1.07 SURFACE WATER MANAGEMENT

Control of surface water caused by precipitation necessary for completion of the work under this contract according to Section 02140 is the responsibility of the Contractor and shall be included in the contract lump sum price.

1.08 SUBMITTALS

A. Materials Handling Plan.

A materials handling plan shall be submitted for construction and protection of the Compacted Clay Liner. The plan shall describe the following:

1. Processing and placement of the Compacted Clay Liner: type, model number, weight, and critical dimensions of equipment to be used for soil processing, compaction, scarification, and smooth rolling;

Electronic Filing: Received, Clerk's Office 06/20/2024

2. Method of protecting the Compacted Clay Liner from changes in moisture content and freezing after placement.

## PART 2. PRODUCTS

### 2.01 MATERIALS

A. Earth Fill Material

Earth Fill Material shall consist of a mixture of clay, silt, sand, and gravel-sized particles obtained from previously constructed subsoil stockpiles. These materials can be used separately or mixed as required for best results. These materials shall be free of ice, snow, organic matter, rubbish, and debris. Coarse-grained particles shall be well dispersed to prevent the development of segregated pockets or zones with insufficient fine material to fill the interstices.

B. Compacted Clay Liners

1. Gypsum Management Facility

The Compacted Clay Liner for the Gypsum Management Facility shall be soil materials obtained from the approximately 5.4 ft. of material remaining above the foundation grade that was left in-place under the previous excavation contract. The material shall be free of ice, snow, organic matter, rubbish, and debris, and shall have a maximum clod size no greater than the length of the compactor foot for the compaction equipment proposed by the Contractor. When compacted, the material shall have a vertical hydraulic conductivity of less than $1 \times 10^{-4}$ cm/sec.

2. CCB Landfill

The Compacted Clay Liner for the CCB Landfill shall be soil materials obtained from on-site excavations and materials stockpiled east of the cell. The material shall be free of ice, snow, organic matter, rubbish, and debris, and shall have a maximum clod size no greater than the length of the compactor foot for the compaction equipment proposed by the Contractor. When compacted, the material shall have a vertical hydraulic conductivity of less than $1 \times 10^{-6}$ cm/sec.

C. Soil Stabilizers and Moisture Conditioning Agents

Additives to accelerate drying or to improve stability and workability of soil shall not be permitted unless approved in writing by the Owner's Representative.

Electronic Filing: Received, Clerk's Office 06/20/2024

2.02 EQUIPMENT

A. Compaction Equipment

1. Tamping foot rollers

Compaction equipment shall consist of tamping foot rollers which have a minimum weight of 40,000 pounds. At least one tamping foot shall be provided for each 110 square in. of drum surface. The length of each tamping foot, measured from the outside surface of the drum, shall be at least 1 in. longer than the loose lift thickness.

2. Steel-Wheeled Rollers

Equipment used to produce a smooth compacted surface shall be a smooth, non-vibratory steel wheeled roller weighing not less than 1,000 lb. per lineal ft.

B. Scarification Equipment

Discs, rotor tillers, or other equipment used to scarify the surface shall be capable of uniformly disturbing at least the upper 6 in. of surface to provide good bonding between lifts.

C. Mixing and Spreading Equipment

Discs, harrows, and motor graders or other similar equipment shall be available at the site for use in spreading, mixing, and drying Compacted Subsoil Stockpile Material.

## PART 3. EXECUTION

3.01 PREPARATION

A. Control of Work

Benchmarks, monuments, and other reference points shall be maintained throughout the work area.

B. Utility Location

Before starting excavation, the location and extent of underground utilities in the work area shall be established.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 3.02 EXCAVATION

### A. General

Excavation consists of removal and redistribution of material encountered when establishing required grade and subgrade elevations. The Contractor shall be responsible for dewatering, protection, shoring, and disposal of excavated materials as necessary to complete the excavation.

### B. Procedures

Excavation may be accomplished by any method and by use of any equipment that is suitable to the work, except that blasting will not be permitted. Based on previous construction experience at the site, it is recommended that excavation to the foundation grade be completed as far in advance of the Compacted Clay Liner placement as possible to allow the foundation surface to dry and form a "crust" capable of sustaining compactive effort.

### C. Overexcavation

Overexcavation shall be performed to the lines and grades indicated on the plans. Additional overexcavation required to remove unsuitable materials as requested by the Owner's Representative shall be paid for by the Owner for at the Unit Price for Excavation. Any overexcavation or excess excavation not requested by the Owner's Representative shall be at the expense of the Contractor.

### D. Disposal of Excavated Materials

Contractor shall stockpile excess excavated subsoil or topsoil materials in their corresponding stockpile for future use.

## 3.03 SUBGRADE PREPARATION

A. Areas to receive fill shall be proof rolled under the observation of the Owner's Representative. Soft, loose, weak, or wet materials shall be removed and replaced with compacted fill or stabilized with geotechnical fabric or geogrid as directed by the Owner's Representative and paid on a time and materials basis. Joints, fractures, and moisture seeps shall be repaired, and local sand deposits, if present at foundation grade, shall be removed and backfilled with compacted fill material as directed by the Owner's Representative.

B. The Owner's Representative may recommend additional drying time for soft, wet subgrade that has not been exposed long enough to permit "crust" formation. If approved by the Owner's Representative, the Contractor may install, at his own expense, geotechnical fabric to stabilize the wet subgrade and expedite construction.

Electronic Filing: Received, Clerk's Office 06/20/2024

C. Following the excavation for the Compacted Clay Liner, the CQA Officer shall direct the Owner's Field Surveyor to verify that actual depths and grades of the foundation are in accordance with the plans and specifications. Elevations shall be surveyed on a 100 ft. grid pattern for the bottom of the cell. The points surveyed for side slopes will be at the top, midpoint, and toe. In addition, all breaks in grade will be surveyed. Foundation excavation grading shall meet a control tolerance requirement of 0 ft to -0.4 ft. The measured depths and grades shall be documented on "as built" drawings furnished to the CQA Officer by the surveyor agency. The CQA Officer shall review the survey data for conformance to requirements and, if found in agreement with requirements, provide certification for the work in accordance with CQA Plan Procedures.

C. The Contractor shall not place fill until the subgrade has been examined jointly with the Owner's Representative and a certificate of approval for the subgrade has been submitted to the Owner's Representative.

3.04 STRUCTURAL FILL

A. Placement

1. Unless otherwise indicated on the plans, all Fill shall be composed of Earth Fill Material.
2. Fill materials used in embankment construction shall normally be placed in lanes parallel to the embankment axis and shall be placed in conformance with the lines, grades, and slopes as indicated on the plans. Placement of fill materials in lanes which are not parallel to the embankment will be allowed only where working room is too restricted for normal placement as determined by the Owner's Representative.
3. Fill shall be spread in approximately flat layers in such a manner as to obtain lifts of relatively uniform thickness without spaces between successively deposited loads. Segregation shall be prevented during placing and spreading. Hauling equipment shall be routed across the fill in such a way as to promote uniform compaction and to prevent the formation of ruts.
4. The maximum compacted thickness of each lift shall not exceed 8 in. where heavy compaction equipment will be used. The maximum compacted thickness shall not exceed 3 in. where power tampers or similar smaller equipment will be used. It may be necessary to reduce the thickness of lifts in order to obtain the required minimum density.
5. Where compacted Fill is to be placed against existing slopes, each lift shall be keyed into existing slope by removing existing slope material in steps as each new lift is placed.
6. The surface of the fill shall be kept reasonably smooth. The fill surface shall be sloped transverse to the axis of the embankments to allow drainage. If the compacted surface is, in the opinion of the Owner's Representative, too smooth or too dry to bond properly with the succeeding lift, it shall be roughened by scarifying, light discing, or other acceptable means, and it shall be sprinkled with water before the

Electronic Filing: Received, Clerk's Office 06/20/2024

succeeding lift is placed thereon. If the surface becomes rutted or uneven subsequent to compaction, it shall be flattened and leveled before placing the next lift. This extra work shall be at the Contractor's expense.

7. Fill operations shall be suspended during periods of extended wet weather. Upon resuming operations, all fill materials that are excessively wet or soft shall be reprocessed in place or removed and stockpiled for reprocessing. The removal of soft material shall be carried to such depth as is necessary to expose firm materials. Fill shall not be placed on frozen surfaces.
8. When filling operations at any section will be suspended for any period in excess of 12 hours or in wet weather, the surface of the fill shall be rolled smooth to seal it against excessive absorption of moisture and to facilitate runoff. Prior to resuming fill placement and compaction, the fill surface shall be scarified and/or disced and moisture conditioned as required.
9. The Contractor will receive no additional compensation for any removal, reprocessing, stockpiling, recompaction, wasting, or similar operation related to suspensions or conditions due to weather or other causes unless caused by the Owner.
10. Earth fill access ramps shall not be constructed within the limits of the compacted embankments without the approval of the Owner's Representative. When such ramps are approved, they shall be constructed of Compacted Clay Liner material (in-board of the perimeter berm) or compacted Fill (out-board of the perimeter berm).

B. Compaction -

1. Fill materials shall be compacted to a dry density equal to or greater than the following:

   a. The Gypsum Management Facility: 95 percent of the maximum dry density obtained from the Standard Proctor Test, ASTM D698.
   b. The CCB Landfill: 90 percent of the maximum dry density obtained from the Standard Proctor Test, ASTM D698.

   In order to insure uniform coverage and to facilitate construction inspection and control, the compaction of each layer shall proceed in a systematic, orderly, and continuous manner. Rolling shall be parallel to the embankment axis, except where there is insufficient working room for such operations.

2. The moisture content of all earth fill materials shall be as uniform as practicable throughout each lift. Fill shall be compacted at a moisture content that is no more than 2 percent below and no more than 2 percent above optimum moisture content.
3. Moisture conditioning of fill materials shall be performed by discing, harrowing, plowing, blading, or other suitable means prior to excavation. Moisture conditioning where the fill is placed shall be limited to minor adjustments prior to compaction. Addition of moisture shall be by using a

Electronic Filing: Received, Clerk's Office 06/20/2024

pressure spray bar mounted in front of or to one side of a water tanker so that water will not collect in the tracks of the truck.

4. Any materials that are placed but not compacted prior to drying out or becoming too wet shall be removed and replaced or reprocessed at the Contractor's expense.
5. No admixtures as drying agents or to improve the workability of the soil will be allowed.

3.05 GENERAL FILL

General Fill materials shall be placed to the specifications for Structural Fill, except it shall be compacted to a dry density equal to or greater than 92 percent of the maximum dry density obtained from the Standard Proctor Test, ASTM D698

3.06 COMPACTED CLAY LINERS

A. Sources

The Compacted Clay Liners for both the Gypsum Management Facility and the CCB Landfill shall be constructed from Compacted Clay Liner material as described in paragraph 2.01(B) above.

B. Test Soil Liner

A Test Soil Liner of the actual full scale liner shall be constructed in accordance with the following requirements:

1. Test liner will be constructed from the same soil material sources, to the same design specifications, and with similar equipment and procedures as are proposed for the full scale liner.
2. Test liner will be at least four times the width of the widest piece of equipment to be used.
3. Test liner will be no less than 100 ft long to allow equipment to reach normal operating speed before reaching a central 40-ft test area.
4. Test liner will be constructed with maximum 8-in. compacted lifts for a total liner thickness of 3 *ft*.
5. Test liner will be tested by the Owner's Testing Firm in accordance with the project Construction Quality Assurance (CQA) Plan, included in Appendix 2, summarized below for each of the following physical properties:

    a. Multiple two-stage Boutwell permeameter tests will be used on the test liner to determine the hydraulic conductivity. The two-stage field hydraulic conductivity test is a falling head infiltration test conducted in a cased borehole, typically 4 in. in diameter. The test is cited in the U.S. EPA Technical Guidance Document: Quality Assurance and Quality Control for Waste Containment Facilities, September 1993 (EPA/600/R-93/182).

Electronic Filing: Received, Clerk's Office 06/20/2024

b. Undisturbed samples (Shelby tubes) will be tested in the laboratory for hydraulic conductivity to determine if there is a statistical correlation to the field testing results.

c. Other engineering parameters including, but not limited to, particle size analysis, liquid limits, plasticity, water content, and in-place density that are needed to evaluate the full scale liner will be determined.

6. Additional test fills will be constructed for each new soil type or for each change in equipment or procedures.

C. Full Scale Liner Construction:

1. Full scale liner construction shall not be commenced until the results of the in-place compaction testing and Boutwell permeameter tests on the test liner confirm that the construction procedures and specified compaction requirements produce in-situ hydraulic conductivities as specified in Section 2.01(B) above.

2. The liner shall be constructed according to the placement and compaction requirements for general fill, except the material shall be compacted to a density of no less than 95 percent of maximum dry density as determined by the Standard Proctor Test (ASTM D 698) at the following moisture contents:

   a. Gypsum Stack Compacted Clay Liner shall be compacted at a moisture content between 100 percent and 105 percent of optimum.

   b. CCB Landfill Compacted Clay Liner shall be compacted at a moisture content determined by the "acceptable zone" criteria as outlined in the project CQA Plan.

   The same compaction procedures, such as number of passes, speed, and compaction equipment used on construction of the test liner shall be used. Grade stakes shall not be driven into the clay liner.

3. Moisture/density, hydraulic conductivity, and strength testing of the Compacted Clay Liner shall be conducted by the soil testing agency under the requirements and frequencies specified in the project CQA Plan to verify that ongoing liner placement meets the criteria developed by the Test Soil Liner.

4. The completed liner shall be smooth rolled to limit moisture loss and promote run-off of surface water. Moisture content shall be maintained within the specified range and erosion or other damage that occurs in the soil liner shall be repaired as directed by the Owner's Representative until the geosynthetic liner is placed.

Electronic Filing: Received, Clerk's Office 06/20/2024

5. Voids created in the Compacted Clay Liner during construction (including, but not limited to, penetrations for test samples, and other penetrations necessary for construction) shall be repaired by removing material that does not meet the requirements for Compacted Clay Liner material, backfill with Compacted Clay Liner material, granular or pelletized bentonite, or a mixture of bentonite and Compacted Clay Liner material in lifts no thicker than 2 in. and tamping each lift with a steel rod. Each lift shall be tamped a minimum of 25 times altering the location of the rod within the void for each blow. Other ruts and depressions in the surface of the lifts shall be scarified, filled, and then compacted to grade.

3.07 CUSHION DIRT (Gypsum Management Facility Only)

Cushion Dirt to be placed beneath the upper High Density Polyethylene (HDPE) Geomembrane is to be placed to the specifications for General Fill in Section 3.04 above, except fill materials for Cushion Dirt shall be compacted to a dry density equal to or greater than 90 percent of the maximum dry density obtained from the Standard Proctor Test, ASTM D698.

3.08 ANCHOR TRENCH CONSTRUCTION

A. Gypsum Management Facility – Gypsum Stack

1. The anchor trench shall be excavated to the depth and width shown on the anchor trench details. The front edge of the trench shall be rounded to eliminate any sharp corners that could cause excessive stress to the geosynthetic liners. Loose soil shall be removed or compacted into the floor of the trench.

2. Subsequent to Geosynthetic Clay Liner (GCL), Bottom HDPE Geomembrane and Geotextile Cushion installation, the liners shall be placed in the trench to fully cover the entire trench floor, but do not extend up the back of the trench wall. After the liner installation, the trench shall be backfilled with 1 ft. of Compacted Clay Liner material. The backfill shall be deposited and compacted according to the requirements for general fill in such a manner as to prevent damage to the GCL and liner materials.

3. Subsequent to installation of separation geotextile on top of drainage layer, it shall be verified that the fabric extends across the top of the initial 1 ft layer of trench backfill, but does not extend up the back of the trench wall. After the separation geotextile has been installed in, the trench shall be backfilled with 2 ft of Compacted Clay Liner material. The backfill shall be deposited and compacted according to the requirements for general fill in such a manner as to prevent damage to the separation geotextile.

Electronic Filing: Received, Clerk's Office 06/20/2024

4. Subsequent to installation of the upper HDPE Geomembrane, the liner shall be installed into the trench and extend across the top of the initial 1 ft layer of trench backfill, but not extend up the back of the trench wall. After the liner installation in the trench has been inspected jointly with the Owner's Representative, and the Geosynthetics Installer's Representative has submitted a certificate of approval that the HDPE Geomembrane was installed in the anchor trench in accordance with the plans and specifications, the Contractor may backfill the remainder of the trench to the top of the Compacted Clay Liner. Deposit and compact the backfill according to the requirements for general fill in such a manner as to prevent damage to the HDPE Geomembrane.

B. Gypsum Management Facility – Recycle Pond

1. The anchor trench shall be excavated to the depth and width shown on the anchor trench details. The front edge of the trench shall be rounded to eliminate any sharp corners that could cause excessive stress to the geosynthetic liners. Loose soil shall be removed or compacted into the floor of the trench.

2. Subsequent to HDPE Geomembrane installation, it shall be verified that the liner covers the entire trench floor, but does not extend up the back of the trench wall. After the liner installation in the trench has been inspected jointly with the Owner's Representative, and the Geosynthetics Installer's Representative has submitted a certificate of approval that the HDPE Geomembrane was installed in the anchor trench in accordance with the plans and specifications, the Contractor may backfill the remainder of the trench to the top of the Recycle Pond berm. The backfill shall be deposited and compacted according to the requirements for general fill in such a manner as to prevent damage to the liner material.

C. CCB Landfill

1. Excavate a ledge at bottom of anchor trench elevation and place and compact Compacted Clay Liner material on the ledge as shown on the anchor trench details in the plans.

2. Excavate the anchor trench to the depth and width shown on the anchor trench details. Round the front edge of the trench to eliminate any sharp corners that could cause excessive stress to the geosynthetic liners. Remove loose soil or compact it into the floor of the trench.

3. Subsequent to GCL and HDPE geomembrane installation by the geosynthetic liner contractor, verify that the liners cover the entire trench floor, but do not extend up the back of the trench wall. After the liner installation in the trench has been inspected jointly with the Owner's Representative, and the Geosynthetics Installer's Representative has submitted a certificate of approval that the HDPE Geomembrane was

Electronic Filing: Received, Clerk's Office 06/20/2024

installed in the anchor trench in accordance with the plans and specifications, the Contractor may backfill the remainder of the trench to the top of the Compacted Clay Liner. Deposit and compact the backfill according to the requirements for general fill in such a manner as to prevent damage to the GCL and HDPE geomembrane.

4. Subsequent to installation of separation geotextile on top of drainage layer, verify that the fabric extends across the top of the initial 1 ft layer of trench backfill, but does not extend up the back of the trench wall. After the fabric installation in the trench has been inspected and approved by the Owner's Representative, backfill the remainder of the trench to the top of the Compacted Clay Liner. Deposit and compact the backfill according to the requirements for general fill in such a manner as to prevent damage to the geotextile fabric.

3.09 TESTING

A. Construction Quality Assurance (CQA) compaction and permeability tests will be made by the Owner's Testing Consultant during the progress of the work as indicated in the Construction Quality Assurance Plan, included in Appendix 2. The Contractor shall cooperate with the Testing Consultant and allow such tests to be performed.

B. If tests indicate that an area of fill or Compacted Clay Liner does not meet the specified requirements, additional tests shall be performed to determine the extent of non-compliance. The Contractor shall moisture condition and recompact that area until a passing test result is obtained.

C. Moisture/density testing by nuclear methods will be conducted by the Owner's Testing Firm at a minimum frequency as outlined in the Construction Quality Assurance (CQA) Plan. The range of moisture content will be determined in accordance with the "acceptable zone" method which is also outlined in the Project CQA Manual. A moisture test will be considered failed if the result indicates that the moisture content does not lie within the "acceptable zone." Material that fails will be dried or wetted until satisfactory moisture content is achieved. A density test will be considered failed if the result indicates a dry density outside the "acceptable zone." The material will be compacted until a passing test is achieved.

To ensure accuracy and reproducibility of testing of the soil liner for compaction and moisture content, all density gauges shall be certified by annual calibration.

3.10 FINISH GRADING

All excavated and filled areas shall be fine graded and leveled to provide a smooth finish free of debris, foreign matter, objectionable stones, clods, lumps, pockets, or high spots, properly drained and true to indicated elevations. Finish grading shall be only near completion of work or when requested. Any portions

Electronic Filing: Received, Clerk's Office 06/20/2024

of the berm damaged by construction shall be restored. The berm ditch shall be finished to design grade, and the ditch side slopes shaped and trimmed to provide a uniform ditch cross section.

## 3.11 CONSTRUCTION TOLERANCES

A. Elevations will be surveyed at breaks in slopes and on a 100 ft. grid pattern on the base before and after liner construction to verify liner thickness and to verify that proper drainage slopes to leachate collection piping are maintained. To verify material thickness, all horizontal survey coordinates will be the same for the bottom and the top of the material that is placed. Side slope thicknesses will be verified using crest (top), midpoint, and toe documentation points. A test will be considered failed if it does not meet the minimum design requirements. To obtain the specified design thickness, additional soil material will be placed and compacted in failing areas where the as-built thickness is less than the design thickness. Surveying required for verification of final construction tolerances will be performed by the Owner's Land Surveyor.

B. The minimum specified design thickness of all Compacted Clay Liners shall be 3.00 ft.

END OF SECTION 02200

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 - SITE WORK
Section 02275 - Riprap

## PART 1. GENERAL

1.01 DESCRIPTION

This section pertains to the placement of riprap for erosion control.

1.02 RELATED SECTIONS

The following section contains items which are related to the work in this section:

02200 - Earthwork

1.03 REFERENCES

Specified references or cited portions thereof, current at date of bidding documents unless otherwise specified, govern the work.

A. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2007.

1.04 SUBMITTALS

Product Data: Provide quarry name and material type prior to delivery.

## PART 2. PRODUCTS

2.01 MATERIALS

A. Stone Riprap and Bedding materials according to Article 1005.01 of the Illinois Standard Specifications for Road and Bridge Construction.

B. Filter Fabric material, where required by IDOT specifications for Stone Riprap, shall furnished according to Article 1080.03, with an AOS (Apparent Opening Size) as indicated on the plans.

C. Riprap Source shall be listed on the current IDOT Approved Aggregate Source List.

D. Gradation as indicated in the drawings. Quality shall be Class A.

Electronic Filing: Received, Clerk's Office 06/20/2024

## PART 3. EXECUTION

3.01 CONSTRUCTION REQUIREMENTS

A. Stone Riprap and Bedding shall be installed in accordance with Section 281 of the Illinois Standard Specifications for Road and Bridge Construction for the placement of Stone Riprap. Measurement and payment provisions of Section 281 shall not apply.

B. Filter Fabric for Stone Riprap shall be installed in accordance with Section 282 of the Illinois Standard Specifications for Road and Bridge Construction.

C. The Owner's Representative shall be allowed to visually inspect Riprap for compliance with specifications prior to placement.

END OF SECTION 02275

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 – SITEWORK
Section 02315 – Granular Materials
***ADDENDUM #2***

## PART 1. GENERAL

### 1.01 DESCRIPTION

A. Gypsum Management Facility

This section pertains to the following:

1. Furnishing and placing granular drainage materials for the drainage layer and Leachate Collection System piping.
2. Furnishing and placing coarse aggregate for encasement of the Process Water Recovery System piping.
3. Furnishing and installing Filter Sand for the protection of the Process Water Recovery System piping.
4. Furnishing and installing materials for roadbed construction related to the Gypsum Management Facility access roads.
5. Recycle Pond Drain.
6. Furnishing and installing materials for roadbed construction related to maintaining McKinley Road on AERG property.
7. ***Furnishing and installing materials for roadbed construction related to the Landfill Haul Road.***

B. CCB Landfill

This section pertains to the following:

1. Placing granular material for Drainage Layer.
2. Placing granular material for Separation Berm.
3. Placing Coarse Aggregate for encasement of leachate collection piping.
4. Furnishing and installing materials for roadbed construction related to the landfill access road.

### 1.02 RELATED SECTIONS

The following sections contain items which are related to the work in this section:

1. 02300 - Earthwork
2. 02373 - Geotextiles
3. 02640 - Leachate Collection Piping

Electronic Filing: Received, Clerk's Office 06/20/2024

## 1.03 REFERENCES

The following references, or cited portions thereof, govern the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2007.
2. American Society for Testing and Materials (ASTM):
   a. ASTM D 75 (2003) Practice for Sampling Aggregates.
   b. ASTM D 422 (1963; R 2002) Test Method for Particle-Size Analysis of Soils.
   c. ASTM D 2434 (1968, R 2000) Test Method for Permeability of Granular Soils (Constant Head).
   d. ASTM D 3042 (2003) Test Method for Insoluble Residue in Carbonate Aggregates.
   e. ASTM C 1260 (2005) Standard Test Method for Potential Alkali Reactivity of Aggregates (Mortar-Bar Method).
3. American Geological Institute (AGI). Geoscience Handbook AGI Data Sheets, 4th Edition.

## 1.04 MEASUREMENT AND PAYMENT

The Contractor shall be responsible for estimating the extent of granular materials required to complete the work including, but not limited to, construction of drainage layer, encasement of leachate collection piping, and road-bed construction. The Contractor shall include the dollar amount associated with furnishing and placing all granular materials in his Lump Sum Bid amount.

## 1.05 COORDINATION

A. The geosynthetic liner shall be covered with granular materials as soon as practicable after a section of liner has been approved by the Owner's Representative.

## 1.06 SUBMITTALS

A. Product Data:

1. Aggregate source list: Submit a list of proposed aggregate sources.

2. Shipping Tickets: Submit shipping tickets for the granular materials delivered to the site. Shipping tickets shall be according to paragraph 1004.01f of the IDOT Standard Specifications.

Electronic Filing: Received, Clerk's Office 06/20/2024

B. Test Reports.

1. Submit results of grain size analysis (ASTM D422) and hydraulic conductivity testing (ASTM D2434) for gradations established by the Contractor that provide the specified hydraulic conductivity. Test results are required for each proposed source and gradation. Submit test results for each source demonstrating compliance with reactivity, soundness, and abrasion requirements specified herein.

C. Samples:

1. Submit one sample per source for each gradation proposed for use on the project. Samples shall be at least one pound and shall be obtained and shipped according to ASTM D75. Submit samples at least 15 days prior to starting construction of the drainage layer and coarse aggregate encasement for leachate piping.

1.07 STORAGE AND HANDLING

A. Storage and handling of granular materials shall be according to paragraph 1004.01e of the IDOT Standard Specifications.

## PART 2. PRODUCTS

2.01 MATERIALS

A. General

1. Coarse Granular materials shall be meet the Description of Gravel, as described in Section 1004.01(a)(1) of the IDOT Standard Specifications, and shall be spherical to sub-discoidal, sub-rounded to well rounded particles as defined by AGI Data Sheet, 4th Edition, Sheet 8.4 – Comparison Charts for Estimating Roundness and Sphericity.
2. Granular materials shall experience no more than 15 percent carbonate loss per ASTM D3042.
3. Granular materials shall be free of deleterious material, and shall meet the $Na_2SO_4$ soundness and Los Angeles Abrasion Specifications for Class B quality aggregate per paragraph 1004.01 of the IDOT Standard Specifications.
4. All material shall pass the 2 in. sieve, and no greater than 5 percent shall be retained on the No. 200 sieve.
5. Granular materials shall be innocuous to alkali-silica reactivity, and shall exhibit internal expansions of less than 0.10 percent at 16 days after casting as determined by ASTM C 1260.

Electronic Filing: Received, Clerk's Office 06/20/2024

B. Gypsum Management Facility Granular Materials

1. Granular Materials for Drainage Layer

Gradation for granular material for Drainage Layer shall be as required to provide a minimum hydraulic conductivity (ASTM D2434) of $1 \times 10^{-3}$ cm/sec.

2. Coarse Aggregate around Ring Drain Collection Piping

Coarse Aggregate used to encase the ring drain collection piping shall be IDOT Gradation CA 7 material as outlined in Article 1004.01 of the IDOT Standard Specifications for Road and Bridge Construction.

3. Filter Sand

Filter Sand used for protective cover over the ring drain collection system shall be IDOT Gradation FA 1, Class B or better according to Article 1003 of the IDOT Standard Specifications for Road and Bridge Construction.

4. Aggregate Base Course, Type B

Aggregate Base Course, Type B used for base material for all new access roads and ***the Landfill Haul Road*** shall be IDOT Gradation CA 2, in accordance with Section 1004.04 of the IDOT Standard Specifications for Road and Bridge Construction. The requirements from Section 2.01A of this specification shall not apply.

5. Aggregate Surface Course, Type B

Aggregate Surface Course, Type B used for surface material for all new access roads and the ***Landfill Haul Road*** ~~McKinley Road relocation~~ shall be IDOT Gradation CA 6, in accordance with Section 1004.04 of the IDOT Standard Specifications for Road and Bridge Construction. The material shall originate from an IDOT approved source. The requirements from Section 2.01A of this specification shall not apply.

***6. Coarse Aggregate for Leachate Collection/Leachate Detection Piping***

***Gradation for coarse aggregate encasement around Leachate Collection/Leachate Detection Laterals shall be as required to provide a minimum hydraulic conductivity (ASTM D2434) of $1 \times 10^{-1}$ cm/sec.***

Electronic Filing: Received, Clerk's Office 06/20/2024

B. CCB Landfill Granular Materials

1. Granular Materials for Drainage Layer and Separation Berm.

Gradation for granular material for drainage layer and separation berm shall be as required to provide a minimum hydraulic conductivity (ASTM D2434) of $1 \times 10^{-3}$ cm/sec.

2. Coarse Aggregate.

Gradation for coarse aggregate shall be as required to provide a minimum hydraulic conductivity (ASTM D2434) of $1 \times 10^{-1}$ cm/sec.

2.02 EQUIPMENT

Equipment for spreading and compacting granular materials shall be low ground pressure equipment to prevent damage to the underlying geosynthetic liners.

## PART 3. EXECUTION

3.01 PROTECTION OF GEOSYNTHETICS

A. Protection of the geosynthetic liners is critically important. Approved geosynthetic liner shall be covered by granular material as soon as practicable. Granular material shall be placed to a minimum thickness of 1 ft before any heavy equipment or loaded trucks are allowed on the lined area.

B. No vehicular traffic shall travel directly on the geosynthetic liner other than an approved low ground pressure All Terrain Vehicle or equivalent.

C. Any damage to the geosynthetic liner system shall be repaired, as directed by the Owner's Representative, at the expense of the Contractor.

3.02 DRAINAGE LAYER (GYPSUM STACK)

A. Placement on Cell Floor

1. The granular material shall be back-dumped on the geotextile cushion fabric in a sequence of operations beginning at the perimeter of the liner on the cell floor.
2. Placement of material on the fabric shall be accomplished by spreading dumped material off of previously placed material with a bulldozer blade or endloader, in such a manner as to prevent tearing or shoving of the cloth. Dumping of material directly on the fabric will only be permitted to establish an initial working platform. No vehicles or construction

Electronic Filing: Received, Clerk's Office 06/20/2024

equipment shall be allowed on the fabric prior to placement of the granular blanket to a minimum thickness of 1 ft.

B. Placement on Cell Side Slopes

1. Placement of granular material on cell side slopes shall be accomplished using methods and equipment similar to that specified for placement of material on cell floor.
2. The Contractor may place earth fill material underlain with separation geotextile fabric to buttress the granular material on the slope:

   a. The Construction Quality Assurance (CQA) survey to certify thickness of drainage material shall be completed within the footprint of the gypsum stack before it is covered with separation geotextile fabric.
   b. Separation geotextile fabric shall extend beyond the toe of gypsum buttress a sufficient distance to prevent contamination of the granular drainage layer. See Sections 02373 and 02320 for construction of separation geotextile fabric.

3.03 DRAINAGE LAYER (CCB LANDFILL)

A. Placement on Cell Floor.

1. The granular material shall be back-dumped on the geotextile cushion fabric in a sequence of operations beginning at the perimeter of the liner on the cell floor.
2. Placement of material on the fabric shall be accomplished by spreading dumped material off of previously placed material with a bulldozer blade or endloader, in such a manner as to prevent tearing or shoving of the cloth. Dumping of material directly on the fabric will only be permitted to establish an initial working platform. No vehicles or construction equipment shall be allowed on the fabric prior to placement of the granular blanket to a minimum thickness of 1 ft.

B. Placement on Cell Side Slopes.

1. Placement of granular material on cell side slopes shall be accomplished using methods and equipment similar to that specified for placement of material on cell floor.
2. The Contractor may place CCB underlain with separation geotextile fabric to buttress the granular material on the slope:

   a. The Construction Quality Assurance (CQA) survey to certify thickness if drainage material shall be completed within the footprint of the CCB before CCB placement.

Electronic Filing: Received, Clerk's Office 06/20/2024

b. Separation geotextile fabric shall extend beyond the toe of CCB buttress a sufficient distance to prevent contamination of the granular drainage layer. See Sections 02373 and 02320 for construction of separation geotextile fabric and CCB, respectively.

C. Placement in Separation Berm.

1. Granular material for the separation berm shall be placed and spread in uniform lifts not to exceed 1 ft. The initial lift shall be placed according to paragraph A. The separation berm shall be constructed across the floor of the cell to at least the level of the top of drainage layer before any CCB is placed within the cell, and the top of berm shall be maintained at or above the level of adjacent CCB as CCB placement progresses.

3.04 COARSE AGGREGATE FOR ENCASEMENT OF RING DRAIN COLLECTION PIPING (GYPSUM MANAGEMENT FACILITY)

A. The geotextile filter fabric for encasement of leachate collection piping shall be placed on the approved cushion geotextile fabric according to Section 02373 – Geotextiles.

B. The coarse aggregate shall be placed and consolidated with a vibratory plate compactor on the encasement fabric to the width shown on the plans to the level of the bottom of the ring drain collection piping.

C. Course aggregate shall be placed and consolidated with a vibratory plate compactor along the pipe during pipe installation. The coarse aggregate shall be placed longitudinally along the pipe in lifts not to exceed 8 in. thick to a height of at least the center of the pipe. The aggregate shall be maintained at equal elevation on each side of the pipe, and the first lift of material shall be mechanically tamped to ensure that the space under the pipe is completely filled. The top of pipe shall not be covered until the CQA survey certifies leachate piping grade has been completed.

D. After the CQA survey has been completed, coarse aggregate material shall continue to be placed in lifts not to exceed 8 in. thick, as specified in the previous paragraph until the minimum cover height shown in the plans is attained.

E. The running of trucks or heavy equipment over leachate piping shall be avoided until there is at least a 12 in. cover of Filter Sand over the completed geotextile envelope.

Electronic Filing: Received, Clerk's Office 06/20/2024

3.05 COARSE AGGREGATE FOR ENCASEMENT OF LEACHATE COLLECTION PIPING (CCB LANDFILL)

A. Place geotextile fabric for encasement of leachate collection piping on the approved cushion geotextile fabric according to Section 02373 – Geotextiles.

B. Place and consolidate coarse aggregate with a vibratory plate compactor on the encasement fabric to the width shown on the plans to the level of the bottom of the leachate piping.

C. Place and consolidate course aggregate along the pipe during pipe installation. Place coarse aggregate longitudinally along the pipe in lifts not to exceed 8 in. thick to a height of at least the center of the pipe. Maintain the aggregate at equal elevation on each side of the pipe, and mechanically tamp the first lift of material to ensure that the space under the pipe is completely filled. Do not cover the top of pipe until the CQA survey to certify leachate piping grade has been completed.

C. After the CQA survey has been completed, continue placing coarse aggregate material in lifts not to exceed 8 in. thick, as specified in the previous paragraph until the minimum cover height shown in the plans is attained.

D. Avoid running trucks or heavy equipment over leachate piping until there is at least 12 in. cover over the completed geotextile envelope. Provide temporary ramps no steeper than 10H:1V transverse to the piping for temporary equipment crossings until the first lift of CCB is placed.

3.06 ROADWAY CONSTRUCTION

A. Prepare the roadway subgrade as shown on the plans, in accordance with Section 02200 – Earthwork.

B. Furnish Geotechnical Fabric for Ground Stabilization in accordance with Section 02373 – Geotextiles.

C. Furnish Aggregate Base Course, Type B in accordance with Article 351 of the IDOT Standard Specifications for Road and Bridge Construction.

D. Furnish Aggregate Surface Course, Type B in accordance with Article 402 of the IDOT Standard Specifications for Road and Bridge Construction.

3.07 TESTING

A. Independent gradation and permeability tests will be made by the Owner's Testing Lab during the progress of the work at frequencies as required in the project Construction Quality Assurance (CQA) Plan, included in Appendix 2.

Electronic Filing: Received, Clerk's Office 06/20/2024

The Contractor shall cooperate with the Testing Lab and allow such tests to be performed.

B. If tests indicate that an area of granular material or coarse aggregate does not meet the specified requirements of the project CQA Plan, then the Contractor shall remove the material and replace it with suitable material.

3.05 FINISH GRADING

The granular drainage layer shall be fine graded, but not compacted, to provide a smooth finish before a CQA survey of the completed portion of the drainage layer is requested. The CQA Officer shall direct the survey agency to determine elevations at the top of the final constructed surface of the Drainage Layer using a 100 ft. grid pattern (and the break points in slope) to verify attainment of the plan grades and elevations. To verify thickness, all horizontal survey coordinates shall be the same for the top of the cushion, and final constructed surface. Side slope thicknesses will be verified using crest (top), midpoint, and toe documentation points. In no instance shall the field determined thickness be less than 1.0 ft. The measured depths and grades shall be documented on "as built" drawings furnished to the CQA Officer by the survey agency. Ruts or erosion damage shall be repaired before placement of the separation geotextile fabric.

END OF SECTION 02315

Electronic Filing: Received, Clerk's Office 06/20/2024

## PART 1. GENERAL

### 1.01 DESCRIPTION

This section pertains to furnishing and installing geotextile fabrics on prepared surfaces.

### 1.02 RELATED SECTIONS

The following sections contain items which are related to the work in this section:

1. 02300 - Earthwork
2. 02315 - Granular Materials
3. 02800 – HDPE Geomembrane

### 1.03 REFERENCES

The following references, or cited portions thereof, govern the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2007.
2. American Society for Testing and Materials (ASTM):
    a. ASTM 3776 (1996; R 2002) Standard Test Method for Mass per Unit Area (Weight) of Fabric;
    b. ASTM D 3786 (2001) Test Method for Hydraulic Bursting Strength of Textile Fabrics -- Diaphragm Bursting Strength Tester Method;
    c. ASTM D 4533 (2004) Test Method for Trapezoid Tearing Strength of Geotextiles;
    d. ASTM D 4632 (1991; R 2003) Test Method for Grab Breaking Load and Elongation of Geotextiles;
    e. ASTM D 4751 (2004) Test Method for Determining Apparent Opening Size of Geotextile;
    f. ASTM D 4833 (2000) Test Method for Index Puncture Resistance of Geotextiles, Geomembranes, and Related Products;
    g. ASTM D 4873 (2002) Guide for Identification, Storage, and Handling of Geosynthetic Rolls;
    h. ASTM D 4884 (1996; R 2003) Test Method for Strength of Sewn or Thermally Bonded Seams of Geotextiles;
    i. ASTM D5261-92(2003) Standard Test Method for Measuring Mass per Unit Area of Geotextiles

Electronic Filing: Received, Clerk's Office 06/20/2024

j. ASTM D6241-04 Standard Test Method for the Static Puncture Strength of Geotextiles and Geotextile-Related Products Using a 50-mm Probe

1.04 MEASUREMENT AND PAYMENT

A. The Contractor shall be responsible for estimating the extent of geotextile fabric required to complete the work including fabric for laps, anchorage, repairs, and samples for Construction Quality Assurance (CQA) testing. The Contractor shall include the dollar amount associated with all geotextile construction in his Lump Sum Bid amount, except as specified in paragraph B.

B. Geotextile Fabric for Ground Stabilization, when directed by the Owner's Representative for stabilization of foundation soils, will be paid for on a time and materials basis.

C. No additional payment will be made for geotextile fabric for ground stabilization installed at the Contractor's discretion.

1.05 SUBMITTALS

A. Product Data

1. The manufacturer's list of guaranteed properties for each geotextile fabric proposed for use on the project shall be submitted.
2. The manufacturer's installation guidelines shall be submitted.

B. Samples

Samples of geotextile fabrics shall be submitted for CQA prequalification testing. Sample size and sampling frequency are specified in Appendix 2.

C. Inventory

A copy of the roll inventory that identifies, as a minimum, manufacturer or supplier, product or style number, roll number, width, and length of roll as identified on the roll label shall be submitted.

1.06 STORAGE AND HANDLING

Geotextiles shall be stored and handled according to ASTM D4873.

Electronic Filing: Received, Clerk's Office 06/20/2024

## PART 2. PRODUCTS

2.01 MATERIALS

A. Geotextile Fabric for Liner System

Geotextile fabrics for use in the cell liner system shall consist of non-woven filaments of polypropylene, polyester, or polyethylene. Stabilizers and/or inhibitors shall be added to the base polymer if necessary to make the filaments resistant to deterioration caused by ultraviolet light and heat exposure. Reclaimed or recycled fibers or polymer shall not be added to the formulation. Non-woven fabric may be needle-punched, heat-bonded, or a combination thereof. The filaments shall be dimensionally stable (i.e., filaments shall maintain their relative position with respect to each other) and resistant to delamination. The edges of the geotextile shall be finished to prevent the outer fiber from pulling away from the geotextile. The filaments shall be free from any chemical treatment or coating that might significantly reduce porosity and permeability.

Fabric shall have the following physical properties:

| **Physical Properties**[1] | **4 oz. (Separation)** | **6 oz. (PWRS)** | **16 oz. (CA Envelope & Rub Sheet)** |
|---|---|---|---|
| Mass/Unit Area (oz./yd$^2$) ASTM D5261 | 4.0 | 6.0 | 16.0 |
| Grab Tensile Strength (lb.) ASTM D4632 | 115 | 160 | 380 |
| Grab Elongation (%) ASTM D4632 | 50 | 50 | 50 |
| Puncture Strength (lb.) ASTM D4833 | 65 | 85 | 240 |
| Puncture (CBR) Strength (lb.) ASTM D6241 | 310 | 410 | 1025 |
| Mullen Burst Strength (psi) ASTM D3786 | 210 | 280 | 750 |
| Trapezoidal Tear Strength (lb.) ASTM D4533 | 50 | 60 | 150 |
| Width (ft.) | 15 | 15 | 15 |
| Apparent Opening Size (AOS) Max. US Std. Sieve No. ASTM D4751 | 70 | 70 | 100 |
| UV Resistance[2] (%) ASTM D4355 | 70 | 70 | 70 |
| Roll Width (ft.) | 15 | 15 | 15 |

Notes

(1) All Values listed are Minimum Average Roll Values (MARV) unless otherwise noted, calculated as the typical minus two standard deviations.

Electronic Filing: Received, Clerk's Office 06/20/2024

(2) UV Resistance is a minimum value and not a MARV. Evaluation to be on 2.0 inch strip tensile specimens after 500 hours exposure.

B. Geotextile Cushion

Fabric for Geotextile Cushion shall consist of non-woven filaments of polypropylene, polyester, or polyethylene. Stabilizers and/or inhibitors shall be added to the base polymer if necessary to make the filaments resistant to deterioration caused by ultraviolet light and heat exposure. Reclaimed or recycled fibers or polymer shall not be added to the formulation. Non-woven fabric may be needle-punched, heat-bonded, or a combination thereof. The filaments shall be dimensionally stable (i.e., filaments shall maintain their relative position with respect to each other) and resistant to delamination. The edges of the geotextile shall be finished to prevent the outer fiber from pulling away from the geotextile. The filaments shall be free from any chemical treatment or coating that might significantly reduce porosity and permeability.

Fabric shall have the following physical properties:

| **Physical Properties[1]** | **10 oz. (Geotextile Cushion)** |
|---|---|
| Mass per unit area ($oz/yd^2$) ASTM D5261 | 10 |
| Grab Tensile Strength (lb.) ASTM D4632 | 230 |
| Grab Tensile Elongation (%) ASTM D4632 | 50 |
| Trapezoidal Tear Strength (lb.) ASTM D4533 | 95 |
| Puncture (CBR) Strength (lb.) ASTM D6241 | 700 |
| Puncture (CBR) Elongation (in.) ASTM D6241 | 1.5 |
| UV Resistance[2] (%) ASTM D4355 | 70 |
| Apparent Opening Size (Max.) (AOS) Sieve No. - ASTM D4751 | --- |
| Roll Width (ft.) | 15 |

Notes

(1) All Values listed are Minimum Average Roll Values (MARV) unless otherwise noted, calculated as the typical minus two standard deviations.

(2) UV Resistance is a minimum value and not a MARV. Evaluation to be on 2.0 inch strip tensile specimens after 500 hours exposure.

C. Geotechnical Fabric for Ground Stabilization

Geotechnical fabric for ground stabilization shall conform to Article 1080.02 of the IDOT Standard Specifications for Road and Bridge Construction.

Electronic Filing: Received, Clerk's Office 06/20/2024

D. Thread for Seams

High strength thread should be used such that seam test should conform to ASTM D4884. The thread shall meet the chemical, ultraviolet, and physical requirements of the geotextile, and the color shall be different from that of the geotextile.

E. Securing Devices

Pins, staples, and other devices that project through the geotextile fabric are not permitted for fabrics installed above the geomembrane. Sandbags, stone, or other appropriate means approved by the Owner's Representative shall be used to prevent movement of the geotextile.

2.02 EQUIPMENT

A. Equipment for spreading and compacting granular materials shall be low ground pressure equipment to prevent damage to the underlying geosynthetic liners.

## PART 3. EXECUTION

3.01 SAMPLES FOR CQA TESTING

A. Geotextile fabric samples shall be obtained, identified and packaged from rolls designated by the Owner's Representative according to ASTM D4873.

B. Samples shall be 3 ft. wide by the full roll width.

3.02 BASE PREPARATION

A. Surface on which the geotextile will be placed shall be prepared to a relatively smooth surface condition, and shall be free from obstruction, debris, depressions, erosion features, or any irregularities that would prevent continuous, intimate contact of the geotextile with the entire surface. Rills, gullies, and ruts must be graded out of the surface before geotextile placement. Areas on which geotextile are to be placed shall be graded and/or dressed in accordance with Section 02200 – Earthwork and Section 02315 – Granular Materials. Prior to daily placement, the Installer shall provide the CQA Officer daily "certificates of acceptance" which document the Installer's inspection and acceptance of the underlying surface as being suitable for the geotextile installation.

B. Geotextile cushion fabric will be installed directly on the geosynthetic liner. Jointly inspect the liner with the Owner's Representative before commencing fabric installation each day. Notify the Owner's Representative promptly of any damage or defects observed in the liner as fabric installation progresses. Do not place fabric in the damaged or defective area until the liner has been repaired and

Electronic Filing: Received, Clerk's Office 06/20/2024

approved by the Owner's Representative. Submit a daily inspection report identifying the area of fabric placement and certifying that there were no visible defects in the area of fabric placement.

C. Do not run heavy vehicle traffic directly on the geosynthetic liner or cushion geotextile. Use vehicles and equipment as specified in paragraph 2.02 to transport and deploy fabric on the liner. Operate the equipment with care, and place protective cover over the geomembrane, if necessary, to avoid damaging the liner. Route traffic and personnel over installed cushion fabric and use the installed fabric as a working platform to the greatest extent possible.

3.03 INSTALLATION

A. General Requirements:

1. Geotextile fabric shall be unrolled and laid out following these requirements to the greatest extent practical:

   a. Orient panels with the longest dimension parallel to the slope.
   b. Minimize the number of seams in corners and odd-shaped areas.
   c. Extend panels on slopes a minimum of 5 ft onto a horizontal surface.

   Geotextile panels shall be unrolled using methods that will not damage the fabric and will protect underlying surface from damage. While unrolling, the geotextile fabric shall be visually inspected for imperfections and faulty or suspect areas marked. Ballast shall be placed on fabric to prevent wind uplift. Expansion and contraction should be allowed for by leaving slack.

   Heavy vehicle traffic shall not be run directly on geotextile fabric. Fabric in areas of heavy traffic shall be protected with protective cover over the fabric.

2. Laps

   Individual panels of geotextile fabric shall be lapped according to manufacturer's instructions and as specified herein. Provide a minimum overlap of 3 in. unless otherwise specified herein or in the plans. Shingle overlaps so that water or other material cannot run down the slope between the two layers of fabric.

Electronic Filing: Received, Clerk's Office 06/20/2024

3. Field Seams

Continuously sew all laps on slopes steeper than 10H:1V. This requirement does not apply to the heavy geotextile fabric for envelopment of coarse aggregate around leachate piping.

4. Defects and Repairs

Examine the installed geotextile fabric for defects, holes discontinuous seams, puckered or separated laps, etc. Repair defective laps and seams. Patch holes and defects according to manufacturer's recommendations and as directed by the Owner's Representative. Do not cover suspect or patched areas until they have been inspected and approved by the Owner's Representative.

B. Geotextile Fabric for Separation

1. Use low ground pressure equipment to avoid rutting the granular material.
2. Horizontal seams (parallel to top of slope) will be permitted on cell side slopes to facilitate staged construction of the drainage layer on the side slope.
3. Extend separation geotextile fabric into and across the bottom of the anchor trench and complete backfill of the trench according to Section 02200.

C. Geotextile Fabric for Coarse Aggregate Envelope

1. Geotextile for coarse aggregate envelope will be installed directly on the cushion fabric. Remove any foreign materials from the cushion fabric within the footprint of the coarse aggregate leachate piping encasement before installing the geotextile envelope. Place sufficient width to completely envelop the coarse aggregate and provide a longitudinal lap of at least 6 in.
2. After the coarse aggregate encasement has been completed, according to Section 02315, wrap the geotextile around the mounded aggregate, and cover the lap with at least 6 in. of material before permitting vehicle or equipment on the fabric.
3. Any ballast material other than coarse aggregate, according to Section 02315, that is placed within the envelope will require removal during coarse aggregate construction.

D. Geotechnical Fabric for Ground Stabilization

1. Install Geotechnical Fabric for Ground Stabilization in accordance with Section 210 of the IDOT Standard Specifications for Road and Bridge Construction.

Electronic Filing: Received, Clerk's Office 06/20/2024

2. If approved by the Owner's Representative, the Contractor may, at his own expense, install geotextile or geogrid for ground stabilization outside the limits designated by the Owner's Representative.
3. Submit as-built drawings that clearly delineate limits and type of ground stabilization.

3.04 PROTECTION

A. Protect installed fabric until it is covered by at least 1 ft. of overlying material.

B. Any damage to the geotextile during its installation or during placement of overlying materials shall be replaced by the Contractor at no cost to the Owner. Unless otherwise noted, the work shall be scheduled so that the covering of the geotextile with a layer of the specified material is accomplished within 14 calendar days after placement of the geotextile. Failure to comply shall require replacement of geotextile. The geotextile shall be protected from damage prior to and during the placement of overlying materials. Before placement of overlying materials, the Contractor shall demonstrate that the placement technique will not cause damage to the geotextile.

3.05 TESTING AND INSPECTION

A. Prequalification Testing

Geotextiles are subject to CQA testing by the Owner's Testing Consultant to verify conformance with the manufacturer's list of guaranteed properties according to the project Construction Quality Assurance Plan, included in Appendix 2. The Contractor shall provide samples as specified herein. Any fabric that does not conform to the list of guaranteed properties shall be removed from the site.

B. Installed fabric shall be inspected by the Owner's Representative. No material shall be placed on the fabric, other than ballast, until the installation has been approved by the Owner's Representative. Ballast shall not obscure seams or significant length of unseamed laps. The Owner's Representative may require removal of ballast to inspect suspect areas.

C. If the Owner's Representative suspects that completed work has been damaged by construction methods that do not conform to the specifications, he may require removal of completed work to verify the integrity of the underlying materials. The Contractor shall bear the cost of removal and subsequent repair as directed by the Owner's Representative, if the integrity of the underlying materials was damaged. If no damage was found, the Owner will pay the Contractor for the investigation work on a time and materials basis.

END OF SECTION 02373

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 - SITEWORK
Section 02376 – Geosynthetic Clay Liner

## PART 1. GENERAL

1.01 DESCRIPTION

A. This section covers furnishing and installation of a reinforced needlepunched Geosynthetic Clay Liner (GCL) at the Gypsum Management Facility and the CCB Landfill.

B. The work includes furnishing all equipment and materials, providing all labor, supervision, administration and management necessary to perform the work as specified herein and as shown on the plans.

1.02 RELATED SECTIONS

None.

1.03 REFERENCES

The following references, or cited portions thereof, govern the work

1.04 SUBMITTALS

A. With the bid, the Contractor shall furnish the following information:

1. Conceptual description of the proposed plan for placement of the GCL panels over the areas of installation.
2. GCL Manufacturer's Quality Control (MQC) Plan for documenting compliance with Sections 2.01 and 2.02 of these specifications.
3. GCL manufacturer's historical data for reinforced GCL of a) 10,000-hour creep shear testing per Section 2.01 D. and b) seam flow data at 2 psi confining pressure per Section 2.01 E.
4. A copy of GCL manufacturer's International Standards Organization (ISO) Quality Certificate of Registration.
5. Statement of experience from the proposed GCL supplier.
6. Statement of experience from the proposed GCL installer.

B. At the Owner Representative's or Owner's request, the Contractor shall furnish:

1. A representative sample of the GCLs.
2. A project reference list for the GCL(s) consisting of the principal details of at least ten projects totaling at least 10 million sq. ft (100,000 sq. meters) in size.

C. Upon shipment, the Contractor shall furnish:

1. The GCL manufacturer's Quality Assurance/Quality Control (QA/QC) certifications to verify that the materials supplied for the project are in accordance with the requirements of this specification.
2. Inventory of materials received.

D. As installation proceeds, the Geosynthetics Installer's Representative shall submit certificates of subgrade acceptance, signed by the Contractor and Construction Quality Assurance (CQA) Inspector (see Sections 1.06 and 3.03) for each area that is covered by the GCL.

Electronic Filing: Received, Clerk's Office 06/20/2024

E. Warranty

After construction, the contractor shall submit material and installation warranty certificates.

1.05 QUALIFICATIONS

A. GCL Manufacturer must have produced at least 10 million sq. ft. (1 million sq. meters) of GCL, with at least 8 million sq. ft. (800,000 sq. meters) installed.

B. The GCL Installer must either have installed at least 1 million sq. ft. (100,000 sq. meters) of GCL, or must provide to the Engineer satisfactory evidence, through similar experience in the installation of other types of geosynthetics, that the GCL will be installed in a competent, professional manner.

1.06 CONSTRUCTION QUALITY ASSURANCE (CQA)

A. Construction Quality Assurance of the GCL installation shall be performed as outlined in the project Construction Quality Assurance Plan, included in Appendix 2 of these Specifications.

B. The GCL Installer shall provide his own CQA inspector. The Owner shall provide a third-party inspector for CQA monitoring of the GCL installation. The inspector shall be an individual or company who is independent from the manufacturer and installer and who shall be responsible for monitoring and documenting activities, related to the CQA of the GCL throughout installation.

C. Testing of the GCL as necessary to support the CQA effort shall be performed by a third party laboratory retained by the Owner and independent from the GCL manufacturer and installer.

WARRANTY

The geomembrane material shall be warranted, on a pro-rata basis against manufacturer's defects for a period of five (5) years from the date of liner installation. The installation shall be warranted against defects in workmanship for a period of (1) year from the date of liner completion.

## PART 2. PRODUCTS

2.01 MATERIALS

A. The GCL shall be manufactured as a hydraulic barrier consisting of clay bonded between two layers of nonwoven geotextile by needle punching.

Electronic Filing: Received, Clerk's Office 06/20/2024

B. The GCL shall be manufactured to conform with the test methods, required properties, and testing frequencies of the GRI-GCL3 specification for Reinforced, Geotextile Related GCL.

C. In addition to the minimum properties given in Table 1(a) of GRI-GCL3, the GCL shall conform to the following specifications.

| Test Method | Minimum Value |
|---|---|
| Bentonite Mass/Area (ASTM D 5993) | 0.75 lb./ft$^2$ |
| GCL Grab Tensile Strength (ASTM D 4632) | 90 lb. |
| GCL Peel Strength (ASTM D 4632) | 15 lb. |

D. The reinforced GCL shall have seam test data from an independent laboratory showing that the seam flow with a grooved cut in one of the nonwoven geotextiles is less than 1 x $10^{-8}$ $m^3/m^2/s$ at 2 psi hydraulic pressure.

E. The minimum acceptable dimensions of full-size GCL panels shall be 150 ft. (45.7 m) in length. Short rolls [(those manufactured to a length greater than 70 ft. (21 meters) but less than a full-length roll)] may be supplied at a rate no greater than three (3) per truckload or three (3) rolls every 36,000 sq. ft. (3,500 sq. meters) of GCL, whichever is less.

## 2.02 PRODUCT QUALITY DOCUMENTATION

The GCL manufacturer shall provide the Contractor or other designated party with manufacturing QA/QC certifications for each shipment of GCL. The certifications shall be signed by a responsible party employed by the GCL manufacturer and shall include:

A. The Manufacturer's Certification that the material was manufactured and tested in accordance with GRI-GCL3 specifications, together with a report of the test results, shall be furnished at the time of shipment.

B. The manufacturers recommended seaming method with seam test data from an independent laboratory showing that the seam flow is less than 1 x $10^{-8}$ $m^3/m^2/s$ at 2 psi hydraulic pressure.

C. GCL lot and roll numbers supplied for the project (with corresponding shipping information).

## 2.03 PRODUCT LABELING

A. Prior to shipment, the GCL manufacturer shall label each roll, identifying:

1. Product identification information (Manufacturer's name and address, brand product code).

Electronic Filing: Received, Clerk's Office 06/20/2024

2. Lot number and roll number.
3. Roll length, width and weight.

Electronic Filing: Received, Clerk's Office 06/20/2024

2.04 PACKAGING

A. The GCL shall be wound around a rigid core whose diameter is sufficient to facilitate handling. The core is not necessarily intended to support the roll for lifting but should be sufficiently strong to prevent collapse during transit.

B. All rolls shall be labeled and bagged in packaging that is resistant to photodegradation by ultraviolet (UV) light.

2.05 ACCESSORY BENTONITE

A. The granular bentonite sealing clay used for overlap seaming, penetration sealing and repairs shall be made from the same natural sodium bentonite as used in the GCL and shall be as recommended by the GCL manufacturer. Seaming of GCLs shall be conducted in accordance with the manufacturer's guidelines for each particular GCL.

## PART 3. EXECUTION

3.01 SHIPPING AND HANDLING

A. The rolls of GCL shall be packaged and shipped by appropriate means to prevent damage to the material and to facilitate off-loading.

B. The Installation Supervisor shall be present during delivery and unloading of the GCL. A visual inspection of each roll should be made during unloading to identify if any packaging has been damaged. Rolls with damaged packaging should be marked and set aside for further inspection. The packaging should be repaired prior to being placed in storage. The Installation Supervisor shall prepare and submit an inventory that includes lot and roll number for materials received.

C. The Installer is responsible for unloading the GCL. The Installer should contact the Manufacturer prior to shipment to ascertain the appropriateness of the proposed unloading methods and equipment.

3.02 STORAGE

A. Storage of the GCL rolls and accessory bentonite shall be the responsibility of the Installer.

B. Rolls should be stored in a manner that prevents sliding or rolling from the stacks and may be accomplished by the use of chock blocks. Rolls should be stacked at a height no higher than that at which the lifting apparatus can be safely handled (typically no higher than four).

Electronic Filing: Received, Clerk's Office 06/20/2024

C. All stored GCL materials and the accessory bentonite must be covered with a plastic sheet or tarpaulin until their installation.

D. The integrity and legibility of the labels shall be preserved during storage.

3.03 EARTHWORK

A. The compacted clay liner upon which the GCL is installed shall be prepared and compacted prior to installation. The surface shall be smooth, firm, and unyielding, and free of:

1. Vegetation.
2. Construction debris.
3. Sticks.
4. Sharp rocks.
5. Void spaces.
6. Ice.
7. Abrupt elevation changes.
8. Standing water.
9. Cracks larger than 0.25 in. (6 mm) in width.
10. Any other foreign matter that could contact the GCL.

B. Immediately prior to GCL deployment, the compacted clay liner shall be final-graded by the contractor to fill in all voids or cracks and then smooth-rolled to provide the best practicable surface for the GCL. At completion of this activity, no wheel ruts, footprints or other irregularities shall exist in the subgrade. Furthermore, all protrusions extending more than 0.5 in. (12 mm) from the surface shall either be removed, crushed or pushed into the surface with a smooth-drum compactor.

C. Prior to daily GCL placement, the installer shall provide to the CQA Officer daily "certificates of acceptance" which document the Installer's inspection and acceptance of the underlying surface as being suitable for GCL installation.

D. It shall be the Installer's responsibility thereafter to indicate to the Owner's Representative any change in the condition of the compacted clay liner that could cause the subgrade to be out of compliance with any of the requirements listed in this Section. The Installation Supervisor shall certify in the daily report that no GCL was placed over visibly defective low permeability soil surface.

E. At the top of sloped areas of the job site, an anchor trench for the GCL shall be excavated by the contractor in accordance with the project plans. The trench shall be excavated and approved by the CQA Inspector prior to GCL placement. No loose soil shall be allowed at the bottom of the trench and no sharp corners or protrusions shall exist anywhere within the trench.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 3.04 GCL PLACEMENT

A. GCL rolls shall be delivered to the working area of the site in their original packaging. Immediately prior to deployment, the packaging shall be carefully removed without damaging the GCL. The orientation of the GCL (i.e., which side faces up) shall be in accordance with the Owner Representative's recommendations.

B. Equipment which could damage the GCL, shall not be allowed to travel directly on it. If the installation equipment causes rutting of the subgrade, the subgrade must be restored to its originally accepted condition before placement continues.

C. Care must be taken to minimize the extent to which the GCL is dragged across the subgrade in order to avoid damage to the bottom surface of the GCL. A temporary geosynthetic subgrade covering commonly known as a slip sheet or rub sheet may be used to reduce friction damage during placement.

D. The GCL panels shall be placed parallel to the direction of the slope.

E. All GCL panels shall lie flat on the underlying surface, with no wrinkles or folds, especially at the exposed edges of the panels.

F. Only as much GCL shall be deployed as can be covered at the end of the working day with soil, a geomembrane, or a temporary waterproof tarpaulin. The GCL shall not be left uncovered overnight. If the GCL is hydrated when no confining stress is present, the Installer shall remove and replace the hydrated material as directed by the Owner Representative.

## 3.05 ANCHORAGE

A. As directed by the project drawings and specifications, the end of the GCL roll shall be placed in an anchor trench at the top of the slope. The front edge of the trench shall be rounded so as to eliminate any sharp corners. Loose soil shall be removed from the floor of the trench. The GCL shall cover the entire trench floor, but shall not extend up the rear trench wall.

## 3.06 SEAMING

A. The GCL seams shall be constructed by overlapping their adjacent edges according to the manufacturer's recommendations. Care should be taken to ensure that the overlap zone is not contaminated with loose soil or other debris.

B. End-of-roll overlapped seams shall be constructed with a minimum overlap of 24 in. (600 mm). Seams at the ends of the panels should be constructed such that they are shingled in the direction of the grade to prevent the potential for runoff

Electronic Filing: Received, Clerk's Office 06/20/2024

flow to enter the overlap zone. End-of-roll overlapped seams for all reinforced GCL seams require bentonite-enhanced seams as described below.

C. Bentonite-enhanced seams shall be constructed between the overlapping adjacent panels as follows. The underlying edge of the longitudinal overlap is exposed and then a continuous bead of granular sodium bentonite is applied along a zone defined by the edge of the underlying panel and the 6-inch (150 mm) line. The granular bentonite shall be applied at a minimum application rate of one quarter pound per lineal ft. (0.4 kg/m). A similar bead of granular sodium bentonite is applied at the end-of-roll overlap.

3.07 DETAIL WORK

A. There shall be no penetrations through the GCL.

B. Cutting the GCL should be performed using a sharp utility knife. Frequent blade changes are recommended to avoid damage to the geotextile components of the GCL during the cutting process.

3.08 DAMAGE REPAIR

A. If the GCL is damaged (torn, punctured, perforated, etc.) during installation, it may be possible, if approved by the Owner's Representative, to repair it by cutting a patch to fit over the damaged area. The patch shall be obtained from a new GCL roll and shall be cut to size such that a minimum overlap of 12 in. (300 mm) is achieved around all of the damaged area. Granular bentonite or bentonite mastic shall be applied around the damaged area prior to placement of the patch. It may be desirable to use an adhesive to affix the patch in place so that it is not displaced during cover placement. Patching shall be certified by the Installer's CQA Inspector and observed by the Owner's Representative.

## PART 4. GRI-GCL3 SPECIFICATIONS

Geosynthetics Research Institute (GRI) GRI-GCL3, "Test Methods, Required Properties, and Testing Frequencies of Geosynthetic Clay Liners (GCLs).", Dated -- May 16, 2005.

END OF SECTION 02376

Electronic Filing: Received, Clerk's Office 06/20/2024

# GRI-GCL3*

Standard Specification for

"Test Methods, Required Properties, and Testing Frequencies of Geosynthetic Clay Liners (GCLs)"

This specification was developed by the Geosynthetic Research Institute (GRI), with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

## 1. Scope

1.1 This specification covers the manufacturing quality control (MQC) of geosynthetic clay liners (GCLs), describing types of tests, the proper test methods, minimum and sometimes maximum values, and the minimum testing frequencies.

Note 1: Geosynthetic Clay Liners (GCLs) are also called Clay Geosynthetics Barriers (GBR-Cs).

1.2 There are two general categories of GCLs covered in this specification: reinforced and nonreinforced. Within each category there are geotextile, polymer coated geotextiles, and geomembrane/geofilm related types.

1.3 This specification is intended to aid manufacturers, suppliers, purchasers and users of GCLs in establishing an acceptable level of effort for manufacturing quality control.

*This GRI standard is developed by the Geosynthetic Research Institute through consultation and review by the member organizations. This specification will be reviewed at least every 2-years, or on an as-required basis. In this regard it is subject to change at any time. The most recent revision date is the effective version.

Copyright © 2005 Geosynthetic Institute
All rights reserved

Electronic Filing: Received, Clerk's Office 06/20/2024

1.4 This specification does not address manufacturing quality assurance (MQA), product acceptance testing, or conformance testing. These are independent activities taken by organizations other than the GCL manufacturer.

1.5 The values stated in SI (metric) units are to be regarded as the standard. The U.S. (English) units are calculated values using a "soft" conversion accuracy.

1.6 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3. Terminology

3.1 Definition

3.1.1 Geosynthetic Definitions:

3.1.1.1 geotextile, n a permeability geosynthetic comprised solely of textiles. (ASTM D 4439)
3.1.1.2 geomembrane, n—an essentially impermeable geosynthetic barrier composed of one or more synthetic sheets. (ASTM D 4439)
3.1.1.3 geofilm, n—a thin polymeric film which is essentially impermeable having a thickness no greater than 0.25 mm (10 mils).
3.1.1.4 geotextile-polymer, n -a geotextile which has been coated with, or impregnated by, a polymer such as polypropylene

Electronic Filing: Received, Clerk's Office 06/20/2024

3.1.1.5 geosynthetic clay liner, n—a manufactured hydraulic barrier consisting of clay bonded to a layer or layers of geosynthetic materials. (ASTM D 4439)

Note 1: Geotextile Related GCL is one in which two geotextiles are used respectively as cap and carrier to the bentonite. Cap and carrier designations in this standard refer to respective orientations during manufacturing. This may or may not be the as-placed orientation in the field. It can be internally reinforced by needle punching or stitching, or be nonreinforced.
Geotextile Polymer Coated GCL is one in which two geotextiles are used respectively as cap and carrier to the encased bentonite, however, one of the geotextiles has been polymer coated in a manner that the permeability and flux are decreased. Cap and carrier designations refer to the as manufactured product and not necessarily to the as-placed orientation. It can be internally reinforced by needle punching or stitching, or be nonreinforced.
Geomembrane/Geofilm Related GCL is one in which a geomembrane or geofilm is included in the cross section either above or below the cap geotextile. It can be internally reinforced needle punching or be nonreinforced. Also in the nonreinforced category is bentonite adhesively bonded to a geomembrane.

3.1.2 Material Definitions

3.1.2.1 bentonite—a distinct type of fine-grained clay soil typically containing not less than 80% montmorillionite clay, usually characterized by high swelling upon wetting.

3.1.2.2 Formulation, n - The mixture of a unique combination of ingredients identified by type, properties and quantity. For geosynthetic materials, a formulation refers to the exact percentages of resin, additives, carbon black and/or other additives. It does not necessarily refer to individual suppliers of each ingredient. The individual suppliers must meet the manufacturer's internal quality control specification.

3.1.3 Organizational Definitions:

3.1.3.1 installer, n—the party who installs, or facilitates installation of, any materials purchased from manufacturers or suppliers.

3.1.3.2 manufacturer, n—the group, corporation, partnership, or individual that manufactures a product.

3.1.3.3 purchaser, n—the person, company, or organization that purchases any materials or work to be performed.

3.1.3.4 supplier, n- the party who supplies material or services.

Electronic Filing: Received, Clerk's Office 06/20/2024

3.1.4 Quality Definitions:

3.1.4.1 Manufacturing Quality Control (MQC) - A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of geosynthetic materials and is necessary to ensure minimum (or maximum) specified values in the manufactured product. MQC refers to measures taken by the manufacturer to determine compliance with the requirements for materials and workmanship as stated in certification documents and contract specifications. ref. EPA/600/R-93/182

3.1.4.2 Manufacturing Quality Assurance (MQA) - A planned system of activities that provides assurance that the materials were constructed as specified in the certification documents and contract specifications. MQA includes manufacturing facility inspections, verifications, audits and evaluation of the raw materials (resins and additives) and geosynthetic products to assess the quality of the manufactured materials. MQA refers to measures taken by the MQA organization to determine if the manufacturer is in compliance with the product certification and contract specifications for the project. ref. EPA/600/R-93/182

3.1.4.3 Construction Quality Control (CQC) - A planned system of inspections that are used to directly monitor and control the quality of a construction project. Construction quality control is normally performed by the geosynthetics manufacturer or installer, or for natural soil materials by the earthwork contractor, and is necessary to achieve quality in the constructed or installed system. Construction quality control (CQC) refers to measures taken by the installer or contractor to determine compliance with the requirements for materials and workmanship as stated in the plans and specifications for the project. ref. EPA/600/R-93/182

3.1.4.4 Construction Quality Assurance (CQA) - A planned system of activities that provide assurance that the facility was constructed as specified in the design. Construction quality assurance includes inspections, verification, audits, and evaluations of materials and workmanship necessary to determine and document the quality of the constructed facility. Construction quality assurance (CQA) refers to measures taken by the CQA organization to assess if the installer or contractor is in compliance with the plans and specifications for a project. ref. EPA.600/R-93/182

Electronic Filing: Received, Clerk's Office 06/20/2024

4. Significance and Use

4.1 GCLs must be properly manufactured in a manner consistent with a minimum level of quality control as determined by in-house testing of the final product. This specification presents the types of tests, standard methods of the testing, required (usually minimum) test values, and minimum testing frequencies which should be embodied in the manufacturer's quality control documents. The quoted tests, test methods and test values in Table 1 must appear in the MQC plan and the MQC report.

4.2 It should be clearly recognized that manufacturers may perform additional tests or at greater frequency than required in this specification, or both. In this case, the manufacturer's quality control plan will then take precedence over this specification.

4.3 It should also be recognized that purchasers and installers of GCLs may require additional tests or at a great frequency than called for in this specification, or both. The organization(s) producing such project specific specification or quality assurance plan should recognize that such requirements are beyond the current state-of-the-practice. If such a request is made by purchasers or installers, they should clearly communicate the requirements to the manufacturer or supplier during the contract decisions in order that disputes do not arise at a subsequent time.

5. Procedure

5.1 The procedures embodied in this specification are contained in the respective test methods given in Table 1.

5.1.1 The minimum recommended quality control tests for the manufacture of GCLs are given in Table 1. Specific tests are performed on the bentonite, the geosynthetic component materials, and the finished GCL. Table 1(a) is in S.I. (Metric) units and Table 1(b) is in U.S. (English) units.

Note 2: The conversion from S.I. units into U.S. units is soft.

5.1.2 The individual properties in Table 1 are minimum values; except fluid loss, moisture content, and permeability (or flux). They are maximum values. The manner of taking specimens is described in the appropriate test method. When an average value is indicated, it is listed in the table as "min. ave.", or "max. ave.".

5.2 Bentonite (as received)
Two tests are required; swell index and fluid loss. The latter is a maximum value. These tests should be performed on the bentonite prior to fabrication into a GCL.

Electronic Filing: Received, Clerk's Office 06/20/2024

or on bentonite taken from the manufactured product if the bentonite is modified in any way during manufacturing, e.g., if an adhesive is added.

5.3 Geotextile (as received)
Mass per unit area is required on the as-manufactured cap and carrier fabrics, with different values depending on the fabric being nonwoven or woven.

Note 3: These tests are to be performed on the geotextiles before manufacturing into the final GCL. Removal of the geotextiles from the manufactured product and subsequent testing will give erroneous values and is not an acceptable practice. The exception is polymer coated GCLs where the geotextile must be removed to determine its mass per unit area.

5.4 Geomembrane/Geofilm (as received)
The following tests are required; thickness, density, and tensile strength at break. All are minimum required values. Tensile strength at break is the lowest of machine direction and cross machine direction.

Note 4: These tests are to be performed on the geomembrane or geofilm before manufacturing into the final GCL. Removal of the geomembrane or geofilm from the manufactured product and subsequent testing will give erroneous values and is not an accepted practice.

5.5 GCL (as manufactured)
Six tests are required on the as-manufactured GCL with one having an alternative, i.e., hydraulic conductivity or flux. All are minimum values, with the exception of moisture content and hydraulic conductivity or flux.

5.6 GCL (long-term)
The purpose of these long-term or endurance tests is to provide confidence in the continuing acceptable performance of the bentonite and geosynthetic components of the installed GCL.

5.6.1 The durability of the bentonite is evaluated using a permeant consisting of 0.1 M calcium chloride solution. See ASTM D 6141 which is a guide for this particular aspect of the specification. The GCL is to be hydrated with distilled dionized water prior to conducting the tests with the calcium chloride solution. In this regard, ASTM D6766 Scenario 1 and Method C is the procedure to be used. Furthermore, this test is conducted twice at two different normal pressures, i.e., 35 and 500 kPa. The maximum allowable values are listed in Table 1.

5.6.2 The geotextiles in their as-received condition are evaluated by incubation in a forced air oven per ASTM D5721 set at 60°C for 50 days. The

Electronic Filing: Received, Clerk's Office 06/20/2024

minimum percent in tensile strength retained at break, as measured by ASTM D6768, is 65%. If individual yarns are used in reinforcing GCLs, they must also meet this same endurance criterion.

5.6.3 The geomembrane in its as-received condition is evaluated for durability via the appropriate GRI Specification. For high density polyethylene (HDPE), the specification is GRI GM13. For linear low density polyethylene (LLDPE), the specification is GRI GM17. For flexible polypropylene (fPP), the specification is GRI GM18.

5.6.4 The geofilm in its as-received condition is evaluated by incubation in a forced air oven per ASTM D5721 set at 60°C for 50 days. The minimum percent tensile strength retained at break for either MD or XMD, as measured by ASTM D882, is reported accordingly and must meet or exceed the specification value.

Note 5: It should be recognized that the above durability criterion for geofilms is not as stringent as the criteria for geomembranes stated in Section 5.6.3.

6. Workmanship and Appearance

6.1 Waterproof ink overlap lines should be printed on both edges of one of the surfaces (geotextile or geomembrane) of the manufactured GCL.

Note 6: The overlap lines are minimally 150 mm (6.0 in.) from the edges of the GCL. Other design-related situations may require greater overlap distances to be printed on the GCLs, e.g., when not backfilled in a timely manner.

6.2 Needle punched and stitch bonded GCLs shall be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product. There must be continuous needle detection and removal devices, e.g., metal detectors and magnets, used during manufacture of GCL products.

6.3 The manufactured GCL shall have good appearance qualities. It shall be free from such defects that would affect the specified properties and integrity of the product.

6.4 General manufacturing procedures shall be performed in accordance with the manufacturer's internal quality control guide and/or documents. ASTM D5888 and D5889 should be followed in this regard.

Electronic Filing: Received, Clerk's Office 06/20/2024

7. MQC Sampling

7.1 Sampling shall be in accordance with the specific test methods listed in Table 1. If no sampling protocol is stipulated in the particular test method, then test specimens shall be taken evenly spaced across the entire roll width, see ASTM D 4354.

7.2 The number of tests shall be in accordance with the appropriate test methods listed in Table 1.

7.3 The average of the test results should be calculated per the particular standard cited and compared to the minimum value listed in these tables, hence the values listed are the minimum average values and are designated as "min. ave.". When the property is a maximum value, the designation is "max. ave.".

8. MQC Retest and Rejection

8.1 If the results of any test do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the manufacturing protocol as set forth in the manufacturer's quality manual.

9. Packaging and Marking

9.1 The GCL shall be rolled, clearly labeled, and onto a substantial core, encased in a waterproof wrapper. Packaging must be adequate for safe transportation to the point of delivery.

9.2 The label should include manufacturer, style, lot and/or roll number, weight, length and width.

10. Conformance and Certification

10.1 Conformance of the manufactured GCL to this specification, or agreed-upon variation thereof, shall be performed by the MQA organization or designated by the purchaser/owner. ASTM D 4759 can be used as a general guide, but individual test methods must be clearly stipulated and communicated to the parties involved.

10.2 Upon request of the purchaser in the contract or order, a manufacturer's certification that the material was manufactured and tested in accordance with this specification, together with a report of the test results, shall be furnished at the time of shipment.

Electronic Filing: Received, Clerk's Office 06/20/2024

Table 1(a) – Specification for Geosynthetic Clay Liners (GCLs)

| Property | ASTM Test Method | Reinforced GCL | | | Non-Reinforced GCL | | | Testing Frequency |
|---|---|---|---|---|---|---|---|---|
| | | GT-Related | GT Polymer Coated | GM-GF Related | GT-Related | GT Polymer Coated | GM-GF Related | |
| Clay (as received) | | | | | | | | |
| swell index (ml/2g) | D5890 | 24 | 24 | 24 | 24 | 24 | 24 | 50 tonnes |

n/a = not applicable with respect to this property

(1) These values are maximum (all others are minimum)

(2) For both cap and carrier fabrics for nonwoven reinforced GCLs, one, or the other, must contain a scrim component of mass ≥ 100 $g/m^2$ for dimensional stability

(3) Calculated value obtained from difference of coated fabric to as-received fabric

(4) Value is both site-specific and product-specific and is currently being evaluated

(5) First value is for smooth geomembrane; second for textured geomembrane; third for geofilm

(6) Mass of the GCL and bentonite is measured after oven drying per the stated test method

(7) Value represents GCL permeability after permeation with a 0.1 M calcium chloride solution (11.1 g CaCl2 in 1-liter water)

(8) Value represents the minimum percent strength retained from the as-manufactured value after oven aging at 60°C for 50 days

(9) Durability criteria should follow the appropriate specification for the geomembrane type used, i.e., GRI GM-13 for HDPE, GRI GM-17 for LLDPE or GRI GM-18 for fPP

DIVISION 2 - SITE WORK
Section 02640 – HDPE Piping
***ADDENDUM #2***

## PART 1. GENERAL

1.01 DESCRIPTION

This section pertains to construction of the HDPE (High Density Polyethylene) Piping for the Leachate Collection System, Process Water Recovery System, ~~***the Slurry Piping and Valves,***~~ and Recycle Pond Decant System at the Gypsum Management Facility and the Leachate Collection System for the CCB Landfill.

1.02 RELATED SECTIONS

None.

1.03 REFERENCES

The following references, or cited portions thereof, govern the work

A. American Society of Testing and Materials:

1. ASTM D 2683 (2004); Specification for Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing.
2. ASTM D 3261 (2003); Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing.
3. ASTM D 3350 (2005); Specification for Polyethylene Plastics Pipe and Fittings Materials.
4. ASTM F 412 (2001a); Terminology Relating to Plastic Piping System.
5. ASTM F 1055 (1998); Specification for Electrofusion Type Polyethylene Fittings for Outside Diameter Controlled Polyethylene Pipe and Tubing.
6. ASTM F 1056 (2004); Specification for Socket Fusion Tools for Use in Socket Fusion Joining Polyethylene Pipe or Tubing and Fittings.
7. ***ASTM F714-06a Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) Based on Outside Diameter.***

1.04 SUBMITTALS

A. Qualifications

Submit qualifications of the Welding Supervisor who will be responsible for construction quality control of the pipe joining process.

Electronic Filing: Received, Clerk's Office 06/20/2024

B. Material Certifications

Submit manufacturer certifications that the pipe provided complies with the requirements herein.

C. Product Data

1. Submit product data and operating instructions for pipe joining equipment.
2. Submit pipe manufacturer's recommended procedures for storing, handling, and installing pipe and fittings.

1.05 QUALIFICATIONS

A. The Contractor or Subcontractor performing the work under this section shall have in his employ a Welding Supervisor who has completed a minimum of 10,000 ft of pipe joining work using the type of equipment proposed for use in this work. The Welding Supervisor shall be on site at all times during pipe line installation, and shall provide direct supervision over other employees.

1.06 WARRANTY

A. The pipe and fittings shall be warranted, on a pro-rata basis, against manufacturer's defects for a period of five (5) years from the date of pipe installation. The installation shall be warranted against defects in workmanship for a period of one (1) year from the date of completion.

## PART 2. PRODUCTS

2.01 MATERIALS

A. Leachate and Process Water Collection Piping

1. Pipe material shall be High Density Polyethylene (HDPE) PE 3408, according to ASTM F412, with minimum cell classification values of 345464C, according to ASTM D3350. Iron pipe size (IPS) and standard dimension ratio (SDR) shall be as indicated in the plans.

2. Size and spacing of holes in perforated pipe shall be as indicated in the plans.

~~B. *Slurry* Sluice Piping~~

~~Pipe for HDPE Sluice Lines shall be manufactured from a PE 3408 resin. The resin material shall meet the specifications of ASTM D3350-02 with a minimum cell~~

Electronic Filing: Received, Clerk's Office 06/20/2024

~~classification of PE345464C. Pipe O.D. sizes 4" to 54" shall be available in steel pipe sizes (IPS). Pipe shall have a manufacturing standard of ASTM D3035 and be manufactured by an ISO 9001 certified manufacturer. The pipe shall contain no recycled compounds except that generated in the manufacturer's own plant from resin of the same specification from the same raw material. The pipe shall be homogeneous throughout and free of visible cracks, holes, foreign inclusions, voids, or other injurious defects.~~

~~***Pipe shall be manufactured from a pipe resin which meets ASTM D 3350-05 with a minimum cell classification of 445474C. Pipe shall be manufactured to the dimensions of ASTM F-714. The service factor to determine the pressure rating shall be 0.63. The pipe shall contain no recycled compounds except that generated in the manufacturer's own plant from resin of the same specification from the same raw material.***~~

C. Fittings ***(Leachate and Process Water Collection Piping)***

1. Fittings shall be made of the same material and size as the HDPE piping, and shall have a pressure rating no less than 160 psi.

2. Butt Fusion Fittings

   Fittings shall be PE3408 HDPE, Cell Classification of 345464C as determined by ASTM D3350-99. Butt Fusion Fittings shall have a manufacturing standard of ASTM D3261. Molded & fabricated fittings shall have the same pressure rating as the pipe unless otherwise specified on the plans. Fabricated fittings are to be manufactured using a Data Logger. Temperature, fusion pressure and a graphic representation of the fusion cycle shall be part of the quality control records.

3. Electrofusion Fittings - Fittings shall be PE3408 HDPE, Cell Classification of 345464C as determined by ASTM D3350-99. Electrofusion Fittings shall have a manufacturing standard of ASTM F-1055. Fittings shall have the same pressure rating as the pipe unless otherwise specified on the plans.

4. Flanged and Mechanical Joint Adapters - Flanged and Mechanical Joint Adapters shall be PE 3408 HDPE, Cell Classification of 345464C as determined by ASTM D-3350. Flanged and Mechanical Joint Adapters shall have a manufacturing standard of ASTM D-3261. Fittings shall have the same pressure rating as the pipe unless otherwise specified on the plans. Flanged and Mechanical Joint Adapters are to be used for Sluice Piping only.

~~D. Valves ***and Valve Piping*** for Sluice ***Slurry*** Piping~~

~~Valves used for Sluice Piping shall be ITT Fabri-Valve XS150-ULV-Urethane~~

Electronic Filing: Received, Clerk's Office 06/20/2024

~~Lined Knife Gate Valves. Valve Material: Yet to Be Determined~~

~~*Valves used for the Slurry Piping System shall be Clarkson KGF Knife Gate Valve with ductile iron housing high tear strength gum rubber sleeves, C276 gate rated at 300 psig, with manual handwheel actuation.*~~

~~*Fittings and piping at valve stations shall be SILVER STREAK model fiberglass reinforced plastic (FRP) as manufactured by Fiber Glass Systems. Flanges shall have ANSI B16.5 Class 150 bolt hole patterns. Flanged connections to valves shall have ANSI B16.5 Class 300 bolt hole patterns. ASTM A307, Grade B, hex head bolts shall be supplied. Washers shall be supplied on all nuts and bolts. Gaskets shall be 1/8" thick, 60-70 durometer full-face type suitable for the service shown on the drawings and as recommended in the manufacturer's standard installation procedures. Pipe shall be installed as specified and indicated on the drawings.*~~

~~*E. Fittings for HDPE Slurry Piping*~~

~~*1. Butt Fusion Fittings - Fittings Pipe shall be manufactured from a pipe resin which meets ASTM D 3350-05 with a minimum cell classification of 445474C. Pipe shall be manufactured to the dimensions of ASTM F-714. The service factor to determine the pressure rating shall be 0.63. The pipe shall contain no recycled compounds except that generated in the manufacturer's own plant from resin of the same specification from the same raw material*~~

~~*2. Molded Butt Fusion Fittings shall have a manufacturing standard of ASTM D-3261. Molded & fabricated fittings shall have the same pressure rating as the pipe unless otherwise specified on the plans. Fabricated fittings must have the same pressure rating as the pipe; a DR less than the pipe shall be used. Fabricated fittings are to be manufactured using a Data Logger to record temperature, fusion pressure, and a graphic representation of the fusion cycle shall be part of the Quality Control records.*~~

~~*3. Electrofusion Fittings - Fittings shall be made from resin or pipe meeting ASTM D 3350-05 with a minimum cell classification of 445474C.; Electrofusion Fittings shall meet the manufacturing standard of ASTM F-1055. Fittings shall have the same pressure rating as the pipe or higher unless otherwise specified on the plans.*~~

~~*4. Flanged and Mechanical Joint Adapters - Flanged and Mechanical Joint Adapters shall be made from materials containing resin that meets ASTM D 3350-05 with a minimum cell classification of 445474C.*~~

Electronic Filing: Received, Clerk's Office 06/20/2024

2.02 EQUIPMENT

A. Sections of polyethylene pipe should be joined into continuous lengths on the jobsite above ground. The joining method shall be the butt fusion method and shall be performed in strict accordance with the pipe manufacturer's recommendations. The butt fusion equipment used in the joining procedures should be capable of meeting all conditions recommended by the pipe manufacturer, including, but not limited to, temperature requirements of 400 degrees Fahrenheit, alignment, and an interfacial fusion pressure of 75 PSI. The butt fusion joining will produce a joint weld strength equal to or greater than the tensile strength of the pipe itself. All field welds shall be made with fusion equipment equipped with a Data Logger. Temperature, fusion pressure and a graphic representation of the fusion cycle shall be part of the Quality Control records.

