0.09	0.54
				Total:	1.74			0.57

These limits are based on the maximum throughput, standard AP-42 emission factors (Table 9.9-1, AP-42, Fifth Edition, Volume I, Update May 2003), 90% control efficiency for baghouse controlled for truck/rail dump pits, and 50% capture efficiency for loadout enclosure.

f. Emissions from and operation of Boiler #1 shall not exceed the following limits:

i. Natural Gas Usage: 82.274 mmscf/month, 822.741 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	3.46	34.56
Nitrogen Oxides (NO_x)	50.0	2.06	20.57
Particulate Matter (PM)	7.6	0.31	3.13
Sulfur Dioxide (SO_2)	0.6	0.02	0.25
Volatile Organic Material (VOM)	5.5	0.23	2.26

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions ($lbs/10^3$ Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

g. Emissions from and operation of Clayton Boiler shall not exceed the following limits:

i. Natural Gas Usage: 23.771 mmscf/month, 237.712 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	1.00	9.98
Nitrogen Oxides (NO_x)	100.0	1.19	11.89
Particulate Matter (PM)	7.6	0.09	0.90
Sulfur Dioxide (SO_2)	0.6	0.01	0.07
Volatile Organic Material (VOM)	5.5	0.07	0.65

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions (lbs/10^3 Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

h. Emissions from and operation of Emergency Generator Set DG-100 shall not exceed the following limits:

i. Hours of Operation: 100 hours/year;

ii. Emissions from the combustion of fuel oil in the Generator Sets:

Pollutant	Emission Factor (lb/hp hr)	Emissions (lbs/Hr)	(Tons/Year)
Carbon Monoxide (CO)	0.0055	11.92	0.60
Nitrogen Oxides (NO_x)	0.024	52.03	2.60
Particulate Matter (PM)	0.0007	1.52	0.08
Sulfur Dioxide (SO_2)	0.0000121	0.03	0.01
Volatile Organic Material (VOM)	0.000642	1.39	0.07

These limits are based on the rated output of the engine powering the generator set (2,168 engine hp), 100 hours/year of operation, standard emission factors (Table 3.4-1, AP-42, Fifth Edition, Volume 1, Supplement B, October 1996), and a sulfur content of 15 ppm.

i. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total).

17. This permit is issued based on the Potential to Emit (PTE) for Hazardous Air Pollutants (HAPs) as listed in Section 112(b) of the Clean Air Act from this source being less than 10 tons/year of any single HAP and 25 tons/year of any combination of such HAPs. As a result, this permit is issued based on the emissions of all HAPs from this source not triggering the requirements to obtain a CAAPP Permit from the Illinois EPA.

18a. Pursuant to 40 CFR 60.8(a), except as specified in 40 CFR 60.8(a)(1), (a)(2), (a)(3), and (a)(4), at such other times as may be required by the Illinois EPA or USEPA under section 114 of the Clean Air Act, the owner or operator of such facility shall conduct performance test(s) and furnish the Illinois EPA or USEPA a written report of the results of such performance test(s).

b. Pursuant to 40 CFR 60.8(b), performance tests shall be conducted and data reduced in accordance with the test methods and procedures contained in each applicable subpart of 40 CFR Part 60 unless the Illinois EPA or USEPA:

i. Specifies or approves, in specific cases, the use of a reference method with minor changes in methodology;

ii. Approves the use of an equivalent method;

iii. Approves the use of an alternative method the results of which the Illinois EPA or USEPA has determined to be adequate for indicating whether a specific source is in compliance;

iv. Waives the requirement for performance tests because the owner or operator of a source has demonstrated by other means to the Illinois EPA's or USEPA's satisfaction that the affected facility is in compliance with the standard; or

v. Approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors. Nothing in this paragraph shall be construed to abrogate the Illinois EPA's or USEPA's authority to require testing under section 114 of the Clean Air Act.

c. Pursuant to 40 CFR 60.8(c), performance tests shall be conducted under such conditions as the Illinois EPA or USEPA shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Illinois EPA or USEPA such records as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test nor shall emissions in excess of the level of the applicable emission limit during periods of startup, shutdown, and malfunction be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

d. Pursuant to 40 CFR 60.8(d), the owner or operator of an affected facility shall provide the Illinois EPA or USEPA at least 30 days prior notice of any performance test, except as specified under other subparts of 40 CFR Part 60, to afford the Illinois EPA or USEPA the opportunity to have an observer present. If after 30 days notice for an initially scheduled performance test, there is a delay (due to operational problems, etc.) in conducting the scheduled performance test, the owner or operator of an affected facility shall notify the Illinois EPA or USEPA as soon as possible of any delay in the original

test date, either by providing at least 7 days prior notice of the rescheduled date of the performance test, or by arranging a rescheduled date with the Illinois EPA or USEPA by mutual agreement.

e. Pursuant to 40 CFR 60.8(e), the owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

i. Sampling ports adequate for test methods applicable to such facility. This includes:

A. Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures; and

B. Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures.

ii. Safe sampling platform(s).

iii. Safe access to sampling platform(s).

iv. Utilities for sampling and testing equipment.

f. Pursuant to 40 CFR 60.8(f), unless otherwise specified in the applicable subpart of 40 CFR Part 60, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the applicable standard under 40 CFR Part 60. For the purpose of determining compliance with an applicable standard under 40 CFR Part 60, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Illinois EPA's or USEPA's approval, be determined using the arithmetic mean of the results of the two other runs.

g. Pursuant to 40 CFR 60.11(e)(2), except as provided in 40 CFR 60.11(e)(3), the owner or operator of an affected facility to which an opacity standard in 40 CFR Part 60 applies shall conduct opacity observations in accordance with 40 CFR 60.11(b), shall record the opacity of emissions, and shall report to the Illinois EPA or USEPA the opacity results along with the results of the initial performance test required under 40 CFR 60.8. The inability of an owner or operator to secure a visible emissions observer shall not be considered a reason for not conducting the opacity observations concurrent with the initial performance test.

19a. Pursuant to 40 CFR 60.303(a), in conducting the performance tests required in 40 CFR 60.8, the owner or operator shall use as reference methods and procedures the test methods in appendix A of 40 CFR Part 60 or other methods and procedures as specified in 40 CFR 60.303, except as provided in 40 CFR 60.8(b). Acceptable alternative methods and procedures are given in 40 CFR 60.303(c).

b. Pursuant to 40 CFR 60.303(b), the owner or operator shall determine compliance with the particulate matter standards in 40 CFR 60.302 as follows:

i. Method 5 shall be used to determine the particulate matter concentration and the volumetric flow rate of the effluent gas. The sampling time and sample volume for each run shall be at least 60 minutes and 1.70 dscm (60 dscf). The probe and filter holder shall be operated without heaters.

ii. Method 2 shall be used to determine the ventilation volumetric flow rate.

iii. Method 9 and the procedures in 40 CFR 60.11 shall be used to determine opacity.

c. Pursuant to 40 CFR 60.303(c)(1), the owner or operator may use the following as alternatives to the reference methods and procedures specified in 40 CFR 60.303: For Method 5, Method 17 may be used.

20a. Pursuant to 40 CFR 60.44c(g), for oil-fired affected facilities where the owner or operator seeks to demonstrate compliance with the fuel oil sulfur limits under 40 CFR 60.42c based on shipment fuel sampling, the initial performance test shall consist of sampling and analyzing the oil in the initial tank of oil to be fired in the steam generating unit to demonstrate that the oil contains 0.5 weight percent sulfur or less. Thereafter, the owner or operator of the affected facility shall sample the oil in the fuel tank after each new shipment of oil is received, as described under 40 CFR 60.46c(d)(2).

b. Pursuant to 40 CFR 60.44c(h), for affected facilities subject to 40 CFR 60.42c(h)(1), (2), or (3) where the owner or operator seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, the performance test shall consist of the certification, the certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

21a. Pursuant to 35 Ill. Adm. Code 201.282, every emission source or air pollution control equipment shall be subject to the following testing requirements for the purpose of determining the nature and quantities of specified air contaminant emissions and for the purpose of determining ground level and ambient air concentrations of such air contaminants:

i. Testing by Owner or Operator. The Illinois EPA may require the owner or operator of the emission source or air pollution control

equipment to conduct such tests in accordance with procedures adopted by the Illinois EPA, at such reasonable times as may be specified by the Illinois EPA and at the expense of the owner or operator of the emission source or air pollution control equipment. The Illinois EPA may adopt procedures detailing methods of testing and formats for reporting results of testing. Such procedures and revisions thereto, shall not become effective until filed with the Secretary of State, as required by the APA Act. All such tests shall be made by or under the direction of a person qualified by training and/or experience in the field of air pollution testing. The Illinois EPA shall have the right to observe all aspects of such tests.

ii. Testing by the Illinois EPA. The Illinois EPA shall have the right to conduct such tests at any time at its own expense. Upon request of the Illinois EPA, the owner or operator of the emission source or air pollution control equipment shall provide, without charge to the Illinois EPA, necessary holes in stacks or ducts and other safe and proper testing facilities, including scaffolding, but excluding instruments and sensing devices, as may be necessary.

b. Testing required by Condition 22 shall be performed upon a written request from the Illinois EPA by a qualified independent testing service.

22. Pursuant to 35 Ill. Adm. Code 212.110(c), upon a written notification by the Illinois EPA, the owner or operator of a particulate matter emission unit subject to 35 Ill. Adm. Code Part 212 shall conduct the applicable testing for particulate matter emissions, opacity, or visible emissions at such person's own expense, to demonstrate compliance. Such test results shall be submitted to the Illinois EPA within thirty (30) days after conducting the test unless an alternative time for submittal is agreed to by the Illinois EPA.

23a. Pursuant to 40 CFR 60.46c(d)(2), as an alternative fuel sampling procedure for affected facilities combusting oil, oil samples may be collected from the fuel tank for each steam generating unit immediately after the fuel tank is filled and before any oil is combusted. The owner or operator of the affected facility shall analyze the oil sample to determine the sulfur content of the oil. If a partially empty fuel tank is refilled, a new sample and analysis of the fuel in the tank would be required upon filling. Results of the fuel analysis taken after each new shipment of oil is received shall be used as the daily value when calculating the 30-day rolling average until the next shipment is received. If the fuel analysis shows that the sulfur content in the fuel tank is greater than 0.5 weight percent sulfur, the owner or operator shall ensure that the sulfur content of subsequent oil shipments is low enough to cause the 30-day rolling average sulfur content to be 0.5 weight percent sulfur or less.

b. Pursuant to 40 CFR 60.46c(e), the monitoring requirements of 40 CFR 60.46c(a) and (d) shall not apply to affected facilities subject to 40

CFR 60.42c(h)(1), (2), or (3) where the owner or operator of the affected facility seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, as described under 40 CFR 60.48c(f), as applicable.

24. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

25a. Pursuant to 40 CFR 60.7(b), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of an affected facility; any malfunction of the air pollution control equipment; or any periods during which a continuous monitoring system or monitoring device is inoperative.

b. Pursuant to 40 CFR 60.7(f), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain a file of all measurements, including continuous monitoring system, monitoring device, and performance testing measurements; all continuous monitoring system performance evaluations; all continuous monitoring system or monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by 40 CFR Part 60 recorded in a permanent form suitable for inspection. The file shall be retained for at least two years following the date of such measurements, maintenance, reports, and records, except as follows:

The Illinois EPA or USEPA, upon notification to the source, may require the owner or operator to maintain all measurements as required by 40 CFR 60.7(f), if the Illinois EPA or USEPA determines these records are required to more accurately assess the compliance status of the affected source.

26a. Pursuant to 40 CFR 60.48c(c)(1), in addition to the applicable requirements in 40 CFR 60.7, the owner or operator of an affected facility subject to the opacity limits in 40 CFR 60.43c(c) shall submit excess emission reports for any excess emissions from the affected facility that occur during the reporting period and maintain records according to the requirements specified in 40 CFR 60.48c(c)(1) through (3), as applicable to the visible emissions monitoring method used.

For each performance test conducted using Method 9 of appendix A-4 of 40 CFR Part 60, the owner or operator shall keep the records including the information specified in 40 CFR 60.48c(c)(1)(i) through (iii).

i. Dates and time intervals of all opacity observation periods;

ii. Name, affiliation, and copy of current visible emission reading certification for each visible emission observer participating in the performance test; and

iii. Copies of all visible emission observer opacity field data sheets;

b. Pursuant to 40 CFR 60.48c(e), the owner or operator of each affected facility subject to the SO_2 emission limits, fuel oil sulfur limits, or percent reduction requirements under 40 CFR 60.42c shall keep records and submit reports as required under 40 CFR 60.48c(d), including the following information, as applicable.

i. Calendar dates covered in the reporting period.

ii. Identification of the F factor used in calculations, method of determination, and type of fuel combusted.

iii. If fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification as described under 40 CFR 60.48c(f)(1), (2), (3), or (4), as applicable. In addition to records of fuel supplier certifications, the report shall include a certified statement signed by the owner or operator of the affected facility that the records of fuel supplier certifications submitted represent all of the fuel combusted during the reporting period.

c. Pursuant to 40 CFR 60.48c(f)(1), fuel supplier certification shall include the following information for distillate oil:

i. The name of the oil supplier;

ii. A statement from the oil supplier that the oil complies with the specifications under the definition of distillate oil in 40 CFR 60.41c; and

iii. The sulfur content of the oil.

d. i. Pursuant to 40 CFR 60.48c(g)(1), except as provided under 40 CFR 60.48c(g)(2) and (g)(3), the owner or operator of each affected facility shall record and maintain records of the amounts of each fuel combusted during each operating day.

ii. Pursuant to 40 CFR 60.48c(g)(2), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility that combusts only natural gas, wood, fuels using fuel certification in 40 CFR 60.48c(f) to demonstrate compliance with the SO_2 standard, fuels not subject to an emissions standard (excluding opacity), or a mixture of these fuels may elect to record and maintain records of the amount of each fuel combusted during each calendar month.

iii. Pursuant to 40 CFR 60.48c(g)(3), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility or multiple affected facilities located on a

contiguous property unit where the only fuels combusted in any steam generating unit (including steam generating units not subject to 40 CFR 60 Subpart Dc) at that property are natural gas, wood, distillate oil meeting the most current requirements in 40 CFR 60.42c to use fuel certification to demonstrate compliance with the SO_2 standard, and/or fuels, excluding coal and residual oil, not subject to an emissions standard (excluding opacity) may elect to record and maintain records of the total amount of each steam generating unit fuel delivered to that property during each calendar month.

e. Pursuant to 40 CFR 60.48c(i), all records required under 40 CFR 60.48c shall be maintained by the owner or operator of the affected facility for a period of two years following the date of such record.

27. Pursuant to 40 CFR 63.10(b)(3), if an owner or operator determines that his or her stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants regulated by any standard established pursuant to Section 112(d) or (f) of the Clean Air Act, and that stationary source is in the source category regulated by the relevant standard, but that source is not subject to the relevant standard (or other requirement established under 40 CFR Part 63) because of limitations on the source's potential to emit or an exclusion, the owner or operator must keep a record of the applicability determination on site at the source for a period of 5 years after the determination, or until the source changes its operations to become an affected source, whichever comes first. The record of the applicability determination must be signed by the person making the determination and include an analysis (or other information) that demonstrates why the owner or operator believes the source is unaffected (e.g., because the source is an area source). The analysis (or other information) must be sufficiently detailed to allow the USEPA and/or Illinois EPA to make a finding about the source's applicability status with regard to the relevant standard or other requirement. If relevant, the analysis must be performed in accordance with requirements established in relevant subparts of 40 CFR Part 63 for this purpose for particular categories of stationary sources. If relevant, the analysis should be performed in accordance with USEPA guidance materials published to assist sources in making applicability determinations under Section 112 of the Clean Air Act, if any. The requirements to determine applicability of a standard under 40 CFR 63.1(b)(3) and to record the results of that determination under 40 CFR 63.10(b)(3) shall not by themselves create an obligation for the owner or operator to obtain a Title V permit.

28a. Pursuant to 40 CFR 63.6655(a), if you must comply with the emission and operating limitations, you must keep the records described in 40 CFR 63.6655(a)(1) through (a)(5), (b)(1) through (b)(3) and (c).

i. A copy of each notification and report that you submitted to comply with 40 CFR 63 Subpart ZZZZ, including all documentation supporting any Initial Notification or Notification of Compliance

Status that you submitted, according to the requirement in 40 CFR 63.10(b)(2)(xiv).

ii. Records of the occurrence and duration of each malfunction of operation (i.e., process equipment) or the air pollution control and monitoring equipment.

iii. Records of performance tests and performance evaluations as required in 40 CFR 63.10(b)(2)(viii).

iv. Records of all required maintenance performed on the air pollution control and monitoring equipment.

v. Records of actions taken during periods of malfunction to minimize emissions in accordance with 40 CFR 63.6605(b), including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation.

b. Pursuant to 40 CFR 63.6655(d), you must keep the records required in Table 6 of 40 CFR 63 Subpart ZZZZ to show continuous compliance with each emission or operating limitation that applies to you.

c. Pursuant to 40 CFR 63.6655(e), you must keep records of the maintenance conducted on the stationary RICE in order to demonstrate that you operated and maintained the stationary RICE and after-treatment control device (if any) according to your own maintenance plan if you own or operate any of the following stationary RICE.

i. An existing stationary emergency RICE.

ii. An existing stationary CI RICE located at an area source of HAP emissions subject to management practices as shown in Table 2d to 40 CFR 63 Subpart ZZZZ.

d. Pursuant to 40 CFR 63.6655(f)(2), If you own or operate an existing emergency stationary CI RICE located at an area source of HAP emissions that does not meet the standards applicable to non-emergency engines, you must keep records of the hours of operation of the engine that is recorded through the non-resettable hour meter. The owner or operator must document how many hours are spent for emergency operation, including what classified the operation as emergency and how many hours are spent for non-emergency operation. If the engines are used for the purposes specified in 40 CFR 63.6640(f)(2)(ii) or (iii) or 40 CFR 63.6640(f)(4)(ii), the owner or operator must keep records of the notification of the emergency situation, and the date, start time, and end time of engine operation for these purposes.

e. Pursuant to 40 CFR 63.6660(a), your records must be in a form suitable and readily available for expeditious review according to 40 CFR 63.10(b)(1).

f. Pursuant to 40 CFR 63.6660(b), as specified in 40 CFR 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

g. Pursuant to 40 CFR 63.6660(c), you must keep each record readily accessible in hard copy or electronic form for at least 5 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to 40 CFR 63.10(b)(1).

29. Pursuant to 35 Ill. Adm. Code 212.110(e), the owner or operator of an emission unit subject to 35 Ill. Adm. Code Part 212 shall retain records of all tests which are performed. These records shall be retained for at least three (3) years after the date a test is performed.

30a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C), On and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the fuel combustion emission source complies with the requirements in 35 Ill. Adm. Code 214.122(b)(2)(A) and (b)(2)(B), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the process emission source complies with the requirements in 35 Ill. Adm. Code 214.305(a)(1) and (a)(2), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA;

31a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the baghouse filters and cyclones:

   A. Records for periodic inspection of the baghouse filters and cyclones with date, individual performing the inspection, and nature of inspection; and

   B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The Permittee shall keep a copy of the Fugitive Particulate Operating Program, any amendments or revisions to the Fugitive Particulate Operating Program, and the Permittee shall also keep a record of activities completed according to the Fugitive Particulate Operating Program.

iii. Records of housekeeping check lists;

iv. Records for the inspections required by Conditions 16(d) and (e), with date, time and observations if such information is not incorporated in the housekeeping check list.

v. Total flow rate for each baghouse blower (scfm);

vi. Total grain loading for each process (gr/dscf);

vii. Total hours of operation of each baghouse (hours/month and hours/year);

viii. The amount of grain received in LTMS Truck/Rail Dump Pit (tons/month and tons/year);

ix. The amount of grain shipped from the LTMS Truck Loadout (tons/month and tons/year);

x. Natural gas usage for Boiler #1 (mmscf/month and mmscf/year);

xi. Distillate fuel oil usage for Boiler #1 (gallons/month and gallons/year);

xii. Natural gas usage for the Clayton Boiler (mmscf/month and mmscf/year);

xiii. Distillate fuel oil usage for the Clayton Boiler (gallons/month and gallons/year);

xiv. Operating hours of Emergency Generator Set DG-100 (hours/month and hours/year);

xv. An inspection, maintenance and repair log of Emergency Generator Set DG-100 listing each activity performed with date; and

xvi. Monthly and annual emissions of CO, NO_x, PM, PM_{10}, SO_2, and VOM from the source with supporting calculations (tons/month and tons/year).

b. All records and logs required by Condition 31(a) of this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be made available for inspection and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

32. Pursuant to 40 CFR 60.7(a)(4), any owner or operator subject to the provisions of 40 CFR Part 60 shall furnish the Illinois EPA or USEPA written notification or, if acceptable to both the Illinois EPA and USEPA and the owner or operator of a source, electronic notification, as follows:

A notification of any physical or operational change to an existing facility which may increase the emission rate of any air pollutant to which a standard applies, unless that change is specifically exempted under an applicable subpart or in 40 CFR 60.14(e). This notice shall be postmarked 60 days or as soon as practicable before the change is commenced and shall include information describing the precise nature of the change, present and proposed emission control systems, productive capacity of the facility before and after the change, and the expected completion date of the change. The Illinois EPA or USEPA may request additional relevant information subsequent to this notice.

33a. Pursuant to 40 CFR 63.6640(b), you must report each instance in which you did not meet each emission limitation or operating limitation in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you. These instances are deviations from the emission and operating limitations in 40 CFR 63 Subpart ZZZZ. These deviations must be reported according to the requirements in 40 CFR 63.6650. If you change your catalyst, you must reestablish the values of the operating parameters measured during the initial performance test. When you reestablish the values of your operating parameters, you must also conduct a performance test to demonstrate that you are meeting the required emission limitation applicable to your stationary RICE.

b. Pursuant to 40 CFR 63.6640(e), you must also report each instance in which you did not meet the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ that apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major

source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing emergency stationary RICE, an existing limited use stationary RICE, or an existing stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ, except for the initial notification requirements: a new or reconstructed stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new or reconstructed emergency stationary RICE, or a new or reconstructed limited use stationary RICE.

c. Pursuant to 40 CFR 63.6645(a), you must submit all of the notifications in 40 CFR 63.7(b) and (c), 63.8(e), (f)(4) and (f)(6), 63.9(b) through (e), and (g) and (h) that apply to you by the dates specified if you own or operate any of the following;

   i. An existing stationary CI RICE located at an area source of HAP emissions.

   ii. This requirement does not apply if you own or operate an existing stationary RICE less than 100 HP, an existing stationary emergency RICE, or an existing stationary RICE that is not subject to any numerical emission standards.

d. Pursuant to 40 CFR 63.6650(a), you must submit each report in Table 7 of 40 CFR 63 Subpart ZZZZ that applies to you.

Table 7 to Subpart ZZZZ of Part 63—Requirements for Reports

As stated in 40 CFR 63.6650, you must comply with the following requirements for reports:

For each . . .	You must submit a . . .	The report must contain . . .	You must submit the report . . .
4. Emergency stationary RICE that operate or are contractually obligated to be available for more than 15 hours per year for the purposes specified 40 CFR 63.6640(f)(4)(ii)	Report	a. The information in 40 CFR 63.6650(h)(1)	i. annually according to the requirements in 40 CFR 63.6650(h)(2)-(3).

e. Pursuant to 40 CFR 63.6650(b), unless the Illinois EPA or USEPA has approved a different schedule for submission of reports under 40 CFR 63.10(a), you must submit each report by the date in Table 7 of 40 CFR 63 Subpart ZZZZ and according to the requirements in 40 CFR 63.6650(b)(1) through (b)(9).

   i. For semiannual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is

specified for your affected source in 40 CFR 63.6595 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in 40 CFR 63.6595.

ii. For semiannual Compliance reports, the first Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in 40 CFR 63.6595.

iii. For semiannual Compliance reports, each subsequent Compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

iv. For semiannual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

v. For annual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in 40 CFR 63.6595 and ending on December 31.

vi. For annual Compliance reports, the first Compliance report must be postmarked or delivered no later than January 31 following the end of the first calendar year after the compliance date that is specified for your affected source in 40 CFR 63.6595.

vii. For annual Compliance reports, each subsequent Compliance report must cover the annual reporting period from January 1 through December 31.

viii. For annual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than January 31.

f. Pursuant to 40 CFR 63.6650(c), the Compliance report must contain the information in 40 CFR 63.6650(c)(1) through (6).

i. Company name and address.

ii. Statement by a responsible official, with that official's name, title, and signature, certifying the accuracy of the content of the report.

iii. Date of report and beginning and ending dates of the reporting period.

iv. If you had a malfunction during the reporting period, the compliance report must include the number, duration, and a brief description for each type of malfunction which occurred during

the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by an owner or operator during a malfunction of an affected source to minimize emissions in accordance with 40 CFR 63.6605(b), including actions taken to correct a malfunction.

v. If there are no deviations from any emission or operating limitations that apply to you, a statement that there were no deviations from the emission or operating limitations during the reporting period.

g. Pursuant to 40 CFR 63.6650(h), if you own or operate an emergency stationary RICE with a site rating of more than 100 brake HP that operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must submit an annual report according to the requirements in 40 CFR 63.6650(h)(1) through (3).

i. The report must contain the following information:

A. Company name and address where the engine is located.

B. Date of the report and beginning and ending dates of the reporting period.

C. Engine site rating and model year.

D. Latitude and longitude of the engine in decimal degrees reported to the fifth decimal place.

E. Hours spent for operation for the purpose specified in 40 CFR 63.6640(f)(4)(ii), including the date, start time, and end time for engine operation for the purposes specified in 40 CFR 63.6640(f)(4)(ii). The report must also identify the entity that dispatched the engine and the situation that necessitated the dispatch of the engine.

F. If there were no deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), a statement that there were no deviations from the fuel requirements during the reporting period.

G. If there were deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), information on the number, duration, and cause of deviations, and the corrective action taken.

ii. The first annual report must cover the calendar year 2015 and must be submitted no later than March 31, 2016. Subsequent annual reports for each calendar year must be submitted no later than March 31 of the following calendar year.

iii. The annual report must be submitted electronically using the subpart specific reporting form in the Compliance and Emissions Data Reporting Interface (CEDRI) that is accessed through EPA's Central Data Exchange (CDX) (www.epa.gov/cdx). However, if the reporting form specific to 40 CFR 63 Subpart ZZZZ is not available in CEDRI at the time that the report is due, the written report must be submitted to the Illinois EPA or USEPA at the appropriate address listed in 40 CFR 63.13.

34. Pursuant to 35 Ill. Adm. Code 212.110(d), a person planning to conduct testing for particulate matter emissions to demonstrate compliance shall give written notice to the Illinois EPA of that intent. Such notification shall be given at least thirty (30) days prior to the initiation of the test unless a shorter period is agreed to by the Illinois EPA. Such notification shall state the specific test methods from 35 Ill. Adm. Code 212.110 that will be used.

35a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C)(iii), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in this 35 Ill. Adm. Code 214.122(b)(2). At minimum, and in addition to any permitting obligations, the notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3)(C), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in 35 Ill. Adm. Code 214.305(a). At minimum, and in addition to any permitting obligations, such notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

36a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit or otherwise, the Permittee shall submit a report to the Illinois EPA's Bureau of Air Compliance Section in Springfield, Illinois within thirty (30) days after the exceedance or deviation. The report shall identify the duration and the emissions impact of the exceedance or deviation, a copy of the relevant records and information to resolve the exceedance or deviation, and a description of the efforts to reduce emissions from, and the duration of exceedance or deviation, and to prevent future occurrences of any such exceedance or deviation.

b. One (1) copy of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

It should be noted that the 150,000 gallon fuel oil storage tank is exempt from permitting, pursuant to 35 Ill. Adm. Code 201.146(n)(3).

If you have any questions on this permit, please call German Barria at 217/785-1705.

Sincerely,

William D. Marr
Manager, Permit Section
Bureau of Air

WDM:GB:

Attachment A - Emission Summary

This attachment provides a summary of the maximum emissions from the Corn Mill & Grain Elevator operating in compliance with the requirements of this federally enforceable permit. In preparing this summary, the Illinois EPA used the annual operating scenario which results in maximum emissions from such a plant. The resulting maximum emissions are below the levels, (e.g., 100 tons/year for CO, NO_x, and PM_{10}) at which this source would be considered a major source for purposes of the Clean Air Act Permit Program. Actual emissions from this source will be less than predicted in this summary to the extent that less material is handled, and control measures are more effective than required in this permit.

	E M I S S I O N S (Tons/Year)					
Emission Unit	CO	NO_x	PM	PM_{10}	SO_2	VOM
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS)			14.02	14.02		
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS)			6.71	6.71		
Dry Corn Milling, Processing and Products Handling			29.00	29.00		
Corn Mill Products Storage			0.50	0.50		
Corn Mill Products Milling and Handling			9.52	8.35		
Boiler #1						
Natural Gas	34.56	20.57	3.13	3.13	0.25	2.26
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Clayton Boiler					0	0
Natural Gas	9.98	11.89	0.90	0.90	0.07	0.65
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Emergency Generator Set DG-100	0.60	2.60	0.08	0.08	0.01	0.07
Totals	49.40	52.06	66.66	65.49	0.51	3.16

GB:

Attachment B - Table 8 to Subpart ZZZZ of Part 63—Applicability of General Provisions to Subpart ZZZZ.

As stated in 40 CFR 63.6665, you must comply with the following applicable general provisions.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.1	General applicability of the General Provisions	Yes.	
§63.2	Definitions	Yes	Additional terms defined in 40 CFR 63.6675.
§63.3	Units and abbreviations	Yes.	
§63.4	Prohibited activities and circumvention	Yes.	
§63.5	Construction and reconstruction	Yes.	
§63.6(a)	Applicability	Yes.	
§63.6(b)(1)-(4)	Compliance dates for new and reconstructed sources	Yes.	
§63.6(b)(5)	Notification	Yes.	
§63.6(b)(6)	[Reserved]		
§63.6(b)(7)	Compliance dates for new and reconstructed area sources that become major sources	Yes.	
§63.6(c)(1)-(2)	Compliance dates for existing sources	Yes.	
§63.6(c)(3)-(4)	[Reserved]		
§63.6(c)(5)	Compliance dates for existing area sources that become major sources	Yes.	
§63.6(d)	[Reserved]		
§63.6(e)	Operation and maintenance	No.	
§63.6(f)(1)	Applicability of standards	No.	
§63.6(f)(2)	Methods for determining compliance	Yes.	
§63.6(f)(3)	Finding of compliance	Yes.	
§63.6(g)(1)-(3)	Use of alternate standard	Yes.	
§63.6(h)	Opacity and visible emission standards	No	Subpart ZZZZ does not contain opacity or visible emission standards.
§63.6(i)	Compliance extension procedures and criteria	Yes.	
§63.6(j)	Presidential compliance exemption	Yes.	
§63.7(a)(1)-(2)	Performance test dates	Yes	Subpart ZZZZ contains performance test dates at 40 CFR 63.6610, 63.6611, and 63.6612.
§63.7(a)(3)	CAA section 114 authority	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.7(b)(1)	Notification of performance test	Yes	Except that 40 CFR 63.7(b)(1) only applies as specified in 40 CFR 63.6645.
§63.7(b)(2)	Notification of rescheduling	Yes	Except that 40 CFR 63.7(b)(2) only applies as specified in 40 CFR 63.6645.
§63.7(c)	Quality assurance/test plan	Yes	Except that 40 CFR 63.7(c) only applies as specified in 40 CFR 63.6645.
§63.7(d)	Testing facilities	Yes.	
§63.7(e)(1)	Conditions for conducting performance tests	No.	Subpart ZZZZ specifies conditions for conducting performance tests at 40 CFR 63.6620.
§63.7(e)(2)	Conduct of performance tests and reduction of data	Yes	Subpart ZZZZ specifies test methods at 40 CFR 63.6620.
§63.7(e)(3)	Test run duration	Yes.	
§63.7(e)(4)	Administrator may require other testing under section 114 of the CAA	Yes.	
§63.7(f)	Alternative test method provisions	Yes.	
§63.7(g)	Performance test data analysis, recordkeeping, and reporting	Yes.	
§63.7(h)	Waiver of tests	Yes.	
§63.8(a)(1)	Applicability of monitoring requirements	Yes	Subpart ZZZZ contains specific requirements for monitoring at 40 CFR 63.6625.
§63.8(a)(2)	Performance specifications	Yes.	
§63.8(a)(3)	[Reserved]		
§63.8(a)(4)	Monitoring for control devices	No.	
§63.8(b)(1)	Monitoring	Yes.	
§63.8(b)(2)-(3)	Multiple effluents and multiple monitoring systems	Yes.	
§63.8(c)(1)	Monitoring system operation and maintenance	Yes.	
§63.8(c)(1)(i)	Routine and predictable SSM	No	
§63.8(c)(1)(ii)	SSM not in Startup Shutdown Malfunction Plan	Yes.	
§63.8(c)(1)(iii)	Compliance with operation and maintenance requirements	No	
§63.8(c)(2)-(3)	Monitoring system installation	Yes.	
§63.8(c)(4)	Continuous monitoring system (CMS) requirements	Yes	Except that subpart ZZZZ does not require Continuous Opacity Monitoring System (COMS).
§63.8(c)(5)	COMS minimum procedures	No	Subpart ZZZZ does not require COMS.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.8(c)(6)-(8)	CMS requirements	Yes	Except that subpart ZZZZ does not require COMS.
§63.8(d)	CMS quality control	Yes.	
§63.8(e)	CMS performance evaluation	Yes	Except for 40 CFR 63.8(e)(5)(ii), which applies to COMS.
		Except that 40 CFR 63.8(e) only applies as specified in 40 CFR 63.6645.	
§63.8(f)(1)-(5)	Alternative monitoring method	Yes	Except that 40 CFR 63.8(f)(4) only applies as specified in 40 CFR 63.6645.
§63.8(f)(6)	Alternative to relative accuracy test	Yes	Except that 40 CFR 63.8(f)(6) only applies as specified in 40 CFR 63.6645.
§63.8(g)	Data reduction	Yes	Except that provisions for COMS are not applicable. Averaging periods for demonstrating compliance are specified at 40 CFR 63.6635 and 63.6640.
§63.9(a)	Applicability and State delegation of notification requirements	Yes.	
§63.9(b)(1)-(5)	Initial notifications	Yes	Except that 40 CFR 63.9(b)(3) is reserved.
		Except that 40 CFR 63.9(b) only applies as specified in 40 CFR 63.6645.	
§63.9(c)	Request for compliance extension	Yes	Except that 40 CFR 63.9(c) only applies as specified in 40 CFR 63.6645.
§63.9(d)	Notification of special compliance requirements for new sources	Yes	Except that 40 CFR 63.9(d) only applies as specified in 40 CFR 63.6645.
§63.9(e)	Notification of performance test	Yes	Except that 40 CFR 63.9(e) only applies as specified in 40 CFR 63.6645.
§63.9(f)	Notification of visible emission (VE)/opacity test	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.9(g)(1)	Notification of performance evaluation	Yes	Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.
§63.9(g)(2)	Notification of use of COMS data	No	Subpart ZZZZ does not contain opacity or VE standards.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.9(g)(3)	Notification that criterion for alternative to RATA is exceeded	Yes	If alternative is in use.
		Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.	
§63.9(h)(1)-(6)	Notification of compliance status	Yes	Except that notifications for sources using a CEMS are due 30 days after completion of performance evaluations. 40 CFR 63.9(h)(4) is reserved.
			Except that 40 CFR 63.9(h) only applies as specified in 40 CFR 63.6645.
§63.9(i)	Adjustment of submittal deadlines	Yes.	
§63.9(j)	Change in previous information	Yes.	
§63.10(a)	Administrative provisions for recordkeeping/reporting	Yes.	
§63.10(b)(1)	Record retention	Yes	Except that the most recent 2 years of data do not have to be retained on site.
§63.10(b)(2)(i)-(v)	Records related to SSM	No.	
§63.10(b)(2)(vi)-(xi)	Records	Yes.	
§63.10(b)(2)(xii)	Record when under waiver	Yes.	
§63.10(b)(2)(xiii)	Records when using alternative to RATA	Yes	For CO standard if using RATA alternative.
§63.10(b)(2)(xiv)	Records of supporting documentation	Yes.	
§63.10(b)(3)	Records of applicability determination	Yes.	
§63.10(c)	Additional records for sources using CEMS	Yes	Except that 40 CFR 63.10(c)(2)-(4) and (9) are reserved.
§63.10(d)(1)	General reporting requirements	Yes.	
§63.10(d)(2)	Report of performance test results	Yes.	
§63.10(d)(3)	Reporting opacity or VE observations	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.10(d)(4)	Progress reports	Yes.	
§63.10(d)(5)	Startup, shutdown, and malfunction reports	No.	
§63.10(e)(1) and (2)(i)	Additional CMS Reports	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.10(e)(2)(ii)	COMS-related report	No	Subpart ZZZZ does not require COMS.
§63.10(e)(3)	Excess emission and parameter exceedances reports	Yes.	Except that 40 CFR 63.10(e)(3)(i) (C) is reserved.
§63.10(e)(4)	Reporting COMS data	No	Subpart ZZZZ does not require COMS.
§63.10(f)	Waiver for recordkeeping/reporting	Yes.	
§63.11	Flares	No.	
§63.12	State authority and delegations	Yes.	
§63.13	Addresses	Yes.	
§63.14	Incorporation by reference	Yes.	
§63.15	Availability of information	Yes.	

1. SUBPART K: FUGITIVE PARTICULATE MATTER

2. Section 212.301 Fugitive Particulate Matter

No person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

(Source: Amended at 20 Ill. Reg.7605, effective May 22, 1996)

3. Section 212.302 Geographical Areas of Application

a) Sections 212.304 through 212.310 and 212.312 of this Subpart shall apply to all mining operations (SIC major groups 10 through 14), manufacturing operations (SIC major groups 20 through 39 except for those operations subject to Subpart S of this Part (Grain-Handling and Grain-Drying Operations) that are outside the areas defined in Section 212.324(a)(1) of this Part), and electric generating operations (SIC group 491), which are located in the areas defined by the boundaries of the following townships, notwithstanding any political subdivisions contained therein, as the township boundaries were defined on October 1, 1979, in the following counties:

Cook:	All townships
Lake:	Shields, Waukegan, Warren
DuPage:	Addison, Winfield, York
Will:	DuPage, Plainfield, Lockport, Channahon, Peotone, Florence, Joliet
Peoria:	Richwoods, Limestone, Hollis, Peoria, City of Peoria
Tazewell:	Fondulac, Pekin, Cincinnati, Groveland, Washington
Macon:	Decatur, Hickory Point
Rock Island:	Blackhawk, Coal Valley, Hampton, Moline, South Moline, Rock Island, South Rock Island
LaSalle:	LaSalle, Utica
Madison:	Alton, Chouteau, Collinsville, Edwardsville, Fort Russell, Godfrey, Granite City, Nameoki, Venice, Wood River
St. Clair	Canteen, Caseyville, Centerville, St. Clair, Stites, Stookey, Sugar Loaf, Millstadt.

b) In the geographical areas defined in Section 212.324(a)(1) of this Part, Sections 212.304 through 212.310, 212.312, and 212.316 of this Subpart shall apply to all emission units identified in subsection (a) of this Section, and shall further apply to the following operations: grain-handling and grain-drying (Subpart S of this Part), transportation, communications, electric, gas, and sanitary services (SIC

major groups 40 through 49). Additionally, Sections 212.304 through 212.310, 212.312, and 212.316 of this Subpart shall apply to wholesale trade-farm supplies (SIC Industry No. 5191) located in the vicinity of Granite City, as defined in Section 212.324(a)(1)(C) of this Part.

c) Emission units must comply with subsection (b) of this Section by May 11, 1993, or upon initial start-up, whichever occurs later.

(Source: Amended at 20 Ill. Reg.7605, effective May 22, 1996)

4. Section 212.304 Storage Piles

a) All storage piles of materials with uncontrolled emissions of fugitive particulate matter in excess of 45.4 Mg per year (50 T/yr) which are located within a source whose potential particulate emissions from all emission units exceed 90.8 Mg/yr (100 T/yr) shall be protected by a cover or sprayed with a surfactant solution or water on a regular basis, as needed, or treated by an equivalent method, in accordance with the operating program required by Sections 212.309, 212.310 and 212.312 of this Subpart.

b) Subsection (a) of this Section shall not apply to a specific storage pile if the owner or operator of that pile proves to the Agency that fugitive particulate emissions from that pile do not cross the property line either by direct wind action or reentrainment.

(Source: Amended at 20 Ill. Reg.7605, effective May 22, 1996)

5. Section 212.305 Conveyor Loading Operations

All conveyor loading operations to storage piles specified in Section 212.304 of this Subpart shall utilize spray systems, telescopic chutes, stone ladders or other equivalent methods in accordance with the operating program required by Sections 212.309, 212.310 and 212.312 of this Subpart.

(Source: Amended at 20 Ill. Reg.7605, effective May 22, 1996)

6. Section 212.306 Traffic Areas

All normal traffic pattern access areas surrounding storage piles specified in Section 212.304 of this Subpart and all normal traffic pattern roads and parking facilities which are located on mining or manufacturing property shall be paved or treated with water, oils or chemical dust suppressants. All paved areas shall be cleaned on a regular basis. All areas treated with water, oils or chemical dust suppressants shall have the treatment applied on a regular basis, as needed,

in accordance with the operating program required by Sections 212.309, 212.310 and 212.312 of this Subpart.

(Source: Amended at 20 Ill. Reg.7605, effective May 22, 1996)

7. Section 212.307 Materials Collected by Pollution Control Equipment

All unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods.

(Source: Amended at 3 Ill. Reg. 45, p. 100, effective October 26, 1979)

8. Section 212.308 Spraying or Choke-Feeding Required

Crushers, grinding mills, screening operations, bucket elevators, conveyor transfer points, conveyors, bagging operations, storage bins and fine product truck and railcar loading operations shall be sprayed with water or a surfactant solution, utilize choke-feeding or be treated by an equivalent method in accordance with an operating program.

(Source: Amended at 3 Ill. Reg. 45, p. 100, effective October 26, 1979)

9. Section 212.309 Operating Program

a) The emission units described in Sections 212.304 through 212.308 and Section 212.316 of this Subpart shall be operated under the provisions of an operating program, consistent with the requirements set forth in Sections 212.310 and 212.312 of this Subpart, and prepared by the owner or operator and submitted to the Agency for its review. Such operating program shall be designed to significantly reduce fugitive particulate matter emissions.

b) The amendment to this Section incorporating the applicability of Section 212.316 shall apply by May 11, 1993, or upon initial start-up, whichever occurs later.

(Source: Amended at 20 Ill. Reg.7605, effective May 22, 1996)

10. Section 212.310 Minimum Operating Program

As a minimum the operating program shall include the following:

a) The name and address of the source;

b) The name and address of the owner or operator responsible for execution of the operating program;

c) A map or diagram of the source showing approximate locations of storage piles, conveyor loading operations, normal traffic pattern access areas surrounding storage piles and all normal traffic patterns within the source;

d) Location of unloading and transporting operations with pollution control equipment;

e) A detailed description of the best management practices utilized to achieve compliance with this Subpart, including an engineering specification of particulate collection equipment, application systems for water, oil, chemicals and dust suppressants utilized and equivalent methods utilized;

f) Estimated frequency of application of dust suppressants by location of materials; and

g) Such other information as may be necessary to facilitate the Agency's review of the operating program,

(Source: Amended at 20 Ill. Reg.7605, effective May 22, 1996)

11.

12. Section 212.312 Amendment to Operating Program

The operating program shall be amended from time to time by the owner or operator so that the operating program is current. Such amendments shall be consistent with this Subpart and shall be submitted to the Agency for its review.

(Source: Amended at 3 Ill. Reg. 45, p. 100, effective October 26, 1979)

13. Section 212.313 Emission Standard for Particulate Collection Equipment

If particulate collection equipment is operated pursuant to Sections 212.304 through 212.310 and 212.312 of this Subpart, emissions from such equipment shall not exceed 68 mg/dscm (0.03 gr/dscf).

(Source: Amended at 20 Ill. Reg.7605, effective May 22, 1996)

14. Section 212.314 Exception for Excess Wind Speed

Section 212.301 of this Subpart shall not apply and spraying pursuant to Sections 212.304 through 212.310 and 212.312 of this Subpart shall not be required when the wind speed is greater

PREFACE

This report was prepared for the U.S. Environmental Protection Agency's Stationary Source Compliance Division under Contract No. 68-02-4463, Work Assignment No. 17. Mr. Robert Marshall, Jr. was the EPA Work Assignment Manager. The work was performed in Midwest Research Institute's Environmental Systems Department (Dr. Chatten Cowherd, Director). The report was prepared by Mr. John Kinsey (Task Leader), Ms. Deann Hecht, and Mr. Frank Pendleton.

Approved for:

MIDWEST RESEARCH INSTITUTE

SECTION 1

INTRODUCTION

1.1 GENERAL OVERVIEW

The Clean Air Act (CAA) of 1970 (and amended in 1977). was passed "to protect and enhance the quality of the Nation's air resource so as to promote the "public health and welfare and the productive capacity of its population." More specifically, the CAA provides the U.S. Environmental Protection Agency (EPA) with the broad responsibility and authority to implement a federal program to achieve these goals.

The interstate nature of air pollution caused Congress to charge the EPA with the responsibility of establishing uniform national ambient air quality standards (NAAQS) to assure consistency in protecting public health and welfare. These standards were set for those pollutants which the administrator identified as widespread (emitted by numerous or diverse mobile and stationary sources) and endangering public health and welfare. These so-called "criteria" pollutants come from the fact that the CAA (Section 108) requires the EPA to issue Air Quality Criteria Documents for each pollutant having an ambient air quality standard.

Through July of 1987 the EPA has identified seven criteria pollutants and promulgated national ambient air quality standards for: particulate matter, sulfur oxides, nitrogen oxides, carbon monoxide, hydrocarbons (revoked in January 1983), ozone, and lead. Of interest in this document is the NAAQS for PM_{10} promulgated on July 1, 1987. The NAAQS for PM_{10} specifies a 24 h primary and secondary standard of 150 $\mu g/m^3$ and an annual primary and secondary standard of 50 $\mu g/m^3$ (calculated as an annual arithmetic mean).

To attain and subsequently maintain the NAAQS for PM_{10}, each state is required to adopt and submit to EPA a plan providing for the implementation, maintenance, and enforcement of the standards over the entire state. Each SIP includes a major portion devoted to emission limitations and other regulations and programs to prohibit stationary sources from "emitting any air pollutant in amounts which will prevent attainment with the NAAQS or interfere with measures to prevent significant deterioration of air quality" (see Part C of Title 1 of CAA). Thus, each state directs its control regulations towards its unique set of sources and circumstances as long as the end result will be attainment of the NAAQS in the required time frame. An overview of SIP requirements for the control of PM_{10} is contained in Appendix A.

Collection of compliance-related information is used to determine compliance of sources with applicable regulations, to identify sources which may be in violation, and to provide evidence to support enforcement actions. The primary method of compliance monitoring is the on-site inspection. Under the CAA, authority has been granted to inspectors for the determination of compliance with applicable standards and regulations. This authority, under Section 114 of the CAA, is described briefly in Appendix B.

1.2 SCOPE AND OBJECTIVES OF INSPECTION MANUAL

This manual outlines the basic procedures necessary to complete an informative and accurate air compliance inspection for sources of fugitive PM_{10}. In addition, it addresses other topics relevant to the on-site inspection and compliance monitoring including the selection of sources for inspection, record keeping and reporting reviews, inspection safety, and technical inspection procedures. The role of opacity measurements is also briefly addressed. However, record keeping is primarily emphasized. An overview of the inspector's general responsibilities, safety, and preparations is provided in Appendix C with more detailed information on specific sources contained in subsequent sections.

The information in this inspection guide is based, in part, on a previous EPA document, "Control of Open Fugitive Dust Sources," EPA 450/3-88-008. Information useful to the inspector may also be found in that document. It provides examples for computing both controlled and uncontrolled PM_{10} emissions, potential regulatory formats, and additional information on various control techniques.

SECTION 2

INSPECTION OVERVIEW

2.1 INTRODUCTION

This section provides an overview of the key elements that together constitute a set of inspection procedures for fugitive sources. First, an introduction to fugitive dust sources, emissions, and controls is presented. The section then discusses baseline inspections, typical permit conditions for roads and storage piles, applicable record-keeping procedures, and sampling and analysis methods for aggregate materials. Finally, field equipment and on-site health and safety considerations are addressed.

2.1.1 Fugitive Dust Sources

Sources of fugitive particulate emissions may be separated into two broad categories--process sources and open dust sources. Process sources of fugitive emissions are those associated with industrial operations that alter the chemical or physical characteristics of a feed material. Open dust sources are those that entail generation of fugitive emissions of solid particles by the forces of wind or machinery acting on exposed materials. Only open dust sources are discussed in this document.

The partially enclosed storage and transfer of materials to or from a process operation do not fit well into either of the two categories of fugitive particulate emissions defined above. Examples are partially enclosed conveyor transfer stations and front-end loaders operating within buildings. Nonetheless, partially enclosed materials handling operations will be classified in this manual as open sources.

Open dust sources include both industrial sources of particulate emissions associated with the transport, storage, and transfer of raw, intermediate, and waste aggregate materials, as well as nonindustrial sources such as unpaved roads and parking lots, paved streets and highways, heavy construction activities, building demolition, and agricultural tilling. Generic categories of open dust sources are listed in Table 2-1.

There is a wide variety of industrial facilities that contain fugitive PM_{10} sources. Examples of industrial operations which could be evaluated by an inspector include asphalt plants, cement plants, mines and processing facilities, concrete ready-mix plants, power plants, quarries and rock products plants, slag processing plants, steel mills, transfer terminals, building demolition, and landfills.

TABLE 2-1. GENERIC CATEGORIES OF OPEN DUST SOURCES

1. Unpaved Travel Surfaces
   - Roads
   - Parking lots and staging areas
   - Storage piles

2. Paved Travel Surfaces
   - Streets and highways
   - Parking lots and staging areas

3. Exposed Areas (wind erosion)
   - Storage piles
   - Bare ground areas

4. Materials Handling and Storage
   - Batch drop (dumping)
   - Continuous drop (conveyor transfer, stacking)
   - Pushing (dozing, grading, scraping)

5. Building Demolition

6. Transfer Terminals
   - Ship loading and unloading
   - Rail facilities

Although the types of sources found in industrial and urban settings are generally similar (e.g., an unpaved road found in sand and gravel plant and an unpaved city street), the quantity of emissions generated and the type(s) of control applied may be quite different. Therefore, the inspector is cautioned to evaluate each source on an individual basis.

2.1.2 Particulate Emission Factor Models

In developing particulate control strategies for "traditional" pollutant concerns (i.e., to meet National Ambient Air Quality Standards [NAAQS]), particulate emissions from open sources are estimated using the predictive emission factors presented in Section 11.2 of EPA's "Compilation of Air Pollutant Emissions Factors" (AP-42).[1] Further details on these emission factors can be found in the EPA document entitled, "Control of Open Fugitive Dust Sources," EPA 450/3-88-008. These factors cover the generic source categories:

- Unpaved travel surfaces
- Paved travel surfaces

- Exposed areas (wind erosion)
- Materials handling

These emission factors share many common features. For example, the models are formulated as empirical expressions that relate variations in emission factor (e) to differences in the physical properties (p) of the material being disturbed and the mechanical energy (m) responsible for the generation of particulate according to the general form:

$$e = Kp^a m^b \qquad (2\text{-}1)$$

As empirical models, open dust source factors have adjustable coefficients (K,a,b) that reflect relationships determined from actual open dust source testing. Table 2-2 provides the correction parameters used in the emission factor models published in AP-42 for the above open dust sources.

TABLE 2-2. CORRECTION PARAMETERS FOR AP-42 EMISSION FACTOR MODELS[a]

Source category	Model parameter	Units of measure
Unpaved roads	Silt content of a surface material	Weight %
	Mean vehicle speed	km/h (mph)
	Mean vehicle weight	Mg or 10^6 g (tons)
	Mean No. of wheels	Dimensionless
	No. of wet days per year	Dimensionless
Paved roads	Silt content of a surface material	Weight %
	Total surface dust loading	kg/km^2 (lb/mi^2)
Exposed areas	No. of disturbances per year	Dimensionless
	Erosion potential	g/m^2
Materials handling	Mean wind speed	m/s (mph)
	Material moisture content	Weight %

[a] From Reference 1.

2.1.3 Preventive and Mitigative Control Options

Typically, there are several options for control of fugitive particulate emissions from any given source. This is clear from the mathematical equation used to calculate the emissions rate:

$$R = A\ e\ (1 - c) \qquad (2\text{-}2)$$

where: R = estimated mass emission rate
A = source extent (i.e., surface area for most open dust sources)
e = uncontrolled emission factor, i.e., mass of uncontrolled emissions per unit of source extent
c = fractional efficiency of control

To begin with, because the uncontrolled emission rate is the product of the source extent and uncontrolled emission factor, a reduction in either of these two variables produces a proportional reduction in the uncontrolled emission rate.

Although the reduction of source extent results in a highly predictable reduction in the uncontrolled emission rate, such an approach in effect usually requires a change in the process operation. Frequently, reduction in the extent of one source may necessitate the increase in the extent of another, as in the shifting of vehicle traffic from an unpaved road to a paved road.

In the case of open sources, the reduction in the uncontrolled emission factor may be achieved by adjusted work practices. The degree of the possible reduction of the uncontrolled emission factor can be estimated from the known dependence of the factor on source conditions that are subject to alteration. For open sources, this information is embodied in the predictive emission factor equations for fugitive dust sources as presented in Section 11.2 of EPA's "Compilation of Air Pollutant Emission Factors" (AP-42).[1]

Control techniques can be divided into two broad categories--preventive and mitigative. Although differences between the two are not always clear, in general, preventive measures involve techniques that reduce source extent or improve mechanical source operations relative to the generation of particulate emissions. By contrast, mitigative techniques typically focus on altering the surface/material conditions that constitute the source of particulate emissions.

The reduction of source extent and adjusted work practices which reduce the amount of exposed dust-producing material are preventive techniques for control of fugitive dust emissions. This would include, for example, the elimination of mud/dirt carryout onto paved roads at construction and demolition sites.

On the other hand, mitigative measures involve the periodic removal of dust-producing material. Examples of mitigative measures include cleanup of spillage on travel surfaces (paved and unpaved) and cleanup of material spillage at conveyor transfer points.

Most of the mitigative control measures for open sources involve periodic rather than continuous control application. Familiar examples are the watering of unpaved travel surfaces and the cleaning of paved travel surfaces. The resultant control efficiency follows a cyclic pattern, decaying in time from the highest value immediately after application. Because of the finite durability of these control techniques, ranging from hours to months, it is essential to relate an average efficiency value to a frequency of application. It must be emphasized that the rate of control efficiency decay is heavily dependent upon the source and control variables discussed in Sections 3, 4 and 5.

2.1.4 Compliance Determination

There are three general compliance formats that are potentially suited to open dust sources. These are:

a. opacity (visible emissions) readings;

b. evaluation of control program records--record keeping; and

c. "indirect" determination(s) of control performance.

These formats are described briefly below.

As a compliance tool, the determination of visible emissions (VE) has a long history of application to stationary sources. VE readings appear appealing as a compliance tool for open dust sources; in fact, two states (Tennessee and Ohio) as well as EPA have promulgated VE methods for open dust sources. A summary of the state methods is presented in Appendix D with EPA Reference Method 22 provided in Appendix E.

Record keeping offers another, easily used compliance tool for fugitive PM_{10} controls. As the name implies, record keeping involves the routine collection and recording of appropriate control application parameters (especially for periodically applied measures) by the source operator for the permitted sources at the facility. These application parameters are generally specified as part of a formal dust control plan and are critical to achieving a certain level of control performance. The level of detail needed for record keeping purposes varies with the control option employed. Record keeping, together with on-site inspections, as required, will allow the regulator to estimate performance of a dust control program.

While record keeping affords a convenient method of assessing long-term control performance, it is important that regulatory personnel have "spot-check" compliance tools at their disposal. For example, permit conditions could be written specifying a minimum surface moisture content (thus, corresponding to a minimum control efficiency) to be maintained on an unpaved

surface which is watered or treated with surfactants or salts. Inspection personnel would then collect grab samples for moisture analysis to determine compliance following the procedures discussed later in this section. This technique is referred to as an "indirect" performance standard which is enforced in lieu of actual source testing.

2.2 BASELINE INSPECTIONS

The purpose of this section is to describe the Baseline Inspection Technique and illustrate how it should be applied to the common types of fugitive dust sources. The Baseline Technique is an approach which inspectors can use to obtain relevant data in an organized fashion. These procedures are organized into four categories that roughly correspond to increasing levels of effort. The inspection procedures have been developed to ensure that the data obtained are as accurate and complete as possible. The procedures outlined should be used by field personnel unless technical or safety considerations at a specific site demand modified approaches. In such a case the reasons for the deviation from the standard procedures should be briefly described in the inspection report.

2.2.1 Inspection Categories

It would be desirable to conduct detailed engineering-oriented inspections at all sources, however, this is obviously impractical due to the large number of sources inspected regularly by EPA, state, and local regulatory personnel. Therefore, inspection categories have been incorporated into the overall inspection program to give agencies the opportunity to properly allocate limited resources. The most complete and time-consuming evaluations are performed only when preliminary information indicates the potential for a significant emission problem.

Inspection categories are designated as Levels 1 through 4 with the intensity of the evaluation increasing from one to another. The types of activities normally associated with each level and the experience necessary to conduct the different types of inspections vary substantially. The four categories are:

- Level 1 inspection is a field surveillance tool intended to provide relatively frequent, but very incomplete indications of source performance. No entry to the plant grounds is usually necessary, and the inspection is never announced in advance. The inspector makes observations on all sources which are visible from the plant boundary and which can be properly observed, given prevailing meteorological conditions. To the extent possible, general plant operations are observed to determine whether they correspond to permit requirements.

- Level 2 inspection is a limited "walk-through" evaluation of the source and its control(s). Entry to the facility is necessary. Therefore, appropriate administrative inspection procedures (Appendix C) should be followed. The inspection can be performed

either in a concurrent (i.e., with the process flow) or countercurrent fashion depending on the anticipated types of problems. In either case the inspection data gathered is limited to that which can be provided by readily available existing information.

- Level 3 inspection includes a detailed evaluation of individual emission sources, types of control techniques employed, source operation, and identification of potential problem areas. Source material analyses may be reviewed and samples obtained for later evaluation. Control techniques and application parameters would also be identified for further engineering analysis. Sufficient data and documentation is also obtained on-site to ascertain if control procedures are being followed as specified by permit or regulatory requirements.

- Level 4 inspection involves the observation of a source test(s) or evaluation of an on-site air quality monitoring program specifically intended to measure control performance. This is a very specialized inspection and should be conducted with full knowledge of the source/control specifications being evaluated. This type of inspection is performed explicitly for the purpose of determining compliance with permit conditions, regulations, and/or site-specific dust control plans.

An important part of the level 3 inspection is the preparation of general material flow charts and site plans. It is recommended that these be prepared in accordance with the guidelines presented in Reference 2. As a starting point, the inspector should request a map of those portions of the plant of interest. Specific flow charts should be prepared so that all of the important information concerning material flow streams, traffic flow and volumes, and locations of all stationary equipment and material storage areas are clearly shown. These charts then are used to perform the on-site inspection.

2.2.2 Assembling Background Information

The inspector's knowledge of the source(s) and the associated controls at a facility plays an important part in the success of an inspection, particularly in the diagnosis of control problems. It is, therefore, highly recommended that the inspector build his or her own and/or an agency technical library of books, reports, guideline documents, and other publications related to the inspection process. This should include materials addressing specific dust-emitting sources, operation and maintenance of all types of controls, and specific inspection procedures for various types of controls and dust sources.

To assist in assembling background information, Table 2-3 provides a list of useful references involving the control of fugitive dust and PM_{10}. Although this list is not all-encompassing, these documents should definitely be available to regulatory personnel prior to making an inspection of an unfamiliar facility or source.

2.2.3 General Inspection Procedures

Although fugitive dust control measures are generally implicit in federal air quality regulations, the regulations generally do not explicitly include readily enforceable standards of performance. However, a number of states have (as part of their State Implementation Plans [SIPs] for PM_{10}) developed and adopted rules to control fugitive dust emissions. These rules are enforceable by either state, local, or federal air pollution control officials. Clearly, a portion of a general air compliance inspection should be devoted to identifying potential sources of fugitive dust emissions and the collection of data indicative of a source's compliance status with regard to applicable permit conditions and regulations.

As is the case for other types of emission sources, the inspector should be familiar with potential sources of fugitive PM_{10} at the plant and applicable state/local/federal regulations and permit requirements. Preentry evaluation from outside the plant (i.e., level 1 inspection) is particularly important in regard to fugitive sources. During this evaluation, the inspector should identify and note any visible fugitive emissions at or near plant boundaries and their source(s); conditions around feed, product, and/or waste storage piles; and any other obvious sources of fugitive emissions. Notations of any visible emissions and photographs should be taken at this time, as appropriate.

The portion of the fugitive emissions inspection which is conducted within the plant boundaries (level 2, 3, and 4 inspections) generally consist of four phases:

1. Visual inspection of the facility in order to observe fugitive sources and controls (including photographs to document).

2. Examination of the source's control equipment.

3. Observations of any spraying or other dust control operations undertaken by source during the inspector's visit.

4. Examination of the source's records relating to the controls used.

A general checklist similar to that shown in Table 2-4 should be used as a reminder of key information to be collected by the inspector during a level 2 evaluation. This list should be refined according to the specific goals of the inspection during subsequent visits and can be arranged in chart formats, if desired. Also, the compliance formats described below should be incorporated into the inspection, as applicable.

2.3 TYPICAL PERMIT CONDITIONS

Specific conditions placed on an air permit for open dust sources depend to a large extent on the type of source being permitted as well as the statute and regulations under which the permit is issued. Also, permit conditions will depend on whether the permit is included in revisions to a State Implementation Plan, which are subsequently enforceable by EPA personnel.

TABLE 2-4. GENERAL CHECKLIST FOR CONDUCTING AN INSPECTION OF FUGITIVE SOURCES

Name of facility: _____

Address: _____

Type of facility or SIC code: _____

VISUAL INSPECTION

1. Are all points listed in current permit/control plan still existent?
   _____

2. Are there additional points that are not noted in the files? If so, please note each new point. _____

4. Does control equipment and/or control measure(s) match the information in the current permit file? If not, specify. _____

5. Does control equipment appear to be well maintained? If not, note that equipment which does not. _____

6. Is there evidence that the source can and does make repairs to control equipment? Specify. _____

INFORMATION FROM SOURCE FILES

1. Does the source have the current permit (and emissions control plan, if applicable) on file and available for inspection? _____

2. Is source operator aware of applicable regulations, permit conditions, and/or control plan specifications under which operation is permitted? _____

(continued)

TABLE 2-4 (continued)

3. Has a regular staff member been assigned to implementation of the control plan? _____

4. Does a budget exist for implementation of the control plan? _____

5. Are permanent facility records being kept in accordance with permit or control plan? _____ If not, what are the deficiencies? _____

6. Is ambient air monitoring being conducted near the facility? _____
How is the monitoring equipment cited relative to fugitive sources?

7. The person to contact regarding fugitive emissions control at facility is: _____ Telephone No.: _____

INSPECTOR'S NAME: _____ DATE OF INSPECTION: _____
TIME OF INSPECTION: _____ REINSPECTION DATE: _____

Because of the wide diversity in permit systems, it is difficult to present "typical permit conditions which apply to all types of generic open dust sources. Therefore, in this section, example conditions will be presented as a guide to the inspector as they may appear on an air permit for a fugitive dust source.

In general, permits for open sources are issued either in response to ambient air quality violations (e.g., sources in nonattainment areas) or, where air quality meets applicable standards, are directed to aesthetic, nuisance, or similar considerations. Where ambient air violations are present, the dust control strategy implemented by the source operator must be very specific. Control application parameters must be rigorously adhered to in order to achieve overall reductions in PM_{10} emissions and thus expected improvements in ambient air quality in the area where the plant is located. A formal schedule and methods of application must be established for each source and control method applied; this is especially true for periodically applied controls used on sources such as paved and unpaved roads.

As mentioned in Section 2.1.4, compliance with a permit condition can be determined either by record keeping or some type of indirect performance standard based on sampling and analysis of the sources material. An example permit condition for sources in areas with air quality problems using record keeping as a measure of compliance might be:

> "Within 90 days of issuance of this permit, the plant operator will submit to the Department a fugitive dust control plan for the following sources . . . . This plan shall include sufficient information to determine the control technique to be used for each emission source, the application parameters for these controls, and the expected level of reduction achieved. Within thirty days after plan submittal, the Director will notify the permittee of plan acceptance of, if found unacceptable, any deficiencies to be corrected. Revisions to the dust control plan shall then be submitted to the Department within 30 days following plan rejection. Appropriate plant records will be kept and submitted to the Department on a monthly basis to verify compliance with the dust control plan."

For sources where indirect measures are used to determine compliance, a permit condition similar to the following might be appropriate:

> "Within 90 days of issuance of this permit, the plant operator will submit to the Department a dust control plan for the following sources . . . . This plan shall include sufficient information to determine the type of control used for each source, the applicable control application parameters, and specific performance goals for each source/control combination. Control performance goals shall be specified in the plan in terms of key source material characteristics (e.g., moisture content) which can be verified by on-site sampling and subsequent laboratory analysis . . . ."

For permits issued for aesthetic, nuisance, or similar considerations where air quality is not a problem, a dust control plan should also be submitted by the source operator. However, in this particular case, some amount of discretion is usually allowed to maintain the dust emissions leaving the site to within some allowable limit. This type of permit is much harder for the inspector to enforce but, if properly handled, can result in adequate dust control. Again, periodically applied controls should be formalized to the extent possible.

For areas where air quality is not an immediate concern, the following could appear on an operating permit for an open dust source:

> "Within 90 days of issuance of this permit, the plant operator will submit the to Department a dust control plan for the following sources . . . . The control measures included in this plan shall be sufficient to preclude dust emissions from leaving the site as determined visually by Department personnel. If, upon inspection, the dust control plan is determined to be inadequate, a revised control plan will be submitted to the Department within 30 days of the inspection . . . ."

Many variations of the above are also possible depending on the statute and regulations in force at the time the permit is issued.

2.4 RECORD KEEPING

As stated previously, record keeping is one alternative method to determine compliance in lieu of an actual performance standard. To implement this technique, records of site activity and control should be submitted to the regulatory agency on a monthly basis. These records must be certified by a responsible party as to their accuracy and completeness. All site records should be maintained by the agency on a permanent basis.

To enforce the permit conditions and/or dust control plan, field audits of key control parameters should be made by inspection personnel. The results of these audits would then be compared to site records submitted to the agency for that period to determine compliance. If differences are found between application of the control(s) observed on-site and those recorded by facility operating personnel, this would constitute a violation and would be grounds for enforcement action. To illustrate this process, an abbreviated example will be given as applied to a typical building demolition project.

Assume a large demolition project consisting of the demolishing of a block of buildings is to be conducted in a large metropolitan area. The site dust control plan calls for watering of all truck routes to and from the active demolition every 2 h as well as cleanup of mud/dirt carryout from the access point on a twice-daily basis. Also, watering of debris during demolition and loadout to haul trucks is to be conducted on days without measurable rainfall. An agency inspector observes the site activity from the public street (Level 1 inspection) for a period of 3 h. During this period no water truck is observed to be in operation, and debris are not watered prior to loading into trucks.

At the end of the month the inspector checks the submittal from the site operators and finds start and stop times for the water truck operator which indicates operation during the observation period. The inspector also notes that the water cannon used for debris control was broken down and was in a repair shop. It is clear from this analysis that the operator is in violation of the dust control plan for watering of unpaved surfaces. Because the truck operator did not follow required dust suppression measures (and/or failed to keep accurate records) an enforcement action could be taken against the site operator.

As noted by the above example, no quantitative data are required for enforcement of the dust control plan. This reduces the need for a set performance standard (e.g., opacity limits) against which the site operator is evaluated. This approach is, however, predicated on the fact that strict implementation of the dust control plan will achieve certain reductions in PM_{10} emissions associated with site operation.

In order to implement record keeping of site control activity, general guidelines are provided in Sections 3, 4, and 5 for paved roads, unpaved roads, and storage piles, respectively. These guidelines include only basic information and should be modified, as necessary, according to the source being monitored. Other information pertaining to control performance determination as related to record keeping is provided in Reference 3.

2.5 SAMPLING AND ANALYSIS TECHNIQUES

Sampling and analysis of source material (i.e., road surface and aggregate materials) can be useful for a number of purposes. First, material characteristics are generally required to calculate uncontrolled PM_{10} emissions for most open dust sources and, in some cases, are used to estimate or verify control effectiveness. For the inspector, material sampling can be used as an indirect measure of control performance as explained previously in Section 2.1.4.

In general sampling of road surface material involves the collection of a composite sample from each road segment being analyzed. For paved roads, this entails collection of samples across the width of the travel lane using a portable, stick-type vacuum cleaner equipped with tared collection bags. In the case of unpaved roads, a whisk broom and dust pan is used in a similar fashion. Details of these techniques are discussed in Appendix F.

For the sampling of aggregate materials, incremental samples are collected from the top, middle, and bottom of storage piles or from the process flow itself. A relatively large gross sample is collected in this manner which is subsequently reduced to laboratory sample which is analyzed. This technique is further described in Appendix F.

Finally, moisture content is determined in the laboratory by drying each sample in a laboratory oven with the silt content determined by dry sieving to obtain the fraction passing a 200 mesh (70 μmP) screen. Details of both techniques as well as special preparation procedures for paved road samples are provided in Appendix F.

2.6 EQUIPMENT PREPARATION

Part of the preinspection preparation involves obtaining and preparing inspection and safety equipment. The type of equipment may vary according to the inspection objectives; the level of inspection; and the process, control equipment, and safety requirements at the facility itself. A general list of recommended equipment is provided in Table 2-5.

All equipment should be checked, calibrated, and tested before use. The inspector is responsible for seeing that all equipment necessary to conduct an inspection is brought to the inspection site.

Safety equipment required for a facility is based on plant health and safety requirements. Safety requirements must be met, not only for safety reasons, but to ensure that the inspector is not denied entry to the facility or parts of it.

TABLE 2-5. RECOMMENDED INSPECTION AND SAFETY EQUIPMENT

Equipment necessary for most inspections	Equipment required for certain inspections
Hard hat	Respirator with appropriate cartridge(s)
Safety glasses or goggles	Air velocity meter
Gloves	Shovel or scoop
Coveralls	Broom-type vacuum sweeper
Safety shoes	Tared vacuum bags and premarked envelopes
Ear protectors	Dustpan and broom
Tape measure	Riffle
Flashlight	Bucket
Stopwatch	Sample containers (polyethylene trash bags and/or screw-top jars)
Duct tape	Self-contained breathing equipment
"NIOSH/OSHA Pocket Guide to Chemical Hazards"	Rope
Rain gear	

As previously stated, Table 2-5 shows a listing of standard inspection and safety equipment for air compliance inspections. It is recommended that those items necessary for the majority of inspections (level 2) be carried in a portable case or tool belt pouch from emission point to emission point. The appropriate items from the list of "Equipment Required for Certain Inspections" (levels 3 and 4 and certain safety equipment not normally required) should be added to the equipment carried or placed in a central location at the plant or in the inspector's car to be retrieved if needed.

Before or after equipment preparation, the inspector must also consider what written materials, forms, documents, etc., he/she will require during the inspection. These should also be gathered and organized before the inspection. These materials may include any or all of the following:

- Maps
- Flow charts
- Plant layout
- Applicable regulations
- Inspection checklists
- Field notebook
- Field observation data recording forms (e.g., Method 22 data sheets)
- Reference materials
- Inspection plan or agenda
- Credentials
- Facility information
- Baseline data
- Information requested by facility

2.7 SAFETY CONSIDERATIONS

The performance of any field inspection always involves a certain degree of risk. It is the objective of this section to describe means of minimizing this risk through adherence to safety procedures. Procedures are presented for most common health and safety problems encountered during the evaluation of fugitive sources and controls. The official EPA Health and Safety Policy can be found in Reference 2.

2.7.1 General Considerations

The inspection of any plant, industrial facility, mine, etc., inherently involves a large number of potential health and safety problems which occur frequently. Therefore, the inspector must be constantly alert so as to avoid potentially hazardous situations.

Inhalation hazards are often created by leaks of pollutant laden gases out of worn expansion joints, cracked welds, and corroded shells of process equipment. The sudden downdraft from nearby stacks and vents can also lead to acute exposures. The partially confined areas can allow high concentrations of toxic material to accumulate even when the leak rates are comparatively small. Most of the high pollutant concentrations occur by accident and without the knowledge of plant personnel. The highly variable conditions make any exposure monitoring data highly questionable. These problems complicate the selection of the proper respirator for these conditions.

The elevated and isolated locations of many types of process equipment also increases the safety risk. It may be necessary to climb permanent or portable ladders to reach the equipment. In some cases, the equipment can only be reached by crossing roofs or elevated walkways. Since these portions of the plant are not regular work areas, even the plant personnel may not be aware of some of the potential problems involved with the ladders and roof areas. Frequently cables, hoses, and debris are found along the elevated

platforms and roofs since plant maintenance personnel do not remove this material. Injuries which occur in these portions of the plant can be very serious. Rescue of injured personnel is difficult and time consuming due again to the isolated and elevated locations of control equipment.

Due to the numerous potential hazards, it is very important that each inspector adhere to established safety policies and procedures. It is also necessary that the inspector recognize unusual and extreme conditions which warrant additional or extreme safety precautions.

To minimize the risk of potential hazards, each inspector should follow the general rules summarized below:

1. The work should be halted immediately when the inspector suffers any nonspecific symptoms of exposure. The area should be approached again only after the proper personal protective equipment has been obtained.

2. The work should be conducted at a controlled pace.

3. If the work cannot be accomplished safely, it should be postponed until the appropriate steps are taken to permit safe inspection.

4. Nothing should be done which risks the health and safety of the inspector, plant personnel, or which risks the conditions of plant equipment.

5. All agency and plant safety requirements must be satisfied at all times.

2.7.2 Specific Safety and Health Procedures

2.7.2.1 General Safety Procedures--
The following general procedures should be adhered to while conducting an inspection:

1. Personal Protective Equipment--Inspectors should bring personal protective equipment necessary to conduct the inspection of the facility. All personal protective equipment should be in good working order and the inspector using it should be trained in its use and limitations.

2. Unaccompanied Inspections--The inspector should request that a responsible plant representative accompany him at all times. The plant representative can identify areas known to be unsafe and can warn the inspector about intermittent plant operations which can result in health and safety risks.

3. Warning Codes and Sirens--The inspector should learn the warning codes and sirens used at the plant to indicate blasting or emergencies such as plant fires, etc. The inspector and plant representative should move to a safe location as rapidly as possible after hearing the warning sirens and report in to the appropriate authorities so that no attempt is made to "rescue" them from the affected area.

4. Personnel Rescue--If an inspector observes another individual who has suffered an accident, help must be summoned immediately. Attempting to rescue the person can jeopardize the rescuer unless the proper procedures are used. Rescue should be attempted only if the proper equipment is available to ensure the safety of the rescuer.

5. Inclement Weather Conditions--Except in the case of public health emergencies, field activities should be interrupted or postponed whenever severe weather conditions present a significant safety risk to the inspector. The specific criteria for interrupting or postponing the field activities should be determined by each office. As a general guideline, work should be delayed whenever: the ambient temperature is less than -20°F (wind chill); the ambient temperature is greater than 100°F; the wind speed is greater than 25 mph; and/or whenever there are sleet and freezing rain conditions.

2.7.2.2 Walking and Climbing Hazards--

Inspectors should wear hard hats at all facilities being inspected. These hats provide protection against collision with overhead beams and protruding obstacles and also provide limited protection against falling objects. Inspectors should also wear safety shoes approved for the specific type of facility being inspected and gloves whenever the inspection will involve climbing of ladders or handling of hot surfaces.

Portions of the facility with potentially slippery surfaces should be avoided to the extent possible. Inspectors should not use temporary "walkways" such as planks and horizontal ladders. Also, before walking on elevated catwalks, the inspector should confirm, to the extent possible, that the supports are intact and have not corroded or rotted.

Accumulations of solids and snow can easily exceed the rated load bearing capacity of roofs. Also, portions of the roof can be made of materials with only a limited load bearing capability. For the above reasons, all roofs and other elevated, horizontal surfaces should be approached cautiously. It is recommended that inspectors follow plant personnel in such areas and that they remain on defined walkways.

In climbing any ladder, the foot rungs should be grasped while climbing even when the rungs are wet or muddy. Under no circumstances should an inspector attempt to climb a ladder covered with ice or snow. Both hands must always be free for climbing ladders.

Portable and fixed ladders in good physical condition should be used. Portable ladders should be inclined on an angle to minimize the chances of slippage or toppling and must extent above the surface being reached by a minimum of 3 ft. The cage (if present) must have an opening ranging from 18 to 24 in at the top. The cage should not be severely distorted since this would prevent easy movement inside. The ladder must have at least 9-in clearance between it and where it is attached to allow secure placement of the feet on the rungs and should extent at least 3 ft above the platform or surface being reached. Finally, guard rails should never be used for climbing.

While walking through the plant, inspectors must be alert for protruding obstacles. Often these are difficult to spot in dimly lit portions of plants. Loose clothing should not be worn when conducting an inspection since this can result in entrapment in rotating equipment. Inspectors must be cautious when in the vicinity of all rotating equipment since it is often impossible to see the components moving at high speed. Equipment which operates intermittently, such as hoists, should never be touched since this equipment often starts automatically and without warning.

Inspectors should stay at least 75 ft from stationary rail cars at sidings since these are sometimes coupled to remote-controlled engines run by an operator without a complete view of the siding areas. Inspectors should also not stand on coal piles and other material stockpiles since it is possible to become entrapped in the conveying equipment which is often underneath these piles.

2.7.2.3 Eye and Hearing Protection--

Because of the possibility of hazardous chemicals or gases, contact lenses should not be used during the inspection. Instead, inspection personnel should use prescription safety glasses with side shields while performing field activities. Splash goggles should be used in addition to the safety glasses whenever there is potential exposure to acid mist and/or liquid chemicals.

Inspectors should use hearing protection whenever required by plant policies and whenever it is difficult to hear another person talking in a normal tone of voice at a distance of 2 ft. To the extent possible, time spent in areas of the plant with high noise levels should be minimized.

2.7.2.4 Electrical Hazards--

The inspector should not use line powered equipment or instrumentation not served by an approved ground fault interrupter. Prior to inspecting any facility, the inspector must ask responsible plant personnel to identify any high voltage cables in the area to be inspected. It is important to find any lines which could be inadvertently touched while walking through the plant.

2.7.2.5 Explosions--

Inspectors should never take battery-powered, portable equipment such as nonexplosion-proof flashlights, etc., into portions of the plant where there are potentially explosive dusts and/or vapors. The equipment can be a source of ignition. Also, smoking materials, including but not limited to matches and lighters, should never be taken into any facility. Many areas of plants visited by inspectors can have explosive dusts and vapors. Finally, the inspection should be terminated immediately whenever a severely vibrating fan is encountered. When a fan disintegrates, shrapnel can be sent over a large area resulting in very serious injuries. Plant personnel should be notified immediately if this problem is detected.

2.7.2.6 Burns--

The areas immediately around hot ducts should be avoided to the extent possible. Also, uninsulated hot roofs should be avoided to the extent possible. In cases where such is required, the proper foot wear must be

worn. When climbing up to potentially hot roofs, gloves should be worn and the roof should not be touched.

2.7.2.7 Inhalation Hazards--

To the extent possible, inspectors should avoid areas which allow the accumulation of airborne pollutants. The appropriate respirators should be selected in accordance with the procedures discussed during safety training provided by the regulatory agency. Furthermore, the respirator must not be worn whenever any condition would prevent a good seal. The most common reason for an improperly fitted respirator is facial hair. The protection factor limits of each respirator must be understood and used only for the specific contaminants listed and only for the concentration range listed. Since monitoring data is rarely available, the inspector must exercise some judgment when selecting the appropriate respirator. Selection of the type of respirator should never be done by smell or taste perception since some of the most toxic pollutants cannot be detected at high concentrations.

Inspectors should use only a self-contained breathing apparatus or an air line respirator when entering areas believed to be oxygen deficient. Each individual using respirator protection must be trained in its proper fitting, use, maintenance, and storage.

The respirator must be inspected before and after each use (disposable respirators excluded). Equipment used only for emergencies will be inspected at least monthly. A record should be kept by date with the results of all inspections. All respirators must be cleaned and disinfected after each use. All filters and cartridges must be replaced whenever necessary. Replacement of other than disposable parts and any repair should be done only by personnel with adequate training and test equipment to ensure the equipment will function properly after the work is accomplished. Only certified parts supplied by the manufacturer for the product being repaired shall be used. The respirators should be stored in atmospheres that will protect them from dust, sunlight, extreme heat or cold, and damaging chemicals.

Individualized eyeglasses mounted to the face piece of full face mask respirators should be used whenever such respirators are necessary for the field duties assigned. Also, contact lenses should not be worn while wearing respirators. Inspectors with perforated ear drums or who have not demonstrated, by means of regular physical examination, that they are capable of withstanding the additional physical stress imposed by respirators, should not wear respirators. Since respirators are necessary for field activities, such individuals should not perform field duties. Finally, inspectors should not chew gum or tobacco while wearing a respirator.

2.7.2.8 Heat Stress--

Each inspector working in moderate and hot climates should drink copious amounts of water and carry drinking water in the vehicle used. The inspection should be interrupted immediately whenever an inspector experiences the symptoms of heat exhaustion including but not limited to fatigue, nausea, vomiting, headache, dizziness, clammy skin, and rapid pulse. The affected individual should rest in a cool place which is not less than 75°F and seek medical care as soon as possible. Continuing the field activities during the onset of

heat exhaustion can lead to heat stroke, a very serious condition requiring immediate medical help. Also, the inspection should be interrupted immediately whenever an inspector experiences heat cramps. The affected individual should find a cool place to rest and drink water containing 0.1% by weight salt (1 teaspoon per 5 quarts of water).

2.7.2.9 Cold Stress--

Field inspectors should avoid portions of the plant exposed to high wind conditions or wet areas when the ambient temperature is low. Clothing for inspections conducted during cold weather must be selected to provide the appropriate degree of protection and to reduce the chances of excessive perspiration accumulation. Clothing should generally be layered to trap heat and to provide the flexibility to adjust to both outside and inside conditions while conducting the inspection. Steel-tipped shoes should not be worn whenever the ambient temperature is low. All shoes worn must be watertight.

2.7.2.10 Skin Absorbable Chemicals--

Inspection personnel should consult published reference materials concerning the selection and use of protective clothing (including gloves) whenever working with or near chemicals which are readily adsorbed by the skin. A partial list of such chemicals is provided in the OSHA Pocket Guide to Occupational Hazards. Inspectors should also exercise extreme caution when sampling liquids containing skin absorbable chemicals. Under no circumstances should the employee allow direct contact between such liquids and the skin (e.g., hands and arms) while acquiring a sample.

SECTION 3

PAVED ROADS

Particulate emissions occur whenever a vehicle travels over a paved surface, such as public and industrial roads and parking lots. These emissions may originate from material previously deposited on the travel surface, or resuspension of material from tires and undercarriages. In general, emissions arise primarily from the surface material loading (measured as mass of material per unit area), and that loading is in turn replenished by other sources (e.g., pavement wear, deposition of material from vehicles, deposition from other nearby sources, carryout from surrounding unpaved areas, and litter). EPA's *Compilation of Air Pollutant Emission Factors* (AP-42) indicates that the PM_{10} emission factors for paved roads may be written in the general form:

$$e = A \left(\frac{sL}{B}\right)^{C} \qquad (3\text{-}1)$$

where A, B, and C are constants and

e = PM_{10} emission factor, mass/vehicle/length
s = fractional surface silt content, dimensionless
L = total surface loading, mass/area

The product sL represents the mass of material less than 200 mesh per unit area of the road travel surface and is usually termed the "silt loading."

Selection of the appropriate emission factor model (i.e., the constants A, B, and C) for a given road depends upon:

- The value of the silt loading (sL)
- The average weight of the vehicles traveling on the road

Table 3-1 describes the selection process for paved road emission factors. Note that, for purposes of preparing an emissions inventory, this equation would be applied to each road segment in a facility. A road segment is the distance between two intersections. Figure 3-1 shows an example facility with each road divided into road segments and assigned an arbitrary identification.

TABLE 3-1. SELECTION OF PAVED ROAD EMISSION FACTOR

Silt loading (sL)		Range weight (W)		Applicable PM_{10} emission factor	
g/m^2	oz/yd^2	Mg	Ton	g/VKT[a]	lb/VMT[a]
sL < 2	< 0.06	W > 4	> 4.4	$220\ (sL/12)^{0.3}$[b]	$0.78\ (sL/0.35)^{0.3}$[b]
sL < 2	< 0.06	W < 4	< 4.4	$2.28\ (sL/0.5)^{0.8}$[c]	$0.0081\ (sL/0.015)^{0.8}$[c]
sL > 2[d]	> 0.06	W > 6	> 6.6	$220\ (sL/12)^{0.3}$[b]	$0.78\ (sL/0.35)^{0.3}$[b]
2 < sL < 15	0.06 < sL < 0.44	W < 6	< 6.6	$220\ (sL/12)^{0.3}$[b]	$0.78\ (sL/0.35)^{0.3}$[b]
sL > 15[d]	> 0.44	W < 6	< 6.6	93	0.33

[a]VKT - Vehicle kilometers traveled, VMT = vehicle miles traveled.

[b]Commonly referred to as the "industrial" paved road model.[3]

[c]Commonly referred to as the "urban" paved road model.[3]

[d]For heavily loaded surfaces [i.e., sL > ~ 300 to 400 g/m^2 (9 to 12 oz/yd^2)], it is recommended that the resulting estimate be compared to that from the unpaved road models (Section 4.1.1 of this manual), and the smaller of the two values used.

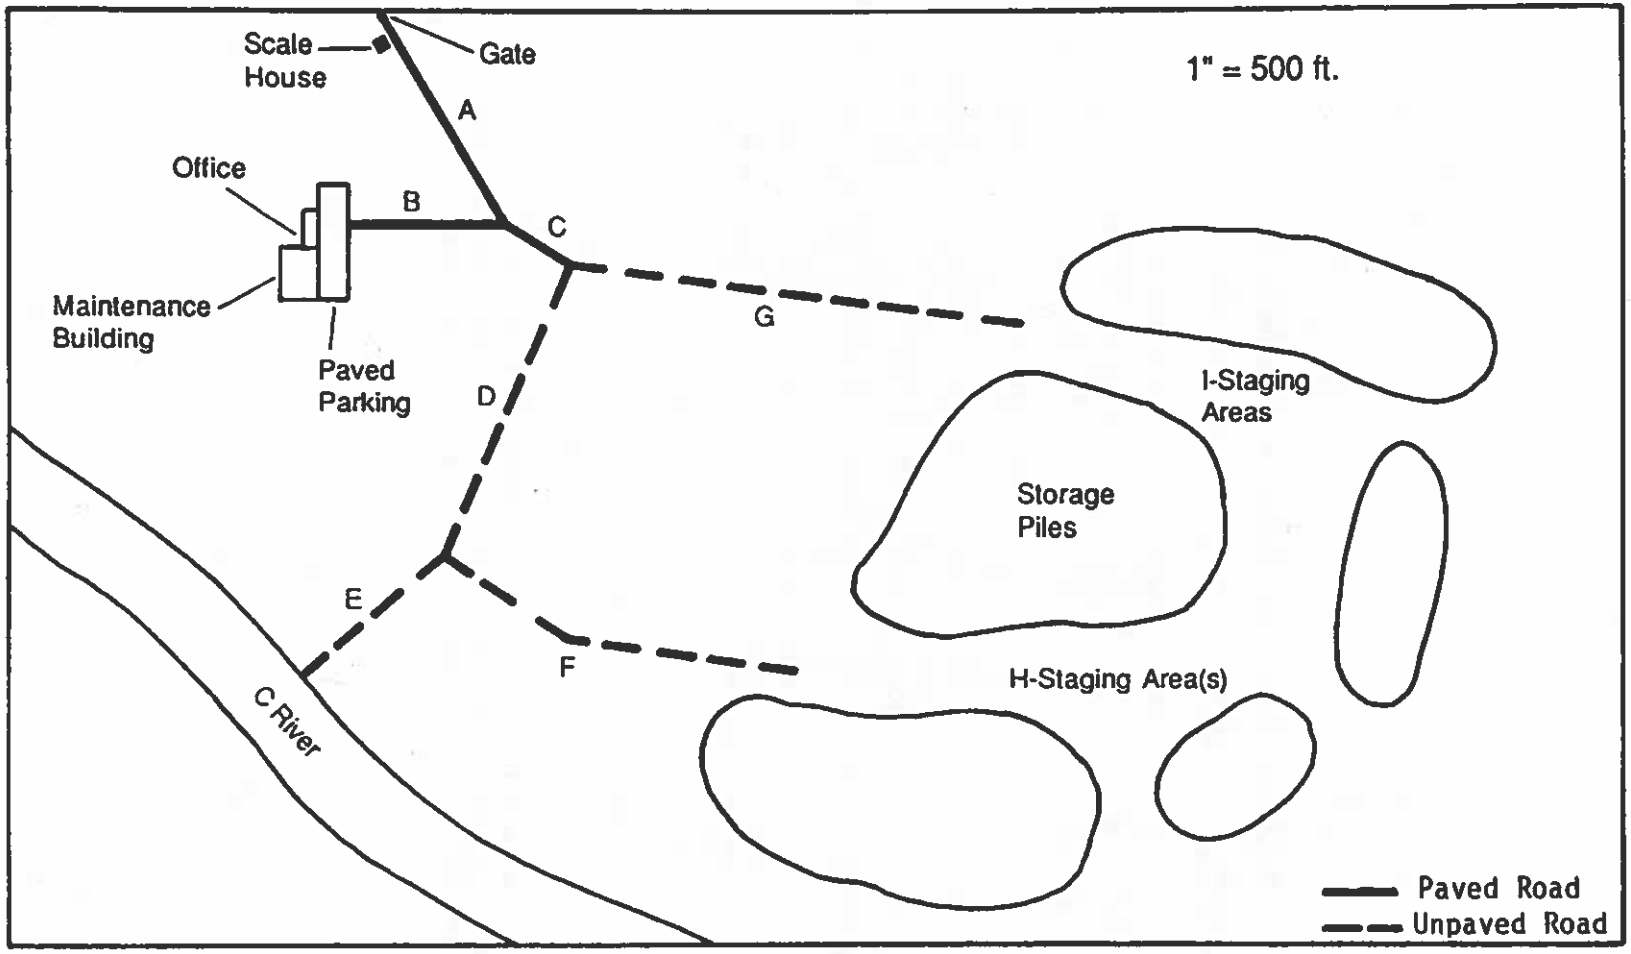

Figure 3-1. Example facility map with roads divided into road segments.

The emission rate is determined by multiplying the emission factor of each road segment by the total vehicle mileage on the segment over the averaging time of interest. Totaling the individual emission rates for each road segment will provide an uncontrolled emission rate for all unpaved roads in the facility.

Surface silt content (s) is the fraction of material smaller than 75 μm in diameter. L is the total dust loading and the product sL represents the mass of silt-size dust particles per unit area of the road surface. As is the case for all predictive models in AP-42, the use of site-specific values of sL is strongly recommended. The silt loading should be determined using the sampling techniques and laboratory analysis procedures described in Appendix F. Figure 3-2 is an example of a sampling data form for paved roads.

Vehicle-related parameters should be obtained using a combination of counting devices, manual or automated records, and information from plant personnel. Pneumatic tube axle counters can be used to obtain traffic volume data. Figure 3-3 shows an example pneumatic traffic log. However, because these counters only record the number of passing axles, it would also be necessary to obtain traffic mix information (e.g., number of axles per vehicle) to convert axle counts to the number of vehicle passes. Vehicle mixes may be observed either visually or by the use of videotape or time-lapse motion pictures. Figure 3-4 shows an example of a manual vehicle log. Comparison of the observed vehicle mix to the pneumatic counter totals allows the accuracy of the axle counter to be assessed.

Paved road emissions can only be controlled in two ways: (a) by reducing the silt loading in Eq. 3-1 and, therefore, reducing the emission factor, and (b) the emission rate may be reduced by limiting the number of vehicles traveling on each road segment. A combination of both techniques could be used. Because it is often impractical to reduce vehicular traffic on a road, most available control techniques either attempt to prevent material from being deposited on the surface or to remove (from the travel lanes) any material that has been deposited.

While the mechanisms of particle deposition and resuspension are largely the same for public and industrial roads, there can be major differences in surface loading characteristics, emission levels, traffic characteristics, and viable control options. For the purpose of estimating particulate emissions and determining control programs, the distinction between public and industrial roads is not a question of ownership but rather a question of surface loading and traffic characteristics.

Although public roads tend to have lower surface loadings than industrial roads, the fact that these roads have far greater traffic volumes may result in a substantial contribution to the measured air quality in certain areas. In addition, many public roads in industrial areas often are heavily loaded and traveled by heavy vehicles. In that instance, better emission estimates would be obtained by treating these roads as industrial roads. In an extreme case, a road or parking lot may have such a high surface loading that the paved surface is essentially covered and is easily mistaken for an unpaved road.

In that event, use of a paved road emission factor may actually result in a higher estimate than that obtained from the unpaved factor, and the road is better characterized as unpaved in nature rather than paved.[2]

3.1 PUBLIC PAVED ROADS

As discussed above, the term "public" is used in this manual to denote not only ownership of the road but also its surface and traffic characteristics. Roads in this class generally are fairly lightly loaded, are used primarily by light-duty vehicles, and usually have curbs and gutters. Examples are streets in residential and commercial areas and major thoroughfares (including freeways and arterials).

3.1.1 Estimation of Emissions

The emission factor for public paved roads is determined by the decision rule discussed above. Tables 3-2 and 3-3 present a summary of silt loadings as a function of roadway classification and the scheme used to classify roadways, respectively.

In general, roads with a higher traffic volume tend to have lower surface silt loadings. This relationship is expressed in the empirical model presented in Reference 3:

$$sL = 21.3/(V^{0.41}) \qquad (3\text{-}2)$$

where: sL = surface silt loading (g/m^2)
V = average daily traffic volume (vehicles/d)

3.1.2 Demonstrated Control Techniques for Public Paved Roads

Available control methods for public roads are largely designed either to prevent deposition of material on the roadway surface or to remove material which has been deposited in the driving lanes. Measurement-based efficiency values for control methods are presented in Table 3-4. Note that all values in this table are for mitigative measures applied to industrial paved roads.

In terms of public paved road dust control, only very limited field measurement data are available. One reference was found that could be used to indirectly quantify emission reductions and this, too, is for mitigative measures. Estimated PM_{10} control efficiencies (Table 3-5) were developed by applying Eq. 3-1 to measurements before and after road cleaning.[4] Note that these estimates should be considered upper bounds on efficiencies obtained in practice because no redeposition after cleaning is considered. Note also that these estimated emission control efficiencies for urban roads compare fairly well with measurements at industrial roads. No airborne mass emission measurements quantifying control efficiency were found.

Improved vacuum sweeping	37

[a] Reference 4. Estimate based on measured initial and residual $\leq$ 63 μm loadings on urban paved roads and Eq. 3-1. Value reported represents the mean of 13 tests for each method.

In general terms, one would expect that demonstrated control techniques applied to industrial paved roads could also be applied to public roads. One important point to note, however, is that it is generally recognized that mitigative measures decrease in effectiveness as the surface loadings decrease. Because mitigative measures are less effective for public paved roads, the use of preventive measures should be stressed, especially in instances where no dominant or localized source of road loading can be identified. Example sources would include: (1) unpaved areas adjacent to the road; (2) erosion due to storm water runoff; and (3) spillage from passing trucks. Corresponding examples of preventive measures include: (1) installing curbs, paving shoulders, or painting lines near the edge of the pavement; (2) controlling storm water or using vegetation to stabilize surrounding areas; and (3) requiring trucks to be covered and to maintain freeboard (i.e., distance between top of the load and top of truck bed sides). In instances where the source of loading can be easily identified (e.g., salt or sand spread during snow or ice storms) or the effects are localized (e.g., near the entrance to construction sites or unpaved parking lots), either preventive or mitigative measures could be prescribed. Table 3-6 summarizes nonindustrial paved road preventive controls.

There are few efficiency values for any of the preventive measures presented in Table 3-6. Because these materials are designed to prevent deposition of additional material onto the paved surface, quantitative measurements before and after the control are generally not possible and interpretation of results are complicated. For example, based on ambient TSP monitoring results over a 3-month period, immediate and continuous manual cleaning of the access area to a construction site was estimated to result in ~ 30% control.[7] It is unclear, however, what effect seasonal variation in the monitoring data has on the estimate of 30%. Also, because this estimate is based on ambient air concentrations, use of the value may be inconsistent with the other efficiency estimates given in this chapter.

Inspection Procedures for Public Paved Roads. In many respects, public paved roads cannot be considered subject to "field inspections" in the traditional regulatory sense. Silt loadings on these roads are at least partially due to a wide range of ubiquitous sources (such as deposition of ambient dust, application of snow/ice controls, pavement wear, spills, tire/brake wear, litter). It is obvious that those types of sources of silt loadings cannot be routinely inspected. In addition, EPA policy emphasizes preventive rather than mitigative controls for public paved roads. In this way, general reductions in silt loadings in an area would be expected. However, the determination of the effective silt reduction due to a particular preventive control is complicated because of the spatial and temporal separation of the cause and the effect.

Thus, with the exception of "localized" preventive controls employed at industrial and construction sites (such as covering haul trucks or cleaning plant entrance areas), control measures taken to reduce silt loadings on public paved roads cannot be generally inspected.

TABLE 3-6. NONINDUSTRIAL PAVED ROAD DUST SOURCES AND PREVENTIVE CONTROLS

Source of deposit on road	Recommended controls
-- Sanding/salt	-- Make more effective use of abrasives through planning, limited, and uniform spreading, etc. -- Improve the abrasive material through specifications limiting the amount of fines and material hardness, etc. -- Rapid cleanup after streets become clear and dry
-- Spills from haul trucks	-- Require trucks to be covered -- Require freeboard between load and top of hopper -- Wet material being hauled
-- Construction carryout and entrainment	-- Clean vehicles before entering road -- Pave access road near site exit -- Semicontinuous cleanup of exit
-- Vehicle entrainment from unpaved adjacent areas	-- Pave/stabilize portion of unpaved areas nearest to paved road
-- Erosion from storm water washing onto streets	-- Storm water control -- Vegetative stabilization -- Rapid cleanup after event
-- Wind erosion from adjacent areas	-- Wind breaks -- Vegetative stabilization or chemical sealing of ground -- Pave/treat parking areas, driveways, shoulders -- Limit traffic or other use that disturbs soil surface
-- Other	-- Case-by-case determination

Implementation and enforcement of "area-wide" (i.e., not "localized" in the sense described above) preventive measures--such as changes in snow/ice control materials and practices or city ordinances requiring homeowners to remove biological debris from streets in their neighborhoods--will generally require a strong working relationship between the air regulatory agency and other administrative bodies. This relationship is often expressed in a Joint Memorandum of Understanding. Once again, competing demands (e.g., the importance of maintaining traffic safety during ice and snow storms) make "inspection" in the usual sense largely impossible.

Consequently, the inspection procedures for public paved roads will be restricted to the localized preventive controls. These procedures are discussed in connection with industrial road inspections in Section 3.2 of this manual.

3.2 INDUSTRIAL PAVED ROADS

As noted earlier, emission estimation for paved roads depends less upon its ownership and more upon its surface material and traffic characteristics. In this manual, the term "industrial" paved road is used to denote those roads with higher surface loadings and/or are traveled by heavier vehicles. Consequently, some publicly owned roads are better characterized as industrial in terms of emissions. Examples would include city streets in heavily industrialized areas or areas of construction as well as paved roads in industrial complexes.

3.2.1 Estimation of Emissions

When estimating emissions from industrial paved roads, Eq. 3-1 and Table 3-1 should be used. Table 3-7 provides measured silt loading values for a few industries.

3.2.2 Demonstrated Control Techniques for Industrial Paved Roads

As noted in Section 3.1.2, the vast majority of measured control efficiency values for paved roads are based on data from industrial roads. Consequently, the information presented earlier in Table 3-4 is more applicable to this class of road.

Mitigative measures may be more practical for industrial plant roads because (1) the responsible party is known; (2) the roads may be subject to considerable spillage and carryout from unpaved roads; and (3) all affected roads are in relatively close proximity, thus allowing a more efficient use of cleaning equipment. Preventive measures, of course, can be used in conjunction with plant cleaning programs and prevention is probably the preferred approach for city streets in industrialized areas with many potential sources of paved road dust.

TABLE 3-7. INDUSTRIAL PAVED ROAD SILT LOADINGS[a]

Industry	No. of sites	No. of samples	Silt, percent w/w		No. of travel lanes	Silt loading, g/m²	
			Range	Mean		Range	Mean
Copper smelting	1	3	[15.4-21.7]	[19.0]	2	[188-400]	[292]
Iron and steel production	6	20	1.1-35.7	12.5	2	0.09-79	12

Sand and gravel processing	1	3	[6.4-7.9]	[7.1]	1	[53-95]	[70]

[a] Reference 1. Brackets indicate values based on only one plant vist.

Preventive Measures. These types of control measures prevent the deposition of additional materials on a paved surface area. As a result, it is difficult to estimate their control effectiveness. For mitigative controls, before and after measurement (of surface loadings or of particulate emissions) is possible; clearly, this is not the case for preventive measures. Table 3-6 contains a list of preventive measures along with recommended controls.

Inspection Procedures for Preventive Measures. As mentioned in Section 3.3.1, it is difficult to estimate control effectiveness for preventive measures. Therefore, inspections for this type of control would require a visual inspection. For example, the control plan/operating permit or construction permit (hereafter referred to as plan/permit) may specify that all haul trucks be covered to prevent spills, and all vehicles be cleaned before entering a public paved road to limit carryout. In this instance, the inspector would determine compliance by visually inspecting the haul trucks and the rinsing of vehicles. The inspector should be familiar with all preventive measures specified in the plan/ permit to determine if facility is in compliance.

Mitigative Measures. While preventive measures are to be preferred under the EPA urban dust policy, some sources of road dust loadings may not be easily controlled by prevention. Consequently, some mitigative measures may be necessary to achieve desired goals. This section discusses demonstrated mitigative measures.

Broom Sweeping of Roads. Mechanical street cleaners employ rotary brooms to remove surface materials from roads and parking lots. Much of their effect is cosmetic, in the sense that, while the roadway appears much cleaner, a substantial fraction of the original loading is emitted during the process. Thus, there is some credence to claims that mechanical cleaning is as much a source as a control of particulate emissions.

Measurement-based control efficiency of broom sweeping for industrial roads and estimated efficiencies for urban roads both indicate a maximum (initial) instantaneous control of roughly 25 to 30%. Efficiency, of course, can be expected to decrease after cleanup.

Vacuum Sweeping of Roads. Vacuum sweepers remove material from paved surfaces by entraining particles in a moving air stream. A hopper is used to contain collected material and air exhausts through a filter system in an open loop. A regenerative sweeper functions in much the same way, although the air is continuously recycled. In addition to the vacuum pickup heads, a sweeper may also be equipped with gutter and other brooms to enhance collection. Figure 3-5 shows a vacuum sweeper truck in operation.

Instantaneous control efficiency values were given earlier in Table 3-4. Available data show considerable scatter, ranging from a field measurement showing no effectiveness (over baseline uncontrolled emissions) to another field measurement of 58%. An average of the field measurements would indicate an efficiency of 34%. In addition, the estimated upper limits for PM_{10} control of urban roads (Table 3-5) compare fairly well with that average.

Figure 3-5. Photo of a vacuum street sweeper.

Water Flushing of Roads. Street flushers remove surface materials from roads and parking lots using high pressure water sprays. Some systems supplement the cleaning with broom sweeping after flushing. Note that the purpose of the program is to remove material from the road surface; in some industries, water is regularly applied to roads to directly control emissions (i.e., as in unpaved roads). Unlike the two sweeping methods, flushing faces some obvious drawbacks in terms of water usage, potential water pollution, and the frequent need to return to the water source. However, flushing generally tends to be more effective in controlling particulate emissions.

Equations to estimate instantaneous control efficiency values are given in Table 3-4. Note that water flushing and flushing followed by broom sweeping represent the two most effective control methods (on the basis of field emission measurements) given in that table.

3.3 REGULATORY FORMATS AND ASSOCIATED INSPECTION PROCEDURES

Once a PM_{10} control strategy has been developed and implemented, it becomes necessary for the control agency to ensure that (a) the plan is being carried out as specified, and (b) the plan is achieving the desired level of control. This section discusses methods for determining compliance, along with inspection procedures for paved roads.

3.3.1 "In-plant" Inspection Procedures

Figure 3-6 is an example inspection form which may be completed at the start of the Level II and III inspections by interviewing plant personnel. After determining any changes from the last inspection, a more thorough plant inspection should be performed. "In-plant" inspections for paved roads may consist of one or more of the following items:

1. Observation of control equipment in use.
2. "Spot" checks of pertinent traffic patterns.
3. Surface material sampling.

Each of these items is discussed in more detail below.

The plant inspection of paved road control equipment should focus on the following items:

- Ensuring that operation of the equipment has not changed markedly since the time of the last inspection.
- Examining that the "on-board" pollution control devices (e.g., bags on vacuum street cleaners, water sprays on flushing devices) are performing in an adequate matter. (This evaluation will usually be made on the basis of visible emissions from vents, brooms, etc.)
- Verifying that maintenance items (e.g., replacement nozzles) shown in the facility's records have actually been installed on the control equipment.

General Questions for Plant Personnel

	Yes*	No	N/A	Comments
1. Have any roads been eliminated or blocked off since last inspection?				
2. Have any roads been paved since last inspection?				
3. Any new roads?				
4. Have traffic volumes or vehicle characteristics on roads changed because of process changes, shutdown, etc.?				
Controls				
5. Have any changes been made in control program since last inspection?				
6. Any new equipment?				
7. Any equipment downtime since last inspection?				

* If any answer is yes, complete comment section.

Figure 3-6. Example inspection form.

- Noting the qualitative performance of the device in removing material from lightly to heavily loaded portions of the roadway.

- Recording the vehicle's odometer (or elapsed usage clock) reading for comparison against last reading and facility records.

In addition to the above items, in-plant inspections of the paved road control equipment may also entail field measurements of silt loadings before and after control. This is discussed in greater detail below.

If the facility personnel indicate marked changes in traffic patterns, traffic volume, etc., or if the control plan calls for vehicle volume reduction (see Section 4.2), the inspector may wish to spot-check traffic parameters at selected roads in the facility. This is accomplished by taking manual traffic mix data. General procedures for manual mix observations are outlined below.

Procedures for Obtaining Manual Traffic Mix Data

Required equipment. Stopwatch, traffic count log (see Figure 3-3)

Procedure:

1. Select unobstructed observation point.

2. Determine distance between two easily defined points (A,B) on the road segment in question.

3. Indicate mix start time.

4. For each passing vehicle, record vehicle type (if known). the number of axles/wheels, and the time in seconds required to travel between points A and B. Alternately, an accumulating stopwatch may be used to determine the average time required to travel between A and B.

5. Record mix stop time.

Finally, the inspector can spot check paved roads by taking material grab samples and comparing either "before and after" silt loadings or comparing the silt loading against some "action level." The latter is useful in assessing prevention of material carryout into public paved roads. As an example, if the silt loading on a public road (with an average traffic volume of 2,000 vehicles per day) adjacent to an industrial or construction site ever exceeds 2.9 g/m^2 (the "action level"), the regulatory agency may require the responsible party to reduce the silt loading to a level less than the action level. The action level is an agency-supplied multiple (3 in this example) of either baseline measurements or the surface silt loading predicted by Eq. 3-1 and should correspond to a minimally acceptable level of control. Figure 3-7 presents a possible format for use with public paved road sources.

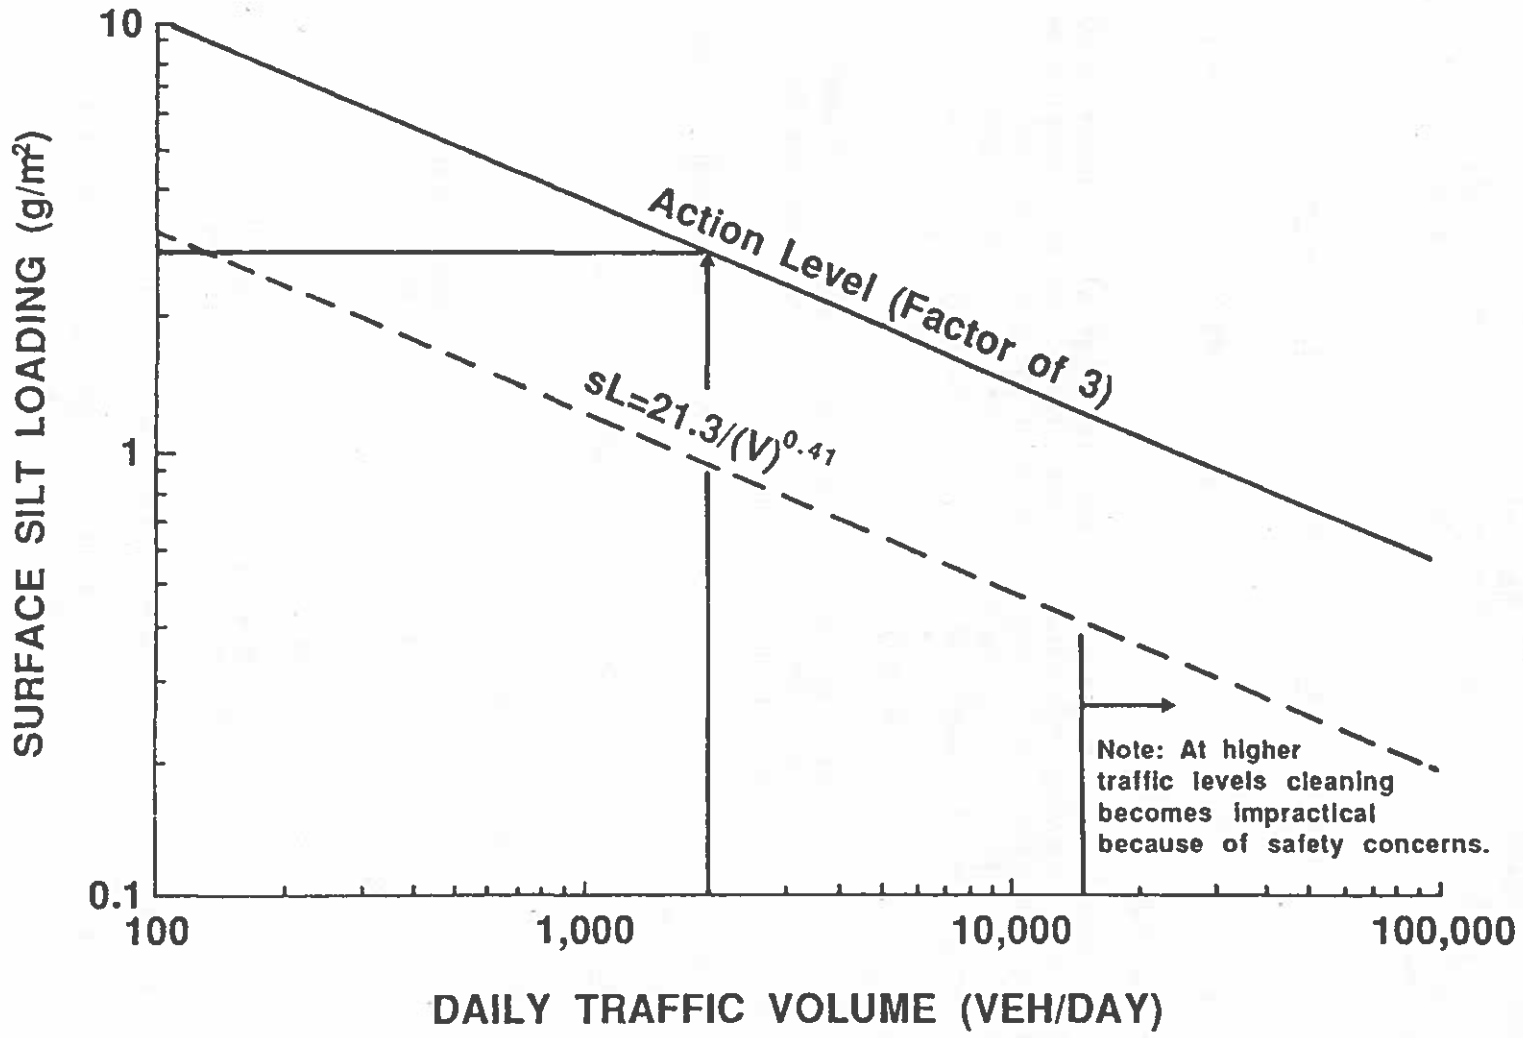

Figure 3-7. Possible use of "action levels" to trigger paved road controls.

The sampling method used to determine silt loading for compliance inspection should conform to the technique used to develop the AP-42 urban paved road equation. That technique is specified in Appendix F and briefly described below.

Procedures for Obtaining Surface Material Samples

Required equipment. Stick-type vacuum, hand broom, dust pan (Figure 3-2)

Procedure (See Appendix F):

1. Arrangements must be made to account for spatial variation of surface silt loading. Possible suggestions include (a) visually determining the heaviest loading on the road and selecting that spot for sampling, (b) sampling the midpoint of the road length segment of interest, and (c) sampling preselected (possibly on the basis of safety considerations) strips on the road surface (note that the samples may be aggregated).

2. After sampling site has been selected, hand sweep with a hand broom and dust pan if there are any large particles in the sampling area. Place sample in jar and label.

3. Vacuum the test site, using preweighed bags. Remove vacuum bag, check for leaks, and label.

4. Analyze for silt content as described in Appendix F.

3.3.2 Plant Record Keeping Requirements

Records must be kept to document the frequency a paved road is vacuumed, flushed, or swept. Pertinent parameters that should be specified in a control plan and regularly recorded include:

General Information to be Specified in the Plan

1. All road segments and parking locations referenced on a map available to both the responsible party and the regulatory agency.

2. Length of each road and area of each parking lot.

3. Type of control applied to each road/area and planned frequency of application

4. Provisions for weather (e.g., program suspended for periods of freezing temperatures; for broom and vacuum sweeping, a predetermined amount of rainfall will be substituted for one treatment).

Specific Records for Each Road Segment/Parking Area Treatment

1. Date of treatment

2. Operator's initials (note that the operator may keep a separate log whose information is transferred to the environmental staff's data sheets)

3. Start and stop times on a particular segment/parking lot, average speed, number of passes

4. Start and stop times for refilling tanks (for water flushing only)

5. Qualitative description of loading before and after treatment

6. Any areas of unusually high loadings, from spills, pavement deterioration, etc.

General Records to be Kept

1. Equipment maintenance records

2. Meteorological log (to the extent that weather influences the control program)

3. Any equipment malfunctions or downtime

Example Compliance Determination--Record Keeping for Flushing of Paved Roads. This example considers the hypothetical facility X with paved roads shown in Figure 3-1. Facility X is located in a PM_{10} nonattainment area and has an approved dust control plan that specifies the following control strategy for paved roads:

1. Flushing at intensities $\geq$ 0.50 gal/yd^2 (2.3 L/m^2)

2. To achieve an average control of 34% by water flushing, no more than 300 vehicle passes can occur between treatments (c.f. Table 3-4). Therefore, the frequency of flushing was determined by traffic volume in the control plan. Because roads A, B, and C have 50, 10, and 40 vehicle passes per working hour, respectively, the roads should be flushed every 6, 30, and 7.5 h of operation. For practical considerations, the permit requires that road B be flushed daily and road C be flushed every 6 h with road A. In addition, paved parking areas should be flushed at the close of each business day.

3. Flushing is to be performed from April 1 through October 31.

4. Each 1/2 in of rainfall (in the previous 24 h) will be substituted for one treatment, and the program will be suspended for days where the morning temperature (8 a.m.) does not exceed 32°F.

Note that the permit also specifies flushing between 11:00 a.m. and 3:00 p.m. when the ambient temperature at 11:00 a.m. is ≥ 40°F for the period from November 1 to March 31.

The source extent parameters for paved surfaces at facility X are given below:

Segment/area	Vehicle passes per hour	Length (ft)	Width (ft)	Approx. area (yd^2)
A	50	650	32	2,300
B	10	350	32	1,250
C	40	200	32	700
Parking	-	300	80	2,700

(Note that the vehicle passes are those used in the equation for determining uncontrolled emissions.) The facility operates a 5,000-gal water truck equipped with auxiliary spray "shoes" for flushing paved surfaces.

Example records kept by facility X to document its flushing program are shown in Figure 3-8 (meteorological data log) and in Figure 3-9 (operator's log). Because the control plan specifies the time interval between each application, the use of the operator's log is the best way to determine compliance. The operator's log should show at least one treatment for every 6 h for roads A and C and one treatment a day for road B. If it does not, the facility should be required to submit a written explanation for the apparent discrepancy. Note that this evaluation may require accumulating scale records over more than one business day, and that it should consider periods of minimal rainfall so as not to confound the check.

SECTION 4

UNPAVED ROADS

As is the case for paved roads, particulate emissions occur whenever a vehicle travels over an unpaved surface. Unlike paved roads, however, the road itself is the source of the emissions rather than any "surface loading." Within the various categories of open dust sources (i.e., paved roads, storage piles, and wind erosion), unpaved travel surfaces have historically accounted for the greatest share of particulate emissions in industrial settings.

Unpaved travel surfaces are found in rural regions throughout the country and in industrial settings. Rural roads may be unpaved because they experience only sporadic traffic and involve considerable road length, making paving generally impractical. Some industrial roads are, by their nature, not suitable for paving. These roads may be used by very heavy vehicles or may be subject to considerable spillage from haul trucks. Other roads may have poorly constructed bases which make paving impractical. Because of the additional maintenance costs associated with a paved road under these service environments, emissions from these roads are usually controlled by regular applications of water and/or chemical dust suppressants.

In addition to roadways, many industries often contain important unpaved travel areas. These areas include travel around stockpiles, staging and reclaim activities. These areas may often account for a substantial fraction of traffic-generated emissions from individual facilities. In addition, these areas tend to be much more difficult to control than stretches of roadway.

4.1 EMISSIONS ESTIMATION

4.1.1 Emission Factor Equation

When considering emissions and their control from unpaved roads, each road must first be divided into road segments. A road segment is the distance between two intersections. Figure 4-1 is a map of an example facility with each road divided into road segments and assigned an arbitrary identification. After identifying each road segment, an emission factor may be determined by applying the following AP-42[1] equation to each road segment:

$$E = 0.61 \left(\frac{s}{12}\right) \left(\frac{S}{48}\right) \left(\frac{W}{2.7}\right)^{0.7} \left(\frac{w}{4}\right)^{0.5} \frac{(365-p)}{365} \text{ (kg/VKT)} \qquad (4\text{-}1)$$

$$E = 2.1 \left(\frac{s}{12}\right) \left(\frac{S}{30}\right) \left(\frac{W}{3}\right)^{0.7} \left(\frac{w}{4}\right)^{0.5} \frac{(365-p)}{365} \text{ (lb/VMT)}$$

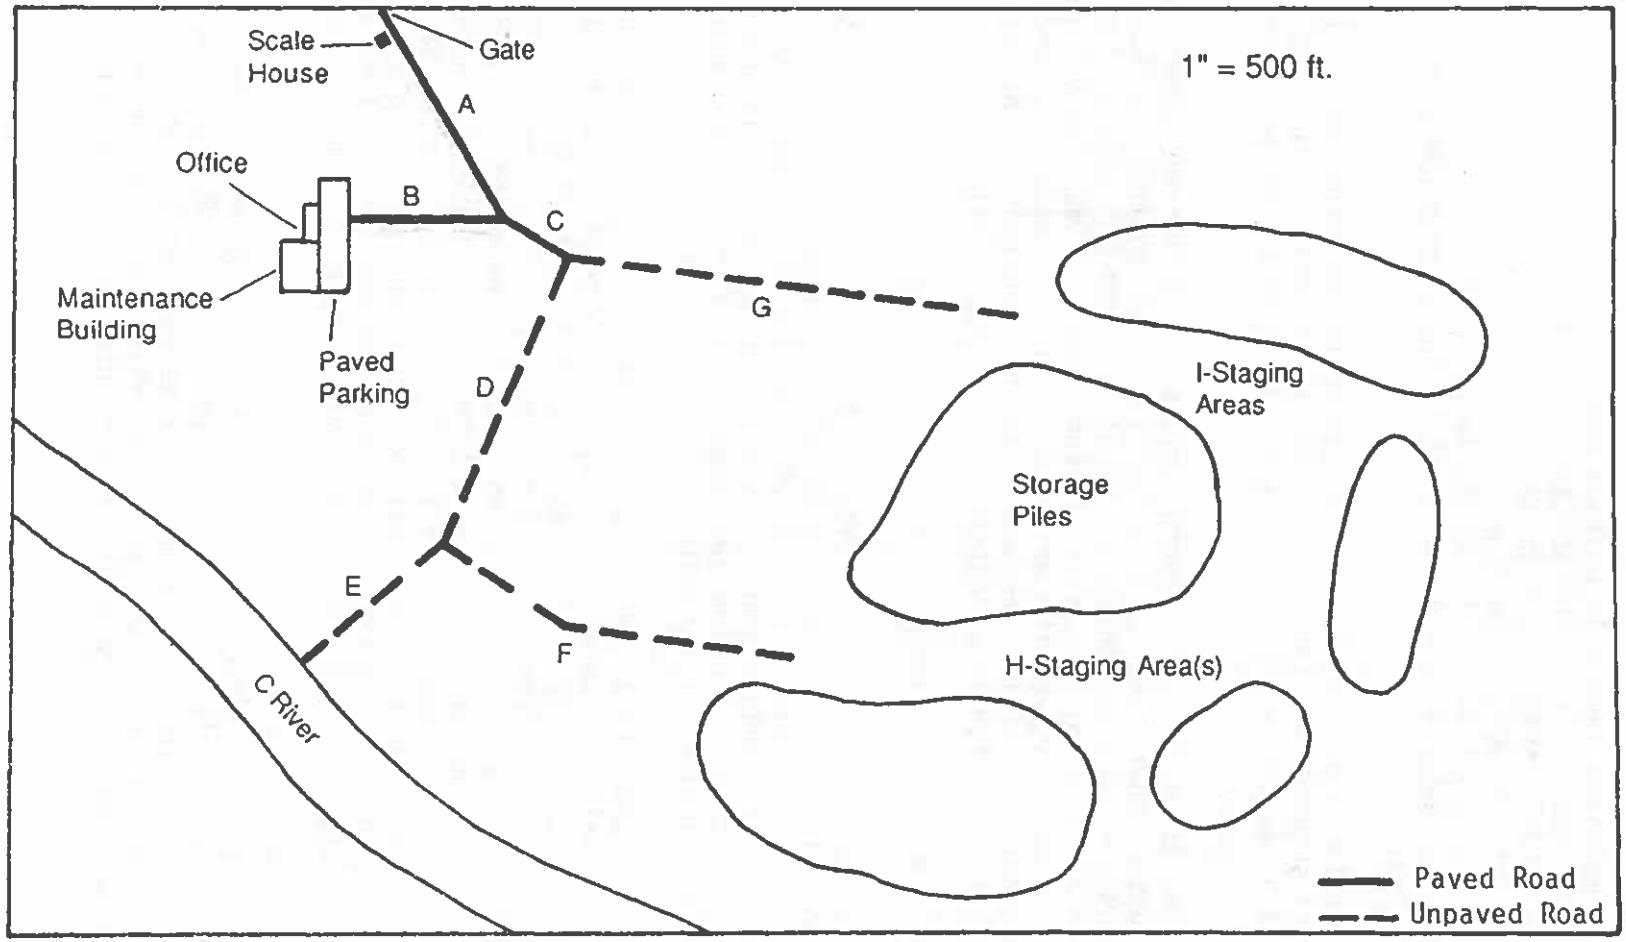

Figure 4-1. Example facility map with roads divided into road segments.

where: E = PM_{10} emission factor in units stated
s = silt content of road surface material, %
S = mean vehicle speed, km/h (mi/h)
W = mean vehicle weight, Mg (ton)
w = mean number of wheels (dimensionless)
p = number of days with $\geq$ 0.254 mm (0.01 in) of precipitation per year

The emission rate is determined by multiplying the emission factor by the length of the road segment and the vehicle passes per day. Adding the emission rate from each segment will provide a total unpaved road emission rate for the facility.

