Table S.1 (Summary of Findings) summarizes the expected impacts of the CIP, CBR-Onsite, and CBR-Offsite closure scenarios with regard to each of the factors specified under IAC Section 845.710 (IEPA, 2021a). Based on this evaluation and the details provided in Section 2 above, CIP has been identified as the most appropriate closure scenario for the GMF. Key benefits relative to other closure scenarios include the more rapid re-development of the Site for use in utility-scale solar generation and reduced impacts on workers, community members, and the environment during construction (*e.g.*, fewer constructed-related accidents, lower energy demands, less air pollution and GHG emissions, and less traffic).

Electronic Filing: Received, Clerk's Office 06/20/2024

# 3 Closure Alternatives Analysis – BAB

## 3.1 Closure Alternative Descriptions (IAC Section 845.710(c))

This section of the report presents a CAA for the BAB pursuant to requirements under IAC Section 845.710 (IEPA, 2021a). For the BAB, Gradient evaluated two closure scenarios: CBR-Onsite and CBR-Offsite. CIP was not evaluated for the BAB because no significant CCR remains in the impoundment. Sections 3.1.1 and 3.1.2 describe the CBR-Onsite and CBR-Offsite closure scenarios. These scenarios are based on information and analyses conveyed to Gradient by Golder (Appendix B; Golder, 2022c,d).

### 3.1.1 Closure-by-Removal with On-Site Disposal

Under the CBR-Onsite scenario, CCR and existing liner system materials will be excavated from the BAB and sent to the on-Site landfill for final disposal. Excavation activities at the BAB will include any residual CCR that is still present in the impoundment; the concrete, compacted clay, and geomembrane components of the existing liner system; and additional subsoil overexcavation (Golder, 2022c,d). Excavated materials from the BAB will be hauled to the on-Site landfill (Appendix B; Golder, 2022d).

The on-Site landfill is located approximately 3.7 miles north of the BAB *via* Site roads (Appendix B). Excavated materials will be hauled to the landfill using haul trucks. The landfill on the property is currently expected to have sufficient capacity to receive all of the materials from the BAB slated for disposal under the CBR-Onsite scenario. This scenario meets the requirements of IAC Section 845.710(c)(2) (IEPA, 2021a) which requires an assessment be included in the CAA of whether the Site has an on-Site landfill with available capacity or whether an on-Site landfill can be constructed.

This scenario includes the following work elements for the closure of the BAB (Appendix B; Golder, 2022c,d):

- Excavation and transport of CCR and liner system materials to the on-Site landfill, as detailed above.
- Grading and filling to convey runoff away from the impoundments.
- Site restoration, including revegetation with native grasses.
- Three years of monitoring at the impoundments, or until such time as GWPSs are achieved.

In total, approximately 3,550 cubic yards of concrete and compacted clay, 1 acre of geomembrane materials from the existing liner system, and 3,200 cubic yards of overexcavated subsoil will be excavated from the BAB under the CBR-Onsite scenario and hauled to the on-Site landfill for disposal. The selected borrow soil location is approximately 3.4 miles north of the BAB *via* Site roads (Appendix B). A total of 17,500 cubic yards of borrow soil are required for grading and filling of the BAB (Appendix B).

Electronic Filing: Received, Clerk's Office 06/20/2024

Under the CBR-Onsite scenario, the expected duration of major construction activities is approximately 12-18 weeks (Appendix B; Golder, 2022c,d). Key parameters for the CBR-Onsite scenario are shown in Table 3.1.

**Table 3.1 Key Parameters for the Closure-by-Removal with On-Site Disposal Scenario – BAB**

| Parameter | Value | Notes |
|---|---|---|
| Surface Area of Impoundment (acres) | 2.2 | Includes all three cells and the area around the cells. |
| In-Place Volume of CCR (CY) | Minimal | The CCR in the impoundment has been excavated previously. |
| Distance to the On-Site Landfill (miles) | 3.7 | |
| Required Volume of Borrow Soil (CY) | 17,500 | Required for grading and filling. |
| Volume of Soil Stockpiled at Borrow Soil Location (CY) | 0 | |
| Distance to the Borrow Soil Location (miles) | 3.4 | |
| Duration of Construction Activities (weeks) | 12-18 | |
| Total On-Site Labor Hours for Major Construction[a] | 4,820 | |
| Required On-Site Hauling Truckloads (Loaded) | 843 | |
| Required Off-Site Hauling Truckloads (Loaded) | 0 | |
| Required On-Site Hauling Miles | 5,870 | |
| Required Off-Site Hauling Miles | 0 | |

Notes:
BAB = Bottom Ash Basin; CCR = Coal Combustion Residual; CY = Cubic Yards.
Sources: Appendix B; Golder (2022c,d).
(a) Major construction was defined as any operation occurring on-Site that required one of the following equipment types: breaker, compactor, dozer, excavator, haul truck, loader, and telehandler. Labor was not included if it was limited to use of the following equipment types: diesel pump, flatbed truck, generator, miscellaneous, pickup truck, and seed drill or hydroseeder. Labor performed by haul truck operators was only included in calculations if the hauling occurred on-Site. Workers assigned to relevant activities were assumed to work full-time (40 hours per week) on that activity for the duration of the activity.

### 3.1.2 Closure-by-Removal with Off-Site Disposal

Under the CBR-Offsite scenario, CCR and existing liner system materials will be excavated from the BAB and sent to an off-Site landfill for final disposal. Excavation activities at the BAB will include any residual CCR that is still present in the impoundment; the concrete, compacted clay, and geomembrane components of the existing liner system; and additional subsoil overexcavation (Golder, 2022c,d). Excavated materials in the BAB will be sent to the Peoria City-County Landfill (11501 W Cottonwood Road, Brimfield, IL 61517), which is approximately 33 miles from the Site (Appendix B).

IAC Section 845.710(c)(1) requires CBR alternatives to consider multiple methods for transporting excavated materials off-Site, including rail, barge, and trucks. Golder evaluated the feasibility of transporting excavated materials to the off-Site landfill *via* rail or barge and found that neither option is viable at this Site. Existing loadout facilities, which would facilitate off-Site rail or barge transport, are not present on the property, and the construction of new loadout facilities is considered infeasible. Only transport *via* on-road haul trucks (with a 16.5-cubic-yard capacity) is considered feasible for CBR-Offsite. The local availability and use of natural gas-powered trucks, or other low-polluting trucks, will be evaluated prior to the start of construction.

The work elements included in this scenario are largely the same as those listed above in Section 3.1.1 for the CBR-Onsite scenario (Appendix B; Golder, 2022c,d):

Electronic Filing: Received, Clerk's Office 06/20/2024

- Excavation and transport of CCR and liner system materials to the off-Site landfill, as detailed above. All areas affected by CCR releases will be decontaminated, including potential over-excavation below the bottom of the liner system.
- Grading and filling to convey runoff away from the impoundments.
- Site restoration, including revegetation with native grasses.
- Three years of monitoring at the impoundments, or until such time as GWPSs are achieved.

In total, approximately 3,550 cubic yards of concrete and compacted clay, 1 acre of geomembrane materials from the existing liner system, and 3,200 cubic yards of overexcavated subsoil will be excavated from the BAB under the CBR-Offsite scenario and hauled to the off-Site landfill for disposal. The selected borrow soil location is approximately 3.4 miles north of the BAB *via* Site roads (Appendix B). A total of 17,500 cubic yards of borrow soil are required for grading and filling of the BAB (Appendix B).

Under the CBR-Offsite scenario, the expected duration of major construction activities is expected to be approximately 12 to 18 weeks for the BAB (Appendix B; Golder, 2022c,d). Key parameters for the CBR-Offsite scenario are shown in Table 3.2.

**Table 3.2 Key Parameters for the Closure-by-Removal with Off-Site Disposal Scenario – BAB**

| Parameter | Value | Notes |
|---|---|---|
| Surface Area of Impoundment (acres) | 2.2 | Includes all three cells and the area around the cells. |
| In-Place Volume of CCR (CY) | Minimal | The CCR in the impoundment has been excavated previously. |
| Distance to the Off-Site Landfill (miles) | 33 | Peoria City-County Landfill in Brimfield, IL. |
| Required Volume of Borrow Soil (CY) | 17,500 | Required for grading and filling. |
| Volume of Soil Stockpiled at Borrow Soil Location (CY) | 0 | |
| Distance to the Borrow Soil Location (miles) | 3.4 | |
| Duration of Construction Activities (weeks) | 12 to 18 | |
| Total On-Site Labor Hours for Major Construction[a] | 4,360 | |
| Required On-Site Hauling Truckloads (Loaded) | 606 | |
| Required Off-Site Hauling Truckloads (Loaded) | 489 | |
| Required On-Site Hauling Miles | 4,120 | |
| Required Off-Site Hauling Miles | 31,900 | |

Notes:
BAB = Bottom Ash Basin; CCR = Coal Combustion Residual; CY = Cubic Yards.

## 3.2 Long- and Short-Term Effectiveness of Closure Alternative (IAC Section 845.710(b)(1))

### 3.2.1 Magnitude of Reduction of Existing Risks (IAC Section 845.710(b)(1)(A))

This section of the report addresses the potential risks to human and ecological receptors due to exposure to CCR-associated constituents in groundwater or surface water. Gradient has performed a Human Health and Ecological Risk Assessment for the Site (Appendix A of this report), which provides a detailed evaluation of the magnitude of existing risks to human and ecological receptors associated with the BAB. This report concluded that there are no current unacceptable risks to any human or ecological receptors associated with the BAB. Moreover, because groundwater concentrations are expected to remain stable and/or decline over time under both closure scenarios, there will also be no unacceptable risks to human health or the environment during or following closure. Thus, there is no current risk or future risk under either closure scenario at the BAB, and the magnitude of reduction of existing risks is the same under both scenarios.

### 3.2.2 Likelihood of Future Releases of CCR (IAC Section 845.710(b)(1)(B))

This section of the report quantifies the risk of future releases of CCR that may occur during dike failure and storm-related events.

#### Storm-Related Releases and Dike Failure During Flood Conditions

There is no current or future risk of sudden CCR releases occurring at the BAB under either closure scenario. No significant amount of CCR remains in the impoundment.

#### Dike Failure Due to Seismicity

Sites in Illinois may be subject to seismic risks arising from the Wabash Valley Seismic Zone and the New Madrid Seismic Zone (IEMA, 2020). However, the Duck Creek property does not lie within a seismic impact zone. The property is also believed to have a "low risk level" for seismic risks based on the 2018 USGS National Seismic Hazard Map. Additionally, the BAB does not lie within 200 feet of an active fault or fault damage zone at which displacement has occurred within the current geological epoch (*i.e.*, within the last ~11,650 years; Burns & McDonnell, 2021b,c; Haley & Aldrich, Inc., 2018a,b). The nearest known fault is the Sicily Fault, which is located about 64 miles southeast of the BAB. The Sicily Fault does not have known recent activity (Haley & Aldrich, Inc., 2018a,b). Thus, the risk of dike failure occurring during or following closure activities due to seismic activity is exceedingly low at the BAB.

### 3.2.3 Type and Degree of Long-Term Management, Including Monitoring, Operation, and Maintenance (IAC Section 845.710(b)(1)(C))

The long-term operation and management plans for the BAB are described in Section 3.1 for each closure scenario. Under both the CBR-Onsite and CBR-Offsite scenarios, the BAB will undergo monitoring for 3 years post-closure, or until such time as GWPSs are achieved.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 3.2.4 Short-Term Risks to the Community or the Environment During Implementation of Closure (IAC Section 845.710(b)(1)(D))

#### 3.2.4.1 Worker Risks

Best practices will be employed during construction in order to ensure worker safety and comply with all relevant regulations, permit requirements, and safety plans. However, it is impossible to completely eliminate risks to workers during construction activities, both on- and off-Site. On-Site accidents include injuries and deaths arising from the use of heavy equipment and/or earthmoving operations during construction activities. Off-Site accidents include injuries and deaths due to vehicle accidents during labor and equipment mobilization and demobilization, material deliveries, and the hauling of CCR and liner system materials to the on-Site landfill and the off-Site landfill.

**Risk of Worker Accidents Occurring On-Site**

For the BAB, two closure scenarios were considered: CBR-Offsite and CBR-Onsite. Based on labor requirements reported in Appendix B of this report, Gradient estimates that 4,820 total on-Site labor hours are required for major construction activities under the CBR-Onsite scenario and 4,360 total on-Site labor hours are required for major construction activities under the CBR-Offsite scenario. The labor requirements under both scenarios are therefore similar. Slightly fewer on-Site labor hours are required under the CBR-Offsite scenario than under the CBR-Onsite scenario, because a greater percentage of hauling (a major construction activity) occurs off-Site rather than on-Site under the former scenario. Based on these values and US BLS labor statistics (US DOL, 2020a,b), we estimate that approximately 0.056 worker injuries and 0.00036 worker fatalities will occur on-Site under the CBR-Onsite scenario due to major construction activities at the BAB (Table 3.3). A slightly smaller number of worker injuries and fatalities (0.050 worker injuries and 0.00033 worker fatalities) are expected to occur on-Site under the CBR-Offsite scenario (Table 3.3). Note that the calculations presented here focus on major construction activities (*e.g.*, excavation, loading, and hauling). They therefore do not account for the additional accidents that could occur on-Site during less intensive construction activities (*e.g.*, surveying, erosion control, and hydroseeding).

**Table 3.3 Expected Number of On-Site Worker Accidents Under Each Closure Scenario – BAB**

| Closure Scenario | Injuries | Fatalities |
|---|---|---|
| CBR-Onsite | 0.056 | 0.00036 |
| CBR-Offsite | 0.050 | 0.00033 |

Notes:
BAB = Bottom Ash Basin; CBR-Offsite = Closure-by-Removal with Off-Site CCR Disposal; CBR-Onsite = Closure-by-Removal with On-Site CCR Disposal.

**Risk of Worker Accidents Occurring Off-Site**

The CBR-Offsite scenario is the only scenario which requires any off-Site hauling. Under the CBR-Offsite scenario, 31,900 vehicle travel miles are required to haul excavated materials to the off-Site landfill (Table 3.2). The US DOT (2020) provides an estimate of the expected number of fatalities and injuries "per vehicle mile driven" for drivers and passengers of large trucks. Based on US DOT's statistics, 0.0041 injuries and 0.000093 fatalities are expected to occur to drivers and passengers of haul trucks due to hauling under the CBR-Offsite scenario (Table 3.4).

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 3.4 Expected Number of Off-Site Worker Accidents Due to Hauling Under Each Closure Scenario – BAB**

| Closure Scenario | Injuries | Fatalities |
|---|---|---|
| CBR-Onsite | 0 | 0 |
| CBR-Offsite | 0.0041 | 0.000093 |

Notes:
BAB = Bottom Ash Basin; CBR-Offsite = Closure-by-Removal with Off-Site CCR Disposal; CBR-Onsite = Closure-by-Removal with On-Site CCR Disposal.

These estimates reflect the minimum number of worker accidents that are likely to occur off-Site under each scenario, because they do not account for the additional vehicle accidents that may occur during non-hauling activities such as labor mobilization and demobilization, equipment mobilization and demobilization, and material deliveries. The vehicle mileages associated with these off-Site activities are not known. For the BAB, both scenarios (CBR-Onsite and CBR-Offsite) have the same expected duration of construction activities, the same required earthwork volumes, similar on-Site labor hours for major construction, and a similar total number of required hauling truckloads (on-Site + off-Site). These two scenarios are therefore likely to have similar impacts with regard to off-Site vehicle accidents arising from labor and equipment mobilization/demobilization and material deliveries.

Taking into account both (i) accidents occurring on-Site due to major construction activities and (ii) accidents occurring off-Site due to hauling, an estimated 0.056 worker injuries and 0.00036 worker fatalities are expected under the CBR-Onsite scenario, and an estimated 0.054 worker injuries and 0.00042 worker fatalities are expected to occur under the CBR-Offsite scenario. Thus, overall risks to workers are likely to be of similar magnitude for both closure scenarios.

#### 3.2.4.2 Community Risks

**Accidents**

Vehicle accidents that occur off-Site can result in injuries or fatalities among community members, as well as workers. Based on the accident statistics for large trucks reported by US DOT (2020) and the off-Site haul truck mileages reported above for the BAB, haul truck accidents could result in an estimated 0.012 injuries and 0.00043 fatalities among community members (Table 3.5). In contrast, no fatalities or injuries are expected to occur among community members under the CBR-Onsite scenarios due to haul truck accidents, because borrow soil will be taken from a location on the property and any excavated materials will be hauled to an on-Site landfill.

**Table 3.5 Expected Number of Community Accidents Due to Hauling Under Each Closure Scenario – BAB**

| Closure Scenario | Injuries | Fatalities |
|---|---|---|
| CBR-Onsite | 0 | 0 |
| CBR-Offsite | 0.012 | 0.00043 |

Notes:
BAB = Bottom Ash Basin; CBR-Offsite = Closure-by-Removal with Off-Site CCR Disposal; CBR-Onsite = Closure-by-Removal with On-Site CCR Disposal.

In addition to impacts due to off-Site hauling, both scenarios may have off-Site impacts due to labor mobilization and demobilization, equipment and vehicle mobilization and demobilization, and material deliveries. For the BAB, both scenarios (CBR-Onsite and CBR-Offsite) have the same expected duration of construction activities, the same required earthwork volumes, similar on-Site labor hours for major

Electronic Filing: Received, Clerk's Office 06/20/2024

construction, and a similar total number of required hauling truckloads (on-Site + off-Site). Both scenarios are therefore also likely to have similar impacts with regard to these off-Site activities.

**Traffic**

Haul routes are expected to use major arterial roads and highways wherever possible, which will reduce the incidence of traffic. However, the heavy use of local roads for construction operations may result in traffic near the Site and, in the case of the CBR-Offsite scenario, the off-Site landfill.

Traffic may increase temporarily around the Site under both closure scenarios due to the daily arrival and departure of the workforce, equipment mobilization/demobilization, and material deliveries. However, these impacts are expected to largely occur at the beginning or end of each work day (arrival/departure of the work force), at the beginning or end of the construction period (equipment mobilization/demobilization), and at specific times throughout the construction period (material deliveries). These impacts will therefore likely be less disruptive to community members than the constant and steady movement of haul trucks to and from the Site under the CBR-Offsite scenario.

Under the CBR-Offsite scenario, Golder estimates that approximately 489 truckloads will be required to transport materials excavated from the BAB to the off-Site landfill over approximately 80 hauling days (Appendix B). Assuming a 10-hour work day, 6 work days per week, and 26 work days per month, a haul truck would need to pass a given location near the Site once every 49 minutes on average for the duration of excavation activities.

**Noise**

Construction generates a great deal of noise, both in the vicinity of the Site and along haul routes. In a closure impact analysis performed by the TVA (2015), the authors found that "[T]ypical noise levels from construction equipment used for closure are expected to be 85 dBA or less when measured at 50 ft. These types of noise levels would diminish with distance … at a rate of approximately 6 dBA per each doubling of distance and therefore would be expected to attenuate to the recommended EPA noise guideline of 55 dBA at 1,500 ft." Because there are no residences or businesses within 1,500 feet of any of the construction areas on the Site (the BAB, the proposed borrow site, and the on-Site landfill), we do not anticipate that any residences or businesses will be adversely impacted by noise pollution at the Site under either closure scenario. Moreover, although there are several scenic, recreational, and historical areas located within a few miles of the Site (the Rice Lake SFWA and the Orendorf and Rice Lake Terrace Archaeological Sites), there are no notable scenic or recreational areas located within 1,500 feet of any of the construction areas on the Site. Noise impacts are therefore expected to be relatively minor at the BAB under both closure scenarios.

In addition to impacts in the immediate vicinity of the BAB, local roads near the Site and the off-Site landfill (CBR-Offsite scenario only) may experience noise pollution due to truck traffic. As described above (Traffic), a haul truck must pass a given location every 49 minutes on average for 10 hours a day while excavation is occurring. Dump trucks generate significant noise pollution, with noise levels of approximately 88 decibels or higher expected within a 50-foot radius of the truck (Exponent, 2018). This noise level is similar to the noise level of a gas-powered lawnmower or leaf blower (CDC, 2019). Decibel levels above 80 can damage hearing after 2 hours of exposure (CDC, 2019). In addition to haul truck impacts, noise pollution may also arise along local roads from the daily arrival and departure of the workforce, equipment mobilization/demobilization, and material deliveries. These impacts are expected to largely occur at the beginning or end of each work day (arrival/departure of the work force), at the beginning or end of the construction period (equipment mobilization/demobilization), and at specific times throughout the construction period (material deliveries); these impacts will therefore likely be less

Electronic Filing: Received, Clerk's Office 06/20/2024

disruptive to community members than the constant and steady movement of haul trucks to and from the Site.

### Air Quality

Construction can adversely impact air quality. Air pollution can occur both on-Site and off-Site (*e.g.*, along haul routes), potentially impacting workers as well as community members. With regards to construction activities, two categories of air pollution are of particular concern: equipment emissions and fugitive dust. The equipment emissions of greatest concern are those found in diesel exhaust. Most construction equipment is diesel-powered, including the dump trucks used to haul material to and from the Site. Diesel exhaust contains hundreds of air pollutants, including $NO_x$, PM, CO, and VOCs (Hesterberg *et al*., 2009; Mauderly and Garshick, 2009). Fugitive dust, another major air pollutant at construction sites, is generated by earthmoving operations and other soil- and CCR-handling activities. Along haul routes, an additional source of fugitive dust is road dust along unpaved dirt roads. Careful planning and the use of BMPs such as wet suppression are used to minimize and control fugitive dust during construction activities; however, it is not possible to prevent dust generation entirely.

The air pollutant mass released under a given closure scenario will be proportional to the expected duration and intensity of construction activities under that scenario. For the BAB, both scenarios (CBR-Onsite and CBR-Offsite) have the same expected duration of construction activities, the same required earthwork volumes, similar on-Site labor hours for major construction, and a similar total number of required hauling truckloads (on-Site + off-Site). These two scenarios therefore most likely have similar impacts with regard to air emissions.

### Environmental Justice

The State of Illinois defines EJ communities to be those communities with a minority population above twice the state average and/or a total population below twice the state poverty rate (IEPA, 2019). Relative to other communities, EJ communities experience an increased risk of adverse health impacts due to environmental pollution and other factors associated with remediation activities (US EPA, 2016).

As shown in a map of EJ communities throughout the state (Figure 3.1; IEPA, 2019), the on-Site landfill and the borrow site are located within the 1-mile buffer zone of the nearest EJ community (near Canton). The BAB lies approximately 2.5 miles from the outer perimeter of this buffer zone. Due to its close proximity to the Site, the EJ community near Canton may be disproportionately impacted by air emissions, traffic, accidents and other factors arising from various closure activities occurring on or near the Site. Each of the evaluated closure scenarios requires some construction activity in at least one of these on-Site areas.

In addition to impacts arising from construction activity on or near the Site, EJ communities may be also impacted by off-Site activities, including the hauling of CCR and liner materials from the Site to the off-Site landfill, labor and equipment mobilization/demobilization, and material deliveries. Unfortunately, in addition to being located near the on-Site landfill and the borrow site, the EJ community near Canton is also located along the three primary haul routes from the Site to the off-Site landfill suggested by Google Maps (Google LLC, 2021). In summary, due to both on-Site and off-Site activities, both closure scenarios are associated with potential negative impacts on the EJ community near Canton (Figure 3.1).

Electronic Filing: Received, Clerk's Office 06/20/2024

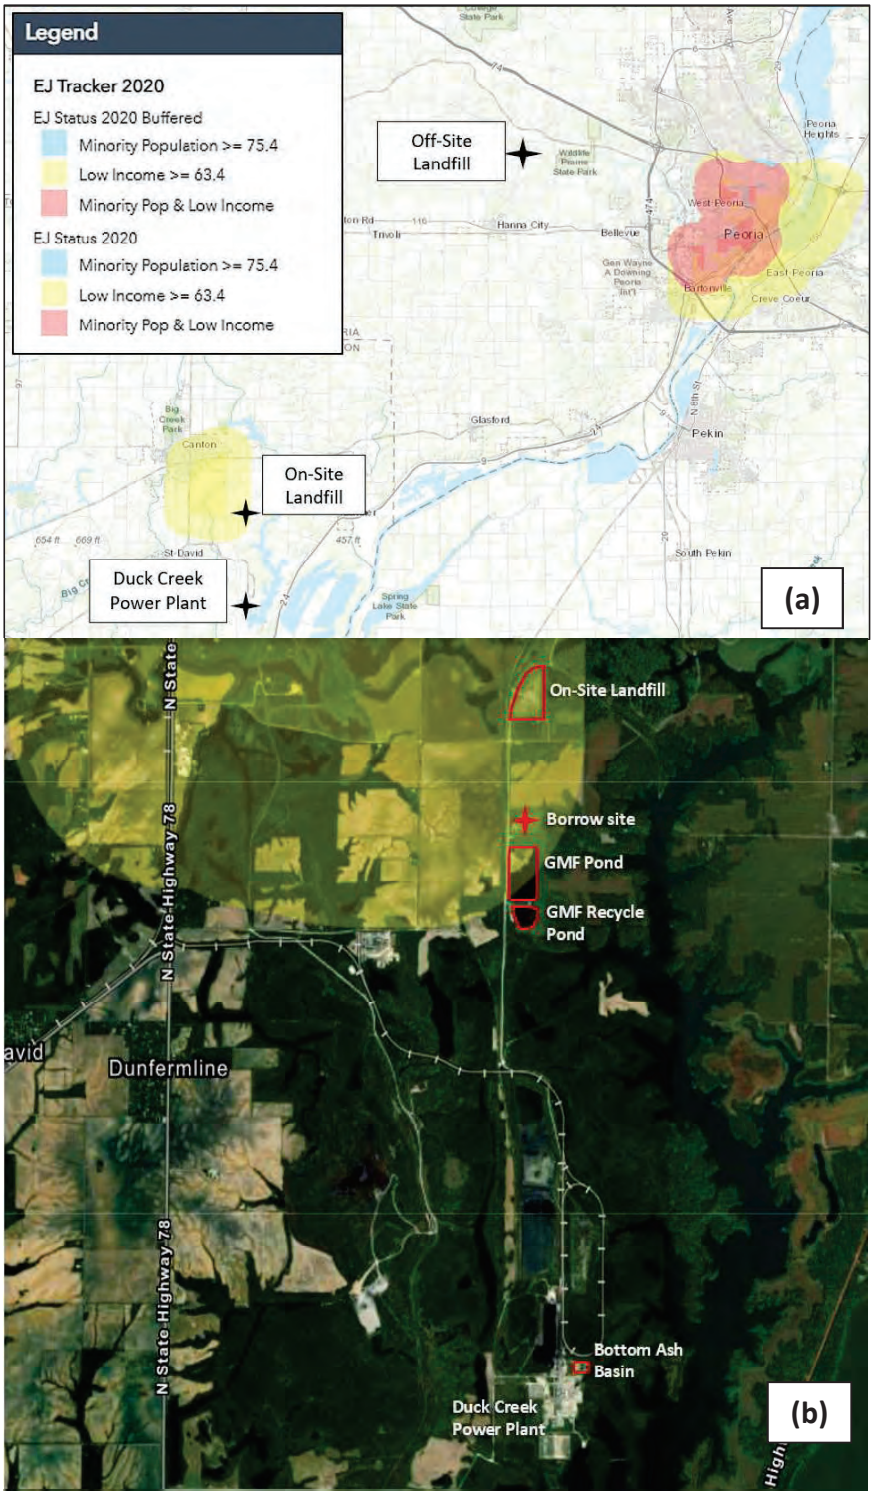

**Figure 3.1 Environmental Justice Communities in the Vicinity of Site Features and the Off-Site Landfill – BAB.** Adapted from IEPA (2019). (a) Regional map. (b) Site map.

Electronic Filing: Received, Clerk's Office 06/20/2024

#### Scenic, Historical, and Recreational Value

There are several scenic, recreational, and historical areas located within a few miles of the Site, including the Rice Lake SFWA and the Orendorf and Rice Lake Terrace Archaeological Sites (Google LLC, 2021; Ramboll, 2021b,c). However, there are no notable scenic or recreational areas located in the immediate vicinity of the BAB, the borrow soil location, or the on-Site landfill. The nearest scenic, recreational, or historical area is the Rice Lake SFWA, which is located over a mile away from the BAB and even further away from the borrow soil location and the on-Site landfill. We therefore do not expect construction activities at the Site to have any direct negative impacts on the scenic, historical, or recreational value of the areas listed above (due to, *e.g.*, noise, obstructions of the view, or restricted access), regardless of the closure scenario.

### 3.2.4.3 Environmental Risks

#### Greenhouse Gas Emissions

In addition to the air pollutants listed above in Section 3.2.4.2, construction equipment emits GHGs, including $CO_2$ and possibly $N_2O$. The potential impact of each closure scenario on GHG emissions is similar to the potential impact of each closure scenario on other emissions from construction vehicles and equipment, as described above in Section 3.2.4.2. For the BAB, both scenarios (CBR-Onsite and CBR-Offsite) have the same expected duration of construction activities and the same required earthwork volumes. These two scenarios therefore most likely have similar impacts with regard to GHG emissions.

#### Energy Consumption

Energy consumption at a construction site is synonymous with fossil fuel consumption, because the energy to power construction vehicles and equipment comes from the burning of fossil fuels. Fossil fuel demands considered in this analysis include the burning of diesel fuel during construction activities and the carbon footprint of manufacturing geomembrane textiles. Because GHG emission impacts and energy consumption impacts both arise from the same sources at construction sites, the trends discussed above with respect to GHG emissions also apply to the evaluation of energy demands. For the BAB, energy requirements are expected to be similar under both the CBR-Onsite and CBR-Offsite scenarios.

#### Natural Resources and Habitat

Construction is likely to have a negative short-term impact on the natural resources and habitat in the vicinity of the BAB and the on-Site borrow soil location (due to, *e.g.*, the temporary destruction of any existing habitat atop these locations, and/or alarm and escape behavior in wildlife found near these locations). For BAB closure, the duration of time over which short-term negative impacts will occur (*i.e.*, the duration of construction activities) is limited to 12-18 weeks under both closure scenarios. Because both closure scenarios have the same expected duration of construction, both scenarios are expected to have similar short-term impacts on natural resources and habitat.

In addition to short-term impacts, closure may also result in long-term shifts in the habitat overlying the BAB and the borrow soil location (*i.e.*, any areas that are not currently grassland will be converted to grassland). Since both BAB closure scenarios (CBR-Onsite and CBR-Offsite) entail excavation followed by site restoration, both scenarios are also expected to have similar long-term impacts on natural resources and habitat.

Electronic Filing: Received, Clerk's Office 06/20/2024

The BAB is not located immediately adjacent to wetlands or notable surface water bodies, such as rivers or lakes (US FWS, 2021). For this reason, construction activities are not expected to have a significant negative impact on any wetland or aquatic species (due to, *e.g.*, erosion and sediment runoff). Impacts are expected to be limited to terrestrial species. According to the IDNR Natural Heritage Database and the US FWS Environmental Conservation Online System, there are 11 state threatened species, 12 state endangered species, three federally threatened species, and one federally endangered species within Fulton County (Ramboll, 2021b,c). To our knowledge, however, no threatened or endangered species have been identified at the Site (Ramboll, 2021b,c). Based on the information that is currently available, we do not expect construction activities to have negative impacts on any threatened or endangered species.

### 3.2.5 Time Until Groundwater Protection Standards Are Achieved (IAC Sections 845.710(b)(1)(E) and 845.710(d)(2 and 3))

Based on a statistical analysis and evaluation of potential exceedances, it was determined that there are no potential groundwater exceedances of applicable groundwater standards attributable to the BAB. Because there are no exceedances of the GWPSs and there is no significant CCR remaining within the impoundment, modeling was not performed for either of the closure scenarios. Because groundwater concentrations are expected to remain stable and/or decline post-closure, groundwater exceedances of applicable groundwater standards that are attributable to the BAB are also not expected to occur in the future, regardless of the closure scenario.

### 3.2.6 Potential for Exposure of Humans and Environmental Receptors to Remaining Wastes, Considering the Potential Threat to Human Health and the Environment Associated with Excavation, Transportation, Re-disposal, Containment, or Changes in Groundwater Flow (IAC Section 845.710(b)(1)(F))

Section 3.2.1 evaluates potential risks to human and ecological receptors arising from the leaching of CCR-associated constituents from the BAB. Section 3.2.2 evaluates the potential for sudden CCR releases to occur at the BAB due to, *e.g.*, dike failure or overtopping during floods or other storm-related events. In summary, under both closure scenarios, there is no current or future risk to any human or ecological receptors associated with the BAB. Additionally, there is minimal current or future risk of overtopping due to flood conditions. Dike failure due to, *e.g.*, seismic activity and storm-related events is also exceedingly unlikely.

Section 3.2.4 evaluates several potential risks to human health and the environment during closure activities, including risks of accidents occurring among workers; risks to nearby residents and EJ communities related to accidents, traffic, noise, and air pollution; and risks to natural resources and wildlife. The findings from this section of the text are summarized in Table S.2.

### 3.2.7 Long-Term Reliability of the Engineering and Institutional Controls (IAC Section 845.710(b)(1)(G))

As described in Section 3.2.2, there is no risk of engineering or institutional failures leading to sudden releases of CCR from the BAB post-closure under either closure scenario. Additionally, there are no current or future unacceptable risks to any human or ecological receptors associated with the BAB under either closure scenario (see Section 3.2.1 above). Moreover, reliable engineering and institutional controls (*e.g.*, a bottom liner, a leachate management system, and groundwater monitoring) will be

Electronic Filing: Received, Clerk's Office 06/20/2024

implemented at the on-Site and off-Site landfills under the CBR-Onsite and CBR-Offsite scenarios. Both closure scenarios are therefore reliable with respect to long-term engineering and institutional controls.

### 3.2.8 Potential Need for Future Corrective Action Associated with the Closure (IAC Section 845.710(b)(1)(H))

At this time, we do not anticipate a need for corrective action at the BAB under any closure scenario.

## 3.3 Effectiveness of the Closure Alternative in Controlling Future Releases (IAC Section 845.710(b)(2))

### 3.3.1 Extent to Which Containment Practices Will Reduce Further Releases (IAC Section 845.710(b)(2)(A))

There are no unacceptable risks to human health or the environment associated with the BAB (Section 3.2.1). Because current conditions do not present a risk to human health or the environment, and because groundwater concentrations are expected to remain stable and/or decline post-closure, there will also be no unacceptable risks to human health or the environment following closure of the BAB, regardless of the closure scenario.

Section 3.2.2 discussed the potential for dike failure or flood overtopping to occur during or following closure activities, resulting in a sudden release of CCR. That analysis showed that there is no risk of CCR releases occurring at the BAB following closure under either closure scenario.

### 3.3.2 Extent to Which Treatment Technologies May Be Used (IAC Section 845.710(b)(2)(B))

At this time, we do not anticipate a need for the use of treatment technologies other than source control (*i.e.*, CBR-Onsite and CBR-Offsite) at the BAB under either closure scenario.

## 3.4 Ease or Difficulty of Implementing Closure Alternative (IAC Section 845.710(b)(3))

### 3.4.1 Degree of Difficulty Associated with Constructing the Closure Alternative

Excavation and landfilling are reliable and standard methods for closing impoundments; we therefore do not expect these activities to pose any special challenges during BAB closure.

Hauling will be more difficult to implement under the CBR-Offsite scenario than under the CBR-Onsite scenario, due to greater haul traffic on public roadways. As described in Section 3.2.4.2 ("Community Risks"), off-Site hauling may also have detrimental community impacts due to an increased incidence of vehicle accidents, truck traffic, noise, and air pollution.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 3.4.2 Expected Operational Reliability of the Closure Alternative

CCR and liner system materials excavated from the BAB will be fully contained after final disposal, regardless of which closure scenario is chosen (CBR-Onsite or CBR-Offsite). The operational reliability of both closure scenarios is therefore expected to be similar. Moreover, high operational reliability is expected under both scenarios due to the full containment of CCR and liner materials.

### 3.4.3 Need to Coordinate with and Obtain Necessary Approvals and Permits from Other Agencies

A construction stormwater permit through IEPA may be needed under both closure scenarios; this permit would include construction stormwater controls and BMPs such as silt fences and other measures. A joint WPC permit may also be needed under both closure scenarios. Under the CBR-Onsite scenario, a landfill permit modification would additionally be needed for the landfill to receive the material excavated from the BAB. Under the CBR-Offsite scenario, an additional permit and approval may be required for waste transport.

### 3.4.4 Availability of Necessary Equipment and Specialists

CBR-Onsite and CBR-Offsite are reliable and standard methods for managing waste that rely on common construction equipment and materials and typically do not require the use of specialists, outside of typical construction labor and equipment operators. However, global supply chains have been disrupted due to the COVID-19 pandemic, resulting in shortages in the availability of construction equipment and parts. There may be some shortages in construction equipment under all scenarios, if supply chain resilience does not improve by the time of construction. Alternatively, extended downtime may be required for equipment repairs and maintenance. A national shortage of truck drivers has also developed during the COVID-19 pandemic. The current shortage of truck drivers may be particularly impactful under the CBR-Offsite scenario, due to the materials that will be hauled from the Site. If sufficient trucks and truck drivers are not available, delays in the construction schedule may arise.

### 3.4.5 Available Capacity and Location of Needed Treatment, Storage, and Disposal Services

The existing landfill on the Duck Creek property has sufficient capacity to receive all of the CCR and liner materials that are currently slated for landfilling under the CBR-Onsite scenario. Under the CBR-Offsite scenario, approximately 7,000 cubic yards of materials excavated from the BAB will require disposal at an off-Site landfill. According to the IEPA "Landfill Disposal Capacity Report" for 2020 (IEPA, 2021b), the closest nearby third-party landfill with the ability to receive and dispose of CCR from the Site is the Peoria City-County Landfill in Brimfield, Illinois. This facility has 750,000 cubic yards of remaining capacity in its current permitted footprint. It receives 230,000 cubic yards of waste annually and is located 33 miles from the Site. The Peoria City-County Landfill therefore has sufficient capacity to receive all of the CCR and liner materials excavated from the BAB.

## 3.5 Impact of Closure Alternative on Waters of the State (IAC Section 845.710(d)(4))

As demonstrated in Gradient's Human Health and Ecological Risk Assessment (Appendix A of this report), modeled surface water concentrations in the Illinois River in the vicinity of the Site are all below

Electronic Filing: Received, Clerk's Office 06/20/2024

relevant human health and ecological screening benchmarks. Post-closure, surface water concentrations of CCR-associated constituents are expected to remain stable and/or decline over time under both closure scenarios. Thus, no future exceedances of any human health or ecological screening benchmarks are anticipated under either closure scenario. Additionally, the lined landfills that will receive any materials excavated from the BAB under the CBR-Onsite and CBR-Offsite scenarios will be managed to ensure that no surface water impacts occur in the vicinity of the landfills.

## 3.6 Concerns of Residents Associated with Closure Alternatives (IAC Section 845.710(b)(4))

Several nonprofits representing community interests near the Site have raised concerns regarding the potential impacts of coal ash impoundments at this Site on groundwater and surface water quality, including Earthjustice, the Prairie Rivers Network, and the Sierra Club (Earthjustice *et al*., 2018; Sierra Club, 2014; Sierra Club and CIHCA, 2014). These parties generally prefer CBR to CIP, citing fears that allowing CCR to remain in place "allows the widespread groundwater contamination to continue indefinitely" (Earthjustice *et al*., 2018, p. 24). Most of the CCR that was historically contained within the BAB has already been excavated from the impoundment; no significant CCR remains. Moreover, only CBR is being considered at this impoundment. Thus, both closure scenarios (CBR-Offsite and CBR-Onsite) are equally responsive to community concerns regarding potential groundwater and surface water impacts.

A public meeting was held on December 7, 2021, pursuant to requirements under IAC Section 845.710(e) (IEPA, 2021a). Questions raised by attendees were answered at the meeting; subsequently, a written summary of all questions and responses was emailed to interested parties.

## 3.7 Class 4 Cost Estimate (IAC Section 845.710(d)(1))

A cost estimate has been prepared for each of the closure scenarios (Appendix B). A summary of these estimates is provided in Table 3.6. The total expected cost of closure under the CBR-Onsite scenario is $479,000; the total expected cost of closure under the CBR-Offsite scenario is $1,360,000. Costs under the CBR-Onsite scenario are smaller than costs under the CBR-Offsite scenario.

**Table 3.6 Expected Costs of Closure – BAB**

| Work Element | CBR-Onsite | CBR-Offsite |
|---|---|---|
| Mobilization/Demobilization | $37,500 | $110,000 |
| Surveying and Site Preparation | $25,000 | $25,000 |
| Dewatering, Unwatering, and Stormwater Management | $5,000 | $5,000 |
| Impoundment Closure and Site Restoration | $370,000 | $1,100,000 |
| Miscellaneous Construction | $41,300 | $122,000 |
| **Total:** | **$479,000** | **$1,360,000** |

Notes:
BAB = Bottom Ash Basin; CBR-Offsite = Closure-by-Removal with Off-Site Disposal; CBR-Onsite = Closure-by-Removal with On-Site Disposal.
Costs are for comparative purposes only. Actual costs will be paid based on actual quantities, and may vary from those calculated.
Source: Appendix B.

Electronic Filing: Received, Clerk's Office 06/20/2024

Both closure scenarios meet or exceed a Class 4 estimate under the AACE Classification Standard (or a comparable classification practice as provided in the AACE Classification Standard), as required by IAC Section 845.710 (IEPA, 2021a).

## 3.8 Summary

Table S.2 (Summary of Findings) summarizes the expected impacts of the CBR-Onsite and CBR-Offsite closure scenarios for the BAB with regard to each of the factors specified under IAC Section 845.710 (IEPA, 2021a). Based on this evaluation and the details provided in Section 3 above, the CBR-Onsite scenario has been identified as the most appropriate closure scenario for the BAB. Key benefits of the CBR-Onsite scenario at the BAB include that off-Site hauling would not be required and, consequently, this scenario would result in reduced impacts to the community (due to, *e.g.*, accidents, traffic, noise, and air pollution) compared to the CBR-Offsite scenario.

# 1 Introduction

The Duck Creek Power Plant (DCPP, or "the Site") is an electric power-generating facility with coal-fired units located in Fulton County, Illinois, approximately 6 miles southeast of the town of Canton. The DCPP is owned by Illinois Power Resources Generating, LLC (IPRG). The facility began operation in 1976 and was retired in December 2019 (AECOM, 2016). The DCPP produced and stored coal combustion residuals (CCRs) as a part of its historical operations in several CCR ash ponds located north and east of the power plant. Two ash ponds are planned for closure and are the subject of this report; these include the Gypsum Management Facility (GMF; Vistra identification [ID] number [No.] 203, Illinois Environmental Protection Agency (IEPA) ID No. W0578010001-04, and National Inventory of Dams [NID] No. IL50573) and the Bottom Ash Basin (BAB; Vistra ID No. 205, IEPA ID No. W0578010001-03, and NID No. IL50716). The BAB is an inactive 2.2-acre lined CCR surface impoundment (SI) formerly used to manage CCR and non-CCR waste streams at the DCPP. The BAB consisted of three cells; the bottom and side slopes of all three cells are concrete lined. All bottom ash (*i.e.,* CCR) was removed from the BAB when the plant was retired; thus, the BAB currently contains no impounded water or CCR materials (Ramboll, 2021a). The GMF is located 2.4 miles north of the power plant, in Section 18 of Township 6 North, Range 5 East. The GMF is a 1,500 ft × 900 ft earthen berm double-lined CCR SI, which retains wet-sluiced gypsum produced in the flue-gas scrubber. The decant water from the GMF discharges to the lined GMF Recycle Pond located to the south of the GMF (Ramboll, 2021b). The Duck Creek Cooling Pond (DCCP) is a 719-acre surface water body (US Fish and Wildlife Service, 1983) located downgradient of the BAB and GMF. The DCCP was formed by damming Duck Creek (Ramboll, 2021a,b). The DCCP is part of the plant property and was used as a source of cooling water for the power plant when it was active. Currently, land adjacent to the DCPP is used for agriculture, pasture, and forest with minimal development (Ramboll, 2021b).

This report presents the results of an evaluation that characterizes potential risks to human and ecological receptors that may be exposed to CCR constituents in environmental media potentially impacted by the GMF and BAB. This risk evaluation was performed to support the Closure Alternatives Assessment (CAA) for the GMF and BAB in accordance with requirements in Title 35, Part 845, of the Illinois Administrative Code (IAC) (IEPA, 2021a). While this report specifically evaluates current risks, it also informs potential future risks under the different closure scenarios. Human and ecological risks were evaluated for Site-specific constituents of interest (COIs) that have the potential to migrate to the DCCP and affect DCCP surface water and sediment.

Consistent with United States Environmental Protection Agency (US EPA) guidance (US EPA, 1989), we used a tiered approach to evaluate potential risks, which included the following steps:

1. Identify complete exposure pathways and develop a conceptual exposure model (CEM).
2. Identify Site-related COIs: Compare maximum detected groundwater concentrations over the period from 2015 to 2021 to groundwater protection standards (GWPSs) listed in Title 35, Part 845.600 of the IAC (IEPA, 2021a), and relevant surface water quality standards (IEPA, 2019; US EPA, 2018).
3. Screening-level Risk Analysis: Compare maximum measured or modeled COI concentrations in surface water and sediment to conservative, health-protective benchmarks to determine constituents of potential concern (COPCs).

Electronic Filing: Received, Clerk's Office 06/20/2024

4. Refined Risk Analysis: If COPCs are identified, perform a refined analysis to evaluate potential risks associated with the COPCs.
5. Formulate risk conclusions and discuss any associated uncertainties.

This assessment relies on a conservative (*i.e.*, health-protective) approach and is consistent with the risk approaches outlined in US EPA guidance. Specifically, we considered evaluation criteria detailed in IEPA guidance documents (*e.g.*, IEPA, 2013a, 2019), incorporating principles and assumptions consistent with the Federal CCR Rule (US EPA, 2015) and US EPA's "Human and Ecological Risk Assessment of Coal Combustion Residuals" (US EPA, 2014).

Based on the evaluation presented in this report, no unacceptable risks to human and ecological receptors resulting from CCR exposures associated with either the GMF or the BAB were identified. Specific risk assessment results include the following:

- No complete exposure pathways were identified for human receptors such as recreators.
- No unacceptable risks were identified for ecological receptors exposed to surface water or sediment.
- No bioaccumulative ecological risks were identified.

It should be noted that this evaluation incorporates a number of conservative assumptions that tend to overestimate exposure and risk. Moreover, it should be noted that because current conditions do not present a risk to human health or the environment, there will also be no unacceptable risk to human health or the environment for future conditions when the GMF and BAB are closed. For all future closure scenarios, potential releases of CCR-related constituents will decline over time and consequently potential exposures to CCR-related constituents in the environment will also decline.

# 2 Site Overview

## 2.1 Site Description

### 2.1.1 Bottom Ash Basin (BAB)

#### Geology/Hydrogeology

The BAB is located just northeast of the DCPP. The geology underlying the Site in the vicinity of the BAB primarily consists of unconsolidated unlithified materials of loess and till deposits that overlie a Pennsylvanian-age shale bedrock unit (Ramboll, 2021a). Previous investigations completed outside of the BAB indicate that bedrock in the area is overlain by deposits of coal mine spoils[1] (AECOM, 2016). The DCCP, located approximately 500 ft to the east of the BAB, is the nearest major surface water body that is hydraulically downgradient of the BAB. The DCCP water flows south into Duck Creek *via* National Pollutant Discharge Elimination System (NPDES) outfalls and ultimately drains into the Illinois River (IEPA, 2013b).

Two distinct hydrostratigraphic units were identified near the BAB: (a) the uppermost aquifer and (b) a confining shale bedrock unit. A detailed description of these two units is provided below.

The uppermost aquifer consists of loess and till (Ramboll, 2021a). The most permeable portion of the uppermost aquifer is a 2- to 7-feet-thick sand layer located within the till. This sand unit, encountered at a depth of 18-40 ft below ground surface (bgs), forms the primary conduit for horizontal migration of shallow groundwater near the BAB (Ramboll, 2021a).

The geometric mean of field hydraulic conductivities measured in the uppermost aquifer is about $6.33 \times 10^{-4}$ cm/sec (Ramboll, 2021a). However, the more permeable sand layer within the till has an average conductivity value of $3.4 \times 10^{-2}$ cm/sec. Groundwater in the uppermost aquifer flows in the south-southeasterly direction toward the DCCP at a velocity of approximately 0.04 ft/day[2] (Ramboll, 2021a). An average horizontal hydraulic head gradient of approximately 0.01 ft/ft was estimated within the uppermost aquifer near the BAB[3] (Ramboll, 2021a).

Shale bedrock lies beneath the unconsolidated deposits between 26 and 46 ft bgs (Ramboll, 2021a). The bedrock acts as an aquitard with mean hydraulic conductivity values ranging between $2 \times 10^{-6}$ and $9 \times 10^{-6}$ cm/sec (AECOM, 2016; Ramboll, 2021a). Bedrock packer tests within the top 100 ft yielded virtually no water (AECOM, 2016). These results, indicate that the shale bedrock is a significant barrier to vertical migration of groundwater.

[1] Several large-scale surface water coal mine operations had been reported in the vicinity of the BAB since the 1930s (AECOM, 2016; Ramboll, 2021); however, those mining activities ceased by 1984 (AECOM, 2016).
[2] The average velocities measured between BA05 and BA04, BA01 and BA03, and BA06 and BA02 were 0.032, 0.050, and 0.030 ft/day, respectively (Ramboll, 2021).
[3] The average head gradients measured between BA05 and BA04, BA01 and BA03, and BA06 and BA02 were 0.0132, 0.0062, and 0.0078 ft/ft, respectively (Ramboll, 2021).

Electronic Filing: Received, Clerk's Office 06/20/2024

### 2.1.2 Gypsum Management Facility (GMF)

#### Geology/Hydrogeology

The GMF is located 2.4 miles north of the DCPP. The geology underlying the Site near the GMF primarily consists of unlithified materials of loess and till deposits that overlie a Pennsylvanian-age shale bedrock unit (Ramboll, 2021b,e; Natural Resource Technology, 2017). The unlithified deposits are present in former coal mine spoils and form shallow water-bearing units beneath the GMF (Ramboll, 2021e; Natural Resource Technology, 2017).

Much of the surface water drainage in the vicinity of the GMF flows into the DCCP (Natural Resource Technology, 2017). The DCCP water drains into Duck Creek *via* NPDES-permitted outfalls and ultimately discharges to the Illinois River (IEPA, 2013b).

The three major hydrostratigraphic units near the GMF are: (a) the uppermost aquifer, (b) the lower confining unit, and (c) the shale bedrock confining unit. A detailed description of these three units is provided below.

Shallow groundwater occurs within two unconsolidated water-bearing units that form the uppermost aquifer: (i) the Peoria/Roxanna loess zone and (ii) the shallow sand unit (Ramboll, 2021b,e; Natural Resource Technology, 2017). The Peoria/Roxanna loess zone, composed of silt, silty-clay, and minor amounts of sand, is hydraulically connected to the 1- to 18-ft-thick shallow sand unit that is laterally extensive across the Site (Ramboll, 2021b,e; Natural Resource Technology, 2017). The shallow sand unit is the primary conduit for horizontal migration of shallow groundwater (Ramboll, 2021b). The geometric mean of field-measured hydraulic conductivities within the uppermost aquifer in the GMF area is $3.58 \times 10^{-4}$ cm/sec (Ramboll, 2021b).

Groundwater in the uppermost aquifer flows to the east-southeast toward the DCCP from topographically high- to low-lying areas (Ramboll, 2021b; Natural Resource Technology, 2017). Groundwater in the uppermost aquifer flows at a velocity of approximately 0.24 ft/day[4] (Ramboll, 2021b). An average horizontal hydraulic head gradient of approximately 0.02 ft/ft was estimated within the uppermost aquifer near the GMF[5] (Ramboll, 2021b).

The lower confining unit consists of till that underlies the uppermost aquifer (Natural Resource Technology, 2017). The till layer restricts vertical migration of groundwater due to its low hydraulic conductivity value of $1.9 \times 10^{-7}$ cm /sec (Ramboll, 2021b; Natural Resource Technology, 2017). Shale bedrock lies beneath the till in this area (Natural Resource Technology, 2017; Ramboll, 2021e). The bedrock is not hydraulically connected to the uppermost aquifer due to the presence of the till (Natural Resource Technology, 2017).

## 2.2 Conceptual Site Model

A Conceptual Site Model (CSM) describes the sources of contamination, hydrogeological units, and physical processes that control the transport of water and solutes. In this case, the CSM describes how groundwater underlying the BAB and GMF may migrate and interact with surface water and sediment in

[4] The average groundwater velocities measured between G50S and G64S, G50S and G60S, and G51S and G54S were 0.045, 0.625, and 0.041 ft/day, respectively (Ramboll, 2021b). [5] The average head gradients measured between G50S and G64S, G50S and G60S, and G51S and G54S were 0.0121, 0.0172, and 0.0199 ft/ft, respectively (Ramboll, 2021b).