B. Sidewall fusions for connections to outlet piping shall be performed in accordance with HDPE pipe and fitting manufacturer's specifications. The heating irons used for sidewall fusion shall have an inside diameter equal to the outside diameter of the HDPE pipe being fused. The size of the heating iron shall be ¼ inch larger than the size of the outlet branch being fused.

C. Mechanical joining will be used where the butt fusion method can not be used. Mechanical joining will be accomplished by either using a HDPE flange adapter with a Ductile Iron back-up ring or HDPE Mechanical Joint adapter with a Ductile Iron back-up ring.

D. Socket fusion, hot gas fusion, threading, solvents, and epoxies will not be used to join HDPE pipe.

## PART 3. EXECUTION

3.01 MATERIAL DELIVERY, STORAGE, AND HANDLING

A. HDPE pipe and fittings shall be packaged and shipped by appropriate means to prevent damage to the material and to facilitate off-loading. The Owner will provide an on-site storage site. Storage site requirements (size and preferred location) shall be submitted with the bid documents.

B. Storage and handling shall be according to manufacturer's recommendations.

3.02 BASE PREPARATION

HDPE Piping for leachate and process water collection shall be installed on a layer of coarse aggregate placed by the Contractor in accordance with the plans. The grade of the coarse aggregate base shall be verified before installing the piping.

3.03 TRENCH INSTALLATION

Electronic Filing: Received, Clerk's Office 06/20/2024

Excavation, Foundation, Bedding and Haunching for the underground installation of HDPE Sluice Piping shall be in accordance with Section 20-2.20 of the "Standard Specifications for Water and Sewer Main Construction in Illinois". The trench shall be backfilled with excavated material to the top of trench surface. Excavations in areas of Structural Fill shall be backfill with and compacted to the specifications of Section 02200-Earthwork for Structural Fill. All other areas shall be backfilled to 92% of the dry density, as determined by the Standard Proctor Test ASTM D698.

3.03 INSTALLATION

All pipe and fittings shall be installed according to the manufacturer's recommendations. Removal of weld beads is not required. Contractor shall place coarse aggregate along the pipe to provide lateral stability. Welds shall not be obscured until they have been approved by the Owner's Representative, the top of pipe shall not be covered until the Construction Quality Assurance (CQA) survey has been completed to verify conformance with specified tolerances.

3.04 INSPECTIONS

A. The Owner's Representative shall shall visually inspect pipe materials to verify that each pipe material is properly stamped (by the manufacturer) for ASTM acceptance before installation. Defective or damaged materials shall be removed from the site.

B. Each weld and connection shall be visually inspected by the Owner's Representative. Defective welds shall be repaired as directed by the Owner's Representative and according to manufacturer's recommendations. Welds and connections shall not be covered until they have been approved by the Owner's Representative.

3.05 TOLERANCES

A. HDPE piping shall be located within 0.5 ft. of plan location, and elevation shall be within 0.1 ft. of plan elevation with no adverse slopes.

~~*3.06 TESTING*~~

~~*A. All Slurry Piping shall be Hydrostatic Tested in accordance with ASTM F 2164, using a Design Pressure of 270 PSIG.*~~

END OF SECTION 02936

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 - SITEWORK
Section 02700–Storm Drainage
***ADDENDUM #1***

## PART 1. GENERAL

1.01 DESCRIPTION

A. This section includes installing pipe culverts and end sections for pipe culverts.

B. Storm Drainage installation shall include incidental related work such as topsoil removal, trench excavation, backfill, compaction, tie-in of existing system, etc.,

1.02 RELATED SECTIONS

A. The following sections contain items which are related to the work in this section:

1. 02200 - Earthwork

1.03 REFERENCES

A. The following reference, or cited portions thereof, governs the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2007. Payment provisions shall not apply.

## PART 2. PRODUCTS

2.01 PIPE CULVERTS

A. ***HDPE*** Pipe Culverts shall be installed in accordance with Article 542 of the Standard Specifications. All piping shall be Corrugated PE (Polyethylene) with a Smooth Interior, in accordance with AASHTO M 294, Type S.

2.02 METAL END SECTIONS

A. Metal End Sections shall be either aluminum or steel in accordance with Article 542.07(c) of the Standard Specifications.

***2.03 REINFORCED CONCRETE CULVERT PIPE***

***A. Reinforced Concrete Culvert Pipe shall be furnished in accordance with Article 1042.06(a) of the Standard Specifications.***

Electronic Filing: Received, Clerk's Office 06/20/2024

***2.03 PRECAST REINFORCED CONCRETE FLARED END SECTIONS***

***A. Precast Reinforced Concrete Flared End Sections shall be furnished in accordance with Article 1042.07(a) of the Standard Specifications.***

## PART 3. EXECUTION

3.01 STORM DRAINAGE PIPING INSTALLATION

A. Construct pipe culverts in accordance with the Article 542 of the Standard Specifications. Bedding and Haunching shall be IDOT CA-6 Gradation. Trench excavations are to be backfilled with on-site clayey materials instead of sand. Compact backfill to 95 percent of the maximum dry density as determined by the Standard Proctor test – ASTM D-698.

3.02 ~~METAL~~ END SECTION INSTALLATION

A. End Treatments shall be installed according to Article 542.07 of the Standard Specifications.

END OF SECTION 02700

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 - SITEWORK

u. D 6365, Standard Practice for the Nondestructive Testing of Geomembrane Seams using The Spark Test

2. Geosynthetic Research Institute (GRI):

a. GRI GM 6, Pressurized Air Channel Test for Dual Seamed Geomembranes
b. GRI GM 9, Cold Weather Seaming of Geomembranes
c. GRI GM 10, Specification for Stress Crack Resistance of HDPE Geomembrane Sheet
d. GRI GM 13, Test Properties, Testing Frequency and Recommended Warranty for High Density Polyethylene (HDPE) Smooth and Textured Geomembranes
e. GRI GM 14, Test Frequencies for Destructive SeamTesting

1.04 SUBMITTALS

A. Submit the following to the Engineer or Owner, for review and approval, within a reasonable time so as to expedite shipment or installation of the Geomembrane:

1. Documentation of manufacturer's qualifications as specified in subsection 1.05A of this Section.

2. Manufacturer's Quality Control program manual or descriptive documentation.

Electronic Filing: Received, Clerk's Office 06/20/2024

3. A material properties sheet, including at a minimum all properties specified in GRI GM 13, including test methods used.

4. Sample of the material.

5. Documentation of Installer's qualifications, as specified below and in subsection 1.05B of this Section.
   a. Submit a list of at least ten completed facilities. For each name and type of facility; its location; the date of installation; phone number of contact at the facility; type and thickness of geomembrane and; surface area of the installed geomembrane.
   b. Submit resumes or qualifications of the Installation Supervisor, Master Seamer and Technicians to be assigned to this project.
   c. Quality Control Program.

6. Example Material Warranty and Liner Installation Warranty complying with subsections 1.07 and 1.08 of this Section.

7. Resin Supplier's name, resin production plant identification, resin brand name and number, production date of the resin, resin Manufacturer's quality control certificates, and certification that the properties of the resin meet the requirements of these specifications.

B. Shop Drawings

1. Submit copies of shop drawings for engineer's approval within a reasonable time so as not to delay the start of geomembrane installation. Shop drawings shall show the proposed panel layout identifying seams and details. Seams should generally follow direction of the slope. Butt seams or roll-end seams should not occur on a slope unless approved by the Owner's Representative. Butt seams on a slope, if allowed, should be staggered.

2. Placement of geomembrane will not be allowed to proceed until Owner's Representative has received and approved the shop drawings.

C. Additional Submittals (In-Progress and at Completion)

1. Manufacturer's warranty (refer to subsection 1.08).
2. Geomembrane installation warranty (refer to subsection 1.09).
3. Daily written acceptance of subgrade surface (refer to subsection 3.01.C).
4. Low-temperature seaming procedures if applicable (refer to subsection 3.03.A)
5. Prequalification test seam samples (refer to subsection 3.05.A.6).
6. Field seam non-destructive test results (refer to subsection 3.05.B.1).
7. Field seam destructive test results (refer to subsection 3.05.C.6).
8. Daily field installation reports (refer to subsection 3.05.G).

Electronic Filing: Received, Clerk's Office 06/20/2024

9. Installation record drawing, as discussed in subsection 3.05.G).

1.05 QUALITY CONTOL

A. Manufacturer's Qualifications:

The manufacturer of geomembrane of the type specified or similar product shall have at least five years experience in the manufacture of such geomembrane. In addition, the geomembrane manufacturer shall have manufactured at least 10,000,000 sq. ft. of the specified type of geomembrane or similar product during the last five years.

B. Installer's Qualifications:

1 The Geomembrane Installer shall be the Manufacturer, approved Manufacturer's Installer or a contractor approved by the Owner's Representative to install the geomembrane.

2 The Geomembrane Installer shall have at least three years experience in the installation of the specified geomembrane or similar. The Geomembrane Installer shall have installed at least 10 projects involving a total of 5,000,000 sq. ft. of the specified type of geomembrane or similar during the last three years.

3 Installation shall be performed under the direction of a field Installation Supervisor who shall be responsible throughout the geomembrane installation, for geomembrane panel layout, seaming, patching, testing, repairs, and all other activities of the Geomembrane Installer. The Field Installation Supervisor shall have installed or supervised the installation and seaming of a minimum of 10 projects involving a total of 5,000,000 sq. ft. of geomembrane of the type specified or similar product.

4 Seaming shall be performed under the direction of a Master Seamer (who may also be the Field Installation Supervisor or Crew Foreman) who has seamed a minimum of 3,000,000 sq. ft. of geomembrane of the type specified or similar product, using the same type of seaming apparatus to be used in the current project. The Field Installation Supervisor and/or Master Seamer shall be present whenever seaming, patching, other welding operations, and testing is performed.

5 All seaming, patching, other welding operations, and testing shall be performed by qualified technicians employed by the Geomembrane Installer.

1.06 DELIVERY, STORAGE AND HANDLING

A. Each roll of geomembrane delivered to the site shall be labeled by the manufacturer. The label shall be firmly affixed and shall clearly state the manufacturer's name, product identification, material thickness, roll number, roll dimensions and roll weight.

B. Geomembrane shall be protected from mud, dirt, dust, puncture, cutting or any other damaging or deleterious conditions.

Electronic Filing: Received, Clerk's Office 06/20/2024

C. Rolls shall be stored away from high traffic areas. Continuously and uniformly support rolls on a smooth, level prepared surface.

D. Rolls shall not be stacked more than three high.

1.07 PROJECT CONDITIONS

Geomembrane shall not be installed in the presence of standing water, while precipitation is occurring, during excessive winds, or when material temperatures are outside the limits specified in Section 3.03.

1.08 MATERIAL WARRANTY

As required by specification. or as required in GRI GM 13 (attachment A)

1.09 GEOMEMBRANE INSTALLATION WARRANTY

The Geomembrane Installer shall guarantee the geomembrane installation against defects in the installation and workmanship for 1 year commencing with the date of final acceptance.

1.10 GEOMEMBRANE PRE-CONSTRUCTION MEETING

A. Geomembrane Pre-Construction Meeting shall be held at the site prior to installation of the geomembrane. At a minimum, the meeting shall be attended by the Geomembrane Installer, Owner, Owner's representative (Engineer and/or CQA Firm), and the General Contractor.

B. Topics for this meeting shall include:

1. Responsibilities of each party.
2. Lines of authority and communication. Resolution of any project document ambiguity.
3. Methods for documenting, reporting and distributing documents and reports.
4. Procedures for packaging and storing archive samples.
5. Review of time schedule for all installation and testing.
6. Review of panel layout and numbering systems for panels and seams including details for marking on geomembrane.
7. Procedures and responsibilities for preparation and submission of as-built panel and seam drawings.
8. Temperature and weather limitations. Installation procedures for adverse weather conditions. Defining acceptable subgrade, geomembrane, or ambient moisture and temperature conditions for working during liner installation.
9. Subgrade conditions, dewatering responsibilities and subgrade maintenance plan.
10. Deployment techniques including allowable subgrade for the geomembrane.
11. Plan for controlling expansion/contraction and wrinkling of the

Electronic Filing: Received, Clerk's Office 06/20/2024

geomembrane.

12. Covering of the geomembrane and cover soil placement.
13. Measurement and payment schedules.
14. Health and safety.

C. The meeting shall be documented by the Owner's Representative and minutes shall be transmitted to all parties.

## PART 2. PRODUCTS

### 2.01 SOURCE QUALITY CONTROL

Manufacturing Quality Control

A. The test methods and frequencies used by the manufacturer for quality control/quality assurance of the above geomembrane prior to delivery, shall be in accordance with GRI GM13, or modified as required for project specific conditions.

B. The manufacturer's geomembrane quality control certifications, including results of quality control testing of the products, as specified in subsection 2.01.C of this Section, must be supplied to the Owner's Representative. The certification shall be signed by a responsible party employed by the manufacturer, such as the QA/QC Manager, Production Manager, or Technical Services Manager. Certifications shall include lot and roll numbers and corresponding shipping information.

C. The Manufacturer will provide Certification that the geomembrane and welding rod supplied for the project have the same base resin and material properties.

### 2.02 GEOMEMBRANE

A. The geomembrane shall consist of new, first quality products designed and manufactured specifically for the purpose of this work which shall have been satisfactorily demonstrated by prior testing to be suitable and durable for such purposes. The geomembrane rolls shall be seamless, high density polyethylene (HDPE- Density >0.94g/cm) containing no plasticizers, fillers or extenders and shall be free of holes, blisters or contaminants, and leak free verified by 100% in line spark or equivalent testing. The geomembrane shall be supplied as a continuous sheet with no factory seams in rolls. Smooth Geomembrane shall meet the property requirements shown in Table 1(a) of the GRI GM13 Specifications included at the end of this Section. Textured Geomembrane shall meet the property requirements shown in Table 2(a) of the GRI GM13 Specifications included at the end of this Section.

B. Material shall be reviewed for conformance to the project specifications by the Owner's Representative.

Electronic Filing: Received, Clerk's Office 06/20/2024

## PART 3. EXECUTION

3.01 SUBGRADE PREPARATION

A. Geomembrane installed over geosynthetic clay liner (GCL) (Gypsum Stack and CCB Landfill).

The area of GCL to be covered with geomembrane shall be jointly inspected by the Geosynthetics Installer's CQA Representative daily with the Owner's Representative before commencing geomembrane installation for the day, and the condition of the GCL shall be continuously observed as geomembrane installation progresses. Rocks, stones, sticks, sharp objects and debris of any kind shall be removed from the surface of the GCL. The Owner's Representative shall be notified of any discontinuities, premature hydration, or otherwise defective GCL. Geomembrane shall not be placed over suspect areas until they have been repaired to the satisfaction of the Owner's Representative. The Geosynthetics Installer's CQA Representative shall submit a certificate of acceptance to the Owner's Representative daily, stating that the GCL surface was acceptable at the time of geomembrane installation.

B. Geomembrane installed over cushion dirt.(Gypsum Stack only) ***or Earth Fill Material (Recycle Pond only)***

The area of cushion dirt to be covered with geomembrane shall be prepared in accordance with the Section 02200 – Earthwork. The surface shall be smooth and free of ruts and holes, rocks, stones, sticks, sharp objects and debris of any kind.

C. The Geomembrane installer shall provide daily, a certificate of acceptance for the surface to be covered by the geomembrane in that day's operations. The surface shall be maintained in a manner, during geomembrane installation, to ensure subgrade suitability.

D. All subgrade damaged by construction equipment and deemed unsuitable by the Owner's Representative for geomembrane deployment shall be repaired prior to placement of the geomembrane. All repairs shall be reviewed by the Owner's Representative and approved by the Geomembrane Installer. This damage, repair, and the responsibilities of the contractor and Geomembrane Installer shall be defined in the preconstruction meeting.

3.02 GEOMEMBRANE PLACEMENT

A. No geomembrane shall be deployed until the applicable certifications and quality control certificates listed in subsection 1.04 of this Section are submitted to and approved by the Owner's Representative. Should geomembrane material be deployed prior to approval by the Owner's Representative it will be at the sole risk of the Geomembrane Installer and/or Contractor. If the material does not meet project specifications it shall be removed from the work area at no cost to the

Electronic Filing: Received, Clerk's Office 06/20/2024

owner.

B. The geomembrane shall be installed to the limits shown on the project drawings and essentially as shown on approved panel layout drawings.

C. No geomembrane material shall be unrolled and deployed if the material temperatures are lower than 0 degrees C (32 degrees F). Temperature limitations should be defined in the preconstruction meeting. Typically, only the quantity of geomembrane that will be anchored and seamed together in one day should be deployed.

D. No vehicular traffic shall travel on the geomembrane other than an approved low ground pressure All Terrain Vehicle or equivalent.

E. Sand bags or equivalent ballast shall be used as necessary to temporarily hold the geomembrane material in position under the foreseeable and reasonably - expected wind conditions. Sand bag material shall be sufficiently close- knit to prevent soil fines from working through the bags and discharging on the geomembrane.

F. Geomembrane placement shall not be done if moisture prevents proper subgrade preparation, panel placement, or panel seaming. Moisture limitations will be defined in the preconstruction meeting.

G. Damaged panels or portions of the damaged panels which have been rejected shall be marked and their removal from the work area recorded.

H. The geomembrane shall not be allowed to "bridge over" voids or low areas in the subgrade. In these areas, the subgrade shall be prepared to allow the geomembrane to rest in intimate contact with the subgrade.

I. Wrinkles caused by panel placement or thermal expansion should be minimized in accordance with section 1.10 B11.

J. Considerations on Site Geometry: In general, seams shall be oriented parallel to the line of the maximum slope. In corners and odd shaped geometric locations, the total length of field seams shall be minimized. Seams shall not be located at low points in the subgrade.

K. Overlapping: The panels shall be overlapped prior to seaming to whatever extent is necessary to effect a good weld and allow for proper testing. In no case shall this overlap be less than 75mm (3 in.).

3.03 SEAMING PROCEDURES

A. No geomembrane material shall be seamed when liner temperatures are less than 0 degrees C (32 degrees F).

B. No geomembrane material shall be seamed when the sheet temperature is above 75 degrees C (170 degrees F) as measured by an infrared thermometer or surface thermocouple.

C. Seaming shall primarily be performed using automatic fusion welding equipment and techniques. Extrusion welding shall be used where fusion welding is not possible such as at pipe penetrations, patches, repairs and short (less than a roll width) runs of seams.

D. Fishmouths or excessive wrinkles at the seam overlaps, shall be minimized and when necessary cut along the ridge of the wrinkles back into the panel so as to

Electronic Filing: Received, Clerk's Office 06/20/2024

effect a flat overlap. The cut shall be terminated with a keyhole cut (nominal 10 mm (1/2 in) diameter hole) so as to minimize crack/tear propagation. The overlay shall subsequently be seamed. The key hole cut shall be patched with an oval or round patch of the same base geomembrane material extending a minimum of 150 mm (6 in.) beyond the cut in all directions.

3.04 PIPE AND STRUCTURE PENETRATION SEALING SYSTEM

A. Provide penetration sealing system as shown in the Project Drawings.

B. Penetrations shall be constructed from the base geomembrane material, flat stock, prefabricated boots and accessories as shown on the Project Drawings. The pre-fabricated or field fabricated assembly shall be field welded to the geomembrane as shown on the Project Drawings so as to prevent leakage. This assembly shall be tested as outlined in section 3.05.B. Alternatively, where field non destructive testing can not be performed, attachments will be field spark tested by standard holiday leak detectors in accordance with ASTM 6365. Spark testing should be done in areas where both air pressure testing and vacuum testing are not possible.

1. Equipment for Spark testing shall be comprised of but not limited to: A hand held holiday spark tester and conductive wand that generates a high voltage.
2. The testing activities shall be performed by the Geomembrane Installer by placing an electrically conductive tape or wire beneath the seam prior to welding. A trial seam containing a non welded segment shall be subject to a calibration test to ensure that such a defect (non welded segment) will be identified under the planned machine settings and procedures. Upon completion of the weld, enable the spark tester and hold approximately 25mm (1 in) above the weld moving slowly over the entire length of the weld in accordance with ASTM 6365. If there is no spark the weld is considered to be leak free.
3. A spark indicates a hole in the seam. The faulty area shall be located, repaired and retested by the Geomembrane Installer.
4. Care should be taken if flammable gases are present in the area to be tested.

3.05 FIELD QUALITY CONTROL

The Owner's Representative shall be notified prior to all pre qualification and production welding and testing, or as agreed upon in the pre construction meeting.

A. Prequalification Test Seams

1. Test seams shall be prepared and tested by the Geomembrane Installer to verify that seaming parameters (speed, temperature and pressure of welding equipment) are adequate.
2. Test seams shall be made by each welding technician and tested in accordance with ASTM D 4437 at the beginning of each seaming period. Test seaming shall be performed under the same conditions and with the same equipment and operator combination as production seaming. The

Electronic Filing: Received, Clerk's Office 06/20/2024

test seam shall be approximately 3.3 meters (10 feet) long for fusion welding and 1 meter (3 feet) long for extrusion welding with the seam centered lengthwise. At a minimum, tests seams should be made by each technician 1 time every 4–6 hours; additional tests may be required with changes in environmental conditions.

3. Two 25 mm (1 in) wide specimens shall be die-cut by the Geomembrane Installer from each end of the test seam. These specimens shall be tested by the Geomembrane Installer using a field tensiometer testing both tracks for peel strength and also for shear strength. Each specimen shall fail in the parent material and not in the weld, "Film Tear Bond"(F.T.B. failure). Seam separation equal to or greater than 10% of the track width shall be considered a failing test.
4. The minimum acceptable seam strength values to be obtained for all specimens tested are listed in Subsection 3.05.C.4 of this Section. All four specimens shall pass for the test seam to be a passing seam.
5. If a test seam fails, an additional test seam shall be immediately conducted. If the additional test seam fails, the seaming apparatus shall be rejected and not used for production seaming until the deficiencies are corrected and a successful test seam can be produced.
6. A sample from each test seam shall be labeled. The label shall indicate the date, geomembrane temperature, number of the seaming unit, technician performing the test seam and pass or fail description. The sample shall then be given to the Owner's Representative for archiving.

B. Field Seam Non-destructive Testing

1. All field seams shall be non-destructively tested by the Geomembrane Installer over the full seam length before the seams are covered. Each seam shall be numbered or otherwise designated. The location, date, test unit, name of tester and outcome of all non-destructive testing shall be recorded and submitted to the Owner's Representative.
2. Testing should be done as the seaming work progresses, not at the completion of all field seaming. All defects found during testing shall be numbered and marked immediately after detection. All defects found should be repaired, retested and remarked to indicate acceptable completion of the repair.
3. Non-destructive testing shall be performed using vacuum box, air pressure or spark testing equipment.
4. Non-destructive tests shall be performed by experienced technicians familiar with the specified test methods. The Geomembrane Installer shall demonstrate to the Owner's Representative all test methods to verify the test procedures are valid.
5. Extrusion seams shall be vacuum box tested by the Geomembrane Installer in accordance with ASTM D 4437 and ASTM D 5641 with the following equipment and procedures:
    a. Equipment for testing extrusion seams shall be comprised of but not limited to: a vacuum box assembly consisting of a rigid housing, a transparent viewing window, a soft rubber gasket

Electronic Filing: Received, Clerk's Office 06/20/2024

attached to the base, port hole or valve assembly and a vacuum gauge; a vacuum pump assembly equipped with a pressure controller and pipe connections; a rubber pressure/vacuum hose with fittings and connections; a plastic bucket; wide paint brush or mop; and a soapy solution.

b. The vacuum pump shall be charged and the tank pressure adjusted to approximately 35 kPa (5 psig).

c. The Geomembrane Installer shall create a leak tight seal between the gasket and geomembrane interface by wetting a strip of geomembrane approximately 0.3m (12 in) by 1.2m (48 in) (length and width of box) with a soapy solution, placing the box over the wetted area, and then compressing the box against the geomembrane. The Geomembrane Installer shall then close the bleed valve, open the vacuum valve, maintain initial pressure of approximately 35 kPa (5 psig) for approximately 5 seconds. The geomembrane should be continuously examined through the viewing window for the presence of soap bubbles, indicating a leak. If no bubbles appear after 5 seconds, the area shall be considered leak free. The box shall be depressurized and moved over the next adjoining area with an appropriate overlap and the process repeated.

d. All areas where soap bubbles appear shall be marked, repaired and then retested.

e. At locations where seams cannot be non destructively tested, such as pipe penetrations, alternate nondestructive spark testing (as outlined in section 3.04.B) or equivalent should be substituted.

f. All seams that are vacuum tested shall be marked with the date tested, the name of the technician performing the test and the results of the test.

6. Double Fusion seams with an enclosed channel shall be air pressure tested by the Geomembrane Installer in accordance with ASTM D 5820 and ASTM D 4437 and the following equipment and procedures:

a. Equipment for testing double fusion seams shall be comprised of but not limited to: an air pump equipped with a pressure gauge capable of generating and sustaining a pressure of 210 kPa (30 psig), mounted on a cushion to protect the geomembrane; and a manometer equipped with a sharp hollow needle or other approved pressure feed device.

b. The Testing activities shall be performed by the Geomembrane Installer. Both ends of the seam to be tested shall be sealed and a needle or other approved pressure feed device inserted into the tunnel created by the double wedge fusion weld. The air pump shall be adjusted to a pressure of 210 kPa (30 psig), and the valve closed,. Allow 2 minutes for the injected air to come to equilibrium in the channel, and sustain pressure for 5 minutes. If pressure loss does not exceed 28 kPa (4 psig) after this five minute period the seam shall be considered leak tight. Release pressure from the opposite end verifying pressure drop on needle to ensure testing of

Electronic Filing: Received, Clerk's Office 06/20/2024

the entire seam. The needle or other approved pressure feed device shall be removed and the feed hole sealed.

c. If loss of pressure exceeds 28 kPa (4 psig) during the testing period or pressure does not stabilize, the faulty area shall be located, repaired and retested by the Geomembrane Installer.

d. Results of the pressure testing shall be recorded on the liner at the seam tested and on a pressure testing record.

C. Destructive Field Seam Testing

1. One destructive test sample per 150 linear m (500 linear ft) seam length or another predetermined length in accordance with GRI GM 14 shall be taken by the Geomembrane Installer from a location specified by the Owner's Representative. The Geomembrane Installer shall not be informed in advance of the sample location. In order to obtain test results prior to completion of geomembrane installation, samples shall be cut by the Geomembrane Installer as directed by the Owner's Representative as seaming progresses.

2. All field samples shall be marked with their sample number and seam number. The sample number, date, time, location, and seam number shall be recorded. The Geomembrane Installer shall repair all holes in the geomembrane resulting from obtaining the seam samples. All patches shall be vacuum box tested or spark tested. If a patch cannot be permanently installed over the test location the same day of sample collection, a temporary patch shall be tack welded or hot air welded over the opening until a permanent patch can be affixed.

3. The destructive sample size shall be 300 mm (12 in) wide by 1 m (36 in) long with the seam centered lengthwise. The sample shall be cut into three equal sections and distributed as follows: one section given to the Owner's Representative as an archive sample; one section given to the Owner's Representative for laboratory testing as specified in paragraph 5 below; and one section retained by the Geomembrane Installer for field testing as specified in paragraph 4 below.

4. For field testing, the Geomembrane Installer shall cut 10 identical 25 mm (1 in) wide replicate specimens from his sample. The Geomembrane Installer shall test five specimens for seam shear strength and five for peel strength. Peel tests will be performed on both inside and outside weld tracks. To be acceptable, 4 of 5 test specimens must pass the stated criteria in section 2.02 with less than 10% separation. If 4 of 5 specimens pass, the sample qualifies for testing by the testing laboratory if required.

5. If independent seam testing is required by the specifications it shall be conducted in accordance with ASTM 5820 or ASTM D4437 or GRI GM 6.

6. Reports of the results of examinations and testing shall be prepared and submitted to the Owner's Representative.

7. For field seams, if a laboratory test fails, that shall be considered as an indicator of the possible inadequacy of the entire seamed length corresponding to the test sample. Additional destructive test portions shall

Electronic Filing: Received, Clerk's Office 06/20/2024

then be taken by the Geomembrane Installer at locations indicated by the Engineer, typically 3 m (10 ft) on either side of the failed sample and laboratory seam tests shall be performed. Passing tests shall be an indicator of adequate seams. Failing tests shall be an indicator of non-adequate seams and all seams represented by the destructive test location shall be repaired with a cap-strip extrusion welded to all sides of the capped area. All cap-strip seams shall be non-destructively vacuum box tested until adequacy of the seams is achieved. Cap strip seams exceeding 50 M in length (150 FT) shall be destructively tested.

D. Identification of Defects

1. Panels and seams shall be inspected by the Installer and Owner's Representative during and after panel deployment to identify all defects, including holes, blisters, undispersed raw materials and signs of contamination by foreign matter.

E. Evaluation of Defects: Each suspect location on the liner (both in geomembrane seam and non-seam areas) shall be non-destructively tested using one of the methods described in Section 3.05.B. Each location which fails non-destructive testing shall be marked, numbered, measured and posted on the daily "installation" drawings and subsequently repaired.

1. If a destructive sample fails the field or laboratory test, the Geomembrane Installer shall repair the seam between the two nearest passed locations on both sides of the failed destructive sample location.
2. Defective seams, tears or holes shall be repaired by reseaming or applying a extrusion welded cap strip.
3. Reseaming may consist of either:
   a. Removing the defective weld area and rewelding the parent material using the original welding equipment; or
   b. Reseaming by extrusion welding along the overlap at the outside seam edge left by the fusion welding process.
4. Blisters, larger holes, and contamination by foreign matter shall be repaired by patches and/or extrusion weld beads as required. Each patch shall extend a minimum of 150 mm (6 in) beyond all edges of the defects.
5. All repairs shall be measured, located and recorded.

F. Verification of Repairs on Seams: Each repair shall be non-destructively tested using either vacuum box or spark testing methods. Tests which pass the non-destructive test shall be taken as an indication of a successful repair. Failed tests shall be reseamed and retested until a passing test results. The number, date, location, technician and test outcome of each patch shall be recorded.

G. Daily Field Installation Reports: At the beginning of each day's work, the Installer shall provide the Engineer with daily reports for all work accomplished on the previous work day. Reports shall include the following:

1. Total amount and location of geomembrane placed;

Electronic Filing: Received, Clerk's Office 06/20/2024

2. Total length and location of seams completed, name of technicians doing seaming and welding unit numbers;
3. Drawings of the previous day's installed geomembrane showing panel numbers, seam numbers and locations of non-destructive and destructive testing;
4. Results of pre-qualification test seams;
5. Results of non-destructive testing; and
6. Results of vacuum testing of repairs.

H. Destructive test results shall be reported prior to covering of liner or within 48 hours.

3.06 LINER ACCEPTANCE

A. Geomembrane liner will be accepted by the Owner's Representative when:

1. The entire installation is finished or an agreed upon subsection of the installation is finished;
2. All Installer's QC documentation is completed and submitted to the owner
3. Verification of the adequacy of all field seams and repairs and associated geomembrane testing is complete.

3.07 ANCHOR TRENCH

A. Construct as specified on the project drawings.

3.08 DISPOSAL OF SCRAP MATERIALS

A. On completion of installation, the Geomembrane Installer shall dispose of all trash and scrap material in a location designated by the Owner's Representative, remove equipment used in connection with the work herein, and shall leave the premises in a neat acceptable manner. Scrap sections larger than 5 feet on each edge shall be segregated from smaller scraps and retained by the Owner. No scrap material shall be allowed to remain on the geomembrane surface.

## PART 4. GRI GM13 SPECIFICATIONS

Geosynthetics Research Institute (GRI) Test Method GM13 – "Test Methods, Test Properties and Testing Frequency for High Density Polyethylene (HDPE) Smooth and Textured Geomembranes", Revision 8, Dated July 10, 2006.

Electronic Filing: Received, Clerk's Office 06/20/2024

Revision 8: July 10, 2006
Revision schedule on pg. 11

**GRI Test Method GM13***

Standard Specification for

"Test Methods, Test Properties and Testing Frequency for
High Density Polyethylene (HDPE) Smooth and Textured Geomembranes"

This specification was developed by the Geosynthetic Research Institute (GRI), with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

1. Scope

1.1 This specification covers high density polyethylene (HDPE) geomembranes with a formulated sheet density of 0.940 g/ml, or higher, in the thickness range of 0.75 mm (30 mils) to 3.0 mm (120 mils). Both smooth and textured geomembrane surfaces are included.

1.2 This specification sets forth a set of minimum, physical, mechanical and chemical properties that must be met, or exceeded by the geomembrane being manufactured. In a few cases a range is specified.

1.3 In the context of quality systems and management, this specification represents manufacturing quality control (MQC).

Note 1: Manufacturing quality control represents those actions taken by a manufacturer to ensure that the product represents the stated objective and properties set forth in this specification.

1.4 This standard specification is intended to ensure good quality and performance of HDPE geomembranes in general applications, but is possibly not adequate for the complete specification in a specific situation. Additional tests, or more restrictive

*This GRI standard is developed by the Geosynthetic Research Institute through consultation and review by the member organizations. This specification will be reviewed at least every 2-years, or on an as-required basis. In this regard it is subject to change at any time. The most recent revision date is the effective version.

values for test indicated, may be necessary under conditions of a particular application.

Note 2: For information on installation techniques, users of this standard are referred to the geosynthetics literature, which is abundant on the subject.

2.3 U. S. Environmental Protection Agency Technical Guidance Document "Quality Control Assurance and Quality Control for Waste Containment Facilities." EPA/600/R-93/182, September 1993, 305 pgs.

3. Definitions

Manufacturing Quality Control (MQC) - A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of geosynthetic materials and is necessary to ensure minimum (or maximum) specified values in the manufactured product. MQC refers to measures taken by the manufacturer to determine compliance with the requirements for materials and workmanship as stated in certification documents and contract specifications.
ref. EPA/600/R-93/182

Manufacturing Quality Assurance (MQA) - A planned system of activities that provides assurance that the materials were constructed as specified in the certification documents and contract specifications. MQA includes manufacturing facility inspections, verifications, audits and evaluation of the raw materials (resins and additives) and geosynthetic products to assess the quality of the manufactured materials. MQA refers to measures taken by the MQA organization to determine if the manufacturer is in compliance with the product certification and contract specifications for the project.
ref. EPA/600/R-93/182

Formulation, n - The mixture of a unique combination of ingredients identified by type, properties and quantity. For HDPE polyethylene geomembranes, a formulation is defined as the exact percentages and types of resin(s), additives and carbon black.

4. Material Classification and Formulation

4.1 This specification covers high density polyethylene geomembranes with a formulated sheet density of 0.940 g/ml, or higher. Density can be measured by ASTM D1505 or ASTM D792. If the latter, Method B is recommended.

4.2 The polyethylene resin from which the geomembrane is made will generally be in the density range of 0.932 g/ml or higher, and have a melt index value per ASTM D1238 of less than 1.0 g/10 min.

4.3 The resin shall be virgin material with no more than 10% rework. If rework is used, it must be a similar HDPE as the parent material.

4.4 No post consumer resin (PCR) of any type shall be added to the formulation.

Electronic Filing: Received, Clerk's Office 06/20/2024

5. Physical, Mechanical and Chemical Property Requirements

5.1 The geomembrane shall conform to the test property requirements prescribed in Tables 1 and 2. Table 1 is for smooth HDPE geomembranes and Table 2 is for single and double sided textured HDPE geomembranes. Each of the tables are given in English and SI (metric) units. The conversion from English to SI (metric) is soft.

Note 3: The tensile strength properties in this specification were originally based on ASTM D 638 which uses a laboratory testing temperature of 23°C ± 2°C. Since ASTM Committee D35 on Geosynthetics adopted ASTM D 6693 (in place of D 638), this GRI Specification followed accordingly. The difference is that D 6693 uses a testing temperature of 21°C ± 2°C. The numeric values of strength and elongation were not changed in this specification. If a dispute arises in this regard, the original temperature of 23°C ± 2°C should be utilized for testing purposes.

Note 4: There are several tests often included in other HDPE specifications which are omitted from this standard because they are outdated, irrelevant or generate information that is not necessary to evaluate on a routine MQC basis. The following tests have been purposely omitted:

- Volatile Loss
- Dimensional Stability
- Coeff. of Linear Expansion
- Resistance to Soil Burial
- Low Temperature Impact
- ESCR Test (D 1693)
- Wide Width Tensile
- Water Vapor Transmission
- Water Absorption
- Ozone Resistance
- Modulus of Elasticity
- Hydrostatic Resistance
- Tensile Impact
- Field Seam Strength
- Multi-Axial Burst
- Various Toxicity Tests

Note 5: There are several tests which are included in this standard (that are not customarily required in other HDPE specifications) because they are relevant and important in the context of current manufacturing processes. The following tests have been purposely added:

- Oxidative Induction Time
- Oven Aging
- Ultraviolet Resistance
- Asperity Height of Textured Sheet (see Note 6)

Note 6: The minimum average value of asperity height does not represent an expected value of interface shear strength. Shear strength

Electronic Filing: Received, Clerk's Office 06/20/2024

associated with geomembranes is both site-specific and product-specific and should be determined by direct shear testing using ASTM D5321/ASTM D6243 as prescribed. This testing should be included in the particular site's CQA conformance testing protocol for the geosynthetic materials involved, or formally waived by the Design Engineer, with concurrence from the Owner prior to the deployment of the geosynthetic materials.

Note 7: There are other tests in this standard, focused on a particular property, which are updated to current standards. The following are in this category:

- Thickness of Textured Sheet
- Puncture Resistance
- Stress Crack Resistance
- Carbon Black Dispersion (In the viewing and subsequent quantitative interpretation of ASTM D 5596 only near spherical agglomerates shall be included in the assessment).

Note 8: There are several GRI tests currently included in this standard. Since these topics are not covered in ASTM standards, this is necessary. They are the following:

- UV Fluorescent Light Exposure
- Asperity Height Measurement

5.2 The values listed in the tables of this specification are to be interpreted according to the designated test method. In this respect they are neither minimum average roll values (MARV) nor maximum average roll values (MaxARV).

5.3 The properties of the HDPE geomembrane shall be tested at the minimum frequencies shown in Tables 1 and 2. If the specific manufacturer's quality control guide is more stringent and is certified accordingly, it must be followed in like manner.

Note 9: This specification is focused on manufacturing quality control (MQC). Conformance testing and manufacturing quality assurance (MQA) testing are at the discretion of the purchaser and/or quality assurance engineer, respectively.

6. Workmanship and Appearance

6.1 Smooth geomembrane shall have good appearance qualities. It shall be free from such defects that would affect the specified properties of the geomembrane.

Electronic Filing: Received, Clerk's Office 06/20/2024

6.2 Textured geomembrane shall generally have uniform texturing appearance. It shall be free from agglomerated texturing material and such defects that would affect the specified properties of the geomembrane.

6.3 General manufacturing procedures shall be performed in accordance with the manufacturer's internal quality control guide and/or documents.

7. MQC Sampling

7.1 Sampling shall be in accordance with the specific test methods listed in Tables 1 and 2. If no sampling protocol is stipulated in the particular test method, then test specimens shall be taken evenly spaced across the entire roll width.

7.2 The number of tests shall be in accordance with the appropriate test methods listed in Tables 1 and 2.

7.3 The average of the test results should be calculated per the particular standard cited and compared to the minimum value listed in these tables, hence the values listed are the minimum average values and are designated as "min. ave."

8. MQC Retest and Rejection

8.1 If the results of any test do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the manufacturing protocol as set forth in the manufacturer's quality manual.

9. Packaging and Marketing

9.1 The geomembrane shall be rolled onto a substantial core or core segments and held firm by dedicated straps/slings, or other suitable means. The rolls must be adequate for safe transportation to the point of delivery, unless otherwise specified in the contract or order.

10. Certification

10.1 Upon request of the purchaser in the contract or order, a manufacturer's certification that the material was manufactured and tested in accordance with this specification, together with a report of the test results, shall be furnished at the time of shipment.

Electronic Filing: Received, Clerk's Office 06/20/2024

*(1)* Machine direction (MD) and cross machine direction (XMD) average values should be on the basis of 5 test specimens each direction.
Yield elongation is calculated using a gage length of 1.3 inches
Break elongation is calculated using a gage length of 2.0 in.

*(2)* The yield stress used to calculate the applied load for the SP-NCTL test should be the manufacturer's mean value via MQC testing.

*(3)* Other methods such as D 4218 (muffle furnace) or microwave methods are acceptable if an appropriate correlation to D 1603 (tube furnace) can be established.

*(4)* Carbon black dispersion (only near spherical agglomerates) for 10 different views:
9 in Categories 1 or 2 and 1 in Category 3

*(5)* The manufacturer has the option to select either one of the OIT methods listed to evaluate the antioxidant content in the geomembrane.

*(6)* It is also recommended to evaluate samples at 30 and 60 days to compare with the 90 day response.

*(7)* The condition of the test should be 20 hr. UV cycle at 75°C followed by 4 hr. condensation at 60°C.

*(8)* Not recommended since the high temperature of the Std-OIT test produces an unrealistic result for some of the antioxidants in the UV exposed samples.

*(9)* UV resistance is based on percent retained value regardless of the original HP-OIT value.

Electronic Filing: Received, Clerk's Office 06/20/2024

| UV Resistance *(9)*<br>(a) Standard OIT (min. ave.)<br>— or —<br>(b) High Pressure OIT (min. ave.) - % retained after 1600 hrs *(11)* | GM11<br>D 3895<br><br>D 5885 | N.R. *(10)*<br><br>50% | N.R. *(10)*<br><br>50% | N.R. *(10)*<br><br>50% | N.R. *(10)*<br><br>50% | N.R. *(10)*<br><br>50% | N.R. *(10)*<br><br>50% | N.R. *(10)*<br><br>50% | per each formulation |

*(1)* Of 10 readings, 8 out of 10 must be ≥ 7 mils, and lowest individual reading must be ≥ 5 mils, also see Note 6

*(2)* Alternate the measurement side for double sided textured sheet

*(3)* Machine direction (MD) and cross machine direction (XMD) average values should be on the basis of 5 test specimens each direction
Yield elongation is calculated using a gage length of 1.3 inches
Break elongation is calculated using a gage length of 2.0 inches

*(4)* P-NCTL test is not appropriate for testing geomembranes with textured or irregular rough surfaces. Test should be conducted on smooth edges of textured rolls or on smooth sheets made from the same formulation as being used for the textured sheet materials.
The yield stress used to calculate the applied load for the SP-NCTL test should be the manufacturer's mean value via MQC testing.

(5) Other methods such as D 4218 (muffle furnace) or microwave methods are acceptable if an appropriate correlation to D 1603 (tube furnace) can be established.

(6) Carbon black dispersion (only near spherical agglomerates) for 10 different views
9 in Categories 1 or 2 and 1 in Category 3

(7) The manufacturer has the option to select either one of the OIT methods listed to evaluate the antioxidant content in the geomembrane.

(8) It is also recommended to evaluate samples at 30 and 60 days to compare with the 90 day response.

(9) The condition of the test should be 20 hr. UV cycle at 75°C followed by 4 hr. condensation at 60°C.

(10) Not recommended since the high temperature of the Std-OIT test produces an unrealistic result for some of the antioxidants in the UV exposed samples.

(11) UV resistance is based on percent retained value regardless of the original HP-OIT value.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Adoption and Revision Schedule**

**for**

**HDPE Specification per GRI-GM13**

"Test Methods, Test Properties, Testing Frequency for
High Density Polyethylene (HDPE) Smooth and Textured Geomembranes"

| | |
|---|---|
| Adopted: | June 17, 1997 |
| Revision 1: | November 20, 1998; changed CB dispersion from allowing 2 views to be in Category 3 to requiring all 10 views to be in Category 1 or 2. Also reduced UV percent retained from 60% to 50%. |
| Revision 2: | April 29, 1999: added to Note 5 after the listing of Carbon Black Dispersion the following: "(In the viewing and subsequent quantitative interpretation of ASTM D5596 only near spherical agglomerates shall be included in the assessment)" and to Note (4) in the property tables. |
| Revision 3: | June 28, 2000: added a new Section 5.2 that the numeric table values are neither MARV or MaxARV. They are to be interpreted per the the designated test method. |
| Revision 4: | December 13, 2000: added one Category 3 is allowed for carbon black dispersion. Also, unified terminology to "strength" and "elongation". |
| Revision 5: | May 15, 2003: Increased minimum acceptable stress crack resistance time from 200 hrs to 300 hrs. |
| Revision 6: | June 23, 2003: Adopted ASTM D 6693, in place of ASTM D 638, for tensile strength testing. Also, added Note 2. |
| Revision 7: | February 20, 2006: Added Note 6 on Asperity Height clarification with respect to shear strength. |
| Revision 8: | Removed recommended warranty from specification. |

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 - SITE WORK
Section 02936 - Topsoil, Seeding, and Mulching

## PART 1. GENERAL

1.01 DESCRIPTION

This section pertains to seeding and placing mulch or erosion control blanket over seeded areas.

1.02 RELATED SECTIONS

A. Specified elsewhere:

1. 02200 - Earthwork

1.03 REFERENCES

The following reference or cited portions thereof, current at date of bidding documents unless otherwise specified, governs the work.

A. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2007.

1.04 SPECIFICATIONS

A. Work shall conform to the applicable requirements of Sections 250 and 251 of Standard Specifications for Road and Bridge Construction and to the requirements hereinafter specified.

B. Exceptions: All references in the IDOT specifications to methods of measurement and payment shall not apply.

1.05 WARRANTY

A. Warranty for one (1) year plus one growing season from date of substantial completion shall be provided.

## PART 2. PRODUCTS

2.01 MATERIALS

A. Seed: Seed shall conform to Article 1081.04 of the IDOT Standard Specifications where IDOT seed mixtures are specified. In areas where Ameren Energy

Electronic Filing: Received, Clerk's Office 06/20/2024

Generating hay seeding mix is specified, it shall be composed as follows:

| Seed Type | Pounds/Acre |
|---|---|
| Vernal Alfalfa | 12 |
| Wrangler Alfalfa | 8 |
| Medium Red Clover | 6 |
| Timothy | 4 |

B. Mulch Material and Erosion Control Blanket: Mulch material shall conform to Article 1081.06 and the excelsior blanket/knitted straw mat shall conform to Article 1081.10 of the IDOT Standard Specifications.

C. Fertilizer and agricultural ground limestone will not be permitted.

## PART 3. EXECUTION

### 3.01 CONSTRUCTION

A. Seed bed preparation and seeding methods shall conform to Section 250 of the IDOT Specifications. Seeding of areas disturbed by construction activities after September 30, 2008 may be deferred until Spring 2009 at no additional cost to the Owner.

B. Seed shall be applied to the perimeter berm ditch, to disturbed portions of the perimeter berm, and to all disturbed earth surfaces outside of the existing perimeter berm. IDOT seeding mixture 7 shall be used on stockpiles. IDOT seeding mixture 1A shall be used on the gypsum stack perimeter earthen berm, the recycle pond dam embankment and on slopes that are 4H:1V or steeper. The Ameren hay seed mix shall be used on slopes flatter than 4H:1V.

C. Application rates for IDOT seed mixtures shall be as specified in Section 250 of the IDOT Specifications. The application rate for the Ameren Energy Resources Generating's seed mix shall be as specified in the Ameren Energy Resources Generating's hay seeding mix.

D. Seeded areas shall be mulched in accordance with Article 251.03. The Contractor may use either Method 2 or Method 3.

### 3.02 MAINTENANCE OF COMPLETED WORK

A. All areas seeded by the Contractor shall be maintained by the Contractor during the period between completion of such work and final completion and acceptance of the Contractor's work by the Owner. This maintenance shall be such that the completed work, at time of acceptance, complies in all respects with the requirements herein

Electronic Filing: Received, Clerk's Office 06/20/2024

specified.

B. The areas seeded will be required to germinate. If the seed does not germinate, the Contractor will be required to regrade and reseed at no additional cost to the Owner.

END OF SECTION 02936

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 3 - CONCRETE
Section 03100 - Concrete Formwork

## PART 1. GENERAL

1.01 WORK INCLUDES

A. The complete installation of the formwork for cast-in-place concrete, with shoring, bracing and anchorage, openings for other work, form accessories, form stripping.

1.02 RELATED SECTIONS

A. Section 03200 - Concrete Reinforcement.

B. Section 03300 - Cast-In-Place Concrete.

C. Section 03400 – Concrete Embedment Liner.

1.03 REFERENCES

A. ACI 347 - Recommended Practice For Concrete Formwork.

B. ACI 301 - Specifications For Structural Concrete For Buildings.

1.04 DESIGN REQUIREMENTS

A. Design, engineer and construct formwork, shoring and bracing to conform to design and code requirements; resultant concrete to conform to required shape, line and dimension.

1.05 QUALITY ASSURANCE

A. Perform Work in accordance with ACI 347 and 301.

1.06 REGULATORY REQUIREMENTS

A. Conform to applicable code for design, fabrication, erection and removal of formwork.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Store off ground in ventilated and protected manner to prevent deterioration from moisture.

Electronic Filing: Received, Clerk's Office 06/20/2024

1.08 COORDINATION

A. Coordinate this Section with other Sections of work which require attachment of components of formwork.

B. If formwork is placed which results in insufficient concrete cover over reinforcement, request instructions from Owner's Representative before proceeding.

## PART 2. PRODUCTS

2.01 WOOD FORM MATERIALS

A. Softwood Plywood: 3/4 in. PS 1-83 "B-B" (concrete form) plywood, Class I, exterior grade or better, mill-oiled and edge sealed with each piece bearing legible inspection trademark.

B. Architectural Plywood: 3/4 in. PS 1-83 "B-B" plyform, Class I, with High Density smooth overlay, 1 surface, edge sealed with each piece bearing legible inspection trademark.

2.02 MANUFACTURERS - PREFABRICATED FORMS

A. Weyerhauser Concrete Form.

B. Georgia Pacific, G-P Exterior Soft Wood Plywood Product.

C. Plywood and Door Corporation's Finn-Form.

2.03 PREFABRICATED FORMS

A. Preformed Steel Forms: Minimum 16 gage matched, tight fitting, stiffened to support weight of concrete without deflection detrimental to tolerances and appearance of finished surfaces.

B. Glass Fiber Fabric Reinforced Plastic Forms: Matched, tight fitting, stiffened to support weight of concrete without deflection detrimental to tolerances and appearance of finished concrete surfaces.

2.04 FORMWORK ACCESSORIES

A. Form Ties: Snap-off type, galvanized metal, adjustable length, 1 in. back break dimension, free of defects that could leave holes larger than 1 in. in concrete surface; Dayton-Sure Grip snap-in-form ties, as manufactured by Dayton Superior

Electronic Filing: Received, Clerk's Office 06/20/2024

Corp., Symons Ties as manufactured by Symons Corporation, Snap-Tys as manufactured by Richmond Corporation. Ties shall be removed after forms are removed, and holes filled with mortar that matches the adjacent surfaces.

B. Form Release Agent: Colorless mineral oil which will not stain concrete, or absorb moisture; by Magic Kote manufactured by Symons Manufacturing Co., Form Coat manufactured by Concrete Services Co., Formcel manufactured by Lambert Corp.

C. Corners: Chamfered, wood strip type; 3/4 x 3/4 in. size on all exterior corners, 3 x 3 in. size where shown on the drawings; maximum possible lengths.

D. Nails, Spikes, Lag Bolts, Through Bolts, Anchorages: Sized as required, of sufficient strength and character to maintain formwork in place while placing concrete.

E. Concrete Embedment Liner, where required, shall be installed in accordance with Section 03400 – Concrete Embedment Liner.

## PART 3. EXECUTION

### 3.01 EXAMINATION

A. Verify lines, levels and centers before proceeding with formwork. Ensure that dimensions agree with drawings.

### 3.02 EARTH FORMS

A. Earth forms are not permitted, except for footings.

### 3.03 ERECTION - FORMWORK

A. Erect formwork, shoring and bracing to achieve design requirements, in accordance with requirements of ACI 301. Metal forms shall be installed in strict accordance with manufacturer's directions and specifications.

B. Provide bracing to ensure stability of formwork. Shore or strengthen formwork subject to overstressing by construction loads.

C. Arrange and assemble formwork to permit dismantling and stripping. Do not damage concrete during stripping. Permit removal of remaining principal shores.

D. Align joints and make watertight. Keep form joints to a minimum.

E. Obtain approval before framing openings in structural members which are not indicated on drawings.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 3.04 APPLICATION - FORM RELEASE AGENT

A. Apply form release agent on formwork in accordance with manufacturer's recommendations.

B. Apply prior to placement of reinforcing steel, anchoring devices, and embedded items.

C. Do not apply form release agent where concrete surfaces will receive special finishes or applied coverings which are affected by agent.

## 3.05 INSERTS, EMBEDDED PARTS, AND OPENINGS

A. Provide formed openings where required for items to be embedded in or passing through concrete work.

B. Locate and set in place items which will be cast directly into concrete.

C. Coordinate work of other Sections in forming and placing openings, slots, reglets, recesses, chases, sleeves, bolts, anchors, and other inserts.

D. Install accessories in accordance with manufacturer's instructions, straight, level, and plumb. Ensure items are not disturbed during concrete placement.

E. Provide temporary ports or openings in formwork where required to facilitate cleaning and inspection. Locate openings at bottom of forms to allow flushing water to drain.

F. Close temporary openings with tight fitting panels, flush with inside face of forms, and neatly fitted so joints will not be apparent in exposed concrete surfaces.

## 3.06 FORM CLEANING

A. Clean and remove foreign matter within forms as erection proceeds.

B. Clean formed cavities of debris prior to placing concrete.

C. Flush with water or use compressed air to remove remaining foreign matter. Ensure that water and debris drain to exterior through clean-out ports.

D. During cold weather, remove ice and snow from within forms. Do not use de-icing salts or water to clean out forms. Use compressed air or other means to remove foreign matter.

Electronic Filing: Received, Clerk's Office 06/20/2024

3.07 FORMWORK TOLERANCES

A. Construct formwork to maintain tolerances required by ACI 301.

3.08 FIELD QUALITY CONTROL

A. Inspect erected formwork. shoring, and bracing to ensure that work is in accordance with formwork design, and that supports, fastenings, wedges, ties, and items are secure.

B. Do not reuse wood formwork more than three times for concrete surfaces to be exposed to view. Do no patch formwork.

3.09 FORM REMOVAL

A. Do not remove forms or bracing until concrete has gained sufficient strength to carry its own weight and imposed loads.

B. Loosen forms carefully. Do not wedge pry bars, hammers, or tools against finished concrete surfaces scheduled for exposure to view.

C. Store removed forms in manner that surfaces to be in contact with fresh concrete will not be damaged. Discard damaged forms.

END OF SECTION 03100

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 3 - CONCRETE
Section 03200 - Concrete Reinforcement

## PART 1. GENERAL

1.01 WORK INCLUDES

A. The complete installation of the reinforcing steel bars and accessories for cast-in-place concrete.

1.02 RELATED SECTIONS

A. Section 03100 - Concrete Formwork.

B. Section 03300 - Cast-in-Place Concrete.

1.03 REFERENCES

A. ACI 301 - Structural Concrete for Buildings.

B. ACI 318 - Building Code Requirements For Reinforced Concrete.

C. ACI SP-66 - American Concrete Institute - Detailing Manual.

D. ASTM A615 - Deformed and Plain Billet Steel Bars for Concrete Reinforcement.

E. CRSI - Concrete Reinforcing Steel Institute Manual of Practice.

1.04 SUBMITTALS

A. Submit under provisions of Section 01010.

B. Shop Drawings: Indicate bar sizes, spacings, locations, and quantities of reinforcing steel, and bending and cutting schedules. Contract drawings shall not be reproduced as the basis for shop drawings.

C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

1.05 QUALITY ASSURANCE

A. Perform Work in accordance with CRSI Manual of Standard Practice.

B. Submit certified copies of mill test report of reinforcement materials analysis.

Electronic Filing: Received, Clerk's Office 06/20/2024

1.06 COORDINATION

A. Coordinate with placement of formwork, formed openings and other work.

## PART 2. PRODUCTS

2.01 REINFORCEMENT

A. Reinforcing Steel: ASTM A615, 60 ksi yield grade; deformed billet steel bars.

2.02 ACCESSORY MATERIALS

A. Tie Wire: Minimum 16 gage, annealed steel wire, epoxy coated when used with epoxy-coated reinforcement.

B. Chairs, Bolsters, Bar Supports, Spacers: Sized and shaped for strength and support of reinforcement during concrete placement conditions.

C. Special Chairs, Bolsters, Bar Supports, Spacers Adjacent to Weather Exposed Concrete Surfaces: Plastic coated steel type; size and shape as required.

2.03 FABRICATION

A. Fabricate concrete reinforcing in accordance with CRSI Manual of Standard Practice and ACI SP-66.

B. Splice reinforcement on at locations indicated on drawings. Indicate location of splices on shop drawings.

## PART 3. EXECUTION

3.01 PLACEMENT

A. Place, support and secure reinforcement against displacement. Do not deviate from required position. Clean reinforcement of foreign particles or coatings.

B. Accommodate placement of formed openings.

C. Conform to ACI 318 code for concrete cover over reinforcement.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 3.02 FIELD QUALITY CONTROL

A. Contractor shall notify the Owner's Representative at least 24 hrs. in advance of concrete placement. Placement of reinforcing shall occur in such sequence that the Owner's Representative has sufficient time to inspect the correctness of the reinforcing within the placement area. The Owner's Representative retains the right to require necessary revisions be made before concrete is placed.

END OF SECTION 03200

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 3 - CONCRETE
Section 03300 - Cast-In-Place Concrete

## PART 1. GENERAL

1.01 WORK INCLUDES

A. The complete installation of cast-in-place concrete structures, including joint sealants.

1.02 RELATED SECTIONS

A. Section 03100 - Concrete Formwork: Formwork and accessories.

B Section 03200 - Concrete Reinforcement.

C. Section 03400 – Concrete Embedment Liner

1.03 REFERENCES

A. ACI 301 – Structural Concrete for Buildings.

B. ACI 302 - Guide for Concrete Floor and Slab Construction.

C. ACI 304 - Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete.

D. ACI 305R - Hot Weather Concreting.

E. ACI 306R - Cold Weather Concreting.

F. ACI 308 - Standard Practice for Curing Concrete.

G. ACI 318 - Building Code Requirements for Reinforced Concrete.

H. ASTM C31 - Concrete Test Specimens.

I. ASTM C33 - Concrete Aggregates.

J. ASTM C94 - Ready-Mixed Concrete.

K. ASTM C150 - Portland Cement.

L. ASTM C260 - Air Entraining Admixtures for Concrete.

Electronic Filing: Received, Clerk's Office 06/20/2024

M. ASTM C494 - Chemical Admixtures for Concrete.

1.04 SUBMITTALS

A. Product Data: Provide data on joint devices, attachment accessories, admixtures.

1.05 QUALITY ASSURANCE

A. Perform Work in accordance with ACI 301.

B. Acquire cement and aggregate from same source for all work.

C. Conform to ACI 305R when concreting during hot weather.

D. Conform to ACI 306R when concreting during cold weather.

1.06 COORDINATION

A. Coordinate this Section with other Sections which require embedment of components in cast-in-place concrete.

1.07 PRODUCT DATA

A. Submit proposed mix design to Owner's Representative for review prior to commencement of work. Identify source and provide material certificates for cement, fine and coarse aggregates. Provide recent laboratory gradation for fine and coarse aggregates and mix design information in accordance with ACI 301.

B. Submit Construction joint plan.

## PART 2. PRODUCTS

2.01 CONCRETE MATERIALS

A. Cement: ASTM C150, Type I - Normal Portland Type, Gray Color.

B. Fine and Coarse Aggregates: ASTM C33.

C. Water: Potable.

2.02 ADMIXTURES

A. Air Entrainment: ASTM C260.

B. Chemical: ASTM C494. Maximum 0.05% Chloride Ion Contents.

Electronic Filing: Received, Clerk's Office 06/20/2024

C. The use of calcium chloride in any concrete is not permitted.

2.03 ACCESSORIES

A. Non-Shrink Grout: Premixed compound consisting of non-metallic aggregate, cement, water reducing and plasticizing agents; capable of developing minimum compressive strength of 2,400 psi in 48 hours and 7,000 psi in 28 days.

B. Curing Compound: Dress and Seal No. 18 by L&M Construction Chemicals, MB-429 by Master Builders, or Sikagard Cure/Hard by the Sika Corporation.

C. Epoxy Grouted Adhesive Anchors: Hilti, Red Head, Simpson, or Rawl.

2.04 CONCRETE MIX

A. Mix concrete in accordance with ACI 304. Deliver concrete in accordance with ASTM C94.

B. Select proportions for normal weight concrete in accordance with ACI 301.

C. Provide normal weight concrete of the following characteristics:

1. Compressive strength at 28 days: 4,000 psi.

2. Slump: 4 in. - A tolerance of up to 1 in. above the maximum shall be allowed for one batch in any five consecutive batches tested.

3. Water/cement ratios: 0.4 (max).

D. Use accelerating admixtures in cold weather only when approved by Owner's Representative. Use of admixtures will not relax cold weather placement requirements.

E. Use set-retarding admixtures during hot weather only when approved by Owner's Representative.

F. Water-reducing admixtures may be used in all concrete except footings and in strict compliance with the manufacturer's directions.

G. Add air-entraining agent to concrete mix for air content of 6% (± 1%).

## PART 3. EXECUTION

3.01 EXAMINATION

Electronic Filing: Received, Clerk's Office 06/20/2024

A. Verify requirements for concrete cover over reinforcement.

B. Verify that anchors, seats, plates, reinforcement and other items to be cast into concrete are accurately placed, positioned securely, and will not cause hardship in placing concrete.

3.02 PLACING CONCRETE

A. Place concrete in accordance with ACI 301.

B. Notify Owner's Representative minimum of 24 hours prior to commencement of operations.

C. Ensure reinforcement, inserts, and embedded parts are not disturbed during concrete placement.

D. Maintain records of concrete placement. Record date, location, quantity, air temperature, and test samples taken.

E. Place concrete continuously between predetermined expansion, control, and construction joints.

F. When air temperature is between 80°F and 90°F, reduce the mixing and delivery time specified in ASTM C94 from 1-1/2 hours to 75 minutes. When the air temperature is above 90°F, reduce the mixing and delivery time to 60 minutes.

G. Cold weather concreting. Comply with ACI 306 except as follows:

1. In freezing weather, provide suitable means for maintaining concrete temperature at a minimum of 70°F for three days, or 50°F for five days after placing.

2. Cooling of concrete to outside temperature: Not faster than 1° per hour for first day and 2° per hour thereafter until outside temperature is reached.

3. Maximum temperature of concrete produced with heated aggregated, heated water, or both, at any time during its production or transportation: 90°F.

4. Do not mix chemicals or other foreign materials in concrete to prevent freezing or to accelerate hardening of concrete, unless approved in writing by Owner's Representative.

H. Hot weather concreting. Comply with ACI 305R.

1. ACI recommendations shall be observed when any combination of high air

Electronic Filing: Received, Clerk's Office 06/20/2024

temperature, low relative humidity and wind velocity tend to impair the quality of fresh or hardened concrete.

2. Retarding and water reducing admixtures shall be approved in writing for each concrete mix design prior to placement.

3.03 CONCRETE FINISHING

A. Provide exterior concrete formed surfaces to be left exposed with smooth rubbed finish in accord with ACI 301. All other formed surfaces shall have fins, projections and offsets removed.

B. Provide Class A tolerances to exterior concrete slabs according to ACI 301.

1. Broom finish all exterior slabs. Broom out all tool marks.

C. Pitch slabs to drain.

3.04 CURING AND PROTECTION

A. Immediately after placement, protect concrete from premature drying, excessively hot or cold temperatures, and mechanical injury.

B. Maintain concrete with minimal moisture loss at relatively constant temperature for a period necessary for hydration of cement and hardening of concrete in accordance with ACI 308.

C. Cure and protect finished concrete slabs in accordance with ACI 308.

3.05 FIELD QUALITY CONTROL

A. Field inspection and testing will be performed in accordance with ACI 301 and under provisions of Section 01010, paragraph 8.0.

B. Testing firm will take cylinders, perform slump and air entrainment tests in accordance with ACI 301.

C. Provide free access to Work and cooperate with appointed firm.

D. Submit proposed concrete mix design to Owner's Representative firm for review 14 days prior to commencement of Work.

E. Testing frequency shall be as specified in Section 01010, paragraph 8, except that one additional test cylinder will be taken during cold weather concreting, cured on job site under same conditions as concrete it represents.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 3.06 PATCHING

A. Defective Concrete: Concrete not conforming to required lines, details, dimensions, tolerances or specified requirements.

B. Repair or replacement of defective concrete will be determined by Owner's Representative and performed by the Contractor at no additional cost to the project.

C. Do not patch, fill, touch-up, repair, or replace exposed concrete except upon express direction of Owner's Representative for each individual area.

END OF SECTION 03300

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 3 - CONCRETE
Section 03400 - Concrete Embedment Liner

## PART 1. GENERAL

1.01 WORK INCLUDES

A. Specifications and guidelines for manufacturing and installing high-density polyethylene embedment liners.

1.02 RELATED SECTIONS

A. Section 03100 - Concrete Formwork.

B. Section 03300 - Cast-in-Place Concrete.

1.04 SUBMITTALS

A. All work for and in connection with the installation of the lining, field seaming and welding joints shall be completed in strict conformity with all applicable instructions and recommendations of the liner manufacturer.

Electronic Filing: Received, Clerk's Office 06/20/2024

B. Included with the shipment of liner, submit certified test reports that the liner and material are manufactured in accordance with standards specified herein.

1.05 QUALIFICATIONS

A. The HDPE liner specified in this section shall be furnished by a manufacturer who is fully experienced, reputable and qualified in the manufacturing of the materials. The manufacturer must at least 10 years of manufacturing experience.

B. Locking devices must be extruded to the sheet as a one step process.

C. Liner shall be GSE StudLiner as manufactured by GSE Lining Technology, Inc.

D. Liner shall be 8 feet in width.

E. Liner shall demonstrate a minimum pull-out strength of 14,000 psf.

1.06 COORDINATION

A. Coordinate with placement of formwork, formed openings and other work.

## PART 2. PRODUCTS

2.01 ROLL DIMENSIONS

A. Embedment sheets shall be produced in rolls that are 8.0 ft (2.4 m) in width and a thickness range of 80 mils (2.0 mm) to 200 mils (5.0 mm) in thickness. Roll lengths vary according to thickness.

B. Locking studs of the same material as that of the liner shall be integrally extruded with the sheet. Stud spacing shall be on approximate 1.25 in (30 mm) centers, such that there are approximately 110 studs per square foot (1200 per square meter).

2.02 MATERIAL PROPERTIES

A. The material used in the embedment liner and in all welding strips shall be made from 97-98% virgin high density polyethylene and 1.5-3% carbon black or pigmentation for the purpose of an otherwise specified color.

B. Plasticizer shall not be added to the resin formulation.

C. Embedment sheet and welding strips shall be free of holes, pinholes, bubbles, blisters, excessive contamination by foreign matter, and nicks and cuts on roll edges.

Electronic Filing: Received, Clerk's Office 06/20/2024

D. The HDPE cap strips shall be made from HDPE, have good impact resistance and have an elongation sufficient to bridge up to 1/4 inch settling cracks.

E. Cap strips shall be approximately 4 inches wide or greater and shall be equivalent to that of the liner.

F. Material shall maintain a repairable state through it's lifecycle by methods approved and recommended by the manufacturer.

G. Embedment sheets shall have the following physical properties when tested in accordance with Table 1.

H. Raw resin shall have the following properties when tested in accordance with Table 2.

**Table 1: Material Properties**

| Property | Test Method | Nominal Value | | | | Testing Frequency |

| Dimensional Stability, % (each direction) | ASTM D 1204 | ± 1.0 | ± 1.0 | ± 1.0 | ± 1.0 | 1/ product |
| Water Absorption, % | ASTM D 570 | 0.1 | 0.1 | 0.1 | 0.1 | 1/ product |
| Water Vapor Transmission, (g/m²/day) | ASTM E 96 | <0.01 | <0.01 | <0.01 | <0.01 | 1/ product |

[1]Note: Concrete must have a compressive strength of at least 5,000 lb/in² (34,500 kPa).

[2]Note: Dispersion only applies to near spherical agglomerates. 9 of 10 views shall be Category 1 or 2. No more than 1 view for category 3.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 2: Raw Material Properties**

| Property | Test Method | Value | Testing Frequency |
|---|---|---|---|
| Density, g/cm3 | ASTM D 1505 | 0.932 | 1/ resin lot |
| Melt Flow, g/10 min | ASTM D 1238 (190/2.16) | ≤ 1.0 | 1/ resin lot |
| OIT, minutes | ASTM D 3895 (1atm/200°C) | 100 | 1/ formulation |

2.03 MATERIAL SUPPLY

A. Embedment sheets shall be supplied in roll form, sheets, pre-fabricated tubes or panels.

B. Cap strips shall be supplied in 4 inch widths or greater.

## PART 3. EXECUTION

3.01 PLACEMENT

A. Place, support and secure reinforcement against displacement. Do not deviate from required position. Clean reinforcement of foreign particles or coatings.

B. Accommodate placement of formed openings.

C. Conform to ACI 318 code for concrete cover over reinforcement.

3.02 FIELD QUALITY CONTROL

A. Contractor shall notify the Owner's Representative at least 24 hrs. in advance of concrete placement. Placement of the Concrete Embedment Liner shall occur in such sequence that the Owner's Representative has sufficient time to inspect the correctness of the placement within the concrete formwork area. The Owner's Representative retains the right to require necessary revisions be made before concrete is placed.

# 1.0 INTRODUCTION

This Plan describes the Construction Quality Assurance (CQA) program for the proposed Gypsum Management and CCB Landfill Facilites at the Ameren Duck Creek Power Plant in Fulton County, Illinois. The plan has been developed in accordance with the requirements of 35 IAC Part 811, Subpart E entitled *Construction Quality Assurance* Programs.

The Plan requires a scheduled program of CQA monitoring, inspection, sampling and testing to verify compliance with project plans and specifications. The Plan also addresses the testing requirements for test soil liners that will be constructed to verify materials and construction methods for the full-scale liners. The goal of this program is to achieve a reasonable degree of certainty that the construction of the facilites meets the specified designs.

Appendix A lists the testing methods, acceptance requirements and testing frequencies that shall guide the implementation of this plan. Also listed is the party responsible for conducting the testing for each of the constucted components of the landfill. The plan requires oversight by the CQA Officer for all testing carried out by the geosynthetic installers.

The CQA Plan also requires preparation by the CQA Officer of a final report at the end of construction that provides all inspection and testing documentation and certifies that the facilites have been constructed in accordance with the engineering design.

This Plan is intended to supplement, the project plans and specifications. Where a conflict exists, the approved CQA Plan will govern.

# 2.0 RESPONSIBILITY AND AUTHORITY OF PROJECT PERSONNEL

The project participants involved in the construction and quality assurance oversight of the construction are shown in Figure 2.1 *Project Organization Chart*. The Owner is the Ameren Energy Resources Generating Company (AERG or Ameren) who will retain a General Contractor to construct the facilities and a CQA Officer to provide the quality assurance oversight services. The following list the responsibilities and authority of each of the participants shown in Figure 2.1.

## 2.1 Owner

Ameren Energy Resources Generating Company (Ameren) is responsible for obtaining all necessary permits for construction and operation of the facilities. Ameren retains under contract all parties for the construction including the General Contractor, the Design Engineer (Hanson Professional Services Inc.), the CQA Officer, and the CQA testing and monitoring firms.

The Ameren Construction Manager will be in charge of coordinating overall construction activities and will act as Ameren's primary interface with the General Contractor. The Construction Manager coordinates all matters involving contract issues with the Ameren Project Manager including approving field changes to the project plans and specifications.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 2.2 Design Engineer

The Design Engineer (Hanson Professional Services Inc.) is responsible for development of plans and specifications that fulfill the needs of the Owner and meet the requirements of the regulatory agencies. The Design Engineer is also responsible for responding to Contractor requests for information (RFIs) during the construction process as may be required to clarify the plans and specifications or to address identified conflicts in the documents. The Design Engineer is further responsible for developing any modifications to the plans and specifications as may be required to address changed field conditions, field cost savings, design improvements or other necessary or desired modifications as approved by the Owner.

## 2.3 CQA Personnel

### *2.3.1 Key Personnel (Owner's Representative)*

Ameren will retain a CQA Officer for the project who will report directly to Ameren's Construction Manager (see Figure 2.1 *Organization Chart*). The CQA Officer shall be a professional engineer registered in the State of Illinois, who is a person other than the operator or an employee of the operator, and who will supervise and be responsible for all inspection, testing, and other activities required to be implemented as part of the CQA program. The CQA Officer will also be responsible for, and will provide direct supervision to, the testing and monitoring firms shown in Figure 2.1 who will perform the monitoring, testing, sampling, and inspections required by the CQA program as described more specifically in Section 6.0. The CQA Officer will be present at the outset of major undertakings and at critical times during the construction. The time that the CQA Officer must be at the project site will be dependent upon the type of construction being conducted. The CQA Officer will exercise his/her own professional judgment to be present at the project site as required to assume full responsibility for the inspection and testing performed by those persons under his/her direct supervision. The CQA Officer shall have sufficient on-site full-time staff to adequately carry out the quality assurance activities specified herein.

If the CQA Officer is unable to be present to perform duties as outlined, then the CQA Officer will provide, in writing, reasons for his/her absence including designation of the person who will exercise professional judgment in carrying out the duties of a CQA Officer as the designated CQA Officer-in-absentia. A signed statement shall be provided and recorded that the CQA Officer assumes full responsibility for all inspections performed and reports prepared by the designated CQA Officer-in-absentia during any absence of the CQA Officer.

It is required that the CQA Officer (or his designated representative), with on-site support personnel as required, provide oversight of the monitoring, inspection, testing and/or sampling of the following construction activities for the facilities:

- Test Liner,
- Excavation, grading, and preparation of the subgrade and foundation,
- Placement of the compacted soil liner,
- Placement of geosynthetic components,

Electronic Filing: Received, Clerk's Office 06/20/2024

- Installation of the leachate drainage and collection systems.
- Construction of surface water ditches, channels, berms, and drainage structures, and
- Placement of concrete structures.

The CQA Officer (or his designated representative) must certify that the sampling, inspection and test results for the major elements of the construction are in compliance with established design requirements before subsequent sequential items of the construction can be initiated. The major elements of Work requiring compliance certification include:

- Subgrade prior to placement of soil test liner (CCB landfill facility only),
- Soil test liner prior to placement of the low permeability soil liner,
- Subgrade prior to placement of the low permeability soil liner (CCB landfill facility only),
- Low permeability soil liner prior to placement of the geosynthetic clay liner (GCL),
- GLC liner prior to placement of the geomembrane,
- Geomembrane prior to placement of the geotextile cushion,
- Geotextile cushion prior to placement of the drainage layer,
- Piping installation prior to completed placement of the drainage layer,
- Drainage layer prior to placement of geotextile fabric,
- Cushion Dirt prior to placement of the geomembrane (gypsum facility only), and
- Geosynthetic installations in anchor trenches prior to backfilling.

Certification will require a through review of all inspection, sampling and testing completed for the work item to ensure that all design requirements have been met, a visual inspection of the work item, and the completion and signing of form CQAP 2.1 *CQA Certification* by the CQA Officer. The Contractor or Installer for the immediately following item of work shall not be allowed to initiate work until completion of the signed form by the CQA Officer.

The completed and signed forms CQAP-2.1 shall be filed as a project records in accordance with the provisions of Section 11.0

### 2.3.2 *Document Controller*

The staff of the CQA Officer shall include a Document Controller who will be responsible for: (1) control of the CQA Plan to ensure that only current documents are being employed by the CQA staff and (2) filing of all CQA records related to the monitoring, sampling, inspecting and testing specified in the CQA Plan.

Requirements for control of the CQA Plan and for filing of project records are presented in Section 11.0.

## 2.4 Testing and Monitoring Firms

The testing and monitoring firms, under the direction of the CQA Officer (see Figure 2.1), shall be responsible for conducting the quality assuranace sampling, inspection and testing required by Section 6.0 of the CQA Plan except that only monitoring and limited (independent) sampling and testing shall be required for the geosyntheties (i.e., geomembranes, geothensytic clay liners and

Electronic Filing: Received, Clerk's Office 06/20/2024

geotextiles). The suppliers and installers shall be responsible for all the sampling and testing required by Section 6.0 for the geosynthetics (see Section 2.6).

### *2.4.1 Soil/Concrete Testing (Lab and Field)*

One or more soil/concrete testing firms that has been qualified by the Illinois Department of Transporation (IDOT) will be retained to perform the field and laboratory sampling and testing required by the CQA Plan. Materials sampled and tested will include fine-grained soils, coarse grained soils, aggregates, rip rap and concrete.

Each firm shall be required to provide "certificates of calibration" (or other proof of calibration) to the CQA Officer for each of the measuring and/or test equipment used in the laboratory or field; except that such certificates are not required for commercial grade equipment such as rulers, tape measures or other devices that provide adequate accuracy for their intended purpose.

All field and laboratory forms proposed for collection of data shall be subject to review by Ameren prior to use. Forms deemed to be incomplete or otherwise shall be modified to meet the intent of the CQA Plan.

### *2.4.2 Surveyor*

One or more surveyors will be retained to verify attainment of specified elevations, slopes and grades within the tolerances required by the CQA Plan. The firm(s) selected shall have the capacity to complete all work by or under the supervision of an Illinois Professional Land Surveyor.

Each surveyor will be required to provide "certificates of calibration" (or other proof of calibration) to the CQA Officer for each surveying device used; except that such certificates are not required for commercial grade equipment such as rulers, tape measures or other devices that provide adequate accuracy for their intended purpose.

All field forms proposed for collection of data shall be subject to review by Ameren prior to use. Forms deemed to be incomplete or otherwise unacceptable shall be modified to meet the intent of the CQA Plan.

### *2.4.3 Geosynthetics Monitor and Geosynthetics Testing Laboratory*

A geosynthetics monitoring firm will be retained to conduct oversight of the quality assurance inspections, testing and sampling carried out in the field by the suppliers and installers for the geosynthetics (see Section 2.5) to ensure that the requirements of the CQA Plan are met including directing additional inspection, sampling and testing as may be deemed necessary by the monitoring firm. The monitoring firm will also collect its own representative samples of the geosynthetics for independent testing by a geosynthetics testing laboratory. The monitoring firm shall have previous experience in installation oversight of at least 10,000,000 sq. ft. of similar geosynthetic materials.

Electronic Filing: Received, Clerk's Office 06/20/2024

The laboratory will be independent of both the manufacturer and the installer of the geosynthetics and will be required to have its own QA plan for the project work. The QA Plan shall be subject to review by Ameren prior to start of services.

All field and laboratory forms proposed for collection of data shall be subject to review by Ameren prior to use. Forms deemed to be incomplete or otherwise unacceptable shall be modified to meet the intent of the CQA Plan.

## 2.5 Contractors, Suppliers and Installers

The contractor, subcontractors, suppliers and installers are responsible for completing their portions of the work within specified schedules and in accordance with the requirements of the plans and specifications. They additionally shall accommodate the monitoring, sampling, inspections and testing that are the responsibility of the CQA Officer under the QCA Plan.

The geosynthetic Suppliers and Installers shall provide the quality assurance inspection, sampling and testing as required by Section 6.0 of the CQA Plan. Additionally, the geosynthetic suppliers shall be required to submit "certificates of acceptance" for certain items of work that precede their construction activities. The "certificates" are more specifically discussed in Section 4.0.

# 3.0 PROJECT MEETINGS

Periodic meetings will be held during the life of the project to enhance coordination among the various parties involved. Meetings will include preconstruction meetings, routine progress meetings and, as needed, problem or work deficiency meetings.

## 3.1 Preconstruction Meetings

Preconstruction meetings shall be held at the site for the major earthwork, items and geosynthetic installations. At a minimum, the Ameren Construction Manager, the CQA Officer, representatives of the testing firms, and the earthwork contractor or geosynthetic installer should attend. In addition to the topics for discussion as listed in the project specifications, the following CQA items will be covered:

- Discuss the established protocol for inspections, tests and sampling including use of form CQAP 8.1 *Daily Inspection Report* (see Section 8.0).
- Discuss items of work requiring CQA Officer certification or Installer acceptance before subsequent work items can be initiated (see Section 4.0), and
- Discuss the established protocol for handling construction deficiencies, corrective measures, and retesting (see Section 7.0).

The meeting shall be conducted by the Ameren Construction Manager or CQA Officer and will be documented by CQA personnel with distribution to all attendees. Meeting minutes will be filed as project records in accordance with Section 11.0.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 3.2 Progress Meetings

At the discretion of the Ameren Construction Manager or the CQA Officer, brief progress meetings will be scheduled to discuss on-going and up-coming construction activities. The meeting will be attended by the Ameren Construction manager, the CQA Officer, and the appropriate site foreman (i.e. when earthwork is being performed, the earthwork foreman will be present; when geosynthetics are being installed, the installer foreman will be present, etc.). In addition to the CQA Officer topics of discussion regarding progress, the following CQA items should be reviewed:

- Discuss the established protocol for inspections, tests and sampling including use of form CQAP 8.1 *Daily Inspection Report* (see Section 8.0).
- Discuss items of work requiring CQA Officer certification or Installer acceptance before new work items can be initiated (see Section 4.0), and
- Discuss the established protocol for handling construction deficiencies, corrective measures, and retesting (see Section 7.0).

These meetings will be documented by the CQA Officer with distribution to all attendees including the Ameren Project Manager. Meeting minutes will be filed as project records in accordance with Section 11.0.

### 3.3 Problem or Work Deficiency Meetings

Special meetings will be approved by the CQA Officer when a problem or work deficiency is present (or is likely to occur) that is (or could be) of a serious nature. At a minimum, the meeting should be attended by theAmeren Construction Manager, earthwork or installer foremen as appropriate, and the CQA Officer. The Ameren Project Manager should attend those meetings that include discussions of severe and/or recurring problems or deficiencies. The purpose of these meetings is to define and resolve the problem or work deficiency in the following manner:

- Define the problem or deficiency and its probable causes,
- Discuss alternative actions to address the problem or deficiency ,
- Implement the selected action to resolve the problem or deficiency, and
- Verify that the implemented action has been effective.

The meeting will be documented by the CQA Officer with distribution to all attendees including the Ameren Project Manager. Meeting minutes will be filed as project records in accordance with Section 11.0.

## 4.0 IN-PROGRESS ACCEPTANCE OF WORK

### 4.1 Introduction

It is very important during placement of the geosynthetics not to entrap fugitive clay, stones, sand, etc. that could damage the geosynthetic, cause clogging of drains or filters, or hamper seaming of the geosynthetic. The geosynthetic installers shall accept responsibility for inspecting

Electronic Filing: Received, Clerk's Office 06/20/2024

the substrate (on a daily basis) to ensure such entrapments are not present within the substrate area to be covered each day. When found acceptable, the installer shall complete and sign form CQAP-4.1 *Installer Certificate of Acceptance* that documents (on a daily basis) acceptance of the substrate for geosynthetic placement. The Installer shall provide the original signed document to the CQA Officer for his signature of receipt.

Completed and signed forms CQAP-4.1 shall be filed as project records in accordance with the provisions of Section 11.0.

## 4.2 Elements of Work Requiring Prior Acceptance

The following table cites the elements of work that shall require daily "certificates of acceptance" for the substrate including the installer responsible for providing the certification. Any other areas of geosynthetic installation not included in the table shall still be subject to the requirements of this section.

***Table 4.1 Installer Certifications for Acceptance of Work***

| Substrate to Be Accepted by Installer | Installer |
|---|---|
| 1. Surface of Low Permeability Soil Liner | Geosynthetic Clay Liner (GLC) Installer |
| 2. Surface of Geosynthethic Clay Liner (GCL) | Geomembrane Installer |
| 3. Surface of Geomembrane | Geotextile Cushion Installer |
| 4. Surface of Drainage Layer | Geotextile Filter Installer |
| 5. Surface of Cushion Dirt | Geomembrane Installer |

# 5.0 TEST SOIL LINER

## 5.1 Introduction

A compacted low permeability soil test liner shall be constructed within the footprint of the proposed soil liner prior to any work being initiated on the full scale construction. The purpose of the test liner is to verify that the materials and methods of construction proposed for the full scale liner will provide the quality of construction required by the CQA Plan. Additional soil test liners shall be constructed for each time the material properties from a new borrow source are found to be significantly different or there is a significant change in the methods of construction and/or equipment.

Electronic Filing: Received, Clerk's Office 06/20/2024

The test liner will be constructed on a competent foundation from the same prequalified soil material sources, to the same design specifications, and with similar equipment and procedures as are proposed by the contractor for the full scale liner. The foundation (subgrade) for the soil test liner shall be subject to the requirements of Section 6.2.1 and sampling/testing for material prequalification and placement shall be that provided in Section 6.2.2 except that:

1. The survey grid for foundation grade verification and for liner thickness verification shall be as established by the CQA Officer.