Note that the above emission factor equation represents uncontrolled conditions. (Roads that are controlled will be discussed later in Section 4.3.) Emissions may be controlled by either "add-on" methods (such as watering, etc.) or by reducing the values of parameters in Equation 4-1 (e.g., halving the vehicle speed halves the emission rate). In addition, some compliance tools also make use of the parameters in this equation. Consequently, each parameter in the equation is discussed in more detail below.

4.1.2 Parameters Affecting Emissions

Silt content is the percent of mass which passes a 200 mesh screen (< 75 μmP). Table 4-1 gives a range of measured silt values for unpaved roads in certain industries. As for all AP-42 emission factors, the use of site-specific data is strongly encouraged. The silt content of the road surface material should be determined using the sampling techniques and laboratory analysis procedures described in Appendix F.

Vehicle-related parameters should be obtained using a combination of counting devices, manual or automated records, and information from plant personnel. Pneumatic tube axle counters can be used to obtain traffic volume data. (Note that traffic volume is also necessary to obtain emission rates from Equation 4-1.) Figure 4-2 shows an example pneumatic traffic log. However, because these counters only record the number of passing axles, it would also be necessary to obtain traffic mix information (e.g., number of axles per vehicle) to convert axle counts to the number of vehicle passes. Vehicle mixes may be observed either visually or by the use of videotape or time-lapse motion pictures. Figure 4-3 shows an example of a manual vehicle log.

Additional information obtained from traffic mix observations include fractions of different vehicle types, vehicle speed, and number of wheels per vehicle. A posted plant speed limit may also be used to represent average speed. Finally, comparison of the observed vehicle mix to the pneumatic counter totals allows the accuracy of the axle counter to be assessed.

TABLE 4-1. TYPICAL SILT CONTENT VALUES OF SURFACE MATERIAL ON INDUSTRIAL AND RURAL UNPAVED ROADS[a]

Industry	Road use or surface material	Plant sites	Test samples	Silt, weight percent Range	Silt, weight percent Mean
Copper smelting	Plant road	1	3	15.9-19.1	17.0
Iron and steel production	Plant road	9	20	4.0-16.0	8.0
Sand and gravel processing	Plant road	1	3	4.1-6.0	4.8

Figure 4-3. Manual traffic count log.

The number of wet days (i.e., precipitation ≥ 0.01 in) per year (p) for the geographical area of interest should be determined from local climatic data. Figure 4-4 gives the geographical distribution of the mean annual number of wet days per year in the United States. Maps giving similar data on a monthly basis are available from the U.S. Department of Commerce.[2]

4.2 EMISSION CONTROL METHODS

As shown in Table 4-2, there are a variety of control options for unpaved travel surfaces. Note that the controls fall into three general categories of: source extent reductions; surface improvements; and surface treatments. Each of these is discussed in greater detail below.

TABLE 4-2. CONTROL TECHNIQUES FOR UNPAVED TRAVEL SURFACES

Source extent reductions:	Speed reduction Traffic reduction
Source improvements:	Paving Gravel surface
Surface treatments:	Watering Chemical stabilization - Asphalt emulsions - Petroleum resins - Acrylic cements - Other

4.2.1 Source Extent Reductions

These controls either limit the amount of traffic on a road to reduce the PM_{10} emission rate, or lower speeds to reduce the emission factor value given by Equation 4-1. Examples could include industrial plant bussing programs for employees, restriction of roads to only certain vehicle types, or strict enforcement of speed limits. In any instance, the control afforded by these measures is readily obtained by the application of the emission factor equation.

4.2.2 Surface Improvements

These controls alter the road surface. Unlike the surface treatments (discussed below), these improvements do not require periodic reapplication.

The most obvious surface improvement is, of course, paving an unpaved road. This option is expensive and is probably most applicable to high volume (i.e., more than a few hundred passes per day) public roads and industrial plant roads that are not subject to very heavy vehicles (e.g., slag pot carriers, haul trucks, etc.) or spillage of material in transport.

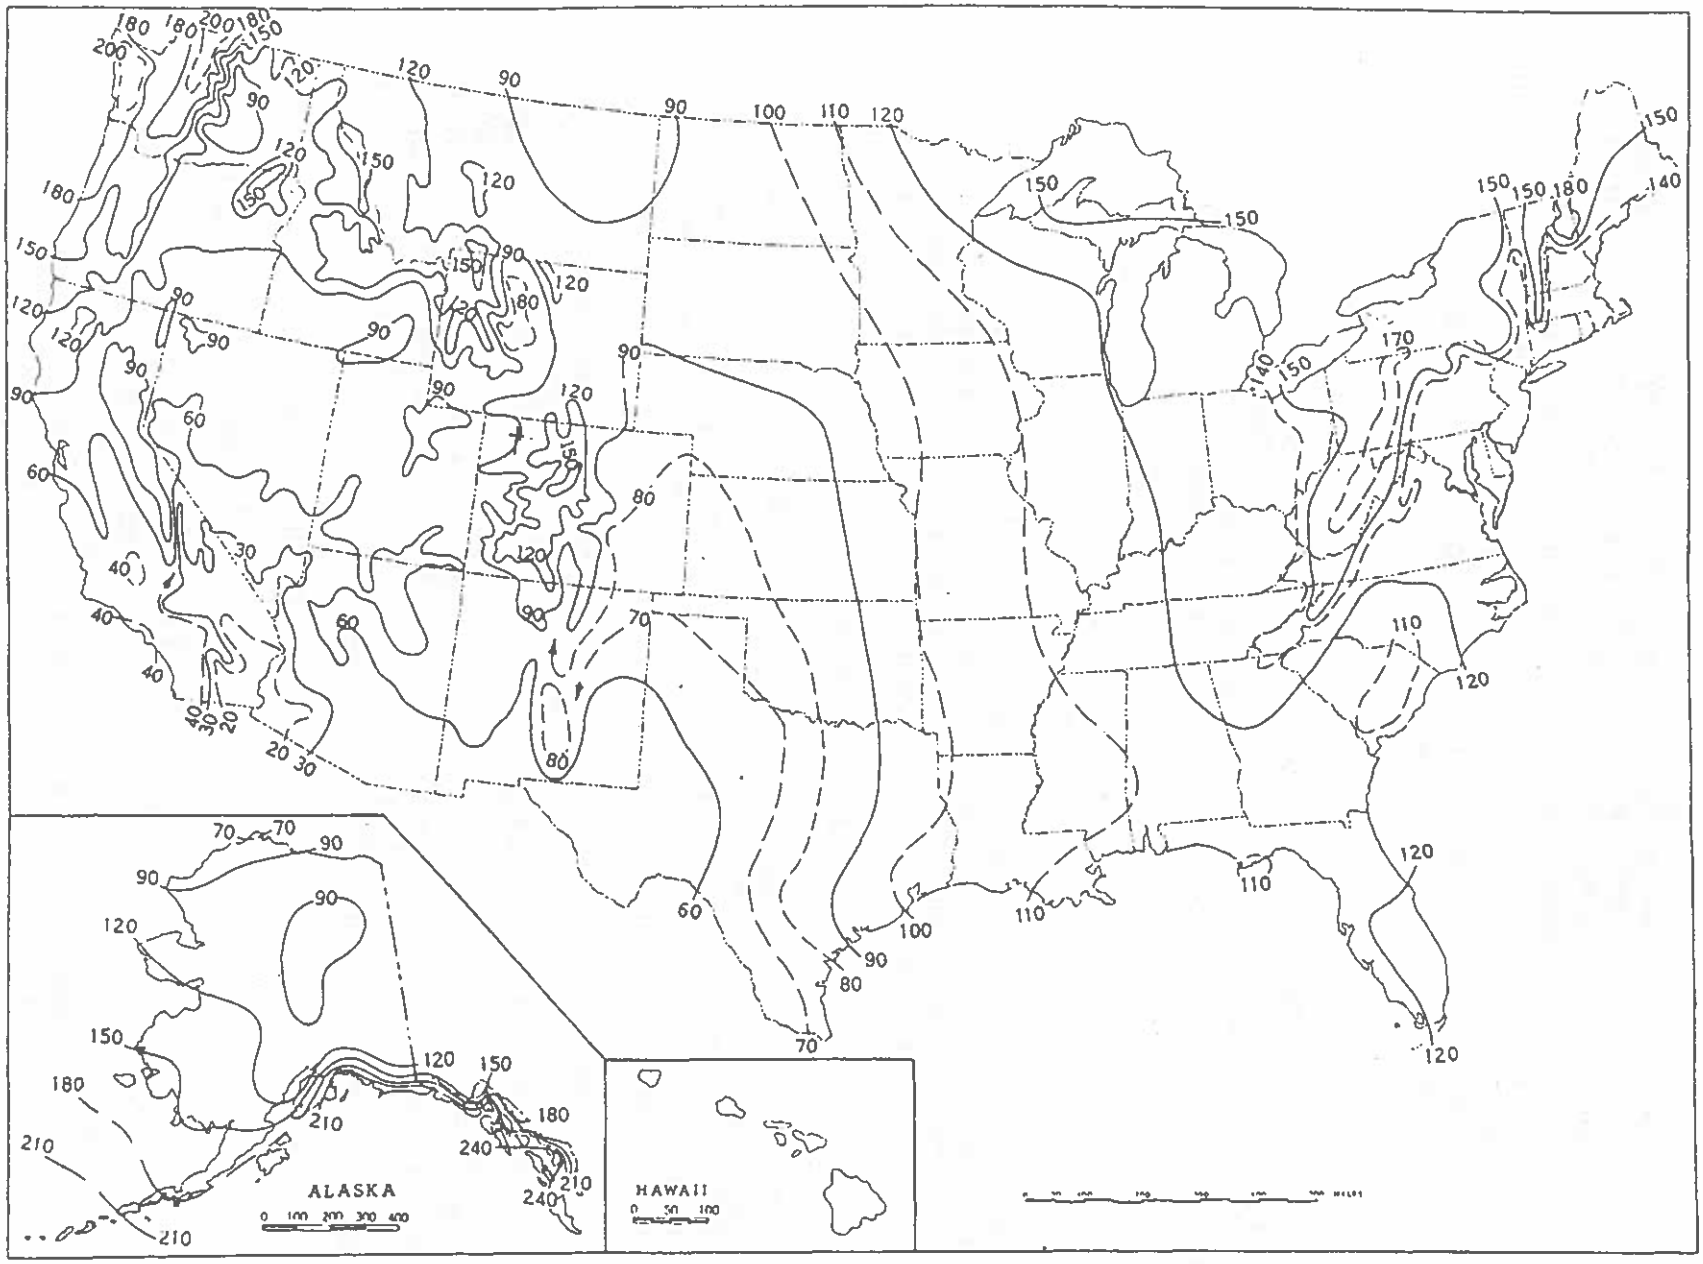

Figure 4-4. Mean annual number of days with at least 0.01 in of precipitation. As noted in Reference 2, patterns are too complex in Hawaii for inclusion on this map. (Means for Hilo, Honolulu, and Lihue are 148,204, and 90 days/yr, respectively.)

Other improvement methods cover the road surface material with another material of lower silt content (e.g., covering a dirt road with gravel or slag, or using a "road carpet" under ballast).[5] Because Equation 4-1 shows a linear relationship between the emission factor and the silt content of the road surface, any reduction in the silt value is accompanied by an equivalent reduction in emissions. This type of improvement is initially much less expensive than paving; however, maintenance (such as grading and spot reapplication of the cover material) may be required.

4.2.3 Surface Treatment

Surface treatment refers to those control techniques which require periodic reapplications. Treatments fall into the two main categories of: (1) wet suppression (i.e., watering, possibly with surfactants or other additives), which keeps the surface wet to control emissions; and (2) chemical stabilization, which attempts to change the physical (and, hence, the emissions) characteristics of the roadway. Necessary reapplication frequencies may range from several minutes for plain water under hot, summer time conditions to several weeks (or months) for chemicals.

Water is usually applied to unpaved roads using a truck with a gravity or pressure feed system. This is only a temporary measure, and periodic reapplications are necessary to achieve any substantial level of control efficiency. Some increase in overall control efficiency is afforded by wetting agents which reduce surface tension. Figure 4-5 shows a typical water truck used to treat unpaved haul roads in a mining operation.

Chemical dust suppressants (Table 4-3), on the other hand, have much less frequent reapplication requirements. These suppressants are designed to alter the roadway surface, such as cementing loose material into a fairly impervious surface (thus simulating a paved surface) or forming a surface which attracts and retains moisture (thus simulating wet suppression).

Chemical dust suppressants are generally applied to the road surface as a water solution of the agent. The degree of control achieved is a direct function of the application intensity (volume of solution per unit area), dilution ratio, and frequency (number of applications per unit time) of the chemical applied to the surface and also depends on the type and number of vehicles using the road.[5] Chemical suppressants have also been proven to be effective as crusting agents for inactive storage piles and for the stabilization of exposed open areas and agricultural fields.[5]

4.3 REGULATORY FORMATS AND ASSOCIATED INSPECTION PROCEDURES

Once a specific PM_{10} control strategy has been developed and implemented, it becomes necessary for the control agency to assure that it is being carried out as specified and is achieving the desired level of control. The control efficiency actually attained by a particular technique depends on the application parameters involved in its implementation. This section will discuss methods for determining compliance, along with inspection procedures, for various surface treatments of unpaved roads.

4.3.1 General Inspection Procedures and Compliance Information

4.3.1.1 General Inspection Procedures--

Figure 4-6 is an example inspection form which may be completed at the start of the Level II or III inspection by interviewing plant personnel. After determining any changes from the last inspection, a more thorough plant inspection should be performed. "In-plant" inspections for a watering/chemical suppression program may consist of one or more of the following items:

1. Qualitative assessment of the water/chemical truck spray pattern.

2. "Spot" checks of pertinent traffic patterns.

3. Surface material sampling.

Each of these items is discussed in more detail below.

The qualitative evaluation of the water/chemical truck spray pattern should verify that:

1. The spray pattern is roughly uniform over the treated area.

2. The observed application pattern (i.e., one or more passes by the truck), effectively treats the entire travel surface.

If the spray pattern is not uniform, it often produces "ponding" of water/chemical in small areas with little or no water/chemical over other areas of the surface. The practical result is that although the average application intensity (e.g., gal/yd^2) based on calculations appears to provide acceptable levels of control, an erratic spray pattern in reality results in lower control efficiencies. Also, the inspector may want to record the vehicles' odometer reading to compare against the last reading and facility records.

If the facility personnel indicate marked changes in traffic patterns, traffic volume, etc., or if the control plan calls for vehicle volume reduction (see Section 4.2), the inspector may wish to spot-check traffic parameters at selected roads in the facility. This is accomplished by taking manual traffic mix data. General procedures for manual mix observations are outlined in Figure 4-7.

Finally, the inspector can spot-check controlled roads by taking material grab samples and comparing the moisture or silt content with a minimum acceptable value specified in the control plan/operating permit, as applicable. This represents an "indirect" measure of compliance determination as discussed in Section 2. An illustration of this technique to spot-check control efficiency of water and chemical suppressants is presented later in Sections 4.3.2.3 and 4.3.3.3, respectively. Figure 4-7 describes briefly the procedures for collecting material samples. A more complete description can be found in Appendix F.

General Questions for Plant Personnel

	Yes*	No	N/A	Comments
1. Have any roads been eliminated/blocked off since last inspection?				
2. Have any roads been paved since last inspection?				
3. Any new roads?				
4. Have traffic volumes or vehicle characteristics on roads changed because of process changes, shutdown, etc.?				
Controls				
5. Have any changes been made in control program since last inspection?				
Watering				
6. Any new equipment?				
7. Any equipment downtime since last inspection?				
Chemicals				
8. Any receipts since last inspection?				
9. Any new equipment?				
10. Any equipment downtime?				
11. Have any treated roads been repaired (e.g., bladed, filled in, etc.)?				
12. Any supplemental cleaning (e.g., flushing) since last inspection?				

* If any answer is yes, complete comment section.

Figure 4-6. Example inspection form.

Procedures for Obtaining Manual Traffic Mix Data

Required equipment: Stopwatch, traffic count log (see Figure 4-3)

Procedure:

1. Select unobstructed observation point.
2. Determine distance between two easily defined points (A,B) on the road segment in question.
3. Indicate mix start time.
4. For each passing vehicle, record vehicle type (if known), the number of axles/wheels, and the time in seconds required to travel between points A and B. Alternately, an accumulating stopwatch may be used to determine the average time required to travel between A and B.
5. Record mix stop time.

Procedures for Obtaining Surface Material Samples

Required equipment: Hand (whisk) broom, dustpan

Procedure:

1. Measure the width of the traveled portion of the roadway.
2. Remove the loose surface material from the hard road base with the hand broom and dustpan. The sample should be taken across the entire traveled portion of the road using an 8-in wide sample strip.
3. Place sample in a container and analyze for moisture or silt content as described in Appendix F.

Figure 4-7. Procedures for obtaining manual traffic mix and material samples.

4.3.1.2 Plant Record Keeping Requirements--

Records must be kept that document the date, time, and amount of water/chemical applied to unpaved surfaces. Pertinent parameters that should be specified in a control plan include:

- All road segments and parking locations referenced on a map available to both the responsible party and the regulatory agency (see Figure 4-1 for an example).
- Length of each road and area of each parking lot.

Watering

- Amount of water applied to each road/area and planned frequency of application. (Alternatively, a minimum moisture level could be specified. This is discussed in greater detail later in this section.)
- Any provisions for weather (e.g., 1/4 in of rainfall will be substituted for one treatment; program suspended during freezing periods; watering frequency as a function of temperature, cloud cover, etc.).
- Source of water and tank capacity.

Chemical treatment

- Type of chemical applied to each road/area, dilution ratio, application intensity, and frequency of application.
- Any provisions for weather (e.g., application of chemical dust suppressants during cooler periods of the year may be inadvisable for traffic safety reasons).

4.3.2 Watering

4.3.2.1 Control Efficiency Determination--

The control efficiency of unpaved road watering depends upon: (a) the amount of water applied per unit area of road surface; (b) the time between reapplications; (c) traffic volume during that period; and (d) prevailing meteorological conditions during the period. While several investigations have estimated or studied watering efficiencies, few have specified all the factors listed above.

An empirical model for the performance of watering as a control technique has been developed.[5] The supporting data base consists of 14 tests performed in four states during five different summer and fall months. The model is:

$$C = 100 - \frac{0.8\ p\ d\ t}{i} \qquad (4\text{-}2)$$

where C = average control efficiency, %
p = potential average hourly daytime evaporation rate, mm/h
d = average hourly daytime traffic rate, h^{-1}
i = application intensity, L/m^2
t = time between applications, h

Estimates of the potential average hourly daytime evaporation rate may be obtained from:

$$p = \begin{cases} 0.0049 \times (\text{value in Figure 4-8}) & \text{for annual conditions} \\ 0.0065 \times (\text{value in Figure 4-8}) & \text{for summer conditions} \end{cases}$$

Note that Figure 4-8 does not present data for Alaska and Hawaii. Readers responsible for those portions of the country should consult local meteorological data from local weather stations, state universities, etc.

An alternative approach is presented as Figure 4-9 which shows that between the average uncontrolled moisture content and a value of twice that, a small increase in moisture content results in a large increase in control efficiency. Beyond this point, control efficiency grows slowly with increased moisture content according to the relationship:

$$C = \begin{cases} 75(M-1) & 1 \le M \le 2 \\ 62 + 6.7M & 2 \le M \le 5 \end{cases}$$

where C = instantaneous control efficiency, %
M = ratio of controlled to uncontrolled surface moisture contents

An example using this procedure is illustrated in Section 4.3.2.3.

4.3.2.2 Record Keeping Review--
To determine compliance using record keeping, the facility must maintain records for each road segment/parking area including:

1. Date of treatment.

2. Operator's initials (note that the operator may keep a separate log from which information is transferred to the environmental staff's data sheets).

3. Start and stop times on a particular segment/parking lot, average speed, number of passes.

4. Start and stop times for tank filling.

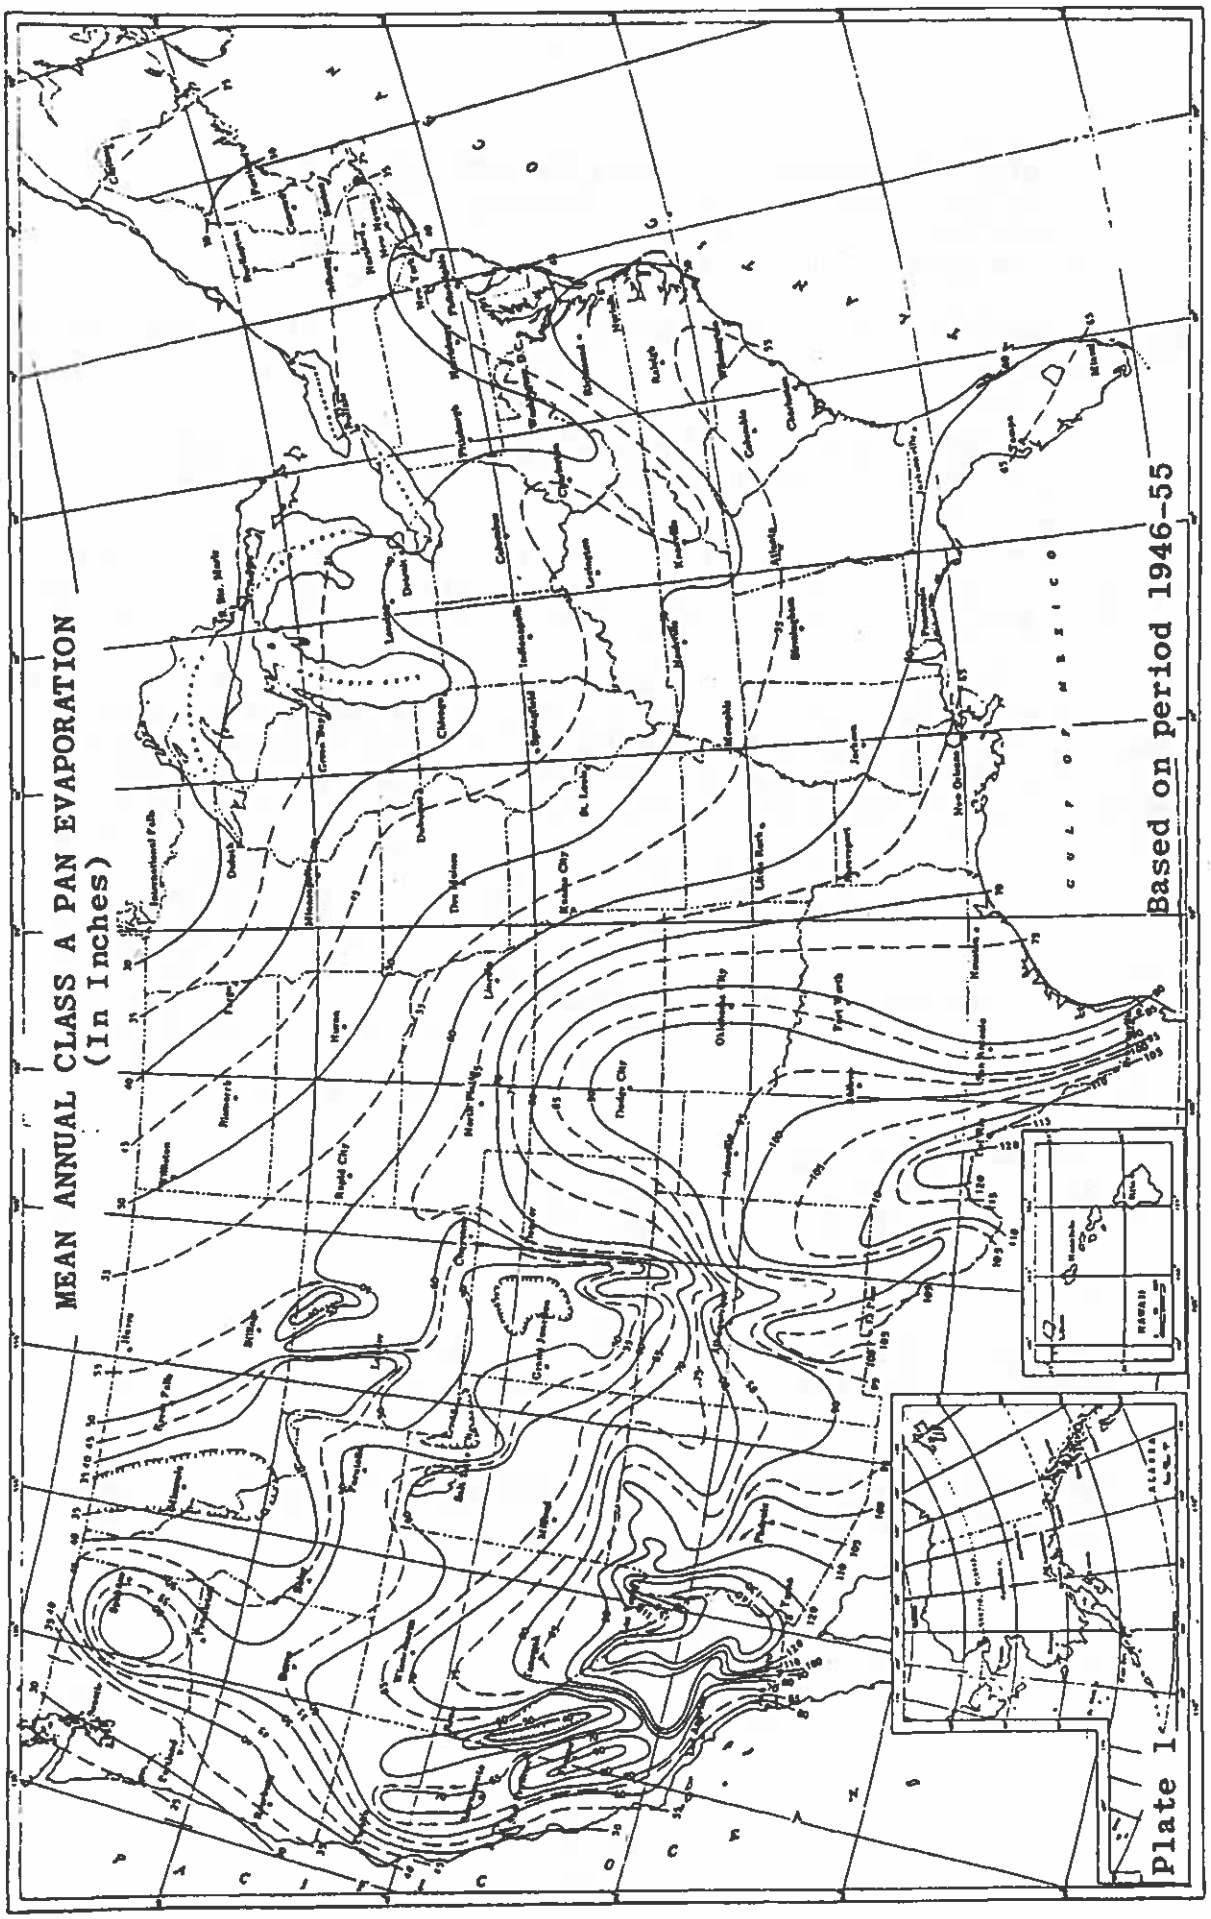

Figure 4-8. Annual evaporation data for the contiguous United States (as diagrammed in the "Climate Atlas of the United States," June 1968).

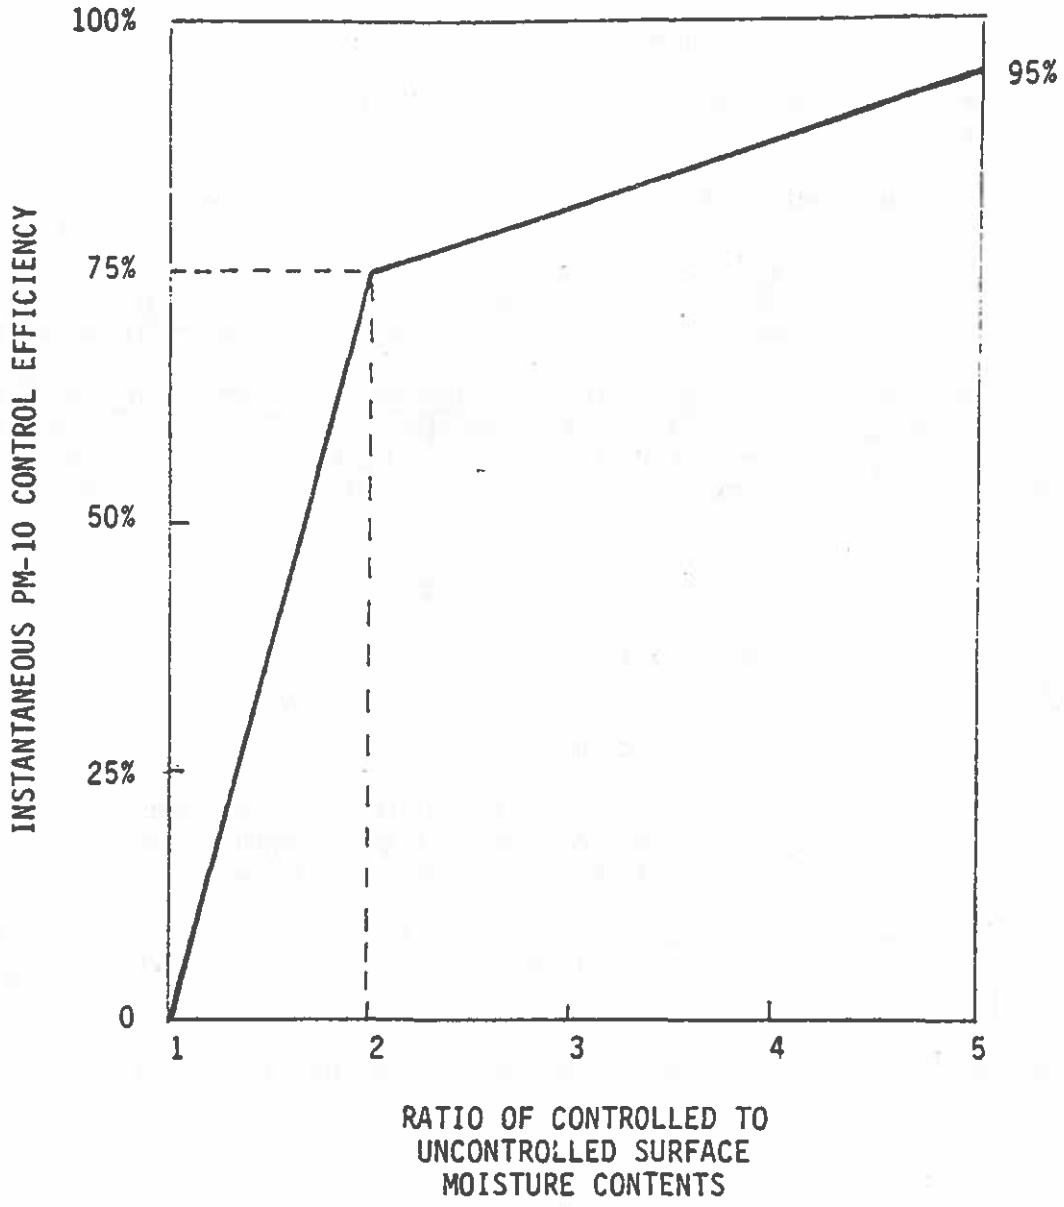

Figure 4-9. Watering control effectiveness for unpaved travel surfaces.

Figure 4-10 is an example form which plant personnel can complete when applying water to unpaved roads. In addition, plant-wide records must be kept including:

1. Equipment maintenance records.

2. Meteorological log (to the extent that weather influences the control program).

3. Any equipment malfunctions or downtime.

The procedures described above allow an inspector to review historical data to determine compliance. A procedure is described below which provides an independent assessment of dust control while the inspector is on-site.

Example Compliance Determination--Record Keeping for a Watering Program. This example considers the hypothetical facility X with unpaved roads and staging areas shown in Figure 4-1. Facility X is located in a PM_{10} nonattainment area and has an approved dust control plan that specifies the following conditions:

1. Application intensity ≥ 0.20 gal/yd² (0.91 L/m²).

2. Application frequency of twice/10-h workday.

3. Watering according to the application parameters is to be performed from April 1 through October 31.

4. Each ¼ in of rainfall (in the previous 24 h) will be substituted for one treatment, and the program will be suspended for days where the morning temperature (8 a.m.) does not exceed 32°F.

Note that the permit also specifies watering between 11:00 a.m. and 3:00 p.m. when the ambient temperature at 11:00 a.m. is ≥ 40°F for the period from November 1 to March 31.

The source extent parameters for unpaved surfaces at facility X are given below:

Segment/area	Length (ft)	Width (ft)	Approx. area (yd²)	Vehicle passes per hour	Vehicle speed (mph)
D	800	40	3,600	40	10
E	500	25	1,400	1	5
F	1,000	40	4,500	40	10
G	1,200	40	5,300	40	10
H (staging area)	-	--	10,000	40	5
I (staging area)	-	--	17,000	40	5

WATER APPLICATION LOG

Date	Time	Application intensity (gal/yd^2)	Area(s) treated	Climatic parameters: Amb. temp. (°F)	Climatic parameters: Date/amt. of last rainfall	Equipment used	Operator initials	Comments

Figure 4-10. Example water application log.

The facility operates a 5,000-gal water truck equipped with a 10-ft spray bar. Visual observation indicates that two water truck passes (i.e., one in each direction) effectively treats the travel surface of the unpaved roads. Five to six passes are required to cover the travel portions of the staging areas (H and I).

Example records kept by facility X to document its watering program are shown in Figure 4-11 (meteorological data log), and in Figure 4-12 (operator's log). The inspector responsible for the facility would, in practice, compare these two records for compliance with permit conditions. The check is intended to verify that all the unpaved roads and staging areas have been treated twice daily (except after significant rainfall or under freezing conditions). Note in Figure 4-12 that only one treatment is logged for 6/22 as 0.27 in of rainfall was recorded for the previous 24-h period.

If it is suspected that the documentation is inaccurate, for example, treatments are logged for periods where no water was applied, the operator's log can be cross-checked against any facility records kept for maintenance/service of the water truck. These records are typically more complete than those for the watering program. If the two sets of records do not match, the facility should be required to submit a written explanation for the apparent discrepancy.

Information compiled in the operator's log represents critical data against which operations observed during Level II and III inspections should be evaluated. For example, Figure 4-12 provides a basis for estimating the typical length of time for a typical "cycle"--the time required to complete a single application to all facility unpaved surfaces. For facility X, this cycle length is on the order of 2 h. In practice, if cycles observed during an inspection deviated considerably from those indicated in the operator's log, the inspector should require the facility to explain the reasons for the deviation.

In a similar fashion, while the operator's log does not allow the inspector to directly determine application intensity--the amount of water applied per unit surface area--a check of filling times during inspection does provide a qualitative indicator of whether or not the facility is, in fact, complying with its permit requirements. In the case of facility X, a typical filling time is on the order of 10 to 15 min. In practice, if the inspector can approximate the filling rate (from a knowledge of pump specifications), it is fairly easy to determine whether application intensities suggested by the log information meet permit requirements.

This procedure can be illustrated for facility X as follows:

1. The pattern of applications indicated in the operator's log--

   E (1 pass)/F (2 passes)/and complete application to staging area I--corresponds to 22,200 yd^2.

Figure 4-12. Operator's log for example facility X.

2. Thus the minimum application intensity of 0.20 gal/yd² requires 4,440 gal (22,200 yd² x 0.20 gal/yd² = 4,440 gal).

3. Given a 10-min filling time, this corresponds to a fill rate of about 400 gal/min.

During an inspection, the inspector for facility X would verify the length of time required to completely fill the tank from an initial near-empty state. Because the application cycle cited above (one-half of the total cycle) requires nearly the entire tank capacity, it follows that if the tank is not at least 90% full after a typical fill time, then it is likely that facility X is not watering at the required application intensities.

4.3.2.3 "In-Plant" Inspection Procedures

An "in-plant" inspection to determine compliance with fugitive dust rules or permit conditions for unpaved roads involves focusing on several items including:

- A visual inspection of the facility in order to observe that all unpaved roads listed in the state permit/control plan still exist and whether additional roads have been developed.

- An examination of the source's records (as described above) documenting frequency of water application, amount applied, area(s) watered, etc.

- Observations of any spraying operations undertaken by the source during the inspector's visit.

After becoming familiar with the plant facilities and the control plan, the inspector should request that plant personnel provide the information that will allow the inspector to complete the example work sheet shown in Figure 4-6. The inspector would conduct a full inspection of the facility in order to obtain and verify actual operating conditions.

The inspector should spot-check the controlled roads by taking either traffic counts or material grab samples from the road(s). The moisture or silt content of the traveled portion of the roadway may be compared against a minimum acceptable value specified in the control plan/operating permit to determine compliance. This is considered to be an indirect method of compliance determination as discussed in Section 2. For example, the control plan/operating permit may specify that the control efficiency can never be below 75% or the average instantaneous control efficiency must not be below 85%. If the latter is specified, more samples would be required because the instantaneous efficiency must be tracked over time.

To illustrate, assume that a facility waters unpaved road D (Figure 4-1) every 3 h to control fugitive emissions. A field estimate of the control efficiency can be determined by the following steps:

1. Determine the uncontrolled moisture content by sampling prior to the first control of the day and having the facility not water a small portion of the road. Then collect a sample and determine moisture content using the procedures found in Appendix F. The uncontrolled moisture content needs only to be collected once. In this example, the uncontrolled moisture is assumed equal to 1.5%.

2. Assume the facility waters road D (Figure 4-1) at noon and again at 3 p.m. A moisture sample should be taken right after water was applied, at 1 p.m., 2 p.m., and again right before reapplication at 3 p.m.

3. Each sample should be analyzed for moisture content as quickly as practical, again following the procedures found in Appendix F.

4. Next, the control efficiency can be determined by calculating the controlled to uncontrolled ratio and using Figure 4-9. Assume the following moistures from the four samples were:

Sample no.	Time	Moisture content (%)
1D	Noon	6.75
2D	1 p.m.	6.00
3D	2 p.m.	5.25
4D	3 p.m.	3.75

Therefore, the moisture content ratios and associated control efficiency values are:

Sample No.	Ratio	Control (%)
1D	6.75/1.5=4.5	92
2D	4.0	89
3D	3.5	85
4D	2.5	79
	Average	86

The instantaneous control efficiencies for this example are shown on Figure 4-13. Note that for this example, this facility would be in compliance with both a minimum of the 75% instantaneous or 85% average control limits.

4.3.3 Chemical Treatments

4.3.3.1 Determination of Control Efficiency--

As noted in Section 4.2, some chemicals (most notably salts) simulate wet suppression by attracting and retaining moisture on the road surface. These methods are often supplemented by some watering. In these cases it is

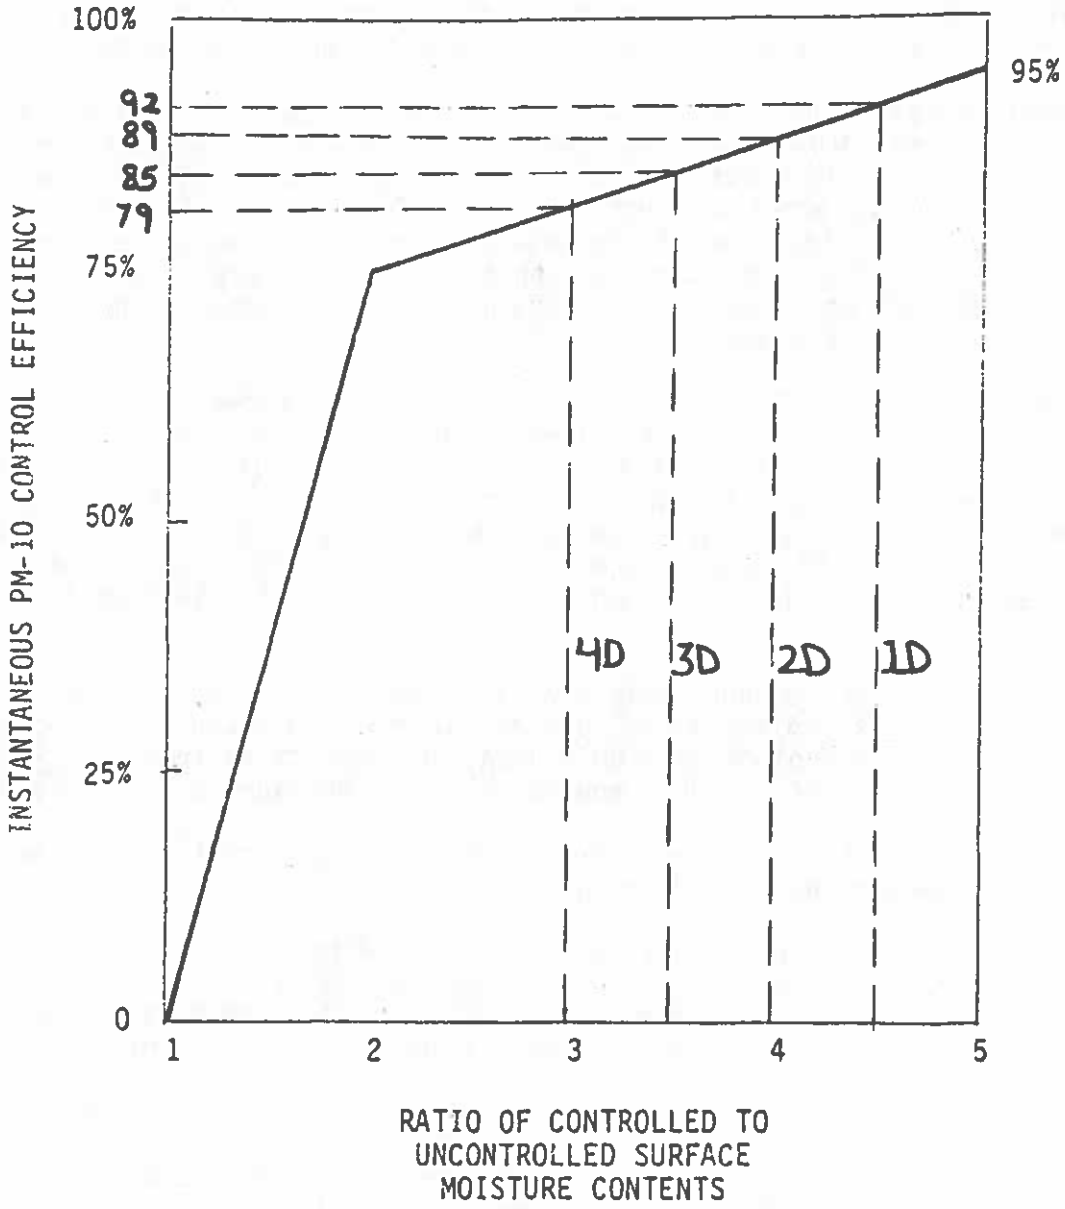

Figure 4-13. Watering control effectiveness for unpaved road D in example problem.

recommended that control efficiency estimates be obtained using Figure 4-9 and enforcement be based on the grab sample moisture content technique described above in Section 4.3.2.3.

The more commonly used chemical dust suppressants form a hard cemented surface. It is this type of suppressant that is considered below.

Besides water, petroleum resins (such as Coherex) have historically been the products most widely used and evaluated. However, considerable interest has been shown in alternative chemical dust suppressants. These have included asphalt emulsions, acrylics, and adhesives. In addition, "generic" petroleum resin formulations (designed to be produced on-site) have gained considerable attention. On-site production of this type of suppressant in quantities commonly used at iron and steel plants has been estimated to reduce chemical costs by approximately 50%.[6]

In an earlier test report, average performance curves were generated for four chemical dust suppressants commonly used in the iron and steel industry: (a) a commercially available petroleum resin; (b) a generic petroleum resin for on-site production at an industrial facility; (c) an acrylic cement; and (d) an asphalt emulsion.[7] The results of this program were combined with other test results to develop a model to estimate time-averaged PM_{10} control performance. This model is illustrated as Figure 4-14. Several items are to be noted:

- The term "ground inventory" is a measure of residual effects from previous applications. Ground inventory is found by adding together the total volume (per unit area) of concentrate (not solution) since the start of the dust control season. An example is provided below.

- Note that no credit for control is assigned until the ground inventory exceeds 0.05 gal/yd^2.

- Because suppressants must be periodically reapplied to unpaved roads, use of the time-averaged values given in the figure are appropriate. Recommended minimum reapplication frequencies (as well as alternatives) are discussed later in this section.

- Figure 4-14 represents an average of the four suppressants given above. The basis of the methodology lies in a similar model for petroleum resins only.[7] However, agreement between the control efficiency estimates given by Figure 4-14 and available field measurements is reasonably good.

4.3.3.2 Record Keeping Review--

After becoming familiar with the plant facilities and the control plan, the inspector should request that plant personnel provide the information that will allow the inspector to complete the example inspection form shown in Figure 4-6. The inspector would conduct a full inspection of the facility in order to obtain and verify actual operating conditions. Specific records for each road segment/parking area should include:

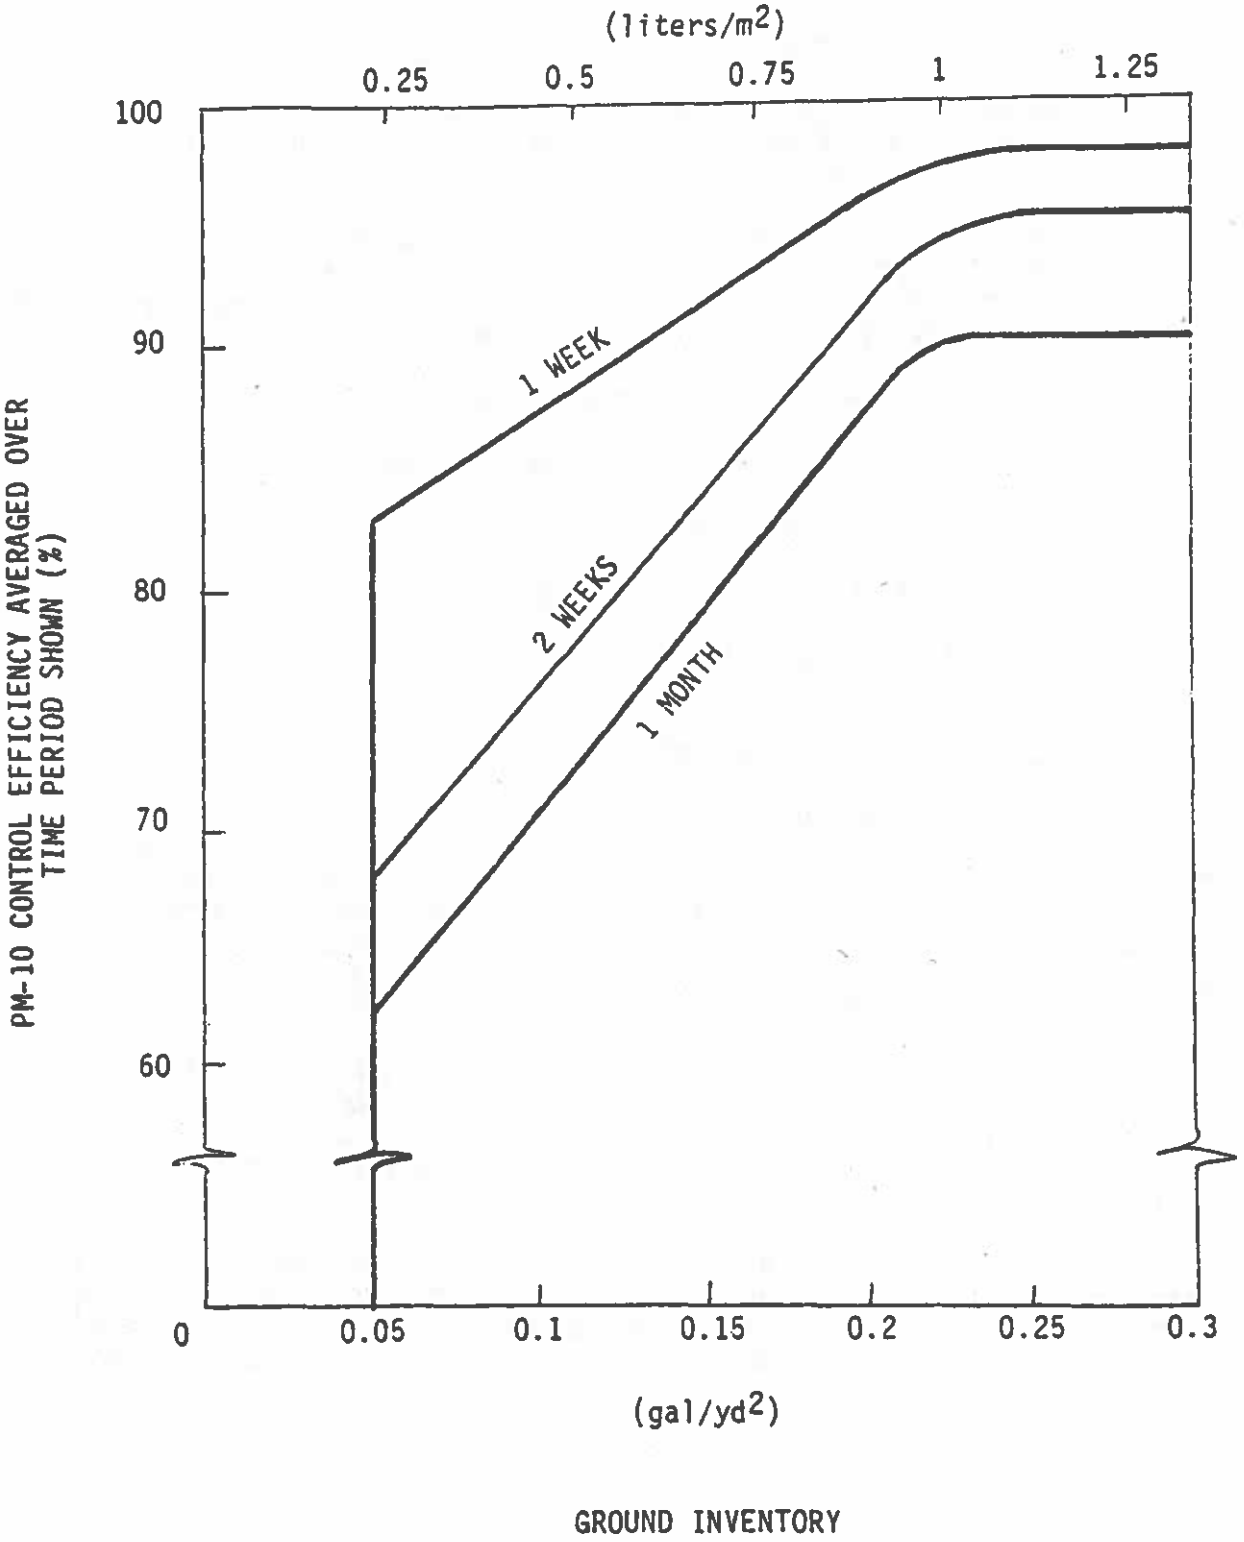

Figure 4-14. Average PM_{10} control efficiency for chemical suppressants.

1. Date of treatment.

2. Operator's initials (note that the operator may keep a separate log of whose information is transferred to the environmental staff's data sheets).

3. Start and stop times on a particular segment/parking lot, average speed, number of passes, amount of solution applied, and dilution. Figure 4-15 is a typical form which plant personnel can complete when applying chemical dust suppressants to unpaved roads.

4. Qualitative description of road surface condition.

In addition, plant-wide records must be kept including:

1. Equipment maintenance records.

2. Suppressant delivery record. Figure 4-16 is an example.

3. Meteorological log (to the extent that weather influences the control program).

4. Any equipment malfunctions or downtime.

These plant-wide records provide the inspector with the information necessary to cross-check the records kept for individual road segments. For example, the start/stop inventories and suppressant delivery record should be compared to the final ground inventory values over all roads at the facility. Also, application records should be checked against the meteorological and equipment maintenance/downtime records. The inspector should request plant personnel to explain any discrepancies.

Another form which can be used as part of record keeping review of chemical control programs is presented in Figure 4-17. A completed form containing typical data is shown in Figure 4-18. The following is an example using the information in Figure 4-16 as applied to the determination of monthly average control efficiency using Figure 4-14 above.

Suppose that Equation 4-1 has been used to estimate a PM_{10} emission factor of 2.0 kg/VKT. Further, suppose that starting on May 1, the road is treated with 0.25 gal/yd^2 of a (1 part chemical to 5 parts water) solution on the first of each month until October. In this instance, the following average controlled emission factors are found:

Date	Time	delivered	delivered	agent	Facility destination[a]	Comments

[a] Denote whether suppressant will be applied immediately upon receipt or placed in storage.

July	0.12	75	0.50
August	0.17	82	0.36
September	0.21	88	0.24

[a] From Figure 4-14; zero efficiency assigned if ground inventory is less than 0.05 gal/yd².

[b] 0.25 gal/yd² x 1/6 = 0.042.

Additional topics must also be considered when inspecting roads controlled by chemical dust suppressants. These are briefly discussed below.

* Use of paved road controls on chemically treated unpaved roads. Repeated use of certain chemical dust suppressants tend, over time, to form fairly impervious surfaces on unpaved roads. The resulting surface may allow the use of paved road cleaning techniques (such as flushing, sweeping, etc.) to reduce aggregate loading due to spillage and track-on. A field program conducted tests on surfaces that had been flushed and vacuumed 3 d earlier.[7] (The surfaces themselves had last been chemically treated 70 d before.) Control efficiency values of 90% or more (based on the uncontrolled emission factor of the unpaved roads) were found for each particulate size fraction considered.

The use of paved road techniques for "housekeeping" purposes would appear to have the benefits of both high control (referenced to an uncontrolled unpaved road) and potentially relatively low cost (compared to follow-up chemical applications). Generally, it is recommended that these methods not be employed until the ground inventory exceeds approximately 0.2 gal/yd² (0.9 L/m²) and the paved controls be tested on a small portion of the chemically treated road prior to full-scale implementation.

* Minimum reapplication frequency. Because unpaved roads in industry are often used for the movement of materials and are often surrounded by additional unpaved travel areas, spillage and carryout onto the chemically treated road require periodic "housekeeping" activities. In addition, gradual abrasion of the treated surface by traffic will result in loose material on the surface which should be controlled.

It is recommended that at least dilute reapplications be employed every month to control loose surface material unless paved road control techniques are used (as described above). More frequent reapplications would be required if spillage and track-on pose particular problems for a road.

* Weather considerations. Roads generally have higher moisture contents during cooler periods due to decreased evaporation. Small increases in surface moisture may result in large increases in control efficiency (as referenced to the dry summertime conditions inherent in the AP-42 unpaved road predictive equation).[6] In addition, application of chemical dust suppressants during cooler periods of the year may be inadvisable for traffic safety reasons.

4.3.3.3 "In-Plant" Inspection Procedures for Chemical Treatment--

While record keeping affords a convenient method of assessing long-term control performance, it is important that regulatory personnel have "spot-check" compliance tools at their disposal (i.e., a hand broom and dustpan). The inspector should broom sweep a portion of the road and determine silt loading as described in Appendix F. The industrial paved road equation (Equation 3-1) will conservatively overestimate controlled emissions:

$$\text{Control efficiency (\%)} \geq \left\{ \frac{[\text{Result from Equation 4-1 for p=0}] - [\text{Result from Equation 3-1}]}{\text{Result from Equation 4-1 for p=0}} \right\} \times 100\%$$

Note that this compliance tool (unlike others in this section) requires the inspector to obtain the all-information necessary to estimate the two emission factors (i.e., Equations 3-1 and 4-1).

SECTION 5

STORAGE PILES

Particulate emissions from aggregate storage piles occur whenever the material is disturbed, relocated, or subjected to wind speeds above the material-specific erosion threshold value. The quantity of emissions released from storage pile activity is dependent on the amount of material involved, its moisture content, silt content, and friability. Emissions are also affected by the material load-in, load-out, and maintenance techniques and by the characteristics of vehicles traveling on and around the storage pile area.

Storage piles are found in most operations that use minerals in aggregate form. Materials can be transferred to and from storage piles by a variety of techniques which can include fixed stacker-reclaimer systems, front end-loaders, scrapers, and other types of mobile equipment. Storage piles are usually left exposed to the ambient winds because of the costs associated with enclosing them and because of the impediment that enclosures cause to the usual requirement for frequent material transfer.

There are two generally recognized mechanisms responsible for the direct generation of dust emissions from storage pile operations. They include:

- Materials handling operations, and
- Wind erosion.

In addition, if vehicular traffic is required for stockpiling activities, vehicles can often be the predominant source of PM_{10} emissions from the area. The traffic-related sources can be assessed, controlled and inspected as discussed in detail in Section 4.

Particulate emissions from the two direct storage pile sources (i.e., materials handling and wind erosion) can be controlled by one of three general methods. These include: containments to physically shelter the pile from ambient winds; surface treatments to agglomerate exposed particulate; and source extent control to reduce the amount of material handled and to enhance natural crusting.

5.1 ESTIMATION OF EMISSIONS

Sections 5.1.1 and 5.1.2 provide methods that can be used for predicting the emissions from materials handling and wind erosion sources associated with storage piles. The quantity of emissions estimated by these techniques are dependent on the physical characteristics of the stockpiled material, on the amount of material handled, and on the local meteorology.

If a fairly complete inventory of the area is needed, then the first step toward the determination of storage pile emissions for a given facility is to identify and map each pile within that facility. Figure 5-1 and Figure 5-2 are sample maps of an example facility X and of storage piles located within that facility, respectively. Once the piles have been identified, estimates can be obtained for the material throughput, the frequency with which the pile surface is disturbed, pile perimeter dimensions, average pile height, and vehicle specifications for any mobile equipment used on or around the storage piles. In addition, climatological data from the nearest recording weather station should be obtained.

Finally, any vehicular traffic related to the area must be identified and emissions estimated using the information presented in Section 4. Figure 5-3 shows typical storage pile emissions for vehicular traffic and materials handling operations.

5.1.1 Estimation of Emissions from Materials Handling Stockpiled Material

Adding aggregate material to a storage pile or removing it usually involves the dropping of material onto a receiving surface or receptacle. This can be performed by one of two methods: by continuous feed as exemplified by conventional fixed stacker reclaimers, or by batch operations such as would be performed by mobile equipment (i.e., front-end loader, truck, or pan scraper).

In order to estimate the emissions from the loading of material in and out of storage piles, one must first obtain a sample of the stockpiled material and a record of historical wind data at that location (Summaries of Local Climatological Data).[1] From the Local Climatological Data (LCD), the mean wind speed can be obtained for the nearest recording weather station (as illustrated by Figure 5-4). This wind speed can be adjusted from the recording anemometer height to represent the wind speed at the average storage pile height by using the procedure described in Section 11.2.7 of EPA's *Compilation of Emission Factors* (AP-42).[2] Aggregate sampling and subsequent moisture analysis should then be performed on the sample(s) as described in Appendix F.

Once the mean wind speed and the material moisture content have been determined, the following equation can be used to estimate emissions from the transfer operations (batch or continuous drop):

$$E = k\ (0.0016)\ \frac{\left(\frac{U}{2.2}\right)^{1.3}}{\left(\frac{M}{2}\right)^{1.4}} \quad \text{(kg/Mg)} \qquad (5\text{-}1)$$

where: E = emission factor
k = particulate size multiplier (dimensionless) = 0.35 for PM_{10}
U = mean approach wind speed (m/s), at height of transfer operation
M = material moisture content (percent)

Annual Mean Wind Speed

...xtre...

Figure 5-4. Mean wind speed.

This equation shows that, for the handling of aggregate materials, emissions increase with the ambient wind speed and are reduced as the material moisture content increases.

5.1.2 Estimation of Emissions from Wind Erosion of Stockpiled Material

Field testing of various stockpiled surfaces using a portable wind tunnel has demonstrated that;

a. Threshold wind speeds exceed 5 m/s (11 mph) at 15 cm above the pile surface which is equivalent to 10 m/s (22 mph) at 7 m above the pile surface.

b. Particulate emission rates tend to decay rapidly (half life of a few minutes) during an erosion event.

c. Precipitation events cause natural crusting of surface material by binding the erodible material, thereby reducing the erosion potential.

Although in some instances wind erosion can be substantial, wind erosion is usually considered the least significant of the mechanisms responsible for dust emissions from storage piles. In most industrial settings, fugitive emissions from vehicular traffic and materials handling overwhelm emissions from wind erosion. If vehicular traffic is present in and around the storage pile area, those emissions are generally far greater than that due to materials handling.

If it is necessary to estimate the particulate emissions from the wind erosion of storage piles, one must first obtain an aggregate sample of the stockpiled material and a record of historical wind data for the nearest recording meteorological station. From the Local Climatological Data (LCD) the fastest mile of wind can be obtained for the nearest recording weather station (as illustrated by Figure 5-5). The fastest mile of wind should then be adjusted to represent the wind speed that impacts the storage pile surface and an equivalent friction velocity determined as described in Section 11.2.7 of AP-42.[2] Aggregate sampling and determination of the threshold friction velocity should also be performed according to the procedures described in Appendix F and AP-42, respectively.[2]

Once the friction velocity and the threshold friction velocity have been determined, the erosion potential (P) can be calculated as:

$$P = 58\ (u^* - u^*_t)^2 + 25\ (u^* - u^*_t) \qquad (5\text{-}2)$$

where: u^* = friction velocity (m/s)
u_t = threshold friction velocity (m/s)

Fastest Mile of Wind

Figure 5-5. Fastest mile of wind.

The emission factor, as a summation over periods between material disturbances, can now be calculated as:

$$\text{Emission factor} = k \sum_{i=1}^{N} P_i \qquad (5\text{-}3)$$

where: k = particle size multiplier = 0.5 for PM_{10}
n = number of disturbances per year
P_i = erosion potential corresponding to the observed (or probable) fastest mile of wind for the i^{th} period between disturbances (g/m^2)

In summary, emissions from wind erosion increase with the speed of wind gusts and with the number of times that the material is disturbed. These emissions can be controlled by reducing wind speeds and the number of disturbances or by increasing the threshold friction velocity (which is a function of the exposed surface particle size distribution).

5.1.3 Material Parameters Affecting Emissions

The two material properties that affect the quantity of emissions from material handling and wind erosion are the materials threshold friction velocity and its unbound moisture content. The threshold friction velocity is a quantitative description of the condition under which the surface material will begin to erode. It is a function of the material aggregate size distribution, density, and moisture content. The threshold friction velocity can be estimated by performing the sieving procedure outlined in Section 11.2.7 of AP-42. The moisture content of a given material simply describes the amount of water retained on the surface of the aggregate material (see Appendix F).

Typical silt values, and unbound moisture content values for some industrial aggregate materials are summarized in Table 5-1. Threshold friction velocities and the associated wind speeds (as measured at 10 m) are presented in Tables 5-2 and 5-3 for typical aggregate materials and soils, respectively. Estimates for emissions are considered more accurate if site specific data are used.

5.2 EMISSION CONTROL METHODS

As described in Table 5-4, there are a variety of options for the control of particulate emissions from storage piles. Note that these controls fall into one of four general categories. Each of these is discussed in greater detail below.

TABLE 5-1. TYPICAL SILT AND MOISTURE CONTENT VALUES OF MATERIALS AT VARIOUS INDUSTRIES

Industry	Material	No. of test samples	Silt, percent		No. of test samples	Moisture, percent	
			Range	Mean		Range	Mean

TABLE 5-4. CONTROL TECHNIQUES FOR EMISSIONS FROM STORAGE PILES

Containment	Buildings\Silos Wind fences Selective siting
Surface Treatments	Watering Chemical stabilization - Petroleum resins - Acrylic cements - Other
Source Extent	Reduced transfer operations Reduced disturbance area Reduced vehicular traffic
Natural Events	Previous erosion of fines Crusting by precipitation

5.2.1 Emissions Control by Containment

Storage piles are usually left exposed to the ambient winds because of the costs associated with enclosures and the impediment that enclosures can cause to the frequent material transfer often necessary. Containment of these piles can be described as the physical separation of the storage pile from the ambient air and its associated winds. Typically used containment strategies include shielding by topography, wind fences, neighboring buildings, or other storage piles; or partial or complete enclosure of the storage pile with a dedicated structure.

Containment by selective siting is often an inexpensive method of removing a storage pile from the winds that could generate emissions. It can include the placement of an active storage pile within several more dormant piles, within a natural depression, or among buildings.

The erection of a dedicated structure for containment of storage piles is also practiced within industry. These structures often consist of wind fences, three sided bunkers, silos, or completely enclosed buildings or bins. Although potentially expensive and somewhat restrictive, this is a very effective method of controlling particulate emissions. Often this method is used to protect materials which deteriorate in weather, for the conservation of expensive minerals, or to control emissions from small storage piles of fine, highly erodible material.

5.2.2 Emissions Control by Surface Treatments

Surface treatments are used to wet or agglomerate exposed fine material. Commonly used surface treatments include water (alone, with surfactants, or with salts), petroleum binders, and latex binders. These methods can be very effective until the time when the treated surface is disturbed or covered. Water with or without wetting agents such as salts, surfactants, and foams are commonly used to control emissions from active storage piles. This technique affects material to a much greater depth then can be reached by binding agents and produces a substantially greater control efficiency for emissions from materials handling. Surface treatments accomplish wind erosion control by increasing the threshold friction velocity of an exposed material.

5.2.3 Emissions Controlled by Source Extent Reduction

Source extent control refers to limiting the amount of aggregate material put through storage (materials handling) or the surface area disturbed (wind erosion). This can include reducing the number of material transfer operations necessary in a process, restricting the area disturbed by transfer and pile maintenance operations, or restricting the amount of vehicular traffic permitted on or around stockpiled material.

5.2.4 Emissions Control by Natural Methods

Finally, simply allowing the pile to crust naturally is an effective control technique for wind erosion control of most stockpiled materials. Wind erosion events remove the exposed surface fine particulate, leaving behind the

coarse nonerodible aggregate. In addition, naturally occurring precipitation tends to agglomerate most aggregate material. Inactivity can provide a natural crust comparable to those achieved by surface treatments

5.3 REGULATORY FORMATS AND ASSOCIATED INSPECTION PROCEDURES

Once a specific PM_{10} control strategy has been conceived, approved, and implemented, it becomes necessary for the control agency to assure that it is being complied with and is achieving the desired level of control. This section will discuss methods for determining compliance, along with inspection procedures for various storage pile control strategies.

5.3.1 General Inspection Procedures and Compliance Information

5.3.1.1 General Inspection Procedures--

Figure 5-6 is an example inspection form which may be completed by interviewing plant personnel at the beginning of a Level II or Level III inspection. After discussing any changes in sources since the last inspection with plant personnel, a more through field inspection should be performed.

Field inspections of control programs for dust from storage piles could include the following steps:

1. Verification of sources located within the facility.
2. Qualitative inspection of surface material moisture or crusting.
3. Spot checks on the control application.
4. Spot checks on storage pile source extent.
5. Surface material sampling so that emissions can be estimated.

Each of these is discussed in more detail below.

The first step in any field inspection is a simple drive or walk through the facility to verify the continued existence of previous sources, the absence of new sources, and any changes identified by plant personnel.

To determine the effectiveness of strategies that depend on containment techniques for dust control, a qualitative inspection should be adequate. This inspection would simply require a verification of the existence and integrity of the specified enclosure to determine compliance.

To determine compliance for a watering program, it is often adequate simply to pick up handfuls of the storage pile surface material and examine for wetness or to observe material transfer operations for emissions. Portable moisture instruments may also be useful to estimate the overall moisture content of the pile material. If visible emissions are observed, an aggregate sample may be collected for moisture analysis, as described in Appendix F to determine compliance as appropriate.

9. Any new equipment?				
10. Any equipment downtime since last inspection?				
11. Any supplemental control since last inspection?				

* If any answer is yes, complete comment section.

Figure 5-6. Sample inspection form.

A qualitative inspection of surface treatment controls on undisturbed portions of storage piles should verify that a control has been applied, and also that it has been applied in a somewhat uniform manner over the entire exposed surface. This is important because the uneven application of a surface treatment can severely compromise the net control efficiency, regardless of the amount applied. Visual inspection is usually adequate to determine where binders have been applied to aggregate material.

If large areas of inspected storage piles are found to be dry or uncrusted (for water and chemically treatments, respectively), then these deficiencies should be noted. If possible, it is recommended that the inspector observe at least one application of any surface control to verify application intensity and the uniformity of the application. This can be done by placing preweighed pans on the stockpile surface during the control application, reweighing them after the application, and dividing the mass collected by the area of the pan.

In addition, note should be made of the source extent of materials handled, of the amount of vehicle traffic on and around the stockpiles, and of any visible emissions from these sources. Visible emissions can indicate inadequacy in the control plan or its implementation.

For storage piles that are controlled simply by their dormant nature, compliance can usually be determined by visual observation that the surface (and any crust) has not been disturbed.

5.3.1.2 Plant Record Keeping Requirements--

Determination of storage pile control compliance by the review of plant records can be performed for surface treatment controls and for reduced source extent strategies. For surface treatments, plant records must be kept to document the date, time, amount, and dilution (if applicable) of water/chemical suppressant applied, and a description of where that control was applied. For strategies based on reductions in source extent, records must be kept of the amount of material transferred, the dates and times of equipment usage for this transfer, or of vehicular usage on and around the storage piles.

Record keeping for a storage pile dust control plan should include the following elements:

Watering

- The amount of water applied to each stock piled material and the proposed frequency of application.

- Any provisions for the reduction or suspension of the control application during periods of inactivity or during specified weather events (e.g., 1/4 in of rainfall to substitute for one treatment; program suspended during freezing periods or during production shutdowns; watering frequency as a function of temperature, cloud cover, etc.).

- Source of water and a description of any additives for performance enhancement (i.e., salts, surfactants, etc.).

Chemical Treatments

- Type of chemical to be applied to each storage pile, the dilution ratio, application intensity, and the frequency of application.

- Any provisions for the reduction or suspension of the control application during periods of material inactivity or during specified weather events (e.g., 1/4 in of rainfall to substitute for one treatment; program suspended during freezing periods; watering frequency as a function of temperature, cloud cover, etc.).

Source Extent Reductions

- The time and identification of any mobile equipment used in the storage pile area before and after implementation of the control plan.

- The times when any fixed stacker-reclaimer equipment would be used, and an estimate of how much material was moved before and after implementation of the control plan.

5.3.2 Watering

5.3.2.1 Record Keeping Review

To determine compliance from plant records, the facility must have records that include:

1. Date of treatment.

2. Operators identification as a signature or initials (note that the operator may keep a separate log from which information is transferred to the environmental staff's data sheets).

3. Start and stop times of the treatment on each storage pile, approximate amount of water used, and the approximate area treated.

4. Description of any additive used (i.e., salts, surfactants, etc.).

Figure 5-7 is an example form which the equipment operator can complete when applying water to storage piles. In addition, plant-wide records must be kept which include:

1. Equipment maintenance records.

2. Meteorological log (to document the influence of weather on the control program).

3. Documentation of any equipment malfunctions or downtime.

Figure 5-7. Operator's log for example facility X.

Documentation which contains these elements will allow an inspector to determine compliance by reviewing the historical data. Below, a procedure is described which allows the inspector to perform an on-site, independent assessment of the control.

5.3.2.2 Example Compliance Determination--Record Keeping for a Watering Program--

This example considers the hypothetical facility X which is shown in Figure 5-1 with the storage piles shown in greater detail in Figure 5-2. Facility X is located in a PM_{10} nonattainment area and has an approved dust control plan that specifies the following conditions:

1. Application intensity > 0.15 gal/yd^2.

2. Application frequency of once/10 h workday.

3. Watering according to the application parameters is to be performed from April 1 through October 31.

4. Each 1/4 in of rainfall (in the previous 24 h) will be substituted for one treatment, and the program will be suspended for days where the morning temperature (8 a.m.) does not exceed 32°F.

Note that the permit also specifies watering between 11:00 a.m. and 3:00 p.m. when the ambient temperature at 11:00 a.m. is ≥ 40°F for the period from November 1 to March 31.

An example of how records could be used to determine compliance for facility X is given below. Facility X maintains the following three storage piles:

Storage Pile	Height (ft)	Approx. Area (sq. ft)	Throughput (tons/yr)
1	20	5,000	10,000
2	15	1,500	500
3	15	2,500	4,000

The facility leases one 5,000-gal water truck and operator from a contractor on an as needed basis. This equipment has a water cannon capable of spraying water 50 ft. No additives to the water are used at this facility.

Example records kept by facility X to document its program of watering storage piles are shown in Figure 5-8 (meteorological data log), and Figure 5-7 (operator's log). The inspector responsible for the facility would, in practice, compare these two records with the permit conditions to determine compliance. This check should verify that all storage piles have been treated daily (except after significant rainfall or under freezing conditions).

T = Trace

Figure 5-8. Meteorological data for example facility X.

If it is suspected that the documentation is inaccurate (i.e., treatments are logged for periods where no water was applied), then the operator's log can be cross-checked against other records. For example, cross-checking would be performed against facility records for maintenance/service of the water truck, or against contractor invoices if the equipment is leased, as in the above example. Both of these sources typically contain more complete records then those kept for an emissions control program. If these records do not match the operator's log, then the facility should be required to submit a written explanation for the apparent discrepancy.

Information compiled in the operator's log represents critical data against which operations observed during Level II and Level III inspections should be evaluated. For example, Figure 5-7 provides a basis for estimating the typical length of time and number of trucks full of water were required to wet all of the storage piles within a facility. These values can be checked against an application observed during the inspection. If the during the inspection, the observed time for an application or required number of trucks full of water required to treat a group of storage piles varies significantly from what is indicated in the operator's log, then the inspector should require the facility to explain the apparent discrepancy. As stated above, this inspection should also verify that the water is being applied somewhat uniformly to the storage piles surface area.

An example that applies this procedure to facility X is demonstrated below:

1. On June 1, the operator's log indicates that the first two trucks full of water were used to wet storage pile Nos. 1 and 2 and a third truck full of water was used to wet storage pile No. 3.

2. About 10 min was required to fill each of the first two trucks, and only 5 min to fill the third truck.

3. The log also indicates that the treatment of storage pile No. 1 required 25 min to empty the first truck of water, and 15 min to complete the pile with the second truck of water. Treatment of storage pile No. 2 took 6 min, and treatment of storage pile No. 3 took 16 min.

4. During the inspection it is noted that 10 min is required to fill the truck and 12.5 min of actual spraying time to empty it.

From these data it can be assumed that approximately 8,000 gal of water was probably applied to storage pile No. 1 (0.18 gal/yd^2) from the first two trucks; about 2,000 gal was probably applied to storage pile No. 2 (0.1 gal/yd^2) with what was left in the second truck; and finally if 0.15 gal/yd^2 was applied to piles 1 and 2 then truck 2 came back empty, and only about 2,500 gal (5 min to fill the third truck) was available for pile No. 3 (0.1 gal/yd^2). These estimates indicate a potential violation of the minimum application intensity of 0.15 gal/yd^2 specified in the dust control plan.

5.3.2.3 "In-Plant" Inspection Procedures

An "in-plant" inspection to determine compliance with fugitive dust rules or permit conditions for storage piles involves focusing on several items. They include:

- A visual inspection of the facility to verify that all of the existing storage piles are listed in the permit/control plan.
- An examination of the source's records (as described above) documenting frequency of water application, amount applied, storage piles watered, meteorology affecting watering, etc.
- Observation of any spraying operations undertaken during the inspectors visit.

After becoming familiar with the plant facilities and the control plan, the inspector should request that the plant personnel provide the information necessary to complete the example work sheet shown in Figure 5-6. The inspector should then conduct a full inspection of the facility in order to obtain and verify the actual control conditions. If water is being applied on the day of the inspection, then this should be observed as described above.

If there is a minimum moisture content criteria specified in the control plan/operating permit, then the inspector could spot-check the moisture content of stockpiled material by using the procedure described in Appendix F. If there is a question as to whether the current control strategy is adequate, an aggregate sample should be taken so that emissions can be estimated as described in Section 5.1. Finally, the inspector should review the plant records to verify that the controls have been applied appropriately since the last inspection.

5.3.3 Chemical Treatments

5.3.3.1 Example Compliance Determination--Record Keeping for a Chemical Control Program--

This example considers the hypothetical facility X shown in Figure 5-1 with the storage piles shown in greater detail in Figure 5-2. Facility X is located in a PM_{10} nonattainment area and has an approved dust control plan that specifies the following conditions:

1. Application of an emulsified petroleum dust suppressant.
2. Application intensity >0.1 gal/yd^2.
3. Dilution of 1 part suppressant to 10 parts water.
4. Application frequency of twice/work week if material has been disturbed since the last application. Once/2 weeks for dormant material.
5. Chemical suppression according to the application parameters is to be performed from April 1 through October 31.

6. Each 1/4 in of rainfall (in the previous 24 h) will be substituted for one treatment, and the program will be suspended for days where the morning temperature (8 a.m.) does not exceed 32°F.

Note that the permit also specifies chemical suppression between 11:00 a.m. and 3:00 p.m. when the ambient temperature at 11:00 a.m. is ≥ 40°F for the period from November 1 to March 31.

An example of how records could be used to determine compliance for facility X is given below. Facility X maintains the following three storage piles:

Storage pile	Height (ft)	Approx. area (sq ft)	Throughput (tons/yr)
1	20	5,000	10,000
2	15	1,500	500
3	15	2,500	4,000

The facility leases one 5,000-gal water truck and operator from a contractor on an as-needed basis. This equipment has a water cannon capable of spraying the suppressant 50 ft. The facility has a receipt for a 5,000 gal order of Coherex® that was delivered in late March. By multiplying the total storage pile area, 1,000 yd^2 by the required 0.1 gal of Coherex required per yd^2 per application, it can be estimated that about 100 gal of Coherex are used per application day. Example records kept by facility X to document days for which the treatment of storage piles was not necessary, are shown in Figure 5-8 (meteorological data log). Plant personnel indicated that other than rain days, there were no days when treatments were not applied. The inspector responsible for the facility would, in practice, compare the amount of Coherex used from the storage tank with what the records and invoices indicate should have been used.

If there are claims that treatments have been reduced because the material has been dormant, then records kept by the storage yard foreman can often be checked for verification. These checks should verify when storage piles have been treated.

If it is suspected that the documentation is inaccurate (i.e., treatments are logged for periods where no suppressant was applied), then the operator's log can be cross-checked against other records. For example, cross-checking would be performed against facility records for maintenance/service of the water truck or, against contractor invoices if the equipment is leased, as in the above example. Both of these sources typically contain more complete records then those kept for a control program. If the two sets of records do not match, then the facility should be required to submit a written explanation for the apparent discrepancy.

Information compiled in the operator's log also represents critical data against which operations observed during Level II and Level III inspections

should be evaluated. For example, Figure 5-9 provides a basis for estimating the typical length of time and number of trucks full of suppressant required to treat all of the storage piles within a facility. These values can be checked against an application observed during the inspection as described for watering in 5.3.2.

If during the inspection the observed time for an application or required number of trucks full of suppressant necessary to treat a given group of storage piles varies significantly from what is indicated in the operator's log, then the inspector should require that the facility explain the apparent differences. As stated above, this inspection should also verify that the suppressant is being applied somewhat uniformly to the storage piles surface area. This can be performed by placing preweighed pans on the stockpile surface during the control application, reweighing them after the application, and dividing the mass collected by the pans area.

5.3.3.2 "In-Plant" Inspection Procedures--

An "in-plant" inspection to determine compliance with fugitive dust rules or permit conditions for storage piles involves focusing on several items. They include:

- A visual inspection of the facility to verify that all of the existing storage piles are listed in the state permit/control plan.
- An examination of the source's records (as described above) documenting frequency of suppressant application, amount applied, storage piles treated, meteorology and plant activity affecting treatment requirements, etc.
- Observation of any spraying operations undertaken during the inspectors visit.

After becoming familiar with the plant facilities and the control plan, the inspector should request that the plant personnel provide the information necessary to complete the example work sheet shown in Figure 5-6. The inspector should then conduct a full inspection of the facility in order to obtain and verify the actual operating conditions. If suppressant is being applied on the day of the inspection, then this should be observed as described above.

If there is a maximum silt content criteria specified in the control plan/operating permit, then the inspector could spot-check the silt content of stockpiled material by using the procedure described in Appendix F. If there is a question as to whether the current control strategy is adequate, an aggregate sample should be taken so that emissions can be estimated as described in Section 11.2.7 of EPA's AP-42. Finally, the inspector should review the plant records to verify that the controls have been applied appropriately since the last inspection.

APPENDIX A

SIP REQUIREMENTS FOR THE CONTROL OF PM_{10}

APPENDIX A

SIP REQUIREMENTS FOR THE CONTROL OF PM_{10}

The following pages contain excerpts from the July 1, 1987, *Federal Register* pertaining to the revision of State Implementation Plans to include PM_{10}.

PART 51—REQUIREMENTS FOR PREPARATION, ADOPTION, AND SUBMITTAL OF IMPLEMENTATION PLANS

For the reasons set forth in the preamble, EPA amends Part 51 of Chapter I of Title 40 of the Code of Federal Regulations as follows:

1. The authority citation for Part 51 is revised to read as follows:

Authority: This rulemaking is promulgated under authority of sections 101(b)(1), 110, 160–169, 171–178, and 301(a) of the Clean Air Act 42 U.S.C. 7401(b)(1), 7410, 7470–7479, 7501–7508, and 7601(a).

2. In § 51.100, paragraphs (oo), (pp), (qq), (rr) and (ss) are added to read as follows:

§ 51.100 Definitions.

* * * * *

(oo) "Particulate matter" means any airborne finely divided solid or liquid material with an aerodynamic diameter smaller than 100 micrometers.

(pp) "Particulate matter emissions" means all finely divided solid or liquid material, other than uncombined water, emitted to the ambient air as measured by applicable reference methods, or an equivalent or alternative method, specified in this chapter, or by a test method specified in an approved State implementation plan.

(qq) "PM_{10}" means particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers as measured by a reference method based

R001524

on Appendix J of Part 50 of this chapter and designated in accordance with Part 53 of this chapter or by an equivalent method designated in accordance with Part 53 of this chapter.

(rr) "PM_{10} emissions" means finely divided solid or liquid material, with an aerodynamic diameter less than or equal to a nominal 10 micrometers emitted to the ambient air as measured by an applicable reference method, or an equivalent or alternative method, specified in this chapter or by a test method specified in an approved State implementation plan.

(ss) "Total suspended particulate" means particulate matter as measured by the method described in Appendix B of Part 50 of this chapter.

3. In § 51.151, the third unnumbered subdivision beginning "sulfur dioxide and particulate matter combined" is removed and the second unnumbered subdivision beginning "particulate matter" is revised to read as follows:

§ 51.151 Significant harm levels.

* * * * *

PM_{10}—600 micrograms/cubic meter; 24-hour average.

* * * * *

4. In § 51.165, the fourth entry in the list in paragraph (a)(1)(x) is removed and paragraph (b) is revised to read as follows:

§ 51.151 Permit requirements.

* * * * *

(b)(1) Each plan shall include a preconstruction review permit program or its equivalent to satisfy the requirements of section 110(a)(2)(D)(i) of the Act for any new major stationary source or major modification as defined in paragraphs (a)(1) (iv) and (v) of this section. Such a program shall apply to any such source or modification that would locate in any area designated as attainment or unclassifiable for any national ambient air quality standard pursuant to section 107 of the Act, when it would cause or contribute to a violation of any national ambient air quality standard.

(2) A major source or major modification will be considered to cause or contribute to a violation of a national ambient air quality standard when such source or modification would, at a minimum, exceed the following significance levels at any locality that does not or would not meet the applicable national standard:

Pollutant	Annual	Averaging time (hours)			
		24	8	3	1
SO_2	1.0 $\mu g/m^3$	5 $\mu g/m^3$		25 $\mu g/m^3$	
PM_{10}	1.0 $\mu g/m^3$	5 $\mu g/m^3$			
NO_2	1.0 $\mu g/m^3$				
CO			0.5 mg/m^3		2 mg/m^3

(3) Such a program may include a provision which allows a proposed major source or major modification subject to paragraph (b) of this section to reduce the impact of its emissions upon air quality by obtaining sufficient emission reductions to, at a minimum, compensate for its adverse ambient impact where the major source or major modification would otherwise cause or contribute to a violation of any national ambient air quality standard. The plan shall require that, in the absence of such emission reductions, the State or local agency shall deny the proposed construction.

(4) The requirements of paragraph (b) of this section shall not apply to a major stationary source or major modification with respect to a particular pollutant if the owner or operator demonstrates that, as to that pollutant, the source or modification is located in an area designated as nonattainment pursuant to section 107 of the Act.

5. In § 51.166, paragraph (a)(6)(i) is revised, the fourth entry in the list in paragraph (b)(23)(i) is revised, the entries under the headings "Particulate matter" in the tables in paragraphs (c) and (p)(4) are revised, paragraphs (i)(8)(i) (c), (f), (h), and (l) are revised, and new paragraph (i)(10) is added to read as follows:

§ 51.166 Prevention of significant deterioration of air quality.

(a) * * *

(6) * * *

(i) Any State required to revise its implementation plan by reason of an amendment to this section, including any amendment adopted simultaneously with this paragraph, shall adopt and submit such plan revision to the Administrator for approval within 9 months after the effective date of the new amendments.

* * * * *

(b) * * *

(23)(i) * * *

Particulate matter: 25 tpy of particulate matter emissions, 15 tpy of PM_{10} emissions.

* * * * *

(c) * * *

Pollutant	Maximum allowable increases (micrograms per cubic meter)
Class I	
Particulate matter:	
TSP, annual geometric mean	5
TSP, 24-hr maximum	10
* * * * *	
Class II	
Particulate matter:	
TSP, annual geometric mean	19
TSP, 24-hr maximum	37
* * * * *	*30
Class III	
Particulate matter:	
TSP, annual geometric mean	37
TSP, 24-hr maximum	75
* * * * *	

* * * * *

(i) * * *

(8) * * *

(i) * * *

(c) Particulate matter—10 $\mu g/m^3$ TSP, 24-hour average.—10 $\mu g/m^3$ PM_{10}, 24-hour average.

* * * * *

(f) Lead—0.1 $\mu g/m^3$, 3-month average.

* * * * *

(h) Beryllium—0.001 $\mu g/m^3$, 24-hour average:

* * * * *

(l) Hydrogen sulfide—0.2 $\mu g/m^3$, 1-hour average:

* * * * *

(10) If EPA approves a plan revision under § 51.166 as in effect before July 31, 1987, any subsequent revision which meets the requirements of this section may contain transition provisions which parallel the transition provisions of § 52.21 (i)(11)(i)(iii), and (m)(1) (vii) and (viii) of this chapter as in effect on that date, these provisions being related to monitoring requirements for particulate matter. Any such subsequent revision may not contain any transition provision which in the context of the revision would operate any less stringently than would its counterpart in § 52.21 of this chapter.

* * * * *

(p) * * *

(4) * * *

Pollutant	Maximum allowable increases (micrograms per cubic meter)
Particulate matter:

TSP, 24-hr maximum	37

R001525

Pollutant	Maximum allowable increases (micrograms per cubic meter)
* * * * *	

* * * * *

6. In § 51.322, paragraphs (a)(1) and (b)(1) are revised to read as follows:

§ 51.322 Sources subject to emissions reporting.

(a) * * *

(1) For particulate matter, PM_{10}, sulfur oxides, VOC and nitrogen oxides, any facility that actually emits a total of 90.7 metric tons (100 tons) per year or more of any one pollutant. For particulate matter emissions, the reporting requirement ends with the reporting of calendar year 1987 emissions. For PM_{10} emissions, the reporting requirement begins with the reporting of calendar year 1988 emissions.

* * * * *

(b) * * *

(1) For particulate matter, PM_{10}, sulfur oxides, VOC and nitrogen oxides. 22.7 metric tons (25 tons) per year or more. For particulate matter, the reporting requirement ends with the reporting of calendar year 1987 emissions. For PM_{10}, the reporting requirement begins with the reporting of calendar year 1988 emissions.

* * * * *

7. In § 51.323, paragraphs (a)(1) and (a)(2) are revised and paragraph (a)(3) is added to read as follows:

§ 51.323 Reportable emissions data and information.

(a) * * *

(1) Emissions of particulate matter, sulfur oxides, carbon monoxide, nitrogen oxides, and VOC as specified by AEROS Users Manual, Vol. II (EPA 450/2-76-029, OAQPS No. 1.2-039) to be coded into the National Emissions Data System point source coding form,

(2) Emissions of lead or lead compounds measured as elemental lead as specified by AEROS Users Manual, Vol. II (EPA 45/2-76-029, OAQPS No. 1.2-039) to be coded into the Hazardous and Trace Emissions System points source coding forms, and

(3) Emissions of PM_{10} as will be specified in a future guideline.

* * * * *

8. In Appendix L, paragraphs 1.1 (b), (c), and (d) are amended by removing the unnumbered subdivisions beginning "SO_2 and particulate combined" and by revising the unnumbered subdivisions beginning "Particulate" to read as follows:

Appendix L—[Amended]

APPENDIX L—EXAMPLE REGULATIONS FOR PREVENTION OF AIR POLLUTION EMERGENCY EPISODES

1.1 * * *

(b) * * *

PM_{10}—350 $\mu g/m^3$, 24-hour average.

(c) * * *

PM_{10}—420 $\mu g/m^3$, 24-hour average.

(d) * * *

PM_{10}—500 $\mu g/m^3$, 24-hour average.

* * * * *

Appendix S—[Amended]

9. In Appendix S, the fourth line beginning "Particulate matter" in the list in section 11.A.10(i) is amended by adding the words "of particulate matter emissions" after the words "25 tpy."

* * * * *

PART 52—APPROVAL AND PROMULGATION OF IMPLEMENTATION PLANS

For the reasons set out in the preamble, Part 52 of Chapter I of Title 40 of the Code of Federal Regulations is amended as follows:

1. The authority citation for Part 52 continues to read as follows:

Authority: 42 U.S.C. 7401-7642.

2. In § 52.21, the fourth item in the table in paragraph (b)(23)(i) is revised; the entries under the heading "Particulate matter" in the tables in paragraphs (c) and (p)(5) are revised; paragraphs (i)(4) (ix) and (x) are added; the third, sixth, eighth, and twelfth items in the list in paragraph (i)(8)(i) are revised; paragraph (i)(11), and paragraphs (m)(1)(vii) and (viii) are added; and paragraph (w)(2) is revised as follows:

§ 52.21 Prevention of significant deterioration of air quality.

* * * * *

(b) **Definitions.** * * *

(23)(i) * * *

Particulate matter: 25 tpy of particulate matter emissions; 15 tpy of PM_{10} emissions.

* * * * *

(c) * * *

Pollutant	Maximum allowable increases (micrograms per cubic meter)
Class I	
Particulate matter:	
TSP, annual geometric mean	5
TSP, 24-hr maximum	10
* * * * *	
Class II	
Particulate matter:	
TSP, annual geometric mean	19
TSP, 24-hr maximum	37
* * * * *	
Class III	
Particulate matter:	
TSP, annual geometric mean	37
TSP, 24-hr maximum	75
* * * * *	

* * * * *

(i) * * *

(4) * * *

(ix) The source or modification was not subject to § 52.21, with respect to particulate matter, as in effect before July 31, 1987, and the owner or operator:

(*a*) Obtained all final Federal, State, and local preconstruction approvals or permits necessary under the applicable State implementation plan before July 31, 1987.

(*b*) Commenced construction within 18 months after July 31, 1987, or any earlier time required under the State implementation plan: and

(*c*) Did not discontinue construction for a period of 18 months or more and completed construction within a reasonable period of time;

(x) The source or modification was subject to 40 CFR 52.21, with respect to particulate matter, as in effect before July 31, 1987 and the owner or operator submitted an application for a permit under this section before that date, and the Administrator subsequently determines that the application as submitted was complete with respect to the particulate matter requirements then in effect in this section. Instead, the requirements of paragraphs (j) through (r) of this section that were in effect before July 31, 1987 shall apply to such source or modification.

* * * * *

(8) * * *

(i) * * *

Particulate matter:

10 $\mu g/m^3$ of TSP, 24-hour average.

10 $\mu g/m^3$ of PM_{10}, 24-hour average:

* * * * *

Lead—0.1 $\mu g/m^3$, 3-month average;

* * * * *

Beryllium—0.001 $\mu g/m^3$, 24-hour average;

* * * * *

Hydrogen sulfide—0.2 $\mu g/m^3$, 1-hour average;

* * * * *

(11)(i) At the discretion of the Administrator, the requirements for air quality monitoring of PM_{10} in paragraphs (m)(1)(i)–(iv) of this section may not apply to a particular source or modification when the owner or operator of the source or modification submits an application for a permit under this section on or before June 1, 1988 and the Administrator subsequently determines that the application as submitted before that date was complete, except with respect to the requirements for monitoring particulate matter in paragraphs (m)(1)(i)–(iv).

(ii) The requirements for air quality monitoring of PM_{10} in paragraphs (m)(1)(iii) and (iv) and (m)(3) of this section shall apply to a particular source or modification if the owner or operator of the source or modification submits an application for a permit under this section after June 1, 1988 and no later than December 1, 1988. The data shall have been gathered over at least the period from February 1, 1988 to the date the application becomes otherwise complete in accordance with the provisions set forth under paragraph (m)(1)(viii) of this section, except that if the Administrator determines that a complete and adequate analysis can be accomplished with monitoring data over a shorter period (not to be less than 4 months), the data that paragraph (m)(1)(iii) requires shall have been gathered over that shorter period.

* * * * *

(m) *Air quality analysis.*

(1) * * *

(vii) For any application that becomes complete, except as to the requirements of paragraph (m)(1)(iii) and (iv) pertaining to PM_{10}, after December 1, 1988 and no later than August 1, 1988 the data that paragraph (m)(1)(iii) requires shall nave been gathered over at least the period from August 1, 1988 to the date the application becomes otherwise complete, except that if the Administrator determines that a complete and adequate analysis can be accomplished with monitoring data over a shorter period (not to be less than 4 months), the data that paragraph (m)(1)(iii) requires shall have been gathered over that shorter period.

(viii) With respect to any requirements for air quality monitoring of PM_{10} under paragraphs (i)(11)(i) and (ii) of this section, the owner or operator of the source or modification shall use a monitoring method approved by the Administrator and shall estimate the ambient concentrations of PM_{10} using the data collected by such approved monitoring method in accordance with estimating procedures approved by the Administrator.

* * * * *

(p) * * *

(5) * * *

Pollutant	Maximum allowable increases (micrograms per cubic meter)
Particulate matter:	
TSP, annual geometric mean	19
TSP 24-hr maximum	37

* * * * *

(w) *Permit rescission.* * * *

(2) Any owner or operator of a stationary source or modification who holds a permit for the source or modification which was issued under § 52.21 as in effect on July 30, 1987, or any earlier version of this section, may request that the Administrator rescind the permit or a particular portion of the permit.

* * * * *

§ 52.24 [Amended]

3. In § 52.24, paragraph (f)(10) is amended by removing the fourth entry, beginning "Particulate matter," from the list of significant emission rates.

[FR Doc. 87-13709 Filed 6-30-87; 8:45 am]
BILLING CODE 6560-50-M

APPENDIX B

OVERVIEW OF CLEAN AIR ACT AUTHORITY FOR INSPECTORS

APPENDIX B

OVERVIEW OF CLEAN AIR ACT AUTHORITY FOR INSPECTORS

The Clean Air Act (CAA) authorizes plant entry for the purposes of inspection. In specific, Section 114 of the Act states:[1]

> ".....the Administrator or his authorized representative, upon presentation of his credentials shall have a right of entry to, upon or through any premises of such person or in which any records required to be maintained.....are located, and may at reasonable times have access to and copy any records, inspect any monitoring equipment or methods....., and sample any emissions which such person is required to sample....."

Inspections conducted under Section 114 extend to all items relating to compliance with the requirements of the CAA which are within the premises being inspected. These may include: records filed, processes, monitoring equipment, controls, sampling methods, and emissions.

Much of the compliance monitoring, including on-site inspections, is accomplished at the state level. Section 114 of the Act provides for the extension of federal authority to the states to carry out that Section. Where a state has been delegated Section 114 authority from EPA, the same authority EPA has to monitor, sample, inspect or copy records, and any other authority under Section 114 can, in like manner, be exercised by the state. No representative of EPA need accompany the state officials.

EPA does not always have the resources available to conduct all of the compliance monitoring functions on its own. To accomplish these functions, EPA frequently hires private contractors to provide technical support for on-site inspections and sampling. EPA maintains that such contractors, upon proper designation, are "authorized representatives" of the administrator within the meaning of Section 114. However, the courts have not unanimously upheld EPA's position. For this reason, EPA has adopted a policy that duly-authorized contractors are only used to conduct on-site inspections in those Circuits where Court of Appeals decisions have not been against the use of contractors as authorized representatives.

---

[1] U. S. Environmental Protection Agency. *The Clean Air Act, Compliance/ Enforcement Guidance Manual.* Office of Enforcement and Compliance Monitoring. Washington, DC. 1987.

EPA's current policy on the use of contractors to conduct on-site inspections is as follows:[2]

- First, Second, Third, Fourth, Fifth, Seventh, Eighth, Eleventh, and District of Columbia Circuits. Authorized contractors may be designated to provide technical support for inspections of facilities owned by anyone other than Stauffer Chemical Company.

- Ninth Circuit. Authorized contractors may be designated to provide technical support for any inspections.

- Sixth and Tenth Circuits. Absent express permission from Headquarters, authorized contractors should not be designated to provide technical support for any inspections.

EPA also has the authority to conduct unannounced, off-the-premises inspections, such as visible emission observations.

APPENDIX C

INSPECTORS RESPONSIBILITIES, SAFETY PROCEDURES, AND PREPARATION

APPENDIX C

INSPECTORS RESPONSIBILITIES, SAFETY PROCEDURES, AND PREPARATION

C.1 INSPECTOR RESPONSIBILITIES

The primary role of the inspector is to gather information needed in the determination of compliance with applicable regulations and other enforcement activities. Closely coupled with these functions are certain responsibilities which include: (1) knowing and abiding by the legal requirements of the inspection; (2) using proper procedures for effective inspection and evidence collection; (3) practicing accepted safety procedures; (4) observing the professional and ethical responsibilities; and (5) maintaining certain quality assurance standards. Each is briefly outlined below.

C.1.1 Legal Responsibilities

It is essential that all inspection activities be conducted within the legal framework established by the Clean Air Act (CAA) or other applicable statutes. In particular, this includes:

- Proper handling of confidential business information.
- Presentation of proper credentials and plant entry at reasonable times.
- Protection of the legal rights of the company and its personnel under the U.S. Constitution.
- Knowledge of all applicable statutes, regulations, and permit conditions.
- Use of notice(s) and receipts, if appropriate.

For federal employees (or their representatives) conducting inspections under the CAA, the guidance provided in Reference 1 should be followed. In the case of state and local inspectors, the appropriate office responsible for legal matters should be consulted regarding the above issues.

---

[1] U.S. Environmental Protection Agency. *The Clean Air Act, Compliance/Enforcement Guidance Manual*. Office of Enforcement and Compliance Monitoring. Washington, DC. 1987.

C.1.2 Procedural Responsibilities

The inspector must be familiar with and adhere to, when possible, all general inspection procedures and evidence gathering techniques. This will ensure accurate inspections and avoid the possibility of endangering a legal proceeding on procedural grounds.

- Inspection procedures--Inspectors should observe standard procedures for conducting each portion of the inspection as established by the regulatory agency, when possible. All deviations should be clearly documented.

- Evidence collection--Inspectors must be familiar with general evidence gathering techniques. Because the agency's case in a civil or criminal prosecution depends on the evidence gathered by the inspector, it is imperative that the inspector keep detailed records of each inspection. These records will serve as an aid in preparing the inspection report, in determining the appropriate enforcement response, and in giving testimony in an enforcement case, as required. Specifically, inspectors must:

  - Know how to substantiate facts with items of evidence, including samples, photographs, document copies, statements from persons, and personal observations.

  - Know how to detect lack of good faith during interviews with company personnel.

  - Be familiar with all applicable regulations and permit conditions and know what type of information is required to determine compliance with each.

  - Be able to evaluate what documentation is necessary (routine inspection).

  - Collect evidence in a manner that will be incontestable in legal proceedings.

  - Be able to write clear, informative inspection reports.

  - Know how to testify in court and at administrative hearings.

C.1.3 Safety Responsibilities

The inspection of industrial facilities generally involves potential exposure to numerous hazards. The inspector must at all times avoid putting anyone at unnecessary risk. To accomplish this, it is the inspector's responsibility to:

- Know and observe all plant safety requirements, warning signals, and emergency procedures.
- Know and observe all agency safety requirements, procedures, and policies.
- Remain current in safety practices and procedures by regular participation in safety training.
- Use any safety equipment required by the facility being inspected in addition to that required by the regulatory agency.
- Use safety equipment in accordance with agency guidance and labeling instructions.
- Maintain safety equipment in good condition and proper working order.
- Dress appropriately for each inspection activity, including protective clothing, if appropriate.

Section 2.7 of this manual (and listed references) address inspection safety procedures in more detail.

C.1.4 Professional and Ethical Responsibilities

As professionals, inspectors are expected to perform their duties with the highest degree of honesty and professionalism. Procedures and requirements ensuring ethical actions have been worked out through many years of governmental inspection activities. These procedures and standards of conduct have evolved for the protection of the individual, the regulatory agency, and industry. The inspector is constantly in a position to set an example for private industry and to encourage concern for the health and safety in environment and compliance with the laws that protect them.

Specifically, the EPA inspector should always consider and observe the following responsibilities:

- U.S. Constitution--All investigations are to be conducted within the framework of the United States Constitution and with due regard for individual rights regardless of race, sex, creed, or national origin.
- EPA employee conduct--Inspectors are to conduct themselves at all times in accordance with the regulations prescribing EPA Employee Responsibilities and Conduct, codified in 40 CFR Part 60, Part 3.
- Objectivity--The facts of an investigation are to be developed and reported completely, accurately, and objectively. In the course of an investigation, any act or failure to act motivated by reason of private gain is illegal. Actions which could be construed as such should be scrupulously avoided.

- Knowledge--A continuing effort to improve professional knowledge and technical skill in the investigative field should be made. The inspector should keep abreast of changes in the field of air pollution, including current regulations, EPA and other agency policies, control technology, methodology, and safety considerations.

- Professional attitude--The inspector is a representative of EPA and is often the initial or only contact between the agency and industry. In dealing with facility representatives and employees, inspectors must be dignified, tactful, courteous, and diplomatic. They should be especially careful not to infringe on union/company agreements. A firm but responsive attitude will help to establish an atmosphere of cooperation and should foster good working relations. He should always strive to obtain the respect of, inspire confidence in, and maintain good will with industry and the public.

- Attire--Inspectors should dress appropriately, including wearing protective clothing or equipment, for the activity in which they are engaged.

- Industry, public, and consumer relations--All information acquired in the course of an inspector's duties is for official use only. Inspectors should not speak of any product, manufacturer, or person in a derogatory manner.

- Gifts, favors, luncheons--Inspectors should not accept favors or benefits under circumstances that might be construed as influencing the performance of governmental duties. EPA regulations provide an exemption whereby an inspector could accept food and refreshment of nominal value on infrequent occasions in the ordinary course of a luncheon or dinner meeting or other meeting, or during an inspection tour. Inspectors should use this exemption only when absolutely necessary.

- Requests for information--EPA has an "open door" policy on releasing information to the public. This policy aims at making information about EPA and its work freely and equally available to all interested individuals, groups, and organizations. In fact, EPA employees have both a legal and traditional responsibility for making useful educational and safety information available to the public. This policy, however, does not extend to information relating to the suspicion of a violation, evidence of possible misconduct, or confidential business information.

C.1.5 Quality Assurance Responsibilities

The inspector assumes primary responsibility for ensuring the quality of data generated as a result of the inspection. Thus quality assurance procedures appropriate to the type of data being generated should be adhered to. In general, quality assurance procedures are developed towards the following elements: valid data collection; approved, standard methods; control of service, equipment, supplies; quality analytical techniques; and standard data

handling and reporting. Reference 2 should be consulted for general guidance in this regard.

C.2 PREINSPECTION PREPARATION

Preinspection preparation is always necessary to ensure effective use of the inspector's and facility's time, and to ensure that the inspection is properly focused on collecting relevant data and information. This preparation involves: review of facility background; development of an inspection plan; notifications; and equipment preparation. Each is discussed briefly below.

C.2.1 Review of Facility Background

A review of the available background information on the facility to be inspected is essential to the overall success of the inspection. The review should enable the inspector to: become familiar with the facility's process and emission characteristics; conduct the inspection in a timely manner; minimize inconvenience to the facility by not requesting unnecessary data such as that previously provided to the EPA or another agency; conduct an efficient, but thorough, inspection; clarify technical and legal issues before entry; and prepare a useful inspection report. The following types of information should be reviewed:

* Basic facility information--Names, titles, and phone numbers of facility representatives; maps showing facility location and geographic relationship to residences, etc., potentially impacted by emissions; process and production information; plot plans or maps identifying sources, control equipment and methods, monitors, and other points of interest; and safety equipment requirements.

* Sources and control equipment data--Sources and extent of fugitive emissions; description and operational data for control equipment; and previous inspection checklists (and reports).

* Regulations, requirements, and limitations--Most recent permits for facility sources; applicable federal, state, and local regulations and requirements; special exemptions and waivers, if any; and permitted operating conditions.

* Facility compliance and enforcement history--Previous inspection reports; complaint history including reports, follow-up, findings, remedial action; past conditions of noncompliance; previous enforcement actions; pending enforcement actions, compliance schedules and/or variances; and control performance data and reports.

---

[2] U.S. Environmental Protection Agency. *Air Compliance Inspection Manual.* EPA-340/1-85-020. Office of Air Quality Planning and Standards. Research Triangle Park, NC. September 1985.

The following sources are recommended for obtaining this background information for EPA inspectors:

- Inspectors "working" file--The inspector's own concise file for a facility containing basic plant and process information, maps, dust control plan, chronology of enforcement related actions, recent permits, and safety requirements.

- Regional office files and data bases--These files should include much of the information needed including inspection reports, permits and permit applications, compliance and enforcement history, exemption or waiver information, and control performance monitoring data.

- State/local files and contacts--These should be used to supplement and update the information available in the regional office files.

- Laws and regulations--The Clean Air Act and related regulations establish emission standards, controls, procedures, and other requirements applicable to a facility. State and local laws and regulations should also be considered.

- Technical reports, documents, and guidelines--These can often be valuable in providing information and/or guidance concerning specific processes, control techniques, performance advantages and limitations of particular types of controls, and specific inspection procedures. Table 2-3 lists some of the reference documents available for fugitive sources.

C.2.2 Inspection Plan Development

Based on the review of the facility background information and the intended purpose of the inspection, the EPA inspector should develop an inspection plan. This plan should address the following items:

- Inspection objectives--Identify the precise purpose of the inspection in terms of what it will accomplish.

- Tasks--Decide on specific tasks to accomplish the inspection objectives including the exact information which must be collected.

- Procedures--Determine the procedures to be used in completing the tasks, particularly special or unfamiliar procedures.

- Resources--Determine what equipment and personnel will be required.

- Schedule--Estimate the time requirements for the inspection; determine a reasonable time for the inspection (when plant is operating at representative conditions).

C.2.3 Facility Notification

EPA regional offices vary in their exact policies concerning giving a facility advance notification of an inspection. In an EPA policy memo entitled "Final Guidance on Use of Unannounced Inspections," the Stationary Source Compliance Division recommends that all regional inspection programs incorporate unannounced inspections as part of their overall inspection approach.[2] The advantages of the unannounced inspection are: (1) the opportunity to observe the source under normal operating conditions (since the source does not have time to prepare for the inspection); (2) detection of visible emissions and O&M-type problems and violations; (3) creation of an increased level of attention by a source to its compliance status; and (4) projection of a serious attitude toward surveillance by the agency.

The potential negative aspects of performing unannounced inspections are: (1) the source may not be operating or key plant personnel may not be available; and (2) there could be an adverse impact on EPA/state or EPA/source relations. However, it has been demonstrated by the regional offices who already use the unannounced inspections that, in the majority of cases, these drawbacks can be overcome.[2]

When using the unannounced inspection, an alternative to arriving at the source totally unannounced is to contact the source shortly before the scheduled inspection time. This is left to the discretion of the regional office and/or the inspector and must be done so as not to alter the representativeness of the source operation. The amount of advanced notice given should be noted in the inspection report.

Announced inspections are performed by EPA (and its authorized representatives) when some specific purpose is served by providing such notice. Situations where announced inspections are appropriate are:

- When specific information is being sought which must be prepared by the source, or where the source must make significant accommodations for the inspector to gather the information.
- When the assistance of specific plant personnel is necessary for the successful performance of the inspections (i.e., the information they provide cannot be obtained from other on-duty plant personnel or by a follow-up information request).
- When inspecting the government facilities or sources operating under government contract where entry is restricted due to classified operations.
- When inspecting unmanned or extremely remote sources.

When the inspection is announced in advance, a lead time of five working days is generally appropriate. Notification may be by telephone or letter and it may or may not include the exact date and time of the inspection. Instances where written notification (instead or oral) is appropriate are:

- When requested by the state/local agency or by the source.
- When extensive or specific records are being sought.
- When the inspection is to be performed solely by an EPA contractor.
- When inspecting government facilities with classified operations or otherwise restricted entry.
- Special-purpose inspections (e.g., to establish conditions for a source-specific SIP revision).

A "114 Letter" (Appendix A) is sometimes used for notification if there is a need to request facility information prior to the inspection. The facility representative notified should have the authority to release data and samples and to arrange for access. In addition, when notifying a facility on an inspection, information should be requested in regard to on-site safety regulations. This will avoid problems concerning safety equipment at the time of the inspection.

APPENDIX D

SUMMARY OF STATE METHODS FOR DETERMINING VISIBLE EMISSIONS FROM OPEN DUST SOURCES

APPENDIX D

SUMMARY OF STATE METHODS FOR DETERMINING VISIBLE EMISSIONS FROM OPEN DUST SOURCES

Visible emission methods have been adopted by a number of states as a tool for compliance. Although opacity observations at the property line have commonly been employed in earlier fugitive dust control regulations, recent court decisions in Colorado and Alabama have found that rules of that type are unconstitutional (failing to provide equal protection). It is strongly recommended that property-line opacity observations serve only as an indicator of a potential problem, thus "triggering" further investigation. Source-specific opacity determinations, on the other hand, have long been a court-tested approach to regulation. The following sections describes two states' approach to fugitive dust regulation using visible emission methods.

D.1 TENNESSEE VISIBLE EMISSION METHOD

The State of Tennessee has developed a method (TVEE Method 1) for evaluating visible emissions (VE) from roads and parking lots. The following discussion focuses on TVEE Method 1 (M1) in the technical areas: (1) reader position/techniques, and (2) data reduction/evaluation procedures. Table D-1 summarizes the relevant features of TVEE M1.

D.1.1 Reader Position/Techniques

As indicated in Table D-1, TVEE M1 specifies an observer location of 15 ft from the source. In most cases, this distance should allow an unobstructed view, and at the same time meet observer safety requirements.

M1 also specifies that the plume be read at ~ 4 ft directly above the emitting surface. This specification presumably results from field experiments conducted to support the method. It is probably intended to represent the point (i.e., location) of maximum opacity. While there is no quantitative supporting evidence, it seems likely that the height and location of maximum opacity relative to a passing vehicle will vary depending upon ambient factors (wind speed and direction) as well as vehicle type and speed.

Implied in the M1 specification that the plume be read ~ 4 ft above the emitting surface, is the fact that observations will be made against a terrestrial (vegetation) background. The results of one study using a conventional smoke generator modified to emit horizontal plumes, indicated that under these conditions observers are likely to underestimate opacity levels. More specifically, the study found that as opacity levels increased, opacity

TABLE D-1. SUMMARY OF TVEE M1 REQUIREMENTS

Reader position/techniques

- Sun in 140 degree sector behind the reader
- Observer position ~ 15 ft from source
- Observer line of sight should be as perpendicular as possible to both plume and wind direction
- Only one plume thickness read
- Plume read at ~ 4 ft directly above emitting surface
- Individual opacity readings taken each 15 s, recorded to nearest 5% opacity
- Readings terminated if vehicle obstructs line of sight
- Readings terminated if vehicles passing in opposite direction create intermixed plume

Data reduction

- 2-min time-averages consisting of eight consecutive 15 s readings

Certification

- Per Tennessee requirements

readings showed an increasing negative bias. For example, at 15% opacity, the observers underestimated opacity by about 5%, and at 40% opacity, observations averaged about 11% low.[1] Black plumes were underestimated at all opacity levels.

M1 specifies that only one plume thickness be read. It includes qualifying provisions that: (1) readings terminate if vehicles passing in opposite directions create an intermixed plume; but (2) readings continue if intermixing occurs as a result of vehicles moving in the same direction. Unlike (1), the latter condition is considered representative of the surface. The intent here is probably to minimize the influence of increasing plume density which results from "overlaying" multiple plumes.

D.1.2 Data Reduction/Evaluation Procedures

There are two basic approaches that can be used to reduce opacity readings for comparison with VE regulations. One approach involves the time-averaging of consecutive 15-s observations over a specified time period to produce an average opacity value.

In the development of M1, the State of Tennessee concluded that a short averaging period--2 min (i.e., eight consecutive 15-s readings) was appropriate for roads and parking lots, as these sources typically produce brief, intermittent opacity peaks.

Although not specified in M1, VE from open sources could be evaluated using time-aggregating techniques. For example, the discrete 15-s readings could be employed in the time-aggregating framework. In this case, the individual observations are complied into a histogram from which the number of observations (or equivalent percent of observation time) in excess of the desired opacity may then be ascertained. The principal advantage of using the time-aggregate technique as a method to reduce VE readings is that the resultant indicator of opacity conditions is then compatible with regulations that include a time exemption clause. Under time exemption standards, a source is permitted opacity in excess of the standard for a specified fraction of the time (e.g., 3 min/h). The concept of time exemption was originally developed to accommodate stationary source combustion processes.

Without more detailed supporting information, it is difficult to determine which of the two approaches is most appropriate for evaluating VE from open sources. With respect to time-averaging, statistics of observer bias in reading plumes from a smoke generator do indicate at least a slight decrease in the "accuracy" of the mean observed opacity value as averaging time decreases. In M1 (2-min average), this is reflected in the inclusion of an 8.8% buffer for observational error. This buffer is taken into account before issuing a Notice of Violation.[2]

---

[1] Rose, T. H. Evaluation of Trained Visible Emission Observers for Fugitive Opacity Measurement. EPA-60/3-84-093, U.S. Environmental Protection Agency, Research Triangle Park, NC. October 1984.

[2] Telecon. Englehart, P., Midwest Research Institute, with J. Walton, Tennessee Division of Air Pollution Control. Nashville, Tennessee. September 1984.

One potential problem with applying time-averaging to opacity from roads and parking lots, is that the resulting average will be sensitive to variations in source activity. For example, interpreting one conclusion offered in support of M1, it is likely that under moderate wind conditions a single vehicle pass will produce only two opacity readings $\geq$ 5%.[2] Averaging these with six zero (0) readings yields a 2-min value below any reasonable opacity standard. Yet, under the same conditions with two or more vehicle passes, the average value will suggest elevated opacity levels. While there is no information available on the use of time aggregation for open source opacity, it appears that this approach would more easily accommodate variations in level of source activity. For this reason alone, it may be the evaluation approach better suited to roads and parking lots.

D.2 OHIO DRAFT RULE 3745-17-(03)(B)

The State of Ohio submitted a fugitive dust visible emission measurement technique which the EPA proposed to approve in the *Federal Register* on January 2, 1987. Unlike the Tennessee method, the Ohio draft rule contains provisions for sources other than roads and parking lots. Average opacity values are based on 12 consecutive readings. Table D-2 summarizes the Ohio method; as can be seen from the table, many features of the Ohio draft rule are similar to TVEE M1. Consequently, the remarks made earlier in this section are equally applicable here.

TABLE D-2. SUMMARY OF OHIO DRAFT RULE 3745-17-(03)(B)

Reader position/techniques

- Roadways and parking lots:
  - * Line of vision approximately perpendicular to plume direction
  - * Plume read at ~ 4 ft above surface
  - * Readings suspended if vehicle obstructs line of sight; subsequent readings considered consecutive to that taken before the obstruction
  - * Readings suspended if vehicles passing in opposite direction create an intermixed plume; subsequent readings considered consecutive to that taken before intermixing
  - * If unusual condition (e.g., spill) occurs, another set of readings must be conducted

- All other sources:
  - * Sun behind observer
  - * Minimum of 15 ft from source
  - * Line of sight approximately perpendicular to flow of fugitive dust and to longer axis of the emissions
  - * Opacity observed for point of highest opacity

APPENDIX E

EPA REFERENCE METHOD 22 FOR VISUAL DETERMINATION OF FUGITIVE EMISSIONS

APPENDIX E

EPA REFERENCE METHOD 22 FOR VISUAL DETERMINATION OF FUGITIVE EMISSIONS

The following pages outline EPA Reference Test Method 22 for the visual determination of fugitive emissions from material sources and smoke emissions from flares.

METHOD 22—VISUAL DETERMINATION OF FUGITIVE EMISSIONS FROM MATERIAL SOURCES AND SMOKE EMISSIONS FROM FLARES

1. *Introduction*

This method involves the visual determination of fugitive emissions, i.e., emissions not emitted directly from a process stack or duct. Fugitive emissions include emissions that (1) escape capture by process equipment exhaust hoods; (2) are emitted during material transfer; (3) are emitted from buildings housing material processing or handling equipment; and (4) are emitted directly from process equipment. This method is used also to determine visible smoke emissions from flares used for combustion of waste process materials.

This method determines the amount of time that any visible emissions occur during the observation period, i.e., the accumulated emission time. This method does not require that the opacity of emissions be determined. Since this procedure requires only the determination of whether a visible emission occurs and does not require the determination of opacity levels, observer certification according to the procedures of Method 9 are not required. However, it is necessary that the observer is educated on the general procedures for determining the presence of visible emissions. As a minimum, the observer must be trained and knowledgeable regarding the effects on the visibility of emissions caused by background contrast, ambient lighting, observer position relative to lighting, wind, and the presence of uncombined water (condensing water vapor). This training is to be obtained from written materials found in References 7.1 and 7.2 or from the lecture portion of the Method 9 certification course.

2. *Applicability and Principle*

2.1 Applicability. This method applies to the determination of the frequency of fugitive emissions from stationary sources (located indoors or outdoors) when specified as the test method for determining compliance with new source performance standards.

This method also is applicable for the determination of the frequency of visible smoke emissions from flares.

2.2 Principle. Fugitive emissions produced during material processing, handling, and transfer operations or smoke emissions from flares are visually determined by an observer without the aid of instruments.

3. *Definitions*

3.1 Emission Frequency. Percentage of time that emissions are visible during the observation period.

3.2 Emission Time. Accumulated amount of time that emissions are visible during the observation period.

3.3 Fugitive Emissions. Pollutant generated by an affected facility which is not collected by a capture system and is released to the atmosphere.

3.4 Smoke Emissions. Pollutant generated by combustion in a flare and occurring immediately downstream of the flame. Smoke occurring within the flame, but not downstream of the flame, is not considered a smoke emission.

3.5 Observation Period. Accumulated time period during which observations are conducted, not to be less than the period specified in the applicable regulation.

