# Dam Inspection Report

Name of Dam IPRG Duck Creek Gypsum Stack & Recycle Pond Dams Dam ID No. IL50573 & IL50574

Permit Number DS2007125 Class of Dam III

Location NW 1/4 Section 18 Township 6N Range 5E 4th P.M.

Owner

Name Telephone Number (Day)

Street Telephone Number (Night)

City Zip Code County Fulton

Type of Dam Homogeneous earthen embankment (gypsum stack is homogeneous gypsum embankment)

Type of Spillway

Date(s) Inspected

Weather When Inspected

Temperature When Inspected

Pool Elevation When Inspected

Tailwater Elevation When Inspected

Inspection Personnel:

The Department of Natural Resources is requesting information that is necessary to accomplish the statutory purpose as outlined under the River, Lakes and Streams Act, 615 ILCS 5 (1994 State Bar Edition). Submittal of this information is REQUIRED. Failure to provide the required information could result in the initiation of non-compliance procedures as outlined in Section 702.160 of the "Rules for Construction and Maintenance of Dams". This form has been approved by the State Forms Management Center.

Electronic Filing: Received, Clerk's Office 06/20/2024

# CONDITION CODES

| | | |
|---|---|---|
| **EC** | **-** | **Emergency Condition. A serious dam safety condition exists that needs immediate action. Emergency measures implemented as instructed by Chief Dam Safety Engineer; such as, pool draw down, work stoppage, plant stoppage.** |
| **NE** | **-** | **No evidence of a problem** |
| **GC** | **-** | **Good condition** |
| **MM** | **-** | **Item needing minor maintenance and/or repairs within the year, the safety or integrity of the item is not yet imperiled** |
| **IM** | **-** | **Item needing immediate maintenance to restore or ensure its safety or integrity. Remediation should be completed within 1 month.** |
| **EC** | **-** | **Emergency condition which if not immediately repaired or other appropriate measures taken could lead to failure of the dam** |
| **OB** | **-** | **Condition requires regular observation to ensure that the condition does not become worse** |
| **NA** | **-** | **Not applicable to this dam** |
| **NI** | **-** | **Not inspected - list the reason for non-inspection under deficiencies** |
| **EC** | **-** | **Emergency Condition. A serious dam safety condition exists that needs immediate action. Emergency measures implemented as instructed by Chief Dam Safety Engineer; such as, pool draw down, work stoppage, plant stoppage.** |

# APPENDIX E
# HERBICIDES

Electronic Filing: Received, Clerk's Office 06/20/2024

# HERBICIDES

Site personnel should check with the Illinois Department of Natural Resources, Regional Fisheries Biologist and the Regional Wildlife Biologist before using any herbicide. Read the product label prior to use and follow the use directions and precautions accordingly.

On March 1, 1979 the U.S. Environmental Protection Agency (U.S.E.P.A.) halted the use of the herbicide 2, 4, 5-T in parks and recreation areas. The use of silvex (2, 4, 5-TP) around water has also been banned.

The Agronomy Department at the University of Illinois and the Aquatic Biology Section of the Department of Natural Resources, Office of Scientific Research and Analysis indicate that the herbicides containing the 2, 4-D or 2, 4-DP are legal for use in parks and recreation areas and effective for controlling brush and woody growth. Some examples of approved herbicides are:

1. Tordon RTU by DOW Chemical. (Can be obtained with blue dye.)
2. WEEDONE 170 by Union Carbide
3. WEEDONE, 2, 4-DP by Union Carbide
4. A 1% to 2% solution of ROUNDUP
5. Garlon by DOW Chemical
6. Banvel by Sandoz

Your distributor may carry brand name herbicides other than those listed above. Be certain that the product does not contain the ingredients 2, 4, 5-T or 2, 4, 5-TP. An example of an unacceptable product is ESTERON 2, 4, 5 by DOW Chemical.

Electronic Filing: Received, Clerk's Office 06/20/2024

# ATTACHMENT C

Electronic Filing: Received, Clerk's Office 06/20/2024

**Duck Creek Power Plant – GMF Pond System's Chemical Constituents**

In accordance with 35 I.A.C. 845.230(d)(2)(C), IPRG is submitting available/existing analyses of "the chemical constituents of all waste streams, chemical additives and sorbent materials entering or contained in" the CCR impoundments, GMF Pond System.

A list of the chemical constituents contained in the CCR surface impoundment and gypsum can be found in Appendix A. As determined through antidegradation studies, this list contains chemical constituents found in the surface free liquid. A list of chemical additives, sorbent materials and waste streams that were submitted in the facility's NPDES permit applications to IEPA within the past ten years at a minimum and/or listed in the current NPDES permit (IL0055620) can be found in Appendix B. For the chemical additives used, IPRG is also including in Appendix C the safety data sheet's Section 3 Composition/Information on Ingredients.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Appendix A: Chemical Constituents Contained in the GMF Pond System

| Pollutant | GMF Pond System | | | |
|---|---|---|---|---|
| | Surface Free Liquids Average Concentration | Units | Spray Dryer Absorber/Gypsum Concentration** | Units |
| Aluminum | | | 236 | mg/kg |
| Ammonia | 430 | mg/L | | mg/kg |
| Antimony | | | < 0.79 | mg/kg |
| Arsenic | | | < 0.79 | mg/kg |
| Barium | | | 7.9 | mg/kg |
| Beryllium | | | < 0.32 | mg/kg |
| Boron | 71 | mg/L | 72.3 | mg/kg |
| Cadmium | | | < 0.13 | mg/kg |
| Calcium | | | 243,000 | mg/kg |
| Chloride | 3,500 | mg/L | | mg/kg |
| Chromium | | | 4.8 | mg/kg |
| Chromium * | | | 4.8 | mg/kg |
| Cobalt | | | < 0.79 | mg/kg |
| Copper | | | < 1.6 | mg/kg |
| Fluoride | | | 16 | mg/kg |
| Iron | | | 570 | mg/kg |
| Lead | | | 0.47 | mg/kg |
| Lithium | | | < 0.79 | mg/kg |
| Magnesium | | | 2,170 | mg/kg |
| Manganese | | | 73.8 | mg/kg |
| Mercury | 0.0018 | mg/L | 0.073 | mg/kg |
| Molybdenum | | | < 0.79 | mg/kg |
| Nickel | | | 1.2 | mg/kg |
| pH | | | 7.2 | SU |
| Potassium | | | 121 | mg/kg |
| Selenium | | | 8.8 | mg/kg |
| Silver | | | < 0.79 | mg/kg |
| Sodium | | | 305 | mg/kg |
| Sulfate | 4,300 | mg/L | | mg/kg |
| Thallium | | | < 0.16 | mg/kg |
| TDS | 12,000 | mg/L | | mg/kg |
| TSS | 30 | mg/L | | mg/kg |
| Vanadium | | | < 1.6 | mg/kg |
| Zinc | | | < 7.9 | mg/kg |

*Chromium screened as both Total Chromium and Hexavalent Chromium to be conservative.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Appendix B: List of Chemical Additives, Waste Streams and Sorbent Materials**

| Chemical Additives |
|---|
| Nalco – 71D5 Plus (Anti-Foam) |
| Activated Carbon (100%) |
| |

| Waste Streams and Sorbent Materials* |
|---|
| Gypsum Slurry |
| |
| |

*No sorbent materials

Electronic Filing: Received, Clerk's Office 06/20/2024

**Appendix C: SDS Section 3 Composition/Information on Ingredients**

## SAFETY DATA SHEET

## NALCO® 71D5 PLUS

### Section: 3. COMPOSITION/INFORMATION ON INGREDIENTS

Pure substance/mixture : Mixture

| Chemical Name | CAS-No. | Concentration: (%) |
|---|---|---|
| Straight Run Middle Distillate | 64741-44-2 | 30 - 60 |
| Hydrotreated Light Distillate | 64742-47-8 | 10 - 30 |
| Polypropylene Glycol | 25322-69-4 | 5 - 10 |
| 1-Octanol | 111-87-5 | 1 - 5 |
| Fatty Alkyl Polyglycol | Proprietary | 1 - 5 |
| Aliphatic alcohol | Proprietary | 1 - 5 |
| Paraffin Wax | 8002-74-2 | 1 - 5 |

Electronic Filing: Received, Clerk's Office 06/20/2024

DYNEGY

# Safety Data Sheet

## Section 1
## Identification of the Substance and of the Supplier

### 1.1 Product Identifier

| | |
|---|---|
| **Product Name/Identification:** | FGD Gypsum |
| **Synonyms:** | Gypsum, calcium sulfate dihydrate, calcium sulphate dihydrate, gesso, alabaster, plaster of Paris. |
| **Formula:** | UVCB Substance |

### 1.2 Relevant Identified Uses of the Substance or Mixture and Uses Advices Against

| | |
|---|---|
| **Relevant Identified Uses:** | Component of wallboard, concrete, roofing material, bricks, cement kiln feed, agricultural amendment. |
| **Uses Advised Against:** | None known. |

### 1.3 Details of the Supplier of the SDS

| | |
|---|---|
| **Manufacturer/Supplier:** | Dynegy, Inc. |
| **Street Address:** | 601 Travis Street, Suite 1400 |
| **City, State and Zip Code:** | Houston, TX 77002 |
| **Customer Service Telephone:** | 800-633-4704 |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 2
## Hazards Identification

### 2.1 Classification of the Substance

**GHS Classification(s) according to OSHA Hazard Communication Standard (29 CFR 1910.1200):**

- STOT-SE Category 3 (Respiratory Irritation)
- STOT-RE Category 1 (Lungs)
- Carcinogen Category 1A

### 2.2 Label Elements

| ***Labelling according to 29 CFR 1910.1200 Appendices A, B and C**** | |
|---|---|
| ***Hazard Pictogram(s):*** |  |
| ***Signal word:*** | **DANGER** |
| ***Hazard Statement(s):*** | *May cause respiratory irritation.*<br>*Causes damage to lungs after repeated/prolonged exposure via inhalation.*<br>*May cause cancer of the lungs.* |
| ***Precautionary Statement(s):*** | *Obtain special instructions before use.*<br>*Do not handle until all safety precautions have been read and understood.*<br>*Do not breathe dust.*<br>*Wash hands thoroughly after handling.*<br>*Do not eat, drink or smoke when using this product.*<br>*Wear protective gloves/protective clothing/eye protection/face protection.*<br>*Do not eat drink or smoke when using this product.*<br>*Use outdoors or in a well-ventilated area.*<br>*If inhaled: Remove to fresh air and keep comfortable for breathing.*<br>*Get medical advice/attention if you feel unwell.*<br>*Store in a secure area.*<br>*Dispose of product in accordance with local/national regulations.* |

*The following elements may be present in trace amounts as oxides: aluminum, calcium, iron, magnesium, nickel, phosphorus, potassium, silicon, sulfur, titanium, and vanadium. The exact composition of the gypsum will be dependent on the fuel source and flue additives composed of many constituents.*

Electronic Filing: Received, Clerk's Office 06/20/2024

### 2.3 Other Hazards

**Listed Carcinogens:**

**-Respirable Crystalline Silica**

**IARC:** [Yes] **NTP:** [Yes] **OSHA:** [Yes] **Other:** **(ACGIH)** [Yes]

## Section 3
## Composition/Information on Ingredients

| ***Substance*** | ***CAS No.*** | ***Percentage (%)*** | ***GHS Classification*** |
|---|---|---|---|
| *Calcium sulfate, dihydrate* | *10104-14-1* | *90 - 99%* | *STOT – Single Exposure Category 3 (Respiratory Irritation)* |
| *Crystalline Silica* | *14808-60-7* | *≥0.1 - 3%* | *STOT – Repeated Exposure Category 1 (Lung)*<br>*Carcinogen, Category 1A* |
| *Silica, crystalline respirable (RCS)* | *14808-60-7* | ***See Footnote 1*** | *STOT – Repeated Exposure Category 1 (Lungs)*<br>*Carcinogen Category 1A* |
| *Fly Ash* | *68131-74-8* | *<2%* | *STOT – Single Exposure Category 3 (Respiratory Irritation)* |

***Footnote 1:*** *The percentage of respirable crystalline silica has not been determined. Therefore, a GHS classification of Carcinogen, Category 1A has been assigned.*

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 4
## First Aid Measures

### 4.1 Description of First Aid Measures

| | |
|---|---|
| **Inhalation:** | If product is inhaled and irritation of the nose or coughing occurs, remove person to fresh air. Get medical advice/attention if respiratory symptoms persist. |
| **Skin Contact:** | If skin exposure occurs, wash with soap and water. |
| **Eye Contact:** | If product gets into the eye, rinse copiously with water for several minutes. Remove contact lenses, if present and easy to do. Seek medical attention/advice if irritation occurs or persists. |
| **Ingestion:** | No specific first aid measures are required. |

### 4.2 Most Important Health Effects, Both Acute and Delayed

**Acute Effects:** Short-term airborne exposure to FGD gypsum dust may cause respiratory irritation. Direct exposure can dry and irritate the skin and cause dermatitis or eye irritation through mechanical abrasion.

**Chronic Effects:** Chronic (long-term) exposure to FGD gypsum may cause lung damage from repeated exposure. Prolonged inhalation of dusts containing respirable crystalline silica above certain concentrations may cause lung disease (silicosis) and lung cancer.

### 4.3 Indication of Any Immediate Medical Attention and Special Treatment Needed

Seek first aid or call a doctor or Poison Control Center if contact with eyes occurs and irritation remains after rinsing. Get medical advice if inhalation occurs and respiratory symptoms persist.

## Section 5
## Firefighting Measures

### 5.1 Extinguishing Media

| | |
|---|---|
| **Suitable Extinguishing Media:** | Product is not flammable. Use extinguishing media appropriate for surrounding fire. |
| **Unsuitable Extinguishing Media:** | Not applicable, the product is not flammable. |

Electronic Filing: Received, Clerk's Office 06/20/2024

### 5.2 Special Hazards Arising from the Substance or Mixture

| | |
|---|---|
| **Hazardous Combustion Products:** | Above 1450°C (~2600°F), gypsum decomposes to calcium oxide and sulfur dioxide. |

### 5.3 Advice for Firefighters

| | |
|---|---|
| **Special Protective Equipment and Precautions for Firefighters:** | As with any fire, wear self-contained breathing apparatus (NIOSH approved or equivalent) and full protective gear. |

## Section 6
## Accidental Release Measures

### 6.1 Personal Precautions, Protective Equipment and Emergency Procedures

| | |
|---|---|
| **Personal precautions/Protective Equipment:** | See Section 8.2.2 Individual Protective Measures. For concentrations exceeding Occupational Exposure Levels (OELs), use a self-contained breathing apparatus (SCBA). |
| **Emergency procedures:** | Use scooping, water spraying/flushing/misting or ventilated vacuum cleaning systems to clean up spills. Do not use pressurized air. |

### 6.2 Environmental Precautions

| | |
|---|---|
| **Environmental precautions:** | Prevent contamination of drains or waterways and dispose according to local and national regulations. |

### 6.3 Methods and Material for Containment and Cleaning Up

| | |
|---|---|
| **Methods and materials for containment and cleaning up:** | Do not use brooms or compressed air to clean surfaces. Use dust collection vacuum and extraction systems.<br>Large spills of dry product should be removed by a vacuum system. Dampened material should be removed by mechanical means and recycled or disposed of according to local and national regulations. |

See Sections 8 and 13 for additional information on exposure controls and disposal.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 7
## Handling and Storage

### 7.1 Precautions for Safe Handling

Practice good housekeeping. Use adequate exhaust ventilation, dust collection and/or water mist to maintain airborne dust concentrations below permissible exposure limits (note: respirable crystalline silica dust may be in the air without a visible dust cloud).

Do not permit dust to collect on walls, floors, sills, ledges, machinery, or equipment. Maintain and test ventilation and dust collection equipment. In cases of insufficient ventilation, wear a NIOSH approved respirator for silica dust when handling or disposing dust from this product. Avoid contact with skin and eyes. Wash or vacuum clothing that has become dusty. Avoid eating, smoking, or drinking while handling the material.

### 7.2 Conditions for Safe Storage, Including any Incompatibilities

Minimize dust produced during loading and unloading.

## Section 8
## Exposure Controls/Personal Protection

### 8.1 Control Parameters

| OCCUPATIONAL EXPOSURE LIMITS | | | | | |
|---|---|---|---|---|---|
| **SUBSTANCE** | | **OSHA PEL TWA ($mg/m^3$)** | **NIOSH REL TWA ($mg/m^3$)** | **ACGIH TLV TWA ($mg/m^3$)** | **CA - OSHA PEL ($mg/m^3$)** |
| **Particulates Not Otherwise Regulated** | Total | 15 | 15 | 10 | 10 |
| | Respirable | 5 | 5 | 3 | 5 |
| **Respirable Crystalline Silica** | Total Respirable | 0.05- | 0.05 | 0.025 | 0.05 |
| **Calcium Sulfate, anhydrous (CAS# 7778-18-9)** | Total Dust | * | 10 | 10 | * |
| | Respirable | * | 5 | - | * |
| Note: In the absence of a CA-PEL, the value for Particulates Not Otherwise Regulated (PNOR) is applied. | | | | | |

### 8.2 Exposure Controls

### 8.2.1 Engineering Controls

Electronic Filing: Received, Clerk's Office 06/20/2024

Provide ventilation to maintain the ambient workplace atmosphere below the occupational exposure limit(s). Use general and local exhaust ventilation and dust collection systems as necessary to minimize exposure.

### 8.2.2 Personal Protective Equipment (PPE)

| | |
|---|---|
| **Respiratory protection:** | Wear a NIOSH approved particulate respirator if exposure to airborne particulates is unavoidable and where occupational exposure limits may be exceeded. If airborne exposures are anticipated to exceed applicable PELs or TLVs, a self-contained breathing apparatus or airline respirator is recommended. |
| **Eye and face protection:** | If eye contact is possible, wear protective glasses with side shields. Avoid contact lenses. |
| **Hand and skin protection:** | Wear gloves and protective clothing. Wash hands with soap and water after contact with material. |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 9
## Physical and Chemical Properties

### 9.1 Information on Basic Physical and Chemical Properties

| Property: Value | Property: Value |
|---|---|
| **Appearance (physical state, color, etc.):** White or gray cake-like material | **Upper/lower flammability or explosive limits:** Not applicable |
| **Odor:** Odorless | **Vapor Pressure (Pa):** Not applicable |
| **Odor threshold:** Not applicable | **Vapor Density:** Not applicable |
| **pH (25 °C) (in water):** 6 - 8 | **Specific gravity or relative density:** 2.0 – 2.9 |
| **Melting point/freezing point (°C):** 128 | **Water Solubility:** 0.1 – 0.3% |
| **Initial boiling point and boiling range (°C):** >163 | **Partition coefficient: n-octane/water:** Not determined |
| **Flash point (°C):** Not determined | **Auto ignition temperature (°C):** Not applicable |
| **Evaporation rate:** Not applicable | **Decomposition temperature (°C):** 1450 |
| **Flammability (solid, gas):** Nonflammable/non-combustible | **Viscosity:** Not applicable |

## Section 10
## Stability and Reactivity

| | |
|---|---|
| **10.1 Reactivity:** | Avoid contact with strong acids or oxidizers and diazomethane. |
| **10.2 Chemical stability:** | The material is stable under normal use conditions. |
| **10.3 Possibility of hazardous reactions:** | The material is a relatively stable, inert material; polymerization will not occur. |
| **10.4 Conditions to avoid:** | Product can become airborne in moderate winds. Dry material should be stored in silos. Materials stored out of doors should be covered or maintained in a damp condition. |
| **10.5 Incompatible materials:** | Acids, ammonium salts, diazomethane, phosphorus and aluminum metal. |
| **10. 6 Hazardous decomposition products:** | None known. |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 11
## Toxicological Information

### 11.1 Information on Toxicological Effects

| Endpoint | Data |
|---|---|
| **Acute oral toxicity** | Oral LD50 > 2000 mg/kg |
| **Acute dermal toxicity** | No data. |
| **Acute inhalation toxicity** | Inhalation LC50: > 3.26 mg/L |
| **Skin corrosion/irritation** | Not irritating or corrosive to skin based on 4-hour, semi-occlusive exposure to rabbits. |
| **Eye damage/irritation** | No positive responses in rabbits based upon 24-, 48-, and 72-hour mean scores for corneal opacity, iritis, conjunctival redness/edema. |
| **Respiratory/skin sensitization** | Not a respiratory or dermal sensitizer. |
| **Germ cell mutagenicity** | Several in vitro and in vivo mutagenicity assays determined that calcium sulfate, dihydrate was non-mutagenic, with and without metabolic activation. |
| **Carcinogenicity** | No data on calcium sulfate, dihydrate. Carcinogenic studies were not conducted based on the non-neoplastic effects noted in the oral and inhalation repeated dose studies as well as the negative mutagenicity assays.<br>Respirable crystalline silica has been identified as a carcinogen by NTP, IARC, ACGIH and OSHA. |
| **Reproductive toxicity** | No significant developmental or reproductive toxicity were identified in rabbits after exposure to either calcium sulfate, dehydrate or calcium sulfate, dihydrate. |
| **STOT-SE** | Acute toxicity testing did not result in direct organ toxicity after a single exposure to calcium sulfate, dihydrate. However, as the form tested was not indicated, FGD gypsum dust may result in mechanical respiratory irritation. |
| **STOT-RE** | A repeat dose oral toxicity study (35-45 days) with calcium sulfate, dihydrate conducted using rats reported a NOAEL for males of 100 mg/kg/day on the basis of decreased total protein, albumin, blood urea nitrogen, and creatinine levels observed at the 300 and 1,000 mg/kg/day dose groups. No effects were observed in females.<br>Repeated inhalation exposures to high levels of respirable crystalline silica may result in lung damage (silicosis) and lung cancer. |
| **Aspiration Hazard** | Not applicable based on product form. |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 12
## Ecological Information

### 12.1 Toxicity

| **Calcium sulfate (CAS# 7778-18-9)** [1] | |
|---|---|
| **Toxicity to Fish** | Fathead Minnow (*Pimephales promelas*):<br>Acute, 7-day LC50 > 1,970 mg/L<br>Acute, 96-hour NOEC = 1,470 mg/L |
| | Rainbow trout (*Oncorhynchus mykiss*):<br>Chronic, 30-day NOEC (survival, growth, reproduction) = 732 mg/L |
| | Bluegill (*Lepomis macrochirus*):<br>Acute, 96-hour LC50 = 2,890 mg/L |
| **Toxicity to Aquatic Invertebrates** | Water Flea (*Ceriodaphnia dubia*):<br>Acute, 96-hour NOEC = 1447.4 mg/L |
| | Water Flea (*Daphnia magna*):<br>Acute, 48-hour LC50 = 1,970 mg/L<br>Chronic, 21-day NOEC (and 42-day post-hatch): 1,600 mg/L |
| **Toxicity to Aquatic Algae and Plants** | Algae (*Navicula seminulum; Nitzschia linearis*):<br>Chronic, 96-hour LC50 and EC50 (growth) = 3,200 mg/L |

[1]The aquatic toxicity of sulfate has been shown to be dependent on water hardness, generally decreasing as hardness increases.

### 12.2 Persistence and Degradability

Not relevant for inorganic materials.

### 12.3 Bioaccumulative Potential

This material does not contain any compounds that that would bioaccumulate up the food chain.

### 12.4 Mobility in Soil

No data available.

### 12.5 Results of PBT and vPvB Assessment

This material does not contain any compounds classified as “persistent, bioaccumulative or toxic” nor as “very persistent/very bioaccumulative”.

### 12.6 Other Adverse Effects

None known.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 13
## Disposal Considerations

See Sections 7 and 8 above for safe handling and use, including appropriate industrial hygiene practices.

Dispose of all waste product and containers in accordance with federal, state and local regulations.

# Memorandum

BURNS McDONNELL

Date: 25 October 2021

Subject: 35 Ill. Admin. Code Part 845 - Fault Area Location Demonstration for GMF Pond at Duck Creek Power Plant

Illinois Power resources Generating, LLC operates the coal-fired Duck Creek Power Plant located in Fulton County, Illinois. The Duck Creek GMF Pond is an existing surface impoundment storing coal combustion residuals (CCR). The requirements for the Duck Creek GMF Pond are found in 35 Ill. Admin. Code (I.A.C.) 845 (Part 845).

This memorandum addresses the requirements of Section 845.320 Fault Areas, which states:

*Section 845.320 Fault Areas*

a) *Existing and new CCR surface impoundments, and all lateral expansions of CCR surface impoundments must not be located within 60 meters (200 feet) of the outermost damage zone of a fault that has had displacement in Holocene time unless the owner or operator demonstrates that an alternative setback distance of less than 60 meters (200 feet) will prevent damage to the structural integrity of the CCR surface impoundment.*

b) *The owner or operator of the CCR surface impoundment must obtain a certification from a qualified professional engineer stating that the demonstration meets the requirements of subsection (a).*

Pursuant to Section 845.210(d)(2), for existing CCR surface impoundments, the owner or operator of the CCR surface impoundment may use a previously completed location restriction demonstration required by Section 845.300 (Placement Above the Uppermost Aquifer), Section 845.310 (Wetlands), Section 845.320 (Fault Areas), Section 845.330 (Seismic Impact Zones), and Section 845.340 (Unstable Areas), provided that the previously completed assessments meet the applicable requirements of those Sections.

The previous fault area demonstration was certified by a qualified professional engineer stating that the demonstration meets the requirements of 40 C.F.R. § 257.62. The requirements described in 40 C.F.R. § 257.62 are nearly identical to the requirements contained in I.A.C. Section 845.320. Pursuant to Section 845.210(d)(2), a certification is not required for this demonstration. The previously completed fault area demonstration is included in Attachment D.

**MEMORANDUM**

16 October 2018
File No. 129788

SUBJECT: Location Restriction Demonstration - Fault Areas
Duck Creek Power Station
GMF Pond
Canton, Illinois

Illinois Power Resources Generating, LLC operates the coal-fired Duck Creek Power Station (Plant) located near Canton, Illinois. The GMF Pond (Unit) is an existing coal combustion residuals (CCR) surface impoundment. This demonstration addresses the requirements of 40 CFR §257.62 *(Fault Areas)* of the U.S. Environmental Protection Agency's (EPA) rule entitled *Hazardous and Solid Waste Management System; Disposal of Coal Combustion Residuals from Electric Utilities*. 80 Fed. Reg. 21,302 (Apr. 17, 2015) (promulgating 40 CFR §257.62); 83 Fed. Reg. 36,435 (July 30, 2018) (amending 40 CFR §257.62).

*§257.62(a): New CCR landfills, existing and new CCR surface impoundments, and all lateral expansions of CCR units must not be located within 60 meters (200 feet) of the outermost damage zone of a fault that has had displacement in Holocene time unless the owner or operator demonstrates by the dates specified in paragraph (c) of this section that an alternative setback distance of less than 60 meters (200 feet) will prevent damage to the structural integrity of the CCR unit.*

A review of available data from the U.S. Geologic Survey, the Illinois State Geological Survey, and other available information was completed for this demonstration. The nearest known mapped fault is the Sicily Fault, which is located approximately 66 miles southeast and the timeframe of the most recent activity on this fault is not known. Based on the available published geologic data and information reviewed, there are no active faults or fault damage zones that have had displacement in Holocene time reported or indicated within 200 feet of the Unit.

Electronic Filing: Received, Clerk's Office 06/20/2024

*§257.62(b): The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer or approval from the Participating State Director or approval from EPA where EPA is the permitting authority stating that the demonstration meets the requirements of paragraph (a) of this section.*

I, Steven F. Putrich, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief, that the information contained in this certification has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the demonstration that the CCR Unit is not located within 60 meters (200 feet) of the outermost damage zone of a fault that has had a displacement in Holocene time as included in the CCR Rule Location Restrictions Evaluation memorandum dated 12 October 2018 meets the requirements of 40 CFR §257.62(a).

# Memorandum

BURNS McDONNELL

Date: 25 October 2021

Subject: 35 Ill. Admin. Code Part 845 - Placement Above the Uppermost Aquifer Location Demonstration for GMF Pond at Duck Creek Power Plant

Illinois Power resources Generating, LLC operates the coal-fired Duck Creek Power Plant located in Fulton County, Illinois. The Duck Creek GMF Pond is an existing surface impoundment storing coal combustion residuals (CCR). The requirements for the Duck Creek GMF Pond are found in 35 Ill. Admin. Code (I.A.C.) 845 (Part 845).

This memorandum addresses the requirements of Section 845.300 Placement Above the Uppermost Aquifer, which states:

*Section 845.300 Placement Above the Uppermost Aquifer*

a) *Existing and new CCR surface impoundments, and all lateral expansions of CCR surface impoundments must, be constructed with a base that is located at least 1.52 meters (five feet) above the upper limit of the uppermost aquifer, or must demonstrate that there will not be an intermittent, recurring, or sustained hydraulic connection between any portion of the base of the CCR surface impoundment and the uppermost aquifer due to normal fluctuations in groundwater elevations (including the seasonal high water table).*

b) *The owner or operator of the CCR surface impoundment must obtain a certification from a qualified professional engineer stating that the demonstration meets the requirements of subsection (a).*

Pursuant to Section 845.210(d)(2), for existing CCR surface impoundments, the owner or operator of the CCR surface impoundment may use a previously completed location restriction demonstration required by Section 845.300 (Placement Above the Uppermost Aquifer), Section 845.310 (Wetlands), Section 845.320 (Fault Areas), Section 845.330 (Seismic Impact Zones), and Section 845.340 (Unstable Areas), provided that the previously completed assessments meet the applicable requirements of those Sections.

The previous upper aquifer demonstration was certified by a qualified professional engineer stating that the demonstration meets the requirements of 40 C.F.R. § 257.60. The requirements described in 40 C.F.R. § 257.60 are nearly identical to the requirements contained in I.A.C. Section 845.300. Pursuant to Section 845.210(d)(2), a certification is not required for this demonstration. The previously completed upper aquifer demonstration is included in Attachment D.

Electronic Filing: Received, Clerk's Office 06/20/2024

HALEY & ALDRICH, INC.
6500 Rockside Road

**MEMORANDUM**

16 October 2018
File No. 129788

SUBJECT: Location Restriction Demonstration – Placement Above Uppermost Aquifer
Duck Creek Power Station
GMF Pond
Canton, Illinois

Illinois Power Resources Generating, LLC operates the coal-fired Duck Creek Power Station (Plant) located near Canton, Illinois. The GMF Pond (Unit) is an existing coal combustion residuals (CCR) surface impoundment. This demonstration addresses the requirements of 40 CFR §257.60 *(Placement above the uppermost aquifer)* of the U.S. Environmental Protection Agency's (EPA) rule entitled *Hazardous and Solid Waste Management System; Disposal of Coal Combustion Residuals from Electric Utilities*. 80 Fed. Reg. 21,302 (Apr. 17, 2015) (promulgating 40 CFR §257.60); 83 Fed. Reg. 36,435 (July 30, 2018) (amending 40 CFR §257.60).

*§257.60(a): New CCR landfills, existing and new CCR surface impoundments, and all lateral expansions of CCR units must be constructed with a base that is located no less than 1.52 meters (five feet) above the upper limit of the uppermost aquifer, or must demonstrate that there will not be an intermittent, recurring, or sustained hydraulic connection between any portion of the base of the CCR unit and the uppermost aquifer due to normal fluctuations in groundwater elevations (including the seasonal high water table). The owner or operator must demonstrate by the dates specified in paragraph (c) of this section that the CCR unit meets the minimum requirements for placement above the uppermost aquifer.*

Haley & Aldrich reviewed available information provided by Vistra including historic record drawings and design drawings and based on review and evaluation of the information provided, the results do not demonstrate compliance with the requirements of 40 CFR §257.60(a).

Electronic Filing: Received, Clerk's Office 06/20/2024

*§257.60(b): The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer or approval from the Participating State Director or approval from EPA where EPA is the permitting authority stating that the demonstration meets the requirements of paragraph (a) of this section.*

I, Steven F. Putrich, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief, that the information contained in this certification has been prepared in accordance with the accepted practice of engineering. I certify that the above-referenced CCR Unit does not meet the requirements of 40 CFR §257.60(a).

# Memorandum

BURNS McDONNELL

Date: 25 October 2021

Subject: 35 Ill. Admin. Code Part 845 – Seismic Impact Zone Location Demonstration for GMF Pond at Duck Creek Power Plant

Illinois Power resources Generating, LLC operates the coal-fired Duck Creek Power Plant located in Fulton County, Illinois. The Duck Creek GMF Pond is an existing surface impoundment storing coal combustion residuals (CCR). The requirements for the Duck Creek GMF Pond are found in 35 Ill. Admin. Code (I.A.C.) 845 (Part 845).

This memorandum addresses the requirements of Section 845.330 Seismic Impact Zone, which states.

*Section 845.330 Seismic Impact Zones*

a) *Existing and new CCR surface impoundments, and all lateral expansions of CCR surface impoundments must not be located in seismic impact zones unless the owner or operator demonstrates that all structural components including liners, leachate collection and removal systems, and surface water control systems, are designed to resist the maximum horizontal acceleration in lithified earth material for the site.*

b) *The owner or operator of the CCR surface impoundment must obtain a certification from a qualified professional engineer stating that the demonstration meets the requirements of subsection (a).*

Pursuant to Section 845.210(d)(2), for existing CCR surface impoundments, the owner or operator of the CCR surface impoundment may use a previously completed location restriction demonstration required by Section 845.300 (Placement Above the Uppermost Aquifer), Section 845.310 (Wetlands), Section 845.320 (Fault Areas), Section 845.330 (Seismic Impact Zones), and Section 845.340 (Unstable Areas), provided that the previously completed assessments meet the applicable requirements of those Sections.

The previous seismic impact zone demonstration was certified by a qualified professional engineer stating that the demonstration meets the requirements of 40 C.F.R. § 257.63. The requirements described in 40 C.F.R. § 257.63 are nearly identical to the requirements contained in I.A.C. Section 845.330. Pursuant to Section 845.210(d)(2), a certification is not required for this demonstration. The previously completed seismic impact zone demonstration is included in Attachment D.

Electronic Filing: Received, Clerk's Office 06/20/2024

HALEY & ALDRICH, INC.
6500 Rockside Road
Suite 200
Cleveland, OH 44131
216.739.0555

**MEMORANDUM**

16 October 2018
File No. 129788

SUBJECT: Location Restriction Demonstration – Seismic Impact Zone
Duck Creek Power Station
GMF Pond
Canton, Illinois

Illinois Power Resources Generating, LLC operates the coal-fired Duck Creek Power Station (Plant) located near Canton, Illinois. The GMF Pond (Unit) is an existing coal combustion residuals (CCR) surface impoundment. This demonstration addresses the requirements of 40 CFR §257.63 *(Seismic Impact Zones)* of the U.S. Environmental Protection Agency's (EPA) rule entitled *Hazardous and Solid Waste Management System; Disposal of Coal Combustion Residuals from Electric Utilities*. 80 Fed. Reg. 21,302 (Apr. 17, 2015) (promulgating 40 CFR §257.63); 83 Fed. Reg. 36,435 (July 30, 2018) (amending 40 CFR §257.63).

*§257.63(a): New CCR landfills, existing and new CCR surface impoundments, and all lateral expansions of a CCR units must not be located in seismic impact zones unless the owner or operator demonstrates by the dates specified in paragraph (c) of this section that all structural components including liners, leachate collection and removal systems, and surface water control systems, are designed to resist the maximum horizontal acceleration in lithified earth material for the site.*

A Seismic Impact Zone is defined in the CCR Rule (40 CFR §257.63) as "an area having a 2% or greater probability that the maximum expected horizontal acceleration, expressed as a percentage of the earth's gravitational pull (g), will exceed 0.10 g in 50 years". The 2014 US Geological Survey Hazard Map raw data for the Duck Creek Power Station GMF Pond indicates that the maximum expected horizontal acceleration for 2 percent probability of exceedance in 50 years is 0.06g. Accordingly, the Unit is not located in a seismic impact zone and a demonstration that the structural components have been designed to resist the maximum horizontal acceleration in lithified earth material for the site is not required.

Electronic Filing: Received, Clerk's Office 06/20/2024

*§257.63(b): The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer or approval from the Participating State Director or approval from EPA where EPA is the permitting authority stating that the demonstration meets the requirements of paragraph (a) of this section.*

I, Steven F. Putrich, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief, that the information contained in this certification has been prepared in accordance with the accepted practice of engineering. I certify, that the CCR Unit is not located in a seismic impact zone as included in the CCR Rule Location Restrictions Evaluation memorandum dated 12 October 2018 and, therefore, satisfies all requirements of 40 CFR §257.63(a).

# Memorandum

BURNS McDONNELL

Date: 25 October 2021

Subject: 35 Ill. Admin. Code Part 845 – Unstable Areas and Floodplains Location Standard Demonstration for the GMF Pond at Duck Creek Power Plant

Illinois Power Resources Generating, LLC is the owner of the coal-fired Duck Creek Power Plant (Plant) located in Fulton County, Illinois. The GMF Pond is an existing surface impoundment storing coal combustion residuals (CCR). The requirements for the GMF Pond are found in 35 Ill. Admin. Code (I.A.C.) 845 (Part 845).

This certification addresses the requirements of Part 845, Section 845.340 Unstable Areas and Floodplains, which states:

> *Section 845.340 (a): An existing or new CCR surface impoundment, or any lateral expansion of a CCR surface impoundment must not be located in an unstable area unless the owner or operator demonstrates that recognized and generally accepted engineering practices have been incorporated into the design of the CCR surface impoundment to ensure that the integrity of the structural components of the CCR surface impoundment will not be disrupted.*
>
> *Section 845.340 (b): The owner or operator must consider all the following factors, at a minimum, when determining whether an area is unstable: 1) On-site or local soil conditions, including but not limited to liquefaction, that may result in significant differential settling; 2) On-site or local geologic or geomorphologic features; and 3) On-site or local human-made features or events (both surface and subsurface).*

Pursuant to Section 845.210(d)(2), for existing CCR surface impoundments, the owner or operator of the CCR surface impoundment may use a previously completed location restriction demonstration required by Section 845.300 (Placement Above the Uppermost Aquifer), Section 845.310 (Wetlands), Section 845.320 (Fault Areas), Section 845.330 (Seismic Impact Zones), and Section 845.340 (Unstable Areas), provided that the previously completed assessments meet the applicable requirements of those Sections.

The previous unstable area demonstration was certified by a qualified professional engineer stating that the demonstration meets the requirements of 40 C.F.R. § 257.64. The requirements described in 40 C.F.R. § 257.64 are nearly identical to the requirements contained in I.A.C. Section 845.340 (a). Pursuant to Section 845.210(d)(2), a certification is not required for the unstable area demonstration. The previously completed unstable area demonstration meeting the requirements of Section 845.340 (a) is included in Attachment D.

Electronic Filing: Received, Clerk's Office 06/20/2024

> *Section 845.340 (c): An existing or new CCR surface impoundment, or any lateral expansion of a CCR surface impoundment, must not be located in a floodplain unless the owner or operator demonstrates that recognized and generally accepted engineering practices have been incorporated into the design of the CCR surface impoundment to ensure that the CCR surface impoundment will not restrict the flow of the base flood , reduce the temporary water storage capacity of a floodplain , or result in washout of CCR, so as to pose a hazard to human life, wildlife, or land or water resources.*

The boundaries of the impoundment were determined by a survey conducted by a professional surveyor licensed in the State of Illinois. The surveyed boundaries were compared to the existing floodplain boundary from the effective FEMA Flood Insurance Rate Map (FIRM) Number 17057C0250E, dated February 4, 2011. The location of the Duck Creek GMF Pond is outside of the FEMA 100-year floodplain, therefore, it was determined that the Duck Creek GMF Pond is not located within the floodplain.

> *Section 845.330 (d): The owner or operator of the CCR surface impoundment must obtain a certification from a qualified professional engineer stating that the demonstration meets the requirements of subsections (a) and (c).*

Pursuant to Section 845.210(d)(2), for existing CCR surface impoundments, the owner or operator of the CCR surface impoundment may use a previously completed location restriction demonstration required by Section 845.340 (Unstable Areas) and demonstrated in Attachment D. Therefore, a new certification is not included for Section 845.340 (a). Certification for Section 845.340 (c) is included below.

Electronic Filing: Received, Clerk's Office 06/20/2024

**35 Illinois Administration Code Part 845:**
**Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments**
**Section 845.340 (c): Certification**

I, *Sarah Espinosa*, being a Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief that this floodplain demonstration meets the requirements of 35 Ill. Adm. Code 845.340(c).

Sarah Espinosa, P.E.

**MEMORANDUM**

16 October 2018
File No. 129788

SUBJECT: Location Restriction Demonstration – Unstable Areas
Duck Creek Power Station
GMF Pond
Canton, Illinois

Illinois Power Resources Generating, LLC operates the coal-fired Duck Creek Power Station (Plant) located near Canton, Illinois. The GMF Pond (Unit) is an existing coal combustion residuals (CCR) surface impoundment. This demonstration addresses the requirements of 40 CFR §257.64 *(Unstable Areas)* of the U.S. Environmental Protection Agency's (EPA) rule entitled *Hazardous and Solid Waste Management System; Disposal of Coal Combustion Residuals from Electric Utilities.* 80 Fed. Reg. 21,302 (Apr. 17, 2015) (promulgating 40 CFR §257.64); 83 Fed. Reg. 36,435 (July 30, 2018) (amending 40 CFR §257.64).

*§257.64(a): An existing or new CCR landfill, existing or new CCR surface impoundment, or any lateral expansion of a CCR unit must not be located in an unstable area unless the owner or operator demonstrates by the dates specified in paragraph (d) of this section that recognized and generally accepted good engineering practices have been incorporated into the design of the CCR unit to ensure that the integrity of the structural components of the CCR unit will not be disrupted.*

*§257.64(b): The owner or operator must consider all of the following factors, at a minimum, when determining whether an area is unstable:*

*(1) On-site or local soil conditions that may result in significant differential settling;*
*(2) On-site or local geologic or geomorphologic features; and*
*(3) On-site or local human-made features or events (both surface and subsurface).*

*Determination of compliance with §257.64(b)(1)* - Conditions associated with the potential for significant differential settlement due to liquefaction were not identified in the area where the Plant is located. A separate report completed by AECOM entitled "CCR Certification Report: Initial Structural Stability Assessment, Initial Safety Factor Assessment, and Initial Inflow Design Flood Control System Plan for the GMF Pond at Duck Creek Power Station" dated October 2016 concluded that the soils beneath the Unit are not susceptible to liquefaction.

*Determination of compliance with §257.64(b)(2)* - Based on available United States Geological Survey (USGS) and Illinois State Geological Survey (ISGS) information, karst topography or physiographic features such as sinkholes, vertical shafts, sinking streams, caves, large springs, or blind valleys do not exist at the Plant. To evaluate the susceptibility of landslides, we reviewed readily available USGS and ISGS data. The USGS data indicates that the Plant is in an area of low landslide incidence and ISGS data indicates that there has not been a documented landslide occurrence at the Unit. The ISGS documented

Electronic Filing: Received, Clerk's Office 06/20/2024

landslide occurrences near the site are along U.S. Highway 24 and appear to be associated with roadside landslides. Accordingly, it is our opinion that the Unit is not located in an area that has high susceptibility to landslides.

*Determination of compliance with §257.64(b)(3)* - Finally, there are no documented surface or subsurface anthropogenic activities that would be indicative of creating unstable foundation conditions.

*§257.64(c): The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer or approval from the Participating State Director or approval from EPA where EPA is the permitting authority stating that the demonstration meets the requirements of paragraph (a) of this section.*

I, Steven F. Putrich, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief, that the information contained in this certification has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the demonstration indicating the CCR Unit is not located in an unstable area as included in the CCR Rule Location Restrictions Evaluation memorandum dated 12 October 2018 meets the requirements of 40 CFR §257.64(a).

# Memorandum

BURNS McDONNELL

Date: 25 October 2021

Subject: 35 Ill. Admin. Code Part 845 - Wetland Location Demonstration for GMF Pond at Duck Creek Power Plant

Illinois Power resources Generating, LLC operates the coal-fired Duck Creek Power Plant located in Fulton County, Illinois. The Duck Creek GMF Pond is an existing surface impoundment storing coal combustion residuals (CCR). The requirements for the Duck Creek GMF Pond are found in 35 Ill. Admin. Code (I.A.C.) 845 (Part 845).

This memorandum addresses the requirements of Section 845.310 Wetlands, which states:

*Section 845.310 Wetlands*

a) *Existing and new CCR surface impoundments, and all lateral expansions of CCR surface impoundments must not be located in wetlands unless the owner or operator demonstrates* [that the requirements listed in 845.310(a)(1) through (5) are met.]

b) *The owner or operator of the CCR surface impoundment must obtain a certification from a qualified professional engineer stating that the demonstration meets the requirements of subsection (a).*

Pursuant to Section 845.210(d)(2), for existing CCR surface impoundments, the owner or operator of the CCR surface impoundment may use a previously completed location restriction demonstration required by Section 845.300 (Placement Above the Uppermost Aquifer), Section 845.310 (Wetlands), Section 845.320 (Fault Areas), Section 845.330 (Seismic Impact Zones), and Section 845.340 (Unstable Areas), provided that the previously completed assessments meet the applicable requirements of those Sections.

The previous wetlands demonstration was certified by a qualified professional engineer stating that the demonstration meets the requirements of 40 C.F.R. § 257.61. The requirements described in 40 C.F.R. § 257.61 are nearly identical to the requirements contained in I.A.C. Section 845.310. Pursuant to Section 845.210(d)(2), a certification is not required for this demonstration. The previously completed wetlands demonstration is included in Attachment D.

Electronic Filing: Received, Clerk's Office 06/20/2024

**MEMORANDUM**

16 October 2018
File No. 129788

SUBJECT: Location Restriction Demonstration - Wetland Areas
Duck Creek Power Station
GMF Pond
Canton, Illinois

Illinois Power Resources Generating, LLC operates the coal-fired Duck Creek Power Station (Plant) located near Canton, Illinois. The GMF Pond (Unit) is an existing coal combustion residuals (CCR) surface impoundment. This demonstration addresses the requirements of 40 CFR §257.61 *(Wetlands)* of the U.S. Environmental Protection Agency's (EPA) rule entitled *Hazardous and Solid Waste Management System; Disposal of Coal Combustion Residuals from Electric Utilities*. 80 Fed. Reg. 21,302 (Apr. 17, 2015) (promulgating 40 CFR §257.61); 83 Fed. Reg. 36,435 (July 30, 2018) (amending 40 CFR §257.61.

*§257.61(a): New CCR landfills, existing and new CCR surface impoundments, and all lateral expansions of CCR units must not be located in wetlands, as defined in §232.2 of this chapter, unless the owner or operator demonstrates by the dates specified in paragraph (c) of this section that the CCR unit meets the requirements of paragraphs (a)(1) through (5) of this section.*

Based on a review of the U.S. Fish and Wildlife Service's National Wetland Inventory mapping, 0.5-meter resolution aerial imagery (2016) and the results of on-site field assessments, the Unit is not located in wetlands as defined by 40 CFR §232.2.

Electronic Filing: Received, Clerk's Office 06/20/2024

*§257.61(b): The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer or approval from the Participating State Director or approval from EPA where EPA is the permitting authority stating that the demonstration meets the requirements of paragraph (a) of this section.*

I, Steven F. Putrich, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief, that the information contained in this certification has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the CCR Unit is not located in wetlands as included in the CCR Rule Location Restrictions Evaluation memorandum dated 12 October 2018 and, therefore, meets the requirements of 40 CFR §257.61(a).

# DUCK CREEK POWER PLANT
# EMERGENCY ACTION PLAN
# CCR IMPOUNDMENTS & RELATED FACILITIES

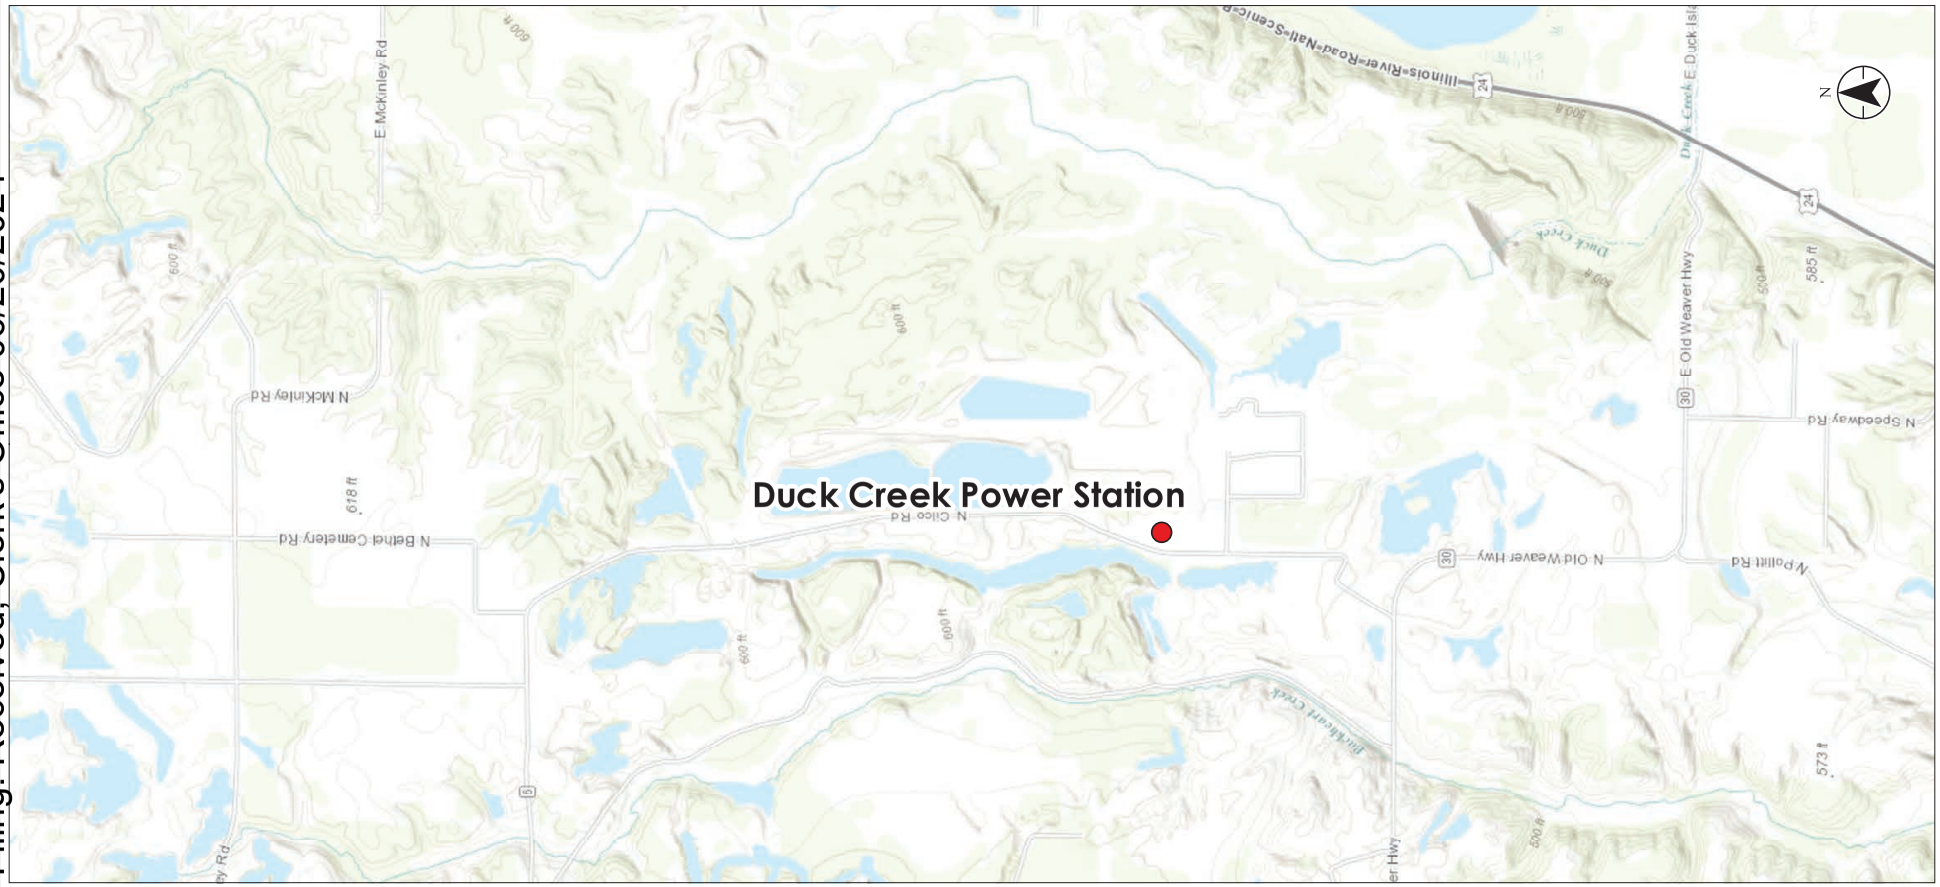
## 1 STATEMENT OF PURPOSE

The Duck Creek Power Plant (Power Plant) is a retired facility located near Canton in Fulton County, Illinois. The location is shown in Figure 1-1. The Power Plant is a coal-fired electricity producing power plant owned and operated by Illinois Power Resources Generating, LLC, a subsidiary of Dynegy Midwest Generation, LLC (DMG). This Emergency Action Plan (EAP) was prepared in accordance with 40 CFR § 257.73(a)(3) and Title 35, Section 845.520 of IEPA Administrative Code and covers the following Coal Combustion Residual (CCR) surface impoundments located at the site:

- Ash Pond No. 1 (Capped/Closed) (NID # IL50715) (IEPA # W0578010001-01)
- Ash Pond No. 2 (Capped/Closed) (NID # IL50014) (IEPA # W0578010001-02)
- Bottom Ash Pond (NID # IL50716) (IEPA # W0578010001-03)
- Gypsum Management Facility (GMF) Pond (NID # IL50573) (IEPA # W0578010001-04)

The locations of these impoundments are shown in Figure 1-2. Section 6 of this EAP includes a description of each impoundment.



The purpose of this Emergency Action Plan (EAP) is to:

1. Safeguard the lives, as well as to reduce property damage, of citizens living within potential downstream flood inundation areas of CCR impoundments and related facilities at the Duck Creek Power Plant.
2. Define the events or circumstances involving the CCR impoundments and related facilities at the Duck Creek Power Plant that represent atypical operating conditions that pose a safety hazard or emergency and how to identify those conditions.
3. Define responsible persons, their responsibilities, and notification procedures in the event of a safety emergency.
4. Provide contact information of emergency responders.
5. Identify emergency actions in the event of a potential or imminent failure of the impoundments.
6. Identify the downstream area that would be affected by failure of the impoundments.
7. Provide for effective facility surveillance, prompt notification to local Emergency Management Agencies, citizen warning and notification responses, and preparation should an emergency occur.

Information provided by Illinois Power Resources Generating, LLC was utilized and relied upon in preparation of this report.

## 2 COMMUNICATION

To facilitate understanding among everyone involved in implementing this EAP, four response levels are used to identify the condition of an impoundment. These are:

**Response Levels:**

- **Level 0:** Normal conditions and routine operations, including surveillance and initial investigation of unusual conditions and effects of storm events.
- **Level 1:** Potentially hazardous condition exists, requiring investigation and possible corrective action.
- **Level 2:** Potential failure situation is developing; possible mode of failure is being assessed; corrective measures are underway.
- **Level 3:** Failure is occurring or is imminent, public protective actions are required.

The 4-Step Incident Response Process is outlined in Figure 2-1. This should be used in conjunction with the Notification Flowchart (Figure 2-2) and EAP Decision Tree (Figure 2-3). Section 4 provides guidance tables for determining Response Levels and a table providing emergency actions to be taken given various situations. Table 2-1 lists contact information for the emergency responders.

**Figure 2-1. Summary/Sequence of Tasks 4-Step Incident Response Process**

**Step 1: Detection, Evaluation, and Response Level Determination**

Sequence of Tasks:

- Notify EAP Coordinator, Power Plant Management (Director and Engineering), and DMG Dam Safety Manager of unusual condition detected and confer on next steps needed.
- Conduct technical evaluation of conditions as needed.
- Determine Response Level based on evaluation. **(Table 4-1)**
- Reset Response Level as revised evaluations warrant.

**Step 2: Notification**

Sequence of Tasks:

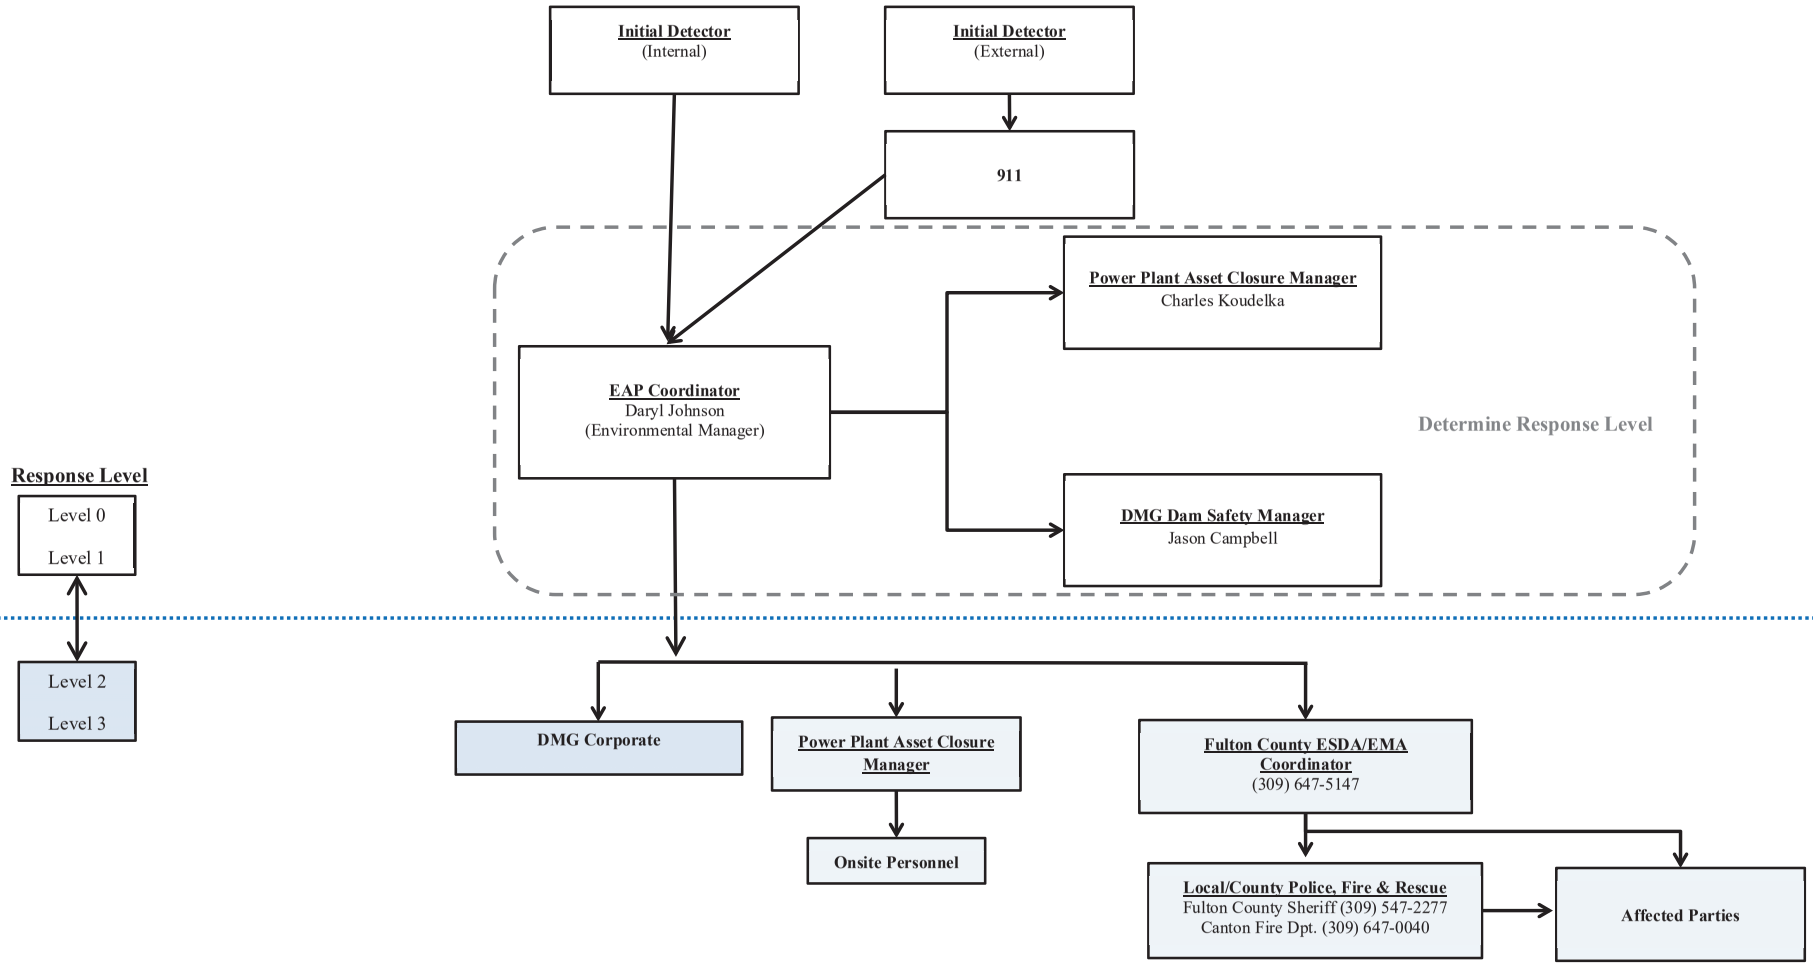
- Notify authorities, designated personnel, and external response partners of change in Response Level, using the Notification Flowchart. **(Figure 2-2)**
- *Re-notify authorities, designated personnel, and external response partners as Response Level is changed*.

**Step 3: Emergency Actions**

Sequence of Tasks:

- Perform emergency actions with goal of saving the impoundment and minimizing impacts to life, property, and environment. **(Table 4-3)**
- Take continuous actions to include situation assessment, information sharing, remediation, and public safety advisories or warnings, as warranted.
- *Revise action plan as changes in conditions warrant*.

**Step 4: Follow-up**



Sequence of Tasks:

- Document conditions and decisions in the Emergency Incident Log.
- Notify authorities, designated personnel, and external response partners that condition is stabilized; limit incident termination declarations to conditions at the site.
- Conduct and document after-action review of incident and response.

# 3 EAP ROLES AND RESPONSIBILITIES

Table 3-1 provides a summary of the EAP roles during an emergency event.

**Table 3-1. Summary of EAP Roles**

| Entity | Role Description |
|---|---|
| **DMG Emergency Response Team (ERT)** | **ERT:** DMG personnel responsible for EAP implementation, distribution, updates/maintenance, and training activities. The *ERT* is comprised of the following roles;<br>1. **DMG Corporate:** DMG corporate entity, committee, team, or position with relevant responsibility for a given generating power plant.<br>2. **Power Plant Management:** Personnel responsible for day-to-day operation and management of the Power Plant.<br>3. **Dam Safety Manager:** Personnel that is most knowledgeable about the design and technical operation of facilities at a given power plant.<br>4. **EAP Coordinator:** Personnel responsible for implementing the EAP and associated activities.<br>**Emergency Event – EAP Responsibilities**<br>1. Respond to emergencies at the Power Plant.<br>2. Verify and assess emergency conditions.<br>3. Notify and coordinate as appropriate with participating emergency services disaster agencies or emergency management agencies (ESDA/EMA's), emergency responders, regulatory agencies, and all other entities involved or affected by this EAP.<br>4. Take corrective action at the Power Plant.<br>5. Declare termination of emergencies at the Power Plant. |
| **Fulton County ESDA/EMA** | 1. Receive Response Level reports from *DMG Corporate* through *EAP Coordinator*.<br>2. Coordinate emergency response activities with local authorities: police, fire and rescue, etc.<br>3. Coordinate notification of public as necessary through established channels, which may include door-to-door contact.<br>4. Coordinate notification activities to affected parties within inundation areas.<br>5. Evaluate risk to areas beyond the inundation areas, communicate needs to the *DMG Corporate* and/or *EAP Coordinator*, and coordinate aid as appropriate.<br>6. Responsible for declaring termination of an emergency condition off-site upon receiving notification of an emergency status termination from the *DMG Corporate*.<br>7. If necessary, coordinate with *State ESDA/EMA*. |
| **Canton Police, Fire, and Rescue** | 1. Receive alert status reports from the *ERT* or the Fulton County *ESDA/EMA*.<br>2. If necessary, notify affected parties and general public within inundation areas (see Section 7).<br>3. Render assistance to Fulton County *ESDA/EMA*, as necessary.<br>4. Render assistance to *DMG Corporate* and *Power Plant Management*, as necessary. |
| **Fulton County Police, Fire and Rescue, and Emergency Services** | 1. Receive alert status reports from the *ERT* or the Fulton County *ESDA/EMA*.<br>2. If necessary, notify affected parties within the inundation area.<br>3. Provide mutual aid to other affected areas, if requested and able. |

Electronic Filing: Received, Clerk's Office 06/20/2024

# 4 EAP RESPONSE

The 4-Step Incident Response Process is shown in Figure 2-1. The Decision Tree shown in Figure 2-3 provides a flowchart for the various elements of the response process. Upon reaching Step 4 of the response process (termination and follow-up), the EAP Coordinator is responsible for notifying the ESDA/EMA's that the condition of the dam/impoundment has been stabilized. The purpose of this section is to provide specific information that can be used during a response. This information is provided in the following tables:

- Table 4-1 provides guidance for determining the response level.
- Table 4-2 provides impoundment pool level trigger elevations.
- Table 4-3 lists emergency actions to be taken depending on the situation.

**Table 4-1. Guidance for Determining the Response Level**

| Event | Situation | Response Level |
|---|---|---|
| Spillway flow (See Table 4-2 for relevant elevations) | Primary spillway flow is not causing active erosion and impoundment water surface elevation is below auxiliary spillway crest elevation (if equipped). | Level 0 |
| | Impoundment water surface elevation is at or above auxiliary spillway crest elevation (if equipped). No active erosion caused by spillway flow. | Level 1 |
| | Spillway flow actively causing minor erosion that is not threatening the control section or dam/impoundment stability. | Level 2 |
| | Spillway flow that could result in flooding of people downstream if the reservoir level continues to rise. | Level 2 |
| | Abnormal operation of the spillway system due to blockage or damage that could lead to flooding. | Level 2 |
| | Spillway flow actively eroding the soil around the spillway that is threatening the control section (e.g. undermining) or dam/impoundment stability. | Level 3 |
| | Spillway flow that is flooding people downstream. | Level 3 |
| Embankment Overtopping (See Table 4-2 for relevant elevations) | Impoundment water surface elevation at or below typical normal pool fluctuation elevation. | Level 0 |
| | Impoundment water surface elevation above typical high pool fluctuation elevation. | Level 1 |
| | Impoundment water surface elevation within 2 feet of the embankment crest elevation | Level 2 |
| | Impoundment water surface elevation at or above embankment crest elevation. | Level 3 |
| Seepage | New seepage areas in or near the dam/impoundment with clear flow. | Level 1 |
| | New seepage areas with cloudy discharge or increasing flow rate. | Level 2 |
| | Heavy seepage with active erosion, muddy flow, and/or sand boils. | Level 3 |
| Sinkholes | Observation of new sinkhole in impoundment area or on embankment. | Level 2 |
| | Rapidly enlarging sinkhole and/or whirlpool in the impoundment. | Level 3 |
| Embankment cracking | New cracks in the embankment greater than ¼ inch wide without seepage. | Level 1 |
| | Any crack in the embankment with seepage. | Level 2 |
| | Enlarging cracks with muddy seepage. | Level 3 |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 4-1. Guidance for Determining the Response Level**

| Event | Situation | Response Level |
|---|---|---|
| Embankment movement | Visual signs of movement/slippage of the embankment slope. | Level 1 |
| | Detectable active movement/slippage of the embankment slope or other related effects (tension cracking, bulges/heaves, etc.) that could threaten the integrity of the embankment. | Level 2 |
| | Sudden or rapidly proceeding slides of the embankment slopes. | Level 3 |
| Embankment Monitoring Equipment (piezometers, inclinometers, surface displacement mounts, etc.) | Instrumentation readings beyond historic normal. | Level 1 |
| | Instrumentation readings indicate the embankment is susceptible to failure. | Level 2 |
| | Instrumentation readings indicate embankment is at threshold of failure or is currently failing. | Level 3 |
| Earthquake or other event | Measurable earthquake felt or reported on or within 100 miles of the impoundment. | Level 1 |
| | Earthquake or other event resulting in visible damage to the impoundment or appurtenances. | Level 2 |
| | Earthquake or other event resulting in uncontrolled release of water or materials from the impoundment. | Level 3 |
| Security threat | Verified bomb threat or other physical threat that, if carried out, could result in damage to the impoundment. | Level 2 |
| | Detonated bomb or other physical damage that has resulted in damage to the impoundment or appurtenances. | Level 3 |
| Sabotage/ vandalism | Damage to impoundment or appurtenance with no impact to the functioning of the impoundment. | Level 1 |
| | Modification to the impoundment or appurtenances that could adversely impact the functioning of the impoundment. This would include unauthorized operation of spillway facilities. | Level 2 |
| | Damage to impoundment or appurtenances that has resulted in seepage flow. | Level 2 |
| | Damage to impoundment or appurtenances that has resulted in uncontrolled water release. | Level 3 |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 4-2. Impoundment Trigger Elevations**

| Impoundment | Embankment Crest Elevation | Auxiliary Spillway Crest Elevation | Normal Pool Fluctuation | |
|---|---|---|---|---|
| | | | Typical | High |
| Ash Pond No. 1 | 625 ft. | N/A | N/A | N/A |
| Ash Pond No. 2 | 640 ft. | N/A | N/A | N/A |
| Bottom Ash Pond | | | | |
| GMF Pond | 620 ft. | Not Applicable | 616 ft. | 618 ft. |

Notes:
*Elevation estimated from Digital Elevation Model (DEM) developed by the Illinois State Geological Survey.

**Table 4-3. Step 3: Emergency Actions**

| Condition | Description of Condition | Action to be Taken |
|---|---|---|
| High Water Level/ Large Spillway Release | Not applicable to capped impoundments. See Table 4-1 and Table 4-2 for elevations and triggering water levels associated with the impoundments and spillways covered by this EAP. | 1. Assess cause of increased reservoir stage, especially during fair weather conditions.<br>2. Determine Response Level.<br>3. Make proper notifications as outlined in the Figure 2-2 Notification Flowchart.<br>4. Perform additional tasks as determined through consultation with the ERT.<br>5. Make notifications if condition worsens such that downstream flooding is imminent.<br>**Response Level 0**: require enhanced surveillance 3 times per day<br>**Response Level 1**: contact internal chain of command and external response partners as necessary; inspect impoundment minimum 1 time per hour<br>**Response Level 2**: contact internal chain of command; notify ESDA/EMA's and notify external response partners. ESDA/EMA's notify affected parties.<br>**Response Level 3**: contact internal chain of command; notify ESDA/EMA's and notify external response partners. ESDA/EMA's notify affected parties of emergency incident. |
| Seepage | Localized new seepage or boil(s) observed along downstream face / toe of earthen embankment with muddy discharge and increasing but controllable discharge of water. | 1. Measure and record feature dimensions, approximate flow rate, and relative location to existing surface features. Take photos. Document location on a site plan and in inspection notes.<br>2. Determine Response Level.<br>3. Make proper notifications as outlined in the Figure 2-2 Notification Flowchart.<br>4. ERT (with Dam Safety Manager as lead) to determine mitigation actions. The following actions may apply:<br>a) Place a ring of sand bags with a weir at the top towards the natural drainage path to monitor flow rate. If boil becomes too large to sand bag, place a blanket filter over the area using non-woven filter fabric and pea gravel. Attempt to contain flow in such a manner (without performing any excavations) that flow rates can be measured. Stockpile gravel and sand fill for later use, if necessary. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 4-3. Step 3: Emergency Actions**

| Condition | Description of Condition | Action to be Taken |
|---|---|---|
| | | b) Inspect the embankment and collect piezometer, water level and seepage flow data daily unless otherwise instructed by the Dam Safety Manager. Record any changes of conditions. Carefully observe embankment for signs of depressions, seepage, sinkholes, cracking or movement.<br>c) Maintain continuous monitoring of feature. Record measured flow rate and any changes of condition, including presence or absence of muddy discharge.<br>5. Make notifications as outlined in the lower portion of the Notification Flowchart (Figure 2-2) if condition worsens such that failure is imminent. |
| Sabotage and Miscellaneous Other Issues | Criminal action with significant damage to embankment or structures where significant repairs are required and the integrity of the facility is compromised—condition appears stable with time. | 1. Contact law enforcement authorities and restrict all access (except emergency responders) to impoundment. Restrict traffic on embankment crest to essential emergency operations only.<br>2. Determine Response Level.<br>3. Make internal notifications as outlined in the upper portion of the Notification Flowchart (Figure 2-2).<br>4. In conjunction with the Dam Safety Manager, assess extent of damage and visually inspect entire embankment and ancillary structures for additional less obvious damage. Based on inspection results, confirm if extent of damage to various components of the impoundment warrants a revised Response Level and additional notifications.<br>5. Perform additional tasks as directed by the ERT.<br>6. Make notifications if conditions worsen. |
| Embankment Deformation | **Cracks:** New longitudinal (along the embankment) or transverse (across the embankment) cracks more than 6 inches deep or more than 3 inches wide or increasing with time. New concave cracks on or near the embankment crest associated with slope movement. | 1. Measure and record feature dimensions, approximate flow rate, and relative location to existing surface features. Take photos. Document location on a site plan and in inspection notes.<br>2. Restrict traffic on embankment crest to essential emergency operations only.<br>3. Determine Response Level.<br>4. Make notifications as outlined in the Figure 2-2 Notification Flowchart.<br>5. ERT (with Dam Safety Manager as lead) to determine mitigation actions. The following actions may apply:<br>a) Place buttress fill against base of slope immediately below surface feature. Stockpile additional fill.<br>b) Place sandbags as necessary around crack area to divert any storm water runoff from flowing into crack(s).<br>6. As directed by the Dam Safety Manager, additional inspection and monitoring of the dam may be required. Items may include; inspect the dam on a schedule determined by the Dam Safety Manager; collect piezometer and water level data; and record any changes of condition. Carefully observe dam for signs of depressions, seepage, sinkholes, cracking or movement.<br>7. Make notifications as outlined in the Figure 2-2 Notification Flowchart if conditions worsen such that failure is imminent. |
| | **Slides / Erosion:** Deep slide / erosion (greater than 2 feet deep) on the embankment that may also extend beyond the | 1. Measure and record feature dimensions, approximate flow rate, and relative location to existing surface features. Take photos. Document location on a site plan and in inspection report.<br>2. Restrict traffic on embankment crest to essential emergency operations only.<br>3. Determine the Response Level. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 4-3. Step 3: Emergency Actions**

| Condition | Description of Condition | Action to be Taken |
|---|---|---|
| | embankment toe but does not encroach onto the embankment crest and appears stable with time. | 4. Make notifications as outlined in the Figure 2-2 Notification Flowchart.<br>5. ERT (with Dam Safety Manager as lead) to determine mitigation actions. Additional actions may include the following items.<br>a) Place sandbags as necessary around slide area to divert any storm water runoff from flowing into slide(s).<br>b) Increase inspections of the dam; collect piezometer and water level data; and record any changes of condition. During inspections, carefully observe dam for signs of depressions, seepage, sinkholes, cracking or movement.<br>6. Make notifications as outlined in the Figure 2-2 Notification Flowchart if conditions worsen such that failure is imminent. |
| | **Sinkholes:** Small depression observed on the embankment or within 50 feet of the embankment toe that is less than 5 feet deep and 30 feet wide or which is increasing with time. | 1. Slowly open drain gates to lower pool elevation.<br>2. Measure and record feature dimensions, approximate flow rate, and relative location to existing surface features. Take photos. Document location on a site plan and in inspection notes.<br>3. Restrict traffic on embankment crest to essential emergency operations only.<br>4. Determine Response Level.<br>5. Make notifications as outlined in the Figure 2-2 Notification Flowchart.<br>6. ERT (with Dam Safety Manager as lead) to determine mitigation actions. Additional actions may include the following items:<br>a) Backfill the depression with relatively clean earth fill (free of organic materials) generally even with surrounding grade and slightly mounded (6 to 12 inches higher) in the center to shed storm water away from the depression. Stockpile additional fill.<br>b) Increase inspections of the dam; collect piezometer and water level data daily unless otherwise instructed by Dam Safety Manager; and record any changes of condition. Carefully observe dam for signs of depressions, seepage, sinkholes, cracking or movement.<br>7. Make notifications as outlined in the Figure 2-2 Notification Flowchart if conditions worsen such that failure is imminent. |
| Gate Malfunction or Failure | Sluice gate damaged structurally (sabotage, debris, etc.) with uncontrolled release of water at a constant volume. Condition appears stable. | 1. Close any other gates, if open.<br>2. Determine Response Level.<br>3. Make notifications as outlined in the Figure 2-2 Notification Flowchart.<br>4. Obtain instructions from the Dam Safety Manager to determine if there are other methods to stop or slow down the flow of water.<br>5. If conditions worsen such that failure is imminent, make notifications as outlined in the lower portion of the Figure 2-2 Notification Flowchart. |

Electronic Filing: Received, Clerk's Office 06/20/2024

# 5 PREPAREDNESS

The intent of this section is to provide information that will be utilized during a response. Established emergency supplies and locations, suppliers, and equipment are provided in Table 5-1. Supplier contact information is listed in Table 5-2.

A coordination meeting shall be conducted annually between representatives of the Illinois Power Resources Generating, LLC and local emergency responders. This meeting may be in the form of a face-to-face meeting, tabletop exercise, or additional training regarding the EAP.

**Table 5-1. Emergency Supplies and Equipment**

| Item | On-site (Yes/No/Occasionally) | Remarks |
|---|---|---|
| Flashlights | Yes | Typically, at Duck Creek Power Plant Maintenance Facility: contact Asset Closure Manager for location(s). |
| Generator | | |
| Extension Cords | | |
| Fire extinguishers | | |
| Floodlights | | |
| Backhoe | Yes | John Deere 301 Backhoe/Loader and Caterpillar 426C Backhoe/Loader; contact Asset Closure Manager for location(s). |
| Dozer | Yes | Caterpillar D9R Dozer and Caterpillar D10R Dozer; contact Asset Closure Manager for location(s). |
| Large Equipment (Rental – including excavating equipment, pumps, lighting) | Yes | Two Caterpillar 834 Rubber Tired Bucket Loader, Fiatt Road Grader, two farm tractors with end loaders, and a Caterpillar Skid Steer with end loaders are also available; contact Asset Closure Manager for location(s). Contact Altorfer, Inc., Bolon's Repair, MH Equipment, or Sunbelt Rentals for additional large equipment (see Table 5-2). |
| Dump Truck | No | Contact Captain Hook Roll-Off Boxes or Done Rite Construction Co. Inc. for additional dump trucks (see Table 5-2). |
| Pump and Hoses | No | Contact Bolon's Repair or Pratt Lumber Do It Center for additional pumps and hoses (see Table 5-2). |
| Sandbags and Sand | No | Contact Duck Creek Sand and Gravel, Davis Sand and Gravel, or Pratt Lumber Do It Center for additional sandbags and sand (see Table 5-2). |
| Fill (Stone, aggregate, sand) | No | Contact Duck Creek Sand and Gravel, Davis Sand and Gravel, or Pratt Lumber Do It Center for additional fill (see Table 5-2). |
| Concrete/grout | No | Contact Canton Redi-Mix for additional batch plant concrete or Pratt Lumber Do It Center for additional bagged concrete (see Table 5-2). |
| Geotextile Filter Fabric | Yes | Two rolls of 10-ounce, non-woven filter fabric are available on site; contact Asset Closure Manager for location(s). |
| Plastic Sheeting | No | Contact Pratt Lumber Do It Center for additional plastic sheeting (see Table 5-2). |
| Rope | No | Contact Alexander Lumber, Bolon's Repair, and Pratt Lumber Do It Center for additional rope (see Table 5-2). |
| Personal Flotation Devices | Yes | Typically, at Duck Creek Power Plant Maintenance Facility, contact Asset Closure Manager for location(s). |

Electronic Filing: Received, Clerk's Office 06/20/2024

# 6 FACILITY/IMPOUNDMENT DESCRIPTION

The impoundments included in this EAP are described as follows and illustrated in Figure 1-2. Table 6-1 contains additional geometric details for each impoundment.