2. The frequencies for placement testing shall be as established by the CQA Officer.

3. The testing for hydraulic conductivity shall be as provided in Section 5.2.

## 5.2 Sampling and Testing Program

The soil test liner shall be sampled and tested under the direction of the CQA officer as described below for each of the physical properties listed.

1. At least five (5) two-stage field tests (ASTM designation D 6391-06) shall be used on the test liner to determine the hydraulic conductivity. Both the vertical hydraulic conductivity (k1) and the horizontal hydraulic conductivity (k2) shall be calculated.

2. Undisturbed samples (Shelby tubes) will be tested in the laboratory for vertical hydraulic conductivity to determine if there is a statistical correlation to the field testing results. At least two (2) samples should be tested.

3. The determination of other engineering parameters including, but not limited to, particle size analysis, liquid limits, plastic limits, water contents, and unconfined compressive strengths that are needed to evaluate the full scale liner shall be as directed by the CQA Officer.

## 5.3 Requirements for CQA Certification of Test Soil Liner for Landfill Construction

1. At least four of the five field hydraulic conductivity tests shall result in a measured vertical hydraulic conductivity of $5.0 \times 10^{-7}$ cm/sec or less. No test shall have a hydraulic conductivity greater than $1.0 \times 10^{-6}$ cm/sec.

2. The laboratory hydraulic conductivity tests shall indicate a measured vertical hydraulic conductivity of $1.0 \times 10^{-6}$ or less.

## 5.4 Requirements for CQA Certification of Test Soil Liner for Gypsum Stack

1. At least four of the five field hydraulic conductivity tests shall result in a measured vertical hydraulic conductivity of $5.0 \times 10^{-5}$ cm/sec or less. No test shall have a hydraulic conductivity greater than $1.0 \times 10^{-4}$ cm/sec.

3. The laboratory hydraulic conductivity tests shall indicate a measured vertical hydraulic conductivity of $1.0 \times 10^{-5}$ or less.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 5.5 Report of Results and Certification

The CQA Officer shall prepare reports describing the test programs carried out and the results obtained. The reports shall be filed as project records in accordance with Section 11.0.

The CQA Officer shall review the sampling and test results for the test soil liners and, if found in agreement with requirements, provide certification for the work using form CQAP 2.1.

# 6.0 SAMPLING AND TESTING REQUIREMENTS

## 6.1 Introduction

Prequalification and placement sampling/testing requirements for the various materials and construction activities are as summarized in Table A.1. Frequencies for material placement testing listed in Table A.1 are based on the volume of material used in construction and are to be considered minimums. The CQA Officer shall select the specific locations for testing on a random basis exercising professional judgment to ensure that testing and sampling fairly represent the construction.

The testing firms under the direction of the CQA Officer shall be responsible for the sampling and testing listed in Table A.1 for: (1) the Soils Prequalification and Placement Testing, (2) the Drainage Media Prequalification and Placement Testing, *and (3) the* Other Material Placement Testing. The geosynthetic installers shall be responsible for the sampling and testing listed in Table A.1 for the Geosynthetics Prequalification and Placement Testing with daily overview (and some independent laboratory testing) by the geosynthetic firms and the CQA Officer.

The results of the sampling and testing shall be documented on a daily basis by each agency or installer providing the quality assurance activities and the originals of the sampling and testing results provided to the CQA Officer. The CQA officer shall complete form CQAP 8.1 *Daily Inspection Report* (see Section 8.0) for each of the testing firms or installer proving results and attach the results to the form. The completed form CQAP 8.1 and attached results shall be incorporated into the *Daily Summary Report* (see Section 8.0).

## 6.2 Soils

### *6.2.1 Foundation (Subgrade) – Low Permeability Soil Liner*

#### *6.2.1a. Foundation Grade Verification*

Following excavation for the low permeability soil liner, the CQA Officer shall direct the surveyor to verify that actual depths and grades of the foundation (subgrade) are in accordance with the plans and specifications. Elevations shall be surveyed on a 100 ft grid pattern for the bottom of the cell. The points surveyed for side slopes will be at the top, midpoint, and toe. In addition, all breaks in grade will be surveyed. Foundation excavation grading shall meet a control tolerance requirement of 0 ft to -0.4 ft. The measured depths and grades shall be documented on "as built" drawings furnished to the CQA Officer by the surveyor.

The CQA Officer shall review the survey data for conformance to requirements and, if found in agreement with requirements, provide certification for the work using form CQAP 2.1.

Electronic Filing: Received, Clerk's Office 06/20/2024

#### *6.2.1b. Foundation Fill*

Foundation (subgrade) materials not meeting the requirements of the plans and specifications are required to be excavated and replaced with suitable foundation fill to develop a stable foundation for the landfill. The CQA Officer shall make a foundation inspection with the soil testing firm and direct any sampling and testing necessary to identify areas requiring removal and replacement. The CQA Officer shall inform the earthwork contractor of unsuitable areas requiring removal and replacement.

Foundation fill used by the contractor for replacement shall be sampled and tested by the soil testing firm to check compliance with the prequalification and placement requirements listed in Table A-1. The CQA Officer shall direct the *surveying firm* to determine the locations and extent of all removal and replacement activity and to document all such information on "as built" drawings to be furnished to the CQA Officer.

The CQA Officer shall review the sampling and test results for the foundation fill and, if found in agreement with the prequalification and placement requirements, provide certification for the work using form CQAP 2.1. The certification for foundation fill may be provided on the same form providing the certification for foundation grade.

### *6.2.2 Low Permeability Soil Liner*

#### *6.2.2a. Prequalification Testing*

Table 1.1 requires that prequalification testing for each soil type being used for liner construction at the landfill include the development of an "acceptable zone" of moisture-density for the compacted soil that will result in a liner with a minimum hydraulic conductivity of $1.0 \times 10^{-6}$ cm/sec. The resulting "acceptable zone" then serves as the major control for material placement during construction.

The CQA officer shall direct the soil testing agency to determine the "acceptable zone" for each soil type to be used for landfill liner construction and provide the results in a written report to be available for comparisons with the material placement testing results. The determination of the "acceptable zone" shall be in accordance with Appendix B or other published methodology used in the profession. The report will be filed as a project record in accordance with Section 11.0.

There is no prequalification testing required for the soil materials to be used for the gypsum stack liner construction except that the materials selected shall have sufficient fines to achieve the in-place hydraulic conductivity specified in Section 5.4.

#### *6.2.2b. Material Thickness Testing*

The CQA Officer shall direct the survey agency to determine elevations at the foundation of the soil liner and at the final constructed surface using a 100 ft grid pattern (and the break points in slope) to verify attainment of the plan grades and elevations. To verify liner thickness, all horizontal survey coordinates shall be the same for the foundation and final constructed surface. Side slope thicknesses will be verified using crest (top), midpoint, and toe documentation points.

Electronic Filing: Received, Clerk's Office 06/20/2024

The measured depths and grades shall be documented on "as built" drawings furnished to the CQA Officer by the surveyor agency.

#### *6.2.2c. Moisture/Density Testing*

Moisture/density testing of the compacted soil liner shall be conducted by the soil testing agency under the requirements and at the frequencies specified in TableA.1. During construction of the soil liner the CQA Officer shall confirm the following:

- Use of the same construction equipment as used in the test soil liner.
- Use of same procedures, such as number of passes and speed,
- Uniformity of coverage by compaction equipment,
- Consistent achievement of density, water content and permeability of each successive lift.
- Use of methods to bond successive lifts together.
- Achievement of liner strengths on sidewalls,
- Contemporaneous placement of protective covering to prevent drying and desiccation, where necessary,
- Prevention of placement of frozen material or the placement of material on frozen ground,
- Prevention of damage to completed liner sections, and
- That construction proceeds only during favorable climatic conditions.

#### *6.2.2d. Hydraulic Conductivity Testing*

Samples of the in-place liner shall be obtained and tested for hydraulic conductivity under the requirements and at the minimum frequency as specified in Table A.1. Multiple samples may be collected at a given test location for the purpose of retesting in the event of unacceptable hydraulic conductivity results from the initial sample.

Boreholes, excavations or other disturbances to the soil liner resulting from the obtainment of samples shall be backfilled as directed by the CQA Officer.

#### *6.2.2e. Certification of Work*

The CQA Officer shall review the sampling and test results for the low permeability soil liner and, if found in agreement with the prequalification and placement requirements, provide certification for the work using form CQAP 2.1.

### *6.2.3 Berms*

#### *6.2.3a. Landfill Containment Berms*

The CQA Officer shall direct verification of excavated foundation (subgrade) depths and grades as specified in Section 6.2.1a except that the foundation grid shall be as directed by the CQA Officer. Foundation fills shall be as specified in Section 6.2.1b.

Prequalification testing for material sources shall meet the requirements in Table A.1.

Electronic Filing: Received, Clerk's Office 06/20/2024

The CQA Officer shall direct the soil agency to conduct the following inspection activities during berm construction:

- Observation of fill material characteristics.
- Observation of loose lift thickness.
- Observation of clod size reduction and material homogenization, and
- Placement testing as specified in Table A.1.

Documentation of construction on "as-built" plans shall be as specified in Section 6.5.2.

The CQA Officer shall review the sampling and test results for the landfill containment berms and, if found in agreement with the prequalification and placement requirements, provide certification for the work using form CQAP 2.1.

#### *6.2.3b Temporary Cell Separation Berms*

The CQA Officer shall direct verification of excavated foundation (subgrade) depths and grades as specified in Section 6.2.1a except that the foundation grid shall be as directed by the CQA Officer. Foundation fills shall be as specified in Section 6.2.1b.

Prequalification testing for material sources shall meet the requirements in Table A.1.

The CQA Officer shall direct the soil agency to conduct the following inspection activities during berm construction:

- Observation of fill material characteristics,
- Observation of loose lift thickness.
- Observation of clod size reduction and material homogenization,
- Placement testing as specified in Table A.1, and
- Measurements of berm slopes.

## 6.3 Geosynthetics

### *6.3.1 Geosynthetic Clay Liner (GCL)*

#### *6.3.1a. Prequalification Testing*

The geosynthetic clay liner (GCL) installer shall provide to the CQA Officer the test results from a qualified laboratory for the type and frequency of prequalification testing listed in Table A.1. The submittal shall include certification from the laboratory that the test results verify the manufacturer's guaranteed properties.

The CQA Officer shall direct the geosynthetics QA monitor firm to select a representative number of additional samples of the GCL for submittal to the monitor's geosynthetic laboratory for independent verification of the manufacturer's guaranteed properties.

Electronic Filing: Received, Clerk's Office 06/20/2024

The results of laboratory testing shall meet the GCL manufacturer's specifications as shown in the following table.

| GCL Laboratory Testing Methods/Minimum Values Required | |
|---|---|
| Test Method | Minimum Value |
| Bentonite Mass/Area (ASTM D5993) | 0.75 lb./ft$^2$ |
| GCL Grab Tensile Strength (ASTM D4632) | 90 lb. |
| GCL Peel Strength (ASTM D4632) | 15 lb. |

The installer shall direct the test laboratory to submit the results of all laboratory test results and certification to the Document Controller for filing as project records in accordance with Section 11.0.

### *6.3.1b. Installer Certification of Placement Surface*

Prior to daily clay liner placement, the installer shall provide to the CQA Officer daily "certificates of acceptance" (form CQAP-4.1) which document the installer's inspection and acceptance of the underlying surface as being suitable for the GCL installation (see Section 4.0).

All daily "certificates of acceptance" (form CQAP-4.1) shall be filed as project records in accordance with Section 11.0.

### *6.3.1c Deployment*

The CQA Officer shall direct the geosynthetic QA monitor firm to oversee activities of the installer during placement and field testing of the GCL.

Incoming rolls of GCL shall be inventoried and inspected by the installer. Manufacturer's certifications will be inspected for conformance with the requirements of this plan. Holes or other visible defects shall be recorded in the CQA Officer's daily report and clearly marked on the GCL roll for identification of necessary repairs or rejection of the roll.

GCL shall be placed such that all seams run parallel to the slope. GCL should be dry when installed. Wet or hydrated GCL shall not be used. GCL panels shall be laid with a minimum 6 in. overlap on longitudinal seams and a minimum 12 in. overlap on panel end seams. Seam overlaps shall be placed such that the direction of flow is from the top panel to the underlying panel to form a shingle effect. Direct contact with GCL shall be minimized.

### *6.3.1d. Seaming*

The GCL shall be sealed in accordance with the recommendations of the GCL manufacturer. Dry bentonite having the same chemical and material properties as the GCL shall be evenly dispersed from the panel edge to the lap line continuously along the seam or overlap areas. All dirt, gravel, or other debris shall be removed from the seam or overlap areas.

Prior to covering the GCL, the installer shall verify all exposed seams or overlaps and examine the GCL for any defects. At the judgment of the installer, a panel or section that becomes seriously damaged or hydrated shall be replaced. All repairs shall be made by placement of a

Electronic Filing: Received, Clerk's Office 06/20/2024

patch of the same material over the damaged area at least 1 ft beyond the repair area. The GCL will be immediately covered and protected from precipitation by the overlaying geomembrane.

#### *6.3.1e. Shear Strength Conformance Testing*

Shear strength conformance tests shall be performed on the GCL to verify the interface shear strengths of the GCL with the appropriate material (HDPE geomembrane or compacted clay). The results of the shear strength conformance tests will be used to confirm that the actual interface shear strengths are equal to or greater than the interface shear strengths used in the stability analyses. Shear strength conformance tests on subsequent phases and/or cell development need not be performed if the same manufacturer and materials are used in the construction of the subsequent phase and/or cell. Conformance testing shall be in accordance with ASTM D 5321 or other suitable method.

### *6.3.2 Geomembrane*

#### *6.3.2a. Prequalification Testing*

The geomembrane installer shall provide to the CQA Officer the test results from a qualified laboratory for the type and frequency of prequalification testing listed in Table A.1. The submittal shall include certification from the laboratory that the test results verify the manufacturer's guaranteed properties.

The CQA Officer shall direct the geosynthetics QA monitor firm to select a representative number of additional samples of the geomembrane for submittal to the monitor's geosynthetic laboratory for independent verification of the manufacturer's guaranteed properties.

The installer shall direct the test laboratory to submit the results of all laboratory results and certification to the Document Controller for filing as project records in accordance with Section 11.0.

#### *6.3.2b. Installer Certification of Placement Surface*

Prior to daily geomembrane placement, the installer shall provide to the CQA Officer daily "certificates of acceptance" (form CQAP-4.1) which document the installer's inspection and acceptance of the underlying surface as being suitable for the geomembrane installation (see Section 4.0).

All daily "certificates of acceptance" (form CQAP-4.1) shall be filed as project records in accordance with Section 11.0.

#### *6.3.2c. Placement Testing for Seam Overlap*

The contractor and installer shall arrange geomembrane sections such that the use of field seams is minimized and that horizontal seams are not used on side slopes. Seam overlaps shall be field measured by the installer to verify the requirement in Table A.1 is met for all seams within the geomembrane footprint. The CQA Officer shall direct the geosynthetics QA monitor firm to

Electronic Filing: Received, Clerk's Office 06/20/2024

make independent measurements of a representative number of seam overlaps for additional verification of the requirement in Table A.1.

At completion of geomembrane placement, the installer shall provide the CQA Officer with "as-built" drawings of the geomembrane installation showing all seam locations and seam measurement locations.

### *6.3.2d. Placement Non-Destructive Testing*

The installer shall conduct non-destructive testing of seams at the frequency specified in Table A.1. All seams shall be nondestructively tested over their full-length using a vacuum test unit, air pressure test or other method approved by the CQA Officer. Continuity testing will be completed as the seaming progresses.

The CQA Officer shall direct the geosynthetics QA monitor firm to monitor all non-destructive testing carried out by the installer.

The installer shall submit all non-destructive field testing results to the CQA Officer for filing as project records in accordance with Section 11.0.

Vacuum testing and air pressure testing procedures shall be as given in the following sections.

***Vacuum Testing (Extruded Welds)***

The following procedures are applicable to those processes which produce an extruded weld.

***Equipment***

The following equipment shall be used when conducting vacuum tests:

- A vacuum box assembly consisting of a rigid housing, a transparent viewing window, a soft neoprene gasket attached to the bottom, a port hole or valve assembly, and a vacuum gauge,
- A steel vacuum tank and pump assembly equipped with a pressure controller and pipe connections,
- A rubber pressure/vacuum hose with fittings and connections,
- A bucket, and
- A soapy solution.

***Procedures***

The following procedures will be followed:

1. Energize the vacuum pump and reduce the tank pressure to approximately minus 5 psi (10 in. of Hg) gauge.
2. Wet a strip of geomembrane approximately 12 in. wide by 48 in. long (an area larger than the coverage size of the vacuum box) with the soapy solution.
3. Place the box over the wetted area.
4. Close the bleed valve and open the vacuum valve.
5. Verify that a leak tight seal is created.

Electronic Filing: Received, Clerk's Office 06/20/2024

6. For a period of not less than 10 seconds, examine the geomembrane through the viewing window for the presence of soap bubbles.
7. If no bubble appears after 10 seconds, close the vacuum valve and open the bleed valve, move the box over the next adjoining area, repeat the process.
8. All areas where soap bubbles appear will be marked and repaired and then retested until passing test results are obtained.

***Air Pressure Testing (For Double Fusion Seam Only)***

The following procedures are applicable to those processes which produce a double seam with an enclosed space.

***Equipment***

The equipment will be comprised of the following:

- An air pump (manual or motor driven) equipped with pressure gauge capable of generating and sustaining a pressure between 25 psi to 30 psi and mounted on a cushion to protect the geomembrane,
- A rubber hose with fittings and connections, and
- A sharp hollow needle, or other approved pressure feed device.

***Procedures***

The following procedures will be observed:

1. Both ends of the seam to be tested will be sealed.
2. A needle or other approved pressure feed device will be inserted into the tunnel created by the fusion weld.
3. A protective cushion will be inserted between the air pump and the geomembrane.
4. The air pump will be energized to a pressure between 25 psi and 30 psi. The valve will be closed, and the pressure will be sustained for approximately 5 minutes.
5. If loss of pressure exceeds 3 psi or does not stabilize, the faulty area will be located, then repaired and retested until passing test results are obtained.
6. At the conclusion of a passing air pressure test, the opposite end of the seam will be slit and subsequent drop in pressure will be monitored. This will ensure that the entire seam was completely tested.
7. Remove needle or other approved pressure feed device and seal.

***6.3.2e. Placement Destructive Testing***

***General***

Destructive seam tests shall be performed at randomly selected geomembrane locations. The purpose of these tests is to evaluate seam strength. Seam strength testing shall be done as the seaming work progresses, not at the completion of all field seaming.

The CQA Officer shall direct the geosynthetics QA monitor firm to monitor all destructive testing carried out by the installer.

Electronic Filing: Received, Clerk's Office 06/20/2024

The installer shall submit the results of all destructive testing to the CQA Officer for filing as project records in accordance with Section 11.0.

***Location and Frequency***

The installer shall select locations where seam samples will be cut out for testing. Those locations shall be established as follows:

1. Selection will be at a minimum frequency of one test location per 500 ft of seam length. This minimum frequency is to be determined as an average taken throughout the entire area of placement.

2. Test locations will be determined during seaming at the installer's discretion. Selection of such locations may be prompted by suspicion of excess crystallinity, contamination, offset welds, or any other potential cause of imperfect welding.

The CQA Officer shall direct the geosynthetics QA monitor firm to select and cut out a representative number of additional samples for independent laboratory testing.

***Sampling Procedure***

Samples will be cut as the seaming progresses in order to have laboratory test results before the geomembrane is covered by another material. The installer shall:

- Assign a number to each sample, and mark it accordingly.
- Record sample location on layout ("as-built") drawing, and
- Record reason for taking the sample at this location (e.g., statistical routine, suspicious feature of the geomembrane).

All holes in the geomembrane resulting from destructive seam sampling shall be immediately repaired. The continuity of the new seams in the repaired area shall be vacuum tested.

***Field Testing***

The installer shall test in the field, by tensiometer, two 1 in. wide sample strips from the samples identified for destructive testing; one for peel and one for shear. This testing shall include the independent samples obtained by the geosynthetics QA monitor firm. Field testing will prequalify samples for laboratory testing. The requirements and frequency for field testing shall be as provided in the table at the end of this section.

The installer shall conduct all field tests and mark all samples and portions with their number. The installer shall also log the date, time, ambient temperature, number of seaming unit, name of seamer, welding apparatus temperatures and pressures, and pass or fail description, and attach a copy to each sample portion.

***Geosynthetic Quality Assurance Laboratory Testing***

Prequalifying field tests shall identify samples for laboratory testing. The installer's quality assurance laboratory shall be as selected by the installer with concurrence of the CQA Officer.

Electronic Filing: Received, Clerk's Office 06/20/2024

Testing shall include shear strength and peel adhesion. At least five specimens shall be tested by the installer's laboratory for each method. Specimens shall be selected alternately by test from the samples (i.e., peel, shear). All laboratory testing shall be accordance with ASTM D 4437.

The CQA Officer shall direct the geosynthetic QA monitor firm to have additional samples tested for peel and strength by the monitor's independent geosynthetics laboratory as deemed necessary.

***Procedures for Destructive Test Failure***

The following procedures will apply whenever a sample fails a destructive test, whether the test was conducted in the laboratory or by field tensiometer. The installer has two options:

1. The installer may reconstruct the seam between any two passed test locations.

2. The installer may trace the welding path to an intermediate location at least 10 ft from the point of the failed test in each direction, and take a small sample for an additional field test at each location. If these additional samples pass the tests, then full laboratory samples are taken. If these laboratory samples pass the tests, then the seam is reconstructed between these locations. If either sample fails, then the process is repeated to establish the zone in which the seam should be reconstructed.

All acceptable seams must be bounded by two locations from which samples passing laboratory destructive tests have been taken. In cases exceeding 150 ft of reconstructed seam, a sample taken from the zone in which the seam has been reconstructed must pass destructive testing.

The installer will document all actions taken in conjunction with destructive test failures.

**Geomembrane Destructive Seam Tests and Frequency**

| Property | Test Method | 60-mil HDPE | 40-mil HDPE | 40-mil LLDPE | Frequency |
|---|---|---|---|---|---|
| Seam Shear Strength | ASTM D 4437 | 120 ppi | 80 ppi | 44 ppi | See Note 1 |
| Seam Peel Strength (hot wedge fusion) | ASTM D 4437 | 78 ppi | 52 ppi | 40 ppi | See Note 1 |
| Seam Peel Strength (fillet extrusion) | ASTM D 4437 | 72 ppi | 45 ppi | 40 ppi | See Note 1 |

Notes:
1. Destructive testing of seams shall occur at a minimum frequency of once per 500 ft of seam length.
2. Values apply for both smooth and textured geomembranes.

### *6.3.3 Geotextile*

#### *6.3.3a. Prequalification Testing*

The geotextile installer shall provide to the CQA Officer the test results from a qualified laboratory for the type and frequency of prequalification testing listed in Table A.1. The submittal

Electronic Filing: Received, Clerk's Office 06/20/2024

shall include certification from the laboratory that the test results verify the manufacturer's guaranteed properties.

The CQA Officer shall direct the geosynthetics QA monitor firm to select a representative number of additional samples of the geomembrane for submittal to the monitor's geosynthetic laboratory for independent verification of the manufacturer's guaranteed properties.

The installer shall submit the results of all laboratory results and certification to the CQA Officer for filing as project records in accordance with Section 11.0.

### *6.3.3b. Installer Certification of Placement Surface*

Prior to daily geotextile placement, the installer shall provide to the CQA Officer daily "certificates of acceptance" (form CQAP-4.1) which document the installer's inspection and acceptance of the underlying surface as being suitable for the geotextile installation (see Section 4.0).

All daily "certificates of acceptance" (form CQAP-4.1) shall be filed as project records in accordance with Section 11.0.

### *6.3.3c. Deployment*

Incoming rolls of geotextile shall be inventoried and inspected by the installer. Manufacturer's certifications will be inspected for conformance with the requirements of this plan. Holes, tears, or other visible defects will be recorded in the CQA Officer's daily report and clearly marked on the synthetic for identification of necessary repairs.

The installer shall check that the geosynthetic installation conforms to the construction requirements and manufacturer's recommendations. The CQA Officer shall direct the geosynthetics QA monitor firm to oversee the inspections by the installer.

On slopes steeper than 10H:1V, all geotextiles shall be continuously sewn. Geotextiles shall be overlapped a minimum of 3 in. prior to seaming. This requirement does not apply to the leachate system filter fabric. All sewing shall be done using thread with physical, chemical, and ultraviolet high resistance properties equal to or exceeding those of the geotextile. The CQA Officer shall direct the geosynthetics QA monitor firm to make independent measurements of a representative number of seam overlaps for additional verification of the requirement in Table A.1.

The 10-oz. cushion geotextile (immediately above the geomembrane liner and beneath the drainage layer) shall be placed with vertical seams running up the slopes and into the anchor trench. Horizontal seams (perpendicular to the slope) shall be allowed on side slopes for the 4-oz. filter geotextile overlaying the drainage layer to facilitate staged construction of the drainage layer going up the slope. All overlaps shall be "shingled" so that water or other material can not run down the slope between the geotextile seams.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 6.4 Drainage Media

### *6.4.1 Granular Drainage Layer*

#### *6.4.1a. Prequalification Testing*

Each source of material for the drainage layer shall be tested for hydraulic conductivity and grain size analyses in accordance with Table A.1 to determine suitability of the source.

#### *6.4.1b. Material Thickness Testing During Placement*

The CQA Officer shall direct the survey firm to determine elevations at the top of the geotextile cushion and at the final constructed surface of the granular drainage layer using a 100 ft grid pattern (and the break points in slope) to verify attainment of the plan grades and elevations. To verify liner thickness, all horizontal survey coordinates shall be the same for the top of the cushion and final constructed surface. Side slope thicknesses will be verified using crest (top), midpoint, and toe documentation points.

The CQA officer may approve the use of thickness plates as an alternative method to surveying.

In no instance shall the field determined thickness be less than 1.0 ft. The measured depths and grades shall be documented on "as built" drawings furnished to the CQA Officer by the surveyor.

#### *6.4.1c. Gradation and Hydraulic Conductivity Testing During Placement*

The CQA officer shall direct the soil test firm to take an initial sample of the granular drainage layer within the first 100 cu. yds. of material placement and test for hydraulic conductivity and grain size to confirm suitability of the source. Continuing sampling and testing shall be completed at the frequencies specified in Table A.1.

Compaction of the drainage layer shall not be allowed during placement to avoid breakdown of materials

Gradation tests may be considered passing provided the hydraulic conductivity requirements are met and the specified percentage of fines is not exceeded.

#### *6.4.d. Certification of Work*

The CQA Officer shall review the sampling and test results for the granular drainage layer and, if found in agreement with the prequalification and placement requirements, provide certification for the work using form CQAP 2.1.

### *6.4.2 Coarse Aggregate*

#### *6.4.2a. Prequalification Testing*

Each source of material for the coarse aggregate shall be tested for hydraulic conductivity and grain size analyses in accordance with Table A.1 to determine suitability of the source.

Electronic Filing: Received, Clerk's Office 06/20/2024

#### *6.4.2b. Material Placement*

The CQA Officer shall direct that inspection of piping as provided in Section 6.5.1 be completed prior to placement of coarse aggregate around the piping. Compaction of the coarse aggregate shall not be allowed during placement to avoid breakdown of materials.

The CQA officer shall direct the soil test firm to take an initial sample of the coarse aggregate within the first 100 cu. yds. of material placement and test for hydraulic conductivity and grain size to confirm suitability of the source. Continuing sampling and testing shall be completed at the frequencies specified in Table A.1.

Gradation tests may be considered passing provided the hydraulic conductivity requirements are met and the specified percentage of fines is not exceeded.

#### *6.4.2c. Certification of Work*

The CQA Officer shall review the sampling and test results for the coarse aggregate and, if found in agreement with the prequalification and placement requirements, provide certification for the work using form CQAP 2.1.

## 6.5 Other Material Placement Testing

### *6.5.1 Placement testing of Leachate Piping System*

The CQA Officer shall direct the surveyor to check the invert elevations and plan coordinates for the constructed piping system at the locations and frequencies specified in Table A.1.

The CQA Officer or other CQA staff shall inspect pile size, materials and connections including all components of the leachate collection and management systems to verify compliance with plan and specification requirements.

The measured grades and coordinates shall be documented on "as built" drawings furnished to the CQA Officer by the surveyor.

The CQA Officer shall review the survey results for the leachate piping system and management systems and, if found in agreement with the placement requirements, provide certification for the work using form CQAP 2.1.

### *6.5.2 Placement Testing of Surface Water Management System*

The CQA Officer shall direct the survey agency to determine the elevations and grades of the constructed berms and channels in accordance with the requirements and frequency specified in Table A.1.

The measured elevations and grades shall be documented on "as built" drawings furnished to the CQA Officer by the surveyor.

Electronic Filing: Received, Clerk's Office 06/20/2024

### *6.5.3 Placement Testing of Concrete*

The CQA Officer shall direct the soil test firm to carry out placement testing for concrete in accordance with the requirements and frequency specified in Table A.1.

The contractor shall submit proposed concrete mix designs to the CQA Officer for review prior to ordering of concrete.

The CQA Officer shall review the concrete testing results and, if found in agreement with the placement requirements, provide certification for the work using form CQAP 2.1.

## 7.0 CORRECTIVE MEASURES

The CQA Officer shall reject and require replacement of all materials for which sampling, testing or inspection results show that prequalification requirements are not met. The CQA Officer shall also reject workmanship (and require corrective rework) for which sampling, testing or inspection results show that material placement requirements are not met. The lateral and/or vertical extent of corrective measures for rework shall be based on the frequency of testing and judgment of the CQA Officer.

The CQA Officer may neglect the occasional occurrence of failed moisture/density tests or laboratory hydraulic conductivity tests carried out for the low permeability soil liner provided the failed tests can be shown to be outliers and are not concentrated in one area or lift. The CQA officer shall provide written justification in the Daily Summary Report for assignment of failed tests as outliers.

## 8.0 DOCUMENTATION OF SAMPLING AND TESTING

### 8.1 Daily Summary Reports

A daily summary report shall be prepared by the CQA Officer, or under the direct supervision of the CQA Officer, during each day of activity. Form CQAP 8.1 *Daily Summary Report* shall serve as the base document to which the daily inspection reports (see Section 8.2) are to be attached.

Each report shall be signed and dated by the CQA Officer and CQA Officer-in-absentia. The original report (and attachments) shall be submitted to the Document Controller and filed as a project record in accordance with Section 11.0.

### 8.2 Daily Inspection Reports

A daily inspection report shall be prepared by the CQA Officer, or under the direct supervision of the CQA Officer. for each day that materials, or placement of materials, are being inspected, sampled or tested. Form CQAP 8.2 *Daily Inspection Report* shall serve as the base document to which the test data, photographic records, test results, etc. are to be attached.

Electronic Filing: Received, Clerk's Office 06/20/2024

Each report shall be signed and dated by the CQA Officer or CQA Officer-in-absentia. The original report (and attachments) shall be submitted to the CQA Officer who shall incorporate the report into the daily summary report.

### 8.3 Photographs

Photographs may be incorporated into the daily inspection report or daily summary report to provide a visual record of work progress, inspection/testing activity, construction work, or other items considered important to the report. The photographs, at a minimum, shall be furnished with the following information:

- The location, date and time of the photograph,
- A description of the item photographed including direction of view (N,S,E or W),
- Personnel, testing agencies, installers or contractors present, and
- Name of photographer.

## 9.0 FINAL CERTIFICATION REPORT

Upon completion of the construction contract (but before the landfill or gypsum stack is placed into service), the CQA Officer shall submit an acceptance report to the Illinois Environmental Protection Agency. The acceptance report shall contain the following:

- A certification by the CQA officer that the construction has been prepared and constructed in accordance with the engineering design.
- As-built drawings as specified herein, and
- All daily summary reports.

## 10.0 CONSTRUCTION MANAGEMENT ACTIVITIES

### *10.1 Requests for Information (RFIs)*

The general contractor or installer may, after exercising due diligence to locate required information, request from the CQA Officer clarification or interpretation of the contract documents. The general contractor or installer shall make specific reference to the contract drawing(s) or specification(s) in question and include estimates of any cost or schedule impacts that could possibly be associated with the requested clarification or interpretation.

The general contractor or installer shall initiate the RFI in a timely manner using form CQAP-10.1 *Request for Information*. The CQA Officer shall, with reasonable promptness, respond to the RFI on the same form CQAP-10.1 and return a copy of the completed form to the party making the request as final disposition of the matter.

Additional copies of the completed form shall be distributed as directed by the CQA Officer. All RFI's shall be filed as project records in accordance with Section 11.0.

Electronic Filing: Received, Clerk's Office 06/20/2024

## *10.2 Review of Contractor Submittals*

The Contractor shall submit shop drawings, product data and samples to the CQA Officer in accordance with the requirements of the project specifications and with such promptness as to cause no delay of the work. The Contractor shall not authorize purchase, fabrication, erection, processing or shipping of any items associated with the submittal until review of the shop drawings, product data or samples has been completed by the CQA Officer and no resubmittals are required by the CQA Officer.

All submittals from subcontractors shall be reviewed first by the Contractor to satisfy the contractor's responsibilities for lengths, dimensions, quantities, means and methods, and other such items.

The CQA Officer and/or Design Engineer shall review the submittals for conformance with design concepts and conformance with the information shown in the contract documents. Upon completion of review, the CQA Officer shall return the submittal to the Contractor with one of the following notations for each item in the submittal:

- No exceptions taken.
- Furnish as corrected.
- Revise and resubmit.
- Submit specified item, or
- Rejected.

The Contractor shall resubmit corrected shop drawings, product data or samples for those items noted as requiring revision or submission or noted as rejected.

The CQA Officer shall maintain copies of all submittals and a log documenting submittal descriptions, dates of receipt, dates of return, review personnel, and actions taken on the submittals. Copies of submittals and the log shall be filed as project records in accordance with Section 11.0.

## *10.3 Field Change Order Process*

The Contractor shall be responsible for preparing requests for field change order (FCO) in accordance with AREG procedures and submitting the FCO requests on the appropriate AREG FCO form to the CQA Officer.

The CQA Officer shall be responsible for reviewing the FCO with the Design Engineer, determining agreement or non-agreement with the requested change, and submitting the documented decision to the Contractor on the appropriate AREG CFO form with copies to the Ameren Project Manager. Agreement to the FCO shall require signature approval of the Ameren Project Manager.

Electronic Filing: Received, Clerk's Office 06/20/2024

The CQA Officer shall maintain an on-going log of authorized FCOs and running balance of project costs. Copies of the FCOs and log of authorized FCOs shall be retained as project records in accordance with Section 11.0.

## 11.0 DOCUMENT CONTROL AND PROJECT RECORDS

### 11.1 CQA Plan

The CQA officer shall control the preparation, issue and revisions of the CQA Plan so that correct documents are being employed by the project participants. The CQA Plan, including all changes thereto, shall be reviewed for adequacy and approved for release by the CQA Officer and Ameren Project Manager.

The Document Controller shall issue controlled copies of the CQA Plan and maintain all records associated with its preparation, issue and revisions.

### 11.2 Project Records

The maintenance of project records during construction of the landfill shall be the responsibility of the Document Controller and shall be protected against damage, deterioration, and loss. Records shall be maintained in a manner as to be readily identifiable and retrievable.

Control of CQA documents and samples during the construction process shall be as shown in Figure 11.1. All original CQA documents from both the field and laboratories shall be ultimately furnished to the Document Controller for filing and maintenance. Samples may be discarded after testing and documentation of results is complete.

Project records shall be made available to the Ameren Project Manager as requested during construction and, when requested, shall be turned over to AERG at completion of the construction contract.

Records shall include, but not be limited to, the following:

- CQA Plan (all revision levels),
- CQA Plan documentation (reviews, issuance and revisions),
- Meeting minutes,
- Daily inspection reports (form CQAP 8.1),
- Daily summary reports (form CQAP 8.2),
- Certificates of acceptance by geosynthetic installers,
- CQA certifications (form CQAP 2.1),
- Certificates of calibration for inspection, measuring and test equipment,
- Report for test soil liner,
- Report for compacted soil liner "acceptable zone",
- "As-built" drawings,
- Laboratory test results for soils, drainage media, and concrete,
- Laboratory test results for geosynthetics,
- Laboratory certifications of manufacturer's guaranteed properties for geosynthetics,
- Contractor Requests for Field Change Order (AERG FCO form),

Electronic Filing: Received, Clerk's Office 06/20/2024

- Log of Authorized Field Change Orders,
- Shop drawing submittals,
- Log of shop drawing submittals,
- Requests for information from contractor/installers,
- Responses to requests for information, and
- Final certification report.

Electronic Filing: Received, Clerk's Office 06/20/2024

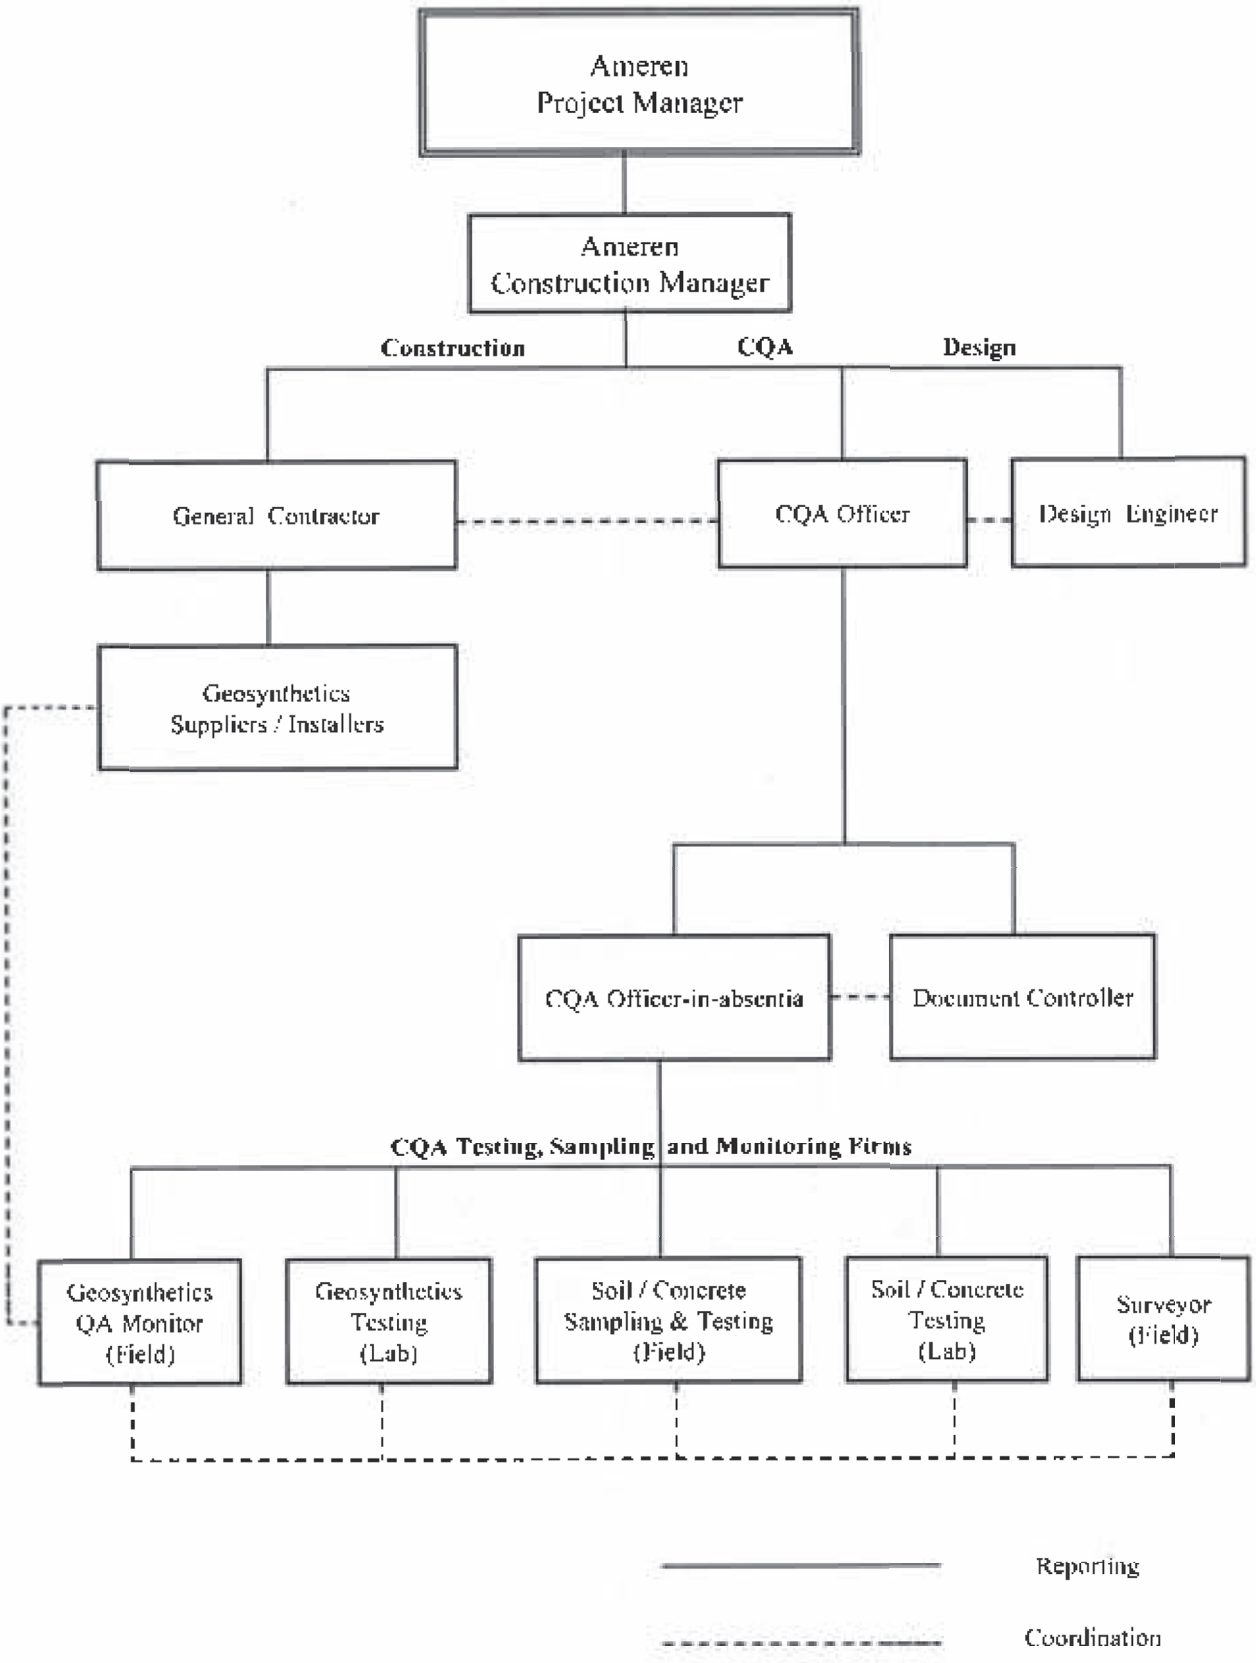

***Figure 2.1 Project Organization Chart***

Electronic Filing: Received, Clerk's Office 06/20/2024

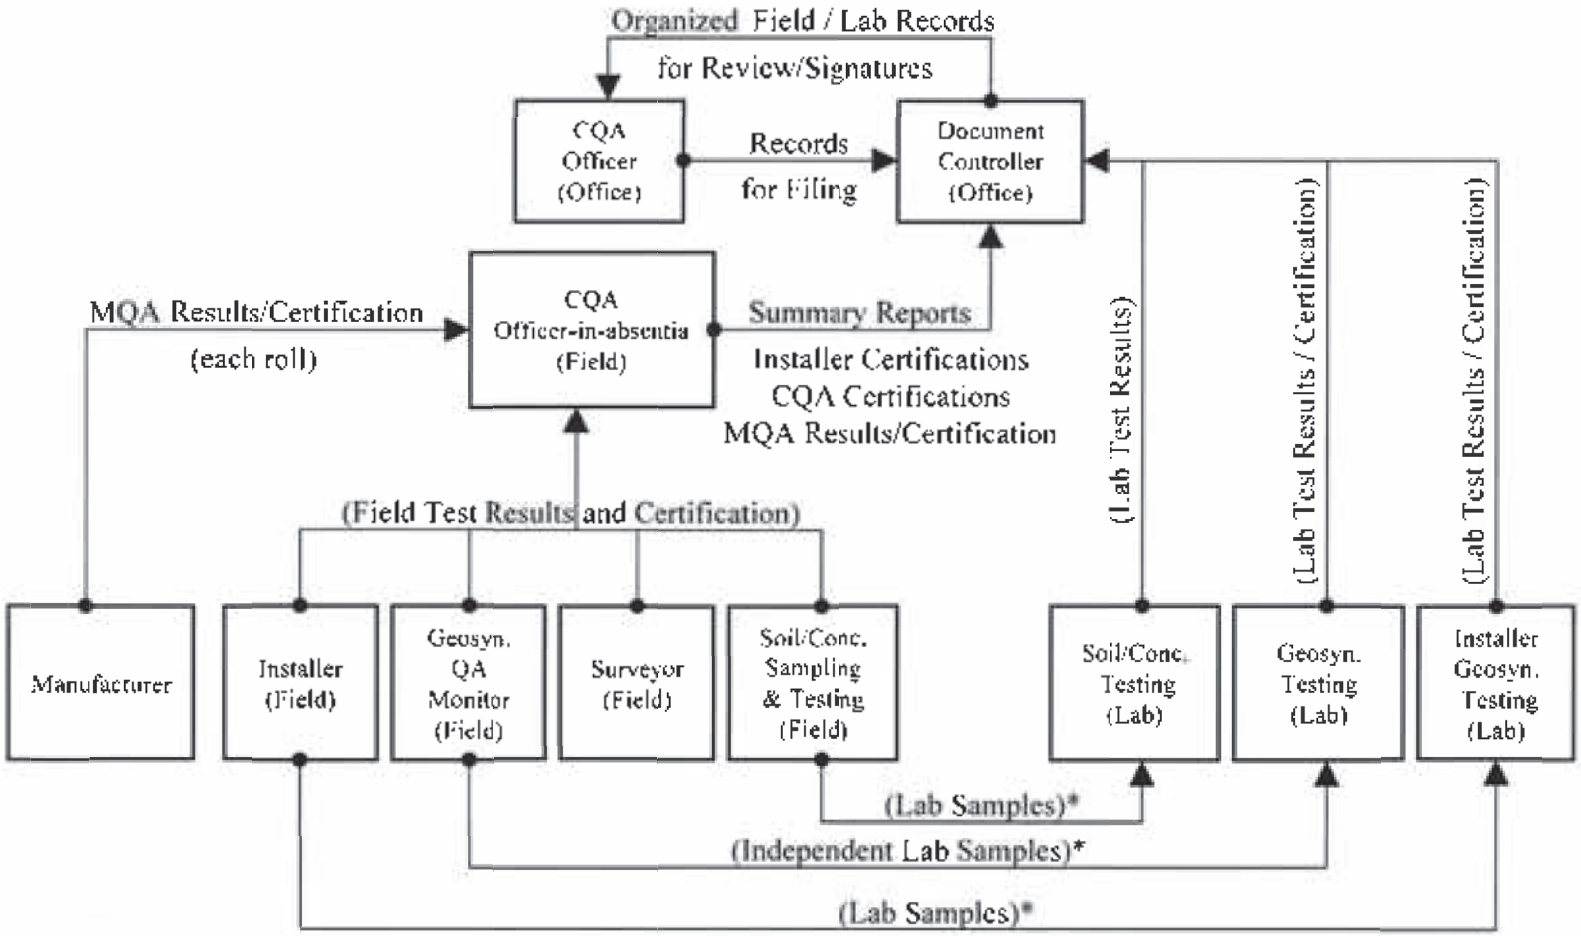

***Figure 11.1 Control of CQA Documents and Samples***

* Transmittal letters shall direct the original lab test results/certifications to be sent to Document Controller with copies to submitting installer or testing/monitoring agency.

Electronic Filing: Received, Clerk's Office 06/20/2024

# Appendix A

Material Testing and Frequency

Electronic Filing: Received, Clerk's Office 06/20/2024

## TABLE A.1: MATERIAL TESTING & FREQUENCY

| Property/Test Method | Requirement/Specification | Frequency | Responsibility |
|---|---|---|---|
| **SOILS - PREQUALIFICATION TESTING** | | | |
| FOUNDATION FILL & BERMS | | | |
| Standard Proctor Curve - ASTM D698 | | Per soil type (See Note 2) | CQA Officer |
| Atterberg Limits - ASTM D4318 | PI > 5, LL > 20% | Per soil type | |
| Grain Size Analysis - ASTM D422 | 200 Sieve > 50% | Per soil type | |
| Hydraulic Conductivity - ASTM D5084 | See Note 1 | Per soil type | |
| | | Per soil type | |
| SOIL LINER | | | |
| Standard Proctor Curve - ASTM D698 | "Acceptable Zone" see Appendix B | Per soil type | CQA Officer |
| Atterberg Limits - ASTM D4318 | USCS Classification | Per soil type | |
| Grain Size Analysis - ASTM D422 | USCS Classification | Per soil type | |
| Hydraulic Conductivity - ASTM D5084 | $1.0 \times 10^{-7}$ cm/sec | Per soil type | |
| Develop "Acceptable Zone" | "Acceptable Zone" see Appendix B | Per soil type | |
| PROTECTIVE FINAL SOIL COVER | | | Not Applicable to this Contract |
| Standard Proctor Curve - ASTM D698* | "Acceptable Zone" see Appendix B | Per soil type* | |
| Atterberg Limits - ASTM D4318* | USCS Classification | Per soil type* | |
| Grain Size Analysis - ASTM D422* | USCS Classification | Per soil type* | |
| Hydraulic Conductivity - ASTM D5084 | See Note 1 | Per soil type* | |
| Develop "Acceptable Zone"* | "Acceptable Zone" see Appendix B | Per soil type* | |
| Suitable for Vegetation | Visual Acceptance | Per soil type | |

* On the first two feet of the protective layer only. (The third foot is topsoil.)

Note 1: There is no specific requirement for hydraulic conductivity for the foundation, berms and final cover soils as they are not part of the liner system. However, insitu materials on the site generally exhibit hydraulic conductivities in the range of $1 \times 10^{-4}$ cm/sec to $1 \times 10^{-5}$ cm/sec. The construction contractor will attempt to utilize the most impermeable materials available (as identified visually) when constructing foundation fill and berms. For purposes of a complete construction record, hydraulic conductivity of placed foundation fill and side berms will be field tested at a rate of 1 test per each 10,000 cubic yards of material placed, although no specific threshold values are required.

Note 2: "Soil Type" refers to differences in soil color and/or textural consistency that would be indicative of differences in soil characteristics.

Note for Geosynthetics: See Section 6.0 of the CQA Plan for additional GCL and geomembrane testing requirements.

Electronic Filing: Received, Clerk's Office 06/20/2024

## TABLE A.1: MATERIAL TESTING & FREQUENCY

| Property/Test Method | Requirement/Specification | Frequency | Responsibility |
|---|---|---|---|
| **SOILS - MATERIAL PLACEMENT TESTING** | | | |
| FOUNDATION | | | CQA Officer |
| Survey | 0 to -0.5 feet Design Grade | 100-foot grid | |
| FOUNDATION FILL & BERMS | | | CQA Officer |
| Density/Moisture - ASTM D2922 & D3017 | 90% Standard Proctor Density and -1% to Optimum Moisture Content | 1 per 10,000 cubic yards (minimum 1 per compacted lift) | |
| Strength | 0.5 tsf (hand-held penetrometer) | 1 per 10,000 cubic yards (minimum 1 per compacted lift) | |
| Hydraulic Conductivity - ASTM D5084 | See Note 1 | 1 per 10,000 cubic yards | |
| Sieve and Hydrometer Analysis of Soils - ASTM D422 | 200 Sieve > 50% | Per Soil Type | |
| Liquid Limit, Plastic Limit and Plasticity Index (Atterberg Limits) - ASTM D4318 | PI > 5, LL > 20 | Per Soil Type | |
| SOIL LINER | | | CQA Officer |
| Thickness | 5 feet minimum thickness (base), 1 foot minimum thickness (cover), and maintain design grade | 100-foot grid | |
| Density/Moisture - ASTM D2922 & D3017 | 95% Standard Proctor Density and Optimum to +5% Moisture Content in accordance with "Acceptable Zone" (see Note 3) | 1 per acre per lift or 1 per 1,000 cubic yards | |
| Strength | 0.5 tsf (hand-held penetrometer) | 1 per acre per lift or 1 per 1,000 cubic yards | |
| Hydraulic Conductivity - ASTM D5084 | See Note 4 | 1 per 10,000 cubic yards | |
| PROTECTIVE FINAL SOIL COVER | | | Not Applicable to this Contract |
| Thickness | 3 feet minimum total thickness including 1 foot of topsoil - maintain design grade | 100-foot grid | |
| Density/Moisture* - ASTM D2922 & D3017 | 90% Standard Proctor Density and -3% to Optimum Moisture Content | 1 per 10,000 cubic yards (minimum 1 per compacted lift) | |
| Strength* | 0.5 tsf (hand-held penetrometer) | 1 per 10,000 cubic yards (minimum 1 per compacted lift) | |

* On the first two feet of the protective layer only. (The third foot is topsoil.)

Note 1 There is no specific requirement for hydraulic conductivity for the foundation, berms and final cover soils as they are not part of the liner system. However, insitu materials on the site generally exhibit hydraulic conductivities in the range of $1 \times 10^{-4}$ cm/sec to $1 \times 10^{-5}$ cm/sec. The construction contractor will attempt to utilize the most impermeable materials available (as identified visually) when constructing foundation fill and berms. For purposes of a complete construction record, hydraulic conductivity of placed foundation fill and side berms will be field tested at a rate of 1 test per each 10,000 cubic yards of material placed, although no specific threshhold values are required.

Note 3 Acceptable Zone" restriction applies only to the soil liner for the landfill. The gypsum stack soil liner shall only be required to meet the compaction and moisture content specification.

Note 4 The hydraulic conductivity for the landfill soil liner is $1.0 \times 10^{-7}$ cm/sec(maximum) and for the gypsum stack soil liner is $1.0 \times 10^{-6}$ cm/sec (maximum).

Electronic Filing: Received, Clerk's Office 06/20/2024

## TABLE A.1: MATERIAL TESTING & FREQUENCY

| Property/Test Method | Requirement/Specification | Frequency | Responsibility |
|---|---|---|---|
| **GEOSYNTHETICS - PREQUALIFICATION TESTING** | | | |
| GEOMEMBRANES (60 mil smooth, 60 mil textured, 40 mil textured) | | | Installer |
| Raw Materials | Manufacturer's List of Guaranteed Properties | All rolls | |
| Geomembrane Properties | Manufacturer's List of Guaranteed Properties | All rolls | |
| Puncture Resistance - ASTM D4833 | Manufacturer's List of Guaranteed Properties | 1 per 100,000 square feet or per raw material batch, whichever is greater. Sample 3 feet wide by the full roll width | |
| Tear Resistance - ASTM D1004 | Manufacturer's List of Guaranteed Properties | 1 per 100,000 square feet or per raw material batch, whichever is greater. Sample 3 feet wide by the full roll width | |
| Thickness - ASTM D5199/D5994 | Manufacturer's List of Guaranteed Properties | 1 per 100,000 square feet or per raw material batch, whichever is greater. Sample 3 feet wide by the full roll width | |
| Tensile Strength and Elongation - ASTM D638 (Modified) or D6693 | Manufacturer's List of Guaranteed Properties | 1 per 100,000 square feet or per raw material batch, whichever is greater. Sample 3 feet wide by the full roll width | |
| GEOTEXTILES (Non-Woven, 4 ounce, 10 ounce, 16 ounce) | | | Installer |
| Geotextile Properties | Manufacturer's List of Guaranteed Properties | All rolls | |
| Mass per Unit Area - ASTM D3776 | Manufacturer's List of Guaranteed Properties | 1 per lot or one per 100,000 square feet, whichever is greater. Sample 3 feet wide by the full roll width | |
| Grab Tensile Strength - ASTM D4632 | Manufacturer's List of Guaranteed Properties | 1 per lot or one per 100,000 square feet, whichever is greater. Sample 3 feet wide by the full roll width | |
| Trapezoidal Tear Strength - ASTM D4533 | Manufacturer's List of Guaranteed Properties | 1 per lot or one per 100,000 square feet, whichever is greater. Sample 3 feet wide by the full roll width | |
| Apparent Opening Size - ASTM D4751 | Manufacturer's List of Guaranteed Properties | 1 per lot or one per 100,000 square feet, whichever is greater. Sample 3 feet wide by the full roll width | |
| Puncture Resistance - ASTM D3787 | Manufacturer's List of Guaranteed Properties | 1 per lot or one per 100,000 square feet, whichever is greater. Sample 3 feet wide by the full roll width | |
| Permittivity - ASTM D4491 | Manufacturer's List of Guaranteed Properties | 1 per lot or one per 100,000 square feet, whichever is greater. Sample 3 feet wide by the full roll width | |

Electronic Filing: Received, Clerk's Office 06/20/2024

## TABLE A.1: MATERIAL TESTING & FREQUENCY

| Property/Test Method | Requirement/Specification | Frequency | Responsibility |
|---|---|---|---|
| **GEOSYNTHETICS - PREQUALIFICATION TESTING** | | | |
| GEOSYNTHETIC CLAY LINER (GCL) | | | Installer |
| GCL Properties | Manufacturer's List of Guaranteed Properties | All rolls | |
| Bentonite Mass/Area - ASTM D5993 | Manufacturer's List of Guaranteed Properties | 1 per 100,000 square feet or per raw material batch, whichever is greater. Sample 3 feet wide by the full roll width | |
| Grab Tensile Strength - ASTM D4632 | Manufacturer's List of Guaranteed Properties | 1 per 100,000 square feet or per raw material batch, whichever is greater. Sample 3 feet wide by the full roll width | |
| Peel Strength - ASTM D4632 | Manufacturer's List of Guaranteed Properties | 1 per 100,000 square feet or per raw material batch whichever is greater. Sample 3 feet wide by the full roll width | |
| **GEOSYNTHETICS - MATERIAL PLACEMENT TESTING** | | | |
| GEOMEMBRANES (60 mil smooth, 60 mil textured, 40 mil textured) | | | Installer |
| Seam Overlap | 3" to 4" | All Seams | |
| Non-Destructive Testing | As per Section 6.3.2c of CQA Plan | All Seams | |
| Destructive Testing | As per Section 6.3.2e of CQA Plan | Maximum One Every 500 Feet | |
| GEOTEXTILES (Non-Woven, 4 ounce, 10 ounce, 26 ounce) | | | Installer |
| Seam Overlap | 3" to 4" | All Seams | |
| Installation | Physical Installation per Section 6.3.3c of CQA Plan | None | |
| GEOSYNTHETIC CLAY LINER (GCL) | | | Installer |
| Seam Overlap | As per Section 6.3.1d of CQA Plan | All Seams | |
| Installation | Physical Installation per Section 6.3.3c of CQA Plan | None | |

Electronic Filing: Received, Clerk's Office 06/20/2024

## TABLE A.1: MATERIAL TESTING & FREQUENCY

| Property/Test Method | Requirement/Specification | Frequency | Responsibility |

Acceptable Zone Procedure

Electronic Filing: Received, Clerk's Office 06/20/2024

# PROCEDURE FOR DETERMINATION OF SOIL LINER ACCEPTABLE ZONE OF COMPACTION AND MOISTURE CONTENT

## INTRODUCTION

One of the most significant factors affecting the performance of compacted soil liners is the adequate control of water content and dry unit weight during construction. A carefully written compaction specification will result in a compacted soil liner achieving the required hydraulic conductivity while also satisfying other factors affecting performance such as strength, compressibility, and resistance to desiccation. Because a soil liner is meant to be a hydraulic barrier, hydraulic conductivity requirements are the primary factor affecting the criteria of a compaction specification. The specification should be then tightened as necessary to meet other performance standards.

For this project, the specification will require that the soil be compacted to at least 95 percent maximum dry density as obtained from the Standard Proctor test per ASTM D 698, with a moisture range of optimum to 5 percentage points wet of optimum. Testing of the proposed liner soils will be performed to determine its acceptable density and moisture content zone for a maximum hydraulic conductivity of $1.0 \times 10^{-6}$ cm/sec for the final cover and base liner. Research work performed by Benson and Daniel (1990) shows that the acceptable zone can be expected to parallel a "line of optimums." This procedure should be run when a new source of soil is selected for liner construction or when the Proctor density changes by 10 pcf or more.

## PROCEDURE

The following steps will be performed during prequalification of a soil source for liner construction. The source investigation will identify consistency of the soil and have completed soil index tests including grain size distribution and Atterberg Limit determinations. Once the initial index testing is complete, a proper value for Proctor density can be selected, and then the following steps can be followed.

- Compact three samples at a controlled moisture of ±1 percent of optimum moisture at approximately 97 percent to 93 percent of standard Proctor maximum dry density. These samples should be tested for hydraulic conductivity using ASTM D 5084. If all samples pass, it can be assumed as confirmation that the specified 95 percent of maximum dry density is an appropriate lower density range.

- If all three initial hydraulic conductivity test results are $\leq 1.0 \times 10^{-6}$ cm/sec for the base liner and the final cover, then three more samples shall be prepared to confirm the moisture content range. Using approximately 93 percent to 95 percent dry density, prepare one sample at -1 points (dry of optimum), one at +3 points and one at +8 points of optimum moisture content. Test these new samples for hydraulic conductivity using ASTM D 5084. If all samples pass, it can be assumed as confirmation that the optimum to +5 percentage points is an appropriate moisture content range.

Electronic Filing: Received, Clerk's Office 06/20/2024

- If the first two steps do not confirm the permeability window, the CQA Officer will determine if the soil will be used for construction. If it will be used, then further testing can be performed to define a smaller acceptable zone.

- In some cases, the borrow sources may be so variable that composting of the soil will be required for testing. In these cases, three or four Proctor tests should be performed to determine the range of maximum dry density. If the range of maximum dry densities is less than 10 pcf, a composite can be tested as outlined above. If the range of maximum dry densities is greater, the highest and lowest soil values should be tested to determine an acceptable range.

Selection of density value shall be based on inspector's identification of soil percentages. Prequalification testing will assure the conformance of permeability.

## USE OF THE ACCEPTABLE RANGE

During construction, the acceptable window will be verified by the specified interval of construction sample testing. Each sample will be tested for density, moisture, grain size, and Atterberg Limits when submitted for hydraulic conductivity testing. The results can then be compared to prequalification testing to verify soil consistency and passing hydraulic conductivity. These tests can also be plotted on the Proctor curve as documentation of acceptable zone or as a demonstration that the zone can be enlarged.

# SECTION 1.0
# GENERAL

This operation and maintenance (O&M) manual outlines objectives, proposed policies, responsibilities, and procedures for Illinois Power Resources Generating, LLC (IPRG) and Contractor personnel who are responsible for the management of the Duck Creek Energy Center Gypsum Management Facility (GMF). The GMF incorporates two reservoirs, the Gypsum Stack and the Recycle Pond, for processing and storing gypsum.

## 1.1 REASONS FOR DEVELOPMENT OF THE O&M MANUAL

In addition to providing guidance to the IPRG and Contractor personnel who are responsible for the operations and maintenance of Duck Creek GMF, this manual has been prepared in accordance with state regulations. The State of Illinois Rivers, Lakes and Streams Act, (615 ILCS 5) Paragraph 23a includes the statement "The Department is authorized to carry out inspections of any dam within the State, and to establish standards and issue permits for the safe construction of new dams and the reconstruction, repair, operation and maintenance of all existing dams." (emphasis added).

Part 3702 of the 17 Illinois Administrative Code, Chapter I entitled the "Construction and Maintenance of Dams" details the requirements to obtain a permit for the construction, operation, and maintenance of a dam. Section 3702.40 b) includes the following statement:

> "5) As a condition of each permit, the dam owner shall submit a maintenance plan detailing the procedures and schedules to be followed to maintain the dam and its appurtenances in a reasonable state of repair."

Thus it is a requirement of all dam owners who have dams which fall under the jurisdiction of the Illinois Department of Natural Resources to operate and maintain them safely.

As a dam owner, IPRG is responsible for the safety of the public and for maintaining the structures at the facility for both safety and economy. The overall public interest is served by providing a document to serve as a basis for the safe and economical operation and maintenance of the dam during both emergency and day-to-day conditions.

## 1.2 GENERAL RESPONSIBILITIES CONCERNING DAMS

IPRG is responsible for the operation and maintenance of the Gypsum Stack Dam and the Recycle Pond Dam. These responsibilities include general maintenance (mowing, removing debris from decants, placing riprap where needed, etc.), operation, inspection and emergency action decisions. IPRG plans to enter into an agreement with an independent contractor to perform certain aspects of the operation and maintenance of the GMF.

Electronic Filing: Received, Clerk's Office 06/20/2024

## SECTION 2.0
## DEFINITIONS

**Abutment** - That part of the valley side or concrete walls against which the dam is constructed. Right and left abutments are those on respective sides of an observer when viewed looking downstream.

**Appurtenant Works** - The structures or machinery auxiliary to dams which are built to operate and maintain dams; such as outlet works, spillways, gates, valves, channels, etc.

**Boil** - A stream of water discharging from the ground surface downstream of the dam carrying with it a volume of soil which is distributed around the hole formed by the discharging water.

**Berm** - A horizontal step or bench in the sloping profile of an embankment dam.

**Breach** - A break, gap, or opening (failure) in a dam which releases impoundment water.

**Dam** - A barrier built for impounding or diverting the flow of water.

**Dike (Levee)** - An embankment, usually applied to embankments or structures built to protect land from flooding.

**Drain, Layer or Blanket** - A layer of pervious material in a dam to facilitate the drainage of the embankment including such items as a toe drain, a weephole, and a chimney drain.

**Drawdown** - The resultant lowering of the water surface level due to the release of water from the impoundment.

**Duck Creek Plant Datum** - the Duck Creek Station horizontal and vertical coordinate system ("Plant System") on which the design and construction survey information, and elevations used in this document is based. Reference the control points shown on the construction drawings (Drawing C180-C102-04, Rev 3, or later) for horizontal and vertical control information.

**Embankment** - Fill material, usually rock or earth, placed with sloping sides.

**Earthen Dam** - Any dam constructed of excavated natural materials.

**Failure** - An incident resulting in the uncontrolled release of water from the dam.

**Freeboard** - The vertical distance between a stated water level and the top of the dam.

**Gate or Valve** - In general, a device in which a leaf or member is moved across the waterway to control or stop the flow.

**Groin** - The junction of the upstream or downstream face of the dam with the valley wall.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Maintenance** - The upkeep, involving labor and materials, necessary for efficient operation of dams and their appurtenant works.

**Operation** - The administration, management, and performance needed to operate the dam and appurtenant works.

**Operation and Maintenance Inspection** - Inspections conducted by the dam Operator. These inspections are frequent visual "Walk-around" inspections of the dam surface and appurtenant works.

**Outlet** - An opening through which water can freely discharge for a particular purpose from an impoundment.

**Phreatic Surface** - The upper surface of saturation in an embankment.

**Piping** - The progressive development of internal erosion by seepage, appearing downstream as a hole or seam, discharging water that contains soil particles.

**Riprap** - A layer of large stones, broken rock or precast blocks placed in a random fashion usually on the upstream slope of an embankment dam, on a reservoir shore, or on the sides of a channel as a protection against wave and ice action.

**Silt/Sediment** - Soil particles and debris in an impoundment.

**Slump/Slide Area** - A portion of earth embankment which moves downslope, sometimes suddenly, often with cracks developing.

**Spillway System** - A structure or structures over or through which flows are discharged. If the flow is controlled by gates, it is considered a controlled spillway. If the elevation of the spillway crest is the only control of the flows, it is considered an uncontrolled spillway.

**Emergency Spillway** - A spillway designed to operate very infrequently, only during exceptionally large floods, usually constructed of materials expected to erode slowly.

**Principal Spillway** - The main spillway which controls both normal and flood flows and is usually constructed of non-erodable materials.

**Auxiliary Spillway** - A spillway which works in conjunction with the principal spillway to control flood flows and is usually constructed of non-erodable materials.

**Stilling Basin** - A basin constructed to dissipate the energy of fast flowing water, such as from a spillway, and to protect the streambed from erosion.

**Toe of Embankment** - The junction of the face of the dam with the ground surface in the floodplain upstream or downstream of the dam.

Electronic Filing: Received, Clerk's Office 06/20/2024

# SECTION 3.0
# INFORMATION ABOUT THE DAMS

## 3.1 LOCATION

The Gypsum Stack and Recycle Pond Dams are located in the NW 1/4 of Section 18, Township 6 North, Range 5 East of the Forth Principal Meridian in Fulton County, Illinois. More specifically, the dams are located east of Bethel Cemetery Road approximately 2 miles southeast of Canton, Illinois. A map showing the location of the dams is included in Appendix A.

## 3.2 DESCRIPTION OF DAM AND APPURTENANCES

The gypsum stack dam has a maximum earthen embankment height of 32 ft and a maximum impounding capacity of 773 acre-ft, measured at the top of the earthen dam elevation of 620 ft per Duck Creek Plant Datum (EL 620). However, due to the "stacking" of gypsum above the top of the earthen dam, the total volume within the completed gypsum stack will be approximately 2256 acre-ft. The recycle pond dam has a maximum embankment height of 41 ft and a maximum impounding capacity of 150 acre-ft (measured at the top of dam elevation of 615 ft).

The gypsum stack dam has a single high density polyethylene (HDPE) lined spillway (transfer channel) which discharges to the recycle pond. The transfer channel is a trapezoidal channel with 3H:1V side slopes. The transfer channel transitions from a 16-ft bottom width at an invert elevation of 614.0 ft at the upstream end, to a 35-ft bottom width at an invert elevation of 609.0 ft at the downstream end. A 2-ft tall HDPE covered concrete weir, located near the upstream end of the transfer channel, is fitted with stop logs capable of raising the discharge control elevation to 616.0 ft. To protect the HDPE liner from abrasion during flows, the transfer channel and a portion of the recycle pond dam incorporate an additional sacrificial layer of HDPE at the location where the transfer channel discharges to the recycle pond.

The emergency spillway for the recycle pond consists of four 42-inch diameter HDPE pipes which discharge into a riprap lined plunge pool. The upstream inverts of the pipes are at EL 610.0 and the downstream inverts are at EL 607.0. The emergency spillway has been provided in the event of an accidental overfilling of the recycle pond or catastrophic rainfall only. It is not expected to be activated during the life of the facility.

Pertinent data about the dams, appurtenant works, and reservoirs are presented in Appendix B.

## 3.3 SIZE CLASSIFICATION

The gypsum stack earthen dam has a maximum embankment height of 32 ft and a maximum impounding capacity of 773 acre-ft (measured at the top of dam elevation of 620 ft). Based on IDNR criteria, the gypsum stack earthen dam is classified as a small-size dam. However, since the gypsum stack is planned to ultimately meet or exceed 100 ft in height, the gypsum stack will eventually be classified as a large-size dam.

Electronic Filing: Received, Clerk's Office 06/20/2024

The recycle pond dam has a maximum embankment height of 41 ft and a maximum impounding capacity of 150 acre-ft (measured at the top of dam elevation 615 ft). Since the recycle pond dam embankment exceeds 40 ft in height, it is classified as an intermediate-size dam.

## 3.4 HAZARD CLASSIFICATION

The breach wave resulting from a failure of either dam is expected to be contained within the Duck Creek Reservoir located immediately downstream. Considering the low probability for causing loss of life or economic loss to adjacent landowners, both dams are classified as CLASS III, LOW HAZARD POTENTIAL dams.

Electronic Filing: Received, Clerk's Office 06/20/2024

# SECTION 4.0
# OPERATIONS ACTIVITIES

The operations plan describes the proposed operation of the Duck Creek Gypsum Management Facility (GMF) which includes the gypsum stack and the recycle pond.

## 4.1 SITE OPERATIONS

The GMF will receive flue gas desulfurization sludge (gypsum) from the Duck Creek Energy Center (the Plant). Gypsum will be transported to the GMF in slurry form (approximately 20 percent solids) and allowed to settle. Clarified process water will then be siphoned or decanted to the recycle pond and returned to the Plant for reuse via pipeline.

The GMF will potentially receive gypsum slurry 24 hours per day, seven days per week. Routine operation and maintenance activities are expected to be conducted during day shift hours. The filling times and staging chronology included in this document are calculated from gypsum production rates estimated at 23,500 tons per month, which is based on the plant burning high sulfur coal (6.8 lbs of $SO_2$ per million BTU) at a 90% capacity factor. The sluice and process water return rates referenced in this document are per the Hitachi Power Systems America, Ltd. MATERIAL BALANCE Case Study: 4,131 mmBtu/hr Drawing No. 0013-361-110-0381 Rev. B dated 3-19-07. Variations in these parameters would result in variations in the estimated chronology and flow rates.

The Plant is a restricted access location. A series of fences and gates exist to prevent unauthorized access to the property. The proposed GMF is located within the restricted plant confines, and is, therefore, not accessible to the general public.

## 4.2 PERSONNEL

The proposed GMF will be owned and operated by IPRG. Corporate offices are located in Houston, Texas. IPRG plans to enter into an agreement with an independent Contractor to perform certain aspects of the operation and maintenance of the GMF. The contractual operator (Operator) of the gypsum stack will be responsible for daily operation and maintenance of the gypsum stack, recycle pond and peripheral areas.

## 4.3 OPERATION OF VAULTS AND VALVES

IPRG personnel will be responsible for the operation of the valves which control the flow of slurry and water between the Plant, recycle pond and gypsum stack to the first valve vault located at the recycle pond entrance road. Beyond that point, the Operator will be responsible for distribution of gypsum slurry to various areas of the gypsum stack (this includes the valve vaults on the mid-western side of the gypsum stack and the north side of the gypsum stack). Two redundant pipes will carry the gypsum slurry from the plant. Although only one pipe will be in use at any time, conditions at the plant may result in a discharge pipe switch at any time. BOTH PIPES MUST BE AVAILABLE TO DISCHARGE GYPSUM AT ALL TIMES WHEN

Electronic Filing: Received, Clerk's Office 06/20/2024

THE PLANT IS OPERATING. Valves to both pipes must be open, and the ends of both pipes must be positioned so that there would be no restrictions to gypsum discharge at any time.

## 4.4 GYPSUM MANAGEMENT FACILITY STARTUP

The major components of the GMF consist of:

- The gypsum stack;
- The recycle pond;
- The HDPE-lined earthen transfer channel that connects the two structures, and through which clarified process water will be decanted from the gypsum stack into the recycle pond; and
- The recycle pond decant system and pump-house, through which process water will be returned to the Plant for reuse.

Upon completion of the recycle pond construction, the recycle pond will be partially filled with water pumped from the Plant or from Duck Creek Reservoir. The recycle pond pumps will be commissioned and then shut off pending the introduction of slurry into the gypsum stack. Procedures for these operations are discussed in the following sections.

### 4.4.1 Siphon Installation and Operation

The bottom of the gypsum stack is approximately 29 ft below the transfer channel invert elevation of 614 ft. During the period when the gypsum sluicing and stacking operations are conducted below the transfer channel elevation, clarified water must be siphoned from the gypsum stack to the recycle pond. Based on a slurry discharge rate of 653 gal/minute (gpm), and an average reclaim water return rate of 626 gpm, a minimum of two redundant (2) 10-inch diameter HDPE siphons should be primed and operable at all times. Installation of the siphon pipes and valves is included in the original GMF construction.

Each of the siphon pipes will pass through the transfer channel and the outlet end of the siphon pipes shall be laid on the bottom of the recycle pond at elevation 590 ft. Ballast will be required at the outlet of the pipe to prevent the pipes from potentially floating to the surface and breaking the siphon. Ballast or other means of restraint may also be required in the transfer channel to hold the pipes in place. For a 300 ft long, 10-inch diameter HDPE siphon, the water level in the gypsum stack will need to be approximately 4.5 ft higher than the water level in the recycle pond in order to pass the equilibrium process water return rates discussed above.

### 4.4.2 Initial Filling of Recycle Pond With Water

The recycle pond will initially be partially filled with water pumped from Duck Creek Reservoir or the plant. The recycle pond will be filled to a water surface elevation of 598 ft in order to accommodate proper pump functioning during commissioning and startup of the slurry discharge to the gypsum stack. Duck Creek plant personnel will monitor and regulate the water level in the recycle pond.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 4.4.3 Commissioning the Pumps and Siphons

Once the recycle pond and gypsum stack have operational levels of water, the siphons, the recirculation pump system (recycle pond to gypsum stack), and the recycle pump system (recycle pond to plant) will be primed and tested. IPRG will be responsible for operation and maintenance of the recycle / recirculation pumps.

## 4.5 GYPSUM MANAGEMENT FACILITY OPERATION

The gypsum slurry (approximately 20 percent solids) will be pumped from the Plant to the gypsum stack via piping. Piping will be HDPE with a pressure rating for the design hydraulic and static head. The HDPE pipe will discharge the slurry into the gypsum stack, and the gypsum will settle by gravity.

The water level in the recycle pond should be maintained at a minimum elevation of 598 ft in order to insure uninterrupted pumping of water back to the plant. However, at times, there will be intermittent outages at the plant. During an outage, bottom drains in the gypsum stack will continue to discharge water to the recycle pond and the recycle pumps will continue to recirculate water from the recycle pond to the gypsum stack. The recirculation of water is required during outages in order to utilize the water storage capacity of the gypsum to help maintain sufficient storage capacity in the recycle pond to accommodate all precipitation runoff from the entire gypsum stack/recycle pond area during an expected maximum 12-week maintenance outage at the Plant.

At a placement rate of 23,500 tons per month, it will take approximately 3 years to fill the gypsum stack with gypsum to the invert of the HDPE-lined transfer channel at EL 614. Until that time, clarified return water will be siphoned into the recycle pond using one of two redundant 10-inch diameter siphon pipelines. Water that flows from the gypsum stack to the recycle pond will be pumped back to the Plant for reuse, or recirculated to the top of the gypsum stack during periods when the plant is shutdown.

In order to stack the gypsum material with the required factors of safety for slope stability, a system of strategically placed perimeter ditches and dikes must be constructed. Interior dikes will also need to be constructed to accommodate the installation of ring drains and the development of cells located within the gypsum stack. Key components of the gypsum stacking process are described in the following sections to highlight the effort required to successfully stack gypsum with the required factors of safety against slope failure.

### 4.5.1 Initial Filling With Gypsum Slurry

There are two redundant gypsum slurry pipelines which will be capable of discharging midway along the north side or west side of the of the gypsum stack at a maximum rate of 1.5 cfs (675 gal/min). The initial construction of the GMF includes a ring drain system on the HDPE liner on the bottom of the gypsum stack. When gypsum slurry is initially discharged into the gypsum stack, **extreme care must be taken to prevent any erosion of the sand layer over the ring drain**. **Any displacement of sand may impair the function of the ring drain.** If necessary, the sand layer may be protected with a layer of larger aggregate or temporarily

Electronic Filing: Received, Clerk's Office 06/20/2024

covered with an approved geotextile wherever necessary to prevent erosion of the sand layer. It may be preferable to use a flange-connected pipe extension to extend the slurry discharge line to the interior side of the ring drain so that the bottom troughs will collect the water and prevent erosion of the sand layer. The pipe extension can be removed when the ring drains are covered and protected by settled gypsum. If any ring drain sand is displaced, the Operator shall immediately notify Ameren so that an appropriate response and repair method can be determined. Please see Figure A for details and a general depiction of the ring drain assembly.

Settled gypsum will gradually create a plane of material (gypsum beach) sloping gently towards the south end of the gypsum stack. Please see Figure B for a depiction of the gypsum beach. Clarified water will collect in the south end of the gypsum stack and will be siphoned into the recycle pond when it reaches EL 602.5, the level necessary to provide the head to siphon the process water at the system equilibrium rates. The GMF Operator will be responsible for operation and maintenance of the siphons. At the design flow rates, it will take approximately 95 days of operation in order for the water in the gypsum stack to reach this level.

### 4.5.2 Gypsum Dike and Cell Construction

The bottom slope of the gypsum stack liner, and the siphoning of water from the gypsum stack to the recycle pond, will partially drain the gypsum to allow for "early stacking" of material below the crest of the earthen dam. This is advantageous for several reasons. One reason is that the construction of compacted dikes at a lower elevation may improve foundation conditions for the remainder of the stack. Employing stacking procedures at a lower elevation also affords the opportunity for the Operator to become familiar with the material and develop confidence in a construction routine which will maximize stability when stacking the material above the top of the earthen embankment. Early stacking also allows Ameren the opportunity to complete preliminary testing on proposed piezometer locations for development of a piezometer installation and monitoring plan, as discussed in Section 4.5.8, which will be refined prior to stacking above the top of the earthen embankment.

The procedures for controlling the deposition of gypsum will begin once the gypsum beach at the north end of the gypsum stack reaches an elevation of approximately 605 ft, NGVD, which is 10 ft above the HDPE liner (7.5 ft above the top of the ring drain assemblies). Based on an assumed deposited gypsum slope of 0.3%, and a water level of 602.5 ft, the gypsum beach which will be visible above water is predicted to span half the length of the gypsum stack (reference Figure B). At full production (16.7 acre-ft deposited per month), the time required for the gypsum beach to reach this configuration is estimated at five to six months. .

The first procedural steps in controlling the deposition of (stacking) gypsum are the construction of a perimeter ditch, a perimeter dike, a rim ditch, and a rim dike. The perimeter ditch is the ditch which will be formed between the earthen embankment and the gypsum. The perimeter dike is the gypsum dike on the interior side of the perimeter ditch. The rim ditch is a ditch which will be formed on the interior side of the perimeter dike. The rim dike is a gypsum dike which will be formed on the interior side of the rim ditch. These basic components of the gypsum stack are illustrated in Figure C. Specific details pertaining to the ditches are provided in Sections 4.5.3 and 4.5.4.

Electronic Filing: Received, Clerk's Office 06/20/2024

During the initial stages of stacking, the perimeter ditch, perimeter dike, rim ditch and rim dike will be constructed simultaneously. They will be constructed by building two elevated dikes on the gypsum beach beginning at the middle of the north side and proceeding both clockwise and counterclockwise around the perimeter of the gypsum beach (see Figure D). Access to the beach will be provided by carefully pushing an approved fill material onto the beach from the crest of the earthen embankment to create an access pad. The thickness of the fill layer will need to be at least 24-inches over the geomembrane liner to avoid damage to the liner, and will need to be at least 36-inches over the gypsum beach. Once the fill material has been placed far enough out onto the beach to allow excavation of the gypsum without damaging the liner, the access pad can be completed using gypsum excavated from the beach (see Figure E).

Gypsum excavated from the beach is expected to be soft and saturated and must be windrowed and allowed to dewater before it can be spread and compacted to form the roadway. The gypsum is expected to dewater sufficiently in 24 hours to allow spreading and compacting. Adequate compaction is expected to be achieved by tracking with a D-6 dozer or similar equipment.

After construction of the dikes and ditches has begun, the slurry discharge lines should be relocated to discharge to the rim ditch. This will allow the rim ditch to be refilled each day to provide gypsum for raising the roadway as the excavator retreats from the most recently placed windrow. The rim ditch will also serve as the primary means of diverting slurry around the stack to the location where deposition is desired.

When the initial perimeter dike is completed, the top of the perimeter dike should be at least 30 ft wide, at least 10 ft above the beach and the side slopes graded to be 3.0H:1.0V (see Detail A on Figure B). The top of the initial rim dike should be at least 3.5 ft above the beach. Additional interior dikes may also be constructed as needed to create cells which facilitate the settling process. The exterior side slope of the rim dike shall be 3.0H:1.0V. The interior side slope of the rim dike and the side slopes on any interior dikes may be allowed to form at the angle of repose for the gypsum material. **A minimum freeboard of 3.5 ft must be maintained between the slurry level in the rim ditch and the crest of the perimeter dike. Subsequently, the perimeter dike must always be maintained at an elevation at least 3.5 ft higher than the rim dike or any other interior dike.**

The rim and perimeter dikes should be raised in lift increments of approximately 1 foot and may be moved laterally each lift as needed to maintain the required design slopes of 3.0H:1.0V on the perimeter dike. The slopes can be graded with a smooth-edged excavator bucket, e.g., a finish or cleanup bucket. **Under no circumstances should the slopes of the gypsum stack be graded using a toothed excavator bucket**.

Clarified water will be transferred from the rim ditch to the perimeter ditch where it will be carried to the transfer channel for discharge to the recycle pond. The GMF construction included installation of a stop log system for the transfer channel. The stop logs may be used for **temporary** reductions in flow to the Recycle Pond and increases in water levels in the gypsum stack for water balance purposes during operation. During the initial stacking process, when a siphon must be used to transfer water to the recycle pond, the transfer of water from the rim ditch

Electronic Filing: Received, Clerk's Office 06/20/2024

to the perimeter ditch may be achieved with an open cut through the perimeter dike. However, once the perimeter dike rises above elevation 614 ft (the invert of the transfer channel), decants, stilling wells and splash pads (see Sections 4.5.5 and 4.5.7 ) are required for the purpose of transferring clarified water from the rim ditch to the perimeter ditch.

### 4.5.3 Perimeter Ditch

Throughout the stacking operations, a perimeter ditch must be constructed and maintained around the toe of the gypsum stack. The perimeter ditch will be located between the perimeter dike (outer gypsum slope) and the HDPE lined earthen embankment. This ditch will collect water from the ring drains, decants and rainfall runoff, and convey it to the transfer channel where it will be discharged to the recycle pond. The perimeter ditch shall be constructed by covering the HDPE liner with a 2 ft thick protective layer of gypsum and shaping the channel to the required dimensions. The perimeter ditch is required to have a maximum invert elevation of 614 ft (6 ft below the top of the earthen perimeter dam) and a bottom width of at least 5 ft. A larger ditch bottom width may be utilized to reduce the frequency of any dredging necessary to maintain the minimum required dimensions.