4. *Equipment*

4.1 Stopwatches. Accumulative type with unit divisions of at least 0.5 seconds; two required.

4.2 Light Meter. Light meter capable of measuring illuminance in the 50- to 200-lux range; required for indoor observations only.

5. *Procedure*

5.1 Position. Survey the affected facility or building or structure housing the process to be observed and determine the locations of potential emissions. If the affected facility is located inside a building, determine an observation location that is consistent with the requirements of the applicable regulation (i.e., outside observation of emissions escaping the building/structure or inside observation of emissions directly emitted from the affected facility process unit). Then select a position that enables a clear view of the potential emission point(s) of the affected facility or of the building or structure housing the affected facility, as appropriate for the applicable subpart. A position at least 15 feet, but not more than 0.25 miles, from the emission source is recommended. For outdoor locations, select a position where the sun is not directly in the observer's eyes.

5.2 Field Records.

5.2.1 Outdoor Location. Record the following information on the field data sheet (Figure 22-1): company name, industry, process unit, observer's name, observer's affiliation, and date. Record also the estimated wind speed, wind direction, and sky condition. Sketch the process unit being observed and note the observer location relative to the source and the sun. Indicate the potential and actual emission points on the sketch.

5.2.2 Indoor Location. Record the following information on the field data sheet (Figure 22-2): company name, industry, process unit, observer's name, observer's af-

filiation, and date. Record as appropriate the type, location, and intensity of lighting on the data sheet. Sketch the process unit being observed and note observer location relative to the source. Indicate the potential and actual fugitive emission points on the sketch.

5.3 Indoor Lighting Requirements. For indoor locations, use a light meter to measure the level of illumination at a location as close to the emission source(s) as is feasible. An illumination of greater than 100 lux (10 foot candles) is considered necessary for proper application of this method.

5.4 Observations. Record the clock time when observations begin. Use one stopwatch to monitor the duration of the observation period; start this stopwatch when the observation period begins. If the observation period is divided into two or more segments by process shutdowns or observer rest breaks, stop the stopwatch when a break begins and restart it without resetting when the break ends. Stop the stopwatch at the end of the observation period. The accumulated time indicated by this stopwatch is the duration of the observation period. When the observation period is completed, record the clock time.

During the observation period, continously watch the emission source. Upon observing an emission (condensed water vapor is not considered an emission), start the second accumulative stopwatch; stop the watch when the emission stops. Continue this procedure for the entire observation period. The accumulated elapsed time on this stopwatch is the total time emissions were visible during the observation period, i.e., the emission time.

5.4.1 Observation Period. Choose an observation period of sufficient length to meet the requirements for determining compliance with the emission regulation in the applicable subpart. When the length of the observation period is specifically stated in the applicable subpart, it may not be necessary to observe the source for this entire period if the emission time required to indicate noncompliance (based on the specified observation period) is observed in a shorter time period. In other words, if the regulation prohibits emissions for more than 6 minutes in any hour, then observations may (optional) be stopped after an emission time of 6 minutes is exceeded. Similarly, when the regulation is expressed as an emission frequency and the regulation prohibits emissions for greater than 10 percent of the time in any hour, then observations may (optional) be terminated after 6 minutes of emissions are observed since 6 minutes is 10 percent of an hour. In any case, the observation period shall not be less than 6 minutes in duration. In some cases, the process operation may be intermittent or cyclic. In such cases, it may be convenient for the observation period to coincide with the length of the process cycle.

5.4.2 Observer Rest Breaks. Do not observe emissions continuously for a period of more than 15 to 20 minutes without taking a rest break. For sources requiring observation periods of greater than 20 minutes, the observer shall take a break of not less than 5 minutes and not more than 10 minutes after every 15 to 20 minutes of observation. If continuous observations are desired for extended time periods, two observers can alternate between making observations and taking breaks.

5.4.3 Visual Interference. Occasionally, fugitive emissions from sources other than the affected facility (e.g., road dust) may prevent a clear view of the affected facility. This may particularly be a problem during periods of high wind. If the view of the potential emission points is obscured to such a degree that the observer questions the validity of continuing observations, then the observations are terminated, and the observer clearly notes this fact on the data form.

5.5 Recording Observations. Record the accumulated time of the observation period on the data sheet as the observation period duration. Record the accumulated time emissions were observed on the data sheet as the emission time. Record the clock time the observation period began and ended, as well as the clock time any observer breaks began and ended.

6. *Calculations*

If the applicable subpart requires that the emission rate be expressed as an emission frequency (in percent), determine this value as follows: Divide the accumulated emission time (in seconds) by the duration of the observation period (in seconds) or by any minimum observation period required in the applicable subpart, if the acutal observation period is less than the required period and multiply this quotient by 100.

APPENDIX F

MATERIAL SAMPLING AND ANALYSIS PROCEDURES

APPENDIX F

MATERIAL SAMPLING AND ANALYSIS PROCEDURES

F.1 SAMPLING TECHNIQUES

The following are recommended procedures for collection of appropriate road surface and aggregate material samples. Where practical, the recommended procedure is structured identically to the standard method published by the American Society of Testing and Materials (ASTM).

F.1.1 Unpaved Roads

The main objective in sampling the surface material from an unpaved road is to collect a minimum gross sample of 23 kg (50 lb) for every 4.8 km (3 mi) of unpaved road. However, for unpaved road segments significantly < 4.8 km (3 mi) found in industrial facilities, a traverse strip ~ 20 to 60 cm wide across the travel lanes every 0.8 km (1/2 mi) is usually adequate. For unpaved roads treated with a chemical dust suppressant, the sampling strips will typically be wider (~ 45 to 125 cm) in order to collect adequate sample mass. Where possible, incremental samples taken from unpaved roads should ideally be distributed over the road segment, as shown in Figure F-1. In these cases at least four incremental samples should be collected and composited to form the gross sample.

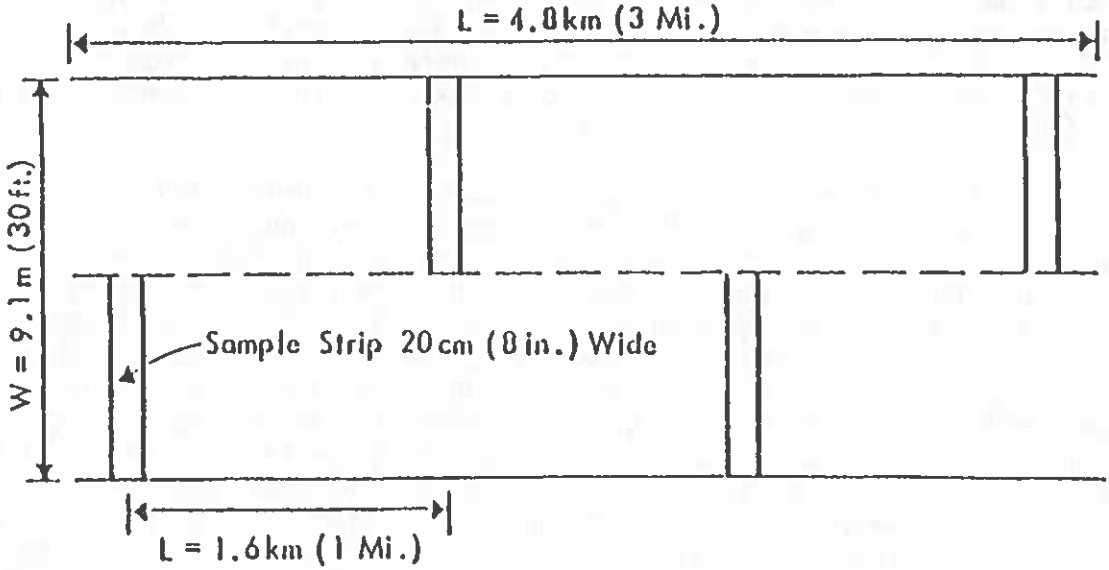

Figure F-1. Location of incremental sampling sites on an unpaved road.

To collect each sample, loose surface material is removed from the hard road base with a whisk broom and dustpan. The material should be swept carefully so that the fine dust is not injected into the atmosphere. The hard road base below the loose surface material should not be abraded so as to generate more fine material than exists on the road in its normal state. Figure F-2 presents a data form to be used for the sampling of unpaved roads. Figure F-3 shows the use of a dust pan and broom for unpaved road sampling as well as a sample strip across the road.

F.1.2 Paved Roads

Ideally, for a given paved road, one gross sample per every 8 km (5 mi) of paved roads should be collected. For industrial roads, one gross sample should be obtained for each road segment in the plant. The gross sample should consist of at least two separate increments per travel lane or each 0.8-km (0.5-mi) of road length should have a separate sample.

Figure F-4 presents a diagram showing the location of incremental samples for a four-lane road. Each incremental sample should consist of a lateral strip 0.3 to 3 m (1 to 10 ft) in width across a travel lane. The exact width is dependent on the amount of loose surface material on the paved roadway. For a visually dirty road, a width of 0.3 m (1 ft) is sufficient; but for a visually clean road, a width of 3 m (10 ft) is needed to obtain an adequate sample.

The above sampling procedure may be considered as the preferred method of collecting surface dust from paved roadways. In many instances, however, the collection of eight sample increments may not be feasible because of manpower, equipment, and traffic/hazard limitations. As an alternative method, samples can be obtained from a single strip across all travel lanes. When it is necessary to resort to this sampling strategy, care must be taken to select sites that have dust loading and traffic characteristics typical of the entire roadway segment of interest. In this situation, sampling from a strip 3 to 9 m (10 to 30 ft) in width is suggested, where possible. From this width, sufficient sample can be collected and a step toward representativeness in sample acquisition will be accomplished.

Samples are removed from the road surface by vacuuming, preceded by broom sweeping if large aggregate is present. The samples should be taken from the traveled portion of the lane with the area measured and recorded on the appropriate data form. With a whisk broom and a dust pan, the larger particles are collected from the sampling area and placed in a clean, labeled sample container (plastic jar or bag). The remaining smaller particles are then swept from the road with an electric broom-type vacuum sweeper. The sweeper must be equipped with a preweighed, prelabeled, disposable vacuum bag. Care must be taken when installing the bags in the sweeper to avoid torn bags which can result in sample loss. After the sample has been collected, the bag should be removed from the sweeper, checked for leaks and stored in a prelabeled, gummed envelope, and sealed for transport. Figure F-5 presents a data form to be used for the sampling of paved roads and Figure F-6 provides photos of sampling procedures for industrial roads and city streets.

F.1.3 Storage Piles

In sampling the surface of a pile to determine representative properties for use in the wind erosion (or materials handling) equation, a gross sample made up of top, middle, and bottom incremental samples should ideally be obtained since the wind disturbs the entire surface of the pile. However, it is impractical to climb to the top or even middle of most industrial storage piles because of the large size.

The most practical approach in sampling from large piles is to minimize the bias by sampling as near to the middle of the pile as practical and by selecting sampling locations in a random fashion. Incremental samples should be obtained along the entire perimeter of the pile. The spacing between the samples should be such that the entire pile perimeter is traversed with approximately equidistant incremental samples. If small piles are sampled, incremental samples should be collected from the top, middle, and bottom.

An incremental sample (e.g., one shovelful) is collected by skimming the surface of the pile in a direction upward along the face. Every effort must be made by the person obtaining the sample not to purposely avoid sampling larger pieces of raw material. Figure F-7 presents a data form to be used for the sampling of storage piles.

In obtaining a gross sample for the purpose of characterizing a load-in or load-out process, incremental samples should be taken from the portion of the storage pile surface (1) which has been formed by the addition of aggregate material or (2) from which aggregate material is being reclaimed.

F.2 LABORATORY ANALYSIS

F.2.1 Sources Other Than Paved Roads

F.2.1.1 Sample Preparation--

Once the gross sample is brought to the laboratory, it must be prepared for silt analysis. This entails dividing the sample to a workable size.

A 23-kg (50-lb) gross sample can be divided by using: (1) mechanical devices; (2) alternative shovel method; (3) riffle; or (4) coning and quartering method. Mechanical division devices are not discussed in this section since they are not found in many laboratories. The alternative shovel method is actually only necessary for samples weighing hundreds of pounds. Therefore, this section discusses only the use of the riffle and the coning and quartering method.

Figure F-7. Data form for storage pile sampling.

ASTM standards describe the selection of the correct riffle size and the correct use of the riffle. Riffle slot widths should be at least three times the size of the largest aggregate in the material being divided. The following quote describes the use of the riffle.[1]

> "Divide the gross sample by using a riffle. Riffles properly used will reduce sample variability but cannot eliminate it. Riffles are shown in Figure F-8(a) and (b). Pass the material through the riffle from a feed scoop, feed bucket, or riffle pan having a lip or opening the full length of the riffle. When using any of the above containers to feed the riffle, spread the material evenly in the container, raise the container, and hold it with its front edge resting on top of the feed chute, then slowly tilt it so that the material flows in a uniform stream through the hopper straight down over the center of the riffle into all the slots, thence into the riffle pans, one-half of the sample being collected in a pan. Under no circumstances shovel the sample into the riffle, or dribble into the riffle from a small-mouthed container. Do not allow the material to build up in or above the riffle slots. If it does not flow freely through the slots, shake or vibrate the riffle to facilitate even flow."

The procedure for coning and quartering is best illustrated in Figure F-9. The following is a description of the procedure: (1) mix the material and shovel it into a neat cone; (2) flatten the cone by pressing the top without further mixing; (3) divide the flat, circular pile into equal quarters by cutting or scraping out two diameters at right angles; (4) discard two opposite quarters; (5) thoroughly mix the two remaining quarters, shovel them into a cone, and repeat the quartering and discarding procedures until the sample has been reduced to 0.9 to 1.8 kg (2 to 4 lb). Samples likely to be affected by moisture or drying must be handled rapidly, preferably in an area with a controlled atmosphere, and sealed in a container to prevent further changes during transportation and storage. Care must be taken that the material is not contaminated by anything on the floor or that a portion is not lost through cracks or holes. Preferably, the coning and quartering operation should be conducted on a floor covered with clean paper or plastic.

The size of the laboratory sample is important--too little sample will not be representative and too much sample will be unwieldy. Ideally, one would like to analyze the entire gross sample in batches, but this is not practical. While all ASTM standards acknowledge this impracticality, they disagree on the exact size, as indicated by the range of recommended samples, extending from 0.05 to 27 kg (0.1 to 60 lb).

---

1 D2013-72. Standard Method of Preparing Coal Samples for Analysis. Annual Book of ASTM Standards, 1977.

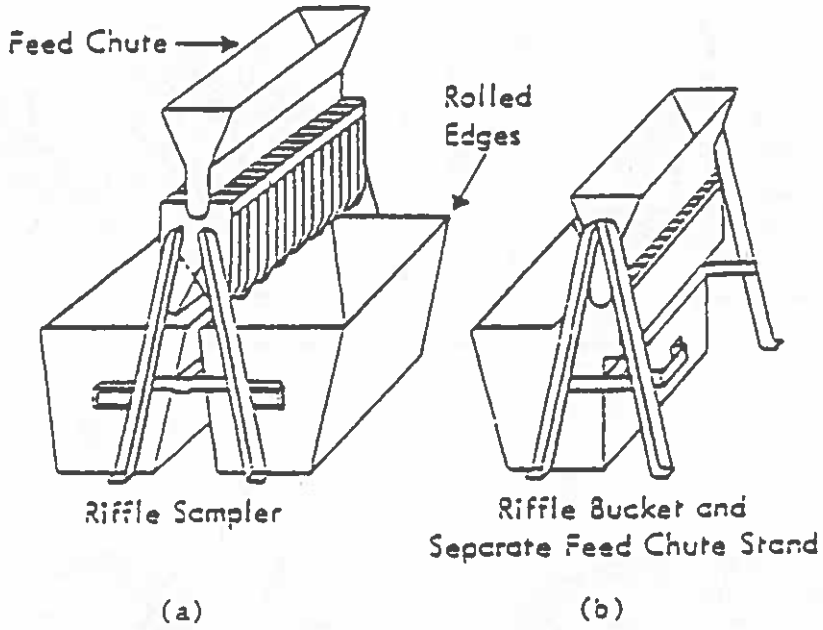

Figure F-8. Sample dividers (riffles).

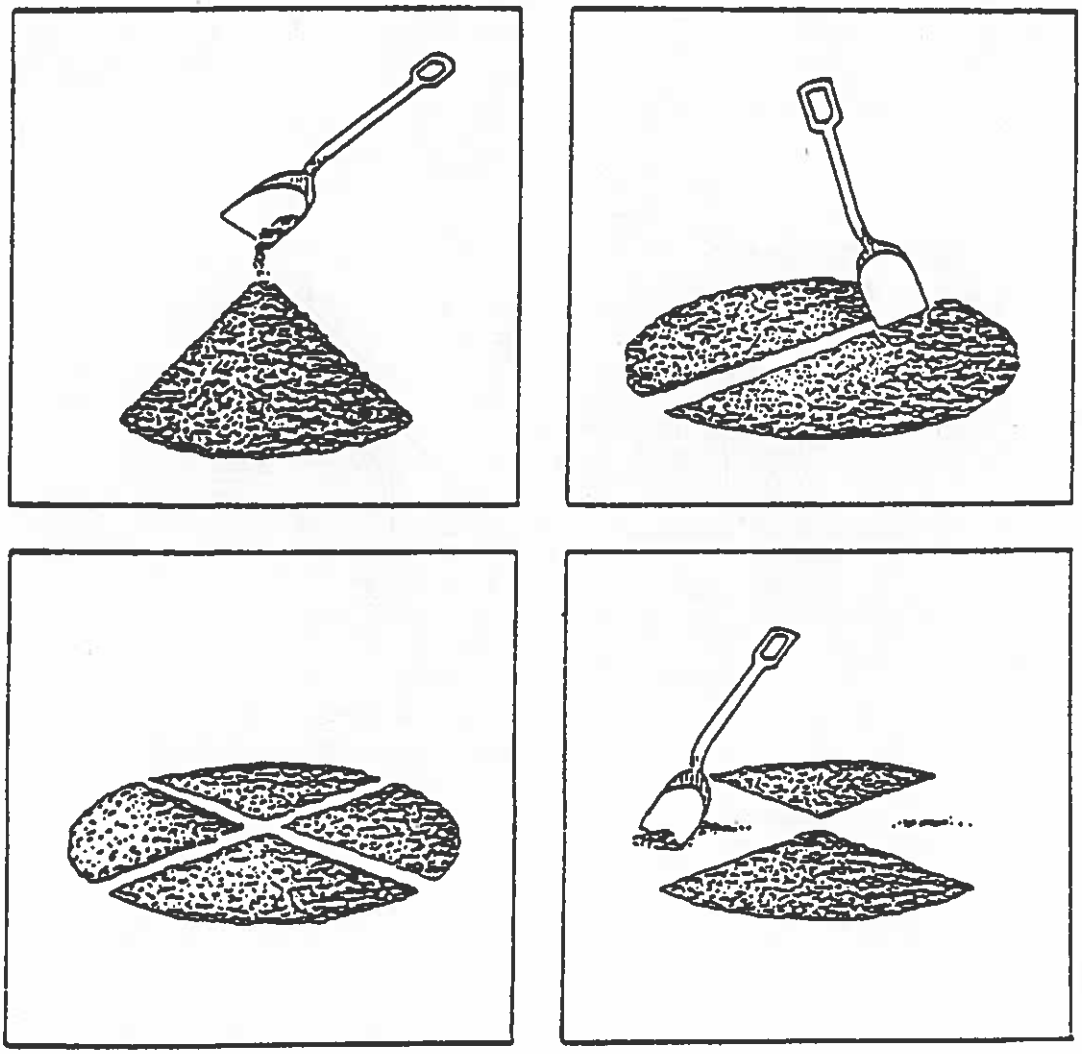

Figure F-9. Coning and quartering.

The main principle in sizing the laboratory sample is to have sufficient coarse and fine portions to be representative of the material and to allow sufficient mass on each sieve so that the weighing is accurate. A recommended rule of thumb is to have twice as much coarse sample as fine sample. A laboratory sample of 800 to 1,600 g is recommended since that is the largest quantity that can be handled by the scales normally available (1,600-g capacity). Also, more sample than this can produce screen blinding for the 8-in-diameter screens normally available.

F.2.1.2 Laboratory Analysis of Samples for Silt Content--

The basic recommended procedure for silt analysis is mechanical dry sieving after moisture analysis. A step-by-step procedure is given in Tables F-1 and F-2. The sample should be oven-dried for 24 h at 230°F (110°C) before sieving. The sieving time is variable; sieving should be continued until the net sample weight collected in the pan increases by less than 3.0% of the previous net sample weight collected in the pan. A minor variation of 3.0% is allowed since some sample grinding due to interparticle abrasion will occur, and consequently, the weight will continue to increase. When the change reduces to 3.0%, it is thought that the natural silt has been passed through the No. 200 sieve screen (75 μmP) and that any additional increase is due to grinding. Both the sample preparation operations and the sieving results can be recorded on Figures F-10 and F-11.

F.2.2 Samples From Paved Roads

F.2.2.1 Sample Preparation and Analysis for Total Loading--

The gross sample of paved road dust will arrive at the laboratory in two types of containers: (1) the broom-swept dust will be in plastic bags; and (2) the vacuum-swept dust will be in vacuum bags.

Both the broom-swept dust and the vacuum-swept dust are weighed on a beam balance. The broom-swept dust is weighed in a tared container. The vacuum-swept dust is weighed in the vacuum bag which was tared and equilibrated in the laboratory before going to the field. The vacuum bag and its contents should be equilibrated again in the laboratory before weighing.

The total surface dust loading on the traveled lanes of the paved road is then calculated in units of kilograms of dust on the traveled lanes per kilometer of road. When only one strip is taken across the traveled lanes, the total dust loading on the traveled lanes is calculated as follows:

$$L = \frac{m_b + m_v}{\ell} \qquad \text{(F-1)}$$

where: L = surface dust loading (kg/km)

m_b = mass of the broom-swept dust (kg)

m_v = mass of the vacuum-swept dust (kg)

ℓ = length of strip as measured along the centerline of the road (km)

TABLE F-1. MOISTURE ANALYSIS PROCEDURE

1. Preheat the oven to approximately 110°C (230°F). Record oven temperature.

2. Tare the laboratory sample containers which will be placed in the oven. Tare the containers with the lids on if they have lids. Record the tare weight(s). Check zero before weighing.

3. Record the make, capacity, smallest division, and accuracy of the scale.

4. Weigh the laboratory sample in the container(s). Record the combined weight(s). Check zero before weighing.

5. Place sample in oven and dry overnight.[a]

6. Remove sample container from oven and (a) weigh immediately if uncovered, being careful of the hot container; or (b) place tight-fitting lid on the container and let cool before weighing. Record the combined sample and container weight(s). Check zero before weighing.

7. Calculate the moisture as the initial weight of the sample and container minus the oven-dried weight of the sample and container divided by the initial weight of the sample alone. Record the value.

8. Calculate the sample weight to be used in the silt analysis as the oven-dried weight of the sample and container minus the weight of the container. Record the value.

[a]Dry materials composed of hydrated minerals or organic materials like coal and certain soils for only 1-1/2 h. Because of this short drying time, material dried for only 1-1/2 h must not be more than 2.5 cm (1 in.) deep in the container.

TABLE F-2. SILT ANALYSIS PROCEDURES

1. Select the appropriate 8-in. diameter, 2-in. deep sieve sizes. Recommended U.S. Standard Series sizes are: 3/8 in., No. 4, No. 20, No. 40, No. 100, No. 140, No. 200, and a pan. Comparable Tyler Series sizes can also be utilized. The No. 20 and the No. 200 are mandatory. The others can be varied if the recommended sieves are not available or if buildup on one particulate sieve during sieving indicates that an intermediate sieve should be inserted.

2. Obtain a mechanical sieving device such as vibratory shaker or a Roto-Tap.

3. Clean the sieves with compressed air and/or a soft brush. Material lodged in the sieve openings or adhering to the sides of the sieve should be removed (if possible) without handling the screen roughly.

4. Obtain a scale (capacity of at least 1,600 g) and record make, capacity, smallest division, date of last calibration, and accuracy (if available).

5. Tare sieves and pan. Check the zero before every weighing. Record weights.

6. After nesting the sieves in decreasing order with pan at the bottom, dump dried laboratory sample (probably immediately after moisture analysis) into the top sieve. Brush fine material adhering to the sides of the container into the top sieve and cover the top sieve with a special lid normally purchased with the pan.

7. Place nested sieves into the mechanical device and sieve for 20 min. Remove pan containing minus No. 200 and weigh. Replace pan beneath the sieves and sieve for another 10 min. Remove pan and weigh. When the differences between two successive pan sample weighings (where the tare of the pan has been subtracted) is less than 3.0 percent, the sieving is complete.

8. Weigh each sieve and its contents and record the weight. Check the zero before every weighing.

9. Collect the laboratory sample and place the sample in a separate container if further analysis is expected.

When several incremental samples are collected on alternate roadway halves as shown in Figure F-4, the total surface dust loading is calculated as follows:

$$L = \frac{m_{b1} + m_{v1} + m_{b5} + m_{v5}}{\ell_1 + \ell_5} + \frac{m_{b2} + m_{v2} + m_{b6} + m_{v6}}{\ell_2 + \ell_6} + \frac{m_{b3} + m_{v3} + m_{b7} + m_{v7}}{\ell_3 + \ell_7} + \frac{m_{b4} + m_{v4} + m_{b8} + m_{v8}}{\ell_4 + \ell_8} + \quad \text{(F-2)}$$

where: L = surface dust loading (kg/km)

m_{b_i} = mass of broom sweepings for increment i (kg)

m_{v_i} = mass of vacuum sweepings for increment i (kg)

ℓ = length of increment i is measured along the road centerline (km)

F.2.2.2 Sample Preparation and Analyses for Road Dust Silt Content--

After weighing the sample to calculate total surface dust loading on the traveled lanes, the broom-swept and vacuum-swept dust is composited. The composited sample is usually small and requires no sample splitting in preparation for sieving. If splitting is necessary to prepare a laboratory sample of 800 to 1,600 g, the techniques discussed in Section F.2.1.1 can be used. The laboratory sample is then sieved using the techniques described in Section F.2.1.2.

PREFACE

In 2004 the Western Regional Air Partnership's (WRAP) Dust Emissions Joint Forum (DEJF) selected Countess Environmental to prepare a fugitive dust handbook and an associated website (www.wrapair.org/forums/dejf/fdh) for accessing the information contained in the handbook. The material presented in the original handbook released on November 15, 2004 addressed the estimation of uncontrolled fugitive dust emissions and emission reductions achieved by demonstrated control techniques for eight major fugitive dust source categories. In 2006 WRAP hired Countess Environmental to update the handbook. The updates included revising each chapter in the handbook to reflect the new PM2.5/PM10 ratios developed for WRAP by the Midwest Research Institute (MRI) in 2005, addressing four additional major fugitive dust source categories as well as several minor source categories, and updating the existing chapters.

The material in this handbook focuses on fugitive dust emissions "at the source" and does not evaluate factors related to the transport and impact of emissions on downwind locations where ambient air monitoring occurs. The methods for estimation of dust emissions rely primarily on AP-42 with additional references to alternative methods adopted by state and local control agencies in the WRAP region. With regard to emission factor correction parameters, source extent/activity levels, control efficiencies for demonstrated control techniques, and emission reductions by natural mitigation and add-on control measures, sources of data are identified and default values are provided in tables throughout the handbook. Graphs, charts, and tables are provided throughout the handbook to assist the end user.

The handbook:

(a) compiles technical and policy evaluations for the benefit of WRAP members, stakeholders, and other interested parties when addressing specific air quality issues and when developing regional haze implementation plans;

(b) incorporates available information from both the public (federal, state and local air quality agencies) and private sectors (e.g., reports addressing options to reduce fugitive dust emissions in areas of the country classified as nonattainment for PM10); and

(c) serves as a comprehensive reference resource tool of currently available technical information on emission estimation methodologies and control measures for the following twelve fugitive dust source categories: agricultural tilling, agricultural harvesting, construction and demolition, materials handling, paved roads, unpaved roads, mineral products industry, abrasive blasting, livestock husbandry, and windblown dust emissions from agricultural fields, material storage piles, and exposed open areas.

This handbook is not intended to suggest any preferred method to be used by stakeholders in preparation of SIPs and/or Conformity analyses but rather to outline the most commonly adopted methodologies currently used in the US. The information contained in this handbook has been derived from a variety of sources each with its own accuracy and use limitations. Because many formulae and factors incorporate default values that have been derived for average US conditions, area specific factors should be used whenever they are available. Additionally, the

input terms (commonly referred to as "correction factors") used in any given emission factor equation presented in this handbook were obtained using a specific test methodology and are designed to give an estimate of the emission from a specific activity or source under specific conditions. As a result the emission estimate must be used appropriately in any downstream application such as dispersion modeling of primary PM emissions.

It is important to note that EPA's criteria for exceedances, violations, and model calibration and validation are based on ambient data from the National Ambient Air Monitoring Sites. It should be further noted that estimates of the relative contribution of fugitive dust to ambient PM concentrations based on chemical analysis of exposed filters are usually much lower than that based on emission inventory estimates, in some cases by a factor of 4. Part of this discrepancy between ambient measurements and emission estimates is due to the near source deposition losses of freshly generated fugitive dust emissions. It is not an objective of this handbook to resolve this modeling discrepancy issue. It is the role of modelers to incorporate deposition losses into their dispersion models and to account for the formation of secondary PM, which in many areas of the country are responsible for an overwhelming contribution to exceedances of the federal PM NAAQS.

Applicability to Tribes

The Regional Haze Rule explicitly recognizes the authority of tribes to implement the provisions of the Rule, in accordance with principles of Federal Indian law, and as provided by the Clean Air Act §301(d) and the Tribal Authority Rule (TAR) (40 CFR §§49.1– .11). Those provisions create the following framework:

1. Absent special circumstances, reservation lands are not subject to state jurisdiction.

2. Federally recognized tribes may apply for and receive delegation of federal authority to implement CAA programs, including visibility regulation, or "reasonably severable" elements of such programs (40 CFR §§49.3, 49.7). The mechanism for this delegation is a Tribal Implementation Plan (TIP). A reasonably severable element is one that is not integrally related to program elements that are not included in the plan submittal, and is consistent with applicable statutory and regulatory requirements.

3. The Regional Haze Rule expressly provides that tribal visibility programs are "not dependent on the strategies selected by the state or states in which the tribe is located" (64. Fed. Reg. 35756), and that the authority to implement §309 TIPs extends to all tribes within the GCVTC region (40 CFR §51.309(d)(12).

4. The EPA has indicated that under the TAR tribes are not required to submit §309 TIPs by the end of 2003; rather they may choose to opt-in to §309 programs at a later date (67 Fed. Reg. 30439).

5. Where a tribe does not seek delegation through a TIP, EPA, as necessary and appropriate, will promulgate a Federal Implementation Plan (FIP) within reasonable timeframes to protect air quality in Indian country (40 CFR §49.11). EPA is committed to consulting with tribes on a

government-to-government basis in developing tribe-specific or generally applicable TIPs where necessary (see, e.g., 63 Fed. Reg.7263-64).

It is our hope that the findings and recommendations of this handbook will prove useful to tribes, whether they choose to submit full or partial 308 or 309 TIPs, or work with EPA to develop FIPs. We realize that the amount of modification necessary will vary considerably from tribe to tribe and we have striven to ensure that all references to tribes in the document are consistent with principles of tribal sovereignty and autonomy as reflected in the above framework. Any inconsistency with this framework is strictly inadvertent and not an attempt to impose requirements on tribes which are not present under existing law.

Tribes, along with states and federal agencies, are full partners in the WRAP, having equal representation on the WRAP Board as states. Whether Board members or not, it must be remembered that all tribes are governments, as distinguished from the "stakeholders" (private interest) which participate on Forums and Committees but are not eligible for the Board. Despite this equality of representation on the Board, tribes are very differently situated than states. There are over four hundred federally recognized tribes in the WRAP region, including Alaska. The sheer number of tribes makes full participation impossible. Moreover, many tribes are faced with pressing environmental, economic, and social issues, and do not have the resources to participate in an effort such as the WRAP, however important its goals may be. These factors necessarily limit the level of tribal input into and endorsement of WRAP products.

The tribal participants in the WRAP, including Board members, Forum and Committee members and co-chairs, make their best effort to ensure that WRAP products are in the best interest of the tribes, the environment, and the public. One interest is to ensure that WRAP policies, as implemented by states and tribes, will not constrain the future options of tribes who are not involved in the WRAP. With these considerations and limitations in mind, the tribal participants have joined the state, federal, and private stakeholder interests in approving this handbook as a consensus document.

EXECUTIVE SUMMARY

This fugitive dust handbook addresses the estimation of uncontrolled fugitive dust emissions and emission reductions achieved by demonstrated control techniques for twelve major and several minor fugitive dust source categories. The handbook focuses on fugitive dust emissions "at the source" and does not evaluate factors related to the transport and impact of emissions on downwind locations where ambient air monitoring occurs. The methods for estimating emissions draw (a) from established methods published by the USEPA, specifically AP-42: Compilation of Air Pollutant Emission Factors that are available from the Internet (www.epa.gov/ttn/chief/ap42), and (b) from alternate methods adopted by state and local air control agencies in the WRAP region such as the California Air Resources Board (www.arb.ca.gov/ei/areasrc/areameth.htm), Clark County, Nevada (www.co.clark.nv.us/air_quality), and Maricopa County, Arizona (www.maricopa.gov/envsvc/air). Sources of data are identified and default values for emission factor correction parameters, source extent/activity levels, control efficiencies, and emission reductions by natural mitigation and add-on control measures are provided in tables throughout the handbook.

The handbook has several distinct features that give it a major advantage over the use of AP-42 or other resource documents. The handbook is a comprehensive document that contains all the necessary information to develop control strategies for major sources of fugitive dust. These features include:

(a) extensive documentation of emission estimation methods adopted by both federal and state agencies as well as methods in the "developmental" stage;
(b) detailed discussion of demonstrated control measures;
(c) lists of published control efficiencies for a large number of fugitive dust control measures;
(d) example regulatory formats adopted by state and local agencies in the WRAP region;
(e) compliance tools to assure that the regulations are being followed; and
(f) a detailed methodology for calculating the cost-effectiveness of different fugitive dust control measures, plus sample calculations for control measure cost-effectiveness for each fugitive dust source category.

The handbook and associated website (www.wrapair.org/forums/dejf/fdh) are intended to:

(a) support technical and policy evaluations by WRAP members, stakeholders, and other interested parties when addressing specific air quality issues and when developing regional haze implementation plans;

(b) incorporate available information from both the public and private sectors that address options to reduce fugitive dust emissions in areas of the country classified as nonattainment for PM10; and

(c) provide a comprehensive resource on emission estimation methodologies and control measures for the following twelve fugitive dust source categories: agricultural tilling, agricultural harvesting, construction and demolition, materials handling, paved roads, unpaved roads, minerals products industry, abrasive blasting, livestock husbandry, and windblown dust emissions from agricultural fields, material storage piles, and exposed open areas.

The handbook contains separate, stand-alone chapters for each of the twelve major fugitive dust source categories identified above. Because the chapters are meant to stand alone, there is some redundancy between chapters. Each chapter contains a discussion of characterization of the source emissions, established emissions estimation methodologies, demonstrated control techniques, regulatory formats, compliance tools, a sample control measure cost-effectiveness calculation, and references. A separate chapter addressing several minor fugitive dust source categories and several appendices are also included in the handbook. Appendix A contains a discussion of test methods used to quantify fugitive dust emission rates. Appendix B contains cost information for demonstrated control measures. Appendix C contains a step-wise method to calculate the cost-effectiveness of different fugitive dust control measures. Appendix D contains a brief discussion of fugitive PM10 management plans and record keeping requirements mandated by one of the air quality districts within the WRAP region.

A list of fugitive dust control measures that have been implemented by jurisdictions designated by the USEPA as nonattainment for federal PM10 standards is presented in the table below. The published PM10 control efficiencies for different fugitive dust control measures vary over relatively large ranges as reflected in the table. The user of the handbook is cautioned to review the assumptions included in the original publications (i.e., references identified in each chapter of the handbook) before selecting a specific PM10 control efficiency for a given control measure. It should be noted that Midwest Research Institute (MRI) found no significant differences in the measured control efficiencies for the PM2.5 and PM10 size fractions of unpaved road emissions based on repeated field measurements of uncontrolled and controlled emissions. Thus, without actual published PM2.5 control efficiencies, the user may wish to utilize the published PM10 values for both size fractions.

Many control cost-effectiveness estimates were reviewed in preparation of this handbook. Some of these estimates contain assumptions that are difficult to substantiate and often appear unrealistic. Depending on which assumptions are used, the control cost-effectiveness estimates can vary by one to two orders of magnitude. Thus, rather than presenting existing cost-effectiveness estimates, the handbook presents a detailed methodology to calculate the cost-effectiveness of different fugitive dust control measures. This methodology is presented in Appendix C. The handbook user is advised to calculate the cost-effectiveness values for different fugitive dust control options based on current cost data and caveats that are applicable to the particular situation.

Fugitive Dust Control Measures Applicable for the WRAP Region

Source Category	Control Measure	Published PM10 Control Efficiency
Agricultural Tilling	Reduce tilling during high winds	1 – 5%
	Roughen surface	15 – 64%
	Modify equipment	50%
	Employ sequential cropping	50%
	Increase soil moisture	90%
	Use other conservation management practices	25 - 100%
Agricultural Harvesting	Limited activity during high winds	5 – 70%
	Modify equipment	50%
	Night farming	10%
	New techniques for drying fruit	25 –60%
Construction/Demolition	Water unpaved surfaces	10 – 74%
	Limit on-site vehicle speed to 15 mph	57%
	Apply dust suppressant to unpaved areas	84%
	Prohibit activities during high winds	98%
Materials Handling	Implement wet suppression	50 – 90%
	Erect 3-sided enclosure around storage piles	75%
	Cover storage pile with a tarp during high winds	90%
Paved Roads	Sweep streets	4 – 26%
	Minimize trackout	40 – 80%
	Remove deposits on road ASAP	> 90%
Unpaved Roads	Limit vehicle speed to 25 mph	44%
	Apply water	10 – 74%
	Apply dust suppressant	84%
	Pave the surface	>90%
Mineral Products Industry	Cyclone or muliclone	68 –79%
	Wet scrubber	78 –98%
	Fabric filter	99 – 99.8%
	Electrostatic precipitator	90 – 99.5%
Abrasive Blasting	Water spray	50 – 93%
	Fabric filter	> 95%
Livestock Husbandry	Daily watering of corrals and pens	> 10%
	Add wood chips or mulch to working pens	> 10%
Wind Erosion (agricultural, open area, and storage piles)	Plant trees or shrubs as a windbreak	25%
	Create cross-wind ridges	24 – 93%
	Erect artificial wind barriers	4 – 88%
	Apply dust suppressant or gravel	84%
	Revegetate; apply cover crop	90%
	Water exposed area before high winds	90%

1.9 Document Organization 1-13
1.10 References 1-14

This chapter describes the purpose for the preparation of this fugitive dust handbook; presents a summary of WRAP's fugitive dust definition and dust emissions categorization scheme; provides a brief overview/primer on fugitive dust that includes a summary of factors affecting dust emissions, an overview of emission calculation procedures (including a discussion of emission factors), and a discussion of options for controlling emissions; and summarizes the organizational structure of the handbook.

This handbook does not address particulate emissions from wildfires or prescribed fires that are discussed in Section 13.1 of EPA's Compilation of Air Pollutant Emission Factors (AP-42). For more information on particulate emissions from fires, the reader is directed to the WRAP's Fire Emissions Joint Forum at www.wrapair.org/forums/fejf.

1.1 Background

Most of the more than 70 areas of the United States that have been unable to attain the national ambient-air quality standards (NAAQS) for PM10 (particles smaller than 10 μm in aerodynamic diameter) are in western states with significant emission contributions from fugitive dust sources. Fugitive dust sources may be separated into two broad categories: process sources and open dust sources. Process sources of fugitive emissions are those associated with industrial operations such as rock crushing that alter the characteristics of a feed material. Open dust sources are those that generate non-ducted emissions of solid particles by the forces of wind or machinery acting on exposed material. Open dust sources include industrial sources of particulate emissions associated with the open transport, storage, and transfer of raw, intermediate, and waste aggregate materials, and nonindustrial sources such as unpaved roads and parking lots, paved streets and highways, heavy construction activities, and agricultural tilling.

On a nationwide basis, fugitive dust consists mostly of soil and other crustal materials. However, fugitive dust may also be emitted from powdered or aggregate materials that have been placed in open storage piles or deposited on the ground or roadway surfaces by spillage or vehicle trackout. Dust emissions from paved roadways contain tire and break wear particles in addition to resuspended road surface dust composed mostly of crustal geological material.

Generic categories of open dust sources include:

Agricultural Tilling and Harvesting
Construction and Demolition (Buildings, Roads)
Materials Handling
Paved Travel Surfaces
Unpaved Travel Surfaces
Minerals Products Industry (Metallic Ores, Non-metallic Ores, Coal)
Abrasive Blasting
Livestock Husbandry (Dairies, Cattle Feedlots)
Wind Erosion of Exposed Areas (Agricultural Fields, Open Areas, Storage Piles)

1.2 Purpose of the Handbook

In early 2004 the Western Regional Air Partnership's (WRAP) Dust Emissions Joint Forum (DEJF) selected the Countess Environmental project team composed of senior scientists/consultants from Countess Environmental and Midwest Research Institute to prepare a fugitive dust handbook and a website (www.wrapair.org/forums/dejf/fdh) for accessing the information contained in the handbook. The handbook and website are intended to:

(a) be used for technical and policy evaluations by WRAP members, stakeholders, and other interested parties when addressing specific air quality issues and when developing regional haze implementation plans;
(b) incorporate available information from both the public and private sectors that address options to reduce fugitive dust emissions in areas of the country classified as nonattainment for PM10; and
(c) serve as a comprehensive reference resource tool that will provide technical information on emission estimation methodologies and control measures for all of the major and several minor fugitive dust source categories.

The material presented in the original handbook released on November 15, 2004 addressed the estimation of uncontrolled fugitive dust emissions and emission reductions achieved by demonstrated control techniques for eight major fugitive dust source categories. In 2006 WRAP hired Countess Environmental to update the handbook. The updates included revising each chapter in the handbook to reflect the new PM2.5/PM10 ratios developed for WRAP by the Midwest Research Institute (MRI) in 2005, addressing four additional major fugitive dust source categories as well as several minor source categories, and updating the existing chapters.

1.3 Dust Definition and Categorization Scheme

The WRAP Dust Emissions Joint Forum (DEJF) adopted a definition of dust and fugitive dust on October 21, 2004 that included developing criteria for separating anthropogenic dust from dust of natural origin.[1] Dust was defined as particulate matter which is or can be suspended into the atmosphere as a result of mechanical, explosive, or windblown suspension of geologic, organic, synthetic, or dissolved solids, and does not include non-geologic particulate matter emitted directly by internal and external combustion processes. Fugitive dust was defined as dust that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening. The purpose of these definitions is to provide consistency when using the terms dust, fugitive dust, anthropogenic dust, and natural dust in the context of the federal regional haze rule. The distinction between anthropogenic dust and natural dust is made to: (a) clarify how the WRAP defines dust, its sources, and causes; (b) provide an operational definition for use in receptor- and emissions-based source apportionment techniques; and (c) identify and prioritize sources of dust which are most appropriate to control for purposes of improving visibility in Class I areas.

Natural and anthropogenic dust will often be indistinguishable and may occur simultaneously. For example, natural, barren areas will emit some dust during high wind events, but will emit more when the surface is disturbed by human activities. Hence, the dust from a disturbed, naturally barren area on a given day could be part natural and part anthropogenic. Any mitigation of dust for regional haze control would likely be focused on those anthropogenic sources which are most likely to contribute to visibility impairment in Class I areas and which are technically feasible and cost-effective to control. Sources that are already controlled or partially controlled may be technically infeasible or not cost-effective to control further. According to the WRAP's definition of dust, anthropogenic emissions do not include any emissions that would occur if the surface were not disturbed or altered beyond a natural range. Such emissions should be subtracted, if practicable, from the total dust emissions to determine the precise anthropogenic emission quantity.

Examples of anthropogenic and natural dust categories in accordance with the WRAP's dust definition are provided in Tables 1-1 and 1-2. All mechanically suspended dust from human activities is classified as anthropogenic emissions, and windblown dust from lands not disturbed or altered by humans beyond a natural range is classified as natural emissions. For emissions from other sources, the emissions may be categorized as either anthropogenic or natural, depending on whether the mechanically-suspended emissions are due to indigenous or non-indigenous animals, and whether the windblown emissions are from surfaces disturbed by humans beyond a natural range or from surfaces which have not been disturbed by humans beyond a natural range.

Table 1-1. WRAP Fugitive Dust Categorization Scheme for Mechanically Generated Dust

Anthropogenic Dust	Natural Dust
Mechanically- and explosively-suspended solids and dissolved solids from activities including but not limited to: • Agriculture • Construction, mining, and demolition • Material handling, processing, and transport • Vehicular movement on paved and unpaved surfaces • Animal movement on surfaces which have been disturbed or altered by humans beyond a natural range • Animal movement on undisturbed or unaltered surfaces by a number of animals which is greater than native populations • Cooling towers	• Movement of a number of indigenous animals on surfaces which have not been disturbed or altered by humans beyond a natural range • Natural landslides, rockslides, and avalanches • Solids and dissolved solids emitted by volcanoes, geysers, waterfalls, rapids, and other types of splashing • Extraterrestrial material and impacts

Table 1-2. WRAP Fugitive Dust Categorization Scheme for Windblown Dust

Anthropogenic Dust	Natural Dust
Solids and dissolved solids entrained by wind passing over surfaces that have been disturbed or altered by humans beyond a natural range. Such surfaces may include, but are not limited to: • Undeveloped lands • Construction and mining sites • Material storage piles, landfills, and vacant lots • Agricultural crop, range, and forest lands • Roadways and parking lots • Artificially-exposed beds of natural lakes and rivers • Exposed beds of artificial water bodies • Areas burned by anthropogenic fires (as defined by the WRAP Policy for Categorizing Fire Emissions) which have yet to be revegetated or stabilized	Solids and dissolved solids entrained by wind passing over surfaces that have not been disturbed or altered by humans beyond a natural range. Such surfaces may include, but are not limited to: • Naturally-dry river and lake beds • Barren lands, sand dunes, and exposed rock • Natural water bodies (e.g., sea spray) • Non-agricultural grass, range, and forest lands • Areas burned by natural fires (as defined by the WRAP Policy for Categorizing Fire Emissions) which have yet to be revegetated or stabilized
Wind-blown particulate matter from sources created by natural events over 12 months ago, similar to EPA's natural events policy	

The WRAP's original dust characterization scheme broke down fugitive dust emissions into five categories ranging from 100% anthropogenic emissions (i.e., all mechanically-suspended dust from human activities except animal movement) to 100% natural emissions (i.e., windblown dust from lands not disturbed or altered by humans beyond a natural range), with three categories between these two extremes representing a mixture of anthropogenic and natural emissions. Environ developed an alternative dust characterization scheme for WRAP in 2005 that broke down fugitive dust emissions into three categories based on activity rather than a description of spatial location since very different dust sources may spatially co-exist at the same site.[2] Environ's three categories are:

Category 1: Purely anthropogenic sources (e.g., construction, mining, wind erosion and vehicle traffic on paved and unpaved roads, agricultural tilling and harvesting, wind erosion of agricultural fields, particle emissions from cooling towers).

Category 2: Purely natural sources (e.g., volcanic ash emissions, wind erosion of unstable soil following landslides, mineral particle emissions from wave action/sea spray).

Category 3: Natural sources that may be anthropogenically influenced (e.g., wind erosion and mechanical suspension of soil due to animal movement [both native and non-native], wind erosion of bare areas on natural lands [undisturbed versus previously disturbed], wind erosion of sediment from dried ephemeral water bodies [natural or anthropogenic]).

1.4 Factors Affecting Dust Emissions

1.3.1 Mechanically Generated Dust

Mechanically generated emissions from open dust sources exhibit a high degree of variability from one site to another, and emissions at any one site tend to fluctuate widely. The site characteristics that cause these variations may be grouped into (a) properties of the exposed surface material from which the dust originates, and (b) measures of energy expended by machinery interacting with the surface. These site characteristics are discussed below.

Surface Material Texture and Moisture. The dry-particle size distribution of the exposed soil or surface material determines its susceptibility to mechanical entrainment. The upper size limit for particles that can become suspended has been estimated at ~ 75 μm in aerodynamic diameter.[3] Conveniently, 75 μm in physical diameter is also the smallest particle size for which size analysis by dry sieving is practical.[4] Particles passing a 200-mesh screen on dry sieving are termed "silt". Note that for fugitive dust particles, the physical diameter and aerodynamic diameter are roughly equivalent because of the offsetting effects of higher density and irregular shape. Dust emissions are known to be strongly dependent on the moisture level of the mechanically disturbed material.[3] Water acts as a dust suppressant by forming cohesive moisture films among the discrete grains of surface material. In turn, the moisture level depends on the moisture added by natural precipitation, the moisture removed by evaporation, and moisture movement beneath the surface. The evaporation rate depends on the degree of air movement over the surface, material texture and mineralogy, and the degree of compaction or crusting. The moisture-holding capacity of the air is also important, and it correlates strongly with the surface temperature. Vehicle traffic intensifies the drying process primarily by increasing air movement over the surface.

Mechanical Equipment Characteristics. In addition to the material properties discussed above, it is clear that the physical and mechanical characteristics of materials handling and transport equipment also affect dust emission levels. For example, visual observation suggests (and field studies have confirmed) that vehicle emissions per unit of unpaved road length increase with increasing vehicle speed.[3] For traffic on unpaved roads, studies have also shown positive correlations between emissions and (a) vehicle weight and (b) number of wheels per vehicle.[5] Similarly, dust emissions from materials-handling operations have been found to increase with increasing wind speed and drop distance.

1.3.2 Wind Generated Dust

Wind-generated emissions from open dust sources also exhibit a high degree of variability from one site to another, and emissions at any one site tend to fluctuate widely. The site characteristics that cause these variations may be grouped into (a) properties of the exposed surface material from which the dust originates, and

(b) measures of energy expended by wind interacting with the erodible surface. These site characteristics are discussed below.

Surface Material Texture and Moisture. As in the case of mechanical entrainment, the dry-particle size distribution of the exposed soil or surface material determines its susceptibility to wind erosion. Wind forces move soil particles by three transport modes: saltation, surface creep, and suspension. Saltation describes particles, ranging in diameter from about 75 to 500 μm, that are readily lifted from the surface and jump or bounce within a layer close to the air-surface interface. Particles transported by surface creep range in diameter from about 500 to 1,000 μm. These large particles move very close to the ground, propelled by wind stress and by the impact of small particles transported by saltation. Particles smaller than about 75 μm in diameter move by suspension and tend to follow air currents. As stated above, the upper size limit of silt particles (75 μm in physical diameter) is roughly the smallest particle size for which size analysis by dry sieving is practical. The threshold wind speed for the onset of saltation, which drives the wind erosion process, is also dependent on soil texture, with 100-150 μm particles having the lowest threshold speed. Saltation provides energy for the release of particles in the PM10 size range that typically are bound by surface forces to larger clusters. Dust emissions from wind erosion are known to be strongly dependent on the moisture level of the erodible material.[6] The mechanism of moisture mitigation is the same as that described above for mechanical entrainment.

Nonerodible Elements. Nonerodible elements, such as clumps of grass or stones (larger than about 1 cm in diameter) on the surface, consume part of the shear stress of the wind which otherwise would be transferred to erodible soil. Surfaces impregnated with a large density of nonerodible elements behave as having a "limited reservoir" of erodible particles, even if the material protected by nonerodible elements is itself highly erodible. Wind-generated emissions from such surfaces decay sharply with time, as the particle reservoir is depleted. Surfaces covered by unbroken grass are virtually nonerodible.

Crust Formation. Following the wetting of a soil or other surface material, fine particles will move to form a surface crust. The surface crust acts to hold in soil moisture and resist erosion. The degree of protection that is afforded by a soil crust to the underlying soil may be measured by the modulus of rupture (roughly a measure of the hardness of the crust) and thickness of the crust.[7] Exposed soil that lacks a surface crust (e.g., a disturbed soil or a very sandy soil) is much more susceptible to wind erosion.

Frequency of Mechanical Disturbance. Emissions generated by wind erosion are also dependent on the frequency of disturbance of the erodible surface. A disturbance is defined as an action that results in the exposure of fresh surface material. This would occur whenever a layer of aggregate material is either added to or removed from the surface. The disturbance of an exposed area may also result from the turning of surface material to a depth exceeding the size of the largest material present. Each time that a surface is disturbed, its erosion potential is increased by destroying the mitigative effects of crusts, vegetation, and friable nonerodible elements, and by exposing new surface fines.

Wind Speed. Under high wind conditions that trigger wind erosion by exceeding the threshold velocity, the wind speed profile near the erodible surface is found to follow a logarithmic distribution:[6]

$$u(z) = \frac{u^*}{0.4} \ln \frac{z}{z_0} \quad (z > z_0) \qquad (1)$$

where: u = wind speed (cm/s)
u^* = friction velocity (cm/s)
z = height above test surface (cm)
z_0 = roughness height (cm)
0.4 = von Karman's constant (dimensionless)

The friction velocity *(u^*)* is a measure of wind shear stress on the erodible surface, as determined from the slope of the logarithmic velocity profile. The roughness height (z_0) is a measure of the roughness of the exposed surface as determined from the y-intercept of the velocity profile (i.e., the height at which the wind speed is zero) on a logarithmic-linear graph. Agricultural scientists have established that total soil loss by continuous wind erosion of highly erodible fields is dependent roughly on the cube of wind speed above the threshold velocity.[6] More recent work has shown that the loss of particles in suspension mode follows a similar dependence. Soils protected by nonerodible elements or crusts exhibit a weaker dependence of suspended particulate emissions on wind speed.[9]

Wind Gusts. Although mean atmospheric wind speeds may not be sufficient to initiate wind erosion from a particular "limited-reservoir" surface, wind gusts may quickly deplete a substantial portion of its erosion potential. In addition, because the erosion potential (mass of particles constituting the "limited reservoir") increases with increasing wind speed above the threshold velocity, estimated emissions should be related to the gusts of highest magnitude. The current meteorological variable which appropriately reflects the magnitude of wind gusts is the fastest 2-minute wind speed from the "First Order Summary of the Day," published by the U.S. Weather Service for first order meteorological stations.[10] The quantity represents the wind speed corresponding to the largest linear passage of wind movement during a 2-minute period. Two minutes is approximately the same duration as the half-life of the erosion process (i.e., the time required to remove one-half the erodible particles on the surface). It should be noted that instantaneous peak wind speeds can significantly exceed the fastest 2-minute wind speed. Because the threshold wind speed must be exceeded to trigger the possibility of substantial wind erosion, the dependence of erosion potential on wind speed cannot be represented by any simple linear function. For this reason, the use of an average wind speed to calculate an average emission rate is inappropriate.

Wind Accessibility. If the erodible material lies on an exposed area with little penetration into the surface wind layer, then the material is uniformly accessible to the wind. If this is not the case, it is necessary to divide the erodible area into subareas representing different degrees of exposure to wind. For example, the results of physical modeling show that the frontal face of an elevated materials storage pile is exposed to

surface wind speeds of the same order as the approach wind speed upwind of the pile at a height matching the top of the pile;[11] on the other hand, the leeward face of the pile is exposed to much lower wind speeds.

1.5 Use of Satellite Imagery to Inventory Erodible Vacant Land

Windblown dust from arid soils in the West contributes to exceedances of national air quality standards for inhalable particulate matter. This problem is intensifying because of increasing land disturbance associated with rapid population growth in areas such as the Las Vegas Valley. The rates of fine particle emissions from open areas are strongly dependent on the type and frequency of land disturbance that destroys the mitigative stabilization effects of natural crusting and vegetation. Satellite imagery has been shown to be a useful tool in tracking land disturbances (source activity levels) and the resultant degree of soil vulnerability to high wind events. This method has recently been used to develop an inventory of native desert, disturbed vacant land, stabilized vacant land and private unpaved roads in the Las Vegas Valley.[12] Wind tunnel studies have shown that each of these land categories have distinctly different potentials for wind-generated dust emissions. For example, native desert is essentially non-erodible because of the high stability of the undisturbed soil surface. Conversely, disturbed vacant land such as active grading areas at construction sites has the highest erodibility among the inventoried land categories.

In this study funded by Clark County, Nevada, multi-spectral satellite imagery was used to inventory vacant land and private unpaved roads throughout the Las Vegas Valley. Landsat TM imagery was found to be appropriate for classifying surface areas as a measure of activity level. Although Landsat TM imagery has much lower spatial resolution (30 meter pixel size) than commercial satellite imagery (10 times smaller pixel size), it has higher spectral resolution (an additional two IR wavelength bands) and costs only about 1 percent of the cost of commercial satellite imagery. In the surface classification process, it was found useful to define additional land categories that could be profiled with the satellite imagery, as follows: barren/shadow (areas with steep slopes); concrete; urban vegetation (golf courses and irrigated parks); natural drainage (rocky surfaces); and urban structures (rooftops, asphalt surfaces, etc.). Ground-truthing test sites were used to develop and verify the applicability of distinctive multi-spectral reflectance patterns for each land category. A classification error matrix showed that the method has an 89 percent reliability for this application. This method can be applied at regular intervals to track the effect of land development on emissions from open areas.

1.6 Emission Calculation Procedure

A calculation of the estimated emission rate for a given source requires data on source extent, uncontrolled emission factor, and control efficiency. The mathematical expression for this calculation is given as follows:

$$R = SE\, e\, (1 - c) \qquad (2)$$

where: R = estimated mass emission rate in the specified particle size range
SE = source extent
e = uncontrolled emission factor in the specified particle size range (i.e., mass of uncontrolled emissions per unit of source extent)
c = fractional efficiency of control

The source extent (activity level) is the appropriate measure of source size or the level of activity that is used to scale the uncontrolled emission factor to the particular source in question. For process sources of fugitive particulate emissions, the source extent is usually the production rate (i.e., the mass of product per unit time). Similarly, the source extent of an open dust source entailing a batch or continuous drop operation is the rate of mass throughput. For other categories of open dust sources, the source extent is related to the area of the exposed surface that is disturbed by either wind or mechanical forces. In the case of wind erosion, the source extent is simply the area of erodible surface. For emissions generated by mechanical disturbance, the source extent is also the surface area (or volume) of the material from which the emissions emanate. For vehicle travel, the disturbed surface area is the travel length times the average daily traffic (ADT) count, with each vehicle having a disturbance width equal to the width of a travel lane.

If an anthropogenic control measure (e.g., treating the surface with a chemical binder which forms an artificial crust) is applied to the source, the uncontrolled emission factor in Equation 2 must be multiplied by an additional term to reflect the resulting fractional control. In broad terms, anthropogenic control measures can be considered as either continuous or periodic, as the following examples illustrate:

Continuous controls	Periodic controls
Wet suppression at conveyor transfer points	Watering or chemical treatment of unpaved roads
Enclosures/wind fences around storage piles	Sweeping of paved travel surfaces
Continuous vegetation of exposed areas	Chemical stabilization of exposed areas

The major difference between the two types of controls is related to the time dependency of performance. For continuous controls, the efficiency of the control measure is essentially constant with respect to time. On the other hand, the efficiency associated with periodic controls tends to decrease (decay) with time after application until the next application, at which time the cycle repeats but often with some residual effects from the previous application.

In order to quantify the performance of a specific periodic control, two measures of control efficiency are required. The first is "instantaneous" control efficiency and is defined by:

$$c(t) = \left(1 - \frac{e_c(t)}{e_u}\right) \times 100 \qquad (3)$$

where: $c(t)$ = instantaneous control efficiency (percent)
$e_c(t)$ = instantaneous emission factor for the controlled source
e_u = uncontrolled emission factor
t = time after control application

The other important measure of periodic control performance is average efficiency, defined as:

$$C(T) = \frac{1}{T}\int_0^T c(t)dt \qquad (4)$$

where: $c(t)$ = instantaneous control efficiency at time t after application (percent)
T = time period over which the average control efficiency is referenced

The average control efficiency is needed to estimate the emission reductions due to periodic applications.

1.7 Emission Factors

Early in the USEPA field testing program to develop emission factors for fugitive dust sources, it became evident that uncontrolled emissions within a single generic source category may vary over two or more orders of magnitude as a result of variations in source conditions (equipment characteristics, material properties, and climatic parameters). Therefore, it would not be feasible to represent an entire generic source category in terms of a single-valued emission factor, as traditionally used by the USEPA to describe average emissions from a narrowly defined ducted source operation. In other words, it would take a large matrix of single-valued factors to adequately represent an entire generic fugitive dust source category. In order to account for emissions variability, therefore, the approach was taken that fugitive dust emission factors be constructed as mathematical equations for sources grouped by the dust generation mechanisms. The emission factor equation for each source category would contain multiplicative correction parameter terms that explain much of the variance in observed emission factor values on the basis of variances in specific source parameters. Such factors would be applicable to a wide range of source conditions, limited only by the extent of experimental verification. For example, the use of the silt content as a measure of the dust generation potential of a material acted on by the forces of wind or machinery proved to be an important step in extending the applicability of the emission factor equations to a wide variety of aggregate materials of industrial importance.

A compendium of predictive emission factor equations for fugitive dust sources is maintained on a CD-ROM by the U.S. EPA.[13] These emission factor equations are also published in Volume I of the U.S. EPA's Compilation of Air Pollutant Emission Factors commonly referred to as AP-42.[14] A set of particle size multipliers for adjusting the calculated emission factors to specific particle size fractions is provided with each equation. The ratios of PM2.5 to PM10 for fugitive dust sources published in Section 13 of AP-42 typically range from 0.10 to 0.20.

Example: Vehicle Traffic on Unpaved Roads. For the purpose of estimating uncontrolled emissions, the U.S. EPA emission factor equation applicable to vehicle traffic on publicly accessible unpaved roads takes source characteristics into consideration:

$$E = [1.8\ (s/12)^{1.8}\ (S/30)^{0.5} / (M/0.5)^{0.2}] - C \qquad (5)$$

where: E = PM10 emission factor (lb/VMT)
s = surface material silt content (%)
S = mean vehicle speed (mph)
M = surface material moisture content (%)
C = emission factor for 1980's vehicle fleet exhaust, plus break/tire wear

The denominators in each of the multiplicative terms of the equation constitute normalizing default values, in case no site-specific correction parameter data are available. The default moisture content represents dry (worst-case) road conditions. Extrapolation to annual average uncontrolled emission estimates (including natural mitigation) is accomplished by assuming that emissions are occurring at the estimated rate on days without measurable precipitation and, conversely, are absent on days with measurable precipitation.

1.8 Emission Control Options

Typically, there are several options for the control of fugitive particulate emissions from any given source. This is clear from Equation 2 used to calculate the emission rate. Because the uncontrolled emission rate is the product of the source extent and the uncontrolled emission factor, a reduction in either of these two variables produces a proportional reduction in the uncontrolled emission rate. In the case of open sources, the reduction in the uncontrolled emission factor may be achieved by adjusted "work practices". The degree of the reduction of the uncontrolled emission factor can be estimated from the known dependence of the factor on source conditions that are subject to alteration. For open dust sources, this information is embodied in the predictive emission factor equations for fugitive dust sources as presented in Section 13 of AP-42. The reduction of source extent and the incorporation of adjusted work practices that reduce the amount of exposed dust-producing material are preventive measures for the control of fugitive dust emissions.

Add-on controls can also be applied to reduce emissions by reducing the amount (areal extent) of dust-producing material, other than by cleanup operations. For example, the elimination of mud/dirt carryout onto paved roads at construction and demolition sites is a cost-effective preventive measure. On the other hand, mitigative measures involve the periodic removal of dust-producing material. Examples of mitigative measures include: cleanup of spillage on travel surfaces (paved and unpaved) and cleanup of material spillage at conveyor transfer points. Mitigative measures tend to be less favorable from a cost-effectiveness standpoint.

Periodically applied control techniques for open dust sources begin to decay in efficiency almost immediately after implementation. The most extreme example of this is the watering of unpaved roads, where the efficiency decays from nearly 100% to 0% in a matter of hours. On the other hand, the effects of chemical dust suppressants applied to unpaved roads may last for several months. Consequently, to describe the performance of most intermittent control techniques for open dust sources, the "time-weighted average" control efficiency must be reported along with the time period over which the value applies. For continuous control systems (e.g., wet suppression for continuous drop materials transfer), a single control efficiency is usually appropriate.

Table 1-3 lists fugitive dust control measures that have been judged to be generally cost-effective for application to metropolitan areas unable to meet PM10 standards. The most highly developed performance models available apply to application of chemical suppressants on unpaved roads. These models relate the expected instantaneous control efficiency to the application parameters (application intensity and dilution ratio) and to the number of vehicle passes (rather than time) following the application. More details on available dust control measure performance and cost are presented in two MRI documents.[15, 16]

Table 1-3. Controls for Fugitive Dust Sources

Source category	Control action
Agricultural Tilling and Harvesting, Livestock Husbandry	Conservation management practices
Construction/Demolition	Paving permanent roads early in project Covering haul trucks Access apron construction and cleaning Watering of graveled travel surfaces
Abrasive Blasting, Materials Handling, Mineral Products Industry	Wet suppression
Paved Roads	Water flushing/sweeping Improvements in sanding/salting applications and materials Covering haul trucks Prevention of trackout Curb installation Shoulder stabilization
Unpaved Roads	Paving Chemical stabilization Surface improvement (e.g., gravel) Vehicle speed reduction
Wind Erosion (agricultural, open area, and storage pile)	Revegetation Limitation of off-road vehicle traffic

1.9 Document Organization

The handbook contains separate, stand-alone chapters for each fugitive dust source category with chapters arranged in the following order:

Chapter 2: Agricultural Tilling
Chapter 3: Construction and Demolition
Chapter 4: Materials Handling
Chapter 5: Paved Roads
Chapter 6: Unpaved Roads
Chapter 7: Agricultural Wind Erosion
Chapter 8: Open Area Wind Erosion
Chapter 9: Storage Pile Wind Erosion
Chapter 10: Agricultural Harvesting
Chapter 11: Mineral Products Industry
Chapter 12: Abrasive Blasting
Chapter 13: Livestock Husbandry
Chapter 14: Miscellaneous Minor Fugitive Dust Sources

Each chapter contains the following subsections:

(a) Characterization of Source Emissions
(b) Emissions Estimation: Primary Methodology (generally from AP-42)
(c) Emissions Estimation: Alternate Methodology (if available; e.g., CARB)
(d) Demonstrated Control Techniques
(e) Regulatory Formats
(f) Compliance Tools
(g) Sample Cost-Effectiveness Calculation
(h) References

A glossary and a series of Appendices are included in the handbook. Appendix A contains a discussion of two basic test methods used to quantify fugitive dust emission rates, namely:

(a) The upwind-downwind method that involves the measurement of upwind and downwind particulate concentrations, utilizing ground-based samplers under known meteorological conditions, followed by a calculation of the source strength (mass emission rate) with atmospheric dispersion equations; and
(b) The exposure-profiling method that involves simultaneous, multipoint measurements of particulate concentration and wind speed over the effective cross section of the plume, followed by a calculation of the net particulate mass flux through integration of the plume profiles.

Appendix B contains cost information for demonstrated control measures. Appendix C contains a step-wise methodology to calculate the cost-effectiveness of different fugitive dust control measures. Appendix D contains a brief discussion of fugitive PM10 management plans and record keeping requirements mandated by one of the air quality districts within the WRAP region.

In compiling information regarding control cost-effectiveness estimates (i.e., $ per ton of PM10 reduction) of different control options for the fugitive dust handbook, we discovered that many of the estimates provided in contractor reports prepared for air quality agencies for PM10 SIPs contain either hard to substantiate assumptions or unrealistic assumptions. Depending on what assumptions are used, the control cost-effectiveness estimates can range over one to two orders of magnitude. Consequently, the end user of the handbook would get a distorted view if we published these estimates. Rather than presenting these published cost-effectiveness estimates, we have prepared a detailed methodology containing the steps to calculate cost-effectiveness that is included in Appendix C. We recommend that the handbook user calculate the cost-effectiveness values for different fugitive dust control options based on current cost data and assumptions that are applicable for their particular situation.

2.1 Characterization of Source Emissions

The agricultural tilling source category includes estimates of the airborne soil particulate emissions produced during the preparation of agricultural lands for planting and after harvest activities. Operations included in this methodology are discing, shaping, chiseling, leveling, and other mechanical operations used to prepare the soil. Dust emissions are produced by the mechanical disturbance of the soil by the implement used and the tractor pulling it. Soil preparation activities tend to be performed in the early spring and fall months. Particulate emissions from land preparation are computed by multiplying a crop specific emission factor by an activity factor. The crop specific emission factors are calculated using operation specific (i.e., discing or chiseling) emission factors which are combined with the number of operations provided in the crop calendars. The activity factor is based on the harvested acreage of each crop for each county in the state. In addition, acre-passes are computed, which are the number of passes per acre that are typically needed to prepare a field for planting a particular crop. The particulate dust emissions produced by agricultural land preparation operations are estimated by combining the crop acreage and the operation specific emission factor.

The current version of AP-42 (i.e., the 5th edition) does not address agricultural tilling even though an earlier edition (i.e., the 4th edition) included a PM10 emission factor equation for this fugitive dust source category expressed as follows:

$$EF = 1.01\ s^{0.6}$$

where, EF is the PM10 emission factor (lb/acre-pass) and s is the silt content of surface soil (%). Thus, the methodology adopted by the California Air Resources Board (CARB) is presented below as the primary emissions estimation methodology in lieu of an official EPA methodology for this fugitive dust source category.

2.2 Emission Estimation: Primary Methodology[1-5]

This section was adapted from Section 7.4 of CARB's Emission Inventory Methodology. Section 7.4 was last updated in January 2003.

The particulate dust emissions from agricultural land preparation are estimated for each crop in each county using the following equation.

$$Emissions_{crop} = Emission\ Factor_{crop} \times Acres_{crop}$$

Then the crop emissions for each county are summed to produce the county and statewide PM10 and PM2.5 emission estimates. The remainder of this section discusses each component of the above equation.

Acres. The acreage data used for estimating land preparation emissions are based on the state summary of crop acreage harvested. The acreage data are subdivided by county and crop type for the entire state, and are compiled from individual county agricultural commissioner reports.

Crop Calendars and Acre-Passes. Acre-passes (the total number of passes typically performed to prepare land for planting during a year) are used in computing crop specific emission factors for land preparation. These land preparation operations may occur following harvest or closer to planting, and can include discing, tilling, land leveling, and other operations. Each crop is different in the type of soil operations performed and when they occur. For the crops that are not explicitly updated, an updated crop profile from a similar crop can be used. For updating acre-pass data, it is also useful to collect specific information on when agricultural operations occur. Using these data, it is possible to create detailed temporal profiles that help to indicate when PM emissions from land preparations may be highest.

Emission Factor. The operation specific PM10 emission factors used to estimate the crop specific emission factor for agricultural land preparations were initially extracted from a University of California Davis report.[4] After discussions with regulators, researchers, and industry representatives, the emission factors were adjusted based on a combination of scientific applicability, general experience, and observations. Five emission factors were developed by UC Davis using 1995 to 1998 test data measured in cotton and wheat fields in California. The operations tested included root cutting, discing, ripping and subsoiling, land planing and floating, and weeding, which produced emission factors that are summarized in Table 2-1 below. CARB has recently proposed adopting a PM2.5/PM10 ratio for fugitive dust from agricultural tilling and related land preparation activities of 0.15 based on the analysis conducted by MRI on behalf of WRAP.[5, 6]

Table 2-1. Land Preparation Emission Factors

Land preparation operations	Emission factor (lbs PM10/acre-pass)
Root cutting	0.3
Discing, Tilling, Chiseling	1.2
Ripping, Subsoiling	4.6
Land Planing & Floating	12.5
Weeding	0.8

There are more than thirty different land preparation operations commonly used. With five emission factors available, the other operations can be assigned "best-fit" factors based on similar potential emission levels. The assignment of emission factors for operations are based on the expertise and experience of regulators, researchers, and industry representatives. For each crop, the emission factor is the sum of the acre-pass weighted emission factors for each land preparation operation.

Assumptions and Limitations. The CARB methodology is subject to the following assumptions and limitations:

1. The land preparation emission factors for discing, tilling, etc., are assumed to produce the same level of emissions, regardless of the crop type.
2. The land preparation emission factors do not change geographically for counties.

3. A limited number of emission factors are assigned to all land preparation activities.
4. Crop calendar data collected for test area (i.e., San Joaquin) crops and practices were extrapolated to the same crops in the remainder of the state. Existing crop profiles were used for the small percentage of crops in which update information was not collected.
5. In addition to the activities provided in the crop calendars, it is also assumed that field and row crop acreage receive a land-planing pass once every five years.

Temporal Activity. Temporal activity for agricultural tilling (and other land preparation activities) is derived by summing, for each county, the monthly emissions from all crops. For each crop, the monthly emissions are calculated based on its monthly crop calendar profile, which reflects the percentage of activities that occurs in that month. An example of the monthly activity profile for almonds, cotton, and wine grapes is shown below in Table 2-2. Because the mix of crops varies by county, composite temporal profiles combining all of the other county crops vary by county. An example of a composite land preparation profile by month for Fresno County, showing the combined temporal profile for all of the land preparation activities in the county, is shown in Table 2-3.

Table 2-2. Monthly Activity Profile of Selected Crops

Crops	JAN	FEB	MAR	APR	MAY	JUN	JULY	AUG	SEP	OCT	NOV	DEC
Almonds	0	0	0	0	0	0	0	0	0	0	50	50
Cotton	0	9	9	0	0	0	0	0	0	0	41	41
Grapes-wine	0	0	0	4	16	16	12	12	12	28	0	0

Table 2-3. County Land Preparation Profile Composite

County	JAN	FEB	MAR	APR	MAY	JUN	JULY	AUG	SEP	OCT	NOV	DEC
Fresno	3	6	6	2	2	1	3	4	2	12	30	29

2.3 Demonstrated Control Techniques

The emission potential of agricultural land preparation operations, including soil tilling, is affected by the soil management and cropping systems that are in place. Table 2-4 presents a summary of demonstrated control measures and the associated PM10 control efficiencies. It is readily observed that reported control efficiencies for many of the control measures are highly variable. This may reflect differences in the operations as well as the test methods used to determine control efficiencies. A list of control measures for agricultural tilling operations is available from the California Air Pollution Control Officers' Association's (CAPCOA) agricultural clearinghouse website (http://capcoa.org/ag_clearinghouse.htm). The list of control measures for land preparation activities for field and orchard crops include: ceasing activities under very windy conditions, combining operations to reduce the number of passes, application of chemicals through an irrigation system, fallowing land, use cover crops and/or mulch/crop residue to reduce wind erosion of soil, operating at night when moisture levels are higher and winds tend to be lighter, precision farming with a GPS system to

reduce overlap of passes, roughening the soil or establishing ridges perpendicular to the prevailing wind direction, and using wind barriers.

Table 2-4. Control Efficiencies for Control Measures for Agricultural Tilling[7-11]

Control measure	PM10 control efficiency	References/Comments
Equipment modification	50%	MRI, 1981. Control efficiency is for electrostatically charged fine-mist water spray.
Limited activity during a high-wind event	1 - 5%	SCAQMD, 1997. Control efficiency assumes no tilling when wind speed exceeds 25 mph.
Reduced tillage system (Conservation Tilling)	35 - 50%	Coates, 1994. This study identified total PM10 emissions generated for five different cotton tillage systems, including conventional tilling. Four of the systems combine several tillage operations (e.g., shredding, discing, mulching).
	60%	MRI, 1981. Control efficiency is for a minimum tillage technique that confines farm equipment and vehicle traffic to specific areas (for cotton and tomatoes).
	25 - 100%	MRI, 1981; U.S. EPA, 1992. Control efficiency is for application of herbicide that reduces need for cultivation (i.e., 25% for barley, alfalfa, and wheat; 100% for cotton, corn, tomatoes, and lettuce).
	30%	MRI, 1981; U.S. EPA, 1992. Control efficiency is for laser-directed land plane that reduces the amount of land planing.
	50%	MRI, 1981; U.S. EPA, 1992. Control efficiency is for using "punch" planter instead of harrowing (for cotton, corn, and lettuce).
	50%	MRI, 1981. Control efficiency is for using "plug" planting that places plants more exactly and eliminates the need for thinning (for tomatoes, only).
	50%	MRI, 1981; U.S. EPA, 1992. Control efficiency is for aerial seeding which produces less dust than ground planting (for alfalfa and wheat).
	91 - 99%	Grantz, et al. 1998. Control efficiency is for revegetation of fallow agricultural lands by direct seeding.
Tillage based on soil moisture	90%	MRI, 1981; U.S. EPA, 1992. Control efficiency is for sprinkler irrigation as a fugitive dust control measure. Also, sprinkler irrigation could reduce the need for extensive land planing associated with surface irrigation.
Sequential cropping	50%	MRI, 1981. Control efficiency is for double cropping corn.
Surface roughening	15 - 64%	Grantz et al, 1998. Control efficiency is for increasing surface roughness using rocks and soil aggregates.

2.4 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. However, most air quality districts currently exempt agricultural operations from controlling fugitive dust. Air quality districts that regulate fugitive dust emissions from agricultural operations include Clark County, NV and several districts in California such as the Imperial County APCD, the San Joaquin Valley APCD and the South Coast AQMD. Imperial County APCD's Rule 806 prohibits fugitive dust emissions from farming activities for farms over 40 acres. The San Joaquin Valley APCD and the South Coast AQMD prohibit fugitive dust emissions for the larger farms defined as farms with areas where the combined disturbed surface area within one continuous property line and not separated by a paved public road is greater than 10 acres. The San Joaquin Valley APCD's Rule 4550 (Conservation Management Practices, CMPs) requires farmers with 100 acres or more of contiguous or adjacent farmland to implement and document a biennial CMP plan to reduce fugitive dust emissions from on-farm sources, such as unpaved roads and equipment yards, during land preparation and harvesting activities. The District's rule requires farmers to implement a separate CMP for each crop for the following source categories: land preparation and cultivation, harvesting, unpaved roads, unpaved equipment yards, and other cultural practices. Example regulatory formats downloaded from the Internet are presented in Table 2-5. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- San Joaquin Valley APCD, CA: valleyair.org/SJV_main.asp
- South Coast AQMD, CA: aqmd.gov/rules
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/aq

CAPCOA's agricultural clearinghouse website (capcoa.org/ag_clearinghouse.htm) provides links to rules of different air quality agencies within California that regulate fugitive dust emissions from agricultural operations.

Table 2-5. Example Regulatory Format for Agricultural Tilling

Control measure	Agency
Any person engaged in agricultural operations shall take all reasonable precautions to abate fugitive dust from becoming airborne from such activities.	Clark County Reg. 41 7/10/04
Limit visible dust emissions to 20% opacity by pre-watering, phasing of work, applying water during active operations	SJVAPCD Rule 8021 11/15/2001
Implement one of following during inactivity: restricting vehicle access or applying water or chemical stabilizers	SJVAPCD Rule 8021 11/15/2001
Use mowing or cutting instead discing and maintain at least 3" stubble above soil (Also requires pre-application of watering if discing for weed abatement)	SCAQMD Rule 403 12/11/1998
Cease activities when wind speeds are greater than 25 mph	SCAQMD Rule 403.1 4/02/04

2.5 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations (e.g., observation of visible dust plume). An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Compliance tools applicable to agricultural tilling are summarized in Table 2-6.

Table 2-6. Compliance Tools for Agricultural Tilling

Record keeping	Site inspection/monitoring
Maintain daily records to document the specific dust control options taken; maintain such records for a period of not less than three years; and make such records available to the Executive Officer upon request.	Observation of dust plumes during periods of agricultural tilling; observation of dust plume opacity (visible emissions) exceeding a standard; observation of high winds (e.g., >25 mph).

2.6 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for agricultural tilling. A sample cost-effectiveness calculation is presented below for a specific control measure (conservation tilling) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for agricultural tilling, the same procedure is used to evaluate each candidate control measure (utilizing the control

measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Agricultural Tilling

Step 1. Determine source activity and control application parameters.

Field size (acres)	320
Frequency of operations per year	4
Control Measure	Conservation tilling
Control application/frequency	Reduce 4 passes to 3 passes
Control Efficiency	25%

The field size and frequency of operations are assumed values, for illustrative purposes. Conservation tilling has been chosen as the applied control measure. The control application/frequency and control efficiency are values determined from the proportional reduction in tilling frequency.

Step 2. Obtain PM10 Emission Factor.
The PM10 emission factor for agricultural tilling dust is 1.2 (lb/acre-pass).[12]

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor, EF, (given in Step 2) is multiplied by the field size and the frequency of operations (both under activity data) and then divided by 2,000 lbs to compute the annual PM10 emissions in tons per year, as follows:

Annual PM10 emissions = (EF x Field Size x Frequency of Ops) / 2,000
Annual PM10 emissions = (1.2 x 320 x 4) / 2,000 = 0.768 tons

Annual PM2.5 emissions = (PM2.5/PM10) x PM10 emissions
CARB proposed PM2.5/PM10 ratio for agricultural operations[5] = 0.15
Annual PM2.5 emissions = (0.15 x 0.768 tons) = 0.115 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

For this example, we have selected conservation tilling as our control measure. Based on a control efficiency estimate of 25%, the annual controlled PM emissions are calculated to be:

Annual Controlled PM10 emissions = (0.768 tons) x (1 – 0.25) = 0.576 tons
Annual Controlled PM2.5 emissions = (0.115 tons) x (1 – 0.25) = 0.086 tons

Step 5. Determine Annual Cost to Control PM Emissions.

In this example, eliminating one tilling pass actually reduces the annual tilling costs. The annual cost savings of this control measure is calculated by multiplying the number of acres by the tilling cost per acre. The cost of tilling is assigned a value of $10 per acre (WSU, 1998[13]). Thus, the annual cost savings from eliminating one tilling pass is estimated to be: 320 x 10 = $3,200.

Step 6. Calculate Cost-effectiveness. Cost-effectiveness is calculated by dividing the annual cost (in this case annual cost savings) by the emissions reduction (i.e., uncontrolled emissions minus uncontrolled emissions), as follows:

Cost-effectiveness = Annual Costs Savings / (Uncontrolled emissions – Controlled emissions)

Cost-effectiveness for PM10 emissions = -$3,200 / (0.687 – 0.576) = -$16,667/ton
Cost-effectiveness for PM2.5 emissions = –$3,200 / (0.115 – 0.086) = –$111,111/ton

[Note: The negative cost-effectiveness values indicate a net cost savings for this control measure.]

3.1 Characterization of Source Emissions

Heavy construction is a source of dust emissions that may have a substantial temporary impact on local air quality. Building and road construction are two examples of construction activities with high emissions potential. Emissions during the construction of a building or road can be associated with land clearing, drilling and blasting, ground excavation, cut and fill operations (i.e., earth moving), and construction of a particular building or road. Dust emissions often vary substantially from day to day, depending on the level of activity, the specific operations, and the prevailing meteorological conditions. A large portion of the emissions results from construction vehicle traffic over temporary roads at the construction site.

The temporary nature of construction differentiates it from other fugitive dust sources as to estimation and control of emissions. Construction consists of a series of different operations, each with its own duration and potential for dust generation. In other words, emissions from any single construction site can be expected (1) to have a definable beginning and an end, and (2) to vary substantially over different phases of the construction process. This is in contrast to most other fugitive dust sources where emissions are either relatively steady or follow a discernable annual cycle. Furthermore, there is often a need to estimate areawide construction emissions without regard to the actual plans of any individual construction project. For these reasons, methods by which either areawide or site-specific emissions may be estimated are presented below.

The quantity of dust emissions from construction operations is proportional to the area of land being worked and to the level of construction activity. By analogy to the parameter dependence observed for other similar fugitive dust sources, one can expect emissions from construction operations to be positively correlated with the silt content of the soil (i.e., particles smaller than 75 micrometers [μm] in diameter), as well as with the speed and weight of the construction vehicle, and to be negatively correlated with the soil moisture content.

Table 3-1 displays the dust sources involved with construction. In addition to the on-site activities shown in Table 3-1, substantial emissions are possible because of material tracked out from the site and deposited on adjacent paved streets. Because all traffic passing the site (i.e., not just that associated with the construction) can resuspend the deposited material, this "secondary" source of emissions may be far more important than all the dust sources located within the construction site. Furthermore, this secondary source will be present during all construction operations. Persons developing construction site emission estimates must consider the potential for increased adjacent emissions from off-site paved roadways (see Chapter 5). High wind events also can lead to emissions from cleared land and material stockpiles. Chapters 8 and 9 present estimation methodologies that can be used for such sources at construction sites.

Table 3-1. Emission Sources for Construction Operations

Construction phase	Dust-generating activities
I. Demolition and debris removal	1. Demolition of buildings or other (natural) obstacles such as trees, boulders, etc. a. Mechanical dismemberment ("headache ball") of existing structures b. Implosion of existing structures c. Drilling and blasting of soil d. General land clearing 2. Loading of debris into trucks 3. Truck transport of debris 4. Truck unloading of debris
II. Site Preparation (earth moving)	1. Bulldozing 2. Scrapers unloading topsoil 3. Scrapers in travel 4. Scrapers removing topsoil 5. Loading of excavated material into trucks 6. Truck dumping of fill material, road base, or other materials 7. Compacting 8. Motor grading
III. General Construction	1. Vehicular Traffic 2. Portable plants a. Crushing b. Screening c. Material transfers 3. Other operations

3.2 Emissions Estimation: Primary Methodology[1-6]

This section was adapted from: Estimating Particulate Matter Emissions from Construction Operations, report prepared for USEPA by Midwest Research Institute dated September 15, 1999.[1]

Note that AP-42 Section 13.2.3, "Heavy Construction Operations," was not adopted for the primary emission estimation methodology because it relies on a single-valued emission factor for TSP of 1.2 tons/acre-month based on only one set of field tests.[2]

3.2.1 PM Emissions from Construction

Construction emissions can be estimated when two basic construction parameters are known: the acres of land disturbed by the construction activity, and the duration of the activity. A general emission factor for all types of construction activity is 0.11 tons PM10/acre-month and is based on a 1996 BACM study conducted by Midwest Research (MRI) Institute for the California South Coast Air Quality Management District (SCAQMD).[3] The single composite factor of 0.11 tons PM10/acre-month assumes that all construction activity produces the same amount of dust on a per acre basis. In other words, the amount of dust produced is not dependent on the type of construction but merely on the area of land being disturbed by the construction activity. A second

assumption is that land affected by construction activity does not involve large-scale cut and fill operations. Factors for the conversion of dollars spent on construction to acreage disturbed, along with the estimates for the duration of construction activity, were originally developed by MRI in 1974.[4]

Separate emission factors segregated by type of construction activity provide better estimates of PM10 emissions that are more accurate estimate than are obtained using a general emission factor. The factors from the 1996 MRI BACM study[3] are summarized in Table 3-2. Specific emission factors and activity levels for residential, nonresidential, and road construction activities are described below.

Table 3-2. Recommended PM10 Emission Factors for Construction Operations[1]

Basis for emission factor	Recommended PM10 emission factor
Level 1 Only area and duration known	0.11 ton/acre-month (average conditions) 0.42 ton/acre-month (worst-case conditions)[a]
Level 2 Amount of earth moving known, in addition to total project area and duration	0.011 ton/acre-month for general construction (for each month of construction activity) plus 0.059 ton/1,000 cubic yards for on-site cut/fill[b] 0.22 ton/1,000 cubic yards for off-site cut/fill[b]
Level 3 More detailed information available on duration of earth moving and other material movement	0.13 lb/acre-work hr for general construction plus 49 lb/scraper-hr for on-site haulage[c] 94 lb/hr for off-site haulage[d]
Level 4 Detailed information on number of units and travel distances available	0.13 lb/acre-work hr for general construction plus 0.21 lb/ton-mile for on-site haulage 0.62 lb/ton-mile for off-site haulage[c]

[a] Worst-case refers to construction sites with active large-scale earth moving operations.

[b] These values are based on assumptions that one scraper can move 70,000 cubic yards of earth in one month and one truck can move 35,000 cubic yards of material in one month. If the on-site/off-site fraction is not known, assume 100% on-site.

[c] If the number of scrapers in use is not knows, MRI recommends that a default value of 4 be used. In addition, if the actual capacity of earth moving units is known, the user is directed to use the following emission rates in units of lb/scraper-hour for different capacity scrapers: 19 for 10 yd^3 scraper, 45 for 20 yd^3 scraper, 49 for 30 yd^3 scraper, and 84 for 45 yd^3 scraper.

[d] Factor for use with over-the-road trucks. If "off-highway" or "haul" trucks are used, haulage should be considered "on-site."

3.2.2 Residential Construction

Residential construction emissions can be calculated for three basic types of residential construction:

- Single-family houses
- Two-family houses
- Apartment buildings

Housing construction emissions are calculated using an emission factor of 0.032 tons PM10/acre-month. Also required are: the number of housing units created, a units-to-acres conversion factor, and the duration of construction activity. The formula for calculating emissions from residential construction is:

$$\text{Emissions} = (0.032 \text{ tons PM10/acre-month})\ B \times f \times m$$

where, B = the number of houses constructed
f = building to acres conversion factor
m = the duration of construction activity in months

Following the California methodology, residential construction acreage is based on the number of housing units constructed rather than the dollar value of construction.

An alternative methodology is recommended for residential construction in areas in which basements are constructed or the amount of dirt moved at a residential construction site is known. The F.W. Dodge reports (www. fwdodge.com/newdodgenews.asp) give the total square footage of homes for both single-family and two-family homes. These values can be used to estimate the volume in cubic yards of dirt moved. Multiplying the total square footage of the homes by an average basement depth of 8 ft, and adding 10% additional volume to account for peripheral dirt removed for footings, space around the footings, and other backfilled areas adjacent to the basement, produces an estimate of the total volume in cubic yards of earth moved during residential construction.

The information needed to determine activity levels of residential construction may be based either on the dollar value of construction or the number of housing units constructed. Construction costs vary throughout the United States. The average home cost can vary from the low to upper $100,000s depending on where the home is located in the United States. Because residential construction characteristics do not show as much variance as the cost does, the number of units constructed is a better indicator of activity level. The amount of land impacted by residential construction is determined to be about the same on a per house basis. The number of housing units for the three types of residential construction (single family, two-family, and apartments) for a county or state are available from the F.W. Dodge's "Dodge Local Construction Potentials Bulletin."

A single-family house is estimated to occupy 1/4 acre. The "building to acres" conversion factor for a single-family house was determined by finding the area of the base of a home and estimating the area of land affected by grading and other construction activities beyond the "footprint" of the house. The average home is around 2,000 sq. ft. Using a conversion factor of 1/4 acre/house indicates that five times the base of the house is affected by the construction of the home. The "building to acres" conversion factor for two-family housing was found to be 1/3 acre per building. The 1/3 acre was derived from the average square footage of a two-family home (approximately 3,500 sq. ft.) and the land affected beyond the base of the house, about 4 times the base for two-family residences.

For comparison purposes, residential construction emission factor calculations are calculated below for BACM Level 1 and Level 2 scenarios. The PM10 construction emission factor for one single-family home is based on typical parameters for a single-family home:

- area of land disturbed 1/4 acre
- area of home 2,000 sq. ft.
- duration 6 months
- basement depth 8 ft.
- moisture level 6%
- silt content 8%

The BACM Level 1 emission calculation is estimated as follows:

0.032 tons PM10/acre-month x 1/4 acre x 6 months = 0.048 tons PM10 = 96 lb PM10

The BACM Level 2 emission calculation is estimated as follows:

Cubic yards of dirt moved = 2,000 ft^2 x 8 ft. x 110% = 17,600 ft^3 = 652 yd^3
PM10 = (0.011 tons/acre-month x 1/4 acre x 6 months) + (0.059 tons/1000 yd^3 dirt x 652 yd^3 dirt)
= 0.016 tons + 0.038 tons = 0.0545 tons PM10 = 109 lb PM10

The emission factor recommended for the construction of apartment buildings is 0.11 tons PM10/acre-month because apartment construction does not normally involve a large amount of cut-and-fill operations. Apartment buildings vary in size, number of units, square footage per unit, floors, and many other characteristics. Because of these variations and the fact that most apartment buildings occupy a variable amount of space, a "dollars-to-acres" conversion is recommended for apartment building construction rather than a "building-to-acres" conversion factor. An estimate of 1.5 acres/$\$10^6$ (in 2004 dollar value) is recommended to determine the acres of land disturbed by the construction of apartments. This "dollars-to-acres" conversion factor is based on updating previous conversion factors developed by MRI[4, 5] using cost of living adjustment factors.

3.2.3 Nonresidential Construction

Nonresidential construction includes building construction (commercial, industrial, institutional, governmental) and also public works. The emissions produced from the construction of nonresidential buildings are calculated using the dollar value of the construction. The formula for calculating the emissions from nonresidential construction is:

PM10 Emissions = (0.19 tons PM10/acre-month) x $ x f x m

where, $ = dollars spent on nonresidential construction in millions
f = dollars to acres conversion factor
m = duration of construction activity in months

The emission factor of 0.19 tons PM10/acre-month was developed by MRI in 1999 using a method similar to a procedure originated by Clark County, Nevada and the emission factors recommended in the 1996 MRI BACM Report.[3] A quarter of all nonresidential construction is assumed to involve active earthmoving in which the recommended emission factor is 0.42 tons PM10/acre-month. The 0.19 tons PM10/acre-month was calculated by taking 1/4 of the heavy emission factor, (0.42 tons PM10/acre-month) plus 3/4 of the general emission factor (0.11 tons/acre-month). The 1/4:3/4 apportionment is based on a detailed analysis of a Phoenix airport construction where specific unit operations had been investigated for PM10 emissions.[6] The proposed emission factor of 0.19 tons/acre-month for nonresidential building construction resulted in a total uncontrolled PM10 emissions estimate that was within 25% of that based on a detailed unit operation emissions inventory using detailed engineering plans and "unit-operation" emission factors.

Extensive earthmoving activities will produce higher amounts of PM10 emissions than the average construction project. Thus, a worst-case BACM "heavy construction emission factor" of 0.42 tons PM10/acre-month should provide a better emissions estimate for areas in which a significant amount of earth is disturbed.

The dollar amount spent on nonresidential construction is available from the U.S. Census Bureau (www.census.gov/prod/www/abs/cons-hou), and the Dodge Construction Potentials Bulletin (www. fwdodge.com/newdodgenews.asp). Census data are delineated by SIC Code, whereas the Potentials Bulletin divides activity by the types of building being constructed rather than by SIC Code. It is estimated that for every million dollars spent on construction (in 2004 dollars), 1.5 acres of land are impacted. The "dollars to acres" conversion factor reflects the current dollar value using the Price and Cost Indices for Construction that are available from the Statistical Abstract of the United States, published yearly. The estimate for the duration of nonresidential construction is 11 months.

3.2.4 Road Construction

Road construction emissions are highly correlated with the amount of earthmoving that occurs at a site. Almost all roadway construction involves extensive earthmoving and heavy construction vehicle travel, causing emissions to be higher than found for other construction projects. The PM10 emissions produced by road construction are calculated using the BACM recommended emission factor for heavy construction[1] and the miles of new roadway constructed. The formula used for calculating roadway construction emissions is:

$$\text{PM10 Emissions} = (0.42 \text{ tons PM10/acre-month}) \times M \times f \times d$$

where, M = miles of new roadway constructed
f = miles to acres conversion factors
d = duration of roadway construction activity in months

The BACM worst case scenario emission factor of 0.42 tons/acre-month is used to account for the large amount of dirt moved during the construction of roadways. Since most road construction consists of grading and leveling the land, the higher emission factor more accurately reflects the high level of cut and fill activity that occurs at road construction sites.

The miles of new roadway constructed are available at the state level from the *Highway Statistics* book published yearly by the Federal Highway Administration (FHWA; www.fhwa.dot.gov/ohim/hs97/hm50.pdf) and the Bureau of Census Statistical Abstract of the United States. The miles of new roadway constructed can be found by determining the change in the miles of roadway from the previous year to the current year. The amount of roadway constructed is apportioned from the state to the county level using housing start data that is a good indicator of the need for new roads.

The conversion of miles of roadway constructed to the acres of land disturbed is based on a method developed by the California Air Resources Board. This calculation is performed by estimating the overall width of the roadway, then multiplying the width by a mile to determine the acres affected by one mile of roadway construction. The California "miles to acres disturbed" conversion factors are available for freeway, highway and city/county roads. In the Highway Statistics book, roadways are divided into separate functional classes. MRI developed a "miles-to-acres" conversion factor in 1999[1] according to the roadway types found in the "Public Road Length, Miles by Functional System" table of the annual *Highway Statistics*. The functional classes are divided into four groups. Group 1 includes Interstates and Other Principal Arterial roads and is estimated to occupy 15.2 acres/mile. Group 2 includes Other Freeways and Expressways (Urban) and Minor Arterial Roads and is estimated at 12.7 acres/mile. Group 3 has Major Collectors (Rural) and Collectors (Urban) and a conversion factor of 9.8 acres/mile. Minor Collectors (Rural) and Local roads are included in Group 4 and converted at 7.9 acres/mile. Table 3-3 shows the data used to calculate the acres per mile of road constructed.

Table 3-3. Conversion of Road Miles to Acres Disturbed

	Group 1	Group 2	Group 3	Group 4
Lane Width (feet)	12	12	12	12
Number of Lanes	5	5	3	2
Average Shoulder Width (feet)	10	10	10	8
Number of Shoulders	4	2	2	2
Roadway Width* (feet)	100	80	56	40
Area affected beyond road width	25	25	25	25
Width Affected (feet)	125	105	81	65
Acres Affected per Mile of New Roadway	15.2	12.7	9.8	7.9

* Roadway Width= (Lane Width x # of Lanes) + (Shoulder Width x # of Shoulders).

The amount of new roadway constructed is available on a yearly basis and the duration of the construction activity is determined to be 12 months. The duration accounts for the amount of land affected during that time period and also reflects the fact that construction of roads normally lasts longer than a year. The duration of construction of a new roadway is estimated at 12 to 18 months.

3.3 Emission Estimation: Alternate Methodology for Building Construction

This section was adapted from Section 7.7 of CARB's Emission Inventory Methodology. Section 7.7 was last updated in September 2002.

The building construction dust source category provides estimates of the fugitive dust particulate matter caused by construction activities associated with building residential, commercial, industrial, institutional, or governmental structures. The emissions result predominantly from site preparation work, which may include scraping, grading, loading, digging, compacting, light-duty vehicle travel, and other operations. Dust emissions from construction operations are computed by using a PM10 emission factor developed by MRI during 1996.[3] The emission factor is based on observations of construction operations in California and Las Vegas. Activity data for construction is expressed in terms of acre-months of construction. Acre-months are based on estimates of the acres disturbed for residential construction, and project valuation for other non-residential construction.

3.3.1 Emission Estimation Methodology

Emission Factor. The PM10 emission factor used for estimating geologic dust emissions from building construction activities is based on work performed by MRI[3] under contract to the PM10 Best Available Control Measure (BACM) working group. For most parts of the state, the emission factor used is 0.11 tons PM10/acre-month of activity. This emission factor is based on MRI's observation of the types, quantity, and duration of operations at eight construction sites (three in Las Vegas and five in California). The bulk of the operations observed were site preparation-related activities. The observed activity data were then combined with operation-specific emission factors provided in AP-42[2] to produce site emissions estimates. These site estimates were then combined to produce the overall average emission factor of 0.11 tons PM10/acre-month. The PM2.5/PM10 ratio for fugitive dust from construction and demolition activities is 0.1 based on the analysis conducted by MRI on behalf of WRAP.[7]

The construction emission factor is assumed to include the effects of typical control measures such as routine watering. A dust control effectiveness of 50% is assumed from these measures, which is based on the estimated control effectiveness of watering.[8] Therefore, if this emission factor is used for construction activities where watering is not used, it should be doubled to more accurately reflect the actual emissions. The MRI document[3] lists their average emission factor values as uncontrolled. However, it can be argued that the activities observed and the emission estimates do include the residual effects of control. All of the test sites observed were actual operations that used watering controls as part of their standard industry practice in California and Las Vegas. So, even if in some cases watering was not performed during MRI's actual site visits, the residual decreases in emissions from the watering controls and raising the soil moisture are included in the MRI estimates.

The 1996 MRI report[3] also includes an emission factor for worst-case emissions of 0.42 tons PM10/acre-month. This emission factor is appropriate for large-scale construction operations, which involve substantial earthmoving operations. The South Coast Air Quality Management District (SCAQMD) estimated that 25% of their construction projects involve these types of operations. For the remainder of the state, such detailed information is not readily available, so the average emission factor of 0.11 tons PM10/acre-month is used by CARB for these other areas of California..

Activity Data. For the purpose of estimating emissions, it is assumed that the fugitive dust emissions are related to the acreage affected by construction. Because regionwide estimates of the acreage under construction may not be directly available, other construction activity data can be used to derive acreage estimates. Activity data are estimated separately for residential construction and the other types of construction (commercial, industrial, institutional, and governmental).

For residential construction, the number of new housing units estimated by the California Department of Finance[9] are used to estimate acreage disturbed. It is estimated that single family houses are built on 1/7 of an acre in heavily populated counties, and 1/5 of an acre in less populated counties.[10-12] It is also estimated that multiple living units such as apartments occupy 1/20 of an acre per living unit. For all of these residential construction activities, a project duration of 6 months is assumed.[10] Applying these factors to the reported number of new units in each county results in an estimate of acre-months of construction. This estimate of acre-months of construction combined with the construction emission factor is used to estimate residential construction particulate emissions.

For commercial, industrial, and institutional building construction, construction acreage is based on project valuations. Project valuations for additions and alterations are not included. According to the Construction Industry Research Board,[13] most additions and alterations would be modifications within the existing structure and normally would not include the use of large earthmoving equipment. Most horizontal additions would usually be issued a new building permit. The valuations are 3.7, 4.0 and 4.4 acres per million dollars of valuation for the respective construction types listed.[12] Valuations were corrected from 1999 values to 1977 values using the Annual Average Consumer Price Index (CPI-U-RS) provided by the U.S. Census Bureau.[14] The Census Bureau uses the Bureau of Labor Statistics' experimental Consumer Price Index (CPI-U-RS) for 1977 through 2000.[15] Valuations were corrected from 1999 values to 1977 values because the acres per dollar valuation values are based on 1977 valuations. For example, the CPI-U-RS for 1999 is 244.1 and the CPI-U-RS for 1977 is 100.0. The ratio of 1977 to 1999 dollars is 100.0/244.1 or 0.41. Inflation from 1999 to 2004 is estimated to be 12%. Thus, updating the 1977 valuation results to 2004 dollars produces a ratio of 1977 to 2004 dollars of 0.41/1.12 or 0.37. CARB assumes that each acre is under construction for 11 months for each project type.[10]

3.3.2 Assumptions and Limitations

1. The current methodology assumes that all construction operations in all parts of the state emit the same levels of PM10 on a per acre basis.
2. It is assumed that watering techniques are used statewide, reducing emissions by 50% and making it valid to apply the MRI emission factor without correction.
3. The methodology assumes that valuation is proportional to acreage disturbed, even for high-rise type building construction.
4. The methodology assumes that construction dust emissions are directly proportional to the number of acres disturbed during construction.
5. The estimates of acreage disturbed are limited in their accuracy. New housing units and project valuations do not provide direct estimates of actual acreage disturbed by construction operations in each county.
6. The methodology assumes that the Consumer Price Index (CPI-U-RS) provides an accurate estimate of 1977 and current values.

3.3.3 Temporal Activity

The temporal activity is assumed to occur five days a week between the hours of 8:00 AM and 4:00 PM. The table below shows the percentage of construction activity that is estimated to occur during each month. The monthly activity increases during the spring and summer months. Some districts may use a different profile that has a larger peak during the summer months.

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
6.4	6.4	8.3	9.2	9.2	9.2	9.2	9.2	9.2	8.3	8.3	7.3

3.4 Emission Estimation: Alternate Methodology for Road Construction

This section was adapted from Section 7.8 of CARB's Emission Inventory Methodology. Section 7.8 was last updated in August 1997.

The road construction dust source category provides estimates of the fugitive dust particulate matter due to construction activities while building roads. The emissions result from site preparation work that may include scraping, grading, loading, digging, compacting, light-duty vehicle travel, and other operations. Dust emissions from road construction operations are computed by using a PM10 emission factor developed by MRI.[3] The emission factor is based on observations of construction operations in California and Las Vegas. Activity data for road construction is expressed in terms of acre-months of construction. Acre-months are based on estimates of the acres disturbed for road construction. The acres disturbed are computed based on: estimates of the annual difference in road mileage; estimates of road width (to compute acres disturbed); and an assumption of 18 months as the typical project duration.

3.4.1 Emissions Estimation Methodology

Emission Factor. The PM10 emission factor used for estimating geologic dust emissions from road construction activities is based on work performed by MRI under contract to the PM10 Best Available Control Measure working group.[3] For most parts of the State, the emission factor used is 0.11 tons PM10/acre-month of activity. This emission factor is based on MRI's observation of the types, quantity, and duration of operations at eight construction sites (three in Las Vegas, and five in California). The bulk of the operations observed were site preparation related activities. The observed activity data were then combined with operation specific emission factors provided in U.S. EPA's AP-42 (5th Edition)[2] document to produce site emissions estimates. These site estimates were then combined to produce the overall average emission factor of 0.11 tons PM10/acre-month. The PM2.5/PM10 ratio for fugitive dust from construction and demolition activities is 0.1 based on the analysis conducted by MRI on behalf of WRAP.[7]

The construction emission factor is assumed to include the effects of routine dust suppression measures such as watering. A dust control effectiveness of 50% is assumed from these measures, which is based on the estimated control effectiveness of watering.[8] Therefore, if this emission factor is used for road construction activities where watering is not used, it should be doubled to more accurately reflect the actual emissions. The MRI document[3] lists their average emission factor values as uncontrolled. However, it can be argued that the activities do include the effects of controls. All of the test sites were actual operations that used watering controls, even if in some cases they were not used during the actual site visits. It is believed that the residual effects of controls are reflected in the MRI emission estimates.

The MRI report[3] also includes an emission factor for worst-case construction emissions of 0.42 tons of PM10/acre-month. This emission factor is appropriate for large scale construction operations that involve substantial earthmoving operations. The South Coast Air Quality Management District (SCAQMD) estimated that a percentage of their construction projects involve these types of operations, and applied the larger emission factor to these activities. For the remainder of the state, such detailed information is not readily available, so the average emission factor of 0.11 tons PM10 per acre-month is used by CARB.

Activity Data. For the purpose of estimating emissions, it is assumed that the fugitive dust emissions are related to the acreage affected by construction. Regionwide estimates of the acreage disturbed by roadway construction may not be directly available. Therefore, the miles of road built and the acreage disturbed per mile of construction can be used to estimate the overall acreage disturbed.

The miles of road built are based on the annual difference in the road mileage. These data, from the California Department of Finance[9] and Caltrans[16], are split for each county into freeways, state highways, and city and county road. The acreage of land disturbed

per mile of road construction is based on the number of lanes, lane width, and shoulder width for each listed road type. The assumptions used are provided in Table 3-4. Because most projects will probably also disturb land outside of the immediate roadway corridor, these acreage estimates are somewhat conservative.

The final parameter needed is project duration, which is assumed to be an average of 18 months.[10] Multiplying the road mileage built by the acres per mile and the months of construction provides the acre-months of activity for road building construction. This, multiplied by the emission factor, provides the emissions estimate.

Table 3-4. Roadway Acres per Mile of Construction Estimates

Road Type	Freeway	Highway	City & County
Number of Lanes	5	5	2
Width per Lane (feet)	12	12	12
Shoulder Width (feet)	10'x4 = 40'	20'x2 = 40'	20'x2 = 40'
Roadway Width* (feet)	100	76	64
Roadway Width* (miles)	0.019	0.014	0.012
Area per Mile** (acres)	12.1	9.2	7.8

*Roadway Width (miles) = [(Lanes x Width per Lane) + Shoulder Width] x (1 mile/5,280 feet)
**Area per Mile (acres) = Length x Width = 1 Mile x Width x 640 acres/mile^2

3.4.2 Temporal Activity

Temporal activity is assumed to occur five days a week between the hours of 8 AM and 4 PM. The table below shows the percentage of construction activity that is estimated to occur during each month. The monthly activity increases during the spring and summer months as shown below. Some districts use a slightly different profile that has a larger peak during the summer months.

ALL	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
100	7.7	7.7	8.5	8.5	8.5	8.5	8.5	8.5	8.5	8.5	8.5	7.7

3.4.3 Assumptions and Limitations

1. The current methodology assumes that all construction operations in all parts of the state emit the same levels of PM10 on a per acre basis.
2. It is assumed that watering techniques are used statewide, reducing emissions by 50% and making it valid to apply the MRI emission factor without correction.
3. The methodology assumes that the acreage disturbed per mile for road building is similar statewide, and the overall disturbed acreage is approximately the same as the finished roadway's footprint.
4. The methodology assumes that construction dust emissions are directly proportional to the number of acres disturbed during construction.

3.5 Supplemental Emission Factors

AP-42 lists uncontrolled TSP emission factors for specific activities at construction sites.[2] These TSP emission factors as well as references to the relevant chapters of this handbook that provide PM10 and/or TSP emission factors for similar activities are presented in Table 3-5.

Table 3-5. TSP Emission Factors for Specific Construction Site Activities

Construction Phase	Activity	TSP Emission Factor*
Demolition and Debris Removal	Drilling soil	1.3 lb/hole
	Land clearing with bulldozer	$5.7\ (s)^{1.2} / M^{1.3}$ lb/hr
	Loading debris into trucks and subsequent unloading	See Chapter 4
	Truck transport of debris on paved or unpaved roads	See Chapters 5 and 6
Site Preparation (earth moving)	Bulldozing and compacting	$5.7\ (s)^{1.2} / M^{1.3}$ lb/hr
	Scrapers unloading topsoil	0.04 lb/ton
	Scrapers in travel mode	See Chapter 6
	Scrapers removing topsoil	20.2 lb/mile
	Grading	$0.040\ (S)^{2.5}$ lb/mile
	Loading excavated material into trucks and subsequent unloading	See Chapter 4
General Construction	Vehicular traffic	See Chapters 5 and 6
	Crushing and screening aggregate	See Chapter 11
	Material transfer	See Chapter 4

* Symbols for equations: M = material moisture content (%), s = material silt content (%), S = mean vehicle speed (mph).

3.6 Demonstrated Control Techniques

Because of the relatively short-term nature of construction activities, some control measures are more cost-effective than others. Frank Elswick of Midwest Industrial Supply Inc. presented an extensive summary of control measures for construction activities and their associated costs at a WRAP sponsored fugitive dust workshop in Palm Springs, CA in May 2005.[17] Elswick concluded that dust suppressant methods fall into the following six categories:

1. **Watering**
   * Watering works by agglomerating surface particles together.
   * No negative environmental impacts from using water.
   * Normally readily available.
   * Evaporates quickly, therefore typically only effective for short periods of time.
   * Frequency of application depends on temperature and humidity.
   * Generally labor intensive due to frequent application.
   * Costs associated with pre-watering and as needed watering are $55 to $80/hour.

2. **Chemical Stabilizers**

(a) Water absorbing products (e.g., calcium chloride brine or flakes, magnesium chloride brine, sodium chloride)

* These products work by significantly increasing surface tension of water between dust particles, helping to slow evaporation and further tighten compacted soil.
* Products ability to absorb water from the air is a function of temperature and humidity.
* These products work best in low humidity environments.
* Frequent re-application in dry climates.
* Must be watered to activate during dry months.
* Potential costly environmental impacts to fresh water aquatic life, plants and water quality
* Corrosive to metal and steel.
* Not suitable for non-traffic areas.
* Costs associated with traffic area program are $.03 - $.05 per square foot.

(b) Organic Petroleum Products (e.g. asphalt emulsions, cut/liquid asphalt, dust oils, petroleum resins)

* These products work by binding and/or agglomerating surface particles together because of asphalt adhesive properties.
* Potentially costly environmental due to presence of polycyclic aromatic hydrocarbons that are "hazardous air and water pollutants" that may be subject to reporting requirements.
* Can fragment under traffic conditions.
* Not suitable for non-traffic areas.
* Costs associated with traffic area program are $.05 - $.075 per square foot.

(c) Organic Non-Petroleum Products (e.g., ligninsulfonates, tall oil emulsions, vegetable oils)

* These products work by binding and/or agglomerating surface particles together.
* Surface binding for these product may be reduced or destroyed by rains.
* Generally limited availability of non-petroleum products.
* Ligninsulfonates can impact freshwater aquatic life due to high B.O.D. and C.O.D.
* Not suitable for non-traffic areas.
* Costs associated with traffic area program are $.04 - $.08 square foot.

(d) Polymer Products (e.g., polyvinyl acetates, vinyl acrylics)

* These products work by binding soil particles together because of the polymer's adhesive properties.
* Polymers also increase the load-bearing strength of all types of soils.
* Polymers are non-toxic, non-corrosive, and do not pollute ground water.
* Polymers dry virtually clear to create an aesthetically pleasing result.
* Polymers create a tough yet flexible crust to prevent wind and water erosion.
* Costs associated with traffic areas are $.05 - $.08 per square foot.
* Costs associated with disturbed non-traffic areas are $300 - $800 per acre depending on longevity desired.

* Costs associated with slopes and inactive stockpiles are $500 to $1,000 per acre.

(e) Synthetic Products (e.g., iso-alkane compounds)
* Synthetic fluids work as a dust suppressing ballasting mechanism, while also acting as a durable re-workable binder.
* Formulated with safe and environmentally friendly synthetic fluids; non-hazardous per OSHA, EPA and US DOT; contains no asphalt, oil or PAH's.
* Easy application; no water required.
* Costs associated with traffic area program are $.05 - $.10 per square foot.

3. **Sand Fences**
* Fabric on chain link fence.
* Redwood slat fence.
* Mylar sand fence.
* Most effective when used in conjunction with chemical stabilizers.

4. **Perimeter Sprinklers**
* Most effective when used in conjunction with other methods.

5. **Tire Cleaning Systems at Site Exit**
* Rumble strips to prevent track-out from site onto pavement.
* Washed rock 100' prior to exit onto pavement.

6. **On- Site Speed Control**
* Limiting on-site vehicle speed to 15mph.

Wet suppression and wind speed reduction are the two most common methods used to control open dust sources at construction sites because a source of water and material for wind barriers tend to be readily available on a construction site. However, several other forms of dust control are available. Table 3-6 displays each of the preferred control measures by dust source.[18, 19]

Table 3-6. Control Options for General Construction Sources of PM10

Emission source	Recommended control methods(s)
Debris handling	Wind speed reduction; wet suppression[a]
Truck transport[b]	Wet suppression; paving; chemical stabilization[c]
Bulldozers	Wet suppression[d]
Pan scrapers	Wet suppression of travel routes
Cut/fill material handling	Wind speed reduction; wet suppression
Cut/fill haulage	Wet suppression; paving; chemical stabilization
General construction	Wind speed reduction; wet suppression; early paving of permanent roads

[a] Dust control plans should contain precautions against watering programs that confound trackout problems.
[b] Loads could be covered to avoid loss of material in transport, especially if material is transported offsite.
[c] Chemical stabilization is usually cost-effective for relatively long-term or semipermanent unpaved roads.
[d] Excavated materials may already be moist and not require additional wetting. Furthermore, most soils are associated with an "optimum moisture" for compaction.

One of the dustiest construction operations is cutting and filling using scrapers, with the highest emissions occurring during scraper transit. In a 1999 MRI field study,[5] it was found that watering can provide a high level of PM10 control efficiency for scraper transit emissions. Average control efficiency remained above 75% approximately 2 hours after watering. The average PM10 efficiency decay rate for water was found to vary from approximately 3% to 14% hour. The decay rate depended upon relative humidity in a manner consistent with the effect of humidity on the rate of evaporation. Test results for watered scraper transit routes showed a steep increase in control efficiency with a doubling of surface moisture and little additional control efficiency at higher moisture levels. This is in keeping with past studies that found that control efficiency data can be successfully fitted by a bilinear function. In another recent MRI field study (MRI, 2001),[20] tests of mud and dirt trackout indicated that a 10% soil moisture content represents a reasonable first estimate of the point at which watering becomes counter productive. The control efficiencies afforded by graveling or paving of a 7.6 m (25 ft) access apron were in the range of 40% to 50%.

Table 3-7 summarizes tested control measures and reported control efficiencies for dust control measures applied to construction and demolition operation.

Table 3-7. Control Efficiencies for Control Measures for Construction/Demolition[20, 21]

Control measure	Source component	PM10 control efficiency	References/Comments
Apply water every 4 hrs within 100 feet of a structure being demolished	Active demolition and debris removal	36%	MRI, April 2001, test series 701. 4-hour watering interval (Scenario: lot remains vacant 6 mo after demolition)
Gravel apron, 25" long by road width	Trackout	46%	MRI, April 2001
Apply dust suppressants (e.g., polymer emulsion)	Post-demolition stabilization	84%	CARB April 2002; for actively disturbed areas
Apply water to disturbed soils after demolition is completed or at the end of each day of cleanup	Demolition Activities	10%	MRI, April 2001, test series 701. 14-hour watering interval.
Prohibit demolition activities when wind speeds exceed 25 mph	Demolition Activities	98%	Estimated for high wind days in absence of soil disturbance activities
Apply water at various intervals to disturbed areas within construction site	Construction Activities	61%	MRI, April 2001, test series 701. 3.2-hour watering interval
		74%	MRI, April 2001, test series 701. 2.1-hour watering interval
Require minimum soil moisture of 12% for earthmoving	Scraper loading and unloading	69%	AP-42 emission factor equation for materials handling due to increasing soil moisture from 1.4% to 12%
Limit on-site vehicle speeds to 15 mph (Scenario: radar enforcement)	Construction traffic	57%	Assume linear relationship between PM10 emissions and uncontrolled vehicle speed of 35 mph

3.7 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. Regulatory formats specify the threshold source size that triggers the need for control application. Example regulatory formats downloaded from the Internet for several local air quality agencies in the WRAP region are presented in Table 3-8. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/envsvc/air/ruledsc.asp

3.8 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations (e.g., whether an unpaved road has been paved, graveled, or treated; whether haul truck beds are covered ; whether water trucks are being used during construction activities). An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 3-9 summarizes the compliance tools that are applicable to construction and demolition.

Table 3-8. Example Regulatory Formats for Construction and Demolition

Source	Control measure	Goal	Threshold	Agency
Paved Roads-Public and Private Track-out and Carryout	Install track-out ctrl device	Prevent/remove track-out from haul trucks and tires	Paved roads within construction sites, where haul trucks traverse; with disturbed surface area >2 acres, with 100 cubic yards of bulk material hauled	Maricopa County Rule 310 04/07/2004
	Either immediately cleanup track-out (>50ft) and nightly clean-up of rest; install grizzly/wheel wash system; install gravel pad--30ftx50ft, 6" deep; pave intersection--100ftx20ft; route traffic over track-out ctrl devices; limit access to unprotected routes; pave construction roadways ASAP	Control track-out on paved construction roads	Immediate track-out clean-up after 50ft, at end of workday for less; gravel pad standards are min, paved intersection also min and must be accessible to public; limit access to unprotected routes with barriers	Maricopa County Rule 310 04/07/2004
	Track-out control device must be installed at all access points to public roads and there must be mud/dirt removal from interior paved roads with sufficient frequency	Allow mud/dirt to drop off before leaving site and prevent track-out	For sites greater than 5 acres or those with more than 100 yd3 of daily import/export	SJVAPCD Rule 8041 11/15/2001
	Removal of track-out within one hour or selecting a track-out prevention option and removing track-out at the end of the day		For sites greater than 5 acres or those with more than 100 yd3 of daily import/export and track-out is less than 50ft	SCAQMD Rule 403 12/11/1998
	Removing track-out ASAP		Track-out greater than 50 ft	SCAQMD Rule 403 12/11/1998
	Require road surface paved or chemically stabilized from point of intersection with a public paved road to distance of at least 100 ft by 20 ft or installation of track-out control device from point of intersection with a public paved road to a distance of at least 25 ft by 20 ft	Prohibits material from extending more than 25 ft from a site entrance	For sites greater than 5 acres or those with more than 100 yd3 of daily import/export	SCAQMD Rule 403 12/11/1998
Bulk Materials Transport	Establishes speed limits. Requires at least 6" freeboard when crossing paved public road, water applied to top of load. Haul trucks need tarp or suitable cover and truck interior must be cleaned before leaving site	Limit visible dust emissions to 20% opacity and prevent spillage from holes	Trucks entering paved public roads (6" freeboard); leaving work site; specific haul trucks need covering	SJVAPCD Rule 8031 11/15/2001
	Requires covering haul trucks or to use bottom-dumping if possible and maintain minimum 6" freeboard (in high winds)			SCAQMD Rule 403 12/11/1998
	Freeboard at least 3"; prevent spillage from holes; install track-out ctrl devices	Prevent/remove track-out onto paved roads	Within the work site; removes possible track-out from tires, exterior of trucks that traverse work site	Maricopa County Rule 310 04/07/2004
Construction and Demolition Earthmoving	Require water and chemical stabilizers (dust suppressants) be applied, in conjunction with optional wind barrier	Limit visible dust emissions to 20% opacity		SJVAPCD Rule 8021 11/15/2001
	Specifies Dust Control Plan must be submitted	Limit visible dust emissions to 20% opacity	For areas 40 acres or larger where earth movement of 2500 yd3 or more on at least 3 days is intended	SJVAPCD Rule 8021 11/15/2001

Table 3-8. Example Regulatory Formats for Construction and Demolition (Continued)

Source	Control measure	Goal	Threshold	Agency
	Requires implementation of Best Available Control Measures (BACM)	Prohibit visible dust emissions beyond property line and limit an upwind/downwind PM10 differential to 50 ug/m3. Limit visible dust emissions to 100 ft from origin		SCAQMD Rule 403 12/11/1998
Construction and Demolition Demolition	Application of dust suppressants	Limit visible dust emissions to 20% opacity		SJVAPCD Rule 8021 11/15/2001
	Application of best available control measures (BACM)	Prohibits visible dust emissions beyond property line. Limits downwind PM10 levels to 50 ug/m3	For projects greater than 5 acres or 100 yd3 of daily import/export	SCAQMD Rule 403 12/11/1998
Construction and Demolition Grading Operations	Requires pre-watering and phasing of work	Limit VDE to 20% opacity		SJVAPCD Rule 8021 11/15/2001
	Requires water application and chemical stabilizers	Increase moisture content to proposed cut	For graded areas where construction will not begin for more than 60 days after grading	SCAQMD Rule 403 12/11/1998
	Preapplication of water to depth of proposed cuts and reapplication of water as necessary. Also stabilization of soils once earth-moving is complete	Ensure visible emissions do not extend more than 100 ft from sources		SCAQMD Rule 403 12/11/1998

Table 3-9. Compliance Tools for Construction and Demolition

Record keeping	Site inspection/monitoring
Site map; description of work practices; duration of project activities; locations and methods for demolition activities; locations and amounts of all earthmoving and material (types) handling operations; dust suppression equipment (types) and maintenance; frequencies, amounts, times, and rates of watering or dust suppressant application; mud/dirt carryout prevention and remediation requirements; wind shelters; meteorological log.	Observation of earthmoving and demolition activities, considering timeframe of project; observation of operation of dust suppression systems, vehicle/ equipment operation and disturbance areas; surface material sampling and analysis for silt and moisture contents; observation of truck spillage onto adjacent paved roads; mud/dirt carryout prevention and remediation; inspection of wind sheltering; real-time portable monitoring of PM; observation of dust plume opacity exceeding a standard.