[5] The average head gradients measured between G50S and G64S, G50S and G60S, and G51S and G54S were 0.0121, 0.0172, and 0.0199 ft/ft, respectively (Ramboll, 2021b).

Electronic Filing: Received, Clerk's Office 06/20/2024

the adjacent DCCP. The CSM was developed using available hydrogeological data (Natural Resource Technology, 2017; Ramboll, 2021e), including information on groundwater flow and surface water characteristics.

Near the BAB, shallow groundwater flows through the uppermost aquifer in a southward direction toward a surface water channel, located about 50 ft to the south, that leads to the DCCP (Ramboll, 2021a). The primary horizontal migration pathway is within the sand layers of the uppermost aquifer. Groundwater flows horizontally rather than vertically through the uppermost aquifer because: (i) vertical hydraulic conductivities within the uppermost aquifer are several orders of magnitude lower than horizontal hydraulic conductivities, and (ii) the underlying shale bedrock acts as an aquitard preventing downward migration (AECOM, 2016; Ramboll, 2021a). Groundwater within the uppermost aquifer near the BAB flows into the DCCP. No other potential groundwater transport pathways exist. At its discharge location, groundwater mixes with surface water in the DCCP. Because the DCCP serves as a sink for groundwater discharge in the area, shallow groundwater migration beneath or beyond the DCCP is unlikely.

Near the GMF, shallow groundwater flows horizontally through the uppermost aquifer from northwest to southeast toward the DCCP (Natural Resource Technology, 2017; Ramboll, 2021b,e). The preferential flow of groundwater is horizontal rather than vertical because the underlying till and shale bedrock restrict groundwater flow (Natural Resource Technology, 2017). Groundwater within the uppermost aquifer near the GMF flows into the DCCP. No other potential groundwater transport pathways exist. At its discharge location, groundwater mixes with surface water in the DCCP. Because the DCCP serves as a sink for groundwater discharge in the area, shallow groundwater migration beneath or beyond the DCCP is unlikely.

## 2.3 Groundwater Monitoring

The analyses presented in this report relied upon the data from the wells used to monitor the BAB and GMF. A total of ten wells were used to monitor the BAB (Table 2.1); of these, six wells are screened in the uppermost aquifer (UA), one well is screened in the bedrock unit (BR), and three wells are screened in a sandy layer within the uppermost aquifer that has been identified as the primary conduit for groundwater flow (Ramboll, 2021a). A total of 31 wells were used to monitor the GMF (Table 2.2); of these, 15 wells are screened in the uppermost aquifer (UA), 1 well is screened in the BR, 13 wells are screened in a sandy layer within the uppermost aquifer that has been identified as the primary conduit for groundwater flow; and the location of 2 wells is unspecified (Ramboll, 2021b).

The analyses presented in this report relied on all available data from the specified wells collected between 2015 and 2021, which is the period subsequent to the promulgation of the Federal CCR Rule (US EPA, 2015). Groundwater samples were analyzed for a suite of constituents specified in Illinois CCR Rule Part 845.600 (IEPA, 2021a). A summary of the groundwater data used in this risk evaluation is presented in Table 2.3 (for the BAB) and Table 2.4 (for the GMF).

# 3 Risk Evaluation

## 3.1 Risk Evaluation Process

A risk evaluation was conducted to determine whether constituents present in groundwater underlying and downgradient of the GMF and BAB have the potential to pose adverse health effects to human and ecological receptors. The risk evaluation is consistent with the principles of risk assessment established by US EPA and has considered evaluation criteria detailed in Illinois guidance documents (*e.g.*, IEPA, 2013a, 2019).

The general risk evaluation approach is summarized in Figure 3.1 and discussed below.

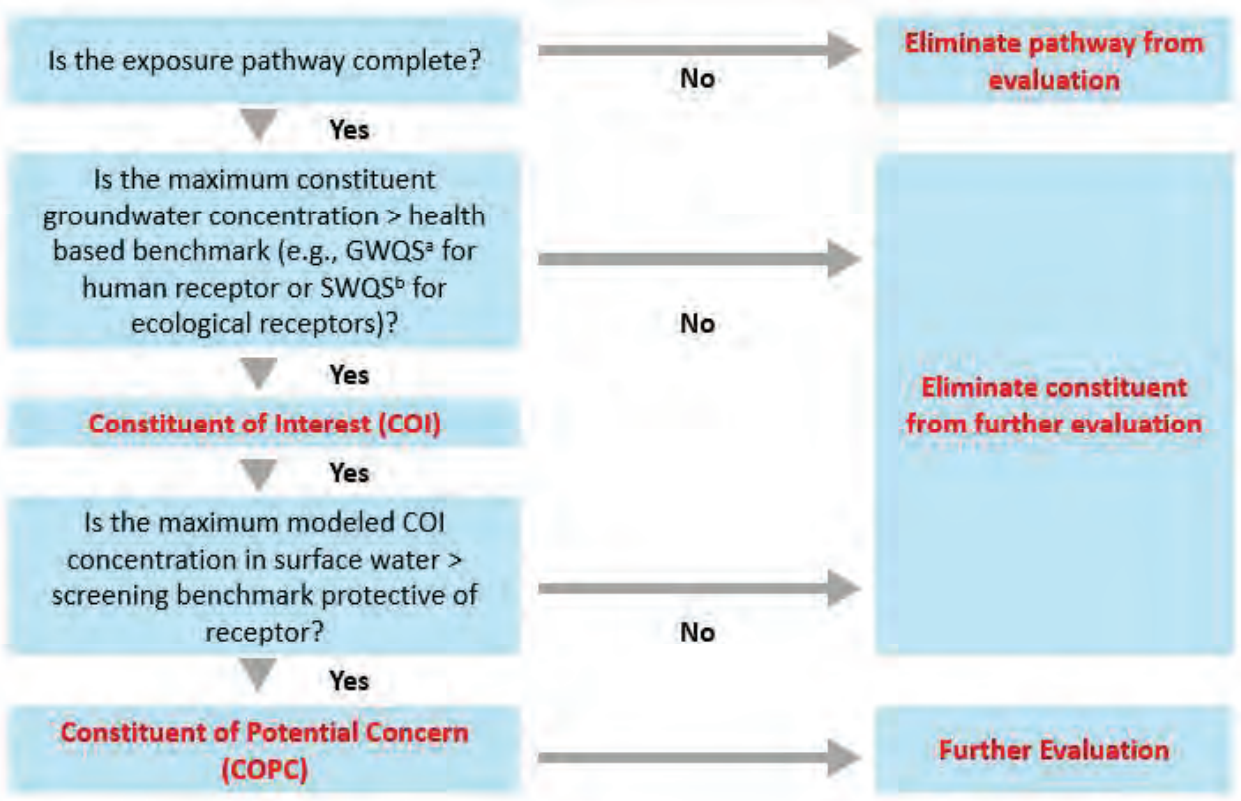

**Figure 3.1 Overview of Risk Evaluation Methodology.** CCR = Coal Combustion Residuals; COI = Constituent of Interest; IEPA = Illinois Environmental Protection Agency; GWQS = Groundwater Quality Standard; SWQS = Surface Water Quality Standard; US EPA = United States Environmental Protection Agency. (a) The Illinois CCR Rule Part 845.600 GWPS are used to identify human health COIs if human health exposure pathways are complete. (b) IEPA SWQS protective of chronic exposures are used to identify ecological COIs. In the absence of a SWQS, US EPA Region IV ecological screening values are used.

Electronic Filing: Received, Clerk's Office 06/20/2024

The first step in the risk evaluation was to develop the CEMs and identify complete exposure pathways. All potential receptors and exposure pathways based on groundwater use and surface water use in the vicinity of the Site were considered. Exposure pathways that are incomplete were excluded from the evaluation. As described in Section 3.2, none of the human exposure pathways were considered complete; therefore, risks to human health were not evaluated further.

The risk assessment evaluated ecological risks in the DCCP. Ecological COIs were identified as constituents with maximum concentrations in groundwater in excess of a surface water quality standard (SWQS) for ecological receptors. Based on the CSM (Section 3.2.2), groundwater underlying the BAB and GMF flows east into the DCCP. Therefore, any potential CCR-related constituents in groundwater would flow toward and discharge into the DCCP.

Surface water and sediment samples have not been collected from the DCCP. Therefore, Gradient modeled the potential migration of COIs from groundwater to surface water and sediment to evaluate potential risks to ecological receptors (see Section 3.3.3). Gradient modeled the COI concentrations in surface water and sediment separately for BAB and GMF, based on the groundwater data from the wells associated with those two CCR management units. The modeled COI concentrations in surface water and sediment were compared to conservative, generic risk-based screening benchmarks for ecological receptors. These generic screening benchmarks rely on default assumptions with limited consideration of Site-specific characteristics. Ecological benchmarks are medium-specific values designed to be protective of all potential ecological receptors exposed to surface water. Ecological screening benchmarks are inherently conservative because they are intended to screen out chemicals that are of no concern with a high level of confidence. Therefore, a modeled COI concentration exceeding a screening benchmark does not indicate an unacceptable risk, but does indicate that further risk evaluation is warranted. COIs with maximum concentrations exceeding a conservative screening benchmark are identified as COPCs requiring further evaluation.

As described in more detail below, this evaluation relied on the screening assessment to demonstrate that constituents present in groundwater underlying the BAB and GMF do not pose an unacceptable ecological risk. That is, after the screening step, no COPCs were identified and further assessment was not warranted.

## 3.2 Human Conceptual Exposure Model

A CEM provides an overview of the receptors and exposure pathways requiring risk evaluation. The CEM describes the source of the contamination, the mechanism that may lead to a release of contamination, the environmental media to which a receptor may be exposed, the route of exposure (exposure pathway), and the types of receptors that may be exposed to these environmental media.

The human CEM for the Site depicts the relationships between the off-Site environmental media potentially impacted by constituents in groundwater and human receptors that could be exposed to these media. Figure 3.2 presents a human CEM for the Site. It considers a human receptor who could be exposed to COIs hypothetically released from the BAB and the GMF into groundwater, surface water, sediment, and fish. The following human receptors and exposure pathways were considered for inclusion in the Site-specific CEM.

Electronic Filing: Received, Clerk's Office 06/20/2024

- Residents – exposure to groundwater/surface water as drinking water
- Residents – exposure to groundwater/surface water used for irrigation
- Recreators in the DCCP to the east of the Site
  - Boaters – exposure to surface water and sediment while boating
  - Swimmers – exposure to surface water and sediment while swimming
  - Anglers – exposure to surface water and sediment *via* consumption of locally caught fish

### 3.2.1 Exposure from Recreational Activities in Surface Water

As shown in Figure 3.2, all of the exposure pathways related to recreational activities in surface water were considered incomplete, and thus were not evaluated in this risk assessment. Groundwater beneath the BAB and GMF flows into the DCCP. The DCCP is owned by IPRG, and access to it is restricted, thus the DCCP is not used for any recreational activities, including boating, swimming, or fishing.

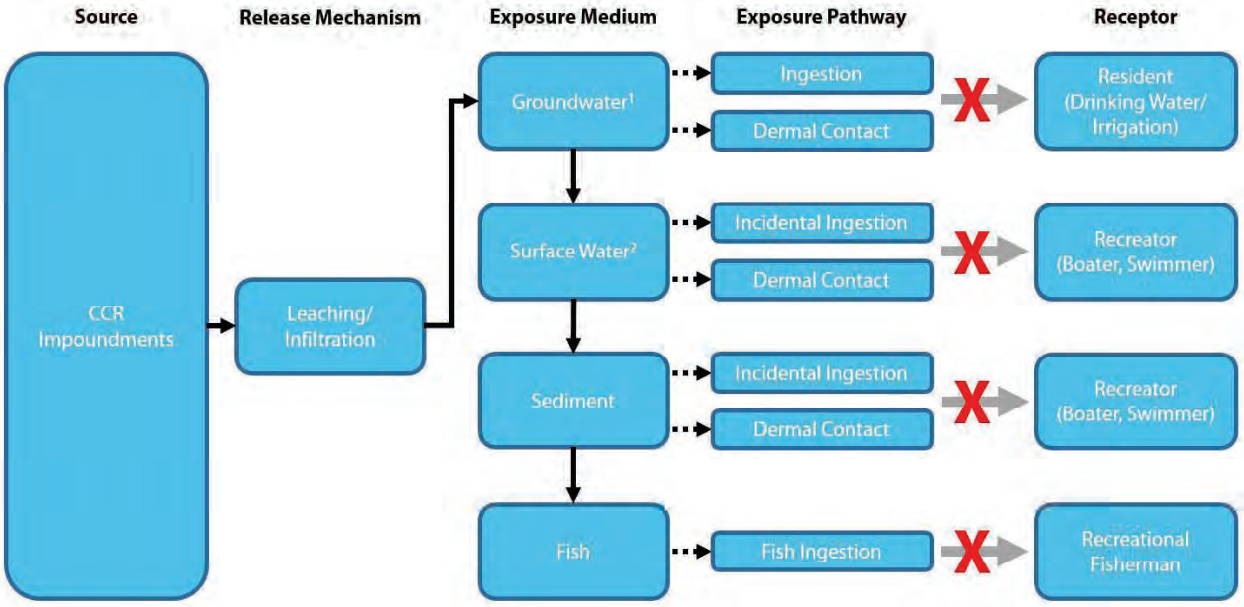

**Figure 3.2 Human Conceptual Exposure Model.** CCR = Coal Combustion Residual. Dashed line/Red X = Incomplete or insignificant exposure pathway. (1) Groundwater in the vicinity of the Site is not used as a drinking water or irrigation source. (2) Surface water is not used as a drinking water source.

### 3.2.2 Exposure from Groundwater or Surface Water as a Drinking Water/Irrigation Source

The following sections explain why the residential drinking water and irrigation pathways are incomplete.

#### 3.2.2.1 BAB

Groundwater as a source of drinking water and/or irrigation water is not a complete exposure pathway for potential CCR-related constituents that originated from the BAB. Specifically, shallow groundwater from

Electronic Filing: Received, Clerk's Office 06/20/2024

the uppermost aquifer in the vicinity of the BAB is not used as a source of drinking water, and no public groundwater systems are downgradient of the DCPP. Further, the downward migration of groundwater from the uppermost aquifer is largely restricted due to the presence of a thick, shale bedrock unit (Ramboll, 2021a; AECOM, 2016). A summary of the evidence supporting the conclusion that residential uses of the shallow groundwater and DCCP water adjacent to the BAB as sources of drinking water are incomplete exposure pathways is presented below.

- **No potential groundwater receptors are in the vicinity of the BAB**. To identify drinking water receptors within a 1,000 m radius of the BAB, a potable water well survey was completed in 2021 utilizing the following federal and state databases (as cited in Ramboll, 2021a): United States Geological Survey (USGS) National Groundwater Monitoring Network (NGWMN) (USGS, 2021); Illinois State Geological Survey (ISGS) Illinois Water and Related Wells (ILWATER) Map (ISGS, 2020); US EPA Safe Drinking Water Information System (SDWIS) (US EPA, 2021); and IEPA Illinois Drinking Water Watch (DWW) (IEPA, 2021b).
  - No potable public supply wells or intakes were identified within a 1,000 m radial distance from the BAB (Ramboll, 2021a).
  - In a prior investigation, only one water supply well was detected one mile north-northwest of Ash Pond 2, but that well is not located downgradient of the BAB (AECOM, 2016).
- **There is no potential off-Site migration of constituents in groundwater to nearby wells because all shallow groundwater discharges into the DCCP.** The DCCP is the discharge point for groundwater from the uppermost aquifer. Groundwater hydraulic head measurements in the uppermost aquifer indicate that groundwater flows southward toward a channel that is connected to the DCCP (Ramboll, 2021a). Because the DCCP serves as the regional groundwater discharge location in the area, constituents present in groundwater are not likely to migrate underneath or beyond the DCCP.
- **The DCCP adjacent to the Site is not used as a public water supply.** The DCCP is owned and maintained by IPRG. IPRG restricts the use of the pond as a source of drinking water or for recreation. Therefore, the human exposure pathway *via* surface water ingestion in the DCCP was not evaluated further.
- **The uppermost aquifer has a limited hydraulic connection to the underlying bedrock unit.** The bedrock acts as an aquitard with mean hydraulic conductivity values ranging between $2 \times 10^{-6}$ and $9 \times 10^{-6}$ cm /sec (AECOM, 2016; Ramboll, 2021a) and bedrock packer tests within the top 100 ft yielded virtually no water (AECOM, 2016). Based on these results, it was concluded that the shale bedrock is a significant barrier to groundwater migration.

#### 3.2.2.2 GMF

Groundwater as a source of drinking water and/or irrigation water is not a complete exposure pathway for CCR-related constituents originating from the GMF. Specifically, shallow groundwater from the uppermost aquifer in the vicinity of the GMF is not used as a source of drinking water, and no public groundwater systems are downgradient of Duck Creek. Additionally, the downward migration of groundwater from the uppermost water-bearing unit is largely restricted due to the presence of underlying low-permeability till and shale bedrock. A summary of the evidence supporting the conclusion that residential uses of the shallow groundwater and DCCP water adjacent to the GMF as sources of drinking water are incomplete exposure pathways is presented below.

Electronic Filing: Received, Clerk's Office 06/20/2024

- **No potential groundwater receptors are in the vicinity of the GMF.** To identify drinking water receptors within a 1,000 m radius of the GMF, a potable water well survey was completed in 2021 utilizing the following federal and state databases (Ramboll, 2021b): USGS NGWMN (USGS, 2021); ISGS ILWATER Map (ISGS, 2020); US EPA SDWIS (US EPA, 2021); and IEPA Illinois DWW (IEPA, 2021b).
  - One private well was identified within a 1,000 m radial distance from the GMF (Ramboll, 2021b). However, the well is located southwest of the GMF, while the groundwater flow within the uppermost aquifer is toward the southeast (Ramboll, 2021b); therefore, this well is not considered to be downgradient of the GMF (Ramboll, 2021b).
- **There is no off-Site groundwater migration to any off-Site wells because all shallow groundwater flows into the DCCP.** The DCCP is the discharge point for groundwater from the uppermost aquifer. Groundwater hydraulic head measurements in a total of 7 wells[6] screened within the uppermost aquifer at the GMF indicate that groundwater flows toward the DCCP (Ramboll, 2021b,e). Because the DCCP serves as the regional groundwater discharge location, shallow groundwater near the GMF is not likely to migrate underneath or beyond the DCCP.
- **The DCCP adjacent to the Site is not used as a public water supply.** The DCCP is owned and maintained by IPRG. IPRG restricts the use of the pond as a source of drinking water and/or for recreation. Therefore, the human exposure pathway *via* surface water ingestion adjacent to the GMF was not evaluated further.
- **The GMF has a limited hydraulic connection to deep groundwater.** Three laboratory permeability tests on the lower confining till unit underlying the uppermost aquifer yielded a low mean hydraulic conductivity value of $1.9 \times 10^{-7}$ cm/sec (Natural Resource Technology, 2017). In addition, the underlying shale bedrock acts as a low-permeability aquitard that restricts vertical intrusion of shallow groundwater. These results indicate that the till and shale bedrock are a significant barrier to groundwater migration.

## 3.3 Ecological Conceptual Exposure Model

The ecological CEM for the Site depicts the relationships between off-Site environmental media (surface water and sediment) potentially impacted by COIs in groundwater and ecological receptors that may be exposed to these media. The ecological risk evaluation considered both direct toxicity as well as secondary toxicity *via* bioaccumulation. Figure 3.3 presents the ecological CEM for the Site. The following ecological receptor groups and exposure pathways were considered.

- **Ecological Receptors Exposed to Surface Water:**
  - Aquatic plants, amphibians, reptiles, and fish.
- **Ecological Receptors Exposed to Sediment:**
  - Benthic invertebrates (*e.g.*, insects, crayfish, mussels).

[6] Three CCR Rule background monitoring wells (G02S, G50S, and G51S), four CCR Rule downgradient monitoring wells (G54S, G57S, G60S, and G64S) (Ramboll, 2021e).

Electronic Filing: Received, Clerk's Office 06/20/2024

- **Ecological Receptors Exposed to Bioaccumulative COIs:**
  - Higher trophic-level wildlife (avian and mammalian) *via* direct exposures (surface water and sediment exposure) and secondary exposures through the consumption of prey (*e.g.*, plants, invertebrates, small mammals, fish).

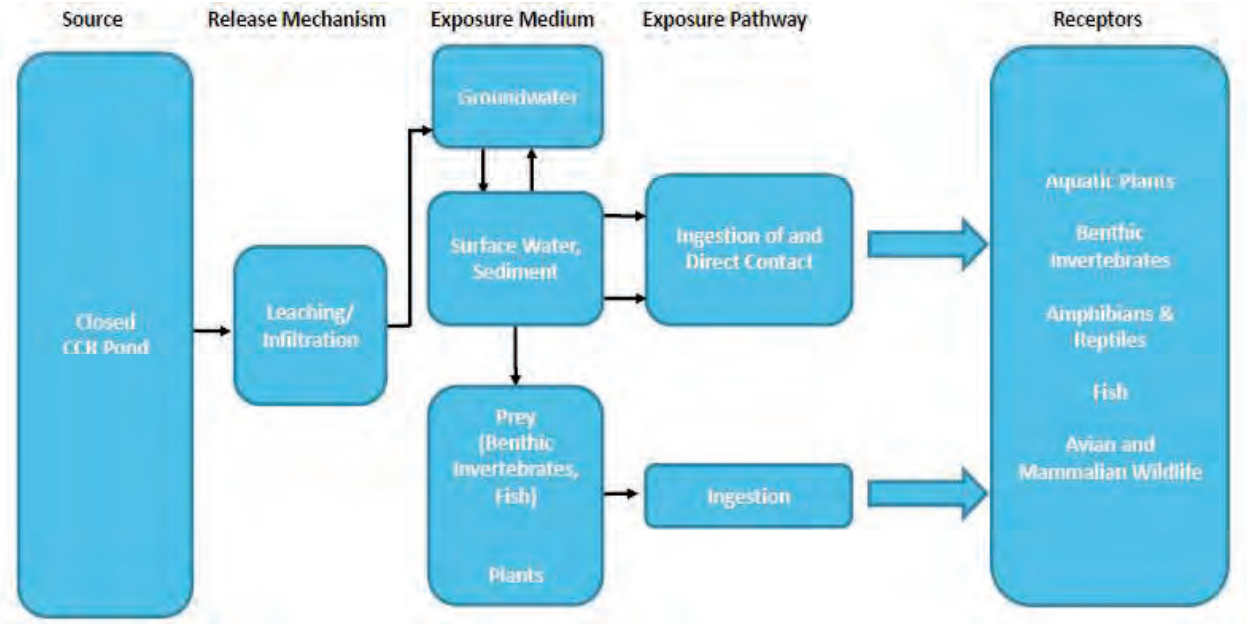

**Figure 3.3 Ecological Conceptual Exposure Model.** CCR = Coal Combustion Residual.

## 3.4 Identification of Ecological Constituents of Interest

Risks were evaluated for ecological COIs. A constituent was considered a COI if the maximum detected constituent concentration in groundwater exceeded a benchmark protective of ecological receptors. According to US EPA Risk Assessment Guidance (US EPA, 1989), this screening step is designed to reduce the number of constituents carried through the risk evaluation that are anticipated to have a minimal contribution to the overall risk. Identified COIs are the constituents that are most likely to pose a risk concern in DCCP surface water and sediment. As described above, there were no complete human health exposure pathways. Therefore, COIs were identified to support an ecological risk evaluation only.

### 3.4.1 Ecological Constituents of Interest

The Illinois GWPSs, as defined in IEPA's guidance, were developed to protect human health, but not necessarily ecological receptors. While ecological receptors are not exposed to groundwater, groundwater can potentially migrate into the adjacent surface water and impact ecological receptors. Therefore, the maximum concentrations of analytes detected in groundwater were compared to ecological surface water benchmarks protective of aquatic life to identify ecological COIs.

Electronic Filing: Received, Clerk's Office 06/20/2024

The surface water screening benchmarks for freshwater organisms were obtained from the following hierarchy of sources:

- IEPA (2019) SWQSs. IEPA SWQSs are health-protective benchmarks for aquatic life exposed to surface water on a long-term basis (*i.e.*, chronic exposure). The SWQSs for several metals are hardness-dependent (in this case cadmium and lead). Screening benchmarks for these constituents were calculated assuming US EPA's (2019) default hardness of 100 mg/L because hardness data are not available for the DCCP.
- NRWQC – Aquatic Life Criteria Table (US EPA, 2019).
- US EPA Region IV (2018) surface water Ecological Screening Values (ESVs) for hazardous waste sites.

For radium, benchmarks from the United States Department of Energy (US DOE) guidance document "A Graded Approach for Evaluating Radiation Doses to Aquatic and Terrestrial Biota" (US DOE, 2019) were used. US DOE presents benchmarks for radium-226 and radium-228 separately (4 and 3 pCi/L, respectively) (US DOE, 2019). Given that radium concentrations are expressed as total radium (radium-226+228, *i.e.*, the sum of radium-226 and radium-228), Gradient used the lower of the two benchmarks (3 pCi/L for radium-228) to evaluate total radium concentrations. The IEPA (2019, Section 302.207) general Surface Water Quality Standard for radium notes that the annual average combined concentration of radium-226+228 must not exceed 3.75 pCi/L; however, this value is not necessarily based on protection of ecological receptors, therefore the benchmark of 3 pCi/L from US DOE (2019) was used.

Gradient used the maximum detected concentrations from groundwater samples collected from the wells associated with the BAB and GMF, without considering spatial or temporal representativeness for ecological receptor exposures. The use of the maximum constituent concentrations in this evaluation is designed to conservatively identify COIs that warrant further investigation.

Boron, cobalt, lead, mercury, radium-226+228, and chloride were identified as COIs for ecological receptors in the BAB (Table 3.1). Cadmium and cobalt were identified as COIs for ecological receptors in the GMF (Table 3.2).

Notes:
COI = Constituent of Interest; DL = Detection Limit; ESV = Ecological Screening Value; GMF = Gypsum Management Facility; IEPA = Illinois Environmental Protection Agency; NA = Not Applicable; NRWQC = National Recommended Water Quality Criteria; SWQC = Surface Water Quality Criteria; US DOE = United States Department of Energy; US EPA = United States Environmental Protection Agency.
(a) The list of constituents includes those with IL Part 845.600 groundwater protection standards (IEPA, 2021a).
(b) Ecological benchmarks are from the hierarchy of sources discussed in Section 3.3.2: IEPA SWQS (IEPA, 2019), US EPA Region IV "Ecological Risk Assessment Supplemental Guidance" (US EPA Region IV, 2018), US EPA NRWQC (2021), and US DOE's guidance document "A Graded Approach for Evaluating Radiation Doses to Aquatic and Terrestrial Biota" (US DOE, 2019).
(c) COIs are constituents for which the maximum concentration exceeds the surface water criterion.
(d) Of the 83 groundwater samples analyzed for radium-226+228, only 1 sample was detected above the ecological benchmark. Given that the maximum result is considered an outlier at the 1% and 5% significance levels, radium-226+228 was not considered an ecological COI.
(e) Results for analytes in the "other" group are based on unfiltered samples.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 3.4.2 Surface Water and Sediment Modeling for the GMF and BAB

Surface water and sediment sampling has not been conducted in the DCCP. Many of the COIs are expected to be present in surface water or sediment from natural or non-Site-related anthropogenic sources. It would be difficult to attribute concentrations of these COIs to a particular source given the dynamic nature of the DCCP (as it flows south and discharges to Duck Creek, which drains into the Illinois River) and the multitude of potential sources. Gradient modeled concentrations in DCCP surface water and sediment as a result of groundwater discharge to the DCCP for all constituents that exceeded ecological benchmarks in groundwater. Surface water and sediment concentrations were modeled based on the maximum detected concentrations in groundwater[7] (from 2015 to 2021, regardless of well location).

For this evaluation, we adapted a simplified and conservative form of US EPA's indirect exposure assessment methodology (US EPA, 1998) that was used in US EPA's coal combustion waste risk assessment (US EPA, 2014). The original model is a mass balance calculation based on surface water and groundwater mixing and the concept that the dissolved and sorbed concentrations can be related through an equilibrium partitioning coefficient ($K_d$). The model assumes a well-mixed groundwater-surface water location, with partitioning among total suspended solids, dissolved water column, sediment porewater, and solid sediments.

Sorption to soil and sediment is highly dependent on the surrounding geochemical conditions. To be conservative, we ignored the natural attenuation capacity of soil and sediment and estimated the surface water concentration based only on the physical mixing of groundwater and surface water (*i.e.*, dilution) at the point of discharge of groundwater to the surface water.

The aquifer and surface water properties used to estimate the volume of groundwater flowing into the DCCP and surface water concentrations from the BAB and GMF are presented in Tables 3.3 and 3.5, respectively. The COI concentrations in sediment were modeled using the COI-specific sediment-to-water partition coefficients and the sediment properties presented in Tables 3.4 and 3.6 for the BAB and GMF, respectively. In the absence of Site-specific information for the DCCP, we used default assumptions (*e.g.*, depth of the upper benthic layer and bed sediment porosity) to model sediment concentrations. A description of the surface water and sediment modeling and the detailed results are presented in Appendix A.

The modeled surface water and sediment concentrations are discussed in Section 3.4. As described earlier, the modeled concentrations reflect conservative contributions from groundwater discharge.

[7] The maximum concentrations were taken, regardless of "total" or "dissolved" concentrations.

## 3.5 Ecological Risk Evaluation

Based on the ecological CEM (Figure 3.3), ecological receptors could be exposed to surface water, sediment, and dietary items (*i.e.*, prey and plants) potentially impacted by identified COIs (boron, cobalt, lead, and mercury in the BAB; cadmium and cobalt in the GMF).

### 3.5.1 Ecological Receptors Exposed to Surface Water

**Screening Exposures:** The ecological evaluation considered aquatic communities in the DCCP potentially impacted by identified ecological COIs. In the absence of surface water data, the maximum of the total and dissolved COI concentrations detected in groundwater was used to model surface water concentrations. Modeled surface water concentrations were compared to risk-based ecological screening benchmarks.

**Screening Benchmarks:** Surface water screening benchmarks protective of aquatic life were obtained from the following hierarchy of sources:

- IEPA SWQS (IEPA, 2019), regulatory standards that are intended to protect aquatic life exposed to surface water on a long-term basis (*i.e.*, chronic exposure). For lead, the surface water benchmark is hardness-dependent and calculated using a default hardness of 100 mg/L. While IEPA's general water quality standard for chloride of 500 mg/L (IEPA, 2019) is not specified to be protective of ecological receptors, it was used because it is on the same order of magnitude as US EPA's NRWQC for chloride (230 and 860 mg/L for chronic and acute exposures, respectively), which is protective of aquatic life (US EPA, 2021).
- US EPA Region IV (2018) surface water ESVs for hazardous waste sites.
- For radium, US DOE presents benchmarks for radium-226 and radium-228 separately (4 and 3 pCi/L, respectively). Given that radium concentrations are expressed as total radium (the sum of radium-226 and radium-228), Gradient used the lower of the two US DOE benchmarks (3 pCi/L for radium-228) to evaluate the total radium concentrations. In addition, this benchmark is protective of bioaccumulative effects in higher trophic-level wildlife discussed further in Section 3.4.3.

**Risk Evaluation:** The maximum modeled COI concentrations in surface water were compared to the above hierarchy of benchmarks protective of aquatic life (Table 3.7). All modeled surface water concentrations were below their respective benchmarks. Thus, none of the COIs evaluated are expected to pose an unacceptable risk to aquatic life in the DCCP.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 3.7 Risk Evaluation for Ecological Receptors Exposed to Surface Water**

| COI[a] | Maximum Surface Water Concentration, Modeled | Ecological Freshwater Benchmark | Basis | COPC |
|---|---|---|---|---|
| **BAB** | | | | |
| Boron (mg/L) | $1.7 \times 10^{-4}$ | 7.6 | IEPA (2019) | No |
| Cobalt (mg/L) | $7.9 \times 10^{-7}$ | 0.019 | US EPA Region IV (2018) | No |
| Lead[b] (mg/L) | $8.9 \times 10^{-7}$ | 0.016 | IEPA (2019) | No |

Notes:
BAB = Bottom Ash Basin; COI = Constituent of Interest; COPC = Constituent of Potential Concern; GMF = Gypsum Management Facility; IEPA = Illinois Environmental Protection Agency; US DOE = United States Department of Energy; US EPA = United States Environmental Protection Agency.
(a) Modeled COI concentrations reflect the potential maximum COI surface water concentrations from groundwater mixing with surface water.
(b) A default hardness value of 100 mg/L was used to calculate this hardness-dependent benchmark.

### 3.5.2 Ecological Receptors Exposed to Sediment

**Screening Exposures:** COIs in impacted groundwater discharging into the DCCP can sorb to sediments *via* chemical partitioning. In the absence of sediment data, sediment concentrations were modeled using maximum detected groundwater concentrations. Therefore, the modeled COI sediment concentrations reflect the potential maximum Site-related sediment concentration from groundwater discharge. Chloride was not modeled in sediment as it does not have a $K_d$ value and is not expected to partition into sediment.

**Screening Benchmarks:** Sediment screening benchmarks were obtained from US EPA Region IV (2018). The majority of the sediment ESVs are based on threshold effect concentrations (TECs) from MacDonald *et al.* (2000), which provide consensus values that identify concentrations below which harmful effects on sediment-dwelling organisms are unlikely to be observed.

For radium, benchmarks from US DOE's guidance document "A Graded Approach for Evaluating Radiation Doses to Aquatic and Terrestrial Biota" (US DOE, 2019), were used. US DOE (2019) presents benchmarks for radium-226 and radium-228 separately (101 and 876 pCi/kg, respectively). Similar to surface water, given that modeled radium is presented as the combined radium-226+228, the lower of the two benchmarks was used as the benchmark to be protective of ecological receptors for both radium-226 and radium-228. In addition, this benchmark is protective of bioaccumulative effects in the higher trophic-level wildlife discussed further in Section 3.4.3. The benchmarks used in this evaluation are listed in Table 3.8.

**Screening Risk Results:** The maximum modeled COI sediment concentrations were below their respective sediment screening benchmarks, for both the BAB and GMF (Table 3.8). The modeled sediment concentrations attributed to potential contributions from Site groundwater for all COIs were less than 1.5% of the sediment screening benchmark. Therefore, the modeled sediment concentrations attributed to potential contributions from Site groundwater are not expected to significantly contribute to ecological exposures in the DCCP adjacent to the Site.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 3.8 Risk Evaluation for Ecological Receptors Exposed to Sediment**

| COI | Modeled Sediment Concentration | ESV[a] | COPC | Percentage of Benchmark |
|---|---|---|---|---|
| **BAB** | | | | |
| Boron (mg/kg) | 0.00100 | 38[b] | No | 0.0026% |
| Cobalt (mg/kg) | 0.00072 | 50 | No | 0.0014% |
| Lead (mg/kg) | 0.0089 | 35.8 | No | 0.025% |
| Mercury (mg/kg) | 0.00092 | 0.18 | No | 0.51% |
| Radium-226+228 (pCi/kg) | 1.5 | 101 | No | 1.4% |
| **GMF** | | | | |
| Cadmium (mg/kg) | 0.0026 | 0.99 | No | 0.27% |
| Cobalt (mg/kg) | 0.0059 | 50 | No | 0.012% |

Notes:
BAB = Bottom Ash Basin; COI = Constituent of Interest; COPC = Constituent of Potential Concern; ESV = Ecological Screening Value; GMF = Gypsum Management Facility; NOEC = No Observed Effect Concentration; US DOE = United States Department of Energy; US EPA = United States Environmental Protection Agency.
(a) ESVs were taken from US EPA Region IV (2018) for all metal COIs. The benchmark for radium-226+228 is the lower of the US DOE (2019) benchmarks for Ra-226 and Ra-228.
(b) Boron NOEC of 38 mg/kg was used as a conservative benchmark for boron in the absence of an ESV (ECHA, 2019).

### 3.5.3 Ecological Receptors Exposed to Bioaccumulative Constituents of Interest

**Screening Exposures:** COIs with bioaccumulative properties can impact higher trophic-level wildlife exposed to these COIs *via* direct exposures (surface water and sediment exposure) and secondary exposures through the consumption of dietary items (*e.g.*, plants, invertebrates, small mammals, and fish).

**Screening Benchmark:** US EPA Region IV (2018) guidance and IEPA (2019) SWQS guidance were used to identify analytes with potential bioaccumulative effects.

**Risk Evaluation:** Mercury was the only COI[8] identified as having potential bioaccumulative effects. The modeled mercury concentration in surface water ($1.3 \times 10^{-8}$ mg/L) is well below the US EPA Region IV (2018) ecological benchmark for wildlife (0.0013 mg/L) that is protective of bioaccumulative effects. Therefore, mercury is not considered to pose an ecological risk *via* bioaccumulation.

Radium is not described in US EPA Region IV guidance, but it has been identified as bioaccumulative by other entities (*e.g.*, ATSDR, 1990). However, the benchmark used to screen radium concentrations in surface water and sediment already considers bioaccumulative exposures. Given that the modeled concentrations are below benchmarks which account for bioaccumulative exposures, radium-226+228 is not expected to pose a risk concern to ecological receptors based on its bioaccumulative properties.

## 3.6 Uncertainties and Conservatisms

A number of uncertainties and their potential impacts on the risk evaluation are discussed below. Wherever possible, conservative assumptions were used in an effort to minimize uncertainties and overestimate rather than underestimate risks.

[8] US EPA Region IV (2018) identifies only mercury (including methyl mercury) and selenium as having potential bioaccumulative effects. IEPA (2019) identifies mercury as the only metal with bioaccumulative properties.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Exposure Estimates:**

- The risk evaluation included the Illinois Part 845.600 (IEPA, 2021a) constituents detected in groundwater samples collected from wells downgradient of the BAB and GMF. However, it is possible that none of the detected constituents are related specifically to these ash ponds.
- The ecological risk characterization was based on the maximum modeled COI concentrations, rather than on average concentrations. Thus, the variability in exposure concentrations was not considered. Assuming continuous exposure to the maximum concentration overestimates ecological exposures, given that receptors are mobile and concentrations change over time. For example, US EPA guidance states that risks should be estimated using average exposure concentrations as represented by the 95% upper confidence limit on the mean (US EPA, 1992). Given that exposure estimates based on the maximum concentrations did not exceed risk benchmarks, we have greater confidence that there is no risk concern.
- Only analytes detected in groundwater were used to identify COIs and model COI concentrations in surface water and sediment. For the constituents that were not detected in groundwater, the detection limits were below the Illinois Part 845.600 GWPS (IEPA, 2021a) and thus do not require further evaluation.
- COI concentrations in surface water were modeled using the maximum detected total or dissolved COI concentrations in groundwater. Surface water concentrations for the BAB were modeled using the maximum detected total groundwater COI concentrations, and maximum detected dissolved groundwater COI concentrations for the GMF. Modeling surface water concentrations using total metal concentrations for BAB COIs may overestimate surface water concentrations because dissolved concentrations, which are lower than total concentrations, represent the mobile fractions of constituents that could likely flow into and mix with surface water.
- The COIs identified in this evaluation also occur naturally in the environment. Contributions to exposure from natural or other non-BAB/GMF related sources were not considered in the evaluation of modeled concentrations; only exposure contributions potentially attributable to Site groundwater mixing with surface water were evaluated. While not quantified, exposures from potential BAB/GMF-related groundwater contributions are likely to represent only a small fraction of the overall human and ecological exposure to COIs that also have natural or non-BAB/GMF-related sources.

**Toxicity Benchmarks:**

- Screening level ecological benchmarks were compiled from IEPA and US EPA guidance and designed to be protective of the majority of site conditions, leaving the option for site-specific refinement. In some cases, these benchmarks may not be representative of the Site-specific conditions or receptors found at the Site, or may not accurately reflect concentration-response relationships encountered at the Site. For example, the ecological benchmark for cadmium is hardness-dependent and US EPA's default hardness of 100 mg/L was used due to a lack of hardness data for the DCCP. Regardless of the hardness, the maximum modeled cadmium concentration is orders of magnitude below the SWQS.
- In addition, for the ecological evaluation, we conservatively assumed all constituents to be 100% bioavailable. Modeled COI concentrations in surface water are considered total COI concentrations. US EPA recommends using dissolved metals as a measure of exposure to ecological receptors because it represents the bioavailable fraction of metal in water (US EPA,

Electronic Filing: Received, Clerk's Office 06/20/2024

1993). Therefore, the modeled surface water COI concentrations may be an overestimation of exposure concentrations to ecological receptors.

- For radium, groundwater concentrations were calculated as the sum of radium-226 and radium-228. US DOE (2019) presents surface water and sediment benchmarks protective of ecological receptors for radium-226 and radium-228 separately. Gradient relied on the lower of the two benchmarks to evaluate risks for radium-226+228. By comparing the total radium-226+228 concentration to the most stringent benchmark, it is assuming that all of the total radium concentrations has the toxicity of the more toxic isotope, which is an overestimation of risk. Despite the overestimation, the modeled exposure estimates are at least an order of magnitude lower than the conservative benchmark.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 4 Summary and Conclusions

A screening-level risk evaluation was performed for Site-related constituents in groundwater at the DCPP in Canton, Illinois. The CSM developed for the Site indicates that groundwater beneath the GMF and BAB flows into the DCCP and may potentially impact surface water and sediment.

CEMs were developed for human and ecological receptors. There are no complete exposure pathways for humans, because the DCCP is part of the Site and does not have any recreational uses. Based on the local hydrogeology, residential exposure to groundwater used for drinking water or irrigation is not a complete pathway and was not evaluated. The complete exposure pathways for ecological receptors include aquatic life (including aquatic and marsh plants, amphibians, reptiles, and fish) exposed to surface water; benthic invertebrates exposed to sediment; and avian and mammalian wildlife exposed to bioaccumulative COIs in surface water, sediment, and dietary items.

Groundwater data collected between 2015 and 2021 were used to estimate exposures. Gradient used the maximum detected concentrations from groundwater samples collected from the wells associated with the BAB and GMF, without considering spatial or temporal representativeness for ecological receptor exposures. The use of the maximum constituent concentrations in this evaluation is designed to conservatively identify COIs that warrant further investigation. For constituents identified as COIs for ecological receptors, surface water and sediment concentrations in the DCCP were modeled using the maximum detected groundwater concentration.

Ecological receptors exposed to surface water include aquatic and marsh plants, amphibians, reptiles, and fish. Surface water and sediment exposure estimates were screened against benchmarks protective of ecological receptors for this risk evaluation. The risk evaluation showed that none of the modeled COIs in surface water exceeded protective screening benchmarks. Ecological receptors exposed to sediment include benthic invertebrates. The modeled sediment COIs did not exceed the conservative screening benchmarks, therefore, none of the COIs evaluated in sediment are expected to pose an unacceptable risk to ecological receptors. Ecological receptors were also evaluated for exposure to bioaccumulative COIs. This evaluation considered higher-trophic-level wildlife with direct exposure to surface water and sediment and secondary exposure through the consumption of dietary items (*e.g.*, plants, invertebrates, small mammals, fish). Based on the modeled concentration, mercury is not considered to pose an ecological risk *via* bioaccumulation. Overall, this evaluation demonstrated that none of the COIs evaluated are expected to pose an unacceptable risk to ecological receptors.

It should be noted that this evaluation incorporates a number of conservative assumptions that tend to overestimate exposure and risk. The risk evaluation was based on the maximum detected COI concentration; however, US EPA guidance states that risks should be based on a representative average concentration such as the 95% upper confidence limit on the mean; thus, using the maximum concentration tends to overestimate exposure. Although the COIs identified in this evaluation also occur naturally in the environment, the contributions to exposure from natural background sources and nearby industry were not considered; thus, CCR-related exposures were likely overestimated. Exposure estimates assumed 100% metal bioavailability, which likely results in overestimates of exposure and risks. Exposure estimates were based on inputs to evaluate the "reasonable maximum exposure"; thus, most individuals will have lower exposures than those estimated in this risk assessment.

Electronic Filing: Received, Clerk's Office 06/20/2024

Finally, it should be noted that because current conditions do not present a risk to human health or the environment, there will also be no unacceptable risk to human health or the environment for future conditions when the GMF or BAB are closed. For all future closure scenarios, potential releases of CCR-related constituents will decline over time and consequently potential exposures to CCR-related constituents in the environment will also decline.

Gradient modeled concentrations in the Duck Creek Cooling Pond (DCCP) surface water and sediment based on available groundwater data. First, we estimated the flow rate of constituents of interest (COIs) potentially discharged to the DCCP *via* groundwater. Then, we adapted United States Environmental Protection Agency's (US EPA's) indirect exposure assessment methodology (US EPA, 1998) in order to model surface water and sediment water concentrations in the DCCP.

## Model Overview

The groundwater flow into the DCCP is represented by a one-dimensional steady-state model. In this model, the groundwater migrates horizontally in the uppermost aquifer in the direction of the DCCP. For the Bottom Ash Basin (BAB), the groundwater flow entering the DCCP is the flow going through a cross-sectional area that has a length equal to the length of the DCCP adjacent to the BAB with potential coal combustion residual (CCR)-related impacts and a height equal to the saturated thickness of the permeable sand unit within the uppermost aquifer (Table 3.3). For the Gypsum Management Facility (GMF), the groundwater flow entering the DCCP is the flow going through a cross-sectional area that has a length equal to the length of the DCCP adjacent to the GMF with potential CCR-related impacts and a height equal to the saturated thickness of the "Shallow Sand Unit" of the uppermost aquifer (Table 3.5). It was assumed that all the groundwater flowing through the uppermost aquifer discharges to the DCCP.

The groundwater flow into the DCCP mixes with the surface water in the DCCP. The COIs potentially entering the DCCP *via* groundwater can dissolve into the water column, sorb to suspended sediments, or sorb to benthic sediments. Using US EPA's indirect exposure assessment methodology (US EPA, 1998), the model evaluates the surface water and sediment concentrations at a location downstream of the groundwater discharge, assuming a well-mixed water column.

## Groundwater Discharge Rate

Gradient used conservative assumptions to evaluate the potential groundwater discharge rate of the COIs. We conservatively assumed that the groundwater concentrations were uniformly equal to the maximum detected concentration for each individual COI. We ignored adsorption by subsurface soil and assumed that all the groundwater flowing through the uppermost aquifer was discharged into the DCCP.

For each groundwater unit, the groundwater flow rate into the river was derived using Darcy's Law:

$$Q = KiA$$

where:

$Q$ = Groundwater flow rate ($m^3/s$)
$K$ = Hydraulic conductivity (m/s)
$i$ = Hydraulic gradient (m/m)
$A$ = Cross-sectional area ($m^2$)

Electronic Filing: Received, Clerk's Office 06/20/2024

For each COI, the mass discharge rate into the DCCP was then calculated by:

$$m_c = C_c \times Q \times CF$$

where:

$m_c$ = Mass discharge rate of the COI (mg/year)
$C_c$ = Maximum groundwater concentration of the COI (mg/L)
$Q$ = Groundwater flow rate ($m^3/s$)
$CF$ = Conversion factors needed for unit conversion: 1,000 $L/m^3$; 31,557,600 s/year

The values of the aquifer parameters used for these calculations are provided in Table A.1 for the BAB and Table A.2 for the GMF. The calculated mass discharge rates were then used as inputs for the surface water and sediment partitioning model.

## Surface Water and Sediment Concentration

Groundwater discharged into the DCCP gets diluted in the surface water. Constituents transported by groundwater into the surface water migrate into the water column and the bed sediments. The surface water model we used to estimate the surface water and sediment concentrations is a steady-state model described in US EPA's indirect exposure assessment methodology (US EPA, 1998) and also used in US EPA's "Human and Ecological Risk Assessment of Coal Combustion Residuals" (US EPA, 2014). This model describes the partitioning of constituents between surface water, suspended sediments, and benthic sediments based on equilibrium partition coefficients. It estimates the concentrations of constituents in surface water, suspended sediments, and benthic sediments at steady-state equilibrium at a theoretical location downstream of the discharge point after complete mixing of the water column. In our analysis, we used the partitioning coefficients given in Table J-1 of the US EPA CCR Risk Assessment for all COIs (US EPA, 2014) except radium (Sheppard, 2009). These coefficients are presented in Table A.3.

To be conservative, we assume that the constituents are not affected by dissipation or degradation once they enter the water body. The total water body concentration of the COI is calculated using the following equation from US EPA (1998):

$$C_{wtot} = \frac{m_c}{V_f \times f_{water}}$$

where:

$C_{wtot}$ = Total water body concentration of the constituent (mg/L)
$V_f$ = Water body annual flow (L/year)
$f_{water}$ = Fraction of COI in the water column (unitless)
$m_c$ = Mass discharge rate of the COI (mg/year)

For the DCCP flow rate, we used a discharge rate of about 18 million gallons per day (MGD), based on the estimated DCCP surface water discharge rates to Duck Creek *via* outfall 001 (0.038 MGD) and outfall 002 (18 MGD), as indicated in National Pollutant Discharge Elimination System (NPDES) Permit No. IL0055620 (IEPA, 2013b).

Electronic Filing: Received, Clerk's Office 06/20/2024

The fraction of COIs in the water column was calculated for each COI using the sediment/water and suspended solids/water partition coefficients (US EPA, 2014, Table J-1). The fraction of COIs in the water column is calculated using the following equation from US EPA (2014):

$$f_{water} = \frac{(1 + [K_{dsw} \times TSS \times 0.000001]) \times \frac{d_w}{d_z}}{\left([1 + (K_{dsw} \times TSS \times 0.000001)] \times \frac{d_w}{d_z}\right) + ([bsp + K_{dbs} \times bsc] \times \frac{d_b}{d_z})}$$

where:

| | | |
|---|---|---|
| $f_{water}$ | = | fraction of COI in the water column |
| $K_{dsw}$ | = | Suspended sediment-water partition coefficient (mL/g) |
| $K_{dbs}$ | = | Sediment-water partition coefficient (mL/g) |
| $TSS$ | = | Total suspended solids in the surface water body (mg/L), set equal to the representative average concentration of 6 mg/L (Hanson Professional Services Inc., 2019) |
| $0.000001$ | = | Units conversion factor |
| $d_w$ | = | Depth of the water column (m) |
| $d_b$ | = | Depth of the upper benthic layer (m), set equal to 0.03 m (US EPA, 2014) |
| $d_z = d_w + d_b$ | = | Depth of the water body (m) |
| $bsp$ | = | Bed sediment porosity (unitless), set equal to 0.6 (US EPA, 2014) |
| $bsc$ | = | Bed sediment particle concentration (g/cm$^3$), set equal to 1.0 g/cm$^3$ (US EPA, 2014) |

The fraction of COIs dissolved in the water column ($f_d$) is calculated as (US EPA 2014):

$$f_d = \frac{1}{1 + K_{dsw} \times TSS \times 0.000001}$$

The values of the fraction of COIs in the water column and other calculated parameters are presented in Table A.4 for the BAB and in Table A.5 for the GMF. Other water body parameters are presented in Table A.6, which apply to both the BAB and GMF.

The total water column concentration ($C_{wcTot}$) of the COIs, comprising both the dissolved and suspended sediment phases, is then calculated using the following equation from US EPA (2014):

$$C_{wcTot} = C_{wtot} \times f_{water} \times \frac{d_z}{d_w}$$

Finally, the dissolved water column concentration ($C_{dw}$) for the COIs is calculated using the following equation from US EPA (2014):

$$C_{dw} = f_d \times C_{wcTot}$$

The dissolved water column concentration is then used to calculate the concentration of COIs sorbed to suspended solids in the water column (US EPA, 1998):

Electronic Filing: Received, Clerk's Office 06/20/2024

$$C_{sw} = C_{dw} \times K_{dsw}$$

where:

$C_{sw}$ = Concentration sorbed to suspended solids (mg/kg)
$C_{dw}$ = Concentration dissolved in the water column (mg/L)
$K_{dsw}$ = Suspended solids/water partition coefficient (mL/g)

In the same way, using the total water body concentration and the fraction of COIs in the benthic sediments, the model derives the total concentration in benthic sediments (US EPA 2014, Table J-1-12):

$$C_{bstot} = f_{benth} \times C_{wtot} \times \frac{d_z}{d_b}$$

where:

$C_{bstot}$ = Total concentration in bed sediment (mg/L or g/m$^3$)
$C_{wtot}$ = Total water body concentration of the constituent (mg/L)
$f_{benth}$ = Fraction of contaminant in benthic sediments (unitless)
$d_b$ = Depth of the upper benthic layer (m)
$d_z = d_w + d_b$ = Depth of the water body (m)

This value can be used to calculate dry weight sediment concentration as follows:

$$C_{sed-dw} = \frac{C_{bstot}}{bsc}$$

where:

$C_{sed-dw}$ = Dry weight sediment concentration (mg/kg)
$C_{bstot}$ = Total sediment concentration (mg/L)
$bsc$ = Bed sediment bulk density (used the default value of 1 g/cm$^3$ from US EPA, 2014)

The total sediment concentration is composed of the concentration dissolved in the bed sediment pore water (equal to the concentration dissolved in the water column) and the concentration sorbed to benthic sediments (US EPA, 1998).