### 4.5.4 Rim Ditch

The rim ditch will be the primary means of diverting slurry from the slurry discharge pipes to the desired deposition area. The rim ditch will also transport clarified water to the decant structures so the water can be discharged to the perimeter ditch. Consequently, the width of the rim ditch will vary according to the needs at any particular location on the gypsum stack. There may also be cases were blocking the rim ditch is desirable to divert water into a particular cell. There are only two primary constraints on the construction of the rim ditch: (1) the outer slope shall not be steeper than 3.0H:1.0V (this is the inner slope of the perimeter dike); and (2) the normal operating water level shall be at least 3.5 ft below the top of the perimeter dike.

### 4.5.5 Installation and Operation of Decants and Stilling Wells

The progressive stacking of gypsum will require the installation of at least four (4) decant structures (2 redundant sets of 2) in the rim ditch to convey water to the lower perimeter ditch without eroding the gypsum stack slopes. A minimum of two (2) decant structures are required in order to maintain the water level in the rim ditch and provide adequate discharge capacity for design precipitation events. An additional redundant set of two (2) decant structures will also be required to be installed. The decant structures will consist of 16-inch diameter solid wall HDPE IPS DR 11 pipe sections with 12-inch diameter screw-capped tees installed at 6 ft intervals along the length of the pipe. (When installed on a 3H:1V slope, the tees at 6 ft intervals will translate to 2 ft elevation intervals.) The decant structures will each discharge to a stilling well located in the perimeter ditch at the toe of the outer gypsum stack slope.

During construction of the first gypsum dike above elevation 614 ft (the invert elevation of the perimeter ditch and transfer channel), a 16-inch diameter solid wall HDPE IPS DR11 pipe will be installed as shown in Figure F**Error! Reference source not found.**. The horizontal portion of the pipe will be approximately 80 ft long with an invert at EL 614. The inlet end of the horizontal pipe will be attached to the first decant pipe section with an 18.4 degree angle

Electronic Filing: Received, Clerk's Office 06/20/2024

fitting. Prior to backfilling over the horizontal portion of the pipe, a 20 ft wide geogrid must be installed over the entire horizontal portion of the pipe, to prevent the pipe from potentially floating out of the saturated gypsum layer during the initial stages of the stacking operation.

The outlet end of the decant pipe will be welded to, and discharge into, a 48-inch diameter HDPE stand pipe with a 1-inch thick HDPE plate welded to the bottom. The stand pipe will have a top elevation of 618 ft and a bottom elevation of 611 ft. The stand pipe will be filled with concrete ballast to EL 614 (see Detail A on Figure F). Additionally, a 4-inch diameter low flow drain will be installed in the stand pipe at elevation 614 ft in order to allow for the cleanout of any gypsum which might accumulate in the stand pipe. In order to allow for proper function of the stilling well, the low flow drain pipe should not be installed in line with the 16-inch decant pipe, but rather offset to one side.

Each time the perimeter gypsum dike is raised, a new decant pipe section will be butt welded to the decant structure. The decant pipe section will be supported by the interior 3H:1V slope of the rim ditch. The water level in the rim ditch will be progressively raised through the stacking operation by capping the appropriate tees in the decant pipe sections. As previously stated, the normal water level shall be at least 3.5 ft below the crest of the perimeter gypsum dike.

### 4.5.6 Installation of Upper Ring Drains

Upon completion of the first gypsum dike above elevation 614 ft, and prior to construction of the next progressively stacked dike, two interior ring drains must be installed concurrent with development and operation of the interior gypsum cells. Additional ring drains will be required as the height of the gypsum stack increases. Final details and specifications for the upper ring drains will be provided by the design engineer at the time of installation. The upper ring drains are required to control the phreatic surface which will develop within the stack. A preliminary design for the upper ring drains is as follows, as shown on Figure C: A 3 ft tall gypsum dike will be constructed along the centerline of the proposed ring drain using the same techniques as for gypsum dike construction. After construction of the dike, a 4 ft deep channel with a 4 ft bottom width will be excavated along the center of the dike. Side slopes on the cut should be no steeper than 1:1. The bottom and sides of the cut should be filled with IDOT FA1 gradation sand to form a layer which is 1 ft thick. After the sand is placed, the channel will then be lined with non-woven geotextile to be specified by the design engineer. The geotextile will be covered with coarse granular material (to be specified) 2 ft wide by 2 ft deep, with a perforated HDPE pipe imbedded in the center. The fabric will then be wrapped over the top of the coarse granular material and covered with an additional 1 ft thick layer of FA1 gradation sand. The gypsum must not be in direct contact with the non-woven geotextile. The upper ring drains will discharge to the perimeter ditch via solid-wall HDPE pipe.

### 4.5.7 Splash Pads at Ring Drain & Decant Discharge Locations

At each location where a ring drain and/or a decant structure discharges to the perimeter ditch, the ditch shall be lined with a material capable of resisting the erosive velocities. Materials such as concrete, cable stayed concrete blocks or a geogrid backfilled with washed

Electronic Filing: Received, Clerk's Office 06/20/2024

aggregate may be acceptable. Operator-proposed methods shall be submitted to Ameren for approval prior to placement. The splash pads shall be installed concurrently with or immediately after construction of the perimeter ditch, ring drain outlets and decant stilling wells.

### 4.5.8 Piezometer Installation and Monitoring

The side slopes of the gypsum stack will be constructed with 3.0H:1.0V side slopes. (After consolidation of the settled gypsum over time, the final slopes are expected to approach 3.75H:1.0V.) The stability of the gypsum stack slopes is critically dependent on the location of the phreatic surface which will develop within the gypsum stack. Proper installation and functioning of the ring drains will ensure that the phreatic surface is located an adequate distance from the surface of the slope as necessary to maintain a stable slope. In order to monitor the phreatic surface within the gypsum stack, piezometers will be installed on each side of the gypsum stack. A preliminary piezometer detail is included on Figure C. The location and depth of each piezometer will be determined by the design engineer prior to installation, and an installation and monitoring plan will be developed based on information obtained during the initial gypsum stacking operations below the level of the earthen berm. "Critical elevations" corresponding to the anticipated readings at various stages during the progressive raising of the gypsum stack will be established for each piezometer. The water level in each piezometer will be read and recorded in accordance with a specified schedule. If at any time a reading is recorded higher than the "critical elevation" for that stage of operation, Ameren and the design engineer must be contacted immediately for evaluation of the reading. It is imperative that the piezometers are installed and monitored in accordance with the plan and the design engineer's specifications. Depending on the piezometer readings, it may also be necessary to install additional seepage collection drains to maintain the phreatic surface at or below the critical level within the gypsum stack.

# SECTION 5.0 DAM INSPECTIONS

The inspection program includes two types of dam inspections which are required to be performed in accordance with IDNR/OWR's Rules for Construction and Maintenance of Dams. The first type of inspection is regularly conducted by the dam Operator and is referred to as an Operation and Maintenance Inspection. The second type of inspection, referred to as the Engineering Inspection, is conducted by a qualified engineer approved by Ameren.

Inspections shall be conducted throughout the operating life of the structures. The "operating life of the structure" will be considered to cease upon receipt of written affirmation from IDNR/OWR indicating that the structure is no longer considered a dam. Copies of all inspection reports shall be maintained at the Plant for the operating life of the structures.

## 5.1 OPERATION AND MAINTENANCE INSPECTION

"Walk-around" inspections of the dams and appurtenant works are to be made by the dam Operator. During these inspections, a checklist of items to be maintained and items to be observed should be recorded. The checklist provided in Appendix B shall be utilized for these inspections. **If any of the following items are found to be unusual or are cause for concern, the Ameren Shift Supervisor should be immediately notified.**

Frequency: Weekly. Also, during and after unusual events such as heavy rainfall or after an earthquake.

Inspection Items: During each inspection the following items should be noted in particular.

1. Water Level - Maximum levels as a result of heavy rainfall should be recorded.

2. Earth Embankment - Walk the crest, side slopes and downstream toe of the dam concentrating on surface erosion, seepage, cracks, settlement, slumps, slides, and animal burrows. These are described as follows:

    - Surface Erosion - Removal of vegetative cover by water action or pedestrian or vehicle usage forming deep ruts or gullies.

    - Seepage - The passage of water through and/or underneath the earth embankment abutment and natural groundline or at the contact between the embankment and outlet works. It can be indicated by cattails or other wet environmental vegetation, erosion, channelization, or slumping on the embankment face.

    - Cracks - Deep cracks usually indicate the movement of the dam and/or the foundation and can be in either the longitudinal (along the length of the dam) or transverse (across the dam) directions. Cracking can be an indicator of the

Electronic Filing: Received, Clerk's Office 06/20/2024

beginning of slumps. Shallow cracks may develop during the summer when the surface soils of the embankment become severely dried and are usually of no concern in regard to the safety of the dam.

- Settlement - Settlement is indicated by depressions or low spots and can be signs of consolidation of the dam or foundation or the loss of material beneath the settlement area.

- Slumps/Slides - A slow or sudden movement of the earth embankment slope on either face toward the toe of the dam.

- If seepage indicates the presence of soil particles, or if deep cracks, settlement, slumps, or slides are noticed, a qualified engineer should be contacted immediately for consultation.

- Animal Burrows - Animal burrows result in a loss of earth embankment material and can provide seepage paths for water through the embankment.

3. Gypsum Embankment - Walk the crest, side slopes and downstream toe of the dam concentrating on surface erosion, seepage, cracks, settlement, slumps, slides and animal burrows. The descriptions for these are the same as for earth embankment.

4. Vegetation - Grass should be a thick vigorous growth to stabilize the earth embankment soils and prevent erosion from occurring. Note the height of the grass; if greater than 1 foot a mowing of the area should be scheduled before the next inspection. There should be NO trees on the earth embankment and NONE within a minimum of 20 ft of the embankment toes or other structures. The gypsum embankment will not be seeded and is not expected to have any vegetation.

5. Gypsum Stack piezometers should be inspected for any damage or loss of function. Damaged piezometers must be promptly repaired or replaced since their function is critical to ensuring stability of the gypsum stack.

6. The water level in each Gypsum Stack piezometer must be measured and recorded. If the water level in any piezometer is above the “critical elevation” as discussed in Section 4.5.8, Ameren should be notified and the **design engineer should be immediately consulted for guidance on an appropriate course of action**.

7. Gypsum Stack LD/LCRS Drains - The change in location or amount of flows discharging from the Leak Detection/Leachate Collection Recovery System (LD/LCRS) should be recorded. If a significant change has occurred, a qualified engineer should be contacted for consultation.

8. Gypsum Stack Ring Drains - The change in location or amount of flows discharging from the Ring Drains should be recorded. If a significant change has occurred, a qualified engineer should be contacted for consultation.

Electronic Filing: Received, Clerk's Office 06/20/2024

9. Gypsum Stack Fixed Decant – Check the alignment and supports for the pipe. Record the amount of flows discharging from the pipe and any erosion or scour around the discharge point.

10. Gypsum Stack Perimeter Ditch – The perimeter ditch should have a consistent prismatic shape for the entire length. Inspect the perimeter ditch for evidence of erosion, sediment deposition and irregularity in channel geometry, especially in the vicinity of siphon, decant or ring drain outfall structures. If irregularities are noted, repairs should be scheduled and completed.

11. Stop Logs - Check to make sure that the stop logs in the transfer ditch are undamaged, and, if installed, are operating well and allowing for the free flow of water over them.

12. Transfer Channel - Check for any debris or other obstructions which may block or restrict the free flow of water. Check for any pools or undulation of the floor of the channel.

13. Recycle Pond Decant - Check for any debris or other obstructions around the Recycle Pond decant which may block or restrict the free flow of water. The emergency dewatering valve should be lubricated. If there is no return water in the pipe, the emergency dewatering valve should be exercised. Record the physical and operating conditions of the system.

14. Recycle Pond Drop Inlet Spillways - Check for any debris or other obstructions around the inlet crest and at the bottom of the drop inlet which may block or restrict the free flow of water. Check for the development of any rusty areas on the concrete, and seepage, cracking, breaking, or spalling of the concrete. Check for settlement or cracking of the crest. Check for any debris in the pipes which may restrict the flow of water. Check for any tears or leaks in the HDPE liner covering the concrete.

15. Recycle Pond Rip Rap Basin - Check for any debris or other obstructions in the riprap basin which may block or restrict the free flow of water. Check to make sure that the rip rap is remaining in a uniform position. Freeze/thaw action or flow over the rip rap may tend to lift or fracture, thus requiring replacement or leveling to maintain the necessary level of protection. NO trees or woody vegetation should be growing through the rip rap.

16. Fences - Check for damage, accumulated debris, operation of gates and locks, and adequacy of locations (this may change with time as people access the area or development occurs in the area).

17. Perimeter - Check the perimeter of the dams for a distance of at least 100 ft beyond the toe for signs of seepage or boils.

Electronic Filing: Received, Clerk's Office 06/20/2024

18. HDPE Liner – Wherever exposed, the HDPE Liner should be inspected for tears, gouges, protrusions under the liner and abrasion.

Records: Log books of activities occurring at the dam is to be kept current by the dam Operator. The log books shall be made available for review by the inspecting engineer during the Engineering Inspection. The log books should contain at the least the following documentation:

1. Completed operation and maintenance inspection checklists
2. Readings from all piezometers on the Gypsum Stack
3. Additional visual observations
4. A list of maintenance performed
5. A list of any unusual occurrences at the dam
6. A copy of the engineering inspection reports

## 5.2 ENGINEERING INSPECTION

The engineering inspection is to be conducted by a qualified engineer approved by IPRG. The inspection will provide a thorough evaluation of the dam and appurtenant structures. The forms provided in Appendix C shall be utilized for these inspections.

**Frequency:** The Gypsum Stack Dam and Recycle Pond Dam are classified as CLASS III, LOW HAZARD POTENTIAL dams. Class III dams are to be inspected at least once every five years.

**Inspection Items:** The engineer will thoroughly inspect all of the items noted under Operation and Maintenance Inspection.

**Records:** The Dam Inspection Report form, Appendix C, will be completed by the inspecting engineer and will be signed and sealed by an Illinois Registered Professional Engineer. This report will document any deficiencies; recommend remedial actions; and establish time requirements for addressing the deficiencies. The original report will be retained in Ameren's file and a copy of the report will be submitted to the Illinois Department of Natural Resources, Office of Water Resources.

Electronic Filing: Received, Clerk's Office 06/20/2024

# SECTION 6.0
# MAINTENANCE ACTIVITIES

Timely repairs are a must after problem areas have been identified. The dam Operator is to perform the work required to correct items noted in the operation and maintenance and engineering inspections. Such items include mowing, seeding, tree and brush removal, replacing rip rap, repairing fences and locks, clearing debris, etc. The maintenance activities specified in the following sections are minimum requirements. NOTE: NO alterations or repairs to structural elements should be made without the assistance of a qualified engineer and the concurrence of the Illinois Department of Natural Resources, Office of Water Resources.

## 6.1 ROUTINE MAINTENANCE

**Debris:** Remove all trash, logs and other debris which may obstruct flow into the principal spillway pipes and drop inlets, or block passage from their discharge channels.

**Rip Rap:** Replace rip rap as needed to provide adequate protection against erosion.

**Vegetation Control:**

1. Maintain a good grass cover on the embankment by seeding, fertilizing and mulching areas which are refilled, barren, or thinly vegetated. Seeding mixtures used for maintenance reseeding shall result in a cover compatible with adjacent cover. The seeding mixture specified at the time of the dam's construction was IDOT Standard Specifications Class 1A (Salt Tolerant Lawn Mixture) as follows:

   IDOT Class 1A Salt Tolerant Lawn Mixture
   Bluegrass .....60 lb/acre
   Perennial Ryegrass .....20 lb/acre
   Dawsons Red Fescue.....20 lb/acre
   Scaldis Hard Fescue .....20 lb/acre
   Fults Salt Grass .....60 lb/acre

2. Grassed areas such as the embankment and the areas beyond the embankment toes for a distance of at least 20 ft should be mowed at least twice annually or at any time the height of the grass exceeds 1 foot.

3. All erosion areas will be filled and compacted, reseeded, fertilized and mulched to establish a thick erosion resistant cover.

4. Remove all trees and brush growing on the dam embankment to prevent development of a root system which could provide seepage paths. Herbicides utilized for tree and brush control are discussed in Appendix D.

5. Keep the riprap basin clear of weeds, brush, and trees.

Electronic Filing: Received, Clerk's Office 06/20/2024

6. Remove all trees and brush growing on the dam embankment to prevent development of a root system which could provide seepage paths. Herbicides utilized for tree and brush control are discussed in Appendix D.

7. Clear all brush and trees to a distance of approximately 20 ft beyond both toes of the dam.

**Animal Damage:** Fill rodent holes and other animal burrows with compacted clayey dirt and reseed. If rodents become a nuisance, an effective rodent control program as approved by the Illinois Department of Natural Resources District Wildlife Biologist should be implemented.

**Signs:** All warning sings shall be maintained (repaired, painted, or replaced) as needed.

## 6.2 EROSION AND DUST CONTROL

As stacking operations commence, the dewatered gypsum is expected to form a thin layer of "crust" which will resist erosion and prevent the migration of fugitive dust from the gypsum stack. (This expectation is based on a case study of flue-gas desulfurization by-product (gypsum) stacking by the Electric Power Research Institute entitled Evaluation of Chiyoda Thoroughbred 121 FGD Process and Gypsum Stacking, Volume 3 Addendum, dated March 1981.) Should a protective layer of crust fail to form or fail to provide adequate erosion and dust control, appropriate measures for addressing these concerns will be implemented.

# APPENDIX E
# HERBICIDES

Electronic Filing: Received, Clerk's Office 06/20/2024

# HERBICIDES

Site personnel should check with the Illinois Department of Natural Resources, Regional Fisheries Biologist and the Regional Wildlife Biologist before using any herbicide. Read the product label prior to use and follow the use directions and precautions accordingly.

On March 1, 1979 the U.S. Environmental Protection Agency (U.S.E.P.A.) halted the use of the herbicide 2, 4, 5-T in parks and recreation areas. The use of silvex (2, 4, 5-TP) around water has also been banned.

The Agronomy Department at the University of Illinois and the Aquatic Biology Section of the Department of Natural Resources, Office of Scientific Research and Analysis indicate that the herbicides containing the 2, 4-D or 2, 4-DP are legal for use in parks and recreation areas and effective for controlling brush and woody growth. Some examples of approved herbicides are:

1. Tordon RTU by DOW Chemical. (Can be obtained with blue dye.)
2. WEEDONE 170 by Union Carbide
3. WEEDONE, 2, 4-DP by Union Carbide
4. A 1% to 2% solution of ROUNDUP
5. Garlon by DOW Chemical
6. Banvel by Sandoz

Your distributor may carry brand name herbicides other than those listed above. Be certain that the product does not contain the ingredients 2, 4, 5-T or 2, 4, 5-TP. An example of an unacceptable product is ESTERON 2, 4, 5 by DOW Chemical.

**Subject: USEPA CCR Rule and IEPA Part 845 Rule Applicability Cross-Reference**
**2021 USEPA CCR Rule Periodic Certification Report**
**GMF Pond, Duck Creek Power Plant, Canton, Illinois**

At the request of Illinois Power Resources Generating, LLC (IPRG), Geosyntec Consultants (Geosyntec) has prepared this letter to document how the attached 2021 United States Environmental Protection Agency (USEPA) CCR Rule Periodic Certification Report (Report) was prepared in accordance with both the Federal USEPA CCR Rule[1] and the state-specific Illinois Environmental Protection Agency (IEPA) Part 845 Rule[2]. Specific sections of the report and the applicable sections of the USEPA CCR Rule and Illinois Part 845 Rule are cross-referenced in **Table 1**. A certification from a Qualified Professional Engineer for each of the CCR Rule sections listed in **Table 1** is provided in Section 9 of the attached Report. This certification statement is also applicable to each section of the Part 845 Rule listed in **Table 1.**

**Table 1 – USEPA CCR Rule and Illinois Part 845 Rule Cross-Reference**

| Report Section | USEPA CCR Rule | | Illinois Part 845 Rule | |
|---|---|---|---|---|
| 3 | §257.73 (a)(2) | Hazard Potential Classification | 845.440 | Hazard Potential Classification Assessment[3] |
| 4 | §257.73 (c)(1) | History of Construction | 845.220(a) | Design and Construction Plans (Construction History) |
| 5 | §257.73 (d)(1) | Structural Stability Assessment | 845.450 (a) and (c) | Structural Stability Assessment |
| 6 | §257.73 (e)(1) | Safety Factor Assessment | 845.460 (a-b) | Safety Factor Assessment |
| 7 | §257.82 (a)(1-3) | Adequacy of Inflow Design Control System Plan | 845.510(a), (c)(1), (c)(3) | Hydrologic and Hydraulic Capacity Requirements / Inflow Design Flood Control System Plan |
| | §257.82 (b) | Discharge from CCR Unit | 845.510(b) | Discharge from CCR Surface Impoundment |

[1] United Stated Environmental Protection Agency, 2015. *40 CFR Parts 257 and 261, Hazardous and Solid Waste Management System, Disposal of Coal Combustion Residuals from Electric Utilities, Final Rule.*
[2] State of Illinois, Joint Committee on Administrative Rule, Administrative Code (2021). *Title 35: Environmental Protection, Subtitle G: Waste Disposal, Chapter I: Pollution Control Board, Subchapter j: Coal Combustion Waste Surface Impoundment, Part 845 Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments.*
[3] "Significant" and "High" hazard, per the CCR Rule[1], are equivalent to Class II and Class I hazard potential, respectively, per Part 845[2].

Electronic Filing: Received, Clerk's Office 06/20/2024

**CLOSING**

This letter has been prepared to demonstrate that the content and Qualified Professional Engineer Certification of the 2021 Periodic USEPA CCR Rule Certification Report fulfills the corresponding requirements of Part 845 of Illinois Administrative Code listed in **Table 1**.

Sincerely,

Lucas P. Carr, P.E.
Senior Engineer

John Seymour, P.E.
Senior Principal

# EXECUTIVE SUMMARY

This Periodic United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule [1] certification report (Periodic Certification Report) for the GMF Pond[1] at the Duck Creek Power Plant (DCPP) has been prepared in accordance with Rule 40, Code of Federal Regulations (CFR) §257. herein referred to as the "CCR Rule" [1]. The CCR Rule requires that initial certifications for existing CCR surface impoundment, completed in 2016 and subsequently posted on the Illinois Power Resources Generating, LLC (IPRG) CCR Website ( [2], [3], [4], [5], [6]) be updated on a five-year basis.

The initial certification reports developed in 2016 and 2017 ( [2], [7], [3], [4], [5], [6], [8]) were independently reviewed by Geosyntec. Additionally, field observations, interviews with plant staff, and evaluations were performed to compare conditions in 2021 at the GMF Pond relative to the 2016 initial certifications. These tasks determined that updates are not required for the Initial Hazard Potential Classification or Inflow Design Flood Control Plan. However, due to changes at the site and technical review comments, updates were required and were performed for the:

- History of Construction Report,
- Initial Structural Stability Assessment, and
- Initial Safety Factor Assessment.

Geosyntec's evaluations of the initial certification reports and updated engineering evaluations determined that the GMF Pond meets all requirements for hazard potential classification, history of construction reporting, structural stability assessment, safety factor assessment, and hydrologic and hydraulic control. **Table 1** provides a summary of the initial 2016 certifications and the updated 2021 periodic certifications.

[1] The GMF Pond is also referred to as ID Number W05780100001-04, GMF Pond by the Illinois Environmental Protection Agency (IEPA); CCR unit ID 203 by IPRG, and IL50573 within the National Inventory of Dams (NID) maintained by the Illinois Department of Natural Resources (IDNR). Within this document it is referred to as the GMF Pond or the GMFP.

**Table 1 – Periodic Certification Summary**

| | CCR Rule Reference | Requirement Summary | 2016 Initial Certification | | 2021 Periodic Certification | |
|---|---|---|---|---|---|---|
| | | | Requirement Met? | Comments | Requirement Met? | Comments |
| **Hazard Potential Classification** | | | | | | |
| 3 | §257.73(a)(2) | Document hazard potential classification | Yes | Impoundment was determined to have Significant hazard potential classification [2]. | Yes | Updates were not determined to be necessary. Geosyntec recommends retaining the Significant hazard potential classification. |
| **History of Construction** | | | | | | |
| 4 | §257.73(c)(1) | Compile a history of construction | Yes | A history of Construction report was prepared for the GMF Pond [3]. | Yes | The Duck Creek Power Plant closed and CCR materials are no longer being placed in the GMF Pond. A letter listing updates to the History of Construction report is provided in **Attachment C.** |
| **Structural Stability Assessment** | | | | | | |
| 5 | §257.73(d)(1)(i) | Stable foundations and abutments | Yes | Foundations and abutments were found to be stable [8]. | Yes | Foundations and abutments were found to be stable after performing updated slope stability analyses. |
| | §257.73(d)(1)(ii) | Adequate slope protection | Yes | Slope protection was adequate [8]. | Yes | No changes were identified that may affect this requirement. |
| | §257.73(d)(1)(iii) | Sufficiency of dike compaction | Yes | Dike compaction was sufficient for expected ranges in loading conditions [8]. | Yes | Dike compaction found to be sufficient after performing updated slope stability analyses. |
| | §257.73(d)(1)(iv) | Presence and condition of slope vegetation | Yes | Vegetation was present on exterior slopes and is maintained. Interior slopes had alternate protection (geomembrane liner) [8]. | Yes | No changes were identified that may affect this requirement. |
| | §257.73(d)(1)(v)(A) and (B) | Adequacy of spillway design and management | Yes | Spillways were adequately designed and constructed and were expected to adequately manage flow during 1,000-year flood [8]. | Yes | No changes were identified that may affect this requirement. |
| | §257.73(d)(1)(vi) | Structural integrity of hydraulic structures | Not Applicable | Hydraulic structures penetrating the dikes or underlying the base of the GMF Pond were not present [8]. | Not Applicable | No changes were identified that may affect this requirement. |
| | §257.73(d)(1)(vii) | Stability of downstream slopes inundated by water body. | Not Applicable | Inundation of exterior slopes was not expected; this requirement was not applicable [8]. | Not Applicable | No changes were identified that may affect this requirement. |
| **Safety Factor Assessment** | | | | | | |
| 6 | §257.73(e)(1)(i) | Maximum storage pool safety factor must be at least 1.50 | Yes | Safety factors were calculated to be 4.27 and higher [8]. | Yes | Safety factors from an updated slope stability analyses were calculated to be 3.47 and higher. |
| | §257.73(e)(1)(ii) | Maximum surcharge pool safety factor must be at least 1.40 | Yes | Safety factors were calculated to be 4.26 and higher [8]. | Yes | Safety factors from an updated slope stability analyses were calculated to be 3.47 and higher. |
| | §257.73(e)(1)(iii) | Seismic safety factor must be at least 1.00 | Yes | Safety factors were calculated to be 2.37 and higher [8]. | Yes | Safety factors from an updated slope stability analyses were calculated to be 1.88 and higher. |
| | §257.73(e)(1)(iv) | For dike construction of soils that have susceptible to liquefaction, safety factor must be at least 1.20 | Not Applicable | Dike soils were not susceptible to liquefaction [8]. | Not Applicable | No changes were identified that may affect this requirement. |
| **Inflow Design Flood Control System Plan** | | | | | | |
| 7 | §257.82(a)(1), (2), (3) | Adequacy of inflow design control system plan. | Yes | Flood control system adequately managed inflow and peak discharge during the 1,000-year, 24-hour, Inflow Design Flood [8]. | Yes | No changes were identified that may affect this requirement. |
| | §257.82(b) | Discharge from CCR Unit | Yes | Discharge into Waters of the United States is not expected during 1,000-year, 24-hour Inflow Design Flood conditions [8]. | Yes | No changes were identified that may affect this requirement. |

# SECTION 1

# INTRODUCTION AND BACKGROUND

This Periodic United States Environmental Protection Agency (USPA) Coal Combustion Residual (CCR) Rule [1] Certification Report was prepared by Geosyntec Consultants (Geosyntec) for Illinois Power Resources Generations, LLC (IPRG) to document the periodic certification of the GMF Pond at the Duck Creek Power Plant (DCPP) located at 17751 North Cilco Road in Canton, Illinois, 61520. The location of Duck Creek is provided in **Figure 1**, and a site plan showing the location of the GMF Pond, among other closed and open CCR units and non-CCR surface impoundments, is provided in **Figure 2**.

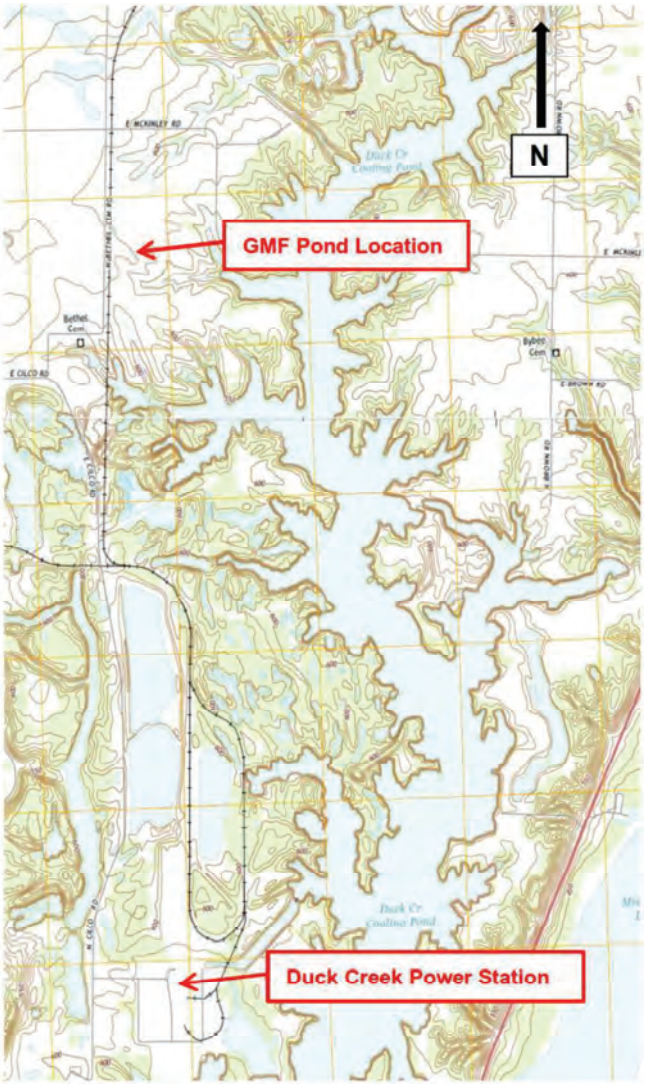

**Figure 1 – Site Location Map (from AECOM, 2016)**

**Figure 2 – Site Plan**

## 1.1 GMF Pond Description

DCPP was retired in 2019. Prior to retirement, two active CCR surface impoundments – the GMF Pond and the Bottom Ash Basin, and one CCR landfill, were used for managing CCRs generated at DCPP [8]. This certification report only pertains to the GMF Pond. The GMF Pond has a "Significant" hazard potential, based on the initial hazard potential classification assessment performed by Stantec in 2016 in accordance with §257.73(a)(2) ( [2], [7]).

The GMF Pond served as the wet impoundment basin for gypsum proceeded by the emissions scrubbers at DCPP. The GMF Pond was constructed between 2008 and 2009 and received inflow from three pairs of 10-in diameter high-density polyethylene (HDPE) gypsum slurry pipes. Clear water discharge from the GMF Pond flows downstream into the approximately 8.5-acre GMF Recycle Pond, which is a non-CCR unit, via a lined channel (transfer channel). The transfer channel is approximately 150-ft long, trapezoidal in shape, lined with 60-mil HDPE, has 3H:1V (horizontal to vertical) side slopes, and a depth of 6 ft. Stoplogs are present within the transfer channel that would allow the pool level to be maintained as high as El. 616.0 ft[2]. The channel transitions from a 16-ft bottom width at an invert elevation of 614.0 ft at the upstream end to a 35-ft bottom width at an invert elevation of 609.0 ft at the downstream end. Outflow from the GMF Recycle Pond was formerly pumped back to DCPP to be recycled for use in the wet scrubber system [8]. Currently, the GMF Pond and GMF Recycle Pond are maintained in a zero-discharge configuration, where the only inflows are precipitation flowing directly into the impoundments and the only outflows are evaporation.

The GMF Pond has a composite liner system that is present underneath the entire footprint of the pond and extends up the interior slopes. The liner system includes, from bottom to top, a 3-ft thick layer of compacted clay that is overlain by a geosynthetic clay liner (GCL) and a 60-mil textured HDPE geomembrane, all of which serve as the lower liner. Above the lower liner, a 10-oz

[2] All elevations are in the North American Vertical Datum of 1988 (NAVD88), unless otherwise noted.

geotextile is overlain by a 1-ft thick granular drainage layer and a 4-oz geotextile filter. The upper liner is comprised from bottom to top of a 1-ft thick soil cushion layer and a 60-mil textured HDPE geomembrane. The upper geomembrane liner is exposed at the pond bottom and side slopes [8].

As formerly operated, the normal pool of the GMF Pond was El. 615.0 ft, as controlled by the stoplog structure at the top of the transfer channel. The GMF Pond is approximately 31.6 acres in size and has a total perimeter embankment length of approximately 4,560 ft. The perimeter dike was constructed to include a crest width of approximately 30 ft and crest height ranging from approximately 5 to 10 ft along the eastern side of the pond. The interior of the ponds extends deeper than the exterior slopes; the maximum interior slope height is approximately 45 ft in the southwest corner of the pond. The design elevation of the embankment crest is 620 ft. Both interior and exterior slopes have an orientation of 3.5H:1V (horizontal to vertical).

Initial certifications for the GMF Pond for Hazard Potential Classification (§257.73(a)(2)), History of Construction (§257.73(c)), Structural Stability Assessment (§257.73(d)), Safety Factor Assessment (§257.73(e)(1)), and Inflow Design Flood Control System Plan (§257.82) were completed by Stantec and AECOM in 2016 and 2017 and subsequently posted to IPRG's CCR Website ( [2], [3], [4], [5], [6]). Additional documentation for the initial certifications included a detailed operating record reports containing calculations and other information prepared for the hazard potential classification by Stantec [7] and for the structural stability assessment, safety factor assessment, and inflow design flood control system plan by AECOM [8]. These operating record reports were not posted to IPRG's CCR Website.

## 1.2 Report Objectives

The following objectives are associated with this report:

- Compare site conditions from 2015/2016, when the initial certifications were developed, to site conditions in 2020/2021, when data for the periodic certification was obtained, and evaluate if updates are required to the:
    - §257.73(a)(2) Hazard Potential Classification [2].
    - §257.73(c) History of Construction [3].
    - §257.73(d) Structural Stability Assessment [4].
    - §257.73(e) Safety Factor Assessment [5], and/or
    - §257.82 Inflow Design Flood Control System Plan [6].
- Independently review the Hazard Potential Classification ( [2], [7]), Structural Stability Assessment ( [4], [8]), Safety Factor Assessment ( [5], [8]), and Inflow Design Flood

Control System Plan ( [6], [8]) reports to determine if updates may be required based on technical considerations.

  - The History of Construction report [3] was not independently reviewed for technical considerations, as this report contained historical information primarily developed prior to promulgation of the CCR Rule [1] for the CCR units at DCPP, and did not include calculations or other information used to certify performance and/or integrity of the impoundments under §257.73(a)(2), §257.73(c)-(e), or §257.82.

- Confirm that the GMF Pond meets all of the requirements associated with §257.73(a)(2), (c), (d), (e), and §257.82, or, if the GMF Pond does not meet any of these requirements, provide recommendations for compliance with those sections of the CCR Rule [1].

# SECTION 2

# COMPARISION OF INITIAL AND PERIODIC SITE CONDITIONS

## 2.1 Overview

This section describes the comparison of conditions at the GMF Pond between the start of the initial CCR certification program in 2015 and 2016 (initial conditions) and subsequent collection of periodic certification site data in 2020 and 2021 (periodic conditions).

## 2.2 Review of Annual Inspection Reports

Annual onsite inspections for the GMF Pond were performed between 2016 and 2020 ( [9], [10], [11], [12], [13]) were certified by a licensed professional engineer in accordance with §257.83(b). Each inspection report stated the following information, relative to the previous inspection:

- A statement that no changes in geometry of the impounding structure were observed since the previous inspection;
- A statement that no instrumentation was present;
- Approximate volumes of impounded water and CCR at the time of inspection;
- A statement that no appearances of actual or potential structural weakness or other disruptive conditions were observed; and
- A statement that no other changes which may have affected the stability or operation of the impounding structure were observed.

In summary, the reports did not indicate any significant changes to the GMF Pond between 2015 and 2020. No signs of instability, structural weakness, or changes which may have affected the operation or stability of the GMF Pond were noted in the inspection reports.

## 2.3 Review of Instrumentation Data

Multiple groundwater monitoring wells are present around the GMF Pond. Eight of the groundwater monitoring wells, G50S, G51S, G54C, G57C, G57S, G60S, G64S, and X301 have been monitored periodically since by IPRG. Water level readings were provided from December 2, 2015 through June 21, 2021 for most of the wells, with the exception of X301, for which water level readings were provided starting on March 2, 2015, and G54C, for which readings were provided starting on April 14, 2021. Geosyntec reviewed the water levels to evaluate if significant fluctuations, partially increases in phreatic levels, may have occurred between development of the

initial structural stability and factor of safety certifications ( [4], [5], [8]) and June 21, 2021. Available monitoring well water levels are plotted in **Attachment A**.

In summary, only minor changes in phreatic conditions were observed in the available monitoring well level data. Phreatic levels typically exhibited consistent seasonal variations of 5 to 10 ft, with the exception of X301 and G54C, which varied by approximately 2 ft. These levels do not significantly differ from those utilized for the initial structural stability and factor of safety certifications ( [4], [5], [8]).

## 2.4 Comparison of Initial to Periodic Surveys

The initial survey of the GMF Pond, conducted by Weaver Consultants (Weaver) in 2015 [14], was compared to the periodic survey of the GMF Pond, conducted by IngenAE, LLC (IngenAE) in 2020 [15], using AutoCAD Civil3D 2021 software. This comparison quantified changes in the volume of CCR placed within the GMF Pond and considered volumetric changes above and below the starting water surface elevation (SWSE) used for the 2016 §257.82 inflow design flood control plan hydraulic analysis [6]. Potential changes to embankment geometry were also evaluated. This comparison is presented in side-by-side comparison of the two surveys in **Drawing 1,** and a plan view isopach map denoting changes in ground surface elevation in **Drawing 2**. A summary of the water elevations and changes in CCR volumes is provided in **Table 2**.

**Table 2 – Initial to Periodic Survey Comparison**

| | |
|---|---|
| **Initial Surveyed Pool Elevation (ft)** | 614.2 |
| **Periodic Surveyed Pool Elevation (ft)** | 613.9 |
| **Initial §257.82 Starting Water Surface Elevation (SWSE) (ft)** | 616.0 |
| **Total Change in CCR Volume* (CY)** | + 8,000 (Fill) |
| **Change in CCR Volume Above SWSE* (CY)** | - 9,000 (Cut) |
| **Change in CCR Volume Below SWSE* (CY)** | + 17,000 (Fill) |

*All volumes rounded to the nearest 1,000 CY

The comparison indicated that approximately 8,000 CY of CCR was placed in the GMF Pond between the initial and periodic surveys. The CCR was placed entirely below the SWSE and a net cut occurred above the SWSE. CCR grades above the SWSE were generally similar to the initial survey (e.g., within +/- 2 ft). These changes are considered unlikely to result in increase in the peak water surface elevation (PWSE) during a flood event, as additional flood storage is present relative to conditions observed in 2015. No significant changes to embankment geometry appeared to have occurred between the initial and periodic surveys.

## 2.5 Comparison of Initial to Periodic Aerial Photography

Initial aerial photographs of the GMF Pond collected by Weaver in 2015 [14] were compared to periodic aerial photographs collected by IngenAE in 2020 [15] to visually evaluate if potential site changes (i.e., changes to the embankment, outlet structures, limits of CCR, other appurtenances)

may have occurred. A comparison of these aerial photographs is provided in **Drawing 3**. No significant changes were noted during this comparison.

## 2.6 Comparison of Initial to Periodic Site Visits

An initial site visit to the GMF Pond was conducted by AECOM in 2015 and documented with a Site Visit Summary and corresponding photographs [16]. A periodic site visit was conducted by Geosyntec on May 27, 2021, with Mr. Lucas P. Carr, P.E. conducting the site visit. The site visit was intended to evaluate potential changes at the site since the initial certifications were prepared (i.e., modification to the embankment, outlet structures or other appurtenances, limits of CCR, maintenance programs, repairs), in addition to performing visual observations of the GMF Pond to evaluate if the structural stability requirements (§257.73(d)) were still met. The stie visit included walking the perimeter of the GMF Pond, visually observing conditions, recording field notes, and collecting photographs. The site visit is documented in a photographic log provided in **Appendix A**. A summary of significant findings from the periodic site visit is provided below:

- Overall site maintenance appears to be similar to conditions observed in 2015.
- No signs or structural stability, erosion, or required maintenance items were observed during the stie visit.

## 2.7 Interview with Power Plant Staff

An interview with Mr. Daryl Johnson and Mr. Brandon Potter of the DCPP was conducted by Lucas P. Carr, P.E. of Geosyntec on May 27, 2021. Mr. Johnson, at the time of the interview, had been employed at the DCPP for 8 years and was responsible for environmental compliance and completed weekly CCR inspections on some years, including for the GMF Pond, in addition to managing vegetation maintenance. Mr. Potter, at the time of the interview, had been employed at DCPP for 10 years and assisted in the inspection and operation of the GMF Pond. The interview included a discussion of included a discussion of potential changes that that may have occurred at the GMF Pond since development of the initial certifications ( [2], [7], [3], [4], [5], [6], [8]).

- Were any construction projects completed for the GMF Pond since 2015, and, if so, are design drawings and/or details available?
    - No.
- Were there any changes to the purpose of the GMF Pond since 2015?
    - The DCPP was closed in December of 2019. Sluicing into the GMF Pond and pumping of water from the GMF Recycle Pond was stopped at this time.
- Were there any changes to the to the instrumentation program and/or physical instruments for the GMF Pond since 2015?

- The GMF Pond does not have instrumentation, so no changes occurred.

- Have area-capacity curves for the GMF Pond been prepared since 2015?
  - No known area-capacity curves have been developed.
- Were there any changes to spillways and/or diversion features for the GMF Pond completed since 2015?
  - No.
- Were there any changes to construction specifications, surveillance, maintenance, and repair procedures for the GMF Pond since 2015?
  - No.
- Were there any instances of dike and/or structural instability for the GMF Pond since 2015?
  - No known instances occurred.

# SECTION 3

# HAZARD POTENTIAL CLASSIFICATION - §257.73(a)(2)

## 3.1 Overview of Initial HPC

The Initial Hazard Potential Classification (Initial HPC) was prepared by Stantec Consulting Services, Inc. (Stantec) in 2016 ( [2], [7]), following the requirements of §257.73(a)(2). The Initial HPC included the following information:

- Visual analysis to evaluate potential hazards associated with a failure of the GMF Pond perimeter dike, along the north, south, east, and west embankments of the GMF Pond.
- Evaluation of potential breach flow paths using elevation data and aerial imagery to assess potential impacts to downstream structures, infrastructure, and waterways.
- While a breach map is not included within the Initial HPC, it included within the §257.73(a)(3) Initial Emergency Action Plan (Initial EmAP) [17].

The visual analysis indicated that only structures owned by DCPP were within the potential breach path, and that public impacts were limited to portions of North Bethel Cemetery Road and the railroad leading to the Power Plant. The reported noted that North Bethel Cemetery Road is intermittently used, and the at-risk population was considered transient. The Initial HPC concluded that breach of the GMF pond would be unlikely to result in a probable loss of human life, although the breach could cause CCR to be released into downstream waterways, thereby causing environmental damage. The Initial HPC therefore recommended a “Significant” hazard potential classification for the GMF Pond [2].

## 3.2 Review of Initial HPC

Geosyntec performed a review of the Initial HPC ( [2], [7]), in terms of technical approach, assessment of the results, and applicable requirements of the CCR Rule [1]. No significant technical issues were noted within the technical review, although a detailed review (e.g., check) of the calculations was not performed as the initial HPC utilized a visual assessment.

## 3.3 Summary of Site Changes Affecting the Initial HPC

Geosyntec did not identify any changes at the site that may affect the HPC. No new structures, infrastructure, frequently occupied facilities/areas, or waterways were observed to be present in the probable breach area indicated in the Initial EmAP [17]. Additionally, no significant changes to the topography in the probable breach were identified.

## 3.4 Periodic HPC

Geosyntec recommends retaining the "Significant" hazard potential classification for the GMF Pond, per §257.73(A)(2), based on the lack of site changes potentially affecting the Initial HPC occurring since the initial HPC was developed, as described in **Section 3.3**, and the lack of significant review comments, as described in **Section 3.2**. Updates to the Initial HPC reports ( [2], [7]) are not recommended at this time.

# SECTION 4

# HISTORY OF CONSTRUCTION REPORT - §257.73(c)

## 4.1 Overview of Initial HoC

The Initial History of Construction report (Initial HoC) was prepared by AECOM in 2016 [3] following the requirements of §257.73(c) and included information on all non-incised CCR surface impoundments at DCPP, including the GMF Pond, Ash Pond No. 1, and Ash Pond No. 2. This report only discusses the HoC as it pertains to the GMF Pond. The Initial HoC included the following information for the GMF Pond:

- The name and address of the owner/operator,
- Location maps,
- Statements of purpose,
- The names and size of the surrounding watershed,
- A description of the foundation and abutment materials,
- A description of the dike materials,
- Approximate dates and stages of construction,
- Available design and engineering drawings,
- A summary of instrumentation,
- Area-capacity curves for the GMF Pond,
- Information on spillway structures,
- Construction specifications,
- Inspection and surveillance plans,
- A statement that operations and maintenance plans are being generated or revised, and that the report will be updated when the new plans are available,
- A statement that no known historical structural instability has occurred at the CCR surface impoundments.

## 4.2 Summary of Site Affecting the Initial HoC

One significant change at the site that occurred after development of the initial HoC report [3] was identified and is described below:

- Electricity generation at the DCPP ceased in December of 2019 and the pumping of inflow and outflow into and from the GMF Recycle Pond ceased at this time.
    - An update to the HoC report was performed to state that the DCPP is no longer active and the GMF Pond is no lower receiving inflows and outflow is no longer pumped back to the DCPP. A letter documenting changes to the HoC report is provided in **Attachment C**.

# SECTION 5

# STRUCTURAL STABILITY ASSESSMENT - §257.73(d)

## 5.1 Overview of Initial SSA

The Initial Structural Stability Assessment (Initial SSA) was prepared by AECOM in 2016 ( [4], [8]), following the requirements of §257.73(d)(1), and included the following evaluations:

- Stability of dike foundations, dike abutments, slope protection, dike compaction, and slope vegetation,
- Spillway stability including capacity, structural stability and integrity; and
- Downstream slope stability under sudden drawdown conditions for a downstream water body.

The Initial SSA ( [4], [8]) concluded that the GMF Pond met all structural stability requirements for §257.73(d)(1)(i)-(vii). This included noting that the structural integrity of hydraulic structures (§257.73(d)(1)(vi)) was not applicable, due to no hydraulic structures penetrating or underlying the base of the GMF Pond. Additionally, it was noted that the stability of downstream slopes inundated by water bodies (§257.73(d)(1)(vii) was also not applicable, due to inundation of the downstream slopes not being expected.

## 5.2 Review of Initial SSA and Updated Periodic SSA

Geosyntec performed a review of the Initial SSA ( [4], [8]) in terms of technical approach, calculation input parameters and methodology, recommendations, and completeness. The review included the following tasks:

- Reviewing photographs collected in 2015 and used to demonstrate compliance with §257.73(d)(1)(i)-(vii).
- Reviewing geotechnical calculations used to demonstrate the stability of foundations, per §257.73(d)(1)(i) and sufficiency of dike compaction, per §257.73(d)(1)(iii), in terms of supporting geotechnical investigation and testing data, input parameters, analysis methodology, selection of critical cross-sections, and loading conditions.
- Review of the methodology used to demonstrate that a downstream water body that could induce a sudden drawdown condition, per §257.73(d)(1)(vii), is not present.

One review comment and corresponding recommended technical update was identified during review of the geotechnical analyses supporting the sufficiency of dike compaction

(§257.73(d)(1)(i)) and foundation and abutment stability (§257.73(d)(1)(iii) portions of the Initial SSA. These analyses were performed for the Initial Safety Factor Assessment (SFA) but also utilized to support the initial SSA. The review comment and subsequent updates the Initial SFA, are discussed in **Section 6.**

## 5.3 Summary of Site Changes Affecting the Initial SSA

No changes since development of the Initial SSA were identified that would require updates to the Initial SSA ( [4], [8]).

## 5.4 Periodic SSA

The updated Periodic SFA (**Section 7**) indicates that foundations and abutments are stable and dike compaction is sufficient for expected ranges in loading conditions, as slope stability factors of safety for slip surfaces passing through the dike and foundation were found to meet or exceed the requirements of §257.73(e)(1), including for static maximum storage pool conditions and post-earthquake (i.e., liquefaction) loading conditions considering seismically-induced strength loss in the foundation soils. Therefore, the requirements of §257.73(d)(1)(i) and §257.73(d)(1)(iii) are met for the Periodic SSA.

# SECTION 6

# SAFETY FACTOR ASSESSMENT - §257.73(e)(1)

## 6.1 Overview of Initial SFA

The Initial Safety Factor Assessment (Initial SFA) was prepared by AECOM in 2016 ( [5], [8]) following the requirements of §257.73(e)(1). The Initial SFA included the following information:

- A geotechnical investigation program with in-situ and laboratory testing;
- An assessment of the potential for liquefaction in the dike and foundation soils;
- The development of a single slope stability cross-sections for limit equilibrium stability analysis utilizing GeoStudio SLOPE/W software; and
- The analysis of the cross-section for maximum storage pool, maximum surcharge pool, and seismic loading conditions.
    - Liquefaction loading conditions were not evaluated as liquefaction-susceptible soil layers were not identified in either the embankments or foundation soils.

The Initial SFA concluded that the GMF Pond met all safety factor requirements, per §257.73(e), as all calculated safety factors were equal to or higher than the minimum required values.

## 6.2 Review of Initial SFA

Geosyntec performed a review of the Initial SFA ( [5], [8]) in terms of technical approach, calculation input parameters and methodology, recommendations, and completeness. The review included the following tasks:

- Reviewing geotechnical calculations used to demonstrate the acceptable safety factors, per §257.73(e)(1), in terms of:
    - Completeness and adequacy of supporting geotechnical investigation and testing data;
    - Completeness and approach of liquefaction triggering assessments; and
    - Input parameters, analysis methodology, selection of critical cross-sections, and loading conditions utilized for slope stability analyses.
    - Phreatic conditions based on piezometric data collected between March 2, 2015 June 21, 2021, as discussed in **Section 2.3**.

One review comment was identified during review of the Initial SFA. The comment and the is described below:

- The Initial SFA utilized a single cross-section (A-A') along the eastern embankment where the exterior slope is approximately 8 ft tall. However, the maximum height of the exterior slope is approximately 11 ft at the southwest corner of the embankment.

## 6.3 Summary of Site Changes Affecting the Initial SFA

No changes since development of the Initial SFA were identified that would require updates to the Initial SFA ( [5], [8]).

## 6.4 Periodic SFA

Following review of the Initial SFA ( [5], [8]), Geosyntec developed a new slope stability analysis cross-section (B-B') at the southwest corner of the GMF Pond embankment to account for the maximum embankment height of 11 ft. The model was developed utilizing the following approach and input data:

- Ground surface geometry was obtained from the 2020 survey of the GMF Pond [15].

- Subsurface stratigraphy was obtained from 2007 borings B-53 and B-67, as provided in the Initial SFA report [8]. Geosyntec reviewed the boring data and determined that subsurface conditions were similar to conditions at cross-section A-A'. Therefore, the soil properties (i.e., strength, unit weight) from the Initial SFA ( [5], [8]) were utilized for cross-section B-B',

- Piezometric levels in the foundation soils were assumed to follow the ground surface past the embankment toe, per providing readings from monitoring wells G51S and G54C; and,

- All other analysis settings and input data from the Initial SFA ( [5], [8]) was utilized, including, but not limited to, software package and version, slip surface search routines and methods, and pseudostatic seismic coefficients.

Factors of safety form the Periodic SFA (cross-section B-B') and Initial SFA (cross-section A-A') are summarized in **Table 3** and confirm that the GMF Pond meets the requirements of §257.73(e)(1). A location of the cross-section B-B' in plan and analysis output data for cross-section B-B' is provided in **Attachment D**.

**Table 3 – Factors of Safety from Periodic SFA**

| | Structural Stability Assessment (§257.73(d)) and Safety Factor Assessment (§257.73(e)) | | | | Structural Stability Assessment (§257.73(d)) |
|---|---|---|---|---|---|
| **Cross-Section** | **Maximum Storage Pool §257.73(e)(1)(i) Minimum Required = 1.50** | **Maximum Surcharge Pool §257.73(e)(1)(ii) Minimum Required = 1.40** | **Seismic §257.73(e)(1)(iii) Minimum Required = 1.00** | **Dike Liquefaction §257.73(e)(1)(iv) Minimum Required = 1.20** | **Foundation Liquefaction §257.73(d)(1)(i) Minimum Required = 1.20** |
| A-A' | 4.27 | 4.26 | 2.37 | N/A | N/A |
| B-B' | 3.47* | 3.47* | 1.88* | N/A | N/A |

Notes:
[1]Denotes cross-section where results from the Initial SFA are presented due to no observed changes relative to the Initial IDF.
[2]Denotes cross-section where changes are occurred, and results are presented from the updated Periodic SFA.
*Indicates critical cross-section (i.e., lowest calculated factor of safety out of the two cross-sections analyzed)
N/A – Loading condition is not applicable.

# SECTION 7

# INFLOW DESIGN FLOOD CONTROL SYSTEM PLAN - §257.82

## 7.1 Overview of Initial IDF

The Initial Inflow Design Flood Control System Plan (Initial IDF) was prepared by AECOM in 2016 ( [6], [8]) following the requirements of §257.82. The Initial IDF included the following information:

- A hydraulic and hydrologic analysis, performed for the 1,000-year design flood event because of the hazard potential classification of "significant", which corresponded to 9.37 inches of rainfall over a 24-hour period.
- The Initial IDF utilized a HydroCAD Version 8.5 model to evaluate spillway flows and pool level increases during the design flood, with a SWSE of 616.0 ft.

The Initial IDF ( [6], [8]) concluded that the GMF Pond met the requirements of §257.82, as the peak water surface estimated by the HydroCAD model was El. 618.3 ft, relative to a minimum GMF Pond dike crest elevation of 620.0 ft. Therefore, overtopping was not expected. The Initial IDF also evaluated the potential for discharge from the CCR unit and determined that discharge into Waters of the United States and no overtopping was expected during the 1,000-year design flood.

## 7.2 Review of Initial IDF

Geosyntec performed a review of the Initial IDF ( [6], [8]) in terms of technical approach, calculation input parameters and methodology, recommendations, and completeness. The review included the following tasks:

- Reviewing the return interval used vs. the hazard potential classification.
- Reviewing the rainfall depth and distribution for appropriateness.
- Performing a high-level review of the inputs to the hydrological modeling.
- Reviewing the hydrologic model parameters for spillway parameters, starting pool elevation, and storage vs. the reference data.
- Reviewing the overall Initial IDF vs. the applicable requirements of the CCR Rule [1].

No significant technical issues were noted within the technical review, although a detailed review (e.g., check) of the calculations was not performed.

## 7.3 Summary of Site Changes Affecting the Initial IDF

No changes since development of the Initial IDF were identified that would require updates to the Initial IDF ( [6], [8]).

# SECTION 8

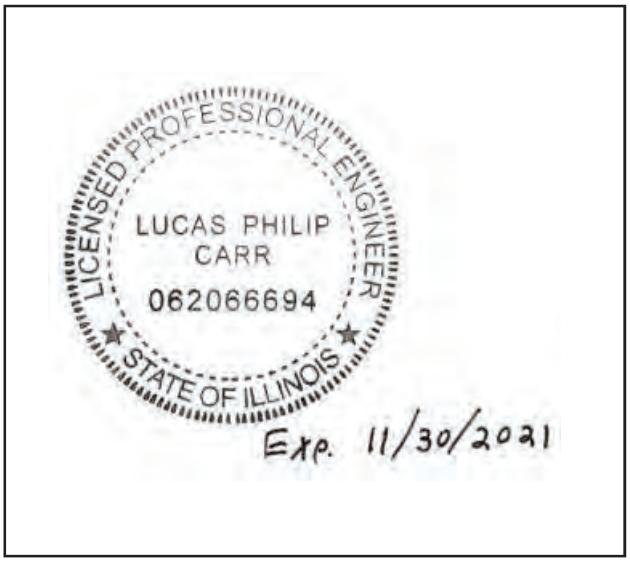
# CONCLUSIONS

The GMF Pond at DCPP was evaluated relative to the USEPA CCR Rule periodic assessment requirements for:

- Hazard potential classification (§257.73(a)(2)),
- History of Construction reporting (§257.73(d)),
- Structural stability assessment (§257.73(d)),
- Safety factor assessment (§257.73(e)), and
- Inflow design flood control system planning (§257.82).

Based on the evaluations presented herein, the referenced requirements are satisfied.

Electronic Filing: Received, Clerk's Office 06/20/2024



## SECTION 9

## CERTIFICATION STATEMENT

CCR Unit: Illinois Power Resources Generation, LLC; Duck Creek Power Plant, GMF Pond

I, Lucas P. Carr, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief that the information contained in this 2021 USEPA CCR Rule Periodic Certification Report, has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the periodic assessment of the hazard potential classification, history of construction report, structural stability, emergency action plan, safety factors, and inflow design flood control system planning, dated October 2021, were conducted in accordance with the requirements of 40 CFR §257.73(a)(2), (c), (d), (e), and §257.82.

Canton, Illinois 61520

**Subject: Periodic History of Construction Report Update Letter**
**USEPA Final CCR Rule, 40 CFR §257.73(c)**
**Duck Creek Power Plant**
**Canton, Illinois**

At the request of Illinois Power Resources Generating, LLC (IPRG), Geosyntec Consultants (Geosyntec) has prepared this Letter to documents updates to the Initial History of Construction (HoC) report for the Duck Creek Power Plant (DCPP), also known as the Duck Creek Power Station (DUC). The Initial HoC report was prepared by AECOM in October of 2016 [1] in accordance with 40 Code of Federal Regulations (CFR) §257.73(c) of the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals Rule, known as the CCR Rule [2]. This letter also includes information required by Section 845.220(a)(1)(B) (Design and Construction Plans) of the state-specific Illinois Environmental Protection Agency (IEPA) Part 845 CCR Rule [3] that is not expressly required by §257.73(c).

## BACKGROUND

The CCR Rule required that, by October 17, 2016, Initial HoC reports to be compiled for existing CCR surface impoundments with: (1) a height of five feet or more and a storage volume of 20 acre-feet or more, or (2) a height of 20 feet or more. The Initial HoC report was required to contain, to the extent feasible, the information specified in 40 CFR §257.73(c)(1)(i)-(xii). The Initial HoC report for DCPP, which included three existing CCR surface impoundments, the GMF Pond (GMFP), Ash Pond No. 1 (AP1), and Ash Pond No. 2 (AP2), was prepared and subsequently posted to IPRG's CCR Website prior to October 17, 2016.

The CCR Rule requires that Initial HoC to be updated if there is a significant change to any information complied in the Initial HoC report, as listed below:

*§ 257.73(c)(2): If there is a significant change to any information complied under paragraph (c)(1) of this section, the owner or operator of the CCR unit must update the relevant information and place it in the facility's operating record as required by § 257.105(f)(9).*

IPRG retained Geosyntec to review the Initial HoC report, review reasonably and readily available information for the GMFP, AP1, and AP2 generated since the Initial HoC report was prepared, and perform a site visit to DCPP to evaluate if significant changes may have occurred since the Initial HoC report was prepared.

This Letter contains the results of Geosyntec's evaluation and documents significant changes that have occurred at the GMFP, AP1, and AP2 at DCPP, as they pertain the requirements of §257.73(c)(1)(i)-(xii)

## UPDATES TO HISTORY OF CONSTRUCTION REPORT

Geosyntec's evaluation for the DCPP GMFP, AP1, and AP2 determined that no known significant changes requiring updates to the information in the Initial HoC report pertaining to §257.73(c)(1)(i)-(ii), §257.73(c)(1)(iv)-(vii), §257.73(c)(1)(ix), and §257.73(c)(1)(xi)-(xii) of the CCR Rule had occurred since the Initial HoC report was developed.

However, Geosyntec's evaluation determined that significant changes at the DCPP GMFP, AP1, and AP2 pertaining to §257.73(c)(1)(iii), §257.73(c)(1)(viii), §257.73(c)(1)(x) of the CCR Rule had occurred since the Initial HoC report had been developed. Additionally, information how long the CCR surface impoundments have been operating and the types of CCR in the surface impoundments, as required by Section 845.220(a)(1)(B) of the Part 845 Rule were not included in the Initial HoC report, as this information is not required by the CCR Rule. Each change and the subsequent updates to the Initial HoC report is described within this section.

*Section 845.220(a)(1)(B): A statement of ... how long the CCR surface impoundment has been in operation, and the types of CCR that have been placed in the surface impoundment.*

*GMF Pond*

GMFP is in operation since 2009. As of the date of this report, the GMFP has been present for approximately 12 years.

CCR placed in the GMFP is being used to store and dispose of gypsum and to clarify recycled process water for plant operations [4].

*Ash Pond No. 1*

Electronic Filing: Received, Clerk's Office 06/20/2024

AP1 was in operation from 1976 until November 2015, for a total of approximately 39 years.

CCR placed in AP1 was used to store and dispose of fly ash and bottom ash [4].

*Ash Pond No. 2*

AP2 was in operation from 1986 until November 2015, for a total of approximately 35 years.

CCR placed in AP2 was used to store and dispose of fly ash and bottom ash and to clarify CCR contact stormwater prior to discharge.

*§257.73(c)(1)(i): The name and address of the person(s) owning or operating the CCR unit; the name associated with the CCR unit; and the identification number of the CCR unit if one has been assigned by the state.*

The state identification numbers (ID) for the GMFP, AP1 and AP2 have been assigned by the Illinois Environmental Protection Agency (IEPA). The IDs are listed in **Table 1**.

**Table 1 – IEPA ID Numbers**

| CCR Surface Impoundment | | State ID |
|---|---|---|
| Ash Pond No. 1 | | W0578010001-01 |
| Ash Pond No. 2 | | W0578010001-02 |
| GMF Pond | | W0578010001-04 |

*§ 257.73(c)(1)(iii): A statement of the purpose for which the CCR unit is being used.*

AP1 and AP2 were closed in 2021, in substantial compliance with the written closure plans posted to IPRG's CCR Website ( [5], [6]), and as documented by a certified Notification of Completion of Closure posted to IPRG's CCR Website [7]. Therefore, AP1 and AP2 are no longer capable of storing CCR or free liquids.

The DCPP was retired in December of 2019, with the generation of electricity ceased at that time. Therefore, the GMFP is no longer being used to storge and disposed of gypsum or to clarify recycled process water for use in plant operations, as gypsum is no longer being generated and process water is no longer required by the DCPP.

*§ 257.73(c)(1)(viii): A description of the type, purpose, and location of existing instrumentation.*

Instrumentation monitoring at AP1 and AP2 is no longer required as both CCR surface impoundments were closed in accordance with §257.102 [7], and the instrumentation

Electronic Filing: Received, Clerk's Office 06/20/2024

network was modified at that time. Therefore, the instrumentation locations shown in Appendix C of the Initial HoC report are no longer applicable to AP1 and AP2.

*§ 257.73(c)(1)(x): A description of each spillway and diversion design features and capacities and calculations used in their determination.*

AP1 and AP2 no longer retain free water as both CCR surface impoundments were closed in 2021 [7]. Therefore, spillways are no longer present the information regarding the spillways of these structures, as presented in the Initial HoC report, is no longer applicable to AP1 and AP2.

**CLOSING**

This letter has been prepared to document Geosyntec's evaluation of changes that have occurred at the GMFP, AP1, and AP2 at the DCPP since the Initial HoC was developed, based on reasonably and readily available information provided by IPRG, observed by Geosyntec during the site visit, or generated by Geosyntec as part of subsequent calculations.

Sincerely,

Lucas P. Carr, P.E.

# 1.0 FACILITY INFORMATION

## 1.1 Coal Combustion Residuals Material Received

The Gypsum Management Facility (GMF) Pond is used to store gypsum (calcium sulfate), a byproduct of the wet scrubber system that was used for flue gas desulfurization at the Duck Creek Power Plant. The synthetic gypsum is generally of the same chemical makeup as natural gypsum.

### 1.1.1 Chemical Analysis

Available information regarding chemical analysis of the gypsum that is stored in the GMF Pond is provided in Attachment 1.

## 1.2 Facility Capacity

The GMF Pond capacity was estimated as 2,200,000 cubic yards in the closure plan prepared in 2016 for compliance with 40 CFR 257.102. However, the Duck Creek Power Plant was retired in December 2019, before the GMF Pond could be filled to its capacity. The amount of coal combustion residuals (CCR) currently contained in the GMF Pond was estimated by a volumetric analysis using Autodesk Civil 3D as approximately 400,000 cubic yards. No additional CCR will be placed in the GMF Pond.

## 1.3 Facility Operation

The GMF Pond is no longer receiving CCR or other waste streams. The GMF Pond received CCR from early 2009 until the Duck Creek Power Plant was retired in December 2019.

## 1.4 Transportation Plan

During operation, transport of CCR to the GMF Pond was by pipeline. Figure 1 shows the main route that is used for vehicle travel between the Duck Creek Power Plant and the GMF Pond. Figure 1 also shows the route that will be used to transport borrow materials from a soil stockpile to the GMF Pond for closure and to transport soils excavated during closure to the soil stockpile. These routes are all on site.

Electronic Filing: Received, Clerk's Office 06/20/2024

Electronic Filing: Received, Clerk's Office 06/20/2024

DYNEGY

# Safety Data Sheet

## Section 1
## Identification of the Substance and of the Supplier

### 1.1 Product Identifier

| | |
|---|---|
| **Product Name/Identification:** | FGD Gypsum |
| **Synonyms:** | Gypsum, calcium sulfate dihydrate, calcium sulphate dihydrate, gesso, alabaster, plaster of Paris. |
| **Formula:** | UVCB Substance |

### 1.2 Relevant Identified Uses of the Substance or Mixture and Uses Advices Against

| | |
|---|---|
| **Relevant Identified Uses:** | Component of wallboard, concrete, roofing material, bricks, cement kiln feed, agricultural amendment. |
| **Uses Advised Against:** | None known. |

### 1.3 Details of the Supplier of the SDS

| | |
|---|---|
| **Manufacturer/Supplier:** | Dynegy, Inc. |
| **Street Address:** | 601 Travis Street, Suite 1400 |
| **City, State and Zip Code:** | Houston, TX 77002 |
| **Customer Service Telephone:** | 800-633-4704 |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 2
## Hazards Identification

### 2.1 Classification of the Substance

**GHS Classification(s) according to OSHA Hazard Communication Standard (29 CFR 1910.1200):**

- STOT-SE Category 3 (Respiratory Irritation)
- STOT-RE Category 1 (Lungs)
- Carcinogen Category 1A

### 2.2 Label Elements

| ***Labelling according to 29 CFR 1910.1200 Appendices A, B and C**** | |
|---|---|
| ***Hazard Pictogram(s):*** |  |
| ***Signal word:*** | **DANGER** |
| ***Hazard Statement(s):*** | *May cause respiratory irritation.*<br>*Causes damage to lungs after repeated/prolonged exposure via inhalation.*<br>*May cause cancer of the lungs.* |
| ***Precautionary Statement(s):*** | *Obtain special instructions before use.*<br>*Do not handle until all safety precautions have been read and understood.*<br>*Do not breathe dust.*<br>*Wash hands thoroughly after handling.*<br>*Do not eat, drink or smoke when using this product.*<br>*Wear protective gloves/protective clothing/eye protection/face protection.*<br>*Do not eat drink or smoke when using this product.*<br>*Use outdoors or in a well-ventilated area.*<br>*If inhaled: Remove to fresh air and keep comfortable for breathing.*<br>*Get medical advice/attention if you feel unwell.*<br>*Store in a secure area.*<br>*Dispose of product in accordance with local/national regulations.* |

*The following elements may be present in trace amounts as oxides: aluminum, calcium, iron, magnesium, nickel, phosphorus, potassium, silicon, sulfur, titanium, and vanadium. The exact composition of the gypsum will be dependent on the fuel source and flue additives composed of many constituents.*

Electronic Filing: Received, Clerk's Office 06/20/2024

### 2.3 Other Hazards

**Listed Carcinogens:**

**-Respirable Crystalline Silica**

**IARC:** [Yes] **NTP:** [Yes] **OSHA:** [Yes] **Other:** **(ACGIH)** [Yes]

## Section 3
## Composition/Information on Ingredients

| ***Substance*** | ***CAS No.*** | ***Percentage (%)*** | ***GHS Classification*** |
|---|---|---|---|
| *Calcium sulfate, dihydrate* | *10104-14-1* | *90 - 99%* | *STOT – Single Exposure Category 3 (Respiratory Irritation)* |
| *Crystalline Silica* | *14808-60-7* | *≥0.1 - 3%* | *STOT – Repeated Exposure Category 1 (Lung)*<br>*Carcinogen, Category 1A* |
| *Silica, crystalline respirable (RCS)* | *14808-60-7* | ***See Footnote 1*** | *STOT – Repeated Exposure Category 1 (Lungs)*<br>*Carcinogen Category 1A* |
| *Fly Ash* | *68131-74-8* | *<2%* | *STOT – Single Exposure Category 3 (Respiratory Irritation)* |

***Footnote 1:*** *The percentage of respirable crystalline silica has not been determined. Therefore, a GHS classification of Carcinogen, Category 1A has been assigned.*

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 4
## First Aid Measures

### 4.1 Description of First Aid Measures

| | |
|---|---|
| **Inhalation:** | If product is inhaled and irritation of the nose or coughing occurs, remove person to fresh air. Get medical advice/attention if respiratory symptoms persist. |
| **Skin Contact:** | If skin exposure occurs, wash with soap and water. |
| **Eye Contact:** | If product gets into the eye, rinse copiously with water for several minutes. Remove contact lenses, if present and easy to do. Seek medical attention/advice if irritation occurs or persists. |
| **Ingestion:** | No specific first aid measures are required. |

### 4.2 Most Important Health Effects, Both Acute and Delayed

**Acute Effects:** Short-term airborne exposure to FGD gypsum dust may cause respiratory irritation. Direct exposure can dry and irritate the skin and cause dermatitis or eye irritation through mechanical abrasion.

**Chronic Effects:** Chronic (long-term) exposure to FGD gypsum may cause lung damage from repeated exposure. Prolonged inhalation of dusts containing respirable crystalline silica above certain concentrations may cause lung disease (silicosis) and lung cancer.

### 4.3 Indication of Any Immediate Medical Attention and Special Treatment Needed

Seek first aid or call a doctor or Poison Control Center if contact with eyes occurs and irritation remains after rinsing. Get medical advice if inhalation occurs and respiratory symptoms persist.

## Section 5
## Firefighting Measures

### 5.1 Extinguishing Media

| | |
|---|---|
| **Suitable Extinguishing Media:** | Product is not flammable. Use extinguishing media appropriate for surrounding fire. |
| **Unsuitable Extinguishing Media:** | Not applicable, the product is not flammable. |

Electronic Filing: Received, Clerk's Office 06/20/2024

### 5.2 Special Hazards Arising from the Substance or Mixture

| | |
|---|---|
| **Hazardous Combustion Products:** | Above 1450°C (~2600°F), gypsum decomposes to calcium oxide and sulfur dioxide. |

### 5.3 Advice for Firefighters

| | |
|---|---|
| **Special Protective Equipment and Precautions for Firefighters:** | As with any fire, wear self-contained breathing apparatus (NIOSH approved or equivalent) and full protective gear. |

## Section 6
## Accidental Release Measures

### 6.1 Personal Precautions, Protective Equipment and Emergency Procedures

| | |
|---|---|
| **Personal precautions/Protective Equipment:** | See Section 8.2.2 Individual Protective Measures. For concentrations exceeding Occupational Exposure Levels (OELs), use a self-contained breathing apparatus (SCBA). |
| **Emergency procedures:** | Use scooping, water spraying/flushing/misting or ventilated vacuum cleaning systems to clean up spills. Do not use pressurized air. |

### 6.2 Environmental Precautions

| | |
|---|---|
| **Environmental precautions:** | Prevent contamination of drains or waterways and dispose according to local and national regulations. |

### 6.3 Methods and Material for Containment and Cleaning Up

| | |
|---|---|
| **Methods and materials for containment and cleaning up:** | Do not use brooms or compressed air to clean surfaces. Use dust collection vacuum and extraction systems.<br>Large spills of dry product should be removed by a vacuum system. Dampened material should be removed by mechanical means and recycled or disposed of according to local and national regulations. |

See Sections 8 and 13 for additional information on exposure controls and disposal.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 7
## Handling and Storage

### 7.1 Precautions for Safe Handling

Practice good housekeeping. Use adequate exhaust ventilation, dust collection and/or water mist to maintain airborne dust concentrations below permissible exposure limits (note: respirable crystalline silica dust may be in the air without a visible dust cloud).

Do not permit dust to collect on walls, floors, sills, ledges, machinery, or equipment. Maintain and test ventilation and dust collection equipment. In cases of insufficient ventilation, wear a NIOSH approved respirator for silica dust when handling or disposing dust from this product. Avoid contact with skin and eyes. Wash or vacuum clothing that has become dusty. Avoid eating, smoking, or drinking while handling the material.

### 7.2 Conditions for Safe Storage, Including any Incompatibilities

Minimize dust produced during loading and unloading.

## Section 8
## Exposure Controls/Personal Protection

### 8.1 Control Parameters

| OCCUPATIONAL EXPOSURE LIMITS | | | | | |
|---|---|---|---|---|---|
| **SUBSTANCE** | | **OSHA PEL TWA ($mg/m^3$)** | **NIOSH REL TWA ($mg/m^3$)** | **ACGIH TLV TWA ($mg/m^3$)** | **CA - OSHA PEL ($mg/m^3$)** |
| **Particulates Not Otherwise Regulated** | Total | 15 | 15 | 10 | 10 |
| | Respirable | 5 | 5 | 3 | 5 |
| **Respirable Crystalline Silica** | Total Respirable | 0.05- | 0.05 | 0.025 | 0.05 |
| **Calcium Sulfate, anhydrous (CAS# 7778-18-9)** | Total Dust | * | 10 | 10 | * |
| | Respirable | * | 5 | - | * |
| Note: In the absence of a CA-PEL, the value for Particulates Not Otherwise Regulated (PNOR) is applied. | | | | | |

### 8.2 Exposure Controls

### 8.2.1 Engineering Controls

Electronic Filing: Received, Clerk's Office 06/20/2024

Provide ventilation to maintain the ambient workplace atmosphere below the occupational exposure limit(s). Use general and local exhaust ventilation and dust collection systems as necessary to minimize exposure.

### 8.2.2 Personal Protective Equipment (PPE)

| | |
|---|---|
| **Respiratory protection:** | Wear a NIOSH approved particulate respirator if exposure to airborne particulates is unavoidable and where occupational exposure limits may be exceeded. If airborne exposures are anticipated to exceed applicable PELs or TLVs, a self-contained breathing apparatus or airline respirator is recommended. |
| **Eye and face protection:** | If eye contact is possible, wear protective glasses with side shields. Avoid contact lenses. |
| **Hand and skin protection:** | Wear gloves and protective clothing. Wash hands with soap and water after contact with material. |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 9
## Physical and Chemical Properties

### 9.1 Information on Basic Physical and Chemical Properties

| Property: Value | Property: Value |
|---|---|
| **Appearance (physical state, color, etc.):** White or gray cake-like material | **Upper/lower flammability or explosive limits:** Not applicable |
| **Odor:** Odorless | **Vapor Pressure (Pa):** Not applicable |
| **Odor threshold:** Not applicable | **Vapor Density:** Not applicable |
| **pH (25 °C) (in water):** 6 - 8 | **Specific gravity or relative density:** 2.0 – 2.9 |
| **Melting point/freezing point (°C):** 128 | **Water Solubility:** 0.1 – 0.3% |
| **Initial boiling point and boiling range (°C):** >163 | **Partition coefficient: n-octane/water:** Not determined |
| **Flash point (°C):** Not determined | **Auto ignition temperature (°C):** Not applicable |
| **Evaporation rate:** Not applicable | **Decomposition temperature (°C):** 1450 |
| **Flammability (solid, gas):** Nonflammable/non-combustible | **Viscosity:** Not applicable |

## Section 10
## Stability and Reactivity

| | |
|---|---|
| **10.1 Reactivity:** | Avoid contact with strong acids or oxidizers and diazomethane. |
| **10.2 Chemical stability:** | The material is stable under normal use conditions. |
| **10.3 Possibility of hazardous reactions:** | The material is a relatively stable, inert material; polymerization will not occur. |
| **10.4 Conditions to avoid:** | Product can become airborne in moderate winds. Dry material should be stored in silos. Materials stored out of doors should be covered or maintained in a damp condition. |
| **10.5 Incompatible materials:** | Acids, ammonium salts, diazomethane, phosphorus and aluminum metal. |
| **10. 6 Hazardous decomposition products:** | None known. |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 11
## Toxicological Information

### 11.1 Information on Toxicological Effects

| Endpoint | Data |
|---|---|
| **Acute oral toxicity** | Oral LD50 > 2000 mg/kg |
| **Acute dermal toxicity** | No data. |
| **Acute inhalation toxicity** | Inhalation LC50: > 3.26 mg/L |
| **Skin corrosion/irritation** | Not irritating or corrosive to skin based on 4-hour, semi-occlusive exposure to rabbits. |
| **Eye damage/irritation** | No positive responses in rabbits based upon 24-, 48-, and 72-hour mean scores for corneal opacity, iritis, conjunctival redness/edema. |
| **Respiratory/skin sensitization** | Not a respiratory or dermal sensitizer. |
| **Germ cell mutagenicity** | Several in vitro and in vivo mutagenicity assays determined that calcium sulfate, dihydrate was non-mutagenic, with and without metabolic activation. |
| **Carcinogenicity** | No data on calcium sulfate, dihydrate. Carcinogenic studies were not conducted based on the non-neoplastic effects noted in the oral and inhalation repeated dose studies as well as the negative mutagenicity assays.<br>Respirable crystalline silica has been identified as a carcinogen by NTP, IARC, ACGIH and OSHA. |
| **Reproductive toxicity** | No significant developmental or reproductive toxicity were identified in rabbits after exposure to either calcium sulfate, dehydrate or calcium sulfate, dihydrate. |
| **STOT-SE** | Acute toxicity testing did not result in direct organ toxicity after a single exposure to calcium sulfate, dihydrate. However, as the form tested was not indicated, FGD gypsum dust may result in mechanical respiratory irritation. |
| **STOT-RE** | A repeat dose oral toxicity study (35-45 days) with calcium sulfate, dihydrate conducted using rats reported a NOAEL for males of 100 mg/kg/day on the basis of decreased total protein, albumin, blood urea nitrogen, and creatinine levels observed at the 300 and 1,000 mg/kg/day dose groups. No effects were observed in females.<br>Repeated inhalation exposures to high levels of respirable crystalline silica may result in lung damage (silicosis) and lung cancer. |
| **Aspiration Hazard** | Not applicable based on product form. |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 12
## Ecological Information

### 12.1 Toxicity

| **Calcium sulfate (CAS# 7778-18-9)** [1] | |
|---|---|
| **Toxicity to Fish** | Fathead Minnow (*Pimephales promelas*):<br>Acute, 7-day LC50 > 1,970 mg/L<br>Acute, 96-hour NOEC = 1,470 mg/L |
| | Rainbow trout (*Oncorhynchus mykiss*):<br>Chronic, 30-day NOEC (survival, growth, reproduction) = 732 mg/L |
| | Bluegill (*Lepomis macrochirus*):<br>Acute, 96-hour LC50 = 2,890 mg/L |
| **Toxicity to Aquatic Invertebrates** | Water Flea (*Ceriodaphnia dubia*):<br>Acute, 96-hour NOEC = 1447.4 mg/L |
| | Water Flea (*Daphnia magna*):<br>Acute, 48-hour LC50 = 1,970 mg/L<br>Chronic, 21-day NOEC (and 42-day post-hatch): 1,600 mg/L |
| **Toxicity to Aquatic Algae and Plants** | Algae (*Navicula seminulum; Nitzschia linearis*):<br>Chronic, 96-hour LC50 and EC50 (growth) = 3,200 mg/L |

[1]The aquatic toxicity of sulfate has been shown to be dependent on water hardness, generally decreasing as hardness increases.

### 12.2 Persistence and Degradability

Not relevant for inorganic materials.

### 12.3 Bioaccumulative Potential

This material does not contain any compounds that that would bioaccumulate up the food chain.

### 12.4 Mobility in Soil

No data available.

### 12.5 Results of PBT and vPvB Assessment

This material does not contain any compounds classified as “persistent, bioaccumulative or toxic” nor as “very persistent/very bioaccumulative”.

### 12.6 Other Adverse Effects

None known.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 13
## Disposal Considerations

See Sections 7 and 8 above for safe handling and use, including appropriate industrial hygiene practices.

Dispose of all waste product and containers in accordance with federal, state and local regulations.

## Section 14
## Transport Information

| | | |
|---|---|---|
| **Regulatory entity:** U.S. DOT | Shipping Name: | Not Regulated |
| | Hazard Class: | Not Regulated |
| | ID Number: | Not Regulated |
| | Packing Group: | Not Regulated |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 15
## Regulatory Information

### 15.1 Safety, Health and Environmental Regulations/Legislation Specific for the Mixture

- TSCA Inventory Status
  - FGD gypsum as well as listed impurities are on the TSCA Inventory.
- California Proposition 65

  The following substances are known to the State of California to be carcinogens and/or reproductive toxicants:
  - Respirable crystalline silica
- State Right-to-Know (RTK)

| Component | CAS | MA[1,2] | NJ[3,4] | PA[5] | RI[6] |
|---|---|---|---|---|---|
| Gypsum; calcium sulfate; calcium sulfate dihydrate | 7778-18-9 or 10101-41-4 | Yes | Yes | Yes | No |
| Calcium carbonate | 1317-65-3 | Yes | Yes | Yes | No |
| Silica-crystalline (SiO2), quartz | 14808-60-7 | Yes | Yes | Yes | No |

# EXECUTIVE SUMMARY

This Hydrogeologic Site Characterization Report (HCR) for the Gypsum Management Facility (GMF) Pond at Duck Creek Power Plant (DCPP) expands upon the hydrogeology, groundwater quality data, and conceptual site model (CSM) presented in previous hydrogeologic investigation reports prepared for the GMF Pond. This report has been assembled to satisfy the information and analysis requirements of Title 35 of the Illinois Administrative Code (35 I.A.C.) Section (§) 845.620 as summarized in **Table ES-1**. The CSM includes hydrogeologic and groundwater quality data specific to the GMF Pond, which has been collected from 2015 to 2021. The GMF Pond (Vistra identification [ID] number [No.] 203, Illinois Environmental Protection Agency [IEPA] ID No. W0578010001-04, and National Inventory of Dams [NID] No. IL50573) is located at the DCPP southwest of Canton, Illinois (**Figure 1-1**).

The DCPP is located near the Duck Creek Cooling Pond, which was used as a source of cooling water for the power plant when it was active, and several small ponds which are remnants of the area's surface mining history. Prior to construction of the power plant and associated facilities, strip mining of coal took place within the property boundary of the DCPP. Currently, land use adjacent to the DCPP is agriculture, pasture, and forest with minimal development.

The GMF Pond is a 1500-foot by 900-foot earthen berm double-lined coal combustion residuals (CCR) Surface Impoundment (SI) located north of the former power plant. The GMF Pond decant water discharges to the lined GMF Recycle Pond. Several other CCR units are located on the DCPP property, including the Landfill located due north of the GMF Pond; the closed units, Ash Pond No. 1 and Ash Pond No. 2, located south of the GMF Pond; and the Bottom Ash Basin located between the former power plant and the closed Ash Pond Nos. 1 and 2.

Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) Coal seam. Mining operations in the area have ceased. Strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) coal unit at some portions of the DCPP property. Previous investigations completed outside of the GMF Pond indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 to 75 feet. The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to and downgradient of several former large surface mining areas.

In addition to the CCR within the lined GMF Pond, there are five layers of unlithified material present above the Pennsylvanian-age shaley siltstone and silty shale bedrock (Carbondale Formation). These materials have been categorized into three hydrostratigraphic units presented below in descending order:

- **Uppermost Aquifer:** At the GMF Pond this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the shallow sands. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (Natural Resource Technology, an OBG Company [NRT/OBG], 2017a). The shallow sands are laterally extensive across the site, vary in thickness from less than 1 to 18 feet, and are generally located at an elevation of 570 to 590 feet above mean sea level (msl). The shallow sand is saturated. During construction of the GMF Pond, sand was completely removed everywhere it was encountered (mainly the

northeast corner and southwest corner of the pond), putting the base of liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place.

- **Lower Radnor Till/Lower Confining Unit:** Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick.
- **Bedrock Confining Unit:** The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet.

The Peoria/Roxanna Loess within the uppermost aquifer has also been identified as a potential migration pathway (PMP) for contaminant migration. While the primary migration pathway is the shallow sand of the uppermost aquifer, the groundwater within the overlying Peoria/Roxanna Loess has the potential to be impacted and is considered a PMP.

Groundwater migrates downward through the loess and upper Radnor Till into the shallow sands of the uppermost aquifer. Groundwater flow in the sands is generally in a northwest to southeast direction. Seasonal variation of groundwater levels at the GMF Pond are present and may fluctuate approximately 1 to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond associated with the elevation changes. Groundwater flows toward the Duck Creek Cooling Pond located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Cooling Pond is estimated from 562.5 to 565 feet North American Vertical Datum of 1988 (NAVD88). Which is approximately 20 feet lower than downgradient groundwater at the GMF Pond.