3.9 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for construction and demolition. A sample cost-effectiveness calculation is presented below for a specific control measure (gravel apron at trackout egress points) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for construction and demolition, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Construction and Demolition (Mud/Dirt Egress Points)

Step 1. Determine source activity and control application parameters.

Egress traffic rate (veh/day)	100
Number of egress points	2
Duration of construction activity (month)	24
Wet days/year	10
Number of workdays/year	260
Number of emission days/yr (workdays without rain)	250
Control Measure	Gravel apron 25 ft long by road width
Economic Life of Control System (yr)	2
Control Efficiency	46%
Reference	MRI, 2001[20]

The number of vehicles per day, wet days per year, workdays per year, and the economic life of the control are determined from climatic and industrial records. The number of emission days per year are calculated by subtracting the number of annual wet days from the number of annual workdays as follows:

Number of workdays/year – Wet days/year = 260 – 10 = 250

Gravel aprons at the two construction site egress points have been chosen as the applied control measure. The control efficiency was obtained from MRI, 2001.[19]

Step 2. Obtain PM10 Emission Factor. The PM10 emission factor for construction and demolition dust is 6 g/vehicle.[22]

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor, EF, (given in Step 2) is multiplied by the number of vehicles per day and by the number of emission days per year (both under activity data) and divided by 454 grams/lb and 2000 lb/ton to compute the annual PM10 emissions, as follows:

Annual PM10 emissions = (EF x Veh/day x Emission days/year)/(454 x 2,000)
Annual PM10 emissions = (6 x 100 x 250) / (454 x 2,000) = 0.165 tons/year

Annual PM2.5 emissions = 0.1 x PM10 emissions[7]
Annual PM2.5 emissions = (0.1 x 0.165 tons/year) = 0.0165 tons/year

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

For this example, we have selected gravel aprons at egress points as our control measure. Based on a control efficiency estimate of 46% for a gravel apron, the annual PM emissions are calculated to be:

Annual Controlled PM10 emissions = (0.165 tons/yr) x (1 – 0.46) = 0.089 tons/yr
Annual Controlled PM2.5 emissions = (0.0165 tons/yr) x (1 – 0.46) = 0.0089 tons/yr

Step 5. Determine Annual Cost to Control PM Emissions.

Capital costs ($)	500
Annual Operating/Maintenance costs ($)	3,150
Annual Interest Rate	5%
Capital Recovery Factor	0.54
Annualized Cost ($/year)	3,419

The capital costs, annual operating and maintenance costs, and annual interest rate (AIR) are assumed values for illustrative purposes. The Capital Recovery Factor (CRF) is calculated as follows:

Capital Recovery Factor = AIR x $(1+AIR)^{\text{Economic life}} / (1+AIR)^{\text{Economic life}} - 1$
Capital Recovery Factor = 5% x $(1+ 5\%)^2 / (1+ 5\%)^2 - 1 = 0.54$

The Annualized Cost is calculated by adding the product of the Capital Recovery Factor and the Capital costs to the annual Operating and Maintenance costs:

Annualized Cost = (CRF x Capital costs) + Annual Operating and Maintenance costs
Annualized Cost = (0.54 x $500) + $3,150 = $3,419

Step 6. Calculate Cost Effectiveness. Cost effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost effectiveness = Annualized Cost / (Uncontrolled emissions – Controlled emissions)

Cost effectiveness for PM10 emissions = $3,420 / (0.165 - 0.089) = $44,991/ton
Cost effectiveness for PM2.5 emissions = $3,420 / (0.0165 - 0.0089) = $449,908/ton

4.1 Characterization of Source Emissions

Inherent in operations that use minerals in aggregate form is the handling and transfer of materials from one process to another (e.g., to and from storage). Outdoor storage piles are usually left uncovered, partially because of the need for frequent material transfer into or out of storage. Dust emissions occur at several points in the storage cycle, such as material loading onto the pile, disturbances by strong wind currents, and loadout from the pile. The movement of trucks and loading equipment in the storage pile area is also a substantial source of dust. Dust emissions also occur at transfer points between conveyors or in association with vehicles used to haul aggregate materials

4.2 Emissions Estimation: Primary Methodology[1-14]

This section was adapted from Section 13.2.4 of EPA's *Compilation of Air Pollutant Emission Factors (AP-42)*. Section 13.2.4 was last updated in January 1995.

The quantity of dust emissions from aggregate storage operations varies with the volume of aggregate passing through the storage cycle. Emissions also depend on the age of the pile, moisture content, and proportion of aggregate fines. When freshly processed aggregate is loaded onto a storage pile, the potential for dust emissions is at a maximum. Fines are easily disaggregated and released to the atmosphere upon exposure to air currents, either from aggregate transfer itself or from high winds. However, as the aggregate pile weathers the potential for dust emissions is greatly reduced. Moisture causes aggregation and cementation of fines to the surfaces of larger particles. Any significant rainfall soaks the interior of the pile, and then the drying process is very slow.

Table 4-1 summarizes measured moisture and silt content values for industrial aggregate materials. Silt (particles equal to or less than 75 micrometers [μm] in diameter) content is determined by measuring the portion of dry aggregate material that passes through a 200-mesh screen, using ASTM-C-136 method.[1]

Total dust emissions from aggregate storage piles result from several distinct source activities within the storage cycle:

1. Loading of aggregate onto storage piles (batch or continuous drop operations).
2. Equipment traffic in storage area.
3. Wind erosion of pile surfaces and ground areas around storage piles (see Chapter 9).
4. Loadout of aggregate for shipment or for return to the process stream (batch or continuous drop operations).

Either adding aggregate material to a storage pile or removing it usually involves dropping the material onto a receiving surface. Truck dumping on the pile or loading out from the pile to a truck with a front-end loader are examples of batch drop operations. Adding material to the pile by a conveyor stacker is an example of a continuous drop operation.

Table 4-1. Typical Silt and Moisture Contents of Materials at Various Industries[a]

Industry	No. of facilities	Material	Silt content (%)			Moisture content (%)		
			No. of samples	Range	Mean	No. of samples	Range	Mean
Iron and steel production	9	Pellet ore	13	1.3-13	4.3	11	0.64-4.0	2.2

[a] References 1-10. ND = no data.

The quantity of particulate emissions generated by either type of drop operation, expressed as a function of the amount of material transferred, may be estimated using the following empirical expression:[11]

Metric Units

$$E = k(0.0016)\ \frac{\left(\frac{U}{2.2}\right)^{1.3}}{\left(\frac{M}{2}\right)^{1.4}}\ \text{(kg/megagram [Mg])} \qquad (1)$$

English Units

$$E = k(0.0032)\ \frac{\left(\frac{U}{5}\right)^{1.3}}{\left(\frac{M}{2}\right)^{1.4}}\ \text{(pound [lb]/ton)}$$

where:

E = emission factor
k = particle size multiplier (dimensionless)
U = mean wind speed (meters per second, m/s, or miles per hour, mph)
M = material moisture content (%)

The particle size multiplier in the equation, k, varies with aerodynamic particle size range. For PM10, k is 0.35.[11] There are two sources of fugitive dust associated with materials handling activities, namely particulate emissions from aggregate handling and storage piles, which typically consists of loader and truck traffic around the storage piles, and fugitive dust associated with the transfer of aggregate by buckets or conveyors. The PM2.5/PM10 ratios for these two sources of fugitive dust are 0.1 and 0.15, respectively.[12] In general, particulate emissions from loader and truck traffic around the storage piles predominates over particulate emissions from transfer of aggregate by buckets or conveyors. Equation 1 retains the assigned quality rating of A if applied within the ranges of source conditions that were tested in developing the equation; see table below. Note that silt content is included, even though silt content does not appear as a correction parameter in the equation. While it is reasonable to expect that silt content and emission factors are interrelated, no significant correlation between the two was found during the derivation of the equation, probably because most tests with high silt contents were conducted under lower winds, and vice versa. It is recommended that estimates from Equation 1 be reduced one quality rating level if the silt content used in a particular application falls outside the following range:

Ranges of Source Conditions for Equation 1			
Silt content (%)	Moisture content (%)	Wind speed	
		m/s	mph
0.44 - 19	0.25 - 4.8	0.6 - 6.7	1.3 - 15

For Equation 1 to retain the quality rating of A when applied to a specific facility, reliable correction parameters must be determined for the specific sources of interest. The field and laboratory procedures for aggregate sampling are given in Reference 3. In the event that site-specific values for correction parameters cannot be obtained, the

appropriate mean values from Table 4-1 may be used, but the quality rating of the equation is reduced by one letter.

For emissions from trucks, front-end loaders, dozers, and other vehicles traveling between or on piles, it is recommended that the equations for vehicle traffic on unpaved surfaces be used (see Chapter 6). For vehicle travel between storage piles, the silt value(s) for the areas among the piles (which may differ from the silt values for the stored materials) should be used.

Worst-case emissions from storage pile areas occur under dry, windy conditions. Worst-case emissions from materials-handling operations may be calculated by substituting into the equation appropriate values for aggregate material moisture content and for anticipated wind speeds during the worst-case averaging period, usually 24 hours. A separate set of nonclimatic correction parameters and source extent values corresponding to higher than normal storage pile activity also may be justified for the worst-case averaging period.

4.3 Demonstrated Control Techniques

Watering and the use of chemical wetting agents are the principal means for control of emissions from materials handling operations involving transfer of bulk minerals in aggregate form. The handling operations associated with the transfer of materials to and from open storage piles (including the traffic around piles) represent a particular challenge for emission control. Dust control can be achieved by: (a) source extent reduction (e.g., mass transfer reduction), (b) source improvement related to work practices and transfer equipment such as load-in and load-out operations (e.g., drop height reduction, wind sheltering, moisture retention)), and (c) surface treatment (e.g., wet suppression).

In most cases, good work practices that confine freshly exposed material provide substantial opportunities for emission reduction without the need for investment in a control application program. For example, loading and unloading can be confined to leeward (downwind) side of the pile. This statement also applies to areas around the pile as well as the pile itself. In particular, spillage of material caused by pile load-out and maintenance equipment can add a large source component associated with traffic-entrained dust. Emission inventory calculations show, in fact, that the traffic dust component may easily dominate over emissions from transfer of material and wind erosion. The prevention of spillage and subsequent spreading of material by vehicles traversing the area is essential to cost-effective emission control. If spillage cannot be prevented because of the need for intense use of mobile equipment in the storage pile area, then regular cleanup should be employed as a necessary mitigative measure.

Fugitive emissions from aggregate materials handling systems are frequently controlled by wet suppression systems. These systems use liquid sprays or foam to suppress the formation of airborne dust. The primary control mechanisms are those that prevent emissions through agglomerate formation by combining small dust particles with larger aggregate or with liquid droplets. The key factors that affect the degree of agglomeration and, hence, the performance of the system are the coverage of the material

by the liquid and the ability of the liquid to "wet" small particles. There are two types of wet suppression systems—liquid sprays which use water or water/surfactant mixtures as the wetting agent and systems that supply foams as the wetting agent.

Liquid spray wet suppression systems can be used to control dust emissions from materials handling at conveyor transfer points. The wetting agent can be water or a combination of water and a chemical surfactant. This surfactant, or surface-active agent, reduces the surface tension of the water. As a result, the quantity of liquid needed to achieve good control is reduced.

Watering is also useful to reduce emissions from vehicle traffic in the storage pile area. Continuous chemical treating of material loaded onto piles, coupled with watering or treatment of roadways, can reduce total particulate emissions from aggregate storage operations by up to 90%.[13, 14]

Table 4-2 presents a summary of control measures and reported control efficiencies for materials handling that includes the application of a continuous water spray at a conveyor transfer point and two control measures for storage piles.

Table 4-2. Control Efficiencies for Control Measures for Materials Handling

Control measure	PM10 control efficiency	References/comments
Continuous water spray at conveyor transfer point	62%	The control efficiency achieved by increasing the moisture content of the material from 1% to 2% is calculated utilizing the AP-42 emission factor equation for materials handling which contains a correction term for moisture content.
Require construction of 3-sided enclosures with 50% porosity for storage pile	75%	Sierra Research, 2003.[15] Determined through modeling of open area windblown emissions with 50% reduction in wind speed and assuming no emission reduction when winds approach open side.
Water the storage pile by hand or apply cover when wind events are declared	90%	Fitz et al., April 2000.[16]

4.4 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. Regulatory formats specify the threshold source size that triggers the need for control application. Example regulatory formats for several local air quality agencies in the WRAP region are presented in Table 4-3. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: http://www.maricopa.gov/envsvc/air/ruledesc.asp

Table 4-3. Example Regulatory Formats for Materials Handling

Control Measure	Goal	Threshold	Agency
Establishes wind barrier and watering or stabilization requirements and bulk materials must be stored according to stabilization definition and outdoor materials covered	Limit visible dust emissions to 20% opacity		SJVAPCD Rule 8031 11/15/2001
Best available control measures: wind sheltering, watering, chemical stabilizers, altering load-in/load-out procedures, or coverings	Prohibits visible dust emissions beyond property line and limits upwind/downwind PM10 differential to 50 µg/m3		SCAQMD Rule 403 12/11/1998
Watering, dust suppressant (when loading, stacking, etc.); cover with tarp, watering (when not loading, etc.); wind barriers, silos, enclosures, etc.	Limit VDE to 20% opacity; stabilize soil	For storage piles with >5% silt content, 3ft high, >/=150 sq ft; work practices for stacking, loading, unloading, and when inactive; soil moisture content min 12%; or at least 70% min for optimum soil moisture content; 3 sided enclosures, at least equal to pile in length, same for ht, porosity </=50%	Maricopa County Rule 310 04/07/2004
Watering, clean debris from paved roads and other surface after demolition	Stabilize demolition debris and surrounding area; establish crust and prevent wind erosion	Immediately water and clean-up after demolition	Maricopa County Rule 310 04/07/2004
Utilization of dust suppressants other than water when necessary; prewater; empty loader bucket slowly	Prevent wind erosion from piles; stabilize condition where equip and vehicles op	Bulk material handling for stacking, loading, and unloading; for haul trucks and areas where equipment op	Maricopa County Rule 310 04/07/2004

4.5 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 4-4 summarizes the compliance tools that are applicable to materials handling.

Table 4-4. Compliance Tools for Materials Handling

Record keeping	Site inspection/monitoring
Site map; work practices and locations; material throughputs; type of material and size characterization; typical moisture content when fresh; vehicle/equipment disturbance areas; material transfer points and drop heights; spillage and cleanup occurrences; wind fence/enclosure installation and maintenance; dust suppression equipment and maintenance records; frequencies, amounts, times, and rates for watering and dust suppressants; meteorological log.	Observation of material transfer operations and storage areas (including spills), operation of wet suppression systems, vehicle/ equipment operation and disturbance areas; surface material sampling and analysis for silt and moisture contents; inspection of wind sheltering including enclosures; real-time portable monitoring of PM; observation of dust plume opacities exceeding a standard.

4.6 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for materials handling. A sample cost-effectiveness calculation is presented

below for a specific control measure (continuous water spray at conveyor transfer point) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for materials handling, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Materials Handling (Conveyor Transfer Point)

Step 1. Determine source activity and control application parameters.

Material throughput (tons/hr)	25
Operating cycle (hours/day)	12
Number of workdays/year	312
Number of transfer points	1
Moisture content of material, M (%)	1
Mean wind speed, U (mph)	6
Control Measure	Water spray located at conveyor transfer point
Control application/frequency	Continuous
Economic Life of Control System (yr)	10

The material throughput, operating cycle, number of workdays per year, number of transfer points, material moisture content, wind speed, and economic life of the control system are assumed values for illustrative purposes. A continuous water spray located at a conveyor transfer point has been chosen as the applied control measure to increase the moisture content of the material from 1% to 2%.

Step 2. Calculate Uncontrolled PM10 Emission Factor. The PM10 emission factor, EF, is calculated from the AP-42 equation utilizing the appropriate correction parameters (mean wind speed U = 6 mph and moisture content M = 1%), as follows:

$$EF=(0.35) \times (0.0032) \times (6/5)^{1.3} / (1/2)^{1.4} = 0.00377 \text{ lb/ton}$$

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor (calculated in Step 2) is multiplied by the material throughput, operating cycle, and workdays per year (all under activity data) and then divided by 2,000 lbs to compute the annual PM10 emissions in tons per year, as follows:

Annual PM10 emissions = (EF x Material Throughput x Operating Cycle x Workdays/yr) / 2,000
Annual PM10 emissions = (0.00377 x 25 x 12 x 312) / 2000 = 0.175 tons

Annual PM2.5 emissions = 0.15 x PM10 emissions[12]
Annual PM2.5 emissions = (0.15 x 0.175 tons) = 0.0263 tons

Step 4. Calculate Controlled PM Emission Factor. The PM emission factor for controlled emissions, EF, is calculated from the AP-42 equation utilizing the appropriate correction parameters (mean wind speed U = 6 mph and moisture content M = 2%), as follows:

$$EF=(0.35) \times (0.0032) \times (6/5)^{1.3} / (2/2)^{1.4} = 0.00142 \text{ lb/ton}$$

Step 5. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) is calculated by multiplying the PM10 emission factor (calculated in Step 4) by the material throughput, operating cycle, and workdays per year (all under activity data) and then divided by 2,000 lbs to compute the annual emissions in tons per year, as follows:

Annual emissions = (EF x Material Throughput x Operating Cycle x Workdays/yr) / 2,000
Annual PM10 Emissions = (0.00142 x 25 x 12 x 312) / 2000 = 0.0664 tons

Annual PM2.5 emissions for material transfer = 0.15 x PM10 emissions[12]
Annual PM2.5 Emissions = (0.15 x 0.0665 tons) = 0.00100 tons

Note: The control efficiency of using a water spray to increase the material moisture content from 1% to 2% is 62% (100 x (0.175 – 0.0664) / 0.175)

Step 6. Determine Annual Cost to Control PM Emissions.

Capital costs ($)	16,000
Annual Operating/Maintenance costs ($)	12,200
Annual Interest Rate	3%
Capital Recovery Factor	0.1172
Annualized Cost ($/yr)	14,076

The capital costs, annual operating and maintenance costs, and annual interest rate (AIR) are assumed values for illustrative purposes. The Capital Recovery Factor (CRF) is calculated from the Annual Interest Rate (AIR) and the Economic Life of the control system, as follows:

$$\text{Capital Recovery Factor} = AIR \times (1+AIR)^{\text{Economic life}} / (1+AIR)^{\text{Economic life}} - 1$$

$$\text{Capital Recovery Factory} = 3\% \times (1+ 3\%)^{10} / (1+ 3\%)^{10} - 1 = 0.1172$$

The Annualized Cost is calculated by adding the product of the Capital Recovery Factor by the Capital costs with the annual Operating/Maintenance costs as follows:

Annualized Cost = (CRF x Capital costs) + Operating/Maintenance costs
Annualized Cost = (0.1172 x 16,000) + 12,200 = $14,076

Step 7. Calculate Cost-effectiveness. Cost-effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost-effectiveness = Annualized Cost/ (Uncontrolled emissions – Controlled emissions)

Cost-effectiveness for PM10 emissions = $14,076/ (0.175– 0.0664) = $129,267/ton
Cost-effectiveness for PM2.5 emissions = $14,076/ (0.0263– 0.0100) = $861,779/ton

5.1 Characterization of Source Emissions

Particulate emissions occur whenever vehicles travel over a paved surface such as a road or parking lot. Particulate emissions from paved surfaces are due to direct emissions from vehicles in the form of exhaust, brake wear and tire wear emissions, and resuspension of loose material on the road surface. In general terms, resuspended particulate emissions from paved surfaces originate from, and result in the depletion of the loose material present on the surface (i.e., the surface loading). In turn, that surface loading is continuously replenished by other sources. At industrial sites, surface loading is replenished by spillage of material and trackout from unpaved roads and staging areas.

Various field studies have found that public streets and highways as well as roadways at industrial facilities can be major sources of the atmospheric particulate matter within an area.[1-9] Of particular interest in many parts of the United States are the increased levels of emissions from public paved roads when the equilibrium between deposition and removal processes is upset. This situation can occur for various reasons, including application of granular materials for snow and ice control, mud/dirt carryout from construction activities in the area, and deposition from wind and/or water erosion of surrounding unstabilized areas. In the absence of continuous addition of fresh material (through localized trackout or application of antiskid material), paved road surface loading should reach an equilibrium value in which the amount of material resuspended matches the amount replenished. The equilibrium surface loading value depends upon numerous factors. It is believed that the most important factors are: the mean speed of vehicles traveling the road, the average daily traffic (ADT), the number of lanes and ADT per lane, the fraction of heavy vehicles (buses and trucks), and the presence or absence of curbs, storm sewers and parking lanes.[10]

5.2 Emissions Estimation: Primary Methodology[1-29]

This section was adapted from Section 13.2.1 of EPA's *Compilation of Air Pollutant Emission Factors (AP-42)*. Section 13.2.1 was last updated in December 2003.

Dust emissions from paved roads have been found to vary with what is termed the "silt loading" present on the road surface as well as the average weight of vehicles traveling the road. The term silt loading (sL) refers to the mass of silt-size material (equal to or less than 75 micrometers [µm] in physical diameter) per unit area of the travel surface. The total road surface dust loading consists of loose material that can be collected by broom sweeping and vacuuming of the traveled portion of the paved road. The silt fraction is determined by measuring the proportion of the loose dry surface dust that passes through a 200-mesh screen using the ASTM-C-136 method. Silt loading is the product of the silt fraction and the total loading, and is abbreviated "sL." Additional details on the sampling and analysis of such material are provided in Appendices C.1 and C.2 of AP-42.

The surface silt loading (sL) provides a reasonable means of characterizing seasonal variability in a paved road emission inventory. In many areas of the country, road surface silt loadings are heaviest during the late winter and early spring months when the residual loading from snow/ice controls is greatest.[11-21] As noted earlier, once replenishment of fresh material is eliminated, the road surface silt loading can be expected to reach an equilibrium value, which is substantially lower than the late winter/early spring values.

The quantity of particulate emissions from resuspension of loose material on the road surface due to vehicle travel on a dry paved road may be estimated using the following empirical expression:

$$E = k\left(\frac{sL}{2}\right)^{0.65} \times \left(\frac{W}{3}\right)^{1.5} - C \qquad (1)$$

where,

E = particulate emission factor (having units matching the units of k),
k = particle size multiplier for particle size range,
sL = road surface silt loading (grams per square meter, g/m^2),
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.[27]

It is important to note that Equation 1 calls for the average weight of all vehicles traveling the road. For example, if 99% of traffic on the road are 2-ton cars/trucks while the remaining 1% consists of 20-ton trucks, then the mean weight "W" is 2.2 tons. More specifically, Equation 1 is not intended to be used to calculate a separate emission factor for each vehicle weight class. Instead, only one emission factor should be calculated to represent the "fleet" average weight of all vehicles traveling the road. The particle size multiplier (k) varies with aerodynamic size range. For PM10, k equals 0.016 lb/VMT (i.e., 7.3 g/VMT or 4.6 g/VKT). The PM2.5/PM10 ratio for fugitive dust from travel on paved roads is 0.15.[28]

The PM2.5 and PM10 emission factors for the exhaust, brake wear and tire wear of a 1980's vehicle fleet (C) were obtained from EPA's MOBILE6.2 model.[29] The emission factor also varies with aerodynamic size range as shown in Table 5-1. Equation 1 is based on a regression analysis of numerous emission tests, including 65 tests for PM10.[10] Sources tested include public paved roads, as well as controlled and uncontrolled industrial paved roads. All sources tested were of freely flowing vehicles traveling at constant speed on relatively level roads. No tests of "stop-and-go" traffic or vehicles under load were available for inclusion in the database. The equation retains the quality rating of A, if applied within the range of source conditions that were tested in developing the equation, as follows:

Silt loading:	0.03 - 400 g/m^2; 0.04 - 570 grains/square foot
Mean vehicle weight:	1.8 - 38 megagrams; 2.0 - 42 tons
Mean vehicle speed:	16 - 88 kilometers per hour; 10 - 55 miles per hour

Table 5-1. Emission Factors for 1980's Vehicle Fleet Exhaust, Brake Wear, and Tire Wear

	C, Emission factor for exhaust, brake wear, and tire wear[a]		
Particle size	g/VMT	g/VKT	lb/VMT
PM2.5	0.1617	0.1005	0.00036
PM10	0.2119	0.1317	0.00047

[a] Units shown are grams per vehicle mile traveled (g/VMT), grams per vehicle kilometer traveled (g/VKT), and pounds per vehicle mile traveled (lb/VMT).

NOTE: There may be situations where low silt loading and/or low average weight will yield calculated negative emissions from Equation 1. If this occurs, the emissions calculated from Equation 1 should be set to zero.

Users are cautioned that application of Equation 1 outside of the range of variables and operating conditions specified above (e.g., application to roadways or road networks with speeds below 10 mph and with stop-and-go traffic) will result in emission estimates with a higher level of uncertainty. To retain the quality rating of A for PM10 for the emission factor equation when it is applied to a specific paved road, it is necessary that reliable correction parameter values for the specific road in question be determined. With the exception of limited access roadways, which are difficult to sample, the collection and use of site-specific silt loading (sL) data for public paved road emission inventories are strongly recommended. The field and laboratory procedures for determining surface material silt content and surface dust loading are summarized in Appendices C.1 and C.2 of AP-42. In the event that site-specific silt loading values cannot be obtained, an appropriate value for a paved public road may be selected from the default values given in Table 5-2, but the quality rating of the equation should be reduced by two levels. Also, recall that Equation 1 refers to emissions due to freely flowing (not stop-and-go) traffic at constant speed on level roads.

Equation 1 may be extrapolated to average uncontrolled conditions (but including natural mitigation) under the simplifying assumption that annual (or other long-term) average emissions are inversely proportional to the frequency of measurable (at least 0.254 mm [0.01 inch]) precipitation by application of a precipitation correction term. The precipitation correction term can be applied on a daily or an hourly basis.[26]

For the daily basis, Equation 1 becomes:

$$E_{ext} = \left[k \left(\frac{sL}{2} \right)^{0.65} \left(\frac{W}{3} \right)^{1.5} - C \right] \left(1 - \frac{P}{4N} \right) \qquad (2)$$

where k, sL, W, *and* C are as defined in Equation 1 and

E_{ext} = annual or other long-term average emission factor in the same units as k,
P = number of "wet" days with at least 0.254 mm (0.01 in) of precipitation during the averaging period, and
N = number of days in the averaging period (e.g., 365 for annual, 91 for seasonal, 30 for monthly)

Note that the assumption leading to Equation 2 is based by analogy with the approach used to develop long-term average unpaved road emission factors in Chapter 6. However, Equation 2 above incorporates an additional factor of "4" in the denominator to account for the fact that paved roads dry more quickly than unpaved roads and that the precipitation may not occur over the complete 24-hour day.

Table 5-2. Ubiquitous Silt Loading Default Values with Hot Spot Contributions from Anti-Skid Abrasives for Public Paved Roads (g/m^2)

Average Daily Traffic (ADT) Category	< 500	500-5,000	5,000-10,000	> 10,000
Ubiquitous baseline (g/m^2)	0.6	0.2	0.06	0.03 0.015 limited access
Ubiquitous winter baseline multiplier during months with frozen precipitation	X4	X3	X2	X1
Initial peak additive contribution from application of antiskid abrasive (g/m^2)	2	2	2	2
Days to return to baseline conditions (assume linear decay)	7	3	1	0.5

For the hourly basis, Equation 1 becomes:

$$E_{ext} = \left[k \left(\frac{sL}{2} \right)^{0.65} \left(\frac{W}{3} \right)^{1.5} - C \right] \left(1 - \frac{1.2P}{N} \right) \quad (3)$$

where k, sL, and W, and C are as defined in Equation 1 and

E_{ext} = annual or other long-term average emission factor in the same units as k,
P = number of hours with at least 0.254 mm (0.01 in) of precipitation during the averaging period, and
N = number of hours in the averaging period (e.g., 8,760 for annual; 2,124 for season; 720 for monthly).

Note that the assumption leading to Equation 3 is based by analogy with the approach used to develop long-term average unpaved road emission factors in Chapter 6. Also note that in the hourly moisture correction term (1-1.2P/N) for Equation 3, the 1.2 multiplier is applied to account for the residual mitigative effect of moisture. For most applications, this equation will produce satisfactory results. However, if the time interval for which the equation is applied is short (e.g., 1 hour or 1 day), the application of this multiplier makes it possible for the moisture correction term to become negative. This will result in calculated negative emissions which is not realistic. Users should expand the time interval to include sufficient "dry" hours such that negative emissions are not calculated. For the special case where this equation is used to calculate emissions on an hour by hour basis, such as would be done in some emissions modeling situations, the moisture correction term should be modified so that the moisture correction "credit" is applied to the first hours following cessation of precipitation. In this special case, it is

suggested that this 20% "credit" be applied on a basis of one hour credit for each hour of precipitation up to a maximum of 12 hours.

Maps showing the geographical distribution of "wet" days on an annual basis for the United States based on meteorological records on a monthly basis are available in the *Climatic Atlas of the United States*.[23] Alternative sources include other Department of Commerce publications such as local climatological data summaries. The National Climatic Data Center (NCDC) offers several products that provide hourly precipitation data. In particular, NCDC offers a *Solar and Meteorological Surface Observation Network 1961-1990* (SAMSON) CD-ROM, which contains 30 years worth of hourly meteorological data for first-order National Weather Service locations. Whatever meteorological data are used, the source of that data and the averaging period should be clearly specified. It is emphasized that the simple assumption underlying Equations 2 and 3 has not been verified in any rigorous manner. For that reason, the quality ratings for Equations 2 and 3 should be downgraded one letter from the rating that would be applied to Equation 1.

Table 5-2 presents recommended default silt loadings for normal baseline conditions and for wintertime baseline conditions for public paved roads in areas that experience frozen precipitation with periodic application of antiskid material.[24] The winter baseline is represented as a multiple of the nonwinter baseline, depending on the average daily vehicle traffic count (ADT) value for the road in question. As shown, a multiplier of 4 is applied for low volume roads (< 500 ADT) to obtain a wintertime baseline silt loading of $4 \times 0.6 = 2.4$ g/m^2.

It is suggested that an additional (but temporary) silt loading contribution of 2 g/m^2 occurs with each application of antiskid abrasive for snow/ice control. This was determined based on a typical application rate of 500 lb per lane mile and an initial silt content of 1%. Ordinary rock salt and other chemical deicers add little to the silt loading because most of the chemical dissolves during the snow/ice melting process.

To adjust the baseline silt loadings for mud/dirt trackout, the number of trackout points is required. It is recommended that in calculating PM10 emissions, six additional miles of road be added for each active trackout point from an active construction site, to the paved road mileage of the specified category within the county. In calculating PM2.5 emissions, it is recommended that three additional miles of road be added for each trackout point from an active construction site. It is suggested the number of trackout points for activities other than road and building construction areas be related to land use. For example, in rural farming areas, each mile of paved road would have a specified number of trackout points at intersections with unpaved roads. This value could be estimated from the unpaved road density (miles per square mile).

The use of a default value from Table 5-2 should be expected to yield only an order-of-magnitude estimate of the emission factor. Public paved road silt loadings are dependent upon: traffic characteristics (speed, ADT, and fraction of heavy vehicles); road characteristics (curbs, number of lanes, parking lanes); local land use (agriculture, new residential construction) and regional/seasonal factors (snow/ice controls, wind blown

dust). As a result, the collection and use of site-specific silt loading data is highly recommended. In the event that default silt loading values are used, the quality ratings for the equation should be downgraded two levels.

Limited access roadways (high speed freeways) pose severe logistical difficulties in terms of surface sampling, and few silt loading data are available for such roads. Nevertheless, the available data do not suggest great variation in silt loading for limited access roadways from one part of the country to another. For annual conditions, a default value of 0.015 g/m^2 is recommended for limited access roadways.[9, 22] Even fewer of the available data correspond to worst-case situations, and elevated loadings are observed to be quickly depleted because of high traffic speeds and high ADT rates. A default value of 0.2 g/m^2 is recommended for short periods of time following application of snow/ice controls to limited access roads.[22]

The limited data on silt loading values for industrial roads have shown as much variability as public roads. Because of the variations of traffic conditions and the use of preventive mitigative controls, the data probably do not reflect the full extent of the potential variation in silt loading on industrial roads. However, the collection of site specific silt loading data from industrial roads is easier and safer than for public roads. Therefore, the collection and use of site-specific silt loading data is preferred and is highly recommended. In the event that site-specific values cannot be obtained, an appropriate value for an industrial road may be selected from the mean values given in Table 5-3, but the quality rating of the equation should be reduced by two levels.

AP-42 measurements of silt loading for paved roads involve periodic sampling from representative roads that are then used to calculate emissions. These silt loadings have been shown to be highly variable in time and space, and the labor required for their acquisition mitigates against frequent sampling that covers a wide spatial extent. Several groups – Desert Research Institute (DRI) and UC Riverside (CE-CERT) - have developed vehicle-based mobile sampling systems for PM10 emissions of re-entrained paved road dust over the past several years.[30] Both systems (DRI's system is called TRAKER and CE-CERT's system is called SCAMPER) have been calibrated in Las Vegas against actual AP-42 silt loadings determined for samples taken in the study area for a complete range of paved roadway classifications and a large range of visible paved road surface loadings. The study results showed a reasonable relationship between the continuous vehicle-based PM10 emission measurements and actual silt loadings.

Table 5-3 Typical Silt Content and Loading Values for Paved Roads at Industrial Facilities[a] (Metric And English Units).

Industry	No. of sites	No. of samples	Silt content (%)		No. of travel lanes	Total loading x 10^{-3}			Silt loading (g/m^2)	
			Range	Mean		Range	Mean	Units[b]	Range	Mean
Copper smelting	1	3	15.4-21.7	19.0	2	12.9-19.5 45.8-69.2	15.9 55.4	kg/km lb/mi	188-400	292
Iron and steel production	9	48	1.1-35.7	12.5	2	0.006-4.77 0.020-16.9	0.495 1.75	kg/km lb/mi	0.09-79	9.7
Asphalt batching	1	3	2.6-4.6	3.3	1	12.1-18.0 43.0-64.0	14.9 52.8	kg/km lb/mi	76-193	120

[b] Multiply entries by 1,000 to obtain stated units: kilograms per kilometer (kg/km) and pounds per mile (lb/mi).

5.3 Emission Estimation: Alternate Methodology

This section was adapted from Section 7.9 of CARB's Emission Inventory Methodology. Section 7.9 was last updated in July 1997.

The paved road dust category includes emissions of fugitive dust particulate matter entrained by vehicular travel on paved roads. The California Air Resources Board (CARB) estimates road dust emissions for the following four classes of roads: (1) freeways/expressways, (2) major streets/highways, (3) collector streets, and (4) local streets. Dust emissions from vehicle travel on paved roads are computed using the emission factor equation provided in AP-42 (see Section 5.2 of this document). Inputs to the paved road dust equation were developed from area-specific roadway silt loading and average vehicle weight data measured by Midwest Research Institute (MRI, 1996).[31]

Data from states and air districts are used to estimate county specific VMT (vehicle miles traveled) data.[32, 33] State highway[34] data are used to estimate the fraction of travel on each of the four road types in each county.

The statewide average vehicle weight for California is assumed to be 2.4 tons. This estimate is based on an informal traffic count estimated by MRI while they were performing California silt loading measurements.[31] CARB assumes the following silt loadings for the four road categories: 0.02 g/m^2 for freeways, 0.035 g/m^2 for major roads, and 0.32 g/m^2 for collector and local roads.[35]

Temporal activity is assumed to be the same as on-road vehicle travel: uniform in spring and fall, increasing slightly in summer, and decreasing slightly in winter. The monthly temporal profile shown below in Table 5-4 shows this trend. The weekly and daily activities are estimated to have higher activities on weekdays and during daylight hours.

Table 5-4. Monthly Temporal Profile for On-road Vehicle Travel

ALL	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
100	7.7	7.7	8.5	8.5	8.5	8.5	8.5	8.5	8.5	8.5	8.5	7.7

This alternative methodology utilized by CARB is subject to the following assumptions and limitations:

1. The current AP-42 emission factor assumes that road dust emissions are proportional to VMT, roadway silt loading, and average vehicle weight.
2. It may be necessary to assume that virtually the same silt loading values apply throughout the state because of lack of measured silt loadings.
3. The methodology assumes that roadway silt loading, and therefore the emission factor, varies by the type of road.
4. It is assumed that the EPA particle size multiplier (i.e., the 'k' factor in the AP-42 equation) reasonably represents the size distribution of paved road dust.

5. The average vehicle fleet weight is assumed to be 2.4 tons in California (except for the SCAQMD that assumes 3 tons).
6. For freeway and major roads, emissions growth is assumed to be proportional to changes in roadway centerline mileage. For collector and local roads, emissions growth is assumed proportional to changes in VMT.

5.4 Demonstrated Control Techniques

Because of the importance of road surface silt loading, control techniques for paved roads attempt either to prevent material from being deposited onto the surface (preventive controls) or to remove from the travel lanes any material that has been deposited (mitigative controls). Covering of loads in trucks and the paving of access areas to unpaved lots or construction sites are examples of preventive measures. Examples of mitigative controls include vacuum sweeping, water flushing, and broom sweeping and flushing. Actual control efficiencies for any of these techniques can be highly variable. Locally measured silt loadings before and after the application of controls is the preferred method to evaluate controls. It is particularly important to note that street sweeping of gutters and curb areas may actually increase the silt loading on the traveled portion of the road. Redistribution of loose material onto the travel lanes will actually produce a short-term increase in the emissions.

In general, preventive controls are usually more cost effective than mitigative controls. The cost-effectiveness of mitigative controls falls off dramatically as the size of an area to be treated increases. The cost-effectiveness of mitigative measures is also unfavorable if only a short period of time is required for the road to return to equilibrium silt loading condition. That is to say, the number and length of public roads within most areas of interest preclude any widespread and routine use of mitigative controls. On the other hand, because of the more limited scope of roads at an industrial site, mitigative measures may be used quite successfully (especially in situations where truck spillage occurs). Note, however, that public agencies could make effective use of mitigative controls to remove sand/salt from roads after the winter ends.

Because available controls will affect the silt loading, controlled emission factors may be obtained by substituting controlled silt loading values into the appropriate equation. (Note that emission factors from controlled industrial roads were used in the development of the equation.) The collection of surface loading samples from treated, as well as baseline (untreated) roads provides a means to track effectiveness of the controls over time.

Table 5-5 summarizes tested control measures and reported control efficiencies for measures that reduce the generation of fugitive dust from paved roads.

Table 5-5. Control Efficiencies for Control Measures for Paved Roads[36-38]

Control measure	Source component	PM10 control efficiency	References/Comments
Implement street sweeping program with non-efficient vacuum units (14-day frequency)	Local streets	7%	MRI, September 1992. For non-PM10 efficient sweepers based on 55% efficient sweeping, 5.5 day equilibrium return time and CA-VMT weighted sweeping frequency (7 to 30 days)
	Arterial/collector streets	11%	
Implement street sweeping program with PM10 efficient vacuum units (14-day frequency)	Local streets	16%	MRI, September 1992. For PM10 efficient sweepers, based on 86% efficient sweeping, 8.6 day return time, and CA-VMT weighted sweeping frequency (7 to 30 days)
	Arterial/collector streets	26%	
Require streets to be swept by non-efficient vacuum units (once per month frequency)	Local, arterial and collector streets	4%	MRI, September 1992. For non-PM10 efficient sweepers based on 55% efficient sweeping, 5.5 day equilibrium return time and CA-VMT weighted sweeping frequency (7 to 30 days)
Require streets to be swept by PM10 efficient vacuum units (once per month frequency)	Local, arterial and collector streets	9%	MRI, September 1992. For PM10 efficient sweepers, based on 86% efficient sweeping, 8.6 day return time, and CA-VMT weighted sweeping frequency (7 to 30 days)
Require wind- or water-borne deposition to be cleaned up within 24 hours after discovery	All Streets	100%	Assumes total cleanup of spill on roadway before traffic resumes
Install pipe-grid trackout-control device	Mud/dirt carryout	80%	Sierra Research, 2003.
Install gravel bed trackout apron (3 in deep, 25 ft long and full road width)	Mud/dirt carryout	46%	MRI, April 2001
Require paved interior roads to be 100 foot long and full road width, or add 4 foot shoulder for paved roads	Mud/dirt carryout	42%	MRI, April 2001

5.5 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. Example regulatory formats for several local air quality agencies in the WRAP region are presented in Table 5-6. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/envsvc/air/ruledesc.asp

Table 5-6. Example Regulatory Formats for Paved Roads

Control Measure	Goal	Threshold	Agency
Limit speed limit to 15 mph or less	Limit track-out from bulk material transport; reduce particulate matter emissions from paved roads	Work site roads, crossing paved roads transporting bulk materials; during disking and blading ops	Maricopa County Rule 310 04/07/2004
Requires paved travel section, and 4 ft of paved or stabilized shoulder on each side of travel section. Shoulders shall be paved with dust palliative or gravel (2"). Medians shall be constructed as follows: with curbing, solid paving; apply dust palliatives, or with material that prevent track-0ut such as landscaping or decorative rock.	Comply with stabilization standard: limit shoulder visible dust emissions to 20% opacity; limit silt loading to 0.33 oz/ft2	Newly constructed or modified paved roads	Clark County Hydrographic Basins 212, 216, 217 Sect. 93 Air Quality Reg. 07/01/04
Requires paved shoulders. As an option to paving or vegetation requirements, oils or chemical dust suppressants can be used and must be maintained	Limit visible dust emissions to 20% opacity	Roads with average daily vehicle trips (ADVT) of 500 or more	SJVAPCD Rule 8061 11/15/2001
Require average shoulder width to be 4 ft. Curbing adjacent to and contiguous with a paved lane or shoulder can be used in lieu of shoulder width requirements. Intersections, auxiliary entry and exit lanes may be constructed adjacent to and contiguous with a paved roadway in lieu of shoulder requirements	Limit visible dust emissions to 20% opacity	Roads with average daily vehicle trips (ADVT) 500-3000	SJVAPCD Rule 8061 11/15/2001
Require average shoulder width to be 8 ft. Curbing adjacent to and contiguous with a paved lane or shoulder can be used in lieu of shoulder width requirements. Intersections, auxiliary entry and exit lanes may be constructed adjacent to and contiguous with a paved roadway in lieu of shoulder requirements	Limit visible dust emissions to 20% opacity	Roads with average daily vehicle trips (ADVT) greater than 3000	SJVAPCD Rule 8061 11/15/2001
Medians constructed with minimum 4 ft shoulder widths adjacent to traffic lanes, and landscaped. Medians constructed with curbing id speed limit < 45 mph	Meet stabilized surface requirements and limit visible dust emissions to 20% opacity	Roads with average daily vehicle trips (ADVT) of 500 or more and medians part of roadway	SJVAPCD Rule 8061 11/15/2001
Curbing and shoulder width requirements in event of contingency notification	Maintain stabilized surface; limit paved road dust	Roads with average daily vehicle trips (ADVT) of 500 or more	SCAQMD Rule 1186 9/10/1999
Require average shoulder width to be 4 ft.	Limit visible dust emissions to 20% opacity	Roads with average daily vehicle trips (ADVT) 500-3000	SCAQMD Rule 1186 9/10/1999
Require average shoulder width to be 8 ft.	Limit visible dust emissions to 20% opacity	Roads with average daily vehicle trips (ADVT) > 3000	SCAQMD Rule 1186 9/10/1999
For speed limit >45 mph: pave median area with typical roadway materials. For speed limit <45 mph: medians must be landscaped or treated with chemical stabilizers.	Maintain stabilized surface	Roads with average daily vehicle trips (ADVT) of 500 or more	SCAQMD Rule 1186 9/10/1999

5.6 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 5-7 summarizes the compliance tools that are applicable to paved roads.

Table 5-7. Compliance Tools for Paved Roads

Record keeping	Site inspection/monitoring
Road map; traffic volumes, speeds, and patterns; vacuum sweeping, mud/dirt trackout precautions, spill cleanup, erosion control, tarping of haul trucks; curbing of roads; application of sand/salt for anti-skid operations; dust suppression equipment and maintenance records.	Sampling of silt loading on paved road surfaces; counting of traffic volumes; observations of vacuum sweeping, high dust emission areas (including track-on and wash-on points), road curbing/shoulders; observation of dust plume opacity (visible emissions) exceeding a standard; real-time portable monitoring of PM.

5.7 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for fugitive dust originating from paved roads. A sample cost-effectiveness calculation is presented below for a specific control measure (PM10 efficient street sweeper) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control

measure for paved roads, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Paved Roads
(Arterial Road Through Industrial Area)

Step 1. Determine source activity and control application parameters.

Vehicles/day	200
Average vehicle speed (mph)	40
Length of road (miles)	10
Control Measure	Use of PM10 efficient street sweepers
Control application/frequency	Once per month
Economic Life of Control System (yr)	10
Control Efficiency	9.2%

The number of vehicles per day, the average vehicle speed, road length, and economic life are assumed values for illustrative purposes. Street sweeping, using PM10 efficient sweepers has been chosen as the applied control measure. The control application/frequency and control efficiency are default values provided by MRI.[37]

Step 2. Calculate PM10 Emission Factor. The PM10 emission factor is calculated from the AP-42 equation.

$$E\ (lb/VMT) = 0.016\ (sL/2)^{0.65}\ (W/3)^{1.5} - C) \times (1-(P/1460))$$

sL—silt loading (g/m^2)	12
W—average vehicle weight (tons)	5
C—exhaust plus break and tire wear (lb/VMT)	0.00047
P—wet days/yr (number/yr)	50

E = 0.106 lb/VMT

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor (calculated in Step 2) is multiplied by the number of vehicles per day and the road length (both under activity data) and then multiplied by 365/2,000 to compute the annual PM10 emissions, as follows:

Annual PM10 emissions = (Emission Factor x Vehicles/day x Road length x 365 / 2,000
Annual PM10 emissions = (0.106 x 200 x 10) x 365 /2,000 = 39 tons

Annual PM2.5 emissions = 0.15 x PM10 emissions[28]
Annual PM2.5 emissions = (0.15 x 39) = 5.8 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

For this example, a PM10 efficient street sweeper with a control efficiency of 9.2% has been selected as the control measure. Thus, the annual controlled PM10 and PM2.5 emissions estimates are calculated to be:

Annual Controlled PM10 emissions = (39 tons) x (1 – 0.092) = 35 tons
Annual Controlled PM2.5 emissions = (5.8 tons) x (1 – 0.092) = 5.3 tons

Step 5. Determine Annual Cost to Control PM Emissions.

Capital costs ($)	152,000
Annual Operating/Maintenance costs ($)	16,000
Annual Interest Rate	3%
Capital Recovery Factor	0.1172
Annualized Cost ($/yr)	33,819

The capital costs, annual operating and maintenance costs, and annual interest rate (AIR) are assumed values for illustrative purposes. The Capital Recovery Factor (CRF) is calculated from the Annual Interest Rate (AIR) and the Economic Life of the control system, as follows:

$$\text{Capital Recovery Factor} = AIR \times (1+AIR)^{\text{Economic life}} / (1+AIR)^{\text{Economic life}} - 1$$

$$\text{Capital Recovery Factory} = 3\% \times (1+3\%)^{10} / (1+3\%)^{10} - 1 = 0.1172$$

The Annualized Cost is calculated by adding the product of the Capital Recovery Factor and the Capital costs to the annual Operating/Maintenance costs:

Annualized Cost = (CRF x Capital costs) + Annual Operating/Maintenance costs

Annualized Cost = (0.1172 x 152,000) + 16,000 = $33,819

Step 6. Calculate Cost Effectiveness. Cost effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost effectiveness = Annualized Cost/ (Uncontrolled emissions – Controlled emissions)

Cost effectiveness for PM10 emissions = $33,819 / (39 - 35) = $9,492/ton
Cost effectiveness for PM2.5 emissions = $33,819 / (5.8 - 5.3) = $63,283/ton

6.1 Characterization of Source Emissions

When a vehicle travels on an unpaved surface such as an unpaved road or unpaved parking lot, the force of the wheels on the road surface causes pulverization of surface material. Particles are lifted and dropped from the rolling wheels, and the road surface is exposed to strong air currents in turbulent shear with the surface. The turbulent wake behind the vehicle continues to act on the road surface after the vehicle has passed. The quantity of dust emissions from a given segment of unpaved road varies linearly with the volume of traffic. Field investigations also have shown that emissions depend on source parameters that characterize the condition of a particular road and the associated vehicle traffic. Characterization of these source parameters allow for "correction" of emission estimates to specific road and traffic conditions present on public and industrial roadways.

6.2 Emission Estimation: Primary Methodology[1-26]

This section was adapted from Section 13.2.2 of EPA's *Compilation of Air Pollutant Emission Factors (AP-42)*. Section 13.2.2 was last updated in December 2003.

Dust emissions from unpaved roads have been found to vary directly with the fraction of silt (particles smaller than 75 micrometers [µm] in physical diameter) in the road surface materials.[1] The silt fraction is determined by measuring the proportion of loose dry surface dust that passes a 200-mesh screen using the ASTM-C-136 method. A summary of this method is contained in Appendix C of AP-42. Table 6-1 summarizes measured silt values for industrial unpaved roads. Table 6-2 summarizes measured silt values for public unpaved roads. It should be noted that the ranges of silt content for public unpaved roads vary over two orders of magnitude. Therefore, the use of data from this table can potentially introduce considerable error. Use of this data is strongly discouraged when it is feasible to obtain locally gathered data.

Since the silt content of a rural dirt road will vary with geographic location, it should be measured for use in projecting emissions. As a conservative approximation, the silt content of the parent soil in the area can be used. Tests, however, show that road silt content is normally lower than in the surrounding parent soil, because the fines are continually removed by the vehicle traffic, leaving a higher percentage of coarse particles. Other variables are important in addition to the silt content of the road surface material. For example, at industrial sites, where haul trucks and other heavy equipment are common, emissions are highly correlated with vehicle weight. On the other hand, there is far less variability in the weights of cars and pickup trucks that commonly travel publicly accessible unpaved roads throughout the United States. For those roads, the moisture content of the road surface material may be more dominant in determining differences in emission levels between a hot desert environment and a cool moist location.

Table 6-1. Typical Silt Content Values of Surface Material on Industrial Unpaved Roads[a]

Industry	Road use or surface material	Plant sites	No. of samples	Silt content (%)	
				Range	Mean
Copper smelting	Plant road	1	3	16-19	17
Iron and steel production	Plant road	19	135	0.2-19	6.0
Sand and gravel processing	Plant road	1	3	4.1-6.0	4.8
	Material storage area	1	1	–	7.1
Stone quarry and processing	Plant road	2	10	2.4-16	10
	Haul road to/from pit	4	20	5.0-15	8.3
Taconite mining and processing	Service road	1	8	2.4-7.1	4.3
	Haul road to/from pit	1	12	3.9-9.7	5.8
Western surface coal mining	Haul road to/from pit	3	21	2.8-18	8.4
	Plant road	2	2	4.9-5.3	5.1
	Scraper route	3	10	7.2-25	17
	Haul road (freshly graded)	2	5	18-29	24
Construction sites	Scraper routes	7	20	0.56-23	8.5
Lumber sawmills	Log yards	2	2	4.8-12	8.4
Municipal solid waste landfills	Disposal routes	4	20	2.2-21	6.4

Table 6-2. Typical Silt Content Values of Surface Material on Public Unpaved Roads[a]

Industry	Road use or surface material	Plant sites	No. of samples	Silt content (%)	
				Range	Mean
Publicly accessible roads	Gravel/crushed limestone	9	46	0.1-15	6.4
	Dirt (i.e., local material compacted, bladed, and crowned)	8	24	0.83-68	11

[a] References 1, 5-16.

6.2.1 Emission Factors

The PM10 emission factors presented below are the outcomes from stepwise linear regressions of field emission test results of vehicles traveling over unpaved surfaces. For vehicles traveling on unpaved surfaces at industrial sites, PM10 emissions are estimated from the following empirical equation:

$$E = 1.5\,(s/12)^{0.9}\,(W/3)^{0.45} \qquad (1a)$$

and, for vehicles traveling on publicly accessible roads, dominated by light duty vehicles, PM10 emissions may be estimated from the following equation:

$$E = \frac{1.8\,(s/12)^{1.8}\,(S/30)^{0.5}}{(M/0.5)^{0.2}} - C \qquad (1b)$$

where

E = PM10 emission factor (lb/VMT)
s = surface material silt content (%)
W = mean vehicle weight (tons)
M = surface material moisture content (%)
S = mean vehicle speed (mph)
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

The source characteristics s, W and M are referred to as correction parameters for adjusting the emission estimates to local conditions. The metric conversion from lb/VMT to grams (g) per vehicle kilometer traveled (VKT) is 1 lb/VMT = 281.9 g/VKT. Equations 1a and 1b have a quality rating of B if applied within the ranges of source conditions that were tested in developing the equations shown in Table 6-3.

Table 6-3. Range of Source Conditions Used in Developing Equations 1a and 1b

Emission factor	Surface silt content, %	Mean vehicle weight		Mean vehicle speed		Mean No. of wheels	Surface moisture content, %
		Mg	ton	km/hr	mph		
Industrial roads (Equation 1a)	1.8-25.2	1.8-260	2-290	8-69	5-43	4-17[a]	0.03-13
Public roads (Equation 1b)	1.8-35	1.4-2.7	1.5-3	16-88	10-55	4-4.8	0.03-13

As noted earlier, the models presented as Equations 1a and 1b were developed from tests of traffic on unpaved surfaces, mostly performed in the 1980s. Unpaved roads have a hard, generally nonporous surface that usually dries quickly after a rainfall or watering, because of traffic-enhanced natural evaporation. Factors influencing how fast a road dries are discussed in Section 6.5 below. A higher mean vehicle weight and a higher than normal traffic rate may be justified when performing a worst-case analysis of emissions from unpaved roads.

The PM2.5/PM10 ratio for fugitive dust from vehicles traveling on unpaved roads is 0.1.[23] The PM2.5 and PM10 emission factors for the exhaust, brake wear, and tire wear of a 1980's vehicle fleet (*C*) are shown in Table 6-4. They were obtained from EPA's MOBILE6.2 model.[24]

Table 6-4. Emission Factors for 1980's Vehicle Fleet Exhaust, Brake Wear, and Tire Wear

Particle size	*C*, Emission factor for exhaust, brake wear, and tire wear (lb/VMT)
PM2.5	0.00036
PM10	0.00047

A PM10 emission factor for the resuspension of fugitive dust from unpaved shoulders created by the wake of high-profile vehicles such as tractor-trailers traveling on paved roads at high speed has been developed by Desert Research Institute (DRI). A discussion of the emissions estimation methodology for fugitive dust originating from unpaved shoulders is presented in Chapter 14.

6.2.2 Source Extent

It is important to note that the vehicle-related source conditions refer to the average weight, speed, and number of wheels for all vehicles traveling the road. For example, if 98% of the traffic on the road are 2-ton cars and trucks while the remaining 2% consists of 20-ton trucks, then the mean weight is 2.4 tons. More specifically, Equations 1a and 1b are not intended to be used to calculate a separate emission factor for each vehicle class within a mix of traffic on a given unpaved road. That is, in the example, one should not determine one factor for the 2-ton vehicles and a second factor for the 20-ton trucks. Instead, only one emission factor should be calculated that represents the "fleet" average of 2.4 tons for all vehicles traveling the road. Moreover, to retain the quality ratings when addressing a group of unpaved roads, it is necessary that reliable correction parameter values be determined for the road in question. The field and laboratory procedures for determining road surface silt and moisture contents are given in Appendices C.1 and C.2 of AP-42. Vehicle-related parameters should be developed by recording visual observations of traffic. In some cases, vehicle parameters for industrial unpaved roads can be determined by reviewing maintenance records or other information sources at the facility.

In the event that site-specific values for correction parameters cannot be obtained, then default values may be used. In the absence of site-specific silt content information, an appropriate mean value from Tables 6-1 and 6-2 may be used as a default value, but the quality rating of the equation is reduced by two letters. Because of significant differences found between different types of road surfaces and between different areas of the country, use of the default moisture content value of 0.5 percent in Equation 1b is discouraged. The quality rating should be downgraded two letters when the default moisture content value is used. It is assumed that readers addressing industrial roads have access to the information needed to develop average vehicle information for their facility.

6.2.3 Natural Mitigation

The effect of routine watering to control emissions from unpaved roads is discussed below in Section 6.5. However, all roads are subject to some natural mitigation because of rainfall and other precipitation. The Equation 1a and 1b emission factors can be extrapolated to annual average uncontrolled conditions (but including natural mitigation) under the simplifying assumption that annual average emissions are inversely proportional to the number of days with measurable (more than 0.254 mm [0.01 inch]) precipitation:

$$E_{ext} = E[(365 - P)/365] \quad (2)$$

where,

E_{ext} = annual size-specific emission factor extrapolated for natural mitigation (lb/VMT)
E = emission factor from Equation 1a or 1b
P = number of days in a year with at least 0.254 mm (0.01 in) of precipitation

Maps showing the geographical distribution of "wet" days on an annual basis for the United States based on meteorological records on a monthly basis are available in the *Climatic Atlas of the United States*.[16] Alternative sources include other Department of Commerce publications such as local climatological data summaries. The National Climatic Data Center (NCDC) offers several products that provide hourly precipitation data. In particular, NCDC offers a *Solar and Meteorological Surface Observation Network 1961-1990* (SAMSON) CD-ROM, which contains 30 years worth of hourly meteorological data for first-order National Weather Service locations. Whatever meteorological data are used, the source of that data and the averaging period should be clearly specified.

Equation 2 provides an estimate that accounts for precipitation on an annual average basis for the purpose of inventorying emissions. It should be noted that Equation 2 does not account for differences in the temporal distributions of the rain events, the quantity of rain during any event, or the potential for the rain to evaporate from the road surface. In the event that a finer temporal and spatial resolution is desired for inventories of public unpaved roads, estimates can be based on a more complex set of assumptions. These assumptions include:

1. The moisture content of the road surface material is increased in proportion to the quantity of water added;
2. The moisture content of the road surface material is reduced in proportion to the Class A pan evaporation rate;
3. The moisture content of the road surface material is reduced in proportion to the traffic volume; and
4. The moisture content of the road surface material varies between the extremes observed in the area.

The CHIEF Web site (www.epa.gov/ttn/chief/ap42/ch13/related/c13s02-2) has a file that contains a spreadsheet program for calculating emission factors that are temporally and spatially resolved. Information required for use of the spreadsheet program includes monthly Class A pan evaporation values, hourly meteorological data for precipitation, humidity and snow cover, vehicle traffic information, and road surface material information.

It is emphasized that the simple assumption underlying Equation 2 and the more complex set of assumptions underlying the use of the procedure which produces a finer

temporal and spatial resolution have not been verified in any rigorous manner. For this reason, the quality ratings for either approach should be downgraded one letter from the rating that would be applied to Equation 1.

6.3 Emission Estimation: Alternate Methodology for Non-Farm Roads

This section was adapted from Section 7.10 of CARB's Emission Inventory Methodology. Section 7.10 was last updated in August 1997.

This source category provides estimates of the entrained geologic particulate matter emissions that result from vehicular travel over non-agricultural unpaved roads. The emissions are estimated separately for three major unpaved road categories: city and county roads, U.S. forests and park roads, and Bureau of Land Management (BLM) and Bureau of Indian Affairs (BIA) roads. The emissions result from the mechanical disturbance of the roadway and the vehicle generated air turbulence effects. Agricultural unpaved road estimates are computed in a separate methodology; see Section 6.4.

6.3.1 Emission Factor

The PM10 emission factor used for estimates of geologic dust emissions from vehicular travel on unpaved roads is based on work performed by UC Davis[28] and the Desert Research Institute.[29] The emission factor used for all unpaved roads statewide is 2.27 lbs PM10/VMT.[30] Because the emission measurements were performed in California, this emission factor was used by CARB to replace the previous generic emission factor provided in EPA's AP-42 document.[31] The new emission factor is slightly smaller than the factors derived with the AP-42 methodology. The PM2.5/PM10 ratio for unpaved road dust is 0.1.[23]

6.3.2 Source Extent (Activity Level)

For the purpose of estimating emissions, it is assumed that the unpaved road dust emissions are primarily related to the vehicle miles traveled (VMT) on the roads. State highway data are used to estimate unpaved road miles for each roadway category in each county. It is assumed that 10 daily VMT (DVMT) are traveled on unpaved city and county roads as well as U.S. forest and parks roads and BLM and BIA roads. Road mileage, if needed, can be simply computed by dividing the annual VMT values by 3650 (which is 10 DVMT x 365 days).

Daily activity on unpaved roads occurs primarily during daylight hours. Activity is assumed to be the same each day of the week. Monthly activity varies by county and is based on estimates of monthly rainfall in each county. This is to reflect that during wet months there is less unpaved road traffic, and there are also lower emissions per mile of road when the road soils have a higher moisture content. Unpaved road growth is tied to on-road VMT growth for many counties. For other counties, growth is set to zero and VMT is not used.

6.3.3 Assumptions and Limitations

CARB's methodology is subject to the following assumptions and limitations:

1. This methodology assumes that all unpaved roads emit the same levels of PM10 per VMT during all times of the year for all vehicles and conditions.
2. It is assumed that all unpaved roads receive 10 VMT per day.
3. This methodology assumes that no controls are used on the roads.
4. It is assumed that the emission factors derived in a test county are applicable to the rest of California.

6.4 Emission Estimation: Alternative Methodology for Farm Roads

This section was adapted from Section 7.11 of CARB's Emission Inventory Methodology. Section 7.11 was last updated in August 1997.

This source category provides estimates of the entrained geologic particulate matter emissions that result from vehicular travel over unpaved roads on agricultural lands. The emissions result from the mechanical disturbance of the roadway and the vehicle generated air turbulence effects. This emission factor used is oriented towards dust emissions from light duty vehicle use, but the activity data implicitly include some larger vehicle use for harvest and other operations.

6.4.1 Emission Factor

The PM10 emission factor used for estimates of geologic dust emissions from vehicular travel on unpaved roads is based on work performed by UC Davis[28] and the Desert Research Institute.[29] The emission factor used for all unpaved roads statewide is 2.27 lbs PM10/VMT.[30] Because the emission measurements were performed in California, this emission factor was used by CARB to replace the previous generic emission factor provided in EPA's AP-42 document.[31] CARB's emission factor is slightly smaller than the factors derived with the AP-42 methodology. The PM2.5/PM10 ratio for unpaved road dust is 0.1.[23]

6.4.2 Source Extent (Activity Level)

For the purpose of estimating emissions, it is assumed that the unpaved road dust emissions are primarily related to the vehicle miles traveled (VMT) on the roads. In 1976 an informal survey was made of several county agricultural commissioners in the San Joaquin Valley, who estimated that each 40 acres of cultivated land receives approximately 175 vehicle passes per year on the unpaved farm roads.[32] This value of 4.28 VMT/acre-year has been used in the past by CARB to calculate emissions from unpaved farm roads. CARB is now proposing the following estimates of source extent for unpaved farm roads for different crops: 0.38 VMT/acre-year for grapes, 0.40 VMT/acre-year for cotton, and 1.23 VMT/acre-year for citrus.[33]

The crop acreage data used to estimate the road dust emissions are from the state agency summary of crop acreage harvested.[34, 35] The acreage estimates do not include pasture lands because it is thought that the quantity of vehicular travel on these lands is minimal. Daily activity on unpaved roads occurs primarily during daylight hours. Activity is assumed to be the same each day of the week. Monthly activity varies by county and is based on estimates of monthly rainfall in each county. This is to reflect that during wet months there is less unpaved road traffic, and there are also lower emissions per mile of road when the road soils have a higher moisture content. Unpaved road growth for farm roads is based on agricultural crop acreage or agricultural production. This value is set to zero for many counties.

6.4.3 Assumptions and Limitations

CARB's methodology is subject to the following assumptions and limitations:

1. This methodology assumes that all unpaved farm roads emit the same levels of PM10 per VMT during all times of the year for all vehicles and conditions.
2. It is assumed that all unpaved farm roads receive 175 VMT per 40 acres per year for all crops and cultivation practices.
3. This methodology assumes that no controls are used on the roads.
4. It is assumed that the emission factors derived in the test area are applicable to the rest of California.
5. This methodology assumes that unpaved road travel associated with pasture lands is negligible.

6.5 Demonstrated Control Techniques

A wide variety of options exist to control emissions from unpaved roads. Options fall into the following three groupings:

1. Vehicle restrictions that limit the speed, weight or number of vehicles on the road
2. Surface improvement by measures such as (a) paving or (b) adding gravel or slag to a dirt road
3. Surface treatment such as watering or treatment with chemical dust suppressants

Available control options span broad ranges in terms of cost, efficiency, and applicability. For example, traffic controls provide moderate emission reductions (often at little cost) but are difficult to enforce. Although paving is highly effective, its high initial cost is often prohibitive. Furthermore, paving is not feasible for industrial roads subject to very heavy vehicles and/or spillage of material in transport. Watering and chemical suppressants, on the other hand, are potentially applicable to most industrial roads at moderate to low costs. However, these require frequent reapplication to

maintain an acceptable level of control. Chemical suppressants are generally more cost-effective than water but not in cases of temporary roads (which are common at mines, landfills, and construction sites). In summary, then, one needs to consider not only the type and volume of traffic on the road but also how long the road will be in service when developing control plans.

Vehicle restrictions. These measures seek to limit the amount and type of traffic present on the road, or to lower the mean vehicle speed. For example, many industrial plants have restricted employees from driving on plant property and have instead instituted bussing programs. This eliminates emissions due to employees traveling to/from their worksites. Although the heavier average vehicle weight of the busses increases the base emission factor, the decrease in vehicle-miles-traveled results in a lower overall emission rate.

Surface improvements. Control options in this category alter the road surface. As opposed to "surface treatments" discussed below, improvements are relatively "permanent" and do not require periodic retreatment. The most obvious surface improvement is paving an unpaved road. This option is quite expensive and is probably most applicable to relatively short stretches of unpaved road with at least several hundred vehicle passes per day. Furthermore, if the newly paved road is located near unpaved areas or is used to transport material, it is essential that the control plan address routine cleaning of the newly paved road surface. The control efficiencies achievable by paving can be estimated by comparing emission factors for unpaved and paved road conditions. The predictive emission factor equation for paved roads, given in Chapter 5, requires estimation of the silt loading on the traveled portion of the paved surface, which in turn depends on whether the pavement is periodically cleaned. Unless curbing is to be installed, the effects of vehicle excursion onto unpaved shoulders (berms) also must be taken into account in estimating the control efficiency of paving.

Other surface improvement methods involve covering the road surface with another material that has a lower silt content. Examples include placing gravel or slag on a dirt road. The control efficiency can be estimated by comparing the emission factors obtained using the silt contents before and after improvement. The silt content of the road surface should be determined after 3 to 6 months rather than immediately following placement. Control plans should address regular maintenance practices, such as grading, to retain larger aggregate on the traveled portion of the road.

Surface treatments. These measures refer to control options that require periodic reapplication. Treatments fall into the two main categories of:

(a) wet suppression (i.e., watering, possibly with surfactants or other additives), which keeps the road surface wet to control emissions, and
(b) chemical stabilization that attempts to change the physical characteristics of the surface.

The necessary reapplication frequency varies from minutes or hours for plain water under summertime conditions to several weeks or months for chemical dust suppressants.

Wet Suppression. Watering increases the moisture content, which in turn causes particles to conglomerate and reduces their likelihood of becoming suspended when vehicles pass over the surface. The control efficiency depends on how fast the road dries after water is added. This in turn depends on: (a) the amount (per unit road surface area) of water added during each application; (b) the period of time between applications; (c) the weight, speed and number of vehicles traveling over the watered road during the period between applications; and (d) meteorological conditions (temperature, wind speed, cloud cover, etc.) that affect evaporation during the period. Figure 6-1 presents a simple bilinear relationship between the instantaneous control efficiency due to watering and the resulting increase in surface moisture. The moisture ratio "M" (i.e., the x-axis in Figure 6-1) is found by dividing the surface moisture content of the watered road by the surface moisture content of the uncontrolled road. As the watered road surface dries, both the ratio M and the predicted instantaneous control efficiency (i.e., the y-axis in the figure) decrease. The figure shows that between the uncontrolled moisture content (M = 1) and a value twice as large (M = 2), a small increase in moisture content results in a large increase in control efficiency. Beyond that, control efficiency grows slowly with increased moisture content.

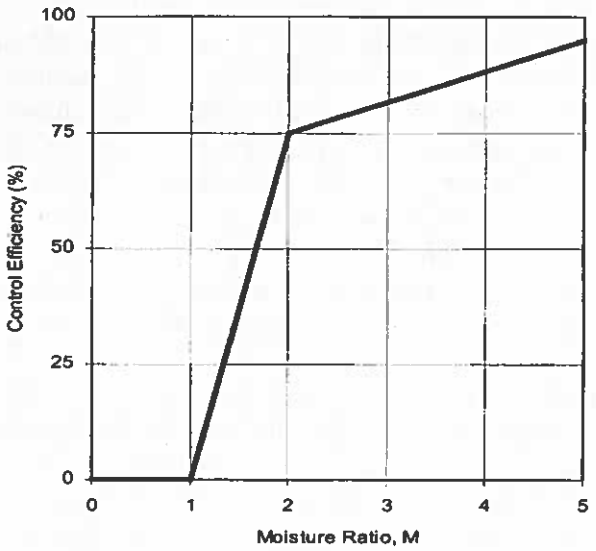

Figure 6-1. Watering Control Effectiveness for Unpaved Travel Surfaces

Given the complicated nature of how the road dries, characterization of emissions from watered roadways is best done by collecting road surface material samples at various times between water truck passes. AP-42 Appendices C.1 and C.2 present the recommended sampling and analysis procedures, respectively, for determining the surface/bulk dust loading. The moisture content measured can then be associated with a control efficiency by use of Figure 6-1. Samples that reflect average conditions during the watering cycle can take the form of either a series of samples between water applications or a single sample at the midpoint. It is essential that samples be collected during periods with active traffic on the road. Finally, because of different evaporation rates, it is recommended that samples be collected at various times during the year. If

only one set of samples is to be collected, these must be collected during hot, summertime conditions.

When developing watering control plans for roads that do not yet exist, it is strongly recommended that the moisture cycle be established by sampling similar roads in the same geographic area. If the moisture cycle cannot be established by similar roads using established watering control plans, the more complex methodology used to estimate the mitigation of rainfall and other precipitation can be used to estimate the control provided by routine watering. An estimate of the maximum daytime Class A pan evaporation (based upon daily evaporation data published in the monthly Climatological Data for the state by the National Climatic Data Center) should be used to insure that adequate watering capability is available during periods of highest evaporation. Hourly precipitation values are replaced by the equivalent inches of precipitation resulting fro watering. One inch of precipitation is equivalent to an application of 5.6 gallons of water per square yard of road. Information on the long term average annual evaporation and on the percentage that occurs between May and October is available in the Climatic Atlas.[16] This methodology should be used only for prospective analyses and for designing watering programs for existing roadways. The quality rating of an emission factor for a watered road that is based on this methodology should be downgraded two letters. Periodic road surface samples should be collected and analyzed to verify the efficiency of the watering program.

Chemical Dust Suppressants. As opposed to wet suppression (i.e., watering), chemical dust suppressants have much less frequent reapplication requirements. These materials suppress emissions by changing the physical characteristics of the existing road surface material. Many chemical dust suppressants applied to unpaved roads form a hardened surface that binds particles together. After several applications, a treated unpaved road often resembles a paved road except that the surface is not uniformly flat. Because the improved surface results in more grinding of small particles, the silt content of loose material on a highly controlled surface may be substantially higher than when the surface was uncontrolled. For this reason, the models presented as Equations 1a and 1b cannot be used to estimate emissions from chemically stabilized roads. Should the road be allowed to return to an uncontrolled state with no visible signs of large-scale cementing of material, the Equation 1a and 1b emission factors could then be used to obtain conservatively high emission estimates.

The control effectiveness of chemical dust suppressants appears to depend on: (a) the dilution rate used in the mixture; (b) the application rate (volume of solution per unit road surface area); (c) the time between applications; (d) the size, speed and amount of traffic during the period between applications; and (e) meteorological conditions (rainfall, freeze/thaw cycles, etc.) during the period. Other factors that affect the performance of chemical dust suppressants include other traffic characteristics (e.g., cornering, track-out from unpaved areas) and road characteristics (e.g., bearing strength, grade). The variability in these factors and differences between individual dust control products make the control efficiencies of chemical dust suppressants difficult to estimate. Past field testing of emissions from controlled unpaved roads has shown that chemical dust

suppressants provide a PM10 control efficiency of about 80% when applied at regular intervals of 2 weeks to 1 month.

Petroleum resin products historically have been the dust suppressants (besides water) most widely used on industrial unpaved roads. Figure 6-2 presents a method to estimate average control efficiencies associated with petroleum resins applied to unpaved roads.[20] The following items should be noted:

1. The term "ground inventory" represents the total volume (per unit area) of petroleum resin concentrate (not solution) applied since the start of the dust control season.
2. Because petroleum resin products must be periodically reapplied to unpaved roads, the use of a time-averaged control efficiency value is appropriate. Figure 6-2 presents control efficiency values averaged over two common application intervals, 2 weeks and 1 month. Other application intervals will require interpolation.
3. Note that zero efficiency is assigned until the ground inventory reaches 0.05 gallon per square yard (gal/yd^2). Requiring a minimum ground inventory ensures that one must apply a reasonable amount of chemical dust suppressant to a road before claiming credit for emission control. Recall that the ground inventory refers to the amount of petroleum resin concentrate rather than the total solution.

As an example of the application of Figure 6-2, suppose that Equation 1a was used to estimate a PM10 emission factor of 7.1 lb/VMT from a particular road. Also, suppose that, starting on May 1, the road is treated with 0.221 gal/yd^2 of a solution (1 part petroleum resin to 5 parts water) on the first of each month through September. The average controlled PM10 emission factors calculated from Figure 6-2 are shown in Table 6-5.

Besides petroleum resins, other newer dust suppressants have also been successful in controlling emissions from unpaved roads. Specific test results for those chemicals, as well as for petroleum resins and watering, are provided in References 18 through 21.

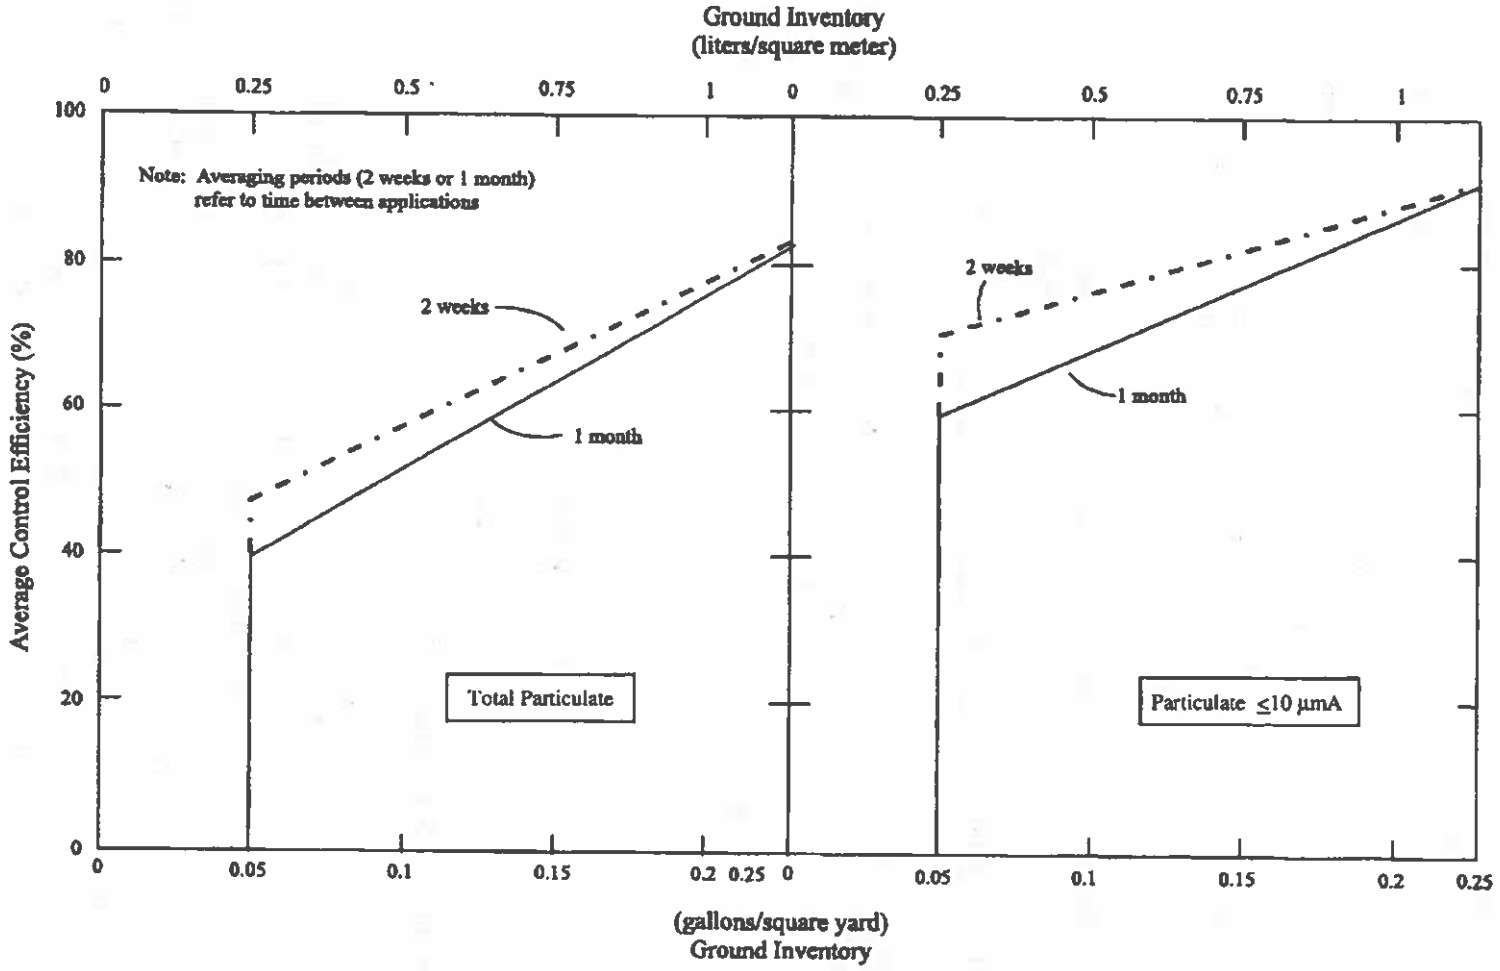

Figure 6-2. Average TSP and PM10 Control Efficiencies for Two Common Application Intervals

Table 6-5. Average Controlled PM10 Emission Factors for Specific Conditions

Period	Ground inventory, gal/yd^2	Average control efficiency, %[a]	Average controlled PM10 emission factor, lb/VMT
May	0.037	0	7.1
June	0.073	62	2.7
July	0.11	68	2.3
August	0.15	74	1.8
September	0.18	80	1.4

[a] From Figure 6-2. Zero efficiency assigned if ground inventory is less than 0.05 gal/yd^2.

1 lb/VMT = 281.9 g/VKT. 1 gal/yd^2 = 4.531 L/m^2.

Table 6-6 summarizes tested control measures and reported control efficiencies for measures that reduce the generation of fugitive dust from unpaved roads.

Table 6-6. Control Efficiencies for Control Measures for Unpaved Roads[36, 37]

Control measure	PM10 control efficiency	References/Comments
Limit maximum speed on unpaved roads to 25 miles per hour	44%	Assumes linear relationship between PM10 emissions and vehicle speed and an uncontrolled speed of 45 mph.
Pave unpaved roads and unpaved parking areas	99%	Based on comparison of paved road and unpaved road PM10 emission factors.
Implement watering twice a day for industrial unpaved road	55%	MRI, April 2001
Apply dust suppressant annually to unpaved parking areas	84%	CARB April 2002

6.6 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. Regulatory formats specify the threshold source size that triggers the need for control application. Example regulatory formats downloaded from the Internet for several local air quality agencies in the WRAP region are presented in Table 6-7. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/envsvc/air/ruledesc.asp

Table 6-7. Example Regulatory Formats for Unpaved Roads

Control Measure	Goal	Threshold	Agency
Requires annual treatment of unpaved public roads beginning in 1998 and continuing for each of 8 years thereafter by implementing one of the following: paving at least one mile with typical roadway material, applying chemical stabilizers to at least two miles to maintain stabilized surface, implementing at least one of the following on at least three miles of road surface: installing signage at 1/4 mile intervals limiting speed to 15 mph, installing speed control devices every 500 ft, or maintaining roadway to limit speed to 15 mph		Set applicability standard: unpaved road must be more than 50 ft wide at all points or must not be within 25 ft of property line, or have more than 20 vehicle trips per day. All roads with average daily traffic greater than average of all unpaved roads within its jurisdiction must be treated	SCAQMD Rule 1186 9/10/1999
Control measures implemented by June 1, 2003: pave, apply dust palliative, or other	Complies with stabilization standard: limit visible dust emissions to 20% opacity, limit silt loading to 0.33 oz/ft2, and limit silt content to 6%	All unpaved roads with vehicular traffic 150 vehicles or more per day	Clark County Hydrographic Basins 212, 216, 217 Sect. 91 Air Quality Reg. 06/22/2000
Limit vehicle speed </=15mph and </=20 trips/day; BACM: watering, paving, apply/maintain gravel, asphalt, or dust suppressant; Dust control plan for construction site roads	Limit VDE to 20% opacity; limit silt loading to 0.33oz/ft^2, limit silt content to 6%	Construction site roads, inactive/active; limiting vehicle speed and trips is alternative to stabilization requirement and max number of trips each day in control plan (also number of vehicles, earthmoving equip, etc.); for roads with >/=150 vehicles/day implement BACM by 06/10/2004; same for >/=250 vehicles day (existing roads by 06/10/2000)	Maricopa County Rules 310 and 310.01 04/07/2004 and 02/16/2000

6.7 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 6-8 summarizes the compliance tools that are applicable for unpaved roads.

Table 6-8. Compliance Tools for Unpaved Roads

Record keeping	Site inspection/monitoring
Road map; traffic volumes, speeds, and patterns; dust suppression equipment and maintenance records; frequencies, amounts, times, and rates for watering and dust suppressants (type); use of water surfactants; calculated control efficiencies; regrading, graveling, or paving of unpaved road segments; control equipment downtime and maintenance records; meteorological log.	Observation of water truck operation and inspection of sources of water; observation of dust plume opacity exceeding a standard; counting of traffic volumes; surface material sampling and analysis for silt and moisture contents; real-time portable monitoring of PM.

6.8 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for fugitive dust originating from unpaved roads. A sample cost-effectiveness calculation is presented below for a specific control measure (watering) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In

selecting the most advantageous control measure for unpaved roads, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Unpaved Roads at an Industrial Facility

Step 1. Determine source activity and control application parameters.

Road length (mile)	2
Vehicles/day	100
Wet days/year	20
Number of 8-hour workdays/year	260
Number of emission days/yr (workdays without rain)	240
Control Measure	Watering
Control Application/Frequency	Twice daily*
Economic Life of Control System (year)	10
Control Efficiency	55%

* No nighttime traffic.

The number of vehicles per day, wet days per year, workdays per year, and the economic life of the control measure are assumed values for illustrative purposes. Watering has been chosen as the applied control measure. The control application/frequency and control efficiency are default values provided by MRI, 2001.[35]

Step 2. Calculate PM10 Emission Factor. The PM10 emission factor is calculated from the AP-42 equation utilizing the appropriate correction parameters.

$$E\ (lb/VMT) = 1.5\ (s/12)^{0.9}\ (W/3)^{0.45}$$

s—silt content (%)	15
W—vehicle weight (tons)	15

E = 3.8 lb/VMT

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor (calculated in Step 2) is multiplied by the number of vehicles per day, by the road length and by the number of emission days per year (see activity data) and divided by 2,000 lb/ton to compute the annual PM10 emissions, as follows:

Annual PM10 emissions = (EF x Vehicles/day x Miles x Emission days/yr) / 2,000
Annual PM10 emissions = (3.8 x 100 x 2 x 240) / 2,000 = 91 tons

Annual PM2.5 emissions = 0.1 x PM10 Emissions[23]
Annual PM2.5 emissions = 0.1 x 91 tons = 9.1 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

For this example, we have selected watering as our control measure. Based on a control efficiency estimate of 55% for the application of water to unpaved roads, the annual controlled emissions estimate are calculated to be:

Annual Controlled PM10 emissions = (91 tons) x (1 – 0.55) = 41 tons
Annual Controlled PM2.5 emissions = (9.1 tons) x (1 – 0.55) = 4.1 tons

Step 5. Determine Annual Cost to Control PM Emissions.

Capital costs ($)	30,000
Annual Operating/Maintenance costs ($)	8,000
Annual Interest Rate	3%
Capital Recovery Factor	0.1172
Annualized Cost ($/yr)	11,517

The capital costs, annual operating and maintenance costs, and annual interest rate (AIR) are assumed values for illustrative purposes. The Capital Recovery Factor (CRF) is calculated from the Annual Interest Rate (AIR) and the Economic Life of the control system, as follows:

$$\text{Capital Recovery Factor} = AIR \times (1 + AIR)^{\text{Economic life}} / (1 + AIR)^{\text{Economic life}} - 1$$

$$\text{Capital Recovery Factor} = 3\% \times (1 + 3\%)^{10} / (1 + 3\%)^{10} - 1 = 0.1172$$

The Annualized Cost is calculated by adding the product of the Capital Recovery Factor and the Capital costs to the annual Operating/Maintenance costs:

Annualized Cost = (CRF x Capital costs) + Annual Operating/Maintenance costs
Annualized Cost = (0.1172 x 30,000) + 8,000 = $11,517

Step 6. Calculate Cost Effectiveness. Cost effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost effectiveness = Annualized Cost/ (Uncontrolled emissions – Controlled emissions)

Cost effectiveness for PM10 emissions = $11,517 / (91 - 41) = $231/ton
Cost effectiveness for PM2.5 emissions = $11,517 / (9.1 – 4.1) = $2,306/ton

7.1 Characterization of Source Emissions

Wind blowing across exposed nonpasture agricultural land results in particulate matter (PM) emissions. Windblown dust emissions from agricultural lands are calculated by multiplying the process rate (acres of crop in cultivation) by an emission factor (tons of PM per acre per year).

7.2 Emission Estimation Methodology [1-13]

This section was adapted from Section 7.12 of CARB's Emission Inventory Methodology. Section 7.12 was last updated in July 1997.

MRI developed a PM10 emission factor for agricultural wind blown dust of 86.6 lb/acre on behalf of the EPA in 1992.[1] However this emission factor is not included in AP-42. Thus, the methodology adopted by the California Air Resources Board[2,3] (CARB) is presented as the emissions estimation methodology in lieu of an official EPA methodology for this fugitive dust source category. The methodology for estimating fugitive dust emissions from open area wind erosion is presented in Chapter 8 of this handbook.

The standard methodology for estimating the emission factor for windblown emissions from agricultural lands is the wind erosion equation (WEQ). Although the WEQ is well established, it is controversial. The WEQ was developed by the United States Department of Agriculture-Agricultural Research Service (USDA-ARS) during the 1960s, for the estimation of wind erosion on agricultural land.[4,5] The U.S. EPA adapted the USDA-ARS methodology for use in estimating windblown TSP emissions from agricultural lands in 1974[5], and the California Air Resources Board (CARB) adopted the U.S. EPA methodology in 1989. The PM10/TSP ratio for wind erosion is 0.5.[6] The PM2.5/PM10 ratio for windblown fugitive dust posted on EPA's CHIEF website is 0.15 based on the analysis conducted by MRI on behalf of WRAP.[7]

The USDA-ARS has undertaken ambitious programs over the past decade to replace the WEQ with improved wind erosion prediction models such as the Revised Wind Erosion Equation (RWEQ)[8] and the Wind Erosion Prediction System (WEPS)[9] models. CARB does not consider these models feasible for use, although certain portions of the RWEQ were incorporated into the CARB methodology in 1997. According to CARB, the WEQ (with modifications) continues to be the best available, feasible method for estimating windblown agricultural emissions.

7.2.1 Summary of CARB's Wind Erosion Equation (ARBWEQ)

Much of the controversy surrounding the WEQ has related to its tendency to produce inflated emission estimates. Some of the reasons for the inflated emissions relate to the fact that it was developed in the Midwestern United States, and that it does not take into account many of the environmental conditions and farm practices specific to the West. In the revised methodology developed by CARB (referred to as the ARBWEQ), CARB staff added adjustments to the WEQ to improve its ability to estimate windblown emissions from western agricultural lands.

The U.S. EPA-modified version of the USDA-ARS derived wind erosion equation (WEQ) reads as follows:[6]

$$E_S = A\ I\ K\ C\ L'\ V' \quad (1)$$

where, E_S = total suspended particulate fraction of wind erosion losses of tilled fields (tons TSP/acre/year)
A = portion of total wind erosion losses that would be measured as total suspended particulate, estimated to be 0.025
I = soil erodibility (tons/acre/year)
K = surface roughness factor (dimensionless)
C = climatic factor (dimensionless)
L' = unsheltered field width factor (dimensionless)
V' = vegetative cover factor (dimensionless)

As an aid in understanding the mechanics of this equation, the soil erodibility factor I may be thought of as the basic erodibility of a flat, very large, bare field in a climate highly conducive to wind erosion (i.e., high wind speeds and high temperature with little precipitation). This factor was initially established for the WEQ for a large, flat, bare field in Kansas that has relatively high winds along with hot summers and low precipitation. The parameters K, C, L' and V' may be thought of as reduction factors for a ridged surface, a climate less conducive to wind erosion, smaller-sized fields, and vegetative cover, respectively, to adjust the equation for applicability to field conditions that differ from the original Kansas field. The A factor in Equation 1 has been used in the ARBWEQ without modification. There has been concern that this factor doesn't take into account finite dust loading. The RWEQ[8] and WEPS[9] models are attempting to address that concern.

Soil Erodibility, I. Soil erodibility by the wind is a function of the amount of erodible fines in the soil. The largest soil aggregate size normally considered to be erodible is approximately 0.84 mm equivalent diameter. The soil erodibility factor, I, is related to the percentage of dry aggregates greater than 0.84 mm as shown in Figure 7-1.[6] The percentage of nonerodible aggregates (and by difference the amount of fines) in a soil sample can be determined experimentally by a standard dry sieving procedure, using a No. 20 U.S. Bureau of Standards sieve with 0.84 mm square openings. For areas larger than can be field sampled for soil aggregate size (e.g., a county) or in cases where soil particle size distributions are not available, a representative value of I can be obtained from the predominant soil type(s) for farmland in the area. Measured erodibilities, I (in units of tons/acre-year), of various soil textural classes are presented in Table 7-1 as a function of percent of dry soil aggregates greater than 0.84 mm in diameter.[6] For California, the soil textural classes were determined by CARB staff from University of California soil maps.[10] An additional level of detail was included in the ARBWEQ by using the United States Department of Agriculture-Natural Resources Conservation Service's (NRCS) State Geographic Data Base (STATSGO) of soil data.[11] In addition, the USDA-ARS recommended an adjustment for changes to long term erodibility due to irrigation.[12] This affects a property known as cloddiness, and refers to the increased tendency for a soil to form stable agglomerations after being exposed to irrigation water.

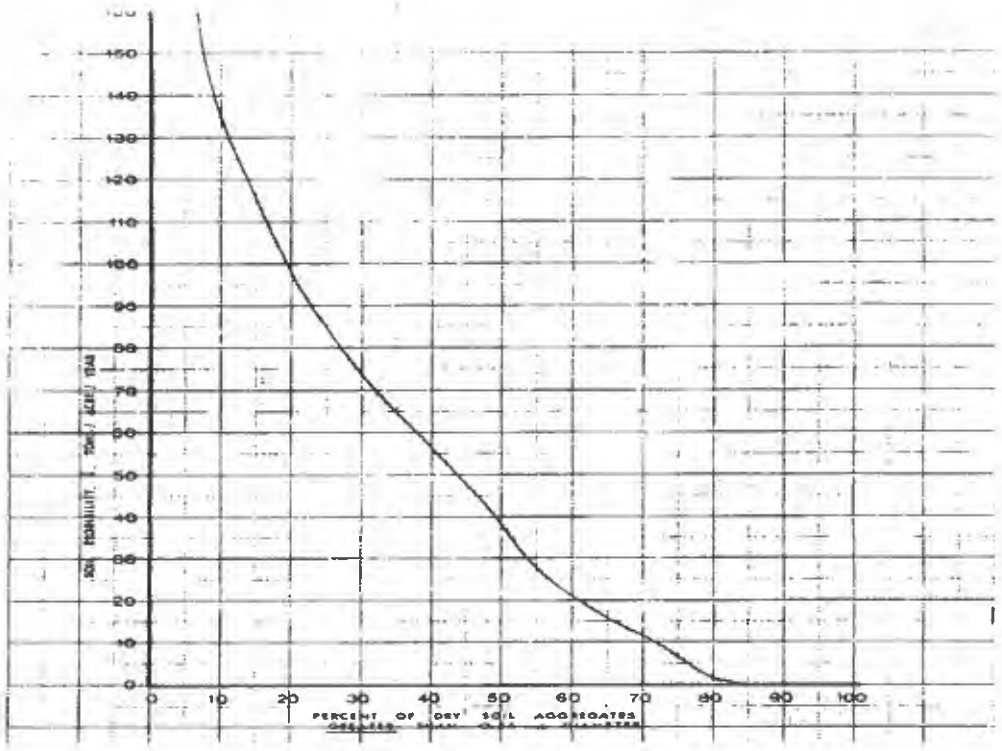

Figure 7-1. Soil Erodibility as a Function of Particle Size[6]

Table 7-1. Soil Erodibility, I, for Various Soil Textural Classes[6]

Predominant Soil Textural Class	Erodibility (tons/acre-year)
Sand	220
Loamy sand	134
Sandy loam, clay, silty clay	86
Loam, sandy clay loam, sandy clay	56
Silty loam, clay loam	47
Silty clay loam, silt	38

Surface Roughness Factor, K. The surface roughness factor, K, accounts for the resistance to wind erosion provided by ridges and furrows or large clods in the field and is crop specific. The surface roughness factor, K, is a function of the height and spacing of the ridges, and varies from 1.0 (no reduction) for a field with a smooth surface to a minimum of 0.5 for a field with the optimum ratio of ridge height (h) to ridge spacing (w). The relationship between K and h^2/w is shown in Figure 7-2.[6] Average K values of common field crops are shown in Table 7-2. Similar crops are assigned similar surface roughness values.

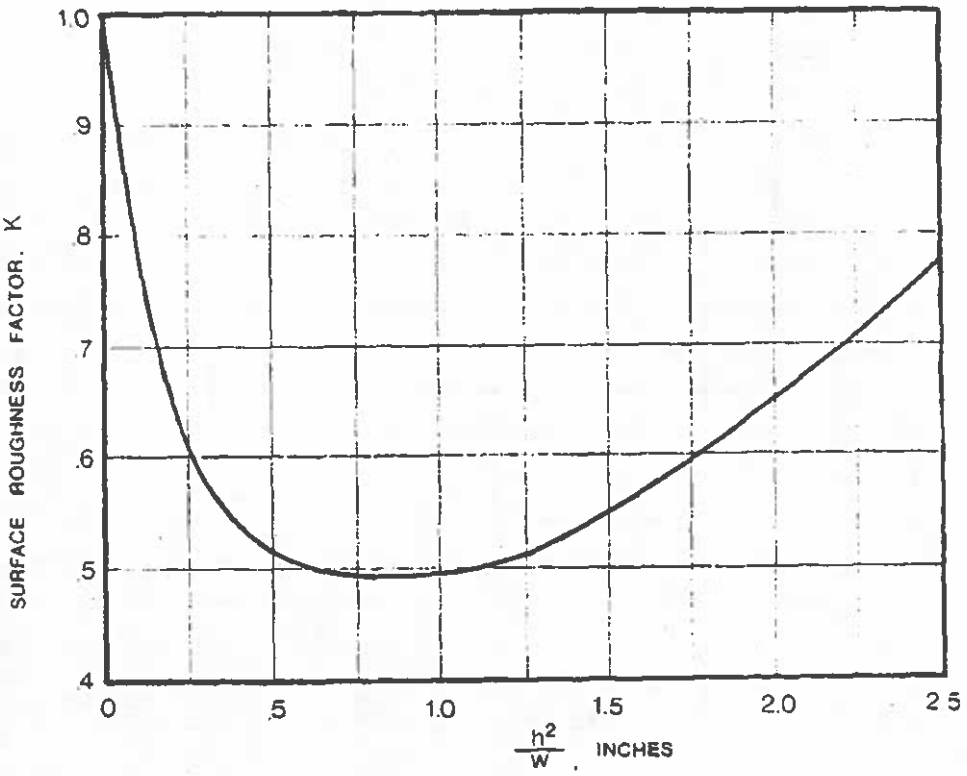

Figure 7-2. Determination of Surface Roughness Factor, K[6]

Table 7-2. Surface Roughness Factor, K, for Common Field Crops[6]

Crop	K
Alfalfa, safflower	1.0
Grain hays, oats, potatoes, rice	0.8
Barley, corn, peanuts, rye, soybeans, sugar beets, vegetables, wheat	0.6
Beans, cotton, sorghum	0.5

Climatic Factor, C. The annual climatic factor, C, is based on data that show that erosion varies directly with the wind speed cubed, and as the inverse of the square of surface soil moisture. The C factor can be calculated from the following equation:

$$C = 0.345\ W^3 / (PE)^2 \qquad (2)$$

where, W = mean annual wind speed (mph), corrected to a standard height of 10 meters
PE = Thornthwaite's precipitation-evaporation index (i.e., ratio of precipitation to evapotranspiration)

Monthly or seasonal climatic factors can be estimated from Equation 2 by substituting the mean wind speed of the period of interest for the mean annual wind speed. Climatic factors have been computed from National Weather Bureau data for

many locations throughout the country. The annual climatic factors for many areas of the US are shown in Figure 7-3. The monthly precipitation/evaporation ratio varies from <16 for arid deserts to >127 for rain forests. For the ARBWEQ, CARB staff improved the input data for calculating the factor C, as well as the methods associated with developing the county wide averaged annual climatic factor. Monthly climatic factors were obtained by modifying the annual climatic factor calculation method. Annual climatic factors for different counties within California range from 0.019 to 1.274.[14] The reader is directed to CARB's website to obtain the list of climatic factors for counties within California (www.arb.ca.gov/emisinv/areasrc/fullpdf).

Unsheltered Field Width Factor, L'. Soil erosion across a field is directly related to the unsheltered width along the prevailing wind direction. The rate of erosion is zero at the windward edge of the field and increases approximately proportionately with distance downwind until, if the field is large enough, a maximum rate of soil movement is reached. Correlation between the width of a field and its rate of erosion is also affected by the soil erodibility of its surface: the more erodible the surface, the shorter the distance in which maximum soil movement is reached. This relationship between the unsheltered width of a field (L), its surface erodibility (IK), and its relative rate of soil erosion (L') is shown graphically for different values of IK (ranging from IK = 20 to IK = 134) in Figure 7-4.[6] If the curves of Figure 7-4 are used to obtain the L' factor for the windblown dust equation, values for the variables I and K must already be known and an appropriate value for L most be determined.

L is calculated as the distance across the field in the prevailing wind direction minus the distance from the windward edge of the field that is protected from wind erosion by a barrier. The distance protected by a barrier is equal to 10 times the height of the barrier, or 10H. For example, a row of 30-foot high trees along the windward side of a field reduces the effective width of the field by 300 feet. If the prevailing wind direction differs significantly (>25 degrees) from perpendicularity with the field. L should be increased to account for this additional distance of exposure to the wind. The distance across the field, L, is equal to the field width divided by the cosine of the angle between the prevailing wind direction and the perpendicularity to the field.

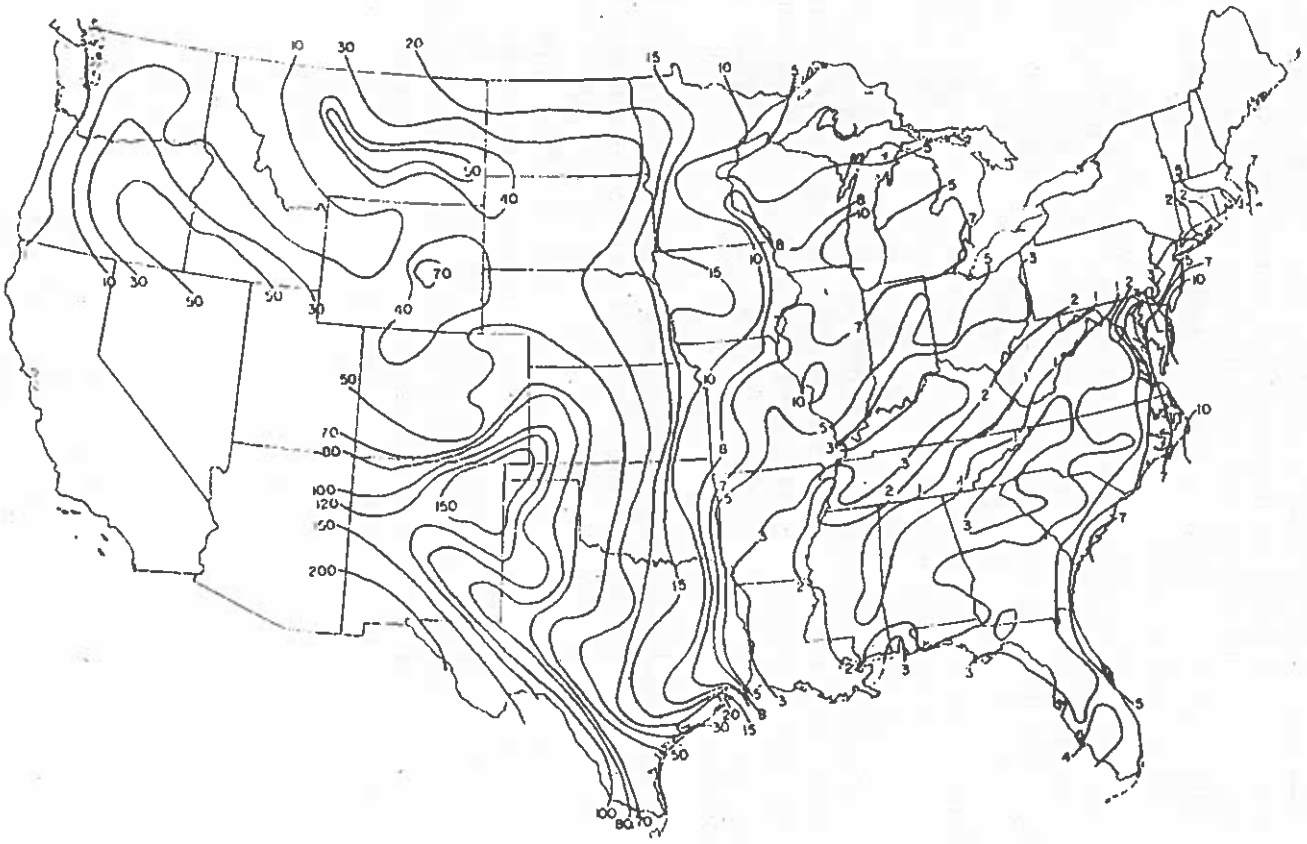

Figure 7-3. Annual Climatic Factor Used in Wind Erosion Equation[6]

[Note: Isopleths for several western and northeastern states were not available at the time this figure was prepared.]

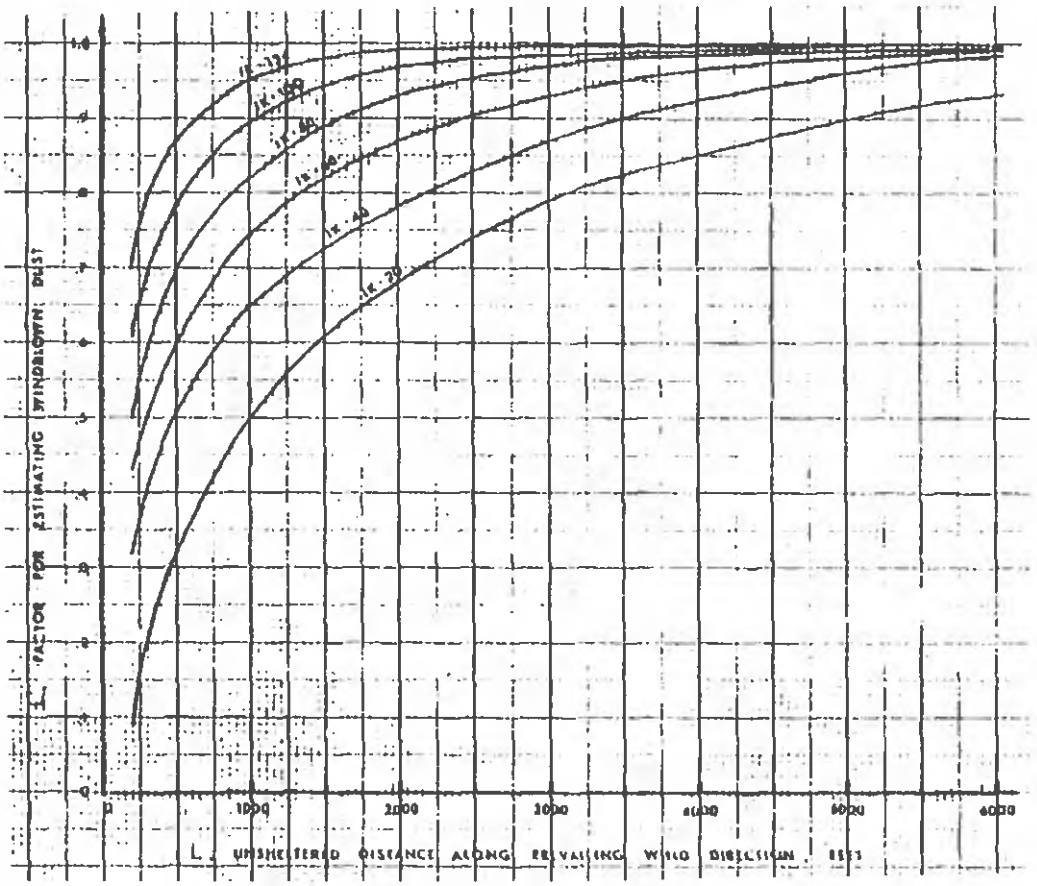

Figure 7-4. Effect of Field Length on Relative Soil Erosion Rate[6]

Vegetative Cover Factor, V'. Vegetative cover on agricultural fields during periods other than the primary crop season greatly reduces wind erosion of the soil. This cover most commonly is crop residue, either standing stubble or mulched into the soil. The effect of various amounts of residue, V, in reducing erosion is shown qualitatively in Figure 7-5, where IKCL' is the potential annual soil loss (in tons/acre-year) from a bare field, and V' is the fractional amount of this potential loss which results when the field has a vegetative cover of V (in lb of air-dried residue/acre). The amount of vegetative cover on a single field can be ascertained by collecting and weighing clean residue from a representative plot or by visual comparison with calibrated photographs. The vegetative soil cover factor, V', is especially problematic for California, and was completely replaced by a series of factors in the ARBWEQ (see analysis below). This factor assumes a certain degree of cover year round based upon post harvest soil cover, and does not account for barren fields from land preparation, growing canopy cover, or replanting of crops during a single annual cycle. All of these factors are very important in the estimation of windblown agricultural dust emissions. Therefore, CARB staff replaced the vegetative soil cover factor, V', with separate crop canopy cover, post harvest soil cover, and post harvest replant factors.

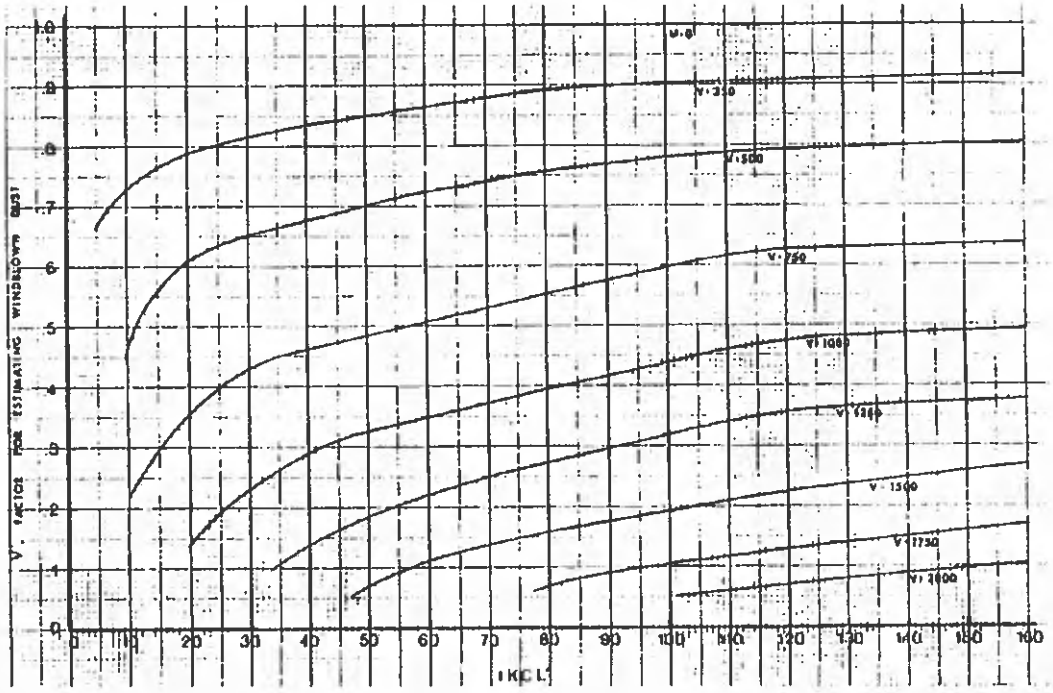

Figure 7-5. Effect of Vegetative Cover on Relative Emission Rate[6]

7.2.2 Climate-Based Improvements in the ARBWEQ

The calculation of the climatic factor C requires mean monthly temperature, monthly rainfall, and mean annual wind speed for a given location as data inputs. This factor is used to estimate climatic effects on an annual basis. In order to make estimates of emissions using the ARBWEQ that are specific to different seasons, it is necessary to estimate the climatic factor that would apply to each season. The changes to the agricultural windblown emissions inventory discussed here, include modifications to both the annual and the monthly climatic factor profile determination methodology included in the ARBWEQ.

The Annual Climatic Factor for the ARBWEQ. Reference 6 includes a definition of the climatic factor that agrees with the method utilized by the NRCS.[13] It incorporates the monthly precipitation effectiveness derived from precipitation and temperature, along with monthly average wind speeds. Garden City, Kansas is assigned a factor of 1.0 and the climatic factors for all other sites are adjusted from this value.

The Monthly Climatic Factor for the ARBWEQ. There are several ways to create a climate-based monthly profile for the ARBWEQ. Because the ARBWEQ is an annual emission estimation model, CARB staff did not directly estimate monthly emissions using the monthly climatic factor. Instead, the annual climatic factor was used to determine annual emissions, and then the monthly-normalized climatic factors were multiplied by the annual emissions. This helped to limit the effect of extreme monthly values on the annual emissions estimate. CARB staff devised a method termed the "month-as-a-year" method which produced climatic factors that would apply if the

climate for a given month were instead the year round climate. These monthly numbers, once normalized, provided the climate-based temporal profile. The improvements arising from the use of the month-as-a-year method are due to the fact that it relies on temperature, and precipitation inputs, in addition to wind. The ARBWEQ further modified the temporal profile calculation, by also adding nonclimate-based temporal factors. The month-as-a-year method in the ARBWEQ produces pronounced curves with small climatic factors (resulting in lower emissions) in the cool, wet and more stagnant periods, and large climatic factors (and higher emissions) in the hot, dry, and windy periods. The U.S. EPA method yields gentler profiles, which are shifted into the cooler and wetter months from the ARBWEQ profiles. The 1989 CARB methodology established one erosive wind energy distribution statewide. This resulted in an unrealistic, nearly flat distribution, with very little seasonality. Therefore, the ARBWEQ month-as-a-year method provides a more realistic picture of the windblown dust temporal profile (see Reference 3 for comparison curves and supporting references).

7.2.3 Nonclimate-Based Improvements in the ARBWEQ

Among the nonclimate-based factors that influence windblown agricultural emissions are soil type, soil structure, field geometry, proximity to wind obstacles, crop, soil cover by crop canopy or post harvest vegetative material, irrigation, and replanting of the post harvest fallow land with a different crop. CARB has attempted to correct many of these limitations in the ARBWEQ. Many of the corrections are temporally based and rely upon the establishment of accurate crop calendars to reflect field conditions throughout the year. The long-term irrigation-based adjustment to erodibility, due to soil cloddiness, is not temporally based, and is therefore applied for the entire year.[12] The change in erodibility varies based on soil type, but often results in a reduction in the tons per acre value for irrigated crops of about one-third.

Crop Calendars: Quantifying Temporal Effects. Factors such as crop canopy cover, post harvest soil cover, irrigation, and replanting to another crop have a major effect on windblown emissions. Estimating the effects of these factors requires establishing accurate crop calendars. The planting and harvesting dates are principal components of the crop calendar. The list of references consulted to establish the planting and harvesting dates is included in Reference 3.

Each planting month for a given crop was viewed by CARB staff as a separate cohort (maturation class). Since a single planting cohort may be harvested in several months, each cohort was split into cohort-plant/harvest date pairs. The cohort-plant/harvest date pairs were then assigned based upon a first-in-first-out ordering. The fraction of the total annual crop assigned to a given cohort-plant/harvest date pair was derived by multiplying the fraction of the total annual crop planted in a given month (cohort) by the fraction of the cohort harvested in a given month. The fraction of a cohort-plant/harvest date pair that has been planted, but not harvested at any given time, is termed the growing canopy fraction, or GCF (although the canopy may or may not actually be increasing at any given time). The growing canopy fraction determines the fraction of the acreage that will have the crop canopy factor applied to its emission calculations. The acreage that is not assigned to the growing canopy fraction is the postharvest/preplant (PHPP) acreage. The PHPP acreage will have the post harvest soil

cover, and replanting to a different crop factors applied when calculating its emissions. The effect of using cohort-plant/harvest date pairs is to blend the crop canopy, soil cover, replanting, and irrigation effects over both the planting and harvesting periods. This approach provides a more realistic estimate of the temporal windblown emissions profile during these periods. All of the monthly factor profile adjustments described below are calculated for each month of the year, for each cohort-harvest/plant date pair, for each crop, for each county.

Adding a Short-Term Irrigation Factor for Wetness. This adjustment takes into account the overall soil texture, number of irrigation events, and fraction of wet days during the time period[12] (one month for the purposes of the CARB inventory). The list of references consulted to establish the irrigation profiles is included in Reference 3. The irrigation factor for months in which irrigations take place will typically be greater than 0.80. In other words, the irrigations will result in a reduction in erodibility of less than 20%. This is only an estimate for a typical case during the growing season. When averaged over the year, the overall reduction in erodibility is lower.

Replacement Factors to Address Problems with the Vegetative Soil Cover Factor in the WEQ. According to CARB, there are many problems with the vegetative soil cover factor, V. For example, this factor is applied to the acreage year round, even during the growing season, and ignores the effect of disk-down and other land preparation operations on post harvest vegetative soil cover. The factor also does not account for canopy cover during the growing season. In addition, the WEQ was derived based on agricultural practices typical of the Midwestern United States. Crops such as alfalfa have full canopy cover for nearly the entire year. There is also a large amount of acreage that is used for more than one crop per year, and there was no provision in the vegetative soil cover factor for estimating the effects on emissions of this replanting. Whether the land is to be immediately replanted to a different crop, or is going to remain fallow until the next planting of the same crop, it is common practice to disk under the harvested crop within a month or two of harvest. The vegetative soil cover factor for the most part assumes that the post harvest debris remains undisturbed. References to support this agricultural practice are included in Reference 3. CARB staff replaced the vegetative soil cover factor in the ARBWEQ with the three adjustments discussed below to approximate the effects on windblown agricultural PM emissions of: (a) crop canopy cover during the growing season; (b) changes to post harvest soil cover; and (c) post harvest planting of a different crop on the harvested acreage.

Crop Canopy Factor. Crop canopy cover is the fraction of ground covered by crop canopy when viewed directly from above. USDA-ARS staff provided CARB with methodology from the RWEQ for estimating the effects of crop canopy cover on windblown dust emissions.[8] The soil loss ratio (SLRcc) is defined as the ratio of the soil loss for a soil of a given canopy cover divided by the soil loss from bare soil. SLRcc is the factor that is multiplied by the erodibility to adjust the erodibility for canopy cover. The greater the canopy cover, the smaller the SLRcc, and the greater the reduction in erodibility. SLRcc defines an exponential curve that demonstrates major differences in the erodibility reduction for the range of zero to 30 percent canopy cover (typically achieved within a few months after planting). Thereafter, reductions occur much more

slowly, and eventually the curve flattens out. This results in a rapid decrease in emissions during the first few months following planting, until the emissions are only a very small fraction of the bare soil emissions. The canopy cover then will remain, and the windblown emissions will consequently stay very low until harvest. Senescence effects (late growing season reduction in canopy) have been excluded from this model, and the rationale for that exclusion is discussed in Reference 3.

Post Harvest Soil Cover Factor. Post harvest soil cover is the fraction of ground covered by vegetative debris when viewed directly from above. USDA-ARS staff provided CARB with methodology from the RWEQ for estimating the effects of post harvest soil cover on windblown dust emissions.[8] The soil loss ratio (SLRsc) is defined as the ratio of the soil loss for a soil of a given soil cover divided by the soil loss from bare soil. SLRsc is the factor that is multiplied by the erodibility to adjust the erodibility for post harvest soil cover. The greater the post harvest soil cover, the smaller the SLRsc, and the greater the reduction in erodibility. The list of references consulted to establish the post harvest soil cover profiles is included in Reference 3.

Post Harvest "Replant-to-Different-Crop" Factor. As discussed above, the vegetative soil cover factor does not include any adjustments for harvested acreages that are quickly replanted to a different crop. This multiple cropping is very common in California, and has been accounted for in this methodology by removing from the inventory calculation the fraction of the harvested acreage that is replanted, at the estimated time of replanting. This removed fraction is based on information provided by agricultural authorities (see reference list in Reference 3). The net result of the application of the fraction is that the post disk-down acreage (one to two months after harvest), and resultant emissions, is reduced by the fraction of harvested acreage converted to a new crop.

Bare and Border Soil Adjustments. Most fields will have some cultivated areas that are barren. These bare areas could be due to uneven ground (e.g., water accumulation), uneven irrigation, pest damage, soil salinity, etc. Most fields will have some type of border. In some cases there is a large barren border, in other cases it is overgrown with vegetation. Many border areas are relatively unprotected, and prone to wind erosion. CARB staff established approximate fractions of cultivated acreage that would be barren and border areas, respectively. These barren and border acreage adjustments result in emission increases disproportionate to the acreage involved. The reason that the bare acreage-based increase is so large is that the bare acreage does not have either a crop canopy or post harvest soil cover factor applied. The same reasons apply to the border adjustment, but the border region is also assumed not to be irrigated. Therefore, no irrigation factor (wetness), and no long-term irrigation adjustment to erodibility (cloddiness) are applied. No border adjustment was applied to the pasture acreage, since pasture areas frequently lack a barren border.

Temporal Activity. For the 1989 CARB methodology, the temporal profile was based on an estimated statewide erosive wind energy profile. The profile, implemented in the ARBWEQ included wind, precipitation and temperature climatic effects, along with the addition of the effects of crop canopy, postharvest soil cover, postharvest replanting to a different crop, and irrigation. In addition, the inclusion of bare ground and

field border effects also adjusted the profile in the ARBWEQ. The profile produced for the ARBWEQ is no longer a separate profile applied to annual emissions, but is now an intermediate output produced during the estimation of annual emissions.

7.3 Demonstrated Control Techniques

The emission potential of agricultural wind erosion is affected by the degree to which soil management and cropping systems provide adequate protection to the exposed soil surface during exposure periods. Table 7-3 presents a summary of demonstrated control measures and the associated PM10 control efficiencies. It is readily observed that reported control efficiencies for many of the control measures are highly variable. This may reflect differences in the operations as well as the test methods used to determine control efficiencies.