The concentration sorbed to benthic sediments is calculated using the following equation from US EPA (1998):

$$C_{sb} = C_{dbs} \times K_{dbs}$$

where:

$C_{sb}$ = Concentration sorbed to bottom sediments (mg/kg)
$C_{dbs}$ = Concentration dissolved in the sediment pore water (mg/L)
$K_{dbs}$ = Sediments/water partition coefficient (mL/kg)

For each COI, the modeled total water column concentration, the modeled dry weight sediment concentration, and the modeled concentration sorbed to sediment are presented in Table A.7 for the BAB and in Table A.8 for the GMF.

# Supporting Information for Closure Alternatives Analysis – Gypsum Management Facility at Duck Creek Power Plant

Electronic Filing: Received, Clerk's Office 06/20/2024

GOLDER
MEMBER OF WSP

# TECHNICAL MEMORANDUM

**DATE** January 25, 2022 **Reference No.** 21454861-13-R-1

**TO** Illinois Power Resources Generating, LLC

**FROM** Golder Associates USA Inc.

**SUPPORTING INFORMATION FOR CLOSURE ALTERNATIVES ANALYSIS – GYPSUM MANAGEMENT FACILITY POND AT DUCK CREEK POWER PLANT**

Golder Associates USA Inc. (Golder), a Member of WSP, has prepared this technical memorandum for Illinois Power Resources Generating, LLC (IPRG) to support the Closure Alternatives Analysis for the Gypsum Management Facility (GMF) Pond at Duck Creek Power Plant (DCPP). The GMF Pond was used for containment of gypsum produced at DCPP and has not received gypsum since the power plant was retired in 2019. The Closure Alternatives Analysis is being completed in accordance with Illinois Administrative Code Title 35, Part 845, Standards for the Disposal of Coal Combustion Residuals (CCR) in Surface Impoundments (Part 845), by Gradient. With this technical memorandum, Golder summarizes the design basis and references used in developing the closure concepts evaluated by the Closure Alternatives Analysis.

## 1.0 GMF POND HISTORY

## 1.1 Existing Liner System Information

Golder reviewed several documents related to the design, construction, and operation of the GMF Pond. Notable documents included the History of Construction (AECOM 2016), the Gypsum Stack Acceptance Report (Hanson 2009a), and the Initial Facility Report Volumes 1–4 (Hanson 2009b). Based on review of these documents, a dual composite liner system with a leak detection layer was installed for the GMF Pond consisting of (from top to bottom):

- primary composite liner
  - Solmax 460T-1000 60-mil textured high-density polyethylene (HDPE) geomembrane
  - 1-foot cushion dirt layer (2 feet in select areas on the sideslopes)
- leak detection layer
  - SKAPS GT-142 4-oz/yd$^2$ geotextile separator
  - 1-foot granular drainage layer
  - SKAPS GE-110 10-oz/yd$^2$ geotextile cushion
- secondary composite liner
  - Solmax 460T-4013 60-mil textured HDPE geomembrane

**Golder Associates Inc.**

Golder and the G logo are trademarks of Golder Associates Corporation

- CETCO Bentomat SDN reinforced geosynthetic clay liner (GCL)
- 3-foot compacted clay layer placed in 8-inch lifts, compacted to at least 95% of the standard Proctor maximum dry density at a moisture content between the standard Proctor optimum moisture content (OMC) and 5% wet of the OMC

According to the Acceptance Report (Hanson 2009a), the liner system was subjected to a rigorous construction quality assurance (CQA) program.

The GMF Pond was constructed by excavating the natural ground a minimum of 5.4 feet to reach foundation grades. During preparation of the foundation grades, unsuitable sand materials were removed from several areas and stockpiled separately. These areas were then backfilled with suitable material previously stockpiled or locally available. Backfilled areas were compacted to at least 95% of the standard Proctor maximum dry density at a moisture content within 2% of the OMC. Eight Shelby tube samples collected from the foundation grade berms were used for hydraulic conductivity testing, with results ranging from $2.2 \times 10^{-8}$ centimeters per second (cm/s) to $1.0 \times 10^{-7}$ cm/s.

After certification of the foundation grades, the 3-foot compacted clay layer was constructed in 8-inch lifts. Eighteen Shelby tube samples were collected during construction. Hydraulic conductivity results from tests on the Shelby tube samples ranged from $8.6 \times 10^{-9}$ cm/s to $9.8 \times 10^{-7}$ cm/s, significantly less than the construction specification of $1.0 \times 10^{-4}$ cm/s. The compacted clay layer was proof rolled prior to installation of the overlying GCL.

After placement of the compacted clay layer, geosynthetic components of the secondary liner system were installed. Certified properties for the geosynthetic materials are provided in the Geosynthetics Quality Assurance Report (Feezor 2009).

A leak detection layer with leachate collection and recovery system (LD/LCRS) was installed above the lower geomembrane. The LD/LCRS included a 10-oz/yd$^2$ geotextile overlain by a 1-foot granular drainage layer with 6-inch- and 12-inch-diameter HDPE piping embedded. Laboratory hydraulic conductivity test results for the granular drainage layer soil ranged from $1.5 \times 10^{-2}$ to $5.7 \times 10^{-2}$ cm/s. Test reports from hydraulic conductivity and particle-size distribution testing are provided in the Acceptance Report (Hanson 2009a). The piping within the LD/LCRS directs leachate to two sumps at the toe of the south berm of the GMF Pond, with risers to facilitate removal of leachate. A 4-oz/yd$^2$ geotextile was installed above the 1-foot granular drainage layer. Certified properties for the geosynthetic materials are provided in the Geosynthetics Quality Assurance Report (Feezor 2009).

A 1-foot cushion soil layer compacted to at least 90% of the standard Proctor maximum dry density was placed above the 4-oz/yd$^2$ geotextile. According to the Acceptance Report (Hanson 2009a), the layer was constructed of general fill transported from a stockpile or borrow to the work area by truck and graded with a dozer to a depth of approximately 1 foot. The local stockpiles generally consisted of fine-grained soils, predominantly low-plasticity silts and clays (classified as CL and ML under the United Soil Classification System [USCS]). The cushion layer was then overlain by a 60-mil HDPE geomembrane constructed with the same installation specifications as the lower geomembrane. Certified properties for the upper geomembrane are provided in the Geosynthetics Quality Assurance Report (Feezor 2009).

In addition to the dual composite liner system, the GMF Pond has a ring drain system above the primary liner system that was used to recover and recycle water used for hydraulic conveyance of gypsum to the GMF Pond. The ring drain system consists of a rectangular array of 6-inch-diameter perforated HDPE pipe installed above the

upper geomembrane around the perimeter of the GMF Pond floor. The pipe is surrounded by coarse aggregate and wrapped in a geotextile. The ring drain pipe network directs water to five sumps (one each along the toes of the north, east, and west embankments and two along the toe of the south embankment).

## 1.2 Operational History

The GMF Pond was constructed between 2007 and 2009 and was put into operation in 2009. The GMF Pond was used to store gypsum and to clarify gypsum transport water for reuse in the wet scrubber system until DCPP was retired in December 2019. Gypsum was hydraulically conveyed to the GMF Pond at approximately 20% solids (Hanson 2009b). It was deposited from the north end of the GMF Pond and in the northwest corner, which formed a delta or beach of built-up gypsum in these locations during the operational life. The gypsum would build up to the water level and then expand laterally (rather than vertically) due to the relatively weak nature of the subaqueous gypsum. During the operational life, the beach expanded so that roughly one-third of the GMF Pond footprint had gypsum built up to the typical water level. The water level was (and still is) controlled by an overflow channel at the southeast corner of the GMF Pond. The overflow elevation was adjustable and could be as low as El. 614 feet or as high as approximately El. 616 feet. Water decanted (or was siphoned early in the life of the GMF Pond) from the GMF Pond into the Recycle Pond, which is located immediately south of the GMF Pond. A set of pumps situated on the west side of the Recycle Pond was used to transfer the decanted water back to the wet scrubber system for reuse. The Operation and Maintenance Manual for the GMF Pond provides additional information and is included in the History of Construction (AECOM 2016).

It is Golder's understanding that the pumps for the LD/LCRS are controlled by the hydraulic head in the 1-foot granular drainage layer (i.e., they only operate when there has been enough infiltration into the LD/LCRS to build up the hydraulic head to a trigger level) and that the pumps have rarely needed to operate. This anecdotal information suggests that the primary composite liner is intact and provides an effective barrier to infiltration from the GMF Pond and that the secondary composite liner is intact and provides an effective barrier to lateral infiltration.

## 1.3 Type and Volume of Materials

Based on Golder's comparison (using Autodesk Civil 3D) of the existing conditions (December 2020 survey by IngenAE) and the approximate top-of-liner-system grades developed from the as-built top of cushion layer (Hanson 2009a), approximately 400,000 cubic yards (cy) of gypsum are present in the GMF Pond. The GMF Pond footprint is approximately 31 acres, with approximately 60,800 cy of cushion dirt, 55,500 cy of granular drainage material, and 166,500 cy of compacted clay used in construction of the GMF Pond.

The wet scrubber system used for flue gas desulfurization at DCPP produced synthetic gypsum (calcium sulfate). The synthetic gypsum is generally of the same chemical structure as natural gypsum. Because the material was sluiced, the particle-size distribution of the gypsum in the GMF Pond is expected to be variable, becoming finer with increased distance from the deposition locations. Based on geotechnical testing Golder conducted on a composite of three samples of gypsum collected near the north end of the GMF Pond, the material is non-plastic with more than 97% by weight passing the No. 200 sieve (ML under the USCS) and a specific gravity of 2.66. Slurry consolidation testing conducted by Golder on a reconstituted sample of gypsum from the GMF Pond indicated a range of hydraulic conductivities from $6 \times 10^{-5}$ cm/s to $1 \times 10^{-4}$ cm/s under typical confining stresses in the GMF Pond.

## 1.4 Water Levels

At the time of the December 2020 survey by IngenAE, the water level in the GMF Pond was at El. 613.9 (North American Vertical Datum of 1988). Although the water level would be expected to respond to wet or dry climate conditions, this water level is likely typical for the GMF Pond. Based on this water level, approximately 95% of the gypsum in the GMF Pond is below the water level. Based on Golder's site observations, gypsum below the water level can be considered saturated. The gypsum above the water level forms a plateau at the north end of the GMF Pond with the highest point at approximately El. 616 feet. Based on Golder's site observations, gypsum above the water level is moist, but not saturated, and is capable of supporting foot traffic, but likely not equipment traffic without dewatering.

# 2.0 CLOSURE CONCEPT INFORMATION

To provide necessary information for the Closure Alternatives Analysis, Golder developed a closure concept that would involve closure with CCR remaining in place and a closure concept that would involve closure by removal of CCR. These closure concepts are described in this section.

## 2.1 Closure in Place

### 2.1.1 Final Cover System Materials

For closure with CCR in place, Part 845 requires installation of a final cover system over the CCR. Based on a demonstration to be submitted to the Illinois Environmental Protection Agency for approval pursuant to Section 845.750(c)(2), an alternative final cover system is incorporated into the closure-in-place concept. The final cover system consists of (from top to bottom):

- 2-foot final protective layer—locally available soils compacted to between 80% and 95% of the standard Proctor maximum dry density for establishment of vegetation and protection of the underlying geomembrane. Material is likely to be primarily low-plasticity silt or clay based on review of site geotechnical information (e.g., Hanson 2009b).
- Geocomposite.
- 40-mil LLDPE geomembrane.

To the extent possible, the gypsum would be graded to achieve final cover subgrade, and the final cover system would be constructed directly on the gypsum surface in most areas. Compacted fill, composed of locally available soils, would be placed only as needed to achieve final cover subgrade. The compacted fill is anticipated to be compacted to a minimum of 95% of the standard Proctor maximum dry density to provide a firm subgrade.

### 2.1.2 Closure Construction Plan

Conceptual final cover system grades and details are shown in Exhibit 1. The closure-in-place concept was developed to reduce the waste footprint at closure, while also recognizing the complications associated with handling and stacking wet gypsum materials. The proposed closure-in-place option would have final cover slopes of 4% to accommodate moderate settlement, with a berm constructed at the south end of the consolidated footprint to enhance stability. The location of the berm has been selected to accommodate the estimated volume

of gypsum to be contained within the consolidated footprint based on the grading plan presented. The general sequencing plan for the closure-in-place option is as follows:

- Pump out ponded water from the GMF Pond. Approximately 112 million gallons of water was contained in the GMF Pond as of the December 2020 survey by IngenAE, not including the pore water within the roughly 400,000 cy of gypsum. Pumping out the ponded water will enable gravity drainage of the gypsum to begin, but there will be a significant amount of saturated material that will need to be relocated.
- Once the ponded water has been removed from the GMF Pond, shallow gypsum zones in the consolidated footprint will be dewatered as needed to enable equipment trafficking. Gypsum south of the consolidated footprint will be dewatered as needed to enable relocation. Free liquids in the gypsum will be eliminated by removing liquid wastes or solidifying gypsum remaining in place.
- Gypsum will be removed from the berm footprint and relocated into the consolidated footprint. The berm will be constructed in an east-west orientation at the south end of the consolidated footprint. The upstream face of the berm will be lined with a composite liner system consisting of a 60-mil HDPE geomembrane overlying a compacted clay layer, which will tie into the existing dual composite liner system.
- The remaining gypsum south of the berm will be collected and deposited north of the berm.
- Geosynthetic components of the existing dual composite liner system south of the berm will be removed and hauled away for disposal. Soil materials that must be removed to expose the geosynthetic layers will be stockpiled on site.

Ponded water removal from the GMF Pond will be a significant effort. Removal of the ponded water at the GMF Pond may take three to six months, depending on pumping rates, operating hours, and weather conditions. Once the ponded water is removed, Golder anticipates that the removal of liquid waste will take 12 to 18 months. The final cover system could be installed during the following construction season.

### 2.1.3 Stormwater Management

Stormwater runoff from the GMF Pond closure area will be managed by sheet flow off the cover system. Runoff will be routed into existing drainage channels northeast and southeast of the GMF Pond. A new channel will be excavated along the northern perimeter of the consolidated footprint to route water into the existing drainage channel northeast of the GMF Pond. To prevent impoundment of water in the south end of the current GMF Pond footprint, existing earthen embankments will be removed in the southeast corner of the GMF Pond and in the Recycle Pond to allow stormwater to passively flow into the existing drainage southeast of the GMF Pond. No new stormwater management ponds or other features would be needed for closure.

## 2.2 Closure by Removal

Under the closure-by-removal option, the gypsum in the GMF Pond will be dewatered and all gypsum will be hauled by truck from the GMF Pond to the existing permitted on-site landfill located approximately 1 mile north of the GMF Pond. Alternatively, the gypsum may be disposed of at an off-site landfill approximately 33 miles away. Additionally, the dual composite liner system described in Section 1.1 will be removed as required under 845.740(a) and disposed. Subsoil beneath the liner system will be excavated to a depth of up to 1 foot and disposed. Additional details on the closure-by-removal option are shown in Exhibit 2.

### 2.2.1 Material Removal Phasing

To completely remove the gypsum material from the GMF Pond, the gypsum will need to be dewatered. As described in Section 2.1.2, removal of ponded water from the GMF Pond is expected to take several months. After removal of the ponded water, the gypsum will still be unsuitable for supporting heavy construction traffic over much of the footprint. Careful planning will be required to safely remove the wet gypsum from the GMF Pond. The gypsum removal will likely be accomplished in phases, relying on a series of trenches to facilitate dewatering of the material. The trenches will shorten drainage routes to facilitate gravity dewatering of gypsum in the vicinity of each trench and will direct the water to sumps from which the water can be pumped. Exact dewatering means and methods would be determined by the gypsum removal contractor. The dewatering and closure-by-removal concept evaluated in the Closure Alternatives Analysis follows:

- Pump out ponded water from the GMF Pond. Approximately 112 million gallons of water was contained in the GMF Pond as of the December 2020 survey by IngenAE, not including the pore water within the roughly 400,000 cy of gypsum. Pumping out the ponded water will enable gravity drainage of the gypsum to begin, but there will be a significant amount of saturated material that will need to be relocated.
- Excavate a series of trenches from north to south in the gypsum. Conceptually, the trenches may be on the order of 5 feet deep at regular spacing (potentially every 50 feet) and graded to allow water to drain to the south. Sumps in the trenches along the south end of the gypsum deposit will be used to collect water, which will be pumped from the GMF Pond to the Recycle Pond. The trenches will remain open until the top layer of gypsum across the GMF Pond is sufficiently dewatered to enable removal and transport without producing free water when disturbed. This process will repeat until all gypsum has been removed from the GMF Pond. Each layer may take several weeks or months to dewater and remove. Active dewatering or multiple handling of the gypsum may be an option to expedite the closure construction. The ring drain system may also be used to facilitate dewatering of the gypsum.
- Once all gypsum has been removed from the GMF Pond, the existing dual composite liner system described in Section 1.1 will be removed as required under 845.740(a). The earthen and geosynthetic materials will be disposed in a permitted landfill.
- A tentative schedule for the closure-by-removal process is:
  - three to six months to pump ponded water out of the GMF Pond
  - between one and two construction seasons to dewater and remove saturated gypsum
  - one or two construction seasons to remove the existing liner system and establish final reclamation grades, depending on on-site or off-site disposal

### 2.2.2 Surface Reconstruction

Once the GMF Pond is completely dewatered and all gypsum has been removed, the site will be reconfigured to allow passive surface water flow. Earthen embankments in the southeast corner of the GMF Pond and in the Recycle Pond will be removed to allow surface water to flow into an existing drainage channel southeast of the GMF Pond.

### 2.2.3 Stormwater Management

Surface water will shed to the south across the footprint and will be directed to an existing drainage southeast of the GMF Pond. To prevent impoundment of water in the south end of the footprint, existing earthen embankments will be removed in the southeast corner of the GMF Pond and in the Recycle Pond to allow stormwater to passively flow into the existing drainage southeast of the GMF Pond. No new stormwater management ponds or other features would be needed for closure.

## 3.0 ADDITIONAL INFORMATION

Gradient provided a request for additional information to support the Closure Alternatives Analysis. The additional information compiled by Golder in response to the request is provided in Tables 1 through 4. Table 1 provides narrative responses for information requests based largely on Part 845 requirements for the Closure Alternatives Analysis. Table 2 summarizes conceptual-level estimates of material quantities, costs, equipment and vehicle usage, labor resources, and haul truck trips for the closure-in-place approach. Table 3 summarizes conceptual-level estimates of material quantities, costs, equipment and vehicle usage, labor resources, and haul truck trips for the closure-by-removal approach with disposal in a permitted on-site landfill, which would require an approximate 2-acre expansion to the existing on-site landfill. Table 4 summarizes conceptual-level estimates of material quantities, costs, equipment and vehicle usage, labor resources, and haul truck trips for the closure-by-removal approach with disposal in an off-site landfill.

In accordance with Part 845, the cost estimates meet the criteria for a Class 4 estimate under the AACE classification standard (feasibility-level, -30% to +50% expected accuracy range). Cost estimates are presented in 2022 United States dollars. cost estimates for many of the cost components, whereby a labor and heavy equipment spread was assigned to the activity. That is, the number and classification (e.g., operator, laborer) of personnel carrying out the activity and the number and type of heavy equipment pieces (e.g., dozer, loader, haul truck) was estimated based on our experience with similar construction operations. This information, combined with an estimate of production rate (e.g., number of cubic yards placed per day), yields a unit cost for the operation (e.g., cost per cubic yard placed). Golder developed production rates based on equipment capabilities (e.g., haul truck capacity, estimated load and unload times, estimates of average speed) and checked them against experience from similar projects. The hourly heavy equipment rates used in the cost estimates were from an internal database of heavy equipment ownership and operating costs by type and size (capacity) of equipment. The internal database reflects the estimated cost associated with owned heavy equipment in the central United States. The hourly labor rates used in the cost estimates were from an internal database of typical labor rates from similar projects in the north-central United States. Unit prices for some cost components (e.g., furnishing and installation of geosynthetics, seeding and mulching) were estimated based on typical unit prices from similar recent projects. Material quantities correspond with the closure approaches shown in Exhibits 1 and 2 and were developed primarily in Autodesk Civil3D. At a conceptual level of cost estimating, project costs other than direct construction costs (e.g., mobilization and demobilization, miscellaneous construction items not captured elsewhere) were estimated as a proportion of the direct construction cost. Experience on similar projects was used as the basis for the proportions applied.

# Tables

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Background/Current Site Conditions | |
|---|---|
| Surface area of impoundment | 30.8 acres |
| Volume of CCR in impoundment | 400,000 cy |
| Published or draft engineering evaluations undertaken at the site to date | |
| Conceptual site models | Refer to the Groundwater Modeling Report. |
| Regional well (receptor) survey information | Refer to the Groundwater Modeling Report. |
| History of construction report | See [1]. |
| Dike stability report | Observations and stability factors of safety described by AECOM [2] and [3] were adequate. |
| Hydraulic evaluation of basins (evaluation of possibility of overtopping and/or emergency spillway releases during flood conditions) | Hydraulic and hydrologic analyses performed by AECOM [4] found that the geomembrane-lined spillway can adequately manage flow during peak discharge from the 1,000-year storm event without overtopping of the embankments. This also means that the spillway is adequate to carry sustained flows. |
| Surface impoundment hazard assessment/hazard category determination | A hazard potential classification assessment performed by Stantec [5] found the GMF Pond to have significant hazard potential. 40 CFR 257.53 defines a significant hazard potential CCR surface impoundment as a diked surface impoundment for which failure or misoperation would result in no probable loss of human life but could cause economic loss, environmental damage, disruption of lifeline facilities, and/or impact other concerns. |
| Habitat survey | During site development, it was confirmed that the site did not contain wild or scenic rivers (per the National Park Service), the facility did not restrict the flow of a 100-year flood, the site did not qualify for listing on the National Register of Historic Places (per the Illinois Historic Preservation Agency), the site did not pose a threat to a dedicated nature preserve persuant to the Illinois Natural Areas Preservation Act (per the Illinois Nature Preserves Commission), and there were no records of the presence of endangered/threatened species or natural areas in the vicinity of the facility [6]. |
| Wetlands survey | In March and May of 2007, field surveys were conducted to determine and delineate the existence of any potential wetland areas in accordance with the 1987 Corps of Engineers Wetland Delineation Manual. It was determined that six unnamed tributaries, a linear ditch wetland, and two headwater drainages were within the facility boundary. No defined hydrologic connection to Duck Creek was identified, so these were determined to be isolated waters and wetlands and not regulated under the Clean Water Act [6]. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Closure Design and Implementation | |
|---|---|
| Copy of draft of closure report, if available | Provided. |
| Engineering spreadsheet containing breakdown of labor, equipment/vehicle, and material requirements for each closure alternative, if available (expected on-site and off-site vehicle and equipment mileages, labor hours, etc.) | See Tables 2 through 4. |
| Overview of planned activities under each closure alternative | Closure in place: Under this scenario, gypsum will be contained in the northern portion of the GMF Pond, which will necessitate relocation of gypsum currently in the southern portion of the GMF Pond to this final containment area, followed by final cover installation. The general sequence is:<br>-Ponded water will be pumped out of the GMF Pond. Approximately 112 million gallons of water was contained in the GMF Pond as of the December 2020 survey by IngenAE, not including the pore water within the roughly 400000 cy of gypsum. Pumping out the ponded water will allow gravity drainage of the gypsum to begin.<br>-Gypsum within the final containment area will be dewatered using trenches and sumps and possibly the existing ring drain system.<br>-Once the ponded water has been removed from the GMF Pond, a berm will be constructed across the GMF Pond in an east-west orientation at the south end of the final containment area. Gypsum in the berm footprint will need to be removed before the berm is constructed. The upstream face of the berm will be lined with a composite liner system, which will tie into the existing dual liner system.<br>-The remaining gypsum south of the berm will be collected and deposited north of the berm.<br>-Geosynthetic components of the existing dual composite liner system south of the berm will be removed and disposed in the closure footprint. Soil materials between these components will be removed and stockpiled south of the GMF Pond.<br>-Compacted fill will be used as needed to achieve subgrade and a final cover system consisting of the following components (from top to bottom) will be constructed over the final containment area:<br>-2-foot-thick final protective layer composed of locally available soils<br>-Geocomposite<br>-40-mil LLDPE geomembrane<br>-A channel will be excavated, including removal of sections of the perimeter embankment around the Recycle Pond, to allow surface water flow into an existing drainage channel southeast of the GMF Pond. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Closure Design and Implementation | |
|---|---|
| Overview of planned activities under each closure alternative | Closure by removal: Under this scenario, the gypsum in the GMF Pond will be dewatered and hauled by truck from the GMF Pond to the existing permitted on-site landfill, which will require a 2-acre expansion, or to a permitted off-site landfill. Additionally, the existing dual composite liner system will be removed as required under Part 845.740(a). The general sequence is:<br>-Ponded water will be pumped out of the GMF Pond. Approximately 112 million gallons of water was contained in the GMF Pond as of the December 2020 survey by IngenAE, not including the pore water within the roughly 400000 cy of gypsum. Pumping out the ponded water will allow gravity drainage of the gypsum to begin.<br>-A series of trenches will be excavated from north to south in the gypsum. The trenches will likely be on the order of 5 feet deep at regular spacing (such as every 50 feet) and graded to allow water to drain to the south. Sumps will be excavated in the trenches along the south end of the gypsum deposit to collect water, which will be pumped from the GMF Pond to the Recycle Pond. The trenches will remain open until the surrounding gypsum is sufficiently dewatered to enable removal and transport without producing free water. This process will repeat until all gypsum has been removed from the GMF Pond. Each layer may take several weeks or months to dewater and remove. The ring drain system may also be used to facilitate dewatering of the gypsum.<br>-Once all gypsum has been removed from the GMF Pond, the existing dual composite liner system will be removed and the subsoil will be overexcavated up to an additional 1 foot. The geosynthetic materials and soils will be disposed in the on-site landfill or in an off-site landfill.<br>-A channel will be excavated, including removal of sections of the perimeter embankment around the Recycle Pond, to allow surface water flow into an existing drainage channel southeast of the GMF Pond. |
| Expected duration of major construction activities under each closure activity | Closure in place: Approximately three years. Removal of ponded water from the GMF Pond may take 3 to 6 months, depending on pumping rates, operating hours, and weather conditions. Once the ponded water is removed, it is anticipated that the removal of liquid waste will take 12 to 18 months. It is anticipated that final cover construction and establishment of final grades efforts could be completed during the following construction season. |
| | Closure by removal: Approximately three years for on-site disposal and four years for off-site disposal. Removal of ponded water from the GMF Pond may take 3 to 6 months, depending on pumping rates, operating hours, and weather conditions. Expansion of the existing landfill can take place during this time. It is anticipated that dewatering and removal of the gypsum will take one or two construction seasons for on-site disposal or two full years for off-site disposal. It is anticipated that removal of the dual composite liner system and establishment of final grades will require an additional construction season for on-site disposal or 18 months for off-site disposal. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Closure Design and Implementation | |
|---|---|
| If an on-site landfill will be constructed on the site under a given closure alternative, please include the years required to construct and later close the on-site landfill | Closure in place: Not applicable. The existing permitted on-site landfill has sufficient capacity to accept waste generated from closure in place without expansion of the existing landfill or construction of a new on-site landfill. |
| | Closure by removal: If disposal will be on site, the landfill expansion could be completed in a single construction season. Landfill closure could be completed in a single construction season following closure of the GMF Pond. |
| If an on-Site landfill must first be constructed on the Site, please estimate the anticipated delay in the commencement of excavation activities while the landfill is being sited, designed, and constructed. Will dewatering/unwatering of the ponds begin immediately, or after the landfill is constructed? | Closure in place: Not applicable. |
| | Closure by removal: The landfill has already been sited and permitted, including the expansion area. Final design and construction of the expansion could be completed while removal of ponded water and gypsum dewatering are occurring at the GMF Pond. |
| Proposed location of the on-site landfill if on-site disposal is being considered for CBR scenario | The existing on-site landfill is approximately 1 mile north of the GMF Pond via site roads. |
| Surface area of the on-site landfill, if a new landfill must be constructed at the site | If a landfill expansion is required (on-site disposal), the additional surface area is estimated as 2 acres. |
| Name and location of proposed off-site landfill | If an off-site landfill were to be used, the Peoria City-County Landfill is the nearest suitable facility (33 miles away). An alternate off-site landfill is the Envirofill of IL Landfill. |
| Location of borrow area, if a borrow area will be established (for either the impoundment or construction/closure of an on-Site landfill). If location is unknown, please estimate a likely distance to the borrow area. | The anticipated on-site borrow source location is approximately 0.4 miles north of the GMF via site roads and approximately 0.7 miles south of the on-site landfill by site roads. |
| Estimated volume of soil to be hauled from the borrow area under each closure alternative | Closure in place: The amount of borrow material required is estimated as 73,800 cubic yards. |
| | Closure by removal: If a landfill expansion is not required, no borrow material will be needed. If a landfill expansion is required (on-site disposal), the maximum amount of borrow material required is estimated as 18,000 cubic yards. |
| Difficulty associated with implementation of each closure alternative (e.g., do any alternatives pose particular engineering/implementation challenges?) | Closure in place: Dewatering and relocation of gypsum will require considerable effort and time. Establishing the surface water drainage channel through the Gypsum Recycle Pond perimeter berm will be challenging because of the excavation depths involved. |
| | Closure by removal: Dewatering of the gypsum prior to removal will require considerable effort and time. Establishing the surface water drainage channel through the Gypsum Recycle Pond perimeter berm will be challenging because of the excavation depths involved. |
| Availability of necessary equipment and specialists for each closure alternative | Good availability of equipment and services is anticipated for all closure alternatives. |
| Available capacity and location of needed treatment, storage, and disposal services for each closure alternative | The distance to the nearest off-site landfill (approximately 33 miles) presents a significant challenge for the option that involves off-site disposal. |
| Estimated cost of each closure alternative | Closure in place: $6.2 million. |
| | Closure by removal: $8.9 million (on-site disposal); $82.4 million (off-site disposal). |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Post-Closure Plan/Long-Term Management Plan | |
|---|---|
| Planned duration of post-closure care activities | Closure in place: The owner or operator of the CCR surface impoundment must conduct post-closure care for 30 years. The owner or operator must continue to conduct post-closure care beyond the 30-year post-closure care period until groundwater monitoring data shows the concentrations are (a) below groundwater protection standards given in Section 845.600 of Part 845 or (b) not increasing for those constiuents over background using the statistical procedures and performance standards in Section 845.640(f) and (g), provided that concentrations have been reduced to the maximum extent feasible and they are protective of human health and the environment. |
| | Closure by removal: An owner or operator of a CCR surface impoundment that elects to close a CCR surface impoundment by removing CCR as provided in Section 845.740 must continue groundwater monitoring for three years after the completion of closure or until concentrations have been reduced to the maximum extent feasible and they are protective of human health and the environment. |
| Expected frequency of groundwater and surface water monitoring during post-closure period | Closure in place: Quarterly for 5 years and semi-annually thereafter. |
| | Closure by removal: Quarterly. |
| Expected frequency of inspections post closure | Monthly for the first year and annually thereafter [6]. |
| Summary of planned maintenance activities post-closure | Closure in place: Groundwater monitoring will be conducted. Site inspections will be conducted on a quarterly basis for a minimum of 5 years after closure. An annual site inspection will be performed until settlement has ceased and there are no eroded or scoured areas or until the end of the 30-year post-closure care period. Over these 30 years, repair and maintenance, including soil filling and reseeding, will be performed if ponding is observed, cracks greater than 1 inch wide or gullies 6 inches or deeper have formed, vegetative or vector problems arise, or leachate seeps are present. Areas susceptible to erosion will be recontoured and reseeded. Eroded and scoured drainage channels will be repaired and the liner material replaced if necessary. Vegetation will be mowed annually. Areas of failed or eroded vegetation in excess of 100 square feet will be revegetated. Minor repairs to ensure the integrity and proper function of fencing, surface water drainage features, monitoring points, and groundwater monitoring wells may be required. Leachate will be pumped from the leachate collection sumps into storage tanks or tanker trucks and transported to a wastewater treatment plant for treatment and disposal [6]. |
| | Closure by removal: Groundwater monitoring will be conducted. |
| Summary of planned post-closure care activities at the on-site landfill, if a new on-site landfill is going to be constructed | Not applicable. |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Drainage Soil - Landfill Expansion | CY | 3,200 | $ 17.00 | $ 54,400 | 2 equipment operators | Dozer, loader | |
| Leachate Collection System - Landfill Expansion | LS | 1 | $ 30,000 | $ 30,000 | 5 laborers | | |
| Construction Quality Assurance | LS | 1 | $ 75,000 | $ 75,000 | 1 to 2 technicians | 1 to 2 pickup trucks | |
| Miscellaneous Construction | LS | 1 | 10% | $ 799,960 | Miscellaneous | Miscellaneous | |
| | | | **Total** | **$ 8,874,560** | | | |

**Notes:**

Miscellaneous Construction includes other work not captured in the items shown.

Disposal was assumed to occur in the on-site landfill (1.2-mile haul).

Soil excavated for the stormwater channel was assumed to be stockpiled 0.4 miles from the excavation.

Soil components for landfill expansion except drainage soil (imported) were assumed to be taken from the stockpile north of the GMF (0.7-mile haul).

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 4: Closure Estimates - Closure by Removal with Off-Site Disposal**

| Description | Unit | Quantity | Unit Price | Total | Labor | Equipment | Truck Trips |
|---|---|---|---|---|---|---|---|

# Supporting Information for Closure Alternatives Analysis – Bottom Ash Basin at Duck Creek Power Plant

Electronic Filing: Received, Clerk's Office 06/20/2024

GOLDER
MEMBER OF WSP

# TECHNICAL MEMORANDUM

**DATE** January 25, 2022 **Reference No.** 21454861-12-R-0

**TO** Illinois Power Resources Generating, LLC

**FROM** Golder Associates USA Inc.

**SUPPORTING INFORMATION FOR CLOSURE ALTERNATIVES ANALYSIS – BOTTOM ASH BASIN AT DUCK CREEK POWER PLANT**

Golder Associates USA Inc. (Golder), a Member of WSP, has prepared this technical memorandum for Illinois Power Resources Generating, LLC (IPRG) to support the Closure Alternatives Analysis for the Bottom Ash Basin at Duck Creek Power Plant (DCPP). The Bottom Ash Basin was used to temporarily store and dewater sluiced bottom ash produced at DCPP and has not received bottom ash since the power plant was retired in 2019. The Closure Alternatives Analysis is being completed in accordance with Illinois Administrative Code Title 35, Part 845, Standards for the Disposal of Coal Combustion Residuals (CCR) in Surface Impoundments (Part 845) by Gradient. With this technical memorandum, Golder summarizes the design basis and references used in developing the closure concepts evaluated by the Closure Alternatives Analysis.

## 1.0 BOTTOM ASH BASIN HISTORY

### 1.1 Existing Liner System Information

Based on construction drawings by Sargent & Lundy (2007a), the existing liner system for the facility consists of (from top to bottom):

- 8 inches of reinforced concrete
- 1 foot of compacted clay, placed in 6-inch-thick lifts to at least 95% of the standard Proctor maximum dry density
- 60-mil HDPE geomembrane
- minimum 6 inches of prepared subgrade (presumably native soils) compacted to at least 95% of the standard Proctor maximum dry density

According to the Bottom Ash and Low Volume Sump Water Basin and Piping General Work Contract Specifications (Sargent & Lundy 2007b), the liner system was subjected to a rigorous construction quality assurance (CQA) program.

According to the technical specifications for the reinforced concrete layer from Sargent & Lundy (2007b), the concrete appears to have used a conventional mix design (28-day compressive strength of 4,000 pounds per square inch, water-to-cement ratio of 0.5 or less).

**Golder Associates Inc.**
7245 W Alaska Drive, Suite 200, Lakewood, Colorado, USA 80226 T: +1 303 980-0540 F: +1 303 985-2080

Golder and the G logo are trademarks of Golder Associates Corporation

The technical specifications for composite-lined ponds from Sargent & Lundy (2007b) required a hydraulic conductivity of 1 x $10^{-6}$ centimeters per second (cm/s) or less for the compacted clay.

According to the technical specifications for geomembrane liner from Sargent & Lundy (2007b), the geomembrane was specified to conform to GRI GM 13, which is a common HDPE geomembrane product for waste containment. According to the technical specifications (Sargent & Lundy 2007b), the CQA program for the liner system included destructive and non-destructive testing of geomembrane seams.

Based on borehole logs from the area of the Bottom Ash Basin (Hanson 2006), native soils at the subgrade elevations (roughly El. 568 to 580 feet) generally consist of clayey silt with trace sand (ML under the Unified Soil Classification System). The hydraulic conductivity of these soils at the degree of compaction required by the technical specifications ranged from 6.0 x $10^{-7}$ to 2.4 x $10^{-5}$ cm/s, with a geometric mean of 6.1 x $10^{-6}$ cm/s, in permeability testing reported by Hanson (2006).

## 1.2 Operational History

The Bottom Ash Basin is an incised CCR surface impoundment with reinforced concrete slopes and floor. It was used to manage sluiced bottom ash at DCPP from the time construction of the Bottom Ash Basin was completed in 2009 until the power plant was retired in December 2019. During operation, bottom ash was hydraulically conveyed (sluiced) from the power plant in 10-inch-diameter basalt-lined piping and deposited at the Bottom Ash Basin in one of the two western cells, known as Primary Pond 1 and Primary Pond 2. Coarse bottom ash particles settled by gravity in the cell where they were deposited, and the sluice water was decanted via 12-inch-diameter corrugated high-density polyethylene (HDPE) piping into the eastern cell, known as the Secondary Pond. Further gravity settling occurred in the Secondary Pond before the clarified water was decanted via 12-inch-diameter corrugated HDPE piping into the Discharge Canal, which flows into Duck Creek Reservoir, with discharge at a permitted outfall in accordance with the site's National Pollutant Elimination System (NPDES) permit. Bottom ash particles accumulated in Primary Pond 1 and Primary Pond 2, requiring periodic cleanout events. During cleanout events, mobile equipment was used to excavate bottom ash out of the cell, stage it on the concrete apron for dewatering as needed, and load it into trucks for beneficial reuse or permanent disposal at the on-site landfill. Primary Pond 1 and Primary Pond 2 could operate alternately, so that bottom ash could be deposited into one cell while the other cell was being cleaned out. When DCPP was retired, nearly all of the remaining bottom ash was removed and disposed, with no appreciable bottom ash remaining at the Bottom Ash Basin.

## 1.3 Type and Volume of Materials

The Bottom Ash Basin does not contain appreciable amounts of CCR. Precipitation is stored in the Bottom Ash Basin when it occurs.

# 2.0 CLOSURE CONCEPT INFORMATION

Although appreciable amounts of CCR are not present in the Bottom Ash Basin, two concepts have been developed regarding closure of the facility. The first option for closure of the Bottom Ash Basin is to leave the existing concrete structure and underlying liner system intact, place fill to establish positive surface water drainage, and construct a final cover system compliant with Part 845 (i.e., closure in place). The second option for the closure of the Bottom Ash Basin is to remove and dispose the existing liner system components and place fill to promote positive surface water drainage (i.e., closure by removal). Additional discussion of these concepts is presented in the following sections.

## 2.1 Closure in Place

Under this scenario, the liner system for the Bottom Ash Basin described in Section 1.1 is to remain in place. Because 845.740(a) requires removal of the liner system for closure by removal, Golder interprets that this concept would be subject to the requirements for closure in place (845.750), including installation of a final cover system, even though no CCR would remain in place. Fill will be brought in to reach subgrade elevations designed to promote positive drainage. The facility will then be closed as described in the following section.

### 2.1.1 Final Cover System Materials

For closure with CCR in place, Part 845 requires installation of a final cover system over the CCR. Based on a demonstration to be submitted to the Illinois Environmental Protection Agency for approval pursuant to Section 845.750(c)(2), an alternative final cover system is incorporated into the closure-in-place concept. The final cover system consists of (from top to bottom):

- 2-foot final protective layer—locally available soils compacted to between 80% and 95% of the standard Proctor maximum dry density for establishment of vegetation and protection of the geomembrane. Material is likely to be primarily low-plasticity silt based on review of site geotechnical information (Hanson 2006).
- Geocomposite.
- 40-mil linear low-density polyethylene (LLDPE) geomembrane.

Compacted fill, composed of locally available soils, would be placed as needed to achieve final cover subgrade. The compacted fill is anticipated to be compacted to a minimum of 95% of the standard Proctor maximum dry density to provide a firm subgrade.

### 2.1.2 Cover System Grades

The closure design consists of the final cover system covering the concrete-lined areas. The final cover system is sloped at a 2% grade, and then terminates at the edge of concrete. A 4H:1V slope composed of compacted fill ties the final cover system at the edge of concrete into existing ground. Cover system grades and details are provided in Figures 1 and 2.

### 2.1.3 Closure Construction Timeline

The closure construction will require approximately 10,750 cubic yards (cy) of import fill to reach subgrade, followed by installation of 87,500 square feet (sf) of geomembrane and geocomposite. Approximately 6,500 cy of soil fill will be installed for the final protective layer. The area is not currently ponding water, and significant dewatering is not anticipated prior to beginning closure construction. Based on these construction quantities, closure is anticipated to be completed in a single construction season, and a phased construction plan is unnecessary.

### 2.1.4 Stormwater Management

Stormwater runoff from the Bottom Ash Basin closure area will be managed by sheet flow off the cover system into an existing stormwater channel (Sargent & Lundy 2007a). Stormwater in this channel is routed into the existing Discharge Canal south of the Bottom Ash Basin. No new stormwater management ponds or features are planned for closure.

## 2.2 Closure by Removal

Under this scenario, the concrete, compacted clay, and geomembrane components of the liner system for the Bottom Ash Basin, as described in Section 1.1, will be removed as required under 845.740(a) and disposed of in the existing permitted on-site landfill located approximately 3.7 miles north of the Bottom Ash Basin. Alternatively, the materials may be disposed of at an off-site landfill approximately 33 miles away. Subsoil beneath the liner system will be excavated to a depth of up to 1 foot and disposed. Fill will be brought in to reach subgrade elevations designed to promote positive surface water drainage. The facility will then be closed as described in the following section.

### 2.2.1 Closure Materials

Because no appreciable amounts of bottom ash remain in the Bottom Ash Basin, once the concrete, compacted clay, geomembrane, and subsoil are removed, closure will consist of grading of the area to promote positive drainage and prevent significant ponding. The closed area will be seeded and mulched to promote long-term vegetation.

Based on a review of the soil materials available on site, the fill to reach closure grades is anticipated to consist of low-plasticity silts (Hanson 2006). To limit the potential for excessive settlement, the fill will be compacted to a minimum of 95% of the standard Proctor maximum dry density.

### 2.2.2 Closure Grades

Because no engineered final cover is necessary for this concept, the closure grades for the closure by removal option are lower in elevation compared to those shown for the closure in place concept. The final grades are still sloped at a 2% grade, and then terminate at the edge of concrete. A 4H:1V slope composed of compacted fill will be used to tie the final surface at the edge of concrete into existing ground. The plan grades and details for this concept are provided in Figures 3 and 4.

### 2.2.3 Closure Construction Timeline

The closure construction will require removal of approximately 1,950 cy of concrete, 1,600 cy of compacted clay, 3,200 cy of subsoil, and 1 acre of geomembrane. Approximately 17,500 cy of fill will be required to reach closure grades. No final cover system is needed for this closure scenario. The area is not currently ponding water, and significant dewatering is not anticipated prior to beginning closure construction. Based on these construction quantities, the closure is anticipated to be completed in a single construction season, and a phased construction plan was deemed unnecessary.

### 2.2.4 Stormwater Management

Stormwater runoff from the Bottom Ash Basin closure area will be managed by sheet flow off the final surface into an existing stormwater channel (Sargent & Lundy 2007a). Stormwater in this channel is routed into the existing Discharge Canal south of the Bottom Ash Basin. No new stormwater management ponds or features are planned for closure.

# 3.0 ADDITIONAL INFORMATION

Gradient provided a request for additional information to support the Closure Alternatives Analysis. The additional information compiled by Golder in response to the request is provided in Tables 1 through 4. Table 1 provides narrative responses for information requests based largely on Part 845 requirements for the Closure Alternatives Analysis. Table 2 summarizes conceptual-level estimates of material quantities, costs, equipment and vehicle usage, labor resources, and haul truck trips for the closure-in-place approach. Table 3 summarizes conceptual-

level estimates of material quantities, costs, equipment and vehicle usage, labor resources, and haul truck trips for the closure-by-removal approach with disposal in the existing permitted on-site landfill, which has ample remaining capacity to accept these materials. Table 4 summarizes conceptual-level estimates of material quantities, costs, equipment and vehicle usage, labor resources, and haul truck trips for the closure-by-removal approach with disposal in an off-site landfill.

In accordance with Part 845, the cost estimates meet the criteria for a Class 4 estimate under the AACE classification standard (feasibility-level, -30% to +50% expected accuracy range). Cost estimates are presented in 2022 United States dollars. cost estimates for many of the cost components, whereby a labor and heavy equipment spread was assigned to the activity. That is, the number and classification (e.g., operator, laborer) of personnel carrying out the activity and the number and type of heavy equipment pieces (e.g., dozer, loader, haul truck) was estimated based on our experience with similar construction operations. This information, combined with an estimate of production rate (e.g., number of cubic yards placed per day), yields a unit cost for the operation (e.g., cost per cubic yard placed). Golder developed production rates based on equipment capabilities (e.g., haul truck capacity, estimated load and unload times, estimates of average speed) and checked them against experience from similar projects. The hourly heavy equipment rates used in the cost estimates were from an internal database of heavy equipment ownership and operating costs by type and size (capacity) of equipment. The internal database reflects the estimated cost associated with owned heavy equipment in the central United States. The hourly labor rates used in the cost estimates were from an internal database of typical labor rates from similar projects in the north-central United States. Unit prices for some cost components (e.g., furnishing and installation of geosynthetics, seeding, and mulching) were estimated based on typical unit prices from similar recent projects. Material quantities correspond with the closure approaches shown in Exhibits 1 and 2 and were developed primarily in Autodesk Civil3D. At a conceptual level of cost estimating, project costs other than direct construction costs (e.g., mobilization and demobilization, miscellaneous construction items not captured elsewhere) were estimated as a proportion of the direct construction cost. Experience on similar projects was used as the basis for the proportions applied.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Background/Current Site Conditions | |
|---|---|
| Surface area of impoundment | 2.2 acres total (includes all three cells and the concrete area around the cells).<br>0.9 acres maximum wetted area. |
| Volume of CCR in impoundment | No appreciable amount (CCR has already been removed and disposed). |
| Published or draft engineering evaluations undertaken at the site to date | |
| Conceptual site models | None. |
| Regional well (receptor) survey information | None. |
| History of construction report | See [1] |
| Dike stability report | Stability analysis was not completed for the CCR Rule (volume is less than 20 acre-feet and height is less than 20 feet), according to AECOM [2]. Based on site observations, there is no risk associated with dike stability. |
| Hydraulic evaluation of basins (evaluation of possibility of overtopping and/or emergency spillway releases during flood conditions) | Hydraulic and hydrologic analyses performed by AECOM [3] found that the Bottom Ash Basin adequately manages outflow during the 25-year IDF, as overtopping of the BAB is not expected. |
| Surface impoundment hazard assessment/hazard category determination | Hazard category determination not completed for the CCR Rule (not required for incised CCR surface impoundments). |
| Habitat survey | Not available. |
| Wetlands survey | Not available. Based on visual observation, wetlands do not appear to be present in the area to be disturbed for closure construction. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Closure Design and Implementation | |
|---|---|
| Copy of draft of closure report, if available | Provided. |
| Engineering spreadsheet containing breakdown of labor, equipment/vehicle, and material requirements for each closure alternative, if available (expected on-site and off-site vehicle and equipment mileages, labor hours, etc.) | See Tables 2 through 4. |
| Overview of planned activities under each closure alternative | Closure by removal: Under this scenario, approximately 1950 cy of concrete, 1600 cy of compacted clay, and 1 acre of geomembrane that make up the BAB liner system, along with 3200 cy of overexcavated subsoil, will be removed and disposed in the on-site landfill or in an off-site landfill. Approximately 17500 cy of low-plasticity silts available on site will be used as fill to reach reclamation grades, and it will be compacted to at least 95% of the standard Proctor maximum dry density to prevent excessive settlement. The site will be graded to promote positive drainage and prevent significant ponding (2% grade to the edge of concrete, 4H:1V from edge of concrete to existing ground), and it will be seeded to promote long-term vegetation. |
| | Closure in place: Under this scenario, the concrete, compacted clay, and geomembrane that make up the BAB liner system will remain in place. Approximately 10750 cy of low-plasticity silt available on site will be used as fill to reach reclamation grades, and it will be compacted to at least 95% of the standard Proctor maximum dry density to prevent excessive settlement. The final cover system will be composed of (from top to bottom): 2 feet of locally available low-plasticity silt, compacted to between 80% and 95% of the standard Proctor maximum dry density; a drainage layer of approximately 87500 sq ft of geocomposite; and approximately 87500 sq ft of 40-mil LLDPE geomembrane. To promote drainage and prevent excessive ponding, the cover system will be sloped at a 2% grade to the edge of concrete, and compacted fill with a 4H:1V slope will extend from the edge of concrete to the existing grades. It will be seeded to promote long-term vegetation. |
| Expected duration of major construction activities under each closure activity | Closure by removal: 12 weeks. |
| | Closure in place: 6 weeks. |
| If an on-site landfill will be constructed on the site under a given closure alternative, please include the years required to construct and later close the on-site landfill | Not applicable. The existing permitted on-site landfill has sufficient capacity to accept waste generated from closure by removal without expansion of the existing landfill or construction of a new on-site landfill. |
| If an on-site landfill must first be constructed on the site, please estimate the anticipated delay in the commencement of excavation activities while the landfill is being sited, designed, and constructed; indicate whether dewatering/unwatering of the ponds will begin immediately, or after the landfill is constructed | Not applicable. |
| Proposed location of the on-site landfill if on-site disposal is being considered for CBR scenario | The existing on-site landfill is approximately 3.7 miles north of the Bottom Ash Basin via site roads. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Closure Design and Implementation | |
|---|---|
| Surface area of the on-site landfill, if a new landfill must be constructed at the site | Not applicable. |
| Name and location of proposed off-site landfill | If an off-site landfill were to be used, the Peoria City-County Landfill is the nearest suitable facility (33 miles away). An alternate off-site landfill is the Envirofill of IL Landfill. |
| Location of borrow area, if a borrow area will be established (for either the impoundment or construction/closure of an on-site landfill); if location is unknown, please estimate a likely distance to the borrow area | The anticipated on-site borrow source location is approximately 3.4 miles north of the Bottom Ash Basin via site roads. |
| Estimated volume of soil to be hauled from the borrow area under each closure alternative | Closure by removal: 18,000 cy. |
| | Closure in place: 17,000 cy. |
| Difficulty associated with implementation of each closure alternative (e.g., do any alternatives pose particular engineering/implementation challenges?) | No major challenges are anticipated for any closure alternative. |
| Availability of necessary equipment and specialists for each closure alternative | Good availability of equipment and services is anticipated for all closure alternatives. |
| Available capacity and location of needed treatment, storage, and disposal services for each closure alternative | The distance to the nearest off-site landfill (approximately 33 miles) presents a significant challenge for the option that involves off-site disposal. |
| Estimated cost of each closure alternative | Closure by removal: $480,000 (on-site disposal); $1,360,000 (off-site disposal). |
| | Closure in place: $500,000. |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1: Information Summary**

| Post-Closure Plan/Long-Term Management Plan | |
|---|---|
| Planned duration of post-closure care activities | Closure by removal: An owner or operator of a CCR surface impoundment that elects to close a CCR surface impoundment by removing CCR as provided in Section 845.740 must continue groundwater monitoring for three years after the completion of closure or until concentrations have been reduced to the maximum extent feasible and they are protective of human health and the environment. |
| | Closure in place: The owner or operator of the CCR surface impoundment must conduct post-closure care for 30 years. The owner or operator must continue to conduct post-closure care beyond the 30-year post-closure care period until groundwater monitoring data shows the concentrations are (a) below groundwater protection standards given in Section 845.600 of Part 845 or (b) not increasing for those constiuents over background using the statistical procedures and performance standards in Section 845.640(f) and (g), provided that concentrations have been reduced to the maximum extent feasible and they are protective of human health and the environment. |
| Expected frequency of groundwater and surface water monitoring during post-closure period | Closure by removal: Quarterly. |
| | Closure in place: Quarterly for 5 years and semi-annually thereafter. |
| Summary of planned maintenance activities post-closure | Closure by removal: Groundwater monitoring will be conducted. |
| | Closure in place: Groundwater monitoring will be conducted. Site inspections will be conducted on a quarterly basis for a minimum of 5 years after closure. An annual site inspection will be performed until settlement has ceased and there are no eroded or scoured areas or until the end of the 30-year post-closure care period. Over these 30 years, repair and maintenance, including soil filling and reseeding, will be performed if ponding is observed, cracks greater than 1 inch wide or gullies 6 inches or deeper have formed, vegetative or vector problems arise, or leachate seeps are present. Areas susceptible to erosion will be recontoured and reseeded. Eroded and scoured drainage channels will be repaired and the liner material replaced if necessary. Vegetation will be mowed annually. Areas of failed or eroded vegetation in excess of 100 square feet will be revegetated. Minor repairs to ensure the integrity and proper function of fencing, surface water drainage features, monitoring points, and groundwater monitoring wells may be required. |
| Summary of planned post-closure care activities at the on-site landfill, if a new on-site landfill is going to be constructed | Not applicable. |

| Corrective Measures Assessment | |
|---|---|
| Corrective measures being considered post-closure | None anticipated. |
| Overview of planned activities for each corrective measure | None anticipated. |

# Technical Memorandum

| | |
|---|---|
| Date: | January 25, 2022 |
| To: | Victor Modeer, P.E., DGE |
| Copies to: | Phil Morris, Rhys Fuller |
| From: | John Seymour, P.E., Geosyntec Consultants (Geosyntec) |
| Subject: | Proposed Alternative Final Protective Layer Equivalency Demonstration<br>Hennepin East Ash Pond and Duck Creek GMF Pond CCR Surface Impoundments<br>Geosyntec Project: GLP8026 |

## PROPOSAL

An alternative final protective layer is proposed by Dynegy Midwest Generation, LLC (DMG) for surface impoundments closed in place for the Hennepin Power Plant (HPP) East Ash Pond (EAP) and by Illinois Power Resources Generating, LLC (IPRG) for the Duck Creek Power Plant (DCPP) Gypsum Management Facility (GMF) Pond. The closure will be in accordance with IAC Part 845 Rule [1] (Part 845). Overall, the proposal will meet the requirements of Section 845.750 c) 2).