The Duck Creek Power Plant is a retired plant located in Canton, Illinois, roughly 50 miles west of Bloomington, Illinois east of IL-78 and west of US-24.

Ash Pond No. 1 is a diked impoundment that was commissioned in 1976. The main inflow into Ash Pond No. 1 was precipitation, which accumulated and transported through channels around the inside perimeter of the pond, reaching two small internal impoundments. It has a maximum embankment height of 28 feet, a crest elevation of 625 feet above Mean Sea Level (MSL), and a crest width of 20 feet. The total length of the embankment is approximately 6,500 feet. The storage capacity of the pond is approximately 1,300 acre-feet at normal pool elevation. Approximately three-fourths of Ash Pond No. 1 is stacked ash, located on the southern side. Free water volume accounts for approximately one-fourth of the pond and is located on the northern end.

Ash Pond No. 2 is a diked impoundment that was commissioned in 1986. The main inflows into Ash Pond No. 2 are precipitation and stormwater pumped from Ash Pond No. 1. The diked fly ash is constructed in a serpentine channel to direct process water and allow for additional time to filter suspended solids before entering the main pond. The outlet structure is in the northeast corner of the pond and transports water into the Recycle Pond, along with a seepage blanket and pump. It has a maximum embankment height of 30 feet, a crest elevation of 640 feet above MSL, and a crest width of 20 feet. The total length of the embankment is approximately 9,000 feet. The storage capacity of the pond is approximately 1,000 acre-feet at normal pool elevation.

The Bottom Ash Pond…….

The GMF Pond is located directly north of the GMF Recycle Pond, east of North Bethel Cemetery Road. The pond encompasses approximately 30 acres and is graded to the south, where water discharges into a channel to flow into the GMF Recycle Pond. From the GMF Recycle Pond, water exits through piping into the Duck Creek Cooling Pond.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 6-1. Power Plant Impoundment Characteristics**

All remaining values are GIS estimated.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 7 BREACH INUNDATION MAPS AND POTENTIAL IMPACTS

Inundation maps for Ash Pond No. 1, Ash Pond No. 2, Bottom Ash Pond, and the GMF Pond potential breach scenarios are provided in this section. It is the Fulton County ESDA/EMA's responsibility to keep a current list of affected parties/properties to contact in the case of emergencies that result in Response Level 2 or 3. This list should encompass all properties within and adjacent to the probable inundation extents shown in the provided maps.

The methodology used to identify probable inundation extents for potential breach scenarios varied as a function of the impoundment size, location, surrounding topography, and surrounding structures/facilities/waterbodies.

Ash Pond No. 1, Ash Pond No. 2, Bottom Ash Pond, and the GMF Pond inundation maps were developed from visual assessments. Topographic data and basemap imagery were used to identify the mapped inundation areas.

Three failure scenarios were identified at Ash Pond No. 1 and Ash Pond No. 2. At both impoundments, the breach would be contained in either the Duck Creek Cooling Pond or the unnamed body of water west of N. Cilco Road. The Bottom Ash Pond is incised and no failure scenarios were identified. Four failure scenarios were identified at the GMF Pond. Only Duck Creek Power Plant owned structures were identified in the potential breach paths, with a breach contained in the Duck Creek Cooling Pond. The land between the impoundments and the Duck Creek Cooling Pond and unnamed body of water west of N. Cilco Road would also be inundated during a breach.

Approximate inundation areas are illustrated on Figure 7-1, Figure 7-2, Figure 7-3, and Figure 7-4.

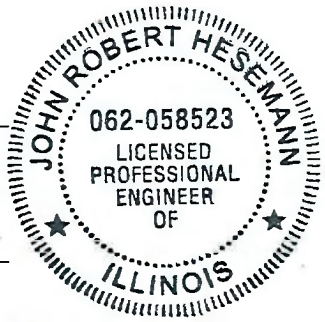
# 1 Introduction

This Coal Combustion Residuals (CCR) fugitive dust control plan has been prepared for the Duck Creek Power Plant, located in Fulton County, Illinois. This plan addresses the air criteria in 40 C.F.R. § 257.80 of the United States Environmental Protection Agency's CCR rule, which requires the owner or operator of a CCR unit to "adopt measures that will effectively minimize CCR from becoming airborne at the facility" and to "prepare and operate in accordance with a CCR fugitive dust control plan." The plan also addresses the air criteria in 35 I.A.C. 845.500 of the Illinois Environmental Protection Agency's CCR rule, which contains similar requirements to the federal CCR rule.

## 1.1 Facility Information

- Facility Name: Duck Creek Power Plant (Retired)
- Facility Address: 17751 North Cilco Road, Canton, IL 61520
- Owner/Operator: Illinois Power Resources Generating, LLC



## 1.2 Certification

The owner or operator must obtain a certification from a qualified professional engineer that the initial CCR fugitive dust control plan, or any subsequent amendment of it, meets the requirements of 40 C.F.R. § 257.80 and 35 I.A.C. 845.500. See 40 C.F.R. §257.80(b)(7); 35 I.A.C. 845.500(b)(7).

I certify under penalty of law that, to the best of my knowledge, this plan meets the requirements of 40 C.F.R. § 257.80 and 35 I.A.C. 845.500. This certification is based on my review of the document and conditions at the site and on my inquiry of the person or persons who managed the preparation of this document.

John R. Hesemann

# 2 CCR Fugitive Dust Control Measures and Appropriateness

CCR fugitive dust has the potential to become airborne at the facility during periods of CCR management in the CCR units, CCR handling and CCR transport. Areas at the facility that have the potential for airborne CCR fugitive dust are CCR surface impoundments, a CCR landfill, CCR handling equipment and CCR transport in trucks. This section identifies and describes the control measures selected and adopted by the facility to minimize CCR from becoming airborne at the facility and explains how the selected measures are applicable and appropriate for site conditions. The control measures may be adjusted or modified based on observed effectiveness of minimizing CCR from becoming airborne and weather conditions.

## 2.1 Management of CCR in the CCR Units

The facility manages CCR in surface impoundments and a landfill located at the facility. Table 2-1 below identifies CCR fugitive dust control measures that have been selected for use by the facility during CCR management in the CCR units, including placement of CCR into the CCR units, and explains how the selected measures are applicable and appropriate for site conditions. The facility will use the identified measures during CCR management in the CCR units to minimize CCR from becoming airborne at the facility.

| CCR Activity | CCR Fugitive Dust Control Measure | Applicability and Appropriateness of Control Measure |
|---|---|---|
| Management of CCR in the facility's CCR units | Condition CCR to be emplaced in the landfill before emplacement. | Conditioning CCR to be placed in the landfill allows CCR to bind together and thus minimizes the potential for CCR fugitive dust generation when CCR is managed in the landfill. The added moisture content will prevent wind dispersal of the CCR but will not result in free liquids. |
| | Cover exposed dry CCR in the landfill. | Applying approved cover material, such as conditioned fly ash, minimizes wind entrainment of CCR. |
| | Wet management of CCR bottom ash and flue gas desulfurization materials in CCR surface impoundments. | Wet management of CCR minimizes the potential for CCR fugitive dust generation. |
| | Water areas of exposed CCR in CCR units, as necessary. | Water will be applied to areas of exposed CCR to maintain moisture content to minimize the potential for CCR fugitive dust generation in excessively dry or windy conditions. Wetting activities will not generate "free liquids" within the landfill. |
| | Naturally occurring grass vegetation in areas of exposed CCR in CCR surface impoundments. | Vegetation provides a wind screen and/or cover and reduces wind entrainment of CCR. |
| | Apply chemical dust suppressant on areas of exposed CCR in CCR units, as necessary. | Mixing an appropriate chemical dust suppressant with water and applying to areas of exposed CCR will minimize the potential for CCR fugitive dust generation in excessively dry or windy conditions. |
| | Reduce or halt operations during high wind events, as necessary. | Reducing or halting operations during high wind events minimizes the potential for CCR fugitive dust generation. |

**Table 2-1. Control Measures for CCR Management in CCR Units**

## 2.2 Handling of CCR

Bottom ash may be periodically removed from the CCR surface impoundments and remains sufficiently wet during and after handling activities, including dewatering, associated with transfer of the CCR. Table 2-2 below identifies CCR fugitive dust control measures that have been selected for use by the facility during handling of CCR and explains how the selected measures are applicable and appropriate for site conditions. The facility will use the identified measures when handling CCR to minimize CCR from becoming airborne at the facility.

| CCR Activity | CCR Fugitive Dust Control Measure | Applicability and Appropriateness of Control Measure |
|---|---|---|
| Handling of CCR at the facility | CCR bottom ash removed from CCR surface impoundments and loaded into trucks for transport remains conditioned during handling. | Conditioned CCR allows CCR to bind together and thus minimizes the potential for CCR fugitive dust generation when CCR is handled. |
| | CCR to be emplaced in the landfill is conditioned before emplacement. | Conditioning allows CCR to bind together and thus minimizes the potential for CCR fugitive dust generation. |
| | Condition CCR materials to be transported offsite before they are loaded into trucks, as necessary. | Conditioning allows CCR to bind together and thus minimizes the potential for CCR fugitive dust generation while loading CCR into trucks and during transport. |
| | Reduce or halt operations during high wind events, as necessary. | Reducing or halting operations during high wind events minimizes the potential for CCR fugitive dust generation. |

**Table 2-2. Control Measures for Handling CCR**

### 2.2.1 Conditioning of CCR Prior to Emplacement in CCR Landfill

Conditioned CCR is CCR that has been wetted with water or an appropriate chemical dust suppressant. Water or a chemical dust suppressant is added to raise the moisture content of the CCR to prevent wind dispersal but will not result in free liquids. Conditioning allows for the CCR to bind together, which minimizes the potential for CCR fugitive dust.

All CCR generated on site that is placed into the facility's landfill, as well as CCR generated offsite that is authorized for placement in the facility's landfill, is conditioned before emplacement. All CCR that is added to the facility's landfill is emplaced in the landfill as conditioned CCR.

## 2.3 Transportation of CCR

CCR is transported via truck at the facility using a combination of paved and unpaved facility roads. Table 2-3 below identifies CCR fugitive dust control measures that have been selected for use by the facility during transport of CCR. The facility will use the identified measures when transporting CCR to minimize CCR from becoming airborne at the facility.

| CCR Activity | CCR Fugitive Dust Control Measure | Applicability and Appropriateness of Control Measure |
|---|---|---|
| Transportation of CCR at the facility | Condition CCR to be emplaced in the landfill before emplacement. | Conditioning CCR increases moisture content of the CCR and minimizes the potential for CCR fugitive dust generation during CCR transport (and emplacement in the landfill). |
| | Condition CCR materials to be transported offsite before they are loaded into trucks, as necessary. | Conditioning allows CCR to bind together and thus minimizes the potential for CCR fugitive dust generation while loading CCR into trucks and during transport. |
| | Cover or enclose trucks used to transport CCR fly ash. | Covering or enclosing trucks transporting CCR on facility roads minimizes the potential for CCR fugitive dust generation from the CCR transport trucks. |
| | Limit the speed of vehicles to no more than 15 mph on facility roads. | Limiting the speed of vehicles traveling on facility roads minimizes the potential for CCR fugitive dust generation from the CCR transport trucks. |
| | Cover or enclose trucks used to transport CCR other than fly ash, as necessary. | Covering or enclosing trucks transporting CCR on facility roads minimizes the potential for CCR fugitive dust generation from the CCR transport trucks. |
| | Sweep or rinse CCR off of the outside of the trucks transporting CCR, as necessary. | Removing CCR present on the outside of the truck minimizes the potential for movement of the truck or wind to cause CCR fugitive dust to become airborne. |
| | Remove CCR, as necessary, deposited on facility road surfaces during transport. | Removing CCR deposited on facility road surfaces as a result of transport minimizes the potential for CCR fugitive dust generation from vehicle traffic. |
| | Condition CCR haul roads with water or dust suppressant, as necessary. | Watering CCR haul roads minimizes the potential for dust generation to occur as a result of CCR hauling traffic and heavy equipment use. |
| | Reduce or halt operations during high wind events, as necessary. | Reducing or halting operations during high wind events minimizes the potential for CCR fugitive dust generation. |

**Table 2-3. Control Measures for Transportation of CCR**

Electronic Filing: Received, Clerk's Office 06/20/2024

# 3 Procedures for Periodic Assessment of Effectiveness of the Plan

The facility conducts inspections associated with CCR fugitive dust control. The facility also uses the procedures identified in section 5 of this plan to log every citizen complaint involving CCR fugitive dust events at the facility. These inspections and the investigations of citizen complaints will be used to periodically assess the effectiveness of the CCR fugitive dust control plan per 40 C.F.R. § 257.80(b)(4) and 35 I.A.C. 845.500(b)(3).

The facility routinely performs inspections to verify the effectiveness of the CCR fugitive dust control measures used at the facility. Inspections are conducted during daylight working hours and include observing for the presence of CCR fugitive dust emissions from vehicles transporting CCR on facility roads, CCR handling and CCR management activities, including CCR placement in CCR units. Inspection records include information such as the name of the person conducting the inspection, the date and time of the inspection, the results of the inspection, and any corrective action taken.

When a CCR fugitive dust event is observed or a citizen complaint involving a CCR fugitive dust event at the facility is received, current CCR management practices will be reviewed to see that the selected control measures are being properly implemented. If the control measures are not being properly implemented, relevant operating personnel will be notified and, as warranted, re-trained in the proper implementation of CCR fugitive dust control measures. If appropriate, use of revised and/or additional control measures will be evaluated. As warranted, revised and/or additional control measures found to be applicable and appropriate to control CCR fugitive dust emissions will be incorporated into an amended CCR fugitive dust control plan.

The plan also will be reassessed in the event of material changes in site conditions potentially resulting in CCR fugitive dust becoming airborne at the facility.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 4 Recordkeeping, Notification, Internet Site

The written CCR fugitive dust control plan, any amendment of the written plan, and the annual CCR fugitive dust control report required by 40 C.F.R. § 257.80(c) and 35 I.A.C. 845.500(c) will be placed in the facility's written operating record and posted to the company's CCR website in accordance with 40 C.F.R. § 257.105(g), § 257.107(g), and 845.800(d)(7), (14), and 845.810(e). Notification of the availability of the CCR fugitive dust control plan, any amendment of the plan, and the annual CCR fugitive dust control report will be provided to IEPA in accordance with 40 C.F.R. § 257.106(g). Any amendment of the fugitive dust control plan will be submitted to IEPA in accordance with 845.500(b)(5).

Additionally, pursuant to 845.500(b)(6), this fugitive dust control plan is being placed in facility's operating record and posted to the company's CCR website prior to the submission of any permits for the Duck Creek Power Plant.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 5 Procedures to Log Citizen Complaints

In the event the owner or operator of the facility receives a citizen complaint involving a CCR fugitive dust event at the facility, relevant information about the complaint will be logged. Information that will be recorded includes, as applicable:

- Date/Time the complaint is received
- Date/Time and duration of the CCR fugitive dust event
- Description of the nature of the CCR fugitive dust event
- Name of the citizen entering the complaint
- Address & phone number of citizen entering the complaint
- Name of the personnel who took the complaint
- All actions taken to assess and resolve the complaint

All citizen complaints involving CCR fugitive dust events at the facility will be investigated promptly. As deemed appropriate or necessary, corrective measures will be taken and a follow-up response will be provided to the complainant.

Pursuant to 35 I.A.C. 845.500(b)(2), quarterly reports will be submitted to IEPA no later than 14 days from the end of the quarter for all complaints received in that quarter. At a minimum, the quarterly report will include the date of the complaint, the date of the incident, the name and contact information of the complainant (if given), and all actions taken to assess and resolve the complaint.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 6 Amendments

The written CCR fugitive dust control plan may be amended at any time provided the revised plan is placed in the facility's operating record as required by 40 C.F.R. § 257.105(g)(1) and 845.500(b)(6). Any amendment of the fugitive dust control plan will be submitted to IEPA in accordance with 845.500(b)(5). The written CCR fugitive dust control plan must be amended whenever there is a change in conditions that would substantially affect the written plan in effect.

| Amendment Number and Date | Pages or Section | Description of Amendment | Professional Engineer Certifying Plan |
|---|---|---|---|
| Version 0 October 2015 | -- | Initial Plan | Wendy M. Pennington |
| Amendment 1 October 2021 | Various | Administrative changes and adjustments to site condition controls as appropriate. | John R. Hesemann |

# EXECUTIVE SUMMARY

This Hydrogeologic Site Characterization Report (HCR) for the Gypsum Management Facility (GMF) Pond at Duck Creek Power Plant (DCPP) expands upon the hydrogeology, groundwater quality data, and conceptual site model (CSM) presented in previous hydrogeologic investigation reports prepared for the GMF Pond. This report has been assembled to satisfy the information and analysis requirements of Title 35 of the Illinois Administrative Code (35 I.A.C.) Section (§) 845.620 as summarized in **Table ES-1**. The CSM includes hydrogeologic and groundwater quality data specific to the GMF Pond, which has been collected from 2015 to 2021. The GMF Pond (Vistra identification [ID] number [No.] 203, Illinois Environmental Protection Agency [IEPA] ID No. W0578010001-04, and National Inventory of Dams [NID] No. IL50573) is located at the DCPP southwest of Canton, Illinois (**Figure 1-1**).

The DCPP is located near the Duck Creek Cooling Pond, which was used as a source of cooling water for the power plant when it was active, and several small ponds which are remnants of the area's surface mining history. Prior to construction of the power plant and associated facilities, strip mining of coal took place within the property boundary of the DCPP. Currently, land use adjacent to the DCPP is agriculture, pasture, and forest with minimal development.

The GMF Pond is a 1500-foot by 900-foot earthen berm double-lined coal combustion residuals (CCR) Surface Impoundment (SI) located north of the former power plant. The GMF Pond decant water discharges to the lined GMF Recycle Pond. Several other CCR units are located on the DCPP property, including the Landfill located due north of the GMF Pond; the closed units, Ash Pond No. 1 and Ash Pond No. 2, located south of the GMF Pond; and the Bottom Ash Basin located between the former power plant and the closed Ash Pond Nos. 1 and 2.

Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) Coal seam. Mining operations in the area have ceased. Strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) coal unit at some portions of the DCPP property. Previous investigations completed outside of the GMF Pond indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 to 75 feet. The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to and downgradient of several former large surface mining areas.

In addition to the CCR within the lined GMF Pond, there are five layers of unlithified material present above the Pennsylvanian-age shaley siltstone and silty shale bedrock (Carbondale Formation). These materials have been categorized into three hydrostratigraphic units presented below in descending order:

- **Uppermost Aquifer:** At the GMF Pond this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the shallow sands. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (Natural Resource Technology, an OBG Company [NRT/OBG], 2017a). The shallow sands are laterally extensive across the site, vary in thickness from less than 1 to 18 feet, and are generally located at an elevation of 570 to 590 feet above mean sea level (msl). The shallow sand is saturated. During construction of the GMF Pond, sand was completely removed everywhere it was encountered (mainly the

northeast corner and southwest corner of the pond), putting the base of liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place.

- **Lower Radnor Till/Lower Confining Unit:** Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick.
- **Bedrock Confining Unit:** The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet.

The Peoria/Roxanna Loess within the uppermost aquifer has also been identified as a potential migration pathway (PMP) for contaminant migration. While the primary migration pathway is the shallow sand of the uppermost aquifer, the groundwater within the overlying Peoria/Roxanna Loess has the potential to be impacted and is considered a PMP.

Groundwater migrates downward through the loess and upper Radnor Till into the shallow sands of the uppermost aquifer. Groundwater flow in the sands is generally in a northwest to southeast direction. Seasonal variation of groundwater levels at the GMF Pond are present and may fluctuate approximately 1 to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond associated with the elevation changes. Groundwater flows toward the Duck Creek Cooling Pond located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Cooling Pond is estimated from 562.5 to 565 feet North American Vertical Datum of 1988 (NAVD88). Which is approximately 20 feet lower than downgradient groundwater at the GMF Pond.

Part 845 parameters were monitored in uppermost aquifer and PMP monitoring wells as part of groundwater quality evaluations performed from 2015 to 2021. These data were supplemented with installation and sampling of additional locations in 2021. The results indicate that the following parameters were detected at concentrations greater than the applicable 35 I.A.C. § 845.600 groundwater protection standards (GWPSs) and are considered potential exceedances:

- Antimony, arsenic, cobalt, lead, pH, sulfate, and thallium were detected at least once at concentrations greater than the GWPS in downgradient uppermost aquifer wells (including PMP wells). Lead, mercury, pH, and thallium were detected at concentrations greater than the GWPS in upgradient uppermost aquifer wells. Radium 226 and 228 combined was detected once at concentrations greater than the GWPS in the bedrock confining unit well.

Concentration results for the above parameters were compared directly to 35 I.A.C. § 845.600 GWPS to determine potential exceedances. Potential exceedances include results reported during the background groundwater monitoring or prior period that are greater than the GWPS. The results are considered potential exceedances because the results were compared directly to the standard and did not include an evaluation of background groundwater quality or the statistical methodologies proposed in the groundwater monitoring plan (GMP) provided in the Operating Permit application. Exceedances will be determined following IEPA approval of the GMP.

HCR = Hydrogeologic Characterization Report
-- = reference to main regulation

# 1. INTRODUCTION

## 1.1 Overview

In accordance with requirements of the Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments: 35 I.A.C. § 845 (Part 845) (IEPA, April 15, 2021), Ramboll Americas Engineering Solutions, Inc. (Ramboll) has prepared this HCR on behalf of DCPP (**Figure 1-1**), operated by Illinois Power Resources Generating, LLC (IPRG). This report will apply specifically to the CCR Unit referred to as the GMF Pond. However, information gathered to evaluate other CCR units in the vicinity regarding geology, hydrogeology, and groundwater quality is included, where appropriate. The GMF Pond consists of a 1,500-foot by 900-foot earthen berm with 3.5:1 side slopes, a maximum elevation of 620 feet, a double geomembrane liner consisting of a 60-millimeter (mil) high-density polyethylene (HDPE) geomembrane liner, 12-inch clay cushion, 4 ounce per square yard ($oz/yd^2$) non-woven geotextile filter fabric, 12-inch highly permeable granular drainage (sand), 10 $oz/yd^2$ non-woven geotextile filter fabric, 60-mil HDPE geomembrane liner, reinforced bentonite mat, 36-inch compacted clay, all installed over in-situ foundation soil, and all pipes, pumps, and appurtenances necessary for the storage of approximately 3.6 million tons of gypsum at a maximum elevation of 715 feet with discharge to the GMF Recycle Pond. This HCR includes Part 845 content requirements specific to 35 I.A.C. § 845.620(b) (Hydrogeologic Site Characterization) for the GMF Pond at the DCPP.

## 1.2 Part 845 Description

CCR is commonly referred to as coal ash, and CCR SIs are commonly referred to as coal ash ponds. Part 845 contains comprehensive rules for the design, construction, operation, corrective action, closure, and post closure care of these SIs. This rule includes GWPSs applicable at the waste boundary at each CCR SI and requires each owner or operator to monitor groundwater. IEPA's rule includes a permitting program as well as all federal standards for CCR SIs promulgated by the United States Environmental Protection Agency (USEPA). In addition, the rules include procedures for public participation, closure alternatives analyses, and closure prioritization, and provides access to records via public website. The rules also include financial assurance requirements for CCR SIs.

A checklist which identifies the specific requirements of 35 I.A.C. § 845.620 is included in **Table ES-1**. The table provides references to sections, tables, and figures included in this document to locate the information that meets specific requirements of 35 I.A.C. § 845.620.

## 1.3 Previous Investigations and Reports

Numerous hydrogeologic investigations have been performed concerning the CCR Units at the DCPP. The information presented in this HCR includes data collected in support of the monitoring well network established for development of the GMP and supplements comprehensive data collection and evaluations from prior hydrogeologic investigation reports (recent to oldest), including, but not limited to, the following:

- ***Hanson Professional Services, Inc. (Hanson), March 25, 2021. First Quarter 2021 Groundwater Report, Duck Creek Power Station, Gypsum Stack and Recycle Pond, WPC Permit No. 2017-EO-62640, Fulton County.***
  Quarterly comparison of groundwater monitoring results to the relevant groundwater standard and submittal of the quarterly sample results.

- ***Natural Resource Technology, an OBG Company (NRT/OBG), October 17, 2017. Hydrogeologic Monitoring Plan, Duck Creek GMF Pond – CCR Unit ID 203, Duck Creek Landfill – CCR Unit ID 204, Duck Creek Power Station, Canton, Illinois.***
  Hydrogeologic Monitoring Plan (HMP) prepared to provide background information necessary to support the groundwater monitoring system established to comply with Title 40 of the Code of Federal Regulations (40 C.F.R.) § 257.91 to regulate the disposal of CCR as solid waste under Subtitle D of the Resource Conservation and Recovery Act (RCRA) [40 C.F.R. § 257 Subpart D; published in 80 FR 21302-21501, April 17, 2015] for the DCPP located in Canton, Illinois.
- ***AECOM, October 2016. History of Construction, USEPA Final CCR Rule, 40 C.F.R. § 257.739(c), Duck Creek Power Station, Canton, Illinois.***
  History of construction for the Ash Pond No. 1, Ash Pond No. 2, and GMF Pond at the DCPP in accordance with 40 C.F.R. § 257.73(c).
- ***Hanson, March 2016. Clay Liner Evaluation Report, Illinois Power Resources Generating LLC, Duck Creek Power Station, Fulton County, Illinois.***
  Evaluation prepared to show that the existing liner in the GMF Pond meets the minimum requirements of the 40 C.F.R. § 257 regulations. Conclusion indicated that the as built liner exceeds the performance standard set by 40 C.F.R. § 257.70(b). Construction Quality Assurance (CQA) documents are presented to verify the integrity of the liner components.
- ***Natural Resource Technology, Inc. (NRT), March 31, 2016. Supplemental Hydrogeologic Site Characterization and Groundwater Monitoring Plan, Duck Creek Ash Ponds 1 and 2, Duck Creek Energy Center, Canton, Illinois.***
  This Supplemental Hydrogeologic Site Characterization and Groundwater Monitoring Plan was prepared to develop hydrogeologic information in support of a Closure Plan for the Duck Creek Energy Center Ash Ponds 1 and 2.
- ***Hanson, February 29, 2016. Ash Pond 1 and Ash Pond 2, Aquifer Evaluation in the Surface (Strip) Mining Area, Duck Creek Power Station, Illinois Power Resources Generating, LLC, Fulton County, IL.***
  Characterization of strip mining areas adjacent to Ash Ponds 1 and 2 at the DCPP.
- ***Hanson, March 2010. Hydrogeologic Report, Ameren Duck Creek Power Generating Station Solid Waste Disposal System (Ash Pond 1, Ash Pond 2, and Recycle Pond).***
  Hydrogeologic site characterization report for multiple ponds at the DCPP.
- ***Hanson, 2009. Section 3 – Hydrogeologic Report, in Support Document for Permit Application, Duck Creek Power Generating Station, Gypsum Management Facility, Springfield, Fulton County, Illinois.***
  An overview prepared to illustrate regional climate, geology, and hydrogeology and site-specific information related to geotechnical, hydrogeological, and geochemical characteristics found at the site.

A GMP is being prepared for the GMF Pond in conjunction with this report and is included in the Operating Permit to which this Report is attached.

## 1.4 Site Location and Background

The DCPP is located in Fulton County, Illinois and approximately 6 miles southeast of the town of Canton. The GMF Pond is located north of the power plant in Section 18 of Township 6 North,

Range 5 East (**Figure 1-1**). The GMF Recycle Pond is located just south of the GMF Pond (**Figure 1-2**). The DCPP is located near the Duck Creek Cooling Pond, which was used as a source of cooling water for the power plant when it was active, and several small ponds which are remnants of the area's surface mining history. The Landfill is located due north of the GMF Pond and the closed units, Ash Pond No. 1 and Ash Pond No 2, are located south of the GMF Recycle Pond. Prior to construction of the power plant and associated facilities, strip mining of coal took place within the property boundary of the DCPP (**Figure 1-1**). Currently, land use adjacent to the DCPP is agriculture, pasture, and forest with minimal development.

## 1.5 Site History and Unit Description

Surface preparation for the GMF Pond began in 2007 and construction took place from 2008 to 2009. The GMF Recycle Pond was constructed at the same time.

The GMF Pond, also referred to as the gypsum stack/management system, operates under an IEPA permit (#2017-E0-62640) issued in December 2017. It consists of a 1,500-foot by 900-foot earthen berm with 3.5:1 side slopes, a maximum elevation of 620 feet, a double geomembrane liner consisting of a 60-mil HDPE geomembrane liner, 12-inch clay cushion, 4 oz/yd$^2$ non-woven geotextile filter fabric, 12-inch highly permeable granular drainage (sand), 10 oz/yd$^2$ non-woven geotextile filter fabric, 60-mil HDPE geomembrane liner, reinforced bentonite mat, 36-inch compacted clay, all installed over in-situ foundation soil, and all pipes, pumps, and appurtenances necessary for the storage of approximately 3.6 million tons of gypsum at a maximum elevation of 715 feet with discharge to the GMF Recycle Pond.

The GMF Pond decant water discharges to the GMF Recycle Pond, which has a capacity of 32.6 million gallons. The GMF Recycle Pond is lined with a 60-mil HDPE geomembrane liner, reinforced bentonite mat and 36 inches of compacted clay.

# 2. REGIONAL AND LOCAL GEOLOGY

## 2.1 Topography

Topography within the DCPP property (**Figure 1-1**) is significantly influenced by the history of mining in the area. Strip mining has occurred in this area since the 1930s prior to mine reclamation laws; and, where present, has completely disrupted the natural stratigraphy down to the Springfield (No. 5) Coal unit. The strip mining activity has produced rough topography from soil piles and depressions, often ponded with water (Hanson, 2009). As discussed later in this document, soils in the immediate vicinity of the GMF Pond and GMF Recycle Pond do not appear to have been disturbed by surface mining activities; however, areas surrounding these ponds have been disturbed. Topography adjacent to the GMF Pond is provided in **Figure 2-1**.

## 2.2 Regional Geomorphology

The DCPP lies near the east edge of Fulton County in north central Illinois. The study area lies along the southeast edge of the Galesburg Plain Division of the Central Lowland Physiographic Province. The area consists of flat to gently rolling uplands that are dissected by many, deeply incised streams that are tributaries to major river systems. The erosional landforms have developed primarily within deposits of glacial drift that blanket Pennsylvanian-aged bedrock. The Pennsylvanian bedrock generally controls the landforms, particularly drainage ways and rivers in the area (Hanson, 2009).

The Illinois River delineates the southeast border of the Galesburg Plain and is the main drainage for the region. The physiography of many areas in the Galesburg Plain has been affected by strip mining of coal. Strip mines have altered the natural landforms and drainage systems. Unreclaimed strip mine areas are usually very hummocky with mine spoils and are pocked with ponds and depressions (Hanson, 2009).

## 2.3 Soils

Surficial soils at the Site and vicinity are shown on **Figure 2-2**, based on the soil survey performed in Fulton County in 1994 available in the Soil Survey Geographic database (SSURGO) by the United States Department of Agriculture Natural Resources Conservation Service (NRCS) provided by the Environmental Systems Research Institute (ESRI) web-hosted layer (NRCS, 1997).

Former soils underlying the Site are identified as Fayette Silt Loam (#280E2 and #280gD2), Keomah Silt Loam (#17A), and Rozetta Silt Loam (#279B and #279C2). The Fayette series consists of well drained loess on sideslopes along upland drainageways. This soil is well suited for and used as habitat for openland and woodland wildlife. These soils are moderately suitable for cultivated crops due to crusting and water erosion and unsuitable for dwellings due to flooding. The Keomah series consists of somewhat poorly drained loess in interfluvial areas. This soil is well suited for and used as habitat for openland wildlife. These soils are moderately suitable for cultivated crops due to crusting and flooding and only moderately suitable to unsuitable for dwellings due to slope. The Rozetta series consists of well drained loess in interfluvial areas, head slopes, and sideslopes along upland drainageways. This soil is well suited for and used as habitat for openland and woodland wildlife. These soils are moderately suitable for cultivated crops due to crusting and water erosion and only moderately suitable for dwellings due to flooding.

Areas surrounding the GMF Pond are classified as Hickory Silt Loam (#8cF), Elco Silt Loam (#119E2), and Clarksdale Silt Loam (#257A). The Hickory series consists of well-drained till. These soils formed on sideslopes along upland drainageways. Most areas of this association are moderately unsuitable for cultivated crops due to frost heave, low pH, and water erosion. The Elco series consists of moderately well drained loess and underlying paleosol. These soils formed in loess and till on sideslopes along upland drainageways. Most areas of this association are moderately suitable for cultivated crops due to frost heave, low pH, and water erosion. The Clarksdale series consists of somewhat poorly drained loess. These soils formed in interfluvial areas. Most areas of this association are moderately suitable for cultivated crops due to frost heave, low pH, and wetness.

## 2.4 Regional Geology

Regionally, the DCPP is positioned on the glacial uplands above the Illinois River in the Ancient Illinois Floodplain of the Till Plains Section of the Central Lowland Province.

### 2.4.1 Regional Unlithified Geology

Upper unlithified materials consist of Wisconsinan Stage materials overlying Illinoian Stage deposits. The undisturbed unlithified materials consist of loess, diamictons, and lacustrine/alluvial deposits. The area is flat to gently rolling uplands that are dissected by deeply incised streams that are tributaries to major river systems. The erosional landforms have developed primarily within deposits of glacial drift that blanket Pennsylvanian-aged bedrock (NRT/OBG, 2017a).

Areas near the GMF Pond are part of several large surface coal mines (**Figure 2-3**) where unlithified materials are present in the excavated strip mine spoils, but have been mixed due to the surface mining activities. Mining operations in the area have ceased (NRT/OBG, 2017a).

The Radnor Till is the only surficial Quaternary geologic deposit regionally mapped in the vicinity of the GMF Pond and is shown on **Figure 2-4**.

### 2.4.2 Regional Bedrock Geology

The uppermost bedrock stratum in the area is the Carbondale Formation of the Kewanee Group of the Pennsylvanian System. The Carbondale Formation consists of interbedded sequences of shale, sandstone, limestone, and coal with associated underclay. These sediments were deposited in shallow marine, deltaic, and swamp environments. Some of the shales are fossiliferous (containing either plant or marine fossils), and some contain sideritic nodules and bands. The sandstones are mostly subgraywackes and occur in elongated channel facies. The limestones are generally gray to dark gray, argillaceous, and normally fossiliferous. Thin black fissile shales are commonly associated with the limestones. The Carbondale Formation includes the principle Illinois economic coals: the Herrin (No. 6), the Springfield (No. 5), the Colchester (No. 2), and the Danville (No. 7). Underclays occur at the base of the coal seams. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) coal seam (Hanson, 2009).

### 2.4.3 Structure

The bedrock surface in the site area has been mapped at about elevation 560 feet NAVD88. The bedrock mapping indicates the beds dip to the east-southeast at about 60 feet per mile. The St. Davis anticline occurs within the Pennsylvanian sequence and passes through the landfill area which explains the lack of strip mining activity in this portion of the DCPP (Hanson, 2005).

### 2.4.4 Seismic Setting

The major geologic structural features within Illinois are depicted on **Figure 2-5**. Fulton County is not located in a seismic impact zone. The nearest areas of present-day fault-related, seismic activity are the Northern Illinois Seismic Source Zone and the Wabash Valley Fault Zone near southwestern Indiana and the New Madrid Fault Zone along the Ohio and Mississippi River Valleys in southeastern Illinois. Records dating from 1811 indicate that earthquakes greater than a Richter Scale Magnitude 6.0 occurred in or near the New Madrid Fault line. Away from the fault, all earthquakes have been a 5.9 magnitude or less. The earthquake epicenters appear to be the result of modern regional stress fields and are not related to the nearby inactive faults (Hanson, 2009).

### 2.4.5 Mining Activities

Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) Coal seam. Mining operations in the area have ceased. As indicated above, strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) Coal unit at some portions of the Site. Previous investigations completed outside of the GMF Pond at the Site also indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 to 75 feet (as observed at monitoring well OM24D and OM15 near the ash ponds). The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to several former large surface mining areas (**Figure 2-3** and **Appendix A**).

## 2.5 Site Geology

A field investigation was performed in 2021 to collect additional data for the discussion of vertical and horizontal lithology, stratigraphy, chemical properties, and physical properties of geologic layers to a minimum of 100 feet below ground surface (bgs) as specified in 35 I.A.C. § 845.620(b). Field investigation locations from 2021 are shown on **Figure 2-6**. The major geomorphic features occurring within and nearby the GMF Pond include Peoria/Roxanna Loess overlying Glasford Formation clayey diamictons (till).

### 2.5.1 Site-Specific Unlithified Geology

The unlithified stratigraphy within and immediately surrounding the GMF Pond consists of the following in descending order: fill material and CCR; silt and clayey silt loess (Peoria/Roxanna Loess); weathered till (upper Radnor Till); shallow, medium-grained sand to silt zone within the Radnor Till; and till (lower Radnor Till). The unlithified units overlay Pennsylvanian-age shaley siltstone and silty shale bedrock (Carbondale Formation). Boring logs and monitoring well and piezometer construction forms obtained from investigations at the GMF Pond are provided in **Appendix B**. Cross-sections showing the subsurface materials encountered at the GMF Pond are included in **Figures 2-7 and 2-8**. Samples for geotechnical analysis were collected from interpreted geologic units and composited to obtain a representative sample of the entire geologic unit prior to submittal (**Table 2-1**).

#### 2.5.1.1 Fill and CCR

Gypsum is present within the GMF Pond at a maximum thickness of approximately 22 feet, as estimated from topography and the elevation of the base of the liner from available construction details (**Figure 2-9**). The range of gypsum thickness is estimated from less than 1 to 22 feet.

The thickest areas of gypsum are to the north and west within the GMF Pond and thin toward the south end of the GMF Pond. The base of the liner rests on top of the lower Radnor Till.

Geotechnical analysis results from two grab samples (sample IDs Gypsum and LSN-3781/Gypsum) collected from the GMF Pond near XTPW01 are summarized in **Table 2-1**. Sample locations are shown on **Figure 2-6**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results from grab samples near XTPW01 indicated the following:

- Average moisture content of 30.7 percent, with a range of 28.8 to 32.5 percent.
- Total porosity (calculated) of 56.1 percent.
- Dry density of 73.9 pounds per cubic foot (pcf).
- Average specific gravity of 2.51, with a range of 2.310 to 2.700.
- Grain size composition of 0 percent gravel, 4 percent sand, and 96 percent fines (silt and clay).
- Vertical hydraulic conductivity of 6.7 x $10^{-4}$ centimeters per second (cm/s).

Solid samples were collected from grab samples near XTPW01 in 2021 for chemical analysis. The results of solid samples collected from within the gypsum are summarized in **Table 2-2**.

To sample porewater, a piezometer (pre-pack well, XTPW02) was installed by Golder Associates, Inc. 5.5 feet into the gypsum on June 23, 2021. XTPW02 is located approximately 132 feet east of the western edge of the GMF Pond and is shown on **Figure 2-6**. The piezometer was installed using hand tools (no drilling log). A porewater sample was collected from XTPW02 on June 23, 2021. The results of porewater sample are summarized in **Table 2-3.**

#### 2.5.1.2 Peoria/Roxanna Loess

The Wisconsinan Stage Peoria/Roxanna Loess extends from beneath the topsoil developed in the loess to depths ranging from 11 to 21 feet. The loess consists predominantly of silt and clayey silt with minor amounts of sand. The loess exhibits iron staining, concretions, and some fracturing. The Loess Unit is saturated below depths varying from approximately 3.5 to 11 feet.

Geotechnical analysis results from samples collected from Peoria/Roxanna Loess yielded Unified Soil Classification System (USCS) soil classifications of lean clay. Sample locations are shown on **Figure 2-6,** the geotechnical results from the most recent investigation are summarized in **Table 2-1**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results indicated the following:

- Average moisture content of 22.0 percent, with a range of 18.6 to 25.9 percent.
- Average total porosity (calculated) of 37 percent, with a range of 32.4 to 41.8 percent.
- Average dry density of 103.8 pcf, with a range of 97.3 to 113.1 pcf.
- Average specific gravity of 2.67, with a range of 2.650 to 2.680.
- Average grain size composition of 0.1 percent gravel, 8.6 percent sand, and 91.4 percent fines (silt and clay). The fines content ranged from 88.2 to 97.4 percent, with a median value of 88.5 percent.

- Geometric mean vertical hydraulic conductivity of 2.1 x $10^{-7}$ cm/s and ranged from 7.1 x $10^{-8}$ to 6.3 x $10^{-7}$ cm/s.

Solid samples were also collected in 2021 for chemical analysis. The results of solid samples collected from the loess are summarized in **Table 2-4**.

#### 2.5.1.3 Upper Radnor Till

The loess is generally underlain by a relatively thin till sequence consisting of the Berry Clay (where present) and the Illinoian Stage upper Radnor Till. The till sequence ranges in thickness from 9 to 21 feet in the area of the GMF Pond. This shallow till is generally weathered and exhibits signs of oxidation and fracturing. The till is primarily clayey silt with minor amounts of sand and gravel.

Geotechnical analysis results from samples collected from the upper Radnor Till yielded USCS soil classifications of lean clay. Sample locations are shown on **Figure 2-6,** the geotechnical results from the most recent investigation are summarized in **Table 2-1**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results indicated the following:

- Average moisture content of 22.4 percent, with a range of 21.1 to 24.6 percent.
- Average total porosity (calculated) of 36.8 percent, with a range of 30.7 to 41.4 percent.
- Average dry density of 106.1 pcf, with a range of 98.0 to 116.7 pcf.
- Average specific gravity of 2.69, with a range of 2.680 to 2.700.
- Average grain size composition of 1.5 percent gravel, 22.6 percent sand, and 75.9 percent fines (silt and clay). The fines content ranged from 77 to 80.6 percent, with a median value of 75.4 percent.
- Geometric mean vertical hydraulic conductivity of 7.7 x $10^{-7}$ cm/s and ranged from 2.6 x $10^{-7}$ to 2.3 x $10^{-6}$ cm/s.

Solid samples were also collected in 2021 for chemical analysis. The results of solid samples collected from the upper Radnor Till are summarized in **Table 2-4**.

#### 2.5.1.4 Shallow Sand Zone

The Shallow Sand Zone is laterally extensive within the Radnor Till across the site and varies in thickness from less than 1 to 18 feet near the GMF Pond. The top of the Shallow Sand Zone is generally located at an elevation of 570 to 590 feet msl. The Shallow Sand Zone exhibits lateral facies changes across the site and varies from a medium-grained sand to a silt and often contains intercalated till seams, as shown in the hydrogeologic cross sections (**Figures 2-7 and 2-8**). The Shallow Sand Zone is saturated. The Shallow Sand Zone is the most laterally extensive at the GMF Pond, with other zones having either an unsaturated component, intermittent presence, or entirely absent.

During construction, shallow sand was encountered and completely removed from underneath the northeast corner and southwest corner of the GMF Pond, putting the liner in contact with clay of the lower Radnor Till (**Figures 2-7 and 2-8**). Sand outside the GMF Pond footprint remains.

Geotechnical analysis results from samples collected from the Shallow Sand Zone yielded USCS soil classifications of silty lean clay and lean clay. These USCS classifications contain more fines

than expected, and are likely a result of difficulty targeting a thin sand zone within largely fine-grained materials. Sample locations are shown on **Figure 2-6**, the geotechnical results from the most recent investigation are summarized in **Table 2-1**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results indicated the following:

- Average moisture content of 17.5 percent, with a range of 14.5 to 21.9 percent.
- Average total porosity (calculated) of 29.5 percent, with a range of 27.4 to 31.4 percent.
- Average dry density of 115.0 pcf, with a range of 105.1 to 122.3 pcf.
- Average specific gravity of 2.663, with a range of 2.640 to 2.700.
- Average grain size composition of 5.7 percent gravel, 27.1 percent sand, and 67.2 percent fines (silt and clay). The fines content ranged from 63.6 to 73.7 percent, with a median value of 64.4 percent.
- Geometric mean vertical hydraulic conductivity of $9.0 \times 10^{-7}$ cm/s and ranged from $7.5 \times 10^{-7}$ to $1.1 \times 10^{-6}$ cm/s.

Solid samples were also collected in 2021 for chemical analysis. The results of solid samples collected from the Shallow Sand Zone are summarized in **Table 2-4**.

#### 2.5.1.5 Lower Radnor Till

Till sequences underlying the Shallow Sand Zone consist of clay, silt, and sand of the Illinoian Stage lower Radnor Till. The till ranges in thickness from 42 to 58 feet. In some areas of the site, including the area near the GMF Pond, the till sequences typically extend from the base of the shallow sand to the bedrock surface. In other areas of the site, the till sequences extend to intermediate or deep sands. The till sequences are typically high in silt content with varying amounts of clay, sand, and gravel, and are often calcareous.

Geotechnical analysis results from samples collected from the lower Radnor Till at soil borings yielded USCS soil classifications of silty clayey sand, silty lean clay, and lean clay. Sample locations are shown on **Figure 2-6**, the geotechnical results from the most recent investigation are summarized in **Table 2-1**, and geotechnical laboratory reports are included in **Appendix C**. Geotechnical results indicated the following:

- Average moisture content of 10.5 percent, with a range of 7.7 to 12.6 percent.
- Average total porosity (calculated) of 22.3 percent, with a range of 20.6 to 23.5 percent.
- Average dry density of 127.5 pcf, with a range of 123.2 to 133.8 pcf.
- Average specific gravity of 2.670, with a range of 2.640 to 2.700.
- Average grain size composition of 7.7 percent gravel, 38.2 percent sand, and 54 percent fines (silt and clay). The fines content ranged from 49.3 to 56.5 percent, with a median value of 64.4 percent.
- Geometric mean vertical hydraulic conductivity of $4.7 \times 10^{-7}$ cm/s and ranged from $4.1 \times 10^{-8}$ to $5.4 \times 10^{-6}$ cm/s.

Solid samples were also collected in 2021 for chemical analysis. The results of solid samples collected from the lower Radnor Till are summarized in **Table 2-4**.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 2.5.2 Site Specific Bedrock Geology

Pennsylvanian bedrock was encountered at greatly varying depths across the site. Bedrock depths ranged from a minimum of 52 feet to a maximum of 108 feet. Bedrock was encountered at boring locations B-54, B-60, and G54C at 84 feet bgs, 88 feet bgs, and 90 feet bgs, respectively, in the vicinity of the GMF Pond (**Appendix D** for boring locations). The bedrock shows little compositional variation across the site and consists primarily of shaley siltstone and silty shale. The shale bedrock unit is typically weathered near the surface, has low hydraulic conductivity, and underlies the glacial till sequences. These units often contain thin dolomite ledges and nodules and some fractures.

# 3. REGIONAL AND LOCAL HYDROGEOLOGY

## 3.1 Regional Hydrogeology

As discussed in **Section 2**, unlithified materials consist of Wisconsinan Stage materials overlying Illinoian Stage deposits. The undisturbed unlithified materials consist of loess, diamictons, and lacustrine/alluvial deposits overlying Pennsylvanian-aged bedrock. The area is flat to gently rolling uplands that are dissected by deeply incised streams that are tributaries to major river systems in areas that have not been disturbed by strip mining activity.

Available records of wells within one mile of the site indicate potable water may be obtained from unconsolidated materials or from deep bedrock. Estimated specific capacity (used to approximate the transmissivity of a formation) indicated shallow sands near the GMF Pond provide a very modest specific capacity and groundwater yield (Hanson, 2009).

## 3.2 Site Hydrogeology

Wells used for groundwater monitoring at the GMF Pond have been constructed in phases since 2008. Prior to 2021, there were more than 30 wells used to monitor the GMF Pond. In 2021, one additional well (G54C) was installed in bedrock to provide information to meet the requirements of Part 845. Construction details for monitoring wells and piezometers associated with the GMF Pond are provided in **Table 3-1** and depicted in **Figure 3-1**. Boring logs, monitoring well and piezometer construction forms are provided in **Appendix B**.

### 3.2.1 Hydrostratigraphic Units

Three distinct water-bearing layers have been identified at the Site based on stratigraphic relationships and common hydrogeologic characteristics which are summarized and discussed in subsequent sections:

- **The Uppermost Aquifer**: At the GMF Pond this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the shallow sands described in detail in **Section 2.5.1**. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (NRT/OBG, 2017a). The shallow sands are laterally extensive across the site, vary in thickness from less than 1 to 18 feet, and are generally located at an elevation of 570 to 590 feet msl. The shallow sand is saturated. During construction of the GMF Pond, sand was completely removed everywhere it was encountered (mainly the northeast corner and southwest corner of the pond), putting the base of liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place.
- **Lower Radnor Till/Lower Confining Unit**: Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick. Previous hydrogeologic studies indicate discontinuous sand lenses observed within the till are not hydraulically connected to the shallow sand unit (NRT/OBG, 2017a).
- **Bedrock Confining Unit**: The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet. The boring for monitoring well G54C extends 11.5 feet into the bedrock. Additional bedrock detail is provided in **Section 2.5.2**.

### 3.2.2 Uppermost Aquifer

As stated above, this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the shallow sand zone. The shallow sand zone is the primary migration pathway within these hydraulically connected formations. In places where the shallow sand unit is absent (such as beneath the GMF Pond Liner) the uppermost aquifer may be functionally absent, as the liner is in contact with clay till. Groundwater monitoring is focused in the shallow sand unit because it is the most permeable and laterally continuous unit at the Site. The top of the uppermost aquifer is presented in **Figure 3-2.** The base of the uppermost aquifer is the lower confining unit (the lower Radnor Till).

### 3.2.3 Potential Migration Pathway

The Peoria/Roxanna Loess within the uppermost aquifer has also been identified as a PMP. While the primary migration pathway is the shallow sand of the uppermost aquifer, impacts have the potential to migrate within groundwater in the overlying Peoria/Roxanna Loess. The PMP is saturated at depths of 3.5 to 11 feet bgs. While the PMP and uppermost aquifer are hydraulically connected, groundwater flow in the PMP is expected to be primarily vertical, with the majority of the horizontal migration expected to occur within the uppermost aquifer. Monitoring wells with the suffix “L” are screened within the loess and provide representative data on the hydraulic properties and groundwater quality of the PMP.

### 3.2.4 Water Table Elevation and Groundwater Flow Direction

Groundwater flow across the GMF Pond within the uppermost aquifer is consistently in a southeast direction toward the Duck Creek Cooling Pond (**Figures 3-3 and 3-4**). Groundwater elevations of the uppermost aquifer vary seasonally although flow directions are generally consistent (additional contour maps are included in **Appendix D**).

Groundwater elevations in the PMP wells are generally higher than those in the uppermost aquifer and reflect the groundwater flow in the underlying uppermost aquifer wells. Surface water elevations within the GMF Pond are higher than the groundwater.

#### 3.2.4.1 Vertical Hydraulic Gradients

Vertical hydraulic gradients were calculated using available groundwater elevation data from April to August 2021 at wells screened in the PMP, uppermost aquifer, and bedrock (**Table 3-2**). The results of the vertical hydraulic gradient calculations between these hydrostratigraphic units are summarized below:

- Uppermost aquifer to PMP:
  - Vertical hydraulic gradients between wells G51L (PMP) and G51S (uppermost aquifer) ranged from -0.01 to -0.03 feet per feet (ft/ft), upward, averaging 0.02 ft/ft upward
  - G54L (PMP) and G54S (uppermost aquifer) ranged from 0.01 to 0.09 ft/ft downward, averaging 0.04 ft/ft downward
  - G57L (PMP) and G57S (uppermost aquifer) ranged from -0.04 ft/ft upward to 0.12 ft/ft downward, averaging 0.02 ft/ft downward
  - G60L (PMP) and G60S (uppermost aquifer) ranged from 1.2 to 1.6 ft/ft downward, averaging 1.3 ft/ft downward

- Bedrock confining unit to uppermost aquifer:
  - Vertical hydraulic gradients between wells G54C (bedrock confining unit) and G54S (uppermost aquifer) ranged from 0.17 to 0.27 ft/ft, downward, averaging a downward vertical gradient of 0.20 ft/ft

The downward gradients observed between downgradient wells G54L and G54S, and G60L and G60S, are consistent with vertical gradients reported by Hanson in 2009. The slightly upward gradient between upgradient wells G51L and G51S, and the variable gradients between downgradient wells G57L and G57S did not have a comparable measurement from previous studies.

#### 3.2.4.2 Impact of Existing Ponds and Ash Saturation

The GMF Pond is lined, as described in **Section 1.5,** and the shallow sands of the uppermost aquifer were removed from within the footprint of the pond. The phreatic surface measured from a transducer at location X301 within the GMF Pond ranges from approximately 613 to 617 feet NAVD88 with an average around 614 feet (**Appendix D**), whereas groundwater elevations measured in monitoring wells located around the GMF Pond and screened within the uppermost aquifer range from approximately 590 to 578 feet NAVD88. Groundwater elevation contours indicate groundwater generally flow to the southeast, with no indication of radial flow. The elevation difference between the phreatic surface and groundwater elevations, in addition to no observations of radial flow, provide evidence that the GMF Pond does not impact groundwater flow directions via recharge to groundwater. Given the low permeability of the liner system, it is more likely that the GMF Pond is a barrier to groundwater flow within the uppermost aquifer, deflecting flow from upgradient areas around the perimeter of the pond toward the downgradient areas.

With the relatively stable phreatic surface elevation within the pond around 614 feet, the thickness of saturated CCR (gypsum) in the pond will correspond with the thickness of gypsum in the pond. Thicker accumulations of gypsum are present in the north end of the pond and thin to the south.

#### 3.2.4.3 Impact of Surface Water Bodies

The nearest surface water body to the GMF Pond is the Duck Creek Cooling Pond, which is located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Cooling Pond is estimated to be from 562.5 to 565 feet NAVD88. Which is approximately 20 feet lower than downgradient groundwater at the GMF Pond, indicating that groundwater in the vicinity of the GMF Pond is flowing toward the Cooling Pond. The shoreline of the Cooling Pond is very irregular (**Figure 1-1**) as it occupies the former surface water drainage features associated with Duck Creek (which was impounded to create the Cooling Pond).

### 3.2.5 Hydraulic Conductivities

#### 3.2.5.1 Field Hydraulic Conductivities

Field hydraulic conductivity tests were performed in the uppermost aquifer by Hanson in 2021. Hydraulic conductivity test analyses and results are summarized in **Table 3-3** and provided in **Appendix E**. Field hydraulic conductivity tests from monitoring wells G50L, G51L, G53L, G54L, G60L, G50S, G51S, G53S, G54S, G57S, G60S, and G63S indicated hydraulic conductivities from $3.0 \times 10^{-5}$ to $3.9 \times 10^{-3}$ cm/s with a geometric mean of $3.6 \times 10^{-4}$ cm/s.

Results of field hydraulic conductivity tests conducted in 2021 in the bedrock confining unit by Hanson at monitoring well G54C ranged from 1.4 x $10^{-4}$ to 1.6 x$10^{-4}$ cm/s, with a geometric mean of 1.5 x $10^{-4}$ cm/s. This is higher in comparison to the horizontal hydraulic conductivity range of 1.3 x $10^{-6}$ cm/s to 1.3 x $10^{-9}$ cm/s, established by Hanson in 2015, which used pressure testing on borehole OM32. The higher values observed at G54C are attributed to the highly weathered nature of the bedrock in the screen interval which is supported by the low rock quality designation (RQD) N values ranging from 14-22 (lower numbers indicating lower percentage of intact rock core recovered).

#### 3.2.5.2 Laboratory Hydraulic Conductivities

Falling head permeability tests (ASTM D5084 Method F) were performed in the laboratory on samples collected during the 2021 investigations. Sample locations are shown on **Figure 2-6**. The geotechnical laboratory report from the most recent investigation and previous investigations (AECOM, 2016) are provided in **Appendix C**. The results are summarized in **Table 2-1** and discussed below.

- One CCR sample (LSN-3781) was collected from gypsum boring XTPW01. Laboratory falling head permeability test results in the CCR indicated a vertical hydraulic conductivity of 6.7 x $10^{-4}$ cm/s.
- Two samples were collected from the lower Radnor Till from soil boring G54C. Laboratory falling head permeability test results in the lower Radnor Till indicated a vertical hydraulic conductivity ranging from 4.1 x $10^{-8}$ to 5.4 x $10^{-6}$ cm/s.
- Seven samples were collected from the uppermost aquifer from soil borings G54C, SB50, and SB62. Laboratory falling head permeability test results in the uppermost aquifer indicated vertical hydraulic conductivities ranging from 7.1 x $10^{-8}$ to 1.1 x $10^{-6}$ cm/s, and a geometric mean vertical hydraulic conductivity of 4.6 x $10^{-7}$ cm/s.

### 3.2.6 Horizontal Groundwater Gradients and Flow Velocities

Groundwater flow around the GMF is generally in a southeast direction (**Figures 3-3 through 3-4**). Seasonal variation of groundwater levels at the GMF Pond are indicated in the series of 2015 to 2020 groundwater elevation contour maps and groundwater elevation table (**Appendix D**). Observed groundwater elevations may fluctuate seasonally by 1 to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond.

Horizontal hydraulic gradients and groundwater velocities for the uppermost aquifer were calculated based upon groundwater elevation measurements from April through August 2021 between G50S and G60S, G51S and G54S, and G50S and G64S (**Table 3-4**). Horizontal hydraulic gradients are slight across the GMF Pond and ranged from 0.0111 ft/ft between G50S and G64S in August 2021 to 0.0225 ft/ft between G51S and G54S in May 2021. The hydraulic gradients are consistent with previous calculations of horizontal gradients at upgradient locations (NRT/OBG, 2017a).

Horizontal hydraulic gradients calculated to the north of the GMF Pond, between G50S and G64S, were on average 0.0121 ft/ft with an average groundwater velocity of 0.045 feet per day (ft/day). Horizontal hydraulic gradients calculated through the center of the GMF Pond, between G50S and G60S, were on average 0.0172 ft/ft with an average groundwater velocity of 0.625 ft/day. Horizontal hydraulic gradients calculated to the south of the GMF Pond, between G51S

and G54S, were on average 0.0199 ft/ft, with an average groundwater velocity of 0.041 ft/day. From April to June 2021, average groundwater flow velocities at the GMF Pond were 0.024 ft/day and from July to August 2021, groundwater flow velocities at the GMF Pond were on average 0.023 ft/day. Horizontal hydraulic gradients and groundwater flow velocities are presented in **Table 3-4**.

### 3.2.7 Groundwater Classification

Per 35 I.A.C. § 620.210, groundwater within the uppermost aquifer at the GMF Pond meets the definition of a Class I – Potable Resource Groundwater based on the following criteria:

- Groundwater in the uppermost aquifer extends 10 feet or more below the land surface.
- Hydraulic conductivity exceeds the 1 x $10^{-4}$ cm/s criterion (**Table 3-3**).

Field hydraulic conductivity tests performed on the unlithified geologic materials that include loess, shallow sand, and intermediate sand at the GMF Pond had geometric mean hydraulic conductivities exceeding 1 x $10^{-4}$ cm/s. Based on this information groundwater is classified as Class I – Potable Resource Groundwater.

However, background (upgradient) groundwater originates from areas north and west of the GMF Pond that have been surface mined and present a significant alternative source for groundwater impacts.

## 3.3 Surface Water Hydrology

Surface water drainage over much of the site flows east or southeast into the Duck Creek Cooling Pond. The Duck Creek Cooling Pond was formed by damming a portion of Duck Creek, a minor tributary of the Illinois River, and was used for thermal treatment of cooling water discharged from the DCPP.

### 3.3.1 Climate

The climate in Canton is humid and annual precipitation generally exceeds evapotranspiration. Illinois State Water Survey (ISWS) records from 1989 through 2020 at Peoria, Illinois, which is located approximately 35 miles northeast of the DCPP, indicates precipitation averages 35.3 inches per year. Monthly precipitation averages higher than 3 inches from April through August, and 1 to 3 inches in September through March. On average 16 inches of precipitation occur as snowfall.

As shown in **Table A** below, ISWS temperature records show average maximum daily temperatures for 1989 to 2020 ranging from above 70 degrees Fahrenheit (°F) in May through September and minimum average daily temperatures that are below freezing December through March.

**Table A. Average Monthly Temperature Extremes and Precipitation for Peoria, Illinois**

| | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Annual |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Maximum Temperature (ºF) | 33.3 | 37.6 | 49.9 | 62.5 | 72.6 | 81.3 | 84.4 | 82.5 | 76.9 | 64.5 | 50.1 | 37.2 | 61.2 |
| Minimum Temperature (ºF) | 18.3 | 21.5 | 31.6 | 41.8 | 52.2 | 61.7 | 65.4 | 63.2 | 55.4 | 44.1 | 33.3 | 22.7 | 42.7 |
| Precipitation (inches) | 1.71 | 1.60 | 2.08 | 3.42 | 3.93 | 3.18 | 3.02 | 3.10 | 2.97 | 2.64 | 2.35 | 1.84 | 35.3 |
| https://www.isws.illinois.edu/warm/stationmeta.asp?site=ICC&from=wx | | | | | | | | | | | | | |

### 3.3.2 Surface Waters

Duck Creek formerly bordered the east perimeter of the DCPP. In this area, Duck Creek has been dammed for use for thermal treatment of cooling water discharge from the DCPP and is now the predominant surface water body in the vicinity of the GMF Pond. Surface water elevations of the Cooling Pond are from 562.5 to 565 feet NAVD88. Other surface waters in the vicinity include Buckheart Creek to the west, and Rice Lake, Miserable Lake, Big Lake, and Goose Lake to the east, all of which are backwater lakes located between Duck Creek and the Illinois River. The distance between the GMF Pond and the Illinois River is sufficient to eliminate influence on local flow conditions at the site; therefore, site-specific flow conditions are not subject to surface water conditions of the Illinois River. Other surface waters in the vicinity of the GMF Pond include freshwater emergent wetland to the east, and various freshwater ponds to the northeast, south, southeast, and southwest.

# 4. GROUNDWATER QUALITY

## 4.1 Summary of Groundwater Monitoring Activities

Groundwater monitoring programs are currently being conducted at the GMF Pond as required by USEPA and IEPA. Additional monitoring was completed in 2021 for development of the Part 845 monitoring program. These programs are summarized below.

### 4.1.1 40 C.F.R. § 257 Program Monitoring and Well Network

The 40 C.F.R. § 257 Well Network consists of seven monitoring wells screened in the uppermost aquifer nearby and adjacent to the GMF Pond including: three background monitoring wells (G02S, G50S, and G51S) and four compliance monitoring wells (G54S, G57S, G60S, and G64S). The boring logs, well construction forms, and other related monitoring well forms for the GMF Pond 40 C.F.R. § 257 Well Network are included in **Appendix B** of this HCR. The well locations are shown on **Figure 3-1**.

Groundwater is being monitored at the GMF Pond in accordance with the Detection Monitoring Program requirements specified in 40 C.F.R. § 257.94. Details of the procedures and techniques used to fulfill the groundwater sampling and analysis program requirements are found in the Sampling and Analysis Plan for the GMF Pond (NRT/OBG, 2017b). Results are discussed in **Section 4.2**.

The 40 C.F.R. § 257 groundwater samples are collected semi-annually and analyzed for the field and laboratory parameters from Appendix III of 40 C.F.R. § 257, summarized in **Table B** below.

**Table B. 40 C.F.R. § 257 Groundwater Monitoring Program Parameters**

| **Field Parameters[1]** | | |
|---|---|---|
| pH | Groundwater Elevation | |
| **Appendix III Parameters (Total, except total dissolved solids [TDS])** | | |
| Boron | Chloride | Sulfate |
| Calcium | Fluoride | TDS |

[1]Dissolved oxygen, temperature, specific conductance, oxidation/reduction potential, and turbidity were recorded during sample collection.

### 4.1.2 IEPA Groundwater Monitoring

Routine quarterly groundwater monitoring is completed at GMF Pond wells G50L/S, G51L/S, G52L/S, G53L/S, G54L/S, G55L/S, G56L/S, G57L/S, G58L/S, G59L/S, G60L/S, R61L/G61S, G62L, G63L/S, and G64L/S at the GMF Pond, in accordance with Water Pollution Control Permit No. 2017-E0-62640. This permit also requires sampling G65L/S, G66L/S, G67L/S, G70L, G71L/S, and G72L/S at the GMF Recycle Pond. The boring logs, well construction forms, and other related monitoring well forms for the GMF Pond well network are included in **Appendix B** of this HCR. The GMF Pond well locations are shown on **Figure 3-1**. Quarterly and annual samples are analyzed for the following field and laboratory parameters listed in **Table C** below.

**Table C. IEPA Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters** | | | |
| pH | Temperature | Specific Conductance | |
| Groundwater Elevation | Depth to Water (bmp) | Bottom of Well Elevation | |
| **Quarterly Parameters (Dissolved)** | | | |
| Arsenic | Cadmium | Lead | Sulfate |
| Boron | Chloride | Manganese | TDS |
| **Annual Parameters (Dissolved)** | | | |
| Alkalinity, bicarbonate | Chromium | Mercury | Selenium |
| Alkalinity, carbonate | Cobalt | Nickel | Sodium |
| Ammonia as Nitrogen | Iron | Nitrate nitrogen | Zinc |
| Calcium | Magnesium | Potassium | |

### 4.1.3 Part 845 Well Installation and Groundwater Monitoring

In 2021, one additional monitoring well (G54C) was installed between the GMF Pond and the Gypsum Recycling Pond to assess the vertical and horizontal lithology, stratigraphy, chemical properties, and physical properties of geologic layers to a minimum of 100 feet bgs as specified in 35 I.A.C. § 845.620(b). Additionally, a porewater sample was collected from temporary leachate monitoring location (XTPW02) installed within the GMF Pond to characterize the CCR materials.

Prospective Part 845 monitoring wells were sampled for eight rounds from February to August 2021 and the results were assessed for selection of the GMF Pond Part 845 monitoring well network presented in the groundwater monitoring plan. Samples were collected from the new monitoring points and analyzed for 35 I.A.C. § 845.600 parameters summarized in **Table D** below. Part 845 groundwater monitoring results are included below in **Section 4.2**.

**Table D. Part 845 Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters[1]** | | | |
| pH | Turbidity | Groundwater Elevation | |
| **Metals (Total)** | | | |
| Antimony | Boron | Cobalt | Molybdenum |
| Arsenic | Cadmium | Lead | Selenium |
| Barium | Calcium | Lithium | Thallium |
| Beryllium | Chromium | Mercury | |
| **Inorganics (Total)** | | | |
| Fluoride | Sulfate | Chloride | TDS |
| **Other (Total)** | | | |
| Radium 226 and 228 combined | | | |

[1]Dissolved oxygen, temperature, specific conductance, and oxidation/reduction potential were recorded during sample collection.

## 4.2 Groundwater Monitoring Results and Analysis

Groundwater data collected from the GMF Pond 40 C.F.R. § 257 network monitoring wells from 2015 to 2021 were supplemented with sampling of additional locations in 2021 and evaluated with respect to standards included in 35 I.A.C. § 845.600(a)(1). This data set was selected because it includes parameters (total metals) consistent with the parameter list in 35 I.A.C. § 845.600(a)(1). The groundwater analytical results are summarized in **Table 4-1** and discussed in the subsections below. Field parameters are included in **Table 4-2**. Results indicate that the parameters discussed in the following sections were detected at concentrations greater than the applicable 35 I.A.C. § 845.600(a)(1) standards and are considered potential exceedances[1].

### 4.2.1 Total Antimony

Total antimony was detected greater than the GWPS (0.006 milligrams per liter [mg/L]) in one of eight samples collected from downgradient well G57S. The other seven samples were non-detect. No other exceedances for total antimony were observed.

### 4.2.2 Total Arsenic

Total arsenic was detected greater than the GWPS (0.01 mg/L) in eleven downgradient wells G52S, G35S, G54L, G56S, G57L, G58L, G59L, G59S, G60S, G64S and P60. Total arsenic concentrations ranged from 0.001 to 0.051 mg/L. G52S is commonly in a side-gradient or upgradient position.

### 4.2.3 Total Cobalt

Total cobalt was detected greater than the GWPS (0.006 mg/L) in one of eight samples collected from downgradient well 60L. The other seven samples ranged from non-detect to 0.0052 mg/L. No other exceedances of total cobalt were observed.

### 4.2.4 Total Lead

Total lead was detected greater than the GWPS (0.0075 mg/L) in nine downgradient wells (G52S, G55S, G56S, G58L, G58S, G59L, G59S, G60S, G63L, and P60); and one background well G51S. Total lead concentrations in downgradient wells ranged from non-detect to 0.041 mg/L. Total lead concentrations in the upgradient well ranged from non-detect to 0.015 mg/L. G52S is commonly in a side-gradient or upgradient position.

### 4.2.5 Total Mercury

Total mercury was detected greater than the GWPS (0.002 mg/L) in one of 16 samples collected from upgradient well G02S. The other 15 samples were non-detect. No other exceedances for total mercury were observed.

[1] Potential exceedances include results reported during the eight rounds of baseline groundwater monitoring that are greater than the applicable 35 I.A.C. § 845.600(a)(1) standards. The results are considered potential exceedances because they were compared directly to the standard and did not include an evaluation of background groundwater quality or apply the statistical methodologies proposed in the Groundwater Monitoring Plan (GMP). For simplicity, “GWPS” will be used hereafter in discussing potential exceedances. Exceedances will be determined following IEPA approval of the GMP.

#### 4.2.6 pH (Lower Limit)

The GWPS lower standard for pH (6.5 standard units [SU]) was exceeded at four downgradient wells (G52L, G54L, G60L, and P60); and one background well G02S. Measurements of pH ranged from 6 to 7.1 SU in downgradient wells. Measurements ranged from 6.4 to 7.1 SU in the background well. G52L is commonly in a side-gradient or upgradient position.

#### 4.2.7 Radium 226 and 228 Combined

Radium 226 and 228 combined was detected greater than the GWPS (5 picocuries per liter [pCi/L]) in one of five samples collected from bedrock well G54C. Observations ranged from non-detect to 5.38 pCi/L. No other exceedances for radium 226 and 228 combined were observed.

#### 4.2.8 Total Sulfate

Sulfate can be a primary indicator parameter of CCR leachate impacts on groundwater quality. Total sulfate has been detected greater than the GWPS (400 mg/L) at downgradient well G58S in two of four samples. Total sulfate concentrations ranged from 250 to 540 mg/L. No other exceedances of total sulfate were observed.

#### 4.2.9 Total Thallium

Total thallium was detected greater than the GWPS (0.002 mg/L) in one downgradient well (G57S); and one background well G51S. One of eight samples collected for total thallium from downgradient well G57S exceeded the GWPS; the other seven samples were non-detect. One of 16 samples collected for total thallium from background well G51S exceeded the GWPS; the other 15 samples were non-detect. No other exceedances for total thallium were observed.

# 5. EVALUATION OF POTENTIAL RECEPTORS

## 5.1 Water Well Survey

A water well survey was conducted for a 1,000 meter radius of the GMF Pond (Hanson, 2021; Ramboll, 2021). Additionally, a potable water well inventory was completed in 2021 utilizing federal and state databases to assess nearby pumping wells, drinking water receptors, and other uses of water in the vicinity of the GMF Pond. The following sources of information were queried to identify well locations, drinking water receptors, and other uses of water within 1,000 meters of the GMF Pond boundary:

- United States Geological Survey (USGS) National Groundwater Monitoring Network (NGWMN)[1]
- Illinois State Geological Survey (ISGS) Illinois Water and Related Wells (ILWATER) Map[2]
- USEPA Safe Drinking Water Information System (SDWIS)[3]
- IEPA Illinois Drinking Water Watch (DWW)[4]

According to the ISGS ILWATER Map, USEPA SDWIS, and IEPA DWW available records, there is one private well located southwest of the GMF Pond and within 1,000-meters of the GMF Pond. There is no data for Fulton County available from USGS NGWMN.

## 5.2 Surface Water

A search was performed utilizing the United States Fish and Wildlife Service (USFWS) Wetlands Mapper[5] and the USGS National Map[6] for surface water bodies within 1,000 meters of the GMF Pond.

As indicated on the USFWS Wetlands Mapper and USGS National Map, various surface water features were identified within a 1,000-meter radius of the GMF Pond. Surface waters in the vicinity of the GMF Pond include freshwater emergent wetland to the east, and various freshwater ponds to the northeast, south, southeast, and southwest (**Appendix A**).

The predominant surface water body in the region is the Illinois River and associated lowland backwater lakes. Duck Creek, a minor tributary of the Illinois River, formerly bordered the east perimeter of the DCPP. In this area, Duck Creek has been dammed for use for thermal treatment of cooling water discharge from the DCPP and is now the predominant surface water body in the vicinity of the GMF Pond. The distance between the GMF Pond and the Illinois River is sufficient to eliminate influence on local flow conditions at the site; therefore, site-specific flow conditions are not subject to surface water conditions of the Illinois River. Other surface waters in the vicinity of the GMF Pond include freshwater emergent wetland to the east, and various freshwater ponds to the northeast, south, southeast, and southwest. The USGS National Map places the DCPP within the lower Illinois-Lake Chautauqua watershed subbasin (Hydrologic Unit Code [HUC] 07130003) (**Appendix A**).

[1] USGS NGWMN: https://cida.usgs.gov/ngwmn/index.jsp
[2] ISGS ILWATER Map: https://prairieresearch.maps.arcgis.com/apps/webappviewer/index.html?id=e06b64ae0c814ef3a4e43a191cb57f87
[3] USEPA SDWIS: https://www.epa.gov/enviro/sdwis-search
[4] IEPA Illinois DWW: http://water.epa.state.il.us/dww/index.jsp
[5] USFWS Wetlands Mapper: https://www.fws.gov/wetlands/data/mapper.html
[6] USGS National Map: https://apps.nationalmap.gov/viewer/

A Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map for Fulton County Unincorporated Areas, Illinois (Map No. 17057C0375E, effective on 02/04/2011) is attached in **Appendix F**. The flood hazard areas to the east of the DCPP are defined as those areas subject to inundation by the 1 percent annual chance flood (*i.e.,* 100-year flood), also known as the base flood, that has a 1 percent chance of being equaled or exceeded in any given year.

## 5.3 Nature Preserves, Historic Sites, Endangered/Threatened Species

A search of the Illinois Department of Natural Resources (IDNR) Natural Heritage Database[7] for natural areas and protected areas within 1,000 meters of the GMF Pond was performed. According to the IDNR Natural Heritage Database, there are 15 Natural Areas in Fulton County, including two Category III - Nature Preserves (Harper-Rector Woods Nature Preserve [34.67 acres] and Kedzior Woodlands Land and Water Reserve [163.64 acres]). No natural areas were identified within 1,000 meters of the GMF Pond.

The IDNR Natural Heritage Database Threatened and Endangered Species by County[8] lists 11 state threatened and 12 state endangered species in Fulton County. The USFWS Environmental Conservation Online System[9] lists three federally threatened and one federally endangered species in Fulton County (**Appendix A**).

Additionally, a search of the IDNR Historic Preservation Division[10] database for historic sites in the vicinity of the Site yielded no results within 1,000 meters of the GMF Pond. The Illinois State Archaeological Survey (ISAS)[11] databases that do not require credentials to access were also searched and yielded no results within 1,000 meters of the GMF Pond.

# 6. CONCLUSIONS

Hydrogeologic characterization of the GMF Pond was originally developed as part of the *Hydrogeologic Report, in Support Document for Permit Application, Duck Creek Power Generating Station, Gypsum Management Facility, Fulton County, Illinois* (Hanson, 2009) and most recently updated for this HCR. Results of these hydrogeologic studies were reintroduced in this HCR and updated to include geologic, hydrogeologic, and groundwater quality data collected with a focus on the GMF Pond (Part 845 regulated) CCR Unit.

The data were summarized and evaluated for changes in groundwater conditions since the previous investigations; available groundwater quality data for the GMF Pond was compared to the Part 845 Standards.

The results of the hydrogeologic and groundwater quality evaluation are:

- The unlithified stratigraphy within and immediately surrounding the GMF Pond consists of the following in descending order: fill material and CCR (gypsum); silt and clayey silt loess (Peoria/Roxanna Loess); weathered till (upper Radnor Till); shallow, medium-grained sand to silt zone; and till (lower Radnor Till).
- The unlithified units overlay Pennsylvanian-age shaley siltstone and silty shale bedrock (Carbondale Formation). Bedrock was encountered approximately 90 feet bgs at the GMF Pond.
- Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) Coal seam. Mining operations in the area have ceased. Strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) Coal unit at some portions of the DCPP property. Previous investigations completed outside of the GMF Pond indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 to 75 feet. The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to and downgradient of several former large surface mining areas.
- Three distinct water-bearing layers have been identified at the Site based on stratigraphic relationships and common hydrogeologic characteristics:
  - **Uppermost Aquifer:** At the GMF Pond this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and the Shallow Sand Zone. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (NRT/OBG, 2017a). The shallow sands are laterally extensive across the site, vary in thickness from less than 1 to 18 feet, and are generally located at an elevation of 570 to 590 feet msl. The shallow sand is saturated. During construction of the GMF Pond, sand was completely removed everywhere it was encountered (mainly the northeast corner and southwest corner of the pond), putting the base of the liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place.
  - **Lower Radnor Till/Lower Confining Unit:** Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick.

  - **Bedrock Confining Unit:** The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet.

- Groundwater flow around the GMF Pond is generally in a southeast direction. Seasonal variation of groundwater levels at the GMF Pond are present and may fluctuate approximately 1 to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond associated with the elevation changes.
- Surface water drainage over much of the site flows east or southeast into the Duck Creek Cooling Pond. The Duck Creek Cooling Pond was formed by damming a portion of Duck Creek, a minor tributary of the Illinois River.
- The nearest surface water body to the GMF Pond is the Duck Creek Cooling Pond, which is located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Cooling Pond is estimated from 562.5 to 565 feet NAVD88. Which is approximately 20 feet lower than downgradient groundwater at the GMF Pond, indicating that groundwater in the vicinity of the GMF Pond is flowing toward the Cooling Pond.
- Groundwater flow velocities in the uppermost aquifer are estimated from $3.1 \times 10^{-2}$ to $6.5 \times 10^{-1}$ ft/day.
- The GMF Pond is lined and the shallow sands of the uppermost aquifer were removed from within the footprint of the pond during construction. The GMF Pond does not appear to impact groundwater flow directions via recharge to groundwater. Given the low permeability of the liner system and the removal of sand below the unit, it is more likely that the GMF Pond is a barrier to groundwater flow within the uppermost aquifer deflecting flow from upgradient areas around the perimeter of the pond toward the downgradient areas south and east of the pond toward the Cooling Pond.
- Based on the detailed geologic information provided, and the hydrogeologic and groundwater quality data, groundwater within the uppermost aquifer at the GMF Pond is classified as Class I – Potable Resource Groundwater. However, background (upgradient) groundwater originates from areas north and west of the GMF Pond that have been extensively surface mined and present a significant alternative source for groundwater impacts.
- Antimony, arsenic, cobalt, lead, pH, sulfate, and thallium were detected at least once at concentrations greater than the GWPS in downgradient uppermost aquifer wells (including PMP wells). Lead, mercury, pH, and thallium were detected at concentrations greater than the GWPS in upgradient uppermost aquifer wells. Radium 226 and 228 combined was detected once at concentrations greater than the GWPS in the bedrock confining unit well.

Groundwater results are considered potential exceedances because they were compared directly to the standard and did not include an evaluation of background groundwater quality or apply the statistical methodologies proposed in the GMP.

This HCR satisfies Part 845 content requirements specific to 35 I.A.C. § 845.620(b) (Hydrogeologic Site Characterization) for the GMF Pond at the DCPP.

**Notes:**
All elevation data are presented relative to the North American Vertical Datum 1988 (NAVD88), GEOID 12A
-- = data not available
BGS = below ground surface
BR = bedrock
CCR = coal combustion residuals
ft = foot or feet
HSU = Hydrostratigraphic Unit
PMP = potential migration pathway
PVC = polyvinyl chloride
S = source water
UA = uppermost aquifer
UA/PMP = uppermost aquifer/potential migration pathway

[O:EDP 8/26/21 U: LDC 09/09/21, C: SSW 09/17/21]

**Notes:**
1. Distance change was calculated using the midpoint of the piezometer screen and water table surface. If the water table surface was above the top of the monitoring well screen, then distance change was calculated using the midpoint of both screens.
2. Vertical gradients between ±0.0015 are considered flat, and typically have less than 0.02 foot difference in groundwater elevation between wells.

