Chicago, IL, 60605

Submitted Via Email to Clerk Don Brown (Don.Brown@Illinois.gov)

Re: Proposed Clean Car and Truck Standards (R-2024-17)

Dear Members of the Board:

I am writing to support the adoption of all three regulations before you – the Advanced Clean Cars 2 Regulation, the Advanced Clean Trucks Regulation (ACT), and the Heavy-Duty Low NOx Omnibus Regulation. My focus for these comments is ACT, which has received some misplaced industry opposition even though it is both achievable for Illinois and clearly in the public interest. I am the former Deputy Executive Officer and Assistant Chief Counsel of the California Air Resources Board (CARB) and oversaw these same regulatory programs which are now before your consideration. Though I am speaking for myself as an independent consultant, I draw upon my nearly twenty years of environmental program design experience, including on all three rules for this comment. I respectfully urge you to join other leading states and adopt these rules.

In this letter, I hope to provide you with resources for your ongoing consideration; as you will see, the evidence strongly supports adoption. I've organized my comments by topic.

I. Availability and Pricing of Heavy-Duty Zero Emission Vehicles

The zero emission truck (ZET) market is rapidly maturing, with the bulk of sales in the U.S. in states that have already adopted ACT. If Illinois adopted the rule, it could expect significant sales increases, with resulting pollution declines. Critically, the world market as a whole is moving towards ZETs – meaning that jurisdictions that align policies to support efficient, electric, supply chains early will have a long-term advantage in logistics. As a major freight hub, Illinois has, in my view, a significant interest in beginning to move its systems towards the emerging global standard – and shedding long-term exposure to long-term diesel fuel costs.

Multiple analysts expect the long-term fuel and maintenance savings associated with zero emissions trucks to fully counterbalance their currently higher upfront costs within the decade. McKinsey projects this "total cost of ownership" (TCO) parity between 2026 and 2030. The federal National Renewable Energy Laboratory has reached similar conclusions, with lighter vehicles (like vans) reaching TCO parity or better shortly, and long-haul trucks following thereafter. The International Council on Clean Transportation (ICCT), a well-regarded expert group, projects cost parity or better by 2030. The ZEV Transition Council has helpfully compiled a long-list of expert studies, all of which generally accord. CALSTART, a multi-industry-group consortium, unsurprisingly documents considerable commercial interest, with over 17,000 ZETs already in the market as of 2023 – a steep year over year increase that has continued, with a proliferating variety of models and makes available in all vehicle classes covered by ACT.

The market has, in fact, advanced even more quickly than my former team anticipated in initial regulatory documents (I append both their initial and final analyses, along with their market and economic analyses). Indeed, manufacturers had sold 60% *more* ZETs than were needed for compliance with ACT in California over a year early. When CARB recently passed the more ambitious Advanced Clean Fleets regulation, it had good reason to be even more bullish on the path forward, as the regulatory documents demonstrate (again, I append both initial and final analyses, including an economic analysis showing very large benefits from ZETs). Staff also compiled a list of 155 different ZETs available at that time (appended); the number has grown since. U.S. EPA has also finalized a federal program that, even if modified as it may be by the current administration, is now in force and will further grow the market.

Notably, the global market is even more advanced than the U.S. market. ZET sales are racing ahead in China and India and the European Union is also seeing steady sales growth. New heavy-duty market entrants, including Windrose and Tesla are advancing the state of the art, while major trucking firms, including Daimler and Volvo, have announced their long-term commitment to a ZET-based future. Further, California's Clean Truck Partnership deal secured manufacturer commitments to continue making and selling ACT compliant vehicles regardless of federal and state regulatory changes, so the U.S. market is well assured to continue.

I will note one wrinkle. A few ACT states have recently adopted various forms of enforcement discretion in response to industry pressure as firms seek a slightly longer transition – but generally only for the largest truck classes, and for a few initial years. These flexibilities are limited, and all of these states have maintained ACT on the books as a critical medium-term direction of travel for their regulatory programs. In my view, these dynamics can largely be attributed to unfortunate pricing decisions by a few large firms who have opted to raise ZET prices in the near-term, likely to fund their long-term transitions.

These price increases are local and transient, can be addressed by state market oversight (e.g. Massachusetts recently provided some regulatory flexibility *only* if firms discontinued these tactics), and are also subject to oversight by state antitrust and unfair business practice authorities if they violate any relevant law. No wonder that governors implementing ACT responded to letters sent by environmental advocates by confirming they would stay the course. These issues will be resolved well before ACT could go into effect in Illinois, and the broad trend towards TCO parity globally – and the race by manufacturers to sell ZETs, along with ongoing multi-state oversight – will erase any current pricing variability. Neither these issues, nor the usual state-level implementation back-and-forth warrant a pause on adoption in Illinois, where years will pass before the rules take effect.

Should the Board have any remaining concerns, it also has mechanisms to address them in due course. ACT already has extensive banking and trading provisions, among other flexibilities, to support implementation. And it can also help ground a larger policy ecosystem that will increasingly take off under its own momentum as firms crowd into the space in response to regulatory certainty.

I know - as a former California official – that opponents often insist that no other state is California, but the truth is that the many other states implementing these rules have shown a clear path forward. Although I of course encourage Illinois to explore complementary policies, from indirect source rules to encourage warehouse electrification to incentive and feebate programs to support businesses, those policies are just that; complementary. The ACT program can operate well on its own, and gather further policy support over time as needed, as states across the country with a wide range of policy mixes demonstrate. The Northeastern states have long implemented these programs are rapidly moving forward and seeing their markets mature. And they are not alone: For instance, just as is proposed in the petition before you, Oregon recently adopted early action credits to manufacturers to ease the transition. This approach is tried and true: Colorado used a similar advance crediting approach to prepare its market to transition to electric cars; a few years later, its zero emission car sales have now topped California's. Illinois has ample time, ample flexibility, and ample tools to benefit from the global shift towards ZETs – and to lead it.

I reviewed opponents's comments alleging that Illinois's role as a freight hub, with bordering states, somehow obviates this analysis. That point appears to me to be entirely rhetorical. Most fleets in a given state operate *in that state* because most trucking trips are local – and serve local clients. As to long-haul trips, I can report that California, too, is a major freight hub, and does not border only ACT-adopting states. The practical reality is that ACT operates, nonetheless, to secure very substantial in-state benefits, from pollution reductions to new jobs, while the remaining trucks registered elsewhere simply continue about their business. Our federal system allows – and encourages – the states to solve problems where they can, while continuing to support our larger multi-state freight system.

Illinois has always been a crucial state to the shipping and logistics industries. If it takes advantage of this growing international market, now, by adopting ACT, it will ensure that its firms benefit, first, from the ZET TCO savings, and from attention by the large truck manufacturing companies, which focus sales efforts in ACT states. This is a chance to capture significant benefits, and to create a midwest market for the growing zero emission vehicle manufacturing industry, which may well wish to locate in Illinois to be near to new customers, along with a chance to secure a large share of the hundreds of thousands of jobs being created to construct and improve associated infrastructure. It will also, of course, save lives and realize over a billion dollars in avoided public health costs, per a recent analysis by the nonpartisan public health experts at the Clean Air Task Force.

Markets respond to regulation and this is a market ripe for change. Illinois can help shape that rapid shift to electrification to the benefit of its residents by adopting this rule, and can be assured of long-term cost savings and a growing ZET market.

II. Infrastructure Challenges are Opportunities in Disguise

Let me make an observation on one more common argument that industry lobbyists have raised in this proceeding, too – that EV infrastructure provision must be entirely solved before ACT can be adopted. The short answer is that Illinois does not, in fact, need to build everything, everywhere, all at once, as a thoughtful ICCT analysis demonstrates – indeed, a substantially greater amount of electrification than is initially required can be supported with a very focused set of investments along just 0.06% of U.S. roads. An independent CALSTART report confirms as much. Trucking activity is concentrated along a limited number of routes, meaning that focusing on key freight hubs and corridors is a highly effective strategy. The federal government adopted and extended these analyses with a recent federal infrastructure strategy that shows how this phased approach can readily meet electrification goals (summary slides lay out the case and detailed technical appendices include Illinois portions of that network that will be needed).

This is a very do-able task, especially with the leadtime Illinois will have and the growing waves of private investment entering this space in addition to public funds. Notably, ZET batteries can also serve to help balance renewable energy on the grid, and so actually help fund network expansion by acting as "virtual power plants" that can provide valuable grid services. So, the infrastructure challenge, in fact, is a major opportunity to integrate transportation electrification with Illinois's clean power goals. The two efforts mutually reinforce each other.

More generally, let me observe that this is not, in fact, a chicken-and-egg problem. Because of the phased nature of infrastructure needs, ACT implementation does *not* require a full build-out before it starts. On the contrary: adopting ACT provides investors in infrastructure, including utilities and truck companies, the certainty they need to build the network. The *first* step is setting the regulatory direction, followed by ongoing infrastructure efforts that are then supported by a growing ecosystem of investors.

III. A Word on Federal Government Activity

It is not lost on me that these programs are likely to come under federal attack – legally spurious though such potential federal administration efforts are likely to be. But this is a reason to proceed, not to pause. Twice now, despite the threat of legal uncertainty, vehicle companies have come to the table to *contractually* agree with the states to continue progress (a recent published article of mine describes this history). First in the light-duty-vehicle Framework Agreements during the first Trump Administration, and then in the truck partnership I noted above a few years ago, manufacturers have recognized their long term interest in a more certain path to electrification. I expect the same pattern to recur now, as manufacturers have invested billions into their zero emission vehicle production plans, and will not be able (or desire) to reverse course in light of growing global competition.

But it is states that have *adopted* these rules that benefit most directly from these deals, because it is those states that have the long-term leverage to bring companies to the table. The

Section 177 states are able to protect their publics from federal rollbacks by forging their own deals with companies – which view them as stable, reliable, market places for zero emission vehicles, and are willing to engage in long-term compliance relationships. If Illinois adopts the rules, it will join this group. If it does not, it will remain at the mercy of federal regulators, who seem entirely ready to attempt to deny it the benefits of electrification. Rule adoption is the right move to manage federal uncertainty – it allows Illinois to shape its own fate.

IV. Conclusion

One of the opposing commenters likened adopting ACT to hopping on a moving train. In fact, the real risk here is being left at the station. As the global economy accelerates towards a ZET-based future, Illinois can best protect its air, its economy, and its critical role in the U.S. logistics system by adopting ACT (and the companion rules being considered) to ensure its participation as a full partner in the electrification shift already underway. I respectfully urge you to approve the rules.

Sincerely,

/s/ Craig Holt Segall

Can zero-emission trucks become viable–and what will it take to boost adoption?

March 3, 2025 | Article

By Dilip Bhattacharjee and Moritz Rittstieg
with Cross Pagano and Saral Chauhan

The total cost of ownership for zero-emission trucks remains significantly higher than for internal combustion engine ones. Closing this gap could boost the transition to zero-emission truck fleets.

DOWNLOADS

Article (10 pages)

Trucking is a significant source of emissions. Given that transportation is the second-largest source of greenhouse gas emissions in the United States, with medium- and heavy-duty trucks accounting for about a quarter of these, transitioning fleets to zero-emission vehicles (ZEVs) has emerged as an urgent priority.[1] McKinsey's recent survey of more than 200 US trucking fleets found that while two-thirds are committed to decarbonization and over half are piloting ZEVs, fewer than 10 percent see a viable path to scaling the use of ZEVs.[2] Adoption currently sits at a few thousand units per year, and even with decarbonization targets, there is uncertainty around scalable and timely zero-emission truck adoption.[3]

Fleet operators aiming to make the ZEV switch share a persistent underlying challenge: The total cost of ownership (TCO) for ZEVs remains significantly higher than that of internal combustion engine (ICE) vehicles. The TCO gap ranges between 30 and 50 percent compared to ICE vehicles running on diesel.[4]

Other barriers to scaling are multifaceted; for instance, available ZEV models, though improving, often struggle with uptime rate, while charging and depot infrastructure remains underdeveloped.[5] Operational complexity further complicates the equation.[6]

Closing the TCO gap could be essential to unlocking ZEV adoption at scale. Even with the significant structural challenges, there are many opportunities for fleet operators, OEMs, and ecosystem partners to act now, collectively, and pave the path to a zero-emissions future at TCO parity. This article explores three areas for potential action:

1. **Truck OEMs** could take steps to incrementally reduce product costs and deliver their offerings in the US market at scale—which, in turn, could unlock opportunities to compete effectively with their global counterparts.

2. **Fleet operators** can consider evolving their ZEV adoption approach from plug-and-play to operations tailored toward optimizing the unique capabilities ZEV assets can deliver compared to ICE vehicles.

3. **Service providers,** beyond OEMs and fleet operators, play an important role in reinforcing an ecosystem that supports zero-emission truck adoption at scale. This may include supplying the

required charging or fuel infrastructure along freight corridors and developing innovative financing offerings.

Sizing the TCO gap

Achieving TCO parity is a pivotal enabler for the ZEV transition, but most fleets struggle to achieve it today. TCO parity exists for light vehicles like vans, but for heavy-duty trucking, TCO is 50 percent higher in many cases.[7] The hurdles to TCO parity differ across truck archetypes and use cases.

For example, local distributors run routes that, on the surface, seem perfect for electrification—low daily mileage, predictable routes, light payloads, and vehicles that return to the same depot each night. However, these operators don't turn the vehicles frequently enough to amortize the higher zero-emission truck costs. To recoup the up-front ZEV costs and approach TCO parity, local distributors may need to increase utilization and raise daily mileage (Exhibit 1).

Exhibit 1

Battery electric vehicles are uneconomical on total cost of ownership for most truck applications.

Total cost of ownership (TCO) parity by application, BEV[1] vs ICE[2] truck

McKinsey & Company

Conversely, long-haul full truckload (FTL) networks have multishift operations with high utilization at over 500 miles per day. Yet, their schedules are less predictable, and the time available to charge is limited. FTL fleets' high payload density also requires large batteries or hydrogen tanks supported by infrastructure built out across freight corridors. Reliance on public fast-charging stations—often during peak electricity rate periods—adds unpredictability and erases much of the variable cost advantages of battery electric vehicle (BEV) trucks compared to ICE trucks. Beyond lower up-front vehicle costs, a path to parity may require FTL fleets to tailor schedules to allow for charging in off-peak times and to form partnerships to develop electrified freight corridors and reduce on-route charging costs.

Truck OEMs: Step change cost reductions for at-scale economics

For fleet operators aiming for TCO parity, the up-front vehicle price tag is a recurring obstacle.[8] In the United States today, BEV trucks can cost between 50 and 250 percent more than ICE alternatives.[9] While there could be opportunities for savings outside of the asset—fuel and maintenance, for example—these are less predictable. Trucking fleet owners are having to reckon with higher up-front asset costs against the uncertain anticipation of lower operational costs and residual value of ZEV assets in the future.

To make the initial outlays more palatable for fleet owners and maintain their own profitability, OEMs can look for opportunities to make a step-change reduction in BEV costs by improving strategic design, technology, and operational excellence. Systematic cost reduction pathways could take into account battery pack sourcing and design, manufacturing and engineering process improvements, economies of scale, and warranty and support reduction. If such measures are implemented, McKinsey's bottom-up modeling suggests an up-front cost reduction of approximately $150,000, which is in line with cost reduction in light vehicles or passenger cars (Exhibit 2). To illustrate, US OEMs could consider exploring cost-saving opportunities in the following four areas.

Battery pack sourcing and design. This area holds significant potential for price improvement. Three interventions could lead to cost savings of up to $60,000.[10] First, in-sourcing or near-sourcing battery cell production has the potential to reduce cell costs. In the United States, local cell production and pack assembly can bring eligibility for battery tax credits of $45 per kilowatt-hour (kWh) in total.[11] Second, selecting cell chemistries for cost by moving from high-cost nickel manganese cobalt (NMC) to cheaper lithium iron phosphate (LFP) cells could also result in savings.[12] Third, implementing cell pack design improvements, such as adopting a cell-to-body architecture approach and designs that incorporate manufacturing efficiency, could add incremental value. These approaches are gaining ground in the passenger car space and by Chinese OEMs.[13]

Manufacturing and engineering improvements. Engineering optimization in areas such as e-powertrain production and manufacturing efficiency could realize up to $30,000 in cost savings. Streamlining processes through innovative manufacturing techniques and automation could drive down production and energy costs.

Scale benefits in production. Increasing production from fewer than 100 vehicles a year to thousands could introduce up to $30,000 in savings. The potential could be realized through operational excellence, economies of scale with suppliers, and platform-specific development costs such as engineering and research and development.

Warranty and support reduction. Warranty accrual rates could come down as BEV products reach a steady state, maturing from prototype-like models to higher-reliability designs. EV-specific OEMs report warranty accrual rates from 5 to 10 percent of revenue, compared to 1.5 to 2.5 percent for traditional truck OEMs.[14] McKinsey analysis indicates that by matching historical ICE warranty accrual levels, OEMs could reclaim $20,000 to $30,000 of their margin.

Exhibit 2

Battery electric vehicle asset costs could potentially be reduced by more than 30 percent, helping close the total-cost-of-ownership gap.

McKinsey & Company

Looking to Chinese OEMs as a reference, US truck OEMs have an opportunity to continue innovating in operational efficiency and product cost. Today, for example, Chinese OEMs have access to Chinese-made LFP cells, spending approximately 25 percent less on battery cells than US truck OEMs that mostly rely on NMC batteries.[15]

Chinese OEMs are also adopting vertical integration, which has improved efficiency and reduced production costs. Incumbent OEMs in the US truck market could take the opportunity to drive product cost improvements and maintain relevance as new providers enter the market.

Fleet operators: Breaking with the current plug-and-play logic

In parallel to OEMs reducing up-front vehicle costs, fleet operators also have a critical role to play in shifting the TCO balance. In most truck applications, a plug-and-play model—trading ICE for BEV without altering operations—is not enough to reach TCO parity. To commit to this transition, fleets may need to dig deep into their operations model and optimize for zero-emission powertrains. While the solutions look different within each application, a core set of optimization enablers can apply across fleets.

McKinsey identified 24 parameters that impact TCO across different fleet operating models. Fleets can directly influence 13 of these (Exhibit 3). The remaining 11 are external market parameters that fleets could monitor but cannot control, such as electricity prices at fleet depots and public charging locations, ambient temperature, diesel and gas prices, and subsidies.

Exhibit 3

Among the 13 parameters that fleets can influence, there are positive, negative, and 'sweet-spot' relationships with total cost of ownership.

Impact on BEV[1] total cost of ownership (TCO) savings vs ICE,[2] by parameter

Least optimal — Most optimal

Impact on TCO savings	Parameters under fleet's ability to influence	Explanation of impact
"Sweet spot" 	(1) Length of haul or single hop	Mileage near EV maximum range drives utilization, while limiting public charging need
	(2) Daily driving distance	High mileage drives vehicle utilization, though countered by higher-cost fast charging required
	(3) Stop/dwell time duration	Long dwell time allows for lower-cost charging options (slower), though limits vehicle utilization
	(4) Number of shifts	High mileage drives vehicle utilization, though countered by higher-cost fast charging required
Positive impact 	(5) Holding period	Longer holding period drives down per-mile asset cost
	(6) Dwell time in off-peak hours	Lower energy cost in off-peak hours
	(7) Route predictability	High predictability enables scheduled charging during optimal hours, reducing charging cost
	(8) Route fit for regen braking	Routes with more stops and/or hilly terrain increase battery electric vehicle efficiency
Negative impact 	(9) Payload density	Increased payload, reduced vehicle energy efficiency
	(10) Auxiliary load	Increased auxiliary load, reduced vehicle energy efficiency
	(11) Number of vehicles at depot	Many vehicles at a single depot increases grid upgrade costs and demand charges at depot
	(12) Charger power rating	High power rating increases energy cost through charging infrastructure and demand charges
	(13) Public charging usage	Expensive public charging increases energy cost

[1]Battery electric vehicle.
[2]Internal combustion engine.

McKinsey & Company

Some of the 13 parameters have a purely positive/negative relationship, where maximizing or minimizing variables has the most substantial impact on TCO. For example, maximizing the vehicle's dwell time during off-peak periods allows for using slower, less expensive chargers in conjunction with lower electricity rates. Similarly, minimizing the number of trucks at a given site can help reduce peak-demand charges and overage fees, reduce the additional capital expenditure required for EV charging infrastructure at the site, and lower total energy costs.

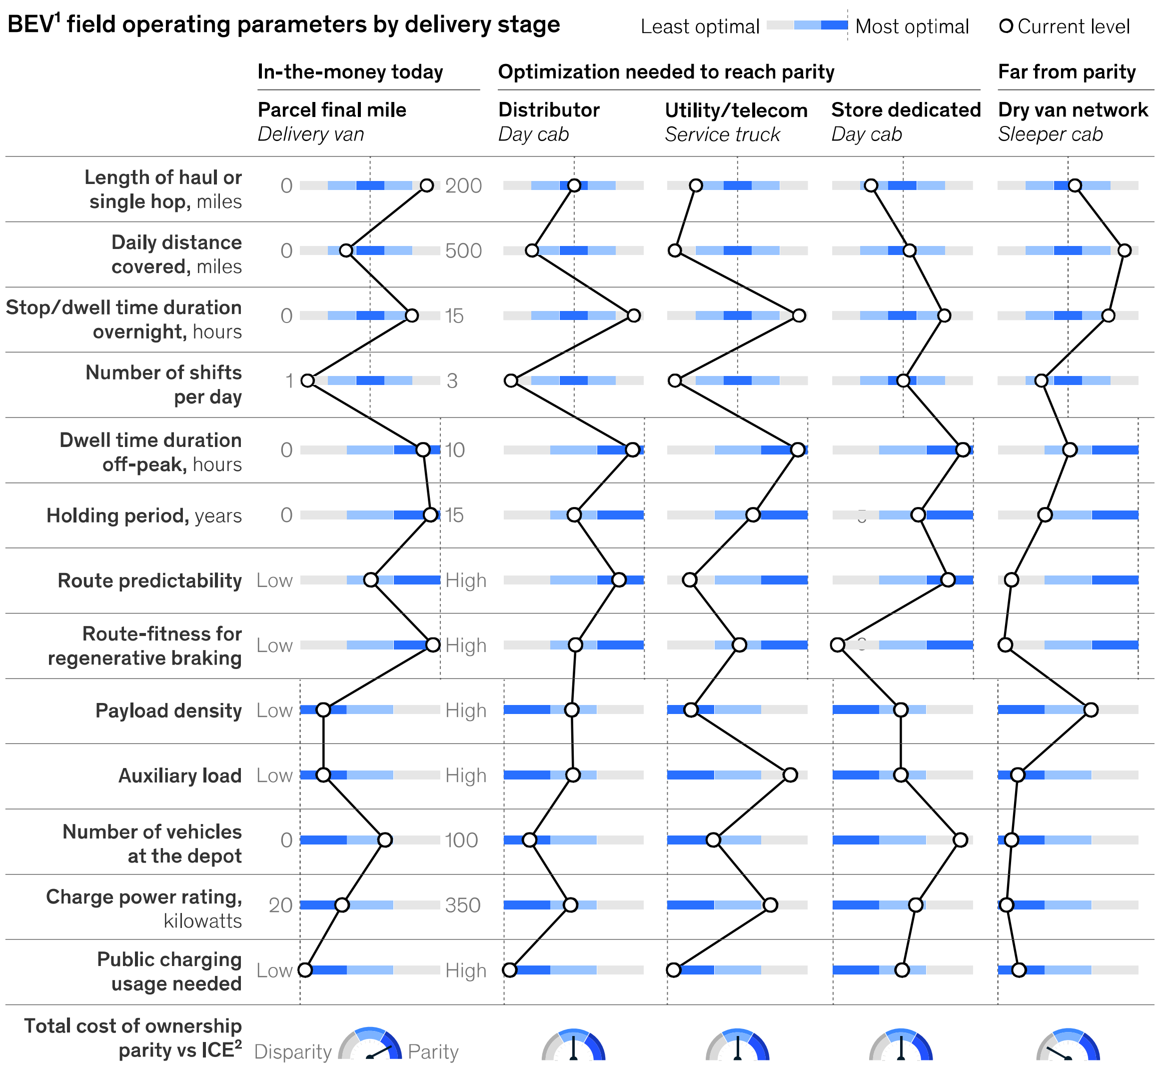
Some operating parameters can be optimized to a specific value or range—a “sweet spot.” When considering the daily driving distance, too few miles result in insufficient utilization. On the other end of the scale, too many daily miles lead to increasingly inefficient charging schedules, requiring the use of pricier fast-charging facilities.

To prepare for the ZEV transition, fleet operators may need to challenge the way they run their ICE truck operations today. Depending on the fleet archetype and baseline TCO parity gap, this could go as deep as re-architecting their network to reduce the length of haul or adding additional shifts to increase utilization. For example, last-mile parcel delivery vehicles are able to achieve TCO parity today; their fleets’ operating parameters are well suited for EVs with moderate daily mileage and long off-peak charging periods and are ideal for regenerative braking during city trips.

Dry van long-haul networks, on the other hand, have a more challenging road to TCO parity. These fleets have less route predictability, haul heavier than average payloads, and don’t have access to an established network of charging stations across major highways (Exhibit 4). The opportunity lies in the vast set of use cases between these two extremes, where fleet owners willing to challenge their existing operating regimes could potentially gain a competitive advantage and accelerate their path to TCO parity.

Exhibit 4

For applications nearing total cost of ownership parity, optimizing fleet operating parameters could close the gap.



[1]Battery electric vehicle.
[2]Internal combustion engine.
Source: McKinsey Center for Future Mobility

McKinsey & Company

Distributor heavy-duty trucking (HDT) fleets nearing TCO parity could reduce TCO by 5 to 25 percent by moving toward the sweet spot in their operations. This would require adjusting parameters alongside other interdependencies. Increasing the daily mileage—moving from one to two driving shifts, doubling the daily driving distance per vehicle—could increase asset utilization if balanced against other interdependencies, such as potential increases in demand charges and grid upgrade costs required for higher-speed charging.

Ecosystems and alliances can support solutions at scale

While fleets and OEMs are the primary stakeholders in the transition to ZEVs, they cannot solve it in isolation—it will take an extended ecosystem of industry stakeholders to support the shift. As has historically been the case with major technology disruptions, a whole new set of business models and participants will likely emerge, where cooperation among existing stakeholders will be critical. While the complete set of solutions cannot be predicted, two ecosystem factors stand out as key enablers to the zero-emission transition: Electrified fleet corridors and fleet ownership innovation.

Realizing electrified fleet corridors

Electrified fleet corridors with reliable on-route charging and fueling options may encourage faster EV adoption, particularly for longer-distance hauls.[16] However, the current US public charging infrastructure situation presents a chicken-and-egg scenario: Most fleets have neither the scale nor budget to justify deploying their own on-route charging infrastructure. Meanwhile, existing public charging infrastructure demands high prices—two to three times higher than depot charging—to make up for the low utilization provided by the small BEV trucking fleet on the road today.[17]

In one possible solution, a consortium comprising US truck fleets and a charging solution provider—potentially with an infrastructure investor—could collaborate, each contributing a key missing piece of the long-haul fleet electrification puzzle. Fleets participating in the consortium could guarantee a minimum utilization of the on-route chargers, between 5 and 10 percent, for instance, while gaining access to competitively priced $/kWh charging rates and guaranteed charger uptime. Simultaneously, the charging solution provider could benefit from a predictable ROI through the pooled utilization of chargers by the participating fleets. An infrastructure investor could underwrite the investment in fast chargers, grid upgrades, and ancillary infrastructure like battery energy storage systems (BESS) and microgrids at the on-route charging locations, thereby easing some of the capital burden on the fleets and the charging provider. Lastly, a system orchestrator could plan the deployment of infrastructure along the freight routes most commonly used by the participant fleets, tailoring the plan to align with each fleet's daily operating patterns.

This collaborative approach enables the deployment of optimal charging infrastructure in a cost-effective manner, potentially allowing for mutual economic and operational benefits for all stakeholders involved. Our analysis indicates that the consortium model of on-route charging could lead to a 15 to 20 percent TCO reduction for HDT electric fleets (Exhibit 5). To illustrate the potential impact: In a scenario where public charging has not been optimized, TCO parity is estimated to be attainable from the early 2030s, whereas a consortium approach could accelerate TCO parity to around the year 2026—with further upside if daily driving distances are higher than 125,000 miles per year or approximately 400 miles per day.

Exhibit 5

A consortium model could reduce zero-emission truck total cost of ownership by 15 to 20 percent in the near term.

Illustrative example: 15 trucks charged per day at one location

Total cost of ownership (TCO) per high-density truck, 2026,[1] $/mile

	BEV with on-route public charging	BEV with on-route consortium charging
Number of chargers needed	~7–8	~1–2
Charger utilization, %	~8–10	~40–45
Peak power draw, megawatts	~3.0	~0.6

Note: Figures may not sum, because of rounding.

Generating innovative financing solutions

Beyond the comparatively high vehicle costs, ZEV operations require capital expenditure-intensive infrastructure for charging and, often, grid upgrades to draw enough energy from the power supply. Hardware alone can cost up to a few hundred thousand dollars per charger, while grid upgrades can cost a couple of million dollars per depot.[18]

While this is challenging for fleets with capital expenditure constraints, there are opportunities to tap into the funding earmarked for energy transition and green investments. The top ten core-plus infrastructure energy transition funds collectively hold an estimated $50 billion in available capital for green investing.[19] Fleet operations could present an attractive investment opportunity due to their predictable business models; operational needs could be calculated with precision well in advance of committing to the investment. While residual vehicle value carries some risk, the sway it has over the overall investment case is minimal, and collaborating with the OEM could help mitigate this concern.

Innovative financing is particularly relevant for electrifying third-party logistics (3PL) or for-hire fleets. Notably, 3PL fleets account for about 86 percent of the total US truck ton-miles traveled.[20] Few companies operate without significant reliance on these services, making the electrification of 3PL fleets an important step toward achieving Scope 3 targets for the companies that use them. A potential approach to accelerate 3PL ZEV adoption could involve a collaborative effort by investors, OEMs, fleets, and 3PLs to “buy out” diesel truck ownership and replace it with a lease-like model for ZEVs, paired with guarantees for routes and a sufficient price level.

An OEM-led version of that model could be truck-as-a-service (TaaS), through which OEMs can support fleets that may not have the necessary capabilities to face the transition. This type of solution could provide charging, insurance, and maintenance services for electric medium-duty trucks—reducing up-front costs and operational risk to fleets. Following a similar approach, there are opportunities for existing and new participants to reinvent the vehicle ownership structure.

Achieving cost parity with ICE trucks could be the catalyst that begins mass ZEV adoption in the United States. The path ahead is visible, but the journey may require a final push to clear various structural hurdles and close the TCO gap. A concerted effort by fleet operators, OEMs, and ecosystem players could activate new levels of collaboration across the industry, unlock opportunities for global competitiveness, and inspire novel business models that support shared decarbonization ambitions.

Study Examines Cost Competitiveness of Zero-Emission Trucks

Tech Progress, Supportive Policies, and Infrastructure Investments Drive Down Costs and Spur Technology Adoption

April 3, 2024 | By Julia Thomas | Contact media relations

Share

A recent NREL study explored how the total cost of driving for medium- and heavy-duty vehicles could evolve over time under different scenarios. *Photo from iStock*

Medium- and heavy-duty vehicles (MHDVs) account for just 5% of vehicles on the road in the United States, yet they are responsible for 21% of transportation-related greenhouse gas emissions. Reducing MHDV emissions is vital to mitigating the effects of climate change and improving air quality. Zero-emission vehicles (ZEVs)—such as battery electric vehicles (EVs) and hydrogen fuel cell electric vehicles (FCEVs)—offer a solution.

While projecting future technology adoption is complex and many factors influence consumer decisions, economics play a key role in choosing technologies for commercial vehicle applications. A recent study by the National Renewable Energy Laboratory (NREL) explored how the total cost of driving for zero-emission and diesel MHDVs could evolve over time under different scenarios, from the present day to 2050.

"With continued improvements in vehicles and fuels, ZEVs are rapidly becoming commercially viable, potentially reaching total cost of driving parity or better compared to diesel vehicles by 2035 in all market segments," said NREL's Catherine Ledna, a decision support analyst who led the study.

A full transition to ZEV sales by 2035 would result in a 65% reduction in emissions by 2050 compared to 2019. Incentives such as the zero-emission MHDV purchase tax credits made possible via the 2022 Inflation Reduction Act (IRA) further accelerate total cost of driving competitiveness and spur emissions reductions up to 70%.

The results of NREL's study are detailed in a recent *iScience* journal article—"Assessing Total Cost of Driving Competitiveness of Zero-Emission Trucks"—by Ledna and NREL's Matteo Muratori, Arthur Yip, Paige Jadun, and Christopher Hoehne as well as Kara Podkaminer from the U.S. Department of Energy.

Paving the Way for Zero-Emission MHDVs

The path to zero-emission MHDVs is supported by various proposed and existing actions, including policies ranging from increased air quality and greenhouse gas emissions standards to tax credits for ZEV purchases as well as investments in research and development for ZEV technologies and infrastructure deployments. For example, the IRA includes tax credits of up to $40,000 for qualifying clean vehicle purchases, including EVs and FCEVs, as well as incentives for charging and refueling infrastructure. More recently, the U.S. Environmental Protection Agency has proposed more stringent greenhouse gas emission rules for model years 2027 to 2032 MHDVs.

TEMPO: The Right Modeling Tool for the Job

At the heart of the study was NREL's Transportation Energy & Mobility Pathway Options (TEMPO^{TM}) Model, the laboratory's flagship sector-wide transportation energy systems model. The research team used TEMPO to estimate how the total cost of driving of MHDVs could evolve under a range of scenarios comprising technology cost and progress, fuel costs, and policies, while also considering new vehicle purchases, stock turnover, vehicle activity, energy consumption, and greenhouse gas emissions.

"While recent studies have evaluated the economic competitiveness and technical feasibility of zero-emission MHDVs in one or more specific market segments, our study was unique in its consideration of total cost of driving competitiveness, adoption, energy consumption, and fleet turnover across *all* MHDV applications," Ledna added.

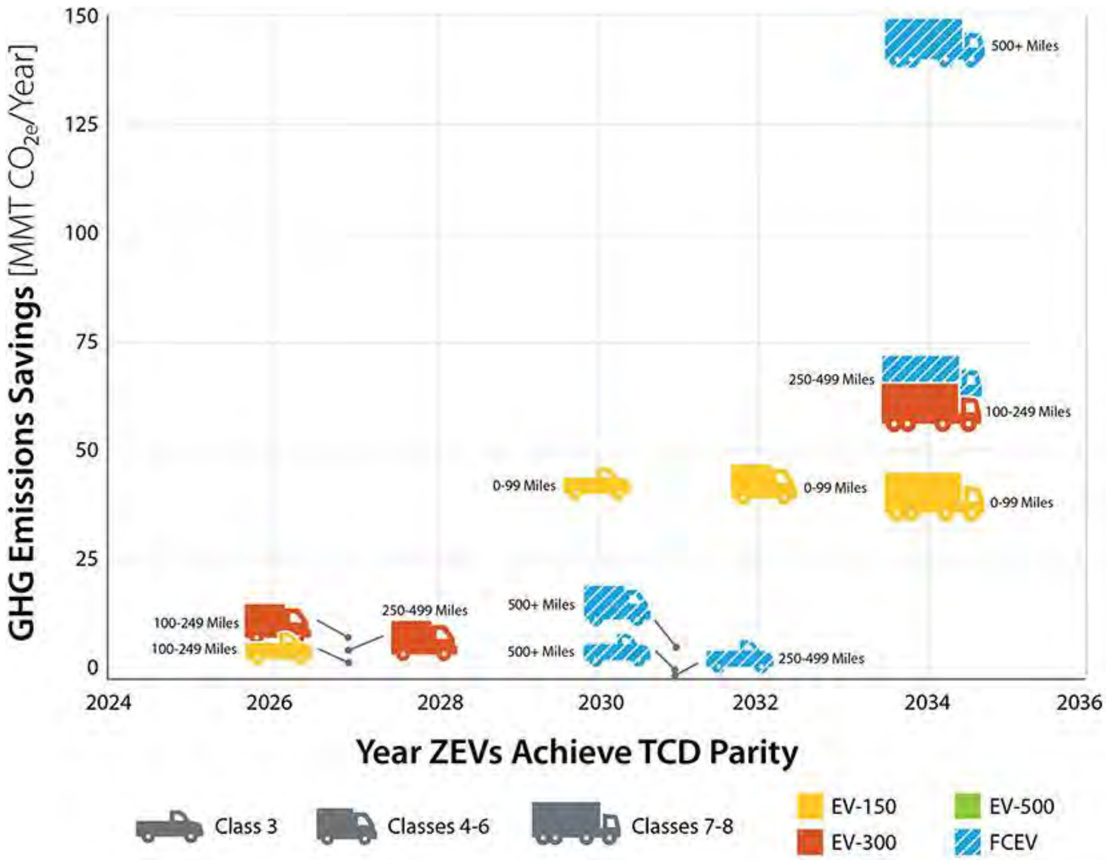
NREL's analysis captured differences in vehicle use and energy consumption across diverse MHDV market segments, which have distinctive technical and economic requirements resulting in differences in the cost competitiveness of ZEV technologies. Case in point: The nation's MHDV fleet encompasses vehicles ranging from 10,000 pounds to more than 33,000 pounds and driving distances of less than 10,000 miles per year to greater than 200,000.

Spotlight on Technology Progress and Incentives

Today, ZEVs comprise a small share of existing MHDVs and face near-term barriers such as high purchase costs, limited charging or refueling infrastructure, and logistical challenges for fleet conversions.

"Thanks to recent technology progress and investments in clean vehicles, EVs have already become a viable solution for some use-cases," said NREL's Muratori, a senior transportation and energy systems engineer. "It will take some years for ZEVs to reach cost-competitiveness with diesel across all segments and applications, but we are on the right path and EV technology has progressed more rapidly than expected during the last decade."

According to the NREL study, the time horizon in which ZEVs become competitive with diesel vehicles on a total cost of driving basis varies according to vehicle class and market segment. The combination of capital costs, operational costs, and vehicle miles traveled generally determines when a ZEV technology achieves parity. For all vehicle applications, at least one ZEV technology achieves parity with diesel before 2035.



Total cost of driving (TCD) parity and greenhouse gas (GHG) emissions savings potential by MHDV class and market segment. (EV labels refer to EV range in miles. Mileage labels indicate the primary traveling distance of a given market segment.) *Figure by Fred Zietz, NREL*

This study shows that by 2032 (and in many cases before then), ZEVs achieve total cost of driving parity with diesel vehicles in light-medium (Class 3) and medium-duty (Class 4–6) trucks, driven by declines in battery costs. By 2035, shorter-range EVs with 150 to 300 miles of electric range reach parity in short-haul and regional market segments, which have lower daily vehicle miles traveled and a reduced need for larger, more expensive batteries. Heavy trucks (Classes 7–8) and trucks that drive longer distances (500-plus-mile shipment distance) achieve parity after 2030.

IRA Incentives Accelerate Technology Adoption and Emissions Savings

With IRA vehicle purchase tax credits, ZEVs—particularly EVs—achieve total cost of driving parity with diesel vehicles on substantially earlier time frames.

Most light-medium vehicles achieve total cost of driving parity by 2026, which could result in an additional 700,000 light-medium vehicles sold, 48 billion vehicle miles traveled by ZEVs, and carbon dioxide tailpipe emissions savings of 33 million metric tons between 2023 and 2032. Meanwhile, most medium vehicles achieve total cost of driving parity by 2023 or 2024, resulting in an additional 1.1 million vehicles sold, 81 billion vehicle miles traveled by ZEVs, and carbon dioxide tailpipe emissions savings of 73 million metric tons. For heavy vehicles, short-haul market segments achieve parity between 2027 and 2030 (versus 2034 without incentives). Heavy regional and long-haul market segments continue to achieve parity in 2034, with FCEVs remaining the most cost competitive on a total cost of driving basis.

"IRA incentives greatly accelerate the time at which ZEVs reach total cost of driving parity, enabling market uptake in the near term," Muratori said. "By 2050, a rapid transition to ZEVs results in substantial greenhouse gas emissions reductions—65% relative to 2019 levels without incentives and 70% with IRA vehicle purchase tax credits."

EXECUTIVE SUMMARY

Heavy-duty vehicles (HDVs) in the United States were responsible for more than a quarter of the transport sector's greenhouse gas (GHG) emissions in 2020. To regulate the sector's GHG emissions, the U.S. Environmental Protection Agency has implemented emission standards. The most recent update, Phase 2, extends from model years 2021 to 2027. The stringency of the standards was based on the improvement potential of HDVs powered by combustion engines. Zero-emission (ZE) HDVs, which have no tailpipe GHG or pollutant emissions, were not considered in the technology pathways underpinning the standards due to their lack of maturity when the standards were adopted in 2016.

Understanding that ZE HDVs are essential for decarbonizing the sector, some truck manufacturers in North America have announced plans to produce ZE trucks and buses at scale. The upcoming Phase 3 GHG standards for HDVs, proposed in early 2023, present an opportunity to review the stringency of the standards and consider the role ZE HDVs will play in deeply decarbonizing the HDV sector in the United States.

Despite their environmental benefits, the widespread adoption of ZE HDVs will only occur if it also leads to economic benefits. To shed light on their financial viability, this paper evaluates the total cost of ownership (TCO) of four different truck technologies: diesel, battery electric, hydrogen fuel-cell, and hydrogen combustion powertrains. We focus on Class 8 tractor-trailers operating in long-haul assuming a first ownership period of five years.

The study assesses the techno-economic performance at the U.S. state and national levels in the 2022–2040 timeframe. For the state analysis, seven representative states—California, Georgia, Illinois, New York, Florida, Texas, and Washington—were chosen due to their geographic coverage over the U.S. mainland, long-haul trucking activity in every geographic region, and differences in energy costs. At the national level, the analysis captures uncertainties in technology cost and representative variations in energy prices that a vehicle might face in cross-state operation.

We arrive at the following main findings:

By 2030, the total cost of ownership of battery electric long-haul trucks will likely be lower than that of their diesel counterparts in all representative states considered in this analysis. Despite their higher upfront price, battery electric trucks have substantially lower operational expenses than the other trucks studied, as shown in Figure ES1. This is driven by the higher energy efficiency of battery electric powertrains and their lower maintenance costs.

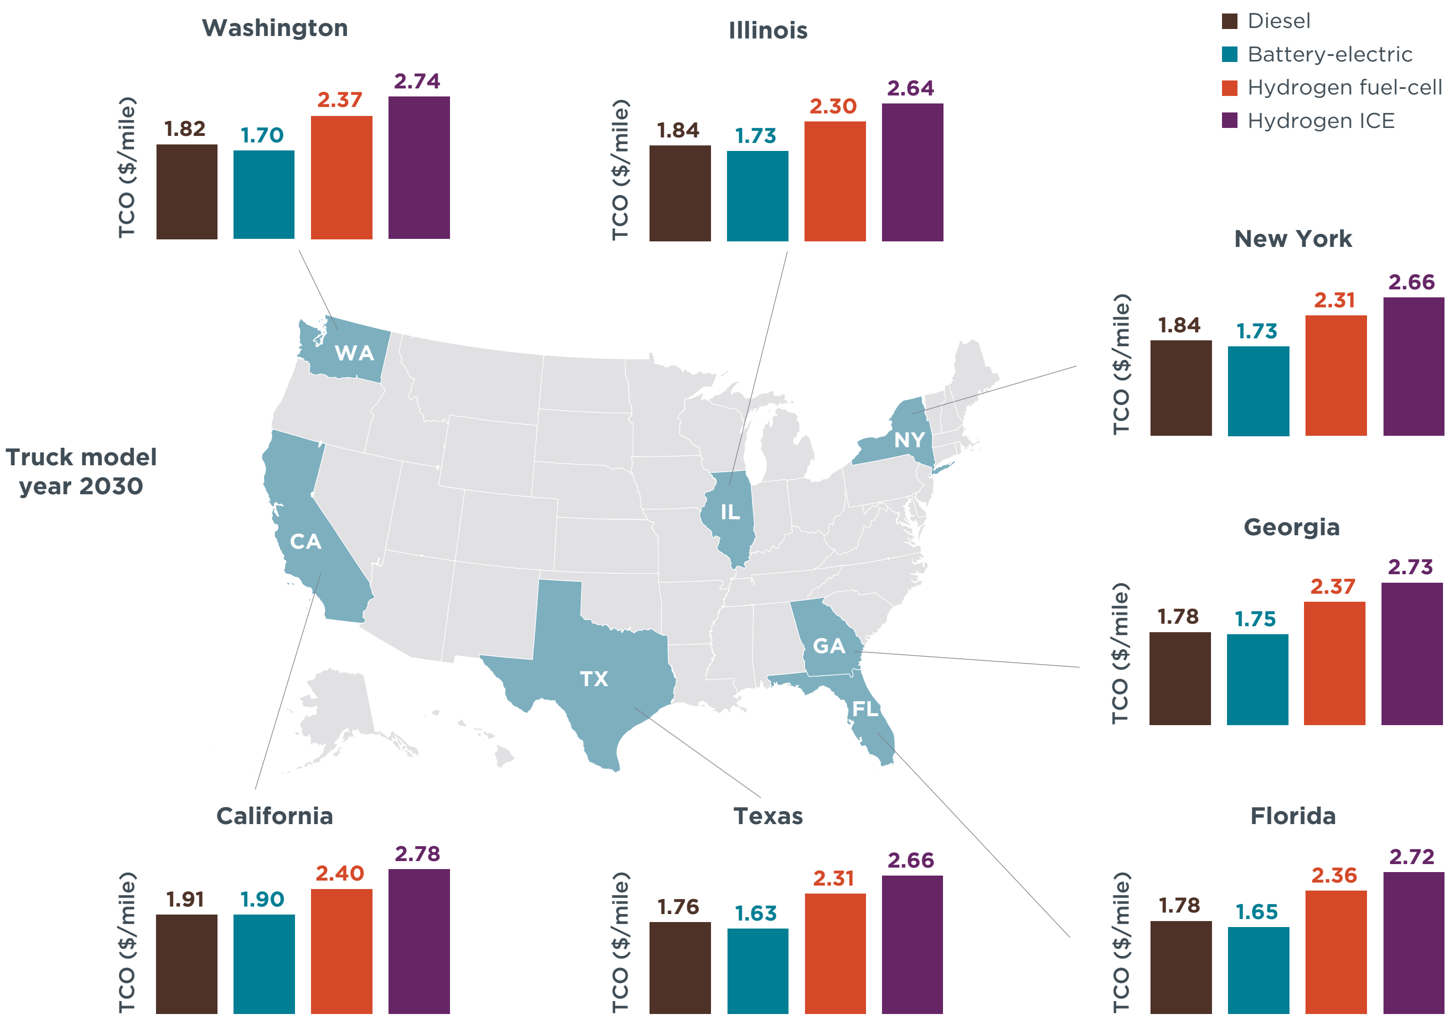

Figure ES1. State-specific total cost of ownership for different model year 2030 truck technologies.

For very high daily mileages, battery electric trucks can still achieve a better total cost of ownership than their diesel counterparts. As a truck's average daily mileage or mileage variability—defined as the percentage difference between the maximum and the average daily mileage—increases, larger batteries are needed to ensure the truck's daily energy needs are covered during average use and on the most demanding days. The larger batteries required increase the upfront price of battery electric trucks. Conversely, higher average daily mileage improves the operational costs of battery electric trucks compared to their diesel counterparts. Overall, battery electric trucks are expected to record a better TCO for average mileages as high as 750 miles per day, provided that the day-to-day milage variability is low (Figure ES2).

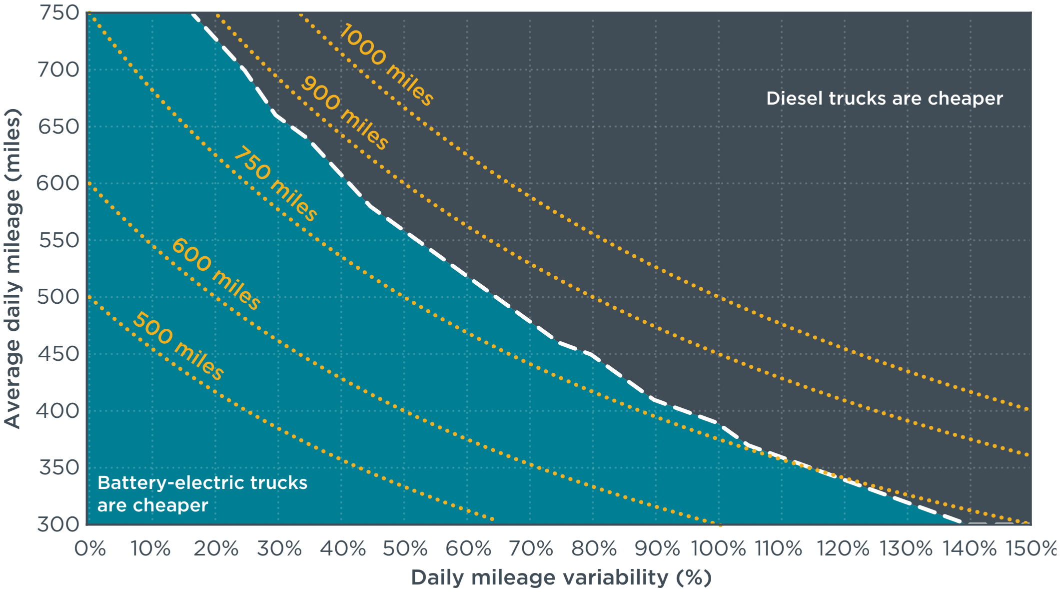

Figure ES2. Impact of daily mileage and mileage variability on the TCO of model year 2040 battery electric and diesel trucks. Daily mileage variability defined as the ratio of maximum to average daily mileage.

Battery electric trucks have a lower total cost of ownership than hydrogen-powered trucks for long-haul applications, even when accounting for tax credits in the Inflation Reduction Act. Lower fuel costs make battery electric trucks the most cost-effective zero-emission technology. With estimated charging costs ranging between $0.15/kWh and $0.30/kWh, green hydrogen fuel prices would need to be in the range of $3.00/kg to $6.50/kg for hydrogen fuel-cell trucks to reach TCO parity with battery electric trucks during the next decade. Hydrogen internal combustion engine trucks will require green hydrogen fuel prices as low was $2.00/kg to reach TCO parity with battery electric trucks by 2030; This is much lower than the estimated green hydrogen price in 2030 ($9.00/kg to $11.00/kg) and 2040 ($8.00/kg to $10.00/kg) with the tax subsidies included in the Inflation Reduction Act, as shown in Figure ES3.

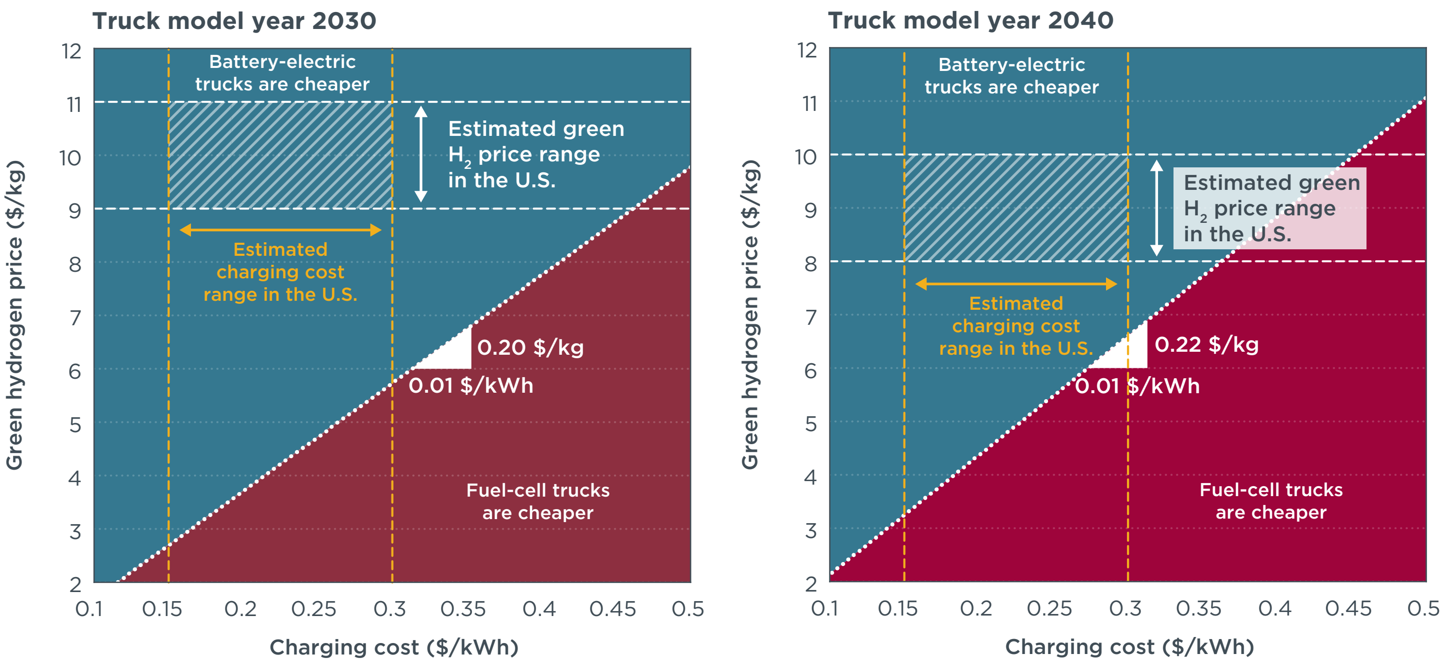

Figure ES3. Total cost of ownership parity sensitivity to charging costs and hydrogen fuel prices for several truck model years. The dashed area in the figure reflects the estimated charging costs and green hydrogen prices, including infrastructure deployment cost. The small triangles in the figure represent the line slope

The analysis presented in this study shows that zero-emission trucks can ensure a cost-effective transition away from fossil diesel, providing a substantial reduction in GHG emissions. Battery electric trucks operating in long-haul are likely to achieve a lower TCO than diesel trucks before the end of this decade in all states considered in this analysis.

INTRODUCTION

Heavy-duty vehicles (HDVs) are among the most significant sources of greenhouse gas (GHG) emissions in the United States. In 2020, HDVs were responsible for more than 27% of the total U.S. transport sector GHG emissions (U.S. Environmental Protection Agency, 2022a). While GHG emissions for most transport means recorded a decline over the past 30 years, the average HDV GHG emissions per vehicle increased by 83% in 2020 relative to 1990 levels and by 5% relative to 2005 levels, mainly driven by the increase in freight activity and a negligible improvement in vehicle fuel economy (U.S. Environmental Protection Agency, 2022a).

Greenhouse gas emissions from heavy-duty vehicles have historically been regulated at the federal level by increasingly stringent standards set by the U.S. Environmental Protection Agency. Last updated in 2016, the current Phase 2 GHG standards for HDVs were predicated on projected improvements in the efficiency of conventional internal combustion engine vehicles. While zero-emission (ZE) HDVs were not considered in setting the stringency of the rule, they were incentivized with super credits intended to support the nascent market. Zero-emission HDVs are defined as vehicles that have no tailpipe GHG or pollutant emissions. In the context of this study, this includes battery electric and hydrogen fuel-cell electric vehicles.

Zero-emission vehicles have a significant role in deeply decarbonizing the HDV sector in the United States, given the limited remaining GHG emission reduction potential for internal combustion engine (ICE) vehicles (Buysse, Sharp, & Delgado, 2021). Since the Phase 2 rulemaking, several states led by California have moved to require the deployment of ZE HDVs. The most notable is California's Advanced Clean Trucks rule, which requires manufacturers to sell an increasing percentage of ZE HDVs, starting at 5% in model year (MY) 2024 and increasing to 40% by 2035 (Buysse & Sharpe, 2020). In addition, several truck manufacturers in North America have announced plans to increase their production of new ZE truck models (Buysse, 2022; International Council on Clean Transportation, 2022). This includes 100% zero-emission sales commitments from major manufacturers like Daimler Trucks (Daimler Truck AG, 2023), Volvo Trucks (Volvo Trucks, 2022), and Navistar (McDaniel, 2022) by or before 2040. Nonetheless, the capital investment needed to transition to these technologies may hinder their wide deployment.

In this report, we evaluate the economic viability of several HDV truck technologies by estimating their total cost of ownership (TCO) over the most important use case in the United States: Class 8 tractor-trailers operating in the long-haul. This class is the most challenging HDV segment to decarbonize, given the trucks' high daily mileage and payloads. We compare four powertrain technologies: diesel, battery electric, hydrogen fuel-cell, and hydrogen internal combustion engine (ICE). The study looks at the TCO from the perspective of the first ownership period, assuming a holding period of five years. The TCO is quantified using detailed assumptions regarding current and future technology potential and costs.

METHODS AND DATA SOURCES

USE CASE DEFINITION

This paper studies the total cost of ownership of diesel, battery electric, hydrogen fuel-cell, and hydrogen internal combustion engine heavy trucks focusing on Class 8 long-haul high-roof sleeper cab trucks operating in the United States. The use case of interest considers a 500-mile average daily mileage. The annual vehicle miles traveled (VMT) curve is shown in Figure 1 as a function of the truck age based on information from MOVES3 (U.S. Environmental Protection Agency, 2022b).

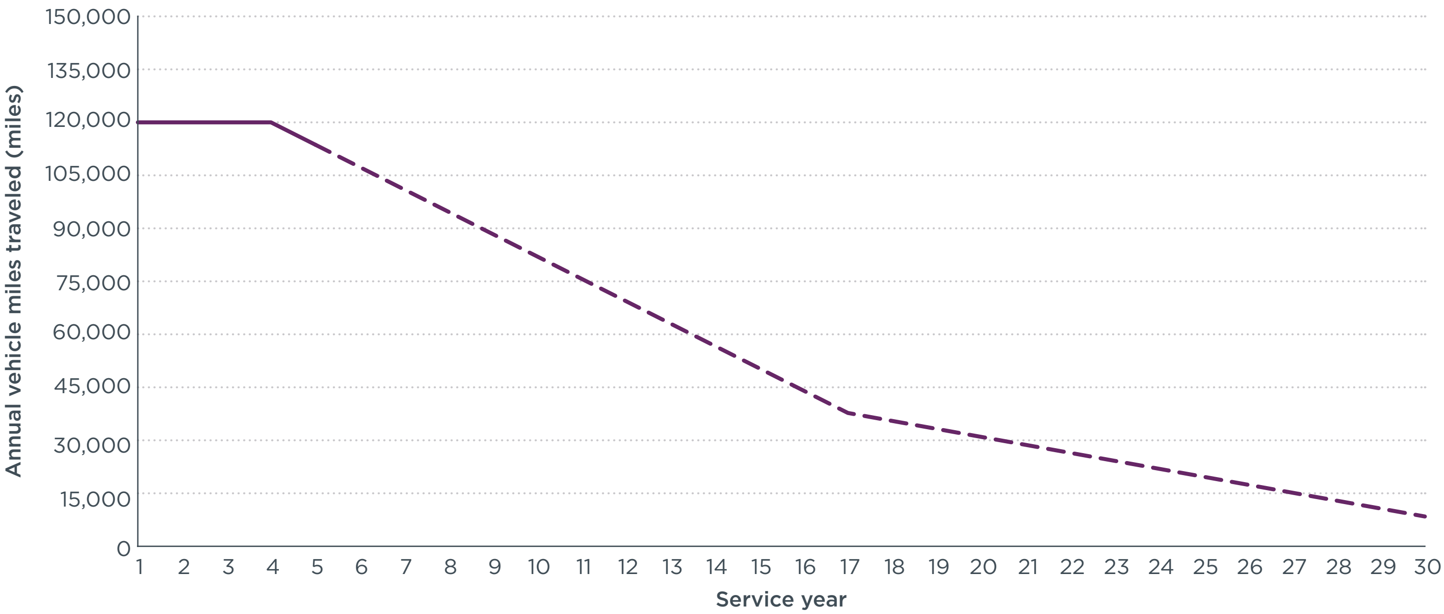

Figure 1. Long-haul truck annual mileage as a function of service years.

This TCO analysis is conducted at the state and national levels, considering state-specific and national-average energy and fuel cost data, respectively. For the state-specific analysis, the study focuses on California, Texas, Washington, Florida, Illinois, Georgia, and New York. These states are chosen based on the following criteria:

1. Ensuring comprehensive geographic coverage over the U.S. mainland.
2. Focusing on states with the highest long-haul trucking activity in every geographic region based on data available from Federal Highway Administration (2018).
3. Ensuring a comprehensive coverage of commercial electricity rates in the United States based on data from U.S. Energy Information Administration (2022a) to reflect charging costs variation among states.

At the national level, we conduct a stochastic Monte Carlo approach considering data from all 50 states, mainly on diesel fuel, hydrogen fuel, and electricity costs, in addition to data reflecting the uncertainties in technology costs, where the main TCO inputs are modeled as probability density functions with predefined ranges of uncertainties.

FUEL CONSUMPTION MODELING AND ENERGY STORAGE SIZING

The fuel consumption of each truck technology is estimated through a multi-physical modeling approach using a commercial simulation tool (Simcenter Amesim, 2022). The models simulate the vehicle's longitudinal dynamics and the physical behavior of the main powertrain components, considering the vehicle road load parameters and technical specifications. More details about the development of the diesel, battery electric, and hydrogen fuel-cell powertrain models can be found in Basma, Beys, and Rodríguez (2021) and Basma and Rodríguez (2022). Regarding the hydrogen ICE powertrain modeling, the main difference relative to the diesel powertrain lies in the engine modeling. We model the hydrogen ICE as a spark-ignited engine in lean combustion mode. The hydrogen fuel specific heating value is 120 MJ/kg, and the air-fuel stoichiometric ratio is 34. Table 1 summarizes the common road load parameters and powertrain specifications among all technologies, and Table 2 summarizes the technology-specific powertrain components. The current technology parameters correspond to an average truck in 2022, while future technology parameters reflect the technology potential that can be achieved in 2035.

Table 1. Common road load parameters and powertrain specification for current (2022) and future (2035) technologies.

Parameter	Current value (2022)	Future value (2035)
Aerodynamic drag area	5.68 m^2 [a)]	4.4 m^2 [b)]
Rolling resistance coefficient	6.15 kg/t [a)]	4.1 kg/t [b)]
Wheel radius	0.49 m	0.49 m
Wheel inertia	22.5 kgm^2	22.5 kgm^2
Gear efficiency [c)]	98.5%	99.1%
Final drive efficiency [c)]	97%	98%
Trailer weight	13,500 lbs [a)]	10,850 lbs [b)]

Table 2. Technology-specific powertrain parameters for current (2022) and future (2035) powertrain technologies.

Parameter	Diesel		Battery electric		Fuel cell		H_2 ICE	
	Current	Future	Current	Future	Current	Future	Current	Future
Power unit [a)]	339 kW (445 HP)							
Battery size	-		1 MWh	740 kWh	70 kWh		-	
Fuel cell power	-		-		210 kW		-	
H_2 tank size	-		-		62 kg	40 kg	76 kg	52 kg
Peak break thermal efficiency	46%	55% [b)]	-		-		44%	50% [c)]
Peak fuel cell efficiency	-		-		60%	67%	-	
Gearbox (gear ratios)	10-speed (12.8, 9.25, 6.76, 4.9, 3.8, 2.61, 1.89, 1.38, 1, 0.73)		2-speed [5,1]		2-speed [5,1]		10-speed (12.8, 9.25, 6.76, 4.9, 3.8, 2.61, 1.89, 1.38, 1, 0.73)	
Final drive ratio	3.31		2		2		3.31	

a) Electric motor or engine rated power.
b) Buysse et al. (2021)
c) Loszka et al. (2022)

The battery in a battery electric truck is sized to meet a specific daily mileage. For this use case, the required daily mileage is 500 miles. We assume that the truck drivers stop for a 30-minute break every 190 miles (Phadke et al., 2021), which can be used to recharge the battery at a rate of 350 kW today and 1 MW as of 2027. The battery size is then estimated given the truck's electric energy consumption, charging power during the day, and required daily mileage. We also assume that the battery size will be, at most, 1 MWh due to payload and volume capacity constraints. When a larger battery is required, we assume that the drivers stop more frequently for charging, which will increase labor costs, as will be discussed later in the total cost of ownership modeling section. We also assume that the battery will be sized to provide at least 300 miles on a single charge. Table A1 in the appendix summarizes the battery sizing approach.

All powertrain models are simulated under the National Renewable Energy Laboratory long-haul cycle (National Renewable Energy Laboratory, 2023), and at a reference payload of 38,000 lb as defined in the U.S. Environmental Protection Agency's regulatory impact analysis of 2016 (U.S. Environmental Protection Agency & U.S. Department of Transportation, 2016). For battery electric trucks, the choice of battery size will significantly impact the fuel economy and maximum payload capacity, given the battery weight. On the other hand, the battery size depends on the truck's fuel economy, total vehicle weight, and driving mileage design point. In this case, an iterative approach is considered to size the battery and determine the truck's energy efficiency and maximum payload capacity.

Figure 2 summarizes the fuel economy of the simulated trucks for current and future vehicle technologies, expressed in miles per gallon diesel equivalent (MPGe). Battery electric is the most energy-efficient technology recording the highest fuel economy of around 13 MPGe for current vehicle technologies. This is almost twice as much as the diesel truck's fuel economy. Hydrogen fuel-cell trucks record an approximate 10% improvement in fuel economy relative to their diesel counterparts for current vehicle technologies. Hydrogen ICE trucks register the lowest fuel economy at 6 MPGe, almost 10% lower than their diesel counterparts.

For future vehicle technologies, improvement in road load technologies benefits all powertrains, increasing fuel economy, as shown in Figure 2. Improvements are also achieved in engine break thermal efficiency and fuel cell peak efficiency, as summarized in Table 2.

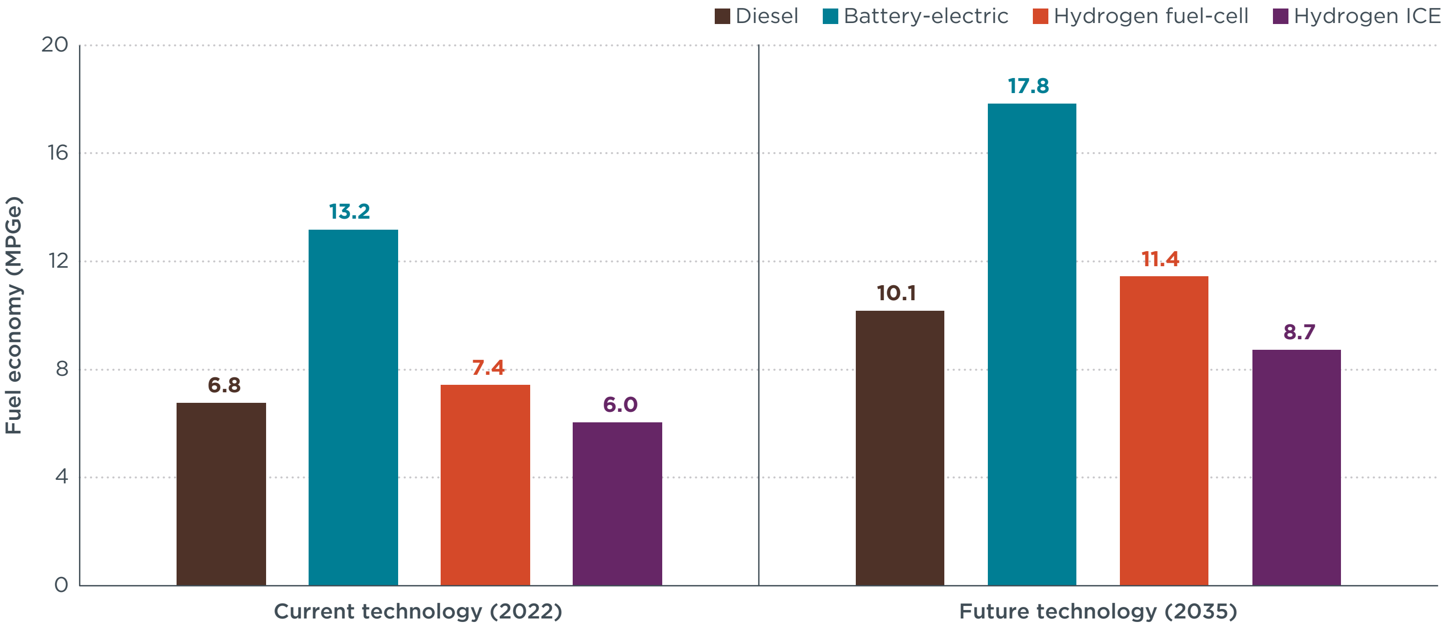

Figure 2. Summary of trucks' fuel economy for current and future vehicle technologies expressed in miles per diesel gallons equivalent, simulated under the NREL long-haul cycle and at reference payload of 38,000 lbs.

PAYLOAD CAPACITY ESTIMATION

The payload capacity of each powertrain technology is calculated using a bottom-up approach. The weights of the main powertrain components are estimated based on a teardown analysis conducted by Ricardo Strategic Consulting on behalf of ICCT (Ricardo Strategic Consulting, 2022). All trucks share a common base glider, i.e., the same chassis and cab design. The base glider weight is 10,439 lb for current technologies in 2022, which is assumed to decrease to 8,638 lb due to chassis light weighting for future technologies. In addition, all trucks share the same trailer, weighing 13,500 lb for current technologies and decreasing to 10,850 lb for future technologies.

The powertrain and energy storage weights differ significantly among the four considered truck technologies, mainly driven by the truck's technical specifications. The battery electric and hydrogen fuel-cell tractor-trailer powertrain components and accessory weights are summarized in Table 3. The diesel truck powertrain componentry weight is estimated to be around 7,559 lb (Ricardo Strategic Consulting, 2022), and the hydrogen ICE truck powertrain componentry weight is estimated to be 6,959 lb,[1] excluding the hydrogen storage tanks.

1 Assumed similar to CNG trucks. Numbers adopted from Hunter et al. (2021).

Table 3. Battery electric and hydrogen fuel-cell tractor-trailer powertrain components and accessory weights.

Component	Specification		Weight multiplier	
	Battery electric	Fuel cell	Current	Future
Battery	Varies by range	70 kWh	0.14 kWh/kg	0.25 kWh/kg
Fuel cell		210 kW	0.6 kW/kg	0.6 kW/kg
Hydrogen tank		Varies by range	0.046 kg/kg	0.046 kg/kg
Electric drive	339 kW		0.4375 kW/kg	
Power electronics	339 kW		3.6 kW/kg for battery electric 5 kW/kg for hydrogen fuel-cell	
On-board charger	44 kW	6.6 kW	0.95 kW/kg for high power 1.12 kW/kg for low power	
Air compressor	6 kW		0.087 kW/kg	
Steering pump	9 kW		0.072 kW/kg	
Air conditioning unit	10 kW		0.91 kW/kg	
Heater	10 kW		1 kW/kg	
Battery thermal management	339 kW		3.5 kW/kg for battery electric 7.14 kW/kg for hydrogen fuel-cell	

Note: Data from Ricardo Strategic Consulting (2022) and Sharpe and Basma (2022)

Figure 3 shows the truck weight breakdown for the four considered powertrain technologies, highlighting the maximum truck payload capacity for current and future vehicle technologies. Hydrogen fuel-cell and hydrogen ICE powertrains show a similar payload capacity relative to their diesel counterparts, while battery electric trucks are expected to suffer from payload capacity losses of less than 20% relative to diesel for current vehicle technology. For future vehicle technologies, the truck battery size is expected to decrease due to energy efficiency improvement, battery energy density improvement, and the rollout of MW charging stations. This diminishes the payload capacity gap between battery electric and diesel trucks to less than 2%.

The payload capacity of current battery electric trucks under the considered truck specifications in this study is around 39,600 lb, which is higher than the 38,000 lb reference payload used in this study and defined by EPA's regulatory impact analysis of 2016. Therefore, we assume there will be no additional costs due to the payload losses for battery electric trucks in this study. The impact of higher truck payloads on the TCO analysis is examined in the sensitivity analysis section.

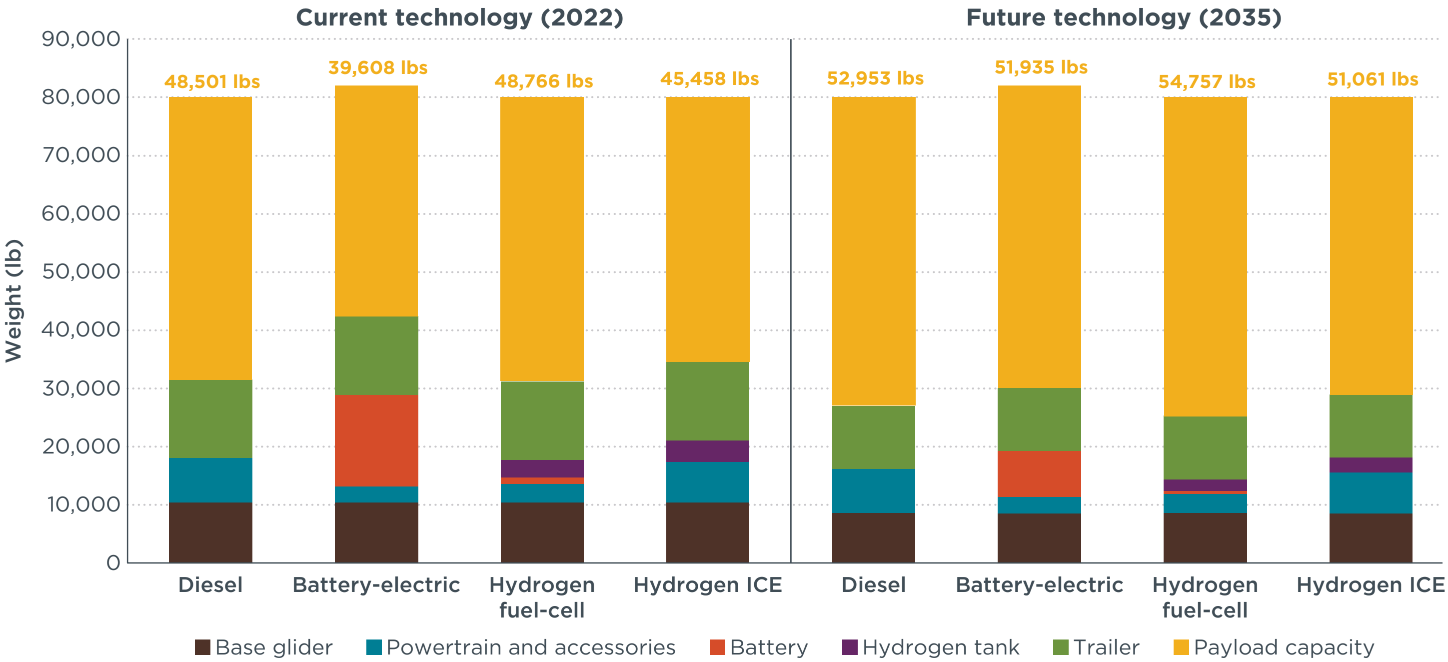

Figure 3. Weight breakdown for Class 8 sleeper cab long-haul trucks for different powertrain technologies. Battery size: 1 MWh for the current technology scenario and 740 kWh for the future technology scenario.

TOTAL COST OF OWNERSHIP MODELING

This section explains the TCO modeling approach for the four considered truck technologies. The TCO model for battery electric trucks has been thoroughly described in previous ICCT publications (Basma, Saboori, & Rodríguez, 2021; Basma, Rodríguez, Hildermeier, & Jahn, 2022). The model for hydrogen fuel-cell trucks is described in Basma, Zhou, and Rodríguez (2022). The model converts all fixed and operational expenses of a particular model year truck into cash flows, considering the analysis period and discount rate. The TCO analysis includes the truck's purchase and finance cost, insurance, residual value, diesel fuel, hydrogen fuel, charging, labor, and maintenance costs. The analysis period is five years, which is considered representative of first ownership in the United States, and the discount rate is 7%.

Capital expenses

The truck capital expenses include its retail price and the related financial costs, in addition to the truck residual value.

Manufacturer suggested retail price

The average manufacturer suggested retail price (MSRP) of a diesel Class 8 tractor in 2022, determined from several publicly available sources, is $158,000 (Slowik et al., 2023). We expect this cost to increase to $170,000 due to compliance with future emissions targets, assuming the diesel technology will reach its full potential by 2035 (Buysse, Sharpe, & Delgado, 2021). For the hydrogen ICE truck, we assume that the tractor cost, excluding the hydrogen tank, will be $3,000 less than its diesel equivalent, considering the diesel fuel tank and the simpler emission control systems.

We estimate MSRPs for the battery electric and hydrogen fuel-cell trucks using a bottom-up approach. First, the base glider cost, which includes the chassis and all powertrain accessories, is estimated based on the truck's technical specifications and the costs reported in Xie et al., (2023). The manufacturing costs of the main powertrain components are then estimated individually, including for the battery, fuel cell unit, hydrogen tanks, and electric drive. Table 4 summarizes these direct manufacturing costs. These costs are then aggregated to calculate the truck's direct manufacturing cost (DMC).

Table 4. Direct manufacturing costs of the main zero-emission truck components in 2022, 2030, and 2040.

Parameter	2022	2030	2040
Energy battery	230 $/kWh	123 $/kWh	99 $/kWh
Power battery	408 $/kWh	242 $/kWh	194 $/kWh
Fuel cell	826 $/kW	301 $/kW	242 $/kW
Hydrogen tank	1,261 $/kg	844 $/kg	675 $/kg
Electric drive	60 $/kW	23 $/kW	18 $/kW

The truck's retail price is calculated by multiplying the DMC by indirect cost multipliers (ICMs) adopted from U.S. Environmental Protection Agency and U.S. Department of Transportation (2016) to account for costs related to research and development, overhead, marketing and distribution, warranty expenditures, and profit markups. In general, technologies with low maturity levels will incur high ICMs. We use ICMs of complexity level "High 1" for the base glider components and the battery pack.[2] For the fuel cell and hydrogen storage tank, ICM complexity level "High 2" is used.[3]

Figure 4 shows the MSRP evolution for the four considered powertrain technologies. The calculated retail prices consider the incentives provided in the Inflation Reduction Act for battery electric and hydrogen fuel-cell trucks (Inflation Reduction Act, 2022). These incentives, which expire in 2032, are calculated as 30% of the price differential between a zero-emission truck and its diesel equivalent, capped at $40,000. The truck retail price is assumed to be financed through loans with a 4% annual interest rate over five years.

2 ICM Complexity level "High 1" corresponds to an ICM of 1.42 in 2022, which decreases linearly to 1.27 by 2035.

3 ICM Complexity level "High 2" corresponds to an ICM of 1.53 in 2022, which decreases linearly to 1.27 by 2035.

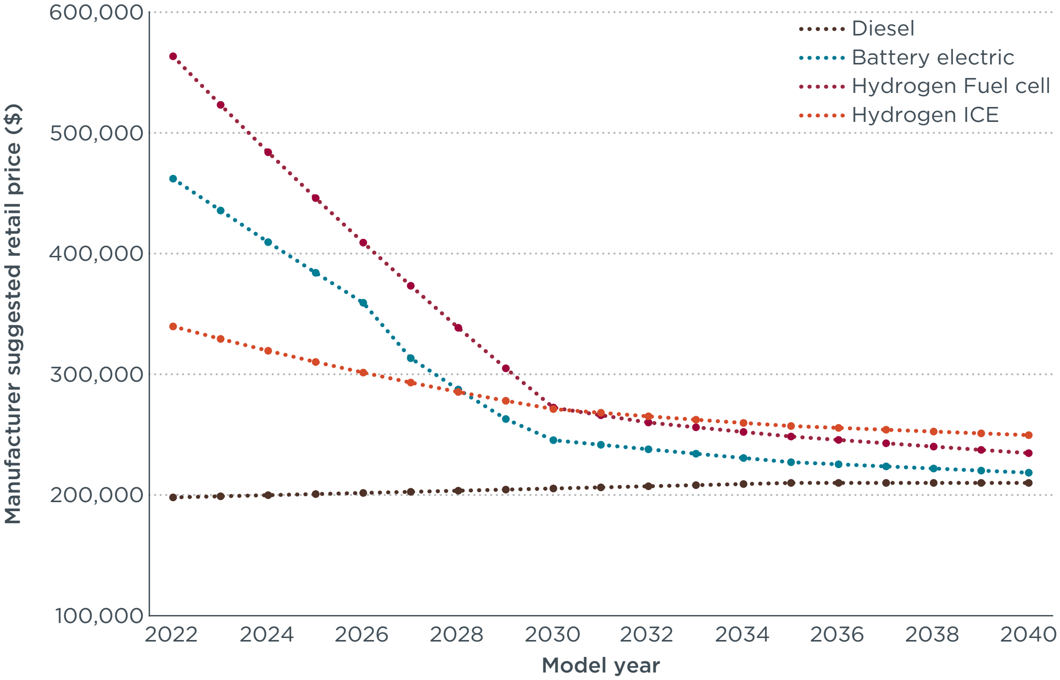

Figure 4. Retail price evolution of Class 8 long-haul tractor-trailers for diesel, battery electric, fuel-cell, and hydrogen internal combustion engine trucks between 2022 and 2040.

Fuel-cell trucks record the highest retail price in 2022, reaching $600k, primarily driven by the fuel cell unit and hydrogen tank cost, followed by the battery electric truck at around $500k. Hydrogen ICE trucks are almost $120k more expensive than their diesel counterparts due to the cost of the hydrogen tanks. The retail price of all alternative truck technologies decreases between 2022 and 2040, driven by cost reduction in main zero-emission powertrain components, such as batteries, fuel cells, and hydrogen tanks. The diesel truck retail price is expected to increase due to the more expensive needed technology packages needed to comply with future emissions standards, assuming that diesel technology will reach its full potential by 2035.

The estimated battery electric truck retail price shows a significant drop between 2026 and 2027, driven by our assumption that MW charging coverage in the United States by 2027 will be large enough so that manufacturers will size batteries considering the possibility of charging during the day, which results in smaller battery sizes and lower retail prices as discussed earlier. A detailed price breakdown can be found in Xie et al. (2023).

Residual value

The truck residual value at the end of the analysis period is estimated using similar methodology as in Basma, Zhou, and Rodríguez (2022) and Mao et al. (2021). For diesel trucks, depreciation is composed of a fixed annual depreciation rate of 7.5% and a variable depreciation rate as a function of the vehicle miles travelled and the truck lifetime. We assume the truck's lifetime is 15 years with a total cumulative VMT of ~ 1.3 million miles (United States Environmental Protection Agency, 2022). After operating for five years and covering a cumulative VMT of ~ 600,000 miles, the estimated truck residual value is 35%.

Alternative truck technologies include components with a potential second-life market, such as batteries, fuel cells, and hydrogen tanks. Current fuel cell durability is estimated to be around 15,000 hours of operation, which increases to 22,000 hours by 2030 (Ricardo Strategic Consulting, 2022). The fuel cell residual value is estimated based on the number of operating hours after five years. This results in a 25% fuel cell unit residual value for 2022 technology and 49% residual value by 2030. The battery lifetime is assumed to be 3,000 cycles in 2022, with the potential to increase to 5,000 cycles in the future (Nykvist & Olsson, 2021). The number of charge-discharge cycles per day depends on the charging power. Given our assumption that trucks today will primarily rely on 350 kW chargers during the day, the daily number of cycles is 1.25, resulting in 2,000 cycles after 5 years. When MW chargers are used as of 2027, the number of daily cycles will increase to 1.8, resulting in ~ 2,900 cycles after 5 years. We also assume that battery residual value at its end life, defined as 80% capacity retention, will be 15% of its original price (Burke & Zhao, 2017). That being said, for current battery and charging technologies, the estimated battery residual value is ~ 43%, increasing to 49% for future battery technologies. Hydrogen storage tanks are assumed to have a lifetime of 5,000 charge/discharge cycles (Pohl & Ridell, 2019), resulting in a 70% residual value after five years of operation. Table 5 summarizes the residual value assumptions.

Table 5. Residual value of components after five years of operation

Component	2022 Model year	2030 Model year
Base glider and e-drive	35%	35%
Battery	43%	49%
Fuel cell	25%	49%
Hydrogen tank	70%	70%

Federal excise tax

The retail sale of commercial vehicles is subject to a 12% federal excise tax (Office of the Federal Register, 2012). This implies that trucks with a higher MSRP will be subject to a higher federal excise tax.

Operational expenses

Operational expenses are related to the vehicle miles driven, including the costs of diesel fuel, hydrogen fuel, charging, maintenance, and labor.

Diesel fuel price

The price of diesel fuel in the United States differs among regions and states. Data from the U.S. Energy Information Administration categorizes diesel fuel prices based on geographic areas (U.S. Energy Information Administration, 2022b). Projecting these prices into the future incurs a very high level of uncertainty. To account for this uncertainty, we assume several scenarios for the diesel fuel price evolution, presented in the results section, with the baseline scenario being the 2022 average prices.

It is worth highlighting that diesel fuel prices have almost doubled between 2020 and 2022, driven by the global energy crisis. In addition, diesel fuel prices are as low as $4.70/gal in the Gulf Coast states, while California records the highest prices exceeding $6.00/gal, 28% higher than the U.S. national average.

Hydrogen fuel price

Hydrogen fuel prices across the U.S. states are taken from Slowik et al. (2023), where all detailed modeling methodology and data assumptions can be found. The prices include on-site renewable (green) hydrogen production costs, hydrogen refueling station costs, and tax credits for renewable electricity and clean hydrogen provided by the Inflation Reduction Act. Figure 5 shows the state-level green hydrogen price between 2023 and 2045 used in this study. Price variations across states result from varying solar and wind resources. States with more abundant solar or wind resources can run renewable electricity plants more often, achieving lower renewable electricity costs. Green hydrogen prices are expected to decrease over time as the technology matures.

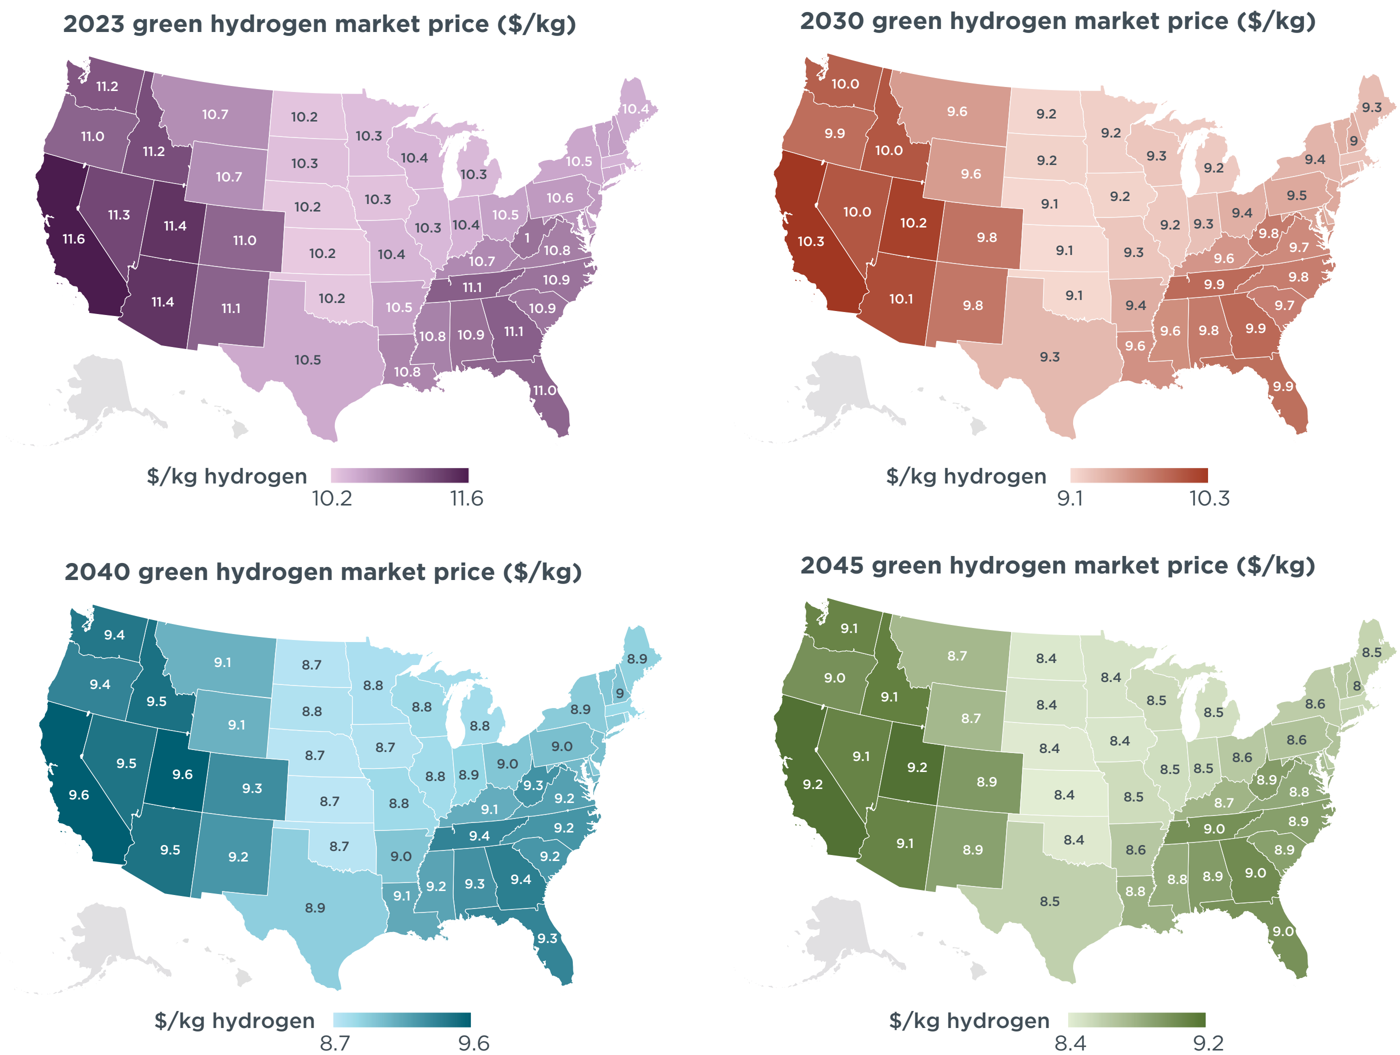

Figure 5. Summary of green hydrogen fuel market price at the pump in different states in 2023, 2030, 2040, and 2045.

Charging cost

Charging cost is comprised of the electricity cost and the cost of the charging infrastructure. Electricity costs vary among and within states depending on local electricity tariffs and rates set by the respective utilities. Infrastructure costs are assumed to be independent of the charging station location and correspond to public on-route charging stations at truck stops along highways. Figure 6 shows the charging cost modeling framework.

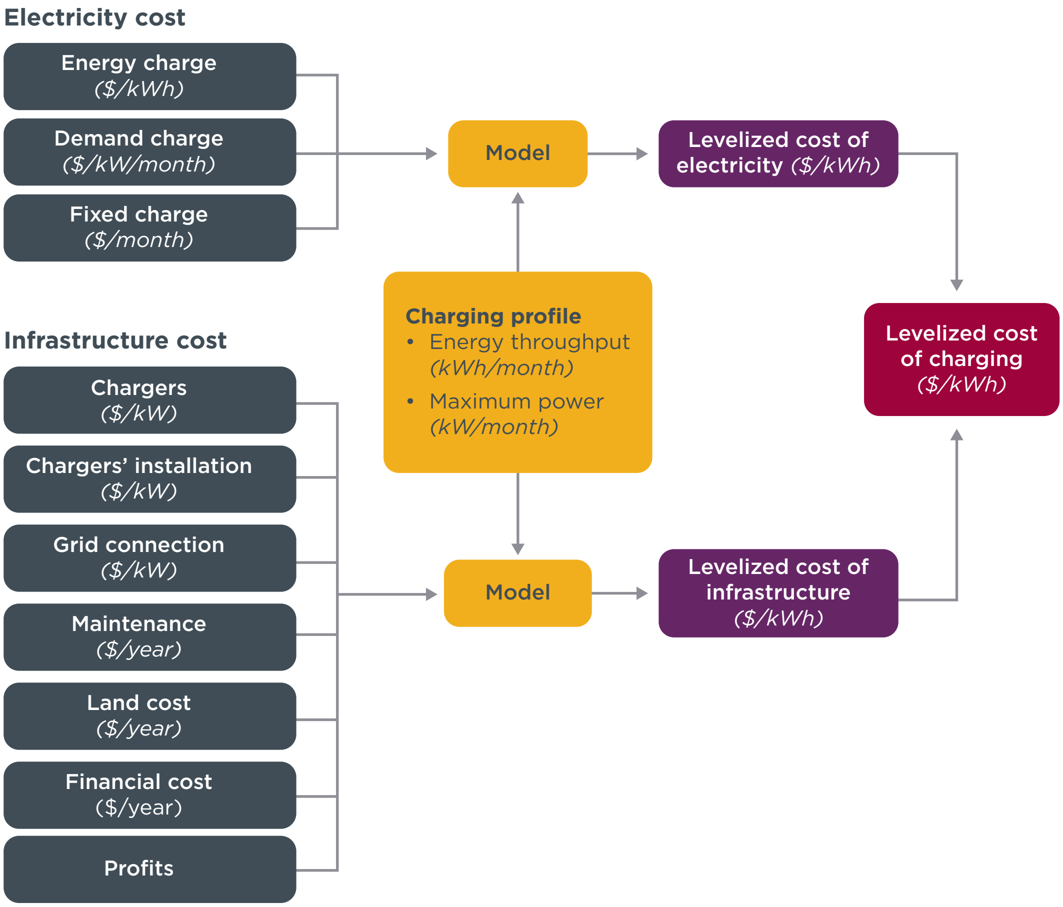

Figure 6. Charging cost modelling framework

We assume long-haul trucks will utilize on-route public charging stations at truck stops along highways. We assume a charging station size of 20 MW, including 17 1-MW chargers and 20 150-kW chargers. The charging station peak power demand is assumed to be 50% of the station size, considering the coincident load of MW charging events, as explained in Bennett et al. (2022). This peak demand drives grid upgrade costs and electricity demand charges.

Charging station utilization is dependent on the market uptake of battery electric trucks in the United States. We assume that the long-term utilization rate of on-route public charging stations is 15% by 2035, assuming utilization will increase linearly until 2035 in an approach similar to Bennett et al. (2022). The station utilization rate will directly impact the levelized cost of charging, as detailed in the proceeding sections.

Levelized cost of electricity

Electricity costs are estimated for each of the seven representative states using cost information from the largest utilities in each state and those covering long-haul routes.

Table 6 summarizes the electricity rates considered in the selected states and the corresponding levelized cost of electricity.

Table 6. Summary of electricity rates considered in selected states.

State	Source	Rate	Energy charge ($ cents/kWh)	Demand charge ($/kW/month)	Fixed charge ($/month)	Levelized cost of electricity (¢/kWh)
California	Pacific Gas and Electric Company (2022)	BEV-2-P rate (Primary distribution > 100 kW)	19.57 [a)]	-	17,196 [b)]	20.48
Florida	Florida Power and Light (2023)	General Service Large Demand Sheet 8.412	1.68	13.57	255	8.84
Georgia	Georgia Power (2022)	Power & Light Large Schedule PLL-13	Levelized cost provided by utility			13.1
Illinois	Billing sample estimate-Commonwealth Edison (2023)	Extra-large load (above 10 MW)	6.53 [c)]	11.17	1,962	12.51
New York	Billing sample estimate - National Grid (2023)	SC3 General – Primary service	4.63	14.08	2,583	12.18
Texas	Oncor (2022)	Primary - > 10 kW substation	3.5 [d)]	8.3 [e)]	-	7.87
Washington	Puget Sound Energy (2022)	Schedule 31	5.6	9.94 [f)]	358	10.85

a) There are three time-of-use energy charges: (1) peak (4p-9p) at 39.046 cents/kWh, (2) off-peak (9p-9a, 2p-4p) at 18.158 cents/kWh, and (3) super off-peak (9a-2p) at 15.892 cents/kWh. We assume 60% of charging will occur during off-peak hours, 10% during peak hours, and 30% during super off-peak hours.
b) Subscription charge at $85.98 per 50 kW block assuming 10 MW peak site capacity.
c) All state and municipal taxes are added to an energy charge of 3.5 cents/kWh, assumed based on the historic 5-year average.
d) Assumption based on a 5-year historic average.
e) aggregates demand and distribution charges.
f) Average between a summer tariff at 7.94 $/kW and a winter tariff at 11.94 $/kW.

Levelized cost of infrastructure

Infrastructure cost includes the grid connection, charger, and the station's operational expenses. Figure 7 illustrates the major components of the battery electric truck charging infrastructure ecosystem. The grid connection costs include all expenses incurred in front of the meter, in addition to on-site transformers, electric panels, and switchgear.

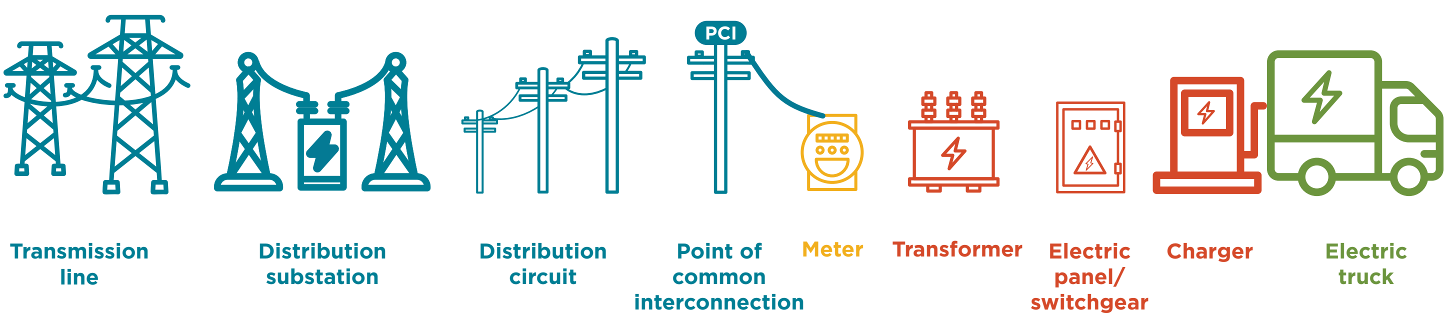

Figure 7. Battery electric truck charging infrastructure ecosystem.

The grid connection cost can add significant cost to the investment needed to deploy public MW charging stations. The underlying assumptions for our grid connection cost estimates are summarized below:

» There will be flexibility in choosing the station locations to reduce grid connection costs. We assume that there will either be sufficient space inside the existing substation to add another substation transformer or it will be possible to upgrade an existing substation transformer. Thus, the land costs for a new substation were not included in the infrastructure cost calculations, as well as the engineering, design, right-of-way acquisition activities (time), and costs.

» The station is connected to the primary voltage grid. Large charging hubs will most probably buy power from the utility at primary voltage.

» There is no onsite energy storage system to help reduce the peak load. Onsite energy storage batteries incur high investment costs. On the other hand, such technology can lower the charging station operational expenses related to demand charges and/or deal with the utility's inability to alleviate grid congestion.

» There is no renewable power generation at this public charging site.

» The charging station will incur all grid connection and upgrade costs.

Based on those underlying assumptions, Table 7 summarizes the grid connection, upgrade, the charger installation costs. These costs are developed based on utility experts' feedback for the 10 MW peak load charging site. The levelized cost is calculated assuming that all the mentioned components have a lifetime of 40 years. All costs are converted into annual cashflows considering an 8% internal rate of return.

Table 7. Summary of grid upgrade and connection costs, and charger's-related costs behind the meter.

Component	Category	Notes	Cost	Levelized cost (¢/kWh)
Sub-transmission line	Sub-transmission	115 kV line – Not included – Assumed the existing substation has sufficient space to accommodate another transformer, or a larger capacity substitute transformer.	-	-
Greenfield substation	Substation	Not included – Assuming the existing substation has sufficient space to accommodate another transformer.	-	-
Substation transformer addition		One 28 MVA transformers added to an existing distribution substation. Cost Includes foundation, grounding, conduit and wiring, supply and install.	$2,000,000	0.74
Other equipment		Feeders, tie, transfer switches	$1,100,000	0.40
Distribution feeder to the closest point on the grid (Point of Interconnection)	Distribution	Assuming an overhead distribution feeder, 1 mile in length.	$900,000	0.33
Connection to the meter: closest point on the grid to a utility meter	To-the-meter	Assuming 300-feet long connection	$100,000	0.04
Utility meter and meter base		Primary service metering	$15,000	0.01
Primary Transformer (converting 13kV to 480V)	Behind-the-meter	1,500 kVA – Assumed 10 1500kVA transformers to meet a 10 MW peak demand, with some redundancy for maintenance, futureproofing, and to meet electrical safety/code requirements.	$600,000	0.22
Charger installation		Includes switchgear, wiring, onsite construction, and trenching. Assumed $195,000 per 1 MW charger (total 17) and $137,250 per 150 kW charger (total 20)	$6,060,000	2.23
Total			**$10,775,000**	**3.97**

Table 8 summarizes the costs for the chargers and charging station, which are adopted from Bennett et al. (2022). The levelized cost is calculated assuming the chargers have a lifetime of 10 years. All these cost components are converted into annual cashflows considering an 8% internal rate of return.

Table 8. Summary of charger and station operation costs. Adopted from Bennett et al. (2022).

Component	Costs	Levelized cost (¢/kWh)
Charger acquisition	1 MW charger: $300,000 per charger (Total 17) 150 kW charger: $53,655 per charger (Total 20)	4.04
Annual maintenance per charger	$3,200 per charger (Total 37)	0.52
Annual land cost	$25,000 for 1 acre	0.11
Total		**4.67**

The total charging cost is the sum of electricity and infrastructure levelized costs, as summarized in Figure 8. This is the estimated average levelized cost of charging over the station's lifetime. In other words, although we expect lower utilization rates during the early years of operation, we assume that charging station operators will average their expenses and profits over the station's lifetime.

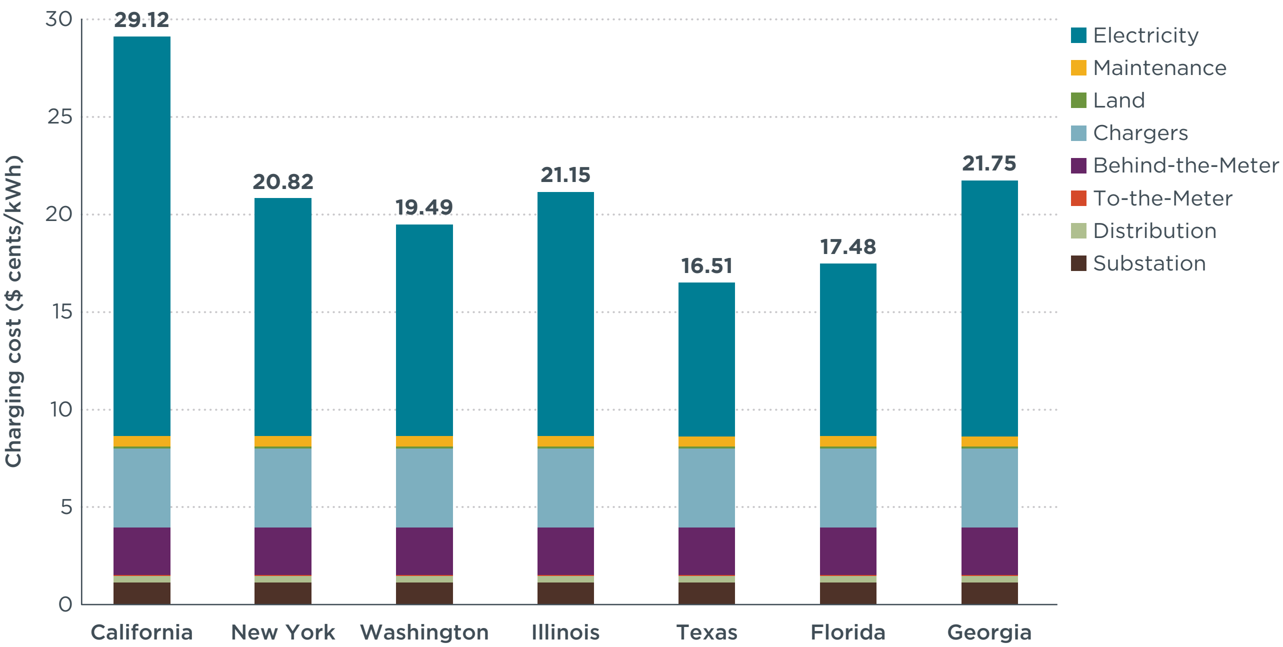

Figure 8. Charging costs in selected states. Data correspond to 2022–2023 electricity rates in each state.

Maintenance cost

Maintenance costs for diesel, battery electric, and hydrogen fuel-cell Class 8 long-haul trucks are adopted from a recent publication by UC Davis (Wang et al., 2022). Figure 9 shows the truck maintenance costs breakdown for the different powertrain technologies. Maintenance costs include common components among all powertrain technologies, such as brakes, gears, air conditioning, tires, and cabin air filters. Powertrain-specific components, such as engine-related maintenance, battery, fuel cell, and hydrogen storage, are also highlighted. Hydrogen ICE trucks are assumed to have similar maintenance costs to their diesel counterparts, with additional costs related to the maintenance of the hydrogen storage system.

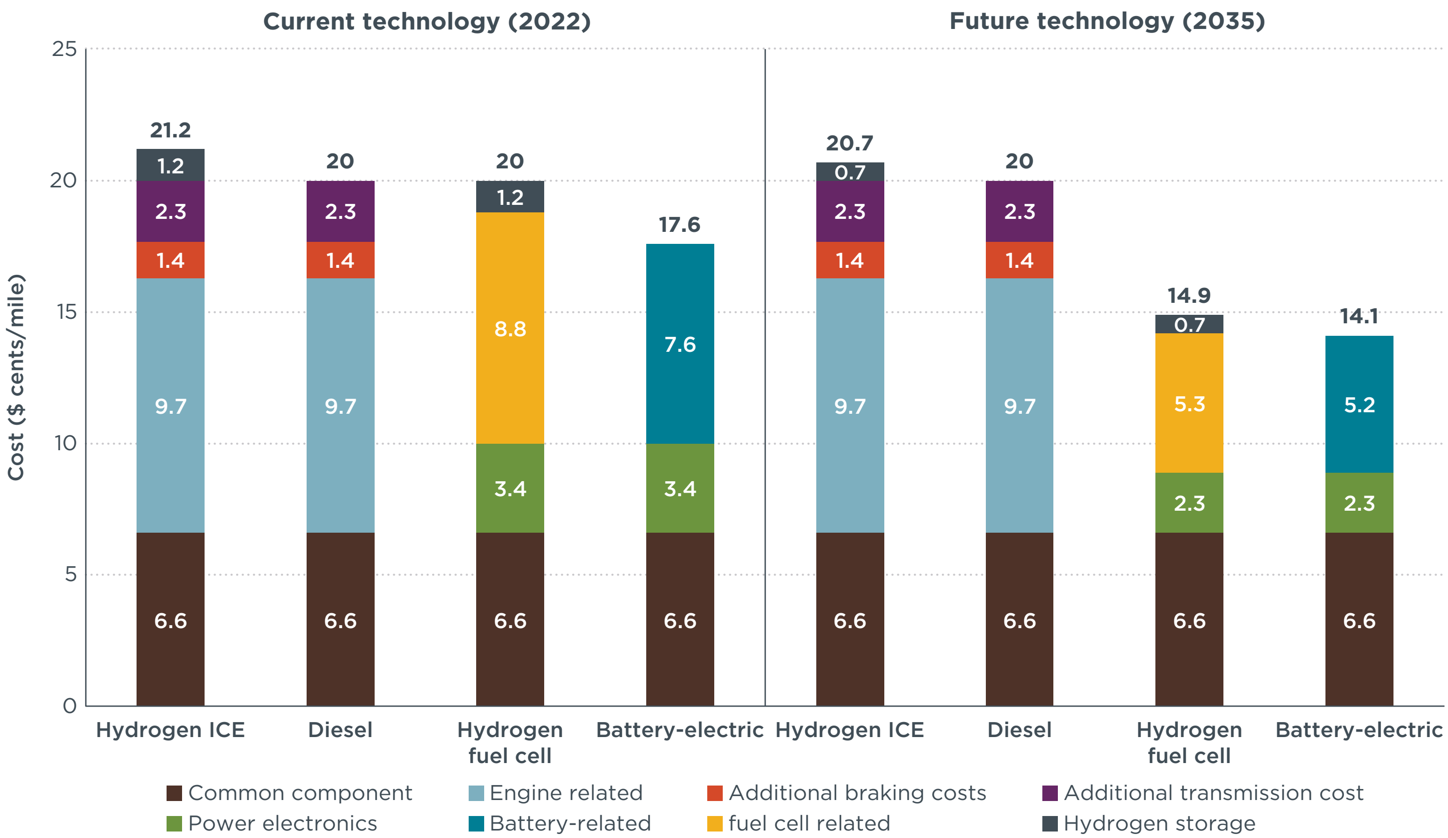

Figure 9. Maintenance costs breakdown for different powertrain technologies for Class 8 long-haul trucks in the United States. Adopted from Wang et al. (2022).

For current vehicle technology, battery electric trucks record the lowest maintenance costs at $0.176/mi, relative to $0.20/mi–$0.212/mi for other technologies. With the expected development in battery and fuel cell technologies over time, associated maintenance costs are expected to decrease to around $0.14/mi–$0.15/mi by 2035 due to the learning curve effect for new technologies.

Labor cost

Labor costs are estimated on a per-mile basis assuming a rate of $0.79 per mile, according to Burnham et al. (2021). For battery electric trucks, drivers may need to stop more frequently to recharge, increasing their number of working hours during the day. This is the case for battery electric trucks before the wide deployment of MW charging stations along long-haul routes prior to 2027. The additional labor cost is calculated depending on the additional number of working hours due to truck charging. Prior to the deployment of MW chargers, this can lead to a 10%–15% increase in labor cost.

Insurance

Insurance costs for tractor-trailers can be a significant TCO component. This study considers comprehensive and collision insurance in addition to liability insurance. The former is an annual cost estimated to be around 3% of the truck purchase price, and the latter is calculated as a fixed per-mile cost at $0.065/mi, similar to Burnham et al. (2021). This approach distinguishes between different powertrain technologies with different retail prices, and also distinguishes between different truck annual VMT.

NATIONAL ANALYSIS: MONTE CARLO SIMULATIONS

The TCO analysis at the U.S. national level is carried out using a stochastic Monte Carlo approach, given the significant variation in several TCO cost components among different states, primarily diesel, hydrogen, and charging costs. In addition, the analysis captures the reported variations in the technology cost, such as for the battery, fuel cell, and hydrogen tanks. Table 9 summarizes the stochastic variables' mean and standard deviation data used to develop the respective probability density functions. Figure 10 illustrates the probability density functions for the different stochastic variables used in the Monte Carlo analysis. We assume that all variables will follow a lognormal distribution.

All technology cost data are available in a recent ICCT publication (Xie et al., 2023), where we collect data from different sources and estimate the sample mean and standard deviation per component. We rely on the state-specific data presented earlier in the operational expenses section for hydrogen fuel, diesel fuel, and charging cost data. We define weights to the different state-specific cost data based on the percent distribution of tractor-trailer vehicle's miles traveled, as shown in Figure A1 in the appendix. We then estimate each stochastic variable's weighted average mean and standard deviation. Diesel and hydrogen fuel price data are collected for all 50 states, while charging costs are only developed for the 7 states considered in this paper, assuming they cover a wide spectrum of charging costs in the United States. Another important stochastic variable to define is the vehicle's daily mileage, which will drive the vehicle energy storage size, mainly the battery energy storage capacity. Variation in daily mileage is also considered, where we define a "mileage variability" variable used in the vehicle energy storage sizing.

Table 9. Summary of stochastic variables used to develop the respective probability density functions.

Variable	Mean			Standard deviation		
	2022	2030	2040	2022	2030	2040
Energy battery cost ($/kWh)	232	123	99	53.4	22.6	7
Power battery cost ($/kWh)	409	242	198	123	63	15
Fuel cell cost ($/kW)	827	301	241	502	191	70
Hydrogen tank cost ($/kg)	1,262	844	675	313	224	120
Electric drive cost ($/kW)	60	23	18	9	4.1	2
Diesel fuel price ($/gal)		4.13			2.95	
Charging cost ($ cents/kWh)		19.6			3.2	
Green hydrogen price ($/kg)	11.2	9.58	9.08	0.4	0.35	0.29
Daily driving mileage (miles)		400			75	
Daily mileage variability		1.1			0.1	

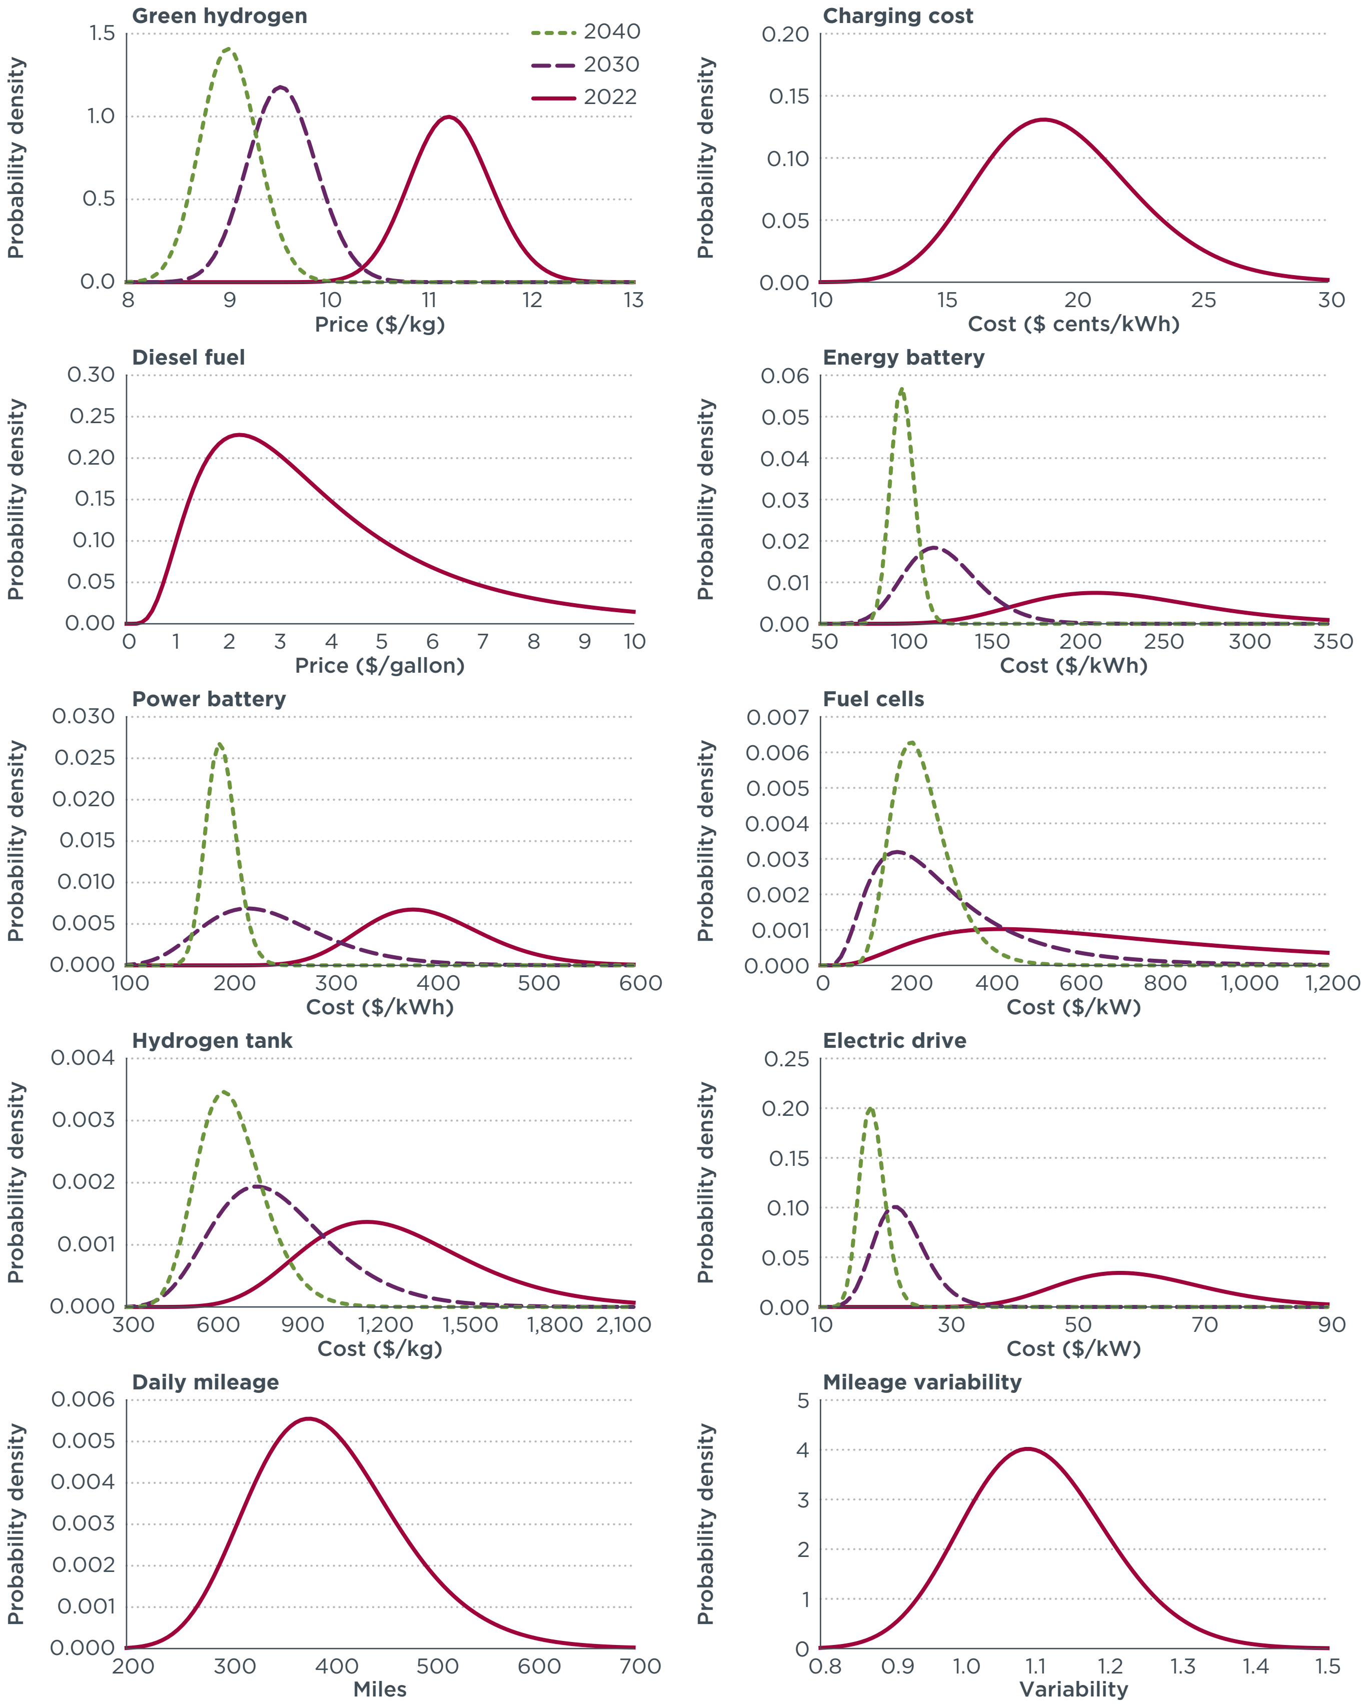

Figure 10. Summary of probability density functions for the different stochastic variables used in the Monte Carlo analysis.

RESULTS AND DISCUSSION

STATE-SPECIFIC ANALYSIS

This section presents the state-specific TCO, considering the average capital expenses and the state-specific fuel and energy prices presented earlier. We consider that diesel and charging costs are fixed between 2022 and 2040 due to the high uncertainty in predicting the diesel and electricity cost evolution during this timeframe. The impact of diesel fuel and charging cost variations on the TCO are examined in the sensitivity analysis section. Hydrogen fuel prices are assumed to vary between 2022 and 2040, as discussed previously.

Figure 11 shows the state-specific TCO for all technologies for truck model year 2022. Across all states, diesel trucks are the cheapest to operate, as their TCO ranges from $1.88/mi (Texas) to $2.06/mi (California). The highest TCO for diesel trucks is recorded in California due to the high diesel fuel prices there. Battery electric trucks come as the second cheapest technology from a TCO perspective. The lowest TCO for battery electric trucks is recorded in Texas at $2.18/mi, driven by the low charging costs, while battery electric trucks operating in California record the highest TCO at $2.50/mi. Battery electric trucks generally record a 13% to 26% higher TCO than their diesel counterparts in 2022.

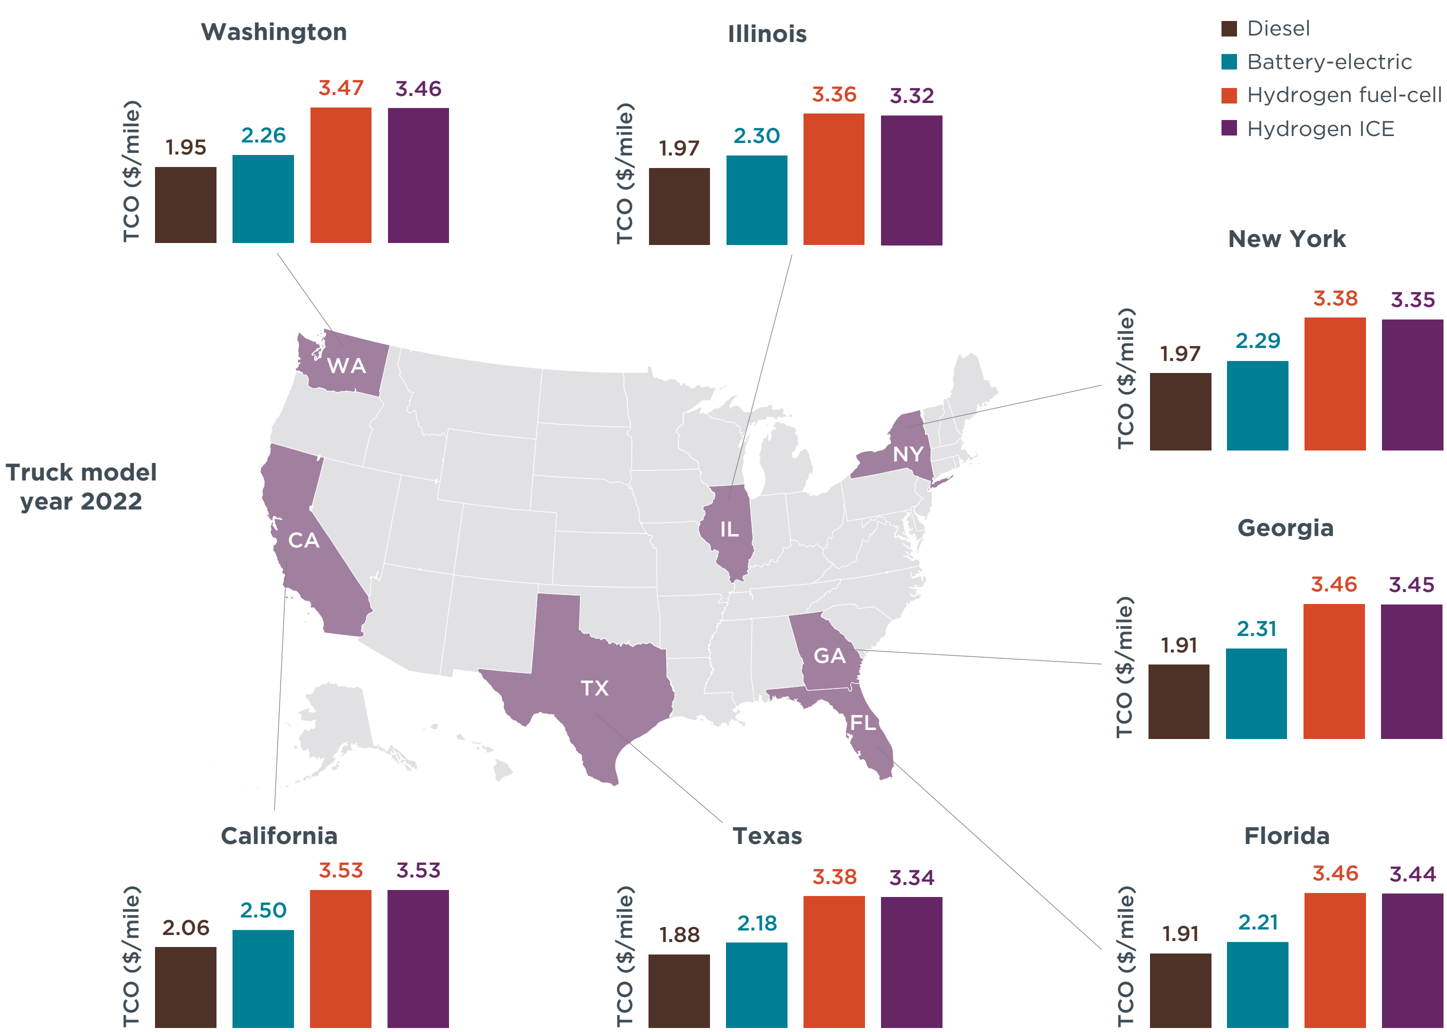

Figure 11. State-specific total cost of ownership for different truck technologies. Case of truck MY 2022.

Hydrogen fuel-cell and hydrogen ICE trucks show a very similar TCO for MY 2022, reaching as high as $3.53/mi for trucks operating in California and as low as $3.36/mi for trucks operating in Illinois. This is mainly driven by the green hydrogen fuel price in each state, which are expected to be the highest in California and the lowest in Illinois. Both hydrogen-powered trucks record a 68%–81% higher TCO than diesel trucks and 34%–59% higher TCO than their battery electric counterparts.

Figure 12 shows the state-specific TCO for all technologies for truck MY 2030. In all considered states, battery electric trucks are expected to record the lowest TCO, ranging from $1.63/mi (Texas) to $1.90/mi (California). Diesel trucks follow with the second lowest TCO, ranging between $1.76/mi and $1.91/mi. For MY 2030 trucks, battery electric trucks are expected to record a 3%–8% lower TCO than diesel trucks. The TCO analysis for MY 2040 trucks is presented in Figure A9 in the appendix.

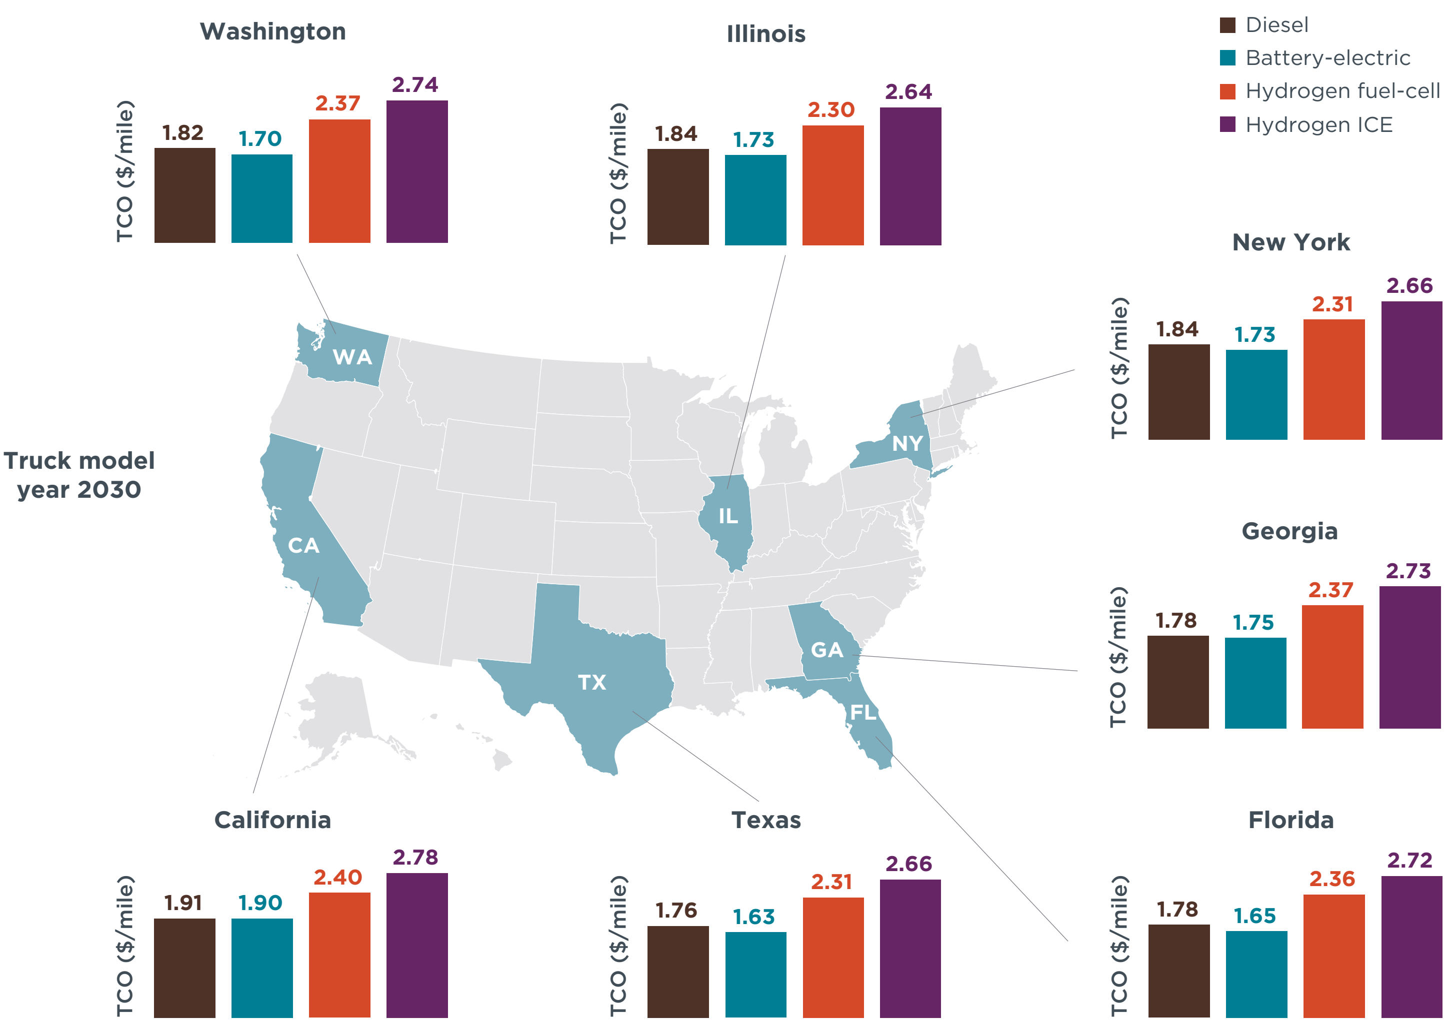

Figure 12. State-specific total cost of ownership for different MY 2030 truck technologies.

The TCO of hydrogen fuel-cell trucks is expected to remain much higher than their diesel and battery electric counterparts but lower than that of hydrogen ICE trucks. Hydrogen fuel-cell trucks record a TCO in the range of $2.30/mi to $2.40/mi, while the TCO of hydrogen ICE trucks ranges from $2.64/mi to $2.78/mi, or almost 20% higher than the TCO of hydrogen fuel-cell trucks.

Table 10 summarises the year of TCO parity of alternative truck technologies relative to diesel trucks in selected states.

Table 10. Summary of TCO parity year between alternative truck technologies and diesel trucks in selected states.

Technology	California	Florida	Georgia	Illinois	New York	Texas	Washington
Battery electric	2030	2028	2029	2028	2028	2027	2028
Hydrogen fuel-cell	> 2040	> 2040	> 2040	> 2040	> 2040	> 2040	> 2040
Hydrogen ICE	> 2040	> 2040	> 2040	> 2040	> 2040	> 2040	> 2040

The TCO findings for MY 2040 trucks and the detailed state specific TCO breakdown are documented in the appendix.

SENSITIVITY ANALYSIS

The previous state-specific analysis uses the 2022 average diesel fuel prices in selected states and 2022 electricity rates. It assumes these prices and costs will remain fixed during the entire analysis period between 2022 and 2040. However, energy and fuel prices are subject to continuous variations, and this section examines the impact of these prices on the TCO of different truck technologies. This section also examines the impact of truck payload on the TCO analysis.

Impact of fuel and energy prices

Figure 13 shows the TCO parity sensitivity to diesel fuel prices and charging costs. The inclined lines represent the TCO parity year between both truck technologies. The sensitivity analysis covers a wide range of fuel prices, where diesel fuel prices are varied between \$2.00/gal and \$7.50/gal, representing the minimum and maximum prices observed in the United States between 2017 and 2022. Charging cost is varied between \$0.10/kWh and \$0.35/kWh. For example, if the diesel fuel price is \$5.00/gal and the charging cost is \$0.20/kWh, TCO parity between battery electric and diesel trucks is expected between 2027 and 2028.

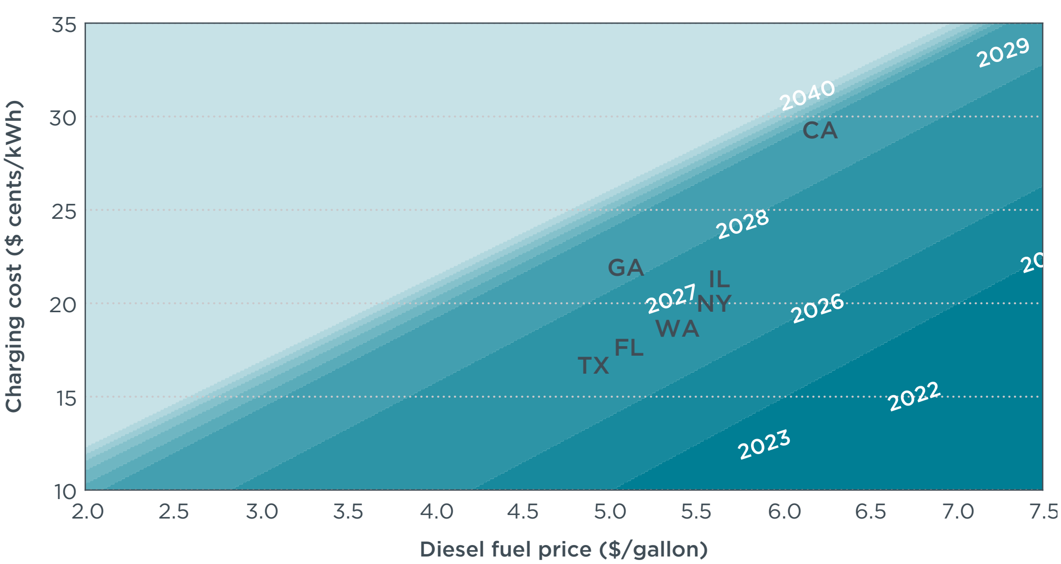

Figure 13. Total cost of ownership parity sensitivity to diesel fuel prices and charging costs. A comparison between battery electric and diesel.

Variations in diesel fuel prices and charging costs significantly impact the year battery electric trucks achieve TCO parity with diesel trucks. For the current range of diesel fuel prices in the United States of between $4.00/gal and $6.00/gal, and the range of charging costs between $0.15/kWh and $0.30/kWh, battery electric trucks can achieve TCO parity with diesel trucks by the end of this decade.

Figure 14 shows the TCO parity sensitivity to diesel and hydrogen fuel prices. The inclined lines represent the TCO parity year between both truck technologies. Hydrogen fuel price is varied between $2.00/kg and $12.00/kg. The higher limit considers the maximum modeled green hydrogen fuel price between 2022 and 2040. The lower limit is a hypothetical figure to model a highly favorable green hydrogen fuel price.

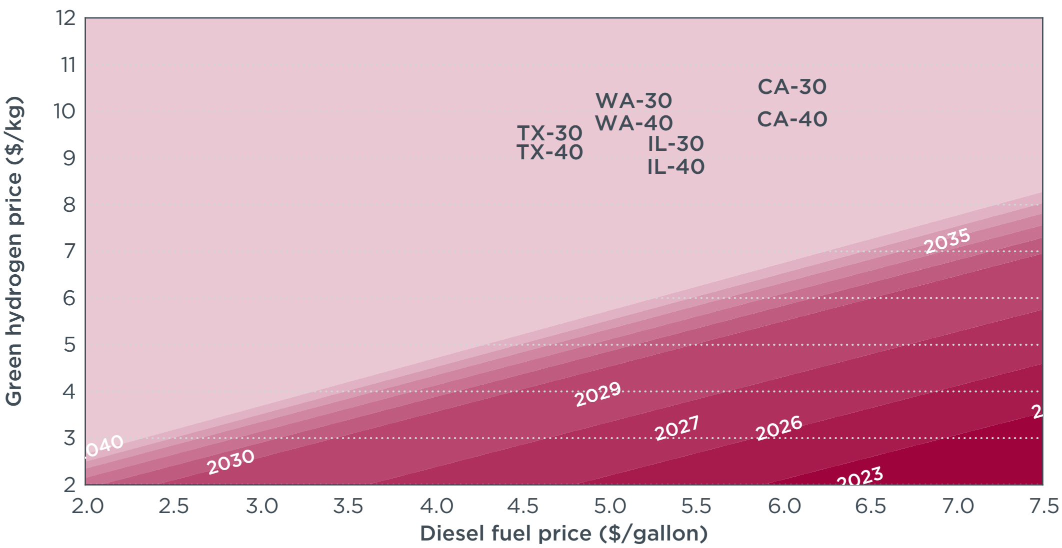

Figure 14. Total cost of ownership parity sensitivity to diesel and hydrogen fuel prices. A comparison between hydrogen fuel-cell and diesel trucks.

Variations in diesel and green hydrogen fuel prices significantly impact the TCO parity year between fuel-cell and diesel long-haul trucks. Fuel-cell long-haul trucks may achieve TCO parity with diesel trucks by 2025 if diesel fuel prices exceed $6.00/gal and green hydrogen fuel price drops below $5.00/kg. The figure highlights the current diesel fuel prices and the expected green hydrogen fuel price in 2030 and 2040 in selected states, ranging between $8.50/kg and $10.50/kg. Under the current diesel fuel prices, if fuel-cell trucks are to achieve TCO parity with diesel trucks by 2030, green hydrogen fuel prices would need to be between $4.00/kg and $6.00/kg. By 2040, the break-even hydrogen price is in the range of $5.00/kg to $7.00/kg.

Figure 15 shows the hydrogen ICE and diesel TCO parity sensitivity to diesel and hydrogen fuel prices. Hydrogen ICE trucks operating in long-haul are unlikely to reach TCO parity with diesel trucks any time before 2040 unless extreme scenarios result in very high diesel fuel prices exceeding $5.00/gal and very low green hydrogen fuel prices below $3.00/kg.

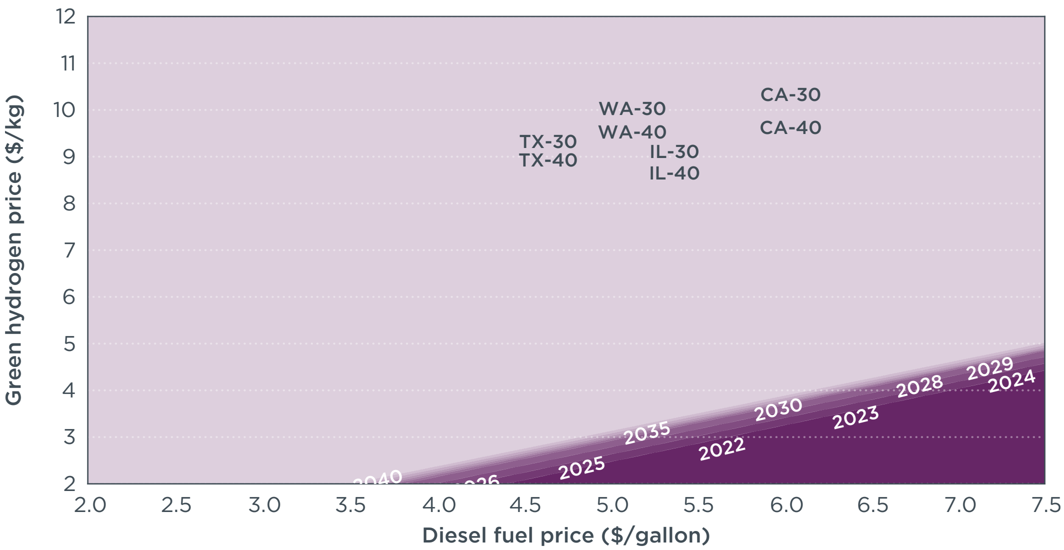

Figure 15. Total cost of ownership parity sensitivity to diesel and hydrogen fuel prices. A comparison between hydrogen ICE and diesel trucks.

Impact of payload

The average payload of the truck and its payload capacity can significantly affect its economic viability. The average use case presented in this study assumes an average payload of 38,000 lb, which is below the payload capacity of all considered powertrain technologies. This section examines the impact of operating at full payload on the TCO of the different trucks. However, as shown earlier, different truck powertrain technologies will have different payload capacities. To be able to compare the TCO for different maximum payloads, we calculate the TCO of each truck technology in $/ton. mi, i.e., dividing the TCO by the maximum payload capacity of each truck, expressed in U.S. tons.

With higher payloads, the fuel consumption of each truck technology increases, which yields higher fuel and energy costs. More energy-efficient powertrains will be less sensitive to this increase in payload. On the other hand, trucks with higher payload capacities can realize lower TCO per ton. Figure 16 shows the TCO for different technologies at average and maximum payloads. The TCO parity between battery electric and diesel trucks will be delayed by three to four years for the case of maximum payload compared to the case of average payload. The TCO gap between battery electric and both hydrogen-powered trucks will also be narrower, but their TCO would still be higher than that of their diesel and battery electric counterparts.

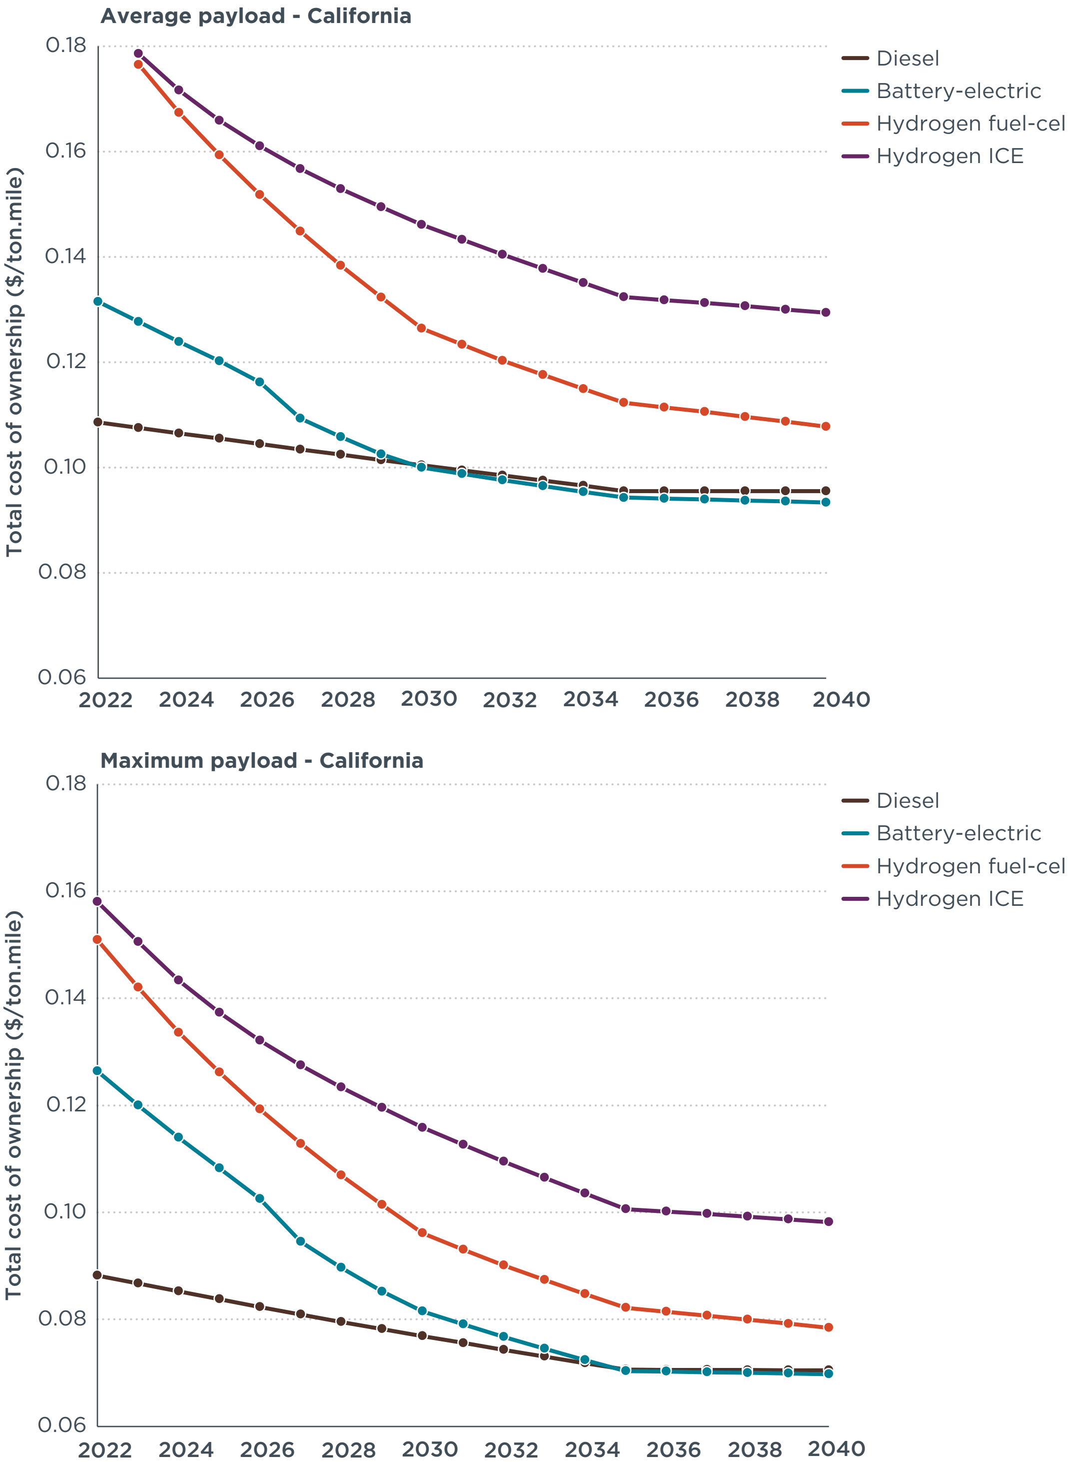

Figure 16. TCO of different truck technologies at average and maximum payloads.

TCO of battery electric versus hydrogen fuel cell trucks

Both battery electric and hydrogen fuel-cell trucks are zero-emission powertrain technologies at the tailpipe level and have the potential to achieve significant GHG emission savings relative to diesel trucks from a lifecycle perspective. As both technologies share a similar environmental performance, their future market uptake in the long-haul segment is expected to be driven by their economic performance, namely their TCO.

Figure 17 shows the TCO parity sensitivity of battery electric and hydrogen fuel-cell trucks to charging costs and green hydrogen fuel prices for several model years. For MY 2023 trucks, given the expected charging cost range of between \$0.15 /kWh and \$0.30/kWh, the break-even green hydrogen price is in the range of \$2.00/kg–\$5.00/kg, which is much lower than the \$10.00/kg–\$12.00/kg estimated price range in 2023. Even under very pessimistic charging cost assumptions of \$0.50/kWh, the required break-even green hydrogen price is \$8.50/kg, which is still lower than the estimated price range in 2023.

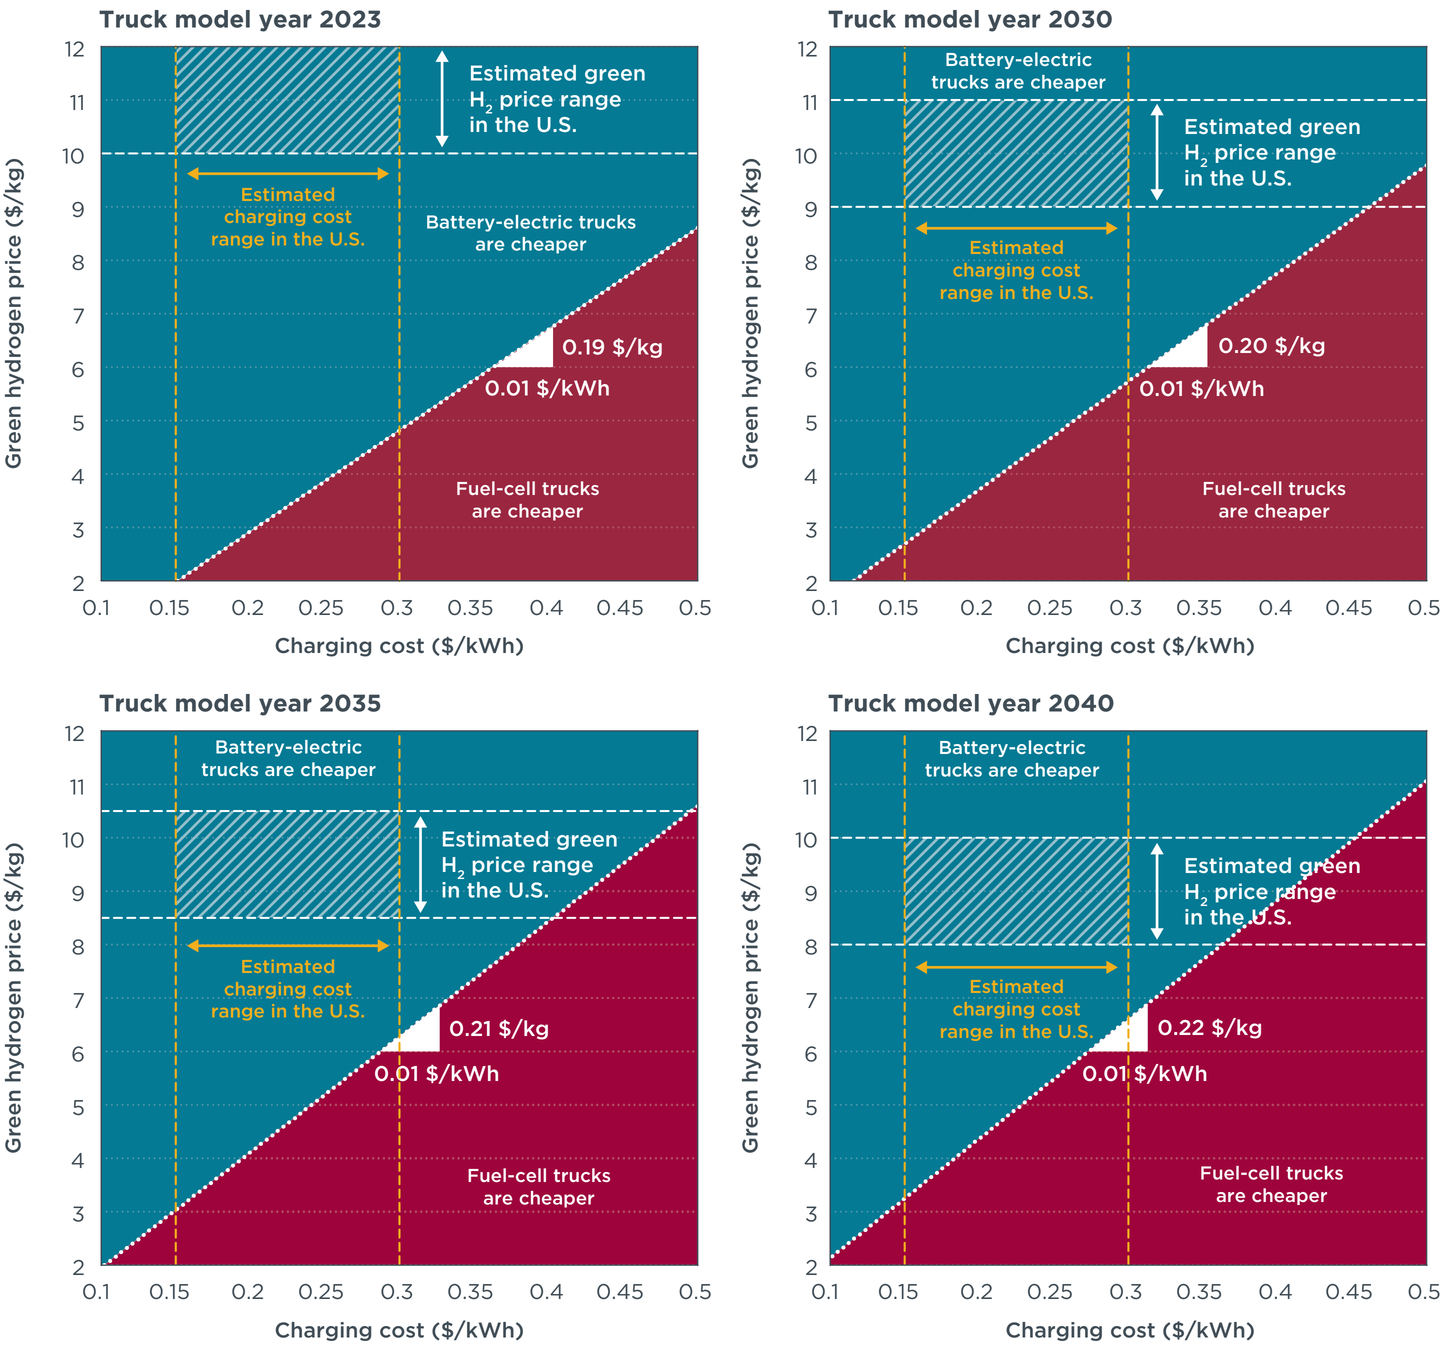

Figure 17. Total cost of ownership parity sensitivity to charging costs and hydrogen fuel prices for several truck model years. A comparison between battery electric and hydrogen fuel cell.

As the fuel-cell truck technology becomes more mature over time, the break-even hydrogen prices slightly increase, as shown in the panels of Figure 17 representing different truck model years. For MY 2040 trucks, given the expected charging cost range of between $0.15 /kWh and $0.30/kWh, the break-even green hydrogen price ranges from $3.50/kg to $7.00/kg, which is still lower than the $8.00/kg–$10.00/kg estimated price range in 2022.

Under the current and future estimates for green hydrogen prices, fuel-cell trucks can achieve a better TCO than their battery electric counterparts as of 2035 only if charging costs exceed $0.45/kWh, which is much higher than the modelled charging costs in this study. Nonetheless, this might be the case for some states or regions that are not considered in this study.

It is worth mentioning how TCO parity is more sensitive to variations in hydrogen fuel prices than charging costs, as implied by the triangle slopes in Figure 17. This is primarily related to the fuel economy, as battery electric trucks are more energy-efficient and consume less per mile than hydrogen fuel-cell trucks.

TCO of hydrogen fuel cell versus hydrogen ICE trucks

Figure 18 shows the TCO parity between both hydrogen-powered trucks as a function of the truck model year, highlighting the break-even hydrogen fuel price point per model year. In general, hydrogen ICE trucks incur a lower MSRP than their hydrogen fuel cell rivals. On the other hand, hydrogen fuel cell trucks have shown better fuel economy, as presented earlier in Figure 2. In cases of low hydrogen fuel prices, hydrogen ICE trucks are expected to have a better TCO because their operational expenses are not high enough to diminish their MSRP gap with hydrogen fuel cell trucks.

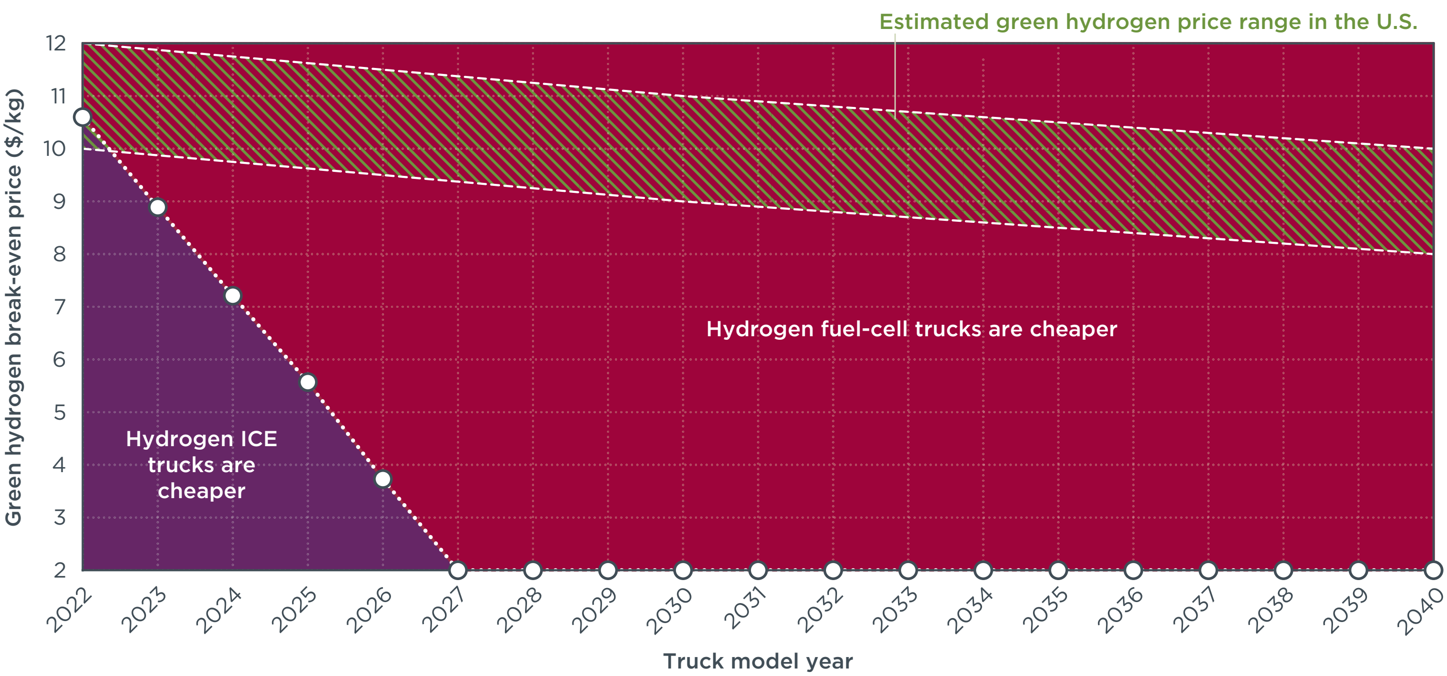

Figure 18. Total cost of ownership parity sensitivity to hydrogen fuel prices from 2022 to 2040. A comparison between hydrogen fuel-cell and hydrogen ICE trucks.

During the early market uptake phase, when fuel-cell truck MSRP is expected to be the highest, the break-even hydrogen fuel price is around $10.50/kg in 2022. In other words, if green hydrogen fuel price at the pump is below 10.5 $/kg, hydrogen ICE trucks will have a lower TCO. The hydrogen break-even price decreases over time as the hydrogen fuel-cell truck MSRP decreases, closing the gap with hydrogen ICE trucks. By 2025, the hydrogen break-even price between both hydrogen-powered technologies will be around $5.70/kg. As of 2027, the break-even price will be very low, reaching unlikely hydrogen prices below $2.00/kg.

Hydrogen ICE trucks may have a better TCO than hydrogen fuel-cell trucks in the short term if hydrogen fuel prices are low enough. However, when fuel-cell technology costs decrease in the long term, hydrogen fuel-cell trucks are expected to have a better TCO even for very low hydrogen fuel prices.

NATIONAL ANALYSIS

The stochastic analysis is conducted considering the inputs presented in Table 9. The analysis quantifies the percentage of cases where a certain technology will achieve the lowest TCO for a given truck model year. Figure 19 shows the split between the different considered truck technologies between 2022 and 2040 based on their TCO. The split is determined based on a Monte Carlo sample size of 10,000. For truck model year 2022, diesel truck is recognized as the technology with the lowest TCO for more than 95% of the cases, followed by battery electric trucks for the remaining 5%. For future truck model years, the percentage of cases where battery electric trucks record the lowest TCO increases continuously, reaching 70% by 2030 and 85% by 2040. This behavior is related to the reduction in the truck's MSRP and improved fuel economy over time, which reduces the operational expenses of battery electric trucks. It is worth highlighting the steep jump from model year 2026 to 2027. This is related to our assumption that MW charging stations will be available with wide coverage as of 2027, allowing long-haul trucks to be equipped with smaller batteries, which reduces their MSRP. Beyond 2030, the increase becomes less steep, driven by the slower reduction in the battery electric truck's retail price.

Both hydrogen-powered trucks are not recognized as the cheapest truck technology in any truck model year, mainly due to the high green hydrogen fuel price.

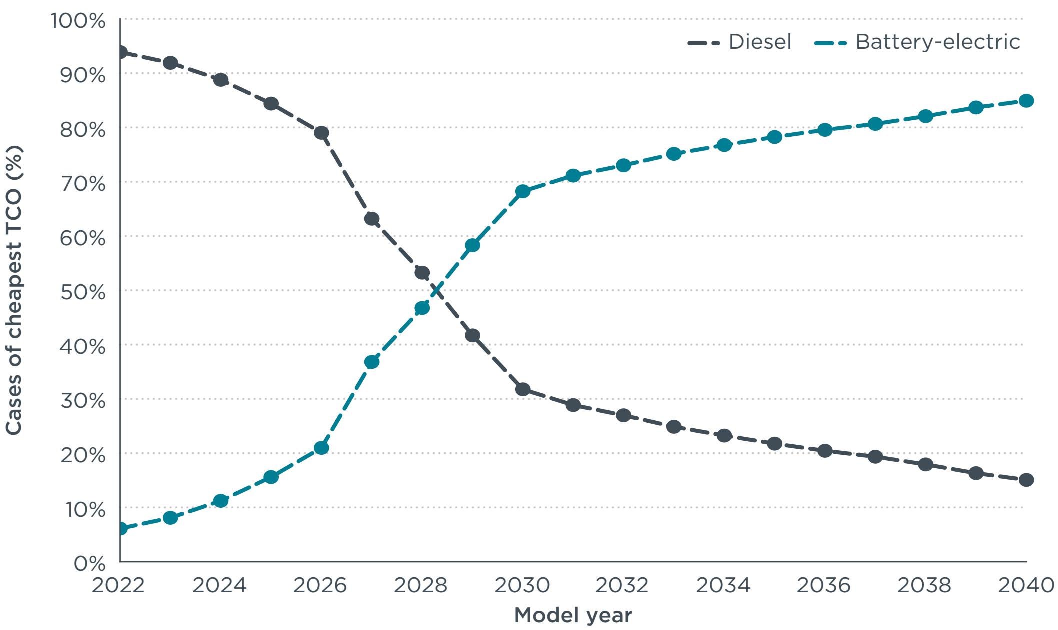

Figure 19. Split among different truck technologies between 2022 and 2040 based on TCO. The share of both hydrogen-powered trucks is 0%.

Battery size will have a significant impact on the TCO parity between battery electric and diesel trucks. A required battery size is affected by several factors, mainly the daily truck mileage and available charging technology. While the average daily truck mileage is a representative metric in the TCO calculation, truck operators will most likely size their batteries considering the worst-case scenario for the daily mileage needs, which could be significantly higher than the average daily mileage. This is captured in the truck daily mileage variability, which corresponds to the maximum variation in the truck's day-to-day average daily miles covered. For example, a daily mileage variability of 10% implies that the maximum number of daily miles covered by a truck is 10% higher than its average daily mileage.

Figure 20 shows the impact of the truck's average daily mileage and the daily mileage variability on its economic viability compared to diesel trucks. The figure corresponds to truck model year 2040 and for the national average diesel and charging costs. The battery design point is the product of the truck's average daily mileage and mileage variability.

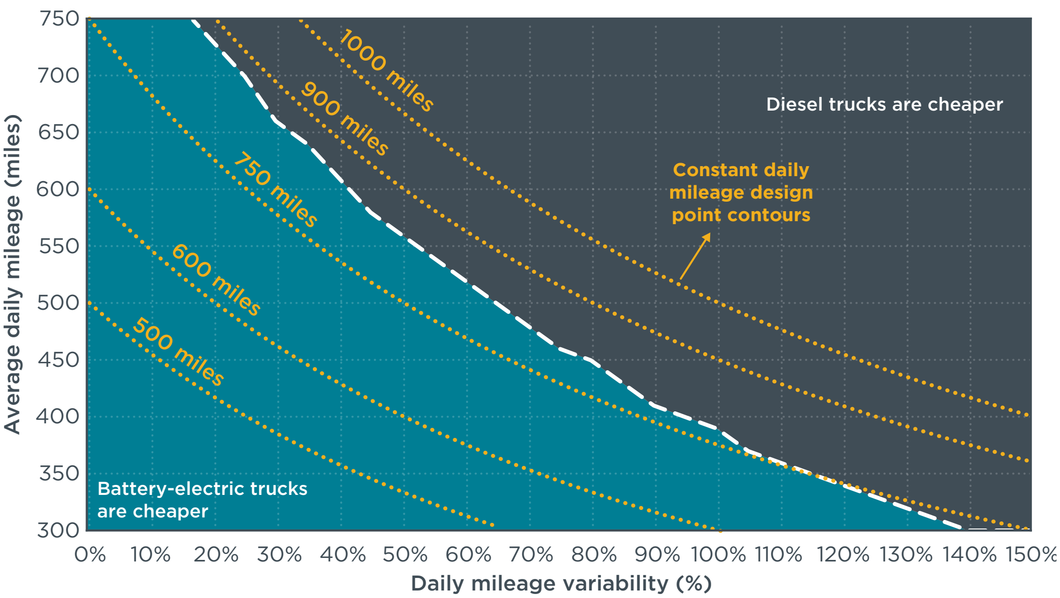

Figure 20. Impact of daily mileage and mileage variability on the TCO of MY 2040 battery electric and diesel trucks.

Generally, a higher average daily mileage or higher mileage variability will result in a higher battery design point in miles; thus, larger and more expensive batteries are needed, increasing the TCO of battery electric trucks. On the other hand, although an increase in the average daily mileage will require a larger battery size, the truck's annual mileage will also increase, benefiting battery electric trucks as their operational expenses per mile are much lower than their diesel counterparts.

This tradeoff is clearly presented in Figure 20. Battery electric trucks are expected to record a lower TCO than diesel trucks, even for average daily mileages reaching 750 miles, as long as the day-to-day mileage variability is low. As daily mileage variability increases, battery electric trucks will struggle to reach TCO parity with their diesel counterparts. For example, for an average daily mileage of 750 miles without any variability, the battery design point is 750 miles. In this case battery electric trucks record a lower TCO than diesel trucks. On the contrary, for a 300-mile average daily mileage coupled with a 150% variability, diesel trucks are expected to record a lower TCO than battery electric trucks, although the battery design point in this case is also 750 miles. This is driven by the fact that the annual truck mileage is much higher in the first case, counterweighting the higher cost of larger batteries due to the lower operational costs of battery electric trucks.

In conclusion, battery electric trucks can achieve better TCO than their diesel counterparts even for very high daily mileages, given that their day-to-day mileage variability is low.

CONCLUSIONS

This study evaluates the economic viability of several powertrain technologies for Class 8 long-haul trucks in the United States between 2022 and 2040. In addition to conventional diesel trucks, we quantify the total cost of ownership of several alternative technologies, including battery electric, hydrogen fuel-cell, and hydrogen internal combustion engine trucks.

We arrive at the following main findings:

» **Battery electric long-haul trucks are expected to reach total cost of ownership parity with diesel trucks in all representative states considered in this analysis before 2030**. Given their higher energy efficiency and lower operational expenses, battery electric trucks are expected to become cheaper than their diesel counterparts in all selected states by the end of the decade.

» **Hydrogen fuel-cell and hydrogen internal combustion engine trucks operating in long-haul will struggle to become cost competitive compared to their diesel counterparts**. Hydrogen fuel-cell and hydrogen ICE trucks are expected to be roughly 25% and 50% more expensive, respectively, to own and operate than diesel trucks by 2030. The high hydrogen fuel costs are the main factor behind this behavior. Green hydrogen fuel prices in the United States are estimated to range between $9.00/kg and $11.00/kg by 2030, including the tax subsidies in the Inflation Reduction Act. For hydrogen fuel-cell trucks to become cost-competitive with diesel trucks during the next decade, green hydrogen prices need to range between $5.00/kg and $7.00/kg.

» **Battery electric trucks are expected to be the most cost-effective zero-emission truck technology for long-haul applications, recording a significantly lower total cost of ownership than hydrogen fuel-cell trucks**. Battery electric trucks benefit from a considerably higher fuel economy than their hydrogen fuel-cell counterparts, which results in much lower operational expenses. This yields a lower TCO for the battery electric technology. Given our modeled charging costs in several states of between $0.15/kWh and $0.30/kWh, green hydrogen fuel prices would have to be as low as $3.00/kg to $6.50/kg for hydrogen fuel-cell trucks to reach TCO parity with diesel trucks during the next decade, a range that is most likely to fall out of the expected green hydrogen fuel price range by 2030.

» **Hydrogen fuel-cell trucks will be the cheaper hydrogen-powered technology for long-haul applications, driven by their better fuel economy compared to hydrogen internal combustion engine trucks**. Hydrogen ICE trucks may have a better TCO than hydrogen fuel-cell trucks in the short term if hydrogen fuel prices are low enough due to the high MSRP of hydrogen fuel-cell trucks during the early market. However, as fuel-cell technology costs decrease in the long term, hydrogen fuel-cell trucks are expected to have a better TCO even for very low hydrogen fuel prices.

» **At the national level, battery electric trucks are expected to record the lowest total cost of ownership among all truck technologies for more than two-thirds of long-haul trucking activity by 2030**. Given the variations in diesel, hydrogen, and charging costs among states and the uncertainty in technology costs evolution between 2022 and 2040, battery electric trucks are the most cost-effective technology for almost 67% of the cases. This number will increase to 84% by 2040, driven by the expected reduction in battery prices and the rollout of MW charging infrastructure.

» **For very high daily mileages, battery electric trucks can still achieve a better total cost of ownership than their diesel counterpart.** As the truck's average daily mileage or mileage variability increases, larger batteries are needed to meet the truck's energy needs on the most demanding days, which increases the MSRP of battery electric trucks. However, given that the operations cost per mile of battery electric trucks is lower than that of diesel trucks, higher average daily mileages benefit the TCO of battery electric trucks relative to diesel. Overall, battery electric trucks are expected to record a better TCO for average mileages as high as 750 miles per day, provided that the day-to-day variability is low.

Based on the analysis presented in this study, battery electric trucks have the potential to ensure a cost-effective transition from the current diesel truck fleets in the United States before the end of the decade, providing a significant reduction GHG emissions from in the heavy-duty vehicle sector. Even for semi-trucks operating in long-haul, which are considered among the most challenging truck classes to decarbonize, the TCO of battery electric trucks is likely to become lower than that of diesel trucks as early as 2027 in some states and by 2030 for all considered states in this analysis.

Given the urgency of the climate crisis and the need for rapid and deep decarbonization of the heavy-duty vehicle sector GHG emissions, our study sheds light on the role that zero-emission technologies can play in the Phase 3 HDV GHG emissions standards. Our findings show that there is an opportunity for significant electrification by 2030 and beyond to support more stringent standards.

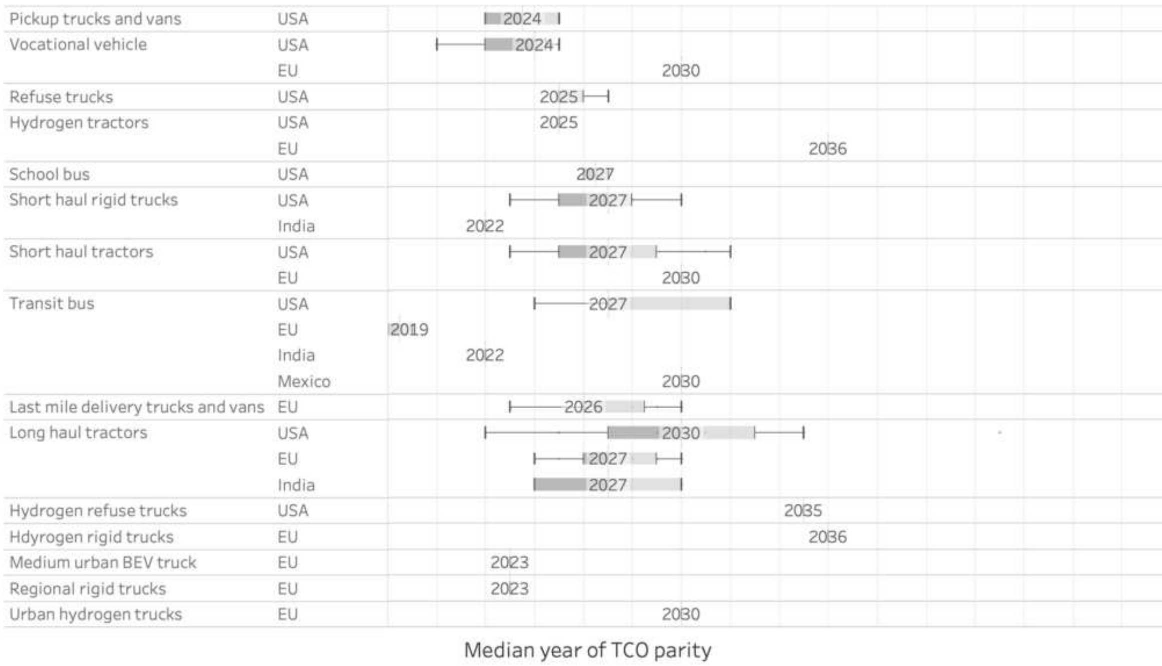
ZEV cost: Total cost of ownership

Verified on 20 November 2024

Median year of TCO parity between ZEV and ICE HDV in current literature by market and vehicle segment



Source: *ICCT Research. For a full list of studies and parity projections, please see the table below.*

Box and whiskers plot analyzing the TCO parity projections in current literature for various vehicle segments in a given market. In the case a single study exists for a market – vehicle segment combination, the median year of TCO parity is the median between a range of years in which ZEV HDVs are likely to achieve TCO parity with ICE HDVs. In the case of multiple studies, the median value reported is the median of median values aggregated from different studies.

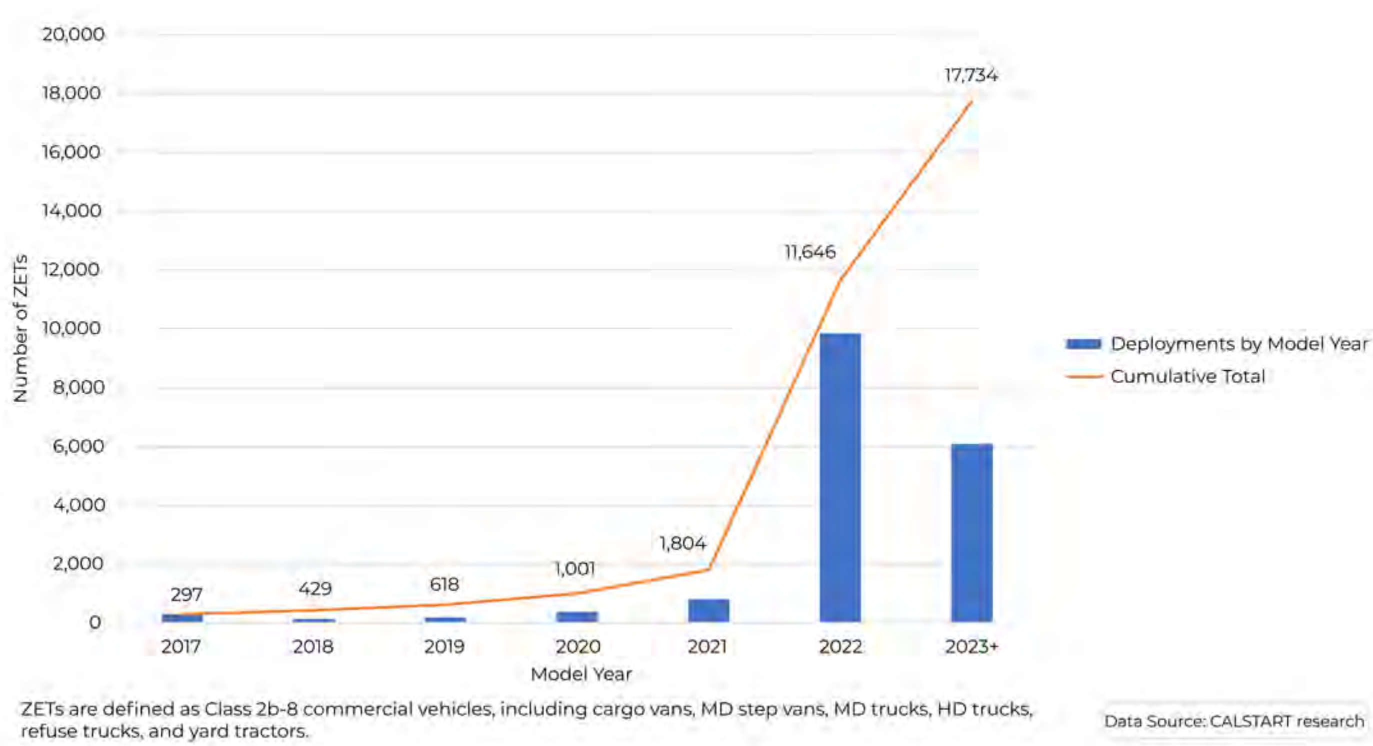
EXECUTIVE SUMMARY

Medium- and heavy-duty (MHD) freight vehicles are a top priority for decarbonizing U.S. transportation and mitigating transportation-related greenhouse gas (GHG) emissions. These vehicles play a vital role in the U.S. economy, but because of their critical high-mileage haulage of the nation's goods, they emit significant amounts of GHGs and criteria pollutants, often in the most vulnerable communities. Fortunately, existing and ever-expanding technology can eliminate tailpipe emissions and significantly reduce the overall carbon footprint of MHD vehicles. More than 160 models of zero-emission trucks (ZETs) are now available from over 40 original equipment manufacturers (OEMs), and **as of June 2023, more than 17,500 ZETs have been deployed in the United States** (Figure ES-1).[1]

Figure ES-1. U.S. ZET Deployments by Vehicle Model Year (2017–June 2023)



1 ZET data are gathered from sources outlined in Appendix D. In previous iterations of this report, "deployments" were referred to as "deployed sales" and model year served as a proxy for deployment year per IHS Markit guidance.

This recent surge can be attributed primarily to the cargo van segment, which represents more than 80 percent of all ZET deployments (Table ES-1) and has limited market barriers for mass adoption (CARB, 2023a).

Table ES-1. U.S. ZET Deployments and Market Share by Segment (As of June 2023)

Vehicle Segment	ZET Deployments	Total Stock	ZET Market Share
Cargo Van	**14,400**	3,687,740	.39%
MD Step Van	843	266,866	.32%
MD Truck	442	3,573,915	.01%
HD Truck	867	**5,104,926**	.02%
Refuse	48	118,135	.04%
Yard Tractor[2]	1,134	23,437	**4.84%**
Total	**17,734**	**12,775,019**	**.14%**

Incentives and regulations continue to be significant drivers of ZET adoption. **States that have passed the Advanced Clean Trucks (ACT) regulation[3] account for 38 percent of all ZET deployments despite making up just 25 percent of all truck registrations.** Meanwhile, ACT states in conjunction with Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding (MOU) states constitute 51 percent of all deployments. States that have had ZET incentive programs prior to 2022 encompass 39 percent of all deployments.[4]

With nearly half of ZET deployments in states without ZET regulations, the maturity of this technology is now undeniable, as well as the fact that the market has evolved to the point where fleets can deploy ZETs without incentives and regulations. In fact, for the first time ever, ZETs have now been deployed in all 50 states. These ZET deployment trends, along with the United States' signing of the Global Memorandum of Understanding on Zero-Emission Medium- and Heavy-Duty Vehicles (Global MOU)[5] to enable 100 percent of new truck and bus sales be zero-emission by 2040, create a compelling market signal to OEMs and fleets to invest in ZETs.

Furthermore, investments are being made to establish dedicated infrastructure for ZETs along highly traveled trucking corridors, bolster domestic manufacturing of essential vehicle components, and further reduce lifecycle vehicle emissions by looking at upstream and end-of-life practices. Additional

2 Yard tractor deployments are likely underreported as many are not registered for on-road use and much of the data on deployments come from vehicle registrations.

3 States that have adopted the ACT rule as of June 2023 include California, Colorado, Massachusetts, New Jersey, New York, Oregon, Vermont, and Washington. New Mexico, Maryland, and Rhode Island have since become the ninth, tenth, and eleventh states, respectively, to adopt the ACT rule in late 2023, though for the purposes of this update, which includes data through June 2023, New Mexico, Maryland, and Rhode Island are not considered ACT states.

4 States considered to have ZET incentive programs prior to 2022 include California, Massachusetts, New York, New Jersey, Pennsylvania, and Washington. More information is available in Appendix A.

5 Visit the Global Commercial Vehicle Drive to Zero's website for more information about the Global MOU at https://globaldrivetozero.org/mou-nations/.

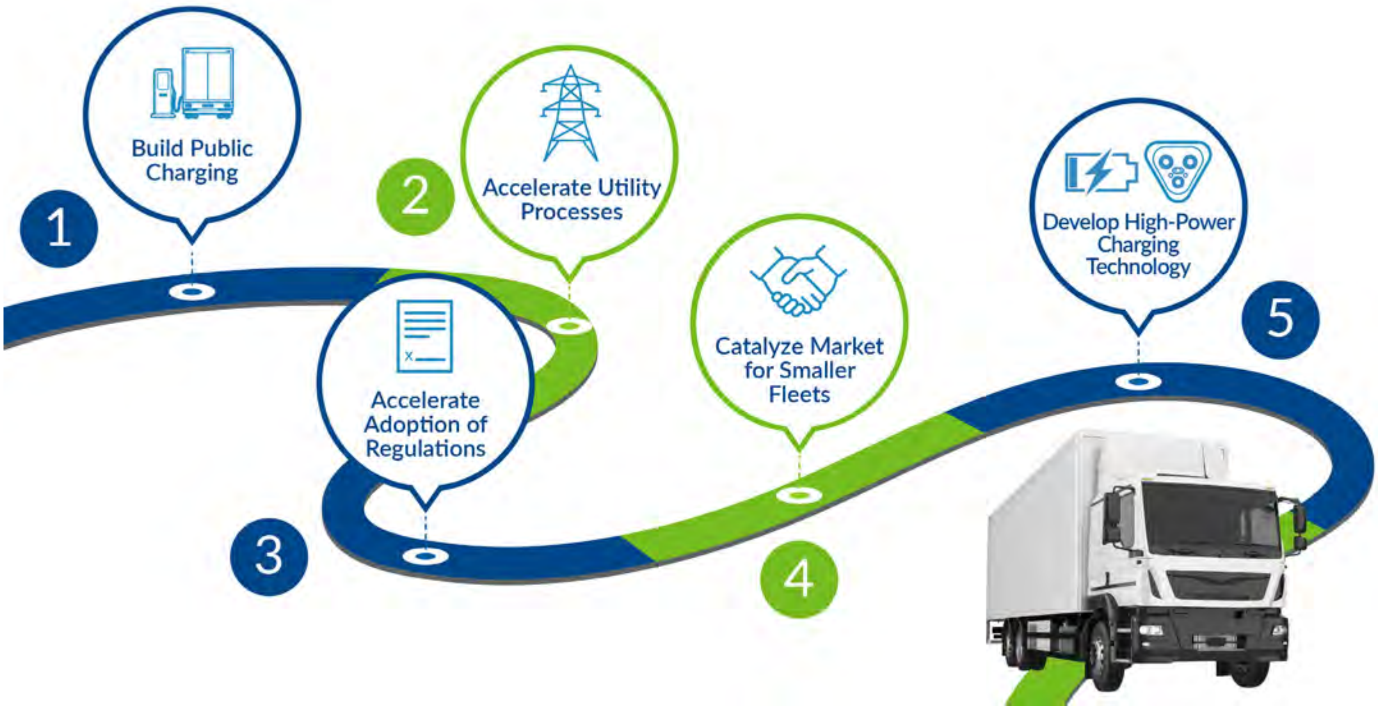
trends that are driving ZET deployments include: increased support for small fleets, increasingly large-scale deployments, shippers' increasing interest in reducing carbon emissions, and hydrogen fuel cell truck developments (Figure ES-2). As the technology continues to advance and economies of scale are achieved, ZETs will begin to dominate the U.S. truck market.

Figure ES-2. Observed 2023 U.S. ZET Market Trends

The momentum toward decarbonizing the trucking sector is indisputable. Nevertheless, sustained action and investment are essential to realize the full potential of this transformative shift (Figure ES-3). **Key opportunities to accelerate ZET deployments in the coming months and years include:**

1. **Building public charging.**
2. **Accelerating utility processes**, including grid buildout, energization of charging infrastructure, and make-ready program processing.
3. **Accelerating adoption of regulations** like the ACT rule and the U.S. Environmental Protection Agency's "Phase 3" heavy-duty GHG standards.
4. **Catalyzing a market for smaller fleets**, which includes a secondary ZET market, access to reasonable financing and insurance, and clear signals from customers.
5. **Developing high-powered charging technology.**

Figure ES-3. Top Five Actions Needed to Accelerate U.S. ZET Market



Unprecedented collaboration will be required from stakeholders across the industry, including fleets, OEMs, utilities, charging providers, shippers, regulators, policymakers, academia, nonprofits, and frontline communities. Everyone has a role to play to ensure the pace and success of this transition.

CHAPTER I

INTRODUCTION

THE U.S. TRUCKING INDUSTRY

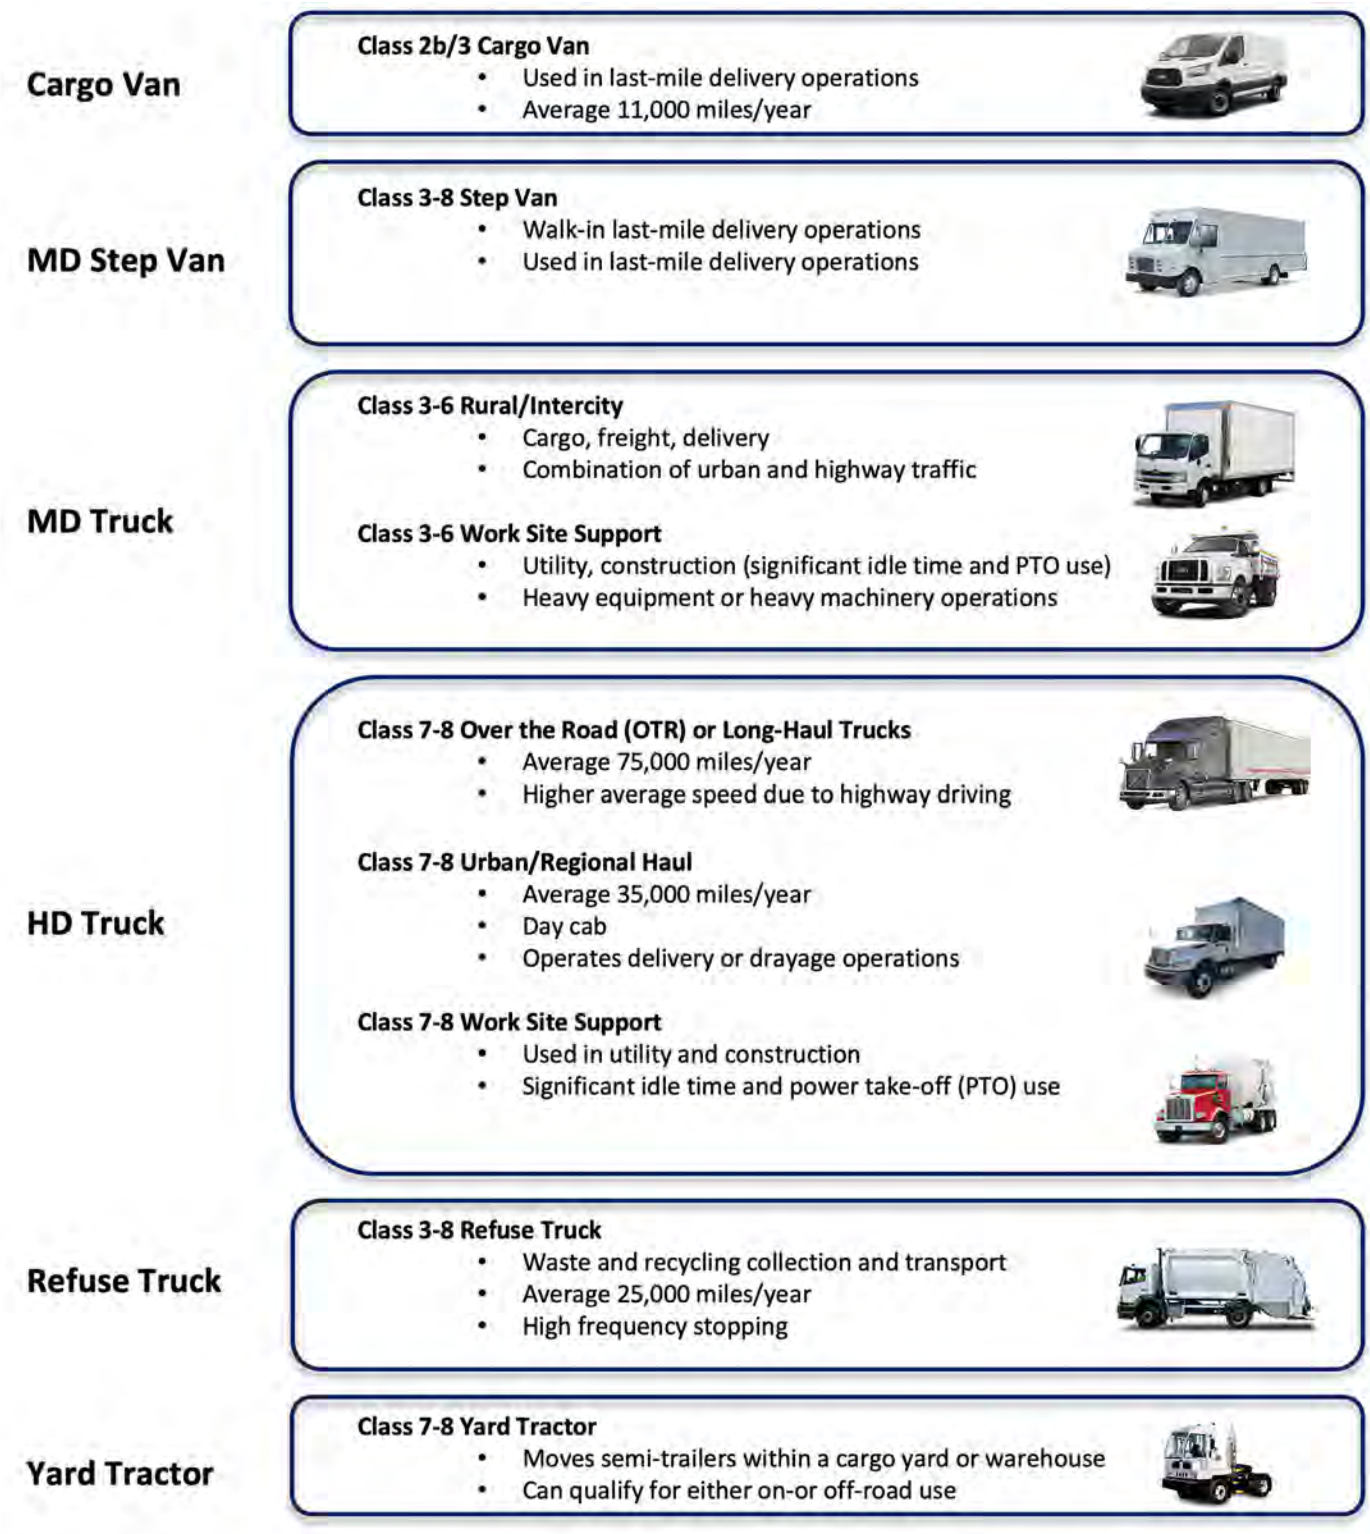
The trucking industry plays a vital role in the U.S. economy, serving as the lifeblood of logistics and transportation. It is the backbone of commerce, responsible for moving nearly three-quarters of all the country's freight. The U.S. trucking industry also employs roughly 8.4 million people while generating more than $940 billion each year in revenue (American Trucking Association, 2023).

The industry enables the timely and efficient delivery of goods, ensuring that products reach their destinations in a reliable and cost-effective manner. Its efficient operation is critical for businesses to thrive and for individuals to access the goods they need. The importance of trucking will only grow—the freight economy is expected to increase 25.6 percent by 2030 due to population and economic growth (American Trucking Association, 2019).

The trucking industry includes many components, including goods, drivers, and the vehicles themselves. In the United States, commercial vehicles are classified according to their gross vehicle weight ratings (GVWR). This analysis considers only Class 2b (8,501–10,000 lbs.) through Class 8 (33,000 lbs. and above) trucks, which are categorized into six distinct segments: cargo vans, medium-duty (MD) step vans, MD trucks, refuse trucks, yard tractors, and all other heavy-duty (HD) trucks (Figure 1).[6] For the purposes of this report, Class 2b–8 trucks that fall into one of these segments are referred to as trucks. In addition to on-road trucks, this analysis includes yard tractors, which may not be registered as on-road vehicles but provide a critical function related to moving freight in the United States.

6 Past reports have included pickup trucks; however, they are excluded in this report since most are privately owned and not used for commercial goods movement. Buses are also not included in this analysis. For information on zero-emission transit and school bus deployments, see CALSTART's *Zeroing in on Zero-Emission Buses* and *Zeroing in on Electric School Buses* reports, respectively. New editions of both reports will be published in 2024.

Figure 1. Vehicle Segmentation



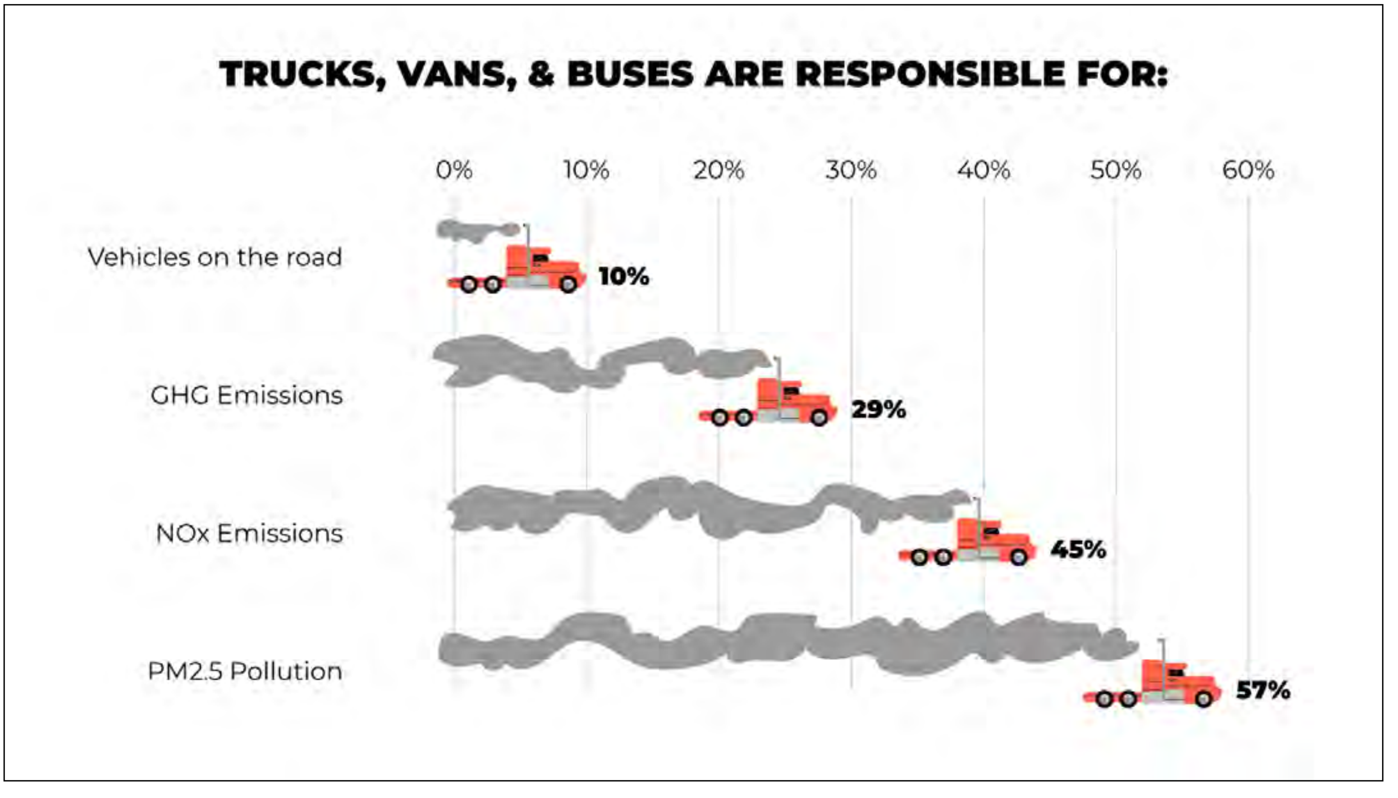
The trucking industry connects producers, suppliers, and consumers, making it an indispensable cornerstone of modern American society. Though the U.S. trucking industry has dramatically reduced its environmental and public health impacts in recent decades, it remains a major source of pollution, contributing to climate change and poor air quality, especially in the communities where these vehicles operate (Roeth, 2020).

WHY ZETS?

The transportation sector is responsible for the largest portion of greenhouse gas (GHG) emissions in the United States, generating roughly 28 percent of total GHG emissions (EPA, 2023). A significant portion of these emissions can be attributed to the trucking industry, which plays a vital role in the U.S. economy; however, its critical high-mileage haulage of the nation's freight emits significant amounts of GHGs and criteria pollutants, often in the most vulnerable communities.

While medium- and heavy-duty (MHD) vehicles represent only 10 percent of vehicles on the road, they are responsible for almost 30 percent of all transportation-related GHG emissions, 45 percent of nitrogen oxide (NOx) emissions, and more than half of fine particulate matter (PM2.5) emissions for all vehicles (Figure 2). Therefore, freight vehicles represent an outsized opportunity to reduce transportation-related emissions.

Figure 2. MHD Vehicle Share of Transportation Emissions (C40, 2023)



Transitioning to zero-emission trucks (ZETs) can substantially reduce harmful environmental impacts from the trucking industry, help to mitigate the effects of climate change, and protect public health. Emissions from freight vehicles also disproportionally affect the most vulnerable communities, as air quality is often worst near highways, warehouses, and ports—areas that tend to have more low-income communities and communities of color (EPA, 2023a). In sum, the transition to ZETs is needed to address environmental challenges and promote a more sustainable and healthier future for all.

WHAT ARE ZETS?

ZETs are a transformative category of commercial vehicles that emit zero tailpipe emissions (of carbon dioxide and criteria pollutants) and therefore reduce their environmental impact during use. These trucks utilize advanced technologies and alternative power sources to eliminate or significantly reduce the release of pollutants into the environment.

There are currently two technology types of ZETs readily available: battery-electric trucks (BETs), fueled with electricity, and fuel cell electric vehicles (FCEVs), fueled with hydrogen. While both use electricity to propel the vehicle, BETs store their electricity in battery packs and FCEVs store hydrogen in high-pressure tanks that, when combined with oxygen from the air in fuel cell stacks, produce electricity. Some consider FCEVs to be a "range extended" version of BETs since both have batteries, though FCEVs typically have much smaller battery packs. This report does not consider "low-emission" or "near-zero-emission" vehicles like natural gas (compressed, liquid, or renewable), hybrid electric, hydrogen internal combustion, renewable diesel, or biodiesel to be ZETs.

ZET technology offers a promising solution for decarbonizing the commercial transportation sector. Though the range of early generation BET models was limited to 100 or less miles on a single charge, thanks to increased energy density and declining battery prices, many of today's models boast ranges exceeding 300 miles, with some able to travel up to 500 miles before needing to refuel (CALSTART, 2022). These ranges can be further extended with electrified trailers and/or maximized regenerative braking. En-route charging mid-shift or between shifts can also allow vehicles to travel many more miles per day than they would otherwise be able to accommodate on a single charge. The majority of freight routes for MHD vehicles are well within these ranges, with approximately 67–87 percent of U.S. freight travelling in shipments less than 250 miles (Geotab, 2021; DOE, 2023).

Options are in development for long-haul trucking as well. Although there are not yet commercially available ZETs with sleeper cabs, FCEVs are coming to market with ranges up to 500 miles and BET technology continues to improve over time. Faster, smarter, and higher-power charging solutions and standards are also in development, enabling trucks to recharge in a timeframe close to parity with diesel refueling (CharIN, n.d.).

While the batteries and fuel cell tanks do add additional weight to the trucks—potentially limiting the payload a vehicle can carry—this impacts a relatively small segment of the trucking industry, as most trucks are constrained by volume more so than weight. In fact, nearly nine in ten trucks on the road operate below the 80,000-lbs. federal maximum weight (DOE, 2023a). Additionally, the Federal Highway Administration (FHWA) provides for a 2,000-lbs. weight exemption for BETs, allowing them to operate at up to 82,000 lbs. (FHWA, 2019).

While ZETs may not be feasible for every truck application today, it is evident that current models are generally sufficient to meet the needs of a majority of truck types and routes—and certainly to achieve the deployment levels required by existing policies. As the technology continues to develop, next-generation models are expected to meet the operational needs of remaining duty cycles.