Part 845 parameters were monitored in uppermost aquifer and PMP monitoring wells as part of groundwater quality evaluations performed from 2015 to 2021. These data were supplemented with installation and sampling of additional locations in 2021. The results indicate that the following parameters were detected at concentrations greater than the applicable 35 I.A.C. § 845.600 groundwater protection standards (GWPSs) and are considered potential exceedances:

- Antimony, arsenic, cobalt, lead, pH, sulfate, and thallium were detected at least once at concentrations greater than the GWPS in downgradient uppermost aquifer wells (including PMP wells). Lead, mercury, pH, and thallium were detected at concentrations greater than the GWPS in upgradient uppermost aquifer wells. Radium 226 and 228 combined was detected once at concentrations greater than the GWPS in the bedrock confining unit well.

Concentration results for the above parameters were compared directly to 35 I.A.C. § 845.600 GWPS to determine potential exceedances. Potential exceedances include results reported during the background groundwater monitoring or prior period that are greater than the GWPS. The results are considered potential exceedances because the results were compared directly to the standard and did not include an evaluation of background groundwater quality or the statistical methodologies proposed in the groundwater monitoring plan (GMP) provided in the Operating Permit application. Exceedances will be determined following IEPA approval of the GMP.

# 1. INTRODUCTION

## 1.1 Overview

In accordance with requirements of the Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments: 35 I.A.C. § 845 (Part 845) (IEPA, April 15, 2021), Ramboll Americas Engineering Solutions, Inc. (Ramboll) has prepared this HCR on behalf of DCPP (**Figure 1-1**), operated by Illinois Power Resources Generating, LLC (IPRG). This report will apply specifically to the CCR Unit referred to as the GMF Pond. However, information gathered to evaluate other CCR units in the vicinity regarding geology, hydrogeology, and groundwater quality is included, where appropriate. The GMF Pond consists of a 1,500-foot by 900-foot earthen berm with 3.5:1 side slopes, a maximum elevation of 620 feet, a double geomembrane liner consisting of a 60-millimeter (mil) high-density polyethylene (HDPE) geomembrane liner, 12-inch clay cushion, 4 ounce per square yard ($oz/yd^2$) non-woven geotextile filter fabric, 12-inch highly permeable granular drainage (sand), 10 $oz/yd^2$ non-woven geotextile filter fabric, 60-mil HDPE geomembrane liner, reinforced bentonite mat, 36-inch compacted clay, all installed over in-situ foundation soil, and all pipes, pumps, and appurtenances necessary for the storage of approximately 3.6 million tons of gypsum at a maximum elevation of 715 feet with discharge to the GMF Recycle Pond. This HCR includes Part 845 content requirements specific to 35 I.A.C. § 845.620(b) (Hydrogeologic Site Characterization) for the GMF Pond at the DCPP.

## 1.2 Part 845 Description

CCR is commonly referred to as coal ash, and CCR SIs are commonly referred to as coal ash ponds. Part 845 contains comprehensive rules for the design, construction, operation, corrective action, closure, and post closure care of these SIs. This rule includes GWPSs applicable at the waste boundary at each CCR SI and requires each owner or operator to monitor groundwater. IEPA's rule includes a permitting program as well as all federal standards for CCR SIs promulgated by the United States Environmental Protection Agency (USEPA). In addition, the rules include procedures for public participation, closure alternatives analyses, and closure prioritization, and provides access to records via public website. The rules also include financial assurance requirements for CCR SIs.

A checklist which identifies the specific requirements of 35 I.A.C. § 845.620 is included in **Table ES-1**. The table provides references to sections, tables, and figures included in this document to locate the information that meets specific requirements of 35 I.A.C. § 845.620.

## 1.3 Previous Investigations and Reports

Numerous hydrogeologic investigations have been performed concerning the CCR Units at the DCPP. The information presented in this HCR includes data collected in support of the monitoring well network established for development of the GMP and supplements comprehensive data collection and evaluations from prior hydrogeologic investigation reports (recent to oldest), including, but not limited to, the following:

- ***Hanson Professional Services, Inc. (Hanson), March 25, 2021. First Quarter 2021 Groundwater Report, Duck Creek Power Station, Gypsum Stack and Recycle Pond, WPC Permit No. 2017-EO-62640, Fulton County.***
  Quarterly comparison of groundwater monitoring results to the relevant groundwater standard and submittal of the quarterly sample results.

- ***Natural Resource Technology, an OBG Company (NRT/OBG), October 17, 2017. Hydrogeologic Monitoring Plan, Duck Creek GMF Pond – CCR Unit ID 203, Duck Creek Landfill – CCR Unit ID 204, Duck Creek Power Station, Canton, Illinois.***
  Hydrogeologic Monitoring Plan (HMP) prepared to provide background information necessary to support the groundwater monitoring system established to comply with Title 40 of the Code of Federal Regulations (40 C.F.R.) § 257.91 to regulate the disposal of CCR as solid waste under Subtitle D of the Resource Conservation and Recovery Act (RCRA) [40 C.F.R. § 257 Subpart D; published in 80 FR 21302-21501, April 17, 2015] for the DCPP located in Canton, Illinois.
- ***AECOM, October 2016. History of Construction, USEPA Final CCR Rule, 40 C.F.R. § 257.739(c), Duck Creek Power Station, Canton, Illinois.***
  History of construction for the Ash Pond No. 1, Ash Pond No. 2, and GMF Pond at the DCPP in accordance with 40 C.F.R. § 257.73(c).
- ***Hanson, March 2016. Clay Liner Evaluation Report, Illinois Power Resources Generating LLC, Duck Creek Power Station, Fulton County, Illinois.***
  Evaluation prepared to show that the existing liner in the GMF Pond meets the minimum requirements of the 40 C.F.R. § 257 regulations. Conclusion indicated that the as built liner exceeds the performance standard set by 40 C.F.R. § 257.70(b). Construction Quality Assurance (CQA) documents are presented to verify the integrity of the liner components.
- ***Natural Resource Technology, Inc. (NRT), March 31, 2016. Supplemental Hydrogeologic Site Characterization and Groundwater Monitoring Plan, Duck Creek Ash Ponds 1 and 2, Duck Creek Energy Center, Canton, Illinois.***
  This Supplemental Hydrogeologic Site Characterization and Groundwater Monitoring Plan was prepared to develop hydrogeologic information in support of a Closure Plan for the Duck Creek Energy Center Ash Ponds 1 and 2.
- ***Hanson, February 29, 2016. Ash Pond 1 and Ash Pond 2, Aquifer Evaluation in the Surface (Strip) Mining Area, Duck Creek Power Station, Illinois Power Resources Generating, LLC, Fulton County, IL.***
  Characterization of strip mining areas adjacent to Ash Ponds 1 and 2 at the DCPP.
- ***Hanson, March 2010. Hydrogeologic Report, Ameren Duck Creek Power Generating Station Solid Waste Disposal System (Ash Pond 1, Ash Pond 2, and Recycle Pond).***
  Hydrogeologic site characterization report for multiple ponds at the DCPP.
- ***Hanson, 2009. Section 3 – Hydrogeologic Report, in Support Document for Permit Application, Duck Creek Power Generating Station, Gypsum Management Facility, Springfield, Fulton County, Illinois.***
  An overview prepared to illustrate regional climate, geology, and hydrogeology and site-specific information related to geotechnical, hydrogeological, and geochemical characteristics found at the site.

A GMP is being prepared for the GMF Pond in conjunction with this report and is included in the Operating Permit to which this Report is attached.

## 1.4 Site Location and Background

The DCPP is located in Fulton County, Illinois and approximately 6 miles southeast of the town of Canton. The GMF Pond is located north of the power plant in Section 18 of Township 6 North,

Range 5 East (**Figure 1-1**). The GMF Recycle Pond is located just south of the GMF Pond (**Figure 1-2**). The DCPP is located near the Duck Creek Cooling Pond, which was used as a source of cooling water for the power plant when it was active, and several small ponds which are remnants of the area's surface mining history. The Landfill is located due north of the GMF Pond and the closed units, Ash Pond No. 1 and Ash Pond No 2, are located south of the GMF Recycle Pond. Prior to construction of the power plant and associated facilities, strip mining of coal took place within the property boundary of the DCPP (**Figure 1-1**). Currently, land use adjacent to the DCPP is agriculture, pasture, and forest with minimal development.

## 1.5 Site History and Unit Description

Surface preparation for the GMF Pond began in 2007 and construction took place from 2008 to 2009. The GMF Recycle Pond was constructed at the same time.

The GMF Pond, also referred to as the gypsum stack/management system, operates under an IEPA permit (#2017-E0-62640) issued in December 2017. It consists of a 1,500-foot by 900-foot earthen berm with 3.5:1 side slopes, a maximum elevation of 620 feet, a double geomembrane liner consisting of a 60-mil HDPE geomembrane liner, 12-inch clay cushion, 4 oz/yd$^2$ non-woven geotextile filter fabric, 12-inch highly permeable granular drainage (sand), 10 oz/yd$^2$ non-woven geotextile filter fabric, 60-mil HDPE geomembrane liner, reinforced bentonite mat, 36-inch compacted clay, all installed over in-situ foundation soil, and all pipes, pumps, and appurtenances necessary for the storage of approximately 3.6 million tons of gypsum at a maximum elevation of 715 feet with discharge to the GMF Recycle Pond.

The GMF Pond decant water discharges to the GMF Recycle Pond, which has a capacity of 32.6 million gallons. The GMF Recycle Pond is lined with a 60-mil HDPE geomembrane liner, reinforced bentonite mat and 36 inches of compacted clay.

# 2. REGIONAL AND LOCAL GEOLOGY

## 2.1 Topography

Topography within the DCPP property (**Figure 1-1**) is significantly influenced by the history of mining in the area. Strip mining has occurred in this area since the 1930s prior to mine reclamation laws; and, where present, has completely disrupted the natural stratigraphy down to the Springfield (No. 5) Coal unit. The strip mining activity has produced rough topography from soil piles and depressions, often ponded with water (Hanson, 2009). As discussed later in this document, soils in the immediate vicinity of the GMF Pond and GMF Recycle Pond do not appear to have been disturbed by surface mining activities; however, areas surrounding these ponds have been disturbed. Topography adjacent to the GMF Pond is provided in **Figure 2-1**.

## 2.2 Regional Geomorphology

The DCPP lies near the east edge of Fulton County in north central Illinois. The study area lies along the southeast edge of the Galesburg Plain Division of the Central Lowland Physiographic Province. The area consists of flat to gently rolling uplands that are dissected by many, deeply incised streams that are tributaries to major river systems. The erosional landforms have developed primarily within deposits of glacial drift that blanket Pennsylvanian-aged bedrock. The Pennsylvanian bedrock generally controls the landforms, particularly drainage ways and rivers in the area (Hanson, 2009).

The Illinois River delineates the southeast border of the Galesburg Plain and is the main drainage for the region. The physiography of many areas in the Galesburg Plain has been affected by strip mining of coal. Strip mines have altered the natural landforms and drainage systems. Unreclaimed strip mine areas are usually very hummocky with mine spoils and are pocked with ponds and depressions (Hanson, 2009).

## 2.3 Soils

Surficial soils at the Site and vicinity are shown on **Figure 2-2**, based on the soil survey performed in Fulton County in 1994 available in the Soil Survey Geographic database (SSURGO) by the United States Department of Agriculture Natural Resources Conservation Service (NRCS) provided by the Environmental Systems Research Institute (ESRI) web-hosted layer (NRCS, 1997).

Former soils underlying the Site are identified as Fayette Silt Loam (#280E2 and #280gD2), Keomah Silt Loam (#17A), and Rozetta Silt Loam (#279B and #279C2). The Fayette series consists of well drained loess on sideslopes along upland drainageways. This soil is well suited for and used as habitat for openland and woodland wildlife. These soils are moderately suitable for cultivated crops due to crusting and water erosion and unsuitable for dwellings due to flooding. The Keomah series consists of somewhat poorly drained loess in interfluvial areas. This soil is well suited for and used as habitat for openland wildlife. These soils are moderately suitable for cultivated crops due to crusting and flooding and only moderately suitable to unsuitable for dwellings due to slope. The Rozetta series consists of well drained loess in interfluvial areas, head slopes, and sideslopes along upland drainageways. This soil is well suited for and used as habitat for openland and woodland wildlife. These soils are moderately suitable for cultivated crops due to crusting and water erosion and only moderately suitable for dwellings due to flooding.

Areas surrounding the GMF Pond are classified as Hickory Silt Loam (#8cF), Elco Silt Loam (#119E2), and Clarksdale Silt Loam (#257A). The Hickory series consists of well-drained till. These soils formed on sideslopes along upland drainageways. Most areas of this association are moderately unsuitable for cultivated crops due to frost heave, low pH, and water erosion. The Elco series consists of moderately well drained loess and underlying paleosol. These soils formed in loess and till on sideslopes along upland drainageways. Most areas of this association are moderately suitable for cultivated crops due to frost heave, low pH, and water erosion. The Clarksdale series consists of somewhat poorly drained loess. These soils formed in interfluvial areas. Most areas of this association are moderately suitable for cultivated crops due to frost heave, low pH, and wetness.

## 2.4 Regional Geology

Regionally, the DCPP is positioned on the glacial uplands above the Illinois River in the Ancient Illinois Floodplain of the Till Plains Section of the Central Lowland Province.

### 2.4.1 Regional Unlithified Geology

Upper unlithified materials consist of Wisconsinan Stage materials overlying Illinoian Stage deposits. The undisturbed unlithified materials consist of loess, diamictons, and lacustrine/alluvial deposits. The area is flat to gently rolling uplands that are dissected by deeply incised streams that are tributaries to major river systems. The erosional landforms have developed primarily within deposits of glacial drift that blanket Pennsylvanian-aged bedrock (NRT/OBG, 2017a).

Areas near the GMF Pond are part of several large surface coal mines (**Figure 2-3**) where unlithified materials are present in the excavated strip mine spoils, but have been mixed due to the surface mining activities. Mining operations in the area have ceased (NRT/OBG, 2017a).

The Radnor Till is the only surficial Quaternary geologic deposit regionally mapped in the vicinity of the GMF Pond and is shown on **Figure 2-4**.

### 2.4.2 Regional Bedrock Geology

The uppermost bedrock stratum in the area is the Carbondale Formation of the Kewanee Group of the Pennsylvanian System. The Carbondale Formation consists of interbedded sequences of shale, sandstone, limestone, and coal with associated underclay. These sediments were deposited in shallow marine, deltaic, and swamp environments. Some of the shales are fossiliferous (containing either plant or marine fossils), and some contain sideritic nodules and bands. The sandstones are mostly subgraywackes and occur in elongated channel facies. The limestones are generally gray to dark gray, argillaceous, and normally fossiliferous. Thin black fissile shales are commonly associated with the limestones. The Carbondale Formation includes the principle Illinois economic coals: the Herrin (No. 6), the Springfield (No. 5), the Colchester (No. 2), and the Danville (No. 7). Underclays occur at the base of the coal seams. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) coal seam (Hanson, 2009).

### 2.4.3 Structure

The bedrock surface in the site area has been mapped at about elevation 560 feet NAVD88. The bedrock mapping indicates the beds dip to the east-southeast at about 60 feet per mile. The St. Davis anticline occurs within the Pennsylvanian sequence and passes through the landfill area which explains the lack of strip mining activity in this portion of the DCPP (Hanson, 2005).

### 2.4.4 Seismic Setting

The major geologic structural features within Illinois are depicted on **Figure 2-5**. Fulton County is not located in a seismic impact zone. The nearest areas of present-day fault-related, seismic activity are the Northern Illinois Seismic Source Zone and the Wabash Valley Fault Zone near southwestern Indiana and the New Madrid Fault Zone along the Ohio and Mississippi River Valleys in southeastern Illinois. Records dating from 1811 indicate that earthquakes greater than a Richter Scale Magnitude 6.0 occurred in or near the New Madrid Fault line. Away from the fault, all earthquakes have been a 5.9 magnitude or less. The earthquake epicenters appear to be the result of modern regional stress fields and are not related to the nearby inactive faults (Hanson, 2009).

### 2.4.5 Mining Activities

Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) Coal seam. Mining operations in the area have ceased. As indicated above, strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) Coal unit at some portions of the Site. Previous investigations completed outside of the GMF Pond at the Site also indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 to 75 feet (as observed at monitoring well OM24D and OM15 near the ash ponds). The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to several former large surface mining areas (**Figure 2-3** and **Appendix A**).

## 2.5 Site Geology

A field investigation was performed in 2021 to collect additional data for the discussion of vertical and horizontal lithology, stratigraphy, chemical properties, and physical properties of geologic layers to a minimum of 100 feet below ground surface (bgs) as specified in 35 I.A.C. § 845.620(b). Field investigation locations from 2021 are shown on **Figure 2-6**. The major geomorphic features occurring within and nearby the GMF Pond include Peoria/Roxanna Loess overlying Glasford Formation clayey diamictons (till).

### 2.5.1 Site-Specific Unlithified Geology

The unlithified stratigraphy within and immediately surrounding the GMF Pond consists of the following in descending order: fill material and CCR; silt and clayey silt loess (Peoria/Roxanna Loess); weathered till (upper Radnor Till); shallow, medium-grained sand to silt zone within the Radnor Till; and till (lower Radnor Till). The unlithified units overlay Pennsylvanian-age shaley siltstone and silty shale bedrock (Carbondale Formation). Boring logs and monitoring well and piezometer construction forms obtained from investigations at the GMF Pond are provided in **Appendix B**. Cross-sections showing the subsurface materials encountered at the GMF Pond are included in **Figures 2-7 and 2-8**. Samples for geotechnical analysis were collected from interpreted geologic units and composited to obtain a representative sample of the entire geologic unit prior to submittal (**Table 2-1**).

#### 2.5.1.1 Fill and CCR

Gypsum is present within the GMF Pond at a maximum thickness of approximately 22 feet, as estimated from topography and the elevation of the base of the liner from available construction details (**Figure 2-9**). The range of gypsum thickness is estimated from less than 1 to 22 feet.

The thickest areas of gypsum are to the north and west within the GMF Pond and thin toward the south end of the GMF Pond. The base of the liner rests on top of the lower Radnor Till.

Geotechnical analysis results from two grab samples (sample IDs Gypsum and LSN-3781/Gypsum) collected from the GMF Pond near XTPW01 are summarized in **Table 2-1**. Sample locations are shown on **Figure 2-6**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results from grab samples near XTPW01 indicated the following:

- Average moisture content of 30.7 percent, with a range of 28.8 to 32.5 percent.
- Total porosity (calculated) of 56.1 percent.
- Dry density of 73.9 pounds per cubic foot (pcf).
- Average specific gravity of 2.51, with a range of 2.310 to 2.700.
- Grain size composition of 0 percent gravel, 4 percent sand, and 96 percent fines (silt and clay).
- Vertical hydraulic conductivity of $6.7 \times 10^{-4}$ centimeters per second (cm/s).

Solid samples were collected from grab samples near XTPW01 in 2021 for chemical analysis. The results of solid samples collected from within the gypsum are summarized in **Table 2-2**.

To sample porewater, a piezometer (pre-pack well, XTPW02) was installed by Golder Associates, Inc. 5.5 feet into the gypsum on June 23, 2021. XTPW02 is located approximately 132 feet east of the western edge of the GMF Pond and is shown on **Figure 2-6**. The piezometer was installed using hand tools (no drilling log). A porewater sample was collected from XTPW02 on June 23, 2021. The results of porewater sample are summarized in **Table 2-3.**

#### 2.5.1.2 Peoria/Roxanna Loess

The Wisconsinan Stage Peoria/Roxanna Loess extends from beneath the topsoil developed in the loess to depths ranging from 11 to 21 feet. The loess consists predominantly of silt and clayey silt with minor amounts of sand. The loess exhibits iron staining, concretions, and some fracturing. The Loess Unit is saturated below depths varying from approximately 3.5 to 11 feet.

Geotechnical analysis results from samples collected from Peoria/Roxanna Loess yielded Unified Soil Classification System (USCS) soil classifications of lean clay. Sample locations are shown on **Figure 2-6,** the geotechnical results from the most recent investigation are summarized in **Table 2-1**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results indicated the following:

- Average moisture content of 22.0 percent, with a range of 18.6 to 25.9 percent.
- Average total porosity (calculated) of 37 percent, with a range of 32.4 to 41.8 percent.
- Average dry density of 103.8 pcf, with a range of 97.3 to 113.1 pcf.
- Average specific gravity of 2.67, with a range of 2.650 to 2.680.
- Average grain size composition of 0.1 percent gravel, 8.6 percent sand, and 91.4 percent fines (silt and clay). The fines content ranged from 88.2 to 97.4 percent, with a median value of 88.5 percent.

- Geometric mean vertical hydraulic conductivity of 2.1 x $10^{-7}$ cm/s and ranged from 7.1 x $10^{-8}$ to 6.3 x $10^{-7}$ cm/s.

Solid samples were also collected in 2021 for chemical analysis. The results of solid samples collected from the loess are summarized in **Table 2-4**.

#### 2.5.1.3 Upper Radnor Till

The loess is generally underlain by a relatively thin till sequence consisting of the Berry Clay (where present) and the Illinoian Stage upper Radnor Till. The till sequence ranges in thickness from 9 to 21 feet in the area of the GMF Pond. This shallow till is generally weathered and exhibits signs of oxidation and fracturing. The till is primarily clayey silt with minor amounts of sand and gravel.

Geotechnical analysis results from samples collected from the upper Radnor Till yielded USCS soil classifications of lean clay. Sample locations are shown on **Figure 2-6,** the geotechnical results from the most recent investigation are summarized in **Table 2-1**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results indicated the following:

- Average moisture content of 22.4 percent, with a range of 21.1 to 24.6 percent.
- Average total porosity (calculated) of 36.8 percent, with a range of 30.7 to 41.4 percent.
- Average dry density of 106.1 pcf, with a range of 98.0 to 116.7 pcf.
- Average specific gravity of 2.69, with a range of 2.680 to 2.700.
- Average grain size composition of 1.5 percent gravel, 22.6 percent sand, and 75.9 percent fines (silt and clay). The fines content ranged from 77 to 80.6 percent, with a median value of 75.4 percent.
- Geometric mean vertical hydraulic conductivity of 7.7 x $10^{-7}$ cm/s and ranged from 2.6 x $10^{-7}$ to 2.3 x $10^{-6}$ cm/s.

Solid samples were also collected in 2021 for chemical analysis. The results of solid samples collected from the upper Radnor Till are summarized in **Table 2-4**.

#### 2.5.1.4 Shallow Sand Zone

The Shallow Sand Zone is laterally extensive within the Radnor Till across the site and varies in thickness from less than 1 to 18 feet near the GMF Pond. The top of the Shallow Sand Zone is generally located at an elevation of 570 to 590 feet msl. The Shallow Sand Zone exhibits lateral facies changes across the site and varies from a medium-grained sand to a silt and often contains intercalated till seams, as shown in the hydrogeologic cross sections (**Figures 2-7 and 2-8**). The Shallow Sand Zone is saturated. The Shallow Sand Zone is the most laterally extensive at the GMF Pond, with other zones having either an unsaturated component, intermittent presence, or entirely absent.

During construction, shallow sand was encountered and completely removed from underneath the northeast corner and southwest corner of the GMF Pond, putting the liner in contact with clay of the lower Radnor Till (**Figures 2-7 and 2-8**). Sand outside the GMF Pond footprint remains.

Geotechnical analysis results from samples collected from the Shallow Sand Zone yielded USCS soil classifications of silty lean clay and lean clay. These USCS classifications contain more fines

than expected, and are likely a result of difficulty targeting a thin sand zone within largely fine-grained materials. Sample locations are shown on **Figure 2-6**, the geotechnical results from the most recent investigation are summarized in **Table 2-1**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results indicated the following:

- Average moisture content of 17.5 percent, with a range of 14.5 to 21.9 percent.
- Average total porosity (calculated) of 29.5 percent, with a range of 27.4 to 31.4 percent.
- Average dry density of 115.0 pcf, with a range of 105.1 to 122.3 pcf.
- Average specific gravity of 2.663, with a range of 2.640 to 2.700.
- Average grain size composition of 5.7 percent gravel, 27.1 percent sand, and 67.2 percent fines (silt and clay). The fines content ranged from 63.6 to 73.7 percent, with a median value of 64.4 percent.
- Geometric mean vertical hydraulic conductivity of $9.0 \times 10^{-7}$ cm/s and ranged from $7.5 \times 10^{-7}$ to $1.1 \times 10^{-6}$ cm/s.

Solid samples were also collected in 2021 for chemical analysis. The results of solid samples collected from the Shallow Sand Zone are summarized in **Table 2-4**.

#### 2.5.1.5 Lower Radnor Till

Till sequences underlying the Shallow Sand Zone consist of clay, silt, and sand of the Illinoian Stage lower Radnor Till. The till ranges in thickness from 42 to 58 feet. In some areas of the site, including the area near the GMF Pond, the till sequences typically extend from the base of the shallow sand to the bedrock surface. In other areas of the site, the till sequences extend to intermediate or deep sands. The till sequences are typically high in silt content with varying amounts of clay, sand, and gravel, and are often calcareous.

Geotechnical analysis results from samples collected from the lower Radnor Till at soil borings yielded USCS soil classifications of silty clayey sand, silty lean clay, and lean clay. Sample locations are shown on **Figure 2-6**, the geotechnical results from the most recent investigation are summarized in **Table 2-1**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results indicated the following:

- Average moisture content of 10.5 percent, with a range of 7.7 to 12.6 percent.
- Average total porosity (calculated) of 22.3 percent, with a range of 20.6 to 23.5 percent.
- Average dry density of 127.5 pcf, with a range of 123.2 to 133.8 pcf.
- Average specific gravity of 2.670, with a range of 2.640 to 2.700.
- Average grain size composition of 7.7 percent gravel, 38.2 percent sand, and 54 percent fines (silt and clay). The fines content ranged from 49.3 to 56.5 percent, with a median value of 64.4 percent.
- Geometric mean vertical hydraulic conductivity of $4.7 \times 10^{-7}$ cm/s and ranged from $4.1 \times 10^{-8}$ to $5.4 \times 10^{-6}$ cm/s.

Solid samples were also collected in 2021 for chemical analysis. The results of solid samples collected from the lower Radnor Till are summarized in **Table 2-4**.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 2.5.2 Site Specific Bedrock Geology

Pennsylvanian bedrock was encountered at greatly varying depths across the site. Bedrock depths ranged from a minimum of 52 feet to a maximum of 108 feet. Bedrock was encountered at boring locations B-54, B-60, and G54C at 84 feet bgs, 88 feet bgs, and 90 feet bgs, respectively, in the vicinity of the GMF Pond (**Appendix D** for boring locations). The bedrock shows little compositional variation across the site and consists primarily of shaley siltstone and silty shale. The shale bedrock unit is typically weathered near the surface, has low hydraulic conductivity, and underlies the glacial till sequences. These units often contain thin dolomite ledges and nodules and some fractures.

# 3. REGIONAL AND LOCAL HYDROGEOLOGY

## 3.1 Regional Hydrogeology

As discussed in **Section 2**, unlithified materials consist of Wisconsinan Stage materials overlying Illinoian Stage deposits. The undisturbed unlithified materials consist of loess, diamictons, and lacustrine/alluvial deposits overlying Pennsylvanian-aged bedrock. The area is flat to gently rolling uplands that are dissected by deeply incised streams that are tributaries to major river systems in areas that have not been disturbed by strip mining activity.

Available records of wells within one mile of the site indicate potable water may be obtained from unconsolidated materials or from deep bedrock. Estimated specific capacity (used to approximate the transmissivity of a formation) indicated shallow sands near the GMF Pond provide a very modest specific capacity and groundwater yield (Hanson, 2009).

## 3.2 Site Hydrogeology

Wells used for groundwater monitoring at the GMF Pond have been constructed in phases since 2008. Prior to 2021, there were more than 30 wells used to monitor the GMF Pond. In 2021, one additional well (G54C) was installed in bedrock to provide information to meet the requirements of Part 845. Construction details for monitoring wells and piezometers associated with the GMF Pond are provided in **Table 3-1** and depicted in **Figure 3-1**. Boring logs, monitoring well and piezometer construction forms are provided in **Appendix B**.

### 3.2.1 Hydrostratigraphic Units

Three distinct water-bearing layers have been identified at the Site based on stratigraphic relationships and common hydrogeologic characteristics which are summarized and discussed in subsequent sections:

- **The Uppermost Aquifer**: At the GMF Pond this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the shallow sands described in detail in **Section 2.5.1**. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (NRT/OBG, 2017a). The shallow sands are laterally extensive across the site, vary in thickness from less than 1 to 18 feet, and are generally located at an elevation of 570 to 590 feet msl. The shallow sand is saturated. During construction of the GMF Pond, sand was completely removed everywhere it was encountered (mainly the northeast corner and southwest corner of the pond), putting the base of liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place.
- **Lower Radnor Till/Lower Confining Unit**: Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick. Previous hydrogeologic studies indicate discontinuous sand lenses observed within the till are not hydraulically connected to the shallow sand unit (NRT/OBG, 2017a).
- **Bedrock Confining Unit**: The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet. The boring for monitoring well G54C extends 11.5 feet into the bedrock. Additional bedrock detail is provided in **Section 2.5.2**.

### 3.2.2 Uppermost Aquifer

As stated above, this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the shallow sand zone. The shallow sand zone is the primary migration pathway within these hydraulically connected formations. In places where the shallow sand unit is absent (such as beneath the GMF Pond Liner) the uppermost aquifer may be functionally absent, as the liner is in contact with clay till. Groundwater monitoring is focused in the shallow sand unit because it is the most permeable and laterally continuous unit at the Site. The top of the uppermost aquifer is presented in **Figure 3-2.** The base of the uppermost aquifer is the lower confining unit (the lower Radnor Till).

### 3.2.3 Potential Migration Pathway

The Peoria/Roxanna Loess within the uppermost aquifer has also been identified as a PMP. While the primary migration pathway is the shallow sand of the uppermost aquifer, impacts have the potential to migrate within groundwater in the overlying Peoria/Roxanna Loess. The PMP is saturated at depths of 3.5 to 11 feet bgs. While the PMP and uppermost aquifer are hydraulically connected, groundwater flow in the PMP is expected to be primarily vertical, with the majority of the horizontal migration expected to occur within the uppermost aquifer. Monitoring wells with the suffix "L" are screened within the loess and provide representative data on the hydraulic properties and groundwater quality of the PMP.

### 3.2.4 Water Table Elevation and Groundwater Flow Direction

Groundwater flow across the GMF Pond within the uppermost aquifer is consistently in a southeast direction toward the Duck Creek Cooling Pond (**Figures 3-3 and 3-4**). Groundwater elevations of the uppermost aquifer vary seasonally although flow directions are generally consistent (additional contour maps are included in **Appendix D**).

Groundwater elevations in the PMP wells are generally higher than those in the uppermost aquifer and reflect the groundwater flow in the underlying uppermost aquifer wells. Surface water elevations within the GMF Pond are higher than the groundwater.

#### 3.2.4.1 Vertical Hydraulic Gradients

Vertical hydraulic gradients were calculated using available groundwater elevation data from April to August 2021 at wells screened in the PMP, uppermost aquifer, and bedrock (**Table 3-2**). The results of the vertical hydraulic gradient calculations between these hydrostratigraphic units are summarized below:

- Uppermost aquifer to PMP:
  - Vertical hydraulic gradients between wells G51L (PMP) and G51S (uppermost aquifer) ranged from -0.01 to -0.03 feet per feet (ft/ft), upward, averaging 0.02 ft/ft upward
  - G54L (PMP) and G54S (uppermost aquifer) ranged from 0.01 to 0.09 ft/ft downward, averaging 0.04 ft/ft downward
  - G57L (PMP) and G57S (uppermost aquifer) ranged from -0.04 ft/ft upward to 0.12 ft/ft downward, averaging 0.02 ft/ft downward
  - G60L (PMP) and G60S (uppermost aquifer) ranged from 1.2 to 1.6 ft/ft downward, averaging 1.3 ft/ft downward

- Bedrock confining unit to uppermost aquifer:
  - Vertical hydraulic gradients between wells G54C (bedrock confining unit) and G54S (uppermost aquifer) ranged from 0.17 to 0.27 ft/ft, downward, averaging a downward vertical gradient of 0.20 ft/ft

The downward gradients observed between downgradient wells G54L and G54S, and G60L and G60S, are consistent with vertical gradients reported by Hanson in 2009. The slightly upward gradient between upgradient wells G51L and G51S, and the variable gradients between downgradient wells G57L and G57S did not have a comparable measurement from previous studies.

#### 3.2.4.2 Impact of Existing Ponds and Ash Saturation

The GMF Pond is lined, as described in **Section 1.5,** and the shallow sands of the uppermost aquifer were removed from within the footprint of the pond. The phreatic surface measured from a transducer at location X301 within the GMF Pond ranges from approximately 613 to 617 feet NAVD88 with an average around 614 feet (**Appendix D**), whereas groundwater elevations measured in monitoring wells located around the GMF Pond and screened within the uppermost aquifer range from approximately 590 to 578 feet NAVD88. Groundwater elevation contours indicate groundwater generally flow to the southeast, with no indication of radial flow. The elevation difference between the phreatic surface and groundwater elevations, in addition to no observations of radial flow, provide evidence that the GMF Pond does not impact groundwater flow directions via recharge to groundwater. Given the low permeability of the liner system, it is more likely that the GMF Pond is a barrier to groundwater flow within the uppermost aquifer, deflecting flow from upgradient areas around the perimeter of the pond toward the downgradient areas.

With the relatively stable phreatic surface elevation within the pond around 614 feet, the thickness of saturated CCR (gypsum) in the pond will correspond with the thickness of gypsum in the pond. Thicker accumulations of gypsum are present in the north end of the pond and thin to the south.

#### 3.2.4.3 Impact of Surface Water Bodies

The nearest surface water body to the GMF Pond is the Duck Creek Cooling Pond, which is located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Cooling Pond is estimated to be from 562.5 to 565 feet NAVD88. Which is approximately 20 feet lower than downgradient groundwater at the GMF Pond, indicating that groundwater in the vicinity of the GMF Pond is flowing toward the Cooling Pond. The shoreline of the Cooling Pond is very irregular (**Figure 1-1**) as it occupies the former surface water drainage features associated with Duck Creek (which was impounded to create the Cooling Pond).

### 3.2.5 Hydraulic Conductivities

#### 3.2.5.1 Field Hydraulic Conductivities

Field hydraulic conductivity tests were performed in the uppermost aquifer by Hanson in 2021. Hydraulic conductivity test analyses and results are summarized in **Table 3-3** and provided in **Appendix E**. Field hydraulic conductivity tests from monitoring wells G50L, G51L, G53L, G54L, G60L, G50S, G51S, G53S, G54S, G57S, G60S, and G63S indicated hydraulic conductivities from $3.0 \times 10^{-5}$ to $3.9 \times 10^{-3}$ cm/s with a geometric mean of $3.6 \times 10^{-4}$ cm/s.

Results of field hydraulic conductivity tests conducted in 2021 in the bedrock confining unit by Hanson at monitoring well G54C ranged from 1.4 x $10^{-4}$ to 1.6 x$10^{-4}$ cm/s, with a geometric mean of 1.5 x $10^{-4}$ cm/s. This is higher in comparison to the horizontal hydraulic conductivity range of 1.3 x $10^{-6}$ cm/s to 1.3 x $10^{-9}$ cm/s, established by Hanson in 2015, which used pressure testing on borehole OM32. The higher values observed at G54C are attributed to the highly weathered nature of the bedrock in the screen interval which is supported by the low rock quality designation (RQD) N values ranging from 14-22 (lower numbers indicating lower percentage of intact rock core recovered).

#### 3.2.5.2 Laboratory Hydraulic Conductivities

Falling head permeability tests (ASTM D5084 Method F) were performed in the laboratory on samples collected during the 2021 investigations. Sample locations are shown on **Figure 2-6**. The geotechnical laboratory report from the most recent investigation and previous investigations (AECOM, 2016) are provided in **Appendix C**. The results are summarized in **Table 2-1** and discussed below.

- One CCR sample (LSN-3781) was collected from gypsum boring XTPW01. Laboratory falling head permeability test results in the CCR indicated a vertical hydraulic conductivity of 6.7 x $10^{-4}$ cm/s.
- Two samples were collected from the lower Radnor Till from soil boring G54C. Laboratory falling head permeability test results in the lower Radnor Till indicated a vertical hydraulic conductivity ranging from 4.1 x $10^{-8}$ to 5.4 x $10^{-6}$ cm/s.
- Seven samples were collected from the uppermost aquifer from soil borings G54C, SB50, and SB62. Laboratory falling head permeability test results in the uppermost aquifer indicated vertical hydraulic conductivities ranging from 7.1 x $10^{-8}$ to 1.1 x $10^{-6}$ cm/s, and a geometric mean vertical hydraulic conductivity of 4.6 x $10^{-7}$ cm/s.

### 3.2.6 Horizontal Groundwater Gradients and Flow Velocities

Groundwater flow around the GMF is generally in a southeast direction (**Figures 3-3 through 3-4**). Seasonal variation of groundwater levels at the GMF Pond are indicated in the series of 2015 to 2020 groundwater elevation contour maps and groundwater elevation table (**Appendix D**). Observed groundwater elevations may fluctuate seasonally by 1 to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond.

Horizontal hydraulic gradients and groundwater velocities for the uppermost aquifer were calculated based upon groundwater elevation measurements from April through August 2021 between G50S and G60S, G51S and G54S, and G50S and G64S (**Table 3-4**). Horizontal hydraulic gradients are slight across the GMF Pond and ranged from 0.0111 ft/ft between G50S and G64S in August 2021 to 0.0225 ft/ft between G51S and G54S in May 2021. The hydraulic gradients are consistent with previous calculations of horizontal gradients at upgradient locations (NRT/OBG, 2017a).

Horizontal hydraulic gradients calculated to the north of the GMF Pond, between G50S and G64S, were on average 0.0121 ft/ft with an average groundwater velocity of 0.045 feet per day (ft/day). Horizontal hydraulic gradients calculated through the center of the GMF Pond, between G50S and G60S, were on average 0.0172 ft/ft with an average groundwater velocity of 0.625 ft/day. Horizontal hydraulic gradients calculated to the south of the GMF Pond, between G51S

and G54S, were on average 0.0199 ft/ft, with an average groundwater velocity of 0.041 ft/day. From April to June 2021, average groundwater flow velocities at the GMF Pond were 0.024 ft/day and from July to August 2021, groundwater flow velocities at the GMF Pond were on average 0.023 ft/day. Horizontal hydraulic gradients and groundwater flow velocities are presented in **Table 3-4**.

### 3.2.7 Groundwater Classification

Per 35 I.A.C. § 620.210, groundwater within the uppermost aquifer at the GMF Pond meets the definition of a Class I – Potable Resource Groundwater based on the following criteria:

- Groundwater in the uppermost aquifer extends 10 feet or more below the land surface.
- Hydraulic conductivity exceeds the 1 x $10^{-4}$ cm/s criterion (**Table 3-3**).

Field hydraulic conductivity tests performed on the unlithified geologic materials that include loess, shallow sand, and intermediate sand at the GMF Pond had geometric mean hydraulic conductivities exceeding 1 x $10^{-4}$ cm/s. Based on this information groundwater is classified as Class I – Potable Resource Groundwater.

However, background (upgradient) groundwater originates from areas north and west of the GMF Pond that have been surface mined and present a significant alternative source for groundwater impacts.

## 3.3 Surface Water Hydrology

Surface water drainage over much of the site flows east or southeast into the Duck Creek Cooling Pond. The Duck Creek Cooling Pond was formed by damming a portion of Duck Creek, a minor tributary of the Illinois River, and was used for thermal treatment of cooling water discharged from the DCPP.

### 3.3.1 Climate

The climate in Canton is humid and annual precipitation generally exceeds evapotranspiration. Illinois State Water Survey (ISWS) records from 1989 through 2020 at Peoria, Illinois, which is located approximately 35 miles northeast of the DCPP, indicates precipitation averages 35.3 inches per year. Monthly precipitation averages higher than 3 inches from April through August, and 1 to 3 inches in September through March. On average 16 inches of precipitation occur as snowfall.

As shown in **Table A** below, ISWS temperature records show average maximum daily temperatures for 1989 to 2020 ranging from above 70 degrees Fahrenheit (°F) in May through September and minimum average daily temperatures that are below freezing December through March.

**Table A. Average Monthly Temperature Extremes and Precipitation for Peoria, Illinois**

| | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Annual |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Maximum Temperature (ºF) | 33.3 | 37.6 | 49.9 | 62.5 | 72.6 | 81.3 | 84.4 | 82.5 | 76.9 | 64.5 | 50.1 | 37.2 | 61.2 |
| Minimum Temperature (ºF) | 18.3 | 21.5 | 31.6 | 41.8 | 52.2 | 61.7 | 65.4 | 63.2 | 55.4 | 44.1 | 33.3 | 22.7 | 42.7 |
| Precipitation (inches) | 1.71 | 1.60 | 2.08 | 3.42 | 3.93 | 3.18 | 3.02 | 3.10 | 2.97 | 2.64 | 2.35 | 1.84 | 35.3 |
| https://www.isws.illinois.edu/warm/stationmeta.asp?site=ICC&from=wx | | | | | | | | | | | | | |

### 3.3.2 Surface Waters

Duck Creek formerly bordered the east perimeter of the DCPP. In this area, Duck Creek has been dammed for use for thermal treatment of cooling water discharge from the DCPP and is now the predominant surface water body in the vicinity of the GMF Pond. Surface water elevations of the Cooling Pond are from 562.5 to 565 feet NAVD88. Other surface waters in the vicinity include Buckheart Creek to the west, and Rice Lake, Miserable Lake, Big Lake, and Goose Lake to the east, all of which are backwater lakes located between Duck Creek and the Illinois River. The distance between the GMF Pond and the Illinois River is sufficient to eliminate influence on local flow conditions at the site; therefore, site-specific flow conditions are not subject to surface water conditions of the Illinois River. Other surface waters in the vicinity of the GMF Pond include freshwater emergent wetland to the east, and various freshwater ponds to the northeast, south, southeast, and southwest.

# 4. GROUNDWATER QUALITY

## 4.1 Summary of Groundwater Monitoring Activities

Groundwater monitoring programs are currently being conducted at the GMF Pond as required by USEPA and IEPA. Additional monitoring was completed in 2021 for development of the Part 845 monitoring program. These programs are summarized below.

### 4.1.1 40 C.F.R. § 257 Program Monitoring and Well Network

The 40 C.F.R. § 257 Well Network consists of seven monitoring wells screened in the uppermost aquifer nearby and adjacent to the GMF Pond including: three background monitoring wells (G02S, G50S, and G51S) and four compliance monitoring wells (G54S, G57S, G60S, and G64S). The boring logs, well construction forms, and other related monitoring well forms for the GMF Pond 40 C.F.R. § 257 Well Network are included in **Appendix B** of this HCR. The well locations are shown on **Figure 3-1**.

Groundwater is being monitored at the GMF Pond in accordance with the Detection Monitoring Program requirements specified in 40 C.F.R. § 257.94. Details of the procedures and techniques used to fulfill the groundwater sampling and analysis program requirements are found in the Sampling and Analysis Plan for the GMF Pond (NRT/OBG, 2017b). Results are discussed in **Section 4.2**.

The 40 C.F.R. § 257 groundwater samples are collected semi-annually and analyzed for the field and laboratory parameters from Appendix III of 40 C.F.R. § 257, summarized in **Table B** below.

**Table B. 40 C.F.R. § 257 Groundwater Monitoring Program Parameters**

| **Field Parameters[1]** | | |
|---|---|---|
| pH | Groundwater Elevation | |
| **Appendix III Parameters (Total, except total dissolved solids [TDS])** | | |
| Boron | Chloride | Sulfate |
| Calcium | Fluoride | TDS |

[1]Dissolved oxygen, temperature, specific conductance, oxidation/reduction potential, and turbidity were recorded during sample collection.

### 4.1.2 IEPA Groundwater Monitoring

Routine quarterly groundwater monitoring is completed at GMF Pond wells G50L/S, G51L/S, G52L/S, G53L/S, G54L/S, G55L/S, G56L/S, G57L/S, G58L/S, G59L/S, G60L/S, R61L/G61S, G62L, G63L/S, and G64L/S at the GMF Pond, in accordance with Water Pollution Control Permit No. 2017-E0-62640. This permit also requires sampling G65L/S, G66L/S, G67L/S, G70L, G71L/S, and G72L/S at the GMF Recycle Pond. The boring logs, well construction forms, and other related monitoring well forms for the GMF Pond well network are included in **Appendix B** of this HCR. The GMF Pond well locations are shown on **Figure 3-1**. Quarterly and annual samples are analyzed for the following field and laboratory parameters listed in **Table C** below.

**Table C. IEPA Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters** | | | |
| pH | Temperature | Specific Conductance | |
| Groundwater Elevation | Depth to Water (bmp) | Bottom of Well Elevation | |
| **Quarterly Parameters (Dissolved)** | | | |
| Arsenic | Cadmium | Lead | Sulfate |
| Boron | Chloride | Manganese | TDS |
| **Annual Parameters (Dissolved)** | | | |
| Alkalinity, bicarbonate | Chromium | Mercury | Selenium |
| Alkalinity, carbonate | Cobalt | Nickel | Sodium |
| Ammonia as Nitrogen | Iron | Nitrate nitrogen | Zinc |
| Calcium | Magnesium | Potassium | |

### 4.1.3 Part 845 Well Installation and Groundwater Monitoring

In 2021, one additional monitoring well (G54C) was installed between the GMF Pond and the Gypsum Recycling Pond to assess the vertical and horizontal lithology, stratigraphy, chemical properties, and physical properties of geologic layers to a minimum of 100 feet bgs as specified in 35 I.A.C. § 845.620(b). Additionally, a porewater sample was collected from temporary leachate monitoring location (XTPW02) installed within the GMF Pond to characterize the CCR materials.

Prospective Part 845 monitoring wells were sampled for eight rounds from February to August 2021 and the results were assessed for selection of the GMF Pond Part 845 monitoring well network presented in the groundwater monitoring plan. Samples were collected from the new monitoring points and analyzed for 35 I.A.C. § 845.600 parameters summarized in **Table D** below. Part 845 groundwater monitoring results are included below in **Section 4.2**.

**Table D. Part 845 Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters**[1] | | | |
| pH | Turbidity | Groundwater Elevation | |
| **Metals (Total)** | | | |
| Antimony | Boron | Cobalt | Molybdenum |
| Arsenic | Cadmium | Lead | Selenium |
| Barium | Calcium | Lithium | Thallium |
| Beryllium | Chromium | Mercury | |
| **Inorganics (Total)** | | | |
| Fluoride | Sulfate | Chloride | TDS |
| **Other (Total)** | | | |
| Radium 226 and 228 combined | | | |

[1]Dissolved oxygen, temperature, specific conductance, and oxidation/reduction potential were recorded during sample collection.

## 4.2 Groundwater Monitoring Results and Analysis

Groundwater data collected from the GMF Pond 40 C.F.R. § 257 network monitoring wells from 2015 to 2021 were supplemented with sampling of additional locations in 2021 and evaluated with respect to standards included in 35 I.A.C. § 845.600(a)(1). This data set was selected because it includes parameters (total metals) consistent with the parameter list in 35 I.A.C. § 845.600(a)(1). The groundwater analytical results are summarized in **Table 4-1** and discussed in the subsections below. Field parameters are included in **Table 4-2**. Results indicate that the parameters discussed in the following sections were detected at concentrations greater than the applicable 35 I.A.C. § 845.600(a)(1) standards and are considered potential exceedances[1].

### 4.2.1 Total Antimony

Total antimony was detected greater than the GWPS (0.006 milligrams per liter [mg/L]) in one of eight samples collected from downgradient well G57S. The other seven samples were non-detect. No other exceedances for total antimony were observed.

### 4.2.2 Total Arsenic

Total arsenic was detected greater than the GWPS (0.01 mg/L) in eleven downgradient wells G52S, G35S, G54L, G56S, G57L, G58L, G59L, G59S, G60S, G64S and P60. Total arsenic concentrations ranged from 0.001 to 0.051 mg/L. G52S is commonly in a side-gradient or upgradient position.

### 4.2.3 Total Cobalt

Total cobalt was detected greater than the GWPS (0.006 mg/L) in one of eight samples collected from downgradient well 60L. The other seven samples ranged from non-detect to 0.0052 mg/L. No other exceedances of total cobalt were observed.

### 4.2.4 Total Lead

Total lead was detected greater than the GWPS (0.0075 mg/L) in nine downgradient wells (G52S, G55S, G56S, G58L, G58S, G59L, G59S, G60S, G63L, and P60); and one background well G51S. Total lead concentrations in downgradient wells ranged from non-detect to 0.041 mg/L. Total lead concentrations in the upgradient well ranged from non-detect to 0.015 mg/L. G52S is commonly in a side-gradient or upgradient position.

### 4.2.5 Total Mercury

Total mercury was detected greater than the GWPS (0.002 mg/L) in one of 16 samples collected from upgradient well G02S. The other 15 samples were non-detect. No other exceedances for total mercury were observed.

[1] Potential exceedances include results reported during the eight rounds of baseline groundwater monitoring that are greater than the applicable 35 I.A.C. § 845.600(a)(1) standards. The results are considered potential exceedances because they were compared directly to the standard and did not include an evaluation of background groundwater quality or apply the statistical methodologies proposed in the Groundwater Monitoring Plan (GMP). For simplicity, "GWPS" will be used hereafter in discussing potential exceedances. Exceedances will be determined following IEPA approval of the GMP.

### 4.2.6 pH (Lower Limit)

The GWPS lower standard for pH (6.5 standard units [SU]) was exceeded at four downgradient wells (G52L, G54L, G60L, and P60); and one background well G02S. Measurements of pH ranged from 6 to 7.1 SU in downgradient wells. Measurements ranged from 6.4 to 7.1 SU in the background well. G52L is commonly in a side-gradient or upgradient position.

### 4.2.7 Radium 226 and 228 Combined

Radium 226 and 228 combined was detected greater than the GWPS (5 picocuries per liter [pCi/L]) in one of five samples collected from bedrock well G54C. Observations ranged from non-detect to 5.38 pCi/L. No other exceedances for radium 226 and 228 combined were observed.

### 4.2.8 Total Sulfate

Sulfate can be a primary indicator parameter of CCR leachate impacts on groundwater quality. Total sulfate has been detected greater than the GWPS (400 mg/L) at downgradient well G58S in two of four samples. Total sulfate concentrations ranged from 250 to 540 mg/L. No other exceedances of total sulfate were observed.

### 4.2.9 Total Thallium

Total thallium was detected greater than the GWPS (0.002 mg/L) in one downgradient well (G57S); and one background well G51S. One of eight samples collected for total thallium from downgradient well G57S exceeded the GWPS; the other seven samples were non-detect. One of 16 samples collected for total thallium from background well G51S exceeded the GWPS; the other 15 samples were non-detect. No other exceedances for total thallium were observed.

# 5. EVALUATION OF POTENTIAL RECEPTORS

## 5.1 Water Well Survey

A water well survey was conducted for a 1,000 meter radius of the GMF Pond (Hanson, 2021; Ramboll, 2021). Additionally, a potable water well inventory was completed in 2021 utilizing federal and state databases to assess nearby pumping wells, drinking water receptors, and other uses of water in the vicinity of the GMF Pond. The following sources of information were queried to identify well locations, drinking water receptors, and other uses of water within 1,000 meters of the GMF Pond boundary:

- United States Geological Survey (USGS) National Groundwater Monitoring Network (NGWMN)[1]
- Illinois State Geological Survey (ISGS) Illinois Water and Related Wells (ILWATER) Map[2]
- USEPA Safe Drinking Water Information System (SDWIS)[3]
- IEPA Illinois Drinking Water Watch (DWW)[4]

According to the ISGS ILWATER Map, USEPA SDWIS, and IEPA DWW available records, there is one private well located southwest of the GMF Pond and within 1,000-meters of the GMF Pond. There is no data for Fulton County available from USGS NGWMN.

## 5.2 Surface Water

A search was performed utilizing the United States Fish and Wildlife Service (USFWS) Wetlands Mapper[5] and the USGS National Map[6] for surface water bodies within 1,000 meters of the GMF Pond.

As indicated on the USFWS Wetlands Mapper and USGS National Map, various surface water features were identified within a 1,000-meter radius of the GMF Pond. Surface waters in the vicinity of the GMF Pond include freshwater emergent wetland to the east, and various freshwater ponds to the northeast, south, southeast, and southwest (**Appendix A**).

The predominant surface water body in the region is the Illinois River and associated lowland backwater lakes. Duck Creek, a minor tributary of the Illinois River, formerly bordered the east perimeter of the DCPP. In this area, Duck Creek has been dammed for use for thermal treatment of cooling water discharge from the DCPP and is now the predominant surface water body in the vicinity of the GMF Pond. The distance between the GMF Pond and the Illinois River is sufficient to eliminate influence on local flow conditions at the site; therefore, site-specific flow conditions are not subject to surface water conditions of the Illinois River. Other surface waters in the vicinity of the GMF Pond include freshwater emergent wetland to the east, and various freshwater ponds to the northeast, south, southeast, and southwest. The USGS National Map places the DCPP within the lower Illinois-Lake Chautauqua watershed subbasin (Hydrologic Unit Code [HUC] 07130003) (**Appendix A**).

[5] USFWS Wetlands Mapper: https://www.fws.gov/wetlands/data/mapper.html
[6] USGS National Map: https://apps.nationalmap.gov/viewer/

A Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map for Fulton County Unincorporated Areas, Illinois (Map No. 17057C0375E, effective on 02/04/2011) is attached in **Appendix F**. The flood hazard areas to the east of the DCPP are defined as those areas subject to inundation by the 1 percent annual chance flood (*i.e.,* 100-year flood), also known as the base flood, that has a 1 percent chance of being equaled or exceeded in any given year.

## 5.3 Nature Preserves, Historic Sites, Endangered/Threatened Species

A search of the Illinois Department of Natural Resources (IDNR) Natural Heritage Database[7] for natural areas and protected areas within 1,000 meters of the GMF Pond was performed. According to the IDNR Natural Heritage Database, there are 15 Natural Areas in Fulton County, including two Category III - Nature Preserves (Harper-Rector Woods Nature Preserve [34.67 acres] and Kedzior Woodlands Land and Water Reserve [163.64 acres]). No natural areas were identified within 1,000 meters of the GMF Pond.

The IDNR Natural Heritage Database Threatened and Endangered Species by County[8] lists 11 state threatened and 12 state endangered species in Fulton County. The USFWS Environmental Conservation Online System[9] lists three federally threatened and one federally endangered species in Fulton County (**Appendix A**).

Additionally, a search of the IDNR Historic Preservation Division[10] database for historic sites in the vicinity of the Site yielded no results within 1,000 meters of the GMF Pond. The Illinois State Archaeological Survey (ISAS)[11] databases that do not require credentials to access were also searched and yielded no results within 1,000 meters of the GMF Pond.

# 6. CONCLUSIONS

Hydrogeologic characterization of the GMF Pond was originally developed as part of the *Hydrogeologic Report, in Support Document for Permit Application, Duck Creek Power Generating Station, Gypsum Management Facility, Fulton County, Illinois* (Hanson, 2009) and most recently updated for this HCR. Results of these hydrogeologic studies were reintroduced in this HCR and updated to include geologic, hydrogeologic, and groundwater quality data collected with a focus on the GMF Pond (Part 845 regulated) CCR Unit.

The data were summarized and evaluated for changes in groundwater conditions since the previous investigations; available groundwater quality data for the GMF Pond was compared to the Part 845 Standards.

The results of the hydrogeologic and groundwater quality evaluation are:

- The unlithified stratigraphy within and immediately surrounding the GMF Pond consists of the following in descending order: fill material and CCR (gypsum); silt and clayey silt loess (Peoria/Roxanna Loess); weathered till (upper Radnor Till); shallow, medium-grained sand to silt zone; and till (lower Radnor Till).
- The unlithified units overlay Pennsylvanian-age shaley siltstone and silty shale bedrock (Carbondale Formation). Bedrock was encountered approximately 90 feet bgs at the GMF Pond.
- Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) Coal seam. Mining operations in the area have ceased. Strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) Coal unit at some portions of the DCPP property. Previous investigations completed outside of the GMF Pond indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 to 75 feet. The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to and downgradient of several former large surface mining areas.
- Three distinct water-bearing layers have been identified at the Site based on stratigraphic relationships and common hydrogeologic characteristics:
  - **Uppermost Aquifer:** At the GMF Pond this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the Shallow Sand Zone. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (NRT/OBG, 2017a). The shallow sands are laterally extensive across the site, vary in thickness from less than 1 to 18 feet, and are generally located at an elevation of 570 to 590 feet msl. The shallow sand is saturated. During construction of the GMF Pond, sand was completely removed everywhere it was encountered (mainly the northeast corner and southwest corner of the pond), putting the base of the liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place.
  - **Lower Radnor Till/Lower Confining Unit:** Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick.

  - **Bedrock Confining Unit:** The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet.

- Groundwater flow around the GMF Pond is generally in a southeast direction. Seasonal variation of groundwater levels at the GMF Pond are present and may fluctuate approximately 1 to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond associated with the elevation changes.
- Surface water drainage over much of the site flows east or southeast into the Duck Creek Cooling Pond. The Duck Creek Cooling Pond was formed by damming a portion of Duck Creek, a minor tributary of the Illinois River.
- The nearest surface water body to the GMF Pond is the Duck Creek Cooling Pond, which is located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Cooling Pond is estimated from 562.5 to 565 feet NAVD88. Which is approximately 20 feet lower than downgradient groundwater at the GMF Pond, indicating that groundwater in the vicinity of the GMF Pond is flowing toward the Cooling Pond.
- Groundwater flow velocities in the uppermost aquifer are estimated from $3.1 \times 10^{-2}$ to $6.5 \times 10^{-1}$ ft/day.
- The GMF Pond is lined and the shallow sands of the uppermost aquifer were removed from within the footprint of the pond during construction. The GMF Pond does not appear to impact groundwater flow directions via recharge to groundwater. Given the low permeability of the liner system and the removal of sand below the unit, it is more likely that the GMF Pond is a barrier to groundwater flow within the uppermost aquifer deflecting flow from upgradient areas around the perimeter of the pond toward the downgradient areas south and east of the pond toward the Cooling Pond.
- Based on the detailed geologic information provided, and the hydrogeologic and groundwater quality data, groundwater within the uppermost aquifer at the GMF Pond is classified as Class I – Potable Resource Groundwater. However, background (upgradient) groundwater originates from areas north and west of the GMF Pond that have been extensively surface mined and present a significant alternative source for groundwater impacts.
- Antimony, arsenic, cobalt, lead, pH, sulfate, and thallium were detected at least once at concentrations greater than the GWPS in downgradient uppermost aquifer wells (including PMP wells). Lead, mercury, pH, and thallium were detected at concentrations greater than the GWPS in upgradient uppermost aquifer wells. Radium 226 and 228 combined was detected once at concentrations greater than the GWPS in the bedrock confining unit well.

Groundwater results are considered potential exceedances because they were compared directly to the standard and did not include an evaluation of background groundwater quality or apply the statistical methodologies proposed in the GMP.

This HCR satisfies Part 845 content requirements specific to 35 I.A.C. § 845.620(b) (Hydrogeologic Site Characterization) for the GMF Pond at the DCPP.

**Notes:**
All elevation data are presented relative to the North American Vertical Datum 1988 (NAVD88), GEOID 12A
-- = data not available
BGS = below ground surface
BR = bedrock
CCR = coal combustion residuals
ft = foot or feet
HSU = Hydrostratigraphic Unit
PMP = potential migration pathway
PVC = polyvinyl chloride
S = source water
UA = uppermost aquifer
UA/PMP = uppermost aquifer/potential migration pathway

[O:EDP 8/26/21 U: LDC 09/09/21, C: SSW 09/17/21]

**Notes:**
1. Distance change was calculated using the midpoint of the piezometer screen and water table surface. If the water table surface was above the top of the monitoring well screen, then distance change was calculated using the midpoint of both screens.
2. Vertical gradients between ±0.0015 are considered flat, and typically have less than 0.02 foot difference in groundwater elevation between wells.

-- = Not calculated
BCU = bedrock confining unit
dh = head change
dl = distance change
ft = feet
NAVD88 = North American Vertical Datum of 1988
PMP = potential migration pathway
UA = uppermost aquifer

[O: EDP 8/28/21, C: LDC 09/17/21]

Notes:
[1] Hydraulic conductivity values used above are the geometric mean of hydrostratigraphic unit hydraulic conductivity values calculated from slug tests completed in April 2021 by Ramboll.
[2] Effective porosity used in these calculations was derived from an average between estimated values of 0.20 for silt material, 0.267 for gravel, 0.07 for clay, and 0.28 for sand from Morris, D.A and A.I. Johnson, 1967. Summary of hydrologic and physical properties of rock and soil materials as analyzed by the Hydrologic Laboratory of the U.S. Geological Survey. U.S. Geological Survey Water-Supply Paper 1839-D, 42p. and Heath, R.C., 1983. Basic ground-water hydrology, U.S. Geological Survey Water-Supply Paper 2220, 86p. Effective porosity may be as high as maximum total porosity (56%) calculated in Table 2-1.
% = percent
ft/day = feet per day
ft/ft = feet per feet
ft= feet
NAVD88 = North American Vertical Datum of 1988
UA = uppermost aquifer

**Notes:**
Detected at concentration greater than the GWPS
-- = data not available
GWPS = Groundwater Protection Standard
mg/L = milligrams per liter
pCi/L = picocuries per liter
SU = standard units
< = concentration is less than the concentration shown, which corresponds to the reporting limit for the method. Estimated concentrations below the reporting limit and associated qualifiers are not provided since they are not utilized in statistics to determine exceedances above Part 845 standards.
35 I.A.C. 845.600 = Residuals in Surface Impoundments: Title 35 of the Illinois Administrative Code § 845

NOTES
1. This profile was developed by interpolation between widely spaced boreholes. Only at the borehole location should it be considered as an approximately accurate representation and then only to the degree implied by the notes on the borehole logs.
2. Scale is approximate.
3. Vertical scale is exaggerated 10X.
4. Groundwater elevations measured on April 14, 2021.

Report Form Completed By: Rhonald W Hasenyager Date: 4/17/2007

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: High-solids bentonite grout

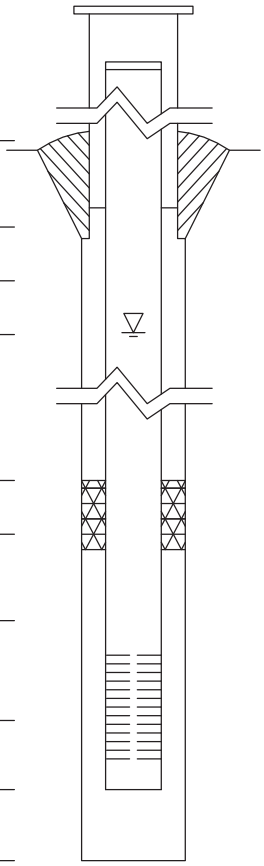
Installation Method: Tremie

Setting Time: >24 hr

Type of Bentonite Seal -- [Granular] Pellet Slurry (choose one)

Installation Method: Gravity

Setting Time: 20 min



Type of Sand Pack: Quartz sand

Grain Size: 10/20 (sieve size)

Installation Method: Gravity

Type of Backfill Material: _____ (if applicable)

Installation Method: _____

| Elevations (MSL)* | Depths (BGS) | (0.01 ft.) |
|---|---|---|
| 624.22 | -3.38 | Top of Protective Casing |
| 623.82 | -2.98 | Top of Riser Pipe |
| 620.84 | 0.00 | Ground Surface |
| 620.54 | 0.30 | Top of Annular Sealant |
| 614.98 | 5.86 | Static Water Level (After Completion) 3/29/2007 |
| 597.42 | 23.42 | Top of Seal |
| 593.80 | 27.04 | Top of Sand Pack |
| 591.67 | 29.17 | Top of Screen |
| 586.86 | 33.98 | Bottom of Screen |
| 586.52 | 34.32 | Bottom of Well |
| 586.52 | 34.32 | Bottom of Borehole |

* Referenced to a National Geodetic Datum

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: High-solids bentonite

Installation Method: Tremie

Setting Time: 24+ hours

Type of Bentonite Seal -- (Granular) Pellet Slurry (choose one)

Installation Method: Gravity

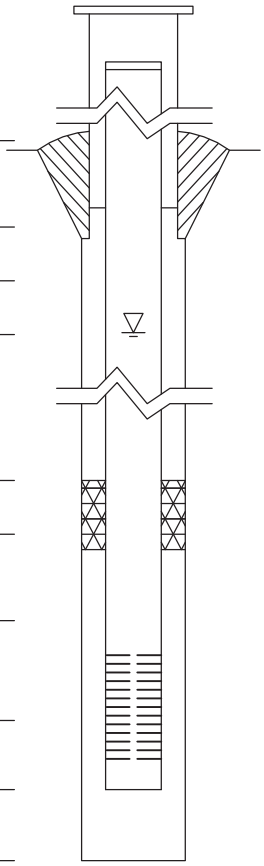
Setting Time: 20 minutes



Type of Sand Pack: Quartz sand

Grain Size: 10/20 (sieve size)

Installation Method: Gravity

Type of Backfill Material: n/a (if applicable)

Installation Method:

| Elevations (MSL)* | Depths (BGS) (0.01 ft.) | |
|---|---|---|
| 623.37 | -3.09 | Top of Protective Casing |
| 623.00 | -2.72 | Top of Riser Pipe |
| 620.28 | 0.00 | Ground Surface |
| 618.48 | 1.80 | Top of Annular Sealant |
| | DRY | Static Water Level (After Completion) 3/4/2009 |
| 597.78 | 22.50 | Top of Seal |
| 595.28 | 25.00 | Top of Sand Pack |
| 592.96 | 27.32 | Top of Screen |
| 583.53 | 36.75 | Bottom of Screen |
| 583.06 | 37.22 | Bottom of Well |
| 583.06 | 37.22 | Bottom of Borehole |

* Referenced to a National Geodetic Datum

## WELL CONSTRUCTION MATERIALS

(Choose one type of material for each area)

| | | | | | |
|---|---|---|---|---|---|
| Protective Casing | SS304 | SS316 | PTFE | PVC | OTHER: |

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: High-solids bentonite

Installation Method: Tremie

Setting Time: 24+ hours

Type of Bentonite Seal -- (Granular) Pellet Slurry (choose one)

Installation Method: Gravity

Setting Time: 20 minutes

Type of Sand Pack: Quartz sand

Grain Size: 10/20 (sieve size)

Installation Method: Gravity

Type of Backfill Material: n/a (if applicable)

Installation Method:

| Elevations (MSL)* | Depths (BGS) (0.01 ft.) | |
|---|---|---|
| 623.24 | -3.20 | Top of Protective Casing |
| 623.04 | -3.00 | Top of Riser Pipe |
| 620.04 | 0.00 | Ground Surface |
| 617.94 | 2.10 | Top of Annular Sealant |
| | DRY | Static Water Level (After Completion) 3/4/2009 |
| 604.54 | 15.50 | Top of Seal |
| 601.49 | 18.55 | Top of Sand Pack |
| 599.35 | 20.69 | Top of Screen |
| 589.94 | 30.10 | Bottom of Screen |
| 589.48 | 30.56 | Bottom of Well |
| 589.48 | 30.56 | Bottom of Borehole |

ILLINOIS DEPARTMENT OF PUBLIC HEALTH
DIVISION OF ENVIRONMENTAL HEALTH
525 W. JEFFERSON ST.
SPRINGFIELD, IL 62761

# WATER WELL SEALING FORM

**TYPE OR PRESS FIRMLY**

**RETURN ALL COPIES TO IDPH OR LOCAL HEALTH DEPARTMENT**

**This form shall be submitted to this Department or the local health department not more than 30 days after a water well, boring or monitoring well is sealed. Such wells are to be sealed not more than 30 days after they are abandoned in accordance with the sealing requirements in the Water Well Construction Code. THE LOCAL HEALTH DEPARTMENT OR REGIONAL PUBLIC HEALTH DEPARTMENT MUST BE NOTIFIED AT LEAST 48 HOURS PRIOR TO SEALING.**

1. **Ownership (Name of Controlling Party)** Duck Creek Power Station - GMF (G61L)

2. **Well Location** 17751 N Cilco Road (Address - Lot Number) Canton (City) Fulton (County)

   **General Description** **Township** 6 (N)(~~S~~) **Range** 5 (E)(~~W~~) **Section** 18

   SW **Quarter of the** NE **Quarter of the** NW **Quarter**

3. **Year Drilled** 2009

4. **Drilling Permit Number (and date, if known)** n/a

5. **Type of Well** **Bored** ____ **Drilled** ✓ **Other** ____

6. **Total Depth** 19.9 **Diameter (inches)** 8

7. **Formation clear of obstruction** ✓ **Yes** ____ **No**

8. **DETAILS OF PLUGGING** *(riser pipe and screen pulled and annulus was grouted)*

   **Filled with** Bentonite grout (cement or other materials) **from** 0 **to** 19.9 **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

   **Filled with** ____ **from** ____ **to** ____ **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

   **Filled with** ____ **from** ____ **to** ____ **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

9. **CASING RECORD** **Upper 2 feet of casing removed** ✓ **Yes** ____ **No**

10. **Date well was sealed** **Month** March **Day** 14 **Year** 2017.

11. **Licensed water well driller or other person approved by the Department performing well sealing.**

Report Form Completed By: Suzanna Simpson Date: 2/26/2009

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: High-solids bentonite

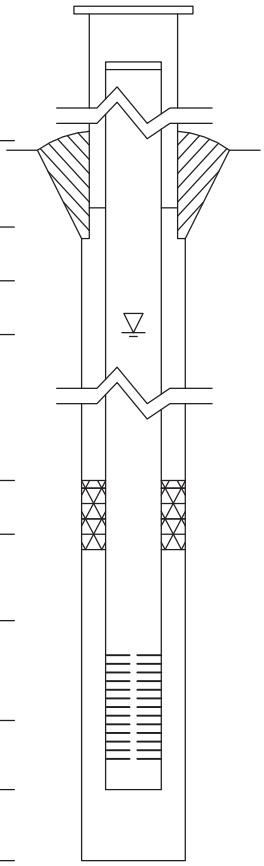
Installation Method: Tremie

Setting Time: 24+ hours

Type of Bentonite Seal -- (Granular) Pellet Slurry (choose one)

Installation Method: Gravity

Setting Time: 2.5 hours



Type of Sand Pack: Quartz sand

Grain Size: 10/20 (sieve size)

Installation Method: Gravity

Type of Backfill Material: Quartz sand (if applicable)

Installation Method: Gravity

| Elevations (MSL)* | Depths (BGS) (0.01 ft.) | |
|---|---|---|
| 622.80 | -2.80 | Top of Protective Casing |
| 622.58 | -2.58 | Top of Riser Pipe |
| 620.00 | 0.00 | Ground Surface |
| 618.00 | 2.00 | Top of Annular Sealant |
| 587.62 | 32.38 | Static Water Level (After Completion) 3/4/2009 |
| 595.00 | 25.00 | Top of Seal |
| 591.80 | 28.20 | Top of Sand Pack |
| 589.81 | 30.19 | Top of Screen |
| 585.37 | 34.63 | Bottom of Screen |
| 584.74 | 35.26 | Bottom of Well |
| 582.00 | 38.00 | Bottom of Borehole |

* Referenced to a National Geodetic Datum

## WELL CONSTRUCTION MATERIALS

(Choose one type of material for each area)

5. **Type of Well** **Bored** ____ **Drilled** ✓ **Other** ____

6. **Total Depth** 35.09 **Diameter (inches)** 8

7. **Formation clear of obstruction** ✓ **Yes** ____ **No**

   After G72S was sealed, replacement well R72S was installed approximately 5 feet west in a blind-drilled borehole.

8. **DETAILS OF PLUGGING**

   **Filled with** Bentonite grout (cement or other materials) **from** 2 **to** 35.09 **ft.**

   **Kind of plug** Random soil **from** 0 **to** 2.0 **ft.**

   **Filled with** ____ **from** ____ **to** ____ **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

   **Filled with** ____ **from** ____ **to** ____ **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

9. **CASING RECORD** **Upper 2 feet of casing removed** ✓ **Yes** ____ **No**

10. **Date well was sealed** **Month** November **Day** 9 **Year** 2016.

11. **Licensed water well driller or other person approved by the Department performing well sealing.**

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: High-solids bentonite

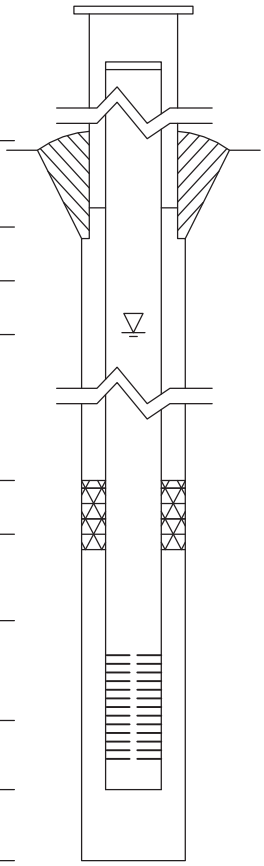
Installation Method: Tremie

Setting Time: 24+ hours

Type of Bentonite Seal -- (Granular) Pellet Slurry (choose one)

Installation Method: Gravity

Setting Time: 12+ hours



Type of Sand Pack: Quartz sand

Grain Size: 10/20 (sieve size)

Installation Method: Gravity

Type of Backfill Material: n/a (if applicable)

Installation Method:

| Elevations (MSL)* | Depths (BGS) (0.01 ft.) | |
|---|---|---|
| 618.23 | -3.59 | Top of Protective Casing |
| 617.58 | -2.94 | Top of Riser Pipe |
| 614.64 | 0.00 | Ground Surface |
| 612.64 | 2.00 | Top of Annular Sealant |
| | DRY | Static Water Level (After Completion) 3/4/2009 |

Bloomington, Illinois 61701

Re: Duck Creek Power Station
Fulton County, Illinois

Dear Mr. Ramsey:

Included in this report are the test results from a bulk sample of gypsum received in our laboratory on March 15, 2021. The sample was tested in general accordance with the test method listed below.

| Test to Determine | Method of Test |
|---|---|
| Hydraulic Conductivity of Soil Using Flexible Wall Permeameter | ASTM D5084 |

We trust this is the information you require. Please contact the undersigned if you have any questions regarding this report.

Respectfully submitted,

**GEOTECHNOLOGY, INC.**

Janet M. May
Illinois Laboratory Manager

JMM/LPH:jmm

Attachment: Test Result Summary
Hydraulic Conductivity Test Data Sheet
Proctor Curve (Provided by Ramsey)

Attn: Mr. Rhonald Hasenyager

RE: Duck Creek Power Station GMF: Fulton County, IL

Dear Mr. Hasenyager:

In accordance with your request, we have completed the analysis of the samples obtained from the exploration borings from the above mentioned project. The selected samples were analyzed in accordance with the applicable ASTM standards. A laboratory results summary sheet is included for your reference.

As always, if you have any questions do not hesitate to contact us.

Sincerely,

GEOTECHNICS, A DIVISION OF KLINGNER

Brian Joseph Sick

Material Description

○ Silty Clay with Sand (CL-ML), Gray, Moist

□ Sandy Silty Clay (CL-ML), Gray, Dry

REMARKS:

○ Moisture Content = 14.5%

□ Moisture Content = 10.0%

○ Location: SB62 Depth: 33 to 39 ft. Sample Number: Comp 3

□ Location: SB62 Depth: 41 to 51 ft. Sample Number: Comp 4

Project No: 21-1004

# Specific Gravity of Soil Solids by Water Pycnometer (ASTM D854)

Project: Duck Creek Power Station GMF  Location: Canton, IL

Client: Hanson Professional Services  Test Method: B

Sample Description: Silty Clay with Sand (CL-ML), Gray, Moist

Sample Source: SS Composite

Boring or Test Pit No.: SB62/Comp#3  Maximum Particle Size: 3/8"

Sample Depth: 33 to 39 ft.  Percent Passing No. 4 Sieve: 97.1%

Sample Type: SS  Percent Passing No. 200 Sieve: 73.7%

| Specific gravity of soil solids (ASTM D854) | | | |
|---|---|---|---|

## G50L FALLING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G50L-fh.aqt
Date: 06/02/21 Time: 16:26:20

## AQUIFER DATA

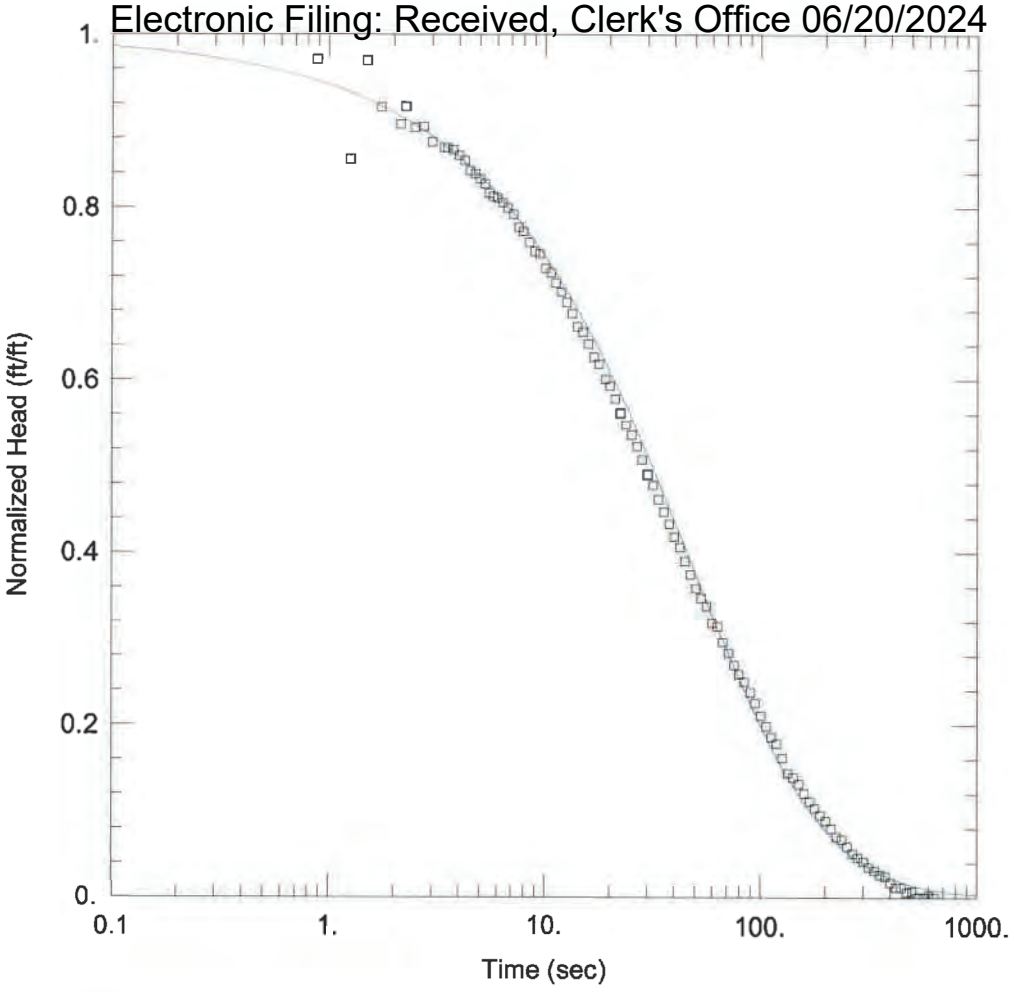
Saturated Thickness: 5.04 ft

## WELL DATA (G50L)

Initial Displacement: 1.6 ft
Total Well Penetration Depth: 7.64 ft
Casing Radius: 0.08333 ft

Static Water Column Height: 5.04 ft
Screen Length: 4.71 ft
Well Radius: 0.08333 ft

## SOLUTION



Aquifer Model: Unconfined

Kr = 0.0023 cm/sec
Kz/Kr = 1.

Solution Method: KGS Model

Ss = 0.006 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

## G50L RISING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G50L-rh.aqt
Date: 06/02/21 Time: 16:26:22

## AQUIFER DATA

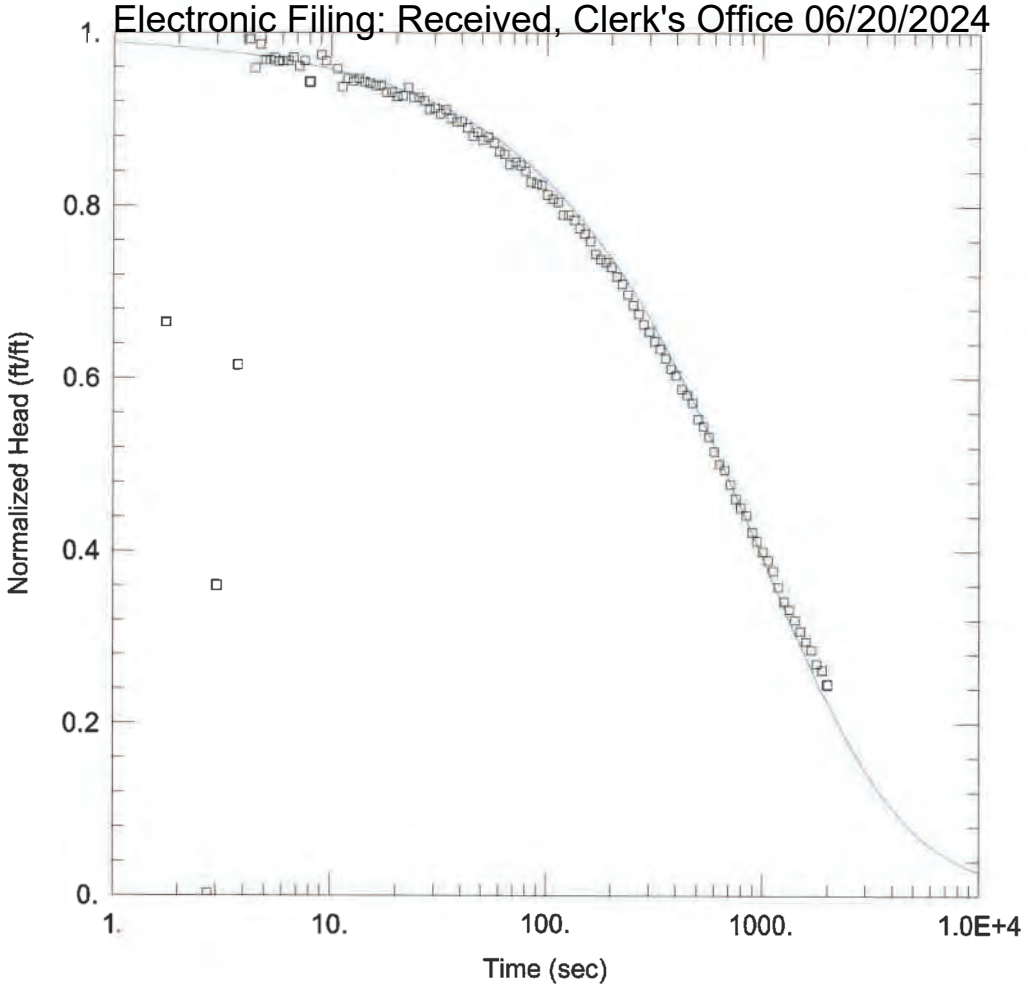
Saturated Thickness: 5.04 ft

## WELL DATA (G50L)

Initial Displacement: 1.625 ft
Total Well Penetration Depth: 7.64 ft
Casing Radius: 0.08333 ft

Static Water Column Height: 5.04 ft
Screen Length: 4.71 ft
Well Radius: 0.08333 ft

## SOLUTION



Aquifer Model: Unconfined

Kr = 0.0021 cm/sec
Kz/Kr = 1.

Solution Method: KGS Model

Ss = 0.005 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

## G50S FALLING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G50S-fh.aqt
Date: 06/02/21 Time: 16:26:23

## PROJECT INFORMATION

Client: Duck Creek Power Statin
Project: 20E0111A
Location: Canton, IL
Test Well: G50S
Test Date: 4 Mar 2021

## AQUIFER DATA

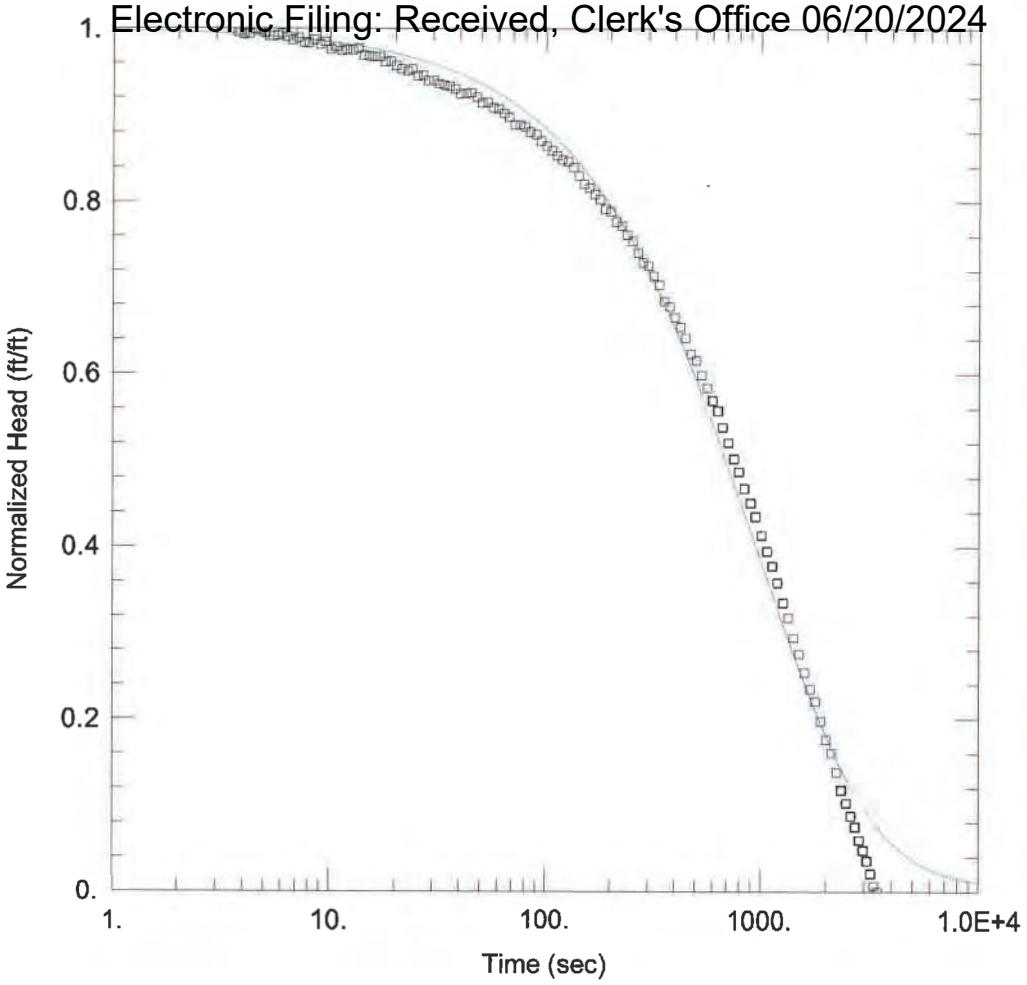
Saturated Thickness: 4.3 ft

## WELL DATA (G50S)

Initial Displacement: 1.07 ft
Total Well Penetration Depth: 22.57 ft
Casing Radius: 0.08333 ft

Static Water Column Height: 20.03 ft
Screen Length: 4.71 ft
Well Radius: 0.08333 ft

## SOLUTION



Aquifer Model: Confined

Kr = 6.5E-5 cm/sec
Kz/Kr = 1.