-- = Not calculated
BCU = bedrock confining unit
dh = head change
dl = distance change
ft = feet
NAVD88 = North American Vertical Datum of 1988

[O: EDP 8/28/21, C: LDC 09/17/21]

Notes:

[1] Hydraulic conductivity values used above are the geometric mean of hydrostratigraphic unit hydraulic conductivity values calculated from slug tests completed in April 2021 by Ramboll.

[2] Effective porosity used in these calculations was derived from an average between estimated values of 0.20 for silt material, 0.267 for gravel, 0.07 for clay, and 0.28 for sand from Morris, D.A and A.I. Johnson, 1967. Summary of hydrologic and physical properties of rock and soil materials as analyzed by the Hydrologic Laboratory of the U.S. Geological Survey. U.S. Geological Survey Water-Supply Paper 1839-D, 42p. and Heath, R.C., 1983. Basic ground-water hydrology, U.S. Geological Survey Water-Supply Paper 2220, 86p. Effective porosity may be as high as maximum total porosity (56%) calculated in Table 2-1.

% = percent
ft/day = feet per day
ft/ft = feet per feet
ft= feet
NAVD88 = North American Vertical Datum of 1988

**Notes:**
Detected at concentration greater than the GWPS
-- = data not available
GWPS = Groundwater Protection Standard
mg/L = milligrams per liter
pCi/L = picocuries per liter
SU = standard units
< = concentration is less than the concentration shown, which corresponds to the reporting limit for the method. Estimated concentrations below the reporting limit and associated qualifiers are not provided since they are not utilized in statistics to determine exceedances above Part 845 standards.
35 I.A.C. 845.600 = Residuals in Surface Impoundments: Title 35 of the Illinois Administrative Code § 845

Fulton County Threatened and Endangered Species List

Federally Threatened Species

| Species | Status | Range | Habitat |
|---|---|---|---|
| Indiana bat (*Myotis sodalis*) | Endangered | Fulton | Hibernates in caves and mines ... ging in surrounding wooded areas in autumn. Roosts and forages in upland forests and woods. |
| Northern long-eared bat (*Myotis septentrionalis*) | Threatened | Fulton | |
| Decurrent false aster (*Boltonia decurrens*) | Threatened | Fulton | Disturbed alluvial soils |
| Eastern prairie fringed orchid (*Platanthera leucophaea*) | Threatened | Fulton | Mesic to wet prairies |

State Threatened Species

| Species | Status | # of Occurrences | Last Observed |
|---|---|---|---|
| Lake Sturgeon Acipenser fulvescens (*Acipenser fulvescens*) | Endangered | 1 | 4/22/2010 |
| Smooth Softshell (*Apalone mutica*) | Threatened | 2 | 6/20/2012 |
| Short-eared Owl (*Asio flammeus*) | Endangered | 1 | 4/10/2014 |
| Upland Sandpiper (*Bartramia longicauda*) | Endangered | 3 | 5/29/2014 |
| Decurrent False Aster (*Boltonia decurrens*) | Threatened | 2 | 10/11/2017 |
| American Bittern (*Botaurus lentiginosus*) | Endangered | 2 | 2011 |
| Northern Harrier (*Circus hudsonius*) | Endangered | 1 | 2/22/2016 |
| Starhead Topminnow (*Fundulus dispar*) | Threatened | 4 | 8/14/2017 |
| Common Gallinule (*Gallinula galeata*) | Endangered | 3 | 6/29/2019 |
| Least Bittern (*Ixobrychus exilis*) | Threatened | 2 | 7/12/2019 |
| Redspotted Sunfish (*Lepomis miniatus*) | Threatened | 4 | 10/24/2011 |
| River Redhorse (*Moxostoma carinatum*) | Threatened | 1 | 6/15/2017 |
| Northern Long-eared (*Myotis Myotis septentrionalis*) | Threatened | 1 | 7/7/1987 |
| Indiana Bat (*Myotis sodalis*) | Endangered | 1 | 8/10/2004 |
| Ironcolor Shiner (*Notropis chalybaeus*) | Threatened | 1 | 7/22/2013 |
| Black-crowned Night-Heron (*Nycticorax nycticorax*) | Endangered | 2 | 6/19/2019 |
| Osprey (*Pandion haliaetus*) | Threatened | 5 | 6/12/2019 |
| Wolf's Bluegrass (*Poa wolfii*) | Endangered | 1 | 5/26/2004 |
| Monkeyface (*Quadrula metanevra*) | Threatened | 9 | 8/29/2010 |
| King Rail (*Rallus elegans*) | Endangered | 1 | 5/26/1988 |
| Royal Catchfly (*Silene regia*) | Endangered | 1 | 7/31/2018 |
| Prairie Spiderwort (*Tradescantia bracteata*) | Endangered | 1 | 5/20/2016 |
| Buffalo Clover (*Trifolium reflexum*) | Threatened | 1 | 6/22/2005 |

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: Bentonite chips

Installation Method: Gravity

Setting Time: >24 hr

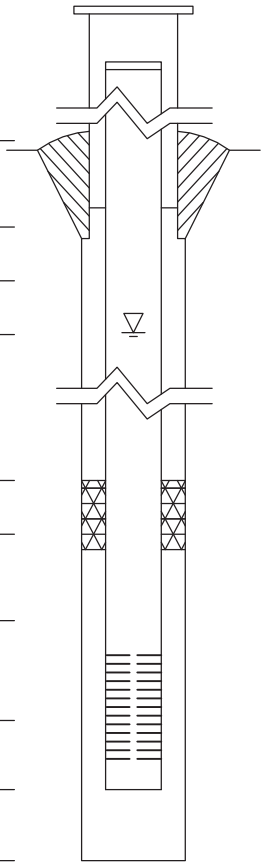
Type of Bentonite Seal -- Granular Pellet Slurry
(choose one)

Installation Method:

Setting Time:



Type of Sand Pack: Quartz sand

Grain Size: 10/20 (sieve size)

Installation Method: Gravity

Type of Backfill Material: Quartz sand
(if applicable)

Installation Method: Gravity

| Elevations (MSL)* | Depths (BGS) (0.01 ft.) | |
|---|---|---|
| 620.35 | -3.44 | Top of Protective Casing |
| 619.91 | -3.00 | Top of Riser Pipe |
| 616.91 | 0.00 | Ground Surface |
| 614.81 | 2.10 | Top of Annular Sealant |
| 606.34 | 10.57 | Static Water Level (After Completion) 1/30/2008 |
| 614.81 | 2.10 | Top of Seal |
| 606.77 | 10.14 | Top of Sand Pack |
| 604.87 | 12.04 | Top of Screen |
| 600.08 | 16.83 | Bottom of Screen |
| 599.70 | 17.21 | Bottom of Well |
| 599.19 | 17.72 | Bottom of Borehole |

* Referenced to a National Geodetic Datum

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: High-solids bentonite grout

Installation Method: Tremie

Setting Time: >24 hr

Type of Bentonite Seal -- (Granular) Pellet Slurry (choose one)

Installation Method: Gravity

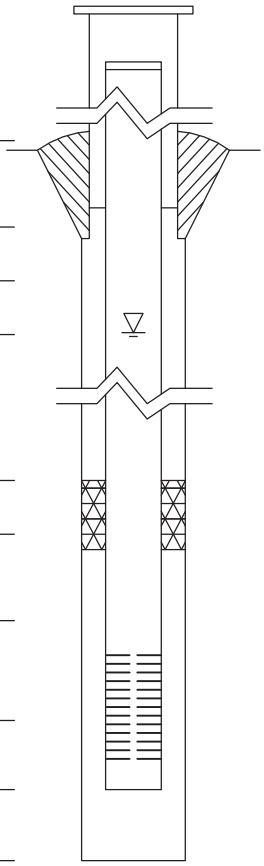
Setting Time: 25 min



Type of Sand Pack: Quartz sand

Grain Size: 10/20 (sieve size)

Installation Method: Gravity

Type of Backfill Material: Quartz sand (if applicable)

Installation Method: Gravity

| Elevations (MSL)* | Depths (BGS) (0.01 ft.) | |
|---|---|---|
| 620.19 | -3.66 | Top of Protective Casing |
| 619.64 | -3.11 | Top of Riser Pipe |

Site #: WPC Permit No. 2007-EA-4026 County: Fulton Well #: G56L

Site Name: Gypsum Management Facility Borehole #: ~~G56a~~

~~State~~ Plant ~~Plane~~ Coordinate: X 979.2 Y 14,708.6 (or) Latitude: Longitude:

Surveyed By: Steven P. Ford IL Registration #: 035-003653

Drilling Contractor: Testing Service Corp. Driller: B. Williamson

Consulting Firm: Hanson Professional Services Inc. Geologist: Rhonald W. Hasenyager, LPG #196-000246

Drilling Method: Hollow stem auger Drilling Fluid (Type): none

Logged By: Suzanna Simpson Date Started: 2/16/2009 Date Finished: 2/16/2009

Report Form Completed By: Suzanna Simpson Date: 2/26/2009

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: Bentonite chips

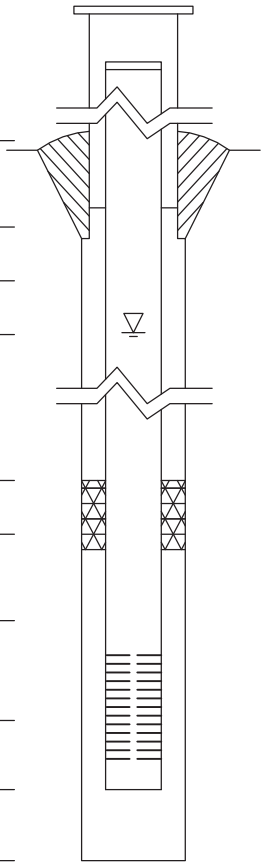
Installation Method: Gravity

Setting Time: 24+ hours

Type of Bentonite Seal -- (Granular) Pellet Slurry (choose one)

Installation Method: Gravity

Setting Time: 24+ hours



Type of Sand Pack: Quartz sand

Grain Size: 10/20 (sieve size)

Installation Method: Gravity

Type of Backfill Material: n/a (if applicable)

Installation Method:

| Elevations (MSL)* | Depths (BGS) (0.01 ft.) | |
|---|---|---|
| 622.94 | -3.03 | Top of Protective Casing |
| 622.37 | -2.46 | Top of Riser Pipe |
| 619.91 | 0.00 | Ground Surface |
| 617.91 | 2.00 | Top of Annular Sealant |
| | DRY | Static Water Level (After Completion) 3/4/2009 |
| 617.91 | 2.00 | Top of Seal |
| 608.91 | 11.00 | Top of Sand Pack |
| 606.14 | 13.77 | Top of Screen |
| 597.80 | 22.11 | Bottom of Screen |
| 597.02 | 22.89 | Bottom of Well |
| 597.02 | 22.89 | Bottom of Borehole |

* Referenced to a National Geodetic Datum

## WELL CONSTRUCTION MATERIALS

(Choose one type of material for each area)

| | | | | | |
|---|---|---|---|---|---|
| Protective Casing | SS304 | SS316 | PTFE | PVC | OTHER: |
| Riser Pipe Above W.T. | SS304 | SS316 | PTFE | PVC | OTHER: |
| Riser Pipe Below W.T. | SS304 | SS316 | PTFE | PVC | OTHER: |
| Screen | SS304 | SS316 | PTFE | PVC | OTHER: |

## CASING MEASUREMENTS

| | | |
|---|---|---|
| Diameter of Borehole | (inches) | 8.0 |
| ID of Riser Pipe | (inches) | 2.0 |
| Protective Casing Length | (feet) | 5.0 |
| Riser Pipe Length | (feet) | 16.23 |
| Bottom of Screen to End Cap | (feet) | 0.78 |
| Screen Length (1st slot to last slot) | (feet) | 9.34 |
| Total Length of Casing | (feet) | 26.35 |
| Screen Slot Size ** | (inches) | 0.010 |

**Hand-Slotted Well Screens Are Unacceptable

ILLINOIS DEPARTMENT OF PUBLIC HEALTH
DIVISION OF ENVIRONMENTAL HEALTH
525 W. JEFFERSON ST.
SPRINGFIELD, IL 62761

# WATER WELL SEALING FORM

TYPE OR PRESS FIRMLY

RETURN ALL COPIES TO IDPH OR LOCAL HEALTH DEPARTMENT

This form shall be submitted to this Department or the local health department not more than 30 days after a water well, boring or monitoring well is sealed. Such wells are to be sealed not more than 30 days after they are abandoned in accordance with the sealing requirements in the Water Well Construction Code. THE LOCAL HEALTH DEPARTMENT OR REGIONAL PUBLIC HEALTH DEPARTMENT MUST BE NOTIFIED AT LEAST 48 HOURS PRIOR TO SEALING.

1. **Ownership (Name of Controlling Party)** Duck Creek Power Station - GMF (G61L)

2. **Well Location** 17751 N Cilco Road (Address - Lot Number) Canton (City) Fulton (County)

   **General Description** **Township** 6 (N)(~~S~~) **Range** 5 (E)(~~W~~) **Section** 18

   SW **Quarter of the** NE **Quarter of the** NW **Quarter**

3. **Year Drilled** 2009

4. **Drilling Permit Number (and date, if known)** n/a

5. **Type of Well** **Bored** ____ **Drilled** ✓ **Other** ____

6. **Total Depth** 19.9 **Diameter (inches)** 8

7. **Formation clear of obstruction** ✓ **Yes** ____ **No**

8. **DETAILS OF PLUGGING** *(riser pipe and screen pulled and annulus was grouted)*

   **Filled with** Bentonite grout (cement or other materials) **from** 0 **to** 19.9 **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

   **Filled with** ____ **from** ____ **to** ____ **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

   **Filled with** ____ **from** ____ **to** ____ **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

9. **CASING RECORD** **Upper 2 feet of casing removed** ✓ **Yes** ____ **No**

10. **Date well was sealed** **Month** March **Day** 14 **Year** 2017.

11. **Licensed water well driller or other person approved by the Department performing well sealing.**

ILLINOIS DEPARTMENT OF PUBLIC HEALTH
DIVISION OF ENVIRONMENTAL HEALTH
525 W. JEFFERSON ST.
SPRINGFIELD, IL 62761

# WATER WELL SEALING FORM

TYPE OR PRESS FIRMLY

RETURN ALL COPIES TO IDPH OR LOCAL HEALTH DEPARTMENT

This form shall be submitted to this Department or the local health department not more than 30 days after a water well, boring or monitoring well is sealed. Such wells are to be sealed not more than 30 days after they are abandoned in accordance with the sealing requirements in the Water Well Construction Code. THE LOCAL HEALTH DEPARTMENT OR REGIONAL PUBLIC HEALTH DEPARTMENT MUST BE NOTIFIED AT LEAST 48 HOURS PRIOR TO SEALING.

1. **Ownership (Name of Controlling Party)** Duck Creek Power Station - Recycle Pond (G72S)

2. **Well Location** 17751 N Cilco Road (Address - Lot Number) Canton (City) Fulton (County)

   **General Description** Township 6 (N)(S) Range 5 (E)(W) Section 18

   NE Quarter of the NW Quarter of the SW Quarter

3. **Year Drilled** 2008

4. **Drilling Permit Number (and date, if known)** n/a

5. **Type of Well** Bored ____ Drilled ✓ Other ____

6. **Total Depth** 35.09 **Diameter (inches)** 8

7. **Formation clear of obstruction** ✓ Yes ____ No

   After G72S was sealed, replacement well R72S was installed approximately 5 feet west in a blind-drilled borehole.

8. **DETAILS OF PLUGGING**

   **Filled with** Bentonite grout (cement or other materials) **from** 2 **to** 35.09 **ft.**

   **Kind of plug** Random soil **from** 0 **to** 2.0 **ft.**

   **Filled with** ____ **from** ____ **to** ____ **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

   **Filled with** ____ **from** ____ **to** ____ **ft.**

   **Kind of plug** ____ **from** ____ **to** ____ **ft.**

9. **CASING RECORD** **Upper 2 feet of casing removed** ✓ Yes ____ No

10. **Date well was sealed** Month November Day 9 Year 2016.

11. **Licensed water well driller or other person approved by the Department performing well sealing.**

## ANNULAR SPACE DETAILS

Type of Surface Seal: Concrete

Type of Annular Sealant: High solids bentonite

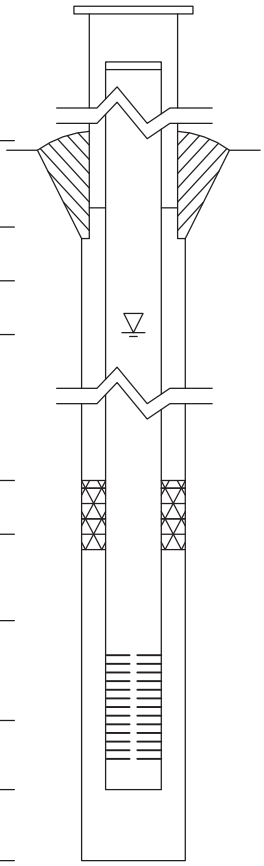
Installation Method: Tremie

Setting Time: >24 hours

Type of Bentonite Seal -- (Granular) Pellet Slurry (choose one)

Installation Method: Gravity

Setting Time: 20 minutes



Type of Sand Pack: Quartz Sand

Grain Size: 10-40 (sieve size)

Installation Method: Gravity

Type of Backfill Material: (if applicable)

Installation Method:

| Elevations (MSL)* | Depths (BGS) (0.01 ft.) | |
|---|---|---|
| 622.82 | -2.70 | Top of Protective Casing |
| 622.52 | -2.40 | Top of Riser Pipe |
| 620.12 | 0.00 | Ground Surface |
| 618.12 | 2.00 | Top of Annular Sealant |
| | | Static Water Level (After Completion) |
| 594.67 | 25.45 | Top of Seal |
| 592.10 | 28.02 | Top of Sand Pack |
| 590.57 | 29.55 | Top of Screen |
| 585.98 | 34.14 | Bottom of Screen |
| 585.50 | 34.62 | Bottom of Well |
| 585.50 | 34.62 | Bottom of Borehole |

* Referenced to a National Geodetic Datum

## WELL CONSTRUCTION MATERIALS

(Choose one type of material for each area)

| | | | | | |
|---|---|---|---|---|---|
| Protective Casing | SS304 | SS316 | PTFE | PVC | OTHER: Steel |

Mr. Douglas P. Ramsey, P.E.
Ramsey Geotechnical Engineering
1701 W. Market Street
Bloomington, Illinois 61701

Re: Duck Creek Power Station
Fulton County, Illinois

Dear Mr. Ramsey:

Included in this report are the test results from a bulk sample of gypsum received in our laboratory on March 15, 2021. The sample was tested in general accordance with the test method listed below.

| Test to Determine | Method of Test |
|---|---|
| Hydraulic Conductivity of Soil Using Flexible Wall Permeameter | ASTM D5084 |

We trust this is the information you require. Please contact the undersigned if you have any questions regarding this report.

Respectfully submitted,

**GEOTECHNOLOGY, INC.**

Janet M. May
Illinois Laboratory Manager

JMM/LPH:jmm

Attachment: Test Result Summary

Dear Mr. Hasenyager:

In accordance with your request, we have completed the analysis of the samples obtained from the exploration borings from the above mentioned project. The selected samples were analyzed in accordance with the applicable ASTM standards. A laboratory results summary sheet is included for your reference.

As always, if you have any questions do not hesitate to contact us.

Sincerely,

GEOTECHNICS, A DIVISION OF KLINGNER

Project No: 21-1004

# Specific Gravity of Soil Solids by Water Pycnometer (ASTM D854)

Project: Duck Creek Power Station GMF  Location: Canton, IL

Client: Hanson Professional Services  Test Method: B

Sample Description: Lean Clay with Sand (CL), YBrn/Lt Brn mot. Lt Gray, RBrn Ox, Silty, Moist

Sample Source: SS Composite

Boring or Test Pit No.: SB50/Comp#2  Maximum Particle Size: 3/8

Sample Depth: 21 to 31 ft.  Percent Passing No. 4 Sieve: 96.6%

Sample Type: SS  Percent Passing No. 200 Sieve: 70.1%

## G50L FALLING HEAD TEST

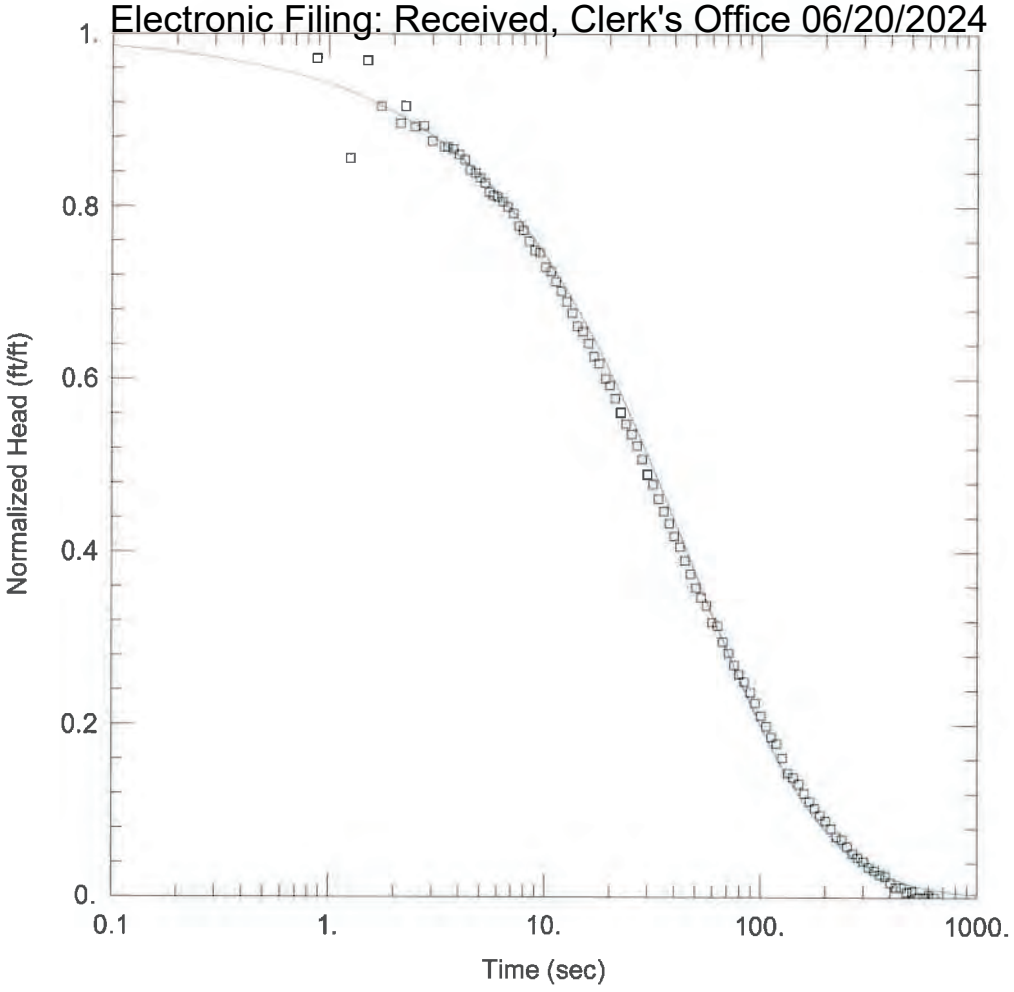
Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G50L-fh.aqt
Date: 06/02/21 Time: 16:26:20

## AQUIFER DATA

Saturated Thickness: 5.04 ft

## WELL DATA (G50L)

Initial Displacement: 1.6 ft
Total Well Penetration Depth: 7.64 ft
Casing Radius: 0.08333 ft



Static Water Column Height: 5.04 ft
Screen Length: 4.71 ft
Well Radius: 0.08333 ft

## SOLUTION

Aquifer Model: Unconfined
Kr = 0.0023 cm/sec
Kz/Kr = 1.

Solution Method: KGS Model
Ss = 0.006 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

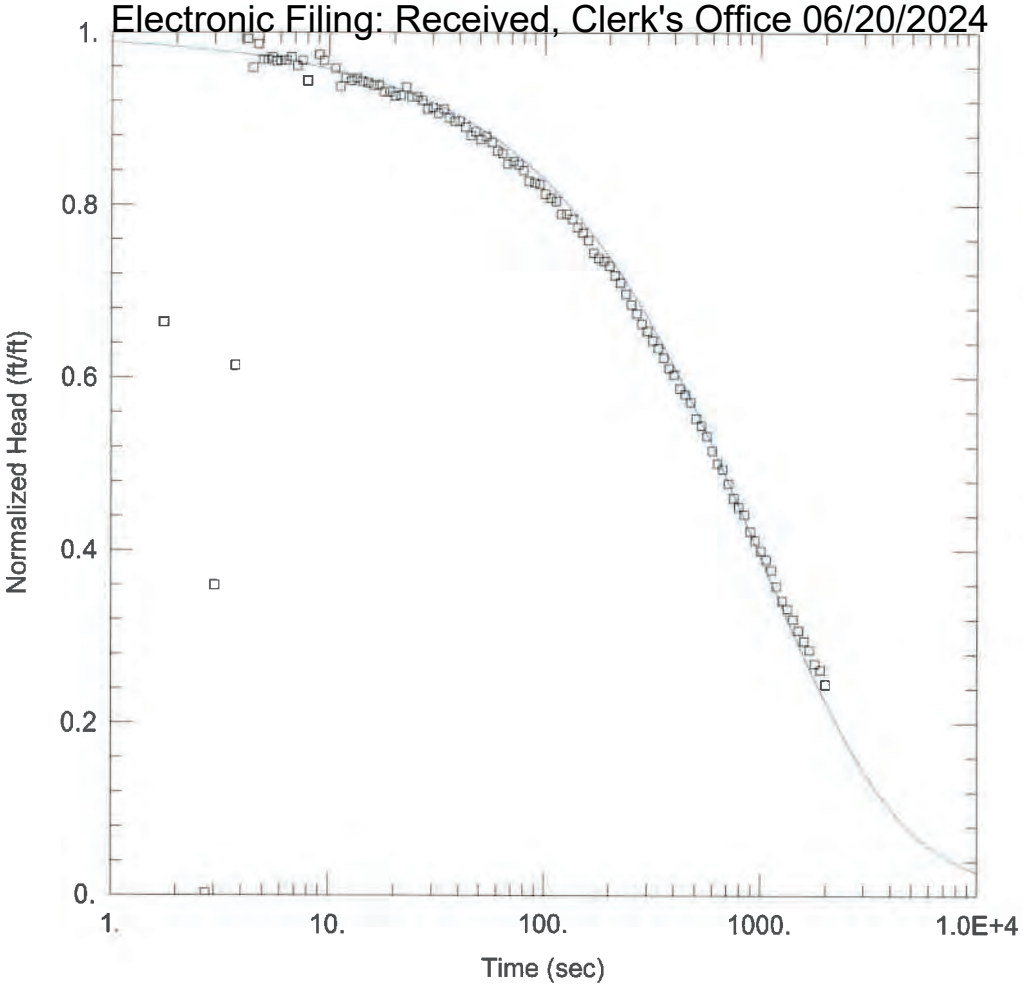
G50L RISING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G50L-rh.aqt
Date: 06/02/21 Time: 16:26:22

AQUIFER DATA

Saturated Thickness: 5.04 ft

WELL DATA (G50L)



Initial Displacement: 1.625 ft
Total Well Penetration Depth: 7.64 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 5.04 ft
Screen Length: 4.71 ft
Well Radius: 0.08333 ft

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 0.0021 cm/sec
Kz/Kr = 1.
Ss = 0.005 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

## G50S FALLING HEAD TEST

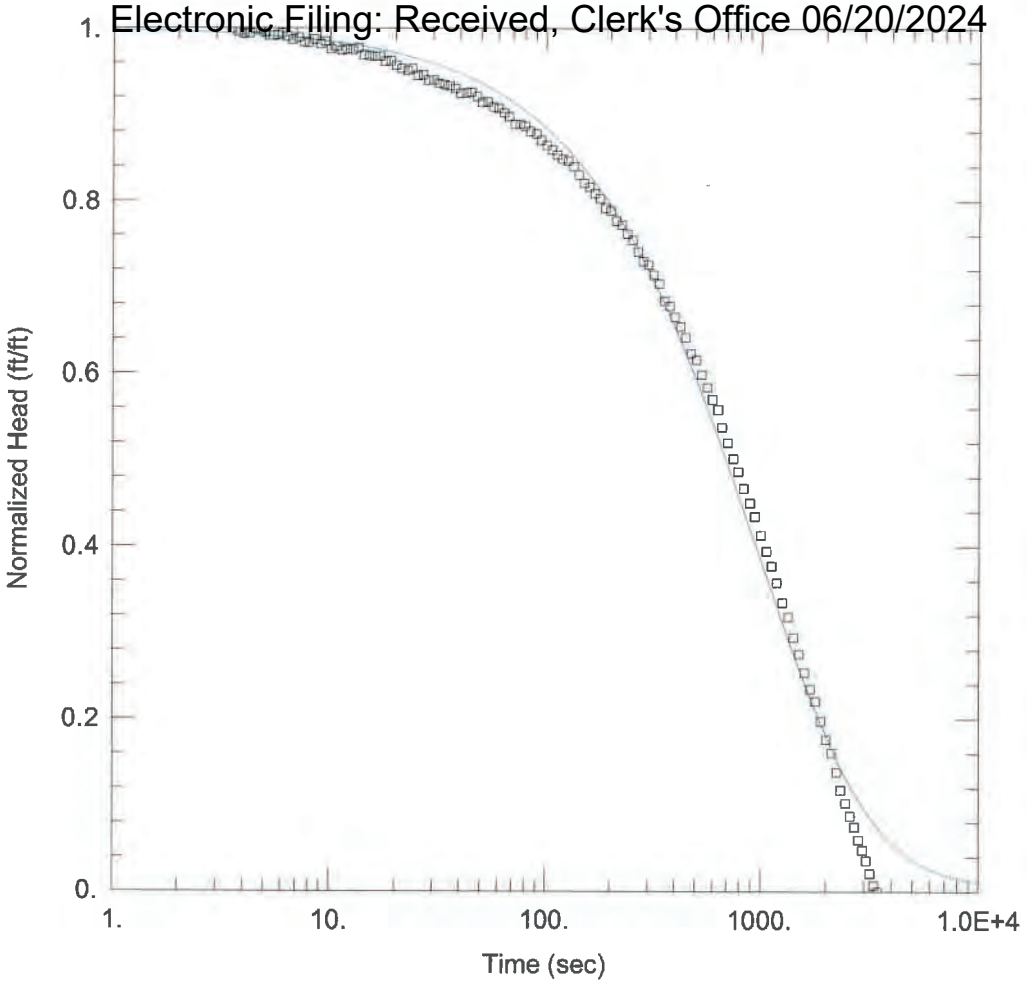
Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G50S-fh.aqt
Date: 06/02/21 Time: 16:26:23

## PROJECT INFORMATION

Client: Duck Creek Power Statin
Project: 20E0111A
Location: Canton, IL
Test Well: G50S
Test Date: 4 Mar 2021

## AQUIFER DATA

Saturated Thickness: 4.3 ft



## WELL DATA (G50S)

Initial Displacement: 1.07 ft
Total Well Penetration Depth: 22.57 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 20.03 ft
Screen Length: 4.71 ft
Well Radius: 0.08333 ft

## SOLUTION

Aquifer Model: Confined
Solution Method: KGS Model
Kr = 6.5E-5 cm/sec
Kz/Kr = 1.
Ss = 0.007 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

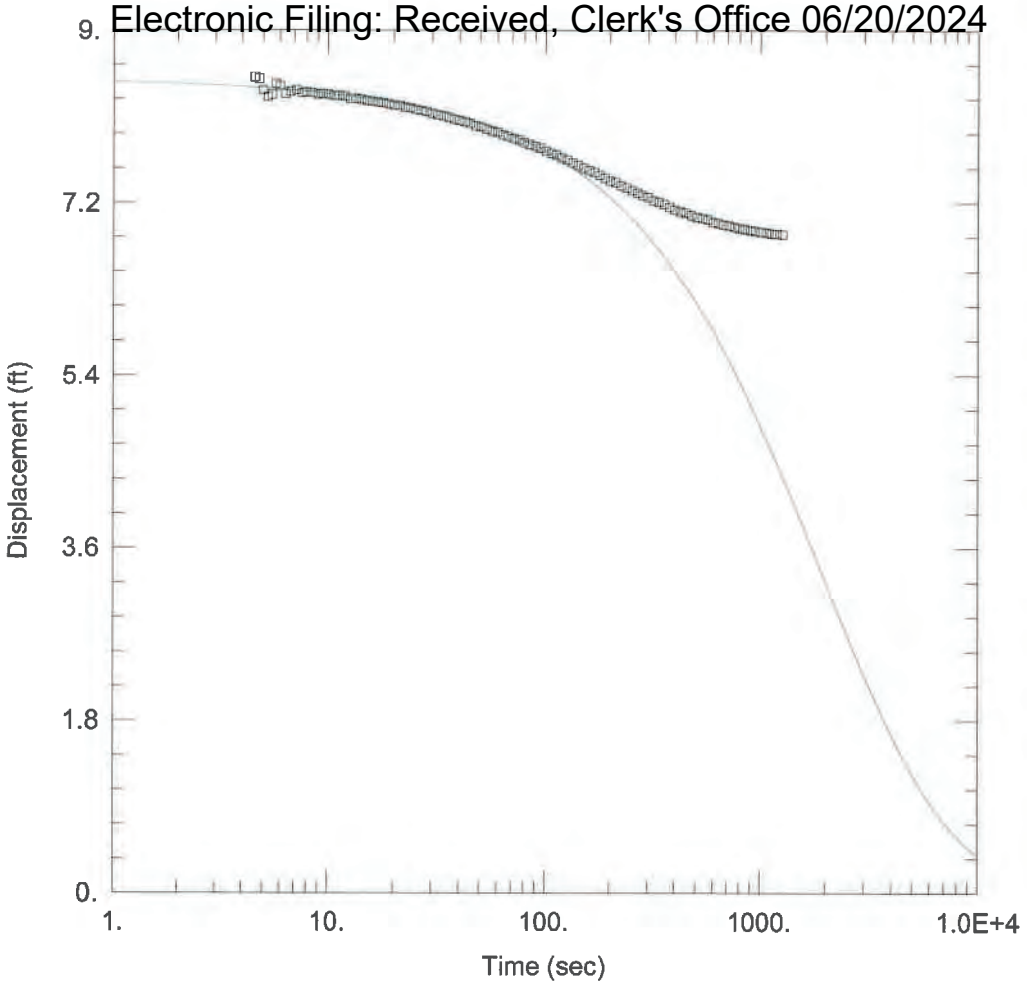
G50S RISING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G50S-rh.aqt
Date: 06/02/21 Time: 16:26:25

AQUIFER DATA

Saturated Thickness: 4.3 ft

WELL DATA (G50S)



Initial Displacement: 1.35 ft
Total Well Penetration Depth: 22.57 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 20.03 ft
Screen Length: 4.71 ft
Well Radius: 0.08333 ft

SOLUTION

Aquifer Model: Confined
Solution Method: KGS Model

Kr = 0.00015 cm/sec
Kz/Kr = 1.
Ss = 1.4E-5 $ft^{-1}$

Electronic Filing: Received, Clerk's Office 06/20/2024

## G51L FALLING HEAD TEST

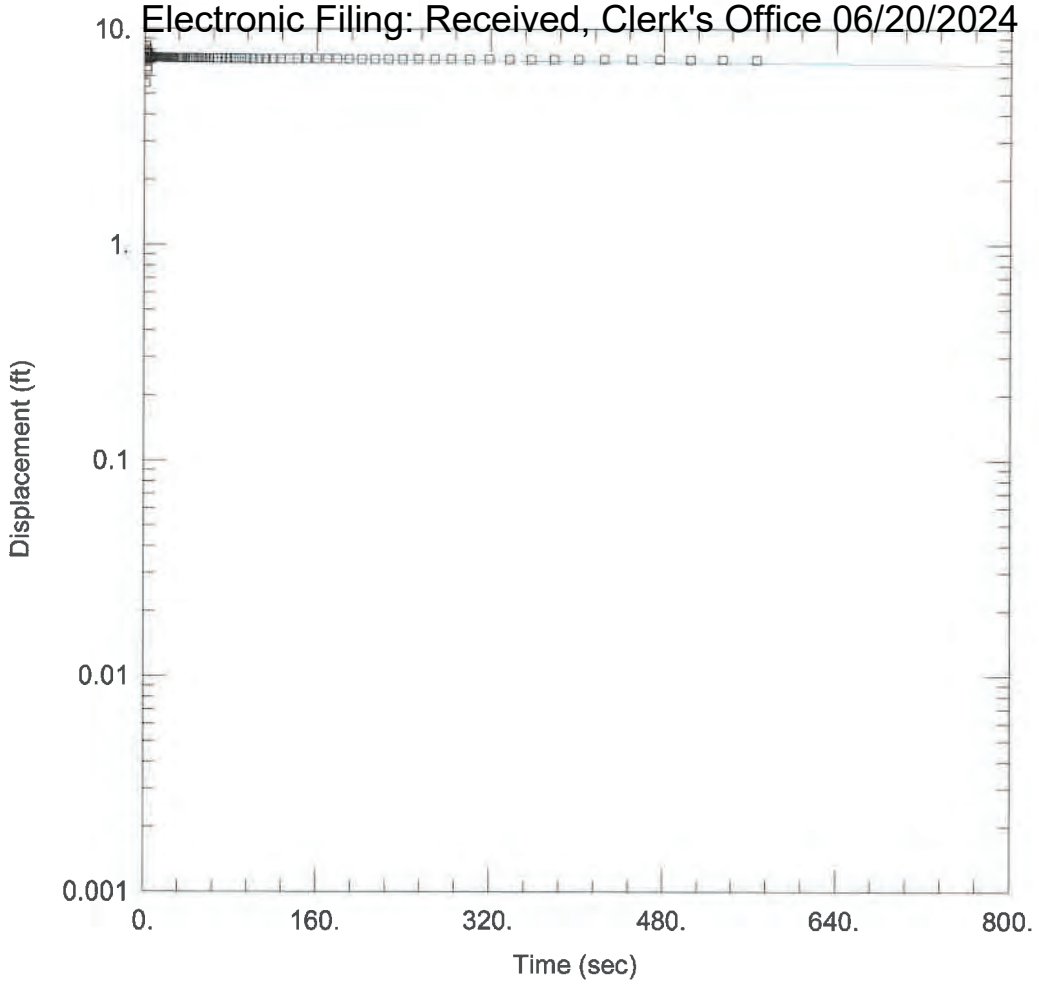
Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G51L-fh.aqt
Date: 06/02/21 Time: 16:26:26

## PROJECT INFORMATION

Client: Duck Creek Power Station
Project: 20E0111A
Location: Canton, IL
Test Well: G51L
Test Date: 4 Mar 2021

## AQUIFER DATA

Saturated Thickness: 8.5 ft



## WELL DATA (G51L)

Initial Displacement: 8.5 ft
Total Well Penetration Depth: 14.11 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 6.32 ft
Screen Length: 4.79 ft
Well Radius: 0.08333 ft

## SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model
Kr = 3.0E-5 cm/sec
Ss = 0.0011 $ft^{-1}$
Kz/Kr = 1.

Electronic Filing: Received, Clerk's Office 06/20/2024

## G51S FALLING HEAD TEST

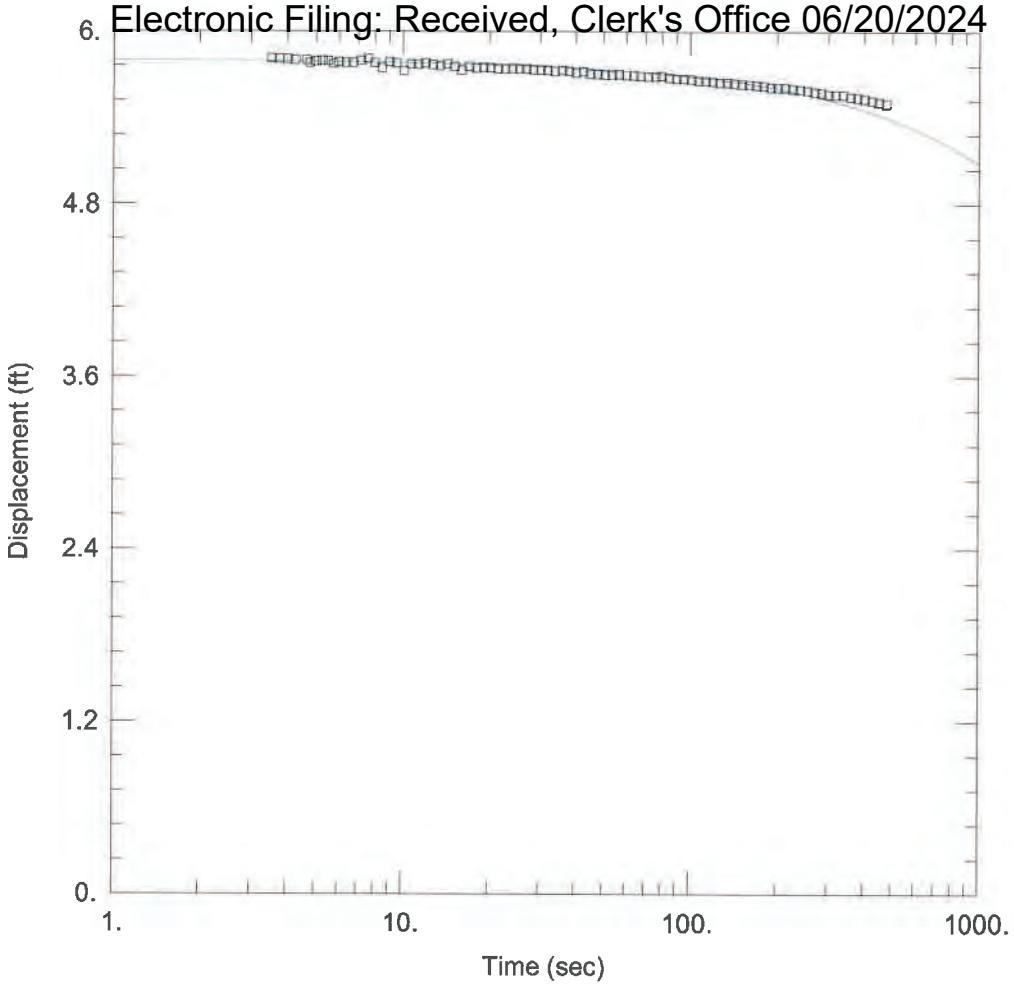
Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G51S-fh.aqt
Date: 06/02/21 Time: 16:26:27

## PROJECT INFORMATION

Client: Duck Creek Power Station
Project: 20E0111A
Location: Canton, IL
Test Well: G51S
Test Date: 4 Mar 2021

## AQUIFER DATA

Saturated Thickness: 0.4 ft
Anisotropy Ratio (Kz/Kr): 1.



## WELL DATA (G51S)

Initial Displacement: 7.4 ft
Total Well Penetration Depth: 20.04 ft
Casing Radius: 0.08333 ft
Static Water Column Height: 17.4 ft
Screen Length: 4.78 ft
Well Radius: 0.08333 ft

## SOLUTION

Aquifer Model: Confined
K = 7.2E-5 cm/sec
Solution Method: Bouwer-Rice
y0 = 7.35 ft

Electronic Filing: Received, Clerk's Office 06/20/2024

## G51S RISING HEAD TEST

Data Set: I:\20jobs\20E0111A\Admin\13-Calculations\Slug Tests\Duck Creek\G51S-rh.aqt

# APPENDIX F
# FEMA FLOOD HAZARD MAP

Electronic Filing: Received, Clerk's Office 06/20/2024

## NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or flood plain management.

**Coastal Base Flood Elevations** shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or flood plain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

In the State of Illinois, any portion of a stream or watercourse that lies within the **floodway fringe** of a studied (AE) stream may have a state regulated floodway. The FIRM may not depict these state regulated floodways.

**Floodways** restricted by anthropogenic features such as bridges and culverts are drawn to reflect natural conditions and may not agree with the model computed widths listed in the Floodway Data table in the Flood Insurance Study report.

Multiple **topographic sources** may have been used in the delineation of Special Flood Hazard Areas. See Flood Insurance Study report for details on source resolution and geographic extent.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 15. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

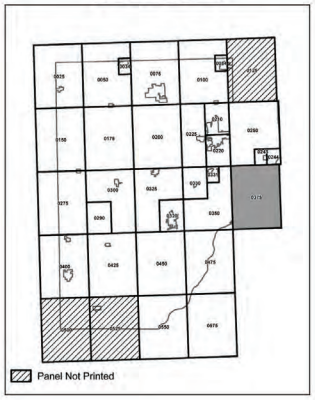
NGS Information Services, NOAA, NNGS12
National Geodetic Survey SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at (301) 713-3242, or visit its website at www.ngs.noaa.gov.

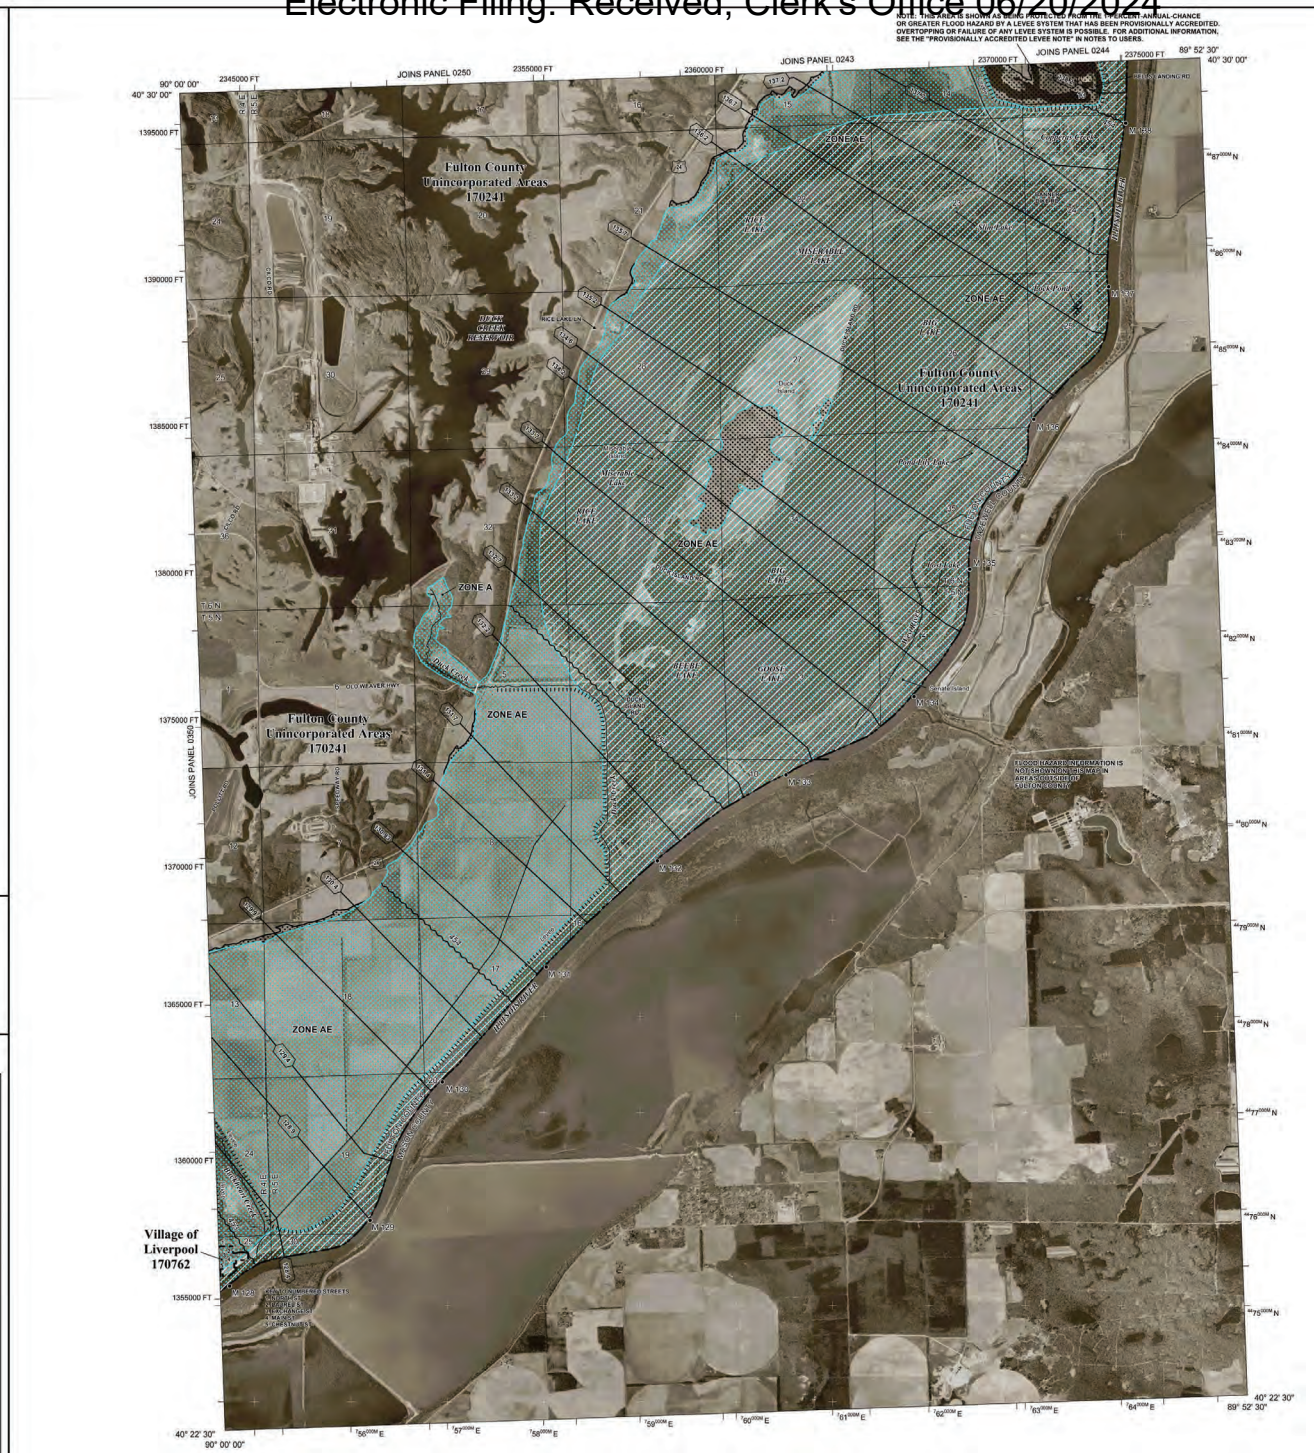
**Base map** information shown on this FIRM was provided in digital format by the United States Geological Survey. Digital orthoimagery with a spatial resolution of 0.5 meter ground sample distance were photogrammetrically compiled from aerial photography acquired during the leaf-off period of spring 2005.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The Special Flood Hazard Areas and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

**Corporate limits** shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.



Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.



For information on available products associated with this FIRM visit the Map Service Center (MSC) website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

If you have **questions about this map**, how to order products or the National Flood Insurance Program in general, please call the **FEMA Map Information eXchange (FMIX)** at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.

Provisionally Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To maintain accreditation, the levee owner or community is required to submit the data and documentation necessary to comply with Section 65.10 of the NFIP regulations by December 31, 2010. If the community or owner does not provide the necessary data and documentation or if the data and documentation provided indicate the levee system does not comply with Section 65.10 requirements, FEMA will revise the flood hazard and risk information for this area to reflect de-accreditation of the levee system. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA website at http://www.fema.gov/business/nfip/index.shtm.

## PANEL INDEX

## LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equalled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

| | |
|---|---|
| ZONE A | No Base Flood Elevations determined. |
| ZONE AE | Base Flood Elevations determined. |
| ZONE AH | Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined. |
| ZONE AO | Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined. |
| ZONE AR | Special Flood Hazard Areas formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood. |
| ZONE A99 | Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined. |
| ZONE V | Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined. |
| ZONE VE | Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined. |

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

| | |
|---|---|
| ZONE X | Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood. |

OTHER AREAS

| | |
|---|---|
| ZONE X | Areas determined to be outside the 0.2% annual chance floodplain. |
| ZONE D | Areas in which flood hazards are undetermined, but possible. |

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

*Referenced to the North American Vertical Datum of 1988

- A — A — Cross section line
- 23 — 23 — Transect line
- 45° 02' 08", 93° 02' 12" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83)
- 4980000 N — 1000-meter Universal Transverse Mercator grid values, zone 15
- 1565000 FT — 5000-foot grid tick: Illinois State Plane West Coordinate System, 3801 zone (FIPSZONE 1202) Transverse Mercator
- DX5510$_X$ — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.5 — River Mile

# 1. INTRODUCTION

## 1.1 Overview

In accordance with requirements of the Standards for the Disposal of Coal Combustion Residuals (CCR) in Surface Impoundments (SIs): Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845 (Part 845) (Illinois Environmental Protection Agency [IEPA], April 15, 2021), Ramboll Americas Engineering Solutions, Inc. (Ramboll) has prepared this Groundwater Monitoring Plan (GMP) on behalf of Duck Creek Power Plant (DCPP), operated by Illinois Power Resources Generating, LLC (IPRG). This report will apply specifically to the CCR Unit referred to as the Gypsum Management Facility Pond (GMF Pond) (Vistra identification [ID] number [No.] 203, IEPA ID No. W0578010001-04, and National Inventory of Dams [NID] No. IL50573). This GMP includes Part 845 content requirements specific to 35 I.A.C. § 845.630 (Groundwater Monitoring System), 35 I.A.C. § 845.640 (Groundwater Sampling and Analysis), and 35 I.A.C. § 845.650 (Groundwater Monitoring Program) for the GMF Pond at the DCPP.

A checklist which identifies the specific requirements of 35 I.A.C. § 845.630, 35 I.A.C. § 845.640, and 35 I.A.C. § 845.650 is included in **Table 1-1**. The table provides references to sections, tables, and figures included in this document to locate the information that meets specific requirements of 35 I.A.C. § 845.630, 35 I.A.C. § 845.640, and 35 I.A.C. § 845.650.

## 1.2 Site Location and Background

The DCPP is located in Fulton County, Illinois, approximately six miles southeast of the town of Canton, Illinois. The GMF Pond is located north of the DCPP within Section 18, Township 6 North, Range 5 East (**Figure 1-1**). Prior to construction of the DCPP and associated facilities, strip mining of coal took place within the current property boundary. Currently, land use adjacent to the DCPP is primarily agriculture, pasture, and forested land with minimal development.

The GMF Pond is a 1,500-foot by 900-foot earthen berm double-lined CCR SI located north of the former DCPP. The GMF Pond decant water discharges to the lined GMF Recycle Pond located to the south of the GMF Pond (**Figure 1-2**). In addition to the GMF Pond, several other CCR units are located on the DCPP property, including the Landfill located due north of the GMF Pond; the closed units Ash Pond No. 1 and Ash Pond No. 2 located south of the GMF Pond; and the Bottom Ash Basin located between the former DCPP and the closed Ash Pond No. 1 and Ash Pond No. 2.

The GMF Pond, also referred to as the gypsum stack/management system, operates under IEPA Water Pollution Control Permit (WPCP) No. 2017-E0-62640, issued in December 2017. It consists of 1,500-foot by 900-foot earthen berm with 3.5:1 side slopes, a maximum elevation of 620 feet above mean sea level, a double geomembrane liner consisting of a 60-millimeter (mil) high-density polyethylene (HPDE) geomembrane liner, 12 inches of clay cushion, 4 ounces per square yard (oz/yd$^2$) non-woven geotextile filter fabric, 12 inches highly permeable granular drainage (sand), 10 oz/yd$^2$ non-woven geotextile filter fabric, 60-mil HPDE geomembrane liner, reinforced bentonite mat, 36 inches compacted clay all installed over in-situ foundation soil, and all pipes, pumps, and appurtenances necessary for the storage of approximately 3.6 million tons of gypsum at a maximum elevation of 715 feet above mean sea level with discharge to the Recycle Pond. The GMF Recycle Pond is lined with a 60-mil HDPE geomembrane liner, reinforced bentonite mat, and 36 inches of compacted clay.

Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) coal seam. Mining operations in the area have ceased. Strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) coal unit at some portions of the DCPP property. Previous investigations completed outside of the GMF Pond indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 to 75 feet. The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to and downgradient of several former large surface mining areas.

## 1.3 Conceptual Model

Significant site investigation has been completed at the DCPP to characterize the geology, hydrogeology, and groundwater quality. Based on extensive investigation and monitoring, the GMF Pond has been well characterized and detailed in the Hydrogeologic Site Characterization Report (HCR; Ramboll, 2021); included in the Operating Permit to which this Plan is attached). A conceptual site model (CSM) has been developed and is discussed below.

The three distinct hydrostratigraphic units summarized below have been identified at the GMF Pond based on stratigraphic relationships and common hydrogeologic characteristics:

- **Uppermost Aquifer:** At the GMF Pond, this unit includes the Peoria/Roxana Loess, the upper Radnor Till, and the shallow sands. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (Natural Resource Technology, an OBG Company [NRT/OBG], 2017a). The shallow sands are laterally extensive across the GMF Pond, vary in thickness from less than one to 18 feet, and are generally located at an elevation of 570 to 590 feet above mean sea level (msl). Sand was completely removed where it was encountered during construction of the GMF Pond, putting the base of liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place. While the primary migration pathway is the shallow sand of the uppermost aquifer, the groundwater within the overlying Peoria/Roxanna Loess has the potential to be impacted and is considered a potential migration pathway (PMP).
- **Lower Radnor Till/Lower Confining Unit**: Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick. Previous hydrogeologic studies indicate discontinuous sand lenses observed within the till are not hydraulically connected to the shallow sand unit (NRT/OBG, 2017a).
- **Bedrock Confining Unit**: The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet.

Groundwater migrates downward through the loess and upper Radnor Till into the shallow sands of the uppermost aquifer. Groundwater flow in the sands is generally in a northwest to southeast direction (**Figure 1-3**). Seasonal variation of groundwater levels at the GMF Pond are present and may fluctuate approximately one to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond associated with the elevation changes. Groundwater flows toward the Duck Creek Cooling Pond located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Duck Creek Cooling Pond is estimated from 562.5 to 565 feet North American Vertical Datum of 1988 (NAVD88). Which is approximately 20 feet lower than downgradient groundwater at the GMF Pond.

Electronic Filing: Received, Clerk's Office 06/20/2024

Part 845 parameters were monitored in the uppermost aquifer and PMP monitoring wells at the GMF Pond as part of the Title 40 of the Code of Federal Regulations (40 C.F.R.) § 257 monitoring program beginning in 2015. These data were supplemented with sampling of additional locations in 2021. The results indicate that the following parameters were detected at concentrations or measurements greater than the applicable 35 I.A.C. § 845.600 groundwater protection standards (GWPSs) and are considered potential exceedances:

- Antimony, arsenic, cobalt, lead, pH, sulfate, and thallium were detected at least once at concentrations or measurements greater than the GWPS in downgradient uppermost aquifer wells (including PMP wells). Lead, mercury, pH, and thallium were detected at concentrations or measurements greater than the GWPS in upgradient uppermost aquifer wells. Radium 226 and 228 combined was detected once at concentrations greater than the GWPS in the bedrock confining unit well.

Concentration results for the above parameters were compared directly to 35 I.A.C. § 845.600 GWPS, without an evaluation of background concentrations. Evaluation of background groundwater quality has been completed as part of this GMP, and compliance with Part 845 will be determined following the first round of groundwater sampling. The first round of groundwater sampling for compliance will be completed the quarter following issuance of the Operating Permit and in accordance with this GMP.

# 2. GROUNDWATER MONITORING SYSTEMS

## 2.1 Existing Monitoring Well Network and Analysis

This GMP is being provided to propose a groundwater monitoring network and monitoring program specific to the GMF Pond that will comply with Part 845. Monitoring networks and programs that apply to other units are not discussed in this GMP. Those programs will continue to be performed as specified in IEPA approvals. Any future modifications will be proposed and submitted to IEPA for approval in a separate document. The remaining discussion in this document will include only these networks and monitoring programs that are applicable and specific to the GMF Pond, specifically the IEPA WPCP monitoring network, the 40 C.F.R. § 257 monitoring network and the proposed Part 845 monitoring network.

### 2.1.1 IEPA Monitoring Program

Routine quarterly groundwater monitoring is completed at GMF Pond wells G50L/S, G51L/S, G52L/S, G53L/S, G54L/S, G55L/S, G56L/S, G57L/S, G58L/S, G59L/S, G60L/S, R61L/G61S, G62L, G63L/S, and G64L/S in accordance with the IEPA WPCP No. 2017-E0-62640. This permit also requires sampling G65L/S, G66L/S, G67L/S, G70L, G71L/S, and G72L/R72S at the GMF Recycle Pond. The boring logs, well construction forms, and other related monitoring well forms for the GMF Pond well network are included in Appendix B of the HCR (included in the Operating Permit to which this Plan is attached). The location of all IEPA monitoring wells is illustrated in **Figure 2-1**. Groundwater samples are collected quarterly and annually and are analyzed for the laboratory and field parameters listed in **Table A** below.

**Table A. IEPA Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters** | | | |
| pH | Temperature | Specific Conductance | |
| Groundwater Elevation | Depth to Water (bmp) | Bottom of Well Elevation | |
| **Quarterly Parameters (Dissolved)** | | | |
| Arsenic | Cadmium | Lead | Sulfate |
| Boron | Chloride | Manganese | Total Dissolved Solids (TDS) |
| **Annual Parameters (Dissolved)** | | | |
| Alkalinity, bicarbonate | Chromium | Mercury | Selenium |
| Alkalinity, carbonate | Cobalt | Nickel | Sodium |
| Ammonia as Nitrogen | Iron | Nitrate nitrogen | Zinc |
| Calcium | Magnesium | Potassium | |

### 2.1.2 40 C.F.R. § 257 Monitoring Program

The 40 C.F.R. § 257 well network for the GMF Pond consists of seven monitoring wells installed nearby or adjacent to the GMF Pond in the uppermost aquifer. The GMF Pond 40 C.F.R. § 257 well network consists of three background monitoring wells (G02S, G50S, and G51S) and four compliance monitoring wells (G54S, G57S, G60S, and G64S). The boring logs, well construction forms, and other related monitoring well forms are available in the Operating Records as required by 40 C.F.R. § 257.91 for each monitored CCR Unit or CCR Multi-Unit, and are included in Appendix B of the HCR (included in the Operating Permit to which this Plan is attached).

Groundwater is being monitored at the GMF Pond in accordance with the Detection Monitoring Program requirements specified in 40 C.F.R. § 257.94. Details on the procedures and techniques used to fulfill the groundwater sampling and analysis program requirements are found in the Sampling and Analysis Plan for the GMF Pond (NRT/OBG, 2017b).

Groundwater samples are collected semiannually and analyzed for the laboratory and field parameters from Appendix III of 40 C.F.R. § 257, summarized in **Table B** below.

**Table B. 40 C.F.R. § 257 Groundwater Monitoring Program Parameters**

| **Field Parameters[1]** | | |
|---|---|---|
| pH | Groundwater Elevation | |
| **Appendix III Parameters (Total, except TDS)** | | |
| Boron | Chloride | Sulfate |
| Calcium | Fluoride | TDS |

[1]Dissolved oxygen, temperature, specific conductance, oxidation/reduction potential, and turbidity were recorded during sample collection.

Results and analysis of groundwater sampling are reported annually by January 31 of the following year and made available on the CCR public website as required by 40 C.F.R. § 257.

### 2.1.3 Part 845 Well Installation and Monitoring

In 2021, one additional monitoring well (G54C) was installed between the GMF Pond and the GMF Recycle Pond to assess the vertical and horizontal lithology, stratigraphy, chemical properties, and physical properties of geologic layers to a minimum of 100 feet below ground surface (bgs) as specified in 35 I.A.C. § 845.620(b). Additionally, a porewater sample was collected from a temporary leachate monitoring location (XTPW02) installed within the GMF Pond to characterize the CCR materials.

Prospective Part 845 monitoring wells were sampled for eight rounds from February to August 2021 and the results were assessed for selection of the GMF Pond Part 845 monitoring well network. Groundwater samples were collected and analyzed for 35 I.A.C. § 845.600 parameters as summarized in **Table C** below.

**Table C. Part 845 Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters[1]** | | | |
| Groundwater Elevation | pH | Turbidity | |
| **Metals (Total)** | | | |
| Antimony | Boron | Cobalt | Molybdenum |
| Arsenic | Cadmium | Lead | Selenium |
| Barium | Calcium | Lithium | Thallium |
| Beryllium | Chromium | Mercury | |
| **Inorganics (Total)** | | | |
| Fluoride | Sulfate | Chloride | TDS |
| **Other (Total)** | | | |
| Radium 226 and 228 combined | | | |

[1] Dissolved oxygen, temperature, specific conductance, and oxidation/reduction potential were recorded during sample collection.

Data and results from the Part 845 background monitoring were included in the water quality discussion included in the HCR (included in the Operating Permit to which this Plan is attached). The data collected from background locations during the Part 845 monitoring were used to evaluate and calculate background concentrations for the GMF Pond. The evaluation and discussion are included in **Section 3.2** of this report.

Data collected from the 40 C.F.R. § 257 monitoring network from 2015 to 2021, and from the Part 845 background monitoring were used for selection of the Part 845 monitoring well network proposed in **Section 2.2**.

## 2.2 Proposed Part 845 Monitoring Well Network

The groundwater monitoring network proposed in this plan will include seven wells screened in the uppermost aquifer (G02S, G50S, G51S, G54S, G57S, G60S, and G64S), three wells screened in the PMP (G54L, G60L, and G64L), and one temporary water level only monitoring point (X301) that is located in a riser along the south end of the pond for monitoring the phreatic surface within the GMF Pond. The proposed network is summarized in **Table D** below and displayed on **Figure 2-2**. Ten wells (three background and seven compliance) will be used to monitor groundwater concentrations within the hydrostratigraphic units.

The groundwater samples collected from the ten wells will be used to monitor and evaluate groundwater quality and demonstrate compliance with the groundwater quality standards listed in 35 I.A.C. § 845.600(a). The proposed monitoring wells will yield groundwater samples that represent the quality of downgradient groundwater at the CCR boundary (as required in 35 I.A.C. § 845.630(a)(2)). Monitoring well depths and construction details are listed in **Table 2-1** and summarized in **Table D** below.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table D. Proposed Part 845 Monitoring Well Network**

| Well ID | Monitored Unit | Well Screen Interval (feet bgs) | Well Type[1] |
|---|---|---|---|
| G02S | UA | 23.0 – 28.0 | Background |
| G50S | UA | 29.2 – 34.0 | Background |
| G51S | UA | 24.0 – 28.8 | Background |
| G54L | PMP | 27.3 – 36.8 | Compliance |
| G54S | UA | 43.5 – 48.0 | Compliance |
| G57S | UA | 29.7 – 34.2 | Compliance |
| G60L | PMP | 20.1 – 24.9 | Compliance |
| G60S | UA | 31.1 – 35.9 | Compliance |
| G64L | PMP | 18.1 – 27.5 | Compliance |
| G64S | UA | 34.5 – 39.0 | Compliance |
| X301[2,3] | CCR | NA | WLO |

[1] Well Type refers to the role of the well in the monitoring network.
[2] Well is to be used for water level data collection only.
[3] Location is temporary pending implementation of impoundment closure per an approved Construction Permit Application.
NA = not applicable
UA = uppermost aquifer
WLO = water level only

## 2.3 Well Abandonment

No wells are currently proposed for abandonment.

# 3. APPLICABLE GROUNDWATER QUALITY STANDARDS

## 3.1 Groundwater Classification

Groundwater at the GMF Pond meets the definition of Class I – Potable Resource Groundwater (35 I.A.C. § 620.210), based on the following criteria:

- Groundwater in the uppermost aquifer extends ten feet or more below the land surface.
- Field hydraulic conductivity tests performed in the unlithified geologic materials that include loess, shallow sand, and intermediate sand at the GMF Pond resulted in an overall (geometric mean) horizontal hydraulic conductivity exceeding the $1 \times 10^{-4}$ centimeters per second (cm/s) criterion.

However, background (upgradient) groundwater originates from areas north and west of the GMF Pond that have been surface mined and present a significant alternative source for groundwater impacts.

## 3.2 Statistical Evaluation of Background Groundwater Data

A Statistical Analysis Plan (**Appendix A**) has been developed to describe procedures that will be used to establish background conditions and implement compliance monitoring as necessary and required by 35 I.A.C. § 845.640 and 35 I.A.C. § 845.650. The Statistical Analysis Plan was prepared in accordance with the requirements of 35 I.A.C. § 845.640(f), with reference to the acceptable statistical procedures provided in United States Environmental Protection Agency's (USEPA) *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, Unified Guidance* (*Unified Guidance,* March 2009), and is intended to provide a logical process and framework for conducting the statistical analysis of the data obtained during groundwater monitoring.

In accordance with 35 I.A.C. § 845.640(f)(1), the statistical method chosen for analysis of background groundwater quality was either the tolerance interval or the prediction interval procedure for each constituent listed in 35 I.A.C. § 845.600(a)(1) at this CCR unit per 35 I.A.C. § 845.640(f)(1)(C). A comparison of the statistical background concentrations and groundwater quality standards listed in 35 I.A.C. § 845.600(a)(1) and the resulting GWPSs are summarized in **Table 3-1**.

## 3.3 Applicable Groundwater Protection Standards

The applicable GWPSs will be established in accordance with 35 I.A.C. § 845.600(a) (greater of the background concentration or numerical limit specified in 35 I.A.C. § 845.600(a)(1)). The results of the statistical analysis of background groundwater data (**Table 3-1**) indicate that most background concentrations in the uppermost aquifer are less than the groundwater quality standards listed in 35 I.A.C. § 845.600(a)(1). Therefore, for these parameters, the groundwater quality standards listed in 35 I.A.C. § 845.600(a)(1) will be applied to the results from the proposed groundwater monitoring network. The exception being lead, where the background concentration is greater than the 35 I.A.C. § 845.600(a)(1) standard (0.015 milligrams per liter [mg/L] versus 0.0075 mg/L). In this instance, the GWPS will be the background concentration.

Under most circumstances, the GWPS will be compared to the lower confidence limit for the observed concentrations for each constituent in each compliance well. Exceptions are when there are high percentages (greater than 50 percent) of non-detects in compliance well data, for which

Electronic Filing: Received, Clerk's Office 06/20/2024

a future mean (for 50 to 70 percent non-detects) or median (for greater than 70 percent non-detects) will be compared to the GWPS. Consistent with the *Unified Guidance*, the same general statistical method of confidence interval testing against a fixed GWPS is recommended in compliance and corrective action programs. Confidence intervals provide a flexible and statistically accurate method to test how a parameter estimated from a single sample compares to a fixed numerical limit. Confidence intervals explicitly account for variation and uncertainty in the sample data used to construct them.

Evaluation of the applicable standards will occur in conjunction with the analysis of groundwater quality results. Background calculations and the resulting concentrations may be updated as appropriate, in accordance with the Statistical Analysis Plan included in **Appendix A.**

Electronic Filing: Received, Clerk's Office 06/20/2024

# 4. GROUNDWATER MONITORING PLAN

The groundwater monitoring plan will monitor and evaluate groundwater quality to demonstrate compliance with the groundwater quality standards included in 40 C.F.R. § 257.94(e), 40 C.F.R. § 257.95(h), and 35 I.A.C. § 845.600(a). The groundwater monitoring program will include sampling and analysis procedures that are consistent and that provide an accurate representation of groundwater quality at the background and compliance wells as required by 35 I.A.C. § 845.630. As discussed in **Section 2**, three monitoring programs specific to the GMF Pond exist: IEPA WPCP monitoring program, the 40 C.F.R. § 257 monitoring program, and the proposed Part 845 monitoring program. These programs will continue to be monitored as specified in IEPA approvals or 40 C.F.R. § 257. Upon approval of the Operating Permit applications (and by extension the GMP) for the GMF Pond, the monitoring program required by IEPA WPCP will be discontinued following approval of a future permit modification submittal and will be replaced by the proposed Part 845 monitoring program. It is expected that upon USEPA approval of Part 845, the 40 C.F.R. § 257 monitoring program and reporting will be eliminated, and the proposed Part 845 monitoring and reporting included in this Plan will continue until requirements of Part 845 have been achieved.

## 4.1 Monitoring Networks and Parameters

### 4.1.1 IEPA Groundwater Monitoring

The existing IEPA monitoring program was discussed in detail in **Section 2.1.1**. Monitoring wells are sampled on a quarterly and yearly frequency for the parameters required under IEPA WPCP 2017-EO-62640. Well locations and parameters will continue to be monitored as required by the WPCP until IEPA approves the Operating Permit (and by extension the GMP) for the GMF Pond.

### 4.1.2 40 C.F.R. § 257 Groundwater Monitoring

The existing 40 C.F.R. § 257 monitoring program was discussed in detail in **Section 2.1.2**. Seven wells (three background and four compliance) are sampled for Appendix III parameters on a semi-annual frequency. No changes are proposed to this monitoring network. Well locations and parameters will continue to be monitored and reported as required by 40 C.F.R. § 257 until USEPA approves Part 845.

### 4.1.3 Part 845 Groundwater Monitoring

The proposed Part 845 monitoring network will consist of three background monitoring wells (G02S, G50S, and G51S), seven compliance monitoring wells (G54L, G54S, G57S, G60L, G60S, G64L, and G64S), and one temporary water level only monitoring point (X301) to monitor potential impacts from the GMF Pond (**Figure 2-2**). The monitoring wells are screened within the uppermost aquifer (G02S, G50S, G51S, G54S, G57S, G60S, and G64S) and PMP (G54L, G60L, and G64L) along the perimeter of the GMF Pond. Groundwater samples will be collected and analyzed for the laboratory and field parameters in **Table E** below.

**Table E. Part 845 Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters[1]** | | | |
| Groundwater Elevation | pH | Turbidity | |
| **Metals (Total)** | | | |
| Antimony | Boron | Cobalt | Molybdenum |
| Arsenic | Cadmium | Lead | Selenium |
| Barium | Calcium | Lithium | Thallium |
| Beryllium | Chromium | Mercury | |
| **Inorganics (Total)** | | | |
| Fluoride | Sulfate | Chloride | TDS |
| **Other (Total)** | | | |
| Radium 226 and 228 combined | | | |

[1] Dissolved oxygen, temperature, specific conductance, and oxidation/reduction potential will be recorded during sample collection.

All parameters listed above were sampled a minimum of eight times by October 18, 2021 to establish background groundwater quality in accordance with 35 I.A.C. § 845.650 (b)(1)(A). Discussion of background groundwater quality is included in **Section 3.2**.

## 4.2 Sampling Schedule

Groundwater sampling for the Part 845 monitoring well network will initially be performed quarterly according to the following schedule:

**Table F. Part 845 Sampling Schedule**

| Frequency | Duration |
|---|---|
| Monthly (groundwater elevations only) | Begins: the quarter following approval of this plan and issuance of the Operating Permit. |
| | Ends: Following the 30-year post closure care period and following IEPA approval of documentation that groundwater concentrations are below standards in 35 I.A.C. § 845.600 and concentrations exceeding background are not increasing and meet requirements in 35 I.A.C. § 845.780 (c)(2)(B)(i) and (ii). |
| Quarterly (groundwater quality) | Begins: the quarter following approval of this plan and issuance of the Operating Permit. |
| | Ends: Following the 30-year post closure care period and following IEPA approval of documentation that groundwater concentrations are below standards in 35 I.A.C. § 845.600 and concentrations exceeding background are not increasing and meet requirements in 35 I.A.C. § 845.780 (c)(2)(B)(i) and (ii), or upon IEPA approval of an alternate schedule as allowed by 35 I.A.C. § 845.650(b)(4). |
| Semi-annual (groundwater quality) | Begins: Following 5 years of quarterly groundwater monitoring and IEPA approval of a demonstration that groundwater concentrations are below standards in 35 I.A.C. § 845.600 and not exhibiting statistically-significant increasing trends, monitoring effectiveness is not compromised by a semi-annual schedule, and sufficient data has been collected to characterize groundwater. |
| | Ends: Following detection of a statistically-significant increasing trend in groundwater concentrations or an exceedance of the standards in 35 I.A.C. § 845.600 (quarterly |

| | |
|---|---|
| | monitoring shall be resumed in these circumstances), or following the 30-year post closure care period and following IEPA approval of documentation that groundwater concentrations are below standards in 35 I.A.C. § 845.600 and concentrations exceeding background are not increasing and meet requirements in 35 I.A.C. § 845.780 (c)(2)(B)(i) and (ii). |

## 4.3 Groundwater Sample Collection

Groundwater sampling procedures have been developed and the collection of groundwater samples is being implemented to meet the requirements of 35 I.A.C. § 845.640. In addition to groundwater well samples, quality assurance samples will be collected as described in **Section 4.5** (**Table 4-1**).

## 4.4 Laboratory Analysis

Laboratory analysis will be performed consistent with the requirements of 35 I.A.C. § 845.640(j) by a state-certified laboratory using methods approved by IEPA and USEPA. Laboratory methods may be modified based on laboratory equipment availability or procedures, but the Reporting Limit (RL) for all parameters analyzed, regardless of method, will be lower than the applicable groundwater quality standard. RLs for the applicable parameters are summarized in **Table 4-2**. Concentrations lower than the RL will be reported as less than the RL.

## 4.5 Quality Assurance Program

Consistent with the requirements of 35 I.A.C. § 845.640(a)(5), the sampling and analysis program includes procedures and techniques for quality assurance/quality control (QA/QC). Additional quality assurance samples to be collected will include the following:

- Field duplicates will be collected at a frequency of one per group of ten or fewer investigative water samples.
- One equipment blank sample will be collected and analyzed for each day of sampling. If dedicated sampling equipment is used, then equipment blank samples will not be collected.
- The duplicate and equipment blank quality assurance samples will be supplemented by the laboratory QA/QC program, which typically includes:
  - Regular generation of instrument calibration curves to assure instrument reliability
  - Laboratory control samples and/or quality control check standards that have been spiked, and analyses to monitor the performance of the analytical method
  - Matrix spike/matrix spike duplicate analyses to determine percent recoveries and relative percent differences for each of the parameters detected
  - Analysis of replicate samples to check the precision of the instrumentation and/or methodology employed for all analytical methods
  - Analysis of method blanks to assure that the system is free of contamination

Water quality meters used to measure pH and turbidity will be calibrated according to manufacturer's specifications. At a minimum, it is recommended that calibration of pH occur daily prior to sampling and checked for accuracy at the end of each day. Unusual or suspect pH measurements during sampling events will be flagged, evaluated, and additional calibration may

be performed throughout the sampling events. Turbidity meters will be checked daily, prior to and following sampling. Unusual measurements or erratic meter performance will be flagged and evaluated for overall effects on the data prior to reporting.

## 4.6 Groundwater Monitoring System Maintenance Plan

Consistent with the requirements of 35 I.A.C. § 845.630(e)(2), maintenance will be performed as needed to assure that the monitoring wells provide representative groundwater samples. Monitoring wells will be inspected during each groundwater sampling event; inspections will consist of the following:

- Visual inspection, clearing of vegetation, replacement of markers, and painting of protective casings as needed to assure that monitoring wells are clearly marked and accessible
- Visual inspection and repair or replacement of well aprons as needed to assure that they are intact, drain water away from the well, and have not heaved
- Visual inspection and repair or replacement of protective casings as needed to assure that they are undamaged, and that locks are present and functional
- Checks to assure that well caps are intact and vented, unless in flood-prone areas in which case caps will not be vented
- Annual measurement of monitoring well depths to determine the degree of siltation within the wells. Wells will be redeveloped as needed to remove siltation from the screened interval if it impedes flow of water into the well
- Checks to assure that wells are clear of internal obstructions, and flow freely

If maintenance of a monitoring well cannot address an identified deficiency, a replacement well will be installed.

## 4.7 Statistical Analysis

Statistical analysis will be consistent with procedures listed in 35 I.A.C. § 845.640(f). A Statistical Analysis Plan, provided in **Appendix A**, has been developed to summarize the statistical procedures that will be used to evaluate the groundwater results.

## 4.8 Data Reporting

Data reporting for the 40 C.F.R. § 257 monitoring program will be consistent with recordkeeping, notification, and internet posting requirements described in 40 C.F.R. § 257.105 through 257.107.