U.S. COMMITMENT

Taking stock of the progress made by ZET technology, in November of 2022, the United States signed the Global Memorandum of Understanding on Zero-Emission Medium- and Heavy-Duty Vehicles (Global MOU), committing to work with other signatory countries to enable 100 percent of new truck and bus sales to be zero-emission (ZE) by 2040, including an interim goal of 30 percent by 2030 (CALSTART, 2023). The Global MOU is co-led by CALSTART's Global Commercial Vehicle Drive to Zero program and campaign and the Government of The Netherlands, with the purpose of accelerating the growth of ZE commercial vehicle adoption. The Global MOU has been signed by a total of 33 nations and has been endorsed by more than 115 subnational governments, manufacturers, suppliers, and other industry stakeholders. The Global MOU symbolizes a commitment to work together to overcome strategic, political, and technical barriers to ZE commercial vehicle adoption. With an increase in investment and economies of scale, this transition can be faster, more cost-effective, and easier for all stakeholders.

The Global MOU has been signed by a total of 33 nations and has been endorsed by more than 115 subnational governments, manufacturers, suppliers, and other industry stakeholders.

In line with the Global MOU, the U.S. National Blueprint for Transportation Decarbonization emphasizes the need to transition to zero-emission vehicles (ZEVs) to meet the country's GHG reduction goals, including for MHD vehicles (DOE, 2023b). Data in this report track progress with respect to the U.S. truck fleet.

CHAPTER II

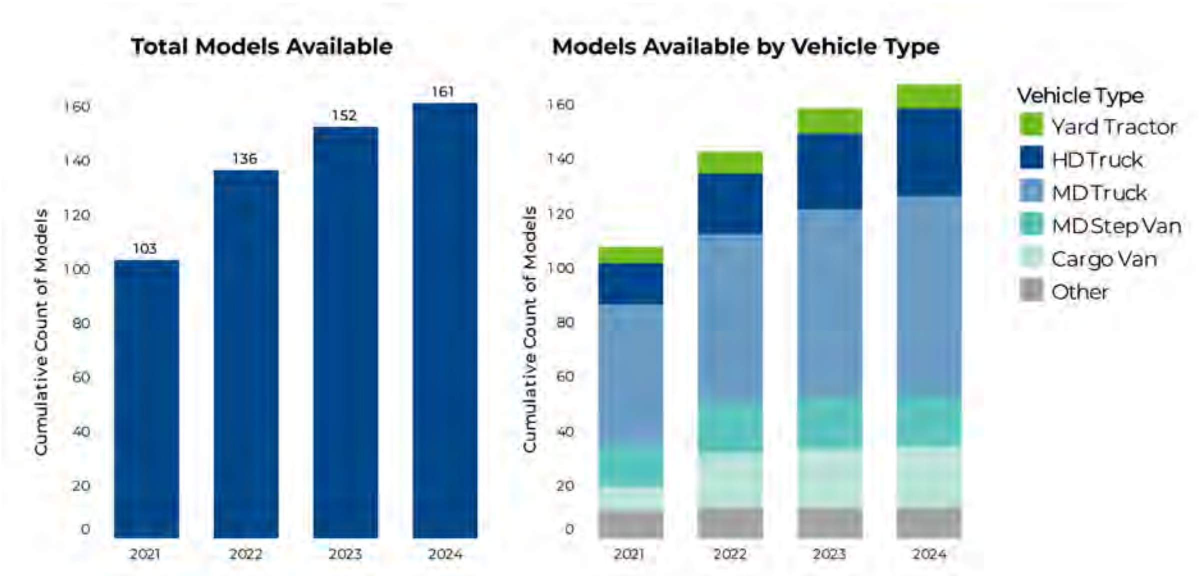
U.S. ZET MARKET UPDATE

ZET MODEL AVAILABILITY

The growth in ZET offerings has expanded each year and can be attributed to many technological advancements, original equipment manufacturer (OEM) investment, increased regulatory action, and nationally and organization-based climate goals. In 2019, only a couple dozen ZET models were available in the United States; there are now more than 160 models available.[7] And while ZET models were once dominated by retrofitters, today more than 40 OEMs have at least one ZET offering, including all the major legacy manufacturers. Numerous startups are also contributing to the advancement of ZETs.

The ZE MD truck market has the most options with 73 models available, followed by ZE HD trucks with 32 models and ZE cargo vans with 23 models (Figure 3). This is fitting given that these vehicle segments are the three largest in terms of current vehicle stock on the road.

Figure 3. ZET Model Availability Over Time (CALSTART, 2023b)



7 The Zero-Emission Technology Inventory (ZETI) Data Explorer includes current and future ZET models that have been announced.

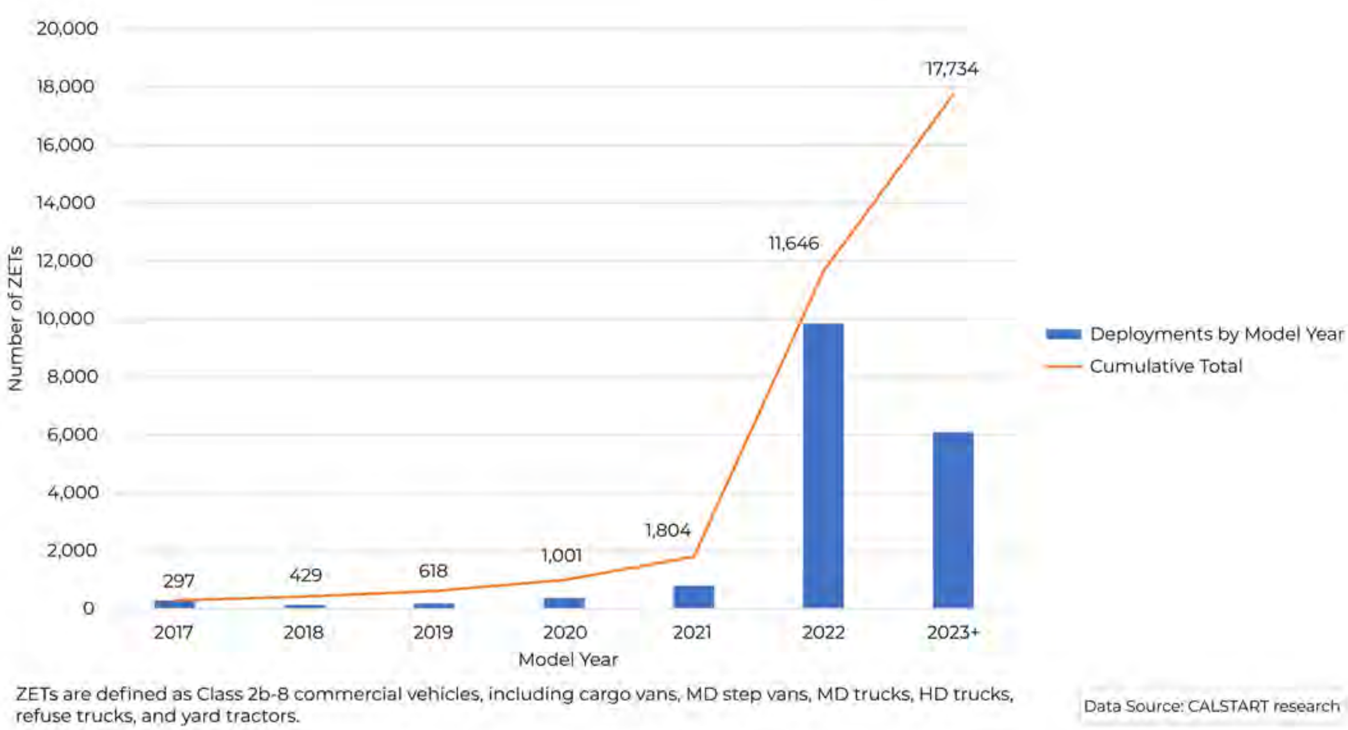
As expected, the number of new ZET models coming to market has tapered off in 2023 due to the significant progress made from 2019 to 2022. Many OEMs are now focused on increasing sales of existing models while also refining their initial ZET offerings based on real-world customer experience and feedback and developing second- or third-generation versions.

Most of the available ZET models fall under the battery-electric technology type. However, FCEV models are starting to see significant growth in availability. In 2021, four FCEV models were available, and as of this writing, there are 12 models available, mainly in the HD truck segment. FCEV model availability is expected to increase in the coming years as many OEMs are currently developing FCEV options (see *Hydrogen Fuel Cell Developments* section).

TOTAL ZET DEPLOYMENTS

As of June 2023, more than 17,500 ZETs have been deployed in the United States,[8] more than doubling the number of total deployments reported in the previous *Zeroing in on Zero-Emission Trucks: May 2023 Market Update*. Figure 4 outlines the distribution of ZET deployments by vehicle model year along with the cumulative total year-over-year, and Table 1 breaks down ZET deployments by vehicle segment and model year.

Figure 4. U.S. ZET Deployments by Vehicle Model Year (2017–June 2023)



8 Trucks are defined as "deployed" if they have been delivered to the customer and registered with the Department of Motor Vehicles. Deployed truck counts do not include undelivered sales or fleet commitments for purchases. Past reports have referred to this as "deployed sales."

Table 1. U.S. ZET Deployments by Vehicle Segment and Model Year (2017-June 2023)

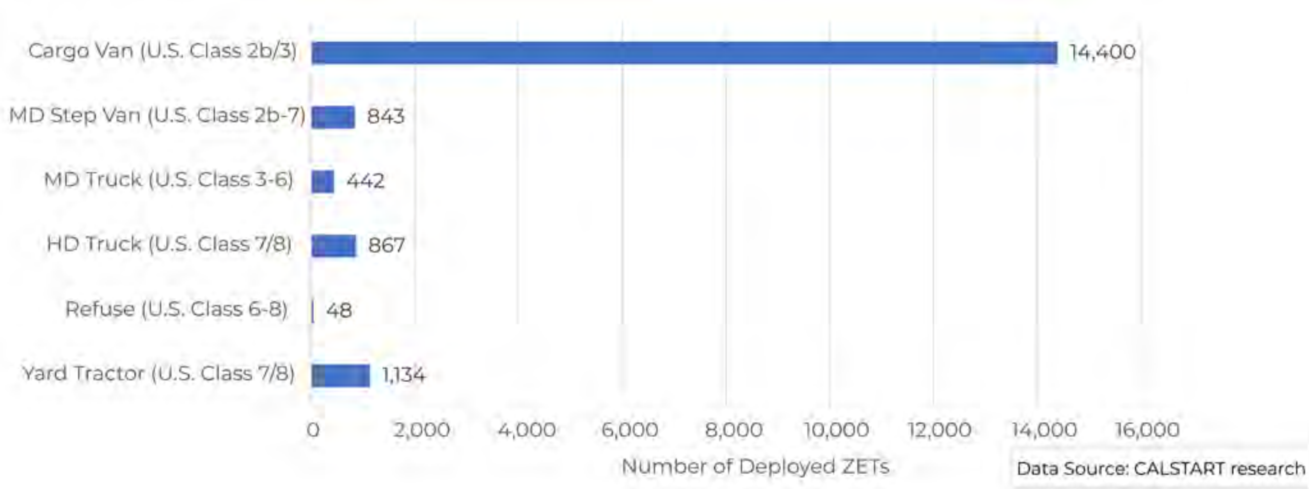
Vehicle Segment	2017	2018	2019	2020	2021	2022	2023+
Cargo Van	30	8	17	5	52	8,991	5,297
MD Step Van	223	25	21	14	275	238	47
MD Truck	18	57	12	44	124	98	89
HD Truck	8	0	16	93	90	219	441
Refuse	1	0	1	4	12	19	11
Yard Tractor[9]	17	42	122	223	250	277	203
Total	**297**	**132**	**189**	**383**	**803**	**9,842**	**6,088**

The continued significant increase in deployments can be attributed to a multitude of factors, including increased incentives, confidence in the technology, model availability, production capacity, and ZET policy adoption.

DEPLOYMENTS BY SEGMENT

The driving force behind such a dramatic increase in ZET deployments has been the meteoric rise of ZE cargo van deployments. Approximately 14,400 ZE cargo vans have now been deployed in the United States (Figure 5), which means 11,835 of these vehicles were deployed in the first half of 2023—a 461-percent increase in deployments from the previous report. Following cargo vans with respect to total ZET deployments are yard tractors (1,134), HD trucks (867), MD step vans (843), MD trucks (442), and lastly, refuse trucks (48).

Figure 5. Cumulative U.S. ZET Deployments by Vehicle Segment (2017–June 2023)



9 Yard tractor deployments are likely underreported as many are not registered for on-road use and much of the data on deployments come from vehicle registrations.

ZE cargo vans have been deployed more than other segments due to various factors, including smaller batteries, high production volumes (and marketing campaigns) from multiple OEMs, ideal duty-cycle capability, and much lower upfront costs compared to other vehicle segments. These factors have allowed several large companies to deploy ZE cargo vans throughout the country relatively quickly. The Commercial Clean Vehicle Credit also provides up to $7,500 toward the purchase price for ZE cargo vans,[10] which brings the price down to be cost competitive with combustion-powered cargo vans (IRS, 2023).

There have been steady increases in ZET deployment numbers among every other segment, though ZE HD trucks stand out as the only other segment that saw its first half of 2023 deployment numbers more than double its total deployments from the previous report, boasting a 250-percent increase. HD trucks are the most common among the vehicle segments, with more than 5 million total trucks registered in the country. The vast number of HD trucks on the road, combined with their high mileage, relatively low efficiency, and therefore high fuel burn, have made them a focal point for decarbonization, especially given the disproportionate amount of GHG and criteria pollutant emissions from these vehicles.

Since charging infrastructure is still in the process of being planned and built out along key freight corridors to support the electrification of long-haul trucks, ZE HD trucks have primarily been deployed in urban/regional or drayage duty cycles. While a number of states now have ZE HD trucks operating within their borders, California continues to lead in ZE HD truck deployments due to ambitious targets, initiatives, and incentives that support reducing emissions from this critical vehicle segment.

10 The Commercial Clean Vehicle Credit allows for up to $7,500 and $40,000 off the initial purchase price for Class 2b–3 and Class 4–8 commercial vehicles, respectively.

California Prioritizes Funding for HD Drayage Trucks

A driver in a heavy-duty fuel cell electric truck at California's Port of Oakland.
Photo Credit: Harbor Trucking Association and Marc Harris Photography

In 2020, California Governor Gavin Newsom issued an Executive Order (N-79-20) that set a goal that all MHD vehicles in the state would be ZE by 2045 for "all operations where feasible" but specified an accelerated timeline for drayage trucks, requiring them to transition by 2035 (State of California, 2020). To realize this goal, the California Air Resources Board (CARB) launched Project 800, an initiative to support 800 ZE drayage truck orders to jumpstart the sector and pave the way for more ZETs serving California ports in the near future (CARB, 2021).

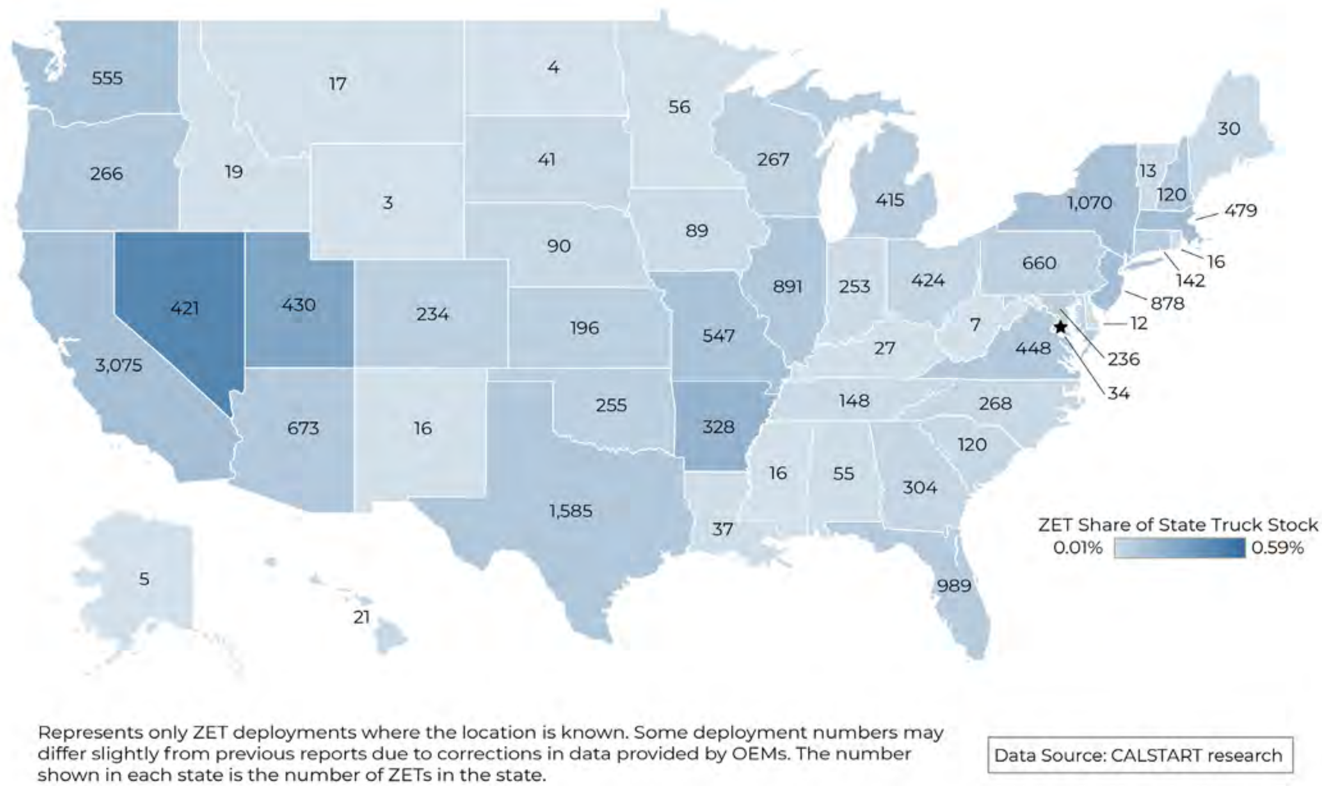
CARB also created special set-asides for drayage trucks within its Clean Truck and Bus Voucher Incentive Project (HVIP). More than 40 HVIP drayage vouchers have already been redeemed—with trucks now in operation—and hundreds more are in process. Additional funding for drayage trucks is available through the Port Plus Up, funded by the Port of Los Angeles and the Port of Long Beach (HVIP, 2023). Combined, these incentives can cover more than $400,000 toward the cost of a drayage truck.

Meanwhile, the California Energy Commission (CEC) has funding set aside through its Energy Infrastructure Incentives for Zero-Emission (EnergIIZE) Commercial Vehicles Project to support charging and hydrogen refueling infrastructure for ZE drayage trucks (EnergIIZE, 2023). With this statewide collaboration, financial support, and policies like the Advanced Clean Fleets (ACF) rule, California is expected to continue to lead the nation in ZE HD truck deployments in the years to come.

DEPLOYMENTS BY STATE

Tracking ZET deployments by state (Figure 6) can provide key insights to understand what conditions may best influence market growth. For example, a range of factors including policy mandates, incentive programs, utility make-ready programs, and electricity prices compared to diesel may all factor into a fleet's decision on if and where to deploy ZETs. Even proximity to OEM manufacturing facilities may sometimes impact ZET deployment locations.

Figure 6. Cumulative U.S. MHD ZET Deployments by State (2017–June 2023)



California continues to lead the nation with respect to ZET deployments, with approximately 3,075 ZETs deployed to date, though it now accounts for less than one-fifth of total U.S. ZET deployments. This is a testament to the viability of ZETs to perform in a wide range of climates and applications, and to the momentum being built to transition MHD vehicles to ZE across the country.

The top states for overall ZET deployments after California include Texas, New York, Florida, and Illinois. However, leading states differ by vehicle segment:

- ZE cargo vans from seven OEMs have primarily been deployed in Texas (1,498), California (1,494), and Florida (953).

- ZE MD step vans from five OEMs have been deployed the most in California (320), New Hampshire (94), and North Carolina (63).
- ZE MD trucks from 12 OEMs have primarily been deployed in California (227), Iowa (38), and New York (25).
- ZE HD trucks from 12 OEMs have been deployed the most in California (346), Wisconsin (93), and New Jersey (91).
- ZE refuse trucks from four OEMs have primarily been deployed in Pennsylvania (10), California (7), Florida (5), and New Jersey (5).
- ZE yard tractors from three OEMs have been deployed the most in California (681), New York (55), New Jersey (39), and Colorado (39).

Note that much of the data used for this report are based on private correspondence with OEMs and vehicle registration data.[11] However, vehicles may not operate exclusively in the state in which they are registered.

OVERALL TRUCK MARKET

The U.S. truck market consists of more than 12 million Class 2b–8 trucks registered as of June 2023.[12] This truck stock is dominated by three segments, with HD trucks being the most common, accounting for roughly 5.1 million vehicles. HD truck registrations are followed by cargo vans and MD trucks, with approximately 3.7 and 3.6 million vehicles, respectively. These three segments combined make up roughly 97 percent of all truck registrations in the United States (excluding pickups).

This market segmentation is generally true of recent deployments as well, as these three segments accounted for 95 percent of model year 2022 deployments. However, more 2022 MD trucks were deployed (roughly 187,000) than HD trucks (roughly 185,000). Truck deployments are cyclical and can vary dramatically from one year to the next (Roeth, 2020a). For example, 2022 deployments were impacted by supply chain challenges, and the increased demand for MD trucks may be due in part to the professional driver shortage—one of the top four issues facing the trucking industry (The American Transportation Research Institute, 2023). As fleets attempt to hire drivers, some are increasingly open to those without commercial driver's licenses (CDLs), which represent a larger candidate pool because of the reduced training required. These non-CDL drivers are not certified to operate HD trucks but can still haul freight using MD trucks.

11 All data sources used to track ZET deployments are outlined in Appendix D.

12 As stated above, this analysis includes Class 2b–8 trucks, excluding pickup trucks.

Figure 7 illustrates the total truck stock and model year 2022 deployments as of June 2023 by vehicle segment.

Figure 7. U.S. MHD Truck Total Stock and Model Year 2022 Deployments by Vehicle Segment (Thousands)

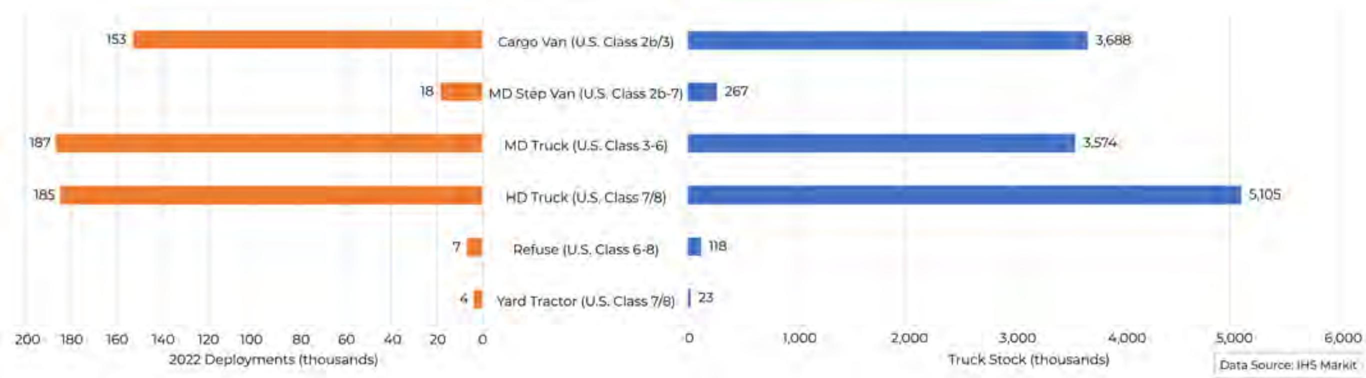


Figure 8 shows the total U.S. truck stock and model year 2022 deployments in thousands by state.

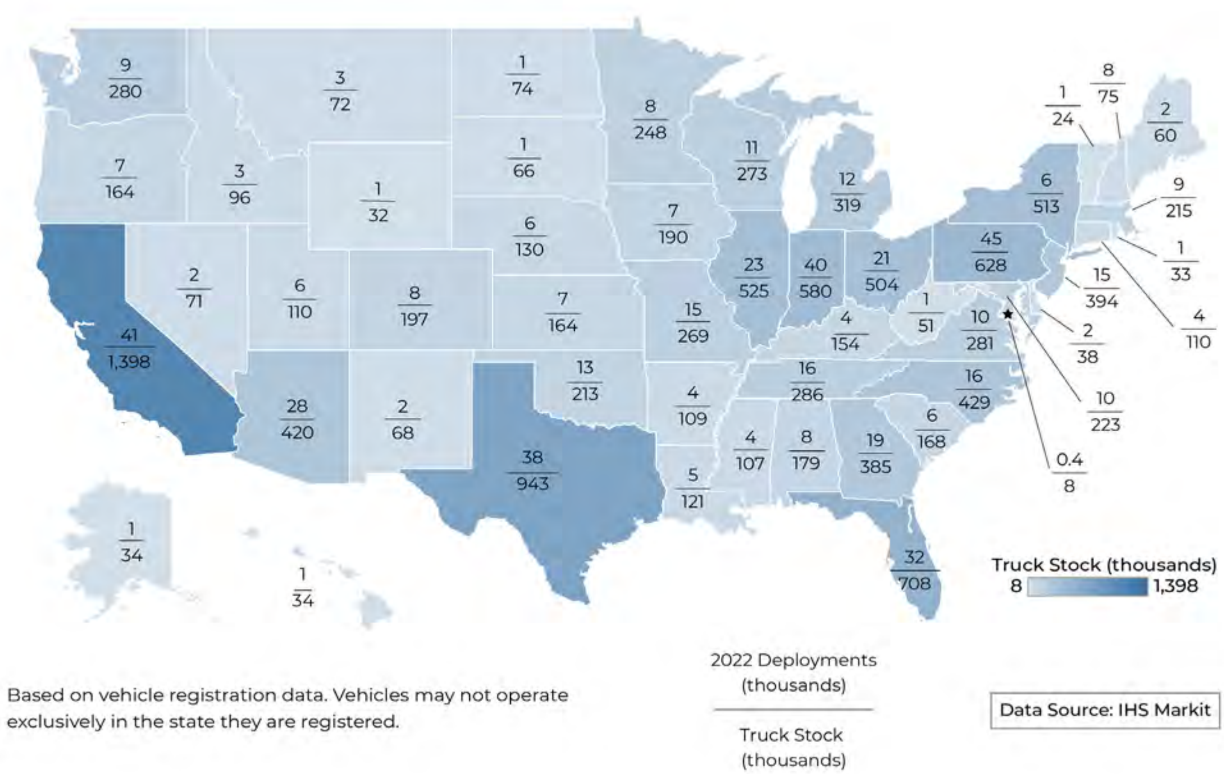
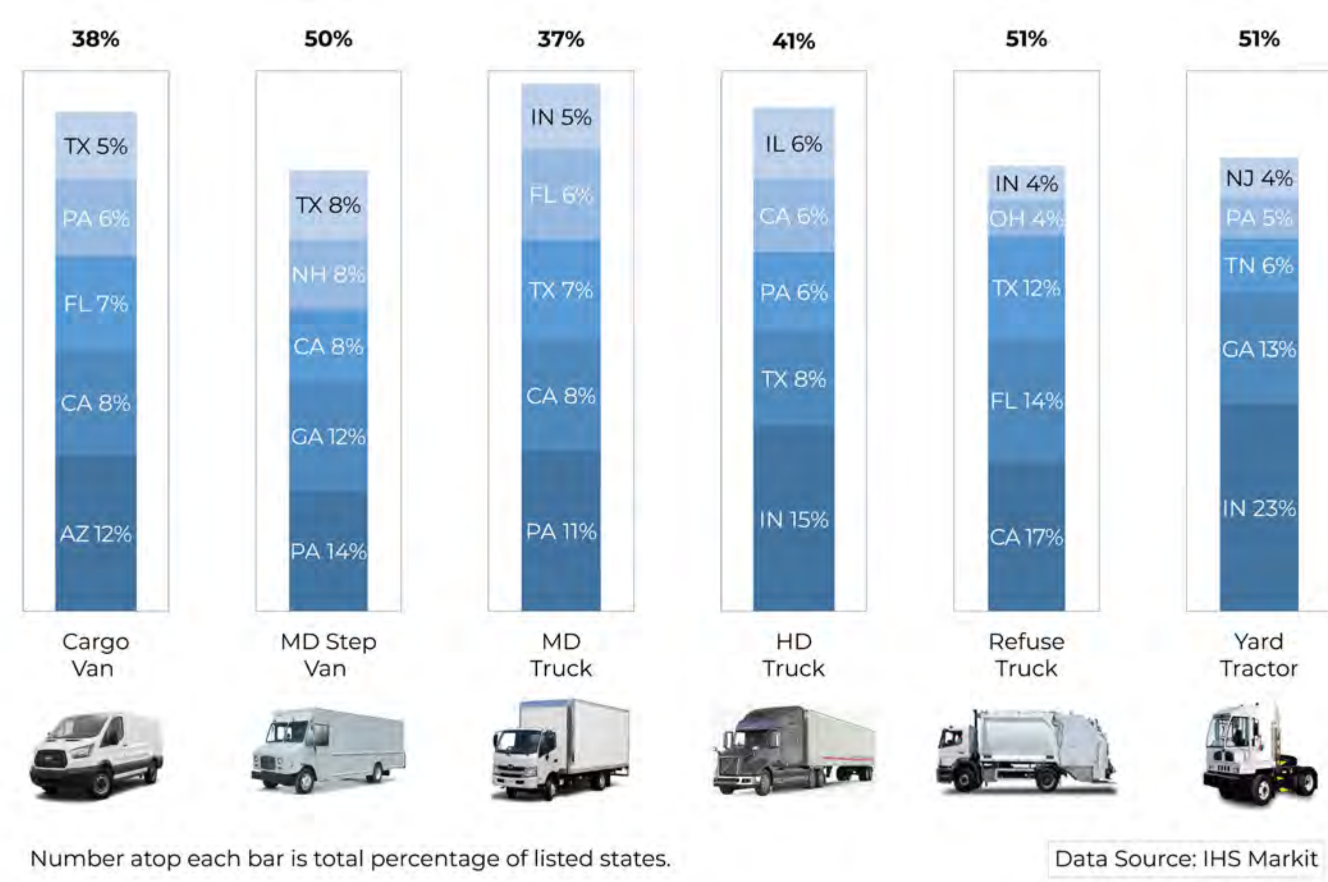
Figure 8. U.S. Truck Stock and Model Year 2022 Deployments by State (Thousands)



The largest truck populations can be found in California (10.9 percent of total U.S. stock), Texas (7.4 percent), and Florida (5.5 percent). However, these are not necessarily the largest markets for new deployments. Rather, 2022 truck deployments were greatest in Pennsylvania (8.1 percent), California (7.3 percent), and Indiana (7.1 percent).

Similar to the ZET market, top states for overall truck deployments differ by vehicle segment. Figure 9 displays the five leading states for 2022 deployments by vehicle segment. For each segment, the top five states make up more than one-third of the total deployments, and in some cases more than half of the total deployments: cargo van (38 percent), MD step van (50 percent), MD truck (37 percent), HD truck (41 percent), refuse truck (51 percent), and yard tractor (51 percent).

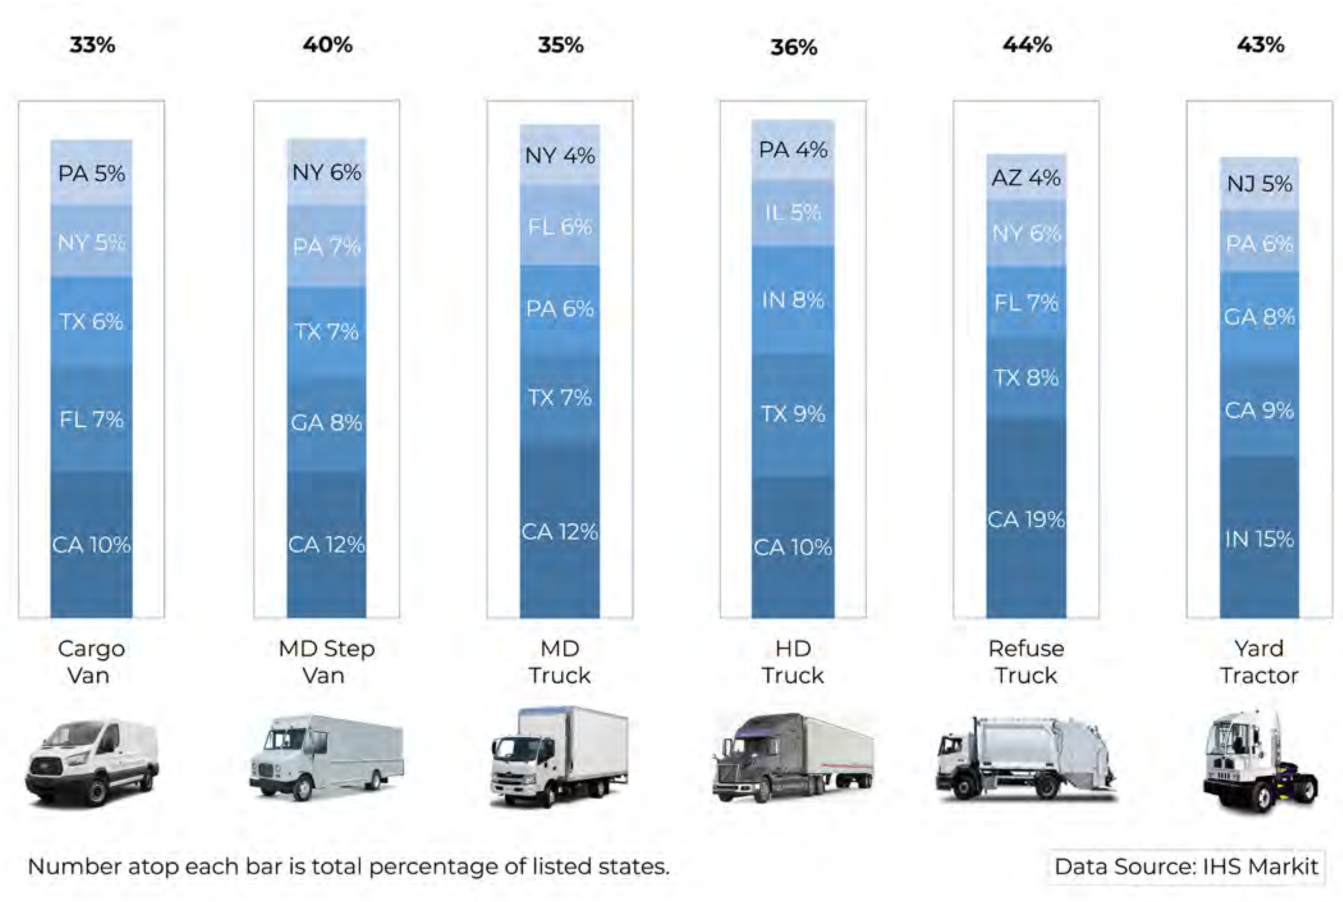
Figure 9. Top Five U.S. States for Model Year 2022 Truck Deployments by Vehicle Segment



The distribution of deployments by vehicle segment has seen little change over the past six months. Most new deployments continue to be concentrated around freight hubs like Indiana, California, Georgia, Texas, and Pennsylvania, as all five states are well represented in 2022 deployments across all vehicle segments.

The distribution is similar when overall truck stock is considered by state and by segment. Figure 10 shows the five leading states for overall truck stock by vehicle segment. Like deployments, the top five states represent more than one-third of the total registrations for each truck segment: cargo van (33 percent), MD step van (40 percent), MD truck (35 percent), HD truck (36 percent), refuse truck (44 percent), and yard tractor (43 percent).

Figure 10. Top Five U.S. States for Truck Stock by Vehicle Segment



Where certain vehicle segments tend to be registered has not changed significantly in the past few years. California continues to lead across all vehicle segments, except for yard tractors. California leads in overall truck stock with 10.9 percent of the market.

CHAPTER III

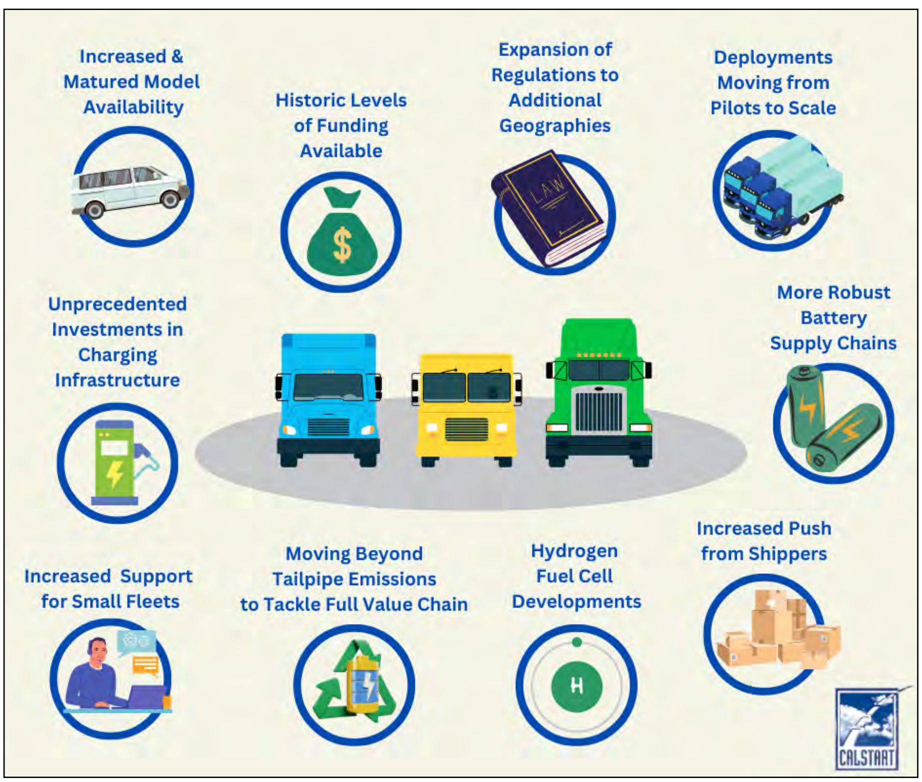
THE ROAD AHEAD

Rapidly accelerating the adoption of ZETs is necessary to reduce pollution from the trucking industry, improve public health, and mitigate climate change. An understanding of the current market and the tactics that have worked to deploy ZETs can provide insight on how to build off early successes.

OBSERVED MARKET TRENDS

Ten key market trends are currently driving ZET deployments (Figure 11).

Figure 11. Observed 2023 U.S. ZET Market Trends



INCREASED AND MATURED MODEL AVAILABILITY

The noticeable increase in ZET adoption since the previous version of this report is due in part to the increased availability of models from all OEMs. As Figure 3 showed earlier, there are now more than 160 ZET models available in the United States from more than 40 OEMs. With these increasingly diverse market offerings, fleets have never had more options capable of meeting their operational needs. This increased competition—along with increasing production volumes and decreasing battery prices—is expected to bring ZET prices down over time, as has been observed in the passenger car market (Dnistran, 2023).

Increased model availability is due in part to the emissions reduction commitments of many truck manufacturers, including legacy OEMs (Garcia Coyne et al., 2021). Table 2 outlines the major OEMs that have set forth a U.S. ZEV or carbon neutrality goal as of December 2023.[13] These goals, coupled with the influx of exclusively ZE companies, have spurred ZET model availability to an all-time high.

Table 2. OEM Commitments to U.S. ZEV Sales and Carbon Neutrality

OEM	ZET Target	Target Year	Source
Cummins	Reduce Scope 3 absolute lifetime GHG emissions from newly sold products by 25%	2030	Cummins, n.d.
Daimler Trucks North America	All new trucks and buses will be carbon neutral	2039	Daimler Truck, n.d.
Ford	100% fossil-free new vehicle sales	2040	Foote, 2021
General Motors	Sell ZE version of all HD trucks	2035	Mihalascu, 2022
Hyundai	Carbon neutrality	2045	Hyundai, 2021
Isuzu	Zero GHG emissions arising directly from Isuzu Group operations	2050	Isuzu, n.d.
Navistar	100% new vehicle sales to be ZE	2040	Navistar, n.d.
PACCAR	Net-zero GHG emissions	2050	Climate Action 100, 2023
Volvo Group	100% fossil-free product sales	2040	Volvo Group, 2023

13 Table 2 does not include ZE-only manufacturers as their targets are inherently ZE.

Increased model availability and production volumes allow these OEMs to grow their ZET business, enabling them to achieve their goals while meeting regulatory requirements.

EXPANSION OF REGULATIONS TO ADDITIONAL GEOGRAPHIES

The Unites States' commitment to decarbonize the trucking industry can be seen through the many regulations being put into place at both the federal and state levels. For example, in 2023, at the federal level, the U.S. Environmental Protection Agency (EPA) announced a proposal for more stringent standards to reduce GHG emissions from trucks. The proposed Phase 3 standards would reduce carbon dioxide emissions by approximately 1.8 billion metric tons from 2027 to 2035 and would provide significant climate and health benefits (EPA, 2023b). The EPA rule is expected to be finalized in early 2024.

Meanwhile, the most stringent policies regarding ZET deployments have been passed at the state level. For example, the Advanced Clean Trucks (ACT) rule requires truck manufacturers to sell an increasing number of ZETs as a percentage of their overall truck sales. First passed in California, seven additional states[14] had adopted ACT as of June 2023.[15] Though model year 2024 trucks are the first to be subject to the rule, the industry is already experiencing the effects of ACT, the anticipation of which has spurred more robust supply chains and increased production volumes. Though the eight ACT states combined represent approximately one in four trucks in the United States, they account for nearly 40 percent of ZET deployments through June 2023.

Many additional states are considering adoption of the ACT rule. Seventeen states plus the District of Columbia signed the Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding (MOU), agreeing to strive to make all sales of new MHD vehicles in their jurisdictions be ZE by 2050 (NESCAUM, 2022). The MOU also includes an interim goal of 30 percent ZE sales by 2030 and commits the states to consider adoption of ACT.

In April 2023, California also adopted the Advanced Clean Fleets (ACF) rule, requiring large fleets with operations in California to deploy an increasing number of ZETs as a proportion of their overall fleet. It also requires any new drayage trucks to be ZE. ACF complements ACT by ensuring customer demand for ZETs is there to match the increased supply from OEMs. ACF also includes a provision to cease the sale of combustion trucks entirely, necessitating all MHD vehicle sales be ZE by 2036 (CARB, 2023). ACT and ACF work in tandem to send a clear market signal to both truck manufacturers and purchasers.

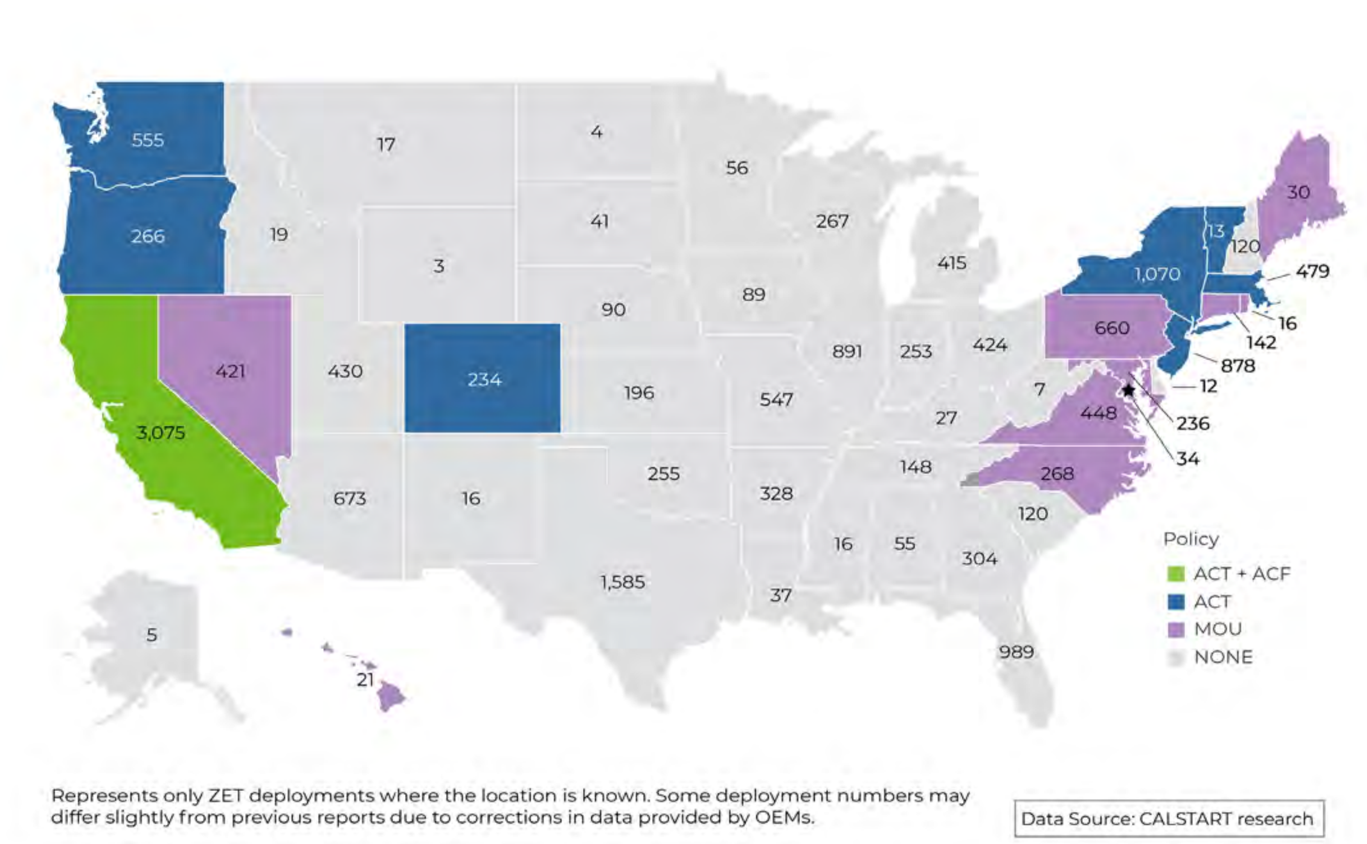
Taken together with local policies regulating emissions from warehouses and requiring streamlined permitting of electric vehicle charging, these regulations have without a doubt resulted in increased ZET deployments in leading geographies (South Coast Air Quality Management District, n.d.; GO-Biz, n.d.). Figure 12 presents the number of ZETs deployed by state (where the state can be identified) and shows

14 Other states that have adopted the ACT regulation as of June 2023 include Colorado, Massachusetts, New Jersey, New York, Oregon, Vermont, and Washington. New Mexico, Maryland, and Rhode Island adopted ACT later in 2023, after the data cutoff for this analysis.

15 Per its authority under section 209 of the Clean Air Act (CAA), California can set more stringent emissions standards than the federal government. Under Section 177 of CAA, other states can then adopt California's standards.

each state's policy status as of June 2023. The policy levels shown are states that have adopted both the ACT and ACF rules (green), states that have adopted only the ACT rule (blue), states that have adopted neither but have signed the MOU indicating intent to adopt the ACT rule (purple), and non-MOU states (gray).

Figure 12. State ZET Deployments and Policy Status (2017–June 2023)



California has announced that it hit its goal of 6 percent of new trucks sold in the state being ZE by 2024 two years early, exceeding the original goal in 2022 with 7.5 percent of trucks sold (including light-duty trucks) being ZE (Office of Governor Gavin Newsom, 2023).

HISTORIC LEVELS OF FUNDING AVAILABLE

Regulations are most likely to be successful when paired with a full ecosystem of supportive programs, including incentives. Though the total cost of ownership (TCO) of a ZET may already be lower than that of a combustion truck (due to the increased efficiency of ZE powertrains and lower operational costs from less maintenance and lower fuel costs), this is not yet true across all duty cycles (though ZETs are expected to achieve TCO parity by the end of the decade, across all standard duty cycles) (Argonne National Laboratory, 2023; Hunter et al., 2021). Even with the promise of lower TCO on the horizon, incremental purchase price—as well as the costs to install charging, upskill employees, and purchase insurance for these more costly vehicles—remains a barrier to ZET adoption for many fleets.

Fortunately, historic levels of funding are available to help U.S. fleets overcome the upfront price premium and deploy ZETs. Analysts estimate approximately $32 billion will be available on average per year for the next few years (Gladstein, Neandross, & Associates, 2023). This support represents an order of magnitude in growth from estimates just two years prior, highlighting the rapid increase in funding availability and overall momentum in the industry.

Similar to policy, this funding is a combination of state and federal programs. ZETs can cost upwards of two to three times the price of a similar combustion truck, so incentives that help lessen this upfront cost premium help make ZE technology more accessible for fleets. At the federal level, the Inflation Reduction Act (IRA)-authorized Commercial Clean Vehicle Credit helps cover the incremental cost of ZETs by providing a credit of up to $40,000 per truck (IRS, 2023). This credit, combined with the Alternative Fuel Refueling Infrastructure Credit, is expected to help ZETs achieve TCO parity with combustion-powered trucks approximately five years sooner than without IRA (Kahn et al., 2022).

At the state level, voucher incentive programs act as a tool to support ZET deployments by offering cash-on-hood funding toward a ZET at the time of purchase. States that offer upfront vehicle incentives, such as California, New York, and New Jersey, have seen greater adoption of ZETs across all vehicle segments. States with a statewide ZE MHD vehicle incentive program prior to 2023 make up 39 percent of all ZET deployments.[16] Some state-level incentive programs also offer funding for charging or refueling infrastructure. To date, there are 15 MHD vehicle incentive programs across 10 states. Additional states are able to take advantage of available federal programs to fund new ZET voucher programs (Mandel et al., 2023). See Appendix A for a list of known ZET incentive programs in the United States.

Additional funding to support ZET deployments is increasingly available from utilities and local government as well (Office of Energy Efficiency and Renewable Energy, n.d.). For example, numerous electric utilities offer "make-ready" programs that can cover the cost of electrical grid upgrades necessary to make the distribution system and/or charging site (i.e., fleet depot) capable of charging ZETs. These make-ready programs are approved by state public utility commissions and funded by ratepayers. Research based on real-world data shows that these programs can drive down electric rates over time for all electricity customers in a utility's territory due to the increased sales of electricity that these programs enable (Whited et al., 2023; MacDougall, 2023). See Appendix B for a list of known utility make-ready programs in the United States.

MORE ROBUST BATTERY SUPPLY CHAINS

For BETs, the battery comprises approximately 70 percent of the overall vehicle cost (Beaty, 2021). Because batteries represent such a large portion of overall vehicle cost, a decrease in their cost has an outsized impact on electric truck pricing. Therefore, another factor impacting overall cost and deployment

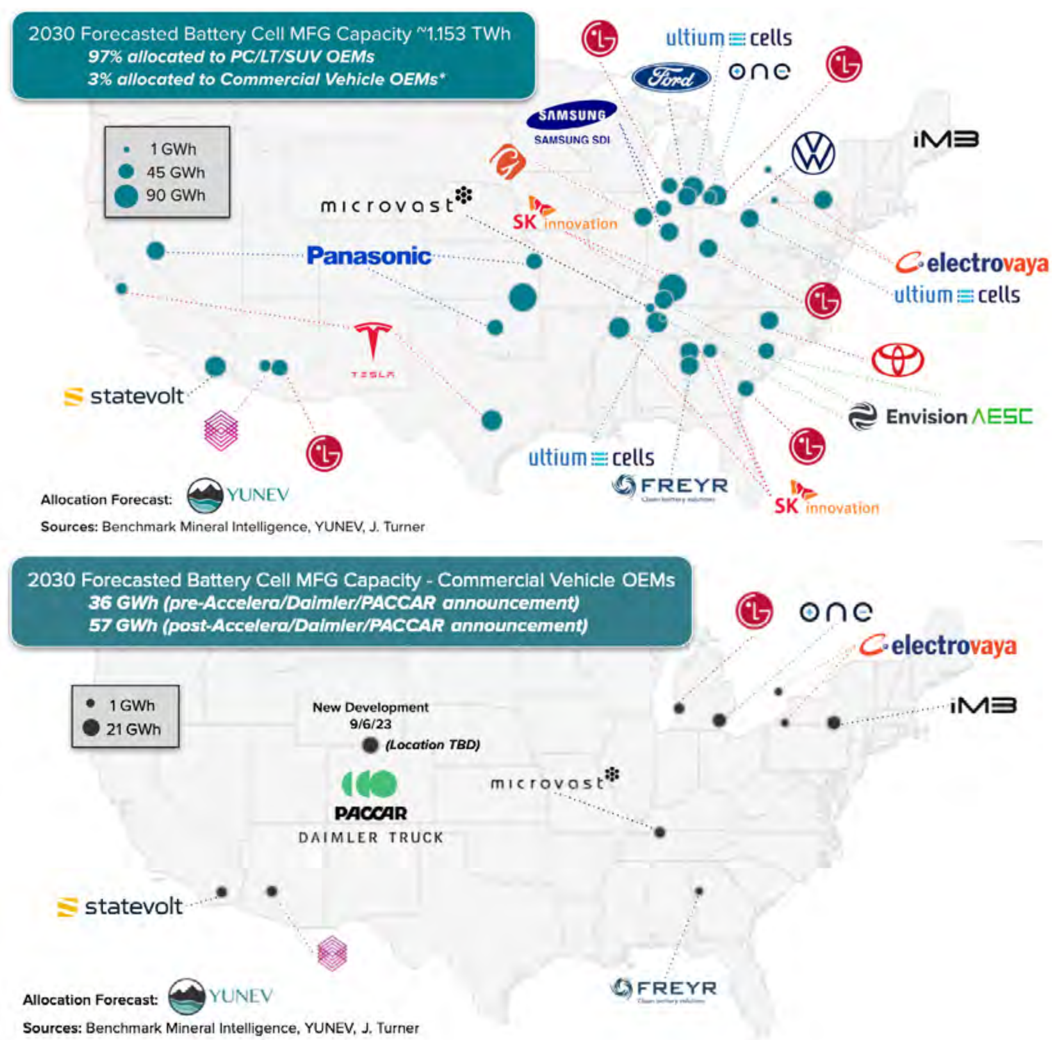
16 For more information about state incentive programs, see Appendix A.

feasibility for ZETs has been the declining cost of lithium-ion battery packs, which have reduced in price nearly 90 percent over the last 15 years (Vehicle Technologies Office, 2023). In just the last year, from 2022 to 2023, average lithium-ion battery pack prices fell 14 percent, due largely to declining raw material costs (Stoikou, 2023). Battery pack prices are expected to continue falling by an average of 11 percent per year from 2023 to 2030 (Goldman Sachs, 2023).

However, it is important to note that ZE commercial vehicles are not able to access batteries at passenger car prices, due in large part to lower production volumes and therefore higher and more volatile battery prices. For example, while global electric passenger car manufacturers reported an average battery pack price of $128 per kilowatt-hour (kWh) in 2023, the commercial vehicle sector (excluding China) saw prices 45 percent higher at around $186 per kWh (Stoikou, 2023).

The MHD commercial vehicle market represents approximately 10 percent of the U.S. vehicle market; however, as illustrated in Figure 13, only about 3 percent of the forecasted 1.2 terawatt-hour battery cell manufacturing capacity is allocated to the commercial vehicle sector.[17]

Figure 13. Maps of Overall and Commercial Vehicle Dedicated U.S. Battery Production Capacity



17 Battery capacity research, data, and infographic (Figure 13) provided by YUNEV.

This inequity is exacerbated by the fact that electric trucks require much larger battery packs than light-duty electric vehicles. Furthermore, the relatively small volumes of truck battery production are split by OEM market share and product differentiation. Some OEMs are realizing they need to partner up with competitors on batteries and fuel cell technologies to get pricing down.

Limited battery production not only has implications on vehicle cost but also impacts the number of ZETs that OEMs are able to produce. For example, GM had to temporarily shut down production of its all-electric BrightDrop delivery vans this past fall due to difficulties securing batteries (Noble, 2023). Production is expected to resume in Spring 2024 when GM opens a new battery-module line. Similarly, Romeo Power, which was bought by Nikola and then liquidated in less than a year, also negatively impacted OEM customer production volumes.

As they look to scale production and minimize price volatility, several other ZET OEMs have begun to make investments in commercial vehicle-focused battery manufacturing. For example, in September 2023, Accelera by Cummins, Daimler Truck, and PACCAR announced a joint venture to advance battery cell production in the United States (Daimler Truck, 2023). The planned joint venture will invest between $2–3 billion for a 21 gigawatt-hour factory. Two months later, the Volvo Group announced plans to purchase Proterra Powered, the bankrupt company's battery business unit, including a development center for battery modules and packs in California and an assembly factory in South Carolina (Volvo Group, 2023a).

IRA-funded subsidies for new U.S. battery manufacturing are available via the Advanced Manufacturing Production Credit (45X). These credits offer $35 per kWh of capacity for battery cells and $10 per kWh for battery packs or modules produced in the United States (McDaniel, 2023). These credits offer $35 per kWh of capacity for battery cells and $10 per kWh for battery packs or modules produced in the United States (McDaniel, 2023). These credits are expected to spur additional investments in domestic battery supply, though it will take a few years for the impacts of these investments to be felt by the industry. These developments are expected to create more than 102,000 U.S. jobs in battery manufacturing, spread across 31 states, with the highest concentration in the emerging Battery Belt (Olano, 2023). Projects spurred by IRA are expected to create an additional 38,000 U.S. jobs in electric vehicle manufacturing. In November 2023, the U.S. Department of Energy (DOE) also announced $3.5 billion for domestic battery manufacturing, prioritizing production and manufacturing for specialized, non-light-duty markets (DOE, 2023d). More investments are needed to expand and strengthen the domestic battery supply chain with dedicated battery manufacturing capacity for MHD vehicles.

IRA-funded subsidies for new U.S. battery manufacturing are available via the Advanced Manufacturing Production Credit (45X). These credits offer $35 per kWh of capacity for battery cells and $10 per kWh for battery packs or modules produced in the United States (McDaniel, 2023).

Meanwhile, fuel cell prices have been falling significantly over the past decade, with FCEVs experiencing a 65-percent reduction in prices (Pocard, 2012). As production volumes increase, cost is expected to continue to fall significantly (Deloitte and Ballard, n.d.).

UNPRECEDENTED INVESTMENTS IN CHARGING INFRASTRUCTURE

ZET deployments have also been spurred by historic investments in charging infrastructure. Many fleets have now installed charging at their depots to support truck electrification. Depending on the number of ZETs being deployed, their charging needs, and existing grid capacity at the site, this infrastructure can be put in place in as little as a few months. Sometimes, this buildout may take a few years, due largely to utility timelines and supply chain constraints. Policymakers, regulators, utilities, nonprofit organizations, and other stakeholders are working to identify opportunities to speed up this energization process.

To help bridge this temporary gap, fleets should consider solutions like the "3 M's"—mobile charging, managed charging, and microgrids—to support faster deployment of depot-based charging infrastructure. (Learn more in the *Accelerate Utility Processes* section below.)

Non-depot charging solutions are increasingly important as well. Shared and public charging solutions are critical for enabling many fleets to deploy ZETs, including those that:

- Do not have a depot at which they park the vehicle(s) overnight.
- Lease depots and whose landlords are unwilling to allow charging.
- Have depot charging but would like redundancy in case of downtime.
- Have depot charging but need en-route charging for longer routes.
- Cannot afford the capital expenditure for charging infrastructure.
- Do not have space/real estate at their depot for charging.
- Are planning to install depot charging but for whom permitting and/or energization will take longer than truck delivery timeline.
- Are considered over-the-road or long-haul.

Fortunately, these sorts of shared and public charging solutions are increasingly available. For example, Electric Island opened publicly accessible electric truck charging in 2021 in Portland, Oregon (Daimler Truck North America, 2021). The Port of Long Beach has offered free ZET charging since late 2022 (Port of Long Beach, 2022). Public ZET charging is also available at TruckNet's Otay Mesa location near the Port of San Diego, and the Los Angeles Cleantech Incubator (LACI) has funding and plans to open public truck charging at the Port of Los Angeles (Nikolewski, 2023; LACI, 2023).

Meanwhile, Charging-as-a-Service (CaaS) providers are opening shared charging sites. WattEV's depot near the Port of Long Beach opened in 2023, and the company has plans to open three more in California—Bakersfield, San Bernardino, and Gardena—in early 2024 (PR Newswire, 2023). WattEV has also received funding to open CaaS depots along I-5 in Sacramento, California, and Salem, Oregon (Hampel, 2023). CaaS company Forum Mobility has also opened its first charging depot for Hight Logistics and has plans to expand to serve many drayage fleets across California, with investments from CBRE, Amazon's Climate Pledge Fund, and Homecoming Capital to do so (Forum Mobility, 2023). Additional CaaS startups like Terawatt and Voltera also have ambitious plans to open charging depots to support electric trucks. And freight-forwarding companies are taking advantage of Zeem Solutions' "fleet-as-a-service" depot at Los Angeles International Airport in Southern California, enabling them to deploy electric box trucks (FleetOwner, 2022).

A conceptual rendering of Forum Mobility's FM Harbor electric truck charging depot at the Port of Long Beach. Image Credit: Forum Mobility

ZET OEMs are also investing in public charging. For example, Volvo and Pilot Company have announced a partnership to deploy truck charging at select Pilot and Flying J travel centers, ideally positioned along transportation corridors (Pilot Company, 2022). Volvo has also partnered with Volvo Financial Services, Volvo Technology of America, Shell Recharge Solutions, TEC Equipment, Affinity Truck Center, and Western Truck Center to develop a publicly accessible ZET charging network that connects several of California's largest metropolitan areas (Volvo Trucks North America, 2022). Daimler Trucks North America has partnered with NextEra Energy Resources and BlackRock to launch Greenlane, a $650 million joint venture to design, develop, install, and operate a U.S. nationwide, high-performance ZE public charging and hydrogen fueling network for MHD battery-electric and hydrogen fuel cell vehicles (Daimler Truck North America, 2023). Tesla has applied for $97 million in subsidies to build charging infrastructure for its electric Semi trucks from Texas to California (Hampel, 2023a). Billions of dollars have already been invested in building out this charging infrastructure, which will continue to come online in the coming years.

INCREASED SUPPORT FOR SMALL FLEETS

As noted above, charging infrastructure to support ZETs is particularly critical for smaller fleets that may not have their own depots and/or access to capital to build out private charging. In fact, small fleets face more barriers to implement ZETs into their operations overall, as they have fewer resources—financial, staff, and informational—than larger fleets and may also lack the ability to adapt to technological issues (Dream.org, 2022).

Yet, small fleets are the norm in the trucking industry. According to the American Trucking Association, 95.8 percent of fleets operate 10 or fewer trucks and 99.7 percent operate 100 or fewer (American Trucking Association, 2023). To ensure the many small fleets and independent owner-operators in this country are not left behind in the transition to ZETs, governments have created special fleet assistance programs like Cal Fleet Advisor and Mass Fleet Advisor[18] to provide concierge-style technical assistance tailored to specific fleets' needs. Advisors in each program can assist fleets with education on vehicles, fueling, and regulations, as well as provide technical assistance with TCO analysis, duty-cycle analysis, and fueling strategies. These assistance programs allow fleets to have a go-to contact that can help guide them to the correct resources, such as utilities, dealers, OEMs, and incentive programs to ensure a fleet's success in the ZET transition. Some special incentives are available for small fleets as well. For example, California's Clean Truck and Bus Voucher Incentive Project (HVIP) offers larger voucher amounts for small fleets. It also has a special carve-out known as the Innovative Small e-Fleet (ISEF) program, which allows trucking fleets with fewer than 20 trucks to access flexible financing, lease, rental, and packaged Truck-as-a-Service (TaaS) options that include enhanced incentives and fueling support. First launched in 2022, ISEF was very popular, having its $25 million budget quickly oversubscribed. ISEF reopened in 2023 with a budget of $83 million (CARB, 2023b).

Similarly, industry is also experimenting with innovative business models to better support small fleets in transitioning to ZETs. For example, as-a-service models like TaaS or CaaS offer fleets the ease and flexibility of an all-in-one package that can include the vehicle, charging, and maintenance for a monthly subscription. This enables fleets to forgo the high upfront capital expenses and allows them to trial vehicles for their operations with shorter-term subscriptions capable of recognizing lower TCO as affordable operational expenses. These solutions are great ways to expand access to ZETs for fleets that may not have the upfront capital or internal expertise to otherwise make the transition. New York is piloting these innovative as-a-service business models via the Clean Transportation Prize state-funded Freight Electrification-as-a-Service for Transformation (FEaST) project (CALSTART, 2022).

Since many small fleets typically purchase used trucks rather than new ones, the industry is also exploring opportunities to promote a more robust used ZET market.

INCREASED PUSH FROM SHIPPERS

Whether small or large, fleets are increasingly transitioning to ZETs to realize ambitious sustainability goals. As investor, employee, and regulatory pressure mounts to address climate change, companies are committing to transparently report on and reduce their carbon emissions. For larger private fleets, this may mean transitioning to ZETs to reduce their direct emissions from their owned vehicle assets. For smaller and/or for-hire fleets, this may mean responding to shippers' desires to reduce their indirect (Scope 3) emissions by transitioning to ZETs and reporting on emissions reductions to these customers.[19]

18 For more information on Cal Fleet Advisor and Mass Fleet Advisor, visit their websites at https://calfleetadvisor.org and https://www.massfleetadvisor.org, respectively.

19 Scope 1 refers to emissions that an organization owns or controls directly. Scope 2 refers to emissions that a company causes indirectly and come from the energy it produces or purchases. Scope 3 refers to emissions not produced by the company but for those that the company is indirectly responsible for up and down its value chain.

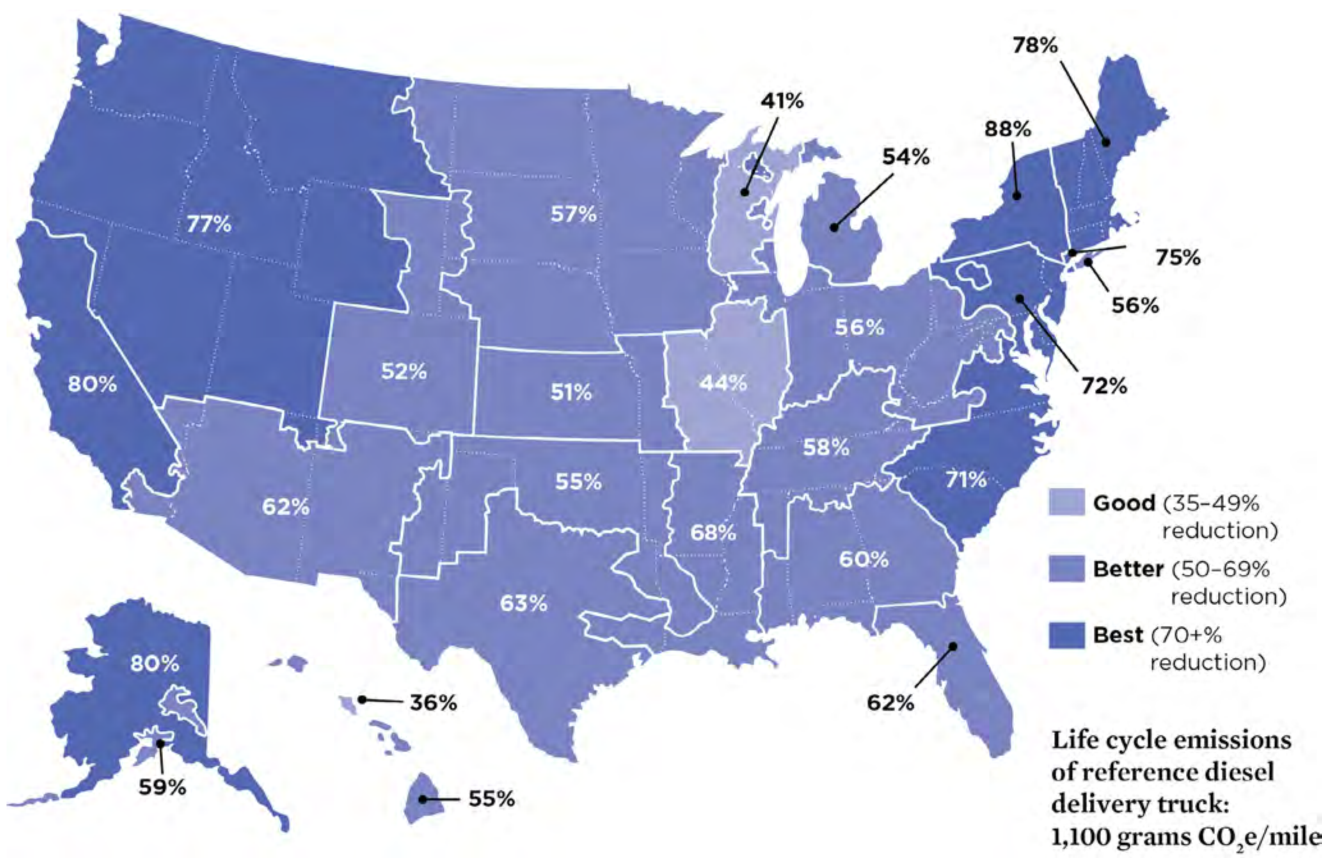
Companies will soon be required to report on their direct and indirect GHG emissions due to a group of landmark climate disclosure bills in California (PWC, 2023). Climate-related disclosures may also soon be required nationwide under a proposal from the U.S. Securities and Exchange Commission (Copley, 2023).

By deploying ZETs, fleets may be better positioned to win contracts from sustainability-minded shippers and/or to earn a premium from these contracts. Even private fleets can benefit by attracting top talent and increased investment thanks to their reduced climate risk. More than 100 fleets have already made commitments to reduce emissions and/or deploy ZETs (Environmental Defense Fund, 2023).

MOVING BEYOND TAILPIPE EMISSIONS TO TACKLE FULL VALUE CHAIN

While it is true that ZETs already offer lower lifecycle emissions than combustion trucks (Figure 14)—savings that will only grow as the electric grid integrates more renewable energy—it is crucial to continue to reduce emissions not just from the truck's tailpipe but from specific processes throughout the vehicle's value chain, such as mining, battery recycling, and manufacturing (O'Dea, 2019). Doing so acknowledges the interconnectedness of the entire lifecycle of a vehicle. A holistic approach can ensure a comprehensive reduction in transportation-related emissions and reinforce the commitment to combat climate change and build a more sustainable future.

Figure 14. Lifecycle GHG Emissions Reductions of ZETs Compared to Diesel Trucks Across the United States (O'Dea, 2019)



Mining battery minerals is vital for manufacturing ZETs, and the United States aims to bolster domestic mining production to meet rising ZET demand. Presently, the United States imports most battery minerals from global mining hubs like China, Chile, and Argentina. Estimates suggest sufficient capacity until 2030, but expansion will be necessary thereafter, partly due to IRA incentives favoring U.S. or allied country sourcing. A recent encouraging analysis from Lawrence Berkeley National Laboratory found that California's Salton Sea has even more lithium than previously thought: up to 18 million metric tons, enough for roughly the equivalent of 382 million electric vehicle batteries (Dobson et al., 2023).

Nonetheless, mining raises environmental and social concerns such as energy consumption, emissions, habitat loss, water contamination, and human rights. Outdated U.S. mining laws are under review, and the interagency Working Group on Mining Reform recently published recommendations to improve mining on public lands. The working group suggests significant reforms to the outdated General Mining Law of 1872 with 65 recommendations across six broad issue categories: improving mineral exploration and development planning and permitting, increasing engagement with stakeholders and potentially affected communities, expanding consultation and engagement with Tribes, obtaining fair compensation for taxpayers, protecting taxpayers from the cost of abandoned mine reclamation, and revitalizing domestic mining and other issues (Interagency Working Group on Mining Laws, Regulations, and Permitting, 2023). The Initiative for Responsible Mining Assurance (IRMA) offers third-party assessments for more responsible mining (IRMA, 2023). Encouraging IRMA certification for mining companies and advocating for its adoption in battery supply chains will enhance self-reliant and efficient battery production for ZETs.

Addressing the full environmental impact of ZETs involves more than upgrading the domestic supply chain; it requires consideration of the emissions associated with mining and manufacturing. While ZETs reduce tailpipe and lifecycle emissions, mining and battery manufacturing still produce substantial GHG emissions. To mitigate this, a focus on battery recycling and reuse is essential to promote a circular economy and lower ZETs' overall carbon footprint. Estimates suggest that if 50 percent of collected end-of-life batteries are recycled, and the other 50 percent are repurposed, mineral demand could be reduced by 28 percent by 2050, subsequently lowering mining emissions (The International Council of Clean Transportation, 2023). Furthermore, in some cases, recycled batteries have been shown to perform better than new ones (Wilkerson, 2022). Funding totaling $74 million to advance domestic battery recycling and reuse has already been awarded (DOE, 2022). While the current battery second-life and recycling market is small, it is due for a significant increase by 2030 as the number of battery-electric vehicles on the road increases. Advocating for supportive policy that encourages battery labeling and traceability requirements, recycling recovering rates and standards, and supporting the development of these markets will be crucial for a successful battery ecosystem. Creating a circular battery ecosystem now will enable the United States to reap the full benefits of a battery's lifecycle in the future.

After eliminating a vehicle's exhaust pipe with a ZE powertrain, producing the steel and aluminum used in vehicles is the second largest source of lifecycle emissions. Steel and aluminum make up roughly half of a vehicle's production emissions, with some estimates attributing as much as 80–85 percent[20] (Lie et al., 2021). Green steel—produced via more sustainable methods than traditional steel—offers a solution

20 Confidential interview with CALSTART member-company.

for reducing emissions from manufacturing. While the United States has seen less activity around green steel than in Europe, there are a few policies in place that impact U.S. steel and aluminum decarbonization. The Bipartisan Infrastructure Law and IRA granted DOE's Office of Clean Energy Demonstrations $6.3 billion for industrial decarbonization projects (Office of Clean Energy Demonstrations, 2023). This funding will target steel and other sectors. California's Buy Clean California Act run by the Department of General Services sets global warming potential limits on the procurement of steel and other materials used for state construction projects (Department of General Services, 2021). The federal government is also enacting a similar Buy Clean Initiative, again focusing on government construction (Office of the Federal Chief Sustainability Officer, 2023). These investments and regulations can better accelerate and create more opportunities to transition to near-ZE steel and aluminum procurement.

While regulations primarily target exhaust emissions in vehicle-related transportation, it is crucial to recognize that emissions also originate from components beyond the exhaust system. Tires and brakes, for instance, emit particulate matter at higher rates than newer model year truck tailpipes, posing potential health and environmental hazards. These non-exhaust emissions have historically been less regulated due to measurement and control challenges. Notably, BETs generate increased tire wear due to their weight and torque characteristics. Particulate matter, especially PM2.5, from these sources can directly enter the bloodstream and is associated with health issues (Carrington, 2022). Regenerative braking has promise to reduce brake wear and overall emissions from tires and brakes, but it is still unknown to what extent those reductions would be. As emissions standards become stricter, understanding and mitigating non-exhaust emissions will be imperative. California is leading efforts by requiring research into safer alternatives to tire chemicals like 6PPD (Department of Toxic Substances Control, 2023). Additionally, embracing alternatives in freight transportation, like electric cargo bikes for last-mile delivery, can further reduce tire and brake emissions. Although non-exhaust emissions are complex to regulate, investing in research can guide future technological advancements for emissions reduction.

HYDROGEN FUEL CELL DEVELOPMENTS

Compared to BETs, FCEV technology has the ability to offer longer ranges, faster fueling, and increased payload that are needed for demanding duty cycles seen in the HD long-haul segment. As such, FCEVs have seen increased interest from the trucking industry. As of June 2023, there have been approximately 15 FCEVs deployed in the United States, a number that is expected to grow rapidly with more OEMs committed to manufacturing and selling these vehicles. For example, Hyundai has brought the XCIENT FCEV to the United States, and other OEMs including Nikola, Kenworth, and Hyzon expect to increase FCEV production in the coming years.

However, with a new technology comes barriers to adoption, such as high upfront costs, an undeveloped refueling network, and complicated logistics, all of which have impeded the technology's adoption. Stakeholders are also hesitant to invest in fuel cell technology as a decarbonization tool due to the fact that the vast majority of hydrogen fuel produced today is made using a GHG-intensive process. The significant upstream emissions from production of this "grey" hydrogen are a challenge for sustainability-minded fleets. "Blue" or "green" hydrogen can be produced using more environmentally friendly methods like carbon capture and storage or electrolysis using renewable electricity, respectively. However, blue and green hydrogen are significantly more expensive than grey hydrogen.

That said, FCEV adoption is slowly progressing, as seen in record dollar amounts being committed to all phases of the hydrogen process. For example, incentive programs in California, New York, Nevada, and Massachusetts have all started to incentivize FCEVs by reducing the upfront costs by way of a voucher or rebate. In addition, the Biden-Harris Administration recently selected seven projects for regional hydrogen hubs that will receive $7 billion in funding to accelerate the domestic market for clean and low-cost hydrogen (The White House, 2023). DOE has also launched the Clean Hydrogen Electrolysis Program that has $1 billion to improve the efficiency and cost-effectiveness of clean hydrogen (Office of Energy Efficiency and Renewable Energy, 2022). This program allows for research, development, demonstration, commercialization, and deployment projects.

The Million Mile Fuel Cell Truck (M2FCT) consortium, which is DOE-funded, aims to improve the durability and efficiency challenges with FCEVs and has an initial focus on long-haul trucking (M2FCT, n.d.). Continuing and expanding on efforts like this will be important to continue the technological development of FCEVs to handle the demands of harder-to-decarbonize duty cycles like long-haul trucking. Continued investment, research, and partnerships to advance FCEVs are needed to meet climate goals.

DEPLOYMENTS MOVING FROM PILOTS TO SCALE

Most fleets have historically purchased only one or two ZETs at a time to pilot in their operations. However, as they gain familiarity and trust in the technology, some fleets are now beginning to deploy ZETs at scale.

For example, as part of its Climate Pledge, Amazon has deployed more than 10,000 electric delivery vans across the country in approximately 18 months (Amazon, 2023). These vans are now on the road in more than 1,800 cities across the country and have delivered more than 260 million packages to customers. To support these vans, Amazon has installed over 12,000 chargers at more than 100 delivery stations across the United States. These deployments are part of Amazon’s partnership with Rivian to put 100,000 electric delivery vehicles on the road by 2030.

A lineup of Amazon's electric delivery vans. Photo Credit: Amazon

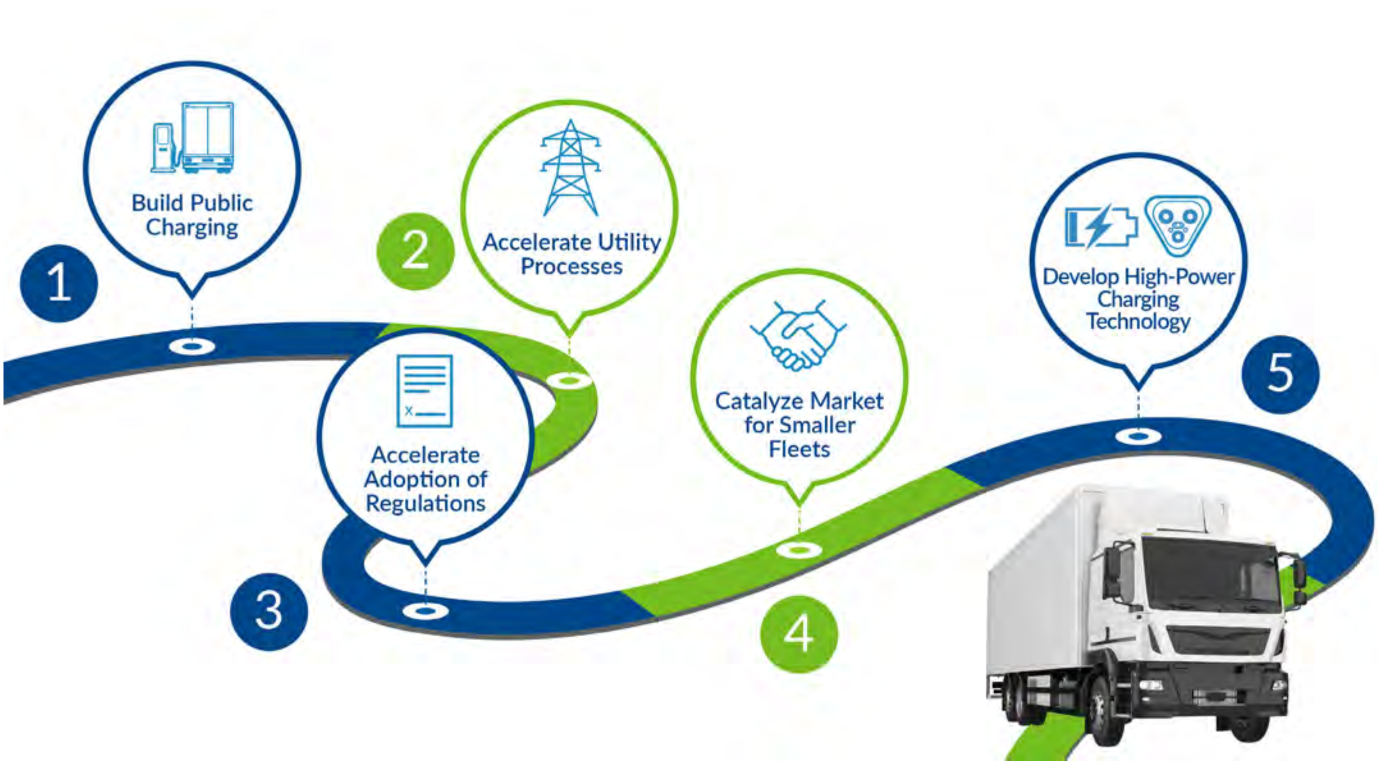
Meanwhile, the CARB-funded Joint Electric Truck Scaling Initiative (JETSI) is working with fleets to successfully deploy ZETs and infrastructure at scale. Fleet partners National Freight Industries (NFI) and Schneider will each operate 50 Class 8 ZETs in regional-haul and/or drayage operations in Southern California (CARB, n.d.). In fact, Schneider's HD electric truck fleet has already achieved the impressive milestone of hauling more than 1 million ZE miles of customer freight (Schneider, 2023). Also in California, Performance Team has ordered 110 VNR Electrics from Volvo Trucks to operate in its Southern California port drayage and warehouse operations, adding to the 16 VNR Electrics it deployed in 2021(Achelpohl, 2022). 4 Gen Logistics has ordered 20 Kenworth T680E electric Class 8 trucks as part of its commitment to becoming a ZE fleet by 2025—10 years before California requires drayage trucks operating in the state to achieve that standard.

In addition, the North American Council for Freight Efficiency's (NACFE's) 2023 Run on Less Electric DEPOT event profiled 10 fleet depots in the United States and Canada with at least 15 ZETs operating at each one (NACFE, n.d.). The 10 depots operated 291 electric trucks, 22 of which shared data throughout the three-week Run. Through the Run, NACFE was "able to show that adopters of battery electric vehicles have demonstrated that they work at scale in various segments of the trucking industry including vans and step vans, medium-duty box trucks, terminal tractors and heavy-duty regional haul," said NACFE's executive director, Mike Roeth (NACFE, 2023). Findings also highlighted the importance of the people involved—their diversity, passion, and capability—to scale the adoption of electric trucks. Data-sharing, such as the work done in Run on Less, is sorely needed in the industry so that others can learn from the successful and growing, but still mostly undocumented, real-world experiences.

NEXT STEPS TO ACCELERATE THE TRANSITION

Though ZET deployments continue to grow, more action is needed to spur the market growth justified by environmental justice considerations and climate science and to be ready to comply with existing and anticipated regulations. The following measures represent the top five opportunities for accelerating ZET deployments in the coming months and years (Figure 15).

Figure 15. Roadmap to Accelerate U.S. ZET Market



1. BUILD PUBLIC CHARGING

As noted in the *Unprecedented Investments in Charging Infrastructure* section above, billions of dollars have already been invested in building out charging infrastructure for ZETs. While there are few public chargers open to ZETs today, many are expected to come online in the coming years. And though significant additional investment is needed, it is important to note that not all of this infrastructure is needed at once—it can be phased in. CALSTART's *Phasing in U.S. Infrastructure* working paper outlines a modeled scenario of how to accelerate infrastructure buildout for MHD vehicles, starting in priority launch areas that have favorable policy, investment, industry concentration, and grid modernization, then building out toward key hubs and corridors that will create a national network through 2035 (Joseph et al., 2023). The infrastructure buildout meets the pace set forth by the Global MOU. This approach allows for cost-effective implementation while signaling to utilities, governments, and investors where they need to target their actions. The outlined roadmap (Figure 16) shows that change is possible through focused, intentional action and investment, and if followed, allows the United States to stay on track to meet climate and ZET sales goals.

Figure 16. Phase-in of Infrastructure to Meet Rapid ZET Adoption (Joseph et al., 2023)

The Biden-Harris Administration has also announced $7.4 million in funding for ZE MHD vehicle corridor projects to help accelerate the creation of an MHD charging network (DOE, 2023c). The federal government also offers funding for public truck charging via the Charging and Fueling Infrastructure discretionary grant program, which has an approved budget of $2.5 billion over five years (FHWA, 2023).

Public charging buildout will be critical to not only ensure overall ZET deployments increase but also small fleets are not left behind in the transition.

2. ACCELERATE UTILITY PROCESSES

As noted earlier in this report, antiquated utility processes designed for real estate development can result in necessary site upgrades taking years to complete before charging infrastructure can be deployed. Given the incredibly fast timeline for transitioning the nation's truck fleet to ZETs, utilities, regulators, policymakers, and industry must work together to update and hasten timelines for grid assessments, upgrades, and electric vehicle supply equipment energization.

As utilities and the electrical supply chain work to adapt to the rapid growth of the ZE MHD sector, fleets have been seeking interim and innovative solutions like the "3 M's" mentioned above: mobile charging, managed charging, and microgrids. There are an increasing number of mobile-charging hardware solutions on the market capable of charging ZETs without needing grid upgrades (CARB, 2023a). Often skid-based or containerized, these solutions are now offered by several OEMs, with some models available for purchase outright while others are available to customers via a lease program. In addition, managed charging software can help fleets limit electricity demand at any time, making grid upgrades less needed and saving money on electric bills by minimizing demand charges and time-of-use rates. Microgrids, including distributed energy resources like onsite solar panels and battery storage, can also minimize utility bills and needed upgrades, potentially even enabling fleets to charge vehicles completely independent of the local electric utility. Companies like Scale Microgrids can help fleets plan and execute optimized solutions (Scale Microgrid Solutions, 2022).

Changing utility regulations to enable them to proactively build no-regret infrastructure to support ZET charging (rather than simply being reactive to individual fleet customer requests) is also being considered as a way to minimize timelines for deploying charging infrastructure. Standardizing and streamlining permitting processes would also hasten this process.

3. ACCELERATE ADOPTION OF REGULATIONS

As noted above in the *Expansion of Regulations to Additional Geographies* section, regulations like ACT have been incredibly important drivers of ZET deployments to date. However, the majority of states have yet to adopt this regulation. Doing so would send a strong market signal to OEMs, fleets, utilities, and charging providers while promoting consistency and regulatory certainty. States may follow California's leadership by adopting ACF as well.

On the federal stage, the industry is awaiting EPA's final "Phase 3" standards to reduce GHG emissions from HD vehicles. These regulations will begin in model year 2027, and the proposed standards maintain the flexible structure created in EPA's Phase 2 GHG program, which is designed to reflect the diverse nature of the HD industry. EPA should finalize a strong Phase 3 standard as soon as possible to support the work of states, send clear nationwide market signals, and help unlock the investments necessary to support clean transportation. Investments in research, development, and production of ZETs will in turn drive innovation and economies of scale, ultimately resulting in more affordable and accessible ZET options for consumers.

Additional policies that should be pursued to accelerate ZET deployments include: enacting low carbon fuel standards that provide funding to fleets using electricity rather than diesel as a fuel, enabling utility make-ready programs to cover the cost of necessary grid-side upgrades to support charging and refueling infrastructure, and exempting HD ZETs from the federal excise tax that exacerbates the price premium challenge of ZETs and prolongs the timeframe for these vehicles to achieve cost parity with combustion trucks.

4. CATALYZE MARKET FOR SMALLER FLEETS

Though there have been significant effort and investments made to help small fleets access ZET technology, more are still needed. In addition to the technical assistance, financial incentives, and as-a-service business models mentioned above, small fleets will not be able to adopt ZETs at scale without a used ZET market, access to reasonable financing and insurance, and clear signals from customers.

The secondary market in the trucking industry plays a vital role in allowing fleets the opportunity to purchase cleaner yet affordable trucks. Smaller fleets often look to the used truck market to buy their vehicles, as this route is better financially for them and it allows larger fleets the opportunity to recoup value from their trucks. The used truck market is expected to grow at 9 percent CAGR (compound annual growth rate) from 2023 to 2032, and its current market size surpassed $40 billion in 2022 (Wadhwani, 2023). However, the used truck market is currently non-existent for ZETs. This is due in large part to the fact that most ZETs have not been on the road long enough to be resold. Seeding a secondary market by encouraging ZET deployment pioneers to turn over their first-generation ZETs will make ZETs more widely available and more affordable, but it will also provide valuable data to financers that currently have no information about the resale value of ZETs.

A current hindrance to ZET adoption has been the ability for fleets to secure loans from financial institutions. As of today, most leases of ZETs treat the residual value of the vehicle as zero, which in turn prompts higher monthly lease values that some fleets cannot afford. Having a robust used ZET market allows financial institutions to gather relevant data on ZETs and allows them to offer more affordable loans to fleets in need. A secondary market for ZETs and their components can also help bring down insurance premiums, which can be astronomically high today and are impeding ZET adoption.

Small fleets also need clear market signals and innovative collaboration with customers. For example, shippers can offer green premiums and/or preferential contracting with carriers that utilize ZETs. They may also require carriers to reduce and report on their carbon emissions by transitioning to ZETs, thereby helping shippers to reduce and report on their Scope 3 emissions.

5. DEVELOP HIGH-POWERED CHARGING TECHNOLOGY

For most ZETs on the market today, charging speeds currently max out around 350 kilowatts (kW), resulting in longer-than-optimal recharge times and/or reduced payload capacity and increased costs caused by the need for more batteries to meet the range requirements of a truck's duty cycle without having to stop to charge. Because of this tradeoff, there is a need for faster charging technology.

For example, the Tesla Semi can charge at much higher power levels, enabling it to recoup up to 70 percent of its 300- to 500-mile range in 30 minutes (Tesla, n.d.). Tesla has installed direct current (DC) fast chargers up to 750 kW at PepsiCo's Sacramento location (NACFE, n.d.a). With this fast-charging capability—on both the vehicle and charger side—PepsiCo was able to demonstrate more than 1,000 miles per day for a Class 8 electric truck operating in real-world regional-haul routes. This is about four times the average 250 miles per day from the competing Freightliner and Volvo Class 8 electric trucks (Wang, 2023).

The Megawatt Charging System (MCS) represents a significant leap forward in the realm of electric vehicle charging technology, particularly for ZETs. This groundbreaking standard emphasizes high-capacity charging solutions capable of delivering multiple megawatts of power to electric trucks rapidly, allowing for charging times less than 15 minutes to get from zero to 100 percent state of charge. By enabling faster charging at unprecedented power levels, MCS not only reduces downtime for commercial fleet operators but also enhances the practicality and competitiveness of electric trucks in HD applications. Led by CharIN, a task force was created in 2018 to create a common solution for charging electric HD vehicles within a reasonable timeframe. Since the task force formation, an MCS white paper has been released, requirements for an MCS system have been established, and a connector compatibility test was successfully completed, with more milestones ahead. This technology not only accelerates the transition to cleaner transportation but also underscores the growing synergy between innovative charging infrastructure and the broader goals of sustainable and efficient freight and logistics operations.

CHAPTER IV

CONCLUSION

ZETs are being deployed across the United States at an increasingly rapid pace due to increasing model availability, incentives, regulations, and available refueling infrastructure, among other developments. Yet, more action is needed to align the trucking industry's transition with the pace required by science and committed to by key U.S. policymakers.

In 2024, improvements are needed across the charging sector, with an emphasis on increasing the amount of public and shared charging available for ZETs, speeding up the energization and permitting processes, and making additional advancements into high-powered charging capabilities. Utilities, public utility commissions, charging developers, local governments, and states must all work together to achieve these needed improvements. States must also continue to adopt ZET sales mandates and implement incentive programs for vehicles and charging. Together, these policies will send a strong market signal, resulting in increased production volumes and lower prices from OEMs.

Further research and development are needed to advance battery and fuel cell technology and to create a more sustainable battery supply chain. Advances in clean hydrogen production and distribution will be required to meet growing demand for increasing options of fuel cell trucks. Market barriers must also be minimized—not just for large, well-resourced fleets but for small businesses and independent owner-operators as well. Shippers have an important role to play in de-risking ZET investments by their carriers.

The transition will no doubt be challenging, but by rapidly deploying increasing numbers of ZETs, the U.S. trucking industry will be able to continue its vital work while eliminating climate change- and disease-causing emissions, repairing relationships with the communities in which it operates, and doing its part to help the country achieve its climate, energy, and air quality targets.

This transition will require unprecedented collaboration from stakeholders across the industry, including fleets, OEMs, utilities, charging providers, shippers, regulators, policymakers, academia, nonprofits, and frontline communities. Everyone has a role to play to ensure the pace and success of this transition. This report will continue to be updated with ZET deployment statistics to provide a measure of progress, identify opportunities for further action and increased impact, and inspire collective action and investment.

EXECUTIVE SUMMARY

Purpose of Proposed Rulemaking

Mobile sources and the fossil fuels that power them are the largest contributors to the formation of ozone, greenhouse gas (GHG) emissions, fine particulate matter ($PM_{2.5}$), and toxic diesel particulate matter. In California, the transportation sector alone accounts for 41 percent of total GHG emissions (50 percent when upstream emissions from fuel is included) and is a major contributor to oxides of nitrogen (NOx) and particulate matter (PM) emissions. The Proposed Advanced Clean Trucks (ACT) Regulation will contribute to achieving the state's criteria pollutant and GHG reduction goals and cleaner technology targets also needed to protect communities.

The purpose of the Proposed ACT Regulation is to accelerate the widespread adoption of zero-emission vehicles (ZEVs) in the medium-and heavy-duty truck sector and reduce the amount of harmful emissions generated from on-road mobile sources. The primary objectives of the Proposed ACT Regulation include the following:

- Accelerate first wave of zero-emission (ZE) truck deployments in best suited applications;
- Achieve 100 percent zero-emission pickup-and-delivery in local applications by 2040;
- Support the Ports of Los Angeles and Long Beach Clean Air Action Plan for 100 percent zero-emission drayage trucks by 2035;
- Support AB 739 requiring California state government fleets to purchase ZEVs;
- Enable a large-scale transition to zero-emission technology;
- Maximize the total number of ZEVs deployed;
- Complement existing and future programs;
- Provide environmental benefits, especially in disadvantaged communities thereby supporting the implementation of AB 617;
- Ensure requirements are technologically feasible and cost effective; and
- Foster a self-sustaining zero-emission truck market.

The deployment of ZEVs meets goals identified in the State Implementation Plan (SIP), the 2017 Climate Change Scoping Plan, Sustainable Freight Action Plan, and the 2016 ZEV Action Plan that supports the Governor's Executive Orders B-16-12 and B-48-18. In 2018, Governor Brown issued Executive Order B-55-18, which sets a target to achieve carbon neutrality in California no later than 2045, and to achieve and maintain net negative emissions thereafter. The Proposed ACT Regulation directly supports achieving these goals through the required sale of ZEVs in California from all large medium- and heavy-duty manufacturers.

Background and Program Overview

Zero-emission truck and buses can meet the needs of most local and regional operations with technology that is available today. Studies have shown that most straight trucks (designed with all axles on a single chassis), particularly those used in local delivery applications, do not travel more than 100 miles per day. A wide assortment of zero-emission trucks and buses are commercially available today that exceed 100 miles of available range. In addition, several battery-electric and fuel cell models are being demonstrated that exceed 200 miles per day.

The Proposed ACT Regulation was first identified as the "Last Mile Delivery" measure in the 2016 Mobile Source Strategy, which is part of the SIP and the 2017 Climate Change Scoping Plan. This measure is a necessary component for California to achieve established near- and long-term air quality and climate mitigation targets. Last mile delivery fleets are well suited for introducing zero-emission technology because they operate in urban centers, have stop and go driving cycles, and are centrally maintained and fueled. Therefore, development of the Proposed ACT Regulation began with an initial focus on these pickup-and-delivery applications; however, as development progressed staff found that other vocational uses have similar operating characteristics that are well suited for electrification. Additionally, zero-emission technology continues to improve rapidly, and costs continue to come down so that zero-emission trucks and buses are now being offered in a wide variety of vehicle classes with varying electric range and utility. Today, nearly one hundred different ZEV models are commercially available in California, with more to come in the near future.

Zero-emission technology deployments are needed in the medium- and heavy-duty market to meet the state's emission reduction goals, but to date, the major truck manufacturers have been relatively absent in this space. For the past decade, smaller startup truck manufacturers have stepped in to fill market demand and have been designing and marketing zero-emission trucks. These startup companies have significantly advanced the technology. However, they do not have broad dealer networks or regional service facilities that can be leveraged quickly to provide support and maintenance services for zero-emission technology. At workshops, a number of fleets that own zero-emission trucks expressed concern about their experience in securing service and repairs to support their ZEVs in operation from smaller startups companies. In a few cases, large ZEV orders were placed that were not fulfilled. In addition, some of these fleets also had early experiences with ZEV products that were launched by large manufacturers that were also discontinued due to issues with their ZEV component suppliers. These experiences have hampered ZEV market expansion for early adopter fleets.

The Proposed ACT Regulation is focused on requiring large truck manufacturers to sell zero-emission trucks in California to broaden the market and to send a clear signal that medium- and heavy- duty ZEVs will be a major part of California's overall strategy to reduce criteria emissions, reduce climate impacts and reduce petroleum use. The Proposed ACT Regulation would also require one-time reporting from large entities to report information about their contracting practices in meeting their transportation needs and how truck and bus owners currently use their vehicles. Information collected from these companies would help CARB structure future end-user regulatory strategies including whether large entities that hire truck fleets could become the point of regulation, help ensure a level playing field, and help CARB determine any appropriate exemptions or flexibilities. This information would be used in developing future regulations designed to further accelerate the purchase and use of ZEVs in fleets. Using both a manufacturer ZEV sales requirement and a requirement for ZEVs to be used, in combination with early market support from funding programs will significantly accelerate the market for ZEV technology.

Summary of Proposal

The Proposed ACT Regulation includes two primary elements. First, it requires manufacturers to make a percentage of truck and bus sales zero-emissions. Second, it requires one-time reporting of information from large entities including retailers, manufacturers, and government agencies, about contracted services requiring the use of trucks and shuttles in addition to their medium- and heavy-duty vehicle fleet. Staff is also proposing to collect information about cars from these same fleets to inform similar strategies to accelerate light-duty ZEV adoption.

ZEV Sales Requirement

Applicability

- ZEV sales requirement applies to manufacturers that certify incomplete chassis or complete vehicles greater than 8,500 lbs. gross vehicle weight rating (GVWR)
- Manufacturers with less than 500 annual California sales are exempt, but may opt-in to earn credits for selling ZEVs

Sales Percentage

- Class 2b-3 group (consisting mainly of full size pickup trucks and vans) and Class 7-8 tractor group (consisting of on-road semi-trucks that haul trailers) ZEV sales begin at 3 percent of California sales in 2024 and increase to 15 percent by 2030 (Class 2b-3 pickups would be excluded until 2027)
- ZEV sales for all other vehicles in the Class 4-8 group begin at 7 percent of California sales in 2024 and increase to 50 percent in 2030
- The ZEV sales percentage requirements remain constant past 2030

Credits

- Manufacturers can earn credits starting with the 2021 model year (MY)
- Starting with the 2024 MY, ZEP Certification would be required, where applicable, for ZEVs to earn credits

- Compliance would be based on a credit and deficit system to provide flexibility for manufacturers to sell more ZEVs in one weight category and fewer in another and credits may be banked and traded
- Near-zero-emission vehicles (Plug-in hybrids with some all-electric range) would earn partial credits, and could be used to offset up to half of each manufacturer's annual deficits through the 2030 MY

Manufacturer Reporting

- Manufacturers would need to report annually to demonstrate compliance, to earn credits, and to report details about credit trade transactions

Large Entity Reporting Requirement

- Large entities are defined as a government agency or a private organization that met one of the following in calendar year 2019:
    - Received more than $50 million in total annual gross revenue and operated a facility in California
    - Owned 100 or more Class 2b and greater vehicles and operated a facility in California
    - Dispatched 100 or more Class 2b and greater vehicles
- Large entities would be required to report the following information in early 2021 about the following:
    - Their contracting practices with motor carriers and for services that require the use of shuttles or trucks, and
    - Those who own trucks and buses would need to report information about their fleets and how they are operated
- To streamline the process, affected entities would only be required to complete a one-time submittal of aggregated and approximate data for representative facilities, rather than detailed information about every facility.
    - Additionally, entities with vehicles would only be required to report approximate, representative information about the vehicle types owned, rather than reporting operational data for every vehicle.

Potential Impacts of Proposal

Environmental Benefits

The Proposed ACT Regulation is designed to assist in attaining air quality standards, reduce health risks to individuals living in California including protecting local communities from exposure to harmful pollutants, and meeting climate change goals. The emission reductions achieved by staff's proposal will contribute to the reduction of cumulative risk of mortality and morbidity from mobile source emissions in the State. The majority of these benefits will be in the State's most populated and impacted areas near ports and city centers. These areas include the South Coast, San Francisco Bay Area, San Joaquin Valley, San Diego County, and the Sacramento Air Basins.

The Proposed ACT Regulation is expected to result in significant NOx, $PM_{2.5}$, and GHG emission reductions due to replacing internal combustion powered vehicles with zero-emission technology. ZEVs produce no tailpipe emissions, reduce brake wear PM emissions, and have lower upstream emissions. Table ES-1 summarizes the expected criteria emission benefits in 2031 and 2040. These emission reductions contribute to the State SIP Strategy and Climate Change Scoping Plan.

Table ES-1: Expected Emission Reductions of Proposed ACT Regulation

Calendar Year	NOx (tpd)	$PM_{2.5}$ (tpd)	WTW GHG (MMT/yr)
2031	5.0	0.16	0.4
2040	16.9	0.46	1.7

Economic Impacts

Currently ZEVs are more expensive upfront but provide operational savings in terms of lower fuel and maintenance costs. The Proposed ACT Regulation is expected to result in a total cost saving of $4.9 billion to truck transportation in California compared to Business as Usual from 2020 through 2040, mostly due to fuel cost savings. This estimate includes infrastructure cost, higher cost of the vehicles, maintenance and fuel savings, and cost savings due to the Low Carbon Fuel Standard. It does not include vehicle or infrastructure incentives. Thus, incentive programs such as the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Program (HVIP), utility investments, and other funding may be used to offset some potential upfront cost to consumers. Several hundred million dollars per year have become available recently, which would further increase savings to fleet owners. The estimated total statewide health benefits derived from criteria emission reductions are estimated to be an additional $5.7 billion in savings.

The Proposed ACT Regulation requires that manufacturers must build and sell more zero-emission trucks, certify their powertrain using the ZEP Certification procedure, and report information to CARB as part of their regulatory requirements. The research, manufacturing, certifying, and development of ZEVs by manufacturers will contribute to the compliance costs associated with the Proposed ACT Regulation. However, the required ZEV sales can also count towards compliance with the California and federal Phase 2 GHG regulations simultaneously. Reporting requirements for vehicle manufacturers are not expected to be significant since most of the information needed is already reported as part of Phase 2 GHG compliance. It is not straightforward to predict how these costs and cost-savings would be passed on to consumers. Vehicle pricing is complex, and different manufacturers could use different strategies to pass on these costs. It is possible that manufacturers may pass on incremental ZEV costs through the ZEVs themselves, through the rest of their ICE fleet, or some combination thereof.

The Proposed ACT Regulation also requires one-time reporting for large companies and government agencies who would need to report about their California locations, and how they and their contractors move freight and perform other services. Large fleet owners would also need to report information about what vehicles they own, and how they operate. The cost of complying with this one-time reporting requirement is not expected to be significant.

Challenges and Long-Term Benefits

Common challenges for deploying zero-emission technologies include high upfront capital costs for both vehicle purchase and fueling/charging infrastructure construction, fueling/charging infrastructure expansion and scalability, electricity rates, vehicle operation flexibility, and workforce training.

Although ZEV technology has advanced rapidly in recent years, there are still challenges both fleets and manufacturers have to address to successfully deploy ZEVs. Continued improvements in ZEV costs and performance are still needed to facilitate the full transition to zero-emission technology. However, the transition to zero-emission technology is essential for California to meet its long-term air quality and climate protection goals.

The Proposed ACT Regulation provides sufficient time for manufacturers to bring new ZEVs to the market, aided by several major funding programs to support early demonstrations and to kick start the market by reducing the incremental costs of commercial zero-emission technologies. Fleet owners can also benefit from lower operating and maintenance costs including LCFS credits to significantly reduce operating costs while supporting the low carbon fuel market. As ZEV sales increase, technology improves, and incremental costs decline a self-sustaining medium and heavy-duty ZEV market is achievable in a wide range of applications.

I. INTRODUCTION AND BACKGROUND

The California Air Resources Board (CARB or Board) is responsible for protecting the public from the harmful effects of air pollution and developing programs and actions to fight climate change. Meeting these public health goals necessitates the transition from internal combustion engines in both light and heavy-duty applications toward zero-emission vehicle (ZEV) technology.

Mobile sources and the fossil fuels that power them are the largest contributors to the formation of ozone, greenhouse gas (GHG) emissions, fine particulate matter (PM2.5), and toxic diesel particulate matter (CARB, 2016a). In California, the transportation sector alone accounts for 41 percent of total GHG emissions (50 percent when upstream emissions from fuel is included), and is a major contributor to oxides of nitrogen (NOx) and particulate matter (PM) emissions (CARB, 2019a). The Proposed Advanced Clean Trucks (ACT) Regulation will contribute towards achieving the state's criteria pollutant and GHG reduction goals and cleaner technology targets.

ZEVs available today are already capable of meeting the majority of the needs of local and regional trucking operations, and will improve over time. ZEVs have unique advantages that will eventually lead to paradigm shifts in fleet operational behaviors, such as quiet operations potentially enabling later shifts when noise would normally be a concern, and less time spent on maintenance or out-of-service time due to the mechanical simplicity of ZEV systems. Studies have shown that trucks used in local delivery applications do not travel more than 100 miles per day and most trucks travel 50 miles per day on average. The majority of zero-emission trucks available today are capable of exceeding a 100 mile daily range, but would need to refuel or charge at the end of the shift to be able to operate within that same range the following day. Therefore, truck delivery applications where the vehicle can return to base or utilize a spoke-and-hub operation are prime candidates for electrification. Over time, projected price reductions and continued zero-emission technology improvements will allow the ZEV market to expand broadly throughout the trucking sector.

The Proposed ACT Regulation was first identified as the "Last Mile Delivery" measure in the 2016 Mobile Source Strategy, which is part of the SIP and the 2017 Climate Change Scoping Plan. This measure is a necessary component for California to achieve established near- and long-term air quality and climate mitigation targets. Last mile delivery fleets are well suited for introducing zero-emission technology because they operate in urban centers, have stop and go driving cycles, and are centrally maintained and fueled. Therefore, development of this proposed rule initially focused on pickup-and-delivery applications.

The primary purpose of the Proposed ACT Regulation is to accelerate the market for zero-emission medium- and heavy-duty on-road vehicles in applications that are well suited for their use. The Proposed ACT Regulation sets clear requirements on manufacturers to sell zero-emission trucks and requires large entities including retailers, manufacturers, and government agencies to report information that would be used for developing future strategies that would require the use of zero-emission trucks.

Medium- and heavy-duty vehicle manufacturers would be required to start producing and selling a modest number of zero-emission vehicles beginning with the 2024 model year with ZEV sales increasing through the 2030 model year. The second part of the Proposed ACT Regulation would require one-time reporting for large companies and government agencies of information about how their facilities utilize local truck shipments and deliveries and how they contract for their transportation needs. Companies that operate a facility in California and have annual revenue above $50 million, government agencies, fleet owners with 100 or more trucks, and brokers that dispatch 100 or more trucks in California would also need to provide information about their vehicle operations and their contracts for motor carrier and other truck services. Information collected from these companies will help CARB structure future ZEV regulatory strategies, ensure a level playing field, and help staff determine any appropriate exemptions or flexibilities.

The Proposed ACT Regulation will result in reductions in criteria pollutants, toxic air contaminants, and GHG emissions at the statewide, regional, and local levels. It is part of California's holistic plan to address challenging Federal air quality mandates, to protect the public health of all Californians, and to meet sustainability goals.

A. Supporting Existing Policies

In developing the Proposed ACT Regulation, CARB staff reviewed and considered air quality attainment goals established by the Federal government, the laws imposed by the California State Legislature, the State Implementation Plans approved by the California Air Resources Board, and the executive orders issued by the Governors of California. The following is a chronological summary of key supporting and existing policies used to guide the development of the Proposed ACT Regulation.

In March 2012, Governor Edmund G. Brown issued Executive Order B-16-2012 directing California agencies to establish benchmarks for key milestones to help support and facilitate the ZEV market in California. One of those milestones include deploying over 1.5 million ZEVs and PHEVs on the road by 2025. As a result of this order, multiple state agencies, including CARB, worked to develop and release the 2013 ZEV Action Plan. The 2013 ZEV Action Plan identifies over 100 strategies to meet the milestones of the Executive Order and includes four broad goals to advance the overall ZEV market. These four goals are as follows:

- Complete needed ZEV infrastructure and planning;
- Expand consumer awareness and demand of ZEVs;
- Transform fleets; and
- Grow jobs and investment in the private sector.

In October 2015, California adopted the Senate Bill 350, the Clean Energy and Pollution Reduction Act (SB 350), which, among other major goals, established GHG reduction targets and ordered the CPUC to direct the six investor-owned utilities in the state to “accelerate widespread transportation electrification.” The resulting programs developed by the electric utilities promote the deployment of medium- and heavy-duty ZEVs through incentivizing infrastructure upgrade projects that offset most or all of the costs for electrical service upgrades.

In July 2015, Governor Edmund G. Brown issued Executive Order B-32-15 directing California state agencies to develop an integrated freight action plan. In July 2016 The Sustainable Freight Action Plan established the strategy of using zero-emission technology where feasible, and “near-zero” with renewable fuels everywhere else, to meet California’s long-term air quality goals. The three primary statewide targets of the plan are:

- Improve freight system efficiency by 25 percent by 2030
- Deploy over 100,000 freight vehicles and equipment capable of zero-emission operation and maximize near-zero emission freight vehicles and equipment powered by renewable energy by 2030
- Minimize negative economic impacts to the freight industry as the efficiency of the freight transport system improves

In 2016, the California legislature passed and California’s Governor Brown signed, Senate Bill 32 (SB 32), which requires CARB to ensure that California’s GHG emissions are reduced to at least 40 percent below the 1990 GHG level, by 2030.

In March 2017, CARB adopted the Revised Proposed 2016 State Strategies document as part of the SIP which identified several sectors that are key to launching heavy-duty zero-emission technology in the on-road heavy-duty sector: transit buses, delivery trucks, and airport shuttles (CARB, 2017a). The Proposed ACT Regulation continues implementation of these strategies to increase the first wave of heavy-duty ZEV deployments. The SIP includes the “Last Mile Delivery” measure which focuses on deploying zero-emission Class 3-7 heavy-duty vehicles in well suited applications. Based on continued assessment of technological readiness, the Proposed ACT Regulation expands in scope to include Class 2b and 8 medium and heavy-duty vehicles in well suited applications.

In January 2018, Governor Brown issued Executive Order B-48-18 building on past efforts to increase ZEVs by increasing California’s goal to 5 million ZEVs on the road by 2030, and setting a target of 250,000 chargers by 2025. Also in 2018, Governor Brown issued executive order B-55-18, which sets a target to achieve carbon neutrality in California no later than 2045, and achieve and maintain net negative emissions thereafter. The Proposed ACT Regulation directly supports achieving these goals through the required sale of ZEVs in California from all large medium- and heavy-duty manufacturers.

In August 2018, Governor Brown sent a letter to Chair Nichols of CARB directing the agency to pursue conversion of public and private fleets to zero-emission vehicles in categories including large employers, delivery vehicles, and transportation service fleets (Governor Brown, 2018). In response, staff proposed adding a reporting requirement to the Proposed ACT Regulation, to collect additional information from large employers, retailers, brokers and fleets. The information collected would inform CARB staff on how to develop future strategies to ensure ZEVs would be placed in service where suitable to meet individual fleet needs and would continue to accelerate progress towards meeting state goals.

In September 2019, Governor Gavin Newsom issued Executive Order N-19-19 which required every aspect of state government to redouble efforts to reduce GHG emissions and mitigate the impacts of climate change while building a sustainable, inclusive economy. Governor Newsom's EO specifically called for CARB to propose new strategies to increase demand in the primary and secondary markets for ZEVs, and to consider strengthening existing regulations or adopting new regulations to achieve necessary GHG reductions in the transportation sector. The Proposed ACT Regulation will support these goals by achieving GHG reductions, gathering information to develop future ZEV regulations which will drive additional GHG reductions in the transportation sector, and expand the primary and secondary ZEV markets.

To accelerate the introduction and deployment of zero-emission technologies, CARB has developed a portfolio of incentive programs that fosters early commercialization and demonstrations to reduce emissions and increase access to clean transportation. Each incentive program comes with its own statutory requirements, emission reduction goals, and eligible projects making the portfolio diverse and far reaching. Together, these projects address multiple goals, including:

- Turning over the legacy fleet to achieve cost-effective, near-term emission reductions in support of State Implementation Plans, air toxics, and community air protection goals,
- Accelerating the introduction and deployment of zero-emission technologies to meet California's longer-term air quality and climate change goals,
- Improving access to clean transportation and mobility options for low-income households and investing in the disadvantaged and low-income communities most impacted by pollution,
- Supporting the transition to and adoption of more sustainable transportation modes to reduce GHG emissions, and
- Expanding the supply chain for advanced technology components, the number of manufacturers choosing California as a home for manufacturing, and leveraging private investment to support the commercial viability of advanced technology.

B. Medium- and Heavy-Duty Vehicle Market

Heavy-duty trucks operate throughout California in numerous vocations and are an essential part of the state's economy. Medium and heavy-duty vehicles over 8,500 pounds gross vehicle weight rating include passenger vans, buses, pickups, vocational trucks, box trucks, and tractor trailer combinations used locally and for long-haul applications.

Traditionally, trucks have been manufactured in a variety of ways that differ significantly from typical light-duty vehicle manufacturing practices. The majority of class 3 through 8 vehicles (except for tractors) are manufactured by a manufacturers that are not vertically integrated (i.e., the manufacturer that produces the drivetrain and chassis likely does not produce the body). Figure I-1 illustrates the fragmented nature of typical truck manufacturing.

Figure I-1: Decentralized Medium- and Heavy- Duty Truck Manufacturing

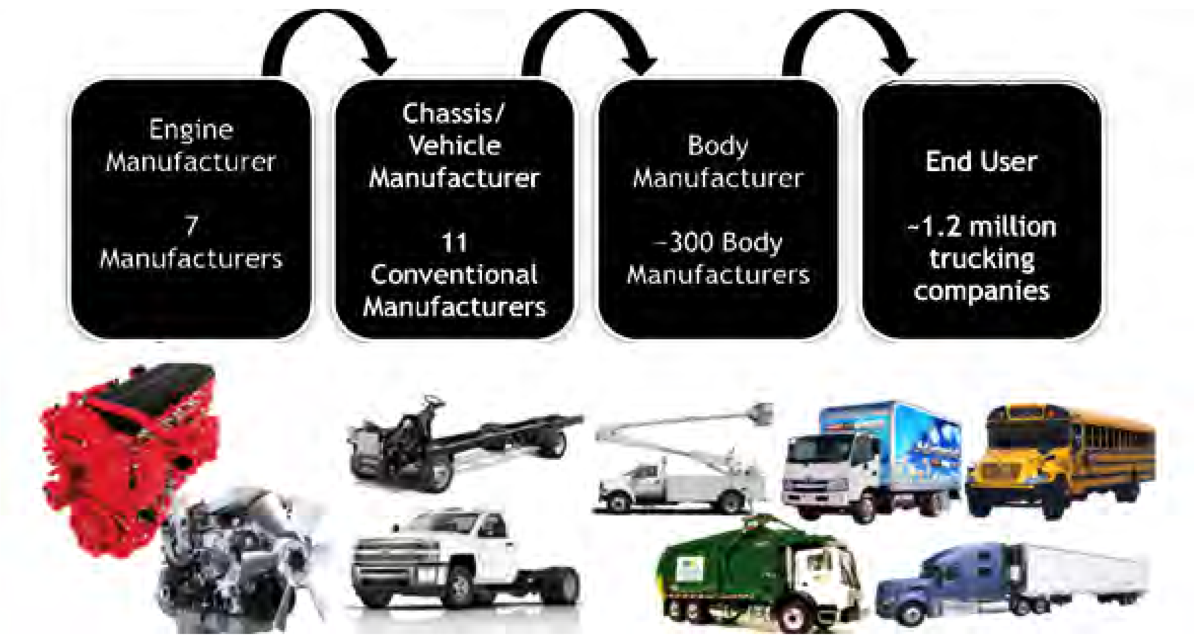

Figure I-2 illustrates the wide variety of body types for medium- and heavy-duty vehicles produced in each class. Class 2a and 2b are subsections of Class 2; Class 2a refers to vehicles with a GVWR of 6,001-8,500 lb. and Class 2b refers to vehicles with a GVWR of 8,501-10,000 lb.

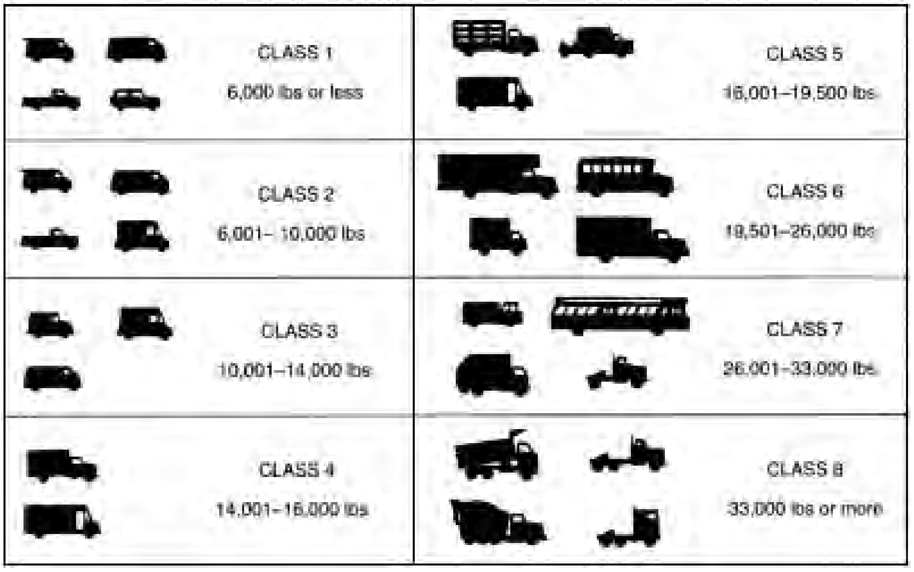
Figure I-2 Vehicle Classes and Body Types



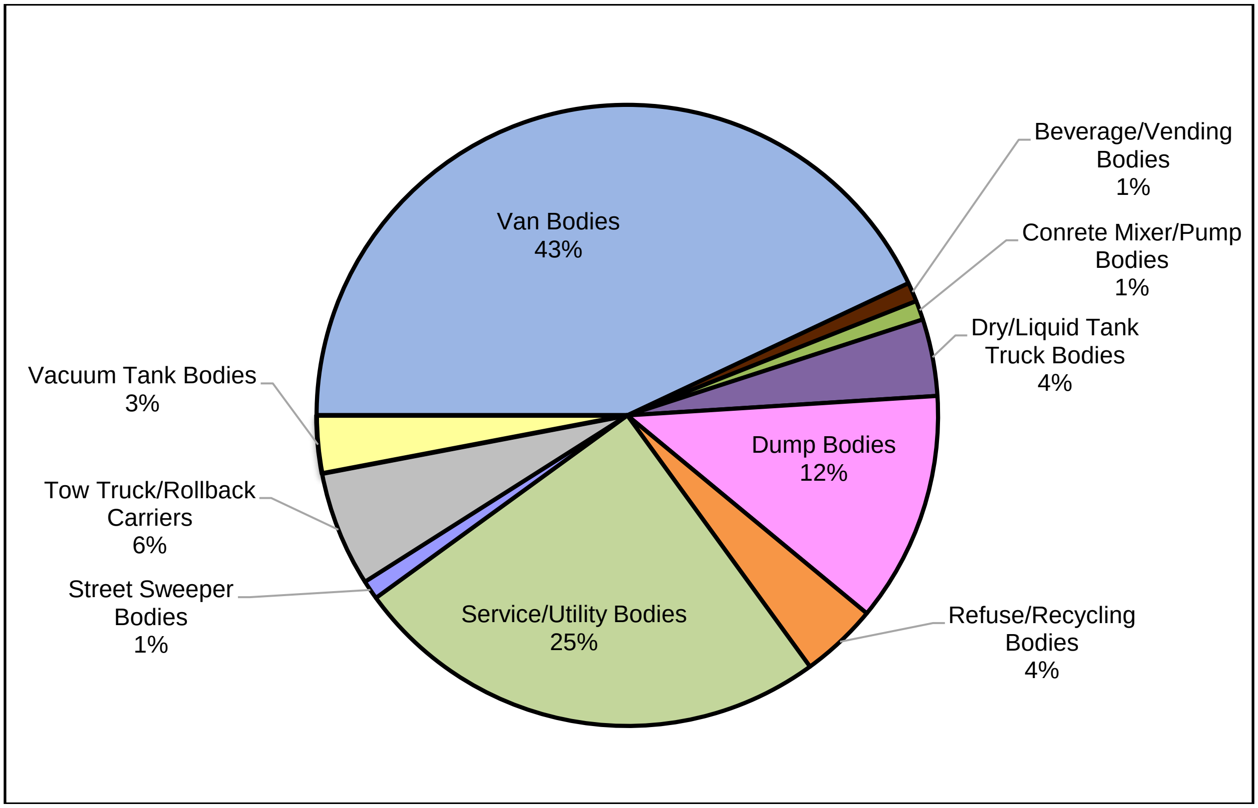
Truck Manufacturing

The majority of Class 2b and some Class 3 medium-duty trucks and vans are manufactured as complete vehicles with fully integrated bodies. Full size vans, chassis-cabs and cutaways, and heavy-duty pickup trucks comprise most of the Class 2b sales. Examples of full size vans include the Ford Transit, Mercedes Sprinter, and Chevrolet Express, and examples of heavy-duty pickup trucks include the Ford F250 and RAM 2500. Class 3 includes the same types as Class 2b with a higher payload, but also includes a higher fraction of incomplete vehicles and stripped chassis (with a frame and engine but has no cab or body) that often become walk-in vans and box trucks with final assembled by a body manufacturer. This market is primarily served by many of the same manufacturers of lighter duty vehicles including Fiat Chrysler of America, Ford, General Motors, Mercedes, and Nissan.

Class 4-8 trucks mainly function in vocational applications as urban delivery vehicles, as work-site trucks, and numerous other fields. The majority of these trucks are manufactured in segments and not in a vertically integrated process. Some manufacturers such as Hino, Navistar, Ford, and GM produce the powertrain and chassis of the vehicles in a vertically integrated process, but do not produce or assemble the final body to the vehicle. The top three manufacturers in Class 4-8 are Ford, Freightliner, and International (CARB, 2016b).

Manufacturers typically work with up fitters and dealers that install vocational bodies to meet the customer’s needs. A single chassis can be configured as a flatbed, box truck, a passenger shuttle or a wide range of other configurations. The body elements are manufactured by a variety of companies and assembled based on the specifications of the end user. Thus, the number and types of vocational bodies are highly varied. Figure I-3 shows the market share by body type in 2011 for vocational trucks and does not include tractors (ST, 2012). Chassis and engine manufacturers would not typically know exactly what type of vehicle the truck will become after the vehicle is delivered to a dealer or up fitter.

Figure I-3: Vocational Truck Body Types by Market Share 2011



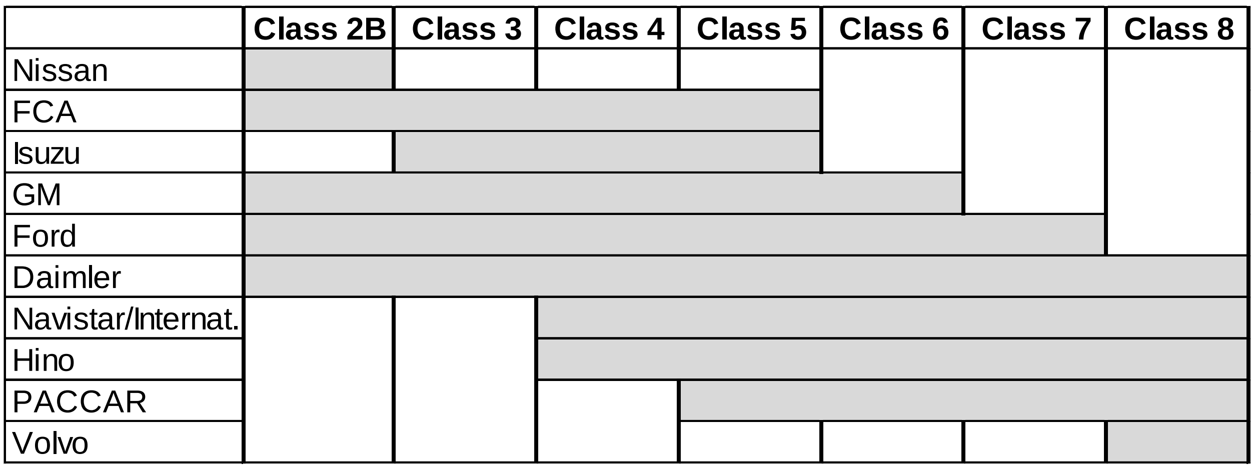
There are over 280 individual body manufacturers engaged in the production of truck bodies in North America. The industry is highly disaggregated with hundreds of small body manufacturers competing in the same market as large national body manufacturers. Most body manufacturers produce less than 1000 body units annually, with 74 percent manufacturing less than 500 body units annually (ST, 2012).

Class 7-8 tractors are typically manufactured as complete vehicles, though like most heavy duty trucks, are assembled as custom orders to customer specifications with parts from a variety of parts suppliers, which can often be mixed-and-matched for a given truck model depending on the customer needs. Several manufacturers supply their own engines, but also accept engines from other manufacturers, most commonly from Cummins (ORNL, 2017). Most major parts suppliers support a variety of manufacturers.

Traditional Manufacturers

Ten major original equipment manufacturers and their subsidiaries make the majority of Class 2b through 8 vehicles, and the classes of vehicles they are involved in producing are highlighted in Figure I-4. In the United States, PACCAR offers both the Kenworth and Peterbilt line of products. Large manufacturers have largely been absent from the ZEV market until recently.

Figure I-4: Truck and Engine Manufacturers by Class

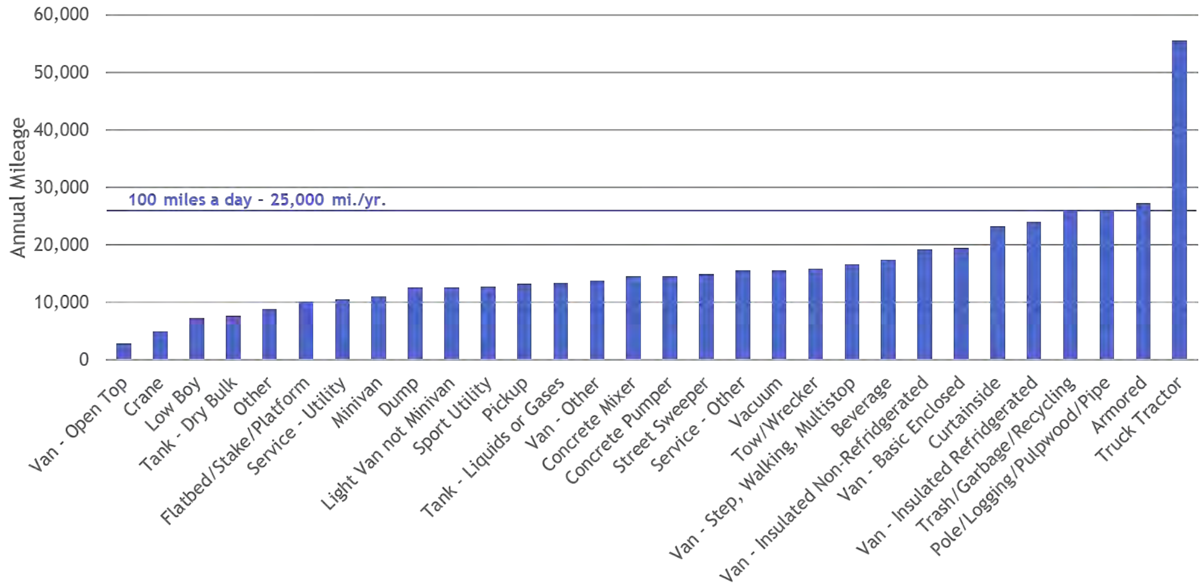


Vehicle Operations

Fleets operate their medium- and heavy-duty vehicles in a wide range of business models. Some fleets that provide the exact same service may operate the same trucks differently. Some may return to base daily, while others may go home with drivers. Some uses may be at the limits of weight, towing or available cargo volume, while others are not. While there is a wide variety of vehicle use cases, there are commonalities amongst all vehicle classes which are favorable for electrification with existing technology that is commercially available today.

The California Department of Transportation, through a contractor, conducted the California Vehicle Inventory and Use Survey (CA VIUS) in 2018 to gather updated information on how commercial vehicles are operated on California roadways to support various California transportation related planning efforts. The 2018 CA VIUS data showed that most "straight trucks" in Class 3-8 travel less than 100 miles per day. The results are consistent with data collected in the 2002 US Census Vehicle Inventory (US VIUS) where more details about truck body types were included. Figure I-5 is a chart of mileage data compiled from the 2002 US VIUS, which includes body types. Available data is limited and dated, but we can effectively piece together information which shows that almost 90 percent of Class 2b to 7 vehicles among a wide variety of body types travel less than 100 miles per day whereas 80 percent of Class 8 vehicles operate at less than 100 miles per day (U.S. Census, 2004).

Figure I-5: 2002 US VIUS Truck Type Daily Mileage



Class 4 through 8 vocational vehicles have general operational characteristics that are more favorable for electrification, typically with predictable routes, less concerns about payload, short daily range needs, stop-and-go operations, and often return to a centralized location daily where they could be charged or fueled with hydrogen. For example, parcel delivery vehicles operate on regular routes, with more than 100 stops per day, and return to a depot at the end of the shift. Delivery trucks often travel short distances from a distribution center to stores where unloading takes 30 minutes to an hour keeping total daily miles relatively low. Similarly, a Class 8 refuse truck may operate from a central location, make thousands of stops in a day, and have low total daily mileage needs, though power take-off loads need to be considered. While the results show the majority of trucks travel less than 100 miles per day on average, additional information is necessary to better understand individual fleet needs.

Stakeholders have indicated payload and towing needs are significant for many fleets that purchase Class 2b-3 vehicles, especially those that purchase heavy duty pickup trucks. ZEVs may not be suitable for periodic towing of heavy loads which could be a problem for a vehicle with limited range capability. Routes and range needs are less predictable for pickup trucks in this category but are less of a concern for vans that are typically not purchased to tow loads. More detail is needed about individual fleets and how they dispatch pickups to determine whether this concern about variable loads and towing could be managed when the percentage of ZEVs in the fleet is relatively small.

Tractors can be used in operations ranging from yard work where they never leave a premises to long-haul, cross country operations. Typically tractors are purchased new to be used in longer-haul operations, then sold on the secondary market for regional or local operations. Drayage trucks that frequently visit the ports typically operate less than 100 miles from the ports (NREL, 2016). Similarly, food and beverage delivery trucks as well as tractors that operate in hub-and-spoke operations do not travel long distances each day, and return to a base of operations daily where infrastructure can be installed, which are favorable characteristics for electrification.

Because of the variability in individual fleet operations, staff need better information on the individual business models for a breadth of industries operating or contracting for the operation of Class 2b-8 trucks to better target effective and appropriately flexible future ZEV strategies.

C. Zero-Emission Vehicle Technologies

ZEVs produce no exhaust emissions of any criteria pollutant under any and all possible operational modes and conditions. The most common ZEVs are battery-electric vehicles (BEVs) and fuel-cell electric vehicles (FCEVs). BEVs utilize batteries to store energy needed to power electric motors and FCEVs use hydrogen stored on board to power a fuel cell in combination with a traction battery that produces electricity to power the electric motor(s). These electric vehicles have instant torque response, low noise, regenerative braking that greatly reduces brake wear and generally have a relatively simple mechanical drivetrain, often having no transmission. Other ZEV powertrains, such as catenary systems and electric rail, are currently being demonstrated for truck applications.

Centralized depot charging is currently the primary BEV charging strategy, and is characterized by drawing electricity at a relatively slower rate over several hours overnight when vehicles are parked in the yard. Lighter trucks up to Class 6 that operate less than 100 miles per day can be charged overnight using Level 2 chargers and greater vehicles or those that travel further may need larger chargers or rely on faster direct current charging. Currently, medium and heavy-duty ZEVs are commonly available with a nominal range of 100-150 miles per charge. Longer range ZEVs are expected to become available as technology continues to improve. Smaller BEVs are already available commercially and larger BEVs (Class 8) are currently being demonstrated at ports and a variety of other applications throughout California. Longer range vehicles require a larger battery where weight becomes more of a concern that must be considered.

The ZEV truck market is beginning to grow in a similar pattern to what we saw in the transit bus market. In 2015, CARB initiated a proposal to partner with California Transit Agencies with a goal to transition to zero-emission buses as part of their normal replacement cycle. There are about 12,600 transit buses in California, and, at that time, there were 22 battery-electric and 17 fuel cell electric buses in operation statewide. As of mid-2018, there were over 150 zero-emission buses (ZEBs) in operation with over 400 ZEBs on order, and over 700 planned purchased in the next few years. By that time, at least 16 transit agencies committed to making a full transition to zero-emission technologies, the majority well before 2040. This market expansion was incentivized, in part, by funding made available from Federal, State, and local sources which resulted in growth of zero-emission bus offerings by bus manufacturers.

With current funding programs, a similar pattern is beginning to take shape for zero-emission trucks as more ZEVs are being sold commercially, and new demonstrations are establishing proof-of-concepts in a variety of applications, and nearly all truck manufacturers have announced zero-emission technology options for their product lines.

The range and fueling time of FCEVs are comparable to conventional internal combustion engine technologies. FCEV technology in ports is being demonstrated as part of the Zero- and Near-Zero Emission Freight Facilities (ZANZEFF) program after successful proof-of-concept by some manufacturers (CARB, 2018a). The hydrogen fuel used in these demonstration projects is delivered from central production facilities or produced on-site. Transit agencies, including Alameda-Contra Costa Transit District (AC Transit) and SunLine Transit Agency, use fuel-cell electric buses (FCEBs) the same way as their diesel or compressed natural gas (CNG) buses without having to dedicate a special route. Eight of the 13 FCEBs operated by AC Transit have surpassed the 25,000 hour target set by the United States Department of Energy (DOE) and the Federal Transit Administration (FTA) and 4 of these FCEBs have surpassed 30,000 hours of operation. This demonstrates the potential for fuel cells to meet the equivalent life cycle expectancy similar to a diesel engine (AC Transit, 2017). FCEVs have demonstrated the feasibility of being integrated into regular fleet operation as they can provide similar capacity, range, or fueling capabilities as conventional vehicles; however, they also tend to have higher curb weight compared to conventional vehicles and near-term costs are still high.

D. Near-Zero Technology

For the purpose of this regulation, near-zero-emission vehicles (NZEV) are plug-in hybrid electric vehicles powered by both an internal combustion and battery-electric powertrain that are capable of operating like as a zero-emission vehicle for some distances. NZEVs are considered a bridge technology which will help the development of the full ZEV market. They provide flexibility to meet applications that are not well suited for full ZEVs and promote the development of zero-emission component supply chains, training, education, and provide an opportunity for fleets to gain experience with electric drivetrains without range anxiety. Vehicles that cannot operate part-time as a pure ZEV are not considered to be “near-zero.”

Most vehicle manufacturers have already announced plans to focus on pure ZEVs and have stated that they are not planning to make additional models available as PHEVs. However, there is an exception. Cummins Inc. unveiled a Class 6 electric plug in hybrid utility truck in 2018 and has plans for commercialization of the drivetrain solution in the near future (InsideEVs, 2018) and it is capable of some all electric range.

E. Cleaner Combustion Technology

Cleaner technology combustion engines that operate on diesel or alternative fuels have the potential to reduce emissions significantly but are not being considered as part of this rulemaking effort. Both the California and federal Phase 2 GHG regulations have been enacted and will make incremental improvements in GHG emissions from 2021 MY and subsequent medium- and heavy-duty vehicles. The GHG emission benefits from the potential use of renewable fuels including biodiesel and renewable natural gas are already attributed to the LCFS regulation and are being enforced through its implementation. In a separate effort, CARB is developing the Heavy-duty Low-NOx Omnibus regulation which is a multi-pronged, holistic approach to decrease emissions of new heavy-duty engines. These requirements will go into effect at the same time the Proposed ACT Regulation will begin to require ZEV sales. Through these existing and pending regulations, CARB is already reducing emissions from combustion engines to protect public health, but transformative change to ZEVs where feasible is still needed to eliminate localized pollution, especially in disadvantaged communities, and to maximize GHG emissions reductions from transportation.

F. Status of Medium and Heavy-Duty ZEV Market

California is leading the way for the introduction of ZEVs in the medium- and heavy-duty space. Today, 15 manufacturers are offering more than 50 different ZEV truck and bus configurations, other than transit buses, from Class 3 through Class 8 through the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Program (HVIP), (HVIP, 2019). HVIP has provided funding for 2,456 zero-emission trucks and buses and 2,593 hybrid trucks since 2010 to support the long-term transition to zero-emission vehicles in the heavy-duty market. These commercially available zero-emission trucks and buses cover a wide variety of vocations and duty cycles; some vehicles available today include delivery vans, school buses, refuse trucks, cutaway shuttles, terminal tractors, and passenger vans.

CARB has also funded a number of demonstrations and pilot projects to accelerate development and early commercial deployment of zero-emission technologies. Most recently, the ZANZEFF project solicitation awarded $205 million to grantees to reduce GHG and criteria pollutants in freight facilities. The approved projects include deployment of 160 battery-electric trucks including 42 truck tractors, 43 yard goats, 46 Class 8 trucks, and 29 medium duty trucks, and 31 fuel-cell electric trucks including 10 truck-tractors, 2 yard goats, and 19 delivery vans. For these projects, CARB has outfitted the zero-emission vehicles and corresponding conventional internal combustion engine (ICE) counterparts with data-loggers. The data on vehicle operations are being collected and will be published periodically. Other public agencies including the California Energy Commission, South Coast Air Quality Management District, and the Department of Energy are funding zero-emission technologies.

California is now home to a number of medium and heavy-duty ZEV manufacturers and suppliers who are creating high-quality employment opportunities. These companies include BYD, Dana Electrified, Efficient Drivetrains, Inc (recently purchased by Cummins), GreenPower, Motiv, Phoenix Motorcars, TransPower, and XOS Trucks (formerly Thor). Figure I-6 shows the location of California's ZEV manufacturers. Other out of state manufacturers producing ZEVs today include Blue Bird, Chanje, Kalmar Ottawa, Lighting Systems, Lion Electric, Orange EV, The Workhorse Group, and Zenith Motors.

Figure I-6: California Medium & Heavy-Duty ZEV Manufacturers and Suppliers as of August 2019 (excludes transit buses)

At this point, nearly every established truck manufacturer has announced plans for zero-emission vehicles ranging from vans to tractors in the early 2020s. While these announcements do not guarantee that enough ZEVs will be produced to meet the Proposed ACT Regulation's requirements, they show that the technology is commercially viable and manufacturers are anticipating market demand for medium- and heavy-duty ZEVs. To date Bollinger Motors is the only manufacturer that has announced plans to produce a ZEV medium duty pickup. Several other manufacturers including, Chevrolet, Ford, Rivian, and Tesla have announced plans to manufacture light-duty zero- emission pickup trucks which will enable technology transfer into medium-duty pickups.

This emerging ZEV market segment is being supported by technology transfer from other, more developed markets. Manufacturers including Volvo and Proterra have developed electric powertrains in the transit bus sector which will soon be utilized in Class 8 trucks and school buses (Volvo, 2018),(Proterra, 2018). Navistar's upcoming electric school bus has been designed using technology from Volkswagen light-duty passenger cars (Trucks, 2018). Daimler is leveraging its light-duty battery investments to power its Mitsubishi Fuso eCanter truck (CARB, 2017b). Motiv is using batteries from the BMW i3 in some of its commercial trucks (Motiv, 2019). Tesla is using electric motors and other components from the Model 3 in its demonstration tractor and Toyota is using two Mirai fuel cells in its demonstration tractor (Tesla, 2019), (Toyota, 2019).

New charging and hydrogen refueling standards are currently being developed for medium- and heavy-duty applications. Existing standards allow for electric vehicle charging up to 350 kW and hydrogen refueling up to 10 kg. In February 2019, CharIn, a consortium of vehicle manufacturers, electric vehicle supply equipment (EVSE) manufacturers, charging networks, fleets, and other parties, announced development of a new working group tasked with developing a standard for high-powered charging above 1 MW (CharIn, 2019). Also in February 2019, an industry group consisting of heavy-duty truck manufacturers and hydrogen suppliers signed a memorandum of understanding to develop a unified refueling protocol for fuel cell electric trucks (Green Car Congress, 2019).

G. Potential Challenges for ZEV Deployment

ZEV technology is in the early stages of commercial development in the medium and heavy-duty space and must overcome challenges before it can become widely accepted by fleets. Notable challenges include the incremental cost of ZEVs, infrastructure investment cost and availability, matching vehicle capability with fleet needs, and potential diverging standards. This section will discuss these four main challenges.

1. Upfront Cost of ZEVs

Today and for the foreseeable future, battery-electric and fuel-cell electric trucks will cost more than their diesel or gasoline counterparts. This is due to a combination of low volume production and more expensive components, including batteries. The incremental cost difference between ZEV and ICE vehicles is expected to decline over time but the ZEV is expected to continue to cost more for a fleet to purchase.

In addition to vehicle prices, fleets purchasing ZEVs must also install refueling infrastructure. Both battery-electric and fuel cell electric vehicles require significant infrastructure installations at the depot in order to operate. Considering that most fleets today either have on-site fueling or fuel off-site, the installation of chargers and the associated infrastructure work or hydrogen refueling stations is a significant expense above business as usual conditions.

As with any new technology, there could also be additional upfront costs associated with ZEV deployment, such as professional services for site assessment and infrastructure buildout and planning, additional procurement processes, as well as operator and technician training.

These initial costs can be a barrier to business and fleets, especially those with limited access to capital. While BEVs cost more initially due to their large upfront investments, they tend to payback over time due to their lower operating costs resulting in a positive total cost of ownership. Financing the vehicles and infrastructure can spread out the payments to be offset with ongoing reductions in operating costs. Additionally, incentive programs for vehicles or infrastructure may allow fleets to lower or eliminate these higher upfront costs. Educating fleets about the lifecycle costs and payback opportunities will be an important part of accelerating the ZEV market.

2. Infrastructure Investment and Fuel Cost

The initial adoption of ZEVs for any fleet requires either dedicated infrastructure onsite or publically available retail stations, the cost of which are dependent on a number of site-specific variables. As such, cost of installing fueling infrastructure and their ongoing maintenance costs may significantly affect the payback period for the transition to ZEVs. Infrastructure expenses are an upfront capital cost necessary prior to vehicle deployment, but may last multiple vehicle lifetimes and can be paid off over time.

The cost of charging infrastructure varies by site. Some locations will need minimal to no electrical site upgrades for deploying a few ZEVs and as a result the fleet will only need to pay for the charger. For larger deployments, in most cases, electrical infrastructure (e.g. trenches, transformers, switchboards, and conduit) will need to be upgraded or installed in order to accept the high-power service necessary to support multiple chargers in a depot or yard. As the number of regulations requiring electric infrastructure continues to expand, CARB must work with the Public Utilities Commission, California Energy Commission, and utilities on holistic long-range planning.

The amount of space or footprint and capital cost of a hydrogen station is usually determined by the method to produce hydrogen and throughput or capacity of the station (Linde Group, 2016). Similar to charging infrastructure, construction and operation of hydrogen stations also involves different agencies in issuing permits, such as land use and air permits (Arnold and Porter, 2015). Hydrogen stations at fleet facilities are often built to be scalable. For example, a station can increase its capacity from supporting 40 to 400 trucks by upgrading the compression and storage equipment, and adding dispensers at a relatively modest cost compared to the initial investment.

The most significant contributor to the payback period of ZEV adoption is the fuel cost savings compared to conventional fuels. Unlike diesel, electricity prices have been stable, but electricity costs are determined by time-of-use, and how charging is done. There is uncertainty over electricity and hydrogen costs for fleet deployments that may deter fleet owners from transitioning to ZEVs. Guarantees of price stability by utilities and hydrogen suppliers as ZEV fleets are built out would provide greater confidence.

The price of hydrogen fuel currently fluctuates depending on a number of factors such as location, supply, and method of generation due to a fledgling supply network with currently low throughput. As the supply chain of hydrogen fuel matures, it is expected that hydrogen fuel prices will drop and offer competitive value with conventional fuels. However, further progress is needed on total cost of ownership, and the landscape footprint in regards to hydrogen fueling costs (CTE, 2016).

The electricity cost varies with factors such as electric utility, number of vehicles deployed in a depot, and charging strategy. Electric utilities typically charge commercial customers in three ways: usage-independent fee as a fixed fee for each electricity meter ($/month), usage charges in terms of cost per kilowatt-hours ($/kWh), and demand charges in terms of cost per kilowatts ($/kW). Whether a truck fleet is charged during daytime or nighttime to avoid on-peak usage charges, and whether the trucks are charged at the same time or sequentially to reduce demand charge can affect the total cost of electricity significantly. A company may experience higher electricity cost when charging a small number of trucks at a depot and will have lower average electricity costs as more BEVs are charged at the site. However, electricity is a relatively inexpensive and efficient way to fuel a vehicle and significant savings can be achieved especially when the LCFS credits are considered. For fleets that charge for extended periods overnight, the LCFS credits can offset all or nearly all of the electricity costs.

Significant infrastructure investments will also be necessary for California's goal of 5 million ZEVs by 2030. The California Public Utilities Commission (CPUC) is collaborating with CARB and California Energy Commission (CEC) to implement requirements set forth by SB 350 to support widespread transportation electrification, as discussed in Section C of Chapter III. The three major investor owned utilities (IOUs) have been approved to invest $686 million in medium- and heavy-duty infrastructure projects to support transportation electrification over a 5-year period (CPUC, 2018). The approved programs offset nearly all of the costs of making electrical service upgrades for a fleet and may offset part of the cost of installing charging infrastructure.

3. ZEV Operational Characteristics

ZEV technologies have inherent characteristics that benefit certain applications and may be a detriment to others. In order to successfully transition to ZEVs, truck fleets will need to consider which zero-emission technology or technologies are best suited to meet their needs. It is essential to work with technology and fuel providers as early as possible regardless of which technology to deploy. Recognition of vehicle specifications is also necessary to identify suitable route/blocks.

BEVs can be less flexible than internal combustion engine vehicles due to their range limitation and needed access to charging. Initially, this may make it difficult to incorporate them into those operations with long daily ranges or long running hours. BEVs in Class 3 through 8 are already commercially available with a nominal range of 100 miles per day and survey data show that most vehicles operate less than 100 miles per day. However, real-world range may be lower due to the use of heating, air conditioning, and other accessories. In time, suitability is expected to improve as some manufacturers are already demonstrating models with ranges over 200 miles per charge or greater.

Future expansion of the medium- and heavy-duty ZEV market must take into account applications that suit current and future ZEV technology. As part of the workgroup process, CARB staff worked with stakeholders, including the Truck and Engine Manufacturer Association (EMA) to identify 87 unique market segments, and to determine where the operational nature of ZEVs would be most beneficial. The most suitable market segments for electrification are ones where weight or space utilization are not overly constrained with relatively short, predictable routes operated from a centralized location. The "Advanced Clean Truck Market Segment Analysis" (CARB, 2019b) spreadsheet identified that just over 70 percent of Class 4-7 vehicles are good fits for electrification today while roughly 30 percent of Class 2b-3 and Class 8 vehicles are good fits. Further advances in technology will increase this portion of the medium- and heavy-duty truck population that is suitable for electrification. Additional details on this analysis may be found in Appendix E.

4. Risk of Differing Charging and Fueling Standards

The Society of Automotive Engineering (SAE) is developing heavy-duty vehicle charging standards. However, currently different charging standards are being used by manufacturers. This is a challenge for BEV adoption as they increase the likelihood of stranded assets for the fleet or additional costs to modify the charging system if a standard is dropped for another. The large-scale deployment of BEVs will benefit from a common charging standard. Applicable standards commonly implemented for buses and other medium- and heavy-duty vehicles include the SAE J1772 Combined Charging Standard. SAE standard J3068 for plug-in (conductive) charging of heavy-duty vehicles has recently been finalized (SAE, 2018), (Truckinginfo, 2018) while J3105 for overhead (conductive) charging may be available soon and J2954 for wireless (inductive) charging is planned to be available in a year or two. As standards for the industry are developed, deployment costs will decrease.

Scaling up hydrogen fueling infrastructure is challenging but feasible. Currently there is no uniform fueling standard for hydrogen into tanks larger than 10 kg, but an industry group consisting of heavy-duty truck manufacturers and hydrogen suppliers signed a memorandum of understanding in February 2019 to develop a unified refueling protocol for medium- and heavy-duty fuel cell electric trucks.

H. Summary of Public Outreach

For the Proposed ACT Regulation, CARB created a technical workgroup that comprises interested stakeholders including manufacturers, fleets, environmental groups, utilities, technology providers, and fuel providers. In addition to coordinating public workgroup meetings, CARB staff has conducted more than 100 individual meetings with more than 50 stakeholders. Some of these key stakeholders include but are not limited to Truck and Engine Manufacturers Association members (EMA), the California Electric Transportation Coalition (CalETC) and electric vehicle manufacturers, fleet representatives, the California Trucking Association, the American Trucking Association, environmental groups, and nonprofit organizations.

Since 2016, CARB staff held seven workshops, and four workgroup meetings to provide information to the public and solicit feedback. CARB staff posted information regarding these events and any associated materials on the ACT website and distributed notice of these meetings through two public list serves; "actruck" and "zevfleet" that include 3,092 and 1,356 recipients, respectively. The majority of the meetings were available by webcast and teleconference. At the meetings, CARB staff solicited stakeholder feedback on the Proposed ACT Regulation and overall regulatory process. In addition to continued efforts to solicit feedback from stakeholders about the Proposed ACT Regulation, CARB staff solicited for alternatives during the May 31, 2018 workshop.

Staff has reached out to the proposed regulated parties throughout the regulatory development. In the April 2017 workshop, staff asked fleets to submit answers to a draft fleet survey questionnaire in an effort to gather detailed information about everyday operations of local fleets. This survey was sent to roughly 500 addresses through mail and 1,500 email addresses through the "actruck" list serve on CARB's website. Staff also mailed notice letters to the 11,000 large entities and fleets that would be required to report under the Proposed ACT Regulation. Further, staff has met with the proposed ten regulated manufacturers (Daimler, FCA, Ford, GM, Isuzu, Navistar, Nissan, PACCAR, Hino/Toyota, and Volvo) on a group and individual basis throughout the regulatory development process.

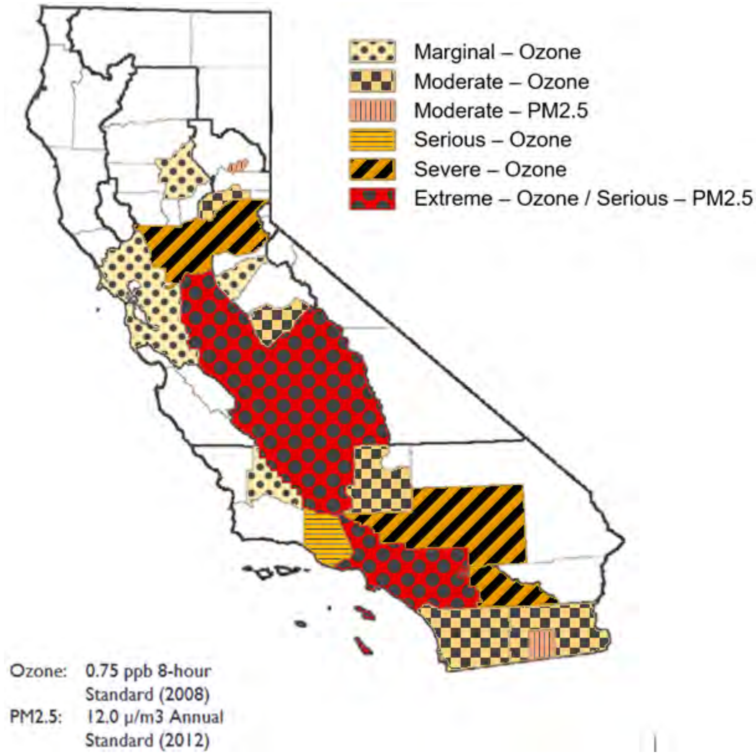
CARB staff also held two joint meetings with the California Governor's Office of Business and Economic Development (GO-Biz) in which fleets, manufacturers, and utilities discussed medium-and heavy-duty electrification. Additionally, staff has engaged in frequent discussions with ZEV technology providers, electric utilities, fuel providers, and non-governmental environmental organizations during various outreach events such as technology symposiums and expositions.

II. THE PROBLEM THAT THE PROPOSAL IS INTENDED TO ADDRESS

A. Need for Emission Reductions

The federal Clean Air Act requires areas that exceed the health-based national ambient air quality standards to develop State Implementation Plans (SIP) that demonstrate how they will attain the standards by specified dates. Despite efforts to date, significant portions of the state remain in non-attainment with ozone and particulate matter standards, as shown in Figure II-1 (U.S. EPA, 2012). In March 2017, the Board adopted the State SIP Strategy to bring California into attainment.

Figure II-1- California Ozone and $PM_{2.5}$ Non-Attainment Areas



In December 2017, the Board adopted the Scoping Plan Update, known as California's 2017 Climate Change Scoping Plan (CARB, 2017c), building on the state's successes to date. The 2017 Scoping Plan proposes to strengthen major programs that have been a hallmark of success while further integrating efforts to reduce both GHG and air pollution. California's climate efforts will:

- Lower GHG emissions on a trajectory to avoid the worst impacts of climate change;
- Support a clean energy economy which provides more opportunities for all Californians;

- Provide a more equitable future with good employment opportunities and less pollution for all communities;
- Improve the health of all Californians by reducing air and water pollution and making it easier to bike and walk; and
- Make California an even better place to live, work, and play by improving our natural and working lands.

To date, California has made significant progress towards reducing GHG emissions standards and is currently on track to meet the goals of Assembly Bill 32 (AB 32) (Nuñez, Chapter 488, Statutes of 2006), the California Global Warming Solutions Act of 2006. AB 32 requires California to reduce GHG emissions to 1990 levels by 2020 and maintains that level afterwards. But more needs to be done. In 2016, the California legislature adopted SB 32 (Pavley, Chapter 249, Statutes of 2016) which amended the California Global Warming Solutions Act to require the statewide GHG emissions target to be at least 40 percent below 1990 levels by 2030 and maintains that level afterwards. Accomplishing these goals requires a transformation from the inefficient fossil fueled conventional vehicles in use today to the more efficient zero-emission vehicles powered by lower carbon intensity fuels.

The Proposed ACT Regulation, under the title "Last Mile Delivery", is identified in the SIP and the 2017 Scoping Plan as a necessary component for California to achieve established near- and long- term air quality and climate mitigation targets (CARB, 2017a). Zero-emission technologies are needed to achieve the maximum GHG and NOx emissions reductions simultaneously and meet our long-term air quality and climate goals. To meet these and other goals, the Proposed ACT Regulation has the following primary objectives:

- Accelerate first wave of zero-emission (ZE) truck deployments in best suited applications.
- Achieve 100 percent zero-emission pickup-and-delivery in local applications by 2040.
- Support Port's Clean Air Action Plans for 100 percent zero-emission drayage trucks by 2035.
- Support AB 739 requiring California state government fleets to purchase ZEVs.
- Enable a large-scale transition to zero-emission technology.
- Maximize the total number of ZEVs deployed.
- Complement existing and future programs.
- Provide environmental benefits, especially in disadvantaged communities thereby supporting the implementation of AB 617.
- Ensure requirements are technologically feasible and cost effective, and
- Foster a self-sustaining zero-emission truck market.

1. Oxides of Nitrogen Emissions

Oxides of nitrogen (NOx) are a group of highly reactive gases including nitrogen dioxide (NO_2), nitrogen oxide, nitric acid, and others. Breathing air with a high concentration of

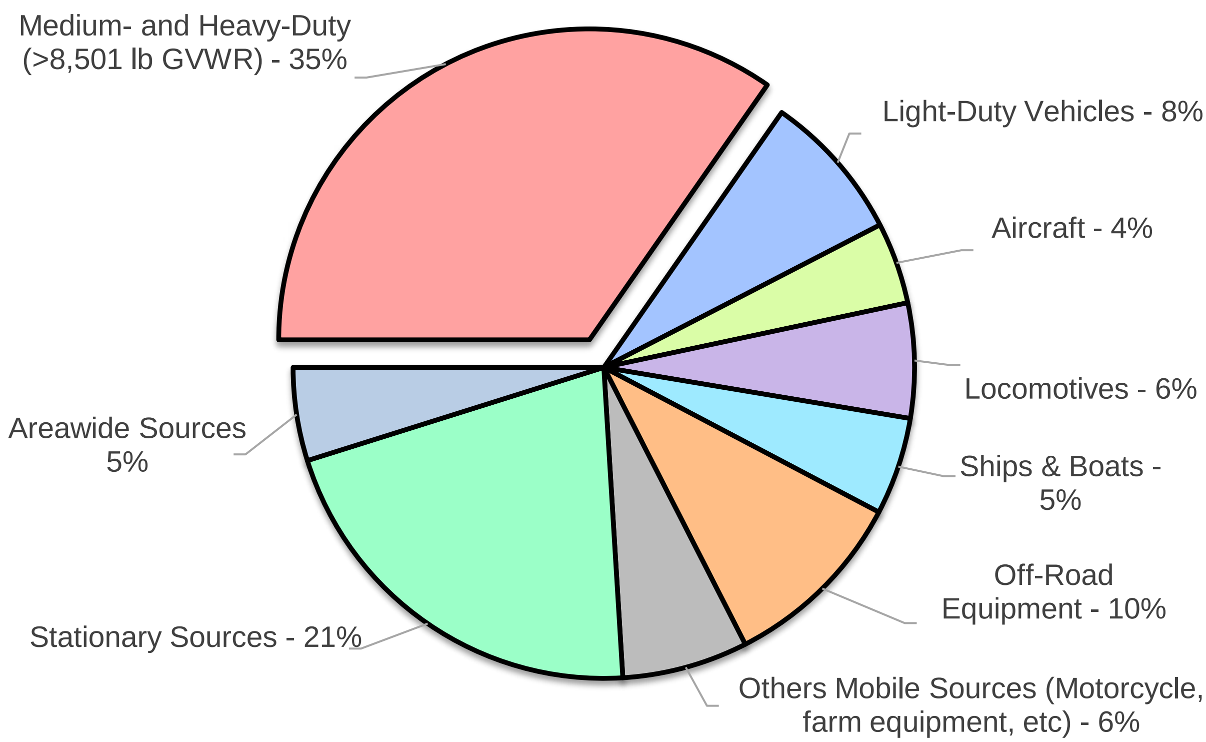
NO_2 can irritate airways in the human respiratory system. Such exposures over short periods can aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms. Longer exposures to elevated concentrations of NOx may contribute to the development of asthma and potentially increase susceptibility to respiratory infections. People with asthma, as well as children and the elderly are generally at greater risk.

NOx reacts with other chemicals in the air to form both ozone and particulate matter. Both of these are also harmful when inhaled due to their effects on the respiratory system. Ozone is a criteria pollutant identified in the federal Clean Air Act and can trigger a variety of health problems including chest pain, coughing, throat irritation, and airway inflammation. It also can reduce lung function and harm lung tissue. Ozone can worsen bronchitis, emphysema, and asthma, leading to increased medical care.

Substantial progress has been achieved in reducing NOx emissions through implementation of CARB's existing mobile source programs, and it is expected that these programs will continue to provide further reductions through 2031, contributing significantly to meeting air quality standards. However, challenges still remain in meeting the ambient air quality standards for ozone in two areas of the state with the most critical air quality challenges: the South Coast Air Basin and the San Joaquin Valley Air Basin (CARB, 2016c), (CARB, 2017e). The South Coast Air Basin has the highest ozone levels in the nation. Since NOx is also a precursor to secondary $PM_{2.5}$ formation, reductions in NOx emissions will also provide benefits for meeting the $PM_{2.5}$ standards. To meet the 2023 and 2031 ambient air quality standards for ozone, the South Coast Air Basin will require an approximate 80 percent NOx reduction by 2031.

Mobile sources are the largest source category of NOx emissions and medium- and heavy-duty vehicles are the largest source of mobile source NOx emissions as displayed in Figure II-2.

Figure II-2: 2019 NOx Emissions by Source



In addition, in October 2015, U.S. EPA adopted a more stringent 70 parts per billion ozone standard with an attainment date of 2037 (U.S. EPA, 2015). This ozone standard will result in additional areas being classified as nonattainment areas, as well as require even further emission reductions in California's existing nonattainment areas.

2. Particulate Matter Emissions

Particulate matter less than 2.5 microns in diameter ($PM_{2.5}$) is small enough to penetrate into the lungs and airways where it may produce harmful health effects such as the worsening of heart and lung diseases (NYDH, 2018). The International Agency for Research on Cancer identified diesel exhaust as a probable human carcinogen, and in 1990, California's Proposition 65 determined that diesel exhaust is a chemical known to cause cancer. In 1998, the Board identified diesel PM as a toxic air contaminant. This resulted in CARB staff developing and the Board approving the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles in 2000. CARB staff estimated that diesel PM emissions were responsible for about 70 percent of the total ambient air toxics risk to individuals living in California, and subsequently established a target goal of reducing statewide diesel PM exposure by 85 percent by the year 2020 (CARB, 2000).

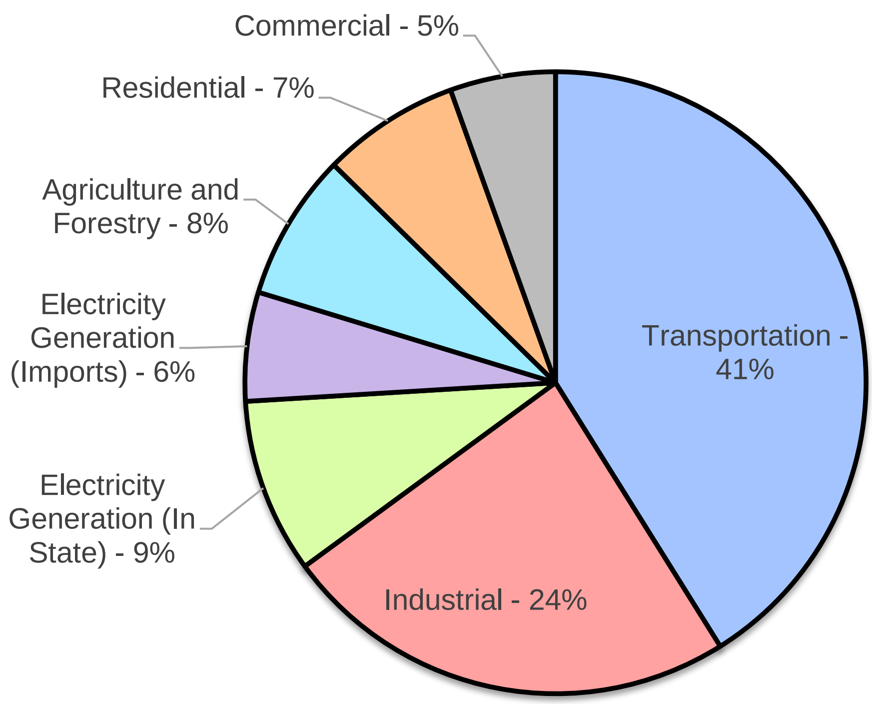
Major portions of California are not in attainment with the federal particulate matter emissions standards including the South Coast Air Basin and the San Joaquin Valley Air Basin. The San Joaquin Valley has the highest $PM_{2.5}$ levels in the nation. Despite regulations such as the Truck and Bus rule that accelerate turnover and require the installation of diesel particulate filters, HD on-road vehicles still account for over 25 percent of statewide diesel PM emissions while making up only a small proportion of California's on-road vehicle fleet. In particular, individuals living near highly impacted trucking corridors, such as near major highway arteries or near major seaports, are at greater risks from diesel vehicle PM emissions than the average individual due to their inherit close proximity to diesel vehicles and equipment.

Furthermore, diesel PM is a major source of black carbon. Black carbon absorbs sunlight and generates heat in the atmosphere which warms the air and can affect regional cloud formation and precipitation patterns. As such, black carbon plays a critical role in global climate change (C2ES, 2010).

3. Greenhouse Gas Emissions

Carbon dioxide (CO_2) is the primary GHG emitted in California, accounting for 83 percent of total GHG emissions in 2017 (CARB, 2019c). The GHG emissions inventory further shows that the transportation sector, primarily comprised of on-road travel, is the single largest source of CO_2 in California as illustrated in Figure II-3. Transportation emissions account for over half of the state's GHG emissions when including upstream emissions.

Figure II-3. 2017 GHG Emissions by Economic Sector

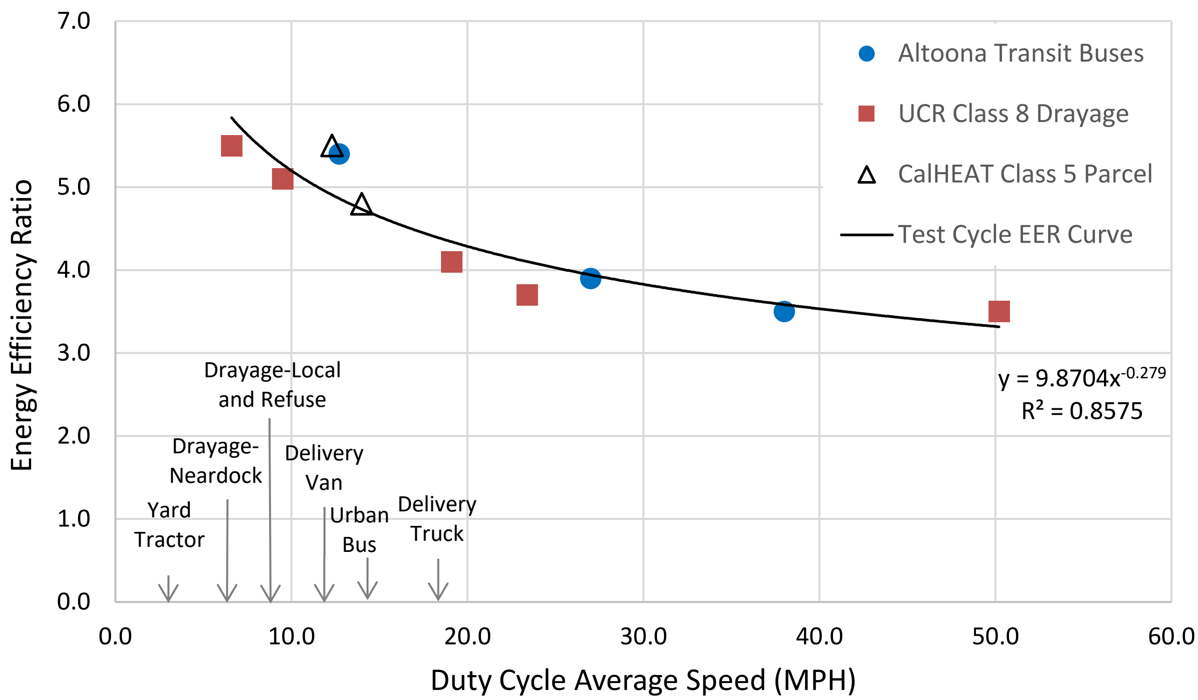


B. Need to Reduce Petroleum and Energy Consumption

Through his 2015 inaugural address and EO B-30-15, Governor Brown established six pillars for California's climate change strategy. One of these key pillars was to reduce petroleum reduction from cars and trucks by 50 percent by 2030. California can meet this ambitious goal by building on existing efforts to improve vehicle efficiency, reduce lifecycle fuel emissions, decreasing vehicle miles traveled, and supporting ZEV deployment. Meeting this goal will reduce pollution, strengthen the state's economy, and will put the state on a path to meet its GHG goals.

ZEVs consume no petroleum and use less energy than conventional internal combustion engine trucks for the same distance travelled. Staff performed an analysis on the relative efficiencies of diesel and battery-electric vehicles (BEVs) and found that in BEVs are two to five times as efficient as a conventional vehicle (CARB, 2018b). The results from the analysis are displayed in Figure II-4 and the discussion paper is included in Appendix G.

Figure II-4. Battery-Electric Vehicle Energy Efficiency Ratio at Different Average Speeds



Due to their higher efficiency, ZEVs lower energy consumption, reduce dependence on petroleum, and reduce emissions substantially because ZEVs have no tailpipe emissions and as of 2017, the majority of California's electricity comes from sources with no criteria pollutant emissions. As more electricity is sourced from renewable sources, upstream emissions from electricity will continue to decline.

C. Need to Foster Zero-Emission Technology

Zero-emission technology deployments are needed in the medium- and heavy-duty market to meet the state's emission reduction goals, but to date, the major truck manufacturers have been relatively absent in this space. At workshops and in meetings, some of these manufacturers stated that customers are not asking for ZEVs. Up to this point, smaller startup truck manufacturers have stepped in to fulfill market demand and have been designing zero-emission trucks for a number of years. The majority of these startup companies do not have broad dealer networks or regional service facilities that can be leveraged quickly to provide support and maintenance services for zero-emission technology. They also may lack the ability to deliver very large orders for major fleets. This has hampered ZEV expansion for early adopter fleets. Over the last decade, a number of fleet owners have purchased zero-emission trucks from smaller startups companies and have expressed concern about their experience in securing service and repairs to support their ZEVs in operation. In some cases ZEV orders were placed that were not fulfilled. In addition, some products launched previously by large manufacturers were also discontinued due to issues with their ZEV component suppliers.

Today, many established manufacturers have announced plans to launch commercially available ZEVs in the next few years. While these announcements indicate the general direction the industry appears to be going, they do not guarantee vehicles will be produced or stay in production. The Proposed ACT Regulation would provide certainty for manufacturers to make the investments today to produce increasing numbers of ZEVs.

D. Need to Gather Information on Vehicle Operations

In August 2018, Governor Brown sent a letter to CARB Chair Mary Nichols directing the agency to assess the viability of new regulations to increase ZEV adoption in California fleets. While CARB has sufficient information for the proposed manufacturer ZEV sales requirement, more fleet specific information is needed to properly assess which strategy would be most effective to require the use of ZEVs to accelerate the market for medium- and heavy-duty ZEVs in a wide range of fleet applications.

As part of the Proposed ACT Regulation rulemaking process, in 2018, CARB staff worked with stakeholders to develop a voluntary Fleet Operation Survey and sent it to about 500 addresses by mail and 1,500 email addresses through the “actruck” list serve on the CARB website. CARB received 20 completed survey responses indicating a less than 1 percent response rate. Staff are planning to develop additional strategies to complement the Proposed ACT Regulation that would be implemented by 2024 as part of the overall strategy to meet state goals. The large entity reporting requirement included in the Proposed ACT regulation will provide key information staff needs to explore alternative methods to further increase the use of ZEVs where they are suitable while incorporating the appropriate flexibilities where needed.

III. OVERVIEW OF PROPOSED ACTIONS AND RELATED PROGRAMS

A. Summary of Proposed Action

The Proposed ACT Regulation is part of a holistic approach to transform the transportation sector to the cleanest possible technologies. It is a technology forcing measure to accelerate the deployment of zero-emission trucks and buses everywhere feasible. The Proposed ACT Regulation also provides a strong market signal for zero-emission technology deployment and would foster a self-sustaining zero-emission truck market through increasing sales of medium and heavy-duty zero-emission trucks and buses in California.

The Proposed ACT Regulation includes two primary elements. First, it requires a percentage of truck and bus sales to be zero-emission. Second, it requires large entities including retailers, manufacturers, government agencies, and large truck fleets to report information to be used for future regulations to increase the use of ZEVs.

B. ZEV Sales Requirement

The proposed manufacturer ZEV sales requirement applies to all manufacturers that certify vehicles for sale in California in weight Classes 2b through 8—that is, with a gross vehicle weight rating (GVWR) greater than 8,500 lbs. Small manufacturers with fewer than 500 annual sales in California would be exempt but may opt-in to the regulation to claim ZEV credits.

Affected manufacturers would incur deficits for each vehicle sold into California starting with the 2024 MY that must be met with credits generated from producing and selling ZEVs or NZEVs into California starting in 2021 MY. Pickup truck sales would be excluded from Class 2b-3 ZEV sales requirement until the 2027 model year due to concerns raised by manufacturers about potentially highly variable towing needs and associated impacts on range. The requirements increase annually until the 2030 MY, and are detailed in Table III-1.

Table III-1: ZEV Sales Percentage Schedule

Model Year (MY)	Class 2b-3 Group*	Class 4-8 Group**	Class 7-8 Tractor Group
2024	3%	7%	3%
2025	5%	9%	5%
2026	7%	11%	7%
2027	9%	13%	9%
2028	11%	24%	11%
2029	13%	37%	13%
2030 and beyond	15%	50%	15%

*Excludes pickups until 2027 MY
**Excludes Class 7-8 Tractors, Includes Yard Tractors

Credit value is based on vehicle weight class to account for higher emissions associated with larger vehicles and to provide manufacturers flexibility in meeting compliance requirements. The proposed weight class modifiers are adjustment factors that were selected to keep credits and deficits approximately equitable from an emissions standpoint and are shown in Table III-2.

Table III-2: Weight Class Modifiers

Weight Class	Class 2b-3	Class 4-5	Class 6–7*	Class 7 Tractors and All Class 8
Weight Class Modifier	0.6	1	1.5	2

*Excludes Class 7 tractors

This approach provides flexibility for manufacturers to produce more ZEVs in one group to avoid making a small number of ZEV sales in other groups. However, to ensure ZEV tractors will be available to reduce emissions at ports and other areas with high tractor concentrations, only Class 7 and 8 tractor credits may be used to satisfy Class 7 and 8 tractor ZEV deficits. For example, if a manufacturer sells 300 Class 4 trucks and 500 Class 6 trucks in the 2024 MY, they would accumulate a deficit of 73.5 credits. A manufacturer can offset this deficit by producing and selling 74 Class 4 ZEVs, or alternatively they could sell 49 Class 6 ZEVs.

Staff are proposing that NZEVs would earn partial credits based on their all-electric range up to 75 percent of an equivalent ZEV. All-electric range would be determined by using the same test methods set forth by the California Phase 2 GHG rules. NZEV credits may only account for up to one half of the total annual weighted deficits to ensure that full ZEVs are produced and sold in California.

Staff are proposing that credits may be generated, banked, and traded by manufacturers starting with the 2021 MY. Staff are also proposing to set a limited lifetime for credits to guarantee actual ZEV production and sale. However, beginning with the 2024 MY, staff are proposing manufacturers must certify using the ZEP Certification procedures where it applies to continue to earn ZEV credits.

Finally, staff are proposing to specify that Class 2b-3 ZEV sales may not be counted in the Proposed ACT Regulation if the same ZEV sales are claimed in the ACC regulation to avoid double counting.

Manufacturers that are subject to the ZEV sales requirement and those who sell ZEVs and want to earn credits must report sales information and credit trade information annually to CARB to demonstrate compliance. Manufacturers must report details of credit trade transactions so CARB can determine and track compliance.

C. Large Entity Reporting Requirement

Under the Proposed ACT Regulation, large entities that operate in California would be subject to a one-time reporting requirement in early 2021. The data collected would be used to inform decisions on what regulatory mechanism is most appropriate to ensure ZEV purchases are made where they are suitable, and to determine the appropriate flexibilities and off-ramps where they are not an appropriate fit. The questions were selected to collect information needed to determine if entities that hire truck fleets could become the point of regulation and to better understand how trucks are used by individual fleets. To streamline the process, affected entities would only be required to complete a one-time submittal of aggregated and binned data for representative facilities, rather than detailed information about every facility. Additionally, entities with vehicles would only be required to report binned, representative information about the vehicle types owned, rather than reporting operational data for every vehicle. The reporting requirement applies to a wide range of large businesses and government agencies, whether or not they own trucks and buses. A large entity is any of the following:

- Any entity with annual revenue greater than $50 million in the U.S. and does business in California including all subsidiaries, subdivisions, or branches.
- Any entity that owns more than 100 vehicles with a GVWR greater than 8,500 lbs. and operated at least one of those vehicles in California in 2019.
- Any entity that dispatched more than 100 vehicles with a GVWR greater than 8,500 lbs. in California in 2019.
- Any California government, including all state and local municipalities.
- Any Federal government agency operating in California.

Large entities can include; retailers, manufacturers, refiners, accounting firms, hotels, drayage terminal operators, utility providers, refuse companies, federal, state, and local government agencies and other types of large employers.

The information that large entities would be required to report includes information about different types of facilities operated in California, contracting practices, and vehicle usage information for those who own trucks. In general, regulated entities would be required to report information regarding any facility category they operate. Facility categories include grocery store (grocery, restaurant, and other), warehouse, distribution center, manufacturer/factory/plant, multi-building campus/base, service center, hotel/motel/resort, medical/hospital/care, administrative/office building, truck yard, and all other properties. Regulated entities would also be required to report information for a single representative facility for each category. Additionally, any regulated entities that own vehicles would be required to report vehicle usage information per facility, grouped by vehicle body type.

Facility information reporting consists of categorizing each physical address an entity operates in California into the facility categories provided, and answering questions for each of those categories for the group of facilities. The facility categories include store, restaurant, warehouse/distribution center, manufacturer/factory/plant, multi-building campus/base, service center, hotel/motel/resort, medical/hospital/care, administrative/office building, truck/equipment yard, and a category for all other properties. Facility information reporting also includes answering questions for a single representative facility for each applicable category. Vehicle usage information reporting consists of answering questions about the vehicles domiciled or assigned at each facility. The vehicle information would be grouped by body type and by weight class. The ability to group information and bins for general responses were selected to simplify reporting and were intended to reduce concerns about providing detailed information that could be considered business confidential.

To provide clarity, a sample reporting response can be found in Appendix J that illustrates what information might be collected and how a regulated entity can submit this information in tabular form.

D. Crossover with Other Programs

California faces challenging goals for public health and climate protections. To achieve these goals, a number of actions have been initiated by the legislature, CARB, and other state agencies. These various actions and directives work together to ensure the State achieve its goals and meets federal mandates. The Proposed ACT Regulation complements existing programs by providing certainty for the ZEV market and setting the stage for a full transition to ZEVs in certain applications.

The Innovative Clean Transit (ICT) regulation, adopted December 2018, requires that California transit agencies purchase zero-emission buses beginning 2023 and ramps up to 100 percent of purchases starting 2029. Larger buses used by transit agencies are typically built as complete vehicles by dedicated bus manufacturers. Nearly every bus manufacturer is offering ZEBs today. These bus manufacturers are distinct from truck manufacturers and are excluded from the Proposed ACT Regulation. However, cutaway shuttle buses are built as incomplete vehicles and are sold by truck manufacturers for a wide range of applications. It is challenging to determine whether a cutaway chassis will become a shuttle bus or a box truck and who the ultimate purchaser will be; therefore, all zero-emission cutaway vehicle sales may still be counted toward compliance with the Proposed ACT Regulation. To avoid double counting of costs and emissions, staff excluded the estimated sales of ZE cutaway shuttles needed to comply with the ICT regulation when estimating costs and emission benefits.

The Zero-Emission Airport Shuttle Bus (ASB) regulation, adopted July 2019, requires that public and private airport shuttle bus operators transition their fleets to fully zero-emissions by 2035. These regulations will require the purchase of ZEBs, cutaway shuttles, and passenger vans. To avoid double counting, staff excluded the estimated sales of zero-emission cutaway shuttles and zero-emission passenger vans needed to comply with the Zero-Emission ASB regulation when estimating costs and emission benefits.

AB 739, signed October 2017, requires California state-owned fleets to purchase 15 percent ZEVs at or over 19,000 lbs. GVWR starting in 2026, and increasing to 30 percent by 2030. This could be met with a wide range of zero-emission truck types. To avoid double counting, staff excluded the estimated sales of ZEVs required to comply with AB739 when estimating costs and emission benefits.

The Low Carbon Fuel Standard (LCFS) is a California regulation that achieves GHG reductions by requiring fuel producers to reduce the carbon intensity of their fuels or purchase credits from low carbon fuel suppliers. In September 2018, the regulation was amended to require that transportation fuel carbon intensity decrease 20 percent by 2030 and maintain that level afterwards. By creating a market mechanism for low carbon transportation fuels, the LCFS program incentivizes alternative fuels including electricity, hydrogen, natural gas and biofuels.

Electricity and hydrogen are both low carbon fuels with high Energy Efficiency Ratios (EER) meaning they can generate LCFS credits. For non-residential EV charging, the EVSE owner is directly eligible to receive LCFS credits which can be sold to regulated deficit generators to offset fuel costs. The LCFS program specifies that emission reductions associated with low carbon fuels are attributed to any regulation that requires the usage of an alternative technology, so the emission benefits of medium- and heavy-duty electrification are attributed to the Proposed ACT Regulation (CARB, 2018c).

In July 2019, CARB adopted the Zero-Emission Powertrain Certification procedures which established new, alternative certification procedures for heavy-duty battery-electric and fuel-cell vehicles and the zero-emission powertrains they use. ZEP Certification establishes a process that can be used to provide additional transparency, consistency, and stability in heavy-duty zero-emission market segments targeted by CARB's technology-forcing regulatory measures or incentives geared to deploying more-commercialized zero-emission vehicles. The Proposed ACT Regulation would make ZEP Certification mandatory starting with the 2024 model year for medium-and heavy-duty ZEVs. The costs associated with mandatory ZEP certification requirements are included in the economic impacts assessment.

In October 2016, U.S. EPA adopted the Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2 (Federal Phase 2 GHG) which requires manufacturers to produce more fuel efficient vehicles with lower CO_2 emissions beginning in 2021 Model Year (MY) and increasing in stringency through 2027 MY. In February 2018, CARB adopted the California Phase 2 GHG regulation that largely harmonizes with the federal regulation with a few separate provisions. Manufacturers can meet the Phase 2 GHG standards through a variety of technologies including improved aerodynamics, low rolling resistance tires, engine and accessory optimization, weight reduction, idle reduction systems, hybridization, powertrain electrification, and more. In addition, Phase 2 GHG has an Advanced Technology Multiplier which gives a credit multiplier until the end of 2027 MY to PHEV, BEV, and FCEV technologies of 3.5, 4.5, and 5.5 respectively.

The Proposed ACT Regulation and the Phase 2 GHG regulations complement each other. Both regulations require the production of cleaner, lower CO_2 emitting vehicles and manufacturers can comply with both regulations simultaneously by building ZEVs. Manufacturers using ZEVs to comply with the Proposed ACT Regulation can use those towards Phase 2 GHG compliance which includes the Advanced Technology Multiplier. By allowing this flexibility, manufacturers can identify low-cost compliance pathways that will achieve real emissions benefits. For the purpose of GHG benefit accounting, only ZEVs sold in excess of the California Phase 2 GHG regulation's requirements are included in the tank-to-wheel portion of GHG calculations to avoid double-counting. For the cost analysis there are overlapping cost considerations that are discussed in detail in chapter IX.

The Advanced Clean Cars (ACC) ZEV Program is an existing California regulation that requires light-duty manufacturers of Class 1 and 2A vehicles to offer for sale specific numbers of the very cleanest cars available. These vehicle technologies include full battery-electric, hydrogen fuel cell, and plug-in hybrid-electric vehicles. The ZEV regulation is part of the broader Advanced Clean Cars package of regulations, a set of tailpipe regulations put in place to limit smog-forming and GHG emissions from light-duty vehicles.

The Proposed ACT Regulation applies to larger vehicles, but interacts with an optional credit provision for Class 2b and 3 ZEVs that is included in the Advanced Clean Cars (ACC) ZEV Program, specifically title 13 CCR §1962.2(g)(3). The ACC ZEV Program does not require manufacturers to produce and sell Class 2b and 3 ZEVs, but it does give credits if they do. The Proposed ACT Regulation avoids double counting with ACC by specifying that manufacturers may not use credits from the same Class 2b and 3 vehicles in both rules.

The San Pedro Bay Ports, consisting of the Port of Los Angeles and the Port of Long Beach, released their updated 2017 Clean Air Action Plan (CAAP) which aims to reduce air pollution over the upcoming decades and support the statewide vision for more sustainable freight movement (SPBP, 2017). This plan calls for significant reductions in NOx, diesel PM, sulfur oxides, and GHGs from all sectors including trucks, off-road equipment, ships, and trains. On-road drayage trucks are the second largest source of NOx at the ports and the largest source of GHG emissions, so reducing their emissions is vital to meeting the ports' goals. The CAAP proposes to establish a new Clean Truck Program with a goal to have a fully zero-emission drayage truck fleet by 2035 by using fees and other policy levers. In 2024 the plan will require trucks entering the port to be zero-emission, meet the upcoming Low-NOx standard, or pay a fee, and by 2035 the trucks would need to be zero-emission or would have to pay the fee. The CAAP creates demand for zero-emission trucks as drayage truck operators have an incentive to adopt ZEV technology and avoid fees, and the Proposed ACT Regulation supports the CAAP by ensuring zero-emission tractors are available for drayage truck operators to purchase.

SB 350 supports widespread transportation electrification. The implementation of SB 350 reduces barriers to cost for infrastructure for fleets that act before the regulation begins in 2024 and supports early ZEV deployments. On May 31, 2018, the California Public Utility Commission (CPUC) unanimously approved transportation electrification projects proposed by three major investor-owned utilities including $236 million from Pacific Gas and Electric and $343 million from Southern California Edison on medium and heavy-duty infrastructure installation. On August 15, 2019, the CPUC unanimously approved a $107 million proposal for San Diego Gas and Electric's transportation electrification of medium- and heavy-duty vehicles. All three investor-owned utilities have either proposed or been approved to establish new electricity rates for commercial ZEV deployments. These programs support the Proposed ACT Regulation by lowering electricity and infrastructure costs to fleets. In addition, the Proposed ACT Regulation supports the utility's SB350 efforts by ensuring that ZEVs will be available to take advantage of these programs.

Assembly Bill 2061 (AB 2061) is a complementary piece of legislation that mitigates vehicle weight concerns for ZEVs required by the Proposed ACT Regulation. AB 2061, to the extent expressly authorized by federal law, authorizes a near-zero-emission vehicle or a zero-emission vehicle to exceed the weight limits on the power unit by up to 2,000 pounds. Today, ZEVs can weigh more than their ICE counterparts so AB 2061 gives ZEVs additional flexibility to fleet needs in higher weight applications.

CARB staff are concurrently developing the Heavy-duty Low-NOx Omnibus rulemaking to further reduce emissions from combustion engines which is scheduled for Board consideration in early 2020.[1] The Heavy-duty Low-NOx Omnibus rulemaking is a multi-pronged, holistic approach to decrease emissions of 2022 MY and subsequent new heavy-duty engines. This rulemaking will lower NOx emissions by lowering tailpipe NOx standards, establishing a new low-load test cycle to ensure emissions reduction are occurring in all modes of operation, strengthening durability, lengthening warranty and useful life, and in-use testing provisions, along with other measures. This effort will complement the Proposed ACT Regulation by ensuring that the portion of a manufacturer's production that will remain combustion powered will be using the cleanest possible technology.

[1] More details on the Heavy-duty Low-NOx rulemaking are discussed on the program website at https://ww2.arb.ca.gov/our-work/programs/heavy-duty-low-nox

IV. THE SPECIFIC PURPOSE AND RATIONALE OF EACH ADOPTION, AMENDMENT, OR REPEAL

The Proposed ACT Regulation language can be found in Appendix A and includes two primary elements. First, it requires manufacturers to make a percentage of truck and bus sales zero-emissions. The manufacturer sales requirements are in title 13, California Code of Regulations, sections 1963 throughout IV to 1963.5. Second, it requires large entities including retailers, manufacturers, and government agencies, to report information about services they contract for that require the use of trucks and shuttles and to provide information about their fleet of vehicles. The large entity reporting requirements are in title 13, California Code of Regulations, sections 2012.0 to 2012.3.

The Proposed ACT Regulation will adopt new sections 1963, 1963.1, 1963.2, 1963.3, 1963.4, 1963.5, 2012.0, 2012.1, 2012.2, and 2012.3, title 13, California Code of Regulations.

A. Manufacturer ZEV Sales Requirement

Section 1963.0 Advanced Clean Trucks Purpose, Applicability, Definitions, and General Requirements.

Purpose

The purpose of this section is to describe the general purpose of the Proposed ACT Regulation, to identify the regulated entities, to set forth definitions for various terms used through the regulation text, and the general requirements.

Rationale

This section is necessary to identify the general purpose of the regulations is to accelerate the market for medium- and heavy-duty ZEVs as part of California’s strategy to reduce emissions. The section also is necessary to identify the scope of the regulation and who is subject to its requirements, and to set forth definitions for various terms used in the regulation. Additionally, the section is needed to identify the basic compliance requirements and to whom the requirements apply.

Section 1963(a) Purpose.

Purpose

This subsection describes the purpose of the regulation, which is to accelerate the market for medium- and heavy-duty ZEVs to reduce criteria pollutants, toxic contaminants, and GHG emissions from the medium- and heavy-duty vehicle sector.

Rationale

This subsection is necessary to identify the purpose of these regulations and is part of the state's overall strategy to reduce emissions. The primary objectives of the Proposed ACT Regulation include the following:

- Accelerate first wave of zero-emission (ZE) truck deployments in best suited applications;
- Achieve 100 percent zero-emission pickup-and-delivery in local applications by 2040;
- Support the Ports of Los Angeles and Long Beach Clean Air Action Plan for 100 percent zero-emission drayage trucks by 2035;
- Support AB 739 requiring California state government fleets to purchase ZEVs;
- Enable a large-scale transition to zero-emission technology;
- Maximize the total number of ZEVs deployed;
- Complement existing and future programs;
- Provide environmental benefits, especially in disadvantaged communities, thereby supporting the implementation of AB 617;
- Ensure requirements are technologically feasible and cost effective; and
- Foster a self-sustaining zero-emission truck market.

Section 1963(b). Scope and Applicability.

Purpose

The purpose of this subsection is to identify manufacturers that certify vehicles over 8,500 lbs. GVWR for sale in California as the regulated parties for the specified sections.

Rationale

This subsection is necessary to establish which parties are the regulated parties. This regulation is intended to reduce emissions from vehicles manufactured and sold into California, and to accelerate the adoption of zero-emission technologies in the medium- and heavy-duty vehicle sectors, which are vehicles over 8,500 lbs. GVWR. ZEV sales are already required by other regulations for vehicles at or below 8,500 lbs. GVWR.

Section 1963(c). Definitions.

Purpose

The purpose of this subsection is to set forth definitions for terms used in the proposed regulation order and identifies the sections for which the definitions apply.

Rationale

This subsection is necessary to define terms and to provide clarity as to what is required and how the regulation's requirements must be met.

Section 1963(c)(1). All-Electric Range.

Purpose

The purpose of this subsection is to define all-electric range as having the same meaning and test procedures as the established California Phase 2 GHG regulation.

Rationale

This subsection is necessary to set forth the meaning and test procedures by which NZEVs must be tested to determine the all-electric range needed to receive NZEV credit for this regulation. Making this definition consistent with what is already required in the California Phase 2 GHG regulation simplifies reporting and compliance tracking and avoids added costs from applying a different method to serve the same purpose.

Subsection 1963(c)(2-10). Class 2b-3, Class 2b-3 Group, Class 4, Class 4-8 Group, Class 5, Class 6, Class 7, Class 7-8 Group, Class 8.

Purpose

The purpose of these subsections is to define each vehicle weight class category by gross vehicle weight rating and to define vehicle groups for purposes of simplifying the description of how the requirements differ for each group.

Rationale

These weight class and group category definitions establish boundaries to ensure manufacturers can determine the number of ZEVs and NZEVs needed to meet the compliance requirements for a wide range of vehicles sold. Weight class is also an indicator of vehicle size and associated emissions needed for establish different credits for larger vehicles than smaller vehicles to provide flexibility for manufacturers without compromising the expected emissions benefits of the regulation.

Yard tractors are included in the Class 4-8 Group as their low speed operation, low range needs, and central operation, are suitable for electrification in-line with the other Class 4-8 vocational vehicles. They are also commonly used in ports and distribution centers in disadvantaged communities that need localized emission reductions.

Subsection 1963(c)(11)(A-D). Excluded Bus

Purpose

The purpose of this subsection is to define which types of buses are excluded from being counted in a manufacturer's sales volume and are excluded from earning credits.

Rationale

This subsection is necessary to ensure more ZEVs are manufactured and to avoid giving credits for producing buses that are already required by other CARB zero-emission regulations and are widely commercially available. Transit buses, double-decker buses, 60-foot articulated buses, and motor coach buses are all examples of passenger- carrying vehicles with a GVWR over 14,000 lbs. that would be excluded from the annual sales requirement because these ZEBs are already required to be purchased due to the ICT and Zero-Emission ASB regulations.

This definition does not include buses that are typically manufactured as cutaway or cab-and-chassis incomplete vehicles and may be equipped with a shuttle body that is added after initial manufacture. Staff recognize that these vehicles may ultimately be sold as ZEVs to comply with the ICT and ASB regulations and has excluded ZEV sales that are already required when estimating costs and emissions for the Proposed ACT Regulation. Staff are not proposing to exclude ZEV sales of these cutaway or cab-and-chassis incomplete vehicles from being counted by manufacturers, because it would be challenging for the manufacturer and CARB to determine whether the incomplete vehicle becomes a transit bus, school bus, or shuttle in final assembly, or whether a shuttle would be used at an airport. In this way, the Proposed ACT Regulation will increase the sale of these incomplete vehicles which will also benefit fleets that need to purchase ZEVs, including transit agencies subject to the ICT regulation and those subject to the Zero-Emission ASB regulation.

Subsection 1963(c)(12). Gross Vehicle Weight Rating (GVWR)

Purpose

The purpose of this subsection is to define GVWR as having the same meaning as the California Vehicle Code Section 350.

Rationale

This subsection is necessary to ensure all manufacturers will use the same criteria to determine a vehicle's weight class and how it will be counted to comply with the regulation.

Subsection 1963(c)(13). Manufacturer

Purpose

This subsection defines manufacturer to mean those entities or persons engaged in manufacturing or assembling new motor vehicles or engines, and includes importers, glider kit manufacturers, and glider kit assemblers in the definition.

Rationale

This definition is needed to describe what a manufacturer is in order to limit the scope of the regulations to only affect intended parties. The definition closely aligns with California Phase 2 GHG for consistency. Dealers are excluded because they do not manufacture vehicles but may be construed as representing a manufacturer, and are a point of sale. Importers of vehicles for resale are included to minimize the potential for importers to gain a competitive advantage and to guard against manufacturers from circumventing the requirements by passing vehicles for sale in California through another entity to artificially reduce compliance obligations or inappropriately claim the small manufacturer exemption.

Subsection 1963(c)(14). Model Year

Purpose

This subsection defines model year as meaning the same as the California Phase 2 GHG definition of Model Year.

Rationale

This is needed to clearly define model year and to avoid potential confusion with differing model year definitions for the same vehicle sold in California that may be counted when determining compliance with different regulations that apply to the manufacturer. Using the same definition as the Phase 2 GHG regulations allows the same information to be used in reporting compliance with both regulations without adding additional reporting burden and it already includes limits on the manufacturer model year designation to prevent circumventing rule requirements.

Subsection 1963(c)(15)(A-B). Near-Zero-Emission Vehicle

Purpose

The purpose of this subsection is to define near-zero-emission vehicle as having the same meaning as a plug-in hybrid electric vehicle as defined in the California Phase 2 GHG regulation with a minimum all electric range regardless of how the battery would be charged from an external electricity source.

Rationale

This subsection is necessary define which vehicles may be counted to claim NZEV credits to comply with the regulation what is meant when the term NZEV is used in the regulation. Using the same definition for PHEV and the minimum all-electric range as the California Phase 2 GHG regulation allows the same information to be used in reporting compliance with both regulations without adding additional reporting burden. The federal definitions are also included in Appendix B. However, this definition is broader than the California Phase 2 GHG definition for PHEV because it also includes vehicles with the same minimum all electric range but can be charged without a plug from an external source such as wireless charging or catenary systems.

Subsection 1963(c)(16). NZEV Credit

Purpose

The purpose of this subsection is to define NZEV credits as meaning the weighted credits that are generated by producing and selling vehicles with NZEV drivetrains in California.

Rationale

This subsection is necessary to establish what is meant when the regulation language references NZEV credits and how they are calculated. NZEV credits are treated different than ZEV credits and will need to be tracked separately.

Subsection 1963(c)(17). Pickup Truck

Purpose

The purpose of this subsection is to define pickup trucks as having the same meaning as the California Code of Regulations section 150.04.

Rationale

This subsection is necessary to ensure consistent definitions between State regulations. It is also necessary to enable manufacturers to identify the types of vehicles that are excluded from the annual sales volume for Class 2b-3 vehicles when determining the ZEV deficits accrued.

Subsection 1963(c)(18)(A-B). Tractor

Purpose

The purpose of this subsection is to define tractor as having the same meaning as the California Phase 2 GHG regulation and to include the definitions of vocational tractor as defined in the California Phase 2 GHG.

Rationale

This subsection is necessary to clearly identify which vehicles are counted in the Class 7 and 8 Tractor weight class category of the proposed regulation. This definition includes the same definition of tractor and vocational tractor in the California Phase 2 GHG regulation to minimize reporting burden.

Subsection 1963(c)(19)(A-D). Vehicle

Purpose

The purpose of this subsection is to define the term vehicle to mean equipment with a GVWR over 8,500 lbs. that is intended for use on highways, and that otherwise meets the definition of vehicle provided in California Phase 2 GHG regulation. This subsection also specifically excludes trailers, which have the same meaning as trailers in the California Phase 2 GHG regulation, and excluded buses as previously defined in the proposed Advanced Clean Trucks regulation.

Rationale

This subsection is necessary to inform regulated entities as to which subset of vehicle sales are included in the scope of the regulation and which are not. It is also necessary to narrow the scope of the proposed regulation to heavier vehicles that are not trailers, as trailers are not self-propelled equipment and are not within the scope of this regulation.

Subsection 1963(c)(20). Yard Tractor

Purpose

The purpose of this subsection is to define yard tractor as an on-road vehicle that operates a hydraulic fifth wheel and is used in moving and spotting trailers and containers at locations or facilities, and provides some common industry terminology by which yard trucks are more commonly referenced.

Rationale

It is also necessary for manufacturers to identify these vehicles in the scope of the regulation and how they will be counted for determining credits and deficits. On-road yard trucks are commonly used in off-road applications and therefore can be mistaken as off-road vehicles that are not subject to the proposed regulation.

Subsections 1963(c)(21). Zero-Emission Vehicle (ZEV)

Purpose

The purpose of this subsection is to define zero-emission vehicles as having drivetrains with zero exhaust emissions of criteria pollutants, precursor pollutants, or GHGs.

Rationale

This subsection is necessary to simplify the language by grouping all ZEV types in this definition. This allows the language to address all ZEVs together rather than needing to describe each type of ZEV separately each time it is needed.

Subsections 1963(c)(22). ZEV Credit

Purpose

The purpose of this section is to define ZEV credit to mean a numerical value that is generated by producing and selling a ZEV in California. .

Rationale

The definitions are needed to establish what is meant where the regulation language references ZEV credits and how they are calculated and how they count towards compliance.

Subsections 1963(d)(1)(A-B). General Requirements: Credits must match or exceed deficits.

Purpose

The purpose of this subsection is to identify the conditions that a manufacturer must meet to be determined in compliance with the ZEV sales requirement. Class 7-8 Tractor Group deficits must be met with credits from selling Class 7-8 vehicles.

Rationale

This subsection is necessary to establish the compliance structure. This section identifies the types of credits acceptable to satisfy each type of deficit and the necessity for the credits to exceed deficits for a manufacturer to be in compliance.

Section 1963(e). Low Volume Exemption

Purpose

The purpose of this subsection is to identify low volume manufacturers as those that never exceed 500 average annual sales of Class 2b and greater vehicles in California, and to exempt those manufacturers from the ZEV sales requirements.

Rationale

This subsection is necessary to make smaller manufacturers exempt from the ZEV sales requirement due to investment costs to design and build ZEVs and limited sale volume. The threshold includes a majority of the largest manufacturers who are in a better position to recoup their investment than small manufacturers. Staff selected 500 vehicles as the appropriate threshold with the input of stakeholders and staff analysis of the manufacturing industry and number of ZEVs required to be produced each year.

Small manufacturers may generate credits for ZEV and NZEV production and sale, which will help support the existing market, will further develop the market supply chain, service and maintenance networks, help drive down the costs of zero-emission drivetrain components, and ultimately accelerate the adoption of zero-emission technologies in California.

Section 1963(f). Voluntary Credit Generation

Purpose

The purpose of this subsection is to establish that manufacturers that are exempt from the general requirements due to their low sales volume can still earn, bank, and trade ZEV or NZEV credits. This subsection also establishes that these manufacturers are subject to the other provisions that apply to all large manufacturers for credit generation, reporting and recordkeeping requirements, and enforcement.

Rationale

This subsection is necessary to set forth the same limitations on credit generation, banking, and trading as the large manufacturers to ensure a level playing field, and establish reporting requirements for CARB to assess compliance and ensure transparency in the credit market. Additionally, this subsection is necessary to reduce barriers to entry in the ZEV and NZEV markets for small volume manufacturers, which may allow for more innovative ground-up vehicle designs and will pave the way for small manufacturers to transition to ZEV manufacturing as the ZEV market matures.