This Technical Memorandum presents a demonstration that a 2-foot-thick alternative final protective layer consisting of an 18-inch-thick soil layer and a 6-inch layer of topsoil provide equivalent or superior performance to the default protective layer set forth in Section 845.750 c) 2). The alternative final protective layer works in combination with an underlying low permeability (geomembrane) layer in place of the default three-foot thick, low permeability compacted earth layer. In addition, a cushion layer consisting of a geotextile (at HPP EAP) or a drainage layer consisting of a geocomposite (at DCPP GMF) are placed on top of the geomembrane prior to installation of the final protective layer. The combination of the above materials comprises the final “alternative final cover system”.

A discussion of how the closure, including the proposed alternative final cover system discussed herein, meets the performance standards is contained in the Closure Plan, which includes the Closure Alternatives Assessment required by Section 845.710.

Electronic Filing: Received, Clerk's Office 06/20/2024

**REQUIREMENTS OF SECTION 845**

Section 845.750 provides requirements for both the final protective layer and underlying low permeability layer. They work in tandem to provide protection of groundwater and surface exposure conditions. A principal intention of the low permeability layer is to reduce the infiltration of liquid through the final cover system and into the CCR waste mass during post-closure conditions, in accordance with Section 845.720 (a), which states in part:

> *The owner or operator of a CCR surface impoundment must ensure that, at a minimum, the CCR surface impoundment is closed in a manner that will*:
>
> *1) Control, minimize or eliminate, to the maximum extent feasible, post-closure infiltration of liquids into the waste and releases of CCR, leachate or contaminated run-off to the ground or surface waters or to the atmosphere;*

Specific default requirements for the final cover system are included in Section 845.750(c), which requires the final cover system to have either: 1) a three-foot thick soil low permeability compacted earth layer overlain by a three-foot-thick final protective layer (final protective layer), or 2) a geomembrane low permeability layer with a three-foot-thick final protective layer.

The specific Section 845.750 (c) (2) design requirements for the final protective layer are as follows (emphasis added):

> *Standards for the Final Protective Layer: The final protective layer must meet the following requirements,* ***unless the owner or operator demonstrates that another final protective layer construction technique or material provides equivalent or superior performance to the requirements of this subsection (c)(2)*** *and is approved by the Agency.*

Therefore, Section 845.750 (c) (2) specifically allows the use of an alternate final protective layer as long as it provides an equivalent or superior performance to the default standards set forth in Section 845.750(c)(2), which are as follows:

*A) Cover the entire low permeability layer;*

*B) Be at least three feet thick, be sufficient to protect the low permeability layer from freezing, and minimize root penetration of the low permeability layer;*

*C) Consist of soil material capable of supporting vegetation;*

*D) Be placed as soon as possible after placement of the low permeability layer; and*

Electronic Filing: Received, Clerk's Office 06/20/2024

*E) Be covered with vegetation to minimize wind and water erosion.*

The alternate design is only requesting an alternate to Section 845.740(c)(2)(B) related to the thickness of the of the final protective layer.

**PROPOSED FINAL COVER SYSTEM SUMMARY**

The proposed final cover systems for each site will include:

- A low permeability layer consisting of a linear low-density polyethylene (LLDPE) geomembrane that is at least 40-mil in thickness, placed on a smooth CCR subgrade.
- A geosynthetic cushion layer, such as a needle-punched, nonwoven geotextile (HPP EAP), or a geocomposite drainage layer (DCPP GMF), on top of the geomembrane.
    - The geocomposite drainage layer is comprised of a high-density polyethylene (HDPE) geonet covered with a geotextile filter fabric (typically a needle-punched, non-woven geotextile fabric)
- A final protective layer consisting of 18 inches of protective cover soil with a 6-inch layer of topsoil capable of supporting vegetation.

The final protective layer will meet all Section 845.750(c)(2) criteria, will not need any supplemental engineering measures, and will be designed by a qualified professional engineer licensed in Illinois.

The concepts of the alternative cover system are illustrated on **Figure 1**.

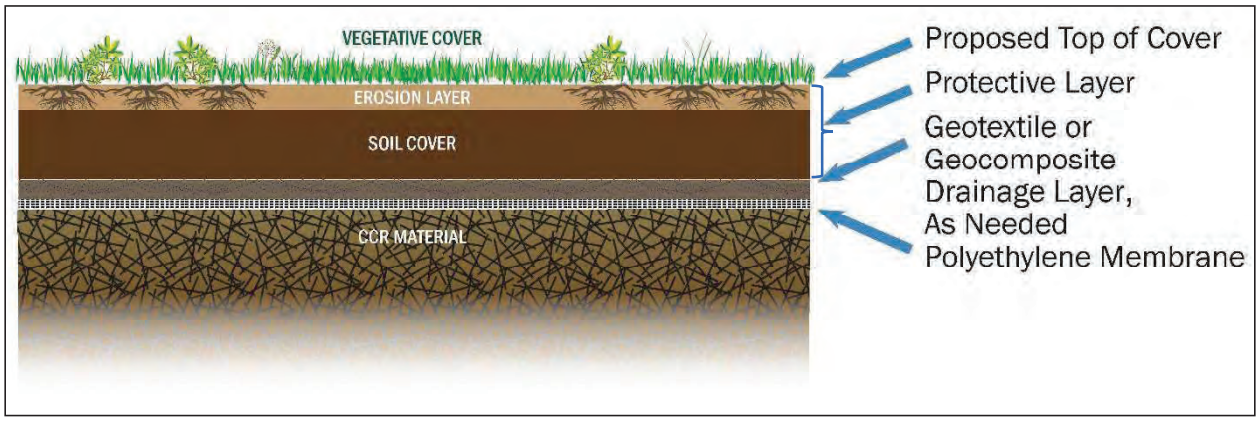

**Figure 1: Proposed Alternative Final Cover System**

Electronic Filing: Received, Clerk's Office 06/20/2024

**DEMONSTRATION**

The proposed alternate final protective layer will address the five requirements of Section 845.750 (c)(2)(A) to (E), as described in this section.

*Section 845.750(c)(2)(A) Cover the entire low permeability layer*

The final protective layer will horizontally cover the entire low-permeability layer, as indicated in the following drawings for each CCR surface impoundment:

- Duck Creek GMF Pond: Closure-in place drawings 4, 5, and 6 within Attachment 2 to the Closure Plan [2].
- Hennepin East Ash Pond: Drawings C-101, C-102, and C-103 within Attachment C to the Closure Plan [3].

Therefore, the use of the two-foot-thick final protective layer will meet the minimum requirements of Section 845 750(c)(2)(A) because it will completely cover the low-permeability layer.

*Section 845.750(c)(2)(B) Be sufficient to protect the low permeability layer from freezing, and minimize root penetration of the low permeability layer*

The existing Part 845, which has the same requirements as Part 814 (closure rule for landfills), requires a three-foot-thick final protective layer to protect the underlying low permeability layer from freeze-thaw effects and root penetration. However, when a geomembrane is used as the low permeability layer it does not need these protections since it is not subject to the same impacts (i.e., increase in hydraulic conductivity) as a compacted earth layer as discussed in more detail below.

Geomembrane low permeability layers will be used for both the HPP EAP and the DCPP GMF Pond. They have the following characteristics:

- Geomembranes do not have pores that can contain water and are therefore not susceptible to freeze-thaw damage that may reduce their performance as a low permeability layer and/or lead to degradation of the geomembrane.
    - In fact, geomembrane panel strength and stiffness both increase with decreasing temperatures ( [4], [5]). In 1996, the United States Bureau of Reclamation [6] (USBR) performed testing of both geomembrane panels and seams subjected to up to 500 freeze-thaw cycles, in both constrained and unconstrained conditions, with temperature cycles as severe as +30º C to -20º C.

Electronic Filing: Received, Clerk's Office 06/20/2024

  - The testing showed no changes in the strength of the geomembrane panels or seams. The USBR concluded that *"...there is simply "no change" in tensile behavior of geomembrane sheets or their seams after freeze-thaw cycling"*.
  - In 2013, the Geosynthetic Institute, upon reviewing the results of the USBR and other studies, concluded that *"the essential question often raised in this regard, i.e., "will freeze-thaw conditions affect geomembrane sheets or their seam behavior," is answered with a resounding "NO""* [7].

- Geomembranes are not susceptible to grass plant root penetration because the geomembranes do not provide organic nutrients to plant roots and do not have pores or other areas where roots can enter the geomembrane.
  - Consequently, geomembranes are not a hospitable material that would either encourage root penetration or allow root penetration. Additionally, the geomembrane will be covered with a geotextile cushion or geocomposite drainage layer, which will provide an additional barrier to root penetration.

U.S. EPA research [8] states that "…a typical minimum thickness of the cover soil is 0.45 to 0.6 m…" (18 to 24 inches) thick "… for cover systems with hydraulic barriers" (low permeability layer). This is particularly appropriate when using a geomembrane low permeability which is not susceptible to any impact from freezing. U.S. EPA research also states that cover thickness design for root penetration into the low permeability layer is only a concern for compacted clay layers or geosynthetic clay barriers. This is when using an appropriate design of cover vegetation.

Therefore, the use of the two-foot-thick final protective layer will provide equivalent or superior performance to the requirements of Section 845.750 (c) (2) (B) when coupled with a geotextile cushion or geocomposite drainage layer, and a geomembrane low permeability layer, as geomembranes are not susceptible to freeze-thaw damage or root penetration as compared to a low permeability compacted earth layer.

*Section 845.750(c)(2)(C) Consist of soil material capable of supporting vegetation.*

The uppermost six inches of the final protective layer will consist of topsoil that is capable of supporting vegetation, which is the same requirement as the default (three-foot thick) final protective layer. This is also consistent with the Federal CCR Rule, which requires a six-inch-thick erosion (topsoil) layer. Research [8] and Geosyntec's experience indicate topsoil layers are designed to have shallow-rooted grasses and most shallow-rooted grasses do not typically penetrate more than six inches into the subsurface. Shallow-rooted grasses will be specified based

Electronic Filing: Received, Clerk's Office 06/20/2024

on recommendations from specialists at nurseries in the location of HPP and DCPP and Illinois Department of Transportation guidelines. The topsoil layer will be fertilized and/or amended, as necessary, on a site-specific basis based on agronomical soil testing, to provide a growing medium for the vegetation that provides the required levels of nutrients and water storage during drought conditions.

Grass species will also be selected on a site-specific basis to minimize long-term vegetation maintenance, based on the climatic conditions at each site and the soil types. Vegetation will be established by applying seed and mulch and watering to establish the vegetation. Temporary erosion control measures will also be used during vegetation establishment to protect the topsoil layer from erosion. These measures may include erosion control blankets (ECBs), silt fences, hydroseeding, and/or other methods. The Post-Closure Care Plan includes the commitment to maintain the vegetation of the surface for the closed DCPP GMF Pond in the Construction Permit Application, Attachment J [2] and the HPP EAP in the Construction Permit Application Attachment J [3].

The 18-inches of the protective layer below the topsoil will consist of a soil type suitable for retaining moisture to provide additional support for vegetation during times of drought, and to support any grass species with roots that exceed six inches. Such soil types may include silts, silty clays, lean clays, sandy clays, and/or sandy silts. A silty granular layer will be used at HPP EAP and a silty clay layer will be used at DCPP GMF.

Therefore, the use of the two-foot-thick protective layer will meet the requirements of Section 845.750(c)(2)(C), as the final protective layer will utilize soil capable of supporting vegetation.

*Section 845.750(c)(2)(D) Be placed as soon as possible after placement of the low permeability layer*

The HPP EAP Closure Plan (Section 4.7.2 [3]) states that the geotextile and cover soil "…will be placed as soon as practical after the geomembrane has been deployed and both quality assurance and quality control testing has been performed on the geomembrane seams." The DCPP GMF Closure Plan (Section 4.7.2 [2]) states the protective layer will be placed "…as soon as possible after placement of the low-permeability layer and will be covered with vegetation to limit wind and water erosion."

The use of a two-foot-thick protective layer will allow the final protective layer to be placed on top of the low permeability layer and vegetation to be established on top of the final protective

Electronic Filing: Received, Clerk's Office 06/20/2024

layer sooner than if a three-foot thick final protective layer is used. This is due to the 33% reduction in earthwork volumes associated with the thinner 2-ft-thick final protective layer.

Therefore, the use of the two-foot-thick final protective layer will exceed the minimum requirements of Section 845.750(c)(2)(D), by allowing the protective layer to be installed sooner than when using a three-foot-thick protective layer.

*Section 845.750(c)(2)(E) Be covered with vegetation to minimize wind and water erosion.*

Vegetation will be established to cover the final protective layer immediately after the protective layer is installed, as noted in the discussion regarding Section 845.750(c)(2)(C). Additionally, the following design and engineering features, construction techniques, and maintenance procedures will be used to reduce the potential for wind and water erosion under both long-term conditions and during vegetation establishment.

- Design and Engineering Features
    - Final cover system slopes will be installed at relatively flat grades (e.g., typically 2.5 to 4%, with steeper slopes used only in limited areas). The use of flat grades will reduce water runoff velocities and therefore reduce the potential for water erosion of the final cover soils.
    - The geotextile cushion and geocomposite drainage layer provide cushioning and help to facilitate lateral drainage of infiltration off the geomembrane, thereby reducing the amount of water available for infiltration through the geomembrane. This layer is not required by Section 845.750 but it enhances the final cover system performance.
    - A stormwater management system consisting of channels and letdown structures is included in each Construction Permit Application and will be designed to collect stormwater in a controlled manner and route it off the final cover system which will minimize infiltration into the CCR waste mass. The stormwater management system will minimize the overland flow distance between stormwater channels. Channels will be lined with an appropriate material, based on estimated stormwater velocities, to limit water erosion.
- Construction Techniques
    - The final protective layer is typically the most susceptible to wind and water erosion in the period between the placement of the protective layer and the establishment of vegetation. To reduce the potential for both wind and water

Electronic Filing: Received, Clerk's Office 06/20/2024

erosion during this time, the following approaches will be utilized:

- Temporary erosion and sediment controls (ESCs) will be installed to reduce the potential for erosion, such as erosion control blankets (ECBs), silt socks, silt fences, and other methods. These ECSs will be regularly inspected and maintained until vegetation is established.
- The entire surface of the final protective layer will be stabilized during seeding and until vegetation is established. Coverings may consist of straw mulch, hydroseeding binder, ECBs, or engineering growing media.
- The final protective layer will be regularly inspected and maintained during vegetation establishment. Any areas that become eroded by wind and water will be repaired until vegetation is established to a suitable level over the surface of the final cover.

- Maintenance Procedures
  - During the post-closure care period, vegetation established on the final protective cover layer will be regularly maintained using a written and IEPA-approved maintenance program. The program will consist of regular mowing and inspections. Any bare areas or areas of erosion will be repaired by seeding and stabilizing the area, and observing the area until vegetation becomes re-established.
  - The final cover slopes will be relatively flat (<5%); these slopes experience less erosion in general, especially less than typical landfill covers sloped at 25 to 33%. Typically, after three to five years, it is Geosyntec's experience that the cover vegetation becomes fully stabilized and experiences less erosion.

Therefore, the use of the two-foot-thick final protective layer will exceed the minimum requirements of Section 845 750 c) 2) E), using a robust program to support the establishment of protective vegetation, prevent and address any erosion that may occur during vegetation establishment, and monitor and maintain the vegetation during post-closure conditions.

Electronic Filing: Received, Clerk's Office 06/20/2024

## ADDITIONAL CONSIDERATIONS

### Infiltration Analysis

The use of the proposed two-foot-thick final protective layer, when coupled with a geomembrane low permeability layer, will also meet the criteria contained within Section 845.750 (a) (1). Section 845.750 (a) (1) provides the following requirement:

> *Section 845.750(a)(1) Control, minimize or eliminate, to the maximum extent feasible, post-closure infiltration of liquids into the waste and releases of CCR, leachate, or contaminated run-off to the ground or surface waters or to the atmosphere;*

Section 845.750(a)(1) is an important overall measure of the effectiveness of the final cover system because it requires control of post-closure infiltration of liquids through the final cover and into the waste and releases of CCR.

An infiltration analysis was performed to estimate post-closure liquid infiltration rates through both the default and the proposed alternate final cover systems. The following infiltration analysis discussion is provided for the proposed closure at the HPP EAP and DC GMF.

The cover systems for both the EAP and GMF have the same final cover system thickness configuration[1]. An infiltration analysis was performed by Ramboll in the HPP EAP Construction Permit Application [3] and in the DCPP GMF Construction Permit Application [2] using the Hydrologic Evaluation of Landfill Performance (HELP) software promulgated by the USEPA [9]. The HELP model estimates the infiltration rates from the top of the cover, through the final protective layer and through the low permeability layer (either a geomembrane or the three-foot thick compacted earth layer). The results are included in **Appendix A**. The resulting estimated infiltration rates are provided in **Table 1** for HPP EAP and in **Table 2** for DCPP GMF.

[1] The EAP has a 40 mil LLDPE with an overlying geotextile cushion, 18-inches of silty granular soil, and 6-inches of topsoil. The GMF has a 40 mil LLDPE with an overlying geocomposite drainage layer, 18-inches of silty clay soil, and 6-inches of topsoil.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 1 – HPP Final Cover Systems for Infiltration Analysis**

| Description | Low Permeability Layer[2] | Final Protective Layer | Infiltration Rate[3] |
|---|---|---|---|
| Proposed Alternative Final Cover System | 40-mil Linear Low-Density Polyethylene (LLDPE) Geomembrane | 2 ft of cover material, including, from bottom to top, a protective geotextile cushion[4], 1.5 ft of sandy soil and 0.5 ft of silty, sandy clay topsoil | 0.53 in/yr |
| Default Cover with Geomembrane Barrier | 40-mil LLDPE Geomembrane | 3 ft of cover material, including, from bottom to top, a protective geotextile cushion, 2.5 ft of silty sandy soil and 0.5 ft of silty, sandy clay topsoil | 0.88 in/yr |
| Default Cover with Compacted Earth Layer | 3-ft thick compacted earth layer ($1\times10^{-7}$ cm/sec) | 3 ft of cover material, including, from bottom to top, 2.5 ft of silty sandy soil and 0.5 ft of silty, sandy clay topsoil | 2.26 in/yr |

The HPP analysis indicated that the proposed alternative final cover system with a geomembrane and a two-foot-thick final protective layer exceeds the performance offered by the default final cover system utilizing a geomembrane with the default three-foot-thick protective layer, with the infiltration rate reduced by a factor of 1.66.

Furthermore, the proposed alternative final cover system performance exceeds the performance of a final cover system using a three-foot-thick compacted earthen low permeability layer and a three-foot-thick final protective layer (a total cover thickness of six feet) by reducing infiltration by a factor of 4.26.

[2] All HELP run versions used a pinhole density of 1 hole per acre, installation defects of 1 hole/acre, and construction quality as "good".
[3] Infiltration is out the bottom of the low permeability layer.
[4] The geotextile cushion was not included in the HELP run as HELP does not include a default drainage value for geotextiles. If the geotextile were included, infiltration may reduce even further than indicated in Table 1, relative to the default cover.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Table 2 – DCPP GMF Final Cover Systems for Infiltration Analysis**

| Description | Low Permeability Layer[5] | Protective Layer | Infiltration Rate |
|---|---|---|---|
| Proposed Alternative Final Cover System | 40-mil Linear Low-Density Polyethylene (LLDPE) Geomembrane | 2 ft of cover soil, including, from bottom to top, a geocomposite drainage layer[6], a 1.5 ft of silty clay soil, and 0.5 ft of silty clay topsoil | 0.00025 in/yr |
| Default Cover with Geomembrane Barrier | 40-mil LLDPE Geomembrane | 3 ft of cover soil, including, from bottom to top, a geocomposite drainage layer, a 2.5 ft of silty clay soil, and 0.5 ft of silty clay topsoil | 0.00026 in/yr |
| Default Cover with Compacted Clay Barrier | 3-ft thick Clay Liner ($1\times10^{-7}$ cm/sec) | 3 ft of cover soil, including, from bottom to top, 2.5 ft of silty clay soil and 0.5 ft of silty clay topsoil | 2.1 in/yr |

The DCPP GMF Pond analysis indicated that the proposed alternative final cover system with a geomembrane and a two-foot-thick final protective layer is essentially equivalent to the performance offered by the geomembrane with the default three-foot-thick final protective layer.

Furthermore, the proposed alternative final cover system performance exceeds the performance of a final cover system using a three-foot-thick compacted earth low permeability layer and a three-foot-thick soil protective layer (a total cover thickness of six feet) by reducing infiltration by a factor of nearly four orders of magnitude.

## Environmental and Societal Benefits

The use of the proposed two-foot-thick final protective layer will provide the following additional environmental and societal benefits, relative to the default three-foot-thick final protective layer:

- The final cover system earthwork quantities will be reduced by 33% for each CCR surface impoundment. This will result in a corresponding 33% reduction in the amount of locally available soil fill that needs to be excavated, hauled to the construction location, and placed. This provides multiple benefits, such as:
    - Reduced disruption to offsite areas caused by the excavation of fill materials and corresponding disturbance to the natural environment.

[5] All HELP run versions used a pinhole density of 1 hole per acre, installation defects of 1 hole/acre, and construction quality as "good".

Electronic Filing: Received, Clerk's Office 06/20/2024

  - Reduced haul truck traffic on local roadways, thereby reducing traffic impacts, roadway damage, air pollution, and carbon emissions.
  - Reduced earthwork effort during installation of the final cover system, thereby reducing air pollution and carbon emissions.
- Construction of the alternate final cover system can be completed faster than the default final cover, providing multiple benefits, such as:
  - Initiation of the reduction of infiltration at a sooner date than with the default final cover system.
  - Ceasing construction-related impacts to offsite residents (e.g., haul truck traffic, congestion) at a sooner date than otherwise possible.

**SUMMARY**

The proposed alternate final protective layer will:

- Provide equivalent or superior performance to the requirements of Section 845.750 (c)(2).
- Have a geotextile cushion or a geocomposite drainage layer, which are not required by Section 845.750, over the geomembrane that add both physical protection and a lateral drainage layer to reduce the amount of water available for infiltration through the geomembrane.
- Have a lower infiltration rate than the infiltration through the default final cover system.
- Meet or exceed the same criteria for long term performance and all other requirements of Section 845.750(c)(2).
- Provide other benefits by reducing the amount of final cover earthwork by 33% at each site.

# APPENDIX A-3
# HENNEPIN POWER PLANT EAST ASH POND HELP RESULTS: 3-FT OF COMPACTED EARTH LAYER, 3-FT OF FINAL PROTECTIVE COVER SOIL

Electronic Filing: Received, Clerk's Office 06/20/2024

---

**HYDROLOGIC EVALUATION OF LANDFILL PERFORMANCE**
**HELP MODEL VERSION 4.0 BETA (2018)**
**DEVELOPED BY USEPA NATIONAL RISK MANAGEMENT RESEARCH LABORATORY**

---

**Title:** HEN EAP - Closure-in-Place **Simulated On:** 10/13/2021 20:45

---

**Layer 1**
Type 1 - Vertical Percolation Layer (Cover Soil)
SCL - Sandy Clay Loam
Material Texture Number 10

| | | | |
|---|---|---|---|
| Thickness | = | 6 | inches |
| Porosity | = | 0.398 | vol/vol |
| Field Capacity | = | 0.244 | vol/vol |
| Wilting Point | = | 0.136 | vol/vol |
| Initial Soil Water Content | = | 0.2488 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 1.20E-04 | cm/sec |

**Layer 2**
Type 1 - Vertical Percolation Layer
CoS - Coarse Sand
Material Texture Number 1

| | | | |
|---|---|---|---|
| Thickness | = | 30 | inches |
| Porosity | = | 0.417 | vol/vol |
| Field Capacity | = | 0.045 | vol/vol |
| Wilting Point | = | 0.018 | vol/vol |
| Initial Soil Water Content | = | 0.275 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 1.00E-02 | cm/sec |

**Layer 3**
Type 3 - Barrier Soil Liner
Liner Soil (High)
Material Texture Number 16

| | | | |
|---|---|---|---|
| Thickness | = | 36 | inches |
| Porosity | = | 0.427 | vol/vol |
| Field Capacity | = | 0.418 | vol/vol |
| Wilting Point | = | 0.367 | vol/vol |
| Initial Soil Water Content | = | 0.427 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 1.00E-07 | cm/sec |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Layer 4**

Type 1 - Vertical Percolation Layer (Waste)
High-Density Electric Plant Coal Fly Ash
Material Texture Number 30

| | | | |
|---|---|---|---|
| Thickness | = | 372 | inches |
| Porosity | = | 0.541 | vol/vol |
| Field Capacity | = | 0.187 | vol/vol |
| Wilting Point | = | 0.047 | vol/vol |
| Initial Soil Water Content | = | 0.19 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 5.00E-05 | cm/sec |

**Layer 5**

Type 1 - Vertical Percolation Layer
Clay - moderate
Material Texture Number 43

| | | | |
|---|---|---|---|
| Thickness | = | 48 | inches |
| Porosity | = | 0.451 | vol/vol |
| Field Capacity | = | 0.419 | vol/vol |
| Wilting Point | = | 0.332 | vol/vol |
| Initial Soil Water Content | = | 0.419 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 1.00E-07 | cm/sec |

**Layer 6**

Type 1 - Vertical Percolation Layer
S - Sand
Material Texture Number 2

| | | | |
|---|---|---|---|
| Thickness | = | 12 | inches |
| Porosity | = | 0.437 | vol/vol |
| Field Capacity | = | 0.062 | vol/vol |
| Wilting Point | = | 0.024 | vol/vol |
| Initial Soil Water Content | = | 0.0641 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 5.80E-03 | cm/sec |

**Layer 7**

Type 1 - Vertical Percolation Layer
Glacial Outwash
Material Texture Number 44

| | | | |
|---|---|---|---|
| Thickness | = | 156 | inches |
| Porosity | = | 0.417 | vol/vol |
| Field Capacity | = | 0.045 | vol/vol |
| Wilting Point | = | 0.018 | vol/vol |
| Initial Soil Water Content | = | 0.045 | vol/vol |
| Effective Sat. Hyd. Conductivity | = | 1.80E-01 | cm/sec |

---

Note: Initial moisture content of the layers and snow water were computed as nearly steady-state values by HELP.

Electronic Filing: Received, Clerk's Office 06/20/2024

**General Design and Evaporative Zone Data**

| | | | |
|---|---|---|---|
| SCS Runoff Curve Number | = | 80.6 | |
| Fraction of Area Allowing Runoff | = | 100 | % |
| Area projected on a horizontal plane | = | 510 | acres |
| Evaporative Zone Depth | = | 8 | inches |
| Initial Water in Evaporative Zone | = | 1.696 | inches |
| Upper Limit of Evaporative Storage | = | 3.222 | inches |
| Lower Limit of Evaporative Storage | = | 0.852 | inches |
| Initial Snow Water | = | 0.27495054 | inches |
| Initial Water in Layer Materials | = | 123.7 | inches |
| Total Initial Water | = | 123.975 | inches |
| Total Subsurface Inflow | = | 0 | inches/year |

---

Note: SCS Runoff Curve Number was calculated by HELP.

**Evapotranspiration and Weather Data**

| | | | |
|---|---|---|---|
| Station Latitude | = | 41.3 | Degrees |
| Maximum Leaf Area Index | = | 0 | |
| Start of Growing Season (Julian Date) | = | 120 | days |
| End of Growing Season (Julian Date) | = | 300 | days |
| Average Wind Speed | = | 9 | mph |
| Average 1st Quarter Relative Humidity | = | 70 | % |
| Average 2nd Quarter Relative Humidity | = | 66 | % |
| Average 3rd Quarter Relative Humidity | = | 74 | % |
| Average 4th Quarter Relative Humidity | = | 77 | % |

---

Note: Evapotranspiration data was obtained for , Illinois

**Normal Mean Monthly Precipitation (inches)**

| Jan/Jul | Feb/Aug | Mar/Sep | Apr/Oct | May/Nov | Jun/Dec |
|---|---|---|---|---|---|
| 1.665246 | 1.874612 | 2.254818 | 3.099339 | 4.449317 | 4.12829018 |
| 3.29051 | 4.017539 | 3.401471 | 3.029886 | 2.510213 | 1.86376189 |

---

Note: Precipitation was simulated based on HELP V4 weather simulation for:
Lat/Long: 41.3/-89.31

**Normal Mean Monthly Temperature (Degrees Fahrenheit)**

| Jan/Jul | Feb/Aug | Mar/Sep | Apr/Oct | May/Nov | Jun/Dec |
|---|---|---|---|---|---|
| 27.4 | 35 | 40.3 | 50 | 69.5 | 78.4 |
| 83 | 79.7 | 71.5 | 56.9 | 46.3 | 33.6 |

MEMBER OF WSP

# CALCULATION

**DATE** January 25, 2022 **Reference No.** 21454861-13-R-1

**PREPARED BY:** Jason Obermeyer

**CHECKED BY:** Jeff Rusch

**REVIEWED BY:** Mark Haddock, PE **CLIENT NAME: Illinois Power Resources Generating, LLC**

**SLOPE STABILITY ANALYSIS – GYPSUM MANAGEMENT FACILITY POND CLOSURE**

## 1.0 OBJECTIVE

Evaluate slope stability for the Gypsum Management Facility (GMF) Pond closure design in terms of global stability and veneer stability for the final cover system and containment berm.

## 2.0 METHODOLOGY

Limit-equilibrium slope stability analyses were performed using Spencer's method of slices (Spencer 1967) in Slide2, a two-dimensional slope stability modeling software platform (Rocscience Inc. 2020). Spencer's method of slices considers both moment and force equilibrium. It is common geotechnical practice to analyze the stability of embankment slopes using limit-equilibrium methods.

### 2.1 Target Factors of Safety

The following target factors of safety are based on the values presented in Illinois Administrative Code Title 35, Subsection 845.460(a), as pertinent to the GMF Pond following closure:

- target minimum factor of safety under static long-term conditions = 1.5
- target minimum factor of safety under seismic loading conditions = 1.0

The locally available soils that will be used for closure construction have relatively high silt and clay contents. Therefore, they are not expected to be susceptible to liquefaction.

## 3.0 SLOPE STABILITY ANALYSIS

### 3.1 Geometry

A typical cross section through the containment berm along the south end of the closure footprint was selected for the slope stability analysis. This is identified as the critical cross section for slope stability following closure of the GMF Pond, as the GMF Pond is mostly incised around the remainder of the closure footprint perimeter.

The existing liner system will remain in place beneath the closure footprint and consists of (from top to bottom):

- 60-mil textured high-density polyethylene (HDPE) geomembrane
- 1 foot of cushion soil (primarily silt and clay)

**Golder Associates USA Inc.**
7245 W Alaska Drive, Suite 200, Lakewood, Colorado, USA 80226 T: +1 303 980-0540 F: +1 (303) 985 2080

Golder and the G logo are trademarks of Golder Associates Corporation

- 4-ounce-per-square-yard (oz/yd$^2$) nonwoven needle-punched (NWNP) geotextile
- 1 foot of granular drainage aggregate
- 10-oz/yd$^2$ NWNP geotextile
- 60-mil textured HDPE geomembrane
- reinforced geosynthetic clay liner (GCL)
- 3 feet of compacted clay

The containment berm is designed with 3H:1V slopes and a crest width of 36 feet. The final cover system will be sloped at 4%. The base of the final cover system is designed to meet the upstream edge of the containment berm crest and terminate with a 3H:1V slope to the crest. The final cover system will consist of the following components (from top to bottom):

- 2 feet of protective cover, anticipated to consist primarily of locally available low-plasticity silt or clay
- double-sided geocomposite drainage layer
- 40-mil textured linear low-density (LLDPE) geomembrane

A liner system will be installed on the upstream containment berm slope and tied into the existing liner system at the toe of the slope. The liner system will consist of the following components (from top to bottom):

- 60-mil textured HDPE geomembrane
- 2 feet of compacted clay

Downstream of the containment berm, the closure grades represent the top of the compacted clay layer in the existing liner system, as the components of the existing liner system above this layer will be removed during closure of the GMF Pond.

For simplification of the model geometry, the liner systems are each represented as a layer having a thickness of 2 feet and the final cover system geosynthetics are represented as a layer having a thickness of 1 foot.

Groundwater levels in the vicinity of the GMF Pond are elevated above the existing liner system. For slope stability analysis, the phreatic surface is modeled along the top of the compacted clay layer in the existing liner system. Within the closure footprint, the liner system will prevent the phreatic surface from rising above this level. Downstream of the containment berm, elevated groundwater is expected to present as surface water that will be managed in a stormwater channel, resulting in phreatic levels near the ground surface.

## 3.2 Approach and Input Parameters

The slope stability analysis uses the following approach and input parameters:

- Circular and non-circular slip surfaces are evaluated. Analysis of non-circular slip surfaces enables evaluation of veneer stability for the final cover system.
- Earthquake (seismic) loading conditions are simulated using a pseudostatic approach. The United States Geological Survey (USGS) Unified Hazard Tool indicates a 2% probability of exceeding a peak ground

acceleration (PGA) of 0.06 g in 50 years at the site. In an actual seismic event, the peak acceleration would be sustained for only a fraction of a second. A pseudostatic analysis conservatively models seismic events as a force with constant acceleration and direction (i.e., an infinitely long seismic pulse). Consequently, it is common geotechnical practice to reduce the predicted PGA when performing pseudostatic analyses. For conservatism, however, the pseudostatic analysis for the GMF Pond is conducted for the long-term condition using a horizontal seismic coefficient of 0.06, corresponding to the PGA.

- Material unit weights were selected based on engineering judgment.
- Strength parameters for zones that may consist of cohesive soils (i.e., containment berm, protective soil cover, and subsoil) are selected based on engineering judgment. These zones are assigned a friction angle of 28 degrees. Cohesion is neglected for conservatism.
- For conservatism, undrained strengths are applied for gypsum. A vertical stress ratio (ratio of undrained strength to initial vertical effective stress) of 0.22 is used, consistent with the typical value for normally consolidated fine-grained material (Mesri 1989).
- Strength parameters for the geosynthetic interfaces included in the liner systems and final cover systems associated with the closed GMF Pond are evaluated from laboratory testing data published by Koerner and Narejo (2005) and summarized in Table 1.
- The lowest geosynthetic interface strength parameters in a given system (liner or final cover) from Table 1 are selected for analysis. Adhesion is conservatively neglected for all geosynthetic interfaces.

**Table 1: Characteristic Geosynthetic Interface Strengths**

| Interface | Peak Friction Angle | Peak Adhesion |
|---|---|---|
| Textured HDPE geomembrane against cohesive soil | 18 degrees | 209 psf |
| NWNP geotextile against cohesive soil | 30 degrees | 104 psf |
| NWNP geotextile against granular soil | 33 degrees | 0 psf |
| NWNP geotextile against textured HDPE geomembrane | 25 degrees | 167 psf |
| Textured HDPE geomembrane against reinforced GCL | 23 degrees | 167 psf |
| Reinforced GCL against cohesive soil | Use NWNP geotextile against cohesive soil | |
| Geocomposite against cohesive soil | Use NWNP geotextile against cohesive soil | |
| Geocomposite against textured LLDPE geomembrane | 26 degrees | 121 psf |
| Textured LLDPE geomembrane against cohesive soil | 21 degrees | 169 psf |

Source: Koerner and Narejo 2005.

A summary of material properties used in the slope stability analysis is presented in Table 2.

**Table 2: Material Properties**

| Zone | Unit Weight | Friction Angle | Cohesion or Adhesion | Vertical Stress Ratio |
|---|---|---|---|---|
| Existing liner system | 120 pcf | 18 degrees | 0 psf | – |
| New liner system | 120 pcf | 18 degrees | 0 psf | – |
| Cover geosynthetics | 120 pcf | 21 degrees | 0 psf | – |
| Protective cover | 120 pcf | 28 degrees | 0 psf | – |
| Containment berm | 120 pcf | 28 degrees | 0 psf | – |
| Gypsum | 100 pcf | – | – | 0.22 |
| Subsoil | 120 pcf | 28 degrees | 0 psf | – |

## 3.3 Results and Conclusions

The factor of safety for slope stability under static loading conditions is calculated as 1.6, as shown in Figure 1. The critical slip surface is surficial on the downstream face of the containment berm. The factor of safety for global stability under seismic loading conditions is calculated as 1.3, as shown in Figure 2. As with the static analysis, the critical slip surface is surficial on the downstream face of the containment berm.

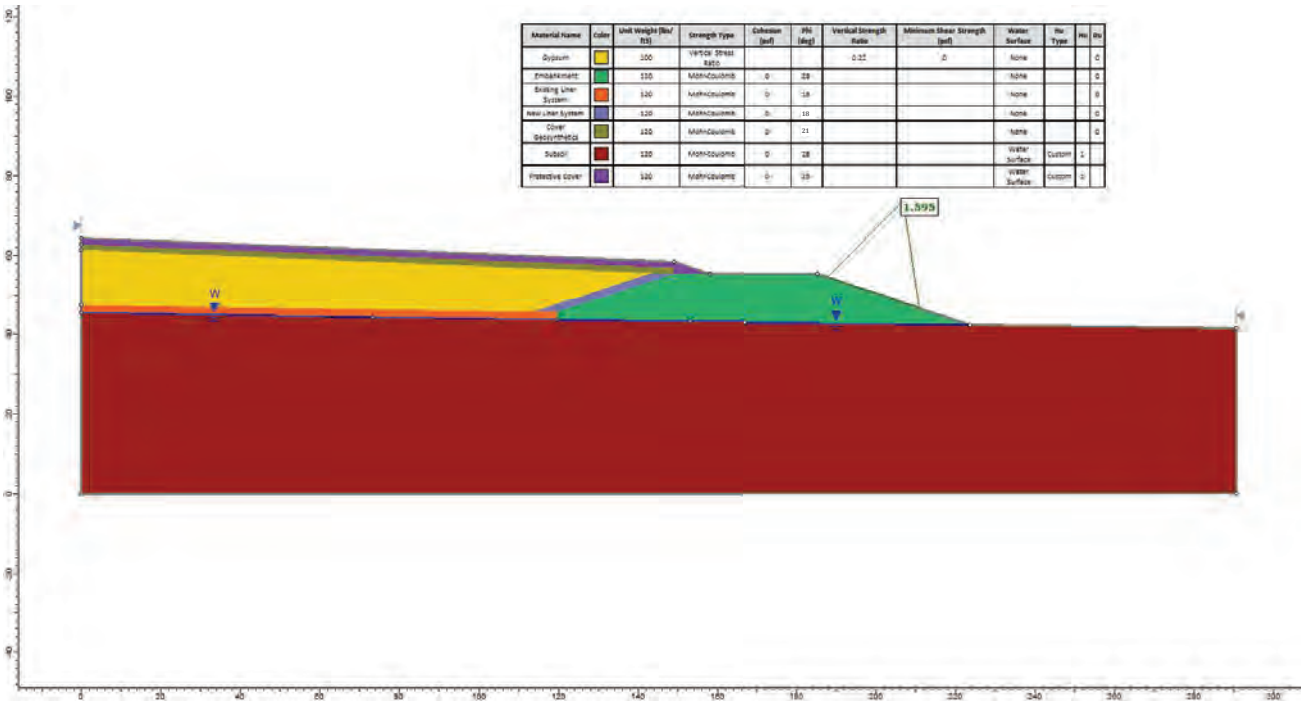

**Figure 1: Analysis Result – Static Loading**

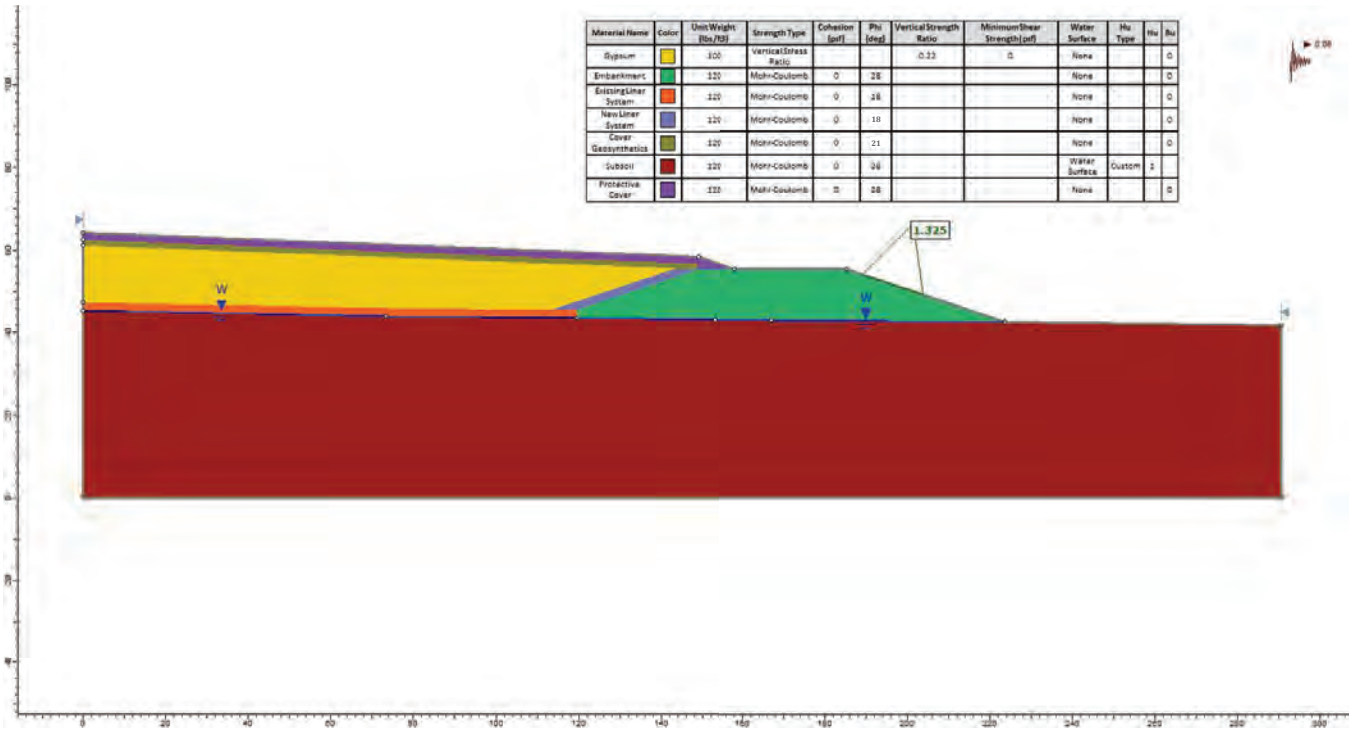

**Figure 2: Analysis Result – Seismic Loading**

Based on the factors of safety computed using the methods and assumptions described, the closed GMF Pond is expected to remain stable with an appropriate safety margin for global and veneer stability. A factor of safety greater that 1.5 was computed for static loading conditions. A factor of safety greater than 1.0 was computed for seismic loading conditions.

**HYDROLOGY CALCULATIONS FOR CLOSURE OF THE GYPSUM MANAGEMENT FACILITY POND AT THE DUCK CREEK POWER PLANT**

## 1.0 OBJECTIVE

Evaluate the hydrology (routing of stormwater runoff) after closure of the Duck Creek Gypsum Management Facility (GMF) Pond. These calculations were done to support the closure plan by determining the minimum channel dimensions.

## 2.0 METHODOLOGY

The areas contributing to the GMF Pond were delineated in AutoCAD, as shown in Figure 1. The ground conditions were used to estimate a lag time using NRCS methodology (NRCS 1986). The calculations for the hydrologic parameters are included in Tables 1 and 2. The hydrologic parameters were used to model the stormwater runoff reporting to a proposed channel south of the closed GMF Pond and another proposed channel north of the closed GMF Pond during the 25-year, 24-hour design storm event using HEC-HMS software (USACE 2021). The channels were analyzed using Manning's equation to evaluate the steady-state hydraulics.

## 3.0 INPUTS AND ASSUMPTIONS

Information and assumptions regarding input parameters used in the analyses include the following:

- A curve number of 58 was used to be consistent with the closed condition of Meadow and hydrologic soil group B (NRCS 1986) based on a review of the Web Soil Survey in the vicinity of the GMF Pond (NRCS 2021).
- The design storm (25-year, 24-hour) depth from NOAA Atlas 14 (NOAA 2006) is 5.25 inches.
- Lag time was estimated using NRCS TR-55 methodology.
- Manning's number used for channel design was 0.030 for capacity and 0.035 for depth assuming a grass-lined channel.

**Golder Associates USA Inc.**
7245 W Alaska Drive, Suite 200, Lakewood, Colorado, USA 80226 T: +1 303 980-0540 F: +1 (303) 985 2080

Golder and the G logo are trademarks of Golder Associates Corporation

## 4.0 RESULTS AND CONCLUSIONS

The HEC-HMS model results provide the estimated peak flow from the 25-year, 24-hour design storm to discharge points of interest:

- The peak flow rate at the proposed stormwater channel south of the closed GMF Pond is estimated as 48.6 cubic feet per second (cfs).
- The peak flow rate at the proposed stormwater channel north of the closed GMF Pond is estimated as 12.6 cfs.

The output from the HEC-HMS model is shown in Table 3.

The channels were designed with dimensions as indicated in Table 4. Freeboard is shown to be at least 1 foot and at least one-half of the velocity head. The calculations indicate that the channel should function properly as designed.

## 35 I.A.C. § 845.630 Groundwater Monitoring Systems (PE)

*I, Eric J. Tlachac, a qualified professional engineer in good standing in the State of Illinois, certify that the groundwater monitoring system described in this document (Groundwater Monitoring Plan, Duck Creek Power Plant Gypsum Management Facility Pond), has been designed and constructed to meet the requirements of 35 I.A.C. § 845.630. The monitoring system was developed based on information included in the Hydrogeologic Site Characterization Report (Ramboll 2021; included in the Operating Permit to which this Groundwater Monitoring Plan is attached).*

# 1. INTRODUCTION

## 1.1 Overview

In accordance with requirements of the Standards for the Disposal of Coal Combustion Residuals (CCR) in Surface Impoundments (SIs): Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845 (Part 845) (Illinois Environmental Protection Agency [IEPA], April 15, 2021), Ramboll Americas Engineering Solutions, Inc. (Ramboll) has prepared this Groundwater Monitoring Plan (GMP) on behalf of Duck Creek Power Plant (DCPP), operated by Illinois Power Resources Generating, LLC (IPRG). This report will apply specifically to the CCR Unit referred to as the Gypsum Management Facility Pond (GMF Pond) (Vistra identification [ID] number [No.] 203, IEPA ID No. W0578010001-04, and National Inventory of Dams [NID] No. IL50573). This GMP includes Part 845 content requirements specific to 35 I.A.C. § 845.630 (Groundwater Monitoring System), 35 I.A.C. § 845.640 (Groundwater Sampling and Analysis), and 35 I.A.C. § 845.650 (Groundwater Monitoring Program) for the GMF Pond at the DCPP.

A checklist which identifies the specific requirements of 35 I.A.C. § 845.630, 35 I.A.C. § 845.640, and 35 I.A.C. § 845.650 is included in **Table 1-1**. The table provides references to sections, tables, and figures included in this document to locate the information that meets specific requirements of 35 I.A.C. § 845.630, 35 I.A.C. § 845.640, and 35 I.A.C. § 845.650.

## 1.2 Site Location and Background

The DCPP is located in Fulton County, Illinois, approximately six miles southeast of the town of Canton, Illinois. The GMF Pond is located north of the DCPP within Section 18, Township 6 North, Range 5 East (**Figure 1-1**). Prior to construction of the DCPP and associated facilities, strip mining of coal took place within the current property boundary. Currently, land use adjacent to the DCPP is primarily agriculture, pasture, and forested land with minimal development.

The GMF Pond is a 1,500-foot by 900-foot earthen berm double-lined CCR SI located north of the former DCPP. The GMF Pond decant water discharges to the lined GMF Recycle Pond located to the south of the GMF Pond (**Figure 1-2**). In addition to the GMF Pond, several other CCR units are located on the DCPP property, including the Landfill located due north of the GMF Pond; the closed units Ash Pond No. 1 and Ash Pond No. 2 located south of the GMF Pond; and the Bottom Ash Basin located between the former DCPP and the closed Ash Pond No. 1 and Ash Pond No. 2.

The GMF Pond, also referred to as the gypsum stack/management system, operates under IEPA Water Pollution Control Permit (WPCP) No. 2017-E0-62640, issued in December 2017. It consists of 1,500-foot by 900-foot earthen berm with 3.5:1 side slopes, a maximum elevation of 620 feet above mean sea level, a double geomembrane liner consisting of a 60-millimeter (mil) high-density polyethylene (HPDE) geomembrane liner, 12 inches of clay cushion, 4 ounces per square yard (oz/yd$^2$) non-woven geotextile filter fabric, 12 inches highly permeable granular drainage (sand), 10 oz/yd$^2$ non-woven geotextile filter fabric, 60-mil HPDE geomembrane liner, reinforced bentonite mat, 36 inches compacted clay all installed over in-situ foundation soil, and all pipes, pumps, and appurtenances necessary for the storage of approximately 3.6 million tons of gypsum at a maximum elevation of 715 feet above mean sea level with discharge to the Recycle Pond. The GMF Recycle Pond is lined with a 60-mil HDPE geomembrane liner, reinforced bentonite mat, and 36 inches of compacted clay.

Strip mining has occurred in this area since the 1930s. Strip mining in the site vicinity extracted coal from the Springfield (No. 5) coal seam. Mining operations in the area have ceased. Strip mining has completely disrupted the natural stratigraphy down to the Springfield (No. 5) coal unit at some portions of the DCPP property. Previous investigations completed outside of the GMF Pond indicated that bedrock in the area is overlain by mine spoil ranging in thickness from approximately 10 to 75 feet. The mine spoil consists of excavated bedrock (weathered shale, shale fragments, and some coal fines) mixed with the sand, silts and silty clays of the unconsolidated glacial and aeolian deposits. The GMF Pond is located immediately adjacent to and downgradient of several former large surface mining areas.

## 1.3 Conceptual Model

Significant site investigation has been completed at the DCPP to characterize the geology, hydrogeology, and groundwater quality. Based on extensive investigation and monitoring, the GMF Pond has been well characterized and detailed in the Hydrogeologic Site Characterization Report (HCR; Ramboll, 2021); included in the Operating Permit to which this Plan is attached). A conceptual site model (CSM) has been developed and is discussed below.