Groundwater monitoring and analysis completed in accordance with the Part 845 monitoring under an approved monitoring program will be reported to IEPA within 60 days after completion of sampling and the data placed in the facility's operating record as required by 35 I.A.C. § 845.610(b)(3)(D). Within 14 days of posting to the operating record, information will be posted to the publicly accessible internet site "Illinois CCR Rule Compliance Data and Information" as required by 35 I.A.C. § 845.810(d). Information will also be submitted to IEPA annually by January 31 as required by 35 I.A.C. § 845.550, for data collected the preceding year. The report will include the status of the groundwater monitoring and any required corrective action plan for the GMF Pond in addition to other requirements detailed in 35 I.A.C. § 845.610(e).

## 4.9 Compliance with Applicable On-site Groundwater Protection Standards

In accordance with 35 I.A.C. § 845.600(a)(1), the groundwater protection standard at the waste boundary will be the higher of either the 35 I.A.C. § 845.600 standard or the concentration determined by background groundwater monitoring.

As provided in 35 I.A.C. § 845.780(c)(2), at the end of the 30-year post-closure care period, groundwater monitoring will continue to be conducted in post-closure care until the groundwater results show the concentrations are:

- Below the GWPS in 35 I.A.C. § 845.600; and
- Not increasing for those constituents over background, using the statistical procedures and performance standards in 35 I.A.C. § 845.640(f) and (g), provided that:
  - Concentrations have been reduced to the maximum extent feasible; and
  - Concentrations are protective of human health and the environment.

Following detection of an exceedance of the GWPS, an Alternate Source Demonstration (ASD) will be evaluated as described in **Section 4.10**.

## 4.10 Alternate Source Demonstrations

As allowed in 35 I.A.C. § 845.650(e), following detection of an exceedance of the GWPS, an ASD will be evaluated and, if completed, submitted to IEPA within 60 days. The ASD will provide lines of evidence that a source other than the GMF Pond caused the contamination and the GMF Pond did not contribute to the contamination, or that the exceedance of the GWPS resulted from error in sampling, analysis, statistical evaluation, natural variation in groundwater quality, or a change in the potentiometric surface and groundwater flow direction.

The ASD will include information and analysis that supports the conclusions and a certification of accuracy by a qualified professional engineer. Once the ASD is approved by IEPA, the Part 845 groundwater monitoring will continue as defined in **Section 4.1.3**.

If an ASD is not completed and submitted, or IEPA does not approve the ASD, a notification of the exceedance will be provided to IEPA and placed in the operating record. Additional actions will also be completed as required by 35 I.A.C § 845.650(d)(1) through (3), including initiation of an assessment of corrective measures under 35 I.A.C § 845.660. As allowed in 35 I.A.C § 845.650(e)(7) a petition for review of IEPA's non-concurrence under 35 I.A.C. § 105 may also be filed.

## 4.11 Assessment of Corrective Measures and Corrective Action

As described in 35 I.A.C. § 845.660, if the ASD summarized in **Section 4.10** has not been approved by IEPA, an assessment of corrective measures will be initiated within 90 days of the detection of a result exceeding 35 I.A.C. § 845.600 standards (*i.e.,* receipt of laboratory data). The assessment of corrective measures will include at least the following (35 I.A.C. § 845.660 (c)):

- The performance, reliability, ease of implementation, and potential impacts of appropriate potential remedies, including safety impacts, cross-media impacts, and control of exposure to any residual contamination;
- The time required to begin and complete the corrective action plan; and

Electronic Filing: Received, Clerk's Office 06/20/2024

- The institutional requirements, such as State or local permit requirements or other environmental or public health requirements that may substantially affect implementation of the corrective action plan.

Within one year of completing the assessment of corrective measures, a corrective action plan will be developed to identify the selected remedy in accordance with 35 I.A.C. § 845.670. If closure of the CCR Unit is required, a closure alternatives analysis will be completed as specified in 35 I.A.C. § 845.710. The analysis and selected alternative will be submitted to IEPA in a Closure Plan as specified by 35 I.A.C. § 845.720. Groundwater monitoring proposed in this Addendum will continue as specified until the post closure care period has expired and IEPA has approved termination of post-closure care.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Notes:**
All elevation data are presented relative to the North American Vertical Datum 1988 (NAVD88), GEOID 12A
Type refers to the role of the well in the monitoring network: background (B), compliance (C), or water level measurements only (WLO)
WLO wells are temporary pending implementation of impoundment closure per an approved Construction Permit application
-- = data not available
BGS = below ground surface
ft = foot or feet
HSU = Hydrostratigraphic Unit
PVC = polyvinyl chloride
S = source water
UA = uppermost aquifer
UA/PMP = uppermost aquifer/potential migration pathway

[O: CJC 09/17/21; C: LDC 09/20/21]

**Notes:**
[1] Analytical method numbers are from SW-846 unless otherwise indicated. Analytical methods may be updated with more recent versions as appropriate.
[2] Field duplicates will be collected at a frequency of one per group of 10 or fewer investigative water samples. Field duplicates will not be collected for radium analysis.
[3] Field blanks will be collected at the discretion of the project manager; Equipment blanks will be collected at a rate of 1 per sampling event if non-dedicated equipment is used.
[4] Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples will be collected at a frequency of one per group of 20 or fewer investigative water samples per CCR unit/multi-unit. Additional volume to be determined by laboratory.
[5] Sample volume is estimated and will be determined by the laboratory.
[6] Metals = antimony, arsenic, barium, beryllium, boron, cadmium, calcium, chromium, cobalt, lead, lithium, molybdenum, selenium, thallium. Metals may be analyzed via ICP/ ICP-MS USEPA methods 6010 or 6020 depending on laboratory instrument availability
[7] If turbidity exceeds 10 NTUs, a duplicate sample filtered through a .45 micron filter may be collected for metals analysis in addition to the unfiltered sample. Both samples would be submitted for analysis.
[8] Parameter collected for quality assurance and quality control for field sampling purposes only; not required to be collected or reported under Part 845; collection of parameter may be discontinued without notification.
< = less than
°C = degrees Celsius
GMF = Gypsum Management Facility
$HNO_3$ = nitric acid
mL = milliliter
NA = not applicable
NTU = nephelometric turbidity unit

**Notes:**

[1] Analytical method numbers are from SW-846 unless otherwise indicated. Metals will be analyzed via Method 6020 or 6010 depending on laboratory equipment availability. Selected method will ensure reporting limits (RL) are below Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845.600 groundwater protection standards.

[2] USEPA MCL = United States Environmental Protection Agency Maximum Contaminant Level.

[3] USEPA SMCL = United States Environmental Protection Agency Secondary Maximum Contaminant Level.

[4] RLs will be less than the 35 I.A.C. § 845.600 groundwater protection standards.

[5] RLs and method detection limits (MDL) will vary depending on the laboratory performing the work.

[6] All radium results will be reported (values may be positive or negative) and will include uncertainty and the calculated MDC.

[7] Laboratories calculate a minimum detectable concentration (MDC) based on the sample.

°C = degrees Celsius

µS/cm = microSiemens per centimeter

CAS = Chemical Abstract Number

MDL = Method detection limit as established by the laboratory

mg/L = milligrams per liter

mV = millivolts

NS = No standard

NTU = nephelometric turbidity unit

pCi/L = picoCuries per liter

RL = Reporting limit as established by the laboratory

SM = Standard Methods for the Examination of Water and Wastewater

SU = standard units

# LICENSED PROFESSIONAL CERTIFICATIONS

This certification is based on the description of the statistical methods selected to evaluate groundwater as presented in the following Statistical Analysis Plan; Duck Creek Power Plant Gypsum Management Facility Pond. The procedures described in the plan will be used to establish background conditions and implement compliance monitoring as necessary and required by 35 I.A.C. § 845.640 and 35 I.A.C. § 845.650. The Statistical Analysis Plan was prepared in accordance with the requirements of 35 I.A.C. § 845.640(f), with reference to the acceptable statistical procedures provided in the United States Environmental Protection Agency (USEPA)'s *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, Unified Guidance* (*Unified Guidance,* March 2009), and is intended to provide a logical process and framework for conducting the statistical analysis of the data obtained during groundwater monitoring. In accordance with 35 I.A.C. § 845.640(f)(1), the statistical method chosen for analysis of background groundwater quality will be either the tolerance interval or the prediction interval procedure for each constituent listed in 35 I.A.C. § 845.600(a)(1) at this CCR unit per 35 I.A.C. § 845.640(f)(1)(C). Groundwater Protection Standards (GWPS) will be established in accordance with 35 I.A.C. § 845.600(a) (greater of the background concentration or numerical limit specified in 35 I.A.C. § 845.600(a)(1)). The GWPS will be compared to the lower confidence limit for the observed concentrations for each constituent in each compliance well. Consistent with the *Unified Guidance*, the same general statistical method of confidence interval testing against a fixed GWPS is recommended in compliance and corrective action programs. Confidence intervals provide a flexible and statistically accurate method to test how a parameter estimated from a single sample compares to a fixed numerical limit. Confidence intervals explicitly account for variation and uncertainty in the sample data used to construct them.

Description of the statistical methods chosen for analysis of groundwater monitoring data and application of these methods for determining exceedances of the GWPS identified in 35 I.A.C. § 845.600(a) is provided in this Statistical Analysis Plan.

## 35 I.A.C. § 845.640 Statistical Analysis (PE)

*I, Eric J. Tlachac, a qualified professional engineer in good standing in the State of Illinois, certify that the statistical methods summarized above and described in this document (Statistical Analysis Plan; Duck Creek Power Plant Gypsum Management Facility Pond) are appropriate for evaluating the groundwater monitoring data collected as described in the attached document and are in substantial compliance with 35 I.A.C. § 845.640.*

## 35 I.A.C. § 845.640 Statistical Analysis

*I, Rachel A. Banoff, a qualified professional, certify that the statistical methods described in this document (Statistical Analysis Plan; Duck Creek Power Plant Gypsum Management Facility Pond), are appropriate for evaluating the groundwater monitoring data collected as described in the attached document and are in substantial compliance with 35 I.A.C. § 845.640.*

# 1. INTRODUCTION

In April 2021, the Illinois Environmental Protection Agency (IEPA) issued a final rule for the regulation and management of Coal Combustion Residuals (CCR) in surface impoundments (SIs) under the Standards for the Disposal of CCR in Surface Impoundments: Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845 (Part 845). Facilities regulated under Part 845 are required to develop and sample a groundwater monitoring well network to evaluate whether impounded CCR materials are impacting downgradient groundwater quality. The groundwater quality evaluation must include selection and certification by a qualified professional engineer of the statistical procedures to be used. The procedures described in the evaluation will be used to establish background conditions and implement compliance and corrective action monitoring as necessary and required by 35 I.A.C. § 845.640 and 35 I.A.C. § 845.650. This Statistical Analysis Plan was prepared in accordance with the requirements of 35 I.A.C. § 845.640(f), with reference to the acceptable statistical procedures provided in United States Environmental Protection Agency's (USEPA's) *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, Unified Guidance* (*Unified Guidance*) (March 2009).

This Statistical Analysis Plan does not include procedures for groundwater sample collection and analysis, as these activities are conducted in accordance with the Sampling and Analysis Plan prepared for each CCR unit in accordance with 35 I.A.C. § 845.640. This Statistical Analysis Plan will be used as the primary reference for evaluating groundwater quality during operation and post-closure care.

## 1.1 Statistical Analysis Objectives

This Statistical Analysis Plan is intended to provide a logical process and framework for conducting the statistical analyses of data obtained during groundwater monitoring conducted in accordance with the Sampling and Analysis Plan for each CCR unit. The Statistical Analysis Plan will enable a qualified professional engineer to certify that the selected statistical methods are appropriate for evaluating the groundwater monitoring data for the applicable CCR unit(s).

## 1.2 Statistical Analysis Plan Approach

The main sections of this Statistical Analysis Plan should be viewed as a "generic" outline of statistical methods utilized for each CCR unit and constituent required to be monitored. The statistical analysis of the groundwater monitoring data, however, will be conducted on an individual-constituent or well basis, and may involve the use of appropriate statistical procedures depending on multiple factors such as detection frequency and normality distributions.

The CCR Rule outlines two phases of groundwater monitoring:

- Background Monitoring in accordance with 35 I.A.C. § 845.650(b)(1)
- Compliance Monitoring in accordance with 35 I.A.C. § 845.650

Each phase of the groundwater monitoring program requires specific statistical procedures to accomplish the intended purpose. During the background monitoring phase, background groundwater quality will be established utilizing upgradient and background wells and downgradient groundwater quality data will be collected to facilitate statistics in subsequent phases. Compliance Monitoring is then initiated through the evaluation of the downgradient

groundwater monitoring data for exceedances of the groundwater protection standard (GWPS) established by Part 845 (concentration specified in 35 I.A.C. § 845.600 or an IEPA-approved background concentration). The developed statistical analysis plan will be implemented for each monitoring phase and in accordance with the statistical procedures.

# 2. BACKGROUND MONITORING AND DATA PREPARATION

The background and compliance monitoring wells were sampled and analyzed for constituents, as listed in Part 845 (antimony, arsenic, barium, beryllium, boron, cadmium, calcium, chloride, chromium, cobalt, fluoride, lead, lithium, mercury, molybdenum, pH, radium 226 and 228 combined, selenium, sulfate, thallium, total dissolved solids, and turbidity), during the baseline phase of the groundwater monitoring program.

The background monitoring well(s) were placed upgradient of the CCR unit, or at an alternative background location, where they are not affected by potential leakage from the CCR unit. Compliance monitoring wells were placed at the waste boundary of the CCR unit, along the same groundwater flow path. As 35 I.A.C. § 845.630(a) specifies, the location of these wells ensures that background accurately represents the quality of unaffected groundwater, while compliance wells accurately represent groundwater quality at the waste boundary and monitor all potential contaminant pathways.

As required by 35 I.A.C. § 845.650(a)(1), eight sampling events were completed within 180 days of April 21, 2021. As outlined, groundwater sampling procedures included sampling of the background and compliance wells using low-flow sampling methods, collection of one field quality control sample per event, and groundwater samples were not field filtered before laboratory analysis of total recoverable metals.

Following completion of the eight sampling events, background groundwater quality was established for Part 845 constituents. Groundwater monitoring will be conducted quarterly for at least the first five years. In accordance with 35 I.A.C. § 845.650(b)(4), after the first five years, a request to reduce the monitoring frequency to semiannual may be submitted to IEPA if all of the following can be demonstrated:

- Groundwater monitoring effectiveness will not be compromised by the reduced frequency
- Sufficient data has been collected to characterize groundwater
- Monitoring to date does not show any statistically significant increasing trends
- The concentrations of monitored constituents at the compliance monitoring wells are below the applicable GWPSs established in 35 I.A.C. § 845.600

The following subsections outline the statistical tests and procedures (methods) that will be utilized to evaluate data collected for each constituent in both background and compliance wells for Background and Compliance Monitoring. When necessary and contingent upon equivalent statistical power, an alternative test not included in this Statistical Analysis Plan may be chosen due to site-specific data requirements.

## 2.1 Sample Independence

Independence of sample results is a major assumption for most statistical analyses. To ensure physical independence of groundwater sampling results, the minimum time between sampling events must be longer than the time required for groundwater to move through the monitoring well. The sampling schedules for both the baseline and compliance monitoring periods are specified in 35 I.A.C. § 845.650(b) and may conflict with the statistical assumption of independence of sample results.

### 2.2 Non-Detect Data Processing

The reporting limit (RL) will be used as the lower level for the reporting of non-detected groundwater quality data. For all summary statistics (box plots, timeseries, etc.), the RL will be substituted for concentrations reported below the RL, including non-detects. With professional judgement, analytical results between the RL and the method detection limit, *i.e.,* estimated values, typically identified with a "J" flag, may be utilized if provided by the laboratory.

For all statistical test procedures:

- If the frequency of non-detect data are less than or equal to 15 percent, half of the RL will be substituted for these data
- If the non-detect frequency is between 15 percent and 50 percent, either the Kaplan-Meier or robust regression on order statistics (ROS) will be used to estimate the mean and standard deviation adjusted for the presence of left-censored values
- If the non-detect frequency is greater than 50 percent, a non-parametric test will be used
- If only one background result is detected that value will be used as the non-parametric upper prediction limit (UPL)

### 2.3 Testing for Normality

Many statistical analyses assume that sample data are normally distributed (parametric). However, environmental data are frequently not normally distributed (nonparametric). 35 I.A.C. § 845.640(g) requires the knowledge of the background data distribution for comparison to compliance results. The *Unified Guidance* document recommends the Shapiro-Wilk normality test for sample sizes of 50 or less, and the Shapiro-Francia normality test for sample sizes greater than 50.

When possible, transformation of datasets to achieve normal distributions is preferred.

### 2.4 Testing for Outliers

Part 845 constituents will be screened for the existence of outliers using a method described by the *Unified Guidance*. Outliers are extreme data points that may represent an anomaly or erroneous data point. To test for outliers, one or more of the following outlier tests will be utilized:

- Dixon's test, for well-constituent pairs with less than 25 samples, assumes normally distributed data.
- Rosner's test, for well-constituent pairs with more than 20 samples, assumes normally distributed data.
- Grubb's test for well-constituent pairs with seven or more samples, assumes normally distributed data.
- Time series, box-whisker plots, and probability plots provide visual tools to identify potential outliers, and evaluation of seasonal, spatial, or temporal variability for both normally and non-normally distributed data.

Data quality control, groundwater geochemistry, and sampling procedures will be evaluated as potential sources of error leading to an outlier result. The outlier tests cannot be used alone to determine whether a value is a true outlier that should be excluded from future statistical

analysis. Corroborating evidence needed to exclude values includes a discrete data reporting or analytical error, or potential laboratory bias. Absent corroborating evidence, the flagged values are considered true, but extreme, values in the data set. Professional judgement will be used to exclude extreme outliers from further statistical analyses. Outliers will be retained in the database.

With professional judgement, a confirmatory sample may be collected to allow for the distinction between an outlier and a true representation of groundwater quality at the monitoring point. If re-sampling is conducted, this sample will be collected within 90 days following outlier identification. If the confirmatory sample indicates the original result as an outlier, it will be reported as such.

### 2.5 Trend Analysis

Statistical analyses supporting the lack of trend are a fundamental step to confirm the assumption that groundwater quality values are stationary or constant over time at a CCR unit. These analyses allow for evaluation of variation in the background and compliance data for each constituent over time. A statistically significant increasing trend in background data could indicate an existing release from the CCR unit or alternate source, requiring further investigation. In addition, statistically significant trending background data can result in increased standard deviation and, therefore, greater prediction or control limits. Consequently, the increased prediction or control limit will have less power or ability to identify a release from the CCR unit.

A linear regression, coupled with a t-test for slope significance at a 95 percent confidence level (0.05 significance level), may be used on datasets for each constituent with few non-detects and a normally distributed variance of the mean to evaluate time trends. The Theil-Sen trend line, coupled with the Mann-Kendall test for slope significance at a 95 percent confidence level (0.05 significance level), will be used for datasets with frequent non-detects or non-normal variance. Similarly, trend analyses could also be used on compliance data to evaluate a possible release from the CCR unit.

### 2.6 Spatial Variation

Spatial trends and/or variation between background wells could indicate an existing release from a CCR unit. If the spatial variability is not due to an existing release, intrawell comparisons in compliance wells may be used to account for spatial variability and monitor for a future release. However, the CCR unit being monitored was placed into service prior to the start of groundwater monitoring and it is unknown whether a previous release has occurred. Accordingly, intrawell comparisons in compliance wells cannot be used to determine the occurrence of a future release. Interwell comparisons between compliance wells and background wells will be used.

### 2.7 Temporal Variation

Time series plots can be used to identify temporal dependence. Potentially significant temporal components of variability can be identified by graphing single constituent data from multiple wells together on a time series plot. With temporal dependence, the time series plot as a pattern of parallel traces, in which the individual wells will tend to rise and fall together across the sequence of sampling dates. Time series plots can be helpful by plotting multiple constituents over time for the same well, or averaging values for each constituent across wells on each sampling event and then plotting the averages over time. In either case, the plots can signify whether the general concentration pattern over time is simultaneously observed for different

constituents. If so, it may indicate that a group of constituents is highly correlated in groundwater or that the same artifacts of sampling and/or lab analysis impacted the results of several monitoring parameters.

Hydrologic factors such as drought, recharge patterns or regular (*e.g.,* seasonal) water table fluctuations may be responsible for the temporal variation. In these cases, it may be useful to test for the presence of a significant temporal effect by first constructing a parallel time series plot and then running a formal one-way analysis of variance (ANOVA) ($\alpha = 0.05$) for temporal effects. A one-way ANOVA for temporal effects considers multiple well data sets for individual sampling events or seasons as the relevant statistical factor. If event-specific analytical differences or seasonality appear to be an important temporal factor, the one-way ANOVA for temporal effects can be used to formally identify seasonality, parallel trends, or changes in lab performance that affect other temporal effects. The one-way ANOVA for temporal effects assumes that the data groups are normally distributed with constant variance. It is also assumed that for each of a series of background wells, measurements are collected at each well on sampling events or dates common to all the wells. Results of the ANOVA can also be used to create temporally stationary residuals, where the temporal effect has been 'subtracted from' the original measurements. These stationary residuals may be used to replace the original data in subsequent statistical testing.

If the data cannot be normalized, a similar test for a temporal or seasonal effect can be performed using the Kruskal-Wallis test ($\alpha = 0.05$). Each sampling event should be treated as a separate 'well,' while each well is treated as a separate 'sampling event.' In this case, no residuals can be computed since the Kruskal-Wallis test employs ranks of the data rather than the measurements themselves.

Where both spatial and temporal variation occur, two-way ANOVA can be considered where both well location and sampling event/season are treated as statistical factors. This procedure is described in Davis (1994).

### 2.8 Updating Background

Updating the background dataset periodically by adding recent results to an existing background dataset can improve the statistical power and accuracy of the statistical analysis, especially for non-parametric prediction intervals. The *Unified Guidance* recommends updating statistical limits (background) when at least four to eight new measurements (every 1 to 2 years under a quarterly monitoring program), are available for comparison to historical data. Professional judgement will be used to evaluate whether any background data appear to be affected by a release and need to be excluded from a background update. A t-test for equal means (if normal data distribution) or appropriate non-parametric test (if non-normal data distribution) such as a Mann-Whitney (or Wilcoxon) rank-sum or box-whisker plots, will be conducted to evaluate whether the two groups of background sample populations are statistically different prior to updating any background datasets. A 0.05 significance level will be utilized when evaluating the two populations, with the null hypothesis that they are equivalent. In addition, time series graphs or other trend evaluation statistics will be conducted on the new background dataset to verify the absence of a release or changing groundwater quality. If the tests indicate that there are no statistical differences between the two background populations, the new data will be combined with the existing dataset. If the two populations are found to be different, the data will be reviewed to evaluate the cause of the difference. If the differences appear to be caused by a

release (if the new data are significantly higher, or lower for pH), then the previous background dataset may continue to be used. Furthermore, verified outliers will not be added to an existing background dataset. In accordance with the *Unified Guidance*, continual background updates will not be conducted due to the lack of sufficient samples for a statistical comparison.

# 3. COMPLIANCE MONITORING

Compliance monitoring is designed to monitor groundwater for evidence of a release by comparing Part 845 constituents in compliance wells to both background concentrations and the GWPS. Compliance Monitoring will begin the 1st quarter following approval of this Groundwater Monitoring Plan and issuance of the Operating Permit. The selected Compliance Monitoring statistical method used to compare compliance groundwater quality data for each constituent to the GWPS will provide for adequate statistical power, error levels and individual test false positive rates, and be appropriate for the distribution and detection frequency of the background dataset. Statistical power is the ability of a statistical test to detect a true exceedance.

In accordance with 35 I.A.C. § 845.610(b)(3)(D), compliance monitoring statistical analyses will be completed and submitted to IEPA within 60 days after completion of sampling.

## 3.1 GWPS Establishment and Exceedance Determination

In accordance with 35 I.A.C. § 845.600(a), the GWPS will be the constituent concentrations specified in 35 I.A.C. § 845.600(a)(1) except for when the background concentration is greater, or no concentration is specified (*i.e.,* for calcium and turbidity), in which case the GWPS will be the background concentration. The GWPS based on background concentration will be calculated using a parametric upper tolerance limit (UTL), a parametric UPL for a future mean, or a non-parametric UPL for a future median.

Statistical calculations that will be utilized in Compliance Monitoring procedures are summarized in **Table A** below and listed in **Sections 3.1.1** through **3.1.7**. Depending on the distribution of the data and the percentage of non-detects, it may be more appropriate to use a parametric model over a non-parametric model. As necessary, other techniques as mentioned in the *Unified Guidance* and/or new methods will be implemented.

**Table A. Statistical Calculations Used in Compliance Monitoring Procedures**

| Compliance Monitoring | | | | | | |
|---|---|---|---|---|---|---|
| Significant Trend? | Background Data | | | Compliance Data | | |
| | Percent Non-Detects | Distribution | GWPS Determination | Percent Non-Detects | Distribution | Method to Determine Exceedance |
| No | 0 ≤ 50 | Normal | 35 I.A.C § 845.600(a)(1) constituent concentration or The Upper Tolerance Limit | ≤75 | Normal | Parametric Lower Confidence Limit around a Normal Mean |
| | | | | ≤75 | Log-Normal | Parametric Lower Confidence Limit around a Lognormal Geometric Mean |
| | | | | NA | Non-Normal | Non-Parametric Lower Confidence Limit around a Median |
| | | | | >75 | Unknown/ Cannot be determined | |
| | 50 ≤ 70 | Normal | The Upper Prediction Limit for a Future Mean | NA | NA | Future mean |
| | >70 | Non-Normal | Upper Prediction Limit for a Future Median | NA | NA | Future median |
| | 100 | Non-Normal | Double Quantification Rule | NA | NA | Individual Retesting Values |
| Yes | 0 ≤ 50 | Normal | UCL of Confidence Band around Linear Regression | ≤75 | Residuals after subtracting trend are normal, equal variance | Lower Limit from Confidence Band around Linear Regression |
| | 50 ≤ 100 | Non-Normal | UCL of Confidence Band around Thiel-Sen trend line | ≤75 | Residuals not normal | Lower Limit from Confidence Band around Thiel-Sen |

### 3.1.1 The Upper Tolerance Limit

The UTL will be used to calculate the GWPS when pooled background data are normally distributed, with a non-detect frequency of 50 percent or less. When non-detect frequency is 15 percent or less, half the RL will be substituted for non-detects. The *Unified Guidance* recommends 95 percent confidence level and 95 percent coverage (95/95 tolerance interval).

- When non-detect frequency is 15 percent or less, half the RL will be substituted for non-detects (simple substitution), and the normal mean and standard deviation will be calculated.

- The Kaplan-Meier or the ROS method will be used when the detection frequency is between 15 percent and 50 percent. The Kaplan-Meier method assesses the linearity of a censored probability plot to determine whether the background sample can be approximately normalized. If so, then the Kaplan-Meier method will be used to compute estimates of the mean and standard deviation adjusted for the presence of left-censored values. The Kaplan-Meier or ROS estimate of the mean and standard deviation will be substituted for the sample mean and standard deviation.
- If background normality cannot be achieved, non-parametric UTLs will not be calculated until a minimum of 60 background samples have been collected (to achieve 95 percent coverage).

The parametric UTL on a future mean will be calculated from the background dataset as follows:

$$UTL = \overline{x} + \kappa\,(n, \gamma, \alpha - 1) \cdot s$$

$\overline{x}$ = background sample mean

$s$ = background sample standard deviation

$\kappa\,(n, \gamma, \alpha - 1)$ = one-sided normal tolerance factor based on the chosen coverage (γ) and confidence level (α -1) and the size of the background dataset (n). Values are tabulated in Table 17-3 in Appendix D of the *Unified Guidance*. If exact values are not provided, then κ values can be estimated by linear interpolation.

If the UTL is constructed on the logarithms of original observations to achieve normality, where $\overline{y}$ and $s_y$ are the log-mean and log-standard deviation, the limit will be exponentiated for back-transformation to the concentration scale as follows:

$$UTL = \exp\left[\overline{y} + \kappa\,(n, \gamma, \alpha - 1) \cdot s_y\right]$$

$\overline{y}$ = background sample log-mean

$s_y$ = background sample log-standard deviation

When the GWPS is based on the 35 I.A.C. § 845.600(a)(1) constituent concentrations or a UTL derived from the background dataset, an exceedance in compliance wells relative to the GWPS will be evaluated using confidence intervals. A confidence interval defines the upper and lower bound of the true mean of a constituent concentration in groundwater within a specified confidence range.

- Non-detects in compliance data will be handled similarly to upgradient analyses, with half the RL substituted for non-detects when the frequency is 15 percent or less.
- The Kaplan-Meier, or the ROS method, will be used when the detection frequency is between 15 percent and 50 percent to compute estimates of the mean and standard deviation adjusted for the presence of left-censored values. These estimates will then be substituted for the sample mean and standard deviation.

Once the GWPS is established for background data using the UTL, either parametric or non-parametric confidence intervals will be computed for each constituent in compliance wells to identify GWPS exceedances.

### 3.1.2 Parametric Confidence Intervals around a Mean

If compliance data are approximately normal, one-sided parametric confidence intervals around a sample mean will be constructed for each constituent and well pair. The lower confidence limit (LCL) will be calculated as:

$$LCL_{1-\alpha} = \overline{x} - t_{1-\alpha,n-1} \cdot \frac{s}{\sqrt{n}}$$

$\overline{x}$ = compliance sample mean

$s$ = compliance sample standard deviation

$n$ = compliance sample size

$t_{1-\alpha,n-1}$ = obtained from a Student's t-table with (n–1) degrees of freedom (Table 16-1 in Appendix D of the *Unified Guidance*)

The chosen t value will aim to achieve both a low false-positive rate, and high statistical power. Minimum α values are tabulated in Table 22-2 of Appendix D of the *Unified Guidance*. The selected minimum α value, from which the t value will be derived, will have at least 80 percent power (1-β = 0.8) when the underlying mean concentration is twice the GWPS.

If compliance data are distributed lognormally, the LCL will be computed around the lognormal geometric mean as:

$$LCL_{1-\alpha} = \exp\left(\overline{y} - t_{1-\alpha,n-1} \cdot \frac{s_y}{\sqrt{n}}\right)$$

$\overline{y}$ = compliance sample log-mean

$s_y$ = compliance sample log-standard deviation

### 3.1.3 Non-Parametric Confidence Intervals around a Median

Non-parametric confidence intervals around the median will be computed if the compliance data contain greater than 50 percent non-detects or are not normally distributed. The mathematical algorithm used to construct non-parametric confidence intervals is based on the probability (*P*) that any randomly selected measurement in a sample of n concentration measurements will be less than an unknown *P* x 100th percentile of interest (where *P* is between 0 and 1). Then the probability that the measurement will exceed the *P* x 100$^{th}$ percentile is (1–*P*). The number of sample values falling below the *P* x 100$^{th}$ percentile out of a set of n should follow a binomial distribution with parameters n and success probability *P*, where 'success' is defined as the event that a sample measurement is below the *P* x 100$^{th}$ percentile. The probability that the interval formed by a given pair of order statistics will contain the percentile of interest will then be determined by a cumulative binomial distribution *Bin(x;n,p)*, representing the probability of *x* or fewer successes occurring in *n* trials with success probability p. *P* will be set to 0.50 for an interval around the median.

The sample size n will be ordered from least to greatest. Given *P* = 0.50, candidate interval endpoints will be chosen by ordered data values with ranks close to the product of (n+1) x 0.50. If the result of (n+1) x 0.50 is a fraction (for even-numbered sample sizes), the rank values immediately above and below will be selected as possible candidate endpoints. If the result of (n+1) x 0.50 is an integer (for odd-numbered sample sizes), one will be added to and subtracted

from the result to get the upper and lower candidate endpoints. The ranks of the endpoints will be denoted L* and U*. For a one-sided LCL, the confidence level associated with endpoint L* will be computed as:

$$1 - \alpha = Bin(L^* - 1; n, 0.50) = \sum_{x=L^*}^{n} \binom{n}{x} \left(\frac{1}{2}\right)^n$$

If the candidate endpoint(s) do not achieve the desired confidence level, new candidate endpoints (L*–1) and (U*+1) and achieved confidence levels will be calculated. If one candidate endpoint equals the data minimum or maximum, only the rank of the other endpoint will be changed. Achievable confidence levels are tabulated using these equations in Table 21-11 in Appendix D of the *Unified Guidance*.

Both parametric and non-parametric confidence limits will then be compared to the GWPS. The CCR unit is considered to be in compliance if the LCL is equal to or lower than the GWPS for all detected constituents at all compliance monitoring wells. A GWPS exceedance is determined if the LCL exceeds the GWPS.

### 3.1.4 The Upper Prediction Limit for a Future Mean

The parametric UPL for a future mean will be used to calculate the GWPS if the pooled background data contain 50 to 70 percent non-detects and normality can be achieved. The Kaplan-Meier or ROS methods will be used to estimate the mean and standard deviation. The non-parametric UPL for a future median will be calculated as the GWPS if background samples cannot be normalized or contain greater than 70 percent non-detects. The parametric UPL for a future mean will be calculated from the background dataset at follows:

$$UPL_{1-\alpha} = \overline{x} + \kappa s$$

$\overline{x}$ = background sample mean

$s$ = background standard deviation

$\kappa$ = multiplier based on the order (p) of the future mean to be predicted, the number of compliance wells to be tested (w), the background sample size (n) the number (c) of constituents of concern (COCs), the “1-of-m” retesting scheme, and the evaluation schedule (annual, semi-annual, quarterly). Values are tabulated in 19-5 to 19-9 in Appendix D of the *Unified Guidance*.

The mean of order p will be computed for each well and compared against the UPL. For any compliance point mean that exceeds the limit, p additional resamples may be collected at that well for a 1-of-2 retesting scheme. Resample means will then be compared to the UPL. A GWPS exceedance has been deemed to occur at a compliance well when the initial mean and all resample means exceed the UPL.

### 3.1.5 The Non-Parametric Upper Prediction Limit for a Future Median

The non-parametric UPL for a future median will be used to calculate the GWPS if the pooled background data contain greater than 70 percent non-detects and normality cannot be achieved. Non-parametric methods assume that the data does not have an underlying distribution. To calculate the non-parametric UPL on a future value, the target per-constituent false positive rate ($\alpha_{const}$) will be determined as follows:

$$\alpha_{const} = 1 - (1 - \alpha)^{1/c}$$

α = the site-wide false positive rate (SWFPR) of 0.10 recommended by the *Unified Guidance*

*c* = the number of monitoring constituents

The number of yearly statistical evaluation (nE) will be multiplied by the number of compliance wells (w) to determine the look-up table entry, w*. The background sample size (n) and w* will be used to select an achievable per-constituent false positive rate value in Table 19-24 of Appendix D in the *Unified Guidance*. The chosen achievable per-constituent false positive rate value will determine the type of non-parametric prediction limit (maximum or 2nd highest value in background) and a retesting scheme for a future median. The background data will be sorted in ascending order, and the upper prediction limit will be set to the appropriate order statistic previously determined by the achievable per-constituent false positive rate value in Table 19-24. If all constituent measurements in a background sample are non-detect, the Double Quantification rule will be used. The use of the Double Quantification rule in Compliance Monitoring will only be applicable if the RL is above the 35 I.A.C. § 845.600(a)(1) constituent concentration or a constituent concentration is not specified in § 845.600(a)(1). This scenario is highly unlikely. The constituent will also be removed from calculations identifying the target false positive rate.

Two initial measurements per compliance well will be collected. If both do not exceed the upper prediction limit, a third initial measurement will not be collected since the median of order 3 will also not exceed the limit. If both exceed the prediction limit, a third initial measurement will not be collected since the median will also exceed the limit. If one initial measurement is above and one below the limit, a third initial observation may be collected to determine the position of the median relative to the UPL. Up to three resamples will be collected in order to assess the resample median. In all cases, if two or more of the compliance point observations are non-detect, the median will be set equal to the RL. The median value for each compliance well will be compared to the UPL. For the 1-of-2 retesting scheme, if any compliance point median exceeds the limit, up to three additional resamples will may be collected from that well. The resample median will be computed and compared to the UPL. A GWPS exceedance has been deemed to occur at a compliance well when either the initial median, or both the initial median and resample median exceed the UPL.

If the concentrations of detected constituents are below the established GWPS, Compliance Monitoring will continue.

### 3.1.6 Parametric Linear Regression and Confidence Band

If the t-test detects a significant trend in the parametric linear regression line using either background or compliance data for a particular constituent, confidence bands accounting for trends will be constructed to account for the trend-induced variation. If this is not accounted for, a wider confidence interval will inevitably be calculated for a given confidence level and sample size (n). A wider confidence interval will result in less statistical power, or ability to demonstrate an exceedance or return to compliance. When a linear trend line has been estimated, a series of confidence intervals is estimated at each point along the trend. This creates a simultaneous confidence band that follows the trend line. As the underlying population mean increases or decreases, the confidence band does also to reflect this change at that point in time.

Linear regression will be used when background or compliance data are approximately normally distributed, with a constant sample variance around the mean, and the frequency of non-detects is low. The linear regression of concentration against sampling date (time) will be computed as follows:

$$\hat{b} = \sum_{i=1}^{n} (t_i - \overline{t}) \cdot x_i / (n-1) \cdot s_t^2$$

$x_i$ = $i^{th}$ concentration value and

$t_i$ = $i^{th}$ sampling date

$\overline{t}$ = sampling mean date

$s_t^2$ = variance of the sampling dates

This estimate leads to the following regression equation:

$$\hat{x} = \overline{x} + \hat{b} \cdot (\mathrm{t} - \overline{t})$$

$\overline{x}$ = mean concentration level

$\hat{x}$ = estimated mean concentration at time t

The regression residuals will also be computed at each sampling event to ensure uniformity and lack of significant skewness. Regression residuals will be computed at each sampling event as follows:

$$r_i = x_i - \hat{x}_i$$

The estimated variance around the regression line, or mean squared error (MSE) will be computed as follows:

$$s_e^2 = \frac{1}{n-2} \sum_{i=1}^{n} r_i^2$$

The confidence intervals around a linear regression trend line given confidence level (1-α) and a point in time ($t_0$), will be computed as follows:

$$LCL_{1-\alpha} = \hat{x}_0 - \sqrt{2 s_e^2 \cdot F_{1-2\alpha,2,\mathrm{n}-1} \cdot \left[\frac{1}{n} + \frac{(t_0 - \overline{t})^2}{(n-1) \cdot s_t^2}\right]}$$

$$UCL_{1-\alpha} = \hat{x}_0 - \sqrt{2 s_e^2 \cdot F_{1-2\alpha,2,\mathrm{n}-2} \cdot \left[\frac{1}{n} + \frac{(t_0 - \overline{t})^2}{(n-1) \cdot s_t^2}\right]}$$

$\hat{x}_0$ = estimated mean concentration from the regression equation at time $t_0$

$F_{1-2\alpha,2,\mathrm{n}-2}$ = upper $(1\text{-}2\alpha)^{th}$ percentage point from an F-distribution with 2 and (n-2) degrees of freedom

For background data, the UCL around the linear regression line will be used as the GWPS for the trending constituent. For compliance data, confidence bands around the linear regression line will be compared to the GWPS. The CCR unit is considered to be in compliance if the LCL is equal to or lower than the GWPS for all detected constituents at all compliance wells. A GWPS exceedance is determined when the LCL based on the trend line first exceeds the GWPS.

### 3.1.7 Non-Parametric Thiel-Sen Trend Line and Confidence Band

If the Mann-Kendall test detects a significant trend in the non-parametric Thiel-Sen line using either background or compliance data for a particular constituent, confidence bands accounting for trends will be constructed to account for the trend-induced variation. The Thiel-Sen trend line will be used as a non-parametric alternative to linear regression when trend residuals cannot be normalized or if there are a higher percentage of non-detects in either background or compliance data. The Thiel-Sen trend line estimates the median concentration over time by combining the median pairwise slope with the median concentration value and the median sample date. To compute the Thiel-Sen line, the data will first be ordered by sampling event x1, x2, xn. All possible distinct pairs of measurements ($x_i$, $x_j$) for j > i will be considered and the simple pairwise slope estimate will be computed for each pair as follows:

$$m_{ij} = (x_j - x_i)/(j - i)$$

With a sample size of n, there will be a total of N = n(n-1)/2 pairwise estimates ($m_{ij}$). If a given observation is a non-detect, half the RL will be substituted. The N pairwise slope estimates ($m_{ij}$) will be ordered from least to greatest (renamed m(1), m(2),..m(N)). The Thiel-Sen estimate of slope (Q) will be calculated as the median value of the list depending on whether N is even or odd as follows:

$$Q = \begin{cases} m_{([N+1]/2)} \; if \; N \; is \; odd \\ (m_{(N/2)} + m_{([N+2]/2)})/2 \; if \; N \; is \; even \end{cases}$$

The sample concentration magnitude will be ordered from least to greatest, x(1), x(2), to x(n) and the median concentration will be calculated as follows:

$$\tilde{x} = \begin{cases} x_{([n+1]/2)} \; if \; n \; is \; odd \\ (x_{(n/2)} + x_{([n+2]/2)})/2 \; if \; n \; is \; even \end{cases}$$

The median sampling date ($\tilde{t}$) with ordered times (t(1), t(2), to t(n)) will also be determined in this way. The Thiel-Sen trend line will then be computed for an estimate at any time (t) of the expected median concentration (x) as follows:

$$x = \tilde{x} + Q \cdot (\mathrm{t} - \tilde{t}) = (\tilde{x} - Q \cdot \tilde{t}) + Q \cdot \mathrm{t}$$

To construct a confidence band around the Thiel-Sen line, sample pairs (ti, xi) will be formed with a sample date (ti) and the concentration measurement from that date (xi). Bootstrap samples (B) will be formed by repeatedly sampling n pairs at random with replacement from the original sample pairs. This will be repeated 500 times. For each bootstrap sample, a Thiel-Sen trend line will be constructed using the equation above. A series of equally spaced time points (tj) will be identified along the range of sampling dates represented in the original sample, j =1 to m. The Thiel-Sen trend line associated with each bootstrap replicate will be used to compute an estimated concentration ($\hat{x}_j^B$). An LCL will be constructed for the lower $\alpha^{th}$ percentile $\hat{x}_j^{[\alpha]}$ from the distribution of estimated concentrations at each time point (tj). For a UCL, compute the upper (1-$\alpha$)$^{th}$ percentile, $\hat{x}_j^{[1-\alpha]}$ at each time point (tj).

For background data, the UCL around the Thiel-Sen trend line will be used as the GWPS for the trending constituent. For compliance data, confidence bands around the Thiel-Sen trend line will be compared to the GWPS. The CCR unit is considered to be in compliance if the LCL is equal to or lower than the GWPS for all detected constituents at all compliance wells. A GWPS exceedance is confirmed when the LCL based on the trend line first exceeds the GWPS.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 3.2 Determination of Statistically Significant Increases over Background

In accordance with 35 I.A.C. §§ 845.610(b)(3)(B) and 845.640(h), individual monitoring event concentrations for each constituent detected in the compliance monitoring wells during compliance monitoring sampling events will be compared to the background concentration as determined by the methods described above. An exceedance of the background concentration for any constituent measured at any compliance monitoring well, or constituent detection if not detected in the background samples, constitutes a Statistically Significant Increase (SSI). An exception to this method is pH, where two-sided (upper and lower) tolerance limits are established from the distribution of the background groundwater quality data. An exceedance of either the UTL or lower tolerance limit (LTL) would constitute an SSI for pH.

BURNS McDONNELL

Date: 25 October 2021

Subject: IEPA Part 845 – Slope Maintenance Documentation for GMF Pond at Duck Creek Power Plant

Illinois Power resources Generating, LLC operates the coal-fired Duck Creek Power Plant (Plant) located in Fulton County, Illinois. The GMF Pond is an inactive surface impoundment storing coal combustion residuals (CCR). The requirements for the Duck Creek GMF Pond are found in 35 Ill. Admin. Code 845, Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments (Part 845).

Pursuant to Part 845, Section 845.230(d)(2)(F), the initial operating permit application for existing or inactive CCR surface impoundments that have not completed an Agency approved closure before prior to July 30, 2021, must contain documentation that the CCR surface impoundment, if not incised, will be operated, and maintained with one of the forms of slope protection specified in Section 845.430. This statement addresses the requirements of Part 845, Section 845.430 Slope Maintenance, which states:

> *Section 845.430: The slopes and pertinent surrounding areas of the CCR surface impoundment must be designed, constructed, operated, and maintained with one of the forms of slope protection specified in subsection (a) that meets all the performance standards of subsection (b).*
>
> *Section 845.430(a): Slope protection must consist of one of the following: 1) A vegetative cover consisting of grassy vegetation; 2) An engineered cover consisting of a single form or combination of forms of engineered slope protection measures; or 3) A combination of the forms of cover specified in subsections (a)(1) or (a)(2).*
>
> *Section 845.430(b): Any form of cover for slope protection must meet the following performance standards: 1) The cover must be installed and maintained on the slopes and pertinent surrounding areas of the CCR surface impoundment; 2) The cover must provide protection against surface erosion, wave action, and adverse effects of rapid drawdown; 3) The cover must be maintained to allow for the observation of, and access to, the slopes and pertinent surrounding areas during routine and emergency events; 4) Woody vegetation must be removed from the slopes or pertinent surrounding areas. Any removal of woody vegetation with a diameter greater than 1/2 inch must be directed by a person familiar with the design and operation of the CCR surface impoundment and in consideration of the complexities of removal of a tree or a shrubbery, who must ensure the removal does not create a risk of destabilizing the CCR surface impoundment or otherwise adversely affect the stability and safety of the CCR surface impoundment or*

Electronic Filing: Received, Clerk's Office 06/20/2024

*personnel undertaking the removal; and 5) The height of vegetation must not exceed 12 inches.*

Slope protection, consisting of vegetative cover, was installed on the slopes and pertinent surrounding areas of the Duck Creek GMF Pond, and is inspected, maintained and repaired as needed. Based on observations from weekly inspections conducted in accordance with Section 845.540(a), and the 2020 annual inspections conducted by Hanson Professional Services Inc., the vegetative cover is described to be in good working condition with a maximum vegetation height of 12 inches. The owner's Operations and Maintenance Plan (O&M Plan) provides details for maintaining grass and removing woody vegetation and addressing erosion features on the slopes. Based on a review of the documentation described above, the owner is implementing the O&M Plan, including the completion of repairs and maintenance as needed and when issues are identified during weekly and/or annual inspections. The slope maintenance portion of the O&M Plan and the Annual Inspection performed by Hanson in 2020 are included in Attachment J. The surface impoundment slope protection (vegetative cover) installed and maintained on the slopes and pertinent areas around the slopes is depicted in the aerial photograph provided below.

Electronic Filing: Received, Clerk's Office 06/20/2024

# Excerpt from the Duck Creek Operations and Maintenance Manual

## 1.1 OPERATION AND MAINTENANCE INSPECTION

"Walk-around" inspections of the dams and appurtenant works are to be made by the dam Operator. During these inspections, a checklist of items to be maintained and items to be observed should be recorded. The checklist provided in Appendix B shall be utilized for these inspections. **If any of the following items are found to be unusual or are cause for concern, Shift Supervisor should be immediately notified.**

Frequency: Weekly. Also, during and after unusual events such as heavy rainfall or after an earthquake.

Inspection Items: During each inspection the following items should be noted.

1. Water Level - Maximum levels because of heavy rainfall should be recorded.

2. Earth Embankment - Walk the crest, side slopes and downstream toe of the dam concentrating on surface erosion, seepage, cracks, settlement, slumps, slides, and animal burrows. These are described as follows:

    - Surface Erosion - Removal of vegetative cover by water action or pedestrian or vehicle usage forming deep ruts or gullies.

    - Seepage - The passage of water through and/or underneath the earth embankment abutment and natural groundline or at the contact between the embankment and outlet works. It can be indicated by cattails or other wet environmental vegetation, erosion, channelization, or slumping on the embankment face.

    - Cracks - Deep cracks usually indicate the movement of the dam and/or the foundation and can be in either the longitudinal (along the length of the dam) or transverse (across the dam) directions. Cracking can be an indicator of the beginning of slumps. Shallow cracks may develop during the summer when the surface soils of the embankment become severely dried and are usually of no concern regarding the safety of the dam.

    - Settlement - Settlement is indicated by depressions or low spots and can be signs of consolidation of the dam or foundation or the loss of material beneath the settlement area.

    - Slumps/Slides - A slow or sudden movement of the earth embankment slope on either face toward the toe of the dam.

Electronic Filing: Received, Clerk's Office 06/20/2024

- If seepage indicates the presence of soil particles, or if deep cracks, settlement, slumps, or slides are noticed, a qualified engineer should be contacted immediately for consultation.

- Animal Burrows - Animal burrows result in a loss of earth embankment material and can provide seepage paths for water through the embankment.

3. Gypsum Embankment - Walk the crest, side slopes and downstream toe of the dam concentrating on surface erosion, seepage, cracks, settlement, slumps, slides, and animal burrows. The descriptions for these are the same as for earth embankment.

4. Vegetation - Grass should be a thick vigorous growth to stabilize the earth embankment soils and prevent erosion from occurring. Note the height of the grass, if greater than 1-foot a mowing of the area should be scheduled before the next inspection. There should be NO trees on the earth embankment and NONE within a minimum of 20 ft of the embankment toes or other structures. The gypsum embankment will not be seeded and is not expected to have any vegetation.

5. Gypsum Stack piezometers should be inspected for any damage or loss of function. Damaged piezometers must be promptly repaired or replaced since their function is critical to ensuring stability of the gypsum stack.

6. The water level in each Gypsum Stack piezometer must be measured and recorded. If the water level in any piezometer is above the "critical elevation" as discussed in Section **Error! Reference source not found.**, Ameren should be notified, and the **design engineer should be immediately consulted for guidance on an appropriate course of action**.

7. Gypsum Stack LD/LCRS Drains - The change in location or amount of flow discharging from the Leak Detection/Leachate Collection Recovery System (LD/LCRS) should be recorded. If a significant change has occurred, a qualified engineer should be contacted for consultation.

8. Gypsum Stack Ring Drains - The change in location or amount of flow discharging from the Ring Drains should be recorded. If a significant change has occurred, a qualified engineer should be contacted for consultation.

9. Gypsum Stack Fixed Decant – Check the alignment and supports for the pipe. Record the amount of flow discharging from the pipe and any erosion or scour around the discharge point.

10. Gypsum Stack Perimeter Ditch – The perimeter ditch should have a consistent prismatic shape for the entire length. Inspect the perimeter ditch for evidence of erosion, sediment deposition and irregularity in channel geometry, especially in the vicinity of siphon, decant or ring drain outfall structures. If irregularities are noted, repairs should be scheduled and completed.

Electronic Filing: Received, Clerk's Office 06/20/2024

11. Stop Logs - Check to make sure that the stop logs in the transfer ditch are undamaged, and, if installed, are operating well, and allowing for the free flow of water over them.

12. Transfer Channel - Check for any debris or other obstructions which may block or restrict the free flow of water. Check for any pools or undulation of the floor of the channel.

13. Recycle Pond Decant - Check for any debris or other obstructions around the Recycle Pond decant which may block or restrict the free flow of water. The emergency dewatering valve should be lubricated. If there is no return water in the pipe, the emergency dewatering valve should be exercised. Record the physical and operating conditions of the system.

14. Recycle Pond Drop Inlet Spillways - Check for any debris or other obstructions around the inlet crest and at the bottom of the drop inlet which may block or restrict the free flow of water. Check for the development of any rusty areas on the concrete, and seepage, cracking, breaking, or spalling of the concrete. Check for settlement or cracking of the crest. Check for any debris in the pipes which may restrict the flow of water. Check for any tears or leaks in the HDPE liner covering the concrete.

15. Recycle Pond Rip Rap Basin - Check for any debris or other obstructions in the riprap basin which may block or restrict the free flow of water. Check to make sure that the rip rap is remaining in a uniform position. Freeze/thaw action or flow over the rip rap may tend to lift or fracture, thus requiring replacement or leveling to maintain the necessary level of protection. NO trees or woody vegetation should be growing through the rip rap.

16. Fences - Check for damage, accumulated debris, operation of gates and locks, and adequacy of locations (this may change with time as people access the area or development occurs in the area).

17. Perimeter - Check the perimeter of the dams for a distance of at least 100 ft beyond the toe for signs of seepage or boils.

18. HDPE Liner – Wherever exposed, the HDPE Liner should be inspected for tears, gouges, protrusions under the liner and abrasion.

Electronic Filing: Received, Clerk's Office 06/20/2024

# Dam Inspection Report

Name of Dam: Duck Creek GMF Gypsum Stack  Dam ID No.: IL 50573

Permit Number: DS2014020  Class of Dam: III

## CONDITION CODES

NE - No evidence of a problem

GC - Good condition

MM - Item needing minor maintenance and/or repairs within the year, the safety or integrity of the item is not yet imperiled

IM - Item needing immediate maintenance to restore or ensure its safety or integrity

EC - Emergency condition which if not immediately repaired or other appropriate measures taken could lead to failure of the dam

OB - Condition requires regular observation to ensure that the condition does not become worse

NA - Not applicable to this dam

NI - Not inspected - list the reason for non-inspection under deficiencies

| | |
|---|---|
| | that may be caused by run-on and run-off.<br><br>Repair activities may include, but are not limited to, repairing, or replacing damaged geosynthetic components, replacing and compacting soil cover, repairing drainage channels that have been eroded, filling in depressions with soil, regrading, and reseeding areas of failed vegetation, as necessary.<br><br>Pursuant to § 257.104(b)(3) and 35 I.A.C. 845.780(b)(3), the groundwater monitoring system will be maintained, and groundwater will be monitored as required by 40 C.F.R. § 257.90 through 40 C.F.R. § 257.98 and 35 I.A.C. 845.600 through 35 I.A.C. 845.680. Monitoring wells will be inspected during each groundwater sampling event. Monitoring wells and associated instrumentation will be maintained so that they perform to the design specifications throughout the life of the monitoring program. Groundwater monitoring frequency will be at least quarterly, except as provided in 40 C.F.R. § 257.94(d), 257.94(c), and 35 I.A.C. 845.650(b)(4). |
| 40 C.F.R. § 257.104(d)(1)(ii) and 35 I.A.C. 845.780(d)(1)(B) – The name, address, telephone number and email address of the person or office to contact about the facility during the post-closure care period. | Illinois Power Generating Company<br>6555 Sierra Drive<br>Irving, Texas 75039<br>800.633.4704<br>ccr@dynegy.com |
| 40 C.F.R. § 257.104(d)(1)(iii) and 35 I.A.C. 845.780(d)(1)(C) – A description of the planned uses of the property during the post-closure period. | The CCR unit is located at a retired electric generation facility. Planned uses of the property during the post-closure period are currently unknown, except for post-closure care of the CCR unit.<br><br>Post-closure use of the property will not disturb the integrity of the final cover system or other components of the containment system, or the function of the monitoring systems unless necessary to comply with the requirements of 40 C.F.R. Part § 257, Subpart D and 35 I.A.C. Part 845. Any other disturbance will be conducted following a demonstration that it will not increase the potential threat to human health or the environment, as required by 40 C.F.R. § 257.104(d)(1)(iii) and 35 I.A.C. 845.780 (d)(1)(C). The demonstration will be certified by a qualified professional engineer and submitted to the Illinois Environmental Protection Agency (IEPA). Per 40 C.F.R. § 257.104(d)(1)(iii) notification shall be provided to the State Director that the demonstration has been placed in the operating record and on the owners or operator's publicly accessible internet site.<br><br>Following closure of the CCR unit, a notation on the deed to the property, or some other instrument that is normally examined during title search, will be recorded in accordance with 40 C.F.R. § 257.102(i) and 35 I.A.C. 845.760(h). The notation will notify potential purchasers of the property that the land has been used as a CCR unit and its use is restricted under the post-closure care requirements in 40 C.F.R. 40 C.F.R. § 257.104(d)(1)(iii) and 35 I.A.C. 845.780(d)(1)(C) or groundwater monitoring requirements per 35 I.A.C. 845.740(b). Within 30 days of recording the deed notation, a notification stating that the notation has been recorded will be submitted to the IEPA and placed in the facility's operating record per 845.760(h)(3). The notification will be placed on |

Electronic Filing: Received, Clerk's Office 06/20/2024

| | |
|---|---|
| | the owner or operator's publicly accessible CCR Web site in accordance with 40 C.F.R. § 257.107(i)(9) and 35 I.A.C. 845.810(e) and placed in the facility's operating record as required by 35 I.A.C. 845.800(d)(26) and §257.105(i)(9). |
| 40 C.F.R. § 257.104(d)(3) and 35 I.A.C. 845.780(d)(3)– Amendments to the initial or subsequent written post-closure plan. | Pursuant to 40 C.F.R. § 257.104(d), the initial post closure care plan for the Duck Creek GMF Pond was prepared on October 17, 2016. That plan is being amended pursuant to 40 C.F.R. § 257.104(d)(3)(i). This plan also serves as the initial post-closure care plan, prepared in accordance with 35 I.A.C. 845.780(d).<br><br>Pursuant to § 257.104(d)(3) and 35 I.A.C. 845.780(d)(3), an operating permit modification application to amend the initial or any subsequent written post-closure care plan developed under 35 I.A.C. 845.780 (d)(1) and § 257.104(d)(1) will be submitted to IEPA. The written post-closure care plan will be amended whenever there is a change in the operation of the CCR surface impoundment that would substantially affect the written post-closure care plan in effect; or unanticipated events necessitate a revision of the written post-closure care plan, after post-closure activities have started.<br><br>The written post-closure care plan will be amended at least 60 days before a planned change in the operation of the facility or CCR surface impoundment, or within 60 days after an unanticipated event requires the need to revise the existing plan. If the plan is revised after post-closure activities have started, a request to modify the operating permit, including an amended written post-closure care plan, will be submitted to the IEPA within 30 days following the triggering event. |
| 40 C.F.R. § 257.104(d)(4) and 35 I.A.C. 845.780(d)(4) – Qualified professional engineering certification. | Certification by a qualified professional engineer will be appended to this plan and any amendment of this plan. |
| 35 I.A.C. 845.780(e) – Termination of post-closure care. | Upon completion of the post-closure period, a request to terminate post-closure care will be submitted to the IEPA. The request will include a certification by a qualified professional engineer verifying that post-closure care has been completed in accordance with the post-closure care plan specified in 35 I.A.C. 845.780(d) and the requirements of 35 I.A.C. 845.780. |
| 40 C.F.R. § 257.104(e) and 35 I.A.C. 845.780(f) – Notification of completion of the post-closure care period. | A notification of completion of post-closure care will be prepared and placed in the facility's operating record within 30 days after IEPA approval of the request to terminate post-closure care. The notification will be placed in the facility's operating record in accordance with 35 I.A.C. 845.800(d)(31) and § 257.105(i)(13).<br><br>The notification will be placed on the owner or operator's publicly accessible CCR Internet site in accordance with the requirements of § 257.107(i)(13) and 35 I.A.C. 845.810(e). The IEPA will be notified when the notification has been placed in the operating record and on the owner or operator's publicly accessible Internet site in accordance with the requirements of § 257.106(i)(13). |

Date: 25 October 2021

Subject: 35 Ill. Admin. Code Part 845 – CCR Liner Design Criteria Demonstration for GMF Pond at Duck Creek Power Plant

Illinois Power Resources Generating, LLC is the owner of the inactive coal-fired Duck Creek Power Plant (Plant) located in Fulton County, Illinois. The GMF Pond is an inactive surface impoundment storing coal combustion residuals (CCR). The requirements for the GMF Pond are found in 35 Ill. Admin. Code (I.A.C.) Part 845 (Part 845).

This liner design criteria demonstration addresses the requirements of Section 845.400 Liner Design Criteria for Existing CCR Surface Impoundments, which states.

*Section 845.400 Liner Design Criteria for Existing CCR Surface Impoundments*

a) *An existing CCR surface impoundment is considered to be an existing lined surface impoundment if it has been constructed with either a composite liner that meets the requirements of subsection (b) or an alternative composite liner that meets the requirements of subsection (c).*

b) *Composite Liner*

1) *A composite liner must consist of two components: the upper component consisting of, at a minimum, a 30-mil geomembrane liner, and the lower component consisting of at least a two-foot layer of compacted soil with a hydraulic conductivity of no more than 1 x 10−7 centimeters per second (cm/sec). The geomembrane liner components consisting of high-density polyethylene (HDPE) must be at least 60 mil. The geomembrane liner or upper liner component must be installed in direct and uniform contact with the compacted soil or lower liner component.*

2) *The composite liner must be:*

A) *Constructed of materials that have appropriate chemical properties and sufficient strength and thickness to prevent failure due to pressure gradients (including static head and external hydrogeologic forces), physical contact with the CCR or leachate to which they are exposed, climatic conditions, the stress of installation, and the stress of daily operation;*

B) *Constructed of materials that provide appropriate shear resistance of the upper and lower component interface to prevent sliding of the upper component, including on slopes;*

C) *Placed upon a foundation or base capable of providing support to the liner and resistance to pressure gradients above and below the liner to prevent failure of the liner due to settlement, compression, or uplift; and*

Electronic Filing: Received, Clerk's Office 06/20/2024

D) *Installed to cover all surrounding earth likely to be in contact with the CCR or leachate.*

c) *Alternative Composite Liner*

1) *An alternative composite liner must consist of two components: the upper component consisting of, at a minimum, a 30-mil geomembrane liner, and a lower component, that is not a geomembrane, with a liquid flow rate no greater than the liquid flow rate of two feet of compacted soil with a hydraulic conductivity of no more than 1 x 10−7 cm/sec. The geomembrane liner components consisting of high-density polyethylene (HDPE) must be at least 60 mil. If the lower component of the alternative liner is compacted soil, the geomembrane liner must be installed in direct and uniform contact with the compacted soil.*

2) *The liquid flow rate through the lower component of the alternative composite liner must be no greater than the liquid flow rate through two feet of compacted soil with a hydraulic conductivity of 1 x 10−7 cm/sec. The hydraulic conductivity for the two feet of compacted soil used in the comparison must be no greater than 1 x 10−7 cm/sec. The hydraulic conductivity of any alternative to the two feet of compacted soil must be determined using recognized and generally accepted methods.*

3) *The liquid flow rate comparison must be made using the following equation, which is derived from Darcy's Law for gravity flow through porous media.*

$$Q/A = q = k((h/t)+1)$$

*Where:*
*Q = flow rate (cubic centimeters/second)*
*A = Surface area of the liner (squared centimeters)*
*q = flow rate per unit area (cubic centimeters/ second/squared centimeter)*
*k = hydraulic conductivity of the liner (centimeters /second)*
*h = hydraulic head above the liner (centimeters); and*
*t = thickness of the liner (centimeters)*

4) *The alternative composite liner must meet the requirements specified in subsection (b).*

d) *The hydraulic conductivity of the compacted soil must be determined using recognized and generally accepted methods.*

e) *The owner or operator of an existing CCR surface impoundment that has not completed an Agency approved closure before July 30, 2021 must submit an initial operating permit application under Section 845.230 that demonstrates whether the CCR surface impoundment was constructed with either of the following:*

Electronic Filing: Received, Clerk's Office 06/20/2024

*1) A composite liner that meets the requirements of subsection (b); or*

*2) An alternative composite liner that meets the requirements of subsection (c).*

*h) The owner or operator of the CCR surface impoundment must obtain a certification from a qualified professional engineer attesting that the CCR surface impoundment meets the requirements of subsection (a) and submit the certification to the Agency in the facility's initial operating permit application.*

A liner evaluation was conducted for the Duck Creek Power Plant GMF Pond in 2016 to evaluate conformance with liner design criteria set forth in 40 C.F.R. § 257.71 and 257.70 (as referenced in 257.71). The evaluation included a review of design drawings, laboratory test data, field test data, construction records and other available information. The evaluation results were documented in the *Liner Evaluation Report – Duck Creek GMF Pond*, prepared by Hanson Professional Services Inc. in October 2016. The report demonstrates that the Duck Creek Power Plant GMF Pond was constructed with an alternative composite liner, as defined in 40 C.F.R. § 257.70(c)(1), that meets the design criteria set forth in 40 C.F.R. § 257.71 and 257.70 (as referenced in 257.71). The report includes a certification from a qualified professional engineer licensed in the State of Illinois stating that the Duck Creek Power Plant GMF Pond meets the applicable requirements set forth in 40 C.F.R. § 257.71 and 257.70.

Because the liner design criteria set forth in Section 845.400 are nearly identical to those presented in 40 C.F.R. § 257.71 and 257.70, the previous liner evaluation report and associated certification demonstrate that the Duck Creek Power Plant GMF Pond meets the design criteria for an alternative composite liner set forth in Section 845.400(c). The previous liner evaluation report and associated certification are provided in Attachment L.

Electronic Filing: Received, Clerk's Office 06/20/2024

I, John R. Hesemann, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief that, based on the information provided in the Duck Creek Power Plant GMF Pond Liner Evaluation Report prepared by Hanson Professional Services Inc., the Duck Creek Power Plant GMF Pond Liner meets the design criteria set forth in 35 I.A.C.845.400(a).

**DUCK CREEK GMF POND**
**ILLINOIS POWER RESOURCES GENERATING, LLC**
**LICENSED PROFESSIONAL ENGINEER CERTIFICATION**

As a Qualified Professional Engineer as defined by 40 CFR 257.53 and being a Professional Engineer licensed in the State of Illinois, I certify that I have personally examined and am familiar with the information in the Duck Creek GMF Pond Liner Evaluation Report and the Duck Creek GMF Pond Liner Documentation Report in the operating record and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate and complete.

As required by 40 CFR 257.71(b), the Duck Creek GMF Pond Liner Evaluation Report and the Duck Creek GMF Pond Liner Documentation Report in the operating record are accurate, and the **Duck Creek GMF Pond** meets the requirements set forth in 40 CFR 257.71(a)(iii) as published on April 17, 2015. As required by 40 CFR 257.70(c)(2), the **Duck Creek GMF Pond** meets the requirements in 40 CFR 257.70(c)(2).

## 1. Summary

The Duck Creek GMF Pond (GMF Pond) was constructed to retain wet-sluiced gypsum produced in the flue-gas scrubber at the Duck Creek Power Station. Construction of the GMF Pond began in 2007 with excavation of the site. Construction of the liner components began in April 2008 and was completed in February 2009. The GMF Pond encompasses about 30.0 acres within Section 18, Township 6 North, Range 5 East of the Fourth Principal Meridian, just north of the Duck Creek Power Station.

The composite liner system in the GMF Pond was designed to exceed compliance with Illinois Environmental Protection Agency rules for solid waste landfills by having a double HDPE geomembrane. Basic liner system performance criteria is contained in 35 Illinois Administrative Code (IAC) Part 811 as follows:

***35 IAC 811.306 Liner Systems***

*d) Compacted Earth Liner Standards*

*1) The minimum allowable thickness shall be 1.52 meters (5 feet).*

*2) The liner shall be compacted to achieve a maximum hydraulic conductivity of $1X10^{-7}$ centimeters per second.*

*3) The construction and compaction of the liner shall be carried out in accordance with the construction quality assurance procedures of Subpart E so as to reduce void spaces and allow the liner to support the loadings imposed by the waste disposal operation without settling that causes or contributes to the failure of the leachate collection system.*

*4) The liner shall be constructed from materials whose properties are not affected by contact with the constituents of the leachate expected to be produced.*

*5) Alternative specifications, using standard construction techniques, for hydraulic conductivity and liner thickness may be utilized under the following conditions:*

*A) The liner thickness shall be no less than 1.52 meter (5 feet) unless a composite liner consisting of a geomembrane immediately overlying a compacted earth liner is installed. The following minimum standards shall apply for a composite liner:*

*i) the geomembrane shall be no less than 60 mils in thickness and meet the requirements of subsection (e); and*

*ii) the compacted earth liner shall be no less than 0.91 meter in thickness (3 feet) and meet the requirements of subsection (d)(2) through (d)(4).*

*B) The modified liner shall operate in conjunction with a leachate drainage and collection system to achieve equivalent or superior performance to the requirements of this subsection. Equivalent performance shall be evaluated at maximum annual leachate flow conditions.*

In accordance with 35 IAC 811.306(d)(5), the GMF Pond was designed and constructed with an alternate liner system composed of the following, from lowest elevation to highest elevation:

- Three (3) feet of compacted clay with a hydraulic conductivity less than $9.8x10^{-7}$ cm/sec (from actual field testing);
- A geosynthetic clay liner (Bentomat SDN); and
- A 60-mil HDPE geomembrane.

In addition to the Part 811 requirements, the Duck Creek GMF Pond has a second 60-mil HDPE geomembrane with an active leachate collection system in the interstitial space between the two geomembranes. From the lowest geomembrane going upward, the additional components are listed below:

- One-foot of drainage sand for the leachate collection system;
- One-foot of cushion soil; and
- A second 60-mil HDPE geomembrane.

The dual liner with interstitial leachate collection system was designed to limit leachate head on the bottom geomembrane to 12 inches or less.

In April 2015, the United States Environmental Protection Agency published rules at 40 CFR Part 257, Subpart D, regulating the disposal of coal combustion residuals (CCR) in landfills and surface impoundments located in association with electrical utilities utilizing coal as the primary fuel source. Liner system performance criteria for existing CCR surface impoundments is contained in 40 CFR Part 257, Subpart D, as follows:

***257.71 Liner design criteria for existing CCR surface impoundments.***

*(a)(1) No later than October 17, 2016, the owner or operator of an existing CCR surface impoundment must document whether or not such unit was constructed with any one of the following:*

*(i) A liner consisting of a minimum of two feet of compacted soil with a hydraulic conductivity of no more than $1 \times 10^{-7}$ cm/sec;*

*(ii) A composite liner that meets the requirements of §257.70(b); or*

*(iii) An alternative composite liner that meets the requirements of §257.70(c).*

*(2) The hydraulic conductivity of the compacted soil must be determined using recognized and generally accepted methods.*

*(3) An existing CCR surface impoundment is considered to be an existing unlined CCR surface impoundment if either:*

*(i) The owner or operator of the CCR unit determines that the CCR unit is not constructed with a liner that meets the requirements of paragraphs (a)(1)(i), (ii), or (iii) of this section; or*

*(ii) The owner or operator of the CCR unit fails to document whether the CCR unit was constructed with a liner that meets the requirements of paragraphs (a)(1)(i), (ii), or (iii) of this section.*

*(4) All existing unlined CCR surface impoundments are subject to the requirements of §257.101(a).*

*(b) The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer attesting that the documentation as to whether a CCR unit meets the requirements of paragraph (a) of this section is accurate.*

*(c) The owner or operator of the CCR unit must comply with the recordkeeping requirements specified in §257.105(f), the notification requirements specified in §257.106(f), and the Internet requirements specified in §257.107(f).*

As referenced in 40 CFR 257.71(a)(1)(ii) and (iii), 40 CFR 257.70(b) and (c) -- Design criteria for new CCR landfills and any lateral expansion of a CCR landfill -- provide:

*(b) A composite liner must consist of two components; the upper component consisting of, at a minimum, a 30-mil geomembrane liner (GM), and the lower component consisting of at least a two-foot layer of compacted soil with a hydraulic conductivity of no more than $1 \times 10^{-7}$ centimeters per second (cm/sec). GM components consisting of high density polyethylene (HDPE) must be at least 60-mil thick. The GM or upper liner component must be installed in direct and uniform contact with the compacted soil or lower liner component. The composite liner must be:*

*(1) Constructed of materials that have appropriate chemical properties and sufficient strength and thickness to prevent failure due to pressure gradients (including static head and external hydrogeologic forces), physical contact with the CCR or leachate to which they are exposed, climatic conditions, the stress of installation, and the stress of daily operation;*

*(2) Constructed of materials that provide appropriate shear resistance of the upper and lower component interface to prevent sliding of the upper component including on slopes;*

*(3) Placed upon a foundation or base capable of providing support to the liner and resistance to pressure gradients above and below the liner to prevent failure of the liner due to settlement, compression, or uplift; and*

*(4) Installed to cover all surrounding earth likely to be in contact with the CCR or leachate.*

*(c) If the owner or operator elects to install an alternative composite liner, all of the following requirements must be met:*

*(1) An alternative composite liner must consist of two components; the upper component consisting of, at a minimum, a 30-mil GM, and a lower component, that is not a geomembrane, with a liquid flow rate no greater than the liquid flow rate of two feet of compacted soil with a hydraulic conductivity of no more than $1 \times 10^{-7}$ cm/sec. GM components consisting of high density polyethylene (HDPE) must be at least 60-mil thick. If the lower component of the alternative liner is compacted soil, the GM must be installed in direct and uniform contact with the compacted soil.*

*(2) The owner or operator must obtain certification from a qualified professional engineer that the liquid flow rate through the lower component of the alternative composite liner is no greater than the liquid flow rate through two feet of compacted soil with a hydraulic conductivity of $1 \times 10^{-7}$ cm/sec. The hydraulic conductivity for the two feet of compacted soil used in the comparison shall be no greater than $1 \times 10^{-7}$ cm/sec. The hydraulic conductivity of any alternative to the two feet of compacted soil must be determined using recognized and generally accepted methods. The liquid flow rate comparison must be made using Equation 1 of this section, which is derived from Darcy's Law for gravity flow through porous media.*

(Eq. 1) $$\frac{Q}{A} = q = k\left(\frac{h}{t} + 1\right)$$

*Where,*
*Q = flow rate (cubic centimeters/second);*
*A = surface area of the liner (squared centimeters);*
*q = flow rate per unit area (cubic centimeters/second/squared centimeter);*
*k = hydraulic conductivity of the liner (centimeters/second);*
*h = hydraulic head above the liner (centimeters); and t = thickness of the liner (centimeters).*

*(3) The alternative composite liner must meet the requirements specified in paragraphs (b)(1) through (4) of this section.*

In accordance with 40 CFR 257.70(b)(1) above, the composite liner in the Duck Creek GMF Pond was constructed of materials that have appropriate chemical properties and sufficient strength and thickness to prevent failure due to pressure gradients (including static head and external hydrogeologic forces), physical contact with the CCR or leachate to which they are exposed, climatic conditions, the stress of installation, and the stress of daily operation. This information is located in Section 4 and Section 5 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

In accordance with 40 CFR 257.70(b)(2) above, the composite liner in the Duck Creek GMF Pond was constructed of materials that provide appropriate shear resistance of the upper and lower component interface to prevent sliding of the upper component, including on slopes. This information is located in Section 4 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

In accordance with 40 CFR 257.70(b)(3) above, the composite liner in the Duck Creek GMF Pond was placed upon a foundation or base capable of providing support to the liner and resistance to pressure gradients above and below the liner to prevent failure of the liner due to settlement, compression, or uplift. This information is located in Section 4 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

In accordance with 40 CFR 257.70(b)(4) above, the composite liner in the Duck Creek GMF Pond was installed to cover all surrounding earth likely to be in contact with the CCR or leachate. This information is located in the "Geosynthetics Quality Assurance Report, Gypsum Stack, AERG (Ameren) Duck Creek Power Station, Canton, Fulton County, Illinois. Feezor Engineering, Inc. (March 2009, Revised July 2009)" in the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

The purpose of this report is to document that the existing composite liner in the Duck Creek GMF Pond meets the minimum requirements of 40 CFR 257.71(a)(1)(iii), i.e., an alternative composite liner that meets the requirements of § 257.70(c).

Briefly, in comparison:

35 IAC 811.306(d)(5)(A) requires a compacted clay liner of at least three (3) feet in thickness with a hydraulic conductivity of less than $1x10^{-7}$ cm/sec, overlain by a geomembrane of no less than 60-mils in thickness.

In addition, the Duck Creek GMF Pond has a second 60-mil HDPE geomembrane overlying an interstitial leachate collection system.

40 CFR 257.71(a)(1)(iii) requires that an alternative composite liner meet the requirements of 40 CFR 257.70(c), which requires (A) a lower component, that is not a geomembrane, with a liquid flow rate no greater than the liquid flow rate of two feet of compacted soil with a hydraulic conductivity of no more than $1x10^{-7}$ cm/sec; and (B) an upper component consisting of, at a minimum, a 30-mil geomembrane. If the geomembrane is composed of high-density polyethylene (HDPE), the geomembrane must be a minimum of 60-mils in thickness.

The soil liner comparison in 40 CFR 257.70(c)(2) is based on an assumed water driving head. In the ideal case, there should be no driving head as the overlying geomembrane would prevent downward migration of water. However, for practical purposes, the driving head is the water head on the overlying geomembrane. For the GMF Pond as-built case, the driving head is limited to 12-inches by the interstitial leachate collection system. For the comparison case, the double geomembrane liner would not exist, and the maximum driving head would be approximately 33.7 feet (the elevation difference between the lowest portion of the clay liner and the overlying pond surface).

The 40 CFR 257.70(c)(2) demonstration calculations comparing these two scenarios are contained in the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

In summary, the lower component of the minimum alternative composite liner required by 40 CFR 257.70(c) has a flow rate per unit area of $1.785 \times 10^{-6}$ cm/sec. The geosynthetic clay liner (GCL) in the GMF Pond has a flow rate per unit area of $4.9 \times 10^{-8}$ cm/sec, and the as-built clay liner for the GMF Pond has a flow rate per unit area of $1.307 \times 10^{-6}$ cm/sec. Consequently, each of the two components of the as-built liner of the GMF Pond exceeds the performance standard set by 40 CFR 257.70(c)(2) for the lower component of an alternative composite liner.

The major components of the construction and Construction Quality Assurance (CQA) of the GMF Pond liner are discussed in the sections below.

## 2. Foundation Preparation

Foundation preparation consisted of removing the soil to foundation grade in the bottom of the GMF Pond, construction of the perimeter berm containing the GMF Pond, and surveying and certifying the foundation surface.

Foundation preparation in 2008 consisted of removing excess soil above foundation grade, construction of the perimeter berm containing the GMF Pond, and surveying and certifying the subgrade surface prior to construction of the test soil liner and the full scale soil liner.

The construction contractor began removing soil material to foundation grade and stockpiling the cut material for later reuse as liner material. Unsuitable sand material was removed from several locations and these areas were backfilled with suitable foundation soils. The foundation surface was proof rolled and visually observed and any unsuitable soils were reworked or removed and replaced.

Foundation backfill lifts were compacted with a Cat 815 sheepsfoot compactor and tested for compaction using a Troxler nuclear moisture/density gauge at a minimum rate of one test per 10,000 $yd^3$ (minimum one test per compacted lift). Fill was placed in approximately 8-inch lifts and compacted to at least 95% Standard Proctor maximum dry density with moisture contents of -2% to +2% of optimum. Nuclear moisture/density and Standard Proctor test results are included in Appendix E in the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

Finished foundation grades were verified by survey and certified, and CQA certifications of completion were provided by the CQA Officer (Appendices K and L in the Duck Creek GMF Pond Liner Documentation Report located in the operating record).

## 3. Berm Construction

The perimeter berm was constructed with structural fill excavated and hauled directly from within the GMF Pond and other borrow areas within the facility. Nuclear moisture/density gauge testing was performed during berm construction at a minimum rate of one test per 10,000 $yd^3$ (and a minimum one test per compacted lift). Fill was placed in approximately 8-inch lifts and compacted with a Cat 815 or 825 sheepsfoot compactor to at least 95% Standard Proctor maximum dry density with moisture contents of -2% to +2% of optimum. Areas that showed deficiencies in compaction or moisture content were reworked or removed, and then compacted with a Cat 815 or 825 sheepsfoot compactor and tested for moisture/density. Nuclear moisture/density and Standard Proctor test results are included in Appendix E of the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

After berm construction was completed, eight Shelby tube samples were collected from the berm, and a soil sample from each tube was tested to determine in-place hydraulic conductivity (or permeability). In-place berm hydraulic conductivities ranged from $2.2 \times 10^{-8}$ cm/sec to $1.0 \times 10^{-7}$ cm/sec. Permeability test results and a drawing showing Shelby tube sample locations are included in Appendix E-3 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

## 4. Test Soil Liner

Prior to construction of the full scale soil liner, two test soil liners were constructed using two different borrow sources. Test Soil Liner No. 1 was constructed in the southeast corner of the GMF Pond footprint. Test Soil Liner No. 2 was constructed to the northeast of the GMF Pond at a location outside the footprint, on higher ground, to avoid flooding from heavy rainfalls being experienced at the project site. The purpose of the test soil liners was to verify that the material and methods of construction proposed for the full scale soil liner would provide the quality of construction required by the design.