Section 1963.1. Advanced Clean Trucks Deficits

Purpose

This section identifies the method of assigning deficits to manufacturers based on the vehicles sold into California each year.

Rationale

This section is necessary to establish the number of deficits a manufacturer generates based on total vehicle sales. The deficits must be offset with credits to comply with the regulations.

Section 1963.1(a)(1). Deficit Generation

Purpose

This section sets forth the requirement that manufacturers generate deficits based on annual sales volume, starting with the 2024 model year. It also identifies the requirement for deficits to be matched with ZEV or NZEV credits.

Rationale

This section is necessary to establish a reasonable lead time for manufacturers to develop new product lines to meet the requirements of the regulation. Additionally, this section is needed to set forth that deficits must be met by credits.

Section 1963.1(a)(1)(A) Pickup Exclusion

Purpose

The purpose of this subsection is to exclude pickup trucks from the calculation of annual sales volume until the 2027 model year when determining annual deficits.

Rationale

This subsection is necessary to recognize stakeholder concerns about unique challenges to electrifying the pickup truck segment. At workshops and meetings, manufacturers indicated that medium- and heavy-duty pickup trucks have highly variable towing needs and could result in limited range for battery-electric platforms until the technology matures. To date there are no commercially available zero-emission pickups although several manufacturers have announce plans to produce light duty pickups in the near future. Providing additional three years provides sufficient time to gain experience with early models, including light-duty ZEV models, and still ensures technology advancement and emission reduction from all medium- and heavy-duty vehicle categories.

Section 1963.1(a)(1)(B). Deficit Calculation

Purpose

This subsection describes the method by which manufacturers are required to calculate annual deficits. The required method is detailed in Equation A-1 of the Proposed ACT Regulation, and identifies the deficit for a weight class category as equal to the weight class modifier multiplied by the annual sales volume and the sales percentage requirement for the weight class in a given model year.

This subsection also describes the percentage of ZEV sales required in each model year for each weight class category and how the weight class modifiers are used to convert sales percentages into weighted deficits. The proposed percentage schedule is detailed in Table A-1 of the proposed regulation. The Class 2b-3 group and the Class 7-8 Tractors group have the same phased in requirements, starting from 3 percent in the 2024 model year and increasing to 15 percent in the 2030 model year. Vehicles in the Class 4-8 group would begin with a 7 percent requirement in the 2024 model year and increase to 50 percent in the 2030 model year. All class category percentage requirements remain constant beyond the 2030 model year.

Finally, this subsection also identifies the weight class modifiers used to weight the annual deficits and credits. Staff are proposing Class 2b-3 vehicle to have a modifier of 0.6, Class 4 to 5 vehicles to have a modifier of 1, all of Class 6 and Class 7 vehicles except for Class 7 tractors to have a modifier of 1.5, and Class 7 tractors and all Class 8 vehicle to have a modifier of 2.

Rationale

This section is needed to establish a method of calculating annual deficits, set forth the required minimum annual percentage of ZEVs that manufacturers must produce and sell for each model year and weight class category, and to identify the modifier needed to convert sales into weighted deficits based on vehicle efficiency.

The required ZEV sales percentages increase gradually with time to reflect continued technology improvements, availability of longer ranges of ZEVs, and to allow time for fleets and manufacturers to expand infrastructure and train more technicians.

Today, the Class 2b-3 group and Class 7 and 8 tractors group have more limited commercial availability, and have operational characteristics that are not as suitable for electrification over the next 5 years when compared to other medium- and heavy-duty vehicles. Many tractors engage in long haul operations where limited battery-electric range may be a concern, and public hydrogen fueling or fast charging for these vehicle is not yet available.

The Class 4-8 group is comprised of straight trucks and shuttles that are widely available with zero-emission technology, and generally have operating characteristics that are suitable for electrification with technology that exists today. Most of these vehicles return to a central yard where infrastructure can be installed, have stop and go operations, predictable daily routes and relatively low daily range needs

The weight class modifiers selected account for higher emissions associated with larger vehicles while preserving expected emissions reductions. The weight class modifiers are necessary to keep the Proposed ACT Regulation as simple as possible while providing flexibility for manufacturers to allow for the transfer of credits between weight classes except as specified in the next section.

Section 1963.2. Advanced Clean Trucks Credit Generation, Banking, and Trading

Purpose

The purpose of this section is to set forth the methods by which a manufacturer may generate ZEV and NZEV credits, requirements for certification and test procedures, and limitations on the lifetime of credits and limits on the amount of NZEV credits that manufacturers can use to meet their deficit obligations. More detail is provided for each subsection following.

Rationale

This section is necessary to establish the calculations used to determine ZEV and NZEV credits, to specify how manufacturers shall maintain and transfer credits, and to describe how credits may be used. More detail is provided for each subsection below.

Section 1963.2(a). ZEV Credit Calculation

Purpose

The purpose of this subsection is to define how ZEV credit generation shall be calculated. ZEV credits would be calculated by multiplying the number of ZEVs sold into California by the applicable weight class modifier.

Rationale

This subsection is necessary to establish the calculation by which CARB will determine the number of ZEV credits earned in a model year by a manufacturer and to establish a weighting factor for credits earned to account for higher emissions associated with larger vehicles. This method applies to both credits and deficits and provides flexibility for manufacturers to produce more ZEVs in one weight class to meet deficits from vehicle sales in another weight class category while keeping expected emission about the same.

Section 1963.2(b). NZEV Credit Calculation & NZEV Factor Value

Purpose

The purpose of this subsection is to define how NZEV credit generation shall be calculated. NZEV credits would be calculated by multiplying the number of NZEVs sold into California by the applicable weight class modifier and NZEV Factor Value. The NZEV factor value would be equal to 0.01 times the vehicle's all-electric range by the same method required in the California Phase 2 GHG regulation. The NZEV factor would not exceed 0.75 so that the maximum credit a NZEV could earn would be up to 75 percent of a ZEV credit for an equivalent vehicle. The NZEV credit would be zero if the NZEV is not certified to achieve a minimum all-electric range. NZEV credits would no longer be generated after the 2030 model year.

Rationale

This subsection is necessary to establish the calculation by which CARB will determine the number of NZEV credits earned in a model year by a manufacturer and to establish weighting factor for credits earned to account for higher emissions associated with larger vehicles. The NZEV factor limitations are designed to ensure that this proposed regulation meets its goals of accelerating the deployment of zero-emission technologies; NZEV s have the potential for zero-emission operations, and are a bridge technology that support the ZEV market, but they have internal combustion engines and thus do not fully meet the goals of the regulation. To reflect this, staff discounted credit values for NZEV s, while providing opportunity for manufacturers to earn credit based on all-electric range which should encourage higher zero-emission range for NZEV s. This provides flexibility for manufacturers to meet customer applications that are not well suited for full ZEVs, and promotes development of the zero-emission component supply chains, training and education.

NZEV credit generation ends with the 2030 model year because NZEV s do not fully meet CARB's zero-emission technology goals. They are a bridge technology which will help the development of the full zero-emission vehicle market, but should no longer be needed by 2030 as ZEVs and fuel cell stations or public fast charging station deployments are expected to be developed enough to meet the needs of all or nearly all applications. NZEV credits can provide flexibility that may support the early ZEV market for applications that are more challenging to be ZEVs, but it is unclear whether manufacturers are likely to utilize this option. NZEVs can avoid range anxiety issues, but still require the use of a conventional engine in combination with an electric drivetrain and may not result in significant cost reductions compared to making a full ZEV; additionally, they may not result in significant maintenance savings for potential buyers. Most manufacturers have already announced plans for full ZEVs and have stated that they are not planning to make additional models available as NZEVs.

Section 1963.2(c). Rounding

Purpose

The purpose of this subsection is to identify how calculated credits for the model year shall be rounded if the number of earned credits is not equal to a whole number, by rounding up to the nearest tenth when the fractional part of the required number of credits is equal to or greater than 0.05, and round down if less than 0.05.

Rationale

This subsection is necessary to establish the rounding practice that shall be used by CARB staff in determining the number of credits a manufacturer shall have generated during the model year. Additionally, the use of the conventional rounding method is consistent with that used in the Advanced Clean Cars ZEV Regulation.

Section 1963.2(d). Credit Banking

Purpose

The purpose of this subsection is to describe how manufactures may bank credits for future use.

Rationale

This subsection is necessary to establish the flexibility options for banking credits. Banking is necessary to allow manufacturers flexibility to prepare for anticipated market fluctuations and to correct for deficits if not enough credits were generated.

Section 1963.2(e). Credit Trading and Transfer

Purpose

The purpose of this subsection is to describe how manufactures may trade credits to other manufacturers.

Rationale

This subsection is necessary to establish the flexibility options trading credits. Trading is necessary to allow manufacturers flexibility to prepare for anticipated market fluctuations and to correct for deficits if enough credits were not generated. Additionally, some manufacturers may desire to over comply with the regulation to generate revenue with credit sales.

Section 1963.2(f). Credit Accounting

Purpose

The purpose of this subsection is to identify how manufacturers must account for credits in accounts separated by drivetrain type (NZEV vs ZEV), model year, and whether the credits are in the Class 7-8 tractor group or in the Class 2b-3 group or Class 4-8 group.

Rationale

The accounting subsection is necessary to identify when and from which categories the credits are generated so that the credits and associated deficit accounts can be appropriately tracked for compliance.

Section 1963.2(g)(1-2). Limited Credit Lifetime

Purpose

The purpose of this subsection is to set limits on the period that credits will be usable by manufacturers to meet deficits. It establishes the end of 2030 as the expiration date for credits generated in the 2021 to 2023 model years, and sets an expiration of the current model year plus four model years on credits earned in 2024 and after.

Rationale

This subsection is necessary to ensure that credits earned in excess of the minimum requirements do not get banked indefinitely and undermine goals to maximize the use of ZEVs everywhere feasible if the ZEV market grows faster than required. The credit life period provides flexibility to manufacturers in introducing new ZEV models and in using banked credits to manage annual truck sales fluctuations. Additional time would be provided to ZEVs manufactured prior to the 2024 model year to encourage early action.

Section 1963.2(h). Zero-Emission Powertrain Certification Requirement

Purpose

The purpose of this subsection is to establish the requirement that ZEVs sold into California must meet the requirements of the Zero-Emission Powertrain Certification regulation starting with the 2024 model year.

Rationale

This subsection is necessary to establish certification requirements for zero-emission vehicles that are sold into California as a result of this regulation. The Zero-Emission Powertrain Certification regulation is not applicable to complete vehicles with a GVWR from 8,501 through 14,000 lbs. GVWR. This requirement is necessary to establish minimum criteria for the quality and reliability of ZEVs, ensure information regarding ZEVs and their powertrains are effectively and consistently communicated to purchasers, and to accelerate progress towards greater vehicle reparability. Adding market transparency, consistency, and stability is critical for broad market adoption of zero-emission technology in the heavy-duty sector.

Section 1963.2(i). No Double Counting for Advanced Clean Cars ZEVs

Purpose

The purpose of this subsection is to avoid double counting credits from selling a medium-duty ZEV into California for both the Proposed ACT Regulation and the Advanced Clean Cars Light Duty ZEV regulation. This subsection also sets a requirement for manufacturers to declare the regulation for which the ZEV sold into California would generate credits to be used for compliance with that regulation.

Rationale

This subsection is necessary to prevent expected emissions benefits already claimed by the Advanced Clean Cars Light Duty ZEV program. The Advanced Clean Cars Light Duty ZEV includes a provision that gives the manufacturer the option to count Class 2b-3 ZEVs towards compliance. This provision gives the manufacturer the choice as to how a ZEV that could be used to comply with either regulation would be counted and ensures the ZEV sold into California would only be counted once.

Section 1963.3. Advanced Clean Trucks Compliance Determination

Purpose

This section describes how compliance is determined, how outstanding deficits may be made up, details the order of ZEV and NZEV credit retirements and establishes a maximum limit for the number of NZEV credits that can be used to meet annual compliance requirements.

Rationale

This section is needed to establish the methods to be used to determine compliance, to specify how credits may be used, and the order in which credits will be retired as detailed in the subsections.

Section 1963.3(a). Annual Compliance Determination

Purpose

The purpose of this subsection is to describe how deficit and credit accounts for manufacturers shall be calculated annually for determining compliance.

Rationale

This subsection is necessary to establish the method and period of determining compliance for each manufacture by calculating deficit and credit accounts based on reported information.

Section 1963.3(b). Requirement to Make Up a Deficit.

Purpose

The purpose of this subsection is to describe the amount of time a manufacturer has to fulfill a ZEV deficit obligation if ZEV deficits were not offset with credits at the end of a model year, and specifies that the deficits must be made up with solely with ZEV credits

Rationale

This subsection is necessary to allow for flexibility in the annual compliance determination to account for unforeseen market fluctuations that may affect a manufacturer's ability to comply in any one year. Manufacturers would have the option to satisfy the outstanding deficit with additional ZEV sales or by purchasing and retiring ZEV credits.

Section 1963.3(c)(1-3). Credit Retirement Order

Purpose

The purpose of this subsection is to establish the order in which CARB will debit credit accounts to meet deficit accounts. First, tractor credits are used to meet tractor deficits before the other deficit category. Second, the credits expiring first in any category shall be used first. Last, NZEV credits will be retired up to the maximum cap for NZEV, then ZEV credits, for each category.

Rationale

This subsection is necessary for three reasons. First, it ensures tractor credits satisfy a tractor deficit before they can be used to offset other deficits. This is to ensure that tractors are manufactured to support the goal of transitioning drayage trucks to zero-emissions by 2035 and in beginning the transition to ZEVs from tractors that operate locally or regionally. Second, using credits that expire first allows flexibility for manufacturers to bank early action credits while preventing, to the extent possible, credits from expiring due to age. Last, because NZEV credits have a cap, the NZEV credits would be used before ZEV credit to allow the more flexible ZEV credits to remain in a manufacturers account to be used when needed and continues to ensure that ZEVs must still be manufactured to meet the goals for maximizing the use of ZEVs where feasible.

Section 1963.3(d). NZEV Credit Limit

Purpose

The purpose of this subsection is to establish a limit to the usage of NZEV credits to satisfy a manufacturer's incurred deficits.

Rationale

This subsection is necessary to ensure ZEVs are produced and NZEVs are not the only vehicles produced. However, allowing NZEV credits to meet up to half of the obligation provides flexibility for manufacturers and promotes the state goal of "zero-emission wherever possible, near-zero everywhere else" in hard-to-electrify market segments.

Section 1963.3(e). Tractor Deficits Must Be Met With Tractor Credits

Purpose

The purpose of this subsection is to set a limit on the type of credits needed to satisfy deficits in the Class 7-8 tractor group.

Rationale

This section is necessary to ensure the development and deployment of zero-emission technologies in tractors which represent one of the largest on-road emissions categories and to support broader CARB strategies to reduce emissions in disadvantaged communities and areas with high concentrations of truck traffic such as ports, railyards, and warehouses.

Section 1963.4. Advanced Clean Trucks Reporting and Recordkeeping

Purpose

The purpose of this section is to establish what information manufacturers are expected to report to CARB. Manufactures must report vehicle sales into California for each model year, credit transfers each year, and to declare which regulation medium-duty ZEV credits are to be applied. Additionally, this subsection establishes reporting deadlines each calendar year for all information required.

Rationale

This section is necessary to establish a reporting deadline for manufacturers and identify the types of information a manufacturer must report to CARB and to identify how long records must be kept.

Section 1963.4(a)(1-7). Sales Reporting

Purpose

This subsection proposes that every manufacturer shall report sales information to CARB annually beginning with the 2021 model year by March 31 of the following calendar year toward meeting the requirements of sections 1963 through 1963.3. This section also proposes that manufacturers report the weight class and number of vehicles sold into California and whether the vehicle type is a tractor or not the type of drive train.

Rationale

This subsection is necessary as it identifies the starting date of the reporting requirements and clarifies all manufacturers that incur deficits or earn credits must report annually.

The reporting deadline of March 31 is necessary to align with the initial reporting date for the California Phase 2 GHG regulation, which already has a reporting system established that staff can leverage to limit the burden of reporting by preventing affected manufacturers from having to report the same information to CARB twice. It also provides time for manufacturers to gather information after the end of the model year to be able to report accurate information to CARB.

Reporting is necessary to facilitate enforcement of the regulation. This section also identifies the information required to establish compliance with the regulation as well as for verification of reported information in case of audit.

The VIN number of the vehicle sold is necessary for CARB to be able to verify whether the vehicle is sold into California.

The VIN code for Class 2b-3 vehicles is necessary for CARB to be able to identify whether the vehicle is sold as a complete pickup truck or an incomplete vehicle, as it relates to the pickup exemption for the Class 2b-3 group from 2024 to the 2027 model year.

The vehicle type weight class of the vehicle type sold is necessary to determine the category the vehicle type applies to regarding the ZEV sales percentage requirement as well as which weight class modifier is applicable to determine compliance.

The vehicle type as a tractor, non-tractor, or pickup is necessary to determine both the ZEV sales percentage requirement and transferability between vehicle weight class groups required to determine compliance.

The vehicle type as a ZEV, NZEV, or other is necessary to determine the vehicle type sales contribute to credit deficit or generation as well as restrictions in use and transferability between vehicle weight class categories required to determine compliance.

The vehicle production volume sold into California per vehicle type is necessary to determine deficits and ZEV credit generation required to determine compliance.

Section 1963.4(b) Credit Transfer Reporting

Purpose

The purpose of this subsection is to establish that manufacturers that either receive or transfer credits must report such transactions annually to CARB, and that CARB will not recognize claimed transfers until the report is received.

Rationale

This subsection is necessary to set forth a reporting requirement for manufacturers that have traded or received credits so that CARB may be made aware of and properly account for and track credit trades between entities.

Section 1963.4(b)(1) Transfer Reporting Deadline

Purpose

The purpose of this subsection is to identify March 31 as the reporting deadline for credit transfer reports.

Rationale

This subsection is necessary to establish a deadline by which manufacturers are expected to report their credit transfer information that is consistent with the sales reporting deadline. This date aligns with the initial reporting date for the California Phase 2 GHG regulation, which already has a reporting system established that staff can leverage to limit the burden of reporting by preventing affected manufacturers from having to report the same information to CARB twice. It also provides time for manufacturers to gather information after the end of the model year to be able to report accurate information to CARB.

Section 1963.4(b)(2)(A-E) Required Credit Transfer Information

Purpose

The purpose of these subsections are to detail the required information that must be included as part of the credit transfer report, which shall include the corporate name of the credit transferor(s) and transferee(s) as well as the number of credits transferred for each model year, whether the credits transferred are ZEV or NZEV credits, and the whether the transferred credits are Class 7-8 Tractor group credits or other credits from other weight class groups. The report must be a letter or other document signed by authorized agents of both parties to the transaction.

Rationale

These subsections are necessary to establishes the information required to keep track of the credit transfer between manufacturers should it be required to demonstrate compliance as well as verification in case of audit.

The corporate name of the credit transferor is necessary to identify the specific manufacturer from which the credit is transferred.

The corporate name of the credit transferee is necessary to identify the specific manufacturer to whom the credit is transferred.

The number of credits transferred for each model year is necessary to identify the quantity of credits transferred between the transferor and transferee.

The identity of credits as ZEV or NZEV credits is necessary to identify the credit type.

The identity of credits as belonging to the Class 7-8 tractors category or other credits category is necessary to identify the credit type.

Section 1963.4(c)(1-2). Class 2b-3 Credit Declaration

Purpose

This subsection proposes that if a specific manufacturer generates credits in the Class 2b-3 weight class category, that specific manufacturer must submit a report by March 31 of each calendar year to CARB's Executive Officer identifying credits generated in accordance with the Proposed ACT Regulations of section 1963 and credits generated in accordance with the ACC regulations of 13 CCR section 1962.

Rationale

This section is necessary to identify the regulation under which credits are generated by a specific manufacturer in the Class 2b-3 weight class category so as to avoid a single generated credit demonstrating compliance for multiple regulations under which Class 2b-3 vehicles are affected.

Section 1963.4(d). Retention of Records

Purpose

The purpose of this subsection is to establish a timeline of 8 years past the model year during which manufacturers must keep reporting records for vehicles produced and sold in California during the model year.

Rationale

This subsection is necessary to ensure records are available for audit and enforcement of the regulation. Additionally, 8 years is consistent with the record retention timeframe of California Phase 2 GHG regulation, and aligns the timeframes to reduce confusion and burden of record retention requirements.

Section 1963.5(a)(1-3). Advanced Clean Trucks Enforcement

Purpose

The purpose of this section is to set forth the rights of CARB to audit a manufacturer's records, the authority of CARB to invalidate credits deemed to be obtained based on falsified information, and a notice to manufacturers of the type of information provided to CARB may be made public.

Rational

This section is necessary to establish that manufacturers must keep and make available records to prove vehicle California sales numbers to ensure accuracy of reported information and enforceability of this regulation. CARBs right to suspend, revoke, or modify credit balances is necessary to establish a pathway by which CARB may deem invalid credits claimed by a manufacturer. The notice of public disclosure is necessary to identify the specific information that is subject to disclosure as public records.

B. Large Entity Reporting Requirement

Section 2012. Purpose, Scope and Applicability, Definitions, Exemptions, and General Requirements.

Purpose

The purpose of this section is to describe the purpose of the Large Entity Reporting Requirement, to identify which entities would be required to report and which entities would be excluded, to set forth definitions for various terms used throughout the regulation text, and to describe the general reporting requirements.

Rationale

This section is necessary to identify the general purpose of the Large Entity Reporting Requirement, which is to collect transportation related information from regulated entities. This section is also necessary to clearly identify who would be regulated, who would be exempt, and to set forth definitions for various terms used in the proposed language to avoid misinterpretation. Additionally, the section is needed to identify the basic reporting requirements and how this information will be collected.

Section 2012(a) Purpose.

Purpose

This section describes the purpose of the regulation, which is to collect information from regulated entities to assess suitability of zero-emission vehicles and to inform strategies on how to accelerate the use of zero-emission vehicles in California to reduce emission from vehicles.

Rationale

This section is necessary to identify the purpose of the Large Entity Reporting Requirement and to inform the public that the information collected will be used to determine strategies for future strategies to maximize the use of zero-emission vehicles in California where suitable. The information would be used to identify common characteristics for different entities that compete in the same sector and would help answer questions about different strategies to accelerate the use of ZEVs

Section 2012(b)(1-5) Scope and Applicability.

Purpose

The purpose of this section is to identify the regulated entities that are subject to the Large Entity Reporting Requirement.

Rationale

This section is necessary to clearly identify the regulated parties that would be subject to the Large Entity Reporting Requirement. The definition was selected to include a wide range of entities because nearly all rely on services that use trucks and buses, and all are likely to be directly or indirectly affected by a future ZEV requirement because a general goal established in the mobile source strategy and the SIP and is to accelerate the use of ZEVs everywhere feasible. The revenue threshold was selected as a way to exclude small businesses from the reporting requirement to reduce the number of entities that report and the expectation that the large entities would provide a representative data set of the wide range of business models and vehicle operations in California. Large entities have adequate resources to respond to questions about their existing operations and are more likely to keep information electronically than smaller entities which means their reporting burden would be less significant. Information from large entities is expected to provide a robust data sample to help answer questions about sector-by-sector variations in vehicle usage and contracting for transportation services. The 2019 tax year was selected as a baseline year so that regulated parties would know whether they are in the scope of the regulation when the regulation is considered by the Board. Federal agencies are necessary to include because they represent a significant portion of government fleet emissions in California, and Governor Brown's directive indicated that government should lead the electrification efforts in California.

Section 2012(c)(1-3) Exemptions.

Purpose

This section identifies entities who would be exempt from the Large Entity Reporting Requirement.

Rationale

This section is necessary to identify the entities that are outside the scope of the large entity reporting requirement and would not be required to report. K-12 schools and school districts comprised of school buses would be exempt because sufficient information about the school bus fleet and its operation has already been collected. Additionally, staff do not anticipate including school buses in a near-term future ZEV fleet regulation. Transit agencies would be exempt because the ICT regulation already requires them to transition their buses to ZEBs. Transportation network companies would be exempt because staff is currently developing a regulation consistent with SB 1014 to require the use of light-duty ZEVs, and would require transportation network companies to report information to CARB.

Section 2012(d) Definitions.

Purpose

This section sets forth definitions for terms used in the proposed regulation order and identifies the sections for which the definitions apply.

Rationale

This section is necessary to define key terms used within the regulation to provide clarity and specificity to regulated entities.

Subsection 2012(d)(1) Definition of Assigned.

Purpose

The purpose of this subsection is to define “Assigned.”

Rationale

The definition for “Assigned” is necessary to ensure that vehicles are accounted for at the correct facilities. Some fleets may not have vehicles domiciled at any particular location so “assigned” allows more flexibility for fleets with variable operations.

Subsection 2012(d)(2) Definition of Broker.

Purpose

The purpose of this subsection is to define “Broker.”

Rationale

The definition for “Broker” is necessary to identify entities that direct truck movements without owning the assets that compete for the same business as motor carriers that own their own trucks. This definition is based on the “broker” definition in the Truck and Bus Regulation for consistency.

Subsection 2012(d)(3) Definition of Corporate Parent.

Purpose

The purpose of this subsection is to define “Corporate Parent.”

Rationale

The definition for “Corporate Parent” is necessary to specify a clear definition of the term and allows for regulated entities to accurately identify their corporate parent if they have one.

Subsection 2012(d)(4) Definition of Facility.

Purpose

The purpose of this subsection is to define “Facility.”

Rationale

The definition for “Facility” is necessary in order to specify the types of properties that are included. This helps narrow the scope as to what to include when reporting.

Subsection 2012(d)(5) Definition of Facility Category.

Purpose

The purpose of this subsection is to define “Facility Category.”

Rationale

The definition for “Facility Category” is necessary to establish common facility categories to ensure consistency in how facilities are grouped. These facility categories were chosen as they represent a variety of common business and operations and simplify reporting by allowing the respondent to summarize facility information by responding to questions about all facilities as a group. Within this definition is additional detail to define each facility category in subsections 2012(d)(5)(A-K).

Subsection 2012(d)(5)(A) Definition of Administrative/Office Building.

Purpose

The purpose of this subsection is to define “Administrative/Office Building.”

Rationale

The definition for "Administrative/Office Building" is necessary to identify the type of facility at which an entity primarily uses for administrative day-to-day tasks. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(B) Definition of Distribution Center/Warehouse.

Purpose

The purpose of this subsection is to define “Distribution Center/Warehouse.”

Rationale

The definition for "Distribution Center/Warehouse" is necessary to identify the type of facility at which an entity primarily stores goods intended for subsequent shipment. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(C) Definition of Hotel/Motel/Resort.

Purpose

The purpose of this subsection is to define “Hotel/Motel/Resort.”

Rationale

The definition for "Hotel/Motel/Resort" is necessary to identify the type of facility from which an entity offers lodging to travelers and/or permanent residents. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(D) Definition of Manufacturer/Factory/Plant.

Purpose

The purpose of this subsection is to define “Manufacturer/Factory/Plant.”

Rationale

The definition for "Manufacturer/Factory/Plant" is necessary to identify the type of facility at which an entity has equipment for assembling parts, producing finished products, intermediate parts, or energy products. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(E) Definition of Medical/Hospital/Care.

Purpose

The purpose of this subsection is to define “Medical/Hospital/Care.”

Rationale

The definition for "Medical/Hospital/Care" is necessary to identify the type of facility from which an entity provides inpatient diagnostic and therapeutic services or rehabilitation services, by or under the supervision of physicians. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(F) Definition of Multi-Building Campus/Base.

Purpose

The purpose of this subsection is to define “Multi-Building Campus/Base.”

Rationale

The definition for "Multi-Building Campus/Base" is necessary to identify the type of facility typically operated by a single entity with several buildings that typically serves multiple purposes. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(G) Definition of Restaurant.

Purpose

The purpose of this subsection is to define “Restaurant.”

Rationale

The definition for "Restaurant" is necessary to identify the type of facility from which entities serve meals or refreshments. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(H) Definition of Service Center.

Purpose

The purpose of this subsection is to define “Service Center.”

Rationale

The definition for "Service Center" is necessary to identify the type of facility from which respondents support business operations that generate revenue through specific service or products. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(I) Definition of Store.

Purpose

The purpose of this subsection is to define “Store.”

Rationale

The definition for "Store" is necessary to identify the type of facility from which entities primarily sell goods or services to the general public. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(J) Definition of Truck/Equipment Yard.

Purpose

The purpose of this subsection is to define “Truck/Equipment Yard.”

Rationale

The definition for "Truck/Equipment Yard" is necessary to identify the type of facility from which trucks and equipment are primarily stored or dispatched. This will enable respondents to clearly identify and group information reported for this type of facility.

Subsection 2012(d)(5)(K) Definition of Any Other Facility Type.

Purpose

The purpose of this subsection is to define "Any Other Facility Type."

Rationale

The definition for "Any Other Facility Type" is necessary to allow fleets to identify and report information about less-common facility types that are not included in the prior list of facilities. This will enable staff to gather information about facilities that were not listed as the most common.

Subsection 2012(d)(6)(A-B) Definition of Fleet.

Purpose

The purpose of this subsection is to define "Fleet."

Rationale

The definition for "Fleet" is necessary for usage in specific information reported and other definitions. This definition is based off of the "fleet" definition currently being used in CARB's Truck and Bus Regulation for consistency.

Subsection 2012(d)(7)(A-B) Definition of Fleet Owner.

Purpose

The purpose of this subsection is to define "Fleet Owner."

Rationale

The definition for "Fleet Owner" is necessary to define which fleets are subject to the Large Entity Reporting Requirements. This definition is based on the "fleet owner" definition currently being used in CARB's Truck and Bus Regulation for consistency.

Subsection 2012(d)(8) Definition of Government Agency.

Purpose

The purpose of this subsection is to define "Government Agency."

Rationale

The definition for “Government Agency” is necessary to minimize confusion as to which government agencies are subject to the Large Entity Reporting Regulation. This definition was chosen to ensure that local, state, and federal government entities would all be included.

Subsection 2012(d)(9) Definition of Gross Annual Revenue.

Purpose

The purpose of this subsection is to define “Gross Annual Revenue.”

Rationale

The definition for “Gross Annual Revenue” is necessary in order to determine which large entities are subject to the Large Entity Reporting Requirement. This definition was chosen as a single point of reference that can be used across a variety of industries and business types.

Subsection 2012(d)(10) Definition of Gross Vehicle Weight Rating.

Purpose

The purpose of this subsection is to define “Gross Vehicle Weight Rating.”

Rationale

The definition for “Gross Vehicle Weight Rating” is necessary to define vehicle weight classes used elsewhere in the regulation order. The GVWR definition in the California Vehicle Code was chosen to be consistent with commonly used definitions of GVWR.

Subsection 2012(d)(11) Definition of Motor Carrier.

Purpose

The purpose of this subsection is to define “Motor Carrier.”

Rationale

The definition for “Motor Carrier” is necessary because some questions and definitions that are only applicable to motor carriers. The motor carrier definition in the California Vehicle Code was chosen to be consistent with commonly used definitions of motor carrier.

Subsection 2012(d)(12) Definition of Municipality.

Purpose

The purpose of this subsection is to define “Municipality.”

Rationale

The definition for “Municipality” is necessary to clearly define what government entities within California are included. This definition is based on the “municipality” definition currently being used in CARB’s Public Agency and Utility Regulation for consistency.

Subsection 2012(d)(13)(A-C) Definition of Responsible official.

Purpose

The purpose of this subsection is to define “Responsible official.”

Rationale

The definition for "Responsible official" is necessary to establish the types of individuals affiliated with the reporting entity that have the authority within the organization to report on behalf of or for the purposes of complying with these requirements.

Subsection 2012(d)(14) Definition of Subsidiary.

Purpose

The purpose of this subsection is to define “Subsidiary.”

Rationale

The definition for "Subsidiary" is necessary to establish the type of corporate entity or subdivision that staff are requiring to report information for this regulation.

Subsection 2012(d)(15) Definition of Subcontractor.

Purpose

The purpose of this subsection is to define “Subcontractor.”

Rationale

The definition for "Subcontractor" is necessary to define a term that has different meanings in different situations and identify entities that are mutually exclusive from "subhaulers" in order to prevent confusion from the use of similar terminology in responding to questions.

Subsection 2012(d)(16) Definition of Subhauler.

Purpose

The purpose of this subsection is to define “Subhauler.”

Rationale

The definition for "Subhauler" is necessary to identify entities that are mutually exclusive from "subcontractors" in order to prevent confusion from the use of similar terminology in responding to questions. This definition was chosen to clearly delineate that a subhauler is providing for-hire transportation to another for-hire motor carrier.

Subsection 2012(d)(17) Definition of Transportation Network Company.

Purpose

The purpose of this subsection is to define “Transportation Network Company.”

Rationale

The definition for "Transportation Network Company" is necessary to establish the specific type of business or entity that is exempt from this regulation due to other regulatory efforts focused on these entities. This definition was chosen to match the California Public Utility Commission’s definition of a “transportation network company” for consistency.

Subsection 2012(d)(18) Definition of Vehicle Body Type.

Purpose

The purpose of this subsection is to define “Vehicle Body Type.”

Rationale

The definition for "Vehicle Body Type" is necessary to establish certain common body types for fleet owners to use in response to questions about vehicle operational characteristics. This will help narrow the scope of vehicle types staff expect fleet owners to respond about, and will allow staff to assign appropriate flexibilities if needed in future regulatory efforts.

Subsection 2012(d)(19) Definition of Vehicles Awaiting Sale.

Purpose

The purpose of this subsection is to define “Vehicles Awaiting Sale.”

Rationale

The definition for "Vehicles Awaiting Sale" is necessary to define vehicles which may be excluded from the reporting requirement. This definition is based on the “vehicle awaiting sale” exemption currently being used in CARB’s Truck and Bus Regulation for consistency.

Subsection 2012(d)(20)(A-D) Definition of Weight Class Bins.

Purpose

The purpose of this subsection is to define “Weight Class Bins.”

Rationale

The definitions for the various "Weight Class Bins" of light-duty, Class 2b-3, Class 4-6, and Class 7-8 are necessary to establish grouped categories by which fleet owners will report vehicle operational information. These bins were selected to be consistent with categories used in the manufacturer ZEV sales requirement and because vehicles in these groups have fairly similar operational characteristics. The data will enable staff to compare results to other data sources to understand how the reported data compares to statewide data, sales trends, and use profiles from other studies about similar vehicles. This type of information will help identify differences among truck types and industries which will help identify appropriate off-ramps or flexibilities for future ZEV requirements.

Section 2012(e)(1-3) General Requirements.

Purpose

The purpose of this section is to summarize what requirements apply to regulated parties and which sections describe requirements for reporting, the method for reporting, and record retention.

Rationale

Section 2012(e)(1) is necessary as it specifies that regulated entities must report by April 1, 2021 for their facility operation in 2020 and for any fleet as it was comprised as of January 1, 2021. Reporting is required by April, 2021, to provide sufficient time for regulated entities to collect information from the prior year. The responses would be used to evaluate new strategies that include fleet regulations, market based strategies, or potential geographic boundaries for a future rulemaking, as well as identify which sectors or individual entities to follow-up with for more detailed conversations. The information will also help identify patterns and guide staff in developing regulatory strategies on the deployment of ZEVs in a manner that encourages their use where they are most suitable, maintains equity among regulated parties that compete in the same markets, and considers the potential impact on funding and access to infrastructure. Requiring that entities disclose whether their reported information contains business confidential information will provide guidance to staff and regulated entities on how to respond to a California Public Records Act request.

Section 2012(e)(2) is necessary to identify how reported information must be submitted as it specifies that all three sections; 2012.1, 2012.2, and 2012.3 of the Large Entity Reporting Requirement should be reported to CARB through the webpage for Advanced Clean Trucks. Large entities are presumed to have internet capabilities and can submit reports in this way, as many already report online for other CARB regulations in this manner. A spreadsheet and instructions for how to submit information will be available on the Advanced Clean Trucks webpage, by December 31, 2020.

Section 2012(e)(3) is necessary to notify regulated entities about the information they must retain for audit purposes as well as the time period the information must be retained. The fleet owner or responsible person must maintain all individual fleet, vehicle, contract, and facility records used to compile responses to sections 2012.1, 2012.2, and 2012.3. The record keeping requirement for three years was deemed to be sufficient time to maintain records and is expected to be fairly consistent with existing practices for most entities.

Section 2012.1 General Entity Information Reporting.

Purpose

The purpose of this section is to specify the general information that regulated entities must report as part of the Large Entity Reporting Requirement.

Rationale

Overall, this section is necessary to identify the entity that is reporting and what information that are required to be submitted to CARB as detailed in the subsections.

Subsection 2012.1(a)(1-9) Entity name, Mailing address, Designated person contact information, Corporate parent name, TRUCRS ID, and Taxpayer identification number.

Purpose

The purpose of these subsections is to specify the information that must be reported so that staff can identity each regulated entity, have a method to contact them if needed, and to have a unique identifier if names are not clear.

Rationale

These subsections are necessary because they allow staff to classify the regulated entities within the scope of Section 2012(b). The mailing address provides a means to contact the entity by mail. The contact information is necessary for CARB to be able to identify to whom outreach, clarification, or other questions should be directed. It is important to identify a regulated entity's corporate parent name because staff needs to relate the regulated entities that are subsidiaries to their corporate parents. Identifying a Truck Regulation Upload, Compliance and Reporting System or TRUCRS ID is important because it will inform to staff that the regulated entity has previously reported information to CARB which includes company and vehicle information. The taxpayer identification number is a unique identifier that will help separate responses from entities with similar names, with grouping information from multiple divisions of the same company, can be used to identify tax records to audit and will help with recordkeeping purposes.

Subsection 2012.1(a)(10-14) Primary NAICS code, Annual U.S. revenue, Applicable operating authority numbers, Subhauler and subcontractor information.

Purpose

The purpose of these subsections is to specify the information that must be reported relevant to the regulated entities' business characteristics and practices.

Rationale

These subsections are necessary because they allow staff to classify the regulated entities within the scope of Section 2012(b) and to have information to put the responses in context. The NAICS code is necessary because it describes the specific sector a regulated entity's business falls under which helps identify entities that compete in the same markets. The total annual revenue in the United States helps determine the relative size of different companies in the same industry and would help compare fleet size or other characteristics among different size companies in the same business. Subsection 2012(b)(12) is necessary to identify the regulated entity's motor carrier identification numbers. Knowing this information allows staff to understand the types of operation an entity is authorized to perform. Subsections 2012(b)(13) and 2012(b)(14) are important to determine whether regulated entities identify use subcontractors or subhaulers in their typical business, the number of trucks subhaulers use, and whether subhaulers are operating under the regulated entity's authority. This information will help answer questions about whether an entity uses its own trucks or rely on other entities to conduct their business. This is critical to understand when developing strategies that have a level playing field if setting differing requirements by fleet size or other threshold.

Subsection 2012.1(a)(15-16) Regulated Entity's Sustainability Plan questions.

Purpose

The purpose of these subsections is to specify the information that must be reported so that staff can determine if a regulated entity has a sustainability plan and if that plan includes transportation-related emissions reduction goals.

Rationale

These subsections are necessary to find out if regulated entities have sustainability incorporated in their business model. This will inform staff whether the regulated entity is already making efforts to reduce their emissions and whether they are accounting for emissions associated with trucking and freight services. This information will provide an opportunity for staff to explore how industry is already incorporating transportation emissions into meeting sustainability goals that could potentially be applied more broadly as a method to increase the use of ZEVs.

Subsection 2012.1(a)(17-18) Number of Vehicles Your Entity Owns, Operates, and are Domiciled Inside and Outside California.

Purpose

The purpose of these subsections is to specify the information that must be reported so that staff can quantify the number of vehicles owned by the company that operate in California and are domiciled in California, as well as the vehicles owned by the entity that operate in California but are not domiciled in any California location.

Rationale

These subsections are necessary to determine the California vehicle populations of California domiciled vehicles and non-California domiciled vehicles for the regulated entities. This will inform staff on how many vehicles stay at the same location in California versus how many vehicles are not assigned to any particular terminal or are domiciled out of state. Currently, ZEVs are suitable for local haul operations that return to base where infrastructure can be installed. Information that identifies out-of-state operations and those that do not return to base will also be needed to identify potential off-ramps or other considerations until the ZEV market matures and access to public charging or hydrogen fueling infrastructure for trucks and buses expands.

Section 2012.2 Facility Category Reporting.

Purpose

The purpose of this section is to identify what general information regulated entities must report for each facility category they operated in California during the 2020 calendar year, and what detailed information for a representative facility of each facility category they operated in California during the 2020 calendar year as described in the subsections.

Rationale

This section is necessary because it provides instructions to complete the facility information reporting requirement and it will identify characteristics and patterns of facility categories in California. At stakeholder requests, staff modified the proposed regulation to allowing entities to group information by facility category rather than reporting information for every facility and to require additional details for one facility within each group. This approach simplifies reporting for affected stakeholders, but still provides sufficient information for staff to evaluate the information. The 2020 calendar year was selected because it is the most recent year before reporting would be required.

Subsection 2012.2(a)(1)(A) Number of Facilities Located in California.

Purpose

The purpose of this subsection is to collect information on the number of facility categories that a regulated entity operated in California.

Rationale

This subsection is necessary to identify the total number of facilities in each category. Collecting this information provides information on how many facilities of each type is operated by the entity and puts in context the responses to other questions about the entity and the fleet of vehicles.

Subsection 2012.2(a)(1)(B) Number of Facilities That Have Dock-Height Loading Bays.

Purpose

The purpose of this subsection is to identify the number of facility types a regulated entity owned or leased in California calendar year that have dock-height loading bays.

Rationale

This subsection is necessary because it will allow staff to identify the number of facility types that have dock-height loading bays. Dock-height loading bays are areas of a building where vehicles are typically loaded and unloaded and are possible indicator of sites that have some dwell time that may be suitable for installing ZEV infrastructure.

Subsection 2012.2(a)(1)(C) Number of facilities that have cold storage rooms.

Purpose

The purpose of these subsections is to identify the number of facility types a regulated entity owned or leased in California that have cold storage areas.

Rationale

These subsections are necessary because collecting this information will allow staff to identify the percentage of facility types that have cold storage and are likely to have transport refrigeration units (TRU) visiting the facility. This information will help identify locations where charging infrastructure may be needed to support zero-emission TRUs and where there may be overlapping requirements with a potential future ZEV truck regulation.

Subsection 2012.2(a)(1)(D-E) Number of facilities that have electric vehicle supply equipment or electric vehicle charging stations available for public or private use.

Purpose

The purpose of these subsections is to identify the number of facility types a regulated entity owned or leased in California that already have existing electric vehicle supply equipment for public or private use.

Rationale

Subsections 2012(a)(1)(D-E) are necessary to identify entities that already provide electric vehicle supply equipment or electric vehicle charging stations for employees or for public use to support light duty ZEV deployment. This information will help identify entities that have experience with the permitting and planning process to install infrastructure to support ZEVs, may be an indicator of entities that have experience with ZEV deployments and are taking action to meet sustainability goals. The information could be used to follow-up with these entities in exploring opportunities to support ZEV trucks and can be useful when evaluating light-duty ZEV policies to accelerate the purchase of ZEVs by large employers.

Subsection 2012.2(a)(1)(F-G) Facility Ownership Status.

Purpose

The purpose of this subsection is to identify the ownership status of facility types in California.

Rationale
This subsection is necessary to identify which facility types that are owned by the entity or subsidiaries with the same corporate parent. This is information will identify which entities have direct control of the facilities they operate and which entities rent, or lease,

their facilities and would need to work with a third party to make site improvements to support ZEVs and fueling infrastructure.

Subsection 2012.2(a)(1)(H) Shuttle Van or Bus Service to or From Facility.

Purpose

The purpose of these subsections is to identify entities that provide shuttle van or bus service.

Rationale

This subsection is necessary to identify the types of facilities that have entity-provided shuttle service. Public and some private fleets are already required to electrify their passenger transportation through the ICT and ZE ASB regulations. Other entities that provide or hire passenger transportation services may have opportunities to deploy ZEV shuttles and buses to further reduce emissions from passenger transportation. These entities could have opportunities to further expand the ZEV bus market and to take advantage of experience already gained by transit agencies.

Subsection 2012.2(a)(1)(I-J) Vehicles Assigned or Domiciled at Facility.

Purpose

The purpose of these subsections is to identify the types of facilities, and how many facilities have light-duty vehicles, trucks, vans, or buses, assigned or domiciled at the facility.

Rationale

These subsections are necessary to identify patterns between facility categories and the number of facilities that have vehicles assigned or domiciled at facilities. Entities that report they do not have trucks or vans will make it clear they do not need to complete the vehicle information in section 2012.3. This information will help identify how many facilities in each facility group have vehicles assigned or domiciled at facilities which will also be useful in interpreting whether vehicle use is a primary part of the operation or not. The information will also help staff interpret how the data provided about vehicles at each facility fits in with the operation of the entity.

Section 2012.2(a)(2)(A-H) Ground transportation needs.

Purpose

The purpose of this subsection is to identify different types of truck ground transportation is used to ship items as part of its operation and whether those needs are met with vehicles owned by the entity or is contracted out to a third party.

Rationale

This section in its entirety is necessary because it will allow staff to identify how shipping needs are met. This information will help staff determine how arrangement for shipments are made and will provide basic information on destination type. This information will help answer questions about potential opportunities and barriers to electrification. For example, ports and rail yards are likely to transition to ZEVs earlier that other fleets and could change the way businesses ship products, shipments that are directed out-of-state where ZEV infrastructure is currently not available are not likely to be suitable for ZEVs until a public fueling infrastructure is available, shipments to homes and neighborhoods for last mile deliveries tend to be short trips from a central location that are likely to be suitable for ZEVs, and shipments that are made between an entity's existing locations may have opportunities to include infrastructure to support charging on-route if there is sufficient dwell time for ZEVs to charge or fuel.

Section 2012.2(a)(3)(A-I) Contracting practices.

Purpose

The purpose of this section is to identify the information that each regulated entity must report for each facility type regarding how the entity typically enters into contracts for deliveries and services provided with trucks and how these contracts are managed.

Rationale

This section in its entirety is necessary because it will allow staff to identify what types of vehicle related services the entity contracts for and whether individual facilities manage the contracts for the services listed in Section 2012.2(a)(3)(A-I) or if they are managed centrally at a corporate level or by some other means. The criteria for contracts to be for one year or more minimizes the need to track information for infrequent services and reduces reporting burden. This set of questions helps identify entities to follow-up with for answering more detailed questions about contracting practices and whether entities could include requirements for their service providers to use ZEVs as part of their services they provide. The list of services represent common pickup and delivery services that tend to be last-mile services where ZEVs are already suitable and are likely to be an area of focus for future ZEV strategies.

Section 2012.2(a)(4) Grouped Facility Addresses

Purpose

The purpose of this section is to set forth the requirement for entities to report a physical address for each location operated and the corresponding facility category.

Rationale

This section is necessary to gather information about where each facility is located to allow staff to evaluate the potential effects of different ZEV adoption strategies including where the emissions benefits would occur, and where infrastructure is available or might be needed. The information would also be used to evaluate effects of potential overlap with other regulations, local requirements and to evaluate effects on disadvantaged communities. Additionally, the address will help identify whether the facility is in an urban area, and whether climate, topography, population density, and congestion may be a factor in accessing the feasibility of ZEVs serving the facility.

Section 2012.2(b) Representative Facility Questionnaire.

Purpose

The purpose of this subsection is to gather information about a representative facility for each facility category that is operated by an entity in California. Regulated entities would need to report general facility characteristics, estimated vehicle trips (excluding light-duty vehicles) in a typical week, and information about the number of suppliers that shipped their items to the representative facility.

Rationale

This subsection is necessary to identify the operational characteristics for a typical representative facility in each category and will provide detailed information about a handful of different facilities to reduce reporting burden. Staff will use information from multiple entities with similar facilities to group the results and identify trends for different businesses and facility types. The language in this section informs regulated entities that they should use their best judgement and select a representative facility for each of the facility categories they operate and indicates that compliance will be based on making good faith effort. This subsection is necessary to gather binned and categorized information about medium or heavy-duty vehicle trips and number of suppliers a typical facility deals with. This information will provide an adequate data sample and will help staff characterize industries to identify appropriate exemptions or flexibilities for future electrification strategies.

Sections 2012.2(b)(1)(A-H) General Representative Facility Questions.

Purpose

The purpose of this subsection is to identify a representative facility's location, approximate square footage of the facility and of cold storage rooms, number of dock-height loading bays, and a short description of the representative facility and its primary function or purpose.

Rationale

The location of the representative facility is necessary for staff to gather geographic information about the facility and will assist in identifying which records are used in supporting the responses. Geographic information will help identify whether the facility is in an urban area, and whether climate, topography, population, and congestion are a factor for the facility operation and where infrastructure would be needed to support ZEVs. The total building square footage is necessary to identify the typical facility size and general scale of operations relative to other similar facilities. The number of dock-height loading bays and cold storage square footage is necessary to identify the locations where goods are frequently loaded or unloaded from trucks with TRUs and to identify potential sites with opportunities for ZEV infrastructure. The short description of the representative facility is necessary to differentiate the types of facilities within the facility category in order to accurately analyze the data collected. For example the category "Store" could be an electronic parts vendor or an ice cream shop which would have significantly different characteristics.

Section 2012.2(b)(2)(A-J) Estimated Number of Vehicle Trips to the Representative Facility in a Typical Week.

Purpose

The purpose of this subsection is to identify the estimated number of vehicle trips to the representative facility in a typical week by using following bins for responses regarding the number of trips (Does not apply, 1-10, 11-20, 20-99, 100-500, >500).

Rationale

This subsection is necessary because it will provide the frequency of vehicle trips a representative facility experiences in a typical week, information on the types of pick-up and delivery services, and some information on the types of vehicles coming to and from the facility. The responses should be based on requirements specified in pick-up and delivery contracts, or by sampling the count of actual deliveries to or from the representative facility. The response bins were selected to simplify the responses and to indicate that a precise response is not required. For example a company that receives parcel delivery packages 3 to 5 days per week would still have the same response by using the bin listed as 1-10 without needing to count trucks nor visit contract terms. Some entities may contract for set deliveries from suppliers that may make it easier for them to rely on the contract terms to complete the responses.

Sections 2012.2(b)(3)(A-D) Identify How Many Suppliers Shipped Their Items to the Representative Facility.

Purpose

The purpose of this subsection is to identify the number of suppliers that shipped items to the representative facilities.

Rationale

This subsection is necessary because it will provide the number of suppliers that shipped food or beverage, linen or uniform cleaning service, goods (excluding food or beverage), or other supplies to a representative facility. This information will allow staff to identify the entities or facility categories that receive supplies that is shipped by others. This information will help staff follow-up with these entities to explore future strategies to encourage the use of ZEVs by suppliers, and to potentially answer questions if infrastructure at a receiver or property owner could enable ZEV deployment by the supplier.

Section 2012.3 Vehicle Usage by Facility Reporting.

Purpose

The purpose of this section is to collect information about existing vehicles and their operating characteristics, and the facility where on-road vehicles are domiciled or assigned.

Rationale

Overall, this section is necessary for staff to gather relevant usage characteristics at a sufficient sample size for various industries and use cases to help identify vehicle operational trends, characteristics, and duty cycles that are most suitable for electrification and to determine potential provisions or flexibilities for future electrification strategies.

Section 2012.3(a)(1-4) Facility Address, Facility Category, Contact Person Name, Contact Person Email Address.

Purpose

The purpose of these subsections are to identify the address, category, and contact person information for the facility location for which the entity is reporting vehicle usage information.

Rationale

These subsections are necessary to gather location and facility category data for each facility where vehicle information is being reported in order to characterize vehicle usage. The contact information is necessary for CARB to be able to identify to whom outreach and clarification or other questions should be directed.

Section 2012.3(a)(5-7) Whether Facility is Owned or Leased, Fueling Infrastructure Installed at the Facility, Whether Refueling Infrastructure is Over 10 Years Old.

Purpose

The purpose of these subsections are to gather information about whether the facility where the vehicles are domiciled or assigned is leased or owned, and to gather information about on-site fueling infrastructure.

Rationale

The facility ownership or lease status is necessary for staff to identify whether the entity has control over facility modifications to install fueling or charging infrastructure for ZEVs. The type of on-site refueling infrastructure, if present, is necessary to provide insight as to whether the facility has the ability to refuel ZEVs, and whether the fleets have already made recent investments to install on-site fueling infrastructure. The age of the primary refueling infrastructure is necessary to identify whether existing refueling assets may become stranded assets if a future regulation requires a transition to ZEVs.

Section 2012.3(a)(8) Trailer Information.

Purpose

The purpose of this section is to identify the types of trailers that tractors pull if there are tractors assigned or domiciled at the facility.

Rationale

This section is necessary because it will allow staff to identify the types of trailers being pulled which provide an indication of the type of cargo the fleet transports and the potential markets they serve.

Section 2012.3(a)(8)(A-H) What Types of Trailers are Pulled by Tractors Domiciled at this Facility.

Purpose

The purpose of these subsections are to gather information about what types of trailers are being pulled by tractors domiciled or assigned at this facility.

Rationale

The types of trailers pulled provides information on what types of items are being moved by the trucks and is easy for a fleet manager to identify. Examples of the clues that the trailer information provides includes, tractors that pull containers are more likely to serve the ports and railyards; whereas, tractors that pull dump trailers are likely to support construction activities and are more likely to be loaded to capacity. This kind of information is useful to narrow area of focus and to identify fleets that may have opportunities or challenges with deploying ZEVs. The information will also assist with comparing responses received with other data sources.

Section 2012.3(b) Grouped Vehicle Usage by Facility.

Purpose

The purpose of this subsection is to collect information about existing fleet vehicle fueling and operating characteristics.

Rationale

This information is key to determining what existing vehicle types are used and how they are operated and fueled to determine which are potentially suitable for electrification and how they compare to commercially available ZEVs and projected ZEV sales. The population information is necessary to identify how many vehicles are at a location and how much infrastructure may be needed to support ZEVs at that location. Grouping information by vehicle body type, weight class bin, and fuel type simplifies reporting for large fleets with multiple vehicles of the same type. Language in this section explains that responses for vehicle with seasonal uses should use a busy period in the year to ensure that the information reported could be used to provide insight as to whether a ZEV would be suitable to replace an equivalent combustion engine vehicle. Lastly, language is included to notify respondents that they are expected to use their judgement to use the same responses for the same vehicle group at multiple locations if their operating characteristics would have similar responses to the vehicle usage questions at multiple locations. Military tactical support vehicles would be excluded to minimize any potential national security concerns and because staff does not foresee including them in any future ZEV fleet regulations. Vehicles awaiting sale would be excluded because these vehicles are not being operated and would not contribute to answering questions about their use.

Section 2012.3(b)(1)

Purpose

The purpose of these subsection is to identify the number of vehicles in each group.

Rationale

The number of vehicles in each group is need to identify how many of each type there are and how many total vehicles are reported at each location.

Section 2012.3(b)(2)(A-Q)

Purpose

The purpose of these subsections is to collect information about how existing vehicles are currently used, operated, and fueled.

Rationale

This information is necessary to determine how the fleet's operational needs are currently being met and whether ZEVs may be suitable to meet those needs. This information can be used to identify opportunities and barriers to assess where exemptions or flexibilities may be appropriate in future electrification strategies. The responses can be rounded to the nearest 10 percent of the fleet to simplify reporting.

The information in section 2012.3(b)(2)(A-E) is needed to determine how many miles vehicles operate per day and is needed to help address questions about whether ZEV range is suitable. The range bins were selected to simplify reporting.

The information in section 2012.3(b)(2)(F) is needed to determine whether vehicles have a predictable usage pattern that is not highly variable and could be served by a vehicle with limited range without compromising the operation.

The information in section 2012.3(b)(2)(G) is needed to determine if the existing operation already relies on on-site fueling and could be an opportunity to deploy ZEVs without changing existing fueling practices.

The information in section 2012.3(b)(2)(H) is needed to determine how many vehicles returning to facility daily where they could be opportunities to install infrastructure to support ZEVs. Vehicles that do not return to the facility would not be able to rely on central fueling or charging at the facility.

The information in section 2012.3(b)(2)(I) is needed to identifying how many vehicles have electronic tracking. This information would be used to gather information about how different fleets track their vehicle operations and would identify entities that staff could contact to determine if electronic tracking information could be used to identify uses that are not suitable for electrification or could be used to support flexibility options or off-ramps.

The information in section 2012.3(b)(2)(J) is needed to identifying how many vehicles operate within a 50 mile radius of the facility. This information can be used to answer questions about emissions impacts in the local area, whether access to ZEV fueling infrastructure in the region would be beneficial and whether ordinances, traffic patterns in the area influence how vehicles are operated.

The information in section 2012.3(b)(2)(K) is needed to identify how many vehicles regularly tow trailers more than 100 miles per day to assess stakeholder concerns that towing with straight trucks could reduce range sufficiently to limit the viability of using ZEVs with limited range.

The information in section 2012.3(b)(2)(L) is needed to identify how many vehicles commonly operate at the vehicle weight limits to address potential concerns with ZEVs that may be heavier than an equivalent gasoline or diesel vehicle. This would also identify the number of vehicles that that could benefit from the increased weight limits of AB 2061.

The information in section 2012.3(b)(2)(M) is needed to identifying vehicles that are not registered in California. This information would help identify how many vehicles like yard trucks or campus vehicles are not registered and could help characterize purchasing and registration patterns of different businesses and whether these patterns vary across different entities.

The information in section 2012.3(b)(2)(N) is needed to identify how many vehicles are at the facility more than eight hours per day which is sufficient time to use overnight charging or on-site refueling for ZEVs.

The information in section 2012.3(b)(2)(O) is needed to identify how many vehicles were dispatched at the same time to support an emergency operation on the behalf of the government. This information would be used to follow-up with fleets that support emergencies and to determine appropriate flexibilities with future ZEV strategies.

The information in section 2012.3(b)(2)(P) is needed to identify how many vehicles have all wheel drive needs which could be used to compare to features available on ZEVs to determine if they are suitable for certain operations and to consider this information in considering appropriate flexibilities.

The information in section 2012.3(b)(2)(Q) is needed to identify how many vehicles are not operating or are kept as backup vehicles. Despite their low annual miles, backup vehicles may not be well suited for electrification as they may operate too few miles to achieve any cost or emissions benefits. Not asking questions about backups would potentially skew the data to over-emphasize the amount of vehicles which operate low miles.

Section 2012.3(b)(3) Average Annual Mileage for a Typical Vehicle in this Vehicle Group.

Purpose

The purpose of this subsection is to collect average annual mileage for a typical vehicle in the respective vehicle group.

Rationale

This subsection is necessary because it will provides relatively easy to identify usage data for a wide range of vehicles for staff to analyze in comparison to the other mileage questions to compare patterns in how vehicles are used.

Section 2012.3(b)(4) Average Number of Years a Vehicle is kept in the Fleet before Being Sold or Retired.

Purpose

The purpose of this subsection is to collect the average number of years vehicles are kept in the fleet before being sold or retired.

Rationale

This subsection is necessary to identify how long vehicles are typically kept which is needed to evaluate total cost of ownership consistent with existing purchase patterns and may shed light on how a used ZEV market may develop.

V. BENEFITS ANTICIPATED FROM THE REGULATORY ACTION, INCLUDING THE BENEFITS OR GOALS PROVIDED IN THE AUTHORIZING STATUTE

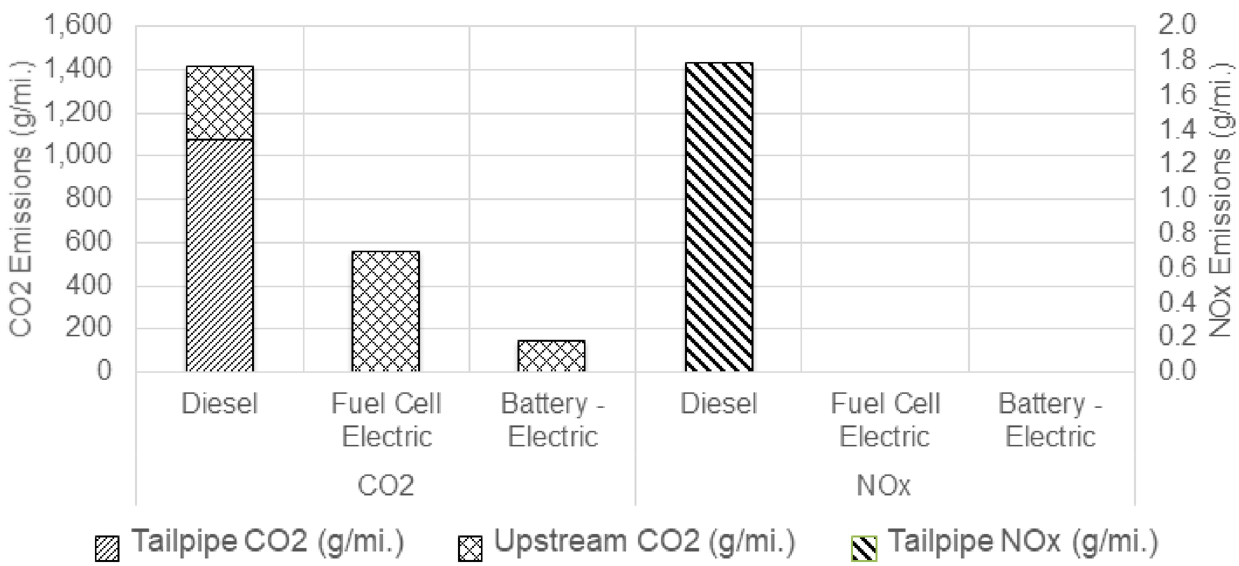
A. Air Quality and Climate Benefits

The purpose of the Proposed ACT Regulation is to accelerate the use of ZEVs in the medium-and heavy- duty truck sector and reduce the amount of harmful emissions generated from on-road mobile sources. The deployment of ZEVs meets goals identified in the SIP, the 2017 Climate Change Scoping Plan, and the 2016 ZEV Action Plan that supports the governor's Executive Orders B-16-12 and B-48-18, which calls for 1.5 million ZEVs in California by 2025 and 5 million ZEVs by 2030 and establishes several milestones on the pathway toward this target.

Also in 2018, Governor Brown issued executive order B-55-18, which sets a target to achieve carbon neutrality in California no later than 2045, and achieve and maintain net negative emissions thereafter. The Proposed ACT Regulation directly supports achieving these goals through the required sale of ZEVs in California from all large medium- and heavy-duty manufacturers.

ZEVs provide significant reductions in both criteria and GHG emissions. Figure V-1 displays the per-mile CO_2 and NOx emissions of a 2030 MY drayage tractor derived from EMFAC2017 (CARB, 2017f), (CARB, 2019d). This figure shows the lower emissions of ZEVs compared to diesel even when accounting for upstream emissions.

Figure V-1: Projected 2030 Emissions per Mile for a 2030 MY Drayage Truck[2]



[2] The NOx emissions displayed are of a vehicle meeting the 2010 MY NOx standard. The upcoming Heavy-duty Low-NOx Omnibus rulemaking will reduce NOx emissions of new on-road heavy-duty vehicles, but the standards have not been finalized.

The Proposed ACT Regulation is expected achieve a significant NOx, $PM_{2.5}$, and GHG emission reductions. These benefits are described in more detail in Chapter VI.

B. Benefits to Typical Businesses

1. Truck and Bus Owners

The Proposed ACT Regulation will increase the supply of ZEVs and will provide another vehicle option for fleets to consider in meeting their needs. Individual businesses that have operations that are well suited for using ZEVs will likely be able to lower their total cost of ownership by taking advantage of the operational cost savings of battery-electric vehicles. Zero-emission truck owners that own their charging or hydrogen fueling stations can lower fuel costs by taking advantage of the Low Carbon Fuel Standard (LCFS) program.

2. Utility Providers

The Proposed ACT Regulation will increase the number of ZEVs deployed, which will in turn increase the amount of electricity supplied by utility providers. Increased electricity usage from ZEVs provides an opportunity for a number of benefits to the utilities, their customers, and the overall grid itself. In a 2017 letter to CARB, the California Electric Transportation Coalition, a non-profit whose board of directors includes all the major California utilities, outlined the benefits of transportation electrification to California's power grid (CalETC, 2017). Electric vehicles are capable of shifting load to off-peak periods and increasing overall demand, both of which help create a more efficient, highly utilized grid. Studies have found that light-duty ZEVs provide a benefit to all utility customers as their electricity utilization drives down rates for all other ratepayers (MJB&A, 2017), (E3, 2019).

The Proposed ACT Regulation also helps the state's investor-owned utilities meet the goals of SB 350. SB350 requires the state's investor-owned utilities to develop programs "to accelerate widespread transportation electrification." Pacific Gas and Electric, Southern California Edison, and San Diego Gas and Electric have been approved to implement programs to install electric infrastructure on the customer's site (up until the charger) and may offer a voucher for the charger itself. All three utilities are either developing or have been approved to establish new electricity rates for commercial ZEV deployments. By ensuring that vehicles will be available to make use of these utility investments and rates, the Proposed ACT Regulation supports the utilities' programs and the goals of SB 350.

3. Other California Businesses

The Proposed ACT Regulation may result in benefits to zero-emission truck component suppliers, EVSE suppliers and installers, and hydrogen fuel station suppliers. Due to higher demand for ZEVs from the Proposed ACT Regulation, production of ZEVs in California would likely lead to increases in manufacturing and related jobs throughout the state. The increase in the production and usage of ZEVs could also benefit various businesses related to the ZEV component supply chain, including those involved in battery, fuel cell, and electric drivetrain businesses.

The Proposed ACT Regulation may also benefit EVSE suppliers who may see an increase in charging equipment installation as a result of increased ZEV purchases. Increased installation of charging infrastructure will benefit the EVSE suppliers, equipment installers, and electricians. All of the installations will be in California, and some of the EVSE equipment may be manufactured in California. Increased purchases of ZEVs under the Proposed ACT Regulation could also benefit various businesses related to installing hydrogen fueling stations and supplying hydrogen for fuel cell vehicles. All of these will likely be in California.

Benefits to Small Businesses

The Proposed ACT Regulation may result in benefits to small business due to higher demand for ZEVs, and would likely lead to increases in manufacturing, distribution, infrastructure installation and maintenance and other related jobs for small businesses throughout the state. Electricians, construction companies, including infrastructure installers, existing ZEV manufacturers, fuel cell and electric drivetrain parts and components businesses may fall into the small business category. Increased installation of charging infrastructure will benefit EVSE suppliers, equipment installers, and electricians that are small business. All of the installations will be in California, and some of the EVSE equipment may be manufactured in California. Increased purchase of ZEVs under the Proposed ACT Regulation could also benefit various California small businesses related to installing hydrogen fueling stations, supplying hydrogen and associated maintenance.

C. Health Benefits to Californians

The Proposed ACT Regulation reduces NOx and $PM_{2.5}$ emissions, resulting in health benefits for Californians, especially those operating trucks or working around them. These health benefits will result in fewer instances of premature mortality, fewer hospital and emergency room (ER) visits, and fewer missed days at school and work. In this staff report, CARB relies on the National Ambient Air Quality Standard for PM which was established by the U.S. EPA to quantify the health risk from exposure to PM. The method to estimate health benefits used in this analysis is the same as the one used for CARB’s proposed Low Carbon Fuel Standard 2018 Amendments, the Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program, and ICT regulations.

CARB analyzed the value associated with five health outcomes in the business as usual (BAU), proposed amendments, and alternatives: Cardiopulmonary[3] mortality,

[3] Outcomes related to the heart or lungs

hospitalizations for cardiovascular[4] illness, hospitalizations for respiratory[5] illness, emergency room (ER) visits for respiratory illness, and ER visits for asthma.

These health outcomes were selected because US EPA has identified these as having a *causal* or *likely causal* relationship with exposure to $PM_{2.5}$ (U.S. EPA, 2010a). The US EPA examined other health endpoints such as cancer, reproductive and developmental effects, but determined there was only *suggestive* evidence for a relationship between these outcomes and PM exposure, and insufficient data to include these endpoints in the national health assessment analyses routinely performed by U.S. EPA.

The U.S. EPA has determined that both long-term and short-term exposure to $PM_{2.5}$ plays a *causal* role in premature mortality, meaning that a substantial body of scientific evidence shows a relationship between $PM_{2.5}$ exposure and increased risk of death. This relationship persists when other risk factors such as smoking rates, poverty and other factors are taken into account (U.S. EPA, 2009). While other mortality endpoints could be analyzed, the strongest evidence exists for cardiopulmonary mortality (U.S. EPA, 2009). The greater scientific certainty for this effect, along with the greater specificity of the endpoint, leads to an effect estimate for cardiopulmonary deaths that is both higher and more precise than that for all-cause mortality (CARB, 2010).

The US EPA has also determined a *causal* relationship between non-mortality cardiovascular effects and short and long-term exposure to $PM_{2.5}$, and a *likely causal* relationship between non-mortality respiratory effects (including worsening asthma) and short and long-term $PM_{2.5}$ exposure (U.S. EPA, 2009). These outcomes lead to hospitalizations and ER visits, and are included in this analysis.

In general, health studies have shown that populations with low socioeconomic standings are more susceptible to health problems from exposure to air pollution. (Krewski et al, 2009), (Gwynn and Thurston, 2001). However, the models currently used by U.S. EPA and CARB do not have the granularity to account for this impact. The location and magnitude of projected emission reductions resulting from many proposed regulations are not known with sufficient accuracy to account for socioeconomic impacts, and an attempt to do so would produce uncertainty ranges so large as to make conclusions difficult. CARB acknowledges this limitation.

Table V-1 shows the estimated avoided premature mortality, hospitalizations, and emergency room visits because of the Proposed ACT Regulation for 2020 through 2040 by California air basin, relative to the baseline. Values in parenthesis represent the 95 percent confidence intervals of the central estimate. As detailed in the previous section, the Proposed ACT Regulation is estimated to reduce overall emissions of $PM_{2.5}$ and NOx in most years, and lead to net reduction in adverse health outcomes statewide, relative to the baseline.

[4] Outcomes related to the heart or blood vessels

[5] Respiratory illness such as chronic obstructive pulmonary disease, and respiratory infections

The Proposed ACT Regulation may decrease the occupational exposure to air pollution of California truck operators and other employees who work around truck traffic. CARB staff cannot quantify the potential effect on occupational exposure due to lack of data on the typical occupational exposure for these types of workers.

Table V-1: Regional and Statewide Avoided Mortality and Morbidity Incidents from 2020 to 2040 under the Proposed ACT Regulation *

Air Basin	Avoided Premature Deaths	Avoided Hospitalizations for Cardiovascular Illness	Avoided Hospitalizations for Respiratory Illness	Avoided ER Visits
Great Basin Valleys	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)
Lake County	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)
Lake Tahoe	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)
Mojave Desert	4 (3 - 5)	1 (0 - 1)	1 (0 - 1)	1 (1 - 2)
Mountain Counties	4 (3 - 5)	0 (0 - 1)	0 (0 - 1)	1 (1 - 2)
North Central Coast	3 (2 - 3)	0 (0 - 1)	1 (0 - 1)	2 (1 - 2)
North Coast	1 (1 - 1)	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)
Northeast Plateau	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)
Sacramento Valley	25 (19 - 30)	3 (0 - 6)	4 (1 - 6)	9 (6 - 13)
Salton Sea	3 (2 - 4)	0 (0 - 1)	1 (0 - 1)	1 (1 - 2)
San Diego County	27 (21 - 33)	4 (0 - 8)	5 (1 - 8)	11 (7 - 15)
San Francisco Bay	55 (43 - 67)	9 (0 - 17)	10 (2 - 18)	30 (19 - 41)
San Joaquin Valley	73 (57 - 89)	9 (0 - 17)	10 (2 - 18)	27 (17 - 36)
South Central Coast	10 (8 - 13)	2 (0 - 3)	2 (0 - 3)	4 (3 - 6)
South Coast	395 (309 - 483)	67 (0 - 131)	79 (19 - 140)	201 (127 - 275)
Statewide	601 (470 - 734)	94 (0 - 185)	113 (26 - 199)	289 (183 - 396)

*Values in parenthesis represent the 95% confidence interval. Totals may not add due to rounding.

In accordance with U.S. EPA practice, health outcomes are monetized by multiplying each incident by a standard value derived from the economic studies (U.S. EPA, 2010b). The value per incident is shown in Table V-2. The value for avoided premature mortality is based on willingness to pay,(U.S. EPA, 2000) which is a statistical construct based on the aggregated dollar amount that a large group of people would be willing to pay for a reduction in their individual risks of dying in a year. While the cost-savings associated with premature mortality is important to account for in the analysis, the evaluation of avoided premature mortality does not correspond to changes in expenditures, and is not included in the macroeconomic modeling (Section E). As avoided hospitalizations and ER visits correspond to reductions in household expenditures on health care, these values are included in the macroeconomic modeling.

Unlike mortality evaluation, the cost-savings for avoided hospitalizations and ER visits are based on a combination of typical costs associated with hospitalization and the willingness of surveyed individuals to pay to avoid adverse outcomes that occur when hospitalized. These include hospital charges, post-hospitalization medical care, out-of-pocket expenses, and lost earnings of both individuals and family members, lost recreation value, and lost household production (e.g., valuation of time-losses from inability to maintain the household or provide childcare)(Chestnut, 2006). These monetized benefits from avoided hospitalizations and ER visits are included in macroeconomic modeling (Section E).

Table V-2: Valuation per Incident for Avoided Health Outcomes

Outcome	Value per incident (2018$)
Avoided Premature Mortality	$9,419,320
Avoided Cardiovascular Hospitalizations	$56,588
Avoided Acute Respiratory Hospitalizations	$49,359
Avoided Emergency Room Visits	$810

Statewide valuation of health benefits were calculated by multiplying the value per incident by the statewide total number of incidents for 2020-2040 as shown in Table V-3. The estimated total statewide health benefits derived from criteria emission reductions are estimated to be $5.7 billion.

Table V-3: Statewide Estimated Annual Valuation from Avoided Health Outcomes

Calendar Year	Avoided Premature Deaths	Avoided Hospitalizations for Cardiovascular Illness	Avoided Hospitalizations for Respiratory Illness	Avoided ER Visits	Valuation (Million $2018)
2024	1	0	0	0	$7
2025	2	0	0	1	$16
2026	3	0	0	1	$28
2027	5	1	1	2	$47
2028	8	1	1	4	$76
2029	13	2	2	6	$118
2030	18	3	3	9	$173
2031	25	4	4	12	$232
2032	31	5	6	15	$294
2033	38	6	7	18	$357
2034	45	7	8	22	$423
2035	52	8	10	25	$489
2036	59	9	11	28	$555
2037	66	10	13	31	$620
2038	72	12	14	35	$683
2039	79	13	15	38	$746
2040	85	14	16	41	$807
Total Cost	$5,659	$5.3	$5.6	$0.2	**$5,670**

D. Greenhouse Gas Reduction Benefits - Social Cost of Carbon

The Proposed ACT Regulation accounts for GHG benefits in terms of carbon dioxide (CO_2). The benefit of these GHG reductions can be estimated using the Social Cost of Carbon (SC-CO_2), which provides a dollar valuation of the damages caused by one ton of carbon pollution and represents the monetary benefit today of reducing carbon emissions in the future.

In this analysis, CARB utilizes the current Interagency Working Group (IWG) supported SC-CO_2 values to consider the social costs of actions taken to reduce GHG emissions. This is consistent with the approach presented in the Revised 2017 Climate Change Scoping Plan (CARB, 2017c) and is in line with Executive Orders including 12866 and the OMB Circular A-4 of September 17, 2003, and reflects the best available science in the estimation of the socio-economic impacts of carbon (OMB, 2003).

The IWG describes the social costs of carbon as follows:

> *The social cost of carbon (SC-CO_2) for a given year is an estimate, in dollars, of the present discounted value of the future damage caused by a 1-metric ton increase in carbon dioxide (CO_2) emissions into the atmosphere in that year, or equivalently, the benefits of reducing CO_2 emissions by the same amount in that year. The SC-CO_2 is intended to provide a comprehensive measure of the net damages – that is, the monetized value of the net impacts- from global climate change that result from an additional ton of CO_2.*
>
> *These damages include, but are not limited to, changes in net agricultural productivity, energy use, human health, property damage from increased flood risk, as well as nonmarket damages, such as the services that natural ecosystems provide to society. Many of these damages from CO_2 emissions today will affect economic outcomes throughout the next several centuries* (NAP, 2017).

The SC-CO_2 is year specific, and is highly sensitive to the discount rate used to discount the value of the damages in the future due to CO_2. The SC-CO_2 increases over time as systems become more stressed from the aggregate impacts of climate change and future emissions cause incrementally larger damages. This discount rate accounts for the preference for current costs and benefits over future costs and benefits, and a higher discount rate decreases the value today of future environmental damages. While the Proposed ACT Regulation cost analysis does not account for any discount rate, this social cost analysis uses the IWG standardized range of discount rates from 2.5 to 5 percent to represent varying valuation of future damages. Table V-4 shows the range of IWG SC-CO_2 values used in California's regulatory assessments (U.S. Government, 2015).

Table V-4. SC-CO_2, 2012-2040 (in 2007$ per Metric Ton)

Year	5 Percent Discount Rate	3 Percent Discount Rate	2.5 Percent Discount Rate
2020	$12	$42	$62
2025	$14	$46	$68
2030	$16	$50	$73
2035	$18	$55	$78
2040	$21	$60	$84

If all GHG reductions under the Proposed ACT Regulation are assumed to be carbon reductions, the avoided SC-CO2 from 2020 to 2040 is the sum of the annual TTW GHG emissions reductions multiplied by the SC-CO2 in each year. The cumulative TTW GHG emission reductions along with the estimated benefits from the Proposed ACT Regulation are shown in Table V-5. These benefits range from about $256 million to nearly $1.1 billion through 2040, depending on the chosen discount rate.

Table V-5. Avoided Social Cost of CO_2

Year	GHG emission reductions (MMT)	Avoided SC-CO_2 5% discount rate (million 2018$)	Avoided SC-CO_2 3% discount rate (million 2018$)	Avoided SC-CO_2 2.5% discount rate (million 2018$)
2024	0.0	$0	$0	$0
2025	0.0	$0	$0	$0
2026	0.0	$0	$0	$0
2027	0.0	$0	$0	$0
2028	0.0	$0	$1	$2
2029	0.1	$2	$7	$10
2030	0.3	$5	$16	$24
2031	0.4	$8	$26	$38
2032	0.6	$12	$36	$52
2033	0.7	$15	$47	$67
2034	0.9	$19	$57	$82
2035	1.0	$22	$68	$97
2036	1.2	$27	$79	$111
2037	1.3	$30	$90	$128
2038	1.4	$35	$101	$142
2039	1.6	$38	$111	$157
2040	1.7	$43	$122	$171
Total	11.2	$256	$762	$1,081

It is important to note that the SC-CO_2, while intended to be a comprehensive estimate of the damage caused by carbon globally, does not represent the cumulative cost of climate change and air pollution to society. There are additional costs to society outside of the SC-CO_2, including costs associated with changes in co-pollutants, the social cost of other GHGs including methane and nitrous oxide, and costs that cannot be included due to modeling and data limitations. The Intergovernmental Panel on Climate Change (IPCC) has stated that the IWG SC-CO_2 estimates are likely underestimated due to the omission of significant impacts that cannot be accurately monetized, including important physical, ecological, and economic impacts.

E. Energy Saving and Reduction of Petroleum Fuel Dependence

In the long term, implementation of the Proposed ACT Regulation will lead the way in the heavy-duty vehicle sector to enable fuel switching from petroleum and other fossil-based fuels toward hydrogen or electricity. SB 350 and Senate Bill 1505 (SB 1505) together ensure the renewable attributes in both grid electricity and transportation use of hydrogen. To date, California is on track to achieve both targets (CPUC, 2017), (CARB, 2017d). The efficient use of energy will decrease overall per capita energy consumption, decreasing reliance on fossil fuels such as coal, natural gas, and oil. The fuel efficiency of ZEVs is higher than that of conventional internal combustion engine vehicles (diesel, gasoline, CNG, and propane powered vehicles). For example, the average fuel efficiency for BEVs is about three to five times as much of that for conventional internal combustion engine buses and the average fuel efficiency for FCEVs is about two times as much. The superior fuel efficiency of ZEVs and their alternative fuel sources together help pave a low carbon future for the heavy-duty vehicle sector.

F. Expanding Zero-Emission Technologies to Multiple Sectors

The Proposed ACT Regulation will require manufacturers to manufacture and sell ZEVs to meet the requirements. However, the rule does not prescribe which specific vehicles manufacturers must produce. The Proposed ACT Regulation credit and deficit method allows manufacturers to determine the vehicle types that are most cost effective for them to produce and to serve the markets they choose and to make adjustments as the market expands. This approach complements the Beachhead Strategy described in CARB’s Three-Year Heavy-Duty Strategy (CARB, 2017b).

The Beachhead Strategy focuses resources on applications with the potential to become sustainable quickly and to transfer to other applications where there may be opportunities to scale production. Expansion of a common supply chain that can provide similar components for powertrains and systems that can reduce cost over time. This in turn helps to build greater production volumes, leading to continued affordability.

By allowing the flexibility to choose which market segments to target, the Proposed ACT Regulation will help the market grow in the best suited sectors for electrification initially. Over time as costs drop, technology improves, and consumer acceptance increases, ZEVs will be able to expand to secondary and tertiary markets.

G. Benefits in Disadvantaged Communities and Job Creation

The Proposed ACT Regulation is expected to deliver environmental benefits that include GHG, and criteria pollutant emission reductions in disadvantaged community (DAC) areas. Production of ZEVs in California would likely increase, leading to an increase in jobs in manufacturing and related fields throughout the state. The heightened production and usage of ZEVs could also benefit various businesses related to the ZEV component supply chain, including those involved in battery, fuel cell, and electric drivetrain businesses.

The growing zero-emission truck industry will likely increase high quality employment opportunities in California. There are multiple zero-emission truck manufacturers with plants located in California. As production of zero-emission medium- and heavy-duty trucks increases, so would the number of zero-emission truck manufacturing and related industry jobs in DACs. Other potential benefits resulting from the Proposed ACT Regulation may relate to zero-emission truck component suppliers, EVSE suppliers and installers, and hydrogen fuel station suppliers and installers.

H. Other Societal Benefits

These efforts would also contribute to plans to reduce local emissions, and creating more sustainable communities and cities. ZEVs offer a number of other benefits to truck operators when compared to gasoline and diesel vehicles. ZEVs are quiet and have a smoother ride than ICE vehicles creating a better driving experience for operators. Reduced noise at the worksite creates a safer working environment, provides additional benefits the community the vehicle is operating, and do not conflict with noise ordinances which means they may be able to make more deliveries at night and could reduce congestion. Finally, ZEVs have the potential to use vehicle to grid technologies to support the electrical grid and lower the cost of electricity. Over time, advanced transportation systems and technologies have the potential to become a transformative element in the development of a cleaner, safer, and more efficient transportation system.

VI. AIR QUALITY

This chapter summarizes the potential air quality impacts in California in response to the Proposed ACT Regulation, and includes an overview of the emission inventory methods, a description of the baseline used to estimate emission benefits of the Proposed ACT Regulation, and the resulting changes in NOx, $PM_{2.5}$, and GHG emissions. The details of the emission inventory development are discussed in Appendix F.

A. Baseline Information

All actions as a result of the Proposed ACT Regulation are compared against a business as usual (BAU) baseline. The BAU Baseline reflects the current situation and includes the effects of existing state and federal regulations. More details on the BAU baseline are discussed in Chapter IX.

For the purposes of CEQA analysis, CARB staff compared the reasonably expected effects from the Proposed ACT Regulation to a fixed point in time, reflecting existing conditions in 2018. The term “existing conditions” is used as a point for comparison when evaluating reasonably foreseeable changes that are expected to result from the deployment of the required number of ZEVs, by the Proposed ACT Regulation.

B. Emission Inventory Methods

Staff used the latest available data on population, activity and in-use emissions from medium- and heavy-duty truck fleets operating in California to estimate the BAU baseline emissions and assess the impact of proposed and alternative scenarios on both criteria and GHG emissions.

All population and mileage numbers for vehicles affected by the Proposed ACT Regulation are derived from the EMFAC2017 model. Staff created scenarios for the BAU baseline conditions, conditions under the Proposed ACT Regulation, as well as alternative scenarios. Staff then produced emissions inventories for all scenarios by running the EMFAC2017 model to estimate tank-to-wheel emissions. WTW emissions were estimated using emission rates derived from the CA GREET 3.0.

NOx, $PM_{2.5}$, and GHG emissions reductions are based on the tailpipe emission difference between the ICE and ZEV vehicles. $PM_{2.5}$ emission reductions also include a 50 percent reduction in brake wear due to the regenerative braking of ZEVs reducing brake usage. GHG emission calculations include upstream emissions associated with fuel production. The GHG benefits for this rule do not include any ZEVs which may be used to comply with the California Phase 2 GHG regulation. Only ZEVs sold in excess of the California Phase 2 GHG regulation’s requirements are included in GHG calculations to avoid double-counting.

C. Emission Inventory Results

The Proposed ACT Regulation is expected to result in significant NOx, $PM_{2.5}$, and GHG emission reductions due to replacing internal combustion powered vehicles with zero-emission technology. ZEVs produce no tailpipe emissions, reduce brake wear PM emissions, and have lower upstream emissions. Table VI-1 summarizes the expected criteria emission benefits in 2031 and 2040. These emission reductions contribute to the State SIP Strategy and Climate Change Scoping Plan.

Table VI-1: Expected Emission Reductions of Proposed ACT Regulation

Calendar Year	NOx (tpd)	$PM_{2.5}$ (tpd)	WTW GHG (MMT/yr)
2031	5.0	0.16	0.4
2040	16.9	0.46	1.7

Figure VI-1 illustrates NOx emissions of the Proposed ACT Regulation relative to the BAU baseline. In the BAU baseline, projected NOx emissions decrease sharply until 2023. This is mainly due to the Truck and Bus regulation which requires most diesel vehicles with a GVWR above 14,000 lb. to upgrade to 2010 MY and newer engines. NOx reductions continue in the baseline as mainly due to natural attrition of Class 2b-3 vehicles and vehicles not subject to the Truck and Bus regulation including solid waste collection vehicles, public and utility fleets, and alternatively fueled vehicles. Under the Proposed ACT Regulation, emissions decline at a greater rate as ZEVs enter the fleet and displace the emissions of ICE vehicles.

Figure VI-1: Projected NOx Emissions

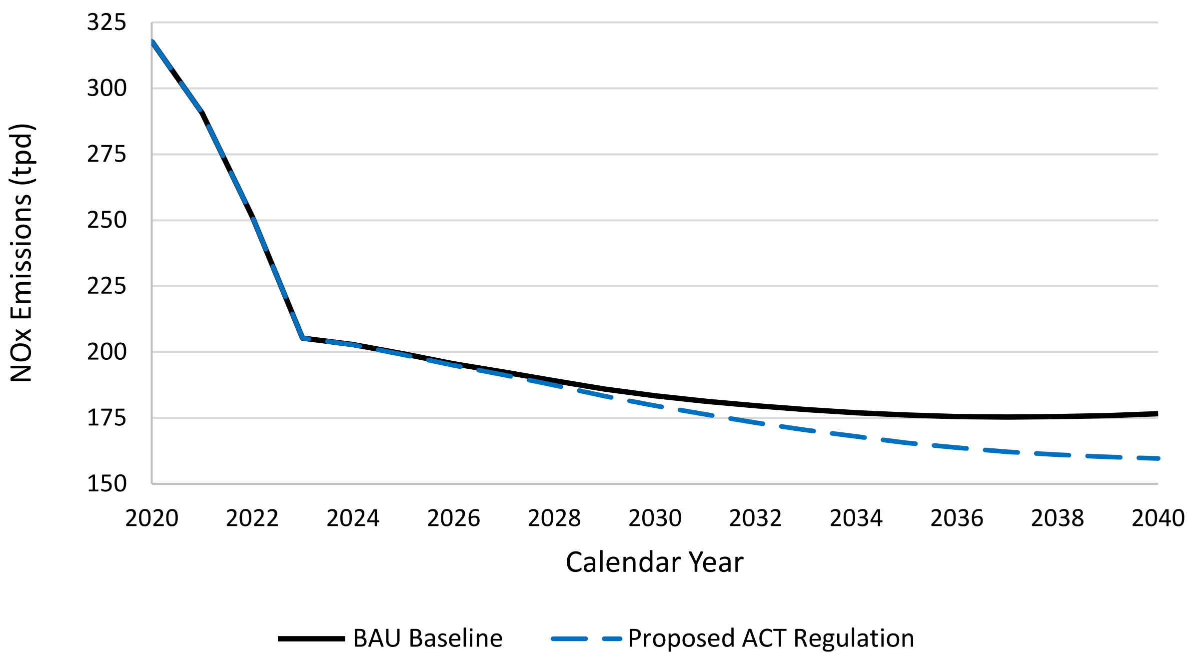


Figure VI-2 illustrates $PM_{2.5}$ emissions of the Proposed ACT Regulation relative to the BAU baseline. Similar to NOx, $PM_{2.5}$ emissions decrease sharply in the BAU baseline scenario until 2023 but slowly rise afterwards. By 2023, nearly all diesel trucks with a GVWR greater than 14,000 lbs. will have diesel particulate matter filters due to the Truck and Bus Regulation. Beginning 2024, $PM_{2.5}$ emissions begin to increase slightly as vehicle miles travelled in EMFAC continue to grow, but the increase is partially offset from some $PM_{2.5}$ emissions reductions from lighter vehicles that continue to be replaced through normal attrition. Under the Proposed ACT Regulation, emissions slightly decline as the emission reductions associated with ZEVs cancel out the expected $PM_{2.5}$ increases.

Figure VI-2: Projected PM2.5 Emissions

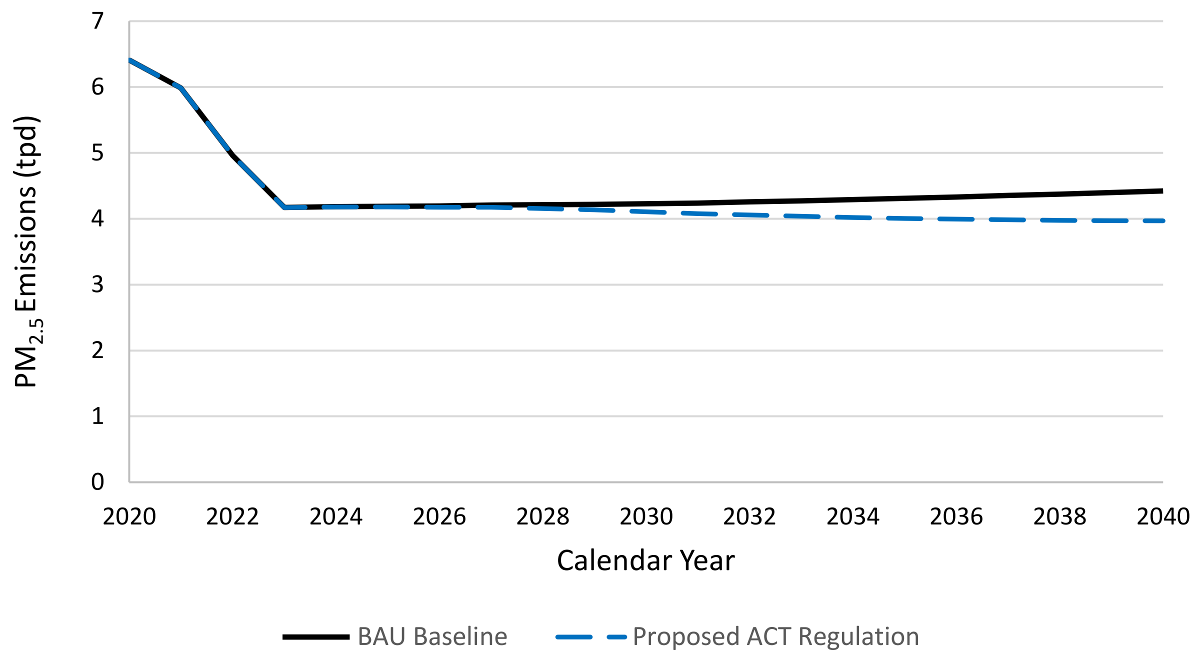

Figure VI-3 illustrates the WTW GHG emissions of the Proposed ACT Regulation relative to the BAU baseline. In the BAU baseline scenario, GHG emissions decline over time as the LCFS regulation decreases the carbon intensity of fuels and trucks are replaced and upgraded to more efficient models subject to the Phase 2 GHG regulations. Emissions start to level out near 2040 as vehicle miles travelled continues to increase. Under the Proposed ACT Regulation, GHG emissions decline throughout 2040 due to the lower tailpipe emissions of ZEVs compared to ICE vehicles. Note that the GHG emission benefits do not include ZEVs which may be used for Phase 2 GHG compliance. As a result, only a portion of the Class 4-8 group generate GHG benefits beyond the Phase 2 GHG regulation under the Proposed ACT Regulation.

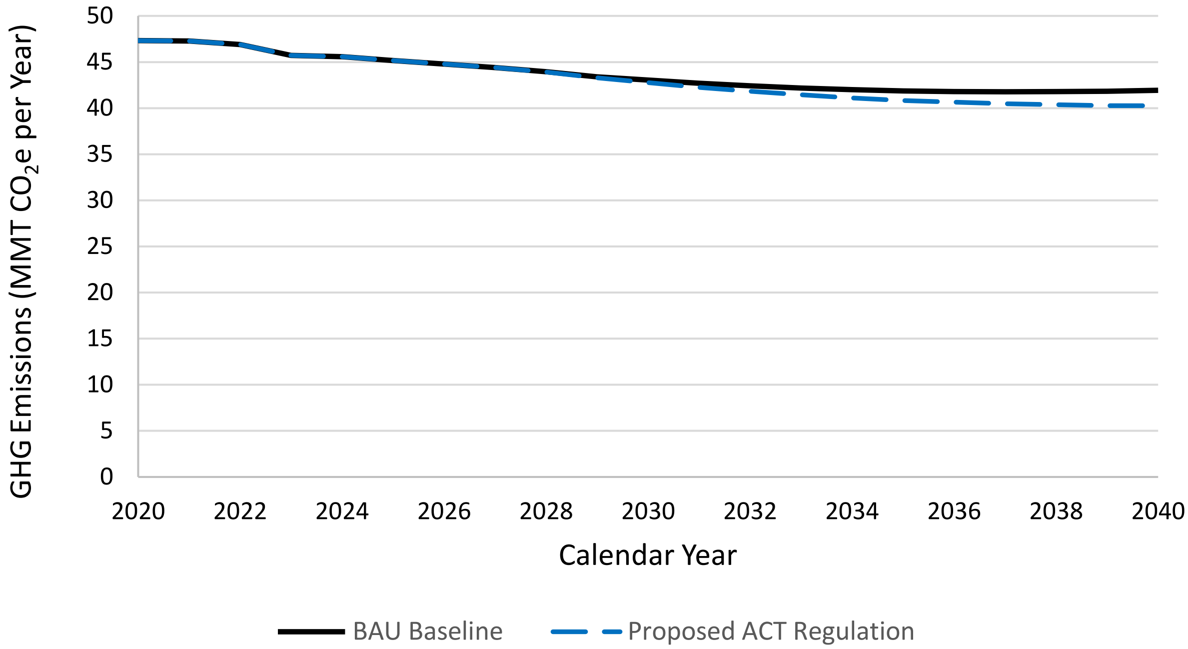
From 2020 to 2040, the Proposed ACT Regulation is expected to reduce GHG emissions by a cumulative 11.2 MMT CO_2e. Of these reductions, 9.6 MMT CO_2e are due to tank-to-wheel emission reductions, 0.2 MMT CO_2e from well-to-tank emission reductions within the AB 32 boundary around California, and 1.4 MMT CO_2e from well-to-tank emission reductions outside the AB 32 boundary i.e. elsewhere in the world. The amount of emission reductions within the AB 32 boundary will vary depending on whether decreases in petroleum production and refining occur within or outside California.

Figure VI-3: Projected WTW GHG Emissions



VII. ENVIRONMENTAL ANALYSIS

CARB is the lead agency for the proposed regulation and has prepared an environmental analysis pursuant to its certified regulatory program (Cal. Code Regs., tit. 17, §§ 60000 through 60008) to comply with the requirements of the California Environmental Quality Act (CEQA). CARB's regulatory program, which involves the adoption, approval, amendment, or repeal of standards, rules, regulations, or plans for the protection and enhancement of the State's ambient air quality has been certified by the California Secretary for Natural Resources under Public Resources Code section 21080.5 of CEQA (Cal. Code Regs., tit. 14, § 15251(d)) Public Resources Code section 21080.5, allows public agencies with certified regulatory programs to prepare a "functionally equivalent" or substitute document in lieu of an environmental impact report or negative declaration, once the program has been certified by the Secretary for the Resources Agency as meeting the requirements of CEQA. CARB, as a lead agency, prepares a substitute environmental document (referred to as an "Environmental Analysis" or "EA") as part of the Staff Report to comply with CEQA (Cal. Code Regs., tit. 17, § 60005).

The Draft Environmental Analysis (Draft EA) for the proposed regulation is included in Appendix D to this Staff Report. The Draft EA provides a programmatic environmental analysis of an illustrative, reasonably foreseeable compliance scenario that could result from implementation of the Proposed ACT Regulation.

The Draft EA states that implementation of the Proposed ACT Regulation could result in beneficial impacts to GHG, PM, and NOx through substantial reductions in emissions from medium and heavy duty vehicles in California, long-term beneficial impacts to air quality through reductions in criteria pollutants, and beneficial impacts to energy demand.

For the purpose of determining whether the Proposed ACT Regulation will have a potential adverse effect on the environment, CARB evaluated the potential physical changes to the environment resulting from a reasonable, foreseeable compliance scenario.

Implementation of the Proposed Project could result in an increase in manufacturing and associated facilities to increase the supply of zero-emission trucks, along with construction of new hydrogen fueling stations and electric vehicle charging stations to support heavy-duty ZEV operations and associated increase in hydrogen fuel supply and transportation. Increased deployment of heavy-duty ZEVs could results in a relatively small increase production of electricity and hydrogen fuel, reduce rates of oil and gas extraction, and result in associated increases in lithium and platinum mining and exports from source countries or other states. This could result in increased rates of disposal of lithium batteries and hydrogen fuel cells; however, disposal would need to be in compliance with California law, including but not limited to California's Hazardous Waste Control Law and implementation regulations. For lithium-ion batteries, it is anticipated they still have a useful life at the end of truck life, and are likely to be repurposed for a second life. To meet an increased demand of refurbishing or reusing batteries and fuel cells, new facilities, or modifications to existing facilities, could be constructed to accommodate recycling activities. Fleet turnover would largely be unaffected since the regulation is based on changes at time of normal vehicle purchase.

While many impacts associated with the Proposed ACT Regulation could be reduced to a less-than-significant level through conditions of approval applied to project-specific development, the authority to apply that mitigation lies with land use agencies or other agencies approving the development projects, not with CARB. Consequently, the EA takes the conservative approach in its significance conclusions and discloses, for CEQA compliance purposes, that impacts from the development of new facilities or modification of existing facilities associated with reasonably foreseeable compliance responses to the Proposed ACT Regulation could be potentially significant and unavoidable. Table VII-1 below summarizes potential impacts of approving the proposed regulation.

Table VII-1: Summary of Potential Environmental Impacts

Resource Area Impact	Significance
Short-Term Construction-Related and Long-Term Operational Impacts on Aesthetics	Potentially Significant and Unavoidable
Conversion of Agricultural and Forest Resources Related to New Facilities	Potentially Significant and Unavoidable
Short-Term Construction-Related Air Quality Impacts	Potentially Significant and Unavoidable
Long-Term Operation Air Quality Emissions	Less than Significant
Short-Term Construction-Related and Long-Term Operational Impacts on Biological Resources	Potentially Significant and Unavoidable
Short-Term Construction-Related and Long-Term Operational Impacts on Cultural Resources	Potentially Significant and Unavoidable
Short Term Construction-Related Impacts on Energy Demand	Less Than Significant
Long-Term Operational Impacts on Energy Demand	Beneficial
Short-Term Construction-Related and Long-Term Operational Effects on Geology and Soil Related to New Facilities	Potentially Significant and Unavoidable
Short-Term Construction Related GHG Impacts	Less Than Significant
Long-Term Operational Related GHG Impacts	Beneficial

Resource Area Impact	Significance
Short-Term Construction-Related Hazard Impacts	Potentially Significant and Unavoidable
Long-Term Increased Transport, Use, and Disposal of Hazardous Materials	Potentially Significant and Unavoidable
Short-Term Construction-Related and Long-Term Operational Effects Hydrology and Water Quality Related to Changes in Land Use	Potentially Significant and Unavoidable
Short-Term Construction-Related Impacts on Mineral Resources	Less than significant
Long-Term Operational-Related Impacts on Mineral Resources	Potentially Significant and Unavoidable
Short-Term Construction and Long Term Operational-Related Noise Impacts	Potentially Significant and Unavoidable
Short-Term Construction-Related Impacts and Long-Term Operational Impacts on Population, Employment, and Housing	Less Than Significant
Short-Term Construction-Related Impacts and Long-Term Operational Impacts on Public Services	Less Than Significant
Short-Term Construction-Related Impacts and Long-Term Operational Impacts on Recreation	Less Than Significant
Short-Term Construction and Long Term Operational-Related Impacts on Traffic and Transportation	Potentially Significant and Unavoidable
Increased Demand for Water, Wastewater, Electricity, and Gas Services	Potentially Significant and Unavoidable

Information on the project description, location, and potential environmental effects, as currently known, are contained in the attached materials, including the notice for public workshops that was held on May 31, 2018. In addition to soliciting input on the proposed project, these workshops served as a CEQA scoping meeting to solicit input on the scope and content of the EA prepared for the proposed project.

The Notice of Preparation (NOP) was available for review and comment for 30 days, per the CEQA Guidelines (Cal. Code Regs., tit. 14 §15082(b)). The comment period for the NOP was held from May 15, 2018 to June 14, 2018.

Written comments on the Draft EA will be accepted starting October 25, 2019, through 5 p.m. on December 9, 2019. The Board will consider the final EA and responses to comments received on the Draft EA before taking action to adopt the Proposed ACT Regulation.

VIII. ENVIRONMENTAL JUSTICE

State law defines environmental justice as the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies (Government Code, section 65040.12, subdivision (c)). CARB is committed to making environmental justice an integral part of its activities. The Board approved its Environmental Justice Policies and Actions (CARB, 2001) on December 13, 2001, to establish a framework for incorporating environmental justice into CARB's programs consistent with the directives of State law These policies apply to all communities in California, but recognize that environmental justice issues have been raised more in the context of low-income and minority communities.

Over the past thirty years, CARB, local air districts, and federal air pollution control programs have made substantial progress towards improving air quality in California and are on track to meet the statutory goals of reducing GHG emissions to 1990 levels by 2020. Despite this progress, some areas in California still exceed health-based air quality standards for ozone and PM. One of the most important factors for identifying disadvantaged communities are disproportionate effects of environmental pollution and other hazards that can lead to negative public health effects, exposure, or environmental degradation.

Legislation like SB 350 (De León, Chapter 547, Statutes of 2015) is at the cornerstone of California’s future ability to meet air quality, public health, and climate goals, along with ensuring economic prosperity, social equity, and energy security (CARB, 2018d). One key strategy to achieve these goals is by transitioning to zero-emission technologies in all sectors including industrial, residential, electricity, and commercial that meet the dynamic needs of low-income and disadvantaged communities. The Proposed ACT Regulation with a goal of developing a self-sustaining zero-emission truck market through increasing sales of zero-emission trucks in California by truck manufacturers is essential to this strategy.

Medium and heavy-duty are the predominant means of distributing good and services. Their prevalence can be seen along distribution centers, ports, warehouses, and major roadways which are commonly located around more densely populated urban areas, including in low-income and disadvantaged communities. The Proposed ACT Regulation requires percentage of heavy-duty truck sales to be ZE. These actions in the Proposed ACT Regulation would ensure that the public would be aware of and would benefit from the cleanest technology available on the market.

The Proposed ACT Regulation provides solutions that overcome barriers to deploy heavy-duty ZEVs in low-income residents and promote environmental justice. The deployment of heavy-duty ZEVs in low-income and disadvantaged communities eliminates tailpipe emissions, reduces particulate matter associated with brake wear, reduces petroleum use, reduces energy consumption and helps California achieve its air quality and climate protection goals. Zero-emission technologies have fuel efficiency two to five times as much as conventional internal combustion engines and are one of the most effective technologies to lead the transportation sector in reducing energy consumption and combustion related emissions. Heavy-duty ZEV adoptions in low-income and disadvantaged communities will be an important part of the solution in achieving GHG goals established in many statues or are complementary to existing measures including AB 32, SB 32, SB 350, and SB 375 and in maximizing NOx and PM reductions needed to meet SIP requirements.

In addition to reducing emissions, the Proposed ACT Regulation is expected to attract heavy-duty ZEVs industries to bring high quality job opportunities to California and to support employment in disadvantaged communities. As the demand and production of heavy-duty ZEV increases, so would the number of heavy-duty ZEVs manufacturing, operation and maintenance related jobs in California. For example, BYD, located in Lancaster, California, has a community benefits agreement (CBA) with Jobs to Move America (JMA), which will support the creation of a robust U.S. jobs program through deep investments in pre-apprenticeship and training programs. This CBA has a goal of recruiting and hiring 40 percent of its workers from populations facing significant barriers to employment, such as veterans and returning citizens (Charged Electric Vehicle Magazine, 2017). In addition, populations that have historically been excluded from the manufacturing industry, such as women and African Americans are also expected to be recruited and placed. The agreement also includes commitments from BYD to work with the JMA coalition to provide support systems for these workers to strengthen retention efforts, such as providing transportation for workers who may not have access to a car.

Besides BYD's heavy-duty ZEVs manufacturing and maintenance industry, the following companies', GreenPower, Motiv, Phoenix Motorcars, TransPower, and Efficient Drivetrains Inc. also produce heavy-duty ZEVs in California. Therefore, an increase demand for production of heavy-duty ZEVs would also create high quality jobs opportunities for other heavy-duty ZEVs manufacturers' in California.

Overall, the Proposed ACT Regulation is consistent with and helps advance CARB's environmental justice policies and goals. The ACT regulation echoes The Sustainable Freight Action Plan and supports the governor's Executive Order B-16-12 and Executive Order B-48-12, which calls for 5 million ZEVs (including heavy-duty vehicles) on the road by 2030, and setting a target of 250,000 chargers by 2025. In addition, establishes several milestones on the pathway toward this target to substantially reduce GHG emissions from medium and heavy-duty vehicles and have health benefits from reducing criteria pollutant emissions. Reducing GHG emissions will help stabilize the climate, which will benefit all communities, including low-income and disadvantaged communities.

IX. ECONOMIC IMPACTS ASSESSMENT OR STANDARDIZED REGULATORY IMPACT ANALYSIS

A. Business-As-Usual Baseline

For the ISOR, the economic and emissions impacts of the Proposed ACT Regulation are evaluated against the BAU baseline scenario each year for the analysis period from 2020 to 2040. The BAU case for the economic and emissions analysis for the Proposed ACT Regulation is referred to as the "BAU baseline" and uses the same vehicle inventory for both analyses. The baseline vehicle inventory includes the same vehicle sales and population growth assumptions reflected in CARB's EMFAC emissions inventory for weight Class 2b and greater vehicles for all fuel types (CARB, 2017f).

ZEVs required by the Proposed ACT Regulation can also be used to comply with the California Phase 2 GHG regulation and the U.S. EPA Phase 2 GHG regulation, and results in potential overlapping emissions and costs. In the Federal Phase 2 GHG rulemaking, EPA stated that they "do not project fully electric vocational vehicles to be widely commercially available in the time frame of the final Phase 2 rules. For this reason, [EPA and NHTSA] have not based the Phase 2 standards on adoption of full-electric vocational vehicles (U.S. EPA, 2016)." California adopted the U.S. EPA Phase 2 GHG regulation and similarly did not model ZEV deployments due to the CA Phase 2 GHG regulation.

Even though Phase 2 GHG has an Advanced Technology Multiplier until the end of the 2027 MY which may make ZEVs a temporarily more cost effective compliance option, staff does not believe the Phase 2 GHG regulation incentivizes ZEVs enough to ensure their production. Manufacturers bear risks in building and selling ZEVs due to the large upfront investments and uncertainty in future growth and may not be the lower cost option to comply with the Phase 2 GHG regulation post 2027.

For purposes of evaluating GHG emissions staff assumes no new GHG emissions benefits as a result of the Proposed ACT Regulation up to the total benefits anticipated from the California Phase 2 GHG requirements. Staff does count GHG emissions benefits after any California Phase 2 GHG anticipated benefits are exceeded. The interactions between California Phase 2 GHG and the Proposed ACT Regulation are also factored into the cost analysis later in this document.

The ZEVs that are already required to be purchased by the existing ICT and ASB regulations and AB 739 are also excluded from the from the costs and emissions analysis of the Proposed ACT Regulation and any alternatives analysis to avoid double counting.

This analysis of the Proposed ACT Regulation counts ZEVs sold starting with the 2021 model year, but will not include those sold in prior years because incentive funding programs are already offsetting most, if not all of the incremental costs. Staff does not assume ZEV sales will continue without incentive or other policies to promote them. For example, some industry market projections forecast ZEV adoption, but these include assumptions about availability of incentives and government policies to increase ZEV sales. ACT Research, a major freight movement analytics firm, released an August 2018 report titled “Commercial Vehicle Electrification: To Charge or Not To Charge (Truck News, 2018)”, which predicted that ZEVs will be adopted in increasing numbers due to incentives and government policies, among other factors. Another reason that ZEVs are not included in the baseline inventory is that medium and heavy-duty ZEV deployments were assumed in the SIP and only actions that are enforceable can be included in the SIP. The Proposed ACT Regulation would make ZEV sales enforceable.

B. Direct Costs

The Proposed ACT Regulation will require manufacturers to produce and sell vehicles that have a higher upfront cost than in the baseline. Manufacturers bear the risk associated with the incremental costs associated with producing and selling ZEVs, but producing and selling these ZEVs will simultaneously decrease the manufacturers’ cost of comply with the Phase 2 GHG regulation. Staff assumes the costs to California includes the higher upfront capital costs, infrastructure upgrades and lower operating expenses. This approach shows the full estimated cost to California for deploying the same number of ZEVs required by the regulation.

1. Changes Since the Release of SRIA

The Proposed ACT Regulation has been updated since the release of the Standardized Regulatory Impact Analysis (SRIA) on August 8, 2019. These changes and their estimated impacts are summarized below.

<u>ZEV percentage sales requirement</u>

The ZEV sales percentage requirements for Class 7-8 tractors was changed to begin 3 years earlier than when the SRIA was submitted to Department of Finance. In the SRIA, the ZEV sales percent requirement for Class 7-8 tractors did not start until 2027 MY. In the updated proposal, the requirements begin at 3 percent in 2024 MY, 5 percent in 2025 MY, and 7 percent in 2026 MY. These changes affect costs to manufacturers and California businesses and have been reflected in the updated analysis below.

<u>Phase 2 GHG Compliance Costs</u>

The formula for calculating Phase 2 GHG compliance costs avoided has been modified slightly to improve accuracy. This change slightly reduces the expected Phase 2 GHG costs avoided and increases the estimated total cost of the rule through 2040 by roughly 0.1 percent.

Large Entity Reporting Cost

The estimated large entity reporting cost has been updated since the release of the SRIA to better reflect the anticipated time needed for regulated entities to report. This change increases the cost of the rule through 2040 by less than 0.01 percent.

Class 4-5/Class 6-7 Split

The estimated ratio of Class 4-5 to Class 6-7 vehicles was changed from 49:51 to 46:54 to correct for an error in calculations. This change decreases the estimated cost of the rule through 2040 by roughly 0.05 percent.

Annualized Benefits

In response to DOF comments found in Appendix C-2, this analysis has been updated to display benefits annually rather than just showing totals as was done in the original SRIA. There are three types of benefits modeled in this analysis: avoided health costs, avoided social cost of carbon, and direct cost savings. Calculation and valuation of health benefits and social cost of carbon are displayed in Chapter VI and are displayed on pages V-6 and V-8, respectively. Direct costs and associated savings are displayed on page IX-30.

2. Vehicle Population and Annual Mileage

Staff divided the affected vehicle population into five vehicle groups to match the requirements of the Proposed ACT Regulation. Note that Class 6-7 and Class 8 excludes Class 7-8 tractors because there is a separate category for those vehicles.

- Class 2b-3 – Vehicles with a GVWR from 8,501 to 14,000 lb.
- Class 4-5 – Vehicles with a GVWR from 14,001 to 19,500 lb.
- Class 6-7 – Vehicles with a GVWR from 19,500 to 33,000 lb. (excluding Class 7 tractors)
- Class 8 – Vehicles with a GVWR above 33,001 lb. (excluding Class 8 tractors)
- Class 7-8 Tractors – Tractors with a GVWR above 26,001 lb.

In this analysis, all estimates for annual California sales come from CARB's Emission Factor (EMFAC) inventory model (CARB, 2017f). The EMFAC model is developed and used by CARB to assess emissions from on-road vehicles including cars, trucks, and buses in California, and to support CARB's regulatory and air quality planning efforts to meet the Federal Highway Administration's transportation planning requirements. U.S. EPA approves EMFAC for use in State Implementation Plan and transportation conformity analyses. It includes vehicle population growth, mileage accrual rates over time, vehicle fuel usage and associated emission factors, and vehicle attrition over time. The vehicle categories in EMFAC were matched to the Proposed ACT Regulation's vehicle groups as shown in Table IX-1:

Table IX-1: Vehicle Groups and EMFAC Categories

Vehicle Group	EMFAC Categories
Class 2b-3	Light Heavy-Duty 1 and Light Heavy-Duty 2
Class 4-5 & Class 6-7	T6 Small (Class 4-6 Vehicles), T6 Heavy (Class 7) excluding tractors, School Bus, All Other Buses
Class 8	T7 (Class 8) excluding tractors
Class 7-8 Tractor	T6 Heavy Tractors, T7 Tractors

EMFAC groups Class 4-5 and Class 6-7 into the same category called T6. However, because staff needed to match population categories with the proposed rule to more accurately model the resulting changes in vehicle populations for this analysis, the T6 category was split into Class 4-5 and Class 6-7. Staff assumes a 46 percent Class 4-5 to 54 percent Class 6-7 split based on Department of Motor Vehicles (DMV) data (DMV, 2018). (CARB, 2019e).

Because the Proposed ACT Regulation only affects vehicles sold into California, the total sales numbers were adjusted downward using California DMV data to remove out-of-state sales. The estimated number of California sales from 2024-2030 model years for each category are shown in Table IX-2. Truck sales are forecasted by EMFAC to grow at about 1 percent per year (CARB, 2018e).

Table IX-2: Estimated Number of Annual Sales per Vehicle Group

Model Year	Class 2b-3	Class 4-5	Class 6-7	Class 8	Class 7-8 Tractor	Total Sales
2024	53,761	6,436	7,556	1,119	4,686	73,559
2025	54,217	6,531	7,667	1,137	4,769	74,321
2026	54,753	6,649	7,806	1,177	4,918	75,302
2027	55,152	6,786	7,966	1,194	4,993	76,091
2028	55,765	6,904	8,105	1,216	5,075	77,064
2029	56,371	7,024	8,246	1,239	5,161	78,041
2030	56,968	7,147	8,390	1,264	5,263	79,032

Vehicle manufacturers sell trucks powered by a variety of fuels – most commonly gasoline or diesel, but also including compressed and liquid natural gas, propane, ethanol, and other fuels. In staff's assumed baseline conditions, for simplification, Class 2b-3 vehicles are split between gasoline- and diesel-powered assuming a 43 percent gasoline to 57 percent diesel ratio based on available EMFAC data (CARB, 2018e). Staff assumes Class 4-8 vehicles are solely diesel-powered to simplify the analysis. Based on EMFAC data, roughly 10 percent of Class 4-8 vehicles use a fuel other than diesel.

Under the Proposed ACT Regulation, manufacturers can comply with a combination of battery-electric, fuel-cell electric, and plug-in hybrid electric technologies. It is difficult to predict manufacturers' future plans for complying with the Proposed ACT Regulation, especially as battery and fuel-cell technologies improve and costs continue to decline.

Based on manufacturers' publicly announced plans, staff assumed manufacturers will comply with the Proposed ACT Regulation requirements for Class 2b-3 and Class 4-8 vocational trucks by building battery-electric vehicles. Staff assumed no FCEVs in these two categories because no manufacturers that would be regulated have announced plans to commercially produce FCEVs. Cummins is a powertrain manufacturer that has announced plans to offer a plug-in hybrid powertrain to vehicle manufacturers that allows for full-electric, series hybrid, and parallel hybrid functionality (Cummins, 2019). At this time it is unclear if PHEVs will result in lower costs for regulated manufacturers because the vehicles would have two propulsion systems, and would earn fewer NZEV credits than an equivalent ZEV meaning that more NZEVs would need to be sold to meet the same credit requirement. The reduced NZEV credit also ensures that total emission benefits remain about the same. Although NZEVs are expected to have lower cost per vehicle than full ZEVs, they still require charging infrastructure and will not have as significant operational cost savings as battery-electric vehicles. At workgroup meetings, multiple manufacturers have stated they would not produce both PHEVs and ZEV models if still required to produce ZEVs to comply. For all of these reasons, staff are not including PHEVs in the cost analysis.

For Class 7-8 tractors, staff assumes 90 percent of the required vehicles will be sold as battery-electric and 10 percent will be sold as fuel-cell electric. While there is interest from numerous manufacturers in fuel-cell tractor technology, most manufacturers are currently investing in battery-electric tractor technology. The proposed percentage requirements are not stringent enough to require electrification of the long haul sector meaning manufacturers can focus their deployments in short-haul tractor applications. Battery-electric technology is well suited for short-haul applications and offers potential fuel savings. Long-haul applications are where fuel cell electric trucks offer the greatest advantage over battery-electric tractors due to their rapid refueling and lower weight.

Table IX-3 outlines the assumptions for each vehicle group in the baseline and proposal scenarios.

Table IX-3: Vehicle Groups and Technologies

Vehicle Group	Baseline Scenario	Proposal Scenario
Class 2b-3	Gasoline (43%)	Battery-electric (All normal range)
Class 2b-3	Diesel (57%)	Battery-electric (All normal range)
Class 4-5	Diesel	Battery-electric (50% long range after 2030)
Class 6-7	Diesel	Battery-electric (50% long range after 2030)
Class 8	Diesel	Battery-electric (50% long range after 2030)
Class 7-8 Tractor	Diesel	Battery-electric (90%)
Class 7-8 Tractor	Diesel	Fuel Cell Electric (10%)

The percentage schedules shown below in Table IX-4 are applied to the annual sales numbers to calculate the annual number of zero-emission trucks required by the regulation.

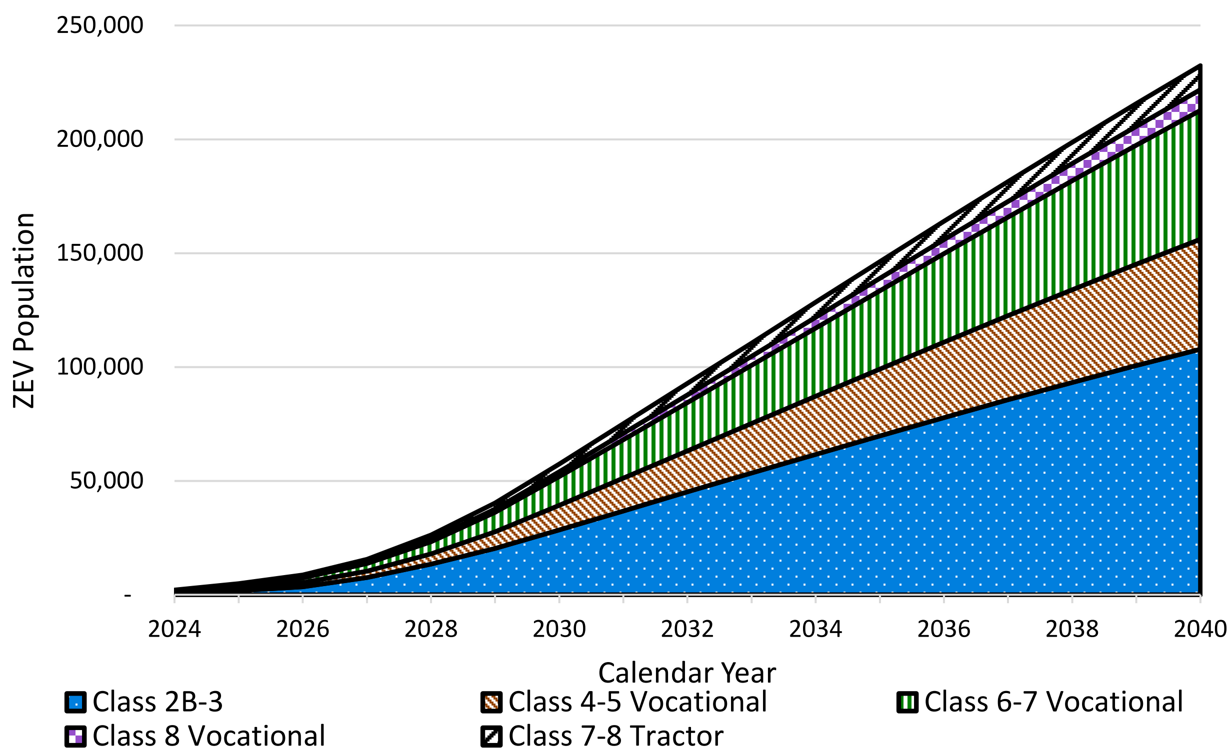
Table IX-4: Advanced Clean Trucks ZEV Sales Percentage Schedule

Model Year	Baseline	Class 2b-3*	Class 4-8**	Class 7-8 Tractor
2024	0%	3%	7%	3%
2025	0%	5%	9%	5%
2026	0%	7%	11%	7%
2027	0%	9%	13%	9%
2028	0%	11%	24%	11%
2029	0%	13%	37%	13%
2030 and beyond	0%	15%	50%	15%

*Pickup trucks are excluded from Class 2b-3 requirements until 2027
**Excluding Class 7-8 tractors

These percentages are applied to the annual California sales numbers to estimate the number of zero-emission trucks that will be sold in California as shown in Figure IX-1. The population growth rate increases to 2030 as the ZEV sales percentage requirement ramps up, and grows more slowly afterwards as the ZEV percentage remains flat and ZEV sales begin to replace ZEVs that retire out of the fleet.

Figure IX-1: ZEV Population Forecast over Time (>8,500 lb. GVWR)



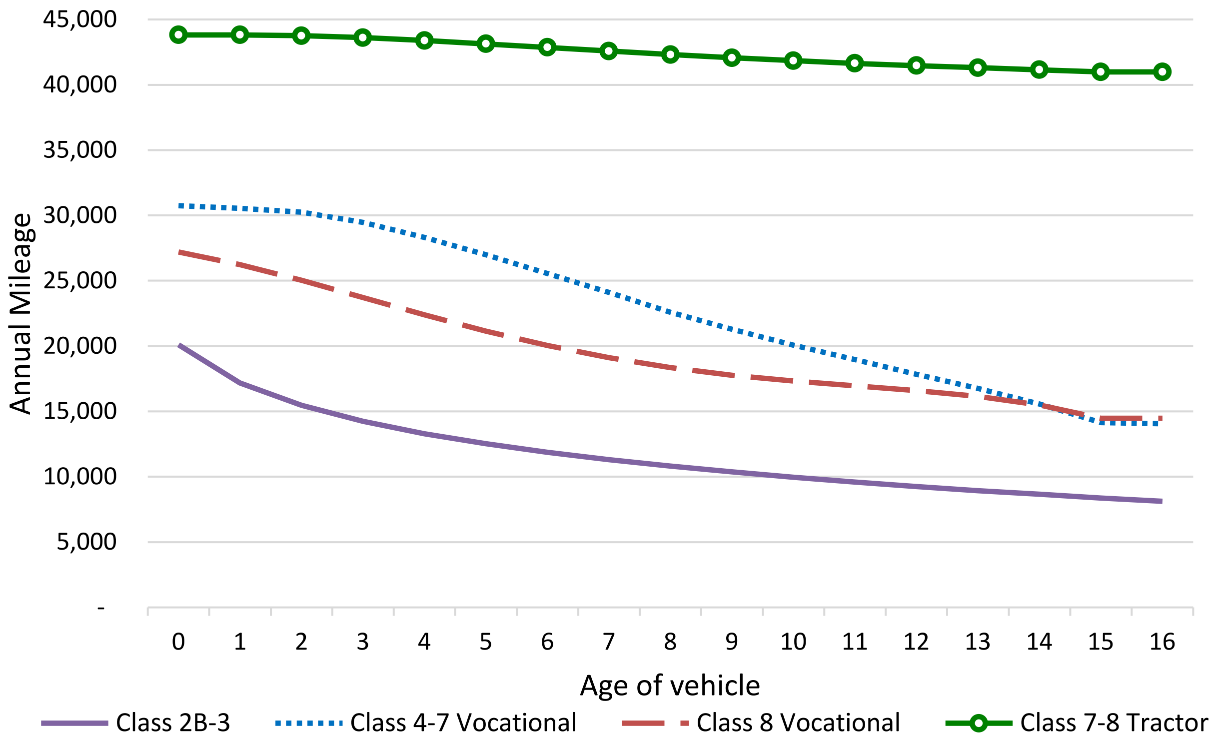
Staff are not anticipating any pre-buy situation where manufacturers increase sales of their vehicles before the Proposed ACT Regulation and decrease sales after implementation begins. Fleets, not manufacturers, decide when to purchase vehicles and this regulation is not likely to change their purchase patterns.

Annual mileage factors into a number of costs in this analysis including fuel costs, maintenance, and LCFS revenue. All annual mileage are based on EMFAC inventory estimates of mileage accrual rates over a vehicles life. For most vehicle categories, annual mileage is the highest early for low age vehicles and drops over time as the vehicle ages. EMFAC categories are matched to vehicle groupings as follows:

- Class 2b-3 annual mileage is the population weighted average of the following EMFAC categories: Light Heavy-Duty 1 and 2
- Class 4-5 and Class 6-7 vehicles are not separated in EMFAC and are lumped together into a Class 4-7 grouping. Based on data available from the 2002 US Vehicle Inventory and Use Survey and the 2018 California Vehicle Inventory and Use Survey, the annual miles for Class 4-5 and Class 6-7 trucks are fairly similar. (U.S. Census, 2004), (Caltrans, 2019). The Class 4-7 vocational truck annual mileage is the population weighted average of the following EMFAC categories: T6 Public, T6 Instate, T6 Instate – Construction, T6 Utility, T6 gasoline powered trucks, School Buses, and All Other Buses.
- Class 8 truck annual mileage is the population weighted average of the following EMFAC categories: T7 Public, T7 Single Unit, T7 Single Unit – Construction, T7 Solid Waste Collection Vehicle, and T7 Utility.
- Class 7-8 tractor annual mileage is the population weighted average on the three EMFAC drayage categories: Port of Los Angeles, Port of Oakland, and All Other Ports. We are currently assuming that all required sales of zero-emission tractors will be used in drayage service or similar shorter-haul operation.

Figure IX-2 illustrates the average mileage assumption for each vehicle group over the life of the vehicle from EMFAC. Staff are assuming ZEVs will travel the same miles as conventional ICE vehicles in their typical operation. Even today, commercially available ZEVs have the range to meet the majority of trucking needs and the lower operating cost of BEVs incentivizes higher mileage duty cycles. Over time as technology advances and more models become available, range should become less of an issue.

Figure IX-2: Annual Mileage Accrual Rates by Vehicle and Age



The California International Registration Plan and Out of State categories are not included in these calculations as these categories represent trucks that regularly travel in interstate operation. Due to their high annual miles and variable infrastructure needs, these categories are not assumed to be representative of a zero-emission duty cycle. In addition, many of these trucks are not sold into California despite operating within the state, so these sales would not be regulated under the Proposed ACT Regulation.

3. Cost Inputs

The estimated direct costs from the Proposed ACT Regulation and the BAU baseline scenario include: upfront capital costs of the vehicles, infrastructure, and ongoing operating costs which include fueling and maintenance. Compared to gasoline or diesel vehicles, ZEVs generally have higher upfront capital costs but lower operating costs, which result in an overall savings in staff's analysis over the useful life of the vehicles. Currently there are a number of rebate and voucher programs in California that offset some or all of the incremental costs for ZEVs and supporting infrastructure; however, none of these incentives are included in the cost analysis. LCFS credits are a form of incentive, but it is a market-based mechanism that increases the use of low carbon transportation fuels in California that has been established by California regulations. The assumptions underlying the direct costs are detailed in the following sections.

i. Costs to Manufacturers

Manufacturers are the regulated party in the Proposed ACT Regulation and would be responsible for selling ZEVs in California. The Proposed ACT Regulation requires that manufacturers must build and sell more expensive zero-emission trucks, certify their powertrain using the optional ZEP Certification procedure, and report information to CARB as part of their regulatory requirements. Manufacturers have the option to use the required zero-emission truck sales to help meet their Phase 2 GHG compliance obligation. Therefore, the incremental costs of producing ZEVs above the expected costs of compliance with the Phase 2 GHG without ZEVs are attributable to the Proposed ACT Regulation.

<u>Vehicle Price</u>

This section covers the cost to the manufacturer of building and selling a baseline ICE vehicle or a ZEV. Today and for the foreseeable future, battery-electric and fuel cell electric trucks will cost more than their diesel or gasoline counterparts. Declining battery and component costs in addition to economies of scale are expected to lower the incremental costs of ZEVs as the market expands. For this subsection, we are assuming the full incremental price of the vehicle when compared to the baseline is treated as a cost to the manufacturer. Vehicle prices are not amortized as the manufacturer would see the full cost in the year it is built and sold.

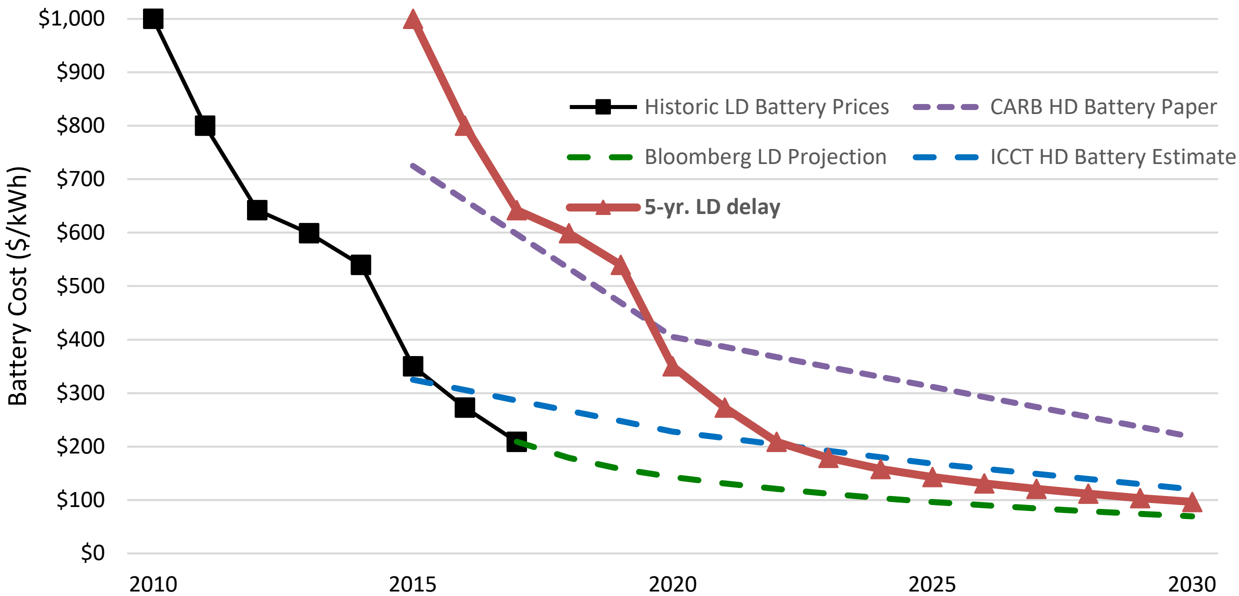
Gasoline and diesel vehicle prices are based on averages of prices taken from manufacturers' websites and other related websites (CARB, 2019f). For the Class 4-5, Class 6-7, and Class 8 vehicles, the cost is meant to represent a vehicle with a basic body such as a box or stake-bed and not a vehicle with an expensive specialty body such a boom truck or refuse truck.

Staff estimated the cost of ZEVs for battery-electric and fuel cell powered vehicles by adding electric components costs, fuel cell component costs, and energy storage costs to a conventional glider vehicle. The final retail price of the ZEVs is the sum of the total component costs adjusted by an additional 10 percent for other upfront costs such as research, development, retooling, and overhead. The calculated prices for battery-electric vehicles are comparable to battery-electric trucks and vans that are available through the HVIP program today

The cost of battery storage is the biggest factor in battery-electric truck incremental cost. Battery pack costs have dropped nearly 80 percent since 2010 and are projected to continue declining. The CARB discussion document "Battery Cost for Heavy-Duty Vehicles" was a literature review published in 2016 using data sources from 2013 and 2014 to assess battery costs for buses and heavy-duty vehicles (CARB, 2017g). Battery pack cost for heavy-duty applications are higher than for light-duty vehicles due to smaller volumes and differing packaging requirements even though many use the same cells. However, this report is somewhat dated and does not reflect the current state of the battery market. At the December 4th, 2018 Advanced Clean Trucks workgroup meeting, a number of manufacturers suggested we use light-duty battery prices with a five-year delay to reflect battery-price projections that are applicable to heavy-duty vehicles.

Figure IX-3 displays various battery price projections and the suggested 5-year light-duty delay. The 5-year delay of light duty battery pack prices is similar to projections made in the CARB discussion document for 2018 and becomes similar to the fairly recent projection made by ICCT after 2020.

Figure IX-3: Battery Price History and Projections



The battery-electric vehicle costs in this analysis are calculated using electric vehicle component costs from the International Council on Clean Transportation whitepaper (ICCT), "Transitioning to Zero-Emission Heavy-Duty Freight Vehicles" and battery costs will use the Bloomberg light-duty battery prices with a five-year delay.(International Council on Clean (ICCT, 2017), (Bloomberg, 2018). Hydrogen fuel cell component costs are from a variety of sources. Electrical component costs and hydrogen tank costs are calculated using the same ICCT source and battery costs are estimated using the same Bloomberg light-duty battery prices with a five year delay. Hydrogen system component costs are calculated using a presentation from Strategic Analysis titled "Fuel Cell Systems Analysis" which estimated fuel cell system costs for medium- and heavy-duty trucks (Strategic Analysis, 2018). This presentation analyzed fuel cell system costs on a component level basis for multiple weight classes of vehicle and provided temporal and volume-based cost projections.

Staff are not forecasting that this rule will affect commercial battery prices and ZEV technology significantly. The Proposed ACT Regulation affects a portion of California's heavy-duty trucking fleet, which is very small compared to the worldwide market for batteries in consumer electronics, light-duty vehicles, battery storage, and other applications. To the extent that this rule increases economies of scale for general ZEV components, infrastructure, and battery production, there may be lower component prices as a result of the rule, but these effects are less certain and are not modelled. The Proposed ACT Regulation may cause the cost for components specifically designed for medium- and heavy-duty ZEVs to decrease as economies of scale start to emerge in this new market.

The battery-electric vehicle is modelled using motors and electrical components in line with an existing diesel counterpart's power needs, and battery storage capacity based on the Age 0 daily mileage, the energy economy of the electric vehicle, and a 35 percent buffer to account for battery degradation and some operational variability. The hydrogen fuel cell tractor cost assumes the battery is 10 kWh, 40 kg of hydrogen storage, and the fuel cell stack's power output is half the vehicle's peak power needs.

In the proposal and some alternatives, a long-range battery-electric vehicle is modelled, which assumes a 50 percent larger battery. For tractors, longer range needs are assumed to be met with fuel cell electric tractors. Table IX-5: lists the specifications of the battery-electric vehicles.

Table IX-5: Battery Size Calculation

Vehicle Group	Age 0 Daily Mileage	Efficiency (kWh/mi)	Normal Range Battery Size (kWh)	Long Range Battery Size (kWh)
Class 2b-3	65	0.6	55	80
Class 4-5 Vocational	100	1.0	135	200
Class 6-7 Vocational	100	1.5	200	300
Class 8 Vocational	90	2.0	240	360
Class 7-8 Tractors	140	2.1	400	N/A

The assumed vehicle prices for gasoline and diesel vehicles are shown in Table IX-6 and the battery-electric and fuel cell electric price forecasts are shown Table IX-7.

Table IX-6: Baseline Vehicle Prices

Vehicle Group	Vehicle Price
Class 2b-3 - Gasoline	$45,000
Class 2b-3 - Diesel	$50,000
Class 4-5	$55,000
Class 6-7	$85,000
Class 8	$120,000
Class 7-8 Tractors	$130,000

Table IX-7: ZEV Price Forecast

Vehicle Group	2024 MY	2025 MY	2026 MY	2027 MY	2028 MY	2029 MY	2030+ MY
Class 2b-3 – Electric Normal Range	$64,896	$63,635	$62,599	$61,684	$60,829	$60,035	$59,241
Class 2b-3 – Electric Long Range	$69,241	$67,568	$66,201	$65,011	$63,909	$62,895	$61,881
Class 4-5– Electric Normal Range	$80,127	$77,616	$75,585	$73,852	$72,267	$70,830	$69,394
Class 4-5– Electric Long Range	$91,424	$87,841	$84,952	$82,503	$80,275	$78,266	$76,258
Class 6-7– Electric Normal Range	$116,174	$112,591	$109,702	$107,253	$105,025	$103,016	$101,008
Class 6-7– Electric Long Range	$133,554	$128,321	$124,112	$120,563	$117,345	$114,456	$111,568

Vehicle Group	2024 MY	2025 MY	2026 MY	2027 MY	2028 MY	2029 MY	2030+ MY
Class 8– Electric Normal Range	$154,799	$150,486	$147,007	$144,057	$141,371	$138,949	$136,527
Class 8– Electric Long Range	$175,655	$169,362	$164,299	$160,029	$156,155	$152,677	$149,199

Class 7-8 Tractor - Fuel Cell	$216,931	$212,353	$207,885	$203,439	$199,004	$194,579	$190,155

Table IX-8 outlines the incremental cost difference between a ZEV and its diesel equivalent.

Table IX-8: Incremental ZEV versus Diesel Price Forecast

Vehicle Group	2024 MY	2025 MY	2026 MY	2027 MY	2028 MY	2029 MY	2030+ MY
Class 2b-3 – Electric Normal Range	$14,896	$13,635	$12,599	$11,684	$10,829	$10,035	$9,241
Class 2b-3 – Electric Long Range	$19,241	$17,568	$16,201	$15,011	$13,909	$12,895	$11,881
Class 4-5– Electric Normal Range	$25,127	$22,616	$20,585	$18,852	$17,267	$15,830	$14,394
Class 4-5– Electric Long Range	$36,424	$32,841	$29,952	$27,503	$25,275	$23,266	$21,258
Class 6-7– Electric Normal Range	$31,174	$27,591	$24,702	$22,253	$20,025	$18,016	$16,008
Class 6-7– Electric Long Range	$48,554	$43,321	$39,112	$35,563	$32,345	$29,456	$26,568
Class 8– Electric Normal Range	$34,799	$30,486	$27,007	$24,057	$21,371	$18,949	$16,527
Class 8– Electric Long Range	$55,655	$49,362	$44,299	$40,029	$36,155	$32,677	$29,199
Class 7-8 Tractor - Electric	$71,351	$64,134	$58,312	$53,371	$48,870	$44,809	$40,748
Class 7-8 Tractor - Fuel Cell	$86,931	$82,353	$77,885	$73,439	$69,004	$64,579	$60,155

Though the cost for manufacturers to comply is estimated in detail as described above, it is not straightforward to predict how these costs and cost-savings would be passed on to consumers. Vehicle pricing is complex, and different manufacturers could use different strategies to pass on these costs. It is possible that manufacturers may pass on incremental ZEV costs through the ZEVs themselves, through the rest of their ICE fleet, or some combination thereof.

Zero-Emission Powertrain Certification Costs

The Proposed ACT Regulation requires manufacturers starting 2024 MY to certify their vehicles using the Zero-emission Powertrain (ZEP) Certification procedure in order to earn ZEV credits. This requirement would only apply to vehicles affected by ZEP certification – complete vehicles above 14,000 lb. GVWR and incomplete vehicles above 10,000 lb. GVWR. Based on our current knowledge, there are roughly ten manufacturers who are regulated by the Proposed ACT Regulation and would sell ZEVs that be required to follow the ZEP certification procedure.

The Initial Statement of Reasons (ISOR) for the ZEP Certification rulemaking estimated the cost of certification would be $9,200 per powertrain (CARB, 2018f). For this rulemaking and analysis, we are estimating that each regulated manufacturer affected would certify two powertrains in 2024 model year and afterwards would certify an additional two new powertrains every 5 years afterwards.

The ISOR for ZEP certification included a $25 cost per vehicle for labelling costs and a $100 cost per vehicle family for ZEP vehicle family certification. We are not modelling this cost in for the Proposed ACT Regulation because this assumption does not take into account for avoided costs from not having to meet more rigorous ICE labelling requirements or ICE vehicle family certifications for the same number of vehicles, nor does it assume any potential reductions in ICE certification costs as the ZEV sales percentage requirement ramps up.

Manufacturers who are not regulated under the Proposed ACT Regulation would need to follow the ZEP certification to generate credits in this proposal. Manufacturers who are not required to meet ZEP certification may still do so if 1) they wish to earn credits in this rule to be sold to other manufacturers, or 2) a different program such as HVIP requires it. Because neither of these are costs attributable to the Proposed ACT Regulation, we are not modelling any ZEP certification costs to unregulated manufacturers. This assumes regulated manufactures would only buy credits if the credits reduce their overall compliance costs which already included ZEP certification costs.

Phase 2 GHG Compliance Costs

The federal and California Phase 2 GHG regulations require manufacturers to build trucks that are more fuel efficient and have lower GHG emissions. These requirements start in 2021 model year and ramp up through the 2027 model year. EPA estimated the cost per vehicle to comply with the regulation shown in Table IX-9 (U.S. EPA., 2016).

Table IX-9: U.S. EPA Phase 2 GHG Incremental Compliance Costs

Phase 2 GHG Category	2021-2023 MY	2024-2026 MY	2027+ MY
Class 2b-3 Pickup/Van	$524	$963	$1,364
Vocational Vehicles	$1,110	$2,022	$2,662
Tractors	$6,484	$10,101	$12,442

Manufacturers can meet the Phase 2 GHG standards through a variety of technologies including improved aerodynamics, low rolling resistance tires, engine and accessory optimization, weight reduction, idle reduction systems, hybridization, powertrain electrification, and more. The Proposed ACT Regulation requires the sale of ZEVs that can also be used to comply with Phase 2 GHG. The costs of producing ZEVs are assumed to be higher than other compliance options, but would also reduce the amount of upgrades the manufacturers would need to make for their remaining ICE sales. While it is possible for a manufacturer to meet their entire compliance obligation with electric trucks, the U.S. EPA assumed this compliance pathway is a higher cost option than building cleaner combustion vehicles. In the Federal Phase 2 GHG rulemaking, EPA stated that they "…do not project fully electric vocational vehicles to be widely commercially available in the time frame of the final Phase 2 rules. For this reason, [EPA and NHTSA] have not based the Phase 2 standards on adoption of full-electric vocational vehicles," (U.S. EPA, 2016).

The cost difference between Phase 2 GHG compliance costs in the BAU baseline scenario and the Proposed ACT Regulation represents the potential cost savings to the manufacturer. Manufacturers can build ZEVs and comply with the Proposed ACT

Regulation and the Phase 2 GHG regulations simultaneously which will reduce the number of ICE vehicles that need to be upgraded to meet Phase 2 standards. In the BAU baseline scenario, the cost to comply with the California Phase 2 GHG regulation is the number of vehicles sold multiplied by the cost per vehicle as outlined in Equation IX-1.

In the Proposed ACT Regulation scenario, as the ZEV sales percentage requirement ramps up, the number of ICE trucks that must be upgraded to the Phase 2 GHG standards decreases. This is because, per the Phase 2 GHG regulation, electric vehicles do not produce tailpipe GHG emissions and therefore can offset compliance requirements for the rest of the manufacturer's fleet. The lower costs of complying with the Phase 2 GHG regulation in the Proposal ACT Regulation scenario are estimated using the following formula:

Equation IX-1: GHG Phase 2 Annual Cost Savings to Manufacturer Due to Proposed ACT Regulation

$$GHG\ Phase\ 2\ Annual\ Cost\ Savings\ to\ Manufacturer\ Due\ to\ Proposed\ ACT\ Regulation$$
$$= \frac{Vehicles\ Sold}{Year}\ x\ \frac{Phase\ 2\ GHG\ Cost}{Vehicle\ Sold}\ x\ \frac{ZEV\ Sales\ \%\ x\ ATM\ x\ (1 - Phase\ 2\ Reduction\ \%)}{Phase\ 2\ Reduction\ \%}$$

Where:

- "ZEV Sales %" is the annual ZEV Sales percentage requirement each year
- "ATM" is the Phase 2 GHG Advanced Technology Multiplier which gives extra credit to NZEV, BEV, and FCEV vehicles until the end of the 2027 MY. This multiplier is 3.5, 4.5, and 5.5, respectively.
- "Phase 2 Reduction %" is the percentage of ZEVs a manufacturer would have to sell to meet the Phase 2 GHG standards while keeping the rest of their fleet at the Phase 2 GHG baseline. By 2027, manufacturers would need to build roughly 17-20 percent of their fleet as ZEVs to comply with Phase 2 GHG solely through ZEVs

This formula calculates the potential avoided costs to upgrade ICE vehicles to comply with the Phase 2 GHG regulation.

The Phase 2 GHG compliance costs offset by the Proposed ACT Regulation are derived primarily from the federal regulation. If these compliance cost savings are passed through to fleets it would likely be a nationwide effect. Therefore, staff make a conservative assumption that percent savings passed through to California fleets is proportional to California's share of the national truck population estimated at 10 percent as to not overestimate the cost-savings (EIA, 2018). Table IX-10: displays the nationwide and California portion of reduced Phase 2 GHG compliance costs relative to the compliance costs relative to the BAU baseline.

Table IX-10: Cumulative Nationwide and California Phase 2 GHG Cost Savings Relative to the BAU Baseline (million 2018$)

Calendar Year	Nationwide	California Portion
2031	-$1,424	-$142
2040	-$3,205	-$320

In February 2018, California adopted the California Phase 2 GHG regulations which incorporated the federal Phase 2 GHG regulation with additional requirements related to reporting and labelling. These additional requirements apply equally to ICE and ZEV vehicles, so there is no cost difference as a result of the Proposed ACT Regulation.

Manufacturer Reporting Costs

The Proposed ACT Regulation will require information from manufacturers regarding their total sales of combustion powered vehicles, ZEV sales, and NZEV sales starting in the 2021 model year. This information will be used to determine which manufacturers are regulated and their annual credit and deficit generation.

Manufacturers are already required to report information to CARB as a requirement of the California Phase 2 GHG regulation including sales per model year of every powertrain and vehicle family. Because manufacturers are already collecting and reporting this information to CARB, we are not modelling any significant additional reporting costs to manufacturers as a result of the Proposed ACT Regulation. Similarly, no reporting costs are attributed to unregulated ZEV manufacturers that may optionally report information for purposes of earning and trading credits to other manufacturers because credits are assumed to be purchased if regulated manufacturers can reduce their overall compliance costs.

ii. Costs to California Businesses

The Proposed ACT Regulation regulates vehicle manufacturers that primarily manufacture vehicles outside of California. Most of regulatory requirements associated with the Proposed ACT Regulation applies to these manufacturers. The only requirement on California businesses in the Proposed ACT Regulation is the large entity reporting requirement which is proposed as a one-time requirement. However, for purposes of demonstrating the potential economic impacts on the state’s overall economy, all of the costs from deploying the number of ZEVs required by the Proposed ACT Regulation are assumed to be borne in California. Therefore, in the statewide cost analysis, all costs including the incremental vehicle costs, infrastructure upgrades, fueling, maintenance, and other costs are assumed to be the direct costs of the regulation in California despite the lack of a specific fleet purchase requirement. For this analysis, vehicle and infrastructure costs are amortized over a five and twenty year period, respectively, to reflect typical purchasing patterns.

Large Entity Reporting

Under the Proposed ACT Regulation, large fleet owners and large companies that contract out for transportation related services will be required to report information to CARB regarding what vehicles they own and how they operate, as well as company-wide information about their California locations and how they and their contractors move freight and perform other services.

Staff are estimating that roughly 12,000 companies or entities will be affected by this reporting requirement consisting of 11,000 large companies or trucking fleets and 1,000 public entities. Companies that do not own trucks will need to report general information about their facilities and the types of contracts they have for meeting their transportation needs and for services they hire.

The amount of time necessary to report will vary from company to company based on the number of facility categories and vehicles they have. Companies are expected to have most of the information on hand, but it will take time to understand the regulation, compile information from various individuals, and submit the required information. Companies with a single facility category and little to no vehicles, such as an insurance firm or bank, or fleets maintaining electronic records on their vehicle operations are likely to complete their reporting in 4-10 hours. These averages assume that some large entities will not have any information to report other than to respond that they do not contract directly for any transportation services and do not operate medium- or heavy-duty trucks. Entities with a moderate amount of facilities and vehicles are estimated to need 20-30 hours to complete their reporting, and entities with a large number of vehicles and a wide range of facility types are estimated to need 40 hours to complete their reporting.

Based on a weighted average of the types of companies reporting, staff is estimating that an average entity will need 25 hours to complete the reporting. The hourly cost is assumed to be $50 per hour for staffing and lost revenue from the employee assigned to collect the information (CARB, 2008).

Sales Tax and Federal Excise Tax

Taxes are additional costs levied on the purchase of a vehicle. Because they are based on the purchase price of the vehicle, they are higher for ZEVs due to their higher upfront costs.

Vehicles purchased in California must pay a sales tax on top of the vehicle’s purchase price. California’s basic sales tax rate is 7.25 percent with 3.94 percent going to the State and the rest to local authorities. In addition to the basic sales tax, districts levy special taxes that differ amongst districts. A sales tax value of 8.5 percent was used for staff’s analysis based on a statewide population weighted average. This results in higher costs for fleets and higher revenue for state and local governments. Class 8 vehicles are subject to an additional Federal Excise Tax which adds 12 percent to their purchase price.

Gasoline, Diesel, Electricity, and Hydrogen Fuel Cost

Fuel costs are calculated using total fuel used per year and the cost of fuel per unit. The total fuel used per year is based on the vehicle population per calendar year, the annual mileage of these vehicles, and the fuel economy of the vehicles. Population and mileage assumptions are discussed on page IX-3. In general, ZEVs are 2 to 5 times as efficient as similar vehicles with internal combustion engines technologies and significantly reduce petroleum and other fossil fuel use and use less total energy (CARB, 2018b).

Fuel economy is measured in miles per gallon for gasoline and diesel, miles per kilowatt-hour for battery-electric, and miles per kilogram for fuel cell electric trucks. Gasoline and diesel fuel economy is derived from EMFAC inventory projections for each gasoline and diesel vehicle group. These projections incorporate the effects of Phase 2 GHG which will increase gasoline and diesel fuel economies over the next decade. Battery-electric vehicle fuel economy is derived from in-use data collected from a variety of vehicles. For fuel cell efficiency, we are applying the LCFS program’s Energy Efficiency Ratio (EER) of 1.9 to the diesel fuel economy to estimate the fuel cell fuel economy as we are not aware of any data available measuring the fuel efficiency of fuel cell electric tractors.

Staff modeled that for both battery-electric and fuel cell electric vehicles, the efficiency will improve at the same rate as for gasoline and diesel powered vehicles. This may be a conservative estimate as both of these technologies are less developed than ICE powertrains and reports have shown improvements in the technology recently.

Table IX-11 outlines the fuel economy assumptions for each vehicle group and technology type over the course of the regulation.

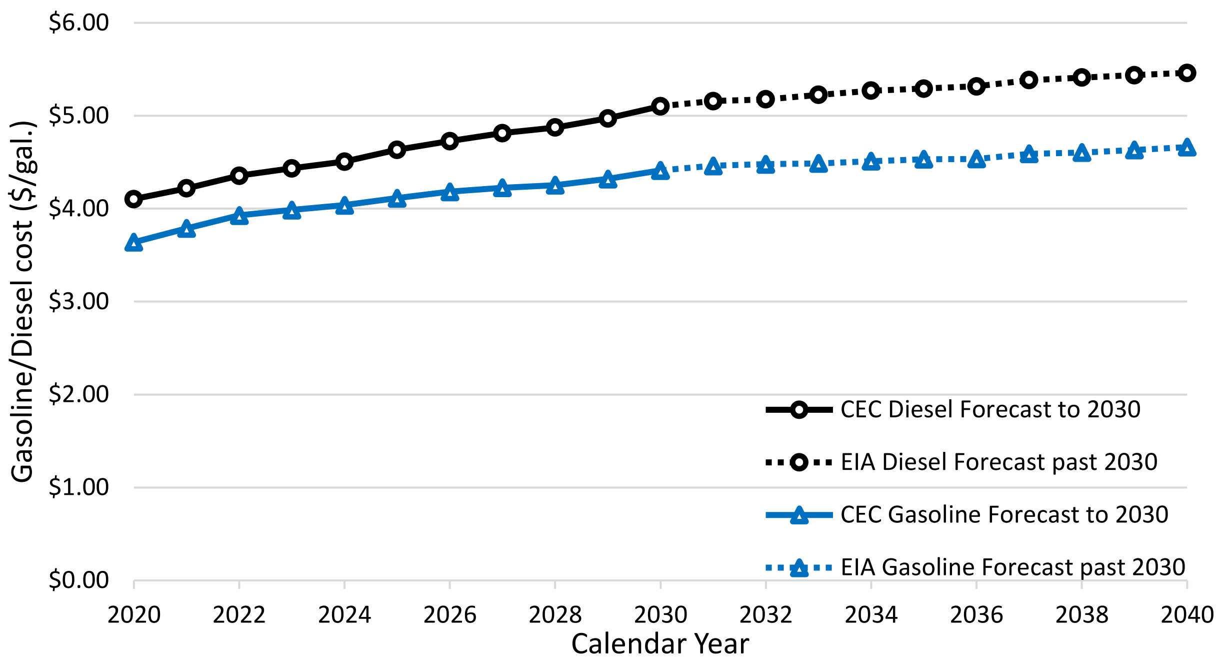
Table IX-11: Fuel Economy for Each Vehicle Group and Technology

Vehicle Group	Technology	Fuel Economy 2024-2026 MY	Fuel Economy 2027 MY and beyond	Units
Class 2b-3	Gasoline	10.9	11.7	mpg
Class 2b-3	Diesel	23.0	24.8	mpg
Class 2b-3	Battery-Electric	2.0	2.1	mi./kWh
Class 4-5	Diesel	13.8	14.3	mpg
Class 4-5	Battery-electric	1.3	1.3	mi./kWh
Class 6-7	Diesel	9.6	9.9	mpg
Class 6-7	Battery-electric	0.8	0.8	mi./kWh
Class 8	Diesel	7.7	8.1	mpg
Class 8	Battery-electric	0.6	0.7	mi./kWh
Class 7-8 Tractor	Diesel	8.8	9.2	mpg

Vehicle Group	Technology	Fuel Economy 2024-2026 MY	Fuel Economy 2027 MY and beyond	Units
Class 7-8 Tractor	Battery-electric	0.6	0.6	mi./kWh
Class 7-8 Tractor	Fuel Cell Electric	16.6	17.5	mi./kg

Gasoline and diesel fuel prices to 2030 are taken from the California Energy Commission's (CEC) "Revised Transportation Energy Demand Forecast, 2018-2030", adjusted to 2018 dollars using California consumer price index (CPI), (DOF, 2019). Fuel prices past 2030 are calculated using the Energy Information Administration's (EIA) 2018 Annual Energy Outlook for the Pacific region.(CEC, 2018), (EIA, 2018). The annual percentage change in EIA gasoline and diesel fuel prices past 2030 is applied to the 2030 CEC gasoline and diesel prices to estimate price changes past 2030. Figure IX-4 shows the projected prices of gasoline and diesel out to 2040.

Figure IX-4: Gasoline and Diesel Price Forecasts



Battery-electric fuel prices depend on how they are charged and include energy costs, fixed fees and demand fees. Vehicles charged at high power or during peak periods will have higher electricity costs than if charging overnight over an extended period. Electricity prices are calculated using CARB's Battery-Electric Truck and Bus Charging Calculator (Charging Calculator), slightly modified to include new utility rates, and assumes a fleet of 20 vehicles will be depot charged overnight on a separate utility meter using a managed charging strategy with the applicable rate schedule. Additionally, charger efficiency losses and local electricity taxes are incorporated into these numbers. The energy, demand, fixed costs, efficiency losses and local taxes and fees are all calculated using the Charging Calculator (CARB, 2019g). The cost per kWh is calculated separately for each utility and a weighted average is used to determine the cost per kWh per vehicle in 2018. Table IX-12 shows the electricity price per kWh for each vehicle group and major utility region as well as the weighted statewide average. In general, electricity costs are lower for larger vehicles because larger vehicles tend to use more electricity which decreases the fixed costs per kWh and allows the use of lower cost rate schedules for larger utility customers.

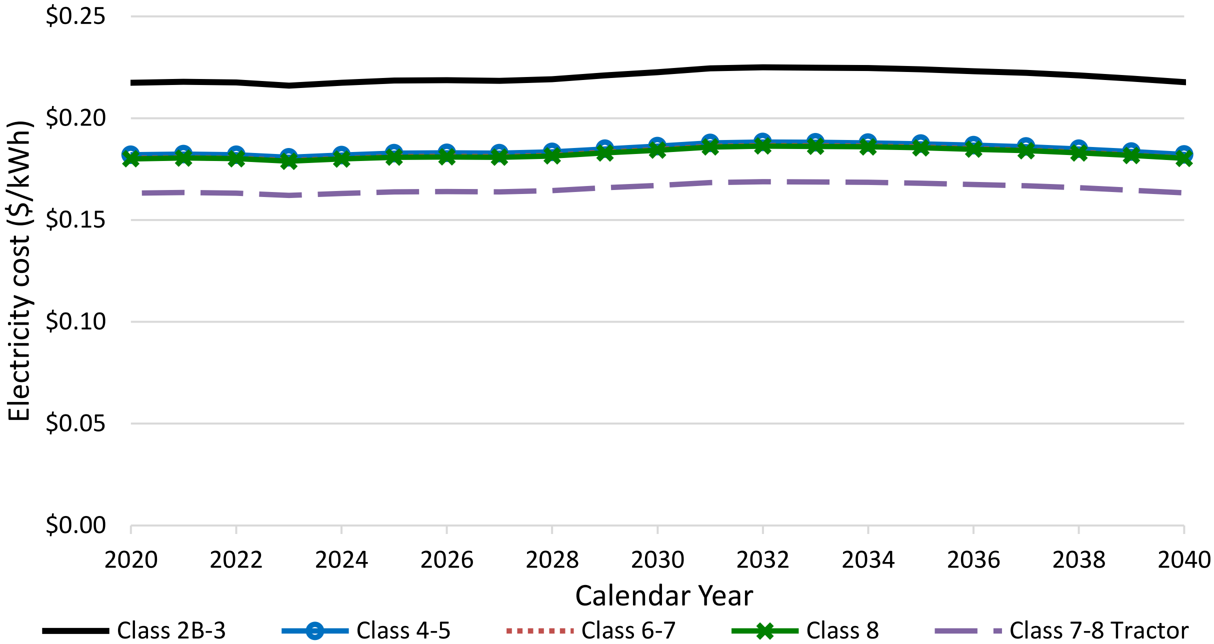
Table IX-12: Electricity Cost Calculation for 2018 (2018$/kWh)

Utility Area	Class 2b-3	Class 4-5	Class 6-7	Class 8	Class 7-8 Tractor
Los Angeles Department of Water and Power	$0.11	$0.10	$0.10	$0.11	$0.10
Pacific Gas and Electric (PG&E)*	$0.23	$0.20	$0.20	$0.20	$0.18
Sacramento Municipal Utility District	$0.15	$0.14	$0.11	$0.11	$0.10
San Diego Gas and Electric (SDG&E)**	$0.24	$0.19	$0.19	$0.22	$0.19
Southern California Edison (SCE)***	$0.19	$0.15	$0.15	$0.14	$0.13
Weighted Statewide Average	$0.21	$0.18	$0.18	$0.18	$0.16

*PG&E has proposed two new electricity rates for commercial ZEVs, CEV-S and CEV-L, which are currently under CPUC review with a decision expected in August/September 2019. If approved, these rates will decrease electricity rates to commercial fleets to roughly $0.13-$0.15/kWh in PG&E territory.
**SDG&E has proposed a new electricity rate for commercial ZEVs, EV-HP, which is currently under CPUC review. If approved, this rate will not significantly change the electricity costs modeled in this analysis but may provide benefits to fleets who intermittently charge during peak periods.
***SCE's newly introduced electric vehicle rates, EV-8 and EV-9, have no demand fees from 2019 to 2023 and phase them back over the following five years, with demand fees being fully reintroduced in 2029. This analysis is based on an SCE estimate for what the electricity rate will look like in 2029 once demand fees are fully reintroduced (SCE, 2019).

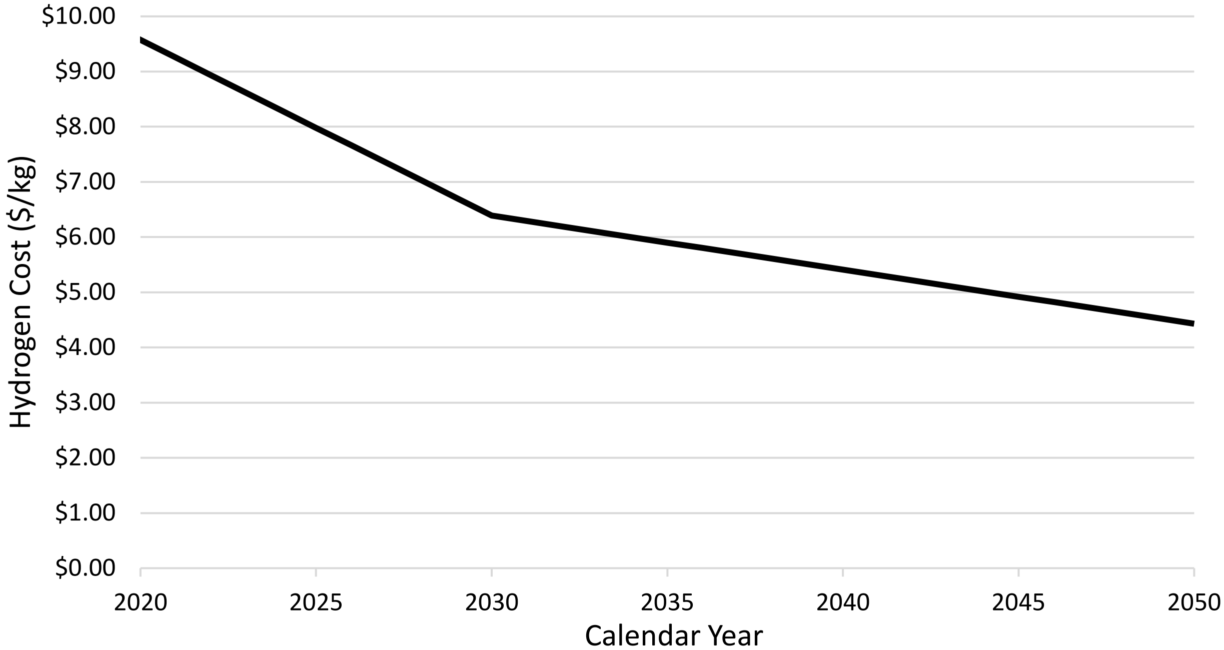
Electricity price changes over time are modelled using the CEC's "Revised Transportation Energy Demand Forecast, 2018-2030", adjusted to 2018 dollars using California CPI. Fuel prices past 2030 are calculated using the EIA 2018 Annual Energy Outlook for the Pacific region. The annual percentage change in EIA gasoline and diesel fuel prices past 2030 is applied to the 2030 CEC gasoline and diesel prices to estimate future price changes. Results per vehicle type are shown in Figure IX-5. The electricity costs for Class 4-5, Class 6-7, and Class 8 are fairly similar resulting in them overlapping on the graph.

Figure IX-5: Electricity Price Forecasts



For this analysis, hydrogen stations were assumed to be available at strategic locations around ports or major distribution hubs where the infrastructure costs are included in the hydrogen fuel price rather than reflecting costs for stations installed in a depot. This model is currently used for light-duty hydrogen stations and heavy-duty diesel sales and based on stakeholder feedback appears most appropriate near term estimate for heavy-duty hydrogen fueling. Hydrogen fuel costs are based on communication with Trillium CNG who estimated the cost of hydrogen at low, intermediate, and high volumes using different production methods (Trillium, 2018). This report uses the liquid hydrogen delivery numbers based on what Trillium presented as being most feasible for production at scale. The low volume cost will be used in 2018, the intermediate volume in 2030, and the high volume in 2050 with intermediate years being interpolated. These assumptions are based on expecting low volume production today, intermediate volume by 2030 when we would see some moderate sized deployments but no complete conversions yet, and continuing price reductions out to 2050. Hydrogen costs over time are shown in Figure IX-6.

Figure IX-6: Hydrogen Price Forecasts



The cost of fuel displayed above includes fuel taxes. State and local taxes on fuel are listed below in Table IX-13.

Table IX-13: Local and State Taxes on Fuel

Fuel Type	Local Tax	State Tax
Gasoline	2.25% sales tax	$0.493/gal excise tax
Diesel	4.5% sales tax	8.5% sales tax + $0.38/gal excise tax
Electricity	3.53% utility user tax*	$0.0003/kWh
Hydrogen	0	0

*Statewide population-weighted average

Low Carbon Fuel Standard Revenue

The Low Carbon Fuel Standard (LCFS) is a California regulation that creates a market mechanism that incentivizes low carbon fuels. The LCFS regulation was amended in 2018. These amendments 1) increased the Energy Efficiency Ratio for Class 4-8 trucks from 2.7 to 5.0, 2) reduced the carbon intensity target to 20 percent reduction by 2030, and 3) clarified how hydrogen station operators can receive credits. The regulation now requires the carbon intensity of California’s transportation fuels to decrease by 20 percent through the 2030 timeframe and maintains the standard afterwards. Electricity and hydrogen are eligible to earn LCFS credits which can be sold and used to offset the costs of these fuels. Fossil gasoline and diesel are generally not eligible for LCFS credits.

Fleets who own and operate their infrastructure generate credits based on the amount of fuel or energy they dispense. Credit values for different fuel types are calculated using the LCFS Credit Price Calculator (CARB, 2019h). The following credit values assume a credit price of $125 as estimated by LCFS program staff in the staff report for the 2018 rulemaking (CARB, 2018g). The average credit price for May 2019 was $185 has been above $180 since December 2018. Thus, the actual cost for fleets could be lower with higher LCFS credit value. An electric Class 2b-3 vehicle will earn $0.073/kWh in 2024 using grid electricity while an electric Class 4-8 vehicle will earn roughly $0.124/kWh in 2024. For hydrogen, we are assuming the hydrogen is produced from 33 percent renewable feedstock as required by SB 1505 (2006). This results in Class 4-8 vehicles earning $1.037/kg in 2024. LCFS credit revenue for a given fuel drops slightly over time as the program standards tighten and maintains upward pressure on the credit price.

Vehicle Maintenance Costs

Maintenance costs reflects the cost of labor and parts for routine maintenance, preventative maintenance, and repairing broken components. Maintenance costs for electric vehicles are generally assumed to be lower than for diesel in part due to their simpler design and fewer moving components. There is very little data available on hydrogen fuel cell vehicles currently, but available data appears to show maintenance costs that are comparable with diesel.

Maintenance costs for ICE Class 2b-3 vehicles are based on four sources from three reports (Access Services, 2016), (Utilimarc, 2015). Maintenance costs for ICE vocational vehicles are based on the American Truck Research Institute study, “An Analysis of the Operational Costs of Trucking: 2017 Update” cost for straight truck maintenance per mile (ATRI, 2017). Maintenance costs for ICE tractors are based on the American Truck Research Institute study, “An Analysis of the Operational Costs of Trucking: 2018 Update” cost for less-than-truckload maintenance cost per mile. (ATRI, 2018). The less-than-truckload cost was used because the slower speed, frequent stops of this type of service pattern matches most closely to the duty cycle of drayage or short-haul tractors that are more likely to become ZEVs prior to 2030. Table IX-14 shows the maintenance cost assumptions used in this analysis. Battery-electric vehicles are assumed to have 25 percent lower vehicle maintenance costs compared to gasoline and diesel based on an aggregation of sources and data (CARB, 2016d), (Electrification Coalition, 2013), (Propfe, 2012), (Taefi, 2015). Fuel cell electric vehicles are assumed to have similar maintenance costs to ICE vehicles. For example, Ballard recommends estimating a fuel cell bus’s maintenance costs as the same as a battery-electric bus plus $0.20/mi. for fuel cell maintenance. This adjustment will put a fuel cell bus’s maintenance costs in line with a diesel or CNG bus (Ballard, 2018).

Table IX-14: Maintenance Cost per Mile per Vehicle Group

Vehicle Group	Gasoline/Diesel ($/mi.)	Battery-Electric ($/mi.)	Fuel Cell Electric ($/mi.)
Class 2b-3	$0.17	$0.128	$0.17
Class 4-5 Vocational	$0.31	$0.233	$0.31
Class 6-7 Vocational	$0.31	$0.233	$0.31
Class 8 Vocational	$0.31	$0.233	$0.31

Vehicle Group	Gasoline/Diesel ($/mi.)	Battery-Electric ($/mi.)	Fuel Cell Electric ($/mi.)
Class 7-8 Tractor	$0.19	$0.142	$0.19

Maintenance Bay Upgrades

Maintenance bays are facilities used to service vehicles. Services performed can include inspections, routine maintenance, preventative maintenance, repairs, overhauls and more. Servicing electric vehicles requires separate safety equipment, diagnostic tools, and equipment which will incur costs to the facility.

Based on transit agency data, upgrading a fifteen bus maintenance bay to handle battery-electric buses would cost $25,000, and upgrading to handle fuel cell electric buses would cost $750,000. For this analysis, it is assumed that the cost per maintenance bay is the same and a fifteen bus maintenance bay could accommodate 25 trucks due to their smaller size. The number of maintenance bay upgrades each year is based on the increase in ZEV population per year to avoid double-counting in situations where a ZEV is replaced by a ZEV.

Midlife Costs

Midlife costs are the cost of rebuilding or replacing major propulsion components due to wear or deterioration. For diesel vehicles, this would be a midlife rebuild, for battery-electric vehicles this would be a battery replacement, and for a hydrogen fuel-cell vehicle this would be a fuel cell stack refurbishment. The frequency and cost of a midlife rebuild vary from technology to technology.

The frequency of a diesel engine rebuild varies based on the vehicle's weight class. Table IX-15 shows the anticipated diesel engine useful life based on years or miles. The cost of an engine rebuild is estimated to be one quarter of the total vehicle price.

Table IX-15: Useful Life of Diesel Engines

Vehicle/Engine Category	Useful Life (Years/Miles)
Class 4-5 (Light-Heavy Duty)	18/350,000
Class 6-7 (Medium-Heavy Duty)	18/450,000
Class 8 (Heavy-Heavy Duty)	18/850,000

Data is limited for battery-electric vehicles, but today ZEV manufacturers are offering vehicles with warranties of eight or more years and up to 300,000 miles on their products. Information on battery degradation trends from light-duty Tesla vehicles was used to estimate when batteries for trucks would need to be replaced. Staff estimate that the battery will be replaced every 300,000 miles. The cost of the battery replacement is assumed to be the size of the battery in kWh multiplied by the price per kWh at the time of the replacement.

For fuel cell electric vehicles, Ricardo has estimated that a fuel cell stack refurbishment is necessary every seven years and costs one third the cost of a new fuel cell stack at the time of refurbishment.

Based on the above assumptions, Table IX-16 shows when vehicles are assumed to incur midlife costs.

Table IX-16: Frequency of Midlife Rebuilds

Vehicle Group	Technology	Midlife Occurrence (yr)
Class 2b-3	Gasoline	Not necessary
Class 2b-3	Diesel	Not necessary
Class 2b-3	Battery-Electric	Not necessary
Class 4-5	Diesel	13
Class 4-5	Battery-electric	10
Class 6-7	Diesel	17
Class 6-7	Battery-electric	10
Class 8	Diesel	18
Class 8	Battery-electric	14
Class 7-8 Tractor	Diesel	18
Class 7-8 Tractor	Battery-electric	5, 13, 20
Class 7-8 Tractor	Fuel Cell Electric	7, 14, 21

Fueling Infrastructure Installation and Maintenance

Infrastructure is necessary to refuel or recharge vehicles. All vehicles need either dedicated refueling infrastructure onsite or publically available retail stations in order to operate. There are numerous ways infrastructure expenses can be accounted for which will affect the TCO in different ways. Infrastructure expenses are generally an upfront capital investment needed prior to vehicles being deployed, but infrastructure can last multiple vehicle lifetimes and generally is amortized over its life.

In the BAU baseline scenario, we are assuming that the fleet is either using existing gasoline or diesel infrastructure or publically accessible stations and the infrastructure cost is already incorporated into the fuel cost. As a result, diesel infrastructure costs are not separately modeled.

When a fleet purchases a battery-electric vehicle, they are responsible for setting up charging on their site. There are two main cost components of installing charging infrastructure: the cost of the charger itself and the cost of upgrading the site to deliver power to the charger. The latter can include trenching, cabling, laying conduit, potential transformer upgrades and more.

Charger and infrastructure cost estimates for Class 2b-3 and Class 4-5 vocational vehicles are derived from Pacific Gas and Electric cost estimates as part of their SB 350 applications (PG&E, 2017). Costs for Class 8 vocational and Class 7-8 tractors are taken from the ICT ISOR and come from electric transit bus deployment data. Class 6-

7 trucks are assumed to use the same infrastructure as a heavier truck but would be able to share the charger with another Class 6-7 truck; as a result, their infrastructure costs are half that of a Class 8 truck. Table IX-17 outlines the assumptions for charger power, charger cost, and infrastructure upgrade costs.

Table IX-17: Charger Power Ratings and Infrastructure Costs

Vehicle Group	Charger Power (kW)	Charger Cost	Infrastructure Upgrade Cost
Class 2b-3	19	$5,000	$20,000
Class 4-5	19	$5,000	$20,000
Class 6-7	40	$25,000	$27,500
Class 8	80	$50,000	$55,000
Class 7-8 Tractor	80	$50,000	$55,000

Fleets are assumed to amortize their infrastructure costs over a 20 year period with an interest rate of five percent. The amount of chargers installations and infrastructure upgrades each year is based on the increase in ZEV population per year to avoid double-counting infrastructure costs in situations where a ZEV is replaced by a ZEV.

Hydrogen infrastructure costs are incorporated into the hydrogen fuel costs identified by Trillium and are not included here.

Depot and on-route chargers for ZEVs require regular maintenance. The maintenance costs of depot chargers are estimated by considering costs for replacing charger heads, connectors, and other components, as well as labor costs for regular inspections (Tesla, 2016), (Clipper Creek, 2016). The information about on-route chargers is based on data from Foothill Transit who has experience with Proterra on-route chargers (Foothill Transit, 2017). Charger maintenance costs are estimated at $500/yr./charger. We assume that the maintenance cost for other fueling infrastructures are reflected in the fuel price.

<u>Transitional Costs and Workforce Development</u>

Transitioning to a new technology has inherent costs associated with its deployment, including shifts in operational and maintenance practices. These recurring costs include operator and technician trainings, purchasing and upgrading of software, securing additional spare parts, and others

Limited information is available for this type of transitional cost, but discussions occurred on this topic during the development of the Innovative Clean Transit rule. Based on discussions with transit agencies, Staff assumed that these “other costs” associated with ZEB deployments are equivalent to 2.5 percent of bus prices for all powertrains and discussed that the costs should go down over time for ZEBs as they become more common. This method is based on the assumption that the Cost Subgroup used to reflect estimated soft costs for conventional internal combustion engine bus (TAS, 2017).

In the cost analysis for the Proposed ACT Regulation, staff are making similar assumptions and that the workforce training and transitional costs are equal to 2.5 percent of the incremental cost difference between a baseline ICE vehicle and a ZEV. These costs continue until 2030 at which point the technology will have developed to a point where these transitional costs become business as usual for trucking fleets.

Registration Fees

Vehicles operating and registered in California must pay an annual registration fee. The registration fee varies based on the vehicle's cost, age, and weight. These calculations are different for ICE vehicles and ZEVs.

ICE and ZEV's are subject to the following fixed fees based on the DMV online calculator (DMV, 2019). These are constant annual fees for every vehicle and are shown in Table IX-18.

Table IX-18: Fixed Registration Fees for Diesel Vehicles and ZEVs

Diesel Fee Name	Amount	ZEV Fee Name	Amount
Current Registration	$58	Current Registration	$58
CVRA Registration Fee	$122	Current California Highway Patrol	$25
CVRA Service Authority for Freeway Emergencies Fee	$3	CVRA Service Authority for Freeway Emergencies Fee	$1
CVRA Fingerprint ID Fee	$3	CVRA Fingerprint ID Fee	$1
CVRA Abandoned Vehicle Fee	$3	CVRA Abandoned Vehicle Fee	$1
CVRA California Highway Patrol Fee	$41	Current Air Quality Management District	$6
Current Air Quality Management District	$6	Alt Fuel/Tech Registration Fee	$3
Current Cargo Theft Interdiction Program Fee	$3	CVRA Auto Theft Deterrence/DUI Fee	$2
CVRA Weight Decal Fee	$3	Reflectorized License Plate Fee	$1
Alt Fuel/Tech Registration Fee	$3	Road Improvement Fee	$100
CVRA Auto Theft Deterrence/DUI Fee	$4		
Reflectorized License Plate Fee	$1		
Total	$250	Total	$198

All vehicles registered in California must pay a Transportation Improvement Fee based on the price of the vehicle. For vehicles priced between $35,000 and $60,000, the fee is $150, and for vehicles priced above $60,000, the fee is $175.

All registered vehicles are assessed a Vehicle License Fee which is equal to the vehicle price multiplied by 0.65 percent and a separate percentage schedule. This separate schedule is shown in Table IX-19.

Table IX-19: Vehicle License Fee Decline over Time

Year	1	2	3	4	5	6	7	8	9	10	11+
Percentage	100%	90%	80%	70%	60%	50%	40%	30%	25%	20%	15%

For commercial ICE vehicles, vehicle owners are assessed an annual weight fee based on the vehicle's potential maximum loaded weight. For electric vehicles, the weight fee is based on its unladen weight. The estimated weight fees are shown in Table IX-20.

Table IX-20: Weight Fees for ICE Vehicles and ZEVS

Vehicle Category	Diesel Weight Fee	ZEV Weight Fee
Class 2b-3	$210	$266
Class 4-5	$447	$358
Class 6-7	$546	$358
Class 8	$1,270	$358
Class 7-8 Tractor	$2,064	$358

Overall, ZEV's pay lower registration fees over the vehicles life although it may be higher in the initial years of registration. This difference is greater for heavier vehicles due to the large difference in annual weight fees.

Battery Recycling, Repurposing, and Disposal

The energy capacity of the batteries used in ZEVs will naturally degrade over their useful life and require battery replacements. When battery capacity is not sufficient for meeting daily range needs for a truck or bus, it is expected that there will be a second life for the batteries. The used battery at the end of its vehicle useful can be repurposed into other applications such as stationary storage, then at the end of the battery life it can be recycled and non-recyclable materials can be disposed.

The cost for battery recycling at the end of battery life is not included here, because this cost could be offset by the residual value of the battery at the end of its useful life in a truck or bus. The end of life may be a revenue source depending on whether the battery can be recycled and repurposed, or could become a cost if it must be disposed of. Today, light-duty vehicle batteries are already being repurposed for second life applications including stationary storage (Nissan, 2018), (BMW, 2018). Even today, some lithium-ion battery manufacturers provide an attractive residual value to customers upon the retirement of a battery. Therefore, staff believes that the residual value will offset the recycling cost and become a revenue source, but does not include a residual battery value in the economic analysis.

4. Total Costs

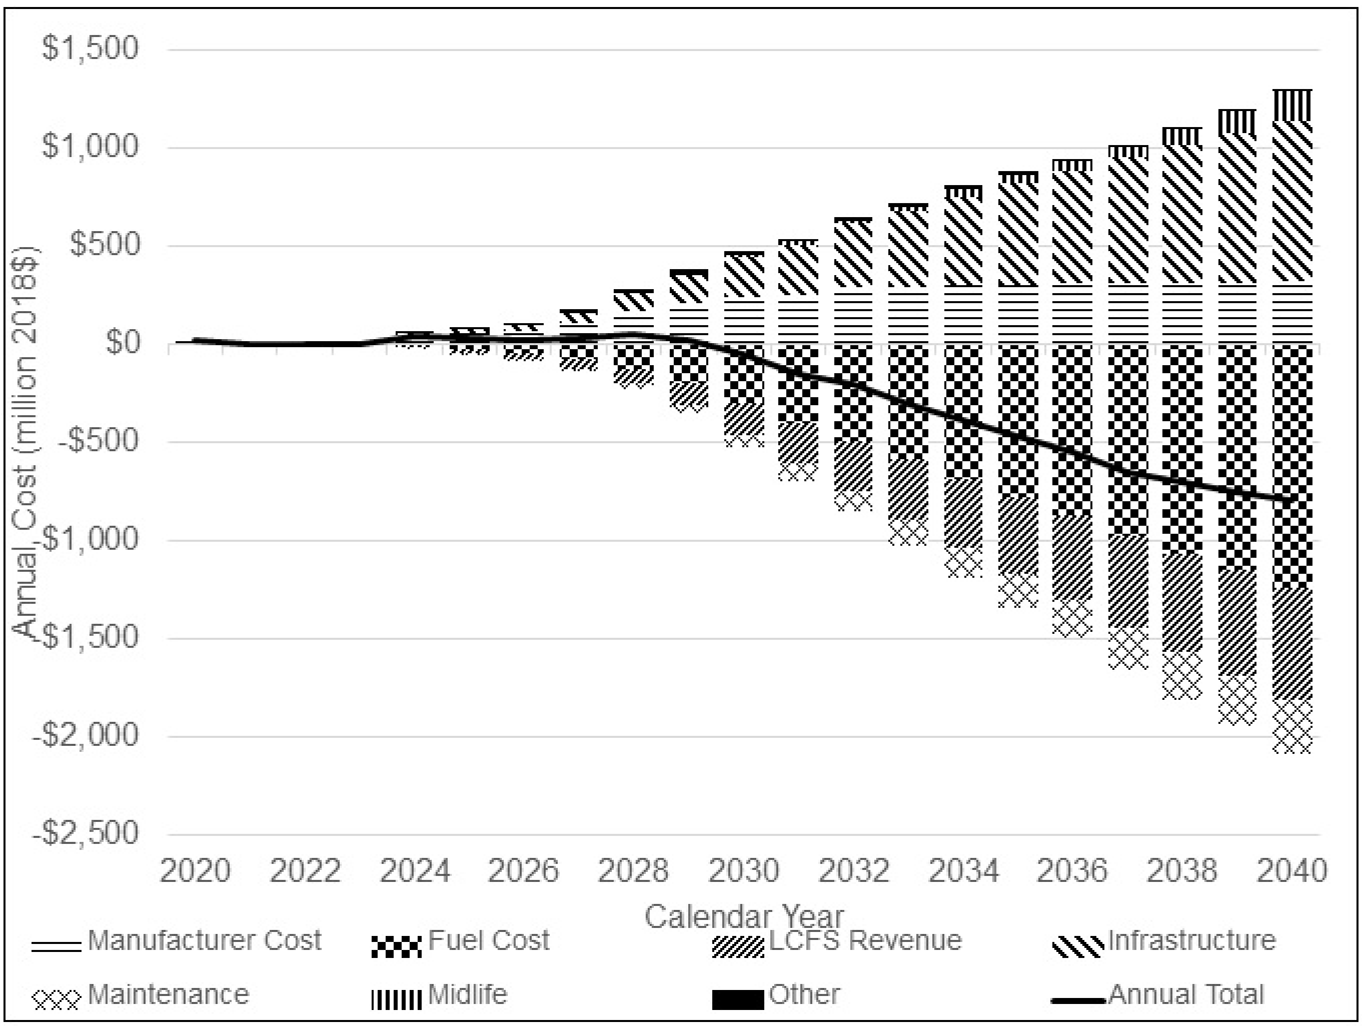
The Proposed ACT Regulation would increase the number of ZEVs sold in California relative to the BAU baseline. These ZEVs have higher upfront capital costs for the vehicle and infrastructure investments, but lower operating costs over time resulting in lower overall costs for truck transportation in California. The cost to truck transportation in California assuming all vehicle manufacturer costs and 10 percent of the Phase 2 GHG savings are passed on is -$4.9 billion between 2020 and 2040 compared to the BAU baseline scenario. Figure IX-7 illustrates the difference in cost between the

Proposed ACT Regulation and the BAU baseline scenario using the cost categories shown in Table IX-21. The total costs by cost input are shown in Table IX-22.

Table IX-21: Summarized Cost Items

Cost Category	Components
Manufacturer Cost	ZEV Price, ICE Phase 2 GHG (cost avoided), ZEP Certification
Fuel Cost	Gasoline, Diesel, Electricity, Hydrogen Fuel Cost
LCFS Revenue	LCFS Revenue
Infrastructure	Charger Costs, Infrastructure Upgrades, Charger Maintenance
Maintenance	Vehicle Maintenance Costs, Maintenance Bay Upgrades
Midlife	Midlife Costs
Other	Sales Tax, Federal Excise Tax, Registration Fees, Large Entity Reporting, Transitional Costs and Workforce Development

Figure IX-7: Total Estimated Direct Costs of Proposed ACT Regulation Relative to the BAU Baseline (million 2018$)



Based on the cost analysis, deploying ZEVs will decrease costs to the California economy primarily due to lower fuel costs. Manufacturers would see increased costs past 2024 MY in California as the cost to build ZEVs would be a higher cost pathway to comply with Phase 2 GHG than using other technologies. However, the Proposed ACT Regulation is estimated to reduce costs of compliance with the Phase 2 GHG regulation when factoring in nationwide savings due to the Advanced Technology Multiplier that expires at the end of 2027 MY.

Despite these potential short term cost savings, large manufacturers have hesitated to invest significant amounts of capital into zero-emission products because of uncertainty in the longer term market and estimated higher costs after 2027. Transitioning from conventional ICE powertrains to battery-electric and fuel cell electric technology represents a major paradigm shift for both manufacturers and fleets, and it is difficult to forecast how the technology may grow without established government policy. There are other non-monetary risks associated with ZEV development that need to be managed such as infrastructure availability, range anxiety, weight concerns. Studies from University of California, Davis and the North American Council on Fuel Efficiency show some hesitancy from the trucking industry despite the potential for cost savings.(Miller, 2017), (NACFE, 2018).

Additionally, manufacturers bear additional risks by building electric vehicles when compared to compliance strategies that depend on modest improvements in existing conventional truck technologies. Developing a zero-emission product line requires initial research and development expenses, new or heavily modified assembly lines, agreements with new suppliers, and more. While this analysis does show a cost saving while the Advanced Technology Multiplier is in effect, on a longer timeframe past 2027 MY, ZEVs are a more expensive vehicle to build. Demand for ZEVs is dependent on many factors outside the manufacturer’s control including fuel price swings, battery and other component prices, shifting fleet behavior, and others. So while this cost analysis shows that ZEVs overall have potential to decrease costs to manufacturers for complying with Phase 2 GHG regulation prior to 2028, staff believe the manufacturers may not commercially produce ZEVs in a BAU scenario without certainty from a regulation.

Table IX-22: Total Estimated Direct Incremental Costs Relative to the BAU Baseline (million 2018$)

Calendar Year	ZEV Price[1]	ICE Phase 2 GHG (Cost Avoided)[1]	ZEP Cert. [1]	Large Entity Reporting[2]	Sales & Excise Tax[2]	Fuel Cost[2]	LCFS Revenue[2]	Vehicle Maintenance Cost[2]	Maintenance Bay Upgrades[2]	Midlife Costs[2]	EVSE & Infrastructure Installation & Maintenance[2]	Transitional Costs & Workforce Development[2]	Registration Fees[2]	Total Cost*

*Note: Totals may differ due to rounding

1 – These cost items are costs to manufacturers

2 – These cost items are costs to California businesses

C. Direct Costs on Businesses and Individuals

1. Direct Costs on Typical Businesses

Medium- and Heavy-duty Manufacturers

Manufacturers are responsible for meeting the ZEV sales percentage requirement by both building and selling zero-emission trucks, or by using flexibility provisions. While none of the regulated manufacturers build vehicles in California, this analysis is included to provide further information to stakeholders. Manufacturing ZEVs requires large upfront costs that go into research and development, prototyping, assembly line upgrades and tooling, and other categories. All these costs plus the actual component cost of the vehicle need to be recouped during the sale of the vehicle.

Manufacturers would have a requirement to sell ZEVs but most fleets do not currently have a requirement to purchase ZEVs. As a result, manufacturers bear risk in that they may have to sell vehicles below cost to fleets to meet the requirements of the regulation. Any ZEV costs that manufacturers cannot pass on through sale of their ZEVs may be added to the cost of the rest of their ICE fleet, or the manufacturer may not pass on the cost and must absorb the cost themselves.

The two extremes are either the manufacturer is able to fully pass on the cost of an electric vehicle to the purchaser, or they are not able to pass any cost on to the purchaser. One way to estimate what the purchaser would be willing to pay for would be to look at the payback of the ZEV. Studies and surveys have found that commercial fleets are willing to pay more for cost-saving technologies within a certain payback period that varies from fleet to fleet.(Volvo, 2019), (U.S. EPA, 2014). Two years is considered to be the time period where any cost-saving expense becomes an easy decision for a fleet. Table IX-23 illustrates the percentage of incremental cost that the fleet will be willing to pay for based on a simple two-year payback analysis incorporating fuel costs, LCFS revenue, and amortized charger & infrastructure payments. These percentages should represent the floor for what portion of the incremental cost the fleet will pay for as most companies have longer horizons than two years with some looking at the full life of the vehicle.

Table IX-23: Percentage of Two-Year Simple Payback vs. Incremental Cost

Vehicle Group*	2024 MY	2025 MY	2026 MY	2027 MY	2028 MY	2029 MY	2030 MY
Class 2b-3	24%	26%	28%	29%	31%	34%	38%
Class 4-5	54%	61%	69%	73%	81%	89%	101%
Class 6-7	54%	63%	72%	77%	86%	98%	113%
Class 8	28%	34%	40%	41%	47%	55%	67%
Class 7-8 Tractor - Electric	33%	38%	42%	44%	48%	53%	60%
Class 7-8 Tractor - Fuel Cell	N/A	N/A	N/A	N/A	N/A	3%	8%

*Class 2b-3 is using average of payback versus diesel and gasoline, all comparisons versus the normal range version of vehicle.

It is possible that manufacturers may shift sales for California-bound trucks out of state to avoid the requirements of the Proposed ACT Regulation which would consequentially reduce overall emissions reductions. Current California conditions include higher sales tax, registration fees and other factors that cause a portion of California tractors and trucks to be sold initially out of state despite operating within California. Generally, trucking companies make purchasing decisions based on a variety of reasons including the location of their headquarters, fleet facilities, expected duty cycles, and level of local delegation. Staff does not believe the Proposed ACT Regulation is likely to exacerbate these issues as fleet behavior determines where vehicles are purchased and operated, not manufacturer decisions.

While the Proposed ACT Regulation cannot ensure that sales will not affect decisions to shift sales out of state, future planned ZEV rules can require companies to incorporate zero-emission trucks into their fleets regardless of whether they were purchased in state or not. This issue can be avoided in how future regulations are structured to ensure real emissions reductions occur in California.

Trucking Fleets

Manufacturers sell trucks to trucking fleets who operate the vehicles and incur costs after the point of sale including taxes, fueling, maintenance, midlife costs, and registration fees. Adding electric trucks to their fleet will also cause fleets to incur cost relating to EVSE, infrastructure, maintenance bay upgrades, workforce training, and other transitional costs.

The Proposed ACT Regulation will reduce costs to the overall state's trucking fleet as the operational cost savings of the ZEVs outweigh the potential infrastructure and vehicle prices. Amortizing the vehicle and infrastructure help with these company's cash-flow so they can have positive cash-flow shortly after purchase.

Table IX-24 illustrates an example where a reference fleet purchases 20 Class 4-5 trucks for usage in last mile delivery applications in 2024 for usage over twelve years. The costs for 20 diesel vehicles, 20 battery-electric vehicles and the difference between them is shown. All other mileage and cost assumptions are the same as described previously in this section. The costs over the twelve year period are lower for the battery-electric fleet as compared to the diesel fleet; however, the upfront capital expenses are significantly higher for the BEV fleet. Access to capital or financing will be critical for fleets to take advantage of the overall savings of BEVs. A more detailed discussion of fleet costs can be found in the "Draft Advanced Clean Trucks Total Cost of Ownership Discussion Document" released earlier this year (CARB, 2019i) and a copy of the document is in Appendix H.

Table IX-24: Fleet Cost Example

Cost line items	Diesel	Battery-Electric	Difference
Amortized Vehicle Price (including all mfr. expenses)	$1,270,361	$1,747,840	$477,479
Sales Tax	$93,280	$135,896	$42,616
Amortized EVSE Cost	$0	$104,315	$104,315

Cost line items	Diesel	Battery-Electric	Difference
Amortized Infrastructure Upgrades	$0	$417,261	$417,261
Charger Maintenance	$0	$120,000	$120,000
Fuel Costs	$2,220,329	$947,961	-$1,272,368
LCFS Revenue	$0	-$764,063	-$764,063
Maintenance Costs	$1,914,913	$1,436,185	-$478,728
Midlife Costs	$0	$259,200	$259,200
Maintenance Bay Upgrades	$0	$20,000	$20,000
Transitional Costs and Workforce Development	$0	$12,564	$12,564
Registration Fees	$245,823	$232,840	-$12,982
Total	$5,744,706	$4,669,999	-$1,074,706

2. Direct Costs on Small Businesses

There is no expected direct cost on small businesses under the Proposed ACT Regulation. No manufacturers or fleets who are regulated under this rule are small businesses.

Small businesses who operate trucks will not be required to purchase zero-emission trucks, but may independently decide to do so. This may enable cost savings for small businesses due to electric trucks' lower cost of operation.

3. Direct Costs on Individuals

There are no direct costs onto individuals as a result of this regulation. Individuals may see health benefits due to ZEVs displacing ICE vehicles and providing statewide, regional, and local emission benefits. Manufacturers and fleets will see increased and decreased costs as a result of this rule and will pass through to individuals in the state. Individuals may see macroeconomic benefits and costs; these costs are discussed further below.

D. Fiscal Impacts

1. Local Government

<u>Large Entity Reporting</u>

Cities and counties are required to complete the Large Entity Reporting requirement in 2021. There are 58 counties and 482 cities in California and each would be required to report information about their fleets and the transportation services they contract for.

<u>Utility User Taxes</u>

Many cities and counties in California levy a Utility User Tax on electricity usage. This tax varies from city to city and ranges from no tax to 11 percent. A value of 3.53 percent was used in this analysis representing a population-weighted average (SCO, 2016). By increasing the amount of electricity used, there will be an increase in the amount of the utility user tax revenue collected by cities and counties.

Gasoline and Diesel Fuel Taxes

Fuel taxes on gasoline and diesel to fund transportation improvements at the state, county, and local levels. Displacing gasoline and diesel with electricity and hydrogen will decrease the total amount of gasoline and diesel dispensed in the state, resulting in a reduction in fuel tax revenue collected by local governments. The local tax on fuel is listed in Table IX-13.

Local Sales Taxes

Sales taxes are levied in California to fund a variety of programs at the state and local level. The Proposed ACT Regulation will require the sale of more expensive zero-emission trucks in California which will result in direct increase in sales tax revenue collected by local governments. Overall, local sales tax revenue may increase less than the direct increase from vehicle sales if overall business spending doesn't increase.

Local Government Fleet Cost Pass-Through

The local government fleet is estimated to make up 2.9 percent of California's fleet based on information from manufacturers and the Department of General Services. A proportionate amount of the total costs outlined in Table IX-22 are assumed to pass-through to local governments.

Fiscal Impact on Local Government

Table IX-25 shows the estimated fiscal cost to local governments due to the Proposed ACT Regulation relative to baseline conditions. The fiscal impact to local government is estimated to be -$0.6 million over the first three years of the regulation and $4 million over the regulatory lifetime.

Table IX-25: Estimated Fiscal Impacts to Local Government (million 2018$)

Model Year	Large Entity Reporting	Utility User Tax Revenue	Local Gasoline and Diesel Fuel Taxes	Local Sales Tax	Local Government Fleet Cost Pass-Through	Fiscal Impact*
2020	-$0.6	$0	$0	$0	$0	-$0.6
2021	$0	$0	$0	$0	$0	$0
2022	$0	$0	$0	$0	$0	$0
2023	$0	$0	$0	$0	$0	$0
2024	$0	$0	-$1	$2	-$1	$1
2025	$0	$1	-$2	$3	-$1	$1
2026	$0	$1	-$3	$4	-$1	$2
2027	$0	$2	-$5	$6	-$1	$2
2028	$0	$3	-$8	$8	-$1	$2
2029	$0	$5	-$12	$10	-$1	$2
2030	$0	$8	-$18	$12	$2	$3
2031	$0	$10	-$24	$12	$5	$2
2032	$0	$12	-$30	$14	$6	$2
2033	$0	$14	-$36	$14	$9	$2
2034	$0	$17	-$41	$14	$11	$1
2035	$0	$19	-$47	$15	$14	$0
2036	$0	$20	-$52	$15	$16	-$1
2037	$0	$22	-$57	$15	$19	-$1
2038	$0	$24	-$62	$15	$21	-$3
2039	$0	$25	-$67	$15	$22	-$5
2040	$0	$27	-$71	$15	$23	-$6
Total*	-$0.6	$211	-$538	$190	$141	$4

*Note: Totals may differ due to rounding

2. State Government

CARB Staffing and Resources

The Proposed ACT Regulation would have a small impact on staffing resources and would require two additional Air Pollution Specialist (APS) positions responsible for administering contracts to set up the reporting systems, assisting stakeholders with inquiries, data analysis and auditing of information submitted by manufacturers and fleets, supporting ACT enforcement actions and other general implementation duties. Each position has a fully burdened cost to CARB of $180,000 in Fiscal Year (FY) 2020-2021 and $179,000 every year afterwards.

The manufacturer reporting requirement will require modifying an existing reporting system or developing a new system to handle the reporting. We are estimating a cost of $200,000 in FY2020-2021 in contracting costs to set up the manufacturer reporting system for the rule.

Similarly, the fleet and large entity reporting requirement will require modifying an existing reporting system or developing a new system to handle the reporting. We are estimating a cost of $200,000 in FY2020-2021 in contracting costs to set up the fleet reporting system for the rule.

Gasoline and Diesel Fuel Taxes

Fuel taxes on gasoline and diesel to fund transportation improvements at the state, county, and local levels. Displacing gasoline and diesel with electricity and hydrogen will decrease the total amount of gasoline and diesel dispensed in the state. This will result in a reduction in revenue collected by the state for use in multiple levels of government. The state tax on fuel is listed in Table IX-13.

Energy Resources Fee

The Energy Resource Fee is a $0.0003/kWh surcharge levied on consumers of electricity purchased from electrical utilities. The revenue collected is deposited into the Energy Resources Programs Account of the General Fund which is used for ongoing energy programs and projects deemed appropriate by the Legislature, including but not limited to, activities of the California Energy Commission.

Registration Fees

The state collects registration fees to fund transportation improvements at the state, county, and local levels. The fee structure for ZEVs is different from diesel vehicles with some fees such as the Vehicle License Fee being higher and others such as weight fees being lower. These differences result in lower registration fees for the ZEVs. These lower fees result in reduced revenue collected by the state for use in transportation services.

State Sales Tax

Sales taxes are levied in California to fund a variety of programs at the state and local level. This Proposed ACT Regulation will require the sale of more expensive zero-emission trucks in California which will result in higher sales tax collected by the state governments. Overall, state sales tax revenue may increase less than the direct increase from vehicle sales if overall business spending doesn't increase.

State Fleet Cost Pass-Through

The state government fleet is estimated to make up 2.1 percent of California's fleet based on information from manufacturers and the Department of General Services. A proportionate amount of the total costs outlined in Table IX-22 are assumed to pass-through to the state government.

Fiscal Impacts on State Government

Table IX-26 shows the estimated fiscal impacts to the state government due to the Proposed ACT Regulation relative to baseline conditions. The fiscal impact to state government is estimated to be -$1.4 million over the first three years of the regulation and -$2.1 billion over the regulatory lifetime.

Table IX-26: Estimated Fiscal Impacts on State Government (million 2018$)

Model Year	CARB Staffing and Resources	State Gasoline and Diesel Fuel Taxes	Energy Resources Fee	Registration Fee	State Sales Taxes	State Fleet Cost Pass-Through	Fiscal Impact*
2020	-$0.6	$0	$0	$0	$0	$0	-$0.6
2021	-$0.4	$0	$0	$0	$0	$0	-$0.4
2022	-$0.4	$0	$0	$0	$0	$0	-$0.4
2023	-$0.4	$0	$0	$0	$0	$0	-$0.4

Total*	-$8	-$2,120	$10	-$222	$165	$102	-$2,073

*Note: Totals may differ due to rounding

E. Macroeconomic Impacts

Regional Economic Models, Inc. (REMI) Policy Insight Plus Version 2.2.8 is used to estimate the macroeconomic impacts of the Proposed ACT Regulation on the California economy. REMI is a structural economic forecasting and policy analysis model that integrates input-output, computable general equilibrium, econometric and economic geography methodologies. More details on the methodology can be found in the original SRIA submitted to Department of Finance in Appendix C-1.