The three distinct hydrostratigraphic units summarized below have been identified at the GMF Pond based on stratigraphic relationships and common hydrogeologic characteristics:

- **Uppermost Aquifer:** At the GMF Pond, this unit includes the Peoria/Roxana Loess, the upper Radnor Till, and the shallow sands. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till (Natural Resource Technology, an OBG Company [NRT/OBG], 2017a). The shallow sands are laterally extensive across the GMF Pond, vary in thickness from less than one to 18 feet, and are generally located at an elevation of 570 to 590 feet above mean sea level (msl). Sand was completely removed where it was encountered during construction of the GMF Pond, putting the base of liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place. While the primary migration pathway is the shallow sand of the uppermost aquifer, the groundwater within the overlying Peoria/Roxanna Loess has the potential to be impacted and is considered a potential migration pathway (PMP).
- **Lower Radnor Till/Lower Confining Unit**: Underlying the uppermost aquifer, the lower Radnor Till is approximately 42 to 58 feet thick. Previous hydrogeologic studies indicate discontinuous sand lenses observed within the till are not hydraulically connected to the shallow sand unit (NRT/OBG, 2017a).
- **Bedrock Confining Unit**: The thick and low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, are estimated to have a thickness of approximately 300 to 400 feet.

Groundwater migrates downward through the loess and upper Radnor Till into the shallow sands of the uppermost aquifer. Groundwater flow in the sands is generally in a northwest to southeast direction (**Figure 1-3**). Seasonal variation of groundwater levels at the GMF Pond are present and may fluctuate approximately one to 10 feet. There is no observable seasonal variation of groundwater flow direction at the GMF Pond associated with the elevation changes. Groundwater flows toward the Duck Creek Cooling Pond located approximately 2,100 feet east of the GMF Pond. The surface water elevation of the Duck Creek Cooling Pond is estimated from 562.5 to 565 feet North American Vertical Datum of 1988 (NAVD88). Which is approximately 20 feet lower than downgradient groundwater at the GMF Pond.

Electronic Filing: Received, Clerk's Office 06/20/2024

Part 845 parameters were monitored in the uppermost aquifer and PMP monitoring wells at the GMF Pond as part of the Title 40 of the Code of Federal Regulations (40 C.F.R.) § 257 monitoring program beginning in 2015. These data were supplemented with sampling of additional locations in 2021. The results indicate that the following parameters were detected at concentrations or measurements greater than the applicable 35 I.A.C. § 845.600 groundwater protection standards (GWPSs) and are considered potential exceedances:

- Antimony, arsenic, cobalt, lead, pH, sulfate, and thallium were detected at least once at concentrations or measurements greater than the GWPS in downgradient uppermost aquifer wells (including PMP wells). Lead, mercury, pH, and thallium were detected at concentrations or measurements greater than the GWPS in upgradient uppermost aquifer wells. Radium 226 and 228 combined was detected once at concentrations greater than the GWPS in the bedrock confining unit well.

Concentration results for the above parameters were compared directly to 35 I.A.C. § 845.600 GWPS, without an evaluation of background concentrations. Evaluation of background groundwater quality has been completed as part of this GMP, and compliance with Part 845 will be determined following the first round of groundwater sampling. The first round of groundwater sampling for compliance will be completed the quarter following issuance of the Operating Permit and in accordance with this GMP.

# 2. GROUNDWATER MONITORING SYSTEMS

## 2.1 Existing Monitoring Well Network and Analysis

This GMP is being provided to propose a groundwater monitoring network and monitoring program specific to the GMF Pond that will comply with Part 845. Monitoring networks and programs that apply to other units are not discussed in this GMP. Those programs will continue to be performed as specified in IEPA approvals. Any future modifications will be proposed and submitted to IEPA for approval in a separate document. The remaining discussion in this document will include only these networks and monitoring programs that are applicable and specific to the GMF Pond, specifically the IEPA WPCP monitoring network, the 40 C.F.R. § 257 monitoring network and the proposed Part 845 monitoring network.

### 2.1.1 IEPA Monitoring Program

Routine quarterly groundwater monitoring is completed at GMF Pond wells G50L/S, G51L/S, G52L/S, G53L/S, G54L/S, G55L/S, G56L/S, G57L/S, G58L/S, G59L/S, G60L/S, R61L/G61S, G62L, G63L/S, and G64L/S in accordance with the IEPA WPCP No. 2017-E0-62640. This permit also requires sampling G65L/S, G66L/S, G67L/S, G70L, G71L/S, and G72L/R72S at the GMF Recycle Pond. The boring logs, well construction forms, and other related monitoring well forms for the GMF Pond well network are included in Appendix B of the HCR (included in the Operating Permit to which this Plan is attached). The location of all IEPA monitoring wells is illustrated in **Figure 2-1**. Groundwater samples are collected quarterly and annually and are analyzed for the laboratory and field parameters listed in **Table A** below.

**Table A. IEPA Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters** | | | |
| pH | Temperature | Specific Conductance | |
| Groundwater Elevation | Depth to Water (bmp) | Bottom of Well Elevation | |
| **Quarterly Parameters (Dissolved)** | | | |
| Arsenic | Cadmium | Lead | Sulfate |
| Boron | Chloride | Manganese | Total Dissolved Solids (TDS) |
| **Annual Parameters (Dissolved)** | | | |
| Alkalinity, bicarbonate | Chromium | Mercury | Selenium |
| Alkalinity, carbonate | Cobalt | Nickel | Sodium |
| Ammonia as Nitrogen | Iron | Nitrate nitrogen | Zinc |
| Calcium | Magnesium | Potassium | |

### 2.1.2 40 C.F.R. § 257 Monitoring Program

The 40 C.F.R. § 257 well network for the GMF Pond consists of seven monitoring wells installed nearby or adjacent to the GMF Pond in the uppermost aquifer. The GMF Pond 40 C.F.R. § 257 well network consists of three background monitoring wells (G02S, G50S, and G51S) and four compliance monitoring wells (G54S, G57S, G60S, and G64S). The boring logs, well construction forms, and other related monitoring well forms are available in the Operating Records as required by 40 C.F.R. § 257.91 for each monitored CCR Unit or CCR Multi-Unit, and are included in Appendix B of the HCR (included in the Operating Permit to which this Plan is attached).

Groundwater is being monitored at the GMF Pond in accordance with the Detection Monitoring Program requirements specified in 40 C.F.R. § 257.94. Details on the procedures and techniques used to fulfill the groundwater sampling and analysis program requirements are found in the Sampling and Analysis Plan for the GMF Pond (NRT/OBG, 2017b).

Groundwater samples are collected semiannually and analyzed for the laboratory and field parameters from Appendix III of 40 C.F.R. § 257, summarized in **Table B** below.

**Table B. 40 C.F.R. § 257 Groundwater Monitoring Program Parameters**

| **Field Parameters[1]** | | |
|---|---|---|
| pH | Groundwater Elevation | |
| **Appendix III Parameters (Total, except TDS)** | | |
| Boron | Chloride | Sulfate |
| Calcium | Fluoride | TDS |

[1]Dissolved oxygen, temperature, specific conductance, oxidation/reduction potential, and turbidity were recorded during sample collection.

Results and analysis of groundwater sampling are reported annually by January 31 of the following year and made available on the CCR public website as required by 40 C.F.R. § 257.

### 2.1.3 Part 845 Well Installation and Monitoring

In 2021, one additional monitoring well (G54C) was installed between the GMF Pond and the GMF Recycle Pond to assess the vertical and horizontal lithology, stratigraphy, chemical properties, and physical properties of geologic layers to a minimum of 100 feet below ground surface (bgs) as specified in 35 I.A.C. § 845.620(b). Additionally, a porewater sample was collected from a temporary leachate monitoring location (XTPW02) installed within the GMF Pond to characterize the CCR materials.

Prospective Part 845 monitoring wells were sampled for eight rounds from February to August 2021 and the results were assessed for selection of the GMF Pond Part 845 monitoring well network. Groundwater samples were collected and analyzed for 35 I.A.C. § 845.600 parameters as summarized in **Table C** below.

**Table C. Part 845 Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters[1]** | | | |
| Groundwater Elevation | pH | Turbidity | |
| **Metals (Total)** | | | |
| Antimony | Boron | Cobalt | Molybdenum |
| Arsenic | Cadmium | Lead | Selenium |
| Barium | Calcium | Lithium | Thallium |
| Beryllium | Chromium | Mercury | |
| **Inorganics (Total)** | | | |
| Fluoride | Sulfate | Chloride | TDS |
| **Other (Total)** | | | |
| Radium 226 and 228 combined | | | |

[1] Dissolved oxygen, temperature, specific conductance, and oxidation/reduction potential were recorded during sample collection.

Data and results from the Part 845 background monitoring were included in the water quality discussion included in the HCR (included in the Operating Permit to which this Plan is attached). The data collected from background locations during the Part 845 monitoring were used to evaluate and calculate background concentrations for the GMF Pond. The evaluation and discussion are included in **Section 3.2** of this report.

Data collected from the 40 C.F.R. § 257 monitoring network from 2015 to 2021, and from the Part 845 background monitoring were used for selection of the Part 845 monitoring well network proposed in **Section 2.2**.

## 2.2 Proposed Part 845 Monitoring Well Network

The groundwater monitoring network proposed in this plan will include seven wells screened in the uppermost aquifer (G02S, G50S, G51S, G54S, G57S, G60S, and G64S), three wells screened in the PMP (G54L, G60L, and G64L), and one temporary water level only monitoring point (X301) that is located in a riser along the south end of the pond for monitoring the phreatic surface within the GMF Pond. The proposed network is summarized in **Table D** below and displayed on **Figure 2-2**. Ten wells (three background and seven compliance) will be used to monitor groundwater concentrations within the hydrostratigraphic units.

The groundwater samples collected from the ten wells will be used to monitor and evaluate groundwater quality and demonstrate compliance with the groundwater quality standards listed in 35 I.A.C. § 845.600(a). The proposed monitoring wells will yield groundwater samples that represent the quality of downgradient groundwater at the CCR boundary (as required in 35 I.A.C. § 845.630(a)(2)). Monitoring well depths and construction details are listed in **Table 2-1** and summarized in **Table D** below.

**Table D. Proposed Part 845 Monitoring Well Network**

| Well ID | Monitored Unit | Well Screen Interval (feet bgs) | Well Type[1] |
|---|---|---|---|
| G02S | UA | 23.0 – 28.0 | Background |
| G50S | UA | 29.2 – 34.0 | Background |
| G51S | UA | 24.0 – 28.8 | Background |
| G54L | PMP | 27.3 – 36.8 | Compliance |
| G54S | UA | 43.5 – 48.0 | Compliance |
| G57S | UA | 29.7 – 34.2 | Compliance |
| G60L | PMP | 20.1 – 24.9 | Compliance |
| G60S | UA | 31.1 – 35.9 | Compliance |
| G64L | PMP | 18.1 – 27.5 | Compliance |
| G64S | UA | 34.5 – 39.0 | Compliance |
| X301[2,3] | CCR | NA | WLO |

[1] Well Type refers to the role of the well in the monitoring network.
[2] Well is to be used for water level data collection only.
[3] Location is temporary pending implementation of impoundment closure per an approved Construction Permit Application.
NA = not applicable
UA = uppermost aquifer
WLO = water level only

## 2.3 Well Abandonment

No wells are currently proposed for abandonment.

# 3. APPLICABLE GROUNDWATER QUALITY STANDARDS

## 3.1 Groundwater Classification

Groundwater at the GMF Pond meets the definition of Class I – Potable Resource Groundwater (35 I.A.C. § 620.210), based on the following criteria:

- Groundwater in the uppermost aquifer extends ten feet or more below the land surface.
- Field hydraulic conductivity tests performed in the unlithified geologic materials that include loess, shallow sand, and intermediate sand at the GMF Pond resulted in an overall (geometric mean) horizontal hydraulic conductivity exceeding the 1 x $10^{-4}$ centimeters per second (cm/s) criterion.

However, background (upgradient) groundwater originates from areas north and west of the GMF Pond that have been surface mined and present a significant alternative source for groundwater impacts.

## 3.2 Statistical Evaluation of Background Groundwater Data

A Statistical Analysis Plan (**Appendix A**) has been developed to describe procedures that will be used to establish background conditions and implement compliance monitoring as necessary and required by 35 I.A.C. § 845.640 and 35 I.A.C. § 845.650. The Statistical Analysis Plan was prepared in accordance with the requirements of 35 I.A.C. § 845.640(f), with reference to the acceptable statistical procedures provided in United States Environmental Protection Agency's (USEPA) *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, Unified Guidance* (*Unified Guidance,* March 2009), and is intended to provide a logical process and framework for conducting the statistical analysis of the data obtained during groundwater monitoring.

In accordance with 35 I.A.C. § 845.640(f)(1), the statistical method chosen for analysis of background groundwater quality was either the tolerance interval or the prediction interval procedure for each constituent listed in 35 I.A.C. § 845.600(a)(1) at this CCR unit per 35 I.A.C. § 845.640(f)(1)(C). A comparison of the statistical background concentrations and groundwater quality standards listed in 35 I.A.C. § 845.600(a)(1) and the resulting GWPSs are summarized in **Table 3-1**.

## 3.3 Applicable Groundwater Protection Standards

The applicable GWPSs will be established in accordance with 35 I.A.C. § 845.600(a) (greater of the background concentration or numerical limit specified in 35 I.A.C. § 845.600(a)(1)). The results of the statistical analysis of background groundwater data (**Table 3-1**) indicate that most background concentrations in the uppermost aquifer are less than the groundwater quality standards listed in 35 I.A.C. § 845.600(a)(1). Therefore, for these parameters, the groundwater quality standards listed in 35 I.A.C. § 845.600(a)(1) will be applied to the results from the proposed groundwater monitoring network. The exception being lead, where the background concentration is greater than the 35 I.A.C. § 845.600(a)(1) standard (0.015 milligrams per liter [mg/L] versus 0.0075 mg/L). In this instance, the GWPS will be the background concentration.

Under most circumstances, the GWPS will be compared to the lower confidence limit for the observed concentrations for each constituent in each compliance well. Exceptions are when there are high percentages (greater than 50 percent) of non-detects in compliance well data, for which

Electronic Filing: Received, Clerk's Office 06/20/2024

a future mean (for 50 to 70 percent non-detects) or median (for greater than 70 percent non-detects) will be compared to the GWPS. Consistent with the *Unified Guidance*, the same general statistical method of confidence interval testing against a fixed GWPS is recommended in compliance and corrective action programs. Confidence intervals provide a flexible and statistically accurate method to test how a parameter estimated from a single sample compares to a fixed numerical limit. Confidence intervals explicitly account for variation and uncertainty in the sample data used to construct them.

Evaluation of the applicable standards will occur in conjunction with the analysis of groundwater quality results. Background calculations and the resulting concentrations may be updated as appropriate, in accordance with the Statistical Analysis Plan included in **Appendix A.**

# 4. GROUNDWATER MONITORING PLAN

The groundwater monitoring plan will monitor and evaluate groundwater quality to demonstrate compliance with the groundwater quality standards included in 40 C.F.R. § 257.94(e), 40 C.F.R. § 257.95(h), and 35 I.A.C. § 845.600(a). The groundwater monitoring program will include sampling and analysis procedures that are consistent and that provide an accurate representation of groundwater quality at the background and compliance wells as required by 35 I.A.C. § 845.630. As discussed in **Section 2**, three monitoring programs specific to the GMF Pond exist: IEPA WPCP monitoring program, the 40 C.F.R. § 257 monitoring program, and the proposed Part 845 monitoring program. These programs will continue to be monitored as specified in IEPA approvals or 40 C.F.R. § 257. Upon approval of the Operating Permit applications (and by extension the GMP) for the GMF Pond, the monitoring program required by IEPA WPCP will be discontinued following approval of a future permit modification submittal and will be replaced by the proposed Part 845 monitoring program. It is expected that upon USEPA approval of Part 845, the 40 C.F.R. § 257 monitoring program and reporting will be eliminated, and the proposed Part 845 monitoring and reporting included in this Plan will continue until requirements of Part 845 have been achieved.

## 4.1 Monitoring Networks and Parameters

### 4.1.1 IEPA Groundwater Monitoring

The existing IEPA monitoring program was discussed in detail in **Section 2.1.1**. Monitoring wells are sampled on a quarterly and yearly frequency for the parameters required under IEPA WPCP 2017-EO-62640. Well locations and parameters will continue to be monitored as required by the WPCP until IEPA approves the Operating Permit (and by extension the GMP) for the GMF Pond.

### 4.1.2 40 C.F.R. § 257 Groundwater Monitoring

The existing 40 C.F.R. § 257 monitoring program was discussed in detail in **Section 2.1.2**. Seven wells (three background and four compliance) are sampled for Appendix III parameters on a semi-annual frequency. No changes are proposed to this monitoring network. Well locations and parameters will continue to be monitored and reported as required by 40 C.F.R. § 257 until USEPA approves Part 845.

### 4.1.3 Part 845 Groundwater Monitoring

The proposed Part 845 monitoring network will consist of three background monitoring wells (G02S, G50S, and G51S), seven compliance monitoring wells (G54L, G54S, G57S, G60L, G60S, G64L, and G64S), and one temporary water level only monitoring point (X301) to monitor potential impacts from the GMF Pond (**Figure 2-2**). The monitoring wells are screened within the uppermost aquifer (G02S, G50S, G51S, G54S, G57S, G60S, and G64S) and PMP (G54L, G60L, and G64L) along the perimeter of the GMF Pond. Groundwater samples will be collected and analyzed for the laboratory and field parameters in **Table E** below.

**Table E. Part 845 Groundwater Monitoring Program Parameters**

| | | | |
|---|---|---|---|
| **Field Parameters[1]** | | | |
| Groundwater Elevation | pH | Turbidity | |
| **Metals (Total)** | | | |
| Antimony | Boron | Cobalt | Molybdenum |
| Arsenic | Cadmium | Lead | Selenium |
| Barium | Calcium | Lithium | Thallium |
| Beryllium | Chromium | Mercury | |
| **Inorganics (Total)** | | | |
| Fluoride | Sulfate | Chloride | TDS |
| **Other (Total)** | | | |
| Radium 226 and 228 combined | | | |

[1] Dissolved oxygen, temperature, specific conductance, and oxidation/reduction potential will be recorded during sample collection.

All parameters listed above were sampled a minimum of eight times by October 18, 2021 to establish background groundwater quality in accordance with 35 I.A.C. § 845.650 (b)(1)(A). Discussion of background groundwater quality is included in **Section 3.2**.

## 4.2 Sampling Schedule

Groundwater sampling for the Part 845 monitoring well network will initially be performed quarterly according to the following schedule:

**Table F. Part 845 Sampling Schedule**

| Frequency | Duration |
|---|---|
| Monthly (groundwater elevations only) | Begins: the quarter following approval of this plan and issuance of the Operating Permit. |
| | Ends: Following the 30-year post closure care period and following IEPA approval of documentation that groundwater concentrations are below standards in 35 I.A.C. § 845.600 and concentrations exceeding background are not increasing and meet requirements in 35 I.A.C. § 845.780 (c)(2)(B)(i) and (ii). |
| Quarterly (groundwater quality) | Begins: the quarter following approval of this plan and issuance of the Operating Permit. |
| | Ends: Following the 30-year post closure care period and following IEPA approval of documentation that groundwater concentrations are below standards in 35 I.A.C. § 845.600 and concentrations exceeding background are not increasing and meet requirements in 35 I.A.C. § 845.780 (c)(2)(B)(i) and (ii), or upon IEPA approval of an alternate schedule as allowed by 35 I.A.C. § 845.650(b)(4). |
| Semi-annual (groundwater quality) | Begins: Following 5 years of quarterly groundwater monitoring and IEPA approval of a demonstration that groundwater concentrations are below standards in 35 I.A.C. § 845.600 and not exhibiting statistically-significant increasing trends, monitoring effectiveness is not compromised by a semi-annual schedule, and sufficient data has been collected to characterize groundwater. |
| | Ends: Following detection of a statistically-significant increasing trend in groundwater concentrations or an exceedance of the standards in 35 I.A.C. § 845.600 (quarterly |

| | |
|---|---|
| | monitoring shall be resumed in these circumstances), or following the 30-year post closure care period and following IEPA approval of documentation that groundwater concentrations are below standards in 35 I.A.C. § 845.600 and concentrations exceeding background are not increasing and meet requirements in 35 I.A.C. § 845.780 (c)(2)(B)(i) and (ii). |

## 4.3 Groundwater Sample Collection

Groundwater sampling procedures have been developed and the collection of groundwater samples is being implemented to meet the requirements of 35 I.A.C. § 845.640. In addition to groundwater well samples, quality assurance samples will be collected as described in **Section 4.5** (**Table 4-1**).

## 4.4 Laboratory Analysis

Laboratory analysis will be performed consistent with the requirements of 35 I.A.C. § 845.640(j) by a state-certified laboratory using methods approved by IEPA and USEPA. Laboratory methods may be modified based on laboratory equipment availability or procedures, but the Reporting Limit (RL) for all parameters analyzed, regardless of method, will be lower than the applicable groundwater quality standard. RLs for the applicable parameters are summarized in **Table 4-2**. Concentrations lower than the RL will be reported as less than the RL.

## 4.5 Quality Assurance Program

Consistent with the requirements of 35 I.A.C. § 845.640(a)(5), the sampling and analysis program includes procedures and techniques for quality assurance/quality control (QA/QC). Additional quality assurance samples to be collected will include the following:

- Field duplicates will be collected at a frequency of one per group of ten or fewer investigative water samples.
- One equipment blank sample will be collected and analyzed for each day of sampling. If dedicated sampling equipment is used, then equipment blank samples will not be collected.
- The duplicate and equipment blank quality assurance samples will be supplemented by the laboratory QA/QC program, which typically includes:
  - Regular generation of instrument calibration curves to assure instrument reliability
  - Laboratory control samples and/or quality control check standards that have been spiked, and analyses to monitor the performance of the analytical method
  - Matrix spike/matrix spike duplicate analyses to determine percent recoveries and relative percent differences for each of the parameters detected
  - Analysis of replicate samples to check the precision of the instrumentation and/or methodology employed for all analytical methods
  - Analysis of method blanks to assure that the system is free of contamination

Water quality meters used to measure pH and turbidity will be calibrated according to manufacturer’s specifications. At a minimum, it is recommended that calibration of pH occur daily prior to sampling and checked for accuracy at the end of each day. Unusual or suspect pH measurements during sampling events will be flagged, evaluated, and additional calibration may

be performed throughout the sampling events. Turbidity meters will be checked daily, prior to and following sampling. Unusual measurements or erratic meter performance will be flagged and evaluated for overall effects on the data prior to reporting.

## 4.6 Groundwater Monitoring System Maintenance Plan

Consistent with the requirements of 35 I.A.C. § 845.630(e)(2), maintenance will be performed as needed to assure that the monitoring wells provide representative groundwater samples. Monitoring wells will be inspected during each groundwater sampling event; inspections will consist of the following:

- Visual inspection, clearing of vegetation, replacement of markers, and painting of protective casings as needed to assure that monitoring wells are clearly marked and accessible
- Visual inspection and repair or replacement of well aprons as needed to assure that they are intact, drain water away from the well, and have not heaved
- Visual inspection and repair or replacement of protective casings as needed to assure that they are undamaged, and that locks are present and functional
- Checks to assure that well caps are intact and vented, unless in flood-prone areas in which case caps will not be vented
- Annual measurement of monitoring well depths to determine the degree of siltation within the wells. Wells will be redeveloped as needed to remove siltation from the screened interval if it impedes flow of water into the well
- Checks to assure that wells are clear of internal obstructions, and flow freely

If maintenance of a monitoring well cannot address an identified deficiency, a replacement well will be installed.

## 4.7 Statistical Analysis

Statistical analysis will be consistent with procedures listed in 35 I.A.C. § 845.640(f). A Statistical Analysis Plan, provided in **Appendix A**, has been developed to summarize the statistical procedures that will be used to evaluate the groundwater results.

## 4.8 Data Reporting

Data reporting for the 40 C.F.R. § 257 monitoring program will be consistent with recordkeeping, notification, and internet posting requirements described in 40 C.F.R. § 257.105 through 257.107.

Groundwater monitoring and analysis completed in accordance with the Part 845 monitoring under an approved monitoring program will be reported to IEPA within 60 days after completion of sampling and the data placed in the facility's operating record as required by 35 I.A.C. § 845.610(b)(3)(D). Within 14 days of posting to the operating record, information will be posted to the publicly accessible internet site "Illinois CCR Rule Compliance Data and Information" as required by 35 I.A.C. § 845.810(d). Information will also be submitted to IEPA annually by January 31 as required by 35 I.A.C. § 845.550, for data collected the preceding year. The report will include the status of the groundwater monitoring and any required corrective action plan for the GMF Pond in addition to other requirements detailed in 35 I.A.C. § 845.610(e).

## 4.9 Compliance with Applicable On-site Groundwater Protection Standards

In accordance with 35 I.A.C. § 845.600(a)(1), the groundwater protection standard at the waste boundary will be the higher of either the 35 I.A.C. § 845.600 standard or the concentration determined by background groundwater monitoring.

As provided in 35 I.A.C. § 845.780(c)(2), at the end of the 30-year post-closure care period, groundwater monitoring will continue to be conducted in post-closure care until the groundwater results show the concentrations are:

- Below the GWPS in 35 I.A.C. § 845.600; and
- Not increasing for those constituents over background, using the statistical procedures and performance standards in 35 I.A.C. § 845.640(f) and (g), provided that:
  - Concentrations have been reduced to the maximum extent feasible; and
  - Concentrations are protective of human health and the environment.

Following detection of an exceedance of the GWPS, an Alternate Source Demonstration (ASD) will be evaluated as described in **Section 4.10**.

## 4.10 Alternate Source Demonstrations

As allowed in 35 I.A.C. § 845.650(e), following detection of an exceedance of the GWPS, an ASD will be evaluated and, if completed, submitted to IEPA within 60 days. The ASD will provide lines of evidence that a source other than the GMF Pond caused the contamination and the GMF Pond did not contribute to the contamination, or that the exceedance of the GWPS resulted from error in sampling, analysis, statistical evaluation, natural variation in groundwater quality, or a change in the potentiometric surface and groundwater flow direction.

The ASD will include information and analysis that supports the conclusions and a certification of accuracy by a qualified professional engineer. Once the ASD is approved by IEPA, the Part 845 groundwater monitoring will continue as defined in **Section 4.1.3**.

If an ASD is not completed and submitted, or IEPA does not approve the ASD, a notification of the exceedance will be provided to IEPA and placed in the operating record. Additional actions will also be completed as required by 35 I.A.C § 845.650(d)(1) through (3), including initiation of an assessment of corrective measures under 35 I.A.C § 845.660. As allowed in 35 I.A.C § 845.650(e)(7) a petition for review of IEPA's non-concurrence under 35 I.A.C. § 105 may also be filed.

## 4.11 Assessment of Corrective Measures and Corrective Action

As described in 35 I.A.C. § 845.660, if the ASD summarized in **Section 4.10** has not been approved by IEPA, an assessment of corrective measures will be initiated within 90 days of the detection of a result exceeding 35 I.A.C. § 845.600 standards (*i.e.,* receipt of laboratory data). The assessment of corrective measures will include at least the following (35 I.A.C. § 845.660 (c)):

- The performance, reliability, ease of implementation, and potential impacts of appropriate potential remedies, including safety impacts, cross-media impacts, and control of exposure to any residual contamination;
- The time required to begin and complete the corrective action plan; and

Electronic Filing: Received, Clerk's Office 06/20/2024

- The institutional requirements, such as State or local permit requirements or other environmental or public health requirements that may substantially affect implementation of the corrective action plan.

Within one year of completing the assessment of corrective measures, a corrective action plan will be developed to identify the selected remedy in accordance with 35 I.A.C. § 845.670. If closure of the CCR Unit is required, a closure alternatives analysis will be completed as specified in 35 I.A.C. § 845.710. The analysis and selected alternative will be submitted to IEPA in a Closure Plan as specified by 35 I.A.C. § 845.720. Groundwater monitoring proposed in this Addendum will continue as specified until the post closure care period has expired and IEPA has approved termination of post-closure care.

[O: CJC 09/17/21; C: LDC 09/20/21]

**Notes:**
[1] Analytical method numbers are from SW-846 unless otherwise indicated. Analytical methods may be updated with more recent versions as appropriate.
[2] Field duplicates will be collected at a frequency of one per group of 10 or fewer investigative water samples. Field duplicates will not be collected for radium analysis.
[3] Field blanks will be collected at the discretion of the project manager; Equipment blanks will be collected at a rate of 1 per sampling event if non-dedicated equipment is used.
[4] Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples will be collected at a frequency of one per group of 20 or fewer investigative water samples per CCR unit/multi-unit. Additional volume to be determined by laboratory.
[5] Sample volume is estimated and will be determined by the laboratory.
[6] Metals = antimony, arsenic, barium, beryllium, boron, cadmium, calcium, chromium, cobalt, lead, lithium, molybdenum, selenium, thallium. Metals may be analyzed via ICP/ ICP-MS USEPA methods 6010 or 6020 depending on laboratory instrument availability
[7] If turbidity exceeds 10 NTUs, a duplicate sample filtered through a .45 micron filter may be collected for metals analysis in addition to the unfiltered sample. Both samples would be submitted for analysis.
[8] Parameter collected for quality assurance and quality control for field sampling purposes only; not required to be collected or reported under Part 845; collection of parameter may be discontinued without notification.
< = less than
°C = degrees Celsius
GMF = Gypsum Management Facility
$HNO_3$ = nitric acid
mL = milliliter
NA = not applicable
NTU = nephelometric turbidity unit

# LICENSED PROFESSIONAL CERTIFICATIONS

This certification is based on the description of the statistical methods selected to evaluate groundwater as presented in the following Statistical Analysis Plan; Duck Creek Power Plant Gypsum Management Facility Pond. The procedures described in the plan will be used to establish background conditions and implement compliance monitoring as necessary and required by 35 I.A.C. § 845.640 and 35 I.A.C. § 845.650. The Statistical Analysis Plan was prepared in accordance with the requirements of 35 I.A.C. § 845.640(f), with reference to the acceptable statistical procedures provided in the United States Environmental Protection Agency (USEPA)'s *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, Unified Guidance* (*Unified Guidance,* March 2009), and is intended to provide a logical process and framework for conducting the statistical analysis of the data obtained during groundwater monitoring. In accordance with 35 I.A.C. § 845.640(f)(1), the statistical method chosen for analysis of background groundwater quality will be either the tolerance interval or the prediction interval procedure for each constituent listed in 35 I.A.C. § 845.600(a)(1) at this CCR unit per 35 I.A.C. § 845.640(f)(1)(C). Groundwater Protection Standards (GWPS) will be established in accordance with 35 I.A.C. § 845.600(a) (greater of the background concentration or numerical limit specified in 35 I.A.C. § 845.600(a)(1)). The GWPS will be compared to the lower confidence limit for the observed concentrations for each constituent in each compliance well. Consistent with the *Unified Guidance*, the same general statistical method of confidence interval testing against a fixed GWPS is recommended in compliance and corrective action programs. Confidence intervals provide a flexible and statistically accurate method to test how a parameter estimated from a single sample compares to a fixed numerical limit. Confidence intervals explicitly account for variation and uncertainty in the sample data used to construct them.

Description of the statistical methods chosen for analysis of groundwater monitoring data and application of these methods for determining exceedances of the GWPS identified in 35 I.A.C. § 845.600(a) is provided in this Statistical Analysis Plan.

## 35 I.A.C. § 845.640 Statistical Analysis (PE)

*I, Eric J. Tlachac, a qualified professional engineer in good standing in the State of Illinois, certify that the statistical methods summarized above and described in this document (Statistical Analysis Plan; Duck Creek Power Plant Gypsum Management Facility Pond) are appropriate for evaluating the groundwater monitoring data collected as described in the attached document and are in substantial compliance with 35 I.A.C. § 845.640.*

# 1. INTRODUCTION

In April 2021, the Illinois Environmental Protection Agency (IEPA) issued a final rule for the regulation and management of Coal Combustion Residuals (CCR) in surface impoundments (SIs) under the Standards for the Disposal of CCR in Surface Impoundments: Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845 (Part 845). Facilities regulated under Part 845 are required to develop and sample a groundwater monitoring well network to evaluate whether impounded CCR materials are impacting downgradient groundwater quality. The groundwater quality evaluation must include selection and certification by a qualified professional engineer of the statistical procedures to be used. The procedures described in the evaluation will be used to establish background conditions and implement compliance and corrective action monitoring as necessary and required by 35 I.A.C. § 845.640 and 35 I.A.C. § 845.650. This Statistical Analysis Plan was prepared in accordance with the requirements of 35 I.A.C. § 845.640(f), with reference to the acceptable statistical procedures provided in United States Environmental Protection Agency's (USEPA's) *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, Unified Guidance* (*Unified Guidance*) (March 2009).

This Statistical Analysis Plan does not include procedures for groundwater sample collection and analysis, as these activities are conducted in accordance with the Sampling and Analysis Plan prepared for each CCR unit in accordance with 35 I.A.C. § 845.640. This Statistical Analysis Plan will be used as the primary reference for evaluating groundwater quality during operation and post-closure care.

## 1.1 Statistical Analysis Objectives

This Statistical Analysis Plan is intended to provide a logical process and framework for conducting the statistical analyses of data obtained during groundwater monitoring conducted in accordance with the Sampling and Analysis Plan for each CCR unit. The Statistical Analysis Plan will enable a qualified professional engineer to certify that the selected statistical methods are appropriate for evaluating the groundwater monitoring data for the applicable CCR unit(s).

## 1.2 Statistical Analysis Plan Approach

The main sections of this Statistical Analysis Plan should be viewed as a "generic" outline of statistical methods utilized for each CCR unit and constituent required to be monitored. The statistical analysis of the groundwater monitoring data, however, will be conducted on an individual-constituent or well basis, and may involve the use of appropriate statistical procedures depending on multiple factors such as detection frequency and normality distributions.

The CCR Rule outlines two phases of groundwater monitoring:

- Background Monitoring in accordance with 35 I.A.C. § 845.650(b)(1)
- Compliance Monitoring in accordance with 35 I.A.C. § 845.650

Each phase of the groundwater monitoring program requires specific statistical procedures to accomplish the intended purpose. During the background monitoring phase, background groundwater quality will be established utilizing upgradient and background wells and downgradient groundwater quality data will be collected to facilitate statistics in subsequent phases. Compliance Monitoring is then initiated through the evaluation of the downgradient

groundwater monitoring data for exceedances of the groundwater protection standard (GWPS) established by Part 845 (concentration specified in 35 I.A.C. § 845.600 or an IEPA-approved background concentration). The developed statistical analysis plan will be implemented for each monitoring phase and in accordance with the statistical procedures.

# 2. BACKGROUND MONITORING AND DATA PREPARATION

The background and compliance monitoring wells were sampled and analyzed for constituents, as listed in Part 845 (antimony, arsenic, barium, beryllium, boron, cadmium, calcium, chloride, chromium, cobalt, fluoride, lead, lithium, mercury, molybdenum, pH, radium 226 and 228 combined, selenium, sulfate, thallium, total dissolved solids, and turbidity), during the baseline phase of the groundwater monitoring program.

The background monitoring well(s) were placed upgradient of the CCR unit, or at an alternative background location, where they are not affected by potential leakage from the CCR unit. Compliance monitoring wells were placed at the waste boundary of the CCR unit, along the same groundwater flow path. As 35 I.A.C. § 845.630(a) specifies, the location of these wells ensures that background accurately represents the quality of unaffected groundwater, while compliance wells accurately represent groundwater quality at the waste boundary and monitor all potential contaminant pathways.

As required by 35 I.A.C. § 845.650(a)(1), eight sampling events were completed within 180 days of April 21, 2021. As outlined, groundwater sampling procedures included sampling of the background and compliance wells using low-flow sampling methods, collection of one field quality control sample per event, and groundwater samples were not field filtered before laboratory analysis of total recoverable metals.

Following completion of the eight sampling events, background groundwater quality was established for Part 845 constituents. Groundwater monitoring will be conducted quarterly for at least the first five years. In accordance with 35 I.A.C. § 845.650(b)(4), after the first five years, a request to reduce the monitoring frequency to semiannual may be submitted to IEPA if all of the following can be demonstrated:

- Groundwater monitoring effectiveness will not be compromised by the reduced frequency
- Sufficient data has been collected to characterize groundwater
- Monitoring to date does not show any statistically significant increasing trends
- The concentrations of monitored constituents at the compliance monitoring wells are below the applicable GWPSs established in 35 I.A.C. § 845.600

The following subsections outline the statistical tests and procedures (methods) that will be utilized to evaluate data collected for each constituent in both background and compliance wells for Background and Compliance Monitoring. When necessary and contingent upon equivalent statistical power, an alternative test not included in this Statistical Analysis Plan may be chosen due to site-specific data requirements.

## 2.1 Sample Independence

Independence of sample results is a major assumption for most statistical analyses. To ensure physical independence of groundwater sampling results, the minimum time between sampling events must be longer than the time required for groundwater to move through the monitoring well. The sampling schedules for both the baseline and compliance monitoring periods are specified in 35 I.A.C. § 845.650(b) and may conflict with the statistical assumption of independence of sample results.

### 2.2 Non-Detect Data Processing

The reporting limit (RL) will be used as the lower level for the reporting of non-detected groundwater quality data. For all summary statistics (box plots, timeseries, etc.), the RL will be substituted for concentrations reported below the RL, including non-detects. With professional judgement, analytical results between the RL and the method detection limit, *i.e.,* estimated values, typically identified with a "J" flag, may be utilized if provided by the laboratory.

For all statistical test procedures:

- If the frequency of non-detect data are less than or equal to 15 percent, half of the RL will be substituted for these data
- If the non-detect frequency is between 15 percent and 50 percent, either the Kaplan-Meier or robust regression on order statistics (ROS) will be used to estimate the mean and standard deviation adjusted for the presence of left-censored values
- If the non-detect frequency is greater than 50 percent, a non-parametric test will be used
- If only one background result is detected that value will be used as the non-parametric upper prediction limit (UPL)

### 2.3 Testing for Normality

Many statistical analyses assume that sample data are normally distributed (parametric). However, environmental data are frequently not normally distributed (nonparametric). 35 I.A.C. § 845.640(g) requires the knowledge of the background data distribution for comparison to compliance results. The *Unified Guidance* document recommends the Shapiro-Wilk normality test for sample sizes of 50 or less, and the Shapiro-Francia normality test for sample sizes greater than 50.

When possible, transformation of datasets to achieve normal distributions is preferred.

### 2.4 Testing for Outliers

Part 845 constituents will be screened for the existence of outliers using a method described by the *Unified Guidance*. Outliers are extreme data points that may represent an anomaly or erroneous data point. To test for outliers, one or more of the following outlier tests will be utilized:

- Dixon's test, for well-constituent pairs with less than 25 samples, assumes normally distributed data.
- Rosner's test, for well-constituent pairs with more than 20 samples, assumes normally distributed data.
- Grubb's test for well-constituent pairs with seven or more samples, assumes normally distributed data.
- Time series, box-whisker plots, and probability plots provide visual tools to identify potential outliers, and evaluation of seasonal, spatial, or temporal variability for both normally and non-normally distributed data.

Data quality control, groundwater geochemistry, and sampling procedures will be evaluated as potential sources of error leading to an outlier result. The outlier tests cannot be used alone to determine whether a value is a true outlier that should be excluded from future statistical

analysis. Corroborating evidence needed to exclude values includes a discrete data reporting or analytical error, or potential laboratory bias. Absent corroborating evidence, the flagged values are considered true, but extreme, values in the data set. Professional judgement will be used to exclude extreme outliers from further statistical analyses. Outliers will be retained in the database.

With professional judgement, a confirmatory sample may be collected to allow for the distinction between an outlier and a true representation of groundwater quality at the monitoring point. If re-sampling is conducted, this sample will be collected within 90 days following outlier identification. If the confirmatory sample indicates the original result as an outlier, it will be reported as such.

### 2.5 Trend Analysis

Statistical analyses supporting the lack of trend are a fundamental step to confirm the assumption that groundwater quality values are stationary or constant over time at a CCR unit. These analyses allow for evaluation of variation in the background and compliance data for each constituent over time. A statistically significant increasing trend in background data could indicate an existing release from the CCR unit or alternate source, requiring further investigation. In addition, statistically significant trending background data can result in increased standard deviation and, therefore, greater prediction or control limits. Consequently, the increased prediction or control limit will have less power or ability to identify a release from the CCR unit.

A linear regression, coupled with a t-test for slope significance at a 95 percent confidence level (0.05 significance level), may be used on datasets for each constituent with few non-detects and a normally distributed variance of the mean to evaluate time trends. The Theil-Sen trend line, coupled with the Mann-Kendall test for slope significance at a 95 percent confidence level (0.05 significance level), will be used for datasets with frequent non-detects or non-normal variance. Similarly, trend analyses could also be used on compliance data to evaluate a possible release from the CCR unit.

### 2.6 Spatial Variation

Spatial trends and/or variation between background wells could indicate an existing release from a CCR unit. If the spatial variability is not due to an existing release, intrawell comparisons in compliance wells may be used to account for spatial variability and monitor for a future release. However, the CCR unit being monitored was placed into service prior to the start of groundwater monitoring and it is unknown whether a previous release has occurred. Accordingly, intrawell comparisons in compliance wells cannot be used to determine the occurrence of a future release. Interwell comparisons between compliance wells and background wells will be used.

### 2.7 Temporal Variation

Time series plots can be used to identify temporal dependence. Potentially significant temporal components of variability can be identified by graphing single constituent data from multiple wells together on a time series plot. With temporal dependence, the time series plot as a pattern of parallel traces, in which the individual wells will tend to rise and fall together across the sequence of sampling dates. Time series plots can be helpful by plotting multiple constituents over time for the same well, or averaging values for each constituent across wells on each sampling event and then plotting the averages over time. In either case, the plots can signify whether the general concentration pattern over time is simultaneously observed for different

constituents. If so, it may indicate that a group of constituents is highly correlated in groundwater or that the same artifacts of sampling and/or lab analysis impacted the results of several monitoring parameters.

Hydrologic factors such as drought, recharge patterns or regular (*e.g.,* seasonal) water table fluctuations may be responsible for the temporal variation. In these cases, it may be useful to test for the presence of a significant temporal effect by first constructing a parallel time series plot and then running a formal one-way analysis of variance (ANOVA) ($\alpha = 0.05$) for temporal effects. A one-way ANOVA for temporal effects considers multiple well data sets for individual sampling events or seasons as the relevant statistical factor. If event-specific analytical differences or seasonality appear to be an important temporal factor, the one-way ANOVA for temporal effects can be used to formally identify seasonality, parallel trends, or changes in lab performance that affect other temporal effects. The one-way ANOVA for temporal effects assumes that the data groups are normally distributed with constant variance. It is also assumed that for each of a series of background wells, measurements are collected at each well on sampling events or dates common to all the wells. Results of the ANOVA can also be used to create temporally stationary residuals, where the temporal effect has been 'subtracted from' the original measurements. These stationary residuals may be used to replace the original data in subsequent statistical testing.

If the data cannot be normalized, a similar test for a temporal or seasonal effect can be performed using the Kruskal-Wallis test ($\alpha = 0.05$). Each sampling event should be treated as a separate 'well,' while each well is treated as a separate 'sampling event.' In this case, no residuals can be computed since the Kruskal-Wallis test employs ranks of the data rather than the measurements themselves.

Where both spatial and temporal variation occur, two-way ANOVA can be considered where both well location and sampling event/season are treated as statistical factors. This procedure is described in Davis (1994).

### 2.8 Updating Background

Updating the background dataset periodically by adding recent results to an existing background dataset can improve the statistical power and accuracy of the statistical analysis, especially for non-parametric prediction intervals. The *Unified Guidance* recommends updating statistical limits (background) when at least four to eight new measurements (every 1 to 2 years under a quarterly monitoring program), are available for comparison to historical data. Professional judgement will be used to evaluate whether any background data appear to be affected by a release and need to be excluded from a background update. A t-test for equal means (if normal data distribution) or appropriate non-parametric test (if non-normal data distribution) such as a Mann-Whitney (or Wilcoxon) rank-sum or box-whisker plots, will be conducted to evaluate whether the two groups of background sample populations are statistically different prior to updating any background datasets. A 0.05 significance level will be utilized when evaluating the two populations, with the null hypothesis that they are equivalent. In addition, time series graphs or other trend evaluation statistics will be conducted on the new background dataset to verify the absence of a release or changing groundwater quality. If the tests indicate that there are no statistical differences between the two background populations, the new data will be combined with the existing dataset. If the two populations are found to be different, the data will be reviewed to evaluate the cause of the difference. If the differences appear to be caused by a

release (if the new data are significantly higher, or lower for pH), then the previous background dataset may continue to be used. Furthermore, verified outliers will not be added to an existing background dataset. In accordance with the *Unified Guidance*, continual background updates will not be conducted due to the lack of sufficient samples for a statistical comparison.

# 3. COMPLIANCE MONITORING

Compliance monitoring is designed to monitor groundwater for evidence of a release by comparing Part 845 constituents in compliance wells to both background concentrations and the GWPS. Compliance Monitoring will begin the 1st quarter following approval of this Groundwater Monitoring Plan and issuance of the Operating Permit. The selected Compliance Monitoring statistical method used to compare compliance groundwater quality data for each constituent to the GWPS will provide for adequate statistical power, error levels and individual test false positive rates, and be appropriate for the distribution and detection frequency of the background dataset. Statistical power is the ability of a statistical test to detect a true exceedance.

In accordance with 35 I.A.C. § 845.610(b)(3)(D), compliance monitoring statistical analyses will be completed and submitted to IEPA within 60 days after completion of sampling.

## 3.1 GWPS Establishment and Exceedance Determination

In accordance with 35 I.A.C. § 845.600(a), the GWPS will be the constituent concentrations specified in 35 I.A.C. § 845.600(a)(1) except for when the background concentration is greater, or no concentration is specified (*i.e.,* for calcium and turbidity), in which case the GWPS will be the background concentration. The GWPS based on background concentration will be calculated using a parametric upper tolerance limit (UTL), a parametric UPL for a future mean, or a non-parametric UPL for a future median.

Statistical calculations that will be utilized in Compliance Monitoring procedures are summarized in **Table A** below and listed in **Sections 3.1.1** through **3.1.7**. Depending on the distribution of the data and the percentage of non-detects, it may be more appropriate to use a parametric model over a non-parametric model. As necessary, other techniques as mentioned in the *Unified Guidance* and/or new methods will be implemented.

**Table A. Statistical Calculations Used in Compliance Monitoring Procedures**

| Compliance Monitoring | | | | | | |
|---|---|---|---|---|---|---|
| Significant Trend? | Background Data | | | Compliance Data | | |
| | Percent Non-Detects | Distribution | GWPS Determination | Percent Non-Detects | Distribution | Method to Determine Exceedance |
| No | 0 ≤ 50 | Normal | 35 I.A.C § 845.600(a)(1) constituent concentration or The Upper Tolerance Limit | ≤75 | Normal | Parametric Lower Confidence Limit around a Normal Mean |
| | | | | ≤75 | Log-Normal | Parametric Lower Confidence Limit around a Lognormal Geometric Mean |
| | | | | NA | Non-Normal | Non-Parametric Lower Confidence Limit around a Median |
| | | | | >75 | Unknown/ Cannot be determined | |
| | 50 ≤ 70 | Normal | The Upper Prediction Limit for a Future Mean | NA | NA | Future mean |
| | >70 | Non-Normal | Upper Prediction Limit for a Future Median | NA | NA | Future median |
| | 100 | Non-Normal | Double Quantification Rule | NA | NA | Individual Retesting Values |
| Yes | 0 ≤ 50 | Normal | UCL of Confidence Band around Linear Regression | ≤75 | Residuals after subtracting trend are normal, equal variance | Lower Limit from Confidence Band around Linear Regression |
| | 50 ≤ 100 | Non-Normal | UCL of Confidence Band around Thiel-Sen trend line | ≤75 | Residuals not normal | Lower Limit from Confidence Band around Thiel-Sen |

### 3.1.1 The Upper Tolerance Limit

The UTL will be used to calculate the GWPS when pooled background data are normally distributed, with a non-detect frequency of 50 percent or less. When non-detect frequency is 15 percent or less, half the RL will be substituted for non-detects. The *Unified Guidance* recommends 95 percent confidence level and 95 percent coverage (95/95 tolerance interval).

- When non-detect frequency is 15 percent or less, half the RL will be substituted for non-detects (simple substitution), and the normal mean and standard deviation will be calculated.

- The Kaplan-Meier or the ROS method will be used when the detection frequency is between 15 percent and 50 percent. The Kaplan-Meier method assesses the linearity of a censored probability plot to determine whether the background sample can be approximately normalized. If so, then the Kaplan-Meier method will be used to compute estimates of the mean and standard deviation adjusted for the presence of left-censored values. The Kaplan-Meier or ROS estimate of the mean and standard deviation will be substituted for the sample mean and standard deviation.
- If background normality cannot be achieved, non-parametric UTLs will not be calculated until a minimum of 60 background samples have been collected (to achieve 95 percent coverage).

The parametric UTL on a future mean will be calculated from the background dataset as follows:

$$UTL = \overline{x} + \kappa\,(n, \gamma, \alpha - 1) \cdot s$$

$\overline{x}$ = background sample mean

$s$ = background sample standard deviation

$\kappa\,(n, \gamma, \alpha - 1)$ = one-sided normal tolerance factor based on the chosen coverage (γ) and confidence level (α -1) and the size of the background dataset (n). Values are tabulated in Table 17-3 in Appendix D of the *Unified Guidance*. If exact values are not provided, then κ values can be estimated by linear interpolation.

If the UTL is constructed on the logarithms of original observations to achieve normality, where $\overline{y}$ and $s_y$ are the log-mean and log-standard deviation, the limit will be exponentiated for back-transformation to the concentration scale as follows:

$$UTL = \exp\left[\overline{y} + \kappa\,(n, \gamma, \alpha - 1) \cdot s_y\right]$$

$\overline{y}$ = background sample log-mean

$s_y$ = background sample log-standard deviation

When the GWPS is based on the 35 I.A.C. § 845.600(a)(1) constituent concentrations or a UTL derived from the background dataset, an exceedance in compliance wells relative to the GWPS will be evaluated using confidence intervals. A confidence interval defines the upper and lower bound of the true mean of a constituent concentration in groundwater within a specified confidence range.

- Non-detects in compliance data will be handled similarly to upgradient analyses, with half the RL substituted for non-detects when the frequency is 15 percent or less.
- The Kaplan-Meier, or the ROS method, will be used when the detection frequency is between 15 percent and 50 percent to compute estimates of the mean and standard deviation adjusted for the presence of left-censored values. These estimates will then be substituted for the sample mean and standard deviation.

Once the GWPS is established for background data using the UTL, either parametric or non-parametric confidence intervals will be computed for each constituent in compliance wells to identify GWPS exceedances.

### 3.1.2 Parametric Confidence Intervals around a Mean

If compliance data are approximately normal, one-sided parametric confidence intervals around a sample mean will be constructed for each constituent and well pair. The lower confidence limit (LCL) will be calculated as:

$$LCL_{1-\alpha} = \overline{x} - t_{1-\alpha,n-1} \cdot \frac{s}{\sqrt{n}}$$

$\overline{x}$ = compliance sample mean

*s* = compliance sample standard deviation

*n* = compliance sample size

$t_{1-\alpha,n-1}$ = obtained from a Student's t-table with (n–1) degrees of freedom (Table 16-1 in Appendix D of the *Unified Guidance*)

The chosen t value will aim to achieve both a low false-positive rate, and high statistical power. Minimum α values are tabulated in Table 22-2 of Appendix D of the *Unified Guidance*. The selected minimum α value, from which the t value will be derived, will have at least 80 percent power (1-β = 0.8) when the underlying mean concentration is twice the GWPS.

If compliance data are distributed lognormally, the LCL will be computed around the lognormal geometric mean as:

$$LCL_{1-\alpha} = \exp\left(\overline{y} - t_{1-\alpha,n-1} \cdot \frac{s_y}{\sqrt{n}}\right)$$

$\overline{y}$ = compliance sample log-mean

$s_y$ = compliance sample log-standard deviation

### 3.1.3 Non-Parametric Confidence Intervals around a Median

Non-parametric confidence intervals around the median will be computed if the compliance data contain greater than 50 percent non-detects or are not normally distributed. The mathematical algorithm used to construct non-parametric confidence intervals is based on the probability (*P*) that any randomly selected measurement in a sample of n concentration measurements will be less than an unknown *P* x 100th percentile of interest (where *P* is between 0 and 1). Then the probability that the measurement will exceed the *P* x 100$^{th}$ percentile is (1–*P*). The number of sample values falling below the *P* x 100$^{th}$ percentile out of a set of n should follow a binomial distribution with parameters n and success probability *P*, where 'success' is defined as the event that a sample measurement is below the *P* x 100$^{th}$ percentile. The probability that the interval formed by a given pair of order statistics will contain the percentile of interest will then be determined by a cumulative binomial distribution *Bin(x;n,p)*, representing the probability of *x* or fewer successes occurring in *n* trials with success probability p. *P* will be set to 0.50 for an interval around the median.