The borrow materials for Test Soil Liner No. 1 were the natural glacial till materials taken from the lower ±5 feet of GMF Pond excavation footprint. The borrow materials for Test Soil Liner No. 2 were obtained from the natural glacial till materials taken from the upper excavation levels in the GMF Pond footprint.

Pursuant to the CQA Plan, the test soil liners were sampled and tested for physical properties utilizing both laboratory and field testing. Required were at least five (5) two-stage field tests to determine both vertical and horizontal hydraulic conductivity and at least two (2) undisturbed Shelby tube samples tested in the laboratory for vertical hydraulic conductivity to determine if there was a statistical correlation with the field tests.

### *4.1 Test Soil Liner No. 1*

#### 4.1.1 Prequalification of Borrow Materials

While no prequalification testing was required by the regulations, a program of laboratory testing was carried out on typical samples of the glacial till materials used for the construction of Test Soil Liner No. 1. Tables 4.1 and 4.2 summarize the primary borrow material properties determined from the testing (Appendix F-1 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record).

**Table 4.1 Properties of Borrow Materials for Test Soil Liner No. 1**

| Sample Location | Percent of Fines | Liquid Limit | Plasticity Index | Maximum Dry Density (MDD) | Optimum Moisture Content (OMC) |
|---|---|---|---|---|---|
| GMF Pond Southeast Floor | 70.9% | 22% | 5% | 122.4 pcf | 11.0% |
| GMF Pond Northwest Floor | 68.4% | 23% | 7% | 122.9 pcf | 11.6% |

**Table 4.2 Results of Constant Head Permeability Tests on Borrow Materials**

| Sample Location | Dry Density | Moisture Content | Permeability Result |
|---|---|---|---|
| GMF Pond | 95% of MDD | OMC | $2.1 \times 10^{-6}$ cm/sec |
| Southeast Floor | 95% of MDD | 3% Wet of OMC | $9.6 \times 10^{-8}$ cm/sec |
| GMF Pond | 95% of MDD | OMC | $9.1 \times 10^{-7}$ cm/sec |
| Northwest Floor | 95% of MDD | 3% Wet of OMC | $3.8 \times 10^{-8}$ cm/sec |

The measured percentages of fines and permeability values confirmed that the material was suitable to achieve the required design hydraulic conductivity. Based on these results, the field compaction criteria for the soil liner were set as follows:

Dry Density ≥ 95% MDD
Moisture Content = 0% to 5% Wet of OMC

4.1.2 Construction

The construction of Test Soil Liner No. 1 was initiated on May 1, 2008. The test soil liner was built in five lifts of approximately 8-inches and compacted with a Cat 815 sheepsfoot compactor.

Nuclear moisture/density gauge testing was performed at a minimum rate of one test per acre per lift or one test per 1,000 $yd^3$ to 95% Standard Proctor MDD with moisture contents of optimum to +5%. Nuclear moisture/density test results and a drawing showing the testing locations are included in Appendix F-3 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record. The Standard Proctor test reports are included in Appendix F-4 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

On June 17, 2008, Test Soil Liner No. 1 was completed after it was smooth drum rolled and then covered with plastic sheeting to prevent moisture loss.

4.1.3 Sampling and Testing Programs for Test Soil Liner

Pursuant to the CQA Plan, the test soil liner was sampled and tested for physical properties utilizing both laboratory and field testing. Required were at least five (5) two-stage field tests to determine the hydraulic conductivity (both vertical and horizontal hydraulic conductivity were calculated), and at least two (2) undisturbed Shelby tube samples tested in the laboratory for vertical hydraulic conductivity to determine a statistical correlation with the field tests.

4.1.3.1 Laboratory Testing

Three (3) Shelby tube samples (ST-01 thru ST-03) were collected from the original Test Soil Liner No. 1 on May 28, 2008. On June 18, 2008, three (3) additional Shelby tube samples (ST-04 thru ST-06) were collected from the test soil liner following repairs from flooding. A sample from each tube was tested for particle size analysis, Atterberg limits, and/or hydraulic conductivity. Table 4.3 summarizes the results of the testing (Appendix F-5 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record contains laboratory test reports and Shelby tube sampling locations).

**Table 4.3 Results of Laboratory Testing Program for Test Soil Liner No. 1**

| Sample No. | Percent of Fines | Liquid Limit | Plasticity Index | Hydraulic Conductivity, $k_v$ | Lift |
|---|---|---|---|---|---|
| ST-01-5 | 67.7% | 22% | 7% | $2.5 \times 10^{-7}$ cm/sec | 2 |
| ST-02-2 | 71.8% | 23% | 7% | $1.7 \times 10^{-7}$ cm/sec | 4/5 |
| ST-03-3 | 65.0% | 21% | 5% | $8.7 \times 10^{-8}$ cm/sec | 3/4 |
| ST-04-5 | | | | $3.0 \times 10^{-7}$ cm/sec | 2 |
| ST-05-3 | | | | $1.7 \times 10^{-7}$ cm/sec | 4 |
| ST-06-2 | | | | $2.1 \times 10^{-7}$ cm/sec | 4/5 |

4.1.3.2 Field Testing

Six (6) two-stage (Boutwell) field permeability tests were conducted on Test Soil Liner No. 1. The tests were carried out to measure the limiting values of field saturated hydraulic conductivity. The first stage of the test measures the maximum possible value for the vertical component of permeability ($k_v$) and the second stage measures the maximum possible value for the horizontal component of permeability ($k_h$). One test installation malfunctioned during testing and was abandoned. Table 4.4 summarizes the results of the testing.

**Table 4.4 Results of Field Testing Program for Test Soil Liner No. 1**

| Date of Installation | Test No. | Stage 1 Permeability, $k_v$ | Stage 2 Permeability, $k_h$ |
|---|---|---|---|
| July 18 and 19, 2008 | 1 | $9.77 \times 10^{-8}$ cm/sec | $6.23 \times 10^{-8}$ cm/sec |
| July 18 and 19, 2008 | 2 | $2.20 \times 10^{-7}$ cm/sec | $1.54 \times 10^{-7}$ cm/sec |
| July 18 and 19, 2008 | 3 | $3.17 \times 10^{-6}$ cm/sec | $9.53 \times 10^{-7}$ cm/sec |
| July 18 and 19, 2008 | 4 | Abandoned | Abandoned |
| July 18 and 19, 2008 | 5 | $1.84 \times 10^{-7}$ cm/sec | $5.17 \times 10^{-7}$ cm/sec |
| July 18 and 19, 2008 | 6 | $9.71 \times 10^{-8}$ cm/sec | $1.30 \times 10^{-7}$ cm/sec |

### *4.2 Test Soil Liner No. 2*

#### 4.2.1 Prequalification of Borrow Materials

Prequalification testing of the borrow materials for the gypsum stack soil liner was not a requirement of the CQA Plan. However, Shelby tube samples collected from the test soil liner were tested for particle size analysis, Atterberg limits, and hydraulic conductivity.

#### 4.2.2 Construction

The construction of Test Soil Liner No. 2 was initiated on July 28, 2008. The test soil liner was built in five approximately 8-inch lifts and compacted with a Cat 815 sheepsfoot compactor.

Nuclear moisture/density gauge testing was performed at a minimum rate of one per acre per lift or one per 1,000 $yd^3$ to 95% Standard Proctor MDD with moisture contents of optimum to +5%. Nuclear moisture/density test results and a drawing showing the testing locations are included in Appendix F-3 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record. The Standard Proctor test reports are included in Appendix F-4 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

On August 1, 2008, Test Soil Liner No. 2 was completed after it was smooth drum rolled and then covered with plastic sheeting.

#### 4.2.3 Sampling and Testing Programs for Test Soil Liner

Pursuant to the CQA Plan, the test soil liner was sampled and tested for physical properties utilizing both laboratory and field testing. Required were at least five (5) two-stage field tests to determine the hydraulic conductivity (both vertical and horizontal hydraulic conductivity were calculated), and at least two (2) undisturbed Shelby tube samples tested in the laboratory for vertical hydraulic conductivity to determine a statistical correlation with the field tests.

##### 4.2.3.1 Laboratory Testing

Three (3) Shelby tube samples were collected from the test liner. A sample from each tube was tested for particle size analysis, Atterberg limits, and hydraulic conductivity. Table 4.5 summarizes the results of the testing (Appendix F-5 of the Duck Creek GMF Pond Liner Documentation Report located in the operating record contains laboratory test reports and Shelby tube sampling locations).

**Table 4.5 Results of Laboratory Testing Program for Test Soil Liner No. 2**

| Sample No. | Percent of Fines | Liquid Limit | Plasticity Index | Hydraulic Conductivity, $k_v$ | Lift |
|---|---|---|---|---|---|
| ST-08-1 | 95.7% | 34% | 14% | $1.1 \times 10^{-7}$ cm/sec | 3/4 |
| ST-09-2 | 97.5% | 38% | 18% | $1.3 \times 10^{-8}$ cm/sec | 4 |
| ST-10-3 | 95.0% | 36% | 17% | $1.3 \times 10^{-8}$ cm/sec | 3 |

4.2.3.2 Field Testing

Five (5) two-stage (Boutwell) field permeability tests were conducted on Test Soil Liner No. 2. The tests were carried out to measure the limiting values of field saturated hydraulic conductivity. The first stage of the test measures the maximum possible value for the vertical component of permeability ($k_v$) and the second stage measures the maximum possible value for the horizontal component of permeability ($k_h$). A complete report of the field testing and data is included in the "Geosynthetics Quality Assurance Report, Gypsum Stack, AERG (Ameren) Duck Creek Power Station, Canton, Fulton County, Illinois. Feezor Engineering, Inc. (March 2009, Revised July 2009)" included in the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

Table 4.6 summarizes the results of the testing.

**Table 4.6 Results of Field Testing Program for Test Soil Liner No. 2**

| Date of Installation | Test No. | Stage 1 Permeability, $k_v$ | Stage 2 Permeability, $k_h$ |
|---|---|---|---|
| August 4 and 5, 2008 | 1 | $5.87 \times 10^{-8}$ cm/sec | $2.79 \times 10^{-6}$ cm/sec |
| August 4 and 5, 2008 | 2 | $3.92 \times 10^{-8}$ cm/sec | $9.79 \times 10^{-9}$ cm/sec |
| August 4 and 5, 2008 | 3 | $1.44 \times 10^{-7}$ cm/sec | $3.09 \times 10^{-8}$ cm/sec |
| August 4 and 5, 2008 | 4 | $5.53 \times 10^{-7}$ cm/sec | $5.28 \times 10^{-7}$ cm/sec |
| August 4 and 5, 2008 | 5 | $3.59 \times 10^{-6}$ cm/sec | $4.29 \times 10^{-7}$ cm/sec |

### *4.3 CQA Certification of Test Soil Liners*

Based on the laboratory and field test results, the CQA Officer certified the construction of the test soil liners and that construction of the full scale soil liner could begin using the same soils and procedures used to construct the test liners.

## 5. Full Scale Soil Liner Construction

Soil materials excavated from the GMF Pond and from the north clay liner soil stockpile were used to construct the 3-ft thick soil liner within the GMF Pond. The soil was placed in approximately 8-inch lifts and compacted with a Cat 815 sheepsfoot compactor. Material placement commenced at the north end of the GMF Pond and proceeded to the south. Nuclear moisture/density gauge testing was performed at a minimum rate of one test per acre per lift or one test per 1,000 $yd^3$. As-placed densities met at least 95% Standard Proctor MDD with moisture contents of optimum to +5%. Nuclear moisture/density and Standard Proctor test results are included in Appendix G in the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

Eighteen (18) Shelby tube samples were collected from the soil liner at various stages of construction. The hydraulic conductivity of the compacted soil liner was sampled and laboratory tested in accordance with ASTM D5084. A sample from each tube was tested to determine hydraulic conductivity. The sample intervals included at least one permeability test from each of the five liner construction lifts. The hydraulic conductivity results ranged from $8.6 \times 10^{-9}$ cm/sec to $9.8 \times 10^{-7}$ cm/sec. Permeability test results and a drawing showing Shelby tube sample locations are included in Appendix G-3 in the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

Base grades and completed liner elevations were surveyed to ensure construction to the design grades and to verify minimum soil liner thickness. Record drawings and certified survey data are included in Appendices K and L, respectively, in the Duck Creek GMF Pond Liner Documentation Report located in the operating record. After the soil liner was smooth drum rolled, CQA certifications of its construction and grades were provided by the CQA Officer prior to installation of the GCL and 60-mil HDPE geomembrane liner.

## 6. GCL Installation

The GCL panels were placed on the rolled surface of the compacted soil liner. Panels were placed on the slopes with the long edge of the panel parallel to the direction of drainage. Panels on the floor were oriented in a manner to make installation as efficient as possible. GCL seams were constructed by overlapping their adjacent edges, generally 6 to 12 inches. The GCL panels included a proprietary groove along the longitudinal seams to ensure a proper seal. Seams at the end of panels were shingled in the direction of the grade and granular bentonite was applied to seams at end-of-rolls and at repairs at a rate of ¼ pound per lineal foot.

A third party engineering firm monitored the installation of all geosynthetic materials and assembled the manufacturing quality control (MQC) data, manufacturing quality assurance (MQA) testing data, installer subgrade acceptance, panel placement information, laboratory CQA test data from destruct samples, and field CQA test data for seam welding integrity. All of this data is included in the "Geosynthetics Quality Assurance Report, Gypsum Stack, AERG (Ameren) Duck Creek Power Station, Canton, Fulton County, Illinois. Feezor Engineering, Inc. (March 2009, Revised July 2009)" in the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

## 7. Lower HDPE Geomembrane Liner Installation

Prior to installation of the lower 60-mil textured HDPE geomembrane liner on the floor and side slopes of the GMF Pond, the surface of the full scale soil liner was accepted by the geomembrane installer. In addition, the installation of the GCL was accepted by the geomembrane installer. Installation of the lower geomembrane liner began on September 27, 2008, and placement continued through November 5, 2008. Textured geomembrane liner was used on the GMF Pond floor and side slopes.

The lower HDPE geomembrane was placed immediately over the GCL. On the side slopes, the HDPE geomembrane was laid parallel to the slope and the tie-in weld with the bottom geomembrane was welded a minimum of 5 feet past the toe of the slope. Adjacent panels were overlapped approximately 4-6 inches and were shingled in the direction of the drainage.

Production seaming of the geomembrane panels was made using a dual hot wedge fusion welder. This device creates an air channel between two fused seams that can later be tested with pressurized air to assure there is no leakage. Destruct sample sites and repairs were welded with extrusion welds which were checked for leaks with a vacuum box. All seams were sampled at a rate of one destruct sample for every 500 feet of seam and tested for strength parameters in the laboratory.

## 8. Upper HDPE Geomembrane Liner Installation

Following installation of the lower 60-mil textured HDPE geomembrane liner, a 10-oz. non-woven geotextile was placed on top of the geomembrane. Twelve inches of drainage media was then installed on the 10-oz. geotextile. Leachate collection pipes and appropriate leachate collection sumps were installed within this drainage layer. The drainage layer was then covered with a 4-oz. non-woven geotextile, one-foot of cushion soil, and a second 60-mil HDPE geomembrane. The second geomembrane was installed utilizing the same practices as the lower geomembrane.

A third party engineering firm monitored the installation of all geosynthetic materials and assembled the manufacturing quality control (MQC) data, manufacturing quality assurance (MQA) testing data, installer subgrade acceptance, panel placement information, laboratory CQA test data from destruct samples, and field CQA test data for seam welding integrity. All of this data is included in the "Geosynthetics Quality Assurance Report, Gypsum Stack, AERG (Ameren) Duck Creek Power Station, Canton, Fulton County, Illinois. Feezor Engineering, Inc. (March 2009, Revised July 2009)" in the Duck Creek GMF Pond Liner Documentation Report located in the operating record.

RAMBOLL

# HISTORY OF POTENTIAL EXCEEDANCES

This presentation of the History of Potential Exceedances, and any corrective action taken to remediate groundwater, is provided to meet the requirements of Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845.230(d)(2)(M) for the Duck Creek Power Plant GMF Pond, Illinois Environmental Protection Agency (IEPA) ID No. W0578010001-04.

***Note***

*Groundwater concentrations from 2015 to 2021 presented in the Hydrogeologic Site Characterization Report (HCR) Table 4-1, and evaluated and summarized in the following tables, are considered potential exceedances because the methodology used to determine them is proposed in the Statistical Analysis Plan (Appendix A to Groundwater Monitoring Plan [GMP]), which has not been reviewed or approved by IEPA at the time of submittal of the 35 I.A.C. § 845 Operating Permit application.*

*Alternate sources for potential exceedances as allowed by 35 I.A.C. § 845.650(e) have not yet been evaluated. These will be evaluated and presented in future submittals to IEPA as appropriate.*

*Table 1 summarizes how the potential exceedances were determined. Table 2 is a summary of all potential exceedances.*

*Background Concentrations*

*Background monitoring wells identified in the GMP include G02S, G50S, and G51S.*

*For monitoring wells that have been historically monitored in accordance with Title 40, Code of Federal Regulations, Part 257, Subpart D (Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments), background concentrations calculated from sampling events in 2015-2017 were compared to the standards identified in 35 I.A.C. § 845.600(a)(1). For constituents with calculated background concentrations in 2015-2017 greater than the standards in 35 I.A.C. § 845.600(a)(1), those calculated background concentrations were used as Groundwater Protection Standards (GWPSs) for comparing to statistical calculation results for each compliance well to determine potential exceedances. Compliance well statistical calculations consider concentrations from all sampling events in 2015-2021.*

*For all other monitoring wells, either newly constructed in 2021 or existing wells not monitored under Title 40, Code of Federal Regulations, Part 257, Subpart D, background concentrations calculated from the eight sampling events required by 35 I.A.C. § 845.650(b)(1)(A), to be collected within 180 days from April 21, 2021, were compared to the standards identified in 35 I.A.C. § 845.600(a)(1). For constituents with calculated background concentrations greater than the standards in 35 I.A.C. § 845.600(a)(1), those calculated background concentrations were used as GWPSs. Compliance well statistical calculations from that same time period were compared to the GWPSs to determine potential exceedances.*

*Corrective Action*

*No corrective actions have been taken to remediate the groundwater.*

## Certification of Financial Assurance Requirements

On June 17, 2021, Illinois Power Resources Generating, LLC provided financial assurance in the form of performance bonds to the Illinois Environmental Protection Agency in the amount of $20,670,871 for Ash Pond 1, Ash Pond 2, the Bottom Ash Basin, and the GMF Pond at the Duck Creek Power Plant.[1]

I, Matthew A. Goering, Senior Vice President of Illinois Power Resources Generating, LLC, do hereby certify to the best of my knowledge for the above referenced CCR Units that the financial assurance instruments satisfy the requirements of 35 I.A.C. Part 845, Subpart I.

Matthew A. Goering
Senior Vice President
Illinois Power Resources Generating, LLC

[1] In the operating permit applications, the Ash Pond 1 is referred to as the Ash Pond No. 1, and the Ash Pond 2 is referred to as the Ash Pond No. 2.

**Initial Hazard Potential Classification Assessment**
**EPA Final CCR Rule**
**GMF Pond**
**Duck Creek Power Station**
**Fulton County, Illinois**

## 1.0 PURPOSE

This report documents Stantec's certification of the initial hazard potential classification assessment for the Duck Creek Power Station GMF Pond.

40 CFR 257.73(a)(2) requires the owner or operator of an existing CCR surface impoundment to conduct an initial hazard potential classification assessment and document the hazard potential classification, and the basis for the classification, of the CCR unit as either a high hazard potential CCR surface impoundment, a significant hazard potential CCR surface impoundment, or a low hazard potential CCR surface impoundment.

## 2.0 FINDINGS

A visual analysis was performed to evaluate potential hazards associated with a failure of the GMF Pond perimeter containment dike. Failure scenarios were considered along the perimeter dike. Breach scenarios were evaluated for potential downstream impacts to structures, infrastructure, frequently occupied facilities/areas, and waterways. Potential for impacts was evaluated by determining probable breach flow paths using available elevation data and imagery of the impoundment along with the nearby area.

The analysis indicates that a breach of the north, east, and south embankments have potential to impact structures on the Duck Creek Power Station property prior to flowing into the Duck Creek Cooling Pond. A breach of the west embankment would likely impact North Bethel Cemetery Road and the railroad to/from the power station prior to flowing into the Duck Creek Cooling Pond. North Bethel Cemetery Road is intermittently used and the at-risk populations are considered transient. In accordance with Federal guidelines, loss of life is not considered probable for scenarios where persons are only temporarily in the potential inundation area. It was concluded that a breach failure of the GMF Pond containment dike will not result in probable loss of human life. However, it is anticipated that a breach failure of the containment dike will release stored CCR materials into downstream areas and waterways causing environmental damage.

40 CFR 257.53 defines a "significant hazard potential CCR surface impoundment" as a diked surface impoundment where failure or mis-operation results in no probable loss of human life, but can cause economic loss, environmental damage, disruption of lifeline facilities, or impact other concerns.

Electronic Filing: Received, Clerk's Office 06/20/2024

Based on the results of the analysis summarized above, the GMF Pond was assigned a Significant hazard potential classification per 40 CFR 257.53.

## 3.0 QUALIFIED PROFESSIONAL ENGINEER CERTIFICATION

I, Matthew Hoy, being a Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief that;

1. the information contained in this report and the underlying data in the operating record was prepared in accordance with the accepted practice of engineering and is accurate as of the date of my signature below; and

2. the initial hazard potential classification assessment for the Duck Creek Power Station GMF Pond was conducted in accordance with the requirements specified in 40 CFR 257.73.

# CCR Rule Report: Initial Structural Stability Assessment

# For

# GMF Pond

# At Duck Creek Power Station

Electronic Filing, Received, Clerk's Office 06/20/2024

# 1 Introduction

This Coal Combustion Residual (CCR) Rule Report documents that the Gypsum Management Facility (GMF) Pond at the Illinois Power Resources Generating, LLC Duck Creek Power Station meets the structural stability assessment requirements specified in 40 Code of Federal Regulations (CFR) §257.73(d). The GMF Pond is located near Canton, Illinois in Fulton County, approximately 2.5 miles north of the Duck Creek Power Station. The GMF Pond serves as the wet impoundment basin for gypsum produced by the wet scrubber system at the Duck Creek Power Station.

The GMF Pond is an existing CCR surface impoundment as defined by 40 CFR §257.53. The CCR Rule requires that an initial structural stability assessment for an existing CCR surface impoundment be completed by October 17, 2016. In general, the initial structural stability assessment must document that the design, construction, operation, and maintenance of the CCR unit is consistent with recognized and generally accepted good engineering practices.

The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer stating that the initial structural stability assessment was conducted in accordance with the requirements of 40 CFR § 257.73(d). The owner or operator must prepare a periodic structural stability assessment every five years.

Electronic Filing, Received, Clerk's Office 06/20/2024

# 2 Initial Structural Stability Assessment

*40 CFR §257.73(d)(1)*
*The owner or operator of the CCR unit must conduct initial and periodic structural stability assessments and document whether the design, construction, operation, and maintenance of the CCR unit is consistent with recognized and generally accepted good engineering practices for the maximum volume of CCR and CCR wastewater which can be impounded therein. The assessment must, at a minimum, document whether the CCR unit has been designed, constructed, operated, and maintained with [the standards in (d)(1)(i)-(vii)].*

An initial structural stability assessment has been performed to document that the design, construction, operation and maintenance of the GMF Pond is consistent with recognized and generally accepted good engineering practices and meets the standards in §257.73(d)(1)(i)-(vii). The results of the structural stability assessment are discussed in the following sections. Based on the assessment and its results, the design, construction, operation, and maintenance of the GMF Pond were found to be consistent with recognized and generally accepted good engineering practices and meets the standards in 257.73(d)(1)(i)-(vii).

## 2.1 Foundations and Abutments (§257.73(d)(1)(i))

*CCR unit designed, constructed, operated, and maintained with stable foundations and abutments.*

The stability of the foundations was evaluated using soil data from field investigations and reviewing design drawings, operational and maintenance procedures, and conditions observed in the field by AECOM. Additionally, slope stability analyses were performed to evaluate slip surfaces passing through the foundations. The GMF Pond is a ring dike structure and does not have abutments.

The foundation consists of medium stiff to very stiff soil, which indicates stable foundations. Slope stability analyses exceed the criteria listed in §257.73(e)(1) for slip surfaces passing through the foundation. The slope stability analyses are discussed in the *CCR Rule Report: Initial Safety Factor Assessment for GMF Pond at Duck Creek Power Station* (October 2016). A review of operational and maintenance procedures as well as current and past performance of the dikes has determined appropriate processes are in place for continued operational performance.

Based on the conditions observed by AECOM, the GMF Pond was designed and constructed with stable foundations. Operational and maintenance procedures are in place to address any issues related to the stability of foundations; therefore, the GMF Pond meets the requirements in §257.73(d)(1)(i).

## 2.2 Slope Protection (§257.73(d)(1)(ii))

*CCR unit designed, constructed, operated, and maintained with adequate slope protection to protect against surface erosion, wave action and adverse effects of sudden drawdown.*

The adequacy of slope protection was evaluated by reviewing design drawings, operational and maintenance procedures, and conditions observed in the field by AECOM.

Based on this evaluation, adequate slope protection was designed and constructed at the GMF Pond. No evidence of significant areas of erosion or wave action were observed. The interior slopes are protected with a geomembrane liner that underlies the entire GMF Pond and extends up the interior slopes, and the exterior slopes are protected with vegetation. The geomembrane liner on the interior slopes isolates the embankment soils from surface erosion or wave action. Operational and maintenance procedures to repair the vegetation

Electronic Filing, Received, Clerk's Office 06/20/2024

(exterior slopes) and liner (interior slopes) as needed are appropriate to protect against surface erosion or wave action. Given the presence of a liner that serves to prevent saturation of the dike's soils below the normal pool, sudden drawdown, as well as the corresponding adverse effects, is not applicable to the GMF Pond. Therefore, the GMF Pond meets the requirements in §257.73(d)(1)(ii).

## 2.3 Dike Compaction (§257.73(d)(1)(iii))

*CCR unit designed, constructed, operated, and maintained with dikes mechanically compacted to a density sufficient to withstand the range of loading conditions in the CCR unit.*

The density of the dike materials was evaluated using soil data from field investigations and reviewing design drawings, operational and maintenance procedures, and conditions observed in the field by AECOM. Additionally, slope stability analyses were performed to evaluate slip surfaces passing through the dike over the range of expected loading conditions as defined within §257.73(e)(1).

Based on this evaluation, the dike consists of stiff to very stiff material, which is indicative of mechanically compacted dikes. Slope stability analyses exceed the criteria listed in §257.73(e)(1) for slip surfaces passing through the dike. The slope stability analyses are discussed in the *CCR Rule Report: Initial Safety Factor Assessment for GMF Pond at Duck Creek Power Station* (October 2016); therefore, the original design and construction of the GMF Pond included sufficient dike compaction. Operational and maintenance procedures are in place to identify and mitigate deficiencies in order to maintain sufficient compaction of the dikes to withstand the range of loading conditions. Therefore, the GMF Pond meets the requirements in §257.73(d)(1)(iii).

## 2.4 Vegetated Slopes (§257.73(d)(1)(iv))[1]

*CCR unit designed, constructed, operated, and maintained with vegetated slopes of dikes and surrounding areas, except for slopes which have an alternate form or forms of slope protection.*

The adequacy of slope vegetation was evaluated by reviewing design drawings, operational and maintenance procedures, and conditions observed in the field by AECOM.

Based on this evaluation, the vegetation on the exterior slopes is adequate as no substantial bare or overgrown areas were observed. Exposed geomembrane liners on the interior slopes are used as an alternate form of slope protection, which is adequate as significant tears or defects were not observed. Therefore, the original design and construction of the GMF Pond included adequate vegetation of the dikes and surrounding areas. Adequate operational and maintenance procedures are in place to regularly manage vegetation growth, including mowing and seeding any bare areas, as evidenced by the conditions observed by AECOM. Therefore, the GMF Pond meets the requirements in §257.73(d)(1)(iv).

[1] As modified by court order issued June 14, 2016, Utility Solid Waste Activities Group v. EPA, D.C. Cir. No. 15-1219 (order granting remand and vacatur of specific regulatory provisions).

R001578

Electronic Filing, Received, Clerk's Office 06/20/2024

## 2.5 Spillways (§257.73(d)(1)(v))

*CCR unit designed, constructed, operated, and maintained with a single spillway or a combination of spillways configured as specified in [paragraph (A) and (B)]:*

*(A) All spillways must be either:*

*(1) of non-erodible construction and designed to carry sustained flows; or*

*(2) earth- or grass-lined and designed to carry short-term, infrequent flows at non-erosive velocities where sustained flows are not expected.*

*(B) The combined capacity of all spillways must adequately manage flow during and following the peak discharge from a:*

*(1) Probable maximum flood (PMF) for a high hazard potential CCR surface impoundment; or*

*(2) 1000-year flood for a significant hazard potential CCR surface impoundment; or*

*(3) 100-year flood for a low hazard potential CCR surface impoundment.*

The spillway was evaluated using design drawings, operational and maintenance procedures, and conditions observed in the field by AECOM. Additionally, hydrologic and hydraulic analyses were completed to evaluate the capacity of the spillway relative to inflow estimated for the 1,000-year flood event for the significant hazard potential GMF Pond. The hazard potential classification assessment was performed by Stantec in 2016 in accordance with §257.73(a)(2).

The spillway is lined with a geomembrane, which is a non-erodible material. The ability of the spillway design to carry sustained flows, as well as the capacity of the spillway, was evaluated using hydrologic and hydraulic analysis performed per §257.82(a). The analysis found that the spillway can adequately manage flow during peak discharge resulting from the 1,000-year storm event without overtopping of the embankments. The hydrologic and hydraulic analyses are discussed in the *CCR Rule Report: Initial Inflow Design Flood Control System Plan for GMF Pond at Duck Creek Power Station* (October 2016). This also means that the design of the spillway is adequate to carry sustained flows. Operational and maintenance procedures are in place to repair any tears in the spillway liner and remove debris or other obstructions from the spillway, as evidenced by the conditions observed by AECOM. As a result, these procedures are appropriate for maintaining the spillway. Therefore, the GMF Pond meets the requirements in §257.73(d)(1)(v).

## 2.6 Stability and Structural Integrity of Hydraulic Structures (§257.73(d)(1)(vi))

*CCR unit designed, constructed, operated, and maintained with hydraulic structures underlying the base of the CCR unit or passing through the dike of the CCR unit that maintain structural integrity and are free of significant deterioration, deformation, distortion, bedding deficiencies, sedimentation, and debris which may negatively affect the operation of the hydraulic structure.*

Based on an evaluation of design drawings, operational and maintenance procedures, and conditions observed in the field by AECOM, no hydraulic structures are present that underlie the base or pass through the dike of the GMF Pond. Therefore, the §257.73(d)(1)(vi) requirements are not applicable to the GMF Pond.

## 2.7 Downstream Slope Inundation/Stability (§257.73(d)(1)(vii))

*CCR unit designed, constructed, operated, and maintained with, for CCR units with downstream slopes which can be inundated by the pool of an adjacent water body, such as a river, stream or lake, downstream slopes that maintain structural stability during low pool of the adjacent water body or sudden drawdown of the adjacent water body.*

The structural stability of the downstream slopes of the GMF Pond was evaluated by comparing the location of the GMF Pond relative to adjacent water bodies using published United States Geological Survey (USGS) topographic maps, aerial imagery, and conditions observed in the field by AECOM.

Based on this evaluation, water bodies adjacent to the downstream slopes of the GMF Pond are not present. Water bodies within the vicinity of the GMF Pond include the Duck Creek Cooling Pond and several small unnamed ponds. These water bodies are located several hundred feet or more beyond the GMF Pond

Electronic Filing, Received, Clerk's Office 06/20/2024

downstream slopes. The adjacent GMF Pond is a non-CCR surface impoundment and is not a river, stream, or lake. Therefore, adjacent water bodies that can inundate the downstream slopes of the GMF Pond are not present.

Based on this evaluation, the requirements in §257.73(d)(1)(vii) are not applicable to the GMF Pond, as inundation of the downstream slopes is not expected to occur.

# 3 Certification Statement

**CCR Unit:** Illinois Power Resources Generating, LLC; Duck Creek Power Station; GMF Pond

I, Victor A. Modeer, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief that the information contained in this CCR Rule Report, and the underlying data in the operating record, has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the initial structural stability assessment dated October 13, 2016 was conducted in accordance with the requirements of 40 CFR § 257.73(d).

# CCR Rule Report: Initial Safety Factor Assessment

# For

# GMF Pond

# At Duck Creek Power Station

Electronic Filing, Received, Clerk's Office 06/20/2024

# 1 Introduction

This Coal Combustion Residual (CCR) Rule Report documents that the Gypsum Management Facility (GMF) Pond at the Illinois Power Resources Generating, LLC Duck Creek Power Station meets the safety factor assessment requirements specified in 40 Code of Federal Regulations (CFR) §257.73(e). The GMF Pond is located near Canton, Illinois in Fulton County, approximately 2.5 miles north of the Duck Creek Power Station. The GMF Pond serves as the wet impoundment basin for gypsum produced by the wet scrubber system at the Duck Creek Power Station.

The GMF Pond is an existing CCR surface impoundment as defined by 40 CFR §257.53. The CCR Rule requires that the initial safety factor assessment for an existing CCR surface impoundment be completed by October 17, 2016.

The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer stating that the initial safety factor assessment meets the requirements of 40 CFR § 257.73(e). The owner or operator must prepare a safety factor assessment every five years.

# 2 Initial Safety Factor Assessment

*40 CFR §257.73(e)(1)*
*The owner or operator must conduct initial and periodic safety factor assessments for each CCR unit and document whether the calculated factors of safety for each CCR unit achieve the minimum safety factors specified in (e)(1)(i) through (iv) of this section for the critical cross section of the embankment. The critical cross section is the cross section anticipated to be the most susceptible of all cross sections to structural failure based on appropriate engineering considerations, including loading conditions. The safety factor assessments must be supported by appropriate engineering calculations.*

*(i) The calculated static factor of safety under the long-term, maximum storage pool loading condition must equal or exceed 1.50.*

*(ii) The calculated static factor of safety under the maximum surcharge pool loading condition must equal or exceed 1.40.*

*(iii) The calculated seismic factor of safety must equal or exceed 1.00.*

*(iv) For dikes constructed of soils that have susceptibility to liquefaction, the calculated liquefaction factor of safety must equal or exceed 1.20.*

A geotechnical investigation program and stability analyses were performed to evaluate the design, performance, and condition of the earthen dikes of the GMF Pond. The exploration consisted of hollow-stem auger borings and laboratory program including strength and index testing. Data collected from the geotechnical investigation, available design drawings, construction records, inspection reports, previous engineering investigations, and other pertinent historic documents were utilized to perform the safety factor assessment and geotechnical analyses.

In general, the subsurface conditions at the GMF Pond consist of stiff to very stiff embankment fill (clay) intermittently overlying medium stiff to stiff loess (clay), which in turn overlies medium stiff to very stiff glacial till (clay) with trace sand and gravel. Phreatic water is within the foundation of the GMF Pond.

A representative cross section was analyzed using limit equilibrium slope stability analysis software to evaluate stability of the perimeter dike system and foundations. The cross section was located at the maximum embankment height for the GMF Pond. Due to the relatively short height of the GMF Pond embankments and uniform slope orientations, subsurface stratigraphy, and phreatic conditions, a single cross section at the maximum embankment height is sufficient to represent the critical cross section. The cross section was evaluated for each of the loading conditions stipulated in §257.73(e)(1).

A liquefaction susceptibly evaluation did not find soils susceptible to liquefaction within the GMF Pond dikes. As a result, the Soils Susceptible to Liquefaction loading condition (§257.73(e)(1)(iv)) is not applicable to the GMF Pond at the Duck Creek Power Station.

Results of the Initial Safety Factor Assessment, for the critical cross-section, are listed in **Table 1**.

**Table 1 – Summary of Initial Safety Factor Assessments**

| Loading Conditions | §257.73(e)(1) Subsection | Minimum Factor of Safety | Calculated Factor of Safety |
|---|---|---|---|
| Maximum Storage Pool Loading | (i) | 1.50 | 4.27 |
| Maximum Surcharge Pool Loading | (ii) | 1.40 | 4.26 |
| Seismic | (iii) | 1.00 | 2.37 |
| Soils Susceptible to Liquefaction | (iv) | 1.20 | Not Applicable |

Based on this evaluation, the GMF Pond meets the requirements in §257.73(e)(1).

# 3 Certification Statement

**CCR Unit:** Illinois Power Resources Generating, LLC; Duck Creek Power Station; GMF Pond

I, Victor A. Modeer, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief that the information contained in this CCR Rule Report, and the underlying data in the operating record, has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the initial safety factor assessment dated October 13, 2016 meets the requirements of 40 CFR §257.73(e).

# CCR Rule Report: Initial Inflow Design Flood Control System Plan

# For

# GMF Pond

# At Duck Creek Power Station

Electronic Filing: Received, Clerk's Office 06/20/2024

# 1 Introduction

This Coal Combustion Residual (CCR) Rule Report documents that the initial inflow design flood control system plan for Gypsum Management Facility (GMF) Pond at the Illinois Power Resources Generating, LLC Duck Creek Power Station meets the requirements specified in 40 Code of Federal Regulations (CFR) §257.82. The GMF Pond is located near Canton, Illinois in Fulton County, approximately 2.5 miles north of the Duck Creek Power Station. The GMF Pond serves as the wet impoundment basin for gypsum produced by the wet scrubber system at the Duck Creek Power Station.

The GMF Pond is an existing CCR surface impoundment as defined by 40 CFR §257.53. The CCR Rule requires that the initial inflow design flood control system plan for an existing CCR surface impoundment be prepared by October 17, 2016. The plan must document how the inflow design flood control system has been designed and constructed to meet the requirements of 40 CFR §257.82 and be supported by appropriate engineering calculations.

The owner or operator of the CCR unit must obtain a certification from a qualified professional engineer stating that the inflow design flood control system meets the requirements of 40 CFR §257.82. The owner or operator must prepare an inflow design flood control system plan every five years.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 2 Initial Inflow Design Flood Control System Plan

*40 CFR §257.82*
*(a) The owner or operator of an existing … CCR surface impoundment … must design, construct, operate, and maintain an inflow design flood control system as specified in paragraphs (a)(1) and (2) of this section.*

*(1) The inflow design flood control system must adequately manage flow into the CCR unit during and following the peak discharge of the inflow design flood specified in paragraph (a)(3) of this section.*

*(2) The inflow design flood control system must adequately manage flow from the CCR unit to collect and control the peak discharge resulting from the inflow design flood specified in paragraph (a)(3) of this section.*

*(3) The inflow design flood is:*

*(i) For a high hazard potential CCR surface impoundment, …, the probable maximum flood;*

*(ii) For a significant hazard potential CCR surface impoundment, …, the 1,000-year flood;*

*(iii) For a low hazard potential CCR surface impoundment, …, the 100-year flood; or*

*(iv) For an incised CCR surface impoundment, the 25-year flood.*

*(b) Discharge from the CCR unit must be handled in accordance with the surface water requirements under §257.3-3.*

Analyses completed for the initial inflow design flood control system plan of the GMF Pond are described in the following subsections. Data and analysis results in the following subsections are based on spillway design information shown on design drawings, construction information, topographic surveys, information about operational and maintenance procedures provided by Illinois Power Resources Generating, LLC, and field measurements collected by AECOM. The analysis approach and results of the hydrologic and hydraulic analyses are presented in the following subsections.

The GMF Pond has a significant hazard potential, based on the initial hazard potential classification assessment performed by Stantec in 2016 in accordance with §257.73(a)(2).

## 2.1 Initial Inflow Design Flood Control Systems (§257.82(a))

An initial inflow design flood control system plan, supported by a hydraulic and hydrologic analysis, was developed for the GMF Pond by evaluating the effects of a 24-hour duration design storm for the 1,000-year Inflow Design Flood (IDF) using a hydrologic HydroCAD (Version 8.5) computer model and a starting water surface elevation of 616.0 feet. The computer model evaluated the GMF Pond's ability to collect and control the 1,000-year IDF under existing operational and maintenance procedures. Rainfall data for the 1,000-year IDF was obtained from the National Oceanic and Atmospheric Administration (NOAA) Atlas 14. The NOAA Atlas 14 rainfall depth is 9.37 inches.

The HydroCAD model results for the GMF Pond indicate that the CCR unit has sufficient storage capacity and spillway structures to adequately manage (1) flow into the CCR unit during and following the peak discharge of the 1,000-year IDF and (2) flow from the CCR unit to collect and control the peak discharge resulting from the 1,000-year IDF. The peak water surcharge elevation is 618.3 feet during the IDF, and the minimum crest elevation of the GMF Pond dike is 620.0 feet. Therefore, overtopping is not expected.

Based on this evaluation, the GMF Pond meets the requirements in §257.82(a).

Electronic Filing: Received, Clerk's Office 06/20/2024

## 2.2 Discharge from the CCR Unit (§257.82(b))

40 CFR §257.82(b) provides that the discharge from the CCR unit must be handled in accordance with the surface water requirements under 40 CFR §257.3-3, which states the following:

*(a) For purposes of section 4004(a) of the Act, a facility shall not cause a discharge of pollutants into waters of the United States that is in violation of the requirements of the National Pollutant Discharge Elimination System (NPDES) under section 402 of the Clean Water Act, as amended.*

*(b) For purposes of section 4004(a) of the Act, a facility shall not cause a discharge of dredged material or fill material to waters of the United States that is in violation of the requirements under section 404 of the Clean Water Act, as amended.*

*(c) A facility or practice shall not cause non-point source pollution of waters of the United States that violates applicable legal requirements implementing an areawide or Statewide water quality management plan that has been approved by the Administrator under section 208 of the Clean Water Act, as amended.*

*(d) Definitions of the terms Discharge of dredged material, Point source, Pollutant, Waters of the United States, and Wetlands can be found in the Clean Water Act, as amended, 33 U.S.C. 1251 et seq., and implementing regulations, specifically 33 CFR part 323 (42 FR 37122, July 19, 1977).*

The handling of discharge was evaluated by reviewing design drawings, operational and maintenance procedures, conditions observed in the field by AECOM, and the inflow design flood control system plan developed per §257.82(a).

Based on this evaluation, the GMF Pond does not discharge into waters of the United States. Water from the GMF Pond is recycled for use in plant operations. Hydraulic and hydrologic analyses performed as part of the initial inflow design flood control system plan found the GMF Pond adequately manages outflow during the 1,000-year IDF, as overtopping of the GMF Pond embankments is not expected.

Therefore, discharge to waters of the United States is not expected during normal or IDF conditions, and the GMF Pond meets the requirements in §257.82(b).

# 3 Certification Statement

**CCR Unit:** Illinois Power Resources Generating, LLC; Duck Creek Power Station; GMF Pond

I, Victor A. Modeer, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief that the information contained in this CCR Rule Report, and the underlying data in the operating record, has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the initial inflow design flood control system plan dated October 13, 2016 meets the requirements of 40 CFR §257.82.

# PREFACE

Illinois Power Resources Generating, LLC (IPRG) has prepared this Safety and Health Plan in accordance with requirements set forth in Title 35 of the Illinois Administrative Code (35 I.A.C.) Part 845: Residuals in Surface Impoundments (Part 845), Section (§) 845.530. IRPG assessed health and safety hazards of its coal combustion residual (CCR) surface impoundments to develop and update this Safety and Health Plan.

This document describes the minimum anticipated protective measures necessary for worker health and safety at Duck Creek Power Plant (DCPP) Gypsum Management Facility Pond (GMFP; Vistra identification [ID] number [No.] 203, Illinois Environmental Protection Agency [IEPA] ID No. W0578010001-04, National Inventory of Dams [NID] No. IL50573) and Bottom Ash Basin (BAB; Vistra ID No. 205, IEPA ID No. W0578010001-03, NID No. IL50716), collectively referred to as the Site. Employees of IPRG, contract workers, and third-party contractors must read and comply with the contents of this document. The contents of this document are not intended to cover all situations that may arise nor to waive any provisions specified in Federal, State, and local regulations or site owner / contractor health and safety requirements.

Third-party contractors are accountable for the health and safety of their employees. Third-party contractors are required to prepare a Safety and Health Plan that meets the minimum requirements herein. However, no requirements or provisions within this plan shall be construed as an assumption of IPRG of their legal responsibilities as an employer.

This Safety and Health Plan will be reviewed and updated annually, at a minimum. The Safety and Health Plan will also be updated if facility operations change, or a new hazard is identified.

# 1. INTRODUCTION

This Safety and Health Plan has been developed to outline the requirements to be met by employees of IPRG, contract workers, and third-party contractors while performing any activity to construct, operate, or close the CCR Units at the Site. This Safety and Health Plan has been developed to meet the requirements of 35 I.A.C. § 845.530 and describes the responsibilities, training requirements, protective equipment, and safety procedures necessary to minimize the risk of injury, fires, explosion, chemical spills, material damage incidents, and near misses related to CCR activities. This Safety and Health Plan incorporates by reference the Occupational Safety and Health Administration (OSHA) regulations contained in Title 29 of the Code of Federal Regulations (29 C.F.R.) § 1910 and 29 C.F.R. § 1926.

The requirements and guidelines in this Safety and Health Plan are based on a review of available information and data, and an evaluation of identified on-site hazards. This Safety and Health Plan will be reviewed with persons assigned to work at the Site and will be available on-site.

## 1.1 Site Description/History

The DCPP is a retired coal-fired power plant located in Section 30 of Township 6 North, Range 5 East, in Fulton County, Illinois and approximately 6 miles southeast of the town of Canton. The BAB is located immediately northeast of the power plant facility in Section 30, 31. The GMFP is located to the north in Section 18, east of Bethel Cemetery Road, and approximately 2 miles southeast of Canton, Illinois (Appendix A).

## 1.2 Facility Personnel

The following table outlines key facility personnel with respect to facility operations and health and safety.

| Name | Position | Phone Number |
|---|---|---|
| Brandon Potter | Point-of-Contact (POC) /Plant Manager | 618-210-3418 |
| Security Guard | Security Guard | 713-542-0619 |
| Daryl Johnson | Environmental Manager | 309-229-6088 |
| Matt Ballance | Engineering Manager | 618-343-7739 (office)<br>618-792-7274 (mobile) |
| Jason Campbell | Dam Safety Manager | 271-753-8904 (Springfield)<br>217-622-3491 (mobile) |
| Stu Cravens | Senior Technical Expert | 217-390-1503 (mobile) |
| Vic Modeer | Engineering Manager | 618-541-0878 |
| Charles Koudelka | Plant Closure Director | 903-235-8633 |

## 1.3 Responsibilities

The following persons have responsibilities associated with communicating and implementing the Safety and Health Plan for the Site.

### 1.3.1 IPRG Point of Contact

The IPRG Point of Contact (POC) is a management-level person who is requiring employees, contract workers, or third-party contractors to enter the Site. The IPRG POC is responsible to communicate Safety and Health Plan information and requirements to employees, contract workers, and third-party contractors, and oversee work performed at the Site to the extent necessary to confirm implementation of Safety and Health Plan requirements.

### 1.3.2 IPRG Employees

IPRG employees are directly hired by IPRG. They are required to implement and/or follow Safety and Health Plan requirements as applicable to their work and exercise their "stop work authority" if safety requirements are unclear or unanticipated site conditions or hazards are observed.

### 1.3.3 Contract Workers

Contract workers are those hired by IPRG through an agency firm. Similar to IPRG employees, contract workers are required to implement and/or follow Safety and Health Plan requirements as applicable to their work and exercise their "stop work authority" if safety requirements are unclear or unanticipated site conditions or hazards are observed.

### 1.3.4 Third-Party Contractor Employees

Third-party contractor employees work for firms under contract to IPRG. Third-party contractors include prime contractors and all of their lower tier subcontractors. Similar to IPRG employees, third-party contractors are required to implement Safety and Health Plan requirements as applicable to their work and exercise their "stop work authority" if safety requirements are unclear or unanticipated site conditions or hazards are observed.

### 1.3.5 Third-Party Contractor Safety Competent Person

Third-party contractors will be required to designate a Safety Competent Person. The Safety Competent Person must be in a management position (*e.g.,* superintendent, foreman, etc.) with OSHA 30-hour construction safety certification who may perform other duties, unless IPRG requires a dedicated Safety Competent Person. A Safety Competent Person must be on site at all times when the subcontractor has employees performing work for IPRG and must possess a sound working knowledge of pertinent OSHA regulations, this Safety and Health Plan, and other applicable safety requirements related to the scope of work. Third-party contractors must also designate a backup Safety Competent Person that possesses the same authority and training. The competent person will ensure timely correction of safety deficiencies identified by IPRG. The Safety Competent Person is responsible to ensure Safety and Health Plan requirements have been communicated to lower-tier subcontractors and enforce Safety and Health Plan requirements.

# 2. SITE ACCESS & CONTROL

This section outlines requirements for ensuring that only authorized personnel and visitors are permitted at the Site.

## 2.1 Facility Security

Elements of site control include restricting access to the CCR Units to persons until they have met the training requirements outlined in this Safety and Health Plan and have been authorized to do so by DCPP POC or their representative.

All IPRG employees, contract workers, and third-party contractors must sign in and out with the security guard.

Upon arrival to the Site, all IPRG employees, contract workers, and third-party contractors must check in/out at Security. A COVID-19 screening must also be completed per Section 3.8.

## 2.2 Third-Party Contractor Management

Prior to working at the Site, all third-party prime contractors must maintain an active registration with ISNetworld and maintain a grade of A or B. Lower tier subcontractors are currently not required to be registered in ISNetworld, but this requirement may change at the discretion of IPRG.

## 2.3 Third-Party Contractor Safety and Health Plan

Prior to being authorized to conduct work at the Site, third-party contractors must develop and submit a Safety and Health Plan. The third-party contractor's Safety and Health Plan must be specific to the scope of work that they will be performing at the Site. The third-party contractor's Safety and Health Plan must meet or exceed all the requirements in this Safety and Health Plan, other IPRG requirements, and applicable regulations. All lower tier subcontractors of third-party contractors must meet the requirements in this Safety and Health Plan as well as the requirements outlined in the Safety and Health Plan of the third-party with whom they are contracted.

## 2.4 Authorized Personnel

At a minimum, authorized personnel who will be granted unescorted access to the project include IPRG employees, contract workers, and third-party contractors that meet the following:

- Reviewed this Safety and Health Plan and other applicable safety planning documentation
- Have completed all the training, medical surveillance, and drug screen and background investigation requirements as outlined in Section 3 of this Safety and Health Plan.

## 2.5 Visitors

Visitors must be escorted by Authorized Personnel through the Site if they have not reviewed this Safety and Health Plan or completed the training requirements outlined in Section 3 of this Safety and Health Plan. Visitors may not undertake any activity to construct, operate, or close a CCR surface impoundment.

## 2.6 Communication

Communication between workers and emergency services must be maintained at all times. Cellular service is consistently available and can be relied upon to summon emergency services.

# 3. TRAINING & MEDICAL REQUIREMENTS

Project personnel must be properly trained for the type of work being performed and in accordance with 35 I.A.C. § 845.530, 29 C.F.R. § 1926 and 29 C.F.R. § 1910, and IPRG policies. Additionally, personnel working in areas regulated by the OSHA Hazardous Waste Operations and Emergency Response (HAZWOPER) standards (29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65) must have current medical surveillance. All employees, contractors, and third-party contractors must complete the following prior to beginning any activity to construct, operate or close the CCR Units at the Site.

## 3.1 HAZWOPER Training

35 I.A.C. § 845.530(c)(2)(E) requires that all employees, contract workers, and third-party contractors be trained in accordance with 29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65. The following training will be completed as required by job function:

- **OSHA 40-Hour Training** per 29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65, for those personnel who are expected to have extensive contact with contaminated materials and/or may be required to wear a respirator.
- **OSHA 24-Hour Training** per 29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65, for those personnel who are expected to have minimal contact with contaminated materials and will NOT be required to wear a respirator.
- **OSHA 8-hour Supervisor Training** per 29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65, for Site Supervisors, Foremen, Superintendents, and others who will be directing and managing site activities.
- **OSHA 8-hour Refresher** per 29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65, completed within 12 months of initial 40-hour or 24-hour training and annually thereafter.

The following matrix outlines HAZWOPER training requirements based on typical job functions at the Site. It is not intended to be all inclusive, new job functions must be evaluated per 29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65.

| Training | Job Function |
|---|---|
| OSHA 40-hour | Ash handlers |
| OSHA 24-hour | Personnel not required to handle CCR materials |
| OSHA 8-hour Supervisor Training | Third-Party Contractor Safety Competent Persons |
| OSHA 8-hour refresher | All personnel |

## 3.2 OSHA Construction Outreach Training

35 I.A.C. § 845.530(c)(2)(E) requires that all employees, contract workers, and third-party contractors complete an OSHA 10-hour or 30-hour construction safety training. These trainings will be completed as follows:

- All employees, contract workers, and third-party contract employees: OSHA 10-hour or 30-hour construction outreach training.
- Supervisors, superintendents, foreman and safety professionals: OSHA 30-hour construction outreach training.

## 3.3 Safety and Health Plan Review

Pursuant to 35 I.A.C. § 845.530(d)(e), before beginning any activity at the Site, and annually thereafter, all IPRG employees, contract workers, and third-party contractors must review the content of this HASP. After reviewing this Safety and Health Plan all personnel will understand the following:

- Procedures for using, inspecting, repairing, and replacing facility emergency and monitoring equipment
- Communications or alarm systems outlined in Section 6
- Response to fires and explosions outlined in Section 6
- Response to a spill or release of CCR
- Information about chemical hazards and hazardous materials outlined in Section 5
- The use of engineering controls, administrative controls, and personal protective equipment (PPE) outlined in Section 4

All personnel will acknowledge this HASP by signing the *Safety and Health Plan Acknowledgment Form (Appendix B).*

### 3.4 Emergency and Monitoring Equipment Training

All IPRG employees, contract workers, and third-party contractors must be aware of how to respond to alarms and other emergencies as outlined in Section 6 of this plan. Individuals may only use facility emergency and monitoring equipment if they have been trained in their use and authorized to do so by the designated POC. Additionally, a written release may need to be completed as required by Vistra Corporate Procedure FFA-POL-0006.

Individual IPRG employees and contract workers may be responsible for using, inspecting, repairing and replacing facility emergency monitoring equipment. These individuals will be trained in accordance with the Authorized Gas Testing training (or equivalent) or other procedures identified by IPRG. These individuals will review and adhere to the manufacturer's instructions, where applicable.

Third-party contractors are responsible for inspecting, repairing, and replacing any owned emergency (*i.e.*, fire extinguishers) and monitoring equipment (*i.e.*, air monitoring equipment). Third-party contractors will maintain procedures for using, inspecting, repairing, and replacing owned emergency and monitoring equipment that is consistent with the manufacturer's requirements. Third-party contractor employees who are responsible for this equipment will be trained in procedures for using, inspecting, and repairing owned equipment by their employer.

### 3.5 Hazard Communication

All employees, contract workers, and third-party contractors must be trained in chemical hazards (if any) associated with their work in accordance with 29 C.F.R. § 1910.1200. Work tasks performed at the Site may include exposure to compounds identified in the Hazard Communication section of this Safety and Health Plan and is included as part of the Safety and Health Plan Review outlined in Section 3.3.

### 3.6 Medical Surveillance

All employees, contract workers, and third-party contractors engaged in operations specified in 29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65 and meet one of the criteria outlined in 29 C.F.R. § 1910.120(f)(2) and 29 C.F.R. § 1926.65(f)(2) must participate in a medical surveillance program that is administered by their employer. The criteria for participating in a medical surveillance program are:

- All employees who are or may be exposed to hazardous substances at or above the established permissible exposure limit, without regard to the use of respirators, for 30 days or more a year;
- All employees who wear a respirator for 30 days or more a year; or
- All employees who are injured, become ill or develop signs or symptoms due to possible overexposure involving hazardous substances or health hazards from an emergency response or hazardous waste operation.

The medical surveillance program must result in documentation that an individual is cleared to work on sites covered by 29 C.F.R. § 1910.120 and 20 C.F.R. § 1926.65 and is medically fit to wear a respirator when applicable.

### 3.7 Drug Screen and Background Investigations

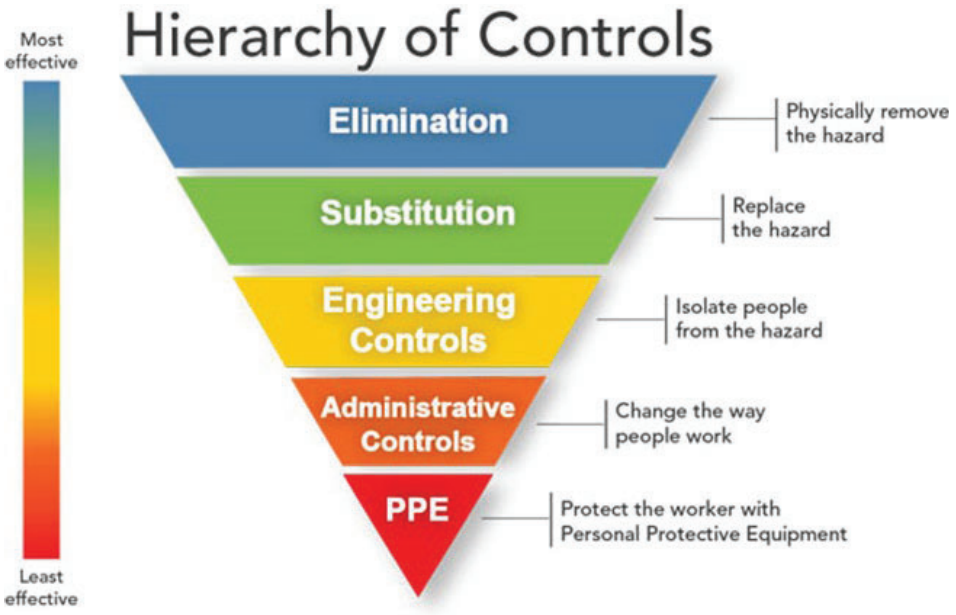
IPRG requires that contract worker agencies and third-party contractors are responsible for ensuring that all personnel have completed and passed a drug and alcohol test and background investigation prior to on-site work as described in Appendix C.

### 3.8 COVID-19 Site Entry Guidelines

All personnel entering Vistra work sites shall review and adhere to the site entry guidelines provided in Appendix D.

### 3.9 Document Management

IPRG will maintain employee and contract employee training and medical surveillance records in the Maintenance Office. Third-party contractors are responsible for maintaining training and medical surveillance documentation for their employees. Third-party contractors will produce documentation upon IPRG request.



### 3.10 Industrial Hygiene Sampling Records

Upon receipt of exposure sampling results IPRG and third-party contractors must distribute exposure sampling results to employees within 15 business days unless otherwise required by applicable regulation. All personnel exposure sampling results and records must be maintained by the employee’s company for at least 30 years following termination of employment.

# 4. HAZARD & CONTROLS

The following section outlines general controls for the hazards and controls. Third-party contractors are still responsible for developing a Safety and Health Plan that incorporates requirements of this Safety and Health Plan, other safety requirements for the DCPP, as well as the third-party contractor's safety policies and procedures. Safety and Health Plans developed by third-party contractors must be specific to the site and the anticipated work means and methods. Safety and Health Plans that consist of only standard operating procedures or are not otherwise specific to the work performed at the Site will not be accepted by IPRG.

IPRG requires that a hierarchy of controls be considered when performing work at the GMFP or BAB. Implement controls that favor elimination, substitution, and engineering over the use of administrative controls and PPE when feasible. See the figure below for additional guidance (courtesy of the National Institute for Occupational Safety and Health [NIOSH]).

## 4.1 Ash/Unstable Surfaces

Prior to working in or on an ash pond, third-party contractors must notify the security guard and the POC. Work in or on an ash pond may not begin until the facility POC has approved the work and all personnel have signed in with the security guard. Upon completion of the work, third-party contractors must notify the POC and security guard that they have left the Site.

When working on ash ponds or unstable surfaces the following requirements must be implemented where applicable and feasible. The following table summarizes safety controls for work performed in ash ponds and on unstable surfaces and are aligned to the hierarchy of controls:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Change the work task or work methods so that work on ash ponds is no longer required | Use the lightest available tracked equipment to reduce ground pressure | Use crane mats or other cribbing to support heavy equipment on ash ponds | Traverse compacted paths that have previously been used by heavy equipment | Use a restraint (tethering) system to prevent falls or slips into unstable ash pond surfaces or surface water that represents a drowning hazard |

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| | | | If an unstable condition exists, complete a Next Level Up Pre-Job Brief prior to accessing the ash pond. | |
| | | | Approach the ash pond from the most stable direction | |
| | | | Inspect travel paths for recent terrain shifts, particularly following heavy rains or rapid dewatering | |
| | | | Working alone on ash ponds is prohibited without pre-approval from the POC. | |
| | | | When a drowning hazard exists, implement requirements for working on/near water as outlined in Section 4.4. | |
| | | | Implement an emergency response plan with trained responders for falls into (or engulfment by) ash | |

## 4.2 Ash Inhalation/Airborne Exposure

Ash that becomes airborne due to site activities or environmental conditions may result in an exposure to its components as outlined in Section 5.1. IPRG and third-party contractors are responsible for ensuring their respective employees' and contract workers' exposures are below occupational exposure limits. Upon request, third-party contractors must demonstrate to IPRG that exposure control methods are adequate. The following table summarizes airborne exposure controls and is aligned to the hierarchy of controls:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Change the work task or work methods so that work on ash ponds is no longer required | Substitute manual work methods for those that can be completed from the cab of a vehicle | Continually wet work areas to reduce the amount of ash that becomes airborne<br><br>Equip vehicles and heavy equipment cabs with filters. Clean and change filters as required | Conduct air monitoring or exposure sampling to confirm that airborne exposure is below regulatory limits | If exposure levels are above the PEL, equip employees with respirators appropriate to the level of exposure |

## 4.3 Stuck Vehicles/Equipment

If a vehicle or piece of equipment becomes stuck, a third-party towing or wrecking company who is trained in vehicle extraction must be retained and the IPRG POC will be notified. Bob's and Swise Towing (309-647-1633) is an approved extraction company that may be used to remove stuck vehicles. Third-party contractors may extract their own vehicle if they have an approved extraction plan, and a competent person is on site to implement the extraction. The extraction plan shall be included as part of the third-party contractor's reviewed and approved Safety and Health Plan. The above notifications are still required.

The hazards presented by stuck vehicles/equipment must not be underestimated. While the weight of the stuck equipment can be calculated, it's impossible to precisely calculate the other forces that are pulling against the towing vehicle which requires special training and experience to properly size towing equipment and select towing techniques. This is especially true for "complex" or high-hazard extractions involving equipment stuck at axle depth (or beyond) or sloped surfaces or any area where extraction activities could trigger shifts in the ground surface. No chains shall be used to remove stuck vehicles/equipment.

The following table summarizes safety controls related to stuck vehicles and equipment and are aligned to the hierarchy of controls:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Change the work task or work methods so that work on ash ponds is no longer required | Use the lightest available tracked equipment to reduce ground pressure<br><br>Substitute tracked equipment for wheeled equipment | Use crane mats or other cribbing to support heavy equipment on ash ponds<br><br>Lighten the load – Remove materials from stuck vehicles or equipment prior to extraction if possible | Only persons trained in vehicle extraction are permitted to remove stuck vehicles/equipment<br><br>A professional towing/wrecking service is required<br><br>Prepare for spills (damage to fuel or hydraulic systems) | All persons involved in removing stuck equipment must wear PPE that includes hard hat, safety boots, safety glasses, high visibility vests, and cut resistant gloves |

## 4.4 Working Near/Over Water

All employees, contract workers, and third-party contractors must wear a United States Coast Guard (USCG) approved personal floatation device (PFD), when within 6 feet of water, over water, and/or wading in water where the danger of drowning exists. The PFD must be properly

secured to the wearer, free of all defects including rips, tears, stress, and fading, and be kept clean and free of excessive dirt and oil.

If the possibility of falling into water has been eliminated through the use of guardrails, fall restraint, or other method, the use of a PFD is no longer required.

When performing work on water from a vessel, at least one lifesaving rescue vessel (*e.g.,* a skiff) shall be immediately available at locations where employees are working over, in, on, or adjacent to water where the danger of drowning exists. However, if the water is so shallow that rescuers could simply walk/run into the water body without endangering themselves and/or others or the work was being conducted very close to shore (*e.g.,* the length of the skiff from shore would be greater than the working distance from shore and/or the skiff would foul on the bottom), a skiff would not be required.

The following table summarizes the requirements for working over/near water where a drowning hazard exists and are aligned to the hierarchy of controls:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Change the work task or work methods so that work near a drowning hazard is no longer required | | Install guardrails that separate work areas from the drowning hazard | All work to be performed by at least two people where each is equipped with proper safety gear and capable of summoning emergency rescue | All personnel are required to wear suitable PFDs |
| | | Utilize equipment (crowd-control barricades, safety fence, etc.) that will keep personnel at least 6 feet from a drowning hazard | When working on water use of a rescue skiff as outlined above | |
| | | | Use of a ring buoy with 90 feet of braided polycarbonate (or equivalent) line | |
| | | | Ring buoys must be positioned within 100 feet of work (maximum of 200 feet spacing) | |

## 4.5 Heavy Equipment

All heavy equipment operators must be competent and authorized to operate each piece of heavy equipment. Forklift and telehandler (*e.g.,* Lull, JLG) operators must have a license or certificate that indicates they have passed a written test and "road" test for the equipment they will be operating within the last 3 years. Third-party contractors will provide proof of qualification upon request of IPRG.

Persons working around heavy equipment must implement the “25 Foot Rule.” The 25 Foot Rule requires that persons get the operator’s attention and permission prior to approaching closer than 25 feet to heavy equipment. Persons must walk quickly through blind spots. Loitering in heavy equipment blind spots (especially to the rear) must be avoided.

Temporary fuel storage tanks will be labelled as to their content and be protected from collision by Site vehicles using solid barricades including balusters, chain link fence, or equivalent. Spill kit (55-gallon sorbent capacity contained in an overpack) and one 20-pound Type ABC fire extinguisher will be located within 45 feet of fueling areas. Tanks will be rated for above ground use and will be double walled or have secondary containment in case of a leak. Tanks and dispensing hose will be bonded and grounded. On-site filling of fuel storage tanks will be completed with trucks that have automatic over-flow shutoffs. These trucks will be properly bonded to the storage tank and meet all of the other storage tank requirements. Temporary secondary containment must be provided in the refueling area that includes the storage tank and dispensing hoses.

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| | | Heavy equipment (and vehicles) must be equipped with backup alarms, horns, roll-over protection (when feasible) | Operators must be competent and authorized | Operators must use seatbelts when equipped |
| | | Vehicles and heavy equipment operated at night must have headlights, tail lamps, and reflectors | Forklift operators must have a current license or certificate (within 3 years) | High visibility vests are required when working around heavy equipment |
| | | | All vehicles and equipment must be turned off when not in use | |
| | | | Operators must inspect equipment daily prior to use | |
| | | | Persons working near heavy equipment must follow the “25 Foot Rule” and avoid lingering in blind spots as outlined above | |
| | | | Always obey site speed limits – 15 mph unless otherwise posted | |

## 4.6 Overhead Powerlines

All overhead powerlines must be assumed to be energized until confirmed otherwise. The minimum clearance distance for equipment working near energized power lines must be in accordance with the table found in 29 C.F.R. § 1926.1408(h).

The following table summarizes safety controls for work near energized power lines:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Plan to work away from powerlines | Use heavy equipment with shorter booms/attachments to avoid coming close to power lines | Contact the utility owner to deenergize the line | Install signs to warn personnel of overhead powerlines | |
| | | Contact the utility owner to install insulated sleeves over energized lines | Install a non-conductive distance marker to delineate minimum clearance | |
| | | | Use a dedicated spotter to ensure equipment does not enter minimum clearance distances | |

## 4.7 Severe Weather

Severe weather conditions include but are not limited to high winds, electrical storms, heavy rain, and tornados can cause hazardous conditions at CCR surface impoundments. The primary control for severe weather is monitoring weather reports prior to beginning work and as work occurs throughout the day.

Monitor lightning using a commercially available mobile application if cellular service is available. When lightning is observed within 10 miles of the CCR surface impoundment, or a storm is imminent, take shelter in the nearest solid structure or fully enclosed vehicle. If possible, secure all tools, materials, and equipment prior to the storm arriving. Work may resume 30 minutes after the last lightning strike is observed within 10 miles. The following locations are acceptable shelter locations near the CCR Units:

- GMF Pump House at the landfill area
- Dumper House at the Coal Yard
- New Stack base

Do not conduct work on a CCR surface impoundment when there is a risk for tornados in the area. If on a CCR surface impoundment and a tornado forms, seek the nearest substantial shelter. The closest tornado shelters are the same as the severe weather shelter locations; shelter locations will be reviewed during the Site Orientation Training. If no shelter is available, attempt to evacuate to a shelter using a vehicle. If a tornado forms and you are not in a shelter, take one of the following actions:

- Stay in a vehicle with the seat belt on, keep your head below the windows and cover it with your hands
- If there is an area which is noticeably lower than the work area, lie in that area and cover your head with your hands.

The following table summarizes safety controls related to severe weather:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Plan outdoor tasks on days with low potential for severe weather. | | | Prior to beginning outdoor work monitor the day’s weather. | |

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| | | | Periodically monitor weather throughout the day. Use a weather app which issues alerts for severe weather and lightning, assuming cell service is available | |
| | | | Utilize a weather radio if cellular service is inconsistent | |
| | | | Stop all outdoor work and seek shelter when lightning is observed | |

## 4.8 Heat Stress

Heat stress can be a significant hazard, especially for workers wearing protective clothing. Depending on the ambient conditions and the work being performed, heat stress can occur very rapidly, within as little as 15 minutes. Employees, contract workers, and third-party contractors will be instructed in the identification of a heat stress victim, the first-aid treatment procedures for the victim, and in the prevention of heat stress incidents.

Workers will be encouraged to immediately report any heat-related problems that they experience or observe in fellow workers. Any worker exhibiting signs of heat stress and exhaustion should be made to rest in a cool location and drink plenty of water. Emergency help by a medical professional is required immediately for anyone exhibiting symptoms of heat stroke, such as red, dry skin, confusion, delirium, or unconsciousness. Heat stroke is a life-threatening condition that must be treated immediately by competent medical authority.

### 4.8.1 Heat Stress Prevention

To prevent heat stress, IPRG employees, contract workers, and third-party contractors will implement heat stress prevention measures as outlined in OSHA's Heat Index (below). A summary of these precautions is described below.

| Heat Index | Risk Level | Protective Measures |
|---|---|---|
| Less than 91°F | Lower (Caution) | Basic heat safety and planning |
| 91°F to 103°F | Moderate | Implement precautions and heighten awareness |
| 103°F to 115°F | High | Additional precautions to protect workers |
| Greater than 115°F | Very High to Extreme | Triggers even more aggressive protective measures |

**Know the Symptoms:** Some symptoms associated with heat stress are: Employees should be aware of these symptoms with themselves and with their co-workers:

- Elevated heart rate, lack of concentration, difficulty focusing on a task, fatigue
- Irritability and/or sickness
- Cramps, rash, headache
- Loss of desire to drink water
- Fainting
- Skin clammy, moist, and pale (severe heat exhaustion)
- Skin extremely dry and red (heat stroke)

**Acclimatize:** When high heat stress conditions arise, employees should be exposed to the heat for short work periods followed by longer periods of work. Acclimatization usually takes five (5) days and should be provided for all new employees and employees returning from an absence of two (2) weeks or more. Contact Corporate Health and Safety for proper procedures.

**Hydration & Pace of Work:** Make sure all employees intake plenty of water throughout the work day (sometimes as much as a quart per worker per hour) and let employees know where the drinking water is located. Adjust your work pace and expectations on how much work can be done during periods of high heat stress. Workers cannot do as much during periods of high heat stress compared with similar periods of low heat stress. After acclimatization, workers may be able to resume a more "normal" work pace as long as fluid intake is adequate.

**Work/Rest Periods:** If possible, heavy work should be scheduled during the cooler parts of the day (*i.e.,* early morning) and rest periods should be taken in cool areas for longer periods.

**Personal Protective Equipment (PPE):** Employees using PPE (*i.e.*, Tyvek® suits or other equipment which may retain heat) can be more susceptible to heat stress due to the fact that heat/sweat often cannot escape the suits and/or the equipment. Persons wearing PPE that contributes to heat stress require more hydration, longer rest periods, or a reduced pace of work. Also, more careful monitoring of each person's health status is required by co-workers and management.

The following table summarizes safety controls for heat related illnesses:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Perform outdoor, strenuous, tasks at cooler times of day/year | Use mechanized equipment in place of manual labor | Install fans or air conditioning units in the work area | Train all personnel to know the signs of heat stress/stroke and how to prevent it | Implement the use of cooling vests or other similar PPE |
| | | Install a canopy to provide shade to work areas | Allow workers to acclimatize to the work environment | |
| | | Provide cool, shaded break areas | Adjust work pace to allow for the effects of heat | |
| | | | Implement work/rest periods | |

## 4.9 Cold Stress

The four environmental conditions that cause cold-related stress are low temperatures, high/cool winds (wind chill), dampness, and cold water. One, or any combination of these factors, can cause cold-related hazards. Cold stress, including frostbite and hypothermia, can result in severe health effects. Employees, contract employees, and third-party contractors will be instructed in the identification of a cold stress victim, the first-aid treatment procedures for the victim and in the prevention of heat stress incidents.

A dangerous situation of rapid heat loss may arise for any individual exposed to high winds and cold temperatures. Major risk factors for cold-related stresses include:

- Wearing inadequate or wet clothing thus increasing the effects of cold on the body.
- Taking certain drugs or medications such as alcohol, nicotine, caffeine, and medication thus inhibiting the body's response to the cold and/or impairing judgment.
- Having a cold or certain disease, such as diabetes, heart, vascular and thyroid problems, and thereby increasing susceptibility to the winter elements.
- Lower body-fat composition or other physiological differences. Statistics show that men experience far greater death rates due to cold exposure than women, potentially attributable to participation in risk-taking activities, lower body-fat composition and/or other physiological differences.
- Becoming exhausted or immobilized, especially due to injury or entrapment, thus speeding up the effects of cold weather.

The following table provides the resulting equivalent chill temperature to exposed skin because of increasing wind speeds at decreasing actual temperatures. Personnel shall be aware of predicted weather conditions before beginning site work and stay apprised of changes.

**TABLE 2. Cooling Power or Wind on Exposed Flesh Expressed as Equivalent Temperature (under calm conditions)***

| Estimated Wind Speed (in mph) | Actual Temperature Reading (°F) | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 50 | 40 | 30 | 20 | 10 | 0 | −10 | −20 | −30 | −40 | −50 | −60 |
| | Equivalent Chill Temperature (°F) | | | | | | | | | | | |
| calm | 50 | 40 | 30 | 20 | 10 | 0 | −10 | −20 | −30 | −40 | −50 | −60 |
| 5 | 48 | 37 | 27 | 16 | 6 | −5 | −15 | −26 | −36 | −47 | −57 | −68 |
| 10 | 40 | 28 | 16 | 4 | −9 | −24 | −33 | −46 | −58 | −70 | −83 | −95 |
| 15 | 36 | 22 | 9 | −5 | −18 | −32 | −45 | −58 | −72 | −85 | −99 | −112 |
| 20 | 32 | 18 | 4 | −10 | −25 | −39 | −53 | −67 | −82 | −96 | −110 | −121 |
| 25 | 30 | 16 | 0 | −15 | −29 | −44 | −59 | −74 | −88 | −104 | −118 | −133 |
| 30 | 28 | 13 | −2 | −18 | −33 | −48 | −63 | −79 | −94 | −109 | −125 | −140 |
| 35 | 27 | 11 | −4 | −20 | −35 | −51 | −67 | −82 | −98 | −113 | −129 | −145 |
| 40 | 26 | 10 | −6 | −21 | −37 | −53 | −69 | −85 | −100 | −116 | −132 | −148 |
| (Wind speeds greater than 40 mph have little additional effect.) | LITTLE DANGER In < hr with dry skin. Maximum danger of false sense of security | | | | INCREASING DANGER Danger from freezing of exposed flesh within one minute. | | | | GREAT DANGER Flesh may freeze within 30 seconds. | | | |
| | Trenchfoot and immersion foot may occur at any point on this chart. | | | | | | | | | | | |

*Developed by U.S. Army Research Institute of Environmental Medicine, Natick, MA.
Equivalent chilll temperature requiring dry clothing to maintain core body tempearture above 36°C (96.8°F) per cold stress TLV

The following table summarizes safety controls for preventing cold stress:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Perform work during warm parts of the day or warmer parts of the year | | Install heaters in enclosed work areas | Train all personnel on the symptoms of cold stress and how to prevent it | All personnel must wear multiple layers of clothing |
| | | Provide a warm break area | Implement work/rest schedule | Utilize hand/foot warmers when required |

An additional hazard in cold weather conditions is the increased risk for slips from the accumulation of ice and snow in general work areas, ruts where water is accumulated, and heavy equipment. The following table outlines controls that may be used for preventing slips:

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Perform work during warm parts of the day or in areas free of accumulated areas | | Clear snow in work areas | | Use traction control devices (*i.e.,* YakTrax) on work boots to provide additional traction. |
| | | Apply salt/sand to icy areas | | |
| | | Use equipment to access work areas | | |

## 4.10 Biological Hazards

The following are biological hazards that may be present at the Site.

### 4.10.1 Ticks (Lyme Disease) & Mites

Although Lyme disease has been detected throughout the continental United States, it is prevalent primarily in certain areas in New England, the Mid-Atlantic and the northern Midwest

states. Although Lyme disease is the most common tickborne illness, other tickborne illnesses include southern tick-associated rash illness, Rocky Mountain spotted fever, ehrlichiosis, and tularemia. More information on Lyme disease and other tickborne illnesses can be found from the CDC.

**Prevention**

- Standard field gear (work boots, socks, and light-colored coveralls) provides good protection against tick bites, particularly if the joints are taped. However, even when wearing field gear, the following precautions shall be taken when working in areas that might be infested with ticks:
  - Wear long pants and long-sleeved shirts that fit tightly at the ankles and wrists, tape cuffs if necessary
  - Wear light colored clothing so ticks can be easily spotted
  - Per- and polyfluoroalkyl substances (PFAS)-free tick repellents (DEET and Permethrin) must be used when walking in all overgrown areas. DEET (≥25 percent [%]) must be applied to skin while permethrin must be applied to clothes and allowed to dry. Spray outer clothing, particularly your pant legs and socks, BUT NOT YOUR SKIN, with an insect repellent that contains permethrin. For heavily infested tick areas, wear spun polypropylene coveralls that have been sprayed with permethrin.
  - Inspect clothing frequently
  - Inspect head and body thoroughly when you return from the field, particularly on your lower legs and areas covered with hair
  - When walking in wooded areas, wear a hard hat, and avoid contact with bushes, tall grass, or brush as much as possible

**Removal**

- Remove any ticks by tugging with tweezers or special tick removal tools
- Do not squeeze or crush the tick
- DO NOT use matches, a lit cigarette, nail polish, or any other type of chemical to "coax" the tick out

**Treatment**

- Disinfect the area with alcohol or a similar antiseptic after removal.
- Notify the Safety Competent Person of the embedded tick.
- For several days to several weeks after removal of the tick, look for the signs of the onset of Lyme disease, such as a rash.
- No further treatment is necessary for ticks embedded <48 hours.
- If other signs or symptoms of Lyme are observed (fever/chills, aches, and pains), then notify the Safety Competent Person and seek medical attention.

The following table summarizes safety controls to reduce the hazards associated with ticks and mites.