1. Summary and Agency Interpretation of Results

The results of the macroeconomic analysis of the Proposed ACT Regulation are summarized in Table IX-27. As analyzed here, CARB estimates the Proposed ACT Regulation is unlikely to have a significant impact on the California economy. Overall, the change in the growth of jobs, State GDP, and output is projected to not exceed 0.03 percent of the baseline. The Proposed ACT Regulation results in increased growth in the truck transportation industry in California as fuel savings and LCFS credit generation from the use of ZEVs grow over time. The fuel savings for the truck transportation industry represent decreased demand for gasoline and diesel from the industry, implying a decrease in growth for the industry. This analysis also shows the negative impact estimated for state and local government output and employment due to tax revenue decreases, without any offsetting revenues.

Table IX-27: Summary of Macroeconomic Impacts of Proposed ACT Regulation

Macroeconomic Output	2020	2025	2030	2035	2040
GSP - % Change	0.00%	0.00%	0.01%	0.01%	0.02%
GSP - Change (2018M$)	1	86	437	452	669
Personal Income - % Change	0.00%	0.00%	0.02%	0.03%	0.04%
Personal Income - Change (2018M$)	-10	65	474	869	1,404
Employment - % Change	0.00%	0.00%	0.02%	0.02%	0.03%
Employment - Change in Jobs	8	871	4,645	5,653	8,102
Output - % Change	0.00%	0.00%	0.01%	0.01%	0.01%
Output - Change (2018M$)	-2	136	632	492	777
Private Investment - % Change	0.00%	0.00%	0.00%	0.00%	0.00%
Private Investment - Change (2018M$)	-3	26	177	312	428

2. California Employment Impacts

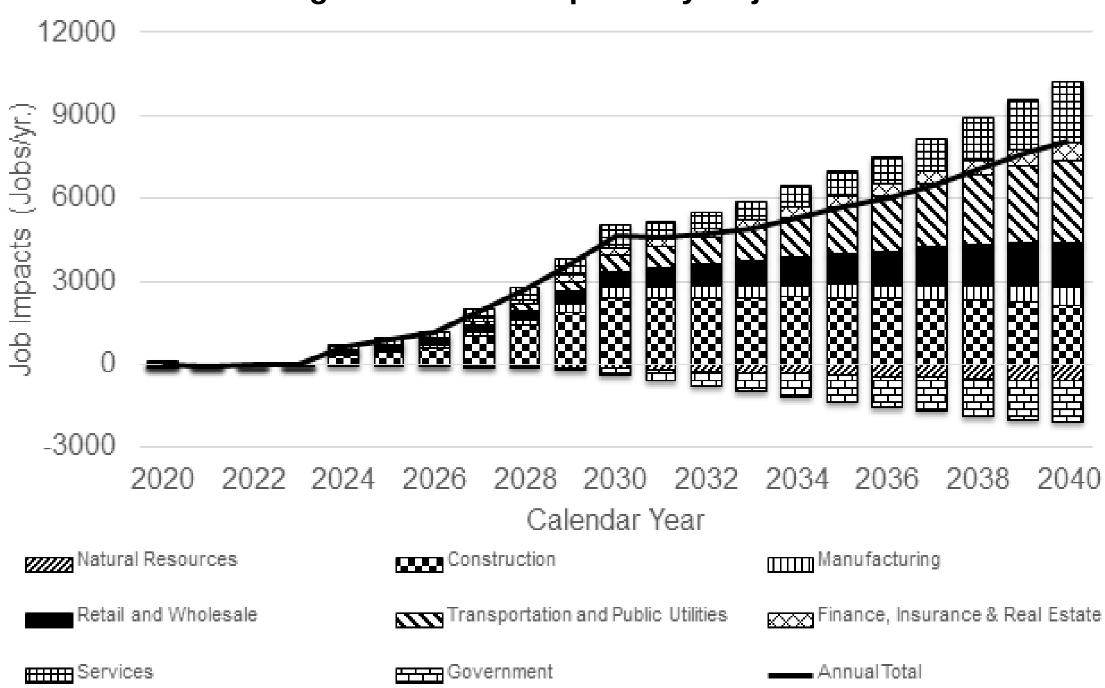
Table IX-28 presents the impact of the Proposed ACT Regulation total employment in California across all industries. The employment impacts represent the net change in employment, which consist of positive impacts for some industries and negative impacts for others. The employment impacts represent the net change in employment, which consist of positive impacts for some industries and negative impacts for others. The Proposed ACT Regulation is estimated to result in a slightly positive job impact from about 2025 to 2040. These changes in employment represent less than 0.04 percent of baseline California employment.

Table IX-28: Total California Employment Impacts

Calendar Year	2020	2025	2030	2035	2040
California Employment	24,368,647	25,267,147	26,206,546	27,105,799	27,920,649
% Change	0.00%	0.00%	0.02%	0.02%	0.03%
Change in Total Jobs	8	871	4,645	5,653	8,102

The total employment impacts shown above are net of changes at the industry level. The overall trend in employment changes by major sector are illustrated in Figure IX-8 and show the changes in employment by industries that are directly impacted by the Proposed ACT Regulation. As the requirements of the Proposed ACT Regulation go into effect, the industries generally realizing reductions in production cost or increases in final demand see an increase in employment growth. This includes the truck transportation, construction, and manufacturing sectors and upstream industries. The largest decrease in employment results from the public sector, which is estimated to realize a decrease in fuel and sales tax revenue and registration fees. The oil and gas extraction industry and automotive repair and maintenance industry see a decreased employment growth rate due to a reduction in final demand for their goods and services.

Figure IX-8: Job Impacts by Major Sector

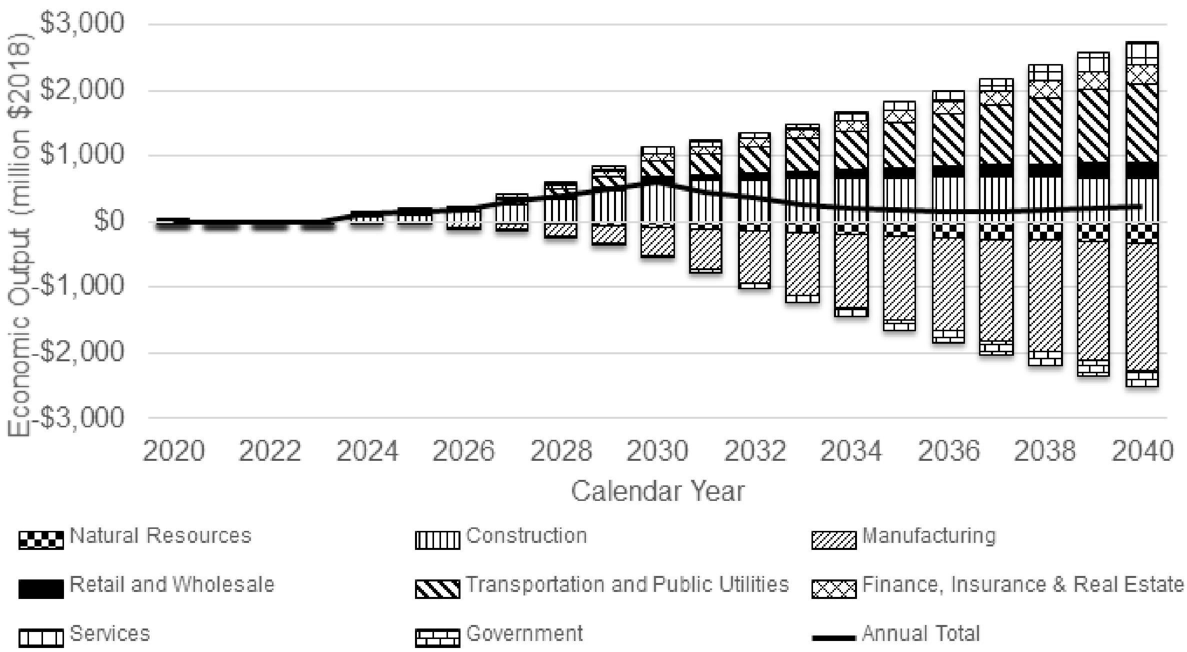


3. California Business Impacts

Gross output is used as a measure for business impacts because as it represents an industry's sales or receipts and tracks the quantity of goods or services produced in a given time period. Output growth is the sum of output in each private industry and State and local government as it contributes to the state's gross domestic product (GDP), and is affected by production cost and demand changes. As production cost increases or demand decreases, output is expected to contract, but as production costs decline or demand increases, industry will likely experience output growth.

The results of the Proposed ACT Regulation show an increase in output of $632 million in 2030 and an increase of $777 million in 2040 as illustrated by major sector in Figure IX-9. Similar to the employment impacts, there are positive impacts on output for transportation, public utilities, and construction and negative impacts on oil and gas extraction, automotive repair and maintenance, and the public sector. The negative output impact on manufacturing is primarily driven by the petroleum and coal products manufacturing industry, which is estimated to see a relatively large decrease in demand for gasoline and diesel.

Figure IX-9: Change in California Economic Output by Major Sector



4. Incentives for Innovation

Staff are proposing incentives for early ZEV sales by allowing credits to be generated from ZEV sales starting in 2021 MY, 3 years prior to the beginning requirements in 2024 MY. Staff anticipates growth in industries that manufacture ZEV technologies, including first and second tier suppliers for manufacturers of ZEVs, which will strengthen the supply chain, and promote technology improvements earlier than they would have otherwise occurred. This growth will help foster and support a self-sustaining medium- and heavy-duty ZEV market.

5. Significant Statewide Adverse Economic Impact Directly Affecting Business, Including Ability to Compete

The Proposed ACT Regulation imposes a ZEV sales mandate on ten large truck manufacturers selling vehicles in California and a one-time reporting requirement on about 12,000 large entities operating in California. Based on CARB staff analysis, the Executive Officer has made an initial determination that proposed regulatory action would not have a significant statewide adverse economic impact on directly affected businesses. In addition, the Executive Officer has made an initial determination that the proposed regulatory action would not have a significant statewide economic impact directly affecting representative private persons.

For the manufacturer ZEV sales mandate, the regulated entities are headquartered and produce vehicles entirely out-of-state for a national and international market. However, all of the costs from deploying the number of ZEVs required by the Proposed ACT Regulation are assumed to be borne in California. These costs including the incremental vehicle costs, infrastructure upgrades, fueling, maintenance, and other costs are assumed to be the direct costs of the regulation in California despite the lack of a specific fleet purchase requirement. This approach shows the full estimated cost to California for deploying the same number of ZEVs required by the regulation.

For the large entity reporting requirement, the regulated entities are large businesses and government agencies operating within California. This is a one-time reporting requirement that collects information about their owned vehicles and contracted vehicle services. It is expected that reporting entities will be using information already on-hand.

As shown in Table IX-22 and Table IX-27, these proposed regulations are not expected to have negative economic impacts and is projected to be a net benefit to the state. Trucking fleets and California businesses are expected to see a net reduction in costs which is projected to result in a net increase in California employment and economic output.

X. EVALUATION OF REGULATORY ALTERNATIVES

Government Code section 11346.2, subdivision (b)(4) requires CARB to consider and evaluate reasonable alternatives to the proposed regulatory action and provide reasons for rejecting those alternatives. This section discusses alternatives evaluated and provides reasons why these alternatives were not included in the proposal. As explained below, no alternative proposed was found to be less burdensome and equally effective in achieving the purposes of the regulation in a manner than ensures full compliance with the authorizing law. The Board has not identified any reasonable alternatives that would lessen any adverse impact on small business.

CARB solicited public input regarding alternatives to achieving the regulatory goals. Two public meetings were specifically devoted to the discussion of regulatory alternatives, including:

- April 25, 2017, at Sacramento: CARB staff held a workshop meeting (CARB, 2017h) to discuss how best to advance the market for advanced clean truck technologies primarily in local truck and last mile delivery application. At the meeting, CARB solicited feedback from stakeholders to develop methods as well as identify metrics and data to quantify the following alternatives concepts: fleet rule requirement and less stringent ZEV sales requirement.
- April 2, 2019, at Sacramento: CARB staff held a regulatory workgroup meeting (CARB, 2019j), to formally solicit regulatory concepts that would require heavy-duty vehicle and chassis manufacturers to sell a portion of Class 2b and greater vehicles sales as zero-emission and would require mandatory reporting for larger companies and fleets. At the meeting, the EMA sector requirement was discussed.

In addition to the workshop meetings, staff received two informal comment letters in regards to the April 2, 2019 regulatory workshop. The following alternatives were discussed: an NGO proposed more stringent Total Truck population requirement and natural gas Low NOx credit system.

A. Alternative Concepts

1. Alternative Concept: Less Stringent ZEV Sales Requirement

This alternative proposes a less stringent ZEV sales requirement than the Proposed ACT Regulation and would apply to the same manufacturers. Under this alternative, three percent of regulated manufacturer sales would need to be ZEVs in Class 2b-7 ramping up to 15 percent in 2030. Class 2b-3 pickup trucks and all Class 8 vehicles would be excluded from the ZEV sales requirement. This alternative would result in fewer ZEV sales compared to the Proposed ACT Regulation. In addition, it is expected that this alternative would result in lower costs to California due to the reduced ZEV percentage sales requirements on the manufacturers. However, all the required ZEV sales are assumed to be counted towards Phase 2 GHG compliance; this means that this alternative does not achieve any additional GHG emissions benefits. Therefore, this alternative is rejected because it fails to maximize the number of ZEVs deployed, does not maximize NOx, $PM_{2.5}$, and results in no new GHG reductions**.**

2. Alternative Concept: Stricter ZEV Sales Requirement

This alternative proposes a more stringent ZEV sales requirement than the Proposed ACT Regulation and would apply to the same manufacturers. Under this alternative, 15 percent of regulated manufacturer sales would need to be ZEVs in Class 2b-8 ramping up to 40 percent in 2030. Unlike the ACT proposed regulation and Alternative 1, no vehicle types are excluded from the ZEV sales requirement in this scenario. This alternative would result in greater ZEV sales compared with the Proposed ACT Regulation.

Furthermore, this alternative assumes that long range BEVs need to be sold in Class 2b-3 and more fuel cell vehicles would need to be sold in Class 7-8 tractors. With this alternative, the manufacturer would be required to sell more ZEVs which would require the manufacturer to make more expensive, longer range vehicles to meet this requirement. Even though this alternative results in more ZEVs deployed than the Proposed ACT Regulation and could provide more NOx and $PM_{2.5}$ emission reductions, it raises questions about the feasibility for manufacturers to comply with its requirements. Therefore this alternative was rejected due to the uncertainty as to whether the requirements could be met or sustained.

3. Alternative Concept: ZEV and Low NOx Credit Policy Approach

The “ZEV and Low NOx Credit Policy Approach” concept would give credit for combustion vehicles that meet a 0.02 g/bhp-hr NOx certification standard or better to count towards the ZEV requirement. Under this alternative, a credit mechanism would be created to allowing manufacturers to offset zero tailpipe vehicle manufacturing sales requirements until CARB implements a new heavy-duty emission standard for internal combustion engines that meets or exceeds the Low NOx standard. CARB is already in the regulatory process to reduce medium and heavy-duty emissions certification levels to maximize NOx reductions from combustion engines. These efforts are expected to establish the new low NOx certification standard by the 2024 model year which is when the Proposed ACT Regulation would begin requiring ZEVs. Low NOx engines do not achieve any GHG reductions and would not reduce PM from tire wear. The potential use of renewable fuels including RNG and RD procured by fleets are already covered under the LCFS program and the GHG reductions from these fuels is already attributed to the LCFS regulation.

Furthermore, this alternative concept will not advance the adoption of heavy-duty zero-emission technologies and develop a self-sustaining zero-emission truck market, which is a cornerstone of California’s long-term transportation strategy to reduce localized pollution and GHG emissions. Therefore, this proposed alternative is rejected because it would duplicative with CARB efforts already underway and would only add complexity to the Proposed ACT Regulation with no additional NOx emission reductions and would potentially result in less PM and GHG reduction.

4. Alternative Concept: 200,000 ZEV Sales Requirement

This alternative concept requires a more aggressive sales percentage requirement that would achieve at least 200,000 ZEVs, or 10 percent of the total truck population, to be on the road by 2030. In addition to increasing the sales percentages, the exemption that excludes pickups until 2027 MY from the class 2b-3 ZEV sales requirement would be removed. In general, this alternative raises questions about the feasibility of manufacturers to comply with this alternative especially for Class 2b-3 vehicles and tractors. Both Class 2b-3 and Class 7-8 tractors have more focused concerns about payload, range, towing, charging/refueling infrastructure and expected availability which presents more challenges for their deployment in this early market and suitability for meeting fleet needs. The sheer number of vehicle sales and likelihood that manufacturers would need to produce more costly long range vehicles, and the vehicles may need to be placed in applications where they may not be fully suitable. Even though this alternative results in more ZEVs deployed than the Proposed ACT Regulation and could provide more NOx and $PM_{2.5}$ emission reductions, it raises questions about the feasibility for manufacturers to comply with its requirements. Therefore this alternative was rejected due to the uncertainty as to whether the requirements could be met or sustained.

5. Alternative Concept: Fleet Rule Requirement

This concept would require fleets to include ZEVs as a certain percentage of their purchases. Under this alternative, fleet operators would be required to purchase ZEVs starting in 2020 beginning with a low fraction and ramping up to a higher percentage at a time when vehicles are normally being retired. This alternative would require the collection of more fleet related information needed to develop one or more fleet requirements. The Proposed ACT Regulation includes a reporting requirement for large entities and fleet owners to report information needed to develop a future regulation that would apply to fleets or those who hire them beginning in 2024 when the ZEV sales requirement would begin. The lead time to implement a manufacturer requirement is longer to provide sufficient time for manufacturers to change their manufacturing process to build ZEVs. Therefore, this alternative was rejected at this time because a manufacturer sales requirement is still necessary to ensure ZEVs are available and are fully supported before fleet rules can begin, and CARB is already planning to implement ZEV fleet rules in the near future.

6. Alternative Concept: EMA Sector Requirement

This concept would require manufacturers to produce and sell one specific model of ZEV for a specific application/use case (e.g., Last-mile delivery, public, utility, drayage, etc.). Under this alternative, beginning in 2024 model year, one specific vehicle application would be identified by CARB and all manufacturer's would need to offer a zero-emission truck that is capable of being used in that application. The concept is that only zero-emission trucks would be sold to fleets that operate their truck in that specific application. Other use cases would be unaffected. Manufacturers will be responsible to track the usage of trucks under this alternative. Due to ZEVs being the sole replacement for existing vehicles it is expected that vehicles under the affected use cases would eventually become entirely zero-emission under this alternative. However, this concept is not feasible until available ZEVs or ZEV technology meets all daily needs for every vehicle under the affected use cases. California already requires diverse types of ZEVs under AB739, ICT, and Zero-Emission ASB regulations while ports are planning an upcoming drayage regulation requiring zero-emission tractors. State and utility fleets also have a wide variety of truck and use cases, and to discretely define and enforce use cases would be difficult. This alternative was dismissed because it would be difficult to realistically implement and does not align with California's goal of maximizing transportation electrification.

B. Required Alternatives

1. Small Business Alternative

Government Code section 11346.2(b)(4)(B) requires a description of reasonable alternatives to the regulation that would lessen any adverse impact on small business and the agency's reasons for rejecting those alternatives.

CARB staff believe that the Proposed ACT Regulation would not result in any unexpected direct cost on small businesses. With high production rates of zero-emission trucks due to the Proposed ACT Regulation, there will be many benefits in various businesses, including ZEV manufacturing industries, ZEV components suppliers, EVSE suppliers and installers, and hydrogen fuel station suppliers. Some of these businesses may fall into the small business category, such as electricians, construction companies (including infrastructure installers), some ZEV manufacturers, fuel cell and battery producers, and electric drivetrain parts and components suppliers.

2. Performance Standards in Place of Prescriptive Standards

Government Code section 11346.2(b)(4)(A) requires that when CARB proposes a regulation that would mandate the use of specific technologies or equipment, or prescribe specific actions or procedures, it must consider performance standards as an alternative. The Proposed ACT Regulation, which requires that zero-emission trucks be produced when trucks are otherwise being purchased, is a performance standard, as it does not prescribe the kind of technology that must be deployed or explicitly require the purchase of any specific trucks by a specific date.

3. Health and Safety Code section 57005 Major Regulation Alternatives

CARB estimates the Proposed ACT Regulation will have an economic saving on the state's business enterprises of more than $8.3 billion between 2020 and 2040. CARB will evaluate alternatives submitted by stakeholders and consider whether there is a less costly alternative or combination of alternatives that would be equally as effective in achieving increments of environmental protection in full compliance with statutory mandates within the same amount of time as the proposed regulatory requirements, as required by Health and Safety Code section 57005. Staff reviewed and consolidated alternative proposals submitted to date in Chapter IX, none of which are as equally effective within the same amount of time.

XI. JUSTIFICATION FOR ADOPTION OF REGULATIONS DIFFERENT FROM FEDERAL REGULATIONS CONTAINED IN THE CODE OF FEDERAL REGULATIONS

Currently, there is no federal regulation requiring the sale of zero-emission technology in vehicles greater than 8,501 lb. GVWR. However, the federal Phase 2 GHG regulation does incentivize manufacturers to build zero-emission technology. This regulation requires medium- and heavy-duty manufacturers to produce more fuel efficient vehicles with lower CO_2 emissions starting in 2021 MY and increases in stringency through 2027 MY. Manufacturers can meet the Phase 2 GHG standards through a variety of technologies including improved aerodynamics, low rolling resistance tires, engine and accessory optimization, weight reduction, idle reduction systems, hybridization, powertrain electrification, and more. The federal Phase 2 GHG regulation also contains an Advanced Technology Multiplier of 3.5, 4.5, and 5.5 for NZEV, BEV, and FCEV technologies, respectively, which lasts until the end of the 2027 MY. The Proposed ACT Regulation compliments this provision because manufacturers can simultaneously earn credit in the Phase 2 GHG regulation and the Proposed ACT Regulation if producing ZEVs or NZEVs. However, despite including provisions to incentivize ZEV development, EPA and NHTSA did not base the Phase 2 standards on adoption of full-electric vehicles and did not assume ZEVs would be produced to comply.

As identified in the State's SIP and Climate Change Scoping Plan, medium- and heavy-duty ZEVs are a critical component of the state's goals and will become more crucial over time. Action is needed today to foster the zero-emission market and move beyond cleaner combustion technologies.

XII. PUBLIC PROCESS FOR DEVELOPMENT OF THE PROPOSED ACTION (PRE-REGULATORY INFORMATION)

Consistent with Government Code sections 11346, subdivision (b), and 11346.45, subdivision (a), and with the Board's long-standing practice, CARB staff held public workshops and had other meetings with interested persons during the development of the proposed regulation. These informal pre-rulemaking discussions provided staff with useful information that was considered during development of the regulation that is now being proposed for formal public comment.

CARB staff developed the Proposed ACT Regulation through an extensive public process. CARB has conducted a multi-level public process that includes technical workgroup meetings and workshops comprised of interested stakeholders including manufacturers, fleets, environmental groups, utilities, technology providers, fuel providers, and others.

The public process comprises many forms of communication dialogues with stakeholders and interested public. In addition to coordinating public workgroup meetings, CARB staff has conducted more than 100 individual meetings with more than 50 stakeholders. CARB staff has held two joint meetings with the California Governor's Office of Business and Economic Development (GO-Biz) in which fleets, manufacturers, and utilities discussed medium-and heavy-duty electrification. Additionally, staff has engaged in frequent discussions with ZEV technology providers, electric utilities, fuel providers, and non-governmental environmental organizations during various outreach events such as technology symposiums and expositions. To facilitate the exchange of information, CARB staff created an informal comment submittal form available for interested parties to submit comments about the Proposed ACT Regulation. The following provides a list of public meetings conducted.

A. Regulatory Workshops

Date	Summary of meeting
• November 1, 2016:	Initial public workshop discussed the strategies to accelerate the market for advanced clean technologies.
• April 25, 2017:	Second regulatory workshop discussed the potential regulatory concept, a draft fleet survey, and continued the discussion on costs.
• May 31, 2018:	Third public workshop staff presented updates on the regulatory concept.

Date	Summary of meeting
• August 30, 2018:	Fourth public workshop discussed the assessment of zero-emission fleet requirements.
• December 4, 2018:	Public workshop meeting discussed potential reporting requirements for car and truck fleets.
• April 2, 2019 :	Fifth public workshop discussed the Proposed ACT Regulation including mandatory reporting for large companies and fleets.
• June 20, 2019 :	Sixth workshop meeting discussed the proposed reporting requirement for large companies that contract to move freight or other products, and for large fleets that operate trucks locally or regionally.
• August 21, 2019 :	Seventh workshop provided updates to the proposed manufacturer sales requirement and large entity reporting requirement.

B. Workgroup Meetings

Date	Summary of Meeting
• November 14, 2016:	Public meeting discussed transportation electrification barriers and solutions for fleets.
• January 20, 2017:	First workgroup meeting included a discussion of strategies for deploying advanced clean local trucks.
• August 30, 2017:	Second workgroup meeting discussed the costs of advanced and conventional truck technologies in CA.
• December 4, 2018:	Third fleet/manufacturer meeting discussed the market potential for zero-emission trucks.
• February 25, 2019:	Fourth workgroup meeting reviewed the zero-emission truck and bus market segment analysis and assumptions.

C. Materials Shared with the Public

Prior to the release of staff proposal, it is essential to engage the public with more productive dialogue through sharing date points, data analysis methodologies, literature review, concept paper, and other technical tools. Workshop and workgroup discussion documents, analysis and tools, and materials are posted on CARB's Advanced Clean

Trucks Meetings and Workshop Public Meetings webpage (CARB, 2019k). Two discussion documents that included workshop documents, concepts and or discussions relating to the Proposed ACT Regulation, four analysis documents and tools, and a draft regulatory language for both parts of the Proposed ACT Regulation are identified here:

1. Discussion Documents

• Battery-Electric Truck and Bus Energy Efficiency Compared to Conventional Diesel Vehicles: May 2018:	This document provided a comparison of energy usage between diesel-powered vehicles and battery-electric vehicles. This document found that the EER for battery-electric heavy-duty vehicles is higher at lower speeds and the EER ranged from 3 in high speed operations to between 5 and 7 in low speed operations.
• February 2019: TCO Discussion Document.	This document analyzed the total cost of ownership for a diesel, battery-electric, and fuel cell electric vehicle in 2018, 2024, and 2030 for three different truck types and was made available for comment.

2. Draft Regulatory Language

• August 21, 2019: Proposed Draft Regulatory Language – Manufacturer Sales Requirement.	Developed proposed draft language for the manufacturer sales requirement for discussion and feedback.
• August 21, 2019: Proposed Draft Regulatory Language – Large Entity Reporting Requirement.	Developed proposed draft language for the large entity reporting requirement for discussion and feedback.

3. Analysis and Tools

Date and Name	Summary
• April 25, 2017: Draft Survey.	Survey tool to gather detailed information about everyday operations of local fleets and fleet characteristics.
• December 4, 2018: EMA Truck Segment Analysis	Matrix prepared by the Truck and Engine Manufacturers Association (EMA) as a first draft analysis of the suitability of ZEVs for Class 2b-8 commercial vehicle applications.
• December 4, 2018: Key Truck Specifications Sheet	Provided a list of questions to discuss and identify the mission critical questions to ask fleets.
• February 25, 2019: ACT Market Segment Analysis	Modified EMA Truck Segment Analysis to reflect the suggested changes to the battery-electric truck assessment.
• February 25, 2019: TCO Calculator	Calculator tool that helps public to compare the total cost of ownership for diesel battery-electric and hydrogen fuel-cell trucks.
• June 20, 2019: Comment Submittal Form	Tool to submit informal comments about the Advanced Clean Trucks proposal.

XIII. REFERENCES

The following documents are the technical, theoretical, or empirical studies, reports, or similar documents relied upon in proposing these regulatory amendments, identified as required by Government Code, section 11346.2, subdivision (b)(3). STANDARDIZED REGULATORY IMPACT ASSESSMENT REFERENCES

The following documents are the technical, theoretical, or empirical studies, reports, or similar documents relied upon in proposing these regulatory amendments, identified as required by Government Code, section 11346.2, subdivision (b)(3). Additionally, each appendix References the documents upon which it relies, as required by Government Code, section 11346.2, subdivision (b)(3).

Note: Each "Explanatory Footnote" is a footnote containing explanatory discussion rather than referencing specific documents relied upon.

Final Statement of Reasons for Rulemaking,

Including Summary of Comments and Agency Response

PUBLIC HEARING TO CONSIDER THE PROPOSED ADVANCED CLEAN TRUCKS REGULATION

Public Hearing Dates: December 12, 2019, and June 25-26, 2020

Agenda Item No.: 20-6-3

I. GENERAL

ACTION TAKEN IN THIS RULEMAKING

The Staff Report: Initial Statement of Reasons for Rulemaking (Staff Report) entitled "The Proposed Advanced Clean Trucks Regulation," and its supporting Appendices A through J, all of which were publicly released October 22, 2019 for a 45-day comment period, are incorporated by reference herein and contain a description of the rationale and supporting documentation for the proposed regulation. On October 22, 2019, all references relied upon and identified in the Staff Report were made available to the public.

Zero-emission (ZE) technologies are necessary to address the state's long-term air quality and climate protection goals. These technologies are part of a comprehensive strategy to reduce emissions from the transportation sector as reflected in the 2016 Mobile Source Strategy.

As explained in the Staff Report, the purpose of these regulations is to accelerate the market for zero-emission vehicles in the medium- and heavy-duty truck sector and to reduce emissions of oxides of nitrogen (NOx), fine particulate matter (PM), toxic air contaminants, greenhouse gases (GHG), and other criteria pollutants generated from on-road mobile sources. Requiring medium- and heavy-duty vehicles to transition to zero-emissions technology will reduce health risks to people living in and visiting California, and is needed to help California meet established near- and long-term air quality and climate mitigation targets. Requirements for fleets to report information about their operations will provide data needed to inform future strategies and policies.

On December 12, 2019, following a 45-day comment period, the California Air Resources Board (CARB or Board) conducted the first public hearing to consider the proposed Advanced Clean Trucks Regulation (ACT), as described in the Staff Report, and the associated Notice of Public Hearing (45-Day Notice). The regulation requirements are included in title 13, division 3, chapter 1, article 2, sections 1963-1963.5, and in title 13, division 3, chapter 1, new article 3.1, sections 2012-2012.3 of the California Code of Regulations. At this public hearing, staff presented the proposal as well as additional suggested modifications to the regulatory text to address comments received following the release of the Staff Report. At the conclusion of the hearing, the Board directed the Executive Officer and staff to consider the testimony and comments received and to continue working with stakeholders to address concerns about the proposed requirements.

A total of 121 written comment letters were received from individuals or organizations throughout the 45-day period. During the December 12, 2019, public hearing, 16 written comments were received along with 99 individuals who gave oral statements. Staff then proposed modifications to the original regulation addressing comments received during both the public hearing and 45-day comment period.

The text of the proposed modifications to the originally proposed regulation and supporting documents were made available for a supplemental 30-day comment period through a "Notice of Public Availability of Modified Text and Availability of Additional Documents" (30-Day Notice). The 30-Day Notice, modified regulatory language, and additional supporting documents were posted on April 28, 2020, on CARB's website (Link), accessible to stakeholders and interested parties. The comment period commenced on April 28, 2020 and ended on May 28, 2020 with a total of 342 comment letters received during this time. All modifications to the regulatory language are clearly indicated in the Notice of Public Availability of Modified Text.

The Final EA and written responses to the Draft Environmental Analysis (EA) were both posted on June 23, 2020 for public review.

The Final EA, Response to Comments, Final Regulation Order, and Proposed Resolution 20-19 were presented to the Board during the June 25, 2020 hearing, during which oral comments from 136 individuals and 114 written comments were received. The Board adopted Resolution 20-19 which approved written responses to the Draft EA, certified the Final EA, approved the findings, approved the statements of overriding considerations, and adopted the ACT Regulation. The June 2020 approval by itself did not and could not have resulted in any environmental impacts because the ACT Regulation will not go into effect until after the Office of Administrative Law approves it. In other words, although CARB complied with CEQA by completing environmental review prior to the Board’s June 2020 approval, CARB still had to comply with additional APA requirements before the ACT Regulation rulemaking process could be concluded. Note: a clerical error occurred in the Final EA. The emissions benefits tables on pages 35 and 55 in the Final EA do not match up with the updated emissions benefits in Attachment C to the Notice of Public Availability of Modified Text and Availability of Additional Documents and Information, posted on CARB’s website on April 28, 2020. This is the result of a minor clerical oversight in not transferring the new numbers from

Attachment C, which reflect the emissions benefits from the modified language identified in the April 28, 2020 notice, to the Final EA. The new emissions benefits result in greater benefits and, as a result, do not change any of the significance conclusions or determinations made in the Final EA for which the Board took action to certify. And the Board was provided with the updated numbers before the June 25th approval (Attachment C: "Updated Costs and Benefits Analysis for the Proposed Advanced Clean Trucks Regulation").

In Resolution 20-19, the Board directed the Executive Officer to "take CARB's final step for final approval of the Board-approved regulations" and submit the rulemaking package to the Office of Administrative Law if the Executive Officer determines no additional modifications to the regulations are appropriate. The Executive Officer determined that no additional modifications to the regulatory language are necessary, but CARB did add some documents to the rulemaking record. A list of supporting documents added to the record was made available for a supplemental 15-day comment period through a "Second Notice of Public Availability of Additional Documents and Information" (15-Day Notice). The 15-Day Notice and additional supporting documents were posted on October 5, 2020, on CARB's Website (Link), accessible to stakeholders and interested parties, and ended on October 20, 2020, with 8 comments received during this period.

This Final Statement of Reasons (FSOR) updates the Staff Report by identifying and providing the rationale for the modifications made to the originally proposed regulation, including changes directed by the Board at the December 12, 2019, hearing and text circulated for public comment during the 30-day comment period. The FSOR also contains a summary of the comments received during the formal rulemaking process by CARB on the proposed ACT Regulation or on the process by which they were adopted as well as CARB's responses to those comments.

MANDATES AND FISCAL IMPACTS TO LOCAL GOVERNMENTS AND SCHOOL DISTRICTS

The Board has determined that this regulatory action will not result in a mandate to local school districts but will to local agencies. However, the Board finds that the costs to local agencies are not reimbursable pursuant to Part 7 (commencing with section 17500), Division 4, Title 2 of the Government Code. Pursuant to Government Code sections 11346.9(a)(2) the proposed regulatory action is a mandate that would create costs and cost-savings to local agencies, but not to school districts. The mandate is not reimbursable because costs associated with the proposed regulation apply generally to all entities that purchase affected vehicles and respond to the reporting requirement, including local agencies. Therefore, the regulation does not constitute a "Program" imposing any unique requirements on local agencies as set forth in section 17514 of the California Government Code.

The ACT Regulation directly impacts local government entities, who are local agencies. In 2021, each of the 58 counties and 482 cities in California would be required to complete the Large Entity Reporting requirement to report information about their fleets and the type of transportation services for which they contract.

Many cities and counties in California levy a Utility User Tax on electricity usage. This tax varies from city to city and ranges from no tax to 11 percent. A value of 3.53 percent was used in this analysis representing a population-weighted average (SCO, 2016).[1] By increasing the amount of electricity used, there will be an increase in the amount of the utility user tax revenue collected by cities and counties.

Fuel taxes on gasoline and diesel fund transportation improvements at the state, county, and local levels. Displacing gasoline and diesel with electricity and hydrogen will decrease the total amount of gasoline and diesel dispensed in the state, resulting in a reduction in fuel tax revenue collected by local governments.

Sales taxes are levied in California to fund a variety of programs at the state and local level. The ACT Regulation will require the sale of more expensive zero-emission trucks in California which will result in a direct increase in sales tax revenue collected by local governments. However, local sales tax revenue may increase less than the direct increase from vehicle sales if overall business spending doesn't increase.

The local government fleet is estimated to make up 2.9 percent of California's total fleet based on information from manufacturers and the Department of General Services. A proportionate amount of the total costs are assumed to pass-through to local governments.

The estimated fiscal impacts to local government compared to a business as usual baseline are estimated at -$0.6 million over the first three years of the regulation and $4 million over the regulatory lifetime.

CONSIDERATION OF ALTERNATIVES

Government Code section 11346.9(a)(4) requires that CARB consider reasonable alternatives which “include, but are not limited to, alternatives that are proposed as less burdensome and *equally effective in achieving the purposes of the regulation* in a manner that ensures full compliance with the authorizing statute or other law being implemented or made specific by the proposed regulation.” (emphasis added) For the reasons set forth in the Staff Report, in staff's comments, responses at the hearing, and in this FSOR, the Board determined that no alternative considered by the agency would be equally effective in achieving the purpose for which the regulatory action was proposed, or would be as effective and less burdensome to affected private persons, or

[1] (SCO, 2016) California State Controller's Office, User Utility Tax Revenue and Rates (web page: https://sco.ca.gov/Files-ARD-Local/LoSCzcRep/2016-17 Cities UUT.pdf, last accessed June 2019).

would be more cost-effective to affected private persons and equally effective in implementing the statutory policy or other provisions of law than the action taken by the Board. The ACT regulation ISOR included the following primary purposes for adoption of the regulation:

- Accelerate first wave of zero-emission (ZE) truck deployments in best suited applications;
- Achieve 100 percent zero-emission pickup-and-delivery in local applications by 2040;
- Support the Ports of Los Angeles and Long Beach Clean Air Action Plan for 100 percent zero-emission drayage trucks by 2035;
- Support AB 739 requiring California state government fleets to purchase ZEVs;
- Enable a large-scale transition to zero-emission technology;
- Maximize the total number of ZEVs deployed;
- Complement existing and future programs;
- Provide environmental benefits, especially in disadvantaged communities thereby supporting the implementation of AB 617;
- Ensure requirements are technologically feasible and cost effective; and
- Foster a self-sustaining zero-emission truck market.

1. Less Stringent ZEV Sales Requirement

This alternative proposes a less stringent zero-emission vehicle (ZEV) sales requirement than the ACT regulation and would apply to the same manufacturers. Under this alternative, three percent of regulated manufacturer sales would need to be ZEVs in Class 2b-7 ramping up to 15 percent in 2030. Class 2b-3 pickup trucks and all Class 8 vehicles would be excluded from the ZEV sales requirement. This alternative would result in fewer ZEV sales compared to the ACT regulation and would be expected to result in lower upfront costs to California due to the reduced ZEV percentage sales requirements on the manufacturers. However, all the required ZEV sales are assumed to be counted towards Phase 2 GHG compliance meaning no additional GHG emissions benefits would be achieved. Therefore, this alternative is rejected because it fails to maximize the number of ZEVs deployed, does not maximize reductions of NOx, $PM_{2.5}$, and results in no new GHG reductions.

2. Stricter in Early Years ZEV Sales Requirement

This alternative proposes a more stringent ZEV sales requirement in the early years of the regulatory timeframe than the ACT Regulation and would apply to the same manufacturers. Under this alternative, 15 percent of regulated manufacturer sales would need to be ZEVs in Class 2b-8 ramping up to 40 percent in 2030. This alternative would result in greater ZEV sales compared with the ACT regulation. Furthermore, this alternative assumes that more long-range battery electric vehicles (BEVs) need to be sold in Class 2b-3 and more fuel cell vehicles would need to be sold in the Class 7-8 tractor category. With this alternative, the manufacturer would be required to make more expensive, longer range vehicles and sell more ZEVs in total to meet this higher sales requirement. Even though this alternative results in more ZEVs deployed than the ACT Regulation in the early years of the requirement and could provide more NOx and $PM_{2.5}$ emission reductions, it raises questions about the feasibility for manufacturers to comply with its requirements since they would need to expand sales for vehicles that are less suitable for early electrification. Therefore, this alternative was rejected due to the uncertainty as to whether the requirements could be met or sustained.

3. ZEV and Low NOx Credit Policy Approach

The “ZEV and Low NOx Credit Policy Approach” concept would give credit for combustion vehicles that meet a 0.02 g/bhp-hr NOx certification standard and use low carbon fuels to count towards the ZEV requirement. This concept is not, functionally, a true alternative to the proposed regulation because it does not propose an alternative to the core element of the ACT regulation which is a ZEV sales requirement. Rather, under this concept, a complementary credit mechanism would be created to allow manufacturers to offset zero tailpipe vehicle manufacturing sales requirements with engines that meet the optional Low NOx standard until CARB implements a new heavy-duty emission standard for internal combustion engines that achieves similar NOx reductions. As a matter of policy, this concept simply does not attempt to address the core goal of the ACT regulation which is to accelerate the widespread adoption of ZEVs but is instead an ancillary concept to this core goal of enabling and incentivizing manufacturers to continue to manufacture internal combustion engines.

CARB has separate regulations and rulemakings to address different issues. The purpose of the ACT regulation is to foster and accelerate the large-scale adoption of ZEVs. Separately, CARB is currently developing the Low NOx Omnibus rulemaking, which, in pertinent part, will ensure that heavy-duty diesel and Otto-cycle engines used in on-road heavy-duty vehicles comply with stringent NOx emission standards as those engines and vehicles are operated. The Low NOx Omnibus regulation will establish a new NOx standard by the 2024 model year, the same year that ACT begins implementation. The Omnibus rulemaking also establishes an opportunity for manufacturers that elect to voluntarily certify engines to more stringent standards than required to generate emissions credits.

CARB also has the Low Carbon Fuel Standard (LCFS) regulation which achieves GHG reductions by requiring fuel producers to reduce the carbon intensity of their fuels or purchase credits from low carbon fuel suppliers. The LCFS program is successfully reducing carbon intensity of California transportation fuels by providing a strong market-based incentive to produce low carbon fuels including electricity, hydrogen, natural gas, and biofuels which can generate credits under that program. LCFS credits can be sold and used to offset the costs of these fuels. Fossil gasoline and diesel are generally not eligible for LCFS credits. Electricity and hydrogen are both low carbon fuels with high Energy Efficiency Ratios (EER) meaning they can generate LCFS credits. Electricity is a relatively inexpensive and efficient way to fuel a vehicle and significant savings can be achieved especially when the LCFS credits are considered. For fleets that charge for extended periods overnight, the LCFS credits can offset all or nearly all of the electricity costs. The LCFS program specifies that emission reductions associated with low carbon fuels are attributed to any regulation that requires the usage of an alternative technology, so the emission benefits of medium- and heavy-duty vehicle electrification are already attributed to the ACT regulation's ZEV requirement, as required under the LCFS program.

Awarding credit to Low NOx engines in this rulemaking under this credit concept would also not achieve all of the primary purposes identified for the ACT regulation as required by Government Code section 11346.2, subsection (b)(4)(A), quoted above.

Notwithstanding the fact that this concept does not meet the bare minimum threshold of being a "reasonable alternative" due to its failure to address the core element of the ACT regulation, the ZEV sales requirement, CARB nonetheless chose to address its shortcomings and reasons for rejecting the credit concept. First, awarding credit to combustion-powered vehicles would incentivize the production of internal combustion engines which is directly inconsistent with the stated goals noted above, especially because it would not achieve maximum emission reductions possible by spurring ZEV production in the heavy and medium duty vehicle categories. Second, and relatedly, this credit concept would have a direct effect in decreasing the number of ZEVs and NZEVs produced in California because manufacturers would likely pursue manufacturing strategies that achieve compliance by simply buying credits to meet the ZEV sales requirement from manufacturers producing combustion vehicles that qualify for the Low NOx credits; this would clearly undermine the goal of accelerating the medium- and heavy-duty vehicle zero-emission market. Third, the proposed credit concept would be duplicative with the Low NOx Omnibus rulemaking and fail to generate additional emissions reductions because the Low NOx Omnibus rulemaking has addressed incentives related to manufacturers' voluntary production of engines that meet this concept's low NOx standard. Fourth, because the actions identified are duplicative with the Low NOx Omnibus rulemaking and the LCFS regulation, this credit concept would generate no criteria or GHG emission benefits which would fail to meet the objective that emission reductions from the ACT regulation are real, permanent, quantifiable, verifiable, and enforceable. Therefore, this concept fails to meet the purposes of the ACT regulation, including the goal to decrease emissions in conjunction with the state's air quality and climate change targets and is therefore rejected as it would be duplicative with CARB efforts already underway.

4. 200,000 ZEV Sales Requirement by 2030

This alternative concept requires a more aggressive sales percentage requirement that would achieve at least 200,000 ZEVs, or 10 percent of the total truck population, to be on the road by 2030. In general, this alternative raises questions about the feasibility of manufacturers to comply with this alternative especially for Class 2b-3 vehicles and tractors. Both Class 2b-3 and Class 7-8 tractors have more focused concerns about payload, range, towing, charging/refueling infrastructure, and model availability than other vehicles. These issues will present more challenges for their deployment in this early market and suitability. The sheer number of vehicle sales and likelihood that manufacturers would need to produce more costly long-range vehicles means they may need to be placed in applications where they may not be fully suitable. Even though this alternative results in more ZEVs deployed than the ACT Regulation and could provide more NOx and $PM_{2.5}$ emission reductions, it raises questions about the feasibility for manufacturers to comply with its requirements due to the rapid increase in sales prior to 2030. Therefore, this alternative was rejected due to the uncertainty as to whether the requirements could be met or sustained.

5. Fleet Rule Requirement

This concept would change the point of regulation to fleet owners. As described in the 2016 Mobile Source Strategy, this would require fleets to gradually increase ZEV purchases when replacing vehicles starting in 2020. As explained in the Staff Report, manufacturers have been reluctant to produce medium- and heavy-duty ZEVs. This alternative cannot succeed unless ZEVs are available to purchase and have a robust maintenance support network. CARB initially considered using a fleet regulation to accelerate the market, but later determined that ZEV availability and support was insufficient to meet state commitments. A necessary first step would be to ensure that ZEVs were supported by manufacturers and made widely available before placing requirements on fleets. In fact, the ACT Regulation includes a reporting requirement for large entities and fleet owners to provide information needed to develop future zero-emission fleet rules. The manufacturer ZEV sales requirement needs to be in place first because of the lead time needed to develop and manufacture vehicles. CARB has already begun the process to develop future fleet regulations that can take effect the same year as the first ZEV sale is required. Therefore, this alternative was rejected at this time because a manufacturer sales requirement is necessary to ensure ZEVs are available and fully supported before fleet rules can begin. CARB is already planning to implement complementary ZEV fleet rules in the near future.

6. Truck and Engine Manufacturer's Association Sector Requirement

This concept would require manufacturers to produce and sell one specific model of ZEV for a specific application/use case (e.g., Last-mile delivery, public, utility, drayage, etc.). Under this alternative, beginning in the 2024 model year, one specific vehicle application would be identified by CARB and all manufacturers would need to offer a zero-emission truck that is capable of being used in that application. The concept is that only zero-emission trucks would be sold to fleets that operate a truck in that specific application while other use cases would be unaffected. Manufacturers will be responsible in tracking the usage of trucks under this alternative. Due to ZEVs being the sole replacement for existing vehicles, it is expected that vehicles under the affected use cases would eventually become entirely zero-emission. However, this alternative concept is not feasible in the near-term until available ZEVs or ZEV technology meets all daily needs for every vehicle under the affected use cases. It is also impractical for the manufacturer and CARB to know if the buyer was planning on using the truck in the specified application when the initial purchase was being made. For example, it is impractical to identify whether a new tractor will be used for drayage or another use at the time of purchase and moreover, the owner can change the intended use at any time. In addition, California already requires diverse types of ZEVs under AB739, Innovative Clean Transit (ICT), and Zero-Emission Airport Shuttle Bus (ASB) regulations. State and utility fleets also have a wide variety of truck and use cases, and to discretely define and enforce requirements based on use cases would be impractical. This alternative was dismissed because it would be difficult to realistically implement and does not align with California's goal of maximizing transportation electrification everywhere feasible.

7. Small Business Alternative

Government Code section 11346.9(a)(5) requires a description of reasonable alternatives to the regulation that would lessen any adverse impact on small business as well as the agency's reasons for rejecting those alternatives. CARB staff believe that the ACT Regulation would not result in any unexpected direct cost on small businesses. With high production rates of zero-emission trucks due to the ACT Regulation, there will be many benefits in various businesses, including ZEV manufacturing industries, ZEV components suppliers, electric vehicle supply equipment (EVSE) suppliers and installers, and hydrogen fuel station suppliers. Some of these businesses may fall into the small business category, such as electricians, construction companies (including infrastructure installers), some ZEV manufacturers, fuel cell and battery producers, and electric drivetrain parts and components suppliers.

Based on the thresholds, staff does not foresee that any manufacturers subject to the ZEV sales requirement would be small businesses. Likewise, staff does not foresee that the large entity reporting requirements for any businesses meeting the revenue threshold, fleets meeting the size threshold, or government agencies subject to the reporting requirement would be small businesses. However, there is the potential that some brokers may qualify as small businesses and may be subject to the large entity reporting requirement. Brokers make up a small percentage of the entities regulated under the ACT Regulation, but their participation in the large entity reporting requirement is fairly unlikely based on the data at hand. Staff estimate that less than one percent of regulated entities are small businesses.

8. Health and Safety Code Section 57005 Major Regulation Alternatives

CARB estimates the ACT regulation will have an economic saving on the state's business enterprises of more than $5.9 billion between 2020 and 2040. CARB evaluated alternatives submitted by stakeholders to consider whether there are less costly alternatives or combinations of alternatives equally as effective in achieving increments of environmental protection, in full compliance with statutory mandates and within the same amount of time as the proposed regulatory requirements, as required by Health and Safety Code section 57005. Staff reviewed and consolidated alternative proposals submitted to date in Chapter IX, none of which are as equally effective within the same amount of time.

II. MODIFICATIONS MADE TO THE ORIGINAL PROPOSAL

MODIFICATIONS APPROVED AT THE BOARD HEARING AND PROVIDED FOR IN THE FIRST 30-DAY COMMENT PERIOD

Subsequent to the December 12, 2019, Board hearing, modifications to the original proposal were made at the Board's direction and to address comments received during the 45-day public comment period. CARB staff released a Notice of Public Availability of Modified Text and Availability of Additional Documents and Information (30-Day Notice)[2] on April 28, 2020, which notified the public of additional documents added into the regulatory record and presented additional modifications to the regulatory text.

The following is a summary of the changes made to the initial proposal as part of the 30-Day Notice. Staff's proposed modifications to previously proposed adoptions of new sections 1963, 1963.1, 1963.2, 1963.3, 1963.4, and 1963.5, that are to be codified into article 2, chapter 1, division 3, title 13 of the California Code of Regulations, and 2012, 2012.1, 2012.2, and 2012.3, that are to be codified into new article 3.1, chapter 1, division 3, title 13 of the California Code of Regulations, are summarized below. For further detail see Notice of Public Availability of Modified Text and Availability of Additional Documents and Information. Posted on April 28, 2020. Available online at: https://ww3.arb.ca.gov/regact/2019/act2019/30daynotice.pdf.

---

[2] California Air Resources Board. Notice of Public Availability of Modified Text and Availability of Additional Documents and Information. Posted on April 28, 2020. Available online at: https://ww3.arb.ca.gov/regact/2019/act2019/30daynotice.pdf.

Staff proposed changes to increase the number of ZEVs sold by manufacturers in California and to streamline reporting requirements for large fleets as directed by the Board.

For the manufacturer ZEV sales requirement, staff proposed changes to sections 1963 through 1963.5 to strengthen ZEV sales requirements and to provide a clearer market signal on the pathway to reach carbon neutrality by 2045 in California, which is consistent with Board direction and many public comments received for the ACT rulemaking. These changes are critical to California achieving its future ZEV adoption goals and to meet both climate and health-based air quality targets.

Staff proposed increasing the percentage of ZEV sales in California across all vehicle groups from 2024 to 2030 as well as from 2030 to 2035 rather than keeping them constant during that period. Staff also proposed including pickups in the ZEV sales requirement for the Class 2b-3 vehicle group beginning with the 2024 model year, rather than excluding them until 2027. This change will increase the number of ZEVs required to be sold in the Class 2b-3 vehicle group from 2024 through 2026 and is supported by new information in recent market announcements showing that a number of zero-emission pickup and van models will be commercially available from several manufacturers well before the 2024 model year. These changes in the Class 2b-3 vehicle group are necessary to ensure strong market signals for ZEVs produced in this category. Proposed increases in the Class 7 and 8 tractor group sales percentages are necessary to ensure there are sufficient tractor sales to meet the goal of achieving an all zero-emission drayage fleet by 2035 which would directly benefit disadvantaged communities and accelerate the market for tractors. In combination, these changes would increase ZEV sales in all vehicle size categories and would provide a clear path towards achieving carbon neutrality by 2045.

Staff proposed additional flexibilities for manufacturers that produce a small number of tractors each year as well as changes to ZEV and near-zero-emission vehicle (NZEV) credit lifetimes to align credit life for manufacturers with California's Greenhouse Gas Phase 2 regulations. Staff also extended NZEV credit for an additional five years from 2030 to 2035 for NZEVs that achieve more than 75 miles of all-electric range. A number of additional changes, both substantive and non-substantive, were made to clarify definitions, better explain credit accounting and retirement order, and prevent double counting of NZEV credits with the Advanced Clean Cars regulation.

For the large entity reporting requirement, staff proposed changes to sections 2012 through 2012.3 to streamline reporting while ensuring key data are still collected to support future ZEV fleet regulations. The changes would limit the required reporting to vehicle owners and brokers. Staff proposed removing the entirety of originally proposed section 2012.2, which eliminated the requirement to report information about contracting practices, facilities, and truck trip counts. CARB will still seek to gather this information through other means, including a voluntary survey by a third-party contractor.

Staff also proposed lowering the vehicle count threshold for the reporting requirement to fleets with 50 or more trucks and buses rather than the originally proposed 100 vehicle fleet size; this will ensure representative sampling of truck usage across more fleets, which is necessary given the higher ZEV sales proposed. Staff proposed including language that specifies a period of time for entities to respond to staff requests for clarification of apparent anomalies in reported information, to the extent they occur. A number of other changes included adding clarifying definitions, removing references to the sections that were removed, clarifying that personal residence information is not part of the reporting requirement, and adding examples of methods to use with existing data when responding to questions.

These changes are necessary to meet Board direction by strengthening ZEV sales requirements consistent with vehicle availability and technological feasibility. These changes would ensure long-term market signals are in place to help achieve carbon neutrality in California by 2045. Additionally, streamlining and clarifying large entity reporting is necessary to meet Board direction and stakeholder concerns, while ensuring critical information is gathered to support future rulemakings and policy decisions.

UPDATE TO THE INITIAL STATEMENT OF REASONS

In the Initial Statement of Reasons, page 84 (IV-35), the rationale for section 2012.1 errantly referenced sections 2012(b)(12), 2012(b)(13), and 2012(b)(14), The correct sections that should be referenced are sections 2012.1(a)(12), 2012.1(a)(13), and 2012.1(a)(14).

UPDATE TO THE ECONOMIC IMPACT ASSESSMENT IN THE INITIAL STATEMENT OF REASONS

As part of the 30-Day Changes to the regulation, staff released Attachment C: Updated Cost and Benefit Analysis. This attachment reevaluated the emission benefits, climate benefits, health benefits, and economic costs and benefits for the ACT regulation due to the proposed modifications. This document also outlines changes made to the economic analysis for the 30-Day Changes.

ADDITIONAL DOCUMENTS INCORPORATED INTO THE RECORD IN THE SECOND 15-DAY COMMENT PERIOD

Subsequent to the June 25, 2019, Board hearing, additional documents were incorporated into the rulemaking record to further support the rulemaking. CARB Staff released a Second Notice of Public Availability of Documents and Information (15-Day

Notice) [3] on October 5, 2020, which notified the public of additional documents added into the regulatory record. No modifications were made to the regulatory text.

NON-SUBSTANTIAL MODIFICATIONS

Subsequent to the 30-day public comment period mentioned above, staff identified the following additional non-substantive changes to the regulation:

1. Section 1963(c)(9). "Pounds" was added after GVWR 26,001 for the definition of Class 7-8 tractor group.

2. Section 1963(d). "The" was corrected to "their" to fix a grammatical error.

3. Section 1963.2(i). Replaced "or" with "and" for consistency with the phrase "produced and delivered for sale" used throughout the regulation. The original regulation text used "produce and deliver" and the notice for the 30 day changes described the modification as using "and" but "and" was inadvertently omitted.

4. Section 1963.5(a)(1). The *Audit of Record* provision was edited to read as "A manufacturer must make records of vehicle sales into California available to the Executive Officer within 30 days of a request for audit to verify the accuracy of the reported information. Submitting false information is a violation of this regulation and violators will be subject to penalty."

5. Section 2012(b)(5). Deleted "operated in California" to remove duplicative language used earlier in the sentence.

6. Section 2012(c)(2). Deleted the second use of "that" for proper grammar.

7. Section 2012(c)(4). Deleted "or" at the end for proper grammar since subsection (c)(4) is not the second to last in the list.

8. Section 2012(c)(5). Added "; or" at the end of this subsection (and deleted the period) for proper grammar as it is the second to last subsection in the list.

9. Section 2012(d)(2). Changed "Federal Motor Carrier Safety Association" to "Federal Motor Carrier Safety Administration" to use the correct name for the federal agency. The correct title is also found in 2012.1(a)(13).

10. Section 2012(e)(1). Changed "title 17, sections 91000-91022" to "17 CCR 91000-91022" to remain consistent with other sections referencing the California Code of Regulations in the regulation text.

---

[3] California Air Resources Board. Second Notice of Public Availability of Additional Documents and Information. Posted on April 28, 2020. Available online at: https://ww3.arb.ca.gov/regact/2019/act2019/15daynotice.pdf.

11. Section 2012.1(a)(15). Replaced “delivery” with “deliver” for proper grammar.

12. Section 2012.2(a)(7). Replaced “refueling infrastructure” with “fueling infrastructure” to be consistent with section 2012.2(a)(6).

13. Section 2012.2(b). “This” was added to amend a grammatical error to now read as “Additional guidance for analysis periods used to respond to questions in this section is located in 2012.2(b)(7).”

14. Section 2012.2(b)(2)(H). This provision was edited to fix grammatical errors to read as “… a vehicle that returns to the vehicle home base nightly for 9 out of 10 work days, or always stays at home base, ~~it~~ would be counted.”

III. DOCUMENTS INCORPORATED BY REFERENCE

The regulation adopted by the Executive Officer incorporates by reference the following document:

- Title 40 of the Code of Federal Regulations, entitled Protection of the Environment: 40 CFR section 86.1803-01, amended on July 1, 2011, incorporated by reference in section 1963(c)(15)(A).

This document was incorporated by reference because it would be cumbersome, unduly expensive, and otherwise impractical to publish it in the California Code of Regulations. Distribution to all recipients of the California Code of Regulations is not needed because the interested audience for this document is limited to the technical staff at a portion of reporting facilities, most of whom are already familiar with this document. Also, the incorporated document was made available by CARB upon request during the rulemaking action and will continue to be available in the future.

IV. SUMMARY OF COMMENTS AND AGENCY RESPONSE:

Written comments were received during the 45-day comment period in response to the December 12, 2019, public hearing notice, and written and oral comments were presented at the First Board Hearing. Written comments were received during the 30-day period in response to the release of the 30-Day Notice package which included the modified staff proposal, and written and oral comments were presented at the Second Board Hearing. Written comments were received during the 15-day comment period in response to the release of the 15-Day Notice. Listed below are the organizations and individuals that provided comments:

Table B: Comment Period Codes

Comment Code	Comment Period	Description
OP	45-Day	Written comments received during the 45-day comment period for the Original Proposal
B1	1st Hearing Written Testimony	Written comments submitted at 1st Board Hearing
T1	1st Hearing Oral Testimony	1st Board Hearing oral testimony comments
RP1	30-Day	Written comments received during the comment period for the 30-Day Notice
B2	2nd Hearing Written Testimony	Written comments submitted at 2nd Board Hearing
T2	2nd Hearing Oral Testimony	2nd Board Hearing oral testimony comments
RP2	15-Day	Written comments received during the comment period for the 15-Day Notice

COMMENTS RECEIVED DURING ORIGINAL PROPOSAL'S 45-DAY COMMENT PERIOD

Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements

Comment: Commenter states the ACT regulation should be stronger, making at least 15% of the California fleet ZEVs by 2030 and should include all medium- and heavy-duty vehicles in the requirements starting in 2024. [OP-01, OP-13, OP-28, OP-59, OP-72, OP-78, OP-96, OP-119, OP-123-Form, OP-124-Form, T1-56]

Comment: Commenter states CARB should set a standard to achieve 15% trucks on the road as zero-emission by 2030 to address pollution and climate concerns, as well as helping disadvantaged communities. [OP-01, OP-08, OP-45, OP-55, OP-56, OP-60, OP-62, OP-67, OP-68, OP-73, OP-77, OP-111, OP-112, OP-113, OP-118, B1-13, T1-17, T1-28, T1-33, T1-36, T1-37, T1-48, T1-49, T1-52, T1-53, T1-54, T1-55, T1-58, T1-59, T1-60, T1-61, T1-62, T1-65, T1-72, T1-74, T1-82, T1-88, T1-91, T1-92, T1-94, T1-95, T1-96, T1-97]

Comment: Commenter states that ACT regulation should be stronger, achieving at least 15% of the California fleet as ZEVs by 2030, and should include all medium- and heavy-duty vehicles in the requirements starting in 2024. Commenter outlines examples of how this can be done, discusses the need, supporting ZEV market, and policy drivers. Commenter also provides supporting comments regarding vehicle electrification suitability and model availability, ZEV market updates, favorable ZEV total cost of ownership, utility investments in ZEV infrastructure, and points out health and economic benefits from a stronger regulation.

Additionally commenter states that 15% ZEVs on-road by 2030 is feasible for 8 main reasons: total cost of ownership is positive today for some classes of electric trucks and is becoming more favorable for others; zero-emission trucks are rapidly becoming available; others are already electrifying faster than this proposal, providing Shenzhen's rapid turnover rates as an example; 80% of vehicles needed to meet this goal are currently suitable based on CARB's market assessment, and forecasted improvements make this goal achievable; urgent climate impacts can be mitigated by transitioning to ZEVs; ZE trucks could be outpaced by growth in combustion trucks; air quality and health benefits from transitioning to ZEVs are enormous.

Finally, Commenter states CARB's feasibility concerns about the state of readiness of ZEV technologies are unreasonable, as more vehicle sales could come from Class 4 through 8 category, CARB's feasibility study states more vehicle classes could be electrified if the whole population of all "1 or 2"'s were included, and new announcements demonstrate movement in the electric market for sectors CARB deemed less feasible. Additionally, anticipated demand for replacing drayage tractors would exceed commenter's "stronger" scenarios. Commenter states that strengthening

2b-3 category does not necessarily require electrification of pickup trucks. Commenter states CARB's caution due to "edge case assumptions" are unfounded, as commenter's strengthened proposal would only require electrification of less than 15% of pickups on the road by 2030, many of which belong to public fleets or commercial private fleets with use patterns suitable for electrification. Commenter also states that a conservative approach is unreasonable in light of Amazon's order of over 100,000 electric delivery vans to be deployed by 2024. Commenter provided supporting documentation, articles, and references to support their comment. [OP-02, OP-46, T1-10]

Comment: Commenter states CARB should set a more stringent manufacturer standard to get hundreds of thousands of ZEV trucks on the road by 2030 to address increases in goods movement and VMT, and to improve public health. Additionally, commenter states that all truck categories should be included starting 2024. Commenter also states CARB should set a stronger model for other states to adopt. [OP-15]

Comment: Commenter states that 15% ZEVs on-road by 2030 is feasible and necessary for the following reasons: trucks in the San Joaquin valley have easily electrifiable operations; ZE trucks could be outpaced by growth in combustion trucks; to protect environmental justice communities that are disproportionately affected by air quality issues; ZEVs provide air quality and health benefits; the Mobile Source Strategy deficits in PM 2.5 attainment are an opportunity to justify stronger, earlier action in the ACT regulation; and staff rejected the more cost-effective and more health-effective stringent alternative in the SRIA, but commenter believes the ACT regulation has the capacity to provide more relief than the current proposal.

Commenter also states the crediting mechanism coupled with the low sales targets would result in large manufacturers having no incentive to begin development as early as possible, as they could just buy credits from smaller manufacturers to delay product lines. Therefore, stronger sales targets are needed. [OP-28]

Comment: Commenter states CARB should consider increasing the sales requirements for 2b-3 and Tractor categories. [OP-33]

Comment: Commenter states that the regulation should be stronger, achieving higher sales percent targets of the California fleet being ZEVs by 2030 and should include all medium- and heavy-duty vehicles in the requirements starting in 2024. [OP-40, OP-85, OP-86, OP-88, OP-89, OP-90, OP-91, OP-92, OP-114, OP-120, B1-14, B1-15, T1-76]

Comment: Commenter requests that at least 15% of medium- and heavy-duty trucks on the road be zero-emission by 2030, and that Class 2b pickups should be included in the requirement beginning 2024. [OP-41, OP-48, OP-83, OP-117, OP-122, T1-13, T1-17, T1-40, T1-48, T1-98]

Comment: Commenter states CARB needs to move faster on acting on the health problems caused by diesel trucks. [OP-43]

Comment: Commenter states that regulation should be stronger, making at least 15% of the California fleet ZEVs by 2030 and requiring all trucks to comply sooner than 2027. [OP-64, OP-70]

Comment: Commenter states that regulation should be stronger, achieving commitment made by Governor Newsom in December 2017 to have “zero diesel pollution by 2030.” [OP-66]

Comment: Commenter states CARB should expand sales targets for Class 2b-3 pickup trucks to 15% and 60% by 2024 and 2030, respectively. Commenter also states Amazon’s recent purchase of Class 3 delivery vans from Rivian dwarfs the current proposal for the Class 2b-3 sales requirement and threatens to swamp the entire ACT regulation by creating a ZEV credit glut. Commenter states that Class 2a and 2b pick trucks, vans, and SUVs will be unable to rely as heavily on fleet mandates because they are part of a large category that are personal vehicles. For this reason, commenter recommends Class 2b pickup trucks should mirror the Advanced Clean Cars regulation in being the primary driver. Commenter provided supporting documentation, articles, and references to support their comment. [OP-72]

Comment: Commenter states the ACT regulation should be stronger. [OP-75, T1-29, T1-32, T1-34, T1-38, T1-57, T1-63, T1-64, T1-71, T1-73, T1-75, T1-81, T1-83, T1-84]

Comment: Commenter states that regulation should be accelerated, achieving California’s goal of deploying 1.5 million zero-emission vehicles by 2025. [OP-82]

Comment: Commenter states that public investment in infrastructure can support more zero-emission trucks than Staff's proposal would require. Commenter states setting weak mandates will be detrimental because ZEVs will be outpaced by growth of the freight industry, allow OEM to delay investments in ZE market, and low targets don’t align with California attainment commitments. Commenter states that stronger regulation is achievable by CARB's own estimates because more trucks are highly suitable for electrification and total cost of ownership shows more indirect cost savings for truck categories. [OP-83]

Comment: Commenter states CARB should adopt regulation to achieve 25% of all trucks as electric by 2030 to meet United Nations IPCC findings that CA must reduce GHG emissions by 50% by 2030. [OP-93]

Comment: Commenter states CARB should consider where the percentages of ZEV trucks sold in each medium- and heavy-duty class can be strengthened and to adopt those higher percentages. Commenter states that medium- and heavy-duty vehicles making up just seven percent of vehicles on the road, release 35 percent of total statewide NOx, 25 percent of statewide diesel PM emissions, and 23 percent of all on-road greenhouse gas emissions, all of which must be greatly reduced to reach California's greenhouse gas and air quality goals. [OP-94, T1-43]

Comment: Commenter states the proposed ACT regulation could be stronger, as a study commenter conducted comparing the ACT proposal to an alternative that achieves carbon-neutrality for California by 2045 shows potentially up to $62 billion more savings to California. Additionally, the study shows that ZEVs could be outpaced by growth in combustion trucks. The alternative would result in zero ICE trucks on the road by 2045. CARB should rigorously evaluate a more stringent alternative to consider adopting. Commenter provided supporting documentation, articles, and references to support their comment. [OP-97]

Comment: Commenter states CARB should strengthen the proposed regulation by starting the sales requirement for class 2b-3 pick-ups in 2024, altering the sales requirement to 20% of medium- and heavy-duty vehicles on the road by 2030 are zero-emission. [OP-109]

Comment: Commenter states that regulation should be stronger, making only 4% of the California fleet ZEVs by 2030 is not acceptable and the regulation should include all medium- and heavy-duty vehicles in the requirements starting in 2024. [OP-121-Form]

Comment: Commenter states the ACT regulation should be stronger, making at least 10-15% of the California fleet ZEVs by 2030 and 100 percent of the California fleet as ZEVs by 2045, respectively. [OP-125-Form]

Comment: Commenters in form letter state the ACT regulation should be stronger, committing to higher sales targets for zero-emissions trucks ranging from no specific suggestion up to 50% by 2030 on the road. Commenters also state that pickups should be included starting 2024. [OP-126-Form]

Comment: Commenter states the ACT regulation should be stronger, making at least 15% of the California fleet ZEVs by 2030 is the bare minimum and CARB should aim for 50% by 2025 instead. [OP-126-Form-3484]

Comment: Commenter states the ACT regulation should be stronger, making at least 20% to 30% of the California fleet ZEVs by 2030 and 2035, respectively. [OP-126-Form-3353]

Comment: Commenter urges CARB to strengthen the regulation to result in 15% of trucks on the road in California being zero-emission by 2030. Commenter states that ambitious sales requirements for zero-emission vehicles will feed commercial demand and improve the business case for electric trucks, allowing automakers and companies to capture savings from economies of scale. [B1-09]

Comment: Commenter recommends that the Board identify where the percentages of ZEV trucks to be sold in each medium- and heavy-duty class can be strengthened and to adopt those higher percentages. One example would be to require pickup trucks in Class 2b/3 to be available in 2024, along the same timeline as all of the other classes of trucks, by eliminating their 3-year exemption. [B1-10]

Comment: Comment states concern the current proposal will not be sufficient to reach California's clean air goals and recommends increasing the 15% sales requirement in Class 2b, 3, 7, and 8 categories. Also recommends sales requirement to be periodically reviewed and increased. [T1-02]

Comment: Comment states CARB should aim for 15 percent of medium- and heavy-duty vehicles on the road being zero-emission by 2030 to create jobs. [T1-14]

Comment: Commenter states CARB should mandate ZEV production for all vehicle types beginning in 2024. CARB should adopt higher sales requirements across all vehicle classes. CARB should aim for a rule that targets the market based on where it should be, not a rule that targets simply a floor. [T1-18]

Comment: Commenter states CARB should adopt a stronger rule resulting in hundreds of thousands of zero-emission trucks on the road by 2030. [T1-39, T1-40]

Comment: Commenter states CARB should propose a stronger sales requirement (four to five times the proposed requirement) as battery technology has improved more than Lawrence Berkeley National Labs expected, price reductions are 10 to 15 years ahead of schedule, total cost of ownership is lower than diesel given the right ecosystem. The current proposal is inconsistent with the carbon neutrality order, which requires four to five-fold increase in ZEV sales mandate. The net present value of a climate consistent, stronger proposal would result in benefits of $60 billion. [T1-45]

Comment: Commenter states that with a low target rule CARB is ensuring that costs will not be brought down as quickly as they could with scaled production and it would allow big trucking fleets to buy all the trucks in the market, while excluding small businesses. The ACT regulation should be stronger because it is feasible, trucks are ready to be electrified, costs are competitive, infrastructure investment are there, and the consumer demand is there. [T1-78]

Comment: Commenter states CARB should include ZEV sales requirement for all truck classes beginning in 2024 and increase the yearly and final percent target goals from 2024 to 2030. Additionally, companies, especially utilities, are eager to electrify their fleets, but are limited by the lack of EV models. [T1-98]

Agency Response: The approved regulation includes a number of modifications to the original proposal in response to comments to significantly increase the number of ZEVs sold in California across all vehicle groups from 2024 to 2030 and to increase the percentage requirements from 2030 to 2035 rather than keeping them constant during that period. In the Class 2b-3 vehicle group, the ZEV sales requirement for pickups now begins with the 2024 model year rather than excluding pickups until 2027. This change will increase the minimum number of ZEVs required to be sold in the Class 2b-3 vehicle group in 2024 through 2026 and is supported by new information in recent market announcements showing that a number of zero-emission pickup and additional van models will be commercially available from several manufacturers well before the 2024 model year. Changes in the Class 2b-3 vehicle group are necessary to ensure strong market signals align with future demand for ZEVs. The increases in the Class 7 and 8 tractor group sales percentages are necessary to ensure there are sufficient tractor sales to meet the goal of achieving an all zero-emission drayage fleet by 2035 which would directly benefit disadvantaged communities as numerous commenters have requested and to accelerate emission reductions in other areas with high concentrations of truck traffic. In combination, these changes would increase ZEV sales in all vehicle size categories and would provide a clear path towards achieving carbon neutrality by 2045.

In total the approved regulation would result in ZEVs for 15% of the fleet by 2035. The approved regulation does not achieve the same total vehicle sales goal some commenters suggest due to concerns about the feasibility of manufacturers to comply with even higher sales requirements especially for Class 2b-3 vehicles and tractors. At this time, both Class 2b-3 and Class 7-8 tractors have more focused concerns about payload, range, towing, charging/refueling infrastructure, and model availability than other vehicles. These issues will present more challenges in identifying suitable applications for their deployment in the early market. Increasing the number of ZEV sales further also increases the likelihood that manufacturers would need to produce more costly long-range vehicles, and that vehicles may need to be placed in applications where they may not be fully suitable. Therefore, the Board determined that the approved regulation is the most feasible path to meet ZEV deployment goals at this time.

Manufacturer ZEV Sales – Reduce the Number of ZEVs Deployed

Comment: Commenter requests penetration rates of class 8 vocational vehicles be the same as class 7 and 8 tractors. [OP-74]

Agency Response: No changes were made in response to this comment. This suggestion would reduce the number of ZEVs sold in the Class 4-8 category and is counter to the Board direction from the first hearing. At the hearing, the Board directed staff to increase the number of ZEVs deployed in California in all categories. See rationale for increasing ZEV sales in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements”.

Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements

Comment: Commenter states CARB needs to analyze the vocational vehicle sector and examine additional factors to determine how quickly a transition to ZEVs technology can occur in different classes. [OP-84]

Comment: Commenter states specific commercial fleet types and applications should be identified and prioritized for an optimized introduction of ZEV trucks. If CARB continues down the current two-track regulatory path for MD and HD vehicles, there is a real chance that manufacturers will be forced out of California market. Low product volume and the high number of different commercial vehicles applications makes unilateral, broad-based and naked ZEV sales mandate inherently impractical. CARB should direct staff to develop a more strategically focused regulation coupling ZEV sales mandate with specific fleet applications, including provisions and incentives to cover marginal costs of purchasing ZEVs and infrastructure, and better coordinate and take into consideration adverse impacts of both a heavy-duty duty on highway ZEV sales mandate and Low NOx Omnibus regulation. Sales mandates directed at beachhead markets should be coupled with a ZEV purchase mandate applicable to the operators of the target fleets of commercial trucks. [OP-87]

Comment: Commenter recommends pairing incentives and fleet requirements with manufacturer requirements to promote market acceptance of electrified products. Commenter urges CARB to execute market-enhancing policies such as incentives, to promote electrification purchases in all segments affected, and invest in the needed infrastructure for the high energy requirements of heavy-duty use cases and ensure availability in both urban and rural areas. Commenter states that a stable policy implemented alongside the ACT rule that hits all market segments impacted, especially in the pickup segments with its large share, would establish a market for electrified heavy-duty product and a more successful ACT regulation. Commenter states that if staff cannot implement the needed (and promised) fleet purchase mandates in time, ACT requirements should be reevaluated. [B1-11]

Agency Response: No changes were made to the regulation in response to these comments. Staff recognizes that some use cases may be more favorable than others and considered this in establishing the minimum ZEV sales requirement and the framework of the regulation. The approved regulation includes flexibility for manufacturers to produce and sell ZEVs into the market segments they deem to be most suitable for the products they manufacture. Specifically, the regulation provides flexibility for manufacturers to shift sales between weight classes, to bank and trade credits, to earn early credits, and to meet part of their compliance obligation with near-zero-emission vehicle sales that have a minimum all-electric range. This approach also recognizes that a single chassis can be used in multiple configurations and sold into multiple vehicle market segments. In summary, the approved regulation will ensure that manufacturers develop competitive ZEV products at price points that will meet fleet needs.

The Board directionally agrees with the concept of using both manufacturer and fleet rules to develop the medium- and heavy-duty ZEV market; however, the Board does not agree they need to be approved at the same time. The Board provided direction in the resolution to return with a ZE fleet rule by the end of 2021 that would begin implementation in 2024, the same initial implementation date as the manufacturer rule. In the resolution, the Board directed staff to work towards a goal to transition key market segments to zero-emission including drayage, first/last mile delivery, refuse, buses, utility, and government fleets.

Before fleets can purchase zero-emission vehicles, they need products available from major manufacturers that will be supported by a robust service and maintenance network. But to date, the major manufacturers have been relatively absent in this space despite the need for zero-emission technology. Up to this point, smaller startup truck manufacturers have stepped in to fulfill market demand and have been designing zero-emission trucks for a number of years. The majority of these startup companies do not have broad dealer networks or regional service facilities that can be leveraged quickly to provide support and maintenance services for zero-emission technology. Many have also lacked the ability to deliver very large orders for major fleets; additionally, several of these start-ups have failed and gone out of business despite having large orders. This has hampered ZEV expansion for early adopter fleets.

The manufacturer sales requirement was developed first because manufacturers need sufficient lead time to research and develop products, perform validation, work with suppliers and establish production lines and a suitable repair and maintenance network prior to production and sale of ZEVs.

Manufacturer ZEV Sales - EMA Proposal

Comment: Commenter states that it wishes for CARB to work with the EMA and other interested stakeholders through the 30-Day Notice process to identify those specific segments of the heavy-duty market that are more readily amenable to electrification, and move forward with 100 percent sales mandates in those segments. The 100 percent mandates would achieve or even overachieve the volumes and time frames the staff is proposing. Commenter believes that the ACT regulation should be focused on mandating the use of ZEV technologies in prioritized, specific segments that are more readily suited to that technology, even earlier than the staff is proposing. Commenter believes this approach would allow specific markets to identify incentives and infrastructure needs while creating beachheads for ZEVs in California. Commenter states that new school buses and municipal fleet step vans could be 100 percent ZEVs in 2023. That in 2024, a 100 percent of new public utility vehicles and yard tractors can be ZEVs. That in 2025, 100 percent of the new step vans, airport service vehicles, and non-airport shuttle buses can be ZEVs. And that in 2026, 100 percent of refuse trucks can be ZEVs. [B1-05, T1-19]

Comment: Commenter states CARB should work with industry and other stakeholders to develop a more focused approach to the ZEV sales requirement which focuses on early adoption in best fit markets, and couples incentive policies to the rule. [T1-11]

Comment: Commenter agrees with Volvo, the rule should have used a focused approach based on certain categories. Commenter agrees with the EMA proposal specifically regarding further segmentation. [T1-79]

Comment: Commenter states CARB should to continue to work on the EMA proposal "beachhead strategy" moving forward with the regulation. Commenter states that the average fleet is struggling to comply with the Truck and Bus regulation and there are approximately 82,000 non-compliant vehicles. Commenter states that the Truck and Bus Regulation is dominated by small businesses and they will have trouble adjusting to the ACT rule. [T1-80]

Agency Response: No changes were made to the regulation in response to these comments. Staff worked with EMA at the Board’s direction to assess the feasibility of EMA's proposal. Several key issues make the EMA proposal unfeasible. First, because the proposal requires 100% of sales and purchases be ZEV, it would by default necessitate a fleet rule. Modifying staff’s proposal to incorporate the EMA proposal would require expanding the rule’s scope to include an entirely new set of stakeholders that have not been noticed about this rulemaking. This would require an entirely new rulemaking and delay the proposal until at least mid-2021 to allow for re-noticing to a much broader population of stakeholders. This is inconsistent with the Board direction for a swift and strengthened proposal to be brought forth.

Additionally, staff and EMA could not find a way to ensure 100 percent of all affected fleets would be able to meet their operational needs with available vehicles. A 100 percent requirement in any sector would mean all fleets must purchase only ZEVs, including small fleets, fleets who cannot install infrastructure to electrify, fleets who have variable operation or must respond to emergencies require widespread infrastructure buildout to account for all use-cases, which would not be feasible by the suggested beginning timeframes in 2023. Some sectors including pickups, vans, and tractors do not easily fit in a 100 percent requirement as the vehicles produced can be used in a wide variety of applications. Finally, staff expects the market to gravitate toward beachhead categories on its own, as the nexus of favorable economics, centralized infrastructure, and ZEV-friendly use cases would create market opportunities for businesses to capitalize on.

Manufacturer ZEV Sales – Add Off-Ramps to the Proposal

Comment: Commenter states CARB should add off-ramps to suspend the ZEV sales mandate if adequate fleet-rule purchase mandates and ZEV infrastructure installations are not in place by 2024. [OP-87]

Comment: Commenter recommends the incorporation of review mechanisms into the regulation that assess both market acceptance of electrified products and infrastructure (lead time and availability), and adjust requirements accordingly. Commenter recommends that CARB consider battery technology (cost, capacity, energy density, specific energy, etc.), customer demand, purchase mandates, and the number of charging stations as objective metrics to assess rule success. If these metrics fall short of expectations, commenter recommends that CARB postpone implementation of the heavy-duty mandate or reduce the number of ZEVs required. Commenter provided supporting documentation, articles, and references to support their comment. [B1-11]

Agency Response: No changes were made to the regulation in response to these comments. The Board determined that developing regulatory off-ramps as suggested is unnecessary and is counter to the goal of providing certainty to the market. The Board approved the regulation without off-ramps to ensure that vehicle manufacturers, suppliers, and infrastructure manufacturers have certainty in making long-term investments needed to ensure large-scale deployment of ZEVs in California.

The regulation's structure gives manufacturers flexibility to bank credits, shift sales between weight classes, and trade credits with other manufacturers. These flexibility provisions give manufacturers assurance that they can comply and does not introduce the uncertainty associated with potential off-ramps.

Manufacturer ZEV Sales – Total Cost of Ownership Concerns for Pickups

Comment: Commenter states that even with the overly optimistic assumptions in CARB's Total Cost of Ownership (TCO) calculator, a conventional Class 2B-3 pickup truck is still less expensive to operate than a ZEV pickup in the 2024 through 2030 timeframe. When CARB's assumptions are corrected to maintain the towing and hauling capacity, the battery size increases 2.5 times. Using the TCO calculator default assumptions with the increased battery size, a Class 3 pickup truck would cost $32,000 more than a conventional truck (a 66% increase). [OP-87]

Comment: Commenter recommends aligning phase-in of pickup and pickup-based products with cost of ownership based on true heavy-duty hauling and towing capability. Commenter states that CARB's analysis was missing for the pickup based portion of the heavy-duty market that span Class 2b-5 segments which make up more than one-third of California's total heavy-duty sales. Commenter states that this analysis, shows that BEV pickup applications are cost negative, even when assuming small battery sizes that limit capability and purchase incentives unlikely to be available to most pickup purchasers. Commenter states that when assumptions are corrected, the cost penalty for BEV heavy-duty pickups increases and capability is still compromised. Commenter recommends that that Class 2b/3 pickup sales requirements start in 2027MY and also recommends the Board consider expanding this timing decision to pickup-based Class 4/5 vehicles. Commenter provided supporting documentation, articles, and references to support their comment. [B1-11]

Comment: Commenter states that CARB's analysis indicates higher lifetime costs for electrified HD pickup trucks. Commenter states that CARB's TCO model suggests that electrified class HD pickup trucks have higher costs than their conventional counterparts throughout the entire period of the ACT policy (2030), even when considering LCFS savings. Commenter states that the lack of a positive total cost of ownership for prospective HD pickup truck consumers even in 2030 is particularly striking given the assumptions that favor electrification throughout the analysis. Commenter states that there are several TCO assumptions that are unrealistic for HD pickup trucks, suggesting that the actual lifetime costs for a fully electric pickup is even less favorable. These unrealistic TCO assumptions include inadequate range and battery capacity, the lack of resources by small fleets to monetize LCFS credits, and the 12-year vehicle lifetime is overstated. [B1-16]

Agency Response: No changes were made to the regulation in response to these comments. Staff disagrees with the premise that the early ZE truck market will need to serve use cases that require the maximum possible range and hauling capacity for a given vehicle type and for that reason did not include it as a representative scenario in the cost analysis. To the extent that some applications such as pickups used for towing and hauling are not suitable to electrify or are significantly more costly, manufacturers can focus their efforts on other use cases that are more suitable for electrification. The approved regulation will ensure that manufacturers develop competitive ZEV products at price points that will meet fleet needs.

The Class 2b-3 costs listed in the Staff Report were estimated based on lower range vans because vans commonly travel shorter distances, often return to base and have lower towing demands than other trucks. Staff foresaw this as being the most likely market for early ZEV deployments and based the cost assumptions on this. However, in the months since the Staff Report was released, there have been a number of announcements regarding zero-emission pickup trucks, described in further detail in Attachment B of the 30-Day Changes, indicating staff may have been too conservative in assuming the possible number of Class 2b-3 sales.

Furthermore, the regulation's structure gives manufacturers flexibility to bank credits, shift sales between weight classes, and trade credits with other manufacturers. This means that a manufacturer who sells pickups, vans, and trucks can meet their compliance obligation by producing ZE vans and trucks without producing any ZE pickups for a number of years if there are better markets to serve or can purchase credits from other manufacturers regardless of the truck types they sold to earn their credits.

Manufacturer ZEV Sales – Operational Challenges for Electrification of HD Pickups

Comment: Commenter states that CARB's analysis shows barriers to near-term electrification of HD pickups. For example, CARB's analysis shows that 99% of California pickups by end use and annual sales volume are not well suited to near-term electrification. As shown in CARB analysis, the relatively poor scores for pickups are due to a combination of factors including range, route variability, infrastructure, and battery space constraints. Commenter states that has been some confusion in workshops and stakeholder meetings about the distinction between fully capable HD pickups used as "work trucks" and their light-duty (LD) counterparts. Commenter states that it is important for policymakers to continue to distinguish the very different abilities, requirements, and use cases of LD (class 2a) pickup trucks vs. HD (class 2b/3) pickup trucks, and to avoid conflating the near-term promise of greater LD electrification with the ill-suited nature of most HD pickup trucks. [B1-16]

Agency Response: No changes were made in response to this comment. As noted in Appendix E to the Staff Report, staff recognizes that Class 2b-3 pickups face additional challenges to electrification. However, staff's updated analysis in Attachment C to the 30-Day Changes shows that Class 2b-3 pickups are showing greater feasibility than modelled in the Staff Report. Based on this updated analysis, higher requirements on Class 2b-3 vehicles are feasible.

Furthermore, the regulation's structure gives manufacturers flexibility to bank credits, shift sales between weight classes, and trade credits with other manufacturers. This means that a manufacturer who sells pickups, vans, and trucks can meet their compliance obligation by producing ZE vans and trucks without producing any ZE pickups for a number of years if there are better markets to serve or can purchase credits from other manufacturers regardless of the truck types sold to earn their credits.

Manufacturer ZEV Sales – Higher Costs Are Barrier to ZEV Deployment

Comment: Commenter states that the most widely recognized barrier to the deployment of ZEV MD and HD vehicles is their substantially higher cost compared to their conventional counterparts. Commenter states that the cost to purchase and deploy an advanced technology vehicle is greater than just the incremental cost. Fleets pay increased sales tax on a more expensive vehicle and face other costs associated with new technologies, such as training and adapting to new maintenance procedures. Commenter states the ability to support California's transportation needs has not been demonstrated for electric MD and HD vehicles. [B1-07]

Agency Response: No changes were made to the regulation in response to this comment.

Staff's methodology to evaluate costs was to look at both the cost to the state as a whole and to look at the total cost of ownership for a vehicle. This method illustrates the costs to both California and a typical fleet. Through these analyses, staff found that while zero-emission vehicles will cost more upfront due to higher vehicle costs and additional infrastructure costs, they will cost less over their lifetime due to lower fuel costs, LCFS revenue, and reduced maintenance expenses. ZEVs placed into well-suited applications will see a positive TCO versus their diesel counterparts, and more applications will show a payback over time as ZEV costs decline.

Staff held numerous workgroup meetings to discuss what cost assumptions to use and what applications to evaluate. Staff used the best available information to evaluate costs. While there are many unknowns regarding future costs, staff does not agree that is too premature to develop a cost model to inform the Board's decision.

Lastly, the regulation does not place a requirement on fleets to purchase ZEVs. Therefore, fleets will only purchase ZEVs if it is economical to do so or if they have a different reason e.g. sustainability goals.

Manufacturer ZEV Sales – Maintain Delayed Timeline for Pickups

Comment: Commenter supports exempting pickup trucks in class 2b-3 group until 2027. [OP-99] [B1-11]

Comment: Commenter states that the incorporation of HD pickup trucks should not occur any earlier than proposed by CARB staff. Commenter states that the ACT policy as proposed would fall unevenly in volume on HD pickup trucks due to the disproportionate number of these vehicles within the combined class of heavy-duty vehicles targeted by the ACT policy (~8,500 lbs. GVWR). For example, national registration data obtained by General Motors for the 2018 calendar year suggests that approximately 65% of the vehicles targeted by the ACT would be made up of class 2b/3 pickup trucks alone. Commenter states that arguably, the proposed MY 2027 start date is insufficient given the unique challenges of this market, and commenter encourages the Board to consider a start date such as the 2030 model year or a slower phase-in given operational challenges, total cost of ownership, and a relative lack of policies to support demand in the HD pickup market. [B1-16]

Agency Response: No changes were made to the regulation in response to these comments, but changes were made to the 2b-3 group in response to Board direction. Staff modified the original proposed start date for Class 2b-3 pickups to be consistent with Board direction and new information about zero-emission pickups. For staff's justification for removing the delayed timeline for pickup trucks, see chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer

ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements".

Manufacturer ZEV Sales – Insufficient Lead Time

Comment: Commenter referenced section 202(a) (42 U.S.C. § 7521(a)) of the Clean Air Act that requires that EPA give a minimum of four full years of lead time before new heavy-duty vehicle emission standards can take effect and because of this requirement, the proposed regulation would be invalid under federal law. [OP-87]

Agency Response: No changes were made to the regulation in response to this comment. The lead-time provisions of section 202(a)(3)(C) of the Clean Air Act (CAA) do not apply to the ACT regulation. Section 202(a)(3)(C) only applies to standards "promulgated or revised under this paragraph [section 202(a) of the CAA]," that is, to standards promulgated by the Administrator of the U.S. EPA. Since CARB adopted the ACT regulation pursuant to authority of California state law and the waiver provisions of section 209(b) of the CAA, the lead-time requirement simply does not apply.

Since 1970, U.S. EPA has typically applied a "2-pronged" test of whether California standards are consistent with CAA section 202(a) as required by section 209(b)(1)(C). The standards must be: (1) technologically feasible in the lead time provided considering the cost of compliance, and (2) compatible with the federal test procedures so that a single vehicle could be subjected to both tests. No more should be required. This is in accord with the legislative history of section 209. When the California waiver provisions and the "consistent with section 202(a)" language were first placed in the CAA in 1965, section 202(a) consisted of just one sentence requiring adequate lead time in consideration of technological feasibility and economic costs. In the 1977 CAA amendments, Congress amended section 209 "to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare." (H. R. Rep. No. 294, 95th Cong., 1st Sess. 301 (1977), reprinted in 4 Leg. Hist. at 2768.) At the same time, Congress expanded section 202(a) to add several directives to U.S. EPA regarding its adoption of emission standards, including the 4-year lead time requirement for heavy-duty vehicles. Given Congress's expressed intent to strengthen the waiver provisions, it is unlikely Congress intended to apply the specific 4-year requirement to California.

Moreover, the Board directed staff, to the extent it is necessary, to either request a waiver or a confirmation that the regulations are within the scope of an existing waiver of federal preemption pursuant to section 209(b) of the Clean Air Act.

Manufacturer ZEV Sales – Exempt Class 8 Vocational Vehicles

Comment: Commenter states that Class 8 vocational vehicles have general operational characteristics that are less favorable for electrification because they have multiple types of unpredictable routes, greater concerns about payload, varied daily range needs, stop-and-go operations, and return to multiple locations daily where they can be charged or fueled. Therefore, they should not be included. [OP-81]

Agency Response: No changes were made to the regulation in response to this comment. As part of the rulemaking process, staff worked closely with stakeholders to develop a market segment analysis that can be found in Appendix F to the Staff Report. This analysis assessed 87 market segments in the Class 2b-8 market and assessed their suitability for electrification based on payload issues, daily range, infrastructure access, and space considerations. The analysis found that while many segments present challenges, there are a large number of segments that are well suited for electrification across the medium- and heavy-duty truck market. In particular, refuse trucks, yard trucks and box trucks are well-suited for electrification within the Class 8 vocational market. The suitable market for ZEVs is expected to expand further as ZEV technology improves, access to infrastructure expands and ZEV weights decline. Excluding all Class 8 vocational vehicles is unnecessary and is counter to the Board direction because it would reduce the number of ZEVs deployed. Furthermore, the regulation’s structure gives manufacturers flexibility to bank credits, shift sales between weight classes, and trade credits with other manufacturers to meet their compliance obligations.

Manufacturer ZEV Sales – Exempt Agricultural Trucks and Other Vehicles with Potential Barriers

Comment: Commenter asks for an exemption from sales requirement for "vehicles such as agricultural light duty trucks, which will likely face challenges with infrastructure". [OP-108]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation does not define vocation-specific requirements for manufacturers; instead, it allows manufacturers to evaluate their product portfolio and customer base to determine which vehicles they should electrify. As a result, the proposal does not require manufacturers to sell to vocations that are not well-suited for electrification. To the extent that some applications such as agricultural trucks are not easy to electrify, manufacturers can focus their efforts elsewhere. As a result, there is no need to exempt specific vehicles as the proposal does not pigeonhole manufacturers into selling any particular vehicle.

Manufacturer ZEV Sales – Credit for Low NOx Engines and Renewable Fuels

Comment: Commenter states that the ACT regulation could achieve 25-50% market penetration by 2025 by including class 7-8 low NOx trucks with renewable fuel that meet or exceed the 0.02 g/bhp-hr NOx standard. Commenter states that including such low NOx trucks would help to surpass the projected emission reductions sought by the ACT regulation. Commenter recommends adding a partial credit for the inclusion of heavy-duty low NOx trucks. Commenter recommends that the proposed credit generation system exist up until CARB implements a new heavy-duty emission standard for internal combustion engines that meets or exceeds the 0.02 g/bhp-hr NOx standard. Commenter states that the proposed credit generation system would expire when the heavy-duty ZEV market has matured in cost, performance, infrastructure, and availability metrics. [OP-07, B1-12]

Comment: Commenter states that low NOx engines using renewable fuels should be included in the ACT regulation, as they are one of the most cost-effective near-term remedies for existing NOx and GHG emissions. [OP-11, T1-42]

Comment: Commenter states CARB should encourage all low carbon/sustainable fuels rather than focusing exclusively on zero-emission technology solutions. Commenter states CARB should allow ultra-low NOx vehicles to acquire credits, at least in the short term, as a single transportation technology may not be not be the correct strategy in many instances. [OP-32, T1-12]

Comment: Commenter states that Low NOx engines should be included in the rule strategy. [OP-44]

Comment: Commenter states that Low NOx engines should generate credits if deployed sooner than the proposed Low NOx Omnibus rule. [OP-60]

Comment: Commenter states that Low NOx trucks running on renewable gas should generate manufacturing credits just like plug-in hybrid electric vehicles. [OP-63]

Comment: Commenter suggests that both Zero-emission and Low NOx truck strategies be included in the proposed ACT Regulation. [OP-79, OP-80]

Comment: Commenter states that including low NOx class 4 - 8 trucks that meet or exceed the 0.02 g/bhp-hr NOx standard and use renewable fuel could achieve 25-50% market penetration by 2025 while surpassing the projected emission reductions sought by the regulation. [OP-80]

Comment: Commenter suggests the ACT regulation and the Low NOx Omnibus rule should be coordinated to better assess the combined aggregate costs and feasibility issues. [OP-87]

Comment: Commenter states they believe that near-zero technologies are being overlooked and need to be considered as an important pathway to achieving the goals from the proposed regulation. [OP-105]

Comment: Commenter suggest that alternative fuel vehicles should be included in the rule until a secure reliable updated electrical grid is in place, as the commenter doesn’t want to be enslaved by an electric choice that does not address the reality that oil-based fuel has been reliable. [OP-121-Form-277]

Comment: Commenter recommends CARB remain open to additional technology options in its pursuit of a net-zero vehicle emission future and that additional compliance pathways are included into the ACT proposal. Commenter suggests that CARB consider partial compliance of ZEV mandates via ultra-low NOx trucks fueled by low to net zero carbon fuels under the ACT or a complementary in-use fleet regulation. [B1-04, T1-08]

Comment: Commenter recommends CARB staff work with SCAQMD staff to determine fleet makeup to reach the 2023 standard and the 2031 standard for ozone attainment through strong incentive programs to replace diesel vehicles with commercialized technologies that are currently available, like ultra-low NOx natural gas engines. [T1-01]

Comment: Commenter states that renewable propane has carbon intensity similar to that of electric and including this with low NOx vehicles would significantly decrease carbon and NOx emissions. Commenter recommends including both zero-emission and low NOx strategies in the ACT regulation. [T1-16]

Comment: Commenter states CARB should include SCAQMD's definition of near-zero which includes the strictest optional low NOx standards for Class 7-8 trucks. Commenter states that incorporating ultra-low NOx trucks into the proposed near-zero standards means more choice and flexibility for fleet operators, addresses impacts to communities, meets CARB's main objective cleaning the air, and provides a pathway for the rule to be strengthened. [T1-21]

Comment: Commenter states that drayage industry already invested in near-zero (not CARB's definition) vehicles in Southern California so they should be allowed to fulfill operational obligations. The CTA would like to include all modes of zero and near-zero (not CARB's definition) technology. [T1-46]

Comment: Commenter states that instead of getting 15 percent by 2030, by doing near-zero and RNG in-state, we can get 50 percent by 2025 and implement SB 1383. [T1-49]

Comment: Commenter states that Low NOx engines have already been invested in and they provide significant benefits. There is uncertainty that commenter will get full lifecycle out of investments made in natural gas. [T1-69]

Agency Response: No changes were made to the regulation in response to these comments. This regulation constitutes one component of CARB's measures intended to achieve emissions reductions from medium- and heavy-duty vehicles, and the fuels they use. The purpose of the ACT regulation is to accelerate the widespread adoption of zero-emission vehicles (ZEVs) in the medium- and heavy-duty truck sector to reduce harmful emissions from on-road mobile sources beginning with the 2024 model year. The primary objectives of the ACT regulation identified in the Staff Report include the following:

- Accelerate first wave of zero-emission (ZE) truck deployments in best suited applications;
- Achieve 100 percent zero-emission pickup-and-delivery in local applications by 2040;
- Support the Ports of Los Angeles and Long Beach Clean Air Action Plan for 100 percent zero-emission drayage trucks by 2035;
- Support AB 739 requiring California state government fleets to purchase ZEVs;
- Enable a large-scale transition to zero-emission technology;
- Maximize the total number of ZEVs deployed;
- Complement existing and future programs;
- Provide environmental benefits, especially in disadvantaged communities thereby supporting the implementation of AB 617;
- Ensure requirements are technologically feasible and cost effective; and
- Foster a self-sustaining zero-emission truck market.

Emissions associated with new heavy-duty diesel and Otto-cycle engines used in on-road heavy-duty vehicles are being addressed by other policies and rulemaking actions, including the Low NOx Omnibus rulemaking and the existing Low Carbon Fuel Standard regulation.

The Low NOx Omnibus rulemaking primarily requires engine manufacturers to reduce the emissions of their new heavy-duty engines starting in the 2024 model year, and includes provisions for manufacturers to earn credit for the early introduction of cleaner engines or certifying engines to more stringent emission standards. The new standards would reduce emissions from all combustion engines sold in California, so that all engines will have similar emissions to those that are being referred to as low NOx engines today. By 2024 when the ACT regulation begins, all conventional internal combustion engines will be required to certify to a 0.05 gram of NOx per brake horsepower-hour standard, by 2027 all conventional internal combustion engines will be required to certify to a 0.02 gram of NOx per brake horsepower-hour standard. To the extent that manufacturers elect to certify and introduce engines that meet more stringent NOx emission standards or that meet more stringent NOx emission standards before specified timelines, they can generate credits under the credit provisions established by the Low NOx Omnibus rulemaking. Allowing manufacturers to also generate credits under the ACT regulation would unreasonably allow manufacturers to double the quantity of credits they are entitled to, which would in effect undermine CARB's goals in enacting both the Low NOx Omnibus and the ACT regulation – to significantly decrease emissions from on-road heavy-duty vehicles operating in California.

Furthermore, providing credit in the ACT regulation for engines that simply meet the NOx emission standards set by the Low NOx Omnibus rulemaking would offset ZEV sales that have no exhaust emissions, and would accordingly achieve fewer emission benefits and would be counter to the Board direction to maximize the number of zero-emission vehicles sold.

As for comments about low carbon fuels, the Low Carbon Fuel Standard regulation is already reducing lifecycle emissions from transportation fuels and the benefits resulting from that regulation cannot be claimed again as suggested by several commenters. The LCFS requires fuel producers and importers to reduce the carbon intensity of their transportation fuels and includes a credit mechanism to provide flexibility to regulated parties to meet the standard. This framework results in a strong market-based incentive for low carbon fuels including biofuels, electricity, and hydrogen which can generate credits to be sold to other regulated parties for their compliance. However, the benefits from switching from conventional fuels to a low carbon fuel of the same type have already been attributed to the LCFS regulation as described in the 2018 LCFS Staff Report and cannot be counted again in another regulation. Therefore, RNG and other low carbon fuels that are produced and sold as a result of the LCFS regulation would not result in new benefits by including these fuels in the ACT regulation. Conversely, when estimating the benefits of the LCFS regulation and its amendments, staff recognized that the LCFS regulation by itself would not be sufficient to encourage fleets to switch to zero-emission vehicles because it means fleets would need to switch to a new vehicle technology and a new fuel type rather than switch to a low carbon variant of the same fuel. Therefore, the low carbon fuel benefits from operating ZEVs was not included in the LCFS and are properly attributed to the ACT regulation and results in benefits that have not been previously claimed by another regulation. Therefore, the commenter's suggestions to include low NOx engines and low carbon fuels would only duplicate what is already expected from the LCFS and the Low NOx Omnibus rulemaking and would not result in any new emission benefits for NOx nor GHG emissions beginning in 2024 which is the timeframe of the approved regulation.

Manufacturer ZEV Sales – Allow More Technologies and/or Fuel Options

Comment: Commenter states that the proposed sales mandates in the ACT are extremely ambitious. Commenter states that until CARB and the manufacturers are able to collaboratively show that these goals are achievable at some reasonable point in time, commenter urges CARB not to shut the door on continued advances in the portable transportation fuels market. Commenter states that putting all of California transportation fuel needs in one basket is a mistake, at least until it can be adequately demonstrated that ZEVs are cost-effective, reliable and feasible. [B1-07]

Agency Response: No changes were made to the regulation in response to this comment. See staff discussion on how the ACT regulation has the primary purpose of expanding electrification in California, but is one of a suite of CARB efforts to reduce emissions from vehicles and fuels, in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Credit for Low NOx Engines and Renewable Fuels".

Manufacturer ZEV Sales – Low NOx Needed for Long-Haul

Comment: Commenter states that Low NOx engines provide a backstop if commercial ZEVs are not available by 2024 for long-haul fleets. [OP-07]

Agency Response: No changes were made to the regulation in response to this comment. Staff recognizes that long-haul will be one of the more challenging sectors to electrify. Staff evaluated that long-haul fleets are challenging to electrify in Appendix E to the Staff Report due to the range and infrastructure concerns associated with long-haul. Due to these challenges, staff proposed lower requirements in the Class 7-8 tractor requirements than in other categories. To the extent that some applications such as long-haul tractors trucks are not easy to electrify, manufacturers can focus their efforts elsewhere. Staff anticipates manufacturers can meet the requirements with drayage and short-haul trucks in the near-term and expanding to regional haul over time.

In August, staff presented a complementary Low NOx Omnibus rulemaking to the Board which requires the remaining combustion-powered vehicles to transition to cleaner possible combustion technologies. This supporting regulation will work in conjunction with the ACT regulation to reduce the emissions of hard-to-electrify segments such as long-haul.

Manufacturer ZEV Sales – Near-Zero-Emissions Vehicle Definition

Comment: Commenter states that the proposed ACT regulation restricts the definition of "near-zero" to only "plug-in hybrids with some all-electric range", purposely omitting low NOx vehicles. Commenter states that there is a long history of low NOx vehicles being included in the definition of "near-zero". For instance, the South Coast Air Quality Management District includes it in the definition of the Indirect Source Rules. CARB in agency documents have also included it at various times. And even opponents do refer near-zero -- as near-zero for low NOx vehicles. [OP-07, T1-41]

Comment: Commenter states that any new definition of "near-zero" should be vetted through a separate public process because the ACT usage is inconsistent with generally accepted use and severely limits its application. [OP-44]

Comment: Commenter states the redefining the definition "near-zero" should be reconsidered. Commenter states that several agencies use “near-zero” as having 90 percent reduction or better. Using the definition outlined in funding plan would redefine what “near-zero" means to the general public and state and local policymakers. [OP-63, T1-66]

Comment: Commenter is perplexed why the regulation interprets the term "near-zero" to apply only to plug-in hybrids with some "all-electric range". Commenter requests current proposed regulation emulate the current definition of near-zero. [OP-81]

Comment: Commenter states it is time to reinforce the existing ‘near-zero’ definition in statute coupled with an in-state RNG requirement to restore the HVIP funding that was discontinued at the October 2019 CARB meeting. Commenter states the need to include the low NOx engine into the near-zero definition. Commenter also supports the comments submitted by Solid Waste Association of North America (SWANA) and the California Refuse Recycling Council (CRRC). [OP-101, T1-49]

Comment: Commenter states CARB should revise the definition of "near-zero" to include low NOx engines. [OP-106]

Comment: Commenter states that the ACT regulation restricts the definition of "near-zero" to only "plug-in hybrids with some all-electric range", purposely omitting low NOx vehicles. Commenter states that there is a long history of low NOx vehicles being included in the definition of "near-zero". Commenter states the proposal's definition of near-zero should change because it conflicts with zero and near-zero definitions in AB 2061, which provides a weight exemption for alternative fuel vehicles. Commenter states that the conflicting definitions could result in confusion for CHP enforcement at weight scales. [B1-12, T1-44]

Comment: Commenter states CARB should include SCAQMD's definition of near-zero which would include low NOx and offer more choice and flexibility for fleet operators to offset diesel. [T1-21]

Agency Response: No changes were made to the regulation in response to these comments. The term “near-zero” has been used in different ways depending on the specific program and its meaning has evolved over time. For the purpose of this regulation, near-zero-emission vehicles (NZEV) are plug-in hybrid electric vehicles powered by both an internal combustion and battery-electric powertrain that are capable of operating like as a zero-emission vehicle for some distances. NZEVs are considered a bridge technology which will help the development of the full ZEV market by electrifying sectors not well suited to full electrification and supporting the ZEV supply chain.

The definition of “near-zero-emission vehicle” used in the ACT regulation is designed to apply to 2024 and later when all new engines sold are expected to have significantly lower emissions as required by the Low NOx Omnibus rulemaking. At that point, it is not meaningful to include solely combustion-powered vehicles in the definition of “near-zero-emission vehicles” as all new vehicles will meet or be close to the commenters’ “near-zero” definition. Staff’s definition is appropriate for the timeframe that the rule will be implemented in.

Manufacturer ZEV Sales – Credit for Conventional Hybrids

Comment: Commenter states that all hybrid technologies should be placed on an equal regulatory footing and should eliminate the negative crediting of hybrids. Also, commenter suggests CARB should allow hybrids to earn credits based on their relative reduction of GHGs. [OP-84]

Comment: Commenter recommends CARB to allow hybrid electric vehicles as defined in the Phase 2 GHG regulation to earn partial credits for a portion of ZEV compliance. [B1-04, T1-08]

Agency Response: No changes were made to the regulation in response to these comments. Conventional hybrid technologies have been commercially available in the heavy-duty sector for over a decade at this point, and other regulations including the California and Phase 2 GHG regulations already incentivize their purchase and use. Because the objective of the ACT regulation is to foster the deployment of zero-emission technologies, hybrid vehicles without zero-emission capability are not sufficient to meet the regulation’s goals. Plug-in hybrid vehicles meeting a minimum all-electric range requirement are a bridging technology that can offer zero-emission capability in applications that are not currently suitable for ZEVs; as a result, staff is giving partial credit for these near-zero-emission plug-in hybrids.

Manufacturer ZEV Sales – Add Credit for Electrified Power Take Off

Comment: Comment: Commenter states CARB should encourage creative solutions that could have near-term impact on existing emissions including technologies that reduce idling emissions from work trucks, such as electric power take-off. [T1-79]

Agency Response: No changes were made to the regulation in response to this comment. The regulation is designed to enable a large-scale transition to zero-emission technologies in the medium- and heavy-duty truck market. Vehicles that cannot operate part-time as a pure ZEV are not considered to be “near-zero” in the approved ACT regulation. Hybridization and ePTO technologies are already commercially viable without incentives and awarding credit for them would decrease the number of ZEVs produced.

Manufacturer ZEV Sales – Support Credit for Plug-in Hybrids

Comment: Commenter states general support for the PHEV credits currently allowed the proposed ACT regulation, and strongly supports the proposed sliding scale for NZEV crediting. [OP-50, T1-20]

Comment: Commenter supports regulation goals and sales requirements, and the inclusion of PHEVs as credit generators. [OP-61]

Comment: Commenter recommends that PHEV technology should be equated to BEV technology for 2024-30MYs as a bridge to full electrification and remain in place until battery technology (including charging) enables BEVs to be viable in the marketplace.

Commenter provided supporting documentation, articles, and references to support their comment. [B1-11]

Comment: Commenter states that many applications can be done much better with plug-in electric vehicles, especially in the fleet truck market, and that zero-emission miles accumulated are more important. [T1-09]

Comment: Commenter states CARB should encourage creative solutions that could have near-term impact on existing emissions, such as credits for plug-in hybrids. [T1-79]

Agency Response: No changes were made to the regulation in response to these comments. The objective of the ACT regulation is to foster the deployment of zero-emission technologies. Plug-in hybrid vehicles meeting a minimum all-electric range requirement are a bridging technology that can offer zero-emission capability in applications that are not suitable for ZEVs; as a result, staff is giving partial credit for these near-zero-emission plug-in hybrids. Staff views hybrid technology as a bridge technology, and will need full ZEVs everywhere feasible to meet CA air quality goals. Parallel hybrids cannot guarantee zero-emission miles and were not included.

Manufacturer ZEV Sales – Extend Sunset Date for Plug-in Hybrids

Comment: Commenter states that PHEV credits should sunset in 2040 instead of 2030, due to the following factors: the urgency of climate and AQ needs; the need for flexibility and a technology neutral approach to reducing emissions; the need for near-zero-emission vehicles for cases where full ZEVs are not yet suitable; better economical choices for low-income truck owners; reduced infrastructure burden. [OP-50]

Comment: Commenter states CARB should remove the restriction in § 1963.2(b) that eliminated the generation of NZEV credits after 2030. [OP-87]

Comment: Commenter states there are many applications that can be done better with long range plug-in hybrid trucks or strong PHEVs that annually get 90% to nearly 100% of their miles from electric energy. However, strong PHEV's need to be encouraged through this regulation with better incentives and no sunset date on eligibility. [B1-03]

Agency Response: Changes to the regulation were made in response to these comments. The Board approved changes to extend the timeframe that NZEVs can earn credits from 2030 to 2035. Plug-in hybrid or NZEVs may perform a key role as a bridging technology in allowing vehicles which cannot be fully electrified to transition to zero-emission in some capacity. This provides a partial zero-emission option for use cases that have highly variable uses or are not as suitable for electrification in the early market. At the same time, minimum all range was extended from the 2030 MY to the 2035 MY and the minimum all-electric range was changed to begin at 10 miles in 2021 but was increased to 75 miles in the 2030 model year to increase zero-emission mile operation. NZEV credits would end after the 2035 MY.

Manufacturer ZEV Sales – Extra Credit for ZEVs Deployed Before 2024 Model Year

Comment: Commenter states that ZEVs should generate additional credits if deployed sooner than the proposed ACT regulation. [OP-60]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation already allows manufacturers to earn credit for ZEVs sold starting in the 2021 MY and grants these credits a longer life. Adding a multiplier to these credits would decrease the number of ZEVs a manufacturer would be required to produce and may decrease the total number of ZEVs deployed into California. In addition, manufacturers at this point have most likely locked in their production plan for the 2021-2023 model years so adding a multiplier would not spur additional action.

Manufacturer ZEV Sales – Avoid Multipliers for ZEVs Based on Range

Comment: Commenter states CARB should maintain the proposed one credit for each ZEV to avoid multipliers for longer range vehicles. [OP-33]

Agency Response: Staff thanks the commenter for the supporting comment.

Manufacturer ZEV Sales – Extra Credit for ZEVs Based on Range

Comment: Commenter recommends adding a range modifier or range multiplier for class 7 and 8 trucks that rewards the sale of long range zero-emission trucks. [OP-63, T1-66]

Agency Response: No changes were made to the regulation in response to this comment. Because of a number of issues associated with crediting ZEVs based on range, staff's proposal awards the same amount of credits regardless of the vehicle's all-electric range capability. First, manufacturers are already announcing single-unit trucks with over 200 miles of range and tractors with ranges of 500 miles. This indicates that range is not a technological issue; rather, it is a question of tradeoffs between cost, payload, and other factors as well as the availability of infrastructure. In this setting, fleets can analyze their operational needs and purchase the ZEV with enough range capability to meet those needs. If the regulation were to award more credit for longer range vehicles, this may lead to marketplace distortions as manufacturers are incentivized to build longer range vehicles than is necessary. This may lead to potential scenarios where fleets are forced to pay more for capabilities they do not need. For example, fleets that plan to rely more on opportunity charging (e.g., transit buses charging at each bus stop) may not need as much range from a vehicle compared to fleets that plan on depot charging their vehicles (e.g., vehicles return to a home base and charge overnight). Lastly, there is no test procedure in place for measuring the zero-emission range of zero-emission heavy-duty vehicles. A ZEV test procedure would require testing a fully manufactured ZEV on a dynamometer or modelling the vehicle's performance using simulation software. These solutions raise issues as a full chassis dynamometer test is costly and there are limited facilities to perform these tests for heavy-duty vehicles, and the data does not exist currently to model range with the resolution needed.

Manufacturer ZEV Sales – Clarify Deficit Generation Language

Comment: Commenter states CARB should modify § 1963.1(a)(1)(B) to clarify how deficits are calculated, specifically whether they are calculated per vehicle or across all sales. [OP-87]

Agency Response: Staff has modified the language to clarify how deficits are calculated. Each vehicle produced and delivered for sale in California generates deficits based on the ZEV sales percentage requirement and the appropriate Weight Class Modifier. The annual deficit is the sum of all deficits generated in a given model year.

Manufacturer ZEV Sales – Clarify All-Electric Range Definition

Comment: Commenter states CARB should modify § 1963.2(b)(1) by adding language to clarify that manufacturers may determine "all-electric range" in the same manner as GHG certification, including the test procedure. [OP-87]

Comment: Commenter states that the NZEV Factor formula changed from a battery capacity-based formula (in prior ACT regulatory workshops) to an all-electric range (AER) based formula. Commenter requests that CARB clearly indicate the exact AER test procedures to be used for chassis and engine dyno certified NZEV applications. [B1-11]

Agency Response: Staff has modified the definition of "all-electric range" and added a subsection describing "minimum all-electric range" requirements in response to these comments. These requirements are consistent with the California Phase 2 GHG requirements for measuring all-electric range and defining a minimum all-electric range until 2030.

Manufacturer ZEV Sales – Extend Credit Lifetime

Comment: Commenter states CARB should extend the credit lifetime in § 1963.2(g)(2) to allow ZEV credits to be used for five model years after the year in which they are generated, like the GHG rule at 40 C.F.R. § 1036.740(d). [OP-87]

Agency Response: Staff has modified the credit life provisions in response to this comment. In staff's original proposal, the credit lifetime was five years from the start of the model year while the Phase 2 GHG rules set the credit lifetime as being five years starting from the end of the model year. To harmonize with the Phase 2 Greenhouse Gas rules, staff has modified the ACT regulation's credit lifetimes so they are calculated from the end of the model year they are generated, not the beginning. This modification effectively extends the credit lifetime by one year. Staff does not anticipate this change will have adverse impacts as the stringent ZEV sales requirements will necessitate manufacturers use their credits rather than bank them excessively.

Manufacturer ZEV Sales – Extend Deficit Makeup Period to Three Years

Comment: Commenter states CARB should extend the requirement in § 1963.3(b) so a manufacturer must make up a deficit within three model years, like the GHG rule at 40 C.F.R. § 1037.745(e). [OP-87]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation uses the same one-year deficit makeup period as the light-duty ZEV regulation. By requiring deficits be made up in a timely manner, the regulation ensures that manufacturers are building sufficient ZEVs to meet the state's goals. Extending the deficit makeup period to three years incentivizes delaying ZEV deployments and potentially damaging the overall zero-emission market. This modification would create unnecessary uncertainty for minimal benefit and therefore has not been incorporated.

Manufacturer ZEV Sales – Modify Credit Retirement Order

Comment: Commenter states CARB should modify § 1963.3(c) to allow manufacturers more flexibility in using credits before they retire. [OP-87]

Agency Response: Staff has modified the credit retirement order specified in section 1963.3(c) during the 30-Day Modifications in response to this comment. The modified credit retirement order states that the earliest expiring credit will be used first. This ensures that manufacturers will have assurance that their credits generated will not be wasted due to the order that credits are retired.

Manufacturer ZEV Sales – Allow Credit Transfer into Class 7-8 Tractor Group

Comment: Commenter requests that Class 8 straight truck credits be allowed free movement into the Class 7-8 tractor category, and requests credits from lower classes be restricted, capped, or otherwise limited (beyond weight class modifiers) in their ability to meet deficits in the class 8 vocational and class 7-8 tractor category. [OP-74]

Comment: Commenter states CARB should remove the restriction in § 1963.3(e) and allow a manufacturer to use straight truck credits to make up tractor deficits. [OP-87]

Agency Response: Staff made changes to the regulation to allow a limited amount of credits to be used towards meeting tractor deficit requirements. This directionally aligns with the commenter's request. The purpose of limiting the transfer of credits into the tractor group is to ensure that ZE Class 7 and 8 tractors are produced. Ensuring ZE tractors are deployed is critical to the regulation's goals as these vehicles are the largest emitters and are the most common vehicle for drayage operation. Allowing manufacturers to use non-tractor credits to meet their tractor requirement will increase the flexibility offered to them but would simultaneously reduce the amount of ZE tractors deployed. By allowing a limited number of credits to transfer from non-tractors to meet tractor-deficits, the proposal allows some flexibility to adjust to the market while ensuring ZE tractors are produced.

Manufacturer ZEV Sales – Move Reporting Date

Comment: Commenter states CARB should modify § 1963.4(a) to clarify that manufacturers must report by March 31 following the end of each model year. [OP-87]

Comment: Commenter suggests rewording section 1963.4(a) Sales Reporting. Beginning with the 2021 Model Year, a manufacturer must report by March 31 of the calendar year after each model year, the following information to CARB for each type of vehicle certified to California standards and sold in California for each model year. [B1-11]

Agency Response: Staff has modified the regulation in response to these comments so information is due by March 31 following the end of each model year rather than 90 days after the end of each model year. This effectively moves the reporting deadline back one day. This modification improves consistency between the ACT regulation and the Phase 2 Greenhouse Gas regulation.

Manufacturer ZEV Sales – Remove Zero-Emission Powertrain (ZEP) Certification Requirements

Comment: Commenter states that mandating ZEP certification combined with the broader sales mandates will unnecessarily inhibit technology development and result in hybrid vehicles generating negative credits. Commenter also states CARB is contradicting a major part of ZEP certification rationale and is concerned with it becoming a "mandatory certification process" for manufacturers subject to the new sales mandate, and states that ZEP certification should not be mandatory as part of the proposed regulation. Instead CARB should retain ZEP certification as an alternative certification method. [OP-84]

Agency Response: No changes were made to the regulation in response to this comment. The ZEP certification procedures are critical in ensuring manufacturers are developing quality products for consumers through its provisions. Specifically, the ZEP certification establishes an alternative certification pathway for HDEVs and HDFCVs that would help reduce the variability in the quality and reliability of such vehicles, ensure information regarding such vehicles and their powertrains are effectively and consistently communicated to purchasers, and accelerate progress towards greater vehicle reparability. ZEP certification requirements include: compliance with applicable emission standards, durability for the useful life of the engine, applicable labeling requirements, emissions warranty to the vehicle purchaser, and compliance with on-board diagnostic requirements. By incorporating ZEP certification into the ACT regulation, staff can ensure that fleets can expect a basic level of manufacturer support. Because the regulation does not require ZEP certification until 2024 MY, it gives manufacturers time to deploy vehicles in the early market but ensures full certification once the regulation begins requiring production at scale.

Manufacturer ZEV Sales – Wait for Results of Demonstrations

Comment: Commenter urges CARB to postpone the final development and Board approval of the regulation (not the date of its implementation), or at least build some flexibility into the rule until more can be learned from the state's current Zero- and Near-Zero-Emission Freight Facilities (ZANZEFF) investments. [OP-74]

Agency Response: No changes were made to the regulation in response to this comment. Meeting the goals laid out in the Staff Report – accelerating the first wave of ZE trucks, providing environmental benefits specifically to disadvantaged communities, fostering a large-scale transition to ZEV technologies, among others –requires immediate action. Waiting on the results of the ZANZEFF programs is inconsistent with these goals and not necessary given that the rule's requirements do not begin until 2024. Manufacturers and fleets have time to implement the ZANZEFF programs and incorporate findings from the programs into their future deployments. The ACT regulation is not dependent on the ZANZEFF and the Board gave clear direction to staff not to delay this rulemaking. Staff will be using information gathered through ZANZEFF and other demonstrations or pilot projects as we consider fleet mandates to deploy ZEVs in applications most suitable for their use.

Manufacturer ZEV Sales – Proposal Not Backed by Data or Analysis

Comment: Commenter states the timing for ZEV technology will vary considerably among different vehicle types and more analysis could provide additional insight into the ability of various market segments to transition to EV technology. Additionally, CARB's analysis doesn't have enough data to make such assessments on vehicle truck segments. Commenter requests CARB gather more data and analysis on suitability of ZEVs for different market sectors rather than finalizing the sales mandate and new reporting obligations concurrently. Commenter also requests CARB to, immediately at beginning of the rule, ensure the market signal delivered is based on thorough consideration of the technical, economic and operational challenges that remain for ZE vocational vehicle fleets. [OP-84]

Comment: Commenter states the proposed ACT regulation lacks a sufficient basis in data or robust market analysis and projections, and states assumptions used to assess TCO of battery-electric medium-duty and heavy-duty vehicles fails to fully recognize the importance of battery capacity for work trucks and overestimates the benefits of available government incentives. [OP-87]

Comment: Commenter states that the rule's timeline and feasibility studies appear to be based upon assumptions that may not reflect the realities of implementation. Commenter states that it seems unreasonable to mandate ZEV vehicles that MD and HD trucking fleets may not be able to use for their particular application. For example, remote or rural trucking operations may not be able to access charging infrastructure, and the batteries used in those trucks to support a feasibility determination may not support the payload and daily activities for which those trucks are typically purchased. [B1-07]

Agency Response: No changes were made to the regulation in response to these comments. The approved regulation does not require any individual fleet to purchase ZEVs. The approved regulation will ensure that manufacturers develop competitive ZEV products at a price point that will meet fleet needs in the market segments they chose.

Staff disagrees that the regulation does not adequately support its assumptions on technology, timing, and cost. As part of CARB's rulemaking process, staff held multiple workshops and workgroup meetings for the Proposed ACT Regulation. Staff held multiple workgroups on ZEV suitability, cost assumptions and methodology, and other key inputs to refine the assumptions and ensure we were using the most up-to-date information possible. To assess the feasibility of ZEV technology, CARB developed Appendix F to the Staff Report which assesses the feasibility of 87 different market segments in the medium- and heavy-duty market and grades their suitability. The methodology for the cost analysis is detailed in Chapter IX of the Staff Report and evaluates the cost to manufacturers to sell the required number of ZEVs, as well as the costs and savings to California businesses to support and operate ZEVs. An analysis of costs to a typical fleet can be found in Appendix H to the Staff Report.

Because the ACT regulation is a manufacturer rule, manufacturers need to identify market segments they can compete in and offer competitive products that fleets will want to purchase. Broadly, vehicles used for local delivery appear better suited while work trucks present more challenges. Manufacturers most likely will not target market segments poorly suited for electrification and will instead focus on the ones that electrification is best suited for.

As more information becomes available, staff will incorporate these new findings into new rulemakings. Staff did not assume any grants or rebates in the statewide cost analysis.

Manufacturer ZEV Sales – Feasibility of Zero-Emission Refuse Trucks

Comment: Commenter is concerned with electric-powered refuse equipment and the current market hasn't demonstrated they can meet certain duty cycle requirements for waste management. Commenter additionally states that staff suitability factors did not properly reflect the suitability weighting of Class 8 integrated solid waste management vehicles and that suitability scores of 1 or 2 for refuse or solid waste vehicles, to be dramatically overstated. [OP-81]

Comment: Commenter states they aren't convinced by the HD readiness now or in future due to duty cycle of collection vehicles and the weight penalty associated with collection systems. Commenter additionally states CARB should not be able to push ZEV technology onto refuse fleets if the ZEV technology is not reasonable, achievable, and cost-effective. Commenter recommends CARB could report back to the Board every 5 years to allow time for the refuse fleets transition off of NGVs. [OP-101]

Agency Response: No changes were made to the regulation in response to these comments. The approved regulation does not require any individual fleet to purchase ZEVs. The approved regulation will ensure that manufacturers develop competitive ZEV products at a price point that will meet fleet needs in the market segments they chose.

Broadly, the market segment analysis was used to inform decisions on the approved ZEV percentages. The market segment analysis in the Staff Report evaluated the suitability of refuse trucks in Appendix F: Market Segment Analysis. Staff found that refuse trucks are generally well suited for electrification and the assessment was informed by early ZE truck demonstrations and announcements by major truck manufacturers including Mack, Peterbilt, Lion Electric, and BYD and the City of Los Angeles commitment to make a full transition to a zero-emission refuse fleet by 2035 after conducting its own demonstration.

Manufacturer ZEV Sales – Infrastructure Concerns

Comment: Commenter states that infrastructure remains a challenge to deploy ZEVs. [OP-07]

Comment: Commenter recommends that a formal structure and process are created wherein CARB, CEC, CPUC and other relevant agencies are accountable to coordinate and plan charging infrastructure. Commenter states that permitting and other local government entitlement delays given the complexity of organizations involved and their unfamiliarity with the technologies can threaten timeline availability for heavy-duty EV's. [OP-74]

Comment: Commenter recommends CARB to continue and expand work with CPUC, CEC, and utilities on holistic long-range planning needs for infrastructure and workforce deployment. [OP-99]

Comment: Commenter states that ZEV sales requirement should include more charging stations to help develop a network before the regulation is adopted. [OP-121-Form-277]

Comment: Commenter states that infrastructure needs to be built out before the current proposal can be successful. [OP-123-Form-1161]

Comment: Commenter states that current proposal should increase the number of fast chargers and put them in strategic locations to help increase access to ZE charging. [OP-123-Form-42]

Comment: Commenter states that the high costs of infrastructure is an important barrier, particularly for zero-emission technologies, and the cost of providing hydrogen and electricity. Fleets face uncertainty on electric charging connection standards, which complicates deployment timing and future fleet expansion. [B1-07]

Comment: Commenter states that CARB could also provide credit for low power, bi-directional and wireless charging for these trucks and other electrified vehicles because of the benefits to the electric grid. [B1-03]

Comment: Commenter states there is a lack of dedicated funding for and access to heavy-duty ZEV infrastructure which are essential for vehicle operation and rollout. Some related items include accurate measurement and sale of fuel as well as policies facilitating rollout of infrastructure and vehicles. [T1-05]

Comment: Commenter states that extensive and costly infrastructure is needed for ZEVs, and that without incentives to offset those differentials, customers either will keep their old products longer or, given the choice, which the proposed regulation allows, will buy new diesel-fueled vehicles. Commenter also states that focusing the funding and infrastructure development in markets most amenable from their operating characteristics to being able to operate on ZEVs will seed the market and will allow us to better focus our efforts to further expand that market beyond 2026. [T1-19]

Comment: Commenter states CARB should, as a part of this rulemaking, assess the adequacy of infrastructure particularly for electric grid improvements vs hydrogen non-grid alternatives to ensure the ZEVs that are deployed as a result of the regulation do not become stranded assets. [T1-86]

Agency Response: Staff recognizes that a streamlined infrastructure rollout is critical for the success of an expanding ZEV market but no changes were made to the regulation in response to these comments. The ZEV sales percentage targets were based on the assumptions of return-to-base operations where infrastructure would be installed by the fleet. The market can expand faster with a broader network of public charging beyond what the regulation requires.

CARB and its sister agencies are coordinating policies to ensure a smooth transition to zero-emission vehicles. The California Public Utilities Commission and California Energy Commission are developing policy frameworks and assessments to support long-term infrastructure development plans. The California Public Utilities Commission has begun work on its draft Transportation Electrification Framework which is a policy framework intended to streamline upcoming investor-owned utility programs while providing metrics and guidance. The framework is designed to offer a holistic strategy for addressing how the state's IOUs will support California's clean transportation and climate goals.

Additionally, pursuant to Senate Bill 350, following approval by the California Public Utilities Commission, the state's three major investor-owned utilities have invested nearly $700 million over the next five years to support medium-duty, heavy-duty, and off-road transportation electrification. These investments are meant to cover all customer-side costs up to the charger and may offer a rebate for the charger itself.

The California Energy Commission, pursuant to AB2127, is developing a biannual infrastructure and energy demand assessment for electric vehicles in all categories including medium- and heavy-duty. This assessment will identify infrastructure needs as well as gaps which will help inform utilities on the investments needed in their service territories. The needs for depot charging and charging along freight corridors will be evaluated as part of these assessments. The information gathered through the Large Entity Reporting can assist our sister agencies in developing these documents and future efforts. These agency actions are part of a holistic effort by the state to streamline and support electric vehicle infrastructure for heavy-duty vehicles. The CEC is also evaluating resiliency and ZEVs which is discussed further in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Fleet Infrastructure Resilience".

The CEC has also recently held a workshop discussing energy resilience and ZEVs. This July 2020 workshop invited several speakers to present on their view on resilience. Some speakers including Envision Solar, FreeWire, and Toyota highlighted different technology solutions including mobile chargers, chargers with battery storage and solar capability, and mobile hydrogen refuelers. Others highlighted the opportunities that vehicle grid integration and bidirectional charging can offer, with the California Transit Association stating that an integrated solution of solar, energy storage, and electric buses can provide resiliency while significantly reducing energy costs. A different presenter from the Blue Lake Rancheria showed how they were able to use ZEVs to support their microgrid during the recent power shutoff events through bidirectional charging, indicating that potential challenges resilience planning is causing, but others pointed out that ZEVs can be more resilient than other vehicles, and in some situations with vehicle grid integration, can support the grid during potential power shutoff events. The presenter Next-Dimension highlighted that ZEVs can be a solution to the state's challenges, but doing so will require coordination from state agencies, vehicle manufacturers, emergency responders, and utilities. The information gathered through the ACT Regulation's Large Entity Reporting requirements will also assist our sister agencies in developing these documents and future efforts. These agency actions are part of a holistic effort by the state to streamline and support electric vehicle infrastructure for heavy-duty vehicles.

The Governor's Office of Business and Economic Development, or GO-Biz, is working with municipalities to implement AB 1236 which requires local governments to streamline permitting processes for all types of charging stations. While streamlining permitting will require changes at the local level, action is begin taken today and many issues are expected to be resolved by the time the regulation's requirements begin.

Numerous commenters have suggested awarding credits within the ACT regulation for deploying chargers or infrastructure. Making this modification would allow vehicles to generate a smaller portion of the required credits and effectively decrease the amount of credits needed from vehicles and decrease the number of ZEVs deployed by the regulation. For this reason, staff has not modified the regulation to allow credits for infrastructure as this can be done more effectively through collaboration with our sister agencies and industry than through the ACT regulation.

Manufacturer ZEV Sales – Grid Resiliency

Comment: Commenter states electricity is not a reliable energy source. [OP-18, OP-21]

Comment: Commenter states the proposed regulation would require electrical energy supply and/or on-site battery backup charging infrastructure to meet the mandated public health and environmental protection services such as homeless encampments, fires, and disaster readiness. [OP-81]

Comment: Commenter states concern about the State's existing electrical infrastructure with blackouts and its ability to address a broader deployment of ZEVs. [OP-101]

Comment: Commenter states that the recent performance of California's electricity infrastructure in the wake of natural or climate driven disasters is not impressive. [B1-07]

Agency Response: No changes were made to the regulation in response to these comments. The California Public Utilities Commission's draft Transportation Electrification Framework, noted in the preceding agency response, explicitly identifies resiliency as a focus for the utilities and discusses vehicle to grid integration, micro grids, backup generation by diesel or fuel cell generators, and other solutions. The CPUC is currently soliciting stakeholder input and intends to finalize the Transportation Electrification Framework after incorporating this feedback. The CPUC has also started a rulemaking process regarding microgrids and resilience as directed by SB 1339. The CPUC has released its Track 1 decision as of June 2020 and has issued the scoping memo for Track 2 of this rulemaking. This work on microgrids will bolster resiliency and help support vehicle applications which rely on the grid. Lastly, as part of San Diego Gas & Electric's SB350 program, the CPUC approved a V2G pilot using buses to evaluate how these vehicles can provide energy to the grid and potentially boost resilience.

See discussion on the work California is undertaking to bolster resilience and the role of ZEVs in chapter “Written Comments Received during the 30-Day Comment Period”, section “Economic Analysis – Fleet Infrastructure Resilience”.

Manufacturer ZEV Sales - Credit for Off-Road Yard Tractors

Comment: Commenter states that small manufacturers should generate credits through sale of off-road yard tractors. [B1-02]

Agency Response: No changes were made to the regulation in response to this comment. The main difference between on-road and off-road yard tractors is whether it is equipped with safety equipment to legally operate on-road e.g., turn signals and whether it is powered by a cleaner on-road engine or dirtier off-road engine. For zero-emission vehicles, there is no emissions difference between an on-road and off-road yard tractor and the only difference is the safety equipment installed. Staff anticipates manufacturers will choose to make all zero-emission yard tractors on-road capable to earn credit in the proposal.

Manufacturer ZEV Sales - Credit for Small Manufacturers

Comment: Commenter suggests that small manufacturers should be allowed to opt-in early and generate credits. [B1-02]

Agency Response: Staff’s proposal allows small manufacturers who are otherwise exempt from the proposal’s requirements to voluntarily generate credits, therefore no changes were made to the regulation in response to this comment. This approach maintains necessary exemptions for small manufacturers while allowing these manufacturers to capitalize on their ZEV investments.

Manufacturer ZEV Sales – Small Manufacturer Considerations

Comment: Commenter states that Autocar qualifies as a small business under the Small Business Administration size criteria that set the standard for GHG, and consistent with California's Government Code. In drafting the ACT, CARB was required to determine whether the adoption of the regulation affected a small business. Commenter states that they were not contacted by CARB staff, and staff confirmed that they did not expect Autocar sales would exceed 500 on-road vehicles annually based on data they had. Thus, with respect to Autocar, CARB has not met its requirement to determine whether the ACT affects small business.

Commenter states that the ACT's ZEV production requirements and time line will impose disproportionately high burdens on a small business like Autocar, which produces small volumes of a select few product lines. The lack of product mix denies

Autocar the benefit of averaging and aggregating credits. The low overall volume denies Autocar the benefit of banking credits and prevents it from spreading development and compliance costs across many vehicles. In contrast, competitors will spread such costs across tens of thousands of vehicles and multiple product lines, and with vertical integration and robust purchasing power, the competition will gain a competitive advantage over its "small town" competitor.

Commenter states that a small business cannot utilize the credit/deficit flexibilities built into the ACT regulation. Commenter states that in the Staff Report, CARB staff describes the weight class modifiers that "provide flexibility for manufacturers to produce more ZEVs in one group to avoid making a small number of ZEV sales in other groups." This construct acknowledges that certain ZEV applications will take longer than others to bring to market (or even that electrifying some vehicles will be "avoided" altogether), and assumes that all manufacturers have products in multiple classes. Commenter states that the flexibility afforded Autocar's competitors is unavailable to Autocar and other (typically smaller) manufactures that do not have large, diverse product lines. [B1-02]

<u>Comment:</u> Commenter states the threshold for the small manufacturer exemption should be raised to a level that captures small businesses. Commenter recommends revising Section 1963(e) as follows: “Manufacturers that never exceed 1,500 annual average sales of Class 2b and greater vehicles in California for the three prior model years are exempt from the requirements of sections 1963 through 1963.5” with other conforming changes. Commenter states that the revision will provide sufficient time for small manufacturers to invest the necessary resources and time to develop ZEV versions. Commenter states that without this exemption they may be forced to stop selling vehicles in California as they see many product lines remaining as diesel or gas sales. [B1-02, T1-07]

<u>Agency Response:</u> No changes were made in response to these comments. Staff’s recommendation of a cutoff of 500 annual sales is based off of data received from EMA and DMV and is designed to ensure all major OEMs are included in the manufacturer ZEV sales requirements. Staff is meeting original intent to have all major OEMs included in the manufacturer ZEV sales requirements based on sales data received from EMA and cross referenced with DMV. The low volume exemption was created for niche and nascent businesses. This ensures an even playing field across the industry. It is not reasonable to exempt specific vehicle types, as this provides manufacturers maximum flexibility to determine how to comply. Multiple vehicle types can be built on the same chassis.

Staff notes that AB 1033 (2016) defines a small business for the purpose of regulatory analyses as one that meets three criteria: is independently owned and operated, is not dominant in its field, and consists of 100 or fewer employees. Autocar is a subsidiary of GVW Group LLC and is not an independently owned and operated company, nor have they demonstrated that they have 100 or fewer employees. Based on this, Autocar does not meet the definition of a small business for purposes of this rulemaking.

Manufacturer ZEV Sales - Require Small Manufacturers to Provide Updates

Comment: Commenter suggests that any manufacturer subject to the small manufacturer exemption should be required to provide semi-annual reports on their progress towards ZEV development, including information such as time lines and stage development by product line, number of ZEVs produced, status of pilots and demos, engine manufacturer interaction, body company involvement, and customer outreach efforts. [B1-02]

Agency Response: No changes were made to the regulation in response to this comment. All manufacturers must report their ZEV sales to earn credits. Small manufacturers are already required to report annual information under the California Phase 2 GHG regulation, and CARB will be able to track their vehicle sales and the number of ZEVs sold into California each year. There is no need to increase the reporting frequency or breadth.

Manufacturer ZEV Sales – Set Performance-based Metrics for ZEVs

Comment: Commenter states CARB should establish standards for ZEVs in this rule to drive continual improvement and innovation in clean mobility. These can include battery performance standards, such as lifecycle emission reduction goals, range requirements, and short and long-term deterioration limits. [T1-08]

Agency Response: No changes were made to the regulation in response to this comment. The regulation makes the Zero-Emission Powertrain Certification program requirements mandatory for manufacturers to earn credits. This program does not have performance standards, but does have performance disclosure and warranty requirements. There is no need to set minimum performance standards in this regulation nor the certification program, because the market will favor product offerings that meet customer needs.

Manufacturer ZEV Sales – Gradual Electrification Ramp Rates

Comment: Commenter recommends gradual electrification ramp rates. Commenter states that the typical product development cycle is four years, consumer awareness and acceptance require months if not years of sustained effort, and that the necessary charging infrastructure requires time to install. This market hesitation points to the need for gradual sales ramp rates to accommodate market adjustment. Commenter states that by specifying a 9% starting requirement for Class 2b/3 pickups in 2027 MY, the ACT regulation does not address the need for gradual transition in the segment. Commenter recommends that when electrified pickups are introduced, the initial ramp rates follow the phase-in pattern of the other Class 2b/3 and Class 8 vehicles. [B1-11]

Agency Response: No changes were made in response to this comment. As a result of the 30-Day Changes, the requirements for Class 2b-3 pickups has been modified to match those of all other Class 2b-3 vehicles. These requirements start at 5 percent in 2024 and ramp up to 30 percent in 2030. These requirements ramp up over time to give manufacturers time to develop and validate new products as well as give fleets time to test new products as well as make necessary infrastructure and workforce preparations. For staff's justification for removing the delayed timeline for pickup trucks, see section Comments Received During Original Proposal's 45-Day Comment Period, section Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements.

The regulation's structure gives manufacturers flexibility to bank credits, shift sales between weight classes, and trade credits with other manufacturers. This means that a manufacturer who sells pickups, vans, and trucks can meet their compliance obligation by producing ZE vans and trucks without producing any ZE pickups for a number of years if there are better markets to serve or can purchase credits from other manufacturers regardless of the truck types they sold to earn their credits.

Manufacturer ZEV Sales – Inclusion of Motor Coaches

Comment: Commenter asks why motor coaches are excluded from the ACT regulation. [T1-85]

Agency Response: No changes were made to the regulation in response to this comment. Staff excluded motor coaches because motor coach manufacturers have already begun zero-emission motor coach development in response to the Innovative Clean Transit (ICT) regulation and Zero-Emission Airport Shuttle Bus regulation. Their sales in California are low such that they would be exempt as small manufacturers, and giving credit for motor coaches and other transit bus categories would not provide additional benefit as these manufacturers are separate from typical bus manufacturers and already producing ZEVs. In addition, they would dilute the total number of ZEVs deployed in the ACT regulation because they are already required by the ICT regulation.

Manufacturer ZEV Sales – Health Impacts Not Fully Quantified

Comment: Commenter states that ACT SRIA didn't fully quantify the health impacts of air pollution. Commenter submitted studies supporting their comments. [OP-73]

Agency Response: No changes were made to the regulation in response to this comment. The health analysis for the ACT regulation was performed by calculating the emission reductions per air basin based off of the number of ZEVs anticipated to be deployed in each air basin. The regulation does not require manufacturer to deploy ZEVs in locations or areas which limits the ability to estimate the emission impacts in greater detail. CARB recognizes this limitation and will reassess emissions methodology in future rulemakings and as newer research allows more thorough methodologies.

Manufacturer ZEV Sales – General Support

Comment: Commenter states they strongly support the proposed regulation. [OP-17, OP-22, T1-31]

Comment: Commenter generally supports, urging the Board to be bold to get diesel trucks off the road. [OP-35]

Comment: Commenter states support in CARB leading California to a future free of the influence of the oil industry. [OP-38]

Comment: Commenter states support for CARB to adopt the regulation and requests CARB work with trucking industry cooperatively to achieve new targets which may be difficult to attain. [OP-95]

Comment: Commenter supports the proposed regulation and reference senate bill 498 (SB 498) and SB 44 showing the Legislature's support in maximizing the adoption of ZEVs in California. [OP-100]

Comment: Commenter states they are supportive of the overall goal of the proposed regulation and are ready to help facilitate transformation of the transportation sector across all medium- and heavy-duty segments. [OP-104]

Comment: Commenter states support for the proposed ACT regulation to address climate change, air pollution, and the impacts to disadvantaged communities. [B1-09]

Comment: Commenter states that ZEVs are good and trucks have the ability to become ZEVs. [T1-35]

Comment: Commenter states they support the ACT regulation and immediate transition to cleanest available technologies. [T1-67, T1-68]

Agency Response: Staff thanks the commenters for these supporting comments. Additional issues raised by commenters, if any, are addressed in the applicable sections.

Manufacturer ZEV Sales – Support for Following Through on SIP Measure

Comment: Commenter states CARB should adopt this rulemaking to follow through on the inclusion of and commitment to the "Last Mile Delivery Standard" in the State Implementation Plan and Scoping Plan. [OP-15]

Agency Response: Staff thanks the commenter for the supporting comment.

Large Entity Reporting – General Support

Comment: Commenter commends CARB staff for making changes to original language and supports the current reporting requirements. [OP-63]

Agency Response: Staff appreciates stakeholder support for collecting this critical information. Any other comments or issues made by the same commenters are addressed in the applicable sections.

Large Entity Reporting – Unclear Language, Unclear Requirements, Unnecessary Information

Comment: Commenter states the regulation language is unclear, asking for judgements, guesses and approximations resulting in unusable data. Additionally, commenter states the goals of the reporting requirement are unclear. Commenters state CARB is asking for information about unrelated vehicles or not asking for more pertinent information regarding existing electric or low-emission vehicles. [OP-04, OP-05, OP-06, OP-09, OP-10, OP-12, OP-14, OP-32, OP-37, OP-39, OP-44, OP-51, OP-52, OP-54, OP-108, T1-26].

Comment: Commenter states that data provided would likely be inaccurate estimates because vendors, not the commenter, would have most of the data being requested. [OP-54]

Comment: Commenter states there are ambiguities in the section language that will lead to misleading or erroneous conclusions that could skew and/or double-count large entity reporting information. [OP-81]

Comment: Commenter states CARB's purpose for collecting facility level and contracting data needs to be clarified in rulemaking documents to refine the best data and collection methods to meet the intended purpose. Additionally, commenter states CARB should directly address whether indirect sources will be a point of future regulation. Commenter states that it is not clear why information on light duty vehicles is needed, or that light duty vehicle information is superfluous. [OP-106]

Comment: Commenter states that light duty vehicles were not evaluated by CARB in the economic analysis, are inconsistent with the medium- and heavy-duty focus of the regulation otherwise, and should be deleted. [OP-108]

Comment: Commenter states the regulation does not provide enough specificity in describing the type and measure of data requested, stating that many of the facility types could be interpreted broadly to apply to the commenter's facilities, but may overlap in interpretation, so the commenter would not know which facility type to group the facilities under. Additionally, commenter has concerns about how to interpret "predictable usage pattern" for the vehicle portion. [OP-110]

Comment: Commenter agrees with the comments submitted by the California Chamber of Commerce expressing concern on excessive reporting, vague enforcement, and unclear goals. [B1-08]

Comment: Commenter states the regulation language is unclear, asking for judgements, guesses and approximations resulting in unusable data. Additionally, commenter states the goals of the reporting requirement are unclear. Commenters state CARB is asking for information about unrelated vehicles or not asking for more pertinent information regarding existing electric or low-emission vehicles. [T1-70, T1-99]

Comment: Commenter states that it is important for staff to clarify and narrow the reporting requirements. [T1-42]

Comment: Commenter states that it is not clear why information on light duty vehicles is needed, or that light duty vehicle information is superfluous. [T1-99]

Agency Response: Staff made changes to the regulation to streamline the reporting process and clarify any confusing language in response to these comments. As part of these changes, staff removed the facility reporting information, truck trip count information, all light-duty vehicle information, as well as streamlined the language and added guidance on how to complete the reporting. This is consistent with the comments received as well as Board direction to streamline the reporting. Staff deliberately designed the reporting to use best estimates in order to allow respondents flexibility and leeway in responding. Staff has worked with stakeholders to streamline, simplify, and clarify expected responses to these questions. The information in the approved regulation is primarily limited to vehicle usage information and about the vehicle home base which will help staff develop effective and fair ZE fleet rules.

Large Entity Reporting – Cost Burden

Comment: Commenter states that staff underestimated the cost of the reporting requirement. [OP-03, OP-04, OP-05, OP-06, OP-09, OP-10, OP-12, OP-14, OP-32, OP-37, OP-39, OP-44, OP-51, OP-52, OP-54, OP-63]

Comment: Commenter states that mandatory reporting and purchasing requirement benefits are outweighed by the cost of regulation. Current investments by commenter's members undermine the need for mandates and ambitious timelines, and would only increase the cost of equipment. The majority of entities do not have tracking in place for the data requested, and would be required to develop and implement such systems, resulting in more cost and time burden than CARB estimated. CARB's compliance cost estimate for the reporting requirements are significantly underestimated. [OP-39, OP-108]

Comment: Commenter states entities would need to develop and implement tracking systems and record retention policies that do not exist, which are complex and expensive. [OP-54]

Comment: Commenter states that economic analysis of the reporting requirement proposal concerns them. [OP-65]

Comment: Commenter states that most waste industry providers are rate-regulated and are not free to unilaterally pass on to their customers the cost associated with a change in law or regulation. [OP-81]

Comment: Commenter states that SRIA estimates for reporting cost is unclear and underlying assumption that companies would already have data management systems to gather information is incorrect, as commenter does not have data at the level requested. Additionally, extensive facility coordination labor costs and time requirements are underestimated by CARB, as individual data points must be gathered to provide correct ranges. [OP-103]

Comment: Commenter states that SRIA severely underestimates time and cost of reporting and CARB should update economic assessment and/or refine the rule requirements to minimize the burden. [OP-106]

Comment: Commenter has concerns on the unforeseen impact to district budgets and operations, as well as the potential for needed inventory to become limited due to potential reduction in manufacturing offerings as a result of the requirements as currently proposed. Commenter is concerned potential impacts of the ACT to district budgets could directly lead to a reduction in critical services provided by districts to their community. [B1-01]

Comment: Commenter is concerned the large entity reporting requirements will imposes new costly and burdensome reporting requirements and should be addressed prior to adoption. [B1-09]

Comment: Commenter states the cost and time requirement of complying is not in line with what staff estimates. [T1-03]

Comment: Commenter states that 4 hours in the SRIA underestimates the time and thus cost burden of reporting. [T1-06]

Comment: Commenter states concern over the cost that future mandates will have to farmers, such as prices of pick-up trucks increasing. [T1-47]

Agency Response: Changes were made to the regulation in response to these comments. Staff removed all questions related to facility contracting, truck trips, and light-duty vehicles. These changes should decrease the time and expense associated with the reporting requirements. In the Staff Report, staff updated the time estimate for the large entity reporting from 4 hours as described in the SRIA to 25 hours. This is an estimate as the time needed to report will vary widely as businesses with few trucks will be able to complete their reporting quickly while large fleets will need more time. The anticipated costs of the reporting requirement are anticipated to be minimal and not result in rate increases to pass on to customers. Staff has added guidance to the regulation that will help fleets who do not have robust data management software complete the reporting requirement.

Large Entity Reporting – Regulation Requires Hard-to-Collect Information

Comment: Commenter states their members do not dictate contracted transport means and have no control over how services are provided, nor information on vehicles used to provide the services, and could likely not identify types of commodities being shipped. Paper correspondence are sent via carriers or postal system and may at some point be on 3rd party trucks over 8,500 GVWR, but validating that or the volume would be impossible. [OP-54]

Comment: Commenter states that questions asked in the large entity reporting requirement are too extensive and states that company revenues should have no place in future regulations. This creates an undue burden on fleets that do not already collect or maintain these types of records. [OP-58]

Comment: Commenter points out the record retention portion of the proposed large entity reporting requirement implies that records must be collected for every facility to support the aggregated and representative responses, which would negate any time or resource savings resulting from aggregate responses. They have hundreds of facilities which could possibly be respondent to the vehicle usage data section, and requests CARB to use vehicle usage data from a representative facility of each type. [OP-102]

Comment: Commenter states concern that vehicle usage section would require commenter to report information for each of its facilities that has a single truck stationed at the facility, and that this results in 7000 vehicles being tracked daily to collect responsive data. The reporting requirements will require unnecessarily extensive data collection and is burdensome. [OP-103]

Comment: Commenter states CARB underestimates administrative burden, costs, and compliance challenges to fleet and facility reporting. The rule implies entities would need to gather data on every facility and vehicle over the 2020, requiring collection of data prior to finalizing the rule, and the recordkeeping requirements would necessitate specificity that staff are trying to avoid with streamlining efforts. [OP-106]

Comment: Commenter states that due to lack of control businesses have over dictating transportation methods or means for services contracted, data requested may be unknown resulting in a lack of usable data. Regulated entities have no control over records of subcontractors or subhaulers that contractors hire to perform services, and will not be able to keep these records. [OP-108]

Comment: Commenter states the Board should recognize various ancillary challenges associated with the ACT fleet reporting proposal and should make efforts to overcome or minimize them. [OP-116]

Comment: Commenter states the information being asked for is intrusive. Some of their small family owned business members do not keep the data CARB will be requesting. [T1-03]

Comment: Commenter states they are being asked to report data about vehicles they do not control. [T1-06]

Comment: Commenter states that the fleet reporting puts an undue burden on entities, many of which have never been regulated by CARB prior to this rule and are not direct sources of GHG emissions. [T1-22]

Comment: Commenter states CARB underestimated the time and cost burden to comply, as members do not have systems in place to track the information CARB is seeking since they are not in the trucking business. [T1-26]

Comment: Commenter mentions the fleet reporting requirement offers challenges. [T1-46]

Comment: Commenter states that staff underestimates reporting time requirement, and states that members need at least 6 months together required data. [T1-77]

Comment: Commenter states that the fleet reporting should be streamlined to be less onerous. [T1-99]

Agency Response: Staff recognizes the potential unintended burden that the initially proposed regulation may impose on businesses, as a result, changes were made to the regulation in response to these comments. Consistent with Board direction to streamline the reporting, staff has made several key changes to the proposal. First, regulated entities were limited to only those that own or direct the operation of medium- or heavy-duty vehicles. Second, all of the facility-based data and truck trip counting questions were removed. Staff will seek to gather this data through other means such as a contract. Third, after the initial hearing, staff worked with stakeholders to further simplify report, and added additional language in the regulation to clarify expected responses and to provide more flexibility in determine which time period to use in analyzing vehicle usage data. Last, language was added to make it clear that CARB staff would seek clarification of apparent anomalies in the reported data. These changes are consistent with commenters' requests and meet the Board's direction.

Large Entity Reporting – Bifurcate the Large Entity Reporting from the ACT Regulation

Comment: Commenter requests CARB bifurcate the large entity reporting requirement from the manufacturer sales requirement into a separate rulemaking and hold additional public workshops to solicit affected businesses. [OP-03, OP-04, OP-05, OP-06, OP-09, OP-10, OP-12, OP-14, OP-32, OP-37, OP-44, OP-51, OP-54, OP-58, OP-102]

Comment: Commenter states that staff should bifurcate this rule and hold a series of workshops to create a workable streamlined data gathering process. At minimum, the current draft has many issues that must be addressed. To that end, appreciates staff's commitment and recommendations to narrow the dates upon which businesses will be required to count vehicles, clarify how businesses will choose representative weeks and facilities, and to work to revise unclear definitions. [OP-39, OP-108, T1-22]

Comment: Commenter requests CARB bifurcate the large entity reporting requirement from the manufacturer sales requirement into its own rulemaking. [T1-03, T1-23, T1-27]

Comment: Commenter asks to delay implementation of the regulation to allow time for a more thoughtful rule to be developed. [T1-99]

Agency Response: No changes were made to the regulation in response to these comments. The Board directed staff to accelerate the rulemaking process for fleet rules when they approved the Resolution. It would not be possible to have enough time to finish the manufacturer rule, craft a separate reporting regulation, have time for fleets to collect and submit data, and then use that data to craft a future ZEV fleet rule by the end of 2021. Staff held multiple workshops and workgroup meetings through a four-year public process with eight public workshops, five public workgroups, two focus group meetings, and well over one hundred meetings with stakeholders, thus providing significant opportunity through the process to obtain and respond to their concerns.

Large Entity Reporting – Specific Changes to the Facility Reporting

Comment: Commenter states the requirement for vendor or subcontractor vehicle trips should be removed, as quantifying "non-refrigerated" vs "refrigerated" trips requires visual inspection, and would be burdensome and infeasible, and the data is duplicative because those vendors would likely be subject to the reporting requirements already. [OP-61]

Comment: Commenter states CARB should recognize businesses don't have vehicle trips based on "typical week" and should work with entities to determine appropriate assumptions to avoid noncompliance. [OP-63]

Comment: Commenter recommends CARB include definitions for "goods", "non-food delivery", and "food delivery" to the representative facility survey, to help provide clarity on what is include and where to report it. Commenter questions how the term "trip" is defined in the vehicle trips section. Does trip refer to an arrival or departure of one vehicle trip or two separate vehicle trips? For example, is arriving on Monday and departing on Tuesday one trip or two trips? Commenter has questions about applicability of vehicle trips and supplier counts and wants to know if these terms include company and or non-company third-party vehicle trips and suppliers. [OP-104]

Comment: Commenter states CARB should clarify rule language if facility reporting for a "typical week" snapshot in time is intended, and provide guidance on how to determine the appropriate tracking period and documentation. [OP-106]

Comment: Commenter states that 2012.3(b)(4) should be deleted, as entities will not have data for vehicles acquired prior to 2020 reporting year. The regulation should be revised to clarify that entities should only report facilities and vehicles operated inside California. [OP-108]

Comment: Commenter states that "typical facility" and "typical week" need to be clarified with guidance. [OP-110]

Agency Response: Staff has removed the entire facility reporting section of the rule in response to these and other comments from stakeholders, and will seek to gather the information through non-regulatory means. For further information on other streamlining modifications, see response in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Unclear Language, Unclear Requirements, Unnecessary Information”.

Large Entity Reporting – Increase Amount of Information Reported

Comment: Commenter states the reporting requirements should ask whether current vehicle is used to help society recover after a catastrophe, whether their current vehicle is used in daily emergencies, the amount of daily average and annual miles per category of vehicle and monthly hours of operation per category of vehicle, the percentage of short trips vs long trips by category of vehicle, how many vehicles in single, double, or triple shift operations, and an estimate of the percentage of daily or annual miles driven within disadvantaged communities. [OP-50]

Comment: Commenter states CARB should require total number of hauls made by the company and the number of hauls made by direct employees to understand the extent to which a business relies on contracting. [OP-76]

Comment: Commenter states that vehicle data requested does not provide useful information, including missing the distribution of miles travelled in a year. [OP-110]

Comment: Commenter states the reporting requirements need to be strengthened and capture key data on industry adoption barriers. [T1-87, T1-91, T1-94, T1-96, T1-97]

Comment: Commenter states CARB should collect data on total hauls and hauls performed by direct employees versus contractors. [T1-88]

Comment: Commenter suggests including the weight class category for vehicles in questions 2012.1(a)(17) and (a)(18). [OP-104]

Agency Response: No changes were made to the regulation in response to these comments. The approved ACT Regulation balances the need to collect as much information as possible with Board direction to streamline the reporting and reduce burden on affected entities. Staff have determined the required information to be sufficient to broadly characterize industry sectors and to identify business models that may be able to electrify their fleets sooner, which will factor into future fleet regulations. Staff intends to allow fleets to submit voluntary information as part of their reporting. Additionally, staff intends to request and accept additional information from fleets as part of a future zero-emission fleet rule.

Large Entity Reporting – Require Annual Reporting

Comment: Commenter states CARB should require reporting on an annual basis to capture continuous updates as trucking industry grows and transforms. [OP-76]

Comment: Commenter states CARB should require annual reporting to help develop a comprehensive picture of the changing industry. [T1-88]

Agency Response: No changes were made to the regulation in response to these comments. The information required by the large entity reporting is sufficient to support further development of ZE fleet rules and gathering information annually afterwards would be unnecessary as staff would not have time to incorporated information received in April 2022 into the ZE fleet rule that staff intends to present to the Board in late 2021. Furthermore, increasing the reporting requirements will be inconsistent with Board direction to streamline the reporting. If additional reporting is necessary, staff can reintroduce requirements at a separate date in the future. Staff intends to allow fleets to submit voluntary information as part of their reporting. Additionally, staff intends to request and accept additional information from fleets as part of a future zero-emission fleet rule.

Large Entity Reporting – Lower Size Threshold

Comment: Commenter states that reporting requirement threshold should be lowered to 15 vehicles dispatched in 2019 for drayage, parcel, construction, and long-haul entities to collect data on the smaller firms that are the primary operators in these industries. Commenter states that reporting requirements should be strengthened, as data captured would be too limited to inform future policies. Commenter provides an example that reporting requirements written would only capture data on 26 trucking firms representing less than 2% of active trucks at the San Pedro Bay ports, which would be insufficient to adequately characterize port operations. Commenter provided supporting documentation, articles, and references to support their comment. [OP-76]

Agency Response: In response to this comment, staff has lowered the threshold for respondent fleets from 100 to 50 vehicles. Based on available information, staff believes that lowering the threshold to 50 would result in significantly more fleet reporting information on their vehicles. This is necessary since as a result of the strengthened manufacturer ZEV sales requirements; more fleets will need to electrify. Gathering information on these smaller fleets will give a more complete picture of the overall truck marketplace. This more granular data provides increased resolution on drayage and delivery operations that tend to attract smaller fleets than other applications. For these reasons, decreasing the fleet size threshold meets the regulation's objectives. Additionally, staff intends to request and accept additional information from fleets as part of a future zero-emission fleet rule.

Large Entity Reporting – Timing of Data Collection

Comment: Commenter states that recordkeeping is required for the year 2020, but will not be in effect until mid-2020, creating an undue burden on fleets that do not already collect or maintain these types of records. [OP-03, OP-04, OP-05, OP-06, OP-09, OP-10, OP-12, OP-14, OP-32, OP-37, OP-39, OP-51, OP-52]

Comment: Commenter states the reporting requirements of reporting and recordkeeping timing will result in a retroactive rule, which does not allow due process, so should be revised to allow facilities at least 1 year after the rule is final to prepare for implementation. The data gathering period and timeline presents challenges, including limited implementation time. Commenter also states that to take end of year odometer readings, beginning of year readings must be taken as well, which would be prior to the rule finalization period. The rule's timeline and feasibility studies are based on situations that may not work in the real world and are aggressive considering the current state of technology. [OP-39, OP-108]

Comment: Commenter states CARB has underestimated the time needed to complete reporting. [OP-110]

Comment: Commenter states the reporting requirement does not provide enough notice for entities to develop and implement tracking systems to collect requested data. [OP-61]

Comment: Commenters states the reporting time frame needs to have further expression for collection and the representative period of data collection. [OP-81]

Comment: Commenter states that recordkeeping is required for the year 2020, but will not be in effect until mid-2020, creating uncertainty on whether the regulation will be final and the amount of time entities will have to gather the data. Commenter states the time needed to gather the information is also underestimated and could take weeks, and is not already collected or easily accessed. [OP-102]

Comment: Commenter states the timing of finalizing the regulation will not leave enough time for entities to comply with the reporting requirements, as CARB requires information from data year 2020 but the entities would not be able to begin data collection until the rule is finalized, as the requirements may change. Some commenters request reporting later or data collection timelines, such as using data collected in 2021 with a reporting deadline of April 1, 2022. [OP-103, OP-116]

Comment: Commenter states the regulation does not provide sufficient time to collect data by requiring reporting in April 2021 for the 2020 calendar year. Commenter requests a July 1, 2021 deadline to avoid conflicts with other federal and state GHG emissions reporting which would unduly burden the staff whose responsibility it is to comply with reporting mandates. [OP-110]

Comment: Commenter request during busy seasons they can use a "time period" to report answers about typical daily operations. [OP-116]

Comment: Commenter states they support comments by CTA recognizing the need to further extend the reporting deadline and busy season reporting leads to overcapacity. [T1-27, T1-70]

Comment: Commenter states they need more time to review the proposed requirement to figure out how to comply. [T1-27]

Comment: Commenter states the timing of finalizing the regulation will not leave enough time for entities to comply with the reporting requirements, as CARB requires information from data year 2020 but the entities would not be able to begin data collection until the rule is finalized, as the requirements may change. Some commenters request reporting later reporting or data collection timelines, such as using data collected in 2021 with a reporting deadline of April 1, 2022. [T1-30, T1-70]

Agency Response: As a part of staff's modifications, more flexibility has been added to how fleets can collect data for the large entity reporting and what time period could be used in response to these comments. These changes were intended to make it easier for fleets to use information that is already available. The regulation describes various methods a regulated entity can use to complete their reporting. The regulation uses binned responses to provide guidance on the level of detail needed to complete the reporting. Additionally, changes were made to give flexibility allowing subsidiaries, joint ventures, and parent companies to report individually. Staff has added an option to allow regulated entities to report information about their fleet data as it consisted any time after January 1, 2019 to allow more flexibility in selecting an appropriate snapshot of their fleet operations using existing records. Beyond this, most of the information required is already expected to be kept by fleets to minimize additional information that would need to be collected. To the extent that it is simpler for fleets to collect new information, changes to the regulation provide additional guidance on how to collect representative information when needed. This representative information can be collected in any time period the fleet owner chooses before the information must be reported. These modifications allow fleets to comply with the reporting requirement regardless of whether they currently collect this information or not. These modifications also ensure that fleets are not required to provide non-existent information to complete their reporting as all information is either already available or can be quickly collected.

Large Entity Reporting – Enforcement Concerns

Comment: Commenter states that potential enforcement penalties are too high for a data gathering exercise, and does not understand how the rule will be enforced or whether reported information will meet an acceptable standard. [OP-03, OP-04, OP-05, OP-06, OP-09, OP-10, OP-12, OP-14, OP-32, OP-37, OP-39, OP-44, OP-51, OP-52, OP-54, OP-108]

Comment: Commenter states CARB cannot impose requirements on entities before a rule is finalized. Commenter states that businesses will not know whether their answers are "enough", with lack of guidance on how CARB will evaluate subjective terms such as "good faith effort" or "best judgement". [OP-39, OP-108]

Comment: Commenter states concern that rule does not provide information about how compliance will be measured or enforced, preventing effective data collection protocols from being developed. [OP-61]

Comment: Commenter states that enforcement procedure for the large entity reporting is unclear and needs to be clarified. [OP-98]

Comment: Commenter supports need for additional streamlining and clarity surrounding enforcement made by California Chamber of Commerce. [OP-116]

Comment: Commenter states that violation penalties of $37,500 is very significant to their members and should result in additional workshops. [T1-23]

Comment: Commenter states that we should ensure enforcement burden is not too great to avoid excess paperwork. [T1-77]

Comment: Commenter is concerned that failing to comply could result in huge fines as the result of a "best estimate". CARB intended to include language that would soften the enforcement of the regulation for those acting in good faith but were off in estimates, but does not see any such language in the regulation draft. [T1-99]

Agency Response: Staff added language stating that regulated entities have 14 days to respond to a request for clarification. This helps ensure that if staff has questions about reported data, there is a pathway for remediation without enforcement action. CARB's Enforcement Division has discretion when determining penalties for non-compliance, and must take into consideration statutory mitigation areas including magnitude of non-compliance, whether emissions were increased as a result of the violation, etc. Staff's intent is to collect useful data with the reporting requirement and will work with regulated entities if questions arise.

Large Entity Reporting – Confidentiality, Proprietary Info, Security, and Public Record Act Requests

Comment: Commenter states that online reporting that asks for specific company identification numbers is a concern about security preservation in light of recent data breaches. [OP-58]

Comment: Commenter states CARB should clarify whether it intends to publish, report on, or otherwise disclose fleet reporting data. [OP-116]

Comment: Commenter raises questions about the regulation’s confidentially provisions and responses to Public Record Act requests. [OP-116, OP-44]

Comment: Commenter states that some businesses will not comply with the reporting requirement because they view the data being requested as proprietary to the business. Commenter states that data collected by CARB could be transferred to other agencies that will sell the data. [T1-03]

Comment: Commenter states concern over the reporting requirements releasing personal home addresses of farm workers. [T1-47]

Comment: Commenter states they support the comments by CTA recognizing the need to further extend handling of confidential reporting data. [T1-70]

Comment: Commenter states they have concerns about potential release of confidential data. [T1-77]

Agency Response: No changes were made to the regulation in response to these comments. CARB follows standard procedures to secure confidential and personally identifiable information. Sensitive data collected in other regulations has maintained the necessary level of data security. CARB staff intend to publicly release aggregated data to meet stakeholder requests for data. Staff will maintain confidential information pursuant to California Code of Regulations title 17, sections 91000 to 91022 and the California Public Records Act.

Large Entity Reporting – Use TRUCRS System for Reporting

Comment: Commenter states CARB collect real-world data from fleets, possibly through telematics, and could potentially tie voluntary fleet submission of such data to the future fleet rule. Commenter believes real-world data is more important than the survey data. [OP-50]

Comment: Commenter states that CNG/LNG fleets already in Truck Regulation, Upload, and Compliance Reporting System (TRUCRS) should be restored. Additionally, commenter states CARB should seek outside software development firms to receive reporting information that is user friendly and meets data privacy concerns. [OP-69]

Agency Response: No changes were made to the regulation in response to these comments. Staff intends to allow respondents to download fleet information out of TRUCRS to minimize duplicate reporting; however, only a subset of vehicles report into the TRUCRS database and only a portion of those vehicles are required to report vehicle usage information. Therefore, staff will be developing a new system for collecting the information. Staff believes that developing the data collection and analysis methods internally is sufficient, and will not seek outside contractors for this specific purpose.

Large Entity Reporting – Gather Information on Existing Infrastructure Costs and Low-Emission Vehicles

Comment: Commenter states that companies responding to the large entity reporting requirement should be able to voluntarily submit the value or cost of CNG, LNG, or EV infrastructure already installed at facilities. Commenter also states CARB should allow voluntary submission of fuel consumption data. [OP-69]

Comment: Commenter states that the rule fails to request data on use of low-emission vehicles, the adoption of which has historically been incentivized by the legislature and by CARB. Failing to account for the environmental benefits these vehicles achieve, and failing to provide credit to those who followed directions and upgraded their vehicles early wastes millions of taxpayer dollars, as well as the millions invested by companies who were doing their best to upgrade their vehicles and lower emissions. For example, § 2012.3 asks for information on refueling infrastructure for fleets, but not for other facilities subject to the rule. CARB should amend the rule to take care not to disturb the investments these companies have already made in non-battery electric vehicles, such a hydrogen, biodiesel, and low NOx vehicles, all of which are contributing to the downward trajectory in transportation emissions. [OP-108]

Comment: Commenter states that reporting fails to ask about existing fueling infrastructure, use of low or near-zero vehicles, or other carbon reduction measures implemented. The reporting requirements should ask for data on low-emission vehicles to recognize existing investments. [OP-108]

Comment: Commenter states CARB should collect data on existing and near-term investments in infrastructure and cleaner vehicles/fuels, including near-zero and other advanced technologies, to help characterize fleet and facility investment plans and to inform future rules. [OP-106]

Comment: Commenter states that reporting should also consider the availability of infrastructure and that it should take into account how previously incentivized adoption of alternative fuel vehicles have been implemented. [T1-22]

Agency Response: No changes were made to the regulation in response to these comments. Staff directionally agrees that capturing the cost of existing infrastructure investments can provide valuable context, but also must comply with Board direction to streamline reporting. To accomplish this, the reporting requirement requires fleets to identify what infrastructure has been installed within the last ten years without providing additional information. This allows staff to identify which fleets have made those investments and who to contact to obtain additional information. Similarly, the fuel type of the fleet's vehicles must be reported and will allow staff to contact fleets who have invested in low-emission vehicles.

Staff intends to allow fleets to submit voluntary information as part of their reporting. Additionally, staff intends to request and accept additional information from fleets as part of a future zero-emission fleet rule.

Large Entity Reporting – Allow Entities to Provide Comments with Reporting

Comment: Commenter suggests adding a "comments" response column so entities can provide clarifications on data anomalies to better characterize their particular use case. [OP-61]

Agency Response: No changes were made to the regulation in response to this comment. Staff intends to allow fleets to submit voluntary information as part of their reporting.

Large Entity Reporting – Insufficient Outreach

Comment: Commenter states the large entity reporting requirement has been fast tracked, and CARB had only released the first concepts of the reporting requirement at the final public workshop which did not allow adequate time to address concerns from affected entities. [OP-03, OP-04, OP-05, OP-06, OP-09, OP-10, OP-12, OP-14, OP-32, OP-39, OP-37, OP-51, OP-52, OP-54, OP-58]

Comment: Commenter states the large entity reporting requirement has had limited public outreach, insufficient workshops, and lack of engagement from regulated businesses. [OP-03, OP-04, OP-05, OP-06, OP-09, OP-10, OP-12, OP-14, OP-32, OP-37, OP-39, OP-51, OP-52, OP-54, T1-26]

Comment: Commenter states CARB had only released the first concepts of the reporting requirement just 3 months before the board hearing. [OP-39]

Comment: Commenter states the large entity reporting requirement has had limited public outreach, insufficient workshops, and lack of engagement from impacted businesses, especially in the light of recent public safety power shutoffs and how those might interact with mandated electric vehicles. [OP-58]

Comment: Commenter states regulated entities were not notified of this rulemaking, and those that were notified were primarily targeted at fleet owners through existing listserves focused on the manufacturer sales requirement. Commenter states that more needs to be done to outreach to businesses to engage on this effort and other CARB efforts. Rulemaking was accelerated, stating concepts for reporting requirements were only released August 21, 2019, and states staff has not responded to public comment from August workshop nor made effort to explore alternatives proposed by stakeholders. Commenter states staff should adjust the data gathering period or the reporting deadline so it is practical for entities to comply. [OP-106, T1-30]

Comment: Commenter states that CARB did not solicit input or feedback from the businesses affected by the ACT regulation reporting requirement. Commenter states that a common criticism of regulatory agencies is that few, if any, understand how business is done and the challenges faced in compliance to such ill-prepared regulations. Commenter urges CARB to reach out and ask for input and suggestions prior to simply developing regulations in an agency vacuum. [B1-08]

Comment: Commenter states there has not been enough outreach to affected entities, and there are thousands that do not know they will be required to report. [T1-03]

Comment: Comment state CARB should interact more with affected stakeholders for the reporting requirement as they will be the end users of ZEVs. [T1-24]

Agency Response: No changes were made to the regulation in response to these comments. CARB's public planning and review process has been robust from the beginning of the ACT regulation development. Since 2016, CARB staff has held eight workshops, five workgroup meetings, and numerous individual meetings with stakeholders to provide information to the public and to solicit feedback. Staff has held several public workshops to propose and refine the large entity reporting concept. CARB staff posted information regarding these events and any associated materials on the ACT website and distributed notice of these meetings through two public list serves; "actruck" and "zevfleet" that include 3,092 and 1,356 recipients, respectively. The majority of the meetings were available by in-person attendance, webcast, and teleconference. Staff proposed this concept first in December 2018, and continued to refine the concept through public workgroups and workshops afterwards. Additionally, staff sent a mail out in mid-2018 to approximately 11,000 entities with corporate revenues at or over $50 million notifying them that staff was considering this concept. The Initial Statement of Reasons (ISOR), which was released to the public on October 22, 2019, identifies the data, reports, and information relied upon for the proposed regulation. The Draft and Final Environmental Analysis (EA) provided an analysis of the potential environmental impacts associated with the ACT Regulation, including the large entity reporting requirements. The Board held a public hearing on December 12, 2019 to consider the proposed ACT Regulation and Draft EA. Then, in February 2020, CARB hosted a workshop to discuss modifications to the ACT Regulation. The Board held another public hearing on June 25, 2020, during which CARB adopted Resolution 20-19 and approved the ACT Regulation. For these reasons, staff believes that the potentially regulated public were sufficiently noticed well in advance of the initially proposed regulation being released and well in advance of the Board's adoption of the proposed regulation.

Large Entity Reporting – Data Can Be Gathered Through Other Sources

Comment: Commenter states CARB can gather the required data through other means. [OP-03, OP-04, OP-05, OP-06, OP-09, OP-10, OP-12, OP-14, OP-32, OP-37, OP-39, OP-51, OP-52, OP-54]

Comment: Commenter recommends data collection be done through a non-regulatory "request for information" process. [OP-61]

Comment: Commenter states that vendor data is best provided by vendor owners. [OP-110]

Comment: Commenter states that some information being requested is already being gathered in other areas, and would like to combine these to avoid duplicative effort. [T1-06]

Agency Response: No changes were made to the regulation in response to these comments. Throughout the rulemaking process, staff has gathered data and information from a variety of sources such as industry reports, Department of Motor Vehicles information, and other publicly available sources. The information that currently exists is insufficient to properly assess the ZEV potential of medium- and heavy-duty as most data sources do not have information about key characteristics for truck electrification, e.g. typical daily mileage, ability to install infrastructure, whether vehicles return to a central base, and so on.

Staff attempted to collect vehicle usage data through a voluntary survey that was sent out early 2018. The response rate was roughly 1 percent and the information received was not representative of the trucking industry or any individual sector. Fleets and organizations who were actively engaged in the ACT rulemaking process did not participate in this voluntary survey. Based on these events, staff determined the best way to gather sufficient data from across the breadth of the trucking sector is through a mandatory reporting requirement.

Large Entity Reporting – Standardized Template

Comment: Commenter requests a standardized response template for the reporting requirement be provided for entities. [OP-61]

Agency Response: Staff intends to use a standardized spreadsheet for regulated entities to complete their responses.

Large Entity Reporting – Only Report Own Vehicles

Comment: Commenter states that reporting requirements should be limited to their own fleet operations under their direct control as opposed to third party vendor fleets. [OP-61]

Agency Response: Changes were made to the regulation in response to this comment. Staff modified the regulation to require vehicle operational characteristics only be reported for vehicles the entity has under their control. Entities will still have to report general information on the number of subcontractors, subhaulers and subhauler vehicles, but will not be required to report operational characteristics of those vehicles.

Large Entity Reporting – Focus on Delivery Vehicles

Comment: Commenter states that only seeking information from light and medium-duty pickup and delivery fleets would be a simpler approach. [OP-58]

Agency Response: No changes were made to the regulation in response to this comment. Because the scope of future ZE fleet rules is anticipated to include more vehicles than just delivery vehicles, it would be inconsistent to only include light- and medium-duty delivery vehicles.

Large Entity Reporting – Allow Fleets to Use a Representative Facility

Comment: Commenter states that each regulated entity should only be required to provide a general inventory of total number of facilities and the number of vehicles stationed at each facility for each group/class of facility, and to have a detailed report of data CARB is requesting submitted for only one representative facility in each group of facilities including vehicle usage information. [OP-102, OP-103]

Agency Response: Staff has clarified the regulation text in response to this comment. The proposal in the Staff Report allowed entities to use the operational data collected from one facility for vehicles at other facilities if the entity determines they have similar operational characteristics. Staff has clarified the language to ensure entities are aware they have this option. This meets the commenter's request and is consistent with Board direction to streamline the reporting.

Large Entity Reporting – Require Future ZEV and Infrastructure Plans

Comment: Commenter suggest CARB should consider adding a question that ask for future acquisition plans for electric vehicles procurements by type, duty cycle, and number of acquisitions by year (over a ten-year period). In addition, CARB should also request the same information for potential future charging infrastructure. [OP-104]

Agency Response: No changes were made to the regulation in response to this comment. Staff is not proposing to collect this information as it would be of minimal value and be inconsistent with Board Direction. At this point, relatively few fleets have concrete plans in place for incorporating ZEVs as most ZEVs are still in the demonstration phase. Likewise, most fleets do not consider infrastructure until they have committed to adding ZEVs to their fleet. Adding this question to a reporting requirement due in April 2021 would have little value as the majority of fleets would not be able to answer anything of value. In addition, including more questions would not be consistent with Board direction to streamline reporting.

Large Entity Reporting – Exempt Emergency Vehicles

Comment: Commenter asks for an exemption from the reporting requirement for emergency vehicles designed to respond during power outages. [OP-108]

Agency Response: No changes were made to the regulation in response to these comments. Emergency vehicles as defined in the California Vehicle Code 165 are exempt from the Large Entity Reporting requirements. The reporting requirements do apply to non-emergency vehicles that are used for emergency response. Understanding these vehicles will be critical in ensuring that future fleet rules do not impede these vehicles from their critical operations.

Large Entity Reporting – Exempt Rental, Leasing, Construction, and Construction Repair Companies

Comment: Commenter states rental and leasing companies and construction and equipment repair vehicles should be exempt from the large entity reporting requirements. [OP-58]

Agency Response: No changes were made to the regulation in response to this comment. The purpose of the Large Entity Reporting is to gather information that can be used to develop future fleet rules. It is premature to exempt any fleet category from the reporting requirement as determining which vehicles may need additional time or cannot be electrified is as critical as determining which vehicles can be easily electrified. The fleets mentioned in the comment letters sum up to be a significant portion of the California fleet, and major rental and leasing companies are already making significant investments in ZEVs. Staff will evaluate the potential for electrifying these vehicles in the ZE fleet rule but removing the reporting requirements will hobble staff’s future efforts.

Large Entity Reporting – Exempt Class 8 Vehicles Registered under the International Registration Plan

Comment: Commenter states the large reporting requirements need to be streamlined and should exclude interstate trucks and Class 8 trucks registered with the International Registration Plan (IRP). [OP-98, T1-70]

Comment: Commenter supports the American Trucking Associations’ Request to Exclude Class 8 trucks registered with the International Registration Plan from Large Fleet Reporting. [OP-116]

Agency Response: No changes were made to the regulation in response to these comments. The purpose of the Large Entity Reporting is to gather information that can be used to develop future fleet rules. It is premature to exempt any fleet category from the reporting requirement as determining which vehicles may need additional time or cannot be electrified is as critical as determining which vehicles can be easily electrified. IRP vehicles represent a significant portion of vehicles miles travelled in California. In addition, many fleets register their entire fleets under IRP for a variety of reasons despite the vehicles not leaving their home base in California. The regulation only applies to those vehicles that travel through or are based in California, so the requirements are only applicable to vehicles that do business in California.

Large Entity Reporting – Exempt Companies Without Vehicles

Comment: Commenter states that their members do not haul or sub haul insurance products, but use national mail carriers or only receive paper and office supplies. Commenter also states that port and rail location usage is rare for their members, and though some companies may have heavier vehicles, a small percentage are used in California. Due to this, commenter requests CARB modify applicability to exclusively apply to haulers or carriers, or carve out exemptions or minimize data requirements for their members (non-hauler/carriers). [OP-54]

Agency Response: Changes were made to the regulation in response to this comment. Staff removed all requirements on businesses that do not own or broker vehicles. This is consistent with the commenter’s request and Board direction to streamline reporting requirements. In addition, staff removed requirements to report about facilities, truck trips, or light-duty information. Staff retained requirements for large businesses with greater than $50 million in annual revenue and at least one vehicle as staff foresees that the future ZE fleet rule may have requirements on large businesses regardless of how many vehicles that business owns.

Large Entity Reporting – Clarification on Off-Road Yard Tractors

Comment: Commenter request CARB clarify whether “yard goats” with off-road engines are included in the large entity reporting. [OP-116]

Agency Response: In response to this comment staff modified the requirements to explicitly include off-road yard tractors or yard goats. This meets the commenter’s request and is consistent with Board direction to clarify the requirement.

Large Entity Reporting – Modify Definition of “Fleet” and “Fleet Owner”

Comment: Commenter suggests removing the definitions of “federal fleet” and “rental or leased fleet” and the last sentence of the first paragraph, as the language suggests there are only two subclassifications of fleets - "federal" and "rental or leased". The California Uniform Commercial Code cited only defines "lease". Commenter suggests separately defining "rental and leased vehicles" as: Rental and Leased Vehicle means a vehicle under a contract or agreement for a term or period of one year or more that may include an option to renew the contract or agreement. Commenter suggests redefining “fleet owner” definition to exclude rental or leasing companies.(This comment incorporates a comment letter that was submitted in response to a draft of the Large Entity Reporting requirement prior to the release of the Staff Report) [OP-58]

Agency Response:

Some changes were made to the regulation in response to this comment. Staff removed the definitions of “federal fleet” and “rented or leased fleet”. However, staff has not defined “rented or leased vehicles” as these terms are generally understood and specific details on the usage of these terms are provided in the definitions of “common ownership and control” and “fleet owner” elsewhere in the regulation text.

Staff has not made modifications to the “fleet owner” definition in response to these comments. The regulation specifies that vehicles that are in a renting or leasing arrangement of one year or more must be reported by the renter or leasee, and arrangements of less than one year must be reported by the renting or leasing company. Removing requirements on renting and leasing companies will prevent necessary data collection on a significant portion of California’s fleet.

Large Entity Reporting – Modify “Subcontractor” and “Subhauler” Definitions”

Comment: Commenter states that current subhauler and subcontractor language in the large entity reporting section is confusing and should be reworded to capture all contracted businesses. [OP-76]

Comment: Commenter recommends changing references of “subcontractor” to “contractor.” and that reporting be limited to identifying the contractors who have a direct relationship with the reporting company and not associates. [OP-104]

Comment: Commenter states that subcontractor counts need to be removed or redefined. [OP-106]

Comment: Commenter states that "subcontractor" definition makes no sense, and revisions should be made. Commenter states that "work" under the subcontractor definition needs to be explained, and related to the vehicle usage. [OP-108]

Agency Response: In response to these comments, staff made changes to the usage of “subcontractor” and “subhauler” within the regulation. Staff removed the definition of “subcontractor” from the list of definitions because the term was only used once within the regulation and the description was incorporated into the body regulatory text. Staff then clarified and elaborated on its usage within the one location it is used in the regulation.

Staff modified the subhauler definition to state that it applies to brokers as well as motor carriers, and removed the phrase “to serve its customers” to make it clear that the definition does not apply to companies who serve customers on the regulated entity’s behalf. These changes improve readability and meet the commenter’s requests.

Large Entity Reporting – Clarification of Confusing Terms

Comment: Commenter requests the term "dispatched" is clarified, and suggests: "provided direction or instruction for routing a vehicle(s) to specified destinations for specific purposes of…" [OP-61]

Comment: Commenter states that facility categories, contracting practices, fleet mix, fueling infrastructure, and service delivery are internally inconsistent and do not match cross-agency policies and mandates. [OP-81]

Comment: Commenter states it is unclear if the potential groupings (vehicle body type, weight class bin, fuel type) are three possible options for respondents to choose one or if all three are required in the reporting in the description of grouping in 2012.3(b). [OP-104]

Comment: Commenter suggests clarifying whether “under your authority” refers to a reporting entity’s motor carrier number in questions 2012.1(a)(14)(B) and (a)(14)(C). [OP-104]

Comment: Commenter suggests defining terms "electric vehicle supply" and electric vehicle" for questions 2012.2(a)(1)(D) and (a)(1)(E) in the grouped facility information sections, and asks whether CARB is asking for all charging equipment to be responded for, including Level 1, portable, Level 2, etc. [OP-104]

Comment: Commenter states the information regarding the infrastructure in question (a)(6)(D) is vague and needs clarity. [OP-104]

Comment: Commenter suggest clarifying general entity information for question (a)(13) "contractors", as it is unclear if CARB is seeking information on activities by contractors that are directly serving a customer need or if a more expansive definition of contractor work is intended. [OP-104]

Comment: Commenter asks if question 2012.3(b)(2)(H), for reporting on the percentage of vehicles that “Returns to this facility daily”, should be interpreted as “always returns” or “typically returns”. [OP-104]

Comment: Commenter suggests changing Section (b)(2)(J) and (K) to “Stays within 50 miles of this facility on a typical day” and “Usually tows a trailer more than 100 miles a day”. [OP-104]

Comment: Commenter asks if, in section 2012.3(b)(3), the average annual mileage for a typical vehicle by vehicle group is an average across the fleet for a particular vehicle type or an average for the vehicle group at the specific facility being reported on. [OP-104]

Comment: Commenter asks that "typical" and "representative" in relation to the facility information be clearly defined. [OP-106, OP-108]

Comment: Commenter states CARB must define "typically", otherwise will get widely varied and unusable data. [OP-108]

Comment: Commenter states that "broker" can be read to include anyone that orders delivery, and should be modified to reflect the intended target. [OP-108]

Comment: Commenter states that "responsible person" needs to be defined or deleted. [OP-108]

Comment: Commenter asks that "operated" in relation to the facility information be clearly defined. [OP-108]

Comment: Commenter asks that partnership and sole proprietorship definitions be updated to "A general partner or the proprietor, respectively, or their delegate or designee." [OP-108]

Comment: Commenter asks that "managed" be more clearly defined for the facility portion of "managed at the facility". [OP-108]

Comment: Commenter asks CARB define "written sustainability plan". [OP-108]

Agency Response: In response to these comments, staff has modified multiple portions or the regulation text to more clearly state what regulated entities are required to do and what specific terms mean.

The definition of “broker” has been narrowed to only entities with brokerage authority. This change clarifies staff’s original intent to only include those with brokerage authority.

The term “electric vehicle supply” has been clarified to refer only to Level 2 or higher powered chargers. This removes ambiguity around what chargers are and aren’t included. The other infrastructure information requested in section 2012.2(a)(6)(d) has not been cited as vague or difficult to understand and as a result has not been modified.

The term “managed” was primarily used in the facility and truck trip reporting sections which have been deleted from the original proposal in the Staff Report.

The term “partnership or sole proprietorship” has been updated to include their delegate or designee as the commenter requested.

The term “operated” was primarily used in the facility and truck trip reporting sections which have been deleted from the original proposal in the Staff Report. The commenter is not referring to the other parts of the regulation which may have used the term “operated”.

The definition of “responsible official” has been clarified to only apply to records retention requirements and not the other portions of the regulation.

The regulation was modified to make more clear by adding language to expand sections 2012.2(b)(2)(H) to give an example that a vehicle returns to its home base daily if it returns to its base 9 out of 10 times.

Section 2012.2(b)(2)(J) was modified to be a “yes or no” question instead of requiring fleets to count the number of trucks. This change simplifies reporting by asking whether a majority of the vehicles do or do not stay within 50 miles of the vehicle home base on a given day. The section was also changed to give fleet managers more flexibility in how to complete the reporting.

Section 2012.2(b)(2)(K) was not modified as section 2012.2(b)(2) allows fleets to estimate their responses to sections 2012(b)(2)(A-Q) and staff expects this particular question to be primarily to answered based on a fleet manager’s knowledge and experience of their fleet operation.

The term “sustainability plan” was not necessary to define because staff’s intent was for the respondent to identify any written plan to support sustainability goals. This question seeks to understand whether sustainability is considered in decisions made at the organization. Creating a specific definition would add complexity and unnecessary burden that is inconsistent with the intent of the question.

Staff has not formally defined the terms “typically” or “representative”. These terms were used most often in the facility and truck trip section which was deleted. Staff has inserted additional language to better describe what “typical” and “representative” means in the context of the individual questions being asked where the terms are still used. Staff specifically used these terms to give respondents flexibility in how to answer these questions and to minimize the amount of information that would need to be collected. These changes will improve the overall quality of the responses and simplify reporting for respondents.

Large Entity Reporting – Some Vehicles Do Not Have Odometers

Comment: Commenter states they have some responsive vehicles that do not measure usage by miles and do not have odometers and have hour meters instead. [OP-110]

Agency Response: No changes were made to the regulation in response to this comment. Vehicles without odometers tend to have low daily mileage. Fleets can use information such as dispatch records or hour readings estimate their mileage, or alternatively capture the mileage for a representative period to estimate the typical mileage. Because the reporting requirement has wide response categories for entities to fill, entities can place their vehicles whichever response category they deem the most appropriate. Staff anticipates that fleets will place these vehicles without odometers into the lowest mileage response category, but will work with regulated entities through the implementation process to provide guidance.

Large Entity Reporting – Remove Language Potentially Requesting Home Addresses

Comment: Commenter asks the rule be revised to not require disclosure of home addresses of employees where a vehicle may be assigned. [OP-108]

Agency Response: Staff has clarified the language to explicitly prevent entities from reporting addresses that may be employee’s home addresses.

Large Entity Reporting – Expand Subcontractor Contract Length

Comment: Commenter states the reporting requirements should be changed to cover all contract lengths, as drayage contracts are often 90 days or less, and the current year or more threshold would miss these fleets. [OP-76]

Agency Response: In response to this comment staff has removed the limitation to contract lengths of only one year or longer to ensure data are gathered about all entities that are contracted to deliver items or perform work for a regulated entity. This change will help ensure sufficient data are collected to craft effective fleet rules.

Large Entity Reporting – Explain Thresholds Used for Large Businesses and Large Fleets

Comment: Commenter asks CARB to explain the $50M US-wide revenue regulatory basis, stating that this will capture entities with very little California presence. Commenter also asks the basis for the use of 100 vehicles in the fleet size requirement. [OP-108]

Agency Response: As stated in the Staff Report, the thresholds were selected to include a wide range of entities because nearly all rely on services that use trucks and buses, and all are likely to be directly or indirectly affected by a future ZEV requirement because a general goal established in the mobile source strategy and the SIP is to accelerate the use of ZEVs everywhere feasible. The revenue threshold was selected as a way to exclude small businesses from the reporting requirement, to reduce the number of entities that report, and provide a representative data set of the wide range of business models and vehicle operations in California. Large entities have adequate resources to respond to questions about their existing operations and are more likely to keep information electronically than smaller entities which means their reporting burden would be less significant. Information from large entities is expected to provide a robust data sample to help answer questions about sector-by-sector variations in vehicle usage and contracting for transportation services. The 2019 tax year was selected as a baseline year so that regulated parties would know whether they are subject to the regulation when the regulation was considered by the Board.

Large Entity Reporting - Vehicle Definition Consistency

Comment: Commenter suggests the definitions under the manufacturer requirement sections (1963 through 1963.5) also be applicable to the large entity reporting sections (2012 through 2012.3). [OP-104]

Comment: Commenter states that the vehicle definition n section 2012 should be the same definition as in section 1963. [OP-106]

Agency Response: No changes were made to the regulation in response to these comments. First, the Large Entity Reporting refers to “on-road vehicles with a GVWR greater than 8,500 lb.” This is a specific and understood phrase that does not need additional description. Second, the definition used in 1963 is a technical definition that may confuse or mislead stakeholders subject to the Large Entity Reporting. For these reasons, staff has not added a definition of “vehicle” to the Large Entity Reporting requirement.

Large Entity Reporting – Apply Same Fleet and Revenue Size Threshold

Comment: Commenter states CARB should apply the same fleet and revenue size thresholds to public agencies as are applied to private companies. [OP-110]

Agency Response: No changes were made to the regulation in response to this comment. Public fleets have been identified as a beachhead target well-suited for electrification and information is needed to determine how quickly these fleets can electrify. The Board reaffirmed this direction and strengthened it by directing staff to return with fleet rules that will transition public fleets to fully zero-emission capable by 2035. Because this goal will apply to all public fleets, information is needed from all public fleets in order to develop effective fleet rules.

Large Entity Reporting – Level Playing Field Analysis

Comment: Commenter states the regulation does not explain how in-state companies will not experience a competitive disadvantage vs out-of-state companies doing business in California. [OP-58]

Agency Response: No changes were made to the regulation in response to this comment. As part of the Original Proposal, staff performed an analysis on the "Significant Statewide Adverse Economic Impact Directly Affecting Business, Including Ability to Compete". Staff determined that the ACT regulation would not have a significant statewide adverse economic impact on businesses or private persons. The manufacturer ZEV sales requirement is anticipated to have a net positive effect on the state. The large entity reporting affects both in-state and out-of-state businesses that do business in California equally so as a result, it is not anticipated to adversely California businesses.

The ACT regulation only applies to manufacturers and does not impose costs on fleets, other than minimal reporting costs for large entities. The regulation is aimed at larger companies and ensures that employee-based companies as well as companies using a contractor model are on a level playing field.

Large Entity Reporting – Lower Size Threshold

Comment: Commenter states that CARB should lower the reporting threshold for firms in trucking segments with high concentrations of contractors like port trucking, and package delivery. [T1-87]

Comment: Commenter states that lowering the firm size threshold to 15 or more dispatched vehicles; clarifying the distinction between subhaulers and subcontractors to ensure that all businesses operating under all length contracts are covered. [T1-88]

Agency Response: The approved regulation was modified from the original proposal to lower the fleet size threshold from 100 to 50 vehicles. Based on available information, staff believes that lowering this number even further would result in exponentially more fleet respondents with diminishing returns on the value added by the additional data.

Large Entity Reporting – Limit Scope Based on Future Fleet Rules

Comment: Commenter states that staff should outline the likely paths of the Fleet Rule prior to finalizing the data request rule, identify the specific data gaps to be filled by the rule, and narrow the scope of the data requests to those issues relevant to the subsequent end-user rule [T1-22]

Agency Response: No changes were made to the regulation in response to this comment. Staff are attempting to broadly capture information from a variety of businesses to understand which fleets have vehicles that are suitable for electrification, and to better understand where and how infrastructure is needed to expand the market beyond depot charging as part of determining the path for the Fleet Rule. See discussion on the timing and content constraints of the large entity reporting requirement as it relates to future fleet strategies in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Bifurcate the Large Entity Reporting from the ACT Regulation”. Also, see discussion related to staffs attempts at narrowing the scope and burden of the large entity reporting requirement, including completely removing the facility reporting section and implementing numerous clarifications and guidance language in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Regulation Requires Hard-to-Collect Information”.

Large Entity Reporting – General Support

Comment: Comment states SCE supports the ACT regulation and stands ready to facilitate the transformation of the transportation sector across all medium- and heavy-duty segments. [T1-04]

Comment: Commenter states they support the effort to collect more and better information to inform future regulation, [T1-06]

Comment: Commenter states they support CARB's proposed reporting requirement. [T1-31]

Comment: Commenter state as they support fleet reporting standards. [T1-52]

Comment: Commenter supports efforts to streamline reporting requirements, stating more needs to be done. [T1-77]

Comment: Commenter supports the reporting requirements and approve of the options presented by staff. The current proposal would lead to quicker collection of the data, which would allow for expediting the fleet requirements. [T1-85]

Agency Response: Staff appreciates stakeholder support in collecting this critical information.

Future ZEV Policy – Adopt Zero-Emission Fleet Rule in 2021

Comment: Commenter states CARB should adopt corresponding fleet purchase requirements in 2021. [OP-02, OP-41, OP-46, OP-48, OP-117, OP-122, T1-13]

Comment: Commenter states CARB should adopt a fleet rule by July 1, 2021, effective January 1, 2024. [OP-13]

Comment: Commenter states CARB should accelerate development of a ZEV fleet rule. Commenter states the fleet rule should be brought forward in time to make sure that a stronger rule is matched with the fleet requirement at the same time. [OP-15, T1-40]

Comment: Commenter states CARB should expedite the "fleet rule" to encourage conversion of large fleet operations to ZEVs. [OP-64]

Comment: Commenter states CARB should expedite the fleet rule by using existing data and augmenting it to finalize, rather than waiting for the ACT regulation reporting requirements to be submitted. CARB should adopt fleet purchase requirements by 2021 to make simultaneous with the ACT regulation. [OP-72]

Comment: Commenter states CARB should adopt fleet purchase requirements earlier than staff's proposal, with implementation in 2021. [OP-83]

Comment: Commenter urges CARB to continue to move forward with development of the fleet regulation with a goal simultaneously broaden infrastructure and financing options. Commenter states CARB should also consider light-duty ZEV rule targeting 100 percent adoption by 2035 to achieve 80 percent GHG reduction by 2050. [OP-94, T1-43]

Comment: Commenter states CARB should adopt fleet purchase requirements earlier than staff's proposal, specifically in 2021 with implementation in 2024. [OP-96, T1-17, T1-48]

Comment: Commenter urges CARB to include flexibilities that allow fleet purchases to access incentive funding even as they are mandated to purchase ZE trucks. CARB needs to adopt fleet mandates that mirror the sales targets of the proposed regulation. [OP-99]

Comment: Commenter states CARB should adopt fleet purchase requirements earlier than staff's proposal, with implementation in 2024. [OP-119, OP-121-Form, OP-123-Form, OP-124-Form]

Comment: Commenter states they support a fleet purchase standard. [T1-52]

Comment: Commenter believes that a multiple fleet rule approach would be more effective than one blanket fleet rule to be implemented in 2024. The Commenter thinks this strategy will help provide certainty to manufacturers that demand further products to exist on a complementary timeline. [T1-79]

Comment: Commenter appreciates the commitment from the Board to develop a suite of fleet programs with the same timeline. Commenter encourages the Board to accelerate the development of fleet rules for those segments that are identified by staff to best positioned for electrification. [T1-79]

Comment: Commenter states the fleet mandate should happen quicker. [T1-81]

Agency Response: No changes were made to the regulation in response to these comments. The Board set a goal of bringing a fleet rule for consideration by the end of 2021, which is earlier than initially proposed, when they approved the Resolution. Staff held a kickoff workshop in February 2020 to begin that rule development process. Staff presented and solicited feedback on a number of ideas ranging from purchase requirements to fleet standards and contracting requirements. Further discussion on the ZE fleet rule is premature as the proposal is still under development and is a separate rulemaking from the ACT regulation.

Future ZEV Policy – Set Clear 100 Percent ZEV Targets

Comment: Commenter states CARB should set aggressive goals to achieve ZE vehicles in targeted categories and explain how the goals would tie into state and federal emissions reduction goals. [OP-01, OP-59, OP-72, OP-83, OP-96, OP-119, OP-121-Form, OP-123-Form, OP-124-Form, T1-48]

Comment: Commenter recommends that staff develop an analysis for ZEV truck sales similar to the one CARB staff presented to the Board for passenger vehicles. Commenter states that the presentation, titled "Critical Need for Actions to Accelerate the Transition to a Zero-Emission Future" clearly showed the need to increase the rate of passenger vehicle sales of ZEVs to near 100 percent by 2035, in order to achieve an 80 percent reduction in GHG emissions by 2050. A similar plan will be necessary to guide the vision for trucks. [B1-10]

Comment: Commenter states CARB should outline long-term objectives to achieve 100 percent zero-emission trucks in various categories while explaining how the manufacturer requirement proposed fits with those objectives and Federal/State air quality and climate goals. [OP-02, OP-41, OP-46, OP-48, T1-13]

Comment: Commenter states CARB should set a goal for all trucks to be zero-emission by 2040. [OP-13]

Comment: Commenter states CARB should specify target dates for 100 percent ZEV by truck sectors, similar to CARB's stated 100 percent delivery trucks by 2040 goal. [OP-15]

Comment: Commenter states CARB should identify long-term ZEV goals for medium- and heavy-duty vehicles consistent with state GHG goals. [OP-33]

Comment: Commenter states CARB should set aggressive goals for ZEV adoption beyond 2030. [OP-40, OP-64, OP-78, OP-126-Form]

Comment: Commenter states the Board should direct staff to develop and share with the Board its analysis for increasing sales of ZEV trucks beyond 2030 that is consistent with the states air quality goals. [OP-94]

Comment: Commenter states CARB should outline long-term objectives to achieve 100 percent zero-emission trucks in all categories. [OP-117]

Comment: Commenter states CARB should inform when all truck sales must be 100 percent zero-emission, which would set goals to inform planning and adaptation for infrastructure. [OP-122]

Comment: Commenter states CARB should set a goal for one hundred percent ZEVs and expedite the timeline for a fleet rule. [T1-18]

Comment: Commenter states CARB should aim for one hundred percent ZEVs in the foreseeable future. [T1-39]

Comment: Commenter recommends an increase of the yearly and final percentage goals from 24 to 30, and urge setting overarching and weight vehicle class specific timelines for 100 percent ZEVs. [T1-98]

Agency Response: The approved regulation includes a number of modifications to the original proposal to significantly increase the number of ZEVs sold in California across all vehicle groups from 2024 to 2030 and to increase the percentage requirements from 2030 to 2035 rather than keeping them constant during that period. The timeframe has also been extended until 2035 with continued increases in annual sales. In addition, the Board directed staff to work towards an ultimate goal of 100 percent zero-emission where feasible by 2045 when they approved the Resolution. In addition, the Board directed staff, through the approved Resolution, to set earlier targets for key beachhead markets including:

- Drayage trucks, last mile delivery, and government fleets: 100 percent zero-emission vehicle fleets by 2035
- Refuse trucks, and local buses: 100 percent zero-emission vehicle fleets by 2040
- Utility fleets: 100 percent zero-emission capable vehicles by 2040

Strong policy targets have guided the development of the ACT regulation and will guide the development of the Advanced Clean Fleets regulation with the goals of achieving carbon-neutrality in California by 2045, achieving a 100 percent zero-emission drayage fleet by 2035 and a 100 percent zero-emission fleet where feasible by 2045 as outlined in Executive Orders B-48-18 and N-79-20.