Table 7-3. Control Efficiencies for Control Measures for Agricultural Wind Erosion [1, 15-18]

Control measure	PM10 Control Efficiency	References/comments
Artificial wind barrier	64-88%	MRI, 1992. Assumes a 50% porosity fence.
	54-71%	Grantz et al, 1998. Control efficiency is for a wind fence.
	4-32%	Bilbro and Stout, 1999. Control efficiency based upon reduction in wind velocity by a wind fence made from plastic pipe with a range of optical density of from 12% to 75%.
Cover crop	90%	Washington State Univ., 1998.
Cross-wind ridges	24-93%	Grantz et al, 1998. Control efficiency is for furrows.
	40-80%	Washington State Univ., 1998.
Mulching	20-40%	Washington State Univ., 1998. Control efficiency is for straw.
Trees or shrubs planted as a windbreak	25%	Sierra Research, 1997. Control efficiency is for trees.

7.4 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. Regulatory formats specify the threshold source size that triggers the need for control application. Example regulatory formats for several local air quality agencies in the WRAP region are presented in Table 7-4. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/envsvc/air/ruledesc.asp

(Note: The Clark County website did not include regulatory language specific to agricultural wind erosion at the time this chapter was written.)

Table 7-4. Example Regulatory Formats for Agricultural Wind Erosion

Control measure	Goal	Threshold	Agency
Requires producers to draft and implement fugitive dust plan with approved control methods	Limits fugitive dust from agricultural sources		SJVAPCD Rule 8081 11/15/2001
Exemption from Rule 403 general requirements.	Limit PM10 Levels to 50 $\mu g/m^3$	Voluntary implementation of district approved conservation practices and complete/maintain self-monitoring plan	SCAQMD Rule 403 12/11/1998
Requires dust plan that contains procedures assuring moisture factor between 20%-40% for manure in top 3" of occupied pens and outlines manure management practices and removal	Reduce fugitive dust from livestock feed yards		ICAPCD Rule 420 8/13/2002
Dust suppressants, gravel, install shrubs/trees	Limit fugitive dust plume to 20% opacity	Commercial feedlot/livestock area; shrubs/trees 50ft-100ft from animal pens; compliance with stabilization limitation	Maricopa County Rule 310.01 02/16/2000
Record keeping for all ctrl measure taken	Ensure that appropriate ctrl measures are implemented and maintained	All ops subject to Rule 310.01, provided within 48 hrs of ctrl officer request	Maricopa County Rule 310.01 02/16/2000

7.5 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 7-5summarizes the compliance tools that are applicable to agricultural wind erosion.

Table 7-5. Compliance Tools for Agricultural Wind Erosion

Record keeping	Site inspection/monitoring
Land condition by date (e.g., vegetation; furrowing of fallow land; soil crusts), including residue management and percentages; meteorological log; establishment/ maintenance of windbreaks.	Observation of land condition (crusts, furrows), especially during period of high winds.

7.6 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for fugitive dust originating from agricultural wind erosion. A sample cost-effectiveness calculation is presented below for a specific control measure (adding a straw mulch to the field) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous

control measure for agricultural wind erosion, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Agricultural Wind Erosion

Step 1. Determine source activity and control application parameters.

Field size (acres)	320
Control Measure	1,000 lb mulch per acre
Control application/frequency	Once post-harvesting
Control Efficiency	30%

The field size is an assumed value, for illustrative purposes. Adding a straw mulch to the field at a rate of 1,000 lbs per acre has been chosen as the applied control measure. The control application/frequency and control efficiency are default values provided by WSU, 1998.

Step 2. Calculate Pm10 Emission Factor. The PM10 emission factor is calculated from AP-42 equation utilizing the appropriate correction parameters:

E (tons/acre-year) = 0.5 A I K C L' V'

A	0.025
I – soil erodibility (tons/acre-year)	86
K- surface roughness factor	0.50
Climatic factor	0.33
Unsheltered field width factor	0.70
Vegetative cover factor	0.25

E = 0.031 tons/acre-year

[Note: the correction parameters above were selected for illustrative purposes.]

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor (given in Step 2) is multiplied by the field size (under activity data) to compute the annual PM10 emissions in tons per year, as follows:

Annual emissions = (Emission Factor x Field Size)
Annual PM10 emissions = (0.031 x 320) = 9.9 tons

Annual PM2.5 emissions = 0.15 x PM10 emissions[7] = 0.15 x 9.9 tons = 1.5 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

For this example, we have selected conservation tilling as our control measure. Based on a control efficiency estimate of 30%, the annual controlled emissions are calculated to be:

Annual Controlled PM10 emissions = (9.9 tons) x (1 – 0.3) = 6.9 tons
Annual Controlled PM2.5 emissions = (1.5 tons) x (1 – 0.3) = 1.0 tons

Step 5. Determine Annual Cost to Control PM Emissions.

The Annual Cost of mulching is calculated by multiplying the number of acres by the cost per acre. The cost of mulching is assigned a value of $40 per acre.[17] Thus, the Annual Cost is estimated to be: 320 x 40 = $12,800

Step 6. Calculate Cost-effectiveness. Cost-effectiveness is calculated by dividing the annual cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost-effectiveness = Annual Cost/ (Uncontrolled emissions – Controlled emissions)

Cost-effectiveness for PM10 emissions = $12,800 / (9.9 – 6.9) = $4,295/ton
Cost-effectiveness for PM2.5 emissions = $12,800 / (1.5 – 1.0) = $28,636/ton

8.1 Characterization of Source Emissions

Dust emissions may be generated by wind erosion of open areas of exposed soils or other aggregate materials within an industrial facility. These sources typically are characterized by nonhomogeneous surfaces impregnated with nonerodible elements (particles larger than approximately 1 centimeter [cm] in diameter). Field testing of coal piles and other exposed materials using a portable wind tunnel has shown that: (a) threshold wind speeds exceed 5 meters per second (m/s) (11 miles per hour [mph]) at 15 cm above the surface or 10 m/s (22 mph) at 7 m above the surface, and (b) particulate emission rates tend to decay rapidly (half-life of a few minutes) during an erosion event. In other words, these aggregate material surfaces are characterized by finite availability of erodible material (mass/area) referred to as the erosion potential. Any natural crusting of the surface binds the erodible material, thereby reducing the erosion potential. Loose soils or other aggregate materials consisting of sand-sized materials act as an unlimited reservoir of erodible material and can sustain emissions for periods of hours without substantial decreases in emission rates.

If typical values for threshold wind speed at 15 cm are corrected to typical wind sensor height (7 to 10 m), the resulting values exceed the upper extremes of hourly mean wind speeds observed in most areas of the country. In other words, mean atmospheric wind speeds are not sufficient to sustain wind erosion from flat surfaces of the type tested. However, wind gusts may quickly deplete a substantial portion of the erosion potential. Because erosion potential has been found to increase rapidly with increasing wind speed, estimated emissions should be related to the gusts of highest magnitude. The routinely measured meteorological variable that best reflects the magnitude of wind gusts is the fastest mile. This quantity represents the wind speed corresponding to the whole mile of wind movement that has passed by the 1-mile contact anemometer in the least amount of time. Daily measurements of the fastest mile are presented in the monthly Local Climatological Data (LCD) summaries. The duration of the fastest mile, typically about 2 minutes (for a fastest mile of 30 mph), matches well with the half-life of the erosion process, which ranges between 1 and 4 minutes. It should be noted, however, that peak winds can significantly exceed the daily fastest mile.

The wind speed profile in the surface boundary layer is found to follow a logarithmic distribution as follows:

$$u(z) = \frac{u^*}{0.4} \ln \frac{z}{z_0} \quad (z>z_0) \tag{1}$$

where,

- u = wind speed (cm/s)
- u^* = friction velocity (cm/s)
- z = height above test surface (cm)
- z_0 = roughness height (cm)
- 0.4 = von Karman's constant (dimensionless)

The friction velocity (u^*) is a measure of wind shear stress on the erodible surface, as determined from the slope of the logarithmic velocity profile. The roughness height (z_0) is a measure of the roughness of the exposed surface as determined from the y-intercept

of the velocity profile, i.e., the height at which the wind speed is zero. These parameters are illustrated in Figure 8-1 for a roughness height of 0.1 cm.

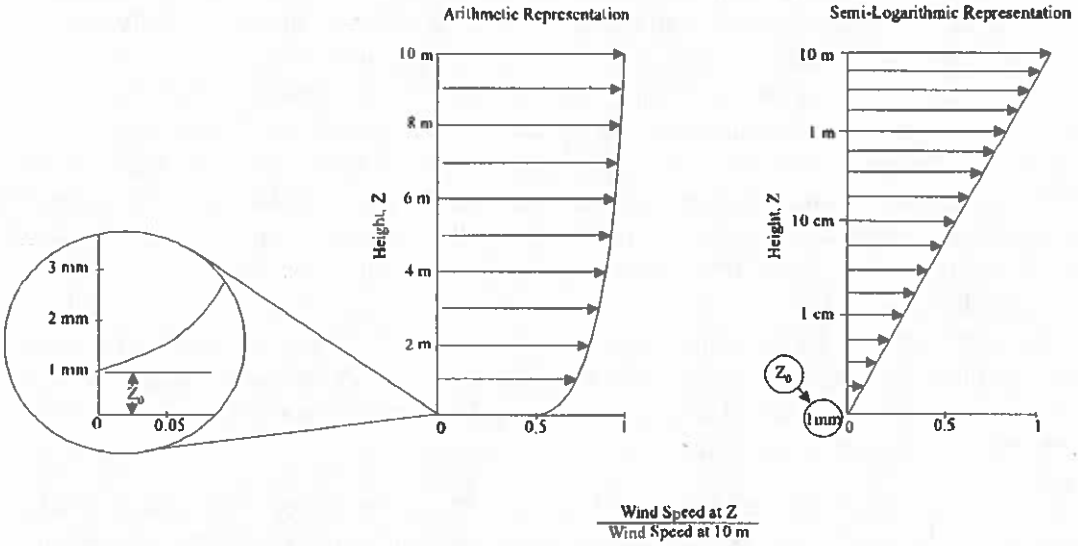

Figure 8-1. Illustration of Logarithmic Wind Velocity Profile

Emissions generated by wind erosion are also dependent on the frequency of disturbance of the erodible surface because each time that a surface is disturbed, its erosion potential is restored. A disturbance is defined as an action that results in the exposure of fresh surface material. On a storage pile, this would occur whenever aggregate material is either added to or removed from the old surface. A disturbance of an exposed area may also result from the turning of surface material to a depth exceeding the size of the largest pieces of material present.

8.2 Emission Estimation: Primary Methodology[1-11]

This section was adapted from Section 13.2.5 of EPA's *Compilation of Air Pollutant Emission Factors (AP-42)*. Section 13.2.5 was last updated in January 1995.

The PM10 emission factor for wind-generated particulate emissions from mixtures of erodible and nonerodible surface material subject to disturbance may be expressed in units of grams per square meter (g/m^2) per year as follows:

$$\text{PM10 Emission Factor} = 0.5 \sum_{i=1}^{N} P_i \qquad (2)$$

where,

N = number of disturbances per year

Pi = erosion potential corresponding to the observed (or probable) fastest mile of wind for the ith period between disturbances (g/m^2)

In calculating emission factors, each area of an erodible surface that is subject to a different frequency of disturbance should be treated separately. For a surface disturbed

daily, N = 365 per year, and for a surface disturbance once every 6 months, N = 2 per year. The erosion potential function for a dry, exposed surface is given as:

$$P = 58\,(u^* - u_t^*)^2 + 25\,(u^* - u_t^*) \qquad (3)$$

$$P = 0 \text{ for } u^* \le u_t^*$$

where,

u^* = friction velocity (m/s)

u_t = threshold friction velocity (m/s)

Because of the nonlinear form of the erosion potential function, each erosion event must be treated separately. The PM2.5/PM10 ratio for windblown fugitive dust posted on EPA's CHIEF website is 0.15. This ratio is based on the analysis conducted by MRI on behalf of WRAP.[11]

Equations 2 and 3 apply only to dry, exposed materials with limited erosion potential. The resulting calculation is valid only for a time period as long or longer than the period between disturbances. Calculated emissions represent intermittent events and should not be input directly into dispersion models that assume steady-state emission rates. For uncrusted surfaces, the threshold friction velocity is best estimated from the dry aggregate structure of the soil. A simple hand sieving test of surface soil can be used to determine the mode of the surface aggregate size distribution by inspection of relative sieve catch amounts, following the procedure described below.

FIELD PROCEDURE FOR DETERMINING THRESHOLD FRICTION VELOCITY
(from a 1952 laboratory procedure published by W. S. Chepil[5])

Step 1. Prepare a nest of sieves with the following openings: 4 mm, 2 mm, 1 mm, 0.5 mm, and 0.25 mm. Place a collector pan below the bottom (0.25 mm) sieve.

Step 2. Collect a sample representing the surface layer of loose particles (approximately 1 cm in depth, for an encrusted surface), removing any rocks larger than about 1 cm in average physical diameter. The area to be sampled should be not less than 30 cm by 30 cm.

Step 3. Pour the sample into the top sieve (4-mm opening), and place a lid on the top.

Step 4. Move the covered sieve/pan unit by hand, using a broad circular arm motion in the horizontal plane. Complete 20 circular movements at a speed just necessary to achieve some relative horizontal motion between the sieve and the particles.

Step 5. Inspect the relative quantities of catch within each sieve, and determine where the mode in the aggregate size distribution lies, i.e., between the opening size of the sieve with the largest catch and the opening size of the next largest sieve.

Step 6. Determine the threshold friction velocity from Table 8-1.

The results of the sieving can be interpreted using Table 8-1. Alternatively, the threshold friction velocity for erosion can be determined from the mode of the aggregate size distribution using the graphical relationship described by Gillette.[5, 6] If the surface material contains nonerodible elements that are too large to include in the sieving (i.e., greater than about 1 cm in diameter), the effect of the elements must be taken into account by increasing the threshold friction velocity.[10]

Table 8-1 Field Procedure for Determination of Threshold Friction Velocity (Metric Units)

Tyler Sieve No.	Opening (mm)	Midpoint (mm)	u_t^* (cm/s)
5	4		
9	2	3	100
16	1	1.5	76
32	0.5	0.75	58
60	0.25	0.375	43

Threshold friction velocities for several surface types have been determined by field measurements with a portable wind tunnel. These values are presented in Table 8-2.

Table 8-2. Threshold Friction Velocities (Metric Units)

Material	Threshold friction velocity (m/s)	Roughness height (cm)	Threshold wind velocity at 10 m (m/s)	
			z_o = Actual	z_o = 0.5 cm
Overburden[a]	1.02	0.3	21	19
Scoria (roadbed material)[a]	1.33	0.3	27	25
Ground coal (surrounding coal pile)[a]	0.55	0.01	16	10
Uncrusted coal pile[a]	1.12	0.3	23	21
Scraper tracks on coal pile[a,b]	0.62	0.06	15	12
Fine coal dust on concrete pad[c]	0.54	0.2	11	10

[b] Lightly crusted.
[c] Eastern power plant; reference 3.

The fastest mile of wind for the periods between disturbances may be obtained from the monthly local climatological data (LCD) summaries for the nearest reporting weather station that is representative of the site in question.[7] These summaries report actual fastest mile values for each day of a given month. Because the erosion potential is a highly nonlinear function of the fastest mile, mean values of the fastest mile are inappropriate. The anemometer heights of reporting weather stations are found in Reference 8, and should be corrected to a 10-m reference height using Equation 1. To convert the fastest mile of wind (u^+) from a reference anemometer height of 10 m to the equivalent friction velocity (u^*), the logarithmic wind speed profile may be used to yield the following equation:

$$u^* = 0.053\, u_{10}^+ \qquad (4)$$

where,

u^* = friction velocity (m/s)
u_{10}^+ = fastest mile of reference anemometer for period between disturbances (m/s)

This assumes a typical roughness height of 0.5 cm for open terrain. Equation 4 is restricted to large relatively flat exposed areas with little penetration into the surface wind layer.

8.3 Emission Estimation: Alternate Methodology

Duane Ono with the Great Basin Unified APCD and Dale Gillette developed a method called the Dust ID method to measure fugitive PM10 dust emissions due to wind erosion that has been approved for use in PM10 SIPs.[12, 13] This method has been applied to the dry lake bed at Owens Lake, CA using an extensive sand flux monitoring network. Owens Lake is the largest single source of fugitive dust in the United States (estimated to be ~80,000 tons PM10/year). The network consisted of co-located electronic Sensits and passive Cox Sand Catchers (CSCs) deployed on a 1 km x 1 km grid covering 135 square kilometers of the lake bed with their sensor or inlet positioned 15 cm above the surface. Sensits measure the kinetic energy or the particle counts of sand-sized particles as they saltate across the surface. Due to differences in the electronic response of individual Sensits, these units had to be co-located with passive sand flux measurement devices to calibrate their electronic output and to determine the hourly sand flux. The battery powered Sensits were augmented with a solar charging system. A data logger recorded hourly Sensit data during inactive periods and switched to 5-minute data during active erosion periods. CSC's are passive instruments that are used to collect sand-sized particles that are blown across the surface during a dust event. These instruments were designed and built by the Great Basin Unified Air Pollution Control District as a reliable, low-cost instrument that could withstand the harsh conditions at Owens Lake. CSC's have no moving parts and can collect sand for a month at Owens Lake without overloading the collector. As an alternative to hourly sand (saltation) flux measurements relying on Sensits, Ono[14] found that monthly sand flux measurements obtained with CSCs could be applied to a model developed by Gillette et al.[15] to provide a good estimate of hourly sand flux rates.

Hourly PM10 emissions from each square kilometer of the lake bed were estimated from the following equation:

$$F_a = K_f \times q$$

where, F_a = PM10 emissions flux ($g/cm^2/hr$)
q = hourly sand flux ($g/cm^2/hr$) measured at 15 cm above the surface
K_f, called the K-factor, = proportionality factor relating the PM10 emissions flux to the sand flux measured at 15 cm above the surface.

K_f values were determined by comparing CALPUFF model predictions, based on meteorological data from thirteen 10-meter towers and an Upper Air Wind Profiler to generate wind fields using the CALMET model, to observed hourly PM10 concentrations measured at six PM10 monitoring sites utilizing TEOM PM10 monitors. A K-factor of 5×10^{-5} was used to initially run the model and to generate PM10 concentration values that were close to the monitored concentrations. Hourly K-factor values were later adjusted in a post-processing step to determine the K-factor value that would have made the modeled concentration match the monitored concentration at each of the six PM10 monitor sites using the following equation:

$$K_f = K_i [(C_{obs} - C_{bac})/C_{mod}]$$

where, K_i = initial K-factor (5×10^{-5})
$C_{obs.}$ = observed hourly PM10 concentration ($\mu g/m^3$)
$C_{bac.}$ = background PM10 concentration (assumed to be 20 $\mu g/m^3$)
$C_{mod.}$ = model-predicted hourly PM10 concentration ($\mu g/m^3$)

The results showed that K_f changed spatially and temporally at Owens Lake and that the changes corresponded to different soil textures on the lake bed and to seasonal surface changes that affected erodibility. The results also showed that some source areas were active all year, while others were seasonal and sometimes sporadic. Wind tunnel tests at Owens Lake independently confirmed these seasonal and spatial changes in K_f. Ono et al.[12] concluded that the emission estimates using their Dust ID method were more accurate than the AP-42 method for estimating daily emissions, since the emissions estimates correspond to measured hourly wind erosion on the lake bed. For daily emissions, Ono and co-workers believe that AP-42 drastically overestimates the emissions at low wind speed conditions, and underestimates emissions at high wind speeds. This large discrepancy in the emission estimates is due to the use of a single threshold friction velocity for the entire erosion area in the AP-42 method. The AP-42 method and the Dust ID method of estimating emissions resulted in very close agreement for the annual emissions.

8.4 Emission Estimation: Other Methodologies

Several alternative emission estimation methods for open area wind erosion have been developed that are still in the developmental stage and have not yet been approved by federal or state agencies. Thus, the reader is cautioned in the use of these methods.

8.4.1 MacDougall Method

MacDougall developed a method for estimating fugitive dust emissions from wind erosion of vacant land.[16] This method, which relies heavily on emission factors developed for different vacant land parcels using wind tunnels. The availability of wind tunnel results for the types of vacant land being assessed must be considered when deciding to use this method for other applications. It should be pointed out that in 2003 Environ (under contract to the Western Governors' Association) abandoned this approach due to the paucity of sufficient wind tunnel data for many different vacant land parcels in the western U.S.[17] Also, the WRAP's fugitive dust expert panel had major reservations regarding the MacDougall method.[18] Panel members were skeptical about using the proposed methodology since wind tunnels have shortcomings and do not represent actual conditions in nature. The panel concluded that determining emission factors in the manner proposed will result in significant underestimation of windblown dust for those cases where saltation plays a role. The six steps described in the MacDougall method are summarized below.

Step 1: Categorizing Vacant Land. Vacant land within the study area must be categorized based upon the potential of the parcels to emit fugitive dust during wind

events. Many wind tunnel studies have been conducted in the western United States, and the vacant land descriptions of the wind tunnel test areas should be used to categorize the vacant land within the study area. When categorizing vacant land, it is especially important whether the land has vegetation, rocks or other sheltering elements, whether the soil crust is intact or disturbed, and whether there are periodic activities on the vacant land such as vehicles or plowing that will change the land from fairly stable to unstable. Not every parcel of vacant land will necessarily fit into a category that has been wind tunnel tested. For parcels without a specific vacant land type wind tunnel test, assumptions will need to be made of the best representative land type and uncertainties noted.

Step 2: Identify Wind Tunnel Emission Factors. Based upon the vacant land categorization, wind tunnel results should be reviewed and applied appropriately to each category of vacant land. Wind tunnel results should be reviewed to determine if "spikes" from the initial portion of the test are presented separately or averaged into an hourly factor. Whenever possible, spikes should not be included in an hourly factor. The spike values should be included only at the beginning of each wind event.

Step 3: Develop Meteorological Data Set. For the area to be studied, hourly average wind speeds, rainfall, and if available peak wind gust data should be gathered. If a study area is particularly large, several different meteorological data sets may need to be gathered, and each land parcel matched with the meteorological data that impacts that parcel.

Step 4: Determine Land Type Reservoirs, Threshold Wind Velocities, Wind Events, and Rainfall Events. Based upon the wind tunnel results for each vacant land type, the wind speed when emissions were first measured for the vacant land type, should be set as the threshold wind speed. Most vacant land does not have an endless reservoir of fugitive dust; however, land that has a high degree of disturbance will continue to emit throughout a wind event. Therefore, for each vacant land type, the wind tunnel results should be reviewed and a determination made on the length of time the parcel will emit for a give wind event. It is recommended that an assumption be made that parcels with sheltering clements, vegetated parcels, or parcels with a soil crust will only emit during the first hour of a wind event. Parcels with a relatively high silt component or with frequent disturbance will probably continue to emit throughout a wind event. Because most threshold wind speeds are relatively high (i.e., sustained hourly winds of 25 to 30 mph), a wind event may be defined as any time period when winds reach the threshold wind velocities separated by at least 24 hours before a new wind event is defined. Depending on the soils in an area, rain may have a large impact on wind erosion. Days with rain should not be included in the inventory.

Step 5: Develop Emission Inventory Specific Emission Factors. Using the reservoir determination, threshold wind speeds, wind event determination and rainfall factors, determine hours when wind conditions produced emissions from each vacant land parcel for the time period of the emission inventory. The number of hours with wind speeds in each wind speed category should be totaled. The number of hours can then be multiplied by the wind tunnel emission factor and a total emission factor for the time period of the

inventory can be calculated. The emission factor equations for vacant land with and without sustained emissions are given as follows:

(a) With sustained emissions: $EF_1 = (\sum (H\ P))$

where, EF_1 = PM10 emission factor (lb/acre)
H = number of hours when wind conditions result in emissions
P = emission factor for a given vacant land category (lb/hour-acre)

(b) Without sustained emissions: $EF_1 = (\sum (W\ P))$

where, EF_1 = PM10 emission factor (lb/acre)
W = number of wind events when wind conditions result in emissions
P = emission factor for a given vacant land category (lb/acre)

The emission factor equation for spike emissions is given as:

$$EF_2 = (\sum (E\ S))$$

where, EF_2 = spike PM10 emission factor (lb/acre)
E = number of events producing spike emissions
S = spike mass for a given vacant land category (lb/acre)

Emission factors will vary from time period to time period and from vacant land type to vacant land type. Generally speaking, disturbed lands will have unlimited reservoirs and lower threshold wind velocities leading to much higher emissions than stable or sheltered parcels with one hour reservoirs. An emission factor should be developed for each vacant land category in the inventory.

Step 6: Apply Emission Inventory Specific Emission Factors to Vacant Land Categories. Once emission inventory emission factors have been developed, the number of acres in each category should be multiplied by the factor and the emissions totaled. It may be useful to develop certain factors over shorter time periods and then total the emissions over a longer time period. For example, one may want to develop winter factors and summer factors and then total them together for the annual inventory. For large areas, where vacant land categories will change over the duration of an inventory or different meteorological data sets will apply, it is advisable to subdivide the inventory by time period or area, and then total the inventory at the end. Annual emissions for each vacant land category are calculated as follows:

$$E = A\ (EF_1 + EF_2)$$

where, E = annual emissions for a given vacant land category
A = vacant land category acreage
EF_1 = annual emission factor for a given vacant land category
EF_2 = spike emission factor for a given vacant land category

8.4.2 Draxler Method

Based on an evaluation of available algorithms for calculating wind blown fugitive dust emissions, the WRAP expert fugitive dust panel[18] recommended the use of the

algorithm developed by Draxler et al.[19] that was based on the earlier work of Marticorena et al.[20] This algorithm received the highest score on the basis of extensive field verification test results and having undergone peer review. Draxler and coworkers developed their algorithm for estimating fugitive dust emissions during desert dust storms in Iraq, Kuwait, and Saudi Arabia using a Lagrangian transport and dispersion model where the vertical dust flux was proportional to the difference in the squares of the friction velocity and threshold friction velocity. A proportionality constant was used to relate the surface soil texture to the PM10 dust emissions, and is defined as the ratio of vertical flux of PM10 to total aeolian horizontal mass flux. PM10 emissions caused by wind erosion were estimated in a stepwise process as follows:

Step I. Obtain large scale and small scale wind fields
Step II. Estimate sand movement (horizontal flux of saltation particles ≥50 μm)
Step III. Calculate vertical resuspended dust emissions

The horizontal flux of sand, Q (μg/meter-second), was modeled as follows:

$$Q = A\,(\rho/g)\,u^{*}\,(u^{*2} - u^{*2}_{t})$$

where, A = a dimensionless constant
ρ = the density of air
g = the acceleration due to gravity
u^{*} = the friction velocity (m/s)
u^{*}_{t} = the threshold friction velocity (m/s) required for initiation of sand movement by the wind.

The value of A is not constant if there is wetting followed by crusting of the surface sediments, or if there is a depletion of loose particles on the surface for a "supply-limited" surface. The value of A ranges from a maximum of ~3.5 when the surface is covered with loose sand to ~0 when the surface has a smooth crust with few loose particles larger than 1 mm. Suspended dust is proportional to saltation or sandblasting as follows:

$$F = K\,Q$$

where, F = the vertical flux of dust ($\mu g/m^2$-second)
K = proportionality factor (m^{-1}) that relates the surface soil texture to PM10 dust emissions
Q = the horizontal flux of saltating particles (μg/m-second)

The value of K is not precisely known, but data sets of F versus Q are available so that estimates of K can be made for certain soils. For sand textured soils, K is estimated to be ~5.6×10^{-4} m^{-1} and A is ~2.8.

8.4.3 UNLV Method

James and co-workers with the University of Nevada Las Vegas (UNLV) developed a wind blown dust inventory for Clark County, NV based on wind tunnel measurements.[21] The method involved deriving estimates of wind blown fugitive dust emission factors for three categories of vacant land: disturbed vacant land, stabilized vacant land, and

undisturbed native desert soils. The emission factors included geometric mean hourly "spike" corrected emission rates (tons/acre-hour) for disturbed vacant land, stabilized vacant land and undisturbed native desert soils as well as geometric mean spike emissions (ton/acre) for disturbed vacant land and undisturbed native desert soils as a function of wind speed and soil type. The emission inventory assumed that the particulate reservoir for disturbed vacant land had no limit. For every hour the sustained wind speeds were within a given wind speed category above the "spike" wind speed, the emissions were calculated. A single "spike" mass was added for each acre of vacant land for those days that the wind speed exceeded a threshold wind speed, assuming each day represented a single wind event and reservoir recharging would not have occurred during a 24-hour period. Wind speeds less than the "spike" speed were not included in the emission calculations. Because the native desert parcels have a limited PM10 reservoir, it was assumed that the reservoir would be depleted within one hour of sustained winds above the "spike" wind speed. Therefore, only one hour of emissions were calculated during each day that winds exceeded the threshold friction velocity ("spike" wind speed) for native desert parcels.

The wind speed threshold for generating fugitive dust emissions was estimated by James et al.[21] to be 20 mph for disturbed vacant land and 25 mph for native desert parcels. Because the parcels stabilized with dust suppressants had been subjected to some disturbance by vehicle traffic that may have caused some dust palliatives to break down, the initial wind threshold for this category was lower than the other categories, namely 15 mph. However, the use of dust palliatives greatly reduced the overall emission factors. Spikes were generally not observed from the stabilized parcels, and emission factors without spike corrections were used for stabilized parcels. As with native desert, it was assumed that the stabilized parcels have a limited PM10 reservoir that would be depleted within one hour of sustained winds above the threshold wind velocity. Therefore, only one hour of emissions was calculated during each day for stabilized parcels.

For a sustained wind speed of 25 mph, the geometric mean hourly spike corrected emission factors across all soil types for Clark County were estimated to be ~5 x 10^{-3} ton/acre-hour for disturbed vacant land, ~2 x 10^{-3} ton/acre-hour for native desert, and ~2 x 10^{-4} ton/acre-hour for stabilized land. The geometric mean spike emissions for a sustained wind speed of 25 mph were estimated to be ~2 x 10^{-3} ton/acre for disturbed vacant land and ~5 x 10^{-4} ton/acre for undisturbed native desert parcels. It should be pointed out that there was significant scatter in the observed data, with within category variability ranging over 1 to 2 orders of magnitude.

8.4.4 WRAP RMC Method

The Dust Emissions Joint Forum (DEJF) of the Western Regional Air Partnership contracted with ENVIRON to develop a particulate emission calculation method for open area wind erosion in 2003. The DEJF extended ENVIRON's original contract (Phase 2) to provide windblown dust emissions inventories, and perform modeling simulations of the effects of those emissions on regional haze for calendar year 2002 and future year projections. The purpose of this additional effort was to improve the windblown dust

emissions model developed as part of Phase 1. The results of the initial model runs and subsequent sensitivity simulations had demonstrated a need to revise and/or update various assumptions associated with the development of the emission inventory. To this end, revised estimation methodologies and algorithms were evaluated in Phase 2 in order to address various shortcomings and limitations of the Phase 1 version of the model. Many of the assumptions employed in the Phase 1 methodology were necessitated by a lack of specificity in the underlying data used to characterize vacant land types and soil conditions in relation to the potential for wind erosion. Even in Phase 2, it was necessary to rely on some assumptions where data were lacking.

Summary of the WRAP RMC Method

The WRAP RMC windblown dust method utilizes wind tunnel-based emission algorithms for different soils and accounts for land use and local meteorology. The complete set of documents that describe the method in full detail may be found at www.wrapair.org. The summary of the method presented below is based on ENVIRON's final report submitted to the DEJF on May 5, 2006.[22]

There are two important factors for characterizing the dust emission process from an erodible surface. They are (a) the threshold friction velocity that defines the inception of the emission process as a function of the wind speed as influenced by the surface characteristics, and (b) the strength of the emissions that follow the commencement of particle movement. The two critical factors affecting emission strength are the wind speed (wind friction velocity) that drives the saltation system, and the soil characteristics.

Friction Velocities Surface friction velocities are determined from the aerodynamic surface roughness lengths and the 10-meter wind speeds based on MM5 model simulations. Friction velocity, u_*, is related to the slope of the velocity versus the natural logarithm of height through the relationship:

$$\frac{u_z}{u_*} = \frac{1}{\kappa} \ln \frac{z}{z_0}$$

where u_z = wind velocity at height z (m/s)
u_* = friction velocity (m/s)
κ = von Karman's constant (0.4)
z_0 = aerodynamic roughness height (m)

The threshold friction velocities, u_{*t}, are determined from the relationships developed by Marticorena et al.[20] as a function of the aerodynamic surface roughness length, z_0. Figure 8-2 shows the comparison between Marticorena's modeled relationship of threshold friction velocity and aerodynamic surface roughness length and wind tunnel data obtained by different investigators.[23 – 26]

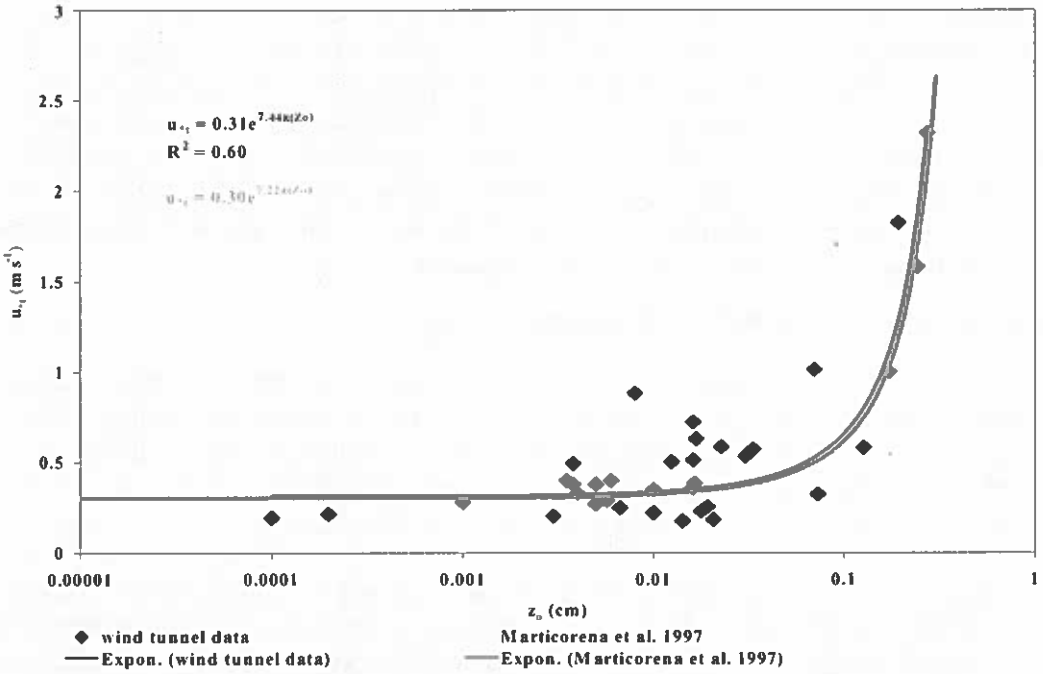

Figure 8-2. Threshold Friction Velocity vs. Aerodynamic Roughness Length

Surface friction velocities, including the threshold friction velocity, are a function of the aerodynamic surface roughness lengths. The surface friction velocities are in turn dependent on surface characteristics, particularly land use/land cover. While these values can vary considerable for a given land type, published data are available which provide a range of surface friction velocities for various land use types and vegetation cover. These data are presented in Table 8-3.

Table 8-3. Threshold Friction Velocities for Typical Surface Types [23-26]

Site Type	Undisturbed u_{*t} (m/s)	Disturbed u_{*t} (m/s)	% change [1-(dist./undist.)]
agricultural fields	1.29	0.55	0.57
alluvial fan	0.72	0.60	0.17
desert flat	0.75	0.51	0.32
desert pavement	2.17	0.59	0.73
fan surface	1.43	0.47	0.67
playa, crusted	2.13	0.63	0.70
playa	1.46	0.58	0.60
prairie	2.90	0.24	0.92
sand dune	0.44	0.32	0.27

Emission Fluxes Emission fluxes, or emission rates, are determined as a function of surface friction velocity and soil texture. The relationships that Chatenet et al.[27] established between the 12 soil types in the classical soil texture triangle and their four dry soil types (silt [FSS], sandy silt [FS], silty sand [MS], and sand [CS]) are of key importance. The relationships developed by Alfaro and others[28, 29] for each of the soil texture groups are used to estimate dust emission fluxes. These relationships are presented in Figure 8-3.

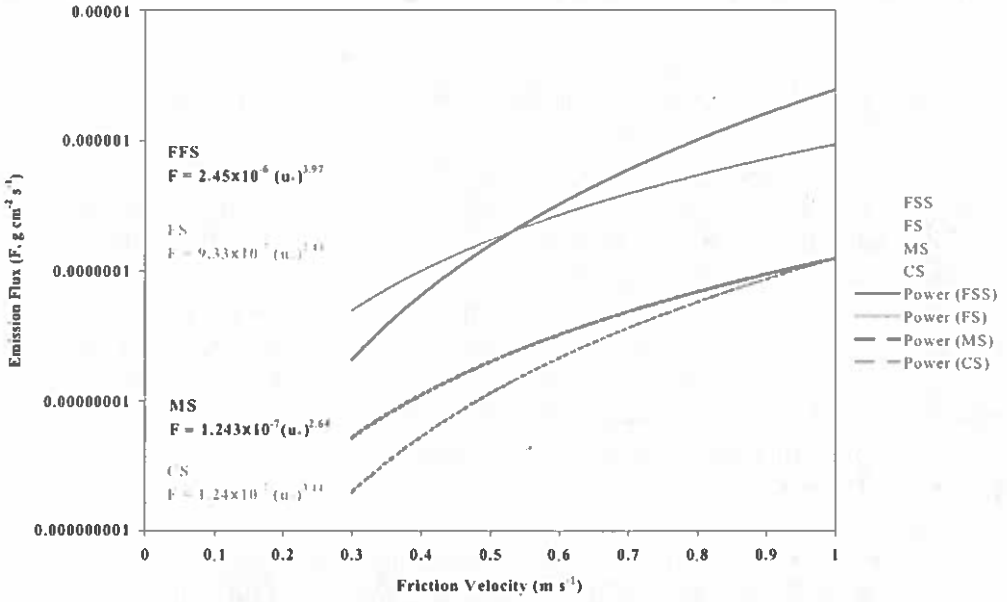

Figure 8-3. Emission Flux vs. Friction Velocity Predicted by the Alfaro and Gomes Model[28] Constrained by the Four Soil Classes of Alfaro et al.[29]

Reservoir Characteristics Reservoirs are classified as limited for stable land parcels and unlimited for unstable land parcels. Classification of reservoirs as limited or unlimited has implications with respect to the duration of time over which the dust emissions are generated. In general, the reservoirs should be classified in terms of the type of soils, the depth of the soil layer, soil moisture content and meteorological parameters. Finally, the time required for a reservoir to recharge following a wind event is influenced by a number of factors including precipitation and snow events and freezing conditions of the soils. A recharge time of 24 hours is assigned to all surfaces. In addition, it is assumed that no surface will generate emissions for more than 10 hours in any 24-hour period.

The duration and amount of precipitation and snow and freeze events will also affect the dust emissions from wind erosion. Barnard[30] has compiled a set of conditions for treating these events based on seasons, soil characteristics and the amounts of rainfall and snow cover. The time necessary to re-initiate wind erosion after a precipitation event ranges from 1 to 10 days, depending on the soil type, season of the year and whether the rainfall amount exceeds 2 inches.

Soil Disturbance The disturbance level of a surface more appropriately has the effect of lowering the threshold surface friction velocity. Except for agricultural lands, which are treated separately in the model as described below, vacant land parcels are typically

undisturbed unless some activity is present such as to cause a disturbance (e.g., off-road vehicle activity in desert lands, or animal grazing on rangelands). It is recommended that all non-agricultural land types be considered undisturbed, since there is no *a priori* information to indicate otherwise for the regional scale modeling domain to be considered. Therefore, for the purpose of evaluating the sensitivity of the model to disturbance levels, all grassland, shrubland and barren land areas are assumed to have 10 % of their land area disturbed. Threshold surface friction velocities for these disturbed lands are assigned as follows: 3.1 m/s for grasslands and shrublands, and 0.82 m/s for barren land.

Soil Characteristics Application of the emission factor relations described above requires the characterization of soil texture in terms of the four soil groups considered by the model. The characteristics or type of soil is one of the parameters of primary importance for the application of the emission estimation relations derived from wind tunnel study results. The State Soil Geographic Database (STATSGO) available from the USDA[31] is used to determine the type of soils present in the modeling domain for which the emission inventory is developed. The classification of soil textures and soil group codes is based on the standard soil triangle that classifies soil texture in terms of percent sand, silt and clay. Combining the soil groups defined by the work of Alfaro et al.[29] and Chatenet et al.[27] and the standard soil triangle provides the mapping of the 12 soil textures to the four soil groups considered in their study. The soil texture mappings are summarized in Table 8-4.

Table 8-4. STATSGO Soil Texture and Soil Group Codes

STATSGO Soil Texture	Soil Texture Code	Soil Group	Soil Group Code
No Data	0	N/A	0
Sand	1	CS	4
Loamy Sand	2	CS	4
Sandy Loam	3	MS	3
Silt Loam	4	FS	1
Silt	5	FSS	2
Loam	6	MS	3
Sandy Clay Loam	7	MS	3
Silty Clay Loam	8	FSS	1
Clay Loam	9	MS	3
Sandy Clay	10	MS	3
Silty Clay	11	FSS	1
Clay	12	FS	2

Surface Roughness Lengths Surface roughness lengths can vary considerably for a given land type, as evidenced by examination of the data in Table 8-5. Surface roughness lengths are assigned as a function of land use type based on a review of the information in Table 8-5. The disturbance level of various surfaces has the effect of altering the surface roughness lengths, which in turn impact the potential for vacant lands to emit dust from wind erosion

Table 8-5. Aerodynamic Surface Aerodynamic Roughness Lengths, Z_0

Site Type	Average z_o (cm)	Reference(s)
agricultural fields (bare)	0.031	23 - 26
desert flat/pavement	0.133	23 - 26
fan surface	0.088	23 - 26
playa, crusted	0.059	23 - 26
playa	0.057	23 - 26
prairie	0.049	23 - 26
sand dune	0.007	23 - 26
scrub desert	0.045	26
sparse veg. (0.04% cover)	0.37	33
sparse veg. (8% cover)	5.4	33
sparse veg. (10.3% cover)	6.8	33
sparse veg. (13.5% cover)	7.2	33
sparse veg. (26% cover)	8.3	33
thick grass	2.3	34
thin grass	5	34
sparse grass	0.12	35
agricultural crops	2-4	35
orchards	50-100	35
decid. forests	100-600	35
conf. forests	100-600	35
agricultural crops	15	36
urban	100	36
decid. forests (closed canopy)	121	36
conif. forests (closed canopy)	134	36

An examination of Figure 8-2, which relates the threshold surface friction velocity to the aerodynamic surface roughness length, reveals that for surface roughness lengths larger than approximately 0.1 cm, the threshold friction velocities increase rapidly above values that can be realistically expected to occur in the meteorological data used in the model implementation. Therefore to simplify the model implementation, only those land types with roughness length less than or equal to 0.1 cm are considered as potentially erodible surfaces.

For a given surface roughness, as determined by the land use type[32], the threshold friction velocity has a constant value. Thus, the land use data is mapped to an internal dust code used within the model to minimize computer resource requirements and coding efforts. The mapping of land use types to dust codes 3 and above (except for code 5 that applies to orchards and vineyards) is presented in Table 8-6, which summarizes the surface characteristics by dust code. [Note: Dust codes 1 and 2 refer to water/wetlands and forest/urban, respectively.]

Table 8-6. Surface Characteristics by Dust Code and Land Use Category

Dust Code	3	4	6	7
Land use category	Agricultural	Grassland	Shrubland	Barren
Surface roughness length, $Z_{0\,(cm)}$	0.031	0.1	0.05	0.002
Threshold friction velocity (m/s)	3.72	6.17	4.30	3.04
Threshold wind velocity at 10 meter height (m/s [mph])	13.2 [29.5]	19.8 [44.3]	14.6 [32.8]	12.7 [28.5]

Meteorology Gridded hourly meteorological data, which is required for the dust estimation methodology is based on MM5 model simulation results. Data fields required include wind speeds, precipitation rates, soil temperatures and ice/snow cover.

Agricultural Land Adjustments Unlike other types of vacant land, windblown dust emissions from agricultural land are subject to a number of non-climatic influences, including irrigation and seasonal crop growth. As a result, several non-climatic correction or adjustment factors were developed for applicability to the agricultural wind erosion emissions. These factors included:

- Long-term effects of irrigation (i.e., soil "clodiness")
- Crop canopy cover
- Post-harvest vegetative cover (i.e., residue)
- Bare soil (i.e., barren areas within an agriculture field that do not develop crop canopy for various reasons, etc.)
- Field borders (i.e., bare areas surrounding and adjacent to agricultural fields)

The methodology used to develop individual non-climatic correction factors was based upon previous work performed by the California Air Resources Board in their development of California-specific adjustment factors for the USDA's Wind Erosion Equation.[37]

Other Adjustments Two other adjustments to modeled air quality impacts relate to fugitive dust transportability and partitioning between fine and coarse fractions of PM10. Transportability fractions as a function of land use are assigned on the basis of the methodology described by Pace.[38] New fine fraction values developed by Cowherd[39] from controlled wind tunnel studies of western soils are applied to determine the fine and coarse fractions of wind-generated fugitive dust emissions.

Concerns Regarding the Method

ENVIRON's methodology for calculating wind-generated fugitive dust emissions relies on several assumptions that may not be valid. As was mentioned above, many of the assumptions employed in Phase 1 were necessitated by a lack of specificity in the underlying data used to characterize vacant land types and soil conditions in relation to the potential for wind erosion. Even in Phase 2, it was necessary to rely on some assumptions where data were lacking.

The pertinent vacant land characteristics that are most difficult to characterize are the dust reservoir capacities and resuspension characteristics in relation to the levels of surface disturbance and the presence of protective surface elements (vegetation, rocks). Another complex feature is the recharge time needed to re-establish all or part of the reservoir after depletion by a wind erosion event.

Surface disturbance tends to have a much stronger impact than soil type in providing a high dust reservoir capacity. If the surface is disturbed in such a way that non-erodible

elements are minimized, it can be considered as having an "unlimited" erosion potential. This means that the reservoir is large enough to support hours of fine particle emissions during a high-wind event. Therefore, it is important any PM10 emission models or empirical relationships account for not only the soil type but also the state of aggregation of the exposed surface material.

After a surface disturbance that creates an unlimited reservoir of available particles, precipitation events can have a major effect in restoring a surface crust and place the surface in a stable condition for an indefinite period. When this occurs, typically a "limited" reservoir will be present on the surface. This reservoir contains only minor amounts of accumulated deposition from previous area-wide wind erosion events or from other more localized fugitive dust sources such as unpaved roads.

Because of the complexity of determining dust reservoir characteristics and their dynamic features, the Phase 2 methodology also tends to rely on assigned characteristics that do not appear to be well founded for most areas subject to wind erosion. For example, the assumed recharge period of only 24 hours is usually unrealistic. For example in the case of agricultural land, this would require a major disturbance to the soil such as a tilling operation that brings fresh, loose and dry soil to the surface. In the absence of a major surface disturbance, actual recharge times may extend to weeks and even months.[40] In some cases, however, a stable surface can transition to a highly erodible state in the absence of mechanical disturbance. The highly alkaline soils at Owens Lake, California for instance are fairly stable during summer months, but can change to a very unstable surface in the winter and spring following periods with precipitation and cold temperatures.[12]

Another example of concern is the value assumed in the Phase 2 model for the estimated time after a precipitation event that it takes to re-initiate wind erosion. The times given for full restoration of the dust reservoir are in the range of 1 to 4 days, depending on the soil type and whether the precipitation exceeded 2 inches. These values are at variance with the results of a multiyear field study conducted by Cowherd et al. in the western Mojave Desert.[41] That study showed that precipitation events of that order could re-stabilize soil surfaces for indefinite periods pending the next major surface disturbance. In the study area, scattered reservoirs of loose sand were stabilized by the presence of desert vegetation.

Stable soils in windy areas tend to have limited reservoirs of erodible particles consisting of a thin surface layer of deposition from previous high wind events. These layers have been homogenized by successive resusupension and atmospheric mixing during wind erosion over many years. This is illustrated by a recently completed inventory of vacant lands in the Las Vegas Valley.[42] This study showed that the vast majority of the land consisted of "native desert" as characterized by a single reflectance signature from satellite imagery with visible and infrared wavelength components. Landsat TM 5 with a 30-meter pixel size was found to provide a useful reflectance averaging that eliminated the effects of micro-features associated with uneven patterns of vegetation. The thin layers of erodible particles appear to exhibit a relatively uniform

chemistry. Therefore, the known soil chemistry differences below the surface layer were not a confounding factor in establishing a single spectral signature for this vacant land category. On the other hand, areas where the soil had been turned as part of land preparation processes for construction projects could not be fitted to a single spectral signature because of surface soil chemistry differences.

Due to the paucity of wind tunnel data, Mansell et al.[17] developed fugitive dust emission factors for wind erosion of vacant land, based on soil texture rather than using area-specific wind tunnel data as recommended by MacDougall.[16] The emission fluxes for four soil aggregate populations were expressed in terms of friction velocity, based on test data from a relatively large portable wind tunnel. It was assumed that the flux would remain constant at any friction velocity for a period of 1 hour or 10 hours depending on whether the surface was classified as having a limited or unlimited reservoir respectively. Mansell and coworkers did not rely on the wind tunnel emission factors derived for Clark County by James et al.[21] because they appeared to be much greater than emission factors measured by other researchers using wind tunnels with a larger cross-section than the UNLV designed wind tunnel (6" wide by 6" high by 60" long).

It should be noted that because ENVIRON's methodology assigns a very short recovery time on (a) replenishing soil losses from high wind events, and on (b) losing the mitigating effects of precipitation, the estimated emissions are driven mostly by wind speed. There is little accounting for the natural tendency of most unlimited reservoir surfaces to re-stabilize for long periods of time in the absence of major surface disturbances or large supplies of available loose sand that can abrade stable crusts. As noted in the land inventory of the Las Vegas Valley cited above, a frequent land disturbance pattern is found only on regularly traveled surfaces, with few exceptions.

Recommendations

In order to use ENVIRON's methodology/model for calculating wind-generated fugitive dust emissions, it is strongly recommended that the user review the necessary inputs for the model, and refine the inputs if better information is available. If a wind blown dust inventory is needed for a planning area, local wind tunnel data, or erosion monitoring using CSC sand flux samplers based on the methodology described by Ono et al.[12] (see Section 8.3) is a very practical approach.

8.5 Demonstrated Control Techniques

Control measures for open area wind erosion are designed to stabilize the exposed surface (e.g., by armoring it with a less erodible cover material) or to shield it from the ambient wind. Table 8-7 presents a summary of control measures and reported control efficiencies for open area wind erosion.

Table 8-7. Control Efficiencies for Control Measures for Open Area Wind Erosion

Control measure	Source Component	PM10 Control Efficiency	References/comments
Apply dust suppressants to stabilize disturbed area after cessation of disturbance	Disturbed areas	84%	CARB, April 2002.[43]
Apply gravel to stabilize disturbed open areas	Disturbed areas	84%	CARB, April 2002.[43] Estimated to be as effective as chemical dust suppressants.

8.6 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. Regulatory formats specify the threshold source size that triggers the need for control application. Example regulatory formats for several local air quality agencies in the WRAP region are presented in Table 8-8. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/envsvc/air/ruledesc.asp

8.7 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Table 8-8. Example Regulatory Formats for Open Area Wind Erosion

Control measure	Goal	Threshold	Agency
Watering, fencing, paving, graveling, dust suppressant, vegetative cover, restrict vehicular access	Maintain soil moisture content min 12%; or 70% min of optimum soil moisture content; reduce windblown emissions	Construction sites; fences 3ft-5ft, adjacent to roadways/urban areas;	Maricopa County Rule 310 04/07/2004
Cease ops (wind speed >25mph); applying dust suppressant 2x hr; watering and fencing (as above); for after work hours: gravel, water 3x/day (possibly 4)	Reduce amt of windblown dust leaving site; maintain soil moisture content 12%	Wind speed must be >25mph for 60 min average; fencing must be 3ft-5ft with <50% porosity; watering for after work, holidays, weekends increase to 4x/day during wind event	Maricopa County Rule 310 04/07/2004
Use of one of following for dust control on all disturbed soil to maintain in damp condition: soil crusted over by watering or other, or graveling or treated with dust suppressant	Prevent visible fugitive dust from exceeding 20% opacity, and prevent dust plume from extending more than 100 yd		Clark County Sect. 94 Air Quality Reg. 06/22/2000
Requires application of water or chemical stabilizers prior to wind event 3 times a day (possible increase to 4 times a day if evidence of wind driven dust), or establish a vegetative cover within 21 days after active operations have ceased to maintain a stabilized surface for 6 months		For operations that remain inactive for not more than 4 consecutive days	SCAQMD Rule 403 12/11/1998

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 8-9 summarizes the compliance tools that are applicable to open area wind erosion.

Table 8-9. Compliance Tools for Open Area Wind Erosion

Record keeping	Site inspection/monitoring
Soil stabilization methods; application frequencies, rates, and times for dust suppressants; establishment/ maintenance of wind breaks.	Crust strength determination (e.g., drop ball test); observation of operation of dust suppression systems; inspection of heights and porosities of windbreaks.

8.8 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for fugitive dust originating from open area wind erosion. A sample cost-effectiveness calculation is presented below for a specific control measure (apply gravel) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for open area wind erosion, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation For Open Area Wind Erosion (Dirt Parking Lot)

Step 1. Determine source activity and control application parameters.

Area of dirt parking lot	10,000 m^2
Disturbance frequency per day	1
Duration of exposure (months)	12
Roughness height (cm)	0.5
Threshold peak wind speed at height of 10 m (m/s)	10

Control Measure	Apply gravel
Control application/frequency	Once every years
Economic Life of Control System (yr)	5
Threshold friction velocity for gravel (m/s)	1.9
Control Efficiency (%)	84
Reference for Control Efficiency	Sierra Research (2003) [44]

The field size, source activity parameters, and control measure parameters are assumed values for illustrative purposes. Applying a 3" deep gravel bed over the dirt has been chosen as the applied control measure.

Step 2. Obtain PM10 Emission Factor.

The PM10 emission factor is obtained from AP-42: PM10 EF = $0.5 \sum_{i=1}^{N} P_i$

P—erosion potential (g/m^2) $P = 58 (u^*-u^*_t)^2 + 25 (u^*-u^*_t)$

$P = 0$ for $u^* \leq u_t^*$

Threshold friction velocity u^*_t (m/s) = $0.053\ u^+_{10}$ 0.53

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor (obtained in Step 2) is applied to each day for which the peak wind exceeds the threshold velocity for wind erosion. The following monthly climatic data are used for illustrative purposes and are assumed to apply to each month of the year.

Monthly erosion potential (P) [a]				
Day of Month	Peak Wind (u^+_{10}) mph	m/s	u* m/s	P g/m^2
6	29	13.0	0.69	5.36
7	30	13.4	0.71	6.41
11	38	17.0	0.90	17.21
22	25	11.2	0.59	1.78
			Sum of P	30.77

[a] Assumed to apply to 12 months of the year.

The annual PM10 emissions are equal to the PM10 emission factor (i.e., 0.5 times the monthly erosion potential) multiplied by 12 and then by the field size (under activity data) and then divided by 454 g/lb and 2,000 lb/ton to compute the annual PM10 emissions in tons per year, as follows:

Annual PM10 emissions = (Emission Factor x Field Size) / (454 x 2,000)
Annual PM10 emissions = (0.5 x 0.77 x 12 x 10,000) / (454 x 2,000)
Annual PM10 emissions = 2.03 tons

Annual PM2.5 emissions = 0.15 x PM10 emissions[12] = 0.15 x 2.03 = 0.30 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

For this example, we have selected applying gravel over the dirt parking lot as our control measure. Based on a control efficiency estimate of 84% for this control measure, the annual controlled emissions estimate are calculated to be:

Annual Controlled PM10 emissions = 0.33 tons
Annual Controlled PM2.5 emissions = 0.049 tons

Step 5. Determine Annual Cost to Control PM Emissions.

Capital costs ($)	50,000
Annual Operating/Maintenance costs ($)	4,000
Annual Interest Rate	3%
Capital Recovery Factor	0.2184
Annualized Cost ($/yr)	13,173

The capital costs, annual operating and maintenance costs, and annual interest rate (AIR) are assumed values for illustrative purposes. The Capital Recovery Factor (CRF) is calculated from the Annual Interest Rate (AIR) and the Economic Life of the control system, as follows:

$$\text{Capital Recovery Factor} = AIR \times (1+AIR)^{\text{Economic life}} / (1+AIR)^{\text{Economic life}} - 1$$

$$\text{Capital Recovery Factor} = 3\% \times (1+3\%)^{5} / (1+3\%)^{5} - 1 = 0.2184$$

The Annualized Cost is calculated by adding the product of the Capital Recovery Factor and the Capital costs to the Annual Operating/Maintenance:

Annualized Cost = (CRF x Capital costs) + Annual Operating/Maintenance costs
Annualized Cost = (0.2084 x 50,000) + 4,000 = 14,918

Step 6. Calculate Cost-effectiveness. Cost-effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost-effectiveness = Annualized Cost/ (Uncontrolled emissions – Controlled emissions)

Cost-effectiveness for PM10 emissions = $14,918 / (2.03 - 0.33) = $8,735/ton
Cost-effectiveness for PM2.5 emissions = $14,918 / (0.30 - 0.049) = $58,234/ton

9.1 Characterization of Source Emissions

Dust emissions may be generated by wind erosion of open areas of exposed soils or other aggregate materials within an industrial facility. These sources typically are characterized by nonhomogeneous surfaces impregnated with nonerodible elements (particles larger than approximately 1 centimeter [cm] in diameter). Field testing of coal piles and other exposed materials using a portable wind tunnel has shown that: (a) threshold wind speeds exceed 5 meters per second (m/s) (11 miles per hour [mph]) at 15 cm above the surface or 10 m/s (22 mph) at 7 m above the surface, and (b) particulate emission rates tend to decay rapidly (half-life of a few minutes) during an erosion event. In other words, these aggregate material surfaces are characterized by finite availability of erodible material (mass/area) referred to as the erosion potential. Any natural crusting of the surface binds the erodible material, thereby reducing the erosion potential. Loose soils or other aggregate materials consisting of sand-sized materials act as an unlimited reservoir of erodible material and can sustain emissions for periods of hours without substantial decreases in emission rates.

If typical values for threshold wind speed at 15 cm are corrected to typical wind sensor height (7 to 10 m), the resulting values exceed the upper extremes of hourly mean wind speeds observed in most areas of the country. In other words, mean atmospheric wind speeds are not sufficient to sustain wind erosion from flat surfaces of the type tested. However, wind gusts may quickly deplete a substantial portion of the erosion potential. Because erosion potential has been found to increase rapidly with increasing wind speed, estimated emissions should be related to the gusts of highest magnitude. The routinely measured meteorological variable that best reflects the magnitude of wind gusts is the fastest mile. This quantity represents the wind speed corresponding to the whole mile of wind movement that has passed by the 1 mile contact anemometer in the least amount of time. Daily measurements of the fastest mile are presented in the monthly Local Climatological Data (LCD) summaries. The duration of the fastest mile, typically about 2 minutes (for a fastest mile of 30 mph), matches well with the half-life of the erosion process, which ranges between 1 and 4 minutes. It should be noted, however, that peak winds can significantly exceed the daily fastest mile.

The wind speed profile in the surface boundary layer is found to follow a logarithmic distribution as follows:

$$u(z) = \frac{u^*}{0.4} \ln \frac{z}{z_0} \quad (z > z_0) \tag{1}$$

where,

- u = wind speed (cm/s)
- u^* = friction velocity (cm/s)
- z = height above test surface (cm)
- z_0 = roughness height (cm)
- 0.4 = von Karman's constant (dimensionless)

The friction velocity (u^*) is a measure of wind shear stress on the erodible surface, as determined from the slope of the logarithmic velocity profile. The roughness height (z_0) is a measure of the roughness of the exposed surface as determined from the y-intercept

of the velocity profile, i.e., the height at which the wind speed is zero. These parameters are illustrated in Figure 9-1 for a roughness height of 0.1 cm.

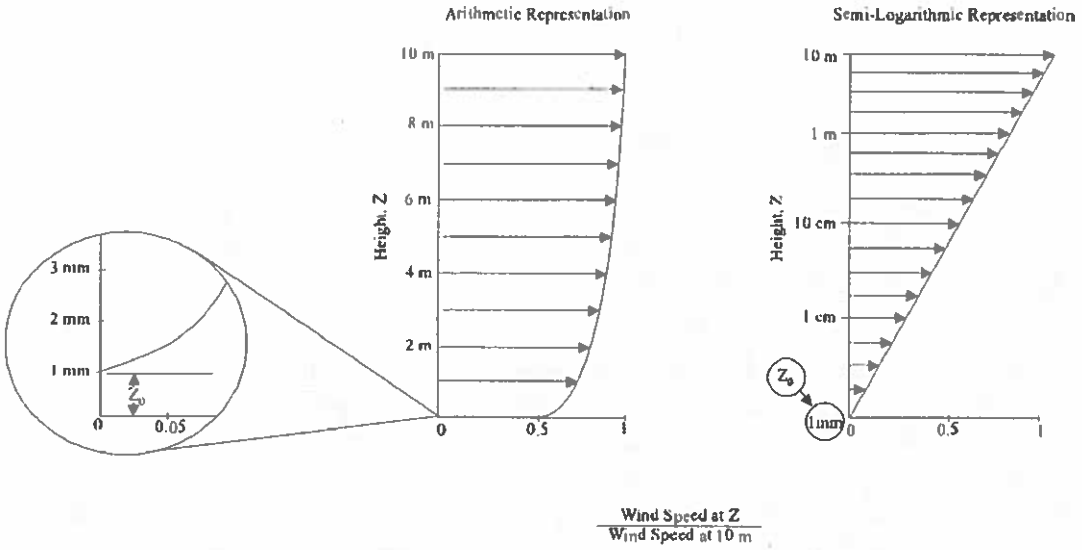

Figure 9-1. Illustration of Logarithmic Wind Velocity Profile

Emissions generated by wind erosion are also dependent on the frequency of disturbance of the erodible surface because each time that a surface is disturbed, its erosion potential is restored. A disturbance is defined as an action that results in the exposure of fresh surface material. On a storage pile, this would occur whenever aggregate material is either added to or removed from the old surface. A disturbance of an exposed area may also result from the turning of surface material to a depth exceeding the size of the largest pieces of material present.

9.2 Emission Estimation: Primary Methodology [1-11]

This section was adapted from Section 13.2.5 of EPA's *Compilation of Air Pollutant Emission Factors (AP-42)*. Section 13.2.5 was last updated in January 1995.

The PM10 emission factor for wind-generated particulate emissions from mixtures of erodible and nonerodible surface material subject to disturbance may be expressed in units of grams per square meter (g/m^2) per year as follows:

$$\text{PM10 Emission Factor} = 0.5 \sum_{i=1}^{N} P_i \qquad (2)$$

where,

N = number of disturbances per year

Pi = erosion potential corresponding to the observed (or probable) fastest mile of wind for the ith period between disturbances (g/m^2)

In calculating emission factors, each area of an erodible surface that is subject to a different frequency of disturbance should be treated separately. For a surface disturbed

daily, N = 365 per year, and for a surface disturbance once every 6 months, N = 2 per year. The erosion potential function for a dry, exposed surface is given as:

$$P = 58 (u^* - u_t^*)^2 + 25 (u^* - u_t^*) \quad (3)$$

$$P = 0 \text{ for } u^* \leq u_t^*$$

where,

u^* = friction velocity (m/s)

u_t = threshold friction velocity (m/s)

Because of the nonlinear form of the erosion potential function, each erosion event must be treated separately. The PM2.5/PM10 ratio for windblown fugitive dust posted on EPA's CHIEF website is 0.15 based on the analysis conducted by MRI on behalf of WRAP.[11]

Equations 2 and 3 apply only to dry, exposed materials with limited erosion potential. The resulting calculation is valid only for a time period as long or longer than the period between disturbances. Calculated emissions represent intermittent events and should not be input directly into dispersion models that assume steady-state emission rates. For uncrusted surfaces, the threshold friction velocity is best estimated from the dry aggregate structure of the soil. A simple hand sieving test of surface soil can be used to determine the mode of the surface aggregate size distribution by inspection of relative sieve catch amounts, following the procedure described below.

FIELD PROCEDURE FOR DETERMINING THRESHOLD FRICTION VELOCITY
(from a 1952 laboratory procedure published by W. S. Chepil[5])

Step 1. Prepare a nest of sieves with the following openings: 4 mm, 2 mm, 1 mm, 0.5 mm, and 0.25 mm. Place a collector pan below the bottom (0.25 mm) sieve.

Step 2. Collect a sample representing the surface layer of loose particles (approximately 1 cm in depth, for an encrusted surface), removing any rocks larger than about 1 cm in average physical diameter. The area to be sampled should be not less than 30 cm by 30 cm.

Step 3. Pour the sample into the top sieve (4-mm opening), and place a lid on the top.

Step 4. Move the covered sieve/pan unit by hand, using a broad circular arm motion in the horizontal plane. Complete 20 circular movements at a speed just necessary to achieve some relative horizontal motion between the sieve and the particles.

Step 5. Inspect the relative quantities of catch within each sieve, and determine where the mode in the aggregate size distribution lies, i.e., between the opening size of the sieve with the largest catch and the opening size of the next largest sieve.

Step 6. Determine the threshold friction velocity from Table 9-1.

The results of the sieving can be interpreted using Table 9-1. Alternatively, the threshold friction velocity for erosion can be determined from the mode of the aggregate size distribution using the graphical relationship described by Gillette.[5, 6] If the surface material contains nonerodible elements that are too large to include in the sieving (i.e., greater than about 1 cm in diameter), the effect of the elements must be taken into account by increasing the threshold friction velocity.[10]

Table 9-1. Field Procedure for Determination of Threshold Friction Velocity (Metric Units)

Tyler Sieve No.	Opening (mm)	Midpoint (mm)	u_t^* (cm/s)
5	4		
9	2	3	100
16	1	1.5	76
32	0.5	0.75	58
60	0.25	0.375	43

Threshold friction velocities for several surface types have been determined by field measurements with a portable wind tunnel. These values are presented in Table 9-2.

Table 9-2 Threshold Friction Velocities (Metric Units)

Material	Threshold friction velocity (m/s)	Roughness height (cm)	Threshold wind velocity at 10 m (m/s)	
			z_o = Actual	z_o = 0.5 cm
Overburden[a]	1.02	0.3	21	19
Scoria (roadbed material)[a]	1.33	0.3	27	25
Ground coal (surrounding coal pile)[a]	0.55	0.01	16	10
Uncrusted coal pile[a]	1.12	0.3	23	21
Scraper tracks on coal pile[a,b]	0.62	0.06	15	12
Fine coal dust on concrete pad[c]	0.54	0.2	11	10

[a] Western surface coal mine; reference 2.
[b] Lightly crusted.
[c] Eastern power plant; reference 3.

The fastest mile of wind for the periods between disturbances may be obtained from the monthly local climatological data (LCD) summaries for the nearest reporting weather station that is representative of the site in question.[7] These summaries report actual fastest mile values for each day of a given month. Because the erosion potential is a highly nonlinear function of the fastest mile, mean values of the fastest mile are inappropriate. The anemometer heights of reporting weather stations are found in Reference 8, and should be corrected to a 10-m reference height using Equation 1. To convert the fastest mile of wind (u^+) from a reference anemometer height of 10 m to the equivalent friction velocity (u^*), the logarithmic wind speed profile may be used to yield the following equation:

$$u^* = 0.053\, u_{10}^+ \qquad (4)$$

where,

u^* = friction velocity (m/s)
u_{10}^+ = fastest mile of reference anemometer for period between disturbances (m/s)

This assumes a typical roughness height of 0.5 cm for open terrain. Equation 4 is restricted to large relatively flat exposed areas with little penetration into the surface wind layer.

If the pile significantly penetrates the surface wind layer (i.e., with a height-to-base ratio exceeding 0.2), it is necessary to divide the pile area into subareas representing different degrees of exposure to wind. The results of physical modeling show that the frontal face of an elevated pile is exposed to wind speeds of the same order as the approach wind speed at the top of the pile.

For two representative pile shapes (conical and oval with flattop, 37-degree side slope), the ratios of surface wind speed (u_s) to approach wind speed (u_r) have been derived from wind tunnel studies.[9] The results are shown in Figure 9-2 corresponding to an actual pile height of 11 m, a reference (upwind) anemometer height of 10 m, and a pile surface roughness height (z_o) of 0.5 cm. The measured surface winds correspond to a height of 25 cm above the surface. The area fraction within each contour pair is specified in Table 9-3.

Table 9-3. Subarea Distribution for Regimes of u_s/u_r

	Percent of pile surface area			
Pile subarea	Pile A	Pile B1	Pile B2	Pile B3
0.2a	5	5	3	3
0.2b	35	2	28	25
0.2c	NA	29	NA	NA
0.6a	48	26	29	28
0.6b	NA	24	22	26
0.9	12	14	15	14
1.1	NA	NA	3	4

NA = not applicable.

The profiles of u_s/u_r in Figure 9-2 can be used to estimate the surface friction velocity distribution around similarly shaped piles, using the following procedure:

Step 1. Correct the fastest mile value (u^+) for the period of interest from the anemometer height (z) to a reference height of 10 m (u^+_{10}) using a variation of Equation 1:

$$u^+_{10} = u^+ \frac{\ln (10/0.005)}{\ln (z/0.005)} \qquad (5)$$

where a typical roughness height (z_o) of 0.5 cm (0.005 m) has been assumed. If a site-specific roughness height is available, it should be used.

Step 2. Use the appropriate part of Figure 9-2 based on the pile shape and orientation to the fastest mile of wind, to obtain the corresponding surface wind speed distribution (u^+_s):

$$u^+_s = \frac{(u_s)}{u_r} \; u^+_{10} \qquad (6)$$

Step 3. For any subarea of the pile surface having a narrow range of surface wind speed, use a variation of Equation 1 to calculate the equivalent friction velocity (u^*): $u^* = (0.4\, u^+_s) / \ln (25 / 0.5) = 0.10\, u^+_s$ (7)

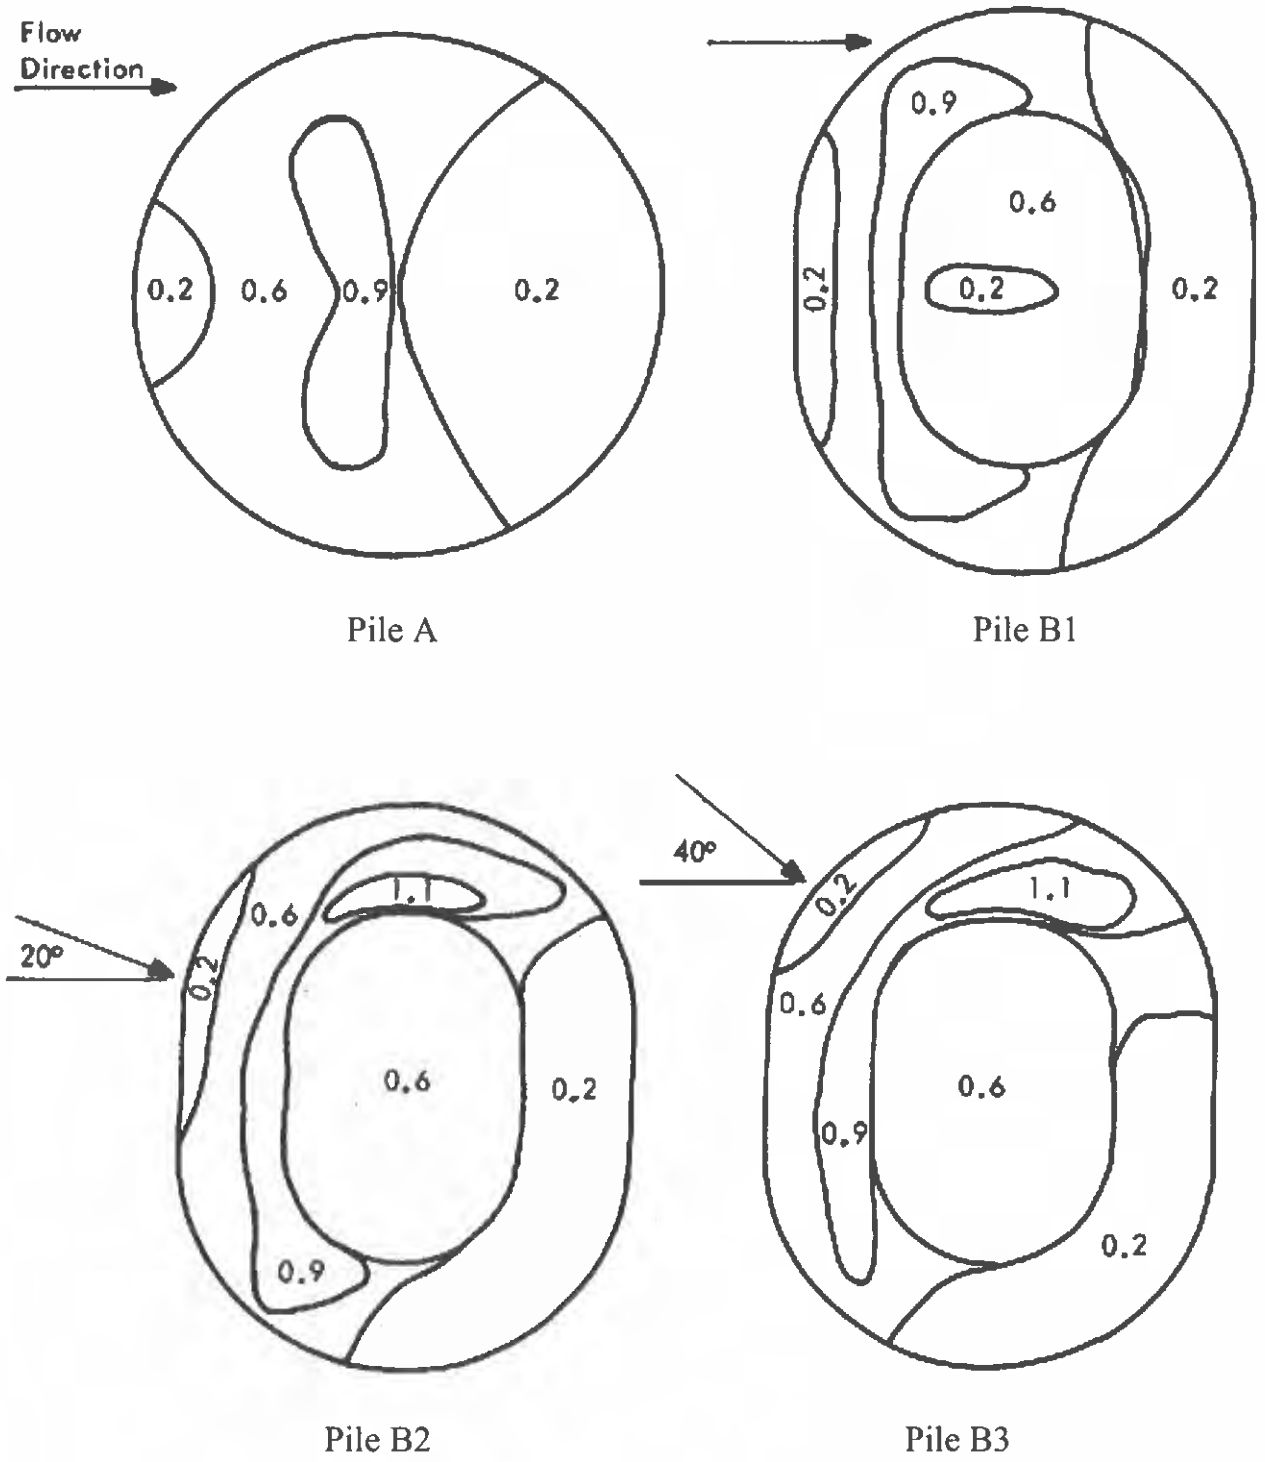

Figure 9-2. Contours of Normalized Surface Wind Speed Ratios, u_s/u_r

From this point on, the procedure is identical to that used for a flat pile, as described above. Implementation of the above procedure is carried out in the following steps:

Step 1. Determine threshold friction velocity for erodible material of interest (see Table 9-2 or determine from mode of aggregate size distribution).

Step 2. Divide the exposed surface area into subareas of constant frequency of disturbance (N).

Step 3. Tabulate fastest mile values (u^+) for each frequency of disturbance and correct them to 10 m (u_{10}^+) using Equation 5.

Step 4. Convert fastest mile values (u_{10}) to equivalent friction velocities (u^*), taking into account (a) the uniform wind exposure of nonelevated surfaces, using Equation 4, or (b) the nonuniform wind exposure of elevated surfaces (piles), using Equations 6 and 7.

Step 5. For elevated surfaces (piles), subdivide areas of constant N into subareas of constant u^* (i.e., within the isopleth values of u_s/u_r in Figure 9-2 and Table 9-3) and determine the size of each subarea.

Step 6. Treating each subarea (of constant N and u^*) as a separate source, calculate the erosion potential (P_i) for each period between disturbances using Equation 3 and the emission factor using Equation 2.

Step 7. Multiply the resulting emission factor for each subarea by the size of the subarea, and add the emission contributions of all subareas. Note that the highest 24-hour emissions would be expected to occur on the windiest day of the year. Maximum emissions are calculated assuming a single event with the highest fastest mile value for the annual period.

The recommended emission factor equation presented above assumes that all of the erosion potential corresponding to the fastest mile of wind is lost during the period between disturbances. Because the fastest mile event typically lasts only about 2 minutes, which corresponds roughly to the half-life for the decay of actual erosion potential, it could be argued that the emission factor overestimates particulate emissions. However, there are other aspects of the wind erosion process that offset this apparent conservatism as follows:

1. The fastest mile event contains peak winds that substantially exceed the mean value for the event.
2. Whenever the fastest mile event occurs, there are usually a number of periods of slightly lower mean wind speed that contain peak gusts of the same order as the fastest mile wind speed.

Of greater concern is the likelihood of over prediction of wind erosion emissions in the case of surfaces disturbed infrequently in comparison to the rate of crust formation.

9.3 Emission Estimation: Alternate Methodology

EPA published a total suspended particulate (TSP) emission factor equation for wind erosion of active storage piles in 1989 that is not included in AP-42.[12] For days when there was at least 0.01 inch of precipitation, the TSP emissions were zero. The TSP emission factor equation (in units of lb/day/acre of surface) for days when there was less than 0.01 inch of precipitation was given as:

$E_{TSP} = 1.7 (s/1.5) (f/15)$

where, s = silt content of material (weight %)
f = percentage of time the unobstructed wind speed is greater than 12 mph at the mean pile height

The annual TSP emissions factor equation for wind blown dust from active storage piles was given as follows:

TSP (lb/year/acre of surface) = 1.7 (s/1.5) (365 [365-p] / 235) (f/15)

where, s = silt content of material (weight %)
p = number of days per year with at least 0.01 inch of precipitation
f = percentage of time the unobstructed wind speed is greater than 12 mph at the mean pile height

Based on the PM10/TSP ratio of 0.5 for wind blown dust from active storage piles published in Section 13.2.5 of AP-42 and a PM2.5/PM10 ratio of 0.15 for wind blown dust[11], the PM10 and PM2.5 emission factor equations (in units of lb/day/acre) would be:

$E_{PM10} = 0.85 (s/1.5) (f/15)$
$E_{PM2.5} = 0.13 (s/1.5) (f/15)$

The short-term hourly TSP emission factor equation for wind blown dust from active storage piles (in units lb/acre-hour) given in the 1989 EPA report was equal to the wind speed (in units of mph) multiplied by a factor of 0.72. Thus for a wind speed that averaged 25 mph during a one-hour period, the TSP emission factor during that hour would be 18 lb/acre which is equal to 2.02 g/m^2. The corresponding PM10 and PM2.5 emission factors would be 1.01 g/m^2 and 0.15 g/m^2, respectively.

9.4 Demonstrated Control Techniques

Control measures for storage pile wind erosion are designed to stabilize the erodible surface (e.g., by increasing the moisture content of the aggregate material being stored) or to shield it from the ambient wind. Table 9-4 presents a summary of control measures and reported control efficiencies for storage pile wind erosion.

Table 9-4. Control Efficiencies for Control Measures for Storage Pile Wind Erosion

Control measure	PM10 control efficiency	References/comments
Require construction of 3-sided enclosures with 50% porosity	75%	Sierra Research, 2003.[13] Determined through modeling of open area windblown emissions with 50% reduction in wind speed and assuming no emission reduction when winds approach open side
Water the storage pile by hand or apply cover when wind events are declared	90%	Fitz et al., April 2000.[14]

9.5 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. Regulatory formats specify the threshold source size that triggers the need for control application. Example regulatory formats for several local air quality agencies in the WRAP region are presented in Table 9-5. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: http://www.maricopa.gov/envsvc/air/ruledesc.asp

(Note: The Clark County website did not include regulatory language specific to storage pile wind erosion at the time this chapter was written.)

9.6 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

Table 9-5. Example Regulatory Formats for Storage Pile Wind Erosion

Control Measure	Goal	Threshold	Agency
Establishes wind barrier and watering or stabilization requirements and bulk materials must be stored according to stabilization definition and outdoor materials covered	Limit visible dust emissions to 20% opacity		SJVAPCD Rule 8031 11/15/2001
Best available control measures: wind sheltering, watering, chemical stabilizers, altering load-in/load-out procedures, or coverings	Prohibits visible dust emissions beyond property line and limits upwind/downwind PM10 differential to 50 ug/m3		SCAQMD Rule 403 12/11/1998
Watering, dust suppressant (when loading, stacking, etc.); cover with tarp, watering (when not loading, etc.); wind barriers, silos, enclosures, etc.	Limit VDE to 20% opacity; stabilize soil	For storage piles with >5% silt content, 3ft high, >150 sq ft; work practices for stacking, loading, unloading, and when inactive; soil moisture content min 12%; or at least 70% min for optimum soil moisture content; 3 sided enclosures, at least equal to pile in length, same for height, porosity <50%	Maricopa County Rule 310 04/07/2004
Utilization of dust suppressants other than water when necessary; prewater; empty loader bucket slowly	Prevent wind erosion from piles; stabilize condition where equip and vehicles op	Bulk material handling for stacking, loading, and unloading; for haul trucks and areas where equipment op	Maricopa County Rule 310 04/07/2004

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 9-6 summarizes the compliance tools that are applicable to wind erosion from material storage piles.

Table 9-6. Compliance Tools for Storage Pile Wind Erosion

Record keeping	Site inspection/monitoring
Site map; work practices, including pile formation and removal times (throughputs); locations, sizes, and shapes of storage piles; moisture and silt contents of pile surface material; location/heights/densities of vegetation or other wind breaks, including maintenance times; dust suppression equipment and maintenance records; frequencies, amounts, times, and rates of watering or dust suppressant application; meteorological log.	Sampling and analysis of storage pile surface material for silt and moisture contents; observation of pile formation and removal, including wet suppression systems; observation of vehicle/ equipment operation and disturbance areas; inspection of wind sheltering including enclosures; real-time portable monitoring of PM; observation of dust plume opacity exceeding a standard.

9.7 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for fugitive dust originating from storage pile wind erosion. A sample cost-effectiveness calculation is presented below for a specific control measure (3-sided enclosure) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for storage pile wind erosion, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Storage Pile Wind Erosion

Step 1. Determine source activity and control application parameters.

Frequency of disturbance (days/yr)	365
Height of pile (m)	11
Base diameter (m)	29.2
Total surface area (m^2)	838
Portion of pile exposed to high winds (%)	12
Surface area exposed to high winds (m^2)	101
Threshold friction velocity u^*_t (m/s)	0.85

Control Measure	3-sided enclosure
Economic Life of Control System (yr)	10
Control Efficiency (%)	74.7
Reference for Control Efficiency	Sierra Research, 2003[13]

The pile size, source activity parameters and control measure parameters are assumed values for illustrative purposes. A 3-sided enclosure has been chosen as the applied control measure. The control efficiency is provided by Sierra Research.[13]

The pile surface area within each surface wind speed range (see AP-42, Section 13.2.5) is as follows:

Surface areas within each wind speed range			
Area ID	u_s / u_r	%	Pile surface Area (m^2)
A	0.9	12	101
B	0.6	48	402
C	0.2	40	335
Total Area			838

Step 2. Obtain PM10 Emission Factor.

The PM10 emission factor is obtained from AP-42: PM10 EF = $0.5 \sum_{i=1}^{N} P_i$

P—erosion potential (g/m^2)	$P = 58 (u^*-u^*_t)^2 + 25 (u^*-u^*_t)$
	$P = 0$ for $u^* \leq u_t^*$

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor (given in Step 2) is applied to each day for which the peak wind exceeds the threshold velocity for wind erosion. The following monthly climatic data are used for illustrative purposes and are assumed to apply to each month of the year.

Monthly erosion potential (P)					
	Peak wind (u^+_{10})		$u^+_{s\ (m/s)}$		
Day of month	mph	m/s	Area C u_s / u_r: 0.2	Area B u_s / u_r: 0.6	Area A u_s / u_r: 0.9
6	29	13.0	2.59	7.78	11.67
7	30	13.4	2.68	8.05	12.07
11	38	17.0	3.40	10.19	15.29
22	25	11.2	2.24	6.71	10.06
28	45	20.1	4.02	12.07	18.10

Monthly erosion potential (P)[a]						
Day of month	u* (m/s)			P (g/m^2)		
	Area C	Area B	Area A	Area C	Area B	Area A
6	0.26	0.78	1.17	0	0	13.74
7	0.27	0.80	1.21	0	0	16.32
11	0.34	1.02	1.53	0	5.89	43.70
22	0.22	0.67	1.01	0	0	5.30
28	0.40	1.21	1.81	0	16.32	77.52
			Sum of P (g/m^2)	0	22.21	156.57
			Area (m^2)	335	402	101
			Monthly PM10 emissions (g)[b]	0	4,464	7,907

[a] Assumed to apply to 12 months of the year.

[b] Monthly PM10 emissions = 0.5 times monthly erosion potential times surface area for each area of the pile.

The annual PM10 emissions in units of tons for each section of the pile is equal to 12 times the monthly PM10 emissions for each section of the pile divided by 454 g/lb and 2,000 lb/ton as follows:

Annual PM10 emissions for Area A = (12 x 7,907) / (454 x 2,000) = 0.104 tons
Annual PM10 emissions for Area B = (12 x 4,464) / (454 x 2,000) = 0.059 tons
Annual PM10 emissions for Area C = 0 tons
Annual PM10 emissions for storage pile = 0.104 + 0.059 + 0 = 0.163 tons

Annual PM2.5 Emissions = 0.15 x PM10 Emissions[11] = 0.15 x 0.163 = 0.025 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency)

For this example we have selected a 3-sided enclosure as our control measure with a control efficiency of 74.7% Thus, the annual controlled PM10 and PM2.5 emissions estimates are calculated to be:

Annual Controlled PM10 emissions = (0.163 tons/yr) x (1 – 0.747) = 0.041 tons
Annual Controlled PM2.5 emissions = (0.025 tons/yr) x (1 – 0.747) = 0.006 tons

Step 5. Determine Annual Cost to Control PM Emissions.

Capital costs ($)	2,000
Annual Operating/Maintenance costs ($)	400
Annual Interest Rate	3%
Capital Recovery Factor	0.1172
Annualized Cost ($/yr)	634

The Capital costs, Annual Operating/Maintenance (O & M) costs and Annual Interest Rate (AIR) are assumed values for illustrative purposes.

The Capital Recovery Factor (CRF) is calculated as follows:

Capital Recovery Factor = AIR x (1 + AIR) $^{\text{Economic life}}$ / (1 + AIR)$^{\text{Economic life}}$ – 1

Capital Recovery Factor = 3% x (1 + 3%)^{10} / (1 + 3%)^{10} – 1 = 0.1172

The Annualized Cost is calculated by adding the product of the Capital Recovery Factor and the Capital costs to the annual O & M costs as follows:

Annualized Cost = (CRF x Capital costs) + O & M costs
Annualized Cost = (0.1172 x 2,000) + $400 = $634

Step 6. Calculate Cost Effectiveness. Cost effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost effectiveness = Annualized Cost/(Uncontrolled emissions – Controlled emissions)

Cost effectiveness for PM10 emissions = $634 / (0.163 – 0.041) = $5,195/ton
Cost effectiveness for PM2.5 emissions = $634 / (0.025 – 0.006) = $34,635/ton

10.8 References 10-8
10.9 Attachment 10-1. PM10 Emission Factors for Harvesting Crops in CA 10-9

10.1 Characterization of Source Emissions

Harvesting emissions are generated by three different operations: crop handling by the harvest machine, loading of the harvested crop into trailers or trucks, and transport by trailers or trucks in the field. Emissions from these operations are in the form of solid particulates composed mainly of raw plant material and soil dust that is entrained into the air. These emissions may simply be due to the vehicles traveling over the soil, or via the mechanical processing of the plant material and underlying soil, or, as in the case of almonds, via the actual blowing or sweeping of the crop to remove waste materials and position it for pickup. Defoliants and/or desiccants are used on some crops several weeks before harvesting which can produce PM emissions from the drifting of these chemicals equal to about 1% of the product applied on the crop.[1]

10.2 EPA's Emission Estimation Methodology

Section 9 of EPA's Compilation of Air Pollutant Emission Factors (AP-42) addresses emission factors for mechanical harvesting of three different crops (cotton, wheat and sorghum). This section of AP-42 was last updated in February 1980. However, it does not list TSP or PM10 emission factors for agricultural harvesting. Instead it lists PM7 emission factors for the three crops expressed in units of pounds per square mile for crop handling by the harvest machine, loading of the harvested crop into trailers or trucks, and transport by trailers or trucks in the field. The sum of the PM7 emission factor for these three separate operations total 0.0086 lb/acre for mechanical picking of cotton, 0.041 lb/acre for mechanical stripping of cotton, 0.0027 lb/acre for wheat, and 0.012 lb/acre for sorghum.[1] The PM7 emission factors for harvesting cotton are based on an average machine speed of 3 mph for pickers and 5 mph for strippers, a basket capacity of 240 lb, a trailer capacity of 6 baskets, a lint cotton yield of 1.17 bales/acre for pickers and 0.77 bales/acre for strippers, and a transport speed of 10 mph. The weighted average stripping factors assumes that 2% of all strippers are 4-row models with baskets and, of the remainder, 40% are 2-row models pulling trailers and 60% are 2-row models with mounted baskets. The PM7 emission factors for harvesting wheat and sorghum are based on an average combine speed of 7.5 mph, a combine swath width of 20 feet, a field transport speed of 10 mph, a truck loading time of 6 minutes, a truck capacity of 13 acres for wheat and 7 acres for sorghum, and a filled truck travel time of 2 minutes per load. These AP-42 PM7 emission factors developed more than 25 years ago for the entire US are much lower than CARB's PM10 emission factors developed in early 2003 for California.

10.3 CARB's Emission Estimation Methodology

This section was adapted from Section 7.5 of CARB's Emission Inventory Methodology. Section 7.5 was last updated in January 2003.

The California Air Resources Board (CARB) has published a PM10 emission estimation method for fugitive dust emissions originating from agricultural harvesting

operations.[2] Unlike the soil preparations activities (e.g., disking, tilling, etc.), harvest operations tend to be fairly unique for each crop. Because of this, harvest emission factors combine all of the operations that go into harvesting a commodity into a single factor that includes emissions from all of the relevant operations. PM10 emission factors have been measured in California by UC Davis for harvesting cotton, almonds and wheat.[3] These emission factors are shown in Table10-1. Using these emission factors as a baseline, harvesting emission factors were assigned to other major crops grown California crops in consultation with agricultural experts. These PM10 emission factors are also included in Table 10-1.

Table 10-1. Harvesting PM10 Emission Factors

Crop	PM 10 Emission Factor (lbs/acre)
Almonds	40.8
Corn	1.7[a]
Cotton	3.4
Fruit trees	0.085[b]
Onions	1.7[a]
Potatoes	1.7[a]
Sugar beets	1.7[a]
Tomatoes	0.17[c]
Vine crops	0.17[c]
Walnuts	40.8[d]
Wheat	5.8

[a] EF = 50% EF for cotton
[b] EF = 2.5% EF for cotton
[c] EF = 5% EF for cotton
[d] EF = same EF as almonds

UC Davis has recently completed a study measuring PM10 emissions from almond harvesting that indicates that CARB's PM10 emission factor for almond harvesting may be over-estimated by 62%.[4] The complete list of harvesting emission factors assigned to over 200 crops is presented in Attachment 10-1 at the end of this chapter. The acreage data used for estimating harvest emissions for different crops are available from each state's Department of Food and Agriculture as well as from individual county agricultural commissioner reports.

Crop Calendar and Temporal Activity. Harvesting is performed at very specific times each year, so crop calendar data, which tells when harvest activities occur, is important. Temporal activity for harvesting is derived by summing, for each county, the monthly emissions from all crops. For each crop, the monthly emissions are calculated based on its monthly profile, which reflects the percentage of harvesting activities occurring in that month. An example of the monthly harvesting profile for almonds, cotton, and wheat is shown in Table 10-2. Because the mix of crops varies by county, composite temporal profiles combining all of the other county crops vary by county. An example of a composite harvesting profile by month for Fresno County, showing the combined temporal profile for all of the harvesting activities in the county, is shown in Table 10-3.

Table 10-2. Sample Monthly Harvesting Profile of Crops

Crops	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
Almonds	0	0	0	0	0	0	0	0	50	50	0	0
Cotton	0	0	0	0	0	0	0	0	0	50	50	0
Wheat	0	0	0	0	0	50	50	0	0	0	0	0

Table 10-3. Sample County Harvesting Profile Composite

County	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
Fresno	0.1	0.1	0.2	0.2	0.1	5.6	5.9	0.8	30.7	42.8	13.6	0.1

Assumptions. The CARB methodology is subject to the following assumptions:

1. The current harvest emission factors assume that for each crop, harvesting produces the same level emissions under all conditions for all equipment.
2. The emission factors for crops other than almonds, cotton, and wheat were assigned to reflect the relative geologic PM10 generation potential of various harvest practices.
3. Crop calendar data collected for San Joaquin Valley crops and practices were extrapolated to the same crops in the remainder of California.

PM2.5 Emission Factors. In July 2006, EPA revised the PM2.5/PM10 ratios listed in AP-42 for fugitive dust resulting from different fugitive dust source categories based on MRI's controlled laboratory experiments conducted for WRAP in 2005.[5] The revised PM2.5/PM10 ratios range from 0.1 for unpaved roads to 0.15 for paved roads, wind erosion, and transfer of aggregate material. CARB is considering adopting a PM2.5/PM10 ratio of 0.15 for both agricultural tilling and agricultural tilling based on MRI's findings.[6]

10.4 Demonstrated Control Techniques

Soil dust emissions from field transport can be reduced by lowering vehicle speed. Also, the use of terraces, contouring, and strip cropping to inhibit soil erosion will suppress the entrainment of harvested crop fragments in the wind. Shelterbelts, positioned perpendicular to the prevailing wind, will lower emissions by reducing the wind velocity across the field. By minimizing tillage and avoiding residue burning, the soil will remain consolidated and less prone to disturbance from transport activities.

Table 10-4 summarizes tested control measures and reported control efficiencies for measures that reduce the generation of fugitive dust from agricultural harvesting.[7-9] A list of control measures for agricultural harvesting operations is available from the California Air Pollution Control Officers' Association's (CAPCOA) agricultural clearing house website (http://capcoa.org/ag_clearinghouse.htm). The list of control measures for harvesting field and orchard crops include: the use of balers to harvest crops that are traditionally harvested by chopping, new drying techniques for dried fruit, increasing equipment size to reduce the number of passes, fallowing land, green chop (i.e., harvesting a forage crop without allowing it to dry in the field), hand harvesting, night harvesting, switch to a crop that requires no waste/residue burning, applying a light

amount of water or other stabilizing material to the soil prior to harvest, packing commodities in an enclosed area, and utilizing a shuttle system to haul multiple trailers per trip.

Table 10-4. Control Efficiencies for Control Measures for Harvesting[7-9]

Control Measure	PM10 Control Efficiency	References / Comments
Equipment modification	50%	MRI, 1981. Control efficiency is for electrostatically charged fine-mist water spray.
Land set-aside/fallowing	100%	SJVAPCD, 2003.
Limited activity during high winds	5 - 70%	URS, 2001. Emissions reduction depends on wind speed.
Night farming	10%	SJVAPCD, 2003. Harvest when humidity and soil moisture is higher than during day.
New techniques for drying fruit Continuous tray Dried on vine (DOV)	 25% 60%	SJVAPCD, 2003.
Precision farming	8%	SJVAPCD, 2003. Use of GPS system.
Reduced harvest activity	29 – 71 %	URS, 2001. Applicable to cotton, alfalfa, hay.
Soil moisture monitoring	30%	URS, 2001.

10.5 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. However, most air quality districts currently exempt agricultural operations from controlling fugitive dust. Air quality districts that regulate fugitive dust emissions from agricultural harvesting include Clark County, NV and several districts in California such as the Imperial County APCD, the San Joaquin Valley APCD and the South Coast AQMD. Imperial County APCD prohibits fugitive dust emissions from farming activities for farms over 40 acres. The San Joaquin Valley APCD and the South Coast AQMD prohibit fugitive dust emissions for the larger farms defined as farms with areas where the combined disturbed surface area within one continuous property line and not separated by a paved public road is greater than 10 acres. Example regulatory formats downloaded from the Internet are presented in Table 10-5. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- San Joaquin Valley APCD, CA: valleyair.org/SJV_main.asp
- South Coast AQMD, CA: aqmd.gov/rules
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/aq

CAPCOA's agricultural clearing house website (http://capcoa.org/ag_clearinghouse.htm) provides links to rules of different air quality agencies that regulate fugitive dust emissions from agricultural operations.

Table 10-5. Example Regulatory Formats for Harvesting

Control Measure	Agency
Any person engaged in agricultural operations shall take all reasonable precautions to abate fugitive dust from becoming airborne from such activities.	Clark County Reg. 41 7/01/04
Limit fugitive dust from off-field agricultural sources such as unpaved roads with more than 75 trips/day and bulk materials handling by requiring producers to develop and implement a Fugitive Dust Management Plan with district approved control methods.	SJVAPCD Rule 8081 11/15/01
Cease activities when wind speeds are greater than 25 mph.	SCAQMD Rule 403.1 4/02/04

10.6 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 10-6 summarizes the compliance tools that are applicable for harvesting.

Table 10-6. Compliance Tools for Harvesting

Record keeping	Site inspection/monitoring
Maintain daily records to document the specific dust control options taken; maintain such records for a period of not less than three years; and make such records available to the Executive Officer upon request.	Observation of dust plumes during periods of agricultural harvesting; observation of dust plume opacity (visible emissions) exceeding a standard; observation of high winds (e.g., >25 mph).

10.7 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for agricultural harvesting. A sample cost-effectiveness calculation is presented below for a specific control measure (precision farming utilizing a GPS system) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for agricultural harvesting, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Agricultural Harvesting

Step 1. Determine source activity and control application parameters.

Field size (acres)	320
Crop	Cotton
Frequency of operations per year	2 (picking & stalk cutting)
Control Measure	Precision farming
Control application/frequency	Reduce overlap of passes by 8%
Economic Life of Control System (yr)	5
Control Efficiency	8%

Precision farming utilizing a GPS system has been chosen as the applied control measure. The field size, frequency of operations, and control application/frequency are assumed values for illustrative purposes. The economic life of the control is determined from industrial records. The control efficiency of 8% is based on the proportional reduction in passes to harvest the cotton and cut the stalks after harvesting the cotton (SJVAPCD, 2003).[8]

Step 2. PM10 Emission Factor.
The PM10 emission factor for harvesting cotton includes the emissions from picking the cotton plus the emissions from cutting the stalks after picking the cotton. The PM10 emission factor for each operation is 1.7 lb/acre.[2]

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor, EF, (given in Step 2) is multiplied by the field size and the frequency of operations (both under activity data) and then divided by 2,000 lbs to compute the annual PM10 emissions in tons per year, as follows:

Annual PM10 emissions = (EF x Field Size x Frequency of Ops) / 2,000

- Annual PM10 Emissions = (1.7 x 320 x 2) / 2,000 = 0.544 tons

Annual PM2.5 emissions = (PM2.5/PM10) x PM10 emissions
Assume PM2.5/PM10 ratio for agricultural harvesting is 0.15 (MRI, 2006).[6]
Annual PM2.5 emissions = 0.15 x PM10 emissions

- Annual PM2.5 Emissions = (0.15 x 0.544 tons) = 0.0816 tons

Step 4. Calculate Controlled PM Emissions. The uncontrolled emissions (calculated in Step 3) are multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency)

For this example, we have selected precision farming as our control measure. Based on a control efficiency estimate of 8%, the annual controlled PM emissions are calculated to be:

Annual Controlled PM10 emissions = (0.544 tons) x (1 – 0.08) = 0.500 tons
Annual Controlled PM2.5 emissions = (0.0816 tons) x (1 – 0.08) = 0.075 tons

Step 5. Determine Annual Cost to Control PM Emissions.

The Annualized Cost of control is calculated by subtracting the cost savings from reducing the overlap of harvesting passes by 8% from the annualized cost of purchasing the GPS system.

Assuming that the cost of harvesting is equivalent to that of tilling, namely $10/acre (WSU, 1998[10]), the cost savings using GPS precision farming is $512 (i.e., 0.08 x 320 acres x $10/acre x 2 harvesting passes [i.e., one pass to harvest the cotton and a second pass to cut the stalks]).

GPS systems range in cost from $200 to $5,000 and have a lifetime of approximately five years (SJVAPCD, 2003[8]). Using an estimate of $1,000 and an economic life (EL) of five years for the GPS system together with an annual interest rate (AIR) of 5%, the annualized cost of the GPS system is calculated by adding the product of the Capital Recovery Factor (CRF) and the capital costs to the annual operating and maintenance costs, which for this example are assumed to be $200 per year.

The Capital Recovery Factor (CRF) is calculated as follows:

$$CRF = AIR \times (1+AIR)^{EL} / [(1+AIR)^{EL} - 1]$$

$$CRF = 5\% \times (1+ 5\%)^5 / [(1+ 5\%)^5 - 1] = 0.231$$

Annualized capital cost = CRF x capital cost = 0.231 x $1,000 = $231

Annual cost of GPS system = Annualized capital costs + Annual O & M costs

Annual cost of GPS system = $231 + $200 = $431

Annualized cost of control measure = Annual cost of GPS system minus the cost savings from reducing the overlap of harvesting passes

Annualized Cost = $431 - $512 = -$81

The annualized cost is negative and represents a net savings.

Step 6. Calculate Cost-effectiveness. Cost-effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost-effectiveness = Annualized Cost/ (Uncontrolled emissions – Controlled emissions)

Cost-effectiveness for PM10 emissions = -$81 / (0.544 – 0.500) = -$1,862/ton
Cost-effectiveness for PM2.5 emissions = -$81 / (0.0816 – 0.075) = -$12,412/ton

The negative cost-effectiveness values indicate cost savings.

11.1 Characterization of Source Emissions

This chapter of the handbook addresses fugitive dust emissions from mineral products industries that involve the production and processing of various ores, as discussed in Chapter 11 of AP-42 [1] In the mineral products industry, there are two major categories of emissions: ducted sources (those vented to the atmosphere through some type of stack, vent, or pipe), and fugitive sources (those not confined to ducts and vents but emitted directly from the source to the ambient air). Ducted emissions are usually collected and transported by an industrial ventilation system having one or more fans or air movers, eventually to be emitted to the atmosphere through some type of stack.

Many operations and processes are common to all mineral products industries, including extraction of aggregate materials from the earth, loading, unloading, conveying, crushing, screening, loadout, and storage. Other operations are restricted to specific industries. These include wet and dry fine milling or grinding, air classification, drying, calcining, mixing, and bagging. Sand and gravel is typically mined in a moist or wet condition such that negligible particulate emissions occur during the mining operation. Construction aggregate processing can produce large amounts of fugitive dust, which due to its generally larger particle sizes tends to settle out within the plant. Some of the individual operations such as wet crushing and grinding, washing, screening, and dredging take place with high moisture content (>4% by weight). Such wet processes do not generate appreciable particulate emissions. For those processing and manufacturing operations that are housed in enclosed buildings with the dust captured by a control device (e.g., product recovery cyclones, fabric filters, and wet scrubber/suppression systems), no uncontrolled fugitive dust emissions are emitted directly into the outdoor air.

The operations at a typical western surface coal mine include drilling and blasting, removal of the overburden with a dragline or shovel, loading trucks, bulldozing and grading, crushing, vehicle traffic, and storage of coal in active storage piles that are subject to wind erosion. All operations that involve movement of soil or coal, or exposure of erodible surfaces, generate some amount of fugitive dust. During mine reclamation, which proceeds continuously throughout the life of the mine, overburden spoils piles are smoothed and contoured by bulldozers. Topsoil is placed on the graded spoils, and the land is prepared for revegetation by furrowing and mulching. From the time an area is disturbed until the new vegetation emerges, all disturbed areas are subject to wind erosion.

11.2 Emission Estimation Methodology

This section was adapted from *EPA's documentation of methods used for the National Emission Inventory (NEI.*[2] and from Section 11, Mineral Products Industry, of EPA's *Compilation of Air Pollutant Emission Factors (AP-42).*[1] Many of the categories addressed in AP-42 have not been updated by the EPA since the mid to late 1990's.

This section addresses three different mineral categories: (a) metallic ores (b) non-metallic ores and rock, and (c) coal. Fugitive dust emission factors for mining and quarrying activities are based on EPA's methodology used for the annual National

Emission Inventory that includes emissions from extraction of the ore or rock from the earth but not processing activities.[2] Fugitive dust emission factors for processing activities are taken from AP-42 and represent average values based on a number of tests made under a variety of conditions such as material silt content, moisture content, and wind speed. As such, the actual uncontrolled emission factors will vary depending upon actual site conditions.

The EPA methodology used to develop the annual National Emission Inventory (NEI) for fugitive PM10 dust emissions from mining and quarrying operations utilizes the sum of the emissions from the mining of metallic and nonmetallic ores and coal as well as rock quarrying, as follows:

$$E = E_m + E_n + E_c \quad (1)$$

where, E = PM10 emissions from mining and quarrying operations
E_m = PM10 emissions from metallic ore mining operations
E_n = PM10 emissions from non-metallic ore mining and rock quarrying operations
E_c = PM10 emissions from coal mining operations

The NEI PM10 emissions estimate for mining and rock quarrying operations involving extraction of ore or rock from the earth include three specific activities: (1) overburden removal, (2) drilling and blasting, and (3) loading and unloading. Ore processing activities that involve transfer and conveyance operations, crushing and screening operations, storage, and travel on haul roads are not included in the NEI emissions estimate since EPA assumes that the dust emissions from these activities are well controlled. Uncontrolled particulate emission factors for ore processing activities are presented in the subsections below for estimating fugitive dust emissions from these sources. Fugitive dust emissions from materials handling, travel on unpaved roads, and wind erosion of storage piles are addressed in Chapters 4, 6 and 9 of this handbook, respectively.

The NEI emissions estimation methodology assumes that the TSP emission factors developed for copper ore mining apply to the three activities listed above for all metallic ore mining. PM10 emission factors for each of these three activities for metallic ore mining are based on the following PM10/TSP ratios: 0.35 for overburden removal, 0.81 for drilling and blasting, and 0.43 for loading/unloading operations.[3]

In the NEI emission estimation methodology, non-metallic ore mining emissions are calculated by assuming that the PM10 emission factors for western surface coal mining apply to mining of all non-metallic ores. The PM10/TSP ratio for western surface coal mining is 0.40.[4]

Coal mining includes two additional sources of PM10 emissions compared to the sources considered for metallic and non-metallic ores, namely overburden replacement and truck loading and unloading of that overburden. EPA assumes that the amount of overburden material handled equals ten times the amount of coal mined.[5]

EPA Method 5 (or equivalent) source tests used to generate particulate emission factors include a filterable PM fraction that is captured on or prior to a filter and a condensable PM fraction that is collected in the impinger portion of the sampling train. PM emission factors presented below include the sum of the filterable and condensable PM fractions for those cases where information exists for both fractions. For those cases where information only exists for the filterable PM fraction, this is clearly identified in the text below.

Previous NEI PM emission inventories for fugitive dust from mineral products industries assumed a PM2.5/PM10 ratio of 0.29.[2] In July 2006 EPA adopted revised PM2.5/PM10 ratios for several fugitive dust source categories, including a ratio of 0.1 for heavy vehicle traffic on unpaved surfaces around aggregate storage piles and a ratio of 0.15 for transfer of aggregate associated with buckets or conveyors based on the recent findings of MRI.[6] Thus, the PM2.5/PM10 ratio for fugitive dust from mineral products industries lies somewhere between 0.1 and 0.15.

Estimates of the amount of metallic and non-metallic ores handled at surface mines are available from the U.S. Geological Survey. Production figures for coal mining operations are available from the Energy Information Administration (EIA) in the U.S. Department of Energy.

11.2.1 Metallic Ores

EPA uses the following equation to calculate PM10 emissions from overburden removal, drilling and blasting, and loading and unloading from metallic ore mining operations:

$$E_m = A_m [EF_o + (B \times EF_b) + EF_l + EF_d] \quad (2)$$

where, A_m = metallic crude ore handled at surface mines (tons)
EF_o = PM10 open pit overburden removal emission factor for copper ore (lbs/ton)
B = fraction of total ore production that is obtained by blasting at metallic ore mines
EF_b = PM10 drilling/blasting emission factor for copper ore (lbs/ton)
EF_l = PM10 loading emission factor for copper ore (lbs/ton)
EF_d = PM10 truck dumping emission factor for copper ore (lbs/ton)

Utilizing the TSP emission factors and PM10/TSP ratios developed for copper ore mining operations, PM10 emissions from metallic ore mining operations are calculated as follows:

$$E_m = A_m [0.0003 + (0.57625 \times 0.0008) + 0.022 + 0.032] = 0.0548\ A_m \quad (3)$$

Based on NEI's emission estimation methodology that excludes fugitive dust emissions from haul truck traffic on unpaved surfaces, PM10 emissions from loading and truck dumping account for 40% and 58%, respectively, of the total PM10 emissions from metallic ore mining operations.

Uncontrolled filterable TSP and PM10 emission factors for metallic ore processing operations are presented in Table 11-1. These emission factors are for emissions after product recovery cyclones. Uncontrolled PM emission factors for taconite ore processing are presented in Table 11-2.

Table 11-1. Filterable TSP and PM10 Emission Factors for Metallic Ore Processing[a]

Source	TSP (lb/ton)	PM10 (lb/ton)
Low-moisture ores[b]		
Primary crushing	0.5	0.05
Secondary crushing	1.2	ND
Tertiary crushing	2.7	0.16
Material handling and transfer – all minerals except bauxite	0.12	0.06
Material handling and transfer – bauxite/alumina	1.1	ND
High-moisture ores[b]		
Primary crushing	0.02	0.009
Secondary crushing	0.05	0.02
Tertiary crushing	0.06	0.02
Material handling and transfer – all minerals except bauxite	0.01	0.004
Material handling and transfer – bauxite/alumina	ND	ND
Both low- and high-moisture ores[b]		
Wet grinding	Neg	Neg
Dry grinding with air conveying and/or air classification	28.8	26
Dry grinding without air conveying and/or air classification	2.4	0.31
Drying – all minerals except titanium/zirconium sands	19.7	12

[a] Emission factors in units of lb/ton of material processed. One lb/ton is equivalent to 0.5 kg/Mg. Neg = negligible. ND = no data.

[b] Low-moisture ore has a moisture content of less than 4% by weight; high-moisture ore has a moisture content of at least 4% by weight.

Table 11-2. TSP and PM10 Emission Factors for Taconite Ore Processing[a]

Source	TSP (lb/ton)	PM10 (lb/ton)
Natural gas-fired grate/kiln	7.4	0.65
Gas-fired vertical shaft top gas stack	16	ND
Oil-fired straight grate	1.2	ND

[a] Applicable to both acid pellets and flux pellets. Emission factors in units of lb/ton of fired pellets produced. One lb/ton is equivalent to 0.5 kg/Mg. ND = no data.

11.2.2 Non-metallic Ores

EPA uses the following equation to calculate the PM10 emissions from overburden removal, drilling and blasting, and loading and unloading from non-metallic ore mining and rock quarrying operations:

$$E_n = A_n [EF_v + (D \times EF_r) + EF_a + 0.5 (EF_e + EF_t)] \quad (4)$$

where, A_n = non-metallic crude ore handled at surface mines (tons)
EF_v = PM10 open pit overburden removal emission factor at western surface coal mining operations (lbs/ton)

efficiencies of approximately 95 to 99%. The industry uses shaker, reverse air, and pulse jet filters as well as some cartridge units, but most newer facilities use pulse jet filters.

Successful control techniques used for haul roads are dust suppressant application, paving, route modifications, and soil stabilization. Controls for conveyors include covering and wet suppression; for storage piles, wet suppression, windbreaks, enclosure, and soil stabilizers; for conveyor and batch transfer points, wet suppression and various methods to reduce freefall distances (e. g., telescopic chutes, stone ladders, and hinged boom stacker conveyors); and for screening and other size classification, covering and wet suppression. Additional information on these control measures can be found in other chapters of this handbook.

AP-42 lists both uncontrolled and controlled PM10 emission factors for different control devices for many mineral processing industries. Comparing the controlled emission factor for a specific control device to the uncontrolled emission factor provides the PM10 control efficiency for that control device presented in Table 11-8.

Table 11-8. PM10 Control Efficiencies for Mineral Processing Operations

Mineral Products Industry	Source	Control Device	PM10 Control Efficiency (%)
Taconite ore	Natural gas fired kiln	Multiclone	79
Crushed stone	Tertiary crushing	Wet scrubber	78
	Fines crushing	Wet scrubber	92
	Screening	Wet scrubber	91.6
	Fines screening	Wet scrubber	96.9
	Conveyor transfer point	Wet scrubber	95.9
Pulverized mineral	Grinding	Fabric filter	>99.5%
Lightweight aggregate	Rotary Kiln	Wet scrubber	99.4
	Rotary Kiln	Fabric filter	99.8
	Rotary Kiln	Electrostatic precipitator	99.5
Kaolin	Flash calciner	Fabric filter	99.99
Fire clay	Rotary dryer	Cyclone	68
	Rotary calciner	Multiclone and wet scrubber	99.8
Bentonite	Rotary dryer	Fabric filter	99.6
Hot mix asphalt	Dryer	Fabric filter	99.4
Brick manufacturing	Grinding and screening	Fabric filter	99.4
Portland cement	Wet process kiln	Electrostatic precipitator	97.9
Cement batching	Unloading into silo	Wet scrubber	99.9
	Mixer loading (central mix)	Wet scrubber	96.5
	Truck loading (truck mix)	Wet scrubber	91.6
Gypsum manufacturing	Flash calciner	Fabric filter	99.8
Lime manufacturing	Coal-fired rotary kiln	Fabric filter	99.6
	Coal-fired rotary kiln	Electrostatic precipitator	90

11.4 Regulatory Formats

PM stack emissions from taconite ore processing facilities constructed or modified after August 24, 1982 are regulated under 40 CFR 60, subpart LL to 0.05 g/m^3 (0.022

grains/ft^3). In addition, the opacity of stack emissions is limited to 7% unless the stack is equipped with a wet scrubber, and process fugitive emissions are limited to 10%. The standard does not affect emissions from indurating furnaces. Emissions from Portland cement plants constructed or modified after August 17, 1971 are regulated to limit PM emissions from kilns to 0.15 kg/Mg (0.30 lb/ton) of feed, and to limit PM emissions from clinker coolers to 0.050 kg/Mg (0.10 lb/ton) of feed. Emissions of filterable PM from rotary lime kilns constructed or modified after May 3, 1977 are regulated to 0.30 kg/Mg (0.60 lb/ton) of stone feed under 40 CFR Part 60, subpart HH.

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. Example regulatory formats downloaded from the Internet for several local air quality agencies in the WRAP region are presented in Table 11-9. The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- San Joaquin Valley APCD, CA: valleyair.org/SJV_main.asp
- South Coast AQMD, CA: aqmd.gov/rules
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/aq

Table 11-9. Example Regulatory Formats for Mineral Processing Operations

Control Measure	Agency
Limits PM emissions from cement kilns to 30 pounds per hour for kiln feed rates of 75 tons per hour or greater. Limits PM emissions to 0.40 pound per ton of kiln feed for kiln feed rates less than 75 tons per hour.	SCAQMD Rule 1112.1 02/07/86
Limits opacity from cement manufacturing facilities to 20 % for open storage piles and unpaved roads and to 10 % for all other operations, Specifies covers for conveying systems and enclosures for conveying system transfer points, and loading/unloading through an enclosed system.	SCAQMD Rule 1156 11/04/05
Limits opacity from an aggregate handling facility to 20% based on an average of 12 consecutive readings, or 50% based on five individual, consecutive readings, using the SCAQMD Opacity Test Method No. 9B.	SCAQMD Rule 1157 01/07/05
Limits (a) PM emissions from stacks at a nonmetallic mineral processing plant to 0.02 grains/dry standard cubic foot (gr/dscf) (50 mg/dscm), (b) opacity of fugitive dust emissions from any transfer point on a conveying system to 7%, and (c) opacity of fugitive dust emissions from any crusher to 15%.	Maricopa Co. Rule 316 6/08/05
No owner or operator of an existing tunnel kiln at a brick or structural product manufacturing facility shall emit more than 0.42 lbs. of particulate matter per ton of fired product from a tunnel kiln with a capacity throughput ≥ 1 ton/hour.	Maricopa Co. Rule 325 8/10/05
Limits the opacity of fugitive dust emissions at metallic or non-metallic mineral mining and processing facilities (based on an aggregate of at least 3 minutes in any 1-hour period) to (a) 10% for grinding mills, screening equipment, conveyors, conveyor transfer points, bagging equipment, storage bin, storage piles, stacker, enclosed truck, or rail car loading stations, (b) 15% for crushers, and (c) 7% for emissions from a stack or exhaust from a control device or building vent.	Clark Co. Rule 34 7/01/04

11.5 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 11-10 summarizes the compliance tools that are applicable for mineral processing industries.

Table 11-10. Compliance Tools for Mineral Processing Industries

Record keeping	Site inspection/monitoring
Maintain daily records onsite for a period of five years, and make such records available to the Executive Officer upon request for: (a) hours of operation, (b) volume of ore or aggregate mined, (c) watering and sweeping schedule for internal paved roads, (d) number of haul trucks exiting the facility, (e) Fugitive Dust Advisories, (f) Dust Control Plan, (g) Operation and Maintenance Plan for the on-site emission control system (ECS), and (h) twice daily moisture results of aggregate material.	Observation of dust plumes during periods of mining and processing operations; observation of dust plume opacity (visible emissions) exceeding a standard; tests of surface soil stabilization and aggregate moisture content; monitoring device to record pressures, flow rates and other ECS operating conditions; posting of signs restricting speeds to 15 mph; observation of high winds (e.g., >25 mph).

11.6 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for mineral processing operations. The reader is directed to Sections 4.6, 6.8, and 9.6 of the handbook for examples of calculating the cost effectiveness of specific control

measures for several minerals processing operations, namely materials handling, haul trucks traveling on unpaved industrial roads, and storage pile wind erosion, respectively.

A sample cost-effectiveness calculation is presented below for a specific control measure (wet scrubber for tertiary crushing of crushed stone) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for mineral processing, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Tertiary Crushing at Crushed Stone Processing Plant

Step 1. Determine source activity and control application parameters.

Material throughput (tons/year)	2,000,000
Control Measure	Wet scrubber
Control application/frequency	Continuous
Economic Life of Control System (yr)	10
Control Efficiency (Reference)	78% (AP-42)

The material throughput and economic life are assumed values for illustrative purposes. A wet scrubber system has been chosen as the control measure for reducing fugitive dust emissions. The moisture content of the crushed stone averages 0.21 to 1.3% for facilities without a wet suppression system and 0.55 to 2.88% for facilities with a wet suppression system.[1]

Step 2. Obtain Uncontrolled PM Emission Factors. The uncontrolled PM10 emission factor for tertiary crushing of crushed stone published in AP-42 is 0.0024 lb/ton of material throughput. The PM2.5/PM10 ratio for crushed stone aggregate is 0.15 (MRI, 2006).[6]

Step 3. Calculate Uncontrolled PM Emissions. The annual uncontrolled PM10 emissions are calculated by multiplying the PM10 emission factor by the material throughput and then divided by 2,000 lbs to compute the annual emissions in tons per year, as follows:

Annual emissions = (EF x Material Throughput)/2,000

Annual PM10 Emissions = (0.0024 x 2,000,000)/2000 = 2.4 tons
Annual PM2.5 Emissions = 0.15 (Annual PM10 Emissions) = 0.36 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

For this example, a wet scrubber/suppression system with a control efficiency of 78% has been selected as the control measure. Thus, the annual controlled PM10 and PM2.5 emissions estimates are calculated to be:

Annual Controlled PM10 emissions = (2.4 tons) x (1 – 0.78) = 0.53 tons
Annual Controlled PM2.5 emissions = (0.36 tons) x (1 – 0.78) = 0.079 tons

Step 5. Determine Annual Cost to Control PM Emissions.