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Use mechanical equipment to remove overgrown vegetation | | Remove overgrowth and excessive vegetation from walkways and work areas (provide safe access) | Train personnel on tick and mite prevention. Areas of vegetation overgrowth and/or debris piles should be considered "high risk" areas | Wear light-colored long sleeved shirt tucked into pants. Tuck pant legs into socks |
| | | | Perform frequent tick checks in the field and a thorough tick check after completing work activities | Apply Permethrin to clothes and DEET (20% or more) to exposed skin |
| | | | Call licensed pesticide contractors to remove infestations of bees, wasps, fire ants, etc. | |

### 4.10.2 Insect Bites/Stings

Stinging/biting insects at the Site include spiders, wasps, and bees. Contact with these insects may result in project personnel experiencing adverse health effects that range from being mildly uncomfortable to being life-threatening. Therefore, insects present a serious hazard to project personnel, and extreme caution must be exercised whenever Site and weather conditions increase the risk of encountering stinging insects. Some of the factors related to stinging insects that increase the degree of risk associated with accidental contact are as follows:

- The nests for these insects are frequently found in remote wooded or grassy areas or equipment staging areas where equipment has not been moved recently.
- Some people are hypersensitive to the toxins injected by a sting, and when stung, experience a violent and immediate allergic reaction resulting in a life-threatening condition known as anaphylactic shock. Anaphylactic shock manifests itself very rapidly and is characterized by extreme swelling of the body, eyes, face, mouth, and respiratory passages.
- The hypersensitivity needed to cause anaphylactic shock, can in some people accumulate over time and exposure, therefore even if someone has been stung previously and not experienced an allergic reaction, there is no guarantee that they will not have an allergic reaction if they are stung again
- Spider bites generally only cause localized reactions such as swelling, pain, and redness. However, bites from a Black Widow or Brown Recluse, or if you are allergic to spiders, can cause symptoms that are more serious.
- *If a worker knows that they are hypersensitive to bee, wasp, or hornet stings, or other insects, they must inform the Safety Competent Person prior to site work. Persons who have been prescribed epi-pens by their physician must have an epi-pen on the Site.*
- Inspect any clothing or PPE that has been left for a period of time prior to putting it on. Shake out the clothing and inspect the inside of safety shoes/boots prior to putting them on
- Nests in active work areas must be eradicated. Small nests may be handled by Site personnel using consumer-type insecticide. A pest control contractor should be hired to handle large or difficult to reach nests.

The following table outlines safety controls to reduce the risk of hazards associated with stinging/biting insects.

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Use mechanical equipment to remove overgrown vegetation | | Remove overgrowth and excessive vegetation from walkways and work areas (provide safe access) | Train personnel on stinging/biting insect prevention. Areas of vegetation overgrowth and/or debris piles should be considered "high risk" areas | Wear light-colored long sleeved shirt tucked into pants. Tuck pant legs into socks |
| | | Eradicate nests in the work area as outlined above. | Instruct personnel to inspect/shake out clothing and work boots that have been left for a period of time. | Apply Permethrin to clothes and DEET (20% or more) to exposed skin – NOTE this will not repel bees/wasps |
| | | | Instruct employees who are hypersensitive to insect bites/stings to carry their epi-pen while on site | |

### 4.10.3 Venomous Snakes

There are four species of venomous snakes in Illinois, they are:

- Copperhead
- Cottonmouth Water Moccasin
- Timber rattlesnake
- Eastern Massasauga

Generally, these snakes are found in the southern one-third of the state, with the Cottonmouth Water Moccasin found mostly in the southernmost portions of Illinois. Snakes are generally found in tall grass, wood piles, or other covered areas. Snakes are generally not aggressive towards humans, but if they are encountered avoid the snake and do not provoke it. If bitten by a snake that may be venomous seek medical treatment.

The following table outlines safety controls to reduce the hazard associated with venomous snakes.

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Use mechanical equipment to remove overgrown vegetation | | Remove debris piles, overgrowth and excessive vegetation from walkways and work areas (provide safe access) | Train personnel on the identification of venomous snakes. Areas of vegetation overgrowth and/or debris piles should be considered "high risk" areas | If working in area with snakes cannot be avoided, wear snake chaps |
| | | | Instruct personnel to not disturb snakes if they identify one in their work area | |

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| | | | Use caution when moving staged tools or materials into which snakes may have moved | |

### 4.10.4 Poisonous Plants and Plant Hazards

Poison ivy and poison oak may be present at the Site. Poison ivy thrives in all types of light and usually grows in the form of a trailing vine; however, it can also grow as a bush and can attain heights of 10 feet or more. Poison ivy has pointed leaves that grow in clusters of three. Poison oak resembles poison ivy except that the poison oak leaves are more rounded rather than jagged like poison ivy, and the underside of poison oak leaves are covered with hair.

The skin reaction associated with contacting these plants is caused by the body's allergic reaction to toxins contained in oils produced by the plant. Becoming contaminated with the oils does not require contact with just the leaves. Contamination can be achieved through contact with other parts of the plant such as the branches, stems or berries, or contact with contaminated items such as tools and clothing. The allergic reaction associated with exposure to these plants will generally cause the following signs and symptoms:

**Symptoms**

- Blistering at the site of contact, usually occurring within 12 to 48 hours after contact and in many cases, persons experience almost immediate irritation.
- Reddening, swelling, itching, and burning at the site of contact.
- Pain, if the reaction is severe.
- Conjunctivitis, asthma, and other allergic reactions if the person is extremely sensitive to the poisonous plant toxin.

**Prevention**

- The best treatment appears to be removal of the irritating oil before it has had time to cause inflammation by wiping exposed skin with rubbing alcohol followed by washing with soap and water.
- A visual Site inspection and identification of the plants should be completed prior to starting work so that all individuals are aware of the potential exposure. Avoid contact with any poisonous plants on the Site, and keep a steady watch to identify, report, and mark poisonous plants found on the Site.
- Avoid contact with, and wash daily, contaminated tools, equipment, and clothing.
- Barrier creams (Ivy Block®) and orally administered desensitization may prove effective and should be tried to find the best preventive solution.
- Keeping the skin covered as much as possible (*i.e.*, long pants and long-sleeved shirts) in areas where these plants are known to exist will limit much of the potential exposure. PFAS-free spun polypropylene coveralls or Tyvek® may be worn to prevent contact of skin and clothes with poison ivy.

The following table outlines safety controls to mitigate the hazards associated with poisonous plants.

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| Use mechanical equipment to remove overgrown vegetation | | Remove overgrowth and excessive vegetation from walkways and work areas (provide safe access) | Train personnel on the identification of poisonous plants | Wear pants and long sleeves when working in overgrown areas |
| | | | Instruct personnel to avoid areas where poisonous plants have been identified | Consider the use of a coverall when working in areas where these plants are present, especially for hypersensitive employees. |
| | | | Provide isopropyl alcohol along with soap and water to remove oils from skin, tools, and equipment. | |

## 4.11 Working Alone

As outlined in Section 4.1, working alone while on an ash pond must be pre-approved by the POC. Working alone is prohibited for tasks deemed to be high risk by IPRG including, but not limited to, handling highly hazardous chemicals (sulfuric acid), work over/near water, excavation and trenching, hot work (grinding, welding and torch cutting), and elevated work that requires personal fall arrest. Third-party contractors are responsible for identifying potential high-risk tasks in their Safety and Health Plan and requiring that a buddy system be implemented while high risk work is performed. The buddy must be located in a safe area but may perform other tasks that do not prevent observing the person performing high risk work. Working alone may occur on and around other parts of the Site when there is no drowning hazard or risk of severe injury due to high-risk work.

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| | Modify work methods by substituting lower hazard methods for high hazard methods | Varies depending on the hazard, but for example, could include installing guardrails (temporary or permanent) which mitigates a fall hazard reducing the risk to levels where working alone may be permitted | Prohibit working alone on ash ponds and for other high hazard tasks without prior approval from the POC | |
| | | | Implement a buddy system whenever feasible (required for high hazard work) | |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Elimination | Substitution | Engineering | Administrative | PPE |
|---|---|---|---|---|
| | | | Implement a worker check-in, emergency alerting, and monitoring system | |

# 5. HAZARD COMMUNICATION

As required by 35 I.A.C. § 845.530, the OSHA HAZWOPER standards (29 C.F.R. § 1910.120 and 29 C.F.R. § 1926.65) and OSHA Hazard Communication Standard, site personnel, subcontractors, and visitors must be informed of chemical hazards associated with their work area. The information in this section is based on:

- Recommendations in the most recent "NIOSH Pocket Guide to Chemical Hazards" by the Department of Health and Human Services, Centers for Disease Control and Prevention, and the NIOSH Pocket Guide.
- Requirements set forth in the OSHA regulations from as defined in Chapter 17 of 29 C.F.R. § 1910.1200(c) for all hazards not otherwise classified.

## 5.1 Coal Combustion Residuals

Primary exposure to CCR is through inhalation and skin contact. CCR is typically a fine, black, grey, or tan particulate. CCR is comprised of several components. The following table outlines the components of the CCR. The exact percentage of each component will vary based on the type of ash and location at the surface impoundment.

| Chemical | Percentage | PEL | IDLH | ACGIH TLV | Symptoms of Exposure & Health Effects |
|---|---|---|---|---|---|
| Crystalline Silica | 20-60% (total) | 0.05 mg/m$^3$ (respirable) | 25 mg/m$^3$ (respirable) | 0.025 mg/m$^3$ (respirable) | Cough, dyspnoea (breathing difficulty), wheezing; decreased pulmonary function, progressive respiratory symptoms (silicosis); irritation eyes; [potential occupational carcinogen] |
| Iron oxide | 1-10% | 5 mg/m$^3$ | 2500 mg/m$^3$ | 5 mg/m$^3$ | Benign pneumoconiosis with X-ray shadows indistinguishable from fibrotic pneumoconiosis (siderosis) |
| Calcium oxide | 10-30% | 5 mg/m$^3$ | 25 mg/m$^3$ | 2 mg/m$^3$ | irritation eyes, skin, upper respiratory tract; ulcer, perforation nasal septum; pneumonitis; dermatitis |
| Titanium dioxide | <3% | 15 mg/m$^3$ | ND | 10 mg/m$^3$ | Lung fibrosis; [potential occupational carcinogen] |
| Aluminosilicates | 10-60% | 15 mg/m$^3$ (PNOR) | ND | 10 mg/m$^3$ (PNOR) | irritation eyes, skin, throat, upper respiratory system |
| Magnesium oxide | 2-10% | | | | |
| Magnesium dioxide | <2% | | | | |
| Phosphorous pentoxide | ≤2% | | | | |
| Sodium oxide | 1-10% | | | | |
| Potassium oxide | ≤1% | | | | |
| Bromide salt | <0.1% | | | | |

**Footnotes:**

All values are 8-hour time-weighted averages (TWAs) unless otherwise indicated.

- PEL: Permissible Exposure Limit, the concentration an employee may be exposed to for an 8-hour work day for a 40-hour work week for which nearly all employees may be repeatedly exposed without adverse health effects.
- IDLH: IMMEDIATELY Dangerous to Life and Health, contaminant concentration which present the possibility for severe health consequences if exposed to the IDLH concentration without the appropriate personal protective equipment (PPE).
- ACGIH TLV: American Conference of Governmental Industrial Hygienists Threshold Limit Value
- mg/m$^3$ = milligrams per cubic meter of air
- PNOR: Particulates Not Otherwise Regulated
- ND: Not Determined

## 5.2 Safety Data Sheets

Pursuant to 35 I.A.C. § 845.530(b)(3), IPRG will provide Safety Data Sheets (SDSs) to all employees, contract workers, and third-party contractors for the CCR located at the Site. Third-party contractors will provide SDSs to the Environmental Manager prior to bringing a material on site. SDSs are provided in Appendix E.

## 5.3 Signage

The absence of any of the following signage does not mean that a potential hazard does not exist. Signage will be posted by IPRG, but employees, contract workers, and third-party contractors must remain vigilant for changing site conditions.

To aid in hazard communication and pursuant to 35 I.A.C. § 845.530(f), IPRG will post the following signs at the Site:

- Signs identifying the hazards of CCR, including dust inhalation when handling CCR.
- Signs identifying unstable CCR areas that make the operation of heavy equipment hazardous.
- Signs identifying the necessary safety measures and necessary precautions, including the proper use of PPE.

The following signs may also be posted at the CCR units to aid in hazard communication:

- Overhead electrical lines that may be struck by heavy equipment of vehicles will have signs warning drivers of their presence.

# 6. EMERGENCY RESPONSE PLAN

This emergency response section details actions to be taken in the event of site emergencies. This section is consistent with the DCPP Emergency Response Plan. All personnel on site must be familiar with emergency signals and the content of this section.

## 6.1 Emergency Phone Numbers & Notifications

| Emergency Number | |
|---|---|
| **Site Address** | **Emergency Phone Number** |
| 17751 North Cilco Rd<br>Canton, IL 61520 | 911 |
| | Security Guard: 713-542-0619 |

| Medical Treatment | |
|---|---|
| **Local Hospital** | **Phone Number** |
| Graham Hospital<br>410 East Elm St<br>Canton, IL | 309-647-4088 |

| Incident Notifications | | |
|---|---|---|
| **Title** | **Name** | **Contact Number** |
| Security Guard | | 712-542-0619 |
| POC | Brandon Potter | 618-210-3418 |

## 6.2 Evacuation Signal

Upon receiving notification to evacuate, all personnel will leave the work area and proceed to the muster point.

## 6.3 Muster Point

The muster point for the Site is located at the Security Office by the Main Entrance (Appendix A). The following locations are acceptable severe weather shelter locations near the CCR Units:

- GMF Pump House at the land fill area
- Dumper House at the Coal Yard
- New Stack base

## 6.4 Calls for Emergency Support

In the case of an emergency, site personnel will call **911** followed by notifying the security guard (713-542-0619). The security guard will coordinate the arrival of on-site emergency personnel. The individual calling for emergency support will briefly explain the nature of the emergency and site conditions as follows:

- Indicate his/her name
- Location of emergency
- Description of emergency conditions that may require special rescue equipment, such as confined spaces, excavations, and elevated work platforms
- Potential chemical hazards and recommended PPE

## 6.5 Fire & Explosion Response Plan

Trained site personnel may respond to incipient stage fires using a 20-pound Type ABC dry chemical fire extinguisher or hose. An incipient stage fire is a fire which is in the initial or beginning stage and which can be controlled or extinguished by portable fire extinguishers, Class

II standpipe or small hose systems without the need for protective clothing or breathing apparatus. Personnel shall only attempt to extinguish the fire if it is safe to do so.

A fire that CANNOT be readily extinguished with a fire extinguisher will require evacuation of the work area personnel to Muster Point areas per this Safety and Health Plan. If personal injuries result from any fire or explosion, the procedures outlined in the Personal Injury Response Plan will also be followed.

All fires or explosions must be reported to the contacts outlined in Section 6.1 of this Safety and Health Plan.

## 6.6 Injury Response Plan

Treatment for minor injuries will be provided on site using available first aid supplies and personnel trained in first aid. All third-party contractors must have at least one individual on site who is trained in first aid, CPR, and AED use. Third-party contractors must provide their own first aid kits and AED. For minor injuries that are not life-threatening but require further medical attention, employees should be treated by occupational physicians at occupational clinics whenever possible. Treatment of minor injuries by emergency room or personal physicians should be avoided. When injured workers are released back to work with restrictions, all subcontractors are expected to accommodate those restrictions.

Emergency medical incidents include puncture wounds to the head, chest, and abdomen, serious head and spinal cord injuries, and loss of consciousness must be treated at the hospital emergency room listed in Section 6.1 of this Safety and Health Plan.

All injuries must be reported to the contacts outlined in Section 6.1 of this Safety and Health Plan.

## 6.7 Spill Response Plan

In general, IPRG employees, contract workers, and third-party contractors are trained and equipped to handle small spills associated with their work. Third-party contractors must include an approved spill response plan in their Safety and Health Plan. Site personnel will generally respond to spills as follows:

- Stop the leak immediately if it can be done without directly contacting the leaking material.
- Remove or stop all ignition sources (hot work, generators, etc.) that are within 25 feet of any part of the spill.
- On-site personnel should immediately secure the area to prevent unauthorized entry into the spill area.
- Although not likely given the anticipated types of spills, site personnel must immediately initiate evacuation if a spill may cause an explosion, death, or serious injury.
- Site personnel may only respond to incipient stage fires regardless if such fires are associated with a spill.
- PPE for spills to open areas generally requires Modified Level D PPE (poly-coat Tyvek®, nitrile gloves, and boot covers or boot decontamination). Over-boots or boot covers may also be used if persons cleaning the spill would have to walk on spilled materials. Latex gloves are not acceptable and will degrade with exposure to petroleum products.
- Contact the Environmental Manager upon containing the spill.

## 6.8 CCR Spill or Release Response Plan

Response to minor or incidental spills of CCR will be managed as outlined in the General Spill Response Plan. An incidental release is a release of a hazardous substance which does not pose a significant safety or health hazard to employees in the immediate vicinity or to the employee cleaning it up, nor does it have the potential to become an emergency within a short time frame. Incidental releases are limited in quantity, exposure potential, or toxicity and present minor

safety or health hazards to employees in the immediate work area or those assigned to clean them up. An incidental spill may be safely cleaned up by employees who are familiar with CCR. Response to major releases of CCR will be in accordance with the DCPP Emergency Action Plan, which can be found on the Luminant CCR website at https://www.luminant.com/ccr/.

## 6.9 Ash Pond Rescue

Ash ponds may be unstable and represent an engulfment hazard if persons and equipment traverse the surface, berms, or other unstable areas. Special training is required on behalf of emergency responders to retrieve persons and equipment who become trapped in unstable ash. **Untrained persons must not enter unstable areas** in an attempt to conduct rescue because of the significant potential that they will also become victims. Call 911 and the Guard Shack emergency number and state that an "ash pond rescue" is required. The Guard Shack will notify the designated service to perform the ash pond rescue. On-site personnel should remain on stand-by to support the ash pond rescue team as necessary.

## 6.10 Incident Reporting

All incidents must be reported to the contacts outlined in Section 6.1 of this Safety and Health Plan. An Incident Report must be completed for all injuries, illnesses, spills, fire, explosion, or property damage. The absence of an injury does not preclude the need to complete an Incident Report as such incidents will be classified as "near miss" or "other." It will include, but is not limited to, the nature of the problem, time, location, and corrective actions taken to prevent recurrence.

## APPENDIX C
## DRUG SCREEN POLICIES AND SUPPLEMENTAL TERMS

Electronic Filing: Received, Clerk's Office 06/20/2024

Drug and Background Investigations

Contractor is solely responsible for ensuring that all members of Contractor Project Team have completed and passed all drug and alcohol tests and background investigations required under this Attachment and under Contractor's own programs before assigning such personnel to perform Work. Contractor is also solely responsible for ensuring that such testing and investigations are performed in accordance with all applicable laws.

1. Required Investigations. Except as otherwise required by applicable law, Required Investigations shall consist of all of the following:

   1.1 a 7-panel drug screening;

   1.2 a background investigation that includes a criminal records check in all counties where the applicable person has resided for at least the last seven (7) years;

   1.3 a third-party verification of previous employment and the highest education level completed by the applicable person;

   1.4 a check of the National Sex Offender Registry and Terrorist Watch List (Denied Parties); and

   1.5 a check of Motor Vehicles Record (if work to be performed by the applicable person requires driving as part of the defined duties).

2. Notices to Tested Persons Regarding Background Checks. All background checks will be conducted in compliance with applicable provisions of the Fair Credit Reporting Act.
3. Forms and Testing Organization for Drug Tests. Except for those positions subject to Department of Transportation ("DOT") drug and alcohol testing regulations, all drug testing shall be performed using the Universal Toxicology four part "Non-DOT" Chain of Custody and Request Form with white and blue top page, and shall be conducted by an independent third-party organization.

4. Pass/Fail Standards – Background Checks. A person shall be deemed to have failed the applicable background check if:

   4.1 information is reported through the background check process indicating that such person has failed to disclose or misrepresented information requested at any time about such a person's criminal background history; or

   4.2 such person has ever committed any felony constituting a violent crime, crime against a person, sexual offense or fraud; or

   4.3 such person has committed any other felony, or has been incarcerated for a felony, within ten (10) years prior to the date of such background check (i.e., for these felonies there must be a ten (10) year lapse in time from the later of the commission and the end of any period of incarceration); or

   4.4 such person has committed any misdemeanor that:

      4.4.1 involves violence that is sexually related; or

Electronic Filing: Received, Clerk's Office 06/20/2024

4.4.2 consists of a DUI that is the second (or more) DUI in the last two (2) years prior to the date of the background check; or

4.4.3 consists of a theft-related offense; provided that there can be no more than one theft by check and it must have been for an amount less that $100; or

4.4.4 consists of any drug-related misdemeanor committed at any time within forty-eight (48) months prior to the date of the background check.

4.4 For purposes of both felonies and misdemeanors, a person is deemed to have committed the applicable offense if he/she is convicted or enters a plea of guilty or nolo contendere for such offense (to include, without limitation, sentences of probation and deferred adjudication).

5. Pass/Fail Standards – Drug Tests. A person shall be deemed to have failed the applicable drug test if any of the following maximum cut-off levels are exceeded, unless there is a legitimate medical explanation for the presence of a tested substance at or above the applicable cut-off level:

| | | |
|---|---|---|
| 5.1 | Amphetamines | 500ng/mL |
| 5.2 | Barbiturates | 150ng/mL |
| 5.3 | Benzodiazepines | 150ng/mL |
| 5.4 | Cocaine | 150ng/mL |
| 5.5 | Marijuana | 150ng/mL |
| 5.6 | Opiates | 2000ng/mL |
| 5.7 | Phencyclidine | 25ng/mL |

For any positions subject to DOT drug and alcohol testing requirements, testing shall be conducted according to the applicable DOT panel and cutoff levels.

6. Other Requirements.

6.1 Background checks and drug tests will be paid for by Contractor without reimbursement by Company.

6.2 Contractor will keep background checks and drug test records while the applicable persons are working pursuant to this Agreement and for three (3) years thereafter.

6.3 Upon request, Contractor will provide a certification to Company that no person required hereunder to pass a background check or drug test has failed such investigation or test. Contractor will not provide the specific results of the background check or drug test of any individual to Company.

6.4 If any person required under this Agreement to pass a background check or drug test fails such check or test, Contractor will not report the specific results of such check or test to Company and will not allow such individual to perform any Work for Company. Although such person may not be assigned to perform any Work for Company, nothing in this Attachment requires Contractor to take any other action with respect to such person's employment with Contractor.

Electronic Filing: Received, Clerk's Office 06/20/2024

Supplemental Terms for Onsite Services

1. SAFETY

1.1 Contractor agrees that any safety-related assistance or initiatives undertaken by Company will not relieve Contractor while on Company Property from responsibility for the implementation of, and compliance with, safe working practices, as developed from their own experience, or as imposed by law or regulation, and will not in any way, affect the responsibilities resting with Contractor under the provisions of any agreement to which these policies are attached and to meet all safety requirements as specified by the Occupational Safety & Health Administration (OSHA), the Mine Safety Health Administration (MSHA), including the "Mining Contractor Safety Reference Handbook" located at http://www.vistraenergy.com/wp-content/uploads/2016/12/Contractors-Safety-Handbook_Final-MC-08262016.pdf, the Department of Transportation (DOT) and any other applicable state or federal safety and health laws or regulations.

1.2 In the event that a material safety data sheet, warning label, or other documentation concerning the use of hazardous chemicals at any property owned or controlled by Company or any of its affiliates (collectively, "Company Properties"), applies to any materials or equipment provided by Contractor as an aspect of the Work, such documentation will be provided by Contractor to Company prior to the commencement of any such Work.

1.3 Contractor will report to Company all accidents involving personal injuries (including death) and damage to property occurring directly or indirectly as a result of the Work performed by Contractor hereunder immediately, but in no event, no later than 24 hours after the occurrence of any such accident. Any accident or incident occurring directly or indirectly as a result of the Work which Contractor must report to a regulatory agency (e.g. OSHA, MSHA, TCEQ) must also be reported to Company immediately following notification to the regulatory agency.

2. SECURITY

2.1 It will be the affirmative duty of Contractor to ensure that Contractor Group assists in carrying out all security measures, to include reporting all information or knowledge of matters adversely affecting security to Company's designated security personnel.

2.2 Company reserves the right to exclude any of Contractor's employees from any Company Property by denial of access, suspension or revocation of access authorization, preemptory expulsion, or by any other means, without notice or cause. Former Company employees, and any of Contractor's employees who previously have been excluded from any Company Property, may be brought onto Company property or facilities only if prior approval from Company is obtained. If Contractor terminates a member of Contractor Group performing Work on Company's premises, Contractor shall inform Company immediately, but in no event, no later than twenty-four (24) hours after such employee is terminated in order for Company to remove access to Company Property for such employee.

2.3 Company measures may also include investigations, whether by Company or law enforcement officials. Contractor agrees to cooperate in such investigations and understands that Company

Electronic Filing: Received, Clerk's Office 06/20/2024

reserves the right to require anyone in Contractor Group to authorize appropriate agencies to release his or her criminal records to Contractor as a condition of either initial or continued permission for access to any Company Property. Investigations may include searches of Contractor Group. Such searches may include searches of facilities assigned to Contractor Group, search of all Company Property areas and property at such Company Property areas, searches of including, but not limited to, offices, lockers, desks, lunch boxes, packages and motor vehicles (regardless of ownership). Without limiting the foregoing, Contractor acknowledges and agrees that all members of Contractor Group, to the extent that Company reasonably determines that such members require security badge access prior to entering onto any Company Property, shall be required to comply with Company's standard security badge requirements, including without limitation a background check to be performed by Company.

3. ISNETWORLD

3.1 Contractor agrees to maintain at Contractor's expense a subscription with ISNetworld (www.ISNetworld.com), Company's safety compliance program or any replacement program therefor, as directed by Company, for the Term of the Agreement. Contractor shall also furnish ISNetworld with any information requested by ISNetworld relating to ISNetworld's evaluation of the Contractor's safety program and practices. As a minimum, requested documents will be related to safety, health, and insurance (i.e., regulatory required training, certifications, safety plans, safe and secure workplace practices, insurance certificates, etc.), OSHA and MSHA injury rates and Experience Modification Rate (EMR).

3.2 Contractor has and during the performance of this Agreement shall continue to report full, complete and accurate information to ISNetworld concerning Contractor's employees.

4. MATERIALS, EQUIPMENT AND LABOR. Contractor will be solely responsible for the proper storage, transportation and disposal of any product or waste, other than sandblasting waste, used or generated in connection with the Work in accordance with all applicable Environmental Laws. Contractor will dispose of all waste materials, other than sandblasting waste, at an off-site disposal facility approved for such waste materials pursuant to applicable Environmental Laws and will complete and sign all waste manifests as the generator of such waste. Company will be responsible for the storage, transportation and disposal of any sandblasting waste generated during the performance of the Work.

5. CONDITIONS AFFECTING WORK

5.1 Contractor will investigate and acquaint itself with the conditions affecting the Work, including but not limited to those related to the transportation, disposal, handling and storage of materials and waste; availability of labor, water, electric power and roads; the uncertainties of weather, river stages or similar physical conditions at the site; the conformation and condition of the ground; and the character of equipment and facilities needed preliminary to and during prosecution of the Work. Contractor has satisfied itself as to the character, quality and quantity of surface and subsurface materials or obstacles to be encountered. Contractor's failure to acquaint itself with any conditions affecting the Work or any available related information will not relieve it from responsibility for properly estimating the difficulty or cost of successfully performing the Work.

5.2 Contractor assumes full responsibility for investigating conditions and determining the existence and magnitude of any hazards to the physical well-being of property of Contractor, the employees, agents, and servants of Contractor, or any other person or entity who is or may become involved in

Electronic Filing: Received, Clerk's Office 06/20/2024

the performance of Work, and any and all other persons in the vicinity of the Work. Contractor will advise all of the above-specified persons or entities of any hazards relating to Work, and will ensure that those persons or entities are advised of and fully understand the nature of the hazards and safety precautions that can be taken to eliminate or minimize dangers relating to the hazards.

5.3 Contractor will provide information to Company regarding hazardous chemicals and/or consumable products that contain constituents listed in 40 CFR 372.65 used at any Company Property. Contractor will report the amount of such material carried on and off the site, the amount actually used and the manner of use. Contractor will provide the maximum quantity of the material stored on site at any one time and if a waste material was collected, where it was disposed of (location name and address). Contractor will provide information on the amount of material used for the previous calendar year by the first of February.

5.4 Contractor will use its best efforts to ensure that the Work is performed so as to minimize any adverse impact upon natural resources and the environment and will use best industry practices in this regard at all times.

5.5 Contractor acknowledges and agrees that all members of Contractor Group performing Work at any Company Generation or Mining Property are required to view Company's "Contractor/Visitor Safety Orientation" video (in the case of Company Generation property), when applicable, and to read and adhere to Company's "Contractor/Visitor Safety Booklet" (in the case of Company Mining property) prior to performing any Work at any Company Generation or Mining Property.

5.6 Contractor will immediately notify Company as soon as Contractor has reason to believe that Contactor, or any employee or other person performing the Work, is not or may not be performing the Work in compliance with applicable Environmental Laws. Contractor will provide Company with written notice to Company of such actual or potential non-compliance within three (3) days following the discovery thereof. Contractor will take immediate steps to ensure compliance with all applicable Environmental Laws and will, if directed by Company, cease all Work until authorized by Company to resume the Work.

5.7 Contractor will report to Company all accidents involving personal injuries (including death) and damage to property occurring directly or indirectly as a result of the Work performed by Contractor hereunder immediately, but in no event, no later than 24 hours after the occurrence of any such accident. Any accident or incident occurring directly or indirectly as a result of the Work which Contractor must report to a regulatory agency (e.g. OSHA, MSHA, TCEQ) must also be reported to Company immediately following notification to the regulatory agency.

## 6. WORK SITE PERMITS AND LICENSES

6.1 Subject to the following two paragraphs, Contractor will obtain, prior to the commencement of the Work, and provide to Company upon request, all permits, licenses and governmental authorizations, at its sole expense, required for the performance of the Work. Contractor will be solely responsible for maintaining compliance with such permits, licenses and governmental authorizations.

6.2 In the event that a storm water discharge permit is required for the performance of the Work, (i) Contractor will be responsible for filing a Notice of Intent with respect to the Work, in addition to any Notice of Intent that Company may be required to file, and (ii) Contractor will coordinate with

Electronic Filing: Received, Clerk's Office 06/20/2024

Company in the preparation and execution of a Storm Water Pollution Prevention Plan for the Work Site.

6.3 In the event that the performance of the Work involves the handling or abatement of asbestos-containing materials, Contractor will coordinate with Company in the preparation and filing of all required notification forms.

7. ACCESS. Should Contractor desire access to the Work Site over any land not controlled by Company, it will, at its sole expense, obtain all proper permits or written permission necessary for that access.

8. COMPANY FACILITIES. Contractor will not use Company's sanitary facilities, changehouses, shops, parks, storage buildings, tools, equipment or other facilities unless so directed by Company. Contractor will not discharge, without Company's prior written authorization, any product or waste used or generated in connection with the Work through any (i) Company-permitted outfall, (ii) Company-owned or operated pollution control equipment, or (iii) storm or sanitary sewer located at or in the vicinity of the Work Site. Any request for authorization to discharge will include, at a minimum, either a copy of the Material Safety Data Sheet for the product or a written description of the waste, including a list of the constituents of the waste and the relative concentrations thereof.

9. ENVIRONMENTAL

9.1 In the event that Contractor discovers during the performance of the Work any substance at the Work Site that is not the subject of the Work or has not otherwise been identified by Company for Contractor, which substance Contractor has reason to believe is or may be a Hazardous Substance that (i) has been or may be released or spilled into the soil, surface water, or groundwater or in a building or structure, or (ii) consists of asbestos-containing materials, lead-based paint, batteries, thermostats, lighting equipment, or equipment containing polychlorinated biphenyls, Contractor will immediately stop Work and notify Company of the discovery. Contractor will not resume the Work until receiving authorization from Company to do so.

9.2 The term "Hazardous Substance" means any product, waste, emission or substance defined, listed or designated as a hazardous or toxic substance, hazardous waste, hazardous material or pollutant by or pursuant to any Environmental Law and includes, but is not limited to, any petroleum-based product, substance or waste, including any additives associated therewith, pesticides, fertilizers, solvents, polychlorinated biphenyls, mercury, lead, lead-based paint, asbestos-containing material or explosives.

9.3 Contractor will immediately notify Company in the event of a spill or release of any material which Contractor knows or has reason to believe is a Hazardous Substance, whether onto the ground, into any body of water, a storm or sanitary sewer, or the air, or anywhere on property owned or controlled by Company, including within any building or structure. Contractor will be solely responsible, as may be required by applicable Environmental Laws, for, in consultation with Company, (i) notifying the appropriate governmental agencies of such spill or release caused or permitted by the acts or omissions of Contractor and (ii) for the cleanup and remediation of such spill or release.

10. PROTECTION OF HIGHWAYS AND RAILROADS. Contractor will make suitable arrangements with governmental authorities and railroads for the construction of all structures, whether underneath or over roads, railroads or rights-of-way to protect the public from accident or delay. Contractor will repair, at its

Electronic Filing: Received, Clerk's Office 06/20/2024

own expense, to the satisfaction of the governmental authorities or other owners, all roads, railroads and bridges that may be damaged by, or given undue wear due to the Work.

11. CLEANING UP

11.1 Contractor will at all times keep the Work Site free of waste materials or rubbish caused by the Work. After completing the Work, Contractor will remove all its waste materials, rubbish, tools, supplies, equipment and surplus materials from and about the Work Site.

11.2 If Contractor fails to keep the Work Site clean or to clean up after completing the Work, Company may do so and charge all costs of cleaning up to Contractor. Those costs may be deducted from the final payment to Contractor.

12. COLLATERAL WORK. Company and other contractors may be working at the Work Site. Company reserves the right to coordinate the performance of Contractor's Work with the work of others. Contractor will cooperate with and will not delay, impede or otherwise impair the work of others. Company does not guarantee Contractor continuous uninterrupted access to the Work Site, but will provide such access as good construction practices will allow, considering the other activities in the area.

13. ALCOHOLIC BEVERAGES, DRUGS AND WEAPONS. Contractor will inform all members of Contractor Group who may be involved in the performance of any Work of the following Company rules relating to alcoholic beverages, drugs and weapons, with which all personnel are expected to comply:

13.1 Bringing, attempting to bring, possessing, using or being under the influence of intoxicants, drugs, or narcotics while on any Company Property, including but not limited to parking areas, is prohibited. Possessing alcoholic beverages in sealed containers is permitted, however, in designated parking areas.

13.2 Prescription or over-the-counter medications that could affect the performance of safety-sensitive work are allowed on Company Property only if they have been previously cleared by Contractor. Contractor must confirm that the medication and dosage do not impair an individual's ability to perform safety-sensitive work before clearing the individual to perform such work while under the influence of the medication.

13.3 Bringing, attempting to bring, possessing or using firearms, whether classified as legal or illegal, while on any Company Property, including but not limited to buildings, parking areas, recreation facilities, equipment and vehicles, is prohibited, unless otherwise required by applicable law. Use or possession of firearms for specific situations is permitted if approved by function or higher level management of Company.

13.4 Off-the-job involvement with intoxicants, illegal drugs, or illegal narcotics that adversely affects Company's business, to include impairing the individual's ability to perform his job or the public trust in the safe operation of Company, is prohibited.

13.5 Any conduct on any Company Property which is in violation of any state or federal law or regulation is considered a violation of these rules and a breach of any agreement to which these policies are attached.

Electronic Filing: Received, Clerk's Office 06/20/2024

13.6 In order to enforce these rules, all individuals with access to any Company Property as well as the vehicles, offices, lockers and any personal belongings of such individuals on any Company Property are subject to search by Company and its agents, to include security representatives appointed or employed by Company. Individuals may be required to take a blood, urinalysis or Breathalyzer test, or submit to other recognized investigatory tests or procedures as are deemed appropriate or necessary by Company in the investigation of a violation of these rules.

14. TITLE AND RIGHT. Nothing in the Agreement will vest Contractor with any right of property in materials used after they have been attached to or incorporated into the Work, nor materials for which Contractor has received full or partial payment. All those materials, upon being so attached, incorporated or paid for, will become the property of Company. Any gravel, sand, stone, minerals, timber or other materials excavated, uncovered, developed or obtained in the Work, or on any land belonging to Company may be used, in the performance of the Work, provided such materials meet the requirements of this Agreement. Any objects or natural materials or animals excavated or exposed that may have historical significance or constitute a threatened or endangered species must be brought to the attention of Company.

15. PROTECTION AGAINST LIENS AND ENCUMBRANCES

15.1 Contractor will not at any time permit any lien, attachment or other encumbrance ("Encumbrance") by any person or persons whosoever or by reason of any claim or demand against Contractor to be placed or remain on the property of Company, including, but not limited to, the Work Site upon which Work is being performed or equipment and materials that are being furnished. To prevent an Encumbrance from being placed on the property of Company, Contractor will furnish during the progress of any Work, as requested from time to time, verified statements showing Contractor's total outstanding indebtedness in connection with the Work.

15.2 If Contractor allows any indebtedness to accrue to subcontractors or others and fails to pay or discharge that indebtedness within five (5) days after demand, then Company may withhold any money due Contractor until that indebtedness is paid or pay the indebtedness and apply that amount against the money due Contractor.

15.3 If Contractor allows any Encumbrances, whether valid or invalid to be placed on the property of Company, any and all claims or demands for payment to Contractor will be denied by Company until the Encumbrance is removed. If the Encumbrance is not removed immediately, Company may pay that claim or demand and deduct the amount paid, together with all related expenses, including attorneys' fees, from any further payment due Contractor, or at Company's election, Contractor will, upon demand, reimburse Company for the amount paid and all related expenses. Any payment made in good faith by Company will be binding on Contractor.

16. TERMINATION FOR DEFAULT

16.1 If a petition in bankruptcy should be filed by Contractor, or if Contractor should make a general assignment for the benefit of creditors, or if a receiver should be appointed due to the insolvency of Contractor, or if Contractor should refuse or fail to supply enough properly skilled workmen or proper equipment, materials or services or should fail to make prompt payment to subcontractors, or to pay promptly for materials or labor, or disregard laws, ordinances or the instruction of Company's Contract Coordinator, or if Contractor should refuse or fail to abide by the SOW Construction Schedule or otherwise violate any provisions of the Agreement or SOW, then Company, upon a

Electronic Filing: Received, Clerk's Office 06/20/2024

determination by Company's Contract Coordinator that sufficient cause exists to justify such action, may, without prejudice to any other right or remedy available to it after giving Contractor seven (7) days' written notice, terminate the Agreement or the SOW and take possession of the Work Site. In the event of such a termination, Company may use all or part of Contractor's equipment and materials and may finish the Work by whatever method Company may deem expedient. In such event, Contractor will not be entitled to receive any further payment hereunder until the Work is finished. If the unpaid balance of the SOW fees will exceed the expense of finishing the Work, including compensation of Company's Contract Coordinator, other Company personnel, third party engineering companies, or other contractors for additional services, such excess will be paid to Contractor. If the expense of finishing the Work will exceed such unpaid balance, Contractor will pay the difference to Company within fifteen (15) days of receiving an invoice for same. The expenses incurred by Company herein, and the damage incurred through Contractor's default, will be determined by Company's Contract Coordinator, in its sole discretion, and such determination will be binding as between the parties.

16.2 In the event of a termination under the provisions of this Section 3, Contractor will transfer and assign to Company, in accordance with Company's instructions, all Work, all construction records, reports, permits, data and information, other materials (including all Company-supplied materials), supplies, Work in progress and other goods for which Contractor is entitled to receive reimbursement hereunder, and any and all plans, drawings, sketches, specifications, and information in connection with the Work, and will take such action as may be necessary to secure Company, at Company's sole election, the rights of Contractor under any or all orders and subcontracts made in connection with the Work.

16.3 In the event that Company so directs or authorizes, Contractor will sell at a price approved by Company, or retain at a mutually agreeable price, any such materials, supplies, Work in progress, or other goods as referred to in the preceding paragraph. In any event, Company will receive any and all records, plans, drawings, data, permits, specifications, sketches, reports, or other information relating to the Work. The proceeds of any such sale or the agreed price will be paid or credited to Company in such manner as Company may direct so as to reduce the amount payable by Company under this Section 3.

Electronic Filing: Received, Clerk's Office 06/20/2024

## APPENDIX D
## COVID-19 SITE ENTRY GUIDELINES

Electronic Filing: Received, Clerk's Office 06/20/2024

COVID-19 Vistra Site Entry Guidelines – *Effective: June 17, 2021*
These guidelines are applicable to ALL PERSONNEL entering Vistra work sites.

To enter a Vistra work site, each person must answer the following three questions with a "no" answer *and* pass the required temperature testing *unless* they display their Vistra vaccination sticker on their employee badge or hardhat:

Site Entry Questions:

1. In the past 10 days, have you tested positive for COVID-19 or are you currently waiting on test results?

2. In the past 10 days, have you been within six feet of someone, where masks were not worn, who:
    a. has tested positive for COVID-19,
    b. is known to be waiting on test results for COVID-19, or
    c. is under a quarantine order?

3. In the past 10 days, have you or someone who has been within six feet of you where masks were not worn had:
    a. flu-like symptoms,
    b. a deep, dry cough,
    c. recent shortness of breath or difficulty breathing,
    d. new loss of taste or smell, and/or
    e. fever of 100 degrees or above?

Temperature Testing:

You must register a temperature between 96- and 100-degrees Fahrenheit as described in the temperature procedures. (see next page for testing procedures)

- If your temperature is below 96 degrees, retest with a different device.
- If your temperature is 100-degrees Fahrenheit or above, retest on another device preferably an ear thermometer, if your temperature still registers 100-degrees Fahrenheit or above you may not enter the site.

## Clearance to enter the site:

- If you have answered **"no"** to all three questions ***and*** passed the temperature test, you may enter the site.
- ***If you have an approved Vistra vaccination sticker, you are cleared to enter the site without the temperature test or answering COVID screening questions.***
- If you passed the temperature test ***and*** answered "Yes" to any of the questions, but have been cleared through VistraTravelerSafety (HR clearance) to enter the Vistra work site for that instance of exposure, testing, or symptoms, you may enter the site.

Anyone *not* cleared to enter the work site must immediately leave the work site and notify their supervisor who will notify HR at VistraTravelerSafety@vistracorp.com for next steps.

**Any symptomatic employee, unvaccinated employee exposed to COVID-19 or any employee tested for COVID-19 as described above must be cleared through VistraTravelerSafety prior to returning to work.**

Electronic Filing: Received, Clerk's Office 06/20/2024

Required Temperature Testing Procedures:

All persons entering the site without a Vistra vaccination sticker, who have cleared all questions above, will also submit to temperature testing or self-administer a temperature test as required by the facility management. If a self-administered test is required, then a member of the management team or their designee will witness the testing; however, where that is not practicable, each person must attest that they are only entering the site premises because they have passed the screening questions and temperature test required for entry. Also:

a. Hats may cause false high temperatures and should not be worn for five minutes immediately preceding a forehead temperature test.
b. Each person is responsible for ensuring all self-testing materials and areas touched during testing are sanitized.
c. All personnel should maintain a **distance of at least six feet** from other people during this process or wear required masks.

Temperature Testing Requirements:

1. **All persons entering the site without a Vistra vaccination sticker must register a temperature between 96- and 100-degrees Fahrenheit. Any such person who has a temperature not within that range or who triggers an alarm on a thermal camera** must **retest with a different device**, preferably an **ear thermometer**, if available. If the second test registers a temperature of 100 degrees or above:
    a. That person **may not enter** the Vistra work site and must notify their supervisor, who will notify HR at VistraTravelerSafety@vistracorp.com for next steps.
    b. If there is significant inconsistency between the two tests, repeat another temperature test and use the two closest readings.
2. **Anyone who registers a temperature between 96- and 100-degrees Fahrenheit** may proceed to their work site.
    - **If temperature is below 96 degrees, wait a few minutes and retest with a different device.**

Control rooms and communal areas:

*All persons entering the site without a Vistra vaccination sticker should maintain at least six-feet distance from other people as much as possible and should wear face coverings when six-feet distance is not feasible. No one should gather in communal areas (including the temperature-testing area) without a Vistra vaccination sticker. Only operators are allowed in control rooms without plant manager approval.*

Vistra Vaccination Sticker protocols:

*All persons with a valid Vistra vaccination sticker do not have to socially distance or wear masks while at the site. They will also not be required to quarantine as a part of COVID-19 exposures unless exhibiting COVID-19 symptoms. To be eligible for these protocols, each person must have their approved Vistra vaccination sticker easily visible at all times while at work*. If someone who has applied for a Vistra vaccination sticker believes they have specific health conditions that may affect the ability to have a full immune response to the vaccination, please consult your health provider prior to working without a mask.

**Any symptomatic employee, unvaccinated employee exposed to COVID-19 or any employee tested for COVID-19 as described above must be cleared through VistraTravelerSafety prior to returning to work.**

# Safety Data Sheet

## Section 1
## Identification of the Substance and of the Supplier

### 1.1 Product Identifier

| | |
|---|---|
| **Product Name/Identification:** | ASTM Bottom Ash |
| **Synonyms:** | Ash; Ashes; Ash residues; Ashes, residues, bottom; Bottom ash; Bottom ash residues; Coal Fly Ash; Pozzolan; Waste solids. |
| **Formula:** | UVCB Substance |

### 1.2 Relevant Identified Uses of the Substance or Mixture and Uses Advices Against

| | |
|---|---|
| **Relevant Identified Uses:** | Component of wallboard, concrete, roofing material, bricks, cement kiln feed. |
| **Uses Advised Against:** | None known. |

### 1.3 Details of the Supplier of the SDS

| | |
|---|---|
| **Manufacturer/Supplier:** | Dynegy, Inc. |
| **Street Address:** | 601 Travis Street, Suite 1400 |
| **City, State and Zip Code:** | Houston, TX 77002 |
| **Customer Service Telephone:** | 800-633-4704 |

## Section 2
## Hazards Identification

### 2.1 Classification of the Substance

**GHS Classification(s) according to OSHA Hazard Communication Standard (29 CFR 1910.1200):**

- Eye Irritant, Category 2A
- STOT-SE, Category 3 (Respiratory Irritation)
- Carcinogen, Category 1A
- STOT-RE, Category 1 (Lungs)
- Toxic to Reproduction, Category 2

### 2.2 Label Elements

| ***Labelling according to 29 CFR 1910.1200 Appendices A, B and C**** | |
|---|---|
| ***Hazard Pictogram(s):*** |  |
| ***Signal word:*** | **DANGER** |
| ***Hazard Statement(s):*** | *Causes serious eye irritation.*<br>*May cause respiratory irritation.*<br>*May cause damage to lungs after repeated/prolonged exposure via inhalation.*<br>*May cause cancer of the lung.*<br>*Suspected of damaging fertility or the unborn child.* |
| ***Precautionary Statement(s):*** | *Obtain special instructions before use.*<br>*Do not handle until all safety precautions have been read and understood.*<br>*Avoid breathing dust.*<br>*Wash thoroughly after handling.*<br>*Do not eat drink or smoke when using this product.*<br>*Wear protective gloves/protective clothing/eye protection/face protection.*<br>*Use outdoors or in a well-ventilated area.*<br>*If exposed or concerned: Get medical advice/attention.*<br>*Store in a secure area.*<br>*Dispose of product in accordance with local/national regulations.* |

** Fly ash and other coal combustion products (CCPs) are UVCB substances (unknown or variable composition or biological). Various CCPs, noted as ashes/ash residuals; Ashes, residues, bottom; Bottom ash; Bottom ash residues; Waste solids, ashes under TSCA are defined as: "The residuum from the burning of a combination of carbonaceous materials. The following elements may be present as oxides: aluminum, calcium, iron, magnesium, nickel, phosphorus, potassium, silicon, sulfur, titanium, and vanadium." Ashes including fly ash and fluidized bed combustion ash are identified by CAS number 68131-74-8. The exact composition of the ash is dependent on the fuel source and flue additives composed of many constituents. The classification of the final substance is dependent on the presence of specific identified oxides as well as other trace elements.*

## 2.3 Other Hazards

**Listed Carcinogens:**

**-Respirable Crystalline Silica**

**IARC:** [Yes] **NTP:** [Yes] **OSHA:** [Yes] **Other:** **(ACGIH)** [Yes]

## Section 3
## Composition/Information on Ingredients

| ***Substance*** | ***CAS No.*** | ***Percentage (%)*** | ***GHS Classification*** |
|---|---|---|---|
| *Crystalline Silica* | *14808-60-7* | *20 - 40%* | *Repeat Dose STOT, Category 1*<br>*Carcinogen, Category 1A* |
| *Silica, crystalline respirable (RCS)* | *14808-60-7* | ***See Footnote 1*** | *Repeat Dose STOT, Category 1*<br>*Carcinogen. Category 1A* |
| *Aluminosilicates*[2] | ***Various, see Footnote 2*** | *10 - 60%* | *Single Exposure STOT, Category 3* |
| *Calcium oxide (CaO)* | *1305-78-8* | *10 - 30%* | *Skin Irritant, Category 2*<br>*Eye Irritant, Category 1*<br>*Single Exposure STOT, Category 3* |
| *Iron oxide* | *1309-37-1* | *1 - 10%* | *Not Classified* |
| *Manganese dioxide ($MnO_2$)* | *1313-13-9* | *<2%* | *Skin Irritant, Category 2*<br>*Eye Irritant, Category 2B* |
| *Magnesium oxide* | *1309-48-4* | *2 - 10%* | *Not Classified* |
| *Phosphorus pentoxide ($P_2O_5$)* | *1314-56-3* | *≤2%* | *Skin Irritant, Category 2*<br>*Eye Irritant, Category 2B* |
| *Sodium oxide* | *1313-59-3* | *1 - 10%* | *Not Classified* |
| *Potassium oxide ($K_2O$)* | *12136-45-7* | *≤1%* | *Skin Irritant Category 2*<br>*Eye Irritant Category 2B* |
| *Titanium dioxide ($TiO_2$)* | *13463-67-7* | *<3%* | *Not Classified* |
| *Bromide salt (calcium)* | *7789-41-5* | ***See Footnote 3*** | *Toxic to Reproduction Category 2* |

[1] *The percentage of respirable crystalline silica has not been determined. Therefore, a GHS classification of Carcinogen 1A has been assigned.*

[2] *Aluminosilicates (CAS# 1327-36-2) may be in the form of mullite (CAS# 1302-93-8); aluminosilicate glass; pozzolans (CAS# 71243-67-9); or calcium aluminosilicates such as tricalcium aluminate (C3A), or calcium sulfoaluminate (C4A3S). The form is dependent on the source of the coal and or the process used to create the CCP. Pulverized coal combustion would be more likely to create high levels of pozzolans. Aluminosilicates may have inclusions of calcium, titanium, iron, potassium, phosphorus, magnesium and other metal oxides.*

[3] *Analytical data are not available to demonstrate that the concentration of bromide salt is <0.1%; therefore, a GHS classification of Toxic to Reproduction Category 2 has been assigned.*

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 4
## First Aid Measures

### 4.1 Description of First Aid Measures

| | |
|---|---|
| **Inhalation:** | If product is inhaled and irritation of the nose or coughing occurs, remove person to fresh air. Get medical advice/attention if respiratory symptoms persist. |
| **Skin Contact:** | If skin exposure occurs, wash with soap and water. |
| **Eye Contact:** | If product gets into the eye, rinse copiously with water for several minutes. Remove contact lenses, if present and easy to do. Seek medical attention/advice if irritation occurs or persists. |
| **Ingestion:** | No specific first aid measures are required. |

### 4.2 Most Important Health Effects, Both Acute and Delayed

**Acute Effects:** Direct exposure may cause respiratory irritation, eye irritation and skin irritation. The product dust can dry and irritate the skin and cause dermatitis and can irritate eyes and skin through mechanical abrasion.

**Chronic Effects:** Chronic exposure may cause lung damage from repeated exposure. Prolonged inhalation of respirable crystalline silica above certain concentrations may cause lung diseases, including silicosis and lung cancer. Repeated exposure to dusts containing inorganic bromide salts may affect fertility and/or result in effects to the unborn child.

### 4.3 Indication of Any Immediate Medical Attention and Special Treatment Needed

Seek first aid or call a doctor or Poison Control Center if contact with eyes occurs and irritation remains after rinsing. Get medical advice if inhalation occurs and respiratory symptoms persist.

## Section 5
## Firefighting Measures

### 5.1 Extinguishing Media

| | |
|---|---|
| **Suitable Extinguishing Media:** | Product is not flammable. Use extinguishing media appropriate for surrounding fire. |
| **Unsuitable Extinguishing Media:** | Not applicable, the product is not flammable. |

### 5.2 Special Hazards Arising from the Substance or Mixture

| | |
|---|---|
| **Hazardous Combustion Products:** | None known. |

### 5.3 Advice for Firefighters

| | |
|---|---|
| **Special Protective Equipment and Precautions for Firefighters:** | As with any fire, wear self-contained breathing apparatus (NIOSH approved or equivalent) and full protective gear. |

## Section 6
## Accidental Release Measures

### 6.1 Personal Precautions, Protective Equipment and Emergency Procedures

| | |
|---|---|
| **Personal precautions/Protective Equipment:** | See Section 8.2.2 Individual Protective Measures. For concentrations exceeding Occupational Exposure Levels (OELs), use a self-contained breathing apparatus (SCBA). |
| **Emergency procedures:** | Use scooping, water spraying/flushing/misting or ventilated vacuum cleaning systems to clean up spills. Do not use pressurized air. |

### 6.2 Environmental Precautions

| | |
|---|---|
| **Environmental precautions:** | Prevent contamination of drains or waterways and dispose according to local and national regulations. |

### 6.3 Methods and Material for Containment and Cleaning Up

| | |
|---|---|
| **Methods and materials for containment and cleaning up:** | Do not use brooms or compressed air to clean surfaces. Use dust collection vacuum and extraction systems.<br><br>Large spills of dry product should be removed by a vacuum system. Dampened material should be removed by mechanical means and recycled or disposed of according to local and national regulations. |

See Sections 8 and 13 for additional information on exposure controls and disposal.

## Section 7
## Handling and Storage

### 7.1 Precautions for Safe Handling

Practice good housekeeping. Use adequate exhaust ventilation, dust collection and/or water mist to maintain airborne dust concentrations below permissible exposure limits (note: respirable crystalline silica dust may be in the air without a visible dust cloud).

Do not permit dust to collect on walls, floors, sills, ledges, machinery, or equipment. Maintain and test ventilation and dust collection equipment. In cases of insufficient ventilation, wear a NIOSH approved respirator for silica dust when handling or disposing dust from this product. Avoid contact with skin and eyes. Wash or vacuum clothing that has become dusty. Avoid eating, smoking, or drinking while handling the material.

### 7.2 Conditions for Safe Storage, Including any Incompatibilities

Minimize dust produced during loading and unloading.

## Section 8
## Exposure Controls/Personal Protection

### 8.1 Control Parameters

| OCCUPATIONAL EXPOSURE LIMITS | | | | | |
|---|---|---|---|---|---|
| **SUBSTANCE** | | **OSHA PEL TWA ($mg/m^3$)** | **NIOSH REL TWA ($mg/m^3$)** | **ACGIH TLV TWA ($mg/m^3$)** | **CA - OSHA PEL ($mg/m^3$)** |
| **Calcium oxide** | | 5 | 2 | 2 | 2 |
| **Particulates Not Otherwise Regulated** | Total | 15 | 15 | 10 | 10 |
| | Respirable | 5 | 5 | 3 | 5 |
| **Respirable Crystalline Silica** | Respirable | 0.05 | 0.05 | 0.025 | 0.05 |
| **Manganese dioxide (as manganese compounds)** | Total | 5 (Ceiling) | 1<br>3 (STEL) | 0.1 | 0.2 |
| | Respirable | - | - | 0.02 | - |

### 8.2 Exposure Controls

#### 8.2.1 Engineering Controls

Provide ventilation to maintain the ambient workplace atmosphere below the occupational exposure limit(s). Use general and local exhaust ventilation and dust collection systems as necessary to minimize exposure.

#### 8.2.2 Personal Protective Equipment (PPE)

| | |
|---|---|
| **Respiratory protection:** | Wear a NIOSH approved particulate respirator if exposure to airborne particulates is unavoidable and where occupational exposure limits may be exceeded. If airborne exposures are anticipated to exceed applicable PELs or TLVs, a self-contained breathing apparatus or airline respirator is recommended. |
| **Eye and face protection:** | If eye contact is possible, wear protective glasses with side shields. Avoid contact lenses. |
| **Hand and skin protection:** | Wear gloves and protective clothing. Wash hands with soap and water after contact with material. |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 9
## Physical and Chemical Properties

### 9.1 Information on Basic Physical and Chemical Properties

| Property: Value | Property: Value |
|---|---|
| **Appearance (physical state, color, etc.):** Fine tan/ gray particulate | **Upper/lower flammability or explosive limits:** Not applicable |
| **Odor:** Odorless[1] | **Vapor Pressure (Pa):** Not applicable |
| **Odor threshold:** Not applicable | **Vapor Density:** Not applicable |
| **pH (25 °C) (in water):** 8 - 11 | **Specific gravity or relative density:** 2.2 – 2.9 |
| **Melting point/freezing point (°C):** Not applicable | **Water Solubility:** Slight |
| **Initial boiling point and boiling range (°C):** Not applicable | **Partition coefficient: n-octane/water:** Not determined |
| **Flash point (°C):** Not determined | **Auto ignition temperature (°C):** Not applicable |
| **Evaporation rate:** Not applicable | **Decomposition temperature (°C):** Not determined |
| **Flammability (solid, gas):** Not combustible | **Viscosity:** Not applicable |

[1] The use of urea or aqueous ammonia injected into the flue gas to reduce nitrogen oxides (NOx) emissions may result in the presence of ammonium sulfate or ammonium bisulfate in the ash at less than 0.1%. When ash containing these substances becomes wet under high pH (>9), free ammonia gas may be released resulting in objectionable/nuisance ammonia odor and potential exposure to ammonia gas especially in confined spaces.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 10
## Stability and Reactivity

| | |
|---|---|
| **10.1 Reactivity:** | The material is an inert, inorganic material primarily composed of elemental oxides. |
| **10.2 Chemical stability:** | The material is stable under normal use conditions. |
| **10.3 Possibility of hazardous reactions:** | The material is a relatively stable, inert material; however, when ash containing ammonia becomes wet under high pH (>9), free ammonia gas may be released resulting in an objectionable/nuisance ammonia odor and potential exposure to ammonia gas especially in confined spaces. Polymerization will not occur. |
| **10.4 Conditions to avoid:** | Product can become airborne in moderate winds. Dry material should be stored in silos. Materials stored out of doors should be covered or maintained in a damp condition. |
| **10.5 Incompatible materials:** | None known. |
| **10. 6 Hazardous decomposition products:** | None known. |

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 11
## Toxicological Information

### 11.1 Information on Toxicological Effects

| Endpoint | Data |
|---|---|
| **Acute oral toxicity** | LD50 > 2000 mg/kg |
| **Acute dermal toxicity** | LD50 > 2000 mg/kg |
| **Acute inhalation toxicity** | LD50 > 5.0 mg/L |
| **Skin corrosion/irritation** | Does not meet the classification criteria but may cause slight skin irritation. Product dust can dry the skin which can result in irritation. |
| **Eye damage/irritation** | Causes serious eye irritation. Positive scores for conjunctiva irritation and chemosis in 2/3 animals based on average of 24, 48 and 72-hour scores with irritation clearing within 21 days; no corneal or iritis effects observed. |
| **Respiratory/skin sensitization** | Not a respiratory or dermal sensitizer. |
| **Germ cell mutagenicity** | Not mutagenic in in-vitro and in-vivo assays with or without metabolic activation. |
| **Carcinogenicity** | Not available. Respirable crystalline silica has been identified as a carcinogen by OSHA, NTP, ACGIH and IARC. |
| **Reproductive toxicity** | No developmental toxicity was observed in available animal studies. Reproductive studies on CCPs showed either no reproductive effects, or some effects on male and female reproductive organs and parameters but without a clear dose response.<br><br>Inorganic bromide salts have been shown to have adverse effects on reproductive parameters in some animal studies. |
| **STOT-SE** | CCPs when present as a nuisance dust may result in respiratory irritation. |
| **STOT-RE** | In a 180-day inhalation study with fly ash dust, no effects were observed at the highest dose tested. NOEC = 4.2 mg/m$^3$; it is not possible to assess the level at which toxicologically significant effects may occur.<br><br>Repeated inhalation exposures to high levels of respirable crystalline silica may result in lung damage (i.e., silicosis). |
| **Aspiration Hazard** | Not applicable based product form. |

## Section 12
## Ecological Information

### 12.1 Toxicity

| | |
|---|---|
| **Fly Ash (CAS# 68131-74-8)** | |
| **Toxicity to Fish** | LC50 > 100 mg/L |
| **Toxicity to Aquatic Invertebrates** | Data indicates that the test substance is not toxic to *Daphnia magna* (EC50 undetermined) |
| **Toxicity to Aquatic Algae and Plants** | EC50 = 10 mg/L |
| **Calcium oxide CAS# 1305-78-8** | |
| **Toxicity to Fish** | LC50 = 50.6 mg/L<br>The findings were closely related to the pH of the test solutions; therefore, pH is considered to be the main reason for the effects. |
| **Toxicity to Aquatic Invertebrates** | EC50 = 49.1 mg/L<br>The findings were closely related to the pH of the test solutions; therefore, pH is considered to be the main reason for the effects. |
| **Toxicity to Aquatic Algae and Plants** | NOEC =48 mg/L @ 72 hours based on $Ca(OH)_2$<br>The initial pH of the test medium was not directly related to the biologically relevant effects. The formation of precipitates is likely the result of the reaction between $CO_2$ dissolved in the medium. |

### 12.2 Persistence and Degradability

Not relevant for inorganic materials.

### 12.3 Bioaccumulative Potential

This material does not contain any compounds that would bioaccumulate up the food chain.

### 12.4 Mobility in Soil

No data available.

### 12.5 Results of PBT and vPvB Assessment

This material does not contain any compounds classified as “persistent, bioaccumulative or toxic” nor as “very persistent/very bioaccumulative”.

### 12.6 Other Adverse Effects

None known.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 13
## Disposal Considerations

See Sections 7 and 8 above for safe handling and use, including appropriate industrial hygiene practices.

Dispose of all waste product and containers in accordance with federal, state and local regulations.

## Section 14
## Transport Information

| | | |
|---|---|---|
| **Regulatory entity:** U.S. DOT | Shipping Name: | Not Regulated |
| | Hazard Class: | Not Regulated |

## Accidental Release Measures

### 6.1 Personal Precautions, Protective Equipment and Emergency Procedures

| | |
|---|---|
| **Personal precautions/Protective Equipment:** | See Section 8.2.2 Individual Protective Measures. For concentrations exceeding Occupational Exposure Levels (OELs), use a self-contained breathing apparatus (SCBA). |
| **Emergency procedures:** | Use scooping, water spraying/flushing/misting or ventilated vacuum cleaning systems to clean up spills. Do not use pressurized air. |

### 6.2 Environmental Precautions

| | |
|---|---|
| **Environmental precautions:** | Prevent contamination of drains or waterways and dispose according to local and national regulations. |

### 6.3 Methods and Material for Containment and Cleaning Up

| | |
|---|---|
| **Methods and materials for containment and cleaning up:** | Do not use brooms or compressed air to clean surfaces. Use dust collection vacuum and extraction systems.<br>Large spills of dry product should be removed by a vacuum system. Dampened material should be removed by mechanical means and recycled or disposed of according to local and national regulations. |

See Sections 8 and 13 for additional information on exposure controls and disposal.

## Section 7
## Handling and Storage

### 7.1 Precautions for Safe Handling

Practice good housekeeping. Use adequate exhaust ventilation, dust collection and/or water mist to maintain airborne dust concentrations below permissible exposure limits (note: respirable crystalline silica dust may be in the air without a visible dust cloud).

Do not permit dust to collect on walls, floors, sills, ledges, machinery, or equipment. Maintain and test ventilation and dust collection equipment. In cases of insufficient ventilation, wear a NIOSH approved respirator for silica dust when handling or disposing dust from this product. Avoid contact with skin and eyes. Wash or vacuum clothing that has become dusty. Avoid eating, smoking, or drinking while handling the material.

### 7.2 Conditions for Safe Storage, Including any Incompatibilities

Minimize dust produced during loading and unloading.

## Section 8
## Exposure Controls/Personal Protection

### 8.1 Control Parameters

| OCCUPATIONAL EXPOSURE LIMITS | | | | | |
|---|---|---|---|---|---|
| **SUBSTANCE** | | **OSHA PEL TWA ($mg/m^3$)** | **NIOSH REL TWA ($mg/m^3$)** | **ACGIH TLV TWA ($mg/m^3$)** | **CA - OSHA PEL ($mg/m^3$)** |
| **Calcium oxide** | | 5 | 2 | 2 | 2 |
| **Particulates Not Otherwise Regulated** | Total | 15 | 15 | 10 | 10 |
| | Respirable | 5 | 5 | 3 | 5 |
| **Respirable Crystalline Silica** | Respirable Crystalline Silica | 0.05 | 0.05 | 0.025 | 0.05 |
| **Titanium dioxide** | Total | 15 | 2.4 (fine)<br>0.3 (ultrafine) | 10 | 10 |
| **Manganese dioxide (as manganese compounds)** | Total | 5 (Ceiling) | 1<br>3 (STEL) | 0.1 | 0.2 |
| | Respirable | - | - | 0.02 | - |

## 8.2 Exposure Controls

### 8.2.1 Engineering Controls

Provide ventilation to maintain the ambient workplace atmosphere below the occupational exposure limit(s). Use general and local exhaust ventilation and dust collection systems as necessary to minimize exposure.

### 8.2.2 Personal Protective Equipment (PPE)

| | |
|---|---|
| **Respiratory protection:** | Wear a NIOSH approved particulate respirator if exposure to airborne particulates is unavoidable and where occupational exposure limits may be exceeded. If airborne exposures are anticipated to exceed applicable PELs or TLVs, a self-contained breathing apparatus or airline respirator is recommended. |
| **Eye and face protection:** | If eye contact is possible, wear protective glasses with side shields. Avoid contact lenses. |
| **Hand and skin protection:** | Wear gloves and protective clothing. Wash hands with soap and water after contact with material. |

## Section 9
## Physical and Chemical Properties

### 9.1 Information on Basic Physical and Chemical Properties

| Property: Value | Property: Value |
|---|---|
| **Appearance (physical state, color, etc.):** Fine tan/ gray particulate | **Upper/lower flammability or explosive limits:** Not applicable |
| **Odor:** Odorless[1] | **Vapor Pressure (Pa):** Not applicable |
| **Odor threshold:** Not applicable | **Vapor Density:** Not applicable |
| **pH (25 °C) (in water):** Not Determined | **Specific gravity or relative density:** 2.2 – 2.9 |
| **Melting point/freezing point (°C):** Not applicable | **Water Solubility:** Slight |
| **Initial boiling point/boiling range (°C):** NA | **Partition coefficient: n-octane/water:** NA |
| **Flash point (°C):** Not determined | **Auto ignition temperature (°C):** Not applicable |
| **Evaporation rate:** Not applicable | **Decomposition temperature (°C):** Not determined |
| **Flammability (solid, gas):** Not combustible | **Viscosity:** Not applicable |

[1] The use of urea or aqueous ammonia injected into the flue gas to reduce nitrogen oxides (NOx) emissions may result in the presence of ammonium sulfate or ammonium bisulfate in the ash at less than 0.1%. When ash containing these substances becomes wet under high pH (>9), free ammonia gas may be released resulting in objectionable/nuisance ammonia odor and potential exposure to ammonia gas especially in confined spaces.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Section 10
## Stability and Reactivity

| | |
|---|---|
| **10.1 Reactivity:** | The material is an inert, inorganic material primarily composed of elemental oxides. |
| **10.2 Chemical stability:** | The material is stable under normal use conditions. |
| **10.3 Possibility of hazardous reactions:** | The material is a relatively stable, inert material; however, when ash containing ammonia becomes wet under high pH (>9), free ammonia gas may be released resulting in an objectionable/nuisance ammonia odor and potential exposure to ammonia gas especially in confined spaces. Polymerization will not occur. |
| **10.4 Conditions to avoid:** | Product can become airborne in moderate winds. Dry material should be stored in silos. Materials stored out of doors should be covered or maintained in a damp condition. |
| **10.5 Incompatible materials:** | None known. |
| **10. 6 Hazardous decomposition products:** | None known. |

## Section 11
## Toxicological Information

### 11.1 Information on Toxicological Effects

| Endpoint | Data |
|---|---|
| **Acute oral toxicity** | LD50 > 2000 mg/kg |
| **Acute dermal toxicity** | LD50 > 2000 mg/kg |
| **Acute inhalation toxicity** | LD50 > 5.0 mg/L |
| **Skin corrosion/irritation** | Does not meet the classification criteria but may cause slight skin irritation. Product dust can dry the skin which can result in irritation. |
| **Eye damage/irritation** | Causes serious eye irritation. Positive scores for conjunctiva irritation and chemosis in 2/3 animals based on average of 24, 48 and 72-hour scores with irritation clearing within 21 days; No corneal or iritis effects observed. |
| **Respiratory/skin sensitization** | Not a respiratory or dermal sensitizer. |
| **Germ cell mutagenicity** | Not mutagenic in in-vitro and in-vivo assays with or without metabolic activation. |
| **Carcinogenicity** | Not available. Respirable crystalline silica has been identified as a carcinogen by OSHA, NTP, ACGIH and IARC. |
| **Reproductive toxicity** | No developmental toxicity was observed in available animal studies. Reproductive studies on CCPs showed either no reproductive effects, or some effects on male and female reproductive organs and parameters but without a clear dose response.<br><br>Inorganic bromide salts have been shown to have adverse effects on reproductive parameters in some animal studies. |
| **STOT-SE** | CCPs when present as a nuisance dust may result in respiratory irritation. |
| **STOT-RE** | In a 180-day inhalation study with fly ash dust, no effects were observed at the highest dose tested. NOEC = 4.2 mg/m$^3$; it is not possible to assess the level at which toxicologically significant effects may occur.<br><br>Repeated inhalation exposures to high levels of respirable crystalline silica may result in lung damage (i.e., silicosis). |
| **Aspiration Hazard** | Not applicable based product form. |

## Section 12
## Ecological Information

### 12.1 Toxicity

| Fly Ash C (CAS# 68131-74-8) | |
|---|---|
| **Toxicity to Fish** | LC50 > 100 mg/L |
| **Toxicity to Aquatic Invertebrates** | Data indicates that the test substance is not toxic to *Daphnia magna* (EC50 undetermined). |
| **Toxicity to Aquatic Algae and Plants** | EC50 = 10 mg/L |

| Calcium oxide CAS# 1305-78-8 | |
|---|---|
| **Toxicity to Fish** | LC50 = 50.6 mg/L<br>The findings were closely related to the pH of the test solutions; therefore, pH is considered to be the main reason for the effects. |
| **Toxicity to Aquatic Invertebrates** | EC50 = 49.1 mg/L<br>The findings were closely related to the pH of the test solutions; therefore, pH is considered to be the main reason for the effects. |
| **Toxicity to Aquatic Algae and Plants** | NOEC =48 mg/L @ 72 hours based on $Ca(OH)_2$<br>The initial pH of the test medium was not directly related to the biologically relevant effects. The formation of precipitates is likely the result of the reaction between $CO_2$ dissolved in the medium. |

### 12.2 Persistence and Degradability

Not relevant for inorganic materials.

### 12.3 Bioaccumulative Potential

This material does not contain any compounds that would bioaccumulate up the food chain.

### 12.4 Mobility in Soil

No data available.

### 12.5 Results of PBT and vPvB Assessment

This material does not contain any compounds classified as “persistent, bioaccumulative or toxic” nor as “very persistent/very bioaccumulative”.

### 12.6 Other Adverse Effects

None known.

## Section 13

Electronic Filing: Received, Clerk's Office 06/20/2024

## Disposal Considerations

See Sections 7 and 8 above for safe handling and use, including appropriate industrial hygiene practices.

Dispose of all waste product and containers in accordance with federal, state and local regulations.

## Section 14
## Transport Information

| | | |

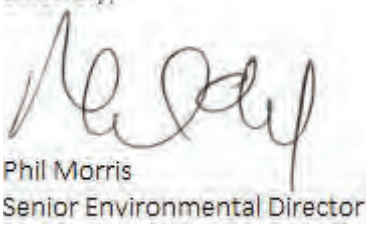
Springfield, IL 62794-9276

Re: CCR Surface Impoundment Category Designation and Justification for Illinois Power Resources Generating, LLC

Dear Mr. LeCrone:

Pursuant to 35 I.A.C. 845.700(c), Illinois Power Resources Generating, LLC submits the information necessary to categorize the CCR surface impoundments located at the Edwards Power Plant and the now retired Duck Creek Power Plant. The following parameters were used in assessing and justifying each assigned category.

- Category 1 – *Impacts to existing potable water supply well or impacts to groundwater quality within the setback of an existing potable water supply well.*
  - This review includes an assessment of potable water wells within 2,500 feet of CCR surface impoundments to determine whether any potential impacts are occurring within the setback zone of any community water supply well established under the Illinois Groundwater Protection Act.
  - This information was developed during the Part 845 rulemaking and is summarized in Attachment 1, Table 2: Impacts to Potable Water Supply.
- Category 2 – *Imminent threat to human health or the environment or have been designated by IEPA under (g)(5)*
  - The surface impoundments at Edwards and Duck Creek Power Plants do not pose an imminent threat to human health or the environment. There are no known conditions at or around the facility where someone or something may be exposed to contaminant concentrations reasonably expected to cause harm
- Category 3 – *Located in areas of environmental justice ("EJ") concern*
  - EJ areas were evaluated using the EJ mapping link from IEPA's webpage located at https://www2.illinois.gov/epa/topics/environmental-justice. Per the IEPA mapping tool, the EJ Status thresholds were determined as twice the state averages for Minority and Low Income consistent with 35 IAC 845.700(g)(6).
  - An EJ map denoting the facilities with impoundments is located in Attachment 2.



Electronic Filing: Received, Clerk's Office 06/20/2024

- Category 4-7
  - Category 4 - Inactive CCR surface impoundments that have an exceedance of the groundwater protection standards in Section 845.600
  - Category 5 - Existing CCR surface impoundments that have exceedances of the groundwater protection standards in Section 845.600
  - Category 6 - Inactive CCR surface impoundments that are in compliance with the groundwater protection standards in Section 845.600.
  - Category 7 – Existing CCR surface impoundments that are in compliance with the groundwater protection standards in Section 845.600

Based on the information above, category designations have been assigned. The category designations for each CCR impoundment are shown in Attachment 1, Table 1: Category Designations.

If you have any questions regarding this submittal, please contact Phil Morris at 618-343-7794 or phil.morris@vistracorp.com.

Sincerely,

Phil Morris
Senior Environmental Director

Electronic Filing: Received, Clerk's Office 06/20/2024

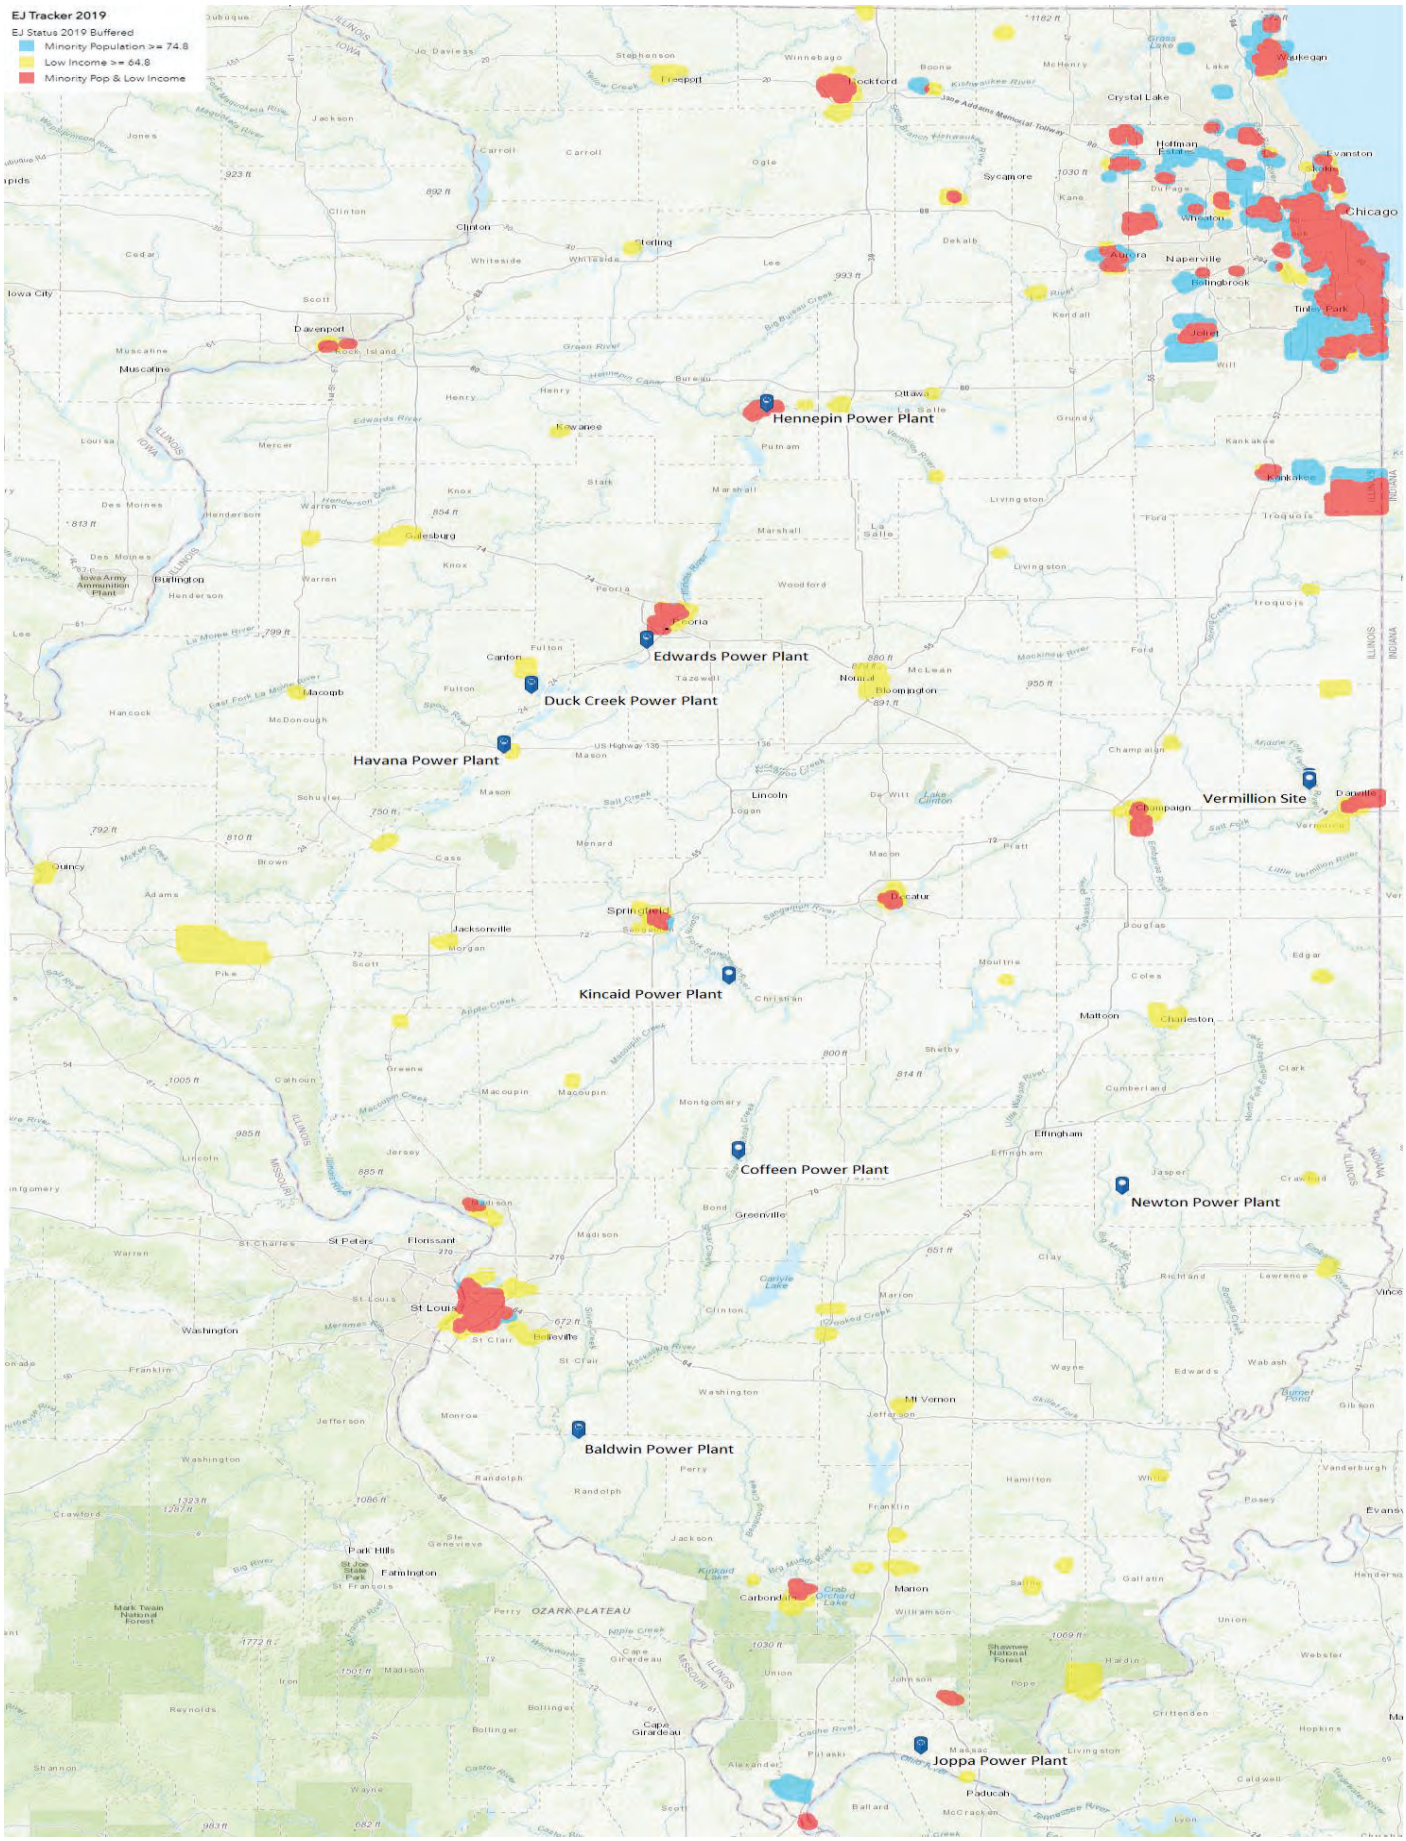
Attachment 1

**Table 1: Category Designation**

| Facility | Pond Description | Classifications | Potable Water Supply Impacts (Category 1) | Human Health or Environment Threat (Category 2) | Located within Environmental Justice Areas[1] (Category 3) | Standards Exceedances[2] (Categories 4,5,6,7) | Impoundment Category 845.700(g) |
|---|---|---|---|---|---|---|---|
| Edwards | Ash Pond 1 | Existing | No | No | No | Yes | 5 |
| Duck Creek | Bottom Ash Basin | Inactive | No | No | Yes | NA[3] | 3 |
| | GMF Pond | Inactive | No | No | Yes | NA[3] | 3 |
| | GMF Recycle Pond | Inactive | No | No | Yes | NA[3] | 3 |

[1] See Attachment 2 Environmental Justice Area Map

[2] Ground water analyses for purposes of categories 4-7, assumptions have been made based on current groundwater data. However, since sampling and analysis is ongoing and subject to IEPA review and approval, IPGC reserves the right to update its category designations for Categories 4-7.