Future ZEV Policy – Additional Credit for Strong Plug-in Hybrids

Comment: Commenter states that PHEVs that get between 75 and 100 percent of annual VMT from off-board power sources such as grid electricity should generate additional credit in a future fleet rule if a crediting system is developed, if fleets can prove through telematics, etc., that the VMT is within that range after a period in-use. [OP-50]

Agency Response: No changes were made to the regulation in response to this comment. The approved ACT Regulation does not require fleets to make vehicle purchases, so the comment is not applicable to this regulation. As staff works on future ZE fleet rules, staff can consider at that time how to credit plug-in hybrid vehicles and whether to use in-use, real world data.

Future ZEV Policy – Considerations to Include in Future ZE Fleet Rule

Comment: Commenter states that waste company investments in alternative fuel vehicles and infrastructure should influence future fleet purchase requirements. [OP-69]

Comment: Commenter states that transition to electric power away from natural gas has the waste industry in a quandary about capital investments and the air quality trade-offs that might occur as a result of the proposed regulation. [OP-81]

Comment: Commenter states they need assurance from CARB that NGV investments will not be stranded. Commenter states that CARB is leapfrogging the local air districts and Short-Lived Climate Pollution Strategies to pursue an ACT regulation that will not achieve the same near-term NOx and carbon intensity reductions compared to the existing emission inventory. [OP-101]

Agency Response: No changes were made in response to these comments. Staff does not agree the ACT regulation is inconsistent with other air quality programs such as the Short Lived Climate Pollutant strategies. The ACT regulation requires manufacturers to sell ZEVs but does not require fleets to purchase ZEVs. Because the ACT regulation is a manufacturer rule, manufacturers need to identify market segments they can compete in and offer competitive products that fleets will want to purchase. Fleets do not face a requirement to purchase ZEVs in the ACT regulation, therefore the comment is not relevant to the manufacturer ZEV sales requirement. Rather, the comment appears to be directed at a future fleet rule. The information being collected in the mandatory fleet reporting in the ACT regulation will provide staff with information needed to evaluate concern in a future zero-emission fleet rule.

The impacts of a ZE fleet rule will be evaluated at the time of that rulemaking and is premature for this discussion. The impacts of related programs such as the Short Lived Climate Pollutant strategies should be addressed during development of these future zero-emission fleet rule. Staff invites interest parties to participate in these upcoming rulemaking and provide relevant information to staff.

<u>Future ZEV Policy – Employee Misclassification Impact on Trucking Emissions</u>

<u>Comment:</u> Commenter states CARB should support fair trucking practices as a part of the rulemaking language to address misclassification related issues, as misclassified companies are less able to comply with clean trucking rules. [OP-76]

<u>Comment:</u> Commenter states CARB needs to address the issue of misclassification of drivers as dependent contractors. Many of the misclassified drivers earn minimum wage and can't afford the cost of purchasing or maintaining electric trucks. [T1-88, T1-94, T1-95]

<u>Comment:</u> Commenter states that in order to achieve compliance with the new rules, CARB needs to ensure the companies that are employing these drivers are taking responsibility for the transition to clean trucks. [T1-88]

<u>Comment:</u> Commenter states California needs to do its part to make sure these regulations spread the burden between companies and workers. [T1-89]

<u>Comment:</u> Commenter states that misclassified independent contractors are important to address to ensure compliance with air quality regulations, and requests more stringent reporting requirements. [T1-90]

<u>Comment:</u> Commenter states when drivers are misclassified, they are being deprived of their minimum wages, benefits, and workers' compensation. Commenter states CARB needs to address the issue of misclassification of drivers as independent contractors that ties them into economic stresses. [T1-91, T1-92]

<u>Comment:</u> Commenter states many of the drivers have a financial burden due to low minimum wages and the cost of maintenance on clean trucks. [T1-92]

<u>Comment:</u> Commenter urges CARB to come up with a policy or act to help the issue of misclassification of drivers and to provide them with more benefits and insurance. As CARB has noticed, drivers can't afford the cost of purchasing or maintaining electric trucks [T1-93]

<u>Agency Response:</u> To better capture information on this market segment, staff has reduced the fleet size threshold from 100 to 50 to ensure smaller fleets, which would be more likely to have owner/operators contracting for work, are included in the data gathered. Additionally, brokers are required to provide additional information and detail

about contracted trucking practices, require respondent entities to keep and provide records on request about dispatched trucks, and have changed the requirement for reporting contracted entities from a 1-year contract threshold to contracts of any length. These changes are anticipated to enable staff to better assess how fleets that use contracted trucks operate, especially from the drayage and delivery sectors. No further changes have been made in response to these comments as the issues raised are beyond the specified scope of the rulemaking.

Future ZEV Policy – Authority to Regulate Businesses Who Do Not Own Vehicles

Comment: Commenter states they are uncertain whether CARB's statutory authority includes the ability to regulate purchases of businesses that are indirect sources as they do not own vehicles themselves. [OP-108]

Comment: Commenter states that it is not clear that the legislature's grant of statutory authority to CARB would include the ability to impose a regulatory purchase requirement on businesses that are indirect sources of emissions -- i.e., those business that rely on trucking to supply their needs on deliver their products, yet do not own or control the vehicles used. Commenter states that such an extension of regulatory power, if the state deems it appropriate, should be granted by the legislature, and not imposed through the regulatory process. [B1-07]

Agency Response: The comments are outside the scope of the ACT regulation. The comments are specific to a fleet purchase concept and, therefore, are not applicable to the approved ACT manufacturer requirements.

Future ZEV Policy – Five Percent Turnover Requirement for Delivery Vehicles

Comment: Commenter states taking 5% of the polluting delivery trucks and vans off the road, starting with the older or more polluting vehicles would be economically feasible. In 10 years, half of delivery vehicles should be emissions free if new purchases are required. [OP-34]

Agency Response: No changes were made in response to this comment. The commenter is advocating for two distinct policies, a requirement for fleets to turnover their vehicles and a requirement that a portion of new purchases be zero-emission. Because the ACT Regulation does not regulate fleet’s vehicles, the commenter’s proposal to turnover vehicles would be outside the scope of the regulation. Staff will evaluate strategies to turnover requirements and potential accelerated replacement as part of the upcoming ZE fleet rule. The ACT regulation requires manufacturers to sell zero-emission medium- and heavy-duty vehicles across all vocations and is anticipated to result in significant electrification of delivery trucks and vans. By regulating all Class 2b-8 vehicles, the ACT regulation achieves greater ZEV penetration than a regulation focused narrowly on delivery vehicles could achieve.

Future ZEV Policy – Support Workforce Development

Comment: Commenter states CARB needs to invest in workforce development that supports the transition to ZE transportation and benefits economically challenged communities. [OP-99]

Agency Response: No changes were made to the regulation in response to this comment. The Board directed staff through the Resolution to identify and commit additional future resources to addressing indirect costs associated with the ACT regulation, including, but not limited to, workforce development and training, when they approved the Resolution. Staff recognizes that state investment that supports California workers can expand the benefits of the regulation, and deliver much-needed jobs training and employment opportunities to communities across the state. Staff's efforts in this area will seek to leverage, to the maximum extent possible, existing and scalable curriculums already utilized by early adopters of zero-emission heavy-duty vehicles.

Out of Scope – Incentive and Funding Policies

Comment: Commenter states more emphasis should be put on an incentive-based program that focuses on those fleets where the current ZEV technology is economically viable. Commenter states that the current Public Safety Power Shutoff events are very real, and regulations that mandate electric vehicles on businesses must be well thought out and thoroughly discussed with the impacted businesses. [OP-58]

Comment: Commenter states CARB should create combined funding for ZEV and NZEVs and infrastructure rather than have separate funding opportunities with different requirements and timelines. Incentives should be structured to support large scale near-zero deployments until 2027, and additional funds for electric and hydrogen infrastructure. [OP-60]

Comment: Commenter states concern that failure to better coordinate funding and planning among the many state, regional and local agencies could jeopardize the entire transition and adoption of EV's. Commenter is concerned with the inability to purchase vehicles using HVIP for state mandated vehicles. Insufficient funding for the grid upgrades and equipment installation can threaten timeline availability for heavy-duty EV's, and continued availability of purchase incentives for fleet owners is crucial and that available funds are multi-year rather than annual funding. Commenter urges CARB that financial incentives be developed to minimize obstacles to ZEV adoption by consolidating vehicle and infrastructure funding programs into a single program. [OP-74, T1-11]

Comment: Commenter states significant incentive funds should be identified and deployed to construct the necessary ZEV infrastructure and reimburse fleets for increased marginal costs of purchasing and operating ZEV trucks. [OP-87]

Comment: Commenter states that challenges identified in the Investment Plan such as purchase cost, ZEV infrastructure, service and support, secondary market undeveloped for ZEVs, and technology concerns need to be addressed to further advance the electric truck market. [OP-98]

Comment: Commenter states CARB needs to make adequate and reliable funding through 2030 such as HVIP and LCFS. [OP-99]

Comment: Commenter states CARB should recognize the need to preserve the HVIP funding for CNG fleet and create a demand for instate RNG from SB 1383. [OP-101]

Comment: Commenter states that hydrogen fuel cell infrastructure can be available for fuel cell trucks if LCFS credits and HVIP are made available to help pay for fuel cell electric trucks and hydrogen fueling infrastructure. Commenter provided supporting documentation, articles, and references to support their comment. [OP-107]

Comment: Commenter states there should be guaranteed incentives that will help with costs of operations and capital purchase reach cost disparity as their current fleets. [OP-123-Form-905]

Comment: Commenter states there should be guaranteed ZEVs on-road by either "carrot on a stick" incentives or enforced regulations. [OP-123-Form-1241]

Comment: Commenter stats that government-driven investment and incentives are critical for the success of the infrastructure build out. [OP-123-Form-1161]

Comment: Commenter states there are insufficient incentives for heavy-duty trucks and vehicles. [T1-05]

Comment: Commenter states CARB should align with other state agencies regarding implementation and funding and provide resources to advance the ZEV industry across the state. [T1-15]

Comment: Commenter states that CTA supports further incentives to bridge the gap between outdated and cleaner engine technologies. [T1-46]

Comment: Commenter states they would like to see ZEV vehicles be pushed through incentives and not mandates. [T1-47]

Comment: Commenter states CARB should take leadership in spurring the development and investment in long-range zero-emission trucks with hydrogen or even long-range battery-electric trucks. [T1-66]

Comment: Commenter suggest CARB introduce a truck buyback program to convert polluting trucks into truck-homes to create low-income housing near resources that minimize vehicle miles travelled. [OP-70]

Comment: Commenter states CARB should focus on how to incentivize pickups; specifically given they're driven by small businesses and they may not be able to earn LCFS credits. They don't think truck market can transform without commitments by the state and hope CARB continues to provide incentives in those regulated categories beyond 2024 or 2027 timeline. Commenter states that current timeline as structured in regulation are dependent on the state providing sufficient and consistent funding for HVIP, CORE, pilots and demonstration projects. [T1-79]

Comment: Commenter states that successful electrification of the HD sector requires a holistic approach addressing not just vehicle availability, but also infrastructure, costs, and potential fleet requirements. Commenter states that purchase incentives, fueling incentives, and infrastructure programs are programs that are generally not designed with HD pickups in mind. Commenter also states that a fleet purchase rule cannot support the sale of HD pickups. [B1-16]

Agency Response: No changes were made to the regulation in response to these comments. The comments relating to funding policies and incentives are outside the scope of this regulation. Staff recognizes that incentives can play an important role in the early adoption of new technologies. However, the cost analysis for this regulation did not include any grants or rebates and the regulation is not predicated on the availability of incentives. The existing LCFS regulation has been in place for a decade and fleets can take advantage of it directly when dispensing low carbon fuels.

CARB offers a portfolio of incentive programs currently which are designed to incentivize technology from early demonstrations to full scale commercial deployment. The demonstrations and pilot projects funded through our incentive programs help reduce costs, increase experience with the new technologies, and expand the overall ZEV marketplace. The ACT regulation is needed to drive manufacturers to develop new ZEV products and generate SIP-creditable emissions reductions beyond what is feasible through incentive programs. By achieving larger economies of scale, the ACT Regulation will help make ZEV technology more viable across sectors and fleets.

Out of Scope - Scale Back the Low NOx Omnibus

Comment: Commenter states the Low NOx Omnibus Rule should be scaled back substantially to allow for a cost-effective and growing transition to medium- and heavy-duty ZEV technologies. [OP-87]

Agency Response: No changes were made to the regulation in response to this comment. This comment is outside the scope of ACT regulation and pertains to a separate regulation, the Low NOx Omnibus regulation.

<u>Out of Scope – Existing In-Use Regulations</u>

<u>Comment:</u> Commenter states CARB should allow older truck models to operate longer in California. [OP-25]

<u>Comment:</u> Commenter talks about his experience with the Truck and Bus rule and grant programs for cleaner trucks. Commenter states that he received a notice in April 2019 stating that his truck will not be allowed on the road after January 1, 2019, and states that this was the first notice that he received. Commenter states that he cannot afford another truck and that there is no financial assistance or grants available for the purchase of another truck. [OP-53]

<u>Agency Response:</u> No changes were made to the regulation in response to these comments. The regulation does not affect in-use vehicles and applies to a portion of new vehicle sales. Comments referring to existing in-use requirements such as the Truck and Bus Regulation are outside the scope of this regulation.

<u>Out of Scope – Carbon Tax</u>

<u>Comment:</u> Commenter opposes the ACT regulation and states that electric cars are not a public benefit. Commenter states polluting vehicles should be taxed or regulated to reduce emissions, including getting older noncompliant vehicles off the road. Commenter states that inflexible mandates are costly and ignore possible solutions such as natural gas trucks. [OP-36]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. The comment is outside the scope of the regulation, as the regulation only establishes requirements for introducing new heavy-duty vehicles and engines. However, CARB notes that it has promulgated several regulations, including the Truck and Bus regulation (13 CCR section 2025) that require on-road truck and bus fleets to ensure that in-use, older, heavy-duty vehicles meet performance standards that are equivalent to new 2010 emission standards.

<u>Out of Scope – Road Use Charges</u>

<u>Comment:</u> Commenter states a "Road Use Charge" system is needed, and to push for legislation requiring it, stating SB1077 provides feasibility. [OP-49]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment as it is outside the scope of the regulation, however, staff appreciates the input. Staff will monitor such efforts as staff begins work on ZE fleet rules and other related policies.

Out of Scope – Effects of Climate Change are Already Here

Comment: Commenter shares an anecdote on the impacts of wildfires and poses an open question as to whether the regulation is too late or not. [OP-47]

Agency Response: No changes were made to the regulation in response to this comment. The past few years have clearly shown the impact that climate change is causing on the state's forests and exasperating wildfires across the state. As wildfires clearly have a significant impact on California's air quality, more needs to be done to mitigate the effects of climate change. CARB will continue to take bold action to reduce pollution and protect the health of Californians. This rulemaking is a key component of CARB's long-term strategy to reach carbon neutrality and protect the health of Californians.

Other – Other Waste Industry Requirements

Comment: Commenter states the rule should take into account and support efforts made to date along alternative fuel pathways. The waste industry is mandated by SB1383 to recycle and recover 75% of organic waste by 2025, which they suggest should be achieved by digesting into low carbon fuels to use in conventional vehicles. [OP-32, OP-44]

Agency Response: No changes were made to the regulation in response to this comment as it proposes a change that is beyond the scope of this rulemaking action.

Other – General Opposition

Comment: Commenter opposes the regulation, stating the voters of California should have a say in it. [OP-16]

Comment: Commenter states they are opposed to rule implementation, as requiring all trucks to be electric is not sustainable and rules must be voted on by taxpayers. [OP-18]

Comment: Commenter states this rule is not the solution, as California consumers cannot afford increases in the cost of living, and states that this rule will cause the cost of living to increase. [OP-19]

Comment: Commenter opposes this action. [OP-20, OP-23, OP-26, OP-31]

Comment: Commenter states opposition, as the regulation is too burdensome. [OP-24]

Comment: Commenter opposes rules that affect small businesses or truckers. [OP-30]

Comment: Commenter states opposition to rule as electric vehicles are neutral in benefit and mandates are inflexible, costly, and ignore other solutions such as natural gas trucks. [OP-36]

Comment: Commenter suggest a sales mandate is no longer warranted because vehicle penetration will grow organically. Commenter states a sales mandate could cause manufacturers to deploy the technology into customer operations for which it is not well suited, thus having the effect of impeding market acceptance. [OP-74]

Comment: Commenter states opposition as the proposal will increase the price of everything exponentially and CARB should be concerned about pollution (including that created by electricity generation). Commenter also asks if the rule will apply to illegal aliens. [OP-21]

Comment: Commenter opposes due to negative impact to California economy that is not justified by the proposed results. [OP-27]

Comment: Commenter opposes as forcing manufacturers and companies outside of California to go to zero-emissions "upends" small businesses and does not achieve anything. [OP-29]

Comment: Commenter states strong opposition due to the impact on the health and finances of California. [OP-42]

Comment: Commenter opposed to rule because of the economic damage to California and the insignificance of GHG benefit globally compared to other countries' GHG emissions. [OP-57]

Comment: Commenter has concerns about maintenance cost when drivers switch from conventional trucks to zero-emission trucks. They believe it would cost drivers 70% more than making this change. [T1-91]

Comment: Commenter opposes rule as a waste of taxpayer funds, and states there is no such thing as a "zero-emission truck" as electricity generation causes emissions. [OP-71]

Agency Response: No changes were made in response to these comments. Staff recognizes that all regulations can result in positive and negative changes. The ACT regulation has undergone a four-year public process with eight public workshops, five public workgroups, two focus group meetings, and well over one hundred meetings with stakeholders. Through this process, staff has developed a proposal that maximizes public benefits while minimizing negative impacts and adverse effects.

Staff acknowledges that vehicles with zero tailpipe emissions may generate upstream emissions as a part of fuel production. The well-to-wheel emissions of zero-emission trucks was already analyzed in Chapter VI of the Staff Report. Due to the lower upstream and downstream emissions of electricity and hydrogen versus gasoline and diesel, zero-emission trucks are anticipated to upstream and downstream emission benefits and produce lower emissions than all other technology options. CARB is simultaneously working to reduce emissions of other combustion-powered vehicles through regulations such as the Low NOx Omnibus and Low Carbon Fuel Standard.

Staff evaluated costs to the state as a whole and the total cost of ownership for a vehicle. Through these analyses, staff found that while zero-emission vehicles will cost more upfront due to higher vehicle costs and additional infrastructure costs, they will cost less over their lifetime due to lower fuel costs, LCFS revenue, and reduced maintenance expenses. ZEVs placed into well-suited applications will see a positive TCO versus their diesel counterparts, and more applications will show a payback over time as ZEV costs decline.

A number of studies from groups including ICF International, the North American Council on Fuel Efficiency, Union of Concerned Scientists, and University of California, Los Angeles have found that ZEVs are both cleaner on a well-to-wheel basis as well as superior economically versus gasoline, diesel, and natural gas options.

Impacts to local government and state government revenues are estimated in Attachment C to the 30-Day Changes. The ACT regulation is projected to have a slightly positive fiscal impact on local government due to increase in sales taxes and utility user taxes, and a significant decrease in revenue to the state government largely due to a decrease in gasoline and diesel fuel taxes.

As part of the Staff Report and 30-Day Changes, staff performed a macroeconomic analysis on the ACT regulation. The analysis found that the regulation is anticipated to have minimal effects on the state's economy and is projected to result in a slight increase in economic indicators. Because zero-emission trucks are anticipated to have a positive total cost of ownership, the regulation results in cost savings in the trucking industry which spreads through the California economy. Because the proposal only affects major manufacturers and large entities, the rule is not anticipated to have major impacts on small businesses and may create new opportunities.

The ACT regulation requires manufacturers to sell ZEVs but does not require fleets to purchase ZEVs. Because the ACT regulation is a manufacturer rule, manufacturers need to identify market segments they can compete in and offer competitive products that fleets will want to purchase. Broadly, vehicles used for local delivery appear better suited while work trucks present more challenges. Manufacturers most likely will not target market segments poorly suited for electrification and will instead focus on the ones that electrification is best suited for. The ACT Regulation applies to medium- and heavy-duty manufacturers, large businesses, large fleets and brokers, and government agencies. It does not directly affect small businesses, although some small businesses such as infrastructure installers and electric vehicle service providers may benefit from the effects of the regulation. The regulation does not apply to individuals.

Staff's TCO analysis and research show that ZEVs have lower maintenance costs per mile than conventional counterparts due to fewer moving parts, technologies such as regenerative braking systems, and other efficiency improvements. Staff has not been made aware of any research or industry models that indicate contrary information.

Other – Comments Addressed in The Environmental Response

Comment: Commenter states the proposed ACT regulation may actually trigger a number of compliance responses producing environmental impacts. Waste recycling and composting activities are either overlooked or completely disregarded and they should better align and harmonize all of our environmental policies at the federal, state and local levels. Commenter is concerned that the Draft EA does not fully factor all the impacts and current initiatives on the state's solid waste management system, and states that the Draft EA should take into consideration the environmental and fiscal impacts from increased costs for construction and operation of new waste management facilities to support recycling replacement of off-road and on-road vehicles. [OP-81]

Agency Response: These comments are addressed in the "Environmental Response to Comments" document. See Response to Comments on Final Environmental Analysis prepared for the ACT Regulation (Response to Comments link) presented and approved by the Board at the June 25, 2020 hearing.

WRITTEN COMMENTS RECEIVED DURING THE 30-DAY COMMENT PERIOD

Manufacturer ZEV Sales – General Support

Comment: Commenter states general support for the proposed changes to the regulation. [RP1-01, RP1-02, RP1-03, RP1-04, RP1-06, RP1-08, RP1-09, RP1-11, RP1-13-Form, RP1-14, RP1-19, RP1-20, RP1-21, RP1-22, RP1-23, RP1-24, RP1-25, RP1-26, RP1-29, RP1-30, RP1-31, RP1-33, RP1-35, RP1-37, RP1-39, RP1-40, RP1-41, RP1-42, RP1-43, RP1-45, RP1-48, RP1-49, RP1-51, RP1-53, RP1-55, RP1-56, RP1-61, RP1-65, RP1-67, RP1-68, RP1-69, RP1-70, RP1-71, RP1-72, RP1-74, RP1-75, RP1-76, RP1-78, RP1-79, RP1-81, RP1-82, RP1-83, RP1-84, RP1-87, RP1-89, RP1-90, RP1-91, RP1-92, RP1-94, RP1-95, RP1-96, RP1-97, RP1-98, RP1-99, RP1-100, RP1-101, RP1-102, RP1-103, RP1-104, RP1-105, RP1-107, RP1-108, RP1-109, RP1-110, RP1-111, RP1-112, RP1-113, RP1-114, RP1-115, RP1-116, RP1-117, 118, RP1-119, RP1-120, RP1-121, RP1-122, RP1-123, RP1-124, RP1-125, RP1-126, RP1-127, RP1-128, RP1-129, RP1-130, RP1-131, RP1-132, RP1-133, RP1-134, RP1-136, RP1-138, RP1-139, RP1-140, RP1-142, RP1-143, RP1-144, RP1-146, RP1-147, RP1-149, RP1-150, RP1-151, RP1- 152, RP1-153, RP1-155, RP1-156, RP1-157, RP1-158, RP1-159, RP1-160, RP1-161, RP1-162, RP1-163, RP1-164, RP1-165, RP1-166, RP1-167, RP1-168, RP1-170, RP1-171, RP1-173, RP1-174, RP1-175, RP1-176, RP1-177, RP1-178, RP1-179, RP1-180, RP1-182, RP1-183, RP1-184, RP1-185, RP1-186, RP1-187, RP1-188, RP1-189, RP1-190, RP1-192, RP1-198, RP1-199, RP1-200, RP1-201, RP1-204, RP1-207, RP1-208, RP1-209, RP1-211, RP1-217, RP1-220, RP1-221, RP1-

222, RP1-224, RP1-225, RP1-226, RP1-229, RP1-230, RP1-231, RP1-235, RP1-241, RP1-242, RP1-243, RP1-244, RP1-245, RP1-246, RP1-248, RP1-249, RP1-250, RP1-251, RP1-252, RP1-253, RP1-256, RP1-257, RP1-260-Form, RP1-261, RP1-262, RP1-264, RP1-267, RP1-268, RP1-270, RP1-271, RP1-273, RP1-276, RP1-282, RP1-286, RP1-290, RP1-291, RP1-292, RP1-293, RP1-295, RP1-300, RP1-301, RP1-309, RP1-311, RP1-319, RP1-323, RP1-325, RP1-331, RP1-336, RP1-339, RP1-341]

Comment: Commenter states his support on hydrogen vehicles. [RP1-13-Form-1746]

Comment: Commenter states his support on hydrogen vehicles and its fuel supply infrastructure. [RP1-13-Form-3346, RP1-191]

Comment: Commenter on behalf of several organizations supports the proposed modifications and updated reporting requirements. Commenter states the reporting requirement will collect sufficient data for development of fleet rules. [RP1-57]

Comment: Commenter applauds improvement of the proposed changes to the regulation and attaches a total cost of ownership for electric class 2b/3 pickup trucks and a press release from General Motors about their Ultrium Battery for the electrification of work trucks. [RP1-58]

Comment: Commenter suggests that there is confidence in battery electric truck infrastructure and CARB can confidently adopt a robust ACT regulation, knowing that agencies, industry, and other stakeholders are engaged in a comprehensive set of programs to meet the needs of battery electric ZEVs. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-188]

Comment: Commenter states that short-haul vehicles should be manufactured as ZEVs, and have incentives like tax breaks to comply. [RP1-213-Form-31]

Comment: Commenter states battery powered vehicles are an economical solution to combustion engine. [RP1-213-Form-557]

Comment: Commenter on behalf of Southern California Edison (SCE) state they support the ACT regulation and are ready to facilitate the transformation of medium- and heavy-duty vehicles to zero-emissions. [RP1-259]

Comment: Commenter on behalf of NRDC submitted form letters from 5,503 signatories providing general support for the propose changes to the regulation. [RP1-260]

Comment: Commenter states general support for the proposed changes to the regulation, and states that the rule will incentivize and accelerate battery development that will boost EV adoption nation- and world-wide. [RP1-278]

Comment: Commenter states general support for the proposed changes to the regulation, and highlights economic benefits: driving down ZEV battery costs for LD and HD, reducing need for expensive and often extremely dirty Peaker power plants, facilitating renewable energy integration into the grid, spurring new technologies and businesses using new inexpensive energy storage in CA. [RP1-279]

Comment: Commenter states general support for the proposed changes to the regulation, and states that the rule will help the 122 CA hospitals and 58 major U.S. businesses that are a part of their coalitions achieve economic growth in a clean, resilient sector, and will generate almost 2 million new jobs for Californians, and save hundreds of millions if not billions of dollars in avoided costs from reduced emissions. [RP1-280]

Comment: Commenter recognizes need for infrastructure needs that will result from the ACT regulation, and stands ready with experience to provide what's needed. Commenter states general support for the proposed changes to the regulation, and states that the rule will help the state meet its climate action goals. [RP1-281]

Comment: Commenter states ACT is needed to bring ZE trucks into wide scale production, and complements other State electrification policies like LCFS that will bring both environmental and economic benefits. [RP1-294]

Comment: Commenter has 3,637 signatures of Californians that believe in the new proposal and urges CARB to reject any delays that might rollback the regulation. [RP1-306]

Comment: Commenter has 36 public comments addressed CARB that were submitted to the Union of Concerned Scientists by California scientists, engineers, doctors, and public health experts urging for a strong ACT Rule. [RP1-308]

Comment: Commenter provides general support for the ACT regulation on grounds of GHG emissions reduction, air quality, public health, and increasing battery development and resulting spread of EVs around the nation and the world. [RP1-318]

Comment: Commenter and the 563 signatories support the proposed changes to the regulation. [RP1-324]

Comment: Commenter on behalf of the Peninsula Interfaith Climate Action Organization supports the proposed changes to the regulation. [RP1-337]

Agency Response: Staff appreciates the supportive comments. Additional issues raised by commenters, if any, will be addressed in the following applicable sections.

Manufacturer ZEV Sales – Strengthen the ACT Proposal Increasing Sales Percentage Requirements

Comment: Commenter suggests earlier ZEV sales requirement beginning in 2022. [RP1-03]

Comment: Commenter states regulation should increase ZEV sales requirements for all classes and years, especially in early years. [RP1-08]

Comment: Commenter states that 100% of vehicles and machinery sold/imported into CA should be zero-emission by 2030. [RP1-27]

Comment: Commenter is in support of a 30% minimum sales requirement of zero-emission trucks by 2030 but suggests a higher manufacturer sales percentage is preferable. [RP1-47, RP1-50, RP1-52, RP1-54, RP1-59, RP1-60, RP1-62, RP1-63, RP1-126, RP1-135, RP1-137, RP1-258, RP1-262, RP1-263, RP1-268, RP1-269, RP1-274, RP1-275, RP1-279, RP1-304, RP1-321, RP1-322, RP1-327, RP1-328, RP1-329, RP1-332, RP1-333, RP1-334, RP1-335, RP1-338, RP1-340, RP1-342]

Comment: Commenter recommends a sales increase of 30% per year. [RP1-93]

Comment: Commenter states that they don't believe the transition should take 13 years. [RP1-160]

Comment: Commenter would like us to consider a different implementation of ZEV sales percentage requirements: 1% by 2025, 2% by 2026, 4% by 2027, 8% by 2028, 16% by 2029, 32% by 2030, and 64% by 2032. [RP1-212]

Comment: Commenter states we should adopt an even stronger ACT regulation. [RP1-219, RP1-260-Form-1556, RP1-261]

Comment: Commenter states that the 50% requirement by 2030 should also apply to the Class 2b-3 group, not just classes 4-8. [RP1-223]

Comment: Commenter states the ACT regulation should require 40% by 2030. [RP1-227]

Comment: Commenter urges CARB to adjust the zero-emission vehicle sales percentage for Class7-8 trucks to start with 12% in 2024 and 80% by 2035. [RP1-236, RP1-289, RP1-297, RP1-299, RP1-310, RP1-314]

Comment: Commenter states all commercial trucks should follow the ACT regulation. [RP1-260-Form-1148]

Comment: Commenter states ACT should apply to all motor vehicles. [RP1-260-Form-1512]

Comment: Commenter states all trucks need to be switched to electric. [RP1-260-Form-2000]

Comment: Commenter states that the ACT regulation needs to include 100% zero-emission trucks by 2023. [RP1-260-Form-2024]

Comment: Commenter urges strengthening the ACT regulation to respond as quickly as the climate and air pollution crises demand. Commenter states that the ACT regulation should call for stronger ZEV sales requirements across vehicle classes and years. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-287]

Comment: Commenter states we should electrify all modes of transportation. [RP1-296]

Comment: Commenter states the ACT regulation should begin in 2025 with 30% ZEVs. [RP1-296]

Comment: Commenter states that Class 7-8 trucks should start with 12% in 2024 and 80% by 2034. [RP1-298]

Comment: Commenter states need for a stronger ACT regulation, comparing Norway's 50% requirement by 2030 to ACT's 30% requirement, and cites falling battery prices as one reason for why stronger ACT requirements are possible. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-305]

Agency Response: No changes were made to the regulation in response to these comments. See further discussion on staff's rationale for the regulation's requirements in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements".

Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements and Focus on Beachhead Markets

Comment: Commenter states that the proposed amendments maintain a fundamentally flawed regulatory structure and does not meet Board direction to revise and restructure the ACT regulation to pair manufacturer and fleet requirements. Commenter provides quotes from Board members from the December 12, 2019, Board hearing supporting commenter's statements. [RP1-218]

Comment: Commenter supports accelerating the transition to zero-emission technologies through a thoughtful policy approach that prioritizes promising sectors and use cases, often referred to as a beachhead or segmented approach. CARB staff's proposed amendments did the opposite by making the rule less segmented. OEMs are segmented in the medium- and heavy-duty market, a broad unsegmented approach may harm certain OEMs who only manufacture in less mature markets and benefit OEMs who happen to manufacture in the more easily electrified segments of the market. [RP1-241]

Comment: Commenter urges CARB staff to consider the value of additional segmentation to add clarity to the goals of this regulation and to strongly inform an effective fleet rule structure. Commenter suggests incorporation of beachhead strategies to quickly get to scale and reduce costs. [RP1-265]

Agency Response: No changes were made to the regulation in response to these comments. Please see the discussion about transitioning key beachhead markets to zero-emission in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements". In addition, the Board has directed staff through the Resolution to return to the Board with a ZE fleet rule by the end of 2021 and to ensure the upcoming zero-emission fleet rules compliment the ACT Regulation. These commitments show CARB's overall direction to have both manufacturer and fleet rules, but do not mean that staff must present both simultaneously.

Manufacturer ZEV Sales – Manufacturer Requirements Are Too Stringent

Comment: Commenter states that ACT sets impossible goals for the deployment of currently non-existent heavy-duty vehicles. Commenter states that the 5% sales requirement by 2024 for Class 7 & 8 trucks is not realistic because ZEVs are not currently produced in the category, and would not be produced in enough quantity required to meet the requirement. [RP1-106]

Comment: Commenter recommends more realistic sales targets and suggests CARB maintain the original sales percentage requirements for MYs 2024-2030, rather than the revised sales requirements. [RP1-205]

Comment: Commenter states that CARB should revert to its original strategy that sales percentages would serve as a "floor" to bring large HD manufacturers into the zero-emission truck market and corresponding fleet rules would be used to meet the ZEV goals of maximizing deployments. [RP1-214]

Comment: Commenter states rule targets are too aggressive, as at-scale commercial production of Class 5/6 and Class 8 ZEVs is not expected by commenter until 2023-2024 timeframe, and not one that has been announced that the commenter can purchase in quantity that will meet their duty-cycle and dispatch business models. [RP1-232]

Comment: Commenter states the proposal to remove the exemption for Class 2b-3 pickup trucks until 2027 as originally proposed is not analytically supported and removes the more segmented original proposal. Commenter recommends reinstating the exemption for Class 2b-3 pickups until 2027 and returning to the sales percentages in the original ACT regulation for Class 7-8 tractors. Commenter supports the increased percentages for Class 2b-3 vans and suggests separating vans from pickups in Class 2b-3. [RP1-241]

Comment: Commenter states the increased sales mandate was not accompanied by any analysis of technical feasibility. [RP1-247]

Comment: Commenter expects small numbers of available tractors in 2021 and expects them to be used for regional haul and not long haul. Commenter predicts that rapid electrification of regional tractors may not lead to achieving the sales percentages and timelines in the 30-Day Changes for years 2024 and 2027. [RP1-265]

Comment: Commenter states targets are too aggressive. [RP1-284]

Agency Response: No changes were made to the regulation in response to these comments. Staff recognizes that the ACT regulation's requirements are aggressive but are technologically and economically feasible. These requirements are necessary in order to enable large-scale electrification at the scale necessary to meet the states air quality and climate goals. Without transitioning as much of the medium- and heavy-duty sector to zero-emission where feasible, California will not be able to meet air quality goals, climate change targets, nor its carbon neutrality goals. By setting stringent requirements on manufacturers, CARB is ensuring there will be sufficient vehicles available for fleets to purchase. CARB intends to develop future ZE fleet rules to ensure ZEV deployments in fleets. To supplement this effort, other California policies can provide incentives, ensure access to infrastructure, and achieve other goals that are needed for widespread transportation electrification.

Staff performed analyses in Appendix F to the Staff Report as well as Attachment B to the 30-Day Changes. These show that the manufacturer ZEV sales requirements are feasible for zero-emission technology. Because of the need for electrification and the feasibility of the requirements, staff is maintaining the current ZEV percentage requirements.

Manufacturer ZEV Sales – Rationale for Increasing Class 2b-3 and Pickup Requirements

Comment: Commenter states that they would like to understand the basis for sales targets increasing by 100%. In addition, commenter would like to understand the inclusion of Class 2b-3 pickups. [RP1-215]

Comment: Commenter states adding pickup trucks to the rule only adds complexity and potentially little value. [RP1-216]

Agency Response: No changes were made to the regulation in response to these comments. As detailed in Attachment B to the “Notice of Public Availability of Modified text and Availability of Additional Documents and Information” for the ACT regulation, released in April 28, 2020, for public comment, staff moved the requirements for Class 2b-3 vehicles forward one year without changing the start date and removed the pickup truck exemption. The inclusion of Class 2b-3 pickup trucks in 2024 is supported by new information in recent market announcements showing that a number of zero-emission pickup and additional van models will be commercially available from several manufacturers well before the 2024 model year. See further discussion of staff’s rationale for increasing manufacturer’s sales requirements for Class 2b-3 vehicles in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements”.

Manufacturer ZEV Sales – Increase Weight Class Modifier for Class 2b-3 Vehicles

Comment: Commenter recommends increasing the weight class modifier for Class 2b-3 to 1.0. [RP1-241]

Agency Response: In response to this comment and new information, the weight class modifier for Class 2b-3 vehicles was increased from 0.6 to 0.8. This change was necessary as there is a higher risk to manufacturers that produce vehicles in this category due to relatively high proportion of personal-use and small fleet purchasers of pickups and vans. The Weight Class Modifiers are designed to allow manufacturers flexibility in producing their products while maintaining overall emissions benefits. Heavier vehicles produce more emissions, and electrifying heavier vehicles provides more benefits. Increasing the weight class modifier to 1.0 for Class 2b-3 vehicles would put them on par with a Class 4-5 vehicle. This would overestimate the emissions of a Class 2b-3 vehicle and overstate the benefit of electrifying a Class 2b-3 vehicle. Keeping the 0.8 value correctly states the emissions of a Class 2b-3 vehicle.

Manufacturer ZEV Sales – Allow More Technologies and/or Fuel Options

Comment: Commenter suggests that the ACT regulation consider the “cyclone” engine, which uses renewable fuels, as an alternative option to meet zero-emissions standards. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-16]

Comment: Commenter states that there are a number of renewable low carbon fuels in the marketplace that are reducing emissions. Commenter suggests that we should let the market figure out the most appropriate technology; and asks why should CARB dictate a winner at this point? Commenter suggests allowing alternative fuels/technologies participate in the rule. [RP1-106]

Comment: Commenter states that air quality improvements could be better accomplished by including other fuel types in the rule. [RP1-260-Form-300]

Comment: Commenter recommends CARB develop a manufacturer rule that is technology neutral. Commenter believes this rule, and any future fleet rule, should set emissions targets and allow any technology to meet it instead of specifying that only electric and hydrogen vehicles can be used for compliance. [RP1-272]

Agency Response: No changes were made to the regulation in response to these comments. The ACT regulation requires manufacturers sell ZEVs as a percentage of annual truck and bus sales in California. A ZEV is defined in the regulation as, “an on-road vehicle with a drivetrain that produces zero exhaust emission of any criteria pollutant (or precursor pollutant) or greenhouse gas under any possible operational modes or conditions”. See staff discussion on how the ACT regulation has the primary purpose of expanding electrification in California, but is one of a suite of CARB efforts to reduce emissions from vehicles and fuels, in chapter “Comments Received During Original Proposal’s 45-Day Comment Period” section “Manufacturer ZEV Sales – Credit for Low NOx Engines and Renewable Fuels”.

Manufacturer ZEV Sales – Give Credit for Low NOx Engines

Comment: Commenter in reference to Section 1963(a), states that the ACT regulation should provide an incentive to build Low NOx RNG medium- and heavy-duty trucks. [RP1-106]

Comment: Commenter recommends that the rule include NZEV credits for vehicles with engines certified to the optional low NOx standard of 0.02g/hp-hr and that use renewable fuel. [RP1-206]

Comment: Commenter states the ACT regulation should include a partial credit for low NOx trucks (0.02 grams of nitrogen oxides per brake horsepower hour (g/bhp-hr)) and a range multiplier for long range trucks (Class 7 and 8 - minimum range of 300 to 400 miles) to incentivize the sale of long range near-zero and zero-emission trucks. [RP1-216]

Comment: Commenter recommends that the rule include NZEV credits for vehicles with engines certified to the optional low NOx standard of 0.02g/hp-hr and that use renewable fuel. Additionally, the commenter is concerned that the, "definition of NZEV in the proposed rule focuses on certain technologies instead of actual emissions performance or capability." [RP1-218]

Comment: Commenter recommends amending the regulation to incentivize the deployment of low NOx trucks powered by RNG to provide immediate air quality benefits. [RP1-254]

Comment: Commenter recommends developing a credit system, much like the one proposed by CARB staff for hybrid-electric platforms, for heavy-duty trucks that meet a 0.02 g/bhp-hr NOx certification standard or better. Additionally, the commenter states the ACT regulation needs to focus on existing technologies such as Low NOx engines now and push later for new technologies in order to reduce air pollution sooner than 8 years. Commenter states staff's current proposal ignores the long-term benefits of using Low NOx trucks powered by renewable natural gas. [RP1-228]

Comment: Commenter states CARB should consider a backup strategy in the event of missing ZEV targets. The Low NOx, RNG powered trucks are able to hit the market soon while manufacturers work on producing ZEVs. [RP1-232]

Comment: Commenter states there should be a credit system for Low NOx trucks powered by RNG. [RP1-233]

Comment: Commenter states that it is unclear from CARB's analysis whether the shorter-term air quality goals could be met utilizing currently existing low and ultra-low NOx technologies in a much more cost-effective manner than the approach currently proposed by CARB. [RP1-272]

Comment: Commenter recommends allowing electric hybrids, including non-plug-in hybrid-electrics that meet or exceed MY2027 Phase 2 GHG standards, to receive partial credit in truck sectors facing challenges to fully electrify. Commenter cites China's related approach in LDVs, and provides a link to an article that also supports their position. Commenter suggests adding a compliance pathway to comply with the ACT regulation that allows for low-carbon fuel use in trucks such as ultra-low NOx trucks. [RP1-284]

Comment: Commenter urges CARB to continue to allow RNG/CNG to be one of the preferred options in the ACT regulation as a bridge to future technologies. [RP1-320]

Agency Response: No changes were made to the regulation in response to these comments. To the extent commenter in RP1-218 is asserting that the NZEV definition sets a prescriptive standard, CARB disagrees. The ACT regulation establishes a compliance option that provides partial credits to manufacturers that elect to produce and sell vehicles that do not meet the full criteria for a ZEV but that can operate for a specified mileage range - a minimum all-electric range (AER)) - without generating GHG or criteria emissions. Vehicles meeting this criterion are referred to as near-zero emission vehicles (NZEVs). The ACT regulation does not require manufacturers to sell NZEVs, but instead permits manufacturers that elect to sell NZEVs to do so as an interim partial compliance option to the primary regulatory requirement to earn ZEV credits in order to offset their deficits. It is a partial compliance option because manufacturers can use NZEV sales to meet no more than half of their deficits and no NZEV credits can be earned after the 2035 model year. Thus, the NZEV credit partial compliance provision does not constitute a prescriptive standard because it is purely optional and not a requirement mandated under the regulation. See discussion about credits for Low NOx vehicles in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Credit for Low NOx Engines and Renewable Fuels”.

For the sake of clarity, commenter RP1-228’s claims must also be put in the correct context. The commenter essentially alleges that its own analysis suggests that the ACT rulemaking will not achieve enough near-term NOx and carbon intensity emission benefits, relative to the existing emissions inventory, for SIP purposes unless CARB allows for manufacturers to generate NZEV credits with Low NOx engines. First, the discussion of “emission benefits” or “emissions inventory” or “emissions analysis” in the ACT rulemaking context is more related to an evaluation of how well the proposed regulations achieve the objectives of the ACT regulation than it is to any consideration of environmental impacts. (See 40 C.F.R. § 1066.605 [requirements for emissions testing not related to CEQA requirements].) In other contexts, like in environmental review situations (e.g., CEQA), these terms might point to air quality impacts or greenhouse gas (GHG) impacts. But, unless specifically incorporated into the environmental analysis of an environmental review document under CEQA, discussions of these terms in the ISOR, FSOR, or other record documents should not be taken to implicate an environmental review analysis of air quality or GHG impacts. Here, the commenter is asserting that its suggested concept of including Low NOx engine to generate NZEV credits will be an emissions benefit for SIP purposes to meet the state's air quality goals under the Clean Air Act. This is not a comment about environmental impacts. Rather, the commenter disagrees with CARB's policy approach. The comment is noted.

Second, the commenter RP1-228's assertion that air quality improvements, relative to the baseline scenario, would be better accomplished through the use of Low NOx engines also deserves clarification. The use of the word "baseline" has a different meaning in the CEQA context than in discussions of non-CEQA issues. For example, ISOR's Appendix F (Emissions Inventory Methods and Results) provides analysis of the proposed ACT regulation on criteria and GHG emissions by estimating emissions under a "Baseline scenario" and a "Proposed Rule scenario." According to Appendix F, the "Baseline scenario represents the existing forecasted emissions inventory without the proposed ACT rule," and this forecasted inventory includes the same vehicle sales and population growth assumptions reflected in CARB's EMFAC (Emission Factor model) emissions inventory for weight Class 2b and greater vehicles for all fuel types. In other words, in the FSOR (Appendix F), the economic and emissions benefits of the ACT Regulation were evaluated against the business-as-usual (BAU) "baseline scenario" for each year of the analysis period from 2020 to 2040. In contrast, the baseline used for CEQA purposes in the EA is "a 2018 baseline, as that is the year in which CARB filed the notice of preparation" (NOP). Per CEQA requirements, the CEQA baseline corresponds with what is known as the existing conditions on the ground (including the regulatory setting and physical conditions in 2018) at the time of the filing of the NOP. (Title 14, California Code of Regulations, section 15125, subd. (a)(1).) Although the discussion of environmental impacts in the EA references the BAU scenario, the EA uses the existing conditions as the point for comparison when evaluating reasonably foreseeable changes that could result from deploying the required number of ZEVs required by the ACT regulation. As such, the CEQA baseline (see Attachment A to Final EA) serves a different purpose and has a different meaning from the "BAU baseline scenario" in Appendix F. For purposes of evaluating these comments, CARB interprets commenter's position as relying on existing forecasted emissions to suggest that its proposed Low NOx credit approach would achieve more emissions reductions below the forecasted emissions than the proposed ACT regulation. There is no suggestion in this comment that the proposed ACT regulation is actually causing an environmental impact, rather, it argues that the proposed ACT regulation could do more to reduce emissions below the forecasted emissions inventory if it adopted commenter's concept. CARB disagrees with commenters' argument on this point based on the reasoning already provided, above, in rejecting Alternative 3.

Manufacturer ZEV Sales – Modify Near-Zero-Emission Vehicle Definition

Comment: Commenter in reference to Section 1963(c)(16) suggests that the NZEVs definition should include the cleanest certified NOx vehicles in California. [RP1-106]

Comment: Commenter states that CARB should include heavy-duty trucks that meet a 0.02-gram NOx standard within the ACT regulation definition of near-zero. Commenter states that they support the Coalition of Natural Gas comment from May 28, 2020 of which they are also a signatory. [RP1-194]

Comment: Commenter suggests that the NZEV definition should define applicable technology in terms of quantifiable exhaust emission standards, to include engines emitting less than 0.02 g/bhp-hr NOx. [RP1-206]

Comment: Commenter states the definition of "near-zero" in the Staff Report is not consistent with many CARB, California Energy Commission, and South Coast Air Quality Management District documents. For example, the SCAQMD Air Quality Management Plan, which was approved by CARB, goes as far as explicitly defining "near-zero" as 0.02 g/bhp-hr, consistent with CARB's 90 percent reduction target. Commenter suggests that CARB set a performance-based definition for "near-zero" and continue to use the 90% reduction target and 0.02 g/bhp-hr emission rate. [RP1-216]

Comment: Commenter recommends modifying the NZEV definition to include additional technologies that can achieve the optional certification to 0.02g/hp-hr NOx standard and use renewable fuel. Commenter states that CARB should also clarify that the new definition of NZEV used in the ACT regulation does not affect the definition of "near-zero" as it is used in other CARB regulations or funding programs. [RP1-218]

Comment: Commenter states the definition of near-zero is a conflicting regulatory and statutory definition that is confusing to everyone. Commenter states PZEV is a vehicle that has the ability to operate partially in zero-emission mode. This would be a consistent definition to what is used in the light-duty vehicle sector, and should be used in the ACT regulation. Commenter states that the Low NOx 0.02 grams standard should be included in the near-zero definition. [RP1-228]

Comment: Commenter states that the near-zero term should include Low NOx trucks. [RP1-233]

Comment: Commenter states the definition of "near-zero" is conflicting with the commonly held "near-zero" definition and is confusing to stakeholders. Commenter recommends the inclusion of low NOx engines that meet the 0.02 g NOx value into the "near-zero" definition of the ACT regulation. [RP1-254]

Agency Response: No changes were made to the regulation in response to these comments. See staff's reasoning for maintaining the "near-zero-emission vehicle" definition in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Near-Zero-Emissions Vehicle Definition".

Manufacturer ZEV Sales – Add Midterm Reviews, Offramps, Market Reviews, or Appeals Process to Assess Regulation

Comment: Commenter requests that staff update their analysis of the current and future manufacturer marketplace and the medium- and heavy-duty ZEV models that will be available for purchase within the timelines of the ACT regulation. Commenter also states an update to CARB's analysis of the current and future economic conditions that will affect availability of ZEV's and sources of funding for government agencies should be completed. [RP1-44]

Comment: Commenter in reference to 1963.3 suggests that ACT does not provide alternatives to the strict requirements of the regulation e.g. an appeals process, technology determination, variance process, compliance provisions and suggests language similar to the Advanced Clean Transit regulation [sic]. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-106]

Comment: Commenter suggest that CARB should reevaluate the ACT regulation prior to 2035 to ensure that progress towards a zero-emission future does not stagnate at the required percentages. [RP1-140]

Comment: Commenter states that CARB should provide a provision in the rule to exempt manufacturers from mandated sales that exceed infrastructure build-out and purchase incentive availability. [RP1-214]

Comment: Commenter states that the ACT regulation should be reconsidered again in 3 years after it becomes law to accelerate the timeline. [RP1-223]

Comment: Commenter states that the ACT regulation should include regulatory provisions for relief if the market causes failure to meet the sales percentages. [RP1-241]

Comment: Commenter requests that CARB update their analysis of the current and future manufacturer marketplace and sources available for funding for fleet agencies at critical milestone dates in the proposed regulation. [RP1-255]

Comment: Commenter suggests it is appropriate for CARB to perform check-ins over the course of the rule's implementation to ensure the rule remains on a path to success. [RP1-259]

Comment: Commenter states it would be highly prudent to build "checkpoints" into the regulation at specific milestones to assess the market, and to assess whether staff's assumptions have borne out. [RP1-265]

Comment: Commenter recommends a future check-in regarding the market's progress in meeting the regulation in 2026. [RP1-281]

Agency Response: No changes were made to the regulation in response to these comments. Staff intends to return to the Board with a recommendation in 2021 with a complementary regulatory strategy on fleet owners to further the deployment of ZEVs. As a result, staff will continue to monitor the ZEV market and will be prepared, if needed, to make any adjustments at that time. Staff does not believe mid-term reviews or checkpoints are necessary, however, staff is prepared to come back to the Board once the regulation is in effect, if market conditions change. The Board provided a pathway to meet future ZEV goals, as described in the Board's final resolution, which will require, at minimum, full compliance with the approved regulation. For additional information, see response summarizing how off-ramps fail to add regulatory certainty in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Add Off-Ramps to the Proposal".

Manufacturer ZEV Sales - Elect ACC or ACT Credits Year Round

Comment: Commenter states that in Section 1963.2(a) staff should clarify that manufacturers have the flexibility to choose the program in which to generate credits throughout the year to prevent double counting between Advanced Clean Cars rule and ACT rule. [RP1-235]

Agency Response: No changes were made to the regulation in response to this comment. Manufacturers can claim credit in either program throughout the model year and are only required to report those credits once per year for the approved ACT regulation.

Manufacturer ZEV Sales – Extra Credit for ZEVs Based on Range

Comment: Commenter states that the current credit modifier value of 0.8 for Class 2b-3 vehicles does not provide incentives for OEMs to develop and produce vehicles to address the need of personal use buyers. OEMs can earn the same amount of credits by offering 150-mile ZEV vs. offering 300-mile ZEV. Toyota recommends adding "bonus" credit to the weight-class modifier in which OEMs are provided incentives to develop and provide longer range vehicles. From light-duty ZEV market assessments, Toyota is aware that one of the important factors for consumers is longer range availability. [RP1-80]

Agency Response: No changes were made to the regulation in response to this comment. See discussion on why staff chose not to give longer ranged ZEVs more credit in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Extra Credit for ZEVs Based on Range".

Manufacturer ZEV Sales – Promote Hydrogen Fuel Cell Electric Vehicles and Associated Incentives

Comment: Commenter recommends a mechanism in the rule to incentivize production of hydrogen ZEVs starting in 2025 through 2035 in heavier GVWR ranges to help Caltrans meet its user range requirements, and/or an incentive program to develop heavy-duty electric vehicles and EV infrastructure that meets their range and needs. [RP1-273]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation categorizes hydrogen fuel cell electric vehicles as ZEVs and sets stringent requirements on manufacturers to produce ZEVs. To meet these stringent targets, staff expects manufacturers to work closely with their customers and design ZEVs that meet their customer's operational needs. Building hydrogen fuel cell electric vehicles with longer range capabilities is one solution for meeting the ZEV mandates. Regarding financial incentives, see discussion about incentives in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Out of Scope – Incentive and Funding Policies".

Manufacturer ZEV Sales – Clarify Changes to Low Volume Manufacturer Exemption

Comment: Commenter states that by striking out "Class 2b and greater vehicles" in the "Low Volume Manufacturer Exemption", it can be interpreted that many light-duty vehicle OEMs will be regulated under the Advance Clean Truck regulation even if they would be qualified as low volume manufacturers under the original description. CARB does not offer explanation as to why the "Class 2b and greater vehicles" description was struck from the modified proposal. Toyota requests reinstatement of "Class 2b and greater vehicles" into description of low volume exemption. [RP1-80]

Agency Response: No changes were made to the regulation in response to this comment. While the text "Class 2b and greater vehicles" was removed from the Low Volume Manufacturer Exemption section, the definition of "vehicle" explicitly states that vehicles must have a GVWR greater than 8,500 lb. The modified statement does not change the applicability of the exemption and only removes duplicative text.

Manufacturer ZEV Sales – Modify NZEV Credit Generation Past 2030

Comment: Commenter recommends modifying NZEV vehicle requirements; specifically, section 1963.2(b)(2) should be eliminated and section 1963.2(b)(1) should be revised to read as follows: "NZEV Factor Value. The NZEV factor used to calculate NZEV credits shall be calculated as 0.01 multiplied by the all-electric range, and is not to exceed 0.75 until the end of the 2029 model year and 0.65 starting with the 2030 model year." [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. The suggested change would effectively decrease the amount of credit longer range NZEVs would generate past 2030 and would maintain a minimum all-electric range of 35 miles. In contrast, the approved ACT regulation increases the minimum all-electric range requirement from 35 miles to 75 miles in 2030 MY. The commenter's proposed change would encourage the production of shorter-range ZEVs since there would be no requirement to produce ZEVs with at least 75 miles of range. In addition, the commenter's proposed change would dis-incentivize the production of longer-range ZEVs since vehicles with more than 65 miles of all-electric range would no longer receive additional credits.

In order to achieve zero-emission wherever feasible by 2045, manufacturers need to be building vehicles with sufficient zero-emission capabilities to meet all fleet needs. These proposed changes recommended by the commenter would not improve the likelihood of achieving this goal.

Manufacturer ZEV Sales – Use Battery Capacity instead of All-Electric Range for NZEVs

Comment: Commenter suggests that the ACT regulation should measure clean air value of a vehicle by its battery capacity in kWh as opposed to the self-claimed all-electric mile range. [RP1-140]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation requires the same test as the California Phase II GHG regulation that measures the all-electric range. The tested all-electric range is a useful metric that is representative of the miles travelled and vehicle efficiency. Because a range test is already required, an additional battery capacity test would place an unnecessary burden on manufacturers while providing no additional benefit.

Manufacturer ZEV Sales – Encourage Longer Range Plug-in Hybrids

Comment: Commenter states that regulations and incentives have not encouraged mid-range to long-range PHEV's and suggests that mid-range and long-range PHEV's, in combination with BEV's, is better in the near- and long-term than a scenario with only BEV's. [RP1-64]

Agency Response: No changes were made to the regulation in response to this comment. The approved regulation requires manufacturers produce ZEVs and provides credits for NZEVs that manufacturers can use to meet part of their compliance obligation.

Manufacturer ZEV Sales – Adjustments to NZEV Credits

Comment: Commenter requests the eligibility to generate credits for PHEV's (NZEV's) should be extended from 2035 to 2045 with a 75-mile AER and also extended past 2045 provided the PHEV has a 75-mile AER and is only capable of using or can be shown to use only an ultra-low carbon fuel for its secondary propulsion system [RP1-64]

Comment: Commenter requests capping the amount of credits in a class from PHEVs (NZEVs) be modified. Specifically, the proposed limit of 50% of class 2b-3 and class 4-8 straight truck credits from NZEVs should be increased to 75% especially in the years after 2030 when NZEVs must have a 75 mile AER. [RP1-64]

Comment: Commenter suggests the crediting system should encourage manufacturers to produce plug-in hybrid electric trucks that can provide more than 75% of their miles from an electric off-board power source through a new after-the-fact credit system based on proving that up to 95% of annual miles are all-electric. [RP1-64]

Comment: Commenter suggests revising the NZEV maximum allowance upward to as much as 70 percent from MYs 2024–2030 and tapered off in MYs 2031–2034 to hit 50 percent in MY 2035. [RP1-205]

Agency Response: Changes were made to the regulation to extend the NZEV credit generation sunset date from 2030 to 2035 for NZEVs that achieve more than 75 miles of all-electric range. This is directionally consistent with these comments. See discussion about staff's reasoning for this extension in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Extend Sunset Date for Plug-in Hybrids". No changes were made to the NZEV credit value nor the limitation of allowing only up to 50% of a manufacturer's annual obligation to be met with NZEV credits. Staff set the NZEV credit value at a minimum, to meet the California's GHG Phase II regulation's minimum all-electric range, and tied the increase to a utility factor based on the vehicle's all-electric range, maxing out at 75% of a full ZEV credit. This is to encourage manufacturers to produce full ZEVs while still allowing for development of NZEVs, considered to be a bridging technology, in cases where ZEVs may not fit in the 2024-2035 timeframe. ZEVs are the preferred technology option because they produce zero tailpipe emissions. The 50 percent NZEV maximum allowance is designed to allow significant production of NZEVs without deviating too significantly from the ZEV goals. Increasing the maximum NZEV allowance could potentially defer ZEVs from being deployed in California which runs counter to the regulation's goals.

Manufacturer ZEV Sales – Do Not Allow PHEVs to Generate Credits

Comment: Commenter states the ACT regulation should be technology forcing, not just call for technology that is available today. CARB should require full electric vehicles rather than relying on near electric vehicles and credits. Credits should be phased out or eliminated altogether. [RP1-287]

Agency Response: No changes were made to the regulation in response to this comment. NZEVs are considered a bridging technology because they use an electric powertrain that is capable of some level of zero-emission miles. Therefore, their sales helps support the zero-emission supply chain, workforce development and are an option to achieve zero-emission operation in situations where ZEVs may not be suitable. In addition, the regulation does not award credits for NZEVs past 2035 to ensure that it is clear that ZEVs are the end goal for all market segments.

Manufacturer ZEV Sales - Credits Retirement Order Preferences NZEV Credits

Comment: Commenter states that in Section 1963.3(c)(2) the revised credit retirement order gives preference to NZEV credits over ZEV credits for different weight class groups, and that there should be no preferential treatment for NZEVs because it will lead to market distortions. Tesla states that modifying the expiration date for NZEV credits would be a more effective approach. [RP1-235]

Agency Response: No changes were made to the regulation in response to this comment. The credit retirement order was developed to simplify implementation. The order in which credits are retired is based on expected manufacturer preferences: older credits should be used before newer credits because they expire first, and NZEV credits should be used before ZEV credits because they are less fungible. Therefore, the retirement order states that oldest credits are used first, and NZEV credits are used before ZEV credits. This order represents how a manufacturer would use their credits if they had the option to do so and is not designed to incentivize NZEV credits.

Manufacturer ZEV Sales – Plug-in Hybrids Instead of Battery-Electric

Comment: Commenter states that PHEVs are a better option than one big battery BEV used for a truck because the energy used in a BEV could be redistributed to many smaller PHEV's resulting in longer life cycles. [RP1-18]

Agency Response: No changes were made to the regulation in response to this comment. Staff considers plug-in hybrids as a bridge technology. Please see the discussion about how the regulatory structure will encourage both full ZEVs and longer ranged NZEVs in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales – Encourage Longer Range Plug-in Hybrids".

Manufacturer ZEV Sales - Add Credit for Electrified Power Take Off

Comment: Commenter recommends that vehicles with approved ePTO systems are included in the definition of near-zero-emission vehicles and proposes a mechanism by which ePTO manufacturers could be designated as credit earners through rule language changes. [B2-24]

Comment: Commenter states that the regulation has been centered on applications which are primarily used for traveling vehicle miles and not for performing work functions. Commenter states that the rule should consider the emissions for vehicles across a range of use cases and urges CARB to evaluate the value of hybridization solutions not just for driving the vehicle, but also for electrifying the primary work function even if it is not conducted during the drive cycle using systems such as electrified power takeoff (ePTO). [RP1-32]

Agency Response: No changes were made to the regulation in response to these comments. See discussion on why awarding credit for electrified power take and similar technologies is unnecessary in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Add Credit for Electrified Power Take Off".

Manufacturer ZEV Sales – Credit for Conventional Hybrids

Comment: Commenter asks if the ACT regulation could include hybrid engines that run on NG, diesel, jet fuel, or gasoline. [RP1-16]

Comment: Commenter recommends the ACT regulation should expand compliance pathways to include conventional heavy-duty hybrids (HEV) and recommends flexibility to the proposed credit system by providing partial credits for HEVs similar to PHEVs. [RP1-205]

Agency Response: No changes were made to the regulation in response to these comments. See staff reasoning for not crediting conventional hybrids in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Credit for Conventional Hybrids". Awarding credit for conventional engines would be inconsistent with the goals of the regulation, regardless of the type of fuel used by the conventional hybrid vehicle. However, the regulation does include credit for NZEVs vehicles regardless of which combustion fuel source they use.

Manufacturer ZEV Sales – Extend Deficit Makeup Period to Three Years

Comment: Commenter recommends modifying the requirements to make up a deficit to require a manufacturer to make up a deficit within three model years, in alignment with the Heavy-Duty GHG rule. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. See discussion on maintaining the current deficit makeup period in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Extend Deficit Makeup Period to Three Years".

Manufacturer ZEV Sales - Allow Credit Transfer Between Categories

Comment: Commenter states that the rule should allow sufficient flexibility to sell more ZEVs in one category and fewer in another. [RP1-191]

Agency Response: No changes were made to the regulation in response to this comment. The regulation already allows manufacturers to transfer credits between weight categories and to use credits from selling ZEVs in one category to meet another category's deficit obligations. The only exception is the Class 7-8 Tractor category, which has limited credit transfers from the other categories to ensure tractors are produced and sold into California. Class 7-8 ZE tractors are needed to meet the state's ZE drayage goals.

Manufacturer ZEV Sales – Class 2b-3 Targets Hindered by Lower Fleet Rule Potential

Comment: Commenter is concerned achieving aggressive Class 2b-3 targets is at risk because fleet mandates will not capture small businesses/single owner operators and therefore a big part of 2b-3 market will not fall under fleet rules. [RP1-265]

Agency Response: No changes were made to the regulation in response to this comment. Staff recognizes that there are fewer large fleets in the Class 2b-3 population; however, some fleets such as government fleets and utilities are well suited for electrification. In addition, staff anticipates manufacturers will sell vehicles to individuals and small fleets regardless of the presence of a fleet mandate. Despite this, staff will evaluate methods to accelerate fleet uptake across all vehicle classes in the upcoming ZE fleet rule.

Manufacturer ZEV Sales – Ban Internal Combustion Engines

Comment: Commenter suggests earlier ZEV sales requirement beginning in 2021, all new trucks should be electric by 2030, and to ban all non-electric trucks from entering CA by 2040. [RP1-10]

Comment: Commenter states the regulation should be strengthened by requiring the elimination of fossil fuel powered trucks before 2030. [RP1-12, RP1-36]

Comment: Commenter states that only electric trucks should be allowed to operate in CA and all other trucks can trans-ship goods at the border. [RP1-260-Form-1914]

Agency Response: No changes were made to the regulation in response to these comments. The Board directed staff, through the approved Resolution, to develop supporting policies and regulations to electrify all vehicles where feasible by 2045. However, due to the early nature of the market, some market segments appear challenging to electrify currently. For example, electrifying long-haul trucks will require an interstate infrastructure network. Other niche markets such as crane trucks, logging trucks, emergency vehicles, etc. also present unique challenges to electrification. For these reasons, staff is not proposing a combustion engine ban in this rulemaking but will assess the market as it develops. For more detailed discussion about why it would not be feasible to require more ZEVs than the approved regulation, see chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements".

Manufacturer ZEV Sales – Cost Analysis Overestimates LCFS Adoption by Fleets

Comment: Commenter states that the proposed ACT regulation assumes significant Low Carbon Fuel Standard (LCFS) benefits to nearly all truck users, when it is completely unproven that operators will receive LCFS credits. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. Staff disagrees with the notion that the LCFS regulation and the credit mechanism is unproven for fleet operators. The LCFS regulation has been in place for a decade and has been used by a wide range of fleets. The LCFS credit value is established by the market and is substantial.

The staff analysis is a representative of a likely scenario of ZEV deployments in California from 2020 to 2040 and intentionally does not include assumptions that are unlikely to occur. By 2035, staff estimates that about 15 percent of the trucks in operation would be ZEVs which is a relatively small fraction of the total fleet. The staff assumptions reflect that fleets are not required to purchase ZEVs, and would make their purchase decisions primarily based on the total cost of ownership. Operators that could not benefit from the LCFS credits are simply less likely to purchase ZEVs than operators that could. For this reason, the staff analysis is representative of a likely ZEV deployment scenario and is appropriate as is. In addition, credits earned by a station owner can be passed on to a vehicle operator by reflecting it in the pump or station price as is currently done for renewable diesel and renewable natural gas.

Manufacturer ZEV Sales – Reduced Government Budgets' Impact on Incentives not Analyzed

Comment: Commenter states that the ACT did not analyze the impacts of a statewide deficit in government budgets and the resulting impacts on availability of incentives. [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. First, the staff analysis did include an analysis of the impacts on state and local governments resulting from the purchase of ZEVs instead of combustion vehicles. Second, the ACT regulation is not predicated on the availability of incentives. See the discussion about incentives in chapter “Comments Received During Original Proposal's 45-Day Comment Period”, section “Out of Scope – Incentive and Funding Policies”.

Manufacturer ZEV Sales – Cost Burden to Consumers

Comment: Commenter asks how the ACT regulation will ensure that consumers are not burdened by costs from switching to zero-emission technology. [RP1-26]

Agency Response: No changes were made to the regulation in response to this comment. As part of the Standard Regulatory Impact Assessment (SRIA), appendix C of the Staff Report, staff performed an analysis on the costs to the state as a whole as well as costs to a typical fleet. The analysis reflects that ZEVs have higher upfront costs, and a lower total cost of ownership primarily from lower maintenance and fuel cost savings. ZE truck owners that own their charging or hydrogen fueling stations can further lower fuel costs by taking advantage of the Low Carbon Fuel Standard (LCFS) program. The ACT regulation is expected to result in a total cost saving of $4.9 billion to truck transportation in California compared to Business as Usual from 2020 through 2040, mostly due to fuel cost savings. This estimate includes infrastructure cost, higher cost of the vehicles, maintenance and fuel savings, and cost savings due to the Low Carbon Fuel Standard. It does not include vehicle or infrastructure incentives. Thus, incentive programs such as the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Program (HVIP), utility investments, and other funding may be used to offset some potential upfront cost to consumers.   Several hundred million dollars per year have become available recently, which would further increase savings to fleet owners.

Manufacturer ZEV Sales – CARB Does Not Have Authority to Require Zero-Emission Powertrain Certification

Comment: Commenter states that CARB does not have the authority to mandate the zero-emission powertrain certification warranty, defect reporting, and recall requirements for ZEVs. Commenter states none of the requirements contained in the ZEP Certification relate to engine or vehicle emission standards or in-use performance and are instead consumer-protection requirements which is beyond CARB's authority. Based on definitions in the Health and Safety Code, commenter states that CARB's certification authority extends to powertrain components that have no authority to discharge emissions into the air. Commenter states, similarly, CARB does not have the authority to require warranty and recall for ZEVs nor defect and recall requirements as the Health and Safety Code are specific to tailpipe emission and related emissions standards.

Commenter states CARB's response to EMA's comments in the ZEP Certification rulemaking does not consist of a response at all. As a result, commenter states the ZEP Certification requirement remains invalid and unlawful. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. CARB adopted the Zero-Emission Powertrain Certification regulation on June 27, 2019, and parts of this comment are directed at CARB's authority to adopt certification, warranty, defect reporting and recall requirements as part of that rulemaking action. Notwithstanding that fact, CARB provides the following response to the comment.

CARB disagrees with the commenters' assertion that it does not have authority to adopt certification, warranty, defect reporting and recall requirements as part of this rulemaking action. CARB is authorized to adopt standards, rules and regulations, and to perform such acts as may be necessary for the proper execution of the powers and duties granted to and imposed upon the Board by law (California Health and Safety Code (H&SC) sections 39600 and 39601). H&SC sections 39002 and 39003 place the responsibility for controlling air pollution from motor vehicles on CARB. Additionally, H&SC section 38560 directs CARB to adopt rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions from sources, including mobile sources. The growth and successful adoption of heavy-duty ZEVs, which will lead to reductions in mobile source emissions, is critical to California meeting its air quality standards and GHG reduction goals. The regulation furthers those reduction goals.

A "motor vehicle" is defined in H&SC section 39039 (referencing California Vehicle Code (CVC) section 415) as a vehicle that is self-propelled. A "new motor vehicle" means a motor vehicle, the equitable or legal title to which has never been transferred to the ultimate purchaser (H&SC 39042) and a "new motor vehicle engine" means a new engine in a motor vehicle (H&SC 49042.5). Clearly, a new heavy-duty battery-electric or fuel-cell vehicle and its engine, (which comprises a primary part of the powertrain), fall within these definitions. New motor vehicles and engines may not be imported, delivered, purchased, rented, leased, acquired, offered for sale, sold, or registered for use in California unless they have first been certified by CARB. Thus, a heavy-duty battery-electric or fuel-cell vehicle, like a heavy-duty internal combustion engine vehicle, must be certified by CARB. Certification includes setting emission standards (H&SC 43101) and test procedures (H&SC 43104) and necessary ancillary requirements such as warranty and recall (see H&SC sections 39600, 39601, 43205.5, 43214, 43106, and 43105). These provisions broadly apply to all new vehicles and engines – there are no exemptions for battery-electric or fuel-cell vehicles and their powertrains. Furthermore, EMA misconstrues the nature of this rulemaking action, as it does establish emission standards and other emission related requirements for heavy-duty battery-electric and fuel cell vehicles and their powertrains. In 2004, the U.S. Supreme Court clarified that the definition of “standard” as it applies to emissions from motor vehicles and motor vehicle engines under Title II of the federal CAA, relates to the emission characteristics of vehicles or engines and includes not only traditional emissions limits for specified pollutants (e.g., 0.4 grams of oxides of nitrogen per mile), but also requirements that vehicles and engines be equipped with certain types of pollution-control devices, or incorporate design features related to the control of emissions. Engine Mfrs. Ass'n v. S. Coast Air Quality Mgmt. Dist., 541 U.S. 246, 253, 124 S. Ct. (2004). The regulation does not primarily comprise a consumer protection regulation – rather, it establishes requirements intended to ensure the introduction of zero-emitting heavy-duty vehicles into California.

HD ZEV failure or lack of support (and resulting downtime) is expected to result in higher usage of internal combustion vehicles and greater emissions. By reducing the number of failures and/or the amount of downtime caused by failures, the regulation will provide some level of protection to HD ZEV adopters and help ensure that the emission reductions attributed to the measures it aims to support will actually be achieved.

Manufacturer ZEV Sales – Allow More Credits to Transfer into Class 7-8 Tractor Group

Comment: Commenter recommends modifying the low tractor volume flexibility language and proposes the following: "Low Tractor Volume Flexibility. A manufacturer who has tractor deficits remaining after retiring credits per the credit retirement order in sections 1963.3(c)(1) and 1963.3(c)(2) can use Class 2b-3 or Class 4-8 group ZEV credits, starting with the earliest expiring credits, to satisfy up to 50 of their Class 7-8 tractor group deficits." [RP1-218]

Comment: Commenter suggests CARB adopt a strategy to cap credit movement into the tractor category at 90% in 2024 and decrease over time such that in model year 2031 the manufacturer would be required to sell their full tractor ZEV requirement. [RP1-214]

Agency Response: See discussion regarding changes staff made to allow credit transfer into the tractor category, and why the amount of credits allowed to transfer were limited to balance the need to ensure Class 7-8 ZE tractor production while providing manufacturers flexibility in complying with the rule, found in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Allow Credit Transfer into Class 7-8 Tractor Group”.

Manufacturer ZEV Sales – Set Performance Metrics for Zero-Emission Technologies

Comment: Commenter states that ACT should include performance-based metrics to ensure continued progress and cost-effectiveness in zero-emission technology. Commenter supports providing performance-based metrics and goals for HD electric vehicles that encourage improving battery performance, account for emissions over the full lifecycle, and take into account range requirements and deterioration limitations that incentivize investment in the technology. [RP1-205]

Comment: Commenter supports revisiting ZEP requirements to establish performance-based metrics on electric trucks' batteries and components. Commenter states that this would drive continual improvement in electric truck component development and ensure the most cost-effective overall emission reductions and the most affordable trucks for California. Commenter states performance based metrics for electric vehicles could include battery performance and durability standards, such as lifecycle emission reduction goals, range requirements, and short- and long-term deterioration limits. [RP1-284]

Agency Response: No changes were made to the regulation in response to these comments. Using performance-based metrics in a regulation would create additional complexity and would be more challenging to develop and enforce. The approved regulation will ensure that manufacturers develop competitive ZEV products at price points that will meet fleet needs. This can be observed in the light-duty market where manufacturers are continuously releasing ZEVs with higher range, higher battery capacity, more battery density, and other improvements. For these reasons, setting performance-based targets for zero-emission vehicles is unnecessary at the current stage of the market.

Manufacturer ZEV Sales – Oppose Extending NZEV Crediting Past 2030

Comment: Commenter states that ACT should not extend the NZEV credit beyond 2030 because ZEVs will be fully accessible and commercialized by 2030. [RP1-140]

Agency Response: No changes were made to the regulation in response to this comment. See the rationale for extending the timeframe that NZEVs can earn credits in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Extend Sunset Date for Plug-in Hybrids”.

Manufacturer ZEV Sales – Penalty Calculation for Failure to Meet a Deficit

Comment: Commenter states that for Section 1963.5(a)(4) the penalty should be based on the manufacturers' actual outstanding deficit rather than one half of their deficit. [RP1-235]

Agency Response: No changes were made to the regulation in response to this comment. Health and Safety Code section 43212 specifies that manufacturers who do not comply with emission standards are subject to a civil penalty of $37,500 for each vehicle which does not comply with California standards. Section 1963.5(a)(5) specifies how to convert the size of a deficit into vehicle equivalents for the purpose of HSC 43212. Staff decided to divide the deficits in half for this conversion to ensure that the penalties are representative. For example, failing to produce a zero-emission Class 8 non-tractor would generate two deficits. Under staff's current proposal, this would result in a penalty of $37,500 per Class 8 ZEV not sold. Without dividing the deficits by two, this penalty would be $75,000 per vehicle, double the statutory amount. The current formula encourages compliance while meeting statutory guidance on the penalty amount per vehicle.

Manufacturer ZEV Sales – Feasibility of Zero-Emission Refuse Trucks

Comment: Commenter expresses concern over the ability of Class 8 waste collection vehicles to go EV, due to their high consumption of energy from the collection and compaction work they do, and citing significant technological hurdles to be overcome. [RP1-320]

Agency Response: No changes were made to the regulation in response to this comment. See response outlining refuse truck electrification in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Feasibility of Zero-Emission Refuse Trucks".

Manufacturer ZEV Sales – Proposal Not Backed by Data or Analysis

Comment: Commenter states CARB needs to conduct additional analysis to ensure accuracy in assumptions and appropriate goals in regulations. [RP1-320]

Agency Response: No changes were made to the regulation in response to this comment. See response detailing staff's work developing and updating the assumptions used to support the regulation in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Proposal Not Backed by Data or Analysis".

Manufacturer ZEV Sales – Clarification Regarding Medium-Duty Passenger Vehicles

Comment: Commenter states that the new ACT regulation does not define medium-duty passenger vehicles (MDPV), while the California Phase II GHG regulations do, and would like clarification on the categorization. Commenter's understanding is that the categorization of a truck for ACT purposes is independent of its categorization for GHG purposes and that a >8500 lb. GVWR MDPV could be part of a manufacturer's light duty fleet for GHG purposes, and, at the same time, be part of the manufacturer's MD/HD fleet for ZEV (ACT) purposes. [RP1-193]

Agency Response: No changes were made to the regulation in response to this comment. The scope of the ACT regulation includes vehicles above 8,500 lb. GVWR to be consistent with the scope of the Advanced Clean Cars ZEV regulation that includes vehicles with a GVWR at or below 8,500 lb. GVWR. This approach avoids any potential overlap where the same vehicle would be face requirements in both ZEV regulations. The ACT regulation uses GVWR for determining which vehicles fall into which categories and does not have a MDPV definition.

Manufacturer ZEV Sales – Use Existing Light-duty CRDTS Reporting System

Comment: Commenter states that for ACT reporting, CARB should use the existing Zero-Emission Vehicle (ZEV) Credit Reporting and Data Tracking System (CRDTS) because a central database provides a single information source that is aligned with CARB executive orders along with maintaining previous reporting and credit bank information [RP1-193]

Agency Response: No changes were made to the regulation in response to this comment. Staff intends to leverage existing CARB reporting systems where feasible to minimize the reporting burden for manufacturers, and will ensure that manufacturers have a system to report their information as required by the ACT regulation.

Manufacturer ZEV Sales – No Pay-to-Pollute Penalties

Comment: Commenter suggests that the ACT regulation restate that paying a penalty provision is just one step a manufacturer must take if ZEV credit shortfalls are not addressed in a timely manner. Commenter also suggests that the ACT regulation should further clarify the need to satisfy credit deficits even after a penalty is applied to avoid a "pay to play" assumption. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-208]

Comment: Commenter states that there needs to be clarification that paying a penalty does not satisfy the compliance obligation with credits. [RP1-235]

Agency Response: No changes were made to the regulation in response to these comments. A manufacturer that does not meet their deficit requirements would be subject to a penalty as specified in section 1963.5(a)(4) and would still need to fulfill their sales obligation to make up the deficit shortfall.

Manufacturer ZEV Sales – Interactions with the Low NOx Omnibus Rulemaking

Comment: Commenter states the overlap from the ACT regulation and Low NOx rules will create a market where traditional truck manufacturers will either reduce sales or abandon the market altogether in California. [RP1-218]

Comment: Commenter recommends emissions inventories and market analyses be considered for the ACT regulation and Low NOx Omnibus rules holistically. [RP1-284]

Agency Response: No changes were made to the regulation in response to these comments. Staff recognizes that the ACT regulation and Low NOx Omnibus regulation will both affect heavy-duty manufacturers over the course of this decade. These regulations in combination will ensure that manufacturers are selling zero-emission vehicles wherever possible, and the cleanest combustion everywhere else.

In addition, because the ACT regulation was proposed and adopted before the Low NOx Omnibus, there is a limit to the amount of analysis that can be done in this rulemaking. The California Department of Finance requires that the impact of regulations be compared against a baseline scenario consisting of current conditions and enacted laws. Because the Low NOx Omnibus was not adopted at the time the regulatory documents for the ACT regulation were released, it would be inappropriate to include that proposed regulation as a part of the baseline for the ACT regulation analysis.

Manufacturer ZEV Sales – Heavy-Duty Trucks Not Suitable For Electrification

Comment: Commenter states that there are challenges with ZEV trucks in the heavy-duty group due to large capital costs, travel range, and charging times that are needed in emergency response and 24-hr operations [RP1-273]

Agency Response: No changes were made to the regulation in response to this comment. See discussion about the market analysis for vocational vehicles in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Exempt Class 8 Vocational Vehicles".

Manufacturer ZEV Sales – Hydrogen Better for Long Haul

Comment: Commenter states that electric trucks will not work for interstate movement but that hydrogen electric trucks will work. [RP1-05]

Agency Response: No changes were made to the regulation in response to this comment. See discussion about the lack of technological barriers to building longer range battery-electric vehicles and the resulting tradeoffs in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Analysis Does Not Include Long-Haul Trucks Used For Freight Movement". Generally, hydrogen electric vehicles are better suited for long haul applications, but infrastructure, cost, and other barriers still exist that currently prevent widespread adoption.

Manufacturer ZEV Sales – Health Benefits will be Greater than Anticipated

Comment: Commenter states that the health benefits analysis is conservative because it does not factor in many pollutants and health endpoints due to limits in CARB's health evaluations and quantifications, which were discussed with the Board at the April 23 hearing. Commenter believes the health benefits from the rule will surpass the estimated $9 Billion in staff's analysis. [RP1-120]

Agency Response: No changes were made to the regulation in response to this comment. Staff recognizes that current health benefit analyses, though conservative, are based on the standard CARB accepted methodology. Efforts to keep the methodology up to date are on-going with the Research Division. CARB is committed to taking bold action to reduce pollution and protect the health of Californians, and will continue to update the health benefits associated with reducing harmful emissions.

Manufacturer ZEV Sales – Three-Legged Stool

Comment: Commenter states that the ACT regulation needs to be restructured by prioritizing the most suitable market segments, link any sales mandates to purchase requirements, focus on the needs of fleets to convert to ZEVs, and recognize the charging infrastructure needs. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. Please see the discussion about staff's exploration into transitioning beachhead markets to zero-emission, as well as timing and other constraints preventing coupling of fleet and manufacturer requirements in this regulation, in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements". In addition, please see the discussion about the development of policy frameworks and assessments to support long-term infrastructure development plans by the California Public Utilities Commission and California Energy Commission in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Infrastructure Concerns".

Manufacturer ZEV Sales - Allow 5 Year Credit Life Starting from Ultimate Purchaser Placement in Service

Comment: Commenter states that the "ultimate purchaser" tracking requirement will create an unintended burden for CARB and its credit reporting mechanism given the proposed five-year expiration of credits. For example, in an ideal setting, 2024MY ZEVs are all sold by December 31, 2024, and OEMs can bank these credits as 2024MY credits by March 2025. Commenter states that if OEMs are unable to place-in-service their ZEVs by Dec 31, 2024, the credit reporting mechanism must allow the flexibility for OEMs to report 2024MY ZEVs to be reported in March 2026 or March 2027. Commenter states that there needs to be modification of the five-year expiration of credits rule that allows OEMs to be given five full years from the date the ZEV was placed-in-service vs. current model year designation. [RP1-80]

Agency Response: No changes were made to the regulation in response to this comment. Staff disagrees that there will be an unintended burden for CARB associated with the tracking requirement and the five-year expiration of credits. ZEV credits are generated for each vehicle based on the manufacturer-designated model year, regardless of when the vehicle is placed in service. The reporting and recordkeeping apply to ZEVs produced and delivered for sale for each model year, beginning in 2021. If the OEM was unable to produce and deliver for sale a number of ZEVs by the end of the vehicles designated model year, the OEM would report those ZEVs at the end of the next model year. However, the five-year credit lifetime would still be based on the manufacturer-designated model year the credit was generated. The rationale for the credit lifetime is to ensure that credits earned in excess of the minimum requirements do not get banked indefinitely and undermine goals to maximize the use of ZEVs everywhere feasible if the ZEV market grows faster than the sales percentage require. The credit life period provides flexibility to manufacturers in introducing new ZEV models and in using banked credits to manage annual truck sales fluctuations.

Manufacturer ZEV Sales – Add Travel and Pooling Provisions for Section 177 States

Comment: Commenter states that the rule should provide additional compliance provisions for other states such as credit travel and pooling provisions. [RP1-218]

Comment: Commenter urges the Board to consider a modified travel provision that allows a calibrated level of credits earned in one state to be counted as earned in all ZEV states at a proportional value. Commenter recommends the ability to pool credits regionally because this will allow manufacturers to place vehicles into high demand areas with existing infrastructure without creating a compliance shortfall in other states. [RP1-326]

Agency Response: No changes were made to the regulation in response to these comments. These comments refer to two potential provisions, a travel provision and pooling provisions.

Ultimately, the Board decided not to include a travel or pooling provision in the ACT regulation but asked staff to work with other potential Section 177 states on this topic. CARB staff will work with our partner Section 177 states to determine if these, or comparable provisions, might enhance both California and Section 177 states' goals in ensuring the introduction and use of more heavy-duty ZEV vehicles in future rulemakings.

Manufacturer ZEV Sales – Clarify or Remove "Sold to Ultimate Purchaser"

Comment: Commenter states the need for clarification of the "Delivered for Sale" language because the deficit generation language, and credit language stating that credits are not earned until vehicles are delivered to the ultimate purchaser do not align with the "delivered for sale" intention or approach. This would impose burdens on OEMs to track vehicles through their final sale. Commenter requests that CARB strike text in the credits/deficits sections of the final rule, so it is clear that CARBs intent is to report ZEVs based on when they were delivered for sale. [RP1-193]

Comment: Commenter recommends modifying of the description of vehicles sold in California. EMA proposes modification of language in Section 1963.1(a) as follows: "Deficit Generation. Starting with the 2024 model year, a manufacturer shall annually incur deficits based on the manufacturer's annual sales volume of on-road vehicles produced and delivered for sale in California." [RP1-218]

Comment: Commenter states that the calculations based on "delivery to final purchaser" is problematic and is concerned that manufacturers have no means of controlling who the final recipient of the vehicle is, and are unclear on the necessity of diverging from standard industry practice to use point of final delivery into California. [RP1-265]

Agency Response: No changes were made to the regulation in response to these comments. The terms "produced and delivered for sale in California" and "sold to the ultimate purchaser in California" are used in the regulation to ensure ZEVs are placed and operated in California in order to ensure the air quality benefits occur in-state. Without this language, manufacturers that sell vehicles to entities based outside of California that are delivered out of state, but are ultimately placed in service in California, would not get credit for these vehicles. Additionally, this language helps ensure that ZEVs are not assigned credits until a vehicle is sold to a customer, rather than allowing credits to accrue by simply delivering it to a California dealer and placing it on the dealer's lot. Staff recognizes that manufacturers will likely need to develop methods to track and document final delivery to the ultimate purchaser.

Manufacturer ZEV Sales – Analysis Did Not Provide Alternatives to the Updated Proposal

Comment: Commenter states that the updated analysis for the proposed amendments only analyze the proposed changes against the original proposal, and does not present a range of options between the two and does not demonstrate why it has chosen one target over a range of others. [RP1-272]

Agency Response: No changes were made to the regulation in response to this comment. Staff developed the final requirements based on Board direction, including to align the regulation's ZEV requirements with major state goals such as 2045 carbon neutrality and 100 percent ZE drayage by 2035 and many public comments requesting more stringent requirements. Staff developed the percentage requirements based on meeting these goals and found these goals feasible based on the state of the technology and market as discussed in the ISOR and updated analyses as part of the 30 day modifications. The Staff Report also includes discussion of a number of alternative scenarios as required by the APA.

Manufacturer ZEV Sales – Non-IOU Utilities Lack Infrastructure Programs

Comment: Commenter states that many fleets will be supported with infrastructure by one of the three large investor-owned utilities, and is concerned that staff is de-emphasizing that approximately 20% of the state's load is served by municipal utilities and these fleet customers may not have access to the IOU make-ready programs. [RP1-265]

Agency Response: No changes were made to the regulation in response to this comment. The approved regulation is a ZEV sales requirement for manufacturers and does not place ZEV purchase requirements on fleets. In addition, staff did not include any rebates or grant in the cost analysis and the results still show that overall, there will be a net economic savings. To the extent that incentives are used the net costs would be lower than staff assumed.

Manufacturer ZEV Sales - Infrastructure Challenges

Comment: Commenter states more hydrogen cars and stations are needed. [RP1-13-Form-60]

Comment: Commenter states that many government fleets are dependent on publicly available refueling infrastructure because they lack capital funding to install infrastructure, available real estate (or the capital funding to purchase that real estate) to install refueling infrastructure, and staffing to operate and manage refueling infrastructure. [RP1-44]

Comment: Commenter states that California should provide certainty for refueling infrastructure for ZEVs. [RP1-191]

Comment: Commenter states that the ACT regulation should encourage hydrogen mobility infrastructure, in addition to battery charging infrastructure. [RP1-205]

Comment: Commenter states that the electric supply in California is a concern because it is not ready for large scale roll out. [RP1-232]

Comment: Commenter states that the ACT regulation needs charging stations in convenient locations to be successful. [RP1-249]

Comment: Commenter notes that the ACT regulation will create significant growth in transportation-related electricity demand and associated needs for utility infrastructure upgrades, additional system-level planning, and customer-side charging infrastructure. Preliminary analysis conducted by SCE shows that the grid impacts and incremental work are within the scope of the utility's ability to manage. To ensure well-timed alignment of work that utilities need to do, utilities will need additional granularity, resolution, and accuracy related to where, when, and how fleets will electrify. Therefore, commenter states it is critical for the state agencies, utilities, fleet owners, and manufacturers to work collectively to reduce uncertainty for customers and address necessary infrastructure upgrades, and commenter urges CARB to help convene these stakeholders during implementation. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-259]

Comment: Commenter suggests close coordination with CARB's sister agencies to support implementation through significantly increased funding for charging infrastructure and enabling widespread infrastructure development. [RP1-265]

Comment: Commenter states that infrastructure is costly and their old facilities may not have space or capacity to support the electricity demand. Commenter also states Caltrans fleets are widely dispersed with 318 locations throughout CA, which hampers moving vehicles around to manage the utilization of ZEV assets. [RP1-273]

Comment: Commenter wants more collaboration among CARB, utilities, CEC, CPUC--including informing CEC and CPUC of timelines needed to meet the regulation, and of the magnitude of electrification needs; and sharing between CARB and utilities of infrastructure process and needs. [RP1-281]

Agency Response: No changes were made to the regulation in response to these comments. See the discussion about infrastructure incentive programs from utilities and the State's long-term development strategies, as well as how the large entity reporting requirement will support infrastructure development in chapter "Written Comments Submitted During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Infrastructure Concerns".

Manufacturer ZEV Sales – Extend Comment Period Due to COVID-19

Comment: Commenter request an additional review and comment period of 90 days due to unanticipated staffing and financial impacts of COVID-19. [RP1-44, RP1-181]

Comment: Commenter states the deadlines should be extended due to the financial burdens from COVID-19. [RP1-233]

Agency Response: No changes were made to the regulation in response to these comments. In response to the challenges presented by the COVID-19 pandemic, staff increased the public comment period from 15 days to 30 days to review and submit comments related to the proposed changes being made to the ACT regulation. The impacts of COVID-19 were addressed by the Board at the hearing, and concluded that adequate additional time was provided.

Manufacturer ZEV Sales – Feasibility of Zero-Emission Refuse Trucks

Comment: Commenter states current range and weight limitations of heavy-duty electrified [refuse] vehicles would significantly increase the need for more vehicles, labor costs, and traffic on municipal streets. [RP1-320]

Agency Response: No changes were made to the regulation in response to this comment. See discussion around the lack of a mandate to produce refuse vehicles, staff's suitability analysis, and current market movements indicating refuse vehicles are suitable for electrification in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Feasibility of Zero-Emission Refuse Trucks".

Manufacturer ZEV Sales - Leakage Out-of-State

Comment: Commenter asks how the ACT regulation will address manufacturers that decide to move out-of-state. [RP1-26]

Agency Response: No changes were made to the regulation in response to this comment. A manufacturer may decide not to sell vehicles into California as a result of this or other regulations, and therefore would no longer be subject per the scope and applicability of the ACT regulation. Because ACT is not a fleet requirement, there is no reason fleets would decrease their purchases as a result of this regulation. Therefore, it is reasonable to conclude that the sales of the manufacturer who departed California will shift to other manufacturers who stay within the California market. This will result in the same number of ZEVs required but split between a different pool of manufacturers.

A growing body of studies, research, and reports indicates that the future of medium- and heavy-duty transportation will be powered by zero-emission technologies. If some manufacturers decide to leave the state, they will still need to develop zero-emission technology to stay competitive in the nationwide trucking market. Regulations such as ACT and policies such as the Memorandum of Understanding between 15 states and the District of Columbia show that the market is shifting towards zero-emissions. Manufacturers who leave the California market due to this zero-emission regulation may be left behind as less of the market will be served by combustion-powered technologies.

Manufacturer ZEV Sales - Reporting Timing

Comment: Commenter recommends CARB revise 17 CCR 1963.4 to include CARB acceptance of OEM information as an explicit step between OEM sales reporting and when OEM credit transfers can occur and recommends adjusting the timing of the credit acceptance and credit transfer steps to each have an additional 90 day window (e.g. CARB credit acceptance is completed no later than 180 days following the end of each model year, and credit transfers occur no later than 270 days following the end of each model year). [RP1-193]

Agency Response: No changes were made to the regulation in response to this comment. Credit transfers must be reported annually with sales information, and staff will adjust credit accounts to ensure accurate information is reflected regardless of when the information is sent. Manufacturers that carry forward a deficit have the flexibility to make up that deficit within one year which will allow credit transfers to occur and be reported for the purposes of making up a prior year's deficit carry-over.

Economic Analysis – General Cost Concerns

Comment: Commenter states that the CARB doesn't recognize that ZEVs will cost more for fleets to purchase and operate than traditional vehicles, and fleets must invest in charging infrastructures at their facilities. [RP1-218]

Comment: Commenter states that their members are concerned that CARB's cost model is premature. Commenter states that it is critical that the state and its businesses better understand proven charging strategies that result in a positive TCO. [RP1-244]

Comment: Commenter states this will put a financial burden on truckers. [RP1-260-Form-3526]

Agency Response: No changes were made to the regulation in response to these comments.

Staff's methodology to evaluate costs was to look at both the cost to the state as a whole and to look at the total cost of ownership for a vehicle. This method illustrates the costs to both California and a typical fleet. Through these analyses, staff found that while zero-emission vehicles will cost more upfront due to higher vehicle costs and additional infrastructure costs, but cost less over their lifetime due to lower fuel costs, LCFS revenue, and reduced maintenance expenses. ZEVs placed into well-suited applications will see a positive TCO versus their gasoline, diesel, and natural gas counterparts, and more applications will show a payback over time as ZEV costs decline. This is shown in numerous studies CARB's own analysis as well as studies and reports from ICF International, Lawrence Berkeley National Laboratory, the North American Council on Fuel Efficiency, Union of Concerned Scientists, University of California, Davis, University of California, Los Angeles, and others.

Staff held numerous workgroup meetings to discuss what cost assumptions to use and what applications to evaluate. Staff used the best available in information to evaluate costs. While there are many unknowns regarding future costs, staff does not agree that is too premature to develop a cost model to inform the Board's decision.

Additionally, the regulation does not place a requirement on fleets to purchase ZEVs and does not believe it is meaningful to evaluate cost scenarios that are not likely to occur.

Lastly, while many electric vehicles appear to offer a positive total cost of ownership over the regulatory timeframe, the ACT regulation is not predicated on a positive total cost of ownership. Some of the main goals of the regulation include reducing criteria and greenhouse gas emissions and fostering the zero-emission medium- and heavy-duty market. Many of CARB's other regulations do not have a defined payback period but have been adopted as the benefits outweigh the costs.

Economic Analysis – Support for Specific Areas

Comment: Commenter's independent economic analysis aligns with CARB's in the following areas: Commenter states that their experience with Class 2b-3 and Class 4-5 EVs infrastructure, and charging costs largely align with the ACT Staff Report and the updated April analysis; Commenter projects that Class 3 electric delivery operations will be cost-neutral without incentive funding in the 2024 timelines targeted by this regulation, inclusive of vehicles, chargers with infrastructure upgrades amortized over the lifetime of multiple trucks, and a managed overnight depot charging strategy, and; Commenter states that the positive TCO model developed by CARB matches the projections of fleet members with last-mile Class 7-8 operations and last-mile Class 3 operations under specific circumstances. The fleet positive TCO scenarios are dependent on the applicability of a) overnight, lower-kW, depot fueling and b) vehicle incremental costs in line with CARB's MY 2024 projections. [RP1-244]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. Staff thanks the commenter for the supporting points.

<u>Economic Analysis – Many Applications Operate Differently Than Modelled</u>

<u>Comment:</u> Commenter states that with regional short-haul distribution of Class 7-8 tractor operations they do see potential opportunities for fleet electrification but only with clear caveats regarding vehicle cost, availability, grants, incentives, and ideal charging operations. Commenter states that the technological and operational needs of drayage, regional haul, vocational, food distribution, retail distribution, last mile, public fleet, and other types of medium- and heavy-duty truck applications vary tremendously, and as a result, present real-world challenges to zero-emission project implementation. [RP1-244]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. In the cost analysis, staff modelled the costs for a typical vehicle, not a vehicle operating in best case or worst-case conditions. Staff recognizes the trucking industry is diverse and covers many unique applications, but because the point of the regulation is on manufacturers, staff does not foresee manufacturers will be targeting their product offerings to fleets poorly suited for electrification. Adoption will likely begin in relatively well-suited fleets first, and then expand over time as costs decline and fleet experience with the technology improves.

<u>Economic Analysis – Analysis Did Not Include Gaps in Heavy-Duty Product Availability</u>

<u>Comment:</u> Commenter states concern that gaps in heavy-duty EV product availability is not reflected in CARB's cost models. As CARB continues to refine their cost models and timelines, vocational fleets need a more nuanced approach that will account for the current market status and the time required to complete the engineering, integration, and total pricing activities required by the suppliers. [RP1-244]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. In the fleet TCO analysis, three vehicles are modeled – a Class 3 passenger van, a Class 6 walk-in step van, and a Class 8 day-cab tractor used in regional operation. These three vehicles represent vehicle types that are commercially available or are in pre-commercial demonstrations. The TCO analysis was not intended to

analyze every vehicle use case but as a general analysis of these representative vehicles.

Staff anticipates due to the ACT regulation that manufacturers will begin to offer more electrified products over the course of the regulation to meet its increasingly stringent requirements. To ensure that fleets purchase these vehicles, manufacturers will need to ensure that they are offering these ZEVs at competitive prices.

In future ZE fleet rules, staff anticipates performing more granular analyses on specific use cases and body types to develop a better understanding of cost in regulated applications.

Economic Analysis – Vehicle Life Assumption is Too Long

Comment: Commenter states CARB made several inaccurate assumptions including assuming very long operating life when many fleets replace trucks after a short period of ownership. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. Because the ACT regulation affects the state as a whole rather than any individual fleet, staff performed an analysis on a statewide level rather than looking at individual fleets. This leads to some key differences from a fleet-level analysis. No set vehicle life is used in the statewide cost analysis; instead, vehicles remain in the analysis until they leave the state fleet due to attrition or being sold out of state. If a fleet sells a truck to another fleet within California, from the statewide perspective nothing has changed.

Staff developed a separate TCO analysis to assess what the costs to a typical fleet would be if they purchased a ZEV. For this analysis, staff assumed the fleet would own the vehicle for 12 years. In reality, some fleets own their vehicles for a shorter period while others own the vehicle for its entire life. Twelve years was meant to be a representative value and has been used by other cost analyses. It is important to note that even if a vehicle is operated by one owner or multiple owners in the same period, the overall cost should remain the same over the period. However, the costs and fleets for each individual fleet will vary.

Economic Analysis – Recognizing the Importance of Service and Support Networks

Comment: Commenter states that up-front truck costs include elements of ongoing support and warranty coverage and that CARB must not underestimate the critical importance of after-sales support and service networks in the analysis. [RP1-244]

Agency Response: No changes were made to the regulation in response to this comment. Staff recognizes the importance of service and support networks to foster this emerging market. A key rationale for the rulemaking is to ensure large manufacturers are developing zero-emission products and providing service and support to ensure these vehicles stay on the road. Staff's vehicle cost analysis included an additional 10 percent adjustment to reflect the "soft costs" associated with vehicle production including setting up service and support networks.

Economic Analysis – Analysis Does Not Include Long-Haul Trucks Used For Freight Movement

Comment: Commenter states there is a significant number of trucks that travel 350-500 miles per day moving freight throughout the state. Commenter questions why the analysis does not include these vehicles or if batteries exist that can meet these range needs. [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. This comment is referring to Class 7-8 tractors that are primarily used for freight movement. While a large portion of these trucks are used for regional and long-haul trucking, this does not represent the entire segment. As stated in the Staff Report, numerous data sources such as the 2002 Vehicle Inventory and Use Survey and 2018 California Vehicle Inventory and Use Survey indicate that a large portion of tractors are used for shorter distance operations. Staff's assessment assumes that electrification in the tractor segment will start with shorter haul applications such as city delivery and drayage first, and then expand to other sectors including regional trucking. Note that ZEV tractors are expected to represent less than 15% of the tractor fleet by 2035 and is it not as likely that long-range ZEVs would be deployed unless the TCO is better than what staff assumed in the cost analysis.

There does not appear to be any technological limitations that would prevent manufacturers from building ZEVs that can meet these 350 to 500 mile range needs, but offering vehicles with such high range creates tradeoffs. Higher range will increase the needed battery capacity for a BEV which will both raise the vehicle's price and could decrease the usable payload of the vehicle. While these challenges will diminish over time as battery prices decline and battery capacity increases, they remain factors that fleets will remain aware off. Hydrogen fuel cell technologies are also a potentially viable ZEV option in these longer distance use cases.

Economic Analysis – Cost Analysis Underestimates Vehicle Cost

Comment: Commenter states concern that CARB's incremental cost of $71,000 for a Class 7-8 EV tractor in 2024 may be an inappropriate cost to apply across all manufacturers. Commenter states that quotes received by members have been 3x to 5x current diesel tractor prices (which is in the low $100K range). Commenter states there is concern about the reliability of the information underpinning the market adoption assumptions. Commenter states concern that a cost model based on preliminary estimates from emerging manufacturers will underestimate the true cost of the incremental operations needed to support the large scale EV deployments industry wide. [RP1-244]

Comment: Commenter states CARB's current assumptions significantly underestimate vehicle costs by more than 300%. [RP1-320]

Agency Response: No changes were made to the regulation in response to these comments. Staff use the best available information in the economic analysis for the regulation and discussed data sources and assumptions with stakeholders in several workshops and work group meetings. Staff recognizes that ZEVs produced today have a significantly higher upfront cost versus their combustion-powered counterpart. Per Appendix H to the Staff Report, staff estimate that in 2018, a day cab tractor capable of 180 miles per day would cost nearly four times its diesel counterpart. However, due to projected battery cost reductions for heavy-duty vehicles and increased economies of scale, CARB forecasts that the cost of ZEVs will drop over the rest of the decade. This assessment matches the findings of other reports on heavy-duty electrification. While staff does not assume a ZEV will match the cost of a combustion-powered vehicle over the regulatory timeframe, decreasing vehicle costs will narrow the gap and make ZEVs an attractive option to fleets based on the total cost of ownership. CARB's findings on vehicle cost are in line with other studies referenced in the Staff Report that indicate declining vehicle costs.

Economic Analysis – Battery-Electric Truck Assumptions Do Not Meet Fleet Needs

Comment: Commenter states that the proposed ACT regulation includes battery-electric truck mileage ranges that will be unacceptable to truck customers – ranges that will be shortened further by the heavy loads and harsh operating conditions associated with commercial vehicles. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. Staff based the range assumptions on the average daily mileage based on the EMFAC inventory. This is meant to represent a "typical" use case, not a best-case or worst-case scenario. Because fleets have no requirement to purchase ZEVs, there is no reason for manufacturers to target applications with long ranges or heavy loads unless they can offer a compelling product in that category. So, by using the "typical" use case, staff avoids using a scenario which may be too optimistic or too pessimistic in regards to ZEV adoption.

Economic Analysis – Light-Duty Battery Price Data Cannot Be Used for Heavy-Duty Vehicles

Comment: Commenter states that the proposed ACT regulation assumes low battery prices based on battery-electric passenger cars, when truck operating conditions and duty cycles will demand different technologies. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. Staff recognizes that heavy-duty vehicles currently have different challenges than light-duty vehicles. As a result, staff assumed heavy-duty battery prices will lag behind light-duty prices by five years. This reflects the smaller economies of scale, unique packaging requirements, enhanced durability requirements, and other factors. Other stakeholders have noted that this assumption leads to drastically higher battery prices than light-duty vehicles and the battery costs and vehicle costs used by staff are too high because in nearly all cases the battery cells used in trucks are the same as those used in cars and some trucks manufacturers are using complete battery packs from light duty cars in their battery electric trucks.

Economic Analysis – Incorrect Financing Terms

Comment: Commenter states that a typical truck loan is six years or longer with interest rates nearer seven percent, rather than the five years with 5 percent interest as staff assumed. [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. Staff recognizes that different fleets will pay different amounts for financing. Generally, larger, well-capitalized fleets will achieve more favorable financing terms than small fleets or small businesses. Staff finds the five years, five percent interest rates appropriate as during the public process in developing cost estimates, numerous stakeholders stated such terms were typical and other assessments used similar values.

Economic Analysis – Total Cost of Ownership Analysis Did Not Include Federal Excise Tax

Comment: Commenter states that the TCO calculations did not include the Federal Excise Tax, a 12 percent tax on the sale of new Class 8 vehicles, is not accounted for. [RP1-265]

Agency Response: No changes were made to the regulation in response to this comment. As described in the Staff Report, staff assumed all Class 8 vehicles are subject to a 12 percent Federal Excise Tax.

Economic Analysis – Regulation Does Not Address Infrastructure Challenges

Comment: Commenter states that the proposed ACT regulation ignores the costs and complications of installing, maintaining, and expanding a charging infrastructure at fleet facilities, which the fleet may rent. [RP1-218]

Comment: Commenter states charging infrastructure that is needed would further burden governmental entities with unfunded capital projects. Commenter notes that current electric infrastructure costs are approximately three times that of already established CNG infrastructure. [RP1-320]

Agency Response: No changes were made to the regulation in response to these comments. Staff recognizes the investments necessary for infrastructure and fully incorporated such costs into the statewide cost analysis in the Staff Report. Staff also notes that because this a manufacturer sales requirement, fleets who face cost barriers to installing infrastructure or fleets who rent vehicles have no requirement to purchase ZEVs. Manufacturers must identify which fleets can install infrastructure and develop competitive products for them to purchase.

Specifically, as part of the Staff Report's cost analysis, staff included the costs of chargers, site infrastructure upgrades, and charger maintenance in the analysis. Staff held multiple workgroup meetings to solicit feedback on the cost inputs and used the most up-to-date information wherever possible using real world experience and fleet data. Staff notes that because this is a manufacturer requirement, no fleet is required to purchase ZEVs unless they choose to do so. Fleets will purchase ZEVs if it makes financial sense for them to do so, including infrastructure costs and expenses. To the extent that some fleets rent their facilities or are unable to access capital for financing, they have no obligation to purchase ZEVs.

Economic Analysis – Regulation Will Increase Electricity Generation, Transmission, and Distribution Costs

Comment: Commenter states that California already has some of the highest electricity rates in the country and significant investments will be required in new generation, transmission, and distribution infrastructure. Commenter states that with so many parallel efforts requiring substantial investment it is hard to see how CARB's future electricity cost projections can be maintained at such low levels. CARB must carefully consider the impacts on future electric rates to end-user customers such as commercial electric truck fleet operators. [RP1-244]

Agency Response: No changes were made to the regulation in response to this comment. As stated in the Staff Report, increased electricity usage from ZEVs provides an opportunity for a number of benefits to the utilities, their customers, and the overall grid itself. In a 2017 letter to CARB, the California Electric Transportation Coalition, a non-profit whose board of directors includes the major California utilities, outlined the benefits of transportation electrification to California's power grid. Electric vehicles are capable of shifting load to off-peak periods and increasing overall demand, both of which help create a more efficient, highly utilized grid. Studies have found that light-duty ZEVs provide a benefit to all utility customers as their electricity utilization drives down rates for all other ratepayers.

Economic Analysis – Diesel Fuel Cost Estimate Is Too High

Comment: Commenter states the cost analysis overestimates fuel costs as diesel costs $3.25/gallon versus the $4/gallon assumed. [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. As described in the Staff Report, the cost analysis was based on the best information available to estimate costs over the analysis period from 2020 to 2040. Using today's diesel fuel price to represent costs out to 2040 is simplistic and is appropriate for a long-term analysis. Staff used the California Energy Commission's "Revised Transportation Energy Demand Forecast" to estimate fuel prices out to 2030, and the Energy Information Administration's "Annual Energy Outlook" to forecast prices from 2030 to 2040. These forecasts are independent projections that include the effects of regulations, legislation, and other factors that influence future prices.

Economic Analysis – Real-World Infrastructure Costs Differ from CARB Projections

Comment: Commenter states that real world fleet operations deviate from CARB's analysis that proposes electric truck charging takes place overnight in a depot with lower-kW, lower-cost EV chargers that can utilize low-cost off-peak charging rates. Commenter states that the reality is electric trucks incur significant incremental costs from expensive charging equipment, electrical service, and electrical rates. Commenter states that CARB's analysis that assumes 80kW chargers are suitable to sufficiently charge Class 7-8 tractors is inconsistent with their members experiences. Commenter states that universally 150kW chargers are being used to charge their members fleet of Class 7-8 EVs to support regional delivery operations.

Commenter states that CARB's analysis for the truck to charger ratio that assumes all Class 8 electric truck charging can take place using a ratio of one (1) EV charger for every one (1) electric truck, using individual 80kW chargers is an aggressive assumption given that their members are using 150kW chargers at a minimum to support their operations. Commenter states that member fleets are examining how to use one (1) charger to support two (2) or more electric trucks and that these efforts are adding new labor expense categories to manage the movement of trucks among the chargers, as well as the daily charger-truck communication and software challenges in an emerging technology space with multiple technologies. Commenter states that their members have been surprised by the ongoing networking and management costs required to operate their charging system. These additional annual costs have ranged from $25,000-$200,000 for a single site. [RP1-244]

Agency Response: No changes were made to the regulation in response to this comment. First, the regulation is a manufacturer sales requirement and does not require any individual fleet to purchase ZEVs. The staff cost analysis is intended to be a representative scenario of ZEV deployment costs. The commenter implies that the staff analysis underestimates costs because the staff assumptions are not the same as an example referenced by the commenter. However, the commenter also explains that the project is looking to use a 150kW charger to support two or more trucks. A 150kW charger costs roughly twice that of an 80kW charger; thus, the cost of purchasing two 80kW chargers as staff assumed versus a single 150kW charger as described by the commenter is essentially the same charger cost. Furthermore, if the 150kW charger is used to support two trucks, the charger cost of the example project would be about one half of that assumed in the staff analysis. The commenter also states that in the example project there is additional labor cost for an attendant to move the plug from one vehicle to another that was not included in the staff analysis. However, this example is not representative of the market in 2024 and beyond. Chargers already exist with two plugs that automatically start charging the second truck without an attendant. Therefore, these costs are not representative of the market during the regulatory analysis period.

Economic Analysis – Lack of Standardization for Electric Vehicle Chargers

Comment: Commenter states that there are no universally accepted standards for EV charging because the charging receptacles for each brand of truck are different. Commenter states that successfully scaling up commercial trucking to meet early regulatory targets requires increased standardization of EV charging to ensure that foundational investments in electrification continue to add value and do not require costly new hardware or infrastructure replacement as the market evolves. [RP1-244]

Agency Response: No changes were made to the regulation in response to this comment. Staff acknowledges that there is no single charger that can meet all fleet charging needs currently. This is a challenge for BEV adoption as they increase the likelihood of stranded charging assets for the fleet or additional costs to modify the charging system if a new charging standard is developed. The large-scale deployment of BEVs will benefit from a common charging standard. However, through conversations with manufacturers, staff has determined that the marketplace appears to be heading in the direction of standardization. Most manufacturers appear to be using J1772 chargers for AC charging up to 19 kW, and J1772 CCS chargers for DC charging up to 350 kW. There is no standard currently in place for conductive charging above 350 kW, but a consortium of heavy-duty manufacturers, equipment providers, and charging networks is developing a charging standard for 1 MW or higher charging.

The Society of Automotive Engineering (SAE) is currently developing heavy-duty vehicle charging standards. CARB will be evaluating charging standards and can set requirements on charging standards if determined to be necessary.

Economic Analysis – Over-the-Road Trucking Has Significantly Higher Charging Costs

Comment: Commenter states that the CARB assumed electricity costs in the Staff Report are consistent with their analysis when overnight charging occurs. However over-the-road trucking operations are not regularly able to take advantage of the lowest cost off peak EV charging rates, where some fleets see 50% of their charging during peak hours. Commenter states that the cost of charging EVs is on average costs $0.45/kWh, and with LCFS credit values included, the net cost of electricity to the fleet operator is thus $0.16/kWh to $0.20/kWh, is above CARB's assumption. Commenter states that as the market matures and public access infrastructure becomes one of the strategies employed to charge electric trucks, it becomes much more difficult for the fleet end-user to capture the value of the LCFS credits. [RP1-244]

Agency Response: No changes were made to the regulation in response to this comment. CARB recognizes that applications where vehicles are charging during peak times will face higher electricity costs than at other times. Because the ACT regulation does not require fleets to purchase ZEVs, there is no requirement that any fleet with high electricity costs would need to purchase ZEVs. This scenario is less likely since the total cost of ownership is less favorable than other scenarios. By 2035 about 15 percent of the fleet is expected to be ZEVs. For this reason, manufacturers will likely favor markets where fleets are able to charge overnight when electricity costs are the lowest. Over time, over-the-road trucking fleets may be able to incorporate ZEVs by purchasing vehicles with larger batteries that would not need to be charged during peak periods or by planning their charging sessions so that they occur during off-peak times in the middle of the day or during the night when electricity is cheapest.

Economic Analysis – Demand Charges Are Costly

Comment: Commenter states that demand charges are a significant concern for fleets. Some utilities like SCE offer a demand charge waiver, but when the waiver expires in a few years, it is estimated that the charging cost will increase from an average of $0.15/kWh to $0.50/kWh (more than a 300% increase). Commenter states that most EV operations fall outside of the service territories which may offer special EV rate programs. [RP1-244]

Agency Response: No changes were made to the regulation in response to this comment. CARB's cost analysis fully included demand charges and did not include short-term demand waivers in the analysis. Electricity costs were estimated by using the Charging Cost Calculator by utility as described in the Staff Report and is a tool that individuals can use to understand electricity costs with different assumptions. The $0.50 per kWh estimate is simply not representative of any likely charging scenario. Furthermore, demand charges can be mitigated by ensuring chargers are highly utilized, spreading charging sessions over a longer time period, and using charging management software to stagger charging sessions.

At this point, all three major IOU's have proposed new electricity rate schedules specifically for commercial electric vehicles and two have already been approved by the CPUC. These utilities service the vast majority of California's fleets. Two of these rate schedules, by PG&E and SDG&E, have removed demand charges and replaced them with subscription charges which offer more flexibility and assurance to fleets. Staff anticipates smaller IOUs and POU's will analyze the impacts of these new rates and design their own rates to enable low cost charging for commercial fleets.

Economic Analysis – Cost Analysis Underestimated Combustion-Powered Fuel Efficiency

Comment: Commenter states that the proposed ACT regulation assumes very low fuel efficiency for traditional diesel-fueled vehicles, artificially making battery-electric vehicles compare better. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. Staff disagrees with the commenter's assertion. The staff analysis and assumptions are described in detail in the Staff Report. Fuel efficiency values for conventional vehicles are from the EMFAC model and reflect significant fuel efficiency improvements expected as a result of federal and California regulations.

Economic Analysis – Battery-Electric Efficiency Improvements Are Overstated

Comment: Commenter states that the proposed ACT regulation inaccurately assumes that battery-electric powertrains will become significantly more efficient over a short period of time. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. As described in the Staff Report, staff assumed that the efficiency of battery-electric and fuel-cell electric vehicles would improve at the same pace as gasoline and diesel vehicles, an increase of roughly 20 percent by 2027.

It is unclear why the commenter claims CARB is inaccurately assuming ZEVs will become more efficient when these improvements are already required for the combustion-powered fleet. Battery electric and fuel cell electric technologies are less developed for heavy-duty applications compared to existing combustion technology, so there is more "room" to improve for these zero-emission technologies. Given this, CARB's assumption that these two technologies will advance at the same pace as conventional technology is likely overly conservative and underestimates further technology improvements.

Economic Analysis – Higher Maintenance Costs for Electric Vehicles

Comment: Commenter states cost per mile for the maintenance of electrified fleets to date have shown to be higher than that for a comparable RNG fleet. [RP1-320]

Agency Response: No changes were made to the regulation in response to this comment. Based on in-use data from light-duty and transit fleets, battery-electric vehicles have a lower maintenance cost per mile compared to their gasoline, diesel, or natural gas-powered counterparts. A battery-electric vehicle has fewer moving parts than a diesel vehicle and does not need many routine maintenance items such as oil changes. In addition, regenerative braking reduces wear on brakes which reduces the number of costly brake replacements/repairs. All studies staff have reviewed to date, and the experiences with light-duty ZEVs, corroborate the reduction in maintenance costs. For these reasons, staff maintains its current assumption that battery-electric vehicles have lower maintenance costs than gasoline or diesel-powered vehicles over their lifetime.

Economic Analysis – Diesel Engine Rebuild

Comment: Commenter states a diesel engine lasts for a million miles with no need for a rebuild as staff assumed. [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. Staff's analysis in the Staff Report found that Class 8 engines required a rebuild typically near 850,000 miles while engines in lighter weight classes required rebuilds sooner. Based on the expected mileage accrual rate, the only engines that require rebuilds in the analysis timeframe (2024-2040) are Class 4-5 engines who have the shortest useful life. Class 6-8 vocational vehicles are more durable and would not require an engine rebuild in the first 16 years of operation.

Economic Analysis – Underestimated Battery-Electric Vehicle Residual Value Penalty

Comment: Commenter states that the proposed ACT regulation underestimates the negative impacts of low battery-electric truck residual values when residual value is critical to a fleet's purchasing decision. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. To provide context, see response detailing staff's methodology in determining vehicle life for the statewide cost analysis and the vehicle TCO analysis in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Vehicle Life Assumption is Too Long".

Economic Analysis – Class 2b-3 Battery Life Assumptions Too Long

Comment: Commenter states that the proposed ACT regulation predicts very long battery replacement cycles, even no replacements over an assumed 26-year life of Class 2b-3 vehicles, when truck operation and charging characteristics will accelerate battery degradation. [RP1-218]

Agency Response: No changes were made to the regulation in response to this comment. Staff assumed battery-electric vehicles would need a battery replacement after 300,000 miles based on data from transit buses and light-duty vehicles with cooling systems. This means that high-mileage vehicles such as Class 8 tractors would need a battery replacement numerous times while low-mileage vehicles may not need a battery replacement. Class 2b-3 vehicles have fairly low annual mileage and are not anticipated to exceed 300,000 miles over the regulatory analysis, so no battery replacement was assumed.

Also note: CARBs economic analysis covers 2024 through 2040, therefore the longest assumption period possible is 16 years, not the 26 years the commenter claims.

<u>Economic Analysis – Fleet Infrastructure Resilience</u>

<u>Comment:</u> Commenter states that many of their member counties are subject to Public Safety Power Shut-Offs and requirements for ZEV vehicles would create an inability to charge municipal vehicle for multiple days and would incapacitate vital and emergency services during these times. [RP1-34]

<u>Comment:</u> Commenter states staff's analysis does not include the backup generators for charging stations. These will become necessary as wildfires cause public safety power shutoffs. Commenter also incorporates comments from the Rural County Representatives of California as reference. [RP1-169]

<u>Comment:</u> Commenter suggests that ACT include a natural disaster reliance assessment to assess natural disaster impacts on ZEV technology. [RP1-206]

<u>Comment:</u> Commenter states ZEVs provide no viable back-up plan during outages and or natural disasters. [RP1-320]

<u>Agency Response:</u> No changes were made to the regulation in response to these comments. Grid resiliency is an evolving issue that is outside of CARB's typical scope of operations. Our sister agencies including the CPUC and CEC are evaluating resiliency and what actions need to be taken to support the grid as directed by SB 350 and other related legislation.

The CPUC has released their draft Transportation Electrification Framework which is designed to offer a holistic strategy for addressing how the state's IOUs will support California's clean transportation and climate goals. This draft framework explicitly identifies resiliency as a focus for the utilities and discusses vehicle to grid integration, micro grids, backup generation by diesel or fuel cell generators, and other solutions. The CPUC is currently soliciting stakeholder input and intends to finalize the Transportation Electrification Framework after incorporating this feedback. In addition, the CPUC has started a rulemaking process regarding microgrids and resilience as directed by SB 1339. The CPUC has released its initial decision as of June 2020 and has issued the scoping memo for the next steps of this rulemaking. This work on microgrids will bolster resiliency and help support vehicle applications which rely on the grid. Lastly, as part of San Diego Gas & Electric's SB350 program, the CPUC approved a V2G pilot using buses to evaluate how these vehicles can provide energy to the grid and potentially boost resilience.

The CEC has recently held a workshop discussing energy resilience and ZEVs. This July 2020 workshop invited several speakers to present on their view on resilience. Some speakers including Envision Solar, FreeWire, and Toyota, where different technology solutions were highlighted including mobile chargers, chargers with battery storage and solar capability, and mobile hydrogen refuelers. Others highlighted the opportunities that vehicle grid integration and bidirectional charging can offer, with the California Transit Association stating that an integrated solution of solar, energy storage, and electric buses can provide resiliency while significantly reducing energy costs. A different presenter from Blue Lake Rancheria showed how they were able to use ZEVs to support their microgrid during the recent power shutoff events through bidirectional charging. Others pointed out that ZEVs can be more resilient than other vehicles, and in some situations with vehicle grid integration, can support the grid during potential power shutoff events. The presenter Next-Dimension highlighted that ZEVs can be a solution to the state's challenges, but doing so will require coordination from state agencies, vehicle manufacturers, emergency responders, and utilities.

Operational concerns associated with power shutoffs is only an issue for extended outages and becomes an issue for all vehicle and fuel types. This issue is highlighted in a 2019 NREL presentation– natural gas stations need electricity to run compressors to move the gas along pipelines and to compress gas to fuel CNG vehicles, and gasoline and diesel stations cannot pump fuel without electricity.

ZEVs have their own trade-offs and benefits but are not the only fuel that faces resiliency issues. Fleets will make their own decisions on how and whether they will plan to have backup measures such as on-site energy storage, backup generators or have larger storage systems onboard the vehicle. Fleets who are not located in areas subject to power shutoff events will not need any measures to improve resiliency. Fleets that operate within these regions will need to evaluate the cost tradeoff of installing storage versus not operating some vehicles on days where the power is shutoff for long periods of time. Because the ACT regulation does not require fleets to purchase ZEVs, only fleets who are comfortable with their resiliency situation would likely purchase ZEVs.

As stated in the Staff Report, increased electricity usage from ZEVs provides an opportunity for a number of benefits to the utilities, their customers, and the overall grid itself. In a 2017 letter to CARB, the California Electric Transportation Coalition, a non-profit whose board of directors is composed of the major California utilities, outlined the benefits of transportation electrification to California's power grid. Electric vehicles are capable of shifting load to off-peak periods and increasing overall demand, both of which help create a more efficient, highly utilized grid. Studies have found that light-duty ZEVs provide a benefit to all utility customers as their electricity utilization drives down rates for all other ratepayers.

Economic Analysis – No Assessment Supports Tractor TCO Findings

Comment: Commenter states that a different set of assumptions in the comparison cost of Class 8 diesel truck tractor will be far more favorable when compared to an all-electric Class 8 truck tractor and states that there is no "financial" analysis to display the capital and annual costs through the "eyes of the fleet owner". [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. As stated in Attachment C to the Notice of 30-Day Changes, numerous studies assessing the TCO of zero-emission tractors have been released. While they differ in their assumptions on vehicle capabilities and duty cycles, they show a common message – while zero-emission tractors are anticipated to have a higher upfront cost, their lower operating costs mean that fleets will see a positive TCO by the time the rule begins in 2024. While it is possible to create assumptions that would show ZE tractors as being less favorable, staff's analysis represents a typical case rather than a best-case or worst-case scenario and is appropriate for a manufacturer requirement.

Economic Analysis - Ignores CNG Investments and Impacts from Stranding Those Investments

Comment: Commenter states that the ACT analysis did not take into account the billions of dollars spent on CNG fueling infrastructure, facility maintenance, and training. [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. To the extent that the comment casts doubt on the validity or comprehensiveness of the economic analysis of the regulation, CARB disagrees with that assertion. As part of staff's regulatory development, staff performed a macroeconomic analysis assessing the impact of the regulation on the state's overall economy. This analysis found that the ACT regulation is anticipated to have a negative impact on the state's oil and gas extraction industries as well as related businesses. This negative impact is offset by positive impacts in infrastructure installation, ZEV manufacturing, and other benefits to the state's economy. Broadly, the ACT regulation is anticipated to have a neutral or positive impact on the state's overall economy in spite of potentially negative effects on industries related to oil and gas extraction.

Staff notes that because this is a manufacturer requirement, no fleet is required to purchase ZEVs unless they choose to do so. Fleets will purchase ZEVs if it makes financial sense for them to do so, including infrastructure costs and expenses. To the extent that some fleets rent their facilities or are unable to access capital for financing, they have no obligation to purchase ZEVs. The approved regulation is a requirement for manufacturers to sell ZEVs into California, but does not require any individual fleet to purchase ZEVs; therefore, the comment does not appear to be directly applicable to the regulation, and would only be relevant if the regulation required CNG fleets to purchase ZEVs.

The commenter asserts that the cost burden of the regulation is higher for a fleet that invested in CNG infrastructure than for fleets that have not similarly invested in CNG infrastructure. That assertion is incorrect for the following reasons. First, the implication that CNG fleets would not be able to recoup their investments means such fleets would not be as likely to purchase ZEVs compared to another fleet that has not made the same investment. Therefore, it is reasonable to assume that fleets that have not invested in CNG infrastructure would purchase ZEVs as was done in the staff analysis. The staff analysis is intended to reflect a representative scenario of what is likely to happen with the approved regulation and it would not be useful to model situations or scenarios that are simply unlikely or are outlier examples.

On a related note, the approved ACT regulation includes a mandatory large entity reporting requirement that includes questions about existing infrastructure investments to better inform future ZEV regulations that may affect fleets, which is discussed further in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Gather Information on Existing Infrastructure Costs”.

Economic Analysis – Impact of COVID-19

Comment: Commenter states that due to COVID-19, the market analysis should be updated to reflect the current and future economic conditions that will affect availability of ZEV’s and sources of available funding for government agencies to procure them. [RP1-181]

Comment: Commenter states that COVID-19 will reduce the lead time that manufacturers need to comply with the rule, reduce the needed capital and financial assistance to fund the higher truck purchase prices and operational costs associated with the ACT regulation, and reduce the time and capital available to develop the necessary charging infrastructure, and considering California’s budget situation it will be much harder for the state to fund incentive programs needed to offset the higher purchase and operational costs of ZE trucks. [RP1-218]

Comment: Commenter states that manufacturers have been impacted by COVID-19 and it is unclear how they will prioritize OEM's capital investments and MDE/HDE platform development. [RP1-232]

Comment: Commenter states that they have started to invest in RNG which runs 90% cleaner than diesel and making a premature push towards electrification when ratepayers are already experiencing financial hardship from COVID-19 will stop the progress made towards California's climate goals. [RP1-233]

Comment: Commenter states concern regarding the budgetary impact of COVID-19 and CARB should prioritize robust funding levels and ongoing market assessments to ensure the 2024 implementation dates remain reasonable and that the Advanced Clean Truck regulation is successful in achieving its goal of stimulating technology development and improved EV market options. [RP1-244]

Comment: Commenter states that CARB needs to consider the economic impacts of COVID-19 on the trucking industry. [RP1-247, RP1-260-Form-300]

Agency Response: No changes were made to the regulation in response to these comments. Staff recognizes there is an economic impact of the COVID-19 pandemic on truck owners and manufacturers. However, for a number of reasons, staff finds that the regulation’s requirements are feasible in spite of this. First, the ACT regulation does not place any requirements until 2024 MY, giving manufacturers time to plan and position themselves for the rule's requirements. The ACT regulation is anticipated to deliver economic benefits to trucking fleets and health benefits to Californians. These ZEV deployments will create green, high-quality jobs in infrastructure and zero-emission vehicle manufacturing to stimulate the state's economy. Lastly, the ACT regulation does not require fleets to purchase ZEVs. It requires manufacturers to sell ZEVs, and it will ensure that manufacturers bring competitive ZEV products to market at price points that will meet fleet needs. For these reasons, staff believes the ACT regulation will support the state's recovery from the COVID-19 pandemic and will not be a hindrance.

Economic Analysis – Incorrect Assumptions for Class 2b-3 Vehicles

Comment: Commenter states that the proposed ACT regulation incorrectly analyzes the TCO of Class 2b-3 vehicles, including incorrect vehicle lifetime/ownership period, assumes decreasing fuel economy of gasoline trucks, no battery replacement assumed for class 2b-3 vehicles, an underestimate of the number of individuals and small businesses ineligible for LCFS credits, and assumes too small battery sizes for vehicles which will be used to tow. [RP1-218]

Comment: Commenter states that the TCO analysis for the Class 2b-3 appears to be using unrealistically small battery sizes – 55 kWh and 80 kWh. In addition, the TCO for Class 2b-3 assumes these vehicle operators will earn LCFS credits, which is unrealistic to assume for non-fleet operators. [RP1-265]

Agency Response: No changes were made to the regulation in response to these comments.

Staff evaluated vehicle life in both the statewide cost analysis and the fleet TCO analysis to assess cost impacts to the state and individual vehicles. See response detailing staff's methodology for vehicle life in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Vehicle Life Assumption is Too Long".

Gasoline fuel economy did not "decrease" as the commenter states. Fuel economy for Class 2b-3 gasoline and diesel vehicles is assumed to rise steadily from 2021 to 2027 and remain constant afterwards. This represents the fuel efficiency standards established in the federal Phase 2 GHG requirements for Class 2b-3 vehicles. See response detailing staff's methodology to calculate fuel economy in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Cost Analysis Underestimated Combustion-Powered Fuel Efficiency".

The LCFS regulation allows non-residential EVSE owners to earn LCFS credits from charging EV's. Residential EV owners cannot claim LCFS credits as the credit is awarded to the utility delivering electricity to the residence. The commenter is conflating two separate topics by claiming that individuals and small businesses cannot claim LCFS credits. Staff does not disagree that a significant portion of Class 2b-3 sales are to small businesses. However, staff's 30 percent assumption discussed in the Staff

Report only apples to individuals. There is no restriction preventing small business owners from claiming LCFS credits. A business who installs a charger at their office can earn LCFS credits with no restrictions and, in fact, some small businesses owning EVs have already begun claiming credit in the LCFS program. Thus, stating that small businesses have “absolutely no opportunity to benefit from LCFS credits” as the commenter claims is factually incorrect.

Staff calculated battery sizes for all vehicles based on the expected efficiency, average daily miles traveled, and adding an additional buffer. Based on these calculations, staff arrived at the 55 kWh and 80 kWh values for Class 2b-3 battery size. Based on these battery sizes, staff estimated the vehicle price would be in the range of $65,000-70,000 in 2024. This was intended to represent small scale production of electric cargo or passenger vans. In the months since the Staff Report was released, staff has observed new announcements of several zero-emission pickups, vans, and SUVs as described in Attachment C to the 30-Day Changes to the ACT regulation. Many of these advertise higher battery capacities and lower prices simultaneously, indicating staff was overly conservative in our assessment of the Class 2b-3 ZEV market. For these reasons, staff is maintaining the current assumptions for Class 2b-3 vehicles as the resulting price appears reasonable.

Large Entity Reporting – General Support

Comment: Commenter states their support to expand the definition of large entity reporting to include fleets that have 50 or more vehicles. [RP1-140]

Comment: Commenter states support for the exemptions of military vehicles and streamlined reporting due to the elimination of the facility reporting section. [RP1-197]

Comment: Commenter states they support the clarification of the term "broker" in Section 2012(d)(2). [RP1-238]

Comment: Commenter states the vehicle fleet data CARB collects as a part of this process will be an important tool to the utility planning and preparedness efforts to accommodate increased MD/HD EV loads. [RP1-259]

Comment: Commenter supports staff’s removal of the facility category reporting requirement. [RP1-302]

Agency Response: Staff appreciates the supportive comments. Additional issues raised by commenters, if any, will be addressed in the applicable sections.

Large Entity Reporting – Regulation Requires Hard-to-Collect Information

Comment: Commenter states it is impossible to comply using 2019 and 2020 data as entities do not have this on record. [RP1-238]

Comment: Commenter states entities have not been previously required to collect emergency dispatch data over the previous three years, so compliance with the requirement to report the prior three years of vehicle emergency dispatches would be impossible. [RP1-238]

Comment: Commenter states that the following required reporting data are not currently available or are challenging to gather for their fleet: dispatch group, vehicle group, vehicle group mileage averages. [RP1-273]

Agency Response: No changes were made to the regulation in response to these comments. As a part of staff's 30 day modifications, more flexibility has been added to how fleets can collect data for the large entity reporting requirement. More details on this answer are provided in chapter "Comments Received During Original Proposal's 45-Day Comment Period", sections "Large Entity Reporting – Regulation Requires Hard-to-Collect Information" and "Large Entity Reporting – Timing of Data Collection".

Large Entity Reporting – Unclear Language, Unclear Requirements, Unnecessary Information

Comment: Commenter states that the survey is intrusive and does not clearly define the purpose of the collected information. [RP1-210]

Agency Response: See response detailing proposed clarifications and streamlining of the large entity reporting requirement in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Large Entity Reporting – Unclear Language, Unclear Requirements, Unnecessary Information".

Large Entity Reporting – Cost Burden

Comment: Commenter states that there is no consideration of cost to companies for completing the survey. [RP1-210]

Comment: Commenter states that CARB has underestimated the number of personnel hours and costs that will be required to produce the information requested for larger fleets. [RP1-44]

Agency Response: No changes were made to the regulation in response to these comments. A detailed streamline of the large entity reporting requirement and updates to cost modeling can be seen in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Large Entity Reporting – Cost Burden".

Large Entity Reporting – Insufficient Outreach

Comment: Commenter states that there has been very little outreach to rural local governments regarding the potential impacts of the proposed regulation, especially considering the scale that urban local governments have engaged in the rulemaking. [RP1-34]

Comment: Commenter states that outreach has been limited and requests that CARB host statewide workshops specifically for government fleets to gather comments and feedback. [RP1-181]

Comment: Commenter states that due to minimal CARB outreach, many smaller companies are unaware of the ACT. [RP1-210]

Comment: Commenter requests statewide workshops for government fleets to comment because opportunities to comment have been limited to date. [RP1-255]

Comment: Commenter requests CARB consider extending its current timelines and establish additional public sessions where concerns can be discussed and addressed. [RP1-320]

Agency Response: Staff disagrees with these comments. CARB created a technical workgroup that comprises interested stakeholders including manufacturers, fleets, environmental groups, utilities, technology providers, and fuel providers. In addition to coordinating public workgroup meetings, CARB staff met with over 50 stakeholders, often multiple times, for a total of over 100 individual meetings.

Since 2016, CARB staff held seven workshops, and four workgroup meetings to provide information to the public and solicit feedback. CARB staff posted information regarding these events and any associated materials on the ACT website and distributed notice of these meetings through two public list serves; "actruck" and "zevfleet" that include 3,092 and 1,356 recipients, respectively. The majority of the meetings were available by webcast and teleconference.

In the April 2017 workshop, staff asked fleets to submit answers to a draft fleet survey questionnaire in an effort to gather detailed information about everyday operations of local fleets. This survey was sent to roughly 500 addresses through mail and 1,500 email addresses through the “actruck” list serve on CARB’s website. However, the survey failed to provide a sufficient amount of responses to gather the required fleet information, and as a result, staff included the Large Entity Reporting requirement at Governor Jerry Brown’s direction in his August 1, 2018 letter to Mary Nichols, Chair of CARB.

In July 2019, staff also mailed notice letters to the 11,000 large entities and fleets that would likely be required to report to seek their participation.

Large Entity Reporting – Bifurcate the Large Entity Reporting from the ACT Regulation

Comment: Commenter states that the reporting requirement for fleet owners and brokers is too cumbersome and should be removed from the rule to be discussed in separate workshop. [RP1-169]

Comment: Commenter states that the reporting requirements should be separated into a new rulemaking. [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. See response explaining the time constraints that led staff to include this reporting requirement in the regulation in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Bifurcate the Large Entity Reporting from the ACT Regulation”.

Large Entity Reporting – Unrepresentative Data or More Time Needed Due to COVID-19

Comment: Commenter is concerned that the reduced vehicle usage in 2020 due to COVID-19 would not be typical or representative of the facilities’ normal operations and the use of uncharacteristic data as basis for future rulemaking [RP1-172]

Comment: Commenter suggests data quality for section 2012 will be greatly diminished by the coronavirus pandemic and that ARB should consider alternative means to collect data through an ongoing, iterative process, similar to the approach to be used for collecting facility-specific data. Commenter is concerned that the collection of poor-quality data could have negative consequences for future rules. [RP1-215]

Comment: Commenter states that CARB needs to provide clarification on how the reporting of statewide trucking data collected will be corrected for the impact of COVID-19 and how the data will inform fleet rules if they are already in progress. [RP1-216]

Comment: Commenter suggests that implementation should begin with the industries (warehousing, regional distribution, local delivery and food supply chain) that have not been impacted by COVID. [RP1-192]

Comment: Commenter states that the reporting requirement should be delayed due to COVID-19. [RP1-206]

Comment: Commenter states that there should be more time for reporting because of COVID-19 impacts. [RP1-238]

Comment: Commenter recommends to extend the submittal date to at least April 2022 to allow time to create a data collection procedure and to capture data in the year 2021 due to COVID-19, as data collected for 2020 will not be representative. [RP1-172]

Agency Response: While staff recognizes that the COVID-19 pandemic will affect fleets, much of the information gathered is anticipated to be valid. For example, all of the general information requested in section 2012.1 and facility locations and vehicle counts in section 2012.2 will not be affected by the pandemic. In addition, while the pandemic is having significant impacts on the economy as a whole, many sectors in the trucking industry appear to be relatively unaffected by the economic slowdown. Because of this, the data submitted will still be useful and critical as staff continues developing future zero-emission fleet rules.

Additionally, staff included additional flexibility in selecting representative time periods for data collection, described in chapter “Comments Received During Original

Proposal's 45-Day Comment Period", section "Large Entity Reporting – Timing of Data Collection".

Large Entity Reporting – Data Collection Timing and Reporting Deadline Issues

Comment: Commenter states that entities will need additional time (15 months from enactment) to collect the required information to comply with the reporting requirement and allow businesses sufficient time to learn the process and submit the data correctly the first time. [RP1-169]

Comment: Commenter states if the rule is adopted in June 2020, the earliest possible effective date is October 2020, which leaves facilities only Q4 2020 to collect data, regardless of whether this period is representative as described by staff. This would only leave October 1, 2020 through March 1, 2021 (to give time to consolidate and report collected information) which may not be representative of a fleet's "busy season". The timeframes are impractical, and will result in poor quality data. [RP1-215]

Comment: Commenter states they are concerned about the timeline for reporting (by April 1, 2021) provides less than six months for entities to collect information, count vehicles, and report in order to provide accurate information. [RP1-238]

Comment: Commenter states that the survey should be pushed out to September to not interfere with other reporting deadlines in April. [RP1-210]

Comment: Commenter states in Section 2012(e)(1) that it is not feasible to report by April 1, 2021. Instead, CARB should allow for a full year after adoption for reporting [RP1-238]

Comment: Commenter requests that the ACT regulation provide reporting entities more time to gather the required data, suggesting a deadline of July 1, 2021 instead of April 1, 2021. [RP1-302]

Agency Response: Staff added more guidance language and expanded the potential data collection periods, which directionally addresses some commenter concerns, as discussed in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Large Entity Reporting – Timing of Data Collection". Staff still need to gather the information and have sufficient time to analyze it to draw conclusions that will inform the fleet focused strategy that staff has committed to bring to the Board in 2021. Delaying the reporting deadline would be contrary to a speedy return to the Board, as directed by the Board members.

Large Entity Reporting – Only Require Reporting from Fleets

Comment: Commenter states that the reporting requirement should be based on the size of the fleet, not the size of the entity. [RP1-169]

Comment: Commenter in reference to Section 2012(b)(1) states small fleets are subject to the $50 million revenue threshold and data collected from these entities is better suited for a non-regulatory facility survey, not regulatory reporting. Commenter recommends this applicability criterion be removed and suggests raising the vehicle threshold so that the administrative burden is commensurate with the value of data collected. [RP1-215]

Agency Response: No changes were made to the regulation in response to these comments. The Large Entity Reporting Requirement is designed to capture information on a cross section of large fleets and large businesses. The reporting requirement was limited to large fleets with 50 or more vehicles and large businesses with greater than $50 million in annual revenue regardless of fleet size. These thresholds were approved by the Board to balance between collecting information and minimizing administrative burden. These entities have the resources to collect and report the needed information to help inform future regulations. These regulations are expected to affect all fleets in order to meet the Board's Resolution and Governor's Executive Order to achieve a fully zero-emission truck and bus fleet by 2045 where feasible. Gathering information on both large fleets and large businesses is critical to the development of future ZE fleet rules.

Large Entity Reporting – Define Large Fleet as 50 or more Vehicles

Comment: Commenter states that the definition of "large fleet" should be 50 or more vehicles. [RP1-223]

Agency Response: No changes were made to the regulation in response to this comment. The regulation requires fleets of 50 or more vehicles to report information. This is not a definitive definition of "large fleet" as staff will evaluate what an appropriate definition should be for the purposes of the zero-emission fleet rule.

Large Entity Reporting – Smaller Fleet Considerations

Comment: Commenter recommends the strengthening of the ACT regulation reporting by lowering the requirement threshold to fleets of 25 or more vehicles to inform future programs and improve compliance in difficult market segments, such as port drayage. [RP1-46]

Comment: Commenter asks how the ACT regulation will ensure that smaller fleet sizes (<= 50) will not be underrepresented and ensure that incentives will be applied to these smaller fleets. [RP1-26]

Agency Response: No changes were made to the regulation in response to these comments. Based on available information, staff believes that lowering this number further would result in exponentially more fleet respondents with diminishing returns on the value added by the additional data, along with additional time required to process the much larger volume. This would be contrary to the Board's direction to streamline the reporting requirement and to return to the Board expeditiously with fleet recommendations in 2021. Staff is in the process of developing the specifics of a future fleet rule to identify which segments and associated fleet sizes are most suitable for electrification. Please see the discussion about staff targeting initial requirements to larger businesses and larger fleets because they are in better capitalized positions in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Level Playing Field Analysis”. In addition, regulations are generally not predicated on incentives, as discussed in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Out of Scope – Incentive and Funding Policies”.

Large Entity Reporting – Oppose Decreasing Fleet Size Cutoff

Comment: Commenter states that they are disappointed that CARB has increased the number of fleets required to respond to the survey by reducing the vehicle threshold from 100 to 50. [RP1-210]

Comment: Commenter is concerned with changes that decrease the vehicle threshold for reporting entities, as this will require many more fleets to report data. [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. While the Board did provide direction to streamline the reporting requirement at the First Board Hearing, they also gave direction to consider lowering the threshold for fleet size. The manufacturer ZEV sales requirements have become more stringent which will mean more fleets need to electrify. As a result, more information on smaller fleets is necessary to develop ZE fleet regulations to support higher manufacturer ZEV sales requirements.

Large Entity Reporting – Allow Public Entities to Report Subsidiaries

Comment: Commenter requests that the ACT regulation clearly allow independent reporting for state and local governments, as is allowed for subsidiaries, joint ventures, or parent companies (as POUs and public water agencies are often departments of city government). [RP1-302]

Agency Response: No changes were made to the regulation in response to this comment. Section 2012(e)(1) states that parents may report on behalf of their subsidiaries. This flexibility option is available to both public and private entities affected by the reporting requirement.

Large Entity Reporting – Inclusion of Vehicles Supporting Emergencies

Comment: Commenter asks if non-emergency vehicles that assist with emergencies are subject to reporting requirements. [RP1-215]

Comment: Commenter states that there needs to be clarification on Section 2012.2(b)(2)(O) because it is unclear if they have to report emergency vehicles that responded to an incident or only the vehicles that are non-emergency but responded. [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. Vehicles classified as an “emergency vehicle” as defined in California Vehicle Code section 165 are exempt from the reporting requirement. Vehicles not meeting the definition of “emergency vehicle” need to report even if they assist with emergencies.

Large Entity Reporting – Exempt Light-Duty Vehicles

Comment: Commenter states in Section 2012(c) there should be an exemption to the reporting requirement for all passenger and light duty trucks since they are not a part of this rulemaking. [RP1-238]

Agency Response: No changes were made to the regulation in response to this comment. There are no requirements on light-duty vehicles in the regulation as all references are to vehicles with a GVWR over 8,500 lbs. or more. For this reason, it is unnecessary to add an explicit exemption for light-duty vehicles.

Large Entity Reporting – Exempt Class 2b Pickups

Comment: Commenter states that 3/4 ton pickups should not be included in the ACT reporting requirements because they are governed by other regulations and that the lower limit of the gross vehicle weight should be increased from 8,500 to 10,000 pounds. [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation requires manufacturers to produce Class 2b-8 ZEVs. During the development of a future ZE fleet rule development, staff will be evaluating the deployment of ZE Class 2b-8 vehicles. Therefore, it is critical to collect operational information on Class 2b vehicles as part of the reporting requirements.

Large Entity Reporting – Exempt Utility Vehicles

Comment: Commenter states that vehicles operated by utilities should be added to the list of emergency exempt vehicles from the ACT regulation. [RP1-181]

Comment: Commenter requests that CARB add vehicles operated by utilities to the list of exempt emergency vehicles. [RP1-255]

Agency Response: No changes were made to the regulation in response to these comments. Utilities have been identified as a beachhead category and through the Resolution, staff aims to fully electrify the utility sector by 2040. To achieve this goal, gathering specific information on the operations of utility vehicles is critical.

Large Entity Reporting – Remove Off-Road Yard Tractors

Comment: Commenter in reference to Section 2012(e)(3) states that “off-road tractors” should be deleted from the reporting requirements for consistency with the ACT regulation. [RP1-169]

Comment: Commenter recommends that "off-road yard tractors" should be removed and dealt with outside of the regulation, especially as it appears not to be part of the scope of the ACT regulation. [RP1-215]

Agency Response: No changes were made to the regulation in response to these comments. While the manufacturer ZEV sales requirements of the ACT regulation do not place requirements on off-road yard tractors, the upcoming ZE fleet rule and Cargo Handling Equipment regulations will affect yard tractors regardless of whether they operate on-road or off-road. For these reasons, getting a better understanding of their inventory and operations is critical.

Large Entity Reporting – Exempt Small Municipalities

Comment: Commenter recommends that smaller municipal jurisdictions be exempt from the reporting requirement because light-duty and heavy-duty applications are not conducive to ZEV's, rural communities lack the charging infrastructure, and reporting will place an undue economic burden on local agencies. [RP1-34]

Agency Response: No changes were made to the regulation in response to this comment. The Board adopted, through the Resolution, a goal to electrify all government fleets by 2035. Meeting this goal will require deploying ZEVs into public fleets, which may include those belonging to small municipalities. The Resolution does not discriminate between large and small municipalities so staff will need to gather information on these small municipalities to ensure future ZE fleet rule requirements are feasible.

Large Entity Reporting – Remove Fleet Category Definitions

Comment: Commenter states the "facility category" definition should be deleted. [RP1-247]

Agency Response: No changes were made to the regulation in response to this comment. The facility categories are required as stated in section 2012.2(a)(2). Therefore, the definitions for facility categories remain necessary.

Large Entity Reporting – Remove Reporting Requirements for Tax ID and Annual Revenue

Comment: Commenter states that “Federal Taxpayer Identification Number”, and the “Total Annual Revenue for the Entity” is not necessary for compliance with the proposed ACT regulation and therefore should be deleted. [RP1-169]

Comment: Commenter states entities should not have to report how much revenue they generate at all. [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. The Federal Taxpayer Identification Number is necessary because it is a unique identifier that can be used to identify companies with similar names or identify subsidiaries of the same company. Total annual revenue for the entity is necessary to ascertain the relative size of different entities. Future fleet rules may have different requirements for larger and smaller businesses, so identifying the relative revenue of different entities is critical

Large Entity Reporting – Remove Reporting Requirements for Emergency Operations

Comment: Commenter recommends that Section 2012(b)(2)(O) should be removed because entities involved with emergency response are not tracking vehicle usage or deployment in those situations; they are focused on assisting with emergencies. The way the question is phrased would require three years of data to be able to answer, which fleets have not been keeping records of, which is impractical to comply with. [RP1-215]

Agency Response: No changes were made to the regulation in response to this comment. Understanding how vehicles that support emergencies operate is critical in ensuring these vehicles receive sufficient flexibility in the upcoming zero-emission fleet rules. Fleets have indicated they typically will send a portion of their fleet to aid in emergency situations, with the size of the dispatched fleet being dependent on the scale and location of the emergency. Staff does not agree that fleets maintain no records of which vehicles are used to support emergency operations as fleets will need to ensure all equipment is tracked and provide logistic support to these vehicles.

Large Entity Reporting – Remove Weight Limit Question

Comment: Commenter in reference to Section 2012(b)(2)(L) states that this provision is geared toward long haul trucks that have access to scales rather than for businesses that simply use trucks at their facilities. Most companies do not have data on daily or typical weight limits. CCEEB requests to have this provision removed. [RP1-215]

Agency Response: No changes were made to the regulation in response to this comment. Many trucks across all weight classes face weight challenges as shown in Appendix F to the Staff Report. Because of this, information on potential weight limitations is needed from all vehicles. Because exceeding weight limits is illegal, staff anticipates fleets keep track of which vehicles are operating near their weight limit.

Large Entity Reporting – Remove Useful Life Questions

Comment: Commenter in reference to Section 2012.2(b)(4) states that in order to respond accurately, entities would need more than 20 years of historical data, i.e. data for the useful life of each vehicle. Commenter suggests this provision should be removed. [RP1-215]

Agency Response: No changes were made to the regulation in response to this comment. Fleets commonly keep records of their assets and other major cost elements such as maintenance and depreciation, which are dependent on the vehicles' age. This question is intended to reflect general business practices for the most appropriate response category (bin) provided in the regulation, and staff recognizes it could change in the future for a variety of reasons. Furthermore, the question provides easy to categorize response options in five-year increments which should be sufficient for the entity to assess the approximate number of years an asset is typically kept after acquisition.

Large Entity Reporting – Define “Most of the Vehicles”

Comment: Commenter states that CARB should clarify the phrase "most of the vehicles," and identify the ratio or percentage they intend to capture (e.g., a fleet that has more than 75% of their vehicles within approximately 50 miles of the facility). [RP1-172]

Agency Response: No changes were made to the regulation in response to this comment. “Most” has a generally accepted meaning of “more than 50 percent” so no additional definition is required in this rulemaking.

Large Entity Reporting – Define “Tractor”

Comment: Commenter states that the term "tractor" is undefined in the rule. [RP1-238]

Agency Response: No changes were made to the regulation in response to this comment. The term “tractor” is commonly understood to refer to a tractor trailer or semi-truck used to haul trailers on highways.

Large Entity Reporting – Rephrase “Van-Dry” and “Van-Reefer”

Comment: Commenter in reference to section 2012(3)(A) & (B) states that "van-dry" should read "dry van" and "van-reefer" should read "reefer van" or “reefer” to reflect common nomenclature. [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. The regulation text was phrased this way to list the two types of vans next to each other when displayed alphabetically in a reporting system.

Large Entity Reporting – Avoid Using “You”

Comment: Commenter in reference to section 2012.2(a)(8) suggests that the word "you" should be replaced with fleet or entity. [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. “Your entity” and “you” are used in multiple places throughout the regulation to indicate information requested from the reporting entity. “You” is correct terminology in these instances.

Large Entity Reporting – Need to Report Data Collection Year

Comment: Commenter asks for clarification on why the distinction in Section 2012.1(a)(20) is necessary. [RP1-238]

Agency Response: No changes were made to the regulation in response to this comment. The regulation allows reporting entities to report their fleet as it was in any time during 2019 or 2020. This question asks what date was used to gather this information. This is necessary to give time frame context to the data reported, and to better allow comparisons between time periods.

Large Entity Reporting – Insufficient Records for Infrastructure Installation

Comment: Commenter in reference to Section 2012.2(a)(6) and (7) asks to clarify the terms "initially installed" and "on or after" because facilities were not required to keep records of whether or not fueling infrastructure had been installed in 2010 or any time since then, which makes compliance record keeping challenging. This would be particularly true for a facility that changed ownership since 2010. [RP1-215]

Agency Response: No changes were made to the regulation in response to this comment. The requirement is for fleets to report if they installed fueling infrastructure at any of their vehicle home bases since 2010. Because fueling infrastructure represents a major investment on the part of fleets, staff expects fleets to maintain records of recent infrastructure installations.

Large Entity Reporting – Require Pre-2010 Infrastructure Information

Comment: Commenter states that in section 2012.2(a)(6)(A) to 2012.2(a)(6)(G) the word “initially” should be removed, and modify “after January 1, 2010” to read “after January 1, 2000” to inform future TCO analysis based on the 20-year amortization period. [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. In comments at the December 12, 2020 hearing, the Board directed staff to streamline the reporting requirement. Increasing the amount of information required would go against the Board direction. In addition, staff does not currently plan for future fleet rules to require full electrification prior to 2030, meaning that infrastructure installed prior to 2010 will be able to be fully amortized.

Staff will include a field in the reporting template for the reporting entity to share additional information. This can include information on older infrastructure if the respondent so chooses.

Large Entity Reporting – Reporting Facilities Outside of California

Comment: Commenter states Section 2012.2 needs to explicitly exclude locations outside of California. [RP1-247]

Agency Response: No changes were made to the regulation in response to this comment. The regulation states regulated entities must report facilities within California with vehicles. In addition, for vehicles that accrue the majority of their miles within California, either the company headquarters or the vehicle facility outside of California must be reported. Facilities with vehicles that do not accrue the majority of their miles within California do not need to be reported.

Large Entity Reporting – Clarify Exempt Military Facilities to be "Operational" not "Tactical"

Comment: Commenter in reference to Section 2012(c)(4) requests the exemption for military facilities be for "operational" rather than "tactical" because the description better meets CARB's stated intent for which facilities should provide information. [RP1-197]

Agency Response: No changes were made to the regulation in response to this comment. Military tactical vehicles and military tactical facilities are exempt from the approved regulation to minimize any potential national security concerns and because staff does not foresee including them in any future ZEV fleet regulations.

Large Entity Reporting – Clarify Record Keeping for Dispatched Vehicles

Comment: Commenter requests clarification of the term "brokers" that dispatch vehicles because the term "dispatched" are specific to brokers except this one, which also appears to be directed toward brokers but is it not specified as such. [RP1-215]

Comment: Commenter recommends clarification of language in Section 2012(e)(3)(B) because there are no requirements in the rule that use the term "dispatch" that are not related to brokers, except this section. [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. Section 2012(e)(3)(B) states what types of records would need to be retained for vehicles "not owned but dispatched by the entity." This certainly would apply to Brokers, but could also apply to any other company that directs the movement of vehicles. For example, some motor carriers own vehicles and also provide brokerage services.

Large Entity Reporting – Clarify Language Regarding Fueling Infrastructure Installation

Comment: Commenter states in Section 2012.2(a)(7) there needs to be clarification for the difference between "fueling infrastructure" and "refueling infrastructure", and to provide clarification on whether the question is referring to a single point in time or a period in which the station was opened. [RP1-238]

Agency Response: Staff did not intend for there to be a difference between "fueling infrastructure" and "refueling infrastructure". Staff has made a non-substantive change to the regulation text to refer to both as "fueling infrastructure."

The date of initial installation is treated as a single point in time. The phrase "on or after" was used to provide more clarity as to whether January 1, 2010, was included rather than leave it ambiguous.

Large Entity Reporting – Clarify What Type of Infrastructure to Report

Comment: Commenter states there needs to be clarification on the "Refueling Infrastructure", which can refer to the equipment/system that dispenses fuel to vehicles or can also refer to equipment that supports the fuel dispensing activities. [RP1-230]

Agency Response: No changes were made to the regulation in response to this comment. The purpose of this particular reporting requirement is to gather information on what fueling capabilities currently exist on fleets' property and what investments were made recently. This can include both fueling infrastructure and infrastructure used to support refueling such as fuel dispensing devices.

Large Entity Reporting – Clarify How to Determine If Locations Are Similar

Comment: Commenter in reference to Section 2012.2(b)(7) asks if two or more "locations" should be deemed "similar" if operations are similar but they have different sized service areas, or different numbers of vehicles domiciled there. [RP1-215]

Agency Response: No changes were made to the regulation in response to this comment. There is no limitation that the service areas need to be identical or the number of vehicles be different, these can differ and still be substantially similar.

Large Entity Reporting – Clarify Requirements Regarding Sustainability Plans

Comment: Commenter requests clarification of intent in Section 2012.1(a)(17)-(18). Commenter states the term sustainability plan means different things to different industries. Will entities that have a sustainability plan be exempt from future rulemaking? If so, what should this sustainability plan look like? Must it include electric vehicles use as a component? Will it have an emissions reduction requirement? [RP1-238]

Agency Response: No changes were made to the regulation in response to this comment. The purpose of the sustainability plan questions is to understand how many companies in which sectors have or have not incorporated sustainability into their business plan, with a focus on transportation issues. This is meant to inform future decision making for the zero-emission fleet rule and does not place requirements on fleets to develop future sustainability plans

Large Entity Reporting – Clarify Requirements on Vehicles Not Registered with the Department of Motor Vehicles

Comment: Commenter would like know how to handle vehicles that operate on private property but are not registered with DMV? Under this definition, these vehicles would not have fleet owners. [RP1-215]

Comment: Commenter states Section 2012(d)(10) and Section 2012 (e)(3)(C) need clarification about vehicles that operate on private property and are not registered at DMV. [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. The regulation does not exclude on-road vehicles who are not registered with the DMV. Fleets should report their on-road vehicles regardless of whether they are registered with DMV or not.

Large Entity Reporting – Clarify Language Regarding Light-duty Vehicles

Comment: Commenter recommends that the definition of light-duty vehicles be removed since this vehicle class is outside the scope of the ACT regulation. [RP1-215]

Comment: Commenter states that Section 2012.2 should clarify that information on vehicle home bases should only be required for locations that have vehicles over 8,500 GVWR, and not for a location where only light-duty vehicle or those under 8,500 GVWR are domiciled. [RP1-215]

Comment: Commenter states in Section 2012.2 that entities that meet the income threshold that have light-duty vehicles but no heavy-duty should not be required to report. [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. The "weight class bin" definition contains a sub-definition of "light-duty". Including this definition is simply meant to help fleets determine what is, and what is not, a light-duty vehicle.

Light-duty vehicles have no reporting requirements and vehicle home bases with only light-duty vehicles do not need to be reported.

Large Entity Reporting – Clarify How to Calculate Mileage Bins

Comment: Commenter in reference to Section 2012.2(b)(2)(A) through (E) asks to clarify whether responses in (B) through (E) are additive to (A) and so on down the list. [RP1-215]

Comment: Commenter states Section 2012.2(b)(3)(A) through (E) needs clarification if the responses to (B), (C), (D), etc. are additive with the percentages from (A) or should be listed separately for each category [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. As clearly described in Sections 2012.2(b)(2)(A) through (E), the percentage responses should add up to 100% and each individual vehicle should only be reported in one bin.

Large Entity Reporting – Clarify Meaning of "Vehicle Group"

Comment: Commenter in reference to section 2012 states that CARB should define "vehicle group" as the "vehicle's body type", "weight class bin, and "fuel type" [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. The regulation states that vehicle responses must be grouped by vehicle body type, weight class bin, and fuel type. The regulation then asks for information by vehicle group. The vehicle group refers to vehicles with the same vehicle body type, weight class bin, and fuel type.

Large Entity Reporting – Clarify Meaning of "Common Ownership and Control"

Comment: Commenter states that in Section 2012(d)(3) there needs to be clarification on the meaning of the term "common ownership or control" and how it applies to the various entities the rule applies to. [RP1-238]

Agency Response: No changes were made to the regulation in response to this comment. The term "common ownership or control" aligns with the same definition in the Truck & Bus regulation and the In-Use Off-Road Diesel Fueled-Fleets regulation. Vehicles under "common ownership and control" means they are owned by the same person, corporation, partnership, or association. In addition, vehicles managed day to day by the same directors, officers, or managers, or by corporations controlled by the same majority stockholders are considered to be under common control even if their title is held by different business entities. This includes vehicles that are rented or leased from a business that regularly engages in the trade or business of leasing or renting motor vehicles without drivers where the vehicle rental or leasing agreement for the use of a vehicle is for a period of one or more years. This term applies to regulated entities subject to the reporting requirements as specified in sections 2012.1 and 2012.2.

Large Entity Reporting – Clarify Meaning of "Represent Your Brand"

Comment: Commenter states CARB should clarify what is meant by "represent your brand" and "to serve your customers?" Does this mean the truck must have a company's logo on it, or that contractors are delivering product in containers with a company's logo? [RP1-215]

Comment: Commenter states Section 2012.1(a)(15) is unclear. Commenter requests clarification of what it means to "represent your brand" and "serve your customers." Does this mean the truck or its container must have a logo on it? Does the contract have to specify a vehicle over 8,500 lbs. in order to trigger this section? [RP1-238]

Agency Response: No changes were made to the regulation in response to this comment. As described in the Staff Report, the intent of this section is to determine whether regulated entities use subcontractors or subhaulers that use vehicles over 8,500 lbs. GVWR in their typical business, the number of trucks that subhaulers use, and whether subhaulers are operating under the regulated entity's authority. This information will help answer questions about whether an entity uses its own trucks or relies on other entities to conduct their business. Establishing a level playing field for future rule development is our primary concern.

Large Entity Reporting – Clarify Meaning of "Dispatched"

Comment: Commenter states entities that deliver cargo from material suppliers should be excluded from the "dispatched" definition to be consistent with guidance for the Truck and Bus Regulation "How to verify if hired fleets comply." [RP1-145]

Comment: Commenter would like to know if materials delivered by a third-party are considered "dispatched" by the entity, such as pick-up and transport of recycling? [RP1-215]

Agency Response: No changes were made to the regulation in response to these comments. As written, the regulation's definition of "dispatched" does not include ordering items or materials where the purchaser is not involved in determining how the delivery is made. For example, if a purchaser orders material from a supplier, then the supplier ships the order, the purchaser did not dispatch the shipment. The intent of the definition "dispatch" is to identify entities, including third-parties such as brokers or subcontractors, that provide direction or instruction for the routing of a vehicle to a specified destination for a specific purpose, including the pick-up and transport of materials for recycling.

Large Entity Reporting – Clarify Meaning of "Operated"

Comment: Commenter states that "operated" should mean that the entity, fleet owner, broker, or agency operated vehicles at a California facility whether or not it was owned or leased by the entity, fleet owner, broker, or agency. [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. The term "operated" correlates to the one of the preceding terms "common ownership or control" or "dispatched" as it relates to the Large Entity Reporting Requirements. Please see the definitions of "common ownership or controlled" and "dispatched" for further clarification.

Large Entity Reporting – Define "Fleet" Same as Truck and Bus Regulation

Comment: Commenter states the "fleet" definition should be the same as the definition used in the Truck and Bus Regulation, Title 13, California Code of Regulations, Section 2025(d)(29). [RP1-215]

Agency Response: No changes were made to the regulation in response to this comment. The definition of "fleet" in the Truck and Bus Regulation includes definitions of "federal fleet" and "rented or leased fleets" which are unnecessary for this regulation. In addition, the definition in the Truck and Bus Regulation does not mention "common ownership or control" which is necessary for the Large Entity Reporting. For these reasons, the definition within the Truck and Bus Regulation was not used.

Large Entity Reporting – Enforcement Policy Concerns

Comment: Commenter requests that CARB clarify in the rule or final Staff Report what enforcement standards it will use to determine violations. [RP1-215]

Comment: Commenter states Section 2012(e)(4) should specify how CARB will enforce penalties and what exactly would cause a penalty to occur when the reporting is based off of best estimates. [RP1-238]

Comment: Commenter states CARB should reconsider strict, prescriptive timelines for enforcement of reporting entities because the short time frame [to respond to a CARB request for clarification] can be problematic and that good faith efforts should guide enforcement and potential violations. [RP1-216]

Comment: Commenter states that a 14-day period to respond to CARB requests for clarification is not sufficient, as it takes time to route CARB requests to proper staff, and time to gather the information requested. More time should be provided. [RP1-215]

Agency Response: No changes were made to the regulation in response to these comments. Staff added language to the originally proposed regulation stating that regulated entities have 14 days to respond to a request by CARB for clarification of reported information. This helps ensure that if reported data is unclear, there is a pathway for remediation without enforcement action. For more detail on this topic please refer to chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Enforcement Concerns”.

Large Entity Reporting – Specifically Exclude Light-Duty in Home Base Scope

Comment: Commenter states the language in Section 2012.2(a) is inconsistent with Section 2012.2 and 2012.2(b) and recommends reporting for vehicle home bases with at least one vehicle above 8,500 lbs. [RP1-172]

Agency Response: No changes were made to the regulation in response to this comment. Section 2012.2 states that vehicles with a GVWR greater than 8,500 lbs. must report general information about the vehicle home base and the vehicle operating characteristics as specified in Section 2012.2(a) and 2012.2(b), respectively. The purpose of the ACT regulation is to accelerate the adoption of zero-emission technologies in the medium- and heavy-duty vehicle sectors, which are vehicles over 8,500 lbs. GVWR. For this reason, it was unnecessary to add the 8,500 lbs. GVWR threshold to Section 2012.2(a).

Large Entity Reporting – Allow Optional Vehicle Usage Metrics

Comment: Commenter states that in order to capture the unique operation of high usage vehicles that are not represented solely using mileage, CARB should include an optional measurement of usage category for each bin (e.g. hours/day or a percentage of time the equipment is used.) [RP1-288]

Agency Response: No changes were made to the regulation in response to this comment. The ACT Regulation balances the need to collect important and critical fleet information with Board direction to streamline the reporting and reduce burden on affected entities. Staff intends to allow fleets to submit voluntary information as part of their reporting. Additionally, staff intends to request and accept additional information from fleets as part of a future zero-emission fleet rule.

Large Entity Reporting – Add Reporting of Auxiliary Equipment Utilization

Comment: Commenter recommends including the percentage of vehicles in each weight bin that utilize auxiliary equipment (> 50 bhp), and the power requirements for the auxiliary equipment as responsive categories for the large entity reporting requirement. [RP1-288]

Agency Response: No changes were made to the regulation in response to this comment. The information commenter is asking for would provide information about power take off units and vehicles that rely on that auxiliary equipment. The goal of the regulation is designed to enable a large-scale transition to zero-emission technologies in the medium- and heavy-duty truck market. Electric power take-off technologies are already fully commercialized, so gathering information about them is not necessary. Additionally, the Board directed staff to streamline the reporting requirement. Adding more questions that would not significantly help drive the zero-emission transition is contrary to Board direction. Respondents may add clarifying or contextual information to their reports if they so choose, which is directionally consistent with the commenter’s request.

Large Entity Reporting – Modify Questions on Emergency Usage

Comment: Commenter states that the definition of emergency should not be limited to "infrequent acts of nature," and should include imminent threats to public health and safety.

Commenter recommends asking facilities whether a majority of a fleet vehicle group is generally subject to emergency usage, making sure to define what is considered as “majority” (e.g., more than 75%), rather than the current emergency usage question. [RP1-172]

Agency Response: No changes were made to the regulation in response to this comment. The regulation states: “The highest approximate percent of the fleet vehicle group that was dispatched at the same time over the last 3 years on the behalf of a local, state or federal government to support an emergency operation such as repairing or preventing damage to roads, buildings, terrain, and infrastructure as a result of an earthquake, flood, storm, fire, terrorism, or other infrequent acts of nature”; that statement includes but is not limited to the types of listed emergencies. This list is not exhaustive and can include other threats to public health and safety which can reasonably be categorized as emergencies.

The purpose of this reporting requirement is to determine the relative portion of vehicles who have been actively involved in responding to emergency situations. During emergency scenarios, a portion of the fleet will need to respond to the emergency while a separate portion will need to remain at the home base to service the local territory. This reporting information is designed to better understand how fleets use their vehicles during emergencies to determine which can and cannot be electrified.

Large Entity Reporting – Inconsistent Definition of Backup Vehicle

Comment: Commenter states that the definition of back-up vehicle in the ACT regulation is not consistent with the definition in the Truck and Bus regulation or Solid Waste Collection Vehicle regulation. [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. Different regulations use different definitions of “backup vehicle”. The definition of “backup vehicle” for this regulation was intentionally broad, and was meant to capture vehicles not commonly used in daily operations across all of California’s trucking sectors.

Furthermore, the definition of “backup vehicle” was removed in the 2019 amendments to the Solid Waste Collection Vehicle regulation and can no longer be cited as a relevant definition.

Large Entity Reporting – Determining Representative Vehicle Mileage

Comment: Commenter asks in Section 2012.2(b)(2) how an entity would determine if the data is representing 90 percent of a vehicles operating day. [RP1-238]

Agency Response: No changes were made to the regulation in response to this comment. As written, the regulation provides flexibility in how the reporting entity can determine the 90 percent threshold for their own vehicles. The regulation language was expanded to include addition guidance on how to select a timeframe based on the information available to the fleet owner. In addition, language was added on how to interpret existing data to complete the reporting. The language clarifies that a fleet may collect information from a sample of their vehicles to complete their responses and decrease the administrative burden.

Large Entity Reporting – Expand “Responsible Official” Definition for Public Agencies

Comment: Commenter states there needs to be an expanded definition of "Responsible Official" in Section 2012(d)(16)(C). Commenter recommends “For a municipality, state, federal, or other governmental agency: Either a principal executive officer or ranking elected official or their delegate, designee, or any other person who performs similar policy or decision-making functions for the agency.” [RP1-230]

Comment: Commenter suggests added flexibility in definition for “Responsible Official” in section 2012 (d)(16)(C), requesting that the flexibility currently extended to corporations and partnerships be extended to public agencies. The ACT regulation should allow for principal executive officer's delegate/designee to report and retain records. [RP1-288]

Agency Response: No changes were made to the regulation in response to these comments. As described in Section 2012(e)(3) of the ACT regulation, the term “responsible official” is only used to specify who the record retention provisions apply to. Thus, the current definition is appropriate for its usage.

Large Entity Reporting – Develop Two Reporting Systems

Comment: Commenter would like to know if the online reporting system will allow for both a main response method and an alternative response method. Commenter recommends that CARB work with users to beta test the system well in advance of the April 1, 2021 deadline, allowing enough time to fix any bugs or flaws. [RP1-215]

Comment: Commenter states that the needed reporting system should allow a main response method and an alternative response method, both of which are built in a time frame to allow user testing. [RP1-238]

Agency Response: No changes were made to the regulation in response to these comments. Staff intends to develop a reporting template based on an Excel spreadsheet-based reporting system which is anticipated to be quick and easy to complete. Staff anticipates releasing the reporting template and the upload site by the end of 2020. Due to this, there is no need to develop two separate reporting systems for the Large Entity Reporting.

Large Entity Reporting – Separately Report Renewable Diesel Infrastructure

Comment: Commenter states that renewable diesel should be included as an option for fuel types dispensed at a facility in the reporting requirement. [RP1-07]

Comment: Commenter states they support adding "renewable diesel" as a selectable fuel type to the revised section 2012.2. [RP1-232]

Agency Response: No changes were made to the regulation in response to these comments. Because renewable diesel is chemically similar to fossil diesel, it can function as a “drop-in” replacement fuel. This means that there is no difference between renewable diesel infrastructure and conventional diesel infrastructure.

Large Entity Reporting – Clarification on Why Brokers Need to Report Directed Vehicles

Comment: Commenter states Section 2012(e)(1) needs clarification as to why brokerages or entities with motor carrier authority must report vehicles if they do not own them. [RP1-238]

Agency Response: No changes were made to the regulation in response to this comment. A goal identified for future fleet rules is to ensure a level playing field between different companies. For example, this includes ensuring that a fleet with 100 trucks has similar requirements to a broker directing 100 trucks as they can compete for the same job. Information on the size and operation of brokers is necessary to inform future decision making in zero-emission fleet rules. Gathering information on the vehicles they direct is needed to determine whether the vehicles they direct can be electrified.

Large Entity Reporting – Use "Four-Wheel Drive" instead of "All-Wheel Drive"

Comment: Commenter in reference to section 2012 states that "all-wheel drive" vehicles should include "four-wheel drive" vehicles. [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. Four-wheel drive and all-wheel drive are different technologies and are not interchangeable. Staff choose to use the term "all-wheel drive" to specifically describe vehicles where power is delivered to all wheels as this is a good indicator for off-road operation and other activities which may pose a challenge to electrification. In the heavy-duty world, four-wheel drive could refer to a wide variety of vehicles and gives insufficient clarity to determine how the vehicle is being used. For these reasons, "all-wheel drive" is preferred.

Large Entity Reporting – Add Additional Questions for Fueling Stations

Comment: Commenter states that additional information should be reported for natural gas, hydrogen, and electric fueling stations. [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. At the December Board Hearing, the Board gave broad direction to streamline the reporting requirement where feasible. These additional reporting requirements would offer minimal information while increasing the reporting burden. Thus, the value added does not support this additional burden.

Large Entity Reporting – Request More Detailed Information than Average Daily Miles

Comment: Commenter states that fleet survey questions should attempt to better understand and collect data on fleet services and the communities they serve to ensure an accurate understanding of the all-electric range (AER) potential of PHEV trucks [RP1-64]

Comment: Commenter suggests instead of asking for the daily average miles for each vehicle body type, it may be beneficial for CARB to take into consideration the maximum hourly usage, the maximum fuel range within the fleet, and a description of common tasks being performed.   This data shows how long a vehicle is operating within a fuel range that is capable of efficiently handling the facility's day-to-day operations. [RP1-172]

Comment: Commenter states average miles per day may be a poor indicator of whether or not a vehicle is suitable for electrification, as it does not describe the upper range of miles at which a vehicle operates. Average daily miles also do not capture information regarding vehicles who travel short distances but idle at job sites, such as aerial bucket trucks. Other metrics would be appropriate for these scenarios. [RP1-215]

Comment: Commenter requests the reporting requirement include the percent of the total vehicles that have devices that run off of the engine to power equipment (e.g., PTOs) and average hours of vehicle operation per day (may be broken into 8-hour shifts) to better characterize commenter's vehicle usage. [RP1-230]

Agency Response: No changes were made to the regulation in response to these comments. While staff recognizes that daily average miles presents some issues in representing vehicle usage, requiring more detailed data would significantly increase the reporting burden on fleets. Given Board direction to streamline reporting, staff chose to maintain the current requirements for vehicle operations reporting.

Large Entity Reporting – Use TRUCRS to Export Existing Fleet Data

Comment: Commenter states the TRUCRS should allow the export of data to satisfy the reporting requirement for the body type, weight bin and fuel types. Furthermore, the commenter states that TRUCRS should be modified to allow manual data entry and large fleet importing for Class 2b-3 trucks and larger vehicles of multiple fuel types not currently available in TRUCRS (e.g., CNG/LNG). [RP1-145]

Agency Response: No changes were made to the regulation in response to this comment. Please see the discussion about the use of TRUCRS and the development of a new reporting system for the collection of information in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Use TRUCRS System for Reporting”.

Large Entity Reporting – Data Security Standard

Comment: Commenter states if the survey is completed online, how can CARB assure that confidential information will be protected? [RP1-210]

Agency Response: No changes were made to the regulation in response to this comment. CARB will follow Federal and State guidelines to secure confidential and personally identifiable information. For further details on this subject, please refer to chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Confidentiality, Proprietary Info, Security, and Public Record Act Requests”.

Large Entity Reporting – Allow Voluntary Submission of Real-World Data

Comment: Commenter suggests the regulation include a voluntary method to collect real-world data from fleets. [RP1-64]

Agency Response: No changes were made to the regulation in response to this comment. Staff intends to allow fleets to submit voluntary information as part of their reporting. However, submitting real-world vehicle data will require significant additions to the reporting system. Staff will evaluate if and how to voluntarily collect real-world data as part of the implantation process for this regulation.

Large Entity Reporting – Limit Scope to Facilities with Infrastructure or Tractors

Comment: Commenter suggests changing the language to identify facilities with fueling infrastructure and/or tractors instead of capturing all facilities with all the submitted information to decrease workload and provide relevant data. [RP1-172]

Agency Response: No changes were made to the regulation in response to this comment. Limiting the scope to only facilities with fueling infrastructure or to only those facilities with tractors would leave out information about many other vehicle categories that are well suited for electrification, and would undermine the Board's direction to achieve zero-emission goals in those categories. The Board directed staff to streamline the reporting requirement, but also to ensure needed data are collected. The Board also directed staff to bring a fleet rule to the Board in 2021, as stated in the Resolution. In order to craft a well-informed fleet rule that seeks to achieve the zero-emission goals adopted by the Board in the resolution and other statewide goals, including achieving carbon neutrality by 2045, staff will need data on where trucks are located, regardless of where fueling infrastructure currently exists, and how those vehicles are used across the entire medium- and heavy-duty vehicle spectrum.

Large Entity Reporting - Implementation Guidance and Standards

Comment: Commenter states that CARB should develop standards describing the level of data accuracy required, and provide entities with clear and transparent guidance on how compliance will be determined, as well as priorities for enforcement. [RP1-215]

Agency Response: No changes were made to the regulation in response to this comment. The regulation contains guidance that gives regulated entities direction on how to complete their reporting requirement to the level of data accuracy that is required. Staff has additionally added language to the regulation in the 30-day changes specifying the process that staff will be able to contact regulated entities to clarify reported data if discrepancies appear to exist. These modifications create a balance between allowing fleets to use data that is simple to correct and allowing CARB the ability to validate data received. For further discussion on enforcement policy for the regulation, see chapter "Written Comments Received During the 30-Day Comment Period", section "Large Entity Reporting – Enforcement Policy Concerns".

Future ZEV Policy – Accelerate Zero-Emission Fleet Rules

Comment: Commenter states that ARB should accelerate the fleet rule to begin no later than the ACT regulation sales requirement in 2024. [RP1-46, RP1-188]

Comment: Commenter urges an earlier adoption of the fleet purchase requirement. [RP1-120]

Comment: Commenter supports strong resolution language linking the ACT regulation to the ACT fleet regulation. Commenter states the fleet rule should support the ACT regulation by creating demand for the truck segments that are market ready, like Class 4-6 and Class2b3 vans. [RP1-241]

Comment: Commenter recommends developing and adopting fleet purchase requirements that mirror the sales targets in the proposed ACT regulations built around the beachhead strategy and applications. Commenter states for other M-HDV classes, CARB is developing fleet rules before the OEM rule, and other rules already adopted (Innovative Clean Transit, Airport Shuttles) took many years to develop, even though they only applied to a very small sector of the MHDV market. Commenter sees a risk of the fleet mandate timeframes lagging the OEM timeframes, which could substantially undermine the successful rollout of the trucks and the regulation. [RP1-265]

Comment: Commenter states development of complementary regulations, including a strategic link of a fleet rule to ACT, is imperative. [RP1-281]

Comment: Commenter recommends CARB expeditiously pursue standards for truck fleet electrification, similar to policies passed for transit buses and airport shuttle buses. [RP1-294]

Comment: Commenter urges accelerating the development of the CARB fleet rule for adoption in late 2021, but ensuring that the rule is implemented no later than 2024. Commenter urges CARB to require that the upcoming CARB fleet rule is stringent enough to reach Governor Jerry Brown's carbon-neutrality by 2045 goal established in Executive Order B-55-18. [RP1-297]

Comment: Commenter recommends accelerating the development of the fleet rule for adoption in late 2021, but ensuring that it is implemented no later than 2024. [RP1-330]

Agency Response: No changes were made to the regulation in response to these comments. The Board directed staff to return with a ZE fleet rule in 2021 when they approved the Resolution, which directionally meets commenters' requests. Staff recognizes that ZE fleet rules will be a key factor in ensuring fleet uptake of ZEVs to meet the targets established in the Resolution. Staff has begun the regulatory process for developing the ZE fleet rules with a goal of returning to the Board with a recommendation by the end of 2021.

Future ZEV Policy – Commit to 100 Percent Zero-Emission Targets

Comment: Commenter states that the rule should articulate a clear vision for when each truck segment should be 100% zero-emission and explain how those targets are consistent with the state's climate and clean air objectives. [RP1-46]

Comment: Commenter states that CARB should formally commit to transition ZEV timelines and that giving tax credits to fleet purchasers will support this effort. [RP1-125]

Comment: Commenter states CARB should formalize goals for 100 percent ZEVs in each truck class and demonstrate how reaching these goals is consistent with attaining state and federal air quality and GHG requirements. [RP1-188]

Comment: Commenter states CARB should electrify all modes of transportation. [RP1-260-Form-2507]

Comment: Commenter states after the ACT regulation, we need to electrify all tractors. [RP1-260-Form-3838]

Comment: Commenter urges requiring a 100% ZEV fleet of local buses, refuse trucks, and first/last mile delivery trucks by 2030, instead of 2040. [RP1-287]

Comment: Commenter recommends CARB formally commit to timelines for transitioning trucks in California to electric technologies, so that most, if not all, trucks in the state will be electric within the next 20 years. [RP1-294]

Comment: Commenter urges CARB to institutionalize targets on reaching zero-emissions: ZE drayage fleet by 2035 or sooner; ZE first/last mile delivery, refuse and local buses by 2040; ZE/plug-in hybrid for utility and government fleet by 2040; ZE/plug-in hybrid for all other truck segments, 'where feasible' by 2045 [RP1-297, RP1-330]

Comment: Commenter urges CARB to clearly articulate when our communities can expect all truck sales must be 100% zero-emission. [RP1-297, RP1-330]

Agency Response: No changes were made to the regulation in response to these comments. Although this is outside the scope of this regulation, the Board has committed through the Resolution to develop complementary zero-emission fleet rules with an ultimate goal of transitioning the state's fleet to zero-emission by 2045 where feasible. Achieving this goal and converting the state's fleet to the cleanest possible technologies will put us on a pathway to achieve our state's 2045 carbon neutrality goal. The ACT regulation takes the first step in ensuring manufacturers are building the needed ZEVs at high volumes to eventually achieve 100% ZEV fleets. Please see the discussion on establishing 100 percent zero-emission targets in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Set Clear 100 Percent ZEV Targets". Also, see the discussion about staff's efforts to develop a future fleet rule in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Adopt Zero-Emission Fleet Rule in 2021".

Future ZEV Policy – Exempt Rural and Low Throughput Ports

Comment: Commenter states that the revised ACT should exempt rural areas and low through-put ports because it is cost prohibitive and emissions are low. [RP1-169]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation does not place any ZEV purchase requirements on fleets or ports. The Board directed staff to set a goal to electrify the state's drayage fleet by 2035, as discussed in the Resolution, and staff will be evaluating strategies to achieve this target. In doing so, staff will consider special provisions for rural areas and low throughput ports if necessary.

Future ZEV Policy – Rule Puts Small Businesses at a Disadvantage

Comment: Commenter states that stricter timelines for ZEV compliance will put smaller transportation companies out of business and urges the Board to reconsider aggressive timelines. [RP1-05]

Comment: Commenter states that small businesses are at a financial disadvantage and suggests subsidies for replacements. [RP1-15]

Comment: Commenter states we need to subsidize small trucking businesses. [RP1-179]

Agency Response: No changes were made to the regulation in response to these comments. The ACT regulation does not require smaller fleets to purchase ZEVs. Manufacturers must build ZEVs and market their products to fleets where electrification makes sense. This may prove advantageous to small fleets as ZEVs are projected to have a lower total cost of ownership that their combustion-powered counterparts. Staff will evaluate how to address small fleets in the future ZE fleet rule.

Future ZEV Policy - Add Targets for Light Duty Vehicles

Comment: Commenter states that targets should include trucks in the Class 1-3 range [RP1-77]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation is designed to regulate all vehicles not included in the light-duty ZEV regulation. Including light-duty vehicles is outside the scope of this regulation. In addition, CARB is currently developing the Advanced Clean Cars II regulation which will set future regulatory goals for the light-duty ZEV market. Therefore, light-duty ZEVs will be addressed, but not in the ACT regulation.

Future ZEV Policy – Develop a Zero-Emission Fleet Rule that Achieves Carbon Neutrality

Comment: Commenter requests that CARB requires the fleet rule to be stringent enough to reach carbon-neutrality by 2045. [RP1-330]

Agency Response: The Board has committed through the Resolution to develop complementary zero-emission fleet rules with an ultimate goal of transitioning the state's fleet to zero-emission by 2045 where feasible. Achieving this goal and converting the state's fleet to the cleanest possible technologies will put us on a pathway to achieve our state's 2045 carbon neutrality goal. The ACT regulation takes the first step in ensuring manufacturers are building the needed ZEVs at high volumes.

Future ZEV Policy – Evaluate Zero-Emission Zones

Comment: Commenter states that well-located urban ZEV zones could help to increase market penetration of ZEVs in California and could align closely with needed fleet rules. Beachhead applications ready for zero-emissions technology are highly aligned with suburban and urban region duty cycles. Targeting zero-emission zones for urban California regions would have the benefit of spurring adoption and use of vehicles most conducive to electrification where unhealthy air quality persists. [RP1-265]

Agency Response: No changes were made to the regulation in response to this comment. Although this comment is outside the scope of this Rulemaking, staff recognizes the potential of zero-emission zones in driving ZEV adoption in fleets and will evaluate them as a part of the upcoming zero-emission fleet rules.

Future ZEV Policy – Allow Early Action Credit in the ZE Fleet Rules

Comment: Commenter suggests that early credits for compliance be allowed in any future complimentary fleet ZEV program. [RP1-208]

Agency Response: No changes were made to the regulation in response to this comment. Although this comment is outside the scope of this rulemaking, staff recognizes the value of early ZEV adoption by fleets and will look to encourage this in the future ZE fleet rules.

Future ZEV Policy – Award Fleets Credit for Using Low Carbon Fuels

Comment: Commenter states that many government fleets have already made significant investments in CARB's past alternative fuels programs and allowing Low Carbon Fuel Standard (LCFS) to be counted as offsetting emissions would take into account these previous investments. [RP1-44]

Comment: Commenter states that the rulemaking should facilitate the use of biodiesel and renewable diesel in those heavy-duty vehicle applications where the transition to electrification is not yet feasible. [RP1-85]

Comment: Commenter requests CARB to allow fleets using Low Carbon Fuel Standard fuels to be counted as offsetting emissions in future fleet rules. [RP1-181, RP1-255]

Comment: Commenter believes that, in their fleet of HD solid waste vehicles, a combination of near-zero NOx engines and renewable natural gas deserves recognition and credit within the proposed ACT regulation. Commenter points to their purchase of an anaerobic digester to produce their own renewable natural gas for use in their solid waste vehicles, citing SB 1383 and a $3M grant from CEC to expand their digester's capacity. Commenter requests this RNG option be available for entities in direct control of solid waste or waste water treatment with obligations under SB 1383. Commenter provides City of Roseville's Waste-to-RNG Facility pamphlet to support their point [RP1-312]

Agency Response: No changes were made to the regulation in response to these comments. ACT requires manufacturers to build ZEVs but does not require fleets to purchase ZEVs. As a result, it would be inappropriate to award fleets credit under this regulation. Additionally, emissions associated with new combustion-powered vehicles and engines are being addressed by other CARB programs including the approved Low NOx Omnibus regulation, which requires manufacturers to build engines that meet the Low NOx standards, and the existing Low Carbon Fuel Standard regulation. The LCFS regulation is already reducing lifecycle emissions from transportation fuels and the benefits resulting from that regulation cannot be claimed again as suggested by several commenters. The commenter's suggestions to include low NOx engines and low carbon fuels would only duplicate what is already expected from the LCFS and the low NOx Omnibus regulation and would not result in any new emission benefits for NOx nor GHG emissions beginning in 2024, as discussed further in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Credit for Low NOx Engines and Renewable Fuels".

Future ZEV Policy - Waste Stream Conversion

Comment: Commenter suggests allowing conversions of waste streams, such as biomethane, for use in their fleets as compliance pathways for entities with control over solid waste or wastewater treatment with obligations under the SLCP strategy. [RP1-202]

Agency Response: The approved regulation is a requirement for manufacturers to sell ZEVs into California and does not require any individual fleet to make ZEV purchases. This comment is outside the scope of the approved regulation. The comments pertain to fleet owners. Staff recommends the commenter participate in the public process for developing the Advanced Clean Fleets regulation to have their concerns addressed.

Emissions Methodology – Focus Needs to Be on VOC Reductions, Not NOx Reductions

Comment: Commenter states that the proposed ACT regulation will further delay California's ozone attainment by generating an even more imbalanced atmospheric NOx reduction largely due to California environmental policy shifting focus from reducing VOCs to reducing NOx. Commenter states that before adopting the proposed ACT regulation, the Board should re-examine why ozone violations increased in Southern California during the recession years (2009-2014), which reduced fuel sales by 2-4 billion gallons per year – the equivalent of replacing 5.7-10.5 million ICE vehicles with ZEVs statewide. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-86]

Agency Response: No changes were made to the regulation in response to this comment.

Ozone is formed through a complicated series of chemical reactions involving NOx and VOCs in the presence of sunlight. Depending on the relative levels of NOx and VOCs in the atmosphere, ozone can be more or less sensitive to changes in NOx and/or VOC emissions. Under certain conditions, where NOx emissions are high relative to VOC emissions, NOx can suppress ozone formation and reducing NOx can lead to higher ozone. This phenomenon can be observed in the “weekend effect” where ozone levels are enhanced on weekends owing to reduced heavy-duty truck activity and lower NOx emissions. With continued NOx reductions, the weekend effect becomes weaker and eventually becomes a reverse weekend effect, where reduced heavy-duty truck activity results in lower ozone on the weekend. This shifting relationship in ozone sensitivity to NOx reductions has been observed in the South Coast over the last decade, where in the early 2010’s the majority of the basin exhibited a strong weekend effect. In contrast, the weekend effect is now much weaker everywhere in the basin and some parts of the basin have already begun exhibiting a reverse weekend effect, which points to the success of the NOx focused control strategy. During this “transition” period, where the basin is shifting from a weekend effect to a reverse weekend effect, ozone becomes relatively insensitive to NOx reductions until the NOx reductions are sufficiently large to fully shift the region into a chemical regime consistent with a reverse weekend effect.

VOC reductions can also have an effect on ozone levels, particularly when a strong weekend effect is present. However, natural emissions of VOCs from plant life represent an uncontrollable source of VOCs that can exceed anthropogenic sources during summer months, when ozone levels are at their highest. Consequently, even if anthropogenic emissions of VOCs were reduced to zero, there would still be sufficient VOCs in the atmosphere to form enough ozone to exceed the ozone NAAQS at current NOx levels. In addition, the non-linearity of ozone chemistry means that ozone formation becomes much less sensitive to changes in VOCs at the NOx levels needed to meet the ozone NAAQS. All of this points to the need for a strongly focused NOx strategy to attain the ozone NAAQS as expediently as possible.

VOC reductions in the near-term may offer some benefit, but in the long-term those same VOC reductions will have little to no effect on ozone levels as the basin nears attainment of the ozone NAAQS.

Emissions Methodology – ZEVs Produce No Benefits Versus Diesel and Natural Gas

Comment: Commenter states that CARB's analysis has errantly determined surplus ZEV criteria emission reductions versus diesel and gasoline. Commenter states that the “super-clean” diesel and natural gas vehicles sold today are far cleaner than CARB assumed in their emissions analysis. ZEVs would need to be compared against these “super-clean” vehicles to generate surplus benefits.

Commenter states that today’s laboratory testing methods do not account for the fact that air contains pollutants. When accounting for this fact, commenter claims that “super-clean” diesel and natural gas vehicles produce negative emissions of VOCs, carbon monoxide, and PM_{10}.

In addition, commenter states that only 2-4 percent of $PM_{2.5}$ emissions come from mobile sources and substantially more come from other sources. Commenter states that the ACT regulation will reduce PM emissions by 3-11 percent, while transitioning the fleet to “super-clean” diesel vehicles would reduce PM emissions by 38 percent. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-86]

Agency Response: No changes were made to the regulation in response to this comment. This comment mischaracterizes the staff analysis and raises several related issues described below.

The emissions analysis for the ACT regulation compared the regulatory proposal versus a baseline consisting of all currently adopted regulations. Because the ACT regulation affects new vehicles sold in California, the emissions of new ZEVs were compared against the emissions of new combustion-powered vehicles including gasoline, diesel, and natural gas fueled vehicles. The baseline assumes all new combustion-powered vehicles meet the applicable engine standard for heavy-duty vehicles or LEV III standards for medium-duty vehicles. While these combustion-powered vehicles are significantly cleaner than older vehicles, they remain a sizable portion of the state’s criteria and GHG inventories and further emissions reductions from these sectors are necessary.

The ACT regulation’s emission inventory analysis quantified NOx, $PM_{2.5}$, and CO_2 emissions benefits. Staff did not quantify the emission benefits for VOCs, carbon monoxide, and PM_{10} as new medium- and heavy-duty vehicles are not significant emission sources for these criteria pollutants. Medium- and heavy-duty vehicles are significant sources of NOx and CO_2 emissions, neither of which were included in the commenter’s claims. The proposed ACT regulation will significantly reduce both NOx and GHG emissions, serving to fulfill one of its objectives which is critical to meeting the state’s climate change and air quality goals.

Emissions testing is performed in accordance with 40 CFR § 1066.605. This calculation methodology explicitly includes and corrects for background pollutants contained within the air that reaches the analyzers. Staff is unaware of any studies, analyses, or reports which support the commenter’s claim of negative emissions by diesel powered vehicles. Commenter’s claim implies that the areas with the highest truck traffic would have the lowest emissions while in reality the opposite is generally true.

The commenter appears to be suggesting that the ACT rulemaking is unnecessary since “super- clean” diesel and natural gas vehicles are already on the road. But the commenter ignores the fact that the ACT rulemaking seeks to further reduce the existing emissions from these engines through the acceleration of the transition to zero emission vehicles. The claim that focusing on “super-clean” diesel and natural gas vehicles will generate additional PM benefits is erroneous as the baseline already assumes all vehicles sold will meet today’s engine standards as stated previously. Additionally, diesel vehicles produce diesel particulate matter which is comprised of black carbon and numerous organic compounds including over 40 known cancer-causing organic substances. While mobile sources comprise a small portion of the state’s PM emissions, they represent a significant portion of the state’s diesel PM inventory. ZEVs produce no tailpipe PM emissions and reduce brake wear PM due to regenerative braking.

Based on these facts and rationale, staff finds the ACT regulation’s emissions inventory analysis was appropriate in quantifying the emissions benefits of ZEVs versus the gasoline and diesel fueled baseline scenario.

Emissions Methodology – Analysis Overestimates Emissions Benefits of ZEVs

Comment: Commenter states that the ACT regulation does not properly account for the fact that MHD ZEVs provide no criteria pollutant reduction benefits until the MHD ZEVs provide greater than 97 percent of the daily vehicle miles traveled (VMT) of the new diesel counterpart displaced. Commenter states that based on the 2014 EMFAC criteria emission displacement break-even estimate, the ACT, if adopted, should only provide ZEV credits for MHD ZEVs used in applications and vocations that the ZEV can demonstrate, for the vehicle’s useful life, daily equivalent VMT to the displaced MHD internal combustion vehicle. CARB should properly account for the super-clean diesel vehicles’ minimized emissions, air-cleaning capacity in ambient air violation areas, and their greater population and greater miles driven then perform a comparison with MHD ZEVs to determine if “surplus” emission reductions do indeed occur. Commenter provided supporting documentation, articles, and references to support their comment. [RP1-86]

Agency Response: No changes were made to the regulation in response to this comment. As stated in chapter “Written Comments Received during the 30-Day Comment Period”, section “Emissions Methodology – Focus Needs to Be on VOC Reductions, Not NOx Reductions”, staff disagrees with the commenter’s assertion that “super-clean” diesel vehicles produce negative emissions. ZEVs produce zero tailpipe emissions while diesel vehicles produce criteria emissions as they operate, emission control systems periodically fail and deterioration occurs over the life of the engine, so on a tank-to-wheel basis, ZEVs produce emission benefits for every mile that they operate. In addition, ZEVs produce fewer upstream GHG emissions as well.

Furthermore, staff disagrees with the commenter's assertion that ZEVs will travel fewer miles than the vehicle they are replacing. Because the ACT regulation does not require fleets to purchase ZEVs, fleets will choose to purchase ZEVs in applications where they can make a one-for-one replacement with a gasoline or diesel-powered vehicle. Thus, the VMT should be identical as compared to existing conditions. In addition, manufacturers are already offering ZE straight trucks with over 200 miles of range and ZE tractors with over 500 miles or range, indicating that ZEVs will be able to fit into a wide variety of ZE applications. This indicates that ZEVs will be capable of fitting into most applications given most trucks travel fewer than 100 miles per day and most tractors that operate in California travel less than 200 miles per day.

<u>Emissions Methodology – Comments on CARB's Calculation of Energy Efficiency Ratios</u>

<u>Comment:</u> Commenter states that CARB mischaracterized the energy economy ratio (EER) for medium- and heavy-duty vehicles as being 2-5 times higher efficiency than their diesel counterparts on a tank-to-wheel basis. The correct energy economy characterization is that medium- and heavy-duty vehicles ZEVs have five to fifty percent higher energy efficiency on a well-to-wheels basis. Commenter states that CARB staff footnoted but do not appear to have incorporated the battery charger and round-trip battery losses in their EER calculation, graphics, and analysis. Accounting for the 15 percent battery and charger losses that CARB staff cite in Appendix G lowers ZEVs' EER to 1.7 - 4.25 EER. Further, including power plants 45% efficiency and 6.5% power line losses lowers CARB Staff's estimated EER to 1.1-1.8 (WTW). Commenter provided supporting documentation, articles, and references to support their comment. [RP1-86]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. This comment represents a misunderstanding on well-to-wheels emissions and how energy economy ratios (EERs) are determined.

Well-to-wheel emissions are accounted for in regulations (e.g., the LCFS regulation) by measuring the carbon intensity (CI) of fuels based on a life cycle assessment, typically expressed in the unit of gCO_2e/MJ. This is done by accounting for the emissions associated with production, distribution, and use of a fuel. CARB uses the CA-GREET model to determine the CI of fuels used in California. For diesel, the CI consists of the emissions associated with extracting, transporting, refining, distributing and using diesel. For electricity, the CI consists of the emissions associated with generating, transmitting and distributing electricity. Included in the CI of electricity are the emissions associated with producing and transporting fuels to the generation unit, if applicable.

Some vehicle technologies are more efficient than their gasoline or diesel counterpart because they can perform more work when given the same amount of energy. This is accounted for in the EER which is the ratio of efficiencies between the alternative fuel-vehicle combination and the baseline fuel-vehicle combination. For example, Figure 3 in Appendix G to the Staff Report illustrates the fuel efficiency of a tractor trailer using diesel and electricity and calculates the EER between the two fuels on a variety of duty cycles. The EER solely represents the ratio of the amount of work performed (i.e., miles traveled) by the two different fuel-vehicle combinations for the same amount of energy (i.e., one diesel gallon equivalent) supplied to the vehicle in the fuel. Power plant efficiencies, transmission losses, and other similar factors are not in the scope for the EER determination as these factors are accounted for in the carbon intensity value of the electricity, just as crude oil extraction efficiencies and refining efficiencies are included in the carbon intensity of the diesel fuel. When properly calculated, the EER between diesel and electricity is shown in Figure 1 in Appendix G which displays the relationship between vehicle average speed and EER.

Lastly, even when accounting for upstream emissions associated with electricity production, BEVs have significantly lower well-to-wheel emissions. In the LCFS, the carbon intensity of ULSD (diesel) is 100.45 gCO_2/MJ, whereas the carbon intensity of California average grid electricity is 82.92 gCO_2e/MJ for the 2020 reporting year (LCFS 2020 Grid Electricity CI link). Roughly half of electricity generated within California came from zero-carbon sources including solar, wind, hydroelectricity, nuclear, and geothermal sources. Factoring in the EERs of the different fuel-vehicle combinations, the resulting EER-adjusted CI values are 100.45 gCO_2e/MJ for a Class 4-8 diesel-fueled vehicle versus 16.58 gCO_2e/MJ for a Class 4-8 battery-electric vehicle using California average grid electricity, representing an almost six-fold reduction in emissions on a per mile traveled basis. Further, using electricity from lower carbon sources (like solar, wind, etc.) for charging a battery-electric truck will significantly increase the emission benefits on a per mile traveled basis.