Capital costs ($)	16,000
Operating/Maintenance costs ($)	12,200
Annual Interest Rate	3%
Capital Recovery Factor	0.12
Annualized Cost ($/yr)	14,076

The capital costs, annual operating and maintenance costs, and annual interest rate (AIR) are assumed values for illustrative purposes. The Capital Recovery Factor (CRF) is calculated from the Annual Interest Rate (AIR) and the Economic Life of the control system, as follows:

$$CRF = AIR \times (1+AIR)^{\text{Economic life}} / (1+AIR)^{\text{Economic life}} - 1$$
$$CRF = 3\% \times (1+ 3\%)^{10} / (1+ 3\%)^{10} - 1 = 0.1172$$

The Annualized Cost is calculated by adding the product of the Capital Recovery Factor (CRF) multiplied by the Capital costs to the sum of the Operating and Maintenance costs, as follows:

Annualized Cost = (CRF x Capital costs) + Operating/Maintenance costs
Annualized Cost = (0.1172 x $16,000) + $12,200 = $14,076

Step 6. Calculate Cost-effectiveness. Cost-effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost-effectiveness = Annualized Cost/ (Uncontrolled emissions – Controlled emissions)

Cost-effectiveness for PM10 emissions = $14,075 / (2.4 – 0.53) = $7,519/ton
Cost-effectiveness for PM2.5 emissions = $14,075 / (0.36 – 0.079) = $50,127/ton

12.1 Emission Estimation Methodology 12-1
12.2 Demonstrated Control Techniques 12-1
12.3 Regulatory Formats 12-1
12.4 Compliance Tools 12-3
12.5 Sample Cost-Effectiveness Calculation 12-4
12.6 References 12-6

12.1 Emission Estimation Methodology

This section was adapted from Section 13.2.6 of EPA's Compilation of Air Pollutant Emission Factors (AP-42). Section 13.2.6 was last updated in September 1997.

Abrasive blasting is the use of abrasive material to clean and prepare metal or masonry surfaces prior to painting. Sand is the most widely used blasting abrasive.[1] Other abrasive materials include coal slag, smelter slag, cast iron grit, cast iron shot, steel shot, garnet, walnut shells, carbon dioxide pellets, as well as synthetic abrasives such as silicon carbide, aluminum oxide, and glass or plastic beads. The PM10 and PM2.5 emission factors listed in AP-42 for sand blasting of mild steel are 13 lb/1,000 lb abrasive and 1.3 lb/1,000 lb abrasive, respectively, giving a PM2.5/PM10 ratio of 0.1. Using grit or shot instead of sand as the abrasive media reduces total PM emissions by 76% and 90%, respectively.

12.2 Demonstrated Control Techniques

A number of different methods have been used to control the emissions from abrasive blasting. Theses methods include: blast enclosures; vacuum blasters; drapes; water curtains; wet blasting; and reclaim systems. Wet blasting controls include not only traditional wet blasting processes but also high pressure water blasting, high pressure water and abrasive blasting, and air and water abrasive blasting. For wet blasting, control efficiencies between 50 and 93 percent have been reported. Fabric filters are typically used to control emissions from enclosed abrasive blasting operations with reported control efficiencies in excess of 95%.[1]

Muleski and Downing recently tested the use of a polyurethane sponge material impregnated with different abrasive materials and compared the particulate emissions from this new sponge media with that from traditional abrasive materials.[2] The pliable nature of the sponge material allows it to surround the point of abrasive impact, thus capturing airborne dust emissions. The most commonly sold sponge media is a product containing 30 grit aluminum oxide known as "Silver 30". Using recycled sponge media mixed with fresh abrasive material per the manufacturer's recommendations reduced TSP emissions by 94% and PM10 emissions by 96% compared to traditionally used abrasives such as coal slag and silica sand. In other words, when used as recommended (i.e., recycled sponge media with fresh abrasive material added), the foam-based blasting media achieved a control level essentially identical to that of fabric filtration.

12.3 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. As an example, Maricopa County's Rule 312 states that all abrasive blasting operations shall be performed in a confined enclosure, unless one of the following conditions are met, in which case unconfined blasting may be performed: (a) the item to be blasted exceeds 8 ft. in any one dimension, or (b) the

surface being blasted is fixed in a permanent location, cannot easily be moved into a confined enclosure, and the surface is not normally dismantled or moved prior to abrasive blasting.[3] Dry abrasive blasting in a confined enclosure with a forced air exhaust requires the use of either a certified abrasive (i.e., an abrasive certified by the California Air Resources Board), or venting to an emission control system (ECS) for which the operator must maintain an operation and maintenance plan. A list of abrasives currently certified by CARB as permissible for dry outdoor blasting can be obtained from Maricopa County's website (maricopa.gov/aq/divisions/planning.aspx#rules). For unconfined blasting, at least one of the following control measures shall be used: wet abrasive blasting, vacuum blasting, or dry abrasive blasting, provided that all of the following conditions are met: performed only on a metal substrate, use of certified abrasive for dry unconfined blasting, blasting paint that has a lead content of less than 0.1 percent, abrasive blasting operation directed away from unpaved surfaces, and the certified abrasive may only be used once unless contaminants are separated from the abrasive after each use. No dry unconfined abrasive blasting operation shall be conducted when the 1-hour average wind speed is greater than 25 miles per hour.

Maricopa County Rule 312 states no owner or operator shall discharge into the atmosphere from any abrasive blasting operation any air contaminant for an observation period or periods aggregating more than three minutes in any sixty minute period an opacity conducted in accordance with EPA Reference Method 9 ("Visual Determination of the Opacity of Emissions from Stationary Sources," 40 CFR 60, Appendix A) equal to or greater than 20 percent. At the end of the work shift the owner or operator shall clean up spillage, carryout, and/or track out of any spent abrasive material with a potential to be transported during periods where the wind exceeds 25 mph.

The South Coast AQMD's Rule 1140 states that before blasting all abrasives used for dry unconfined blasting shall contain no more than1% by weight material passing a No. 70 U.S. Standard sieve, and after blasting the abrasive shall not contain more than 1.8% by weight material five microns or smaller.[4] Rule 1140 states that visible emission evaluation of abrasive blasting operations shall be conducted in accordance with the following provisions:

1. Emissions shall be read in opacities and recorded in percentages.
2. The light source should be behind the observer during daylight hours.
3. The light source should be behind the emission during hours of darkness.
4. The observer position should be at approximately right angles to wind direction and at a distance no less than twice the height of the source but not more than a quarter mile from the base of the source.
5. Emissions from unconfined abrasive blasting shall be read at the densest point in the plume, which point shall be at least 25 feet from the source.

6. Where the presence of uncombined water is the only reason for failure to comply with opacity limits, the opacity limits shall not apply. The burden of proof in establishing that opacity limits shall not apply shall be upon the operator.

7. Emissions from unconfined abrasive blasting employing multiple nozzles shall be evaluated as a single source unless it can be demonstrated by the operator that each nozzle, evaluated separately, meets the requirements of this rule.

8. Emissions from confined abrasive blasting shall be read at the densest point after the air contaminant leaves the enclosure.

The website addresses for obtaining information on fugitive dust regulations for local air quality districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- San Joaquin Valley APCD, CA: valleyair.org/SJV_main.asp
- South Coast AQMD, CA: aqmd.gov/rules
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/aq

12.4 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Maricopa County Rule 312 states that as a minimum each owner or operator subject to this rule shall keep the following records onsite for at least 5 years at permitted Title V

sources and for at least 2 years at Non-Title V sources: (a) the type and amount of solid abrasive material consumed on a monthly basis, including the name of the certified abrasive used, as applicable; and (b) Material Safety Data Sheets (MSDS) or results of any lead testing that was performed on paint that is to be removed via unconfined blasting, as applicable. In addition if blasting operations occur daily or are a part of a facility's primary work activity, then records shall be kept of the blasting equipment including a description of the type of blasting (e.g., confined, unconfined, sand, wet, etc.), the location of the blasting equipment or specify if the equipment is portable, a description of the emission control system (ECS) associated with the blasting operations, the days of the week blasting occurs, and the normal hours of operation. If blasting operations occur periodically, then records shall be kept of the dates the blasting occurs, the blasting equipment that is operating including a description of the type of blasting, and a description of the ECS associated with the blasting operations.

12.5 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for abrasive blasting operations. A sample cost-effectiveness calculation is presented below for a specific control measure (fabric filtration used to capture particulates from sand blasting of mild steel) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for abrasive blasting, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Sand Blasting of Mild Steel

Step 1. Determine source activity and control application parameters.

Silica sand abrasive use (tons/year)	10
Control Measure	Fabric Filter
Control application/frequency	Continuous
Economic Life of Control System (yr)	10
Control Efficiency (Reference)	95% (AP-42)

The amount of abrasive material used on a yearly basis and the economic life of the control system are assumed values for illustrative purposes. A fabric filter filtration system has been chosen as the control measure for reducing fugitive dust emissions from abrasive blasting of mild steel.

Step 2. Obtain Uncontrolled PM Emission Factors. The uncontrolled PM10 and PM2.5 emission factors for sand blasting of mild steel published in AP-42 are 26 lb/ton of abrasive and 2.6 lb/ton of abrasive.

Step 3. Calculate Uncontrolled PM Emissions. The annual uncontrolled PM emissions are calculated by multiplying the PM emission factors by the amount of abrasive material used per year divided by 2,000 lb/ton to produce emission estimates in tons per year, as follows:

- Annual PM10 Emissions = (26 lb/ton x 10 tons/year) / 2,000 lb/ton = 0.13 tons
- Annual PM2.5 Emissions = (2.6 lb/ton x 10 tons/year) / 2,000 lb/ton = 0.013 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

For this example, fabric filters with a control efficiency of 95%% has been selected as the control measure. Thus, the annual controlled PM10 and PM2.5 emissions estimates are calculated to be:

Annual Controlled PM10 emissions = (0.13 tons) x (1 – 0.95) = 0.0065 tons
Annual Controlled PM2.5 emissions = (0.013 tons) x (1 – 0.95) = 0.00065 tons

Step 5. Determine Annual Cost to Control PM Emissions.

Capital costs ($)	10,000
Annual operating and maintenance costs ($)	1,000
Annual Interest Rate	3%
Capital Recovery Factor	0.12
Annualized Cost ($/yr)	2,200

The capital costs, annual operating and maintenance costs, and annual interest rate (AIR) are assumed values for illustrative purposes. The Capital Recovery Factor (CRF) is calculated from the Annual Interest Rate (AIR) and the Economic Life of the control system, as follows:

$$CRF = AIR \times (1+AIR)^{\text{Economic life}} / (1+AIR)^{\text{Economic life}} - 1$$
$$CRF = 3\% \times (1+ 3\%)^{10} / (1+ 3\%)^{10} - 1 = 0.1172$$

The Annualized Cost is calculated by adding the product of the Capital Recovery Factor (CRF) multiplied by the Capital costs to the sum of the operating and maintenance costs, as follows:

Annualized Cost = (CRF x Capital costs) + Operating and Maintenance costs
Annualized Cost = (0.1172 x $10,000) + $1,000 = $2,172

Step 6. Calculate Cost-effectiveness. Cost-effectiveness is calculated by dividing the annualized cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions:

Cost-effectiveness = Annualized Cost/ (Uncontrolled emissions – Controlled emissions)

Cost-effectiveness for PM10 emissions = $2,172/ (0.13 – 0.0065) = $17,590/ton
Cost-effectiveness for PM2.5 emissions = $2,172/ (0.013 – 0.00065) = $175,895/ton

Chapter 13. Livestock Husbandry

13.1 Emission Estimation Methodology 13-1
13.2 Demonstrated Control Techniques 13-2
13.3 Regulatory Formats 13-3
13.4 Compliance Tools 13-4
13.5 Sample Cost-Effectiveness Calculation 13-5
13.6 References 13-7

13.1 Emission Estimation Methodology

This section was adapted from Section 7.6 of CARB's Emission Inventory Methodology. Section 7.6 was last updated in May 2004.

AP-42 does not address livestock husbandry. Thus, the methodology adopted by the California Air Resources Board (CARB) is presented here as the primary emissions estimation methodology for this fugitive dust source category.[1] The CARB methodology only provides estimates of PM10 emissions from cattle feedlot and dairy operations. For each category, the emissions are calculated by multiplying a per animal emission factor by the population of each animal type. The livestock population is available from the US Department of Agriculture. Livestock emissions research is ongoing.

CARB's PM10 emission factor for cattle feedlots is 28.9 lbs PM10/1000 head/day (i.e., 10.55 lb/head-year) based on a work performed by UC Davis.[2] The corresponding PM10 emission factor for dairy cattle is 6.72 lbs PM10/1000 head/day (i.e., 2.45 lb/head-year) based on an emission factor of 4.4 lbs PM10/1000 lactating head/day, developed by Texas A&M.[3] To make the Texas emission factor more California specific, it was multiplied by a scaling factor based on the ratio of the California feedlot PM10 emission factor to a Texas feedlot PM10 emission factor. This ratio is 29:19; thus, the scaling factor is 1.53. The PM10/TSP and PM2.5/PM10 ratios for this source category are 0.48 and 0.11, respectively.

The CARB methodology is subject to the following assumptions:

1. Population data and residence time data adequately represent average animal population values for each county.

2. All animals within a single class produce the same emissions (e.g., dairy cows, calves, and heifers).

3. It is assumed that all dairies or feedlots produce the same PM10 emissions on a per-head basis.

4. For dairies, the baseline PM10 emission factor includes the effects of support stock such as calves and heifers. This is because the emissions testing included these animals within its analysis.

5. For feedlots, the baseline PM10 emission factor represents the population mix at a typical feedlot.

6. The method does not include emissions for animal waste composting or land application.

7. Due to insufficient temporal information, it is assumed that air emissions occur evenly throughout the year seven days a week and 24 hours a day.

The San Joaquin Valley APCD has developed separate emission factors for different operations associated with dairies and cattle feedlots based on CARB's PM10 emission factors of 2.45 lb/head-year for dairies and 10.55 lb/head-year for cattle feedlots.[4] These emission factors are shown in Table 13-1.

Table 13-1. PM10 Emission Factors for Cattle Feedlot and Dairy Operations

Source Category	Operation	PM10 Emission Factor
Dairies	Corral/Manure Handling	1.845 lb/head-yr (freestall) 4.6 lb/head-yr (open corral)
	Overall Management/Feeding	1.845 lb/head-yr (freestall) 4.6 lb/head-yr (open corral)
	Unpaved Road	0.369 lb/head-yr
	Unpaved Area	0.123 lb/head-yr
Cattle Feedlots	Pens/Manure Handling	7.94 lb/head-yr
	Overall Management/Feeding	0.53 lb/head-yr
	Unpaved Road	1.59 lb/head-yr
	Unpaved Area	0.53 lb/head-yr

13.2 Demonstrated Control Techniques

CARB does not list any control measures for this fugitive dust source category. However, the San Joaquin Valley APCD (District) has been very proactive in identifying potential control measures for cattle feedlots and dairies. For example, fugitive dust emissions originating from the disturbance of dry and loose surface material (e.g., feed, bedding material, and manure) caused by animal movement and mechanical disturbances by vehicles can be controlled by sprinkling water on the surface of the open corral or pen, removing manure before it dries, using a layer of wood chips in dusty areas, housing dairy cattle in stalls with concrete floors rather than dirt floors, and adopting a feeding schedule when animals are less active. Wind blown fugitive dust originating from uncovered bulk materials can be controlled by applying water or chemical suppressants, covering the material with tarps or storing the material in enclosure, and erecting wind barriers. Since no data could be found in the literature on which to base a control efficiency factor for these practices, the District has conservatively assumed a minimal 10% control effectiveness. Control measures identified by the District for cattle feedlots and dairies are shown in Table 13-2. A list of control measures for cattle feedlots and dairies is available from the California Air Pollution Control Officers' Association's (CAPCOA) agricultural clearing house website (http://capcoa.org/ag_clearinghouse.htm).

Control measures for unpaved roads and unpaved parking/traffic areas include application of chemical dust suppressants, paving the surface or placing a layer of gravel over the unpaved surface, speed reduction, access restriction, and track out control measures. These control measures and their associated control efficiencies are listed in Chapter 6 of the handbook. Control measures for storage piles of bulk materials other than manure include dust suppressants, watering, covering and wind barriers. These

control measures and their associated control efficiencies are listed in Chapter 9 of the handbook.

Table 13-2. Control Measures for Cattle Feedlots and Dairies[a]

Source Category	Control Measure
Manure management	Frequent manure removal (every 6 months) with equipment that leaves an evenly corral surface of compacted manure on top of the soil.
	Insert the manure directly beneath the soil.
Dust entrainment by animal	Daily water sprinkling, and timing of watering around 6PM or before sunset.
	Use of freestalls with concrete surface for animal housing/feeding areas to allow frequent manure removal.
	Stocking density adjustment in accordance to the moisture found in the unit area to reduce dust.
	Removal of loose material on surface and maintain a compacted layer of manure 1 to 2 inches thick.
	Addition of fibrous material such as wood chips to working pens.
	Delaying the last daily feeding to reduce end-of-day spike in livestock activity.
Other	Adding moisture to hay
	Using a totally enclosed delivery system and covered feeders, and using palletized feed.
	Planting rows of vegetation around a building to create a barrier for air exiting from the building.

[a] Since no data could be found in the literature on which to base a control efficiency factor for these practices, the SJVAPCD has conservatively assumed a minimal 10% control effectiveness for each control measure.

13.3 Regulatory Formats

Fugitive dust control options have been embedded in many regulations for state and local agencies in the WRAP region. However, most air quality districts currently exempt agricultural operations from controlling fugitive dust. Air quality districts that regulate fugitive dust emissions from agricultural operations include Clark County, NV and several districts in California such as the Imperial County APCD, the San Joaquin Valley APCD and the South Coast AQMD. Imperial County APCD prohibits fugitive dust emissions from farming activities for farms over 40 acres. The San Joaquin Valley APCD and the South Coast AQMD prohibit fugitive dust emissions for the larger farms defined as farms with areas where the combined disturbed surface area within one continuous property line and not separated by a paved public road is greater than 10 acres. SJVAPCD's Rule 4550 applies to animal feeding operations (AFOs) that house animals for a total of at least 45 days in any 12 month period for agricultural parcels exceeding 100 acres excluding the AFO. Example regulatory formats downloaded from the Internet for several local air quality agencies in the WRAP region are presented in Table 13-3. CAPCOA's agricultural clearing house website (http://capcoa.org/ag_clearinghouse.htm) provides links to rules of different air quality agencies that regulate fugitive dust emissions from agricultural operations. The website addresses for obtaining information on fugitive dust regulations for local air quality

districts within California, for Clark County, NV, and for Maricopa County, AZ, are as follows:

- Districts within California: www.arb.ca.gov/drdb/drdb.htm
- San Joaquin Valley APCD, CA: valleyair.org/SJV_main.asp
- South Coast AQMD, CA: aqmd.gov/rules
- Clark County, NV: www.co.clark.nv.us/air_quality/regs.htm
- Maricopa County, AZ: www.maricopa.gov/aq

Table 13-3. Example Regulatory Formats for Cattle Feedlots and Dairies

Control Measure	Agency
Limit fugitive dust from animal feeding operations for facilities exceeding 100 acres excluding the AFO by requiring owner/operator to implement a Conservation Management Practice (CMP) Plan with district approved control methods.	SJVAPCD Rule 4550 5/20/04
Limit fugitive dust from off-field agricultural sources such as unpaved roads with more than 75 trips/day and bulk materials handling by requiring producers to draft and implement a Fugitive Dust Management Plan with district approved control methods.	SJVAPCD Rule 8081 9/16/04
Producers that voluntarily implement district approved conservation practices and complete and maintain the self-monitoring plan can maintain an exemption from the Rule 403 general requirements.	SCAQMD Rule 403 4/02/04
Cease tilling/mulching activities when wind speeds are greater than 25 mph.	SCAQMD Rule 403.1 4/02/04
Limit fugitive dust from paved and unpaved roads and livestock operations by ceasing all hay grinding activities between 2 and 5 PM if visible emissions extend more than 50 feet from a hay grinding source, and treating all unpaved access connections to livestock operations and unpaved feed lane access areas with either pavement, gravel (maintained to a depth of 4 inches), or asphaltic road-base.	SCAQMD Rule 1186 4/02/04
Reduce fugitive dust from livestock feed yards by requiring that the moisture content in the top three inches of manure piles for occupied pens be maintained between 20% and 40%. This rule also outlines manure management practices, including removal.	SCAQMD Rule 1186 4/02/04
Reduce fugitive dust from livestock feed yards by requiring that the moisture content for manure piles be maintained between 20% and 40%.	ICAPCD Rule 420 8/13/02

13.4 Compliance Tools

Compliance tools assure that the regulatory requirements, including application of dust controls, are being followed. Three major categories of compliance tools are discussed below.

Record keeping: A compliance plan is typically specified in local air quality rules and mandates record keeping of source operation and compliance activities by the source owner/operator. The plan includes a description of how a source proposes to comply with all applicable requirements, log sheets for daily dust control, and schedules for compliance activities and submittal of progress reports to the air quality agency. The purpose of a compliance plan is to provide a consistent reasonable process for documenting air quality violations, notifying alleged violators, and initiating enforcement action to ensure that violations are addressed in a timely and appropriate manner.

Site inspection: This activity includes (1) review of compliance records, (2) proximate inspections (sampling and analysis of source material), and (3) general observations. An inspector can use photography to document compliance with an air quality regulation.

On-site monitoring: EPA has stated that "An enforceable regulation must also contain test procedures in order to determine whether sources are in compliance." Monitoring can include observation of visible plume opacity, surface testing for crust strength and moisture content, and other means for assuring that specified controls are in place.

Table 13-4 summarizes the compliance tools that are applicable for cattle feedlots and dairies.

Table 13-4. Compliance Tools for Cattle Feedlot and Dairies

Record keeping	Site inspection/monitoring
Maintain daily records to document the specific dust control options taken; maintain such records for a period of not less than three years; and make such records available to the APCO upon request. Submit a Conservation Management Practice (CMP) Plan to the APCO listing the selected CMPs for implementation, contact information for the owner/operator, a site plan or map of the site.	Observation of dust plumes and dust plume opacity (visible emissions) exceeding a standard; observation of high winds (e.g., >25 mph).

13.5 Sample Cost-Effectiveness Calculation

This section is intended to demonstrate how to select a cost-effective control measure for cattle feedlots and dairies. A sample cost-effectiveness calculation is presented below for cattle feedlots for a specific control measure (frequent scraping and manure removal) to illustrate the procedure. The sample calculation includes the entire series of steps for estimating uncontrolled emissions (with correction parameters and source extent), controlled emissions, emission reductions, control costs, and control cost-effectiveness values for PM10 and PM2.5. In selecting the most advantageous control measure for cattle feedlots and dairies, the same procedure is used to evaluate each candidate control measure (utilizing the control measure specific control efficiency and cost data), and the control measure with the most favorable cost-effectiveness and feasibility characteristics is identified.

Sample Calculation for Cattle Feedlots

Step 1. Determine source activity and control application parameters.

Number of cattle at the feedlot	1,000
Control Measure	Scraping and manure removal

Frequency of operations per year	2
Control Efficiency	10%

Scraping and removal of manure from feedlot pens every six months has been chosen as the applied control measure. The number of cattle at the feedlot is an assumed value for illustrative purposes. Since no data could be found in the literature on which to base a control efficiency factor for control measures for cattle feedlots and dairies, the SJVAPCD has conservatively assumed a minimal 10% control effectiveness for each control measure (SVAPCD, 2004[4]).

Step 2. Obtain Uncontrolled PM10 Emission Factor.
The uncontrolled PM10 emission factor for cattle feedlots is 10.55 lb/head/year (CARB, 2004[1]).

Step 3. Calculate Uncontrolled PM Emissions. The PM10 emission factor, EF, (given in Step 2) is multiplied by the number of cattle (see activity data) and then divided by 2,000 lb/ton to compute the annual PM10 emissions in tons per year, as follows:

Annual PM10 emissions = (EF x Number of Cattle) / 2,000
Annual PM10 Emissions = (10.55 x 1,000) / 2,000 = 5.28 tons

Annual PM2.5 emissions = (PM2.5/PM10) x PM10 emissions
where the PM2.5/PM10 ratio for cattle feedlots is 0.11 (CARB, 2004[1]).

Annual PM2.5 emissions = 0.11 x PM10 emissions
Annual PM2.5 Emissions = (0.11 x 5.28 tons) = 0.58 tons

Step 4. Calculate Controlled PM Emissions. The controlled PM emissions (i.e., the PM emissions remaining after control) are equal to the uncontrolled emissions (calculated above in Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency)

For this example, we have selected frequent scraping and removal of manure as our control measure. Based on a control efficiency estimate of 10%, the annual controlled PM emissions are calculated to be:

Annual Controlled PM10 emissions = (5.28 tons) x (1 – 0.10) = 4.75 tons
Annual Controlled PM2.5 emissions = (0.58 tons) x (1 – 0.10) = 0.52 tons

Step 5. Determine Annual Cost to Control PM Emissions.

The SJVAPCD assumes that the cost for scraping and removal of manure is $3 per head.[4] Thus, the annualized cost of scraping and removal of manure from feedlot pens holding 1,000 head of cattle every six months is calculated as follows:

Annual Costs = Cost per head to remove manure x Head of Cattle x Frequency of Ops/year
Annual Costs = $3/head x 1,000 head x 2/year = $6,000

Step 6. Calculate Cost-effectiveness. The cost-effectiveness is calculated by dividing the annual cost by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions from the uncontrolled emissions as follows:

Cost-effectiveness = Annual Cost/ (Uncontrolled emissions – Controlled emissions)

Cost-effectiveness for PM10 emissions = $6,000 / (5.28 – 4.75) = $11,374/ton
Cost-effectiveness for PM2.5 emissions = $6,000 / (0.58 – 0.52) = $103,404/ton

Note: The actual cost-effectiveness values for this control measure are lower than the calculated values shown here since the SJVAPCD assumes that the control efficiency is at least 10%.

Chapter 14. Miscellaneous Minor Fugitive Dust Sources

14.1 Introduction 14-1
14.2 Windblown Dust from Unpaved Roads 14-1
14.3 Uncovered Haul Trucks 14-3
14.4 Unpaved Shoulders 14-3
14.5 Leaf Blowers 14-4
14.6 Explosives Detonation 14-5
14.7 References 14-5

14.1 Introduction

This Chapter identifies emission estimation methods for several minor fugitive dust source categories not addressed in other chapters of the handbook. Because several of these methods have not been approved by federal or state agencies, the reader is cautioned in the use of the emission factors included in these emission estimation methods. The emission estimation methods discussed here address:

- windblown dust from unpaved roads
- uncovered haul trucks,
- unpaved shoulders,
- leaf blowers, and
- explosives detonation.

14.2 Windblown Dust from Unpaved Roads

The California Air Resources Board adopted the U.S. EPA-modified version of the USDA-ARS derived wind erosion equation (WEQ) used to estimate windblown dust from agricultural fields[1] to estimate windblown dust from unpaved roads[2] as follows:

$$E_S = a\ I\ K\ C\ L'\ V' \qquad (1)$$

where, E_S = the quantity of unpaved road dust entrained to the air by wind erosion (tons TSP/acre/year)
a = portion of total roadway wind erosion losses that are assumed to be suspended into the air; estimated to be 0.038 for TSP
I = soil erodibility (tons/acre/year)
K = surface roughness factor (dimensionless)
C = climatic factor (dimensionless)
L' = unsheltered width factor (dimensionless)
V' = vegetative cover factor (dimensionless)

In summary, the 'I' term in the windblown dust equation provides an estimate of the soil erosion from an area that is large, flat, bare, and highly erodible. The additional terms in the equation reduce emissions from this worst-case scenario. The climatic, C, factor helps to account for regional differences in wind and rainfall. If a surface is rough, as represented by K, soil erosion is decreased. If the length of the erodible area parallel to the wind is short, then the erosion is decreased, as represented by the L' factor. If there is crop residue on the erodible area, then erosion is further decreased by the V' factor. A detailed discussion of the parameters I, K, C, L', and V' is presented in Chapter 7 of the Handbook.

Soil Erodibility – I. The soil erodibility, I, of an unpaved road is related to the soil type of the road surface. Because roadway soil types are not readily available, the county specific, average soil types are used to estimate the erodibility. The county soil types are computed using a geographic information system (GIS) to average detailed county soil profile maps provided by the Natural Resources Conservation Service. This approach

assumes that unpaved road surfaces have the same soil characteristics as the base soils in the vicinity of the roadway.

Climatic Factor - C. The rate of soil erosion varies directly with the wind velocity and inversely with the soil surface moisture. The climatic factor is used to adjust for these parameters. CARB staff computed the county 'C' factors based on regional rainfall and wind speed data measured in California.

Surface Roughness - K. Surface roughness can help to reduce soil erosion. The 'K' factor is used to account for ridges or furrows that help to minimize wind related erosion. Because most unpaved roads are flat, the surface roughness factor is assumed to be 1.0, indicating no reduction in emissions due to surface texture.

Unsheltered Width Factor - L'. Soil erosion is directly related to the unprotected width of the area in the prevailing wind direction. For unpaved roads, depending on the wind direction, the width of the erosive area parallel to the wind direction could be very narrow, very long, or somewhere in between. CARB assumes that the wind direction is equally distributed for all roads and that the average value of L' is 0.32.

Vegetative Cover Factor - V'. Vegetative cover reduces soil erosion. For unpaved roads, it is assumed that there is no vegetative cover, therefore a value of 1.0 is used.

Based on analysis of resuspended California soil samples, CARB estimated that the PM10/TSP ratio for windblown dust from unpaved roads is 0.5. Windblown dust emissions from unpaved roads are calculated for each county by multiplying the PM10 emission rate (i.e., 50% of the TSP emission rate calculated from the TSP emission factor equation, Equation 1) by the unpaved road mileage and the average width of the unpaved roads assumed to average 20 feet. CARB's estimates does not include windblown dust from agricultural unpaved roads since they assume that windblown emissions from agricultural unpaved roads are included in the source category for windblown dust from agricultural lands.

The CARB methodology is subject to the following assumptions and limitations:

1. It is assumed that the unpaved road soil characteristics are approximately the same as the soils in the vicinity of the unpaved road that are not used for vehicular travel. This implies that no additional gravel or other treatments have been applied to the unpaved roads.

2. It is assumed that the soil wind erosion equation may be reasonably applied to estimate windblown dust from unpaved roads. Because of the large differences between unpaved road surfaces and agricultural lands, the validity of this assumption is questionable.

3. Using the soil erosion equation, it is assumed that 3.8% of the total eroded material is
entrained to the air. ('a' factor = 0.038).

4. It is assumed that the county average soil erodibility, 'I', and climatic, 'C', factors are representative (on average) of the overall county conditions.

5. It is assumed that a value of 0.32 for the unsheltered width factor, L', is valid.

6. It is assumed that unpaved roads have no vegetative cover and are essentially flat.

7. The typical unpaved road width is 20 feet.

8. This methodology assumes no extraordinary windstorm activity; only average annual conditions are estimated.

CARB is aware that their methodology for estimating windblown dust from unpaved roads is built on a foundation of dubious assumptions. Because of the differences between unpaved roads and agricultural lands, it is unlikely that the agricultural soil erosion equation provides very accurate estimates of windblown road dust. The emissions estimates could be improved by performing wind tunnel tests on unpaved roads, and then extrapolating the resulting emission factors to the remainder of the State. With the use of geographic information systems, it is also possible to incorporate localized climatological and soil texture properties into the emission estimates. In addition, the mileage of unpaved roads could be improved using available digital maps which include public, as well as private unpaved roads.

14.3 Uncovered Haul Trucks

A total suspended particulate (TSP) emission factors for uncovered haul trucks was included in a USEPA report published in 1989.[3] The hourly TSP emission estimate for uncovered haul trucks was estimated from the following equation:

$$TSP\ (lb/yd^2/hour) = 0.00015\ u$$

where, u = sum of wind speed and vehicle speed (mph)

To estimate PM10 and PM2.5 emissions, PM10/TSP and PM2.5/TSP ratios will need to be obtained for this source category.

14.4 Unpaved Shoulders

DRI developed a PM10 emission factor for the resuspension of fugitive dust from unpaved shoulders created by the wake of high-profile vehicles such as tractor-trailers (semis) traveling on paved roads at high speed (50-65 mph).[4] The emission factor for unpaved shoulder with surface loadings of 4,500 to 5,500 g/m^2, silt content of 3 to 6%, and a surface moisture content under 1% was given as:

$$EF = 0.028 \pm 0.014\ lb/VMT$$

DRI concluded that emissions from unpaved shoulders due to smaller vehicles such as cars, vans and SUVs were negligible. It should be pointed out that the PM10

emissions were estimated utilizing nephelometers that are not quantitative for coarse particles. Thus, PM10 emissions may be underestimated.

14.5 Leaf Blowers

Dennis Fitz and other researchers from CE-CERT at UC Riverside recently completed a study on behalf of the San Joaquin Valley APCD to determine PM2.5 and PM10 emissions from leaf blowing/vacuuming, raking and sweeping activities.[5] Real-time PM2.5 and PM10 measurements were obtained with DustTrak aerosol monitors calibrated against Arizona road dust (NIST SRM 8632). The precision of the DustTrak PM2.5 and PM10 measurements were determined to be 19% and 27%, respectively, based on collocated DustTrak monitors. The accuracy of the DustTrak measurements was determined by comparing the DustTrak measurements to the filter-based measurements. In general the two data sets agreed to within 50%, which was similar to the variability between replicate tests. The PM2.5 and PM10 emission factors determined by DustTrak monitors for different cleaning activities and surfaces are summarized in Table 14-1. The DustTrak results for blowing leaves on asphalt and concrete surfaces as a function of power blower type are presented in Table 14-2.

Table 14-1. PM Emission Factors for Leaf Blowing/Vacuuming, Raking and Sweeping Activities (mg/m^2)

Cleaning Action and Surface Cleaned	PM2.5	PM10
Power blowing/vacuuming over concrete surfaces	30	80
Power blowing/vacuuming over asphalt surfaces	20	60
Push broom to sweep asphalt surfaces	0	20
Push broom to sweep concrete surfaces	20	80
Raking asphalt surfaces	0	0
Raking on concrete surfaces	0	0
Raking lawns	0	1
Power blowing on lawns	1	2
Power blowing from gutters	9	30
Power blowing on packed dirt	80	120
Power blowing cut grass on walkways	2	6

Table 14-2. PM Emission Factors by Power Blower Type and Surface (mg/m^2)

Power Blower Type	Surface	PM2.5	PM10
Electric	Asphalt	20	60
Gas Hand Held	Asphalt	10	40
Gas Backpack	Asphalt	20	60
Electric: vacuum mode	Asphalt	40	120
Electric: vacuum mode, full bag	Asphalt	20	70
Electric	Concrete	40	130
Gas Hand Held	Concrete	10	40
Gas Backpack	Concrete	30	70
Electric: vacuum mode	Concrete	30	80

14.6 Explosives Detonation

Emissions from the detonation of industrial explosives and firing of small arms (excluding military operations) are addressed in Section 13.3 of AP-42.[6] This section of AP-42 was last updated in February 1980 (and reformatted in January 1995). Such large quantities of particulate are generated in the shattering of rock and earth by the explosive that the quantity of particulates from the explosive charge cannot be distinguished. With the exception of a few studies in underground mines, most studies have been performed in laboratory test chambers that differ substantially from the actual environment. Any estimates of emissions from explosives use must be regarded as approximations that cannot be made more precise because explosives are not used in a precise, reproducible manner.

GLOSSARY

Areal extent—Fraction (or percentage) of the source area that is affected by the control measure.

Aerodynamic particle size—Diameter of a sphere of unit density, which behaves aerodynamically as a particle with different sizes, shapes, and densities.

Aggregate material—Mineral particles, such as sand or stone, typically derived from a mechanical process.

Agricultural tilling—Mechanical disturbance of agricultural soil by discing, shaping, chiseling, and leveling using a tractor or implement.

Annual interest rate—The yearly cost of borrowing money, expressed as a percentage of the amount borrowed.

Annualized cost of control—Average yearly costs of a control system including annual operating costs such as labor, materials, utilities and maintenance items, and annualized costs of the capital costs of purchase and installation. Annualized costs are dependent on the interest rate paid on borrowed money or collectable by the plant as interest (if available capital is used), the useful life of the control equipment, and depreciation rates of the equipment.

AP-42—Abbreviation for the U.S. EPA's publication "Compilation of Air Pollutant Emission Factors."

BACM—Abbreviation for Best Available Control Measures—techniques that achieve the maximum degree of emissions reduction from a source, as determined on a case-by-case basis considering technological and economic feasibility.

Bare soil adjustment—Adjustment to windblown emissions for the planted acreage on which plants do not establish.

Base year—Year for which the pre-control emissions inventory was performed.

Baseline Emissions—Emissions (total or source) in the base year.

Batch drop—Materials handling process involving free fall of aggregate, as from a bucket.

Border adjustment—Adjustment to windblown emissions for the nonplanted regions of the acreage dedicated to a given crop that separate it from surrounding regions.

CAPCOA—Acronym for California Air Pollution Control Officers' Association.

Capital recovery factor—Amount of money per dollar of machinery investment required to pay annual interest costs on unrecovered investment and to recover the costs of the investment within a specified number of years at the given interest rate.

Chemical wetting agent—Compound added to water in order to enhance the penetration of water into dusty material and prevent dust emissions.

Clay—Cohesive soil with individual particles not visible to the unaided human eye (less than 0.002 mm in diameter). Clay can be molded into a ball that will not crumble.

Climatic factor "C," annual—Parameter used to estimate the effects of climate on soil erodibility. Garden City, Kansas is set to 1.0 and temperature, wind, and precipitation are used to adjust the factor.

Climatic factor "C," monthly—Parameter used to modify the annual "C" factor equation for a particular month of the year. The U.S. EPA uses mean monthly wind speed in place of the annual wind speed. The ARB methodology uses the month-as-a-year method.

Cloddiness—Level of relatively stable agglomerations in soil caused by exposure to water cohort (maturation class).

Compliance tool—Means for checking whether a facility is meeting legal requirements for control of a pollutant. Compliance tools include record keeping logs, databases, and site inspection methods.

Continuous drop—Materials handling process involving continual release of aggregate, such as from a conveyor.

Control application rate/frequency—Amount of pollutant suppressant applied over a particular area and the number of times per period that the suppressant is applied.

Control efficiency—Degree (e.g., percentage) to which a control measure is effective in limiting the release of a pollutant.

Control efficiency decay rate—Decrease in control efficiency for a control measure with a limited life span.

Control extent—Fraction of emissions from a source category that will be affected by a control method.

Control measure—Procedure or course of action taken to reduce air pollution. Preventive measures reduce source extent or incorporate process modifications or adjust work practices to reduce the amount of pollutants. Mitigative measures involve the periodic removal of pollutant causing materials, such as the cleanup of

spillage on travel surfaces and cleanup of material spillage at conveyor transfer points.

Controlled emissions—Estimated emissions (total or by source category) after application of control measures, i.e., remaining emissions.

Cost effectiveness— Control cost divided by the mass of emissions reduced (most typically expressed in terms of "dollars per ton").

Crop calendar—Temporal distribution of agricultural activities (e.g., planting and harvesting dates).

Crop canopy cover factor—Adjustment to windblown emissions based on the crop canopy cover.

Crop canopy cover—Fraction of land sheltered by vegetation, as viewed directly from above.

Crust—The hard outer surface of soil (or other dust producing material) that inhibits the wind erosion of underlying fine particles.

Cut and fill—The activities of earthmoving equipment where soil or rock is removed from one area (cut) and deposited elsewhere on shallow ground (fill).

***De Minimis* source**—Facility or operation with emissions that are below a certain threshold, classifying them as insignificant sources of emissions; refer to 40 CFR, Part 52 for more details.

Demonstrated control technique—A control measure that is supported by verifiable tests as to the control efficiency the measure will achieve.

Deposition—Accumulation of airborne particles on ground-level surfaces through gravitational settling and other physical phenomena.

Disturbance—Destabilization of a land surface from its undisturbed natural condition thereby increasing the potential for fugitive dust emissions.

Dunes—Ridges or mounds of loose, wind-blown material, usually sand.

Dust—Fine, dry particles of matter able to be suspended in the air.

Dust Control Plan—Legally mandated plan for a geographical area or dust-producing operation that identifies how emissions will be controlled to attain the requirements of the Clean Air Act and Amendments.

Dust suppressants—Water, hygroscopic materials, solution of water and chemical surfactant, foam, or non-toxic chemical/ organic stabilizers not prohibited for use by the U.S. Environmental Protection Agency or any applicable law, rule or regulation, as a treatment material to reduce fugitive dust emissions.

Economic Life—Length of time during which a product or piece of property may be put to profitable use. (Usually less than its physical life)

Emission activity level—A numerical measure of the intensity of a process that emits pollutants (e.g., miles traveled by a vehicle, tons of transferred material). Also referred to as source extent or process rate.

Emission factor—A representative value that relates the quantity of a pollutant released to the atmosphere with an activity associated with the release of that pollutant. These factors are usually expressed as the weight of pollutant divided by a unit weight, volume, distance, or duration of the activity emitting the pollutant.

Emission parameters—Values that affect pollutant emissions, such as moisture level and silt content of the emitting material.

Emission reduction—Amount (mass or percent) of emissions eliminated by control application.

Enforcement/Compliance costs—Expenses associated with enforcing control measures, including government agency and source facility expenditures.

Erosion potential—Value representing the potential for suspension of surface dust by wind erosion. Depending on the presence of a surface crust or surface disturbance, particle size distribution, and moisture content, a site is characterized as having 1) unlimited erosion potential, 2) limited erosion potential, or 3) no erosion potential.

Fastest mile of wind—The highest wind speed over a specified period (usually the 24-hour observational day) of any "mile" of wind. The fastest mile of wind is the reciprocal of the shortest interval (in 24 hours) that it takes one mile of air to pass a given point.

Fetch—Distance over which soil is eroded by a wind having a relatively constant direction and speed.

Friction velocity—Measure of shear stress of the wind on the exposed surface of soil or other aggregate material, causing loose particles to be lifted from the surface.

Fugitive dust source—Emitter of airborne particles where the particulate emissions cannot reasonably be passed through a stack, chimney, vent, or other functionally equivalent opening. Fugitive dust sources include roadways, construction

(earthmoving and demolition), material handling operations, soil tillage, and wind erosion.

Gravel—Soil particles ranging from 1/5 inch to 3 inches in diameter.

Grid counting method—Method used to estimate areas contained between contour lines on maps.

Ground inventory—A measurement of the amount of dust suppressant applied to an unpaved surface, usually expressed as gallons of suppressant per square yard of road surface.

Growing canopy fraction (GCF)—The proportion of the acreage that will have the crop canopy cover factor applied to it.

Half life of control—The time required for control efficiency to fall to half its initial value.

Irrigation factor (wetness)—Adjustment to the erodibility due to surface wetness from irrigation.

Long-term irrigation-based erodibility adjustment—Adjustment that takes into account changes in cloddiness of the soil, based upon differences between irrigated and nonirrigated soils.

Material throughput—Output rate of processed material.

Mitigative control—Control measure that periodically removes exposed dust-producing material.

MOBILE model—Software tool developed by EPA to predict gram per mile emissions of hydrocarbons, carbon monoxide, oxides of nitrogen, carbon dioxide, particulate matter, and toxics from cars, trucks, and motorcycles under various conditions.

Mode—The most frequent value in a group of values. The approximate mode of a particle size distribution (i.e., particle size diameter) can be found by sieving a surface material sample to find the threshold friction velocity using a modification to W.S. Chepil's method.

Moisture content—A measurement, usually expressed as a percent, of the mass of water in a material sample. Moisture content is obtained by weighing the original sample and then drying the sample to obtain the mass of vaporized water.

Month-as-a-year—Term used by California Air Resources Board (ARB) staff to describe method of calculating the climatic "C" factor profile by assuming that each month's data for a given site describes a unique annual climatic regime.

Most cost-effective—Having the lowest cost per mass of PM emissions reduced.

Most efficient—Having the highest control efficiency (note that preventive controls are usually addressed before mitigative controls).

Mulch—Any material used to cover a soil surface to conserve soil moisture and prevent erosion.

Nonattainment area—Geographic area that is not in compliance with federal health-based air quality standards for an air pollutant (e.g., PM-10).

Nonerodible material—Objects larger than 1 centimeter in diameter that are not susceptible to movement even on windy days (e.g., gravel, hard-packed soil clods).

Operating/Maintenance costs—Expenses associated with personnel, materials, consumables, equipment repair, and other types of continuing expenses.

Overhead costs—A broad category of costs associated with administration.

Pan evaporation rate—The rate of evaporation from a US Class-A pan that is filled with water, with daily measurements made of the water level to compute the resulting daily water loss.

Peak wind gust—A maximum wind speed defined by U.S. weather observing practice, with gusts reported when the peak wind speed reaches at least 16 knots and the variation in wind speed between the peaks and lulls is at least 9 knots. The duration of a gust is usually less than 20 seconds.

Plant/harvest date pair—Methodology that uses planting cohorts split between harvest months, using the fraction of the total crop planted in a given month with the fraction of the total crop harvested in a given month.

PMx—Airborne particulate matter with aerodynamic diameters equal to or less than x μm (e.g. PM10, PM2.5)

Portable wind tunnel—Moveable air channel with an open bottom through which air is drawn at different velocities. This type of wind tunnel with a backend sampling system is used to investigate particle emissions by wind erosion, as a function of wind speed.

Postharvest soil cover factor—Adjustment to windblown emissions based on the fraction of land covered after harvest when viewed directly from above.

Precipitation effectiveness (PE)—See "Thornthwaite's precipitation-evaporation index"; the sum of 12 monthly values (ratios of precipitation to actual evapotranspiration).

Preventive control—Control measure that inhibits or minimizes the accumulation of exposed dust-producing material.

Prewatering—Application of water during construction and earthmoving operations to excavation areas and borrow pits before earth is excavated. The areas to be excavated are moistened to the full depth from the surface to the bottom of the excavation to achieve an optimum moisture content for fugitive dust control.

Quality rating—An assessment level of A through E as assigned by EPA to each emission factor in AP-42, with A being the best. A factor's rating is a general indication of the reliability, or robustness, of that factor.

Replant-to-different-crop factor—Adjustment to windblown emissions for harvested acreages that are quickly replanted to a different crop.

Reservoir—Amount of surface particles available for sustaining wind erosion. Surface soil properties determine the duration of dust events, and limited reservoirs will emit dust for a shorter duration of time (i.e., minutes) than unlimited reservoirs (i.e., days).

Revegetation—Vegetative cover that has been established on previously disturbed ground, such as a construction site.

Revised Wind Erosion Equation (RWEQ)—Model that is intermediate in complexity between the wind erosion equation (WEQ) and the wind erosion prediction system (WEPS).

Rock—Soil particles greater than 3 inches in diameter.

Roughness height—Height above ground level where the wind speed is theoretically reduced to zero because of surface obstructions; a measure of surface protrusion into the boundary layer wind flow.

Sand—Soil particles ranging from 0.05 to 2.0 mm in diameter; individual particles are visible to the unaided human eye.

Senescence—Process of plant aging and dying that is characterized by decreasing growth rates, chlorophyll breakdown, and mobilization of nitrogen out of leaves and into other plant organs.

Sheltering elements—Blockages to wind that inhibit wind erosion of soil. Examples include wind fences and trees.

SIC code—Abbreviation for Standard Industrial Classification code. A numbering system established by the Office of Management and Budget that identifies companies by industry.

Sieving—Process of passing a material through a series of woven square meshes of decreasing size to separate particles into different particle size classes. For agricultural soil classification, wet sieving disperses the material in a liquid before passing the suspension through one or more sieves. Dry sieving is used to characterize material dustiness levels and can be performed either by a mechanical sieve shaker or by rotational hand sieving.

Silt content—Percentage of particles less than 74 μm in physical diameter (i.e., fraction passing a standard 200-mesh sieve).

Silt—Noncohesive soil whose individual particles are not visible to the unaided human eye (0.002 to 0.05 mm). Silt will crumble when rolled into a ball.

Soil classes (types)—Classifications used by soil scientists: representative erodibilities have been measured, which allow soil maps to be used to estimate erodibilities for agricultural land.

Soil cover deterioration—Reduction in postharvest soil cover due to the effects of weather, sunlight, insects, microbes, etc.

Soil loss ratio (SLR)—The ratio of the soil loss for a soil of a given cover divided by the soil loss from bare soil.

Soil texture—The relative proportions of clay, silt, and sand in soil.

Soil—Surface material consisting of disintegrated rock and organic material.

Source Extent—See "Emission activity level.'

State Geographic Data Base (STATSGO)—Database of soil data produced and maintained by the NRCS.

Stepwise linear regression—Process of determining best-fit polynomials for a predictive mathematical model. The procedure involves least squares regression analysis in a forward stepping procedure

Surface disturbance—See "Disturbance."

Surface loading—Mass of loose material per paved road surface area. Total surface loading is measured by vacuuming a known area of paved road surface to obtain all material regardless of particle size. Silt surface loading is obtained by sieving the

total surface loading and refers only to particles with physical diameters less than 74 μm.

Surface stabilization/treatment/improvement—The paving, graveling, chemical stabilization, or watering of a dust-emitting surface to prevent dust emissions due to mechanical disturbance and wind erosion.

Thornthwaite's precipitation-evaporation index—A measure of soil aridity, calculated as the ratio of precipitation to evapotranspiration.

Threshold friction velocity—Friction velocity that closely corresponds to the threshold wind speed for wind erosion of a specific surface. See "Friction velocity."

Threshold source size—An emission level below which a facility or dust-emitting activity is not regulated.

Threshold wind speed—Wind speed (measured at a reference height of 10 m) below which wind erosion does not occur from the exposed surface being considered.

Tillage—Practice of producing a soil surface to maintain surface residue, prepare a seed bed, conserve soil moisture, and reduce wind erosion.

Trackout—Accumulation of mud/dirt on paved roads, as deposited by vehicles that exit unpaved sites such as construction areas, agricultural fields, quarries, dumps, or batch plants.

Traffic volume—Measure of the number of vehicles traveling over a road segment. Vehicle miles traveled (VMT) on a road equals the average daily traffic (ADT) times the roadway length.

Uncontrolled emissions—Total emissions before application of any control measures.

Unit-operation emission factors—Emission factors that represent sub-processes or separate activities associated with an emission source.

Vegetative cover/residue—Organic matter, either growing or dead, that protects the soil surface from the erosive force of wind.

Visible dust—For regulatory purposes, means airborne particles that obscure an observer's view to a degree equal to or greater than a specified opacity limit.

Wet stabilization/watering—See "Surface stabilization."

Wind barrier/Wind sheltering—See "Sheltering element."

Wind erosion equation (WEQ)—Methodology originally developed to estimate wind erosion from agricultural lands. Later modified by U.S. EPA to use for estimating PM emissions.

Wind Erosion Prediction System (WEPS)—Detailed simulation model to predict wind erosion emissions; currently in development. May be useful in future, especially for episodic modeling.

Wind erosion—Removal of dry soil particles from the ground surface by wind, causing airborne particulate matter downwind of the emitting soil area.

Wind shear—Force of wind parallel to a surface that can remove loose particles, as opposed to wind directly impacting the surface.

Worst-case emissions—See "Uncontrolled emissions."

Appendix A
Emission Quantification Techniques

EMISSION QUANTIFICATION TECHNIQUES

Fugitive dust emission rates and particle size distributions are difficult to quantify because of the diffuse and variable nature of such sources and the wide range of particle sizes, including particles that deposit immediately adjacent to the source. Standard source testing methods, which are designed for application to confined flows under steady-state, forced-flow conditions, are not suitable for the measurement of fugitive emissions unless the plume can be drawn into a forced-flow system. The available source testing methods for fugitive dust sources are described in the following paragraphs.

Mechanical Entrainment Processes

Because it is usually impractical to enclose open dust sources or to capture the entire emissions plume, only two methods are suitable for the measurement of particulate emissions from most open dust sources:

1. The upwind-downwind method involves the measurement of upwind and downwind particulate concentrations, utilizing ground-based samplers under known meteorological conditions, followed by a calculation of the source strength (mass emission rate) with atmospheric dispersion equations.[1]

2. The exposure-profiling method involves simultaneous, multipoint measurements of particulate concentration and wind speed over the effective cross section of the plume, followed by a calculation of the net particulate mass flux through integration of the plume profiles.[2]

In both cases it is customary to use high-volume air samplers, so that quantifiable sample mass can be accumulated in sampling periods no longer than about six hours.

Upwind-Downwind Method. The upwind-downwind method involves the measurement of airborne particulate concentrations both upwind and downwind of the pollutant source. The number of upwind sampling instruments depends on the degree of isolation of the source operation of concern (i.e., the absence of interference from other sources upwind). Increasing the number of downwind instruments improves the reliability in determining the emission rate by providing better plume definition. In order to reasonably define the plume emanating from a point source, instruments need to be located at a minimum of two downwind distances and three crosswind distances. The same sampling requirements pertain to line sources except that measurements need not be made at multiple crosswind distances.

Net downwind (i.e., downwind minus upwind) concentrations are used as input to atmospheric dispersion equations (normally of the Gaussian type) to back-calculate the particulate emission rate (i.e., source strength) required to generate the pollutant concentrations measured. Emission factors are obtained by dividing the calculated emission rate by the source extent. A number of meteorological parameters must be concurrently recorded for input to this dispersion equation. As a minimum, the wind direction and speed must be recorded on-site.

While the upwind-downwind method is applicable to virtually all types of sources, it has significant limitations with regard to the development of source-specific emission factors. Because of the impracticality of adjusting the locations of the sampling array for shifts in wind direction during sampling, it may be questionable to assume that the plume position is fixed in the application of the dispersion model. In addition, the usual assumption that a line or area source is uniformly emitting may not allow for a realistic representation of spatial variation in source activity.

Exposure-Profiling Method As an alternative to conventional upwind-downwind sampling, the exposure-profiling technique utilizes the emission profiling concept, which is the basis for the conventional ducted source testing method (i.e., USEPA Method 5[3]), except that, in the case of exposure-profiling, the ambient wind directs the plume to the sampling array. The passage of airborne particulate matter immediately downwind of the source is measured directly by means of a simultaneous, multipoint sampling of particulate concentration and wind velocity over the effective cross section of the fugitive emissions plume.

For the measurement of nonbuoyant fugitive emissions using exposure profiling, sampling heads are distributed over a vertical network positioned just downwind (usually about 5 m) from the source. Particulate sampling heads should be symmetrically distributed over the concentrated portion of the plume containing at least 80% of the total mass flux. A vertical line grid of at least three samplers is sufficient for the measurement of emissions from line or moving point sources (see Figure A-1), while a two-dimensional array of at least five samplers is required for quantification of the fixed virtual point source of emissions. For quantifying emissions of particles larger than about 10 μm, the particulate samplers should have directional intakes, as discussed below. At least one upwind sampler must be operated to measure the background concentration, and wind speed and direction must be measured concurrentlv on-site.

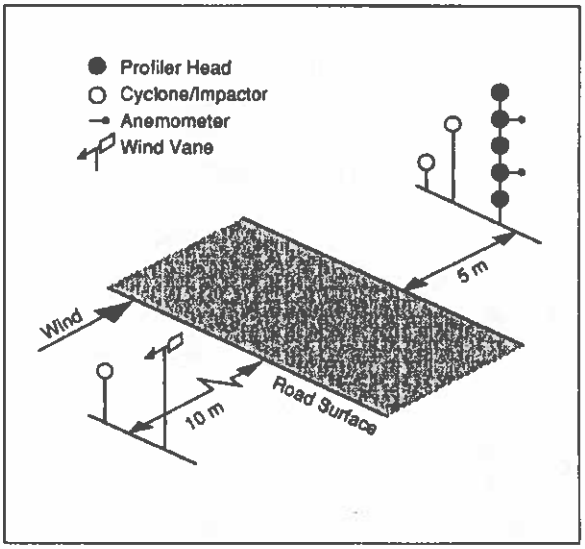

Figure A-1. Exposure Profiling Method—Roadway

The particulate emission rate is obtained by a spatial integration of the distributed measurements of exposure (accumulated mass flux), which is the product of mass concentration and wind speed:

$$R = \int_A C(h,w)u(h,w)dhdw \qquad (1)$$

where, R = emission rate, (g/s)
C = net particulate concentration, (g/m^3)
u = wind speed, (m/s)
h = vertical distance coordinate, (m)
w = lateral distance coordinate, (m)
A = effective cross-sectional area of plume, (m^2)

Usually, a numerical integration scheme is used to calculate the emission rate. This mass-balance calculation scheme requires no assumptions about plume dispersion phenomena.

Isokinetic Sampling Regardless of which method is used, isokinetic sampling is required for a representative collection of particles larger than about 10 μm in aerodynamic diameter. The directional sampling intakes are pointed into the mean wind direction and the intake velocity of each sampler is periodically adjusted (usually with intake nozzles) to closely match the mean wind velocity approaching the sampling intake. Because of natural fluctuations in wind speed and direction, some anisokinetic sampling effects will always be encountered. If the angle α between the mean wind direction and the direction of the sampling axis equals 30°, the sampling error is about 10%.[4] For an isokinetic flow ratio of sampling intake speed to approach wind speed between 0.8 and 1.2, the sampling error is about 5%.[4]

Wind Erosion

The two wind erosion source testing methods of interest are the upwind-downwind method as described above and the portable wind tunnel method. The wind tunnel method involves the use of a portable open-floored wind tunnel for *in situ* measurement of emissions from representative surfaces under predetermined wind conditions.[5]

Upwind-Downwind Method The upwind-downwind method is burdened with practical difficulties for the study of wind erosion, in that the onset of erosion and its intensity is beyond the control of the investigator. In addition, background (upwind) particulate concentrations tend to be high during erosion events, making source isolation very difficult.

Wind Tunnel Method The most common version of the wind tunnel method utilizes a pull-through wind tunnel with an open-floored test section placed directly over the surface to be tested. Air is drawn through the tunnel at controlled velocities. The exit air stream from the test section passes through a circular duct fitted with a directional sampling probe at the downstream end. Air is drawn isokinetically through the probe by

a high-volume sampling train. The wind tunnel method incorporates the essential features of the USEPA Method 5 stack sampling method.[3] The one prime difference, the use of single-point sampling, is justified by the high turbulence levels in the sampling module. The measurement uncertainty inherent in this method is of the same order as that in Method 5, which has been subjected to extensive collaborative testing by EPA. The wind tunnel method relies on a straightforward mass-balance technique for the calculation of emission rate. By sampling under light ambient wind conditions, background interferences from upwind erosion sources can be avoided. Although a portable wind tunnel does not generate the larger scales of turbulent motion found in the atmosphere, the turbulent boundary layer formed within the tunnel simulates the smaller scales of atmospheric turbulence. It is the smaller-scale turbulence, which penetrates the wind flow in direct contact with the erodible surface and contributes to the particle entrainment mechanisms.[6]

Particle Sizing

Concurrent with the measurement of mass emissions, the aerodynamic particle size distribution should be characterized. Chemical, biological, and morphological analyses may also be performed to characterize the nature and origin of the particles. For particle sizing, a high-volume cyclone/cascade impactor featuring isokinetic sample collection has been used.[7] A cyclone preseparator (or other device) is needed to remove the coarse particles, which otherwise would bounce off the greased substrate stages within the impactor, causing fine-particle bias. Once again, the sampling intake is pointed into the wind and the sampling velocity adjusted to the mean local wind speed by fitting the intake with a nozzle of appropriate size. This system offers the advantage of a direct determination of aerodynamic particle size.

Another particle sizing option includes an analysis of the particulate deposit by optical or electron microscopy. Disadvantages include: (a) potential artificial disaggregation of particle clusters during sample preparation, and (b) uncertainties in converting physical size data to equivalent aerodynamic diameters. In a collaborative field test of the exposure-profiling method, the cyclone/impactor method was judged to be more suitable than microscopy for the particle sizing of fugitive dust emissions.[8]

Control Efficiency Estimation

Field evaluation of the control efficiency requires that the study design include not only adequate emission measurement techniques but also a proven "control application plan." In the past, two major types of plans have been used. Under the Type-1 plan, controlled and uncontrolled emission measurements are obtained simultaneously. Under the Type-2 plan, uncontrolled tests are performed initially, followed by controlled tests.

In order to ensure comparability between the operating characteristics of the controlled and uncontrolled sources, many evaluations are forced to employ Type-2 plans. An example would be a wet suppression system used on a primary crusher. One important exception to this; however, is unpaved-road dust control. In this instance,

testing under a Type-1 plan may be conducted on two or more contiguous road segments. One segment is left untreated and the others are treated with the dust suppressant. Under a Type-2 plan, a normalization of emissions may be required to allow for potential differences in source characteristics during the uncontrolled and controlled tests because they do not occur simultaneously.

Appendix B

Estimated Costs of Fugitive Dust Control Measures

Source Category	Control Measure	Estimated Costs	Comments/Assumptions
Paved Roads	4' Paved Shoulders	$8,200/mile-year	Useful life of 20 years
	Polymer emulsion to stabilize shoulders	$0.92/square yard	
	Purchase PM10 efficient sweeper	$190/mile-year	Useful life of 8 years; sweep 15 centerline miles per day
	Clean up spills	$640/cleanup	
Unpaved Roads and Parking Areas	Pave unpaved roads	$44,100/mile-year	Useful life of 25 years
	Pave section 100' long before facility exit	$716/year	30' wide with 3" of asphalt; useful life of 25 years
	Pave unpaved parking lots	$0.23/ft^2-year	Useful life of 25 years
	Pipe grid trackout control device	$1,820/year	Useful life of 8 years
	Gravel bed to reduce trackout	$1,360/year	50' x 30' x 3" thick
	Post speed limit sign	$53/year for two signs	Useful life of 15 years
	Apply water to unpaved parking lot once a day	$68-$81/acre-day	
	Chemical dust suppressant	$5,340/acre-year	Useful life of 1 year
Construction and Demolition	Chemical dust suppressant	$5,340/acre-year	Useful life of 1 year
	Apply water once a day	$68-$81/acre-day	
	Apply water during high winds	$272/acre	
	Prohibit activities during high winds	$1.360 per 8 hour day idled	Demolition of 1,000 ft^2 structure on 1.2 acres
	Require air quality monitoring	$7,500/month	
	Onsite dust control coordinator	$100/day	
	Sprinkler system to maintain minimum soil moisture of 12%	$138/acre	
	Limit speed to 15 mph	$22/inspection	Radar gun = $700
	Post speed limit signs	$180/sign	
Bulk Materials	3-sided enclosure with 50% porosity	$109/year	Useful life of 15 years; pile volume = 5 yd^3
Disturbed Open Areas	Polymer emulsion dust suppressant	$2,140/acre	Surface stabilized for 3 years if no vehicle disturbance
	Gravel, 1" deep	$490/acre-year	Useful life of 15 years
	Post no trespassing signs	$53/sign	Useful life of 15 years
Windblown Dust	Prohibit activities at construction sites during high winds	$3,100 per high wind day	40 acre construction site
	Water storage pile each hour during high winds	$22/day	100 cubic yard pile

Methodology for Calculating Cost-Effectiveness of Fugitive Dust Control Measures

INTRODUCTION

In compiling information on control cost-effectiveness estimates for the fugitive dust handbook, we discovered that many of the estimates provided in contractor reports prepared for air quality agencies for PM10 SIPs contain either hard to substantiate assumptions or unrealistic assumptions. Depending on which assumptions are used, the control cost-effectiveness estimates can range over one to two orders of magnitude. Rather than presenting existing cost-effectiveness estimates, we have prepared a detailed methodology containing the steps to calculate cost-effectiveness that is presented below. We recommend that the handbook user calculate the cost-effectiveness values for different fugitive dust control options based on current cost data and assumptions that are applicable to their particular situation.

Based on field measurements of uncontrolled and controlled unpaved road emissions conducted by Midwest Research Institute, there were no significant differences in the measured control efficiencies for the PM2.5 and PM10 size fractions. Thus, the cost-effectiveness for PM2.5 reduction can be calculated by dividing the cost-effectiveness estimate for PM10 reduction by the PM2.5/PM10 ratio for that fugitive dust source.

TECHNICAL APPROACH

The steps necessary to calculate the cost-effectiveness for different fugitive dust control measures are listed below. This methodology was employed to calculate the cost-effectiveness for each control application case study for the different fugitive dust source categories addressed in the handbook.

Step 1: Select a specific control measure for the fugitive dust source category of interest.

Step 2: Specify the basic parameters required to calculate uncontrolled and controlled emissions for the specific source:

(a) applicable emission factor equation
(b) parameters used in the emission factor equation
(c) source extent (activity level)
(d) characteristics of the source
(e) control measure implementation schedule (frequency, application rate)

Step 3: Calculate the annual uncontrolled emission rate as the product of the emission factor and the source extent (from Step 2).

Step 4: Determine the control efficiency for the selected control measure. This may involve either (a) using a published value, (b) calculating the control efficiency based on comparing the controlled emissions estimate derived from the applicable emission factor equation with the uncontrolled emissions estimate derived from the same emission factor equation, or (c) specifying the desired control efficiency which then will entail determining the appropriate level of control to achieve the desired control efficiency.

Step 5: Calculate the annual controlled emissions rate (i.e., the emissions remaining after control) as the product of the annual uncontrolled emission rate (from Step 3) multiplied by the percentage that uncontrolled emissions are reduced, as follows:

Controlled emissions = Uncontrolled emissions x (1 – Control Efficiency).

Step 6: Calculate the reduction in emissions as the difference between the annual uncontrolled emission rate (from Step 3) and the annual controlled emission rate (from Step 5).

Step 7: Gather cost estimates for implementing the selected control measure for the following items:

(a) annualized capital costs (total capital costs/lifetime of the control)

(b) annual operating and maintenance costs that include overhead, enforcement, and compliance costs

Step 8: Calculate the annualized capital investment cost as the product of the annual capital cost and the capital recovery factor. The capital recovery factor is calculated as follows:

$$CRF = [\, i\,(1 + i)^n \,] \,/\, [(1 + i)^n - 1]$$

where, CRF = capital recovery factor
i = annual interest rate (fraction)
n = number of payment years

Step 9: Calculate the total annualized cost by combining the annualized capital investment cost (from Step 8) with annual operating and maintenance costs (from Step 7).

Step 10: Calculate the cost-effectiveness of the selected control measure by dividing the total annualized costs (from Step 9) by the emissions reduction. The emissions reduction is determined by subtracting the controlled emissions (from Step 5) from the uncontrolled emissions (from Step 3).

Appendix D
Fugitive PM10 Management Plan

Overview

The San Joaquin Valley APCD's Regulation VIII that addresses fugitive dust specifies two general control methods for controlling fugitive dust: (1) limiting visible dust emissions and (2) maintaining a stabilized surface. Visible dust emissions (VDE) may not exceed 20 percent opacity during periods when soil or other dust-producing materials are being disturbed by vehicles, equipment, or the forces of wind. "Opacity" is a visual evaluation of the amount of one's view that is obscured by a dust plume. The VDE limit applies to construction sites, the handling and storage of bulk materials, and to unpaved roads and traffic areas. A stabilized surface is a treated surface that is resistant to wind effects. This requirement applies to vacant open areas that have previously been disturbed, unpaved roads and traffic areas, and outdoor bulk storage piles. Methods for creating and maintaining a stabilized surface may include applying chemical or organic stabilizers, road-mix or paving materials, vegetative materials, or water for soaking the soil or forming a visible crust.

For unpaved roads and unpaved traffic areas, a Fugitive PM10 Management Plan (FPMP) may be implemented as a compliance alternative to the Visible Dust Emission standard and the requirement to maintain a stabilized unpaved road surface. The FPMP identifies the control measures to be implemented whenever vehicular traffic reaches and exceeds the applicable thresholds i.e., $\geq$ 75 vehicles per day or $\geq$26 vehicles per day with 3 or more axles). Acceptable control measures are those that have demonstrated to achieve at least 50 percent PM10 control efficiency when properly applied to an unpaved surface.

A FPMP may not be prepared for unpaved haul roads and access roads as well as traffic areas at construction projects nor as an alternative to a Conservation Management Practice (CMP) Plan for agricultural sources. Non-agricultural sources choosing to implement a FPMP are required to submit a plan to the District for approval. Once approved, the owner or operator is required to implement the District-approved FPMP on all days where traffic exceeds the applicable minimum thresholds. An approved plan remains active until the District notifies the owner or operator that it is no longer valid, or until the owner or operator notifies the District that plan implementation has been permanently discontinued.

Required Information

The FPMP must include the following information:

1. The names, addresses, and phone numbers of persons responsible for the preparation, submittal, and implementation of the FPMP, and of the persons responsible for the unpaved road or traffic area.

2. A plot plan or map showing the location of each unpaved road or traffic area to be covered by the FPMP, the total length in miles of unpaved roads, and the total area in acres of unpaved traffic areas that will be subject to the plan.

3. The months (and weeks, if known) of the year when vehicle traffic is expected to exceed the minimum thresholds described in the applicable rules, and the types of vehicles (i.e. passenger vehicles, trucks, mobile equipment, etc.).

4. The control methodologies to be applied, including:
   a. Product specifications;
   b. Manufacturer's usage instructions (method, frequency, and intensity of application);
   c. Application equipment (type, number, and capacity); and
   d. Environmental impact information and approvals or certificates related to appropriate and safe use for ground application.

5. The condition of the treated surfaces to be achieved as a result of the use of suppressants or other dust control material.

Record Keeping Requirements

Owners and operators are required to maintain records and any other supporting documents to demonstrate compliance for those days when control measures were implemented. Records are to include the type of control measure implemented, the location and extent of coverage, and the date, amount and frequency of applying dust suppressants.

Record keeping forms developed by the District or a facsimile that provides the necessary information may be used for record keeping purposes. Records are to be kept for a minimum of one year following termination of dust generating activities. Title V stationary sources are required to keep the records for a minimum of five years. Records must be made available to the District inspector upon request. The matrix below lists the forms to be used for Regulation VII record keeping.

	Activity at site and corresponding record keeping forms					
Industry	Bulk Materials	Unpaved Roads	Equip & Vehicle Storage	Open Areas	Earth Moving	Trackout and Carryout
Construction	A C	A C D	A C D	A C	A	B
Oilfields	A C	A C D	A C D	A C	A	B
Off-field Ag Ops	A C	A C D	A C D			
Ag Product Processing	A C	A C D	A C D			B
Bulk Materials	A C	A C D	A C D			B
Equipment & Vehicle Storage	A C	A C D	A C D	A C		B
Truck Stops	A C	A C D	A C D	A C		B

Form A = Daily watering schedule
Form B = Sweeping/cleanup schedule for trackout and carryout
Form C = Permanent control measure (e.g., paving, gravel, a grizzly, chemical dust suppressants)
Form D = Daily schedule for water application onto unpaved roads and equipment areas

I. INTRODUCTION

Bunge North America, Inc. has applied for a Federally Enforceable State Operating Permit (FESOP) for its plant located at 321 E. North Street in Danville. This plant requires an air pollution control operating permit because it is a source of emissions. The Illinois EPA has prepared a draft of the renewed permit that it would propose to issue for the plant. However, before renewing the permit, the Illinois EPA is holding a public comment period to receive comments on this proposed action and the terms and conditions of the draft permit that it would propose to issue.

II. SOURCE DESCRIPTION

Bunge North America, Inc. is a corn mill and grain elevator. The emission units at this plant that require an operating permit are shown in Table 1, below.

Table 1. Listing of Non-Exempt Emission Units Located at the Source.

Emission Unit and Description	Construction Date (and Date Last Modified)
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):	
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10	Prior to 1978
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96	Prior to 1970
West Headhouse Transfer General Aspiration (5012-0005-0029) controlled by Baghouse Filters DD 484RF12	Prior to 1978
RHOMBO Truck Dump Pit #3 (5012-0003-0013) controlled by Baghouse Filters APM SJL156-6	1973
Railcar Dump Pit (5012-0004-0016) controlled by Baghouse Filters APM 41120.12	Prior to 1978
RHOMBO West General Aspiration (5012-0009-0009) controlled by Baghouse Filters APM SJL72-6	1973
RHOMBO Gallery Aspiration (5012-0003-0018) controlled by Baghouse Filters APM SJL72-6	1973
Track 6 Vacuum (5012-0010-0047) controlled by Baghouse Filters HOFFMAN 48X96	Prior to 1970
Cleanings Discharge (4870-0013-0015) controlled by Baghouse Filters BUHLER 16S-6-30	Prior to 1978
Conveying General Aspiration (4750-0029-0015) controlled by Baghouse Filters MICROPUL 100S-6-20	Prior to 1978
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS):	
Truck Dump #4 & W. Gallery Aspiration (5012-0005-0021) controlled by Baghouse Filters DD 484RF12	1985
Cleaning North APM (4870-0013-0001) controlled by Baghouse Filters APM 41216.12	1996
Corn Cleaning Bldg 115 #2 (4880-0034-0069) controlled by Baghouse Filters TD 484RF12	1996
North St Grain/Meal Truck Dump Pit #2 (5012-0002-0012) controlled by Baghouse Filters DD 48RF12	Prior to 1978

Emission Unit and Description	Construction Date (and Date Last Modified)
Dry Corn Milling, Processing and Products Handling:	
Bemis Bagging (4870-0010-0055) controlled by Baghouse Filters APM 16019.8	1996

These units are sources of emissions because Particulate Matter (PM) and Particulate Matter less than 10 microns (PM_{10}) is generated from the receiving, handling, and milling of grain at the facility. This source is also a source of Carbon Monoxide (CO) and Nitrogen Oxides (NO_x) from the combustion of fuel in the boilers and generator at this facility. NO_x is formed thermally by the combination of oxygen and nitrogen in the air at the temperatures at which fuel is burned. Thermal NO_x is formed during all common high temperature combustion processes. CO is formed from incomplete combustion of the fuel.

The following table lists annual emissions (tons) of pollutants emitted from this source, as reported in the last three Annual Emission Reports (AER) sent to the Illinois EPA:

Table 2. Actual and Potential (as limited by permit) Emissions of the Source.

Pollutant	Actual Emissions			PTE
	2018 (tons)	2019 (tons)	2020 (tons)	as limited by permit (tons/year)
Carbon Monoxide (CO)	16.5000	16.3400	17.3000	49.40
Nitrogen Oxides (NO_x)	11.9000	11.6000	11.9000	52.06
Particulate Matter (PM)	67.8000	65.8000	65.5000	69.03
Particulate Matter less than 10 Microns (PM_{10})	27.8000	28.0000	32.9000	67.86
Sulfur Dioxide (SO_2)	0.1100	0.1100	0.1300	0.51
Volatile Organic Material (VOM)	1.1900	1.1700	1.5800	3.16

This source also contains emission units and activities that are exempt from permitting under 35 Ill. Adm. Code 201.146 and the emissions from such units are not limited by the conditions of the draft permit. These emission units include:

150,000 gallon fuel oil storage tank

Based on a review of the estimated potential emissions from the exempt emission units as included in the permit application, the Illinois EPA has determined that the emissions from such exempt emission units are trivial and will not contribute to this source being a major source of emissions for any regulated pollutants emitted from any such exempt emission unit. This is because the emission limits for CO, NO_x, and PM_{10} in the draft FESOP are 90% or less of the applicable major source thresholds, and the combined PTE of the exempt emission units are less than 5% of the applicable major source thresholds, In other words, the emission limits for CO, NO_x, and PM_{10} have been limited to 90% or less of the applicable threshold (or 100 tons/year) by the draft FESOP and the combined potential to emit of the CO, NO_x, and PM_{10} from the exempt units is estimated to be less than 5% of 100 tons/year. In addition, as shown in Table 2, above, the margin of compliance between the actual emissions reported by the source during the last three years and the potential emissions as limited in the draft FESOP is more than 66% for CO, 77% for NO_x, and 56% for PM_{10}, which further minimizes the likelihood of the source exceeding its permit limits or the applicable major source thresholds.

In cases where the potential emissions of exempt emission units may contribute to the source exceeding major source thresholds (for example, if the emission limits in the FESOP are 90% or more of the applicable major source thresholds and the exempt units' PTE is 5% or more of the threshold) the Illinois EPA has established limits on such emission units in the draft FESOP that would normally be exempt from permitting. The permitting exemptions in 35 Ill. Adm. Code 201.146 do not relieve the owner or operator of any source from any obligation to comply with any other applicable requirements.

III. GENERAL DISCUSSION

FESOPs are federally enforceable, that is, the terms and conditions of the permits can be enforced by the United States Environmental Protection Agency (USEPA) under federal law, as well as by Illinois government and the public under state law. These permits can establish federally enforceable limitations on the operation and emissions of a source that restrict the potential emissions of the source.

The source may operate this plant under a FESOP because the actual emissions of the plant are below the levels at which the plant would be considered a major source under Title V of the federal Clean Air Act. However, in the absence of federally enforceable limitations, the plant's potential emissions would be such that the plant would be considered a major source. The permit acts to restrict the plant potential emissions so that it need not be considered a major source. As a result, the source does not need to obtain a Clean Air Act Permit Program (CAAPP) permit for the plant, as would otherwise be required.

The FESOP limits the operation and annual emissions of the plant to below the major-source-thresholds of 100 tons for CO, NO_x, and PM_{10}. The potential emissions of other pollutants (e.g., SO_2, VOM, and Hazardous Air Pollutants) from the plant are small enough that no restrictions are needed to avoid being a major source of these pollutants.

IV. APPLICABLE EMISSION STANDARDS

All emission units in Illinois must comply with state emission standards adopted by the Illinois Pollution Control Board (Board). These emission standards represent the basic requirements for sources in Illinois. The Board has specific standards for particulate matter under 35 Ill. Adm. Code Part 212. The processing and milling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions), which limits the opacity of emissions to 30 percent, and 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units), which limits PM emissions based on each units process weight rate. The receipt and handling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions) and 35 Ill. Adm. Code Part 212 Subpart S (Agriculture), which requires the source to implement and use certain housekeeping practices to reduce particulate matter emissions and to equip the sources receiving dump pits with air pollution control equipment that is capable of at least 90% collection efficiency for PM emissions. The boilers are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions) and 35 Ill. Adm. Code Part 212 Subpart E (Particulate Matter Emissions From Fuel Combustion Emission Units), which limits the emissions of PM from the combustion of liquid fuel to 0.10 lb/mmBtu.

The Clayton Boiler is at this source are subject to the New Source Performance Standards (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR 60, Subparts A and Dc. The Illinois EPA is administering the NSPS in

Illinois on behalf of the United States EPA under a delegation agreement. The source also has another boiler that was constructed prior to June 9, 1989 and as result will not be subject the NSPS standards.

Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) at this source are subject to the New Source Performance Standards (NSPS) for Grain Elevators, 40 CFR 60, Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States EPA under a delegation agreement. The source also has other grain receiving, cleaning and storage operations that were constructed prior to August 3, 1978 and as result will not be subject the NSPS standards.

Emergency Generator Set DG-100 at this source are subject to the National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR 63, Subparts A and ZZZZ. The Illinois EPA is administering the NESHAP in Illinois on behalf of the United States EPA under a delegation agreement.

The application shows that the plant is in compliance with applicable state and federal emission standards.

V. CONTENTS OF THE PERMIT

The permit that the Illinois EPA is proposing to issue will identify the specific emission standards that apply to the emission units at the plant. As explained, the processing and milling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B, which limits the opacity of emissions to 30 percent, and 35 Ill. Adm. Code Part 212 Subpart L, which limits PM emissions based on each units process weight rate. The receipt and handling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B and 35 Ill. Adm. Code Part 212 Subpart S, which requires the source to implement and use certain housekeeping practices to reduce particulate matter emissions and to equip the sources receiving dump pits with air pollution control equipment that is capable of at least 90% collection efficiency for PM emissions. The boilers are subject to 35 Ill. Adm. Code Part 212 Subpart B and 35 Ill. Adm. Code Part 212 Subpart E, which limits the emissions of PM from the combustion of liquid fuel to 0.10 lb/mmBtu. The conditions of this permit are intended to ensure that the source continues to comply with applicable emission standards.

The permit would also contain limitations and requirements to assure that this plant is operated as a non-major source. The permit would limit the operation and annual emissions of the plant to below the major-source-thresholds of 100 tons for CO, NO_x, and PM_{10}. (Annual emissions of other pollutants from the plant are well below the 100 ton major source threshold.)

The permit would also set limitations on PM_{10} emissions based on the air flow to the baghouses and cyclones and the grain loading of these control devices determine by stack testing conducted at the source. The boilers are to be limited based on the types of fuel combusted and the amount of each fuel usage. These limitations are consistent with the historical operation of emission units at the plant.

The permit conditions would also continue to require appropriate compliance procedures, including inspection practices as well as recordkeeping and reporting requirements. The source must carry out these procedures on an on-going basis to demonstrate that the plant is being operated within the limitations set by the permit and the plant's emissions are being properly controlled.

VI. REQUEST FOR COMMENTS

It is the Illinois EPA's preliminary determination that the source has met the requirements for issuance of its permit. The Illinois EPA is therefore proposing to issue the permit.

Comments are requested on this proposed action by the Illinois EPA and the proposed conditions on the draft permit. If substantial public interest is shown in this matter, the Illinois EPA will consider holding a public hearing in accordance with 35 IAC Part 166.

PERMIT CALCULATION SHEET

Facility: : Bunge North America, Inc.	**I.D.:** 183020ABT
Anal. Eng.: GB **Date:** 04-26-22	**P.N.:** 96020027
Rev. Eng.: _____ **Date:** _____	**Date Rec.:** 12/05/11

Section 1: Identify noted File Traveler Sheet and ICEMAN source information that may affect permit issuance; if active VN indicate if Compliance is ok with issuance of a permit or NOI/Denial letter:
No current violation, there was a USEPA NOV/ Soybean Processing/ Consent Decree back in 2007/2008. there doesn't seem to have been a certify investigation on file. The source is located at 321 East North Street, Danville, Vermilion County. There is also a flag for the facility because this Source is located in an E.J. area with >=70% minority population.

LEGAL:	None
FOS FLAG:	None
CROPA:	None
Other	The source is not subject to 212.302(a) or (b)

Section 2: Identify type of permit and brief summary of application/permit history if submitted in response to a NOI/Denial letter or to request revision to an existing permit:
The purpose for opening this permit is to review the application for Title V FESOP received on December, 2011. The source is requesting a Federally Enforceable State Operating Permit (FESOP) permit # 96020027 for their corn mill and grain elevator. The source requires a FESOP to limit their potential emission to less than 100 tons/year for Carbon Monoxide (CO), Nitrogen Oxides (NO_x), and Particulate Matte less than 10 microns (PM_{10}). The current ICEMAN status for the above mentioned permit number #96020027 is for operating.

Section 3: Description of the source with an itemized list of emission units and pollution control equipment included in the application. If for an operating permit, list all existing and proposed units and equipment that the operating permit will need to address:
Bunge North America, Inc owns and operates a corn mill and grain elevator that creates flour and other grain mill products such as PCM and USG specialty starch binder which are used to sold to wallboard fabricators to aid in bonding paper to gypsum. The facility located at 321 East North Street, Danville, Vermilion County. This permit is granted to the above-designated Permittee to operate emission units and/or air pollution control equipment consisting of the following:

Emission Units:

Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10;
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96;
West Headhouse Transfer General Aspiration (5012-0005-0029) controlled by Baghouse Filters DD 484RF12;
RHOMBO Truck Dump Pit #3 (5012-0003-0013) controlled by Baghouse Filters APM SJL156-6;
Railcar Dump Pit (5012-0004-0016) controlled by Baghouse Filters APM 41120.12;
RHOMBO West General Aspiration (5012-0009-0009) controlled by Baghouse Filters APM SJL72-6;
RHOMBO Gallery Aspiration (5012-0003-0018) controlled by Baghouse Filters APM SJL72-6;
Track 6 Vacuum (5012-0010-0047) controlled by Baghouse Filters HOFFMAN 48X96;
Cleanings Discharge (4870-0013-0015) controlled by Baghouse Filters BUHLER 16S-6-30;
Conveying General Aspiration (4750-0029-0015) controlled by Baghouse Filters MICROPUL 100S-6-20;

Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS):
Truck Dump #4 & W. Gallery Aspiration (5012-0005-0021) controlled by Baghouse Filters DD 484RF12;
Cleaning North APM (4870-0013-0001) controlled by Baghouse Filters APM 41216.12;
Corn Cleaning Bldg 115 #2 (4880-0034-0069) controlled by Baghouse Filters TD 484RF12;
North St Grain/Meal Truck Dump Pit #2 (5012-0002-0012) controlled by Baghouse Filters DD 48RF12;

Dry Corn Milling, Processing and Products Handling:
Bemis Bagging (4870-0010-0055) controlled by Baghouse Filters APM 16019.8;
Bagging General Aspiration (4870-0010-0030) controlled by Baghouse Filters APM 40020.8;
Bagging Packer General Aspiration (4870-0013-0019) controlled by Baghouse Filters APM 14042.8;
Bran Dryer Process (4880-0042-0057) controlled by Baghouse Filters APM 14036.8;
Bran Sifter Process (4880-0042-0062) controlled by Baghouse Filters APM 10144.8;
East Meal Dryer/Cooler (4880-0034-0054) controlled by Baghouse Filters APM 40120.10;
West Meal Dryer (4880-0034-0059) controlled by Baghouse Filters APM 40144.8;

Satake Sifter and Sifter Air Locks;

One (1) Pneumatic Transfer Line and Cyclone Receiver (45:20) controlled by 8th Floor Donaldson Filter (34:27);

One (1) Pneumatic Transfer Line and Cyclone Receiver (23:102) controlled by West MAC Filter (34:01) ;

Corn Mill Products Storage:
Bldg 201/202 Vacuum (4912-0008-0006) controlled by Baghouse Filters HOFFMAN 36X96;
Bldg 208 Vacuum (4912-0009-0005) controlled by Baghouse Filters HOFFMAN 36X96;
Hominy Feed Bins Aspiration (4750-0029-0074) controlled by Baghouse Filters DONALDSON 276RFW12;

Corn Mill Products Milling and Handling:
Hominy Binning (4750-0029-0032) controlled by Baghouse Filters APM 40240.8;
Hominy Grinder General Aspiration (4750-0029-0001) controlled by Baghouse Filters APM 40224.4;
Truck Hominy Loadout (4912-0004-0022) controlled by Baghouse Filters 376RF8;
Rail Hominy/Grain Loadout #1 (4912-0003-0011) controlled by Baghouse Filters 376RF12;
Long Term Meal System (LTMS) & Rail Meal/Grain Transfer (4750-0033-0001) controlled by Baghouse Filters 376RF8;
LTMS & Rail Meal/Grain Loadout (4750-0033-0011) controlled by Baghouse Filters MAC 144MCF416;
Flour Pellet Cooler (4750-0025-0015) controlled by Baghouse Filters MAC Cyclone HE39;
Hominy Screener General Aspiration (4750-0029-0045) controlled by Baghouse Filters MICROPUL 100S-6-20;
LTMS Truck/Rail Dump Pit (4750-0033-0000A);
LTMS Truck Loadout (4750-0033-0000B);

Boiler House/Grounds:
One (1) 96.55 mmBtu/hour Natural Gas/Distillate Fuel-Oil Fired Boiler with Low NOx Burner (Boiler #1);
One (1) 27.90 mmBtu/hour Natural Gas-Fired/Distillate Fuel-Oil Fired Boiler (Clayton Boiler);
One (1) 2,168 engine Hp Diesel-Powered Emergency Generator Set (DG-100); and

Fugitive PM and PM10 emissions

Section 4: Identify the proposed type(s) and maximum actual operating quantities and rates of pollutant containing materials to be used/processed/produced that will be included in permit:

The amount of grain receipts in LTMS Truck/Rail Dump Pit shall not exceeded 12,500 tons per month and 75,000 tons per year;
The amount of grain loadout in LTMS Truck Loadout shall not exceed 12,500 tons per month and 75,000 tons per year;
Natural Gas Usage: 82.274 mmscf/month, 822.741 mmscf/year for boiler #1;
Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year for boiler #1;
Natural Gas Usage: 23.771 mmscf/month, 237.712 mmscf/year for the Clayton Boiler;
Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year for the Clayton Boiler; and
Hours of Operation: 100 hours/year for Emergency Generator Set DG-100

Baghouse S 105 Roof Carter-Day Filter (34:86) flow rate 40,600dscfm, 99.9 control efficiency;
Baghouse 8th Floor Donaldson Filter (34:27) flow rate 600 dscfm;
Baghouse West MAC Filter (34:01) flow rate 740 dscfm; and
Baghouse South APM Filter (34:35) flow rate to be distributed to Baghouses 8th Floor Donaldson, West MAC, North Lunchroom, and South Lunchroom – 28,220 dscfm.

Section 5: Identify the proposed type(s), quantities and rates of maximum actual operating emissions for the source to be included in the permit including the units/controls proposed. Identify the source(s) of the emission factors used:

The proposed type, quantities and rates of maximum actual operating emissions for the source are as follow:

Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS) shall not exceed the following limits:

CALCULATION SHEET

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	EMISSIONS PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #1	0.0017	18,500	0.30	1.20
Hoffman Bldg 301 Vacuum	0.0017	1,000	0.02	0.10
West Headhouse Transfer General Aspiration	0.0017	55,000	0.78	3.40

			Total:	28.32

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

Emissions from and operation of the corn flour/bran handling system emission units (#1 Coarse Gravity Table Aspiration Cyclone Collector (05:68), #3 Fine Gravity Table Aspiration Cyclone Collector (06:88), #1 Satake Degerminator Cyclone Collector (45:07), #1 Satake Aspiration Cyclone Collector (45:12), #2 Satake Degerminator Cyclone Collector (45:09), and #2 Satake Aspiration Cyclone Collector (45:24)) controlled by the baghouse S 105 Roof Carter-Day Filter (34:86) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (dscfm)	EMISSIONS PM & PM_{10} (lbs/Hour)	(Tons/Yr)
S 105 Roof Carter-Day Filter (34:86)	0.002	40,600	0.70	3.05
			Total:	3.05

These limits are based on the maximum exhaust air flow rate, maximum grain loading, 100% capture efficiency, 99.9% control efficiency, and 8,760 hours/year of operation. The limits on PM_{10} also limit the emissions of $PM_{2.5}$.

Emissions from and operation of the Corn Mill Products Storage shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	EMISSIONS PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Bldg 201/202 Vacuum	0.0006	700	0.01	0.02
Bldg 208 Vacuum	0.0006	700	0.01	0.02
Hominy Feed Bins Aspiration	0.0006	21,000	0.11	0.47
			Total:	0.50

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

Emissions from and operation of the Corn Mill Products Milling and Handling shall not exceed the following limits:

CALCULATION SHEET

Corn Mill Products Milling and Handling excluding the LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	EMISSIONS PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Hominy Binning	0.0006	30,000	0.15	0.68
Hominy Grinder General Aspiration	0.0006	21,000	0.11	0.47
Truck Hominy Loadout	0.0006	34,960	0.18	0.79
Rail Hominy/Grain Loadout #1	0.0006	34,960	0.18	0.79
Long Term Meal System (LTMS) & Rail Meal/Grain Transfer	0.0006	20,000	0.10	0.45
LTMS & Rail Meal/Grain Loadout	0.0006	34,600	0.18	0.78
Flour Pellet Cooler	0.0055	8,000	0.38	1.65
Hominy Screener General Aspiration	0.0006	7,600	0.04	0.17
Hominy Loadout Fugitives				1.90
Grain Loadout Fugitives				0.10
			Total:	7.78

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

Emission Unit	Throughput (T/Mo)	(T/Yr)	EMISSIONS PM (lb/T)	(T/Mo)	(T/Yr)	PM_{10} (lb/T)	(T/Mo)	(T/Yr)
LTMS Truck/Rail Dump Pit	12,500	75,000	0.035	0.02	0.13	0.0078	0.00	0.03
LTMS Truck Loadout	12,500	75,000	0.086	0.27	1.61	0.029	0.09	0.54
				Total:	1.74			0.57

These limits are based on the maximum throughput, standard AP-42 emission factors (Table 9.9-1, AP-42, Fifth Edition, Volume I, Update May 2003), 90% control efficiency for baghouse controlled for truck/rail dump pits, and 50% capture efficiency for loadout enclosure.

Emissions from and operation of Boiler #1 shall not exceed the following limits:

Natural Gas Usage: 82.274 mmscf/month, 822.741 mmscf/year.

Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	3.46	34.56
Nitrogen Oxides (NO_x)	50.0	2.06	20.57
Particulate Matter (PM)	7.6	0.31	3.13
Sulfur Dioxide (SO_2)	0.6	0.02	0.25
Volatile Organic Material (VOM)	5.5	0.23	2.26

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

Emissions from the combustion of fuel oil:

Pollutant	(lbs/10^3 Gal)	Emissions (Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

Emissions from and operation of Clayton Boiler shall not exceed the following limits:

Natural Gas Usage: 23.771 mmscf/month, 237.712 mmscf/year.

Emissions from the combustion of natural gas:

Pollutant	(lbs/mmscf)	Emissions (Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	1.00	9.98
Nitrogen Oxides (NO_x)	100.0	1.19	11.89
Particulate Matter (PM)	7.6	0.09	0.90
Sulfur Dioxide (SO_2)	0.6	0.01	0.07
Volatile Organic Material (VOM)	5.5	0.07	0.65

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

Emissions from the combustion of fuel oil:

Pollutant	(lbs/10^3 Gal)	Emissions (Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

Emissions from and operation of Emergency Generator Set DG-100 shall not exceed the following limits:

Hours of Operation: 100 hours/year;

Emissions from the combustion of fuel oil in the Generator Sets:

CALCULATION SHEET

Pollutant	Emission Factor (lb/hp hr)	Emissions (lbs/Hr)	Emissions (Tons/Year)
Carbon Monoxide (CO)	0.0055	11.92	0.60
Nitrogen Oxides (NO_x)	0.024	52.03	2.60
Particulate Matter (PM)	0.0007	1.52	0.08
Sulfur Dioxide (SO_2)	0.0000121	0.03	0.01
Volatile Organic Material (VOM)	0.000642	1.39	0.07

These limits are based on the rated output of the engine powering the generator set (2,168 engine hp), 100 hours/year of operation, standard emission factors (Table 3.4-1, AP-42, Fifth Edition, Volume 1, Supplement B, October 1996), and a sulfur content of 15 ppm.

Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total).

This permit is issued based on the Potential to Emit (PTE) for Hazardous Air Pollutants (HAPs) as listed in Section 112(b) of the Clean Air Act from this source being less than 10 tons/year of any single HAP and 25 tons/year of any combination of such HAPs. As a result, this permit is issued based on the emissions of all HAPs from this source not triggering the requirements to obtain a CAAPP Permit from the Illinois EPA.

Source Emission Summary:

	EMISSIONS (Tons/Year)					
Emission Unit	CO	NO_x	PM	PM_{10}	SO_2	VOM
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS)			14.02	14.02		
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS)			6.71	6.71		
Dry Corn Milling, Processing and Products Handling			28.32	28.32		
Corn Flour/Bran Handling System			3.05	3.05		
Corn Mill Products Storage			0.50	0.50		
Corn Mill Products Milling and Handling			9.52	8.35		
Boiler #1						
Natural Gas	34.56	20.57	3.13	3.13	0.25	2.26
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Clayton Boiler					0	0
Natural Gas	9.98	11.89	0.90	0.90	0.07	0.65
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Emergency Generator Set DG-100	0.60	2.60	0.08	0.08	0.01	0.07
Totals	49.40	52.06	69.03	67.86	0.51	3.16

Section 6: Identify the source's potential-to-emit (PTE) including any proposed additions/revisions. Show calculations or reference where ir application or file PTE is satisfactorily presented. Emissions from 35 IAC 201.146 exempt units must be included in PTE calculations:

The source's potential-to-emit (PTE), including any construction construction permit thaty has previously been issued indicates that this source had been a CAAPP source, and is requesting to be issued a FESOP to limit the emissions of air pollutants from the source to less than major source thresholds, the FESOP containing federally enforceable limits in the form of permit conditions which effectively restrict the potential emissions of a source to below major source threshold, thereby excluding the source from the CAAPP.

There have been the following construction permits granted since the FESOP App was received December 5, 2011 (11110009, 15100009, 16030026, 18050016, and 22040008).

Section 7: List potentially applicable State and Federal (NSPS and NESHAP) regulations and indicate if application demonstrated those regulations would not be violated by construction and/or operation of equipment/units/processes in application:
Following is a list of potentially applicable State and Federal (NSPS and NESHAP) regulations and exemptions:

Applicable Regulations:
1) 35 Ill Adm. Code 212.123 no visible of PM with opacity greater than 30 percent.
2) 35 Ill. Adm. Code 212.206. no emission of particulate matter into the atmosphere in any one hour period to exceed 0.15 kg of particulate matter per MW-hr of actual heat input from any fuel combustion emission unit using liquid fuel exclusively (0.10 lbs/mmBtu)
3) 35 Ill Adm. Code 212.301 no emissions beyond property line
4) 35 Ill Adm. Code 212.321, 322 process emission rate, applies to milling process.
5) 35 Ill Adm. Code 212.461 grain handling and drying in general
6) 35 Ill Adm. Code 212.462 grain handling operations
7) 35 Ill. Adm. Code 212.463 grain-drying operations for which construction or modification commenced prior to June 30, 1975
8) 35 Ill. Adm. Code 214.122(b)(2), New Fuel Combustion Emission Sources,
9) 35 Ill. Adm. Code 214.301, Process Emission Sources
10) 35 Ill. Adm. Code 215.301 Use of Organic Material,
11) 35 Ill. Adm. Code 216.121 the steam boiler is subject to 35 Ill. Adm. Code Part 216 Subpart B (Fuel Combustion Emission Sources).
12) New Source Performance Standards (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR 60, Subparts A and Dc for steam boiler 10mmBtu/hr or greater
13) NSPS for Grain Elevators, 40 CFR Part 60 Subparts A and DD,
14) National Emission Standard for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR Part 63 Subparts A and ZZZZ.

Section 8: Conclusions and recommendations. Indicate your final recommendation (e.g., NOI, denial, issue permit with conditions, etc.) and indicate reason(s) for that action:
It is recommended that a FEDERALLY ENFORCEABLE STATE OPERATING PERMIT -- NSPS and NESHAP SOURCE be issue after a draft of this FESOP permit has undergone a public notice period.

ILLINOIS ENVIRONMENTAL PROTECTION AGENCY
1021 NORTH GRAND AVENUE EAST, P.O. BOX 19276, SPRINGFIELD, ILLINOIS 62794-9276 · (217) 782-3397
JB PRITZKER, GOVERNOR JOHN J. KIM, DIRECTOR

217/785-1705

FEDERALLY ENFORCEABLE STATE OPERATING PERMIT -- NSPS and NESHAP SOURCE

PERMITTEE

Bunge North America, Inc.
Attn: Dean Hughes
11720 Borman Drive
St. Louis, Missouri 63146-1000

Application No.: 96020027 I.D. No.: 183020ABT
Applicant's Designation: Date Received: December 5, 2011
Operation of: Corn Mill & Grain Elevator
Date Issued: Expiration Date:
Source Location: 321 E. North Street, Danville, Vermilion County

This permit is hereby granted to the above-designated Permittee to OPERATE emission unit(s) and/or air pollution control equipment consisting of:

Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10;
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96;
West Headhouse Transfer General Aspiration (5012-0005-0029) controlled by Baghouse Filters DD 484RF12;
RHOMBO Truck Dump Pit #3 (5012-0003-0013) controlled by Baghouse Filters APM SJL156-6;
Railcar Dump Pit (5012-0004-0016) controlled by Baghouse Filters APM 41120.12;
RHOMBO West General Aspiration (5012-0009-0009) controlled by Baghouse Filters APM SJL72-6;
RHOMBO Gallery Aspiration (5012-0003-0018) controlled by Baghouse Filters APM SJL72-6;
Track 6 Vacuum (5012-0010-0047) controlled by Baghouse Filters HOFFMAN 48X96;
Cleanings Discharge (4870-0013-0015) controlled by Baghouse Filters BUHLER 16S-6-30;
Conveying General Aspiration (4750-0029-0015) controlled by Baghouse Filters MICROPUL 100S-6-20;

Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS):
Truck Dump #4 & W. Gallery Aspiration (5012-0005-0021) controlled by Baghouse Filters DD 484RF12;
Cleaning North APM (4870-0013-0001) controlled by Baghouse Filters APM 41216.12;
Corn Cleaning Bldg 115 #2 (4880-0034-0069) controlled by Baghouse Filters TD 484RF12;
North St Grain/Meal Truck Dump Pit #2 (5012-0002-0012) controlled by Baghouse Filters DD 48RF12;

Dry Corn Milling, Processing and Products Handling:

Bemis Bagging (4870-0010-0055) controlled by Baghouse Filters APM 16019.8;
Bagging General Aspiration (4870-0010-0030) controlled by Baghouse Filters APM 40020.8;
Bagging Packer General Aspiration (4870-0013-0019) controlled by Baghouse Filters APM 14042.8;
Bran Dryer Process (4880-0042-0057) controlled by Baghouse Filters APM 14036.8;
Bran Sifter Process (4880-0042-0062) controlled by Baghouse Filters APM 10144.8;
East Meal Dryer/Cooler (4880-0034-0054) controlled by Baghouse Filters APM 40120.10;
West Meal Dryer (4880-0034-0059) controlled by Baghouse Filters APM 40144.8;
~~South APM Binning (4880-0034-0035) controlled by Baghouse Filters APM~~ 41144.12;
8th FR DRACCO Screening (4880-0034-0027) controlled by Baghouse Filters DRACO 6MB-60;
9th FR DRACCO Screening (4880-0034-0001) controlled by Baghouse Filters DRACO 8MB-72;
Bldg 105 Vacuum (4880-0032-0052) controlled by Baghouse Filters HOFFMAN 36X96;
Bulk Loading White Goods (4870-0021-0001) controlled by Baghouse Filters DD 484RF12;
Bldg 104 Vacuum (4870-0015-0016) controlled by Baghouse Filters HOFFMAN 38405A;
Bran Bin (4880-0042-0054) controlled by Baghouse Filters BUHLER 16S-6-30;
6th Flr Screening (4880-0008-0028) controlled by Baghouse Filters WIEDENMANN 2X4 LF150-1200;
West 4th Floor Gravity Tables (4880-0008-0040) controlled by Baghouse Filters WIEDENMANN 2X5 LF225-2250;
South Lunchroom Screening (4880-0034-0010) controlled by Baghouse Filters CD 484RF12;
South CD Screening (4880-0034-0042) controlled by Baghouse Filters CD 484RF12;
North CD General Aspiration (4880-0034-0048) controlled by Baghouse Filters CD 484RF12;
North Lunchroom Screening (4880-0034-0019) controlled by Baghouse Filters CD 484RF12;
Pack & Bulk Loading Bldg 115 (4870-0013-0024) controlled by Baghouse Filters TD 484RF12;
CAMAS/Bran Bldg 115 (4880-0034-0077) controlled by Baghouse Filters TD 484RF12;
Thru/Tail Stock Dryers Bldg 115 (4880-0034-0071) controlled by Baghouse Filters TD 484RF12;
Bldg 115 Vacuum (4880-0032-0070) controlled by Baghouse Filters HOFFMAN S54002;
Gravity Tables #3 (4880-0044-0070), #4 (4880-0044-0073), and #5 (4880-0044-0076) controlled by Baghouse Filters TORIT CPC-12;
Track 2 Railcar Unloading Secondary Receiver (4870-0005-0003) controlled by Baghouse Filters USS INC. 15CF P/D;
GERM General Aspiration (4880-0009-0005) controlled by Baghouse Filters APM 16030.4;

Round Bin General Aspiration (4750-0029-0027) controlled by Baghouse Filters APM 14072.6;
Hominy Truck Loadout Aspiration (4912-0002-0054) controlled by Baghouse Filters DD 484RF12;
North and South Hominy Feed (4860-0018-0007 and 4860-0018-0003) controlled by Baghouse Filters MICROPUL 1F2;
Secondary Clean Grinding (4860-0022-0017) controlled by Baghouse Filters APM 15030.8;
Bran Dryer (4860-0024-0003) controlled by Corona Cyclone;
Track 16 Bulk Rail Loadout (4912-0006-0017) controlled by Baghouse Filters WEIDENMAN LFT 2X7;
Flaking General Aspiration (4860-0017-0073) controlled by Baghouse Filters APM 40120.8;
Germ Dusters Aspiration (4860-0023-0001) controlled by Baghouse Filters APM 40120.8;
Germ Dryer (4860-0017-0003) controlled by DAY CYCLONE HV56;
Germ Rolls Aspiration (4860-0017-0072) controlled by DAY CYCLONE HV56;
Fts Dryer Aspiration (4860-0019-0003) controlled by CORONA 15 CYCLONE;
Pet Bran Kice Lites Filter (4860-0024-0037) controlled by Baghouse Filters MICROPUL;
Bin 945 Germ Receiver (4860-0017-0026) controlled by Baghouse Filters BUHLER 36S-6-30;
Two (2) Cyclone Receivers (Extrusion Receiver; 108 A-Bin Receiver) controlled by Baghouse Filters (5&6 Allbond Receiving Filter);
Pneumatic Lift Receiver for Coarse Whole Grain transfer (WG260);
PCM Hammermill controlled by Filter System (78-03:11);
USG Hammermill controlled by Filter System (78-03:27);
USG Extruder Pellet Transfer controlled by Collection Cyclone (78-08:22);

One (1) Baghouse S 105 Roof Carter-Day Filter (34:86) controlling the following:

One (1) #1 Coarse Gravity Table Aspiration Cyclone Collector (05:68) (17,000 dscfm);
One (1) #3 Fine Gravity Table Aspiration Cyclone Collector (06:88) (17,000 dscfm);
One (1) #1 Satake Degerminator Cyclone Collector (45:07) (1,400 dscfm);
One (1) #1 Satake Aspiration Cyclone Collector (45:12) (1,400 dscfm);
One (1) #2 Satake Degerminator Cyclone Collector (45:09) (1,400 dscfm);
One (1) #2 Satake Aspiration Cyclone Collector (45:24) (1,400 dscfm);
Satake Sifter and Sifter Air Locks;

One (1) Pneumatic Transfer Line and Cyclone Receiver (45:20) controlled by 8th Floor Donaldson Filter (34:27);

One (1) Pneumatic Transfer Line and Cyclone Receiver (23:102) controlled by West MAC Filter (34:01);

Corn Mill Products Storage:
Bldg 201/202 Vacuum (4912-0008-0006) controlled by Baghouse Filters HOFFMAN 36X96;
Bldg 208 Vacuum (4912-0009-0005) controlled by Baghouse Filters HOFFMAN 36X96;
Hominy Feed Bins Aspiration (4750-0029-0074) controlled by Baghouse Filters DONALDSON 276RFW12;

Corn Mill Products Milling and Handling:
Hominy Binning (4750-0029-0032) controlled by Baghouse Filters APM 40240.8;
Hominy Grinder General Aspiration (4750-0029-0001) controlled by Baghouse Filters APM 40224.4;
Truck Hominy Loadout (4912-0004-0022) controlled by Baghouse Filters 376RF8;
Rail Hominy/Grain Loadout #1 (4912-0003-0011) controlled by Baghouse Filters 376RF12;
Long Term Meal System (LTMS) & Rail Meal/Grain Transfer (4750-0033-0001) controlled by Baghouse Filters 376RF8;
LTMS & Rail Meal/Grain Loadout (4750-0033-0011) controlled by Baghouse Filters MAC 144MCF416;
Flour Pellet Cooler (4750-0025-0015) controlled by Baghouse Filters MAC Cyclone HE39;
Hominy Screener General Aspiration (4750-0029-0045) controlled by Baghouse Filters MICROPUL 100S-6-20;
LTMS Truck/Rail Dump Pit (4750-0033-0000A);
LTMS Truck Loadout (4750-0033-0000B);

Boiler House/Grounds:
One (1) 96.55 mmBtu/hour Natural Gas/Distillate Fuel-Oil Fired Boiler with Low NO_x Burner (Boiler #1);
One (1) 27.90 mmBtu/hour Natural Gas-Fired/Distillate Fuel-Oil Fired Boiler (Clayton Boiler);
One (1) 2,168 engine Hp Diesel-Powered Emergency Generator Set (DG-100); and

Fugitive PM and PM_{10} emissions

pursuant to the above referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This Federally Enforceable State Operating Permit (FESOP) is issued to limit the emissions of air pollutants from the source to less than major source thresholds (i.e., 100 tons/year for Carbon Monoxide (CO), Nitrogen Oxides (NO_x), and Particulate Matter less than 10 microns (PM_{10})). As a result, the source is excluded from the requirements to obtain a Clean Air Act Permit Program (CAAPP) permit. The maximum emissions of this source, as limited by the conditions of this permit, are described in Attachment A.

b. Prior to issuance, a draft of this permit has undergone a public notice and comment period.

c. This permit supersedes all operating permit(s) for this location.

2a. The Clayton Boiler is subject to the New Source Performance Standard (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR Part 60 Subparts A and Dc. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States Environmental Protection Agency (USEPA) under a delegation agreement. Pursuant to 40 CFR 60.40c(a), except as provided in 40 CFR 60.40c(d), (e), (f), and (g), the affected facility to which 40 CFR 60 Subpart Dc applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (mmBtu/hr)) or less, but greater than or equal to 2.9 MW (10 mmBtu/hr).

b. Pursuant to 40 CFR 60.42c(d), on and after the date on which the initial performance test is completed or required to be completed under 40 CFR 60.8, whichever date comes first, no owner or operator of an affected facility that combusts oil shall cause to be discharged into the atmosphere from that affected facility any gases that contain SO_2 in excess of 215 ng/J (0.50 lb/mmBtu) heat input from oil; or, as an alternative, no owner or operator of an affected facility that combusts oil shall combust oil in the affected facility that contains greater than 0.5 weight percent sulfur. The percent reduction requirements are not applicable to affected facilities under this paragraph.

c. Pursuant to 40 CFR 60.42c(h)(1), for distillate oil-fired affected facilities with heat input capacities between 2.9 and 29 MW (10 and 100 mmBtu/hour), compliance with the emission limits or fuel oil sulfur limits under 40 CFR 60.42c may be determined based on a certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

d. Pursuant to 40 CFR 60.42c(i), the SO_2 emission limits, fuel oil sulfur limits, and percent reduction requirements under 40 CFR 60.42c apply at all times, including periods of startup, shutdown, and malfunction.

3a. The Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) are subject to the NSPS for Grain Elevators, 40 CFR Part 60 Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 60.300(a), the provisions of 40 CFR 60 Subpart DD apply to each affected facility at any grain terminal elevator or any grain storage elevator, except as provided under 40 CFR 60.304(b). The affected facilities are each truck unloading station, truck loading station, barge and ship unloading station, barge and ship loading station, railcar loading station, railcar unloading station, grain dryer, and all grain handling operations.

b. Pursuant to 40 CFR 60.300(b), any facility under 40 CFR 60.300(a) which commences construction, modification or reconstructed after August 3, 1978 is subject to the requirements of 40 CFR 60 Subpart DD.

c. Pursuant to 40 CFR 60.302(b), on and after the date on which the performance test required to be conducted by 40 CFR 60.8 is completed, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere from any affected facility except a grain dryer any process emission which:

i. Contains particulate matter in excess of 0.023 g/dscm (ca. 0.01 gr/dscf).

ii. Exhibits greater than 0 percent opacity.

d. Pursuant to 40 CFR 60.302(c), on and after the 60th day of achieving the maximum production rate at which the affected facility will be operated, but no later than 180 days after initial startup, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere any fugitive emission from:

i. Any individual truck unloading station, railcar unloading station, or railcar loading station, which exhibits greater than 5 percent opacity.

ii. Any grain handling operation, which exhibits greater than 0 percent opacity.

iii. Any truck loading station which exhibits greater than 10 percent opacity.

4a. Emergency Generator Set DG-100 is subject to the National Emission Standard for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR Part 63 Subparts A and ZZZZ. The Illinois EPA is administering the NESHAP in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 63.6590(a), an affected source is any existing, new, or reconstructed stationary RICE located at a major or area source of HAP emissions, excluding stationary RICE being tested at a stationary RICE test cell/stand.

b. Pursuant to 40 CFR 63.6595(a)(1), if you have an existing stationary RICE, excluding existing non-emergency CI stationary RICE, with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the applicable emission limitations, operating limitations and other requirements no later than June 15, 2007. If you have an existing non-emergency CI stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, an existing stationary CI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary CI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than May 3, 2013. If you have an existing stationary SI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary SI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than October 19, 2013.

c. Pursuant to 40 CFR 63.6603(a), if you own or operate an existing stationary RICE located at an area source of HAP emissions, you must comply with the requirements in Table 2d to 40 CFR 63 Subpart ZZZZ and the operating limitations in Table 2b to 40 CFR 63 Subpart ZZZZ that apply to you.

Table 2d to Subpart ZZZZ of Part 63—Requirements for Existing Stationary RICE Located at Area Sources of HAP Emissions

As stated in 40 CFR 63.6600 and 63.6640, you must comply with the following requirements for existing stationary RICE located at area sources of HAP emissions:

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
4. Emergency stationary CI RICE and black start stationary CI RICE.[2]	a. Change oil and filter every 500 hours of operation or annually, whichever comes first;[1]	
	b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first; and	
	c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.	

[1]Sources have the option to utilize an oil analysis program as described in 40 CFR 63.6625(i) or (j) in order to extend the specified oil change requirement in Table 2d of 40 CFR 63 Subpart ZZZZ.

[2]If an emergency engine is operating during an emergency and it is not possible to shut down the engine in order to perform the management practice

requirements on the schedule required in Table 2d of 40 CFR 63 Subpart ZZZZ, or if performing the management practice on the required schedule would otherwise pose an unacceptable risk under federal, state, or local law, the management practice can be delayed until the emergency is over or the unacceptable risk under federal, state, or local law has abated. The management practice should be performed as soon as practicable after the emergency has ended or the unacceptable risk under Federal, State, or local law has abated. Sources must report any failure to perform the management practice on the schedule required and the Federal, State or local law under which the risk was deemed unacceptable.

5a. The Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; Corn Mill Products Milling and Handling; Boiler #1, Clayton Boiler, and Emergency Generator Set DG-100 are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions). Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute period shall occur from only one such emission unit located within a 305 m (1000 ft) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 212 Subpart E (Particulate Matter Emissions From Fuel Combustion Emission Units). Pursuant to 35 Ill. Adm. Code 212.206, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period to exceed 0.15 kg of particulate matter per MW-hr of actual heat input from any fuel combustion emission unit using liquid fuel exclusively (0.10 lbs/mmBtu).

d. This source is subject to 35 Ill. Adm. Code Part 212 Subpart K (Fugitive Particulate Matter). Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

e. When processing and handling processed materials, the emission units constructed on or after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products

Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

f. Pursuant to 35 Ill. Adm. Code 212.321(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.321(c) shall be determined by using the equation:

$$E = A(P)^B$$

where:

P = Process weight rate; and
E = Allowable emission rate; and,

i. Up to process weight rates of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.214	2.54
B	0.534	0.534

ii. For process weight rate greater than or equal to 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	11.42	24.8
B	0.16	0.16

g. Pursuant to 35 Ill. Adm. Code 212.321(c), Limits for Process Emission Units for Which Construction or Modification Commenced on or After April 14, 1972:

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lbs/hr
0.05	0.25	0.05	0.55
0.1	0.29	0.10	0.77
0.2	0.42	0.20	1.10
0.3	0.64	0.30	1.35
0.4	0.74	0.40	1.58
0.5	0.84	0.50	1.75
0.7	1.00	0.75	2.40

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lbs/hr
0.9	1.15	1.00	2.60
1.8	1.66	2.00	3.70
2.7	2.1	3.00	4.60
3.6	2.4	4.00	5.35
4.5	2.7	5.00	6.00
9.	3.9	10.00	8.70
13.	4.8	15.00	10.80
18.	5.7	20.00	12.50
23.	6.5	25.00	14.00
27.	7.1	30.00	15.60
32.	7.7	35.00	17.00
36.	8.2	40.00	18.20
41.	8.8	45.00	19.20
45.	9.3	50.00	20.50
90.	13.4	100.00	29.50
140.	17.0	150.00	37.00
180.	19.4	200.00	43.00
230.	22.	250.00	48.50
270.	24.	300.00	53.00
320.	26.	350.00	58.00
360.	28.	400.00	62.00
408.	30.1	450.00	66.00
454.	30.4	500.00	67.00

where:

P = Process weight rate in metric or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

h. When processing and handling processed materials, the emission units constructed before after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.322(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any process emission unit for which construction or modification commenced prior to April 14, 1972, which, either alone or in combination with the emission of particulate matter from all other similar process emission units at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.322(c).

i. Pursuant to 35 Ill. Adm. Code 212.322(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.322(c) shall be determined by using the equation:

$$E = C + A(P)^B$$

where:

P = process weight rate; and,
E = allowable emission rate; and,

i. For process weight rates up to 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.985	4.10
B	0.67	0.67
C	0	0

ii. For process weight rates in excess or 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	25.21	55.0
B	0.11	0.11
C	-18.4	-40.0

j. Pursuant to 35 Ill. Adm. Code 212.322(c), Limits for Process Emission Units For Which Construction or Modification Commenced Prior to April 14, 1972:

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lbs/hr
0.05	0.27	0.05	0.55
0.1	0.42	0.10	0.87

400.0	30.6	450.00	67.70
454.0	31.3	500.00	69.00

where:

P = Process weight rate in Mg/hr or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

k. The handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations are subject to 35 Ill. Adm. Code Part 212 Subpart S (Agriculture). Pursuant to 35 Ill. Adm. Code 212.462, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d), or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), existing grain-handling operations with a total annual grain through-put of 300,000 bushels or more shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall demonstrate compliance with the following:

i. Cleaning and Separating Operations.

A. Particulate matter generated during cleaning and separating operations shall be captured to the extent necessary to prevent visible particulate matter emissions directly into the atmosphere.

B. For grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area, air contaminants collected from cleaning and separating operations shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

ii. Major Dump-Pit Area.

Induced Draft.

A. Induced draft shall be applied to major dump pits and their associated equipment (including, but not limited to, boots, hoppers and legs) to such an extent that a minimum face velocity is maintained, at the effective grate surface, sufficient to contain particulate emissions generated in unloading operations. The minimum face velocity at the effective grate surface shall be at least 200 fpm, which shall be determined by using the equation:

$$V = Q/A$$

where:
V = face velocity; and
Q = induced draft volume in scfm; and
A = effective grate area in ft^2; and

B. The induced draft air stream for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be confined and conveyed through air pollution control equipment which has an overall rated and actual particulate collection efficiency of not less than 90 percent by weight;

C. Means or devices (including, but not limited to, quick-closing doors, air curtains or wind deflectors) shall be employed to prevent a wind velocity in excess of 50 percent of the induced draft face velocity at the pit; provided, however, that such means or devices do not have to achieve the same degree of prevention when the ambient air wind exceeds 25 mph. The wind velocity shall be measured, with the induced draft system not operating, at a point midway between the dump-pit area walls at the point where the wind exits the dump-pit area, and at a height above the dump-pit area floor of approximately 2 ft; or

iii. Internal Transferring Area.

A. Internal transferring area shall be enclosed to the extent necessary to prohibit visible particulate matter emissions directly into the atmosphere.

B. Air contaminants collected from internal transfer operations for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

iv. Load-Out Area.

A. Truck and hopper car loading shall employ socks, sleeves or equivalent devices which extend 6 inches below the sides of the receiving vehicle, except for topping off. Choke loading shall be considered an equivalent method as long as the discharge is no more than 12 inches above the sides of the receiving vehicle.

B. Box car loading shall employ means or devices to prevent the emission of particulate matter into the atmosphere to

the fullest extent which is technologically and economically feasible.

1. Pursuant to 35 Ill. Adm. Code 212.463, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d) or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), grain-drying operations for which construction or modification commenced prior to June 30, 1975, with a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity (using the American Society of Agricultural Engineers Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers) shall be operated in such a fashion as to preclude the emission of particulate matter larger than 300 microns mean particle diameter, shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the following:

   i. Column Dryers. The largest effective circular diameter of transverse perforations in the external sheeting of a column dryer shall not exceed 0.094 inch, and the grain inlet and outlet shall be enclosed.

   ii. Rack Dryers. No portion of the exhaust air of rack dryers shall be emitted to the ambient atmosphere without having passed through a particulate collection screen having a maximum opening of 50 mesh, U.S. Sieve Series.

      A. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling facilities having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 90 percent by weight prior to release into the atmosphere.

      B. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling sources having a grain through-put exceeding 2 million bushels per year and located in a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 98 percent by weight prior to release into the atmosphere.

   iii. Other Types of Dryers. All other types of dryers shall be controlled in a manner which shall result in the same degree of control required for rack dryers pursuant to 35 Ill. Adm. Code 212.463(b).

   iv. New and Modified Grain-Drying Operations. Grain-drying operations constructed or modified on or after June 30, 1975, shall file applications for construction and operating permits

pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the control equipment requirements of 35 Ill. Adm. Code 212.463, except for new and modified grain-drying operations which do not result in a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity, using the American Society of Agricultural Engineer Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers.

6a. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 214 Subpart B (New Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 214.122(b)(2), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The sulfur content of all distillate fuel oil used by the fuel combustion emission source must not exceed 15 ppm;

b. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 214 Subpart K (Process Emission Sources). Pursuant to 35 Ill. Adm. Code 214.301, except as further provided by 35 Ill. Adm. Code Part 214, no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm.

c. Pursuant to 35 Ill. Adm. Code 214.305(a)(2), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The sulfur content of all distillate fuel oil used by the process emission source must not exceed 15 ppm;

7. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 215 Subpart K (Use of Organic Material). Pursuant to 35 Ill. Adm. Code 215.301, no person shall cause or allow the discharge of more than 3.6 kg/hr (8 lbs/hr) of organic material into the atmosphere from any emission source, except as provided in 35 Ill. Adm. Code 215.302, 215.303, 215.304 and the following exception: If no odor nuisance exists the limitation of 35 Ill. Adm. Code Part 215 Subpart K shall apply only to photochemically reactive material.

8. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 216 Subpart B (Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 216.121, no person shall cause or allow the emission of carbon monoxide (CO) into the atmosphere from any fuel combustion emission source with actual heat input greater than 2.9 MW (10 mmBtu/hr) to exceed 200 ppm, corrected to 50 percent excess air.