[3] NA for this determination since the CCR surface impoundment was assign a highest priority category

**Table 2: Impacts to Potable Water Supply**

| Site Name | Private and Semi-Private Wells | Non-Community Water Supply (CWS) Wells | Non-CWS Surface Water Intakes | Community Water Supply Wells | CWS Surface Water Intakes |
|---|---|---|---|---|---|
| Edwards | **Present, but not at risk** Seven (7) water wells were identified and one (or possibly two) are located potentially downgradient of the site. Based on Ramboll's review of groundwater data, these wells are unlikely to be impacted by coal ash constituents. | **Present, but not at risk** One non-CWS well was identified; however, it is unlikely to be at risk because of its hydrogeologic location relative to the power plant. | Absent | Absent | Absent |
| Duck Creek | **Present, but not at risk** Three (3) water wells were identified; however, they are unlikely to be at risk because of their hydrogeologic location relative to the power plant and/or they are abandoned. None of the off-site wells are located in a downgradient direction. | Absent | Absent | Absent | Absent |

**Subject: USEPA CCR Rule and IEPA Part 845 Rule Applicability Cross-Reference**
**2021 USEPA CCR Rule Periodic Certification Report**
**GMF Pond, Duck Creek Power Plant, Canton, Illinois**

At the request of Illinois Power Resources Generating, LLC (IPRG), Geosyntec Consultants (Geosyntec) has prepared this letter to document how the attached 2021 United States Environmental Protection Agency (USEPA) CCR Rule Periodic Certification Report (Report) was prepared in accordance with both the Federal USEPA CCR Rule[1] and the state-specific Illinois Environmental Protection Agency (IEPA) Part 845 Rule[2]. Specific sections of the report and the applicable sections of the USEPA CCR Rule and Illinois Part 845 Rule are cross-referenced in **Table 1**. A certification from a Qualified Professional Engineer for each of the CCR Rule sections listed in **Table 1** is provided in Section 9 of the attached Report. This certification statement is also applicable to each section of the Part 845 Rule listed in **Table 1.**

**Table 1 – USEPA CCR Rule and Illinois Part 845 Rule Cross-Reference**

| Report Section | USEPA CCR Rule | | Illinois Part 845 Rule | |
|---|---|---|---|---|
| 3 | §257.73 (a)(2) | Hazard Potential Classification | 845.440 | Hazard Potential Classification Assessment[3] |
| 4 | §257.73 (c)(1) | History of Construction | 845.220(a) | Design and Construction Plans (Construction History) |
| 5 | §257.73 (d)(1) | Structural Stability Assessment | 845.450 (a) and (c) | Structural Stability Assessment |
| 6 | §257.73 (e)(1) | Safety Factor Assessment | 845.460 (a-b) | Safety Factor Assessment |
| 7 | §257.82 (a)(1-3) | Adequacy of Inflow Design Control System Plan | 845.510(a), (c)(1), (c)(3) | Hydrologic and Hydraulic Capacity Requirements / Inflow Design Flood Control System Plan |
| | §257.82 (b) | Discharge from CCR Unit | 845.510(b) | Discharge from CCR Surface Impoundment |

[1] United Stated Environmental Protection Agency, 2015. *40 CFR Parts 257 and 261, Hazardous and Solid Waste Management System, Disposal of Coal Combustion Residuals from Electric Utilities, Final Rule.*
[2] State of Illinois, Joint Committee on Administrative Rule, Administrative Code (2021). *Title 35: Environmental Protection, Subtitle G: Waste Disposal, Chapter I: Pollution Control Board, Subchapter j: Coal Combustion Waste Surface Impoundment, Part 845 Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments.*
[3] "Significant" and "High" hazard, per the CCR Rule[1], are equivalent to Class II and Class I hazard potential, respectively, per Part 845[2].

Electronic Filing: Received, Clerk's Office 06/20/2024

**CLOSING**

This letter has been prepared to demonstrate that the content and Qualified Professional Engineer Certification of the 2021 Periodic USEPA CCR Rule Certification Report fulfills the corresponding requirements of Part 845 of Illinois Administrative Code listed in **Table 1**.

Sincerely,

Lucas P. Carr, P.E.
Senior Engineer

John Seymour, P.E.
Senior Principal

# EXECUTIVE SUMMARY

This Periodic United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule [1] certification report (Periodic Certification Report) for the GMF Pond[1] at the Duck Creek Power Plant (DCPP) has been prepared in accordance with Rule 40, Code of Federal Regulations (CFR) §257. herein referred to as the "CCR Rule" [1]. The CCR Rule requires that initial certifications for existing CCR surface impoundment, completed in 2016 and subsequently posted on the Illinois Power Resources Generating, LLC (IPRG) CCR Website ( [2], [3], [4], [5], [6]) be updated on a five-year basis.

The initial certification reports developed in 2016 and 2017 ( [2], [7], [3], [4], [5], [6], [8]) were independently reviewed by Geosyntec. Additionally, field observations, interviews with plant staff, and evaluations were performed to compare conditions in 2021 at the GMF Pond relative to the 2016 initial certifications. These tasks determined that updates are not required for the Initial Hazard Potential Classification or Inflow Design Flood Control Plan. However, due to changes at the site and technical review comments, updates were required and were performed for the:

- History of Construction Report,
- Initial Structural Stability Assessment, and
- Initial Safety Factor Assessment.

Geosyntec's evaluations of the initial certification reports and updated engineering evaluations determined that the GMF Pond meets all requirements for hazard potential classification, history of construction reporting, structural stability assessment, safety factor assessment, and hydrologic and hydraulic control. **Table 1** provides a summary of the initial 2016 certifications and the updated 2021 periodic certifications.

[1] The GMF Pond is also referred to as ID Number W05780100001-04, GMF Pond by the Illinois Environmental Protection Agency (IEPA); CCR unit ID 203 by IPRG, and IL50573 within the National Inventory of Dams (NID) maintained by the Illinois Department of Natural Resources (IDNR). Within this document it is referred to as the GMF Pond or the GMFP.

**Table 1 – Periodic Certification Summary**

| | CCR Rule Reference | Requirement Summary | 2016 Initial Certification | | 2021 Periodic Certification | |
|---|---|---|---|---|---|---|
| | | | Requirement Met? | Comments | Requirement Met? | Comments |
| **Hazard Potential Classification** | | | | | | |
| 3 | §257.73(a)(2) | Document hazard potential classification | Yes | Impoundment was determined to have Significant hazard potential classification [2]. | Yes | Updates were not determined to be necessary. Geosyntec recommends retaining the Significant hazard potential classification. |
| **History of Construction** | | | | | | |
| 4 | §257.73(c)(1) | Compile a history of construction | Yes | A history of Construction report was prepared for the GMF Pond [3]. | Yes | The Duck Creek Power Plant closed and CCR materials are no longer being placed in the GMF Pond. A letter listing updates to the History of Construction report is provided in **Attachment C.** |
| **Structural Stability Assessment** | | | | | | |
| 5 | §257.73(d)(1)(i) | Stable foundations and abutments | Yes | Foundations and abutments were found to be stable [8]. | Yes | Foundations and abutments were found to be stable after performing updated slope stability analyses. |
| | §257.73(d)(1)(ii) | Adequate slope protection | Yes | Slope protection was adequate [8]. | Yes | No changes were identified that may affect this requirement. |
| | §257.73(d)(1)(iii) | Sufficiency of dike compaction | Yes | Dike compaction was sufficient for expected ranges in loading conditions [8]. | Yes | Dike compaction found to be sufficient after performing updated slope stability analyses. |
| | §257.73(d)(1)(iv) | Presence and condition of slope vegetation | Yes | Vegetation was present on exterior slopes and is maintained. Interior slopes had alternate protection (geomembrane liner) [8]. | Yes | No changes were identified that may affect this requirement. |
| | §257.73(d)(1)(v)(A) and (B) | Adequacy of spillway design and management | Yes | Spillways were adequately designed and constructed and were expected to adequately manage flow during 1,000-year flood [8]. | Yes | No changes were identified that may affect this requirement. |
| | §257.73(d)(1)(vi) | Structural integrity of hydraulic structures | Not Applicable | Hydraulic structures penetrating the dikes or underlying the base of the GMF Pond were not present [8]. | Not Applicable | No changes were identified that may affect this requirement. |
| | §257.73(d)(1)(vii) | Stability of downstream slopes inundated by water body. | Not Applicable | Inundation of exterior slopes was not expected; this requirement was not applicable [8]. | Not Applicable | No changes were identified that may affect this requirement. |
| **Safety Factor Assessment** | | | | | | |
| 6 | §257.73(e)(1)(i) | Maximum storage pool safety factor must be at least 1.50 | Yes | Safety factors were calculated to be 4.27 and higher [8]. | Yes | Safety factors from an updated slope stability analyses were calculated to be 3.47 and higher. |
| | §257.73(e)(1)(ii) | Maximum surcharge pool safety factor must be at least 1.40 | Yes | Safety factors were calculated to be 4.26 and higher [8]. | Yes | Safety factors from an updated slope stability analyses were calculated to be 3.47 and higher. |
| | §257.73(e)(1)(iii) | Seismic safety factor must be at least 1.00 | Yes | Safety factors were calculated to be 2.37 and higher [8]. | Yes | Safety factors from an updated slope stability analyses were calculated to be 1.88 and higher. |
| | §257.73(e)(1)(iv) | For dike construction of soils that have susceptible to liquefaction, safety factor must be at least 1.20 | Not Applicable | Dike soils were not susceptible to liquefaction [8]. | Not Applicable | No changes were identified that may affect this requirement. |
| **Inflow Design Flood Control System Plan** | | | | | | |
| 7 | §257.82(a)(1), (2), (3) | Adequacy of inflow design control system plan. | Yes | Flood control system adequately managed inflow and peak discharge during the 1,000-year, 24-hour, Inflow Design Flood [8]. | Yes | No changes were identified that may affect this requirement. |
| | §257.82(b) | Discharge from CCR Unit | Yes | Discharge into Waters of the United States is not expected during 1,000-year, 24-hour Inflow Design Flood conditions [8]. | Yes | No changes were identified that may affect this requirement. |

# SECTION 1

# INTRODUCTION AND BACKGROUND

This Periodic United States Environmental Protection Agency (USPA) Coal Combustion Residual (CCR) Rule [1] Certification Report was prepared by Geosyntec Consultants (Geosyntec) for Illinois Power Resources Generations, LLC (IPRG) to document the periodic certification of the GMF Pond at the Duck Creek Power Plant (DCPP) located at 17751 North Cilco Road in Canton, Illinois, 61520. The location of Duck Creek is provided in **Figure 1**, and a site plan showing the location of the GMF Pond, among other closed and open CCR units and non-CCR surface impoundments, is provided in **Figure 2**.

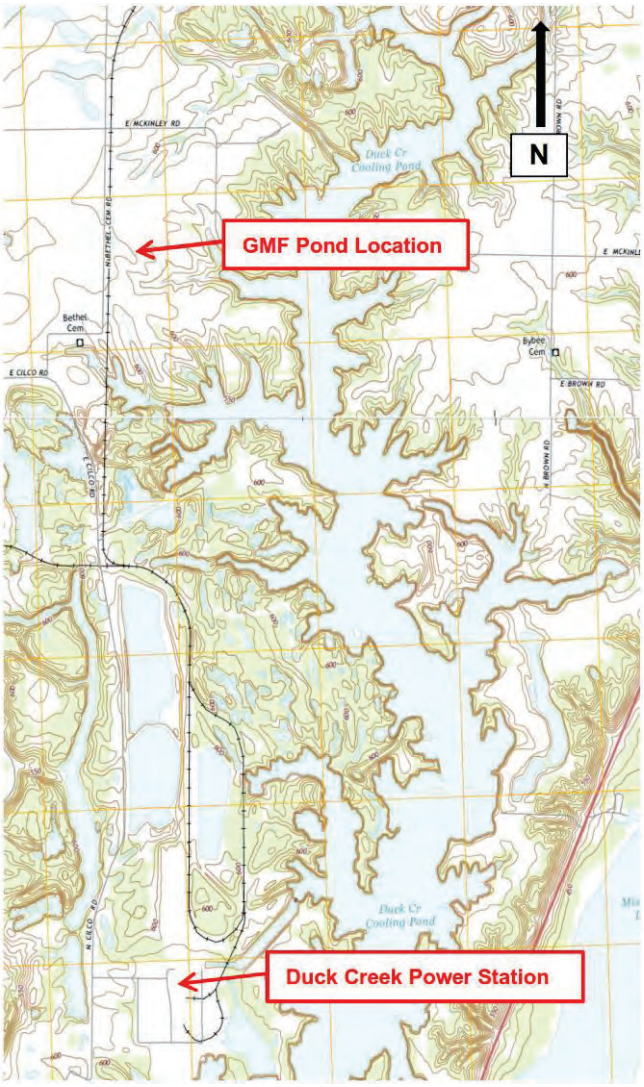

**Figure 1 – Site Location Map (from AECOM, 2016)**

**Figure 2 – Site Plan**

## 1.1 GMF Pond Description

DCPP was retired in 2019. Prior to retirement, two active CCR surface impoundments – the GMF Pond and the Bottom Ash Basin, and one CCR landfill, were used for managing CCRs generated at DCPP [8]. This certification report only pertains to the GMF Pond. The GMF Pond has a "Significant" hazard potential, based on the initial hazard potential classification assessment performed by Stantec in 2016 in accordance with §257.73(a)(2) ( [2], [7]).

The GMF Pond served as the wet impoundment basin for gypsum proceeded by the emissions scrubbers at DCPP. The GMF Pond was constructed between 2008 and 2009 and received inflow from three pairs of 10-in diameter high-density polyethylene (HDPE) gypsum slurry pipes. Clear water discharge from the GMF Pond flows downstream into the approximately 8.5-acre GMF Recycle Pond, which is a non-CCR unit, via a lined channel (transfer channel). The transfer channel is approximately 150-ft long, trapezoidal in shape, lined with 60-mil HDPE, has 3H:1V (horizontal to vertical) side slopes, and a depth of 6 ft. Stoplogs are present within the transfer channel that would allow the pool level to be maintained as high as El. 616.0 ft[2]. The channel transitions from a 16-ft bottom width at an invert elevation of 614.0 ft at the upstream end to a 35-ft bottom width at an invert elevation of 609.0 ft at the downstream end. Outflow from the GMF Recycle Pond was formerly pumped back to DCPP to be recycled for use in the wet scrubber system [8]. Currently, the GMF Pond and GMF Recycle Pond are maintained in a zero-discharge configuration, where the only inflows are precipitation flowing directly into the impoundments and the only outflows are evaporation.

The GMF Pond has a composite liner system that is present underneath the entire footprint of the pond and extends up the interior slopes. The liner system includes, from bottom to top, a 3-ft thick layer of compacted clay that is overlain by a geosynthetic clay liner (GCL) and a 60-mil textured HDPE geomembrane, all of which serve as the lower liner. Above the lower liner, a 10-oz

[2] All elevations are in the North American Vertical Datum of 1988 (NAVD88), unless otherwise noted.

geotextile is overlain by a 1-ft thick granular drainage layer and a 4-oz geotextile filter. The upper liner is comprised from bottom to top of a 1-ft thick soil cushion layer and a 60-mil textured HDPE geomembrane. The upper geomembrane liner is exposed at the pond bottom and side slopes [8].

As formerly operated, the normal pool of the GMF Pond was El. 615.0 ft, as controlled by the stoplog structure at the top of the transfer channel. The GMF Pond is approximately 31.6 acres in size and has a total perimeter embankment length of approximately 4,560 ft. The perimeter dike was constructed to include a crest width of approximately 30 ft and crest height ranging from approximately 5 to 10 ft along the eastern side of the pond. The interior of the ponds extends deeper than the exterior slopes; the maximum interior slope height is approximately 45 ft in the southwest corner of the pond. The design elevation of the embankment crest is 620 ft. Both interior and exterior slopes have an orientation of 3.5H:1V (horizontal to vertical).

Initial certifications for the GMF Pond for Hazard Potential Classification (§257.73(a)(2)), History of Construction (§257.73(c)), Structural Stability Assessment (§257.73(d)), Safety Factor Assessment (§257.73(e)(1)), and Inflow Design Flood Control System Plan (§257.82) were completed by Stantec and AECOM in 2016 and 2017 and subsequently posted to IPRG's CCR Website ( [2], [3], [4], [5], [6]). Additional documentation for the initial certifications included a detailed operating record reports containing calculations and other information prepared for the hazard potential classification by Stantec [7] and for the structural stability assessment, safety factor assessment, and inflow design flood control system plan by AECOM [8]. These operating record reports were not posted to IPRG's CCR Website.

## 1.2 Report Objectives

The following objectives are associated with this report:

- Compare site conditions from 2015/2016, when the initial certifications were developed, to site conditions in 2020/2021, when data for the periodic certification was obtained, and evaluate if updates are required to the:
    - §257.73(a)(2) Hazard Potential Classification [2].
    - §257.73(c) History of Construction [3].
    - §257.73(d) Structural Stability Assessment [4].
    - §257.73(e) Safety Factor Assessment [5], and/or
    - §257.82 Inflow Design Flood Control System Plan [6].
- Independently review the Hazard Potential Classification ( [2], [7]), Structural Stability Assessment ( [4], [8]), Safety Factor Assessment ( [5], [8]), and Inflow Design Flood

Control System Plan ( [6], [8]) reports to determine if updates may be required based on technical considerations.

  - The History of Construction report [3] was not independently reviewed for technical considerations, as this report contained historical information primarily developed prior to promulgation of the CCR Rule [1] for the CCR units at DCPP, and did not include calculations or other information used to certify performance and/or integrity of the impoundments under §257.73(a)(2), §257.73(c)-(e), or §257.82.

- Confirm that the GMF Pond meets all of the requirements associated with §257.73(a)(2), (c), (d), (e), and §257.82, or, if the GMF Pond does not meet any of these requirements, provide recommendations for compliance with those sections of the CCR Rule [1].

# SECTION 2

# COMPARISION OF INITIAL AND PERIODIC SITE CONDITIONS

## 2.1 Overview

This section describes the comparison of conditions at the GMF Pond between the start of the initial CCR certification program in 2015 and 2016 (initial conditions) and subsequent collection of periodic certification site data in 2020 and 2021 (periodic conditions).

## 2.2 Review of Annual Inspection Reports

Annual onsite inspections for the GMF Pond were performed between 2016 and 2020 ( [9], [10], [11], [12], [13]) were certified by a licensed professional engineer in accordance with §257.83(b). Each inspection report stated the following information, relative to the previous inspection:

- A statement that no changes in geometry of the impounding structure were observed since the previous inspection;
- A statement that no instrumentation was present;
- Approximate volumes of impounded water and CCR at the time of inspection;
- A statement that no appearances of actual or potential structural weakness or other disruptive conditions were observed; and
- A statement that no other changes which may have affected the stability or operation of the impounding structure were observed.

In summary, the reports did not indicate any significant changes to the GMF Pond between 2015 and 2020. No signs of instability, structural weakness, or changes which may have affected the operation or stability of the GMF Pond were noted in the inspection reports.

## 2.3 Review of Instrumentation Data

Multiple groundwater monitoring wells are present around the GMF Pond. Eight of the groundwater monitoring wells, G50S, G51S, G54C, G57C, G57S, G60S, G64S, and X301 have been monitored periodically since by IPRG. Water level readings were provided from December 2, 2015 through June 21, 2021 for most of the wells, with the exception of X301, for which water level readings were provided starting on March 2, 2015, and G54C, for which readings were provided starting on April 14, 2021. Geosyntec reviewed the water levels to evaluate if significant fluctuations, partially increases in phreatic levels, may have occurred between development of the

initial structural stability and factor of safety certifications ( [4], [5], [8]) and June 21, 2021. Available monitoring well water levels are plotted in **Attachment A**.

In summary, only minor changes in phreatic conditions were observed in the available monitoring well level data. Phreatic levels typically exhibited consistent seasonal variations of 5 to 10 ft, with the exception of X301 and G54C, which varied by approximately 2 ft. These levels do not significantly differ from those utilized for the initial structural stability and factor of safety certifications ( [4], [5], [8]).

## 2.4 Comparison of Initial to Periodic Surveys

The initial survey of the GMF Pond, conducted by Weaver Consultants (Weaver) in 2015 [14], was compared to the periodic survey of the GMF Pond, conducted by IngenAE, LLC (IngenAE) in 2020 [15], using AutoCAD Civil3D 2021 software. This comparison quantified changes in the volume of CCR placed within the GMF Pond and considered volumetric changes above and below the starting water surface elevation (SWSE) used for the 2016 §257.82 inflow design flood control plan hydraulic analysis [6]. Potential changes to embankment geometry were also evaluated. This comparison is presented in side-by-side comparison of the two surveys in **Drawing 1,** and a plan view isopach map denoting changes in ground surface elevation in **Drawing 2**. A summary of the water elevations and changes in CCR volumes is provided in **Table 2**.

**Table 2 – Initial to Periodic Survey Comparison**

| | |
|---|---|
| **Initial Surveyed Pool Elevation (ft)** | 614.2 |
| **Periodic Surveyed Pool Elevation (ft)** | 613.9 |
| **Initial §257.82 Starting Water Surface Elevation (SWSE) (ft)** | 616.0 |
| **Total Change in CCR Volume* (CY)** | + 8,000 (Fill) |
| **Change in CCR Volume Above SWSE* (CY)** | - 9,000 (Cut) |
| **Change in CCR Volume Below SWSE* (CY)** | + 17,000 (Fill) |

*All volumes rounded to the nearest 1,000 CY

The comparison indicated that approximately 8,000 CY of CCR was placed in the GMF Pond between the initial and periodic surveys. The CCR was placed entirely below the SWSE and a net cut occurred above the SWSE. CCR grades above the SWSE were generally similar to the initial survey (e.g., within +/- 2 ft). These changes are considered unlikely to result in increase in the peak water surface elevation (PWSE) during a flood event, as additional flood storage is present relative to conditions observed in 2015. No significant changes to embankment geometry appeared to have occurred between the initial and periodic surveys.

## 2.5 Comparison of Initial to Periodic Aerial Photography

Initial aerial photographs of the GMF Pond collected by Weaver in 2015 [14] were compared to periodic aerial photographs collected by IngenAE in 2020 [15] to visually evaluate if potential site changes (i.e., changes to the embankment, outlet structures, limits of CCR, other appurtenances)

may have occurred. A comparison of these aerial photographs is provided in **Drawing 3**. No significant changes were noted during this comparison.

## 2.6 Comparison of Initial to Periodic Site Visits

An initial site visit to the GMF Pond was conducted by AECOM in 2015 and documented with a Site Visit Summary and corresponding photographs [16]. A periodic site visit was conducted by Geosyntec on May 27, 2021, with Mr. Lucas P. Carr, P.E. conducting the site visit. The site visit was intended to evaluate potential changes at the site since the initial certifications were prepared (i.e., modification to the embankment, outlet structures or other appurtenances, limits of CCR, maintenance programs, repairs), in addition to performing visual observations of the GMF Pond to evaluate if the structural stability requirements (§257.73(d)) were still met. The stie visit included walking the perimeter of the GMF Pond, visually observing conditions, recording field notes, and collecting photographs. The site visit is documented in a photographic log provided in **Appendix A**. A summary of significant findings from the periodic site visit is provided below:

- Overall site maintenance appears to be similar to conditions observed in 2015.
- No signs or structural stability, erosion, or required maintenance items were observed during the stie visit.

## 2.7 Interview with Power Plant Staff

An interview with Mr. Daryl Johnson and Mr. Brandon Potter of the DCPP was conducted by Lucas P. Carr, P.E. of Geosyntec on May 27, 2021. Mr. Johnson, at the time of the interview, had been employed at the DCPP for 8 years and was responsible for environmental compliance and completed weekly CCR inspections on some years, including for the GMF Pond, in addition to managing vegetation maintenance. Mr. Potter, at the time of the interview, had been employed at DCPP for 10 years and assisted in the inspection and operation of the GMF Pond. The interview included a discussion of included a discussion of potential changes that that may have occurred at the GMF Pond since development of the initial certifications ( [2], [7], [3], [4], [5], [6], [8]).

- Were any construction projects completed for the GMF Pond since 2015, and, if so, are design drawings and/or details available?
    - No.
- Were there any changes to the purpose of the GMF Pond since 2015?
    - The DCPP was closed in December of 2019. Sluicing into the GMF Pond and pumping of water from the GMF Recycle Pond was stopped at this time.
- Were there any changes to the to the instrumentation program and/or physical instruments for the GMF Pond since 2015?

- The GMF Pond does not have instrumentation, so no changes occurred.

- Have area-capacity curves for the GMF Pond been prepared since 2015?
  - No known area-capacity curves have been developed.
- Were there any changes to spillways and/or diversion features for the GMF Pond completed since 2015?
  - No.
- Were there any changes to construction specifications, surveillance, maintenance, and repair procedures for the GMF Pond since 2015?
  - No.
- Were there any instances of dike and/or structural instability for the GMF Pond since 2015?
  - No known instances occurred.

# SECTION 3

# HAZARD POTENTIAL CLASSIFICATION - §257.73(a)(2)

## 3.1 Overview of Initial HPC

The Initial Hazard Potential Classification (Initial HPC) was prepared by Stantec Consulting Services, Inc. (Stantec) in 2016 ( [2], [7]), following the requirements of §257.73(a)(2). The Initial HPC included the following information:

- Visual analysis to evaluate potential hazards associated with a failure of the GMF Pond perimeter dike, along the north, south, east, and west embankments of the GMF Pond.
- Evaluation of potential breach flow paths using elevation data and aerial imagery to assess potential impacts to downstream structures, infrastructure, and waterways.
- While a breach map is not included within the Initial HPC, it included within the §257.73(a)(3) Initial Emergency Action Plan (Initial EmAP) [17].

The visual analysis indicated that only structures owned by DCPP were within the potential breach path, and that public impacts were limited to portions of North Bethel Cemetery Road and the railroad leading to the Power Plant. The reported noted that North Bethel Cemetery Road is intermittently used, and the at-risk population was considered transient. The Initial HPC concluded that breach of the GMF pond would be unlikely to result in a probable loss of human life, although the breach could cause CCR to be released into downstream waterways, thereby causing environmental damage. The Initial HPC therefore recommended a “Significant” hazard potential classification for the GMF Pond [2].

## 3.2 Review of Initial HPC

Geosyntec performed a review of the Initial HPC ( [2], [7]), in terms of technical approach, assessment of the results, and applicable requirements of the CCR Rule [1]. No significant technical issues were noted within the technical review, although a detailed review (e.g., check) of the calculations was not performed as the initial HPC utilized a visual assessment.

## 3.3 Summary of Site Changes Affecting the Initial HPC

Geosyntec did not identify any changes at the site that may affect the HPC. No new structures, infrastructure, frequently occupied facilities/areas, or waterways were observed to be present in the probable breach area indicated in the Initial EmAP [17]. Additionally, no significant changes to the topography in the probable breach were identified.

## 3.4 Periodic HPC

Geosyntec recommends retaining the "Significant" hazard potential classification for the GMF Pond, per §257.73(A)(2), based on the lack of site changes potentially affecting the Initial HPC occurring since the initial HPC was developed, as described in **Section 3.3**, and the lack of significant review comments, as described in **Section 3.2**. Updates to the Initial HPC reports ( [2], [7]) are not recommended at this time.

# SECTION 4

# HISTORY OF CONSTRUCTION REPORT - §257.73(c)

## 4.1 Overview of Initial HoC

The Initial History of Construction report (Initial HoC) was prepared by AECOM in 2016 [3] following the requirements of §257.73(c) and included information on all non-incised CCR surface impoundments at DCPP, including the GMF Pond, Ash Pond No. 1, and Ash Pond No. 2. This report only discusses the HoC as it pertains to the GMF Pond. The Initial HoC included the following information for the GMF Pond:

- The name and address of the owner/operator,
- Location maps,
- Statements of purpose,
- The names and size of the surrounding watershed,
- A description of the foundation and abutment materials,
- A description of the dike materials,
- Approximate dates and stages of construction,
- Available design and engineering drawings,
- A summary of instrumentation,
- Area-capacity curves for the GMF Pond,
- Information on spillway structures,
- Construction specifications,
- Inspection and surveillance plans,
- A statement that operations and maintenance plans are being generated or revised, and that the report will be updated when the new plans are available,
- A statement that no known historical structural instability has occurred at the CCR surface impoundments.

## 4.2 Summary of Site Affecting the Initial HoC

One significant change at the site that occurred after development of the initial HoC report [3] was identified and is described below:

- Electricity generation at the DCPP ceased in December of 2019 and the pumping of inflow and outflow into and from the GMF Recycle Pond ceased at this time.
    - An update to the HoC report was performed to state that the DCPP is no longer active and the GMF Pond is no lower receiving inflows and outflow is no longer pumped back to the DCPP. A letter documenting changes to the HoC report is provided in **Attachment C**.

# SECTION 5

# STRUCTURAL STABILITY ASSESSMENT - §257.73(d)

## 5.1 Overview of Initial SSA

The Initial Structural Stability Assessment (Initial SSA) was prepared by AECOM in 2016 ( [4], [8]), following the requirements of §257.73(d)(1), and included the following evaluations:

- Stability of dike foundations, dike abutments, slope protection, dike compaction, and slope vegetation,
- Spillway stability including capacity, structural stability and integrity; and
- Downstream slope stability under sudden drawdown conditions for a downstream water body.

The Initial SSA ( [4], [8]) concluded that the GMF Pond met all structural stability requirements for §257.73(d)(1)(i)-(vii). This included noting that the structural integrity of hydraulic structures (§257.73(d)(1)(vi)) was not applicable, due to no hydraulic structures penetrating or underlying the base of the GMF Pond. Additionally, it was noted that the stability of downstream slopes inundated by water bodies (§257.73(d)(1)(vii) was also not applicable, due to inundation of the downstream slopes not being expected.

## 5.2 Review of Initial SSA and Updated Periodic SSA

Geosyntec performed a review of the Initial SSA ( [4], [8]) in terms of technical approach, calculation input parameters and methodology, recommendations, and completeness. The review included the following tasks:

- Reviewing photographs collected in 2015 and used to demonstrate compliance with §257.73(d)(1)(i)-(vii).
- Reviewing geotechnical calculations used to demonstrate the stability of foundations, per §257.73(d)(1)(i) and sufficiency of dike compaction, per §257.73(d)(1)(iii), in terms of supporting geotechnical investigation and testing data, input parameters, analysis methodology, selection of critical cross-sections, and loading conditions.
- Review of the methodology used to demonstrate that a downstream water body that could induce a sudden drawdown condition, per §257.73(d)(1)(vii), is not present.

One review comment and corresponding recommended technical update was identified during review of the geotechnical analyses supporting the sufficiency of dike compaction

(§257.73(d)(1)(i)) and foundation and abutment stability (§257.73(d)(1)(iii) portions of the Initial SSA. These analyses were performed for the Initial Safety Factor Assessment (SFA) but also utilized to support the initial SSA. The review comment and subsequent updates the Initial SFA, are discussed in **Section 6.**

## 5.3 Summary of Site Changes Affecting the Initial SSA

No changes since development of the Initial SSA were identified that would require updates to the Initial SSA ( [4], [8]).

## 5.4 Periodic SSA

The updated Periodic SFA (**Section 7**) indicates that foundations and abutments are stable and dike compaction is sufficient for expected ranges in loading conditions, as slope stability factors of safety for slip surfaces passing through the dike and foundation were found to meet or exceed the requirements of §257.73(e)(1), including for static maximum storage pool conditions and post-earthquake (i.e., liquefaction) loading conditions considering seismically-induced strength loss in the foundation soils. Therefore, the requirements of §257.73(d)(1)(i) and §257.73(d)(1)(iii) are met for the Periodic SSA.

# SECTION 6

# SAFETY FACTOR ASSESSMENT - §257.73(e)(1)

## 6.1 Overview of Initial SFA

The Initial Safety Factor Assessment (Initial SFA) was prepared by AECOM in 2016 ( [5], [8]) following the requirements of §257.73(e)(1). The Initial SFA included the following information:

- A geotechnical investigation program with in-situ and laboratory testing;
- An assessment of the potential for liquefaction in the dike and foundation soils;
- The development of a single slope stability cross-sections for limit equilibrium stability analysis utilizing GeoStudio SLOPE/W software; and
- The analysis of the cross-section for maximum storage pool, maximum surcharge pool, and seismic loading conditions.
    - Liquefaction loading conditions were not evaluated as liquefaction-susceptible soil layers were not identified in either the embankments or foundation soils.

The Initial SFA concluded that the GMF Pond met all safety factor requirements, per §257.73(e), as all calculated safety factors were equal to or higher than the minimum required values.

## 6.2 Review of Initial SFA

Geosyntec performed a review of the Initial SFA ( [5], [8]) in terms of technical approach, calculation input parameters and methodology, recommendations, and completeness. The review included the following tasks:

- Reviewing geotechnical calculations used to demonstrate the acceptable safety factors, per §257.73(e)(1), in terms of:
    - Completeness and adequacy of supporting geotechnical investigation and testing data;
    - Completeness and approach of liquefaction triggering assessments; and
    - Input parameters, analysis methodology, selection of critical cross-sections, and loading conditions utilized for slope stability analyses.
    - Phreatic conditions based on piezometric data collected between March 2, 2015 June 21, 2021, as discussed in **Section 2.3**.

One review comment was identified during review of the Initial SFA. The comment and the is described below:

- The Initial SFA utilized a single cross-section (A-A') along the eastern embankment where the exterior slope is approximately 8 ft tall. However, the maximum height of the exterior slope is approximately 11 ft at the southwest corner of the embankment.

## 6.3 Summary of Site Changes Affecting the Initial SFA

No changes since development of the Initial SFA were identified that would require updates to the Initial SFA ( [5], [8]).

## 6.4 Periodic SFA

Following review of the Initial SFA ( [5], [8]), Geosyntec developed a new slope stability analysis cross-section (B-B') at the southwest corner of the GMF Pond embankment to account for the maximum embankment height of 11 ft. The model was developed utilizing the following approach and input data:

- Ground surface geometry was obtained from the 2020 survey of the GMF Pond [15].

- Subsurface stratigraphy was obtained from 2007 borings B-53 and B-67, as provided in the Initial SFA report [8]. Geosyntec reviewed the boring data and determined that subsurface conditions were similar to conditions at cross-section A-A'. Therefore, the soil properties (i.e., strength, unit weight) from the Initial SFA ( [5], [8]) were utilized for cross-section B-B',

- Piezometric levels in the foundation soils were assumed to follow the ground surface past the embankment toe, per providing readings from monitoring wells G51S and G54C; and,

- All other analysis settings and input data from the Initial SFA ( [5], [8]) was utilized, including, but not limited to, software package and version, slip surface search routines and methods, and pseudostatic seismic coefficients.

Factors of safety form the Periodic SFA (cross-section B-B') and Initial SFA (cross-section A-A') are summarized in **Table 3** and confirm that the GMF Pond meets the requirements of §257.73(e)(1). A location of the cross-section B-B' in plan and analysis output data for cross-section B-B' is provided in **Attachment D**.

**Table 3 – Factors of Safety from Periodic SFA**

| | Structural Stability Assessment (§257.73(d)) and Safety Factor Assessment (§257.73(e)) | | | | Structural Stability Assessment (§257.73(d)) |
|---|---|---|---|---|---|
| **Cross-Section** | **Maximum Storage Pool §257.73(e)(1)(i) Minimum Required = 1.50** | **Maximum Surcharge Pool §257.73(e)(1)(ii) Minimum Required = 1.40** | **Seismic §257.73(e)(1)(iii) Minimum Required = 1.00** | **Dike Liquefaction §257.73(e)(1)(iv) Minimum Required = 1.20** | **Foundation Liquefaction §257.73(d)(1)(i) Minimum Required = 1.20** |
| A-A' | 4.27 | 4.26 | 2.37 | N/A | N/A |
| B-B' | 3.47* | 3.47* | 1.88* | N/A | N/A |

Notes:
[1]Denotes cross-section where results from the Initial SFA are presented due to no observed changes relative to the Initial IDF.
[2]Denotes cross-section where changes are occurred, and results are presented from the updated Periodic SFA.
*Indicates critical cross-section (i.e., lowest calculated factor of safety out of the two cross-sections analyzed)
N/A – Loading condition is not applicable.

# SECTION 7

# INFLOW DESIGN FLOOD CONTROL SYSTEM PLAN - §257.82

## 7.1 Overview of Initial IDF

The Initial Inflow Design Flood Control System Plan (Initial IDF) was prepared by AECOM in 2016 ( [6], [8]) following the requirements of §257.82. The Initial IDF included the following information:

- A hydraulic and hydrologic analysis, performed for the 1,000-year design flood event because of the hazard potential classification of "significant", which corresponded to 9.37 inches of rainfall over a 24-hour period.
- The Initial IDF utilized a HydroCAD Version 8.5 model to evaluate spillway flows and pool level increases during the design flood, with a SWSE of 616.0 ft.

The Initial IDF ( [6], [8]) concluded that the GMF Pond met the requirements of §257.82, as the peak water surface estimated by the HydroCAD model was El. 618.3 ft, relative to a minimum GMF Pond dike crest elevation of 620.0 ft. Therefore, overtopping was not expected. The Initial IDF also evaluated the potential for discharge from the CCR unit and determined that discharge into Waters of the United States and no overtopping was expected during the 1,000-year design flood.

## 7.2 Review of Initial IDF

Geosyntec performed a review of the Initial IDF ( [6], [8]) in terms of technical approach, calculation input parameters and methodology, recommendations, and completeness. The review included the following tasks:

- Reviewing the return interval used vs. the hazard potential classification.
- Reviewing the rainfall depth and distribution for appropriateness.
- Performing a high-level review of the inputs to the hydrological modeling.
- Reviewing the hydrologic model parameters for spillway parameters, starting pool elevation, and storage vs. the reference data.
- Reviewing the overall Initial IDF vs. the applicable requirements of the CCR Rule [1].

No significant technical issues were noted within the technical review, although a detailed review (e.g., check) of the calculations was not performed.

## 7.3 Summary of Site Changes Affecting the Initial IDF

No changes since development of the Initial IDF were identified that would require updates to the Initial IDF ( [6], [8]).

# SECTION 8

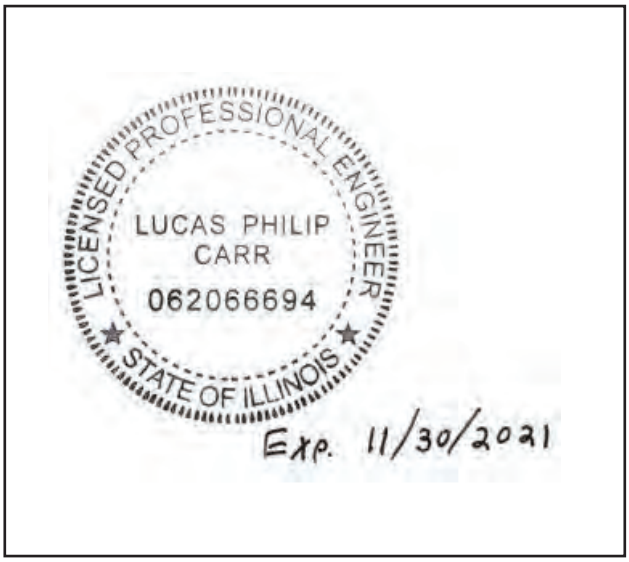
# CONCLUSIONS

The GMF Pond at DCPP was evaluated relative to the USEPA CCR Rule periodic assessment requirements for:

- Hazard potential classification (§257.73(a)(2)),
- History of Construction reporting (§257.73(d)),
- Structural stability assessment (§257.73(d)),
- Safety factor assessment (§257.73(e)), and
- Inflow design flood control system planning (§257.82).

Based on the evaluations presented herein, the referenced requirements are satisfied.

Electronic Filing: Received, Clerk's Office 06/20/2024



## SECTION 9

## CERTIFICATION STATEMENT

CCR Unit: Illinois Power Resources Generation, LLC; Duck Creek Power Plant, GMF Pond

I, Lucas P. Carr, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief that the information contained in this 2021 USEPA CCR Rule Periodic Certification Report, has been prepared in accordance with the accepted practice of engineering. I certify, for the above-referenced CCR Unit, that the periodic assessment of the hazard potential classification, history of construction report, structural stability, emergency action plan, safety factors, and inflow design flood control system planning, dated October 2021, were conducted in accordance with the requirements of 40 CFR §257.73(a)(2), (c), (d), (e), and §257.82.

Canton, Illinois 61520

**Subject: Periodic History of Construction Report Update Letter**
**USEPA Final CCR Rule, 40 CFR §257.73(c)**
**Duck Creek Power Plant**
**Canton, Illinois**

At the request of Illinois Power Resources Generating, LLC (IPRG), Geosyntec Consultants (Geosyntec) has prepared this Letter to documents updates to the Initial History of Construction (HoC) report for the Duck Creek Power Plant (DCPP), also known as the Duck Creek Power Station (DUC). The Initial HoC report was prepared by AECOM in October of 2016 [1] in accordance with 40 Code of Federal Regulations (CFR) §257.73(c) of the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals Rule, known as the CCR Rule [2]. This letter also includes information required by Section 845.220(a)(1)(B) (Design and Construction Plans) of the state-specific Illinois Environmental Protection Agency (IEPA) Part 845 CCR Rule [3] that is not expressly required by §257.73(c).

## BACKGROUND

The CCR Rule required that, by October 17, 2016, Initial HoC reports to be compiled for existing CCR surface impoundments with: (1) a height of five feet or more and a storage volume of 20 acre-feet or more, or (2) a height of 20 feet or more. The Initial HoC report was required to contain, to the extent feasible, the information specified in 40 CFR §257.73(c)(1)(i)-(xii). The Initial HoC report for DCPP, which included three existing CCR surface impoundments, the GMF Pond (GMFP), Ash Pond No. 1 (AP1), and Ash Pond No. 2 (AP2), was prepared and subsequently posted to IPRG's CCR Website prior to October 17, 2016.

The CCR Rule requires that Initial HoC to be updated if there is a significant change to any information complied in the Initial HoC report, as listed below:

engineers | scientists | innovators

Electronic Filing: Received, Clerk's Office 06/20/2024

*§ 257.73(c)(2): If there is a significant change to any information complied under paragraph (c)(1) of this section, the owner or operator of the CCR unit must update the relevant information and place it in the facility's operating record as required by § 257.105(f)(9).*

IPRG retained Geosyntec to review the Initial HoC report, review reasonably and readily available information for the GMFP, AP1, and AP2 generated since the Initial HoC report was prepared, and perform a site visit to DCPP to evaluate if significant changes may have occurred since the Initial HoC report was prepared.

This Letter contains the results of Geosyntec's evaluation and documents significant changes that have occurred at the GMFP, AP1, and AP2 at DCPP, as they pertain the requirements of §257.73(c)(1)(i)-(xii)

## UPDATES TO HISTORY OF CONSTRUCTION REPORT

Geosyntec's evaluation for the DCPP GMFP, AP1, and AP2 determined that no known significant changes requiring updates to the information in the Initial HoC report pertaining to §257.73(c)(1)(i)-(ii), §257.73(c)(1)(iv)-(vii), §257.73(c)(1)(ix), and §257.73(c)(1)(xi)-(xii) of the CCR Rule had occurred since the Initial HoC report was developed.

However, Geosyntec's evaluation determined that significant changes at the DCPP GMFP, AP1, and AP2 pertaining to §257.73(c)(1)(iii), §257.73(c)(1)(viii), §257.73(c)(1)(x) of the CCR Rule had occurred since the Initial HoC report had been developed. Additionally, information how long the CCR surface impoundments have been operating and the types of CCR in the surface impoundments, as required by Section 845.220(a)(1)(B) of the Part 845 Rule were not included in the Initial HoC report, as this information is not required by the CCR Rule. Each change and the subsequent updates to the Initial HoC report is described within this section.

*Section 845.220(a)(1)(B): A statement of … how long the CCR surface impoundment has been in operation, and the types of CCR that have been placed in the surface impoundment.*

*GMF Pond*

GMFP is in operation since 2009. As of the date of this report, the GMFP has been present for approximately 12 years.

CCR placed in the GMFP is being used to store and dispose of gypsum and to clarify recycled process water for plant operations [4].

*Ash Pond No. 1*

AP1 was in operation from 1976 until November 2015, for a total of approximately 39 years.

CCR placed in AP1 was used to store and dispose of fly ash and bottom ash [4].

*Ash Pond No. 2*

AP2 was in operation from 1986 until November 2015, for a total of approximately 35 years.

CCR placed in AP2 was used to store and dispose of fly ash and bottom ash and to clarify CCR contact stormwater prior to discharge.

*§257.73(c)(1)(i): The name and address of the person(s) owning or operating the CCR unit; the name associated with the CCR unit; and the identification number of the CCR unit if one has been assigned by the state.*

The state identification numbers (ID) for the GMFP, AP1 and AP2 have been assigned by the Illinois Environmental Protection Agency (IEPA). The IDs are listed in **Table 1**.

**Table 1 – IEPA ID Numbers**

| CCR Surface Impoundment | | State ID |
|---|---|---|
| Ash Pond No. 1 | | W0578010001-01 |
| Ash Pond No. 2 | | W0578010001-02 |
| GMF Pond | | W0578010001-04 |

*§ 257.73(c)(1)(iii): A statement of the purpose for which the CCR unit is being used.*

AP1 and AP2 were closed in 2021, in substantial compliance with the written closure plans posted to IPRG's CCR Website ( [5], [6]), and as documented by a certified Notification of Completion of Closure posted to IPRG's CCR Website [7]. Therefore, AP1 and AP2 are no longer capable of storing CCR or free liquids.

The DCPP was retired in December of 2019, with the generation of electricity ceased at that time. Therefore, the GMFP is no longer being used to storge and disposed of gypsum or to clarify recycled process water for use in plant operations, as gypsum is no longer being generated and process water is no longer required by the DCPP.

*§ 257.73(c)(1)(viii): A description of the type, purpose, and location of existing instrumentation.*

Instrumentation monitoring at AP1 and AP2 is no longer required as both CCR surface impoundments were closed in accordance with §257.102 [7], and the instrumentation

Electronic Filing: Received, Clerk's Office 06/20/2024

network was modified at that time. Therefore, the instrumentation locations shown in Appendix C of the Initial HoC report are no longer applicable to AP1 and AP2.

*§ 257.73(c)(1)(x): A description of each spillway and diversion design features and capacities and calculations used in their determination.*

AP1 and AP2 no longer retain free water as both CCR surface impoundments were closed in 2021 [7]. Therefore, spillways are no longer present the information regarding the spillways of these structures, as presented in the Initial HoC report, is no longer applicable to AP1 and AP2.

**CLOSING**

This letter has been prepared to document Geosyntec's evaluation of changes that have occurred at the GMFP, AP1, and AP2 at the DCPP since the Initial HoC was developed, based on reasonably and readily available information provided by IPRG, observed by Geosyntec during the site visit, or generated by Geosyntec as part of subsequent calculations.

Sincerely,

Lucas P. Carr, P.E.
Senior Engineer

**Re: Duck Creek Power Plant GMF Pond; IEPA ID # W0578010001-04**

Dear Mr. LeCrone:

In accordance with 35 I.A.C. § 845.200, Illinois Power Resource Generating, LLC (IPRG) is submitting a construction permit application for the Duck Creek Power Plant GMF Pond (IEPA ID # W0578010001-04). One hardcopy is provided with this submittal.

The permit application was prepared in accordance with 35 I.A.C. § 845.220 (a) and (d). This submittal includes the completed permit forms as required by § 845.210.

Sincerely,

Cynthia Vodopivec
SVP-Environmental Health and Safety

## SECTION 1: DESIGN AND CONSTRUCTION PLANS (35 Ill. Adm. Code 845.220)

**Design and Construction Plans (Construction History)**

| | |
|---|---|
| 1.1 | CCR surface impoundment name. |
| | GMF Pond and GMF Recycle Pond |
| 1.2 | Identification number of the CCR surface impoundment (if one has been assigned by the Agency). |
| | W0578010001-04 |
| 1.3 | Describe the boundaries of the CCR surface impoundment (35 Ill. Adm. Code 845.210 (c)). |
| | See Attachment A. |
| 1.4 | State the purpose for which the CCR surface impoundment is being used. |
| | See Attachment B. |
| 1.5 | How long has the CCR surface impoundment been in operation? |
| | See Attachment B. |
| 1.6 | List the types of CCR that have been placed in the CCR surface impoundment. |
| | See Attachment B. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Design and Construction Plans (Continued)**

| | | | | | |
|---|---|---|---|---|---|
| 1.7 | List the name of the watershed within which the CCR surface impoundment is located. | | | | |
| | See Attachment B. | | | | |
| 1.8 | What is the size in acres of the watershed within which the CCR surface impoundment is located? | | | | |
| | See Attachment B. | | | | |
| 1.9 | Check the corresponding boxes to indicate that you have attached the following: | | | | |
| | ☑ | A description of the physical and engineering properties of the foundation and abutment materials on which the CCR surface impoundment is constructed. | | | |
| | ☑ | A statement of the type, size, range, and physical and engineering properties of the materials used in constructing each zone or stage of the CCR surface impoundment. | | | |
| | ☑ | A statement of the method of site preparation and construction of each zone of the CCR surface impoundment. | | | |
| | ☑ | A statement of the approximate dates of construction of each successive stage of construction of the CCR surface impoundment. | | | |
| | ☑ | Drawings satisfying the requirements of 35 Ill. Adm. Code 845.220(a)(1)(F). | | | |
| | ☑ | A description of the type, purpose, and location of existing instrumentation. | | | |
| | ☑ | Area capacity curves for the CCR impoundment. | | | |
| | ☑ | A description of each spillway and diversion design features and capacities and provide the calculations used in their determination. | | | |
| | ☑ | The construction specifications and provisions for surveillance, maintenance, and repair of the CCR surface impoundment. | | | |
| 1.10.1 | Is there any record or knowledge of structural instability of the CCR surface impoundment? | | | | |
| | ☐ | Yes | ☑ | No | |
| 1.10.2 | If you answered yes to Item 1.10.1, provide detailed explanation of the structural instability. | | | | |
| | | | | | |

Electronic Filing: Received, Clerk's Office 06/20/2024

## SECTION 2: NARRATIVE DESCRIPTION OF THE FACILITY (35 Ill. Adm. Code 845.220)

**Narrative Description**

2.1 List the types of CCR expected in the CCR surface impoundments.

See Attachment B.

2.2 Have you attached a chemical analysis of each type of expected CCR?

☑ Yes

2.3 Estimate of the maximum capacity of the surface impoundment in gallons or cubic yards.

See Attachment B.

2.4 The rate at which CCR and non-CCR waste streams currently enter the CCR impoundment in gallons per day and dry tons.

| | | | |
|---|---|---|---|
| 0 | GPD | 0 | dTn |

2.5 Estimate length of time the CCR surface impoundment will receive CCR and non-CCR waste streams.

NA

2.6 Have you attached an on-site transportation plan that includes all existing and planned roads in the facility that will be used during the operation of the CCR surface impoundment?

☑ Yes

## SECTION 3: MAPS (35 Ill. Adm. Code 845.220)

**Maps**

3.1 Check the corresponding boxes to indicate that you have attached the following maps:

☑ A site location map on the most recent United Sates Geological Survey (USGS) quadrangle of the area from the 7 ½ minute series (topographic) or on another map whose scale clearly shows the information required in 35 Ill. Adm. Code 845.220(a)(3).

☑ Site plans maps satisfying the requirements of 35 Ill. Adm. Code 845.220(a)(4).

## SECTION 4: ATTACHMENTS

**Attachments**

4.1 Check the corresponding boxes to indicate that you have attached the following:

☑ A narrative description of the proposed construction of, or modification to, a CCR surface impoundment and any projected changes in the volume or nature of the CCR or non-CCR waste streams.

☑ Plans and specifications fully describing the design, nature, function, and interrelationship of each individual component of the facility.

☑ The signature and seal of a qualified professional engineer.

☑ Certification that the owner or operator of the CCR surface impoundment completed the public notification and public meetings required under 35 Ill. Adm. Code 845.240.

Electronic Filing: Received, Clerk's Office 06/20/2024

| | | | |
|---|---|---|---|
| Attachments (Continued) | | ☑ | A summary of the issues raised by the public during the public notification and public meetings. |
| | | ☑ | A summary of any revisions, determinations, or other considerations made in response to those issues raised by the public during the public notification and public meetings. |
| | | ☑ | A list of interested persons in attendance who would like to be added to the Agency's listserv for the facility. |
| | | ☑ | Certification that all contractors, subcontractors, and installers utilized to construct, install, modify, or close a CCR surface impoundment are participants in a training program that is approved by and registered with the U.S. Department of Labor's Employment and Training Administration and that includes instruction in erosion control and environmental remediation. |
| | | ☑ | Certification that all contractors, subcontractors, and installers utilized to construct, install, modify, or close a CCR surface impoundment are participants in a training program that is approved by and registered with the U.S. Department of Labor's Employment and Training Administration and that includes instruction in the operation of heavy equipment and excavation. |
| **SECTION 5: GROUNDWATER MONITORING PROGRAM** | | | |
| Groundwater Monitoring | 5.1 | Indicate that you have attached the following components of a new groundwater monitoring program or any modifications to an existing groundwater monitoring program by checking the corresponding boxes: | |
| | | ☑ | A hydrogeologic site investigation meeting the requirements of 35 Ill. Adm. Code 845.620, if applicable. |
| | | ☑ | Design and construction plans of a groundwater monitoring system meeting the requirements of 35 Ill. Adm. Code 845.630. |
| | | ☑ | A proposed groundwater sampling and analysis program that includes selection of the statistical procedures to be used for evaluating groundwater monitoring data as required by 35 Ill. Adm. Code 845.640 and 845.650. |
| **SECTION 6: CLOSURE (35 Ill. Adm. Code 845.220(d))** | | | |
| Closure | 6.1 | What is the closure prioritization category under 35 Ill. Adm. Code 845.700(g), if applicable? | |
| | | Category 3 | |
| | 6.2 | Indicate that you have attached the following by checking the corresponding boxes: | |
| | | ☑ | The final closure plan, as specified in 35 Ill. Adm. Code 845.720(b), which includes the closure alternatives analysis required by 35 Ill. Adm. Code 845.710. |
| | | ☑ | Proposed schedule to complete closure. |
| | | ☑ | Post-closure care plan as specified in 35 Ill. Adm. Code 845.780(d). |
| **SECTION 7: GROUNDWATER MODELING (35 Ill. Adm. Code 845.220(d)(3))** | | | |
| Groundwater | 7.1 | Indicate that you have attached the following by checking the corresponding boxes: | |
| | | ☑ | The results of groundwater contaminant transport modeling and calculations showing how the closure will achieve compliance with the applicable groundwater standards. |
| | | ☑ | All modeling inputs and assumptions. |
| | | ☑ | Description of the fate and transport of contaminants with the selected corrective action over time. |

Electronic Filing: Received, Clerk's Office 06/20/2024

| | | | |
|---|---|---|---|
| | | ☑ | Capture zone modeling, if applicable. |
| | | ☑ | Any necessary licenses and software needed to review and access both the model and the data contained within the model. |

# Executive Summary

## Introduction

Illinois Power Resources Generating, LLC (IPRG) owns and operates the Gypsum Management Facility (GMF) Pond at the Duck Creek Power Plant in Fulton County, Illinois. The GMF Pond is a coal combustion residuals (CCR) surface impoundment that was used to manage gypsum produced at the Duck Creek Power Plant from the time construction of the GMF Pond was completed in early 2009 until the power plant was retired in December 2019. Since the retirement of the Duck Creek Power Plant, the GMF Pond has no longer received CCR or any other waste stream. IPRG is submitting this Part 845 Construction Permit Application for the GMF Pond to provide the Illinois Environmental Protection Agency (IEPA) with the information required under 35 Illinois Administrative Code (I.A.C.) 845, Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments (Part 845) for closure of the GMF Pond.

## Closure Method Selection

As required under 35 I.A.C. § 845.710, a closure alternatives analysis has been completed to identify the most appropriate closure method for the GMF Pond. The following closure alternatives were evaluated:

- closure by removal of CCR with disposal in an on-site landfill
- closure by removal of CCR with disposal in an off-site landfill
- closure with a final cover system constructed over the CCR

Based on the findings of the closure alternatives analysis, the GMF Pond will be closed with a final cover system (i.e., closure in place). The closed GMF Pond will contain approximately 400,000 cubic yards of CCR. Closure in place will be completed in accordance with 35 I.A.C. § 845.750.

## Closure Method Description

The GMF Pond has a dual composite liner system with a leachate collection and removal system. These systems will remain in place below the closure footprint to minimize the release of CCR or leachate to groundwater or the atmosphere. Closure of the GMF Pond will begin with the removal of supernatant water contained in the GMF Pond. Water removed from the GMF Pond will be managed in accordance with the National Pollutant Discharge Elimination System (NPDES) permit for the Duck Creek Power Plant. The gypsum currently contained within an approximate 15-acre area in the northern portion of the GMF Pond will remain in place. The upper gypsum layer in this northern portion will be dewatered as necessary to allow mobile equipment traffic across the surface using a series of trenches and sumps, and free liquids will be eliminated by removing liquid wastes or solidifying the remaining wastes and waste residues. Water flowing to the sumps will be pumped out and managed in accordance with the NPDES permit for the Duck Creek Power Plant. An earthen containment berm will be constructed across the southern limit of the 15-acre area to enhance the structural stability of the closed GMF Pond and reduce the closure footprint. A composite liner system will be installed on the upstream face of the containment berm and tied into the existing liner system. Gypsum currently situated south of the containment berm will be loaded, hauled, and placed atop the existing gypsum north of the containment berm (i.e., within the closure footprint) to establish closure grades. After closure grades have been established, a final cover system meeting the requirements of 35 I.A.C. § 845.750 will be constructed over the gypsum to minimize the post-closure

infiltration of liquids into the waste. The liner system and the cover system will provide complete encapsulation of gypsum in the GMF Pond, physically isolating it from contact with surrounding soils, groundwater, surface water, and the atmosphere.

In portions of the GMF Pond that are outside of (i.e., generally south of) the closure footprint, the primary composite liner system, the leachate collection and removal system, and the geosynthetic components of the secondary composite liner system will be removed and disposed in the closure footprint or the existing permitted on-site landfill. Up to 1 foot of additional subsoil may also be removed. The existing permitted on-site landfill has sufficient capacity to accept the removed materials. The subsoils will be visually observed for signs of CCR staining. If subsoils with CCR staining are observed, they will be removed and disposed. A surface water channel will be excavated south of the GMF Pond to route stormwater flows away from the GMF Pond. Groundwater modeling indicates that the closure method described is expected to maintain compliance with the groundwater protection standards.

## Document Organization

IEPA Application Form CCR 1 and IEPA Application Form CCR 2CC precede this Executive Summary. A checklist identifying the required elements of the Part 845 Construction Permit Application and the location in this document where each element can be found follows this Executive Summary. Supplemental information required under Part 845 is organized in a set of appendices that follow the checklist:

- Appendix A (History of Construction) provides general information about the GMF Pond and describes its design and construction.
- Appendix B (Narrative Description) describes the types and generation rates of CCR managed in the GMF Pond.
- Appendix C (Map Package) includes a Site Location Map and a Site Plan Map depicting important site features and information.
- Appendix D (Hydrogeologic Site Characterization) describes hydrogeologic conditions in the vicinity of the GMF Pond.
- Appendix E (Evaluation of Potential Exceedances of Groundwater Protection Standards) summarizes the potential exceedances of groundwater protection standards that have been detected at the GMF Pond and identifies the alternative sources that have caused them.
- Appendix F (Closure Priority Categorization) identifies the closure priority category assigned to the GMF Pond.
- Appendix G (Groundwater Modeling) describes the results of groundwater modeling that has been conducted to assess the expected fate and transport of chemical constituents following closure of the GMF Pond (a link to access the groundwater model files will be transmitted to the IEPA separately).
- Appendix H (Final Closure Plan) provides design information for closure of the GMF Pond, as well as the results of a closure alternatives analysis that has been conducted to determine the most effective approach for closure of the GMF Pond.
- Appendix I (Groundwater Monitoring Plan) describes the monitoring locations and procedures that will be used to assess groundwater quality after closure of the GMF Pond.

- Appendix J (Post-closure Care Plan) describes the procedures that will be followed to maintain the closed GMF Pond during the post-closure care period.
- Appendix K (Legal Description) provides the land description of the GMF Pond facility boundary.
- Appendix L (Public Meetings Information) provides the information pertaining to the public notification and public meetings required under Part 845.
- Appendix M (Training Program Statement) certifies that personnel utilized to construct, install, modify, or close the GMF Pond will participate in required training programs.

Electronic Filing: Received, Clerk's Office 06/20/2024

| Regulation | Requirement | Location in Permit Application |
|---|---|---|
| **Section 845.220 - Construction Permits** | | |
| a) | All construction permit applications must contain the following information and documents. | |
| 1) | Design and Construction Plans (Construction History) | Appendix A |
| A) | Identifying information | Appendix A |
| i) | The name and address of the person or persons owning or operating the CCR surface impoundment; | Appendix A |
| ii) | The name associated with the CCR surface impoundment; | Appendix A |
| iii) | The identification number of the CCR surface impoundment if one has been assigned by the Agency. | Appendix A |
| B) | A statement of the purpose for which the CCR surface impoundment is being used, how long the CCR surface impoundment has been in operation, and the types of CCR that have been placed in the CCR surface impoundment. | Appendix A |
| C) | The name and size in acres of the watershed within which the CCR surface impoundment is located. | Appendix A |
| D) | A description of the physical and engineering properties of the foundation and abutment materials on which the CCR surface impoundment is constructed. | Appendix A |
| E) | A statement of the type, size, range, and physical and engineering properties of the materials used in constructing each zone or stage of the CCR surface impoundment; the method of site preparation and construction of each zone of the CCR surface impoundment; and the approximate dates of construction of each successive stage of construction of the CCR surface impoundment. | Appendix A |
| F) | At a scale that details engineering structures and appurtenances relevant to the design, construction, operation, and maintenance of the CCR surface impoundment, detailed dimensional drawings of the CCR surface impoundment, including a plan view and cross-sections of the length and width of the CCR surface impoundment, showing all zones, foundation improvements, drainage provisions, spillways, diversion ditches, outlets, instrument locations, and slope protection, in addition to the normal operating pool surface elevation and the maximum pool surface elevation following peak discharge from the inflow design flood, the expected maximum depth of CCR within the CCR surface impoundment, and any identifiable natural or manmade features that could adversely affect operation of the CCR surface impoundment due to malfunction or mis-operation. | Appendix A |
| G) | A description of the type, purpose, and location of existing instrumentation. | Appendix A |
| H) | Area-capacity curves for the CCR surface impoundment. | Appendix A |
| I) | A description of each spillway and diversion design features and capacities and calculations used in their determination. | Appendix A |
| J) | The construction specifications and provisions for surveillance, maintenance, and repair of the CCR surface impoundment. | Appendix A |
| K) | Any record or knowledge of structural instability of the CCR surface impoundment. | Appendix A |
| 2) | Narrative Description of the Facility. The permit application must contain a written description of the facility with supporting documentation describing the procedures and plans that will be used at the facility to comply with the requirements of this Part. The descriptions must include, but are not limited to, the following information: | Appendix B, Appendix H |
| A) | The types of CCR expected in the CCR surface impoundment, including a chemical analysis of each type of expected CCR; | Appendix B |
| B) | An estimate of the maximum capacity of each surface impoundment in gallons or cubic yards; | Appendix B |
| C) | The rate at which CCR and non-CCR waste streams currently enter the CCR surface impoundment in gallons per day and dry tons; | Appendix B |
| D) | The estimated length of time the CCR surface impoundment will receive CCR and non-CCR waste streams; and | Appendix B |
| E) | An on-site transportation plan that includes all existing and planned roads in the facility that will be used during the operation of the CCR surface impoundment. | Appendix B |
| 3) | Site Location Map. All permit applications must contain a site location map on the most recent United States Geological Survey (USGS) quadrangle of the area from the 7½ minute series (topographic), or on such other map whose scale clearly shows the following information: | Appendix C |
| A) | The facility boundaries and all adjacent property, extending at least 1000 meters (3280 feet) beyond the boundary of the facility; | Appendix C |
| B) | All surface waters; | Appendix C |
| C) | The prevailing wind direction; | Appendix C |
| D) | The limits of all 100-year floodplains; | Appendix C |
| E) | All natural areas designated as a Dedicated Illinois Nature Preserve under the Illinois Natural Areas Preservation Act [525 ILCS 30]; | Appendix C |
| F) | All historic and archaeological sites designated by the National Historic Preservation Act (16 USC 470 et seq.) and the Illinois Historic Sites Advisory Council Act [20 ILCS 3410]; and | Appendix C |
| G) | All areas identified as critical habitat under the Endangered Species Act of 1973 (16 USC 1531 et seq.) and the Illinois Endangered Species Protection Act [520 ILCS 10]. | Appendix C |
| 4) | Site Plan Map. The application must contain maps, including cross-sectional maps of the site boundaries, showing the location of the facility. The following information must be shown: | Appendix C |
| A) | The entire facility, including any proposed and all existing CCR surface impoundment locations; | Appendix C |
| B) | The boundaries, both above and below ground level, of the facility and all CCR surface impoundments or landfills containing CCR included in the facility; | Appendix C |
| C) | All existing and proposed groundwater monitoring wells; and | Appendix C |
| D) | All main service corridors, transportation routes, and access roads to the facility. | Appendix C |
| 5) | A narrative description of the proposed construction of, or modification to, a CCR surface impoundment and any projected changes in the volume or nature of the CCR or non-CCR waste streams. | Appendix H |
| 6) | Plans and specifications fully describing the design, nature, function and interrelationship of each individual component of the facility. | Appendix A, Appendix H |
| 7) | A new groundwater monitoring program or any modification to an existing groundwater monitoring program that includes but is not limited to the following information: | |
| A) | A hydrogeologic site investigation meeting the requirements of Section 845.620, if applicable; | Appendix D |
| B) | Design and construction plans of a groundwater monitoring system meeting the requirements of Section 845.630; and | Appendix I |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Regulation | Requirement | Location in Permit Application |
|---|---|---|
| **Section 845.220 - Construction Permits (Continued)** | | |
| C) | A proposed groundwater sampling and analysis program that includes selection of the statistical procedures to be used for evaluating groundwater monitoring data, as required by Sections 845.640 and 845.650. | Appendix I |
| 8) | The signature and seal of a qualified professional engineer | Executive Summary |
| 9) | Certification that the owner or operator of the CCR surface impoundment completed the public notification and public meetings required under Section 845.240, a summary of the issues raised by the public, a summary of any revisions, determinations, or other considerations made in response to those issues, and a list of interested persons in attendance who would like to be added to the Agency's listserv for the facility. | Appendix L |
| b) | New Construction. In addition to the requirements in subsection (a), all construction permit applications to build a new CCR surface impoundment, lateral expansion of a CCR surface impoundment, or retrofit of an existing CCR surface impoundment must also contain the following information and documents: | Not applicable - not new construction, lateral expansion, or retrofit |
| 1) | Plans and specifications that demostrate the proposed CCR surface impoundment will meet the location standards in the following sections: | |
| A) | Section 845.300 (Placement Above the Uppermost Aquifer); | |
| B) | Section 845.310 (Wetlands); | |
| C) | Section 845.320 (Fault Areas); | |
| D) | Section 845.330 (Seismic Impact Zones); and | |
| E) | Section 845.340 (Unstable Areas and Floodplains). | |
| 2) | Plans and specifications demonstrate the proposed CCR surface impoundment will meet the following design criteria: | |
| A) | The CCR surface impoundment will have a liner meeting the liner requirements of Section 845.400(b) or (c); | |
| B) | The CCR surface impoundment will have a leachate collection system meeting the requirements of Section 845.420; and | |
| C) | The CCR surface impoundment, if not incised, will be constructed with slope protection, as required by Section 845.430. | |
| 3) | CCR fugitive dust control plan (see Section 845.500(b)). | |
| 4) | Preliminary written closure plan (see Section 845.720(a)). | |
| 5) | Initial written post-closure care plan, if applicable (see Section 845.780(d)). | |
| c) | Corrective Action Construction. In addition to the requirements in subsection (a), all construction permit applications that include any corrective action performed under Subpart F must also contain the following information and documents: | Not applicable - no corrective action included |
| 1) | Corrective action plan (see Section 845.670); | |
| 2) | Groundwater modeling, including: | |
| A) | The results of groundwater contaminant transport modeling and calculations showing how the closure will achieve compliance with the applicable groundwater standards; | |
| B) | All modeling inputs and assumptions; | |
| C) | Description of the fate and transport of contaminants, with the selected closure over time; and | |
| D) | Capture zone modeling, if applicable. | |
| 3) | Any necessary licenses and software needed to review and access both the models and the data contained within the models required by subsection (c)(2); | |
| 4) | Corrective action groundwater monitoring program, including identification of revisions to the groundwater monitoring system for corrective action; and | |
| 5) | Any interim measures necessary to reduce the contaminants leaching from the CCR surface impoundment, and/or potential exposures to human or ecological receptors, including an analysis of the factors specified in Section 845.680(a)(3). | |
| d) | Closure Construction. In addition to the requirements in subsection (a), all construction permit applications for closure of the CCR surface impoundment under Subpart G must contain the following information and documents: | |
| 1) | Closure prioritization category under Section 845.700(g), if applicable; | Appendix F |
| 2) | Final closure plan, as specified in Section 845.720(b), which includes the closure alternatives analysis required by Section 845.710; | Appendix H |
| 3) | Groundwater modeling, including: | Appendix G |
| A) | The results of groundwater contaminant transport modeling and calculations showing how the closure will achieve compliance with the applicable groundwater standards; | Appendix G |
| B) | All modeling inputs and assumptions; | Appendix G |
| C) | Description of the fate and transport of contaminants, with the selected closure over time; | Appendix G |
| D) | Capture zone modeling, if applicable; and | Not applicable |
| E) | Any necessary licenses and software needed to review and access both the model and the data contained within the model. | Provided separately if applicable |
| 4) | Proposed schedule to complete closure; and | Appendix H |
| 5) | Post-closure care plan as specified in Section 845.780(d), if applicable. | Appendix J |
| e) | *Owners or operators of CCR surface impoundments who submitted a closure plan to the agency before May 1, 2019, and who complete closure before July 30, 2021, shall not be required to obtain a construction permit for closure under subsection (d).* [415 ILCS 5/22.58(e)] | Not applicable - closure not completed before July 31, 2021 |
| f) | A single construction permit application may be submitted for new construction, corrective action, and closure if the construction is related to the same multiphased project. The permit application for a project with multiple phases must contain all information required by subsections (a), (b), (c) and (d), as applicable. | Not applicable - not a multiphased project |
| g) | Duration of Construction Permits | |
| 1) | For any construction permit that is not for the closure or retrofit of the CCR surface impoundment, the construction permit must be issued for fixed terms not to exceed 3 years. | Not applicable - permit application is for closure |
| 2) | For any construction permit for the closure or retrofit of a CCR surface impoundment, the construction permit must be issued for an initial fixed term expiring within the timeframe approved by the Agency in the construction permit or five years, whichever is less. The Agency may renew a construction permit for closure or retrofit in two-year increments under Section 845.760(b). | Acknowledged |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Regulation | Requirement | Location in Permit Application |
|---|---|---|
| **Section 845.620 - Hydrogeologic Site Characterization** | | |
| a) | The owner or operator of the CCR surface impoundment must design and implement a hydrogeologic site characterization. | Appendix D |
| b) | The hydrogeologic site characterization must include, but is not limited to, the following: | |
| 1) | Geologic well logs/boring logs; | Appendix D |
| 2) | Climatic aspects of the site, including seasonal and temporal fluctuations in groundwater flow; | Appendix D |
| 3) | Identification of nearby surface water bodies and drinking water intakes; | Appendix D |
| 4) | Identification of nearby pumping wells and associated uses of the groundwater; | Appendix D |
| 5) | Identification of nearby dedicated nature preserves; | Appendix D |
| 6) | Geologic setting; | Appendix D |
| 7) | Structural characteristics; | Appendix D |
| 8) | Geologic cross-sections; | Appendix D |
| 9) | Soil characteristics; | Appendix D |
| 10) | Identification of confining layers; | Appendix D |
| 11) | Identification of potential migration pathways; | Appendix D |
| 12) | Groundwater quality data; | Appendix D |
| 13) | Vertical and horizontal extent of the geologic layers to a minimum depth of 100 feet below land surface, including lithology and stratigraphy; | Appendix D |
| 14) | A map displaying any known underground mines beneath a CCR surface impoundment; | Appendix D |
| 15) | Chemical and physical properties of the geologic layers to a minimum depth of 100 feet below land surface; | Appendix D |
| 16) | Hydraulic characteristics of the geologic layers identified as migration pathways and geologic layers that limit migration, including: | Appendix D |
| A) | Water table depth; | Appendix D |
| B) | Hydraulic conductivities; | Appendix D |
| C) | Effective and total porosities; | Appendix D |
| D) | Direction and velocity of groundwater flow; and | Appendix D |
| E) | Map of the potentiometric surface; | Appendix D |
| 17) | Groundwater classification under 35 Ill. Adm. Code 620; and | Appendix D |
| 18) | Any other information requested by the Agency that is relevant to the hydrogeologic site characterization. | Appendix D |
| **Section 845.630 - Groundwater Monitoring Systems (excerpts providing requirements for the construction permit application)** | | |
| g) | The owner or operator must obtain a certification from a qualified professional engineer stating that the groundwater monitoring system has been designed and constructed to meet the requirements of this Section. If the groundwater monitoring system includes the minimum number of monitoring wells specified in subsection (c)(1), the certification must document the basis supporting this determination. The certification must be submitted to the Agency with the appropriate permit application. | Appendix I |
| **Section 845.640 - Groundwater Sampling and Analysis Requirements (excerpts providing requirements for the construction permit application)** | | |
| a) | The groundwater monitoring program must include consistent sampling and analysis procedures that are designed to ensure monitoring results that provide an accurate representation of groundwater quality at the background and downgradient wells required by Section 845.630. The owner or operator of the CCR surface impoundment must develop a sampling and analysis program that includes procedures and techniques for: | Appendix I |
| b) | The groundwater monitoring program must include sampling and analysis methods that are appropriate for groundwater sampling and that accurately measure constituents and other monitoring parameters in groundwater samples. | Appendix I |
| 1) | Sample collection; | Appendix I |
| 2) | Sample preservation and shipment; | Appendix I |
| 3) | Analytical procedures; | Appendix I |
| 4) | Chain of custody control; and | Appendix I |
| 5) | Quality assurance and quality control. | Appendix I |
| f) | Statistical Methods | Appendix I |
| 1) | The owner or operator of the CCR surface impoundment must select one of the statistical methods specified in subsection (f)(1) to be used in evaluating groundwater monitoring data for each specified constituent. The statistical test chosen must be conducted separately for each constituent in each monitoring well. | Appendix I |
| 2) | The owner or operator of the CCR surface impoundment must obtain a certification from a qualified professional engineer stating that the selected statistical method is appropriate for evaluating the groundwater monitoring data for the CCR surface impoundment. The certification must include a narrative description of the statistical method selected to evaluate the groundwater monitoring data. The certification must be submitted to the Agency with the appropriate permit application. | Appendix I |
| **Section 845.710 - Closure Alternatives (excerpts providing requirements for the construction permit application)** | | |
| b) | Before selecting a closure method, the owner or operator of each CCR surface impoundment must complete a closure alternatives analysis. The closure alternatives analysis must examine the following for each closure alternative: | Appendix H |
| 1) | The long- and short-term effectiveness and protectiveness of the closure method, including identification and analyses of the following factors: | Appendix H |
| A) | The magnitude of reduction of existing risks; | Appendix H |
| B) | The magnitude of residual risks in terms of likelihood of future releases of CCR; | Appendix H |
| C) | The the type and degree of long-term management required, including monitoring, operation, and maintenance; | Appendix H |
| D) | The short-term risks that might be posed to the community or the environment during implementation of such a closure, including potential threats to human health and the environment associated with excavation, transportation, and re-disposal of contaminants; | Appendix H |
| E) | The time until closure and post-closure care or the completion of groundwater monitoring under Section 845.740(b) is completed; | Appendix H |
| F) | The potential for exposure of humans and environmental receptors to remaining wastes, considering the potential threat to human health and the environment associated with excavation, transportation, re-disposal, containment or changes in groundwater flow; | Appendix H |
| G) | The long-term reliability of the engineering and institutional controls, including an analysis of any off-site, nearby destabilizing activities; and | Appendix H |
| H) | Potential need for future corrective action of the closure alternative. | Appendix H |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Regulation | Requirement | Location in Permit Application |
|---|---|---|
| **Section 845.710 - Closure Alternatives (excerpts providing requirements for the construction permit application) (Continued)** | | |
| 2) | The effectiveness of the closure method in controlling future releases based on analyses of the following factors: | Appendix H |
| A) | The extent to which containment practices will reduce further releases; and | Appendix H |
| B) | The extent to which treatment technologies may be used. | Appendix H |
| 3) | The ease or difficulty of implementing a potential closure method based on analyses of the following types of factors: | Appendix H |
| A) | Degree of difficulty associated with constructing the technology; | Appendix H |
| B) | Expected operational reliability of the technologies; | Appendix H |
| C) | Need to coordinate with and obtain necessary approvals and permits from other agencies; | Appendix H |
| D) | Availability of necessary equipment and specialists; and | Appendix H |
| E) | Available capacity and location of needed treatment, storage, and disposal services. | Appendix H |
| 4) | The degree to which the concerns of the residents living within communities where the CCR will be handled, transported and disposed are addressed by the closure method. | Appendix H |
| c) | In the closure alternative analysis, the owner or operator of the CCR surface impoundment must: | Appendix H |
| 1) | Analyze complete removal of the CCR as one closure alternative, along with the modes for transporting the removed CCR, including by rail, barge, low-polluting trucks, or a combination of these transportation modes; | Appendix H |
| 2) | Identify whether the facility has an onsite landfill with remaining capacity that can legally accept CCR, and, if not, whether constructing an onsite landfill is possible; and | Appendix H |
| 3) | Include any other closure method in the alternatives analysis if requested by the Agency. | Appendix H |
| d) | The analysis for each alternative completed under this Section must: | Appendix H |
| 1) | Meet or exceed a class 4 estimate under the AACE Classification Standard, incorporated by reference in Section 845.150, or a comparable classification practice as provided in the AACE Classification Standard; | Appendix H |
| 2) | Contain the results of groundwater contaminant transport modeling and calculations showing how the closure alternative will achieve compliance with the applicable groundwater protection standards; | Appendix H |
| 3) | Include a description of the fate and transport of contaminants with the closure alternative over time including consideration of seasonal variations; and | Appendix H |
| 4) | Assess impacts to waters in the state. | Appendix H |
| e) | At least 30 days before submission of a construction permit application for closure, the owner or operator of the CCR surface impoundment must discuss the results of the closure alternatives analysis in a public meeting with interested and affected parties as required by Section 845.240. | Appendix L |
| f) | After completion of the public meeting under subsection (e), the owner or operator of a CCR surface impoundment must select a closure method and submit a final closure plan to the Agency under Section 845.720(b). All materials demonstrating completion of the closure alternatives analysis specified in this Section must be submitted with the final closure plan. | Appendix H |
| **Section 845.720 - Closure Plan (excerpts providing requirements for the construction permit application)** | | |
| b) | Final Closure Plan | Appendix H |
| 1) | The owner or operator of a CCR surface impoundment must submit to the Agency, as a part of a construction permit application for closure, a final closure plan. The plan must be submitted before the installation of a final cover system or removal of CCR from the surface impoundment for the purpose of closure. | Appendix H |
| 3) | The final closure plan must identify the proposed selected closure method, and must include the information required in subsection (a)(1) and the closure alternatives analysis as specified in Section 845.710. | Appendix H |
| 5) | The owner or operator of the CCR surface impoundment must obtain and submit with its construction permit application for closure a written certification from a qualified professional engineer that the final written closure plan meets the requirements of this Part. | Appendix H |
| **Section 845.750 - Closure with a Final Cover System (excerpts providing requirements for the construction permit application)** | | |
| c) | Final Cover System. If a CCR surface impoundment is closed by leaving CCR in place, the owner or operator must install a final cover system that is designed to minimize infiltration and erosion, and, at a minimum, meets the requirements of this subsection (c). The final cover system must consist of a low permeability layer and a final protective layer. The design of the final cover system must be included in the preliminary and final written closure plans required by Section 845.720 and the construction permit application for closure submitted to the agency. | Appendix H |
| **Section 845.780 - Post-Closure Care Requirements (excerpts providing requirements for the construction permit application)** | | |
| d) | Written Post-Closure Care Plan | Appendix J |
| 1) | Content of the Plan. The owner or operator of a CCR surface impoundment must prepare a written post-closure care plan that includes, at a minimum, the information specified in this subsection (d)(1). | Appendix J |
| A) | A description of the monitoring and maintenance activities required in subsection (b) for the CCR surface impoundment and the frequency at which these activities will be performed; | Appendix J |
| B) | The name, address, telephone number, and email address of the person or office to contact about the facility during the post-closure care period; and | Appendix J |
| C) | A description of the planned uses of the property during the post- closure care period. Post-closure use of the property must not disturb the integrity of the final cover, liners, or any other component of the containment system, or the function of the monitoring systems unless necessary to comply with the requirements in this Part. Any other disturbance is allowed if the owner or operator of the CCR surface impoundment demonstrates that disturbance of the final cover, liner, or other component of the containment system, including any removal of CCR, will not increase the potential threat to human health or the environment. The demonstration must be certified by a qualified professional engineer and must be submitted to the Agency. | Appendix J |
| 4) | The owner or operator of the CCR surface impoundment must obtain a written certification from a qualified professional engineer that the initial, and any amendment of the, written post-closure care plan meets the requirements of this Section. | Appendix J |

# History of Construction

Electronic Filing: Received, Clerk's Office 06/20/2024

AECOM

October 2016

Illinois Power Resources Generating, LLC
17751 North Cilco Road
Canton, IL 61520

**RE: History of Construction**
**USEPA Final CCR Rule, 40 CFR § 257.73(c)**
**Duck Creek Power Station**
**Canton, Illinois**

On behalf of Illinois Power Resources Generating, LLC, AECOM has prepared the following history of construction for the Ash Pond No. 1, Ash Pond No. 2, and GMF Pond at the Duck Creek Power Station in accordance with 40 CFR § 257.73(c). The Bottom Ash Basin is an incised pond with a storage volume of less than 20 acre-feet. A history of construction is not required for the Bottom Ash Basin as specified in § 257.73(b).