Emissions Methodology – Lacking Greenhouse Gas Benefits

Comment: Commenter states staff's analysis shows the regulation will not result in greenhouse gas (GHG) emissions reductions until 2028 and starts at 0.1 MMT/yr. Commenter states this is inconsistent with the goals staff has outlined for the regulation; other technologies, such as natural gas, could generate greater GHG emissions benefits. [RP1-228]

Agency Response: No changes were made to the regulation in response to this comment. This comment indicates that the commenter does not fully understand the emissions accounting methodology used in this rulemaking action.

US EPA and California have both adopted Phase 2 GHG regulations which require medium- and heavy-duty manufacturers to meet increasingly more stringent GHG emissions. The Phase 2 GHG regulation allows manufacturers to build ZEVs and use these vehicles to meet their overall GHG requirements. Because of this, CARB does not claim GHG benefits for the ACT regulation until the number of ZEVs required exceed the number of ZEVs needed for Phase 2 GHG compliance. Accordingly, CARB only claims GHG benefits under the ACT regulation after the ZEV sales percentage of medium- and heavy-duty vehicles exceeds 20%. This methodology avoids double-counting benefits between the ACT and Phase 2 GHG regulations, although it may be too conservative in a scenario where a manufacturer decides to build ZEVs for ACT and meet the Phase 2 GHG requirements with only their combustion-powered fleet.

In a scenario where CARB was requiring fleets to transition to renewable natural gas as the commenter is suggesting, CARB would be unable to claim any GHG benefits. The GHG benefit from switching from diesel to fossil natural gas would be accounted for in the Phase 2 GHG regulation, and all GHG benefits associated with using renewable natural gas over fossil natural gas would be accounted for in the LCFS regulation. Therefore, requiring fleets to transition to renewable natural gas would generate zero GHG emission benefits.

Emissions Methodology – Lack of Urgency for Air Quality Benefits

Comment: Commenter states that the cost benefit analysis and Table II-3 shows a lack of urgency related to air quality issues. Commenter asks what is CARB doing to address the air quality issues between now and when the ACT is implemented? [RP1-228]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation requires manufacturers to start selling ZEVs beginning with the 2024 MY. In addition to its dozens of programs addressing air quality issues from multiple sources throughout the state, in the context of medium and heavy duty vehicle emissions, the Board recently approved the Low NOx Omnibus regulation which sets lower standards for manufacturers beginning in the 2024 model year with a further reduction of the standard in 2027 MY. Through these two regulations, CARB is reducing the emissions of new heavy-duty and medium-duty trucks as quickly as feasible by encouraging zero-emission where feasible, and the cleanest combustion possible everywhere else. However, because both of these regulations only address new sales, there is a limit to the level of potential emissions reductions as they cannot address vehicles sold prior to the rules' adoption. Generating further emission reductions will require fleet requirements to incorporate cleaner vehicles into fleets. Staff will work on this action in the upcoming ZE fleet rule.

Staff notes that because the ACT regulation is a manufacturer requirement, some lead time is necessary for the manufacturers to give manufacturers ample time to address any technological and supply hurdles required to achieve compliance with the new sales requirements. What this means is that setting requirements before 2024 would be overly burdensome because it wouldn't allow adequate time for manufacturers to meet the new ZEV sales requirements under the ACT regulation. Providing optional early action credits would not generate additional emission reductions as the commenter contends because there is neither a regulatory requirement to provide optional credits. Therefore, the ACT regulation is not designed to provide benefits until after the rule begins in 2024 regardless of the technologies included.

Requiring fleets to turnover their vehicles is outside the scope of this manufacturer-focused rulemaking.

<u>Emissions Methodology – Inconsistency in Emissions Accounting</u>

<u>Comment:</u> Commenter states CARB has not considered the quantities of NOx and $PM_{2.5}$ emission reductions claimed by the Low Carbon Fuel Standard program through 2030 and recommends that staff address this gap in its inventory baseline for the ACT regulation. [RP1-272]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. Attachment H to the Second 15-Day Modifications to the 2018 LCFS amendments state "An increase in electricity, hydrogen, natural gas, and propane use for transportation is also expected to take place. Increased use of these fuels is primarily dependent upon adoption rates for alternative-fueled vehicles, and therefore, despite the value created for these fuels by the LCFS, staff assigns the air quality benefits of these increases to the ZEV regulation and other vehicle incentive programs and not to the LCFS amendments." Based on this statement, there is no inconsistency between the methodology used in the 2018 LCFS amendments and the ACT rulemaking.

As outlined in Appendix G for the 2018 LCFS Amendments, emissions reductions from switching to vehicles powered by grid electricity or 33% renewable hydrogen are attributed to the regulation or incentive that caused the fuel switch. The LCFS regulation claims incremental credit for vehicles fueled using electricity cleaner than the grid or hydrogen that is more than 33% renewable.

<u>Emissions Methodology – Include Upstream Criteria Pollutants</u>

<u>Comment:</u> Commenter states that the ACT regulation's impact analysis excludes well-to-tank criteria emissions, and states that the rationale for this assumption should be added. [RP1-284]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. Staff provided an analysis in Chapter VI of the Staff Report of the estimated well-to-wheel GHG emission reductions versus the baseline scenario of GHG emission reductions without the ACT regulation in place. This included both an upstream and downstream emissions analysis.

For criteria emissions, the situation is different than for GHG, which resulted in a different methodology. First, NOx and $PM_{2.5}$ are regional pollutants. Upstream sources of NOx within California such as power plants are regulated separately as stationary sources, so including their emissions again would be double-counting. In addition, upstream emissions sources are not necessarily located where vehicles are operating. For example, electricity imported from outside of California will not have a criteria emissions impact for vehicles operating within California. Lastly, legislation such as SB350 and SB100 are transitioning the state's grid to renewable, zero-emission electricity. This transition will decrease upstream emissions. For these reasons, an upstream criteria emissions reduction is unnecessary and counterproductive to assessing the emissions benefits of the ACT regulation.

Emissions Methodology – Brake Wear and Tailpipe Particulate Matter Should Be Separated

Comment: Commenter states tailpipe emissions should be separated from brake wear. [RP1-247]

Agency Response: No changes were made to the regulation in response to this comment. Staff included the combined $PM_{2.5}$ emissions both from the tailpipe and from brake wear since both are criteria emissions, regardless of their source.

Emissions Methodology – Omnibus Interaction Upstream Emissions

Comment: Commenter states that the ACT regulation should require upstream emission accounting for GHG and criteria emissions from upstream electricity generation because without it, it poses a problem for the Averaging, Banking and Trading (ABT) program for the HD Low NOx Omnibus rulemaking. [RP1-205]

Agency Response: No changes were made in response this comment. See discussion on why staff did not perform upstream criteria emissions accounting in chapter "Written Comments Received during the 30-Day Comment Period", section "Emissions Methodology – Include Upstream Criteria Pollutants". Also, it is outside of the scope of this rulemaking to assess emissions impacts that may result from another rulemaking.

Out of Scope – Incentives and Funding Policy

Comment: Commenter would like to share his support for clean air vehicles and would like to ask for incentives for clean air vehicles for truck owners like individuals receive. [RP1-13-Form-3374]

Comment: Commenter asks if incentives could be provided to a manufacturer for engines that only have NOx emissions during engine start-up? [RP1-16]

Comment: Commenter requests CARB move forward with funding for infrastructure to support electric vehicle rollout. [RP1-66]

Comment: Commenter states there needs to be incentives for the purchase of electric trucks. [RP1-141, RP1-191, RP1-260-Form-2129, RP1-260-Form-4164]

Comment: Commenter states incentives should be available for people who want to switch, but they do not support the forced transition to ZEVs. [RP1-154]

Comment: Commenter states that the revised ACT regulation should not be enacted due to the current economy because there are insufficient funds for incentives. [RP1-169]

Comment: Commenter states their support for continued and increased investment in heavy-duty ZEVs and NZEVs which are essential for motor vehicle suppliers' research and development. Commenter states that the ACT regulation should provide incentives from state public procurement programs to support the development of ZEVs and NZEVs, as well as vehicle purchase premiums. [RP1-205]

Comment: Commenter states that stakeholders will not comply with the ACT regulation without incentives. [RP1-213-Form-814]

Comment: Commenter states that CARB should provide assistance for phasing out polluting vehicles. [RP1-213-Form-1100]

Comment: Commenter states that purchase incentives must be available until such time as HD ZEV actual in-use total costs of operation have reached parity with ICE-powered vehicles. [RP1-214]

Comment: Commenter states the increased cost to purchase and operate ZEVs need to be offset by government funded incentives until life-cycle costs of ZE trucks are lower than costs associated with traditional vehicles. [RP1-218]

Comment: Commenter states that the EV projects being implemented were only possible due to the availability of multiple local, state, and federal incentives. Commenter states that the current prices of Class 6-8 vehicles are 3-5 times higher than traditional vehicle costs and are not economically feasible without incentives. Commenter states that to become an economically self-sustaining marketplace will require significant grant funding to assist in the development, demonstration, and deployment of cost competitive technologies and charging models. [RP1-244]

Comment: Commenter states that the ACT regulation needs incentives for fleet owners in order to be successful. [RP1-249]

Comment: Commenter states that we need to seek funding from the state and federal government for the ACT regulation. [RP1-260-Form-3583]

Comment: Commenter states we need to include financial help for truck drivers in the rule. [RP1-260-Form-2197]

Comment: Commenter suggests creating an incentive ramp up to the rule for the capital and infrastructure costs. [RP1-265]

Comment: Commenter states incentives from CARB & CEC are necessary for ACT success. [RP1-281]

Comment: Commenter recommends ensuring incentive funding availability. [RP1-284]

Comment: Commenter states there needs to be incentives for manufacturers to produce ZEVs. [RP1-296]

Comment: Commenter states that the ACT regulation needs to expand the network of charging stations and fund this through increased fees on gas powered trucks. [RP1-114]

Agency Response: No changes were made to the regulation in response to these comments. See discussion about the availability of incentive programs in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Out of Scope – Incentive and Funding Policies".

Out of Scope – Pollution Tax

Comment: Commenter states that we should impose a pollution tax on polluting vehicles based on miles driven and the level of the pollutants emitted in order to give more people the incentive to switch to ZEVs. [RP1-260-Form-458]

Agency Response: No changes were made to the regulation in response to this comments. See discussion on the taxes in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Out of Scope – Carbon Tax"

Out of Scope – Require Zero-Emission Yard Equipment

Comment: Commenter states CARB should also make all yard maintenance equipment electric as well. [RP1-260-Form-1739]

Agency Response: This comment is outside the scope of this regulation. The ACT regulation focuses on on-road medium- and heavy-duty vehicles; therefore, off-road yard maintenance equipment is outside the scope of the regulation.

Out of Scope – Issues Regarding SCE Rule 18

Comment: Commenter states that staff's cost analysis does not acknowledge CPUC rules (known as Rule 18 in SCE), which excludes private enterprise from infrastructure/refueling by preventing resale of electricity. [RP1-106]

Agency Response: No changes were made to the regulation in response to this comment. The commenter's issue is outside of the scope of CARB's authority. In the past, the CPUC has modified their rules to allow the resale of electricity for light-duty EV charging. In September 2020, the CPUC approved a decision allowing resale of electricity for medium-duty, heavy-duty, and off-road applications making this comment null and void. Broadly, commentary on sister agency policy should be presented to the relevant agency rather than on a different regulatory item.

Out of Scope – Use Rail Instead of Trucks

Comment: Commenter states that we should transport everything by rail and not use trucks. [RP1-260-Form-4701]

Comment: Commenter states we should focus on the implementation of electric trains for people to commute to work and leave the truckers alone. [RP1-260-Form-3526]

Agency Response: This comment is outside the scope of this regulation. Trucks and trains are both components of California's freight system and serve different purposes. California is taking action to reduce the emissions of both trucks and trains.

Out of Scope – Ban Other Dirty Emission Sources

Comment: Commenter states that the ACT regulation needs to include: coal and oil mining reduced to nearly zero by 2029, zero petroleum use by 2030, all nuclear plants shut down by 2022, zero fracking by 2022, and zero synthetic chemical farming by 2023. [RP1-260-Form-2024]

Agency Response: This comment is outside the scope of this regulation. Staff appreciates the comment.

Out of Scope - Encourage Public Transit

Comment: Commenter states CARB should encourage the use of public transportation to reduce air pollution. [RP1-260-Form-1599]

Agency Response: This comment is outside the scope of this regulation. Staff appreciates the comment.

Other - Higher Transportation Cost

Comment: Commenter states they would like to know if the transition to ZEVs will result in a higher transportation cost. [RP1-260-Form-3718]

Comment: Commenter states CARB's efforts are trying to fix something that isn't broken. Commenter states all of the efforts from CARB to clean the air are causing the price of vehicle related items to increase. Commenter states that CARB is causing more financial hardships for truckers. [RP1-260-Form-2778]

Agency Response: No changes were made to the regulation in response to these comments. If commenter is referring to goods movement, staff modeled the costs and benefits of the required numbers of ZEVs in the SRIA, Staff Report, and Attachment C to the "Proposed Amendments to the Proposed ACT Regulation" document released for public comment in April 28, 2020. The regulation is anticipated to resulting in a net cost savings to California of $5.9 billion indicating a net savings to the state's trucking fleet and as a result, the California economy. In addition, because this is a manufacturer mandate, fleets do not have a requirement to purchase ZEVs and would only do so if it made financial sense for them.

Other - Add Lion Vehicles to HVIP

Comment: Commenter states that they would like Lion's zero-emission Class 4-8 trucks and Class 7-8 tractors to be added to CARB's Attachment B to the Modified Proposal as vehicles currently available. [RP1-140]

Agency Response: No changes were made to the regulation in response to this comment. Staff were not aware of Lion’s vehicles at the time the Modified Proposal was released, and will add them in market analysis used to support future rulemakings.

Other – No Market-Based Pollution Approach

Comment: Commenter states that California does not need market-based solutions to address pollution so that corporations can pay their way out of environmental responsibility. [RP1-316]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation requires manufacturers to either produce and sell ZEVs and NZEVs, or purchase credits from another manufacturer. This structure ensures that regardless of the actions of any individual manufacturer, zero-emission vehicles will be sold into California. The regulation’s structure gives the needed amount of flexibility to manufacturers to produce battery-electric, hydrogen fuel cell, or plug-in hybrid technologies, but sets firm requirements that manufacturers sell cleaner technologies as there are no other compliance options available to them. In addition, manufacturers who do not meet its requirements cannot “pay-to-pollute” as described in chapter “Written Comments Received during the 30-Day Comment Period”, section “Manufacturer ZEV Sales – No Pay-to-Pollute Penalties”. Therefore, while the ACT regulation could be described as a “market-based regulation” since it allows credit trading, the safeguards embedded within the regulation ensure that there is no way to avoid its requirements or pay to avoid compliance.

Other – Comments Addressed in the Environmental Analysis

Comment: Commenter states disposal of dead batteries need to be addressed. [RP1-13-Form-1296]

Comment: Commenter states we cannot go forward with the ACT regulation until the problems with electric vehicles are addressed. Commenter states children are enslaved to dig up the minerals needed for ZEVs, the process to make the batteries are polluting toxins, how to dispose of the batteries, and asks where the additional power comes from. Commenter states the additional power needed for ZEVs cannot come from hydrogen power because it is too overtaxed, and it can’t be nuclear because it’s too dangerous and polluting. [RP1-260-Form-1812]

Agency Response: These comments are addressed in the “Final Environmental Analysis” document. See the Final Environmental Analysis prepared for the ACT regulation (Final EA link) presented and approved by the Board at the June 25, 2020 hearing.

Other – Comments Addressed in the Environmental Response

Comment: Commenter states that the State of CA has violated CEQA by not studying reductions in VMT, which is an alternative to emission reduction strategies. [RP1-28]

Comment: Commenter states that the manufacturing impacts of COVID-19 were not addressed in the Draft EA. In addition, commenter states the draft EA does not display evidence to support that SB 350 and its affected utilities can or will meet the fleet end users infrastructure needs and that “most or all of the costs” needed for a fleet end user to enable ZEV deployments will be satisfied through SB 350 funds. [RP1-145]

Comment: Commenter wants to know where the lithium batteries will be disposed and if CARB will be liable for the children mining the lithium. [RP1-260-Form-3526]

Agency Response: These comments are addressed in the “Environmental Response to Comments” document. See Response to Comments on Final Environmental Analysis prepared for the ACT regulation (Response to Comments link) presented and approved by the Board at the June 25, 2020 hearing.

Other – Additional Revisions May Be Needed to Achieve Carbon Neutrality

Comment: Commenter provided results from their Freight Action Climate Consistent model to compare the updated ZEV sales percentage schedule to the original proposal and also compares both scenarios against a "climate-consistent" scenario (which aligns with broader 2045 carbon-neutrality goals). The model indicates that the revised proposal will reduce emissions by 54% instead of 36% compared to 2019 levels, however, future revisions to the ACT regulation may be needed to meet carbon neutrality goals. In addition, the model indicates $11 billion in savings over the original proposal, a "climate consistent" ACT proposal would provide an additional $23 billion in savings. Finally, ICE truck populations are modeled which indicate the updated ACT standards show marked improvement, with all classes showing a significant decrease in gas and diesel truck populations. In contrast however, the climate-consistent scenario which necessitates 100% ZEV sales by 2030 across all truck classes would lead to further decreases. [RP1-148]

Agency Response: No changes were made to the regulation in response to this comment. Staff thanks commenter for including the analysis and will consider the information in future actions.

Other – Share Lessons Learned

Comment: Commenter recommends CARB share lessons learned with public agencies and fleets outside of California. [RP1-294]

Agency Response: No changes were made to the regulation in response to this comment. Staff has already made commitments (and will continue to do so) with other State agencies and companies to promote widespread transportation electrification including those outside of California.

Other – Miscellaneous/Outside the Scope Comments

Comment: Commenter states CARB is using COVID-19 to manipulate the ACT agenda. [RP1-260-Form-3526]

Comment: Commenter states the elected officials should take a stand against Amazon and transportation companies that have a history of alleged nefarious business practices in regards to air pollution. [RP1-317]

Comment: Commenter states that CARB should address wood burning in homes. [RP1-13-Form-992]

Comment: Commenter states CARB should make a short-lived climate pollutant reduction strategy and support new green job infrastructures. [RP1-233]

Comment: Commenter states the switch to ZEVs by acquiring resources should not exploit indigenous lands. [RP1-245]

Comment: Commenter states that citizens should adopt a vegan diet to reduce methane emissions and improve the environment. [RP1-213-Form-815]

Comment: Commenter states CARB needs to promote solar energy programs. [RP1-260-Form-3944]

Comment: Commenter states that every home in the country should have solar panels and the energy harnessed from those would power all of the ZEVs. [RP1-260-Form-2088]

Comment: Commenter states we need trucks powered by solar and wind. [RP1-260-Form-2387]

Comment: Commenter states CARB needs to take action to also clean up all water sources and make higher fines for over fishing. [RP1-260-Form-2015]

Agency Response: No changes were made to the regulation in response to these comments. These comments were determined to be outside the scope of this regulation.

Duplicate - Resubmittal of Comments at First Board Hearing

Comment: Commenter resubmits comments submitted on December 12, 2019, as an attachment for the record and for the Board's additional consideration. [RP1-195]

Agency Response: No changes were made to the regulation in response to this comment. To re-address commenter B1-16's original comments, please see the discussion about the TCO of pickups, new information since the original Staff Report, and the role TCO plays in the approved regulation in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Total Cost of Ownership Concerns for Pickups". Additionally, see discussion related to incentives, infrastructure, and fleet purchase requirements in chapter "Comments

Received During Original Proposal's 45-Day Comment Period", sections "Out of Scope – Incentive and Funding Policies", "Manufacturer ZEV Sales – Infrastructure Concerns", and "Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements", respectively.

WRITTEN COMMENTS RECEIVED DURING THE JUNE 2020 BOARD HEARING

Manufacturer ZEV Sales - General Support

Comment: Commenter states general support for the proposed changes to the regulation. [B2-01, B2-02, B2-03, B2-04, B2-05, B2-06, B2-07, B2-09, B2-11, B2-12, B2-13, B2-14, B2-15, B2-16, B2-17, B2-18, B2-20, B2-21, B2-22, B2-23-Form, B2-26, B2-28, B2-29, B2-30, B2-31, B2-32, B2-33, B2-34, B2-35, B2-36, B2-37, B2-38, B2-41, B2-42, B2-43, B2-44, B2-45, B2-48, B2-49, B2-50, B2-52, B2-53, B2-54, B2-55, B2-56, B2-57, B2-59, B2-60, B2-61, B2-62, B2-63, B2-64, B2-65, B2-66, B2-67, B2-68, B2-69, B2-70, B2-71, B2-72, B2-73, B2-74, B2-75, B2-76, B2-77, B2-78, B2-79, B2-80, B2-81, B2-82, B2-83, B2-84, B2-85, B2-86, B2-88, B2-89, B2-90, B2-91, B2-92, B2-93, B2-94, B2-95, B2-96, B2-97, B2-98, B2-99, B2-100, B2-101, B2-102, B2-103, B2-104, B2-105, B2-106, B2-107, B2-108, B2-109, B2-111, B2-112, B2-113, B2-114, B2-115, B2-116, B2-117]

Comment: Commenter states support for the proposed changes and that the regulation is a step towards racial justice because communities of color are disproportionally affected by pollution because their neighborhoods are closer to freeways. [B2-47]

Agency Response: Staff appreciates the supportive comments. Additional issues raised by commenters, if any, will be addressed in the applicable sections.

Manufacturer ZEV Sales - Strengthen the ACT Proposal by Including Other Vehicles, Starting Requirements Earlier, and/or Increasing Sales Percentage Requirements

Comment: Commenter is urging CARB to strengthen the ACT Regulation. Commenter believes that CARB should look at both short-term and long-term strategies where zero-emission trucks should be the goal as soon as possible and as a part of the long-term strategy. [B2-10]

Comment: Commenter states their support for a stronger ACT regulation by increasing the mandate as much and as quickly as possible. [B2-17, B2-39, B2-23-Form-4151]

Comment: Commenter states that the timeline for the ACT regulation should be sped up to make ZEVs happen right away. [B2-23-Form-1162]

Comment: Commenter states we need to find a way to get more vehicles electric, not just trucks. [B2-23-Form-1467]

Comment: Commenter states that California should be encouraging electrification for all modes of transportation. [B2-23-Form-3208]

Comment: Commenter states that the ACT regulation should require ZEVs by 2023. [B2-23-Form-3685]

Comment: Commenter states that the ACT regulation should apply to all motor vehicles. [B2-23-Form-4195]

Comment: Commenter states to convert all trucks to electric. [B2-27]

Comment: Commenter states their support for a stronger ACT regulation for heavy-duty class 7-8 trucks and to increase the sales requirement for heavy-duty trucks as high as possible. [B2-31]

Comment: Commenter states they support the electrification of all vehicles and the charging infrastructure to be powered by solar. Commenter states that areas with historically higher pollution and mining operations should take priority. [B2-87]

Agency Response: No changes were made to the regulation in response to these comments. Several challenges currently prevent more aggressive requirements. Staff will evaluate how the zero-emission market develops and can propose modifications in the future to reflect what is feasible. See further discussion on staff's rationale for the regulation's requirements and limitations to increasing the requirements more than staff already did in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements".

Manufacturer ZEV Sales – Manufacturer Requirements Are Too Stringent

Comment: Commenter shares their support for a less aggressive approach to implementing the ACT regulation and its reporting requirements due to financial impacts on businesses and consumers. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. See staff discussion on why the ACT regulation is aggressive and how we plan to meet the states air quality and climate goals in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales – Manufacturer Requirements Are Too Stringent".

Manufacturer ZEV Sales – Near-Zero-Emissions Vehicle Definition

Comment: Commenter believes that on-road Low NOx medium- or heavy-duty vehicle powered by an engine that is certified to CARB's Optional Low NOx standard of 0.02g/bhp-hr should be considered in the near-zero definition. [B2-10]

Agency Response: No changes were made to the regulation in response to this comment. See response summarizing how the term “near-zero-emission vehicle” is not appropriate to apply to vehicles meeting the upcoming Low NOx engine standard in chapter “Written Comments Submitted During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Near-Zero-Emissions Vehicle Definition”.

Manufacturer ZEV Sales - Increasing Class 2b-3 and Pickup Requirements Too Costly

Comment: Commenter states that removing the pick-up truck exemption, and accelerating the implementation of ZEVs by 2024 will be too costly for businesses that are dealing with the financial impact of COVID-19. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. Staff recognizes the economic impact of the COVID-19 pandemic and its impact on the trucking industry. However, for a number of reasons, staff finds that the regulation’s requirements are feasible in spite of this. The ACT regulation does not place any requirements until 2024 MY, giving manufactures time to plan and position themselves for the rule’s requirements. Further details may be found in chapter “Written Comments Received during the 30-Day Comment Period”, section “Economic Analysis – Impact of COVID-19”. As detailed in Attachment B to the “Notice of Public Availability of Modified text and Availability of Additional Documents and Information” for the ACT regulation, released in April 2020 for public comment, staff moved the requirements for Class 2b-3 vehicles forward one year without changing the start date and removed the pickup truck exemption. The inclusion of Class 2b-3 pickup trucks in 2024 is supported by new information in recent market announcements showing that a number of zero-emission pickup and additional van models will be commercially available from several manufacturers well before the 2024 model year. See further discussion of staff’s rationale for increasing manufacturer’s sales requirements for Class 2b-3 vehicles in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements”.

Manufacturer ZEV Sales – Delay Until 2026

Comment: Commenter proposes that the sales mandate begin in 2026 to allow time for staff to develop and implement the promised fleet rule, develop the necessary charging infrastructure, for the state to recover from current budget crisis and to allocate incentive funds, and time for manufacturers to recover from the impacts of the COVID crisis and recession. [B2-11]

Agency Response: No changes were made to the regulation in response to this comment. See response detailing why impacts from the COVID-19 pandemic will not affect this regulation in chapter “Written Comments Received during the 30-Day Comment Period”, section “Economic Analysis – Impact of COVID-19”.

<u>Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements</u>

<u>Comment:</u> Commenter proposes that staff fully link the ZEV sales mandate with ZEV purchase requirements. [B2-11]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. See staff response detailing the next rulemaking effort for fleets in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements".

<u>Manufacturer ZEV Sales – Add Off-Ramps to the Proposal Due to COVID-19</u>

<u>Comment:</u> Commenter believes a provision should be incorporated into the regulation to ensure, related to the impacts of COVID-19 on the trucking and truck manufacturing industries, truck manufacturers aren't deemed non-compliant for not reaching vehicle sales totals beyond those which can be achieved with limited, disconnected public funding for vehicles and infrastructure, as well as the long lead times for the charging infrastructure installation. [B2-08]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. See response detailing considerations for the impacts for COVID-19 in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Impact of COVID-19". Additionally, see response summarizing how off-ramps fail to add regulatory certainty in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Add Off-Ramps to the Proposal".

<u>Manufacturer ZEV Sales – Ban Internal Combustion Engines</u>

<u>Comment:</u> Commenter states that only ZEVs should be allowed to operate in California and if out-of-state and federal fleets do not abide, then trucks can trans-ship at the state border. [B2-23-Form-3797]

<u>Agency Response:</u> No changes were made to the regulation in response to this comment. See discussion about why staff is not proposing a combustion engine ban in this rulemaking due to varied suitability of vehicle use cases to transition to ZEVs in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales – Ban Internal Combustion Engines".

<u>Manufacturer ZEV Sales – Pollution Tax Instead of Sales Mandate</u>

<u>Comment:</u> Commenter states the transition to clean engines should be driven by setting annually increasing pollution taxes based on miles driven and how much pollution they emit. [B2-23-Form-5242]

Agency Response: No changes were made to the regulation in response to this comment. See discussion about CARB's inability to levy taxes and other policies in place that are reducing the number of polluting engines on the road in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Out of Scope – Carbon Tax".

Manufacturer ZEV Sales - Alternative Fuels Instead of ZEV Sales Mandate

Comment: Commenter states the ACT regulation could accomplish the reduction of pollution by transitioning to an alternative fuel, and not forcing electric vehicles. [B2-23-Form-5400]

Agency Response: No changes were made to the regulation in response to this comment. The primary objectives of the ACT regulation include accelerating the use of zero-emission vehicles in California. Vehicle emissions associated with combustion-powered vehicles and engines are being addressed in the approved Low NOx Omnibus rulemaking and existing cleaner fuels policies. Further detail are found in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Credit for Low NOx Engines and Renewable Fuels".

Manufacturer ZEV Sales – ACT Targets ZEV Replacements for all Class 2b-3 in CA

Comment: Commenter states that there is a disconnect between stated objectives and its proposed application. Commenter points out that while the ACT regulation states it applies to fleets, objectives in ongoing presentations and assessments speak directly to targeting ZEV replacements for the 1.04 million Class 2b-3 vehicles on California's roads. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. The Board directed staff, through the approved Resolution, to begin regulatory development for turning over certain trucking sectors to 100% ZEVs by certain dates in California, but none of those sectors are comprised entirely of Class 2b-3 vehicles. See further discussion of staff's rationale for increasing manufacturer's sales requirements for Class 2b-3 vehicles in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements".

Manufacturer ZEV Sales - Infrastructure Concerns

Comment: Commenter states that businesses and taxpayers will bear the brunt of the costs associated with infrastructure and maintenance. [B2-58]

Comment: Commenter also states that infrastructure and market deficiencies are obstacles to successful development. [B2-58]

Comment: Commenter states that the charging infrastructure should be included in the ACT regulation. [B2-102]

Agency Response: No changes were made to the regulation in response to these comments. See staff discussion about infrastructure costs taken into consideration in chapter “Written Comments Received during the 30-Day Comment Period”, section “Economic Analysis – Regulation Does Not Address Infrastructure Challenges”. Additionally, see discussion about current efforts to develop widespread infrastructure, including funding available, in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Infrastructure Concerns”.

Economic Analysis – Cost Analysis Underestimates Vehicle Cost

Comment: Commenter states estimated costs of suitable replacements (Tesla’s 500-mile, $70K [pickup]) are prohibitive and do not reflect assumptions in CARB’s market assessment. Commenter provided supporting documentation, articles, and references to support their comment. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. See discussion about the higher upfront cost of ZEVs that may decrease over time in chapter “Written Comments Received during the 30-Day Comment Period”, section “Economic Analysis – Cost Analysis Underestimates Vehicle Cost”.

Economic Analysis – Independent Review

Comment: Commenter states that the infrastructure and electric utility costs require an independent review and deeper analysis of the ACT regulation’s impact on businesses and consumers. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. As described in the Staff Report, the economic impacts to businesses and consumers was thoroughly analyzed. In the analysis, all costs including the incremental vehicle costs, infrastructure upgrades, fueling, maintenance, and other costs are assumed to be the direct costs of the regulation in California despite the lack of a specific fleet purchase requirement. Staff determined that the ACT Regulation will reduce costs to the overall state’s trucking fleet as the operational cost savings of the ZEVs outweigh the potential infrastructure and vehicle prices. Amortizing the vehicle and infrastructure help with these company’s cash-flow so they can have positive cash-flow shortly after purchase. Staff also determined that ZEVs are 2 to 5 times as efficient as similar vehicles with internal combustion engines technologies and significantly reduce petroleum and other fossil fuel use and use less total energy. Battery-electric fuel prices depend on how they are charged and include energy costs, fixed fees and demand fees. Vehicles charged at high power or during peak periods will have higher electricity costs than if charging overnight over an extended period.

Additionally, electricity and hydrogen are eligible to earn LCFS credits which can be sold and used to offset the costs of electric and hydrogen fuels.

Economic Analysis – Rural Infrastructure Cost Impact Not Analyzed

Comment: The commenter states that there should be further analysis of the infrastructure cost impact on rural areas, due to the difficulty to maintain charging stations these environments. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. Staff incorporated infrastructure cost impacts in the statewide economic analysis, which includes rural areas, detailed in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Regulation Does Not Address Infrastructure Challenges".

Economic Analysis – Incorporate ZANZEFF Experiences for More Realistic Cost and Timeline Assumptions

Comment: Commenter recommends that CARB and other state agencies incorporate into the regulation lessons learned about realistic project timelines and cost estimates from ZANZEFF-funded projects. [B2-08]

Agency Response: No changes were made to the regulation in response to this comment. Staff took into account all information available at the time to draft the regulation and will continue to incorporate new information during the implementation stage as it becomes available. For additional information, please see chapter "Comments Received During Original Proposal's 45-Day Comment Period" section "Manufacturer ZEV Sales – Wait for Results of Demonstrations".

Economic Analysis – Underestimated Time Needed for Fleets to Plan for Replacements

Comment: Commenter states that zero-emissions models won't hit the market until maybe a year or two before the requirement takes effect which leaves little opportunity for cost consideration in planning vehicle and fleet replacements. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation does not require fleets to purchase ZEVs. It requires manufacturers to sell ZEVs, and it will ensure that manufacturers develop competitive ZEV products at price points that will meet fleet needs. Manufacturers will need to ensure that fleets are prepared to accept ZEVs into their fleets by communicating when their ZE products will become available and ensuring fleets are aware of potential issues such as infrastructure and technician training. The ACT regulation gives manufacturers lead time to both prepare their products and help prepare the overall marketplace for acceptance of ZEVs, both of which are necessary for a successful rollout.

Economic Analysis – Fleet Infrastructure Resilience

Comment: Commenter states that resiliency is not addressed in the TCO. Commenter states that one day of resiliency through battery storage for a fleet would require a 6 MWh battery system costing approximately $3M; and vehicles are backed up with a 700 kW diesel or NG genset which would cost $500k-$1M. [B2-40]

Agency Response: No changes were made to the regulation in response to this comment. See discussion on the work California is undertaking to bolster resilience and the role of ZEVs in chapter “Written Comments Received during the 30-Day Comment Period”, section “Economic Analysis – Fleet Infrastructure Resilience”.

Economic Analysis – Impact of COVID-19

Comment: Commenter states that CARB should consider the timing of the ACT regulation due to COVID-19 which has put many people out of work and disrupted truck distribution. [B2-23-Form-5400]

Comment: Commenter states she does not support the ACT regulation because it puts a financial burden on truck drivers after going through COVID-19. [B2-23-Form-2194]

Comment: Commenter doubts the market’s readiness to absorb the volumes proposed in this regulation due to the economic impacts of COVID-19 which have reduced product development budgets for manufacturer's and reduced carbon auction revenue (HVIP funding) to support ZEV sales. [B2-08]

Agency Response: No changes were made to the regulation in response to these comments. See response detailing why COVID-19 does not affect staff’s analysis in chapter “Written Comments Received during the 30-Day Comment Period”, section “Economic Analysis – Impact of COVID-19”.

Economic Analysis – Long Range Pickups Not Addressed

Comment: Commenter states Class 2b-3 pickups and their associated longer-range needs are not addressed in the TCO. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. Staff updated the cost benefit and analysis in Attachment C to the “Notice of Public Availability of Modified text and Availability of Additional Documents and Information” for the ACT regulation, released in the April 2020 30-day public comment period, to include long-range Class 2b-3 vehicle sales. See the Attachment C for additional details about how the cost calculations were updated to account for these types of vehicle sales for the increased Class 2b-3 requirements.

Economic Analysis – Multi-Shift Operation Impacts on Infrastructure Cost

Comment: Commenter states that staff based the TCO model on nearly idealized assumptions about the operation of fleets, specifically that trucks can charge overnight at their home base. However, the model would have to be extensively revised to capture the impacts on a two-shift fleet, in particular, reassessing the infrastructure and electricity costs. [B2-40]

Agency Response: No changes were made to the regulation in response to this comment. As described in Appendix E, the only segments where multishift operations are common is in regional and long-haul trucking with tractors. Multi shift operations grade poorly due to the high-power needs and short time between shifts necessitating high-power charging. The lower grading for these segments has been reflect in the lower percentage requirements in the Class 7-8 tractor category versus other segments.

The ACT regulation does not contain a requirement that fleets purchase ZEVs. Therefore, there is no requirement that fleets with multishift operations would need to purchase ZEVs unsuited for their application. Because there is no mandate that fleets purchase ZEVs, there is no reason to assume manufacturers will sell vehicles into categories where they are unsuited. Some manufacturers have indicated that multi shift operations may enable higher cost savings for fleets and are targeting this segment.

Lastly, staff's definition of zero-emission includes both battery-electric and hydrogen fuel cell vehicles. While battery-electric vehicles may not be ideal for multi shift operations, hydrogen fuel cell vehicles are anticipated to perform better due to their ability to quickly refuel and travel longer ranges without refueling. Manufacturers who want to target multi shift operations have the option of pursuing hydrogen fuel cell vehicles.

Economic Analysis – Ignored Insurance Cost

Comment: Commenter states that insurance costs are not included in the TCO. Commenter states that because ZEVs are more expensive, insurance costs are greater. [B2-40]

Agency Response: No changes were made to the regulation in response to this comment. While protecting a company's vehicles can be a component of insurance, most of the value of an insurance policy is to cover liability in the event of causing property damage or personal injury to another party. ZEVs are equally likely to be liable in the event of an insurance claim as a combustion-powered truck and therefore there is no difference in the cost in the largest portion of an insurance policy. Staff is not aware of any studies or reports which show higher insurance costs for electric trucks. Adding insurance costs to the TCO analysis would not significantly change the outcome of needing to significantly increase the number of ZEVs deployed by this regulation in order to meet state goals and the Board's direction.

Economic Analysis – Underestimated Infrastructure Network Service Costs

Comment: Commenter states there is missing analysis from the TCO such as charger network service costs. Commenter states that the TCO includes a $500 per charger cost for maintenance, however the actual cost for Class 8 vehicles is between $2,500 and $10,000 per charger a year. [B2-40]

Agency Response: No changes were made in response to this comment. See staff discussion on infrastructure costs and assumptions in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Real-World Infrastructure Costs Differ from CARB Projections".

Economic Analysis – Underestimated Tractor Battery Capacity Needs

Comment: Commenter states that the analysis underestimates the battery capacity required for ZEVs and states data from the 2018 California VIUS survey and several other studies of drayage trucks and goods movement trucks in Southern California suggests that a Class 8 tractor's maximum daily mileage is approximately 1.65 times higher than the average daily mileage. Commenter makes a comparison on how an individual would not purchase a ZEV with a range of 70 miles when their average commute is 50 miles. Commenter states that staff should be using a higher average VMT when sizing the battery (but not when calculating activity) because trucks are specified by buyer to meet the higher daily activity of a new truck. Commenter states that because battery capacity has such a significant impact on the TCO model that ignoring mileage factors dramatically overestimates the utilization of the battery and underestimates the TCO of the EV. Commenter states that staff is underestimating the TCO of a Class 8 electric truck by 30-40%. [B2-40]

Agency Response: No changes were made to the regulation in response to this comment.

Staff's assumptions regarding battery size for tractors is appropriate for fleet usage. In the Staff Report, staff assumed ZE tractors would be sold to drayage and other shorter-range applications. Based on statements from manufacturers and demonstrations currently underway, these shorter-range applications are well suited for ZEV deployments in the tractor segment due to their predictable routes, access to infrastructure, and ability to remain parked overnight. Staff acknowledges that a portion of drayage trucks operate using multi shifts, but because there is no mandate that fleets purchase ZEVs, manufacturers have the option to comply by selling ZEVs to other applications which do not use multi shift operations such as local food and beverage delivery. Staff will evaluate multi shift operations in drayage during the development of future requirements for zero-emission drayage.

Staff disagrees with the commenter's claim that the battery sizes are inappropriate and unrepresentative of how businesses operate. When evaluating the cost of a ZEV, fleets face a tradeoff between the range of the vehicle and the upfront capital cost. Fleets are unlikely to purchase a vehicle with limited range that will not be able to meet their needs, nor will they purchase a vehicle with excessive range that results in excess cost. Because fleets face no requirement to purchase ZEVs, manufacturers must ensure that they are selling vehicles with sufficient range at a price point that is attractive to fleets. Fleets have flexibility in how they choose to incorporate ZEVs into their fleet as they can elect to dispatch their ZEVs on shorter range, more predictable routes and leave the longer-range routes to the remaining combustion-powered vehicles in their fleet. Because of factors like this, decision making for fleets is fundamentally different to that of individuals and comparing the two is not appropriate in this scenario.

Large Entity Reporting – Burdensome to Business

Comment: Commenter states that the compliance and reporting requirements of ACT are too burdensome, even though they generally support improving air quality. Commenter also states the reporting requirement duplicates processes and information that is already available, which adds unnecessary bureaucracy that businesses must navigate. Commenter states CARB has not taken time to consider that abruptly lowering the reporting requirement from 100 to 50 vehicles will be adding back a considerable number of businesses that will now be forced to report. Commenter states that this maneuver blindsides businesses without sufficient time to assess the impacts of the regulation. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. The lowering of the reporting requirement from 100 to 50 vehicles was proposed during the 30 day comment period in compliance with APA requirements. Staff recognizes the potential unintended burden that the regulation may impose on businesses. Consistent with Board direction to streamline the reporting requirements, staff made several key changes to the original proposal: First, the changes would limit regulated entities to only those that own or direct the operation of medium- or heavy-duty vehicles. Second, the changes would also reduce the burden of reporting by completely removing the facility-based data and truck trip counting. Please see the discussion about staff's recognition of the potential unintended burden that the regulation may impose on businesses in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Large Entity Reporting – Regulation Requires Hard-to-Collect Information". In addition, please see response detailing the proposed streamlining of the large entity reporting requirement in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Large Entity Reporting – Cost Burden". Lastly, see discussion on the extensive outreach staff has conducted during the rulemaking process to inform fleets in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Large Entity Reporting – Insufficient Outreach"

Future ZEV Policy – Target Large Entities

Comment: Commenter states large entities that can afford ZEVs should be held accountable to meet fleet compliance requirements. [B2-31]

Agency Response: See response detailing the Board direction for staff to bring a fleet based recommendation to the Board in 2021, work so far on launching the next rulemaking effort for fleets, and why it is premature to discuss future ZE fleet rules at this time in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Future ZEV Policy – Adopt Zero-Emission Fleet Rule in 2021”.

Future ZEV Policy – Phased Fleet ZEV Rollout

Comment: Commenter states that the ACT regulation should start phasing in requirements beginning with local last mile operations, then regional operations, and lastly address long hauls. Commenter states the infrastructure costs are more gradual when using these phases. [B2-23-Form-2714]

Agency Response: No changes were made to the regulation in response to this comment. See discussion about the infrastructure costs to implement ZEVs in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Infrastructure Concerns”. Also, see the discussion about the rationale for the compliance strategy detailed in the approved ACT regulation in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Future ZEV Policy – Considerations to Include in Future ZE Fleet Rule”.

Future ZEV Policy – Employee Misclassification Impact on Trucking Emissions

Comment: Commenter states that we need to look into trucking contractors. Trucking companies, brokers, and other contracting entities often misclassify drivers as ‘independent contractors’ when they are, by law, employees. He states that 70-90% of drayage trucks are contractors that operate in firms of less than 100 trucks. [B2-06]

Agency Response: See response discussion on the importance of labor issues and their impact on air quality, and staff’s proposed changes to the large entity reporting requirement to ensure more potentially misclassified drayage workers are covered by the data reporting requirement for the entities that contract with them, in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Future ZEV Policy – Employee Misclassification Impact on Trucking Emissions”.

Future ZEV Policy – Mandate ePTO Use in Non-Attainment Zones

Comment: Commenter recommends mandating the use of ePTO technology in certain zones with high NOx emissions. Commenter states that ePTO systems can be installed on existing trucks as a retro-fit to reduce emissions without the purchase of newer vehicles. [B2-25]

Agency Response: No changes were made to the regulation in response to this comment. See discussion about why staff did not include ePTO technology in the manufacturer ZEV sales mandates in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales - Add Credit for Electrified Power Take Off". Additionally, see discussion about why it is premature to discuss potential future ZE fleet mandates in this rulemaking in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Considerations to Include in Future ZE Fleet Rule".

Future ZEV Policy – Commit to 100 Percent Zero-Emission Targets

Comment: Commenter states they support goals to have half of all trucks in California be zero-emissions by 2035, and all trucks be zero-emissions by 2045. [B2-77]

Agency Response: No changes were made to the regulation in response to this comment. Please see the discussion on establishing 100 percent zero-emission targets in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Set Clear 100 Percent ZEV Targets". Also, see the discussion about staff's efforts to develop a future fleet rule in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Adopt Zero-Emission Fleet Rule in 2021".

Out of Scope – Disadvantaged Community Policy

Comment: Commenter states that CARB should address the systemic marginalization of low-income communities of color that are more likely to be exposed to diesel pollution because their communities are usually located near freeways. [B2-37]

Agency Response: Staff made numerous modifications to the original proposal to increase the number of ZEVs deployed in California consistent with commenter and the Board's direction. Increases in class 7 and 8 tractor group sales percentages ensure there are sufficient tractor sales to meet the goal of achieving an all zero-emission drayage fleet by 2035, which would directly benefit disadvantaged communities. For further details on the changes made to the original proposal that positively impact the environment and disadvantaged communities, please refer to chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements". In July 2017, Governor Brown signed Assembly Bill (AB) 617 to reduce air pollution and the associated health impacts in highly impacted communities. To implement AB 617, CARB Board approved the Community Air Protection Blueprint on September 27, 2018, which includes strategies to reduce emissions and establishes Program requirements. For more information about CARB's implementation of AB 617, see https://ww2.arb.ca.gov/our-work/programs/resource-center/ab-617-implementation.

Out of Scope – Incentive and Funding Policies

Comment: Commenter states it is important that the ACT regulation includes incentives to encourage the purchase of ZEVs. [B2-104, B2-23-Form-1503, B2-23-Form-3517, B2-23-Form-3583]

Comment: Commenter supports the ACT regulation and states that adequate funding be sought from the state legislators and the federal government to be put it in place, even if a tax increase or hike in the fees assessed under cap-and-trade is required. [B2-23-Form-2138]

Agency Response: No changes were made to the regulation in response to these comments. See the discussion about incentives in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Out of Scope – Incentive and Funding Policies".

Other - General Opposition

Comment: Commenter states that the efforts made to clean California's air has caused the quality of life to decrease for Californians. Commenter states the efforts of CARB are misleading and are trying to fix something that is not broken and causes economic harm to the poorest people in the state. Commenter states the ACT regulation will force the poor and middle-class truckers out of business leaving the state to only large trucking companies. [B2-23-Form-2943]

Agency Response: No changes were made to the regulation in response to this comment. See discussion in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Other – General Opposition".

Other – Comments Addressed in the Environmental Analysis

Comment: Commenter would like to know where people would dispose of the lithium batteries and who is held accountable for the children mining the lithium. [B2-23-Form-2194]

Comment: Commenter states that CARB needs to solve the problems associated with electric vehicles, such as issues with child enslavement to mine minerals, the polluting from the battery manufacturing process, where/how to dispose of the batteries, and where does all the additional power to charge the batteries come from. [B2-23-Form-3900]

Comment: Commenter states that there is no regulatory assessment on the impacts on the power grid as a result of CARB's aggressive approach to adding ZEVs. [B2-58]

Agency Response: These comments are addressed in the "Final Environmental Analysis" document. See the Final Environmental Analysis prepared for the ACT regulation (Final EA link) presented and approved by the Board at the June 25, 2020, hearing. Related to the assessment of impacts on the power grid, the Final Environmental Analysis found that short term impacts on energy demand were less than significant, and that long-term impacts on energy demand were net beneficial. Details can be found in the discussions for Impacts 6-1 and 6-2. Overall, ZEVs will be a small portion of overall electricity demand, and utilities are planning for this load as required by the CEC and CPUC.

Other – Support for Other Commenters

Comment: Commenter shares their support for EMA's recommendations to connect mandates to sales, and delay the implementation to improve the chances of successful fuel-engine replacements with ZEV. [B2-58]

Agency Response: No changes were made to the regulation in response to this comment. Please see staff's response to EMA's comment to delay the ZEV sales mandate until 2026 in chapter "Written Comments Received during the June 2020 Board Hearing", section "Manufacturer ZEV Sales – Delay Until 2026". Also, please see staff's response to EMA's comment to link the ZEV sales mandate with the ZEV purchase requirements in chapter "Written Comments Received during the June 2020 Board Hearing", section "Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements".

Other – Miscellaneous/Out of Scope Comments

Comment: Commenter states that agricultural vehicles, dust, and burning are also major factors of pollution. [B2-23-Form-3183]

Comment: Commenter states the ACT regulation should not only clean the air but also the water. Commenter states that water ways are polluted with plastic, chemicals, noise, and over fishing. Commenter states there should be high penalties for over fishing. [B2-23-Form-3695]

Comment: Commenter states we should look at London's hybrid double decker bus and how it decreased the air pollution, doing the same in California will change the air and soundscape. [B2-23-Form-2350]

Comment: Commenter states California needs to urge people to drive less. [B2-23-Form-2639]

Comment: Commenter states that social change must advocate for decreased use of foreign made products and increased investment in sustainable manufacturing within the USA. [B2-23-Form-2297]

Comment: Commenter states we need to promote more solar energy programs for California residents for cleaner electricity. [B2-23-Form-1725]

Comment: Commenter states CARB should require replacement of all yard equipment with electric. [B2-23-Form-3973]

Comment: Commenter states that it is time to make coal, oil, fracking, and nuclear power illegal. Commenter states that the ACT regulation should require cutting oil and coal mining in half annually to be zero by 2029, reducing petroleum use in half each year to be zero by 2030, shutting down nuclear power plants by 2022, zero fracking by 2022, and have aero synthetic chemical farming by 2023. [B2-23-Form-3685]

Comment: Commenter states there should be more transportation by rail and if people are still burning rice fields they should compost instead. [B2-23-Form-971]

Comment: Commenter states that trucks need to be powered by solar and wind. [B2-23-Form-3327]

Comment: Commenter states that trucks crossing the state should have to meet certain clean energy criteria. [B2-23-Form-4126]

Comment: Commenter states that pipeline gas will require permanent infrastructure and will keep the ports and goods movement industry locked into old tech instead of moving into modern, 21st Century solutions. Commenter states that we cannot let pipeline gas become the new normal in running our vehicles, trucks or other infrastructure. [B2-23-Form-1503]

Comment: Commenter states that all vehicles should be powered by solar, hydroelectric, tidal, wind, and or geothermal energy to recharge batteries. [B2-23-Form-1008]

Agency Response: These comments are outside the scope of this rulemaking, however, staff appreciates the comments.

VERBAL COMMENTS RECEIVED DURING THE JUNE 2020 BOARD HEARING

Manufacturer ZEV Sales – General Support

Comment: Commenter states general support for the proposed changes to the regulation. [T2-01, T2-02, T2-03, T2-04, T2-05, T2-06, T2-08, T2-10, T2-11, T2-13, T2-15, T2-16, T2-17, T2-18, T2-19, T2-20, T2-21, T2-22, T2-23, T2-24, T2-26, T2-27, T2-28, T2-29, T2-30, T2-31, T2-32, T2-33, T2-34, T2-35, T2-36, T2-37, T2-38, T2-40, T2-44, T2-45, T2-46, T2-47, T2-48, T2-50, T2-51, T2-53, T2-56, T2-57, T2-58, T2-59, T2-60, T2-61, T2-62, T2-63, T2-64, T2-65, T2-66, T2-67, T2-68, T2-71, T2-72. T2-73, T2-74, T2-76, T2-77, T2-83, T2-84, T2-85, T2-87, T2-88, T2-89, T2-90, T2-92, T2-93, T2-97, T2-98, T2-99, T2-100, T2-101, T2-102, T2-103, T2-104, T2-106, T2-107, T2-108, T2-110, T2-111, T2-112, T2-113, T2-115, T2-116, T2-118, T2-119, T2-120, T2-122, T2-123]

Comment: Commenter states that his constituents are electricians who look forward to the enactment of ACT because of the job opportunities that will be created to build the charging infrastructure needed for electric vehicles. [T2-42]

Comment: Commenter states support for ACT regulation because it will provide economic stimulus, further environmental justice efforts, help fight climate change, improve working conditions, and transform our markets. [T2-55]

Comment: Commenter states that last-minute changes to definitions that invite fossil fuels into this rule are unacceptable because it undermines the intent of the ACT regulation. [T2-72]

Agency Response: Staff appreciates the supportive comments. Any additional issues raised by each commenter, if any, are addressed in the applicable sections of this document based on the nature of the issue being raised.

Manufacturer ZEV Sales - Strengthen the ACT Proposal by Increasing Sales Percentage Requirements

Comment: Commenter states the sales requirements for heavy-duty Class 7 and Class 8 tractors should be stronger. [T2-22, T2-35, T2-53, T2-73, T2-81, T2-84, T2-114]

Comment: Commenter states that the ACT regulation is not ambitious enough. [T2-96]

Comment: Commenter states the ACT regulation should start in 2021. [T2-97]

Agency Response: No changes were made to the regulation in response to these comments. Staff recognizes several challenges that currently appear to be barriers to more aggressive requirements. Staff will evaluate how the zero-emission market develops and can propose modifications in the future to reflect what is feasible. Please see the discussion on staff's rationale for increasing the regulation's requirements and limitations to increasing them further or starting them earlier in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements".

Manufacturer ZEV Sales – Manufacturer Requirements Are Too Stringent

Comment: Commenter states that CARB should maintain the original sales purchase requirements for model years 2024 through 2030. [T2-23]

Agency Response: No changes were made to the regulation in response to this comment. Staff recognizes that the ACT regulation's requirements are aggressive but are technically and economically feasible. These requirements are necessary in order to enable large-scale electrification at the scale necessary to meet the states air quality and climate goals. Without transitioning as much of the medium- and heavy-duty sector to zero-emission where feasible, California will not be able to meet its air quality goals, climate change targets, nor its carbon neutrality goals. Further detail on this topic may be found in chapter “Written Comments Received during the 30-Day Comment Period”, section “Manufacturer ZEV Sales – Manufacturer Requirements Are Too Stringent”.

Manufacturer ZEV Sales – Credit for Low NOx Engines or Alternative Fuels

Comment: Commenter is requesting an addition to the definition of near-zero-emission vehicle to include the certified low NOx 0.02-gram engine and allow these vehicles to earn credits. [T2-09, T2-14]

Comment: Commenter states the need to incentivize low NOx trucks to prevent fleet operators from defaulting to dirtier diesel models. Commenter states that the Omnibus Rule does nothing to deploy the most stringent low NOx trucks prior to 2027. [T2-09]

Comment: Commenter is requesting an addition to the definition of near-zero-emission vehicle to include the certified low NOx 0.02-gram engine to allow these vehicles to earn credits. Commenter requests corresponding changes to the NZEV credit provisions, such that near-term air quality benefits are incentivized in this rulemaking. [T2-25, T2-82, T2-91]

Comment: Commenter requests partial credits for low NOx trucks until the Omnibus rule requires manufacture of such trucks in 2027 and beyond. [T2-54]

Comment: Commenter states that we need to make sure that combustion trucks on the road continue to get cleaner without undermining zero-emission mandates by providing credits for fuels that do not advance zero-emission technology. [T2-67]

Comment: Commenter requests clarification on the interplay between the ACT regulation and the Omnibus rule so that OEMs and fleets can understand how the compliance requirements interact. [T2-70]

Comment: Commenter states that the proposed ACT regulation should consider including technologies such as low emission diesel, renewable diesel, biodiesel, natural gas hybrids, and natural gas vehicles as technologies that can meet the immediate need to reduce both air quality and greenhouse gas emissions at lower costs. Commenter states that separating out near-zero technologies from the ACT regulation undermines CARB's process to find a comprehensive solution to air quality problems by comparing different technologies and pick the best pathway. [T2-80]

Comment: Commenter states that because Class 7 and Class 8 vehicles are more difficult to electrify, 0.02 low NOx vehicles would be a more accessible solution to meet near-term emission goals. [T2-82]

Comment: Commenter states the ACT regulation does not support the manufacture and purchase of low NOx engines, risking near-term progress towards San Joaquin and South Coast deadlines. Commenter states that the Board is, in effect, encouraging the purchase of today's diesel technology over RNG and low NOx technology. [T2-121]

Agency Response: No changes were made to the regulation in response to these comments. The ACT regulation is focused on accelerating the use of zero-emission vehicles where emissions associated with new combustion-powered vehicles and engines are being addressed in the recently approved Low NOx Omnibus rulemaking and existing cleaner fuels policies. Further details are found in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Credit for Low NOx Engines and Renewable Fuels".

From a process perspective, CARB provides the following general explanation about its procedural approach to conducting review of emission impacts in the context of adopting regulations.

CARB's emission analyses are based on the expected compliance responses of the regulated entities covered a proposed regulation. In other words, the potential indirect physical changes to the environment will be the result of reasonably foreseeable actions undertaken by other entities (both private and public) in response to a CARB regulation. For example, individual vehicle manufacturers or major refiners for hydrogen and renewable fuels could choose other compliance responses that result in different project impacts. It is not possible, however, to know with a reasonable level of certainty the specific actions that would be selected by regulated communities to comply with a CARB regulation. Such regulated entities, in addition to local communities, would be required to undergo project-level environmental review once they decide specific actions they need to take, which could conclude there are more adverse or less substantial environmental effects as those contained a CARB environmental review document.

Ultimately, CARB takes a conservative approach and considers some environmental impacts as potentially significant because of the inherent uncertainties in the relationship between the potential compliance responses that are reasonably foreseeable under the ACT Regulation and environmentally sensitive resources or conditions that may be affected by those responses. In other words, the speculative nature of trying to predict how the regulated community will respond with the level of specificity that would inform a detailed impact analysis is inherently uncertain given the high variability of potential physical development projects that could result in response to the ACT regulation. Therefore, in an effort to acknowledge the inherent uncertainty and speculative nature of attempting to forecast compliance responses and potential resultant physical projects (e.g., uncertainty about the location and extent of construction for new manufacturing and associated facilities, the ability to repurpose existing infrastructure, the number of manufacturers that will decide not to sell vehicles in California, and how fleets will respond by purchasing ZEVs or installing onsite energy storage) while still seeking to make good-faith, full-disclosure to the public, CARB tends to overstate environmental impacts.

Where a potentially significant environmental effect could not be feasibly mitigated with certainty, CARB identifies the impact as significant and unavoidable. These are significant and unavoidable impacts because all of the physical projects associated with compliance responses will be permitted by local land use agencies whose jurisdiction govern the use of the project site; CARB has no land use permit authority over development projects. These land use agencies are likely to employ a range of different approaches to mitigating impacts related to new infrastructure and manufacturing facilities that may be built as part of the compliance response to regulations, such as the ACT Regulation. Moreover, even if CARB had land use authority over future development projects, CARB does not have enough information about potential impacts to impose mitigation measures that meet the two constitutional requirements for the imposition of mitigation measures: (1) the need for the mitigation measures to show a connection that they mitigate actual, specific impacts from a project; and (2) the need for the mitigation measures to be "roughly proportional" to the impacts of the project. (Nollan v. California Coastal Commission (1987) 483 U.S. 825, 837; *Erlich v. City of Culver* (1996) 12 Cal.4th 854, 879-880; Title 14 CCR section 15126.4, subd. (a)(4).) As a result, CARB determined that the potential impacts from the reasonably foreseeable compliance responses and associated speculative projects could be significant and unavoidable in certain resource areas.

Manufacturer ZEV Sales – Near-Zero-Emission Vehicle Definition

Comment: Commenter requests the inclusion of the low NOx 0.02 gram engines as part of the near-zero definition because the proposed near-zero definition in the ACT is in conflict with the widely used near-zero definition. [T2-43, T2-54, T2-91]

Comment: Commenter states that they would like to change the definition of "near-zero" to include vehicles with Low NOx engines in order to meet near-term emissions goals before the first ACT compliance deadline. [T2-52, T2-85, T2-94]

Comment: Commenter states that the "Near-Zero" definition should include the 0.02 gram low NOx standard when coupled with renewable natural gas. [T2-70, T2-79, T2-110]

Agency Response: No changes were made to the regulation in response to these comments. See response summarizing how the term "near-zero-emission vehicle" is not appropriate to apply to vehicles meeting the recently approved Low NOx engine standard in chapter "Written Comments Submitted During Original Proposal's 45-Day

Comment Period", section "Manufacturer ZEV Sales – Near-Zero-Emissions Vehicle Definition".

Manufacturer ZEV Sales – Near-Zero-Emission Vehicle Definition - ePTO

Comment: Commenter states that the definition of near-zero should include work trucks that are primarily used to power the work functions. Commenter states a definition of all-electric mile range that provides partial emission credits doesn't allow solutions that would electrify the auxiliary functions and reduce stationary emissions. [T2-96]

Comment: Commenter requests that ePTO systems are included in the definition of near-zero-emission vehicles. [T2-109]

Agency Response: No changes were made to the regulation in response to these comments. Please see further details about why staff did not include ePTO technology in the manufacturer ZEV sales mandates in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales - Add Credit for Electrified Power Take Off". In addition, please see further details about the "near-zero" definition in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Low NOx Needed for Long-Haul".

Manufacturer ZEV Sales – Adjustments to NZEV Credits

Comment: Commenter proposes that eligibility for the 75-mile all-electric range to continue to at least 2045. [T2-30]

Agency Response: No changes were made to the regulation in response to this comment. Please see the discussion about why extending the sunset date for plug-in hybrids could mean less preferred ZEV technology on the road in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales – Adjustments to NZEV Credits".

Manufacturer ZEV Sales – Credit for Conventional Hybrids

Comment: Commenter encourages CARB to expand the compliance pathway to include partial credits for conventional heavy-duty hybrids. [T2-23]

Comment: Commenter states that partial credit for hybrid electric vehicles that meet the phase two GHG standards early would provide a path for faster CO_2 reduction. [T2-75]

Agency Response: No changes were made to the regulation in response to these comments. See staff discussion on why conventional hybrids do not need credit in the ACT regulation due to its already commercialized status in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Credit for Conventional Hybrids".

Manufacturer ZEV Sales – Extra Credit for ZEVs Based on Range

Comment: Commenter states CARB should assess how truck manufacturers and fleet operators could be incentivized to push for longer range vehicles through the credit system for trucks, because this aligns with the needs of the truck fleet operators and the longer-range vehicles with maximum payload capacity. [T2-41]

Agency Response: See response summarizing why staff is not proposing modifications to add credit for ZEVs based on range in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Extra Credit for ZEVs Based on Range".

Manufacturer ZEV Sales – Feasibility of Zero-Emission Refuse Trucks

Comment: Commenter requests consideration of a separate compliance pathway for the waste industry to address the industry's unique issues. Commenter states that the waste industry is often grouped with buses because of duty cycle characteristics but that these sectors are different because bus ridership is subsidized whereas the waste industry is funded by unsubsidized rates. [T2-39]

Agency Response: No changes were made to the regulation in response to this comment. The ACT regulation does not require any manufacturer to produce ZE refuse trucks nor does it require any refuse truck fleet to purchase ZEVs. Manufacturers must electrify a portion of their sales based on their own assessment of what they believe is best suited for electrification. Fleets have no requirement to purchase ZEVs as it is the responsibility of manufacturers to build ZEVs that meet fleets needs at an attractive price point. Based on this regulatory structure, it does not make sense to create a separate compliance pathway for the refuse industry given that they face no requirement to purchase ZEVs.

As part of the regulatory process, staff analyzed the feasibility of 87 different market segments as described in Appendix F to the staff report. This analysis included several different types of refuse trucks. Staff did not assess the feasibility of transit buses as they are outside the scope of the regulation, and staff did not base any feasibility assessments on the performance of zero-emission transit buses. For further discussion on the feasibility of zero-emission refuse trucks in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Feasibility of Zero-Emission Refuse Trucks".

Manufacturer ZEV Sales – ACT Labor Requirements

Comment: Commenter urges CARB to include strong labor requirements in the ACT regulation and related rules. [T2-86]

Agency Response: No changes were made to the regulation in response to this comment. See response discussion on the importance of labor issues and their impact on air quality, and staff's proposed changes to the large entity reporting requirement to ensure more potentially misclassified drayage workers are covered by the data reporting requirement for the entities that contract with them, in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Employee Misclassification Impact on Trucking Emissions".

Manufacturer ZEV Sales – Focus on Beachhead Markets

Comment: Commenter states that if a focused beachhead approach is used, the proposed higher percentage targets in the ACT regulation can be achieved. [T2-05]

Agency Response: No changes were made to the regulation in response to this comment. Please see the discussion about transitioning key beachhead markets to zero-emission in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements".

Manufacturer ZEV Sales – Include Hydrogen Stored on Vehicle in AER Calculation

Comment: Commenter states that the definition of "all-electric range" should include energy stored on board the vehicle in the form of hydrogen that converts to electricity. [T2-49]

Agency Response: No changes were made to the regulation in response to this comment. The rationale for this definition is to set forth the meaning and test procedures by which NZEVs must be tested to determine the all-electric range needed to receive NZEV credit for this regulation. NZEVs are not currently expected to use hydrogen fuel cells due to the lack of any commercial product or announcement that manufacturers are developing this technology. Fuel cell vehicles earn full ZEV in the ACT regulation and therefore do not need their all-electric range considered.

Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements

Comment: Commenter recommends an alternative approach that links the ZEV sales mandate with ZEV purchase requirements. [T2-12]

Comment: Commenter strongly recommends that the resolution language for the ACT regulation include a direct tie to the Fleet Rule. Commenter recommends that the language explicitly state that the ACT regulation will go into effect no less than two years after the Fleet Rule is adopted. [T2-34]

Agency Response: No changes were made to the regulation in response to these comments. Per Resolution 20-19, the Board directed staff to develop a zero-emission fleet rule that is consistent with the manufacturer rule for Board consideration in 2021. Generally, staff believes that the manufacturer sales mandate coupled with a future ZEV fleet rule is the best approach to give manufacturers lead time to produce vehicles, time for staff to receive and analyze the reporting and usage data, and craft an effective and equitable fleet rule. Infrastructure developments will happen concurrently through other state efforts. See staff response detailing the next rulemaking effort for fleets in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements".

Manufacturer ZEV Sales - Add Midterm Reviews, Offramps, Market Reviews, or Appeals Process to Assess Regulation

Comment: Commenter recommends that the resolution language include a date next year for when CARB staff can present an update on the development of the fleet rule, the progress of the ACT regulation, and any amendments necessary. [T2-34]

Agency Response: No changes were made to the regulation in response to this comment. Staff intend to return to the Board with a recommendation in 2021 related to complementary strategies to further the deployment of ZEVs, and the approved ACT regulation can be adjusted at that time if staff and the Board deem it necessary. Staff does not believe mid-term reviews or checkpoints are necessary, as the pathway to meet the various ZEV goals described in the Board's final resolution will require, at minimum, full compliance with the approved regulation. For additional information, see response summarizing how off-ramps fail to add regulatory certainty in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales – Add Midterm Reviews, Offramps, Market Reviews, or Appeals Process to Assess Regulation".

Manufacturer ZEV Sales – Add Travel and Pooling Provisions for Section 177 States

Comment: Commenter recommends that CARB include an optional compliance pathway for Section 177 states by adding a mechanism such as a credit pooling provision for the ACT regulation that will allow OEMs to pull credits within the east and west regions. [T2-34]

Agency Response: No changes were made to the regulation in response to this comment. Please see the discussion about why travel and pooling provisions were not included for Section 177 states in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales – Add Travel and Pooling Provisions for Section 177 States".

Manufacturer ZEV Sales – Add Off-Ramps to the Proposal Due to COVID-19

Comment: Commenter believes that due to the pandemic a provision should be incorporated into the regulation to ensure truck manufacturers aren't deemed non-compliant for not reaching vehicle sales totals beyond those which can be achieved with limited, disconnected public funding for vehicles and infrastructure, as well as the long lead times for the charging infrastructure installation. [T2-07]

Agency Response: No changes were made to the regulation in response to this comment. See response detailing considerations for the impacts for COVID-19 in chapter “Written Comments Received during the 30-Day Comment Period”, section “Economic Analysis – Impact of COVID-19”. Additionally, see response summarizing how off-ramps fail to add regulatory certainty in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Manufacturer ZEV Sales – Add Off-Ramps to the Proposal”.

Manufacturer ZEV Sales – No Pay-to-Pollute Penalties

Comment: Commenter requests that CARB, in the final statement of reasons, reiterate that ZEV penalties are not intended to serve as a pay-to-play mechanism and further clarify that penalties applied to deficits that have not been made up in the time allotted, do not obviate the need for manufacturers to fill ZEV credit deficits. [T2-57]

Agency Response: No changes were made to the regulation in response to this comment. See discussion about how manufacturers must still make up deficits even if assessed a penalty for non-compliance in chapter “Written Comments Received during the 30-Day Comment Period”, section “Manufacturer ZEV Sales – No Pay-to-Pollute Penalties”.

Manufacturer ZEV Sales – Infrastructure Concerns

Comment: Commenter supports creating public or private partnerships to address infrastructure challenges. [T2-34]

Comment: Commenter states that there needs to be more focus on fueling infrastructure for the zero-emission trucks because it incentivizes investment in renewable fuel production capacity, both for hydrogen and electricity. [T2-41]

Comment: Commenter states that the ACT regulation needs to address the infrastructure needed to extend the reach of these ZEV technologies with energy that is renewably sourced. [T2-107]

Comment: Commenter urges CARB to collaborate with utilities, local air districts, and manufacturers to implement infrastructure, specifically in Inland Empire communities. [T2-119]

Agency Response: No changes were made to the regulation in response to these comments. See the discussion about infrastructure incentive programs from utilities and the State’s long-term development strategies, as well as how the large entity reporting requirement will support infrastructure development in chapter “Written

Comments Submitted During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Infrastructure Concerns".

Manufacturer ZEV Sales – Delay Until 2026

Comment: Commenter presents an alternative approach that proposes the sales mandate begin in 2026 to allow time for staff to develop and implement the fleet rule, develop the necessary charging infrastructure, recovery from current budget crisis, allocate funds for incentives, and time for manufacturers to recover from the impacts of the COVID crisis. [T2-12]

Agency Response: No changes were made to the regulation in response to this comment. Delaying the start of the rule is inconsistent with Board direction to increase the number of ZEVs deployed. See discussion on staff's rationale to increase the regulation's requirements in chapter "Written Comments Submitted During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and /or Increasing Sales Percentage Requirements". In addition, see response detailing why impacts from the COVID-19 pandemic will not affect this regulation in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Impact of COVID-19".

Manufacturer ZEV Sales – 15- and 30-Day Changes Timeframe Insufficient

Comment: Commenter would like an explanation for the use of 15-Day and 30-Day changes of major regulations (i.e., ACT and At Berth) because staff made significant changes after the initial hearing at the direction of the Board. Commenter states the analyses for these changes has not been as rigorous as it was for the initial proposals and expresses concern that the process may discourage legitimate and valuable course corrections. [T2-70]

Agency Response: No changes were made to the regulation in response to this comment. The regulatory process includes mandatory comment periods for any rulemaking. After the Staff Report was posted and the 45-day comment period and public hearing concluded, direction from the Board and many comments from the public lead to modifications to strengthen the ACT regulation. Any time there are substantial changes made to a proposed regulation, another comment period has to occur. Staff doubled the amount of time required, a total of 30 days, for the public to comment on the modified regulations and the supporting analyses of the now approved ACT regulation to address concerns related to the COVID-19 pandemic. Staff had already performed rigorous analyses in the Staff Report to address technological feasibility, cost, emissions, and health benefits. That initial analysis was expanded and updated with the new information gathered after the Staff Report was released to reflect the ongoing market changes supporting increases to the ZEV sales requirements. The modifications after the First Board hearing can be found in Attachment C to the 30-Day Changes. The additional information added in Attachment C indicated that electrification is more suitable than the original model in the Staff Report, and the new requirements were supported by these new findings.

Manufacturer ZEV Sales – ZEV Reliability

Comment: Commenter asks, what is CARB's expectations for ZEV reliability and how does CARB propose to meet reliability targets to ensure customers/companies have a product that remains in operation and stays within monetary limits? [T2-105]

Agency Response: No changes were made to the regulation in response to this comment. CARB adopted the optional Zero-Emission Powertrain Certification regulation on June 27, 2019. The approved ACT regulation requires that ZEVs sold into California must meet the requirements of the Zero-Emission Powertrain Certification regulation starting with the 2024 model year. This requirement establishes minimum criteria for the quality and reliability of ZEVs, provides emissions warranty to the vehicle purchaser, ensures information regarding ZEVs and their powertrains are effectively and consistently communicated to purchasers, and accelerates progress towards greater vehicle reparability. CARB anticipates that ZEV technology will continue to rapidly improve thereby increasing reliability, and as the market matures, costs will continue to decrease.

Manufacturer ZEV Sales – BEVs vs FCEVs

Comment: Commenter states that hydrogen fuel cell vehicles are verified to be zero-emissions technology, however it is difficult to verify the content of emissions from battery charging. [T2-78]

Comment: Commenter states that hydrogen fuel cells are produced by fossil fuels and are half as efficient as batteries, while the Community Choice electricity the commenter uses to plug-in is 88% carbon free. [T2-90]

Agency Response: No changes were made to the regulation in response to these comments. Staff disagrees with commenter that hydrogen fuel cells are produced entirely by fossil fuels. Hydrogen is produced from several different sources which include electrolysis from water, steam reformation from renewable sources, biomethane capture from the breakdown of organic waste from landfills, wastewater, animal waste, crop residuals, and food waste, and fossil fuel natural gas. In addition, the LCFS program incentivizes the production and use of renewable hydrogen by providing higher credit values per kilogram of hydrogen when compared to fossil fuel hydrogen. Finally, SB1505 emphasizes the use of renewable hydrogen to diversify sources of transportation energy.

Additionally, staff disagrees with commenter that it is difficult to verify the emissions associated with battery charging. CARB is able to determine the carbon intensity of emissions from battery charging (the emissions resulting from the generation and distribution of electricity). Through the LCFS program, there are three Lookup Table pathways available to identify the carbon intensity of electricity used as a fuel for transportation. These pathways include the California Average Grid Electricity, zero-carbon intensity electricity, and smart charging/smart electrolysis. For more information on the LCFS electricity pathways, please visit https://ww2.arb.ca.gov/resources/documents/lcfs-electricity-and-hydrogen-provisions.

Manufacturer ZEV Sales – Remove Zero-Emission Powertrain (ZEP) Certification Requirements

Comment: Commenter states that the zero-emission powertrain rule puts additional compliance costs on every manufacturer which would make it more difficult for start-ups to enter the market without some form of waiver to reduce the costs. [T2-96]

Agency Response: No changes were made to the regulation in response to this comment. The ZEP certification procedures are critical for ensuring manufacturers are developing quality products for consumers through its provisions. Please see the discussion about ZEP certification in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Remove Zero-Emission Powertrain (ZEP) Certification Requirements". In addition, CARB offers a portfolio of incentive programs which are designed to incentivize technology from early demonstrations to full scale commercial deployment. The demonstrations and pilot projects funded through our incentive programs help reduce costs, increase experience with the new technologies, and expand the overall ZEV marketplace.

Economic Analysis – General Cost Concerns

Comment: Commenter states they are concerned about the financial burden to independent and misclassified drivers resulting from the purchase of new equipment. [T2-87]

Agency Response: No changes were made to the regulation in response to this comment. See staff discussion on how ZEVs will save money over time versus diesel vehicle and how there is not a purchasing requirement for fleets in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – General Cost Concerns". Also, see staff discussion on changes made that will help gather more information to address misclassification issues in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Employee Misclassification Impact on Trucking Emissions".

Economic Analysis – Include More Fuel Cell Vehicles

Comment: Commenter states that there needs to be more of a balance between battery electric and fuel cell electric technologies in the proposed regulation. Commenter states the hydrogen fuel cell electric truck option appears to be considered as a marginal contributor in the impact calculations. [T2-41]

Agency Response: No changes were made to the regulation in response to this comment. Battery-electric and fuel cell electric technologies are treated equally as credit generators in the approved ACT regulation. Staff's analyses only included hydrogen fuel cell vehicles as a small percentage due to lack of currently commercial vehicles and larger near-term barriers to adoption of these vehicles.

Economic Analysis – Underestimated Tractor Battery Capacity Needs

Comment: Commenter states, citing a Gladstein, Neandross and Associates analysis, that battery capacity for [tractor] range is underestimated by 50%, which negates CARB's idealized assumptions regarding fleet operations. [T2-54]

Agency Response: No changes were made to the regulation in response to this comment. See discussion about staff's assumptions for fleets used to determine the battery sizing used in the analysis in chapter "Written Comments Received during the June 2020 Board Hearing", section "Economic Analysis – Underestimated Tractor Battery Capacity Needs".

Economic Analysis – Ignored Insurance Cost

Comment: Commenter states that the TCO analysis did not include insurance costs. [T2-54]

Agency Response: No changes were made to the regulation in response to this comment. See discussion on insurance costs in chapter "Written Comments Received during the June 2020 Board Hearing", section "Economic Analysis – Ignored Insurance Cost".

Economic Analysis – Cost Analysis Underestimates Total Cost of Ownership

Comment: Commenter states that the total cost of ownership for ZEVs is underestimated by 80% to 90%. [T2-54]

Agency Response: No changes were made to the regulation in response to this comment. Please see the discussion regarding CARB's methodology to evaluate costs to the state as a whole and the total cost of ownership for a vehicle in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – General Cost Concerns". In addition, see the discussion about vehicle cost in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Cost Analysis Underestimates Vehicle Cost".

Economic Analysis – Underestimated Infrastructure Network Service Costs

Comment: Commenter states that the TCO analysis did not include the cost of the charger network service and insurance costs. [T2-54]

Agency Response: No changes were made to the regulation in response to this comment. See discussion on insurance costs in chapter "Written Comments Received during the June 2020 Board Hearing", section "Economic Analysis – Underestimated Infrastructure Network Service Costs". See also discussion on insurance costs in chapter "Written Comments Received during the June 2020 Board Hearing", section "Economic Analysis – Ignored Insurance Cost".

Economic Analysis – Fleet Infrastructure Resilience

Comment: Commenter states that fleet infrastructure redundancy and resiliency were not considered in the TCO analysis. [T2-54]

Agency Response: No changes were made to the regulation in response to this comment. See discussion on the work California is undertaking to bolster resilience and the role of ZEVs in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Fleet Infrastructure Resilience".

Economic Analysis – Impact of COVID-19

Comment: Commenter doubts the market's readiness to absorb the volumes proposed in this regulation due to lack of infrastructure and economic impacts of the pandemic, including reduced carbon auction revenue that will impact HVIP funding to support early ZEV sales. [T2-07]

Comment: Commenter states that due to the pandemic, the degree of difficulty to implement the ACT regulation has increased. [T2-95]

Agency Response: No changes were made to the regulation in response to these comments. For discussion on staff's recognition of COVID-19's impact on the trucking industry and why staff feels the regulation's requirements are feasible see chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Impact of COVID-19".

Emissions Methodology – Include Upstream Emissions

Comment: Commenter states that CARB needs look beyond the GHG emissions from the tailpipe and consider the source of electricity generation. [T2-90]

Agency Response: No changes were made to the regulation in response to this comment. See discussion detailing how staff already assessed well-to-wheel GHG emissions and why it is not appropriate to include NOx or PM upstream emissions in the emissions analysis for this regulation in chapter “Written Comments Received during the 30-Day Comment Period”, section “Emissions Methodology – Include Upstream Criteria Pollutants”.

Large Entity Reporting – Clarify Light-Duty Fleets With One Truck Are In Scope

Comment: Commenter states additional clarification is needed on whether light-duty fleet companies that own one large truck are required to report. [T2-85]

Agency Response: No changes were made to the regulation in response to this comment. The reporting requirement applies to entities that had annual revenues greater than $50 million in 2019 and had one or more vehicles over 8,500 lbs. GVWR under common ownership or control in California. For entities below the annual revenue threshold, the reporting requirement applies to fleet owners with 50 or more vehicles with a GVWR greater than 8,500 lbs. under common ownership or control and brokers/entities that dispatch 50 or more vehicles with a GVWR greater than 8,500 lbs. Light-duty vehicles have no reporting requirements and vehicle home bases with only light-duty vehicles do not need to be reported.

Large Entity Reporting – Timing of Data Collection

Comment: Commenter requests that CARB consider the differences between construction fleets and delivery fleets for fleet reporting and the impacts of COVID-19 on the quality of data required in April. [T2-69]

Agency Response: No changes were made to the regulation in response to this comment. While the pandemic is having significant impacts on the economy as a whole, many sectors in the trucking industry appear to be relatively unaffected by the economic slowdown. Because of this, the data submitted will still be of high quality, useful, and critical as staff continues developing future zero-emission fleet rules. Staff have already included additional flexibility in selecting representative time periods for data collection, described in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Timing of Data Collection”.

With regards to the differences between fleet types, staff is in the process of developing the specifics of a future fleet rule to identify which segments and associated fleet sizes are most suitable for electrification. The fleet segment information collected from the reporting requirement will be considered and critical to the development of the fleet rule.

Large Entity Reporting – Reporting Guidance Needed

Comment: Commenter states that there needs to be proper education on reporting to get all of the data needed to make the ACT regulation successful. [T2-92]

Agency Response: No changes were made to the regulation in response to this comment. Staff is in the process of developing a standardized reporting template/system. Staff will also conduct stakeholder outreach and hold a public workshop in the near future to allow entities the opportunity to provide feedback on the system.

Large Entity Reporting – Insufficient Outreach

Comment: Commenter states that they would like more collaboration with CARB on regulations that impact their industry. [T2-52]

Agency Response: See response detailing outreach actions staff undertook during the public process of this regulation, including workshops, workgroup meetings, and a mass mailout in chapter “Comments Received During Original Proposal’s 45-Day Comment Period”, section “Large Entity Reporting – Insufficient Outreach”.

Large Entity Reporting – Strengthen the Reporting Requirement

Comment: Commenter states the reporting requirement should be strengthened. [T2-89]

Comment: Commenter states that the 50-vehicle threshold is not low enough, as it would not gather information about the majority of small fleets, which is critical. [T2-117]

Agency Response: No changes were made to the regulation in response to these comments. Staff previously lowered the threshold for respondent fleets from 100 to 50 vehicles. Based on available information, staff believes that lowering this number further would result in exponentially more fleet respondents with diminishing returns on the value added by the additional data. Lowering the threshold further would be contrary to the Board’s direction to streamline the reporting requirement. Please see the discussion about lowering the reporting requirement for fleets in chapter “Written Comments Received during the 30-Day Comment Period”, section “Large Entity Reporting – Smaller Fleet Considerations”. The information required captures the information necessary to support the development of the fleet rule; adding more questions could significantly increase the amount of data collection required for fleets. Staff believes an appropriate balance was struck.

Large Entity Reporting – Unclear Language Will Require Technical Support

Comment: Commenter states that the rule requires significant interpretation by the regulated community and doesn't address enforcement penalties. Commenter states that if CARB adopts the ACT regulation without language fixes, resources should be dedicated for technical support to comply with the regulation. [T2-85]

Agency Response: No changes were made to the regulation in response to this comment. See response detailing proposed clarifications and streamlining of the large entity reporting requirement in chapter “Comments Received During Original Proposal’s

45-Day Comment Period", section "Large Entity Reporting – Unclear Language, Unclear Requirements, Unnecessary Information".

With regards to enforcement penalties, staff added section 1963.5(a)(4) in the approved regulation to provide stakeholders clarity in the event of manufacturer noncompliance and to ensure a consistent methodology in determining how the penalty should be assessed. Staff's intent is to collect useful data with the reporting requirement and will work with regulated entities if questions arise. Please see the discussion about remediation pathways without enforcement action in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Large Entity Reporting – Enforcement Concerns". In addition, staff is in the process of developing Large Entity Reporting guidance and a standardized reporting template/system. Staff will also conduct a virtual public workshop in the near future to allow entities the opportunity to provide feedback on the reporting template/system.

Future ZEV Policy – Include Labor Standards as Part of Incentives Used for Future Fleet Rules

Comment: Commenter recommends that CARB include labor standards with any funds distributed as part of the Fleet rule. [T2-29]

Agency Response: No changes were made to the regulation in response to this comment. This comment is outside of the scope of the ACT rulemaking. Please see the discussion on the importance of labor issues and their impact on air quality, and staff's proposed changes to the large entity reporting requirement to ensure that more potentially misclassified drayage workers are covered by the data reporting requirement for the entities that contract with them, in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Employee Misclassification Impact on Trucking Emissions".

Future ZEV Policy – Adopt Zero-Emission Fleet Rule

Comment: Commenter states the need for a strong fleet rule to attain climate goals and to protect public health. [T2-10]

Comment: Commenter encourages CARB take complementary actions such as accelerating the adoption of the pending fleet rule, and passing a resolution to establish a target date for when the State can achieve hundred percent zero-emission truck fleets. [T2-66]

Comment: Commenter states they support a strong Fleet rule with strong reporting requirements. [T2-87]

Agency Response: No changes were made to the regulation in response to these comments. The Board directed staff to bring a fleet rule for Board consideration by the end of 2021, which is earlier than initially proposed, when they approved the Resolution. For further detail on the topic, refer to chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Adopt Zero-Emission Fleet Rule in 2021". Please see the discussion on establishing 100 percent zero-emission targets in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Set Clear 100 Percent ZEV Targets".

Future ZEV Policy – Remove "Everywhere Feasible" from 100 Percent ZEV Targets

Comment: Commenter states that the "everywhere feasible" caveat to the proposed goal of 100% ZE by 2045 should be removed because the caveat leaves room for interpretation and confusion. [T2-72]

Agency Response: No changes were made to the regulation in response to this comment. The Board directed staff to work towards an ultimate goal of 100 percent zero-emission, where feasible, by 2045 when they approved the Resolution. It is not currently feasible to require 100% ZEVs in all use cases. As technology improves, staff and the Board can revisit the goals if needed. See discussion detailing ZEV transition goals in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Set Clear 100 Percent ZEV Targets".

Future ZEV Policy – Strengthen Timelines and Targets in Future ZEV Rules

Comment: Commenter states that the ACT regulation does not go far enough to protect public health and CARB must institutionalize, strengthen, and speed up the timelines and targets in subsequent rules for electrification and ZEVs adoption. [T2-86]

Comment: Commenter states that they support the transition to ZEVs for all public transportation. [T2-97]

Agency Response: No changes were made to the regulation in response to these comments. See discussion detailing ZEV transition goals in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Set Clear 100 Percent ZEV Targets".

Future ZEV Policy – Employee Misclassification Impact on Trucking Emissions

Comment: Commenter states the need to address the issue of driver misclassification of independent contractors in the fleet rule. [T2-10, T2-72, T2-101, T2-102]

Comment: Commenter states support for strong labor standards to prevent the exploitation of independent contractors in the truck driving sector. [T2-11]

Comment: Commenter urges CARB to include language in the resolution that addresses the problem of misclassified drivers and illegal contracting industry. [T2-35]

Agency Response: No changes were made to the regulation in response to these comments. See response discussion on the importance of labor issues and their impact on air quality, and staff's proposed changes to the large entity reporting requirement to ensure more potentially misclassified drayage workers are covered by the data reporting requirement for the entities that contract with them, in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Future ZEV Policy – Employee Misclassification Impact on Trucking Emissions".

Future ZEV Policy – Disadvantaged Community Policy

Comment: Commenter states that poor air quality in low income communities must be addressed because these communities are usually located in areas subjected to more pollution which contribute to health issues in these communities. [T2-81]

Agency Response: No changes were made to the regulation in response to this comment. CARB recognizes the need to improve air quality in disadvantaged communities and sees the ACT regulation in combination with future ZE fleet rules as key components of helping these communities. The manufacturer sales requirement does not direct where trucks are to be placed but follows up with other requirements for fleets to report information about their vehicle home base locations.

Staff made numerous modifications to the original to increase the number of ZEVs deployed in California consistent with commenters and the Boards request. One of the many changes included the increase in class 7 and 8 tractor group sales percentages to ensure there are sufficient tractor sales to meet the goal of achieving an all zero-emission drayage fleet by 2035 which would directly benefit disadvantaged communities. For further details on the changes made to the original proposal to positively impact the environment and disadvantaged communities, please refer to chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Strengthen the ACT Proposal by Including Pickups Earlier and/or Increasing Sales Percentage Requirements".

In July 2017, Governor Brown signed Assembly Bill (AB) 617 to reduce air pollution and the associated health impacts in highly impacted communities. To implement AB 617, CARB Board approved the Community Air Protection Blueprint at a September 27, 2018 Board hearing, which includes strategies to reduce emissions and establishes Program requirements. For more information about CARB's implementation of AB 617, see https://ww2.arb.ca.gov/our-work/programs/resource-center/ab-617-implementation.

Out of Scope – Incentives and Funding Policies

Comment: Commenter states that there needs to be incentive funding for successful implementation of the ACT regulation. [T2-05]

Comment: Commenter states that in order to meet sales targets, there must be adequate vehicle and infrastructure incentives, in addition to the Fleet Rule which is currently in development. [T2-56]

Comment: Commenter states that there should be incentives provided for the use of low carbon fuels in ultra-low NOx trucks to accelerate CO2 reduction in the non-electric portion of fleets. [T2-75]

Comment: Commenter states there needs to be incentives and other policies that would align with the ACT regulation during this critical phase amidst the pandemic. [T2-88]

Comment: Commenter states there needs to be more funding for oversubscribed programs. [T2-92]

Comment: Commenter states that there needs to be support for smaller fleets. [T2-92]

Comment: Commenter states that incentives are needed to encourage the adoption of ZEVs to ensure a successful ACT regulation. [T2-104]

Comment: Commenter supports funding for small fleets and independent contractors. [T2-117]

Comment: Commenter supports funding for ZEV medium- and heavy-duty vehicles for either the fleet and/or manufacturers that achieve these higher measures and other advancements. [T2-117]

Comment: Commenter states that ZEV manufacturers are in critical need of more support and programs available for educating fleets, garage services, and dealerships in order to achieve the aimed adoption. [T2-117]

Agency Response: No changes were made to the regulation in response to these comments. Staff did not include incentives in the economic analysis, and the ACT regulation is not predicated on the availability of incentives. See discussion about CARB incentives policy in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Out of Scope – Incentive and Funding Policies".

Out of Scope – Rule Abandons Natural Gas Infrastructure

Comment: Commenter states concern that the natural gas vehicles and infrastructure that they invested in are being abandoned by the current process. [T2-121]

Agency Response: No changes were made to the regulation in response to this comment. See staff discussion on how the ACT regulation does not require fleets invested in natural gas to strand their assets in chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Ignores CNG Investments and Impacts from Stranding Those Investments."

Staff will evaluate the status of natural gas infrastructure during development of the future ZE fleet rule to the extent that the rule affects existing infrastructure.

Out of Scope – Support In-State RNG Production

Comment: Commenter states that a strategy that reduces GHG emissions by using in-state RNG fuel in refuse collection vehicles should be encouraged and approved by CARB. [T2-32]

Agency Response: No changes were made to the regulation in response to this comment. Commenter statement is out of the scope of the ACT regulation because it is asking for strategies on clean fuels rather than clean vehicles. The purpose of the ACT regulation is to foster and accelerate the adoption of medium- and heavy-duty ZEVs. CARB has other policies in place to encourage the adoption of low-carbon fuels such as the LCFS regulation. These other policies are incentivizing production of clean fuels including production within California and are the more appropriate path for accommodating these fuels.

Out of Scope – Infrastructure Effects on Small Businesses

Comment: Commenter states that the utilization of charging is impacting electric tariff rate designs resulting in a low load factor barrier which affects small fleets and will produce data gaps if a program is not developed to support small fleets. [T2-117]

Agency Response: This comment is outside of the scope of the modifications to the ACT rulemaking. It is too early to identify the impacts of large-scale EV charging on electricity tariff rates. The IOUs are currently developing Transportation Electrification Plans to ensure that new vehicle loads are integrated into the electrical system efficiently and identify strategies to improve existing EV-specific tariffs. In addition, future fleet rules will likely target larger businesses and segments that are well-suited for electrification in the earlier years, allowing sufficient time for infrastructure issues that may affect smaller fleets to be worked out.

Out of Scope – Encourage Infrastructure Deployment to Stimulate COVID Economy

Comment: Commenter states that due to the economic impact from COVID-19, it is important to encourage infrastructure development to stimulate the economy. [T2-79]

Agency Response: No changes were made to the regulation in response to this comment. See the discussion about infrastructure incentive programs from utilities and the State's long-term development strategies, as well as how the large entity reporting requirement will support infrastructure development in chapter "Written Comments Submitted During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Infrastructure Concerns", and discussion about staff's recognition of COVID-19's impact on the trucking industry and why staff feels the regulation's requirements are feasible see chapter "Written Comments Received during the 30-Day Comment Period", section "Economic Analysis – Impact of COVID-19".

Out of Scope – Zero-Emission Powertrain Certification Performance Standards

Comment: Commenter supports strengthening performance standards through zero-emission powertrain certification in order to promote innovation in clean vehicles. [T2-75]

Agency Response: No changes were made to the regulation in response to this comment. Changes to the Zero-Emission Powertrain Certification program are outside the scope of the current proposal. In addition, see discussion on why performance-based metrics for zero-emission performance are not appropriate in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales – Set Performance-Based Targets for Zero-Emission Technologies".

Out of Scope – Hydrogen Policies

Comment: Commenter states that to meet SIP and climate goals, more work is needed in areas such as addressing infrastructure issues, integrating hydrogen and fuel cell reversible electrolyzers, vehicle-to-grid integration, and the use of excess renewables in order to move towards 100 percent renewable hydrogen. [T2-33]

Comment: Commenter recommends adding renewable hydrogen production and hydrogen fueling stations in parallel efforts to support the ACT regulation. [T2-78]

Agency Response: No changes were made to the regulation in response to these comments. See discussion about infrastructure concern in chapter "Comments Received During Original Proposal's 45-Day Comment Period", section "Manufacturer ZEV Sales – Infrastructure Concerns". Furthermore, see the discussion about manufacturing Hydrogen vehicles to meet emissions reduction goals in chapter "Written Comments Received during the 30-Day Comment Period", section "Manufacturer ZEV Sales – Promote Hydrogen Fuel Cell Electric Vehicles and Associated Incentives".

WRITTEN COMMENTS RECEIVED DURING THE SECOND 15-DAY COMMENT PERIOD

Comments in Support of the Regulation

Comment: Commenter supports staff's regulatory proposal to reduce emissions from trucks. [RP2-01, RP2-02, RP2-03, RP2-04, RP2-08]

Agency Response: Staff appreciates the supportive comments.

Comments Related to Documents Added to Record

Comment: Commenter states two documents added to record as part of the second 15-day comment period follow the flawed regulatory structure of the ACT Regulation by expecting a sales mandate alone to establish a commercial ZEV market. This ignores barriers such as the need for fleets to earn profit on the vehicle, and challenges from the lack of available infrastructure, lower utility of ZEVs, and higher lifecycle costs. [RP2-07]

Agency Response: No changes were made to the regulation in response to this comment. See staff's response to EMA's various issues with the regulatory structure of the ACT Regulation in chapter "Comments Received During Original Proposal's 45-Day Comment Period", sections "Manufacturer ZEV Sales – Pair Manufacturer and Fleet Requirements", "Manufacturer ZEV Sales - EMA Proposal", and "Manufacturer ZEV Sales – Higher Costs Are Barrier to ZEV Deployment".

Out of Scope – Various

Comment: Commenter provides comments on the regulatory process for the Advanced Clean Fleets regulation. Commenter repeats criticism of the ACT Regulation, including a perceived lack of addressing needed ZEV infrastructure and needed long-term funding to purchase the vehicles. [RP2-07]

Comment: Commenter states the ACT Regulation ignores: the lifetime benefits of fuel cell vehicles compared to battery electric vehicles; the payload, weight, and profit/operations benefits of fuel cells vs battery electric; and the environmental hazards and associated AB617 impacts of battery production and disposal. [RP2-05]

Comment: Commenter states auxiliary or PTO equipment usage and average hours of vehicle operations should be included in the Large Entity Reporting requirement to capture information that better characterizes their fleet usage compared to metrics such as average daily mileage. Commenter also states the regulation does not provide sufficient time to collect the data needed to report which creates additional workload for their staff, and requests CARB create outreach opportunities with fleet managers which will allow agencies to explain their operations and ensure the data is accurately reported by CARB. Commenter requests CARB update their analysis of current and future available ZEVs and sources of funding for government agency procurements. Commenter also requests CARB allow LCFS fuels to be counted as offsetting emissions due to already investing significant capital in alternative fuel vehicles and infrastructure. [RP2-06]

Agency Response: No changes were made to the regulation in response to these comments. Per the “Second Notice of Public Availability of Additional Documents and Information”, comments submitted during the 15-day period must be responsive to the notice or documents added to the record. These comments do not reference the notice or the documents added to the record and therefore are outside of the scope of the notice. Additionally, all topics commenters refer to have been addressed elsewhere in this document and responses can be found in the relevant sections.

V. PEER REVIEW

Health and Safety Code Section 57004 sets forth requirements for peer review of identified portions of rulemakings proposed by entities within the California Environmental Protection Agency, including CARB. Specifically, the scientific basis or scientific portion of a proposed rule may be subject to this peer review process. Here, CARB determined that the rulemaking did not contain a scientific basis or scientific portion subject to peer review, and thus no peer review as set forth in section 57004 needed to be performed.

The regulation requires medium- and heavy-duty manufacturers to produce and sell ZEVs and requires large businesses, fleets, and government agencies to report information on their vehicles and how they use them. Requirements to build and sell ZEVs and report information do not establish “a regulatory level, standard, or other requirement for the protection of public health or the environment,” such as an ambient air quality standard or toxic exposure level. As such, it does not have a “scientific basis” or “scientific portions” that form the foundations of a regulatory standard or level.

The scientific studies and assessments used to analyze the potential environmental impacts of these regulations, such as the findings that diesel particulate is a toxic air contaminant and that greenhouse gases contribute to climate change were developed previously and subject to public review.

Appendix E
Zero Emission Truck Market Assessment

Table of Contents

Table of Figures

This appendix provides a market assessment and discusses the suitability of zero-emission vehicles (ZEVs) in the medium and heavy-duty commercial space.

A. Introduction

The future expansion of the medium and heavy-duty ZEV market is dependent on matching the suitability of zero-emission technologies with fleet operational needs. The California Air Resources Board (CARB) staff worked with various stakeholders during the rulemaking process, including the Truck and Engine Manufacturers Association (EMA), to help identify those truck market segments where the operational nature of ZEVs would be compatible with existing truck uses. EMA developed an initial assessment matrix of the suitability of battery electric applications for Class 2B through 8 commercial vehicles by identifying 87 market segments and 4 suitability factors to rank the compatibility of each market segment for electrification.

In addition to grading the suitability of ZEVs for each market segment, the assessment identified the general vehicle specifications needed by fleets that operate in each segment. The assessment also identified whether vehicles in each segment are built complete by manufacturers, or originally built as an incomplete vehicle (e.g., completed by a bodybuilder). Finally, the assessment includes estimates of the annual sales for each market segment, based on information provided by manufacturers derived from Polk registration data in California. The EMA sales numbers are generally consistent with 2016 and 2017 model year annual registrations in California.

CARB staff updated the suitability analysis to include effects of legislation and other sources of truck operational data and used quantitative method to assign a weighting factor representing the suitability for each vehicle market segment. CARB staff also extended the assessment to include fuel cell electric vehicles (FCEVs). This updated assessment was released by CARB staff as the “Advanced Clean Truck Market Segment Analysis[1]” which includes specific comments addressing all modifications CARB staff made to the original suitability factors developed by EMA. An abridged version of this assessment can be found in section E.

In addition, a more detailed overview of CARB staff’s review and assessment of each suitability factor may be found in section B. CARB staff’s final assessment and suitability results can be found in section C and section D.

The key findings from the “Advanced Clean Truck Market Segment Analysis” indicates that nearly 40 percent of sales may be suitable for transition into ZEV powertrains. The

[1]California Air Resources Board. ACT Market Analysis. February 22, 2019. https://ww2.arb.ca.gov/index.php/sites/default/files/2019-02/190225actmarketanalysis.xlsx

highest suitability for electrification are uses with predictable routes with daily VMT of under 100 miles, where weight or space is not compromised with the ZEV powertrain, and vehicles are expected to be in centralized operations where they return to base. The assessment identified that just over 70 percent of Class 4-7 vehicle sales are into markets that present a good fit for electrification today while roughly 30 percent of Class 2b-3 and Class 8 vehicles provide a good fit for electrification based on operational characteristics. These percentages are expected to increase as further advances are made in zero-emission technologies.

B. CARB Assessment of ZEV Suitability Factors

CARB staff reviewed the four suitability factors presented in the original EMA assessment and this section provides a detailed analysis of the changes made to each of these four suitability factors; weight, route/range, chagrining/fueling infrastructure, and battery/vehicle space constraints.

1. Weight

Battery-electric and fuel cell electric technology could reduce payload or increase weight compared to conventional vehicles depending on range needs, however AB 2061 allows for higher weights in California. AB 2061 which increases the weight limits by 2,000 lbs. for alternative fueled vehicles including zero emission vehicles[2]. The powertrain of a diesel vehicle includes many components not present in electric powertrains, (drivelines, transmissions and the engine) reducing the impact of a ZE powertrain on weight. In addition for some vehicle classes the owner has the option to use a higher weight class to account for any increased weight of ZEVs if necessary. Additionally, some ground-up BEV designs are lighter than their conventional counterparts through use of lightweight composite materials, as demonstrated by Proterra in their transit buses and by Chanje with their vans. In general, the hydrogen powertrain is less than that of a battery-electric powertrain for meeting higher range needs.

2. Route/Range

While high daily range requirements occur, both the US and California Vehicle In-Use Surveys (VIUS) as well as EMFAC analysis and market studies show that, on average, most trucks travel less than 100 vehicle miles travelled per day (VMT per day). This implies that range limitations may not be the primary concern for a wide range of applications. In addition as larger fleets begin to purchase ZEVs, they will be a small

[2]California Legislature. Assembly Bill No. 2061 Chapter 580. (web link: https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=201720180AB2061)

percentage of the fleet and can use conventional vehicles to meet longer range needs until ZEV technology advances and infrastructure is built out to meet all of their needs. Staff assumed the range of FCEVs would be equivalent to conventional vehicles but that fueling would still primarily occur at the fleet yard.

3. Charging/Fueling Infrastructure

Centralized deployments, where vehicles return to a depot or similar location a night, is expected to be the primary situation where BEVs are initially used and where charging infrastructure can be installed. Charging at night over extended periods also results in lower cost charging during off-peak hours. Similarly, for FCEVs, staff also assumed hydrogen stations would initially be primarily installed in centralized yards except for vehicles in Class 2B-3 because they would likely be able to fuel at light duty hydrogen stations.

4. Battery/Vehicle Space Constraints

The original EMA assessment of battery and vehicle space constraints was generally accepted by workshop participants and no changes were made to the original assessment regarding suitability for space or weight constraints.

C. Final CARB Market Segment and Suitability Analysis

CARB staff released a final market segment and suitability analysis titled “Advanced Clean Truck Market Segment Analysis” to show the suitability of zero-emission (ZE) powertrains for each of the 87 market segments. The analysis reflects estimated suitability for existing ZEV vehicle technology. This assessment is based on four vehicle operating characteristics including the following:

- Weight,
- Route/range,
- Charging/fueling infrastructure access, and
- Battery/vehicle space constraints.

The characteristics for each market segment was ranked by assigning a number value to the suitability factors as follows:

- Poorly suitable characteristics were assigned a value of 10 (RED)
- Challenging suitability characteristics were assigned a value of 3 (YELLOW)
- Highly suitable characteristics are assigned a value of 1 (GREEN)

These values were then averaged for each market segment to assign each segment a value between 1 and 10, where the lowest values would suggest the highest suitability for electrification. Suitability scores that average above 5 have at least two characteristics identified with poor suitability factors and indicate that electrification with today's technology is not likely to be feasible for most of that market segment. Details of the analysis may be found in Section E of this document.

The market segment analysis does not account for ZEV model availability, costs, site specific issues that could impact infrastructure installations, normal truck replacement rates, fleet size, nor other factors that could impact the number of ZEVs that could be deployed.

D. Suitability Results

The market segment and suitability analysis indicates that nearly 40 percent of the 87 identified truck markets have a ZEV suitability score of 1 or 2, indicating that they are the most suitable segments to transition to ZE powertrains. This suitability assessment has similar results for BEV vs. FCEV, largely because infrastructure was assumed to be at central fleet yards. As expected the results show that a transition to ZEVs is more likely to begin with fleets that have predictable route with daily VMT of under 100 miles, and have a centralized operation where infrastructure investments would likely to be installed.

The suitability distribution for all BEVs and FCEVs are presented below in Figure D-1 and Figure D-2.

Figure D-1 - BEV Suitability Distribution by Score

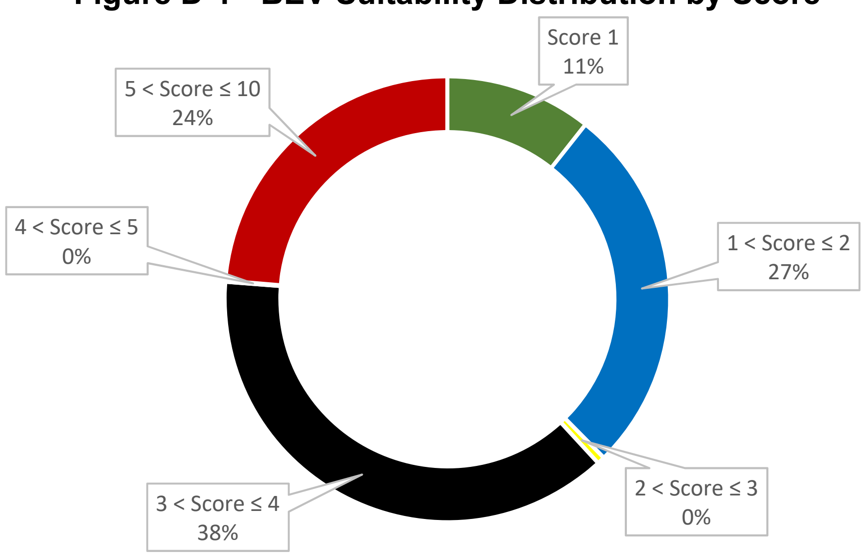

Figure D-2 - FCEV Suitability Distribution by Score

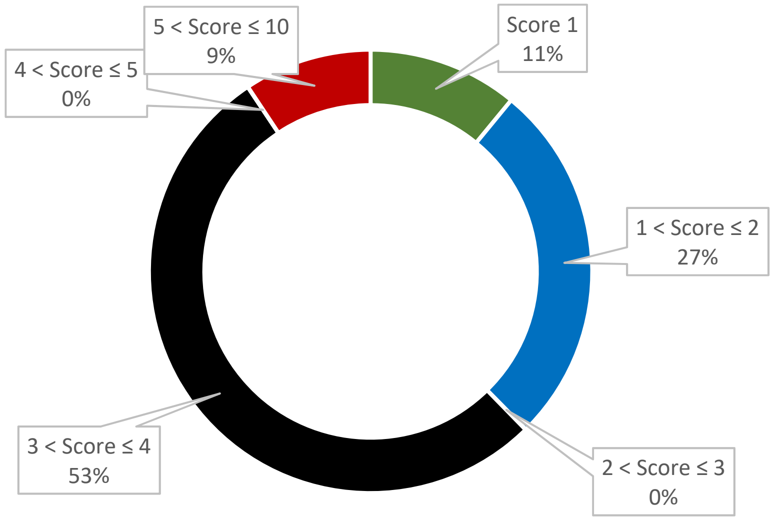

CARB staff also analyzed the suitability factors by weight class, grouping all 87 market segments into three weight categories as determined by the Gross Vehicle Weight Rating (GVWR) of the trucks that operate within each market segment. These categories are Class 2b-3, Class 4-7, and Class 8. The overall results of this assessment show that just over 70 percent of Class 4-7 vehicles received a suitability score of 1 or 2 and are good fits for electrification today while roughly 30 percent of Class 2b-3 and Class 8 vehicles are good fits. CARB staff believe that further advances in ZE technology will increase these percentages. The following is a detailed analysis of the ZE suitability factors for all three weight class categories.

a. Class 2b-3 (GVWR 8,500 to 14,000 lbs.)

Class 2b-3 covers roughly 75,000 California sales on an annual basis and consists of vehicles serving in both private and commercial roles. Figure D-3 and Figure D-4 summarize the suitability scores of Class 2b-3 vehicles from the market segment suitability analysis. The figures show that about 30 percent of trucks in this category received a suitability score of 1 or 2 and have operational characteristics that are suitable for electrification.

Figure D-3 - BEV Suitability, Class 2b-3

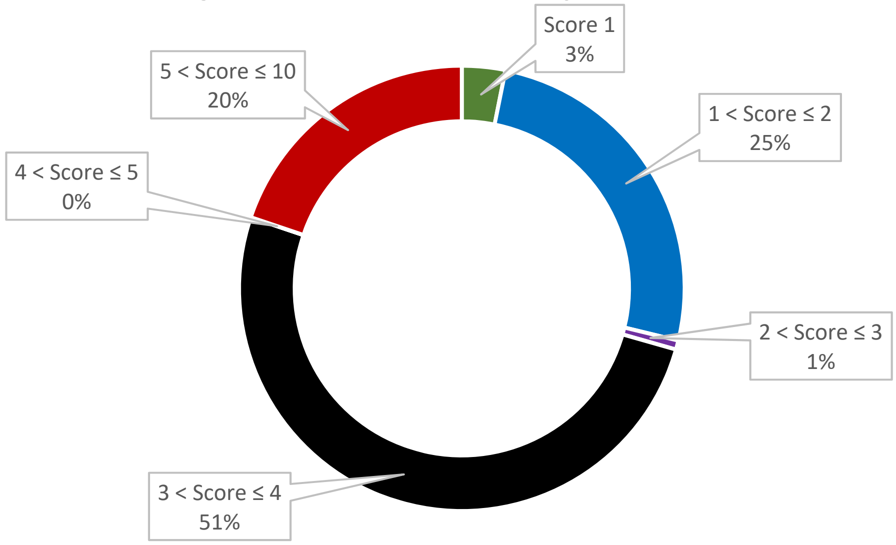

Figure D-4 - FCEV Suitability, Class 2b-3

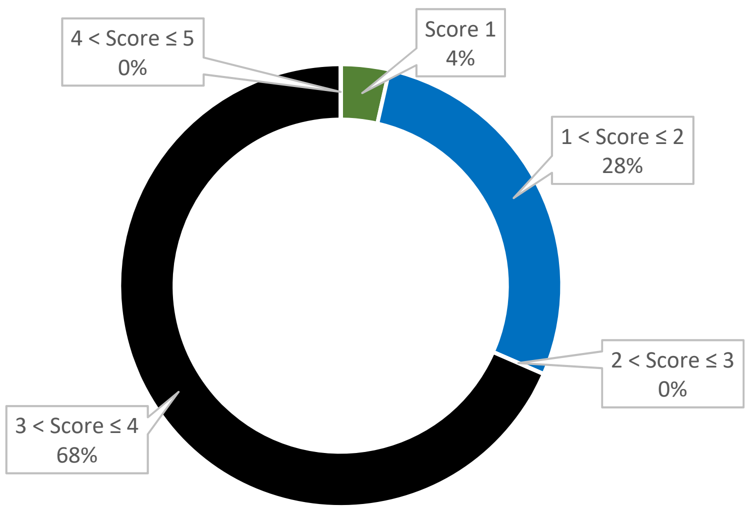
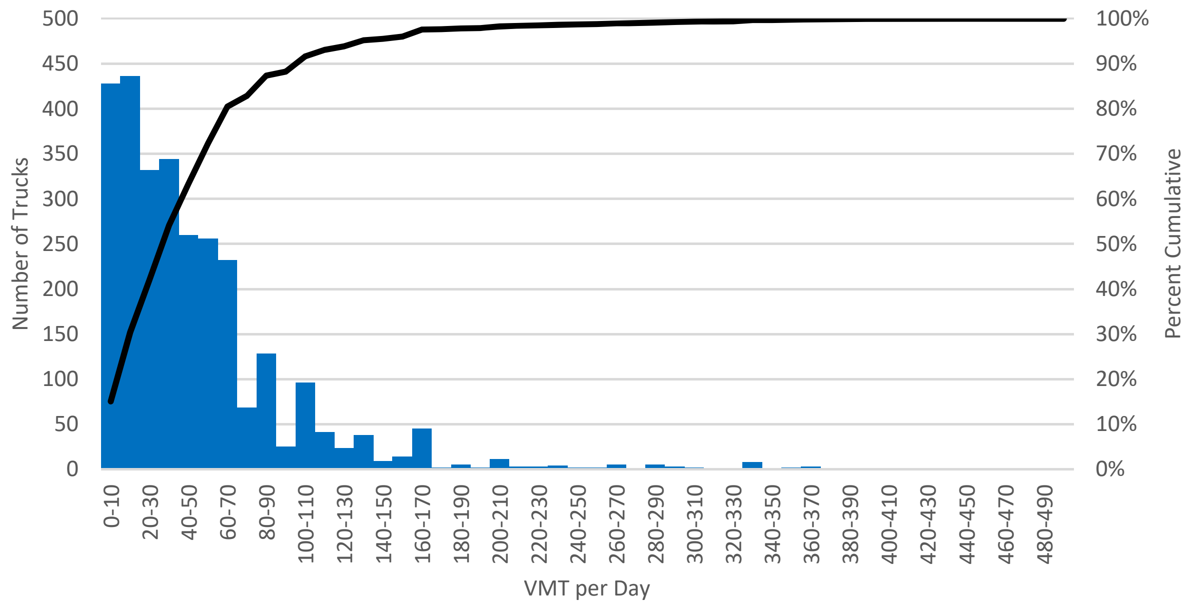


The 2018 California Vehicle Inventory and Use Survey identifies that almost 90 percent of vehicles within Class 3 accrue less than 100 vehicle miles travelled (VMT) per day. The result of the California VIUS VMT for Class 3 vehicles is shown in Figure D-5. This conclusion is supported by the 2002 US VIUS[3], which identifies around 90 percent of vehicles in Class 3 as having less than 100 daily VMT.

[3]U.S. Census Bureau. 2002 Economic Census Vehicle Inventory and Use Survey Geographic Area Series. (web link: https://www2.census.gov/library/publications/economic-census/2002/vehicle-inventory and-use-survey/ec02tv-us.pdf)

Figure D-5 - Distribution of VMT per Day, Class 3, California VIUS



This population of vehicles is dominated by pickup trucks whose variable towing needs, and lack of space to mount battery systems or hydrogen tanks form the primary obstacles to electrification. Space constraints are not identified as a concern for vans within this segment, which accounts for approximately 30 percent of the Class 2b-3 vehicles, making them well-positioned for transition to zero-emission technologies. Commercial light-duty ZE pickup trucks are planned to be introduced to the market in upcoming years, and it is expected that improvement in battery technology and vehicle designs will make ZE pickup trucks in these higher weight classes more suitable.

b. Class 4-7 (GVWR 14,001 to 33,000 lbs.)

Class 4-7 vehicles account for nearly 19,000 sales annually in California and consist of a wide range of truck body configurations and applications. Figure D-6 and Figure D-7 summarize the suitability score for BEV and FCEV technologies in this vehicle segment. The figures show that about 70 percent of trucks in this category received a suitability score of 1 or 2 and have operational characteristics that are suitable for electrification.

Figure D-6 - BEV Suitability, Class 4-7

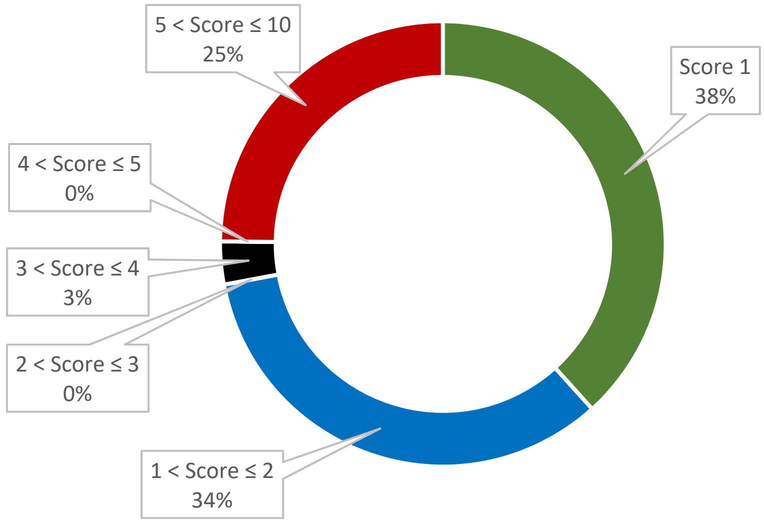


Figure D-7 - FCEV Suitability, Class 4-7

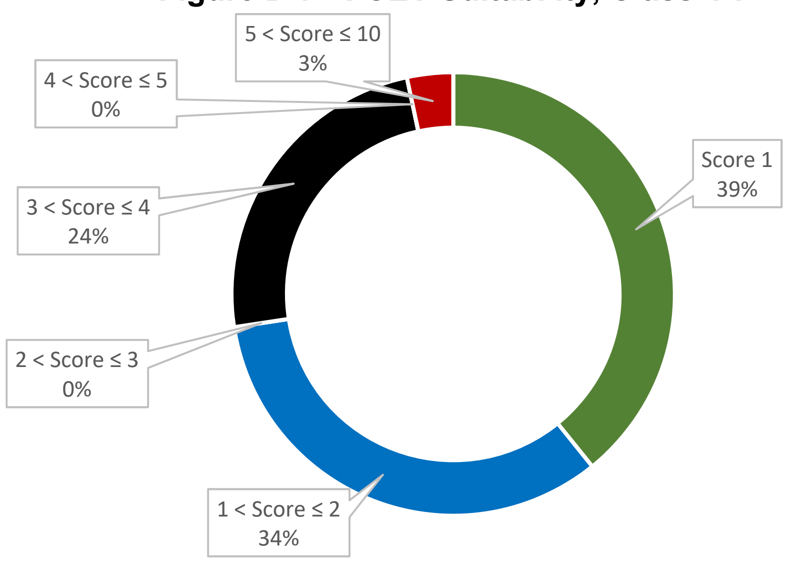
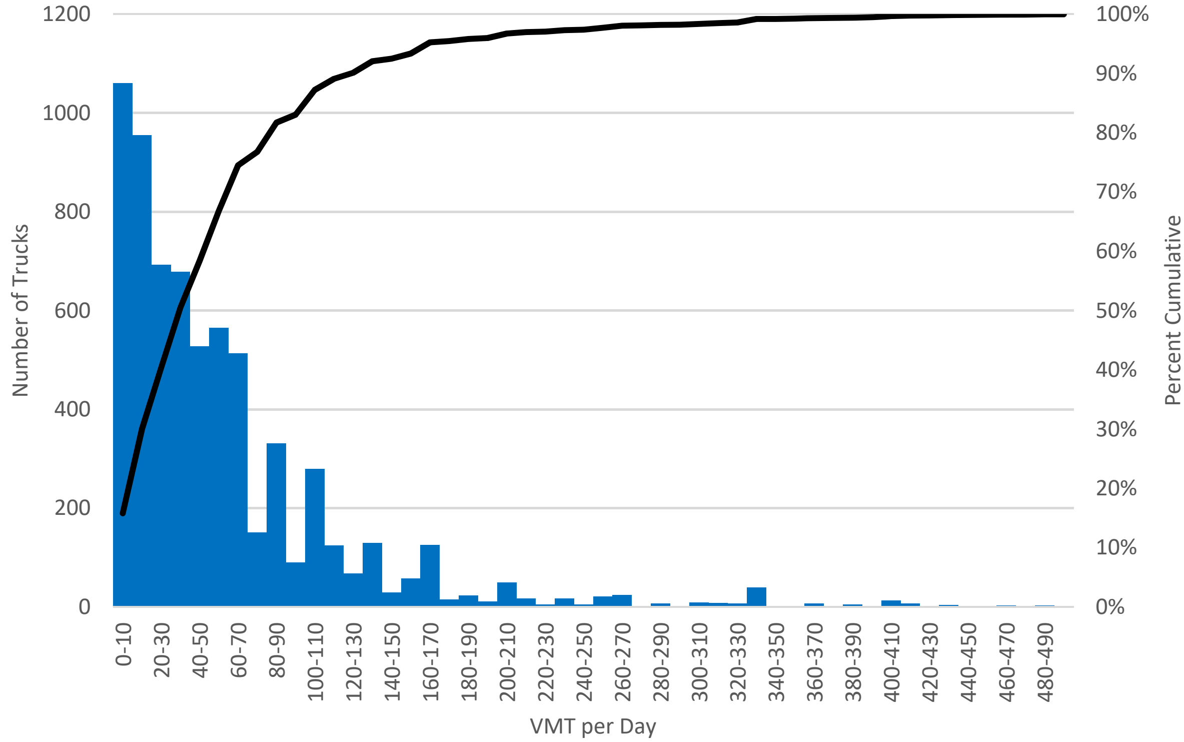


Vehicles in this segment are typically incomplete vehicles (such as cutaway van chassis) used by second stage manufacturers to customize the vehicles' utility to the individual needs of the customer. The California VIUS identifies that more than 80 percent of vehicles in these classes accrue less than 100 daily VMT. The results of the California VIUS is shown in Figure D-8. The US VIUS corroborates this finding and data collected indicates that almost 90 percent of vehicles in these weight categories accrue less than 100 daily VMT.

Figure D-8 - Distribution of VMT per Day, Class 4-7, California VIUS



Class 4-7 represents the segment with highest percentage of vehicles that are suitable for electrification. Centralized deployment, short, predictable routes and the flexibility to accommodate the weight and size of ZE powertrains cause this segment to stand out. These characteristics are reflected in the numerous ZEV options readily available on the market to replace existing conventional vehicles.

c. Class 8 (GVWR >33,000 lbs.)

Class 8 represents nearly 7,600 annual sales in California and consists of large tractors and some vocational vehicles. The results of the market segment analysis are shown in Figure D-9 and Figure D-10. The figures show that about 30 percent of trucks in this category received a suitability score of 1 or 2 and have operational characteristics that are potentially suitable for electrification.

Figure D-9 - BEV Suitability Distribution, Class 8

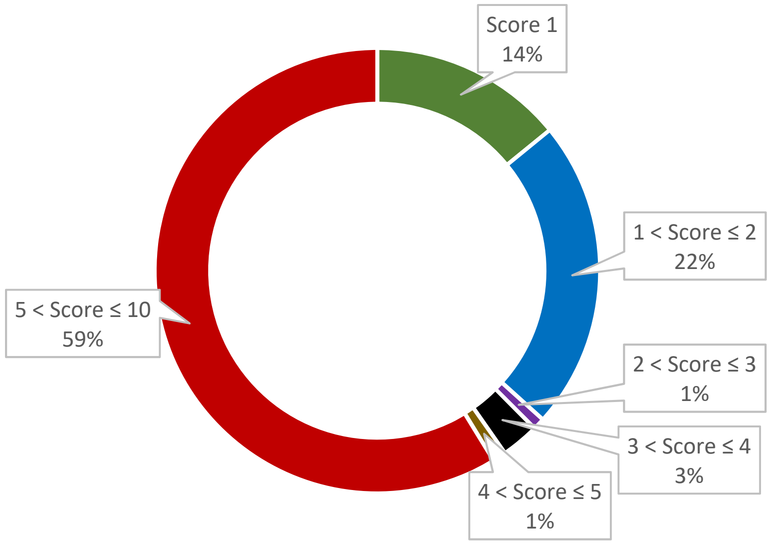


Figure D-10 - FCEV Suitability Distribution, Class 8

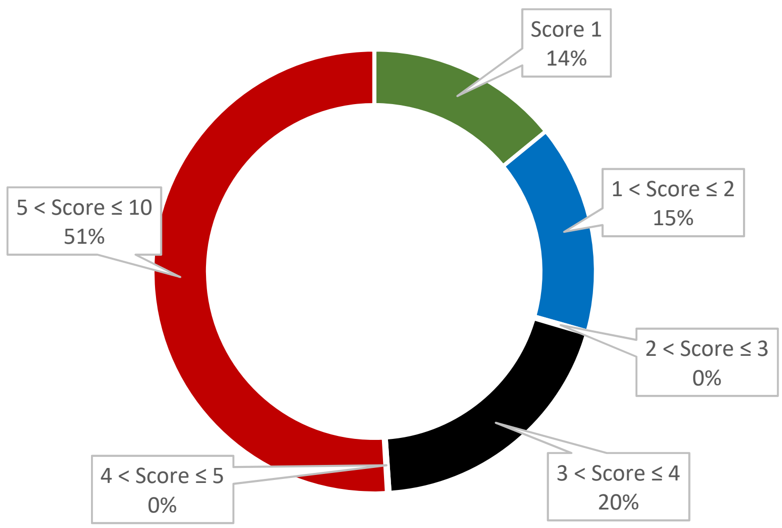
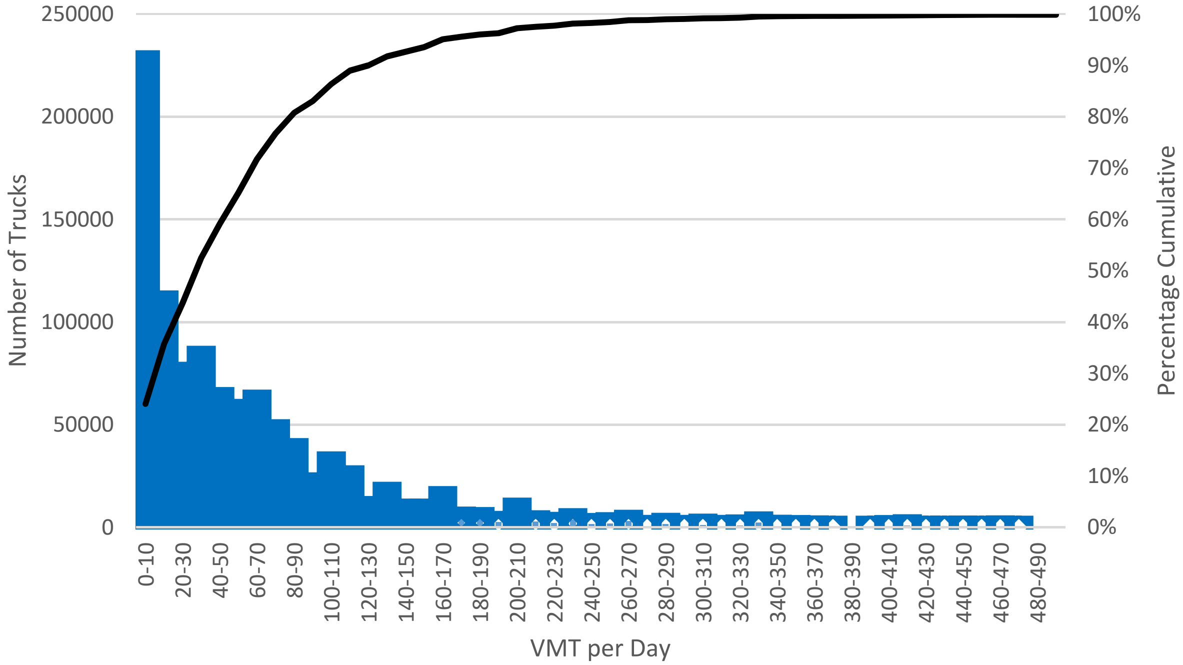


The US VIUS indicates that around 80 percent of the Class 8 population accrue less than 100 VMT. The results of the US VIUS is shown in Figure D-11.

Figure D-11 - Distribution of VMT per Day, Class 8, US VIUS



Vehicles in this market segment are operated in a variety of uses, ranging from a good to poor potential for electrification.

Vehicles in Class 8 are generally characterized by heavy loads, long and unpredictable routes, but many also operate short and predictable routes from centralized locations. Some examples include yard tractors and short-haul on-road tractors used for local delivery and drayage operations. Long-haul ZEVs are not expected to offer one-to-one replacements for conventional vehicles for some time due to limited at present. Class 8

E. Advanced Clean Truck Market Segment Analysis

1. Battery Electric Vehicle Suitability Table

Table E-1 - Battery Electric Vehicle Suitability Table

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
1	3.75	**Beverage Tractor**	8	123	I	Start at max load, diminish throughout day (Value=1)	Fixed, 100 miles per day (Value=3)	Centralized, at night (Value=1)	Constrained (Value=10)
2	1.5	**School Bus - Class C (Longer Rural Routes)**	4-7	87	C or I	Light (Value=1)	125 miles per day (Value=3)	Centralized, at night and during the day (Value=1)	Open (Value=1)
3	1	**School Bus - Class C (Shorter Urban Routes)**	4-7	608	C or I	Light (Value=1)	<75 miles per day (Value=1)	Centralized, at night and during the day (Value=1)	Open (Value=1)
4	1	**School Bus - Class C (Special Needs - ADA)**	4-7	87	C or I	Light (Value=1)	50-150 miles per day (Value=1)	Centralized, at night and during the day (Value=1)	Open (Value=1)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
5	1.5	**School Bus - Class C (Long distance - Field Trip, special Events - just a bus)**	4-7	87	C or I	Light (Value=1)	125 miles per day Multiple uses, fixed and flexible routes (Value=3)	Centralized, at night and during the day (Value=1)	Open (Value=1)
6	1	**School Bus - Class Rear Engine (Transit Style) All**	4-7	226	C or I	Light to medium. Higher capacity. (Value=1)	Varied Occassional use on long routes (Value=1)	Centralized, at night and during the day (Value=1)	Open (Value=1)
7	2	**Refuse, Automatic Side Loader (ASL), Residential Service**	8	400	I	Start light, end day at max load (Value=3)	Fixed, 75 miles per day. Occasional long routes (Value=1)	Centralized, at night (Value=1)	Constrained (Value=3)
8	2	**Refuse, Front Loader, Commercial or High Density Residential Service**	8	65	I	Start light, end day at max load (Value=3)	Fixed, 100 miles per day. Occasional long routes (Value=1)	Centralized, at night (Value=1)	Constrained (Value=3)
9	2	**Refuse, Rear Packer, Residential Service**	8	133	I	Start light, end day at max load (Value=3)	Fixed, 75 miles per day. Occasional long routes (Value=1)	Centralized, at night (Value=1)	Constrained

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
10	2.5	**Refuse Hauler (roll on/roll off)**	8	65	I	50% laden, 50% unladen, highly variable from lightly loaded to grossed out. (Value=3)	Variable, up to 250 miles per day (Value=3)	Centralized, at night (Value=1)	Somewhat constrained (Value=3)
11	1	**Step Van - Parcel Delivery**	4-7	1985	I	Light (Value=1)	Fixed, 50 miles per day (Value=1)	Centralized, at night (Value=1)	Open (Value=1)
12	1	**Step Van - Municipal Fleet**	4-7	298	I	Can be heavy (like electrician or plumber) (Value=1)	Can be highly variable, local some days potentially to many sites around municipality in same day (Value=1)	Centralized, at night Can have a need for emergency service (e.g., storms) that force long drives and long hours away from charging (Value=1)	Open (Value=1)
13	1.5	**H-D Van - Parcel Delivery Class 2B-3)**	2B-3	951	I	Light (Value=1)	50-300 miles per day, Medium route variability (Value=1)	Centralized, at night (Value=1)	Constrained (Value=3)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
14	1.5	**H-D Van - Parcel Delivery (Class 4,5)**	4-7	1985	I	Light (Value=1)	50-300 miles per day, Medium route variability (Value=1)	Centralized, at night (Value=1)	Constrained (Value=3)
15	2	**H-D Van - Contractor**	2B-3	11854	C	Heavy (Value=1)	50-150 miles per day, High route variability (Value=1)	Some central dispatch, many go with driver o/n (Value=3)	Constrained (Value=3)
16	1	**H-D Van - Shuttle**	2B-3	1116	I	Light (Value=1)	50-300 miles per day, Medium route variability (Value=1)	Centralized, but 24/7 operation (Value=1)	Open (Value=1)
17	2	**H-D Van - Refrigerated**	2B-3	70	I	Heavy (Value=1)	200-300 miles per day. Refrigeration reduces range, High route variability (Value=3)	Centralized, at night (Value=1)	Constrained (Value=3)
18	1	**H-D Van - School Bus**	2B-3	70	I	Light (Value=1)	65 miles per day, Low route variability (Value=1)	Centralized, at night (Value=1)	Open (Value=1)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints

2. Fuel Cell Electric Vehicle Suitability Table

Table E-3 - Fuel Cell Electric Vehicle Suitability Table

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Fueling Infrastructure	Vehicle Space Constraints
1	3.25	**Beverage Tractor**	8	123	I	Start at max load, diminish throughout day (Value=1)	Fixed, 100 miles per day (Value=1)	Centralized, at night (Value=1)	Constrained (Value=10)
2	1	**School Bus - Class C (Longer Rural Routes)**	4-7	87	C or I	Light (Value=1)	125 miles per day (Value=1)	Centralized, at night and during the day (Value=1)	Open (Value=1)
3	1	**School Bus - Class C (Shorter Urban Routes)**	4-7	608	C or I	Light (Value=1)	<75 miles per day (Value=1)	Centralized, at night and during the day (Value=1)	Open (Value=1)
4	1	**School Bus - Class C (Special Needs - ADA)**	4-7	87	C or I	Light (Value=1)	50-150 miles per day (Value=1)	Centralized, at night and during the day (Value=1)	Open (Value=1)
5	1	**School Bus - Class C (Long distance - Field Trip, special Events - just a bus)**	4-7	87	C or I	Light (Value=1)	125 miles per day Multiple uses, fixed and flexible routes (Value=1)	Centralized, at night and during the day (Value=1)	Open (Value=1)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
6	1	**School Bus - Class Rear Engine (Transit Style) All**	4-7	226	C or I	Light to medium. Higher capacity. (Value=1)	Varied Occassional use on long routes (Value=1)	Centralized, at night and during the day (Value=1)	Open (Value=1)
7	3.75	**Refuse, Automatic Side Loader (ASL), Residential Service**	8	400	I	Start light, end day at max load (Value=3)	Fixed, 75 miles per day (Value=1)	Centralized, at night (Value=1)	Constrained (Value=10)
8	3.75	**Refuse, Front Loader, Commercial or High Density Residential Service**	8	65	I	Start light, end day at max load (Value=3)	Fixed, 100 miles per day. Occasional long routes (Value=1)	Centralized, at night (Value=1)	Constrained (Value=10)
9	3.75	**Refuse, Rear Packer, Residential Service**	8	133	I	Start light, end day at max load (Value=3)	Fixed, 75 miles per day. Occasional long routes (Value=1)	Centralized, at night (Value=1)	Constrained (Value=10)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
10	2	**Refuse Hauler (roll on/roll off)**	8	65	I	50% laden, 50% unladen, highly variable from lightly loaded to grossed out. (Value=3)	Variable, up to 250 miles per day (Value=1)	Centralized, at night (Value=1)	Somewhat constrained (Value=3)
11	1	**Step Van - Parcel Delivery**	4-7	1985	I	Light (Value=1)	Fixed, 50 miles per day (Value=1)	Centralized, at night (Value=1)	Open (Value=1)
12	1	**Step Van - Municipal Fleet**	4-7	298	I	Can be heavy (like electrician or plumber) (Value=1)	Can be highly variable, local some days potentially to many sites around municipality in same day (Value=1)	Centralized, at night Can have a need for emergency service (e.g., storms) that force long drives and long hours away from charging (Value=1)	Open (Value=1)
13	1.5	**H-D Van - Parcel Delivery Class 2B-3)**	2B-3	951	I	Light (Value=1)	50-300 miles per day (Value=1)	Centralized, at night (Value=1)	Constrained (Value=3)
14	1.5	**H-D Van - Parcel Delivery (Class 4,5)**	4-7	1985	I	Light (Value=1)	50-300 miles per day (Value=1)	Centralized, at night (Value=1)	Constrained (Value=3)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
15	2	**H-D Van - Contractor**	2B-3	11854	C	Heavy (Value=1)	50-150 miles per day (Value=1)	Some central dispatch, many go with driver o/n (Value=3)	Constrained (Value=3)
16	1	**H-D Van - Shuttle**	2B-3	1116	I	Light (Value=1)	50-300 miles per day (Value=1)	Centralized, but 24/7 operation (Value=1)	Open (Value=1)
17	1.5	**H-D Van - Refrigerated**	2B-3	70	I	Heavy (Value=1)	200-300 miles per day. Refrigeration reduces range (Value=1)	Centralized, at night (Value=1)	Constrained (Value=3)
18	1	**H-D Van - School Bus**	2B-3	70	I	Light (Value=1)	65 miles per day (Value=1)	Centralized, at night (Value=1)	Open (Value=1)
19	3.75	**H-D Van - Motor Home**	2B-3	29	I	Heavy (Value=1)	300-450 miles per day (Value=1)	Dispersed, or infrastructure dependent (Value=10)	Constrained (Value=3)
20	1	**Box Truck - Pickup & Delivery (Fixed Light <100 Miles per Day)**	4-7	3075	I	Light (Value=1)	Variable <100 miles per day (Value=1)	Centralized (Value=1)	Open (Value=1)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
21	1.5	**Box Truck - Pickup & Delivery (Medium to Heavy Load >100 Miles per Day)**	4-7	1538	I	Medium to heavy (Value=3)	Variable >100 miles per day (Value=1)	Centralized (Value=1)	Open (Value=1)
22	3.75	**Box Truck - Pickup & Delivery (Medium to Heavy Load >200 Miles per Day)**	4-7	1538	I	Medium to heavy (Value=10)	Variable >200 miles per day (Value=1)	Centralized or remote (Value=3)	Open (Value=1)
23	1.5	**Box Truck - Leasing (Daily Rental)**	4-7	152	I	Light (Value=1)	Variable <100 miles per day (Value=1)	Centralized or remote (Value=3)	Open (Value=1)
24	1	**Box Truck - Leasing (Fixed Customer and Application)**	4-7	228	I	Light to medium (Value=1)	Variable <100 miles per day (Value=1)	Centralized (Value=1)	Open (Value=1)
25	1	**Box Truck - Leasing (Fixed Customer and Application)**	4-7	228	I	Medium to heavy (Value=1)	Variable <100 miles per day (Value=1)	Centralized (Value=1)	Open (Value=1)
26	1.5	**Box Truck - Leasing (Fixed Customer and Application)**	4-7	76	I	Medium to heavy (Value=3)	Variable >100 miles per day (Value=1)	Centralized (Value=1)	Open (Value=1)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
27	1.5	**Box Truck - Leasing (Fixed Customer and Application)**	4-7	76	I	Medium to heavy GVWR limited (Value=3)	Variable >200 miles per day (Value=1)	Centralized (Value=1)	Open (Value=1)
28	1	**Straight Truck Pickup & Delivery (Heavy Load >100 Miles per Day)**	8	1069	I	Heavy (Value=1)	Variable >100 miles per day (Value=1)	Centralized (Value=1)	Open (Value=1)
29	1.5	**Box Truck - Refrigerated**	4-7	390	I	Medium to heavy load (Value=1)	Variable <100 miles per day (Value=1)	Centralized (Value=1)	Constrained if equipped with diesel TRU (Value=3)
30	1	**Flatbed - Stake/Platform**	4-7	370	I	Variable (Value=1)	Variable (Value=1)	Centralized (Value=1)	Open (Value=1)
31	1.5	**Regional Tractor - Short Haul**	4-7	400	C	Variable, up to 80K GCW (Value=1)	Variable, <100 miles per day (Value=1)	Centralized, at night. Multiple shift operations impact charging times (Value=1)	Constrained - short wheelbase (Value=3)
32	1.5	**Regional Tractor - Short Haul**	8	400	C	Variable, up to 80K GCW (Value=1)	Variable, <100 miles per day (Value=1)	Centralized, at night. Multiple shift operations impact charging times (Value=1)	Constrained - short wheelbase (Value=3)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
33	1.5	**Regional Tractor - Medium Haul**	4-7	200	C	Variable, up to 80K GCW (Value=1)	Variable, 100-300 miles per day (Value=1)	Centralized, at night. Multiple shift operations impact charging times (Value=1)	Constrained, short wheelbase (Value=3)
34	1.5	**Regional Tractor - Medium Haul**	8	400	C	Variable, up to 80K GCW (Value=1)	Variable, 100-300 miles per day (Value=1)	Centralized, at night. Multiple shift operations impact charging times (Value=1)	Constrained, short wheelbase (Value=3)
35	6	**Regional Tractor - Long Haul**	4-7	100	C	Variable (Value=3)	Variable, >200 miles per day (Value=1)	Future retail charging network? Multiple shift operations impact charging times (Value=10)	Constrained - short wheelbase, fairings (Value=10)
36	6	**Regional Tractor - Long Haul**	8	300	C	Heavy (Value=3)	Variable, 200-500+ miles per day (Value=1)	Future retail charging network? Multiple shift operations impact charging times (Value=10)	Constrained (Value=10)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
37	2	**Port Drayage**	8	120	C	Heavy (Value=1)	Variable, 100-500 miles per day (Value=1)	Variable / Centralized, depending on owner. Multiple shift operations impact charging times (Value=3)	Constrained - short wheelbase (Value=3)
38	2	**Pickup Truck - Agriculture**	2B-3	500	C or I	Variable--dependent on type of agriculture. (Value=3)	Assume set routes, <100 miles per day, may have extended idling. Likely extended operation (Value=1)	Centralized (Value=1)	Constrained (Value=3)
39	3.75	**Pickup Truck - Contractor**	2B-3	5000	C or I	Moderate to heavy (Value=1)	Variable (Value=1)	Variable (Value=3)	Constrained (Value=10)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
40	3.75	**Pickup Truck - Towing**	2B-3	3000	C or I	Heavy (Value=1)	Variable--expect several will have long distance (~500 mile) routes. Towing will significantly shorten available EV range. (Value=1)	Variable (Value=3)	Constrained (Value=10)
41	5.5	**Pickup Truck - 4WD Off Road**	2B-3	5000	C or I	Light to moderate (Value=1)	Variable--expect some will have long distance routes. (Value=1)	Variable--off road usage will likely be away from EV grid. Off-highway usage and extended operation will make charging impossible for extended offroad operation. (Value=10)	Constrained (Value=10)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
42	3.75	**Pickup Truck - PTO Equipped**	2B-3	1500	C or I	Moderate to heavy (Value=1)	Assume set routes, <100 miles per day, may have extended idling. (Value=1)	Variable (Value=3)	Constrained (Value=10)
43	5.5	**Line Haul Tractor**	4-7	500	C	Heavy (Value=10)	Variable; 500+ mile days (Value=1)	Variable (Value=10)	Open (Value=1)
44	5.5	**Line Haul Tractor**	8	3000	C	Heavy (Value=10)	Variable; 500+ mile days (Value=1)	Variable (Value=10)	Open (Value=1)
45	7.75	**Logging**	8	5	C	Heavy (Value=10)	Variable (Value=1)	Variable, Long off-road travel (Value=10)	Constrained, ground clearance (Value=10)
46	5.5	**Concrete Mixer**	8	70	I	Typically 50% empty, 5-% grossed out (Value=10)	Highly variable (Value=1)	Centralized, at night (Value=1)	Highly constrained due to body equipment and weight (Value=10)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
47	7.75	**Concrete Pumper**	8	37	I	Due to weight of pumping equipment the vehicle is always heavily loaded (Value=10)	Highly variable (Value=1)	Vehicle may remain at construction site for multiple days (Value=10)	Highly constrained (Value=10)
48	4.25	**Mining Hauler**	8	15	I	Heavy (Value=10)	Fixed (Value=1)	Centralized; Long off-road travel (Value=3)	Constrained (Value=3)
49	2.5	**Mining Service**	8	15	C	Medium – fixed (Value=3)	Variable (Value=1)	Centralized; Long off-road travel (Value=3)	Constrained, due to body (Value=3)
50	5.5	**Heavy Equipment Transport**	8	110	C	Heavy (Value=10)	Variable (Value=1)	Variable (Value=10)	Open (Value=1)
51	1.5	**Utility/Lube Service**	4-7	76	I	Can be heavy (like electrician or plumber) (Value=1)	Can be highly variable, local some days potentially to many sites around municipality in same day (Value=1)	Centralized, at night Can have a need for emergency service (e.g., storms) (Value=3)	Open (Value=1)
52	7	**Oil Field Rig Mover**	8	14	C	Extremely high (Value=10)	Highly variable (Value=1)	May be enroute/onsite multiple days (Value=10)	

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
53	7.75	**Oil Field Well Servicing**	8	110	I	Always loaded at or near GVWR (Value=10)	Highly variable (Value=1)	Mixed locations, could need to charge during peak times Many of these vehicles are for off-road use only. (Value=10)	Constrained (Value=10)
54	1.5	**Tow/Wrecker**	4-7	250	I	Variable (Value=1)	Variable, <100 miles per day (Value=1)	Centralized when not in use (Value=1)	Constrained. Need space for bed/hoist and hydraulic mechanisms between the frame rails where batteries would be installed (Value=3)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints
55	1	**Farm Service - Truck**	2B-3	119	I	Heavy (almost like a dump truck) May be restricted on weight due to heavy produce and need to operate in ag fields (Value=1)	Fixed, but can be long distance from farm to city (Value=1)	Centralized but in rural area at night (Value=1)	Open (Value=1)
56	5.5	**Farm Service - Tractor**	8	90	C	Heavy (almost like a dump truck) May be restricted on weight due to heavy produce and need to operate in ag fields (Value=10)	Fixed, but can be long distance from farm to city (Value=1)	Centralized but in rural area at night (Value=1)	Constrained (short wheelbase) (Value=10)
57	3.75	**Tanker Truck - Liquids or Gases**	8	44	I	Start at max load, may diminish throughout day (Value=3)	Fixed, but can be long distance from depot to destination (Value=1)	Centralized, at night (Value=1)	Constrained due to effort to maximize payload (Value=10)

Index	Quantitative Suitability Score	Market Segment	Class	Annual CA Sales	Complete/ Incomplete	Loading	Routes/Range	Infrastructure/ Charging	Battery Space Constraints

A. Introduction

Mobile sources are the greatest contributor to emissions of criteria pollutants and greenhouse gases (GHG) in California, accounting for about 80 percent of ozone precursor emissions and approximately 50 percent of statewide GHG emissions when upstream emissions are included. Zero-emission vehicles (ZEVs) have no tailpipe emissions and help protect public health, reduce petroleum use, meet sustainability objectives, and reduce direct exposure to diesel emissions in local communities.

The proposed Advanced Clean Trucks (ACT) regulation (Proposed ACT Regulation) aims to accelerate adoption of medium and heavy duty ZEVs with a gross vehicle weight rating (GVWR) greater than 8,500 lbs. as part of California's strategy to reduce emissions from transportation. The Proposed ACT Regulation has two main elements:

- Manufacturers would be required to produce and sell medium and heavy duty ZEVs at an increasing percentage of California sales, and
- Large employers like retailers, manufacturers, government agencies and fleet owners would be required to report information that can be used to develop future strategies to further accelerate the use of ZEVs.

The proposed manufacturer ZEV sales requirement will meet several objectives and recommendations included in the Sustainable Freight Action Plan, Mobile Source Strategy[1] and ZEV Action Plan. The Proposed ACT Regulation will also complement recently approved regulations that require transit agencies and airport shuttle service providers to begin purchasing zero-emission buses, and to meet the zero-emission (ZE) truck purchase requirements in Assembly Bill 769 (AB 769) for state government fleets. The proposed manufacturer ZEV sales requirement also complements the federally and California-adopted Phase 2 GHG (CA Phase 2 GHG) regulation, because ZEVs can be used to meet these existing requirements. Finally, the Proposed ACT Regulation, including the proposed reporting requirement, establishes a foundation for meeting executive orders, plans, and directives issued by the Governor as described in the next section.

1. Regulatory History

In March 2017, CARB adopted the Revised Proposed 2016 State Strategies document as part of the State Implementation Plan (SIP) which identified several sectors that are key to launching heavy-duty zero-emission technology in the on-road heavy-duty sector: transit buses, delivery trucks, and airport shuttles.[2] The Proposed ACT Regulation continues implementation of these strategies to increase the first wave of heavy-duty ZEV deployments. The SIP includes the "Last Mile Delivery" measure which focuses on deploying zero-emission vehicles and equipment in well-suited applications. Based on continued assessment of

[1] California Air Resources Board, 2016 Mobile Source Strategy, May 2016, (web link: https://www.arb.ca.gov/planning/sip/2016sip/2016mobsrc.pdf, last accessed June 2019).
[2] California Air Resources Board, Revised Proposed 2016 State Strategy for the State Implementation Plan, released on March 7, 2017 (web link: https://www.arb.ca.gov/planning/sip/2016sip/rev2016statesip.pdf, last accessed June 2019).

technological readiness, the Proposed ACT Regulation includes last mile delivery vehicles and expands to include a wider range of vehicles in well-suited applications. The experience gained by operating these early ZEVs are expected to benefit other heavy-duty vehicle markets and increase the commercialization, and acceptance, of clean transportation technologies in a wide range of applications.

The Sustainable Freight Action Plan established the strategy of using zero-emission technology where feasible, and “near-zero” with renewable fuels everywhere else, to meet California’s long-term air quality goals.[3] The Proposed ACT Regulation requires ZEV production and sales, while allowing for partial compliance with “near-zero” plug-in hybrid electric vehicle (PHEV) technology, closely matches with the Sustainable Freight strategy.

Several California executive orders and policies provide additional background for the Proposed ACT Regulation. In March 2012, Governor Edmund G. Brown issued Executive Order B-16-2012[4] directing California agencies to establish benchmarks for key milestones to help support and facilitate the ZEV market in California. One of those milestones include deploying over 1.5 million ZEVs and PHEVs on the road by 2025. As a result of this order, multiple state agencies, including the California Air Resources Board (CARB), worked to develop and release the 2013 ZEV Action Plan (2013 Plan).[5] The 2013 Plan identified over 100 strategies to meet the milestones of the Executive Order and included four broad goals to advance the overall ZEV market:

- Complete needed ZEV infrastructure and planning;
- Expand consumer awareness and demand of ZEVs;
- Transform fleets; and
- Grow jobs and investment in the private sector.

In January 2018, Governor Brown issued Executive Order B-48-18 building on past efforts to increase ZEVs by increasing California’s goal to 5 million ZEVs on the road by 2030, and setting a target of 250,000 chargers by 2025.[6] Also in 2018, Governor Brown issued executive order B-55-18, which sets a target to achieve carbon neutrality in California no later than 2045, and achieve and maintain net negative emissions thereafter.[7] The Proposed ACT Regulation

will support these goals by ensuring large scale production by manufacturers and is estimated to place 56,000 medium- and heavy-duty ZEV's in California by 2030.

In August 2018, Governor Brown sent a letter to Chair Nichols of CARB directing CARB to pursue conversion of public and private fleets to zero-emission vehicles in categories including large employers, delivery vehicles, and transportation service fleets.[8] In response, staff proposed adding a reporting requirement to the Proposed ACT Regulation, to collect additional information from large employers, retailers, brokers and fleets. The information would inform future rules to require the use of ZEVs that would further expand the ZEV market, and to complement the proposed manufacturer ZEV sales requirements, and other policies.

The Proposed ACT Regulation would complement other regulations recently adopted by the Board that require zero-emission airport shuttle and transit bus purchases. It also supports AB 739 that requires state fleets to purchase ZE trucks. The Innovative Clean Transit (ICT) regulation applies to buses with a GVWR greater than 14,000 lbs. It requires transit agencies to begin purchasing zero-emission buses (ZEBs) in 2023, and is phased-in so that 100 percent of bus purchases must be ZEBs beginning in 2029. Similarly, the Airport Shuttle Bus (ASB) regulation requires the purchase of zero-emission shuttle buses with a GVWR greater than 8,500 lbs. with a complete transition to zero-emission shuttles by 2035. Finally, AB 739 requires California state owned fleets of vehicles at or over 19,000 lbs. GVWR to purchase 15 percent ZEVs [9] starting in 2026, ramping up to 30 percent by 2030. Manufacturers can earn credit in the Proposed ACT Regulation for ZEVs sold to fleets affected by these other requirements. However, staff are excluding the cost and benefits of the ZEV purchases that are already required by the ICT regulation, ASB regulation, and AB739 from the Proposed ACT Regulation as they are already expected and attributed to other regulations.

The Proposed ACT Regulation also complements other regulations approved by CARB and the United States Environmental Protection Agency (US EPA) to reduce GHG emissions from medium- and heavy-duty vehicles. The U.S. EPA Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2 (Federal Phase 2 GHG) is structured to provide a range of options to manufacturers to reduce the fuel consumption of medium- and heavy-duty vehicles through use of a range of technologies including aerodynamics, more efficient engines, ZEVs and other technologies.[10] California adopted this federal program with minor changes. The California Greenhouse Gas Emissions Standards for Medium- and Heavy-duty Engines and Vehicles, and the Amendments to the Tractor-Trailer GHG Regulation (CA Phase 2 GHG) were adopted by the Board in February 2018.[11] There are some synergies in costs and emissions benefits between CA Phase 2 GHG

[11] California Air Resources Board, Staff Report: Initial Statement of Reasons for Proposed Rulemaking Proposed California Greenhouse Gas Emission Standards for Medium- and Heavy-Duty Engines and Vehicles and

and the Proposed ACT Regulation, because ZEVs can be used to comply with both regulations. Since the Phase 2 GHG regulation is already in effect, no new GHG emissions reductions are attributed to the Proposed ACT Regulation unless the number of ZEVs sold exceeds what is required to comply with the Phase 2 GHG regulation. The impact on cost estimates is described in the baseline discussion in Section 5.

The Advanced Clean Cars (ACC) ZEV regulation requires manufacturers of Class 1 and 2A vehicles to produce and sell ZEVs in California as a percentage of total annual sales.[12] The ACC ZEV regulation does not require manufacturers to produce and sell Class 2B and 3 ZEVs, but it does provide an optional credit provision for Class 2B and 3 ZEVs. The Proposed ACT Regulation interacts with this optional credit provision for Class 2B and 3 ZEVs. However, the Proposed ACT Regulation avoids double counting with the ACC ZEV regulation by specifying that manufacturers may not use credits from the same Class 2B and 3 vehicles in both rules.

Zero-Emission Powertrain (ZEP) Certification was approved by the Board earlier this year as optional certification procedures for medium and heavy-duty electric and fuel-cell vehicles or zero-emission powertrains. ZEP certification supports future zero-emission measures by helping ensure fleet purchasers are provided with consistent and reliable information about zero-emission technology and the vehicles that use it, and that heavy-duty electric and fuel-cell vehicles are well supported once deployed.[13] ZEP certification will help ensure that zero-emission powertrains, along with the heavy-duty vehicles they are designed for, are reliable in their intended applications. The Proposed ACT Regulation will make ZEP certification required for manufacturers to earn credits needed to comply.

The cost analysis includes the value of Low Carbon Fuel Standard program (LCFS) credits as part of the analysis to show the potential impacts on the state economy. The LCFS is a regulation designed to reduce GHG emissions associated with the lifecycle of transportation fuels used in California.[14] A fleet owner that opts into the LCFS program can receive credits for consuming electricity or producing an alternative fuel (e.g., hydrogen) onsite. The credits can be sold to regulated parties in the LCFS credit market, thereby reducing operating costs for fleet owners. These credits will have a monetary value when sold to regulated parties who must offset deficits created by their supply of fuels with Carbon Indexing that exceed the LCFS standards. According to the LCFS staff report, regulations are needed to encourage the adoption of zero-emission vehicles, and the generation of LCFS credits can assist that effort.[15]

[13] Staff Report: Initial Statement of Reasons - Proposed Alternative Certification Requirements and Test Procedures for Heavy Duty Electric and Fuel-Cell Vehicles And Proposed Standards and Test Procedures For Zero Emission Powertrains (Zero-Emission Powertrain Certification Regulation), December 31, 2018 (web link: https://www.arb.ca.gov/regact/2019/zepcert/isor.pdf, last accessed June 2019).

[14] Subarticle 7: Low Carbon Fuel Standard, California Code of Regulations § 95480-95503, January 4, 2019 (web link: https://www.arb.ca.gov/fuels/lcfs/fro_oal_approved_clean_unofficial_010919.pdf, last accessed June 2019).

[15] California Air Resources Board, Public Hearing to Consider Proposed Amendments to the Low Carbon Fuel Standard Regulation and to the Regulation on Commercialization of Alternative Diesel Fuels. Staff Report: Initial Statement of Reasons (web link: https://www.arb.ca.gov/regact/2018/lcfs18/isor.pdf, last accessed June 2019).

To isolate the effects of switching to lower carbon fuels of the same type vs switching to new vehicle technologies the LCFS program does not count GHG benefits that are resultant from regulations that require switching to different vehicle technologies that influence carbon intensities of transportation fuels. Therefore, all of the GHG emissions benefits of deploying ZEVs will be counted as part of the Proposed ACT Regulation except if the ZEVs are already required to be purchased from existing regulations or legislation.

Additionally, Assembly Bill 2061 (AB 2061) is a complementary piece of legislation that mitigates vehicle weight concerns for ZEVs required by the Proposed ACT Regulation. AB 2061, to the extent expressly authorized by federal law, authorizes a near-zero-emission vehicle or a zero-emission vehicle, to exceed the weight limits on the power unit by up to 2,000 pounds.[16] AB 2061 factors into staff's assessment because it improves the suitability of ZEVs and reduces concerns about the potential for reduced payload and loss in revenue for vehicles that operate at their weight limits.

2. Proposed Advanced Clean Trucks (ACT) Regulation

The overall strategy of the Proposed ACT Regulation is to develop a self-sustaining ZE truck market through increasing sales of ZE trucks in California by truck manufacturers. The Proposed ACT Regulation includes two primary elements. First, it requires a percentage of truck and bus sales to be zero-emissions. Second, it requires large organizations including retailers, manufacturers, government agencies, and large truck fleets to report information about services they contract for that require the use of trucks and shuttles.

The primary objectives of the Proposed ACT Regulation include the following:

- Accelerate first wave of zero-emission truck deployments in best suited applications
- Enable a large-scale transition to zero-emission technology
- Maximize the total number of ZEVs deployed
- Provide environmental benefits, targeting disadvantaged communities
- Ensure requirements are technologically feasible and cost effective
- Foster a self-sustaining zero-emission truck market

a. *ZEV Sales Requirement*

The proposed manufacturer ZEV sales requirement applies to all manufacturers that certify incomplete chassis or complete vehicles with combustion engines in weight Classes 2B through 8 (GVWR greater than 8,500 lbs.). Manufacturers with 500 or more total annual California sales would be required to sell zero-emission vehicles as a percentage of annual California vehicle sales including incomplete vehicles, and complete vehicles. Manufacturers with less than 500 annual California sales are exempt from staff's proposal because they will incur similar investment costs to comply with the rule as larger manufacturers, but would not be likely to recoup their investments over their smaller production volumes.

The sales percentage requirements would begin with the 2024 MY to give manufacturers lead time to develop product lines. The requirements increase annually until the 2030 MY, and are

[16] California State Legislature, Assembly Bill 2061, signed into law September 20, 2018 (web link: https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=201720180AB2061, last accessed June 2019).

detailed in Table A-1. The proposed ZEV sales percentages were developed based on analysis of ZE technology suitability to date, and current market developments. Staff subdivided vehicles into three categories reflecting differences in available ZEV technologies, and vehicle characteristics. The Class 4 through 8 straight trucks and shuttles are highly suited to electrification due to low average range needs, lower weight and payload concerns, and typically return to a base of operations enabling centralized fueling, thereby justifying the significant ramp up of the vehicle category requirements sooner than the others categories.

Table A-1. ZEV Sales Percentage Schedule

Model Year (MY)	Class 2B-3*	Class 4-8**	Class 7-8 Tractors
2024	3%	7%	0%
2025	5%	9%	0%
2026	7%	11%	0%
2027	9%	13%	9%
2028	11%	24%	11%
2029	13%	37%	13%
2030 and beyond	15%	50%	15%

*Excludes pickups until 2027 MY
**Excludes Class 7-8 Tractors

Class 7 and 8 tractors would be excluded until the 2027 MY because many vehicles in this category are more challenging to electrify due to longer range needs and higher payload needs. Today, only one Class 8 tractor is available for purchase and there is no publicly accessible infrastructure network to charge or fuel ZE trucks. Pickup truck sales are excluded from Class 2B-3 ZEV sales requirement until the 2027 model year due to concerns raised by stakeholders about highly variable towing needs and associated impacts on range.

Transit buses, double-decker buses, 60-foot articulated buses, and motor coach buses are excluded from the annual sales requirement because ZE buses are already required to be purchased by the Innovative Clean Transit (ICT)[17] and Zero-Emission Airport Shuttle Bus (ASB)[18] regulations, bus manufacturers have less than 500 annual sales in California, and several buses are already commercially available. However, there are some vehicles that are typically manufactured as cutaway or cab-and-chassis incomplete vehicles with a transit or shuttle body added after initial manufacture and sale that may be sold as ZEVs needed to comply with the ICT and ASB regulations. Similarly, ZEVs that are sold to state agencies to meet the requirements of AB 739 are already expected to be purchased. To simplify reporting and compliance tracking, staff are proposing to give credit for the sale of all ZEVs that are subject to the regulation, but will exclude projected sales of ZEV cutaway and cab-and-chassis sales that are already required from the existing ICT and ASB regulations and ZEV trucks required by AB739 from the inventory when estimating the cost and benefits of the Proposed ACT Regulation, and in the alternatives analysis discussed later in this document.

[17] California Air Resources Board, Innovative Clean Transit (web link: https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit, Last accessed June, 2019)
[18] California Air Resources Board, Zero-Emission Airport Shuttle (web link: https://ww2.arb.ca.gov/our-work/programs/zero-emission-airport-shuttle, Last accessed June, 2019)

Staff are proposing that credits can begin being generated starting with the 2021 MY, to incentivize early deployments, early development of ZE technologies and supply chains, and early action to result in achieving economies of scale sooner than the Proposed ACT Regulation would require.

b. ***ZEV Sales Flexibility***

The Proposed ACT Regulation, is structured to use a credit and deficit system for required ZEV sales to provide flexibility to the manufacturer. The method accounts for the fact that larger vehicles have higher emissions per mile than lighter vehicles and allows manufactures to exceed ZEV sales requirements in one category to offset required ZEV sales in another category without significantly impacting expected emissions benefits. For the cost analysis, staff assumed manufacturers would meet the specified ZEV requirement in each vehicle category and did not assume reduced costs from flexibility.

c. ***Plug-in Hybrid Electric Vehicles***

Staff are proposing plug-in hybrid electric vehicles (PHEVs) be allowed to earn partial credits based on their battery size and to use PHEV credits to meet part of their compliance obligation. It is unclear whether manufacturers are likely to utilize this option. Most manufacturers have already announced plans for full ZEVs and have stated that they are not planning to make additional models available as PHEVS; therefore, staff did not model costs differently for PHEVs.

d. ***ZEP Certification***

The Proposed ACT Regulation would make ZEP Certification mandatory starting with the 2024 model year for medium and heavy duty ZEVs, and includes the costs associated with mandatory ZEP certification requirements in the cost analysis.

e. ***Manufacturer Reporting***

Manufacturers that are subject to the ZEV sales requirement and those who sell ZEVs and want to earn credits must report annually to CARB. Manufacturers of ICE and ZEV chassis and complete vehicles must report to CARB annually to demonstrate compliance. Any manufacturers that sell ZEVs in California and elect to earn ZEV credits must report vehicle or chassis sales annually to earn credits. Manufacturers must report details of credit trade transactions so CARB can determine and track compliance.

f. ***Large Entity Reporting Requirement***

Under the Proposed ACT Regulation, a large entity would be required to report information about contracting practices for services that require the use of shuttles or trucks and these large entities would also be required to report information about how their existing trucks and buses are used. Reporting would be done once, in early 2021. This information is needed to build a knowledge base of typical fleet operations and contracting practices to help develop future rules that would increase the use of ZEVs in California starting in 2024, with a goal of complementing the Proposed ACT Regulation. A large entity is defined as a public or private organization that did business in California and met one of the following in calendar year 2019:

- Received more than $50M in total annual gross revenue
- Owned or dispatched 100 or more Class 2B and larger vehicles

Large entity reporting applies to a wide range of large businesses and government agencies whether or not they own trucks and buses. Large entities include, retailers, manufacturers, refiners, accounting firms, hotels, drayage terminal operators, utility providers, refuse companies, federal, state, and local government agencies and other types of large employers. The information that large entities would be required to submit about the type of service, frequency of deliveries, type of facility, approximate location, and other summary information about any of the following that might apply:

- Contracts to move freight/materials by truck or van
- Contract for regular pick-up or delivery services
- Contract for shuttle or bus service
- Contracts for vocational truck service
- Vehicle usage characteristics if they own/lease trucks vans or buses
- For-hire truck or bus transportation services they provide
- Characteristics of facilities they operate that receive deliveries.

Vehicle owners would need to provide individual vehicle characteristics, operation data and usage data, and location information. Many fleets already provide some vehicle characteristics to CARB in the TRUCRS reporting system, but more would need to report and would need to include additional information about vehicle usage characteristics and terminal or yard locations. These data would then be used to identify opportunities for ZEV adoption and to inform decisions on what regulatory mechanism is most appropriate to ensure ZEV purchases are made and that ZEVs would be placed in uses that are suitable to meet individual fleet needs. Staff believes that collecting this level of detailed information from large organizations will provide sufficient information about fleet types and businesses in California to support and focus future rulemaking efforts that would require the use of ZEVs in California. Affected entities would need to spend time to understand the data request, would take staff time to gather all relevant information or to export data to submit. The estimated staff time to collect and report the information is a cost associated with the Proposed ACT Regulation.

3. Statement of the Need of the Proposed ACT Regulation

The Proposed ACT Regulation will contribute to achieve the state's criteria pollutant and GHG reduction goals and cleaner technology targets. The California 2016 Mobile Source Strategy states that mobile sources and the fossil fuels that power them are the largest contributors to the formation of ozone, GHG emissions, fine particulate matter (PM2.5), and toxic diesel particulate matter[19]. In California, the transportation sector alone accounts for 41 percent of

[19] California Air Resources Board, 2016 Mobile Source Strategy (web link: https://ww3.arb.ca.gov/planning/sip/2016sip/2016mobsrc.pdf, last accessed June 2019)

total GHG emissions (50% when upstream emissions from fuel is included)[20] and is a major contributor to oxides of nitrogen (NOx) and particulate matter (PM) emissions.

The Proposed ACT Regulation is needed to accelerate the transition to zero-emissions in the medium-and heavy- duty vehicle sector. The Proposed ACT Regulation is identified as the “Last Mile Delivery” measure in the SIP and 2017 Climate Change Scoping Plan[21] as a necessary component for California to achieve established near- and long-term air quality and climate mitigation targets. In addition, the deployment of ZEVs meets goals identified in the 2016 ZEV Action Plan that supports the governor’s Executive Order B-16-12 and Executive Order B-48-18, which calls for 1.5 million ZEVs in California by 2025 and establishes several milestones on the pathway toward this target.

Currently, regulations including Phase 2 GHG provide an incentive to build more fuel efficient, lower GHG vehicles, but these regulations have no specific requirement for medium- and heavy-duty manufacturers to build ZEVs. Phase 2 GHG includes a temporary credit multiplier for ZEVs through 2027. The Proposed ACT Regulation is needed to provide certainty and to ensure that manufacturers will invest into ZEV technology.

4. Major Regulation Determination

The Proposed ACT Regulation has been determined to be a major regulation because the economic impact of the regulation in California is estimated to exceed $50 million in multiple years of the regulatory timeline extending from 2020 to 2040. The economic impact is estimated as a result of direct cost and cost-savings to the manufacturer as passed on to California businesses. Cost increases are associated with the higher cost of producing ZEVs and savings for the manufacturers are the result of reduced costs of compliance with the Phase 2 GHG regulation while the ZEV multiplier is in effect prior to 2028. The temporary ZEV multiplier results in making ZEVs a lower cost option for manufacturers to meet Phase 2 GHG requirements for a few years than if assuming compliance would be achieved without producing ZEVs as originally assumed in the Phase 2 GHG rulemakings. More detail on this is in the next section.

5. Baseline Information

For the SRIA, the economic and emissions impacts of the Proposed ACT Regulation are evaluated against the business-as-usual (BAU) scenario each year for the analysis period from 2020 to 2040. The BAU case for the economic and emissions analysis for the Proposed ACT Regulation is referred to as the “baseline” and uses the same vehicle inventory for both analyses. The baseline vehicle inventory includes the same vehicle sales and population growth assumptions reflected in CARB’s EMFAC emissions inventory for weight Class 2B and

---

[20] California Air Resources Board, California Greenhouse Gas Emission Inventory (web link: https://www.arb.ca.gov/cc/inventory/data/data.htm, last accessed June 2019)
[21] California Air Resources Board, California’s 2017 Climate Change Scoping Plan, released in November 2017 (web link: https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf, last accessed June 2019)

larger vehicles for all fuel types[22]. EMFAC emissions inventory includes assumptions reflecting Phase 2 GHG, and LCFS program compliance.

ZEVs required by the Proposed ACT Regulation can also be used to comply with the CA Phase 2 GHG regulation and the U.S. EPA Phase 2 GHG regulation, and results in potential overlapping emissions and costs. In the Federal Phase 2 GHG rulemaking, EPA stated that they "do not project fully electric vocational vehicles to be widely commercially available in the time frame of the final Phase 2 rules. For this reason, [EPA and NHTSA] have not based the Phase 2 standards on adoption of full-electric vocational vehicles."[23] California adopted the U.S. EPA Phase 2 GHG regulation and similarly did not model ZEV deployments due to the CA Phase 2 GHG regulation.

Even though Phase 2 GHG gives an Advanced Technology Multiplier (ATM) that may make ZEVs a temporarily more cost effective compliance option until the end of the 2027 MY, staff does not believe the Phase 2 GHG regulation incentivizes ZEVs enough to ensure their production. Manufacturers bear risks in building and selling ZEVs due to the large upfront investments and uncertainty in future growth and may not be the lower cost option to comply with the Phase 2 GHG regulation post 2027.

For purposes of evaluating GHG emissions staff assumes no new GHG emissions benefits as a result of the Proposed ACT Regulation up to the total benefits anticipated from the CA Phase 2 GHG requirements. Staff does count GHG emissions benefits after any CA Phase 2 GHG anticipated benefits are exceeded. The interactions between CA Phase 2 GHG and the Proposed ACT Regulation are also factored into the cost analysis later in this document.

The ZEVs that are already required to be purchased by the existing ICT and ASB regulations and AB 739 are also excluded from the from the costs and emissions analysis of the Proposed ACT Regulation and any alternatives analysis to avoid double counting.

This analysis of the Proposed ACT Regulation counts ZEVs sold starting with the 2021 model year, but will not include those sold in prior years because incentive funding programs are already offsetting most, if not all of the incremental costs. Staff does not assume ZEV sales will continue without incentive or other policies to promote them. For example, some industry market projections forecast ZEV adoption, but these include assumptions about availability of incentives and government policies to increase ZEV sales. ACT Research, a major freight movement analytics firm, released an August 2018 report titled "Commercial Vehicle Electrification: To Charge or Not To Charge[24]", which predicted that ZEVs will be adopted in increasing numbers due to incentives and government policies, among other factors. Another reason that ZEVs are not included in the baseline inventory is that medium and heavy duty ZEV deployments were assumed in the SIP and only actions that are enforceable can be included in the SIP. The Proposed ACT Regulation would make ZEV sales enforceable.

6. Public Outreach and Input

For the Proposed ACT Regulation, CARB created a technical workgroup that comprises interested stakeholders including manufacturers, fleets, environmental groups, utilities, technology providers, and fuel providers. In addition to public workgroup meetings, CARB staff has conducted more than 100 individual meetings with more than 50 stakeholders. Some of these key stakeholders include but are not limited to Truck and Engine Manufacturers Association members (EMA), the California Electric Transportation Coalition (CalETC) and electric vehicle manufacturers, several fleet representatives, and nonprofit organizations.

Since 2016, CARB staff held six workshops, and five workgroup meetings to provide information to the public and solicit feedback. CARB staff posted information regarding these events and any associated materials on the ACT website and distributed notice of these meetings through two public list serves; actruck and zevfleet that include 2,662 and 948 recipients. The majority of the meetings were available by webcast and teleconference. At the meetings, CARB staff solicited stakeholder feedback on the Proposed ACT Regulation and overall regulatory process.[25] In addition to continued efforts to solicit feedback from stakeholders about the Proposed ACT Regulation, CARB staff solicited for alternatives during the May 31, 2018 workshop.[26]

Staff has reached out to the proposed regulated parties throughout the regulatory development. In the April 2017 workshop, staff asked fleets to submit answers to a draft fleet survey questionnaire in an effort to gather detailed information about everyday operations of local fleets. Staff also mailed notice letters to the 11,000 large entities and fleets that would be required to report under the Proposed ACT Regulation. Further, staff has met with the proposed ten regulated manufacturers (Daimler, FCA, Ford, GM, Isuzu, Navistar, Nissan, PACCAR, Hino/Toyota, and Volvo) on a group and individual basis throughout the regulatory development process. CARB staff has held two joint meetings with California Governor's Office of Business and Economic Development (GO-Biz) in which fleets, manufacturers, and utilities discussed medium-and heavy-duty electrification. Additionally, staff has engaged in frequent discussions with ZEV technology providers, electric utilities, fuel providers, and non-governmental environmental organizations during various outreach events such as technology symposiums and expositions.

Staff has produced two discussion documents that were made available to the public for comment on the ACT website; Total Cost of Ownership (TCO) and Energy Efficiency Ratio (EER) papers.[27,28] The TCO paper assessed the costs of owning and operating zero-emission vehicles. The EER paper analyzed of the efficiency of heavy-duty electric vehicles compared to conventional ICE vehicles of the same type and use; this analysis supported LCFS

regulation amendments which increased the EER for heavy-duty battery-electric vehicles, resulting in nearly doubling the amount of credits earned for using electricity as a transportation fuel. In addition, CARB staff posted an updated version of a TCO calculator, on the ACT website, which allows stakeholders to calculate and compare the TCO between diesel, battery-electric, and hydrogen fuel-cell vehicles.

B. Benefits

The 2016 State SIP Strategy identifies that "electrification and progress toward zero emission is critical to address the remaining (from renewable fuels) localized risk of cancer and other adverse effects from major freight hubs, and (electrification) must play a growing role in reducing GHG emissions and petroleum use."[29] The Proposed ACT Regulation supports the goals of the SIP and reduces pollutants linked to multiple adverse health effects identified by the California Ambient Air Quality Standards (CAAQS).[30] These pollutants are nitrogen oxides (NOx), key ingredients in the formation of several airborne toxic substances[31], and particulate matter of diameter less than 2.5 microns ($PM_{2.5}$), which may deposit deep inside the lung. Long-term exposure to PM2.5 has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children.[32] The Proposed ACT Regulation also reduces GHG emissions, petroleum use, and provides the certainty needed to establish a long term medium- and heavy-duty ZEV market.

1. Benefits to Typical Businesses

a. Truck and Bus Owners

Individual businesses that have operations that are well suited for using ZEVs may be able to lower their total cost of ownership by taking advantage of the operational cost savings of battery-electric vehicles. ZE truck owners that own their charging or hydrogen fueling stations can lower fuel costs by taking advantage of Low Carbon Fuel Standard (LCFS) program.

b. Utility Providers

The Proposed ACT Regulation will increase the number of ZEVs deployed which in turn will increase the amount of electricity supplied by utility providers

The Proposed ACT Regulation also helps the state's investor-owned utilities meet the goals of SB350. SB350 requires the state's investor-owned utilities to develop programs "to accelerate widespread transportation electrification." Pacific Gas and Electric and Southern California Edison have both developed and been approved to set up programs to install electric

infrastructure on the customer's site up to the charger and would offer a voucher for the charger itself. San Diego Gas and Electric has proposed a similar program that is currently awaiting CPUC decision. All three utilities are either developing or have been approved to establish new electricity rates for commercial ZEV deployments. By ensuring that vehicles will be available to make use of these utility investments and rates, the Proposed ACT Regulation supports the utilities' programs and the goals of SB350.

c. Other California Businesses

The Proposed ACT Regulation may result in benefits to zero-emissions truck component suppliers, electrical vehicle supply equipment (EVSE) suppliers and installers, and hydrogen fuel station suppliers. Due to higher demand for ZEVs from the Proposed ACT Regulation, production of ZEVs in California would likely increase leading to increases in manufacturing and related jobs throughout the state. The increase in the production and usage of ZEVs could also benefit various businesses related to the ZEV component supply chain, including those involved in battery, fuel cell, and electric drivetrain businesses.

The Proposed ACT Regulation may also benefit EVSE suppliers who may see an increase in charging equipment installation as a result of increased medium and heavy duty ZEV purchases. Most of these installations are expected to be located in central depots or yards where trucks are parked overnight. Increased installation of charging infrastructure will benefit the EVSE suppliers, equipment installers, and electricians. All of the installations will be in California, and some of the EVSE equipment may be manufactured in California. Increased purchase of ZEVs under the Proposed ACT Regulation could also benefit various California businesses related to installing hydrogen fueling stations, supplying hydrogen and associated maintenance.

2. Benefits to Small Businesses

The Proposed ACT Regulation may result in benefits to small business due to higher demand for ZEVs, and would likely lead to increases in manufacturing, distribution, infrastructure installation and maintenance and other related jobs for small businesses throughout the state. Electricians, construction companies, including infrastructure installers, existing ZEV manufacturers, fuel cell and electric drivetrain parts and components businesses may fall into the small business category. Increased installation of charging infrastructure will benefit EVSE suppliers, equipment installers, and electricians that are small business. All of the installations will be in California, and some of the EVSE equipment may be manufactured in California. Increased purchase of ZEVs under the Proposed ACT Regulation could also benefit various California small businesses related to installing hydrogen fueling stations, supplying hydrogen and associated maintenance.

3. Benefits to Individuals

The Proposed ACT Regulation will benefit California residents mainly from reductions in NOx, PM, and from improvements in California air quality and reduced impact on adverse health impacts. The reduction of GHG emissions, while being a global pollutant, will also benefit California residents.

a. *Criteria Pollutant Emissions Benefits*

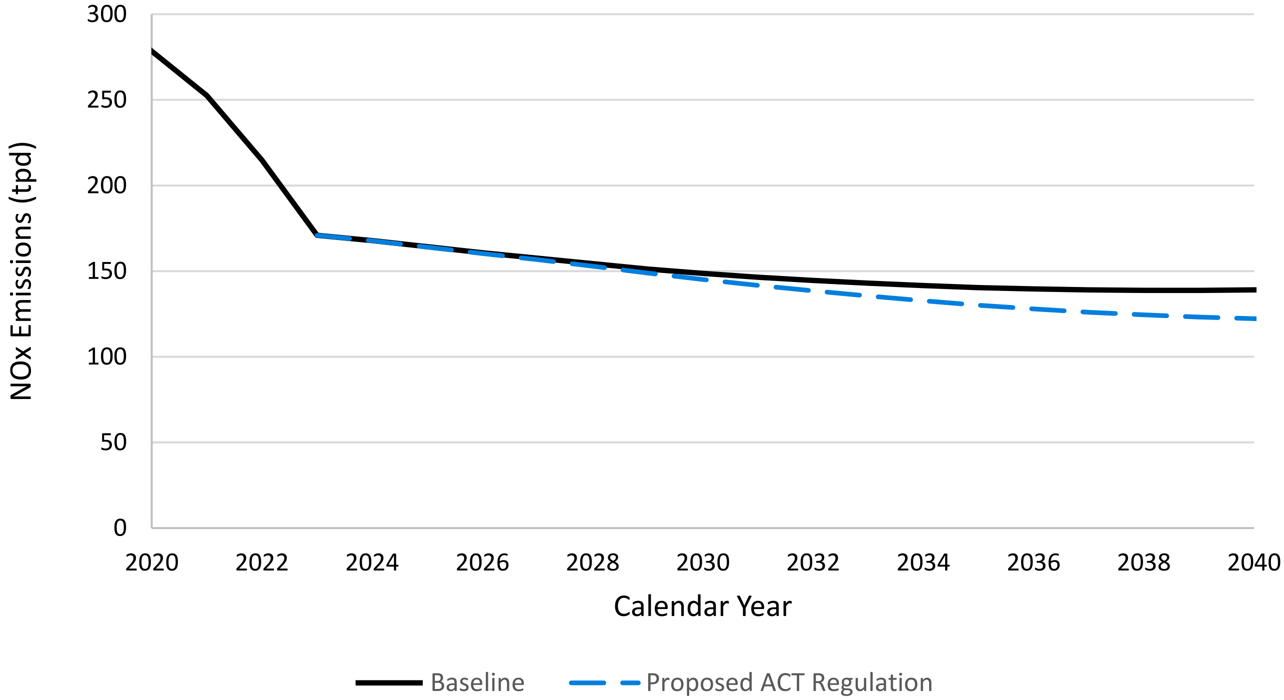
The projected benefits of the proposed Advanced Clean Trucks regulation are identified in Table B-1 with respect to NOx, $PM_{2.5}$, and GHG. Emissions benefits are projected by assuming zero tailpipe emissions for the forecasted number of ZEVS sold in California assuming no change in VMT and California sales compared to the baseline. In addition, staff is including an estimated 50% brake wear reduction for electric vehicles compared to conventional due to the effects of regenerative braking. These sales projections are further discussed in Section C. Emission benefits continue to grow as the ZEV sales requirement continues to be in effect past 2030 and the population of ZEV continue to grow. The cumulative total emission reductions from 2020 to 2040 is estimated to result in 125,830 tons reduction in NOx and a 3,382 tons reduction in $PM_{2.5}$ relative to baseline. The emissions presented below for GHG are solely tank-to-wheel (TTW) meaning upstream emission reductions are not included. Staff is in the process of developing and updating upstream emission factors and will include WTW emissions in the Initial Statement of Reasons. Once these are included, they are expected to show greater GHG emissions reductions due to the lower upstream emissions of electricity and hydrogen compared to gasoline and diesel. Table B-1 shows the benefits of the Proposed ACT Regulation in 2031 and 2040.

Table B-1. Proposed ACT Regulation NOx, $PM_{2.5}$, and TTW GHG Benefits Relative to Baseline

Calendar Year	NOx (tpd)	$PM_{2.5}$ (tpd)	CO_2 (MMT/yr)
2031	4.77	0.16	0.34
2040	16.84	0.46	1.27

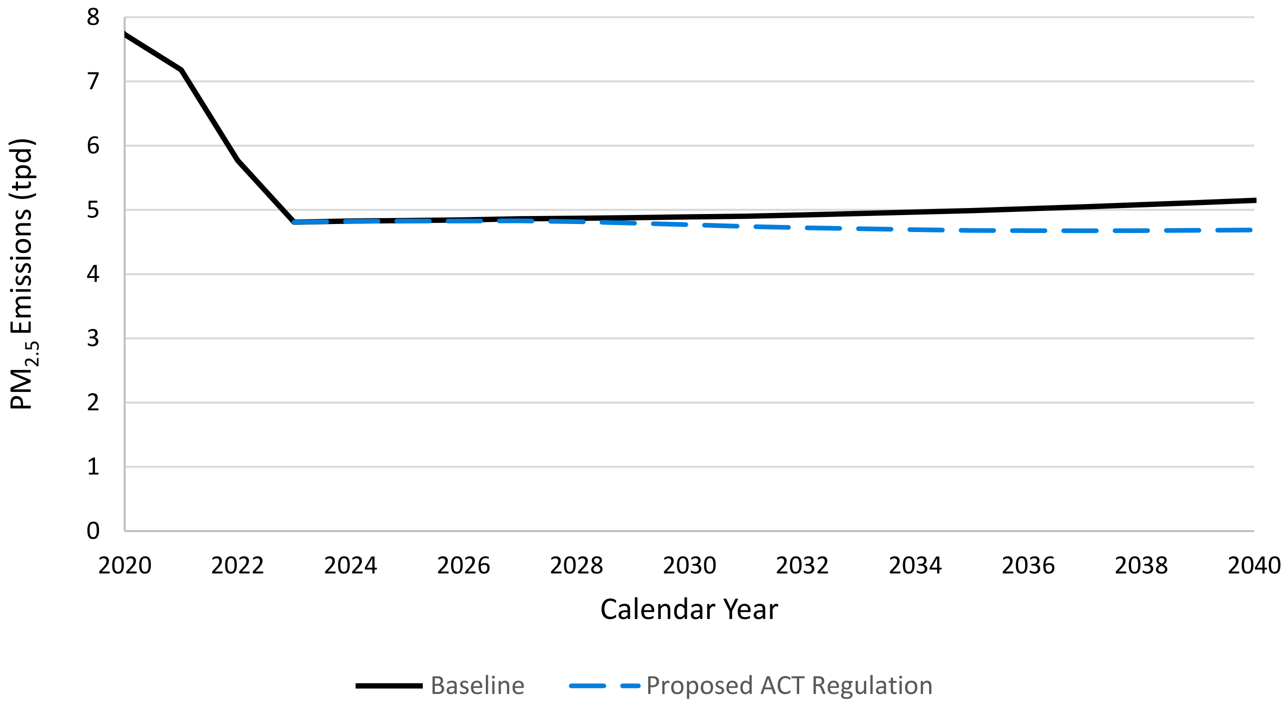
The NO_x and $PM_{2.5}$ emissions impact of the Proposed ACT Regulation are presented relative to the baseline in Figure B-1 and Figure B-2 respectively and are shown in short tons per day (tpd). In the baseline, projected NOx emissions decrease sharply until 2023 when the Truck and Bus regulation achieves its goal of upgrading most diesel vehicles to 2010 MY and newer engines. The Truck and Bus regulation applies to trucks and buses with a GVWR greater than 14,000 lbs.

Figure B-1. Projected TTW NO_x Emissions, Baseline and Proposed ACT Regulation



Past 2023, NOx emissions are expected to decrease in the baseline scenario in EMFAC even as miles travelled continues to grow. This occurs because of continued NOx reduction through natural attrition to cleaner engines for vehicles that are not subject to the Truck and Bus Regulation. Medium- and heavy-duty vehicles that are not subject to the Truck and Bus regulation include, public fleet vehicles, Solid Waste Collection Vehicles with pre-2007 MY engines, vehicles with a GVWR less than 14,001 lbs and other vehicles that do not use diesel fuel.

Figure B-2. Projected $PM_{2.5}$ Emissions, Baseline and Proposed ACT Regulation



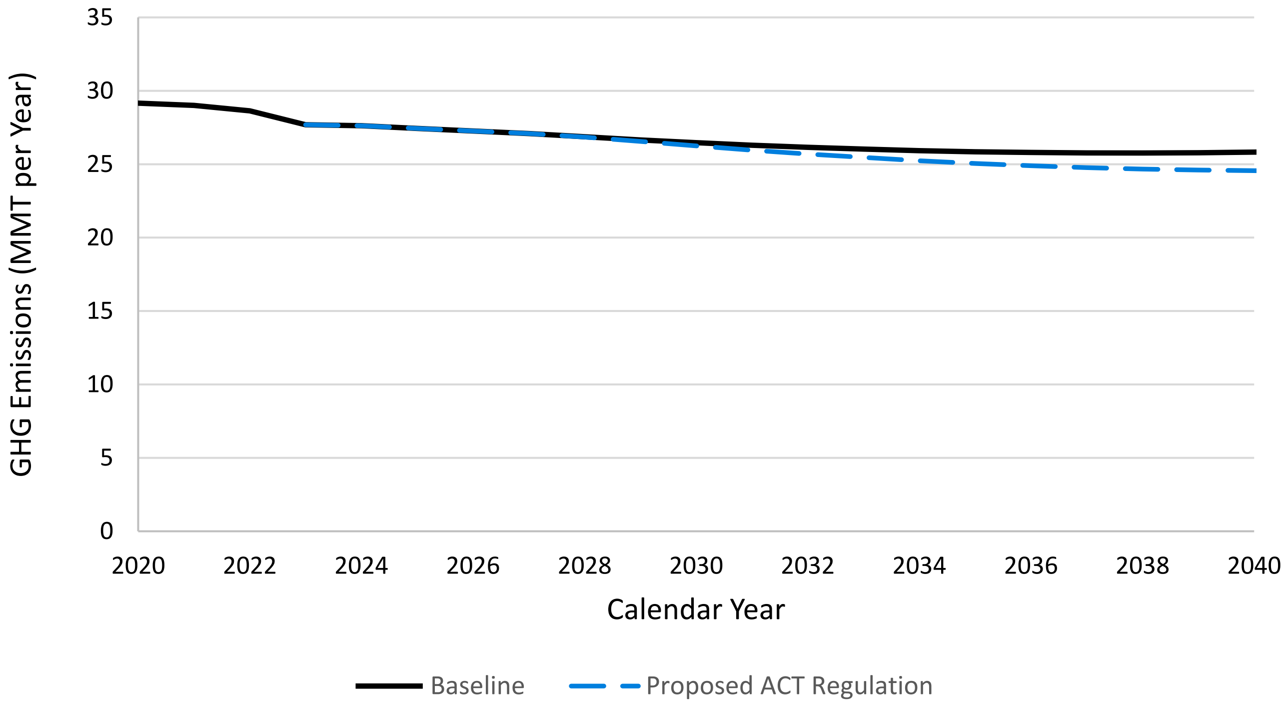
Similarly, $PM_{2.5}$ emissions decrease sharply in the baseline scenario until 2023 but level off for several years before beginning to rise in later years. By 2023, nearly all diesel trucks with a GVWR greater than 14,000 lbs will have PM filters due to the Truck and Bus Regulation. Beginning 2024, $PM_{2.5}$ emissions begin to increase slightly as vehicle miles travelled in EMFAC continue to grow, but the increase is partially offset from some $PM_{2.5}$ emissions reductions from lighter vehicles that continue to be replaced through normal attrition. These vehicles, with a GVWR less than 14,000 lbs, are not subject to in-use requirements to be retrofitted or replaced. For these lighter vehicles, when the pre-2007 diesel engines that do not have $PM_{2.5}$ are replaced, the PM emissions from this segment of the truck population continues to go down until all diesel vehicles have PM filters.

b. ***GHG Emissions Benefits***

The Proposed ACT Regulation accounts for GHG benefits in terms of carbon dioxide (CO_2). Figure B-3 summarizes the estimated TTW GHG emissions reductions with the Proposed ACT Regulation compared to the baseline in million metric tons per year (MMT per Year). The emissions presented below for GHG are solely tank-to-wheel (TTW) meaning upstream emission reductions are not included. Staff is in the process of developing and updating upstream emission factors and will include WTW emissions in the Initial Statement of Reasons. Once these are included, they are expected to show greater GHG emissions reductions due to the lower upstream emissions of electricity and hydrogen compared to gasoline and diesel. Staff expects the Proposed ACT Regulation to reduce cumulative TTW GHG emissions by an estimated 10.1 Million Metric Tons (MMT) of CO_2 relative to the baseline from 2020 to 2040. The benefits for this rule do not include any ZEVs which may be used to comply with the California Phase 2 GHG regulation. Only ZEVs sold in excess of the

California Phase 2 GHG regulation's requirements are included in GHG calculations to avoid double-counting.

Figure B-3. Projected TTW GHG Emissions under the Baseline and Proposed ACT Regulation



The benefit of these GHG reductions can be estimated using the Social Cost of Carbon (SC-CO_2), which provides a dollar valuation of the damages caused by one ton of carbon pollution and represents the monetary benefit today of reducing carbon emissions in the future.

In this analysis, CARB utilizes the current Interagency Working Group (IWG) supported SC-CO_2 values to consider the social costs of actions taken to reduce GHG emissions. This is consistent with the approach presented in the Revised 2017 Climate Change Scoping Plan [33] and is in line with Executive Orders including 12866 and the OMB Circular A-4 of September 17, 2003, and reflects the best available science in the estimation of the socio-economic impacts of carbon.[34]

The IWG describes the social costs of carbon as follows:

> *The social cost of carbon (SC-CO_2) for a given year is an estimate, in dollars, of the present discounted value of the future damage caused by a 1-metric ton increase in carbon dioxide (CO_2) emissions into the atmosphere in that year, or equivalently, the*

---

[33]California Air Resources Board, California's 2017 Climate Change Scoping Plan, released in November 2017 (web link: https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf, last accessed June 2019).
[34] Office of Management and Budgets, Circular A-4 (web link: https://www.transportation.gov/sites/dot.gov/files/docs/OMB%20Circular%20No.%20A-4.pdf, last accessed June 2019).

benefits of reducing CO_2 emissions by the same amount in that year. The SC-CO_2 is intended to provide a comprehensive measure of the net damages – that is, the monetized value of the net impacts- from global climate change that result from an additional ton of CO_2.

These damages include, but are not limited to, changes in net agricultural productivity, energy use, human health, property damage from increased flood risk, as well as nonmarket damages, such as the services that natural ecosystems provide to society. Many of these damages from CO_2 emissions today will affect economic outcomes throughout the next several centuries.[35]

The SC-CO_2 is year specific, and is highly sensitive to the discount rate used to discount the value of the damages in the future due to CO_2. The SC-CO_2 increases over time as systems become more stressed from the aggregate impacts of climate change and future emissions cause incrementally larger damages. This discount rate accounts for the preference for current costs and benefits over future costs and benefits, and a higher discount rate decreases the value today of future environmental damages. While the Proposed ACT Regulation cost analysis does not account for any discount rate, this social cost analysis uses the IWG standardized range of discount rates from 2.5 to 5 percent to represent varying valuation of future damages. Table B-2 shows the range of IWG SC-CO_2 values used in California's regulatory assessments.[36]

Table B-2. SC-CO_2, 2012-2050 (in 2007$ per Metric Ton)

Year	5 Percent Discount Rate	3 Percent Discount Rate	2.5 Percent Discount Rate
2020	$12	$42	$62
2025	$14	$46	$68
2030	$16	$50	$73
2035	$18	$55	$78
2040	$21	$60	$84
2045	$23	$64	$89
2050	$26	$69	$95

If all TTW GHG reductions under the Proposed ACT Regulation are assumed to be carbon reductions, the avoided SC-CO2 from 2020 to 2040 is the sum of the annual TTW GHG emissions reductions multiplied by the SC-CO2 in each year. The cumulative TTW GHG emission reductions along with the estimated benefits from the Proposed ACT Regulation are shown in Table B-3. These benefits range from about $239 million to $1.01 billion through 2040, depending on the chosen discount rate.

[35] National Academies of Sciences, Engineering, Medicine, Valuing Climate Damages: Updating Estimation of Carbon Dioxide (web link: http://www.nap.edu/24651, last accessed June 2019.

[36] Interagency Working Group on the Social Cost of Carbon, Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis -Under Executive Order 12866 (web link: https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/scc-tsd-final-july-2015.pdf, last accessed June 2019).

Table B-3. Avoided Social Cost of CO_2

Year	GHG emission reductions (MMT)	Avoided SC-CO_2 (Million 2018$)		
		5% discount rate	3% discount rate	2.5% discount rate
2024	0.0	$0.0	$0.0	$0.0
2025	0.0	$0.0	$0.0	$0.0
2026	0.0	$0.0	$0.0	$0.0
2027	0.0	$0.0	$0.1	$0.1
2028	0.0	$0.4	$1.5	$2.1
2029	0.1	$2.0	$6.6	$9.7
2030	0.2	$5.0	$15.6	$22.8
2031	0.4	$7.8	$25.0	$36.3
2032	0.5	$11.3	$34.7	$50.0
2033	0.7	$14.3	$44.5	$63.8
2034	0.8	$18.1	$54.4	$77.5
2035	0.9	$21.0	$64.2	$91.0
2036	1.1	$25.1	$73.9	$104.2
2037	1.2	$27.8	$83.5	$118.6
2038	1.3	$32.1	$93.0	$131.5
2039	1.4	$34.7	$102.4	$144.0
2040	1.5	$39.1	$111.6	$156.3
Total	**10.1**	**$238.8**	**$710.8**	**$1,007.9**

It is important to note that the SC-CO_2, while intended to be a comprehensive estimate of the damage caused by carbon globally, does not represent the cumulative cost of climate change and air pollution to society. There are additional costs to society outside of the SC-CO_2, including costs associated with changes in co-pollutants, the social cost of other GHGs including methane and nitrous oxide, and costs that cannot be included due to modeling and data limitations. The Intergovernmental Panel on Climate Change (IPCC) has stated that the IWG SC-CO_2 estimates are likely underestimated due to the omission of significant impacts that cannot be accurately monetized, including important physical, ecological, and economic impacts.

c. *Health Benefits*

The Proposed ACT Regulation reduces NOx and $PM_{2.5}$ emissions, resulting in health benefits for individuals in California. The value of these health benefits are due to fewer instances of premature mortality, fewer hospital and emergency room visits, and fewer lost days of work. As part of setting the National Ambient Air Quality Standard for PM, the U.S. EPA quantifies the health risk from exposure to PM and CARB relies on the same health studies for this evaluation.[37] The evaluation method used in this analysis is the same as the one used for

[37] United States Environmental Protection Agency, Health and Environmental Effects of Particulate Matter (web link: https://www.epa.gov/pm-pollution/health-and-environmental-effects-particulate-matter-pm, last accessed June 2019)

CARB proposed Low Carbon Fuel Standard 2018 Amendments, and Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program.

CARB analyzed the value associated with five health outcomes in the BAU, proposed amendments, and alternatives: Cardiopulmonary[38] mortality, hospitalizations for cardiovascular[39] illness, hospitalizations for respiratory[40] illness, emergency room (ER) visits for respiratory illness, and ER visits for asthma.

These health outcomes were selected because US EPA has identified these as having a *causal* or *likely causal* relationship with exposure to $PM_{2.5}$.[41] The US EPA examined other health endpoints such as cancer, reproductive and developmental effects, but determined there was only *suggestive* evidence for a relationship between these outcomes and PM exposure, and insufficient data to include these endpoints in the national health assessment analyses routinely performed by U.S. EPA.

The U.S. EPA has determined that both long-term and short-term exposure to $PM_{2.5}$ plays a *causal* role in premature mortality, meaning that a substantial body of scientific evidence shows a relationship between $PM_{2.5}$ exposure and increased risk of death. This relationship persists when other risk factors such as smoking rates, poverty and other factors are taken into account.[42] While other mortality endpoints could be analyzed, the strongest evidence exists for cardiopulmonary mortality.[43] The greater scientific certainty for this effect, along with the greater specificity of the endpoint, leads to an effect estimate for cardiopulmonary deaths that is both higher and more precise than that for all-cause mortality.[44]

The US EPA has also determined a *causal* relationship between non-mortality cardiovascular effects and short and long-term exposure to PM2.5, and a *likely causal* relationship between non-mortality respiratory effects (including worsening asthma) and short and long-term $PM_{2.5}$ exposure.[45] These outcomes lead to hospitalizations and ER visits, and are included in this analysis.

[45] U.S. EPA. Integrated Science Assessment (ISA) for Particulate Matter (Final Report, Dec 2009). U.S. Environmental Protection Agency, Washington, DC, EPA/600/R-08/139F, 2009. http://ofmpub.epa.gov/eims/eimscomm.getfile?p_download_id=494959

In general, health studies have shown that populations with low socioeconomic standings are more susceptible to health problems from exposure to air pollution.[46,47] However, the models currently used by U.S. EPA and CARB do not have the granularity to account for this impact. The location and magnitude of projected emission reductions resulting from many proposed regulations are not known with sufficient accuracy to account for socioeconomic impacts, and an attempt to do so would produce uncertainty ranges so large as to make conclusions difficult. CARB acknowledges this limitation.

A detailed summary of the health modeling methodology is included in Health Benefits Appendix of this SRIA.

i. Results

Table B-4 shows the estimated avoided premature mortality, hospitalizations, and emergency room visits because of the Proposed ACT Regulation for 2020 through 2040 by California air basin, relative to the baseline. Only the regions with values of one or higher are shown, and regions with zero or insignificant impacts are not shown. Values in parenthesis represent the 95 percent confidence intervals of the central estimate. As detailed in the previous section, the Proposed ACT Regulation is estimated to reduce overall emissions of $PM_{2.5}$ and NOx in most years, and lead to net reduction in adverse health outcomes statewide, relative to the baseline.

The Proposed ACT Regulation may decrease the occupational exposure to air pollution of California truck operators and other employees who work around truck traffic. CARB staff cannot quantify the potential effect on occupational exposure due to lack of data on the typical occupational exposure for these types of workers.

Table B-4. Regional and Statewide Avoided Mortality and Morbidity Incidents from 2020 to 2040 under the Proposed ACT Regulation*

Air Basin	Avoided Premature Deaths	Avoided Hospitalizations for cardiovascular illness	Avoided Hospitalizations for respiratory illness	Avoided ER visits
Great Basin Valleys	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)
Lake County	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)

*Values in parenthesis represent the 95% confidence interval. Totals may not add due to rounding.

In accordance with U.S. EPA practice, health outcomes are monetized by multiplying each incident by a standard value derived from the economic studies.[48] The value per incident is shown in Table B-5. The value for avoided premature mortality is based on willingness to pay,[49] which is a statistical construct based on the aggregated dollar amount that a large group of people would be willing to pay for a reduction in their individual risks of dying in a year. While the cost-savings associated with premature mortality is important to account for in the analysis, the valuation of avoided premature mortality does not correspond to changes in expenditures, and is not included in the macroeconomic modeling (Section E). As avoided hospitalizations and ER visits correspond to reductions in household expenditures on health care, these values are included in the macroeconomic modeling.

Unlike mortality valuation, the cost-savings for avoided hospitalizations and ER visits are based on a combination of typical costs associated with hospitalization and the willingness of surveyed individuals to pay to avoid adverse outcomes that occur when hospitalized. These include hospital charges, post-hospitalization medical care, out-of-pocket expenses, and lost earnings or both individuals and family members, lost recreation value, and lost household production (e.g., valuation of time-losses from inability to maintain the household or provide childcare).[50] These monetized benefits from avoided hospitalizations and ER visits are included in macroeconomic modeling (Section E).

Table B-5. Valuation per Incident for Avoided Health Outcomes

Outcome	Value per incident (2018$)
Avoided Premature Mortality	$9,419,320
Avoided Cardiovascular Hospitalizations	$56,588
Avoided Acute Respiratory Hospitalizations	$49,359
Avoided Emergency Room Visits	$810

Statewide valuation of health benefits were calculated by multiplying the value per incident by the statewide total number of incidents for 2020-2040 as shown in Table B-6. The estimated

total statewide health benefits derived from criteria emission reductions is estimated to be $5.5 billion, with $5.2 billion resulting from reduced premature mortality and $0.34 billion resulting from reduced hospitalizations and emergency room visits. The spatial distribution of these benefits across the state follows the distribution of the health impacts by air basin as described in Table B-4.