9a. This permit is issued based on the Cooling Tower at this source not being subject to the NESHAP for Process Cooling Towers, 40 CFR 63 Subpart Q because the cooling tower is not operated with chromium-based

water treatment chemicals and is not either major sources or is an integral part of a facility that is a major source.

b. This permit is issued based on the source no longer being subject to the NESHAP for Solvent Extraction for Vegetable Oil Production, 40 CFR 63 Subpart GGGG, because the source no longer operates a vegetable oil production process and is no longer a major source of HAP emissions.

c. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters, 40 CFR 63 Subpart DDDDD because this source is not or is part of, a major source of Hazardous Air Pollutant (HAP) emissions as defined in 40 CFR 63.2.

d. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the requirements of the NESHAP for Industrial, Commercial, and Institutional Boilers Area Sources, 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11195(e), gas-fired boilers are not subject to 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11237, gas-fired boiler includes any boiler that burns gaseous fuels not combined with any solid fuels, burns liquid fuel only during periods of gas curtailment, gas supply emergencies, or periodic testing on liquid fuel. Periodic testing of liquid fuel shall not exceed a combined total of 48 hours during any calendar year.

e. This permit is issued based on the source not being subject to the National Emission Standards (NESHAP) for Area Sources: Prepared Feeds Manufacturing, 40 CFR 63 Subpart DDDDDDD because the source does not use a material containing chromium or a material containing manganese in the manufacturing of prepared feeds.

10a. Pursuant to 35 Ill. Adm. Code 212.314, 35 Ill. Adm. Code 212.301 shall not apply and spraying pursuant to 35 Ill. Adm. Code 212.304 through 212.310 and 35 Ill. Adm. Code 212.312 shall not be required when the wind speed is greater than 40.2 km/hr (25 mph). Determination of wind speed for the purposes of 35 Ill. Adm. Code 212.314 shall be by a one-hour average or hourly recorded value at the nearest official station of the U.S. Weather Bureau or by wind speed instruments operated on the site. In cases where the duration of operations subject to 35 Ill. Adm. Code 212.314 is less than one hour, wind speed may be averaged over the duration of the operations on the basis of on-site wind speed instrument measurements.

b. This permit is issued based on the handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations not being subject to 35 Ill. Adm. Code Part 212 Subpart L while handling grain. Pursuant to 35 Ill. Adm. Code 212.461(a), 35 Ill. Adm. Code 212.302(a), 212.321, and 212.322 shall not apply to grain-handling and grain-drying operations, portable grain-handling equipment and one-turn storage space.

11. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to 35 Ill. Adm. Code Part 215 Subpart K. Pursuant to 35 Ill. Adm. Code 215.303, the provisions of 35 Ill. Adm. Code 215.301 and 215.302 shall not apply to fuel combustion emission sources.

12a. Pursuant to 40 CFR 60.11(b), compliance with opacity standards in 40 CFR Part 60 shall be determined by conducting observations in accordance with Method 9 in appendix A of 40 CFR Part 60, any alternative method that is approved by the Illinois EPA or USEPA, or as provided in 40 CFR 60.11(e)(5). For purposes of determining initial compliance, the minimum total time of observations shall be 3 hours (30 6-minute averages) for the performance test or other set of observations (meaning those fugitive-type emission sources subject only to an opacity standard).

b. Pursuant to 40 CFR 60.11(c), the opacity standards set forth in 40 CFR Part 60 shall apply at all times except during periods of startup, shutdown, malfunction, and as otherwise provided in the applicable standard.

c. Pursuant to 40 CFR 60.11(d), at all times, including periods of startup, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

13a. Pursuant to 40 CFR 63.6595(c), if you own or operate an affected source, you must meet the applicable notification requirements in 40 CFR 63.6645 and in 40 CFR Part 63, Subpart A.

b. Pursuant to 40 CFR 63.6604(b), beginning January 1, 2015, if you own or operate an existing emergency CI stationary RICE with a site rating of more than 100 brake HP and a displacement of less than 30 liters per cylinder that uses diesel fuel and operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must use diesel fuel that meets the requirements in 40 CFR 80.510(b) for nonroad diesel fuel, except that any existing diesel fuel purchased (or otherwise obtained) prior to January 1, 2015, may be used until depleted.

c. Pursuant to 40 CFR 63.6605(a), you must be in compliance with the emission limitations and operating limitations in 40 CFR 63 Subpart ZZZZ that apply to you at all times.

d. Pursuant to 40 CFR 63.6605(b), at all times you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with

safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by 40 CFR 63 Subpart ZZZZ have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

e. Pursuant to 40 CFR 63.6625(e)(3), if you own or operate any of the following stationary RICE, you must operate and maintain the stationary RICE and after-treatment control device (if any) according to the manufacturer's emission-related written instructions or develop your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions:

   An existing emergency or black start stationary RICE located at an area source of HAP emissions;

f. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

g. Pursuant to 40 CFR 63.6625(h), if you operate a new, reconstructed, or existing stationary engine, you must minimize the engine's time spent at idle during startup and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the emission standards applicable to all times other than startup in Tables 1a, 2a, 2c, and 2d to 40 CFR 63 Subpart ZZZZ apply.

h. Pursuant to 40 CFR 63.6625(i), if you own or operate a stationary CI engine that is subject to the work, operation or management practices in items 1 or 2 of Table 2c to 40 CFR 63 Subpart ZZZZ or in items 1 or 4 of Table 2d to 40 CFR 63 Subpart ZZZZ, you have the option of utilizing an oil analysis program in order to extend the specified oil change requirement in Tables 2c and 2d to 40 CFR 63 Subpart ZZZZ. The oil analysis must be performed at the same frequency specified for changing the oil in Table 2c or 2d to 40 CFR 63 Subpart ZZZZ. The analysis program must at a minimum analyze the following three parameters: Total Base Number, viscosity, and percent water content. The condemning limits for these parameters are as follows: Total Base Number is less than 30 percent of the Total Base Number of the oil when new; viscosity of the oil has changed by more than 20 percent from the viscosity of the oil when new; or percent water content (by volume) is greater than 0.5. If all of these condemning limits are not exceeded, the engine owner or operator is not required to change the oil. If any of the limits are exceeded, the engine owner or operator must change

the oil within 2 business days of receiving the results of the analysis; if the engine is not in operation when the results of the analysis are received, the engine owner or operator must change the oil within 2 business days or before commencing operation, whichever is later. The owner or operator must keep records of the parameters that are analyzed as part of the program, the results of the analysis, and the oil changes for the engine. The analysis program must be part of the maintenance plan for the engine.

i. Pursuant to 40 CFR 63.6640(a), you must demonstrate continuous compliance with each emission limitation, operating limitation, and other requirements in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you according to methods specified in Table 6 to 40 CFR 63 Subpart ZZZZ.

Table 6 to Subpart ZZZZ of Part 63– Continuous Compliance With Emission Limitations, Operating Limitations, Work Practices, and Management Practices

As stated in 40 CFR 63.6640, you must continuously comply with the emissions and operating limitations and work or management practices as required by the following:

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
9. Existing emergency and black start stationary RICE ≤500 HP located at a major source of HAP, existing non-emergency stationary RICE <100 HP located at a major source of HAP, existing emergency and black start stationary RICE located at an area source of HAP, existing non-emergency stationary CI RICE ≤300 HP located at an area source of HAP, existing non-emergency 2SLB stationary RICE located at an area source of HAP, existing non-emergency landfill or digester gas stationary SI RICE located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE ≤500 HP located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE >500 HP located at an area source of HAP that operate 24 hours or less per calendar year	a. Work or Management practices	i. Operating and maintaining the stationary RICE according to the manufacturer's emission-related operation and maintenance instructions; or ii. Develop and follow your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions.

j. Pursuant to 40 CFR 63.6640(f), if you own or operate an emergency stationary RICE, you must operate the emergency stationary RICE according to the requirements in 40 CFR 63.6640 (f)(1) through (4). In order for the engine to be considered an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ, any operation other than emergency operation, maintenance and testing, emergency demand response, and operation in non-emergency situations for 50 hours per year, as

described in 40 CFR 63.6640(f)(1) through (4), is prohibited. If you do not operate the engine according to the requirements in 40 CFR 63.6640(f)(1) through (4), the engine will not be considered an emergency engine under 40 CFR 63 Subpart ZZZZ and must meet all requirements for non-emergency engines.

i. There is no time limit on the use of emergency stationary RICE in emergency situations.

ii. You may operate your emergency stationary RICE for any combination of the purposes specified in 40 CFR 63.6640(f)(2)(i) for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by 40 CFR 63.6640(f)(3) and (4) counts as part of the 100 hours per calendar year allowed by this paragraph (40 CFR 63.6640(f)(2)).

Emergency stationary RICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by Federal, State or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company associated with the engine. The owner or operator may petition the Illinois EPA or USEPA for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that Federal, State, or local standards require maintenance and testing of emergency RICE beyond 100 hours per calendar year.

iii. Emergency stationary RICE located at area sources of HAP may be operated for up to 50 hours per calendar year in non-emergency situations. The 50 hours of operation in non-emergency situations are counted towards the 100 hours per calendar year provided in 40 CFR 63.6640(f)(2). Except as provided in 40 CFR 63.6640(f)(4)(i) and (ii), the 50 hours per year for non-emergency situations cannot be used for peak shaving or non-emergency demand response, or to generate income for a facility to an electric grid or otherwise supply power as part of a financial arrangement with another entity.

The 50 hours per year for non-emergency situations can be used to supply power as part of a financial arrangement with another entity if all of the following conditions are met:

A. The engine is dispatched by the local balancing authority or local transmission and distribution system operator.

B. The dispatch is intended to mitigate local transmission and/or distribution limitations so as to avert potential voltage collapse or line overloads that could lead to the interruption of power supply in a local area or region.

C. The dispatch follows reliability, emergency operation or similar protocols that follow specific NERC, regional, state, public utility commission or local standards or guidelines.

D. The power is power provided only to the facility itself or to support the local transmission and distribution system.

E. The owner or operator identifies and records the entity that dispatches the engine and the specific NERC, regional, state, public utility commission or local standards or guidelines that are being followed for dispatching the engine. The local balancing authority or local transmission and distribution system operator may keep these records on behalf of the engine owner or operator.

k. Pursuant to 40 CFR 63.6665, Table 8 to 40 CFR 63 Subpart ZZZZ (see Attachment B) shows which parts of the General Provisions in 40 CFR 63.1 through 63.15 apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with any of the requirements of the General Provisions specified in Table 8: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing stationary RICE that combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, an existing emergency stationary RICE, or an existing limited use stationary RICE. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in the General Provisions specified in Table 8 except for the initial notification requirements: A new stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new emergency stationary RICE, or a new limited use stationary RICE.

l. Pursuant to 40 CFR 63.6675, emergency stationary RICE means any stationary reciprocating internal combustion engine that meets all of the criteria in paragraphs (1) through (3) of this definition. All emergency stationary RICE must comply with the requirements specified in 40 CFR 63.6640(f) in order to be considered emergency stationary RICE. If the engine does not comply with the requirements specified in 40 CFR 63.6640(f), then it is not considered to be an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ:

i. The stationary RICE is operated to provide electrical power or mechanical work during an emergency situation. Examples include stationary RICE used to produce power for critical networks or equipment (including power supplied to portions of a facility)

when electric power from the local utility (or the normal power source, if the facility runs on its own power production) is interrupted, or stationary RICE used to pump water in the case of fire or flood, etc.

ii. The stationary RICE is operated under limited circumstances for situations not included in paragraph (1) of this definition, as specified in 40 CFR 63.6640(f).

iii. The stationary RICE operates as part of a financial arrangement with another entity in situations not included in paragraph (1) of this definition only as allowed in 40 CFR 63.6640(f)(2)(ii) or (iii) and 40 CFR 63.6640(f)(4)(i) or (ii).

14a. Pursuant to 40 CFR 80.510(b), beginning June 1, 2010. Except as otherwise specifically provided in 40 CFR 80 Subpart I, all nonroad (NR) and locomotive (LM) diesel fuel is subject to the following per-gallon standards:

i. Sulfur content 15 ppm maximum for NR diesel fuel.

ii. Cetane index or aromatic content, as follows:

A. A minimum cetane index of 40; or

B. A maximum aromatic content of 35 volume percent.

15a. Housekeeping Practices. Pursuant to 35 Ill. Adm. Code 212.461(b), all grain-handling and grain-drying operations, regardless of size, must implement and use the following housekeeping practices:

i. Air pollution control devices shall be checked daily and cleaned as necessary to insure proper operation.

ii. Cleaning and Maintenance.

A. Floors shall be kept swept and cleaned from boot pit to cupola floor. Roof or bin decks and other exposed flat surfaces shall be kept clean of grain and dust that would tend to rot or become airborne.

B. Cleaning shall be handled in such a manner as not to permit dust to escape to the atmosphere.

C. The yard and surrounding open area, including but not limited to ditches and curbs, shall be cleaned to prevent the accumulation of rotting grain.

iii. Dump Pit.

A. Aspiration equipment shall be maintained and operated.

B. Dust control devices shall be maintained and operated.

iv. Head House. The head house shall be maintained in such a fashion that visible quantities of dust or dirt are not allowed to escape to the atmosphere.

v. Property. The yard and driveway of any source shall be asphalted, oiled or equivalently treated to control dust.

vi. Housekeeping Check List. Housekeeping check lists shall be completed by the manager and maintained on the premises for inspection by Illinois EPA personnel.

16a. In the event that the operation of this source results in an odor nuisance, the Permittee shall take appropriate and necessary actions to minimize odors, including but not limited to, changes in raw material or installation of controls, in order to eliminate the odor nuisance.

b. The baghouse filters and cyclones shall be in operation at all times when the associated emission units are in operation and emitting air contaminants.

c. The Permittee shall, in accordance with the manufacturer(s) and/or vendor(s) recommendations, perform periodic maintenance on the baghouse filters and cyclones such that the baghouse filters and cyclones are kept in proper working condition and not cause a violation of the Illinois Environmental Protection Act or regulations promulgated therein.

d. Each receiving dump pit shall be inspected for proper operation while receiving is occurring, at least once each week (Monday through Sunday) when grain is received.

e. The source shall be inspected for presence of visible emissions from internal transfer and cleaning, while such activity is occurring, at least once each week when such activity is performed.

f. Boiler #1 and Clayton Boiler shall only be operated with natural gas or distillate fuel oil (Grades No. 1 and 2) as the fuel. The use of any other fuel in Boiler #1 or Clayton Boiler may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable requirements.

g. Emergency Generator Set DG-100 shall only be operated with distillate fuel oil (Grades No. 1 and 2) as the fuel. The use of any other fuel in Emergency Generator Set DG-100 may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable requirements.

h. Organic liquid by-products or waste materials shall not be used in any emission unit at this source without written approval from the Illinois EPA.

i. The Illinois EPA shall be allowed to sample all fuels stored at the above location.

j. All normal traffic pattern access areas and all normal traffic pattern roads and parking facilities which are located on Ag Transload Facility property shall be paved or treated with water, oils or chemical dust suppressants. All paved areas shall be cleaned on a regular basis. All areas treated with water, oils or chemical dust suppressants shall have the treatment applied on a regular basis, as needed, in accordance with the operating program required by Condition 16(m).

k. All unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods.

l. Grinding mills, screening operations, bucket elevators, conveyor transfer points, conveyors, bagging operations, storage bins and fine product truck and railcar loading operations shall be sprayed with water or a surfactant solution, utilize choke-feeding or be treated by an equivalent method in accordance with an operating program.

m. The emission units described in Conditions 16(j), (k), and (l) shall be operated under the provisions of an operating program, consistent with 35 Ill. Adm. Code 212.310 and 212.312, and prepared by the owner or operator and submitted to the Illinois EPA for its review. Such operating program shall be designed to significantly reduce fugitive particulate matter emissions.

n. As a minimum the operating program shall include the following:

   i. The name and address of the source;

   ii. The name and address of the owner or operator responsible for execution of the operating program;

   iii. A map or diagram of the source showing approximate locations of storage piles, conveyor loading operations, normal traffic pattern access areas surrounding storage piles and all normal traffic patterns within the source;

   iv. Location of unloading and transporting operations with pollution control equipment;

   v. A detailed description of the best management practices utilized to achieve compliance with 35 Ill. Adm. Code 212.301, including an engineering specification of particulate collection equipment, application systems for water, oil, chemicals and dust suppressants utilized and equivalent methods utilized;

   vi. Estimated frequency of application of dust suppressants by location of materials; and

vii. Such other information as may be necessary to facilitate the Illinois EPA's review of the operating program.

o. The Fugitive Particulate Operating Program, as submitted by the Permittee on DATE PROGRAM APPROVED BY FOS WAS RECEIVED is incorporated herein by reference. The source shall be operated under and shall comply with the provisions of this Fugitive Particulate Operating Program and any amendments to the Fugitive Particulate Operating Program submitted pursuant to Condition 16(m) and (n).

p. The operating program shall be amended from time to time by the owner or operator so that the operating program is current. Such amendments shall be consistent with Condition 16(m) and (n) and shall be submitted to the Illinois EPA within thirty (30) days of any such amendment. Any future amendment to the Fugitive Particulate Operating Program made by the Permittee during the permit term is automatically incorporated by reference provided the revision is not expressly disapproved, in writing, by the Illinois EPA. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the Fugitive Particulate Operating Program, the Permittee shall be required to revise and resubmit the Fugitive Particulate Operating Program within thirty (30) days of receipt of the notification to address the deficiency.

17a. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #1	0.0017	18,500	0.30	1.20
Hoffman Bldg 301 Vacuum	0.0017	1,000	0.02	0.10
West Headhouse Transfer General Aspiration	0.0017	55,000	0.78	3.40
RHOMBO Truck Dump Pit #3	0.0017	14,500	0.21	0.90
Railcar Dump Pit	0.0017	27,000	0.39	1.70
RHOMBO West General Aspiration	0.0017	6,800	0.09	0.40
RHOMBO Gallery Aspiration	0.0017	9,200	0.14	0.60
Track 6 Vacuum	0.0017	700	0.01	0.04
Cleanings Discharge	0.0006	1,900	0.01	0.04
Conveying General Aspiration	0.00085	7,600	0.05	0.24
Grain Receiving Fugitives				5.40
			Total:	14.02

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

b. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #4 & W. Gallery Aspiration	0.0017	36,017	0.52	2.30
Cleaning North APM	0.00085	41,000	0.30	1.31
Corn Cleaning Bldg 115 #2	0.00085	57,372	0.42	1.83
North St Grain/Meal Truck Dump Pit #2	0.0017	20,000	0.29	1.28
			Total:	6.71

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

c. Emissions from and operation of the Dry Corn Milling, Processing and Products Handling shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)

			Total:	28.32

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

d. Emissions from and operation of the corn flour/bran handling system emission units (#1 Coarse Gravity Table Aspiration Cyclone Collector (05:68), #3 Fine Gravity Table Aspiration Cyclone Collector (06:88), #1 Satake Degerminator Cyclone Collector (45:07), #1 Satake Aspiration Cyclone Collector (45:12), #2 Satake Degerminator Cyclone Collector (45:09), and #2 Satake Aspiration Cyclone Collector (45:24)) controlled

by the baghouse S 105 Roof Carter-Day Filter (34:86) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (dscfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
S 105 Roof Carter-Day Filter (34:86)	0.002	40,600	0.70	3.05

These limits are based on the maximum exhaust air flow rate, maximum grain loading, 100% capture efficiency, 99.9% control efficiency, and 8,760 hours/year of operation.

e. Emissions from and operation of the Corn Mill Products Storage shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Bldg 201/202 Vacuum	0.0006	700	0.01	0.02
Bldg 208 Vacuum	0.0006	700	0.01	0.02
Hominy Feed Bins Aspiration	0.0006	21,000	0.11	0.47
			Total:	0.50

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

f. Emissions from and operation of the Corn Mill Products Milling and Handling shall not exceed the following limits:

i. Corn Mill Products Milling and Handling excluding the LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Hominy Binning	0.0006	30,000	0.15	0.68
Hominy Grinder General Aspiration	0.0006	21,000	0.11	0.47
Truck Hominy Loadout	0.0006	34,960	0.18	0.79
Rail Hominy/Grain Loadout #1	0.0006	34,960	0.18	0.79
Long Term Meal System (LTMS) & Rail Meal/Grain Transfer	0.0006	20,000	0.10	0.45
LTMS & Rail Meal/Grain Loadout	0.0006	34,600	0.18	0.78
Flour Pellet Cooler	0.0055	8,000	0.38	1.65
Hominy Screener General Aspiration	0.0006	7,600	0.04	0.17
Hominy Loadout Fugitives				1.90
Grain Loadout Fugitives				0.10
			Total:	7.78

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

ii. LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

Emission Unit	Throughput (T/Mo)	(T/Yr)	(lb/T)	E M I S S I O N S PM (T/Mo)	(T/Yr)	(lb/T)	PM_{10} (T/Mo)	(T/Yr)
LTMS Truck/Rail Dump Pit	12,500	75,000	0.035	0.02	0.13	0.0078	0.00	0.03
LTMS Truck Loadout	12,500	75,000	0.086	0.27	1.61	0.029	0.09	0.54
				Total:	1.74			0.57

These limits are based on the maximum throughput, standard AP-42 emission factors (Table 9.9-1, AP-42, Fifth Edition, Volume I, Update May 2003), 90% control efficiency for baghouse controlled for truck/rail dump pits, and 50% capture efficiency for loadout enclosure.

g. Emissions from and operation of Boiler #1 shall not exceed the following limits:

i. Natural Gas Usage: 82.274 mmscf/month, 822.741 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	3.46	34.56
Nitrogen Oxides (NO_x)	50.0	2.06	20.57
Particulate Matter (PM)	7.6	0.31	3.13
Sulfur Dioxide (SO_2)	0.6	0.02	0.25
Volatile Organic Material (VOM)	5.5	0.23	2.26

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions ($lbs/10^3$ Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

h. Emissions from and operation of Clayton Boiler shall not exceed the following limits:

i. Natural Gas Usage: 23.771 mmscf/month, 237.712 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	1.00	9.98
Nitrogen Oxides (NO_x)	100.0	1.19	11.89
Particulate Matter (PM)	7.6	0.09	0.90
Sulfur Dioxide (SO_2)	0.6	0.01	0.07
Volatile Organic Material (VOM)	5.5	0.07	0.65

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions (lbs/10^3 Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

i. Emissions from and operation of Emergency Generator Set DG-100 shall not exceed the following limits:

i. Hours of Operation: 100 hours/year;

ii. Emissions from the combustion of fuel oil in the Generator Sets:

Pollutant	Emission Factor (lb/hp hr)	Emissions (lbs/Hr)	(Tons/Year)
Carbon Monoxide (CO)	0.0055	11.92	0.60
Nitrogen Oxides (NO_x)	0.024	52.03	2.60
Particulate Matter (PM)	0.0007	1.52	0.08
Sulfur Dioxide (SO_2)	0.0000121	0.03	0.01
Volatile Organic Material (VOM)	0.000642	1.39	0.07

These limits are based on the rated output of the engine powering the generator set (2,168 engine hp), 100 hours/year of operation, standard emission factors (Table 3.4-1, AP-42, Fifth Edition, Volume 1, Supplement B, October 1996), and a sulfur content of 15 ppm.

j. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total).

17. This permit is issued based on the Potential to Emit (PTE) for Hazardous Air Pollutants (HAPs) as listed in Section 112(b) of the Clean Air Act from this source being less than 10 tons/year of any single HAP and 25 tons/year of any combination of such HAPs. As a result, this permit is issued based on the emissions of all HAPs from this source not triggering the requirements to obtain a CAAPP Permit from the Illinois EPA.

18a. Pursuant to 40 CFR 60.8(a), except as specified in 40 CFR 60.8(a)(1), (a)(2), (a)(3), and (a)(4), at such other times as may be required by the Illinois EPA or USEPA under section 114 of the Clean Air Act, the owner or operator of such facility shall conduct performance test(s) and furnish the Illinois EPA or USEPA a written report of the results of such performance test(s).

b. Pursuant to 40 CFR 60.8(b), performance tests shall be conducted and data reduced in accordance with the test methods and procedures contained in each applicable subpart of 40 CFR Part 60 unless the Illinois EPA or USEPA:

i. Specifies or approves, in specific cases, the use of a reference method with minor changes in methodology;

ii. Approves the use of an equivalent method;

iii. Approves the use of an alternative method the results of which the Illinois EPA or USEPA has determined to be adequate for indicating whether a specific source is in compliance;

iv. Waives the requirement for performance tests because the owner or operator of a source has demonstrated by other means to the Illinois EPA's or USEPA's satisfaction that the affected facility is in compliance with the standard; or

v. Approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors. Nothing in this paragraph shall be construed to abrogate the Illinois EPA's or USEPA's authority to require testing under section 114 of the Clean Air Act.

c. Pursuant to 40 CFR 60.8(c), performance tests shall be conducted under such conditions as the Illinois EPA or USEPA shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Illinois EPA or USEPA such records as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test nor shall emissions in excess of the level of the applicable emission limit during periods of startup, shutdown, and malfunction be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

d. Pursuant to 40 CFR 60.8(d), the owner or operator of an affected facility shall provide the Illinois EPA or USEPA at least 30 days prior notice of any performance test, except as specified under other subparts of 40 CFR Part 60, to afford the Illinois EPA or USEPA the opportunity to have an observer present. If after 30 days notice for an initially scheduled performance test, there is a delay (due to operational problems, etc.) in conducting the scheduled performance test, the owner or operator of an affected facility shall notify the Illinois EPA or USEPA as soon as possible of any delay in the original

test date, either by providing at least 7 days prior notice of the rescheduled date of the performance test, or by arranging a rescheduled date with the Illinois EPA or USEPA by mutual agreement.

e. Pursuant to 40 CFR 60.8(e), the owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

i. Sampling ports adequate for test methods applicable to such facility. This includes:

A. Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures; and

B. Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures.

ii. Safe sampling platform(s).

iii. Safe access to sampling platform(s).

iv. Utilities for sampling and testing equipment.

f. Pursuant to 40 CFR 60.8(f), unless otherwise specified in the applicable subpart of 40 CFR Part 60, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the applicable standard under 40 CFR Part 60. For the purpose of determining compliance with an applicable standard under 40 CFR Part 60, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Illinois EPA's or USEPA's approval, be determined using the arithmetic mean of the results of the two other runs.

g. Pursuant to 40 CFR 60.11(e)(2), except as provided in 40 CFR 60.11(e)(3), the owner or operator of an affected facility to which an opacity standard in 40 CFR Part 60 applies shall conduct opacity observations in accordance with 40 CFR 60.11(b), shall record the opacity of emissions, and shall report to the Illinois EPA or USEPA the opacity results along with the results of the initial performance test required under 40 CFR 60.8. The inability of an owner or operator to secure a visible emissions observer shall not be considered a reason for not conducting the opacity observations concurrent with the initial performance test.

19a. Pursuant to 40 CFR 60.303(a), in conducting the performance tests required in 40 CFR 60.8, the owner or operator shall use as reference methods and procedures the test methods in appendix A of 40 CFR Part 60 or other methods and procedures as specified in 40 CFR 60.303, except as provided in 40 CFR 60.8(b). Acceptable alternative methods and procedures are given in 40 CFR 60.303(c).

b. Pursuant to 40 CFR 60.303(b), the owner or operator shall determine compliance with the particulate matter standards in 40 CFR 60.302 as follows:

i. Method 5 shall be used to determine the particulate matter concentration and the volumetric flow rate of the effluent gas. The sampling time and sample volume for each run shall be at least 60 minutes and 1.70 dscm (60 dscf). The probe and filter holder shall be operated without heaters.

ii. Method 2 shall be used to determine the ventilation volumetric flow rate.

iii. Method 9 and the procedures in 40 CFR 60.11 shall be used to determine opacity.

c. Pursuant to 40 CFR 60.303(c)(1), the owner or operator may use the following as alternatives to the reference methods and procedures specified in 40 CFR 60.303: For Method 5, Method 17 may be used.

20a. Pursuant to 40 CFR 60.44c(g), for oil-fired affected facilities where the owner or operator seeks to demonstrate compliance with the fuel oil sulfur limits under 40 CFR 60.42c based on shipment fuel sampling, the initial performance test shall consist of sampling and analyzing the oil in the initial tank of oil to be fired in the steam generating unit to demonstrate that the oil contains 0.5 weight percent sulfur or less. Thereafter, the owner or operator of the affected facility shall sample the oil in the fuel tank after each new shipment of oil is received, as described under 40 CFR 60.46c(d)(2).

b. Pursuant to 40 CFR 60.44c(h), for affected facilities subject to 40 CFR 60.42c(h)(1), (2), or (3) where the owner or operator seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, the performance test shall consist of the certification, the certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

21a. Pursuant to 35 Ill. Adm. Code 201.282, every emission source or air pollution control equipment shall be subject to the following testing requirements for the purpose of determining the nature and quantities of specified air contaminant emissions and for the purpose of determining ground level and ambient air concentrations of such air contaminants:

i. Testing by Owner or Operator. The Illinois EPA may require the owner or operator of the emission source or air pollution control

equipment to conduct such tests in accordance with procedures adopted by the Illinois EPA, at such reasonable times as may be specified by the Illinois EPA and at the expense of the owner or operator of the emission source or air pollution control equipment. The Illinois EPA may adopt procedures detailing methods of testing and formats for reporting results of testing. Such procedures and revisions thereto, shall not become effective until filed with the Secretary of State, as required by the APA Act. All such tests shall be made by or under the direction of a person qualified by training and/or experience in the field of air pollution testing. The Illinois EPA shall have the right to observe all aspects of such tests.

ii. Testing by the Illinois EPA. The Illinois EPA shall have the right to conduct such tests at any time at its own expense. Upon request of the Illinois EPA, the owner or operator of the emission source or air pollution control equipment shall provide, without charge to the Illinois EPA, necessary holes in stacks or ducts and other safe and proper testing facilities, including scaffolding, but excluding instruments and sensing devices, as may be necessary.

b. Testing required by Condition 22 shall be performed upon a written request from the Illinois EPA by a qualified independent testing service.

22. Pursuant to 35 Ill. Adm. Code 212.110(c), upon a written notification by the Illinois EPA, the owner or operator of a particulate matter emission unit subject to 35 Ill. Adm. Code Part 212 shall conduct the applicable testing for particulate matter emissions, opacity, or visible emissions at such person's own expense, to demonstrate compliance. Such test results shall be submitted to the Illinois EPA within thirty (30) days after conducting the test unless an alternative time for submittal is agreed to by the Illinois EPA.

23a. Pursuant to 40 CFR 60.46c(d)(2), as an alternative fuel sampling procedure for affected facilities combusting oil, oil samples may be collected from the fuel tank for each steam generating unit immediately after the fuel tank is filled and before any oil is combusted. The owner or operator of the affected facility shall analyze the oil sample to determine the sulfur content of the oil. If a partially empty fuel tank is refilled, a new sample and analysis of the fuel in the tank would be required upon filling. Results of the fuel analysis taken after each new shipment of oil is received shall be used as the daily value when calculating the 30-day rolling average until the next shipment is received. If the fuel analysis shows that the sulfur content in the fuel tank is greater than 0.5 weight percent sulfur, the owner or operator shall ensure that the sulfur content of subsequent oil shipments is low enough to cause the 30-day rolling average sulfur content to be 0.5 weight percent sulfur or less.

b. Pursuant to 40 CFR 60.46c(e), the monitoring requirements of 40 CFR 60.46c(a) and (d) shall not apply to affected facilities subject to 40

CFR 60.42c(h)(1), (2), or (3) where the owner or operator of the affected facility seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, as described under 40 CFR 60.48c(f), as applicable.

24. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

25a. Pursuant to 40 CFR 60.7(b), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of an affected facility; any malfunction of the air pollution control equipment; or any periods during which a continuous monitoring system or monitoring device is inoperative.

b. Pursuant to 40 CFR 60.7(f), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain a file of all measurements, including continuous monitoring system, monitoring device, and performance testing measurements; all continuous monitoring system performance evaluations; all continuous monitoring system or monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by 40 CFR Part 60 recorded in a permanent form suitable for inspection. The file shall be retained for at least two years following the date of such measurements, maintenance, reports, and records, except as follows:

The Illinois EPA or USEPA, upon notification to the source, may require the owner or operator to maintain all measurements as required by 40 CFR 60.7(f), if the Illinois EPA or USEPA determines these records are required to more accurately assess the compliance status of the affected source.

26a. Pursuant to 40 CFR 60.48c(c)(1), in addition to the applicable requirements in 40 CFR 60.7, the owner or operator of an affected facility subject to the opacity limits in 40 CFR 60.43c(c) shall submit excess emission reports for any excess emissions from the affected facility that occur during the reporting period and maintain records according to the requirements specified in 40 CFR 60.48c(c)(1) through (3), as applicable to the visible emissions monitoring method used.

For each performance test conducted using Method 9 of appendix A-4 of 40 CFR Part 60, the owner or operator shall keep the records including the information specified in 40 CFR 60.48c(c)(1)(i) through (iii).

i. Dates and time intervals of all opacity observation periods;

ii. Name, affiliation, and copy of current visible emission reading certification for each visible emission observer participating in the performance test; and

iii. Copies of all visible emission observer opacity field data sheets;

b. Pursuant to 40 CFR 60.48c(e), the owner or operator of each affected facility subject to the SO_2 emission limits, fuel oil sulfur limits, or percent reduction requirements under 40 CFR 60.42c shall keep records and submit reports as required under 40 CFR 60.48c(d), including the following information, as applicable.

i. Calendar dates covered in the reporting period.

ii. Identification of the F factor used in calculations, method of determination, and type of fuel combusted.

iii. If fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification as described under 40 CFR 60.48c(f)(1), (2), (3), or (4), as applicable. In addition to records of fuel supplier certifications, the report shall include a certified statement signed by the owner or operator of the affected facility that the records of fuel supplier certifications submitted represent all of the fuel combusted during the reporting period.

c. Pursuant to 40 CFR 60.48c(f)(1), fuel supplier certification shall include the following information for distillate oil:

i. The name of the oil supplier;

ii. A statement from the oil supplier that the oil complies with the specifications under the definition of distillate oil in 40 CFR 60.41c; and

iii. The sulfur content of the oil.

d. i. Pursuant to 40 CFR 60.48c(g)(1), except as provided under 40 CFR 60.48c(g)(2) and (g)(3), the owner or operator of each affected facility shall record and maintain records of the amounts of each fuel combusted during each operating day.

ii. Pursuant to 40 CFR 60.48c(g)(2), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility that combusts only natural gas, wood, fuels using fuel certification in 40 CFR 60.48c(f) to demonstrate compliance with the SO_2 standard, fuels not subject to an emissions standard (excluding opacity), or a mixture of these fuels may elect to record and maintain records of the amount of each fuel combusted during each calendar month.

iii. Pursuant to 40 CFR 60.48c(g)(3), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility or multiple affected facilities located on a

contiguous property unit where the only fuels combusted in any steam generating unit (including steam generating units not subject to 40 CFR 60 Subpart Dc) at that property are natural gas, wood, distillate oil meeting the most current requirements in 40 CFR 60.42c to use fuel certification to demonstrate compliance with the SO_2 standard, and/or fuels, excluding coal and residual oil, not subject to an emissions standard (excluding opacity) may elect to record and maintain records of the total amount of each steam generating unit fuel delivered to that property during each calendar month.

e. Pursuant to 40 CFR 60.48c(i), all records required under 40 CFR 60.48c shall be maintained by the owner or operator of the affected facility for a period of two years following the date of such record.

27. Pursuant to 40 CFR 63.10(b)(3), if an owner or operator determines that his or her stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants regulated by any standard established pursuant to Section 112(d) or (f) of the Clean Air Act, and that stationary source is in the source category regulated by the relevant standard, but that source is not subject to the relevant standard (or other requirement established under 40 CFR Part 63) because of limitations on the source's potential to emit or an exclusion, the owner or operator must keep a record of the applicability determination on site at the source for a period of 5 years after the determination, or until the source changes its operations to become an affected source, whichever comes first. The record of the applicability determination must be signed by the person making the determination and include an analysis (or other information) that demonstrates why the owner or operator believes the source is unaffected (e.g., because the source is an area source). The analysis (or other information) must be sufficiently detailed to allow the USEPA and/or Illinois EPA to make a finding about the source's applicability status with regard to the relevant standard or other requirement. If relevant, the analysis must be performed in accordance with requirements established in relevant subparts of 40 CFR Part 63 for this purpose for particular categories of stationary sources. If relevant, the analysis should be performed in accordance with USEPA guidance materials published to assist sources in making applicability determinations under Section 112 of the Clean Air Act, if any. The requirements to determine applicability of a standard under 40 CFR 63.1(b)(3) and to record the results of that determination under 40 CFR 63.10(b)(3) shall not by themselves create an obligation for the owner or operator to obtain a Title V permit.

28a. Pursuant to 40 CFR 63.6655(a), if you must comply with the emission and operating limitations, you must keep the records described in 40 CFR 63.6655(a)(1) through (a)(5), (b)(1) through (b)(3) and (c).

i. A copy of each notification and report that you submitted to comply with 40 CFR 63 Subpart ZZZZ, including all documentation supporting any Initial Notification or Notification of Compliance

Status that you submitted, according to the requirement in 40 CFR 63.10(b)(2)(xiv).

ii. Records of the occurrence and duration of each malfunction of operation (i.e., process equipment) or the air pollution control and monitoring equipment.

iii. Records of performance tests and performance evaluations as required in 40 CFR 63.10(b)(2)(viii).

iv. Records of all required maintenance performed on the air pollution control and monitoring equipment.

v. Records of actions taken during periods of malfunction to minimize emissions in accordance with 40 CFR 63.6605(b), including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation.

b. Pursuant to 40 CFR 63.6655(d), you must keep the records required in Table 6 of 40 CFR 63 Subpart ZZZZ to show continuous compliance with each emission or operating limitation that applies to you.

c. Pursuant to 40 CFR 63.6655(e), you must keep records of the maintenance conducted on the stationary RICE in order to demonstrate that you operated and maintained the stationary RICE and after-treatment control device (if any) according to your own maintenance plan if you own or operate any of the following stationary RICE.

i. An existing stationary emergency RICE.

ii. An existing stationary CI RICE located at an area source of HAP emissions subject to management practices as shown in Table 2d to 40 CFR 63 Subpart ZZZZ.

d. Pursuant to 40 CFR 63.6655(f)(2), If you own or operate an existing emergency stationary CI RICE located at an area source of HAP emissions that does not meet the standards applicable to non-emergency engines, you must keep records of the hours of operation of the engine that is recorded through the non-resettable hour meter. The owner or operator must document how many hours are spent for emergency operation, including what classified the operation as emergency and how many hours are spent for non-emergency operation. If the engines are used for the purposes specified in 40 CFR 63.6640(f)(2)(ii) or (iii) or 40 CFR 63.6640(f)(4)(ii), the owner or operator must keep records of the notification of the emergency situation, and the date, start time, and end time of engine operation for these purposes.

e. Pursuant to 40 CFR 63.6660(a), your records must be in a form suitable and readily available for expeditious review according to 40 CFR 63.10(b)(1).

f. Pursuant to 40 CFR 63.6660(b), as specified in 40 CFR 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

g. Pursuant to 40 CFR 63.6660(c), you must keep each record readily accessible in hard copy or electronic form for at least 5 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to 40 CFR 63.10(b)(1).

29. Pursuant to 35 Ill. Adm. Code 212.110(e), the owner or operator of an emission unit subject to 35 Ill. Adm. Code Part 212 shall retain records of all tests which are performed. These records shall be retained for at least three (3) years after the date a test is performed.

30a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C), On and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the fuel combustion emission source complies with the requirements in 35 Ill. Adm. Code 214.122(b)(2)(A) and (b)(2)(B), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the process emission source complies with the requirements in 35 Ill. Adm. Code 214.305(a)(1) and (a)(2), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA;

31a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the baghouse filters and cyclones:

   A. Records for periodic inspection of the baghouse filters and cyclones with date, individual performing the inspection, and nature of inspection; and

   B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The Permittee shall keep a copy of the Fugitive Particulate Operating Program, any amendments or revisions to the Fugitive Particulate Operating Program, and the Permittee shall also keep a record of activities completed according to the Fugitive Particulate Operating Program.

iii. Records of housekeeping check lists;

iv. Records for the inspections required by Conditions 16(d) and (e), with date, time and observations if such information is not incorporated in the housekeeping check list.

v. Total flow rate for each baghouse blower (scfm);

vi. Total grain loading for each process (gr/dscf);

vii. Total hours of operation of each baghouse (hours/month and hours/year);

viii. The amount of grain received in LTMS Truck/Rail Dump Pit (tons/month and tons/year);

ix. The amount of grain shipped from the LTMS Truck Loadout (tons/month and tons/year);

x. Natural gas usage for Boiler #1 (mmscf/month and mmscf/year);

xi. Distillate fuel oil usage for Boiler #1 (gallons/month and gallons/year);

xii. Natural gas usage for the Clayton Boiler (mmscf/month and mmscf/year);

xiii. Distillate fuel oil usage for the Clayton Boiler (gallons/month and gallons/year);

xiv. Operating hours of Emergency Generator Set DG-100 (hours/month and hours/year);

xv. An inspection, maintenance and repair log of Emergency Generator Set DG-100 listing each activity performed with date; and

xvi. Monthly and annual emissions of CO, NO_x, PM, PM_{10}, SO_2, and VOM from the source with supporting calculations (tons/month and tons/year).

b. All records and logs required by Condition 31(a) of this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be made available for inspection and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

32. Pursuant to 40 CFR 60.7(a)(4), any owner or operator subject to the provisions of 40 CFR Part 60 shall furnish the Illinois EPA or USEPA written notification or, if acceptable to both the Illinois EPA and USEPA and the owner or operator of a source, electronic notification, as follows:

A notification of any physical or operational change to an existing facility which may increase the emission rate of any air pollutant to which a standard applies, unless that change is specifically exempted under an applicable subpart or in 40 CFR 60.14(e). This notice shall be postmarked 60 days or as soon as practicable before the change is commenced and shall include information describing the precise nature of the change, present and proposed emission control systems, productive capacity of the facility before and after the change, and the expected completion date of the change. The Illinois EPA or USEPA may request additional relevant information subsequent to this notice.

33a. Pursuant to 40 CFR 63.6640(b), you must report each instance in which you did not meet each emission limitation or operating limitation in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you. These instances are deviations from the emission and operating limitations in 40 CFR 63 Subpart ZZZZ. These deviations must be reported according to the requirements in 40 CFR 63.6650. If you change your catalyst, you must reestablish the values of the operating parameters measured during the initial performance test. When you reestablish the values of your operating parameters, you must also conduct a performance test to demonstrate that you are meeting the required emission limitation applicable to your stationary RICE.

b. Pursuant to 40 CFR 63.6640(e), you must also report each instance in which you did not meet the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ that apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major

source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing emergency stationary RICE, an existing limited use stationary RICE, or an existing stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ, except for the initial notification requirements: a new or reconstructed stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new or reconstructed emergency stationary RICE, or a new or reconstructed limited use stationary RICE.

c. Pursuant to 40 CFR 63.6645(a), you must submit all of the notifications in 40 CFR 63.7(b) and (c), 63.8(e), (f)(4) and (f)(6), 63.9(b) through (e), and (g) and (h) that apply to you by the dates specified if you own or operate any of the following;

i. An existing stationary CI RICE located at an area source of HAP emissions.

ii. This requirement does not apply if you own or operate an existing stationary RICE less than 100 HP, an existing stationary emergency RICE, or an existing stationary RICE that is not subject to any numerical emission standards.

d. Pursuant to 40 CFR 63.6650(a), you must submit each report in Table 7 of 40 CFR 63 Subpart ZZZZ that applies to you.

Table 7 to Subpart ZZZZ of Part 63—Requirements for Reports

As stated in 40 CFR 63.6650, you must comply with the following requirements for reports:

For each . . .	You must submit a . . .	The report must contain . . .	You must submit the report . . .
4. Emergency stationary RICE that operate or are contractually obligated to be available for more than 15 hours per year for the purposes specified 40 CFR 63.6640(f)(4)(ii)	Report	a. The information in 40 CFR 63.6650(h)(1)	i. annually according to the requirements in CFR 63.6650(h)(2)(3).

e. Pursuant to 40 CFR 63.6650(b), unless the Illinois EPA or USEPA has approved a different schedule for submission of reports under 40 CFR 63.10(a), you must submit each report by the date in Table 7 of 40 CFR 63 Subpart ZZZZ and according to the requirements in 40 CFR 63.6650(b)(1) through (b)(9).

i. For semiannual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is

specified for your affected source in 40 CFR 63.6595 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in 40 CFR 63.6595.

ii. For semiannual Compliance reports, the first Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in 40 CFR 63.6595.

iii. For semiannual Compliance reports, each subsequent Compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

iv. For semiannual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

v. For annual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in 40 CFR 63.6595 and ending on December 31.

vi. For annual Compliance reports, the first Compliance report must be postmarked or delivered no later than January 31 following the end of the first calendar year after the compliance date that is specified for your affected source in 40 CFR 63.6595.

vii. For annual Compliance reports, each subsequent Compliance report must cover the annual reporting period from January 1 through December 31.

viii. For annual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than January 31.

f. Pursuant to 40 CFR 63.6650(c), the Compliance report must contain the information in 40 CFR 63.6650(c)(1) through (6).

i. Company name and address.

ii. Statement by a responsible official, with that official's name, title, and signature, certifying the accuracy of the content of the report.

iii. Date of report and beginning and ending dates of the reporting period.

iv. If you had a malfunction during the reporting period, the compliance report must include the number, duration, and a brief description for each type of malfunction which occurred during

the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by an owner or operator during a malfunction of an affected source to minimize emissions in accordance with 40 CFR 63.6605(b), including actions taken to correct a malfunction.

v. If there are no deviations from any emission or operating limitations that apply to you, a statement that there were no deviations from the emission or operating limitations during the reporting period.

g. Pursuant to 40 CFR 63.6650(h), if you own or operate an emergency stationary RICE with a site rating of more than 100 brake HP that operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must submit an annual report according to the requirements in 40 CFR 63.6650(h)(1) through (3).

i. The report must contain the following information:

A. Company name and address where the engine is located.

B. Date of the report and beginning and ending dates of the reporting period.

C. Engine site rating and model year.

D. Latitude and longitude of the engine in decimal degrees reported to the fifth decimal place.

E. Hours spent for operation for the purpose specified in 40 CFR 63.6640(f)(4)(ii), including the date, start time, and end time for engine operation for the purposes specified in 40 CFR 63.6640(f)(4)(ii). The report must also identify the entity that dispatched the engine and the situation that necessitated the dispatch of the engine.

F. If there were no deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), a statement that there were no deviations from the fuel requirements during the reporting period.

G. If there were deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), information on the number, duration, and cause of deviations, and the corrective action taken.

ii. The first annual report must cover the calendar year 2015 and must be submitted no later than March 31, 2016. Subsequent annual reports for each calendar year must be submitted no later than March 31 of the following calendar year.

iii. The annual report must be submitted electronically using the subpart specific reporting form in the Compliance and Emissions Data Reporting Interface (CEDRI) that is accessed through EPA's Central Data Exchange (CDX) (www.epa.gov/cdx). However, if the reporting form specific to 40 CFR 63 Subpart ZZZZ is not available in CEDRI at the time that the report is due, the written report must be submitted to the Illinois EPA or USEPA at the appropriate address listed in 40 CFR 63.13.

34. Pursuant to 35 Ill. Adm. Code 212.110(d), a person planning to conduct testing for particulate matter emissions to demonstrate compliance shall give written notice to the Illinois EPA of that intent. Such notification shall be given at least thirty (30) days prior to the initiation of the test unless a shorter period is agreed to by the Illinois EPA. Such notification shall state the specific test methods from 35 Ill. Adm. Code 212.110 that will be used.

35a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C)(iii), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in this 35 Ill. Adm. Code 214.122(b)(2). At minimum, and in addition to any permitting obligations, the notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3)(C), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in 35 Ill. Adm. Code 214.305(a). At minimum, and in addition to any permitting obligations, such notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

36a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit or otherwise, the Permittee shall submit a report to the Illinois EPA's Bureau of Air Compliance Section in Springfield, Illinois within thirty (30) days after the exceedance or deviation. The report shall identify the duration and the emissions impact of the exceedance or deviation, a copy of the relevant records and information to resolve the exceedance or deviation, and a description of the efforts to reduce emissions from, and the duration of exceedance or deviation, and to prevent future occurrences of any such exceedance or deviation.

b. One (1) copy of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

It should be noted that the 150,000 gallon fuel oil storage tank is exempt from permitting, pursuant to 35 Ill. Adm. Code 201.146(n)(3).

If you have any questions on this permit, please call German Barria at 217/785-1705.

Sincerely,

William D. Marr
Manager, Permit Section
Bureau of Air

WDM:GB:

Attachment A - Emission Summary

This attachment provides a summary of the maximum emissions from the Corn Mill & Grain Elevator operating in compliance with the requirements of this federally enforceable permit. In preparing this summary, the Illinois EPA used the annual operating scenario which results in maximum emissions from such a plant. The resulting maximum emissions are below the levels, (e.g., 100 tons/year for CO, NO_x, and PM_{10}) at which this source would be considered a major source for purposes of the Clean Air Act Permit Program. Actual emissions from this source will be less than predicted in this summary to the extent that less material is handled, and control measures are more effective than required in this permit.

	E M I S S I O N S (Tons/Year)					
Emission Unit	CO	NO_x	PM	PM_{10}	SO_2	VOM
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS)			14.02	14.02		
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS)			6.71	6.71		
Dry Corn Milling, Processing and Products Handling			28.32	28.32		
Corn Flour/Bran Handling System			3.05	3.05		
Corn Mill Products Storage			0.50	0.50		
Corn Mill Products Milling and Handling			9.52	8.35		
Boiler #1						
Natural Gas	34.56	20.57	3.13	3.13	0.25	2.26
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Clayton Boiler					0	0
Natural Gas	9.98	11.89	0.90	0.90	0.07	0.65
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Emergency Generator Set DG-100	0.60	2.60	0.08	0.08	0.01	0.07
Totals	49.40	52.06	69.03	67.86	0.51	3.16

Attachment B - Table 8 to Subpart ZZZZ of Part 63—Applicability of General Provisions to Subpart ZZZZ.

As stated in 40 CFR 63.6665, you must comply with the following applicable general provisions.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.1	General applicability of the General Provisions	Yes.	
§63.2	Definitions	Yes	Additional terms defined in 40 CFR 63.6675.
§63.3	Units and abbreviations	Yes.	
§63.4	Prohibited activities and circumvention	Yes.	
§63.5	Construction and reconstruction	Yes.	
§63.6(a)	Applicability	Yes.	
§63.6(b)(1)-(4)	Compliance dates for new and reconstructed sources	Yes.	
§63.6(b)(5)	Notification	Yes.	
§63.6(b)(6)	[Reserved]		
§63.6(b)(7)	Compliance dates for new and reconstructed area sources that become major sources	Yes.	
§63.6(c)(1)-(2)	Compliance dates for existing sources	Yes.	
§63.6(c)(3)-(4)	[Reserved]		
§63.6(c)(5)	Compliance dates for existing area sources that become major sources	Yes.	
§63.6(d)	[Reserved]		
§63.6(e)	Operation and maintenance	No.	
§63.6(f)(1)	Applicability of standards	No.	
§63.6(f)(2)	Methods for determining compliance	Yes.	
§63.6(f)(3)	Finding of compliance	Yes.	
§63.6(g)(1)-(3)	Use of alternate standard	Yes.	
§63.6(h)	Opacity and visible emission standards	No	Subpart ZZZZ does not contain opacity or visible emission standards.
§63.6(i)	Compliance extension procedures and criteria	Yes.	
§63.6(j)	Presidential compliance exemption	Yes.	
§63.7(a)(1)-(2)	Performance test dates	Yes	Subpart ZZZZ contains performance test dates at 40 CFR 63.6610, 63.6611, and 63.6612.
§63.7(a)(3)	CAA section 114 authority	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.7(b)(1)	Notification of performance test	Yes	Except that 40 CFR 63.7(b)(1) only applies as specified in 40 CFR 63.6645.
§63.7(b)(2)	Notification of rescheduling	Yes	Except that 40 CFR 63.7(b)(2) only applies as specified in 40 CFR 63.6645.
§63.7(c)	Quality assurance/test plan	Yes	Except that 40 CFR 63.7(c) only applies as specified in 40 CFR 63.6645.
§63.7(d)	Testing facilities	Yes.	
§63.7(e)(1)	Conditions for conducting performance tests	No.	Subpart ZZZZ specifies conditions for conducting performance tests at 40 CFR 63.6620.
§63.7(e)(2)	Conduct of performance tests and reduction of data	Yes	Subpart ZZZZ specifies test methods at 40 CFR 63.6620.
§63.7(e)(3)	Test run duration	Yes.	
§63.7(e)(4)	Administrator may require other testing under section 114 of the CAA	Yes.	
§63.7(f)	Alternative test method provisions	Yes.	
§63.7(g)	Performance test data analysis, recordkeeping, and reporting	Yes.	
§63.7(h)	Waiver of tests	Yes.	
§63.8(a)(1)	Applicability of monitoring requirements	Yes	Subpart ZZZZ contains specific requirements for monitoring at 40 CFR 63.6625.
§63.8(a)(2)	Performance specifications	Yes.	
§63.8(a)(3)	[Reserved]		
§63.8(a)(4)	Monitoring for control devices	No.	
§63.8(b)(1)	Monitoring	Yes.	
§63.8(b)(2)-(3)	Multiple effluents and multiple monitoring systems	Yes.	
§63.8(c)(1)	Monitoring system operation and maintenance	Yes.	
§63.8(c)(1)(i)	Routine and predictable SSM	No	
§63.8(c)(1)(ii)	SSM not in Startup Shutdown Malfunction Plan	Yes.	
§63.8(c)(1)(iii)	Compliance with operation and maintenance requirements	No	
§63.8(c)(2)-(3)	Monitoring system installation	Yes.	
§63.8(c)(4)	Continuous monitoring system (CMS) requirements	Yes	Except that subpart ZZZZ does not require Continuous Opacity Monitoring System (COMS).
§63.8(c)(5)	COMS minimum procedures	No	Subpart ZZZZ does not require COMS.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.8(c)(6)-(8)	CMS requirements	Yes	Except that subpart ZZZZ does not require COMS.
§63.8(d)	CMS quality control	Yes.	
§63.8(e)	CMS performance evaluation	Yes	Except for 40 CFR 63.8(e)(5)(ii), which applies to COMS.
		Except that 40 CFR 63.8(e) only applies as specified in 40 CFR 63.6645.	
§63.8(f)(1)-(5)	Alternative monitoring method	Yes	Except that 40 CFR 63.8(f)(4) only applies as specified in 40 CFR 63.6645.
§63.8(f)(6)	Alternative to relative accuracy test	Yes	Except that 40 CFR 63.8(f)(6) only applies as specified in 40 CFR 63.6645.
§63.8(g)	Data reduction	Yes	Except that provisions for COMS are not applicable. Averaging periods for demonstrating compliance are specified at 40 CFR 63.6635 and 63.6640.
§63.9(a)	Applicability and State delegation of notification requirements	Yes.	
§63.9(b)(1)-(5)	Initial notifications	Yes	Except that 40 CFR 63.9(b)(3) is reserved.
		Except that 40 CFR 63.9(b) only applies as specified in 40 CFR 63.6645.	
§63.9(c)	Request for compliance extension	Yes	Except that 40 CFR 63.9(c) only applies as specified in 40 CFR 63.6645.
§63.9(d)	Notification of special compliance requirements for new sources	Yes	Except that 40 CFR 63.9(d) only applies as specified in 40 CFR 63.6645.
§63.9(e)	Notification of performance test	Yes	Except that 40 CFR 63.9(e) only applies as specified in 40 CFR 63.6645.
§63.9(f)	Notification of visible emission (VE)/opacity test	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.9(g)(1)	Notification of performance evaluation	Yes	Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.
§63.9(g)(2)	Notification of use of COMS data	No	Subpart ZZZZ does not contain opacity or VE standards.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.9(g)(3)	Notification that criterion for alternative to RATA is exceeded	Yes	If alternative is in use.
		Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.	
§63.9(h)(1)-(6)	Notification of compliance status	Yes	Except that notifications for sources using a CEMS are due 30 days after completion of performance evaluations. 40 CFR 63.9(h)(4) is reserved.
			Except that 40 CFR 63.9(h) only applies as specified in 40 CFR 63.6645.

Subject: [External] RE: Bunge North America, In. - ID: 183020ABT

German,

We have had a chance to review your email related to our pending FESOP permit, your request for a fugitive dust plan, our recent application for a construction permit and your request for Bunge to evaluate opportunities to reduce its permitted emissions as an offset to the increase in the construction permit application. Bunge would like to address each of these points individually.

1) Bunge proposes to perform a complete review of the draft FESOP and provide IEPA with comments no later than September 1, 2022.
2) Along with the review of the FESOP, Bunge will prepare and submit a fugitive dust plan for the Danville facility no later than September 1, 2022.
3) Bunge will evaluate opportunities to reduce its permitted emissions by at least the amount of the proposed increase in the construction permit application and submit the necessary construction permit applications to enact the changes necessary to realize the permitted emission reductions and subsequently incorporate the changes into the facility's operating permit.
4) Bunge requests that IEPA proceed with the review of the construction permit application while we work on the tasks 1, 2 and 3. The effort to complete them will take time and Bunge does not want this to delay your review or the issuance of the construction permit. It is important to Bunge that the facility can start construction as soon as possible.

Bunge appreciates your consideration of our proposal. Please contact me with any questions.

Thank you,

CAUTION: This email originated from outside of Bunge. Do not click links or open attachments unless you recognize the sender !

Good morning Mr. Burris,
We received an application for a construction permit (App No. 22040008) on April 8, 2022. We also sent Bunge a draft of their FESOP back in June 1, 2021 for their review, as well as we requested a fugitive dust plan.
We will need a fugitive dust plan in order to process this application for construction.
Further, this source is located in an Environmental Justice Area (E.J), as so, IEPA has been requesting applicant for construction permit to what emission limits they request in construction permit, to offset them in their source overall operating permit limits. In this application Bunge proposes a permit limit for the S 105 Roof Carter-Day Filter of PM/PM10: 3.05 tons/year, PM2.5: 1.52 tons/year, we will like to see that been reduced in some where else in the limits that are proposed in the draft FESOP.

Please don't hesitate to contact me if you have any questions.

Thank you.

I. INTRODUCTION

Bunge North America, Inc. has applied for a Federally Enforceable State Operating Permit (FESOP) for its plant located at 321 E. North Street in Danville. This plant requires an air pollution control operating permit because it is a source of emissions. The Illinois EPA has prepared a draft of the renewed permit that it would propose to issue for the plant. However, before renewing the permit, the Illinois EPA is holding a public comment period to receive comments on this proposed action and the terms and conditions of the draft permit that it would propose to issue.

II. SOURCE DESCRIPTION

Bunge North America, Inc. is a corn mill and grain elevator. The emission units at this plant that require an operating permit are shown in Table 1, below.

Table 1. Listing of Non-Exempt Emission Units Located at the Source.

Emission Unit and Description	Construction Date (and Date Last Modified)
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):	
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10	Prior to 1978
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96	Prior to 1970

These units are sources of emissions because Particulate Matter (PM) and Particulate Matter less than 10 microns (PM_{10}) is generated from the receiving, handling, and milling of grain at the facility. This source is also a source of Carbon Monoxide (CO) and Nitrogen Oxides (NO_x) from the combustion of fuel in the boilers and generator at this facility. NO_x is formed thermally by the combination of oxygen and nitrogen in the air at the temperatures at which fuel is burned. Thermal NO_x is formed during all common high temperature combustion processes. CO is formed from incomplete combustion of the fuel.

The following table lists annual emissions (tons) of pollutants emitted from this source, as reported in the last three Annual Emission Reports (AER) sent to the Illinois EPA:

Table 2. Actual and Potential (as limited by permit) Emissions of the Source.

Pollutant	Actual Emissions			PTE
	2018 (tons)	**2019** (tons)	**2020** (tons)	**as limited by permit** (tons/year)
Carbon Monoxide (CO)	16.5000	16.3400	17.3000	49.40
Nitrogen Oxides (NO_x)	11.9000	11.6000	11.9000	52.06
Particulate Matter (PM)	67.8000	65.8000	65.5000	69.03
Particulate Matter less than 10 Microns (PM_{10})	27.8000	28.0000	32.9000	67.86
Sulfur Dioxide (SO_2)	0.1100	0.1100	0.1300	0.51
Volatile Organic Material (VOM)	1.1900	1.1700	1.5800	3.16

This source also contains emission units and activities that are exempt from permitting under 35 Ill. Adm. Code 201.146 and the emissions from such units are not limited by the conditions of the draft permit. These emission units include:

150,000 gallon fuel oil storage tank

Based on a review of the estimated potential emissions from the exempt emission units as included in the permit application, the Illinois EPA has determined that the emissions from such exempt emission units are trivial and will not contribute to this source being a major source of emissions for any regulated pollutants emitted from any such exempt emission unit. This is because the emission limits for CO, NO_x, and PM_{10} in the draft FESOP are 90% or less of the applicable major source thresholds, and the combined PTE of the exempt emission units are less than 5% of the applicable major source thresholds, In other words, the emission limits for CO, NO_x, and PM_{10} have been limited to 90% or less of the applicable threshold (or 100 tons/year) by the draft FESOP and the combined potential to emit of the CO, NO_x, and PM_{10} from the exempt units is estimated to be less than 5% of 100 tons/year. In addition, as shown in Table 2, above, the margin of compliance between the actual emissions reported by the source during the last three years and the potential emissions as limited in the draft FESOP is more than 66% for CO, 77% for NO_x, and 56% for PM_{10}, which further minimizes the likelihood of the source exceeding its permit limits or the applicable major source thresholds.

In cases where the potential emissions of exempt emission units may contribute to the source exceeding major source thresholds (for example, if the emission limits in the FESOP are 90% or more of the applicable major source thresholds and the exempt units' PTE is 5% or more of the threshold) the Illinois EPA has established limits on such emission units in the draft FESOP that would normally be exempt from permitting. The permitting exemptions in 35 Ill. Adm. Code 201.146 do not relieve the owner or operator of any source from any obligation to comply with any other applicable requirements.

III. GENERAL DISCUSSION

FESOPs are federally enforceable, that is, the terms and conditions of the permits can be enforced by the United States Environmental Protection Agency (USEPA) under federal law, as well as by Illinois government and the public under state law. These permits can establish federally enforceable limitations on the operation and emissions of a source that restrict the potential emissions of the source.

The source may operate this plant under a FESOP because the actual emissions of the plant are below the levels at which the plant would be considered a major source under Title V of the federal Clean Air Act. However, in the absence of federally enforceable limitations, the plant's potential emissions would be such that the plant would be considered a major source. The permit acts to restrict the plant potential emissions so that it need not be considered a major source. As a result, the source does not need to obtain a Clean Air Act Permit Program (CAAPP) permit for the plant, as would otherwise be required.

The FESOP limits the operation and annual emissions of the plant to below the major-source-thresholds of 100 tons for CO, NO_x, and PM_{10}. The potential emissions of other pollutants (e.g., SO_2, VOM, and Hazardous Air Pollutants) from the plant are small enough that no restrictions are needed to avoid being a major source of these pollutants.

IV. APPLICABLE EMISSION STANDARDS

All emission units in Illinois must comply with state emission standards adopted by the Illinois Pollution Control Board (Board). These emission standards represent the basic requirements for sources in Illinois. The Board has specific standards for particulate matter under 35 Ill. Adm. Code Part 212. The processing and milling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions), which limits the opacity of emissions to 30 percent, and 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units), which limits PM emissions based on each units process weight rate. The receipt and handling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions) and 35 Ill. Adm. Code Part 212 Subpart S (Agriculture), which requires the source to implement and use certain housekeeping practices to reduce particulate matter emissions and to equip the sources receiving dump pits with air pollution control equipment that is capable of at least 90% collection efficiency for PM emissions. The boilers are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions) and 35 Ill. Adm. Code Part 212 Subpart E (Particulate Matter Emissions From Fuel Combustion Emission Units), which limits the emissions of PM from the combustion of liquid fuel to 0.10 lb/mmBtu.

The Clayton Boiler is at this source are subject to the New Source Performance Standards (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR 60, Subparts A and Dc. The Illinois EPA is administering the NSPS in

Illinois on behalf of the United States EPA under a delegation agreement. The source also has another boiler that was constructed prior to June 9, 1989 and as result will not be subject the NSPS standards.

Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) at this source are subject to the New Source Performance Standards (NSPS) for Grain Elevators, 40 CFR 60, Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States EPA under a delegation agreement. The source also has other grain receiving, cleaning and storage operations that were constructed prior to August 3, 1978 and as result will not be subject the NSPS standards.

Emergency Generator Set DG-100 at this source are subject to the National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR 63, Subparts A and ZZZZ. The Illinois EPA is administering the NESHAP in Illinois on behalf of the United States EPA under a delegation agreement.

The application shows that the plant is in compliance with applicable state and federal emission standards.

V. CONTENTS OF THE PERMIT

The permit that the Illinois EPA is proposing to issue will identify the specific emission standards that apply to the emission units at the plant. As explained, the processing and milling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B, which limits the opacity of emissions to 30 percent, and 35 Ill. Adm. Code Part 212 Subpart L, which limits PM emissions based on each units process weight rate. The receipt and handling of grain is subject to 35 Ill. Adm. Code Part 212 Subpart B and 35 Ill. Adm. Code Part 212 Subpart S, which requires the source to implement and use certain housekeeping practices to reduce particulate matter emissions and to equip the sources receiving dump pits with air pollution control equipment that is capable of at least 90% collection efficiency for PM emissions. The boilers are subject to 35 Ill. Adm. Code Part 212 Subpart B and 35 Ill. Adm. Code Part 212 Subpart E, which limits the emissions of PM from the combustion of liquid fuel to 0.10 lb/mmBtu. The conditions of this permit are intended to ensure that the source continues to comply with applicable emission standards.

The permit would also contain limitations and requirements to assure that this plant is operated as a non-major source. The permit would limit the operation and annual emissions of the plant to below the major-source-thresholds of 100 tons for CO, NO_x, and PM_{10}. (Annual emissions of other pollutants from the plant are well below the 100 ton major source threshold.)

The permit would also set limitations on PM_{10} emissions based on the air flow to the baghouses and cyclones and the grain loading of these control devices determine by stack testing conducted at the source. The boilers are to be limited based on the types of fuel combusted and the amount of each fuel usage. These limitations are consistent with the historical operation of emission units at the plant.

The permit conditions would also continue to require appropriate compliance procedures, including inspection practices as well as recordkeeping and reporting requirements. The source must carry out these procedures on an on-going basis to demonstrate that the plant is being operated within the limitations set by the permit and the plant's emissions are being properly controlled.

VI. REQUEST FOR COMMENTS

It is the Illinois EPA's preliminary determination that the source has met the requirements for issuance of its permit. The Illinois EPA is therefore proposing to issue the permit.

Comments are requested on this proposed action by the Illinois EPA and the proposed conditions on the draft permit. If substantial public interest is shown in this matter, the Illinois EPA will consider holding a public hearing in accordance with 35 IAC Part 166.

ILLINOIS ENVIRONMENTAL PROTECTION AGENCY

FEDERALLY ENFORCEABLE STATE OPERATING PERMIT -- NSPS and NESHAP SOURCE

PERMITTEE

Bunge North America, Inc.
Attn: Dean Hughes
11720 Borman Drive
St. Louis, Missouri 63146-1000

Application No.: 96020027 I.D. No.: 183020ABT
Applicant's Designation: Date Received: December 5, 2011
Operation of: Corn Mill & Grain Elevator
Date Issued: Expiration Date:
Source Location: 321 E. North Street, Danville, Vermilion County

This permit is hereby granted to the above-designated Permittee to OPERATE emission unit(s) and/or air pollution control equipment consisting of:

Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10;
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96;

Blended Food Packaging (4820-0001-0052) controlled by Baghouse Filters APM 16150.6;
ALLBOND Visc. Flour General Aspiration (4900-0001-0068) controlled by Baghouse Filters BUHLER 16-8-100;
Milk Bins (4820-0003-0007) controlled by Baghouse Filters MICROPUL 6B;
300 Series Binning (4990-0007-0049) controlled by Baghouse Filters MICROPUL 1F1;
Soy Meal General Aspiration (4990-0001-0002) controlled by Baghouse Filters APM 16022.4;
Soy Meal Surge Bin (4990-0001-0006) controlled by Baghouse Filters MICROPUL 6B;

Meal Bin Cooler (4990-0001-0025) controlled by Baghouse Filters APM 400072.10;
3/4 Soy Flour Receiver (4990-0002-0043) controlled by Baghouse Filters APM16014.8;
Tri Cal Bins (4820-0003-0072) controlled by Baghouse Filters APM 16009.8;
5/6 Allond Receiver (4900-0001-0058) controlled by Baghouse Filters APM 16014.8;
7/8 Soy Flour Receiver (4990-0003-0032) controlled by Baghouse Filters APM 16014.8;
Five (5) Bins (Bin 308 (4990-0002-0033), 309 (4990-0002-0036), 310 (4820-0003-0038), 508 (4820-0002-0068), and 509 (4820-0002-0072)) controlled by Baghouse Filters MICROPUL 6B;
9/10 Pulvicron Receiver (4990-0004-0037) controlled by Baghouse Filters BUHLER 16-6-220;
Milk Bins (4820-0002-0038) controlled by Baghouse Filters MICROPUL 21-6-220;
Milk Bin Bag Dump (4820-0002-0035) controlled by Baghouse Filters APM 14048.6;
Blending Batch Bin General Aspiration (4990-0007-0029) controlled by Baghouse Filters BUHLER 25S-6-30;
Blender General Aspiration (4990-0007-0036) controlled by Baghouse Filters BUHLER 16S-6-30;
Blender General Aspiration (4990-0007-0032) controlled by Baghouse Filters MICROPUL 36S-8-30;
Two (2) CSB Binning General Aspiration (4820-0003-0063 and 4820-0003-0059) controlled by Baghouse Filters BUHLER 64S-6-20;
General Aspiration (4990-0006-0040) controlled by Baghouse Filters BUHLER 9-8-220;
#5 SL General Aspiration & #5 Expander (4900-0001-0091) controlled by Baghouse Filters APM 14024.6;
Fiber Receiver General Aspiration (4990-0011-0001) controlled by Baghouse Filters BUHLER 9-8-220;
PCM Binning (4820-0002-0011) controlled by Baghouse Filters MICROPUL 1F1;
CF Bran Packing Binning (4870-0010-0005) controlled by Baghouse Filters MICROPUL 25-8-220;
Bldg 111 Vacuum (4900-0005-0035) controlled by Baghouse Filters HOFFMAN 60X120;
110/210 Receiver General Aspiration (4870-0006-0006) controlled by Baghouse Filters APM 16030.4;
Fiber Receiver General Aspiration (4990-0011-0029) controlled by Baghouse Filters APM 16019.4;
Cooling Tower (4990-0001-0029) controlled by Baghouse Filters APM 40072.10;
Two (2) Ingredient Bins (601 (4820-0003-0022) and 602 (4820-0003-0026)) controlled by Baghouse Filters MICROPUL 4B;
Ingredient Bin 603 (4820-0003-0030) controlled by Baghouse Filters MICROPUL 2 1/2 B;
Ingredient Bin 604 (4820-0003-0034) controlled by Baghouse Filters APM 15105.4;
Micro Ingredient Dump Filter (4820-0003-0018) controlled by Baghouse Filters APM 15105.4;
Mixer General Aspiration (4820-0003-0004) controlled by Baghouse Filters BUHLER 25S-6-30;
3/4 Hammermill (4900-0001-0065) controlled by Baghouse Filters APM 16009.6;

#3 & #4 Expanders (4900-0001-0006) controlled by Baghouse Filters APM 16009.6;
Reprocess General Cooler Dryer Roof (4900-0005-0001) controlled by Baghouse Filters CD 376RF10;
#6 Pulverizer Grinder (4900-0001-0042) controlled by Baghouse Filters BUHLER 37-8-220;
5/6 Pulverizer AB Finished Product Surge Bin (4900-0001-0046) controlled by Baghouse Filters MICROPUL 4B;
Pellet Bins (4900-0002-0032) controlled by Baghouse Filters BUHLER 16S-6-30;
Viscosity Flour Receiver (4990-0006-0027) controlled by Baghouse Filters APM 16022.8;
Conditioning Receiver/Soy Meal Grinder (4990-0011-0010) controlled by Baghouse Filters APM 16014.8;
Grind Reject/Scrap Bin (4900-0005-0007) controlled by Baghouse Filters MICROPUL 2 1/2B;
Bldg 112 Vacuum (4900-0005-0029) controlled by Baghouse Filters HOFFMAN 36X96;
AB Grinder Surge Bin (4900-0001-0030) controlled by Baghouse Filters BUHLER 37-8-220;
N DAY General Aspiration & #5 Expander (4900-0005-0006) controlled by Baghouse Filters CD 484RF12;
Blended Foods Filter (4820-0001-0093) controlled by Baghouse Filters DD 124RF10;
Round Bin General Aspiration (4750-0029-0027) controlled by Baghouse Filters APM 14072.6;
Hominy Truck Loadout Aspiration (4912-0002-0054) controlled by Baghouse Filters DD 484RF12;
North and South Hominy Feed (4860-0018-0007 and 4860-0018-0003) controlled by Baghouse Filters MICROPUL 1F2;
Secondary Clean Grinding (4860-0022-0017) controlled by Baghouse Filters APM 15030.8;
Bran Dryer (4860-0024-0003) controlled by Corona Cyclone;
Track 16 Bulk Rail Loadout ,(4912-0006-0017) controlled by Baghouse Filters WEIDENMAN LFT 2X7;
Flaking General Aspiration (4860-0017-0073) controlled by Baghouse Filters APM 40120.8;
Germ Dusters Aspiration (4860-0023-0001) controlled by Baghouse Filters APM 40120.8;
Germ Dryer (4860-0017-0003) controlled by DAY CYCLONE HV56;
Germ Rolls Aspiration (4860-0017-0072) controlled by DAY CYCLONE HV56;
Fts Dryer Aspiration (4860-0019-0003) controlled by CORONA 15 CYCLONE;
Pet Bran Kice Lites Filter (4860-0024-0037) controlled by Baghouse Filters MICROPUL;
Bin 945 Germ Receiver (4860-0017-0026) controlled by Baghouse Filters BUHLER 36S-6-30;
Two (2) Cyclone Receivers (Extrusion Receiver; 108 A-Bin Receiver) controlled by Baghouse Filters (5&6 Allbond Receiving Filter);
Pneumatic Lift Receiver for Coarse Whole Grain transfer (WG260);
PCM Hammermill controlled by Filter System (78-03:11);
USG Hammermill controlled by Filter System (78-03:27);
USG Extruder Pellet Transfer controlled by Collection Cyclone (78-08:22);

One (1) Baghouse S 105 Roof Carter-Day Filter (34:86) controlling the following:

One (1) #1 Coarse Gravity Table Aspiration Cyclone Collector (05:68) (17,000 dscfm);
One (1) #3 Fine Gravity Table Aspiration Cyclone Collector (06:88) (17,000 dscfm);
One (1) #1 Satake Degerminator Cyclone Collector (45:07) (1,400 dscfm);
One (1) #1 Satake Aspiration Cyclone Collector (45:12) (1,400 dscfm);
One (1) #2 Satake Degerminator Cyclone Collector (45:09) (1,400 dscfm);
One (1) #2 Satake Aspiration Cyclone Collector (45:24) (1,400 dscfm);
Satake Sifter and Sifter Air Locks;

One (1) Pneumatic Transfer Line and Cyclone Receiver (45:20) controlled by 8th Floor Donaldson Filter (34:27);

One (1) Pneumatic Transfer Line and Cyclone Receiver (23:102) controlled by West MAC Filter (34:01);

Corn Mill Products Storage:
Bldg 201/202 Vacuum (4912-0008-0006) controlled by Baghouse Filters HOFFMAN 36X96;
Bldg 208 Vacuum (4912-0009-0005) controlled by Baghouse Filters HOFFMAN 36X96;
Hominy Feed Bins Aspiration (4750-0029-0074) controlled by Baghouse Filters DONALDSON 276RFW12;

Corn Mill Products Milling and Handling:
Hominy Binning (4750-0029-0032) controlled by Baghouse Filters APM 40240.8;
Hominy Grinder General Aspiration (4750-0029-0001) controlled by Baghouse Filters APM 40224.4;
Truck Hominy Loadout (4912-0004-0022) controlled by Baghouse Filters 376RF8;
Rail Hominy/Grain Loadout #1 (4912-0003-0011) controlled by Baghouse Filters 376RF12;
Long Term Meal System (LTMS) & Rail Meal/Grain Transfer (4750-0033-0001) controlled by Baghouse Filters 376RF8;
LTMS & Rail Meal/Grain Loadout (4750-0033-0011) controlled by Baghouse Filters MAC 144MCF416;
Flour Pellet Cooler (4750-0025-0015) controlled by Baghouse Filters MAC Cyclone HE39;
Hominy Screener General Aspiration (4750-0029-0045) controlled by Baghouse Filters MICROPUL 100S-6-20;
LTMS Truck/Rail Dump Pit (4750-0033-0000A);
LTMS Truck Loadout (4750-0033-0000B);

Boiler House/Grounds:
One (1) 96.55 mmBtu/hour Natural Gas/Distillate Fuel-Oil Fired Boiler with Low NO_x Burner (Boiler #1);
One (1) 27.90 mmBtu/hour Natural Gas-Fired/Distillate Fuel-Oil Fired Boiler (Clayton Boiler);
One (1) 2,168 engine Hp Diesel-Powered Emergency Generator Set (DG-100); and

Fugitive PM and PM_{10} emissions

pursuant to the above referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This Federally Enforceable State Operating Permit (FESOP) is issued to limit the emissions of air pollutants from the source to less than major source thresholds (i.e., 100 tons/year for Carbon Monoxide (CO), Nitrogen Oxides (NO_x), and Particulate Matter less than 10 microns (PM_{10})). As a result, the source is excluded from the requirements to obtain a Clean Air Act Permit Program (CAAPP) permit. The maximum emissions of this source, as limited by the conditions of this permit, are described in Attachment A.

b. Prior to issuance, a draft of this permit has undergone a public notice and comment period.

c. This permit supersedes all operating permit(s) for this location.

2a. The Clayton Boiler is subject to the New Source Performance Standard (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR Part 60 Subparts A and Dc. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States Environmental Protection Agency (USEPA) under a delegation agreement. Pursuant to 40 CFR 60.40c(a), except as provided in 40 CFR 60.40c(d), (e), (f), and (g), the affected facility to which 40 CFR 60 Subpart Dc applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (mmBtu/hr)) or less, but greater than or equal to 2.9 MW (10 mmBtu/hr).

b. Pursuant to 40 CFR 60.42c(d), on and after the date on which the initial performance test is completed or required to be completed under 40 CFR 60.8, whichever date comes first, no owner or operator of an affected facility that combusts oil shall cause to be discharged into the atmosphere from that affected facility any gases that contain SO_2 in excess of 215 ng/J (0.50 lb/mmBtu) heat input from oil; or, as an alternative, no owner or operator of an affected facility that combusts oil shall combust oil in the affected facility that contains greater than 0.5 weight percent sulfur. The percent reduction requirements are not applicable to affected facilities under this paragraph.

c. Pursuant to 40 CFR 60.42c(h)(1), for distillate oil-fired affected facilities with heat input capacities between 2.9 and 29 MW (10 and 100 mmBtu/hour), compliance with the emission limits or fuel oil sulfur limits under 40 CFR 60.42c may be determined based on a certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

d. Pursuant to 40 CFR 60.42c(i), the SO_2 emission limits, fuel oil sulfur limits, and percent reduction requirements under 40 CFR 60.42c apply at all times, including periods of startup, shutdown, and malfunction.

3a. The Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) are subject to the NSPS for Grain Elevators, 40 CFR Part 60 Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 60.300(a), the provisions of 40 CFR 60 Subpart DD apply to each affected facility at any grain terminal elevator or any grain storage elevator, except as provided under 40 CFR 60.304(b). The affected facilities are each truck unloading station, truck loading station, barge and ship unloading station, barge and ship loading station, railcar loading station, railcar unloading station, grain dryer, and all grain handling operations.

b. Pursuant to 40 CFR 60.300(b), any facility under 40 CFR 60.300(a) which commences construction, modification or reconstructed after August 3, 1978 is subject to the requirements of 40 CFR 60 Subpart DD.

c. Pursuant to 40 CFR 60.302(b), on and after the date on which the performance test required to be conducted by 40 CFR 60.8 is completed, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere from any affected facility except a grain dryer any process emission which:

i. Contains particulate matter in excess of 0.023 g/dscm (ca. 0.01 gr/dscf).

ii. Exhibits greater than 0 percent opacity.

d. Pursuant to 40 CFR 60.302(c), on and after the 60th day of achieving the maximum production rate at which the affected facility will be operated, but no later than 180 days after initial startup, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere any fugitive emission from:

i. Any individual truck unloading station, railcar unloading station, or railcar loading station, which exhibits greater than 5 percent opacity.

ii. Any grain handling operation, which exhibits greater than 0 percent opacity.

iii. Any truck loading station which exhibits greater than 10 percent opacity.

4a. Emergency Generator Set DG-100 is subject to the National Emission Standard for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR Part 63 Subparts A and ZZZZ. The Illinois EPA is administering the NESHAP in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 63.6590(a), an affected source is any existing, new, or reconstructed stationary RICE located at a major or area source of HAP emissions, excluding stationary RICE being tested at a stationary RICE test cell/stand.

b. Pursuant to 40 CFR 63.6595(a)(1), if you have an existing stationary RICE, excluding existing non-emergency CI stationary RICE, with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the applicable emission limitations, operating limitations and other requirements no later than June 15, 2007. If you have an existing non-emergency CI stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, an existing stationary CI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary CI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than May 3, 2013. If you have an existing stationary SI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary SI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than October 19, 2013.

c. Pursuant to 40 CFR 63.6603(a), if you own or operate an existing stationary RICE located at an area source of HAP emissions, you must comply with the requirements in Table 2d to 40 CFR 63 Subpart ZZZZ and the operating limitations in Table 2b to 40 CFR 63 Subpart ZZZZ that apply to you.

Table 2d to Subpart ZZZZ of Part 63—Requirements for Existing Stationary RICE Located at Area Sources of HAP Emissions

As stated in 40 CFR 63.6600 and 63.6640, you must comply with the following requirements for existing stationary RICE located at area sources of HAP emissions:

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
4. Emergency stationary CI RICE and black start stationary CI RICE.[2]	a. Change oil and filter every 500 hours of operation or annually, whichever comes first;[1]	
	b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first; and	
	c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.	

[1]Sources have the option to utilize an oil analysis program as described in 40 CFR 63.6625(i) or (j) in order to extend the specified oil change requirement in Table 2d of 40 CFR 63 Subpart ZZZZ.

[2]If an emergency engine is operating during an emergency and it is not possible to shut down the engine in order to perform the management practice

requirements on the schedule required in Table 2d of 40 CFR 63 Subpart ZZZZ, or if performing the management practice on the required schedule would otherwise pose an unacceptable risk under federal, state, or local law, the management practice can be delayed until the emergency is over or the unacceptable risk under federal, state, or local law has abated. The management practice should be performed as soon as practicable after the emergency has ended or the unacceptable risk under Federal, State, or local law has abated. Sources must report any failure to perform the management practice on the schedule required and the Federal, State or local law under which the risk was deemed unacceptable.

5a. The Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; Corn Mill Products Milling and Handling; Boiler #1, Clayton Boiler, and Emergency Generator Set DG-100 are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions). Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute period shall occur from only one such emission unit located within a 305 m (1000 ft) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 212 Subpart E (Particulate Matter Emissions From Fuel Combustion Emission Units). Pursuant to 35 Ill. Adm. Code 212.206, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period to exceed 0.15 kg of particulate matter per MW-hr of actual heat input from any fuel combustion emission unit using liquid fuel exclusively (0.10 lbs/mmBtu).

d. This source is subject to 35 Ill. Adm. Code Part 212 Subpart K (Fugitive Particulate Matter). Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

e. When processing and handling processed materials, the emission units constructed on or after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products

Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

f. Pursuant to 35 Ill. Adm. Code 212.321(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.321(c) shall be determined by using the equation:

$$E = A(P)^B$$

where:

P = Process weight rate; and
E = Allowable emission rate; and,

i. Up to process weight rates of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.214	2.54
B	0.534	0.534

ii. For process weight rate greater than or equal to 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	11.42	24.8
B	0.16	0.16

g. Pursuant to 35 Ill. Adm. Code 212.321(c), Limits for Process Emission Units for Which Construction or Modification Commenced on or After April 14, 1972:

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lbs/hr
0.05	0.25	0.05	0.55
0.1	0.29	0.10	0.77
0.2	0.42	0.20	1.10
0.3	0.64	0.30	1.35
0.4	0.74	0.40	1.58
0.5	0.84	0.50	1.75
0.7	1.00	0.75	2.40

Metric		English	
P Mg/hr	E kg/hr	P T/hr	E lbs/hr
320.0	29.4	350.00	64.90
360.0	30.0	400.00	66.20
400.0	30.6	450.00	67.70
454.0	31.3	500.00	69.00

where:

P = Process weight rate in Mg/hr or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

k. The handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations are subject to 35 Ill. Adm. Code Part 212 Subpart S (Agriculture). Pursuant to 35 Ill. Adm. Code 212.462, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d), or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), existing grain-handling operations with a total annual grain through-put of 300,000 bushels or more shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall demonstrate compliance with the following:

i. Cleaning and Separating Operations.

A. Particulate matter generated during cleaning and separating operations shall be captured to the extent necessary to prevent visible particulate matter emissions directly into the atmosphere.

B. For grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area, air contaminants collected from cleaning and separating operations shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

ii. Major Dump-Pit Area.

Induced Draft.

A. Induced draft shall be applied to major dump pits and their associated equipment (including, but not limited to, boots, hoppers and legs) to such an extent that a minimum face velocity is maintained, at the effective grate surface, sufficient to contain particulate emissions generated in unloading operations. The minimum face velocity at the effective grate surface shall be at least 200 fpm, which shall be determined by using the equation:

$$V = Q/A$$

where:
V = face velocity; and
Q = induced draft volume in scfm; and
A = effective grate area in ft^2; and

B. The induced draft air stream for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be confined and conveyed through air pollution control equipment which has an overall rated and actual particulate collection efficiency of not less than 90 percent by weight;

C. Means or devices (including, but not limited to, quick-closing doors, air curtains or wind deflectors) shall be employed to prevent a wind velocity in excess of 50 percent of the induced draft face velocity at the pit; provided, however, that such means or devices do not have to achieve the same degree of prevention when the ambient air wind exceeds 25 mph. The wind velocity shall be measured, with the induced draft system not operating, at a point midway between the dump-pit area walls at the point where the wind exits the dump-pit area, and at a height above the dump-pit area floor of approximately 2 ft; or

iii. Internal Transferring Area.

A. Internal transferring area shall be enclosed to the extent necessary to prohibit visible particulate matter emissions directly into the atmosphere.

B. Air contaminants collected from internal transfer operations for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

iv. Load-Out Area.

A. Truck and hopper car loading shall employ socks, sleeves or equivalent devices which extend 6 inches below the sides of the receiving vehicle, except for topping off. Choke loading shall be considered an equivalent method as long as the discharge is no more than 12 inches above the sides of the receiving vehicle.

B. Box car loading shall employ means or devices to prevent the emission of particulate matter into the atmosphere to

the fullest extent which is technologically and economically feasible.

1. Pursuant to 35 Ill. Adm. Code 212.463, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d) or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), grain-drying operations for which construction or modification commenced prior to June 30, 1975, with a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity (using the American Society of Agricultural Engineers Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers) shall be operated in such a fashion as to preclude the emission of particulate matter larger than 300 microns mean particle diameter, shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the following:

   i. Column Dryers. The largest effective circular diameter of transverse perforations in the external sheeting of a column dryer shall not exceed 0.094 inch, and the grain inlet and outlet shall be enclosed.

   ii. Rack Dryers. No portion of the exhaust air of rack dryers shall be emitted to the ambient atmosphere without having passed through a particulate collection screen having a maximum opening of 50 mesh, U.S. Sieve Series.

      A. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling facilities having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 90 percent by weight prior to release into the atmosphere.

      B. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling sources having a grain through-put exceeding 2 million bushels per year and located in a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 98 percent by weight prior to release into the atmosphere.

   iii. Other Types of Dryers. All other types of dryers shall be controlled in a manner which shall result in the same degree of control required for rack dryers pursuant to 35 Ill. Adm. Code 212.463(b).

   iv. New and Modified Grain-Drying Operations. Grain-drying operations constructed or modified on or after June 30, 1975, shall file applications for construction and operating permits

pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the control equipment requirements of 35 Ill. Adm. Code 212.463, except for new and modified grain-drying operations which do not result in a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity, using the American Society of Agricultural Engineer Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers.

6a. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 214 Subpart B (New Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 214.122(b)(2), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The sulfur content of all distillate fuel oil used by the fuel combustion emission source must not exceed 15 ppm;

b. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 214 Subpart K (Process Emission Sources). Pursuant to 35 Ill. Adm. Code 214.301, except as further provided by 35 Ill. Adm. Code Part 214, no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm.

c. Pursuant to 35 Ill. Adm. Code 214.305(a)(2), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The sulfur content of all distillate fuel oil used by the process emission source must not exceed 15 ppm;

7. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 215 Subpart K (Use of Organic Material). Pursuant to 35 Ill. Adm. Code 215.301, no person shall cause or allow the discharge of more than 3.6 kg/hr (8 lbs/hr) of organic material into the atmosphere from any emission source, except as provided in 35 Ill. Adm. Code 215.302, 215.303, 215.304 and the following exception: If no odor nuisance exists the limitation of 35 Ill. Adm. Code Part 215 Subpart K shall apply only to photochemically reactive material.

8. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 216 Subpart B (Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 216.121, no person shall cause or allow the emission of carbon monoxide (CO) into the atmosphere from any fuel combustion emission source with actual heat input greater than 2.9 MW (10 mmBtu/hr) to exceed 200 ppm, corrected to 50 percent excess air.

9a. This permit is issued based on the Cooling Tower at this source not being subject to the NESHAP for Process Cooling Towers, 40 CFR 63 Subpart Q because the cooling tower is not operated with chromium-based

water treatment chemicals and is not either major sources or is an integral part of a facility that is a major source.

b. This permit is issued based on the source no longer being subject to the NESHAP for Solvent Extraction for Vegetable Oil Production, 40 CFR 63 Subpart GGGG, because the source no longer operates a vegetable oil production process and is no longer a major source of HAP emissions.

c. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters, 40 CFR 63 Subpart DDDDD because this source is not or is part of, a major source of Hazardous Air Pollutant (HAP) emissions as defined in 40 CFR 63.2.

d. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the requirements of the NESHAP for Industrial, Commercial, and Institutional Boilers Area Sources, 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11195(e), gas-fired boilers are not subject to 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11237, gas-fired boiler includes any boiler that burns gaseous fuels not combined with any solid fuels, burns liquid fuel only during periods of gas curtailment, gas supply emergencies, or periodic testing on liquid fuel. Periodic testing of liquid fuel shall not exceed a combined total of 48 hours during any calendar year.

e. This permit is issued based on the source not being subject to the National Emission Standards (NESHAP) for Area Sources: Prepared Feeds Manufacturing, 40 CFR 63 Subpart DDDDDDD because the source does not use a material containing chromium or a material containing manganese in the manufacturing of prepared feeds.

10a. Pursuant to 35 Ill. Adm. Code 212.314, 35 Ill. Adm. Code 212.301 shall not apply and spraying pursuant to 35 Ill. Adm. Code 212.304 through 212.310 and 35 Ill. Adm. Code 212.312 shall not be required when the wind speed is greater than 40.2 km/hr (25 mph). Determination of wind speed for the purposes of 35 Ill. Adm. Code 212.314 shall be by a one-hour average or hourly recorded value at the nearest official station of the U.S. Weather Bureau or by wind speed instruments operated on the site. In cases where the duration of operations subject to 35 Ill. Adm. Code 212.314 is less than one hour, wind speed may be averaged over the duration of the operations on the basis of on-site wind speed instrument measurements.

b. This permit is issued based on the handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations not being subject to 35 Ill. Adm. Code Part 212 Subpart L while handling grain. Pursuant to 35 Ill. Adm. Code 212.461(a), 35 Ill. Adm. Code 212.302(a), 212.321, and 212.322 shall not apply to grain-handling and grain-drying operations, portable grain-handling equipment and one-turn storage space.

11. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to 35 Ill. Adm. Code Part 215 Subpart K. Pursuant to 35 Ill. Adm. Code 215.303, the provisions of 35 Ill. Adm. Code 215.301 and 215.302 shall not apply to fuel combustion emission sources.

12a. Pursuant to 40 CFR 60.11(b), compliance with opacity standards in 40 CFR Part 60 shall be determined by conducting observations in accordance with Method 9 in appendix A of 40 CFR Part 60, any alternative method that is approved by the Illinois EPA or USEPA, or as provided in 40 CFR 60.11(e)(5). For purposes of determining initial compliance, the minimum total time of observations shall be 3 hours (30 6-minute averages) for the performance test or other set of observations (meaning those fugitive-type emission sources subject only to an opacity standard).

b. Pursuant to 40 CFR 60.11(c), the opacity standards set forth in 40 CFR Part 60 shall apply at all times except during periods of startup, shutdown, malfunction, and as otherwise provided in the applicable standard.

c. Pursuant to 40 CFR 60.11(d), at all times, including periods of startup, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

13a. Pursuant to 40 CFR 63.6595(c), if you own or operate an affected source, you must meet the applicable notification requirements in 40 CFR 63.6645 and in 40 CFR Part 63, Subpart A.

b. Pursuant to 40 CFR 63.6604(b), beginning January 1, 2015, if you own or operate an existing emergency CI stationary RICE with a site rating of more than 100 brake HP and a displacement of less than 30 liters per cylinder that uses diesel fuel and operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must use diesel fuel that meets the requirements in 40 CFR 80.510(b) for nonroad diesel fuel, except that any existing diesel fuel purchased (or otherwise obtained) prior to January 1, 2015, may be used until depleted.

c. Pursuant to 40 CFR 63.6605(a), you must be in compliance with the emission limitations and operating limitations in 40 CFR 63 Subpart ZZZZ that apply to you at all times.

d. Pursuant to 40 CFR 63.6605(b), at all times you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with

safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by 40 CFR 63 Subpart ZZZZ have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

e. Pursuant to 40 CFR 63.6625(e)(3), if you own or operate any of the following stationary RICE, you must operate and maintain the stationary RICE and after-treatment control device (if any) according to the manufacturer's emission-related written instructions or develop your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions:

   An existing emergency or black start stationary RICE located at an area source of HAP emissions;

f. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

g. Pursuant to 40 CFR 63.6625(h), if you operate a new, reconstructed, or existing stationary engine, you must minimize the engine's time spent at idle during startup and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the emission standards applicable to all times other than startup in Tables 1a, 2a, 2c, and 2d to 40 CFR 63 Subpart ZZZZ apply.

h. Pursuant to 40 CFR 63.6625(i), if you own or operate a stationary CI engine that is subject to the work, operation or management practices in items 1 or 2 of Table 2c to 40 CFR 63 Subpart ZZZZ or in items 1 or 4 of Table 2d to 40 CFR 63 Subpart ZZZZ, you have the option of utilizing an oil analysis program in order to extend the specified oil change requirement in Tables 2c and 2d to 40 CFR 63 Subpart ZZZZ. The oil analysis must be performed at the same frequency specified for changing the oil in Table 2c or 2d to 40 CFR 63 Subpart ZZZZ. The analysis program must at a minimum analyze the following three parameters: Total Base Number, viscosity, and percent water content. The condemning limits for these parameters are as follows: Total Base Number is less than 30 percent of the Total Base Number of the oil when new; viscosity of the oil has changed by more than 20 percent from the viscosity of the oil when new; or percent water content (by volume) is greater than 0.5. If all of these condemning limits are not exceeded, the engine owner or operator is not required to change the oil. If any of the limits are exceeded, the engine owner or operator must change

the oil within 2 business days of receiving the results of the analysis; if the engine is not in operation when the results of the analysis are received, the engine owner or operator must change the oil within 2 business days or before commencing operation, whichever is later. The owner or operator must keep records of the parameters that are analyzed as part of the program, the results of the analysis, and the oil changes for the engine. The analysis program must be part of the maintenance plan for the engine.

i. Pursuant to 40 CFR 63.6640(a), you must demonstrate continuous compliance with each emission limitation, operating limitation, and other requirements in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you according to methods specified in Table 6 to 40 CFR 63 Subpart ZZZZ.

Table 6 to Subpart ZZZZ of Part 63– Continuous Compliance With Emission Limitations, Operating Limitations, Work Practices, and Management Practices

As stated in 40 CFR 63.6640, you must continuously comply with the emissions and operating limitations and work or management practices as required by the following:

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
9. Existing emergency and black start stationary RICE ≤500 HP located at a major source of HAP, existing non-emergency stationary RICE <100 HP located at a major source of HAP, existing emergency and black start stationary RICE located at an area source of HAP, existing non-emergency stationary CI RICE ≤300 HP located at an area source of HAP, existing non-emergency 2SLB stationary RICE located at an area source of HAP, existing non-emergency landfill or digester gas stationary SI RICE located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE ≤500 HP located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE >500 HP located at an area source of HAP that operate 24 hours or less per calendar year	a. Work or Management practices	i. Operating and maintaining the stationary RICE according to the manufacturer's emission-related operation and maintenance instructions; or ii. Develop and follow your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions.

j. Pursuant to 40 CFR 63.6640(f), if you own or operate an emergency stationary RICE, you must operate the emergency stationary RICE according to the requirements in 40 CFR 63.6640 (f)(1) through (4). In order for the engine to be considered an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ, any operation other than emergency operation, maintenance and testing, emergency demand response, and operation in non-emergency situations for 50 hours per year, as

described in 40 CFR 63.6640(f)(1) through (4), is prohibited. If you do not operate the engine according to the requirements in 40 CFR 63.6640(f)(1) through (4), the engine will not be considered an emergency engine under 40 CFR 63 Subpart ZZZZ and must meet all requirements for non-emergency engines.

i. There is no time limit on the use of emergency stationary RICE in emergency situations.

ii. You may operate your emergency stationary RICE for any combination of the purposes specified in 40 CFR 63.6640(f)(2)(i) for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by 40 CFR 63.6640(f)(3) and (4) counts as part of the 100 hours per calendar year allowed by this paragraph (40 CFR 63.6640(f)(2)).

Emergency stationary RICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by Federal, State or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company associated with the engine. The owner or operator may petition the Illinois EPA or USEPA for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that Federal, State, or local standards require maintenance and testing of emergency RICE beyond 100 hours per calendar year.

iii. Emergency stationary RICE located at area sources of HAP may be operated for up to 50 hours per calendar year in non-emergency situations. The 50 hours of operation in non-emergency situations are counted towards the 100 hours per calendar year provided in 40 CFR 63.6640(f)(2). Except as provided in 40 CFR 63.6640(f)(4)(i) and (ii), the 50 hours per year for non-emergency situations cannot be used for peak shaving or non-emergency demand response, or to generate income for a facility to an electric grid or otherwise supply power as part of a financial arrangement with another entity.

The 50 hours per year for non-emergency situations can be used to supply power as part of a financial arrangement with another entity if all of the following conditions are met:

A. The engine is dispatched by the local balancing authority or local transmission and distribution system operator.

B. The dispatch is intended to mitigate local transmission and/or distribution limitations so as to avert potential voltage collapse or line overloads that could lead to the interruption of power supply in a local area or region.

C. The dispatch follows reliability, emergency operation or similar protocols that follow specific NERC, regional, state, public utility commission or local standards or guidelines.

D. The power is power provided only to the facility itself or to support the local transmission and distribution system.

E. The owner or operator identifies and records the entity that dispatches the engine and the specific NERC, regional, state, public utility commission or local standards or guidelines that are being followed for dispatching the engine. The local balancing authority or local transmission and distribution system operator may keep these records on behalf of the engine owner or operator.

k. Pursuant to 40 CFR 63.6665, Table 8 to 40 CFR 63 Subpart ZZZZ (see Attachment B) shows which parts of the General Provisions in 40 CFR 63.1 through 63.15 apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with any of the requirements of the General Provisions specified in Table 8: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing stationary RICE that combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, an existing emergency stationary RICE, or an existing limited use stationary RICE. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in the General Provisions specified in Table 8 except for the initial notification requirements: A new stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new emergency stationary RICE, or a new limited use stationary RICE.

l. Pursuant to 40 CFR 63.6675, emergency stationary RICE means any stationary reciprocating internal combustion engine that meets all of the criteria in paragraphs (1) through (3) of this definition. All emergency stationary RICE must comply with the requirements specified in 40 CFR 63.6640(f) in order to be considered emergency stationary RICE. If the engine does not comply with the requirements specified in 40 CFR 63.6640(f), then it is not considered to be an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ:

i. The stationary RICE is operated to provide electrical power or mechanical work during an emergency situation. Examples include stationary RICE used to produce power for critical networks or equipment (including power supplied to portions of a facility)

i. The Illinois EPA shall be allowed to sample all fuels stored at the above location.

j. All normal traffic pattern access areas and all normal traffic pattern roads and parking facilities which are located on Ag Transload Facility property shall be paved or treated with water, oils or chemical dust suppressants. All paved areas shall be cleaned on a regular basis. All areas treated with water, oils or chemical dust suppressants shall have the treatment applied on a regular basis, as needed, in accordance with the operating program required by Condition 16(m).

k. All unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods.

l. Grinding mills, screening operations, bucket elevators, conveyor transfer points, conveyors, bagging operations, storage bins and fine product truck and railcar loading operations shall be sprayed with water or a surfactant solution, utilize choke-feeding or be treated by an equivalent method in accordance with an operating program.

m. The emission units described in Conditions 16(j), (k), and (l) shall be operated under the provisions of an operating program, consistent with 35 Ill. Adm. Code 212.310 and 212.312, and prepared by the owner or operator and submitted to the Illinois EPA for its review. Such operating program shall be designed to significantly reduce fugitive particulate matter emissions.

n. As a minimum the operating program shall include the following:

   i. The name and address of the source;

   ii. The name and address of the owner or operator responsible for execution of the operating program;

   iii. A map or diagram of the source showing approximate locations of storage piles, conveyor loading operations, normal traffic pattern access areas surrounding storage piles and all normal traffic patterns within the source;

   iv. Location of unloading and transporting operations with pollution control equipment;

   v. A detailed description of the best management practices utilized to achieve compliance with 35 Ill. Adm. Code 212.301, including an engineering specification of particulate collection equipment, application systems for water, oil, chemicals and dust suppressants utilized and equivalent methods utilized;

   vi. Estimated frequency of application of dust suppressants by location of materials; and

vii. Such other information as may be necessary to facilitate the Illinois EPA's review of the operating program.

o. The Fugitive Particulate Operating Program, as submitted by the Permittee on DATE PROGRAM APPROVED BY FOS WAS RECEIVED is incorporated herein by reference. The source shall be operated under and shall comply with the provisions of this Fugitive Particulate Operating Program and any amendments to the Fugitive Particulate Operating Program submitted pursuant to Condition 16(m) and (n).

p. The operating program shall be amended from time to time by the owner or operator so that the operating program is current. Such amendments shall be consistent with Condition 16(m) and (n) and shall be submitted to the Illinois EPA within thirty (30) days of any such amendment. Any future amendment to the Fugitive Particulate Operating Program made by the Permittee during the permit term is automatically incorporated by reference provided the revision is not expressly disapproved, in writing, by the Illinois EPA. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the Fugitive Particulate Operating Program, the Permittee shall be required to revise and resubmit the Fugitive Particulate Operating Program within thirty (30) days of receipt of the notification to address the deficiency.

17a. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #1	0.0017	18,500	0.30	1.20
Hoffman Bldg 301 Vacuum	0.0017	1,000	0.02	0.10
West Headhouse Transfer General Aspiration	0.0017	55,000	0.78	3.40
RHOMBO Truck Dump Pit #3	0.0017	14,500	0.21	0.90
Railcar Dump Pit	0.0017	27,000	0.39	1.70
RHOMBO West General Aspiration	0.0017	6,800	0.09	0.40
RHOMBO Gallery Aspiration	0.0017	9,200	0.14	0.60
Track 6 Vacuum	0.0017	700	0.01	0.04
Cleanings Discharge	0.0006	1,900	0.01	0.04
Conveying General Aspiration	0.00085	7,600	0.05	0.24
Grain Receiving Fugitives				5.40
			Total:	14.02

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

b. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #4 & W. Gallery Aspiration	0.0017	36,017	0.52	2.30
Cleaning North APM	0.00085	41,000	0.30	1.31
Corn Cleaning Bldg 115 #2	0.00085	57,372	0.42	1.83
North St Grain/Meal Truck Dump Pit #2	0.0017	20,000	0.29	1.28
			Total:	6.71

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

c. Emissions from and operation of the Dry Corn Milling, Processing and Products Handling shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Bemis Bagging	0.0006	1,660	0.01	0.04
Bagging General Aspiration	0.0006	3,400	0.02	0.08

			Total:	28.32

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

d. Emissions from and operation of the corn flour/bran handling system emission units (#1 Coarse Gravity Table Aspiration Cyclone Collector (05:68), #3 Fine Gravity Table Aspiration Cyclone Collector (06:88), #1 Satake Degerminator Cyclone Collector (45:07), #1 Satake Aspiration Cyclone Collector (45:12), #2 Satake Degerminator Cyclone Collector (45:09), and #2 Satake Aspiration Cyclone Collector (45:24)) controlled

by the baghouse S 105 Roof Carter-Day Filter (34:86) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (dscfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
S 105 Roof Carter-Day Filter (34:86)	0.002	40,600	0.70	3.05

These limits are based on the maximum exhaust air flow rate, maximum grain loading, 100% capture efficiency, 99.9% control efficiency, and 8,760 hours/year of operation.

e. Emissions from and operation of the Corn Mill Products Storage shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Bldg 201/202 Vacuum	0.0006	700	0.01	0.02
Bldg 208 Vacuum	0.0006	700	0.01	0.02
Hominy Feed Bins Aspiration	0.0006	21,000	0.11	0.47
			Total:	0.50

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

f. Emissions from and operation of the Corn Mill Products Milling and Handling shall not exceed the following limits:

i. Corn Mill Products Milling and Handling excluding the LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Hominy Binning	0.0006	30,000	0.15	0.68
Hominy Grinder General Aspiration	0.0006	21,000	0.11	0.47
Truck Hominy Loadout	0.0006	34,960	0.18	0.79
Rail Hominy/Grain Loadout #1	0.0006	34,960	0.18	0.79
Long Term Meal System (LTMS) & Rail Meal/Grain Transfer	0.0006	20,000	0.10	0.45
LTMS & Rail Meal/Grain Loadout	0.0006	34,600	0.18	0.78
Flour Pellet Cooler	0.0055	8,000	0.38	1.65
Hominy Screener General Aspiration	0.0006	7,600	0.04	0.17
Hominy Loadout Fugitives				1.90
Grain Loadout Fugitives				0.10
			Total:	7.78

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

ii. LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

	Throughput			E M I S S I O N S PM			PM_{10}	
Emission Unit	(T/Mo)	(T/Yr)	(lb/T)	(T/Mo)	(T/Yr)	(lb/T)	(T/Mo)	(T/Yr)
LTMS Truck/Rail Dump Pit	12,500	75,000	0.035	0.02	0.13	0.0078	0.00	0.03
LTMS Truck Loadout	12,500	75,000	0.086	0.27	1.61	0.029	0.09	0.54
				Total:	1.74			0.57

These limits are based on the maximum throughput, standard AP-42 emission factors (Table 9.9-1, AP-42, Fifth Edition, Volume I, Update May 2003), 90% control efficiency for baghouse controlled for truck/rail dump pits, and 50% capture efficiency for loadout enclosure.

g. Emissions from and operation of Boiler #1 shall not exceed the following limits:

i. Natural Gas Usage: 82.274 mmscf/month, 822.741 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	3.46	34.56
Nitrogen Oxides (NO_x)	50.0	2.06	20.57
Particulate Matter (PM)	7.6	0.31	3.13
Sulfur Dioxide (SO_2)	0.6	0.02	0.25
Volatile Organic Material (VOM)	5.5	0.23	2.26

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions (lbs/10^3 Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

h. Emissions from and operation of Clayton Boiler shall not exceed the following limits:

i. Natural Gas Usage: 23.771 mmscf/month, 237.712 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	1.00	9.98
Nitrogen Oxides (NO_x)	100.0	1.19	11.89
Particulate Matter (PM)	7.6	0.09	0.90
Sulfur Dioxide (SO_2)	0.6	0.01	0.07
Volatile Organic Material (VOM)	5.5	0.07	0.65

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions (lbs/10^3 Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

i. Emissions from and operation of Emergency Generator Set DG-100 shall not exceed the following limits:

i. Hours of Operation: 100 hours/year;

ii. Emissions from the combustion of fuel oil in the Generator Sets:

Pollutant	Emission Factor (lb/hp hr)	Emissions (lbs/Hr)	(Tons/Year)
Carbon Monoxide (CO)	0.0055	11.92	0.60
Nitrogen Oxides (NO_x)	0.024	52.03	2.60
Particulate Matter (PM)	0.0007	1.52	0.08
Sulfur Dioxide (SO_2)	0.0000121	0.03	0.01
Volatile Organic Material (VOM)	0.000642	1.39	0.07

These limits are based on the rated output of the engine powering the generator set (2,168 engine hp), 100 hours/year of operation, standard emission factors (Table 3.4-1, AP-42, Fifth Edition, Volume 1, Supplement B, October 1996), and a sulfur content of 15 ppm.

j. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total).

17. This permit is issued based on the Potential to Emit (PTE) for Hazardous Air Pollutants (HAPs) as listed in Section 112(b) of the Clean Air Act from this source being less than 10 tons/year of any single HAP and 25 tons/year of any combination of such HAPs. As a result, this permit is issued based on the emissions of all HAPs from this source not triggering the requirements to obtain a CAAPP Permit from the Illinois EPA.

18a. Pursuant to 40 CFR 60.8(a), except as specified in 40 CFR 60.8(a)(1), (a)(2), (a)(3), and (a)(4), at such other times as may be required by the Illinois EPA or USEPA under section 114 of the Clean Air Act, the owner or operator of such facility shall conduct performance test(s) and furnish the Illinois EPA or USEPA a written report of the results of such performance test(s).

b. Pursuant to 40 CFR 60.8(b), performance tests shall be conducted and data reduced in accordance with the test methods and procedures contained in each applicable subpart of 40 CFR Part 60 unless the Illinois EPA or USEPA:

i. Specifies or approves, in specific cases, the use of a reference method with minor changes in methodology;

ii. Approves the use of an equivalent method;

iii. Approves the use of an alternative method the results of which the Illinois EPA or USEPA has determined to be adequate for indicating whether a specific source is in compliance;

iv. Waives the requirement for performance tests because the owner or operator of a source has demonstrated by other means to the Illinois EPA's or USEPA's satisfaction that the affected facility is in compliance with the standard; or

v. Approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors. Nothing in this paragraph shall be construed to abrogate the Illinois EPA's or USEPA's authority to require testing under section 114 of the Clean Air Act.

c. Pursuant to 40 CFR 60.8(c), performance tests shall be conducted under such conditions as the Illinois EPA or USEPA shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Illinois EPA or USEPA such records as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test nor shall emissions in excess of the level of the applicable emission limit during periods of startup, shutdown, and malfunction be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

d. Pursuant to 40 CFR 60.8(d), the owner or operator of an affected facility shall provide the Illinois EPA or USEPA at least 30 days prior notice of any performance test, except as specified under other subparts of 40 CFR Part 60, to afford the Illinois EPA or USEPA the opportunity to have an observer present. If after 30 days notice for an initially scheduled performance test, there is a delay (due to operational problems, etc.) in conducting the scheduled performance test, the owner or operator of an affected facility shall notify the Illinois EPA or USEPA as soon as possible of any delay in the original

test date, either by providing at least 7 days prior notice of the rescheduled date of the performance test, or by arranging a rescheduled date with the Illinois EPA or USEPA by mutual agreement.

e. Pursuant to 40 CFR 60.8(e), the owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

i. Sampling ports adequate for test methods applicable to such facility. This includes:

A. Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures; and

B. Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures.

ii. Safe sampling platform(s).

iii. Safe access to sampling platform(s).

iv. Utilities for sampling and testing equipment.

f. Pursuant to 40 CFR 60.8(f), unless otherwise specified in the applicable subpart of 40 CFR Part 60, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the applicable standard under 40 CFR Part 60. For the purpose of determining compliance with an applicable standard under 40 CFR Part 60, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Illinois EPA's or USEPA's approval, be determined using the arithmetic mean of the results of the two other runs.

g. Pursuant to 40 CFR 60.11(e)(2), except as provided in 40 CFR 60.11(e)(3), the owner or operator of an affected facility to which an opacity standard in 40 CFR Part 60 applies shall conduct opacity observations in accordance with 40 CFR 60.11(b), shall record the opacity of emissions, and shall report to the Illinois EPA or USEPA the opacity results along with the results of the initial performance test required under 40 CFR 60.8. The inability of an owner or operator to secure a visible emissions observer shall not be considered a reason for not conducting the opacity observations concurrent with the initial performance test.

19a. Pursuant to 40 CFR 60.303(a), in conducting the performance tests required in 40 CFR 60.8, the owner or operator shall use as reference methods and procedures the test methods in appendix A of 40 CFR Part 60 or other methods and procedures as specified in 40 CFR 60.303, except as provided in 40 CFR 60.8(b). Acceptable alternative methods and procedures are given in 40 CFR 60.303(c).

b. Pursuant to 40 CFR 60.303(b), the owner or operator shall determine compliance with the particulate matter standards in 40 CFR 60.302 as follows:

i. Method 5 shall be used to determine the particulate matter concentration and the volumetric flow rate of the effluent gas. The sampling time and sample volume for each run shall be at least 60 minutes and 1.70 dscm (60 dscf). The probe and filter holder shall be operated without heaters.

ii. Method 2 shall be used to determine the ventilation volumetric flow rate.

iii. Method 9 and the procedures in 40 CFR 60.11 shall be used to determine opacity.

c. Pursuant to 40 CFR 60.303(c)(1), the owner or operator may use the following as alternatives to the reference methods and procedures specified in 40 CFR 60.303: For Method 5, Method 17 may be used.

20a. Pursuant to 40 CFR 60.44c(g), for oil-fired affected facilities where the owner or operator seeks to demonstrate compliance with the fuel oil sulfur limits under 40 CFR 60.42c based on shipment fuel sampling, the initial performance test shall consist of sampling and analyzing the oil in the initial tank of oil to be fired in the steam generating unit to demonstrate that the oil contains 0.5 weight percent sulfur or less. Thereafter, the owner or operator of the affected facility shall sample the oil in the fuel tank after each new shipment of oil is received, as described under 40 CFR 60.46c(d)(2).

b. Pursuant to 40 CFR 60.44c(h), for affected facilities subject to 40 CFR 60.42c(h)(1), (2), or (3) where the owner or operator seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, the performance test shall consist of the certification, the certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

21a. Pursuant to 35 Ill. Adm. Code 201.282, every emission source or air pollution control equipment shall be subject to the following testing requirements for the purpose of determining the nature and quantities of specified air contaminant emissions and for the purpose of determining ground level and ambient air concentrations of such air contaminants:

i. Testing by Owner or Operator. The Illinois EPA may require the owner or operator of the emission source or air pollution control

equipment to conduct such tests in accordance with procedures adopted by the Illinois EPA, at such reasonable times as may be specified by the Illinois EPA and at the expense of the owner or operator of the emission source or air pollution control equipment. The Illinois EPA may adopt procedures detailing methods of testing and formats for reporting results of testing. Such procedures and revisions thereto, shall not become effective until filed with the Secretary of State, as required by the APA Act. All such tests shall be made by or under the direction of a person qualified by training and/or experience in the field of air pollution testing. The Illinois EPA shall have the right to observe all aspects of such tests.

ii. Testing by the Illinois EPA. The Illinois EPA shall have the right to conduct such tests at any time at its own expense. Upon request of the Illinois EPA, the owner or operator of the emission source or air pollution control equipment shall provide, without charge to the Illinois EPA, necessary holes in stacks or ducts and other safe and proper testing facilities, including scaffolding, but excluding instruments and sensing devices, as may be necessary.

b. Testing required by Condition 22 shall be performed upon a written request from the Illinois EPA by a qualified independent testing service.

22. Pursuant to 35 Ill. Adm. Code 212.110(c), upon a written notification by the Illinois EPA, the owner or operator of a particulate matter emission unit subject to 35 Ill. Adm. Code Part 212 shall conduct the applicable testing for particulate matter emissions, opacity, or visible emissions at such person's own expense, to demonstrate compliance. Such test results shall be submitted to the Illinois EPA within thirty (30) days after conducting the test unless an alternative time for submittal is agreed to by the Illinois EPA.

23a. Pursuant to 40 CFR 60.46c(d)(2), as an alternative fuel sampling procedure for affected facilities combusting oil, oil samples may be collected from the fuel tank for each steam generating unit immediately after the fuel tank is filled and before any oil is combusted. The owner or operator of the affected facility shall analyze the oil sample to determine the sulfur content of the oil. If a partially empty fuel tank is refilled, a new sample and analysis of the fuel in the tank would be required upon filling. Results of the fuel analysis taken after each new shipment of oil is received shall be used as the daily value when calculating the 30-day rolling average until the next shipment is received. If the fuel analysis shows that the sulfur content in the fuel tank is greater than 0.5 weight percent sulfur, the owner or operator shall ensure that the sulfur content of subsequent oil shipments is low enough to cause the 30-day rolling average sulfur content to be 0.5 weight percent sulfur or less.

b. Pursuant to 40 CFR 60.46c(e), the monitoring requirements of 40 CFR 60.46c(a) and (d) shall not apply to affected facilities subject to 40

CFR 60.42c(h)(1), (2), or (3) where the owner or operator of the affected facility seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, as described under 40 CFR 60.48c(f), as applicable.

24. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

25a. Pursuant to 40 CFR 60.7(b), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of an affected facility; any malfunction of the air pollution control equipment; or any periods during which a continuous monitoring system or monitoring device is inoperative.

b. Pursuant to 40 CFR 60.7(f), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain a file of all measurements, including continuous monitoring system, monitoring device, and performance testing measurements; all continuous monitoring system performance evaluations; all continuous monitoring system or monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by 40 CFR Part 60 recorded in a permanent form suitable for inspection. The file shall be retained for at least two years following the date of such measurements, maintenance, reports, and records, except as follows:

The Illinois EPA or USEPA, upon notification to the source, may require the owner or operator to maintain all measurements as required by 40 CFR 60.7(f), if the Illinois EPA or USEPA determines these records are required to more accurately assess the compliance status of the affected source.

26a. Pursuant to 40 CFR 60.48c(c)(1), in addition to the applicable requirements in 40 CFR 60.7, the owner or operator of an affected facility subject to the opacity limits in 40 CFR 60.43c(c) shall submit excess emission reports for any excess emissions from the affected facility that occur during the reporting period and maintain records according to the requirements specified in 40 CFR 60.48c(c)(1) through (3), as applicable to the visible emissions monitoring method used.

For each performance test conducted using Method 9 of appendix A-4 of 40 CFR Part 60, the owner or operator shall keep the records including the information specified in 40 CFR 60.48c(c)(1)(i) through (iii).

i. Dates and time intervals of all opacity observation periods;

ii. Name, affiliation, and copy of current visible emission reading certification for each visible emission observer participating in the performance test; and

iii. Copies of all visible emission observer opacity field data sheets;

b. Pursuant to 40 CFR 60.48c(e), the owner or operator of each affected facility subject to the SO_2 emission limits, fuel oil sulfur limits, or percent reduction requirements under 40 CFR 60.42c shall keep records and submit reports as required under 40 CFR 60.48c(d), including the following information, as applicable.

i. Calendar dates covered in the reporting period.

ii. Identification of the F factor used in calculations, method of determination, and type of fuel combusted.

iii. If fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification as described under 40 CFR 60.48c(f)(1), (2), (3), or (4), as applicable. In addition to records of fuel supplier certifications, the report shall include a certified statement signed by the owner or operator of the affected facility that the records of fuel supplier certifications submitted represent all of the fuel combusted during the reporting period.

c. Pursuant to 40 CFR 60.48c(f)(1), fuel supplier certification shall include the following information for distillate oil:

i. The name of the oil supplier;

ii. A statement from the oil supplier that the oil complies with the specifications under the definition of distillate oil in 40 CFR 60.41c; and

iii. The sulfur content of the oil.

d. i. Pursuant to 40 CFR 60.48c(g)(1), except as provided under 40 CFR 60.48c(g)(2) and (g)(3), the owner or operator of each affected facility shall record and maintain records of the amounts of each fuel combusted during each operating day.

ii. Pursuant to 40 CFR 60.48c(g)(2), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility that combusts only natural gas, wood, fuels using fuel certification in 40 CFR 60.48c(f) to demonstrate compliance with the SO_2 standard, fuels not subject to an emissions standard (excluding opacity), or a mixture of these fuels may elect to record and maintain records of the amount of each fuel combusted during each calendar month.

iii. Pursuant to 40 CFR 60.48c(g)(3), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility or multiple affected facilities located on a

contiguous property unit where the only fuels combusted in any steam generating unit (including steam generating units not subject to 40 CFR 60 Subpart Dc) at that property are natural gas, wood, distillate oil meeting the most current requirements in 40 CFR 60.42c to use fuel certification to demonstrate compliance with the SO_2 standard, and/or fuels, excluding coal and residual oil, not subject to an emissions standard (excluding opacity) may elect to record and maintain records of the total amount of each steam generating unit fuel delivered to that property during each calendar month.

e. Pursuant to 40 CFR 60.48c(i), all records required under 40 CFR 60.48c shall be maintained by the owner or operator of the affected facility for a period of two years following the date of such record.