## BACKGROUND

40 CFR § 257.73(c)(1) requires the owner or operator of an existing coal combustion residual (CCR) surface impoundment that either (1) has a height of five feet or more and a storage volume of 20 acre-feet or more, or (2) has a height of 20 feet or more to compile a history of construction by October 17, 2016 that contains, to the extent feasible, the information specified in 40 CFR § 257.73(c)(1)(i)–(xii).

The history of construction presented herein was compiled based on existing documentation, as reasonably and readily available (see 80 Fed. Reg. 21302, 21380 [April 17, 2015]), AECOM's site experience, and discussion with plant engineers. AECOM's document review included construction drawings, geotechnical investigations, observation reports, etc. for the Ash Pond No. 1, Ash Pond No. 2, and GMF Pond at the Duck Creek Power Station.

Electronic Filing: Received, Clerk's Office 06/20/2024

AECOM

## HISTORY OF CONSTRUCTION

***§ 257.73(c)(1)(i): The name and address of the person(s) owning or operating the CCR unit; the name associated with the CCR unit; and the identification number of the CCR unit if one has been assigned by the state.***

Owner: Illinois Power Resources Generating, LLC

Address: 1500 Eastport Plaza Drive
Collinsville, IL 62234

CCR Units: Ash Pond No. 1
Ash Pond No. 2, IDNR Dam ID No. IL50014
GMF Pond, IDNR Dam ID No. IL50573

Ash Pond No. 1 does not have a state assigned identification number.

***§ 257.73(c)(1)(ii): The location of the CCR unit identified on the most recent USGS $7^1/_2$ or 15 minute topographic quadrangle map or a topographic map of equivalent scale if a USGS map is not available.***

The locations of the Ash Pond No. 1, Ash Pond No. 2, and the GMF Pond have been identified on an USGS 7-1/2 minute topographic quadrangle map in **Appendix A**.

***§ 257.73(c)(1)(iii): A statement of the purpose for which the CCR unit is being used.***

The following captures the purpose of each CCR unit:

- The Ash Pond No. 1 (inactive) was used to store and dispose of fly ash and bottom ash.
- The Ash Pond No. 2 (inactive) was used to store and dispose of fly ash and bottom ash and to clarify CCR contact stormwater prior to discharge in accordance with the station's Water Pollution Control Permit (#2015-EO-59369).
- The GMF Pond is being used to store and dispose of gypsum and to clarify recycled process water for plant operations.

Notice of intent to close Ash Pond No. 1 and Ash Pond No. 2 was provided in November, 2015.[1]

[1] This history of construction report was prepared on a facility-wide basis for CCR surface impoundments at the Duck Creek Power Station. The inclusion of Ash Pond No. 1 and Ash Pond No. 2 in this history of construction report does not concede and should not be construed to concede that Ash Pond No. 1 and Ash Pond No. 2 are subject to the Design Criteria or all Operating Criteria in the CCR Rule.

Electronic Filing: Received, Clerk's Office 06/20/2024

AECOM

***§ 257.73(c)(1)(iv): The name and size in acres of the watershed where the CCR unit is located.***

Ash Pond No. 1, Ash Pond No. 2, and the GMF Pond are located at the western edge of the Rice Lake-Illinois River Watershed with a 12-digit Hydrologic Unit Code (HUC) of 071300030603 and a drainage area of 21,203 acres (USGS, 2016).

***§ 257.73(c)(1)(v): A description of the physical and engineering properties of the foundation and abutment materials on which the CCR unit is constructed.***

Physical properties of the foundation materials for Ash Pond No. 1 and Ash Pond No. 2 are primarily strip-mine spoils with variable thickness overlying shale bedrock. The mine spoils consist of a mixtures of native loess and glacial till and, to a lesser extent, the underlying (primarily shale) bedrock. The loess is classified as silty low plastic clay, with a zone of high plastic clay identified in the upper few feet of the stratum. The glacial till is classified as medium stiff to stiff, silty low plastic clay with trace sand and gravel.

Physical properties of the foundation materials for the GMF Pond are (from top to bottom) native loess, glacial till, and bedrock (primarily shale). The loess is classified as silty low plastic clay, with a zone of high plastic clay identified in the upper few feet of the stratum. The glacial till is classified as medium stiff to stiff, silty low plastic clay with trace sand and gravel.

An available summary of foundation material engineering properties for Ash Pond No.1, Ash Pond No. 2, and the GMF Pond is presented in **Table 1** below. The foundation material engineering properties are based on previous geotechnical explorations and laboratory testing.

**Table 1. Summary of Foundation Material Engineering Properties**

| Material | Unit Weight (pcf) | Effective (drained) Shear Strength Parameters | | Total (undrained) Shear Strength Parameters | |
|---|---|---|---|---|---|
| | | c' (psf) | Φ' (°) | c (psf) | Φ (°) |
| Loess | 116 | 100 | 32 | 1,250 | 0 |
| Glacial Till | 125 | 200 | 30 | 1,900 | 0 |
| Mine Spoils | 120 | 100 | 30 | 250 | 15 |
| Shale Bedrock | 130 | 300 | 26 | 600 | 13 |

Ash Pond No.1, Ash Pond No. 2, and the GMF Pond are enclosed impoundments with embankments and do not have abutments.

***§ 257.73(c)(1)(vi): A statement of the type, size, range, and physical and engineering properties of the materials used in constructing each zone or stage of the CCR unit; the method of site preparation and construction of each zone of the CCR unit; and the approximate dates of construction of each successive stage of construction of the CCR unit.***

Electronic Filing: Received, Clerk's Office 06/20/2024

The embankments of the Ash Pond No. 1 and Ash Pond No. 2 were constructed with mine spoils excavated from within the center of the existing pond footprints. The mine spoils consist of a mixtures of native loess and glacial till and, to a lesser extent, the underlying (primarily shale) bedrock. The loess is classified as silty low plastic clay, with a zone of high plastic clay identified in the upper few feet of the stratum. The glacial till is classified as medium stiff to stiff, silty low plastic clay with trace sand and gravel.

The embankments of the GMF Pond generally consists of silty, low plastic clay and generally had a stiff to very stiff consistency and appeared to be well-compacted material. The liner system within the GMF Pond consists of (from top to bottom) a 60-mil textured high density polyethylene (HDPE) geomembrane, 1-foot-thick layer of “cushion dirt”, 4-ounce geotechnical filter fabric, 1-foot-thick drainage layer, 10-ounce geotextile cushion, 60-mil textured HDPE geomembrane, a Bentomat SDN reinforced geosynthetic clay liner (GCL), and 3-foot-thick layer of compacted clay. A typical cross section profile of the liner system is shown on drawing C180-C102-8 presented in **Appendix B**.

An available summary of construction material engineering properties is presented in **Table 2** below. The construction material engineering properties are based on previous geotechnical investigations and laboratory testing.

**Table 2. Summary of Construction Material Engineering Properties**

| Material | Unit Weight (pcf) | Effective (drained) Shear Strength Parameters | | Total (undrained) Shear Strength Parameters | |
|---|---|---|---|---|---|
| | | c’ (psf) | Φ’ (°) | c (psf) | Φ (°) |
| Liner-Cushion Material | 116 | 0 | 38 | 660 | 0 |
| Liner-Granular Drainage Layer | 120 | 0 | 33 | 0 | 33 |
| Liner-Geotextile /Geomembrane | 75 | 100 | 25 | 100 | 25 |
| Embankment Fill | 116 | 150 | 32 | 2,150 | 0 |

The methods used for preparation and construction of Ash Pond No. 1 and Ash Pond No. 2 are not reasonably and readily available.

The site preparation work for the GMF Pond included stripping and stockpiling the topsoil. The subsoil was then excavated to approximately 5.4 feet above the proposed foundation grade and stockpiled. Temporary and permanent erosion control measures were also installed. The site was later excavated to the proposed subgrade and proof rolled to inspect for unsuitable soils. Any unsuitable soils were either removed or reworked. A sheepsfoot roller was used to compact suitable backfill material placed in 8-inch lifts. Compaction testing was performed using a nuclear density gauge at a minimum rate of one test per 10,000 cubic yards (minimum one test per lift). Backfill was compacted to at least 95% of standard proctor maximum dry density and with a moisture content of -2% to +2% of optimum. Embankment

Electronic Filing: Received, Clerk's Office 06/20/2024

AECOM

construction was performed using similar compacting and testing techniques as for the subgrade preparation.

Prior to constructing the clay liner for the GMF Pond, two test pad liners were constructed using separate borrow material. Testing of both liners indicated that the construction practice and material used were acceptable. The full scale clay liner was constructed with fill placed in 8-inch lifts and compacted with a sheepsfoot roller. Placed fill was compacted to at least 95% of standard proctor maximum dry density and with a moisture content of optimum to +5%. Compaction testing was performed using a nuclear density gauge at a minimum rate of one test per 1,000 cubic yards (minimum one test per lift). After the minimum clay liner thickness was achieved, the surface was smooth rolled in preparation of the GCL. The GCL and lower geomembrane were then placed sequentially followed by the 10-ounce geotextile cushion. A leak detection/leachate collection and recovery system (LD/LCRS) was then installed which includes a 1-foot-thick sand drainage layer and collection pipes. The sand was graded to minimum thickness using a dozer. The LD/LCRS was completed by placing a 4-ounce geotechnical filter fabric on top of the sand. A 1-foot-thick “cushion dirt” layer was then placed using a dozer to spread general fill. The liner was completed by placing the upper geomembrane on top.

The approximate dates of each successive event stage of construction of Ash Pond No. 1, Ash Pond No. 2, and the GMF Pond are provided in **Table 3** below.

**Table 3. Approximate dates of construction of each successive stage of construction.**

| Date | Event |
|---|---|
| 1976 | Ash Pond No. 1 was commissioned |
| 1986 | Ash Pond No. 2 was commissioned |
| 2007 | Surface preparation for GMF Pond began |
| 2008-2009 | Construction of GMF Pond |

***§ 257.73(c)(1)(vii): At a scale that details engineering structures and appurtenances relevant to the design, construction, operation, and maintenance of the CCR unit, detailed dimensional drawings of the CCR unit, including a plan view and cross sections of the length and width of the CCR unit, showing all zones, foundation improvements, drainage provisions, spillways, diversion ditches, outlets, instrument locations, and slope protection, in addition to the normal operating pool surface elevation and the maximum pool surface elevation following peak discharge from the inflow design flood, the expected maximum depth of CCR within the CCR surface impoundment, and any identifiable natural or manmade features that could adversely affect operation of the CCR unit due to malfunction or mis-operation.***

Drawings that contain items pertaining to the requested information for Ash Pond No. 1, Ash Pond No. 2, and the GMF Pond are listed in **Table 4** below. Items marked as "Not Available" are items not found during review of reasonably and readily available record documentation

Electronic Filing: Received, Clerk's Office 06/20/2024

AECOM

**Table 4. List of drawings containing items pertaining to the information requested in § 257.73(c)(1)(vii).**

| | Ash Pond No. 1 | Ash Pond No. 2 | GMF Pond |
|---|---|---|---|
| **Dimensional plan view (all zones)** | C180-G1916-3 | C180-G1916-4, C180-G1916-6 | C180-C102-8 thru -11 |
| **Dimensional cross sections** | C180-G1916-3 | C180-G1916-7 | C180-C102-12 thru -14 |
| **Foundation Improvements** | C180-G1916-3 | C180-G1916-7 | Not Applicable |
| **Drainage Provisions** | Not Applicable | C180-G1916-9 thru -11, M-1001 | C180-C102-12 thru -14 C180-C102-30 thru -31 |

| **Instrument Locations** | Figure in Appendix C, Plate 2 | Figure in Appendix C, Plate 2 | Not Applicable |
| **Slope Protection** | C180-G1916-3 | Not Available | C180-C102-12 |
| **Normal Operating Pool Elevation** | Not Available | Not Available | Not Available |
| **Maximum Pool Elevation** | C180-G1916 | C180-G1916-7 | Not Available |
| **Approximate Maximum Depth of CCR in 2016** | 68 feet | 59 feet | 25 feet |

All drawings referenced in the table above can be found in **Appendix B** and **Appendix C**.

Based on the review of the drawings listed above, no natural or manmade features that could adversely affect operation of these CCR units due to malfunction or mis-operation were identified.

***§ 257.73(c)(1)(viii): A description of the type, purpose, and location of existing instrumentation.***

Existing instrumentation at Ash Pond No. 1 and Ash Pond No. 2 consists of open-standpipe piezometers. The purpose of the piezometers is to measure the pore water pressures within and around the CCR units. Two (2) piezometers (B-2 and B-5) were installed in 2010 and the locations are presented on Plate 2 in **Appendix C**. Five (5) additional piezometers were installed in 2010 and the locations are presented in **Appendix C**.

Electronic Filing: Received, Clerk's Office 06/20/2024

AECOM

The GMF Pond does not contain existing instrumentation used for monitoring the operation of the CCR unit.

***§ 257.73(c)(1)(ix): Area-capacity curves for the CCR unit.***

Area-capacity curves for the Ash Pond No. 1 and Ash Pond No. 2 are not reasonably and readily available. The area-capacity curve for the GMF Pond is presented in **Figure 1** below. "Area-capacity curves", as defined by 40 CFR § 257.53, "means graphic curves which readily show the reservoir water surface area, in acres, at different elevations from the bottom of the reservoir to the maximum water surface, and the capacity or volume, in acre-feet, of the water contained in the reservoir at various elevations."

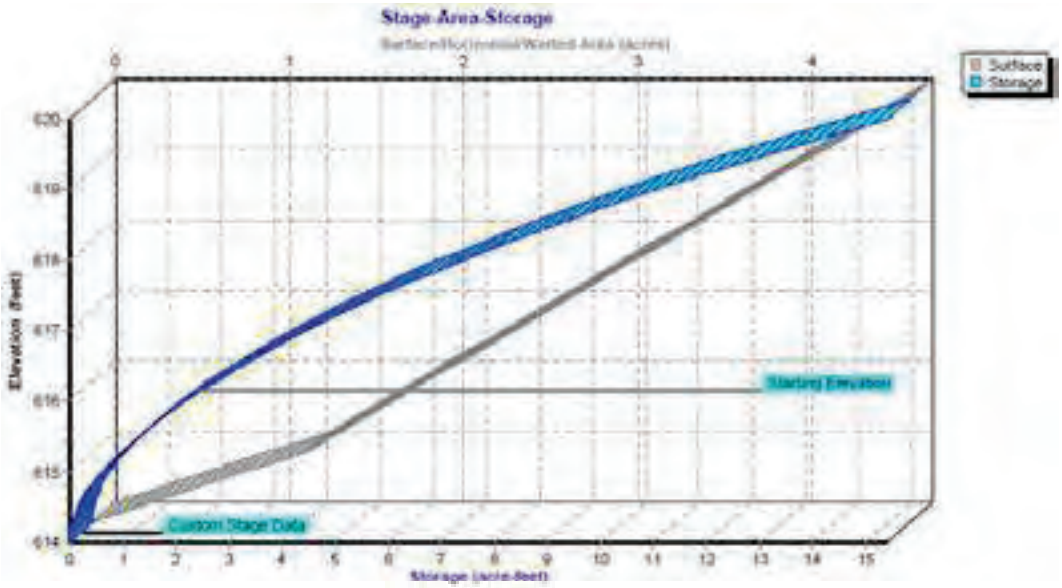

**Figure 1. Area-capacity curve for GMF Pond prepared in 2016**

***§ 257.73(c)(1)(x): A description of each spillway and diversion design features and capacities and calculations used in their determination.***

Ash Pond No. 1 does not contain an active spillway or diversion feature. Stormwater collected in Ash Pond No. 1 is manually pumped to Ash Pond No. 2 at the judgement of plant personnel. Current discharge capacity and calculation information for Ash Pond No. 1 is not reasonably and readily available.

Stormwater collected in Ash Pond No. 2 is drained via a 36-inch diameter (dia.) steel morning glory spillway, formed by 2-foot tall stacked sections, located in the northeast corner of the pond. The spillway transitions to a 36-inch dia. reinforced concrete pipe (RCP) and drains towards the return water pumphouse and discharges in accordance with the station's Water Pollution Control Permit. Current discharge capacity and calculation information for Ash Pond No. 2 is not reasonably and readily available.

Electronic Filing: Received, Clerk's Office 06/20/2024

The GMF Pond contains a transfer channel that discharges clear water into the GMF Recycle Pond. The transfer channel is trapezoidal in shape with 3H:1V side slopes. The channel transitions from a 16-foot bottom width at an invert elevation of 616 feet at the upstream end to a 35-foot bottom width at an invert elevation of 609 feet at the downstream end. In 2016 the discharge capacity of the GMF Pond was evaluated using HydroCAD 8.50 software modeling a 1,000-year, 24-hour rainfall event. The results of the HydroCAD 8.50 analysis are presented below in **Table 5**.

**Table 5. Results of HydroCAD 8.50 analyses**

| | GMF Pond |
|---|---|
| **Approximate Minimum Berm Elevation[1] (ft)** | 620.0 |
| **Approximate Emergency Spillway Elevation[1] (ft)** | 616.0 |
| **Starting Pool Elevation[1] (ft)** | 616.0 |
| **Peak Elevation[1] (ft)** | 618.3 |
| **Time to Peak (hr)** | 12.0 |
| **Surface Area (ac)** | 3.5 |
| **Storage[2] (ac-ft)** | 8.3 |

Notes: 1. Elevations are based on NAVD88 datum.
2. Storage given is from Starting Pool Elevation to Peak Elevation

***§ 257.73(c)(1)(xi): The construction specifications and provisions for surveillance, maintenance, and repair of the CCR unit.***

The construction specification for Ash Pond No. 1 is located in Technical Specification Section 21, however the construction specification is not reasonably and readily available. The construction specification for the Ash Pond No. 2 is not reasonably and readily available. The construction specification for the GMF Pond is located in *Project Manual; Specification No's.: C180-C102* (presented in **Appendix D**).

The provisions for surveillance, general maintenance, and repair of the GMF Pond are presented in **Appendix E**.

The operations and maintenance plans for Ash Pond No. 1, Ash Pond No. 2, and GMF Pond are currently either being generated or being revised by Illinois Power Resources Generating,

Electronic Filing: Received, Clerk's Office 06/20/2024

LLC. This section will be updated when the new operations and maintenance plans are available.

***§ 257.73(c)(1)(xii): Any record or knowledge of structural instability of the CCR unit.***

There is no record or knowledge of structural instability of Ash Pond No. 1, Ash Pond No. 2, and the GMF Pond at Duck Creek Power Station.

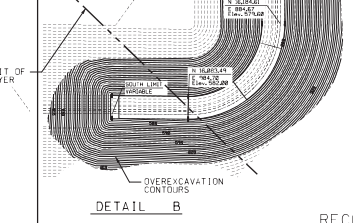
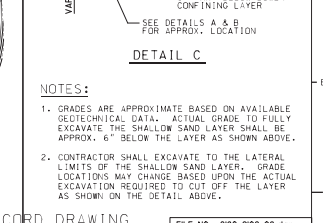
NOTE: RECORD ELEVATIONS AND LAYER THICKNESSES BASED ON A COMPILATION OF RECORD SURVEY DATA PROVIDED BY MAURER-STUTZ, INC. THIS RECORD SURVEY PROVIDED BY MAURER-STUTZ, INC., IS CONTAINED ELSEWHERE IN THIS ACCEPTANCE REPORT.



TYPICAL POINT NUMBER LOCATION



POINT NUMBERING DETAIL

DETAIL A

DETAIL B

DETAIL C

NOTES:

1. GRADES ARE APPROXIMATE BASED ON AVAILABLE GEOTECHNICAL DATA. ACTUAL GRADE TO FULLY EXCAVATE THE SHALLOW SAND LAYER SHALL BE APPROX. 6" BELOW THE LAYER AS SHOWN ABOVE.
2. CONTRACTOR SHALL EXCAVATE TO THE LATERAL LIMITS OF THE SHALLOW SAND LAYER. GRADE LOCATIONS MAY CHANGE BASED UPON THE ACTUAL EXCAVATION REQUIRED TO CUT OFF THE LAYER AS SHOWN ON THE DETAIL ABOVE.

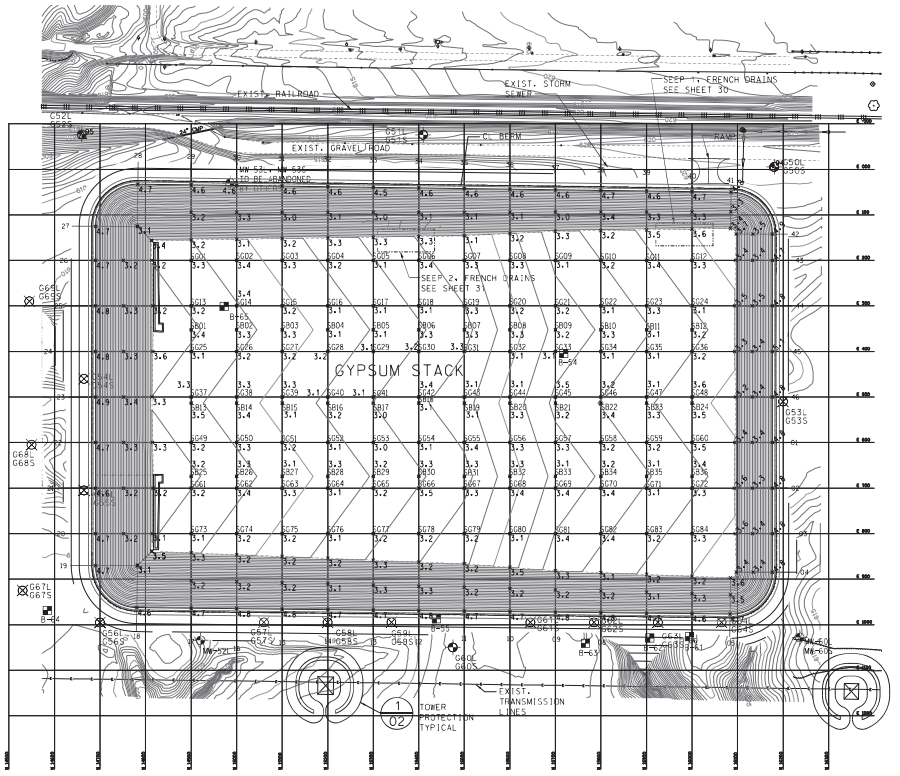
NOTE: RECORD ELEVATIONS AND LAYER THICKNESSES BASED ON A COMPILATION OF RECORD SURVEY DATA PROVIDED BY MAURER-STUTZ, INC. THIS RECORD SURVEY PROVIDED BY MAURER-STUTZ, INC., IS CONTAINED ELSEWHERE IN THIS ACCEPTANCE REPORT.

TYPICAL POINT NUMBER LOCATION



SB 00 — GRID POINT NUMBER; CLAY LAYER GRADE (BREAK POINT)

SG 00 — GRID POINT NUMBER; CLAY LAYER GRADE

S 00 00 — POINT NUMBER (SEE POINT NUMBERING DETAIL); CONTROL LINE NUMBER; CLAY LAYER GRADE

POINT NUMBERING DETAIL

STANDARD LEGEND

(ALL SYMBOLS MAY NOT BE USED ON EACH PLAN)

- ORIGINAL CONTOURS
- NEW CONTOURS
- FENCELINE
- LD/LCRS COLLECTION PIPE
- TRANSMISSION TOWER
- GEONET
- OVERHEAD ELECTRIC
- MONITORING WELL
- LIMITS OF VEGETATION
- BORING
- GRAVEL ROAD
- FUTURE GROUNDWATER MONITORING WELL
- RAILROAD
- STORM SEWER
- 4" DIA. PERFORATED DRAINAGE PIPING
- CONTROL POINT
- 6" DIA. OUTFALL PIPING
- CLAY LAYER THICKNESS (IN FEET)

SCALE: 1" = 100'

NOTE: RECORD ELEVATIONS AND LAYER THICKNESSES BASED ON A COMPILATION OF RECORD SURVEY DATA PROVIDED BY MAURER-STUTZ, INC. THIS RECORD SURVEY PROVIDED BY MAURER-STUTZ, INC., IS CONTAINED ELSEWHERE IN THIS ACCEPTANCE REPORT.

TYPICAL POINT NUMBER LOCATION

CB 00
- GRID POINT NUMBER
- CUSHION LAYER GRADE (BREAK POINT)

CG 00
- GRID POINT NUMBER
- CUSHION LAYER GRADE

C 00 00
- POINT NUMBER (SEE POINT NUMBERING DETAIL)
- CONTROL LINE NUMBER
- CUSHION LAYER GRADE

POINT NUMBERING DETAIL

STANDARD LEGEND
(ALL SYMBOLS MAY NOT BE USED ON EACH PLAN)

- ORIGINAL CONTOURS
- NEW CONTOURS
- FENCELINE
- LD/LCRS COLLECTION PIPE
- TRANSMISSION TOWER
- GEONET
- OVERHEAD ELECTRIC
- MONITORING WELL
- LIMITS OF VEGETATION
- BORING
- GRAVEL ROAD
- FUTURE GROUNDWATER MONITORING WELL
- RAILROAD
- STORM SEWER
- 4" DIA. PERFORATED DRAINAGE PIPING
- 6" DIA. OUTFALL PIPING
- CONTROL POINT
- CUSHION DIRT LAYER THICKNESS (IN FEET)
- RING DRAIN SAND LIMITS
- CONSTRUCTION ROAD LIMITS

SCALE: 1" = 100'

**GYPSUM MANAGEMENT FACILITY AND CCB LANDFILL**
**PROJECT SPECIFICATIONS NO. C180-C102**
**ADDENDUM #2**

Prepared March 24, 2008
By Hanson Professional Services, Inc.
Preparer: DBH

Hanson Professional Services is please to provide the following clarifications to outstanding questions regarding the contract documents:

1) *Please clarify again Bid Form page BF-A-5 the 146,740 cy is the amount excavated and stockpiled. In addition in that price we include 146,740 cy going back in place?*

   Answer: The Estimated Quantity of 146,740 C.Y. shown on Bid Forms A and B is our estimated TOTAL excavation needed for the Over-excavation of Soil and Sand from NE & SW Corners of Gypsum Stack Area. The excavation shall be backfilled with suitable structural backfill after the unsuitable sand lens material has been removed and stockpiled. Our estimate for unsuitable sand material is the 17,600 C.Y. shown in the same section of the Bid Forms.

2) *What is the status of design on slurry piping plan and details? Currently sheet C102-27 does not provide sufficient information.*

   Answer: An updated sheet will be issued with Addendum #2.

3) *Per sheet C102-05, "All under drain pipes installed under the excavation contract C180-C101 shall remain in place. Subsurface drainage piping shall be sealed with bentonite slurry in accordance with project specifications upon completion of the liner system". Please provide specifications.*

   Answer: Sealing of the subsurface drainage system is specified in Section 02141 - Surface Water Management, paragraph 3.06.

4) *Is dwg. format available with Landfill, Gypsum and Recycle Pond area merged to one drawing. We specifically need existing and proposed contours for both projects consolidated as one design and existing layer. The tins provided are for the Gypsum Pond only, would appreciate fill for Landfill if drawings can not be merged. Will Hanson be able to provide design contours for cushion dirt layer? Currently available drawings provide points only from sheet C102-11.*

   Answer: We will be issuing updated tin & dwg files for the Gypsum Stack Recycle Pond that reflects the work completed under Contract C180-C101 with Addendum #2. Tin & DWG files for the CCB Landfill will be issued later in the week, as it is currently being surveyed and verified.

5) *The granular materials for the drainage layer and seperation berm shall provide a minimum hydraulic conductivity (ASTM D2434) of 1 X 10-3. Is there a specific material anticipated for the completion of this work?*

   Answer: The granular materials required for the drainage layer and separation berm are adequately specified in the Project Specifications. The Contractor shall be responsible for determining availability and sourcing for these materials.

Electronic Filing: Received, Clerk's Office 06/20/2024

6) *Is a construction joint allowed in the Process Water Control Structure.*

Answer: A Bonded Construction Joint will be allowed for this structure, provided that it is constructed in accordance with article 503.09 of the Illinois Department of Transportation "Standard Specifications for Road and Bridge Construction" Adopted January 1. 2007.

7) *What if anything is required on the low water crossing on sheet 16 of the CCB Landfill?*

Answer: No special materials are required in this area, the invert of the existing spillway channel shall be maintained and crossed by the proposed haul road.

8) *Is the Coarse Aggregate for the Leachate collection pipe also the IDOT CA-7 Per Article 1004.1 of IDOT Specs.*

Answer: The Coarse Aggregate for the Leachate Collection Pipe shall be a gradation as required to provide a minimum hydraulic conductivity (ASTM D2434) of $1 \times 10^{-3}$ cm/sec. We will issue a correction to the specifications with Addendum #2.

9) *Detail 7/17 for the Ultrasonic Transducer from your web site is different than your handout at the pre-bid meeting is the web site detail the one we are to provide?*

Answer: The latest detail on the web site is the latest one, however a revision to that detail will be issued with Addendum #2.

10) *Bid Form page A-3 Riprap Class B4, the unit of measure is LF, should that be TONS or S.Y.?*

Answer: The correct unit should be S.Y.

11) *In an effort to utilize local aggregate sources, can we use "Special Provision Rock" as specified by IDOT for Contracts 68206 & 68205 for the aggregate base and surface course?*

Answer: All aggregates shall be supplied as specified in Section 02315 Granular Materials.

12) *Can we substitute a butt fusion reducer in lieu of the 50% welded extrusion joints" as shown in detail 5/13?*

Answer: A butt fusion reducer would be acceptable in that location (Detail 5/13 - Plans C180-C102)

13) *Page 27, slurry piping- Is this the sluice piping from section 2640? There is no size listed on the plans. The plan shows dashed and solid lines, what do they represent. Section 2640 calls for valves in the sluice piping, are these the valves shown on sheet 27?*

Answer: A revised sheet C180-102-27 and a new sheet C180-102-28 are included in Addendum #2.

14) *The specs say all underdrain within lined areas of cell is to be grouted. Is the recycle pond lined?*

Answer: The subdrainage outfall piping beneath the recycle pond is to be grouted.

Electronic Filing: Received, Clerk's Office 06/20/2024

15) *We are trying to figure out what gradation of rock is required for detail 6/14 on the gypsum stack and also for detail 1/12 and 2/12 on the CCB Landfill. Section 2315 Part 2 does not have the gradation language we are used to looking at for the CCB Landfill Course Aggregate.*

Answer: The Coarse Aggregate material called out in these details is the same as is specified in Section 02315 - Part 2.01-B-2 for CCB Landfill Coarse Aggregate. A revised specification will be included in this Addendum.

Electronic Filing: Received, Clerk's Office 06/20/2024

**BIDDING CLARIFICATIONS FOR AMEREN CONTRACT DOCUMENTS**
**AMEREN ENERGY RESOURCES GENERATING COMPANY**
**GYPSUM MANAGEMENT FACILITY AND CCB LANDFILL**
**PROJECT SPECIFICATIONS NO. C180-C102**

**ADDENDUM #3**

Prepared March 27, 2008
By Hanson Professional Services, Inc.
Preparer: DBH

Hanson Professional Services is pleased to provide the following clarifications to outstanding questions regarding the contract documents:

*Question: One GCL manufacturer produces a double nonwoven, needlepunch reinforced geosynthetic clay liner that will meet or exceed the project requirements and the GRI-GCL-3 specification, with only two clarifications:*

*Footnote #2 in Table 1 of the GRI-GCL-3 specification states that for nonwoven reinforced GCLs, one of the Geotextiles must contain a scrim component of mass > 2.9 oz/yd2 for dimensional stability. An exception to the scrim reinforcement requirement has been requested.*

*Table 1 of the GRI-GCL-3 specification states that nonwoven reinforced GCLs should be manufactured with minimum 5.9 and 5.8 oz/yd2 Geotextiles. Our product is manufactured with minimum 6.0 and 2.7 oz/yd2 nonwoven Geotextiles and it will still meet the peel and tensile strength requirements in the specifications. Accordingly, an exception to the minimum geotextile weights has been requested.*

**Answer: *We will allow these exceptions, provided that all of the other requirements of the specifications are met by the GCL being submitted for bid.***

*Question: Aggregate suppliers cannot perform the testing required to qualify that their materials will meet the project specifications in the time allotted for bidding. What can the aggregate suppliers do to provide a reasonable quote for the aggregate materials within the Gypsum Stack and CCB Landfill footprints.*

**Answer: Adequate bidding time was allotted for relatively quick permeability and gradation testing, and these test results should be available. However, based on the time allotted for bidding and the turn-around time needed to complete the longer tests necessary to certify project specification compliance, we will allow aggregate suppliers to certify a unit price for these materials based on the contingency that they will meet the following required specifications:**

**ASTM D3042-03 Standard Test Method for Insoluble Residue in Carbonate Aggregates (15% loss Max.)**

Electronic Filing: Received, Clerk's Office 06/20/2024

**$Na_2SO_4$ Soundness 5 Cycle, Illinois Modified AASHTO T 104 (15% Loss Max.)**
**ASTM C 1260 Standard Test Method for Potential Alkali Reactivity of Aggregates (Mortar-Bar Method) (Less than 0.10% internal expansions at 16 days after casting)**

*Additional question related to the overexcavation and replacement of materials in the NE and SW corners of the gypsum stack area:*
*Please clarify "The excavation shall be backfilled with suitable structural backfill". How and where will that backfill be paid for?*

**Answer: Please note that the bid form section for additional items to be paid on a unit cost or time and material basis provides estimated quantities only. The bid form allows for separate pricing for unsuitable sand soils that will need to be excavated from the NE and SW corners of the gypsum stack areas and transported to stockpiles (estimated at 17,600 cy) and for excavation and recompaction of soil material suitable for reuse (estimated at 146,740 cy). Based on these ESTIMATED volumes, the total ESTIMATED volume to be over-excavated from the NE and SW corners of the gypsum stack excavation is 164,340 cy (17,600 cy of which is estimated to be unsuitable sand that needs to be transported out of the excavation and stockpiled). Note again that we will be removing an unknown amount of sand from the excavation. Shrinkage as a result of the compaction process may also be a factor. Any shortage of suitable backfill shall be obtained from the subsoil stockpiles. Backfilling the excavation with Structural Fill to be obtained from stockpiles will be paid for at Time and Material or by the unit cost included on the bid form for "Backfill w/Structural Fill from Stockpile."**

*Question: Can the test pad for the clay liner be constructed outside the footprint of the cell?*

**Answer: The test soil liner must be constructed within the footprint of the cell.**

*What end treatment is to be applied to the upstream ends of the 6" and 12" perforated laterals shown on Sheet C180-C110-09 and detailed on sheet C180-C110-12 for the CCB Landfill?*

**Answer: Cleanouts with threaded caps shall be installed at the termination points for the 6" and 12" perforated laterals. Revised drawing #C180-C110-09 is attached indicating this detail.**

*Question: The new details for vaults on the slurry lines show 8" RFP being bolted into 8" Valves, then a 10" HDPE pipes. The bolt patterns on the 10" pipe and 8" valve are not compatible. Please clarify.*

**Answer: An FRP spindle needs to be provided to go from the 8" valve to the 10" HDPE pipe. Revised drawing #C180-C102-28 is attached to show this configuration.**

**FINAL NOTE: THE BIDS ARE DUE MONDAY, 3/31/08. NO MORE QUESTIONS WILL BE ACCEPTED PRIOR TO BIDDING. PLEASE INCLUDE ANY ADDITIONAL ASSUMPTIONS AND CLARIFICATIONS WITH YOUR BIDS.**

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 1 - GENERAL REQUIREMENTS
Section 01010 - Summary of Work
***ADDENDUM #1***

## PART 1. GENERAL

1.0 INTRODUCTION

A. Gypsum Management Facility

The intent of this contract is to provide the services of a General Contractor to construct Gypsum Management Facility, consisting of a lined Gypsum Stack and Recycle Pond for the disposal of gypsum at Ameren Energy Resources Generating Company (AERG) Duck Creek Power Station's Gypsum Management Facility located near Canton, Illinois.

Excavation to approximately 5.4 ft. above foundation grade, partial construction of Recycle Pond perimeter berm, installation of a temporary stormwater outlet ditch, a temporary subsurface drainage system and the Recycle Pond pump station pad with access road were completed under a prior contract as outlined in the plans. Excavated material was stockpiled north and east of the excavation for use in this contract.

B. CCB Landfill

The intent of this contract is to provide the services of a General Contractor to construct a CCB Landfill, consisting a base 3 ft. thick Compacted Clay Liner, Geosynthetic Clay Liner (GCL), High Density Polyethylene (HDPE) Geomembrane, Geotextile Cushion Fabric and Leachate Collection System for the permanent disposal of coal combustion by-products (CCB) at the Ameren Energy Resources Generating Company (AERG) Duck Creek Power Station CCB Landfill located near Canton, Illinois.

Excavation to approximately 6 in. above foundation grade, construction of perimeter berm, installation of a permanent berm ditch outlet structure and a temporary subsurface drainage system were completed under prior contract. Excavated material was visually segregated during excavation and stockpiled east of the excavation for use in this contract.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 2.0 DESCRIPTION OF WORK

### 2.01 Gypsum Management Facility

The scope of work shall consist of furnishing all materials, equipment, tools, labor, and incidentals necessary to perform the work as described below:

A. Gypsum Stack - Foundation Preparation

1. Excavate areas indicated on the plans to remove areas of underground sand seams and backfill with structural soil backfill.
2. Locally excavate to the foundation grade as indicated on the plans and finish grade the portion of the cell to be covered by Compacted Clay Liner.
3. Proof roll to identify unsuitable foundation soil materials.
4. As directed by the Owner's Representative, Excavate and replace unsuitable foundation materials consisting of unknown pockets of peat, sand, muck or other unsuitable materials with suitable structural backfill. Installation of geotextile fabric for ground stabilization, as deemed necessary by the owner's Representative, will be installed on a time and materials basis.

B. Gypsum Stack - Compacted Clay Liner

1. Construct Test Soil Liner, as outlined Section 5.0 of the project Construction Quality Assurance (CQA) Plan, included in Appendix 2, to demonstrate construction procedures and equipment that will produce the specified permeability.
2. Obtain Foundation Grade Verification by Amerens Field Surveyor prior to constructing areas requiring Compacted Clay Liner, as outlined in Section 6.2.1a of the project Construction Quality Assurance Plan.
3. Install Compacted Clay Liner in accordance with the project specifications using the compactive means demonstrated by the Test Soil Liner.

C. Gypsum Stack - Excavation and Backfill of Anchor Trench

1. Excavate anchor trench.
2. Place initial trench backfill after installation of Geosynthetic Clay Liner (GCL) and High Density Polyethylene (HDPE) Geomembrane by geosynthetic liner Contractor.
3. Complete trench backfill after installation of separation geotextile.

D. Gypsum Stack - Geosynthetic Clay Liner (GCL)

1. The Geosynthetics Installer's Representative shall jointly inspect the surface of the Compacted Clay Liner with the Owner's Representative

Electronic Filing: Received, Clerk's Office 06/20/2024

before commencing daily work. The Geosynthetics Installer's Representative shall continuously observe the condition of the Compacted Clay Liner during GCL placement and submit a Certificate of Acceptance in the daily report that no GCL was placed over visibly defective Compacted Clay Liner.

2. Furnish and install GCL on accepted Compacted Clay Liner. Provide reinforced GCL on the sideslopes and bottom of Gypsum Stack. Protect GCL per the Manufacturer's recommendations until it is covered by HDPE Geomembrane

E. Gypsum Stack High Density Polyethylene (HDPE) Geomembrane (Lower Layer)

1. The Geosynthetics Installer's Representative shall jointly inspect the GCL with the Owner's Representative: continuously observe the condition of the GCL during HDPE Geomembrane placement; and submit a Certificate of Acceptance in the daily report that no HDPE Geomembrane was placed over visibly defective GCL.
2. Furnish and install HDPE geomemebrane on accepted GCL. Provide textured HDPE liner on the side slopes and bottom of the Gypsum Stack. Protect HDPE liner until it is covered by geotextile cushion fabric.
3. The Geosynthetics Installer shall perform non-destructive seam testing at frequencies specified in Section 6.3.2 of the Construction Quality Assurance Plan. Provide samples for destructive seam testing by the Owner's testing consultant, and repair sampled locations.

F. Gypsum Stack - Geotextile Cushion Fabric

1. The Geosynthetics Installer's Representative shall jointly inspect the HDPE Geomembrane with the Owner's Representative: continuously observe the condition of the HDPE Geomembrane during placement of the geotextile cushion fabric; and submit a Certificate of Acceptance in the daily report that no geotextile fabric was placed over visibly defective HDPE Geomembrane.
2. Furnish and install geotextile cushion on accepted Geomembrane.
3. Furnish and install drainage layer material for ballast.

G. Gypsum Stack - HDPE Leachate Collection Piping

1. Furnish and install geotextile fabric for coarse aggregate envelope.
2. Furnish and install initial lift of coarse agregate.
3. Furnish and install leachate collection piping as shown on the plans.
4. Furnish and install coarse aggregate along the pipe to provide lateral stability.
5. The piping installer shall obtain concurrance with the Owner's Representative that the piping installation meets the intended design

Electronic Filing: Received, Clerk's Office 06/20/2024

requirements before placing remainder of coarse aggregate and geotextile envelope.

H. Gypsum Stack - Drainage Layer

1. Furnish and install granular material for drainage layer in accordance with the project plans and specifications.
2. Obtain verification by the Owner's Field Surveyor that the minimum required Drainage Layer thickness has been achieved.

I. Gypsum Stack - Separation Fabric

1. The Geosynthetics Installer's Representative shall jointly inspect the Drainage Layer with the Owner's Representative; continuously observing the condition of the surface of the Drainage Layer during placement of the Geotextile Separation Fabric; and submit a Certificate of Acceptance in the daily report that no geotextile fabric was placed over visibly defective Drainage Layer surface.
2. Furnish and install geotextile fabric on accepted Drainage Layer and anchor geotextile fabric in anchor trench.

J. Gypsum Stack - Cushion Dirt

1. Place Cushion Dirt to facilitate installation of the second HDPE Geomembrane. The Contractor shall protect the underlaying Separation Fabric per the project specifications.
2. Obtain verification by the Owner's Field Surveyor that the minimum required Cushion Dirt thickness has been achieved.

K. Gypsum Stack High Density Polyethylene (HDPE) Geomembrane (Upper Layer)

1. The Geosynthetics Installer's Representative shall jointly inspect the surface of the Cushion Dirt with the Owner's Representative before commencing daily work. The Geosynthetics Installer's Representative shall continuously observe the condition of the Cushion Dirt during HDPE Geomembrane placement and submit a Certificate of Acceptance in the daily report that no HDPE Geomembrane was placed over visibly defective Cushion Dirt.
2. Furnish and install HDPE Geomembrane on approved Cushion Dirt. Provide textured HDPE Geomembrane on cell side slopes and bottom of cell. Protect HDPE Geomembrane until it is initially covered by gypsum waste material.
3. The Geosynthetics Installer shall perform non-destructive seam testing at frequencies specified in Section 6.3.2 of the Construction Quality Assurance Plan. Provide samples for destructive seam testing by the Owner's testing consultant, and repair sampled locations.

Electronic Filing: Received, Clerk's Office 06/20/2024

L. Gypsum Stack - HDPE Process Water Recovery System

1. Furnish and install HDPE Process Water Collection System, as shown on the plans.
2. The piping installer shall obtain concurrance with the Owner's Representative that the piping installation meets the intended design requirements before covering the piping with aggregate and filter fabric as shown on the plan.

M. Gypsum Stack - Miscellaneous Earthwork

1. Provide access ramp to perimeter berm of cell.

N. Gypsum Sluice Piping

1. Connect to existing piping and install new Gypsum Sluice Piping, fittings and valves for the Gypsum Stack.

O. Gypsum Stack - Subdrainage System

1. Abandon existing subdrainage system, and remove vent pipes, vertical drains and inlet structures as specified in Section 02140 – Surface Water Management.

P. Gypsum Stack - Erosion Control

2. Maintain previously installed temporary erosion control systems during the life of the contract.
3. Seed and mulch all exposed soil surfaces.

Q. Recycle Pond - Earthwork

1. Strip topsoil from areas of the proposed excavation and proposed compacted berms.
2. Excavate the recycle pond to the lines and grades shown on the plans.
3. Proof roll stripped/excavated areas to expose unsuitable materials.
4. Remove and replace unsuitable foundation material and/or install geotextile fabric for ground stabilization as directed by the Owner's Representative. Work required to correct unsuitable foundation material will be paid by the Owner on a Time and Materials Basis.
5. Construct Recycle Pond Embankments, Process Water Transfer Channel and Emergency Spillway to the line and grades shown on the plans.

Electronic Filing: Received, Clerk's Office 06/20/2024

R. Recycle Pond – Toe Drain

1. Furnish and install aggregate materials and filter fabric at the outside toe of the recycle pond dam as shown on the plans.

S. Recycle Pond - Excavation and Backfill of Anchor Trench

1. Excavate anchor trench.
2. Backfill trench after installation of High Density Polyethylene (HDPE) Geomembrane by Geosynthetics Installer.

T. Recycle Pond - HDPE Geomembrane

1. The Geosynthetics Installer's Representative shall jointly inspect the surface of the recycle pond foundation soils with the Owner's Representative before commencing daily work. The Geosynthetics Installer's Representative shall continuously observe the condition of the foundation soils during HDPE Geomembrance placement and submit a Certificate of Acceptance in the daily report that no HDPE Geomembrane was placed over visibly defective foundation soil.
2. Furnish and install HDPE Geomembrane on approved foundation soil. Provide textured HDPE Geomembrane on recycle pond side slopes and bottom. Anchor in the excavated anchor trench and backfill in accordance with the project specifications.
3. The Geosynthetics Installer shall perform non-destructive seam testing at frequencies specified in Section 6.3.2 of the Construction Quality Assurance Plan. Provide samples for destructive seam testing by the Owner's testing consultant, and repair sampled locations.

U. Recycle Pond - Water Transfer Structures

1. Furnish, fabricate, and install all materials and aggregate necessary to construct the Process Water Control Structure, Process Water Transfer Channel, Recycle Pond Emergency Spillway/Riprap Stilling Basin, and Side Slope Decant Pipe/Riprap Basin as shown on the plans.

~~V. Construction Field Office~~

~~The Contractor shall furnish and install a Construction Field Office for the Owner's use in accordance with the Specifications of Appendix 4 of these Specifications.~~

Electronic Filing: Received, Clerk's Office 06/20/2024

2.02 CCB Landfill

A. Foundation Preparation:

1. Remove top 6" of soil from the existing excavation and stockpile in an area designated on the Plans.
2. Finish grade the portion of the cell to be covered by Compacted Clay Liner.
3. Proof roll to expose any unsuitable foundation materials..
4. Remove and replace unsuitable foundation material and/or install geotextile fabric for ground stabilization as directed by the Owner's Representative.

B. Compacted Clay Liner

1. Construct Test Soil Liner, as outlined Section 5.0 of the project Construction Quality Assurance (CQA) Plan, included in Appendix 2, to demonstrate construction procedures and equipment that will produce the specified permeability.
2. Obtain Foundation Grade Verification by Amerens Field Surveyor prior to constructing areas requiring Compacted Clay Liner, as outlined in Section 6.2.1a of the project Construction Quality Assurance Plan.
3. Install Compacted Clay Liner in accordance with the project specifications using the compactive means demonstrated by the Test Soil Liner.

C. Excavation and Backfill of Anchor Trench:

1. Excavate anchor trench.
2. Place initial trench backfill after installation of GCL and HDPE geomembrane by geosynthetic liner contractor.
3. Complete trench backfill after installation of separation geotextile.

D. Geosynthetic Clay Liner (GCL)

1. The Geosynthetics Installer's Representative shall jointly inspect the surface of the Compacted Clay Liner with the Owner's Representative before commencing daily work. The Geosynthetics Installer's Representative shall continuously observe the condition of the Compacted Clay Liner during GCL placement and submit a Certificate of Acceptance in the daily report that no GCL was placed over visibly defective Compacted Clay Liner.
2. Furnish and install GCL on accepted Compacted Clay Liner. Provide re-inforced GCL on the sideslopes and bottom of the cell. Protect GCL per the Manufacturer's recommendations until it is covered by HDPE Geomembrane

Electronic Filing: Received, Clerk's Office 06/20/2024

E. High Density Polyethylene (HDPE) Geomembrane (Lower Layer)

1. The Geosynthetics Installer's Representative shall jointly inspect the GCL with the Owner's Representative; continuously observe the condition of the GCL during HDPE Geomembrane placement; and submit a Certificate of Acceptance in the daily report that no HDPE Geomembrane was placed over visibly defective GCL.
2. Furnish and install HDPE Geomemebrane on accepted GCL. Provide textured HDPE Geomembrane on cell side slopes and smooth HDPE Geomembrane on bottom of the cell. Protect HDPE liner until it is covered by geotextile cushion fabric.
3. The Geosynthetics Installer shall perform non-destructive seam testing at frequencies specified in Section 6.3.2 of the Construction Quality Assurance Plan. Provide samples for destructive seam testing by the Owner's testing consultant, and repair sampled locations.

F. Geotextile Cushion Fabric:

1. The Geosynthetics Installer's Representative shall jointly inspect the HDPE Geomembrane with the Owner's Representative; continuously observe the condition of the HDPE Geomembrane during placement of the geotextile cushion fabric; and submit a Certificate of Acceptance in the daily report that no geotextile fabric was placed over visibly defective HDPE Geomembrane.
2. Install geotextile cushion on accepted Geomembrane.
3. Install drainage layer material for ballast.

G. HDPE Leachate Collection Piping:

1. Place geotextile fabric for coarse aggregate envelope.
2. Place initial lift of Coarse Aggregate Bedding.
3. Furnish and install HDPE Leachate Collection Piping on Coarse Aggregate bedding.
4. Place coarse aggregate along the pipe to provide lateral stability.
5. The piping installer shall obtain concurrance with the Owner's Representative that the piping installation meets the intended design requirements before covering the piping with remainder of coarse aggregate and geotextile envelope as shown on the plans.

H. Drainage Layer and Separation Berm:

1. Place granular material for separation berm and drainage layer.

Electronic Filing: Received, Clerk's Office 06/20/2024

I. Separation Fabric:

1. Install geotextile fabric on accepted drainage layer and anchor geotextile fabric in anchor trench.

J. Haul Road

s

1. Funish materials and construct Haul Road to the top of the CCB Landfill.

K. Miscellaneous Earthwork:

1. Provide construction access ramp to bottom of cell.
2. Place general fill to form in-board side of berm ditch.

L. Construct and maintain temporary erosion control systems during the life of the contract. Remove and dispose of temporary erosion control items when no longer required. Seed and mulch all remaining disturbed soil surfaces.

## 3.0 OWNER AND MANUFACTURER'S DRAWINGS

### 3.1 Provided By Ameren Energy Resources Generating

A. Hard-Copy Drawings

The following drawings are intended to indicate the scope of the work to be done and details necessary for the installation of items set forth in this specification, and are part of this specification. These drawings in general are to scale, but dimensions shall always be followed and drawings are not to be scaled. In case of errors or discrepancies, the Owner's Representative shall be consulted for the adjustment of all complications arising therefrom. The Owner's Representative's decisions shall be final.

B. Electronic Files

The following electronic files are provided solely for the convenience of the bidder and/or Contractor and are subject to the terms and conditions stipulated in the Disclaimer text included with the electronic files.

1. Drawings listed above in PDF format.
2. TIN files of the existing and proposed ground surfaces.
3. Bid Forms.
4. Disclaimer text.

In the event of a conflict between the hard-copy documents and the electronic files, the hard-copy documents shall govern.

3.2 Provided by the Contractor

The Contractor shall submit to the Owner's Representative, with such promptness as to cause no delay in the performance of the work, four copies of shop drawings, product data sheets, etc., as required by these specifications. No purchasing, fabrication, erection, processing, or shipping of the aforementioned materials may begin until the required documentation has been reviewed by the Owner.

Three copies of data required to be submitted to the Owner's Representative shall be forwarded to each of the following:

Ameren Energy Resources Generating
Dave Boyce
Duck Creek Power Station
17751 North CILCO Road
Canton, Illinois 61520

Hanson Professional Services Inc.
Steven Bishoff
1525 South Sixth Street
Springfield, Illinois 62703-2886

Data sheets and shop drawings shall be reviewed and returned to the Contractor within ten (10) working days after receipt. Approval is for general design features only and will not relieve the Contractor of responsibility for proper quantities, adequacy of details, and

Electronic Filing: Received, Clerk's Office 06/20/2024

coordination with other trades. Deviation from Contract Documents are not approved unless specifically requested in writing by the Contractor and approved in writing by the Owner.

Should field changes be required, such changes shall be promptly documented by the Contractor and submitted to the Owner in the form of as-built drawings. The field change order process is included in Appendix 1.

## 4.0 MATERIALS AND EQUIPMENT SUPPLIED BY THE OWNER

The materials and equipment that are to be furnished by the Owner are listed in the schedule below:

| ITEM | SHIPPING DATE | LOCATION |
|---|---|---|
| ~~Drainage Layer Material (Gypsum Stack & CCB Landfill)~~ | ~~Prior to Start of Construction~~ | ~~Stockpile~~ |
| ~~Coarse Aggregate Encasement for Ring Drain Piping (IDOT CA-7) (Gypsum Stack)~~ | ~~Prior to Start of Construction~~ | ~~Stockpile~~ |
| ~~Filter Sand for Protection of Ring Drain Piping (IDOT FA-1) (Gypsum Stack)~~ | ~~Prior to Start of Construction~~ | ~~Stockpile~~ |
| ~~Coarse Aggregate Coarse Encasement For Leachate Collection Piping (CCB Landfill)~~ | ~~Prior to Start of Construction~~ | ~~Stockpile~~ |

***Note: Per Addendum #1, none of the above listed aggregates will be supplied by the owner***

## 5.0 MATERIALS AND EQUIPMENT FURNISHED BY THE CONTRACTOR

All materials, equipment, tools, and any incidental items necessary to complete each portion of the work described herein and/or shown on the drawings shall be furnished by the Contractor.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 6.0 UTILITIES, FACILITIES, AND MISCELLANEOUS

The following utilities, facilities, etc., shall be provided as indicated.

| | Item | Provided By |
|---|---|---|
| A. | Telephone Service for Use of Construction Forces | Contractor |
| B. | Sanitary Facilities | Contractor |
| C. | Drinking Water | Contractor |
| D. | Construction Water | Contractor |
| E. | Electric Service for Contractor's Use | Contractor |
| F. | Construction Office and Storage Facilities for Contractor's Use | Contractor |
| G. | Construction of Gravel Haul Roads and Parking Area for Construction Forces | Contractor |

Submit with the bid documents a general layout of temporary facilities required for the Contractor's operations, such as haul roads, parking areas, temporary drainage facilities, Contractor's construction field office and storage facilities, electric service, telephone service, staging and laydown areas, etc.

## 7.0 SCHEDULE

The Contractor shall be required to furnish the Owner's Representative with a complete schedule of the Work to be performed under this contract broken down by major activity.

The schedule shall include the Contractor's estimate of man-days required for each activity, and shall show precedent relationships between activities. The schedule shall be included as part of the bid package presented by the Contractor. The schedule shall comply with the dates and guidelines listed below:

A. The required start date of this contract is upon receipt of Purchase Order. The Purchase Order is expected to be issued within two (2) weeks of the bid due date.

B. The required finish date of this for the Gypsum Management Facility Contract is September 30, 2008. The required finish date for the CCB Landfill Contract is December 31, 2008 for the Scope of Work incuded in Bid Forms A & C.

Electronic Filing: Received, Clerk's Office 06/20/2024

C. The level of detail in each schedule shall be sufficient to permit the Owner to monitor the Contractor's performance relative to the specified guidelines. The required level of detail will be discussed at the pre-bid meeting.

D. The Contractor shall submit a daily construction report and shall furnish schedule status reports at weekly progress meetings until the work is completed. The schedule status reports shall indicate by activity the scheduled percent of completion as shown on the original schedule, the actual percent completion as of the date of the report, and the number of man-days expended on the project to date.

If at any time during this Contract, when the Contractor's actual progress, in the opinion of the Owner, is such that the completion dates of the work will not be met, the Contractor shall participate in a re-evaluation of the remaining work.

If, as a result of this re-evaluation of the remaining work, it is determined by the Owner that the completion date will not be met, the Owner retains the right to direct the Contractor to accelerate the construction program. It shall be the responsibility of the Contractor to initiate and comply with such corrective action as required or directed.

At the time of the award of this contract, scheduling requirements will be discussed in detail by all interested parties.

## 8.0 CONSTRUCTION QUALITY CONTROL ASSURANCE

A. Construction Quality Assurance Plan

A Construction Quality Assurance (CQA) Plan has been developed for this project to ensure compliance with the all applicable permit requirements. A copy of this plan is included in Appendix 2. The testing requirements and frequency of this plan will govern in instances which there may be discrepancies between the CQA Plan and these specifications.

B. Testing and Inspections:

1. The Contractor is responsible for construction quality control testing, sampling, and inspections to ensure that the materials and workmanship comply with the plans and specifications. The Contractor shall submit results of construction quality control testing. The Contractor shall visually inspect underlying surfaces on a continuous basis immediately ahead of placement of geosynthetics and geotextile and shall certify in the daily report that no material was placed over visibly defective substrate.
2. The Contractor is responsible for non-destructive testing of all Geomembrane seams and for providing samples for prequalification material testing and destructive seam testing as directed by the Owner's

Electronic Filing: Received, Clerk's Office 06/20/2024

Representative. The minimum sampling frequencies are specified in Appendix 2.

3. Except as specified above, Construction Quality Assurance (CQA) testing, sampling, and inspections to verify compliance with the plans and specifications are the responsibility of the Owner. The CQA sampling and testing requirements are summarized in Appendix 2. The Contractor shall coordinate and cooperate with the Owner's materials testing consultant to provide samples and accommodate testing activities at no additional cost to the Owner.

C. Construction Surveying

Construction surveying for layout and grading control shall be the responsibility of the Contractor. Finished grades will be surveyed by the Owner's surveyor to verify that the finished grade is within 0.1 ft. of plan grade.

D. CQA Surveys to certify material thickness, leachate piping and ditch grades are the responsibility of the Owner. CQA Surveying requirements are summarized in Appendix 2.

## 9.0 COORDINATION WITH OTHERS

This Contractor will work in close harmony with other Contractors or AERG personnel who may be employed at this site. In the event of differences of opinion regarding scheduling of work, the decision of the Owner will be final and binding.

The following construction activities are anticipated within the landfill facility boundary during this contract:

A. Loading and Hauling of coal combustion by-product to the site by AERG personnel or Contractor.

B. Loading and Hauling of water for dust contol operations on AERG property.

C. Loading and hauling stockpiled excavated material from the stockpile south of East McKinley Road by Fulton County Highway Department Contractor and by Ameren personnel or contractor.

D. Monitoring, removing, and disposing of leachate by Ameren's CCB disposal facility operator.

Electronic Filing: Received, Clerk's Office 06/20/2024

10.0 SAFETY AND SITE SECURITY

The Contractor will comply with safety and security requirements stipulated in the General Conditions and Supplemental General Conditions.

A. Although the Ameren Energy Resources Generating property is generally fenced and patrolled by Ameren Energy Resources Generating security, the site should not be considered secure.

1. A Security Check-In Station will be provided by AERG for the duration of the construction project at the entrance on McKinley Road.

B. Contractor personnel will be required to attend a 2-hour site-specific safety orientation conducted by the Owner.

C. Contractor personnel will be required to submit to a ten (10) panel drug test to be performed and provided by AERG.

D. A copy of the Contractor's Field Construction Safety Program shall be submitted with the Contractor's bid package.

E. The Contractor shall have a designated Safety Supervisor on site whenever construction work is being performed.

11.0 DUST CONTROL

The Contractor shall be responsible for controlling dust and air-borne dirt generated by construction activities. Dust shall be controlled by applying water to exposed surfaces, particularly surfaces on which construction vehicles travel. Water from the Duck Creek Reservoir is unsuitable. A pond north and east of the proposed CCB Landfill is designated at the only water source available for use by the Contractor.

No chemical dust suppressants shall be permitted unless approved in writing by the Owner's Representative. Dust control measures shall be readily available for implementation whenever the Contractor or the Owner's Representative deems that that dust control is needed. The cost of dust control shall be included in the contract lump sum price.

## PART 2. PRODUCTS

No products used.

Electronic Filing: Received, Clerk's Office 06/20/2024

## PART 3. EXECUTION

1.0 The Contractor shall be responsible for inspecting the site to note any and all conditions that may affect the work under the contract. The Contractor shall satisfy himself as to the nature, extent and location of the work; the configuration of the ground; the equipment and facilities needed for construction; the general and local conditions of the area; and all other factors and conditions which can, in any way, affect the work under the contract. Any failure by the Contractor to do so will not relieve him from responsibility for successfully performing the work without additional expense to the Owner.

2.0 The Contractor is specifically advised of the presence of overhead power lines that traverse the project work area.

END OF SECTION 01010

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 1–GENERAL REQUIREMENTS
Section 01356 – Storm Water Pollution Prevention Measures

## PART 1. GENERAL

### 1.01 DESCRIPTION

A. This section pertains to the construction and maintenance of existing and proposed temporary erosion control systems to control erosion and sediment damage to adjacent properties and water resources.

### 1.02 RELATED SECTIONS

The following sections contain items which are related to the work in this section:

02936 - Topsoil, Seeding, and Mulching.

### 1.03 REFERENCES

The following reference, or cited portions thereof, governs the work:

Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2007.

### 1.04 SUBMITTALS

A. Submittals shall follow the provisions of Section 01010.

B. Preconstruction Submittals: A storm water best management practices (BMP) plan shall be submitted that includes the following items:

1. Inspection and record-keeping procedures; and
2. Maintenance procedures for erosion controls.

## PART 2. PRODUCTS

### 2.01 EROSION CONTROL SYSTEMS

Materials for erosion control systems shall be in accordance with Article 280.02 of the IDOT Standard Specifications.

Electronic Filing: Received, Clerk's Office 06/20/2024

## PART 3. EXECUTION

3.01 EXAMINATION

The site shall be examined to determine the condition existing temporary erosion controls systems installed under a prior contract and the extent of new work required.

3.02 PRECONSTRUCTION JOBSITE INSPECTION

A. The person who shall be at the jobsite during construction and who shall be responsible for insuring that erosion control work is completed in a timely manner shall be identified at the preconstruction meeting.

B. A jobsite inspection shall be conducted with the Owner's Representative to review and designate the locations and types of erosion protection to be placed. The inspection shall be scheduled at the preconstruction conference and carried out on the job site before beginning any work that will disturb existing drainage or potentially create erodible conditions.

3.03 CONSTRUCTION

A. Temporary erosion control systems shall be constructed in accordance with IDOT Standard 280001 and Article 280.04 of the Standard Specifications and as directed by the Owner's Representative. Erosion control devices shall be in place and approved by the Owner's Representative prior to beginning other work.

B. Incorporate permanent erosion control features into the project at the earliest practicable time to minimize the need for temporary erosion controls.

3.04 MAINTENANCE

A. Temporary erosion control systems shall be maintained in accordance with Article 280.05 of the Standard Specifications, except that measurement and payment provisions shall not apply.

B. Temporary erosion control systems for unprotected disturbed areas shall be cleaned of trapped sediment and repaired immediately prior to project close out.

C. Temporary seeding shall be applied to all disturbed areas except the gypsum stack excavation and the future fill and topsoil stockpiles.

Electronic Filing: Received, Clerk's Office 06/20/2024

## 3.05 REMOVAL AND DISPOSAL

All temporary erosion control system shall be left in place by the Contractor for future construction operations at both facilities.

END OF SECTION 01356

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 - SITE WORK
Section 02010 - Subsurface Investigation

## PART 1. GENERAL

1.01 DESCRIPTION

Logs of borings and laboratory soil test data.

## PART 2. PRODUCTS

No products used.

## PART 3. EXECUTION

3.01 TEST BORINGS

A. Test borings were taken at the locations shown on the drawings. Copies of boring logs, along with soil test data on soil samples recovered from the borings are included in Appendix 3.

B. Data on indicated subsurface conditions are not intended as representations or warrants of continuity of such conditions between soil borings. It is expressly understood that the Owner will not be responsible for interpretations or conclusions drawn therefrom by the Contractor. Data are made available for the convenience of the Contractor.

C. Additional test borings and other exploratory operations may be made by the Contractor at no additional cost to the Owner, provided such operations are approved by the Owner's Representative.

3.02 SITE OBSERVATIONS

B. Gypsum Management Facility (Gypsum Stack & Recycle Pond)

1. The Gypsum Stack has been excavated to foundation grade on the sideslopes, and to within approximately 5.4 of foundation grade at the bottom of the cell. The remaining 5.4 feet of material will be utilized to construct the 3 foot thick clay layer. A drainage channel was cut from the southwest floor of the excavation to allow adequate surface water drainage. During the pre-bid meeting, Contractors will be given opportunity to view the excavation and resulting stockpiles, and to observe the in-situ conditions at the time of the meeting.

Electronic Filing: Received, Clerk's Office 06/20/2024

2. The earthwork for the recycle pond pump station pad and access road, as well as sections of the recycle pond perimeter berm have been constructed to finish grade. During the pre-bid meeting, Contractors will be given the opportunity to view the in-situ conditions at the time of the meeting.

A. CCB Landfill

1. The CCB Landfill has been excavated to within 6 in. of foundation grade. During the pre-bid meeting, Contractors will be given opportunity to view the excavation and observe the in-situ conditions near foundation grade at the time of the meeting.

END OF SECTION 02010

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 - SITEWORK
Section 02100 - Site Preparation
***ADDENDUM #1***

## PART 1. GENERAL

1.01 DESCRIPTION

This section pertains to stripping of topsoil and vegetation from areas of the site that are to be excavated.

1.02 RELATED SECTIONS

No related sections.

## PART 2. PRODUCTS

No products used.

## PART 3. EXECUTION

3.01 EXAMINATION

The Contractor shall examine the site to determine the extent of work required, as well as the extent of previously stripped topsoil completed under a previous contract.

3.02 SITE PREPARATION - STRIPPING

A. The Gypsum Stack and portions of the Recycle Pond grading limits have been previously stripped under a separate contract as shown on the plans. Any remaining vegetation and topsoil encountered within the Gypsum Stack and Recycle Pond grading limits required to complete the work in this contract shall be stripped. ~~Topsoil shall be kept clean and free of all foreign material, and stored in separate stockpiles from vegetation and common excavations. Stockpiles shall be located as indicated on the drawings or as directed by the Owner's Representative.~~ ***Topsoil removed by stripping shall not be stockpiled, and shall be deposited completely as described in section 3.02-C of this specification.***

B. The top 6" of the existing excavation area of the CCB Landfill-Cell 1 within the CCB Landfill shall be removed and stockpiled per Specification Section 02200 Earthwork.

C. Stripped Topsoil shall be used to fill depressions east of the Gypsum Management Facility as shown in the Plans.

Electronic Filing: Received, Clerk's Office 06/20/2024

3.03 DISPOSAL

A. All materials resulting from site preparation operations shall be stockpiled in the designated spoil area. Contractor shall obey all laws and regulations when disposing of the materials.

END OF SECTION 02100

Electronic Filing: Received, Clerk's Office 06/20/2024

## PART 1. GENERAL

### 1.01 DESCRIPTION OF WORK

Control of surface water caused by precipitation and abandonment of existing subsurface drainage facilities within the construction limits of the Gypsum Management CCB Landfill shall be considered as part of the work under this specification.

A. The work to be completed by the Contractor includes, but is not necessarily limited to, the following:

1. Maintenance of existing Erosion and Sedimentation Control Measures according to Section 01356; and
2. Dewatering excavations from water caused by precipitation.
3. Abandonment of the existing subdrainage systems.

B. The Contractor shall be responsible for providing all materials, equipment, labor, and services necessary for care of water and erosion control and abandonment of the existing subsurface dewatering systems at the end of the Contract.

### 1.02 EXISTING FACILITIES

A. Gypsum Management Facility

1. An existing ditch at the south end of the existing excavation provides gravity outlet for the excavation to 5.4 feet above the foundation grade.

2. An existing subdrainage system provides limited control of groundwater migration into the excavation. The subdrainage system outlets by gravity flow to an existing ditch approximately 0.3 mile south of the existing excavation.

B. CCB Landfill Facility

1. An existing ditch at the southeast corner of the existing excavation provides gravity outlet for the excavation to foundation grade.

2. An existing subdrainage system provides limited control of groundwater migration into the excavation. The subdrainage system outlets by gravity flow to an existing channel approximately 0.2 mile east of the existing excavation.

Electronic Filing: Received, Clerk's Office 06/20/2024

1.03 REQUIREMENTS

B. The General Contractor shall employ standard surface water management practices to prevent the ponding of stormwater runoff and/or erosion of existing and proposed earth surfaces, as required to complete the work.

1.04 RELATED SECTIONS

The following sections contain items which are related to the work in this section:

1. 01356 – Storm Water Pollution Prevention Measures
2. 02010 - Subsurface Investigation
3. 02200 - Earthwork

## PART 2. PRODUCTS

2.01 MATERIALS

A. Materials and equipment for surface water management shall be reviewed by the Owner's Representative for compatibility with future construction and operation of the facility.

## PART 3. EXECUTION

3.01 SURFACE WATER MANAGEMENT

A. The Contractor shall be responsible for providing all facilities required to divert, collect, control, and remove water caused by precipitation from all construction work areas and excavations.

B. Drainage features shall have sufficient capacity to avoid flooding of work areas.

C. Drainage features shall be so arranged and altered, as required to avoid degradation of the final excavated surface(s).

D. The Contractor shall utilize all necessary erosion and sediment control measures according to Section 01356 to avoid construction-related sedimentation of existing and proposed facilities.

3.02 WATER DISPOSAL

A. Dispose of water removed from the excavations in such a manner as:

1. Will not endanger portions of work under construction or completed.
2. Will cause no inconvenience to Owner or to others working near site.
3. Will comply with the stipulations of Section 01356.

Electronic Filing: Received, Clerk's Office 06/20/2024

4. Will control runoff. The Contractor shall be responsible for control of runoff in all work areas, including, but not limited to: excavations, access roads, parking areas, stockpile, laydown, and staging areas. The Contractor shall provide, operate, and maintain all ditches, basins, sumps, culverts, site grading, and pumping facilities to divert, collect, and remove all water from the work areas. All water shall be removed from the immediate work areas and shall be disposed of in accordance with Section 01356.

B. Existing site drainage features or proposed subdrainage system may be used for water disposal.

3.03 DAMAGES

A. Immediately repair damages to adjacent facilities caused by the surface water management facilities, as constructed by the Contractor.

3.04 REMOVAL OF STORMWATER MANAGEMENT SYSTEMS INSTALLED BY CONTRACTOR

A. Remove and backfill temporary sumps, ditches, trenches, etc. according to Section 02300, as required by the Owner.

3.05 CORRECTIVE ACTION

Work shall be performed as necessary for reinstatement of foundation soil and damaged structure resulting from such inadequacy or failure by Contractor to control surface water, at no additional cost to Owner.

3.06 ABANDONMENT OF EXISTING SUBDRAINAGE SYSTEMS

Concurrence shall be obtained from Owner before discontinuing operation of subdrainage system.

The General Contractor shall maintain the existing subdrainage systems during construction of the Gypsum Management and CCB Landfill Facilities.

Prior to construction of the Compacted Clay Liner at the Gypsum Management Facility, all vertical drains consisting of a geotextile fabric encased pea gravel envelope shall be removed. The pea gravel shall be stockpiled and the geotextile fabric shall be removed and disposed of in a legal manner. Subdrainage piping damaged during removal of the vertical drains shall be repaired with equal material incidental to the work. An existing drainage structure consisting of 24" diameter reinforced concrete pipes with a ditch grate shall be removed. The concrete pipes shall be disposed of in a legal manner and the ditch grate shall be salvaged per the direction of Owner's Representative

Electronic Filing: Received, Clerk's Office 06/20/2024

Upon completion of the construction of either facility, that facility's existing subdrainage system within the lined portion of the cell shall be abandoned as follows:

1. At each subdrainage vent pipe riser location, a mixture of high solids bentonite grout shall be pumped into the subdrainage piping to completely seal the system. The high solids bentonite grout shall be CETCO Volclay Grout or an approved equal that is NSF/ANSI Standard 60 certified. The grout shall be mixed *according to* the manufacturer's specifications for this application to provide a low permeability seal less than $1x10^{-7}$ cm/sec.
2. Cut the vent pipe risers 36 inches below with the ground surface. Fill the remaining vent piping with concrete as shown on the plans.
3. Remove completely the existing concrete inlet at the southeast quadrant of the gypsum stack excavation and dispose of in a legal manner. The grate will be salvaged and stored at the direction of the owner.
4. Remove completely the vent pipe protective bollards and dispose of in a legal manner.

END OF SECTION 02140

Electronic Filing: Received, Clerk's Office 06/20/2024

DIVISION 2 – SITEWORK
Section 02200 – Earthwork
***ADDENDUM #1***

## PART 1. GENERAL

### 1.01 DESCRIPTION

This section pertains to excavation, fill, and backfill required for foundation preparation, construction of Compacted Clay Liners, anchor trench construction, miscellaneous site grading, berm construction.

### 1.02 RELATED SECTIONS

A. The following sections contain items which are related to the work in this section:

1. 01356 – Storm Water Pollution Prevention Measures
2. 02100 - Site Preparation
3. 02140 – Surface Water Management
4. 02373 – Geotextiles
5. 02936 - Topsoil, Seeding, and Mulching

### 1.03 REFERENCES

The following references, or cited portions thereof, govern the work:

1. Illinois Department of Transportation (IDOT): Standard Specifications for Road and Bridge Construction, adopted January 1, 2007
2. Department of Sustainable Natural Resources, Soil Survey Standard Test Method, Unified Soil Classification System: Field Method (USCS).

### 1.04 MEASUREMENT AND PAYMENT

A. The Contractor shall be responsible for estimating the extent of excavation and fill required to complete the work, including, but not limited to, excavation to required elevations; loading, transporting, placing, and compacting the Compacted Clay Liners; excavation and backfill of anchor trench; and miscellaneous site grading, including berm construction. The Contractor shall include the dollar amount associated with all earthwork in his Lump Sum Bid amount.

B. Removal and replacement of unsuitable foundation material (including underground sand channel materials) and subgrade stabilization measures directed by the Owner's Representative will be paid for on a time and material basis. Payment quantities will be based volume of excavation, determined from field surveys by the Owner's Field Surveyor.

Electronic Filing: Received, Clerk's Office 06/20/2024

1.05 EARTHWORK COMPLETED UNDER PRIOR CONTRACT

A. Gypsum Management Facility

1. The gypsum stack has been excavated to approximately 5.4 ft. above foundation grade across the bottom of the cell.

2. Excavated subsoil material was stockpiled north and east into short term and long term subsoil stockpiles as shown on the plans. Stripped Topsoil was stockpiled separately.

3. The ~~75,000 yard~~ subsoil stockpile east of the Gypsum Stack shall be completely depleted under this contract. Schedule and timing shall be determined by the Contractor.

B. CCB Landfill

1. The cell has been excavated to approximately 6 in. above foundation grade and the perimeter berm has been completed, except for an existing construction access ramp on the east side of the cell near Sta. 205+00.

2. Excavated material was stockpiled in locations east of the excavation. The intended use and location for each stockpile is shown on the plans

1.06 COORDINATION

Existing utilities or other plant facilities shall not be interrupted, except when permitted in writing by the Owner's Representative and then only after acceptable temporary services have been provided. A minimum 48-hour notice shall be provided prior to proceeding with an approved temporary interruption.