Table B-6 Statewide Valuation from Avoided Health Outcomes

Outcome	Avoided Incidents	Valuation (Million 2018$)
Avoided Premature Mortality	587	$5,528.9
Avoided Cardiovascular Hospitalizations	92	$5.2
Avoided Acute Respiratory Hospitalizations	110	$5.4
Avoided Emergency Room Visits	283	$0.2
Total		**$5,540**

d. *Other Benefits to Individuals*

In addition to emission reductions, ZEVs offer a number of other benefits to truck operators when compared to gasoline and diesel vehicles. ZEVs are quiet and have a smoother ride than ICE vehicles, and reduces noise at the worksite as well as in the community the vehicle is operating.

C. Direct Costs

The Proposed ACT Regulation will require manufacturers to produce and sell vehicles that have a higher upfront cost than in the baseline. Manufacturers bear the risk associated with the incremental costs associated with producing and selling ZEVs, but producing and selling these ZEVs will simultaneously decrease the manufacturers' cost of comply with the Phase 2 GHG regulation. Staff assumes the costs to California includes the higher upfront capital costs, infrastructure upgrades and lower operating expenses. This approach shows the full estimated cost to California for deploying the same number of ZEVs required by the regulation.

1. Direct Cost Inputs

The estimated direct costs from the Proposed ACT Regulation and the baseline scenario include: upfront capital costs of the vehicles, infrastructure, and ongoing operating costs which include fueling and maintenance. Compared to gasoline or diesel vehicles, ZEVs generally have higher upfront capital costs but lower operating costs, which result in an overall savings in staff's analysis over the useful life of the vehicles. Currently there are a number of rebate and voucher programs in California that offset some or all of the incremental costs for ZEVs and supporting infrastructure; however, none of these incentives are included in the cost analysis. LCFS credits are a form of incentive, but it is a market-based mechanism that increases the use of low carbon transportation fuels in California that has been established by California regulations. The assumptions underlying the direct costs are detailed in the following sections.

a. ***Vehicle Population and Annual Mileage***

Staff divided the affected vehicle population into five vehicle groups to match the requirements of the Proposed ACT Regulation. Note that Class 6-7 and Class 8 excludes Class 7-8 tractors because there is a separate category for those vehicles.

- Class 2B-3 – Vehicles with a GVWR from 8,501 to 14,000 lb.
- Class 4-5 – Vehicles with a GVWR from 14,001 to 19,500 lb.
- Class 6-7 – Vehicles with a GVWR from 19,500 to 33,000 lb. (excluding Class 7 tractors)
- Class 8 – Vehicles with a GVWR above 33,001 lb. (excluding Class 8 tractors)
- Class 7-8 Tractors – Tractors with a GVWR above 26,001 lb.

In this analysis, all estimates for annual California sales come from CARB's Emission Factor (EMFAC) inventory model.[51] The EMFAC model is developed and used by CARB to assess emissions from on-road vehicles including cars, trucks, and buses in California, and to support CARB's regulatory and air quality planning efforts to meet the Federal Highway Administration's transportation planning requirements. U.S. EPA approves EMFAC for use in State Implementation Plan and transportation conformity analyses. It includes vehicle population growth, mileage accrual rates over time, vehicle fuel usage and associated emission factors, and vehicle attrition over time. The vehicle categories in EMFAC were matched to the Proposed ACT Regulation's vehicle groups as shown in Table C-1:

Table C-1. Vehicle Groups and EMFAC categories

Vehicle Group	EMFAC Categories
Class 2B-3	Light Heavy-Duty 1 and Light Heavy-Duty 2
Class 4-5 & Class 6-7	T6 Small (Class 4-6 Vehicles), T6 Heavy (Class 7) excluding tractors, School Bus, All Other Buses
Class 8	T7 (Class 8) excluding tractors
Class 7-8 Tractor	T6 Heavy Tractors, T7 Tractors

EMFAC groups Class 4-5 and Class 6-7 into the same category called T6. However, because staff needed to match population categories with the proposed rule to more accurately model the resulting changes in vehicle populations for this analysis, the T6 category was split into Class 4-5 and Class 6-7. Staff assumes a 49% Class 4-5 to 51% Class 6-7 split based on DMV data.[52]

Because the Proposed ACT Regulation only affects vehicles sold into California, the total sales numbers were adjusted downward using California DMV data to remove out-of-state sales. The estimated number of California sales from 2024-2030 model years for each category are shown in Table C-2. Truck sales are forecasted by EMFAC to grow at about 1 percent per year.[53]

Table C-2. Estimated Number of Annual Sales per Vehicle Group

Model Year	Class 2B-3	Class 4-5	Class 6-7	Class 8	Class 7-8 Tractor	Total Sales
2024	53,761	6,856	7,136	1,119	4,686	73,559
2025	54,217	6,957	7,241	1,137	4,769	74,321
2026	54,753	7,083	7,372	1,177	4,918	75,302
2027	55,152	7,228	7,523	1,194	4,993	76,091
2028	55,765	7,354	7,654	1,216	5,075	77,064
2029	56,371	7,482	7,788	1,239	5,161	78,041
2030	56,968	7,613	7,924	1,264	5,263	79,032

Vehicle manufacturers sell trucks powered by a variety of fuels – most commonly gasoline or diesel, but also including compressed and liquid natural gas, propane, E85, and other fuels. In staff's assumed baseline conditions, for simplification, Class 2B-3 vehicles are split between gasoline- and diesel-powered assuming a 43 percent gasoline to 57 percent diesel ratio based on available EMFAC data.[54] Staff assumes Class 4-8 vehicles are solely diesel-powered to simplify the analysis. Based on EMFAC data, roughly 10 percent of Class 4-8 vehicles use a fuel other than diesel.

Under the Proposed ACT Regulation, manufacturers can comply with a combination of battery-electric, fuel-cell electric, and plug-in hybrid electric technologies. It is difficult to predict manufacturers' future plans for complying with the Proposed ACT Regulation, especially as battery and fuel-cell technologies improve and costs continue to decline. Based on manufacturers' publicly announced plans, staff assumed manufacturers will comply with the Proposed ACT Regulation requirements for Class 2B-3 and Class 4-8 vocational trucks by building battery-electric vehicles. Staff assumed no FCEVs in these two categories because no manufacturers that would be regulated have announced plans to commercially produce FCEVs. Cummins is a powertrain manufacturer that has announced plans to offer a plug-in hybrid powertrain to vehicle manufacturers that allows for full-electric, series hybrid, and parallel hybrid functionality.[55] At this time it is unclear if PHEVs will result in lower costs for regulated manufacturers because the vehicles would have two propulsion systems, and would earn fewer PHEV credits than an equivalent ZEV meaning that more PHEVs would need to be sold to meet the same credit requirement. The reduced PHEV credit also ensures that total emission benefits remain about the same. Although PHEVs are expected to have lower cost per vehicle than full ZEVs, they still require charging infrastructure and will not have as significant operational cost savings as battery-electric vehicles. At workgroup meetings, multiple manufacturers have stated they would not produce both PHEVs and ZEV models if still required to produce ZEVs to comply. For all of these reasons, staff are not including PHEVs in the cost analysis.

For Class 7-8 tractors, staff assumes 90% of the required vehicles will be sold as battery-electric and 10% will be sold as fuel-cell electric. While there is interest from numerous manufacturers in fuel-cell tractor technology, most manufacturers are currently investing in

[54] California Air Resources Board, EMFAC2017 Web Database (web link: https://www.arb.ca.gov/emfac/2017/, last accessed June 2019).
[55] Cummins, Powerdrive for Electric Trucks (web link: https://www.cummins.com/electrification/powerdrive-for-electric-trucks, last accessed June 2019).

battery-electric tractor technology. The proposed percentage requirements are not stringent enough to require electrification of the long haul sector meaning manufacturers can focus their deployments in short-haul tractor applications. Battery-electric technology is well suited for short-haul applications and offers potential fuel savings. Long-haul applications are where fuel cell electric trucks offer the greatest advantage over battery-electric tractors due to their rapid refueling and lower weight.

Table C-3 outlines the assumptions for each vehicle group in the baseline and proposal scenarios.

Table C-3. Vehicle Groups and Technologies

Vehicle Group	Baseline Scenario	Proposal Scenario
Class 2B-3	Gasoline (43%) Diesel (57%)	Battery-electric (All normal range)
Class 4-5	Diesel	Battery-electric (50% long range after 2030)
Class 6-7	Diesel	Battery-electric (50% long range after 2030)
Class 8	Diesel	Battery-electric (50% long range after 2030)
Class 7-8 Tractor	Diesel	Battery-electric (90%) Fuel Cell Electric (10%)

The percentage schedules shown below in Table C-4 are applied to the annual sales numbers to calculate the annual number of zero-emission trucks required by the regulation.

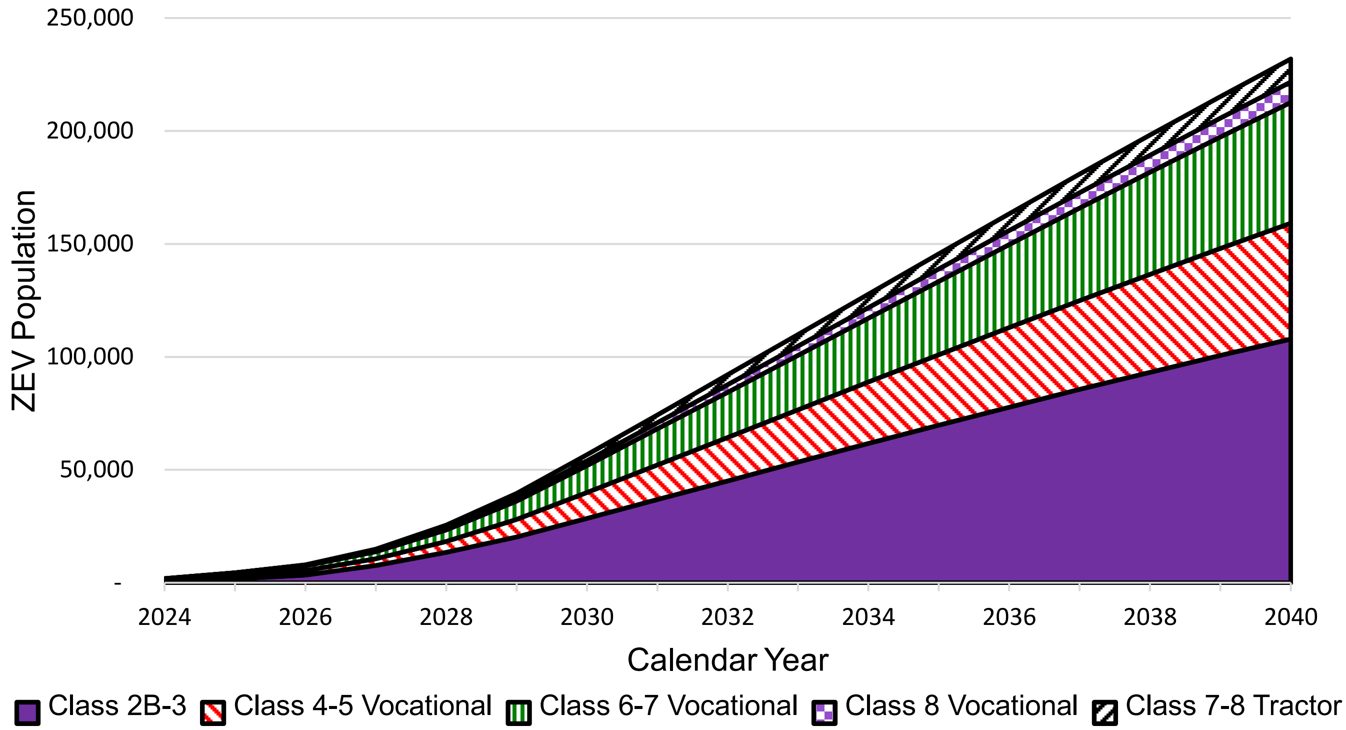
Table C-4. Advanced Clean Trucks ZEV Sales Percentage Schedule

Model Year	Baseline	Class 2B-3*	Class 4-8**	Class 7-8 Tractor
2024	0%	3%	7%	0%
2025	0%	5%	9%	0%
2026	0%	7%	11%	0%
2027	0%	9%	13%	9%
2028	0%	11%	24%	11%
2029	0%	13%	37%	13%
2030 and beyond	0%	15%	50%	15%

*Pickup trucks are excluded from Class 2B-3 requirements until 2027
**Excluding Class 7-8 tractors

These percentages are applied to the annual California sales numbers to estimate the number of zero-emission trucks that will be sold in California as shown in Figure C-1. The population growth rate increases to 2030 as the ZEV sales percentage requirement ramps up, and starts to slow down afterwards as ZEV sales begin to replace ZEVs that retire out of the fleet.

Figure C-1. ZEV Population Forecast over Time (>8,500 lb. GVWR)



Staff are not anticipating any pre-buy situation where manufacturers increase sales of their vehicles before the Proposed ACT Regulation and decrease sales after implementation begins. Fleets, not manufacturers, decide when to purchase vehicles and this regulation would not encourage them to delay their purchases.

Annual mileage factors into a number of costs in this analysis including fuel costs, maintenance, and LCFS revenue. All annual mileage are based on EMFAC inventory estimates of mileage accrual rates over a vehicles life. For most vehicle categories, annual mileage is the highest early for low age vehicles and drops over time as the vehicle ages. EMFAC categories are matched to vehicle groupings as follows:

- Class 2B-3 annual mileage is the population weighted average of the following EMFAC categories: Light Heavy-Duty 1 and 2
- Class 4-5 and Class 6-7 vehicles are not separated in EMFAC and are lumped together into a Class 4-7 grouping. Based on data available from the 2002 US Vehicle Inventory and Use Survey and the 2018 California Vehicle Inventory and Use Survey, the annual miles for Class 4-5 and Class 6-7 trucks are fairly similar.[56, 57] The Class 4-7 vocational truck annual mileage is the population weighted average of the following EMFAC categories: T6 Public, T6 Instate, T6 Instate – Construction, T6 Utility, T6 gasoline powered trucks, School Buses, and All Other Buses.

---

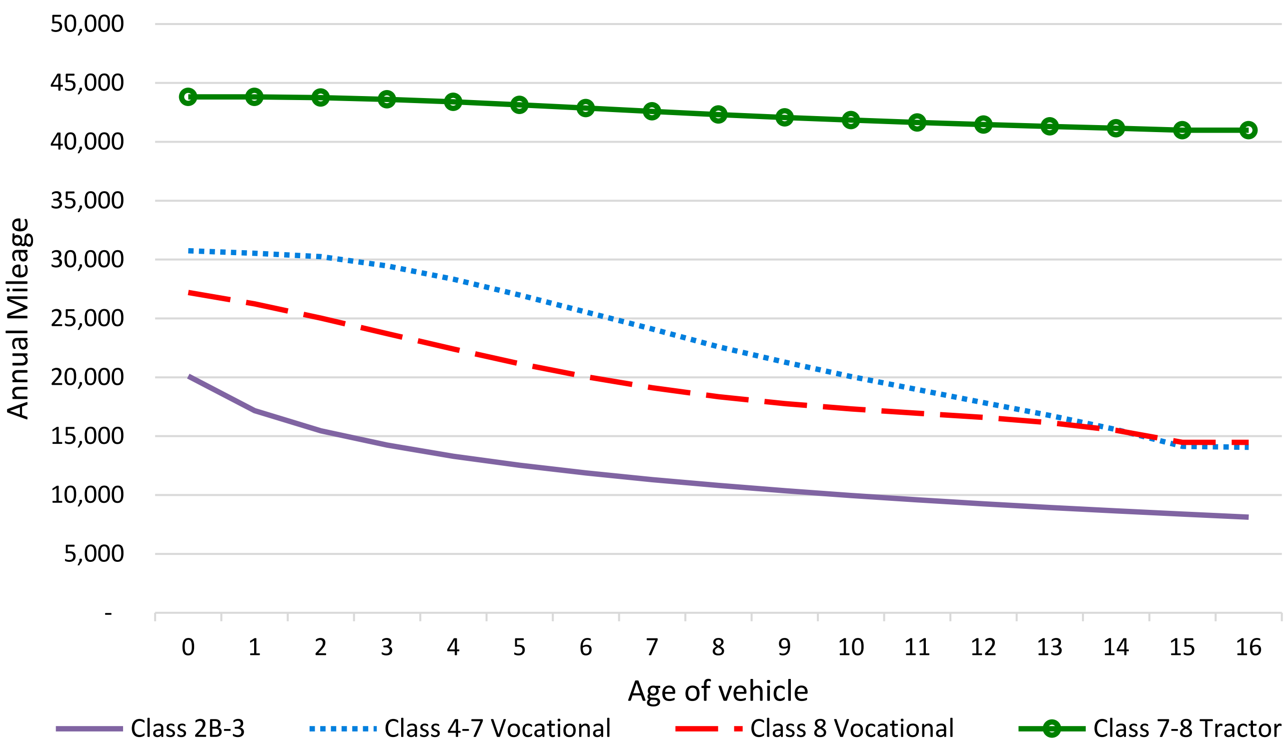
[56] United States Census, 2002 Vehicle Inventory and Use Survey (web link: https://www.census.gov/library/publications/2002/econ/census/vehicle-inventory-and-use-survey.html , last accessed June 2019).

[57] California Department of Transportation, CalTrans Truck Survey, 2018. (Summarized data available here: http://www.scag.ca.gov/committees/CommitteeDocLibrary/mtf012319_CAVIUS.pdf, Last accessed June 2019).

- Class 8 truck annual mileage is the population weighted average of the following EMFAC categories: T7 Public, T7 Single Unit, T7 Single Unit – Construction, T7 Solid Waste Collection Vehicle, and T7 Utility.
- Class 7-8 tractor annual mileage is the population weighted average on the three EMFAC drayage categories: Port of Los Angeles, Port of Oakland, and All Other Ports. We are currently assuming that all required sales zero-emission tractors will be used in drayage service or similar shorter-haul operation.

Figure C-2 illustrates the average mileage assumption for each vehicle group over the life of the vehicle from EMFAC. Staff are assuming ZEVs will travel the same miles as conventional ICE vehicles in their typical operation. Even today, commercially available ZEVs have the range to meet the majority of trucking needs and the lower operating cost of BEVs incentivizes higher mileage duty cycles. Over time as technology advances and more models become available, range should become less of an issue.

Figure C-2. Annual Mileage Accrual Rates by Vehicle and Age



The California International Registration Plan and Out of State categories are not included in these calculations as these categories represent trucks that regularly travel in interstate operation. Due to their high annual miles and variable infrastructure needs, these categories are not assumed to be representative of a zero-emission duty cycle. In addition, many of these trucks are not sold into California despite operating within the state, so these sales would not be regulated under the proposed ACT rule.

b. ***Costs to Manufacturers***

Manufacturers are the regulated party in the Proposed ACT Regulation and would be responsible for selling zero-emission vehicles in California. The Proposed ACT Regulation requires that manufacturers must build and sell more expensive zero-emission trucks, certify their powertrain using the optional ZEP Certification procedure, and report information to CARB as part of their regulatory requirements. Manufacturers have the option to use the required zero-emission truck sales to help meet their Phase 2 GHG compliance obligation. Therefore, the incremental costs of producing ZEVs above the expected costs of compliance with the Phase 2 GHG without ZEVs are attributable to the Proposed ACT Regulation.

i. Vehicle Price

This section covers the cost to the manufacturer of building and selling a baseline ICE vehicle or a ZEV. Today and for the foreseeable future, battery-electric and fuel cell electric trucks will cost more than their diesel or gasoline counterparts. Declining battery and component costs in addition to economies of scale are expected to lower the incremental costs of zero-emission vehicles as the market expands. For this subsection, we are assuming the full incremental price of the vehicle when compared to the baseline is treated as a cost to the manufacturer. Vehicle prices are not amortized as the manufacturer would see the full cost in the year it is built and sold.

Gasoline and diesel vehicle prices are based on averages of prices taken from manufacturers' websites and other related websites. [58,59,60,61,62] For the Class 4-5, Class 6-7, and Class 8 vehicles, the cost is meant to represent a vehicle with a basic body such as a box or stake-bed and not a vehicle with an expensive specialty body such a boom truck or refuse truck.

Staff estimated the cost of zero-emission vehicles for battery-electric and fuel cell powered vehicles by adding electric components costs, fuel cell component costs, and energy storage costs to a conventional glider vehicle. The final retail price of the zero-emission vehicle is the sum of the total component costs adjusted by an additional 10 percent for other upfront costs such as research, development, retooling, and overhead. The calculated prices for battery electric vehicles are comparable to battery electric trucks and vans that are available through the HVIP program today

The cost of battery storage is the largest contributing factor associated with the price of battery-electric truck. Battery pack costs have dropped over 80 percent since 2010 and are projected to continue declining. The CARB discussion document "Battery Cost for Heavy-Duty Vehicles" was a literature review published in 2016 using data sources from 2013 and 2014 to assess battery costs for buses and heavy duty vehicles.[63] Battery pack cost for heavy duty applications are higher than for light cars due to smaller volumes and differing packaging requirements even though many use the same cells. However, this report is somewhat dated and does not reflect the current state of the battery market. At the December 4th, 2018

[63] California Air Resources Board, Battery Cost for Heavy-Duty Electric Vehicles (Discussion Draft) (web link: https://www.arb.ca.gov/msprog/bus/battery_cost.pdf, last access June 2019).

Advanced Clean Trucks workgroup meeting, a number of manufacturers suggested we use light-duty battery prices with a five-year delay to reflect battery-price projections that are applicable to heavy duty vehicles.

The battery-electric vehicle costs in this analysis are calculated using electric vehicle component costs from the International Council on Clean Transportation whitepaper (ICCT), "Transitioning to Zero-Emission Heavy-Duty Freight Vehicles" and battery costs will use the Bloomberg light-duty battery prices with a five-year delay.[64,65] Hydrogen fuel cell component costs are from a variety of sources. Electrical component costs and hydrogen tank costs are calculated using the same ICCT source and battery costs are estimated using the same Bloomberg light-duty battery prices with a five year delay. Hydrogen system component costs are calculated using a presentation from Strategic Analysis titled "Fuel Cell Systems Analysis" which estimated fuel cell system costs for medium- and heavy-duty trucks.[66] This presentation analyzed fuel cell system costs on a component level basis for multiple weight classes of vehicle and provided temporal and volume-based cost projections.

Staff are not forecasting that this rule will affect commercial battery prices and ZEV technology significantly. The Proposed ACT Regulation affects a portion of California's heavy-duty trucking fleet, which is very small compared to the worldwide market for batteries in consumer electronics, light-duty vehicles, battery-storage, and other applications. To the extent that this rule increases economies of scale for general ZEV components, infrastructure, and battery production, there may be lower component prices as a result of the rule, but these effects are less certain and are not modelled. The Proposed ACT Regulation may cause the cost for components specifically designed for medium- and heavy-duty ZEVs to decrease as economies of scale start to emerge in this new market.

The battery-electric vehicle is modelled using motors and electrical components in line with an existing diesel counterpart's power needs, and battery storage capacity based on the Age 0 daily mileage, the energy economy of the electric vehicle, and a 35% buffer to account for battery degradation and some operational variability. The hydrogen fuel cell tractor cost assumes the battery is 10 kWh, 40 kg. of hydrogen storage, and the fuel cell stack's power output is half the vehicle's peak power needs.

In the proposal and some alternatives, a long-range battery-electric vehicle is modelled, which assumes a 50% larger battery. For tractors, longer range needs are assumed to be met with fuel cell electric tractors. Table C-5 lists the specifications of the battery-electric vehicles.

Class 7-8 Tractor - Electric	$201,351	$194,134	$188,312	$183,371	$178,870	$174,809	$170,748
Class 7-8 Tractor - Fuel Cell	$216,931	$212,353	$207,885	$203,439	$199,004	$194,579	$190,155

Table G-8 outlines the incremental cost difference between a ZEV and its diesel equivalent.

Table G-8. Incremental ZEV versus Diesel Price Forecast

Vehicle Group	2024 MY	2025 MY	2026 MY	2027 MY	2028 MY	2029 MY	2030+ MY
Class 2B-3 – Electric Normal Range	$14,896	$13,635	$12,599	$11,684	$10,829	$10,035	$9,241
Class 2B-3 – Electric Long Range	$19,241	$17,568	$16,201	$15,011	$13,909	$12,895	$11,881
Class 4-5– Electric Normal Range	$25,127	$22,616	$20,585	$18,852	$17,267	$15,830	$14,394
Class 4-5– Electric Long Range	$36,424	$32,841	$29,952	$27,503	$25,275	$23,266	$21,258
Class 6-7– Electric Normal Range	$31,174	$27,591	$24,702	$22,253	$20,025	$18,016	$16,008
Class 6-7– Electric Long Range	$48,554	$43,321	$39,112	$35,563	$32,345	$29,456	$26,568
Class 8– Electric Normal Range	$34,799	$30,486	$27,007	$24,057	$21,371	$18,949	$16,527
Class 8– Electric Long Range	$55,655	$49,362	$44,299	$40,029	$36,155	$32,677	$29,199
Class 7-8 Tractor - Electric	$71,351	$64,134	$58,312	$53,371	$48,870	$44,809	$40,748
Class 7-8 Tractor - Fuel Cell	$86,931	$82,353	$77,885	$73,439	$69,004	$64,579	$60,155

Though the cost for manufacturers to comply is estimated in detail as described above, it is not straightforward to predict how these costs and cost-savings would be passed on to consumers. Vehicle pricing is complex, and different manufacturers could use different strategies to pass on these costs. It is possible that manufacturers may pass on incremental ZEV costs through the ZEVs themselves, through the rest of their ICE fleet, or some combination thereof.

ii. Zero-Emission Powertrain Certification Costs

The Proposed ACT Regulation requires manufacturers starting 2024 MY to certify their vehicles using the Zero-emission Powertrain (ZEP) Certification procedure in order to earn ZEV credits. This requirement would only apply to vehicles affected by ZEP certification – complete vehicles above 14,000 lb. GVWR and incomplete vehicles above 10,000 lb. GVWR. Based on our current knowledge, there are roughly ten manufacturers who are regulated by the Proposed ACT Regulation and would sell ZEVs that be required to follow the ZEP certification procedure.

The Initial Statement of Reasons (ISOR) for the ZEP Certification rulemaking estimated the cost of certification would be $9,200 per powertrain.[67] For this rulemaking and analysis, we are estimating that each regulated manufacturer affected would certify two powertrains in 2024 model year and afterwards would certify an additional two new powertrains every 5 years afterwards.

The ISOR for ZEP certification included a $25 cost per vehicle for labelling costs and a $100 cost per vehicle family for ZEP vehicle family certification. We are not modelling this cost in for the Proposed ACT Regulation because this assumption does not take into account for avoided costs from not having to meet more rigorous ICE labelling requirements or ICE vehicle family certifications for the same number of vehicles, nor does it assume any potential reductions in ICE certification costs as the ZEV sales percentage requirement ramps up.

Manufacturers who are not regulated under the Proposed ACT Regulation would need to follow the ZEP certification to generate credits in this proposal. Manufacturers who are not required to meet ZEP certification may still do so if 1) they wish to earn credits in this rule to be sold to other manufacturers, or 2) a different program such as HVIP requires it. Because neither of these are costs attributable to the Proposed ACT Regulation, we are not modelling any ZEP certification costs to unregulated manufacturers. This assumes regulated manufactures would only buy credits if the credits reduce their overall compliance costs which already included ZEP certification costs.

[67] California Air Resources Board, Proposed Alternative Certification Requirements and Test Procedures for Heavy-Duty Electric and Fuel Cell Electric Vehicles and Proposed Standards and Test Procedures for Zero-Emission Powertrains – Staff Report: Initial Statement of Reasons (web link: https://www.arb.ca.gov/regact/2019/zepcert/isor.pdf, last accessed June 2019).

iii. Phase 2 GHG Compliance Costs

The federal and California Phase 2 GHG regulations require manufacturers to build trucks that are more fuel efficient and have lower GHG emissions. These requirements start in 2021 model year and ramp up through the 2027 model year. EPA estimated the cost per vehicle to comply with the regulation shown in Table C-9.[68]

Table C-9. U.S. EPA Phase 2 GHG Incremental Compliance Costs

Phase 2 Category	2021-2023 MY	2024-2026 MY	2027+ MY
Class 2B-3 Pickup/Van	$524	$963	$1,364
Vocational Vehicles	$1,110	$2,022	$2,662
Tractors	$6,484	$10,101	$12,442

Manufacturers can meet the Phase 2 standards through a variety of technologies including improved aerodynamics, low rolling resistance tires, engine and accessory optimization, weight reduction, idle reduction systems, hybridization, powertrain electrification, and more. The Proposed ACT Regulation requires the sale of zero-emission vehicles that can also be used to comply with Phase 2 GHG. The costs of producing ZEVs are assumed to be higher than other compliance options, but would also reduce the amount of upgrades the manufacturers would need to make for their remaining ICE sales. While it is possible for a manufacturer to meet their entire compliance obligation with electric trucks, the U.S. EPA assumed this compliance pathway is a higher cost option than building cleaner combustion vehicles. In the Federal Phase 2 GHG rulemaking, EPA stated that they "…do not project fully electric vocational vehicles to be widely commercially available in the time frame of the final Phase 2 rules. For this reason, [EPA and NHTSA] have not based the Phase 2 standards on adoption of full-electric vocational vehicles."[69]

The cost difference between Phase 2 GHG compliance costs in the baseline scenario and the Proposed ACT Regulation represents the potential cost savings to the manufacturer. Manufacturers can build ZEVs and comply with the Proposed ACT regulation and the Phase 2 GHG regulations simultaneously which will reduce the number of ICE vehicles that need to be upgraded to meet Phase 2 standards. In the baseline scenario, the cost to comply with the California Phase 2 GHG regulation is the number of vehicles sold multiplied by the cost per vehicle as outlined in Table C-9.

In the Proposed ACT Regulation scenario, as the ZEV sales percentage requirement ramps up, the number of ICE trucks that must be upgraded to the Phase 2 GHG standards decreases. This is because, per the Phase 2 GHG regulation, electric vehicles do not produce tailpipe GHG emissions and therefore can offset compliance requirements for the rest of the

[68] United States Environmental Protection Agency, Final Rule for Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2 (web link: https://www.govinfo.gov/content/pkg/FR-2016-10-25/pdf/2016-21203.pdf, last accessed June 2019).

[69] United States Environmental Protection Agency, Final Rule for Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2: Regulatory Impact Analysis, pg. 73704 (web link: https://nepis.epa.gov/Exe/ZyPDF.cgi/P100P7NS.PDF?Dockey=P100P7NS.PDF, last accessed June 2019).

manufacturer's fleet. The lower costs of complying with the Phase 2 GHG regulation in the Proposal ACT Regulation scenario are modelled using the following formula:

$$GHG\ Phase\ 2\ Annual\ Cost\ Savings\ to\ Manufacturer\ Due\ to\ Proposed\ ACT\ Regulation = \frac{Vehicles\ Sold}{Year} x \frac{Phase\ 2\ GHG\ Cost}{Vehicle\ Sold} x \frac{ZEV\ Sales\ \% * ATM}{Phase\ 2\ Reduction\ \%}$$

Where:

- "ZEV Sales %" is the annual ZEV Sales percentage requirement each year
- "ATM" is the Phase 2 GHG Advanced Technology Multiplier which gives extra credit to PHEV, BEV, and FCEV vehicles until the end of the 2027 MY. This multiplier is 3.5, 4.5, and 5.5, respectively.
- "Phase 2 Reduction %" is the percentage of GHG reduction that the Phase 2 GHG regulation requires per year. By 2027, the standards are roughly 17-20% more stringent than the 2018 Phase 2 GHG baseline.

This formula calculates the potential avoided costs to upgrade ICE vehicles to comply with the Phase 2 GHG regulation.

The Phase 2 GHG compliance costs offset by the Proposed ACT Regulation are derived primarily from the federal regulation. If these compliance cost savings are passed through to fleets it would likely be a nationwide effect. Therefore, staff make a conservative assumption that percent savings passed through to California fleets is proportional to California's share of the national truck population estimated at 10% as to not overestimate the cost-savings.[70] Table C-10 displays the nationwide and California portion of reduced Phase 2 GHG compliance costs relative to the compliance costs relative to the baseline.

Table C-10. Cumulative Nationwide and California Phase 2 GHG Cost Savings Relative to the Baseline (million 2018$)

Calendar Year	Nationwide	California Portion
2031	-$1,539	-$154
2040	-$3,737	-$375

iv. Manufacturer Reporting Costs

The Proposed ACT Regulation will require information from manufacturers regarding their total sales of combustion powered vehicles, ZEV sales, and PHEV sales starting in the 2021 model year. This information will be used to determine which manufacturers are regulated and their annual credit and deficit generation.

Manufacturers are already required to report information to CARB as a requirement of the California Phase 2 GHG regulation including sales per model year of every powertrain and vehicle family. Because manufacturers are already collecting and reporting this information to CARB, we are not modelling any significant additional reporting costs to manufacturers as a result of the Proposed ACT Regulation. Similarly, no reporting costs are attributed to

[70] Energy Information Administration, Annual Energy Outlook 2018 (web link: https://www.eia.gov/outlooks/aeo/data/browser/#/?id=3-AEO2018&cases=ref2018&sourcekey=0, last accessed June 2019).

unregulated ZEV manufacturers that may optionally report information for purposes of earning and trading credits to other manufacturers because credits are assumed to be purchased if regulated manufacturers can reduce their overall compliance costs.

c. *Costs to California Businesses*

The Proposed ACT Regulation regulates vehicle manufacturers that primarily manufacture vehicles outside of California. Most of regulatory requirements associated with the Proposed ACT Regulation applies to these manufacturers. The only requirement on California businesses in the Proposed ACT Regulation is the large entity reporting requirement which is proposed as a one-time requirement. However, for purposes of demonstrating the potential economic impacts on the state's overall economy, all of the costs from deploying the number of ZEVs required by the Proposed ACT Regulation are assumed to be borne in California. Therefore, in the statewide cost analysis, all costs including the incremental vehicle costs, infrastructure upgrades, fueling, maintenance, and other costs are assumed to be the direct costs of the regulation in California despite the lack of a specific fleet purchase requirement. For this analysis, vehicle and infrastructure costs are amortized over a five and twenty year period, respectively, to reflect typical purchasing patterns.

i. Large Entity Reporting

Under the Proposed ACT Regulation, large fleet owners and large companies that contract out for transportation related services will be required to report information to CARB regarding what vehicles they own and how they operate, as well as company-wide information about their California locations and how they and their contractors move freight and perform other services.

Staff are estimating that roughly 12,000 companies or entities will be affected by this reporting requirement consisting of 11,000 large companies or trucking fleets and 1,000 public entities, utility fleet, and refuse fleets. Companies that do not own trucks will need to report summary information about the types of product they move and services they hire. Most large companies that own trucks or buses will have fleet software or other data management systems to pull information about their fleet and company quickly. Staff are estimating it will take on average two hours to retrieve, review, and report company-specific information, and an additional two hours to retrieve, review, and report vehicle information resulting in four hours of reporting per company. This may be higher or lower from company to company. These averages assume that some large entities will not have information to report other than to respond that they do not contract directly for any transportation services. The hourly cost is assumed to be $50 per hour for staffing and lost revenue from the employee assigned to pull the information.[71]

[71] California Air Resources Board, Technical Support Document: Proposed Regulation for In-Use Road Diesel Vehicles (web link: https://www.arb.ca.gov/regact/2008/truckbus08/tsd.pdf, last accessed June 2019).

ii. Sales Tax and Federal Excise Tax

Taxes are additional costs levied on the purchase of a vehicle. Because they are based on the purchase price of the vehicle, they are higher for zero-emission vehicles due to their higher upfront costs.

Vehicles purchased in California must pay a sales tax on top of the vehicle's purchase price. The sales tax varies across the state from a minimum of 7.25% up to 10.25% in some municipalities; a value of 8.5% was used for staff's analysis based on a statewide population weighted average.[72] This results in higher costs for fleets and higher revenue for state and local governments. Class 8 vehicles are subject to an additional Federal Excise Tax which adds 12% to their purchase price.

iii. Gasoline, Diesel, Electricity, and Hydrogen Fuel Cost

Fuel costs are calculated using total fuel used per year and the cost of fuel per unit. The total fuel used per year is based on the vehicle population per calendar year, the annual mileage of these vehicles, and the fuel economy of the vehicles. Population and mileage assumptions are discussed on Vehicle Population and Annual Mileage subsection on page 24. In general, ZEVs are 2 to 5 times as efficient as similar vehicles with internal combustion engines technologies and significantly reduce petroleum and other fossil fuel use and use less total energy.[73]

Fuel economy is measured in miles per gallon for gasoline and diesel, miles per kilowatt-hour for battery-electric, and miles per kilogram for fuel cell electric trucks. Gasoline and diesel fuel economy is derived from EMFAC inventory projections for each gasoline and diesel vehicle group. These projections incorporate the effects of Phase 2 GHG which will increase gasoline and diesel fuel economies over the next decade. Battery-electric vehicle fuel economy is derived from in-use data collected from a variety of vehicles. For fuel cell efficiency, we are applying the LCFS program's Energy Efficiency Ratio (EER) of 1.9 to the diesel fuel economy to estimate the fuel cell fuel economy as we are not aware of any data available measuring the fuel efficiency of fuel cell electric tractors.

Staff modeled that for both battery-electric and fuel cell electric vehicles, the efficiency will improve at the same rate as for gasoline and diesel powered vehicles. This may be a conservative estimate as both of these technologies are less developed than ICE powertrains and reports have shown improvements in the technology recently.

Table C-11 outlines the fuel economy assumptions for each vehicle group and technology type over the course of the regulation.

---

[72] California's basic sales tax rate is 7.25 percent with 3.94 percent going to the State and the rest to local authorities. In addition to the basic sales tax, districts levy special taxes that differ amongst districts.
[73] California Air Resources Board, Battery Electric Truck and Bus Efficiency Compared to Diesel Vehicles (web link: https://ww2.arb.ca.gov/sites/default/files/2018-11/180124hdbevefficiency.pdf, last accessed June 2019).

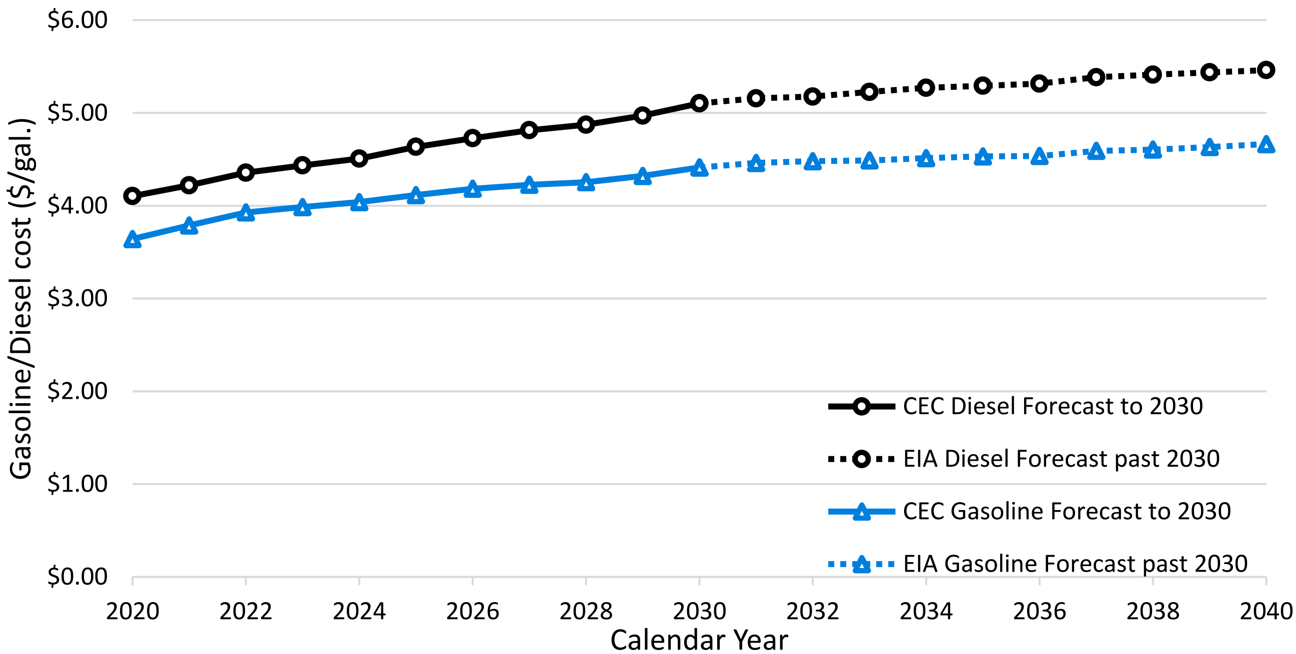
Table C-11. Fuel Economy for Each Vehicle Group and Technology

Vehicle Group	Technology	Fuel Economy 2024-2026 MY	Fuel Economy 2027 MY and beyond	Units
Class 2B-3	Gasoline	10.89	11.74	mpg
	Diesel	23.03	24.83	mpg
	Battery-Electric	1.98	2.13	mi./kWh
Class 4-5	Diesel	13.75	14.28	mpg
	Battery-electric	1.26	1.30	mi./kWh
Class 6-7	Diesel	9.55	9.91	mpg
	Battery-electric	0.80	0.83	mi./kWh
Class 8	Diesel	7.72	8.08	mpg
	Battery-electric	0.62	0.65	mi./kWh
Class 7-8 Tractor	Diesel	8.75	9.22	mpg
	Battery-electric	0.61	0.64	mi./kWh
	Fuel Cell Electric	16.63	17.53	mi./kg

Gasoline and diesel fuel prices to 2030 are taken from the California Energy Commission's (CEC) "Revised Transportation Energy Demand Forecast, 2018-2030", adjusted to 2018 dollars using California CPI.[74] Fuel prices past 2030 are calculated using the Energy Information Administration's (EIA) 2018 Annual Energy Outlook for the Pacific region.[75,76] The annual percentage change in EIA gasoline and diesel fuel prices past 2030 is applied to the 2030 CEC gasoline and diesel prices to estimate price changes past 2030. Figure C-3 shows the projected prices of gasoline and diesel out to 2040.

[74] California Department of Finance, Consumer Price Forecast (web link: http://www.dof.ca.gov/Forecasting/Economics/Eco_Forecasts_Us_Ca/index.html , last accessed June 2019)
[75] California Energy Commission, Revised Transportation Energy Demand Forecast 2018-2030 (web link: https://efiling.energy.ca.gov/getdocument.aspx?tn=223241, last accessed June 2019).
[76] Energy Information Administration, Annual Energy Outlook 2018 (web link: https://www.eia.gov/outlooks/aeo/data/browser/#/?id=3-AEO2018&cases=ref2018&sourcekey=0, last accessed June 2019).

Figure C-3. Gasoline and Diesel Price Forecasts



Battery-electric fuel prices depend on how they are charged and include energy costs, fixed fees and demand fees. Vehicles charged at high power or during peak periods will have higher electricity costs than if charging overnight over an extended period. Electricity prices are calculated using CARB's Battery-Electric Truck and Bus Charging Calculator and assumes a fleet of 20 vehicles will be depot charged overnight on a separate utility meter using a managed charging strategy with the applicable rate schedule. Additionally, charger efficiency losses and local electricity taxes are incorporated into these numbers. The energy, demand, fixed costs, efficiency losses and local taxes and fees are all calculated using the Charging Calculator.[77] The cost per kWh is calculated separately for each utility and a weighted average is used to determine the cost per kWh per vehicle in 2018. Table C-12 shows the electricity price per kWh for each vehicle group and major utility region as well as the weighted statewide average. In general, electricity costs are lower for larger vehicles because larger vehicles tend to use more electricity which decreases the fixed costs per kWh and allows the use of lower cost rate schedules for larger utility customers.

Table C-12. Electricity Cost Calculation for 2018 (2018$/kWh)

Utility Area	Class 2B-3	Class 4-5	Class 6-7	Class 8	Class 7-8 Tractor
Los Angeles Department of Water and Power	$0.11	$0.10	$0.10	$0.11	$0.10
Pacific Gas and Electric (PG&E)*	$0.23	$0.20	$0.20	$0.20	$0.18
Sacramento Municipal Utility District	$0.15	$0.14	$0.11	$0.11	$0.10
San Diego Gas and Electric	$0.24	$0.19	$0.19	$0.22	$0.19
Southern California Edison (SCE)**	$0.19	$0.15	$0.15	$0.14	$0.13

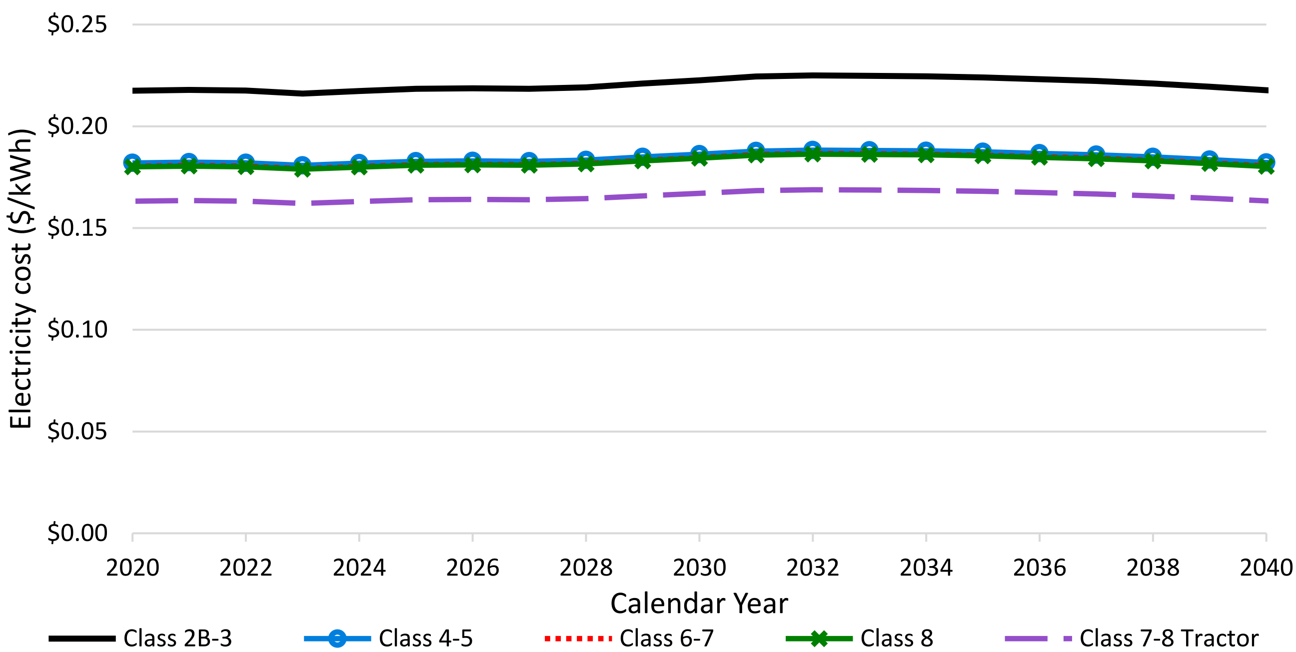
[77] California Air Resources Board, Battery-Electric Truck and Bus Charging Calculator (web link: https://ww2.arb.ca.gov/resources/documents/battery-electric-truck-and-bus-charging-cost-calculator, last accessed June 2019).

Utility Area	Class 2B-3	Class 4-5	Class 6-7	Class 8	Class 7-8 Tractor
Weighted Statewide Average	$0.21	$0.18	$0.18	$0.18	$0.16

*PG&E has proposed two new electricity rates for commercial ZEVs, CEV-S and CEV-L, which are currently under CPUC review with a decision expected in August/September 2019. If approved, these rates will decrease electricity rates to commercial fleets to roughly $0.13-$0.15/kWh in PG&E territory.
**SCE's newly introduced electric vehicle rates, EV-8 and EV-9, have no demand fees from 2019 to 2023 and phase them back over the following five years, with demand fees being fully reintroduced in 2029. This analysis is based on an SCE estimate for what the electricity rate will look like in 2029 once demand fees are fully reintroduced.[78]

Electricity price changes over time are modelled using the CEC's "Revised Transportation Energy Demand Forecast, 2018-2030", adjusted to 2018 dollars using California CPI. Fuel prices past 2030 are calculated using the EIA 2018 Annual Energy Outlook for the Pacific region. The annual percentage change in EIA gasoline and diesel fuel prices past 2030 is applied to the 2030 CEC gasoline and diesel prices to estimate future price changes. Results per vehicle type are shown in Figure C-4. The electricity costs for Class 4-5, Class 6-7, and Class 8 are fairly similar resulting in them overlapping on the graph.

Figure C-4. Electricity Price Forecasts

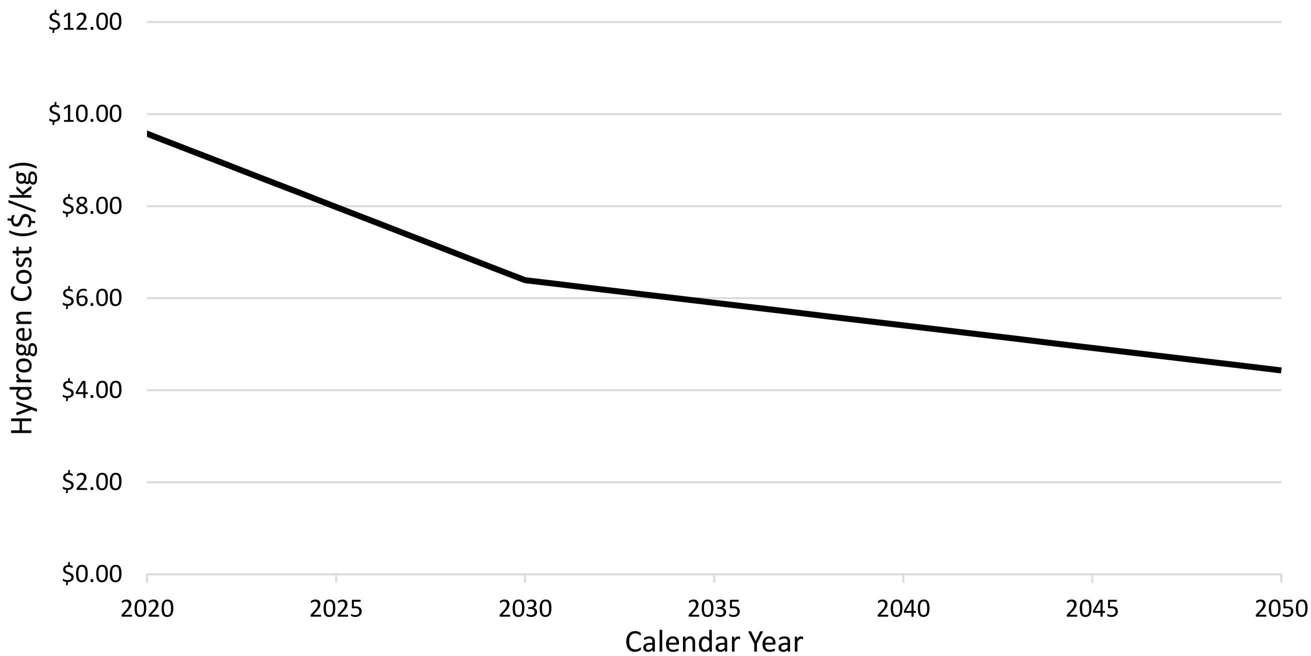


For this analysis, hydrogen stations were assumed to be available at strategic locations around ports or major distribution hubs where the infrastructure costs are included in the hydrogen fuel price rather than reflecting costs for stations installed in a depot. This model is currently used for light-duty hydrogen stations and heavy-duty diesel sales and based on stakeholder feedback appears most appropriate near term estimate for heavy-duty hydrogen fueling. Hydrogen fuel costs are based on communication with Trillium CNG who estimated the cost of

[78] Southern California Edison, Communication via email with Alexander Echele in April 2019.

hydrogen at low, intermediate, and high volumes using different production methods.[79] This report uses the liquid hydrogen delivery numbers based on what Trillium presented as being most feasible for production at scale. The low volume cost will be used in 2018, the intermediate volume in 2030, and the high volume in 2050 with intermediate years being interpolated. These assumptions are based on expecting low volume production today, intermediate volume by 2030 when we would see some moderate sized deployments but no complete conversions yet, and continuing price reductions out to 2050. Hydrogen costs over time are shown in Figure C-5.

Figure C-5. Hydrogen Price Forecasts



The cost of fuel displayed above includes fuel taxes. State and local taxes on fuel are listed below in Table C-13.

Table C-13. Local and State Taxes on Fuel

Fuel Type	Local Tax	State Tax
Gasoline	2.25% sales tax	$0.493/gal excise tax
Diesel	4.5% sales tax	8.5% sales tax + $0.38/gal excise tax
Electricity	3.53% utility user tax*	$0.0003/kWh
Hydrogen	0	0

*Statewide population-weighted average

iv. Low Carbon Fuel Standard Revenue

The Low Carbon Fuel Standard (LCFS) is a California regulation that creates a market mechanism that incentivizes low carbon fuels. The LCFS regulation was amended in 2018. These amendments 1) increased the Energy Efficiency Ratio for Class 4-8 trucks from 2.7 to 5.0, 2) reduced the carbon intensity target to 20% reduction by 2030, and 3) clarified how

[79] Trillium CNG, Email communication with Ryan Erickson in November 2018.

hydrogen station operators can receive credits. The regulation now requires the carbon intensity of California's transportation fuels to decrease by 20% through the 2030 timeframe and maintains the standard afterwards. Electricity and hydrogen are eligible to earn LCFS credits which can be sold and used to offset the costs of these fuels. Fossil gasoline and diesel are generally not eligible for LCFS credits.

Fleets who own and operate their infrastructure generate credits based on the amount of fuel or energy they dispense. Credit values for different fuel types are calculated using the LCFS Credit Price Calculator.[80] The following credit values assume a credit price of $125 as estimated by LCFS program staff in the staff report for the 2018 rulemaking.[81] The average credit price for May 2019 was $185 has been above $180 since December 2018. Thus, the actual cost for fleets could be lower with higher LCFS credit value. An electric Class 2B-3 vehicle will earn $0.073/kWh in 2024 using grid electricity while an electric Class 4-8 vehicle will earn roughly $0.124/kWh in 2024. For hydrogen, we are assuming the hydrogen is produced from 33% renewable feedstock as required by SB 1505 (2006). This results in Class 4-8 vehicles earning $1.037/kg in 2024. LCFS credit revenue for a given fuel drops slightly over time as the program standards tighten and maintains upward pressure on the credit price.

v. Vehicle Maintenance Costs

Maintenance costs reflects the cost of labor and parts for routine maintenance, preventative maintenance, and repairing broken components. Maintenance costs for electric vehicles are generally assumed to be lower than for diesel in part due to their simpler design and fewer moving components. There is very little data available on hydrogen fuel cell vehicles currently, but available data appears to show maintenance costs that are comparable with diesel.

Maintenance costs for ICE Class 2B-3 vehicles are based on four sources from three reports.[82] [83] Maintenance costs for ICE vocational vehicles are based on the American Truck Research Institute study, "An Analysis of the Operational Costs of Trucking: 2017 Update" cost for straight truck maintenance per mile.[84] Maintenance costs for ICE tractors are based on the American Truck Research Institute study, "An Analysis of the Operational Costs of Trucking: 2018 Update" cost for less-than-truckload (LTL) maintenance cost per mile.[85] The LTL cost was used because the slower speed, frequent stops of LTL service match most closely to the

[85] American Trucking Research Institute, An Analysis of the Operational Costs of Trucking: 2018 Update (web link: https://atri-online.org/wp-content/uploads/2018/10/ATRI-Operational-Costs-of-Trucking-2018.pdf, last accessed June 2019).

duty cycle of drayage or short-haul tractors that are more likely to become ZEVs prior to 2030. Table C-14 shows the maintenance cost assumptions used in this analysis. Battery-electric vehicles are assumed to have 25 percent lower vehicle maintenance costs compared to gasoline and diesel based on an aggregation of sources and data.[86, 87, 88, 89] Fuel cell electric vehicles are assumed to have similar maintenance costs to ICE vehicles; Ballard recommends estimating a fuel cell bus's maintenance costs as the same as a battery-electric bus plus $0.20/mi. for fuel cell maintenance. This adjustment will put a fuel cell bus's maintenance costs in line with a diesel or CNG bus.[90]

Table C-14. Maintenance Cost per Mile per Vehicle Group

Vehicle Group	Gasoline/Diesel ($/mi.)	Battery-Electric ($/mi.)	Fuel Cell Electric ($/mi.)
Class 2B-3	$0.17	$0.128	$0.17
Class 4-5 Vocational	$0.31	$0.233	$0.31
Class 6-7 Vocational	$0.31	$0.233	$0.31
Class 8 Vocational	$0.31	$0.233	$0.31
Class 7-8 Tractor	$0.19	$0.142	$0.19

vi. Maintenance Bay Upgrades

Maintenance bays are facilities used to service vehicles. Services performed can include inspections, routine maintenance, preventative maintenance, repairs, overhauls and more. Servicing electric vehicles requires separate safety equipment, diagnostic tools, and equipment which will incur costs to the facility.

Based on transit agency data, upgrading a fifteen bus maintenance bay to handle battery-electric buses would cost $25,000, and upgrading to handle fuel cell electric buses would cost $750,000. For this analysis, we are assuming the cost per maintenance bay is the same and a fifteen bus maintenance bay could accommodate 25 trucks due to their smaller size. The amount of maintenance bay upgrades each year is based on the increase in ZEV population per year to avoid double-counting in situations where a ZEV is replaced by a ZEV.

vii. Midlife Costs

Midlife costs are the cost of rebuilding or replacing major propulsion components due to wear or deterioration. For diesel vehicles, this would be a midlife rebuild, for battery-electric vehicles

[86] California Air Resources Board, Literature Review on Transit Bus Maintenance Cost (web link: https://www.arb.ca.gov/msprog/bus/maintenance_cost.pdf, last accessed June 2019).
[87] Electrification Coalition, State of the Plug-in Electric Vehicle Market (web link: https://www.pwc.com/gx/en/automotive/industry-publications-and-thought-leadership/assets/pwc-ec-state-of-pev-market-final.pdf, last accessed June 2019).
[88] Propfe, B. et.al. Cost analysis of Plug-in Hybrid Electric Vehicles including Maintenance & Repair Costs and Resale Values (web link: http://www.mdpi.com/2032-6653/5/4/886, last accessed June 2019).
[89] Taefi, T. et.al. Comparative Analysis of European examples of Freight Electric Vehicle Schemes. http://nrl.northumbria.ac.uk/15185/1/Bremen_final_paperShoter.pdf, last accessed June 2019).
[90] Ballard, Fuel Cell Electric Buses: Proven Performance and the Way Forward (web link: https://info.ballard.com/fuel-cell-electric-buses-proven-performance-white-paper?hsCtaTracking=ab0058ba-1240-4ab6-a4e6-0032faf329b7%7Cd0616627-31ce-416a-bbe8-d036529a4d75, last accessed June 2019).

this would be a battery replacement, and for a hydrogen fuel-cell vehicle this would be a fuel cell stack refurbishment. The frequency and cost of a midlife rebuild vary from technology to technology.

The frequency of a diesel engine rebuild varies based on the vehicle's weight class. Table C-15 shows the anticipated diesel engine useful life based on years or miles. The cost of an engine rebuild is estimated to be one quarter of the total vehicle price.

Table C-15. Useful life of diesel engines

Vehicle/Engine Category	Useful Life (Years/Miles)
Class 4-5 (Light-Heavy Duty)	18/350,000
Class 6-7 (Medium-Heavy Duty)	18/450,000
Class 8 (Heavy-Heavy Duty)	18/850,000

Data is limited for battery-electric vehicles, but today zero-emission manufacturers are offering vehicles with warranties of eight or more years and up to 300,000 miles on their products. Information on battery degradation trends from light-duty Tesla vehicles was used to estimate when batteries for trucks would need to be replaced. [91,92,93,94] Staff estimate that the battery will be replaced every 300,000 miles. The cost of the battery replacement is assumed to be the size of the battery in kWh multiplied by the price per kWh at the time of the replacement.

For fuel cell electric vehicles, the consulting firm Ricardo has estimated that a fuel cell stack refurbishment is necessary every seven years and costs one third the cost of a new fuel cell stack at the time of refurbishment. [95]

Based on the above assumptions, Table C-16 shows when vehicles are assumed to incur midlife costs.

Table C-16. Frequency of Midlife Rebuilds

Vehicle Group	Technology	Midlife Occurrence (yr)
Class 2B-3	Gasoline	Not necessary
	Diesel	Not necessary
	Battery-Electric	Not necessary
Class 4-5	Diesel	13
	Battery-electric	10
Class 6-7	Diesel	17
	Battery-electric	10

[95] Ricardo, Economics of Truck TCO and Hydrogen Refueling Stations, 2016.

Vehicle Group	Technology	Midlife Occurrence (yr)
Class 8	Diesel	18
	Battery-electric	14
Class 7-8 Tractor	Diesel	18
	Battery-electric	5, 13, 20
	Fuel Cell Electric	7, 14, 21

viii. Fueling Infrastructure Installation and Maintenance

Infrastructure is necessary to refuel or recharge vehicles. All vehicles need either dedicated refueling infrastructure onsite or publicly available retail stations in order to operate. There are numerous ways infrastructure expenses can be accounted for which will affect the cost to California businesses in different ways. Infrastructure expenses are generally an upfront capital investment needed prior to vehicles being deployed, but infrastructure can last multiple vehicle lifetimes and generally is amortized over its life.

In the baseline scenario, we are assuming that the fleet is either using existing gasoline or diesel infrastructure or publicly accessible stations and the infrastructure cost is already incorporated into the fuel cost. As a result, diesel infrastructure costs are not separately modeled.

In the proposal scenario, we are assuming that fleets using battery-electric will be setting up private, behind-the-fence infrastructure to recharge their vehicles and will not depend on publically available charging networks. There are two main cost components of installing charging infrastructure: the cost of the charger itself and the cost of upgrading the site to deliver power to the charger. The latter can include trenching, cabling, laying conduit, potential transformer upgrades and more.

Charger and infrastructure cost estimates for Class 2B-3 and Class 4-5 vocational vehicles are derived from Pacific Gas and Electric and Southern California Edison cost estimates as part of their SB 350 applications. Costs for Class 8 vocational and Class 7-8 tractors are taken from the ICT ISOR and comes from electric transit bus deployment data. Class 6-7 trucks are assumed to use the same infrastructure as a heavier truck but would be able to share the charger with another Class 6-7 truck; as a result, their infrastructure costs are half that of a Class 8 truck. Table C-17 outlines the assumptions for charger power, charger cost, and infrastructure upgrade costs.

Table C-17. Charger Power Ratings and Infrastructure Costs

Vehicle Group	Charger Power (kW)	Charger Cost	Infrastructure Upgrade Cost
Class 2B-3	19	$5,000	$20,000
Class 4-5	19	$5,000	$20,000
Class 6-7	40	$25,000	$27,500
Class 8	80	$50,000	$55,000
Class 7-8 Tractor	80	$50,000	$55,000

Fleets are assumed to amortize their infrastructure costs over a 20 year period with an interest rate of five percent. The amount of chargers installations and infrastructure upgrades each year is based on the increase in ZEV population per year to avoid double-counting infrastructure costs in situations where a ZEV is replaced by a ZEV.

Hydrogen infrastructure costs are incorporated into the hydrogen fuel costs identified by Trillium and are not included here.

Depot and on-route chargers for zero-emission vehicles require regular maintenance. The maintenance costs of depot chargers are estimated by considering costs for replacing charger heads, connectors, and other components, as well as labor costs for regular inspections.[96] The information about on-route chargers is based on data from Foothill Transit who has experience with Proterra on-route chargers.[97] Charger maintenance costs are estimated at $500/yr/charger. We assume that the maintenance cost for other fueling infrastructures are reflected in the fuel price.

ix. Transitional Costs and Workforce Development

Transitioning to a new technology has inherent costs associated with its deployment, including shifts in operational and maintenance practices. These recurring costs include operator and technician trainings, purchasing and upgrading of software, securing additional spare parts, and others.

Limited information is available for this type of transitional cost, but discussions occurred on this topic during the development of the Innovative Clean Transit rule. Based on discussions with transit agencies, Staff assumed that these “other costs” associated with ZE bus deployments are equivalent to 2.5 percent of bus prices for all powertrains and discussed that the costs should go down over time for ZEBs as they become more common. This method is based on the assumption that the Cost Subgroup used to reflect estimated soft costs for conventional internal combustion engine bus.[98]

In the cost analysis for the Proposed ACT Regulation, staff are making similar assumptions and that the workforce training and transitional costs are equal to 2.5% of the incremental cost difference between a baseline ICE vehicle and a ZEV. These costs continue until 2030 at which point the technology will have developed to a point where these transitional costs become business as usual for trucking fleets.

x. Registration Fees

Vehicles operating and registered in California must pay an annual registration fee. The registration fee varies based on the vehicle’s cost, age, and weight. These calculations are different for ICE vehicles and ZEVs.

[96] Personal communications with Tesla and Clipper Creek in October 2016
[97] Foothill Transit, Email communication with Andrew Papson, Electric Bus Program Manager, in March 2017
[98] Transit Agency Subcommittee-Lifecycle Cost Modeling Subgroup (2017). Report of Findings, April 2017.

ICE and ZEV's are subject to the following fixed fees based on the DMV online calculator.[99] These are constant annual fees for every vehicle and are shown in Table C-18.

Table C-18. Fixed Registration Fees for Diesel Vehicles and ZEVs

Diesel Fee Name	Amount	ZEV Fee Name	Amount
Current Registration	$58	Current Registration	$58
CVRA Registration Fee	$122	Current California Highway Patrol	$25
CVRA Service Authority for Freeway Emergencies Fee	$3	CVRA Service Authority for Freeway Emergencies Fee	$1
CVRA Fingerprint ID Fee	$3	CVRA Fingerprint ID Fee	$1
CVRA Abandoned Vehicle Fee	$3	CVRA Abandoned Vehicle Fee	$1
CVRA California Highway Patrol Fee	$41	Current Air Quality Management District	$6
Current Air Quality Management District	$6	Alt Fuel/Tech Registration Fee	$3
Current Cargo Theft Interdiction Program Fee	$3	CVRA Auto Theft Deterrence/DUI Fee	$2
CVRA Weight Decal Fee	$3	Reflectorized License Plate Fee	$1
Alt Fuel/Tech Registration Fee	$3	Road Improvement Fee	$100
CVRA Auto Theft Deterrence/DUI Fee	$4		
Reflectorized License Plate Fee	$1		
Total	$250	Total	$198

All vehicles registered in California must pay a Transportation Improvement Fee based on the price of the vehicle. For vehicles priced between $35,000 and $60,000, the fee is $150, and for vehicles priced above $60,000, the fee is $175.

All registered vehicles are assessed a Vehicle License Fee which is equal to the vehicle price multiplied by 0.65% and a separate percentage schedule. This separate schedule is shown in Table C-19.

Table C-19. Vehicle License Fee Decline over Time

Year	1	2	3	4	5	6	7	8	9	10	11+
Percentage	100%	90%	80%	70%	60%	50%	40%	30%	25%	20%	15%

For commercial ICE vehicles, vehicle owners are assessed an annual weight fee based on the vehicle's potential maximum loaded weight. For electric vehicles, the weight fee is based on its unladen weight. The estimated weight fees are shown in Table C-20.

Table C-20. Weight Fees for ICE Vehicles and ZEVS

Diesel Fee Name	Diesel Weight Fee	ZEV Weight Fee
Class 2B-3	$210	$266
Class 4-5	$447	$358
Class 6-7	$546	$358
Class 8	$1,270	$358
Class 7-8 Tractor	$2,064	$358

[99] California Department of Motor Vehicles, California New Vehicle Fees (web link: https://www.dmv.ca.gov/portal/dmv/detail/portal/feecalculatorweb, last accessed June 2019).

Overall, ZEV's pay lower registration fees over the vehicles life although it may be higher in the initial years of registration. This difference is greater for heavier vehicles due to the large difference in annual weight fees.

xi. Battery Recycling, Repurposing, and Disposal

The energy capacity of the batteries used in ZEVs will naturally degrade over their useful life and require battery replacements. When battery capacity is not sufficient for meeting daily range needs for a truck or bus, it is expected that there will be a second life for the batteries. The used battery at the end of its vehicle useful can be repurposed into other applications such as stationary storage, then at the end of the battery life it can be recycled and non-recyclable materials can be disposed.

The cost for battery recycling at the end of battery life is not included here, because this cost could be offset by the residual value of the battery at the end of its useful life in a truck or bus. The end of life may be a revenue source depending on whether the battery can be recycled and repurposed, or could become a cost if it must be disposed of. Today, light-duty vehicle batteries are already being repurposed for second life applications including stationary storage.[100,101] Even today, some lithium-ion battery manufacturers provide an attractive residual value to customers upon the retirement of a battery. Therefore, staff believes that the residual value will offset the recycling cost and become a revenue source, but does not include a residual battery value in the economic analysis.

d. *Total Costs*

The Proposed ACT Regulation would increase the number of ZEVs sold in California relative to the baseline. These ZEVs have higher upfront capital costs for the vehicle and infrastructure investments, but lower operating costs over time resulting in lower overall costs for truck transportation in California. The cost to truck transportation in California assuming all vehicle manufacturer costs and 10 percent of the Phase 2 GHG savings are passed on is -$4.8 billion between 2020 and 2040 compared to the baseline scenario. Figure C-6 and Table C-22 illustrates the difference in cost between the Proposed ACT Regulation and the baseline scenario. In Figure C-6, the cost components are grouped as shown in Table C-21.

Table C-21. Summarized Cost Items

Cost Category	Components
Manufacturer Cost	ZEV Price, ICE Phase 2 GHG (cost avoided), ZEP Certification
Fuel Cost	Gasoline, Diesel, Electricity, Hydrogen Fuel Cost
LCFS Revenue	LCFS Revenue
Infrastructure	Charger Costs, Infrastructure Upgrades, Charger Maintenance
Maintenance	Vehicle Maintenance Costs, Maintenance Bay Upgrades

[100] Nissan Motor Corporation, Nissan LEAF batteries to light up Japanese town. (web link: https://newsroom.nissan-global.com/releases/180322-01-e?lang=en-US&la=1&downloadUrl=%2Freleases%2F180322-01-e%2Fdownload, last accessed June 2019).
[101] BMW Group, BMW Group, Northvolt and Umicore join forces to develop sustainable life cycle loop for batteries (web link: https://www.press.bmwgroup.com/global/article/detail/T0285924EN/bmw-group-northvolt-and-umicore-join-forces-to-develop-sustainable-life-cycle-loop-for-batteries, last accessed June 2019).

Cost Category	Components
Midlife	Midlife Costs
Other	Sales Tax, Federal Excise Tax, Registration Fees, Large Entity Reporting, Transitional Costs and Workforce Development

Based on the cost analysis, deploying ZEVs will decrease costs to the California economy primarily due to lower fuel costs. Manufacturers would see increased costs past 2024 MY in California as the cost to build ZEVs would be a higher cost pathway to comply with Phase 2 GHG than using other technologies. However, the Proposed ACT Regulation is estimated to reduce costs of compliance with the Phase 2 GHG regulation when factoring in nationwide savings due to the Advanced Technology Multiplier that expires at the end of 2027 MY.

Despite these potential short term cost savings, large manufacturers have hesitated to invest significant amounts of capital into ZE products because of uncertainty in the longer term market and estimated higher costs after 2027. Transitioning from conventional ICE powertrains to battery-electric and fuel cell electric technology represents a major paradigm shift for both manufacturers and fleets, and it is difficult to forecast how the technology may grow without established government policy. There are other non-monetary risks associated with ZEV development that need to be managed such as infrastructure availability, range anxiety, weight concerns. Studies from University of California, Davis and the North American Council on Fuel Efficiency show some hesitancy from the trucking industry despite the potential for cost savings.[102, 103]

Additionally, manufacturers bear additional risks by building electric vehicles when compared to compliance strategies that depend on modest improvements in existing conventional truck technologies. Developing a ZE product line requires initial research and development expenses, new or heavily modified assembly lines, agreements with new suppliers, and more. While this analysis does show a cost saving while the Advanced Technology Multiplier is in effect, on a longer timeframe past 2027 MY, ZEVs are a more expensive vehicle to build. Demand for ZEVs is dependent on many factors outside the manufacturer’s control including fuel price swings, battery and other component prices, shifting fleet behavior, and others. So while this cost analysis shows that ZEVs overall have potential to decrease costs to manufacturers for complying with Phase 2 GHG regulation prior to 2028, staff believe the manufacturers may not commercially produce ZEVs in a BAU scenario without certainty from a regulation.

*Note: Totals may differ due to rounding

2. Direct Costs on Typical Businesses

e. *Medium- and Heavy-duty Manufacturers*

Manufacturers are responsible for meeting the ZEV sales percentage requirement by either building and selling zero-emission trucks, or using flexibility provisions. While none of the regulated manufacturers build vehicles in California, this analysis is included to provide further information to stakeholders. Manufacturing ZEVs requires large upfront costs that go into research and development, prototyping, assembly line upgrades and tooling, and other categories. All these costs plus the actual component cost of the vehicle need to be recouped during the sale of the vehicle.

Manufacturers would have a requirement to sell ZEVs but most fleets do not currently have a requirement to purchase ZEVs. As a result, manufacturers bear risk in that they may have to sell vehicles below cost to fleets to meet the requirements of the regulation. Any ZEV costs that manufacturers cannot pass on through sale of their ZEVs may be added to the cost of the rest of their ICE fleet, or the manufacturer may not pass on the cost and must absorb the cost themselves.

The two extremes are either the manufacturer is able to fully pass on the cost of an electric vehicle to the purchaser, or they are not able to pass any cost on to the purchaser. One way to estimate what the purchaser would be willing to pay for would be to look at the payback of the ZEV. Studies and surveys have found that commercial fleets are willing to pay more for cost-saving technologies within a certain payback period that varies from fleet to fleet.[104,105] Two years is considered to be the time period where any cost-saving expense becomes an easy decision for a fleet. Table C-23 illustrates the percentage of incremental cost that the fleet will be willing to pay for based on a simple two-year payback analysis incorporating fuel costs, LCFS revenue, and amortized charger & infrastructure payments. These percentages should represent the floor for what portion of the incremental cost the fleet will pay for as most companies have longer horizons than two years with some looking at the full life of the vehicle.

Table C-23. Percentage of Two-Year Simple Payback vs. Incremental Cost

Vehicle Group*	2024 MY	2025 MY	2026 MY	2027 MY	2028 MY	2029 MY	2030 MY
Class 2B-3	24%	26%	28%	29%	31%	34%	38%
Class 4-5	54%	61%	69%	73%	81%	89%	101%
Class 6-7	54%	63%	72%	77%	86%	98%	113%
Class 8	28%	34%	40%	41%	47%	55%	67%
Class 7-8 Tractor - Electric	33%	38%	42%	44%	48%	53%	60%
Class 7-8 Tractor - Fuel Cell	N/A	N/A	N/A	N/A	N/A	3%	8%

*Class 2B-3 is using average of payback versus diesel and gasoline, all comparisons versus the normal range version of vehicle.

[104] Volvo Technology of North America, Heavy-Duty Class 8 Electrification Roadmap: Regional Distribution and Short Haul Applications.
[105] Environmental Protection Agency, Heavy-duty Trucking and the Energy Efficiency Paradox (web link: https://www.epa.gov/sites/production/files/2014-12/documents/heavy-duty_trucking_and_the_energy_efficiency_paradox.pdf, last accessed June 2019).

It is possible that manufacturers may shift sales for California-bound trucks out of state to avoid the requirements of the Proposed ACT Regulation which would consequentially reduce overall emissions reductions. Current California conditions include higher sales tax, registration fees and other factors that cause a portion of California tractors and trucks to be sold initially out of state despite operating within California. Generally, trucking companies make purchasing decisions based on a variety of reasons including the location of their headquarters, fleet facilities, expected duty cycles, and level of local delegation. Staff does not believe the Proposed ACT Regulation is likely to exacerbate these issues as fleet behavior determines where vehicles are purchased and operated, not manufacturer decisions.

While the proposed ACT regulation cannot ensure that sales will not affect decisions to shift sales out of state, future planned ZEV rules can require companies to incorporate zero-emission trucks into their fleets regardless of whether they were purchased in state or not. This issue can be avoided in how future regulations are structured to ensure real emissions reductions occur in California.

f. *Trucking Fleets*

Manufacturers sell trucks to trucking fleets who operate the vehicles and incur costs after the point of sale including taxes, fueling, maintenance, midlife costs, and registration fees. Adding electric trucks to their fleet will also cause fleets to incur cost relating to EVSE, infrastructure, maintenance bay upgrades, workforce training, and other transitional costs.

The Proposed ACT Regulation will reduce costs to the overall state's trucking fleet as the operational cost savings of the ZEVs outweigh the potential infrastructure and vehicle prices. Amortizing the vehicle and infrastructure help with these company's cash-flow so they can have positive cash-flow shortly after purchase.

Table C-24 illustrates an example where an example fleet purchases 20 Class 4-5 trucks for usage in last mile delivery applications in 2024 for usage over twelve years. The costs for 20 diesel vehicles, 20 battery-electric vehicles and the difference between them is shown. All other mileage and cost assumptions are the same as described previously in this section. The costs over the twelve year period are lower for the battery-electric fleet as compared to the diesel fleet; however, the upfront capital expenses are significantly higher for the BEV fleet. Access to capital or financing will be critical for fleets to take advantage of the overall savings of BEVs. A more detailed discussion of fleet costs can be found in the "Draft Advanced Clean Trucks Total Cost of Ownership Discussion Document" released earlier this year.[106]

Table C-24. Fleet Cost Example

Cost line items	Diesel	Battery Electric	Difference
Amortized Vehicle Price (including all mfr. expenses)	$1,270,361	$1,747,840	$477,479
Sales Tax	$93,280	$135,896	$42,616
Amortized EVSE Cost	$0	$104,315	$104,315
Amortized Infrastructure Upgrades	$0	$417,261	$417,261
Charger Maintenance	$0	$120,000	$120,000

[106] California Air Resources Board, Draft Advanced Clean Trucks Total Cost of Ownership Discussion Document (web link: https://ww2.arb.ca.gov/sites/default/files/2019-02/190225tco_0.pdf, last accessed June 2019).

Cost line items	Diesel	Battery Electric	Difference
Fuel Costs	$2,220,329	$947,961	-$1,272,368
LCFS Revenue	$0	-$764,063	-$764,063
Maintenance Costs	$1,914,913	$1,436,185	-$478,728
Midlife Costs	$0	$259,200	$259,200
Maintenance Bay Upgrades	$0	$20,000	$20,000
Transitional Costs and Workforce Development	$0	$12,564	$12,564
Registration Fees	$245,823	$232,840	-$12,982
Total	$5,744,706	$4,669,999	-$1,074,706

3. Direct Costs on Small Businesses

There is no expected direct cost on small businesses under the Proposed ACT Regulation. No manufacturers or fleets who are regulated under this rule are small businesses.

Small businesses who operate trucks will not be required to purchase zero-emission trucks, but may independently decide to do so. This may enable cost savings for small businesses due to electric trucks' lower cost of operation.

4. Direct Costs on Individuals

There are no direct costs onto individuals as a result of this regulation. Individuals may see health benefits as described in Section B.3 due to ZEVs displacing ICE vehicles and providing statewide, regional, and local emission benefits. Manufacturers and fleets will see increased and decreased costs as a result of this rule and will pass through to individuals in the state. Individuals may see macroeconomic benefits and costs; these costs are discussed further in Section E.

Some of the vehicles affected by this regulation, mainly Class 2B-3 pickup trucks, are purchased by individuals. Based on manufacturer estimates, this portion is roughly half of the overall Class 2B-3 population compared to the 15% sales requirement in the Class 2B-3 category in 2030.[107] Staff is assuming in this analysis that all ZEVs will be sold to businesses rather than individuals. Businesses are more likely to look at lifetime savings and the total cost of ownership compared to individuals, and the vehicles businesses purchase including vans are better suited for electrification as opposed to the pickups purchased by individuals.

D. Fiscal Impacts

1. Local Government

[107] Truck and Engine Manufacturers Association, Advanced Clean Truck Market Segment Analysis (web link: https://ww2.arb.ca.gov/sites/default/files/2018-11/181204emaanalysis_0.xlsx , last accessed June 2019).

a. Large Entity Reporting

Cities and counties are required to complete the Large Entity Reporting requirement in 2020. There are 58 counties and 482 cities in California and each would be required to report information about their fleets, and the transportation services they contract for.

b. Utility User Taxes

Many cities and counties in California levy a Utility User Tax on electricity usage. This tax varies from city to city and ranges from no tax to 11%. A value of 3.53% was used in this analysis representing a population-weighted average.[108] By increasing the amount of electricity used, there will be an increase in the amount of the utility user tax revenue collected by cities and counties.

c. Gasoline and Diesel Fuel Taxes

Fuel taxes on gasoline and diesel to fund transportation improvements at the state, county, and local levels. Displacing gasoline and diesel with electricity and hydrogen will decrease the total amount of gasoline and diesel dispensed in the state, resulting in a reduction in fuel tax revenue collected by local governments. The local tax on fuel is listed in Table C-13.

d. Local Sales Taxes

Sales taxes are levied in California to fund a variety of programs at the state and local level. The Proposed ACT Regulation will require the sale of more expensive zero-emission trucks in California which will result in direct increase in sales tax revenue collected by local governments. Overall, local sales tax revenue may increase less than the direct increase from vehicle sales if overall business spending doesn't increase.

e. Local Government Fleet Cost Pass-Through

The local government fleet is estimated to make up 2.9% of California's fleet based on information from manufacturers and the Department of General Services. A proportionate amount of the total costs outlined in Table C-22 are assumed to pass-through to local governments.

f. Fiscal Impact on Local Government

Table D-1 shows the estimated fiscal cost to local governments due to the Proposed ACT Regulation relative to baseline conditions. The fiscal impact to local government is estimated to be -$0.1 million over the first three years of the regulation and $7 million over the regulatory lifetime.

[108] California State Controller's Office, User Utility Tax Revenue and Rates (web page: https://sco.ca.gov/Files-ARD-Local/LocRep/2016-17 Cities UUT.pdf, last accessed June 2019).

Table D-1. Estimated Fiscal Impacts to Local Government (million 2018$)

Model Year	Large Entity Reporting	Utility User Tax Revenue	Local Gasoline and Diesel Fuel Taxes	Local Sales Tax	Local Government Fleet Cost Pass-Through	Fiscal Impact*
2020	-$0.1	$0	$0	$0	$0	-$0.1
2021	$0	$0	$0	$0	$0	$0
2022	$0	$0	$0	$0	$0	$0
2023	$0	$0	$0	$0	$0	$0
2024	$0	$0	-$1	$2	-$1	$0
2025	$0	$1	-$1	$2	-$1	$1
2026	$0	$1	-$2	$3	$0	$2
2027	$0	$2	-$4	$6	-$1	$3
2028	$0	$3	-$7	$8	-$2	$2
2029	$0	$5	-$12	$10	-$1	$2
2030	$0	$7	-$18	$12	$1	$2
2031	$0	$10	-$23	$12	$5	$4
2032	$0	$12	-$29	$14	$6	$3
2033	$0	$14	-$35	$14	$9	$2
2034	$0	$16	-$41	$14	$11	$0
2035	$0	$18	-$46	$15	$13	$0
2036	$0	$20	-$51	$15	$16	$0
2037	$0	$22	-$57	$15	$19	-$1
2038	$0	$24	-$62	$15	$20	-$3
2039	$0	$25	-$66	$15	$22	-$4
2040	$0	$26	-$71	$15	$23	-$7
Total	-$0.1	$206	-$526	$187	$140	$7

*Note: Totals may differ due to rounding

2. State Government

a. CARB Staffing and Resources

The Proposed ACT Regulation would have a small impact on staffing resources and would require two additional Air Pollution Specialist (APS) positions responsible for administering contracts to set up the reporting systems, assisting stakeholders with inquiries, data analysis and auditing of information submitted by manufacturers and fleets, supporting ACT enforcement actions and other general implementation duties. Each position has a fully burdened cost to CARB of $180,000 in Fiscal Year (FY) 2020-2021 and $179,000 every year afterwards.

The manufacturer reporting requirement will require modifying an existing reporting system or developing a new system to handle the reporting. We are estimating a cost of $200,000 in FY2020-2021 in contracting costs to set up the manufacturer reporting system for the rule.

Similarly, the fleet and large entity reporting requirement will require modifying an existing reporting system or developing a new system to handle the reporting. We are estimating a cost of $200,000 in FY2020-2021 in contracting costs to set up the fleet reporting system for the rule.

b. Gasoline and Diesel Fuel Taxes

Fuel taxes on gasoline and diesel to fund transportation improvements at the state, county, and local levels. Displacing gasoline and diesel with electricity and hydrogen will decrease the total amount of gasoline and diesel dispensed in the state. This will result in a reduction in revenue collected by the state for use in multiple levels of government. The state tax on fuel is listed in Table C-13.

c. Energy Resources Fee

The Energy Resource Fee is a $0.0003/kWh surcharge levied on consumers of electricity purchased from electrical utilities. The revenue collected is deposited into the Energy Resources Programs Account of the General Fund which is used for ongoing energy programs and projects deemed appropriate by the Legislature, including but not limited to, activities of the California Energy Commission.

d. Registration Fees

The state collects registration fees to fund transportation improvements at the state, county, and local levels. The fee structure for zero-emission vehicles is different from diesel vehicles with some fees such as the Vehicle License Fee being higher and others such as weight fees being lower. These differences result in lower registration fees for the zero-emission vehicles. These lower fees result in reduced revenue collected by the state for use in transportation services.

e. State Sales Tax

Sales taxes are levied in California to fund a variety of programs at the state and local level. This Proposed ACT Regulation will require the sale of more expensive zero-emission trucks in California which will result in higher sales tax collected by the state governments. Overall, state sales tax revenue may increase less than the direct increase from vehicle sales if overall business spending doesn’t increase.

f. State Fleet Cost Pass-Through

The state government fleet is estimated to make up 2.1% of California’s fleet based on information from manufacturers and the Department of General Services. A proportionate amount of the total costs outlined in Table C-22 are assumed to pass-through to the state government.

g. Fiscal Impacts on State Government

Table D-2 shows the estimated fiscal impacts to the state government due to the Proposed ACT Regulation relative to baseline conditions. The fiscal impact to local government is estimated to be -$1.4 million over the first three years of the regulation and -$2.01 billion over the regulatory lifetime.

Table D-2. Estimated Fiscal Impacts on State Government (million 2018$)

Model Year	CARB Staffing and Resources	State Gasoline and Diesel Fuel Taxes	Energy Resources Fee	Registration Fee	State Sales Taxes	State Fleet Cost Pass-Through	Fiscal Impact*
2020	-$0.6	$0	$0	$0	$0	$0	-$1
2021	-$0.4	$0	$0	$0	$0	$0	$0
2022	-$0.4	$0	$0	$0	$0	$0	$0
2023	-$0.4	$0	$0	$0	$0	$0	$0
2024	-$0.4	-$2	$0	$0	$2	$1	$1
2025	-$0.4	-$6	$0	$0	$2	$0	-$4
2026	-$0.4	-$10	$0	$0	$3	$0	-$7
2027	-$0.4	-$18	$0	-$1	$5	-$1	-$15
2028	-$0.4	-$30	$0	-$1	$7	-$1	-$25

*Note: Totals may differ due to rounding

E. Macroeconomic Impacts

1. Methods for Determining Economic Impacts

This section describes the estimated total impact of the Proposed ACT Regulation on the California economy. The Proposed ACT Regulation will result in changes in expenditures by businesses in order to comply with its requirements. These changes in expenditures will affect employment, output, and investment in sectors that supply goods and services in support of the trucking industry and ZEVs.

These lead to additional induced effects, like changes in personal income that affect consumer expenditures across other spending categories. The incremental total economic impacts of the Proposed ACT Regulation are simulated relative to the baseline scenario using the cost data described in Section C. The analysis focuses on the incremental changes in major macroeconomic indicators from 2020 to 2040 including employment, growth, and gross state product (GSP). The years of the analysis are used to simulate the Proposed ACT Regulation through 12 months post full implementation.

Regional Economic Models, Inc. (REMI) Policy Insight Plus Version 2.2.8 is used to estimate the macroeconomic impacts of the Proposed ACT Regulation on the California economy. REMI is a structural economic forecasting and policy analysis model that integrates input-output, computable general equilibrium, econometric and economic geography methodologies.[109] REMI Policy Insight Plus provides year-by-year estimates of the total impacts of the Proposed ACT Regulation, pursuant to the requirements of SB 617 and the California Department of Finance.[110,111] CARB uses the REMI single-region, 160-sector model with the model reference case adjusted to reflect the Department of Finance conforming forecasts. These forecasts include California population figures dated May 2019, U.S. real GDP forecast, and civilian employment growth numbers dated April 2019.

2. Inputs of the Assessment

The estimated economic impact of the Proposed ACT Regulation are sensitive to modeling assumptions. This section provides a summary of the assumptions and inputs used to determine the suite of policy variables that best reflect the macroeconomic impacts of the Proposed ACT Regulation. The direct costs estimated in Section C and the non-mortality health benefits estimated in Section B are translated into REMI policy variables and used as inputs for the macroeconomic analysis.[112]

The direct costs of the Proposed ACT Regulation, as described in Section C, include costs on manufacturers for producing the ZEVs as well as cost-savings that accrue for offsetting of a portion of Federal and California Phase 2 GHG compliance costs. While these costs are directly incurred by manufacturers, those manufacturers are not located in California; because this analysis focuses on the impacts to the California economy it is assumed here that these costs must be passed on from manufacturers to fleets in California through the price of vehicles. Additionally, the Phase 2 GHG compliance costs offset by the Proposed ACT Regulation is derived primarily from the federal regulation. If these compliance cost savings are passed through to fleets it would likely be a nationwide effect. Staff therefore make a conservative assumption, as to not overestimate the cost-savings, that the savings passed through to California fleets is proportional to California's share of the national truck population; estimated at 10%.[113] The net change in vehicle costs is input into the economic model as an increase in production costs in the truck transportation industry (NAICS 484) in California.

---

[111] Department of Finance, Chapter 1: Standardized regulatory Impact Analysis For Major Regulations - Order of Adoption (web link http://dof.ca.gov/Forecasting/Economics/Major_Regulations/SB_617_Rulemaking_Documents/documents/Order_of_Adoption-1.pdf, last accessed June 2019)

[112] Refer to Section G: Macroeconomic Appendix for a full list of REMI inputs for this analysis.

[113] Energy Information Administration, Annual Energy Outlook 2018 (web link: https://www.eia.gov/outlooks/aeo/data/browser/#/?id=3-AEO2018&cases=ref2018&sourcekey=0, last accessed June 2019).

Fleets which use ZEVs will realize changes in production costs related to their change in fuel mix and operations and maintenance costs. Fleets will also need to make investments in infrastructure to support their use of the ZEVs, which will increase their production costs. Finally, fleets' changes in equipment, fuel, and activities will change the amount paid in federal, state, and local taxes. The total change in taxes businesses in the truck transportation industry are modeled as a reduction in production costs for the industry.

Costs and savings incurred by both manufacturers and fleets will result in corresponding changes in final demand for industries supplying those particular goods or services as shown in Table E-1. As the direct costs and cost-savings on vehicle manufacturers are incurred out of state, demand changes for the corresponding ZEV and ICE supply chain can't be directly modeled as a change in final demand in California. In order to account for this, staff estimates the share of demand which may be fulfilled be California businesses, based on California's share of national output for each industry (Electrical component mfg. and Motor vehicle parts mfg.).[114] All other changes in demand are included in this analysis. The infrastructure upgrades necessary for fleet use of ZEVs is assumed to be provided by businesses in the construction sector (NAICS 23). The electric vehicle supply equipment and maintenance is assumed to be supplied by businesses in the Other Electrical Equipment and Component Manufacturing industry (NAICS 3359). The change in demand for vehicle maintenance and midlife rebuild realized by the automotive repair and maintenance industry (NAICS 8111). The reduction in gasoline and diesel fuel demand is assumed to be incurred by the Petroleum and Coal Products manufacturing industry (NAICS 324). The increased demand for electricity and hydrogen fuel is assumed to be provided by the Electric power generation, transmission, and distribution industry (NAICS 2211) and Basic Chemical manufacturing industry (NAICS 3251), respectively. The large entity reporting and the transitional costs and workforce development are assumed to be provided by the Office administrative services (NAICS 5611, 5612) and private education services industries (NAICS 61), respectively.

Table E-1: Sources of Changes in Production Cost and Final Demand by Industry

Source of Cost or Savings	Industry with changes in Production costs (NAICS)	Industries with Changes in Final Demand (NAICS)
Vehicle Prices	Truck Transportation (484)	*One-time cost: Electrical* component mfg.* (3353)
Phase 2 GHG Compliance (Costs Offset)		*One-time cost:* Motor vehicle parts mfg.* (3363)
Infrastructure Upgrades		*One-time cost:* Construction (23)
EVSE and maintenance		*One-time and recurring cost:* Other electrical equipment and component mfg. (3359)
Vehicle maintenance and midlife rebuild		*One-time and recurring cost:* Automotive repair and maintenance (8111)

[114] Based on REMI Policy Insight Plus (v 2.2.8), California's share of national output is 4.3% for electrical component mfg. (3353) and 2.0% for motor vehicle parts mfg. (3363) in 2018.

Gas and diesel fuel		*Recurring cost:* Petroleum and Coal Products Mfg. (324)
Electricity		*Recurring cost:* Electric power generation, transmission, and distribution (2211)
Hydrogen fuel		*Recurring cost:* Basic Chemical manufacturing (3251)
Large Entity Reporting		*One-time cost:* Office administrative services; Facilities support services (5611, 5612)
Transitional Costs and Workforce Training		*Recurring costs:* Education services; private (61)

*The Industry Sales policy variable is used here rather Exogenous Final Demand.

In addition to these changes in production costs and final demand for businesses, there will also be economic impacts as a result of the fiscal effects, primarily from changes in fuel and sales tax revenue and registration fees, as described in Section D. The changes in fuel tax revenue change the production costs for the affected industry of truck transportation (484) and the corresponding change in government revenue is modeled as a change in state and local government spending, assuming this revenue reduction is not offset elsewhere. Additional CARB staff and resources in support of this regulation are modeled as changes in state government employment and spending. The change in federal excise tax revenue is outside the scope of the economic model and not evaluated here.

The health benefits resulting from the emission reductions of the Proposed ACT Regulation reduce healthcare costs for individuals on average. This reduction in healthcare cost is modeled as a decrease in spending for hospitals, with a reallocation of this spending towards other goods and increased savings. The GHG emission reductions benefits as valued through the SC-CO_2 represent the avoided damage from climate change worldwide per MT of CO2e. These benefits fall outside the scope of our economic model and are not evaluated here.

3. Results of the Assessment

The results from the REMI model provide estimates of the impact of the Proposed ACT Regulation on the California economy. These results represent the annual incremental change from the implementation of the Proposed ACT Regulation relative to the baseline scenario. The California economy is forecasted to grow through 2040, therefore, negative impacts reported here should be interpreted as a slowing of growth and positive impacts as an acceleration of growth resulting from the Proposed ACT Regulation. The results are reported here in tables for every five years from 2020 through 2040.

a. *California Employment Impacts*

Table E-2 present the impact of the Proposed ACT Regulation total employment in California across all industries. The employment impacts represent the net change in employment, which consist of positive impacts for some industries and negative impacts for others. The Proposed ACT Regulation is estimated to result in a slightly positive job impact from about

2025 to 2040. These changes in employment represent less than 0.04 percent of baseline California employment.

Table E-2: Total California Employment Impacts

	2020	2025	2030	2035	2040
California Employment	24,368,647	25,267,147	26,206,546	27,105,799	27,920,649
% Change	0.00%	0.00%	0.02%	0.02%	0.03%
Change in Total Jobs	-2	725	4,587	5,607	8,065

The total employment impacts shown above are net of changes at the industry level. The overall trend in employment changes by major sector are illustrated in Figure E-1 and Table E-3 shows the changes in employment by industries that are directly impacted by the Proposed ACT Regulation. As the requirements of the Proposed ACT Regulation go into effect the industries generally realizing reductions in production cost or increases in final demand see an increase in employment growth. This includes the truck transportation, construction, and manufacturing sectors and upstream industries. The largest decrease in employment results from the public sector, which is estimated to realize a decrease in fuel and sales tax revenue and registration fees. The oil and gas extraction industry and automotive repair and maintenance industry see a decreased employment growth rate due to a reduction in final demand for their goods and services.

Figure E-1: Job Impacts by Major Sector

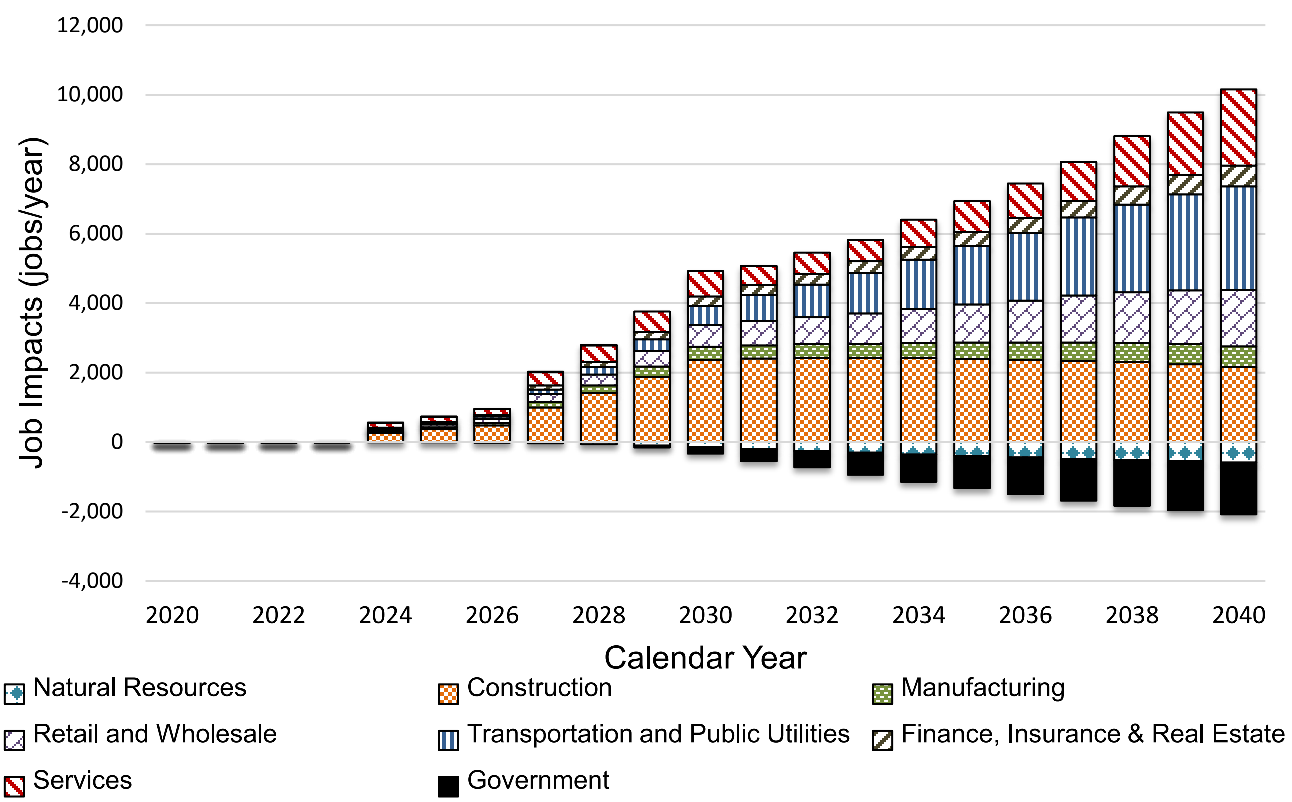

Table E-3: Job Impacts by Primary and Secondary Industries

		2020	2025	2030	2035	2040

	Change in Jobs	-2	18	-184	-928	-1,498

b. *California Business Impacts*

Gross output is used as a measure for business impacts because as it represents an industry's sales or receipts and tracks the quantity of goods or services produced in a given time period. Output growth is the sum of output in each private industry and State and local government as it contributes to the state's gross domestic product (GDP), and is affected by production cost and demand changes. As production cost increases or demand decreases, output is expected to contract, but as production costs decline or demand increases, industry will likely experience output growth.

The results of the Proposed ACT Regulation show an increase in output of $639 million in 2030 and an increase of $785 million in 2040 as shown in Table E-4. The trend in output changes is illustrated by major sector in Figure E-2. Similar to the employment impacts, there are positive impacts on output for transportation, public utilities, and construction and negative impacts on oil and gas extraction, automotive repair and maintenance, and the public sector. The negative output impact on manufacturing is primarily driven by the petroleum and coal products manufacturing industry, which is estimated to see a relatively large decrease in final demand for gasoline and diesel.

Table E-4: Change in California Output Growth by Industry

		2020	2025	2030	2035	2040
California Economy	Output (2018M$)	4,602,716	5,031,749	5,482,557	6,057,456	6,759,388

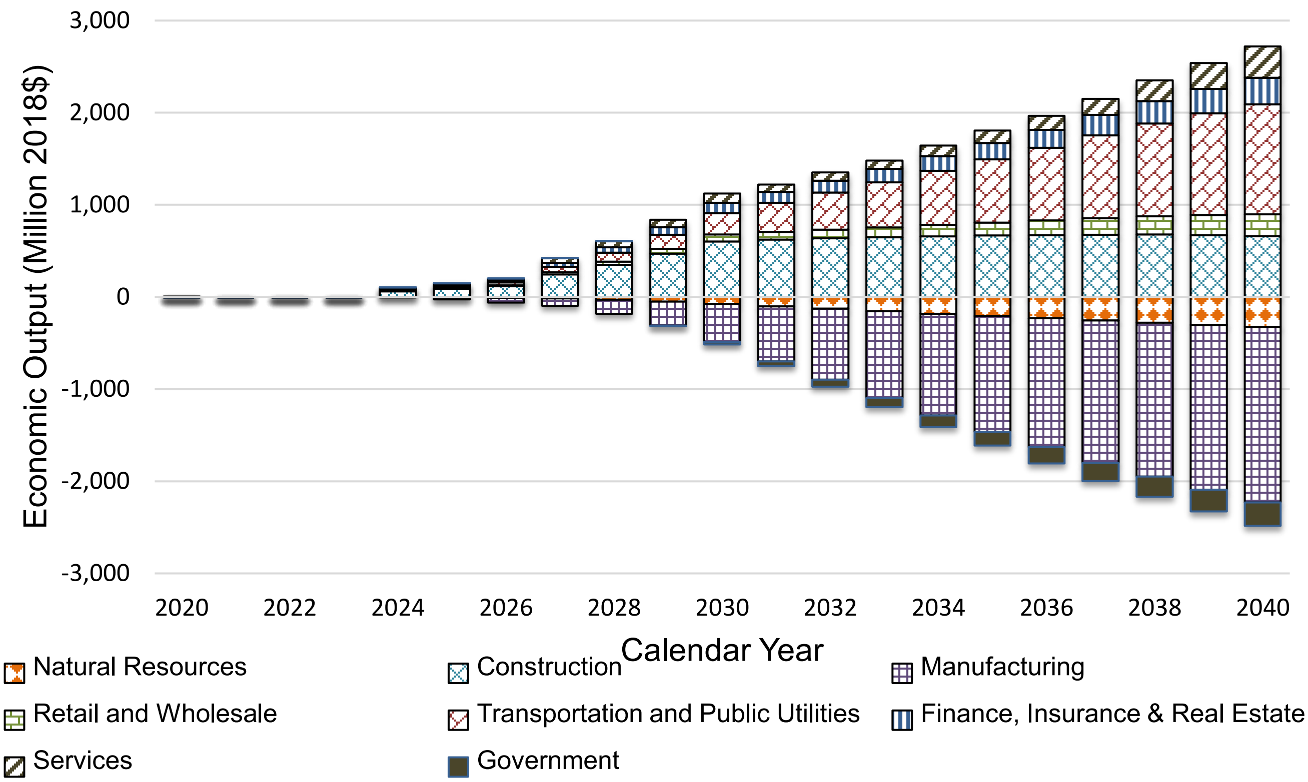
Figure E-2: Change in California Economic Output by Major Sector



c. ***Impacts on Investments in California***

Private domestic investment consists of purchases of residential and nonresidential structures and of equipment and software by private businesses and nonprofit institutions. It is used as a proxy for impacts on investments in California because it provides an indicator of the future productive capacity of the economy.

The relative changes to growth in private investment for the Proposed ACT Regulation are shown in Table E-5 and show an increase of private investment of about $175 million in 2030 and $425 million in 2040, or less than 0.01 percent of baseline investment.

Table E-5: Change in Gross Domestic Private Investment Growth

	2020	**2025**	**2030**	**2035**	**2040**
Private Investment (2018M$)	464,563	499,173	534,917	587,262	641,970
% Change	0.00%	0.00%	0.00%	0.00%	0.00%
Change (2018M$)	-1	22	175	307	425

d. ***Impacts on Individuals in California***

The Proposed ACT Regulation will impose no direct costs on individuals in California. However, the costs incurred by affected businesses and the public sector will cascade through the economy and affect individuals.

One measure of this impact is the change in real personal income. Table E-6 shows annual change in real personal income across all individuals in California. Total personal income growth increases by about $470 million in 2030 and $1.40 billion in 2040 as a result of the Proposed ACT Regulation, representing about 0.01 percent of the baseline. The change in personal income estimated here can also be divided by the California population to show the average or per capita impact on personal income. The increase in personal income growth is estimated to be about $6 per person in 2030 and $11 per person in 2040.

Table E-6: Change in Personal Income Growth

	2020	2025	2030	2035	2040
Personal Income (2018M$)	2,483,138	2,786,816	3,102,269	3,439,395	3,826,616
% Change	0.00%	0.00%	0.02%	0.02%	0.04%
Change (2018M$)	-2	54	470	859	1,397
Personal Income per capita (2018$)	61,362	66,247	71,102	76,213	82,320
% Change	0.00%	0.00%	0.01%	0.01%	0.01%
Change (2018$)	0	1	6	8	11

e. ***Impacts on Gross State Product (GSP)***

Gross State Product (GSP) is the market value of all goods and services produced in California and is one of the primary indicators used to gauge the health of an economy. Under the Proposed ACT Regulation, GSP growth is anticipated to increase by about $438 million in 2030 and decrease by $670 million in 2040 as shown in Table E-7. These changes do not exceed 0.01 percent of baseline GSP.

Table E-7: Change in Gross State Product

	2020	2025	2030	2035	2040
GSP (2018M$)	2,787,689	2,905	3,160	3,459	3,797
% Change	0.00%	0.00%	0.01%	0.01%	0.02%
Change (2018M$)	0	72	438	451	670

f. ***Creation or Elimination of Businesses***

The REMI model cannot directly estimate the creation or elimination of businesses. Changes in jobs and output for the California economy described above can be used to understand some potential impacts. The overall jobs and output impacts of the Proposed ACT Regulation are very small relative to the total California economy, representing changes of less than 0.01 percent. However, impacts to specific industries are larger as described in previous sections. The trend of in decreasing production costs for the truck transportation industry has the potential to result in an expansion or increases in businesses in this industry if sustained over time. While, the decreasing trend in demand for gasoline and diesel fuel following from this Proposed ACT Regulation has the potential to result in a decrease in businesses in this industry if sustained over time.

g. ***Incentives for Innovation***

Staff are proposing incentives for early ZEV sales by allowing credits to be generated from ZEV sales starting in 2021 MY, 3 years prior to the beginning requirements in 2024 MY. Staff anticipates growth in industries that manufacture ZEV technologies, including first and second tier suppliers for manufacturers of ZEVs, which will strengthen the supply chain, and promote technology improvements earlier than they would have otherwise occurred. This growth will help foster and support a self-sustaining medium- and heavy-duty ZEV market.

h. ***Competitive Advantage or Disadvantage***

The Proposed ACT Regulation imposes a sales mandate on large truck manufacturers. These truck manufacturers are headquartered and produce vehicles entirely out-of-state for a national and international market. There are small manufacturing entities in- and out-of-state that would not be required to sell ZEVs in California. Any risk of creating a competitive advantage is mitigated by the 500 vehicle sales threshold. Any small manufacturer that is able to increase sales would become subject to the same ZEV requirements as other large manufacturers.

Early credit generation incentives are proposed to benefit all manufacturing entities, and therefore would not give an explicit competitive advantage or disadvantage to competing manufacturers.

4. Summary and Agency Interpretation of the Assessment Results

The results of the macroeconomic analysis of the Proposed ACT Regulation are summarized in Table E-8. As analyzed here, CARB estimates the Proposed ACT Regulation is unlikely to have a significant impact on the California economy. Overall, the change in the growth of jobs, State GDP, and output is projected to not exceed 0.03 percent of the baseline. The Proposed ACT Regulation results in increased growth in the truck transportation industry in California as fuel savings and LCFS credit generation from the use of ZEVs grow over time. The fuel savings for the truck transportation industry represent decreased demand for gasoline and diesel from the industry, implying a decrease in growth for the industry. This analysis also shows the negative impact estimated for state and local government output and employment due to tax revenue decreases, without any offsetting revenues.

Table E-8: Summary of Macroeconomic Impacts of Proposed ACT Regulation

		2020	2025	2030	2035	2040
GSP	% Change	0.00%	0.00%	0.01%	0.01%	0.02%
	Change (2018M$)	0	72	438	451	670
Personal Income	% Change	0.00%	0.00%	0.02%	0.02%	0.04%
	Change (2018M$)	-2	54	470	859	1,397

	Change (2018M$)	-1	22	175	307	425

F. Alternatives

1. Alternative 1

Alternative 1 is a less stringent ZEV sales requirement than the Proposed ACT Regulation and would apply to the same manufacturers. Under this alternative, three percent of regulated manufacturer sales would need to be ZEVs in Class 2B-7 ramping up to 15 percent in 2030. Class 2B-3 pickup trucks and all Class 8 vehicles would be excluded from the ZEV sales requirement. This alternative would result in fewer ZEV sales compared to the Proposed ACT Regulation, but more ZEVs compared to the baseline scenario. Alternative 1 is based on the original ACT rule proposal presented in April 2017.[115] Table F-1 summarizes the ZEV sales percentage requirements of Alternative 1.

Table F-1. Alternative 1 ZEV Sales Requirement

Model Year	Class 2B-3*	Class 4-7	Class 8
2024	3%	3%	0%
2025	5%	5%	0%
2026	7%	7%	0%
2027	9%	9%	0%
2028	11%	11%	0%
2029	13%	13%	0%
2030 and beyond	15%	15%	0%

*Pickups excluded

Table F-2 shows the assumptions for vehicle groups in the baseline scenario and Alternative 1. The main difference between the assumptions for Alternative 1 and the Proposed ACT Regulation is Alternative 1 does not assume any long range BEVs need to be sold in Class 4-5 and Class 6-7 during the analysis period. Due to the reduced ZEV sales percentage requirements on the manufacturer, they would not need to sell more expensive long range vehicles to meet their requirement.

Table F-2. Alternative 1 Vehicle Groups and Technologies

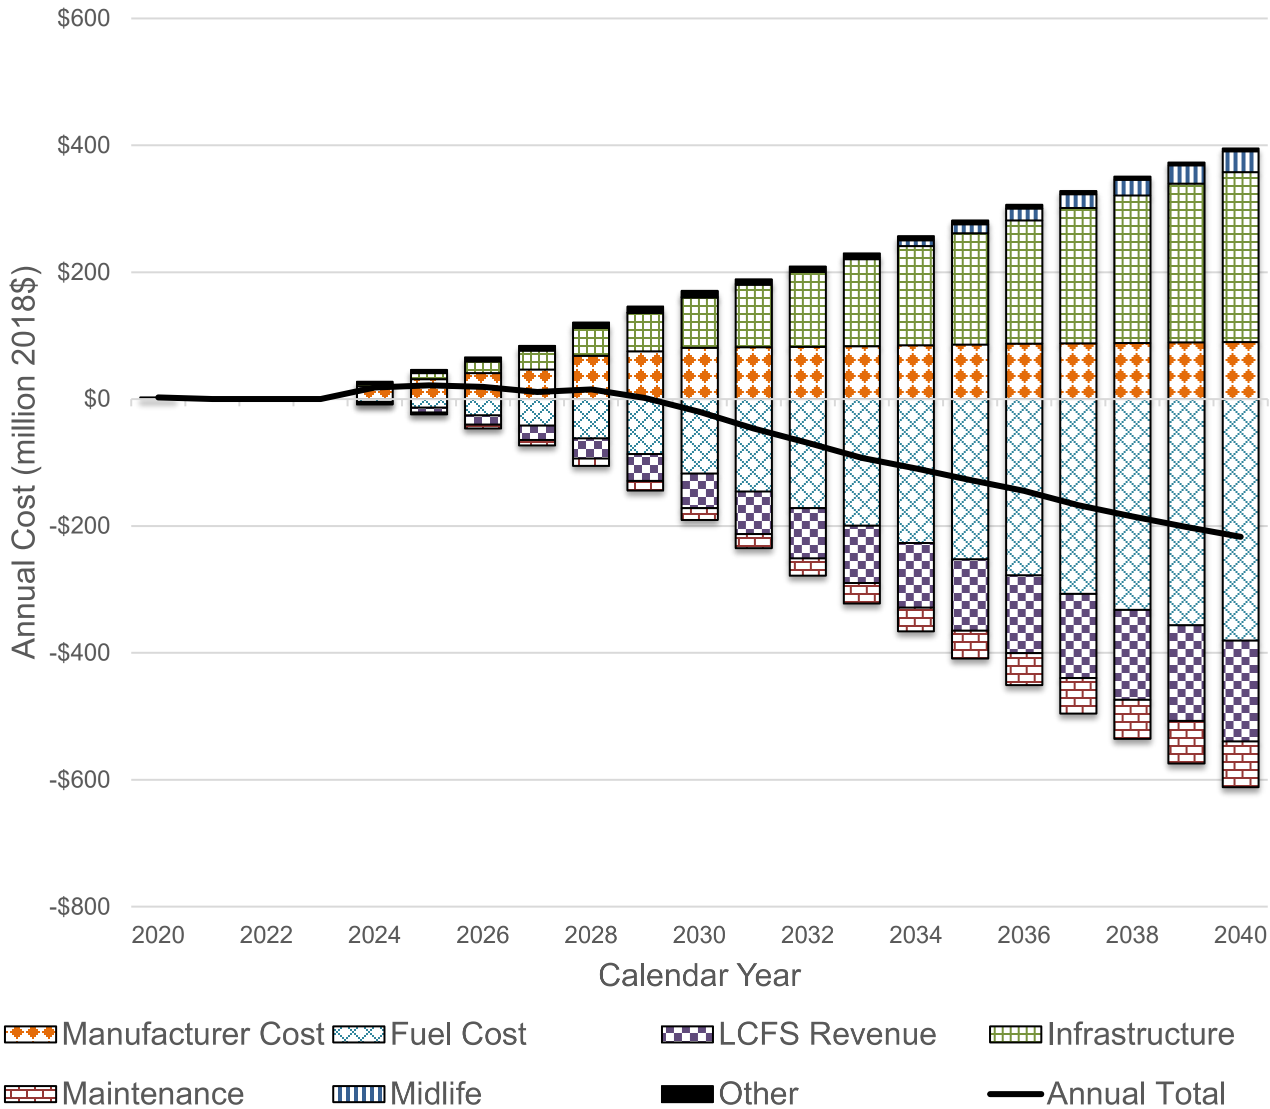
Vehicle Group	Baseline Scenario	Proposal Scenario
Class 2B-3	Gasoline (43%) Diesel (57%)	Battery-electric (All normal range)
Class 4-5	Diesel	Battery-electric (All normal range)
Class 6-7	Diesel	Battery-electric (All normal range)
Class 7 Tractor	Diesel	Battery-electric (90%) Fuel Cell Electric (10%)

115 California Air Resources Board, Advanced Clean Trucks Workshop (web link: https://ww2.arb.ca.gov/sites/default/files/2018-10/170425workshoppresentation.pdf, last accessed June 2019).

a. ***Costs***

Alternative 1 would increase the number of ZEVs sold in California relative to the baseline, but would not deploy as many ZEVs as the Proposed ACT Regulation. This will result in lower costs to California compared to the baseline but increased costs compared to the Proposed ACT Regulation. The cost to the California economy when assuming all costs occur in California would be -$1.3 billion between 2020 and 2040 in Alternative 1 versus the baseline scenario, versus a cost of -$4.8 billion between 2020 and 2040 in the Proposed ACT Regulation versus the baseline. Figure F-1 illustrates the difference in cost between Alternative 1 and the baseline scenario.

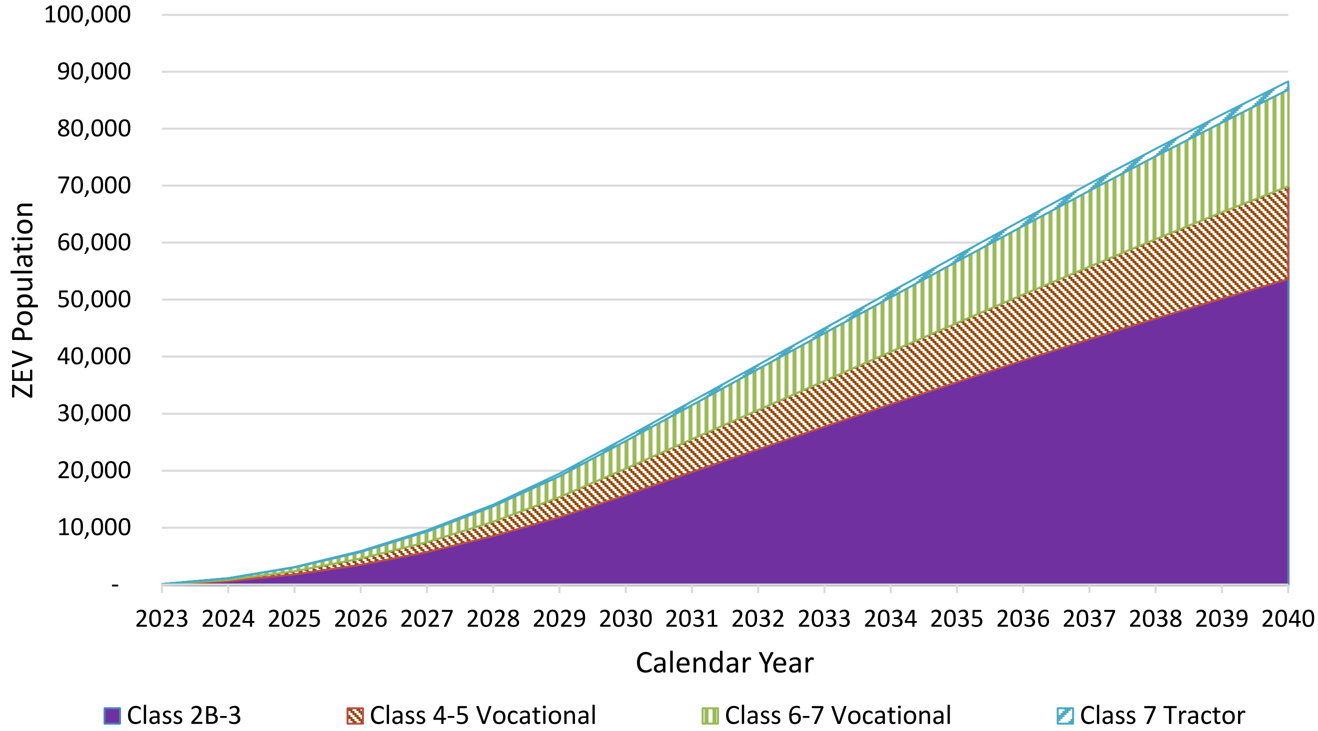
Figure F-1. Alternative 1 Costs Compared to Baseline



b. ***Benefits***

Alternative 1 results in more ZEVs deployed than the baseline scenario providing NOx and $PM_{2.5}$ emission reductions, but less total ZEVs than the Proposed ACT Regulation. Figure F-2 illustrates the ZEV population over time under Alternative 1.

Figure F-2. Alternative 1 ZEV Population Forecast over Time (>8,500 lb. GVWR)



i. Emission Benefits

The ZEVs deployed as a result of Alternative 1 provides NOx and $PM_{2.5}$ benefits compared to the baseline scenario, but results in fewer NOx, $PM_{2.5}$, and GHG benefits compared to the Proposed ACT Regulation. This alternative does not provide any additional GHG emission reductions compared to the baseline because all the required ZEV sales are assumed to be counted towards Phase 2 GHG compliance meaning this alternative does not achieve any additional GHG emissions benefits. Table F-3 summarizes the expected annual NOx, $PM_{2.5}$, and CO_2 reductions in Alternative 1 in 2031 and 2040when compared to the baseline.

Table F-3. Alternative 1 NOx, GHG, and $PM_{2.5}$ Benefits Relative to Baseline

Calendar Year	NOx (tpd)	$PM_{2.5}$ (tpd)	CO_2 (MMT/yr)
2031	1.3	0.05	0
2040	3.5	0.14	0

Figure F-3, Figure F-4, and Figure F-5 show the difference in GHG, NOx, and $PM_{2.5}$ emissions between baseline, Alternative 1, and the Proposed ACT Regulation.

Figure F-3. Projected GHG Emissions under Baseline, Proposed ACT Regulation, and Alternative 1

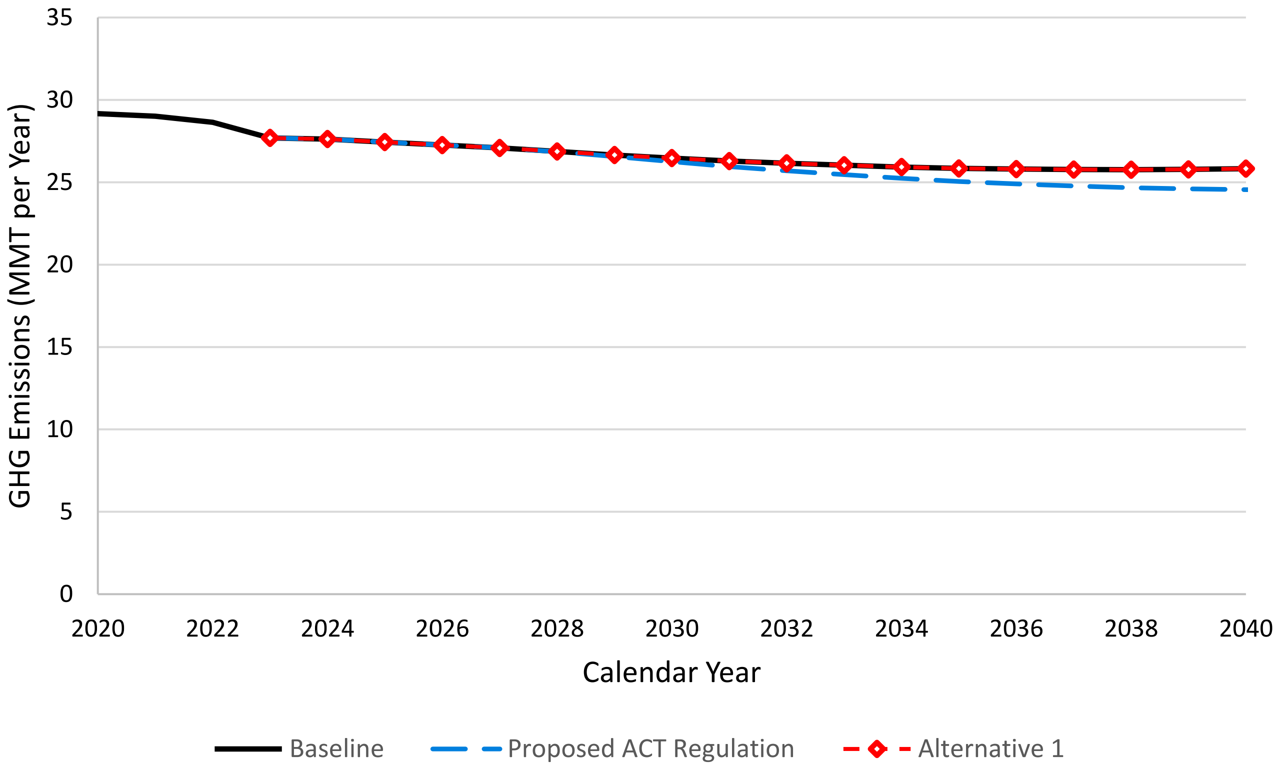


Figure F-4. Projected NOx Emissions under Baseline, Proposed ACT Regulation, and Alternative 1

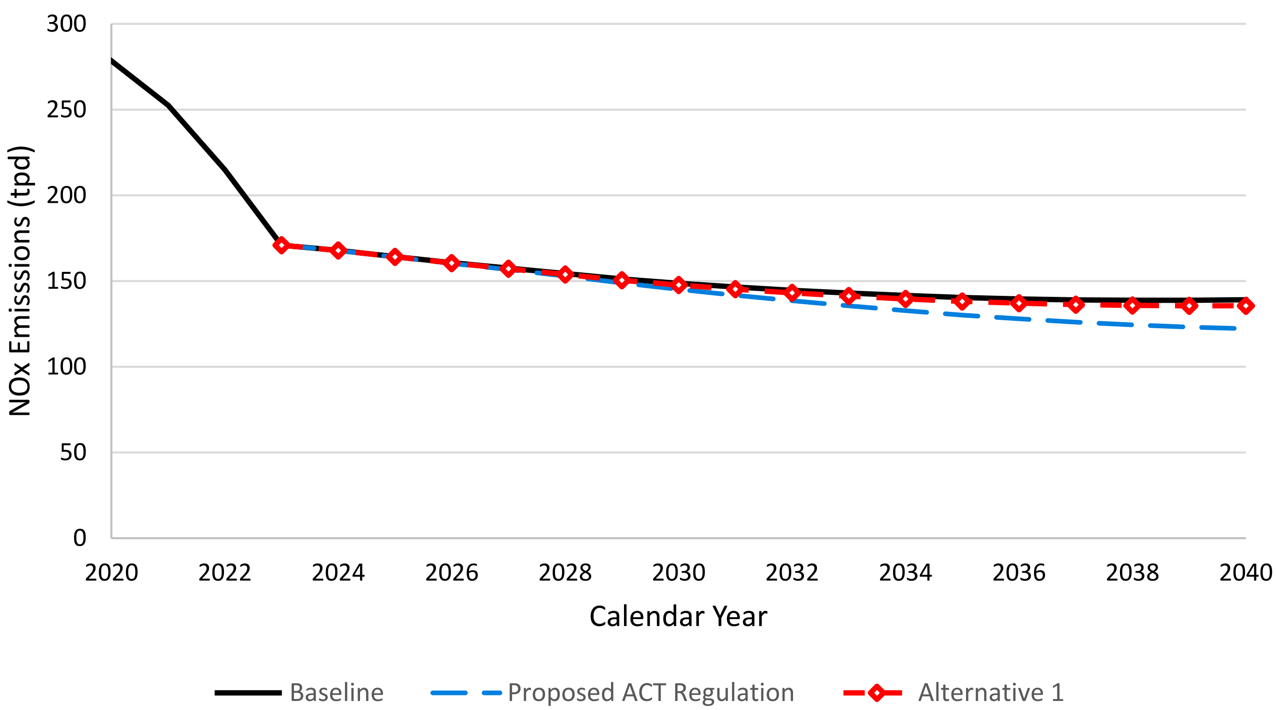

Figure F-5. Projected $PM_{2.5}$ Emissions under Baseline, Proposed ACT Regulation, and Alternative 1

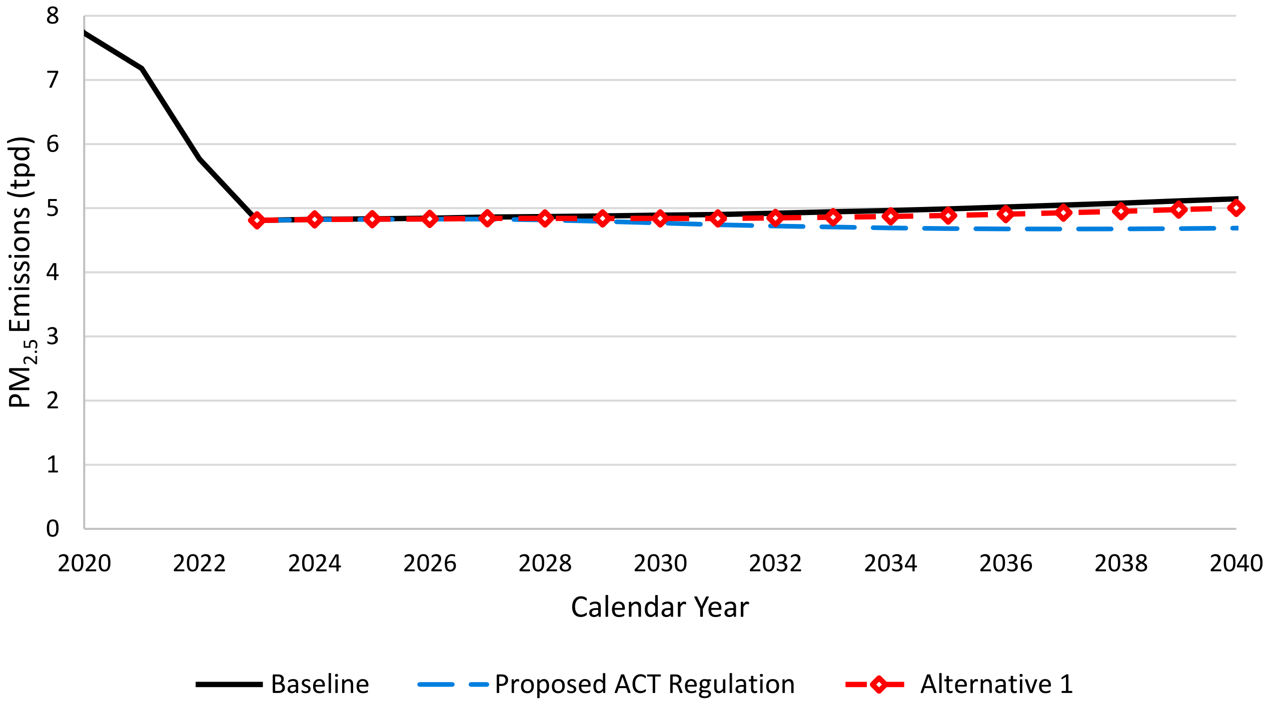

ii. Health Benefits

Alternative 1 results in emission reductions relative to the baseline leading to health benefits as shown in Table F-4. The health benefits are less than those of the Proposed ACT Regulation (Table B-6) due to less emission reductions estimated for this alternative.

Table F-4. Statewide Valuation from Avoided Health Outcomes for Alternative 1

Outcome	Avoided Incidents	Valuation (Million 2018$)
Avoided Premature Mortality	157	$1,483.1
Avoided Cardiovascular Hospitalizations	25	$1.4
Avoided Acute Respiratory Hospitalizations	30	$1.5
Avoided Emergency Room Visits	77	$0.1
Total		**$1,486**

c. *Economic Impacts*

Alternative 1 imposes a less stringent ZEVs sales requirement compared to the Proposed ACT Regulation. This results in lower incremental vehicle cost as passed-through to fleets, but also less Phase 2 GHG cost offsets and lower fuel savings. The macroeconomic impact analysis results are qualitatively similar to the results of the Proposed ACT Regulation, but of a smaller magnitude as shown in Table F-5. Figure F-6 and Figure F-7 show the job and economic impact changes of Alternative 1, respectively.

Table F-5: Change in Growth of Economic Indicators for Alternative 1 Relative to Baseline

		2020	2025	2030	2035	2040
GSP	% Change	0.00%	0.00%	0.00%	0.00%	0.01%
	Change (2018M$)	0	51	137	152	195
Personal Income	% Change	0.00%	0.00%	0.01%	0.01%	0.01%
	Change (2018M$)	-2	36	158	274	412
Employment	% Change	0.00%	0.00%	0.01%	0.01%	0.01%
	Change in Jobs	-2	513	1,498	1,842	2,317
Output	% Change	0.00%	0.00%	0.00%	0.00%	0.00%
	Change (2018M$)	-1	83	190	171	221
Private Investment	% Change	0.00%	0.00%	0.00%	0.00%	0.00%
	Change (2018M$)	-1	14	60	96	122

Figure F-6: Job Impacts of Alternative 1 by Major Sector

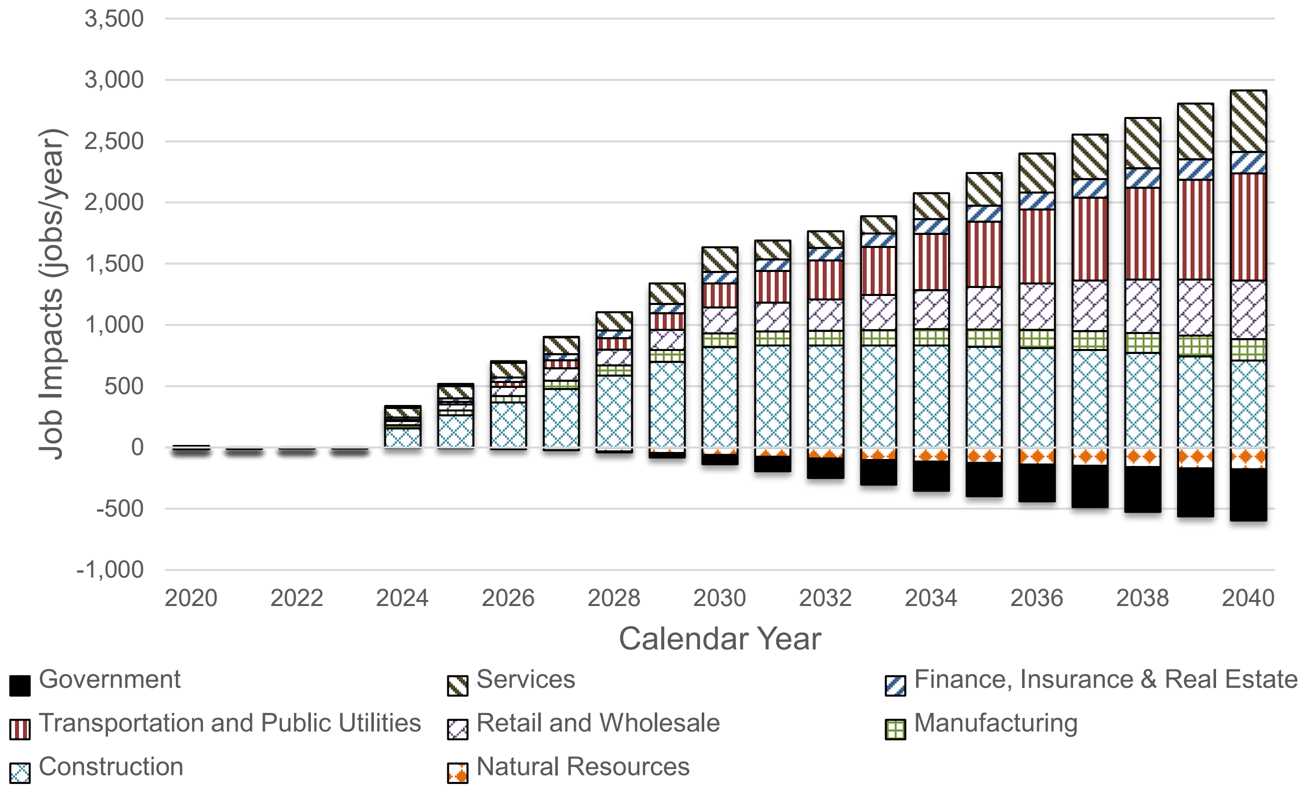

Figure F-7: Changes in Economic Output from Alternative 1 by Major Sector

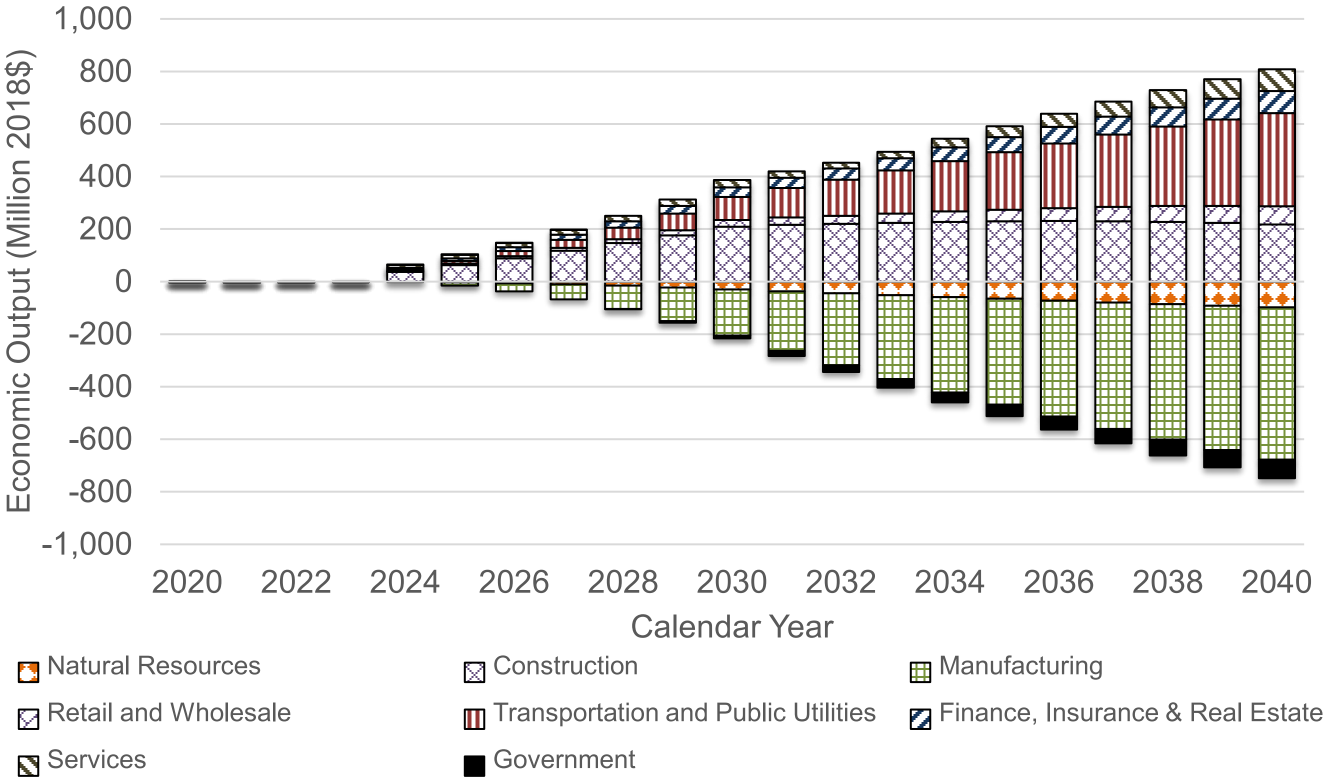


d. ***Cost-Effectiveness***

Cost-effectiveness is defined as the cost to achieve a ton of emission reduction. In the case of Alternative 1, the total cost from 2024 to 2040 is higher (lower net savings) than the proposed ACT regulation and would achieve less emission reductions. Alternative 1 is a less cost-effective alternative compared to the proposed ACT regulation.

e. ***Reason for Rejecting***

Alternative 1 is rejected because it fails to maximize the number of ZEVs deployed, does not maximize NOx, $PM_{2.5}$, and GHG reductions, and does not adequately foster ZEV market development in California. The Proposed ACT Regulation is identified as a technology-forcing measure in the State SIP Strategy as well as part of the Climate Change Scoping Plan as a necessary component needed to improve California's air quality and achieve the state's climate protection goals.

Alternative 1 does not maximize the number of ZEVs deployed in California as it requires a low amount of ZEVs to be produced and excludes both Class 2B-3 pickup trucks and all Class 8 vehicles. Because of the low number of vehicles deployed, Alternative 1 does not maximize NOx and $PM_{2.5}$ emission reductions which are necessary to meet SIP attainment goals. Alternative 1 does not reduce GHG emissions as its requirements do not exceed the standards already set by Phase 2 GHG, failing to meet the goals of the Climate Change Scoping Plan.

2. Alternative 2

Alternative 2 is a more stringent ZEV sales requirement than the Proposed ACT Regulation and would apply to the same manufacturers. Under this alternative, 15 percent of regulated manufacturer sales would need to be ZEVs in Class 2B-8 ramping up to 40 percent in 2030. Unlike the proposal and Alternative 1, no vehicle types are excluded from the ZEV sales requirement in this scenario. This alternative was proposed by Earthjustice, Union of Concerned Scientists, and Sierra Club in a letter to CARB on March 25th, 2019.[116] Alternative 2 would result in greater zero-emission vehicle sales compared to the baseline and Proposed ACT Regulation.

Table F-6 summarizes the ZEV sales percentage requirements of Alternative 1.

Table F-6. Alternative 2 ZEV Sales Requirement

Model Year	Class 2B-8
2024	15%
2025	20%
2026	24%
2027	28%
2028	32%
2029	36%
2030 and beyond	40%

Table F-7 shows the assumptions for vehicle groups in the baseline scenario and Alternative 2. The main difference between the assumptions for Alternative 2 and the Proposed ACT Regulation is Alternative 2 assumes long range BEVs need to be sold in Class 2B-3 and more fuel cell vehicles would need to be sold in Class 7-8 tractors. Due to the increased ZEV sales percentage requirements on the manufacturer, they would need to sell more capable and expensive longer range vehicles to meet their requirement.

Table F-7. Vehicle Groups and Technologies

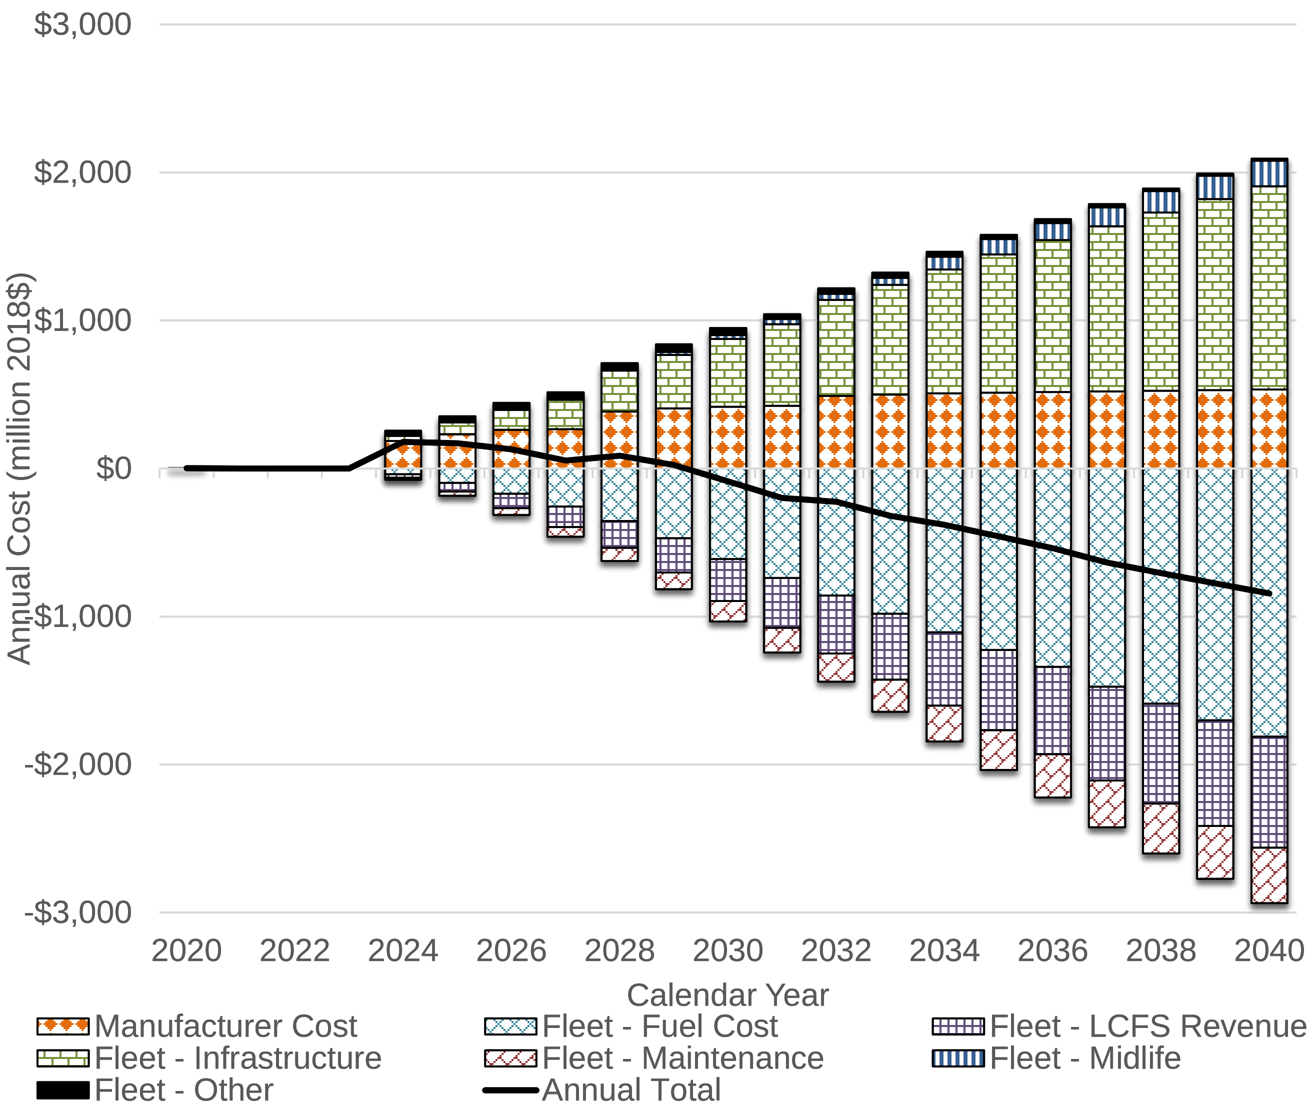
Vehicle Group	Baseline Scenario	Proposal Scenario
Class 2B-3	Gasoline (43%) Diesel (57%)	Battery-electric (50% long range after 2030)
Class 4-5	Diesel	Battery-electric (50% long range after 2030)
Class 6-7	Diesel	Battery-electric (50% long range after 2030)
Class 8	Diesel	Battery-electric (50% long range after 2030)
Class 7-8 Tractor	Diesel	Battery-electric (75%) Fuel Cell Electric (25%)

[116] Cort, Paul; O'Dea, Jimmy; Pingle, Ray, Advanced Clean Truck Rulemaking, 2019.

a. ***Costs***

Alternative 2 would increase the number of ZEVs sold in California relative to the baseline and the Proposed ACT Regulation. This will result in lower costs to California compared to the baseline and the Proposed ACT Regulation. The cost to the California economy when assuming all costs occur in California would be -$4.5 billion between 2020 and 2040 in Alternative 2 versus the baseline scenario, versus a cost of -$4.8 billion between 2020 and 2040 in the Proposed ACT Regulation versus the baseline. Figure F-8 illustrates the difference in cost between Alternative 2 and the baseline scenario.

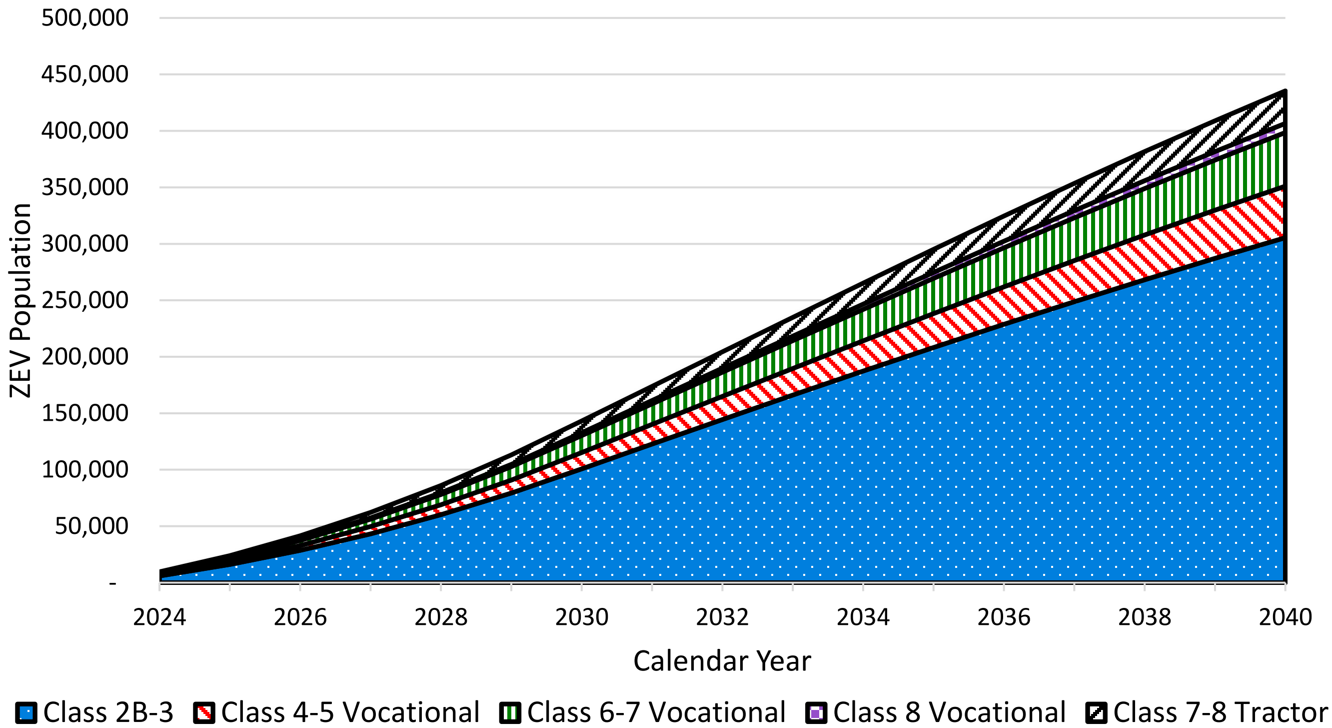
Figure F-8. Alternative 2 Costs Compared to Baseline



b. ***Benefits***

Alternative 2 results in more ZEVs deployed than the baseline scenario and the Proposed ACT Regulation providing NOx, $PM_{2.5}$ and GHG emission reductions. Figure F-9 illustrates the ZEV population over time under Alternative 2.

Figure F-9. Alternative 2 ZEV Population Forecast over Time (>8,500 lb. GVWR)



i. Emission Benefits

Alternative 2 results in greater ZEV deployments compared to the baseline scenario and the Proposed ACT Regulation. These ZEVs will provide NOx, $PM_{2.5}$ and CO_2 benefits compared to both the baseline scenario and the Proposed ACT Regulation. Table F-8 summarizes the expected annual NOx, $PM_{2.5}$, and CO_2 benefits in Alternative 2 in 2031 and 2040.

Table F-8. Alternative 2 NOx, GHG, and $PM_{2.5}$ Benefits Relative to Baseline

Calendar Year	NOx (tpd)	$PM_{2.5}$ (tpd)	CO_2 (MMT/yr)
2031	8.7	0.32	1.16
2040	22.6	0.70	2.78

Figure F-10, Figure F-11, and Figure F-12 represent the difference in GHG, NOx, and $PM_{2.5}$ emissions between baseline and Alternative 2.

Figure F-10. Projected GHG Emissions under Baseline, Proposed ACT Regulation, and Alternative 2

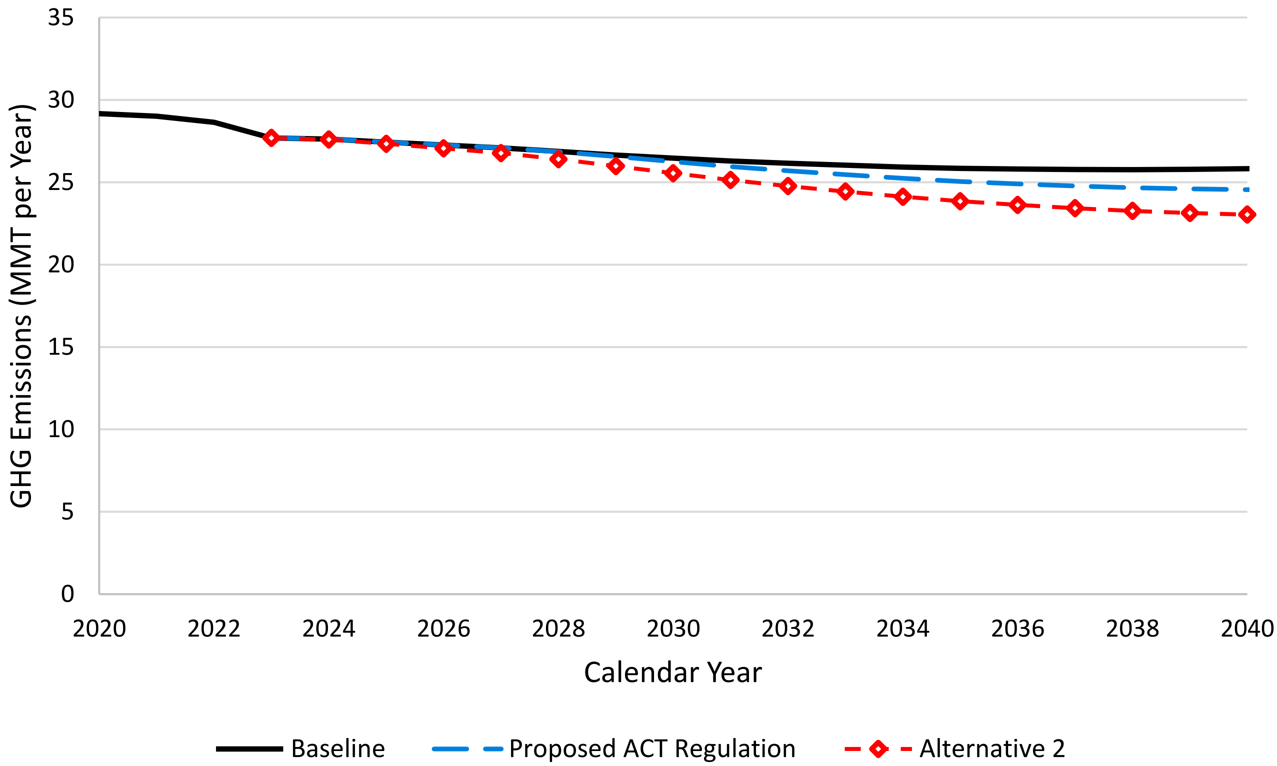


Figure F-11. Projected NOx Emissions under Baseline, Proposed ACT Regulation, and Alternative 2

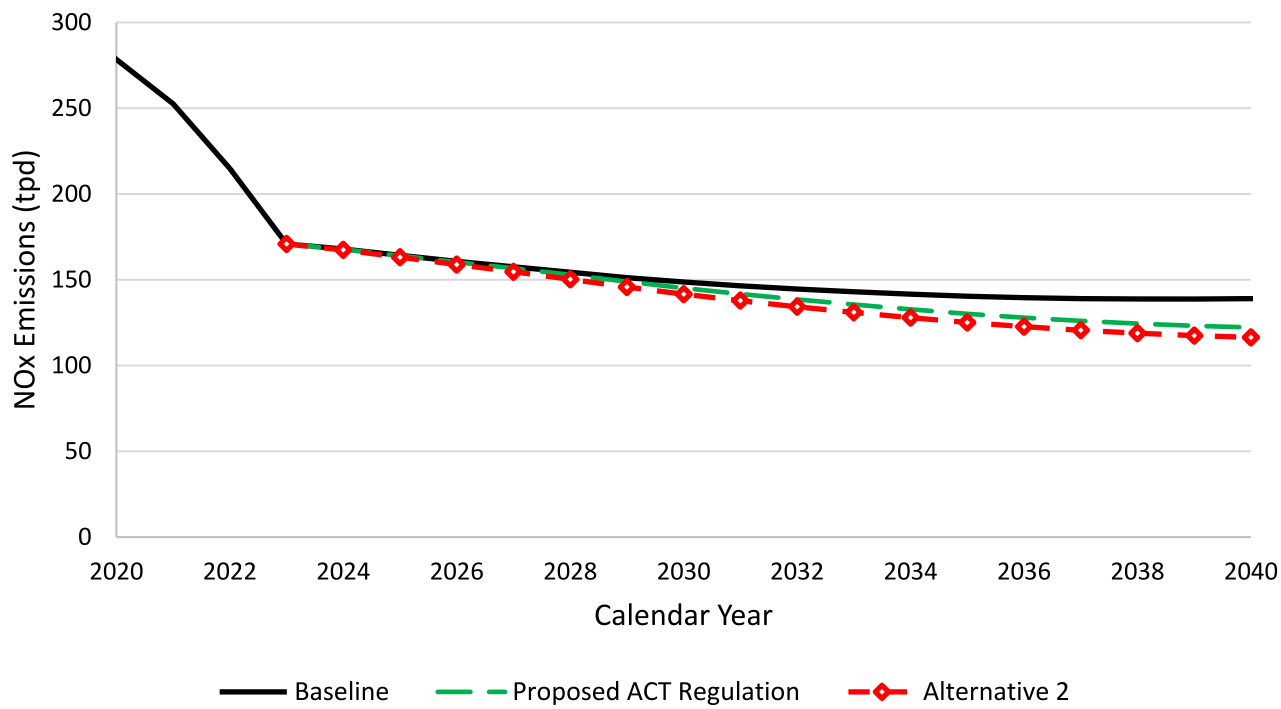

Figure F-12. Projected $PM_{2.5}$ Emissions under Baseline, Proposed ACT Regulation, and Alternative 2

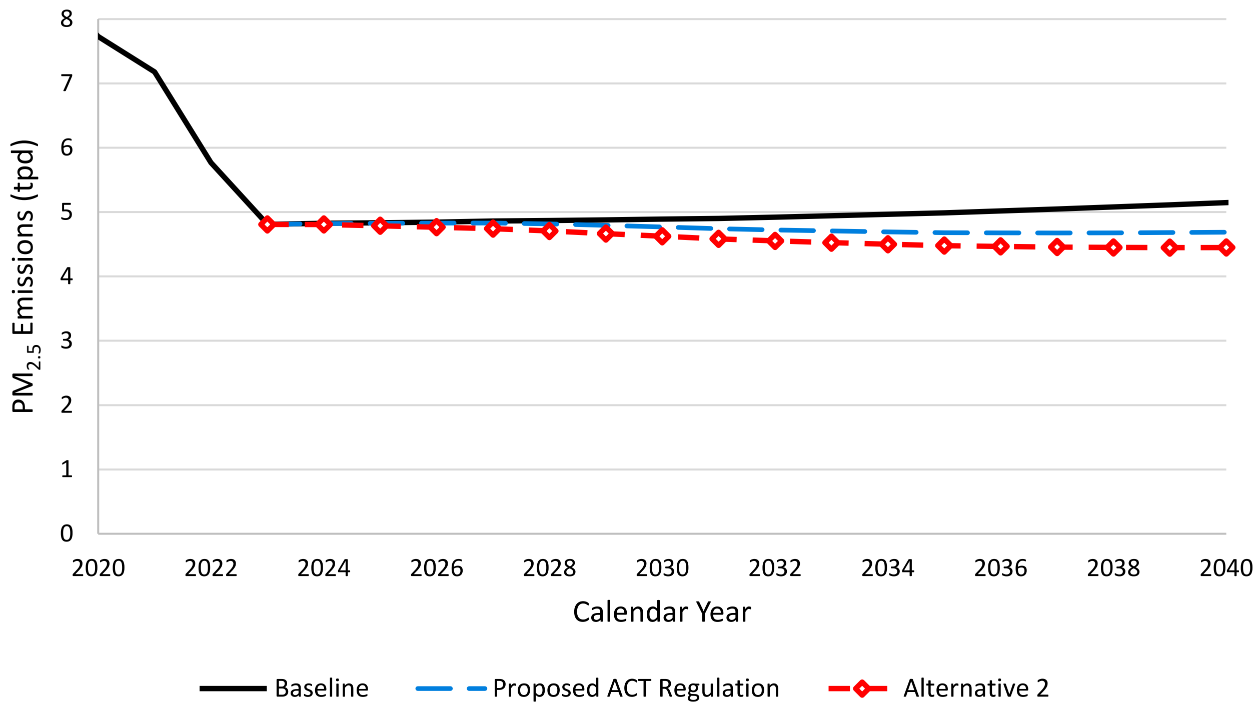

The cumulative GHG emission reductions multiplied by the SC-CO2 values shown in Table B-2 gives a monetary estimate of the benefit of GHG emission reductions from Alternative 2. These benefits range from about $624 million to $2.67 billion through 2040, depending on the chosen discount rate.

ii. Health Benefits

Alternative 2 results in emission reductions relative to the baseline leading to health benefits as shown in Table F-9. The health benefits are greater than those of the Proposed ACT Regulation (Table B-6) due to greater emission reductions estimated for this alternative.

Table F-9. Statewide Valuation from Avoided Health Outcomes for Alternative 2

Outcome	Avoided Incidents	Valuation (Million 2018$)
Avoided Premature Mortality	920	$8,663.7
Avoided Cardiovascular Hospitalizations	143	$8.1
Avoided Acute Respiratory Hospitalizations	171	$8.4
Avoided Emergency Room Visits	442	$0.4
Total		**$8,681**

c. ***Economic Impacts***

Alternative 2 would impose a more stringent ZEVs sales requirement compared to the Proposed ACT Regulation. This results in a greater incremental vehicle cost as passed-through to fleets, but also more Phase 2 GHG cost offsets and more fuel savings. The macroeconomic impacts analysis results shows that this alternative would result in similar impacts to the proposal on employment and output but of a smaller magnitude as displayed in Table F-10. These smaller positive impact appears to result primarily from the greater reduction in gasoline in diesel fuel demand. This reduces output more substantially in the petroleum and coal products manufacturing industry, shown in Figure F-14, and reduces employment more substantially in the public sector as the result of lower tax revenues, shown in Figure F-13.

Table F-10: Change in Growth of Economic Indicators for Alternative 2 Relative to Baseline

		2020	2025	2030	2035	2040
GSP	% Change	0.00%	0.01%	0.01%	0.01%	0.01%
	Change (2018M$)	0	349	464	294	308
Personal Income	% Change	0.00%	0.01%	0.02%	0.03%	0.03%
	Change (2018M$)	-2	226	598	868	1,334
Employment	% Change	0.00%	0.01%	0.02%	0.02%	0.02%
	Change in Jobs	-2	3,529	5,774	5,594	6,615
Output	% Change	0.00%	0.01%	0.01%	0.00%	0.00%
	Change (2018M$)	-1	562	562	62	-43
Private Investment	% Change	0.00%	0.00%	0.00%	0.00%	0.00%
	Change (2018M$)	-1	94	237	331	430

Figure F-13: Job Impacts from Alternative 2 by Major Sector

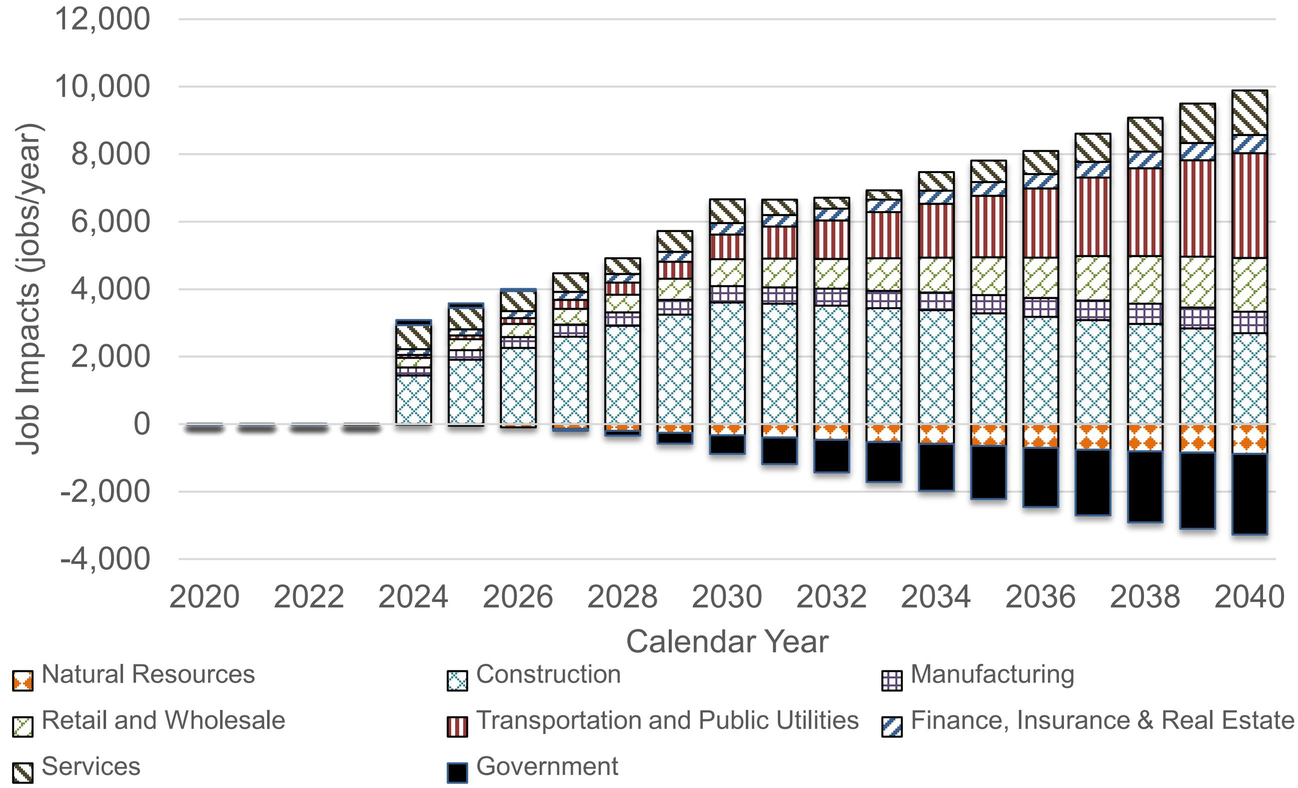

Figure F-14: Change in Economic Output from Alternative 2 by Major Sector

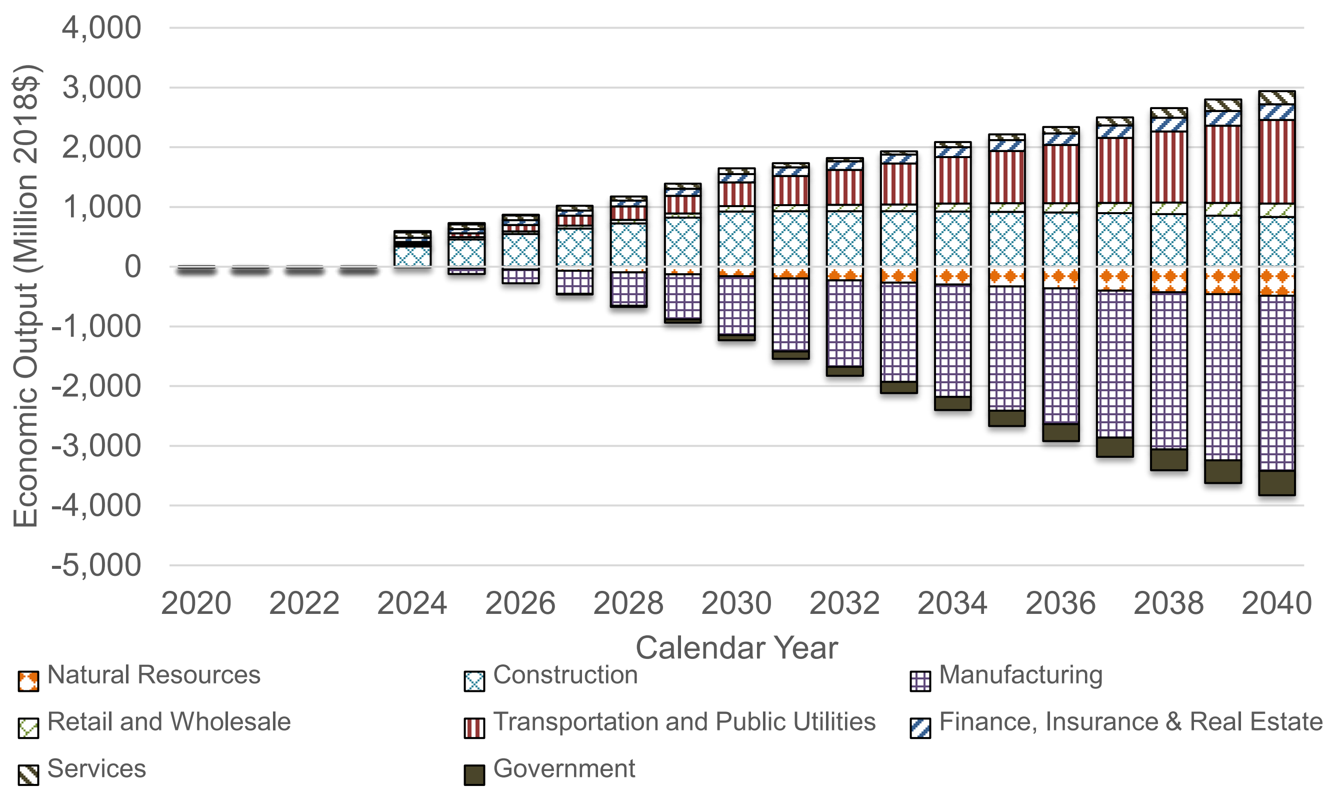

d. ***Cost-Effectiveness***

Cost-effectiveness is defined as the cost to achieve a ton of emission reduction. As Alternative 2 is modeled, the total cost from 2020 to 2040 is slightly higher (lower net savings) than the proposed ACT regulation and would achieve greater emission reductions. Alternative 2 is a more cost-effective alternative compared to the proposed ACT regulation.

e. ***Reason for Rejecting***

Alternative 2 is rejected as the more aggressive timeframe raises questions about feasibility for manufacturers to comply with its requirements. Alternative 2 nearly doubles the cumulative number of ZEVs to be sold between 2020 and 2040 with all of the increased sales occurring in the Class 2B-3 and Class 7-8 tractor categories. The current scarcity of commercial vehicle deployments in these categories present uncertainty in setting future requirements. Both Class 2B-3 and Class 7-8 tractors have increased concerns about payload, range, towing, charging/refueling infrastructure availability which may present barriers to their deployment. Given the greater emissions benefits and greater cost-effectiveness of Alternative 2, staff continues to analyze the rapidly evolving technical progress of these categories to determine if additional stringency is warranted.

G. Health Benefits Methodology Appendix

DRAFT (8/1/2019): Estimating Health Benefits Associated with Reductions in PM and NOx Emissions: Detailed Description

1. Introduction

CARB uses two different methods to estimate the number of adverse health outcomes, including premature death, related to exposure to particulate matter less than or equal to 2.5 μm in diameter (PM2.5). In most cases, CARB uses the *incidence-per-ton* (IPT) methodology to estimate health outcomes from emissions data. The IPT methodology is a simplified procedure that uses pre-calculated results, obtained by running a mathematical health model on a baseline scenario, to compute estimates of the number of cases of adverse health outcomes. In cases where measured or modeled PM2.5 concentrations are available at a high spatial resolution, CARB staff may input them directly into the health model to obtain estimates of health outcomes. This is referred to as *direct estimation*.

2. Overview of the IPT methodology

CARB uses the IPT methodology to quantify the health benefits of regulations and programs that reduce PM2.5 and precursor emissions. It is based on an approach developed by the U.S. Environmental Protection Agency (EPA), as described by Fann et al. (2009, 2012, 2018). The mathematical relationship between changes in emissions and changes in health outcomes is approximately linear. The IPT methodology is based upon this relationship, and makes the following assumptions:

(1) Changes in health outcomes are proportional to changes in PM concentration;
(2) Changes in primary pollutant concentrations are proportional to changes in emissions; and
(3) Changes in secondary pollutant concentrations are approximately proportional to changes in emissions. It should be noted that there may be cases where the relationship between emission of oxides of nitrogen (NOx) and ammonium nitrate aerosol is not linear.

Due to the approximately linear relationship between premature deaths (or other health outcomes) and emission concentrations, the number of premature deaths can be estimated by multiplying emissions by a scaling factor: the *IPT factor*. IPT factors are developed by a applying a health model to measured air pollution concentrations for a baseline period to estimate the number of health outcomes associated with PM2.5 exposure, then dividing by emissions of PM2.5 or a precursor.

Measured or modeled air pollution concentrations, baseline incidence rates, projections of future population size, and a concentration-response function relating changes in PM2.5 exposure to changes in mortality incidence are used to perform calculations.
Current IPT factors were developed from a baseline scenario using air quality data, incidence data and emission inventories for 2014-2016, and age-stratified population projections for 2010 through 2060. IPT factors are calculated separately for each air basin.

IPT factors are currently available for two types of PM: diesel particulate matter (DPM) primarily from on-road sources, and secondary ammonium nitrate formed from NOx. Health effects of primary PM2.5 from sources other than on-road diesel engines are estimated by using IPT factors developed for DPM and multiplied by a relative potency factor, as described below.

In addition to premature mortality from cardiopulmonary causes, CARB currently uses IPT factors to estimate hospitalizations due to cardiovascular and respiratory causes and emergency room visits due to asthma.

Since the total incidence of health effects is proportional to population, results for future years are adjusted by the ratio of the projected population in the target year to the average population in the base years 2014-2016.

3. CARB's health model

CARB's health model is based on the methodology used by US EPA's BenMAP benefits mapping and analysis software [US EPA BenMAP]. CARB developed its own health model in order to overcome limitations of BenMAP, primarily to provide the capacity to handle very large data sets, enable automation of repetitive tasks, and facilitate the incorporation of California-specific data. The health model uses a multi-step process to estimate health impacts from measured or modeled PM2.5 concentrations. These steps are described below.

Estimating exposure from measured concentrations
CARB's health model estimates population-weighed exposure to primary and secondary PM2.5 is from annual concentrations measured at monitors located throughout California. The mortality quantification method requires estimation of exposure between monitors across a geographic area, not only at points where monitors are located. The model uses a well established spatial interpolation method known as inverse distance-squared weighting. Since PM2.5 is emitted directly from sources (primary PM2.5) and also formed from gases that convert to PM2.5 through atmospheric chemical processes (secondary PM2.5), separate exposure estimates are made for each:

- ***Estimating Diesel particulate matter concentrations***

Annual diesel particulate matter (DPM) concentrations are not measured directly. Rather, they are estimated indirectly from annual average NOx concentrations by multiplying them by air basin and year-specific DPM/NOx emission ratios computed from CARB emission inventories.

The emissions and air quality used to perform this calculation are tabulated in the appendix. The methodology and its rationale is described in greater detail in CARB 2010a and Propper et al., 2015. DPM concentrations were estimated at 106 monitors located throughout the state. In order for an annual NOx average to be considered valid, the data were required to be at least 75% complete.

- ***Estimating secondary ammonium nitrate concentrations***

In addition to DPM, CARB computes health impacts for secondary ammonium nitrates PM2.5 formed in the atmosphere from NOx by chemical processes. To estimate ammonium nitrate PM2.5 exposure, CARB staff use speciated PM2.5 nitrate ion (NO_3^-) concentration data from two sources: the air quality monitoring network maintained by CARB and local air quality districts, and the IMPROVE visibility network (IMPROVE Visibility Network).

CARB and air pollution control districts operate a network of PM2.5 monitors around the state, mostly in urban areas (ARB AQMN). PM2.5 samples are collected as 24-hour filter samples, once every 3-6 days. Samples from some monitors are further analyzed to determine the concentration of nitrate ion and other constituents. During 2014-2016, nitrate data were available from 18 urban monitors. Data for these monitors are retrieved from ARB's ADAM air quality database (ARB ADAM).

In addition to the urban monitors, the national IMPROVE visibility network operated 20 PM2.5 nitrate ion monitor during 2014-2016, mainly in national parks and other remote locations (IMPROVE Visibility Network). These instruments collect one sample every three days. IMPROVE data are retrieved from the project web site (IMPROVE Visibility Network).

Daily samples were aggregated by monitor to obtain annual averages. In order for an annual average to be considered valid, the data were required to be at least 75% complete. To convert from nitrate ion concentration to ammonium nitrate (NH_4NO_3) concentration, the annual averages were multiplied by the ratio of the molecular weight of ammonium nitrate to that of the nitrate ion.

Prior to May, 2019 CARB used PM10 nitrate data instead of more accurate PM2.5 nitrate data to estimate ammonium nitrate aerosol concentrations to compute health impacts. This is because speciated PM10 data was available for more locations than speciated PM2.5, and better reflected the spatial variability in ammonium concentrations across California. However, the number of monitors in the speciated PM10 network has shrunk and is now comparable in size and coverage to the speciated PM2.5 network. Therefore, as of May, 2019 CARB uses PM2.5 nitrate data to compute impacts instead. The PM2.5 nitrate monitors are more accurate because they store the filters in a refrigerated compartment, and less of the sample is lost to volatilization. Consequently, the estimated PM2.5 nitrate concentrations and associated IPT factors for NOx emissions are approximately 50% higher than those used prior to May, 2019.

Estimating exposure using from modeled concentrations

The health model can also be run with concentrations derived from an air quality model as input. Air quality models include dispersion models, which model how pollutants are dispersed by the wind, and photochemical models, which are more elaborate and capture the effects of sunlight, temperature, chemical reactions and other physical processes on pollutants. Dispersion models are only used for primary pollutants, as they are not capable of modeling formation of secondary pollutants. Air quality models generate gridded results, with grid cells typically in the range of 500-2,000m square.

Population projections at the census tract level

CARB's health model uses age-resolved population data at the census tract level, for the 2010 Census, obtained from the U.S. Census Bureau (U.S. Census Bureau). These were projected to 2011-2060 using age-resolved county population projections from the California Department of Finance (CDOF).

Age-specific growth factors for each county, for each year, were computed from the CDOF projections by dividing each county population for the target year by the average county population for the base years 2014-2016. These growth factors were applied to each census tract in the county, for each age group separately. Population was projected for five-year age groups 0-4 through 80-84, and for age 85 and older.

This method of projection reflects growth in overall county population, but does not model changes in population distribution within counties, such as expansion of urban areas into surrounding rural land.

Estimating baseline incidence

CARB's health model uses incidence data for cardiopulmonary mortality extracted from the Center of Disease Control (CDC) Wonder database. Incidence data for hospitalizations for cardiovascular and respiratory causes, and emergency room visits for asthma are taken from US EPA BenMAP benefits mapping software (US EPA BenMAP).

Baseline incidence rates vary by age bracket. Incidence was estimated separately for five-year age groups 0-4 through 80-84, and for age 85 and older.

Mortality incidence data are county-specific. Incidence data for other health outcomes is uniform throughout California.

Baseline incidence of mortality, hospitalizations and emergency room visits is tabulated in the appendix.

Estimating health outcomes using a concentration-response function

CARB's health model estimates the incidence of premature death and other health outcomes at each census tract or modeling grid cell by an equation

$$\text{Incidence} = [\text{population}]_i \times [\text{baseline incidence}]_i \times [\,1 - \exp(-\beta \times \text{PM2.5})\,]$$

where the subscript *i* indexes the age groups. The incidence is summed over age groups to obtain the total incidence for the census tract. The coefficient β is taken from one of the health studies discussed below.

The specific form of this equation is determined by the type of statistical model used by the health studies to model the relationship between PM2.5 exposure and health risk. All the studies selected by CARB use a so-called log-linear relationship, so all the equation for the incidence takes the form shown above.

CARB draws upon health studies used by the U.S. EPA for its risk assessments (US EPA 2010). CARB uses a subset of the endpoints used by U.S. EPA, chosen on the basis of their strength and robustness. For premature mortality, CARB uses the cardiopulmonary mortality risk coefficient for the 1999-2000 time period from Krewski et al., 2009, among the largest studies of its kind, with 360,000 participants. For cardiovascular and respiratory hospitalizations, CARB used Bell et al., 2008, and for emergency room visits for asthma CARB used Ito et al., 2007.

The process for selecting these studies was described in detail in CARB's 2010 PM2.5 mortality report (CARB 2010b).

Aggregating health outcomes by air basin

To aggregate results from census tracts to larger geographical subdivisions such as counties or air basins, CARB's health model uses a geospatial technique called areal interpolation. Areal interpolation is a procedure for translating spatial data from one set of geographical subdivisions to another when the boundaries do not exactly overlap. Numerous variants of the technique exist, but for the purpose of this analysis the simplest form, which uses area of polygon intersection, was employed (Goodchild and Lam, 1980, Flowerdew and Green, 1994). The precision of this method depends on the size of the geographical subdivisions and the spatial homogeneity of the quantity being apportioned. In urban areas, where census tracts are small and population is distributed more evenly, areal interpolation to larger subdivisions such as air basins yields relatively precise estimates. In rural areas where the population is distributed unevenly over large census tracts, estimates are less precise.

4. Computing IPT factors From health outcomes and emissions

IPT factors are computed separately for each air basin. To compute IPT factors for DPM, the estimates incidence of premature death or other health outcomes associated with DPM exposure for the baseline years is divided by DPM emissions for each air basin. To compute IPT factors for secondary ammonium nitrate, incidence is divided by emissions of the precursor, NOx.

Health benefit calculations using IPT factors

To estimate the reduction in health outcomes associated with reductions in DPM and NOx from a regulation, the change in emissions is multiplied by IPT factor. This value is then multiplied by the ratio of the projected target year population with the 2014-2016 average population to adjust for population growth.

5. Uncertainty in health impact estimates

This methodology is well-established and includes up-to-date information. However, there are uncertainties in the underlying data and assumptions:

- *Air quality data is subject to natural variability from meteorological conditions, local activity, etc.*
- *The assumption that changes in concentrations of pollutants are proportional to changes in emissions of those pollutants or their precursors is an approximation. There may be cases where actual changes in concentrations are higher or lower than predicted.*
- *The estimation of DPM concentrations and DPM/NOx emission ratios is subject to uncertainty. Emissions are reported at an air basin resolution, and do not capture local variations.*
- *Inverse distance-squared weighting, the spatial interpolation method is used to estimate concentrations each census tract. Compared with other geospatial estimation methods such as Kriging, inverse distance-squared interpolation has the virtue of simplicity, and does not require selection of parameters. When data are abundant, most simple interpolation techniques give similar results (Jarvis et al., 2001). All geospatial estimation techniques exhibit greater uncertainty when data points are sparser, and uncertainty increases with distance from the nearest data points.*
- *Future population estimates are subject to increasing uncertainty as they are projected further into the future. For reasons of computational efficiency, the spatial resolution of population estimates is limited to census tract resolution.*
- *Observed baseline incidence rates change over time, and are subject to random year-to-year variation and systematic shifts as population characteristics and medical treatments evolve. Sample size requirements necessitate estimating baseline incidence rates at large geographic scales, state or county.*
- *Relative risks in the concentration response function are estimated with uncertainty and reported as confidence ranges.*

6. Relative potency factors for non on-road diesel sources

To quantify the health benefits of reductions in primary PM2.5 from sources other than on-road diesel vehicles, CARB uses IPT factors developed for DPM and multiplies the results by a relative potency factor specific to the source and location of the emissions.

Relative potency may be determined in several ways, including but not limited to

- *The ratio of the Intake Fraction of the source to the Intake Fraction for DPM. The Intake Fraction is a measure of the fraction of the emissions from a given source that is inhaled by the receptor population. It is specific to a source and a location; e.g., a particular type of facility in a given air basin.*
- *Comparison of IPT results with direct estimation results for the same scenario. The ratio of the results obtained by the two methods may then be used to adjust the results obtained by IPT factors in a larger setting. For example, the ratio of results obtained by IPT and direct estimation for one air basin may be used to adjust results for other air basins.*
- *General consideration of conditions under which emissions take place. For example, if an on-road vehicle delivers goods from a facility in a remote location to a facility located in an urban area, half of idling emissions may be considered to occur far from receptor populations. Hence an adjustment factor of 0.5 may be appropriate for computing the health benefits of reducing idling emissions.*

Errata to Advanced Clean Trucks Standardized Regulatory Impact Analysis

1) The cumulative NOx and PM2.5 emission reductions shown on page 14 are erroneous because they are based on benefits from 2020 to 2050, not 2020 to 2040 as written in the text. The correct emission benefit numbers for 2020 to 2040 cumulative emissions are 36,770 tons of NOx and 1,092 tons of $PM_{2.5}$.

2) The cumulative GHG emission reductions shown on page 17 are erroneous because they do not account for the difference between short tons and metric tons. The correct emission benefit numbers for 2020 to 2040 cumulative emissions is 9.6 MMT CO_2e

3) To better follow CARB guidelines on references, Reference 52 is replaced with the following: California Air Resources Board, Class 4-5/6-7 Population Analysis, 2019.

4) To better follow CARB guidelines on references, References 58-62 are replaced with the following: California Air Resources Board, New Vehicle Prices, 2019.

5) Figures have been graphically edited to better comply with the American with Disabilities Act of 1990, the Rehabilitation Act of 1973, and Assembly Bill 434 (2017). The content contained within figures has not changed from what was originally submitted to Department of Finance on August 8, 2019.

Do truck manufacturers need to sell zero-emission vehicles (ZEVs)?

Yes, starting with the 2024 model year, the Advanced Clean Trucks (ACT) regulation requires manufacturers to sell ZEVs as an increasing percent of total medium- and heavy-duty sales in California. By the end of the 2024 model year 5% to 9% of sales will need to be ZEVs depending on the truck category. We estimate the statewide ZEV sales will need to be about 6% of total vehicle sales in 2024.

Manufacturers can get early credits for selling 2021 through 2023 model year ZEVs. They also have flexibility to sell more ZEVs in one category while selling less of another except they must still sell a minimum number of ZEV tractors. Manufacturers also can trade, or bank credits from excess ZEV sales and have one extra year to make up any shortfall.

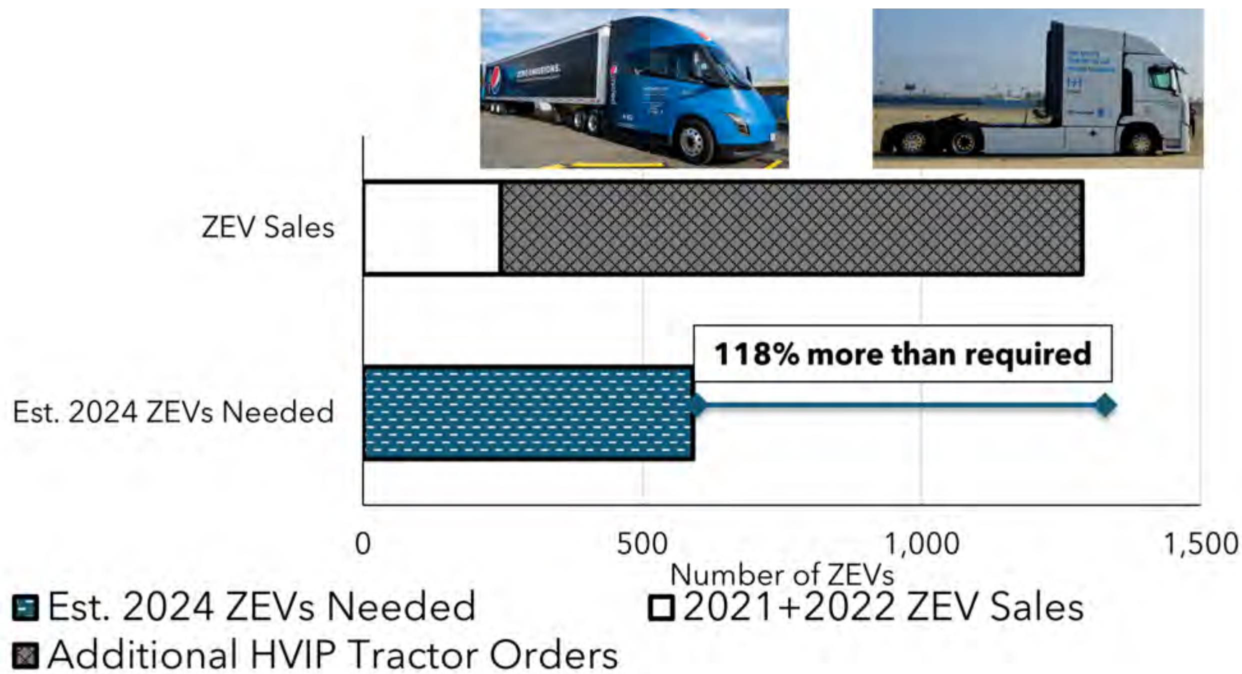
Will there be enough ZEVs by the end of the 2024 model year?

Yes, manufacturers already have sold more single unit medium- and heavy-duty ZEVs than is needed for 2024 based on data reported by manufacturers for 2021 and 2022. Manufacturers are also on track to more than double the required ZEV tractors sales based on existing sales and funding vouchers that have been issued. Some manufacturers already have excess credits, while others are just beginning to build their credit banks with early ZEV sales. Figure 1 illustrates that for Class 2b-8 single unit trucks, manufacturers have already sold 60% more ZEVs than is required by the end of 2024 when including vehicles which have received HVIP vouchers in 2023.

Figure 1: Expected Single Unit ZEV Truck Sales

For Class 7-8 tractors, currently 290 ZE tractors have been delivered for sale in 2021 and 2022. In addition, there are over 1,000 ZE tractors that have received HVIP vouchers and are expected to be delivered in 2023 or 2024. With these combined sales, there will be more than twice as many ZEV tractors sold than is needed to comply with the ACT regulation by the end of 2024. The estimated total sales including tractors with HVIP vouchers is shown in Figure 2. The chart shows 118% more ZE tractors are expected to be sold than will be needed to comply by the end of 2024.

Figure 2: Expected Class 7-8 Tractor ZEV Sales



In addition, the regulation has flexibility provisions for individual manufacturers to use. First, manufacturers can trade earned ZEV credits with other manufacturer as part of their overall compliance strategy. For example, to meet its 2024 ACT requirement, a manufacturer could choose to buy ZEV credits from another manufacturer with excess ZEV sales. Some manufacturers have already transferred their earned ZEV credits into other markets. Second, the ACT regulation includes a one-year grace period for manufacturers that sell fewer ZEVs than required by the end of 2024. More information is available in the *Advanced Clean Trucks Credit Summary Through the 2022 Model Year* and on the *Advanced Clean Trucks* website.

What percent of California sales are ZEVs?

In 2022, a total of 104,558 medium- and heavy-duty trucks were produced and delivered for sale in California as shown in Table 1. Of that total, about 7,639 were ZEVs. This means that about 7.5% of medium- and heavy-duty vehicle sales in 2022 were ZEVs. This is two years ahead of the first compliance date for manufacturers to produce any medium and heavy-duty ZEVs. This percentage is also higher than the annual sales percentage required for 2024. It is likely that ZEV sales will grow as manufacturers launch new ZEV models.

Manufacturer (Parent Company)	Total Number of Vehicles Produced and Delivered for Sale	Total Number of ZEVs Produced and Delivered for Sale	Total Number of ZEVs Sold to the Ultimate Purchaser
Blue Bird	638	97	93
BYD	38	38	-
Daimler	6,814	26	16
Ford	28,606	1,727	1,686
GM	24,500	-	-

Lion Electric	4	4	2
Mercedes Benz Group	5,859	-	-
Navistar	1,733	111	104
Nikola Motor	13	13	13
Nissan	61	-	-
Paccar	8,166	49	31

Rivian	5,289	5,289	5,286
Stellantis	18,260	-	-
Volvo	2,995	153	66
XOS Trucks	89	89	89
Totals	**104,558**	**7,639**	**7,427**

Can manufacturers get credit for ZEVs that were supported with funding?

Yes, the ZEVs produced or delivered for sale in California can count towards ACT compliance, regardless of whether they are funded through the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project (HVIP) or any other funding program. This also means that ZEV sales supported by funding programs will also help manufacturers meet or exceed their ZEV sales requirements.

Which manufacturers met the 2024 ZEV sales requirements early?

Several manufacturers already delivered enough ZEVs for sale in California through the 2022 model year to earn enough ZEV credits to comply with the ACT regulation by the end of 2024. They include Bluebird, BYD, Ford, GreenPower, Lightning eMotors, Lion Electric, Nikola Motor, Rivian, Volvo, and XOS Trucks.

Is there any risk that a lack of ACT ZEV credits will result in a shortage of internal combustion truck sales in 2024?

No, there are ample medium- and heavy-duty ZEV sales that have already occurred or are currently on order supported by public funding to more than satisfy the statewide ACT sales requirement at the end of 2024. In addition, several manufacturers are likely to have excess credits that can be used towards meeting the end of the 2025 model year requirements. These early ZEV sales means the ZEV requirements do not impact manufacturer's ability to satisfy remaining internal combustion engine demand.

Under this proposed regulation example, the operator owns a 2014 MY diesel day cab tractor purchased in 2022. The drayage operator would likely turn over their diesel tractor at the end of 2029 when the tractor is 15-years-old (average age or MY of tractors reaching 800,000 miles) and has exceeded the useful life and would replace it with a new 2030 MY battery-electric tractor which they would operate for 20 years.

Most assumptions are the same as previously described in this document; however, some modifications were made for this example to better illustrate the costs the small business would face:

- The drayage operator is assumed to finance their vehicles for 5 years at an interest rate of 15 percent;
- The drayage operator would not install infrastructure themselves and instead would rely solely on retail charging; and
- No transitional costs associated with maintenance or infrastructure planning are assumed as these are costs are associated with organizational shifts within a large business.

Table 42 and Figure 23 illustrate the costs for the example small business. The small business would see a net savings by 2040 and thereafter but would need to make significant upfront capital expenses in 2030 to purchase a new battery-electric tractor rather than buying another used diesel tractor. Incentives, financing assistance, and other programs offered will be helpful to support smaller operators with upfront capital expenses.

Table 42. Small Business Cumulative Cost Example 2024 to 2050

Cost line items	Legal Baseline 2030	ACF Proposal 2030	Legal Baseline 2040	ACF Proposal 2040	Legal Baseline 2050	ACF Proposal 2050	Difference 2050

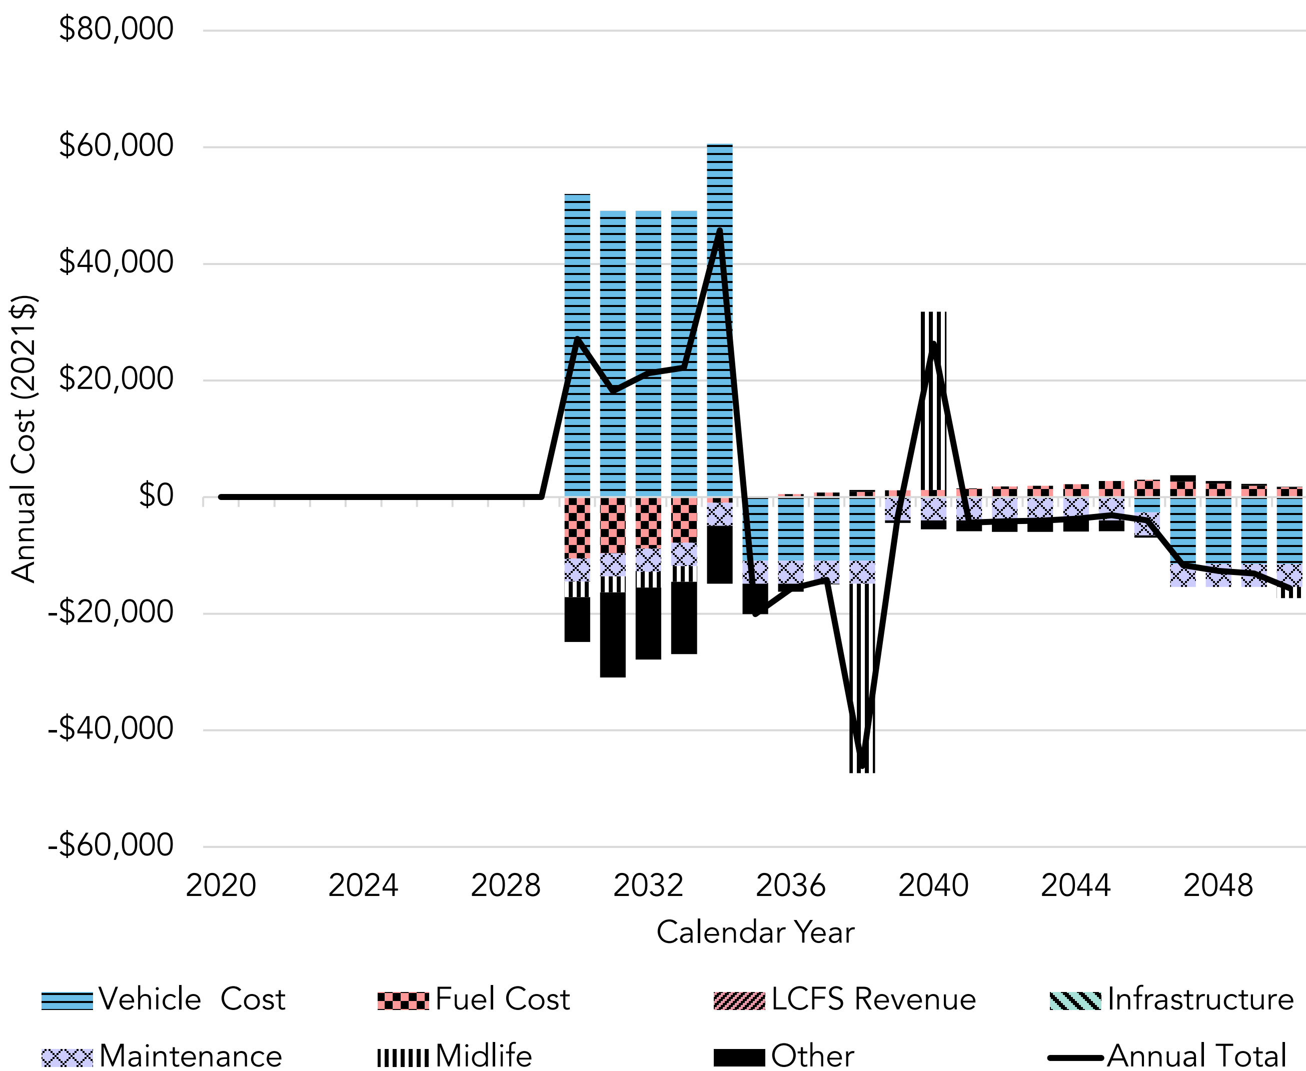
Figure 23. Estimated Costs of Proposed Regulation to the Example Small Business (2021$)



3.4 Direct Costs on Individuals

There would be no direct costs on individuals as a result of this regulation. Individuals will realize health benefits, described in the Benefits Chapter, from statewide, regional, and local emissions benefits due to medium- and heavy-duty ZEVs displacing ICE vehicles. Manufacturers and fleets would see increased and decreased costs because of this rule which will indirectly impact individuals in the state. These indirect impacts are considered in the Macroeconomic Impacts Section.

4 Fiscal Impacts

The proposed regulation would impact State and local government expenditures through the purchase and operation of new vehicles and would impact revenues generated from a variety of State and local taxes and vehicle registration fee revenues that are collected.

These revenues, particularly those from State and local gasoline taxes and registration fees, are used to fund transportation projects across the state including road maintenance, construction of state highways and local streets, transit facilities and operation, and active transportation projects as described in Table 43 below. Thus, increases or decreases will impact funds available for these projects at the state, county, and local levels for use on road and transportation infrastructure improvements. We note that, though outside of this specific analysis, the transition towards zero emission vehicles and its impacts on some of these revenues, are the subject of continued policy development given the importance of the services funded. Thus, though this analysis does not assume the creation of new specific revenue-raising measures, such measures are not unlikely.

Table 43. Transportation Funding Source and Purpose

Revenue Source	Account/Program	Allocation Funding Purpose
Gasoline Excise Tax	State Highway Account (SHA)	highway projects and transportation maintenance and operational needs
	Road Maintenance & Rehabilitation Account (RMRA)	prioritized road maintenance and rehabilitation projects for state and local transportation systems
	Highway Users' Tax Account (HUTA)	local streets and roads projects
Diesel Excise Tax	Public Transportation Account (PTA)	transit and intercity and commuter rail operating programs and projects.
	RMRA	prioritized road maintenance and rehabilitation projects for the state and local transportation systems.
	SHA	highway projects and transportation maintenance and operational needs.
	Trade Corridors Enhancement Account (TCEA)	trade corridor projects

Revenue Source	Account/Program	Allocation Funding Purpose
State Sales Tax (diesel)	State Transit Assistance (STA)	transit purposes as outlined in the Transportation Development Act (TDA); local transit operation and capital purposes
	State Rail Assistance Program	intercity and commuter rail agencies for operation and capital purposes
Zero-Emission Vehicle Registration Fee	RMRA	basic road maintenance, rehabilitation, critical safety projects and other transportation initiatives, including complete street components for the state and local transportation systems
Motor Vehicle Registration Fees	California Highway Patrol (CHP) and Department of Motor Vehicles (DMV)	traffic law enforcement and regulations
Local Sales Tax Measures[182]	City/County Road Funds	Maintenance, new construction, engineering/administration, right of way, mass transit, and other
	Regional Transportation Planning Agencies (RTPAs)/Transit Operators	transit operations, transit planning

4.1 Local Government

4.1.1 Local Government Fleet Cost Pass-Through

The local government fleet is estimated to make up roughly 81 percent of California's public fleet based the total public fleet population and information from the Department of General Services. All local government fleets are subject to the proposed regulation with

[182] Counties can adopt a sales tax increase for transportation programs. The passage of a local sales tax measure requires 2/3 of local voter approval, generally lasting 20 to 30 years. Twenty-five counties have implemented sales tax measures for their transportation needs; and four transit authorities have approved permanent local tax measures.

requirements beginning for most fleets in 2024. Fleets located in designated counties would face their first requirements in 2027. A proportionate amount of the total costs outlined in Table 44 would be assumed to pass-through to local governments. Cost passthrough has been split into three categories – upfront costs, operating costs, and operating savings.