Solution Method: KGS Model

Ss = 0.007 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

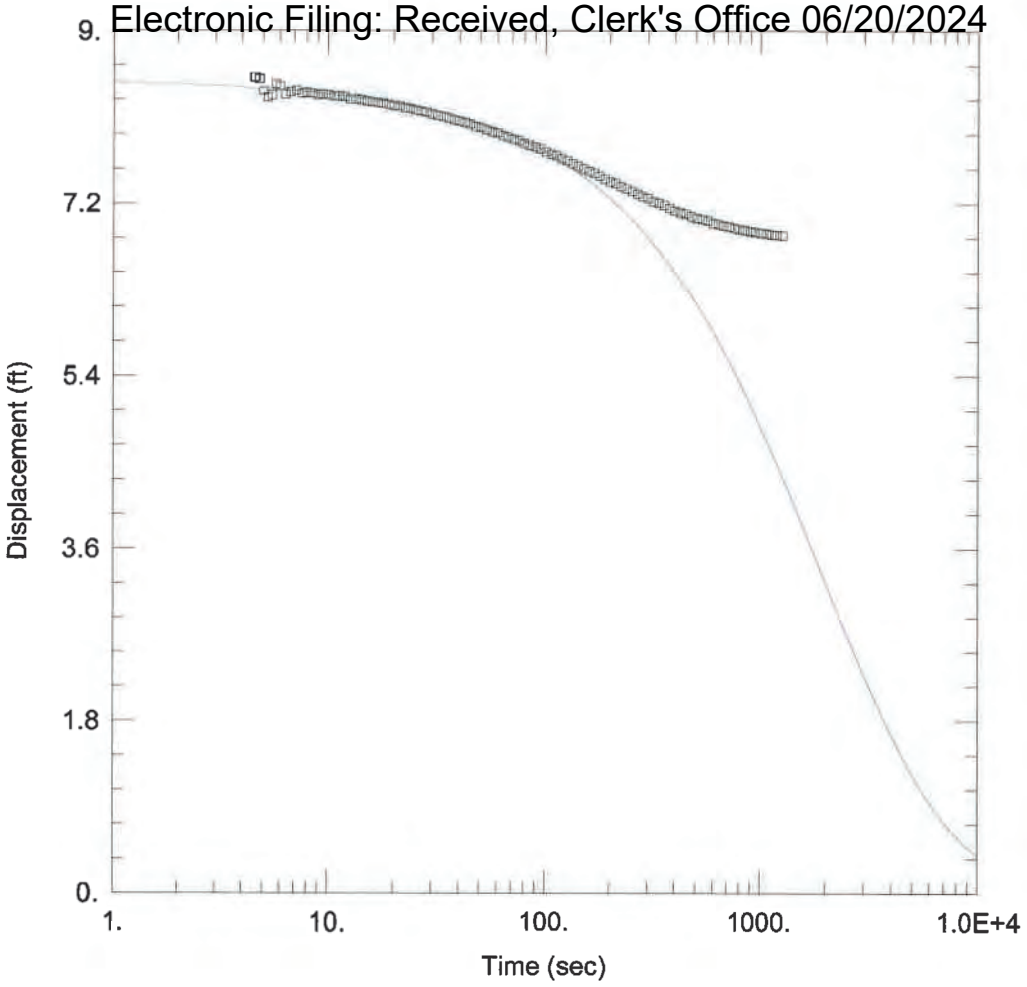
G50S RISING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G50S-rh.aqt
Date: 06/02/21 Time: 16:26:25

AQUIFER DATA

Saturated Thickness: 4.3 ft

WELL DATA (G50S)



Initial Displacement: 1.35 ft
Total Well Penetration Depth: 22.57 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 20.03 ft
Screen Length: 4.71 ft
Well Radius: 0.08333 ft

SOLUTION

Aquifer Model: Confined
Solution Method: KGS Model

Kr = 0.00015 cm/sec
Kz/Kr = 1.
Ss = 1.4E-5 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

## G51L FALLING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G51L-fh.aqt
Date: 06/02/21 Time: 16:26:26

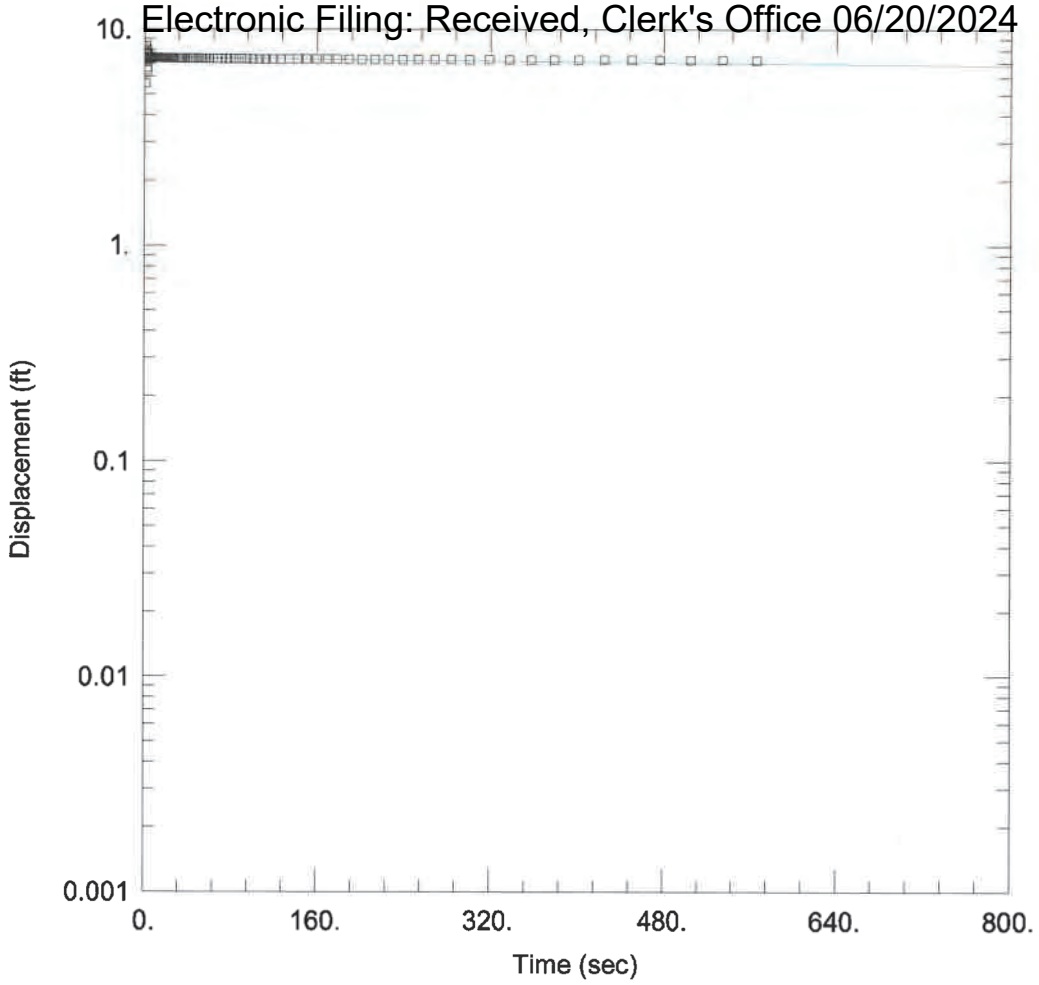
## PROJECT INFORMATION

Client: Duck Creek Power Station
Project: 20E0111A
Location: Canton, IL
Test Well: G51L
Test Date: 4 Mar 2021

## AQUIFER DATA

Saturated Thickness: 8.5 ft

## WELL DATA (G51L)



Initial Displacement: 8.5 ft
Total Well Penetration Depth: 14.11 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 6.32 ft
Screen Length: 4.79 ft
Well Radius: 0.08333 ft

## SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 3.0E-5 cm/sec
Kz/Kr = 1.
Ss = 0.0011 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

## G51S FALLING HEAD TEST

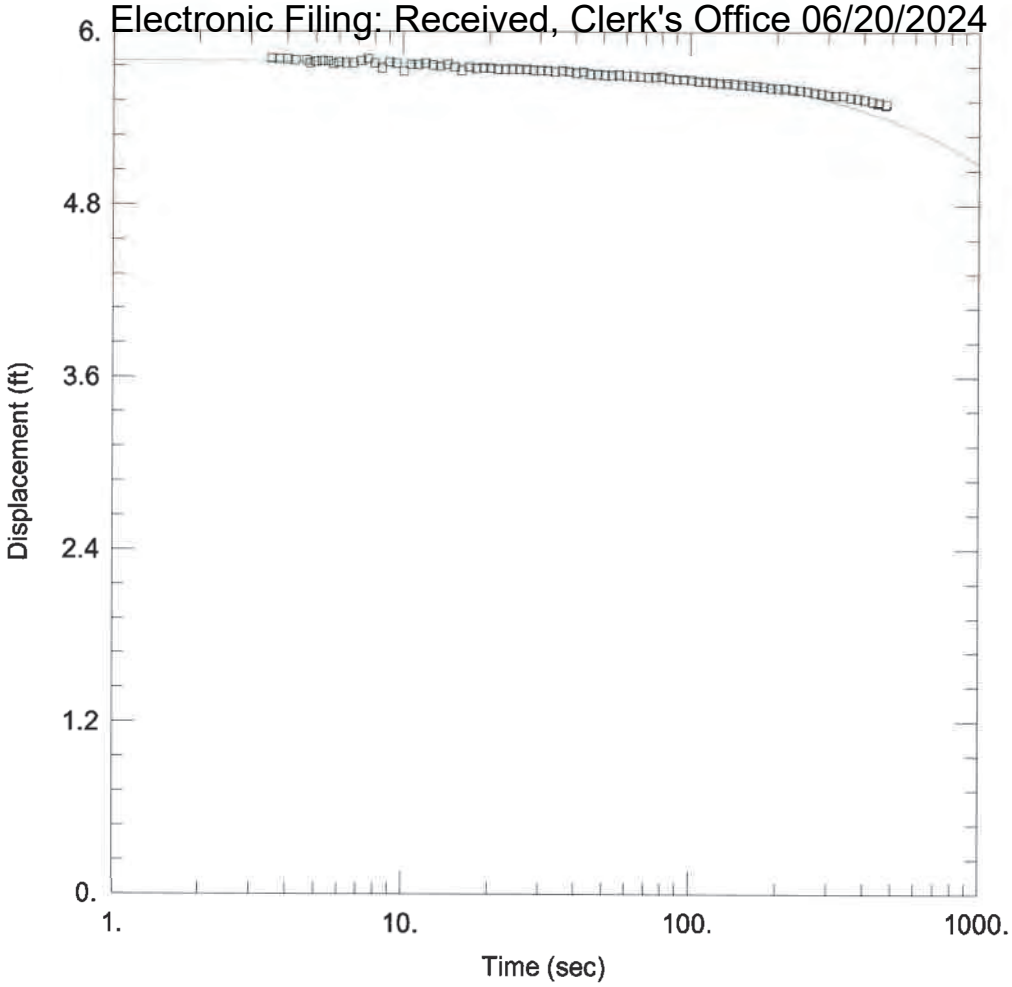
Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G51S-fh.aqt
Date: 06/02/21 Time: 16:26:27

## PROJECT INFORMATION

Client: Duck Creek Power Station
Project: 20E0111A
Location: Canton, IL
Test Well: G51S
Test Date: 4 Mar 2021

## AQUIFER DATA

Saturated Thickness: 0.4 ft
Anisotropy Ratio (Kz/Kr): 1.



## WELL DATA (G51S)

Initial Displacement: 7.4 ft
Total Well Penetration Depth: 20.04 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 17.4 ft
Screen Length: 4.78 ft
Well Radius: 0.08333 ft

## SOLUTION

Aquifer Model: Confined
K = 7.2E-5 cm/sec
Solution Method: Bouwer-Rice
y0 = 7.35 ft

Electronic Filing: Received, Clerk's Office 06/20/2024

## G51S RISING HEAD TEST

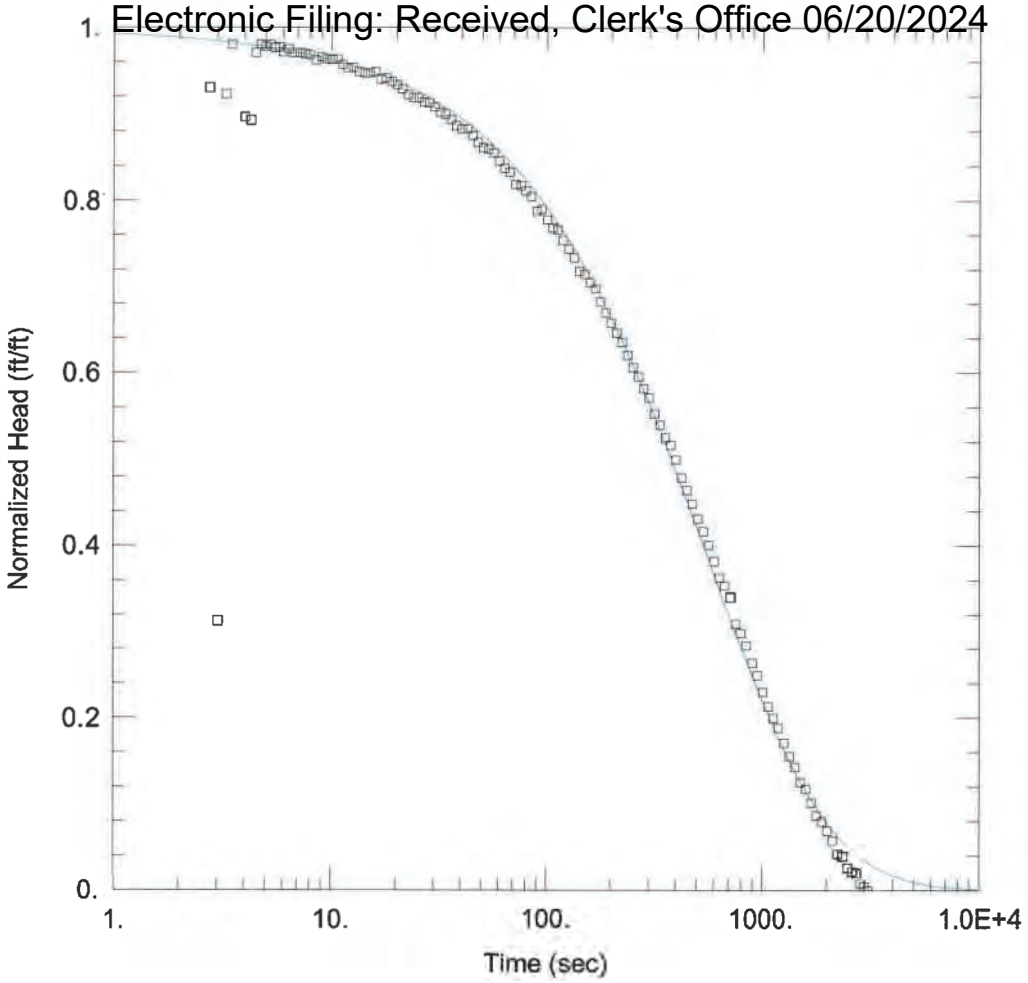
Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G51S-rh.aqt
Date: 06/02/21 Time: 16:26:29

## PROJECT INFORMATION

Client: Duck Creek Power Station
Project: 20E0111A
Location: Canton, IL
Test Well: G51S
Test Date: 4 Mar 2021

## AQUIFER DATA

Saturated Thickness: 0.4 ft



## WELL DATA (G51S)

Initial Displacement: 5.8 ft
Total Well Penetration Depth: 20.04 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 17.4 ft
Screen Length: 4.78 ft
Well Radius: 0.08333 ft

## SOLUTION

Aquifer Model: Confined
Solution Method: KGS Model
Kr = 0.00011 cm/sec
Kz/Kr = 1.
Ss = 0.0015 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

## G53L FALLING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G53L-fh.aqt
Date: 06/02/21 Time: 16:26:30

## PROJECT INFORMATION

Client: Duck Creek Power Station
Project: 20E0111A
Location: Canton, IL

# APPENDIX F
# FEMA FLOOD HAZARD MAP

## NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown in the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or flood plain management.

**Coastal Base Flood Elevations** shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or flood plain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

In the State of Illinois, any portion of a stream or watercourse that lies within the **floodway fringe** of a studied (AE) stream may have a state regulated floodway. The FIRM may not depict these state regulated floodways.

**Floodways** restricted by anthropogenic features such as bridges and culverts are drawn to reflect natural conditions and may not agree with the model computed widths listed in the Floodway Data table in the Flood Insurance Study report.

Multiple **topographic sources** may have been used in the delineation of Special Flood Hazard Areas. See Flood Insurance Study report for details on source resolution and geographic extent.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 15. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

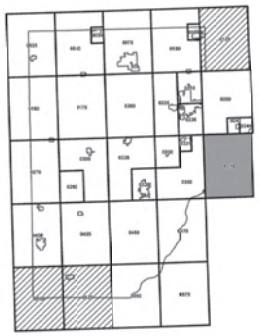
NGS Information Services, NOAA, N/NGS12
National Geodetic Survey SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at (301) 713-3242, or visit its website at www.ngs.noaa.gov.

**Base map** information shown on this FIRM was provided in digital format by the United States Geological Survey. Digital orthoimagery with a spatial resolution of 0.5 meter ground sample distance were photogrammetrically compiled from aerial photography acquired during the leaf-off period of spring 2005.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The Special Flood Hazard Areas and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

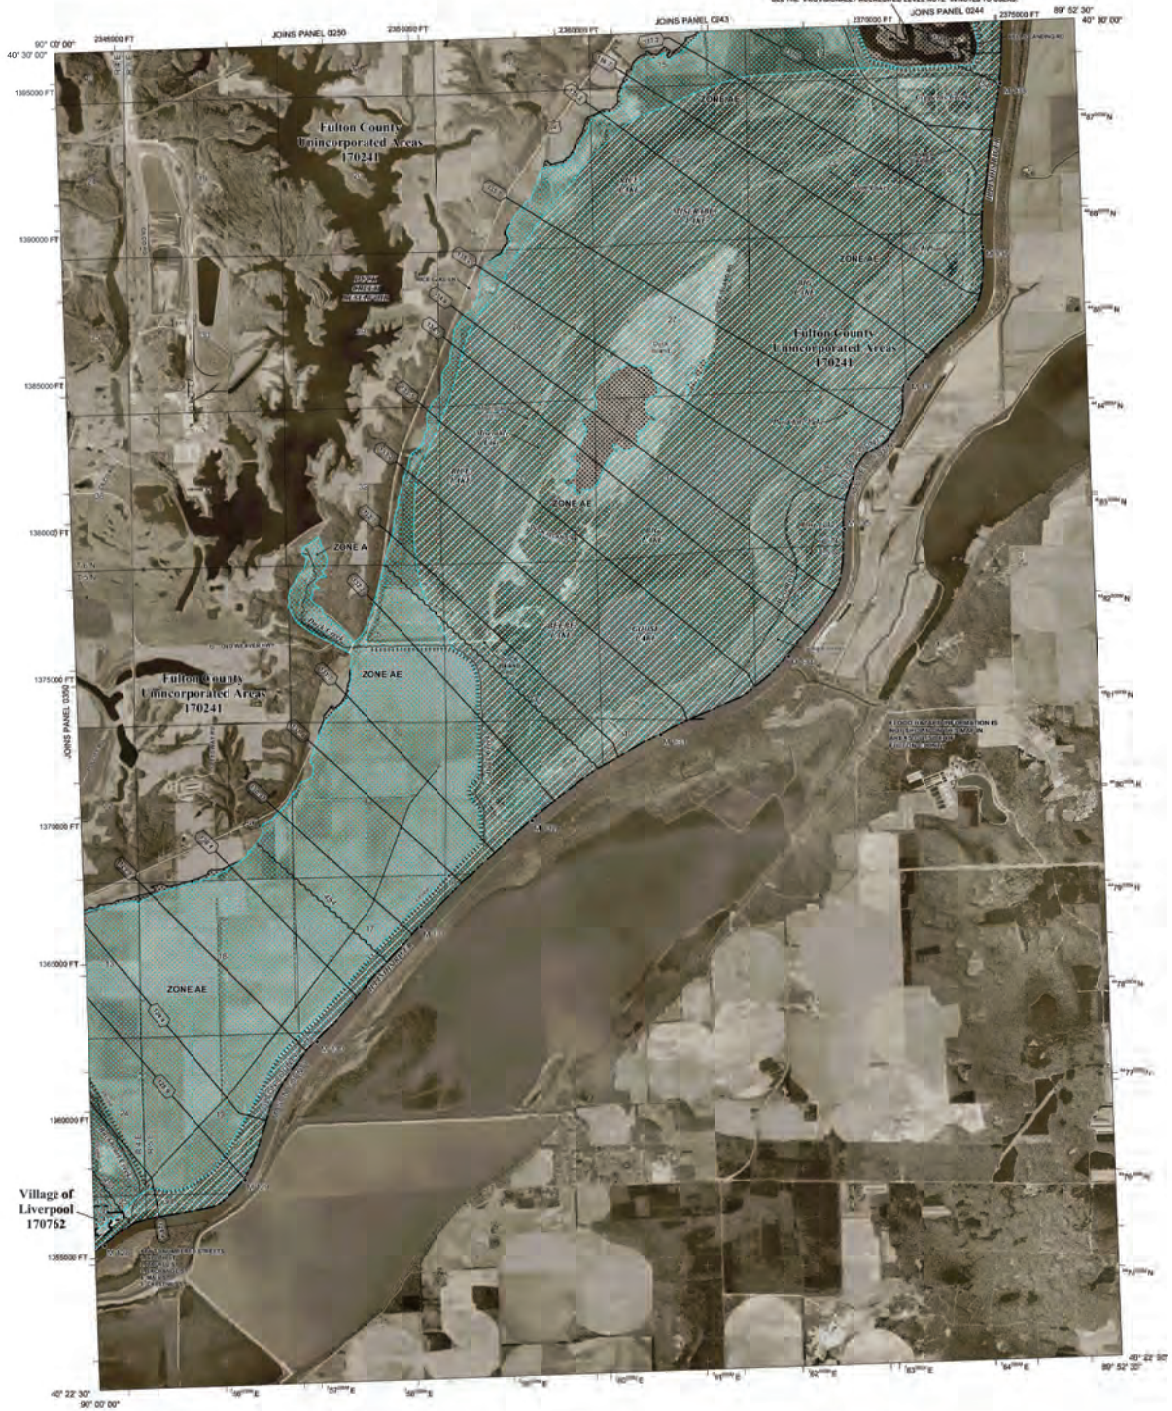
**Corporate limits** shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.



Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information on available products associated with this FIRM visit the Map Service Center (MSC) website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

If you have **questions about this map**, how to order products or the National Flood Insurance Program in general, please visit the **FEMA Map Information eXchange (FMIX)** at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.



Provisionally Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To maintain accreditation, the levee owner or community is required to submit the data and documentation necessary to comply with Section 65.10 of the NFIP regulations by December 31, 2010. If the community or owner does not provide the necessary data and documentation or if the data and documentation provided indicate the levee system does not comply with Section 65.10 requirements, FEMA will revise the flood hazard and risk information for this area to reflect de-accreditation of the levee system. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA website at http://www.fema.gov/business/nfip/index.shtm.

## PANEL INDEX

Panel Not Printed

NOTE: THIS AREA IS SHOWN AS BEING PROTECTED FROM THE 1-PERCENT-ANNUAL-CHANCE OR GREATER FLOOD HAZARD BY A LEVEE SYSTEM THAT HAS BEEN PROVISIONALLY ACCREDITED. OVERTOPPING OR FAILURE OF ANY LEVEE SYSTEM IS POSSIBLE. FOR ADDITIONAL INFORMATION, SEE THE "PROVISIONALLY ACCREDITED LEVEE NOTE" IN NOTES TO USERS.

## LEGEND

**SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD**

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

- **ZONE A** No Base Flood Elevations determined.
- **ZONE AE** Base Flood Elevations determined.
- **ZONE AH** Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
- **ZONE AO** Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
- **ZONE AR** Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
- **ZONE A99** Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
- **ZONE V** Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
- **ZONE VE** Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

**FLOODWAY AREAS IN ZONE AE**

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

**OTHER FLOOD AREAS**

- **ZONE X** Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

**OTHER AREAS**

- **ZONE X** Areas determined to be outside the 0.2% annual chance floodplain.
- **ZONE D** Areas in which flood hazards are undetermined, but possible.

**COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS**

**OTHERWISE PROTECTED AREAS (OPAs)**

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
- 513 Base Flood Elevation line and value; elevation in feet*
- (EL. 987) Base Flood Elevation value where uniform within zone; elevation in feet*

*Referenced to the North American Vertical Datum of 1988

- A-A Cross section line
- 23-23 Transect line
- 65° 02' 08", 93° 02' 12" Geographic coordinates referenced to the North American Datum of 1983 (NAD 83)
- 4000-meter Universal Transverse Mercator grid values, zone 15
- 5000-foot grid ticks: Illinois State Plane West Coordinate System of 1983, 3601 zone (FIPSZONE 1202) Transverse Mercator
- Bench mark (see explanation in Notes to Users section of this FIRM panel)
- River Mile

# Evaluation of Potential Exceedances of Groundwater Protection Standards

Electronic Filing: Received, Clerk's Office 06/20/2024

GOLDER
MEMBER OF WSP

# TECHNICAL MEMORANDUM

**DATE** October 15, 2021 **Project No.** 21454831

**TO** David Mitchell, Stu Cravens, Vic Modeer
Illinois Power Resources Generating, LLC

**CC** Brian Hennings - Ramboll

**FROM** Roberta Russell, Jeffrey Ingram, Pat Behling - Golder

**EVALUATION OF POTENTIAL GWPS EXCEEDANCES, GYPSUM MANAGEMENT FACILITY POND, DUCK CREEK POWER PLANT, FULTON COUNTY, ILLINOIS**

## 1.0 INTRODUCTION

Illinois Power Resource Generating, LLC (IPRG) formerly operated the Duck Creek Power Plant (DCPP) located in Fulton County, Illinois. The Gypsum Management Facility Pond (GMFP, Illinois Environmental Protection Agency [IEPA] ID No. W0578010001-04) is a surface impoundment used to manage gypsum and related coal combustion residuals (CCRs) at the DCPP. The GMFP is regulated under Part 845 *"Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments"* (State CCR Rule or Part 845) which was promulgated by the Illinois Pollution Control Board (IPCB) on April 21, 2021.

IPRG is currently preparing an Operating Permit application for the GMFP as required under Section 845.230 which requires that known exceedances of groundwater protection standards (GWPS) be documented as a part of the Operating Permit application. In October 2021, Ramboll Americas Engineering Solutions, Inc. (Ramboll) identified potential GWPS exceedances for pH, arsenic, and lead in groundwater samples collected from selected monitoring wells in the vicinity of the GMFP as presented in the Operating Permit application for the GMFP. This Technical Memorandum was developed to further evaluate these potential GWPS exceedances.

## 1.1 Site Setting, Geology and Hydrogeology

The Duck Creek Power Plant (Site) is an inactive power plant in Fulton County, located in central Illinois, approximately 9 miles southeast of the town of Canton. The GMFP is located north of the power plant (see Figure 1). Agricultural land surrounds the DCPP.

Regionally, the Site is positioned on the glacial uplands above the Illinois River in the Ancient Illinois Floodplain of the Till Plains Section of the Central Lowland Province. The undisturbed unlithified materials consist of loess, diamictons, and lacustrine/alluvial deposits. The area is flat to gently rolling uplands that are dissected by deeply incised streams that are tributaries to major river systems (NRT/OBG 2017).

Several large former surface coal mines are present in the vicinity; unlithified materials are present in the excavated strip mine spoils and have been mixed due to the surface mining activities. Mining operations in the area have ceased.

The uppermost bedrock stratum in the area is the Carbondale Formation of the Kewanee Group of the Pennsylvanian System. Bedrock in the area is identified as Pennsylvanian-age shale deposits. Bedrock occurs within approximately 50 feet (ft) of the ground surface in this area.

**Golder Associates Inc.**
13515 Barrett Parkway Drive, Suite 260, Ballwin, Missouri, USA 63021 T: +1 314 984-8800 F: +1 314 984-8770

Golder and the G logo are trademarks of Golder Associates Corporation

The following two unlithified water-bearing units are present beneath the GMF Pond (beginning at the ground surface):

- Loess Zone – Moderate to high permeability silts and clayey silts, including: the Peoria and Roxanna Silt (Loess Units); underlain by the low permeability clayey diamictons of the Berry Clay and upper Radnor Till Members of the Glasford Formation.
- Shallow Sand Unit – Thin to moderately thick (6 to 18 ft), moderate to high permeability, medium-grained sand to silt with intercalated till seams; underlain by till sequences of the lower Radnor Till Member of the Glasford Formation.

The Uppermost Aquifer in the area consists of the Loess and Shallow Sand. These hydraulically connected units are underlain by the lower Radnor Till Member of the Glasford Formation. As shown on Figure 1, groundwater typically flows from northwest to southeast in the Uppermost Aquifer (NRT/OBG 2017).

## 1.2 Gypsum Management Facility Pond Design and Operation History

The GMFP is a 1,500-foot by 900-foot earthen berm double-lined CCR surface impoundment. Construction of the dual composite liner system and a leak detection system layer was completed in 2007-2009 under a rigorous construction quality assurance program (Hanson, 2009), which is an important determinant of liner system performance. The GMFP consists of the following components from top to bottom:

- Primary Composite Liner
  - SOLMAX 460T-1000 60-mil (0.06-inch thick) textured high-density polyethylene (HDPE) geomembrane
  - 1-foot cushion soil layer (2 feet in selected areas on the side slopes)
- Leak detection layer
  - SKAPS GT-142 4-0z/yd$^2$ geotextile separator
  - 1-foot granular drainage layer
  - SKAPS FE-110 10-oz/yd$^2$ geotextile cushion
- Secondary composite liner
  - Solmax 460T-4013 60-mil texture HDPE geomembrane
  - CETCO Bentomat SDN reinforced geosynthetic clay liner (GCL)
  - 3-foot compacted clay layer placed in 8-inch lifts, compacted to at least 95% of the standard Proctor maximum dry density at a moisture content between the standard Proctor optimum moisture content (OMC) and 5% of the wet OMC

The GMFP was used to store gypsum and to clarify gypsum transport water for reuse in the wet scrubber system at the DCPP until the plants retirement in 2019. Gypsum materials are the only waste managed in the GMFP.

## 2.0 POTENTIAL GWPS EXCEEDANCES REVIEW

As required by Section 845.230 (d)(2)(M), an evaluation of the history of potential GWPS exceedances was competed for the Operating Permit application by Ramboll. Data collected from groundwater samples collected from the GMFP monitoring well network since January 30, 2015, were evaluated and potential exceedances of the GWPSs are summarized below.

- Field pH at monitoring well G52L: A field pH GWPS exceedance was noted in a single sample collected from this well in February 2021. The pH value of 6.4 standard units (s.u.) measured in the sample is outside the Part 845 GWPS pH range of 6.5-9.0 s.u. G52L is located cross-gradient/up-gradient from the GMF pond and the screening interval is completed within the Loess unit.
- Field pH at monitoring well G60L: Field pH GWPS exceedances were noted in this well for each of the nine samples collected from this well from March-July 2021. The average pH for the nine samples was 6.1 s.u., which is outside the Part 845 GWPS pH range of 6.5-9.0 s.u. The well is located down-gradient on the east side of the GMFP and the screening interval is completed within the Loess unit.
- Arsenic at monitoring well P60: A total arsenic GWPS exceedance was noted in a single sample collected from this well in March 2021. The arsenic concentration of 0.02 milligrams per liter (mg/L) measured in the sample slightly exceeds the Part 845 GWPS of 0.01 mg/L. P60 is located down-gradient on the east side of the GMFP and the screening interval is completed within the Loess unit.
- Lead at monitoring well P60: A total lead GWPS exceedance was noted in a single sample collected from this well in March 2021. The lead concentration of 0.036 mg/L measured in the sample slightly exceeds the Part 845 GWPS of 0.015 mg/L. P60 is located down-gradient on the east side of the GMFP and the screening interval is completed within the Loess unit.

## 3.0 EVIDENCE THAT POTENTIAL GWPS EXCEEDANCES ARE NOT RELATED TO THE GMFP

Groundwater data for samples collected from monitoring wells that exhibited potential GWPS exceedances, background monitoring wells and pore water samples from the GMFP were evaluated. The review of these data indicates that the GWPS exceedances are not related to the GMFP, as described in the lines of evidence (LOE) below:

- **The ionic composition of groundwater collected from G52L, G60L and P60 is similar to groundwater collected from background wells G02S, G50S and G52S.**

A Piper diagram is a graphical technique used to classify and compare different groundwater sources based on their ionic composition in aqueous solution. As shown on the Piper diagram presented as Figure 2, the ionic composition of groundwater samples collected from G52L, G60L and P60 is similar to groundwater samples collected from the background wells – both groups of samples exhibit a calcium-bicarbonate water-type. Pore

and surface water samples collected from the GMFP exhibit a magnesium-chloride water-type, which is distinctly different to the background wells and monitoring wells G52L, G60L and P60. It would be expected that if there were a release from the GMFP, the ionic composition of the monitoring wells would show a mixing pattern towards the pore water ionic composition. However, as shown on Figure 2, the compositions of the monitoring wells are clustered with the background well compositions and distant from the pore and surface water compositions. These data support that the GWPS standard exceedances of pH in G52L and G60; the arsenic exceedance in P60; and the lead exceedance in P60 are not related to the GMFP.

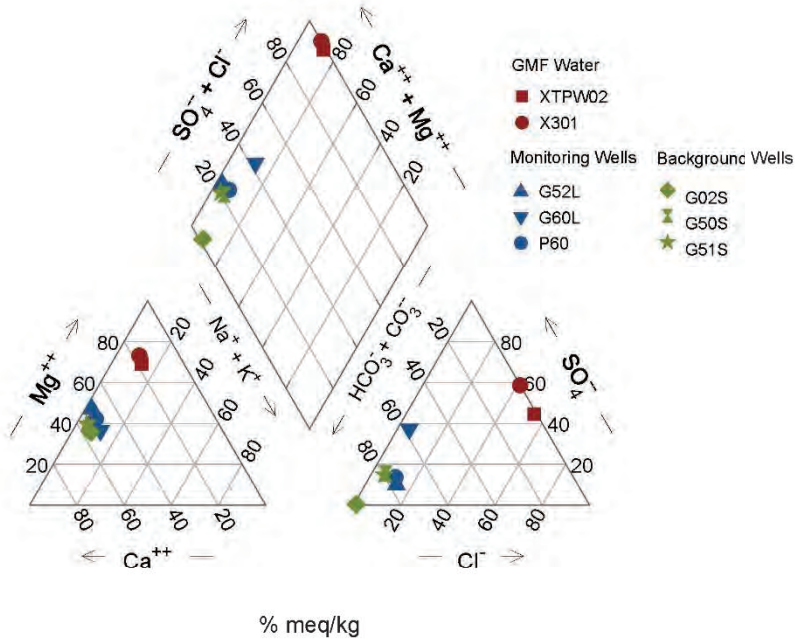

**Figure 2: Piper diagram showing water chemistry of GMF Surface and Pore Water, monitoring wells G52L, G60L and P60, and background wells.**

- **Concentrations of key GMFP constituents differ significantly in GMFP pore water samples and groundwater samples from monitoring wells G52L, G60L and P60.**

Concentrations of key constituents typically associated with CCR gypsum waste (boron, calcium, chloride, fluoride, sodium and sulfate) differ significantly between pore water/surface water in the GMFP and groundwater samples collected from the monitoring wells (Table 1, Figures 3 and 4). For example, boron, a typical gypsum indicator that is very mobile and non-reactive within a groundwater matrix, is elevated in GMF surface water and pore water samples (29 - 98 mg/L), whereas the monitoring wells G52L, G60L and P60 contain significantly lower concentrations (0.022 – 0.068 mg/L) that are more consistent with background results. Given the geochemical behavior of boron, it would be expected that elevated boron concentrations above background values would be observed in monitoring wells had a release occurred from the GMF pond. Similarly, fluoride and sulfate, other very mobile GMF constituents, would be expected to be observed in monitoring wells above the site GWPS in the event of a release from the GMF Pond. Figures 3 and 4 below and Table 1 show the

differences in concentrations between GMF surface water/pore water and monitoring wells for other key GMF constituents. Table 1 also contains site background and the Part 845 GWPSs. These data support that the GWPS standard exceedances of pH in G52L and G60; the arsenic exceedance in P60; and the lead exceedance in P60 are not related to the GMFP.

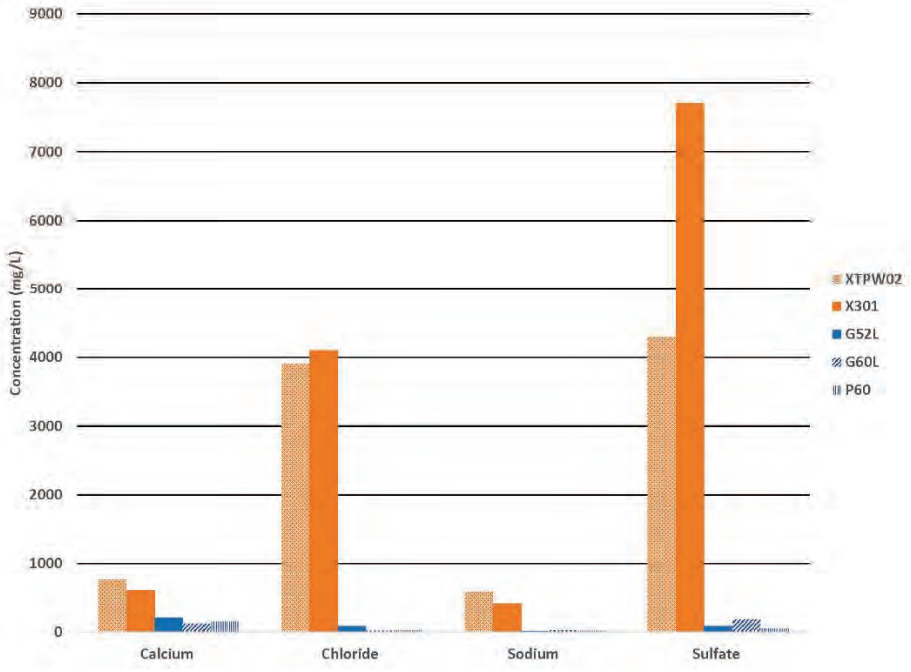

**Figure 3: Bar chart showing GMFP constituent concentration comparisons between GMFP Surface and Pore Water and monitoring wells G52L, G60L and P60.**

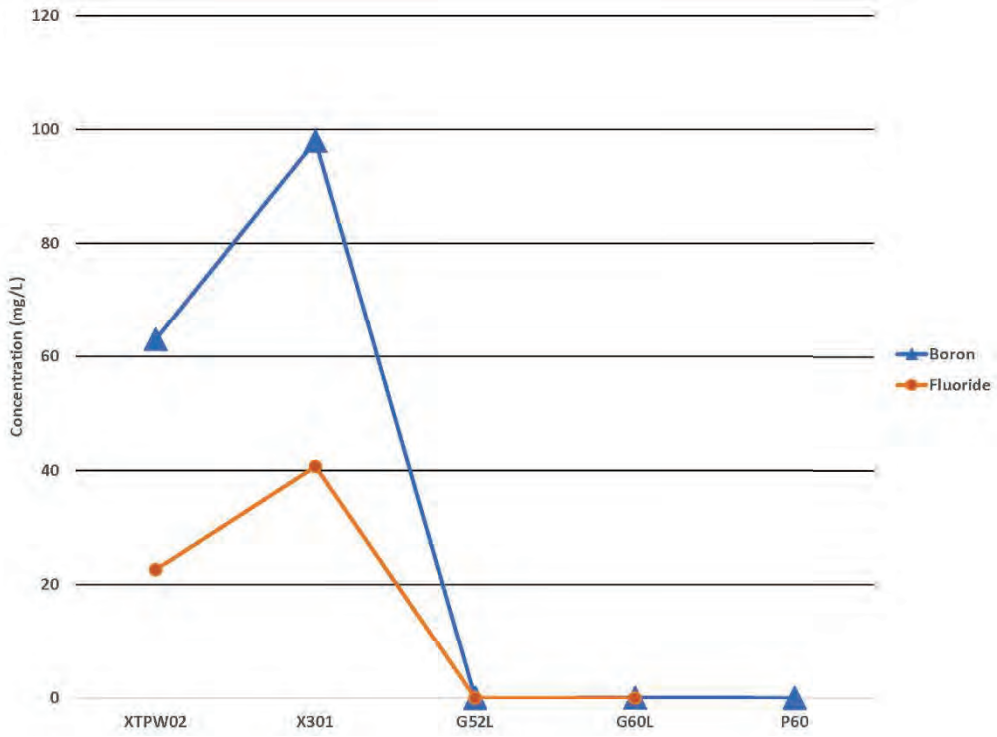

**Figure 4: Line chart showing GMFP constituent concentration comparisons between GMFP Surface and Pore Water and monitoring wells G52L, G60L and P60.**

- **High turbidity was recorded on the groundwater sampling record for the sample collected from P60.**

The arsenic and lead GWPS exceedances were based on a single sample collected from P60 in March 2021. The groundwater sampling record indicated an unusually high turbidity reading just before sample collection (1620 nephelometric turbidity units (NTU)). According to the sampling record, the sample did not appear to be field filtered, nor was it filtered in the lab. Thus, the arsenic and lead sample concentrations are likely elevated due to the presence of excessive soil and/or colloidal particles in the sample and are not representative of actual groundwater conditions in the vicinity of this well. These circumstances support the conclusion that GWPS standard exceedances of lead and arsenic in P60 are not related to the GMFP.

- **A peat layer ranging in thickness from 1 to 4 feet is present in the immediate vicinity of P60.**

Peat was recorded in the boring log of P60 within the saturated zone (approximately 19.5-20.5 and 24-24.2 feet below ground surface (ft bgs)), but above the screened interval of the well (approximately 29.5-34.5 feet bgs) (Appendix A). Approximately 4 feet of peat was recorded within the saturated zone in a nearby soil boring, B-55 (approximately 13.5-17.5 feet bgs). Given the interconnected nature of the unlithified water-bearing units, it is possible that the peat layer is interacting with the groundwater-bearing unit in the immediate vicinity. Peat is typically associated with low pH and is known to sequester certain metals, including arsenic and lead. In combination with a high turbidity and unfiltered sample, this may be the cause of the slightly elevated arsenic

and lead concentrations in P60. Thus, the GWPS standard exceedances of pH in G60L and the arsenic lead exceedance in P60 may be associated with the peat layer encountered in the immediate vicinity of those wells.

- **Arsenic and lead are not typical CCR indicators and are not present in GMFP pore and surface water above the GWPS.**

Arsenic and lead are not typical coal ash or gypsum indicators (EPRI, 2017). As shown on Table 1, arsenic and lead have been either not detected or detected below the applicable GWPS in GMFP pore and surface water samples. In addition, concentrations in GMFP pore and surface water are lower than concentrations measured in the groundwater sample collected from P60. These data support that GWPS exceedances of lead and arsenic in P60 are not related to the GMFP, as the unit is not a source of elevated arsenic or lead.

- **The GMFP liner was constructed with a dual composite liner system with a leak detection system, has undergone rigorous construction quality assurance and has indicated strong performance**

As discussed in Section 2.0, the GMFP liner was constructed with a primary and secondary liner system with a leak detection layer between the primary and secondary liners. The construction process underwent a detailed construction quality assurance program (Hanson, 2009). The leak detection system has to date shown excellent performance of the primary liner system. Pumps in the leak detection system designed to operate to remove water from the primary liner have only run for a few hours for the lifetime of the facility (beginning in 2009). This indicates that a release from the GMFP has likely not occurred and that the GWPS standard exceedances of pH in G52L and G60; the arsenic exceedance in P60; and the lead exceedance in P60 are not related to the GMFP.

## 4.0 SUMMARY

The evaluation presented in this document demonstrates that the GWPS exceedances of pH in G52L and G60; the arsenic exceedance in P60; and the lead exceedance in P60 are not related to the GMFP. The following lines of evidence demonstrate the GWPS exceedances are not related to the GMFP:

- The ionic composition of groundwater collected from G52L, G60L and P60 is similar to groundwater collected from background wells G02S, G50S and G52S and not the pore water/surface water in the GMFP.
- Concentrations of key gypsum constituents differ significantly between GMFP pore water samples and groundwater samples collected from monitoring wells G52L, G60L and P60.
- High turbidity was recorded on the groundwater sampling record for the sample collected from P60, which likely resulted in arsenic and lead concentrations that are not representative of actual groundwater conditions in the vicinity of this well.
- Arsenic and lead are not CCR indicators for this CCR unit and are not present in GMFP pore and surface water above their corresponding GWPS.
- The GMFP liner was constructed with a dual composite liner system with a leak detection system, has undergone rigorous construction quality assurance and has indicated strong performance.

- Naturally occurring peat is present within the saturated zone in the immediate vicinity of P60 and G60L and may be causing naturally occurring lower pH in G60L and slightly elevated arsenic and lead concentrations in P60, particularly in a high-turbidity, unfiltered groundwater sample.

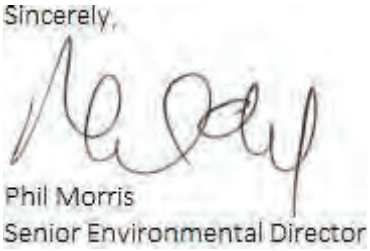
Re: CCR Surface Impoundment Category Designation and Justification for Illinois Power Resources Generating, LLC

Dear Mr. LeCrone:

Pursuant to 35 I.A.C. 845.700(c), Illinois Power Resources Generating, LLC submits the information necessary to categorize the CCR surface impoundments located at the Edwards Power Plant and the now retired Duck Creek Power Plant. The following parameters were used in assessing and justifying each assigned category.

- Category 1 – *Impacts to existing potable water supply well or impacts to groundwater quality within the setback of an existing potable water supply well.*
    - This review includes an assessment of potable water wells within 2,500 feet of CCR surface impoundments to determine whether any potential impacts are occurring within the setback zone of any community water supply well established under the Illinois Groundwater Protection Act.
    - This information was developed during the Part 845 rulemaking and is summarized in Attachment 1, Table 2: Impacts to Potable Water Supply.
- Category 2 – *Imminent threat to human health or the environment or have been designated by IEPA under (g)(5)*
    - The surface impoundments at Edwards and Duck Creek Power Plants do not pose an imminent threat to human health or the environment. There are no known conditions at or around the facility where someone or something may be exposed to contaminant concentrations reasonably expected to cause harm
- Category 3 – *Located in areas of environmental justice ("EJ") concern*
    - EJ areas were evaluated using the EJ mapping link from IEPA's webpage located at https://www2.illinois.gov/epa/topics/environmental-justice. Per the IEPA mapping tool, the EJ Status thresholds were determined as twice the state averages for Minority and Low Income consistent with 35 IAC 845.700(g)(6).
    - An EJ map denoting the facilities with impoundments is located in Attachment 2.



Electronic Filing: Received, Clerk's Office 06/20/2024

- Category 4-7
    - Category 4 - Inactive CCR surface impoundments that have an exceedance of the groundwater protection standards in Section 845.600
    - Category 5 - Existing CCR surface impoundments that have exceedances of the groundwater protection standards in Section 845.600
    - Category 6 - Inactive CCR surface impoundments that are in compliance with the groundwater protection standards in Section 845.600.
    - Category 7 – Existing CCR surface impoundments that are in compliance with the groundwater protection standards in Section 845.600

Based on the information above, category designations have been assigned. The category designations for each CCR impoundment are shown in Attachment 1, Table 1: Category Designations.

If you have any questions regarding this submittal, please contact Phil Morris at 618-343-7794 or phil.morris@vistracorp.com.

Sincerely,

Phil Morris
Senior Environmental Director

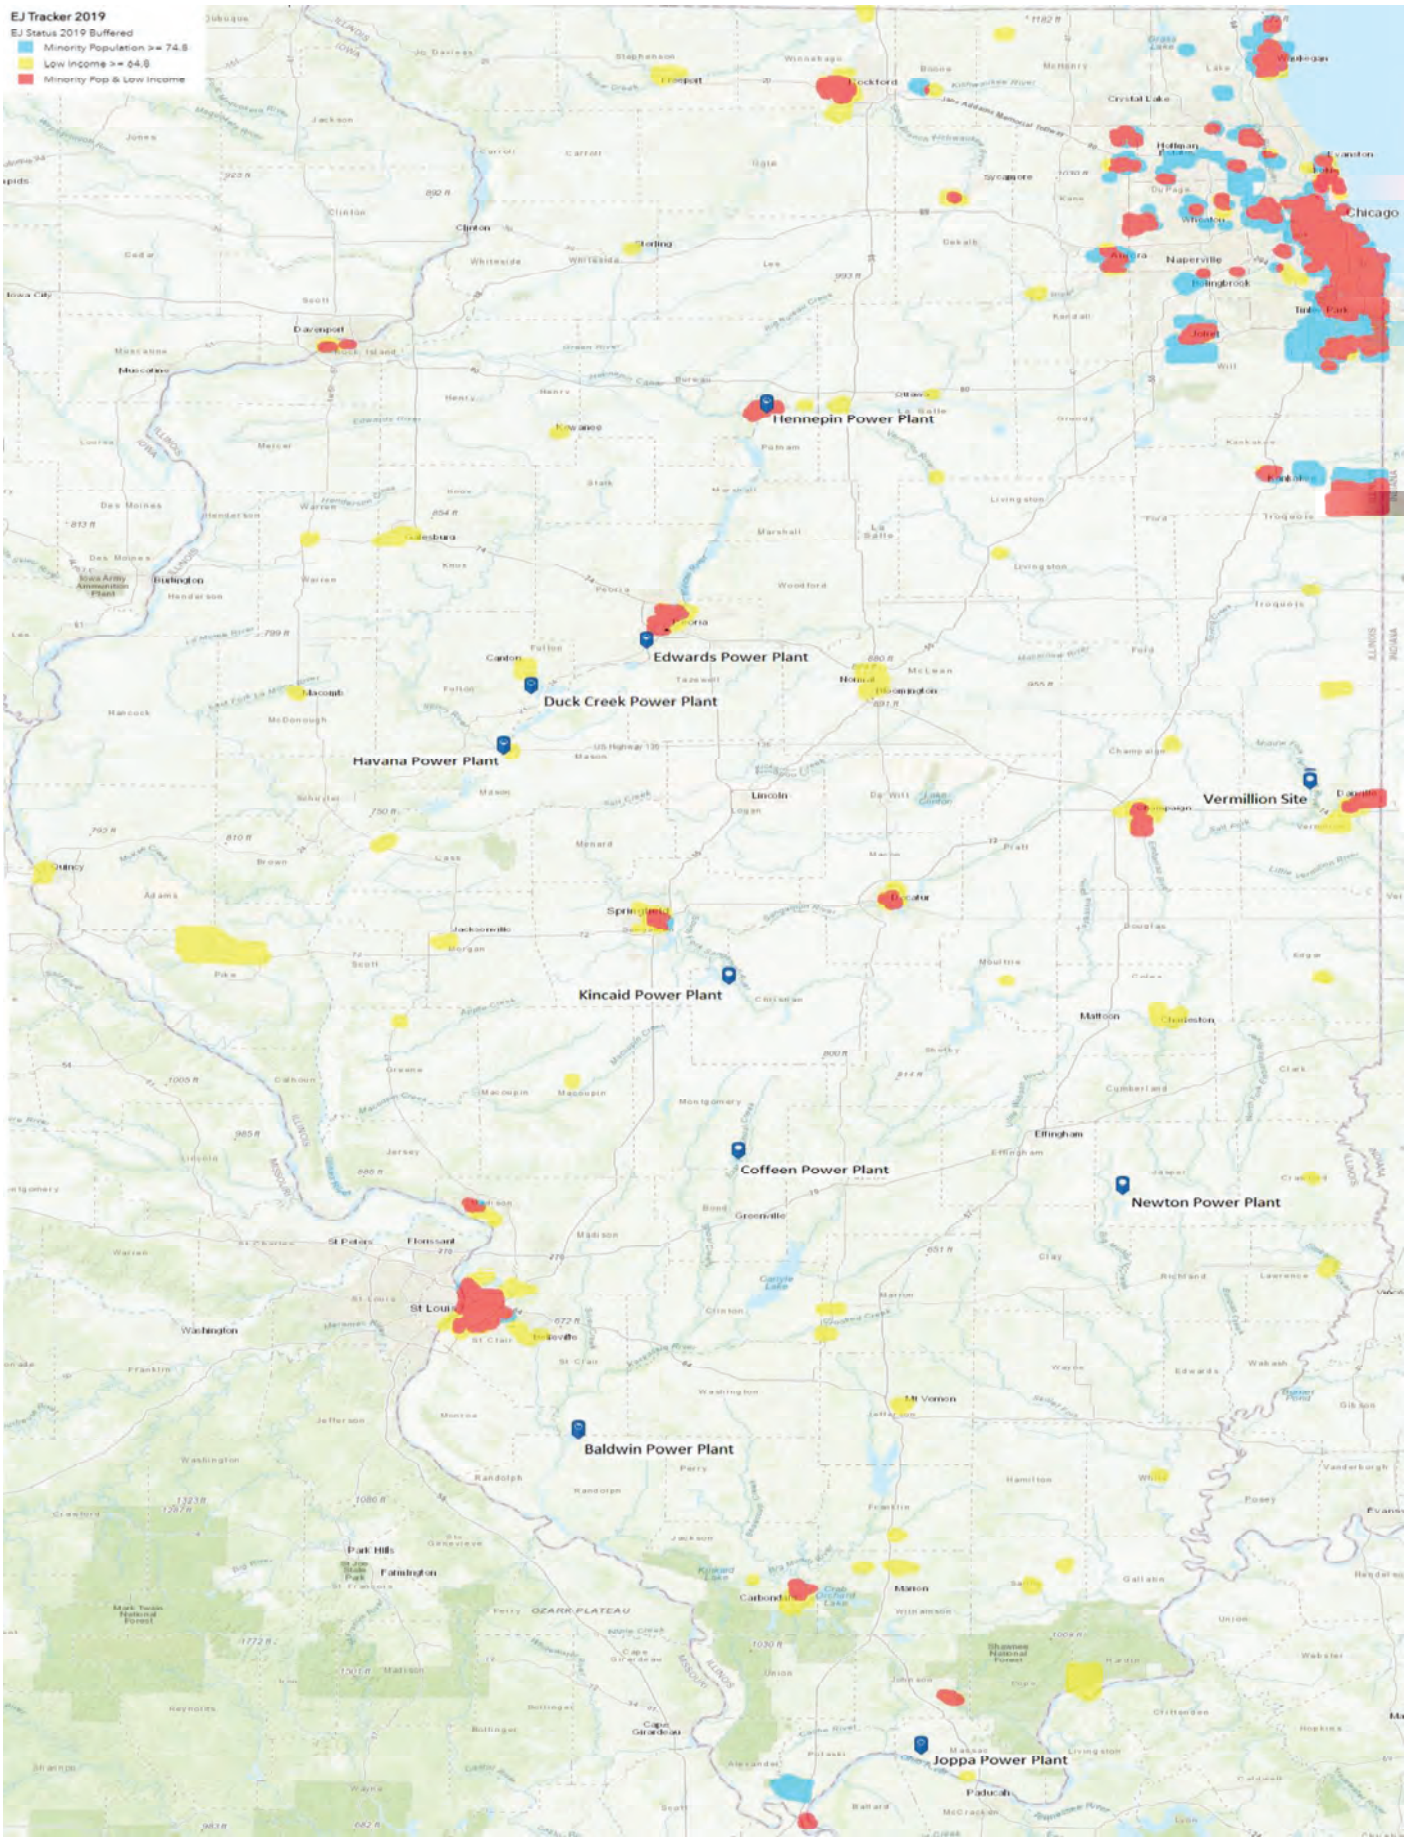
[2] Ground water analyses for purposes of categories 4-7, assumptions have been made based on current groundwater data. However, since sampling and analysis is ongoing and subject to IEPA review and approval, IPGC reserves the right to update its category designations for Categories 4-7.



[3] NA for this determination since the CCR surface impoundment was assign a highest priority category

**Table 2: Impacts to Potable Water Supply**

| Site Name | Private and Semi-Private Wells | Non-Community Water Supply (CWS) Wells | Non-CWS Surface Water Intakes | Community Water Supply Wells | CWS Surface Water Intakes |
|---|---|---|---|---|---|
| Edwards | **Present, but not at risk** Seven (7) water wells were identified and one (or possibly two) are located potentially downgradient of the site. Based on Ramboll's review of groundwater data, these wells are unlikely to be impacted by coal ash constituents. | **Present, but not at risk** One non-CWS well was identified; however, it is unlikely to be at risk because of its hydrogeologic location relative to the power plant. | Absent | Absent | Absent |
| Duck Creek | **Present, but not at risk** Three (3) water wells were identified; however, they are unlikely to be at risk because of their hydrogeologic location relative to the power plant and/or they are abandoned. None of the off-site wells are located in a downgradient direction. | Absent | Absent | Absent | Absent |

# EXECUTIVE SUMMARY

This Groundwater Modeling Report (GMR) has been prepared to show how proposed closure solutions for the Gypsum Management Facility (GMF) Pond will maintain compliance with the applicable groundwater standards at the Duck Creek Power Plant (DCPP), Fulton County, Illinois. This report integrates existing site data and information with the latest hydrogeology and groundwater quality data to generate a conceptual and numerical model of the GMF Pond. The conceptual site model (CSM) includes hydrogeologic and groundwater quality data specific to the GMF Pond, which has been collected between 2015 and 2021.

The GMF Pond (Vistra identification [ID] number [No.] 203, Illinois Environmental Protection Agency [IEPA] ID No. W0578010001-04, and National Inventory of Dams [NID] No. IL50573) is located at the DCPP southwest of Canton, Illinois (**Figure 1-1**). The DCPP is located near the Duck Creek Cooling Pond, which was used as a source of cooling water for the power plant when it was active, and several small ponds which are remnants of the area's surface mining history. Prior to construction of the power plant and associated facilities, strip mining of coal took place within the property boundary of the DCPP. Currently, land use adjacent to the DCPP is agriculture, pasture, and forest with minimal development.

The GMF Pond is a 1,500-foot by 900-foot earthen berm double-lined coal combustion residual (CCR) surface impoundment (SI) located north of the former power plant. The GMF Pond decant water discharges to the lined GMF Recycle Pond. In addition to the CCR within the lined GMF Pond, there are five layers of unlithified material present above the Pennsylvanian-age shaley siltstone and silty shale bedrock (Carbondale Formation). These materials have been categorized into three hydrostratigraphic units presented below in descending order:

- **Uppermost Aquifer:** this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the shallow sands. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (Natural Resource Technology, an OBG Company [NRT/OBG], 2017a).
- **Lower Radnor Till/Lower Confining Unit:** Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick.
- **Bedrock Confining Unit:** The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet.

While the primary migration pathway is the shallow sand of the uppermost aquifer, the groundwater within the overlying Peoria/Roxanna Loess has the potential to be impacted and is considered a potential migration pathway (PMP).

Groundwater migrates downward through the loess and upper Radnor Till into the shallow sands of the uppermost aquifer. Groundwater flow in the sands is generally in a northwest to southeast direction. Seasonal variation of groundwater levels at the GMF Pond are present and may fluctuate approximately 1 to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond associated with the elevation changes. Groundwater flows toward the Duck Creek Cooling Pond located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Cooling Pond is estimated to range from 562.5 to 565 feet North American

Vertical Datum of 1988 (NAVD88), which is approximately 20 feet lower than water elevations at the GMF Pond.

The CSM for modeling the GMF Pond is as follows:

- All hydrostratigraphic layers are laterally continuous across the area. The flat to gently rolling uplands are dissected by deeply incised streams (into the materials of the uppermost aquifer and lower confining unit) that are tributaries to major river systems in areas that have not been disturbed by strip mining activity.
- The GMF Pond is constructed such that the double liner system is in direct contact with the lower confining unit or backfill of similar properties (i.e., removal of the uppermost aquifer sand below the footprint of the GMF Pond).
- Groundwater migrates vertically through the upper portions of the uppermost aquifer and horizontally within the sands above the lower confining unit to the southeast towards the Duck Creek Cooling Pond. The stage in Duck Creek Cooling Pond is managed with minimal (less than 3 feet) variability throughout the year.
- Vertical gradients measured between the bedrock and uppermost aquifer are generally downward near the GMF Pond, indicating that it is a recharge area.

Groundwater quality parameters were monitored in the shallow sands and the PMP monitoring wells at the GMF Pond as part of the groundwater quality investigations performed between 2015 and 2021. The History of Potential Exceedances attached to the Operating Permit Application summarizes all potential groundwater exceedances following the proposed statistical analysis plan. The following potential exceedances were identified:

- Arsenic and lead – determined from a single sample from well P60 screened in the loess (PMP).
- pH – values less than the lower limit were determined in wells G52L and G60L which are also screened in the loess (PMP).

Multiple lines of evidence that these limited potential groundwater protection standard (GWPS) exceedances are not related to the GMF Pond is provided in the technical memorandum attached to this report, *Evaluation of potential GWPS Exceedances* (Golder, 2021). Based on statistical analysis and evaluation of subsequent potential exceedances it has been determined there are no potential groundwater exceedances of applicable groundwater standards attributable to the GMF Pond.

All available hydrological information were used to construct a conceptual model and numerical model of the GMF Pond. A steady state, 5-layer numerical model was constructed to characterize the long-term groundwater flow conditions at the site. Calibration of the model focused on simulating mean groundwater elevations for 59 wells at the site by modifying hydraulic parameters for the different hydrostratigraphic units, alongside drain and general head boundary conductance. The calibrated model represents a reasonable match to the observed data given the simplicity of the model. Particle tracking was used both for the closure scenario and sensitivity analysis to provide a quantitative estimate of the distance a potential contaminant from the GMF Pond may travel in 100 years.

Particle tracking for the CIP scenario for a 100-year period indicates that contaminants will not migrate beyond the liner system, maintaining compliance with the applicable groundwater standards post closure.

# 1. INTRODUCTION

## 1.1 Overview

In accordance with requirements of the Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments: 35 I.A.C. § 845 (Part 845) (IEPA, 2021), Ramboll Americas Engineering Solutions, Inc. (Ramboll) has prepared this GMR on behalf of the DCPP (**Figure 1-1**), operated by Illinois Power Resources Generating, LLC (IPRG). This report will apply specifically to the CCR Unit referred to as the GMF Pond. However, information gathered to evaluate other CCR units in the vicinity regarding geology, hydrogeology, and groundwater quality is included, where appropriate.

## 1.2 Previous Groundwater Reports

Numerous hydrogeologic investigations have been performed at the DCPP. The information presented in this GMR includes data collected as part of a 2021 field investigation and previous investigations summarized and presented in the Hydrogeologic Site Characterization Report (HCR) (Ramboll, 2021a) which was provided as an attachment to the Initial Operating Permit application required by 35 I.A.C. § 845.230.

## 1.3 Site Location and Background

The DCPP is located in Fulton County, Illinois and approximately 6 miles southeast of the town of Canton. The GMF Pond is located north of the power plant in Section 18 of Township 6 North, Range 5 East (**Figure 1-1**). The GMF Recycle Pond is located just south of the GMF Pond (**Figure 1-2**). The DCPP is located near the Duck Creek Cooling Pond, which was used as a source of cooling water for the power plant when it was active, and several small ponds which are remnants of the area's surface mining history. The Landfill is located due north of the GMF Pond and the closed units, Ash Pond No. 1 and Ash Pond No. 2, are located south of the GMF Recycle Pond. Prior to construction of the power plant and associated facilities, strip mining of coal took place within the property boundary of the DCPP (**Figure 1-1**). Currently, land use adjacent to the DCPP is agriculture, pasture, and forest with minimal development. The area is flat to gently rolling uplands that are dissected by deeply incised streams that are tributaries to major river systems in areas that have not been disturbed by strip mining activity.

## 1.4 Site History and CCR Units

Surface preparation for the GMF Pond began in 2007 and construction took place from 2008 to 2009. The GMF Recycle Pond was constructed at the same time.

The GMF Pond, also referred to as the gypsum stack/management system, operates under an IEPA permit (#2017-E0-62640) issued in December 2017. It consists of a 1,500-foot by 900-foot earthen berm with 3.5:1 side slopes, a maximum elevation of 620 feet, a double geomembrane liner consisting of a 60-millimeter (mil) high-density polyethylene (HDPE) geomembrane liner, 12-inch clay cushion, 4 ounce per square yard ($oz/yd^2$) non-woven geotextile filter fabric, 12-inch highly permeable granular drainage (sand), 10 $oz/yd^2$ non-woven geotextile filter fabric, 60-mil HDPE geomembrane liner, reinforced bentonite mat, 36-inch compacted clay, all installed over in-situ foundation soil, and all pipes, pumps, and appurtenances necessary for the storage of approximately 3.6 million tons of gypsum at a maximum elevation of 715 feet with discharge to the GMF Recycle Pond.

Electronic Filing: Received, Clerk's Office 06/20/2024

During construction, shallow sand was encountered and completely removed from underneath the northeast corner and southwest corner of the GMF Pond, putting the liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains. The GMF Pond decant water discharges to the GMF Recycle Pond, which has a capacity of 32.6 million gallons. The GMF Recycle Pond is lined with a 60-mil HDPE geomembrane liner, reinforced bentonite mat and 36 inches of compacted clay (Ramboll, 2021a).

# 2. SITE GEOLOGY AND HYDROGEOLOGY

## 2.1 Stratigraphy

The hydrogeology of the GMF Pond is described in detail in the Hydrological Characterization Report (Ramboll, 2021a). A short summary is provided below.

The unlithified stratigraphy within and immediately surrounding the GMF Pond consists of the following in descending order: fill material and CCR; silt and clayey silt loess (Peoria/Roxanna Loess); weathered till (upper Radnor Till); shallow, medium-grained sand to silt zone within the Radnor Till; and till (lower Radnor Till). The unlithified units overlay Pennsylvanian-age shaley siltstone and silty shale bedrock (Carbondale Formation).

CCR (gypsum) is present within the GMF Pond at a maximum thickness of approximately 22 feet, as estimated from topography and the elevation of the base of the liner from available construction details (AECOM, 2016). The range of gypsum thickness is estimated from less than 1 to 22 feet. The thickest areas of gypsum are to the north and west within the GMF Pond and thin toward the south end of the GMF Pond. The base of the liner rests on top of the lower Radnor Till.

The Wisconsinan Stage Peoria/Roxanna Loess extends from beneath the topsoil developed in the loess to depths ranging from 11 to 21 feet. The loess consists predominantly of silt and clayey silt with minor amounts of sand. The loess exhibits iron staining, concretions, and some fracturing. The Loess Unit is saturated below depths varying from approximately 3.5 to 11 feet.

The loess is generally underlain by a relatively thin till sequence consisting of the Berry Clay (where present) and the Illinoian Stage upper Radnor Till. The till sequence ranges in thickness from 9 to 21 feet in the area of the GMF Pond. This shallow till is generally weathered and exhibits signs of oxidation and fracturing. The till is primarily clayey silt with minor amounts of sand and gravel.

The shallow sand zone is laterally extensive within the Radnor Till across the site and varies in thickness from less than 1 to 18 feet near the GMF Pond; the top of the shallow sand zone is generally located at an elevation of 570 to 590 feet msl. The shallow sand zone exhibits lateral facies changes across the site and varies from a medium-grained sand to a silt and often contains intercalated till seams. The shallow sand zone is saturated.

Till sequences underlying the shallow sand zone consist of clay, silt, and sand of the Illinoian Stage lower Radnor Till. The till ranges in thickness from 42 to 58 feet. In some areas of the site, including the area near the GMF Pond, the till sequences typically extend from the base of the shallow sand to the bedrock surface. In other areas of the site, the till sequences extend to intermediate or deep sands. The till sequences are typically high in silt content with varying amounts of clay, sand, and gravel, and are often calcareous.

Pennsylvanian bedrock was encountered at greatly varying depths across the site. Bedrock depths ranged from a minimum of 52 feet to a maximum of 108 feet below ground surface (bgs). The bedrock shows little compositional variation across the site and consists primarily of shaley siltstone and silty shale. The shale bedrock unit is typically weathered near the surface, has low hydraulic conductivity, and underlies the glacial till sequences. These units often contain thin dolomite ledges and nodules and some fractures.

## 2.2 Hydrogeology

Three distinct water-bearing layers have been identified at the site based on stratigraphic relationships and common hydrogeologic characteristics, which are summarized below:

- **The Uppermost Aquifer**: This unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the shallow sands described in detail in **Section 2.5.1**. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (NRT/OBG, 2017a). The shallow sands are laterally extensive across the site, vary in thickness from less than 1 to 18 feet, and are generally located at an elevation of 570 to 590 feet above mean sea level (msl). The shallow sand is saturated. During construction of the GMF Pond, sand was completely removed everywhere it was encountered (mainly the northeast corner and southwest corner of the pond), putting the base of liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place.
- **Lower Radnor Till/Lower Confining Unit**: Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick. Previous hydrogeologic studies indicate discontinuous sand lenses observed within the till are not hydraulically connected to the shallow sand unit (NRT/OBG, 2017a).
- **Bedrock Confining Unit**: The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation are estimated to have a thickness of approximately 300 to 400 feet.

### 2.2.1 Groundwater Flow

Groundwater flow around the GMF Pond is generally in a southeast direction. The Peoria/Roxanna Loess (PMP) and shallow sands of the uppermost aquifer are hydraulically connected. The groundwater flow in the Peoria/Roxanna Loess is expected to be primarily vertical, with the majority of the horizontal migration expected to occur within the shallow sand unit. Groundwater flow across the GMF Pond within the uppermost aquifer (well locations adjacent to the pond are shown in **Figure 2-1**) is consistently in a southeast direction toward the Duck Creek Cooling Pond (as shown by groundwater elevation contours from April 14, 2021, **Figure 2-2**). Groundwater elevations of the uppermost aquifer vary seasonally although flow directions are generally consistently downward (Ramboll, 2021a). Surface water elevations within the GMF Pond are higher than the groundwater. The elevation difference between the phreatic surface and groundwater elevations, in addition to no observations of radial flow, provide evidence that the GMF Pond does not impact groundwater flow directions via recharge to groundwater. Given the low permeability of the liner system, it is more likely that the GMF Pond is a barrier to groundwater flow within the uppermost aquifer, deflecting flow from upgradient areas around the perimeter of the pond toward the downgradient areas.

### 2.2.2 Hydraulic Properties

Field estimates of the hydraulic properties of the uppermost aquifer (including both the loess and the shallow sand zones) indicated hydraulic conductivities from $3.0 \times 10^{-5}$ to $3.9 \times 10^{-3}$ centimeters per second (cm/s) (equivalent to 0.085 to 11.1 feet per day [ft/d]) with a geometric mean of $3.6 \times 10^{-4}$ cm/s (1.02 ft/d), based on field tests conducted on 12 wells (5 wells were screened in the loess and 7 wells were screened in the sand) (Ramboll, 2021a).

Hydraulic properties for the Loess ranged from 3.0 x $10^{-5}$ to 2.3 x $10^{-3}$ cm/s (0.085 to 6.5 ft/d) with a geometric mean of 2.2 x $10^{-4}$ cm/s (0.62 ft/d). Shallow sand wells ranged from 6.5 x $10^{-5}$ to 3.9 x $10^{-3}$ cm/s (0.18 to 11.0 ft/d) with a geometric mean of 4.9 x $10^{-4}$ cm/s (1.4 ft/d).

Additional laboratory analysis of seven samples from the loess, upper Radnor Till and shallow sand provided vertical hydraulic conductivities ranging from 7.1 x $10^{-8}$ to 2.3 x $10^{-6}$ cm/s (0.0002 to 0.0065 ft/d).

Laboratory estimates for the Lower Radnor Till based on two samples indicated a vertical hydraulic conductivity ranging from 4.1 x $10^{-8}$ to 5.4 x $10^{-6}$ cm/s (0.00012 to 0.015 ft/d).

Results of field hydraulic conductivity tests conducted in 2021 in the bedrock confining unit by Hanson Professional Services, Inc. (Hanson) at monitoring well G54C ranged from 1.4 x $10^{-4}$ to 1.6 x$10^{-4}$ cm/s, with a geometric mean of 1.5 x $10^{-4}$ cm/s. This is high in comparison to the horizontal hydraulic conductivity range of 1.3 x $10^{-6}$ cm/s to 1.3 x $10^{-9}$ cm/s, established by Hanson in 2015, which used pressure testing on borehole OM32. The higher values observed at G54C are attributed to the highly weathered nature of the bedrock in the screen interval, which is supported by the low rock quality designation (RQD) N values ranging from 14 to 22 (lower numbers indicating lower percentage of intact rock core recovered).

### 2.2.3 Groundwater Elevation Data

There are 59 wells located around the GMF Pond, with most wells located around the perimeter of the GMF Pond and the GMF RP. In most of these wells, water level measurement are available from 2004 to 2021 (**Table 2-1**). The data are summarized in **Table 2-2**. The observed range in groundwater elevation (GWL) within the data set is 41.6 feet. For wells with more than 1 reading, the mean variation in GWL within each well is 13.9 feet (mean GWL variation), with an observed minimum and maximum variation of 4.8 and 28.4 feet, respectively.

### 2.2.4 Mining Activity

Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) coal seam. Mining operations in the area have ceased (NRT/OBG, 2017a). Strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) coal unit at some portions of the site. Previous investigations completed outside of the GMF Pond at the site also indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 feet to 75 feet. The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts, and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to several former large surface mining areas (**Figure 2-3**).

# 3. GROUNDWATER QUALITY

## 3.1 Groundwater Classification

Per 35 I.A.C. § 620.210, groundwater within the uppermost aquifer at the GMF Pond meets the definition of a Class I – Potable Resource Groundwater based on the following criteria:

- Groundwater in the uppermost aquifer extends 10 feet or more below the land surface.
- Hydraulic conductivity exceeds the 1 x $10^{-4}$ cm/s criterion.

Field hydraulic conductivity tests performed on the unlithified geologic materials that include loess and shallow sand at the GMF Pond had geometric mean hydraulic conductivities exceeding 1 x $10^{-4}$ cm/s. Based on this information groundwater is classified as Class I – Potable Resource Groundwater.

However, background (upgradient) groundwater originates from areas north and west of the GMF Pond that have been surface mined and present a significant alternative source for groundwater impacts.

## 3.2 Potential Groundwater Exceedances

There are no potential groundwater exceedances of applicable groundwater standards attributable to the GMF Pond as described below.

Groundwater concentrations from 2015 to 2021 presented in the HCR Table 4-1 (Ramboll, 2021a), and evaluated and summarized in the History of Potential Exceedance tables (Ramboll, 2021b), are considered potential exceedances because the methodology used to determine them is proposed in the Statistical Analysis Plan (Appendix A to Groundwater Monitoring Plan [GMP]; Ramboll, 2021c), which has not been reviewed or approved by IEPA at the time of submittal of 35 I.A.C. § 845 Operating Permit application.

The History of Potential Exceedances attached to the Operating Permit Application summarizes all potential groundwater exceedances following the proposed Statistical Analysis Plan. The following potential exceedances were identified:

- Arsenic and lead – determined from a single sample from well P60 screened in the loess (PMP)
- pH – values less than the lower limit were determined in wells G52L and G60L, which are also screened in the loess (PMP)

Multiple lines of evidence that these limited potential GWPS exceedances are not related to the GMF Pond is provided in the *Evaluation of potential GWPS Exceedances* (**Appendix A**, Golder, 2021) and summarized below:

- The ionic composition of groundwater collected from G52L, G60L, and P60 is similar to groundwater collected from background wells G02S, G50S, and G52S.
- Concentrations of key GMF Pond constituents differ significantly in GMF Pond pore water samples when compared to groundwater samples from monitoring wells G52L, G60L, and P60.
- High turbidity was recorded on the groundwater sampling record for the one sample collected from P60 that had elevated arsenic and lead concentrations.

Electronic Filing: Received, Clerk's Office 06/20/2024

- A peat layer ranging in thickness from 1 to 14 feet is present in the immediate vicinity of P60, resulting in lower pH.
- Arsenic and lead are not typical CCR indicators and are not present in GMF Pond porewater and surface water at concentrations above the GWPS.
- The GMF Pond liner was constructed with a dual composite liner system with a leak detection system, has undergone rigorous construction quality assurance, and has indicated strong performance.

# 4. GROUNDWATER MODEL

## 4.1 Overview

Data collected at the Site from 2004 to the recent 2021 field investigation were used to construct a groundwater model of the GMF Pond. The model was then used to evaluate how the proposed closure plan would maintain compliance with the applicable groundwater standards following the closure construction. The modeling results are summarized and evaluated in this GMR. A disk containing the associated model files is included as **Appendix B**.

## 4.2 Conceptual Model

The HCR (Ramboll, 2021a) forms the foundation of the GMF Pond hydrogeological setting. The GMF Pond overlies the recharge area for the underlying transmissive geologic media, which are composed of unlithified deposits.

### 4.2.1 Hydrogeology

As discussed in **Section 2.2**, groundwater flow around the GMF Pond is generally in a southeast direction. The Peoria/Roxanna Loess and Shallow Sands are hydraulically connected. The groundwater flow in the Peoria/Roxanna Loess is expected to be primarily vertical, with the majority of the horizontal migration expected to occur within the Shallow Sands unit. The geological conceptual model for the site consisted of the following layers:

- Loess – silt and clayey silt of the Wisconsinan Stage Peoria/Roxanna Loess which extends beneath the topsoil.
- Upper Radnor Till – a thin layer of low permeability till consisting of the Berry Clay and the Illinoian Stage upper Radnor Till.
- Shallow Sands – glacial outwash and re-worked glacial deposits at the base of the Upper Radnor Till formation is the lowermost, laterally extensive coarse grained unlithified deposit identified beneath the site.
- Lower Radnor Till – composed of clay, silt, and sand of the Illinoian Stage lower Radnor Till.
- Bedrock Confining Unit – lowermost unit identified at the site and underlies all unlithified deposits. This unit, composed of low permeability shaley siltstone, silty shale, and coal beds, occurs within the Carbondale Formation of the Kewanee Group.

Surfaces for each of the four major geological units (Loess, Upper Radnor Till, shallow sand, and lower Radnor Till) was made by interpolating contacts between the units interpreted from boring logs. Since all boring log information is centered around the ponds, the surfaces were extended to the full model domain by extrapolation. During construction of the pond, it was noted that sand was removed so that the liner was in contact with the Lower Radnor Till or backfill of similar properties.

### 4.2.2 Extent and Boundaries

The United States Geological Survey (USGS) National Map places the DCPP within the lower Illinois-Lake Chautauqua watershed subbasin (Hydrologic Unit Code [HUC] 07130003). The GMF Pond CSM extent is bounded by a hydrological catchment (watershed) divide to the east based on watershed data from USGS. Along the north, south, and east, the model boundary has been

placed along known waterbodies as much as possible. As such, it is assumed groundwater inflow from adjacent watersheds is negligible through both the uppermost aquifer and lower confining unit.

The Duck Creek Cooling Pond water levels are managed such that they remain at an elevation between 562.5 and 565 feet NAVD88. The Duck Creek Cooling Pond is the receiving body of water for the area encompassed by the CSM.

Infiltration of precipitation to the groundwater table is applied as recharge at the site. Groundwater in the loess and upper Radnor Till migrates downward into the shallow sands (the primary horizontal migration pathway) (discussed in **Section 2.2.1**). Groundwater flow through the loess and upper Radnor Till above the sand zone adjacent to the GMF Pond is considered a PMP.

### 4.2.3 GMF Pond

The GMF Pond is a 1,500-foot by 900-foot earthen berm and has a double liner system which acts as a low permeability interface (**Table A**) between the gypsum contained within the GMF Pond and the ambient groundwater system. The double liner system was installed along the inner faces of the pond (sides and base of the excavated area).

**Table A. Double Liner System Properties from Top to Bottom**

| Liner Component | Thickness (feet) | Hydraulic Conductivity (ft/d) |
|---|---|---|
| HDPE geomembrane | 0.005 | $5.7 \times 10^{-10}$ |
| Cushion of soil | 1 | 16.4 |
| 4 oz/yd$^2$ non-woven geotextile filter fabric | NA | high |
| Drainage layer (sand) | 1 | 28.4 |
| 10 oz/yd$^2$ non-woven geotextile filter fabric | NA | high |
| HDPE geomembrane | 0.005 | $5.7 \times 10^{-10}$ |
| Geosynthetic clay liner (bentonite) | 0.005 | $1 \times 10^{-10}$ * |
| Compacted Clay | 3 | $2 \times 10^{-3}$ |
| **Vertical Harmonic Mean of double-liner system** | **5.015** | **$2.8 \times 10^{-7}$** |

* Estimated based on available information
NA = not applicable

Estimates of the hydraulic properties of each of the components within the double-liner system were derived using values from the Hydrologic Evaluation of Landfill Performance (HELP) model Tolaymat and Krause, 2020); see **Section 5-1** for more information about HELP. For flow perpendicular to the layer orientation, as is the case in the liner where the hydraulic gradient is vertical for the base and horizontal for the sides of the pond, the harmonic mean was used to obtain the effective hydraulic conductivity ($K_{eff}$) (Fetter, 1988). The harmonic mean was determined by:

$$K_{eff} = \frac{\sum b}{\sum \frac{b}{K}}$$

where b is the layer thickness and K is the horizontal hydraulic conductivity.

Findings from the HCR (Ramboll, 2021a) indicate that the GMF Pond does not appear to impact groundwater flow directions via recharge to groundwater. Given the low permeability of the liner system and the removal of sand below the unit, it is more likely that the GMF Pond is a barrier to groundwater flow within the Loess and Shallow Sands aquifers, directing flow from upgradient areas around the perimeter of the pond toward the downgradient areas south and east of the pond toward the Duck Creek Cooling Pond.

If a release to groundwater were to occur, this would be detected by increased boron concentrations (or other parameters included in 35 I.A.C. § 845.600(a)(1)) in the uppermost aquifer or PMP wells. Boron is commonly used as an indicator parameter for contaminant transport modeling for CCR because: (i) it is commonly present in coal ash leachate; (ii) it is mobile and typically not very reactive but conservative (*i.e.*, low rates of sorption or degradation) in groundwater; and (iii) it is less likely than other constituents to be present in background groundwater from natural or other anthropogenic sources. Groundwater quality data shows no boron levels above background levels, therefore there is no meaningful data to use in model calibration. Contaminant transport is therefore modeled with particle tracking, which allows for evaluation of transport times and directions.

## 4.3 Model Approach

A three-dimensional groundwater flow model was calibrated to represent the conceptual flow system described above. A steady state model was used to simulate the mean groundwater flow conditions at the site. The model was calibrated to match mean groundwater elevations observed between 2004 to 2021 (**Table 2-2**). Prediction simulations were then performed to evaluate the potential impacts to groundwater from closure in place as presented in the *Final Closure Plan for the Gypsum Management Facility Pond, Duck Creek Power Plant* (Golder, 2022) which is an appendix to the Construction Permit Application to which this report is also attached.

Three model codes were used to simulate groundwater flow and contaminant transport:

- Groundwater flow was modeled in three dimensions using MODFLOW 2005.
- Contaminant transport was modeled in three dimensions using MODPATH.
- Percolation (recharge) was modeled using the results of the HELP model.

# 5. MODEL SETUP AND CALIBRATION

## 5.1 Model Descriptions

For the construction and calibration of the numerical groundwater flow model for the site, Ramboll selected the model code MODFLOW, a publicly-available groundwater flow simulation program developed by the United States Geological Survey (USGS) (McDonald and Harbaugh, 1988). MODFLOW is thoroughly documented, widely used by consultants, government agencies and researchers, and is consistently accepted in regulatory and litigation proceedings. MODFLOW uses a finite difference approximation to solve a three-dimensional head distribution in a transient, multi-layer, heterogeneous, anisotropic, variable-gradient, variable-thickness, confined or unconfined flow system—given user-supplied inputs of hydraulic conductivity, aquifer/layer thickness, recharge, wells, and boundary conditions. The program also calculates water balance at wells, rivers, and drains.

MODFLOW was developed by the USGS (McDonald and Harbaugh, 1988) and has been updated several times since. Major assumptions of the code are: (1) groundwater flow is governed by Darcy's law; (2) the formation behaves as a continuous porous medium; (3) flow is not affected by chemical, temperature, or density gradients; and (4) hydraulic properties are constant within a grid cell. Other assumptions concerning the finite difference equation can be found in McDonald and Harbaugh (1988). MODFLOW 2005 was used for these simulations with Groundwater Vistas 7 software for model pre- and post- processing tasks (Environmental Simulations, Inc, 2017).