The sample size n will be ordered from least to greatest. Given *P* = 0.50, candidate interval endpoints will be chosen by ordered data values with ranks close to the product of (n+1) x 0.50. If the result of (n+1) x 0.50 is a fraction (for even-numbered sample sizes), the rank values immediately above and below will be selected as possible candidate endpoints. If the result of (n+1) x 0.50 is an integer (for odd-numbered sample sizes), one will be added to and subtracted

from the result to get the upper and lower candidate endpoints. The ranks of the endpoints will be denoted L* and U*. For a one-sided LCL, the confidence level associated with endpoint L* will be computed as:

$$1 - \alpha = Bin(L^* - 1; n, 0.50) = \sum_{x=L^*}^{n} \binom{n}{x} \left(\frac{1}{2}\right)^n$$

If the candidate endpoint(s) do not achieve the desired confidence level, new candidate endpoints (L*–1) and (U*+1) and achieved confidence levels will be calculated. If one candidate endpoint equals the data minimum or maximum, only the rank of the other endpoint will be changed. Achievable confidence levels are tabulated using these equations in Table 21-11 in Appendix D of the *Unified Guidance*.

Both parametric and non-parametric confidence limits will then be compared to the GWPS. The CCR unit is considered to be in compliance if the LCL is equal to or lower than the GWPS for all detected constituents at all compliance monitoring wells. A GWPS exceedance is determined if the LCL exceeds the GWPS.

### 3.1.4 The Upper Prediction Limit for a Future Mean

The parametric UPL for a future mean will be used to calculate the GWPS if the pooled background data contain 50 to 70 percent non-detects and normality can be achieved. The Kaplan-Meier or ROS methods will be used to estimate the mean and standard deviation. The non-parametric UPL for a future median will be calculated as the GWPS if background samples cannot be normalized or contain greater than 70 percent non-detects. The parametric UPL for a future mean will be calculated from the background dataset at follows:

$$UPL_{1-\alpha} = \overline{x} + \kappa s$$

$\overline{x}$ = background sample mean

$s$ = background standard deviation

$\kappa$ = multiplier based on the order (p) of the future mean to be predicted, the number of compliance wells to be tested (w), the background sample size (n) the number (c) of constituents of concern (COCs), the "1-of-m" retesting scheme, and the evaluation schedule (annual, semi-annual, quarterly). Values are tabulated in 19-5 to 19-9 in Appendix D of the *Unified Guidance*.

The mean of order p will be computed for each well and compared against the UPL. For any compliance point mean that exceeds the limit, p additional resamples may be collected at that well for a 1-of-2 retesting scheme. Resample means will then be compared to the UPL. A GWPS exceedance has been deemed to occur at a compliance well when the initial mean and all resample means exceed the UPL.

### 3.1.5 The Non-Parametric Upper Prediction Limit for a Future Median

The non-parametric UPL for a future median will be used to calculate the GWPS if the pooled background data contain greater than 70 percent non-detects and normality cannot be achieved. Non-parametric methods assume that the data does not have an underlying distribution. To calculate the non-parametric UPL on a future value, the target per-constituent false positive rate ($\alpha_{const}$) will be determined as follows:

$$\alpha_{const} = 1 - (1 - \alpha)^{1/c}$$

$\alpha$ = the site-wide false positive rate (SWFPR) of 0.10 recommended by the *Unified Guidance*

*c* = the number of monitoring constituents

The number of yearly statistical evaluation (nE) will be multiplied by the number of compliance wells (w) to determine the look-up table entry, w*. The background sample size (n) and w* will be used to select an achievable per-constituent false positive rate value in Table 19-24 of Appendix D in the *Unified Guidance*. The chosen achievable per-constituent false positive rate value will determine the type of non-parametric prediction limit (maximum or 2nd highest value in background) and a retesting scheme for a future median. The background data will be sorted in ascending order, and the upper prediction limit will be set to the appropriate order statistic previously determined by the achievable per-constituent false positive rate value in Table 19-24. If all constituent measurements in a background sample are non-detect, the Double Quantification rule will be used. The use of the Double Quantification rule in Compliance Monitoring will only be applicable if the RL is above the 35 I.A.C. § 845.600(a)(1) constituent concentration or a constituent concentration is not specified in § 845.600(a)(1). This scenario is highly unlikely. The constituent will also be removed from calculations identifying the target false positive rate.

Two initial measurements per compliance well will be collected. If both do not exceed the upper prediction limit, a third initial measurement will not be collected since the median of order 3 will also not exceed the limit. If both exceed the prediction limit, a third initial measurement will not be collected since the median will also exceed the limit. If one initial measurement is above and one below the limit, a third initial observation may be collected to determine the position of the median relative to the UPL. Up to three resamples will be collected in order to assess the resample median. In all cases, if two or more of the compliance point observations are non-detect, the median will be set equal to the RL. The median value for each compliance well will be compared to the UPL. For the 1-of-2 retesting scheme, if any compliance point median exceeds the limit, up to three additional resamples will may be collected from that well. The resample median will be computed and compared to the UPL. A GWPS exceedance has been deemed to occur at a compliance well when either the initial median, or both the initial median and resample median exceed the UPL.

If the concentrations of detected constituents are below the established GWPS, Compliance Monitoring will continue.

### 3.1.6 Parametric Linear Regression and Confidence Band

If the t-test detects a significant trend in the parametric linear regression line using either background or compliance data for a particular constituent, confidence bands accounting for trends will be constructed to account for the trend-induced variation. If this is not accounted for, a wider confidence interval will inevitably be calculated for a given confidence level and sample size (n). A wider confidence interval will result in less statistical power, or ability to demonstrate an exceedance or return to compliance. When a linear trend line has been estimated, a series of confidence intervals is estimated at each point along the trend. This creates a simultaneous confidence band that follows the trend line. As the underlying population mean increases or decreases, the confidence band does also to reflect this change at that point in time.

Linear regression will be used when background or compliance data are approximately normally distributed, with a constant sample variance around the mean, and the frequency of non-detects is low. The linear regression of concentration against sampling date (time) will be computed as follows:

$$\hat{b} = \sum_{i=1}^{n} (t_i - \overline{t}) \cdot x_i / (n-1) \cdot s_t^2$$

$x_i$ = $i^{th}$ concentration value and

$t_i$ = $i^{th}$ sampling date

$\overline{t}$ = sampling mean date

$s_t^2$ = variance of the sampling dates

This estimate leads to the following regression equation:

$$\hat{x} = \overline{x} + \hat{b} \cdot (\mathrm{t} - \overline{t})$$

$\overline{x}$ = mean concentration level

$\hat{x}$ = estimated mean concentration at time t

The regression residuals will also be computed at each sampling event to ensure uniformity and lack of significant skewness. Regression residuals will be computed at each sampling event as follows:

$$r_i = x_i - \hat{x}_i$$

The estimated variance around the regression line, or mean squared error (MSE) will be computed as follows:

$$s_e^2 = \frac{1}{n-2} \sum_{i=1}^{n} r_i^2$$

The confidence intervals around a linear regression trend line given confidence level (1-α) and a point in time ($t_0$), will be computed as follows:

$$LCL_{1-\alpha} = \hat{x}_0 - \sqrt{2 s_e^2 \cdot F_{1-2\alpha,2,\mathrm{n}-1} \cdot \left[\frac{1}{n} + \frac{(t_0 - \overline{t})^2}{(n-1) \cdot s_t^2}\right]}$$

$$UCL_{1-\alpha} = \hat{x}_0 - \sqrt{2 s_e^2 \cdot F_{1-2\alpha,2,\mathrm{n}-2} \cdot \left[\frac{1}{n} + \frac{(t_0 - \overline{t})^2}{(n-1) \cdot s_t^2}\right]}$$

$\hat{x}_0$ = estimated mean concentration from the regression equation at time $t_0$

$F_{1-2\alpha,2,\mathrm{n}-2}$ = upper (1-2α)$^{th}$ percentage point from an F-distribution with 2 and (n-2) degrees of freedom

For background data, the UCL around the linear regression line will be used as the GWPS for the trending constituent. For compliance data, confidence bands around the linear regression line will be compared to the GWPS. The CCR unit is considered to be in compliance if the LCL is equal to or lower than the GWPS for all detected constituents at all compliance wells. A GWPS exceedance is determined when the LCL based on the trend line first exceeds the GWPS.

### 3.1.7 Non-Parametric Thiel-Sen Trend Line and Confidence Band

If the Mann-Kendall test detects a significant trend in the non-parametric Thiel-Sen line using either background or compliance data for a particular constituent, confidence bands accounting for trends will be constructed to account for the trend-induced variation. The Thiel-Sen trend line will be used as a non-parametric alternative to linear regression when trend residuals cannot be normalized or if there are a higher percentage of non-detects in either background or compliance data. The Thiel-Sen trend line estimates the median concentration over time by combining the median pairwise slope with the median concentration value and the median sample date. To compute the Thiel-Sen line, the data will first be ordered by sampling event x1, x2, xn. All possible distinct pairs of measurements ($x_i$, $x_j$) for j > i will be considered and the simple pairwise slope estimate will be computed for each pair as follows:

$$m_{ij} = (x_j - x_i)/(j - i)$$

With a sample size of n, there will be a total of N = n(n-1)/2 pairwise estimates ($m_{ij}$). If a given observation is a non-detect, half the RL will be substituted. The N pairwise slope estimates ($m_{ij}$) will be ordered from least to greatest (renamed m(1), m(2),..m(N)). The Thiel-Sen estimate of slope (Q) will be calculated as the median value of the list depending on whether N is even or odd as follows:

$$Q = \begin{cases} m_{([N+1]/2)} \; if \; N \; is \; odd \\ (m_{(N/2)} + m_{([N+2]/2)})/2 \; if \; N \; is \; even \end{cases}$$

The sample concentration magnitude will be ordered from least to greatest, x(1), x(2), to x(n) and the median concentration will be calculated as follows:

$$\tilde{x} = \begin{cases} x_{([n+1]/2)} \; if \; n \; is \; odd \\ (x_{(n/2)} + x_{([n+2]/2)})/2 \; if \; n \; is \; even \end{cases}$$

The median sampling date ($\tilde{t}$) with ordered times (t(1), t(2), to t(n)) will also be determined in this way. The Thiel-Sen trend line will then be computed for an estimate at any time (t) of the expected median concentration (x) as follows:

$$x = \tilde{x} + Q \cdot (\mathrm{t} - \tilde{t}) = (\tilde{x} - Q \cdot \tilde{t}) + Q \cdot \mathrm{t}$$

To construct a confidence band around the Thiel-Sen line, sample pairs (ti, xi) will be formed with a sample date (ti) and the concentration measurement from that date (xi). Bootstrap samples (B) will be formed by repeatedly sampling n pairs at random with replacement from the original sample pairs. This will be repeated 500 times. For each bootstrap sample, a Thiel-Sen trend line will be constructed using the equation above. A series of equally spaced time points (tj) will be identified along the range of sampling dates represented in the original sample, j =1 to m. The Thiel-Sen trend line associated with each bootstrap replicate will be used to compute an estimated concentration ($\hat{x}_j^B$). An LCL will be constructed for the lower $\alpha^{th}$ percentile $\hat{x}_j^{[\alpha]}$ from the distribution of estimated concentrations at each time point (tj). For a UCL, compute the upper (1-$\alpha$)$^{th}$ percentile, $\hat{x}_j^{[1-\alpha]}$ at each time point (tj).

For background data, the UCL around the Thiel-Sen trend line will be used as the GWPS for the trending constituent. For compliance data, confidence bands around the Thiel-Sen trend line will be compared to the GWPS. The CCR unit is considered to be in compliance if the LCL is equal to or lower than the GWPS for all detected constituents at all compliance wells. A GWPS exceedance is confirmed when the LCL based on the trend line first exceeds the GWPS.

Electronic Filing: Received, Clerk's Office 06/20/2024

### 3.2 Determination of Statistically Significant Increases over Background

In accordance with 35 I.A.C. §§ 845.610(b)(3)(B) and 845.640(h), individual monitoring event concentrations for each constituent detected in the compliance monitoring wells during compliance monitoring sampling events will be compared to the background concentration as determined by the methods described above. An exceedance of the background concentration for any constituent measured at any compliance monitoring well, or constituent detection if not detected in the background samples, constitutes a Statistically Significant Increase (SSI). An exception to this method is pH, where two-sided (upper and lower) tolerance limits are established from the distribution of the background groundwater quality data. An exceedance of either the UTL or lower tolerance limit (LTL) would constitute an SSI for pH.

## POST-CLOSURE PLAN DESCRIPTION

| | |
|---|---|
| 40 C.F.R. § 257.104(c)(1) and 35 I.A.C. 845.780(c)(1) – Length of post-closure care period. | Post-closure care will be conducted for a period of 30 years as required by 40 C.F.R. § 257.104(c)(1) and 35 I.A.C. 845.780(c)(1), except as provided by 40 C.F.R. § 257.104(c)(2) and 35 I.A.C. 845.780(c)(2). |
| 40 C.F.R. § 257.104(c)(2) and 35 I.A.C. 845.780(c)(2) - Circumstances extending the post closure care period. | If at the end of the post-closure care period the CCR unit is operating under assessment monitoring in accordance with §257.95, the post-closure care as described in this plan will continue until returning to detection monitoring in accordance with §257.95.<br><br>Under 35 I.A.C. 845.780(c)(2), the post-closure care period will be extended until groundwater monitoring data demonstrate that concentrations are below the groundwater protection standards in Section 845.600 and are not increasing for those constituents over background, using the statistical procedures and performance standards in Section 845.640(f) and (g), provided that concentrations have been reduced to the maximum extent feasible and concentrations are protective of human health and the environment. |
| 40 C.F.R. § 257.104(d)(1)(i) and 35 I.A.C. 845.780(d)(1)(A) – A description of the monitoring and maintenance activities required in 40 C.F.R. § 257.104(b) and 845.780(b), and the frequency at which these activities will be performed, to maintain the integrity and effectiveness of the final cover system, maintain the groundwater monitoring system and monitor the groundwater. | Pursuant to § 257.104(b)(1) and 35 I.A.C. 845.780(b)(1), throughout the post-closure care period, periodic visual observations of the final cover system and stormwater management system will be performed at least annually for evidence of settlement, subsidence, erosion, or other damage that may adversely affect the integrity and effectiveness of the final cover system. When practical, visual observations of the final cover will be made concurrent with groundwater monitoring activities.<br><br>Noted evidence of damage, such as damage to the geosynthetic components, rills, surface cracks and settlement, will be repaired to maintain the integrity and effectiveness of the final cover system. Vegetation will be established and maintained on the final cover system, including storm drainage areas, where appropriate, to provide long-term erosion control. Established vegetation and the slope design of the final cover system will prevent potential erosion and damage |

Electronic Filing: Received, Clerk's Office 06/20/2024

| | |
|---|---|
| | that may be caused by run-on and run-off.<br><br>Repair activities may include, but are not limited to, repairing, or replacing damaged geosynthetic components, replacing and compacting soil cover, repairing drainage channels that have been eroded, filling in depressions with soil, regrading, and reseeding areas of failed vegetation, as necessary.<br><br>Pursuant to § 257.104(b)(3) and 35 I.A.C. 845.780(b)(3), the groundwater monitoring system will be maintained, and groundwater will be monitored as required by 40 C.F.R. § 257.90 through 40 C.F.R. § 257.98 and 35 I.A.C. 845.600 through 35 I.A.C. 845.680. Monitoring wells will be inspected during each groundwater sampling event. Monitoring wells and associated instrumentation will be maintained so that they perform to the design specifications throughout the life of the monitoring program. Groundwater monitoring frequency will be at least quarterly, except as provided in 40 C.F.R. § 257.94(d), 257.94(c), and 35 I.A.C. 845.650(b)(4). |
| 40 C.F.R. § 257.104(d)(1)(ii) and 35 I.A.C. 845.780(d)(1)(B) – The name, address, telephone number and email address of the person or office to contact about the facility during the post-closure care period. | Illinois Power Generating Company<br>6555 Sierra Drive<br>Irving, Texas 75039<br>800.633.4704<br>ccr@dynegy.com |
| 40 C.F.R. § 257.104(d)(1)(iii) and 35 I.A.C. 845.780(d)(1)(C) – A description of the planned uses of the property during the post-closure period. | The CCR unit is located at a retired electric generation facility. Planned uses of the property during the post-closure period are currently unknown, except for post-closure care of the CCR unit.<br><br>Post-closure use of the property will not disturb the integrity of the final cover system or other components of the containment system, or the function of the monitoring systems unless necessary to comply with the requirements of 40 C.F.R. Part § 257, Subpart D and 35 I.A.C. Part 845. Any other disturbance will be conducted following a demonstration that it will not increase the potential threat to human health or the environment, as required by 40 C.F.R. § 257.104(d)(1)(iii) and 35 I.A.C. 845.780 (d)(1)(C). The demonstration will be certified by a qualified professional engineer and submitted to the Illinois Environmental Protection Agency (IEPA). Per 40 C.F.R. § 257.104(d)(1)(iii) notification shall be provided to the State Director that the demonstration has been placed in the operating record and on the owners or operator's publicly accessible internet site.<br><br>Following closure of the CCR unit, a notation on the deed to the property, or some other instrument that is normally examined during title search, will be recorded in accordance with 40 C.F.R. § 257.102(i) and 35 I.A.C. 845.760(h). The notation will notify potential purchasers of the property that the land has been used as a CCR unit and its use is restricted under the post-closure care requirements in 40 C.F.R. 40 C.F.R. § 257.104(d)(1)(iii) and 35 I.A.C. 845.780(d)(1)(C) or groundwater monitoring requirements per 35 I.A.C. 845.740(b). Within 30 days of recording the deed notation, a notification stating that the notation has been recorded will be submitted to the IEPA and placed in the facility's operating record per 845.760(h)(3). The notification will be placed on |

Electronic Filing: Received, Clerk's Office 06/20/2024

| | |
|---|---|
| | the owner or operator's publicly accessible CCR Web site in accordance with 40 C.F.R. § 257.107(i)(9) and 35 I.A.C. 845.810(e) and placed in the facility's operating record as required by 35 I.A.C. 845.800(d)(26) and §257.105(i)(9). |
| 40 C.F.R. § 257.104(d)(3) and 35 I.A.C. 845.780(d)(3)– Amendments to the initial or subsequent written post-closure plan. | Pursuant to 40 C.F.R. § 257.104(d), the initial post closure care plan for the Duck Creek GMF Pond was prepared on October 17, 2016. That plan is being amended pursuant to 40 C.F.R. § 257.104(d)(3)(i). This plan also serves as the initial post-closure care plan, prepared in accordance with 35 I.A.C. 845.780(d).<br><br>Pursuant to § 257.104(d)(3) and 35 I.A.C. 845.780(d)(3), an operating permit modification application to amend the initial or any subsequent written post-closure care plan developed under 35 I.A.C. 845.780 (d)(1) and § 257.104(d)(1) will be submitted to IEPA. The written post-closure care plan will be amended whenever there is a change in the operation of the CCR surface impoundment that would substantially affect the written post-closure care plan in effect; or unanticipated events necessitate a revision of the written post-closure care plan, after post-closure activities have started.<br><br>The written post-closure care plan will be amended at least 60 days before a planned change in the operation of the facility or CCR surface impoundment, or within 60 days after an unanticipated event requires the need to revise the existing plan. If the plan is revised after post-closure activities have started, a request to modify the operating permit, including an amended written post-closure care plan, will be submitted to the IEPA within 30 days following the triggering event. |
| 40 C.F.R. § 257.104(d)(4) and 35 I.A.C. 845.780(d)(4) – Qualified professional engineering certification. | Certification by a qualified professional engineer will be appended to this plan and any amendment of this plan. |
| 35 I.A.C. 845.780(e) – Termination of post-closure care. | Upon completion of the post-closure period, a request to terminate post-closure care will be submitted to the IEPA. The request will include a certification by a qualified professional engineer verifying that post-closure care has been completed in accordance with the post-closure care plan specified in 35 I.A.C. 845.780(d) and the requirements of 35 I.A.C. 845.780. |
| 40 C.F.R. § 257.104(e) and 35 I.A.C. 845.780(f) – Notification of completion of the post-closure care period. | A notification of completion of post-closure care will be prepared and placed in the facility's operating record within 30 days after IEPA approval of the request to terminate post-closure care. The notification will be placed in the facility's operating record in accordance with 35 I.A.C. 845.800(d)(31) and § 257.105(i)(13).<br><br>The notification will be placed on the owner or operator's publicly accessible CCR Internet site in accordance with the requirements of § 257.107(i)(13) and 35 I.A.C. 845.810(e). The IEPA will be notified when the notification has been placed in the operating record and on the owner or operator's publicly accessible Internet site in accordance with the requirements of § 257.106(i)(13). |

Electronic Filing: Received, Clerk's Office 06/20/2024

**Certification Statement 40 C.F.R. § 257.104 (d)(4) and 35 I.A.C. 845.780(d)(4) – Amended/Initial Written Post Closure Plan for a CCR Surface Impoundment**

**CCR Unit: Illinois Power Resources Generating, LLC; Duck Creek Power Plant; GMF Pond**

I, John R. Hesemann, being a Registered Professional Engineer in good standing in the State of Illinois, do hereby certify, to the best of my knowledge, information, and belief, that the information contained in this certification has been prepared in accordance with the accepted practice of engineering. I certify, for the above referenced CCR Unit, that the information contained in the amended/initial written post closure plan, dated October 30, 2021, meets the requirements of 40 C.F.R. § 257.104 and 35 I.A.C. 845.780.

**Re: 35 IAC 845.220(a)(9) Certification Statement**
**Duck Creek Power Plant GMF Pond (IEPA ID # W0578010001-04)**

Dear Mr. Darin LeCrone:

For the above-refenced CCR surface impoundment and in accordance with 35 IAC 845.220(a)(9), Illinois Power Resources Generating, LLC certifies that the public notification and public meetings required under 35 IAC 845.240 were completed. Please find enclosed both the public meeting summary and listserv.

Sincerely,
**Illinois Power Resources Generating, LLC**

Dianna Tickner
Director, Decommissioning & Demolition

Electronic Filing: Received, Clerk's Office 06/20/2024

## Duck Creek Public Meeting Issues Summary, December 7, 2021

On Sunday, November 7, 2021, Illinois Power Resource Generating, LLC made available to the public its plans to close the GMF Pond and Bottom Ash Basin (BAB) CCR surface impoundments located at Duck Creek Power Plant. On Tuesday, December 7, 2021, Illinois Power Resource Generating, LLC held in-person and virtual public meetings at 3:00 pm and 5:30 pm to present its decision-making process, a comparison of projected groundwater impacts for the alternatives presented, and an objective comparison of the pros and cons of each alternative presented. During the question-and-answer portion of the meeting, the public asked questions related to the closure and, the company-provided answers.

As required by Section 845.240(g), Illinois Power Resource Generating, LLC distributed to those public meeting attendees who requested a copy a general summary of the issues raised by the public, a response to those issues or comments raised by the public, and a summary of any revisions, changes, and considerations made to the closure plans, on December 21, 2021.

| Issue/Topic | | Summary of Response Provided at Meeting | Additional Written Response |
|---|---|---|---|
| 1. | Engineered Final Cover System at the GMF Pond | The final cover system includes a 60-mil high-density polyethylene (HDPE) geomembrane and 2 feet of soil on top of the geomembrane to protect the geomembrane from damage. Vegetative grass with a shallow root system will be planted on the final cover system.<br><br>The geomembrane will be rolled out in panels. The panels will be heat sealed to each other. In combination with the existing liner system, the final cover system will provide complete encapsulation of the material within the GMF Pond.<br><br>The final cover system will be monitored for 30 years.<br><br>If preferential pathways for water infiltration through the final cover system were to form, they would be detected during the monitoring and inspections and would be corrected.<br><br>Groundwater data will continue to be collected to monitor system performance. Groundwater data will be publicly available. | The issue of geomembrane service life was raised. A significant amount of research has been conducted to evaluate the expected service life of geomembranes under different field conditions. The Geosynthetics Research Institute developed the foremost technical paper on this topic entitled "Geomembrane Lifetime Predictions: Unexposed and Exposed Conditions" (Koerner et al., 2011) to summarize the findings from a 12-year study on this topic and to provide guidance on the expected service life for geomembranes. The expected service life of a geomembrane is dependent on whether it is exposed or unexposed to ultraviolet radiation and other environmental factors, as well as the in-service temperature of the geomembrane. The geomembrane in the final cover system over the GMF Pond will be covered with soil, so it will be unexposed. Considering the soil cover thickness and the climate at the site, the highest expected in-service temperature at the depth of the geomembrane is about 20°C (68°F). According to Koerner et al. (2011), the expected service life of an HDPE geomembrane under these conditions is nearly 450 years. |

Electronic Filing: Received, Clerk's Office 06/20/2024

| Issue/Topic | | Summary of Response Provided at Meeting | Additional Written Response |
|---|---|---|---|
| | | | In accordance with Section 845.780(c), the monitoring and inspection period for the GMF Pond is at least 30 years. |
| 2. | GMF Pond Liner System | The GMF Pond was built and lined in or around 2010.<br><br>The liner system beneath the GMF Pond is a very robust, state-of-the-art system.<br><br>No exceedances of Groundwater Protection Standards (GWPS) related to the GMF Pond have been detected. | Based on information reviewed after the public meeting, the GMF Pond was constructed in 2008 and 2009.<br><br>The GMF Pond liner system was designed and constructed to meet or exceed the criteria specified in 35 IAC 811 and 40 CFR 257 (Hanson Professional Services Inc., 2016). It has an upper geomembrane and a lower geomembrane with a leak detection system between them. The leak detection system has not detected any leakage. The lower geomembrane has two additional soil barrier layers below it for enhanced containment/redundancy.<br><br>The issue of geomembrane service life was raised. A significant amount of research has been conducted to evaluate the expected service life of geomembranes under different field conditions. The Geosynthetics Research Institute developed the foremost technical paper on this topic entitled "Geomembrane Lifetime Predictions: Unexposed and Exposed Conditions" (Koerner et al., 2011) to summarize the findings from a 12-year study on this topic and to provide guidance on the expected service life for geomembranes. The expected service life of a geomembrane is dependent on whether it is exposed or unexposed to ultraviolet radiation and other environmental factors, as well as the in-service temperature of the geomembrane. The geomembranes in the liner system beneath the GMF Pond will be unexposed at closure. Considering the depth to the liner system and the measured temperatures of groundwater in the vicinity of the GMF Pond, the highest expected in-service temperature at the depths of the geomembranes is about 20°C (68°F). |

| Issue/Topic | | Summary of Response Provided at Meeting | Additional Written Response |
|---|---|---|---|
| | | | According to Koerner et al. (2011), the expected service life of an HDPE geomembrane under these conditions is nearly 450 years.<br><br>As a result of the issue raised by the public, the closure plan for the GMF Pond will be revised slightly to indicate that all areas of the liner system will be covered with soil to prevent geomembrane exposure. |
| 3. | Groundwater Monitoring | At the GMF Pond, there are approximately 52 groundwater monitoring wells.<br><br>At the BAB, there are approximately 10 groundwater monitoring wells.<br><br>Maps and tables showing well locations and depths have been provided in the on-line, publicly available materials.<br><br>Quarterly groundwater monitoring is required for at least 30 years after closure of the GMF Pond (closure in place). Groundwater monitoring is required for at least 3 years after closure of the BAB (closure by removal).<br><br>Follow-up actions are required if GWPS exceedances are detected, as prescribed in Part 845, but there is no expectation of future impacts associated with the GMF Pond or BAB. | Based on information reviewed after the public meeting, we have confirmed there are 10 monitoring wells around the BAB. There are 36 monitoring wells around the GMF Pond, and 16 monitoring wells located around the GMF Recycle Pond. The proposed Part 845 monitoring well network for the BAB consists of 8 monitoring wells. The proposed Part 845 monitoring well network for the GMF Pond will consist of 10 wells and 1 unit water monitoring location. |
| 4. | Water Handling | Ponded water in the GMF Pond will be removed to facilitate closure; interstitial water (water within pore spaces) will remain.<br><br>Water will be discharged through an existing NPDES outfall, consistent with permit requirements.<br><br>Treatment may be required prior to discharge. | No additional response is necessary. |

Electronic Filing: Received, Clerk's Office 06/20/2024

R003091

| Issue/Topic | | Summary of Response Provided at Meeting | Additional Written Response |
|---|---|---|---|
| 5. | Risk Assessment | We will provide a written response for this issue due to the level of technical detail involved. | The Duck Creek Power Plant Risk Assessment was conducted to identify potential hazards and evaluate potential risks to human and ecological receptors that may be exposed to CCR constituents in environmental media potentially impacted by the GMF Pond and BAB.<br><br>The conceptual site model (CSM) provides a basis for understanding the site conditions and exposure pathways for receptors that may be exposed to site-related constituents. Exposure pathways refer to the way a person or animal could come in contact with a constituent. They are generally referred to as either complete or incomplete. The necessary components for a complete exposure pathway consist of:<br><br>▪ A source and mechanism of constituent release from the source;<br>▪ Retention or transport of the constituent through the environmental medium;<br>▪ A point of contact between the receptor and the environmental medium; and<br>▪ A route of exposure for the potential receptor at the contact point.<br><br>Cancer risks are expressed as a unitless probability of an individual developing cancer over a lifetime, above background risk, as a result of site-related exposures. US EPA has established an acceptable target cancer risk range of $1 \times 10^{-6}$ to $1 \times 10^{-4}$ (US EPA, 1990, 1991). Non-cancer risks are expressed as a hazard index (HI) and US EPA has established an acceptable target HI of 1 (US EPA, 1997). An HI less than 1 suggests that exposures are not likely to cause an appreciable risk of non-cancer effects during a lifetime. Risks above these US EPA defined target levels are termed potentially "unacceptable risks". |

Electronic Filing: Received, Clerk's Office 06/20/2024

R003092

| Issue/Topic | | Summary of Response Provided at Meeting | Additional Written Response |
|---|---|---|---|
| | | | For the Duck Creek Risk Assessment, we followed processes and protocols provided by US EPA comparing measured and modeled environmental concentrations to screening levels (*e.g.*, surface water quality standards) that have been determined by US EPA to be protective of human health and the environment. If the environmental concentrations were below the health protective screening levels, we concluded that there is no unacceptable risk.<br><br>Based on the evaluation, no unacceptable risks to human and ecological receptors resulting from CCR exposures associated with either the GMF Pond or the BAB were identified. |
| 6. | Closure Cost Estimation | For this current evaluation cost estimates were not considered. Cost estimates are being prepared and will be included in the construction permit application. | |
| 7. | Financial Assurance/Future Assurances | Part 845 requires that the owner provide financial assurance instruments to cover the cost of closure and post-closure care in the event that the owner is unable to carry out these obligations. | Illinois Power Resources Generating, LLC (IPRG) has complied with the Part 845 financial assurance requirements for each of the CCR surface impoundments it is closing under Part 845. The financial assurance provisions in Part 845 are robust and were constructed based on other established financial assurance program regulations. Financial assurance has already been provided for closure activities, post-closure activities, and to address the need for potential remediation of releases and will be updated in the future as needed. The mechanisms for financial assurance provided for under Part 845 are all ones that have been successfully used in other regulatory contexts and that can be easily accessed by IEPA. For Duck Creek, IPRG is using surety bonds guaranteeing performance as its financial assurance mechanism. In the unlikely event of a default, this form of financial assurance allows the surety to step in to perform the closure, post-closure care, or corrective action or to pay a penal sum that will |

Electronic Filing: Received, Clerk's Office 06/20/2024

R003093

| Issue/Topic | | Summary of Response Provided at Meeting | Additional Written Response |
|---|---|---|---|
| | | | be placed into the CCR Surface Impoundment Financial Assurance Fund within the State Treasury, assuring the work under Part 845 will be performed. |
| 8. | Availability of Information Related to Public Meetings | Slides will not be posted on our publicly available website.<br>Written responses will be provided to all issues raised in the public meetings. | |
| 9. | On-Site Landfill | The landfill has been permitted with IEPA and permit conditions allow disposal of CCR. It has received CCR and will be closed in accordance with the permit after final receipt of waste. | The landfill remains open only for decommissioning activities. There is not capacity in the landfill for disposal of materials from the GMF Pond. |
| 10. | GMF Recycle Pond | The GMF Recycle Pond is regulated under different regulatory provisions (*i.e.*, not Part 845) since it is not a CCR surface impoundment. | No further response is necessary since this question does not pertain to the GMF Pond or Bottom Ash Basin. |
| 11. | Cooling Pond | The cooling pond is not subject to Part 845.<br>Sampling is required for discharges from the cooling pond in accordance with the NPDES permit. | No further response is necessary since this question does not pertain to the GMF Pond or Bottom Ash Basin. |
| 12. | NPDES Permitting | All surface water runoff from the closed GMF Pond and BAB will flow into the cooling pond.<br>Discharges from the cooling pond are regulated by a NPDES permit.<br>The NPDES permit is currently up for reauthorization. The NPDES permit reauthorization is a different issue from the CCR units and the Part 845 requirements. | The ammonia and other constituents are a byproduct of former used air pollution control devices. |

**From:** Hunt, Lauren <Lauren.Hunt@Illinois.gov>
**Sent:** Wednesday, November 1, 2023 3:22 PM
**To:** Dunaway, Lynn <LYNN.DUNAWAY@Illinois.gov>; Summers, Michael <Michael.Summers@Illinois.gov>
**Cc:** Mullenax, Heather <Heather.Mullenax@Illinois.gov>; Garee, Matthew J. <Matthew.Garee@Illinois.gov>; Bierwagen, Justin <Justin.Bierwagen@Illinois.gov>
**Subject:** RE: Joppa West Adjusted Standard Recommendation Meeting follow up

Final draft for Lynn to pass on:

As filed, the Recommendation allows a 6-year temp. AS to allow sampling (5 years) and modeling/reporting (1 year) to prove monitored natural attenuation (MNA) will work.
USEPA has been very non-receptive to MNA demonstrations at other sites around the country. Therefore, IEPA needs to amend the Rec to withdraw the Alt Standard suggested or not amend in which case Joppa maybe subject to USEPA enforcement. (Note: This was where the upper management decision came in, considering our goal to get primacy)

IEPA also asked for source monitoring, Joppa did install and has been doing total metals monitoring, but is not done yet, so the ask would be:
Please provide the groundwater sampling and analysis results for total metals at site wells listed in the Attachment B from Ramboll and Associates dated December 19, 2022 for 8 quarters of groundwater sampling along with the precipitation, infiltration and leaching analysis. [Note: unlikely that they have completed this at this time since we are just under two years since the submittal of our recommendation]

IEPA also asked for CCR characterization. Joppa provided 6 CCR samples with analysis. The issue is that there are roughly 5 million cubic yards of CCR in Joppa West, so the ask would be:
Please provide further CCR solids sampling and analysis to include a minimum of 1 sample location per 10% of the total cubic yards of CCR, ~~and~~ with ~~one-third of the~~ 3 samples collected from each location: ~~must be~~ one (1) from the upper 1/3 of the CCR by depth from ground surface, ~~one-third collected~~ one (1) from the middle 1/3 of the CCR by depth from ground surface, and ~~one-third collected~~ one (1) from the bottom 1/3 of the CCR by depth from ground surface. This would 30 samples over the entire site. The SPLP analysis in accordance with SW846 using the lowest pH on site of 3.5. ~~the samples must be spread out as follows:~~

**Subject:** RE: Joppa West Adjusted Standard Recommendation Meeting follow up

How about something like this:

1 sample per 10% of the volume with one-third of the samples being collected as follows:
upper 1/3 of the CCR by depth from ground surface,
middle 1/3 of the CCR by depth from ground surface, and
bottom 1/3 of the CCR by depth from ground surface.

**Subject:** RE: Joppa West Adjusted Standard Recommendation Meeting follow up

Do we have an rational for 50,000 cubic yards? If its 5 million cubic yards and one sample per 50,000 would equal 100 samples. is this an amount we want to look at?

When using a volume are we likely to run into a “disagreement” with the site on how actual large the site is? Would it be more appropriate to base sample on the surface area of the site. Or since we do have volumes (ie depth estimates) we could do a percentage of the entire volume. It is easily quantifiable, no argument on the size of the facility. Something like a shallow, mid-point and deep (3) samples collected per acre? 3 Per every 5 acres of surface area? take a look at what is a reasonable number of samples to characterize the site.

If we to end up asking for a set number of samples, we still need to make sure that various depth are mentioned in the request for samples to adequately characterize the site.

**Subject:** Joppa West Adjusted Standard Recommendation Meeting follow up

Hi Mike and Lynn.
Please review the following for Sara and Stefanie:

1. Please provide the groundwater sampling and analysis results for total metals at site wells listed in the Attachment B from Ramboll and Associates dated December 19, 2022 for 8 quarters of groundwater sampling along with the precipitation, infiltration and leaching analysis. [unlikely that they have completed this at this time since we are just under two years

Electronic Filing: Received, Clerk's Office 06/20/2024

since the submittal of our recommendation].

2. Please provide further CCR solids sampling and analysis to include a minimum of 1 sample per 50,000? cubic yards of CCR and SPLP analysis in accordance with SW846 using the lowest pH on site of 3.5. [Current status is 6 total samples for approximately 5 million cubic yards (or 103.5 acres and 30 feet deep).]

Please note: EEI shows that the hydraulic conductivities are downward from the CCR unit through the UCU (Upper confining unit) into the Upper Aquifer (UA). Total solids CCR samples show that the CCR contains all of the constituents in 845.600 whereas the surrounding formations do not contain some of those and generally contain less of the 845.600 constituents than the CCR where present.

Thanks. Lauren

**Re: Duck Creek GMF Pond; IEPA ID # W0578010001-04**

Dear Mr. LeCrone:

In accordance with Title 35 of the Illinois Administrative Code (35 I.A.C.) Section (§) 845.650(e), Illinois Power Resources Generating, LLC (IPRG) is submitting this Alternative Source Demonstration (ASD) for exceedances observed from the Quarter 2 2023 sampling event at the Duck Creek GMF Pond, identified by Illinois Environmental Protection Agency (IEPA) ID No. W0578010001-04.

This ASD is being submitted within 60 days from the date of determination of an exceedance of a groundwater protection standard (GWPS) for constituents listed in 35 I.A.C. § 845.600. As required by 35 I.A.C. § 845.650 (e)(1), the ASD was placed on the facility's website within 24 hours of submittal to the agency.

One hard copy is provided with this submittal.

Sincerely,

Dianna Tickner

# 1. INTRODUCTION

Under Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845.650(e), within 60 days from the date of determination of an exceedance of a groundwater protection standard (GWPS) for constituents listed in 35 I.A.C. § 845.600, an owner or operator of a coal combustion residuals (CCR) surface impoundment may complete a written demonstration that a source other than the CCR surface impoundment caused the contamination and the CCR surface impoundment did not contribute to the contamination, or that the exceedance of the GWPS resulted from error in sampling, analysis, statistical evaluation, natural variation in groundwater quality, or a change in the potentiometric surface and groundwater flow direction (Alternative Source Demonstration [ASD]).

This ASD has been prepared on behalf of Illinois Power Resources Generating, LLC, by Ramboll Americas Engineering Solutions, Inc (Ramboll), to provide pertinent information pursuant to 35 I.A.C. § 845.650(e) for the Duck Creek Power Plant (DCPP) Gypsum Management Facility Pond (GMF Pond) located near Canton, Illinois.

The first quarterly sampling event (Event 1 [E001]) was completed on May 15, 2023, and analytical data were received on July 14, 2023. In accordance with 35 I.A.C. § 845.610(b)(3)(C), comparison of statistically derived values with the GWPSs described in 35 I.A.C. § 845.600 to determine exceedances of the GWPS was completed by September 12, 2023, within 60 days of receipt of the analytical data (Ramboll, 2023a). The statistical determination identified the following GWPS exceedances at compliance groundwater monitoring wells:

- pH at well G60L

Pursuant to 35 I.A.C. § 845.650(e), the lines of evidence (LOEs) presented in **Section 3** demonstrate that sources other than the GMF Pond were the cause of the pH GWPS exceedance listed above and the GMF Pond has not contributed to the exceedance. A localized native peat deposit located upgradient of G60L is an alternative source of the pH exceedance. This ASD was completed by November 11, 2023, within 60 days of determination of the exceedances (September 12, 2023), as required by 35 I.A.C. § 845.650(e). This ASD has been completed in conformance with guidance provided in the Electric Power Research Institute (EPRI) guidance for development of ASDs at CCR sites (EPRI, 2017), and the United States Environmental Protection Agency (USEPA)'s Solid Waste Disposal Facility Criteria: Technical Manual (USEPA, 1993).

Electronic Filing: Received, Clerk's Office 06/20/2024

# 2. BACKGROUND

## 2.1 Site Location and Description

The DCPP is located in Fulton County, in central Illinois, approximately 9 miles southeast of the town of Canton. Duck Creek Cooling Pond is located east of the power plant and the GMF Pond with agricultural land surrounding the entire property.

## 2.2 Geology and Hydrogeology

The DCPP geologic and hydrogeologic setting is fully characterized and described in the October 25, 2021 operating permit application (Burns McDonnell, 2021) and January 28, 2022 closure construction permit application (Golder, 2022). Those materials are incorporated herein by reference. The summary below is obtained from published sources, hydrogeologic investigation data, and boring data collected during site investigations conducted from 2005 to 2021 (Natural Resource Technology, an OBG Company [NRT/OBG], 2017; Ramboll, 2021a).

Regionally, the DCPP is positioned on the glacial uplands above the Illinois River in the Ancient Illinois Floodplain of the Till Plains Section of the Central Lowland Province. The undisturbed unlithified materials consist of loess, diamictons, and lacustrine/alluvial deposits. The area is flat to gently rolling uplands that are dissected by deeply incised streams that are tributaries to major river systems.

Several large former surface coal mines are present in the vicinity. Strip mining in the region since the 1930s disrupted the natural stratigraphy down to the Springfield (No. 5) Coal unit. The strip mining activity produced rough topography from soil piles and depressions, often ponded with water. Unlithified materials are present in the excavated strip mine spoils and have been mixed due to the surface mining activities. Mining operations in the area have ceased.

The uppermost bedrock stratum in the area is the Carbondale Formation of the Kewanee Group of the Pennsylvanian System. The Carbondale Formation consists primarily of shaley siltstone and silty shale and includes the Springfield (No. 5) Coal and other coal units. Bedrock occurs within approximately 50 feet of the ground surface in this area.

Quaternary deposits in the Canton area consist mainly of loess, diamictons, and lacustrine/alluvial deposits that were deposited during Illinoian and Wisconsinan glaciations. Four hydrostratigraphic units have been identified at the DCPP based on stratigraphic relationships and common hydrogeologic characteristics, and are summarized as follows (beginning at the ground surface):

- CCR: This unit is composed of gypsum CCR, present within the GMF Pond at a thickness ranging from less than 1 to 22 feet. The thickest areas of gypsum are to the north and west within the GMF Pond and thin toward the south end of the GMF Pond. This material is considered to be homogeneous because the scrubber operations at the facility have not materially changed over the 10-year operating period (2009-2019).
- Uppermost Aquifer (UA): At the GMF Pond, this unit includes the Peoria/Roxanna Loess, the upper Radnor Till, and shallow sands. These units are hydraulically connected and underlain by a thick till sequence of the Radnor Till. The shallow sand zone is the primary migration pathway within these hydraulically connected formations. The shallow sands are laterally extensive across the site, vary in thickness from less than 1 to 18 feet, and are generally

located at an elevation of 570 to 590 feet North American Vertical Datum of 1988 (NAVD88). The shallow sand is saturated. During construction of the GMF Pond, sand was completely removed everywhere it was encountered (mainly the northeast corner and southwest corner of the pond), putting the base of the liner in contact with clay of the lower Radnor Till. Sand outside the GMF Pond footprint remains in place.

  - The Peoria/Roxanna Loess within the UA has been identified as a potential migration pathway (PMP). While the primary migration pathway (*i.e.*, the UA) is the shallow sand of the UA, impacts have the potential to migrate within groundwater in the overlying Peoria/Roxanna Loess. The PMP is saturated at depths of 3.5 to 11 feet below ground surface (bgs). While the PMP and UA are hydraulically connected, groundwater flow in the PMP is expected to be primarily vertical, with the majority of the horizontal migration expected to occur within the UA.

- Lower Confining Unit: Underlying the UA, the lower Radnor Till is approximately 42 to 58 feet thick. Previous hydrogeologic studies indicate discontinuous sand lenses observed within the till are not hydraulically connected to the UA.
- Bedrock Confining Unit: The bedrock encountered across the site consists of low permeability shaley siltstone, silty shale, and coal beds of the Carbondale Formation, and is estimated to have a thickness of approximately 300 to 400 feet.

Groundwater elevations (referenced to NAVD88) in the UA near the GMF Pond are shown on **Figure 1**. Groundwater elevations were measured on May 8, 2023, prior to a combined sampling event at the DCPP for the three CCR units located there and for multiple monitoring programs required by both federal and state regulatory agencies. Groundwater elevations from UA wells at the GMF Pond ranged from 616.72 to 588.23 feet NAVD88.

## 2.3 GMF Pond Groundwater and Porewater Monitoring

The monitoring system for the GMF Pond is shown on **Figure 1**. Monitoring wells G02S, G50S, and G51S are used to monitor background groundwater quality for the GMF Pond. These wells are located north (G02S), northwest (G50S), and west (G51S) of the GMF Pond. The compliance monitoring wells screened in the UA are G54S, G57S, G60S, and G64S. The compliance monitoring wells screened in the PMP are G54L, G60L, and G64L (Ramboll, 2021b).

Groundwater samples are collected and analyzed in accordance with the Multi-Site Sampling and Analysis Plan (Ramboll, 2023b). Statistical evaluation of analytical data is performed in accordance with Multi-Site Statistical Analysis Plan (Ramboll, 2022).

GMF Pond source water samples are collected from the GMF Pond at location X301, a riser pipe from the ring drain present above the upper liner that collects gypsum contact water and pond surface water. The most recent pond water sample was collected from X301 on January 16, 2023. Prior to performing hydrogeologic investigations in 2021, Ramboll completed a review of existing data to determine whether sufficient information existed to meet the requirements of 35 I.A.C. § 845. Based on review of the limited extent of gypsum visible through time on aerial photographs, identifying visible differences (color) in surficial materials, and capturing a representative spatial distribution, a single porewater well location was identified (**Figure 2**) with consideration for health & safety risks associated with accessing locations where gypsum was present. Location XTPW02 is a temporary monitoring well installed in the gypsum within the pond for collection of porewater (**Figure 2**). CCR porewater most accurately represents the mobile

Electronic Filing: Received, Clerk's Office 06/20/2024

constituents associated with the waste management activity within the CCR SI (EPRI, 2017). XTPW02 was last sampled in June of 2021. In this double lined surface impoundment the samples from the ring drain riser and the porewater well (collectively referred to herein as "source water") are representative of the waters present above the double lined system that could be potential contributions to groundwater observed in compliance monitoring wells.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 3. ALTERNATIVE SOURCE DEMONSTRATION: LINES OF EVIDENCE

As allowed by 35 I.A.C. § 845.650(e), this ASD demonstrates that sources other than the GMF Pond (the CCR unit) caused the pH exceedance at G60L. LOEs supporting this ASD include the following:

1. The GMF Pond has a double geomembrane liner designed to prevent CCR contact with groundwater.
2. Boron concentrations in compliance groundwater monitoring wells do not exceed background groundwater limits.
3. Geochemical analysis and empirical observations at and near G60L demonstrate that a localized pocket of native peat is an alternative source of the pH exceedance.

These LOEs are described and supported in greater detail below.

## 3.1 LOE #1: The GMF Pond Has a Double Geomembrane Liner Designed to Prevent CCR Contact with Groundwater

Construction of the GMF Pond was in accordance with Water Pollution Control Permit 2017-EO-62336 granted by the Illinois Environmental Protection Agency (IEPA). The GMF Pond liner system includes the following components:

- 60-mil high-density polyethylene (HDPE) geomembrane liner
- Minimum 12-inch soil cushion layer (up to 24 inches thick in select areas on the side slope)
- 4 ounce per square yard ($oz/yd^2$) non-woven geotextile filter fabric
- 12-inch highly permeable granular drainage sand layer
- 10 $oz/yd^2$ non-woven geotextile filter fabric
- 60-mil HDPE geomembrane liner
- Geosynthetic clay liner (GCL) with a manufacturer's certified maximum hydraulic conductivity of $5 \times 10^{-9}$ centimeters per second (cm/s)
- 36-inch compacted clay layer with a maximum hydraulic conductivity of $9 \times 10^{-7}$ cm/s based upon laboratory testing of samples collected from the site

Supporting information for the hydraulic conductivity of the compacted clay and GCL is provided in **Appendix A**.

The IEPA-approved GMF Pond double geomembrane liner system far exceeds the design criteria for a composite liner for CCR surface impoundments established by 35 I.A.C. § 845.400, suggesting that the GMF Pond is not the source of the pH exceedance.

## 3.2 LOE #2: Boron Concentrations in Compliance Groundwater Monitoring Wells Do Not Exceed Background Groundwater Limits

Boron is a potential indicator of CCR impacts to groundwater due to its leachability from CCR, low occurrence as an anthropogenic contaminant, and mobility in groundwater (Electric Power Research Institute [EPRI], 2012). If boron concentrations in CCR source water are present above

background groundwater concentrations, then groundwater impacted by CCR would be expected to contain boron concentrations elevated above the background groundwater Upper Tolerance Limit (UTL). The UTL is a statistically derived upper bound on background groundwater concentrations calculated for comparing compliance well results to background groundwater. Source water samples collected from the GMF Pond have elevated boron concentrations, indicating that boron is a site-specific key indicator for CCR (**Appendix B**). Boron concentrations measured in compliance monitoring wells during the first quarterly sampling event (Ramboll, 2023a) are summarized in **Table A** below. All compliance wells had concentrations of boron below the UTL (0.21 milligrams per liter [mg/L]) calculated for background groundwater, indicating that compliance wells have not been affected by CCR in the GMF Pond. Therefore, the GMF Pond is not the source of the pH GWPS exceedance at G60L.

**Table A. Summary of Boron Concentrations Measured in Compliance Wells during the first quarterly sampling event.**

| | G54S | G54L | G57S | G60L | G60S | G64L | G64S |
|---|---|---|---|---|---|---|---|
| **Boron (mg/L)** (Background Groundwater UTL=0.21 mg/L) | 0.062 | 0.095 | <0.01 | 0.042 | 0.030 | 0.031 | 0.014 |

## 3.3 LOE #3: Geochemical Analysis and Empirical Observations at and Near G60L Demonstrate that a Localized Pocket of Native Peat is an Alternative Source of the pH Exceedance

Multivariate statistical analysis of the groundwater and GMF Pond source water data, review of ionic composition of both, and literature review were performed by Life Cycle Geo, LLC (2023) to support the conclusion that the pH exceedance at G60L is due to the influence of a localized, native peat deposit located upgradient of the well. Details of the analysis are included as **Appendix C**. The following conclusions were made based on the results of the evaluation:

- Principal component analysis (PCA) shows that the groundwater signature at G60L is similar to background and compliance well groundwater signatures and distinct from the source water signature.
- The major ion composition of groundwater at G60L is inconsistent with influence from source water due to a low proportion of chloride, an indicator of CCR impacts in groundwater, and is similar to the major ion composition of nearby groundwater.
- A localized native peat deposit located upgradient of G60L is an alternative source of the pH exceedance based on literature review of peat influence on groundwater conditions, evaluation of other wells downgradient of the peat deposit (including hydraulic gradients and aqueous and solid-phase geochemistry), and the absence of CCR indicators boron and chloride.

Electronic Filing: Received, Clerk's Office 06/20/2024

# 4. CONCLUSIONS

Based on the three LOEs below, it has been demonstrated that the GMF Pond is not the source of the pH exceedance at G60L and the GMF Pond has not contributed to the exceedance.

1. The GMF Pond has a double geomembrane liner designed to prevent CCR contact with groundwater.
2. Boron concentrations in compliance groundwater monitoring wells do not exceed background groundwater limits.
3. Geochemical analysis and empirical observations at and near G60L demonstrate that a localized pocket of native peat is an alternative source of the pH exceedance.

This information serves as the written ASD prepared in accordance with 35 I.A.C. § 845.650(e), demonstrating that the pH exceedance observed at G60L during the first quarterly sampling event was not due to the GMF Pond and is attributable to local peat deposits. Therefore, assessment of corrective measures is not required for pH at the GMF Pond.