27. Pursuant to 40 CFR 63.10(b)(3), if an owner or operator determines that his or her stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants regulated by any standard established pursuant to Section 112(d) or (f) of the Clean Air Act, and that stationary source is in the source category regulated by the relevant standard, but that source is not subject to the relevant standard (or other requirement established under 40 CFR Part 63) because of limitations on the source's potential to emit or an exclusion, the owner or operator must keep a record of the applicability determination on site at the source for a period of 5 years after the determination, or until the source changes its operations to become an affected source, whichever comes first. The record of the applicability determination must be signed by the person making the determination and include an analysis (or other information) that demonstrates why the owner or operator believes the source is unaffected (e.g., because the source is an area source). The analysis (or other information) must be sufficiently detailed to allow the USEPA and/or Illinois EPA to make a finding about the source's applicability status with regard to the relevant standard or other requirement. If relevant, the analysis must be performed in accordance with requirements established in relevant subparts of 40 CFR Part 63 for this purpose for particular categories of stationary sources. If relevant, the analysis should be performed in accordance with USEPA guidance materials published to assist sources in making applicability determinations under Section 112 of the Clean Air Act, if any. The requirements to determine applicability of a standard under 40 CFR 63.1(b)(3) and to record the results of that determination under 40 CFR 63.10(b)(3) shall not by themselves create an obligation for the owner or operator to obtain a Title V permit.

28a. Pursuant to 40 CFR 63.6655(a), if you must comply with the emission and operating limitations, you must keep the records described in 40 CFR 63.6655(a)(1) through (a)(5), (b)(1) through (b)(3) and (c).

i. A copy of each notification and report that you submitted to comply with 40 CFR 63 Subpart ZZZZ, including all documentation supporting any Initial Notification or Notification of Compliance

Status that you submitted, according to the requirement in 40 CFR 63.10(b)(2)(xiv).

ii. Records of the occurrence and duration of each malfunction of operation (i.e., process equipment) or the air pollution control and monitoring equipment.

iii. Records of performance tests and performance evaluations as required in 40 CFR 63.10(b)(2)(viii).

iv. Records of all required maintenance performed on the air pollution control and monitoring equipment.

v. Records of actions taken during periods of malfunction to minimize emissions in accordance with 40 CFR 63.6605(b), including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation.

b. Pursuant to 40 CFR 63.6655(d), you must keep the records required in Table 6 of 40 CFR 63 Subpart ZZZZ to show continuous compliance with each emission or operating limitation that applies to you.

c. Pursuant to 40 CFR 63.6655(e), you must keep records of the maintenance conducted on the stationary RICE in order to demonstrate that you operated and maintained the stationary RICE and after-treatment control device (if any) according to your own maintenance plan if you own or operate any of the following stationary RICE.

i. An existing stationary emergency RICE.

ii. An existing stationary CI RICE located at an area source of HAP emissions subject to management practices as shown in Table 2d to 40 CFR 63 Subpart ZZZZ.

d. Pursuant to 40 CFR 63.6655(f)(2), If you own or operate an existing emergency stationary CI RICE located at an area source of HAP emissions that does not meet the standards applicable to non-emergency engines, you must keep records of the hours of operation of the engine that is recorded through the non-resettable hour meter. The owner or operator must document how many hours are spent for emergency operation, including what classified the operation as emergency and how many hours are spent for non-emergency operation. If the engines are used for the purposes specified in 40 CFR 63.6640(f)(2)(ii) or (iii) or 40 CFR 63.6640(f)(4)(ii), the owner or operator must keep records of the notification of the emergency situation, and the date, start time, and end time of engine operation for these purposes.

e. Pursuant to 40 CFR 63.6660(a), your records must be in a form suitable and readily available for expeditious review according to 40 CFR 63.10(b)(1).

f. Pursuant to 40 CFR 63.6660(b), as specified in 40 CFR 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

g. Pursuant to 40 CFR 63.6660(c), you must keep each record readily accessible in hard copy or electronic form for at least 5 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to 40 CFR 63.10(b)(1).

29. Pursuant to 35 Ill. Adm. Code 212.110(e), the owner or operator of an emission unit subject to 35 Ill. Adm. Code Part 212 shall retain records of all tests which are performed. These records shall be retained for at least three (3) years after the date a test is performed.

30a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C), On and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the fuel combustion emission source complies with the requirements in 35 Ill. Adm. Code 214.122(b)(2)(A) and (b)(2)(B), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the process emission source complies with the requirements in 35 Ill. Adm. Code 214.305(a)(1) and (a)(2), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA;

31a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the baghouse filters and cyclones:

   A. Records for periodic inspection of the baghouse filters and cyclones with date, individual performing the inspection, and nature of inspection; and

   B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The Permittee shall keep a copy of the Fugitive Particulate Operating Program, any amendments or revisions to the Fugitive Particulate Operating Program, and the Permittee shall also keep a record of activities completed according to the Fugitive Particulate Operating Program.

iii. Records of housekeeping check lists;

iv. Records for the inspections required by Conditions 16(d) and (e), with date, time and observations if such information is not incorporated in the housekeeping check list.

v. Total flow rate for each baghouse blower (scfm);

vi. Total grain loading for each process (gr/dscf);

vii. Total hours of operation of each baghouse (hours/month and hours/year);

viii. The amount of grain received in LTMS Truck/Rail Dump Pit (tons/month and tons/year);

ix. The amount of grain shipped from the LTMS Truck Loadout (tons/month and tons/year);

x. Natural gas usage for Boiler #1 (mmscf/month and mmscf/year);

xi. Distillate fuel oil usage for Boiler #1 (gallons/month and gallons/year);

xii. Natural gas usage for the Clayton Boiler (mmscf/month and mmscf/year);

xiii. Distillate fuel oil usage for the Clayton Boiler (gallons/month and gallons/year);

xiv. Operating hours of Emergency Generator Set DG-100 (hours/month and hours/year);

xv. An inspection, maintenance and repair log of Emergency Generator Set DG-100 listing each activity performed with date; and

xvi. Monthly and annual emissions of CO, NO_x, PM, PM_{10}, SO_2, and VOM from the source with supporting calculations (tons/month and tons/year).

b. All records and logs required by Condition 31(a) of this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be made available for inspection and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

32. Pursuant to 40 CFR 60.7(a)(4), any owner or operator subject to the provisions of 40 CFR Part 60 shall furnish the Illinois EPA or USEPA written notification or, if acceptable to both the Illinois EPA and USEPA and the owner or operator of a source, electronic notification, as follows:

A notification of any physical or operational change to an existing facility which may increase the emission rate of any air pollutant to which a standard applies, unless that change is specifically exempted under an applicable subpart or in 40 CFR 60.14(e). This notice shall be postmarked 60 days or as soon as practicable before the change is commenced and shall include information describing the precise nature of the change, present and proposed emission control systems, productive capacity of the facility before and after the change, and the expected completion date of the change. The Illinois EPA or USEPA may request additional relevant information subsequent to this notice.

33a. Pursuant to 40 CFR 63.6640(b), you must report each instance in which you did not meet each emission limitation or operating limitation in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you. These instances are deviations from the emission and operating limitations in 40 CFR 63 Subpart ZZZZ. These deviations must be reported according to the requirements in 40 CFR 63.6650. If you change your catalyst, you must reestablish the values of the operating parameters measured during the initial performance test. When you reestablish the values of your operating parameters, you must also conduct a performance test to demonstrate that you are meeting the required emission limitation applicable to your stationary RICE.

b. Pursuant to 40 CFR 63.6640(e), you must also report each instance in which you did not meet the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ that apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major

source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing emergency stationary RICE, an existing limited use stationary RICE, or an existing stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ, except for the initial notification requirements: a new or reconstructed stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new or reconstructed emergency stationary RICE, or a new or reconstructed limited use stationary RICE.

c. Pursuant to 40 CFR 63.6645(a), you must submit all of the notifications in 40 CFR 63.7(b) and (c), 63.8(e), (f)(4) and (f)(6), 63.9(b) through (e), and (g) and (h) that apply to you by the dates specified if you own or operate any of the following;

   i. An existing stationary CI RICE located at an area source of HAP emissions.

   ii. This requirement does not apply if you own or operate an existing stationary RICE less than 100 HP, an existing stationary emergency RICE, or an existing stationary RICE that is not subject to any numerical emission standards.

d. Pursuant to 40 CFR 63.6650(a), you must submit each report in Table 7 of 40 CFR 63 Subpart ZZZZ that applies to you.

Table 7 to Subpart ZZZZ of Part 63—Requirements for Reports

As stated in 40 CFR 63.6650, you must comply with the following requirements for reports:

For each . . .	You must submit a . . .	The report must contain . . .	You must submit the report . . .
4. Emergency stationary RICE that operate or are contractually obligated to be available for more than 15 hours per year for the purposes specified 40 CFR 63.6640(f)(4)(ii)	Report	a. The information in 40 CFR 63.6650(h)(1)	i. annually according to the requirements in 4 CFR 63.6650(h)(2)(3).

e. Pursuant to 40 CFR 63.6650(b), unless the Illinois EPA or USEPA has approved a different schedule for submission of reports under 40 CFR 63.10(a), you must submit each report by the date in Table 7 of 40 CFR 63 Subpart ZZZZ and according to the requirements in 40 CFR 63.6650(b)(1) through (b)(9).

   i. For semiannual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is

specified for your affected source in 40 CFR 63.6595 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in 40 CFR 63.6595.

ii. For semiannual Compliance reports, the first Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in 40 CFR 63.6595.

iii. For semiannual Compliance reports, each subsequent Compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

iv. For semiannual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

v. For annual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in 40 CFR 63.6595 and ending on December 31.

vi. For annual Compliance reports, the first Compliance report must be postmarked or delivered no later than January 31 following the end of the first calendar year after the compliance date that is specified for your affected source in 40 CFR 63.6595.

vii. For annual Compliance reports, each subsequent Compliance report must cover the annual reporting period from January 1 through December 31.

viii. For annual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than January 31.

f. Pursuant to 40 CFR 63.6650(c), the Compliance report must contain the information in 40 CFR 63.6650(c)(1) through (6).

i. Company name and address.

ii. Statement by a responsible official, with that official's name, title, and signature, certifying the accuracy of the content of the report.

iii. Date of report and beginning and ending dates of the reporting period.

iv. If you had a malfunction during the reporting period, the compliance report must include the number, duration, and a brief description for each type of malfunction which occurred during

the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by an owner or operator during a malfunction of an affected source to minimize emissions in accordance with 40 CFR 63.6605(b), including actions taken to correct a malfunction.

v. If there are no deviations from any emission or operating limitations that apply to you, a statement that there were no deviations from the emission or operating limitations during the reporting period.

g. Pursuant to 40 CFR 63.6650(h), if you own or operate an emergency stationary RICE with a site rating of more than 100 brake HP that operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must submit an annual report according to the requirements in 40 CFR 63.6650(h)(1) through (3).

i. The report must contain the following information:

A. Company name and address where the engine is located.

B. Date of the report and beginning and ending dates of the reporting period.

C. Engine site rating and model year.

D. Latitude and longitude of the engine in decimal degrees reported to the fifth decimal place.

E. Hours spent for operation for the purpose specified in 40 CFR 63.6640(f)(4)(ii), including the date, start time, and end time for engine operation for the purposes specified in 40 CFR 63.6640(f)(4)(ii). The report must also identify the entity that dispatched the engine and the situation that necessitated the dispatch of the engine.

F. If there were no deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), a statement that there were no deviations from the fuel requirements during the reporting period.

G. If there were deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), information on the number, duration, and cause of deviations, and the corrective action taken.

ii. The first annual report must cover the calendar year 2015 and must be submitted no later than March 31, 2016. Subsequent annual reports for each calendar year must be submitted no later than March 31 of the following calendar year.

iii. The annual report must be submitted electronically using the subpart specific reporting form in the Compliance and Emissions Data Reporting Interface (CEDRI) that is accessed through EPA's Central Data Exchange (CDX) (www.epa.gov/cdx). However, if the reporting form specific to 40 CFR 63 Subpart ZZZZ is not available in CEDRI at the time that the report is due, the written report must be submitted to the Illinois EPA or USEPA at the appropriate address listed in 40 CFR 63.13.

34. Pursuant to 35 Ill. Adm. Code 212.110(d), a person planning to conduct testing for particulate matter emissions to demonstrate compliance shall give written notice to the Illinois EPA of that intent. Such notification shall be given at least thirty (30) days prior to the initiation of the test unless a shorter period is agreed to by the Illinois EPA. Such notification shall state the specific test methods from 35 Ill. Adm. Code 212.110 that will be used.

35a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C)(iii), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in this 35 Ill. Adm. Code 214.122(b)(2). At minimum, and in addition to any permitting obligations, the notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3)(C), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in 35 Ill. Adm. Code 214.305(a). At minimum, and in addition to any permitting obligations, such notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

36a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit or otherwise, the Permittee shall submit a report to the Illinois EPA's Bureau of Air Compliance Section in Springfield, Illinois within thirty (30) days after the exceedance or deviation. The report shall identify the duration and the emissions impact of the exceedance or deviation, a copy of the relevant records and information to resolve the exceedance or deviation, and a description of the efforts to reduce emissions from, and the duration of exceedance or deviation, and to prevent future occurrences of any such exceedance or deviation.

b. One (1) copy of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

It should be noted that the 150,000 gallon fuel oil storage tank is exempt from permitting, pursuant to 35 Ill. Adm. Code 201.146(n)(3).

If you have any questions on this permit, please call German Barria at 217/785-1705.

Sincerely,

William D. Marr
Manager, Permit Section
Bureau of Air

WDM:GB:

Attachment A - Emission Summary

This attachment provides a summary of the maximum emissions from the Corn Mill & Grain Elevator operating in compliance with the requirements of this federally enforceable permit. In preparing this summary, the Illinois EPA used the annual operating scenario which results in maximum emissions from such a plant. The resulting maximum emissions are below the levels, (e.g., 100 tons/year for CO, NO_x, and PM_{10}) at which this source would be considered a major source for purposes of the Clean Air Act Permit Program. Actual emissions from this source will be less than predicted in this summary to the extent that less material is handled, and control measures are more effective than required in this permit.

	E M I S S I O N S (Tons/Year)					
Emission Unit	CO	NO_x	PM	PM_{10}	SO_2	VOM
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS)			14.02	14.02		
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS)			6.71	6.71		
Dry Corn Milling, Processing and Products Handling			28.32	28.32		
Corn Flour/Bran Handling System			3.05	3.05		
Corn Mill Products Storage			0.50	0.50		
Corn Mill Products Milling and Handling			9.52	8.35

Attachment B - Table 8 to Subpart ZZZZ of Part 63—Applicability of General Provisions to Subpart ZZZZ.

As stated in 40 CFR 63.6665, you must comply with the following applicable general provisions.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.1	General applicability of the General Provisions	Yes.	
§63.2	Definitions	Yes	Additional terms defined in 40 CFR 63.6675.
§63.3	Units and abbreviations	Yes.	
§63.4	Prohibited activities and circumvention	Yes.	
§63.5	Construction and reconstruction	Yes.	
§63.6(a)	Applicability	Yes.	
§63.6(b)(1)-(4)	Compliance dates for new and reconstructed sources	Yes.	
§63.6(b)(5)	Notification	Yes.	
§63.6(b)(6)	[Reserved]		
§63.6(b)(7)	Compliance dates for new and reconstructed area sources that become major sources	Yes.	
§63.6(c)(1)-(2)	Compliance dates for existing sources	Yes.	
§63.6(c)(3)-(4)	[Reserved]		
§63.6(c)(5)	Compliance dates for existing area sources that become major sources	Yes.	
§63.6(d)	[Reserved]		
§63.6(e)	Operation and maintenance	No.	
§63.6(f)(1)	Applicability of standards	No.	
§63.6(f)(2)	Methods for determining compliance	Yes.	
§63.6(f)(3)	Finding of compliance	Yes.	
§63.6(g)(1)-(3)	Use of alternate standard	Yes.	
§63.6(h)	Opacity and visible emission standards	No	Subpart ZZZZ does not contain opacity or visible emission standards.
§63.6(i)	Compliance extension procedures and criteria	Yes.	
§63.6(j)	Presidential compliance exemption	Yes.	
§63.7(a)(1)-(2)	Performance test dates	Yes	Subpart ZZZZ contains performance test dates at 40 CFR 63.6610, 63.6611, and 63.6612.
§63.7(a)(3)	CAA section 114 authority	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.7(b)(1)	Notification of performance test	Yes	Except that 40 CFR 63.7(b)(1) only applies as specified in 40 CFR 63.6645.
§63.7(b)(2)	Notification of rescheduling	Yes	Except that 40 CFR 63.7(b)(2) only applies as specified in 40 CFR 63.6645.
§63.7(c)	Quality assurance/test plan	Yes	Except that 40 CFR 63.7(c) only applies as specified in 40 CFR 63.6645.
§63.7(d)	Testing facilities	Yes.	
§63.7(e)(1)	Conditions for conducting performance tests	No.	Subpart ZZZZ specifies conditions for conducting performance tests at 40 CFR 63.6620.
§63.7(e)(2)	Conduct of performance tests and reduction of data	Yes	Subpart ZZZZ specifies test methods at 40 CFR 63.6620.
§63.7(e)(3)	Test run duration	Yes.	
§63.7(e)(4)	Administrator may require other testing under section 114 of the CAA	Yes.	
§63.7(f)	Alternative test method provisions	Yes.	
§63.7(g)	Performance test data analysis, recordkeeping, and reporting	Yes.	
§63.7(h)	Waiver of tests	Yes.	
§63.8(a)(1)	Applicability of monitoring requirements	Yes	Subpart ZZZZ contains specific requirements for monitoring at 40 CFR 63.6625.
§63.8(a)(2)	Performance specifications	Yes.	
§63.8(a)(3)	[Reserved]		
§63.8(a)(4)	Monitoring for control devices	No.	
§63.8(b)(1)	Monitoring	Yes.	
§63.8(b)(2)-(3)	Multiple effluents and multiple monitoring systems	Yes.	
§63.8(c)(1)	Monitoring system operation and maintenance	Yes.	
§63.8(c)(1)(i)	Routine and predictable SSM	No	
§63.8(c)(1)(ii)	SSM not in Startup Shutdown Malfunction Plan	Yes.	
§63.8(c)(1)(iii)	Compliance with operation and maintenance requirements	No	
§63.8(c)(2)-(3)	Monitoring system installation	Yes.	
§63.8(c)(4)	Continuous monitoring system (CMS) requirements	Yes	Except that subpart ZZZZ does not require Continuous Opacity Monitoring System (COMS).
§63.8(c)(5)	COMS minimum procedures	No	Subpart ZZZZ does not require COMS.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.8(c)(6)-(8)	CMS requirements	Yes	Except that subpart ZZZZ does not require COMS.
§63.8(d)	CMS quality control	Yes.	
§63.8(e)	CMS performance evaluation	Yes	Except for 40 CFR 63.8(e)(5)(ii), which applies to COMS.
		Except that 40 CFR 63.8(e) only applies as specified in 40 CFR 63.6645.	
§63.8(f)(1)-(5)	Alternative monitoring method	Yes	Except that 40 CFR 63.8(f)(4) only applies as specified in 40 CFR 63.6645.
§63.8(f)(6)	Alternative to relative accuracy test	Yes	Except that 40 CFR 63.8(f)(6) only applies as specified in 40 CFR 63.6645.
§63.8(g)	Data reduction	Yes	Except that provisions for COMS are not applicable. Averaging periods for demonstrating compliance are specified at 40 CFR 63.6635 and 63.6640.
§63.9(a)	Applicability and State delegation of notification requirements	Yes.	
§63.9(b)(1)-(5)	Initial notifications	Yes	Except that 40 CFR 63.9(b)(3) is reserved.
		Except that 40 CFR 63.9(b) only applies as specified in 40 CFR 63.6645.	
§63.9(c)	Request for compliance extension	Yes	Except that 40 CFR 63.9(c) only applies as specified in 40 CFR 63.6645.
§63.9(d)	Notification of special compliance requirements for new sources	Yes	Except that 40 CFR 63.9(d) only applies as specified in 40 CFR 63.6645.
§63.9(e)	Notification of performance test	Yes	Except that 40 CFR 63.9(e) only applies as specified in 40 CFR 63.6645.
§63.9(f)	Notification of visible emission (VE)/opacity test	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.9(g)(1)	Notification of performance evaluation	Yes	Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.
§63.9(g)(2)	Notification of use of COMS data	No	Subpart ZZZZ does not contain opacity or VE standards.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.9(g)(3)	Notification that criterion for alternative to RATA is exceeded	Yes	If alternative is in use.
		Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.	
§63.9(h)(1)-(6)	Notification of compliance status	Yes	Except that notifications for sources using a CEMS are due 30 days after completion of performance evaluations. 40 CFR 63.9(h)(4) is reserved.
			Except that 40 CFR 63.9(h) only applies as specified in 40 CFR 63.6645.
§63.9(i)	Adjustment of submittal deadlines	Yes.	
§63.9(j)	Change in previous information	Yes.	
§63.10(a)	Administrative provisions for recordkeeping/reporting	Yes.	
§63.10(b)(1)	Record retention	Yes	Except that the most recent 2 years of data do not have to be retained on site.
§63.10(b)(2)(i)-(v)	Records related to SSM	No.	
§63.10(b)(2)(vi)-(xi)	Records	Yes.	
§63.10(b)(2)(xii)	Record when under waiver	Yes.	
§63.10(b)(2)(xiii)	Records when using alternative to RATA	Yes	For CO standard if using RATA alternative.
§63.10(b)(2)(xiv)	Records of supporting documentation	Yes.	
§63.10(b)(3)	Records of applicability determination	Yes.	
§63.10(c)	Additional records for sources using CEMS	Yes	Except that 40 CFR 63.10(c)(2)-(4) and (9) are reserved.
§63.10(d)(1)	General reporting requirements	Yes.	
§63.10(d)(2)	Report of performance test results	Yes.	
§63.10(d)(3)	Reporting opacity or VE observations	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.10(d)(4)	Progress reports	Yes.	
§63.10(d)(5)	Startup, shutdown, and malfunction reports	No.	
§63.10(e)(1) and (2)(i)	Additional CMS Reports	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.10(e)(2)(ii)	COMS-related report	No	Subpart ZZZZ does not require COMS.
§63.10(e)(3)	Excess emission and parameter exceedances reports	Yes.	Except that 40 CFR 63.10(e)(3)(i) (C) is reserved.
§63.10(e)(4)	Reporting COMS data	No	Subpart ZZZZ does not require COMS.
§63.10(f)	Waiver for recordkeeping/reporting	Yes.	
§63.11	Flares	No.	
§63.12	State authority and delegations	Yes.	
§63.13	Addresses	Yes.	
§63.14	Incorporation by reference	Yes.	
§63.15	Availability of information	Yes.

Hi Mr. Burris,
Sorry to have miss your call, regarding your inquiring about the construction permit application status.
Like I mentioned previously, a draft of both the Construction permit and FESOP have been done and are under internal review.
we can set up a call, between Bunge and permit section, my manager would like to discuss the situations about permitting.

Let me know what times would work for this week. Tue - Fri

Flour Pellet Cooler (4750-0025-0015) controlled by Baghouse Filters MAC Cyclone HE39;
Hominy Screener General Aspiration (4750-0029-0045) controlled by Baghouse Filters MICROPUL 100S-6-20;
LTMS Truck/Rail Dump Pit (4750-0033-0000A);
LTMS Truck Loadout (4750-0033-0000B);

Boiler House/Grounds:

Formatted: Indent: Left: 0", Hanging: 0.5"

One (1) 96.55 mmBtu/hour Natural Gas/Distillate Fuel-Oil Fired Boiler with Low NO_x Burner (Boiler #1);
One (1) 27.90 mmBtu/hour Natural Gas-Fired/Distillate Fuel-Oil Fired Boiler (Clayton Boiler);
One (1) 2,168 engine Hp Diesel-Powered Emergency Generator Set (DG-100); and

Fugitive PM and PM_{10} emissions

pursuant to the above referenced application. This Permit is subject to standard conditions attached hereto and the following special condition(s):

1a. This Federally Enforceable State Operating Permit (FESOP) is issued to limit the emissions of air pollutants from the source to less than major source thresholds (i.e., 100 tons/year for Carbon Monoxide (CO), Nitrogen Oxides (NO_x), and Particulate Matter less than 10 microns (PM_{10})). As a result, the source is excluded from the requirements to obtain a Clean Air Act Permit Program (CAAPP) permit. The maximum emissions of this source, as limited by the conditions of this permit, are described in Attachment A.

b. Prior to issuance, a draft of this permit has undergone a public notice and comment period.

c. This permit supersedes all operating permit(s) for this location.

2a. The Clayton Boiler is subject to the New Source Performance Standard (NSPS) for Small Industrial - Commercial - Institutional Steam Generating Units, 40 CFR Part 60 Subparts A and Dc. The Illinois EPA is administering the NSPS in Illinois on behalf of the United States Environmental Protection Agency (USEPA) under a delegation agreement. Pursuant to 40 CFR 60.40c(a), except as provided in 40 CFR 60.40c(d), (e), (f), and (g), the affected facility to which 40 CFR 60 Subpart Dc applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (mmBtu/hr)) or less, but greater than or equal to 2.9 MW (10 mmBtu/hr).

b. Pursuant to 40 CFR 60.42c(d), on and after the date on which the initial performance test is completed or required to be completed under 40 CFR 60.8, whichever date comes first, no owner or operator of an affected facility that combusts oil shall cause to be discharged into the atmosphere from that affected facility any gases that contain SO_2 in excess of 215 ng/J (0.50 lb/mmBtu) heat input from oil; or, as an alternative, no owner or operator of an affected facility that combusts oil shall combust oil in the affected facility that contains greater than 0.5 weight percent sulfur. The percent reduction requirements are not applicable to affected facilities under this paragraph.

c. Pursuant to 40 CFR 60.42c(h)(1), for distillate oil-fired affected facilities with heat input capacities between 2.9 and 29 MW (10 and 100 mmBtu/hour), compliance with the emission limits or fuel oil sulfur limits under 40 CFR 60.42c may be determined based on a certification

from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

d. Pursuant to 40 CFR 60.42c(i), the SO_2 emission limits, fuel oil sulfur limits, and percent reduction requirements under 40 CFR 60.42c apply at all times, including periods of startup, shutdown, and malfunction.

3a. The Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) are subject to the NSPS for Grain Elevators, 40 CFR Part 60 Subparts A and DD. The Illinois EPA is administering the NSPS in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 60.300(a), the provisions of 40 CFR 60 Subpart DD apply to each affected facility at any grain terminal elevator or any grain storage elevator, except as provided under 40 CFR 60.304(b). The affected facilities are each truck unloading station, truck loading station, barge and ship unloading station, barge and ship loading station, railcar loading station, railcar unloading station, grain dryer, and all grain handling operations.

b. Pursuant to 40 CFR 60.300(b), any facility under 40 CFR 60.300(a) which commences construction, modification or reconstructed after August 3, 1978 is subject to the requirements of 40 CFR 60 Subpart DD.

c. Pursuant to 40 CFR 60.302(b), on and after the date on which the performance test required to be conducted by 40 CFR 60.8 is completed, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere from any affected facility except a grain dryer any process emission which:

i. Contains particulate matter in excess of 0.023 g/dscm (ca. 0.01 gr/dscf).

ii. Exhibits greater than 0 percent opacity.

d. Pursuant to 40 CFR 60.302(c), on and after the 60th day of achieving the maximum production rate at which the affected facility will be operated, but no later than 180 days after initial startup, no owner or operator subject to the provisions of 40 CFR 60 Subpart DD shall cause to be discharged into the atmosphere any fugitive emission from:

i. Any individual truck unloading station, railcar unloading station, or railcar loading station, which exhibits greater than 5 percent opacity.

ii. Any grain handling operation, which exhibits greater than 0 percent opacity.

iii. Any truck loading station which exhibits greater than 10 percent opacity.

4a. Emergency Generator Set DG-100 is subject to the National Emission Standard for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines, 40 CFR Part 63 Subparts A and ZZZZ. The

Illinois EPA is administering the NESHAP in Illinois on behalf of the USEPA under a delegation agreement. Pursuant to 40 CFR 63.6590(a), an affected source is any existing, new, or reconstructed stationary RICE located at a major or area source of HAP emissions, excluding stationary RICE being tested at a stationary RICE test cell/stand.

b. Pursuant to 40 CFR 63.6595(a)(1), if you have an existing stationary RICE, excluding existing non-emergency CI stationary RICE, with a site rating of more than 500 brake HP located at a major source of HAP emissions, you must comply with the applicable emission limitations, operating limitations and other requirements no later than June 15, 2007. If you have an existing non-emergency CI stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, an existing stationary CI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary CI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than May 3, 2013. If you have an existing stationary SI RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions, or an existing stationary SI RICE located at an area source of HAP emissions, you must comply with the applicable emission limitations, operating limitations, and other requirements no later than October 19, 2013.

c. Pursuant to 40 CFR 63.6603(a), if you own or operate an existing stationary RICE located at an area source of HAP emissions, you must comply with the requirements in Table 2d to 40 CFR 63 Subpart ZZZZ and the operating limitations in Table 2b to 40 CFR 63 Subpart ZZZZ that apply to you.

Table 2d to Subpart ZZZZ of Part 63—Requirements for Existing Stationary RICE Located at Area Sources of HAP Emissions

As stated in 40 CFR 63.6600 and 63.6640, you must comply with the following requirements for existing stationary RICE located at area sources of HAP emissions:

For each . . .	You must meet the following requirement, except during periods of startup . . .	During periods of startup you must . . .
4. Emergency stationary CI RICE and black start stationary CI RICE.[2]	a. Change oil and filter every 500 hours of operation or annually, whichever comes first;[1]	
	b. Inspect air cleaner every 1,000 hours of operation or annually, whichever comes first; and	
	c. Inspect all hoses and belts every 500 hours of operation or annually, whichever comes first, and replace as necessary.	

[1]Sources have the option to utilize an oil analysis program as described in 40 CFR 63.6625(i) or (j) in order to extend the specified oil change requirement in Table 2d of 40 CFR 63 Subpart ZZZZ.

[2]If an emergency engine is operating during an emergency and it is not possible to shut down the engine in order to perform the management practice requirements on the schedule required in Table 2d of 40 CFR 63 Subpart ZZZZ, or if performing the management practice on the required schedule would otherwise pose an unacceptable risk under federal, state, or local law, the management practice can be delayed until the emergency is over or the unacceptable risk under federal, state, or local law has abated. The management practice should be performed as soon as practicable after the emergency has ended or the unacceptable risk under Federal, State, or local law has abated. Sources must report any failure to perform the management practice on the schedule required and the Federal, State or local law under which the risk was deemed unacceptable.

5a. The Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; Corn Mill Products Milling and Handling; Boiler #1, Clayton Boiler, and Emergency Generator Set DG-100 are subject to 35 Ill. Adm. Code Part 212 Subpart B (Visible Emissions). Pursuant to 35 Ill. Adm. Code 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to 35 Ill. Adm. Code 212.122.

b. Pursuant to 35 Ill. Adm. Code 212.123(b), the emission of smoke or other particulate matter from any such emission unit may have an opacity greater than 30 percent but not greater than 60 percent for a period or periods aggregating 8 minutes in any 60 minute period provided that such opaque emissions permitted during any 60 minute period shall occur from only one such emission unit located within a 305 m (1000 ft) radius from the center point of any other such emission unit owned or operated by such person, and provided further that such opaque emissions permitted from each such emission unit shall be limited to 3 times in any 24 hour period.

c. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 212 Subpart E (Particulate Matter Emissions From Fuel Combustion Emission Units). Pursuant to 35 Ill. Adm. Code 212.206, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period to exceed 0.15 kg of particulate matter per MW-hr of actual heat input from any fuel combustion emission unit using liquid fuel exclusively (0.10 lbs/mmBtu).

d. This source is subject to 35 Ill. Adm. Code Part 212 Subpart K (Fugitive Particulate Matter). Pursuant to 35 Ill. Adm. Code 212.301, no person shall cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

e. When processing and handling processed materials, the emission units constructed on or after April 14, 1972 within the following groups: Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling are subject to 35 Ill. Adm. Code Part 212 Subpart L (Particulate Matter Emissions from Process Emission Units). Pursuant to 35 Ill. Adm. Code 212.321(a), except as further provided in 35 Ill. Adm. Code Part 212, no person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 Ill. Adm. Code 212.321(c).

f. Pursuant to 35 Ill. Adm. Code 212.321(b), interpolated and extrapolated values of the data in 35 Ill. Adm. Code 212.321(c) shall be determined by using the equation:

$$E = A(P)^B$$

where:

P = Process weight rate; and
E = Allowable emission rate; and,

i. Up to process weight rates of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.214	2.54
B	0.534	0.534

ii. For process weight rate greater than or equal to 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	11.42	24.8
B	0.16	0.16

g. Pursuant to 35 Ill. Adm. Code 212.321(c), Limits for Process Emission Units for Which Construction or Modification Commenced on or After April 14, 1972:

400.0	30.6	450.00	67.70
454.0	31.3	500.00	69.00

where:

P = Process weight rate in Mg/hr or T/hr, and
E = Allowable emission rate in kg/hr or lbs/hr.

k. The handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations are subject to 35 Ill. Adm. Code Part 212 Subpart S (Agriculture). Pursuant to 35 Ill. Adm. Code 212.462, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d), or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), existing grain-handling operations with a total annual grain through-put of 300,000 bushels or more shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall demonstrate compliance with the following:

i. Cleaning and Separating Operations.

A. Particulate matter generated during cleaning and separating operations shall be captured to the extent necessary to prevent visible particulate matter emissions directly into the atmosphere.

B. For grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area, air contaminants collected from cleaning and separating operations shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

ii. Major Dump-Pit Area.

Induced Draft.

A. Induced draft shall be applied to major dump pits and their associated equipment (including, but not limited to, boots, hoppers and legs) to such an extent that a minimum face velocity is maintained, at the effective grate surface, sufficient to contain particulate emissions generated in unloading operations. The minimum face velocity at the effective grate surface shall be at least 200 fpm, which shall be determined by using the equation:

$$V = Q/A$$

where:
V = face velocity; and
Q = induced draft volume in scfm; and
A = effective grate area in ft^2; and

B. The induced draft air stream for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be confined and conveyed through air pollution control equipment which has an overall rated and actual particulate collection efficiency of not less than 90 percent by weight;

C. Means or devices (including, but not limited to, quick-closing doors, air curtains or wind deflectors) shall be employed to prevent a wind velocity in excess of 50 percent of the induced draft face velocity at the pit; provided, however, that such means or devices do not have to achieve the same degree of prevention when the ambient air wind exceeds 25 mph. The wind velocity shall be measured, with the induced draft system not operating, at a point midway between the dump-pit area walls at the point where the wind exits the dump-pit area, and at a height above the dump-pit area floor of approximately 2 ft; or

iii. Internal Transferring Area.

A. Internal transferring area shall be enclosed to the extent necessary to prohibit visible particulate matter emissions directly into the atmosphere.

B. Air contaminants collected from internal transfer operations for grain-handling sources having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be conveyed through air pollution control equipment which has a rated and actual particulate removal efficiency of not less than 90 percent by weight prior to release into the atmosphere.

iv. Load-Out Area.

A. Truck and hopper car loading shall employ socks, sleeves or equivalent devices which extend 6 inches below the sides of the receiving vehicle, except for topping off. Choke loading shall be considered an equivalent method as long as the discharge is no more than 12 inches above the sides of the receiving vehicle.

B. Box car loading shall employ means or devices to prevent the emission of particulate matter into the atmosphere to the fullest extent which is technologically and economically feasible.

l. Pursuant to 35 Ill. Adm. Code 212.463, unless otherwise exempted pursuant to 35 Ill. Adm. Code 212.461(c) or (d) or allowed to use alternate control according to 35 Ill. Adm. Code 212.461(g), grain-drying operations for which construction or modification commenced prior to June 30, 1975, with a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity (using the American Society of Agricultural Engineers Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers) shall be operated in such a fashion as to preclude the emission of particulate matter larger than 300 microns mean particle diameter, shall apply for an operating permit pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the following:

i. Column Dryers. The largest effective circular diameter of transverse perforations in the external sheeting of a column dryer shall not exceed 0.094 inch, and the grain inlet and outlet shall be enclosed.

ii. Rack Dryers. No portion of the exhaust air of rack dryers shall be emitted to the ambient atmosphere without having passed through a particulate collection screen having a maximum opening of 50 mesh, U.S. Sieve Series.

A. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling facilities having a grain through-put of not more than 2 million bushels per year or located outside a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 90 percent by weight prior to release into the atmosphere.

B. All such screens will have adequate self-cleaning mechanisms, the exhaust gas of which for grain-handling sources having a grain through-put exceeding 2 million bushels per year and located in a major population area shall be ducted through air pollution control equipment which has a rated and actual particulate removal efficiency of 98 percent by weight prior to release into the atmosphere.

iii. Other Types of Dryers. All other types of dryers shall be controlled in a manner which shall result in the same degree of control required for rack dryers pursuant to 35 Ill. Adm. Code 212.463(b).

iv. New and Modified Grain-Drying Operations. Grain-drying operations constructed or modified on or after June 30, 1975, shall file applications for construction and operating permits pursuant to 35 Ill. Adm. Code Part 201, and shall comply with the control equipment requirements of 35 Ill. Adm. Code 212.463, except for new and modified grain-drying operations which do not result in a total grain-drying capacity in excess of 750 bushels per hour for 5 percent moisture extraction at manufacturer's rated capacity, using the American Society of Agricultural Engineer Standard 248.2, Section 9, Basis for Stating Drying Capacity of Batch and Continuous-Flow Grain Dryers.

6a. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 214 Subpart B (New Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm. Code 214.122(b)(2), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The sulfur content of all distillate fuel oil used by the fuel combustion emission source must not exceed 15 ppm;

b. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 214 Subpart K (Process Emission Sources). Pursuant to 35 Ill. Adm. Code 214.301, except as further provided by 35 Ill. Adm. Code Part 214, no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm.

c. Pursuant to 35 Ill. Adm. Code 214.305(a)(2), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The sulfur content of all distillate fuel oil used by the process emission source must not exceed 15 ppm;

7. Emergency Generator Set DG-100 is subject to 35 Ill. Adm. Code Part 215 Subpart K (Use of Organic Material). Pursuant to 35 Ill. Adm. Code 215.301, no person shall cause or allow the discharge of more than 3.6 kg/hr (8 lbs/hr) of organic material into the atmosphere from any emission source, except as provided in 35 Ill. Adm. Code 215.302, 215.303, 215.304 and the following exception: If no odor nuisance exists the limitation of 35 Ill. Adm. Code Part 215 Subpart K shall apply only to photochemically reactive material.

8. Boiler #1 and Clayton Boiler are subject to 35 Ill. Adm. Code Part 216 Subpart B (Fuel Combustion Emission Sources). Pursuant to 35 Ill. Adm.

Code 216.121, no person shall cause or allow the emission of carbon monoxide (CO) into the atmosphere from any fuel combustion emission source with actual heat input greater than 2.9 MW (10 mmBtu/hr) to exceed 200 ppm, corrected to 50 percent excess air.

9a. This permit is issued based on the Cooling Tower at this source not being subject to the NESHAP for Process Cooling Towers, 40 CFR 63 Subpart Q because the cooling tower is not operated with chromium-based water treatment chemicals and is not either major sources or is an integral part of a facility that is a major source.

b. This permit is issued based on the source no longer being subject to the NESHAP for Solvent Extraction for Vegetable Oil Production, 40 CFR 63 Subpart GGGG, because the source no longer operates a vegetable oil production process and is no longer a major source of HAP emissions.

c. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters, 40 CFR 63 Subpart DDDDD because this source is not or is part of, a major source of Hazardous Air Pollutant (HAP) emissions as defined in 40 CFR 63.2.

d. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to the requirements of the NESHAP for Industrial, Commercial, and Institutional Boilers Area Sources, 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11195(e), gas-fired boilers are not subject to 40 CFR 63 Subpart JJJJJJ. Pursuant to 40 CFR 63.11237, gas-fired boiler includes any boiler that burns gaseous fuels not combined with any solid fuels, burns liquid fuel only during periods of gas curtailment, gas supply emergencies, or periodic testing on liquid fuel. Periodic testing of liquid fuel shall not exceed a combined total of 48 hours during any calendar year.

e. This permit is issued based on the source not being subject to the National Emission Standards (NESHAP) for Area Sources: Prepared Feeds Manufacturing, 40 CFR 63 Subpart DDDDDDD because the source does not use a material containing chromium or a material containing manganese in the manufacturing of prepared feeds.

10a. Pursuant to 35 Ill. Adm. Code 212.314, 35 Ill. Adm. Code 212.301 shall not apply and spraying pursuant to 35 Ill. Adm. Code 212.304 through 212.310 and 35 Ill. Adm. Code 212.312 shall not be required when the wind speed is greater than 40.2 km/hr (25 mph). Determination of wind speed for the purposes of 35 Ill. Adm. Code 212.314 shall be by a one-hour average or hourly recorded value at the nearest official station of the U.S. Weather Bureau or by wind speed instruments operated on the site. In cases where the duration of operations subject to 35 Ill. Adm. Code 212.314 is less than one hour, wind speed may be averaged over the duration of the operations on the basis of on-site wind speed instrument measurements.

b. This permit is issued based on the handling of grain in the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn,

Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling Operations not being subject to 35 Ill. Adm. Code Part 212 Subpart L while handling grain. Pursuant to 35 Ill. Adm. Code 212.461(a), 35 Ill. Adm. Code 212.302(a), 212.321, and 212.322 shall not apply to grain-handling and grain-drying operations, portable grain-handling equipment and one-turn storage space.

11. This permit is issued based on Boiler #1 and Clayton Boiler at this source not being subject to 35 Ill. Adm. Code Part 215 Subpart K. Pursuant to 35 Ill. Adm. Code 215.303, the provisions of 35 Ill. Adm. Code 215.301 and 215.302 shall not apply to fuel combustion emission sources.

12a. Pursuant to 40 CFR 60.11(b), compliance with opacity standards in 40 CFR Part 60 shall be determined by conducting observations in accordance with Method 9 in appendix A of 40 CFR Part 60, any alternative method that is approved by the Illinois EPA or USEPA, or as provided in 40 CFR 60.11(e)(5). For purposes of determining initial compliance, the minimum total time of observations shall be 3 hours (30 6-minute averages) for the performance test or other set of observations (meaning those fugitive-type emission sources subject only to an opacity standard).

b. Pursuant to 40 CFR 60.11(c), the opacity standards set forth in 40 CFR Part 60 shall apply at all times except during periods of startup, shutdown, malfunction, and as otherwise provided in the applicable standard.

c. Pursuant to 40 CFR 60.11(d), at all times, including periods of startup, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

13a. Pursuant to 40 CFR 63.6595(c), if you own or operate an affected source, you must meet the applicable notification requirements in 40 CFR 63.6645 and in 40 CFR Part 63, Subpart A.

b. Pursuant to 40 CFR 63.6604(b), beginning January 1, 2015, if you own or operate an existing emergency CI stationary RICE with a site rating of more than 100 brake HP and a displacement of less than 30 liters per cylinder that uses diesel fuel and operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must use diesel fuel that meets the requirements in 40 CFR 1090.305~~80.510(b)~~ for nonroad diesel fuel, except that any existing diesel fuel purchased (or otherwise obtained) prior to January 1, 2015, may be used until depleted.

c. Pursuant to 40 CFR 63.6605(a), you must be in compliance with the emission limitations and operating limitations in 40 CFR 63 Subpart ZZZZ that apply to you at all times.

d. Pursuant to 40 CFR 63.6605(b), at all times you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by 40 CFR 63 Subpart ZZZZ have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Illinois EPA or USEPA which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

e. Pursuant to 40 CFR 63.6625(e)(3), if you own or operate any of the following stationary RICE, you must operate and maintain the stationary RICE and after-treatment control device (if any) according to the manufacturer's emission-related written instructions or develop your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions:

An existing emergency or black start stationary RICE located at an area source of HAP emissions;

f. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

g. Pursuant to 40 CFR 63.6625(h), if you operate a new, reconstructed, or existing stationary engine, you must minimize the engine's time spent at idle during startup and minimize the engine's startup time to a period needed for appropriate and safe loading of the engine, not to exceed 30 minutes, after which time the emission standards applicable to all times other than startup in Tables 1a, 2a, 2c, and 2d to 40 CFR 63 Subpart ZZZZ apply.

h. Pursuant to 40 CFR 63.6625(i), if you own or operate a stationary CI engine that is subject to the work, operation or management practices in items 1 or 2 of Table 2c to 40 CFR 63 Subpart ZZZZ or in items 1 or 4 of Table 2d to 40 CFR 63 Subpart ZZZZ, you have the option of utilizing an oil analysis program in order to extend the specified oil change requirement in Tables 2c and 2d to 40 CFR 63 Subpart ZZZZ. The oil analysis must be performed at the same frequency specified for changing the oil in Table 2c or 2d to 40 CFR 63 Subpart ZZZZ. The analysis program must at a minimum analyze the following three

parameters: Total Base Number, viscosity, and percent water content. The condemning limits for these parameters are as follows: Total Base Number is less than 30 percent of the Total Base Number of the oil when new; viscosity of the oil has changed by more than 20 percent from the viscosity of the oil when new; or percent water content (by volume) is greater than 0.5. If all of these condemning limits are not exceeded, the engine owner or operator is not required to change the oil. If any of the limits are exceeded, the engine owner or operator must change the oil within 2 business days of receiving the results of the analysis; if the engine is not in operation when the results of the analysis are received, the engine owner or operator must change the oil within 2 business days or before commencing operation, whichever is later. The owner or operator must keep records of the parameters that are analyzed as part of the program, the results of the analysis, and the oil changes for the engine. The analysis program must be part of the maintenance plan for the engine.

i. Pursuant to 40 CFR 63.6640(a), you must demonstrate continuous compliance with each emission limitation, operating limitation, and other requirements in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you according to methods specified in Table 6 to 40 CFR 63 Subpart ZZZZ.

Table 6 to Subpart ZZZZ of Part 63– Continuous Compliance With Emission Limitations, Operating Limitations, Work Practices, and Management Practices

As stated in 40 CFR 63.6640, you must continuously comply with the emissions and operating limitations and work or management practices as required by the following:

For each . . .	Complying with the requirement to . . .	You must demonstrate continuous compliance by . . .
9. Existing emergency and black start stationary RICE ≤500 HP located at a major source of HAP, existing non-emergency stationary RICE <100 HP located at a major source of HAP, existing emergency and black start stationary RICE located at an area source of HAP, existing non-emergency stationary CI RICE ≤300 HP located at an area source of HAP, existing non-emergency 2SLB stationary RICE located at an area source of HAP, existing non-emergency landfill or digester gas stationary SI RICE located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE ≤500 HP located at an area source of HAP, existing non-emergency 4SLB and 4SRB stationary RICE >500 HP located at an area source of HAP that operate 24 hours or less per calendar year	a. Work or Management practices	i. Operating and maintaining the stationary RICE according to the manufacturer's emission-related operation and maintenance instructions; or ii. Develop and follow your own maintenance plan which must provide to the extent practicable for the maintenance and operation of the engine in a manner consistent with good air pollution control practice for minimizing emissions.

j. Pursuant to 40 CFR 63.6640(f), if you own or operate an emergency stationary RICE, you must operate the emergency stationary RICE according to the requirements in 40 CFR 63.6640 (f)(1) through (4). In order for the engine to be considered an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ, any operation other than emergency operation, maintenance and testing, emergency demand response, and operation in non-emergency situations for 50 hours per year, as described in 40 CFR 63.6640(f)(1) through (4), is prohibited. If you do not operate the engine according to the requirements in 40 CFR 63.6640(f)(1) through (4), the engine will not be considered an emergency engine under 40 CFR 63 Subpart ZZZZ and must meet all requirements for non-emergency engines.

i. There is no time limit on the use of emergency stationary RICE in emergency situations.

ii. You may operate your emergency stationary RICE for any combination of the purposes specified in 40 CFR 63.6640(f)(2)(i) for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by 40 CFR 63.6640(f)(3) and (4) counts as part of the 100 hours per calendar year allowed by this paragraph (40 CFR 63.6640(f)(2)).

Emergency stationary RICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by Federal, State or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company associated with the engine. The owner or operator may petition the Illinois EPA or USEPA for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that Federal, State, or local standards require maintenance and testing of emergency RICE beyond 100 hours per calendar year.

iii. Emergency stationary RICE located at area sources of HAP may be operated for up to 50 hours per calendar year in non-emergency situations. The 50 hours of operation in non-emergency situations are counted towards the 100 hours per calendar year provided in 40 CFR 63.6640(f)(2). Except as provided in 40 CFR 63.6640(f)(4)(i) and (ii), the 50 hours per year for non-emergency situations cannot be used for peak shaving or non-emergency demand response, or to generate income for a facility to an electric grid or otherwise supply power as part of a financial arrangement with another entity.

The 50 hours per year for non-emergency situations can be used to supply power as part of a financial arrangement with another entity if all of the following conditions are met:

A. The engine is dispatched by the local balancing authority or local transmission and distribution system operator.

B. The dispatch is intended to mitigate local transmission and/or distribution limitations so as to avert potential voltage collapse or line overloads that could lead to the interruption of power supply in a local area or region.

C. The dispatch follows reliability, emergency operation or similar protocols that follow specific NERC, regional, state, public utility commission or local standards or guidelines.

D. The power is power provided only to the facility itself or to support the local transmission and distribution system.

E. The owner or operator identifies and records the entity that dispatches the engine and the specific NERC, regional, state, public utility commission or local standards or guidelines that are being followed for dispatching the engine. The local balancing authority or local transmission and distribution system operator may keep these records on behalf of the engine owner or operator.

k. Pursuant to 40 CFR 63.6665, Table 8 to 40 CFR 63 Subpart ZZZZ (see Attachment B) shows which parts of the General Provisions in 40 CFR 63.1 through 63.15 apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with any of the requirements of the General Provisions specified in Table 8: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing stationary RICE that combusts landfill or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, an existing emergency stationary RICE, or an existing limited use stationary RICE. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in the General Provisions specified in Table 8 except for the initial notification requirements: A new stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new emergency stationary RICE, or a new limited use stationary RICE.

l. Pursuant to 40 CFR 63.6675, emergency stationary RICE means any stationary reciprocating internal combustion engine that meets all of the criteria in paragraphs (1) through (3) of this definition. All emergency stationary RICE must comply with the requirements specified in 40 CFR 63.6640(f) in order to be considered emergency stationary

RICE. If the engine does not comply with the requirements specified in 40 CFR 63.6640(f), then it is not considered to be an emergency stationary RICE under 40 CFR 63 Subpart ZZZZ:

i. The stationary RICE is operated to provide electrical power or mechanical work during an emergency situation. Examples include stationary RICE used to produce power for critical networks or equipment (including power supplied to portions of a facility) when electric power from the local utility (or the normal power source, if the facility runs on its own power production) is interrupted, or stationary RICE used to pump water in the case of fire or flood, etc.

ii. The stationary RICE is operated under limited circumstances for situations not included in paragraph (1) of this definition, as specified in 40 CFR 63.6640(f).

iii. The stationary RICE operates as part of a financial arrangement with another entity in situations not included in paragraph (1) of this definition only as allowed in 40 CFR 63.6640(f)(2)(ii) or (iii) and 40 CFR 63.6640(f)(4)(i) or (ii).

14a. Pursuant to 40 CFR ~~80.510~~1090.305(~~b~~a), except as specified in 40 CFR 1090.300(a), ~~beginning June 1, 2010. Except as otherwise specifically provided in 40 CFR 80 Subpart I, all nonroad (NR) and locomotive (LM)~~ diesel fuel must meet the ULSD~~is subject to the following~~ per-gallon standards~~:~~ of 40 CFR 1090.305.

~~i~~ b. Pursuant to 40 CFR 1090.305(b), Maximum sSulfur content of 15 ppm ~~maximum for NR diesel fuel~~.

Formatted: Indent: Left: 0"

~~ii~~ c. Pursuant to 40 CFR 1090.305(b), diesel fuel must meet one of the ~~Cetane index or aromatic content, as~~ following standards:

~~A~~i. ~~A minimum~~ Minimum cetane index of 40~~; or~~.

Formatted: Indent: Left: 0.5"

~~B~~ii. ~~A maximum~~ Maximum aromatic content of 35 volume percent.

15a. Housekeeping Practices. Pursuant to 35 Ill. Adm. Code 212.461(b), all grain-handling and grain-drying operations, regardless of size, must implement and use the following housekeeping practices:

i. Air pollution control devices shall be checked daily and cleaned as necessary to insure proper operation.

ii. Cleaning and Maintenance.

A. Floors shall be kept swept and cleaned from boot pit to cupola floor. Roof or bin decks and other exposed flat surfaces shall be kept clean of grain and dust that would tend to rot or become airborne.

B. Cleaning shall be handled in such a manner as not to permit dust to escape to the atmosphere.

C. The yard and surrounding open area, including but not limited to ditches and curbs, shall be cleaned to prevent the accumulation of rotting grain.

iii. Dump Pit.

A. Aspiration equipment shall be maintained and operated.

B. Dust control devices shall be maintained and operated.

iv. Head House. The head house shall be maintained in such a fashion that visible quantities of dust or dirt are not allowed to escape to the atmosphere.

v. Property. The yard and driveway of any source shall be asphalted, oiled or equivalently treated to control dust.

vi. Housekeeping Check List. Housekeeping check lists shall be completed by the manager and maintained on the premises for inspection by Illinois EPA personnel.

16a. In the event that the operation of this source results in an odor nuisance, the Permittee shall take appropriate and necessary actions to minimize odors, including but not limited to, changes in raw material or installation of controls, in order to eliminate the odor nuisance.

b. The baghouse filters and cyclones shall be in operation at all times when the associated emission units are in operation and emitting air contaminants.

c. The Permittee shall, in accordance with the manufacturer(s) and/or vendor(s) recommendations, perform periodic maintenance on the baghouse filters and cyclones such that the baghouse filters and cyclones are kept in proper working condition and not cause a violation of the Illinois Environmental Protection Act or regulations promulgated therein.

d. Each receiving dump pit shall be inspected for proper operation while receiving is occurring, at least once each week (Monday through Sunday) when grain is received.

e. The source shall be inspected for presence of visible emissions from internal transfer and cleaning, while such activity is occurring, at least once each week when such activity is performed.

f. Boiler #1 and Clayton Boiler shall only be operated with natural gas or distillate fuel oil (Grades No. 1 and 2) as the fuel. The use of any other fuel in Boiler #1 or Clayton Boiler may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable

requirements.

g. Emergency Generator Set DG-100 shall only be operated with distillate fuel oil (Grades No. 1 and 2) as the fuel. The use of any other fuel in Emergency Generator Set DG-100 may require that the Permittee first obtain a construction permit from the Illinois EPA and perform stack testing to verify compliance with all applicable requirements.

h. Organic liquid by-products or waste materials shall not be used in any emission unit at this source without written approval from the Illinois EPA.

i. The Illinois EPA shall be allowed to sample all fuels stored at the above location.

j. All normal traffic pattern access areas and all normal traffic pattern roads and parking facilities which are located on Ag Transload Facility property shall be paved or treated with water, oils or chemical dust suppressants. All paved areas shall be cleaned on a regular basis. All areas treated with water, oils or chemical dust suppressants shall have the treatment applied on a regular basis, as needed, in accordance with the operating program required by Condition 16(m).

Formatted: Font: Courier New

k. All unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods.

Formatted: Font: Courier New

l. Grinding mills, screening operations, bucket elevators, conveyor transfer points, conveyors, bagging operations, storage bins and fine product truck and railcar loading operations shall be sprayed with water or a surfactant solution, utilize choke-feeding or be treated by an equivalent method in accordance with an operating program.

m. The emission units described in Conditions 16(j), (k), and (l) shall be operated under the provisions of an operating program, consistent with 35 Ill. Adm. Code 212.310 and 212.312, and prepared by the owner or operator and submitted to the Illinois EPA for its review. Such operating program shall be designed to significantly reduce fugitive particulate matter emissions.

n. As a minimum the operating program shall include the following:

   i. The name and address of the source;

   ii. The name and address of the owner or operator responsible for execution of the operating program;

   iii. A map or diagram of the source showing approximate locations of storage piles, conveyor loading operations, normal traffic pattern access areas surrounding storage piles and all normal traffic patterns within the source;

iv. Location of unloading and transporting operations with pollution control equipment;

v. A detailed description of the best management practices utilized to achieve compliance with 35 Ill. Adm. Code 212.301, including an engineering specification of particulate collection equipment, application systems for water, oil, chemicals and dust suppressants utilized and equivalent methods utilized;

vi. Estimated frequency of application of dust suppressants by location of materials; and

vii. Such other information as may be necessary to facilitate the Illinois EPA's review of the operating program.

o. The Fugitive Particulate Operating Program, as submitted by the Permittee on DATE PROGRAM APPROVED BY FOS WAS RECEIVED is incorporated herein by reference. The source shall be operated under and shall comply with the provisions of this Fugitive Particulate Operating Program and any amendments to the Fugitive Particulate Operating Program submitted pursuant to Condition 16(m) and (n).

p. The operating program shall be amended from time to time by the owner or operator so that the operating program is current. Such amendments shall be consistent with Condition 16(m) and (n) and shall be submitted to the Illinois EPA within thirty (30) days of any such amendment. Any future amendment to the Fugitive Particulate Operating Program made by the Permittee during the permit term is automatically incorporated by reference provided the revision is not expressly disapproved, in writing, by the Illinois EPA. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the Fugitive Particulate Operating Program, the Permittee shall be required to revise and resubmit the Fugitive Particulate Operating Program within thirty (30) days of receipt of the notification to address the deficiency.

17a. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #1	0.0017	18,500	0.30	1.20
Hoffman Bldg 301 Vacuum	0.0017	1,000	0.02	0.10
West Headhouse Transfer General Aspiration	0.0017	55,000	0.78	3.40
RHOMBO Truck Dump Pit #3	0.0017	14,500	0.21	0.90
Railcar Dump Pit	0.0017	27,000	0.39	1.70
RHOMBO West General Aspiration	0.0017	6,800	0.09	0.40
RHOMBO Gallery Aspiration	0.0017	9,200	0.14	0.60
Track 6 Vacuum	0.0017	700	0.01	0.04
Cleanings Discharge	0.0006	1,900	0.01	0.04
Conveying General Aspiration	0.00085	7,600	0.05	0.24
Grain Receiving Fugitives				5.40
			Total:	14.02

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

b. Emissions from and operation of the Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS) shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Truck Dump #4 & W. Gallery Aspiration	0.0017	36,017	0.52	2.30
Cleaning North APM	0.00085	41,000	0.30	1.31
Corn Cleaning Bldg 115 #2	0.00085	57,372	0.42	1.83
North St Grain/Meal Truck Dump Pit #2	0.0017	20,000	0.29	1.28
			Total:	6.71

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source, and 8,760 hours/year of operation.

c. Emissions from and operation of the Dry Corn Milling, Processing and Products Handling shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Bemis Bagging	0.0006	1,660	0.01	0.04

Formatted Table

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

~~d. Emissions from and operation of the corn flour/bran handling system emission units (#1 Coarse Gravity Table Aspiration Cyclone Collector (05:68), #3 Fine Gravity Table Aspiration Cyclone Collector (06:88), #1 Satake Degerminator Cyclone Collector (45:07), #1 Satake Aspiration Cyclone Collector (45:12), #2 Satake Degerminator Cyclone Collector (45:09), and #2 Satake Aspiration Cyclone Collector (45:24)) controlled by the baghouse S 105 Roof Carter-Day Filter (34:86) shall not exceed the following limits:~~

~~Emission Unit~~	~~Grain Loading (gr/dscf)~~	~~Total Flow Rate (dscfm)~~	~~E M I S S I O N S PM & PM_{10} (lbs/Hour)~~	~~(Tons/Yr)~~
~~S 105 Roof Carter-Day Filter (34:86)~~	~~0.002~~	~~40,600~~	~~0.70~~	~~3.05~~

~~These limits are based on the maximum exhaust air flow rate, maximum grain loading, 100% capture efficiency, 99.9% control efficiency, and 8,760 hours/year of operation.~~

e d. Emissions from and operation of the Corn Mill Products Storage shall not exceed the following limits:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Bldg 201/202 Vacuum	0.0006	700	0.01	0.02
Bldg 208 Vacuum	0.0006	700	0.01	0.02
Hominy Feed Bins Aspiration	0.0006	21,000	0.11	0.47
			Total:	0.50

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

fe. Emissions from and operation of the Corn Mill Products Milling and Handling shall not exceed the following limits:

i. Corn Mill Products Milling and Handling excluding the LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

Emission Unit	Grain Loading (gr/dscf)	Total Flow Rate (scfm)	E M I S S I O N S PM & PM_{10} (lbs/Hour)	(Tons/Yr)
Hominy Binning	0.0006	30,000	0.15	0.68
Hominy Grinder General Aspiration	0.0006	21,000	0.11	0.47
Truck Hominy Loadout	0.0006	34,960	0.18	0.79
Rail Hominy/Grain Loadout #1	0.0006	34,960	0.18	0.79
Long Term Meal System (LTMS) & Rail Meal/Grain Transfer	0.0006	20,000	0.10	0.45
LTMS & Rail Meal/Grain Loadout	0.0006	34,600	0.18	0.78
Flour Pellet Cooler	0.0055	8,000	0.38	1.65
Hominy Screener General Aspiration	0.0006	7,600	0.04	0.17
Hominy Loadout Fugitives				1.90
Grain Loadout Fugitives				0.10
			Total:	7.78

These limits are based on the maximum exhaust air flow rate, maximum grain loading determined by stack testing at the source or manufacturers' guaranty, and 8,760 hours/year of operation.

ii. LTMS Truck/Rail Dump Pit and LTMS Truck Loadout:

Emission Unit	Throughput (T/Mo)	(T/Yr)	E M I S S I O N S PM (lb/T)	(T/Mo)	(T/Yr)	PM_{10} (lb/T)	(T/Mo)	(T/Yr)
LTMS Truck/Rail Dump Pit	12,500	75,000	0.035	0.02	0.13	0.0078	0.00	0.03

Formatted Table

	Throughput			E M I S S I O N S PM			PM_{10}	
Emission Unit	(T/Mo)	(T/Yr)	(lb/T)	(T/Mo)	(T/Yr)	(lb/T)	(T/Mo)	(T/Yr)
LTMS Truck Loadout	12,500	75,000	0.086	0.27	1.61	0.029	0.09	0.54
				Total:	1.74			0.57

Formatted Table

These limits are based on the maximum throughput, standard AP-42 emission factors (Table 9.9-1, AP-42, Fifth Edition, Volume I, Update May 2003), 90% control efficiency for baghouse controlled for truck/rail dump pits, and 50% capture efficiency for loadout enclosure.

gf. Emissions from and operation of Boiler #1 shall not exceed the following limits:

i. Natural Gas Usage: 82.274 mmscf/month, 822.741 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	84.0	3.46	34.56
Nitrogen Oxides (NO_x)	50.0	2.06	20.57
Particulate Matter (PM)	7.6	0.31	3.13
Sulfur Dioxide (SO_2)	0.6	0.02	0.25
Volatile Organic Material (VOM)	5.5	0.23	2.26

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions ($lbs/10^3$ Gal)	(Tons/Mo)	(Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

hg. Emissions from and operation of Clayton Boiler shall not exceed the following limits:

i. Natural Gas Usage: 23.771 mmscf/month, 237.712 mmscf/year.

ii. Emissions from the combustion of natural gas:

Pollutant	Emissions (lbs/mmscf)	Emissions (Tons/Mo)	Emissions (Tons/Yr)
Carbon Monoxide (CO)	84.0	1.00	9.98
Nitrogen Oxides (NO_x)	100.0	1.19	11.89
Particulate Matter (PM)	7.6	0.09	0.90
Sulfur Dioxide (SO_2)	0.6	0.01	0.07
Volatile Organic Material (VOM)	5.5	0.07	0.65

These limits are based on the maximum fuel usage and standard emission factors (Tables 1.4-1 and 1.4-2, AP-42, Fifth Edition, Volume I, Supplement D, July 1998).

iii. Fuel Oil Usage: 141,667 gallons/month, 850,000 gallons/year.

iv. Emissions from the combustion of fuel oil:

Pollutant	Emissions (lbs/10^3 Gal)	Emissions (Tons/Mo)	Emissions (Tons/Yr)
Carbon Monoxide (CO)	5.00	0.35	2.13
Nitrogen Oxides (NO_x)	20.00	1.42	8.50
Particulate Matter (PM)	3.30	0.23	1.40
Sulfur Dioxide (SO_2)	0.213	0.02	0.09
Volatile Organic Material (VOM)	0.20	0.01	0.09

These limits are based on the maximum fuel usage, a heat content of 140,000 Btu/gal, a sulfur content of 15 ppm, and standard emission factors (Tables 1.3-1, 1.3-2, and 1.3-3, AP-42, Fifth Edition, Volume I, Supplement E, September 1999, corrected May 2010).

+h. Emissions from and operation of Emergency Generator Set DG-100 shall not exceed the following limits:

i. Hours of Operation: 100 hours/year;

ii. Emissions from the combustion of fuel oil in the Generator Sets:

Formatted Table

Pollutant	Emission Factor (lb/hp hr)	Emissions (lbs/Hr)	Emissions (Tons/Year)
Carbon Monoxide (CO)	0.0055	11.92	0.60
Nitrogen Oxides (NO_x)	0.024	52.03	2.60
Particulate Matter (PM)	0.0007	1.52	0.08

Formatted Table

Pollutant	Emission Factor (lb/hp hr)	Emissions (lbs/Hr)	Emissions (Tons/Year)
Sulfur Dioxide (SO_2)	0.0000121	0.03	0.01
Volatile Organic Material (VOM)	0.000642	1.39	0.07

These limits are based on the rated output of the engine powering the generator set (2,168 engine hp), 100 hours/year of operation, standard emission factors (Table 3.4-1, AP-42, Fifth Edition, Volume 1, Supplement B, October 1996), and a sulfur content of 15 ppm.

ii. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total).

17. This permit is issued based on the Potential to Emit (PTE) for Hazardous Air Pollutants (HAPs) as listed in Section 112(b) of the Clean Air Act from this source being less than 10 tons/year of any single HAP and 25 tons/year of any combination of such HAPs. As a result, this permit is issued based on the emissions of all HAPs from this source not triggering the requirements to obtain a CAAPP Permit from the Illinois EPA.

18a. Pursuant to 40 CFR 60.8(a), except as specified in 40 CFR 60.8(a)(1), (a)(2), (a)(3), and (a)(4), at such other times as may be required by the Illinois EPA or USEPA under section 114 of the Clean Air Act, the owner or operator of such facility shall conduct performance test(s) and furnish the Illinois EPA or USEPA a written report of the results of such performance test(s).

b. Pursuant to 40 CFR 60.8(b), performance tests shall be conducted and data reduced in accordance with the test methods and procedures contained in each applicable subpart of 40 CFR Part 60 unless the Illinois EPA or USEPA:

i. Specifies or approves, in specific cases, the use of a reference method with minor changes in methodology;

ii. Approves the use of an equivalent method;

iii. Approves the use of an alternative method the results of which the Illinois EPA or USEPA has determined to be adequate for indicating whether a specific source is in compliance;

iv. Waives the requirement for performance tests because the owner or operator of a source has demonstrated by other means to the Illinois EPA's or USEPA's satisfaction that the affected facility is in compliance with the standard; or

v. Approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors. Nothing in

this paragraph shall be construed to abrogate the Illinois EPA's or USEPA's authority to require testing under section 114 of the Clean Air Act.

c. Pursuant to 40 CFR 60.8(c), performance tests shall be conducted under such conditions as the Illinois EPA or USEPA shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Illinois EPA or USEPA such records as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test nor shall emissions in excess of the level of the applicable emission limit during periods of startup, shutdown, and malfunction be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

d. Pursuant to 40 CFR 60.8(d), the owner or operator of an affected facility shall provide the Illinois EPA or USEPA at least 30 days prior notice of any performance test, except as specified under other subparts of 40 CFR Part 60, to afford the Illinois EPA or USEPA the opportunity to have an observer present. If after 30 days notice for an initially scheduled performance test, there is a delay (due to operational problems, etc.) in conducting the scheduled performance test, the owner or operator of an affected facility shall notify the Illinois EPA or USEPA as soon as possible of any delay in the original test date, either by providing at least 7 days prior notice of the rescheduled date of the performance test, or by arranging a rescheduled date with the Illinois EPA or USEPA by mutual agreement.

e. Pursuant to 40 CFR 60.8(e), the owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

i. Sampling ports adequate for test methods applicable to such facility. This includes:

A. Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures; and

B. Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures.

ii. Safe sampling platform(s).

iii. Safe access to sampling platform(s).

iv. Utilities for sampling and testing equipment.

f. Pursuant to 40 CFR 60.8(f), unless otherwise specified in the applicable subpart of 40 CFR Part 60, each performance test shall

consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the applicable standard under 40 CFR Part 60. For the purpose of determining compliance with an applicable standard under 40 CFR Part 60, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Illinois EPA's or USEPA's approval, be determined using the arithmetic mean of the results of the two other runs.

g. Pursuant to 40 CFR 60.11(e)(2), except as provided in 40 CFR 60.11(e)(3), the owner or operator of an affected facility to which an opacity standard in 40 CFR Part 60 applies shall conduct opacity observations in accordance with 40 CFR 60.11(b), shall record the opacity of emissions, and shall report to the Illinois EPA or USEPA the opacity results along with the results of the initial performance test required under 40 CFR 60.8. The inability of an owner or operator to secure a visible emissions observer shall not be considered a reason for not conducting the opacity observations concurrent with the initial performance test.

19a. Pursuant to 40 CFR 60.303(a), in conducting the performance tests required in 40 CFR 60.8, the owner or operator shall use as reference methods and procedures the test methods in appendix A of 40 CFR Part 60 or other methods and procedures as specified in 40 CFR 60.303, except as provided in 40 CFR 60.8(b). Acceptable alternative methods and procedures are given in 40 CFR 60.303(c).

b. Pursuant to 40 CFR 60.303(b), the owner or operator shall determine compliance with the particulate matter standards in 40 CFR 60.302 as follows:

i. Method 5 shall be used to determine the particulate matter concentration and the volumetric flow rate of the effluent gas. The sampling time and sample volume for each run shall be at least 60 minutes and 1.70 dscm (60 dscf). The probe and filter holder shall be operated without heaters.

ii. Method 2 shall be used to determine the ventilation volumetric flow rate.

iii. Method 9 and the procedures in 40 CFR 60.11 shall be used to determine opacity.

c. Pursuant to 40 CFR 60.303(c)(1), the owner or operator may use the following as alternatives to the reference methods and procedures specified in 40 CFR 60.303: For Method 5, Method 17 may be used.

20a. Pursuant to 40 CFR 60.44c(g), for oil-fired affected facilities where the owner or operator seeks to demonstrate compliance with the fuel oil

sulfur limits under 40 CFR 60.42c based on shipment fuel sampling, the initial performance test shall consist of sampling and analyzing the oil in the initial tank of oil to be fired in the steam generating unit to demonstrate that the oil contains 0.5 weight percent sulfur or less. Thereafter, the owner or operator of the affected facility shall sample the oil in the fuel tank after each new shipment of oil is received, as described under 40 CFR 60.46c(d)(2).

b. Pursuant to 40 CFR 60.44c(h), for affected facilities subject to 40 CFR 60.42c(h)(1), (2), or (3) where the owner or operator seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, the performance test shall consist of the certification, the certification from the fuel supplier, as described under 40 CFR 60.48c(f), as applicable.

21a. Pursuant to 35 Ill. Adm. Code 201.282, every emission source or air pollution control equipment shall be subject to the following testing requirements for the purpose of determining the nature and quantities of specified air contaminant emissions and for the purpose of determining ground level and ambient air concentrations of such air contaminants:

i. Testing by Owner or Operator. The Illinois EPA may require the owner or operator of the emission source or air pollution control equipment to conduct such tests in accordance with procedures adopted by the Illinois EPA, at such reasonable times as may be specified by the Illinois EPA and at the expense of the owner or operator of the emission source or air pollution control equipment. The Illinois EPA may adopt procedures detailing methods of testing and formats for reporting results of testing. Such procedures and revisions thereto, shall not become effective until filed with the Secretary of State, as required by the APA Act. All such tests shall be made by or under the direction of a person qualified by training and/or experience in the field of air pollution testing. The Illinois EPA shall have the right to observe all aspects of such tests.

ii. Testing by the Illinois EPA. The Illinois EPA shall have the right to conduct such tests at any time at its own expense. Upon request of the Illinois EPA, the owner or operator of the emission source or air pollution control equipment shall provide, without charge to the Illinois EPA, necessary holes in stacks or ducts and other safe and proper testing facilities, including scaffolding, but excluding instruments and sensing devices, as may be necessary.

b. Testing required by Conditions 22 and 23 shall be performed upon a written request from the Illinois EPA by a qualified independent testing service.

22a. Pursuant to 35 Ill. Adm. Code 212.107, for both fugitive and nonfugitive particulate matter emissions, a determination as to the presence or absence of visible emissions from emission units shall be

conducted in accordance with Method 22, 40 CFR part 60, Appendix A, except that the length of the observing period shall be at the discretion of the observer, but not less than one minute. 35 Ill. Adm. Code Part 212 Subpart A shall not apply to 35 Ill. Adm. Code 212.301.

b. Pursuant to 35 Ill. Adm. Code 212.109, except as otherwise provided in 35 Ill. Adm. Code Part 212, and except for the methods of data reduction when applied to 35 Ill. Adm. Code 212.122 and 212.123, measurements of opacity shall be conducted in accordance with Method 9, 40 CFR Part 60, Appendix A, and the procedures in 40 CFR 60.675(c) and (d), if applicable, except that for roadways and parking areas the number of readings required for each vehicle pass will be three taken at 5-second intervals. The first reading shall be at the point of maximum opacity and second and third readings shall be made at the same point, the observer standing at right angles to the plume at least 15 feet away from the plume and observing 4 feet above the surface of the roadway or parking area. After four vehicles have passed, the 12 readings will be averaged.

c. Pursuant to 35 Ill. Adm. Code 212.110(a), measurement of particulate matter emissions from stationary emission units subject to 35 Ill. Adm. Code Part 212 shall be conducted in accordance with 40 CFR Part 60, Appendix A, Methods 5, 5A, 5D, or 5E.

d. Pursuant to 35 Ill. Adm. Code 212.110(b), the volumetric flow rate and gas velocity shall be determined in accordance with 40 CFR Part 60, Appendix A, Methods 1, 1A, 2, 2A, 2C, 2D, 3, and 4.

e. Pursuant to 35 Ill. Adm. Code 212.110(c), upon a written notification by the Illinois EPA, the owner or operator of a particulate matter emission unit subject to 35 Ill. Adm. Code Part 212 shall conduct the applicable testing for particulate matter emissions, opacity, or visible emissions at such person's own expense, to demonstrate compliance. Such test results shall be submitted to the Illinois EPA within thirty (30) days after conducting the test unless an alternative time for submittal is agreed to by the Illinois EPA.

23a. Within ninety (90) days after the issuance of this permit, the Permittee shall:

i. Conduct opacity observations from the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling during conditions which are representative of maximum emissions in order to demonstrate compliance with 35 Ill. Adm. Code 212.123. Thereafter, this testing shall be conducted at least once every (5) five years from the preceding testing date.

ii. Measure and quantify the emissions of PM (gr/dscf and lb/hr) and PM_{10} (gr/dscf and lb/hr) emissions from the Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS); Corn,

Soybean & Products Receiving, Cleaning and Storage (NSPS); Dry Corn Milling, Processing and Products Handling; Corn Mill Products Storage; and Corn Mill Products Milling and Handling during conditions which are representative of maximum emissions in order to demonstrate compliance with 35 Ill. Adm. Code 212.321 and Condition 13(b) of this permit. Thereafter, this testing shall be conducted at least once every (5) five years from the preceding testing date.

b. The following methods and procedures shall be used for testing of emissions, unless another method is approved by the Illinois EPA: (refer to 40 CFR 60, Appendix A for USEPA test methods).

Sample and Velocity Traverses for Stationary Sources	USEPA Method 1
Sample and Velocity Traverses for Stationary Sources with Small Stacks or Ducts	USEPA Method 1A
Determination of Stack Gas Velocity and Volumetric Flow Rate (Type S Pitot Tube)	USEPA Method 2
Direct Measurement of Gas Volume through Pipes and Small Ducts	USEPA Method 2A
Determination of Gas Velocity and Volumetric Flow Rate in Small Stacks or Ducts (Standard Pitot Tube)	USEPA Method 2C
Measurement of Gas Volume Flow Rates in Small Pipes and Ducts	USEPA Method 2D
Gas Analysis for the Determination of Dry Molecular Weight	USEPA Method 3
Determination of Moisture Content in Stack Gases	USEPA Method 4
Determination of Particulate Matter from Stationary Sources	USEPA Method 5
Determination of Particulate Matter Emissions from Positive Pressure Fabric Filters	USEPA Method 5D
Visual Determination of the Opacity of Emissions from Stationary Sources	USEPA Method 9
Visual Determination of Fugitive Emissions from Material Sources	USEPA Method 22

c. Within sixty (60) days prior to the actual date of testing, the Permittee shall submit a written test plan to the Illinois EPA, Bureau of Air, Compliance Section Manager. This plan shall include at a minimum:

i. The name (or other identification) of the emission unit(s) to be tested and the name and address of the facility at which they are located;

ii. The name and address of the independent testing service(s) performing the tests, with the names of the individuals who may be performing sampling and analysis and their experience with similar tests;

iii. The specific determinations of emissions and/or performance which are intended to be made, including the site(s) in the ductwork or stack at which sampling will occur;

iv. The specific conditions under which testing will be performed, including a discussion of why these conditions will be representative of the maximum emissions, maximum operating rate, minimum control performance, the levels of operating parameters for the emission unit, including associated control equipment, at or within which compliance is intended to be shown, and the means by which the operating parameters will be determined;

v. The test method(s) which will be used, with the specific analysis method, if the method can be used with different analysis methods. The specific sampling, analytical and quality control procedures which will be used, with an identification of the standard methods upon which they are based;

vi. Any minor changes in standard methodology proposed to accommodate the specific circumstances of testing, with justification;

vii. Any proposed use of an alternative test method, with detailed justification; and

viii. The format and content of the Source Test Report.

d. The Permittee shall provide the Illinois EPA with written notification of testing at least thirty (30) days prior to testing and again five (5) days prior to the testing to enable the Illinois EPA to have an observer present. This notification shall include the name of emission unit(s) to be tested, scheduled date and time, and contact person with telephone number.

e. If testing is delayed, the Permittee shall promptly notify the Illinois EPA by e-mail or facsimile, at least five (5) days prior to the scheduled date of testing or immediately, if the delay occurs in the five (5) days prior to the scheduled date. This notification shall also include the new date and time for testing, if set, or a separate notification shall be sent with this information when it is set.

f. The Permittee shall submit the Final Source Test Report(s) for these tests accompanied by a cover letter stating whether or not compliance was shown, to the Illinois EPA, Bureau of Air, Compliance Section Manager within thirty (30) days after the test results are compiled, but no later than sixty (60) days after the date of testing or sampling. The Final Source Test Report shall include as a minimum:

i. General information describing the test, including the name and identification of the emission source, which was tested, date of testing, names of personnel performing the tests, and Illinois EPA observers, if any;

ii. A summary of results;

iii. Description of test procedures and method(s), including description and map of emission units and sampling points,

sampling train, testing and analysis equipment, and test schedule;

iv. Detailed description of test conditions, including:

A. List and description of the equipment (including serial numbers or other equipment specific identifiers) tested and process information (i.e., mode(s) of operation, process rate or throughput, fuel or raw material consumption rate, and heat content of the fuels);

B. Control equipment information (i.e., equipment condition and operating parameters) during testing; and

C. A discussion of any preparatory actions taken (i.e., inspections, maintenance and repair).

v. Data and calculations, including copies of all raw data sheets and records of laboratory analyses, sample calculations, and data on equipment calibration. Identification of the applicable regulatory standards and permit conditions that the testing was performed to demonstrate compliance with, a comparison of the test results to the applicable regulatory standards and permit conditions, and a statement whether the test(s) demonstrated compliance with the applicable standards and permit conditions;

vi. An explanation of any discrepancies among individual tests, failed tests or anomalous data;

vii. The results and discussion of all quality control evaluation data, including a copy of all quality control data; and

viii. The applicable operating parameters of the pollution control device(s) during testing (temperature, pressure drop, flow rate, etc.), if any.

24. Pursuant to 40 CFR 60.46c(d)(2), as an alternative fuel sampling procedure for affected facilities combusting oil, oil samples may be collected from the fuel tank for each steam generating unit immediately after the fuel tank is filled and before any oil is combusted. The owner or operator of the affected facility shall analyze the oil sample to determine the sulfur content of the oil. If a partially empty fuel tank is refilled, a new sample and analysis of the fuel in the tank would be required upon filling. Results of the fuel analysis taken after each new shipment of oil is received shall be used as the daily value when calculating the 30-day rolling average until the next shipment is received. If the fuel analysis shows that the sulfur content in the fuel tank is greater than 0.5 weight percent sulfur, the owner or operator shall ensure that the sulfur content of subsequent oil shipments is low enough to cause the 30-day rolling average sulfur content to be 0.5 weight percent sulfur or less.

b. Pursuant to 40 CFR 60.46c(e), the monitoring requirements of 40 CFR 60.46c(a) and (d) shall not apply to affected facilities subject to 40 CFR 60.42c(h)(1), (2), or (3) where the owner or operator of the affected facility seeks to demonstrate compliance with the SO_2 standards based on fuel supplier certification, as described under 40 CFR 60.48c(f), as applicable.

245. Pursuant to 40 CFR 63.6625(f), if you own or operate an existing emergency stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions or an existing emergency stationary RICE located at an area source of HAP emissions, you must install a non-resettable hour meter if one is not already installed.

256a. Pursuant to 40 CFR 60.7(b), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of an affected facility; any malfunction of the air pollution control equipment; or any periods during which a continuous monitoring system or monitoring device is inoperative.

b. Pursuant to 40 CFR 60.7(f), any owner or operator subject to the provisions of 40 CFR Part 60 shall maintain a file of all measurements, including continuous monitoring system, monitoring device, and performance testing measurements; all continuous monitoring system performance evaluations; all continuous monitoring system or monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by 40 CFR Part 60 recorded in a permanent form suitable for inspection. The file shall be retained for at least two years following the date of such measurements, maintenance, reports, and records, except as follows:

The Illinois EPA or USEPA, upon notification to the source, may require the owner or operator to maintain all measurements as required by 40 CFR 60.7(f), if the Illinois EPA or USEPA determines these records are required to more accurately assess the compliance status of the affected source.

267a. Pursuant to 40 CFR 60.48c(c)(1), in addition to the applicable requirements in 40 CFR 60.7, the owner or operator of an affected facility subject to the opacity limits in 40 CFR 60.43c(c) shall submit excess emission reports for any excess emissions from the affected facility that occur during the reporting period and maintain records according to the requirements specified in 40 CFR 60.48c(c)(1) through (3), as applicable to the visible emissions monitoring method used.

For each performance test conducted using Method 9 of appendix A-4 of 40 CFR Part 60, the owner or operator shall keep the records including the information specified in 40 CFR 60.48c(c)(1)(i) through (iii).

i. Dates and time intervals of all opacity observation periods;

ii. Name, affiliation, and copy of current visible emission reading certification for each visible emission observer participating in the performance test; and

iii. Copies of all visible emission observer opacity field data sheets;

b. Pursuant to 40 CFR 60.48c(e), the owner or operator of each affected facility subject to the SO_2 emission limits, fuel oil sulfur limits, or percent reduction requirements under 40 CFR 60.42c shall keep records and submit reports as required under 40 CFR 60.48c(d), including the following information, as applicable.

i. Calendar dates covered in the reporting period.

ii. Identification of the F factor used in calculations, method of determination, and type of fuel combusted.

iii. If fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification is used to demonstrate compliance, records of fuel supplier certification as described under 40 CFR 60.48c(f)(1), (2), (3), or (4), as applicable. In addition to records of fuel supplier certifications, the report shall include a certified statement signed by the owner or operator of the affected facility that the records of fuel supplier certifications submitted represent all of the fuel combusted during the reporting period.

c. Pursuant to 40 CFR 60.48c(f)(1), fuel supplier certification shall include the following information for distillate oil:

i. The name of the oil supplier;

ii. A statement from the oil supplier that the oil complies with the specifications under the definition of distillate oil in 40 CFR 60.41c; and

iii. The sulfur content of the oil.

d. i. Pursuant to 40 CFR 60.48c(g)(1), except as provided under 40 CFR 60.48c(g)(2) and (g)(3), the owner or operator of each affected facility shall record and maintain records of the amounts of each fuel combusted during each operating day.

ii. Pursuant to 40 CFR 60.48c(g)(2), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility that combusts only natural gas, wood, fuels using fuel certification in 40 CFR 60.48c(f) to demonstrate compliance with the SO_2 standard, fuels not subject to an emissions standard (excluding opacity), or a mixture of these fuels may elect to record and maintain records of the amount of each fuel combusted during each calendar month.

iii. Pursuant to 40 CFR 60.48c(g)(3), as an alternative to meeting the requirements of 40 CFR 60.48c(g)(1), the owner or operator of an affected facility or multiple affected facilities located on a contiguous property unit where the only fuels combusted in any steam generating unit (including steam generating units not subject to 40 CFR 60 Subpart Dc) at that property are natural gas, wood, distillate oil meeting the most current requirements in 40 CFR 60.42c to use fuel certification to demonstrate compliance with the SO_2 standard, and/or fuels, excluding coal and residual oil, not subject to an emissions standard (excluding opacity) may elect to record and maintain records of the total amount of each steam generating unit fuel delivered to that property during each calendar month.

e. Pursuant to 40 CFR 60.48c(i), all records required under 40 CFR 60.48c shall be maintained by the owner or operator of the affected facility for a period of two years following the date of such record.

278. Pursuant to 40 CFR 63.10(b)(3), if an owner or operator determines that his or her stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants regulated by any standard established pursuant to Section 112(d) or (f) of the Clean Air Act, and that stationary source is in the source category regulated by the relevant standard, but that source is not subject to the relevant standard (or other requirement established under 40 CFR Part 63) because of limitations on the source's potential to emit or an exclusion, the owner or operator must keep a record of the applicability determination on site at the source for a period of 5 years after the determination, or until the source changes its operations to become an affected source, whichever comes first. The record of the applicability determination must be signed by the person making the determination and include an analysis (or other information) that demonstrates why the owner or operator believes the source is unaffected (e.g., because the source is an area source). The analysis (or other information) must be sufficiently detailed to allow the USEPA and/or Illinois EPA to make a finding about the source's applicability status with regard to the relevant standard or other requirement. If relevant, the analysis must be performed in accordance with requirements established in relevant subparts of 40 CFR Part 63 for this purpose for particular categories of stationary sources. If relevant, the analysis should be performed in accordance with USEPA guidance materials published to assist sources in making applicability determinations under Section 112 of the Clean Air Act, if any. The requirements to determine applicability of a standard under 40 CFR 63.1(b)(3) and to record the results of that determination under 40 CFR 63.10(b)(3) shall not by themselves create an obligation for the owner or operator to obtain a Title V permit.

289a. Pursuant to 40 CFR 63.6655(a), if you must comply with the emission and operating limitations, you must keep the records described in 40 CFR 63.6655(a)(1) through (a)(5), (b)(1) through (b)(3) and (c).

i. A copy of each notification and report that you submitted to comply with 40 CFR 63 Subpart ZZZZ, including all documentation supporting any Initial Notification or Notification of Compliance Status that you submitted, according to the requirement in 40 CFR 63.10(b)(2)(xiv).

ii. Records of the occurrence and duration of each malfunction of operation (i.e., process equipment) or the air pollution control and monitoring equipment.

iii. Records of performance tests and performance evaluations as required in 40 CFR 63.10(b)(2)(viii).

iv. Records of all required maintenance performed on the air pollution control and monitoring equipment.

v. Records of actions taken during periods of malfunction to minimize emissions in accordance with 40 CFR 63.6605(b), including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation.

b. Pursuant to 40 CFR 63.6655(d), you must keep the records required in Table 6 of 40 CFR 63 Subpart ZZZZ to show continuous compliance with each emission or operating limitation that applies to you.

c. Pursuant to 40 CFR 63.6655(e), you must keep records of the maintenance conducted on the stationary RICE in order to demonstrate that you operated and maintained the stationary RICE and after-treatment control device (if any) according to your own maintenance plan if you own or operate any of the following stationary RICE.

i. An existing stationary emergency RICE.

ii. An existing stationary CI RICE located at an area source of HAP emissions subject to management practices as shown in Table 2d to 40 CFR 63 Subpart ZZZZ.

d. Pursuant to 40 CFR 63.6655(f)(2), If you own or operate an existing emergency stationary CI RICE located at an area source of HAP emissions that does not meet the standards applicable to non-emergency engines, you must keep records of the hours of operation of the engine that is recorded through the non-resettable hour meter. The owner or operator must document how many hours are spent for emergency operation, including what classified the operation as emergency and how many hours are spent for non-emergency operation. If the engines are used for the purposes specified in ~~40 CFR 63.6640(f)(2)(ii) or (iii) or~~ 40 CFR 63.6640(f)(4)(ii), the owner or operator must keep records of the notification of the emergency situation, and the date, start time, and end time of engine operation for these purposes.

e. Pursuant to 40 CFR 63.6660(a), your records must be in a form suitable and readily available for expeditious review according to 40 CFR 63.10(b)(1).

f. Pursuant to 40 CFR 63.6660(b), as specified in 40 CFR 63.10(b)(1), you must keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

g. Pursuant to 40 CFR 63.6660(c), you must keep each record readily accessible in hard copy or electronic form for at least 5 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to 40 CFR 63.10(b)(1).

~~29~~30. Pursuant to 35 Ill. Adm. Code 212.110(e), the owner or operator of an emission unit subject to 35 Ill. Adm. Code Part 212 shall retain records of all tests which are performed. These records shall be retained for at least three (3) years after the date a test is performed.

~~30~~31a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C), On and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the fuel combustion emission source complies with the requirements in 35 Ill. Adm. Code 214.122(b)(2)(A) and (b)(2)(B), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must:

i. Maintain records demonstrating that the fuel oil used by the process emission source complies with the requirements in 35 Ill. Adm. Code 214.305(a)(1) and (a)(2), such as records from the fuel supplier indicating the sulfur content of the fuel oil; and

ii. Retain the records for at least 5 years, and provide copies of the records to the Illinois EPA within 30 days after receipt of a request by the Illinois EPA;

3~~2~~a. The Permittee shall maintain records of the following items so as to demonstrate compliance with the conditions of this permit:

i. Records addressing use of good operating practices for the baghouse filters and cyclones:

A. Records for periodic inspection of the baghouse filters and cyclones with date, individual performing the inspection, and nature of inspection; and

B. Records for prompt repair of defects, with identification and description of defect, effect on emissions, date identified, date repaired, and nature of repair.

ii. The Permittee shall keep a copy of the Fugitive Particulate Operating Program, any amendments or revisions to the Fugitive Particulate Operating Program, and the Permittee shall also keep a record of activities completed according to the Fugitive Particulate Operating Program.

iii. Records of housekeeping check lists;

iv. Records for the inspections required by Conditions 16(d) and (e), with date, time and observations if such information is not incorporated in the housekeeping check list.

v. Total flow rate for each baghouse blower (scfm);

vi. Total grain loading for each process (gr/dscf);

vii. Total hours of operation of each baghouse (hours/month and hours/year);

viii. The amount of grain received in LTMS Truck/Rail Dump Pit (tons/month and tons/year);

ix. The amount of grain shipped from the LTMS Truck Loadout (tons/month and tons/year);

x. Natural gas usage for Boiler #1 (mmscf/month and mmscf/year);

xi. Distillate fuel oil usage for Boiler #1 (gallons/month and gallons/year);

xii. Natural gas usage for the Clayton Boiler (mmscf/month and mmscf/year);

xiii. Distillate fuel oil usage for the Clayton Boiler (gallons/month and gallons/year);

xiv. Operating hours of Emergency Generator Set DG-100 (hours/month and hours/year);

xv. An inspection, maintenance and repair log of Emergency Generator Set DG-100 listing each activity performed with date; and

xvi. Monthly and annual emissions of CO, NO_x, PM, PM_{10}, SO_2, and VOM from the source with supporting calculations (tons/month and tons/year).

b. All records and logs required by Condition 3~~2~~(a) of this permit shall be retained at a readily accessible location at the source for at least five (5) years from the date of entry and shall be made available for inspection and copying by the Illinois EPA or USEPA upon request. Any records retained in an electronic format (e.g., computer storage device) shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Illinois EPA or USEPA request for records during the course of a source inspection.

3~~2~~3. Pursuant to 40 CFR 60.7(a)(4), any owner or operator subject to the provisions of 40 CFR Part 60 shall furnish the Illinois EPA or USEPA written notification or, if acceptable to both the Illinois EPA and USEPA and the owner or operator of a source, electronic notification, as follows:

A notification of any physical or operational change to an existing facility which may increase the emission rate of any air pollutant to which a standard applies, unless that change is specifically exempted under an applicable subpart or in 40 CFR 60.14(e). This notice shall be postmarked 60 days or as soon as practicable before the change is commenced and shall include information describing the precise nature of the change, present and proposed emission control systems, productive capacity of the facility before and after the change, and the expected completion date of the change. The Illinois EPA or USEPA may request additional relevant information subsequent to this notice.

3~~3~~4a. Pursuant to 40 CFR 63.6640(b), you must report each instance in which you did not meet each emission limitation or operating limitation in Tables 1a and 1b, Tables 2a and 2b, Table 2c, and Table 2d to 40 CFR 63 Subpart ZZZZ that apply to you. These instances are deviations from the emission and operating limitations in 40 CFR 63 Subpart ZZZZ. These deviations must be reported according to the requirements in 40 CFR 63.6650. If you change your catalyst, you must reestablish the values of the operating parameters measured during the initial performance test. When you reestablish the values of your operating parameters, you must also conduct a performance test to demonstrate that you are meeting the required emission limitation applicable to your stationary RICE.

b. Pursuant to 40 CFR 63.6640(e), you must also report each instance in which you did not meet the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ that apply to you. If you own or operate a new or reconstructed stationary RICE with a site rating of less than or equal to 500 brake HP located at a major source of HAP emissions (except new or

reconstructed 4SLB engines greater than or equal to 250 and less than or equal to 500 brake HP), a new or reconstructed stationary RICE located at an area source of HAP emissions, or any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ: An existing 2SLB stationary RICE, an existing 4SLB stationary RICE, an existing emergency stationary RICE, an existing limited use stationary RICE, or an existing stationary RICE which fires landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis. If you own or operate any of the following RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, you do not need to comply with the requirements in Table 8 to 40 CFR 63 Subpart ZZZZ, except for the initial notification requirements: a new or reconstructed stationary RICE that combusts landfill gas or digester gas equivalent to 10 percent or more of the gross heat input on an annual basis, a new or reconstructed emergency stationary RICE, or a new or reconstructed limited use stationary RICE.

c. Pursuant to 40 CFR 63.6645(a), you must submit all of the notifications in 40 CFR 63.7(b) and (c), 63.8(e), (f)(4) and (f)(6), 63.9(b) through (e), and (g) and (h) that apply to you by the dates specified if you own or operate any of the following;

   i. An existing stationary CI RICE located at an area source of HAP emissions.

   ii. This requirement does not apply if you own or operate an existing stationary RICE less than 100 HP, an existing stationary emergency RICE, or an existing stationary RICE that is not subject to any numerical emission standards.

d. Pursuant to 40 CFR 63.6650(a), you must submit each report in Table 7 of 40 CFR 63 Subpart ZZZZ that applies to you.

Table 7 to Subpart ZZZZ of Part 63—Requirements for Reports

As stated in 40 CFR 63.6650, you must comply with the following requirements for reports:

For each . . .	You must submit a . . .	The report must contain . . .	You must submit the report . . .
4. Emergency stationary RICE that operate or are contractually obligated to be available for more than 15 hours per year for the purposes specified 40 CFR 63.6640(f)(4)(ii)	Report	a. The information in 40 CFR 63.6650(h)(1)	i. annually according to the requirements in 40 CFR 63.6650(h)(2)-(3).

e. Pursuant to 40 CFR 63.6650(b), unless the Illinois EPA or USEPA has approved a different schedule for submission of reports under 40 CFR 63.10(a), you must submit each report by the date in Table 7 of 40 CFR

63 Subpart ZZZZ and according to the requirements in 40 CFR 63.6650(b)(1) through (b)(9).

i. For semiannual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in 40 CFR 63.6595 and ending on June 30 or December 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in 40 CFR 63.6595.

ii. For semiannual Compliance reports, the first Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date follows the end of the first calendar half after the compliance date that is specified for your affected source in 40 CFR 63.6595.

iii. For semiannual Compliance reports, each subsequent Compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

iv. For semiannual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

v. For annual Compliance reports, the first Compliance report must cover the period beginning on the compliance date that is specified for your affected source in 40 CFR 63.6595 and ending on December 31.

vi. For annual Compliance reports, the first Compliance report must be postmarked or delivered no later than January 31 following the end of the first calendar year after the compliance date that is specified for your affected source in 40 CFR 63.6595.

vii. For annual Compliance reports, each subsequent Compliance report must cover the annual reporting period from January 1 through December 31.

viii. For annual Compliance reports, each subsequent Compliance report must be postmarked or delivered no later than January 31.

f. Pursuant to 40 CFR 63.6650(c), the Compliance report must contain the information in 40 CFR 63.6650(c)(1) through (6).

i. Company name and address.

ii. Statement by a responsible official, with that official's name, title, and signature, certifying the accuracy of the content of the report.

iii. Date of report and beginning and ending dates of the reporting period.

iv. If you had a malfunction during the reporting period, the compliance report must include the number, duration, and a brief description for each type of malfunction which occurred during the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by an owner or operator during a malfunction of an affected source to minimize emissions in accordance with 40 CFR 63.6605(b), including actions taken to correct a malfunction.

v. If there are no deviations from any emission or operating limitations that apply to you, a statement that there were no deviations from the emission or operating limitations during the reporting period.

g. Pursuant to 40 CFR 63.6650(h), if you own or operate an emergency stationary RICE with a site rating of more than 100 brake HP that operates for the purpose specified in 40 CFR 63.6640(f)(4)(ii), you must submit an annual report according to the requirements in 40 CFR 63.6650(h)(1) through (3).

i. The report must contain the following information:

A. Company name and address where the engine is located.

B. Date of the report and beginning and ending dates of the reporting period.

C. Engine site rating and model year.

D. Latitude and longitude of the engine in decimal degrees reported to the fifth decimal place.

E. Hours spent for operation for the purpose specified in 40 CFR 63.6640(f)(4)(ii), including the date, start time, and end time for engine operation for the purposes specified in 40 CFR 63.6640(f)(4)(ii). The report must also identify the entity that dispatched the engine and the situation that necessitated the dispatch of the engine.

F. If there were no deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), a statement that there were no deviations from the fuel requirements during the reporting period.

G. If there were deviations from the fuel requirements in 40 CFR 63.6604 that apply to the engine (if any), information on the number, duration, and cause of deviations, and the corrective action taken.

ii. The first annual report must cover the calendar year 2015 and must be submitted no later than March 31, 2016. Subsequent annual reports for each calendar year must be submitted no later than March 31 of the following calendar year.

iii. The annual report must be submitted electronically using the subpart specific reporting form in the Compliance and Emissions Data Reporting Interface (CEDRI) that is accessed through EPA's Central Data Exchange (CDX) (www.epa.gov/cdx). However, if the reporting form specific to 40 CFR 63 Subpart ZZZZ is not available in CEDRI at the time that the report is due, the written report must be submitted to the Illinois EPA or USEPA at the appropriate address listed in 40 CFR 63.13.

34. Pursuant to 35 Ill. Adm. Code 212.110(d), a person planning to conduct testing for particulate matter emissions to demonstrate compliance shall give written notice to the Illinois EPA of that intent. Such notification shall be given at least thirty (30) days prior to the initiation of the test unless a shorter period is agreed to by the Illinois EPA. Such notification shall state the specific test methods from 35 Ill. Adm. Code 212.110 that will be used.

35a. Pursuant to 35 Ill. Adm. Code 214.122(b)(2)(C)(iii), on and after January 1, 2017, the owner or operator of a new fuel combustion emission source with actual heat input smaller than, or equal to, 73.2 MW (250 mmBtu/hr), burning liquid fuel exclusively, must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in this 35 Ill. Adm. Code 214.122(b)(2). At minimum, and in addition to any permitting obligations, the notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

b. Pursuant to 35 Ill. Adm. Code 214.305(a)(3)(C), except as provided in 35 Ill. Adm. Code 214.305(b), (c), and (d), on and after January 1, 2017, the owner or operator of a process emission source must comply with the following:

The owner or operator must notify the Illinois EPA within 30 days after discovery of deviations from any of the requirements in 35 Ill. Adm. Code 214.305(a). At minimum, and in addition to any permitting obligations, such notification must include a description of the deviations, a discussion of the possible cause of the deviations, any corrective actions taken, and any preventative measures taken.

36a. If there is an exceedance of or a deviation from the requirements of this permit as determined by the records required by this permit or otherwise, the Permittee shall submit a report to the Illinois EPA's Bureau of Air Compliance Section in Springfield, Illinois within thirty (30) days after the exceedance or deviation. The report shall identify the duration and the emissions impact of the exceedance or deviation, a

copy of the relevant records and information to resolve the exceedance or deviation, and a description of the efforts to reduce emissions from, and the duration of exceedance or deviation, and to prevent future occurrences of any such exceedance or deviation.

b. One (1) copy of required reports and notifications shall be sent to:

Illinois Environmental Protection Agency
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

It should be noted that the 150,000 gallon fuel oil storage tank is exempt from permitting, pursuant to 35 Ill. Adm. Code 201.146(n)(3).

If you have any questions on this permit, please call German Barria at 217/785-1705.

Sincerely,

William D. Marr
Manager, Permit Section
Bureau of Air

WDM:GB:

Attachment A - Emission Summary

This attachment provides a summary of the maximum emissions from the Corn Mill & Grain Elevator operating in compliance with the requirements of this federally enforceable permit. In preparing this summary, the Illinois EPA used the annual operating scenario which results in maximum emissions from such a plant. The resulting maximum emissions are below the levels, (e.g., 100 tons/year for CO, NO_x, and PM_{10}) at which this source would be considered a major source for purposes of the Clean Air Act Permit Program. Actual emissions from this source will be less than predicted in this summary to the extent that less material is handled, and control measures are more effective than required in this permit.

	E M I S S I O N S (Tons/Year)					
Emission Unit	CO	NO_x	PM	PM_{10}	SO_2	VOM
Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS)			14.02	14.02		
Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS)			6.71	6.71		
Dry Corn Milling, Processing and Products Handling			28.32	28.32		
Corn Flour/Bran Handling System			3.05	3.05		
Corn Mill Products Storage			0.50	0.50		
Corn Mill Products Milling and Handling			9.52	8.35		
Boiler #1						
Natural Gas	34.56	20.57	3.13	3.13	0.25	2.26
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Clayton Boiler					0	0
Natural Gas	9.98	11.89	0.90	0.90	0.07	0.65
Distillate Fuel Oil	2.13	8.50	1.40	1.40	0.09	0.09
Emergency Generator Set						
DG-100	0.60	2.60	0.08	0.08	0.01	0.07

GB:

Attachment B - Table 8 to Subpart ZZZZ of Part 63—Applicability of General Provisions to Subpart ZZZZ.

As stated in 40 CFR 63.6665, you must comply with the following applicable general provisions.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.1	General applicability of the General Provisions	Yes.	
§63.2	Definitions	Yes	Additional terms defined in 40 CFR 63.6675.
§63.3	Units and abbreviations	Yes.	
§63.4	Prohibited activities and circumvention	Yes.	
§63.5	Construction and reconstruction	Yes.	
§63.6(a)	Applicability	Yes.	
§63.6(b)(1)-(4)	Compliance dates for new and reconstructed sources	Yes.	
§63.6(b)(5)	Notification	Yes.	
§63.6(b)(6)	[Reserved]		
§63.6(b)(7)	Compliance dates for new and reconstructed area sources that become major sources	Yes.	
§63.6(c)(1)-(2)	Compliance dates for existing sources	Yes.	
§63.6(c)(3)-(4)	[Reserved]		
§63.6(c)(5)	Compliance dates for existing area sources that become major sources	Yes.	
§63.6(d)	[Reserved]		
§63.6(e)	Operation and maintenance	No.	
§63.6(f)(1)	Applicability of standards	No.	
§63.6(f)(2)	Methods for determining compliance	Yes.	
§63.6(f)(3)	Finding of compliance	Yes.	
§63.6(g)(1)-(3)	Use of alternate standard	Yes.	
§63.6(h)	Opacity and visible emission standards	No	Subpart ZZZZ does not contain opacity or visible emission standards.
§63.6(i)	Compliance extension procedures and criteria	Yes.	
§63.6(j)	Presidential compliance exemption	Yes.	
§63.7(a)(1)-(2)	Performance test dates	Yes	Subpart ZZZZ contains performance test dates at 40 CFR 63.6610, 63.6611, and 63.6612.
§63.7(a)(3)	CAA section 114 authority	Yes.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.7(b)(1)	Notification of performance test	Yes	Except that 40 CFR 63.7(b)(1) only applies as specified in 40 CFR 63.6645.
§63.7(b)(2)	Notification of rescheduling	Yes	Except that 40 CFR 63.7(b)(2) only applies as specified in 40 CFR 63.6645.
§63.7(c)	Quality assurance/test plan	Yes	Except that 40 CFR 63.7(c) only applies as specified in 40 CFR 63.6645.
§63.7(d)	Testing facilities	Yes.	
§63.7(e)(1)	Conditions for conducting performance tests	No.	Subpart ZZZZ specifies conditions for conducting performance tests at 40 CFR 63.6620.
§63.7(e)(2)	Conduct of performance tests and reduction of data	Yes	Subpart ZZZZ specifies test methods at 40 CFR 63.6620.
§63.7(e)(3)	Test run duration	Yes.	
§63.7(e)(4)	Administrator may require other testing under section 114 of the CAA	Yes.	
§63.7(f)	Alternative test method provisions	Yes.	
§63.7(g)	Performance test data analysis, recordkeeping, and reporting	Yes.	
§63.7(h)	Waiver of tests	Yes.	
§63.8(a)(1)	Applicability of monitoring requirements	Yes	Subpart ZZZZ contains specific requirements for monitoring at 40 CFR 63.6625.
§63.8(a)(2)	Performance specifications	Yes.	
§63.8(a)(3)	[Reserved]		
§63.8(a)(4)	Monitoring for control devices	No.	
§63.8(b)(1)	Monitoring	Yes.	
§63.8(b)(2)-(3)	Multiple effluents and multiple monitoring systems	Yes.	
§63.8(c)(1)	Monitoring system operation and maintenance	Yes.	
§63.8(c)(1)(i)	Routine and predictable SSM	No	
§63.8(c)(1)(ii)	SSM not in Startup Shutdown Malfunction Plan	Yes.	
§63.8(c)(1)(iii)	Compliance with operation and maintenance requirements	No	
§63.8(c)(2)-(3)	Monitoring system installation	Yes.	
§63.8(c)(4)	Continuous monitoring system (CMS) requirements	Yes	Except that subpart ZZZZ does not require Continuous Opacity Monitoring System (COMS).
§63.8(c)(5)	COMS minimum procedures	No	Subpart ZZZZ does not require COMS.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.8(c)(6)-(8)	CMS requirements	Yes	Except that subpart ZZZZ does not require COMS.
§63.8(d)	CMS quality control	Yes.	
§63.8(e)	CMS performance evaluation	Yes	Except for 40 CFR 63.8(e)(5)(ii), which applies to COMS.
		——Except that 40 CFR 63.8(e) only applies as specified in 40 CFR 63.6645.	
§63.8(f)(1)-(5)	Alternative monitoring method	Yes	Except that 40 CFR 63.8(f)(4) only applies as specified in 40 CFR 63.6645.
§63.8(f)(6)	Alternative to relative accuracy test	Yes	Except that 40 CFR 63.8(f)(6) only applies as specified in 40 CFR 63.6645.
§63.8(g)	Data reduction	Yes	Except that provisions for COMS are not applicable. Averaging periods for demonstrating compliance are specified at 40 CFR 63.6635 and 63.6640.
§63.9(a)	Applicability and State delegation of notification requirements	Yes.	
§63.9(b)(1)-(5)	Initial notifications	Yes	Except that 40 CFR 63.9(b)(3) is reserved.
		——Except that 40 CFR 63.9(b) only applies as specified in 40 CFR 63.6645.	
§63.9(c)	Request for compliance extension	Yes	Except that 40 CFR 63.9(c) only applies as specified in 40 CFR 63.6645.
§63.9(d)	Notification of special compliance requirements for new sources	Yes	Except that 40 CFR 63.9(d) only applies as specified in 40 CFR 63.6645.
§63.9(e)	Notification of performance test	Yes	Except that 40 CFR 63.9(e) only applies as specified in 40 CFR 63.6645.
§63.9(f)	Notification of visible emission (VE)/opacity test	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.9(g)(1)	Notification of performance evaluation	Yes	Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.
§63.9(g)(2)	Notification of use of COMS data	No	Subpart ZZZZ does not contain opacity or VE standards.

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.9(g)(3)	Notification that criterion for alternative to RATA is exceeded	Yes	If alternative is in use.
		——Except that 40 CFR 63.9(g) only applies as specified in 40 CFR 63.6645.	
§63.9(h)(1)-(6)	Notification of compliance status	Yes	Except that notifications for sources using a CEMS are due 30 days after completion of performance evaluations. 40 CFR 63.9(h)(4) is reserved.
			Except that 40 CFR 63.9(h) only applies as specified in 40 CFR 63.6645.
§63.9(i)	Adjustment of submittal deadlines	Yes.	
§63.9(j)	Change in previous information	Yes.	
§ 63.9(k)	Electronic reporting procedures	Yes	Only as specified in 40 CFR 63.9(j).
§63.10(a)	Administrative provisions for recordkeeping/reporting	Yes.	
§63.10(b)(1)	Record retention	Yes	Except that the most recent 2 years of data do not have to be retained on site.
§63.10(b)(2)(i)-(v)	Records related to SSM	No.	
§63.10(b)(2)(vi)-(xi)	Records	Yes.	
§63.10(b)(2)(xii)	Record when under waiver	Yes.	
§63.10(b)(2)(xiii)	Records when using alternative to RATA	Yes	For CO standard if using RATA alternative.
§63.10(b)(2)(xiv)	Records of supporting documentation	Yes.	
§63.10(b)(3)	Records of applicability determination	Yes.	
§63.10(c)	Additional records for sources using CEMS	Yes	Except that 40 CFR 63.10(c)(2)-(4) and (9) are reserved.
§63.10(d)(1)	General reporting requirements	Yes.	
§63.10(d)(2)	Report of performance test results	Yes.	
§63.10(d)(3)	Reporting opacity or VE observations	No	Subpart ZZZZ does not contain opacity or VE standards.
§63.10(d)(4)	Progress reports	Yes.	
§63.10(d)(5)	Startup, shutdown, and malfunction reports	No.	

General provisions citation	Subject of citation	Applies to subpart	Explanation
§63.10(e)(1) and (2)(i)	Additional CMS Reports	Yes.	
§63.10(e)(2)(ii)	COMS-related report	No	Subpart ZZZZ does not require COMS.
§63.10(e)(3)	Excess emission and parameter exceedances reports	Yes.	Except that 40 CFR 63.10(e)(3)(i) (C) is reserved.
§63.10(e)(4)	Reporting COMS data	No	Subpart ZZZZ does not require COMS.
§63.10(f)	Waiver for recordkeeping/reporting	Yes.	
§63.11	Flares	No.	
§63.12	State authority and delegations	Yes.	
§63.13	Addresses	Yes.	
§63.14	Incorporation by reference	Yes.	
§63.15	Availability of information	Yes.

Mr. Burris,

Please find attached a draft of the proposed construction permit, and draft FESOP.
Note that there is a place holder for the fugitive dust plan receival date.

Thank you.

FEDERALLY ENFORCEABLE STATE OPERATING PERMIT -- NSPS and NESHAP SOURCE

PERMITTEE

Bunge North America, Inc.
Attn: Dean Hughes
11720 Borman Drive
St. Louis, Missouri 63146-1000

Application No.: 96020027 I.D. No.: 183020ABT
Applicant's Designation: Date Received: December 5, 2011
Operation of: Corn Mill & Grain Elevator
Date Issued: Expiration Date:
Source Location: 321 E. North Street, Danville, Vermilion County

This permit is hereby granted to the above-designated Permittee to OPERATE emission unit(s) and/or air pollution control equipment consisting of:

Corn, Soybean & Products Receiving, Cleaning and Storage (Pre-NSPS):
Truck Dump #1 (5012-0001-0016) controlled by Baghouse Filters APM 40072.10;
Hoffman Bldg 301 Vacuum (5012-0010-0054) controlled by Baghouse Filters HOFFMAN 48X96;
West Headhouse Transfer General Aspiration (5012-0005-0029) controlled by Baghouse Filters DD 484RF12;
RHOMBO Truck Dump Pit #3 (5012-0003-0013) controlled by Baghouse Filters APM SJL156-6;
Railcar Dump Pit (5012-0004-0016) controlled by Baghouse Filters APM 41120.12;
RHOMBO West General Aspiration (5012-0009-0009) controlled by Baghouse Filters APM SJL72-6;
RHOMBO Gallery Aspiration (5012-0003-0018) controlled by Baghouse Filters APM SJL72-6;
Track 6 Vacuum (5012-0010-0047) controlled by Baghouse Filters HOFFMAN 48X96;
Cleanings Discharge (4870-0013-0015) controlled by Baghouse Filters BUHLER 16S-6-30;
Conveying General Aspiration (4750-0029-0015) controlled by Baghouse Filters MICROPUL 100S-6-20;

Corn, Soybean & Products Receiving, Cleaning and Storage (NSPS):
Truck Dump #4 & W. Gallery Aspiration (5012-0005-0021) controlled by Baghouse Filters DD 484RF12;
Cleaning North APM (4870-0013-0001) controlled by Baghouse Filters APM 41216.12;

Corn Cleaning Bldg 115 #2 (4880-0034-0069) controlled by Baghouse Filters TD 484RF12;
North St Grain/Meal Truck Dump Pit #2 (5012-0002-0012) controlled by Baghouse Filters DD 48RF12;

Dry Corn Milling, Processing and Products Handling:
Bemis Bagging (4870-0010-0055) controlled by Baghouse Filters APM 16019.8;
Bagging General Aspiration (4870-0010-0030) controlled by Baghouse Filters APM 40020.8;
Bagging Packer General Aspiration (4870-0013-0019) controlled by Baghouse Filters APM 14042.8;
Bran Dryer Process (4880-0042-0057) controlled by Baghouse Filters APM 14036.8;
Bran Sifter Process (4880-0042-0062) controlled by Baghouse Filters APM 10144.8;
East Meal Dryer/Cooler (4880-0034-0054) controlled by Baghouse Filters APM 40120.10;
West Meal Dryer (4880-0034-0059) controlled by Baghouse Filters APM 40144.8;
8th FR DRACCO Screening (4880-0034-0027) controlled by Baghouse Filters DRACO 6MB-60;
9th FR DRACCO Screening (4880-0034-0001) controlled by Baghouse Filters DRACO 8MB-72;
Bldg 105 Vacuum (4880-0032-0052) controlled by Baghouse Filters HOFFMAN 36X96;
Bulk Loading White Goods (4870-0021-0001) controlled by Baghouse Filters DD 484RF12;
Bldg 104 Vacuum (4870-0015-0016) controlled by Baghouse Filters HOFFMAN 38405A;
Bran Bin (4880-0042-0054) controlled by Baghouse Filters BUHLER 16S-6-30;
6th Flr Screening (4880-0008-0028) controlled by Baghouse Filters WIEDENMANN 2X4 LF150-1200;
West 4th Floor Gravity Tables (4880-0008-0040) controlled by Baghouse Filters WIEDENMANN 2X5 LF225-2250;
South Lunchroom Screening (4880-0034-0010) controlled by Baghouse Filters CD 484RF12;
South CD Screening (4880-0034-0042) controlled by Baghouse Filters CD 484RF12;
North CD General Aspiration (4880-0034-0048) controlled by Baghouse Filters CD 484RF12;
North Lunchroom Screening (4880-0034-0019) controlled by Baghouse Filters CD 484RF12;
Pack & Bulk Loading Bldg 115 (4870-0013-0024) controlled by Baghouse Filters TD 484RF12;
CAMAS/Bran Bldg 115 (4880-0034-0077) controlled by Baghouse Filters TD 484RF12;
Thru/Tail Stock Dryers Bldg 115 (4880-0034-0071) controlled by Baghouse Filters TD 484RF12;
Bldg 115 Vacuum (4880-0032-0070) controlled by Baghouse Filters HOFFMAN S54002;
Gravity Tables #3 (4880-0044-0070), #4 (4880-0044-0073), and #5 (4880-0044-0076) controlled by Baghouse Filters TORIT CPC-12;
Track 2 Railcar Unloading Secondary Receiver (4870-0005-0003) controlled by Baghouse Filters USS INC. 15CF P/D;

GERM General Aspiration (4880-0009-0005) controlled by Baghouse Filters APM 16030.4;
Lab Filter (4932-0001-0001) controlled by Baghouse Filters APM 14106.4;
AB Fin Product Surge Bin North (4900-0003-0039) controlled by Baghouse Filters MICROPUL 8B;
AB Fin Product Surge Bin South (4900-0003-0045) controlled by Baghouse Filters MICROPUL 8B;
1/2 Pulvocron Meal Receiver (4990-0005-0012) controlled by Baghouse Filters BUHLER 9-6-100;
1/2 Pulvocron Visc Flour Receiver (4990-0005-0042) controlled by Baghouse Filters BUHLER 16-8-100;
3/4 Pulvocron Meal Receiver (4990-0002-0010) controlled by Baghouse Filters BUHLER 9-6-100;
9/10 Pulvocron Meal Secondary Receiver (4990-0004-0013) controlled by Baghouse Filters BUHLER 16009.4;
7/8 Pulvocron Meal Secondary Receiver (4990-0003-0010) controlled by Baghouse Filters BUHLER 16009.4;
Three (3) Mills (#3 Pulvocron (4990-0002-0019), #4 Pulvocron (4990-0002-0022), and #5 Pulvocron (4900-0001-0039)) controlled by Baghouse Filters BUHLER 37-8-220;
Two (2) Mills (#1 Pulvocron (4990-0005-0021) and #2 Pulvocron (4990-0005-0024)) controlled by Baghouse Filters BUHLER 37-8-220;
Four (4) Mills (#7 Pulvocron (4990-0003-0019), #8 Pulvocron (4990-0003-0022), #9 Pulvocron (4990-0004-0022) and #10 Pulvocron (4990-0004-0025)) controlled by Baghouse Filters APM 16022.8;
3/4 Pulvocron Grinder Surge Bin (4990-0002-0008) controlled by Baghouse Filters MICROPUL 2 1/2B;
1/2 Pulvocron Grinder Surge Bin (4990-0005-0010) controlled by Baghouse Filters MICROPUL 2 1/2B;
9/10 Pulvocron Grinder Surge Bin (4990-0004-0011) controlled by Baghouse Filters APM 16104.4;
7/8 Pulvocron Grinder Surge Bin (4990-0003-0008) controlled by Baghouse Filters APM 16104.4;
1/2 Flour Surge Bin (4990-0005-0028) controlled by Baghouse Filters MICROPUL 2 1/2B;
3/4 Flour Surge Bin (4990-0002-0026) controlled by Baghouse Filters MICROPUL 2 1/2B;
7/8 Flour Surge Bin (4990-0003-0026) controlled by Baghouse Filters APM 16104.4;
9/10 Flour Surge Bin (4990-0004-0029) controlled by Baghouse Filters APM 16104.4;
HIBOND Visc. Flake Roller Mill (4990-0006-0024) controlled by Baghouse Filters APM 15066.8;
CSM Blended Food Receiver (4820-0001-0029) controlled by Baghouse Filters APM 40070.7;
Blended Food Packaging (4820-0001-0052) controlled by Baghouse Filters APM 16150.6;
ALLBOND Visc. Flour General Aspiration (4900-0001-0068) controlled by Baghouse Filters BUHLER 16-8-100;
Milk Bins (4820-0003-0007) controlled by Baghouse Filters MICROPUL 6B;
300 Series Binning (4990-0007-0049) controlled by Baghouse Filters MICROPUL 1F1;

Soy Meal General Aspiration (4990-0001-0002) controlled by Baghouse Filters APM 16022.4;
Soy Meal Surge Bin (4990-0001-0006) controlled by Baghouse Filters MICROPUL 6B;
Meal Bin Cooler (4990-0001-0025) controlled by Baghouse Filters APM 400072.10;

Fts Dryer Aspiration (4860-0019-0003) controlled by CORONA 15 CYCLONE;
Pet Bran Kice Lites Filter (4860-0024-0037) controlled by Baghouse Filters MICROPUL;
Bin 945 Germ Receiver (4860-0017-0026) controlled by Baghouse Filters BUHLER 36S-6-30;
Two (2) Cyclone Receivers (Extrusion Receiver; 108 A-Bin Receiver) controlled by Baghouse Filters (5&6 Allbond Receiving Filter);
Pneumatic Lift Receiver for Coarse Whole Grain transfer (WG260);
PCM Hammermill controlled by Filter System (78-03:11);
USG Hammermill controlled by Filter System (78-03:27);

USG Extruder Pellet Transfer controlled by Collection Cyclone (78-08:22);
One (1) #1 Coarse Gravity Table Aspiration Cyclone Collector (05:68) (17,000 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #3 Fine Gravity Table Aspiration Cyclone Collector (06:88) (17,000 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #1 Satake Degerminator Cyclone Collector (45:07) (1,400 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #1 Satake Aspiration Cyclone Collector (45:12) (1,400 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #2 Satake Degerminator Cyclone Collector (45:09) (1,400 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) #2 Satake Aspiration Cyclone Collector (45:24) (1,400 dscfm) controlled by the S 105 Roof Carter-Day Filter (334:86);
Satake Sifter and Sifter Air Locks controlled by the S 105 Roof Carter-Day Filter (334:86);
One (1) Pneumatic Transfer Line and Cyclone Receiver (45:20) controlled by 8th Floor Donaldson Filter (34:27) controlled by the S 105 Roof Carter-Day Filter (334:86);