The program uses the standard finite difference method, the particle-tracking-based Eulerian-Lagrangian methods and the higher-order finite-volume total-variation-diminishing (TVD) method for the solution schemes. The finite difference solution has numerical dispersion for low-dispersivity transport scenarios but conserves good mass balance. The particle-tracking method avoids numerical dispersion but was not accurate in conserving mass. Groundwater quality data indicates negligible transport of contaminants from the GMF Pond; therefore, the particle-tracking method was used to provide estimates of groundwater transport in the event of leakage through the pond liner.

The HELP model was developed by USEPA. HELP is a one-dimensional hydrologic model of water movement across, into, through and out of a landfill or soil column based on precipitation, evapotranspiration, runoff, and the geometry and hydrogeologic properties of a layered soil and waste profile. For this modeling, results of the HELP model, HELP Version 4.0 (Tolaymat and Krause, 2020) completed for the groundwater model were used to estimate the hydraulic flux from beneath the GMF Pond.

## 5.2 Flow and Transport Model Setup

Under current conditions, the groundwater protection standards are being met for the GMF Pond. While no potential exceedances of GWPS have been identified in the monitoring well network for this unit (**Section 3.2**); and, source control will mitigate future groundwater impacts, groundwater modeling of closure in place was completed to demonstrate that closure will maintain compliance with applicable groundwater quality standards following construction. The modeled area was approximately 7,900 feet by 9,950 feet with the GMF Pond located in the southeast quadrant. The model grid and boundary conditions for the five model layers are displayed in **Figures 5-1 through 5-5**.

Evaluation of monitoring well data for the GMF Pond has not identified statistically significant seasonal trends in groundwater flow or quality which could affect model applicability for prediction of transport. The MODFLOW model was calibrated to mean groundwater elevations from 2004 to 2021. Multiple iterations of MODFLOW calibration were performed to achieve an acceptable match to observed flow data. For the GMF Pond, the calibrated flow model was used in predictive modeling to evaluate closure in place (CIP). Because no groundwater impacts attributable to the CCR unit have been observed, there is no need to simulate a closure by removal (CBR) option because no future exceedances would be expected. Details of the proposed CIP are described below:

- The CCR within the GMF Pond will be consolidated in the north end of the pond, graded, and covered with a geomembrane and soil layers with an estimated timeline of completion of 12 months.

### 5.2.1 Grid and Boundary Conditions

A five-layer, 340 x 220 node grid was established with 25-foot grid spacing (**Figure 5-1 through 5-5**), with a total number of 200,732 active cells. The northern and western edges of the model are no-flow boundaries in all layers of the model. For both the southern and eastern boundaries, where the model boundary is the Duck Creek Cooling Pond, a constant head boundary was placed equal to the surface elevation of the Duck Creek Cooling Pond. In areas where the model boundary deviates inland from the Duck Creek Cooling Pond, a general head boundary with a conductance estimate based on the distance to the Duck Creek Cooling Pond was placed. The southern and eastern boundaries are only present in layer 5 due to the change in elevation.

The bottom of the model was also a no-flow boundary. The top of the model was a time-dependent specified flux boundary, with specified flux rates equal to the mean recharge rate.

Natural (streams) and man-made (associated with the railroad) drainage features are present in the modeled area; these are represented as drains in the model.

#### 5.2.1.1 Layer Top/Bottom

A digital elevation model of the area was used to assign the top of layer one. The elevations for the base of each hydrostratigraphic layer were interpolated from boring log data primarily from logs provided in the HCR (Ramboll, 2021a) and imported as grid data into MODFLOW. The silts and clays of the Upper Radnor Till unit was divided into two layers to accommodate the explicit inclusion of the GMF Pond liner system (see **Section 5.2.1.4**). The Loess, Shallow sands, and Lower Radnor Till were all represented as single layers within the model.

Flow model layer description and parameters are summarized in **Table B** below.

Electronic Filing: Received, Clerk's Office 06/20/2024

R002686

**Table B. Flow Model Layer Descriptions**

| Layer | Hydrostratigraphic unit name | Hydrostratigraphic unit used to determine layer thickness | Top Elevation (feet) | Bottom Elevation (feet) | Thickness (feet) |
|---|---|---|---|---|---|
| | | | Mean (Minimum – Maximum) | | |
| **1** | uppermost aquifer (PMP) | Loess | 616.2 (594.7-663.0) | 597.7 (585.0-604.5) | 18.6 (0.5-65.6) |
| **2 & 3** | uppermost aquifer | Silts and clays of the Upper Radnor Till | 597.7 (585.0-604.5) | 587.0 (577.0-597.5) | 10.2 (1.0-19.8) |
| **4** | uppermost aquifer | Shallow sands | 587.0 (577.0-597.5) | 582.8 (566.8-595.4) | 4.2 (0.5-14.3) |
| **5** | lower confining unit | Lower Radnor till | 582.8 (566.8-595.4) | 527.7 (517.3-547.7) | 54.9 (34.0-67.1) |

PMP = potential migration pathway

#### 5.2.1.2 Hydraulic Conductivity

The spatial distribution of the hydraulic conductivities within each layer was considered homogenous. With the exception that in the strip-mining area to the south of the GMF Pond described in **Section 2.2.4** (**Figure 2-3**), where all hydrostratigraphic units were excavated and the area back-filled, resulting in what is assumed to be a more homogenous fill in the strip-mining area. Therefore, the hydraulic conductivity values for each layer in the mine spoil area are uniform. **Figures 5-6 through 5-11** show the spatial distribution of the hydrostratigraphic units, as well as the mining spoils associated with the strip mining activity, GMF Pond and GMF Recycle Pond, and the GMF Pond liner for each of the model layers.

Where available, hydraulic conductivity values were derived from field measured values reported in the HCR (Ramboll, 2021a) (**Section 2.2.2**). During calibration it became clear that tested values in general were low and therefore hydraulic conductivities for the hydrostratigraphic layers were further refined through model calibration and tend to be greater than the tested values. No horizontal anisotropy was assumed. Vertical anisotropy with ratios between 1/10 and 1/3 were applied to the Loess, Upper Radnor Till, Shallow sands, Lower Radnor Till, and the mine spoils to simulate preferential flow in the horizontal direction in these materials.

#### 5.2.1.3 Recharge

Recharge rates were determined through calibration of the model to observed groundwater elevations. For the calibration model, recharge was applied uniformly across the model. Model inputs are summarized in **Table C** in **Section 5.4**.

#### 5.2.1.4 GMF Pond Parameters

Implementation of the GMF Pond into the model used hydraulic flow barriers to represent the double liner system on the sides of the pond. The bottom of the liner is implemented by assigning the liner system hydraulic conductance to model layer 2 within the footprint of the pond. The base elevation of layer 2 within the footprint of the GMF Pond simulates the base elevation of the liner. The thickness of model layer 2 within the footprint of the pond was set to five feet. Removal of the Shallow Sands below the GMF Pond (as described Section 4.2.3) means that the liner is in direct contact with the Upper Radnor Till or backfill of similar characteristics.

A drain was placed in model layer 1, where the elevation of the base of the drain was equal to the water level monitored in the pond. The drain was included to represent flow to the GMF Recycle Pond. The GMF Recycle Pond was implemented in the same way. The actual recharge to the ponds is unknown, but for simplicity the same values as were used for the surrounding area were applied. The drain conductance was adjusted to allow for enough "runoff" from the ponds to fit expected water levels in both ponds.

The vertical hydraulic conductivity of the double liner system was calculated as $2.8 \times 10^{-7}$ ft/d (horizontal hydraulic conductivity of $2.8 \times 10^{-6}$ ft/d) based on the harmonic mean of the hydraulic conductivities for the different components within the liner (**Table A** in **Section 4.2.3**). These values were assigned to model layer 2 within the footprint of the GMF Pond representing the liner system.

### 5.2.2 Transport Model Input Values

Particle tracking was used both for the sensitivity analysis (discussed in **Section 6.2.1**) and the closure scenario to provide a quantitative estimate of the distance a potential contaminant from the GMF Pond may travel in 100 years.

#### 5.2.2.1 Effective Porosity

MODPATH uses estimates of the effective porosity of the hydrostratigraphic unit to calculate Darcy velocities, which strongly impact the movement of particles. Estimates of porosity for the hydrostratigraphic units provided in the HCR (Ramboll, 2021a) and summarized below:

- Loess - Average total porosity of 37 percent (range of 32.4 to 41.8 percent).
- Upper Radnor Till - Average total porosity of 36.8 percent (range of 30.7 to 41.4 percent).
- Shallow sands - Average total porosity of 29.5 percent (range of 27.4 to 31.4 percent).
- Lower Radnor Till - Average total porosity of 22.3 percent (range of 20.6 to 23.5 percent)

The values from the HCR are based on laboratory testing and are not expected to represent effective porosities, but rather be at the upper level of possible values. The values used in the modeling were chosen based on expected values for the hydrostratigraphic units; the chosen values are shown in **Table C** in **Section 5.4**.

#### 5.2.2.2 Particles

Particles represent a given mass of contaminant and are initially placed within the GMF Pond at the top of model layer 2 (representing the top of the liner). At each cell within the GMF Pond, one particle was started at the top of model layer 2 and allowed to travel for 100 years.

Simplifying assumptions were made while developing this model:

- Except for changes induced by cap construction and ash fill consolidation/removal, the groundwater flow system is at steady state.
- Natural recharge is constant over the long term.
- Fluctuations in Duck Creek Cooling Pond stage do not affect groundwater flow and transport over the long term.
- Hydraulic conductivity is consistent within hydrostratigraphic units.

- The conductance term used to simulate the GMF Pond double liner system adequately represents a composite estimate of the permeability of the liner system.
- Particles represent a mass of Boron which leaves the GMF Pond and enters the groundwater system.
- Boron is not adsorbed and does not decay, and mixing and dispersion are the only attenuation mechanisms.

## 5.3 Calibration Flow Model

The groundwater model was manually calibrated to best approximate the mean groundwater elevations in 59 wells at the site. The mean elevations used for calibration and locations of wells within the flow model are summarized in **Table 2-2**. Well locations are shown in **Figure 2-1**. This involved modifying the hydraulic conductivities of the different hydrostratigraphic units, recharge rate, and conductance of the drains and general head boundaries within the model to minimize the difference between the mean observed groundwater elevation and simulated groundwater elevation. Where possible, the range of the parameter values used during calibration were based on observed values (*i.e.,* for the range in hydraulic conductivity estimates from the HCR). Where this was not possible, such as for the drain and general head boundary conductance, the range of parameter values were based on other site information or inferred from knowledge from similar sites. Where data were limited, the parameter values were less constrained during calibration (*e.g.,* parameter values had wider ranges). The root mean squared error (RMSE) was used as a metric to identify the optimal values for the different parameters.

The groundwater model is steady state and is therefore only able to simulate the long term mean groundwater flow conditions. It is unable to capture seasonal variability in groundwater elevations. There may be a bias in the groundwater elevation data used to quantify the mean groundwater elevation for the wells, based on the temporal distribution of the data and the frequency of the data collection. The potential for deviation away from mean conditions can be integrated into the calibration process by using the standard deviation of the groundwater levels as an additional metric (**Table 2-2**). This assumes that all groundwater data have a gaussian distribution (normal distribution) such that 95 percent of the observed groundwater elevation would fall within plus or minus (±) 2 standard deviations (std) from the average groundwater elevation. If a simulated groundwater level was within ±2 std of the mean observed groundwater level, the simulation may be considered reasonable.

## 5.4 Calibration Flow Model Results

Results of the MODFLOW modeling are presented below. A disk containing the model files is attached to this report (**Attachment A**). **Table C** shows the calibrated hydraulic conductivity for the different units shown in **Figures 5-6** to **5-11**.

Groundwater model calibration results are presented in **Figure 5-12** and **Figure 5-13**, which shows the observed GWL and simulated groundwater elevations. The RMSE of the GWL across all wells was 6.22 feet. The mass balance error for the flow model was 0.001 percent and the ratio of the residual std to the range of heads was 20.9 percent, which is above the desired target value of 10 percent. The simulated groundwater elevations within the Loess (**Figure 5-12A**) are generally in good agreement with the observed groundwater elevations. Most of the simulated groundwater elevations fall within ±1 std of the observed groundwater elevation. The simulated groundwater elevations in the shallow sands have a greater tendency to be overestimated

relative to the observed groundwater levels. **Figure 5-13** shows the observed versus simulated concentrations within the model. Overestimation of groundwater elevation in the model is more pronounced in the shallow sands at lower groundwater elevations.

**Table C. Calibrated Flow Model Layer Hydraulic Parameters**

| Parameter | Type | Units | Calibrated Value | Ratio Kh to Kv | Porosity |
|---|---|---|---|---|---|
| **Recharge** | Rate | ft/d | 0.001 | NA | NA |
| **Layer 1: Uppermost Aquifer (PMP)** | Hydraulic conductivity | ft/d | 5 | 7 | 0.37 |
| **Layer 2 & 3: Uppermost Aquifer** | Hydraulic conductivity | ft/d | 1 | 5 | 0.37 |
| **Layer 4: Uppermost Aquifer (Sand)** | Hydraulic conductivity | ft/d | 30 | 3 | 0.17 |
| **Layer 5: Lower Confining Unit** | Hydraulic conductivity | ft/d | 0.7 | 10 | 0.22 |
| **Strip mining area** | Hydraulic conductivity | ft/d | 5 | 5 | 0.20 |
| **GMF Pond Base Liner** | Hydraulic conductivity | ft/d | $2.8 \times 10^{-6}$ | 10 | 0.20 |
| **GMF Pond Horizontal Flow Barrier** | Hydraulic conductivity | ft/d | $5.68 \times 10^{-7}$ | NA | NA |
| **General Head** | Conductance | $ft^2/d/ft$ | 1.5 | NA | NA |

$ft^2/d/ft$ = square feet per day per foot
NA = not applicable
Kh = horizontal Hydraulic Conductivity
Kv = Vertical Hydraulic Conductivity

**Figure 5-14** and **Figure 5-15** show the simulated groundwater elevations for layers 1 (Loess) and 4 (Shallow Sands), respectively. In both the Loess and Shallow Sands, the model is able to simulate the groundwater levels around the GMF Pond within 1 standard deviation. This indicates that the model is adequate to simulate the hydraulic head between the GMF Pond and the surrounding groundwater in the uppermost aquifer, which is an important driver of groundwater flow from the pond into the aquifer. The largest errors tend occur in wells to the north and south of the GMF Pond. In general, the flow patterns are comparable to those shown in **Figure 2-2** interpreted from the site well data for May 2021. The GMF Pond forms a barrier to groundwater flow, directing groundwater to flow around the unit in layer 1 of the model. Some impact of the GMF Pond on groundwater flow can be seen in **Figure 5-14**, where the groundwater contours are deflected along the GMF Pond's footprint. **Table D** provides an overview of the GMF Pond water balance. The estimated particle travel distances after 100 years are also provided as a no action scenario for comparison to the proposed closure scenario.

**Table D. Water Balance Results from Calibrated GMF Pond and Particle Travel Distances after 100 years for Current Conditions (no action scenario)**

| Water Balance Components | Calibrated Model |
|---|---|
| **Inflow: Recharge ($ft^3/d$)** | 942.5 |
| **Outflow: Drain Flow ($ft^3/d$)** | 941.0 |
| **Outflow: Leakage ($ft^3/d$)** | 0.62 |
| **Mean distance travelled by particles (feet) ± (std)** | 0.123±0.039 |
| **Mean distance travelled by particles in z direction (feet) ± (std)** | 0.121±0.035 |

$ft^3/d$ = cubic feet per day
K = hydraulic conductivity

Review of the model calibration indicates good agreement with observed conditions in the local area around the GMF Pond. The elevated ratio of the residual std to the range of heads suggests that sitewide subsurface heterogeneity (the uppermost aquifer is located in glacial deposits that grade laterally from sand to silt) is not optimally represented by the homogenous layers used in the model. Further, because the shallow sand layer is less than 5-feet thick in most locations, wells monitoring the shallow sand are screened across the shallow sand and into the overlying and/or underlying finer grained deposits of the Radnor Till, which are represented in the model as separate layers. Based on the objective of the model to estimate potential impacts from the GMF Pond, a homogenous representation in hydraulic properties within layers was maintained.

# 6. CLOSURE SCENARIO MODEL

As discussed in **Section 5.2**, because no groundwater impacts attributable to the CCR unit have been observed, there is no need to simulate a CBR option because no future exceedances would be expected. Modeling for the CIP closure scenario was conducted using particle tracking for a period of 100 years, based on a steady state model of the site under closure conditions. HELP (Version 4.0; (Tolaymat and Krause, 2020) was used to estimate percolation through GMF Pond capping solution (described below). HELP modeling input and output values can be found in **Appendix C**.

The following simplifying assumptions were made for the simulation:

- Cap construction has an instantaneous and constant effect on recharge and percolation through surface materials.
- In the CIP scenario, average annual percolation rates through the cap system were estimated from a 100-year HELP model run. There was no significant change in percolation rates over the 100-year timeframe of HELP-simulated values. This 100-year HELP-calculated percolation rate remained constant over the duration of the closure scenario prediction model runs.
- The design for CIP for the GMF Pond involves pumping out ponded water from the GMF Pond, construction of a berm mid-way (east-west orientation) across the pond (also lined with 60-mil HDPE geomembrane), and collection of all gypsum south of the berm to be deposited north of the berm. The existing double-liner system south of the berm will be disposed.
- Cap construction in the scenario was assumed to be completed with a cover system consisting of the following (listed from ground surface down): a vegetative cover (6 inches thick), protective layer of compacted soil (18 inches thick), geo-composite drainage layer, and 40-mil Linear Low-Density Polyethylene (LLDPE) geomembrane.
- Final grade of the capping system was assumed at or above current top of berms. Proper storm water control systems were assumed to remove excess water from the surface of the capped areas based on design drawings (Golder, 2022).
- Predicted recharge rates for the GMF Pond cover system can be estimated based on the HELP cap system percolation rates.
- All saturated gypsum is consolidated into the designed footprint of the CIP closure scenario. This assumes all gypsum is placed within the final footprint of the caps for the closure-in-place scenario. Local fill materials were assumed to replace the compacted clay liner.
- Local fill materials applied to the CIP models have similar hydraulic properties as the Upper Radnor Till used in the calibrated model.

## 6.1 Closure in Place Model Setup

Both the HELP and a modified version of the calibrated groundwater flow models were used to evaluate the impact of the CIP scenario. The scenario was simulated as steady state flow model and particle tracking was used to estimate contaminant travel distances from the capped unit. In the modified version of the steady state flow model the horizontal flow boundary and liner properties of layer 1 and 2 are only applied within the CIP footprint.

HELP input data and results are provided in **Appendix C**. The CIP scenario was modeled for a period of 100 years. Climatic inputs were synthetically generated using default equations developed for Indianapolis, Indiana (the closest weather station included in the HELP database), 100-year average precipitation and temperature values recorded at the Peoria, Illinois weather station, and the latitude of the GMF Pond. Soil layering was developed for the CIP scenario using data provided in the closure scenario designs documented in the Golder (2022) report described above.

HELP model results indicated that an average of 0.00025 inches/year ($2.1 \times 10^{-5}$ foot/year) of leakage occurs through the CIP cap system (**Appendix C**). The CIP scenario footprint is shown in **Figure 6-1**, the HELP calculated cap system percolation rate was applied to the CIP footprint as recharge, the recharge rate for the area outside this footprint was set the same as in the calibrated model (**Table C**). The CIP plan also includes surface drainage in the southern area of the GMF Pond footprint, therefore the drainage in this area was simulated with drain cells set equal to the planned surface elevation. The Recycle Pond was removed as part of the CIP model scenario. The CIP scenario model was run as steady state. A particle was placed in each cell in the CIP footprint (**Figure 6-2**) to simulate advective transport.

The groundwater flow from the CIP GMP Pond footprint is correlated to the conductivity of the liner system; therefore, a sensitivity analysis was performed for the CIP scenario to determine the impact of the liner system's hydraulic properties on the leakage from the CIP GMP Pond footprint. The conductance values of the horizontal hydraulic barriers and liner of the pond were increased by an order of magnitude. This simulation approach represents the upper bounds of potential flow rates through the liner and results are presented in **Section 6.2.1**. All other hydraulic parameters were unchanged from the calibrated model in the CIP scenario model.

Two additional CIP sequences were simulated using HELP to support the *Proposed Alternative Final Protective Layer Equivalency Demonstration* (Geosyntec, 2022) which is an appendix to the Construction Permit Application to which this report is also attached. Results of these HELP simulations were not incorporated into the MODFLOW model simulations for CIP:

- One CIP sequence was simulated by increasing the thickness of the proposed Final Protective Layer from 24 to 36 inches. This cap construction scenario consisted of the following (listed from ground surface down): a vegetative cover (6 inches thick), protective layer of compacted soil (30 inches thick), geo-composite drainage layer, and 40-mil LLDPE geomembrane underlain by gypsum.
- The other CIP sequence representing the default cover system provided in 35 I.A.C. § 845.750(c) consisted of the following (listed from ground surface down): a vegetative cover (6 inches thick), protective layer of compacted soil (30 inches thick), and 36 inches of compacted clay with a hydraulic conductivity of $1 \times 10^{-7}$ cm/sec underlain by gypsum.

HELP simulation inputs and output results are presented in **Appendix C**.

## 6.2 Closure in Place Model Results

The simulation of the CIP scenario resulted in dry cells within the CIP footprint in both layer 1 (the gypsum) and layer 2 (the basal liner) indicating water is not expected to accumulate in the closed unit following placement of the cap. Low levels of saturation within the capped CIP scenario are anticipated due the unwatering and dewatering of the GMF pond prior to capping and the low infiltration rate through the cap. However, in order to use MODPATH to determine

the travel distance of particles through the basal liner, cells are required to be saturated (active). To get saturated cells in the CIP footprint, the horizontal and vertical hydraulic conductivities of the gypsum unit (see **Table C**) were reduced to 0.1 ft/d and 0.01 ft/d respectively, thus allowing for MODPATH simulations. All water balance and particle tracking results provided below pertain to the groundwater model with the reduced gypsum hydraulic conductivity.

The results of simulated CIP for the GMP Pond at DCPP are shown in **Table E** below. All particles remain within the CIP footprint (liner and gypsum), indicating the proposed closure method is not expected to result in exceedances of the GWPS. The mean travel distance of all particles within the liner system and gypsum was 0.29 feet horizontally and 0.03 feet vertically after 100 years. Reduced head within the closed pond creates variable hydraulic gradients with the surrounding groundwater. This results in simulated groundwater inflow into the CIP footprint and outflow from the CIP footprint. Approximately 57 percent of the particles (in the north-western corner of the unit) move upward from the liner system into the over lying gypsum. The remaining 43 percent move downward while remaining within the liner system.

Estimated vertical flow rates are reduced compared to the calibration model. In the calibrated model, vertical flow is 0.62 $ft^3/d$ (**Table D**); whereas, in the CIP scenario this is reduced to 0.07 $ft^3/d$ (**Table E**).

Of primary interest is the simulation of particles moving downwards within the liner which could potentially enter the groundwater system. Comparison of the downwards advective travel distance of the particles for the calibration model (no action) and CIP scenario show a reduction in travel distance after 100 years. In the calibrated model, the mean distance traveled by the particles was 0.12 feet (**Table D**) into the liner system; whereas, in the CIP scenario this is reduced to 0.04 feet (**Table E**) into the liner system.

**Table E. Water Balance Results from Closure-in-Place Scenario and Particle Travel Distances after 100 Years**

| Water Balance components | CIP Scenario | CIP Increase liner K by $10^1$ |
|---|---|---|
| **Inflow: Recharge ($ft^3/d$)** | 0.027 | 0.027 |
| **Inflow: Groundwater inflows ($ft^3/d$)** | 0.042 | 0.75 |
| **Outflow: Leakage ($ft^3/d$)** | 0.068 | 0.78 |
| **Mean distance travelled by all particles (feet)** | 0.285±0.46 | 17.21±18.12 |
| **Mean distance travelled by all particles in z direction (feet)** | 0.025±0.019 | 0.326±0.2 |
| **Percentage of particles which moved downward** | 43 | 42 |
| **Mean distance travelled by downward moving particles in z direction (feet)** | 0.035±0.02 | 0.226±0.127 |
| **Percentage of particles which moved upward** | 57 | 58 |
| **Mean distance travelled by upward moving particles in z direction (feet)** | 0.017±0.0 | 0.4±0.21 |

$ft^3/d$ = cubic feet per day
K = hydraulic conductivity

### 6.2.1 GMF Pond Sensitivity

The impact of changes to the liner conductivity, on the simulated CIP GMP Pond groundwater outflows and particle tracking are shown in **Table E** above. Increasing the hydraulic conductivity of the liner system by an order of magnitude results in a similar increase in outflow from 0.07 to 0.78 $ft^3$/day. There is a significant lateral component to the particle movement in this sensitivity test leading to an increase in mean distance traveled by particles from 0.29 to 17.21 feet. However, the downward movement of particles only increases from 0.04 feet to 0.23 feet. In both simulations the particles remain within the CIP unit and pond liner system, which is 5 feet thick.

# 7. CONCLUSIONS

There are no potential groundwater exceedances of applicable groundwater standards attributable to the GMF Pond. This GMR has been prepared to show how proposed CIP for the GMF Pond will maintain compliance with the applicable groundwater standards at the DCPP. This report integrates existing site data and information with the latest hydrogeology and groundwater quality data to generate a conceptual and numerical model of the GMF Pond.

The calibrated numerical model of the GMF Pond successfully simulated the groundwater flows and elevations around the GMF Pond. The water balance for the GMF Pond and particle tracking simulations indicated that the outflow from the GMF Pond will decrease as compared to current conditions and that all particles representing potential contaminant mass will remain within the CIP unit and liner system after 100 years.

In the CIP scenario, estimated vertical flow rates through the GMF Pond liner system were reduced from 0.62 $ft^3$/day in the calibration model to 0.07 $ft^3$/day. Particle tracking showed that the hydraulic gradient between the CIP unit and the groundwater in the aquifer moved particles a mean distance of 0.29 feet horizontally and 0.04 feet downward after 100 years and remained within the model layers representing the liner system and gypsum unit. Increasing the conductivity of the liner system for sensitivity testing influenced both the water balance and the travel distances of the particles. With the liner conductivity in the CIP model increased by one order of magnitude for testing, the flow out of the pond increased from 0.07 $ft^3$/day to 0.8 $ft^3$/day; likewise, the downwards distance travelled by the particles increased from 0.04 feet to 0.22 feet. This indicates that in both the CIP scenario and sensitivity test simulations, the particles do not migrate beyond the liner system which is 5 feet thick.

Particle tracking for the CIP scenario for a 100-year period indicates that contaminants will not migrate beyond the liner system, maintaining compliance with the applicable groundwater standards post closure.

**EVALUATION OF POTENTIAL GWPS EXCEEDANCES, GYPSUM MANAGEMENT FACILITY POND, DUCK CREEK POWER PLANT, FULTON COUNTY, ILLINOIS**

## 1.0 INTRODUCTION

Illinois Power Resource Generating, LLC (IPRG) formerly operated the Duck Creek Power Plant (DCPP) located in Fulton County, Illinois. The Gypsum Management Facility Pond (GMFP, Illinois Environmental Protection Agency [IEPA] ID No. W0578010001-04) is a surface impoundment used to manage gypsum and related coal combustion residuals (CCRs) at the DCPP. The GMFP is regulated under Part 845 *"Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments"* (State CCR Rule or Part 845) which was promulgated by the Illinois Pollution Control Board (IPCB) on April 21, 2021.

IPRG is currently preparing an Operating Permit application for the GMFP as required under Section 845.230 which requires that known exceedances of groundwater protection standards (GWPS) be documented as a part of the Operating Permit application. In October 2021, Ramboll Americas Engineering Solutions, Inc. (Ramboll) identified potential GWPS exceedances for pH, arsenic, and lead in groundwater samples collected from selected monitoring wells in the vicinity of the GMFP as presented in the Operating Permit application for the GMFP. This Technical Memorandum was developed to further evaluate these potential GWPS exceedances.

## 1.1 Site Setting, Geology and Hydrogeology

The Duck Creek Power Plant (Site) is an inactive power plant in Fulton County, located in central Illinois, approximately 9 miles southeast of the town of Canton. The GMFP is located north of the power plant (see Figure 1). Agricultural land surrounds the DCPP.

Regionally, the Site is positioned on the glacial uplands above the Illinois River in the Ancient Illinois Floodplain of the Till Plains Section of the Central Lowland Province. The undisturbed unlithified materials consist of loess, diamictons, and lacustrine/alluvial deposits. The area is flat to gently rolling uplands that are dissected by deeply incised streams that are tributaries to major river systems (NRT/OBG 2017).

Several large former surface coal mines are present in the vicinity; unlithified materials are present in the excavated strip mine spoils and have been mixed due to the surface mining activities. Mining operations in the area have ceased.

The uppermost bedrock stratum in the area is the Carbondale Formation of the Kewanee Group of the Pennsylvanian System. Bedrock in the area is identified as Pennsylvanian-age shale deposits. Bedrock occurs within approximately 50 feet (ft) of the ground surface in this area.

13515 Barrett Parkway Drive, Suite 260, Ballwin, Missouri, USA 63021 T: +1 314 984-8800 F: +1 314 984-8770

Golder and the G logo are trademarks of Golder Associates Corporation

The following two unlithified water-bearing units are present beneath the GMF Pond (beginning at the ground surface):

- Loess Zone – Moderate to high permeability silts and clayey silts, including: the Peoria and Roxanna Silt (Loess Units); underlain by the low permeability clayey diamictons of the Berry Clay and upper Radnor Till Members of the Glasford Formation.
- Shallow Sand Unit – Thin to moderately thick (6 to 18 ft), moderate to high permeability, medium-grained sand to silt with intercalated till seams; underlain by till sequences of the lower Radnor Till Member of the Glasford Formation.

The Uppermost Aquifer in the area consists of the Loess and Shallow Sand. These hydraulically connected units are underlain by the lower Radnor Till Member of the Glasford Formation. As shown on Figure 1, groundwater typically flows from northwest to southeast in the Uppermost Aquifer (NRT/OBG 2017).

## 1.2 Gypsum Management Facility Pond Design and Operation History

The GMFP is a 1,500-foot by 900-foot earthen berm double-lined CCR surface impoundment. Construction of the dual composite liner system and a leak detection system layer was completed in 2007-2009 under a rigorous construction quality assurance program (Hanson, 2009), which is an important determinant of liner system performance. The GMFP consists of the following components from top to bottom:

- Primary Composite Liner
  - SOLMAX 460T-1000 60-mil (0.06-inch thick) textured high-density polyethylene (HDPE) geomembrane
  - 1-foot cushion soil layer (2 feet in selected areas on the side slopes)
- Leak detection layer
  - SKAPS GT-142 4-0z/yd$^2$ geotextile separator
  - 1-foot granular drainage layer
  - SKAPS FE-110 10-oz/yd$^2$ geotextile cushion
- Secondary composite liner
  - Solmax 460T-4013 60-mil texture HDPE geomembrane
  - CETCO Bentomat SDN reinforced geosynthetic clay liner (GCL)
  - 3-foot compacted clay layer placed in 8-inch lifts, compacted to at least 95% of the standard Proctor maximum dry density at a moisture content between the standard Proctor optimum moisture content (OMC) and 5% of the wet OMC

The GMFP was used to store gypsum and to clarify gypsum transport water for reuse in the wet scrubber system at the DCPP until the plants retirement in 2019. Gypsum materials are the only waste managed in the GMFP.

## 2.0 POTENTIAL GWPS EXCEEDANCES REVIEW

As required by Section 845.230 (d)(2)(M), an evaluation of the history of potential GWPS exceedances was competed for the Operating Permit application by Ramboll. Data collected from groundwater samples collected from the GMFP monitoring well network since January 30, 2015, were evaluated and potential exceedances of the GWPSs are summarized below.

- Field pH at monitoring well G52L: A field pH GWPS exceedance was noted in a single sample collected from this well in February 2021. The pH value of 6.4 standard units (s.u.) measured in the sample is outside the Part 845 GWPS pH range of 6.5-9.0 s.u. G52L is located cross-gradient/up-gradient from the GMF pond and the screening interval is completed within the Loess unit.
- Field pH at monitoring well G60L: Field pH GWPS exceedances were noted in this well for each of the nine samples collected from this well from March-July 2021. The average pH for the nine samples was 6.1 s.u., which is outside the Part 845 GWPS pH range of 6.5-9.0 s.u. The well is located down-gradient on the east side of the GMFP and the screening interval is completed within the Loess unit.
- Arsenic at monitoring well P60: A total arsenic GWPS exceedance was noted in a single sample collected from this well in March 2021. The arsenic concentration of 0.02 milligrams per liter (mg/L) measured in the sample slightly exceeds the Part 845 GWPS of 0.01 mg/L. P60 is located down-gradient on the east side of the GMFP and the screening interval is completed within the Loess unit.
- Lead at monitoring well P60: A total lead GWPS exceedance was noted in a single sample collected from this well in March 2021. The lead concentration of 0.036 mg/L measured in the sample slightly exceeds the Part 845 GWPS of 0.015 mg/L. P60 is located down-gradient on the east side of the GMFP and the screening interval is completed within the Loess unit.

## 3.0 EVIDENCE THAT POTENTIAL GWPS EXCEEDANCES ARE NOT RELATED TO THE GMFP

Groundwater data for samples collected from monitoring wells that exhibited potential GWPS exceedances, background monitoring wells and pore water samples from the GMFP were evaluated. The review of these data indicates that the GWPS exceedances are not related to the GMFP, as described in the lines of evidence (LOE) below:

- **The ionic composition of groundwater collected from G52L, G60L and P60 is similar to groundwater collected from background wells G02S, G50S and G52S.**

A Piper diagram is a graphical technique used to classify and compare different groundwater sources based on their ionic composition in aqueous solution. As shown on the Piper diagram presented as Figure 2, the ionic composition of groundwater samples collected from G52L, G60L and P60 is similar to groundwater samples collected from the background wells – both groups of samples exhibit a calcium-bicarbonate water-type. Pore

and surface water samples collected from the GMFP exhibit a magnesium-chloride water-type, which is distinctly different to the background wells and monitoring wells G52L, G60L and P60. It would be expected that if there were a release from the GMFP, the ionic composition of the monitoring wells would show a mixing pattern towards the pore water ionic composition. However, as shown on Figure 2, the compositions of the monitoring wells are clustered with the background well compositions and distant from the pore and surface water compositions. These data support that the GWPS standard exceedances of pH in G52L and G60; the arsenic exceedance in P60; and the lead exceedance in P60 are not related to the GMFP.

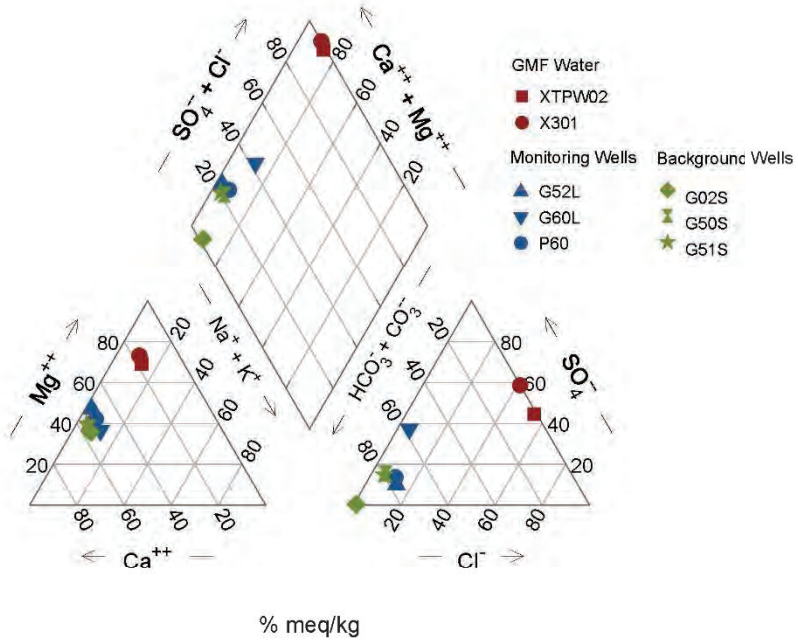

**Figure 2: Piper diagram showing water chemistry of GMF Surface and Pore Water, monitoring wells G52L, G60L and P60, and background wells.**

- **Concentrations of key GMFP constituents differ significantly in GMFP pore water samples and groundwater samples from monitoring wells G52L, G60L and P60.**

Concentrations of key constituents typically associated with CCR gypsum waste (boron, calcium, chloride, fluoride, sodium and sulfate) differ significantly between pore water/surface water in the GMFP and groundwater samples collected from the monitoring wells (Table 1, Figures 3 and 4). For example, boron, a typical gypsum indicator that is very mobile and non-reactive within a groundwater matrix, is elevated in GMF surface water and pore water samples (29 - 98 mg/L), whereas the monitoring wells G52L, G60L and P60 contain significantly lower concentrations (0.022 – 0.068 mg/L) that are more consistent with background results. Given the geochemical behavior of boron, it would be expected that elevated boron concentrations above background values would be observed in monitoring wells had a release occurred from the GMF pond. Similarly, fluoride and sulfate, other very mobile GMF constituents, would be expected to be observed in monitoring wells above the site GWPS in the event of a release from the GMF Pond. Figures 3 and 4 below and Table 1 show the

differences in concentrations between GMF surface water/pore water and monitoring wells for other key GMF constituents. Table 1 also contains site background and the Part 845 GWPSs. These data support that the GWPS standard exceedances of pH in G52L and G60; the arsenic exceedance in P60; and the lead exceedance in P60 are not related to the GMFP.

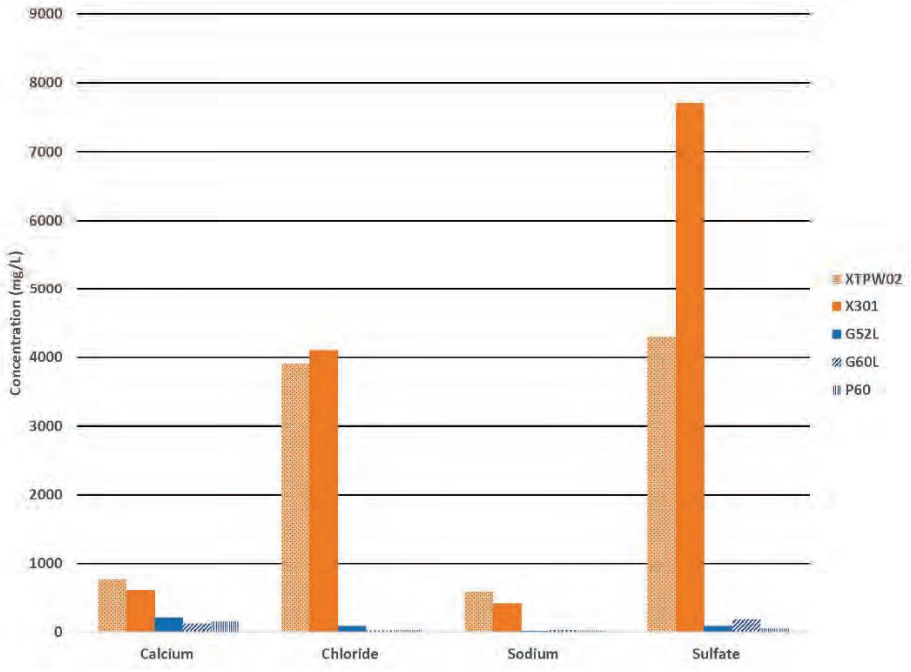

**Figure 3: Bar chart showing GMFP constituent concentration comparisons between GMFP Surface and Pore Water and monitoring wells G52L, G60L and P60.**

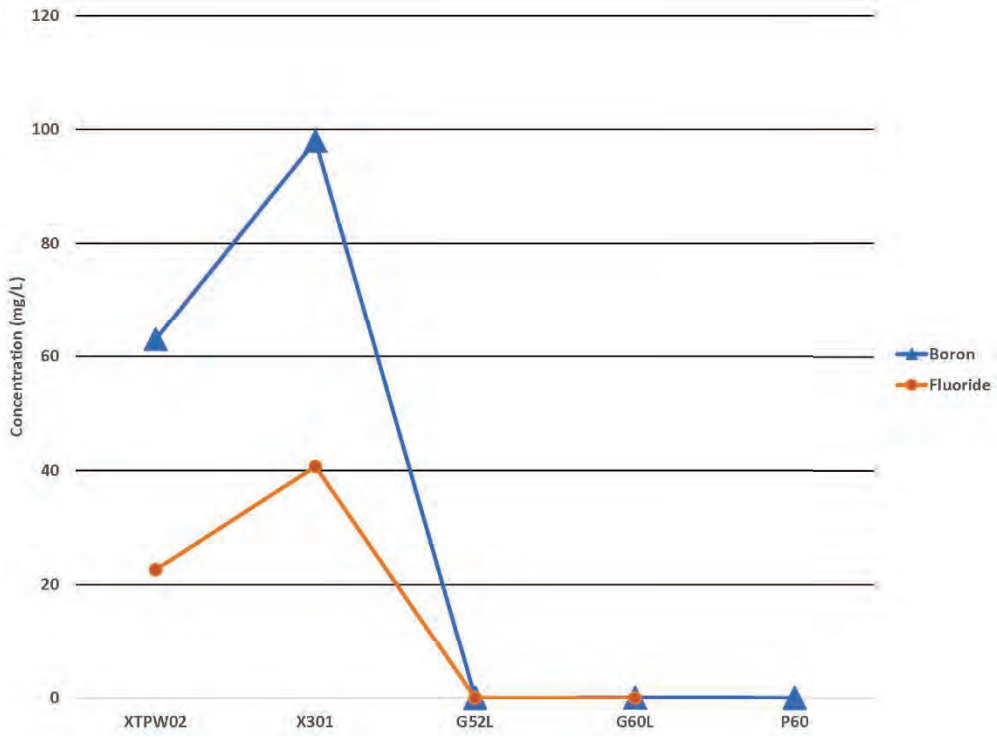

**Figure 4: Line chart showing GMFP constituent concentration comparisons between GMFP Surface and Pore Water and monitoring wells G52L, G60L and P60.**

- **High turbidity was recorded on the groundwater sampling record for the sample collected from P60.**

The arsenic and lead GWPS exceedances were based on a single sample collected from P60 in March 2021. The groundwater sampling record indicated an unusually high turbidity reading just before sample collection (1620 nephelometric turbidity units (NTU)). According to the sampling record, the sample did not appear to be field filtered, nor was it filtered in the lab. Thus, the arsenic and lead sample concentrations are likely elevated due to the presence of excessive soil and/or colloidal particles in the sample and are not representative of actual groundwater conditions in the vicinity of this well. These circumstances support the conclusion that GWPS standard exceedances of lead and arsenic in P60 are not related to the GMFP.

- **A peat layer ranging in thickness from 1 to 4 feet is present in the immediate vicinity of P60.**

Peat was recorded in the boring log of P60 within the saturated zone (approximately 19.5-20.5 and 24-24.2 feet below ground surface (ft bgs)), but above the screened interval of the well (approximately 29.5-34.5 feet bgs) (Appendix A). Approximately 4 feet of peat was recorded within the saturated zone in a nearby soil boring, B-55 (approximately 13.5-17.5 feet bgs). Given the interconnected nature of the unlithified water-bearing units, it is possible that the peat layer is interacting with the groundwater-bearing unit in the immediate vicinity. Peat is typically associated with low pH and is known to sequester certain metals, including arsenic and lead. In combination with a high turbidity and unfiltered sample, this may be the cause of the slightly elevated arsenic

and lead concentrations in P60. Thus, the GWPS standard exceedances of pH in G60L and the arsenic lead exceedance in P60 may be associated with the peat layer encountered in the immediate vicinity of those wells.

- **Arsenic and lead are not typical CCR indicators and are not present in GMFP pore and surface water above the GWPS.**

Arsenic and lead are not typical coal ash or gypsum indicators (EPRI, 2017). As shown on Table 1, arsenic and lead have been either not detected or detected below the applicable GWPS in GMFP pore and surface water samples. In addition, concentrations in GMFP pore and surface water are lower than concentrations measured in the groundwater sample collected from P60. These data support that GWPS exceedances of lead and arsenic in P60 are not related to the GMFP, as the unit is not a source of elevated arsenic or lead.

- **The GMFP liner was constructed with a dual composite liner system with a leak detection system, has undergone rigorous construction quality assurance and has indicated strong performance**

As discussed in Section 2.0, the GMFP liner was constructed with a primary and secondary liner system with a leak detection layer between the primary and secondary liners. The construction process underwent a detailed construction quality assurance program (Hanson, 2009). The leak detection system has to date shown excellent performance of the primary liner system. Pumps in the leak detection system designed to operate to remove water from the primary liner have only run for a few hours for the lifetime of the facility (beginning in 2009). This indicates that a release from the GMFP has likely not occurred and that the GWPS standard exceedances of pH in G52L and G60; the arsenic exceedance in P60; and the lead exceedance in P60 are not related to the GMFP.

## 4.0 SUMMARY

The evaluation presented in this document demonstrates that the GWPS exceedances of pH in G52L and G60; the arsenic exceedance in P60; and the lead exceedance in P60 are not related to the GMFP. The following lines of evidence demonstrate the GWPS exceedances are not related to the GMFP:

- The ionic composition of groundwater collected from G52L, G60L and P60 is similar to groundwater collected from background wells G02S, G50S and G52S and not the pore water/surface water in the GMFP.
- Concentrations of key gypsum constituents differ significantly between GMFP pore water samples and groundwater samples collected from monitoring wells G52L, G60L and P60.
- High turbidity was recorded on the groundwater sampling record for the sample collected from P60, which likely resulted in arsenic and lead concentrations that are not representative of actual groundwater conditions in the vicinity of this well.
- Arsenic and lead are not CCR indicators for this CCR unit and are not present in GMFP pore and surface water above their corresponding GWPS.
- The GMFP liner was constructed with a dual composite liner system with a leak detection system, has undergone rigorous construction quality assurance and has indicated strong performance.

- Naturally occurring peat is present within the saturated zone in the immediate vicinity of P60 and G60L and may be causing naturally occurring lower pH in G60L and slightly elevated arsenic and lead concentrations in P60, particularly in a high-turbidity, unfiltered groundwater sample.

# FIELD BORING LOG

HANSON

**CLIENT:** Illinois Power Generating Company, LLC
**Site:** Duck Creek Power Station - Ash Landfill
**Location:** 17751 N. CILCO Rd., Canton, IL 61520
**Project:** 17E0057
**DATES:** **Start:** 3/15/2017
**Finish:** 3/15/2017
**WEATHER:** Sunny, cold (lo-30s)

**CONTRACTOR:** Ramsey Geotechnical Engineering, LLC
**Rig mfg/model:** Diedrich D-50
**Drilling Method:** 4¼" Hollow Stem Auger, split spoon sampler
**FIELD STAFF:** **Driller:** B. Williamson
**Helper:** D. Crump
**Eng/Geo:** R. Hasenyager

**BOREHOLE ID:** P60
**Well ID:** P60
**Surface Elev:** 620.12 ft. MSL
**Completion:** 34.62 ft. BGS
**Station:** 15,477.09N
992.24E

**TOPOGRAPHIC MAP INFORMATION:**
**Quadrangle:** Banner, IL
**Township:** Banner
**Section** 18, **Tier** 6N; **Range** 5E

**WATER LEVEL INFORMATION:**
▼ = 16.80 - During drilling
▼ = Dry - At completion

**Layer 1**

Type 1 - Vertical Percolation Layer (Cover Soil)
SiL - Silty Loam(Moderate)
Material Texture Number 23

| | | | |
|---|---|---|---|
| Thickness | = | 6 | inches |
| Porosity | = | 0.461 | vol/vol |
| Field Capacity | = | 0.36 | vol/vol |
| Wilting Point | = | 0.203 | vol/vol |
| Initial Soil Water Content | = | 0.4073 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 9.00E-06 | cm/sec |

**Layer 2**

Type 1 - Vertical Percolation Layer
SiL - Silty Loam(Moderate)
Material Texture Number 23

| | | | |
|---|---|---|---|
| Thickness | = | 18 | inches |
| Porosity | = | 0.461 | vol/vol |
| Field Capacity | = | 0.36 | vol/vol |
| Wilting Point | = | 0.203 | vol/vol |
| Initial Soil Water Content | = | 0.3829 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 9.00E-06 | cm/sec |

**Layer 3**

Type 2 - Lateral Drainage Layer
Drainage Net (0.5 cm)
Material Texture Number 20

| | | | |
|---|---|---|---|
| Thickness | = | 0.2 | inches |
| Porosity | = | 0.85 | vol/vol |
| Field Capacity | = | 0.01 | vol/vol |
| Wilting Point | = | 0.005 | vol/vol |
| Initial Soil Water Content | = | 0.0338 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 1.00E+01 | cm/sec |
| Slope | = | 4 | % |
| Drainage Length | = | 450 | ft |

**Layer 4**

Electronic Filing: Received, Clerk's Office 06/20/2024

Type 4 - Flexible Membrane Liner
LDPE Membrane
Material Texture Number 36

| | | | |
|---|---|---|---|
| Thickness | = | 0.04 | inches |
| Effective Sat. Hyd. Conductivity | = | 4.00E-13 | cm/sec |
| FML Pinhole Density | = | 1 | Holes/Acre |
| FML Installation Defects | = | 1 | Holes/Acre |
| FML Placement Quality | = | 3 | Good |

**Layer 5**

Type 1 - Vertical Percolation Layer
Gypsum waste material (Sandy Loam)
Material Texture Number 43

| | | | |
|---|---|---|---|
| Thickness | = | 240 | inches |
| Porosity | = | 0.437 | vol/vol |
| Field Capacity | = | 0.105 | vol/vol |
| Wilting Point | = | 0.047 | vol/vol |
| Initial Soil Water Content | = | 0.105 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 6.70E-04 | cm/sec |

---

Note: Initial moisture content of the layers and snow water were computed as nearly steady-state values by HELP.

**General Design and Evaporative Zone Data**

| | | | |
|---|---|---|---|
| SCS Runoff Curve Number | = | 90.1 | |
| Fraction of Area Allowing Runoff | = | 100 | % |
| Area projected on a horizontal plane | = | 15 | acres |
| Evaporative Zone Depth | = | 8 | inches |
| Initial Water in Evaporative Zone | = | 3.294 | inches |
| Upper Limit of Evaporative Storage | = | 3.688 | inches |
| Lower Limit of Evaporative Storage | = | 1.624 | inches |
| Initial Snow Water | = | 0 | inches |
| Initial Water in Layer Materials | = | 34.543 | inches |
| Total Initial Water | = | 34.543 | inches |
| Total Subsurface Inflow | = | 0 | inches/year |

---

Note: SCS Runoff Curve Number was calculated by HELP.

**Evapotranspiration and Weather Data**

| | | | |
|---|---|---|---|
| Station Latitude | = | 40.5 | Degrees |
| Maximum Leaf Area Index | = | 0 | |
| Start of Growing Season (Julian Date) | = | 120 | days |

Electronic Filing: Received, Clerk's Office 06/20/2024

| | | | |
|---|---|---|---|
| End of Growing Season (Julian Date) | = | 300 | days |
| Average Wind Speed | = | 9 | mph |
| Average 1st Quarter Relative Humidity | = | 72 | % |
| Average 2nd Quarter Relative Humidity | = | 67 | % |
| Average 3rd Quarter Relative Humidity | = | 74 | % |
| Average 4th Quarter Relative Humidity | = | 75 | % |

---

Note: Evapotranspiration data was obtained for ,

**Normal Mean Monthly Precipitation (inches)**

| Jan/Jul | Feb/Aug | Mar/Sep | Apr/Oct | May/Nov | Jun/Dec |
|---|---|---|---|---|---|
| 2.01298 | 1.895696 | 2.373253 | 3.597322 | 4.095479 | 4.395065 |
| 3.769391 | 3.145982 | 3.272523 | 2.912689 | 2.788342 | 2.489949 |

---

Note: Precipitation was simulated based on HELP V4 weather simulation for:
Lat/Long: 40.5/-89.98

**Normal Mean Monthly Temperature (Degrees Fahrenheit)**

# 1.0 INTRODUCTION

This Final Closure Plan has been prepared to address certain requirements of Illinois Administrative Code Title 35, Part 845, Standards for the Disposal of Coal Combustion Residuals (CCR) in Surface Impoundments (Part 845) for Illinois Power Resources Generating, LLC's (IPRG's) Gypsum Management Facility (GMF) Pond at the Duck Creek Power Plant near Canton, Illinois. Specifically, this document addresses requirements pertaining to the development of a Final Closure Plan for the GMF Pond. The GMF Pond has identification codes as follow:

- IPRG ID Number: CCR Unit ID 203
- IEPA ID Number: W0578010001-04
- IDNR Dam ID Number: IL50573

## 1.1 Selected Closure Method

*Part 845.720 (b)(3): The final closure plan must identify the proposed selected closure method, and must include the information required in subsection (a)(1) and the closure alternatives analysis specified in Section 845.710.*

IPRG evaluated closure with a final cover system (hereafter referred to as closure in place or CIP) (Section 845.750) and closure by removal of CCR (CBR) (Section 845.740). An analysis of these closure alternatives is summarized in Attachment 1. Based on the Closure Alternatives Analysis, CIP with a final cover system has been identified as the most appropriate closure method. In combination with the existing dual composite liner system beneath the GMF Pond, the final cover system will provide complete encapsulation of gypsum in the GMF Pond, physically isolating it from contact with surrounding soils, groundwater, surface water, and the atmosphere, and minimizing the potential for release of CCR or leachate. The final cover system has been designed to minimize the post-closure infiltration of liquids into the waste.

# 2.0 FINAL CLOSURE PLAN

## 2.1 Narrative Closure Description

*Part 845.720(a)(1)(A): A narrative description of how the CCR surface impoundment will be closed in accordance with this Part.*

Closure grades and details are shown in the Drawings included as Attachment 2. The CIP concept was developed to reduce the gypsum footprint at closure, while also recognizing the complications associated with handling and stacking gypsum materials. Free liquids will be eliminated by removing liquid wastes or solidifying the remaining wastes prior to final cover system installation. The final cover system will have slopes of 4% to accommodate settlement, with an earthen berm constructed at the south end of the closure footprint to enhance stability. The location of the berm, as shown in Drawing 4, has been selected to accommodate the estimated volume of gypsum to be contained within the closure footprint based on the grading plan presented. The general sequencing plan for CIP is as follows:

- Ponded water will be pumped out from the GMF Pond. Approximately 112 million gallons of water were contained in the GMF Pond as of a December 2020 survey by IngenAE, not including the pore water within the roughly 400,000 cubic yards (cy) of gypsum. Pumping out the ponded water will enable gravity drainage of the gypsum to begin. Water pumped out of the GMF Pond will be routed to the Recycle Pond immediately south of the GMF Pond and then to Duck Creek Reservoir, where it will be managed in accordance with the National Pollutant Discharge Elimination System (NPDES) permit for the site.

- The upper gypsum layer will be dewatered within the northern portion of the GMF Pond as necessary to allow mobile equipment traffic across the surface using a series of trenches and sumps. Free liquids in the gypsum will be eliminated by removing liquid wastes or solidifying gypsum remaining in place. Liquid wastes and water flowing to sumps will be managed in accordance with the NPDES permit for the site.
- Where required to allow construction of the new berm in an east–west orientation at the south end of the closure footprint, gypsum will be excavated and relocated. The upstream face of the berm will be lined with a composite liner system, which will tie into the existing liner system. The new liner system will include (from bottom to top):
  - 2-foot-thick compacted soil liner (permeability of 1 x $10^{-7}$ cm/sec or less)
  - 60-mil high-density polyethylene (HDPE) geomembrane
- Liquid wastes will be removed from the remaining gypsum south of the berm, and the gypsum will be excavated and deposited north of the berm (i.e., within the closure footprint) to achieve the approximate closure grades shown in Attachment 2. This may be accomplished by traditional earthwork methods and/or by washing the material towards sumps at the south end of the GMF Pond, where the material can be collected and liquid wastes can be removed.
- In portions of the GMF Pond that are outside of (i.e., generally south of) the closure footprint, the geosynthetic components of the existing liner system will be removed and disposed in the closure footprint or in the existing permitted on-site landfill. The existing permitted on-site landfill has sufficient capacity to accept the removed materials. The earthen components of the existing primary liner system and leachate collection and removal system will be removed and stockpiled on site. Up to 1 foot of subsoil may also be removed. The subsoils will be visually observed for signs of CCR staining. If subsoils with CCR staining are observed, they will be removed and disposed.
- Once all gypsum is contained within the closure footprint and appropriate grades for closure have been achieved (with grading fill used as necessary), a final cover system will be installed over the closure footprint in accordance with Part 845.750. The final cover system will consist of (from top to bottom) the following:
  - Based on the demonstration provided in Attachment 3, pursuant to Section 845.750(c)(2), a 2-foot-thick final protective layer consisting of locally available soils compacted to between 80% and 95% of the standard Proctor maximum dry density. The uppermost 6 inches of the final protective layer will be tracked in place with a density suitable for establishment of vegetation. Soils are expected to consist primarily of low-plasticity silt or clay based on a review of site geotechnical information.
  - Drainage geocomposite.
  - 40-mil linear low-density polyethylene (LLDPE) geomembrane.
- Surface water channels will be excavated as shown in Attachment 2 to route stormwater flows away from the closure footprint.

## 2.2 Decontamination of CCR Surface Impoundment

*Part 845.720(a)(1)(B): If closure of the CCR surface impoundment will be accomplished through removal of CCR from the CCR surface impoundment, a description of the procedures to remove the CCR and decontaminate the CCR surface impoundment in accordance with Section 845.740.*

After gypsum south of the berm has been relocated to within the closure footprint, the geosynthetic components of the existing liner system will be removed and disposed in the closure footprint or in the existing permitted on-site landfill. The earthen components of the existing primary liner system and leachate collection and removal system will be removed and stockpiled on site. Up to 1 foot of subsoil may also be removed. The subsoils will be visually observed for signs of CCR staining. If subsoils with CCR staining are observed, they will be removed and disposed.

## 2.3 Final Cover System Performance Standards

*Part 845.720(a)(1)(C): If closure of the CCR surface impoundment will be accomplished by leaving CCR in place, a description of the final cover system, designed in accordance with Section 845.750, and the methods and procedures to be used to install the final cover. The closure plan must also discuss how the final cover system will achieve the performance standards specified in Section 845.750.*

The final cover system is described in Section 2.1 and shown in the Drawings (Attachment 2). Documentation in support of the final cover system achieving the performance standards of Section 845.750 is provided in Section 4.7.

## 2.4 Maximum CCR Inventory Estimate

*Part 845.720(a)(1)(D): An estimate of the maximum inventory of CCR ever on-site over the active life of the CCR surface impoundment.*

Based on a comparison between the permitted top-of-liner-system grades and the bathymetric and topographic data obtained by IngenAE in December 2020, the estimated volume of gypsum in the GMF Pond is approximately 400,000 cy. No additional CCR will be placed in the GMF Pond before it is closed.

## 2.5 Largest Surface Area Estimate

*Part 845.720(a)(1)(E): An estimate of the largest area of the CCR surface impoundment ever requiring a final cover (see Section 845.750), at any time during the CCR surface impoundment's active life.*

In the Closure Plan developed for compliance with the United States Environmental Protection Agency's (USEPA's) CCR Rule (40 CFR 257, Subpart D), the largest area of the GMF Pond ever requiring a final cover system was estimated to be approximately 31 acres. This area represents the entire footprint of the GMF Pond. The area of the closure footprint requiring a final cover system under this Final Closure Plan is approximately 15 acres.

## 2.6 Closure Completion Schedule

*Part 845.720(a)(1)(E): A schedule for completing all activities necessary to satisfy the closure criteria in this Section, including an estimate of the year in which all closure activities for the CCR surface impoundment will be completed. The schedule should provide sufficient information to describe the sequential steps that will be taken to close the CCR surface impoundment, including identification of major milestones such as coordinating with and obtaining necessary approvals and permits from other agencies, the dewatering and stabilization phases of CCR surface impoundment closure, or installation of the final cover system, and the estimated timeframes to complete each step or phase of CCR surface impoundment closure. When preparing the preliminary written closure plan, if the owner or operator of a CCR surface impoundment estimates that the time required to complete closure will exceed the timeframes specified in Section 845.760(a), the preliminary written closure plan must include the site-specific information, factors and considerations that would support any time extension sought under Section 845.760(b).*

**Table 1: Closure Completion Milestone Schedule**

| Milestone | Timeframe (all preliminary estimates) |
|---|---|
| Final Closure Plan Submittal | February 2022 |
| Final Design and Bid Process | 6 to 12 months after Final Closure Plan approval |
| Agency Coordination and Permit Acquisition<br>▪ State permits for dewatering/water treatment (NPDES), land disturbance, and dam modification | |
| Dewater and Stabilize CCR<br>▪ Pump water from GMF Pond<br>▪ Dewater and stabilize gypsum | 12 to 18 months after issuance of necessary permits, design completion, and bid award |
| Consolidate Gypsum Footprint<br>▪ Construct berm<br>▪ Install new liner system on upstream face of berm<br>▪ Relocate gypsum south of berm to closure footprint | 3 to 6 months after dewatering and gypsum stabilization |
| Installation of Final Cover System<br>▪ Prepare top of gypsum for final cover system installation<br>▪ Install geomembrane<br>▪ Install geocomposite<br>▪ Place final protective layer | 3 to 6 months after gypsum relocation to closure footprint |
| Site Restoration<br>▪ Remove existing liner system south of berm<br>▪ Excavate drainage channel<br>▪ Seed and mulch final cover system and disturbed areas | 3 to 6 months after final cover system installation |
| Timeframe to Complete Closure | Prior to April 2026 |

## 3.0 AMENDMENT OF THE FINAL CLOSURE PLAN

*Part 845.720(b)(4): If a final written closure plan revision is necessary after closure activities have started for a CCR surface impoundment, the owner or operator must submit a request to modify the construction permit within 60 days following the triggering event.*

IPRG will submit a written request to modify the construction permit within 60 days of a triggering event.

# 4.0 CLOSURE WITH A FINAL COVER SYSTEM

## 4.1 Minimization of Post-closure Infiltration and Releases

*Part 845.750(a): The owner or operator of a CCR surface impoundment must ensure that, at a minimum, the CCR surface impoundment is closed in a manner that will:*

*1) Control, minimize or eliminate, to the maximum extent feasible, post-closure infiltration of liquids into the waste and releases of CCR, leachate, or contaminated run-off to the ground or surface waters or to the atmosphere.*

Post-closure infiltration into the GMF Pond will be minimized by the construction of a final cover system. The final cover system will consist of (from top to bottom) the following:

- Based on the demonstration provided in Attachment 3, pursuant to Section 845.750(c)(2), a 2-foot-thick final protective layer consisting of locally available soils compacted to between 80% and 95% of the standard Proctor maximum dry density. The uppermost 6 inches of the final protective layer will be tracked in place with a density suitable for establishment of vegetation. Soils are likely to consist primarily of low-plasticity silt or clay based on a review of site geotechnical information.
- Drainage geocomposite. This layer will provide lateral drainage to limit the potential for the final protective layer to become saturated.
- 40-mil LLDPE geomembrane.

The use of HDPE geomembrane was considered, but LLDPE geomembrane was selected because it can be installed more easily in a wider range of cold-temperature conditions. This final cover system is compliant with the Part 845 requirements, as described in Section 4.7, and will minimize the post-closure infiltration of liquids into the waste. After closure, the gypsum stored in the facility will be completely encapsulated by the final cover and liner systems, physically isolating it from contact with surrounding soils, groundwater, surface water, and the atmosphere, and minimizing the potential for release of CCR or leachate. This is supported by groundwater modeling, as presented in Appendix G to the Part 845 Construction Permit Application for the GMF Pond.

## 4.2 Preclusion of Future Impoundment

*Part 845.750(a): The owner or operator of a CCR surface impoundment must ensure that, at a minimum, the CCR surface impoundment is closed in a manner that will:*

*2) Preclude the probability of future impoundment of water, sediment, or slurry.*

The final cover system will be crowned with 4% slopes to direct surface water away from the facility. Beyond the final cover system, channels will direct surface water away from the GMF Pond to existing site drainages.

## 4.3 Provisions for Preventing Instability, Sloughing and Movement

*Part 845.750(a): The owner or operator of a CCR surface impoundment must ensure that, at a minimum, the CCR surface impoundment is closed in a manner that will:*

*3) Include measures that provide for major slope stability to prevent the sloughing or movement of the final cover system during the closure and post-closure care period.*

An assessment of the GMF Pond structural stability was completed as part of compliance with USEPA's CCR Rule (AECOM 2016). This assessment concluded that the GMF Pond meets stability factor of safety requirements and does not pose a significant risk of instability.

An earthen berm is provided in the closure design to enhance stability along the southern end of the closure footprint. Slope stability calculations are included in Attachment 4 to demonstrate that factors of safety for static and seismic stability after closure are acceptable. The slope stability calculations also considered veneer stability to verify that the final cover system will not be susceptible to instability, sloughing, or movement during the closure and post-closure care period.

## 4.4 Minimize the Need for Future Maintenance

*Part 845.750(a): The owner or operator of a CCR surface impoundment must ensure that, at a minimum, the CCR surface impoundment is closed in a manner that will:*

*4) Minimize the need for further maintenance of the CCR surface impoundment*

The 4% design closure slopes are sufficient to adequately shed water from the facility but are flat enough to limit erosion of the final protective layer. Minor maintenance of the final cover system (potentially including filling of low areas, reseeding, fertilizing, etcetera) will likely be necessary for several years after completion of final cover system construction, as described in the Post-closure Care Plan (Appendix J to the Part 845 Construction Permit Application for the GMF Pond). The need for long-term future maintenance is expected to be minimal after installation of the final cover system has been completed and vegetation has been established.

The channels designed to convey surface water runoff away from the closed facility have been sized to accommodate the 25-year, 24-hour storm event. The design calculations are provided in Attachment 5.

## 4.5 Be Completed in the Shortest Amount of Time

*Part 845.750(a): The owner or operator of a CCR surface impoundment must ensure that, at a minimum, the CCR surface impoundment is closed in a manner that will:*

*5) Be completed in the shortest amount of time consistent with recognized and generally accepted engineering practices.*

The CIP method will require significantly less material handling compared with a CBR approach. Both approaches require the removal of liquid wastes, but the CIP method will require relocation of less than 25% of the gypsum present in the GMF Pond. This reduced material handling volume means that the CIP construction can be completed in approximately 24 to 30 months, compared with 36 to 48 months, or possibly more, for CBR.

## 4.6 Drainage and Stabilization

*Part 845.750(b): Drainage and Stabilization of CCR Surface Impoundments. The owner or operator of a CCR surface impoundment or any lateral expansion of a CCR surface impoundment must meet the requirements of this subsection (b) before installing the final cover system required by subsection (c).*

*1) Free liquids must be eliminated by removing liquid wastes or solidifying the remaining wastes and waste residues.*

*2) Remaining wastes must be stabilized sufficiently to support the final cover system.*

Approximately 112 million gallons of water will be pumped from the GMF Pond as the initial step for facility closure. After removal of the ponded water, the gypsum will still be unsuitable for supporting heavy construction traffic over much of the footprint. Careful planning will be required to safely work on the wet gypsum within the GMF Pond. The planned gypsum removal and relocation will rely on a series of trenches or other engineering measures to remove liquid wastes or solidify the remaining wastes. Trenches will shorten drainage routes to facilitate gravity removal of liquid wastes in the gypsum (i.e., liquid that is readily separable from the gypsum under ambient temperature and pressure) in the vicinity of each trench and direct the liquid wastes to sumps. Other engineering measures may be considered to facilitate removal of liquid wastes. Sumps will be used to collect liquid wastes, which will be managed in accordance with the NPDES permit for the site. Using the process described or other engineering measures for removal of liquid wastes or solidification of the remaining wastes, the gypsum remaining in place will be stabilized sufficiently to support the final cover system.

## 4.7 Final Cover System

*Part 845.750(c): Final Cover System. If a CCR surface impoundment is closed by leaving CCR in place, the owner or operator must install a final cover system that is designed to minimize infiltration and erosion, and, at a minimum, meets the requirements of this subsection (c). The final cover system must consist of a low permeability layer and a final protective layer. The design of the final cover system must be included in the preliminary and final written closure plans required by Section 845.720 and the construction permit application for closure submitted to the Agency.*

### 4.7.1 Low-Permeability Layer

*Part 845.750(c)(1) Standards for the Low Permeability Layer. The low permeability layer must have a permeability less than or equal to the permeability of any bottom liner system or natural subsoils present, or a hydraulic conductivity no greater than 1 x $10^{-7}$ cm/sec, whichever is less. The low permeability layer must be constructed in accordance with the standards in either subsection (c)(1)(A) or (c)(1)(B), unless the owner or operator demonstrates that another low permeability layer construction technique or material provides equivalent or superior performance to the requirements of either subsection (c)(1)(A) or (c)(1)(B) and is approved by the Agency.*

*A) A compacted earth layer constructed in accordance with the following standards:*

*i) The minimum allowable thickness must be 0.91 meter (three feet); and*

*ii) The layer must be compacted to achieve a hydraulic conductivity of 1 x $10^{-7}$ cm/sec or less and minimize void spaces.*

*B) A geomembrane constructed in accordance with the following standards:*

*i) The geosynthetic membrane must have a minimum thickness of 40 mil (0.04 inches) and, in terms of hydraulic flux, must be equivalent or superior to a three-foot layer of soil with a hydraulic conductivity of 1 x $10^{-7}$ cm/sec;*

*ii) The geomembrane must have strength to withstand the normal stresses imposed by the waste stabilization process; and*

*iii) The geomembrane must be placed over a prepared base free from sharp objects and other materials that may cause damage.*

The final cover system will include a 40-mil LLDPE geomembrane placed on a prepared subgrade of gypsum (see the Drawings in Attachment 2). The prepared subgrade will be free of sharp objects prior to geomembrane installation. The geomembrane material will conform with the specifications of Geosynthetic Institute GRI-GM17 "Test Methods, Test Properties and Testing Frequency for Linear Low Density Polyethylene (LLDPE) Smooth and Textured Geomembranes" and will be installed per GRI-GM19a "Seam Strength and Related Properties of Thermally Bonded Homogeneous Polyolefin Geomembranes/Barriers" to help ensure that the material itself and the seams between panels will withstand the expected normal and tensile stress conditions. Furthermore, a 40-mil LLDPE geomembrane manufactured and installed to these specifications is widely accepted to be equivalent or superior to a 3-foot-thick layer of soil with a hydraulic conductivity of 1 x $10^{-7}$ cm/sec.

### 4.7.2 Final Protective Layer

*Part 845.750(c)(2): Standards for the Final Protective Layer. The final protective layer must meet the following requirements, unless the owner or operator demonstrates that another final protective layer construction technique or material provides equivalent or superior performance to the requirements of this subsection (c)(2) and is approved by the Agency.*

*A) Cover the entire low permeability layer;*

*B) Be at least three feet thick, be sufficient to protect the low permeability layer from freezing, and minimize root penetration of the low permeability layer;*

*C) Consist of soil material capable of supporting vegetation;*

*D) Be placed as soon as possible after placement of the low permeability layer; and*

*E) Be covered with vegetation to minimize wind and water erosion.*

Based on the demonstration provided in Attachment 3, pursuant to Section 845.750(c)(2), a 2-foot-thick final protective layer will be installed for the final cover system, immediately overlaying the drainage geocomposite and covering the entire low-permeability layer (see the Drawings in Attachment 2). The final protective layer will comprise locally available soils compacted to between 80% and 95% of the standard Proctor maximum dry density. The uppermost 6 inches of the final protective layer will be tracked in place to a density suitable for establishment of vegetation. This soil is expected to consist primarily of low-plasticity silt or clay based on a review of site geotechnical information. This soil is capable of supporting vegetation, will be placed as soon as possible after placement of the low-permeability layer, and will be covered with vegetation to limit wind and water erosion.

## 4.8 Final Cover System Settling

*Part 845.750(c)(3): The disruption of the integrity of the final cover system must be minimized through a design that accommodates settling and subsidence.*

The closure slopes are designed at 4% to accommodate settlement while still maintaining positive drainage off the facility. Additional discussion on this subject is provided in Section 4.4.

## 4.9 Use of CCR in Closure

*Part 845.750(d): This subsection specifies the allowable uses of CCR in the closure of CCR surface impoundments closing under Section 845.700. Notwithstanding the prohibition on further placement in Section*

*845.700, CCR may be placed in these surface impoundments, but only for purposes of grading and contouring in the design and construction of the final cover system, if:*

*1) The CCR placed was generated at the facility and is located at the facility at the time closure was initiated;*

*2) CCR is placed entirely above the elevation of CCR in the surface impoundment, following dewatering and stabilization (see subsection (b));*

*3) The CCR is placed entirely within the perimeter berms of the CCR surface impoundment; and*

*4) The final cover system is constructed with either:*

*A) A slope not steeper than 5% grade after allowance for settlement; or*

*B) At a steeper grade, if the Agency determines that the steeper slope is necessary, based on conditions at the site, to facilitate run-off and minimize erosion, and that side slopes are evaluated for erosion potential based on a stability analysis to evaluate possible erosion potential. The stability analysis, at a minimum, must evaluate the site geology; characterize soil shear strength; construct a slope stability model; establish groundwater and seepage conditions, if any; select loading conditions; locate critical failure surface; and iterate until minimum factor of safety is achieved.*

The GMF Pond is not closing under Section 845.700. Nevertheless, closure of the GMF Pond is anticipated to comply with the requirements of Subsection 845.750(d). Following dewatering of the GMF Pond, gypsum currently located within the facility (which was generated at Duck Creek Power Plant) will be relocated to within the closure footprint. A berm will be constructed in an east–west orientation at the south end of the closure footprint. The upstream face of the berm will be lined with a liner system compliant with Section 845.400, which will tie into the existing composite liner system. Gypsum currently located south of this berm (approximately 85,000 cy) will be removed and relocated to within the closure footprint, above the elevation of existing gypsum and completely within the perimeter berms, to achieve final grades. The final cover system has been designed with 4% slopes.

## 5.0 ADDITIONAL INFORMATION

According to the Hydrogeologic Site Characterization Report by Ramboll (Appendix D to the construction permit application), the base of the closed GMF Pond is within a geologic formation with the following characteristics in the vicinity of the GMF Pond:

- geometric mean hydraulic conductivity of 3.6 x $10^{-4}$ centimeters per second
- groundwater flow generally in a southeasterly direction
- average groundwater flow velocity of 2.4 x $10^{-1}$ feet per day

The base and sides of the GMF Pond have a robust dual composite liner system consisting of the following components (from top to bottom):

- primary composite liner system
  - 60-mil textured HDPE geomembrane
  - 1-foot-thick (minimum) cushion soil layer

- leak detection layer
  - geotextile separator
  - 1-foot-thick granular drainage layer
  - geotextile cushion
- secondary composite liner system
  - 60-mil textured HDPE geomembrane
  - reinforced geosynthetic clay liner
  - 3-foot-thick compacted clay layer

The liner system was subjected to a rigorous construction quality assurance program during installation. The leak detection layer has not detected infiltration since initial facility construction, either from the gypsum or from outside the facility (i.e., lateral infiltration). The liner system prevents lateral infiltration of groundwater into the gypsum.

## 6.0 CERTIFICATION

*Part 845.750(c)(4): The owner or operator of the CCR surface impoundment must obtain and submit with its construction permit application for closure a written certification from a qualified professional engineer that the design of the final cover system meets the requirements of this Section.*

The undersigned qualified professional engineer registered in Illinois certifies that the design of the final cover system meets the requirements of Section 845.750.

Electronic Filing: Received, Clerk's Office 06/20/2024

# Summary of Findings

Title 35, Part 845, of the Illinois Administrative Code (IAC; IEPA, 2021a) requires the development of a Closure Alternatives Analysis (CAA) prior to undertaking closure activities at certain surface impoundments containing coal combustion residuals (CCRs) in the State of Illinois. Pursuant to requirements under IAC Section 845.710, this report presents a CAA for the Gypsum Management Facility (GMF) and the Bottom Ash Basin (BAB) located on the Illinois Power Resources Generating, LLC (IPRG) Duck Creek Power Plant property near Canton, Illinois. The GMF contains synthetic gypsum generated historically by the plant's flue gas desulfurization system. No significant volume of CCR remains in the BAB. CCR that was historically contained within the BAB has already been excavated from the impoundment.

The goal of a CAA is to holistically evaluate potential closure scenarios with respect to a wide range of factors, including the efficiency, reliability, and ease of implementation of the closure scenario; its potential positive and negative short- and long-term impacts on human health and the environment; and its ability to address concerns raised by residents (IAC Part 845; IEPA, 2021a). For the GMF, Gradient evaluated three closure scenarios: Closure-in-Place (CIP), Closure-by-Removal with On-Site CCR Disposal (CBR-Onsite), and Closure-by-Removal with Off-Site CCR Disposal (CBR-Offsite). For the BAB, Gradient evaluated two closure scenarios: CBR-Onsite and CBR-Offsite. CIP was not evaluated for the BAB because there is no significant CCR remaining in the unit. The CIP scenario for the GMF entails consolidating all of the gypsum in the northern portion of the impoundment, then capping the impoundment with a new cover system. The CBR-Onsite scenario entails excavating the CCR and liner system materials from the GMF and/or the BAB and transporting these materials to an on-Site landfill for disposal. The CBR-Offsite scenario entails excavating the CCR and liner system materials from the GMF and/or the BAB and transporting these materials to an off-Site landfill. IPRG will also continue to evaluate potential opportunities for beneficial re-use of CCR excavated from the GMF as an alternative to disposal.