Electronic Filing: Received, Clerk's Office 06/20/2024

### Hydrometer Test Data

**Hydrometer test uses material passing #10**
**Percent passing #10 based upon complete sample = 95.5**
**Weight of hydrometer sample =50.00**
**Hygroscopic moisture correction:**
- **Moist weight and tare =** 48.49
- **Dry weight and tare =** 48.13
- **Tare weight =** 16.01
- **Hygroscopic moisture =** 1.1%

**Table of composite correction values:**

| Temp., deg. C: | 18.0 | 28.0 |
|---|---|---|
| Comp. corr.: | -4.4 | -2.0 |

**Meniscus correction only =** 0.0
**Specific gravity of solids =** 2.70
**Hydrometer type =** 151H
**Hydrometer effective depth equation: L = 16.294964 - 0.2645 x Rm**

**GEOSYNTHETIC CLAY LINER**
**MANUFACTURING QUALITY ASSURANCE DATA PACKAGE**

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
ORDER NUMBERS: 023940201, 023940202, 023940203, 023940204, 023940205, 023940206, 023940207, 023940208, 023940209, 023940210, 023940211, 023940212, 023940213, 023940214, 023940215, 023940216, 023940217, 023940218, 023940219, 023940220, 023940221, 023940222, 023940223, 023940224, 023940225, 023940226, 023940227, 023940228, 023940229, 023940230, 023940231, 023940232, 023940233, 023940234, 023940235, 023940236, 023940237, 023940238, 023940239, 023940240, 023940241, 023940243, 023940245
PREPARED FOR: GSI-Headquarters

**CONTENTS:**

- Daily production and needle detection certification
- GCL property specifications
- Order packing list
- GCL MQA tracking form
- GCL manufacturing quality control test data
- Bentonite clay certification
- Raw material test results

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

Prepared For: GSI-Headquarters

The GCL raw materials and GCL finished product manufactured for the above-referenced order number(s) are hereby certified to achieve the properties listed in the tables below.

## GCL PROPERTY SPECIFICATIONS FOR BENTOMAT SDN

| Test Method | Test Method Property | Test Frequency | Certified Value |
|---|---|---|---|
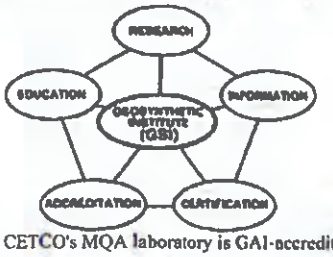
| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 5321 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (24 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN



| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

## GCL MANUFACTURING QUALITY CONTROL TEST DATA

The following rolls in GCL certification package number 000239402 have been tested in our production facility lab.

| Product | Lot # Tested | Roll # Tested | Mass Area | Grab Strength | Peel Strength |
|---|---|---|---|---|---|
| | | Standard Test Method: | ASTM D 5993 | ASTM D 6768 | ASTM D 6496 |
| | | Standard Specification: | 0.75 lb/sq ft MARV | 30lbs/in MARV | 2.5lbs/in MARV |
| Non-standard specifications were requested for this order as indicated on the attatched property sheet | | | | | |
| LO-BENTOMAT SDN | 200820LO | 00000001 | 0.88 | 65.5 | 4.2 |
| LO-BENTOMAT SDN | 200820LO | 00000019 | 0.90 | 65.5 | 8.6 |
| LO-BENTOMAT SDN | 200820LO | 00000037 | 0.91 | 65.5 | 13.6 |
| LO-BENTOMAT SDN | 200820LO | 00000055 | 1.04 | 65.5 | 9.7 |
| LO-BENTOMAT SDN | 200820LO | 00000073 | 1.02 | 61.5 | 12.8 |
| LO-BENTOMAT SDN | 200820LO | 00000091 | 0.96 | 61.5 | 8.8 |
| LO-BENTOMAT SDN | 200821LO | 00000101 | 0.94 | 54.0 | 11.2 |

To Whom it May Concern:

Please find enclosed the MQA/MQC test data package for Geosynthetic Clay Liner shipments to GSI-Headquarters. The shipments left our Lovell, Wyoming plant on 6/6/2008.

If you have any questions regarding this information, please contact me at 800-322-1149 ext. 413.

Sincerely,

Roger B. Wilkerson

**GEOSYNTHETIC CLAY LINER**
**MANUFACTURING QUALITY ASSURANCE DATA PACKAGE**

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
ORDER NUMBERS: 023940242, 023940244, 023940246, 023940248
PREPARED FOR: GSI-Headquarters

**CONTENTS:**

- Daily production and needle detection certification
- GCL property specifications
- Order packing list
- GCL MQA tracking form
- GCL manufacturing quality control test data
- Bentonite clay certification
- Raw material test results

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

The GCL raw materials and GCL finished product manufactured for the above-referenced order number(s) are hereby certified to achieve the properties listed in the tables below.

## GCL PROPERTY SPECIFICATIONS FOR BENTOMAT SDN

| Test Method | Test Method Property | Test Frequency | Certified Value |
|---|---|---|---|
| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 5321 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (24 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN

| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

## BENTONITE CLAY CERTIFICATION

The Bentonite Clay used to produce package 000239402 has been tested by American Colloid Company and yeilded the following test results.

| Reference | Swell | Fluid Loss |
|---|---|---|
| Test Method: | ASTM D 5890 | ASTM D 5891 |
| Specification: | 24 Min | 18 ml Max |
| 042608C | 27.0 | 15.6 |
| 042608D | 27.0 | 14.4 |
| 042608E | 30.0 | 14.4 |
| 042708A | 27.0 | 13.8 |
| 042908A | 25.0 | 16.4 |
| 051008A | 26.0 | 17.2 |
| 051008B | 25.0 | 17.2 |
| 051208A | 27.0 | 15.4 |
| 051308B | 29.0 | 15.4 |

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

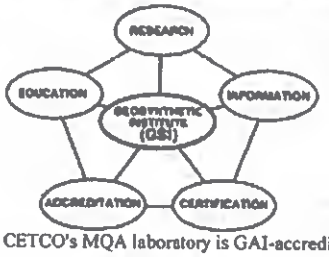
Ship Date: 6/9/2008
Order Numbers: 023940244, 023940252, 023940255
Prepared For: GSI-Headquarters

The GCL raw materials and GCL finished product manufactured for the above-referenced order number(s) are hereby certified to achieve the properties listed in the tables below.

## GCL PROPERTY SPECIFICATIONS FOR BENTOMAT SDN

| Test Method | Test Method Property | Test Frequency | Certified Value |
|---|---|---|---|
| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 5321 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (24 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN



| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

## BENTONITE CLAY CERTIFICATION

The Bentonite Clay used to produce package 000239402 has been tested by American Colloid Company and yeilded the following test results.

| Reference | Swell | Fluid Loss |
|---|---|---|
| Test Method: | ASTM D 5890 | ASTM D 5891 |
| Specification: | 24 Min | 18 ml Max |
| 042608C | 27.0 | 15.6 |
| 042608D | 27.0 | 14.4 |
| 042708A | 27.0 | 13.8 |
| 051008A | 26.0 | 17.2 |
| 051008B | 25.0 | 17.2 |
| 051208A | 27.0 | 15.4 |
| 051208C | 27.0 | 15.6 |
| 051308B | 29.0 | 15.4 |
| 052308D | 25.0 | 15.2 |
| 052408A | 26.0 | 15.8 |

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

Ship Date: 06/06/2008
Order Number: 023940247
Prepared For: GSI-Headquarters

The GCL raw materials and GCL finished product manufactured for the above-referenced order number(s) are hereby certified to achieve the properties listed in the tables below.

## GCL PROPERTY SPECIFICATIONS FOR BENTOMAT SDN

| Test Method | Test Method Property | Test Frequency | Certified Value |
|---|---|---|---|
| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 6243 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (48 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN

| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 5321 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (24 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN

| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

**GEOSYNTHETIC CLAY LINER**
**MANUFACTURING QUALITY ASSURANCE DATA PACKAGE**

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
ORDER NUMBERS: 023940256, 023940258, 023940260
PREPARED FOR: GSI-Headquarters

**CONTENTS:**

- Daily production and needle detection certification
- GCL property specifications
- Order packing list
- GCL MQA tracking form
- GCL manufacturing quality control test data
- Bentonite clay certification
- Raw material test results

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

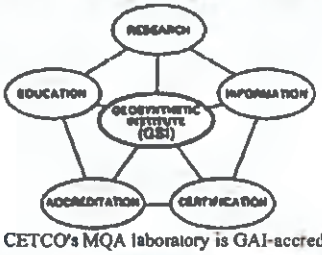
Ship Date: 6/19/2008
Order Numbers: 023940256, 023940258, 023940260
Prepared For: GSI-Headquarters

The GCL raw materials and GCL finished product manufactured for the above-referenced order number(s) are hereby certified to achieve the properties listed in the tables below.

## GCL PROPERTY SPECIFICATIONS FOR BENTOMAT SDN

| Test Method | Test Method Property | Test Frequency | Certified Value |
|---|---|---|---|
| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 5321 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (24 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN



| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

## BENTONITE CLAY CERTIFICATION

The Bentonite Clay used to produce package 000239402 has been tested by American Colloid Company and yeilded the following test results.

| Reference | Swell | Fluid Loss |
|---|---|---|
| Test Method: | ASTM D 5890 | ASTM D 5891 |
| Specification: | 24 Min | 18 ml Max |
| 060608C | 27.0 | 15.0 |
| 060608D | 28.0 | 15.0 |
| 060608E | 27.0 | 15.0 |
| 060608F | 27.0 | 15.0 |
| 060708A | 26.0 | 14.8 |

# GEOTEXTILE TEST RESULTS FOR RAW MATERIAL SUPPLIED BY A CETCO FACILITY

The GCL in certification package number 000239402 was manufactured using these geotextiles:

| Material | Lot # | Roll # | Mass Area | Grab Strenth |
|---|---|---|---|---|
| CV-NON-WOVEN | 200817CV | 00001467 | 6.4 | 35.9 |
| CV-NON-WOVEN | 200817CV | 00001498 | 6.7 | 42.7 |
| CV-NON-WOVEN | 200817CV | 00001523 | 6.8 | 41.1 |
| CV-NON-WOVEN | 200817CV | 00001533 | 6.6 | 34.7 |
| CV-NON-WOVEN | 200818CV | 00001610 | 6.3 | 42.6 |

## GEOTEXTILE TEST RESULTS FROM MATERIAL SUPPLIERS

The GCL in certification package number 000239402 was manufactured with geotextiles which were tested with the following results.

| BASE | | | |
|---|---|---|---|
| **Material** | **Roll Number** | **Mass Area oz/yd2** | **Grab Strenth lbs** |
| PPX 311 | 2010170122 | 3.5 | 72.9 |
| PPX 311 | 2010170130 | 3.7 | 77.6 |
| PPX 311 | 2010431248 | 3.6 | 68.8 |
| PPX 311 | 2010437127 | 3.7 | 87.8 |
| PPX 311 | 2010437136 | 4.0 | 74.1 |
| PPX 311 | 2010495964 | 3.3 | 74.4 |
| PPX 311 | 2010496428 | 3.9 | 80.4 |
| PPX 311 | 2010496440 | 3.1 | 68.6 |
| PPX 311 | 2010497626 | 3.3 | 72.3 |
| **CAP** | | | |
| **Material** | **Roll Number** | **Mass Area oz/yd2** | **Grab Strenth lbs** |
| PPX 650 | 2010495070 | 7.2 | 61.9 |
| PPX 650 | 2010495074 | 7.2 | 83.7 |
| PPX 650 | 2010495085 | 7.4 | 62.8 |
| PPX 650 | 2010495094 | 7.4 | 65.5 |
| PPX 650 | 2010496877 | 7.5 | 75.0 |
| PPX 650 | 2010496878 | 7.2 | 64.1 |
| PPX 650 | 2010496885 | 7.0 | 58.6 |
| PPX 650 | 2010496887 | 7.2 | 61.9 |
| PPX 650 | 2010496888 | 7.2 | 61.9 |

Certifications from our suppliers are on file at our production facility. An '*' or 'PT' indicates supplier certifications were unavailable prior to shipping so testing was performed at a CETCO lab.

**GEOSYNTHETIC CLAY LINER**
**MANUFACTURING QUALITY ASSURANCE DATA PACKAGE**

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
ORDER NUMBERS: 023940257, 023940259, 023940261, 023940262, 023940263, 023940264, 023940266
PREPARED FOR: GSI-Headquarters

**CONTENTS:**

- Daily production and needle detection certification
- GCL property specifications
- Order packing list
- GCL MQA tracking form
- GCL manufacturing quality control test data
- Bentonite clay certification
- Raw material test results

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

Ship Date: 6/20/2008
Order Numbers: 023940257, 023940259, 023940261, 023940262, 023940263, 023940264, 023940266
Prepared For: GSI-Headquarters

The GCL raw materials and GCL finished product manufactured for the above-referenced order number(s) are hereby certified to achieve the properties listed in the tables below.

## GCL PROPERTY SPECIFICATIONS FOR BENTOMAT SDN

| Test Method | Test Method Property | Test Frequency | Certified Value |
|---|---|---|---|
| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 5321 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (24 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN

| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

**GEOSYNTHETIC CLAY LINER**
**MANUFACTURING QUALITY ASSURANCE DATA PACKAGE**

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
ORDER NUMBER: 023940265
PREPARED FOR: GSI-Headquarters

**CONTENTS:**

- Daily production and needle detection certification
- GCL property specifications
- Order packing list
- GCL MQA tracking form
- GCL manufacturing quality control test data
- Bentonite clay certification
- Raw material test results

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

Order Number: 023940265
Prepared For: GSI-Headquarters

The GCL raw materials and GCL finished product manufactured for the above-referenced order number(s) are hereby certified to achieve the properties listed in the tables below.

## GCL PROPERTY SPECIFICATIONS FOR BENTOMAT SDN

| Test Method | Test Method Property | Test Frequency | Certified Value |
|---|---|---|---|
| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 5321 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (24 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN

| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

# GCL MANUFACTURING QUALITY CONTROL TEST DATA

The following rolls in GCL certification package number 000239402 have been tested in our production facility lab.

| Product | Lot # Tested | Roll # Tested | Mass Area | Grab Strength | Peel Strength |
|---|---|---|---|---|---|
| | | Standard Test Method: | ASTM D 5993 | ASTM D 6768 | ASTM D 6496 |
| | | Standard Specification: | 0.75 lb/sq ft MARV | 30lbs/in MARV | 2.5lbs/in MARV |
| Non-standard specifications were requested for this order as indicated on the attatched property sheet | | | | | |
| LO-BENTOMAT SDN | 200825LO | 00001329 | 0.85 | 38.7 | 12.1 |
| LO-BENTOMAT SDN | 200825LO | 00001347 | 0.88 | 38.7 | 10.5 |
| LO-BENTOMAT SDN | 200825LO | 00001365 | 0.94 | 30.5 | 7.4 |
| LO-BENTOMAT SDN | 200825LO | 00001383 | 0.85 | 30.5 | 9 |
| LO-BENTOMAT SDN | 200825LO | 00001419 | 0.88 | 30.5 | 6.9 |
| LO-BENTOMAT SDN | 200825LO | 00001473 | 0.89 | 44.2 | 7 |

| Product | Lot # Tested | Roll # Tested | PEEL 4632 | GRAB 4632 |
|---|---|---|---|---|
| LO-BENTOMAT SDN | 200825LO | 00001329 | 60.7 | 154.9 |
| LO-BENTOMAT SDN | 200825LO | 00001347 | 38.7 | 154.9 |
| LO-BENTOMAT SDN | 200825LO | 00001365 | 39.3 | 119.4 |
| LO-BENTOMAT SDN | 200825LO | 00001383 | 47.5 | 119.4 |
| LO-BENTOMAT SDN | 200825LO | 00001419 | 38.8 | 119.4 |
| LO-BENTOMAT SDN | 200825LO | 00001473 | 43.7 | 177.1 |

ASTM test methods and property specifications per CETCO standard unless non-standard specifications were requested.
Any non-standard property specifications requested for this order are noted on the attached GCL property specifications sheet.

## BENTONITE CLAY CERTIFICATION

The Bentonite Clay used to produce package 000239402 has been tested by American Colloid Company and yeilded the following test results.

| Reference | Swell | Fluid Loss |
|---|---|---|
| Test Method: | ASTM D 5890 | ASTM D 5891 |
| Specification: | 24 Min | 18 ml Max |
| 060508C | 25.0 | 17.0 |
| 060608B | 27.0 | 15.0 |
| 060608C | 27.0 | 15.0 |
| 060608D | 28.0 | 15.0 |
| 060608E | 27.0 | 15.0 |

## GEOTEXTILE TEST RESULTS FROM MATERIAL SUPPLIERS

The GCL in certification package number 000239402 was manufactured with geotextiles which were tested with the following results.

| BASE | | | |
|---|---|---|---|
| **Material** | **Roll Number** | **Mass Area oz/yd2** | **Grab Strenth lbs** |
| PPX 311 | 2010170122 | 3.5 | 72.9 |
| PPX 311 | 2010170130 | 3.7 | 77.6 |
| PPX 311 | 2010342851 | 3.9 | 92.1 |
| PPX 311 | 2010342857 | 3.6 | 91.5 |
| PPX 311 | 2010342879 | 3.6 | 85.1 |
| PPX 311 | 2010342888 | 3.6 | 85.3 |

| CAP | | | |
|---|---|---|---|
| **Material** | **Roll Number** | **Mass Area oz/yd2** | **Grab Strenth lbs** |
| PPX 650 | 2010495066 | 7.7 | 70.9 |
| PPX 650 | 2010495083 | 7.4 | 62.8 |
| PPX 650 | 2010495094 | 7.4 | 65.5 |
| PPX 650 | 2010496546 | 7.2 | 69.6 |
| PPX 650 | 2010496551 | 6.8 | 70.0 |
| PPX 650 | 2010496567 | 7.9 | 77.1 |
| PPX 650 | 2010496879 | 7.2 | 64.1 |
| PPX 650 | 2010496887 | 7.2 | 61.9 |

Certifications from our suppliers are on file at our production facility. An '*' or 'PT' indicates supplier certifications were unavailable prior to shipping so testing was performed at a CETCO lab.

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

## BENTONITE CLAY CERTIFICATION

The Bentonite Clay used to produce package 000239402 has been tested by American Colloid Company and yeilded the following test results.

| Reference | Swell | Fluid Loss |
|---|---|---|
| Test Method: | ASTM D 5890 | ASTM D 5891 |
| Specification: | 24 Min | 18 ml Max |
| 060508C | 25.0 | 17.0 |
| 060608C | 27.0 | 15.0 |
| 060608E | 27.0 | 15.0 |
| 060608F | 27.0 | 15.0 |

# GEOTEXTILE TEST RESULTS FROM MATERIAL SUPPLIERS

The GCL in certification package number 000239402 was manufactured with geotextiles which were tested with the following results.

**BASE**

| Material | Roll Number | Mass Area oz/yd2 | Grab Strenth lbs |
|---|---|---|---|
| PPX 311 | 2010170122 | 3.5 | 72.9 |
| PPX 311 | 2010342851 | 3.9 | 92.1 |
| PPX 311 | 2010342857 | 3.6 | 91.5 |
| PPX 311 | 2010342879 | 3.6 | 85.1 |
| PPX 311 | 2010342888 | 3.6 | 85.3 |
| PPX 311 | 2010495964 | 3.3 | 74.4 |
| PPX 311 | 2010496428 | 3.9 | 80.4 |
| PPX 311 | 2010497626 | 3.3 | 72.3 |

**CAP**

| Material | Roll Number | Mass Area oz/yd2 | Grab Strenth lbs |
|---|---|---|---|
| PPX 650 | 2010495082 | 7.4 | 62.8 |
| PPX 650 | 2010495083 | 7.4 | 62.8 |
| PPX 650 | 2010496546 | 7.1 | 61.8 |
| PPX 650 | 2010496546 | 7.2 | 69.6 |
| PPX 650 | 2010496551 | 6.8 | 70.0 |
| PPX 650 | 2010496551 | 7.1 | 61.8 |
| PPX 650 | 2010496567 | 7.9 | 77.1 |
| PPX 650 | 2010496879 | 7.2 | 64.1 |
| PPX 650 | 2010496885 | 7.0 | 58.6 |

Certifications from our suppliers are on file at our production facility. An '*' or 'PT' indicates supplier certifications were unavailable prior to shipping so testing was performed at a CETCO lab.

**GEOSYNTHETIC CLAY LINER**
**MANUFACTURING QUALITY ASSURANCE DATA PACKAGE**

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
ORDER NUMBER: 023940268
PREPARED FOR: GSI-Headquarters

**CONTENTS:**

- Daily production and needle detection certification
- GCL property specifications
- Order packing list
- GCL MQA tracking form
- GCL manufacturing quality control test data
- Bentonite clay certification
- Raw material test results

## PRODUCTION CERTIFICATION

PROJECT NAME: Ameren Duck Creek
CUSTOMER P.O.: 12738-00
PREPARED FOR: GSI-Headquarters

CETCO affirms that these products meet the physical and chemical criteria listed on the attached GCL property specification sheet.

## NEEDLE REMOVAL AND DETECTION PROCEDURE

CETCO hereby affirms that all Bentomat® geosynthetic clay liner material manufactured for this project is continually passed under a magnet for needle removal and then screened with a metal detection device. CETCO certifies Bentomat® to be essentially free of broken needles and fragments of needles that would negatively effect the performance of the final product.

Ship Date: 6/30/2008
Order Number: 023940268
Prepared For: GSI-Headquarters

The GCL raw materials and GCL finished product manufactured for the above-referenced order number(s) are hereby certified to achieve the properties listed in the tables below.

## GCL PROPERTY SPECIFICATIONS FOR BENTOMAT SDN

| Test Method | Test Method Property | Test Frequency | Certified Value |
|---|---|---|---|
| ASTM D 5891 | Bentonite Fluid Loss | 1 per 50 Tons | 18 ml Max |
| ASTM D 5993 | Bentonite Mass/Area | 40,000 sq ft (4000 sq m) | 0.75 lb /sq ft (3.6 kg/sq m) Min |
| ASTM D 5890 | Bentonite Swell Index | 1 per 50 Tons | 24 ml/2g Min |
| ASTM D 4632 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 90 lbs (400 N) MARV |
| ASTM D 6768 | GCL Grab Strength | 200,000 sq ft (20,000 sq m) | 30 lbs/in MARV |
| ASTM D 5321 | GCL Hydrated Internal Shear Strength | Periodic | 500 psf (24 kPa) typ @ 200 psf |
| ASTM D 5887 | GCL Hydraulic Conductivity | Weekly | 5 x 10^-9 cm/ sec Max |
| ASTM D 5887 | GCL Index Flux | Weekly | 1 x 10^-8 m^3/m^2/sec Max |
| ASTM D 6496 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 2.5 lbs/in Min |
| ASTM D 4632 | GCL Peel Strength | 40,000 sq ft (4000 sq m) | 15 lbs (65 N) Min |

## SPECIALY REQUESTED CERTIFIED PROPERTIES FOR THIS ORDER OF BENTOMAT SDN

| Test Method | Test Method Property | Requested Frequency | Requested Value | Requested Conditions |
|---|---|---|---|---|
| ASTM D 4632 | GCL Grab Strength | Standard | Standard | Standard |
| ASTM D 4632 | GCL Peel Strength | Standard | Standard | Standard |

Bentonite property tests are performed at a bentonite processing facility before shipment to CETCO's production facility.
All tensile testing is in the machine direction.

## FABRIC SUPPLIER REQUIREMENTS FOR BENTOMAT SDN

| Raw Material | test method | mass per area | units |
|---|---|---|---|
| Nonwoven Cover Fabric | ASTM D 5261 | 6.0 | oz/yd2 |
| Bentomat SDN Base Nonwoven Fabric | ASTM D 5261 | 2.7 | oz/yd2 |

Fabric certifications from our raw material suppliers are on file at our production facility.

CETCO's MQA laboratory is GAI-accredited (www.geosynthetic-institute.org/gai/lab.html).

## BENTONITE CLAY CERTIFICATION

The Bentonite Clay used to produce package 000239402 has been tested by American Colloid Company and yeilded the following test results.

| Reference | Swell | Fluid Loss |
|---|---|---|
| Test Method: | ASTM D 5890 | ASTM D 5891 |
| Specification: | 24 Min | 18 ml Max |
| 060608B | 27.0 | 15.0 |
| 060608C | 27.0 | 15.0 |
| 060608E | 27.0 | 15.0 |
| 060608F | 27.0 | 15.0 |

Electronic Filing: Received, Clerk's Office 06/20/2024

# GEOTEXTILE TEST RESULTS FOR RAW MATERIAL SUPPLIED BY A CETCO FACILITY

The GCL in certification package number 000239402 was manufactured using these geotextiles:

| Material | Lot # | Roll # | Mass Area | Grab Strenth |
|---|---|---|---|---|
| CV-NON-WOVEN | 200817CV | 00001467 | 6.4 | 35.9 |

# GEOTEXTILE TEST RESULTS FROM MATERIAL SUPPLIERS

The GCL in certification package number 000239402 was manufactured with geotextiles which were tested with the following results.

| BASE | | | |
|---|---|---|---|
| **Material** | **Roll Number** | **Mass Area oz/yd2** | **Grab Strenth lbs** |
| PPX 311 | 2010170122 | 3.5 | 72.9 |
| PPX 311 | 2010342851 | 3.9 | 92.1 |
| PPX 311 | 2010342879 | 3.6 | 85.1 |
| PPX 311 | 2010342888 | 3.6 | 85.3 |
| PPX 311 | 2010431249 | 3.6 | 68.8 |
| PPX 311 | 2010497626 | 3.3 | 72.3 |
| **CAP** | | | |
| **Material** | **Roll Number** | **Mass Area oz/yd2** | **Grab Strenth lbs** |
| PPX 650 | 2010495058 | 8.0 | 65.7 |
| PPX 650 | 2010495066 | 7.7 | 70.9 |
| PPX 650 | 2010495082 | 7.4 | 62.8 |
| PPX 650 | 2010496551 | 6.8 | 70.0 |
| PPX 650 | 2010496551 | 7.1 | 61.8 |
| PPX 650 | 2010496567 | 7.9 | 77.1 |
| PPX 650 | 2010496885 | 7.0 | 58.6 |

Certifications from our suppliers are on file at our production facility. An '*' or 'PT' indicates supplier certifications were unavailable prior to shipping so testing was performed at a CETCO lab.

**GEOCHEMICAL ANALYSIS OF DUCK CREEK GMF POND GROUNDWATER IN SUPPORT OF AN ALTERNATE SOURCE DEMONSTRATION (ASD)**

## 1.0 EXECUTIVE SUMMARY

This document serves as an Appendix to the November 11, 2023, Alternative Source Demonstration (ASD) for Duck Creek Power Plant (DC) Gypsum Management Facility Pond (GMF Pond) for monitoring Event 1 (E001) (referred to as the E001 ASD), completed to fulfill the requirements of Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845.650(e). Life Cycle Geo, LLC (LCG) has completed a review of geochemical conditions to evaluate the feasibility of an ASD at monitoring well G60L associated with the DC GMF Pond. Compliance well G60L monitors conditions in the Uppermost Aquifer (UA) to the east of the GMF Pond and currently exhibits pH levels lower than the groundwater protection standard (GWPS) range for pH. This technical review considered all available groundwater and solid-phase chemical analysis and empirical field observations, and utilized multivariate statistical analysis to conclude the low pH levels at G60L is due to an alternate source and is unrelated to the GMF Pond. Further, information pertaining to flow conditions, lithology, and solid-phase geochemistry are utilized to conclude that the likely source of low pH is a localized pocket of native peat identified in boring logs immediately upgradient of G60L. This scope of work was executed by subcontract to Ramboll Americas Engineering Solutions, Inc. (Ramboll) on behalf of Electric Energy Inc (EEI).

## 2.0 GROUNDWATER CONDITIONS

Monitoring well G60L is located on the eastern side and downgradient of the GMF Pond (Attachment 1). From 2021 through May 2023 (the period of groundwater monitoring at this well for the 35 I.A.C. § 845 monitoring program), pH at G60L is consistently lower than the GWPS (Table 1).

**Table 1: Concentration Ranges for Select Constituents in Compliance Well G60L and Background Groundwater. Data in Appendix B-1**

| | pH | Sulfate, total (mg/L) | TDS (mg/L) |
|---|---|---|---|
| G60L | 5.90-6.42 | 150-180 | 510-630 |
| Background | 6.42-7.26 | ND-56 | 290-490 |

# 3.0 MULTIVARIATE PRINCIPAL COMPONENTS ANALYSIS

## 3.1 APPROACH

Groundwater chemistry data are by nature multivariate datasets given the high number of parameters observed per sampling location and date. With such a large number of variables, advanced statistical analysis of multivariate groundwater data can provide important insights into spatial and chemical relationships influencing constituent distribution and compliance in groundwater. The multivariate technique Principal Components Analysis (PCA) is used to interrogate the groundwater chemistry around the GMF Pond.

PCA is a multivariate technique that reduces dataset dimensionality to its principal, independent components thereby revealing the inner structure of the dataset. Multivariate techniques such as PCA are valuable because they identify variables that are highly dependent on each other but do not inherently provide insights into water origin, type, or evolution. As an example, calcium, magnesium, and hardness are typically highly correlated in groundwater datasets, but this relationship is known and does not provide additional insight towards the identification of water types and geochemical processes that describe water quality changes. Reducing multivariate data dimensionality reduces redundant information, revealing inner structures in the data that might otherwise be obscured by these dependencies. These structures might include revealing groups of related variables, changing chemical evolution through time, or spatial locations with similar chemical signatures.

PCA results are most easily viewed on biplots, which depict the sample population plotted on two axes, each representing a principal component. The principal components are created from a linear combination of the original variables in the dataset and variance in the data. For natural compositional datasets, the population variance can often be expressed as six or seven principal components (in some cases less and in others, more), each representing decreasing amounts of variance in the data while remaining uncorrelated to previous principal components. Typically, the first few principal components represent significant dataset variance and include a larger number of variables. The principal components are visualized using biplots with the variables expressed as vectors; the location of groups of samples relative to component vectors provides insight into geochemical relationships among groups of variables and samples.

## 3.2 DATA PREPARATION

In order to perform multivariate analysis, it is first necessary to prepare the dataset. Raw chemical data requires preparation prior to analysis because the data often contains values in two forms unsuitable for advanced analytics: 1) measurements reported below a method detection limit (MDL), referred to as censored data, and 2) missing values. For this work any sample or analyte with a high percentage (≥40%) of missing and/or censored data was assessed for meaningful statistical variance. If variance was determined to be low, the sample or analyte was removed, otherwise data was included in the analysis. Any remaining censored data was converted to half the MDL. Remaining missing values were imputed, a method of assigning an estimated value that accounts for the entire distribution of the material's composition (Sanford et al., 1993) and also takes into consideration the values associated with samples of similar composition. Imputation was done with a nearest neighbor algorithm and resulting values were checked against the overall data distribution for both the analyte and sample to ensure representative results. The resulting

729 Main Street, Longmont, CO 80501 720.550.0745 contact@lifecyclegeo.com www.lifecyclegeo.com

Electronic Filing: Received, Clerk's Office 06/20/2024

dataset includes both compliance wells and other monitoring wells, incorporates data from multiple lithologic units, and spans sampling events from 2014 through 2023. The dataset contains 15 measured analytes, including the hydrogen ion (H+), which represents acidity in groundwater and is proportional to pH. The final dataset contained 1425 values, 54 of which were imputed. This data represents both the most recent data measured at the GMF Pond as well as the most complete set of regularly measured and detectable analytes. All data used in PCA analysis is presented in Electronic Attachment 1.

PCA also requires transformation of the dataset to address the numeric closure problem inherent within chemical compositional datasets (Aitchison, 1986). Numeric closure can often occur in water quality data since water quality concentrations are not completely independent. To address this issue, all data was converted to the same units and the centered-log ratio transformation (CLR; Aitchison 1986; Egozcue et al. 2011) was applied to the prepared dataset. In practice, closure only significantly affects elements present in large concentrations (e.g., major ions in typical water quality samples), but for consistency the entire dataset (i.e., including trace metals) was CLR-transformed.

All data preparation was conducted using python programming language. Only total (i.e., unfiltered) concentrations of major ions and metals were used in this analysis as those data are both relatively complete and consistent across the wells around the GMF Pond and are the parameters of interest for regulatory purposes.

## 3.3 FINDINGS

A biplot for principal components 1 and 2 (PC1 and PC2) is provided in Attachment 2. PC1 explains approximately 53% of the statistical variance in the entire water quality dataset, and imposes the dominant compositional structure observed in the biplot. PC2 explains approximately 14% of the variability in the dataset.

The compositional vectors on the biplot and their position/spacing reveal the following key insights into groundwater geochemistry at the GMF Pond:

1) Groundwater samples plot along a linear trend from the upper left quadrant toward the lower left quadrant, with significant overlap between background, compliance, and monitoring wells. This suggests overall groundwater chemistry at compliance wells and monitoring wells is compositionally similar to background conditions.
2) Data from G60L plots between H+, calcium, sodium, and sulfate vectors, indicating in this case the concentrations are relatively high compared with other locations consistent with the pH exceedance at this location. Monitoring well G50L also plots between these vectors, suggesting possible compositional end members distinct from the main cluster of background and compliance wells.
3) The majority of porewater and leachate samples plot in the upper right quadrant of the biplot, near the boron, fluoride, and molybdenum vectors. These samples plot far from the groundwater samples, indicating the chemistry of the porewater and leachate is distinct from the chemistry of the groundwater. There are three leachate samples that plot away from the main body of leachate data, with one plotting in the lower right quadrant near the magnesium and chloride vectors. These three samples are (1) chemically distinct from the groundwater samples, (2) irregularly spaced in time, and (3) likely represent anomalous conditions unique to the GMF Pond. These samples are discussed further in Section 4.2.

# 4.0 MAJOR ION DISTRIBUTION

## 4.1 APPROACH

Piper diagrams are a useful way to classify water samples based on major ion chemistry. The diagrams include separate ternary anion and cation proportion plots and a central diamond plot for classifying combined cation/anion predominance for overall classification. Piper diagrams account for major ion proportionality, but not for actual concentrations nor trace element chemistry, an important contrast and complement to PCA.

The Piper diagram for the GMF Pond is provided in Attachment 3. Given the large number of sampling locations and sampling instances, the data plotted here is limited to background, leachate, and groundwater wells in the immediate vicinity of G60L over the same time period as the samples included in the PCA. This provides the clearest depiction of both the site-wide data and localized geochemistry around G60L and allows for ease of comparison to the PCA. To provide a more robust evaluation of the local geochemistry in the area of the GMF Pond and to increase the density of datapoints at wells near G60L, the groundwater wells immediately adjacent to G60L are presented as a combination of dissolved and total major ions, rather than exclusively total ions. The difference between total and dissolved major ions was determined qualitatively through comparison of values when both total and dissolved were measured. No major differences were observed, therefore when total phase data was not available, dissolved data was used in place. All data used in the Piper diagram is presented in Appendix B-2.

## 4.2 FINDINGS

The primary finding from the Piper diagram is that groundwater at G60L exhibits a major ion composition that is distinct from the GMF Pond leachate. The groundwater samples near G60L all have consistent cation proportions with almost equal distributions of calcium and magnesium, consistent with other compliance groundwater wells around the GMF Pond (Ramboll 2023). The leachate samples differ in that they primarily show a more magnesium-dominant signature. Similarly, the anion proportions of groundwater are distinct from leachate, particularly with respect to chloride. The groundwater samples all show low chloride proportion but exhibit a wide range of sulfate proportion. In contrast, the leachate shows a more consistent composition of anions with a substantial proportion of chloride. The chloride-rich signature of the leachate samples provides critical evidence of chemical separation between leachate and G60L groundwater. Chloride is a conservative ion with regard to groundwater transport, such that it does not tend to interact with the solid phase once dissolved into solution. Therefore, groundwater impacted by GMF Pond leachate should contain a chloride proportion similar to the leachate, or at a proportion falling along a mixing line between the groundwater and leachate. Such a mixing signal is not observed, which paired with low chloride proportion in the groundwater (Attachment 5), is strong evidence that the groundwater at G60L is not influenced by the GMF Pond. This is consistent with the PCA results, which showed both the variability in the groundwater composition and the clear distinction between groundwater and leachate.

Notable distinctions on the Piper diagram are leachate samples from Q2 2020, Q2 2022, and Q1 2023, which correspond to the anomalous leachate samples in the PCA. These samples plot between the groundwater data and the main cluster of leachate data in the cation space. These instances are irregularly spaced

729 Main Street, Longmont, CO 80501 720.550.0745 contact@lifecyclegeo.com www.lifecyclegeo.com

Electronic Filing: Received, Clerk's Office 06/20/2024

through time and do not have a temporal trend in concentration nor overall major ion composition. This suggests changes are not related to seasonal changes at the site but rather indicates a more random control, such as operational influences on concentrations (*e.g.*, variable proportions of porewater and surface water passing into the leachate collection system or inconsistencies in sample collection).

# 5.0 IDENTIFIED PROBABLE ALTERNATE SOURCE

Empirical field observations revealed a localized peat unit in boring B-55 and monitoring well P-60 (Attachment 4), both located immediately upgradient of G60L (Attachment 1). Peat-rich soils in connection with groundwater are known to produce water chemistries with lower pH and higher sulfate concentrations (Bourbonniere, 2009), such as those consistently observed at G60L (Table 1). The peat unit ranges in elevation from 593.2 to 600.6 feet (ft) mean sea level (msl), approximately the same elevation as the top of the filter pack (594.8 ft msl) and just above the elevation of the screened interval (587.4 to 592.4 ft msl) of G60L. The hydraulic conductivity of the filter pack is higher than the surrounding native material and would intercept flow from groundwater under the influence of the local peat. There is a downward vertical component to the hydraulic gradient in this area (Ramboll, 2021), which is consistent with a flow path from the peat unit downgradient horizontally and vertically towards the well screen of G60L.

Other monitoring wells near the local peat unit also exhibit higher sulfate concentrations than background and are stable over time (Attachment 5; Appendix B-1), supporting the conclusion that this region is influenced by an alternate source of sulfate, the local native peat, rather than the GMF Pond. This is particularly meaningful when considered contextually with boron and chloride concentrations, conservative tracers of CCR-related influence. Sulfate, chloride (Attachment 5), and boron (Ramboll 2023, LOE #2) are all elevated in the leachate while only sulfate is elevated above background in the groundwater. The low concentrations of boron and chloride in the groundwater at G60L are a strong indicator that sulfate concentrations originate from an alternate source unrelated to the GMF Pond.

While the local peat is the interpreted source of sulfate (and therefore TDS also), it is notable that other wells in the vicinity of G60L do not reflect the same low pH as G60L. In addition to the peat content of the aquifer solids, carbonate content also influences groundwater pH, with higher proportions of carbonate minerals calcite and dolomite present in the aquifer solids resulting in a higher, or more neutral, pH. Therefore, variation in groundwater pH is a function of variability in both peat and carbonate content in the aquifer solids. Carbonate mineralization is known to buffer against pH changes associated with peat. Solid phase mineralogy analysis including X-ray diffraction (XRD; Attachment 6) and sequential extraction (SEP; Attachment 7) data both show variable carbonate content across the site, indicating that some locations have higher pH buffering capacity than others. Aqueous alkalinity concentration, a contributor of aqueous phase pH buffering capacity, is lower at G60L than at surrounding wells (Attachment 5). These data in combination suggest the presence of peat immediately upgradient with the relatively low buffering capacity of the groundwater observed for monitoring well G60L have naturally resulted in a groundwater pH that is lower than the pH of the surrounding site groundwater.

# 6.0 CONCLUSIONS

This technical review presents empirical evidence and analysis that demonstrates the GMF Pond is not the source of low pH at compliance well G60L. The PCA identified a geochemical signature in the GMF Pond leachate that is different from groundwater and simultaneously demonstrates that geochemistry at G60L is

far more similar to background/compliance wells than to the GMF Pond leachate. This analysis was supported by evaluation of the major ion distribution, which showed a sulfate-chloride leachate signature not evident in the groundwater. The absence of boron and chloride (both conservative tracers) from groundwater further demonstrates the GMF Pond is not impacting G60L. Soil boring logs revealed a localized pocket of native peat immediately upgradient of G60L. The combination of hydraulic gradients, aqueous and solid phase geochemistry, and empirical field observations at this location supports the conclusion that local peat is likely the source of the low pH at G60L.

Electronic Filing: Received, Clerk's Office 06/20/2024

**Appendix B-1. Supporting analytical data for Attachment 5 and inline Table 1**

Notes:
mg/L = milligrams per liter
SU= standard units
< = less than analytical detection limit; data not included in Attachment 3 and 4 analyses.
-- = data not measured
Table 1: Background wells are G02S, G50S, and G51S. Data from these wells determined the range for pH, TDS, and total sulfate in Table 1.
Data from 2021 through May 2023 for G60L was used for Table 1
Attachment 5: Data from G60L, G61S, G62L, P60, R61L, and X301 were used for Attachment 5.
HSU = hydrostratigraphic unit
CCR = coal combustion residual
UA = uppermost aquifer
PMP = potential migration pathway
S= source water
DC= Duck Creek

Electronic Filing: Received, Clerk's Office 06/20/2024

Electronic Filing: Received, Clerk's Office 06/20/2024

## Method Summary

***Mineral Identification and Interpretation:***

Mineral identification and interpretation involves matching the diffraction pattern of an unknown material to patterns of single-phase reference materials. The reference patterns are compiled by the Joint Committee on Powder Diffraction Standards - International Center for Diffraction Data (JCPDS-ICDD) database and released on software as Powder Diffraction Files (PDF).

Interpretations do not reflect the presence of non-crystalline and/or amorphous compounds, except when internal standards have been added by request. Mineral proportions may be strongly influenced by crystallinity, crystal structure and preferred orientations. Mineral or compound identification and quantitative analysis results should be accompanied by supporting chemical assay data or other additional tests.

***Quantitative Rietveld Analysis:***

Quantitative Rietveld Analysis is performed by using Topas 4.2 (Bruker AXS), a graphics based profile analysis program built around a non-linear least squares fitting system, to determine the amount of different phases present in a multicomponent sample. Whole pattern analyses are predicated by the fact that the X-ray diffraction pattern is a total sum of both instrumental and specimen factors. Unlike other peak intensity-based methods, the Rietveld method uses a least squares approach to refine a theoretical line profile until it matches the obtained experimental patterns.

Rietveld refinement is completed with a set of minerals specifically identified for the sample. Zero values indicate that the mineral was included in the refinement calculations, but the calculated concentration was less than 0.05wt%. Minerals not identified by the analyst are not included in refinement calculations for specific samples and are indicated with a dash.

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| B | Compound was found in the blank and sample. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

**Narrative**

**Job Narrative**
**140-23190-1**

**Receipt**
The samples were received on 5/21/2021 at 9:20am and arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 0.5° C.

**Metals**
7 Step Sequential Extraction Procedure

These soil samples were prepared and analyzed using Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0008, "7 Step Sequential Extraction Procedure". SW-846 Method 6010B as incorporated in Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0007 was used to perform the final instrument analyses.

An aliquot of each sample was sequentially extracted using the steps listed below:

- Step 1 - Exchangeable Fraction: A 5 gram aliquot of sample was extracted with 25 mL of 1M magnesium sulfate (MgSO4), centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 2 - Carbonate Fraction: The sample residue from step 1 was extracted with 25 mL of 1M sodium acetate/acetic acid (NaOAc/HOAc) at pH 5, centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 3 - Non-crystalline Materials Fraction: The sample residue from step 2 was extracted with 25 mL of 0.2M ammonium oxalate (pH 3), centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 4 - Metal Hydroxide Fraction: The sample residue from step 3 was extracted with 25 mL of 1M hydroxylamine hydrochloride solution in 25% v/v acetic acid, centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 5 - Organic-bound Fraction: The sample residue from step 4 was extracted three times with 25 mL of 5% sodium hypochlorite (NaClO) at pH 9.5, centrifuged and filtered. The resulting leachates were combined and 5 mL were digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 6 - Acid/Sulfide Fraction: The sample residue from step 5 was extracted with 25 mL of a 3:1:2 v/v solution of HCl-HNO3-H2O, centrifuged and filtered. 5 mL of the resulting leachate was diluted to 50 mL with reagent water and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 7 - Residual Fraction: A 1.0 g aliquot of the sample residue from step 6 was digested using HF, HNO3, HCl and H3BO3. The digestate was analyzed by ICP using method 6010B. Results are reported in mg/kg on a dry weight basis.

In addition, a 1.0 g aliquot of the original sample was digested using HF, HNO3, HCl and H3BO3. The digestate was analyzed by ICP using method 6010B. Total metal results are reported in mg/kg on a dry weight basis.

Results were calculated using the following equation:

Result, µg/g or mg/Kg, dry weight = (C × V × V1 × D) / (W × S × V2)

Where:
C = Concentration from instrument readout, µg/mL
V = Final volume of digestate, mL
D = Instrument dilution factor
V1 = Total volume of leachate, mL
V2 = Volume of leachate digested, mL
W = Wet weight of sample, g
S = Percent solids/100

A method blank, laboratory control sample and laboratory control sample duplicate were prepared and analyzed with each SEP step in

## Case Narrative

Client: Golder Associates Inc.
Project/Site: Duck Creek Power Station - Illinois

Job ID: 140-23190-1

### Job ID: 140-23190-1 (Continued)

#### Laboratory: Eurofins TestAmerica, Knoxville (Continued)

order to provide information about both the presence of elements of interest in the extraction solutions, and the recovery of elements of interest from the extraction solutions. Results outside of laboratory QC limits do not reflect out of control performance, but rather the effect of the extraction solution upon the analyte.

A laboratory sample duplicate was prepared and analyzed with each batch of samples in order to provide information regarding the reproducibility of the procedure.

SEP Report Notes:

The final report lists the results for each step, the result for the total digestion of the sample, and a sum of the results of steps 1 through 7 by element.

Magnesium was not reported for step 1 because the extraction solution for this step (magnesium sulfate) contains high levels of magnesium. Sodium was not reported for steps 2 and 5 since the extraction solutions for these steps contain high levels of sodium. The sum of steps 1 through 7 is much higher than the total result for sodium and magnesium due to the magnesium and sodium introduced by the extraction solutions.

The digestates for steps 1, 2 and 5 were analyzed at a dilution due to instrument problems caused by the high solids content of the digestates. The reporting limits were adjusted accordingly.

Method 6010B: The following sample was diluted to bring the concentration of target analyte, calcium, within the calibration range: B-AP-1 (140-23190-1). Elevated reporting limits (RLs) are provided.

Method 6010B: The following samples were diluted due to the nature of the sample matrix: B-AP-1 (140-23190-1), B-G52S (140-23190-2), B-G54L (140-23190-3), B-G57L (140-23190-4), B-G57S (140-23190-5), B-G62L (140-23190-6), B-G53S (140-23190-7), B-G02S (140-23190-8) and B-G02L (140-23190-9). Elevated reporting limits (RLs) are provided for aluminum and calcium.

Method 6010B: The following samples were diluted to bring the concentration of target analyte, potassium, within the calibration range: B-G52S (140-23190-2), B-G54L (140-23190-3), B-G57S (140-23190-5), B-G62L (140-23190-6), B-G53S (140-23190-7), B-G02S (140-23190-8) and B-G02L (140-23190-9). Elevated reporting limits (RLs) are provided.

Method 6010B: The following samples were diluted due to the presence of silicon which interferes with Arsenic, Lead and Selenium: B-G52S (140-23190-2) and B-G53S (140-23190-7). Elevated reporting limits (RLs) are provided.

Method 6010B: The following samples were diluted due to the presence of titanium which interferes with Cobalt and Lead: B-G54L (140-23190-3), B-G62L (140-23190-6) and B-G02L (140-23190-9). Elevated reporting limits (RLs) are provided.

Method 6010B: Due to sample matrix effect on the internal standard (ISTD), a dilution was required for the following sample: B-G57L (140-23190-4).

Method 6010B SEP: The method blank for preparation batch 140-51550 and 140-51581 contained Iron above the reporting limit (RL). The following samples, 23190-1, 23190-3, 23190-4, 23190-5, 23190-6, 23190-7, 23190-8 and 23190-9 associated with this method blank did not contain the target compound; therefore, re-extraction and/or re-analysis of samples were not performed.

Method 6010B SEP: The following sample was diluted to bring the concentration of target analyte, calcium, within the calibration range: B-AP-1 (140-23190-1). Elevated reporting limits (RLs) are provided.

Method 6010B SEP: The following samples were diluted to bring the concentration of target analyte, sodium, within the calibration range: B-AP-1 (140-23190-1), B-G52S (140-23190-2), B-G54L (140-23190-3), B-G57L (140-23190-4), B-G57S (140-23190-5), B-G62L (140-23190-6), B-G53S (140-23190-7), B-G02S (140-23190-8) and B-G02L (140-23190-9). Elevated reporting limits (RLs) are provided.

Method 6010B SEP: The method blank for preparation batch 140-51449 and 140-51455 and analytical batch 140-51720 contained Iron above the reporting limit (RL). Associated sample 23190-2 was not re-extracted and/or re-analyzed because results were greater than

**Subject:** [External] RE: Duck Creek/Hennepin Power Plant ASD submittal notice
**Date:** Tuesday, November 14, 2023 9:49:13 AM

Hello Josiah,
The Hennepin WAPS and Duck Creek GMF Pond ASDs were both sent via FedEx next day air on Thursday, November 9 with delivery scheduled before 10:30am Friday morning.
I received email notification on Monday that both were delivered. I have no idea why FedEx did not deliver on Friday as we selected and paid for next day air service.

The FedEx tracking numbers are:
Hennepin WAPS - 774057520028
Duck Creek GMF Pond – 774053052491

These are also available on the public website. The link is below. To view the ASDs go to the site, then select 2023 folder.
https://www.luminant.com/ccr/illinois-ccr/

Please let me know if you need anything else.

Thanks,
Brian

EXTERNAL EMAIL

Good morning Brian,

I have not received the hard copy for either of these locations. Did you happen to have a tracking number for these? Since it was sent by FedEx, I can look it up and see who checked it in. Thank you.

I have electronic versions, but the files are too large to send via email. We need to setup a SharePoint site where I can transfer ASDs and other reports?

A SharePoint site will also be useful for the 2023 annual part 845 consolidated report due by end of Jan 24. Is this something you can setup and send me a link to?

Thanks,
Brian

Re: Joppa Power Plant East Ash Pond; W1270100004-02
Alternative Source Demonstration Submittal

Dear Ms. Tickner:

The purpose of this correspondence is to notify you that the Illinois Environmental Protection Agency (Illinois EPA) does not concur with the Joppa East Ash Pond Alternative Source Demonstration (ASD) dated October 21, 2023. The Illinois EPA does not concur due to the following data gaps:

1. Source characterization of the CCR at the East Ash Pond must include total solids sampling in accordance with SW846.
    a. 35 IAC 845.650(e) states "the owner or operator of a CCRSI may…submit a demonstration to the Agency that a source other than the CCRSI caused the contamination and the CCRSI did not contribute to the contamination… Either type of ASD must include a report that contains the factual or evidentiary basis for any conclusions…"
        i. The Illinois EPA cannot concur with ASDs that do not include source characterization of the CCR with adequate sampling and analysis of the CCR which must characterize the CCR horizontally and vertically within the CCRSI.
2. Characterization to include sample and analysis in accordance with 35 IAC 845.640 of alternative source must be provided with the ASD.
    a. 35 IAC 845.640(a) requires evidence of field collection methods and field and laboratory quality control and quality assurance.
    b. 35 IAC 845.650(e) requires alternative source data as evidence of the alternative source, see item 1(a)(i) above. SW846 chapter 1, incorporated by reference in 35 IAC 845, states that regulatory decisions must be made with environmental data.

Re: Joppa Power Plant East Ash Pond; W1270100004-02
Alternative Source Demonstration Submittal

Dear Ms. Tickner:

The purpose of this correspondence is to notify you that the Illinois Environmental Protection Agency (Illinois EPA) does not concur with the Joppa East Ash Pond Alternative Source Demonstration (ASD) dated October 21, 2023. The Illinois EPA does not concur due to the following data gaps:

1. Source characterization of the CCR at the East Ash Pond must include total solids sampling in accordance with SW846.
    a. 35 IAC 845.650(e) states "the owner or operator of a CCRSI may…submit a demonstration to the Agency that a source other than the CCRSI caused the contamination and the CCRSI did not contribute to the contamination… Either type of ASD must include a report that contains the factual or evidentiary basis for any conclusions…"
        i. The Illinois EPA cannot concur with ASDs that do not include source characterization of the CCR with adequate sampling and analysis of the CCR which must characterize the CCR horizontally and vertically within the CCRSI.
2. Characterization to include sample and analysis in accordance with 35 IAC 845.640 of alternative source must be provided with the ASD.
    a. 35 IAC 845.640(a) requires evidence of field collection methods and field and laboratory quality control and quality assurance.
    b. 35 IAC 845.650(e) requires alternative source data as evidence of the alternative source, see item 1(a)(i) above. SW846 chapter 1, incorporated by reference in 35 IAC 845, states that regulatory decisions must be made with environmental data.