Table S.1 summarizes the expected impacts of the CIP, CBR-Onsite, and CBR-Offsite closure scenarios at the GMF with regard to each of the factors specified under IAC Section 845.710 (IEPA, 2021a). Table S.2 summarizes the expected impacts of the CBR-Onsite and CBR-Offsite closure scenarios at the BAB with regard to each of the factors specified under IAC Section 845.710 (IEPA, 2021a). Based on Table S.1 and the additional details provided in Section 2 of this report, CIP has been identified as the most appropriate closure scenario for the GMF. Key benefits of CIP at the GMF include the more rapid re-development of the Site for use in utility-scale solar generation and reduced impacts on workers, community members, and the environment during construction (*e.g.*, fewer construction-related accidents, lower energy demands, less air pollution and greenhouse gas [GHG] emissions, and less traffic). Based on Table S.2 and the additional details provided in Section 3 of this report, CBR-Onsite has been identified as the most appropriate closure scenario for the BAB. Key benefits of CBR-Onsite at the BAB are that no off-Site hauling is required and, consequently, that this scenario will result in reduced impacts to the community (due to, *e.g.*, accidents, traffic, noise, and air pollution) compared to CBR-Offsite.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table S.1 Comparison of Proposed Closure Scenarios for the GMF**

| Evaluation Factor (Report Section; Part 845 Section) | GMF Closure Scenario | | |
|---|---|---|---|
| | CIP | CBR-Onsite | CBR-Offsite |
| Closure Alternative Descriptions (Section 2.1; IAC Section 845.710(c)) | The CIP scenario would entail consolidating all of the gypsum in the GMF in the northern portion of the impoundment, then capping the impoundment with a new cover system consisting of, from bottom to top, a geomembrane layer, a geocomposite layer, and 24 inches of protective cover soil capable of supporting vegetative growth. | For CBR-Onsite, CCR and existing liner system materials would be excavated from the GMF and sent *via* truck to the on-Site landfill for disposal. The gypsum, the primary composite liner system, the leachate collection and removal system, the geosynthetic components of the secondary composite liner system, and the underlying 3-foot compacted clay liner would be hauled to the on-Site landfill for disposal. The on-Site landfill does not have sufficient capacity for these materials and would require expansion. This scenario meets the requirements of IAC Section 845.710(c)(2) (IEPA, 2021a), which requires an assessment be included in the CAA of whether the Site has an on-Site landfill with available capacity or whether an on-Site landfill can be constructed. | For CBR-Offsite, CCR and existing liner system materials would be excavated from the GMF and sent *via* truck to an off-Site landfill for disposal. The gypsum, the primary composite liner system, the leachate collection and removal system, the geosynthetic components of the secondary composite liner system, and the underlying 3-foot compacted clay liner would be hauled to the off-Site landfill for disposal. Expansion of the off-Site landfill may be necessary in order to accept all of the CCR and liner materials from the GMF. |
| Type and Degree of Long-Term Management, Including Monitoring, Operation, and Maintenance (Section 2.2.3; IAC Section 845.710(b)(1)(C)) | Monitoring would be performed at the GMF for at least 30 years post-closure, or until GWPSs have been achieved, whichever is longer. The post-closure care plan under the CIP scenario additionally includes periodic inspections and mowing and maintenance of the final cover system for the GMF. | Monitoring would be performed at the GMF for at least 3 years post-closure, or until GWPSs have been achieved, whichever is longer. | Monitoring would be performed at the GMF for at least 3 years post-closure, or until GWPSs have been achieved, whichever is longer. |
| Magnitude of Reduction of Existing Risks (Section 2.2.1; IAC Sections 845.710(b)(1)(A) and 845.710(b)(1)(F)) | There are no current risks to any human or ecological receptors associated with the GMF. Because groundwater concentrations are expected to remain stable and/or decline under all closure scenarios, no risks to human or ecological receptors are expected post-closure. | There are no current risks to any human or ecological receptors associated with the GMF. Because groundwater concentrations are expected to remain stable and/or decline under all closure scenarios, no risks to human or ecological receptors are expected post-closure. | There are no current risks to any human or ecological receptors associated with the GMF. Because groundwater concentrations are expected to remain stable and/or decline under all closure scenarios, no risks to human or ecological receptors are expected post-closure. |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Evaluation Factor (Report Section; Part 845 Section) | GMF Closure Scenario | | |
|---|---|---|---|
| | CIP | CBR-Onsite | CBR-Offsite |
| Likelihood of Future Releases of CCR (Section 2.2.2; IAC Sections 845.710(b)(1)(B) and 845.710(b)(1)(F)) | During closure, there would be minimal risk of dike failure occurring (due to, *e.g.*, flooding or seismic activity) and minimal risk of dike overtopping during flood conditions. Post-closure, the risks of overtopping and dike failure would be even smaller than they are currently, due to the installation of a protective soil cover and new stormwater control structures. Dikes, final cover, and stormwater control features have been designed to withstand earthquakes and storm events. | During closure, there would be minimal risk of dike failure occurring (due to, *e.g.*, flooding or seismic activity) and minimal risk of dike overtopping during flood conditions. Following excavation, there would be no risk of CCR releases due to dike failure. | During closure, there would be minimal risk of dike failure occurring (due to, *e.g.*, flooding or seismic activity) and minimal risk of dike overtopping during flood conditions. Following excavation, there would be no risk of CCR releases due to dike failure. |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Evaluation Factor (Report Section; Part 845 Section) | GMF Closure Scenario | | |
|---|---|---|---|
| | CIP | CBR-Onsite | CBR-Offsite |
| Worker Risks (Section 2.2.4.1; IAC Sections 845.710(b)(1)(D) and 845.710(b)(1)(F)) | An estimated 0.17 injuries and 0.0011 fatalities would be expected to occur to workers due to major on-Site construction activities under this scenario. Overall, risks to workers would likely be highest under the CBR-Offsite scenario and lowest under the CIP scenario.<br><br>Simultaneous with closure activities, the Site will be re-developed for use in utility-scale solar generation. The simultaneous pursuit of two large construction projects may lead to significant traffic congestion on Site access roads, resulting in greater overall risks to workers than would result from either project alone. The CIP scenario is expected to result in less traffic congestion – and, hence, a smaller increase in risks to workers – than the two CBR scenarios. | An estimated 0.30 injuries and 0.0020 fatalities would be expected to occur to workers due to major on-Site construction activities under this scenario. Overall, risks to workers would likely be highest under the CBR-Offsite scenario and lowest under the CIP scenario.<br><br>Simultaneous with closure activities, the Site will be re-developed for use in utility-scale solar generation. The simultaneous pursuit of two large construction projects may lead to significant traffic congestion on Site access roads, resulting in greater overall risks to workers than would result from either project alone. The two CBR scenarios are expected to result in more traffic congestion – and, hence, a greater increase in risks to workers – than the CIP scenario. | An estimated 0.41 injuries and 0.0027 fatalities would be expected to occur to workers due to major on-Site construction activities under this scenario. An additional estimated 0.42 injuries and 0.0096 fatalities would be expected to occur to workers due to off-Site hauling under this scenario. In total, a minimum of 0.84 worker injuries and 0.012 worker fatalities would be expected under this scenario. Overall, risks to workers would likely be highest under the CBR-Offsite scenario and lowest under the CIP scenario.<br><br>Simultaneous with closure activities, the Site will be re-developed for use in utility-scale solar generation. | | **CIP** | **CBR-Onsite** | **CBR-Offsite** |
| Ease or Difficulty of Implementing the Alternative (Section 2.4; IAC Section 845.710(b)(3))<br>*Degree of Difficulty Associated with Construction* | CIP is a reliable and standard method for closing impoundments. However, dewatering and relocating saturated gypsum as part of closure activities at the GMF may be moderately challenging. Careful planning would be required to work safely on the wet gypsum within the GMF. | Relative to CIP, CBR-Onsite and CBR-Offsite pose additional implementation difficulties due to higher earthwork volumes, higher dewatering volumes, and longer construction schedules, and the need to remove and dispose of the existing bottom liner geomembrane.<br><br>The construction schedule for excavation may be negatively impacted under the CBR-Onsite scenario, because the on-Site landfill will need to be expanded in order to receive all of the materials excavated from the GMF. | Relative to CIP, CBR-Onsite and CBR-Offsite pose additional implementation difficulties due to higher earthwork volumes, higher dewatering volumes, and longer construction schedules, and the need to remove and dispose of the existing bottom liner geomembrane.<br><br>Hauling would be more difficult to implement under the CBR-Offsite scenario than under the CBR-Onsite scenario, due to the need to use public roadways for hauling. Because the CCR would be hauled on public roads (*i.e.*, intrastate travel), it would also need to be dewatered to a greater extent than would be necessary under the CBR-Onsite scenario. Off-Site landfilling would additionally require the development of a disposal plan and could raise issues related to the co-disposal of CCR and other non-hazardous wastes.<br><br>The construction schedule for excavation may be negatively impacted under the CBR-Offsite scenario if, during the course of closure, it is determined that the off-Site landfill must be expanded in order to receive all of the materials excavated from the GMF. |
| *Expected Operational Reliability* | Operational reliability would be expected under all closure scenarios. | Operational reliability would be expected under all closure scenarios. | Operational reliability would be expected under all closure scenarios. |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Evaluation Factor (Report Section; Part 845 Section) | GMF Closure Scenario | | |
|---|---|---|---|
| | **CIP** | **CBR-Onsite** | **CBR-Offsite** |
| *Need for Permits and Approvals* | Permits required under all closure scenarios include: a modification to the existing NPDES permit; a construction permit from the IDNR Dam Safety Program to allow the embankment and spillways of the impoundment to be modified; a construction stormwater permit through IEPA; and a joint water pollution control construction and operating permit. | Permits required under all closure scenarios include: a modification to the existing NPDES permit; a construction permit from the IDNR Dam Safety Program to allow the embankment and spillways of the impoundment to be modified; a construction stormwater permit through IEPA; and a joint water pollution control construction and operating permit. The existing on-Site landfill will also require expansion under the CBR-Onsite scenario; however, the on-Site landfill has already been permitted for an expansion of an additional 2 acres of waste disposal area. | Permits required under all closure scenarios include: a modification to the existing NPDES permit; a construction permit from the IDNR Dam Safety Program to allow the embankment and spillways of the impoundment to be modified; a construction stormwater permit through IEPA; and a joint water pollution control construction and operating permit. Under the CBR-Offsite scenario, additional permitting may be required for transport of the CCR and to expand the off-Site landfill. |
| *Availability of Equipment and Specialists* | Global supply chains have been disrupted due to the COVID-19 pandemic, resulting in shortages in the availability of construction equipment and parts. There may be some shortages in construction equipment or delays in the construction schedule under all scenarios, if supply chain resilience does not improve by the time of construction. A national shortage of truck drivers has also developed during the COVID-19 pandemic. Due to higher earthwork volumes and a longer construction schedule under the two CBR scenarios than under the CIP scenario, shortages in construction equipment may cause greater challenges under the CBR scenarios than under the CIP scenario. The current shortage of truck drivers may be particularly impactful under the CBR-Offsite scenario, due to the large volume of CCR and liner materials to be hauled from the Site. | Global supply chains have been disrupted due to the COVID-19 pandemic, resulting in shortages in the availability of construction equipment and parts. | Evaluation Factor (Report Section; Part 845 Section) | GMF Closure Scenario | | |
|---|---|---|---|
| | **CIP** | **CBR-Onsite** | **CBR-Offsite** |
| *Available Capacity and Location of Treatment, Storage, and Disposal Services* | Under the CIP scenario, the gypsum currently within the GMF will be consolidated and stored within the existing footprint of the impoundment. The GMF will be unwatered at the start of construction *via* pumping. Pumped water will be managed in accordance with the facility's NPDES permit. | The on-Site landfill does not have sufficient capacity to receive all of the CCR and liner materials that are currently slated for landfilling under the CBR-Onsite scenario. Expansion of the on-Site landfill would thus be necessary. The on-Site landfill is already permitted for a potential expansion, which would create an additional 2 acres of waste disposal area. The landfill expansion could be completed in a single construction season during the removal of ponded water at the GMF. | The Peoria City-County Landfill in Brimfield, Illinois, has sufficient capacity to receive all of the CCR and liner materials from the GMF. However, due to the limited space remaining in this landfill and the short time frame over which CCR would be received at the landfill, vertical and/or lateral expansions may become necessary. Additionally, the landfill operators may need to develop a disposal plan to account for the increased volume of material that will be received and the unique CCR waste characteristics. If expansion of the Peoria City-County Landfill is impractical or infeasible, then an alternative landfill located farther from the Site would need to be identified. A likely alternative to the Peoria City-County Landfill is the Envirofil of IL Landfill in Macomb, Illinois. |
| Impact of Alternative on Waters of the State (Section 2.5; IAC Section 845.710(d)(4)) | No current or future exceedances of any screening benchmarks for surface water would be anticipated. | No current or future exceedances of any screening benchmarks for surface water would be anticipated. | No current or future exceedances of any screening benchmarks for surface water would be anticipated. |

**Table S.2 Comparison of Proposed Closure Scenarios for the BAB**

| Evaluation Factor (Report Section; Part 845 Section) | BAB Closure Scenario | |
|---|---|---|
| | CBR-Onsite | CBR-Offsite |
| Closure Alternative Descriptions (Section 3.1; IAC Section 845.710(c)) | For CBR-Onsite, the concrete, compacted clay, and geomembrane components of the existing liner system, and any remaining CCR, will be excavated from the BAB and sent *via* truck to the on-Site landfill for disposal. This scenario meets the requirements of IAC Section 845.710(c)(2) (IEPA, 2021a), which requires an assessment be included in the CAA of whether the Site has an on-Site landfill with available capacity or whether an on-Site landfill can be constructed. | For CBR-Offsite, the concrete, compacted clay, and geomembrane components of the existing liner system, and any remaining CCR, will be excavated from the BAB and sent *via* truck to an off-Site landfill for disposal. |
| Type and Degree of Long-Term Management, Including Monitoring, Operation, and Maintenance (Section 3.2.3; IAC Section 845.710(b)(1)(C)) | Monitoring would be performed at the BAB for at least 3 years post-closure, or until GWPSs have been achieved. | Monitoring would be performed at the BAB for at least 3 years post-closure, or until GWPSs have been achieved. |
| Magnitude of Reduction of Existing Risks (Section 3.2.1; IAC Sections 845.710(b)(1)(A) and 845.710(b)(1)(F)) | There are no current risks to any human or ecological receptors associated with the BAB. Because groundwater concentrations are expected to remain stable and/or decline under all closure scenarios, no risks to human or ecological receptors are expected post-closure. | There are no current risks to any human or ecological receptors associated with the BAB. Because groundwater concentrations are expected to remain stable and/or decline under all closure scenarios, no risks to human or ecological receptors are expected post-closure. |
| Likelihood of Future Releases of CCR (Section 3.2.2; IAC Sections 845.710(b)(1)(B) and 845.710(b)(1)(F)) | There is no current or future risk of CCR releases occurring at the BAB under either closure scenario. No significant volume of CCR currently remains in the BAB. | There is no current or future risk of CCR releases occurring at the BAB under either closure scenario. No significant volume of CCR currently remains in the BAB. |
| Worker Risks (Section 3.2.4.1; IAC Sections 845.710(b)(1)(D) and 845.710(b)(1)(F)) | An estimated 0.056 injuries and 0.00036 fatalities would be expected to occur to workers due to major on-Site construction activities under this scenario. Overall, risks to workers would likely be of similar magnitude for both closure scenarios. | An estimated 0.050 injuries and 0.00033 fatalities would be expected to occur to workers due to major on-Site construction activities under this scenario. An additional estimated 0.0041 injuries and 0.000093 fatalities would be expected to occur to workers due to off-Site hauling. In total, a minimum of 0.054 worker injuries and 0.00042 worker fatalities would be expected under this scenario. Overall, risks to workers would likely be of similar magnitude for both closure scenarios. |

| Community Risks (Section 3.2.4.2; IAC Sections 845.710(b)(1)(D) and 845.710(b)(1)(F)) *Off-Site Impacts on Nearby Residents and Environmental Justice (EJ) Communities* | Off-Site impacts on nearby residents under this scenario (including accidents, traffic, noise, and air pollution) will be smaller than off-Site impacts under the CBR-Offsite scenario, because no off-Site hauling is required under this scenario.<br><br>The on-Site landfill and the borrow site are both located within the one-mile buffer zone of the nearest EJ community (near Canton). Both closure scenarios are therefore associated with potential negative impacts on this EJ community. | Off-Site impacts on nearby residents under this scenario (including accidents, traffic, noise, and air pollution) will be larger than off-Site impacts under the CBR-Onsite scenario, because off-Site hauling is required under this scenario. In total, an estimated 0.012 injuries and 0.00043 fatalities are expected to occur among community members due to off-Site hauling under this scenario. A haul truck is likely to pass a location near the Site every 49 minutes on average during working hours for the duration of excavation activities under this scenario.<br><br>The on-Site landfill and the borrow site are both located within the one-mile buffer zone of the nearest EJ community (near Canton). This EJ community is also located along the primary haul routes from the Site to the off-Site landfill. Both closure scenarios are therefore associated with potential negative impacts on this EJ community. |
| *Impacts on Scenic, Historical, and Recreational Value* | There are no notable scenic, historical, or recreational areas located in the immediate vicinity of the BAB, the borrow soil location, or the on-Site landfill. Construction activities at the Site are therefore not expected to have direct negative impacts on any scenic, historical, or recreational areas under either closure scenario. | There are no notable scenic, historical, or recreational areas located in the immediate vicinity of the BAB, the borrow soil location, or the on-Site landfill. Construction activities at the Site are therefore not expected to have direct negative impacts on any scenic, historical, or recreational areas under either closure scenario. |
| Environmental Risks (Section 3.2.4.3; IAC Sections 845.710(b)(1)(D) and 845.710(b)(1)(F)) *Impacts on Greenhouse Gas Emissions and Energy Consumption* | Total energy demands and GHG emissions would likely be similar under the CBR-Onsite and CBR-Offsite scenarios, because both scenarios would have the same expected duration of construction activities and required earthwork volumes. | Total energy demands and GHG emissions would likely be similar under the CBR-Onsite and CBR-Offsite scenarios, because both scenarios would have the same expected duration of construction activities and required earthwork volumes. |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Evaluation Factor (Report Section; Part 845 Section) | BAB Closure Scenario | |
|---|---|---|
| | **CBR-Onsite** | **CBR-Offsite** |
| *Impacts on Natural Resources and Habitat* | Construction may have a negative short-term impact on terrestrial species in the vicinity of the BAB and the on-Site borrow soil location and may also cause long-term shifts in the habitat atop these locations. Both BAB closure scenarios are expected to have similar short- and long-term impacts on natural resources and habitat. | Construction may have a negative short-term impact on terrestrial species in the vicinity of the BAB and the on-Site borrow soil location and may also cause long-term shifts in the habitat atop these locations. Both BAB closure scenarios are expected to have similar short- and long-term impacts on natural resources and habitat. |
| Time Until Groundwater Protection Standards Are Achieved (Section 3.2.5; IAC Sections 845.710(b)(1)(E) and 845.710(d)(2 and 3)) | There are no exceedances of potentially applicable groundwater standards attributable to the BAB. | There are no exceedances of potentially applicable groundwater standards attributable to the BAB. |
| Long-Term Reliability of the Engineering and Institutional Controls (Section 3.2.7; IAC Section 845.710(b)(1)(G)) | CBR-Onsite would be expected to be a reliable closure alternative over the long term. | CBR-Offsite would be expected to be a reliable closure alternative over the long term. |
| Potential Need for Future Corrective Action (Section 3.2.8; IAC Section 845.710(b)(1)(H)) | Corrective action is not expected to be required at this Site. | Corrective action is not expected to be required at this Site. |
| Effectiveness of the Alternative in Controlling Future Releases (Section 3.3; IAC Section 845.710(b)(2)(A and B)) | There are no current or future risks to any human or ecological receptors associated with the BAB. There is no current or future risk of sudden CCR releases occurring at the BAB under either closure scenario. There is no significant volume of CCR remaining in the BAB. | There are no current or future risks to any human or ecological receptors associated with the BAB. There is no current or future risk of sudden CCR releases occurring at the BAB under either closure scenario. There is no significant volume of CCR remaining in the BAB. |
| Ease or Difficulty of Implementing the Alternative (Section 3.4; IAC Section 845.710(b)(3)) | Hauling would be easier to implement under the CBR-Onsite scenario than under the CBR-Offsite scenario, since it would not require the use of public roadways. | Hauling would be more difficult to implement under the CBR-Offsite scenario than under the CBR-Onsite scenario, since it would require the use of public roadways. |
| *Degree of Difficulty Associated with Construction* | | |

# 1 Introduction

## 1.1 Site Description and History

### 1.1.1 Site Location and History

The Illinois Power Resources Generating, LLC (IPRG) Duck Creek Power Plant is an electric-power-generating facility with coal-fired units located approximately 9 miles southeast of the City of Canton in Fulton County, Illinois (AECOM, 2016a; Ramboll, 2021a). Beginning in the 1930s, strip mining took place within the boundaries of the Site. Mining operations on the property have since ceased (AECOM, 2016a; Ramboll, 2021b). The Duck Creek Power Plant began operating in 1976 and was retired in December 2019 (AECOM, 2016a; Appendix B).

### 1.1.2 CCR Impoundments

The Duck Creek Power Plant produced and stored coal combustion residuals (CCRs) as a part of its historical operations. The subjects of this report are the Gypsum Management Facility (GMF; Vistra CCR Unit ID No. 203; Illinois Environmental Protection Agency [IEPA] ID No. W0578010001-04; National Inventory of Dams [NID] No. IL50573) and the Bottom Ash Basin (BAB; Vistra CCR Unit ID No. 205; IEPA ID No. W0578010001-03; NID No. 50716) (Figure 1.1).

The GMF is a 31-acre lined surface impoundment constructed between 2007 and 2009 that operated from 2009 until the plant was retired in 2019. This facility was historically used to store gypsum and to clarify gypsum transport water for reuse (Appendix B; Golder, 2022a). The GMF has a dual-composite liner system with a leak detection layer (Appendix B). The GMF Recycle Pond, which is located immediately south of the GMF, historically received decanted water from the GMF and leachate from the on-Site landfill (described below). The GMF Recycle Pond never received CCR. A set of pumps on the western side of the GMF Recycle Pond were used to transport decanted water back to the flue gas desulfurization system for re-use (Appendix B). The GMF Recycle Pond has a liner system consisting of a 60-mil high-density polyethylene (HDPE) geomembrane, a reinforced bentonite mat, and a 36-inch layer of compacted clay (Natural Resource Technology, 2017). The GMF Recycle Pond has been closed, and the closure was approved by IEPA.

The BAB is a 2.2-acre lined surface impoundment constructed in late 2007 or early 2008 for the management of sluiced bottom ash. It operated from 2008 until the plant was retired in 2019 (Appendix B; Golder, 2022b). There are three cells within the BAB: Primary Pond 1, Primary Pond 2, and the Secondary Pond (Appendix B). Historically, ash was sluiced to either Primary Pond 1 or Primary Pond 2. The Secondary Pond received decanted water from the two primary ponds (Appendix B; Golder, 2022b). Decanted water from the Secondary Pond flowed to the Duck Creek Cooling Pond *via* a discharge channel to the south of the pond (Appendix B). During operation of the BAB, Primary Ponds 1 and 2 were cleaned out frequently *via* excavation, and excavated bottom ash was sent to the on-Site landfill for disposal (Appendix B; Golder, 2022b). Bottom ash was also removed from the BAB when the plant was retired in 2019, such that no significant bottom ash currently remains (Appendix B). The BAB is a lined impoundment. The components of the liner system include (from bottom to top): compacted native soils,

Electronic Filing: Received, Clerk's Office 06/20/2024

a 60-mil HDPE geomembrane, a 1-foot compacted clay layer, and an 8-inch reinforced concrete layer (Appendix B).

**Figure 1.1 Site Location Map.** Adapted from Stantec (2017).

### 1.1.3 Surface Water Hydrology

Surface water bodies on the Site include the Duck Creek Cooling Pond, which is the cooling water impoundment for the plant, and various small ponds resulting from historical surface mining on the property, including Long Lake (AECOM, 2016a; Natural Resource Technology, 2017). Surface water in the vicinity of the GMF and the BAB drains into the Duck Creek Cooling Pond (Natural Resource Technology, 2017), which drains to the Illinois River *via* National Pollutant Discharge Elimination System (NPDES)-permitted outfalls (IEPA, 2013). Other surface water bodies in the vicinity of the Site include various backwater lakes of the Illinois River, including Buckheart Creek to the west and Rice Lake, Miserable Lake, Big Lake, and Goose Lake to the east (Ramboll, 2021b,c).

### 1.1.4 Hydrogeology

#### 1.1.4.1 GMF

Three major hydrostratigraphic units have been identified near the GMF: (a) the uppermost aquifer, (b) the lower Radnor till/lower confining unit, and (c) the bedrock confining unit. The first of these layers, the uppermost aquifer, is composed of three units: (i) the Peoria/Roxanna loess, (ii) the upper Radnor till, and (iii) the shallow sand unit (Ramboll, 2021c). The Peoria/Roxanna loess zone is composed of silt, clayey silt, and minor amounts of sand. The upper Radnor till is composed of clayey silt with minor amounts of sand and gravel. The shallow sand unit is composed of medium-grained sand and silt with interbedded till seams. The shallow sand unit, which varies from less than 1- to 18-feet thick in the vicinity of the GMF, is the primary conduit for horizontal migration of shallow groundwater near the impoundment (Ramboll, 2021c). The Peoria/Roxanna loess has also been identified as a potential migration pathway (Ramboll, 2021c). The lower Radnor till layer has high silt content with varying amounts of clay, sand, and gravel. The bedrock confining unit is composed primarily of low-

Electronic Filing: Received, Clerk's Office 06/20/2024

permeability, shaley siltstone and silty shale. The Hydrogeological Site Characterization Report prepared by Ramboll for the GMF (Ramboll, 2021c) provides more details regarding the hydrostratigraphic units in the vicinity of the GMF.

Near the GMF, shallow groundwater flows southeast through the uppermost aquifer toward the Duck Creek Cooling Pond (Natural Resource Technology, 2017; Ramboll, 2021a,c). The preferential flow of groundwater is horizontal rather than vertical because the underlying till and shale bedrock layers restrict vertical groundwater flow (Natural Resource Technology, 2017). Groundwater within the uppermost aquifer near the GMF flows into the Duck Creek Cooling Pond. No other potential groundwater transport pathways exist. Because the Duck Creek Cooling Pond serves as a sink for groundwater discharge in the area, shallow groundwater migration beneath or beyond the Duck Creek Cooling Pond is unlikely (Ramboll, 2021c).

Groundwater monitoring is ongoing at the GMF. The Hydrogeologic Site Characterization Report prepared by Ramboll for the GMF includes a summary of the groundwater data collected from GMF monitoring wells between 2015 and 2021 (Ramboll, 2021c).

#### 1.1.4.2 BAB

Two distinct hydrostratigraphic units have been identified near the BAB: the uppermost aquifer and a confining shale bedrock unit (Ramboll, 2021b). The first of these layers, the uppermost aquifer, consists of the Peoria/Roxanna loess, which is characterized by medium to very stiff silt with little clay and trace very fine- to fine-grained sand, and the Radnor till, which is characterized by silty clay with trace very fine- to coarse-grained sand and trace small gravel to hard clay with little silt, few very fine- to coarse-grained sand, and trace small gravel (Ramboll, 2021b). The most permeable portion of the uppermost aquifer is the shallow sand unit, a two- to seven-foot-thick sand zone located within the Radnor till. The shallow sand unit, which is encountered at a depth of 18-40 feet below ground surface (bgs), forms the primary conduit for horizontal migration of shallow groundwater near the BAB (Ramboll, 2021b). The Peoria/Roxanna loess has also been identified as a potential migration pathway. A confining unit composed of Pennsylvanian shaley siltstone and silty shale bedrock underlies the uppermost aquifer from approximately 26-46 feet bgs (top of bedrock; Ramboll, 2021b). The bedrock acts as an aquitard due to its low hydraulic conductivity (AECOM, 2016a; Ramboll, 2021b). The Hydrogeological Site Characterization Report prepared by Ramboll for the BAB (Ramboll, 2021b) provides more details regarding the hydrostratigraphic units in the vicinity of the BAB.

Near the BAB, shallow groundwater flows southwards through the uppermost aquifer toward an unnamed drainage channel, which leads to the Duck Creek Cooling Pond (Ramboll, 2021b). Groundwater flows horizontally rather than vertically through the uppermost aquifer because: (i) vertical hydraulic conductivities within the uppermost aquifer are several orders of magnitude lower than horizontal hydraulic conductivities, and (ii) the underlying shale bedrock acts as an aquitard (AECOM, 2016a; Ramboll, 2021b). Groundwater within the uppermost aquifer near the BAB flows into the Duck Creek Cooling Pond. No other potential groundwater transport pathways exist. Because the Duck Creek Cooling Pond serves as a sink for groundwater discharge in the area, shallow groundwater migration beneath or beyond the Duck Creek Cooling Pond is unlikely (Ramboll, 2021b).

Groundwater monitoring is ongoing at the BAB. The Hydrogeologic Site Characterization Report prepared by Ramboll for the BAB includes a summary of the groundwater data collected from BAB monitoring wells between 2015 and 2021 (Ramboll, 2021b).

Electronic Filing: Received, Clerk's Office 06/20/2024

### 1.1.5 Site Vicinity

The Duck Creek property is surrounded by agricultural fields, pastures, and forests (Ramboll, 2021b). There are several scenic, recreational, and historical areas within a few miles of the Site, including the Rice Lake State Fish and Wildlife Area (SFWA) to the east and the Orendorf and Rice Lake Terrace Archaeological Sites to the east/northeast. The Rice Lake SFWA, which spans approximately 5,660 acres, was established in 1945 and includes Big Lake, Slim Lake, Goose Lake, Pond Lily Lake, Lock Pond, and the Copperas Creek Management Unit. Popular activities at the Rice Lake SFWA include picnicking, fishing, camping, and hunting (IDNR, c. 2008). The Orendorf Archaeological Site, which was added to the National Register of Historic Places in 1977 (National Park Service, 2021), encompasses at least four distinct Middle Mississippian settlement areas with known trade and migration linkages to the Mississippian city of Cahokia, the largest archaeological site in North America (Archaeological Institute of America, 2021; Emerson, c. 2016). The Rice Lake Terrace Archaeological Site is located south of the Orendorf Archaeological Site on the shore of Rice Lake and includes evidence of Archaic (8000-500 BC), Woodland (500 BC-1000 AD) and Mississippian (1000-1673 AD) cultures (Archaeological Institute of America, 2021). In addition to the sites listed above, there are several high-value scenic and recreational areas within 10 miles downstream along the Illinois River, including the Spring Lake SFWA, the Sand Ridge State Forest, the Chautauqua National Wildlife Refuge, and the Emiquon Preserve.

## 1.2 Part 845 Regulatory Review and Requirements

Title 35, Part 845, of the Illinois Administrative Code (IAC; IEPA, 2021a) requires the development of a Closure Alternatives Analysis (CAA) prior to undertaking closure activities at certain CCR-containing surface impoundments in the State of Illinois. Section 2 of this report presents a CAA for the GMF pursuant to requirements under IAC Section 845.710. Section 3 of this report presents a CAA for the BAB. The goal of a CAA is to holistically evaluate each potential closure scenario with respect to a wide range of factors, including the efficiency, reliability, and ease of implementation of the closure scenario; its potential positive and negative short- and long-term impacts on human health and the environment; and its ability to address concerns raised by residents (IEPA, 2021a). A CAA is a decision-making tool that is designed to aid in the selection of an optimal closure alternative for the impoundments at a site.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 2 Closure Alternatives Analysis – GMF

## 2.1 Closure Alternative Descriptions (IAC Section 845.710(c))

This section of the report presents a CAA for the GMF pursuant to requirements under IAC Section 845.710 (IEPA, 2021a). Gradient evaluated three closure scenarios: Closure-in-Place (CIP), Closure-by-Removal with On-Site CCR Disposal (CBR-Onsite), and Closure-by-Removal with Off-Site CCR Disposal (CBR-Offsite). Sections 2.1.1 through 2.1.3 describe the CIP, CBR-Onsite, and CBR-Offsite closure scenarios. These scenarios are based on information conveyed to Gradient by Golder (Appendix B; Golder, 2022c,d).

### 2.1.1 Closure-in-Place

Under the CIP scenario, the gypsum in the GMF will be consolidated in the northern portion of the impoundment and the impoundment will be capped with a new cover system. This scenario includes the following work elements for the closure of the GMF (Appendix B; Golder, 2022c):

- Elimination of free liquids by solidifying waste residues, as needed, or by removing liquid waste, including *via* pumping. Water will be managed in accordance with the NPDES permit for the facility.
- Dewatering of the upper gypsum layer within the northern portion of the GMF *via* trenches and sumps in order to support construction traffic across the surface.
- Construction of a new internal berm with an east-west orientation. The upstream slope of the berm will be lined with a new composite liner, which will tie into the existing primary composite liner system for the facility.
- Consolidation of all gypsum in an approximately 15-acre area north of the berm. All gypsum from the area south of the berm will be removed and placed north of the berm.
- Contouring and grading to promote stormwater management.
- Construction of an alternative cover system north of the berm that will consist of a 40-mil linear low-density polyethylene (LLDPE) geomembrane layer, a geocomposite layer, and 24 inches of protective soil cover suitable for supporting vegetative growth. The performance of this alternative cover system relative to a default cover is presented in Geosyntec Consultants (2022).
- Removal of the geosynthetic components of the dual-composite liner system south of the berm. Liner system materials will be disposed of in the northern portion of the capped GMF. Soil materials located between these components will be removed and stockpiled south of the GMF.
- Excavation of a surface water channel south of the GMF, including removal of sections of the GMF Recycle Pond perimeter dike, in order to promote passive stormwater drainage to the southeast of the impoundment.
- Long-term (post-closure) monitoring and maintenance, including:
    - Groundwater monitoring at the impoundment for a minimum of 30 years, or until groundwater protection standards (GWPSs) are achieved.

Electronic Filing: Received, Clerk's Office 06/20/2024

- Post-closure care for the final cover system, including cap inspections, mowing, and maintenance, for a minimum of 30 years.

This CIP plan meets all closure requirements of Part 845.750 (Golder, 2022a). Key closure elements that address the Part 845 closure requirements are summarized below. Further details are provided in the Closure Plan (Golder, 2022a).

- An alternative cover system will be installed over the CCR that remains in the GMF. The cover, consisting of a 40-mil LLDPE geomembrane low-permeability layer, a geocomposite cushion if needed, and 24 inches of soil, will minimize vertical infiltration of precipitation into the basin [Part 845.750(a)(1)].
- The final cover system will be crowned with 4% slopes to direct surface water away from the facility. Beyond the final cover system, channels will direct surface water away from the GMF to existing site drainages [Part 845.750(a)(2)].
- Impounded water will be removed from the GMF and managed in accordance with the NPDES permit for the facility [845.750(b)(1) and 845.750(b)(2)].
- Free liquids in the CCR will be eliminated by removing liquid wastes or solidifying the remaining wastes. Trenches will facilitate gravity drainage of liquid wastes in the gypsum and direct the liquid wastes to sumps. Other engineering measures may be considered to facilitate removal of liquid wastes and stabilization of wastes. Sumps will be used to collect liquid wastes which will be managed in accordance with the NPDES permit for the site [845.750(b)(1) and 845.750(b)(2)].

As an additional consideration, the proposed alternative cover system and the existing bottom liner system will provide complete encapsulation of the CCR, physically isolating it from contact with surrounding soils, groundwater, surface water and the atmosphere. Lateral infiltration of groundwater into the basin will also be controlled due to the presence of the existing dual-composite bottom liner system which will prevent groundwater from flowing into the basin (Golder, 2022a).

Approximately 85,000 cubic yards of gypsum will be relocated from south of the berm to north of the berm under this scenario (an assumed travel distance of 0.2 miles; Appendix B). Hauling will also be required to relocate 17 acres of geosynthetic liner materials north of the berm and 55,700 cubic yards of liner soils excavated from south of the berm to a stockpile located south of the closure footprint (an assumed travel distance of 0.2 miles).

Soil required for construction of the new berm and the final GMF cover system will be sourced from a location on the property; a borrow location will not need to be established off-Site. The selected borrow soil location is approximately 0.4 miles north of the GMF (Appendix B). The estimated volume of borrow soil required for GMF closure *via* CIP is 76,100 cubic yards (Appendix B). Additionally, approximately 81,000 cubic yards of soil will be excavated during construction of the stormwater channel south of the GMF during Site restoration. This material will be hauled to the borrow soil location for stockpiling (Appendix B).

Under the CIP scenario, the expected duration of major construction activities at the GMF is 12-24 months (Appendix B; Golder, 2022c). Key parameters for the CIP scenario are shown in Table 2.1.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 2.1 Key Parameters for the Closure-in-Place Scenario – GMF**

| Parameter | Value | Notes |
|---|---|---|
| Surface Area of Impoundment (acres) | 31 | |
| Surface Area of Final Cover System (acres) | 15 | Area north of the proposed berm. |
| In-Place Volume of CCR (CY) | 400,000 | CCR contained in the GMF is gypsum from flue gas desulfurization. |
| Volume of CCR to be Relocated (CY) | 85,000 | Amount of gypsum to be removed from the southern portion of the GMF and relocated north of the berm. |
| Travel Distance for Relocation of CCR (miles) | 0.2 | |
| Required Volume of Borrow Soil (CY) | 76,100 | Required for berm construction and the final cover system. |
| Volume of Material Stockpiled On-Site (CY) | 137,000 | Excavated during construction of the stormwater channel and removal of existing liner system components south of the berm (Site restoration). |
| Distance to the Borrow Soil Location (miles) | 0.4 | |
| Duration of Construction Activities (months) | 12-24 | |
| Total On-Site Labor Hours for Major Construction[a] | 14,600 | |
| Required On-Site Hauling Truckloads (Loaded) | 10,200 | |
| Required Off-Site Hauling Truckloads (Loaded) | 0 | |
| Required On-Site Hauling Miles | 6,270 | |
| Required Off-Site Hauling Miles | 0 | |

Notes:
CCR = Coal Combustion Residual; CY = Cubic Yards; GMF = Gypsum Management Facility.
Sources: Appendix B; Golder (2022c).
(a) Major construction is defined as any operation occurring on-Site that requires one or more of the following equipment types: breaker, compactor, dozer, excavator, haul truck, loader, and telehandler. Labor is not included if it is limited to the use of one or more of the following equipment types: diesel pump, flatbed truck, generator, miscellaneous, pickup truck, and seed drill or hydroseeder. Labor performed by haul truck operators is only included in calculations if the hauling occurs on-Site. Workers assigned to relevant activities are assumed to work full-time (40 hours per week) on that activity for the duration of the activity.

### 2.1.2 Closure-by-Removal with On-Site Disposal

Under the CBR-Onsite scenario, CCR and existing liner system materials will be excavated from the GMF and sent to the on-Site landfill for final disposal. Excavation at the GMF will include all of the gypsum in the impoundment and the existing dual-composite liner system. The gypsum excavated from the GMF is currently expected to be hauled to the on-Site landfill. IPRG will also continue to evaluate potential opportunities for beneficial re-use of CCR excavated from the GMF as an alternative to disposal. The primary composite liner system, the leachate collection and removal system, the geosynthetic components of the secondary composite liner system, and the 3-foot compacted clay layer beneath the GMF will also be hauled to the on-Site landfill for disposal.

This scenario includes the following work elements for the closure of the GMF (Appendix B; Golder, 2022c,d):

- Free water removal and dewatering of the GMF.
- Excavation and transport of CCR and liner system materials to the on-Site landfill, as detailed above. All areas affected by CCR releases will be decontaminated, including potential over-excavation below the bottom of the liner system.

Electronic Filing: Received, Clerk's Office 06/20/2024

- Grading and filling to convey runoff away from the impoundments. This process will include excavation of a surface water channel south of the GMF and removal of sections of the GMF Recycle Pond perimeter dike in order to promote passive stormwater drainage to the southeast of the impoundment.
- Site restoration, including revegetation with native grasses.
- Monitoring at the impoundments for at least 3 years, or until GWPSs are achieved.

Approximately 31 acres of geosynthetic liner system materials, 283,000 cubic yards of earthen liner system materials, 50,000 cubic yards of subsoil overexcavation, and 400,000 cubic yards of gypsum will be excavated from the GMF and hauled to the on-Site landfill for disposal. The on-Site landfill is located approximately 1.2 miles north of the GMF (Appendix B). Excavated materials will be hauled to the landfill using off-road haul trucks with an assumed capacity of 34 cubic yards. The on-Site landfill currently has approximately 445,000 cubic yards of available capacity. Of this, approximately 7,000 cubic yards may be used for the disposal of materials associated with excavation of the BAB. Thus, the on-Site landfill does not have sufficient capacity to receive all of the CCR and liner materials from the GMF that are slated for disposal under the CBR-Onsite scenario. Expansion of the landfill would thus be necessary. The on-Site landfill is already permitted for a potential expansion, which could create an additional 2-acre landfill cell (Appendix B). This scenario meets the requirements of IAC Section 845.710(c)(2) (IEPA, 2021a), which requires an assessment be included in the CAA of whether the Site has an on-Site landfill with available capacity or whether an on-Site landfill can be constructed.

No borrow soil is required for grading and filling the GMF under the CBR-Onsite scenario (Appendix B). However, approximately 9,700 cubic yards of compacted clay is required for landfill expansion; this material will be hauled in from the borrow site, which is located 0.7 miles from the landfill. Finally, approximately 86,000 cubic yards of soil will be excavated during construction of the stormwater channel south of the GMF during Site restoration. This material will be hauled to the borrow soil location for stockpiling (Appendix B).

Under the CBR-Onsite scenario, the expected duration of major construction activities is expected to be 24-36 months at the GMF (Appendix B; Golder, 2022c,d). Key parameters for the CBR-Onsite scenario are shown in Table 2.2.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 2.2 Key Parameters for the Closure-by-Removal with On-Site Disposal Scenario – GMF**

| Parameter | Value | Notes |
|---|---|---|
| Surface Area of Impoundment (acres) | 31 | |
| In-Place Volume of CCR (CY) | 400,000 | CCR contained in the GMF is gypsum from flue gas desulfurization. |
| Volume of Earthen Components of Existing Liner System (CY) | 283,000 | |
| Distance to the On-Site Landfill (miles) | 1.2 | |
| Required Volume of Borrow Soil (CY) | 9,700 | Required for landfill expansion. |
| Volume of Soil Stockpiled at Borrow Soil Location (CY) | 86,000 | Soil excavated south of the impoundment during construction of the stormwater channel (Site restoration). |
| Distance to the Borrow Soil Location from the GMF (miles) | 0.4 | |
| Distance to the Borrow Soil Location from the On-Site Landfill (miles) | 0.7 | |
| Duration of Construction Activities (months) | 24-36 | |
| Total On-Site Labor Hours for Major Construction[a] | 26,400 | |
| Required On-Site Hauling Truckloads (Loaded) | 28,000 | |
| Required Off-Site Hauling Truckloads (Loaded) | 0 | |
| Required On-Site Hauling Miles | 62,100 | |
| Required Off-Site Hauling Miles | 0 | |

Notes:
CCR = Coal Combustion Residual; CY = Cubic Yards; GMF = Gypsum Management Facility.
Sources: Appendix B; Golder (2022c,d).
(a) Major construction is defined as any operation occurring on-Site that requires one of the following equipment types: breaker, compactor, dozer, excavator, haul truck, loader, and telehandler. Labor is not included if it is limited to use of the following equipment types: diesel pump, flatbed truck, generator, miscellaneous, pickup truck, and seed drill or hydroseeder. Labor performed by haul truck operators is only included in calculations if the hauling occurs on-Site. Workers assigned to relevant activities are assumed to work full-time (40 hours per week) on that activity for the duration of the activity.

### 2.1.3 Closure-by-Removal with Off-Site Disposal

Under the CBR-Offsite scenario, CCR and existing liner system materials will be excavated from the GMF and sent to an off-Site landfill for final disposal. All of the gypsum in the GMF and the primary composite liner system, the leachate collection and removal system, the geosynthetic components of the secondary composite liner system, and the 3-feet-thick compacted clay layer underlying the GMF will be hauled to the off-Site landfill for disposal (Golder, 2022c,d). IPRG will also continue to evaluate potential opportunities for beneficial re-use of CCR excavated from the GMF as an alternative to disposal.

Excavated materials will be sent to the Peoria City-County Landfill in Brimfield, Illinois (11501 W Cottonwood Road), which is approximately 33 miles from the Site (Appendix B). As is described below in Section 2.4.5, it is possible that the Peoria City-County Landfill will have to be expanded in order to accept all of the CCR and liner materials.

IAC Section 845.710(c)(1) requires Closure-by-Removal (CBR) alternatives to consider multiple methods for transporting CCR off-site, including rail, barge, and trucks. Golder evaluated the feasibility of transporting CCR to the off-Site landfill *via* rail or barge and found that neither option is viable at this Site. Existing loadout facilities, which would facilitate off-Site rail or barge CCR transport, are not present on the property, and the construction of new loadout facilities is considered infeasible. Only transport *via* on-road haul trucks (with a 16.5-cubic-yard capacity) is considered feasible for CBR-Offsite.

Electronic Filing: Received, Clerk's Office 06/20/2024

The local availability and use of natural gas-powered trucks, or other low-polluting trucks, will be evaluated prior to the start of construction.

The work elements included in this scenario are largely the same as those listed above in Section 2.1.2 for the CBR-Onsite scenario (Appendix B; Golder, 2022c,d):

- Free water removal and dewatering of the GMF.
- Excavation and transport of CCR and liner system materials to the off-Site landfill, as detailed above. All areas affected by CCR releases will be decontaminated, including potential over-excavation below the bottom of the liner system.
- Grading and filling to convey runoff away from the impoundments. This process will include excavation of a surface water channel south of the GMF and removal of sections of the GMF Recycle Pond perimeter dike in order to promote passive stormwater drainage to the southeast of the impoundment.
- Site restoration, including revegetation with native grasses.
- Monitoring at the impoundments for at least 3 years, or until GWPSs are achieved.

Approximately 31 acres of geosynthetic liner system materials, 283,000 cubic yards of earthen liner system materials, 50,000 cubic yards of subsoil overexcavation, and 400,000 cubic yards of gypsum will be excavated from the GMF and hauled to the off-Site landfill for disposal. No borrow soil is required for grading and filling of the GMF under the CBR-Offsite scenario (Appendix B). Finally, approximately 86,000 cubic yards of soil will be excavated during construction of the stormwater channel south of the GMF during Site restoration. This material will be hauled to the borrow soil location for stockpiling (Appendix B).

Under the CBR-Offsite scenario, the expected duration of major construction activities is expected to be 36-48 months at the GMF (Appendix B; Golder, 2022c,d). Key parameters for the CBR-Offsite scenario are shown in Table 2.3.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 2.3 Key Parameters for the Closure-by-Removal with Off-Site Disposal Scenario – GMF**

| Parameter | Value | Notes |
|---|---|---|
| Surface Area of Impoundment (acres) | 31 | |
| In-Place Volume of CCR (CY) | 400,000 | CCR contained in the GMF is gypsum from flue gas desulfurization. |
| Volume of Earthen Components of Existing Liner System (CY) | 283,000 | |
| Distance to the Off-Site Landfill (miles) | 33 | Peoria City-County Landfill in Brimfield, IL. |
| Required Volume of Borrow Soil (CY) | 0 | |
| Volume of Soil Stockpiled at Borrow Soil Location (CY) | 86,000 | Soil excavated south of the impoundment during construction of the stormwater channel (Site restoration). |
| Distance to the Borrow Soil Location (miles) | 0.4 | |
| Duration of Construction Activities (months) | 36-48 | |
| Total On-Site Labor Hours for Major Construction[a] | 35,700 | |
| Required On-Site Hauling Truckloads (Loaded) | 2,980 | |
| Required Off-Site Hauling Truckloads (Loaded) | 50,900 | |
| Required On-Site Hauling Miles | 2,380 | |
| Required Off-Site Hauling Miles | 3,320,000 | |

Notes:
CCR = Coal Combustion Residual; CY = Cubic Yards; GMF = Gypsum Management Facility.
Sources: Appendix B; Golder (2022c,d).
(a) Major construction is defined as any operation occurring on-Site that requires one of the following equipment types: breaker, compactor, dozer, excavator, haul truck, loader, and telehandler. Labor is not included if it is limited to use of the following equipment types: diesel pump, flatbed truck, generator, miscellaneous, pickup truck, and seed drill or hydroseeder. Labor performed by haul truck operators is only included in calculations if the hauling occurs on-Site. Workers assigned to relevant activities are assumed to work full-time (40 hours per week) on that activity for the duration of the activity.

## 2.2 Long- and Short-Term Effectiveness of Closure Alternative (IAC Section 845.710(b)(1))

### 2.2.1 Magnitude of Reduction of Existing Risks (IAC Section 845.710(b)(1)(A))

This section of the report addresses the potential risks to human and ecological receptors due to exposure to CCR-associated constituents in groundwater or surface water. Gradient has performed a Human Health and Ecological Risk Assessment for the Site (Appendix A of this report), which provides a detailed evaluation of the magnitude of existing risks to human and ecological receptors associated with the GMF. This report concluded that there are no current unacceptable risks to any human or ecological receptors. Because groundwater concentrations are expected to remain stable and/or decline under all closure scenarios, there will also be no unacceptable risks to human health or the environment during or following closure at the GMF. Thus, there is no current risk or future risk under any closure scenario at the GMF, and the magnitude of reduction of existing risks is the same under all scenarios.

### 2.2.2 Likelihood of Future Releases of CCR (IAC Section 845.710(b)(1)(B))

This section of the report quantifies the risk of future CCR releases that may occur during dike failure and storm-related events.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Storm-Related Releases and Dike Failure During Flood Conditions**

Engineering analyses show that the existing dikes at the GMF are expected to remain stable under static, seismic, and flood conditions (AECOM, 2016b; Burns & McDonnell, 2021a). Prior to closure (*i.e.*, under current conditions), the risk of dike failure occurring during floods or other storm-related events is therefore minimal. Engineering analyses similarly show that the current risk of sudden CCR releases occurring at the GMF due to overtopping during flood conditions is minimal (AECOM, 2016c; Burns & McDonnell, 2021a). Post-closure, the risks of overtopping and dike failure occurring at the GMF will be even smaller than they are currently. Under the CIP scenario, all free water will be pumped from the GMF and a new cover system will be installed, which will include 24 inches of soil and a geomembrane liner. Construction activities at the GMF under the CIP scenario will also result in improved stormwater management. Relative to current conditions, this cover system and the associated stormwater management improvements will provide increased protection against berm and surface erosion, groundwater infiltration, and other adverse effects that could potentially trigger a dike slope failure event. Under the CBR-Onsite and CBR-Offsite scenarios, all of the CCR in the GMF will be excavated and relocated, eliminating the risk of a sudden CCR release occurring under a dike failure or flood overtopping event. In summary, there is minimal risk of sudden CCR releases occurring during or prior to closure (*i.e.*, under current conditions). Additionally, post-closure there is minimal risk of sudden CCR releases occurring under the CIP scenario, and there is no risk of sudden CCR releases occurring under the CBR-Onsite or CBR-Offsite scenarios.

**Dike Failure Due to Seismicity**

Sites in Illinois may be subject to seismic risks arising from the Wabash Valley Seismic Zone and the New Madrid Seismic Zone (IEMA, 2020). However, the Duck Creek property does not lie within a seismic impact zone. The property is also believed to have a "low risk level" for seismic risks based on the 2018 United States Geological Survey (USGS) National Seismic Hazard Map. Additionally, the GMF does not lie within 200 feet of an active fault or fault damage zone at which displacement has occurred within the current geological epoch (*i.e.*, within the last ~11,650 years; Burns & McDonnell, 2021b,c; Haley & Aldrich, Inc., 2018a,b). The nearest known fault is the Sicily Fault, which is located about 66 miles southeast of the GMF. The Sicily Fault does not have known recent activity (Haley & Aldrich, Inc., 2018a,b). Thus, the risk of dike failure occurring during or following closure activities due to seismic activity is exceedingly low at the GMF.

### 2.2.3 Type and Degree of Long-Term Management, Including Monitoring, Operation, and Maintenance (IAC Section 845.710(b)(1)(C))

The long-term operation and management plans for the GMF are described in Section 2.1 for each closure scenario. In summary, under the CIP scenario, the GMF will undergo monitoring for at least 30 years post-closure, or until such time as GWPSs are achieved. The post-closure care plan under the CIP scenario additionally includes periodic inspections and mowing and maintenance of the final cover system for the GMF. Under the CBR-Onsite and CBR-Offsite scenarios, the GMF will undergo monitoring for 3 years post-closure, or until such time as GWPSs are achieved.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 2.2.4 Short-Term Risks to the Community or the Environment During Implementation of Closure (IAC Section 845.710(b)(1)(D))

#### 2.2.4.1 Worker Risks

Best practices will be employed during construction in order to ensure worker safety and comply with all relevant regulations, permit requirements, and safety plans. However, it is impossible to completely eliminate risks to workers during construction activities, both on- and off-Site. On-Site accidents include injuries and deaths arising from the use of heavy equipment and/or earthmoving operations during construction activities. Off-Site accidents include injuries and deaths due to vehicle accidents during labor and equipment mobilization and demobilization, material deliveries, and the hauling of CCR and liner system materials to the on-Site landfill and the off-Site landfill.

**Risk of Worker Accidents Occurring On-Site**

For the GMF, three closure scenarios were considered: CIP, CBR-Offsite, and CBR-Onsite. Based on labor requirements reported in Appendix B of this report, Gradient estimates that 14,600 total on-Site labor hours are required for major construction activities under the CIP scenario, 26,400 on-Site labor hours are required for major construction activities under the CBR-Onsite disposal scenario, and 35,700 on-Site labor hours are required for major construction activities under the CBR-Offsite scenario. The CIP scenario therefore requires the smallest number of on-Site labor hours for major construction activities across all scenarios.

The United States Bureau of Labor Statistics (US BLS) (US DOL, 2020a,b) provides an estimate of the hourly fatality and injury rates for construction workers. Based on the accident rates reported by US BLS and the on-Site labor hours reported above, we estimate that approximately 0.17 worker injuries and 0.0011 worker fatalities will occur on-Site under the CIP scenario due to major construction activities at the GMF (Table 2.4). Approximately 0.30 worker injuries and 0.0020 worker fatalities are expected to occur under the CBR-Onsite scenario, and approximately 0.41 worker injuries and 0.0027 worker fatalities are expected to occur under the CBR-Offsite scenario (Table 2.4). Thus, the expected number of worker accidents occurring on-Site due to major construction activities is smallest under the CIP scenario and is largest under the CBR-Offsite scenario. Note that the calculations presented here focus on major construction activities (*e.g.*, excavation, loading, and hauling). They therefore do not account for the additional accidents that could occur on-Site during less intensive construction activities (*e.g.*, surveying, erosion control, and hydroseeding).

**Table 2.4 Expected Number of On-Site Worker Accidents Under Each Closure Scenario – GMF**

| Closure Scenario | Injuries | Fatalities |
|---|---|---|
| CIP | 0.17 | 0.0011 |
| CBR-Onsite | 0.30 | 0.0020 |
| CBR-Offsite | 0.41 | 0.0027 |

Notes:
CBR-Offsite = Closure-by-Removal with Off-Site CCR Disposal; CBR-Onsite = Closure-by-Removal with On-Site CCR Disposal; CIP = Closure-in-Place; GMF = Gypsum Management Facility.

Concurrently with closure activities, a utility-scale solar facility will be constructed on the Duck Creek Site. The simultaneous pursuit of closure-related construction and solar facility construction may lead to significant traffic congestion on Site access roads, resulting in greater overall risks to workers than would result from closure or solar re-development alone. Conflicts are particularly likely to arise during GMF closure (relative to BAB closure), because it is expected to take 1-4 years to complete and involve major

Electronic Filing: Received, Clerk's Office 06/20/2024

earthmoving operations. For the GMF, the CIP scenario requires less total hauling activity than either of the two CBR scenarios (Tables 2.1-2.3). The CIP scenario can also be completed within a shorter time frame than the two CBR scenarios (12-24 months *versus* 24-48 months). The CIP scenario is therefore expected to result in less congestion on Site access roads during Site re-development – and, hence, a smaller increase in the risks to workers – than either the CBR-Onsite or CBR-Offsite scenarios.

**Risk of Worker Accidents Occurring Off-Site**

The CBR-Offsite scenario is the only scenario which requires any off-Site hauling. Under the CBR-Offsite scenario, 3,320,000 vehicle travel miles are required to haul excavated materials from the GMF to the off-Site landfill (Tables 2.1-2.3). The United States Department of Transportation (US DOT, 2020) provides an estimate of the expected number of fatalities and injuries "per vehicle mile driven" for drivers and passengers of large trucks. Based on US DOT's statistics, an estimated 0.42 injuries and 0.0096 fatalities are expected to occur to drivers and passengers of haul trucks due to off-Site hauling under the CBR-Offsite scenario during closure of the GMF (Table 2.5).

**Table 2.5 Expected Number of Off-Site Worker Accidents Due to Hauling Under Each Closure Scenario – GMF**

| Closure Scenario | Injuries | Fatalities |
|---|---|---|
| CIP | 0 | 0 |
| CBR-Onsite | 0 | 0 |
| CBR-Offsite | 0.42 | 0.0096 |

Notes:
CBR-Offsite = Closure-by-Removal with Off-Site CCR Disposal; CBR-Onsite = Closure-by-Removal with On-Site CCR Disposal; CIP = Closure-in-Place; Gypsum Management Facility.

These estimates reflect the minimum number of worker accidents that are likely to occur off-Site under each scenario, because they do not account for the additional vehicle accidents that may occur during non-hauling activities such as labor mobilization and demobilization, equipment mobilization and demobilization, and material deliveries. The vehicle mileages associated with these off-Site activities are not known. However, the mileages associated with these activities are expected to scale with the duration and intensity of the planned construction activities under each scenario. The CIP scenario is the closure scenario with the shortest expected duration of construction activities, the smallest required volume of CCR dewatering and handling, the least amount of total on-Site labor hours for major construction, and the least amount of required hauling truckloads (Tables 2.1-2.3). This scenario is therefore also likely to have the smallest amount of off-Site activity due to labor and equipment mobilization/demobilization and material deliveries – and, hence, the smallest number of off-Site vehicle accidents arising from these activities.

Taking into account both (i) accidents occurring on-Site due to major construction activities and (ii) accidents occurring off-Site due to hauling, a minimum of 0.17 worker injuries and 0.0011 worker fatalities are expected to occur during GMF closure under the CIP scenario. An estimated 0.30 worker injuries and 0.0020 worker fatalities are expected to occur during GMF closure under the CBR-Onsite scenario, and an estimated 0.84 worker injuries and 0.012 worker fatalities are expected to occur during GMF closure under the CBR-Offsite scenario. Thus, for the GMF, the overall risks to workers are likely to be highest under the CBR-Offsite scenario and lowest under the CIP scenario.

Electronic Filing: Received, Clerk's Office 06/20/2024

#### 2.2.4.2 Community Risks

**Accidents**

Vehicle accidents that occur off-Site can result in injuries or fatalities among community members, as well as workers. Based on the accident statistics for large trucks reported by US DOT (2020) and the off-Site haul truck mileages reported above for the GMF, haul truck accidents could result in an estimated 1.2 injuries and 0.044 fatalities among community members (*i.e.*, people involved in haul truck accidents that are neither haul truck drivers nor passengers, including pedestrians, drivers of other vehicles, *etc.*) under the CBR-Offsite scenario due to hauling of excavated materials from the GMF (Table 2.6). In contrast, no fatalities or injuries are expected to occur among community members under the CBR-Onsite or CIP scenarios due to haul truck accidents, because borrow soil will be taken from a location on the property and any excavated materials will be hauled to an off-Site landfill.

**Table 2.6 Expected Number of Community Accidents Due to Hauling Under Each Closure Scenario – GMF**

| Closure Scenario | Injuries | Fatalities |
|---|---|---|
| CIP | 0 | 0 |
| CBR-Onsite | 0 | 0 |
| CBR-Offsite | 1.2 | 0.044 |

Notes:
CBR-Offsite = Closure-by-Removal with Off-Site CCR Disposal; CBR-Onsite = Closure-by-Removal with On-Site CCR Disposal; CIP = Closure-in-Place; GMF = Gypsum Management Facility.

In addition to impacts due to off-Site hauling, all scenarios may have off-Site impacts due to labor mobilization and demobilization, equipment and vehicle mobilization and demobilization, and material deliveries. As described above (Risk of Worker Accidents Occurring Off-Site), the CIP scenario is likely to require the smallest amount of off-Site activity due to these off-Site vehicle uses – and, hence, the smallest number of off-Site vehicle accidents arising from these activities – across all scenarios evaluated for the GMF.

**Traffic**

Haul routes are expected to use major arterial roads and highways wherever possible, which will reduce the incidence of traffic. However, the heavy use of local roads for construction operations may result in traffic near the Site and, in the case of the CBR-Offsite scenario, the off-Site landfill.

Traffic may increase temporarily around the Site under all three closure scenarios due to the daily arrival and departure of the workforce, equipment mobilization/demobilization, and material deliveries. However, these impacts are expected to largely occur at the beginning or end of each work day (for the arrival/departure of the work force), at the beginning or end of the construction period (for equipment mobilization/demobilization), and at specific times throughout the construction period (for material deliveries). These impacts will therefore likely be less disruptive to community members than the constant and steady movement of haul trucks to and from the Site under the CBR-Offsite scenario.

Under the CBR-Offsite scenario, Golder estimates that approximately 50,900 truckloads will be required to transport excavated materials from the GMF to the off-Site landfill over 1,220 hauling days (Appendix B). Assuming a 10-hour work day, 6 work days per week, and 26 work days per month, a haul truck would therefore need to pass a given location near the Site once every 7.2 minutes on average for the duration of excavation activities under the CBR-Offsite scenario for the GMF. Thus, traffic demands are

Electronic Filing: Received, Clerk's Office 06/20/2024

considerable. This level of traffic (one truck passing a location approximately once every 7.2 minutes) could potentially cause traffic delays on local roads and cause damage to local roadways. It could also cause delays in the re-development of the Site for use in utility-scale solar generation.

**Noise**

Construction generates a great deal of noise, both in the vicinity of the Site and along haul routes. In a closure impact analysis performed by the Tennessee Valley Authority (TVA, 2015), the authors found that "[T]ypical noise levels from construction equipment used for closure are expected to be 85 dBA or less when measured at 50 ft. These types of noise levels would diminish with distance … at a rate of approximately 6 dBA per each doubling of distance and therefore would be expected to attenuate to the recommended EPA noise guideline of 55 dBA at 1,500 ft." Because there are no residences or businesses within 1,500 feet of any of the construction areas on the Site (the GMF, the proposed borrow site, and the on-Site landfill), we do not anticipate that any residences or businesses will be adversely impacted by noise pollution at the Site under any closure scenario. Moreover, although there are several scenic, recreational, and historical areas located within a few miles of the Site (the Rice Lake SFWA and the Orendorf and Rice Lake Terrace Archaeological Sites), there are no notable scenic or recreational areas located within 1,500 feet of any of the construction areas on the Site. Noise impacts are therefore expected to be relatively minor under all closure scenarios.

In addition to impacts in the immediate vicinity of the GMF, local roads near the Site and the off-Site landfill (CBR-Offsite scenario only) may experience noise pollution due to high volumes of truck traffic. As described above (Traffic), the construction schedule under the CBR-Offsite scenario requires haul trucks to pass by a given location every 7.2 minutes on average for 10 hours each day while excavation is occurring at the GMF. Dump trucks generate significant noise pollution, with noise levels of approximately 88 decibels or higher expected within a 50-foot radius of the truck (Exponent, 2018). This noise level is similar to the noise level of a gas-powered lawnmower or leaf blower (CDC, 2019). Decibel levels above 80 can damage hearing after 2 hours of exposure (CDC, 2019). In addition to haul truck impacts, noise pollution may also arise along local roads from the daily arrival and departure of the workforce, equipment mobilization/demobilization, and material deliveries. These impacts are expected to largely occur at the beginning or end of each work day (for the arrival/departure of the work force), at the beginning or end of the construction period (for equipment mobilization/demobilization), and at specific times throughout the construction period (for material deliveries); these impacts will therefore likely be less disruptive to community members than the constant and steady movement of haul trucks to and from the Site.

**Air Quality**

Construction can adversely impact air quality. Air pollution can occur both on-Site and off-Site (*e.g.*, along haul routes), potentially impacting workers as well as community members. With regards to construction activities, two categories of air pollution are of particular concern: equipment emissions and fugitive dust. The equipment emissions of greatest concern are those found in diesel exhaust. Most construction equipment is diesel-powered, including the dump trucks used to haul material to and from the Site. Diesel exhaust contains hundreds of air pollutants, including nitrogen oxides ($NO_x$), particulate matter (PM), carbon monoxide (CO), and volatile organic compounds (VOCs) (Hesterberg *et al.*, 2009; Mauderly and Garshick, 2009). Fugitive dust, another major air pollutant at construction sites, is generated by earthmoving operations and other soil- and CCR-handling activities. Along haul routes, an additional source of fugitive dust is road dust along unpaved dirt roads. Careful planning and the use of Best Management Practices (BMPs) such as wet suppression are used to minimize and control fugitive dust during construction activities; however, it is not possible to prevent dust generation entirely.

Electronic Filing: Received, Clerk's Office 06/20/2024

The air pollutant mass released under a given closure scenario will be proportional to the expected duration and intensity of construction activities under that scenario. As initially described in Section 2.2.4.1 (Worker Risks), the CIP scenario is the GMF closure scenario with the shortest expected duration of construction activities, the smallest required volumes of CCR dewatering and handling, the least amount of total on-Site labor hours for major construction, and the least amount of required hauling truckloads. This scenario is therefore likely to result in the least amount of air emissions of the three closure scenarios.

**Environmental Justice**

The State of Illinois defines environmental justice (EJ) communities to be those communities with a minority population above twice the state average and/or a total population below twice the state poverty rate (IEPA, 2019). Relative to other communities, EJ communities experience an increased risk of adverse health impacts due to environmental pollution and other factors associated with remediation activities (US EPA, 2016).

As shown in a map of EJ communities throughout the state (Figure 2.1; IEPA, 2019), the on-Site landfill, the borrow site, and a portion of the GMF are all located within the one-mile buffer zone of the nearest EJ community (near Canton). Due to its close proximity to the Site, the EJ community near Canton may be disproportionately impacted by air emissions, traffic, accidents and other factors arising from various closure activities occurring on or near the Site. Activities occurring near the GMF, the borrow site, and the on-Site landfill may have particularly negative impacts. Unfortunately, each of the evaluated closure scenarios requires significant construction activity in at least one of these three on-Site areas.

In addition to impacts arising from construction activity on or near the Site, EJ communities may be also impacted by off-Site activities, including the hauling of CCR and liner materials from the Site to the off-Site landfill, labor and equipment mobilization/demobilization, and material deliveries. Unfortunately, in addition to being located near the on-Site landfill, the borrow site, and the GMF, the EJ community near Canton is also located along the three primary haul routes from the Site to the off-Site landfill suggested by Google Maps (Google LLC, 2021). In summary, due to both on-Site and off-Site activities, all possible closure scenarios are associated with potential negative impacts on the EJ community near Canton (Figure 2.1).

Electronic Filing: Received, Clerk's Office 06/20/2024

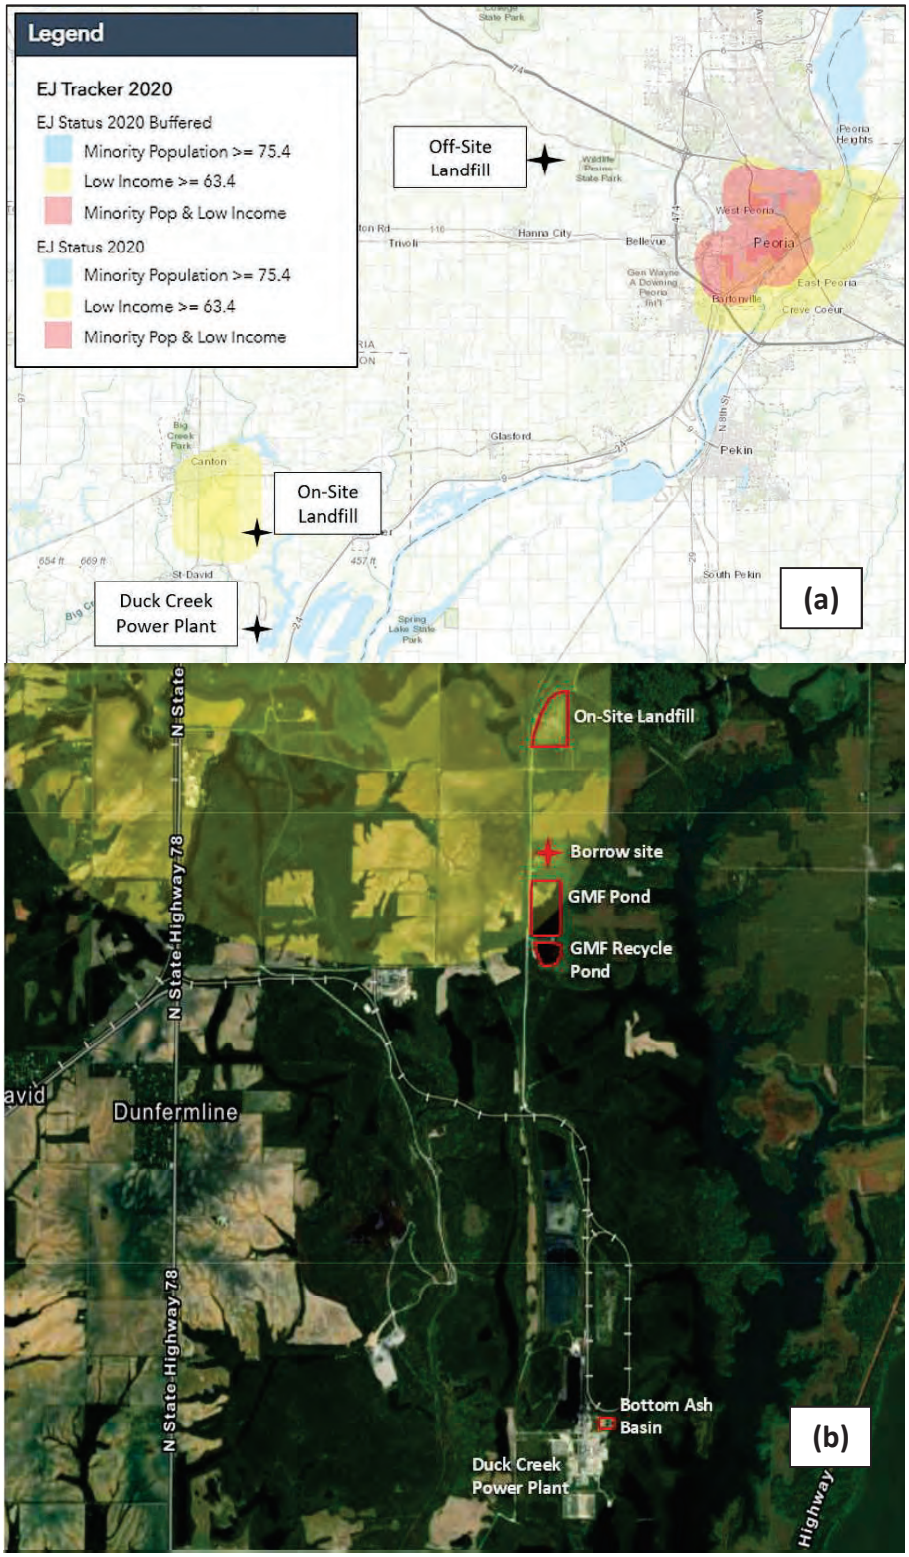

**Figure 2.1 Environmental Justice Communities in the Vicinity of Site Features and the Off-Site Landfill – GMF.** Adapted from IEPA (2019). (a) Regional map. (b) Site map.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Scenic, Historical, and Recreational Value**

There are several scenic, recreational, and historical areas located within a few miles of the Site, including the Rice Lake SFWA and the Orendorf and Rice Lake Terrace Archaeological Sites (Google LLC, 2021; Ramboll, 2021b,c). However, there are no notable scenic or recreational areas located in the immediate vicinity of the GMF, the borrow soil location, or the on-Site landfill. The nearest scenic, recreational, or historical area is the Rice Lake SFWA, which is located over 2.5 miles from the GMF, the borrow soil location, and the on-Site landfill. We therefore do not expect construction activities at the Site to have any direct negative impacts on the scenic, historical, or recreational value of the areas listed above (due to, *e.g.*, noise, obstructions of the view, or restricted access), regardless of the closure scenario.

### 2.2.4.3 Environmental Risks

**Greenhouse Gas Emissions**

In addition to the air pollutants listed above in Section 2.2.4.2, construction equipment emits greenhouse gas emissions (GHGs), including carbon dioxide ($CO_2$) and possibly nitrous oxide ($N_2O$). The potential impact of each closure scenario on GHG emissions is similar to the potential impact of each closure scenario on other emissions from construction vehicles and equipment, as described above in Section 2.2.4.2. For the GMF, the CIP scenario has the shortest duration of construction activities and requires the least amount of CCR dewatering and handling; this scenario is therefore likely to have the lowest amount of predicted GHG emissions.

We did not quantify the carbon footprint of the approximately 31 acres of 40-mil LLDPE geomembrane liner required for the final GMF cover system under the CIP scenario, or the carbon footprint of the additional composite liner that will be required for the upstream slope of the berm to be constructed under this scenario (Appendix B). The carbon footprint of these geomembranes (*i.e.*, the fossil fuel emissions required to manufacture them) is an additional source of GHG emissions at the Site under the CIP scenario. Expansion of the on-Site landfill and the potential expansion of the off-Site landfill under the CBR-Onsite and CBR-Offsite scenarios would have an additional, unquantified carbon footprint due to the manufacture of geomembranes used in the expanded landfill liners.

**Energy Consumption**

Energy consumption at a construction site is synonymous with fossil fuel consumption, because the energy to power construction vehicles and equipment comes from the burning of fossil fuels. Fossil fuel demands considered in this analysis include the burning of diesel fuel during construction activities and the carbon footprint of manufacturing geomembrane textiles. Because GHG emission impacts and energy consumption impacts both arise from the same sources at construction sites, the trends discussed above with respect to GHG emissions also apply to the evaluation of energy demands. In summary, for the GMF, the energy requirements of construction are expected to be smallest under the CIP scenario. We did not quantify the energy demands of the geomembranes required for the construction of the final GMF cover system or the new GMF berm under the CIP scenario, the geomembranes required for the expansion of the on-Site landfill under the CBR-Onsite scenario, or, potentially, the geomembranes required for expansion of the off-Site landfill under the CBR-Offsite scenario.

The Duck Creek Site is slated for re-development as a utility-scale solar power generating facility. At the grid scale, solar generation will add energy back onto the grid and reduce reliance on non-renewable energy sources. In the short-term, closure activities at the Site may delay and obstruct these re-development efforts. The magnitude of expected delays will scale with the expected duration and

Electronic Filing: Received, Clerk's Office 06/20/2024

intensity of construction activities during closure. For the GMF, the CIP scenario requires less total hauling activity than either of the two CBR scenarios (Tables 2.1-2.3). The CIP scenario can also be completed within a shorter time frame than the two CBR scenarios (12-24 months *versus* 24-48 months). The CIP scenario is therefore expected to result in fewer delays to re-development than either the CBR-Onsite or CBR-Offsite scenarios.

**Natural Resources and Habitat**

Construction is likely to have a negative short-term impact on the natural resources and habitat in the vicinity of the GMF and the on-Site borrow soil location. For example, excavation of the impoundment and the borrow soil location could result in the destruction of some habitat that may currently overlie these areas under all closure scenarios. Closure could also result in long-term shifts in the habitat overlying the impoundment and the borrow soil location (*e.g.*, areas of the impoundment that are not currently grassland would be converted to grassland). Use of the on-Site and off-Site landfill under the CBR-Onsite and CBR-Offsite scenarios, in contrast, is not expected to result in significant habitat changes, because these landfills are already in use.

In addition to direct impacts on the existing habitat atop the impoundment and the borrow soil location, construction activities may have indirect impacts by causing alarm and escape behavior in wildlife near these locations. For the GMF, the duration of time over which the direct and indirect habitat impacts of construction will occur (*i.e.*, the duration of construction activities) is longest under the two CBR scenarios (24-48 months) and shortest under the CIP scenario (12-24 months). Thus, negative short-term impacts on natural resources and habitat are expected to be smallest under the CIP scenario.

The GMF is not located immediately adjacent to wetlands or notable surface water bodies, such as rivers or lakes (US FWS, 2021). For this reason, construction activities in the vicinity of the GMF are not expected to have a significant negative impact on any wetland or aquatic species (due to, *e.g.*, erosion and sediment runoff). Impacts are expected to be limited to terrestrial species. According to the Illinois Department of Natural Resources (IDNR) Natural Heritage Database and the United States Fish & Wildlife Service (US FWS) Environmental Conservation Online System, there are 11 state threatened species, 12 state endangered species, three federally threatened species, and one federally endangered species within Fulton County (Ramboll, 2021b,c). To our knowledge, however, no threatened or endangered species have been identified at the Site (Ramboll, 2021b,c). Based on the information that is currently available, we do not expect construction activities to have negative impacts on any threatened or endangered species.

### 2.2.5 Time Until Groundwater Protection Standards Are Achieved (IAC Sections 845.710(b)(1)(E) and 845.710(d)(2 and 3))

The primary groundwater migration pathway near the GMF is within the shallow sand unit within the uppermost aquifer. Groundwater flow in the shallow sand unit is generally in a northwest to southeast direction. Seasonal variation in groundwater levels at the GMF occurs and can result in groundwater elevation fluctuations of approximately 1-10 feet. There is no observable seasonal variation in groundwater flow direction at the GMF associated with these groundwater elevation changes. Groundwater flows toward the Duck Creek Cooling Pond, which is located approximately 2,100 feet east of the GMF (Ramboll, 2022).

Based on a statistical analysis and evaluation of potential exceedances, it was determined that there are no potential groundwater exceedances of applicable groundwater standards attributable to the GMF (Ramboll, 2022). However, a groundwater model was developed to evaluate whether groundwater

Electronic Filing: Received, Clerk's Office 06/20/2024

concentrations would maintain compliance with the GWPSs post-closure under the CIP scenario. For this evaluation, a groundwater flow model was developed and calibrated in MODFLOW. Contaminant transport was evaluated using MODPATH, and vertical percolation from the GMF into groundwater was evaluated using the HELP model (Ramboll, 2022).

The results of contaminant transport modeling *via* particle tracking for the CIP scenario at the GMF indicate that all particles will remain within the footprint of the GMF. Over a model-simulated period of 100 years following closure by CIP, the mean travel distance of all particles within the liner system and gypsum in the GMF was 0.29 feet horizontally and 0.03 feet vertically (Ramboll, 2022). Based on these modeling results, it was concluded that groundwater concentrations under the CIP scenario are expected to maintain compliance with the GWPSs well into the future (Ramboll, 2022).

### 2.2.6 Potential for Exposure of Humans and Environmental Receptors to Remaining Wastes, Considering the Potential Threat to Human Health and the Environment Associated with Excavation, Transportation, Re-disposal, Containment, or Changes in Groundwater Flow (IAC Section 845.710(b)(1)(F))

Section 2.2.1 evaluates potential risks to human and ecological receptors arising from the potential leaching of CCR-associated constituents from the GMF. Section 2.2.2 evaluates the potential for sudden CCR releases to occur at the GMF due to, *e.g.*, dike failure or overtopping during floods or other storm-related events. In summary, under all evaluated closure scenarios, there is no current or future risk to any human or ecological receptors associated with the GMF. Additionally, there is minimal current or future risk of overtopping due to flood conditions. Dike failure due to, *e.g.*, seismic activity and storm-related events is also exceedingly unlikely.

Section 2.2.4 evaluates several potential risks to human health and the environment during closure activities, including risks of accidents occurring among workers; risks to nearby residents and EJ communities related to accidents, traffic, noise, and air pollution; and risks to natural resources and wildlife. The findings from this section of the text are summarized in Table S.1.

### 2.2.7 Long-Term Reliability of the Engineering and Institutional Controls (IAC Section 845.710(b)(1)(G))

As described in Section 2.2.2, there is minimal risk of engineering or institutional failures leading to sudden releases of CCR from the GMF post-closure under the CIP scenario. Under the CBR-Onsite and CBR-Offsite scenarios, there is no risk of engineering or institutional failures leading to sudden releases of CCR post-closure. Additionally, there are no current or future unacceptable risks to any human or ecological receptors associated with the GMF under any of the closure scenarios (see Section 2.2.1 above). Moreover, reliable engineering and institutional controls (*e.g.*, a bottom liner, a leachate management system, and groundwater monitoring) will be implemented at the on-Site and off-Site landfills under the CBR-Onsite and CBR-Offsite scenarios. All of the evaluated closure scenarios are therefore reliable with respect to long-term engineering and institutional controls.

### 2.2.8 Potential Need for Future Corrective Action Associated with the Closure (IAC Section 845.710(b)(1)(H))

At this time, we do not anticipate a need for corrective action at the GMF under any closure scenario.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 2.3 Effectiveness of the Closure Alternative in Controlling Future Releases (IAC Section 845.710(b)(2))

### 2.3.1 Extent to Which Containment Practices Will Reduce Further Releases (IAC Section 845.710(b)(2)(A))

The gypsum in the GMF currently poses no unacceptable risks to human health or the environment (Section 2.2.1). Because current conditions do not present a risk to human health or the environment, and groundwater concentrations are expected to remain stable and/or decline post-closure, there will also be no unacceptable risks to human health or the environment following closure of the impoundments, regardless of the closure scenario.

Section 2.2.2 discussed the potential for dike failure or flood overtopping to occur during or following closure activities, resulting in a sudden release of CCR. That analysis showed that there is minimal risk of CCR releases occurring at the GMF following closure under any closure scenario.

### 2.3.2 Extent to Which Treatment Technologies May Be Used (IAC Section 845.710(b)(2)(B))

At this time, we do not anticipate a need for the use of treatment technologies other than source control (*i.e.*, CIP, CBR-Onsite, and CBR-Offsite) at the GMF under any closure scenario.

## 2.4 Ease or Difficulty of Implementing Closure Alternative (IAC Section 845.710(b)(3))

### 2.4.1 Degree of Difficulty Associated with Constructing the Closure Alternative

CIP using a final cover system is a reliable and standard method for closing impoundments. However, dewatering and relocating saturated gypsum as part of closure activities at the GMF may be moderately challenging. Careful planning will be required to work safely on the wet gypsum within the GMF.

Excavation and landfilling of CCR is also a reliable and standard method for closing impoundments. However, relative to CIP, CBR-Onsite, and CBR-Offsite pose additional implementation difficulties due to higher earthwork volumes, higher dewatering volumes, and longer construction schedules. Dewatering the gypsum in the GMF prior to excavation will require considerable effort and time. Removal and disposal of the existing bottom liner geomembranes may also prove challenging during CBR activities. Specifically, it may be difficult to remove and handle the geomembranes. Additionally, the geomembranes may need to be decontaminated prior to disposal. Finally, the geomembranes may not be accepted for disposal at the off-Site landfill.

Hauling will be easier to implement under the CBR-Onsite scenario than under the CBR-Offsite scenario, due to less haul traffic on public roadways. Additionally, because the CBR-Offsite scenario involves hauling CCR off-Site (*i.e.*, intrastate travel), a higher level of dewatering will be required compared to the CBR-Onsite scenario. As described in Section 2.2.4.2 ("Community Risks"), off-Site hauling may also have detrimental community impacts due to an increased incidence of vehicle accidents, truck traffic, noise, and air pollution.

Electronic Filing: Received, Clerk's Office 06/20/2024

In addition to off-Site hauling, off-Site landfilling under the CBR-Offsite scenario may pose particular challenges. A disposal plan will need to be developed between IPRG and the owner/operator of the third-party landfill in order to outline acceptable waste conditions upon delivery, daily waste production rates, and the expected duration of the project. Off-Site landfilling may additionally raise issues related to the co-disposal of CCR and liner materials and other non-hazardous wastes. Finally, the construction schedule for excavation may be negatively impacted if, during the course of closure, it is determined that the off-Site landfill must be expanded in order to receive all of the materials excavated from the GMF.

### 2.4.2 Expected Operational Reliability of the Closure Alternative

The operational reliability of the CIP scenario, the CBR-Onsite scenario, and the CBR-Offsite scenario is expected to be similar. The GMF currently includes a bottom liner system, and CIP will utilize a final cover system that includes a geomembrane. Under the CIP scenario, the gypsum in the GMF will therefore be surrounded by an engineered containment system on the top, sides, and bottom. The CBR-Offsite and CBR-Onsite scenarios similarly involve placing the gypsum from the GMF in an engineered landfill system that has a bottom liner, leachate collection system, and final cover system, resulting in the gypsum being surrounded by an engineered containment system on the top, sides, and bottom. The operational reliability of all three closure scenarios is therefore expected to be similar for both impoundments. Moreover, high operational reliability is expected under all scenarios due to the full containment of CCR and liner materials.

### 2.4.3 Need to Coordinate with and Obtain Necessary Approvals and Permits from Other Agencies

Permits and approvals will be needed under all closure scenarios. Components of the three closure scenarios that are expected to require a permit include:

- A modification to the existing NPDES permit through IEPA to allow the disposal of water generated from unwatering and dewatering operations to the Illinois River *via* the existing NPDES-permitted outfall for the Site;
- A construction permit from the IDNR, Office of Water Resources, Dam Safety Program to allow the embankment and spillways of the impoundment to be modified as part of closure;
- A construction stormwater permit through IEPA, including construction stormwater controls and other BMPs such as silt fences and other measures; and
- A joint water pollution control construction and operating permit (WPC permit).

As discussed below in Section 2.4.5, the existing on-Site landfill will require expansion under the CBR-Onsite scenario in order to accommodate all of the material excavated from the GMF. The on-Site landfill has already been permitted for an expansion of an additional 2 acres of waste disposal area. Under the CBR-Offsite scenario, it may similarly be necessary to expand the off-Site landfill. Additional permitting may be required under this scenario for transport of the CCR and to expand the off-Site landfill. It may also be necessary to modify the operating plan for the off-Site landfill in order to accommodate the increased rate of filling of the landfill and the likely need for additional equipment and personnel to manage the receipt and disposal of the CCR and liner system materials.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 2.4.4 Availability of Necessary Equipment and Specialists

CIP, CBR-Onsite, and CBR-Offsite are reliable and standard methods for managing waste that rely on common construction equipment and materials and typically do not require the use of specialists, outside of typical construction labor and equipment operators. However, global supply chains have been disrupted due to the COVID-19 pandemic, resulting in shortages in the availability of construction equipment and parts. There may be some shortages in construction equipment under all scenarios, if supply chain resilience does not improve by the time of construction. Alternatively, extended downtime may be required for equipment repairs and maintenance. A national shortage of truck drivers has also developed during the COVID-19 pandemic. Due to higher earthwork volumes and a longer construction schedule under the CBR-Onsite and CBR-Offsite scenarios than under the CIP scenario, shortages in construction equipment may cause greater challenges under the CBR-Onsite and CBR-Offsite scenarios than under the CIP scenario. The current shortage of truck drivers may be particularly impactful under the CBR-Offsite scenario, due to the large volume of CCR and liner materials to be hauled from the Site. If sufficient trucks and truck drivers are not available, the construction schedule at both impoundments may lengthen based on hauling-related delays.

The availability of critical materials such as metal, wood, and electronic chips has also been impacted by the COVID-19 pandemic. However, soil materials and geomembrane liner materials have generally been available during 2021 for landfill development and closure projects.

### 2.4.5 Available Capacity and Location of Needed Treatment, Storage, and Disposal Services

Under the CIP scenario, the gypsum currently within the GMF will be consolidated and stored within the existing footprint of the impoundment. The GMF will be unwatered at the start of construction *via* pumping. Pumped water will be managed in accordance with the facility's NPDES permit. Treatment is not expected to be necessary prior to discharge.

The existing landfill on the Duck Creek property does not have sufficient capacity to receive all of the CCR and liner materials that are currently slated for landfilling under the CBR-Onsite scenario. Expansion of the on-Site landfill would thus be necessary. The on-Site landfill is already permitted for added waste disposal capacity, which would create an additional 2 acres of landfill area (Appendix B). The landfill expansion could be completed in a single construction season during the removal of ponded water at the GMF.

Under the CBR-Offsite scenario, up to 733,000 cubic yards of gypsum, liner materials, and additional subsoil overexcavation and 31 acres of geosynthetic liner system materials excavated from the GMF will require disposal at an off-Site landfill. An additional 7,000 cubic yards of material excavated from the BAB would also require disposal at the off-Site landfill, if CBR-Offsite were selected for the BAB. According to the IEPA "Illinois Landfill Disposal Capacity Report" for 2020 (IEPA, 2021b), the closest third-party landfill with the ability to receive and dispose of CCR from the Site is the Peoria City-County Landfill in Brimfield, Illinois. This facility has 750,000 cubic yards of remaining capacity in its current permitted footprint. It receives 230,000 cubic yards of waste annually, and is located 33 miles from the Site. The Peoria City-County Landfill therefore has sufficient capacity to receive all of the CCR and liner materials from the GMF. However, due to the limited space remaining in this landfill and the short time frame over which CCR would be received at the landfill, vertical and/or lateral expansions may become necessary. Additionally, the landfill operators may need to develop a disposal plan to account for the increased volume of material that will be received and the unique CCR and liner system waste characteristics. Elements of this disposal plan might include increasing daily operational capacity and procedures, expediting planned airspace construction, and potentially expediting landfill expansion. If

Electronic Filing: Received, Clerk's Office 06/20/2024

expansion of the Peoria City-County Landfill is impractical or infeasible, then an alternative landfill located farther from the Site would need to be identified. A likely alternative to the Peoria City-County Landfill is the Envirofil of IL Landfill in Macomb, Illinois. It has 7,700,000 cubic yards of remaining capacity in its current permitted footprint, receives 97,000 cubic yards of waste annually, and is located approximately 45 miles from the Site (IEPA, 2021b).

## 2.5 Impact of Closure Alternative on Waters of the State (IAC Section 845.710(d)(4))

As demonstrated in Gradient's Human Health and Ecological Risk Assessment (Appendix A of this report), modeled surface water concentrations in the Illinois River in the vicinity of the Site are all below relevant human health and ecological screening benchmarks. Due to closure activities, surface water concentrations of CCR-associated constituents are expected to remain stable and/or decline over time under all three closure scenarios. Thus, no future exceedances of any human health or ecological screening benchmarks are anticipated under any closure scenario. Additionally, the lined landfills that will receive any materials excavated from the GMF under the CBR-Onsite and CBR-Offsite scenarios will be managed to ensure that no surface water impacts occur in the vicinity of the landfills.

## 2.6 Concerns of Residents Associated with Closure Alternatives (IAC Section 845.710(b)(4))

Several nonprofits representing community interests near the Site have raised concerns regarding the potential impacts of coal ash impoundments at this Site on groundwater and surface water quality, including Earthjustice, the Prairie Rivers Network, and the Sierra Club (Earthjustice *et al*., 2018; Sierra Club, 2014; Sierra Club and CIHCA, 2014). These parties generally prefer CBR to CIP, citing fears that allowing CCR to remain in place "allows the widespread groundwater contamination to continue indefinitely" (Earthjustice *et al*., 2018, p. 24). For the GMF, both CIP and CBR are being considered; however, it is not the case that closing the GMF *via* CIP rather than CBR would result in undue risks to groundwater and surface water post-closure. As described in Sections 2.2.1 and 2.2.2, no current or future unacceptable risks to human or ecological receptors are associated with the GMF under any closure scenario. There is also minimal risk of future CCR releases occurring under any closure scenario. Furthermore, based on a model-simulated period of 100 years, groundwater concentrations under the CIP scenario are expected to maintain compliance with the GWPSs post-closure (Ramboll, 2022). In summary, all closure scenarios are responsive to residents' concerns regarding groundwater and surface water quality.

For the GMF, the CIP scenario has advantages over the CBR-Offsite and CBR-Onsite scenarios with regard to likely community concerns. Specifically, compared to the other evaluated alternatives, CIP presents fewer risks to workers and community members during construction in the form of accidents, traffic, and air pollution (Section 2.2.4 above) and is also associated with the shortest time to closure. By minimizing the expected time to closure, CIP minimizes the duration of negative impacts arising from construction activities and minimizes the time required to re-develop the Site for use in utility-scale solar generation. Re-development of the Site for use in solar generation and storage will bring new jobs to the community and contribute positively to Illinois's growing renewable energy portfolio.

A public meeting was held on December 7, 2021, pursuant to requirements under IAC Section 845.710(e) (IEPA, 2021a). Questions raised by attendees were answered at the meeting; subsequently, a written summary of all questions and responses was emailed to interested parties.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 2.7 Class 4 Cost Estimate (IAC Section 845.710(d)(1))

A cost estimate has been prepared for each of the closure scenarios (Appendix B). A summary of these estimates is provided in Table 2.7. The total expected cost of closure under the CIP scenario is $6,210,000. The total expected cost of closure under the CBR-Onsite scenario is $8,870,000. The total expected cost of closure under the CBR-Offsite scenario is $82,400,000. Costs under the CIP scenario are therefore considerably smaller than costs under the CBR-Onsite and CBR-Offsite scenarios.

**Table 2.7 Expected Costs of Closure – GMF**

| Work Element | CIP | CBR-Onsite | CBR-Offsite |
|---|---|---|---|
| Mobilization/Demobilization | $488,000 | $727,000 | $6,810,000 |
| Surveying and Site Preparation | $125,000 | $50,000 | $25,000 |
| Dewatering, Unwatering, and Stormwater Management | $2,260,000 | $2,310,000 | $2,280,000 |
| Impoundment Closure and Site Restoration | $2,800,000 | $4,660,000 | $65,800,000 |
| Landfill Expansion | $0 | $331,000 | $0 |
| Miscellaneous Construction | $537,000 | $800,000 | $7,490,000 |
| **Total:** | **$6,210,000** | **$8,870,000** | **$82,400,000** |

Notes:
CBR-Offsite = Closure-by-Removal with Off-Site Disposal; CBR-Onsite = Closure-by-Removal with On-Site Disposal; CIP = Closure-in-Place; GMF = Gypsum Management Facility.
Costs are for comparative purposes only. Actual costs will be paid based on actual quantities and may vary from those calculated.
Source: Appendix B.

All three closure scenarios meet or exceed a Class 4 estimate under the Association for the Advancement of Cost Engineering (AACE) Classification Standard (or a comparable classification practice as provided in the AACE Classification Standard), as required by IAC Section 845.710 (IEPA, 2021a).

## 2.8 Summary