Heather Mullenax and Groundwater Section staff
Illinois Environmental Protection Agency
EPA.BOW.GWS.CCR@illinois.gov

**RE: Public Comments on Alternative Source Demonstrations for Hennepin West Ash Pond System and Duck Creek surface impoundments**

Dear Ms. Mullenax and other Groundwater Section staff,

Pursuant to 35 I.A.C. § 845.650(e)(3), Earthjustice, Prairie Rivers Network, and Sierra Club (collectively, "Commenters") respectfully submit these public comments concerning the "alternative source demonstrations" submitted for the Hennepin and Duck Creek facilities.

Under the Part 845 rules, an alternative source demonstration ("ASD") is a:

> demonstration . . . that a source other than the CCR surface impoundment caused the contamination and the CCR surface impoundment *did not contribute* to the contamination, or that the exceedance . . . resulted from error in sampling, analysis, statistical evaluation, natural variation in groundwater quality, or a change in potentiometric surface and groundwater flow direction.

35 I.A.C. § 845.650(e) (emphasis added).

Commenters urge Illinois EPA ("IEPA" or "the Agency") to deny the ASDs for two reasons. First, as explained below, IEPA should deny the ASDs due to the lack of an approved groundwater monitoring program at the sites under Part 845. Second, IEPA should deny the ASD for Hennepin because omissions in documentation submitted for the site render the purported "demonstration" inadequate to bypass corrective action mandates for cadmium.

First, IEPA should deny the ASDs for Hennepin and Duck Creek because IEPA has not yet, for either of these facilities, issued an operating permit that sets out an approved groundwater monitoring program. Without an approved groundwater monitoring program, the Agency cannot make a supported decision that the purported "demonstration" in fact establishes that the impoundment has not contributed to the contamination.

An approved groundwater monitoring program – which includes appropriate locations, depths, and number of background and downgradient monitoring wells, as well as satisfactory sampling procedures and determinations of which wells accurately represent "background" groundwater quality – is an essential prerequisite for any ASD. Without an approved program, owners/operators may be engaging in a variety of erroneous monitoring practices that result in contamination from the CCR surface impoundment not being fully detected or characterized. Among other flaws, owners or operators may have set up a groundwater monitoring system that is missing contaminant pathways; treating CCR-contaminated wells as "background" wells, resulting in pollution associated with the CCR surface impoundment improperly not being

Electronic Filing: Received, Clerk's Office 06/20/2024

classified as an exceedance; or failing to account for "mounding" or other hydrogeological characteristics that affect groundwater flow direction. **In short, without an IEPA-approved program properly revealing what contamination is coming from a CCR surface impoundment, there is insufficient information for IEPA to determine—or for owners/operators to demonstrate—that pollution is NOT coming from the impoundment**.

Our concerns about serious flaws in groundwater monitoring performed by industry, absent review and approval (after public comment) from the Agency, are far from hypothetical. USEPA has reviewed the groundwater monitoring systems of multiple CCR surface impoundments – including one here in Illinois[1] – and found, or proposed to find, numerous grave errors in how that monitoring is being carried out.

Many of these evaluations have come in the form of USEPA's review of owners/operators' "Part A" applications. To obtain an extension of the deadline to cease receipt of CCR in a CCR surface impoundment that is required to close, owners/operators were required to demonstrate, among other things, full compliance with the CCR rule at the entire facility where the CCR surface impoundment is located.[2] As of this writing, USEPA has issued thirteen proposed decisions on Part A applications, one of which it finalized.[3] It evaluated compliance with the groundwater monitoring mandates of the CCR rule at eight of those facilities.[4]

At *every* site that USEPA reviewed as part of its Part A evaluations, it identified serious problems with facilities' groundwater monitoring systems:

- At the Gavin coal-fired power plant, USEPA found that the owner/operator failed to thoroughly characterize groundwater flow direction, failed to properly establish background wells, and lacked adequate downgradient wells, among other flaws.[5]

- At the Waukegan plant, USEPA proposed to find that Midwest Generation did not properly characterize groundwater flow direction, lacked sufficient wells to fully monitor potential contamination, improperly used "intrawell" statistical analysis of monitoring results, and used improper "background" wells that were dug through CCR.[6]

Electronic Filing: Received, Clerk's Office 06/20/2024

- At the Ottumwa, Clifty Creek, and Spurlock plants, USEPA proposed to find that, among other deficiencies, the groundwater monitoring wells were too far apart or not properly sited, leaving potential contaminant pathways unmonitored.[7]

- At A.B. Brown, USEPA proposed to find, among other concerns, that the groundwater monitoring wells were not placed in sufficient locations to detect all potential contaminant pathways, that groundwater flow characterization was inadequate, and samples were improperly evaluated using "intrawell" statistical analysis.[8]

- At Mountaineer, USEPA proposed to find, among other flaws, that the company did not appropriately locate either background or downgradient wells, and improperly analyzed groundwater monitoring data, including by excluding so-called "outlier" data and by using intrawell analysis.[9]

- At the Calaveras plant, USEPA proposed to find, among other flaws, that groundwater monitoring wells are improperly spaced, inadequate in number, and not located at the waste boundary, and the company did not appropriately identify background wells.[10]

USEPA has likewise identified severe deficiencies in the groundwater monitoring programs at multiple CCR facilities in Alabama[11] and at one facility in Kansas to which it sent a letter summarizing conversations regarding compliance concerns.[12] In effect, *every time* USEPA has taken a close look at the groundwater monitoring program for a CCR surface impoundment or landfill, it has identified deficiencies that could lead to contamination from those CCR units being released undetected. There is no reason to believe those deficiencies are limited to sites outside of Illinois; indeed, as noted, one facility where USEPA found those deficiencies is the Waukegan plant. Until IEPA fulfills the critical oversight role assigned to it by the Coal Ash Pollution Prevention Act and Part 845, namely, it has reviewed and approved groundwater monitoring programs for Hennepin and Duck Creek, **ASDs for those sites should be denied**.

IEPA should also deny the ASD for Hennepin because site-specific concerns identified by IEPA underscore the inadequacy of groundwater monitoring at that site. In evaluating Dynegy's operating permit application for Hennepin, IEPA identified flaws in the hydrogeologic

site characterization for the Old West Ash Pond ("OWAP") and Old West Polishing Pond ("OWPP"), which make up the West Ash Pond System at the site.[13] Specifically, IEPA noted that the hydrogeologic site characterization fails to adequately identify potential migration pathways and does not include seasonal and temporal fluctuations in groundwater flow.[14]

Commenters reserve the right to provide additional comment on these or any other ASDs for Hennepin or Duck Creek once approved groundwater monitoring systems, set out in IEPA-approved operating permits, are in place.

Thank you kindly for taking these comments into consideration.

---

In response to Tim's question below, I would assume we should invite Mike Brown? My understanding is he's supposed to become fully knowledgeable about the CCR program, so he may as well be shoved into the deep end of the CCRSI. Maybe when the full extent of CCR is more obvious to him, additional staff for all the other duties we have won't be such a bad idea.

Re: Response to Violation Notice No. W-2023-50186 (Settlement Confidential Communication)

Dear Mr. Bejster:

I write on behalf of Electric Energy, Inc. ("EEI") pursuant to 415 ILCS 5/31 and in response to the above-referenced Illinois Environmental Protection Agency ("IEPA" or the "Agency") violation notice ("VN"), received by EEI on October 16, 2023.

While EEI does not agree with the violations alleged in the notice, it nonetheless wishes to come to a mutually agreeable resolution of the VN with the Agency. Accordingly, below EEI explains why the violations alleged in the VN are without merit, but also proposes terms for a compliance commitment agreement ("CCA") with the Agency to address and resolve the VN allegations.

## Background

The VN alleges violations of the 35 Ill. Admin. Code 845.600(a) Groundwater Protection Standards ("GWPS") for boron, arsenic, lead, cobalt and pH. It also alleges violations of 415 ILCS 5/12(a) and the groundwater quality standards ("GWQSs") in 35 Ill. Admin. Code 620.410(a) and (e) for boron, pH, lead and iron. The alleged violations are based on sampling conducted as part of Joppa Power Station East Ash Pond's ("Joppa EAP's") Supplemental Site Investigation to assess the nature, degree and extent of boron groundwater impacts downgradient of the Joppa EAP.

EEI submitted an operating permit application for the Joppa EAP, including a proposed groundwater monitoring plan, to IEPA on October 25, 2021. The groundwater monitoring plan identifies a network of 14 monitoring wells (two background and 12 downgradient) to be used to monitor for exceedances of the 845.600(a) GWPSs at the Joppa EAP waste boundary. *See* October 21, 2021 Operating Permit Application for Joppa East Ash Pond, Attachment I (Groundwater Monitoring Plant) at Table 2-1. The downgradient wells in the monitoring

Electronic Filing: Received, Clerk's Office 06/20/2024

network are G03, G05, G06, G07, G08, G09, G10, G11, G51D, G52D, G53D, and G54D (the "waste boundary wells"). These monitoring wells are not the subject of the VN.

In its operating permit application, EEI also identified historical levels of boron above the GWPSs at the waste boundary of the Joppa EAP. Evidence indicated that the Joppa EAP could be contributing to those exceedances. Thus, while Joppa EAP does not yet have an approved Part 845 groundwater monitoring program, EEI started taking steps proactively to address the boron exceedances, including the completion of a Supplemental Site Investigation to characterize the nature and extent of the release and by providing notice to persons who own or reside on land directly overlying any part of the plume, consistent with 845.650(d)(1) and (2). As part of the Supplemental Site Investigation, EEI installed 31 additional monitoring wells to help define the boron plume (the "delineation wells"). It also installed two observation wells and a pumping well to facilitate aquifer pump testing within the upper aquifer. The allegations in the VN relate to samples taken from the delineation wells.

Additionally, while Joppa EAP's operating permit (including an approved groundwater monitoring plan) has not yet been issued, in May of 2023, EEI commenced quarterly sampling for exceedances of the 845.600(a) GWPSs, in accordance with the groundwater monitoring plan submitted with its operating permit application. This sampling found exceedances of the GWPS for boron at waste boundary wells G06, G07, G08, G09 and G10. It also found exceedances of the GWPS for cobalt at well G05 and the GWPS for pH at wells G11 and G51D. On October 21, 2023, EEI submitted an alternative source demonstration, in accordance with 35 Ill Admin. Code 845.650(e), demonstrating that the cobalt and pH contamination was caused by a source other than the Joppa EAP and that the Joppa EAP did not contribute to those exceedances.

For the boron exceedances, as discussed above, EEI has already begun taking and continues to take actions to investigate and address downgradient boron impacts in accordance with 35 Ill Admin. Code 845.650, .660, .670, and .680(a)(3).

## I. The Alleged Violations Are Without Merit

### a. Part 845 Allegations

As explained below, the alleged violations of 35 Ill. Admin. Code 845.600(a) in the VN are without merit

First, 35 Ill. Admin. Code 845.600(a) does not apply to the delineation wells. The GWPSs apply "at the waste boundary" of a CCR surface impoundment. 35 Ill Admin Code 845.600(a)(1) ("The groundwater protection standards at the waste boundary must be . . ."). The delineation wells are not indicative of or meant to monitor conditions at the waste boundary of the Joppa EAP. The only wells fitting that description are the waste boundary wells. All of the

Electronic Filing: Received, Clerk's Office 06/20/2024

wells for which violations are alleged in the VN are delineation wells. Because 845.600(a) does not apply to those wells, any allegation of a violation of 845.600(a) in the VN is without merit.

Second, the mere existence of an exceedance of the GWPSs in 35 Ill Admin. Code 845.600(a) does not trigger a violation of that provision (or any other provision of 35 Ill. Admin. Code Part 845 for that matter). Again, 845.600(a) sets forth GWPSs that apply at the waste boundaries for existing and inactive CCR surface impoundments. 35 Ill. Admin. Code 845.600(a). No provision of Part 845, including 845.600(a), includes a prohibition against being in exceedance of the GWPSs, or otherwise states that finding or contributing to an exceedance of those standards by itself triggers a violation of law. Rather, if a CCR surface impoundment is contributing to an exceedance of the GWPSs at the waste boundary of a CCR surface impoundment, it triggers additional requirements under Part 845, such as (1) notifying the Agency of the exceedance and posting that notification in the facility's operating record; (2) characterizing the nature and extent of the release; (3) notifying persons who own or reside on the land that overlies any plume contamination; (4) initiating and performing an assessment of corrective measures; and (5) implementing a corrective action plan. Failure to engage in these additional requirements when triggered could be a violation of Part 845 but merely exceeding the GWPSs is not.

Finally, EEI has started taking steps consistent with Part 845 to address exceedances. As noted above, boron exceedances were found at the waste boundary of the Joppa EAP. EEI has been and continues to investigate and address this boron contamination, including by delineating the plume and notifying persons who own or reside on land overlying that plume. For cobalt and pH exceedances found at the waste boundary, EEI submitted an alternative source demonstration indicating another source is the cause of that contamination and that the Joppa EAP did not contribute to it. Evidence gathered by EEI demonstrates that cobalt contamination at the waste boundary is from naturally occurring cobalt in soil and that pH exceedances at the waste boundary are consistent with iron oxidization. The other 845.600(a) exceedances alleged in the VN are for arsenic and lead. However, sampling at the Joppa EAP waste boundary did not find any arsenic or lead exceedances. This is evidence that the Joppa EAP is not responsible for or contributing to arsenic or lead contamination in the delineation wells.

In conclusion, there is no such thing as a "violation" of the GWPSs in 845.600(a). Rather, an exceedance of a GWPS at a waste boundary monitoring well triggers additional actions that an owner/operator must undertake to address the exceedance. A GWPS exceedance at a delineation well, such as those identified in the VN, therefore, triggers no violation of Part 845 or any additional requirements under Part 845. EEI has been and continues to comply with its obligations to investigate and address any exceedances.

**b. <u>415 ILCS 5/12(a) and 35 Ill. Adm. Code 620.410(a) and (e) Allegations</u>**

Electronic Filing: Received, Clerk's Office 06/20/2024

The alleged violations of 415 ILCS 5/12(a)[1] and 35 Ill. Admin. Code 620.410(a) and (e) are also without merit.

First, as IEPA explained during the course of the Part 845 rulemaking proceeding, for constituents that have GWPSs under Part 845, the GWQSs in 35 Ill. Admin. Code 620.410 do not apply until the end of the Part 845 post-closure care period. *See e.g*. IEPA's Response to Illinois Pollution Control Board's Prefiled Questions at 48 (Aug. 3, 2020), *In the Matter of: Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments: Proposed new 35 Ill. Adm. Code 845*, R2020-19 ("Part 845 must be applied first for any constituent with a GWPS. For any constituent which has no GWPS, and after the active life of a CCR surface impoundment as defined by Part 845, the requirements of Part 620 are applicable."); Hrg. Transcript at 28-30 (Aug. 13, 2020, *In the Matter of: Standards for the Disposal of Coal Combustion Residuals in Surface Impoundments: Proposed new 35 Ill. Adm. Code 845,* R2020-19 ("Q. Let's use an example. Boron. There's a GWPS under 845 for boron, correct? A: right. Q: And there's also a corresponding GWQS under Part [620] for boron, correct? A: Correct. Q: So for boron, are the corresponding Part 620 standards applicable during the active life of a CCR surface impoundment? A: No, they're not. Q: And can you give me an example of a constituent where the Part 620 standards would be applicable during the active life of a CCR surface impoundment? A: An example would be nitrate.").

From a practical perspective, this makes sense. Under Part 845, the owner or operator of a CCR surface impoundment will already have an obligation to investigate and take corrective action to remedy contamination of an 845.600(a) constituent to which a CCR surface impoundment is contributing. It makes little sense to have dueling cleanup regimes in place.[2] Notably, 845.600(c) prohibits an owner or operator of a CCR surface impoundment from obtaining an alternative standard under Part 620.450(a)(4), which is available to constituents with a GWQS, for any constituent with a GWPS before the end of post-closure care under Section 845.780. This further supports the idea that Part 620 requirements are superseded for overlapping constituents while a unit is undergoing Part 845 closure and post-closure care.

The VN alleges violations of Part 620 GWPSs for boron, pH, lead and iron. All of these constituents, other than iron, have Part 845 GWPSs and thus, the Part 620 standards do not apply to those constituents (other than iron) while the Joppa EAP is subject to Part 845.

---

[1] Given that the VN groups the allegation of violation of Section 12(a) of the Act together with the violations of 35 Ill. Admin. Code 620.410(a) and (e) without further detail, EEI assumes the Agency's allegations of Section 12(a) violations are based upon the alleged exceedances of the GWQSs in 620.410(a) and (e).

[2] Absent agreement from the Agency, CCR surface impoundments with exceedances of GWPS will likely have to apply for groundwater management zones to avoid situations like this creating an administrative quagmire for all parties.

Electronic Filing: Received, Clerk's Office 06/20/2024

Second, for each of the constituents for which a violation of the GWQSs is alleged, the alleged exceedance(s) are either (1) already being addressed, (2) not supported by the evidence, and/or (3) not being caused by the Joppa Power Plant. Below each constituent is addressed, in turn.

Boron

The GWQS for boron, 2.0 mg/L, is the same as the GWPS for boron. The boron exceedances identified in the VN are already being addressed through additional investigation and corrective actions under Part 845. As noted above, EEI has already conducted a Supplemental Site Investigation (the results of which were used by IEPA as the basis for their VN) to characterize the nature and extent of the boron contamination downgradient of the Joppa EAP. EEI has also begun to evaluate the use of an extraction well system as a corrective action to address the boron impacts identified in the Supplemental Site Investigation. EEI will continue to investigate, plan and implement corrective action to address the boron exceedances identified in the VN, in accordance with Part 845.

pH

The prohibition against exceedances of GWQSs located in 35 Ill. Admin. Code 620.405 provides "no person shall cause, threaten or allow the release of any contaminant to groundwater so as to *cause* a GWQS set forth in this Subpart to be exceeded." (emphasis added). Section 620.410 further states that the GWQS apply "except due to natural causes." Thus, a person cannot be in violation of the water quality standards unless they caused the exceedance and the exceedance is the result of something other than natural causes.

Both the GWPSs and GWQSs set a pH range of 6.5 - 9.0 units. The alternative source demonstration conducted for the Joppa EAP demonstrated that the Joppa EAP is not the source of pH exceedances in the waste boundary wells and that the Joppa EAP did not contribute to that contamination. The Joppa EAP is also not the cause of pH exceedances identified in the delineation wells. Based on the location of the delineation wells, additional data collected as part of the Supplemental Site Investigation, and the lines of evidence within the alternative source demonstration dated October 21, 2023, the Joppa EAP is not the cause of the pH exceedances of the GWQSs and the exceedances are from natural causes.

Lead

First, an exceedance of the GWQS for lead was found only in one well (G13S) and only in one (January 2023) out of four total sampling events included in the Supplemental Site Investigation. One sample result is not reliable evidence of an exceedance. In the other three sampling events at well G13S, not only were lead concentrations below the 0.0075 mg/L GWQS,

Electronic Filing: Received, Clerk's Office 06/20/2024

lead was not even detected at concentrations above the reporting levels.[3] Additionally, sampling at the waste boundary of the Joppa EAP did not identify any exceedances of the 0.0075 mg/L lead standard. Thus, there is no evidence of an ongoing exceedance of lead at G13S in need of corrective action, with the one-time exceedance being a statistical outlier unrelated to the Joppa EAP or the Joppa Power Plant.

Iron

Similar to lead, an exceedance of the GWQS for iron was found only in one well (G24D) and in one (November 2022) out of two total sampling events. Again, one sample result is not reliable evidence of an exceedance. Significantly, the most recent sampling event at well G24D did not show an exceedance of the 5.0 mg/L GWQS for iron. Thus, there is no evidence of an ongoing iron exceedance in need of corrective action.

Additionally, the Joppa Power Plant did not cause the iron exceedance found in delineation well G24D. This is evidenced by the location of this well and concentrations of iron found in upgradient wells. G24D is one of the most distant monitoring wells from the Joppa EAP and the Joppa facility property boundary. The well is bounded vertically above by well G24S (which has iron concentrations less than 0.2 mg/L) and is bounded laterally to the west, northwest, and north-northeast by seven delineation wells that all have iron concentrations below the GWQS. Rather, the source of the iron exceedance in that well is entirely from natural causes

**Proposed Compliance Commitment Agreement**

As noted above, while EEI does not agree with the violations alleged by IEPA, it would like to amicably resolve the allegations in the VN. Thus, EEI proposes the following terms for a CCA with the Agency.

1. Investigation activities

    a. EEI will continue to conduct monitoring under 35 Ill. Admin. Code section 845.650(b) in accordance with the proposed groundwater monitoring plan and sampling methodologies provided in the operating permit application for the Joppa East Ash Pond, until it receives an approved operating permit under 35 Ill. Admin. Code Part 845. After that time, it will conduct monitoring in accordance with its approved Part 845 operating permit.

[3] The groundwater protection standard for lead under 845.600(a) is also 0.0075 mg/L. Reporting limits for the four completed water quality samples in the Supplemental Site Investigation ranged from <0.001 to <0.005mg/L.

Electronic Filing: Received, Clerk's Office 06/20/2024

ArentFox Schiff

November 30, 2023

b. In Q1 2024, EEI will conduct an additional round of monitoring of the following 16 delineation monitoring wells as part of its characterization of the nature and extent of the boron release consistent with 35 Ill. Admin. Code 845.650(d)(1): G12S, G12D, G13S, G13D, G16S, G18S, G19S, G19D, G20S, G20D, G21S, G21D, G22S, G22D, G23S, and G24S.

c. EEI will complete its assessment of corrective measures for boron exceedances in accordance with 35 Ill. Admin. Code 845.660, including but not limited to assessing the extraction well system for treating groundwater.

2. Corrective action planning and implementation

a. By year-end 2024, EEI will start operation of the extraction well system as a preliminary corrective action to address boron exceedances.

b. EEI will submit a corrective action plan in accordance with 35 Ill Admin. Code 845.670 to address boron exceedances and implement the corrective action plan in accordance with 845.680.

c. In any instance where results of monitoring conducted in accordance with the Joppa EAP's applicable groundwater monitoring plan (i.e. the groundwater monitoring plan included with the Joppa East Ash Pond's operating permit application or, after Joppa East Ash Pond receives an operating permit, the monitoring plan implemented in accordance with that permit) indicate an exceedance of the 35 Ill Admin. Code 845.600(a) groundwater protection standards at the waste boundary, EEI will commence with the additional steps required under 35 Ill. Admin. Code sections 845.650(d), 845.650(e), 845.660, 845.670 and 845.680(a).

EEI believes its proposed CCA elements address the violations alleged in the VN and are consistent with the recommendations provided by IEPA. Pursuant to 415 ILCS 5/31(a)(2), EEI requests a meeting with IEPA regarding the VN. EEI looks forward to discussing its proposed CCA elements with IEPA and reaching an amicable resolution of the VN.

Please contact me at (312)258-5605 or via email (bina.joshi@afslaw.com) should you have any questions and to facilitate further discussions.

**From:** Garee, Matthew J.
**To:** Hunt, Lauren
**Subject:** Duck Creek ASD Draft
**Date:** Thursday, November 30, 2023 4:02:04 PM
**Attachments:** Draft ASD Duck Creek NonConcurrence letter Dec 2023.docx

---

Good afternoon Lauren,

I have attached the ASD letter draft. The two main items of concern were the lack of data provided to characterize the CCR and the peat that was cited as the potential alternative source. Only data for CCR characterization was data collected from one well located in the southwest corner of the impoundment. No data was provided from the peat unit that they identified as the alternate source. I do have a question as far as their first line of evidence relating to the CCR impoundment liner. Since the liner appears to have been in use at the site since the pond has been in place would be take that into account, or would it not matter since they still didn't provide us with proper data?

Thanks,

Matthew J. Garee

Re: Duck Creek Power Plant GMF Pond – W0578010001-04
Alternative Source Demonstration Submittal

Dear Ms. Tickner:

The purpose of this correspondence is to notify you that the Illinois Environmental Protection Agency (Illinois EPA) does not concur with the Duck Creek GMF Pond Alternative Source Demonstration (ASD) dated November 11, 2023. The Illinois EPA does not concur due to the following data gaps:

1. Source characterization of the CCR at the GMF Pond must include total solids sampling in accordance with SW846.
2. Characterization to include sample and analysis in accordance with 35 IAC 845.640 of alternative source must be provided with the ASD.

If you have any questions, please contact: Matthew Garee Illinois EPA, Bureau of Water, PWS #13, P.O. Box 19276, Springfield, Illinois 62794-9276. If you have any questions concerning the investigation described above, please call 217-782-1020.

Re: Illinois Power Resources Generating, LLC
Duck Creek Power Plant
NPDES Permit No. IL0055620
Bureau ID: W0578010001
Final Permit (after public notice)

Dear Permittee:

The Illinois Environmental Protection Agency has reviewed the request for modification of the above-referenced NPDES Permit and issued a public notice based on that request. The final decision of the Agency is to modify the Permit as follows:

1. Monitoring for Chromium and Nickel has been removed from Outfall 001 and Special Condition 13 referring to the Chromium and Nickel monitoring has been removed from the permit.

2. Special Condition 8 has been removed from the permit and the special conditions below it have been renumbered.

3. The 30-day average concentration limit for Boron at Outfall 002 has been changed to 7.6 mg/L.

Enclosed is a copy of the modified Permit. You have the right to appeal this modification to the Illinois Pollution Control Board within a 35 day period following the modification date shown on the first page of the permit.

Should you have questions concerning the Permit, please contact Mark E. Liska at 217/782-0610.

Sincerely,

Darin E. LeCrone, P.E.

Modified(NPDES) Permit

Expiration Date: February 28, 2027

Issue Date: February 15, 2022
Effective Date: March 1, 2022
Modification Date: November 08, 2023

Name and Address of Permittee:

Illinois Power Resources Generating, LLC
17751 North Cilco Road
Canton, IL 61520

Name and Address of Facility:

Duck Creek Power Plant
17751 North Cilco Road
Canton, IL 61520
(Fulton County)

| Discharge Number and Name: | Receiving Waters: |
|---|---|
| 001 Dam Seepage Collection System | Duck Creek tributary to Illinois River |
| 002 Cooling Pond Overflow (at EL 565.0) | Duck Creek tributary to Illinois River |
| 004 Cooling Pond Overflow (at EL 562.5) | Illinois River |

In compliance with the provisions of the Illinois Environmental Protection Act, Title 35 of Ill. Adm. Code, Subtitle C and/or Subtitle D, Chapter 1, and the Clean Water Act (CWA), the above-named permittee is hereby authorized to discharge at the above location to the above-named receiving stream in accordance with the standard conditions and attachments herein.

Permittee is not authorized to discharge after the above expiration date. In order to receive authorization to discharge beyond the expiration date, the permittee shall submit the proper application as required by the Illinois Environmental Protection Agency (IEPA) not later than 180 days prior to the expiration date.

Modification Date: November 08, 2023

NPDES Permit No. IL0055620

Effluent Limitations and Monitoring

1. From the modification date of this permit until the expiration date, the effluent of the following discharge(s) shall be monitored and limited at all times as follows:

| PARAMETER | LOAD LIMITS lbs/day DAF (DMF) 30 DAY AVERAGE | LOAD LIMITS lbs/day DAF (DMF) DAILY MAXIMUM | CONCENTRATION LIMITS mg/L 30 DAY AVERAGE | CONCENTRATION LIMITS mg/L DAILY MAXIMUM | SAMPLE FREQUENCY | SAMPLE TYPE |
|---|---|---|---|---|---|---|
| Outfall 001 – Dam Seepage Collection System (DAF = 0.038 MGD) | | | | | | |
| Flow (MGD) | See Special Condition 1. | | | | Measure When Discharging | |
| pH | | | | Monitor Only | 1/Month | Grab |
| Total Suspended Solids | | | | Monitor Only | 1/Month | Grab |
| Iron (Total) | | | | Monitor Only | 1/Month | Grab |
| Boron | | | 7.6 | Monitor Only | 1/Month | Grab |

Outfall 002 – Cooling Pond Overflow (at EL. 565.0)
(Intermittent Discharge – See Special Condition 13)

The discharge consists of :

1. Coal Pile & Limestone Storage Area Runoff
2. Station Yard and Roof Drainage & Stormwater Runoff
3. GMF System Unwaters/Dewaters
4. Cooling Pond Dewatering (Intermittent)

| | | | | | | |
|---|---|---|---|---|---|---|
| Flow (MGD) | See Special Condition 1. | | | | Measure When Discharging | |

| Boron* | | | | Monitor Only | 1/Month | Grab |
| Mercury** | | | Report | 0.000012*** | 1/Month | Grab |
| Ammonia | | | 3.0 | 6.0 | 1/Month | Grab |

*See Special Condition 11.
** See Special Condition 10.
***This is an annual average.

Special Conditions

SPECIAL CONDITION 1. Flow shall be measured in units of Million Gallons per Day (MGD) and reported as a monthly average and a daily maximum on the monthly Discharge Monitoring Report.

SPECIAL CONDITION 2. The pH shall be in the range 6.0 to 9.0. The monthly minimum and monthly maximum values shall be reported on the DMR form.

SPECIAL CONDITION 3. Samples taken in compliance with the effluent monitoring requirements shall be taken at a point representative of the discharge, but prior to entry into the receiving stream.

SPECIAL CONDITION 4. If an applicable effluent standard or limitation is promulgated under Sections 301(b)(2)(C) and (D), 304(b)(2), and 307(a)(2) of the Clean Water Act and that effluent standard or limitation is more stringent than any effluent limitation in the permit or controls a pollutant not limited in the NPDES Permit, the Agency shall revise or modify the permit in accordance with the more stringent standard or prohibition and shall so notify the permittee.

SPECIAL CONDITION 5. The Permittee shall record monitoring results on Discharge Monitoring Report (DMR) electronic forms using one such form for each outfall each month.

In the event that an outfall does not discharge during a monthly reporting period, the DMR Form shall be submitted with no discharge indicated.

The Permittee is required to submit electronic DMRs (NetDMRs) instead of mailing paper DMRs to the IEPA unless a waiver has been granted by the Agency. More information, including registration information for the NetDMR program, can be obtained on the IEPA website, https://www2.illinois.gov/epa/topics/water-quality/surface-water/netdmr/Pages/quick-answer-guide.aspx.

The completed Discharge Monitoring Report forms shall be submitted to IEPA no later than the 25th day of the following month, unless otherwise specified by the permitting authority.

Permittees that have been granted a waiver shall mail Discharge Monitoring Reports with an original signature to the IEPA at the following address:

Illinois Environmental Protection Agency
Division of Water Pollution Control
Attention: Compliance Assurance Section, Mail Code # 19
1021 North Grand Avenue East
Post Office Box 19276
Springfield, Illinois 62794-9276

SPECIAL CONDITION 6. The Agency has determined that the effluent limitations in this permit constitute BAT/BCT for storm water which is treated in the existing treatment facilities for purposes of this permit reissuance, and no pollution prevention plan will be required for such storm water. In addition to the chemical specific monitoring required elsewhere in this permit, the permittee shall conduct an annual inspection of the facility site to identify areas contributing to a storm water discharge associated with industrial activity, and determine whether any facility modifications have occurred which result in previously-treated storm water discharges no longer receiving treatment. If any such discharges are identified the permittee shall request a modification of this permit within 30 days after the inspection. Records of the annual inspection shall be retained by the permittee for the term of this permit and be made available to the Agency on request.

SPECIAL CONDITION 7. There shall be no discharge of polychlorinated biphenyl compounds such as those commonly used for transformer fluid.

SPECIAL CONDITION 8. This permit may be modified to include different final effluent limitations or requirements which are consistent with applicable laws, regulations, or judicial orders. The Agency will public notice the permit modification. Should the permittee wish to discharge chemical metal cleaning wastes to waters of the state, the permittee shall submit to the Agency an application indicating such intention. The Agency may then issue a modified permit, following public notice and opportunity for public comment.

SPECIAL CONDITION 9. Proper operation and maintenance - the permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance includes effective performance, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of back-up, or auxiliary facilities, or similar systems which are installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

SPECIAL CONDITION 10. All samples for mercury must be analyzed by EPA Method 1631E using the digestion procedure described in Section 11.1.1.2 of 1631E, which dictates that samples must be heated at 50°C for 6 hours in a bromine chloride (BrCl) solution in closed vessels.

SPECIAL CONDITION 11. Allowed mixing is recognized for boron at outfall 004 extending 497 feet downstream. Within the allowed mixing, 20.9:1 dilution is afforded.

Special Conditions

SPECIAL CONDITION 12. The Permittee shall monitor the effluent from Outfall 002 for the following parameters on a 2/year basis. This Permit may be modified with public notice to establish effluent limitations if appropriate, based on information obtained through sampling. The sample shall be a grab except as otherwise specifically provided below and the results shall be submitted on the DMR's to IEPA. The parameters to be sampled and the minimum reporting limits to be attained are as follows:

| STORET CODE | PARAMETER | Minimum reporting limit |
|---|---|---|
| 10197 | Antimony | 5.0 ug/L |
| 01002 | Arsenic | 0.05 mg/L |
| 01007 | Barium | 0.5 mg/L |
| 01027 | Cadmium | 0.001 mg/L |
| 01032 | Chromium (hexavalent) | 0.01 mg/L |
| 01034 | Chromium (total) | 0.05 mg/L |
| 01042 | Copper | 0.005 mg/L |
| 00718 | Cyanide (weak acid dissociable) | 5.0 ug/L |
| 00720 | Cyanide | 5.0 ug/L |
| 00951 | Fluoride | 0.1 mg/L |
| 01045 | Iron (total) | 0.5 mg/L |
| 01046 | Iron (Dissolved) | 0.5 mg/L |
| 01051 | Lead | 0.05 mg/L |
| 01055 | Manganese | 0.5 mg/L |
| 01067 | Nickel | 0.005 mg/L |
| 32730 | Phenols | 0.005 mg/L |
| 01147 | Selenium | 0.005 mg/L |
| 01077 | Silver (total) | 0.003 mg/L |
| 10159 | Thallium | 5.0 ug/L |
| 01092 | Zinc | 0.025 mg/L |

Unless otherwise indicated, concentrations refer to the total amount of the constituent present in all phases, whether solid, suspended or dissolved, elemental or combined, including all oxidation states.

Electronic Filing: Received, Clerk's Office 06/20/2024

## Attachment H

## Standard Conditions

### Definitions

**Act** means the Illinois Environmental Protection Act, 415 ILCS 5 as Amended.

**Agency** means the Illinois Environmental Protection Agency.

**Board** means the Illinois Pollution Control Board.

**Clean Water Act** (formerly referred to as the Federal Water Pollution Control Act) means Pub. L. 92-500, as amended. 33 U.S.C. 1251 et seq.

**NPDES** (National Pollutant Discharge Elimination System) means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Sections 307, 402, 318 and 405 of the Clean Water Act.

**USEPA** means the United States Environmental Protection Agency.

**Daily Discharge** means the discharge of a pollutant measured during a calendar day or any 24-hour period that reasonably represents the calendar day for purposes of sampling. For pollutants with limitations expressed in units of mass, the "daily discharge" is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurements, the "daily discharge" is calculated as the average measurement of the pollutant over the day.

**Maximum Daily Discharge Limitation** (daily maximum) means the highest allowable daily discharge.

**Average Monthly Discharge Limitation** (30 day average) means the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

**Average Weekly Discharge Limitation** (7 day average) means the highest allowable average of daily discharges over a calendar week, calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

**Best Management Practices** (BMPs) means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the State. BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

**Aliquot** means a sample of specified volume used to make up a total composite sample.

**Grab Sample** means an individual sample of at least 100 milliliters collected at a randomly-selected time over a period not exceeding 15 minutes.

**24-Hour Composite Sample** means a combination of at least 8 sample aliquots of at least 100 milliliters, collected at periodic intervals during the operating hours of a facility over a 24-hour period.

**8-Hour Composite Sample** means a combination of at least 3 sample aliquots of at least 100 milliliters, collected at periodic intervals during the operating hours of a facility over an 8-hour period.

**Flow Proportional Composite Sample** means a combination of sample aliquots of at least 100 milliliters collected at periodic intervals such that either the time interval between each aliquot or the volume of each aliquot is proportional to either the stream flow at the time of sampling or the total stream flow since the collection of the previous aliquot.

(1) **Duty to comply**. The permittee must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of the Act and is grounds for enforcement action, permit termination, revocation and reissuance, modification, or for denial of a permit renewal application. The permittee shall comply with effluent standards or prohibitions established under Section 307(a) of the Clean Water Act for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if the permit has not yet been modified to incorporate the requirements.

(2) **Duty to reapply**. If the permittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the permittee must apply for and obtain a new permit. If the permittee submits a proper application as required by the Agency no later than 180 days prior to the expiration date, this permit shall continue in full force and effect until the final Agency decision on the application has been made.

(3) **Need to halt or reduce activity not a defense**. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

(4) **Duty to mitigate**. The permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

(5) **Proper operation and maintenance**. The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with conditions of this permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of back-up, or auxiliary facilities, or similar systems only when necessary to achieve compliance with the conditions of the permit.

(6) **Permit actions**. This permit may be modified, revoked and reissued, or terminated for cause by the Agency pursuant to 40 CFR 122.62 and 40 CFR 122.63. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance, does not stay any permit condition.

(7) **Property rights**. This permit does not convey any property rights of any sort, or any exclusive privilege.

(8) **Duty to provide information**. The permittee shall furnish to the Agency within a reasonable time, any information which the Agency may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit, or to determine compliance with the permit. The permittee shall also furnish to the Agency upon request, copies of records required to be kept by this permit.

(9) **Inspection and entry**. The permittee shall allow an authorized representative of the Agency or USEPA (including an authorized contractor acting as a representative of the Agency or USEPA), upon the presentation of credentials and other documents as may be required by law, to:

(a) Enter upon the permittee's premises where a regulated facility or activity is located or conducted, or where records

Electronic Filing: Received, Clerk's Office 06/20/2024

must be kept under the conditions of this permit;
(b) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit;
(c) Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and
(d) Sample or monitor at reasonable times, for the purpose of assuring permit compliance, or as otherwise authorized by the Act, any substances or parameters at any location.

(10) **Monitoring and records.**
(a) Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.
(b) The permittee shall retain records of all monitoring information, including all calibration and maintenance records, and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of this permit, measurement, report or application. Records related to the permittee's sewage sludge use and disposal activities shall be retained for a period of at least five years (or longer as required by 40 CFR Part 503). This period may be extended by request of the Agency or USEPA at any time.
(c) Records of monitoring information shall include:
(1) The date, exact place, and time of sampling or measurements;
(2) The individual(s) who performed the sampling or measurements;
(3) The date(s) analyses were performed;
(4) The individual(s) who performed the analyses;
(5) The analytical techniques or methods used; and
(6) The results of such analyses.
(d) Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit. Where no test procedure under 40 CFR Part 136 has been approved, the permittee must submit to the Agency a test method for approval. The permittee shall calibrate and perform maintenance procedures on all monitoring and analytical instrumentation at intervals to ensure accuracy of measurements.

(11) **Signatory requirement.** All applications, reports or information submitted to the Agency shall be signed and certified.
(a) **Application.** All permit applications shall be signed as follows:
(1) For a corporation: by a principal executive officer of at least the level of vice president or a person or position having overall responsibility for environmental matters for the corporation:
(2) For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or
(3) For a municipality, State, Federal, or other public agency: by either a principal executive officer or ranking elected official.
(b) **Reports.** All reports required by permits, or other information requested by the Agency shall be signed by a person described in paragraph (a) or by a duly authorized representative of that person. A person is a duly authorized representative only if:
(1) The authorization is made in writing by a person described in paragraph (a); and
(2) The authorization specifies either an individual or a position responsible for the overall operation of the facility, from which the discharge originates, such as a plant manager, superintendent or person of equivalent responsibility; and
(3) The written authorization is submitted to the Agency.
(c) **Changes of Authorization.** If an authorization under (b) is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of (b) must be submitted to the Agency prior to or together with any reports, information, or applications to be signed by an authorized representative.
(d) **Certification.** Any person signing a document under paragraph (a) or (b) of this section shall make the following certification:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

(12) **Reporting requirements.**
(a) **Planned changes.** The permittee shall give notice to the Agency as soon as possible of any planned physical alterations or additions to the permitted facility.
Notice is required when:
(1) The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source pursuant to 40 CFR 122.29 (b); or
(2) The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in the permit, nor to notification requirements pursuant to 40 CFR 122.42 (a)(1).
(3) The alteration or addition results in a significant change in the permittee's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan.
(b) **Anticipated noncompliance.** The permittee shall give advance notice to the Agency of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.
(c) **Transfers.** This permit is not transferable to any person except after notice to the Agency.
(d) **Compliance schedules.** Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit shall be submitted no later than 14 days following each schedule date.
(e) **Monitoring reports.** Monitoring results shall be reported at the intervals specified elsewhere in this permit.
(1) Monitoring results must be reported on a Discharge Monitoring Report (DMR).

Electronic Filing: Received, Clerk's Office 06/20/2024

(2) If the permittee monitors any pollutant more frequently than required by the permit, using test procedures approved under 40 CFR 136 or as specified in the permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR.

(3) Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified by the Agency in the permit.

(f) **Twenty-four hour reporting.** The permittee shall report any noncompliance which may endanger health or the environment. Any information shall be provided orally within 24-hours from the time the permittee becomes aware of the circumstances. A written submission shall also be provided within 5 days of the time the permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and time; and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. The following shall be included as information which must be reported within 24-hours:

(1) Any unanticipated bypass which exceeds any effluent limitation in the permit.

(2) Any upset which exceeds any effluent limitation in the permit.

(3) Violation of a maximum daily discharge limitation for any of the pollutants listed by the Agency in the permit or any pollutant which may endanger health or the environment.

The Agency may waive the written report on a case-by-case basis if the oral report has been received within 24-hours.

(g) **Other noncompliance.** The permittee shall report all instances of noncompliance not reported under paragraphs (12) (d), (e), or (f), at the time monitoring reports are submitted. The reports shall contain the information listed in paragraph (12) (f).

(h) **Other information.** Where the permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application, or in any report to the Agency, it shall promptly submit such facts or information.

(13) **Bypass.**

(a) Definitions.

(1) Bypass means the intentional diversion of waste streams from any portion of a treatment facility.

(2) Severe property damage means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

(b) Bypass not exceeding limitations. The permittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions of paragraphs (13)(c) and (13)(d).

(c) Notice.

(1) Anticipated bypass. If the permittee knows in advance of the need for a bypass, it shall submit prior notice, if possible at least ten days before the date of the bypass.

(2) Unanticipated bypass. The permittee shall submit notice of an unanticipated bypass as required in paragraph (12)(f) (24-hour notice).

(d) Prohibition of bypass.

(1) Bypass is prohibited, and the Agency may take enforcement action against a permittee for bypass, unless:

(i) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;

(ii) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and

(iii) The permittee submitted notices as required under paragraph (13)(c).

(2) The Agency may approve an anticipated bypass, after considering its adverse effects, if the Agency determines that it will meet the three conditions listed above in paragraph (13)(d)(1).

(14) **Upset.**

(a) Definition. Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

(b) Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph (14)(c) are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review.

(c) Conditions necessary for a demonstration of upset. A permittee who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

(1) An upset occurred and that the permittee can identify the cause(s) of the upset;

(2) The permitted facility was at the time being properly operated; and

(3) The permittee submitted notice of the upset as required in paragraph (12)(f)(2) (24-hour notice).

(4) The permittee complied with any remedial measures required under paragraph (4).

(d) Burden of proof. In any enforcement proceeding the permittee seeking to establish the occurrence of an upset has the burden of proof.

Electronic Filing: Received, Clerk's Office 06/20/2024

(15) **Transfer of permits.** Permits may be transferred by modification or automatic transfer as described below:

(a) Transfers by modification. Except as provided in paragraph (b), a permit may be transferred by the permittee to a new owner or operator only if the permit has been modified or revoked and reissued pursuant to 40 CFR 122.62 (b) (2), or a minor modification made pursuant to 40 CFR 122.63 (d), to identify the new permittee and incorporate such other requirements as may be necessary under the Clean Water Act.

(b) Automatic transfers. As an alternative to transfers under paragraph (a), any NPDES permit may be automatically transferred to a new permittee if:

(1) The current permittee notifies the Agency at least 30 days in advance of the proposed transfer date;

(2) The notice includes a written agreement between the existing and new permittees containing a specified date for transfer of permit responsibility, coverage and liability between the existing and new permittees; and

(3) The Agency does not notify the existing permittee and the proposed new permittee of its intent to modify or revoke and reissue the permit. If this notice is not received, the transfer is effective on the date specified in the agreement.

(16) All manufacturing, commercial, mining, and silvicultural dischargers must notify the Agency as soon as they know or have reason to believe:

(a) That any activity has occurred or will occur which would result in the discharge of any toxic pollutant identified under Section 307 of the Clean Water Act which is not limited in the permit, if that discharge will exceed the highest of the following notification levels:

(1) One hundred micrograms per liter (100 ug/l);

(2) Two hundred micrograms per liter (200 ug/l) for acrolein and acrylonitrile; five hundred micrograms per liter (500 ug/l) for 2,4-dinitrophenol and for 2-methyl-4,6 dinitrophenol; and one milligram per liter (1 mg/l) for antimony.

(3) Five (5) times the maximum concentration value reported for that pollutant in the NPDES permit application; or

(4) The level established by the Agency in this permit.

(b) That they have begun or expect to begin to use or manufacture as an intermediate or final product or byproduct any toxic pollutant which was not reported in the NPDES permit application.

(17) All Publicly Owned Treatment Works (POTWs) must provide adequate notice to the Agency of the following:

(a) Any new introduction of pollutants into that POTW from an indirect discharge which would be subject to Sections 301 or 306 of the Clean Water Act if it were directly discharging those pollutants; and

(b) Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of issuance of the permit.

(c) For purposes of this paragraph, adequate notice shall include information on (i) the quality and quantity of effluent introduced into the POTW, and (ii) any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW.

(18) If the permit is issued to a publicly owned or publicly regulated treatment works, the permittee shall require any industrial user of such treatment works to comply with federal requirements concerning:

(a) User charges pursuant to Section 204 (b) of the Clean Water Act, and applicable regulations appearing in 40 CFR 35;

(b) Toxic pollutant effluent standards and pretreatment standards pursuant to Section 307 of the Clean Water Act; and

(c) Inspection, monitoring and entry pursuant to Section 308 of the Clean Water Act.

(19) If an applicable standard or limitation is promulgated under Section 301(b)(2)(C) and (D), 304(b)(2), or 307(a)(2) and that effluent standard or limitation is more stringent than any effluent limitation in the permit, or controls a pollutant not limited in the permit, the permit shall be promptly modified or revoked, and reissued to conform to that effluent standard or limitation.

(20) Any authorization to construct issued to the permittee pursuant to 35 Ill. Adm. Code 309.154 is hereby incorporated by reference as a condition of this permit.

(21) The permittee shall not make any false statement, representation or certification in any application, record, report, plan or other document submitted to the Agency or the USEPA, or required to be maintained under this permit.

(22) The Clean Water Act provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Clean Water Act is subject to a civil penalty not to exceed $25,000 per day of such violation. Any person who willfully or negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318 or 405 of the Clean Water Act is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than one year, or both.
Additional penalties for violating these sections of the Clean Water Act are identified in 40 CFR 122.41 (a)(2) and (3).

(23) The Clean Water Act provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or both.

(24) The Clean Water Act provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than 6 months per violation, or by both.

(25) Collected screening, slurries, sludges, and other solids shall be disposed of in such a manner as to prevent entry of those wastes (or runoff from the wastes) into waters of the State. The proper authorization for such disposal shall be obtained from the Agency and is incorporated as part hereof by reference.

(26) In case of conflict between these standard conditions and any other condition(s) included in this permit, the other condition(s) shall govern.

(27) The permittee shall comply with, in addition to the requirements of the permit, all applicable provisions of 35 Ill. Adm. Code, Subtitle C, Subtitle D, Subtitle E, and all applicable orders of the Board or any court with jurisdiction.

(28) The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit is held invalid, the remaining provisions of this permit shall continue in full force and effect.

(Rev. 7-9-2010 bah)

Mark,

Any updates on this permit? Just want to make sure we didn't miss it in the mail.

I was in the process of leaving you a voicemail as well but my call apparently dropped.

Thanks,

Rhys Fuller

Ms. Mullenax and others,

Thank you for sending the decision letters concerning the ASDs for Newton and Baldwin. I would be grateful if you would provide IEPA's concurrence or non-concurrence with the ASD via email, as Ms. Hunt did with the Joppa non-concurrence, as I often am not in the office and will be even less so over the holidays.

Thanks in advance,
Jenny Cassel

Re: Newton Power Plant Primary Ash Pond – W079807001-01
Alternative Source Demonstration Submittal

Dear Mr. Morris:

The purpose of this correspondence is to notify you that the Illinois Environmental Protection Agency (Illinois EPA) does not concur with the Newton Primary Ash Pond Alternative Source Demonstration (ASD) dated October 6, 2023. The Illinois EPA does not concur due to the following data gaps:

1. Source characterization of the CCR at the Primary Ash Pond must include total solids sampling in accordance with SW846.
2. Hydraulic conductivities from laboratory or in-situ testing must be collected, analyzed, and presented with hydrogeologic characterization of bedrock unit.
3. Characterization to include sample and analysis in accordance with 35 IAC 845.640 of alternative source must be provided with the ASD.

If you have any questions, please contact: **Heather Mullenax** Illinois EPA, Bureau of Water, PWS #13, P.O. Box 19276, Springfield, Illinois 62794-9276. If you have any questions concerning the investigation described above, please call 217-782-1020.

Sincerely,

Michael Summers, P.G.

Hi all.
Please see attached for an example CC list for the ASDs (in the ASD letters). We are getting comments for ASDs from Earth Justice, Prairie Network and Sierra Club via email and can respond to them via email. The emails of the individuals involved are in the BOW GWS CCR email from Jenny Cassel.
Also, each of these folks will need a PDF copy from us (like the GWS person in charge of the site) when we issue the letter to the O/O.
Thanks. Lauren

Re: Duck Creek Power Plant GMF Pond – W0578010001-04
Alternative Source Demonstration Submittal

Dear Ms. Tickner:

The purpose of this correspondence is to notify you that the Illinois Environmental Protection Agency (Illinois EPA) does not concur with the Duck Creek GMF Pond Alternative Source Demonstration (ASD) dated November 11, 2023. The Illinois EPA does not concur due to the following data gaps:

1. Source characterization of the CCR at the GMF Pond must include total solids sampling in accordance with SW846.
2. Characterization to include sample and analysis in accordance with 35 IAC 845.640 of alternative source must be provided with the ASD.

If you have any questions, please contact: Matthew Garee Illinois EPA, Bureau of Water, PWS #13, P.O. Box 19276, Springfield, Illinois 62794-9276. If you have any questions concerning the investigation described above, please call 217-782-1020.

Hi all.
We need to make sure we are filing ASDs on the N Drive under GW Submittals in the Part 845 folder.
Thanks, Lauren

**Subject:** Draft ASD Duck Creek NonConcurrence letter Dec 2023.docx

Hi all.
Please see attached for an example CC list for the ASDs (in the ASD letters). We are getting comments for ASDs from Earth Justice, Prairie Network and Sierra Club via email and can respond to them via email. The emails of the individuals involved are in the BOW GWS CCR email from Jenny Cassel.
Also, each of these folks will need a PDF copy from us (like the GWS person in charge of the site) when we issue the letter to the O/O.
Thanks. Lauren

Hi Lynn.
Here is the ASD for Duck Creek for review. We need to send this out on Thursday.
Thanks, Lauren

Good morning Mike,

Here is the final draft for the Duck Creek ASD. It's ready for your signature when you get a chance. Once it's signed if you could make a PDF and send it back my way and get a hard copy to Sherry to send out I would appreciate it. Once I have the signed PDF I'll get it on the N-Drive and get it sent out to the other people cc'd.

Thanks,

Matthew J. Garee

Re: Duck Creek Power Plant GMF Pond – W0578010001-04
Alternative Source Demonstration Submittal

Dear Ms. Tickner:

The purpose of this correspondence is to notify you that the Illinois Environmental Protection Agency (Illinois EPA) does not concur with the Duck Creek GMF Pond Alternative Source Demonstration (ASD) dated November 11, 2023. The Illinois EPA does not concur due to the following data gaps:

1. Source characterization of the CCR at the GMF Pond must include total solids sampling in accordance with SW846.
2. Characterization to include sample and analysis in accordance with 35 IAC 845.640 of alternative source must be provided with the ASD.

If you have any questions, please contact: Matthew Garee Illinois EPA, Bureau of Water, PWS #13, P.O. Box 19276, Springfield, Illinois 62794-9276. If you have any questions concerning the investigation described above, please call 217-782-1020.

Sincerely,

Michael Summers, P.G.