4.1.2 Utility User Taxes

Many cities and counties in California levy a Utility User Tax on electricity usage. This tax varies from city to city and ranges from no tax to 11 percent. A value of 3.53 percent was used in this analysis representing a population-weighted average.[183] By increasing the amount of electricity used, there would be an increase in the amount of the utility user tax revenue collected by cities and counties.

4.1.3 Gasoline and Diesel Fuel Taxes

Fuel taxes on gasoline and diesel fund transportation improvements at the state, county, and local levels. Displacing gasoline and diesel with electricity and hydrogen would decrease the total amount of gasoline and diesel dispensed in the state, resulting in a reduction in fuel tax revenue collected by local governments. Natural gas is not taxed by local governments and therefore is not included in this section. The local tax on fuel is listed in Table 28.

4.1.4 Local Sales Taxes

Sales taxes are levied in California to fund a variety of programs at the state and local level. The proposed regulation would require the sale of medium- and heavy-duty ZEVs in California resulting in a direct increase in sales tax revenue collected by local governments in the initial years of the regulation. Overall, local sales tax revenue may increase less than the direct increase from vehicle sales if overall business spending does not increase.

4.1.5 Fiscal Impacts on Local Government

Table 44 shows the estimated fiscal cost to local governments due to the proposed regulation relative to the Legal Baseline scenario. The fiscal impact to local government is estimated to be $288 million over the first 3 years of the regulation and $4.5 billion over the regulatory analysis period to 2050.

Table 44. Estimated Fiscal Impacts to Local Government (million 2021$)

Year	Local Government Fleet Upfront Cost Passthrough	Local Government Fleet Operational Cost Passthrough	Local Government Fleet Operational Saving Passthrough	Utility User Tax Revenue	Local Gasoline and Diesel Fuel Taxes	Local Sales Tax	Total Fiscal Impact*

*Note: Totals may differ due to rounding

4.2 State Government

4.2.1 CARB Staffing and Resources

To implement the proposed regulation, CARB would require permanent staffing resources. This would be met through a combination of new staffing resources and redirecting existing staffing resources. These resource needs are identified as follows:

- One new section consisting of one Air Resources Supervisor (ARS) I, two Air Resources Engineers (ARE), five Air Pollution Specialists (APS), and four Air Resources Technician (ART) II positions beginning in fiscal year (FY) 2023-2024 to implement the proposed regulation requirements on public and private fleets. Staff in this new section would provide compliance assistance to affected stakeholders, assist in outreach activities with business, public agencies, and fleet operators affected by the regulation to provided compliance assistance, and to support enforcement of the regulation. Staff would recognize ZEV fleets by posting compliant fleet information online and implement the ZEV Partner Program. Staff would develop program guidelines and applications, develop outreach materials, assist participants with inquiries, and audit information submitted by participants in the program.
- One ARE position beginning in FY 2023-2024 would be needed to develop and implement the database reporting system for the proposed regulation and provide ongoing support and maintenance.
- Two ART II, 0.25 ARS I, and 0.5 APS to assist drayage truck owners with CARB registration, verify annual compliance reporting requirements for the legacy fleet, provide technical assistance, answer calls and emails, analyze reported data sets, and develop and maintain an updated CARB online reporting system.
- Two APS, two ART II, and two ART I positions beginning in FY 2023-2024 would be used to conduct enforcement activities including data mining, reporting verification, inspections, audits, and other related activities. Table 45 shows the total number of additional positions and estimated cost per position.

Table 45. Estimated CARB Staffing Needs (million 2021$)

Position	Number of Positions	Initial Budget Year Cost ($/year per person)	Ongoing Cost ($/year per person)
Air Resources Supervisor	1.25	$238,000	$237,000
Air Resources Engineer	3	$206,000	$205,000
Air Pollution Specialist	7.5	$195,000	$194,000
Air Resources Technician I	2	$85,000	$84,000
Air Resources Technician II	8	$101,000	$100,000

In addition to staffing needs, the proposed regulation would require modifying an existing reporting system or developing a new system to handle the reporting. Staff is estimating contracting costs of $200,000 in FY 2023-2024 to set up or augment existing fleet reporting systems for this rule. The proposed regulation would also require contract funds for outreach related to the "Optional Certified ZEV Fleet and Partner Program"; however, staff estimates that current agency funds allocated towards outreach can cover these proposed costs, so no additional funding is necessary.

Six permanent intermittent personnel years would be redirected from the CARB Truck and Bus Call Center Team to primarily provide compliance assistance and respond to stakeholder inquiries via phone or email about all aspects of the proposed regulation.

4.2.2 State Fleet Cost Pass-Through

The State government fleet is estimated to make up 19 percent of California's public fleet based the total public fleet population and information from the Department of General Services. A proportionate amount of the total costs outlined in Table 46 would be assumed to pass-through the State governments. Cost passthrough has been split into three categories – upfront costs, operating costs, and operating savings.

4.2.3 Gasoline, Natural Gas, and Diesel Fuel Taxes

Fuel taxes on gasoline, natural gas, and diesel are used to fund transportation improvements at the state, county, and local levels. Displacing these combustion fuels with electricity and hydrogen would decrease the total amount of gasoline, natural gas, and diesel dispensed in the state. This would result in a reduction in revenue collected by the State for use in multiple levels of government. As noted above, though outside the scope of this analysis, State policy efforts continue to explore replacement revenue sources in light of the need for the zero-emission transition and the continuing need to fund vital services.

4.2.4 Energy Resources Fee

The Energy Resource Fee is a $0.0003/kWh surcharge levied on consumers of electricity purchased from electrical utilities. The revenue collected is deposited into the Energy Resources Programs Account of the General Fund which is used for ongoing energy programs and projects deemed appropriate by the Legislature, including but not limited to, activities of the CEC.

4.2.5 Registration Fees

The State collects registration fees to fund transportation improvements at the state, county, and local levels. The fee structure for ZEVs is different from diesel vehicles with some fees such as the Vehicle License Fee being higher and others such as weight fees being lower. These differences result in lower registration fees for the ZEVs which would reduce revenue collected by the State for use in transportation services.

4.2.6 State Sales Tax

Sales taxes are levied in California to fund a variety of programs at the state and local level. This proposed regulation would require the sale of medium- and heavy-duty ZEVs in California resulting in higher sales tax collected by the State government in the initial years of the regulation.

4.2.7 Depreciation

In California, the State collects corporate income tax from businesses based on their net profit for the year at a rate of 8.84 percent. Depreciation can be treated as an expense and would reduce the tax burden for a fleet and decrease tax revenue for the State.

4.2.8 Fiscal Impacts on State Government

shows the estimated fiscal impacts to the State government due to the proposed regulation relative to Legal Baseline conditions. The fiscal impact to local government is estimated to be -$83 million over the first 3 years of the regulation and -$38.0 billion over the regulatory analysis period to 2050.

Table 46. Estimated Fiscal Impacts on State Government (million 2021$)

Year	CARB Staffing and Resources	State Government Fleet Upfront Cost Passthrough	State Government Fleet Operational Cost Passthrough	State Government Fleet Operational Saving Passthrough	State Fuel Taxes	Energy Resources Fees	Registration Fees	State Sales Taxes	Depreciation	Total Fiscal Impact*

5 Macroeconomic Impacts

5.1 Methods for determining economic impacts

This section describes the estimated total impact of the proposed regulation on the California economy. The proposed regulation would result in incremental cost and cost-savings for businesses to comply with the regulation. These costs would result in direct changes in expenditures in the economy and are passed on to businesses. These changes in expenditures by businesses would indirectly affect employment, output, and investment in sectors that move freight and provide services to affected businesses.

These direct and indirect effects would lead to induced effects, such as changes in personal income that affect consumer expenditures across other spending categories. The total economic impact is the sum of these effects and is presented in this section. The total economic impact of the proposed regulation is simulated relative to the baseline scenario using the cost estimates described in Section C. The analysis focuses on the changes in major macroeconomic indicators from 2022 to 2050, including employment, output, personal income, and gross state product (GSP). The years of the analysis are used to simulate the proposed regulations through more than 12 months post full implementation.

Regional Economic Models, Inc. (REMI) Policy Insight Plus Version 2.5.0 is used to estimate the macroeconomic impacts of the Proposed Regulation on the California economy. REMI is a structural economic forecasting and policy analysis model that integrates input-output, computable general equilibrium, econometric and economic geography methodologies.[184] REMI Policy Insight Plus provides year-by-year estimates of the total impacts of the Proposed Regulation, pursuant to the requirements of SB 617 and the California Department of Finance. Staff used the REMI single region, 160 sector model with the model reference case adjusted to reflect California Department of Finance's most current publicly available economic and demographic projections.[185,186]

Specifically, REMI model's National and Regional Control was updated to conform to the most recent California Department of Finance economic forecasts which include U.S. Real Gross Domestic Product, income, and employment, as well as California civilian employment by industry, released with the Governor's Budget on January 10, 2022 and Department of Finance demographic forecasts for California population forecasts, last updated in July

[184] For further information and model documentation see: *https://www.remi.com/model/pi/*
[185] California Legislature, Senate Bill 617. October 2011.
[186] California Department of Finance, Chapter 1: Standardized Regulatory Impact Analysis for Major Regulations - Order of Adoption. December 2013.

2021.[187,188,189,190] After the Department of Finance economic forecasts end in 2025, CARB staff made assumptions that post-2025, economic variables would continue to grow at the same rate projected in the REMI baseline forecasts.

5.2 Inputs and Assumptions of the Assessment

The estimated economic impact of the proposed regulation is sensitive to modeling assumptions. This section provides a summary of the assumptions and inputs used to determine the suite of policy variables that best reflect the macroeconomic impacts of the proposed regulation. The direct costs and savings estimated in Section C and the non-mortality related health benefits estimated in Section B are translated into REMI policy variables and used as inputs for the macroeconomic analysis.[191]

The direct costs of the proposed regulation, as described in Section C, would include changes in upfront costs to fleets for the increased purchase of ZEVs and decreased purchase of ICE vehicles. The net change in vehicle costs is input into the economic model as an increase in production costs for all industries in California that operate fleets anticipated to be affected by the proposed regulation (see Table 47). Fleets which use ZEVs would realize changes in production costs related to their change in fuel mix, operations costs, and maintenance and repair costs. Fleets would also need to make investments in infrastructure to support their use of the ZEVs, which would increase their production costs. Fleets that own ZEV infrastructure to charge their vehicles would be able to generate LCFS credits and receive a direct financial benefit. Fleets required to accelerate the retirement of their non-ZEVs may see an increased residual value from resale of the vehicles on the used market, as described in the Direct Costs Section of this report. This however is not expected to result in any statewide economic impact, as other fleets would also be purchasing the vehicles at the higher residual value, directly offsetting revenue received by the seller as an expenditure to the buyer. Finally, changes in fleets' vehicle purchases, fuel use, and other activities would reduce the amount paid in federal, State, and local taxes and fees. The total change in taxes and fees businesses pay are modeled as a reduction in production costs for the fleets.

Table 47. Share of Vehicles Owned and Operated by Fleets Affected by the High Priority and Federal Fleet Requirements of the Proposed Regulation

Major Sectors	NAICS	Share of Vehicles
Agriculture and Natural Resources	111-115, 21	5.12%
Construction	23	9.35%
Manufacturing	31-33	4.37%
Retail and Wholesale	42, 44-45	15.44%
Transportation and Public Utilities	22, 48, 492-493	50.40%
Finance, Insurance & Real Estate	52, 53	1.13%
Services	51, 54-56, 61, 62, 71, 72, 81	14.14%
Government (Public Administration)	92	0.05%

Costs and savings incurred by fleets would result in corresponding changes in final demand for industries supplying those particular goods or services as shown in Table 48. The term "fleets" in the table includes all of the industries with businesses operating affected vehicles as shown in Table 47. As fleets' purchase of vehicles are estimated to be primarily from out-of-state manufacturers, demand changes for the corresponding ZEV supply chain cannot be directly modeled as a change in final demand in California. In order to account for this, staff estimates the share of demand which may be fulfilled by California businesses, based on California's share of national output for the industry (electrical component mfg.).[192] All other changes in demand are included in this analysis. The infrastructure upgrades necessary for fleet use of ZEVs is assumed to be provided by businesses in the construction sector (NAICS 23). The EVSE and maintenance is assumed to be supplied by businesses in the Other Electrical Equipment and Component Manufacturing industry (NAICS 3359). The change in demand for vehicle maintenance and midlife rebuild is realized by the automotive repair and maintenance industry (NAICS 8111). The reduction in gasoline and diesel fuel demand is assumed to be incurred by the Petroleum and Coal Products manufacturing industry (NAICS 324), while the decrease in natural gas demand occurs for the Natural gas distribution industry (NAICS 2212). The increased demand for electricity and hydrogen fuel is assumed to be provided by the Electric power generation, transmission, and distribution industry (NAICS 2211) and Basic Chemical manufacturing industry (NAICS 3251), respectively. The reporting cost and the workforce training and development are assumed to be provided by the Office administrative services (NAICS 5611, 5612) and private education services industries (NAICS 61), respectively. The change in demand for gasoline stations (NAICS 4471) selling some of the products above, is estimated based on the retail margin for that industry and entered in

[192] Based on REMI Policy Insight Plus (v 2.4.1), California's share of national output is 2.3 percent for motor vehicle parts mfg. (3363) in 2019.

as change in final demand for the retail sector (NAICS 44-45).[193] Finally, the LCFS credits generated by fleets that install and use EVSE are assumed to be purchased by producers of fossil fuels, which pass those costs through in the price of fuel; this is modeled as an increase in fuel costs for individuals and businesses in California.

Table 48. Sources of Changes in Production Cost and Final Demand by Industry

Source of Cost or Savings for Fleets	Industries with Changes in Final Demand (NAICS)
Vehicle Prices	Upfront cost: Electrical Component Mfg.[a] (3363)
Infrastructure upgrades	Upfront cost: Construction (23)
Electric Vehicle Supply Equipment	Upfront cost: Other Electrical Equipment and Component Mfg. (3359)
EVSE maintenance	Upfront cost: Construction (23)
Vehicle maintenance and midlife rebuild	One-time and recurring cost: Automotive Repair and Maintenance (8111)
Gas and diesel fuel	Recurring cost: Petroleum and Coal Products Mfg. (324)
Natural gas	Recurring cost: Natural Gas Distribution (2212)
Hydrogen fuel	Recurring cost: Basic Chemical Manufacturing (3251)
Diesel Exhaust Fluid	Recurring cost: Agricultural Chemical mfg. (3253)
Workforce training and education	Recurring costs: Education Services; Private (61)

[193] A gross margin 10.5 percent is used, based on the average gross margin of small and medium gasoline stations (NAICS 4471) from *Bizminer* (https://www.bizminer.com/).

Source of Cost or Savings for Fleets	Industries with Changes in Final Demand (NAICS)
Reporting	One-time cost: Office Administrative Services; Facilities Support Services (5611, 5612)
LCFS credit generation	Recurring cost: Fuel prices[b]

[a] The Industry Sales policy variable is used here rather than Exogenous Final Demand.
[b] Individuals and each industry share of cost resulting from increasing fuel prices is based on data from REMI v2.5 (see the Macroeconomic Appendix for the distribution).

In addition to these changes in production costs and final demand for businesses, there would also be economic impacts as a result of the fiscal effects, primarily from changes in fuel and sales tax revenue, depreciation, and registration fees, as described in Section D. The changes in fuel tax revenue would change the production costs for fleets and the corresponding change in government revenue is modeled as a change in State and local government spending, assuming this revenue reduction is not offset elsewhere. Additional CARB staff and resources in support of this regulation are modeled as changes in State government employment and spending. The change in federal excise tax revenue and depreciation is outside the scope of the economic model and not evaluated here.

The health benefits resulting from the emissions reductions of the proposed regulation would reduce healthcare costs for individuals on average. This reduction in healthcare cost is modeled as a decrease in spending for hospitals, with a reallocation of this spending towards other goods and increased savings. The GHG emissions reductions benefits, as valued through the SC-CO_2, represent the avoided damage from climate change worldwide per metric ton of CO_2e. These benefits fall outside the scope of our economic model and are not evaluated here.

5.3 Results of the assessment

The results from the REMI model provide estimates of the impact of the proposed regulation on the California economy. These results represent the annual incremental change from the implementation of the proposed regulation relative to the baseline scenario. The California economy is forecasted to grow through 2050, therefore, negative statewide impacts reported here should be interpreted as a slowing of growth and positive impacts as an acceleration of growth resulting from the proposed regulation. The results are reported here in tables for every four years from 2022 through 2050.

5.3.1 California Employment Impacts

Table 49 presents the impact of the proposed regulation on total employment in California across all industries. Employment comprises estimates of the number of jobs, full-time plus part-time, by place of work for all industries. Full-time and part-time jobs are counted at equal weight. Employees, sole proprietors, and active partners are included, but unpaid family workers and volunteers are not included. The employment impacts represent the net change in employment, which consist of positive impacts for some industries and negative impacts for others. The proposed regulation is estimated to initially result in a slightly positive employment impact through about 2026 after which the trend reverses with a negative employment impact through rest of the regulatory horizon. The results are further described at the industry level in the following paragraph. These changes in employment do not exceed 0.2 percent of baseline California employment across the entire regulatory horizon.

Table 49. Total California Employment Impacts

Metric	2026	2030	2034	2038	2042	2046	2050
California Employment	25,955,120	25,988,237	26,215,483	26,620,729	27,193,545	27,865,042	28,673,835
% Change	0.00%	-0.07%	-0.13%	-0.16%	-0.13%	-0.09%	-0.15%
Change in Total Jobs	21	-18,835	-33,107	-43,138	-34,577	-25,572	-41,990

The total employment impacts shown above are net of changes at the industry level. The overall trend in employment changes by major sector are illustrated in Figure 24 and Table 50 shows the changes in employment by industries that would be directly impacted by the proposed regulation. As the requirements of the proposed regulation go into effect the industries generally realizing reductions in production cost or increases in final demand would see an increase in employment growth. This initially includes the construction sector as businesses install EVSE and make other facility upgrades, and the electric power sector due to increased demand. The directly affected fleets, which primarily operate in the transportation and warehousing sector, would initially see a decrease in employment due to higher vehicle costs, but as those vehicles are operated the operational savings build up over time, reducing production costs for the industry reducing the negative impact. The reduced spending on maintenance and repair costs for ZE trucks would result in a downward trend in employment for the industry. The largest decrease in employment results from the public sector, which is estimated to realize a decrease in fuel and sales tax revenue and registration fees. This foregone revenue may eventually be replaced by revenue from other sources, in which case these negative job impacts to State and local government would be diminished. However, this is outside the scope of the proposed regulation and not evaluated here. It is important to note that many of these negative job impacts represent a structural shift for these industries that directly correspond to substantial benefits to ZEV owners who would have much lower operational costs from the lower fuel expenses and reduced maintenance and repair of ZEVs.

Figure 24. Job Impacts by Major Sector

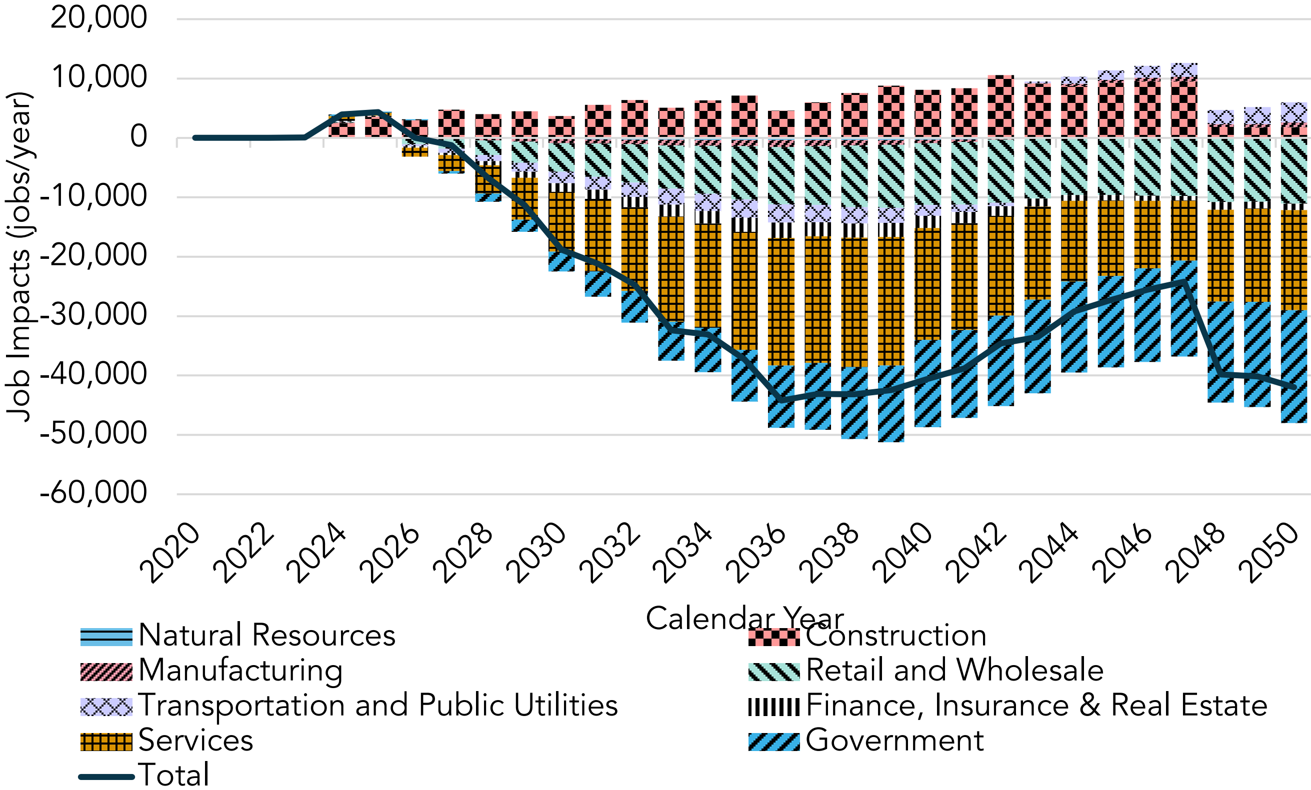

Table 50. Employment Impacts by Primary and Secondary Industries

5.3.2 California Business Impacts

Gross output is used as a measure for business impacts as it represents an industry's sales or receipts and tracks the quantity of goods or services produced in a given time period. Output growth is the sum of output in each private industry and State and local government as it contributes to the state's GDP and is affected by production cost and demand changes. As production cost increases or demand decreases, output is expected to contract, but as production costs decline or demand increases, industry would likely experience output growth.

The results of the proposed regulation show a decrease in output of $99 million in 2030 and a decrease of $5.3 billion in 2050 as shown in Table 51. The trend in output changes is illustrated by major sector in Figure 25. Similar to the employment impacts, there would initially be positive impacts on output for construction and electric power sectors, which trend towards positive impacts over time as the operational savings accumulate, leading to output growth. There would be negative impacts on output in the oil and gas extraction, automotive repair and maintenance, and public sectors. The negative output impact on manufacturing is primarily driven by the petroleum and coal products manufacturing industry, which is estimated to see a relatively large decrease in final demand for diesel and gasoline.

Table 51. Change in Output Growth in California by Industry

Industry	Metric	2026	2030	2034	2038	2042	2046	2050

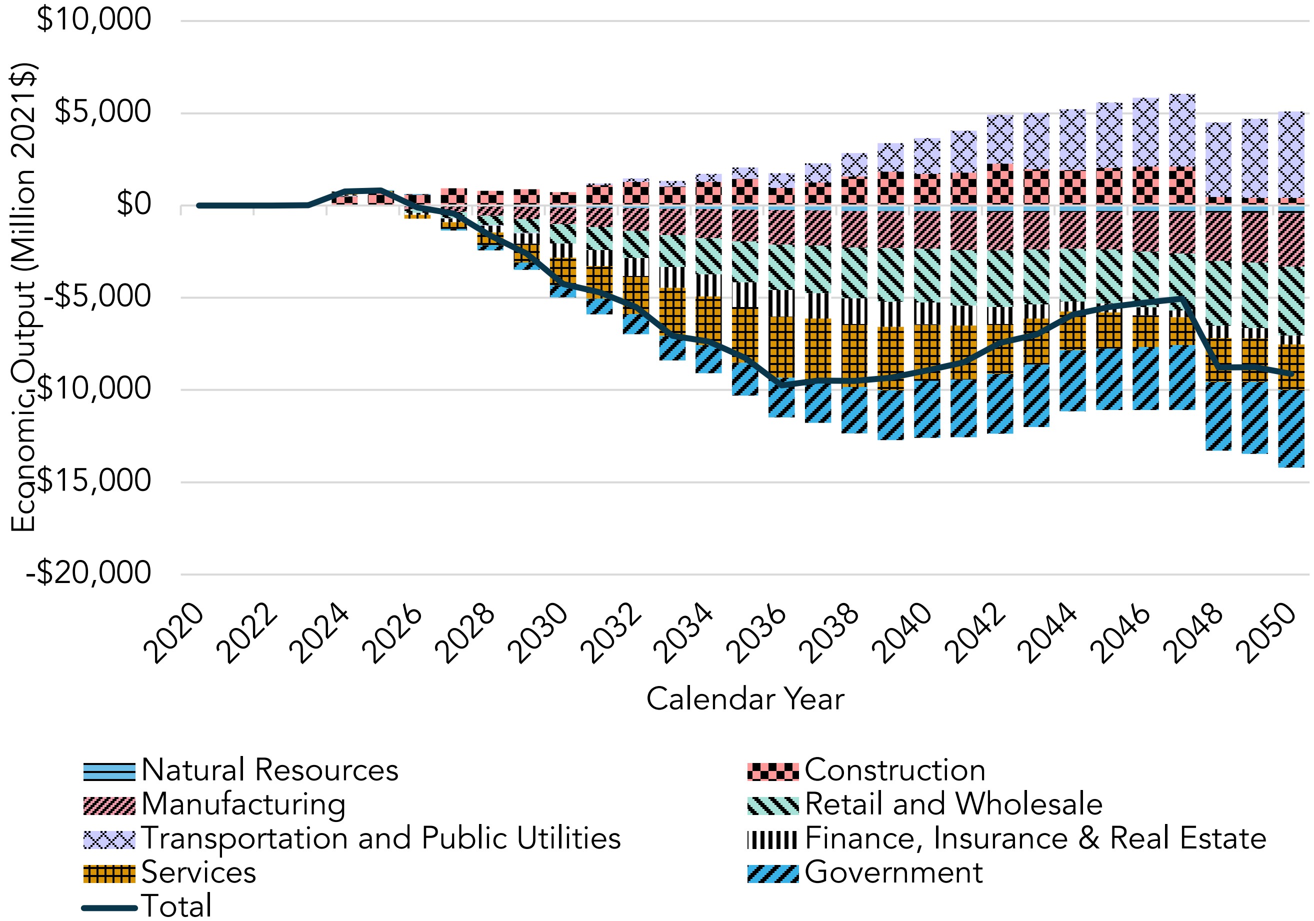
Figure 25. Change in Output in California by Major Sector



5.3.3 Impacts on Investments in California

Private domestic investment consists of purchases of residential and nonresidential structures and of equipment and software by private businesses and nonprofit institutions. It is used as a proxy for impacts on investments in California because it provides an indicator of the future productive capacity of the economy.

The relative changes to growth in private investment for the proposed regulation are shown in Table 52 and shows a decrease of private investment of about $1.0 billion in 2030 which trends towards an increase of $2.49 billion in 2050. These changes in investment do not exceed 0.4 percent baseline investment across the regulatory horizon.

Table 52. Change in Gross Domestic Private Investment Growth

Metric	2026	2030	2034	2038	2042	2046	2050
Private Investment (2021M$)	547,621	571,932	605,292	646,614	693,307	742,261	795,973
% Change	-0.03%	-0.18%	-0.19%	-0.07%	0.17%	0.33%	0.31%
Change (2021M$)	-172	-1,040	-1,141	-453	1,200	2,436	2,492

5.3.4 Impacts on Individuals in California

The proposed regulation would impose no direct costs on individuals in California. However, the costs incurred by affected businesses and the public sector would cascade through the economy and affect individuals.

One measure of this impact is the change in real personal income, which is income received from all sources, including compensation of employees and government and business transfer activity, adjusted for inflation. This is an aggregate statewide measure of personal income change, representing a net of income lost from jobs foregone in some sectors and jobs gained in other sectors. Table 53 estimates annual change in real personal income across all individuals in California due to the proposed regulation. Total personal income growth decreases by about $3.86 billion in 2030 but the impact begins to diminish after 2040, resulting in a decrease of about $2.1 billion by 2050, not exceeding 0.2 percent of the baseline. The change in personal income estimated here can also be divided by the California population to show the average or per capita impact on personal income. The change in personal income growth is estimated to decrease $19 per person in 2030, which trends positive over time resulting in an increase of $68 per person in 2050.[194]

Table 53. Impacts on Individuals in California

Metric	2026	2030	2034	2038	2042	2046	2050
Personal Income (2021M$)	2,861,550	3,187,013	3,477,682	3,737,691	4,040,484	4,378,592	4,745,721
% Change	-0.02%	-0.11%	-0.17%	-0.18%	-0.11%	-0.05%	-0.04%
Change (2021M$)	-764	-3,855	-6,195	-7,140	-4,745	-2,180	-2,071

[194] The sign of the change in personal income per capita differs from overall personal income due to population growth changes estimated by the REMI model as a result of the proposed regulation.

Change (2021$)	-19	-64	-71	-44	25	62	68

5.3.5 Impacts on Gross State Product

GSP is the market value of all goods and services produced in California and is one of the primary indicators of economic growth. It is calculated as the sum of the dollar value of consumption, investment, net exports, and government spending. Under the proposed regulation, GSP growth would be anticipated to decrease by about $2.42 billion in 2030 and by $4.28 billion in 2050 as shown in Table 54. These changes do not exceed 0.2 percent of baseline GSP. This metric summarizes impacts discussed above, including consumer spending, investment, and government spending. This is why the results trend negative, as the decrease in consumer and government spending in California would outweigh the increase in investment resulting from the proposed regulation.

Table 54. Change in Gross State Product

Metric	2026	2030	2034	2038	2042	2046	2050
GSP (2021M$)	3,666,219	3,893,045	4,161,493	4,471,810	4,822,161	5,207,097	5,630,591
% Change	0.00%	-0.06%	-0.10%	-0.12%	-0.08%	-0.04%	-0.08%
Change (2021M$)	-43	-2,420	-4,169	-5,276	-3,796	-2,293	-4,276

5.3.6 Creation or Elimination of Businesses

The REMI model cannot directly estimate the creation or elimination of businesses. However, changes in jobs and output for the California economy described above can be used to understand some potential impacts. The overall jobs and output impacts of the proposed regulation would be small relative to the total California economy, representing changes of no greater than 0.2 percent. However, impacts to specific industries are larger as described in previous sections. While there would initially be negative impacts on the transportation and warehousing sector, these diminish over time. The trend of increasing demand for the construction sector to provide services related to EV charging has the potential to lead to an expansion or creation of businesses over time. While the electric power sector similarly sees large increases in demand, its services are provided by public utilities, which would not directly impact business creation. The decreasing trend in demand for gasoline and diesel fuel following from this proposed regulation has the potential to result in the elimination of businesses in this industry and downstream industries, such as gasoline stations and vehicle repair businesses, if sustained over time.

5.3.7 Incentives for Innovation

The proposed regulation provides flexibility for fleets to purchase ZEVs ahead of their requirements. Private and public fleet owners that purchase ZEVs before they are required would be able to count them towards a future compliance requirement to gain flexibility when making future vehicle purchase. This may encourage fleets to make ZEV purchases early for vehicles that are well suited to their needs which could provide flexibility to purchase ICE vehicles in later years. High priority and federal fleets could purchase Group 1 ZEVs at any point prior to 2025, Group 2 ZEVs at any point prior to 2027, and Group 3 ZEVs at any point prior to 2030. Drayage fleets could add ZEVs to the drayage online reporting system at any point prior to turnover requirements or the 2035 ZEV deadline. Fleets that act early would be more likely to be eligible for incentive programs that may be available to finance costs or lower the upfront cost.

ZEVs are anticipated to lead to other unquantified benefits and operational efficiencies that may provide another incentive for fleets to use ZEVs to better serve customers. For example, ZEV may be able to make deliveries at night where noise ordinances limit deliveries, their quiet operation can also improve safety at a work site, and the ability to plug in power tools or export power at a job site or as back-up power may increase overall productivity.

Staff anticipates growth in industries who manufacture or support ZEVs including ZEV manufacturer and component suppliers, infrastructure installers, electrical vehicle technicians, and others. This growth would strengthen the ZEV supply chain, foster a ZE market, and promote technology growth sooner than would have otherwise occurred.

5.3.8 Competitive Advantage or Disadvantage

The proposed regulation has three primary regulatory components for different fleet types and each addresses competitive advantage or disadvantage differently.

The public fleet requirement would not be anticipated to create a competitive advantage or disadvantage. Public agencies do not compete against each other, and each agency would be able to identify the strategy which allows them to comply within their allocated budgets.

The drayage truck requirement would not be anticipated to create a competitive advantage or disadvantage. The proposal applies equally to all drayage trucks that enter seaports and railyards. It also applies equally to California companies as well as companies headquartered out-of-state.

The high priority and federal fleet requirement would not be anticipated to create a significant change in competitive advantage or disadvantage. First, federal agencies do not compete with other fleets and would not have a competitive advantage or disadvantage. For high priority fleets, the milestone requirements apply to all trucks that operate in California regardless of where the truck or company is headquartered and would be phased in by truck type. This ensures that all vehicles in these fleets would be subject to the same requirements.

Fleets that do not meet the fleet size or revenue threshold would not be regulated by this proposal, but the risk of creating a competitive advantage or disadvantage is mitigated as these fleets would become subject to the regulation if their revenue or fleet size increases above the thresholds established in the regulation. In addition, the fleet size for determining which fleet would be subject to the regulation includes all medium- and heavy-duty vehicles that are operated under common ownership and control. This ensures a level playing field between businesses that compete for the same work regardless of their business model.

5.4 Summary and Agency Interpretation of the Assessment Results

The results of the macroeconomic analysis of the proposed regulation are summarized in Table 55. As analyzed here, CARB estimates the proposed regulation would be unlikely to have a significant impact on the California economy. Overall, the change in the growth of jobs, state GDP, and output is projected to not exceed 0.2 percent of the baseline. While the proposed regulation would initially result in decreased growth in the transportation and warehousing sector in California, it trends positively over time diminishing the negative impact. Both the construction and electric power sectors would see large positive growth by providing their services to affected fleets. The diesel and gasoline fuel savings for the fleets represent decreased demand for gasoline and diesel from the industry, implying a decrease in growth for the industry and downstream industries such as gasoline stations and vehicle repair. This analysis also shows the negative impact estimated for State and local government output and employment due to tax revenue decreases, without any offsetting revenues. This foregone revenue, which supports important programs in the state, may eventually be replaced by revenue from other sources, in which case these negative impacts to State and local government would be diminished.

Table 55. Summary of Macroeconomic Impacts of Proposed Regulation

Indicator	Metric	2026	2030	2034	2038	2042	2046	2050

6 Alternatives

Pursuant to SB 617,[195] and HSC Sections 11346.2, 11346.3, 11346.5, 11346.9, 11347.3, 11349.1, 13401, 13402, 13403, 13404, 13405, 13406, 13407, 11342.548, 11346.36, and 11349.1.5, CARB staff solicited alternatives for the proposed regulation during workgroups, public workshops, and individual meetings with industry. CARB staff encouraged public input on alternative approaches that may yield the same or greater benefits compared to the proposed regulation or may achieve the goals at a lower cost. Based on comments received, two alternatives, one more stringent and one less stringent than the proposed regulation, are shown below. The analysis includes a comparison of costs, benefits, economic impacts, and cost-effectiveness.

6.1 Alternative 1

Alternative 1 is a less stringent alternative to the proposed regulation. This alternative is based on an alternative concept suggested by the California Council for Environmental and Economic Balance and applies to the same fleets as the proposed regulation. This alternative is structured as a cleaner combustion option that would count engines certified to the Heavy-Duty Omnibus regulation equivalent to a ZEV purchase for the same regulated fleets as the proposed regulation.[196]

Under this alternative, regulated fleets would have the option to meet compliance requirements by purchasing a combination of ZEVs or engines certified to the engine standards established by the Heavy-Duty Omnibus regulation. All medium- and heavy-duty engines sold in California need to be certified to this standard regardless of fuel type. Engines certified in California starting in 2024 are initially certified to standards 75 percent to 90 percent lower than U.S. EPA certified engines and have additional requirements that ensure real world emissions remain low for a longer period of time in all modes of operation through improved test procedures, lengthened warranty, strengthened durability demonstrations, and other emissions control requirements.[197] We expect real world NOx emissions to be about 90 percent lower during the life of the vehicle than existing engines starting in 2024.

October 6, 2011 (web link: http://dof.ca.gov/Forecasting/Economics/Major_Regulations/SB_617_Rulemaking_Documents/documents/Section%202000%20ISOR%201%20sb_617_bill_20111006_chaptered.pdf, last accessed January 2022).

[196] California Council for Economic and Environmental Balance, *Re:Comments on Advanced Clean Fleets Proposed Regulation and Alternatives for the Environmental Analysis*, 2021 (web link: https://www.arb.ca.gov/lists/com-attach/29-acf-comments-ws-UDNUMVUxUGZWMlcl.pdf, last accessed January 2022).

[197] California Air Resources Board, *Heavy-Duty Omnibus: Appendix D – Emissions Inventory and Results for the Proposed Amendments*, 2020 (web link: https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2020/hdomnibuslownox/appd.pdf, last accessed January 2021).

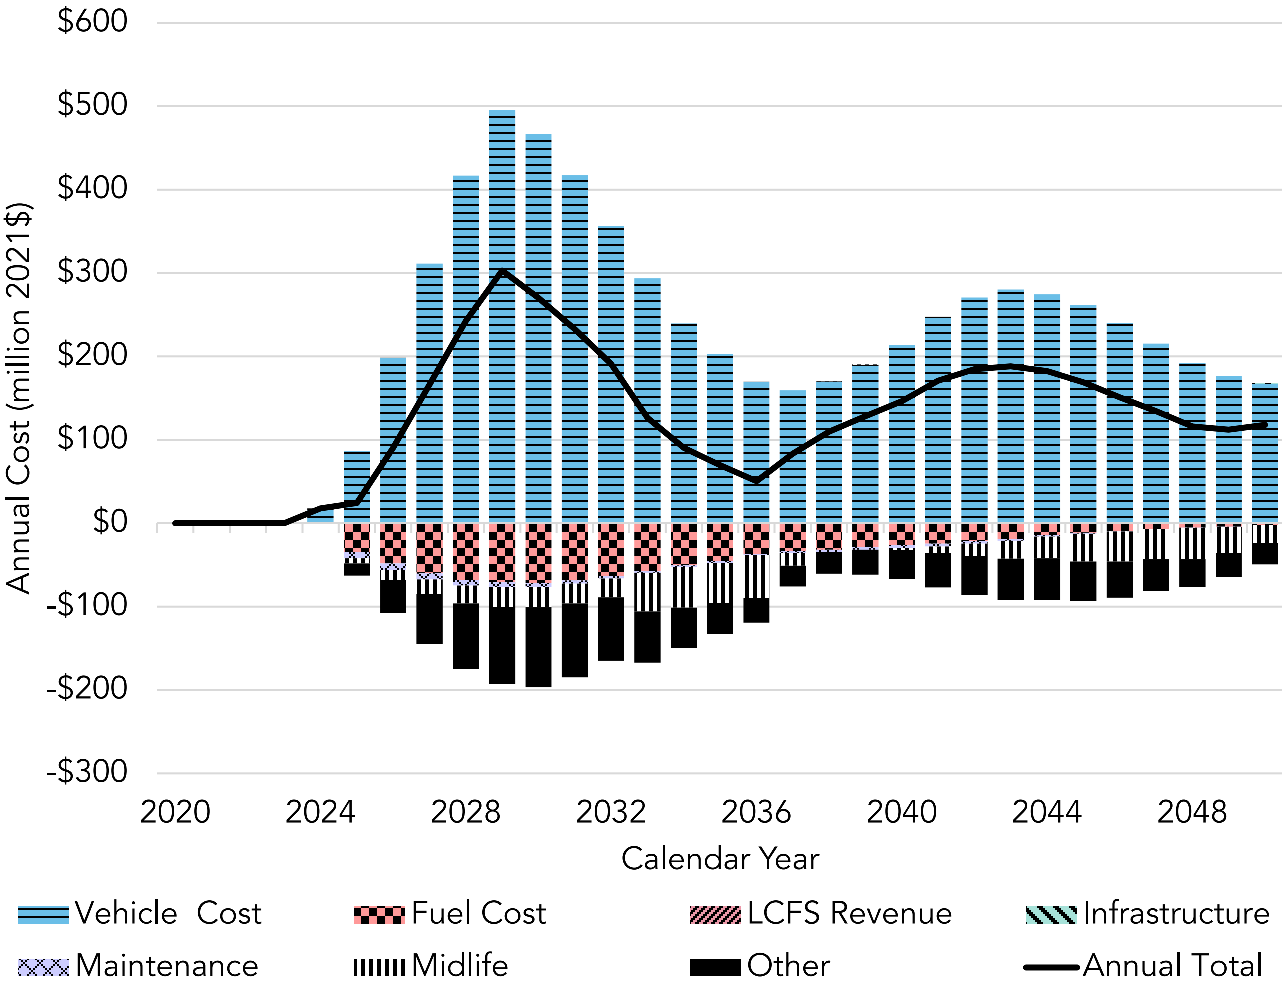
In this alternative, starting in 2024, public fleets and high priority fleets would be required to purchase either ZEVs or engines certified to the California Omnibus engine standards. For State and local government fleets, this alternative is not expected to result in any changes because they already buy California certified engines. For high priority and federal fleets, this would result in accelerated emissions benefits and increased costs as fleets that would have otherwise normally purchased used federally certified engines in the baseline, would now be required to purchase new California Omnibus certified engines. For drayage fleets, pre-2024 MY trucks would be removed from the CARB drayage online reporting system at the end of their useful life and all vehicles added in the online reporting system would be either a ZEV or 2024 MY or newer engine certified to the Heavy-Duty Omnibus requirements. Under this alternative, the number of ZEVs would not increase beyond what is expected from the ACT regulation already reflected in the Legal Baseline.

When compared to the proposed regulation, this alternative would result in fewer ZEVs, lower criteria emissions benefits, lower health benefits, and lower climate emissions reductions benefits as shown in the following sections.

6.1.1 Costs

Alternative 1 results in incremental costs of California certified engines versus federal certified engines which is partially offset by incremental savings associated with projected improved fuel economy of newer vehicles. The cost to the California economy when assuming all costs occur in California would be $3.8 billion between 2024 and 2050 in Alternative 1 versus the Legal Baseline. Figure 26 illustrates the incremental difference in cost between Alternative 1 and the Legal Baseline scenario.

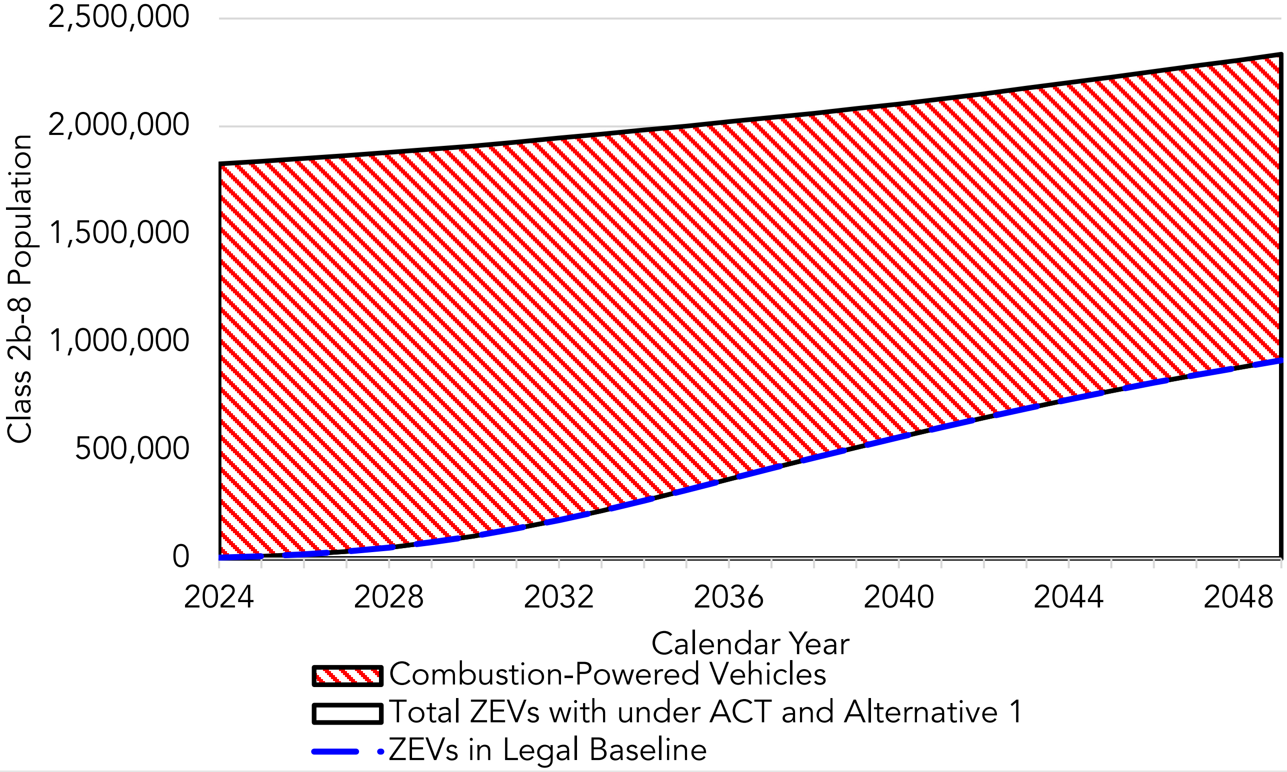
Figure 26. Total Estimated Direct Costs of Alternative 1 Relative to the Legal Baseline Scenario (million 2021$)



6.1.2 Benefits

Alternative 1 results in NOx emissions benefits relative to the Legal Baseline from the more stringent NOx standards of California certified engines compared to federal engine standards. Alternative 1 results in some $PM_{2.5}$ emissions benefits and negligible GHG benefits. Figure 27 illustrates the ZEV population over time under Alternative 1. Alternative 1 results in roughly 650,000 ZEVs by 2035 and 950,000 ZEVs by 2050, the same number as in the Legal Baseline. This represents 200,000 fewer ZEVs by 2035 and 650,000 fewer ZEVs by 2050 when compared to the proposed regulation. Because of the identical number of ZEVs between Alternative 1 and the Legal Baseline, the "ZEVs due to ACT" line overlaps with the "Total ZEVs" line.

Figure 27. Statewide Vehicle Population Forecast over Time under Alternative 1



6.1.2.1 Emissions Benefits

Alternative 1 results in lower NOx, $PM_{2.5}$, and GHG emissions compared to the Legal Baseline scenario. However, this alternative results in significantly fewer NOx, $PM_{2.5}$, and GHG benefits compared to the proposed regulation. Table 56 summarizes the expected annual NOx, $PM_{2.5}$, and CO_2 benefits of Alternative 1 from 2024 through 2050 when compared to the Legal Baseline. The alternative generates fewer criteria emissions reductions than the proposed regulation, is less effective at meeting our SIP obligations, and does not make progress towards meeting the State's GHG reduction targets. In addition, this alternative is not projected to result in any additional near-term emissions reductions compared to the proposed regulation.

Table 56. Alternative 1 NOx, $PM_{2.5}$, and GHG Benefits Relative to the Legal Baseline

Calendar Year	NOx (tpd)	$PM_{2.5}$ (tpd)	CO_2 (MMT/year)
2024	0.4	0.0002	0
2025	1.4	0.0048	0
2026	2.9	0.011	0
2027	5.2	0.020	0
2028	7.6	0.027	0
2029	9.9	0.034	0
2030	12.2	0.040	0
2031	14.4	0.042	0
2032	16.6	0.042	0
2033	18.6	0.043	0
2034	20.7	0.046	0
2035	22.6	0.050	0
2036	24.4	0.053	0
2037	26.1	0.057	0
2038	27.7	0.062	0
2039	29.3	0.067	0
2040	30.8	0.073	0
2041	32.2	0.078	0
2042	33.7	0.083	0
2043	35.1	0.088	0
2044	36.4	0.093	0
2045	37.8	0.097	0
2046	39.2	0.10	0
2047	40.6	0.11	0
2048	41.9	0.11	0
2049	43.3	0.11	0
2050	44.7	0.12	0

Figure 28, Figure 29, and Figure 30 show the difference in GHG, NOx, and $PM_{2.5}$ emissions between Alternative 1, the Legal Baseline, and the proposed regulation. The cumulative emissions benefits for this alternative accounts for a negligible CO_2 reduction, 204,500 tons of NOx, and 518 tons of $PM_{2.5}$ from 2024 to 2050. In comparison, the proposed regulation has total emissions benefits that are approximately 316 MMT CO_2, 443,800 tons of NOx, and 9,300 tons of $PM_{2.5}$ reductions during the same time period. GHG emissions of this alternative are about the same as the baseline.

Figure 28. Projected GHG Emissions under Legal Baseline, Proposed Regulation, and Alternative 1

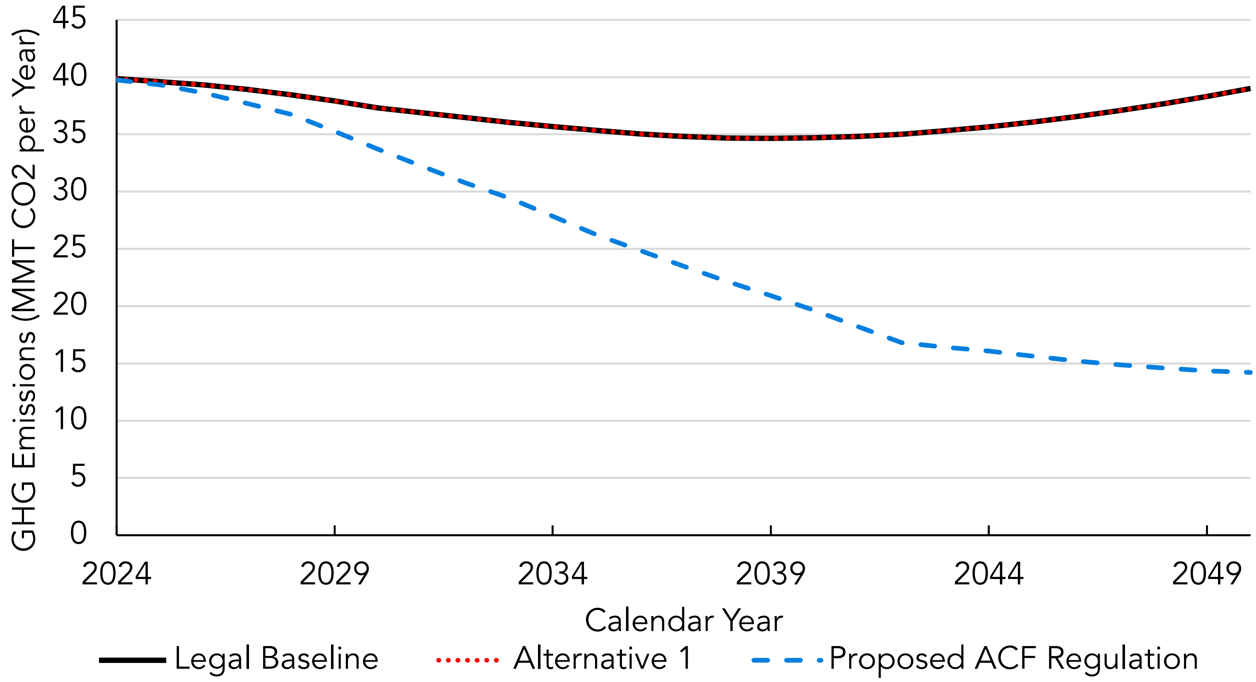


Figure 29. Projected NOx Emissions under Legal Baseline, Proposed Regulation, and Alternative 1

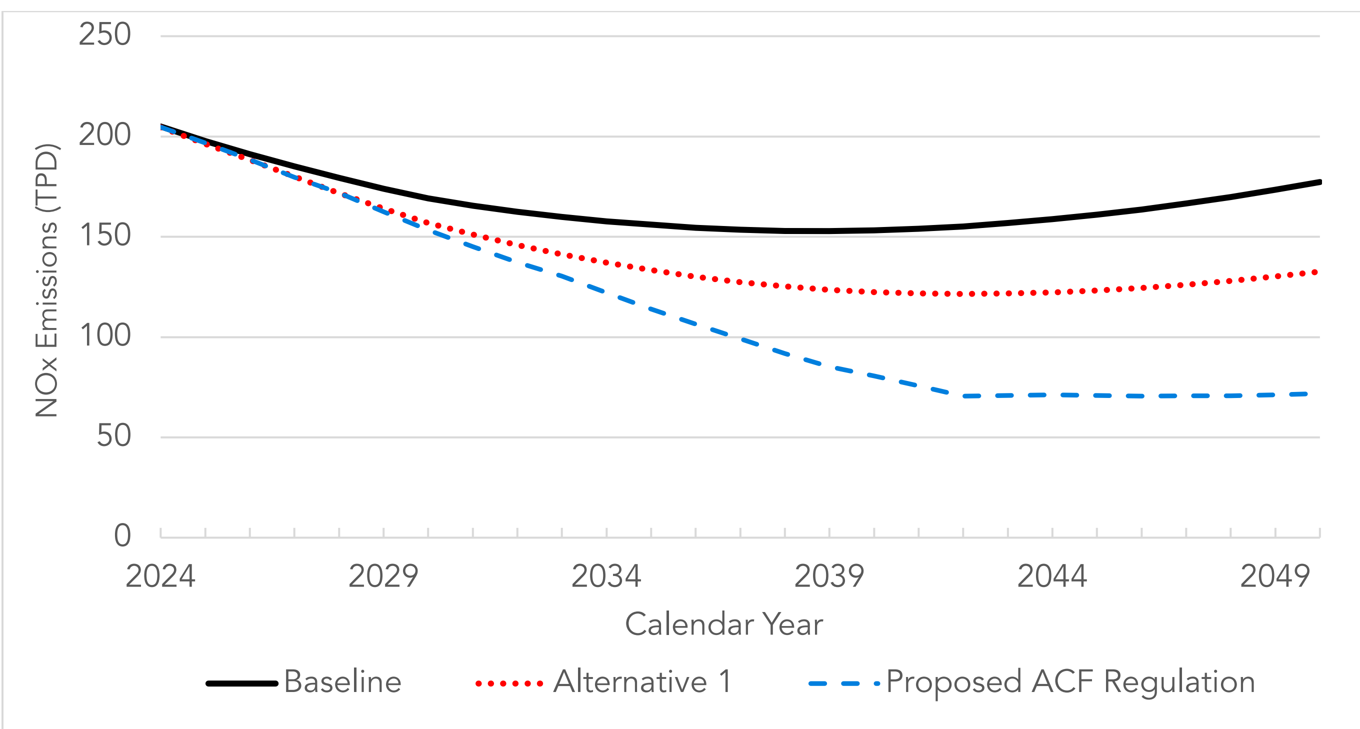

Figure 30. Projected $PM_{2.5}$ Emissions under Legal Baseline, Proposed Regulation, and Alternative 1

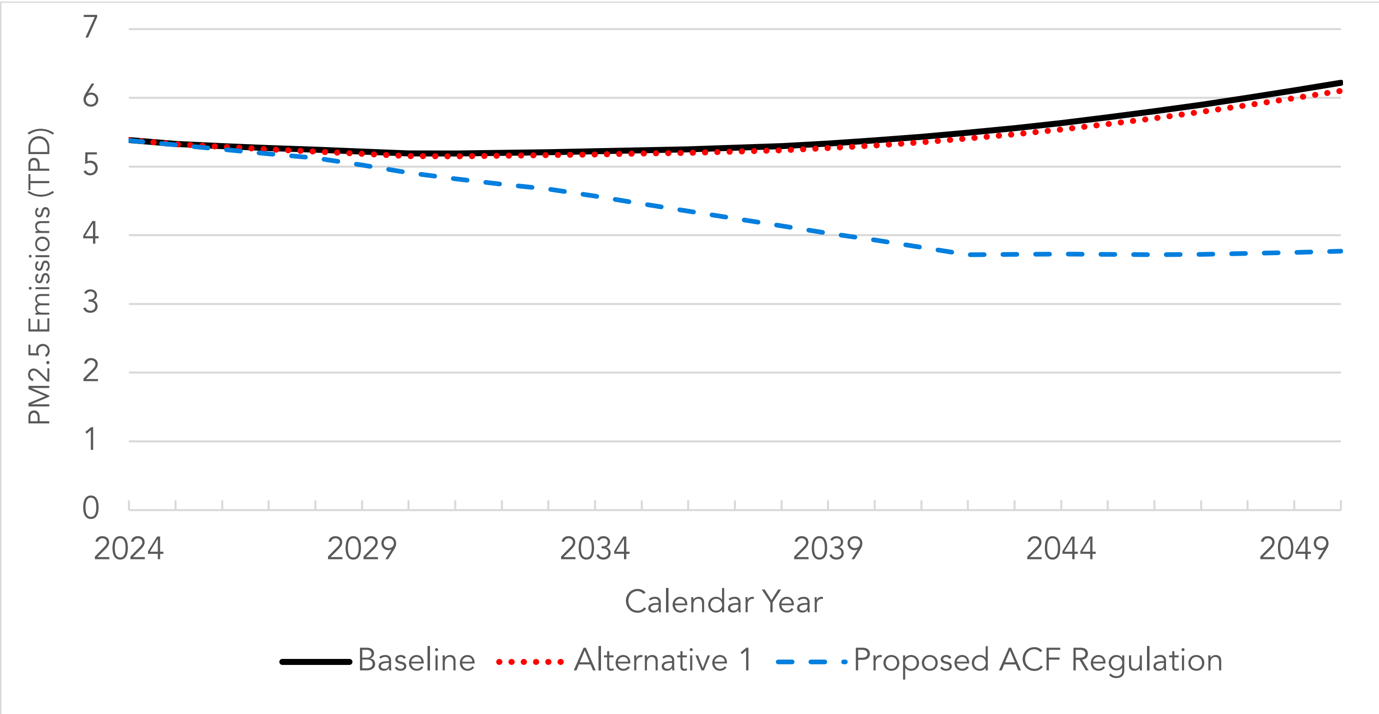

6.1.2.2 Health Benefits

Alternative 1 results in emissions reductions relative to the Legal Baseline leading to health benefits as shown in Table 57. The health benefits for Alternative 1 are less than those of the proposed ACF regulation due to less emissions reductions estimated. The total statewide valuation of health benefits of the less stringent alternative is estimated to be $22.7 billion as summarized in Table 57. Totals may not add up due to rounding.

Table 57. Statewide Valuation from Avoided Health Outcomes for Alternative 1 (Million 2021$)

Calendar Year	Avoided Cardiopulmonary Mortality	Avoided Hospitalizations for Cardiovascular Illness	Avoided Hospitalizations for Respiratory Illness	Avoided ER Visits	**Total Avoided Annual Valuation**

*Note: Totals may differ due to rounding

6.1.3 Economic Impacts

Alternative 1 imposes a less stringent ZEV purchase requirement in the near-term compared to the proposed regulation. This results in lower incremental vehicle cost as passed-through to fleets, but also results in fewer fuel costs savings and fewer total cost-savings during the analysis period. The macroeconomic impacts analysis indicates a very small change relative to the results of the proposed regulation, as shown in Table 58. Figure 31 and Figure 32 show the job impacts and output changes of Alternative 1, respectively.

Table 58. Change in Growth of Economic Indicators for Alternative 1

Indicator	Metric	2026	2030	2034	2038	2042	2046	2050

Figure 31. Job Impacts of Alternative 1 by Major Sector

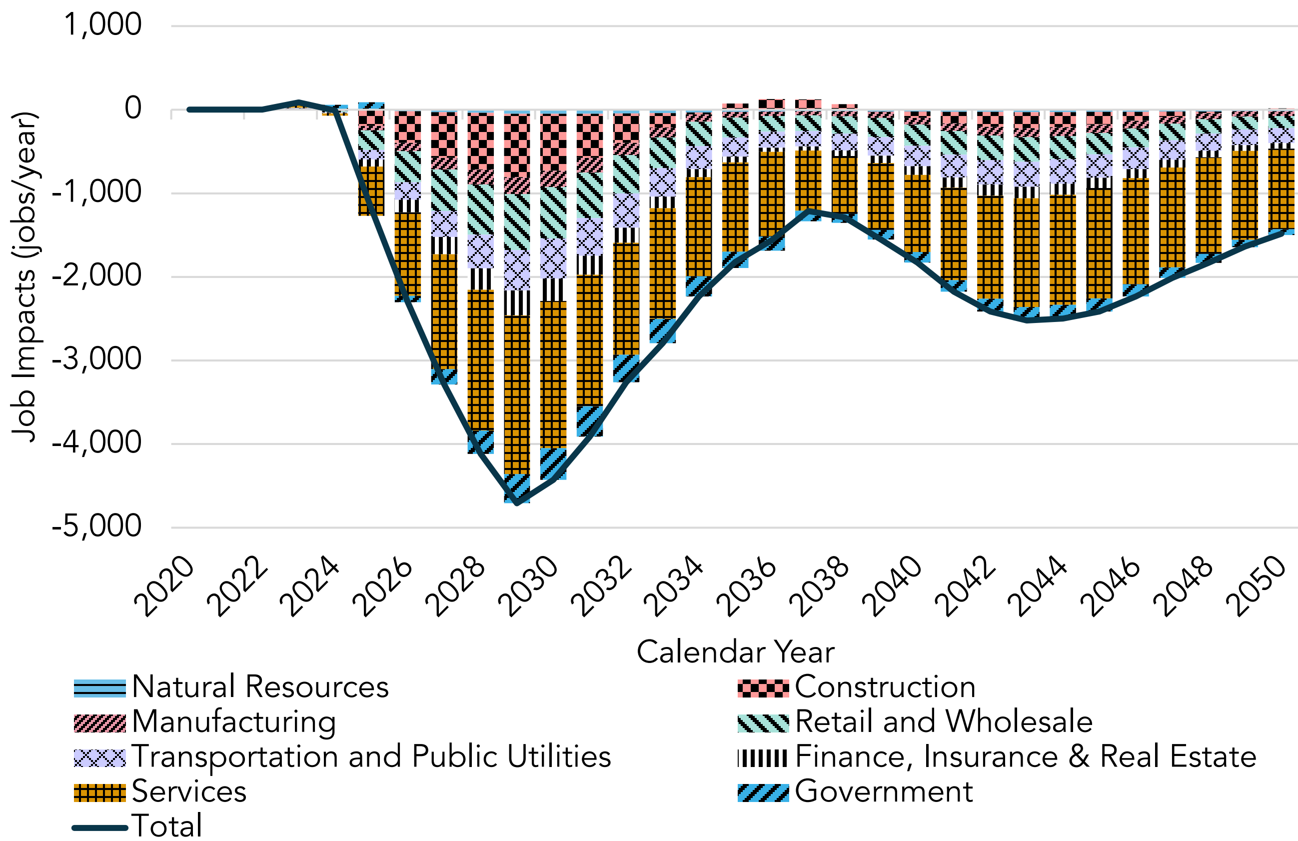

Figure 32. Changes in Output from Alternative 1 by Major Sector

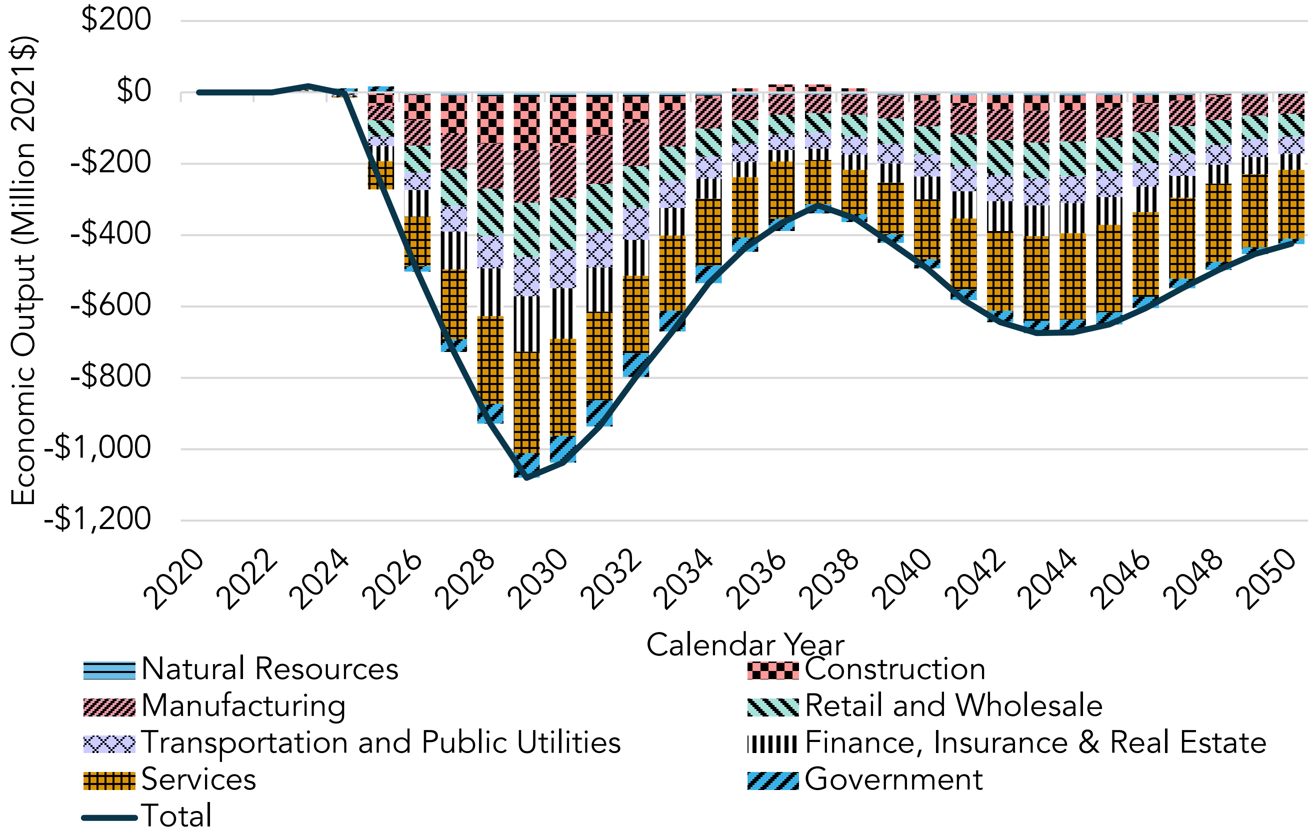


6.1.4 Cost-Effectiveness

Cost-effectiveness is defined as the cost to achieve a ton of emissions reductions. However, like the proposed regulation, Alternative 1, has a lower net cost than the Legal Baseline and can be compared as a benefit-cost ratio. Table 59 shows the estimated benefit-cost ratio for Alternative 1. Alternative 1 has a benefit-cost ratio of 3.8 that is higher than the 1.5 benefit-cost ratio with the proposed regulation.

Table 59. Benefit-Cost Ratio of the Alternative 1 (billion $2021)

Alternative	Total Costs	Cost-Savings (benefit)	Health Benefits	Tax and Fee Revenue	Total Benefit	Net Benefit	Benefit-Cost Ratio
Alternative 1	$6.7	$2.9	$22.7	$0.0	$25.6	$18.8	3.8

6.1.5 Reason for Rejecting

Alternative 1 is rejected because it fails to adequately advance the adoption of medium- and heavy-duty ZEV technologies and is not as effective at reducing criteria emissions and achieving carbon neutrality goals. Alternative 1 achieves minimal $PM_{2.5}$ and GHG emissions reductions and is less effective at reducing NOx emissions. It is not as effective as the proposed regulation in meeting objectives to protect public health, achieve attainment, and to maximize benefits in disadvantage communities. Alternative 1 also does not effectively accelerate the deployment of ZEV deployments compared to the proposed regulation and is not consistent with the goals established by the Governor in multiple Executive Orders and by the Board. ZEV deployments are a key part of the State SIP Strategy, and the Climate Change Scoping Plan as a necessary component needed to improve California's air quality and achieve the State's climate protection goals. Therefore, this alternative is rejected because it would not advance CARB's Mobile Source Strategy, it would be less effective at meeting SIP targets, it would be less effective at reducing exposure to $PM_{2.5}$, and would be less effective at achieving California's carbon neutrality targets.

6.2 Alternative 2

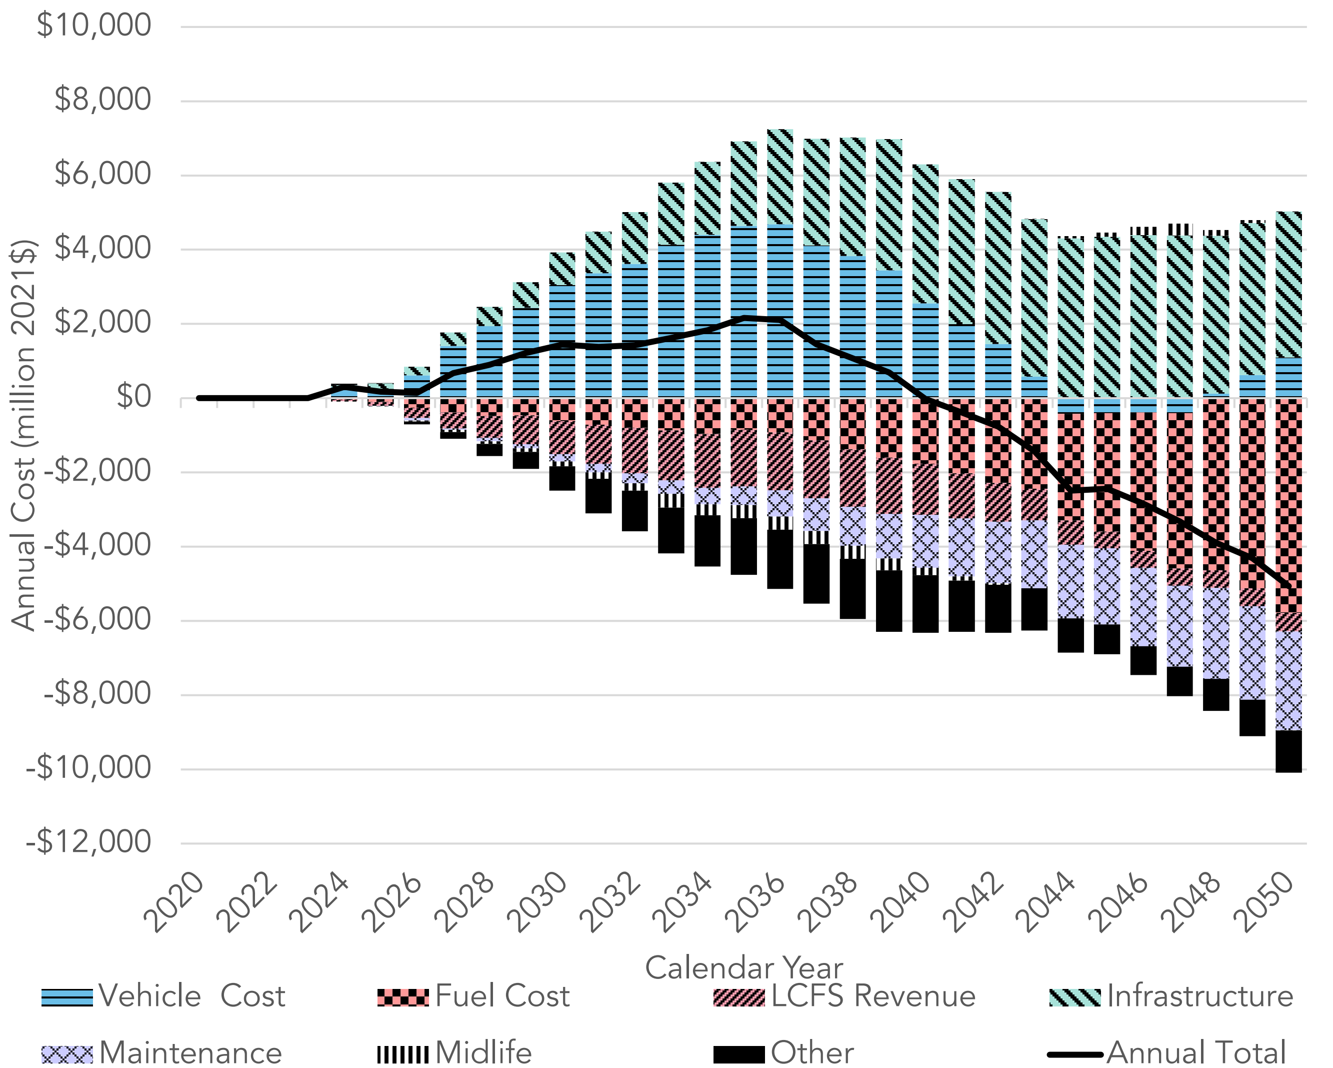
Alternative 2 is a more stringent medium- and heavy-duty ZEV purchase requirement than the proposed regulation. This alternative is based on a comment letter sent by the AMPLY, Los Angeles Cleantech Incubator, Itron, and PCS Energy. This alternative primarily recommends reducing the fleet size threshold for high priority and federal fleets to ten trucks and moves up the date for when all medium- and heavy-duty vehicle sales would need to be ZE.

This alternative is similar to the proposed regulation but includes modifications to the high priority and federal fleet requirements. In this alternative the fleet size threshold would be reduced from 50 vehicles to 10 vehicles. This alternative also includes a 100 percent sales requirement starting in 2036 rather than in 2040. Other aspects of the proposed regulation would stay the same. As such, the ZEV purchase requirement would apply to any entity that owns or controls 10 or more vehicles and to brokers that dispatch 10 or more vehicles per year. No changes would be made to the drayage truck requirement. Alternative 2 would increase the number of fleets affected and the number of medium- and heavy-duty ZEVs deployed.

6.2.1 Costs

Alternative 2 increases the number of medium- and heavy-duty ZEVs sold in California relative to the Legal Baseline. ZEV sales would also be higher than under the proposed regulation. This results in higher initial costs and lower net costs to California compared to the Legal Baseline. The cost to the California economy when assuming all costs occur in California would be -$8.5 billion between 2020 and 2050 in Alternative 2 versus the Legal Baseline scenario. In comparison, the cost of the proposed regulation is -$12.4 billion between 2020 and 2050 versus the Legal Baseline. The negative costs correspond to a net savings for the State. Figure 33 illustrates the incremental difference in cost between Alternative 2 and the Legal Baseline scenario.

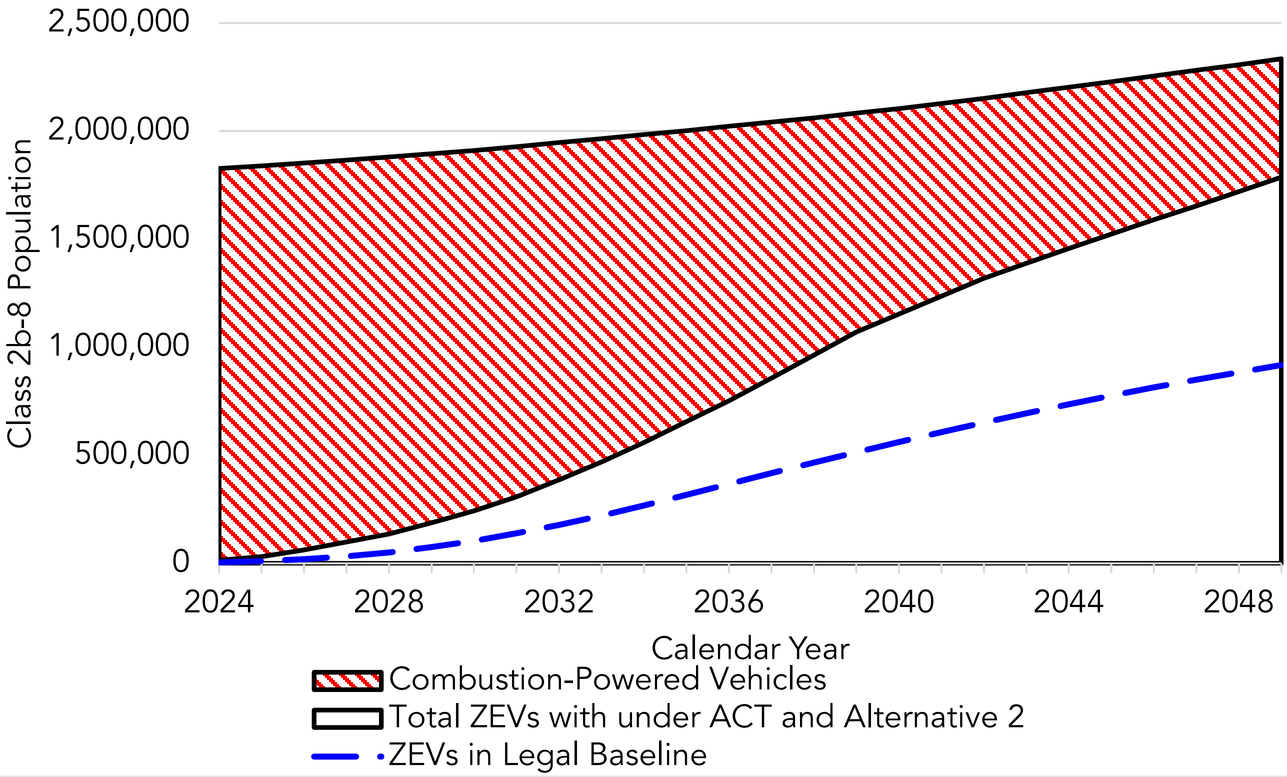
Figure 33. Total Estimated Direct Costs of Alternative 2 Relative to the Legal Baseline Scenario (million 2021$)



6.2.2 Benefits

Alternative 2 results in more medium- and heavy-duty ZEVs deployed than the Legal Baseline scenario and the proposed regulation and achieves more emissions benefits than the proposed regulation. Figure 34 illustrates the ZEV population over time under Alternative 2 in comparison to the proposed regulation. Alternative 2 results in roughly 520,000 ZEVs by 2035 and 1,260,000 ZEVs by 2050. This is an increase of 320,000 ZEVs by 2050 versus the Legal Baseline and 60,000 more ZEVs in 2050 than the proposed regulation.

Figure 34. Statewide Population Forecast over Time under Alternative 2



6.2.2.1 Emissions Benefits

Alternative 2 results in greater medium- and heavy-duty ZEV deployments compared to the Legal Baseline scenario and the proposed regulation. This Alternative provides more cumulative NOx, $PM_{2.5}$ and CO_2 benefits due to the more stringent ZEV purchase requirement for high priority fleets. The cumulative emissions benefits for the more stringent alternative relative to the Legal Baseline accounts for approximately 443 MMT of CO_2, 636,100 tons of NOx, and 12,800 tons of $PM_{2.5}$ from 2024 – 2050, whereas the proposed regulation relative to the Legal Baseline provides approximately 316 MMT CO_2, 443,800 tons of NOx, and 9,300 tons of $PM_{2.5}$ reductions during the same time period. Table 60 summarizes the expected annual NOx, $PM_{2.5}$, and CO_2 benefits in Alternative 2 from 2024 through 2050.

Table 60. Alternative 2 NOx, $PM_{2.5}$, and GHG Benefits Relative to the Legal Baseline

Calendar Year	NOx (tpd)	$PM_{2.5}$ (tpd)	CO_2 (MMT/year)
2024	0.5	0.009	0.2
2025	1.6	0.03	0.5
2026	4.6	0.08	1.2
2027	8.1	0.1	1.9
2028	11.1	0.2	2.6

2044	127.5	2.7	27.6
2045	130.1	2.8	28.2
2046	133.0	2.8	28.9
2047	136.0	2.9	29.6
2048	139.5	3.0	30.4
2049	143.1	3.1	31.2
2050	146.8	3.2	32.0

Figure 35, Figure 36, and Figure 37 represent the difference in GHG, NOx, and $PM_{2.5}$ emissions between Legal Baseline and Alternative 2.

Figure 35. Projected GHG Emissions under Legal Baseline, Proposed Regulation, and Alternative 2

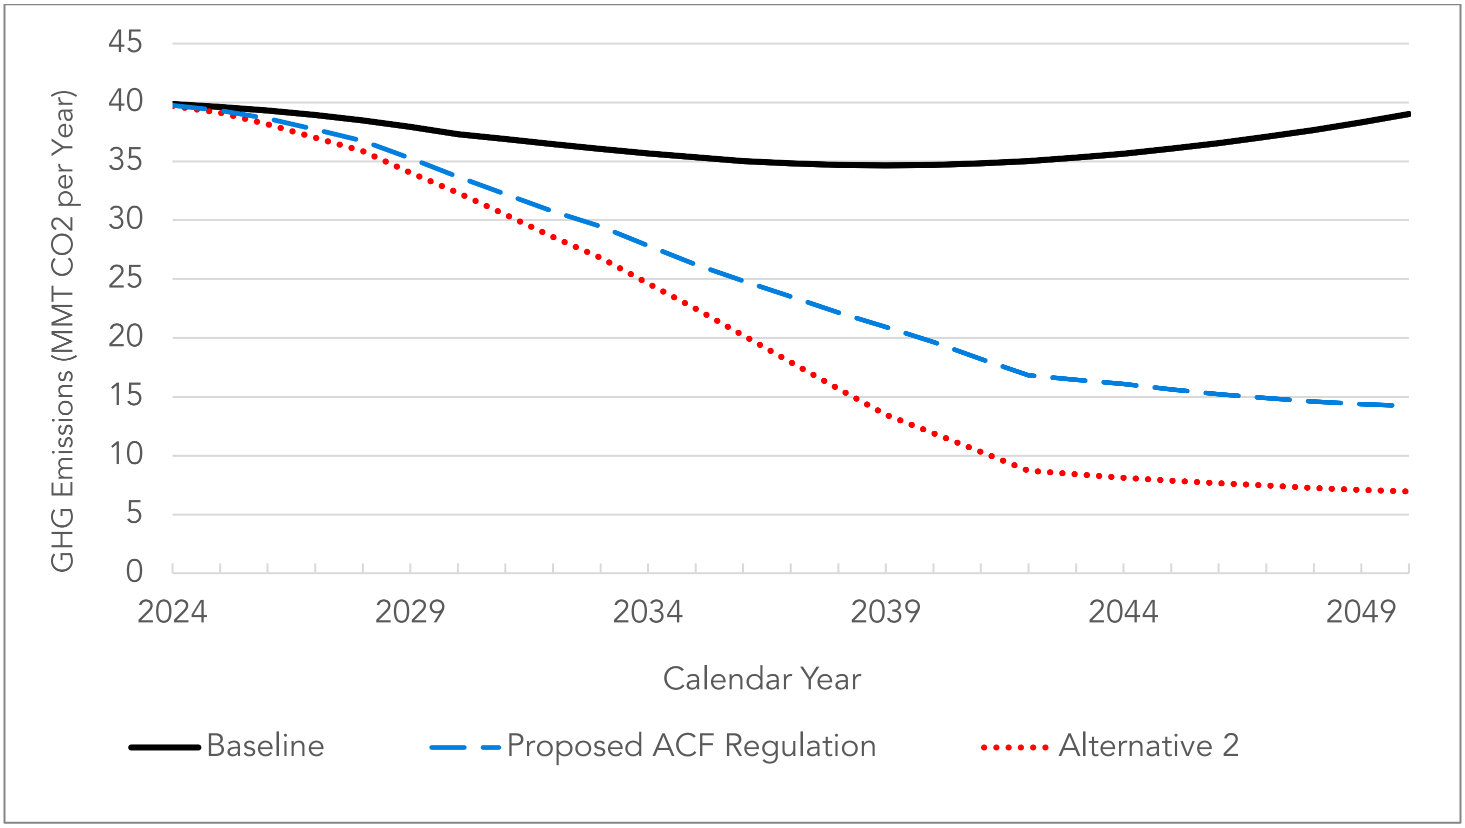

Figure 36. Projected NOx Emissions under Legal Baseline, Proposed Regulation, and Alternative 2

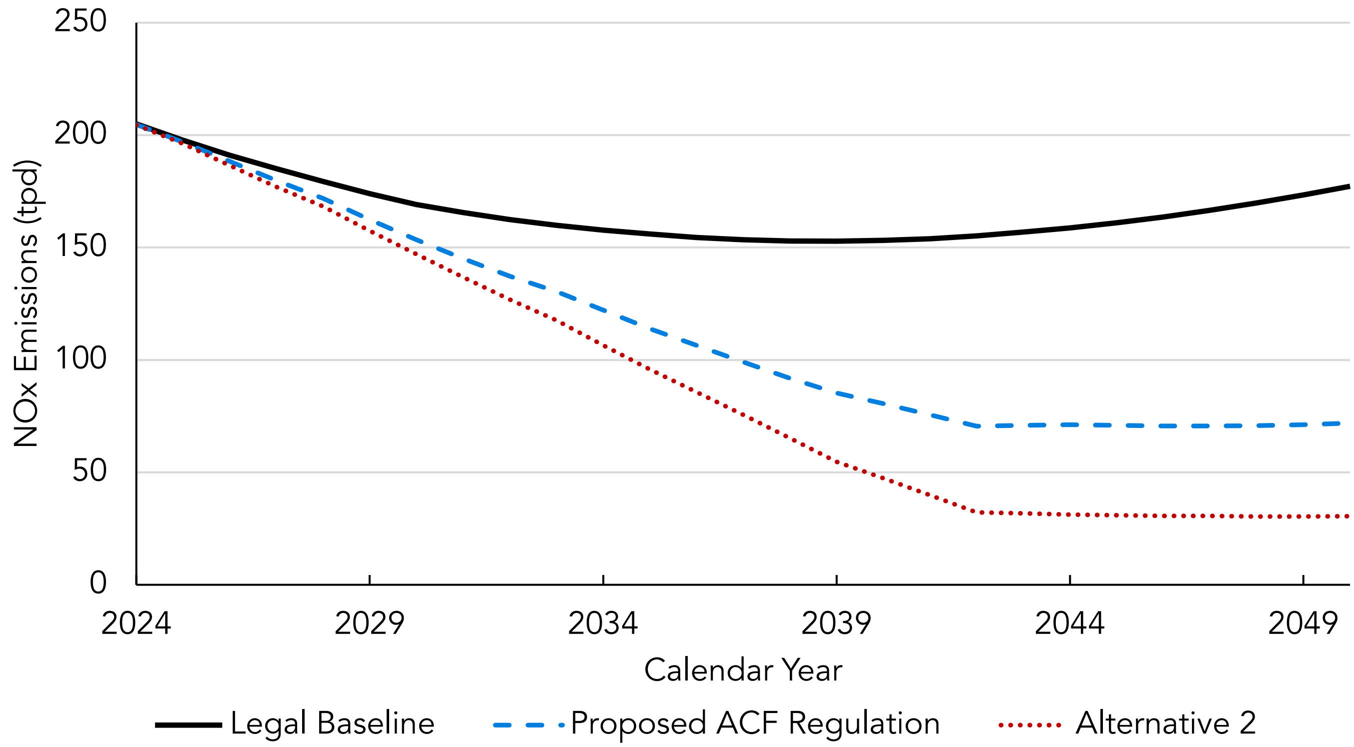

Figure 37. Projected $PM_{2.5}$ Emissions under Legal Baseline, Proposed Regulation, and Alternative 2

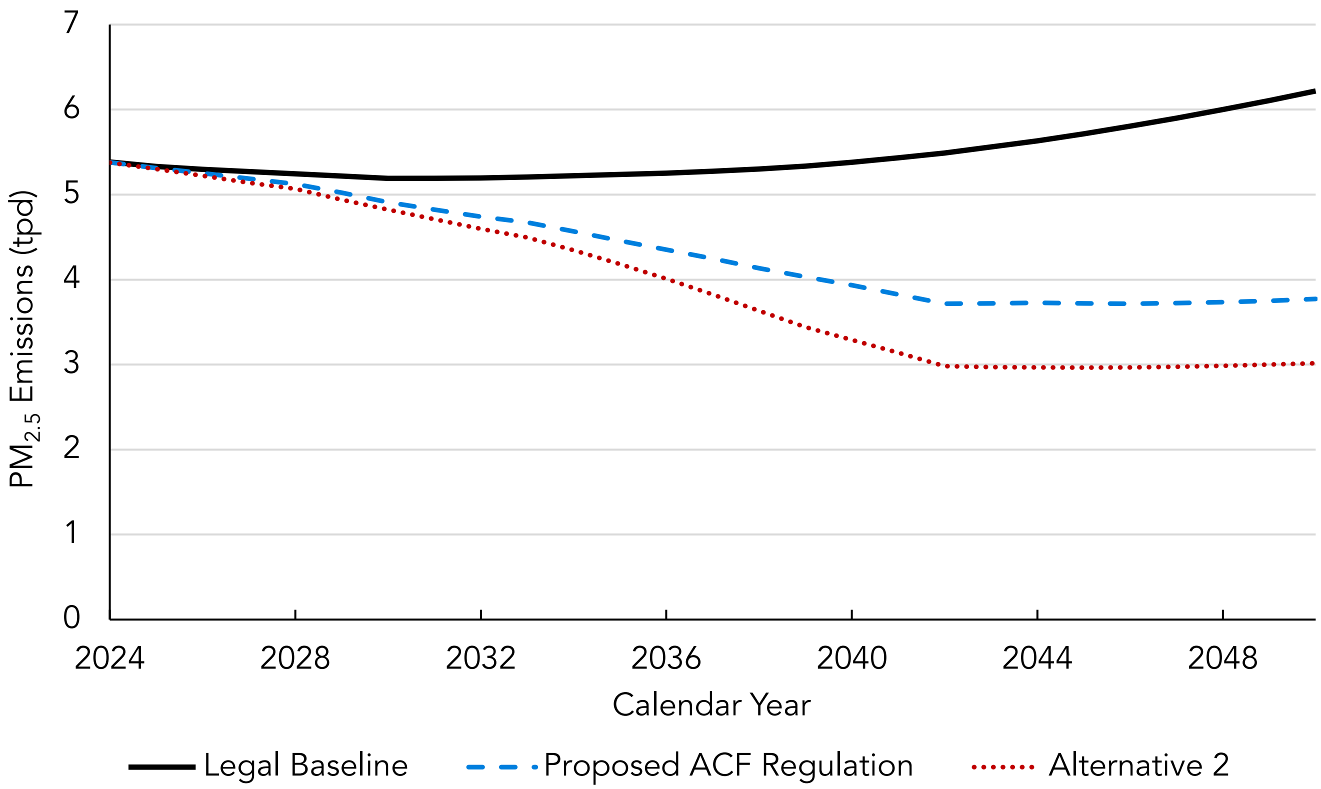

The cumulative GHG emissions reductions multiplied by the SC-CO_2 values gives a monetary estimate of the benefit of GHG emissions reductions from Alternative 2. These benefits range from about $13.5 billion to $54.4 billion through 2050, depending on the chosen discount rate.

6.2.2.2 Health Benefits

Alternative 2 results in emissions reductions relative to the Legal Baseline leading to health benefits as shown in Table 61. The health benefits for Alternative 2 are greater than those of the proposed regulation due to higher estimated emissions reductions. The total statewide valuation of health benefits of the more stringent alternative is estimated to be $87.6 billion.

Table 61. Statewide Valuation from Avoided Health Outcomes for Alternative 2 (million 2021$)

Calendar Year	Avoided Cardiopulmonary Mortality	Avoided Hospitalizations for Cardiovascular Illness	Avoided Hospitalizations for Respiratory Illness	Avoided ER Visits	Total Avoided Annual Valuation*

*Note: Totals may differ due to rounding

6.2.3 Economic Impacts

Alternative 2 would impose a more stringent medium- and heavy-duty ZEVs sales requirement compared to the proposed regulation. This results in a greater incremental vehicle cost as passed-through to fleets, but also more Phase 2 GHG cost offsets and more fuel savings. The macroeconomic impacts analysis results show that this alternative would result in similar impacts to the proposal on employment and output but of a greater magnitude as displayed in Table 62.

Table 62. Change in Growth of Economic Indicators for Alternative 2

Indicator	Metric	2026	2030	2034	2038	2042	2046	2050

Figure 38. Job Impacts of Alternative 2 by Major Sector

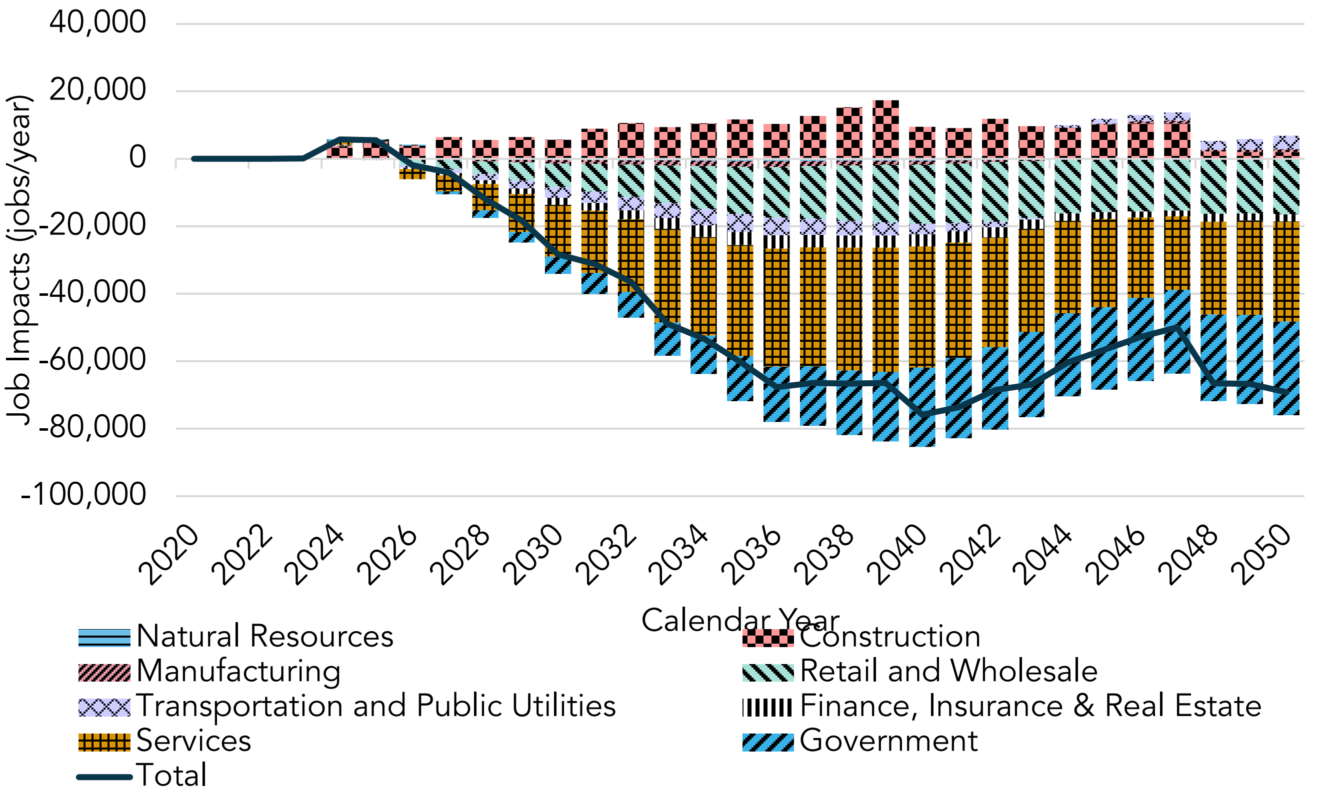

Figure 39. Changes in Output from Alternative 2 by Major Sector

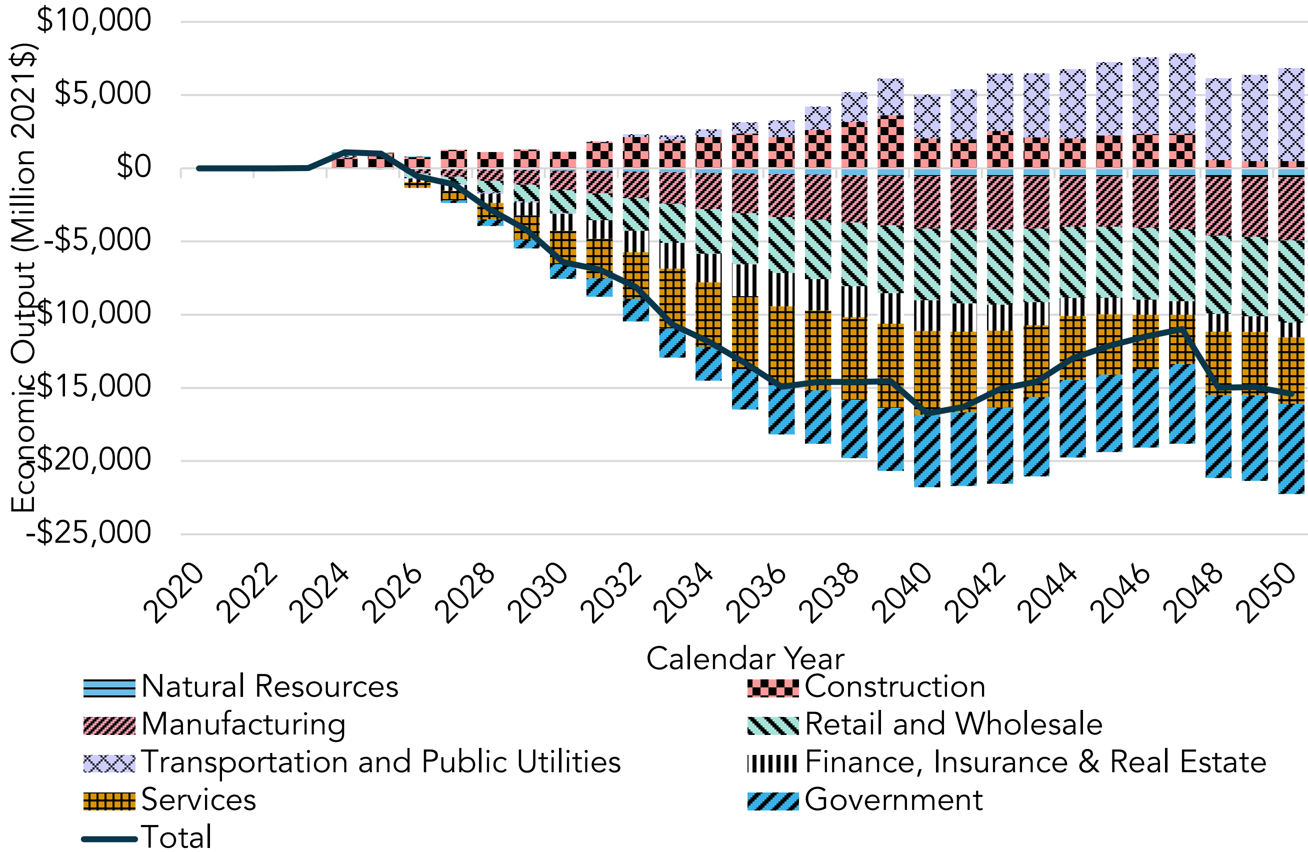


6.2.4 Cost-Effectiveness

Cost-effectiveness is defined as the cost to achieve a ton of emissions reductions. However, like the proposed regulation, Alternative 2, has a lower net cost than the Legal Baseline and can be evaluated as a benefit-cost ratio.

For Alternative 2, the total cost from 2020 to 2050 results in higher initial costs due to the increase in ZEVs and a larger total net savings than the proposed regulation. Alternative 2 also achieves greater emissions reductions for criteria pollutants and GHG emissions. Table 63 illustrates the benefit-cost ratio of Alternative 2. Alternative 2 has a benefit-cost ratio of 1.3 that is lower than the 1.5 benefit-cost ratio with the proposed regulation.

Table 63. Benefit-Cost Ratio of the Alternative 2 (billion $2021)

Alternative	Total Costs	Cost-Savings (benefit)	Health Benefits	Tax and Fee Revenue	Total Benefit	Net Benefit	Benefit-Cost Ratio
Alternative 2	$124.9	$133.2	$87.6	-$59	$161.8	$36.9	1.3

6.2.5 Reason for Rejecting

Alternative 2 substantially increases the number of affected fleets and nearly doubles the number of medium- and heavy-duty ZEVs required. The increase in ZEVs is primarily in the Class 2b-3 and Class 7-8 tractor categories. Alternative 2 is rejected as the more aggressive timeframe raises questions about feasibility for certain fleets in the near-term while the ZEV market is still developing. Increasing the purchase requirements further by regulating more fleets would introduce potential market imbalances between required ZEV sales and purchases and more issues on the learning curve in deploying these new technologies in more fleets that could slow progress of the ZEV market in early implementation. This alternative would immediately bring in a wide range of smaller fleets operating statewide that may not operate in major transportation corridors where infrastructure is more likely to be sited in the early years. This alternative also proposes an earlier end date for combustion technologies which increases risks about feasibility for trucks with more challenging use cases, although the 2036 timeframe does provide time for zero-emission solutions to be identified.

With an accelerated timeframe, smaller fleets would not have the opportunity to learn from the experiences of early adopters and larger fleets. For a smooth transition to ZEV technologies, sufficient time is needed to build out maintenance, supply, and infrastructure networks to make a full transition to ZEVs. Smaller fleets are more likely to rely on publicly available charging infrastructure that is still in the process of being developed and may not be available where needed in all cases. Additionally, small fleets are more likely to purchase used vehicles, which may not be available as ZEVs due to the Alternative's accelerated timeframe. This could result in holding ICE vehicles longer as well as an administrative burden for fleets and CARB staff with potential increases in exemption requests as well as other unintended consequences.

Additionally, market forces need to be considered in expanding the early ZEV market. The ACT regulation guarantees a supply of ZEVs in the California market. However, Alternative 2 would result in a fast ramp-up of additional ZEV demand significantly above the expected supply of ZEVs, that may result put upward pressure on vehicle prices. Market dynamics concentrated in the hands of consumer fleets would help maintain downward price pressures and would bring ZEV costs in line with other technologies sooner.

Alternative 2 is rejected because it raises additional questions about timing, introduces additional uncertainty associated with the feasibility of successfully deploying ZEVs in the early market, and results in imbalanced market forces that could slow ZEV deployment. Alternative 2 has a lower cost-benefit ratio but greater emissions benefits and number of ZEVs deployed than the proposed regulation. Staff will continue to analyze the rapidly evolving technical progress of these categories to determine if additional stringency or future regulation is warranted.

7 Modified Baseline Analysis Appendix

As previously discussed, the Legal Baseline used for impact analysis did not include implementation of the HDIM regulation. Therefore, staff is including an additional analysis here that compares the proposed regulation to a Modified Baseline. The Modified Baseline accounts for the effects of the HDIM regulation, which was heard by the Board in December 2021 but has not yet been approved by OAL. The HDIM regulation would reduce statewide PM and NOx emissions from heavy-duty engines by ensuring that the emission control systems are operating as designed and are repaired in a timely manner if they malfunction. The HDIM regulation is anticipated to be fully approved into the California Code of Regulations by the time the proposed regulation would be implemented in 2023. In addition, the Modified Baseline accounts for the potential effects of the proposed Advanced Clean Cars II (ACC II) regulation that is expected to lower criteria emissions standards for Class 2b-3 vehicles that would be included in the proposed regulation. ACC II is anticipated to be presented to the Board in the summer of 2022. ACC II impacts on the proposed regulation's emissions benefits are negligible, accounting for less than 0.1 tons per day for vehicles over 8500 lbs. GVWR. In general, staff used the same benefit and cost impact analysis methodologies as described above for the Legal Baseline to analyze the scenario including the proposed HDIM and ACC II regulations in the baseline. Broadly, the Modified Baseline has lower criteria pollutant emissions and higher costs than the Legal Baseline which change both the costs and benefits of the proposed regulation. The Modified Baseline does not substantially change the alternatives analysis nor the conclusions drawn when using the Legal Baseline.

7.1 Benefits

7.1.1 Criteria Emissions Benefits

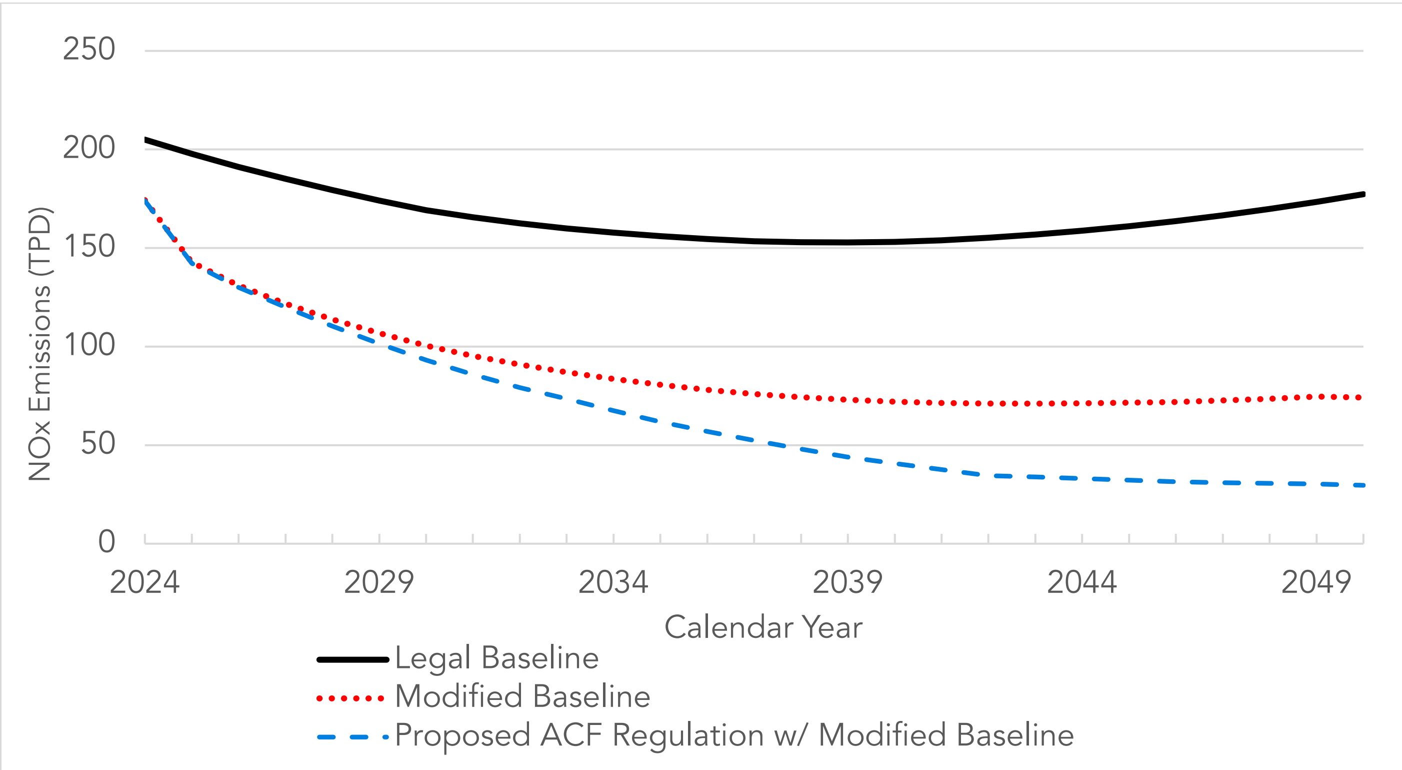
The emissions benefits for the proposed regulation with the Modified Baseline are shown in Table 64. The cumulative NOx and PM emissions benefits of the proposed regulation with Modified Baseline are projected to be about 55 percent and 25 percent lower respectively, compared to the analysis using the Legal Baseline because the HDIM program will ensure that heavy-duty engine emissions standards continue to be met throughout the vehicles' operating life through implementation of more comprehensive vehicle inspection and maintenance. This change lowers both the NOx and PM emissions benefits expected from the proposed regulation when a ZEV is purchased instead of an ICE vehicle.

Table 64. Projected Statewide TTW NOx and $PM_{2.5}$ Emissions Benefits of the Proposed Regulation with the Modified Baseline

Calendar Year	NOx (tpd)	$PM_{2.5}$ (tpd)
2024	0.3	0.0061
2025	0.4	0.011
2026	0.9	0.027
2027	1.9	0.049
2028	3.4	0.078
2029	5.3	0.14
2030	7.2	0.20
2031	9.5	0.27
2032	11.7	0.33
2033	13.5	0.39
2034	16.1	0.48
2035	18.8	0.57
2036	21.1	0.66
2037	23.6	0.75
2038	26.3	0.85
2039	29.1	0.96
2040	31.4	1.1
2041	33.9	1.20
2042	36.6	1.34
2043	37.3	1.40
2044	38.1	1.46
2045	39.3	1.53
2046	40.5	1.61
2047	41.7	1.67
2048	43.0	1.75
2049	44.3	1.82
2050	44.6	1.88

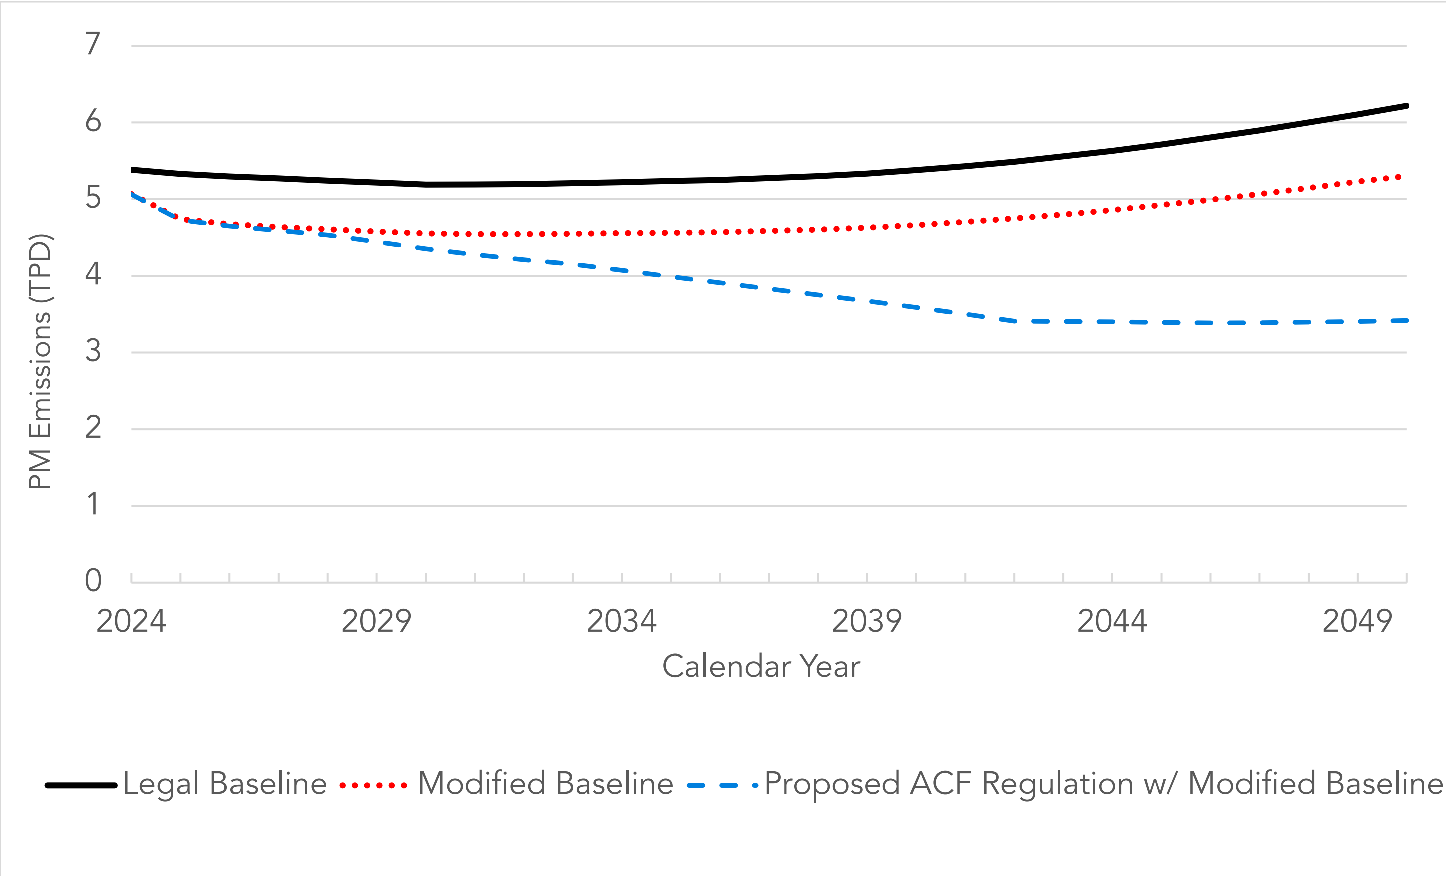
Figure 40 compares the NOx emissions for the proposed regulation with the Modified Baseline, the Legal Baseline, and the Proposed ACF Regulation with Modified Baseline scenarios. The cumulative NOx emissions benefits of the proposed regulation with the Modified Baseline compared to the Legal Baseline and Modified Baseline from 2024-2050 are approximately 843,800 tons and 193,400 tons, respectively.

Figure 40. Projected TTW NOx Emissions Benefits for the Proposed Regulation with Modified Baseline relative to the Legal Baseline and Modified Baseline (tpd)



Similarly, Figure 41 compares the PM emissions for the proposed regulation with the Modified Baseline, Legal Baseline, and Modified Baseline. The cumulative PM emissions benefits of the proposed regulation with the Modified Baseline compared to the Legal Baseline and Modified Baseline from 2024-2050 are approximately 12,900 tons and 7,000 tons, respectively.

Figure 41. Projected TTW PM Emissions Benefits for the Proposed Regulation with Modified Baseline relative to the Legal Baseline and Modified Baseline (tpd)



7.1.2 GHG Emissions Benefits

The HDIM regulation does not change the GHG emissions of heavy-duty vehicles, so there are no changes in the GHG emissions reductions or SC-CO_2 between the Modified Baseline and the Legal Baseline. All calculations from Chapter “2 Benefits”, in Section “2.1 – Emissions Benefits" are identical between the two Baseline scenarios.

7.1.3 Health Benefits

Table 65 summarizes staff’s estimated avoided statewide and regional premature mortality, hospitalizations, and ER visits associated with the proposed regulation relative to the Modified Baseline for 2024 through 2050.

Table 65. Regional and Statewide Avoided Mortality and Morbidity Incidents from 2024 to 2050 under the Proposed Regulation versus the Modified Baseline

Air Basin	Avoided Cardiopulmonary Deaths	Avoided Hospitalizations for cardiovascular illness	Avoided Hospitalizations for respiratory illness	Avoided ER visits for asthma
Great Basin Valleys	2 (2 - 2)	0 (0 - 0)	0 (0 - 1)	1 (0 - 1)
Lake County	2 (1 - 2)	0 (0 - 0)	0 (0 - 0)	1 (0 - 1)
Lake Tahoe	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)	0 (0 - 0)
Mojave Desert	49 (39 - 61)	7 (0 - 15)	9 (2 - 16)	19 (12 - 26)
Mountain Counties	28 (21 - 34)	3 (0 - 5)	3 (1 - 5)	9 (6 - 12)
North Central Coast	13 (10 - 16)	2 (0 - 5)	3 (1 - 5)	7 (5 - 10)
North Coast	5 (4 - 7)	1 (0 - 1)	1 (0 - 1)	2 (1 - 3)
Northeast Plateau	2 (1 - 2)	0 (0 - 0)	0 (0 - 0)	1 (0 - 1)
Sacramento Valley	137 (107 - 168)	18 (0 - 35)	21 (5 - 37)	51 (32 - 70)
Salton Sea	37 (28 - 45)	6 (0 - 11)	7 (2 - 12)	17 (11 - 23)
San Diego County	135 (105 - 166)	20 (0 - 40)	24 (6 - 43)	53 (34 - 73)
San Francisco Bay	255 (199 - 312)	41 (0 - 81)	49 (11 - 87)	137 (86 - 187)
San Joaquin Valley	519 (406 - 633)	66 (0 - 130)	79 (18 - 139)	183 (116 - 250)
South Central Coast	37 (29 - 46)	6 (0 - 12)	7 (2 - 12)	16 (10 - 22)
South Coast	1807 (1413 - 2209)	312 (0 - 611)	372 (87 - 657)	906 (573 - 1239)
Statewide	3029 (2368 - 3703)	482 (0 - 945)	575 (135 - 1015)	1403 (888 - 1919)

The total statewide valuation of health benefits for the proposed regulation with the Modified Baseline are estimated to be $31.6 billion as summarized in Table 66. The health benefit valuation is about 48 percent lower relative to the analysis using the Legal Baseline, due to the lower projected NOx and PM emissions benefits.

Table 66. Statewide Valuation from Avoided Health Outcomes for the Proposed Regulation versus the Modified Baseline (million 2021$)

Year	Avoided cardiopulmonary mortality	Avoided hospitalizations for cardiovascular illness	Avoided hospitalizations for respiratory illness	Avoided ER visits for asthma	Avoided annual total valuation*

2050	237	39	46	108	$2,482.6
Total Benefit *	$31,654.4	$29.8	$30.9	$1.2	$31,716.4

*Note: Totals may differ due to rounding

7.2 Costs

7.2.1 Direct Costs

The Modified Baseline has higher costs than the Legal Baseline due to the costs associated with the HDIM regulation which affects non-gasoline Class 4-8 vehicles operating within California. ZEVs are not subject to many provisions of the HDIM regulation and as a result can avoid many of the costs associated with the regulation.[198] Costs associated with the HDIM regulation are derived from the Staff Report and are summarized in Table 67. These

[198] California Air Resources Board, *Proposed Heavy-Duty Inspection and Maintenance Regulation – Appendix F: Further Details on Costs and Economic Analysis*, 2021 (web link: https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2021/hdim2021/appf.pdf, last accessed January 2022).

costs differ depending on whether the vehicle is based in-state or out-of-state, and whether the vehicle is equipped with on-board diagnostics (OBD).

Table 67. Annual Heavy-Duty Inspection and Maintenance Costs per Vehicle

Cost	Non-OBD In-State	Non-OBD Out-of-State	OBD In-State	OBD Out-of-State	ZEV
Inspection Result Reporting	$5.70	$5.70	$0	$0	$0
Periodic Testing and Follow-up Testing	$41	$401	$24	$24	$0
Repair Costs	$279	$211	$228	$172	$0

The cost of the proposed regulation, assuming all cost increases would be borne by fleets operating in California, is -$13.4 billion between 2020 and 2050 compared to the Modified Baseline. These savings are $0.9 billion greater than when the proposed regulation is compared to Legal Baseline. Figure 42 and Table 68 illustrate the incremental difference in cost between the proposed regulation and the Modified Baseline scenario. For simplicity, all costs which are identical to the legal baseline have been lumped together into one group, titled "Cost Versus Legal Baseline", which are identical to the costs displayed in Table 39. The benefit-cost ratio of the proposed regulation versus the modified baseline is shown in Table 69.

Figure 42. Total Estimated Direct Costs of Proposed Regulation Relative to the Legal Baseline Scenario (million 2021$)

7.2.2 Macroeconomics

Table 70, Table 71, Figure 43, and Figure 44 shows the impact of the proposed regulation relative to the Modified Baseline on select macroeconomic indicators in the economy. The macroeconomic analysis of the proposed regulation using the Modified Baseline shows that the major macroeconomic indicators would have a similar range of impact as using the Legal Baseline from 2024 to 2050, though they vary by year.

POLICY UPDATE

SEPTEMBER 2024

SUMMARIZES REGULATORY AND OTHER DEVELOPMENTS RELATED TO CLEAN TRANSPORTATION WORLDWIDE

U.S. EPA Phase 3 greenhouse gas emission standards for heavy-duty vehicles

Yihao Xie

INTRODUCTION

On April 22, 2024, the U.S. Environmental Protection Agency (EPA) published the Phase 3 greenhouse gas (GHG) emission standards for heavy-duty vehicles (HDVs) final rule, which set CO_2 emission limits for Class 2b–8 vehicles of model years (MYs) 2027 to 2032.[1] The Phase 3 standards require CO_2 emission reductions per ton-mile of freight moved by up to 60% for vocational trucks and up to 40% for tractor trucks in MY 2032 compared with the Phase 2 MY 2027 levels. Importantly, the new standards follow the same technology-neutral principle as the previous standards and do not mandate the sales of zero-emission vehicles (ZEVs), such as battery electric or hydrogen fuel-cell vehicles.

As in previous phases, the Phase 3 standards retain the same fleet-average regulatory scheme. This does not require individual vehicles to meet the standards but instead allows manufacturers to meet the standards based on the average emissions within each weight class. The regulation retained the non-CO_2 GHG emission standards from Phase 2, including nitrous oxide (N_2O), methane (CH_4), and hydrofluorocarbon (HFC). The heavy-duty engine CO_2 emission standards are also unchanged. The new standards also largely retained the existing compliance provisions, flexibilities, and testing procedures for HDVs.

HDVs are a major source of greenhouse gas emissions in the United States, contributing to 25% of transportation emissions. According to EPA, the new standards will reduce approximately 1 billion metric tons of HDV CO_2 emissions from 2027

1 Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 89 F.R. 29440 (April 22, 2024) (to be codified at 40 C.F.R. § 86, 1036, 1037, 1039, 1054, and 1065), https://www.govinfo.gov/content/pkg/FR-2024-04-22/pdf/2024-06809.pdf; Only Class 2b-3 vocational vehicles are subject to the HDV regulation. Other Class 2b–3 vehicles are regulated by the Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles.

This policy update was revised on September 27, 2024 to correct the values in Table 2.

www.theicct.org

communications@theicct.org

THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION

through 2055. This will lessen air pollution for the 72 million people who live close to major truck freight routes and who are disproportionately more likely to be people of color or reside in low-income households.[2]

With the promulgation of the Phase 3 HDV GHG standards, EPA has completed the final regulatory piece of the Clean Trucks Plan announced in 2021, which also includes the Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, finalized in December 2022, and the Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, finalized in March 2024.[3]

KEY ELEMENTS

EMISSION STANDARDS

The Phase 2 MY 2027 emission standards are used as the baseline for the new Phase 3 standards. EPA modeled a potential compliance pathway from MY 2027 to MY 2032, projecting a production mix of internal combustion engine (ICE) vehicles and ZEVs. Phase 3 CO_2 limits are determined based on the projected ZEV adoption rates in this potential compliance pathway. To arrive at the projected ZEV adoption rates, EPA developed the Heavy-Duty Technology Resource Use Case Scenario (HD TRUCS), a tool that projects technology feasibility and payback of zero-emission HDV technologies for more than a hundred vehicle types in MYs 2027, 2030, and 2032.[4] Payback periods were then converted to ZEV adoption rates using an adoption rate curve based on National Renewable Energy Laboratory's TEMPO model.[5] EPA capped the maximum ZEV technology penetration at 20% in MY 2027 and 70% in MY 2032. The final adoption rates for all model years were then calculated by linearly interpolating between MY 2027 and MY 2030, and between MY 2030 and MY 2032.[6] Figure 1 summarizes the key steps in EPA's determination of the new standards. The ZEV adoption rates in the modeled potential compliance pathway are also the percentage of CO_2 emission reductions from HDVs, presented in Table 1.

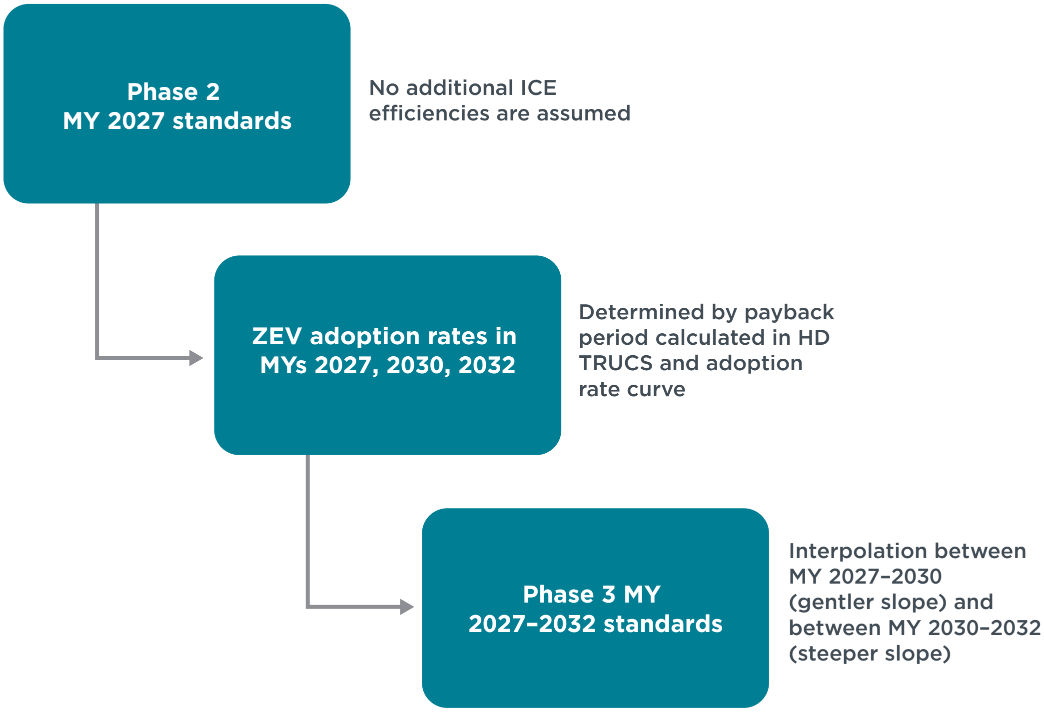
6 The exception is sleeper cab tractors, where the percentage of ZEVs in MY 2031 is not a linear interpolation but 33% of the difference between MY 2030 and MY 2032.

Figure 1

A simplified illustration of EPA's Phase 3 emission standard setting



THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION **THEICCT.ORG**

Table 1

EPA's projected zero-emission vehicle shares for the modeled potential compliance pathway

Regulatory group	MY 2027	MY 2028	MY 2029	MY 2030	MY 2031	MY 2032
Light heavy-duty vocational	17%	22%	27%	32%	46%	60%
Medium heavy-duty vocational	13%	16%	19%	22%	31%	40%
Heavy heavy-duty vocational	—	—	13%	15%	23%	30%
Medium heavy-duty all cab and heavy heavy-duty day cab tractors	—	8%	12%	16%	28%	40%
Sleeper cab tractors	—	—	—	6%	12%	25%
Heavy-haul tractors	—	—	1%	1%	3%	5%

The Phase 3 CO_2 limits between MY 2027 and MY 2032 were set for 10 subcategories of tractors based on weight rating, cab configuration, and roof height; 15 subcategories of vocational vehicles; and 8 optional custom chassis vocational vehicle categories. The numerical emission limits—in terms of g/ton-mile, for each category of vocational trucks powered by compression ignition (CI) and spark ignition (SI) engines and tractors in MY 2032, when Phase 3 standards are fully phased in—are shown in Table 2 and Table 3.

Table 2

Phase 3 MY 2032 and later vocational vehicle CO_2 limits by vehicle service class in g/ton·mile

Subcategory	Light heavy-duty compression ignition	Medium heavy-duty compression ignition	Heavy heavy-duty compression ignition	Light heavy-duty spark ignition	Medium heavy-duty spark ignition
Urban	147	155	188	193	194
Multipurpose	132	141	161	174	174
Regional	116	131	132	144	160

Table 3

Phase 3 MY 2032 and later tractor CO_2 limits in g/ton·mile

Roof height	Class 7 all cab styles	Class 8 day cab	Class 8 sleeper cab	Heavy-haul tractor
Low	57.7	44	48.1	45.9
Mid	62	46.8	52.2	
High	60	45.4	48.2	

The ICE technology packages developed for the Phase 2 were used the Phase 3 rulemaking. Therefore, the Phase 3 standards did not assume any improvements in engine efficiency or efficiency gains from other features, such as improved aerodynamics or low rolling-resistance tires, for example. Manufacturers can choose to deploy these technologies to reduce emissions of their ICE vehicle fleet toward compliance and thus may not sell as many ZEVs as the modeled potential compliance pathway suggests.

UPDATES TO CREDIT AVERAGING, BANKING, AND TRADING SYSTEM

Credit generation and usage

Under the Phase 3 rule, manufacturers can continue to generate advanced technology credit multipliers through MY 2027 for sales of plug-in hybrid electric, battery electric, and hydrogen fuel-cell vehicles. These multipliers are set at 3.5 for plug-in hybrid electric vehicles, 4.5 for battery electric vehicles, and 5.5 for hydrogen fuel-cell electric vehicles. Manufacturers can use these multiplier credits to offset existing Phase 2 deficits through MY 2029, and toward Phase 3 compliance after exhausting any normally accumulated credits, or base credits, from prior years. Multiplier credits for advanced technology will expire in MY 2030 while base credits previously earned from plug-in hybrid, battery electric, or fuel-cell electric vehicle sales that are still within the 5-year credit life will be retained.

In the standards, HDV production that occurs in states that have emission standards different from federal standards are now considered part of the “U.S.-directed production volume.” This means that between MY 2024 and MY 2027, manufacturers can generate federal advanced technology credit multipliers by complying with state-level regulations—such as the Advanced Clean Trucks (ACT) regulations adopted by multiple states—and using these credits to count toward federal compliance of the Phase 3 emission standards. This change effectively increases the number of advanced technology credits available for averaging, banking, and trading during that period.

Averaging sets

In the Phase 3 standards, several changes were made to the existing averaging, banking, and trading system, giving more flexibility to manufacturers to facilitate compliance with the emission limits. In the Phase 1 and 2 standards, credit trading could only occur within averaging sets, which are HDV regulatory groups aggregated based on vehicle weight class.[7] Between MY 2027 to MY 2032, emission credits can be averaged, traded, and banked across HDV averaging sets, with no limitations on the direction or volume of credits. EPA further extends the interim flexibility to allow one-way credit transfers from averaging sets of medium-duty vehicles certified to the light and medium-duty vehicle standards, to averaging sets of Class 2b–5 and Class 6–7 HDVs (i.e. light HDVs and medium HDVs). In other words, between MY 2027 and MY 2032, manufacturers can trade and use CO_2 credits generated from the production of Class 2b–3 pickups and vans, which are subject to the light- and medium-duty standards, to offset emissions deficits in their Class 6–7 vocational vehicles or tractor trucks. They can also use credits from the production of Class 4–5 vocational vehicles to offset deficits in Class 8 vocational vehicles and tractors.

To mitigate any dilution of the Phase 3 emission benefits, EPA has created a priority list for manufacturers to use credits within an averaging set to count toward Phase 3 compliance. Specifically, manufactures can use credits in the following order:

- Base credits banked or traded within the same averaging set
- Base credits earned in the same model year from other averaging sets
- Base credits banked or traded in other averaging sets and used across averaging sets
- Multiplier credits within the same averaging set for the same model year
- Multiplier credits banked or traded within the same averaging set.
- Multiplier credits earned in the same model year from other averaging sets
- Multiplier credits banked or traded in other averaging sets

HYDROGEN INTERNAL COMBUSTION ENGINE VEHICLES

Hydrogen internal combustion engine (H_2-ICE) vehicles are a nascent technology being explored by manufacturers. H_2-ICE vehicles can either run on pure, or neat, hydrogen or via dual-fuel, which is when diesel fuel is also involved in the combustion process. Both types of H_2-ICE vehicles have tailpipe emissions of air pollutants and GHGs because NO_x and particulate matter (PM) are formed during the combustion process, thus requiring an aftertreatment system. CO_2 emissions from dual-fuel H_2-ICE vehicles come predominantly from the diesel fuel. H_2-ICE vehicles fueled by neat H_2 still produce trace amounts of tailpipe CO_2 stemming from urea decomposition and engine lubricant oil in the selective catalytic reduction system.

Consistent with the existing treatment emissions from urea decomposition in diesel vehicles, trace CO_2 emissions from H_2-ICE vehicles operating on neat hydrogen are not counted when determining compliance with the Phase 3 GHG standards. Dual-fuel H_2-

7 The three averaging sets in the HDV GHG standards are light heavy-duty (Class 2b–5), medium heavy-duty (Class 6–7), and heavy heavy-duty (Class 8).

ICE vehicles are to be certified to the GHG emission levels resulting from the existing testing provisions.

BATTERY HEALTH, DURABILITY, AND WARRANTY

Given that the Phase 3 standards are expected to drive the production and sales of zero-emission HDVs, the rule includes new requirements for batteries; degraded batteries affect life-cycle mileage and are therefore an important component in vehicle emissions performance.

The rule requires manufacturers to provide a customer-facing battery state-of-health (SOH) monitor which tracks and displays battery energy capacity for all battery electric and plug-in electric vehicles. This SOH expresses a vehicle's usable battery energy as a percentage of the original energy when the battery is new. The rule does not mandate a specific testing procedure for determining the usable battery energy. It instead provides specific requirements for a test procedure to ensure accurate results that represent in-use operation.

The rule includes the high-voltage battery in battery electric and hydrogen fuel-cell electric vehicles as emission-related components that must be covered by warranty, along with other powertrain components such as the fuel-cell stack, electric motors, and inverters. The emissions warranty periods in the Phase 2 standards—5 years or 50,000 miles for light HDVs and 5 years or 100,000 miles for medium HDVs and heavy HDVs—apply to these components.

PROJECTED BENEFITS

According to EPA, the Phase 3 standards will reduce cumulative CO_2 emissions from the HDV sector by over 1 billion metric tons between 2027 and 2055 compared to the reference case.8 EPA's reference case in the final standards includes higher ZEV adoption levels to account for the production and sales of zero-emission HDVs in states that have adopted the Advanced Clean Trucks regulation. It is worth noting that EPA's analysis finds an increase in upstream GHG emissions from electricity generation related to operating HD ZEVs, but the emission increases are more than offset by GHG emission reductions from upstream refineries and downstream HDV activities.

Figure 2 shows EPA's calculations of Phase 3 vehicle and infrastructure technology costs, health and climate benefits, operating savings, and energy security benefits from 2027 to 2055. Except in the first few years, benefits brought by the Phase 3 standards are projected to far outweigh the costs. Overall, EPA estimates that the Phase 3 standards will bring $13 billion in annualized net benefits through the year 2055, at a 2% discount rate. The total includes around $10 billion in annualized climate benefits from reduced greenhouse gas emissions, and up to $300 million in annualized health benefits from reduced fine particulate matter ($PM_{2.5}$) precursor emissions. The annualized cost of production to the industry is expected to be about $1.1 billion while operating savings are valued at $3.5 billion. An additional $450 million in annualized benefits are expected from reduced dependency on oil imports.

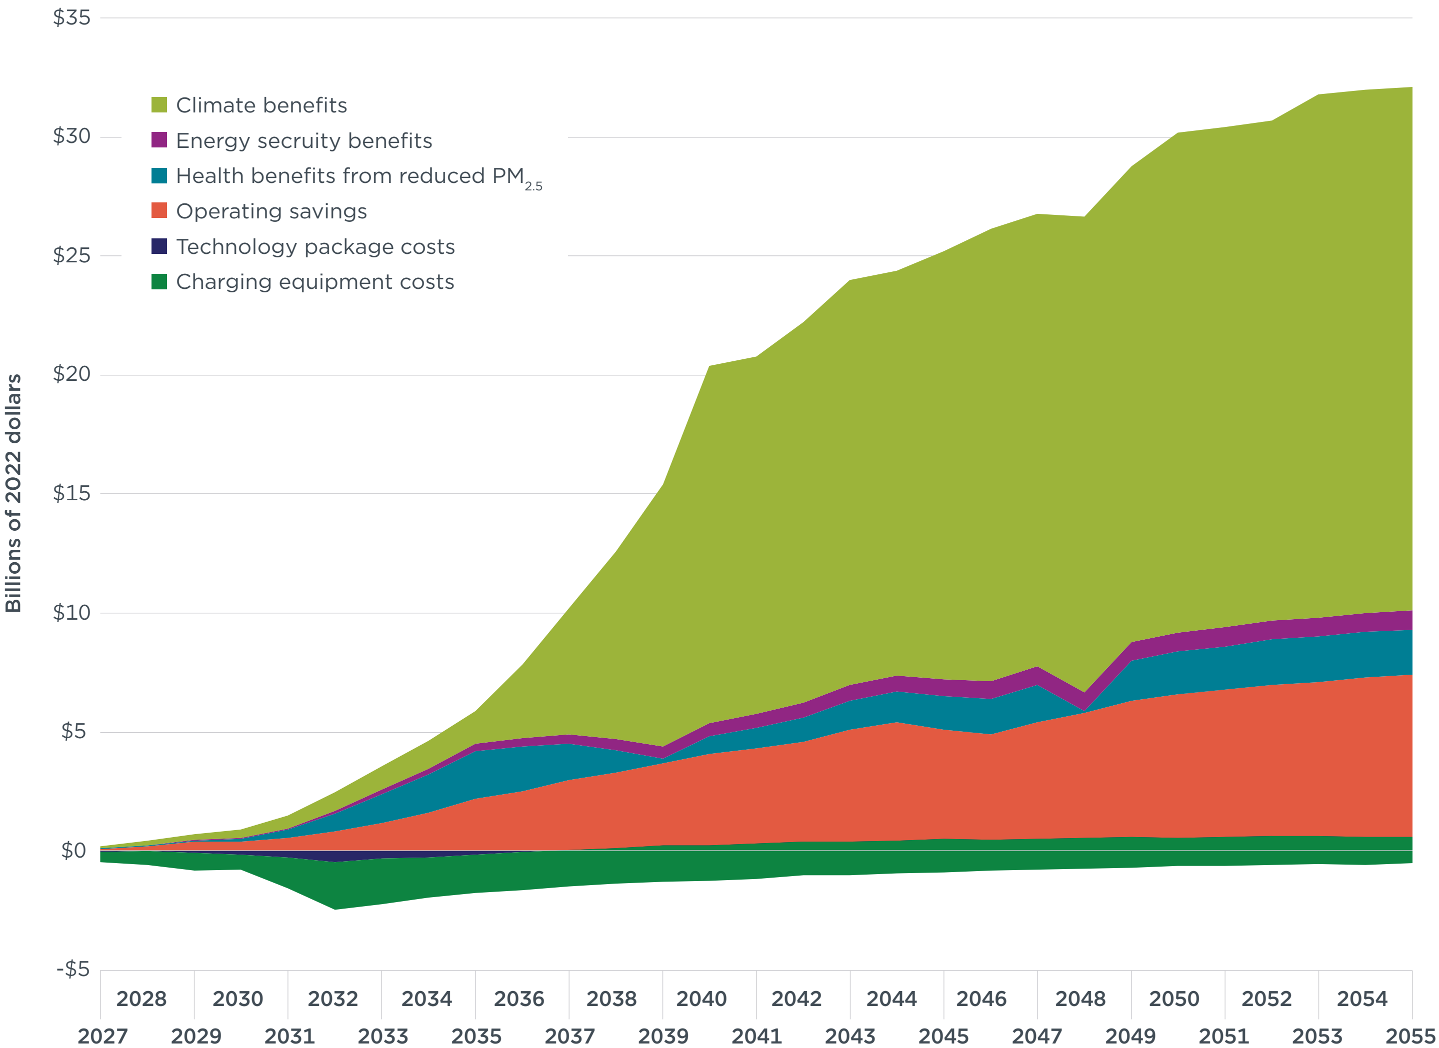
Figure 2

Costs and benefits of EPA's Phase 3 GHG standards for heavy-duty trucks through 2055, relative to the reference case



THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION **THEICCT.ORG**

2026 ASSESSMENT

EPA plans to collaborate with the Department of Energy and the Department of Transportation to review charging and refueling infrastructure growth and issue regular status reports beginning as early as 2026. EPA has identified several areas for data collection, including the number, size, location and growth rate of public and depot charging sites, the sales of electric vehicle service equipment, charging facility installation timelines, electric distribution system upgrades, and hydrogen fuel production and fueling station developments. Based on findings of the reports, EPA may decide to issue guidance documents or modify the Phase 3 rule to give more lead time to manufacturers.

POLICY CONTEXT IN OTHER MARKETS

On May 13, 2024, the Council of the European Union ratified the agreement on the revision of HDV CO_2 standards.[9] Compared to the original standards adopted in 2019, the revision ramps up the stringency of targets and widens the scope of vehicles covered to include more types of trucks, buses, coaches, trailers, and vocational vehicles.

At a high level, the European Union's revised CO_2 standards kept the 2025 CO_2 reduction target of 15%, raised the 2030 target to 45%, and added a 65% reduction target for 2035 and a 90% reduction target for 2040 relative to a baseline reporting period. The reduction targets are further broken down to vehicle bins and groups based on type, axel configuration, and weight.

With the exception of urban buses in the European Union, both the EU and U.S. standards are performance based and do not mandate sales numbers for zero-emission vehicles. Compared to the U.S. Phase 3 standards, the European Union's revised GHG standards for HDVs have a longer temporal scope and a higher stringency. Table 4 compares the key differences between the two regulations.

Table 4

Comparison of the most recent EU and U.S. CO_2/GHG emission standards for HDVs

	Revised EU standards	U.S. EPA Phase 3 standards
Level of stringency	45% CO_2 reduction in 2030, 65% in 2035 and 90% in 2040 across all new HDVs relative to respective baseline	Stringency varies by segment, ranging from 5% to 60% reduction by 2032 relative to 2027 baseline.
Regulatory period	2025, 2030, 2035, 2040; no interim targets between those years.	2027–2032, with annual targets
ICE efficiency improvements	Considers low-cost ICE efficiency technologies available to manufacturers to meet the standards	No consideration of improvements beyond Phase 2 ICE vehicle efficiency technologies
Trailers	Includes targets for semitrailers, drawbar trailers, and center-axle trailers with box body configurations	No trailer targets

The Advanced Clean Trucks (ACT) regulation is the other important supply-side HDV regulation in the United States that will drive manufacturers' production of zero-emission trucks. Adopted by the California Air Resources Board in 2020, it requires manufacturers to sell increasing percentages of zero-emission Class 2b–8 trucks.[10] EPA granted a waiver for preemption regarding the ACT regulation in April 2023.[11] ACT has gone into effect in California, with nine additional states poised to begin implementation in the next few years. As mentioned previously, manufacturers' compliance with ACT can generate multiplier credits between MY 2024 and MY 2027 that will also aid their compliance with the federal Phase 3 standards.

10 Claire Buysse and Ben Sharpe, California's Advanced Clean Trucks Regulation: Sales Requirements for Zero-Emission Heavy-Duty Trucks (International Council on Clean Transportation, 2020), https://theicct.org/publication/californias-advanced-clean-trucks-regulation-sales-requirements-for-zero-emission-heavy-duty-trucks/.

11 California State Motor Vehicle and Engine Pollution Control Standards; Heavy-Duty Vehicle and Engine Emission Warranty and Maintenance Provisions; Advanced Clean Trucks; Zero Emission Airport Shuttle; Zero Emission Power Train Certification; Waiver of Preemption; Notice of Decision, 88 F.R. 20688 (April 6, 2023), https://www.govinfo.gov/content/pkg/FR-2023-04-06/pdf/2023-07184.pdf.

The California Air Resources Board adopted the Advanced Clean Fleets (ACF) regulation in April 2023.[12] As a complement to the ACT regulation, ACF requires federal, state, and local government fleets, in addition to large private fleets, to begin purchasing zero-emission HDVs starting in in 2024. ACF also requires that manufacturers sell only zero-emission medium- and heavy-duty vehicles starting in 2036. The regulation is intended to work in tandem with the ACT regulation to ensure there is both a supply and demand for zero-emission HDVs. Combined, the ACT and ACF regulations position California as the world leader in terms of legally-binding zero-emission HDV regulations.

12 California Air Resources Board, "California Approves Groundbreaking Regulation That Accelerates the Deployment of Heavy-Duty ZEVs to Protect Public Health," press release, April 28, 2023, https://ww2.arb.ca.gov/news/california-approves-groundbreaking-regulation-accelerates-deployment-heavy-duty-zevs-protect.

MARKET SPOTLIGHT

ZERO-EMISSION MEDIUM- AND HEAVY-DUTY VEHICLE MARKET IN CHINA (JANUARY–JUNE 2024)

November 18, 2024 | By: Shiyue Mao, Lingxiao Xu, and Felipe Rodriguez

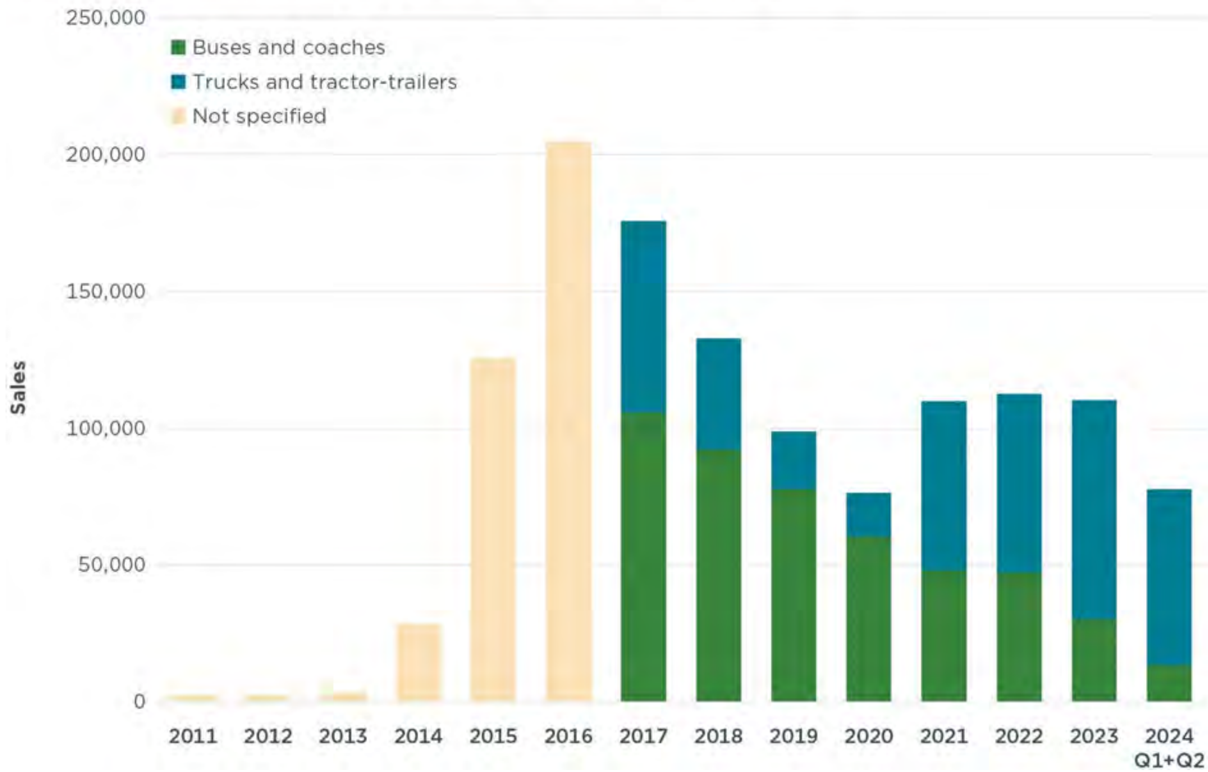
DOWNLOAD

Overview

This overview of China's zero-emission heavy-duty vehicle (ZE-HDV) market covers city buses and coaches, medium and heavy straight trucks, and tractor-trailers above 3.5 tonnes. Sales of ZE-HDVs in China saw two spikes in the last 13 years: first in 2015–2016, underpinned by government subsidies, and more recently in 2021, amid a rebound in domestic and foreign demand after COVID-19.

Through the first half of 2024, total ZE-HDV sales in China reached approximately 77,700, including roughly 64,500 ZE trucks and tractor-trailers and 13,200 ZE buses and coaches. Sales of ZE trucks and tractor-trailers were particularly noteworthy, as they almost matched the total number of these vehicles sold in the whole year in 2022 (65,200). Meanwhile, ZE bus and coach sales continued to shrink.

Sales of zero-emission heavy-duty vehicles in China, 2011 to June 2024



Heavy trucks

The heavy truck market saw changes in the mix of fuel types from previous years. In the first half of 2024, diesel trucks accounted for 55% of sales, down from 80% in the first half of 2023, and natural gas-powered trucks made up 35% of sales, up 8% year-on-year. Battery electric trucks reached a 9% sales share and were the third most popular powertrain technology in the market.

Sales of both battery electric and fuel-cell heavy trucks have mostly grown steadily in 2024, except for a dip in February during the Spring Festival, when most business activity is paused. In June, the market share of battery electric heavy trucks hit a new high of 14%, a 35% increase from January 2024. The market for fuel-cell heavy trucks remains nascent, with 332 vehicles sold in June 2024, a 1% market share.

Lithium iron phosphate (LFP) batteries dominate the heavy truck market in China due to their economy, durability, and safety. In terms of capacity, the most popular battery sizes for these vehicles were 282 kWh, 350 kWh, and 423 kWh, indicating a balance between cost and efficiency.

The collective market share of the top 5 original equipment manufacturers (OEMs), known as the 5-firm concentration ratio or CR5, is an indicator of market maturity. In the first half of 2024, the CR5 among internal combustion engine (ICE) heavy truck manufacturers was 79%, while the ratio among ZE manufacturers was 69%. This implies that the ZE heavy truck industry is approaching a level of market maturity similar to that of ICE manufacturers, with top OEMs capturing a growing share of the market.

🔍 Click on the figures to take a closer look at the data

Medium trucks

Diesel remained the dominant powertrain in the medium truck market in the first half of 2024, accounting for 86% of total sales, a 4% year-on-year decrease. Battery electric reached a 10% market share, making it the second most popular powertrain in the segment.

By month, battery electric trucks showed steady growth in market share, reaching 14.4% in June 2024, more than double the level in January 2024. Just two fuel-cell trucks were sold in June, representing a 0.4% market share; this powertrain remains in early stages of development in this segment.

As in the heavy truck market, LFP is the dominant battery chemistry among medium trucks in China. Most electric medium truck models were equipped with 100 kWh batteries to balance cost and available range. Equipping trucks with heavier batteries may not necessarily improve the available range, as reduced energy efficiency due to the increased weight of the battery may offset the range benefits of added battery capacity.

Here there is a small difference in the market share of the top 5 OEMs between the ICE and ZE medium truck industries: In the first half of 2024, the CR5 of ICE OEMs was 79%, while the CR5 of zero-emission truck OEMs was 69%.

🔍 Click on the figures to take a closer look at the data

City buses and coaches

City buses have the highest electrification rate of all vehicle categories in China, with a cumulative battery electric, hybrid electric, and fuel-cell electric market share of almost 100% as of mid-2024. Electrification among coaches, which are used for intercity transport, has been far more limited: The market share of battery electric coaches was 6% in the first half of 2024, and most coaches were still powered by diesel. This implies that the uptake of electric commercial vehicles is driven by demonstrated applicability in certain uses, with widespread adoption for (generally shorter-distance) intra-city bus travel but not yet for (typically longer-distance) trips between cities.

In terms of market share, there were no major changes in the adoption of zero-emission technologies during the first half of 2024. City bus sales saw a peak in January with 2,670 units sold, predominantly battery electric buses, followed by a sharp decline in February and March before a bounce in April. As of June 2024, the market share of battery electric coaches was 6.0%.

🔍 Click on the figures to take a closer look at the data

Battery swapping

Battery swapping, whereby a depleted electric vehicle battery can be switched out for a fully charged replacement within minutes, is an innovative technology that can make battery electric vehicles operate more efficiently and affordably. Fleet operators save on the upfront investment by purchasing vehicles without batteries installed and renting batteries from third-party lessors; operators can also be free from range anxiety, assuming there is battery swapping infrastructure deployed close to their yard. Swap-capable technology has gained in popularity in China in recent years, particularly for trucks and tractors.

In the first half of 2024, sales of swap-capable vehicles increased and reached a total of 2,497 in June 2024. That is up 87% from the first half of 2023. The popularity of swap-capable vehicles has been jointly driven by policy and market developments: Several policies were introduced in 2024 to support this emerging technology (see Table 4.1), and pilot projects have been launched to assess use cases in several industries, including mining, steel, and port logistics.

WORKING PAPER

ASSESSING THE SCALE OF ZERO-EMISSION TRUCK DEPLOYMENT REQUIRED FOR MEETING INDIA'S NET-ZERO GOAL

April 17, 2024 | By: Namita Singh and Aviral Yadav

DOWNLOAD

India has committed to reduce the carbon emissions intensity of its GDP by 45% by 2030 and to achieve net-zero emissions by 2070. Reducing heavy-duty truck emissions, which are a large and growing source of overall transport emissions, will be essential to meeting these goals. This paper assesses the rate of zero-emission truck (ZET) adoption necessary for India to meet its 2030 and 2070 climate targets. Considering various policy and market scenarios, it examines the impact of ZET penetration on the total fleet's tank-to-wheel and well-to-wheel CO2 emissions. As India seeks to expand its production and use of green hydrogen, this paper also analyzes the impact of grey and green hydrogen uses on fleet-wide emissions.

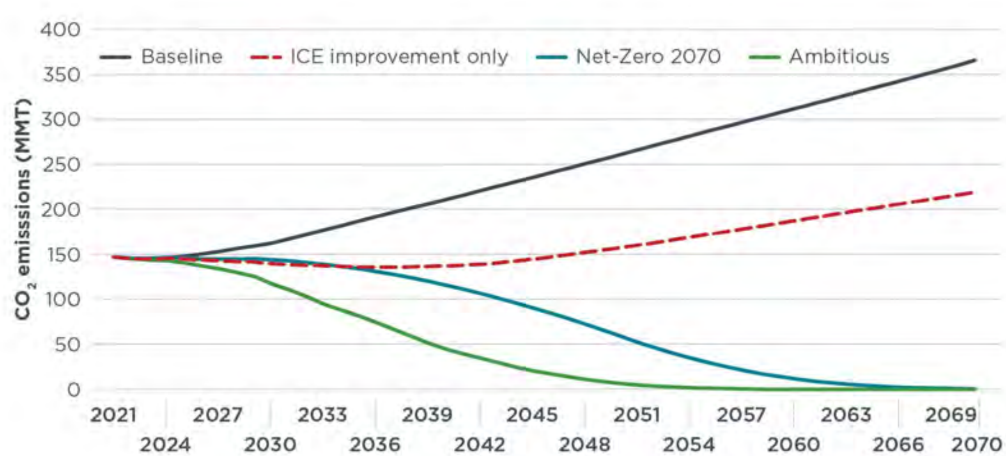

Figure 10. TTW CO_2 emissions from the HDT segment

This paper finds that for India to achieve its 2070 net-zero target would require 100% ZET penetration by 2050. A more ambitious scenario, which would keep India below the 2 °C warming limit set out in the Paris Agreement, would necessitate ZET uptake of 30% by 2030 and 100% by 2045. Grid decarbonization and green hydrogen use will also be critical to India's emissions-reduction outlook. Overall, accelerating ZET adoption would contribute significantly to India's economy wide emissions reduction aims.

RACE TO ZERO: EUROPEAN HEAVY-DUTY VEHICLE MARKET DEVELOPMENT QUARTERLY (JANUARY–DECEMBER 2024)

February 11, 2025 | By: Eamonn Mulholland and Pierre-Louis Ragon

DOWNLOAD

Summary

Just over 14,000 zero-emission heavy-duty vehicles (HDVs) were sold in 2024, up from 11,000 in 2023. Heavy trucks (above 12 tonnes) had a zero-emission sales share of 1.2% in 2024, up from 0.9% in 2023; light and medium trucks (below 12 tonnes) had a 10% zero-emission share, up from 6% in 2023; and buses and coaches saw a marginal increase to 17% in 2024 from 16% in 2023. Sale shares of zero-emission buses and coaches fluctuated from a low of 12% in the first quarter to a high of 26% in the fourth quarter, and electric city buses pushed this share significantly. When the sales share of zero-emission city buses breached 50% in the fourth quarter of 2024, it marked the first quarter in which sales surpassed internal combustion engine buses.

Germany led the increase in sales of zero-emission trucks: Its sales of zero-emission heavy trucks rose from 750 (1% share) in 2023 to 1,200 (1.7% share) in 2024, and its sales of zero-emission light and medium trucks rose from 1,600 (7% share) in 2023 to 2,700 (16% share) in 2024. In other major vehicle markets such as Spain and Italy, which were a combined 6% of EU-27 sales in 2024, sales of zero-emission trucks remained low despite these markets accounting for nearly 20% of the conventional truck market.

Overall market developments

In 2024, sales of all HDVs were 360,000, down from 390,000 in 2023. This 8% drop was largely driven by a fall in sales in the third quarter, when the 74,000 vehicles sold was substantially lower than the 100,000 sold in the third quarter of 2023. Sales bounced back in the fourth quarter relative to the third by 12%, and 2024 ended with a similar sales volume as the same period in 2023. While Germany's share of the market remained the same in 2024 as it was in 2023, France and Spain increased their shares by 1.5 and 2.5 percentage points, respectively.

Manufacturer market shares shifted only slightly in 2024. Mercedes remained the top seller (19.6% of all HDVs) but captured less than the 21% of the market it had in 2023. Following behind were MAN with a 14% share, Iveco (13.1%), Volvo (12.8%), Scania (12.4%), DAF (10.1%), and Renault (7.8%).

Heavy trucks

Trucks with a gross vehicle weight above 12 tonnes

In 2024, heavy trucks were 77% of all HDV sales. Out of 275,000 heavy trucks sold, 3,400 (1.2%) were zero-emission vehicles. Sales in the segment contracted by 5% relative to 2023 when 290,000 vehicles were sold. The zero-emission market still grew against the backdrop of this contraction, as the 2,600 zero-emission vehicles sold in 2023 were a 0.9% sales share.

In the fourth quarter of 2024, 940 zero-emission heavy trucks were sold, representing a sales share of 1.5%, roughly the same volume and share as in the last quarter of 2023, when 950 zero-emission heavy trucks were sold (1.4% share).

Volvo Trucks maintained its leading position in the zero-emission heavy truck market in the fourth quarter of 2024, but its 33% share was a drop from its 43.5% share in the previous quarter. Renault trailed closely by selling 32% of all zero-emission heavy trucks and was followed by Mercedes with a 17% share.

Germany continued to lead in sales of zero-emission heavy trucks in the fourth quarter of 2024, with the 300 units sold representing 32% of the market. Just five countries (Germany, France, the Netherlands, Sweden, and Denmark) were responsible for 90% of all zero-emission heavy trucks sales.

🔍 Click on the figures to take a closer look at the data

Light and medium trucks

Trucks with a gross vehicle weight between 3.5 tonnes and 12 tonnes

In 2024, light and medium trucks were 13% of all HDV sales. Out of 46,000 light and medium trucks sold, 4,800 (10%) were zero-emission vehicles. The segment contracted by 16% relative to 2023, when 55,000 vehicles were sold. The zero-emission market grew against the backdrop of this contraction, though: In 2023, the 3,500 zero-emission sales were only 6% of the market. In the fourth quarter of 2024, 1,500 zero-emission light and medium trucks were sold, a sales share of 13%. In terms of volume and share, this is more than double the fourth quarter of 2023 when 780 zero-emission light and medium trucks were sold, a share of 6%.

Germany was home to 55% of the zero-emission sales. The same five countries (Germany, France, the Netherlands, Denmark, and Sweden) were home to 88% of all zero-emission light and medium trucks sales. Notably, in the fourth quarter of 2024, zero-emission vehicles were 48% of all light and medium trucks sales in Denmark and 42% in Sweden.

Ford regained its position as the leading seller of zero-emission light and medium trucks. The Ford E-Transit was the most popular zero-emission model in 2024 with 1,800 sold and it was followed by the Iveco eDaily (1,200 sold), the Mercedes eSprinter (560 sold), and the Fiat Ducato (430 sold). Combined, these four models were 83% of all zero-emission light and medium trucks sold in 2024.

🔍 Click on the figures to take a closer look at the data

Figure 3.4. Sales of zero-emission light and medium commercial vehicles by Member State in Q4 2024

Buses and coaches

With a gross vehicle weight above 3.5 tonnes

In 2024, buses and coaches were 10% of all HDV sales. Out of 35,000 buses and coaches sold, 6,000 (17%) were zero-emission vehicles. The bus and coach market grew by 31% relative to 2023 when 27,000 vehicles were sold. The volume of zero-emission buses and coaches also increased in 2024 relative to 2023, when 4,500 zero-emission vehicles were sold; the sales share remained relatively constant at 17% in 2024 compared with 16% in 2023.

In the fourth quarter of 2024, 2,000 zero-emission buses and coaches were sold, 26% of total sales and an increase in both volume and share compared with the last quarter of 2023, when 1,600 (22% share) were sold. Over 50% of all city buses sold in the fourth quarter of 2024 were battery electric—zero-emission powertrains were more popular than combustion engines for the first time ever. Seven countries (Belgium, Ireland, Latvia, Lithuania, Luxembourg, the Netherlands, and Romania) only sold zero-emission city buses in the fourth quarter of 2024. That same quarter, sales share of zero-emission interurban buses and coaches increased to 6%, largely driven by a surge in electric minibuses sold by Iveco, Mercedes, and Ford.

🔍 Click on the figures to take a closer look at the data

Technology focus: Energy efficiency technology deployment

Manufacturers are pursuing various strategies to reduce the carbon dioxide (CO2) emissions of their new HDVs, and all major manufacturers recently launched new technology packages that benefit the energy efficiency of both conventional and zero-emission vehicles. These include improvements in the aerodynamic design of truck cabins, advanced driver assistance systems (ADAS), lightweighting of various vehicle components, and, for conventional vehicles, more efficient engines and transmissions. All combined, fuel savings of up to 15% have been reported in the new generation of long-haul tractor-trailers compared with 2020-2021 trucks.

New rules on truck cabin design implemented in 2021 allowed all major manufacturers to launch new, elongated truck cabins with significantly improved aerodynamics and other features such as air fenders, aero seals, under hood aerodynamic design improvement (closing gaps between components), side skirts, and improved windscreen design. Another innovation driven by the new safety requirements is the introduction of camera mirrors to replace traditional side mirrors; this reduces blind spots for increased safety and considerably reduces air drag on the side of the cabin. Improved aerodynamics have been reported to result in up to 5% fuel savings.

ADAS have also become more widespread in the past few years. ADAS deliver up to 5% fuel savings compared with vehicles that are not equipped with the technology. Most importantly, predictive cruise control (PCC) adjusts the speed of the vehicle to gain momentum as it approaches hills, which reduces the impacts of positive road gradients on fuel consumption. Recent improvements in PCC algorithms were reported to deliver further 2% fuel savings. For conventional vehicles, through more efficient combustion, engine lightweighting, and gearbox automation and increased rear axle ratio enabling engine downspeeding, fuel savings of up to 8% have been reported.

Windrose rolls out electric longhaul sleeper truck in U.S.

by **Today's Trucking**
April 23, 2025

Electric vehicle manufacturer Windrose Technology said it has launched the first all-electric longhaul sleeper truck in the U.S. The EV truck has a 420-mile (676-km) range and is set for commercial deployment in the U.S., according to a news release.

Windrose partnered with JoyRide Logistics, a Phoenix, Ariz.-based carrier and the first U.S. regional trucking company to operate fully-electric sleeper trucks, all of which will be powered by EO Charging. The initial rollout begins in Arizona, California and Nevada, with nationwide expansion in sight, the company says.

"This isn't just a prototype or promise-this is a fully operational, long-range electric truck that's ready to haul freight today," Wen Han, founder, chairman, and CEO of Windrose said in the release. "We've validated our technology globally and are proud to bring it to the U.S.- one of the most important logistics markets in the world."

(Photo: Windrose Technology)

Windrose trucks have undergone real-world testing across Asia, Europe, Oceania and North America. In a recent U.S. field test, the Windrose sleeper completed a 2,800-mile (4,506-km) cross-country trip using only public charging stations. Further, Windrose also completed a 3,000-plus-mile (4,828-plus-km) loaded trip shipping clothing from the Hong Kong area to the China-Kazakhstan border.

Fast-charging capabilities

The sleeper includes a bunk area, fast-charging capabilities (megawatt charging system and combined charging system), and more than 700 kWh of battery offering with both lithium-ion phosphate and nickel manganese cobalt battery types, all while maintaining

Class 8 performance standards and weighing less than 26,000 lb. (11793 kg).

"Partnering with Windrose allows us to stay ahead – not just on sustainability, but on total operational performance," said Adis Danan, president at JoyRide Logistics. "We're talking fuel savings, reduced maintenance, and a future-ready fleet that our customers can get behind. We want to make electric logistics efficient, scalable and cool."

Powering the rollout is EO Charging, whose platform provides real estate acquisition, charging infrastructure deployment and vehicle financing, plus a promise of greater than 99% uptime.

Our ePortfolio

E-mobility is a crucial factor for the traffic of the future. As the technology leader of today, Daimler Truck is also aiming to shape the logistics and passenger transportation of tomorrow – with electrified solutions that provide maximum benefits for customers and the environment.

To this end Daimler Truck has initially focused on market segments in which electrified trucks and buses can function first – both technologically and economically. With the all-electric Mercedes-Benz eCitaro, Daimler Buses has been offering a locally CO_2-neutral city bus for environmentally friendly public transport in cities and metropolitan areas since 2018. Series production of the battery-powered eCitaro is well underway. Products such as the eCitaro make a substantial contribution to keeping the air cleaner in urban areas. The Mercedes-Benz eActros for heavy urban distribution is in series production since October 2021 and the eEconic, our special truck for municipal waste disposal, since July 2022. The light-duty FUSO eCanter is being put through its paces by customers under real-world, everyday conditions since 2017. In December 2018 the first Freightliner eM2 was also turned over to customers in the U.S.; the heavy Freightliner eCascadia followed in 2019. The Mercedes-Benz eActros 600 for long-distance haulage has been in series production since the end of 2024. With the Mercedes-Benz eActros GenH2 further locally CO_2-neutral vehicles are being planned or tested. Daimler Buses is also planning to launch the first all-electric intercity bus on the market from 2025. The first all-electric coach is due to follow at the end of this decade.

Customer trials are worth their weight in gold to Daimler Trucks: Every day new and important insights are gained. These include, for example, which routes the customers drive, when they want to or must load, or how long it actually takes for the trucks to be charged with enough power again and how the charging infrastructure has to be optimized to do so.

About Daimler Truck

We are one of the world's largest commercial vehicle manufacturers, with over 40 production sites around the globe and more than 100,000 employees. We offer light, medium and heavy duty trucks, city and intercity buses, coaches and bus chassis. Tailored financial services are also part of our portfolio.

Breakthrough: Volvo to launch electric truck with 600 km range

2024-09-03

AB Volvo

Up to 600 km on one single charge. That's how far Volvo's next-generation heavy-duty electric truck will be able to drive. The longer range represents a breakthrough for long-distance transport with zero tailpipe emissions.

The electrification of heavy trucks is continuing across the world and longer distances are now becoming a possibility.

Next year Volvo will launch a new long-range version of its FH Electric that will be able to reach up to 600 km on one charge. This will allow transport companies to operate electric trucks on ...egional and long-distance routes and to drive a full working day without having to recharge. ...ew Volvo FH Electric will be released for sale during the second half of 2025.

"Our new electric flagship will be a great complement to our wide range of electric trucks and enable zero-exhaust emission transport also for the longer distances. It will be a great solution for transport companies with a high annual mileage on their trucks and with a strong commitment to reduce CO2," says Roger Alm, President Volvo Trucks.

Five years of electric leadership

The enabler for the 600 km range is Volvo's new driveline technology, the so-called e-axle, which creates space for significantly more battery capacity onboard. More efficient batteries, a further improved battery management system and overall efficiency of the powertrain also contribute to the extended range.

Volvo Trucks is a global leader in medium- and heavy-duty electric trucks with eight battery-electric models in their portfolio. The wide product range makes it possible to electrify city and regional distribution, construction, waste management and, soon, long distance transport. Volvo has so far delivered more than 3,800 electric trucks to customers in 46 countries around the world.

"The transport sector represents seven percent of global carbon emissions. Battery-electric trucks are important tools to reduce the climate footprint. Besides the important environmental gains that electric trucks bring, they offer truck drivers a much better working environment, with much lower levels of noise and vibrations," says Roger Alm.

Volvo Trucks drives the transition towards fossil-free transport to reach its net-zero emissions target by 2040 using a three-path technology strategy. The three-path technology approach is built on battery electric, fuel cell electric and combustion engines that run on renewable fuels like green hydrogen, biogas or HVO (Hydrogenated Vegetable Oil).

Volvo Trucks supplies complete transport solutions for discerning professional customers with its full range of medium- and heavy-duty trucks. Customer support is provided via a global network of dealers with 2,200 service points in about 130 countries. Volvo trucks are assembled in 12 countries across the globe. In 2023 approximately 145,000 Volvo trucks were delivered worldwide. Volvo

Trucks is part of the Volvo Group, one of the world's leading manufacturers of trucks, buses, construction equipment and marine and industrial engines. The group also provides complete solutions for financing and service. Volvo Trucks' work is based on the core values of quality, safety and environmental care.

Clean Truck Partnership

The Clean Truck Partnership (CTP), is an agreement between CARB, the Truck and Engine Manufacturers Association (EMA), and other major truck manufacturers that represent over 90 percent of California's truck market. In exchange for commitments that the companies will meet California's vehicle standards and will require the sale and adoption of zero-emission (ZE) technology, regardless of whether any other entity challenges California's authority to set more stringent emissions standards under the federal Clean Air Act. CARB has agreed to work collaboratively with manufacturers to provide more lead time to meet CARB's existing regulatory requirements before imposing new regulations, and to support the development of necessary ZE infrastructure.

Trucking Industry Disinformation Will Cost Lives

October 30, 2024 | 10:00 am

JOE RAEDLE/NEWSMAKERS

Dave Cooke
Senior Vehicles Analyst

Recently, the states of Oregon and Massachusetts have proposed delaying enforcement of state truck engine emissions standards originally put in place to protect the health and welfare of their residents, standards stronger than what is enforced by EPA at the national level, and we're seeing truck manufacturers push for even more delays around the country. The rationale for this delay is largely based on industry disinformation, with manufacturers choosing to gin up anxiety among truck dealers to wage a war on the regulations by proxy. We heard this all in full effect at recent meetings of the California Air Resources Board (CARB) and Oregon Department of Environmental Quality, where some in industry advocated for delays all the way out to 2027.

This path taken by industry is a game of chicken with the regulators, a refusal to comply with the regulations as they stand and a dare to enforce them. Below, we walk through this cynical industry action and why it's critical that regulators hold firm in the face of this market manipulation. Lives are on the line.

Industry is compliant with state regulations and agreed not to oppose them

There are two separate state regulatory actions that

("Omnibus") rule, which requires new heavy-duty engines achieve a 75 percent reduction in health-harming NO_x emissions, on average, compared to the current federal standards that have been in effect since 2010.

California is the only state in which those standards are in effect in model year 2024, and manufacturers are overcomplying with both standards at this time, thanks in large part to electric truck sales that well exceed what is required by ACT and flexibilities in the Omnibus rule that were agreed to with the manufacturers.

Truck manufacturers, however, are now throwing a temper tantrum behind the scenes in order to try to renegotiate a rule they promised to follow. Because they've agreed not to oppose adoption of these standards, they are waging that war by proxy, pushing dealers to oppose the regulations through lies and market manipulation. The dealers themselves made clear they are feeling the pain of these actions and are struggling to fight back against the manufacturers, embodied best in a plea from one dealer to CARB at the recent hearing to get the manufacturers to "act in the spirit of the Clean Truck Partnership agreement and stop putting politics ahead of public services."

Truck makers are manipulating the market with draconian rules

compliance exclusively on the backs of dealers and ignoring the many flexibilities in the regulation aimed to reduce compliance burdens. Such tactics represent a new anti-regulatory approach to compliance that seem more like a political statement than sound business strategy.

This tactic only makes sense if the goal is not to comply with the regulation but to maximize the pain felt by dealers. And, because increasing a company's compliance costs is bad for business, this strategy is dependent upon one's competitors also pursuing this uneconomic strategy. Incredibly, that is exactly what appears to be happening, a fact highly suggestive of collusion among the truck manufacturers.

So what exactly are they doing? Rather than working *with* dealers as required by the Clean Truck Partnership and as one would expect from a good faith effort to comply with the law, manufacturers are instead enforcing quotas that have absolutely no grounding in either regulation. Manufacturers are requiring dealerships to purchase a specified number of electric trucks before receiving any allotment of diesel-powered vehicles, even in applications for which there is no electric vehicle availability. This behavior, known as ratio-ing, has resulted in massive decreases in in-state truck sales, including (according to the California New Car Dealer Association) an 80 percent year-over-year decrease in Class 8 vehicle sales, the heaviest and biggest on-road vehicles. This

Importantly, manufacturers are lying to their dealers about the origin of this artificial product shortage. According to interviews with dealers and manufacturers, sales representatives are telling dealerships that limited product availability is being driven by compliance with ACT regulation. However, representatives from the same manufacturers have explicitly told regulators (accurately) they are well-situated to comply with ACT.

ACT does not require a specific share of any given application be electric—rather, compliance is based on the average of a manufacturer's entire portfolio. This allows manufacturers to prioritize electric truck sales in the vehicle markets that are most advantageously deployed.

The voluntary decision by manufacturers to withhold sales from its dealers via ratio-ing is simply part of a strict, non-regulatory, and nonsensical business plan.

Truck makers are pursuing high-cost compliance to burden dealerships

Ultimately, it is the manufacturer that determines product availability, and it is critical to re-emphasize that the shortage felt by dealers is a crisis manufactured by truckmakers. This was reiterated by CARB at a recent meeting, and the dealers themselves confirmed this as well

Manufacturers comply with ACT and the Omnibus through credits. For ACT, there is a minimum number of zero-emission trucks a manufacturer is required to sell—if they sell more than is required, they can bank those credits to offset future obligations, and if they fall short they need to either draw upon any bank they may have built up or purchase vehicle credits from manufacturers that have exceeded their obligations. The Omnibus works in much the same way, but with credits tallied in tons of emissions. Under both rules, there is an excess of available credits, particularly from the growing number of all-electric truck manufacturers that naturally exceed the requirements of both rules.

As we heard repeatedly during the CARB hearing, manufacturers are refusing to engage in the credit market. As in the case of ratio-ing, this artificially increases their costs of compliance but also naturally increases the pain felt by dealerships. Manufacturers are price gouging on the electric trucks they do sell, with costs nearly $90,000 per truck higher in the US than a comparable EV goes for on the European market, and then in markets where such trucks aren't available, manufacturers are unwilling to compensate by using the flexibilities available. As Trevor Gasper of Thor Industries, an RV manufacturer that looks to truck manufacturers to supply chassis on which to build RVs, "These manufacturers are not interested in purchasing credits to assist the RV industry."

And it's one that flies in the face of industry sustainability commitments.

Truck makers have manufactured a crisis despite product availability

Of course, credits are meant as a temporary fallback—in the long run, it's more cost-effective to simply comply with the regulations yourself. And in fact, that's exactly what we see. Manufacturers have used their credit bank to buy time to supply product. While they certainly could have made some of these products available more quickly and, in some cases, have such compliant products available overseas, there is no doubt that manufacturers are preparing right now to comply without credits.

PACCAR was the first to certify its 13L heavy-duty diesel engine to the CARB 2024 standards, but Volvo introduced its own compliant engine shortly thereafter. The reason why they were able to do so is that 2024 compliance doesn't require massive investment or timelines, as Volvo themselves noted: "Really, the D13 is the same engine on the inside. (The CARB-complaint D13) is more about the turbo and then the enhanced aftertreatment system, and the 48-volt alternator." Cummins, the largest engine manufacturer, noted in recent comments to CARB that while they have not yet certified a diesel engine to these standards without credits, "This medium- and heavy-duty 20-50 mg engine families in 2025, 2026, and 2027."

The question of product availability isn't whether or not manufacturers *can* meet the rules on the books—it's *how* they approach meeting them. And right now they are choosing to ignore all the available flexibilities that lower costs in an effort to undermine the regs themselves, punishing dealers in the process.

Tallying up the harm

If state regulators grant delays in these regulations by capitulating to this manufactured crisis, they are granting truck manufacturers exactly what they have set out to do, and they are doing so on the backs of those who these regulations were meant to protect. Every delay, every carve-out, every weakening made by regulators at the behest of industry has a direct and permanent cost on the health of residents around the country.

The table below tallies up the harm from delaying these rules, as Oregon and Massachusetts have proposed, as we continue to see industry support for similar action in other locales. There are lives at stake, as evidenced by UCS modeling.

	Omnibus Delay to 2026		Omnibus Delay to 2027		ACT Delay to 2026		ACT Delay to 2027	
	Health Impacts ($M)	Deaths	Health Impacts ($M)	Deaths	Health Impacts ($M)	Deaths	Health Impacts ($M)	Deaths
Massachusetts	$304.5-391.4	19-25	$589.8-758.1	36-48	$36.9-48.7	2-3	$97.2-127.8	6-8
New Jersey	n/a		n/a		$119.5-160.4	7-10	$276.7-372.9	17-24
New York	n/a		$670.1-897.4	42-57	$103.6-136	6-9	$236.4-311.1	15-20
Oregon	$245.1-297.8	15-18	$475.1-577.2	29-36	$27.5-34.2	- 2	$74.9-93.2	5-6
Vermont	n/a		$26.1-31.9	- 2	n/a		$5.6-7	< - 1
Washington	n/a		$203-254.3	12-16	$28.8-35.6	- 2	$67.6-83.7	4-5
TOTAL:	$549.6-689.2	34-43	$1,964.1-2,518.8	121-159	$316.3-414.8	19-26	$758.4-995.7	47-63
TOTAL HARM GENERATED BY ACQUIESCING TO INDUSTRY DEMANDS:					$2.7-3.5 Billion		167-221 Premature Deaths	

Industry's push to delay state clean truck regulations until 2027 would result in up to $3.5 billion in monetized health impacts from ER visits, school days lost to asthma, etc. Part of these harms would be the premature deaths of up to 221 individuals, the result of additional pollution from delaying these critical regulations.

Regulators should ensure communities benefit as intended

Industry has engaged state regulators in a game of chicken, and for the health of communities around the country, it's critical that regulators not blink. Afterall, trucking industry disinformation is nothing new: this is just the latest example. But, if any agencies choose to weaken these rules through delay or carve-outs, they must ensure those emissions reductions still happen.

There is already a mechanism in place to do this in the Omnibus rule—as part of the Clean Truck Partnership, California negotiated an extension of a "legacy" provision that allows the sale of non-compliant engines in exchange for commensurate emissions reductions through designated

This is a poor replacement for compliance, but it at least makes an attempt to mitigate the harm caused directly by manufacturers, and on their dime.

Manufacturers have broken the rules with artificial caps that undermine the regulations. Regulators should hold firm on these rules to force industry's hand, but if they're going to fold, they better make sure industry pays for the harms caused by such market manipulations and ensure the communities suffering from diesel pollution aren't the ones paying with their health.

Zero-Emission Class 8 Truck Pricing Comparisons – EU & US

As part of CARB's efforts to support clean trucks in California, this fact sheet explores the differences between zero-emission truck (ZET) pricing in the European Union (EU) and the United States (US) and the reasons for it. To better understand the current market situation, these findings are based on a preliminary assessment of pricing focused on battery electric Class 8 truck in the US/California and equivalent models (Class 5 LH) in the EU.

The assessment's primary finding is that, based on the incremental price difference between zero-emission and diesel trucks, ZETs in the EU have a roughly $57,000 less incremental price difference than similar ZETs in the US.

Process Used

Pricing data in California was pulled directly from purchase orders submitted as part of the HVIP voucher request process. Pricing in the EU came from EU industry sources.

There are many differences between European and American truck designs and regulations that make direct comparisons on pricing difficult. The standard approach to address this is to determine "incremental pricing"–the difference between the base diesel truck price and the battery electric truck price. This roughly reveals the added price of the electric powertrain (including batteries).

This assessment determined incremental pricing by finding the difference between the base diesel truck price in each region and the base ZET price, using equivalent models. Diesel truck pricing is quite different in each region, but the battery electric powertrains are essentially the same. This enables a more direct "apples-to-apples" comparison.

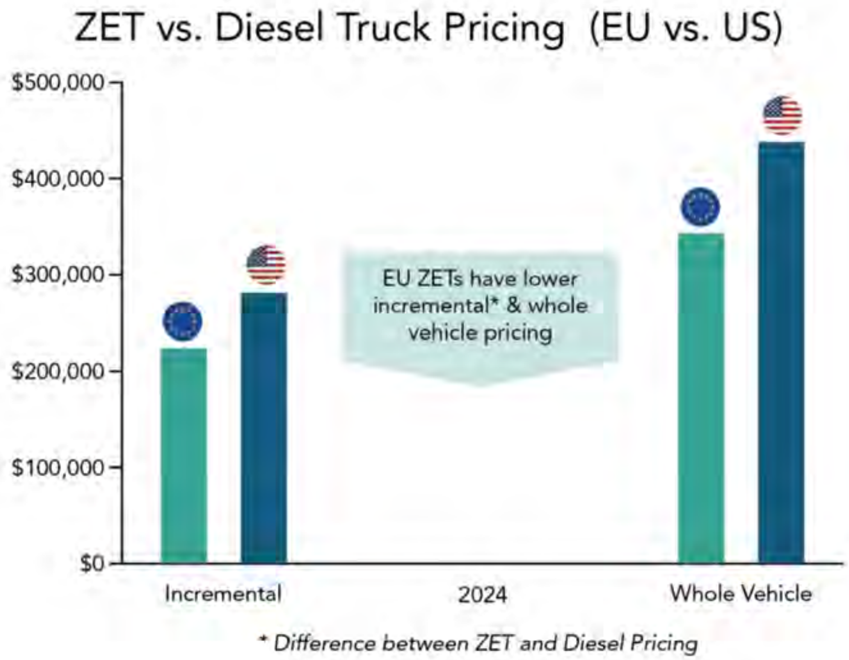
Findings

EU ZETs have lower incremental pricing than ZETs in the US/California.

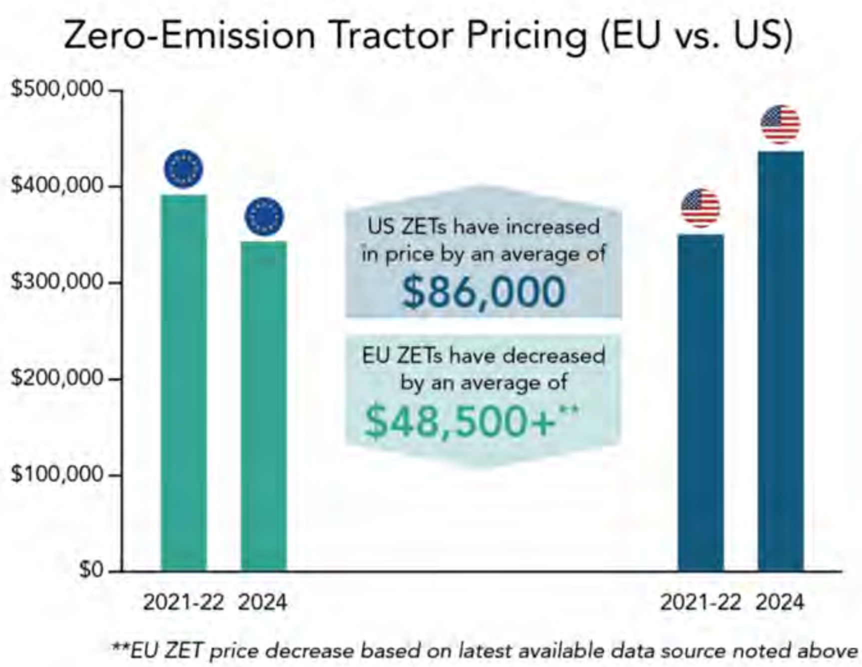
- The incremental ZE powertrain price for US/California Class 8 ZETs in 2024 averages $279,937.
- The incremental ZE powertrain price for European Class 5 LH ZETs averages roughly $223,000.
- **US incremental ZE powertrain price is around $57,000 more than EU incremental ZE powertrain price** even when accounting for lower base truck pricing in the EU.

EU ZETs have lower whole-vehicle prices compared to equivalent US/California ZETs.

- The average US/California zero-emission Class 8 truck in 2024 was priced at $435,839.
- The average EU zero-emission truck of similar capability to US trucks (Class 5 LH in Europe) in 2024 was priced at roughly $342,000.
- **US zero-emission trucks averaged nearly $94,000 more to purchase than in Europe.**



Total ZET sales volumes are roughly comparable between each region[iii]. Some European industry observers noted that as battery prices edge lower European vehicle makers have increased capability (increased battery size, range) while holding prices steady. Observers also note some OEM price competition in Europe in advance of the VECTO[iii] CO_2 model reporting deadline in 2025.



Aggregate HVIP Invoice Data by Year

HVIP Voucher Order Year	Average HVIP Purchase Order	Number of Orders	Average Diesel Equivalent Price	Average Incremental Cost
2021	$332,757	30	-	-
2022	$365,898	27	-	-
2023	$401,479	12	-	-
2024	$435,839	32	$155,902	$279,937

Truck Price Data Sources

- **US/California ZET Prices 2024 (Class 8 truck – day cab): $435,839**
  - Source: Purchase orders from HVIP voucher request documents; averaged across 32 orders
- **US/California ZET Prices 2021-22 (Class 8 truck – day cab): $349,328**
  - Source: Purchase orders from HVIP request documents 2021-2022; averaged across 57 orders

Oregon's Advanced Clean Trucks Rule

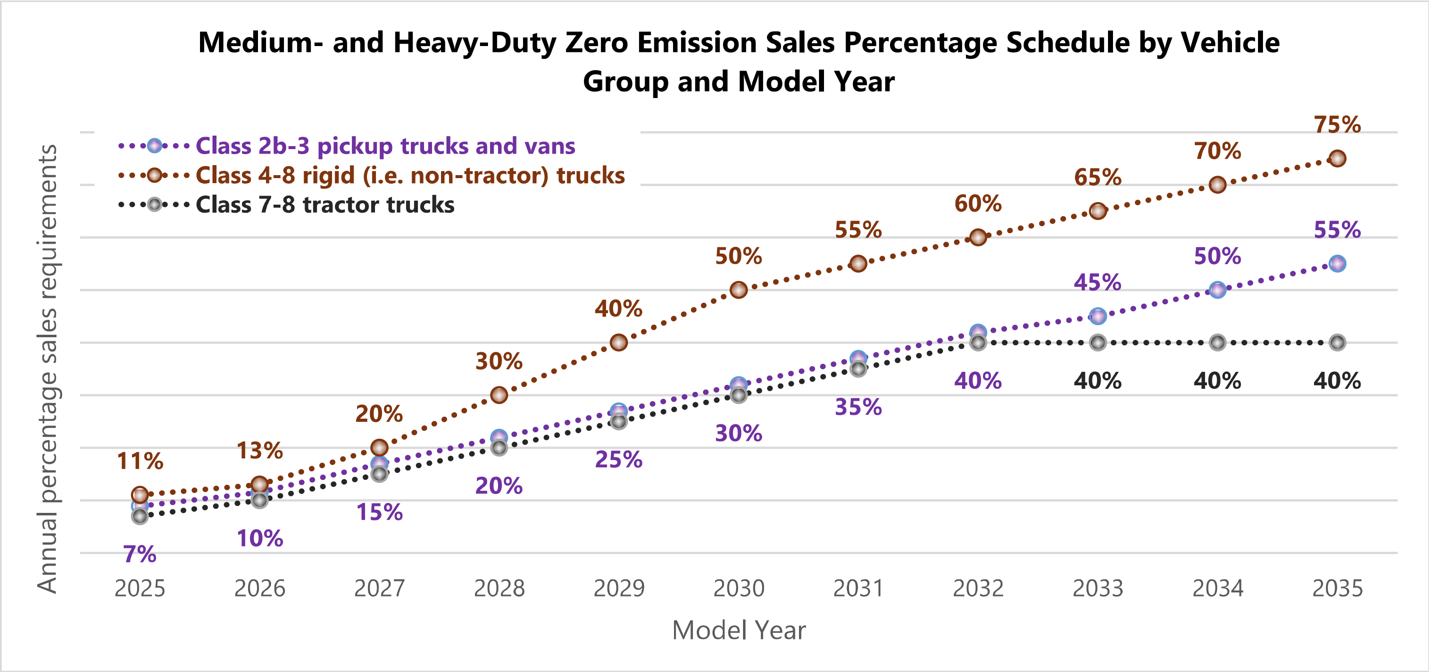
Updated 2/10/2025

In November 2021, Oregon's Environmental Quality Commission adopted the Clean Truck Rules, which includes Oregon's Advanced Clean Trucks Rule. This specific rule adopts by reference California's Advanced Clean Trucks Regulation designed to support the transition of medium- and heavy-duty vehicles to zero-emission engines over time.

At the same meeting, the commission also adopted California's Heavy-Duty Engine and Vehicle Omnibus Regulation, which in Oregon is known as the Heavy-Duty Low NOx Omnibus Rule, or the Low NOX Omnibus Rule. Details of this rule are described in a separate FAQ.

What does the rule require?

The ACT Rule requires medium- and heavy-duty vehicle manufacturers to sell an increasing number of zero-emission vehicles, beginning with the 2025 model year. The rule sets specific sales targets that grow each year, making a shift from producing gas- and diesel-powered trucks to cleaner electric- or hydrogen-powered options. **These target requirements apply to all new on-road vehicles with a gross vehicle weight rating greater than 8,500 lbs.**



Translation or other formats

Español | 한국어 | 繁體中文 | Русский | Tiếng Việt | العربية

800-452-4011 | TTY: 711 | deqinfo@deq.oregon.gov

State of Oregon
Department of Environmental Quality

Are any vehicles exempt from the requirements?

Emergency vehicles, transit buses, motor coaches, articulated shuttles and double-decker buses are exempt from the ACT rule.

To whom does the rule apply?

The ACT rule applies to any manufacturers offering new medium- and heavy-duty vehicles for sale in Oregon. However, if a manufacturer sells an average of fewer than 500 medium- and heavy-duty vehicles in a model year, then it is exempt from the ACT Rule requirements.

Does the ACT rule ban the sale of certain new vehicles in Oregon?

No. The ACT rule includes a number of flexibilities for manufacturers to determine which vehicle models to move to zero emissions. There is no ban on producing combustion-powered vehicle types. Manufacturers can continue to produce and sell gasoline- or diesel-powered trucks, like motor homes or tow trucks, while focusing on electrifying other vehicles, such as zero-emission school buses.

Is it true that even without a ban, the ACT rule is so restrictive that there will be no diesel-powered vehicles available for sale in Oregon?

No. The ACT rule was designed to ensure a smooth adoption of ZEVs while still ensuring that diesel-powered vehicles are available for purchase. The rule is flexible and was recently changed to accommodate manufacturers' requests for more flexibility. For example, manufacturers can purchase credits from other manufacturers selling ZEVs or produce and sell near-ZEVs (e.g. plug-in hybrid electric trucks). In 2025, only 7-11% of vehicle sales must be zero-emission, as shown in the above chart.

Is there a market for zero-emission medium- and heavy-duty vehicles?

Yes. There are currently over 190 Class 2b-8 MHD ZEV models from 66 different manufacturers available for sale in the U.S., including medium-duty trucks, heavy-duty tractors, cargo vans, yard tractors, refuse trucks, coach buses, school buses, shuttle buses and transit buses.

How many ZEV sales have occurred in Oregon thus far?

Manufacturers have started to report their ZEV sales prior to the 2025 model year requirements. These manufacturers can earn early action credits on ZEV sales beginning with model year 2022. These early action credits can be used to help them meet their sales target requirements in 2025 and beyond.

Based on current reported sales through model year 2023, some manufacturers are already able to meet their 2025 ACT compliance obligation.

How do the purchase and operating costs of medium- and heavy-duty ZEVs compare with combustion-powered vehicles?

ZEVs have higher upfront costs but have lower operating costs than combustion-powered vehicles. The total cost of ZEV ownership in Oregon is similar to ownership of a combustion-powered vehicle for certain duty cycles. It is expected that upfront costs should come down as technology continues to improve, volumes increase and more ZEVs become available. Also, Oregon has a number of financial incentives and grants available to offset the higher purchase costs of ZEVs (See below).

Has DEQ made any changes to the ACT Rule?

On Nov. 21, 2024, the Environmental Quality Commission adopted temporary rules to incorporate recent California Air Resources Board changes to the Advanced Clean Truck regulation. Changes include:

- An increase to the deficit makeup period from one model year to three model years.
- Compliance to be based on reported sales of delivered vehicles instead of reporting when vehicles reach the ultimate purchaser.
- Several other minor updates to manufacturer reporting and certification requirements.

Temporary rules are in place until June 29, 2025. DEQ will propose permanent rules in early 2025. The process will include a rulemaking advisory committee, stakeholder engagement and a public comment period.

In addition, DEQ is closely tracking any future California amendments to its Advanced Clean Trucks regulation and will propose additional amendments as needed to ensure Oregon remains aligned with the California requirements.

What are the rules that apply to fleets that plan to purchase new medium- and heavy-duty vehicles in Oregon?

Vehicle owners and fleets do not have any specific purchasing requirements. The ACT rule only applies to businesses or manufacturers that sell new medium- and heavy-duty vehicles in Oregon.

NOTE: California adopted the Advanced Clean Fleets Regulation, which requires government and high priority fleets (organizations with $50 million or more in annual sales or at least 50 vehicles) to phase in ZEVs as a percentage of their total fleet. Additionally, it requires that by model year 2036, all new medium- and heavy-duty trucks sold must be ZEV. **Oregon has not adopted this rule and has no immediate plans to do so.**

Will there be adequate charging available to support the new ZEVs?

Yes. Many medium- and heavy-duty vehicles, such as urban delivery vans, drayage trucks, and transit and school buses drive less than 100 miles per day and can be electrified with only depot charging. These depots can largely be served by Level 2 chargers. Additionally, fleet managers can sequence charging to occur overnight when vehicles are not in use or during off-peak periods. There is ongoing state agency and utility coordination work to ensure there is sufficient infrastructure available.

What is DEQ doing to help support the transition to cleaner medium- and heavy-duty vehicles?

There are several grant programs and opportunities available to help fleets make the transition to cleaner vehicles. They include funding to support reducing diesel emissions through replacing older, more polluting diesel vehicles with similar cleaner burning or all-electric equipment. DEQ offers the Diesel Emission Mitigation Grants, Diesel Emission Reduction Act Grants and Congestion Mitigation Air Quality Grants. The one-time Zero-Emission Fueling Infrastructure Grants awarded $15 million to support entities with installing and siting medium and heavy-duty charging infrastructure. DEQ is also in the process of establishing a medium- and heavy-duty, zero-emission vehicle rebate program for the purchase of new zero-emission trucks. Recently, the agency was awarded $23 million through an EPA Climate Pollution Reduction Act Implementation Grant to help fund grants and rebates for medium- and heavy-duty vehicles and charging infrastructure. Finally, DEQ was also recently awarded $6.5 million through an EPA Clean Heavy-Duty Vehicles Grant to help replace 26 older diesel school buses with new zero-emission school buses.

In addition, DEQ's Clean Fuels Program offers incentives in the form of credits to providers of clean transportation fuels, including electricity. Owners of chargers that service on-road (light-, medium- and heavy-duty) and off-road vehicles can earn CFP credits when they report how much electricity is dispensed to EVs monthly. Those credits can be sold to other program participants, and the revenue can be used at the discretion of the charger owner.

What is the penalty for noncompliance?

DEQ will evaluate compliance based on the sales information submitted to DEQ. It is important to note the rules provide an additional three years for manufacturers to comply. Manufacturers can carry-over up to 30% of deficit balance each year. This is intended to provide flexibility to manufacturers as they begin to ramp up ZEV sales.

DEQ will not take any enforcement action on deficit compliance until manufacturers have had time to settle their deficits. That will occur in mid-2027, at the earliest. If DEQ does need to pursue an enforcement action, it will evaluate the facts of each case and apply the formula in Division 12 to calculate a penalty.

DEQ recognizes that the latest CARB amendments are awaiting review by California's Office of Administrative Law. To the degree the California ACT regulations are further modified, DEQ will move swiftly maintain identicality. When evaluating deficit compliance the agency will recognize manufacturers endeavors to comply with the rules, as they were in place in the state of Oregon.

Enforcement Discretion for Advanced Clean Trucks Requirements
April 14, 2025

The Massachusetts Department of Environmental Protection (MassDEP) will exercise enforcement discretion to exempt on-road medium- and heavy-duty vehicles in Classes 2b-8 from Advanced Clean Trucks (ACT) requirements in 310 CMR 7.40 in Massachusetts for Model Years 2025 and 2026, provided that manufacturers supply internal combustion (ICE) engines to distributors seeking those vehicles, without restriction.

Background

MassDEP adopted California's ACT regulations in 310 CMR 7.40 in 2021. ACT requires manufacturers of on-road medium- and heavy-duty vehicles to produce and deliver for sale an increasing percentage of zero emission vehicles (ZEVs) starting in Model Year 2025 through Model Year 2035.

While manufacturers were involved in developing the ACT framework, they now indicate that ACT requirements are too difficult to meet. Some manufacturers are limiting ICE truck sales as a means to ensure their compliance with ACT sales requirements, reducing availability to a wide range of users. Further, the current federal administration has created significant uncertainty around ZEV incentives, charging investments, manufacturing and tariffs, each of which threaten a smooth transition to medium- and heavy-duty ZEVs.

Enforcement Discretion

MassDEP will exercise enforcement discretion by not taking enforcement action against manufacturers that do not meet their Model Year 2025 or Model Year 2026 ACT ZEV sales compliance obligations. To qualify for this exercise of enforcement discretion, manufacturers must supply ICE vehicles to distributors seeking them, without restriction — i.e., manufacturers may not engage in withholding or rationing practices.

This enforcement discretion replaces and supersedes the ACT enforcement discretion MassDEP issued on October 18, 2024 (i.e., state and local agencies no longer need to submit written requests regarding purchases of snow removal and street-sweeping vehicles since all medium- and heavy-duty vehicle purchases are covered by this updated enforcement discretion).

Disclaimer: This enforcement discretion directive does not constitute “final agency action” and is not a “regulation” as that term is used in M.G.L. c.30A. It may not be relied upon to create rights, duties, obligations or defenses, implied or otherwise, enforceable by any party in any administrative proceeding with the Commonwealth. In addition, this enforcement discretion directive does not exempt any person from complying with the other requirements in 310 CMR 7.40 or any other applicable local, state or federal law or regulation.

If you have any questions about this enforcement discretion, please contact Sharon Weber at Sharon.Weber@mass.gov.

October 18, 2024

Dear Attorney General Bonta, Secretary Garcia, Chair Randolph, and Legal Secretary Sapp:

We are writing to urge further attention to manufacturer behavior in the market for cleaner heavy-duty trucks that implicates both California's climate and clean air policies and its continued efforts to support a positive business environment, especially for small businesses. In our view, immediate oversight is warranted.

California truckers face real cost challenges, and the state, under Governor Newsom's California Climate Commitment, has invested billions in incentives to support these businesses as they transition to cleaner vehicles. However, there is now evidence (cited below and attached) that the few companies manufacturing trucks compliant with California rules may be employing pricing and production strategies that could erode the benefit of the state's investments, limit supply of some key models, and raise truck prices for ordinary businesses. These strategies, which appear to be being used by dominant market actors, have broad implications for consumers up and down the supply chain. These strategies appear to be operating in multiple states, and would have the additional effect of eroding clean air and climate progress.

Because these matters critically affect California's own market, and air quality – as well as that of other states – **we believe California officials should review these manufacturer behaviors for compliance with relevant state and federal antitrust law, unfair business practice law, and consumer protection statutes, partnering with federal regulators where appropriate**.

The truck market generally warrants protective attention because it is such a concentrated one; a few manufacturers, generally aligned through their trade group, the Engine Manufacturers Association, dominate sales, both in state and nationally. That means manufacturers have market power which can unreasonably affect small businesses, as well as communities exposed to truck pollution. Market power may operate with particular force in California and in states that follow its rules because only certain cleaner combustion trucks and zero emission trucks can be sold in these states – meaning that changes in production and pricing for just a subset of truck products in already concentrated market can have large, immediate, effects on trucking fleets and other supply chain businesses.

Specifically, CARB staff recently documented at least three such manufacturer behaviors with regard to both the Advanced Clean Trucks (ACT) rule, which requires growing sales of zero emission trucks, and with the Heavy-Duty Low NOx Omnibus Rule (HDO), which requires combustion trucks to cut tailpipe pollution. It appears these strategies, individually and collectively, could have large market impacts.

These strategies, per the memo, include (1) **supply restrictions** on HDO-compliant engines, (2) **tying requirements** that dealers of HDO compliant engines tie sales of such engines to a set sales ratio of zero emission trucks, whether or not buyers demand those additional vehicles (thereby restricting overall supply of HDO compliant engines and shifting truck maker compliance costs directly to buyers), and (3) what appear to be **substantial price increases** for some ACT-compliant zero emission truck models, even though prices are falling for similar models in Europe. Several corporate communications regarding these policies are attached to this letter substantiating CARB's memo.

While companies have a right to lobby governments, the question here is their behavior with regard to consumers. These specific restrictions in the market itself, appearing in multiple states from multiple manufacturers, raise questions about the legitimate use of market power, and, per reporting, the associated shifts in costs and compliance burdens to consumers in ways that raise questions about consumer protection. To our knowledge, these policies appear to be underway, by multiple manufacturers, in many states that have adopted HDO and ACT, and were a critical factor in Oregon's recent decision to propose rolling back HDO requirements for at least one year. We are not aware of any other roll-backs of this sort in recent history, shrinking the market for clean vehicles and slowing the pace of transition, to the detriment of consumers, market competition, and the environment.

As Oregon regulators wrote, consistent with the strategies CARB flagged in the memo above, "some manufacturers are:

- Expected to have limited availability of Low NOx Omnibus compliant engine families.
- Expected to limit their use of available compliance flexibilities like credit purchases and emission offset projects.
- Expected to place restrictions on dealers that order new vehicles such as requiring a zero-emission vehicle to be sold prior to releasing any diesel-powered vehicles for sale."

Per Oregon, "[a] pause in implementation for one year is being proposed to avoid severe restrictions in supply of new vehicles based on these manufacturer business decisions." We are informed that the Commonwealth of Massachusetts, which also plans to implement HDO next year, is facing similar challenges, and that states which intend to implement ACT and HDO in 2026 and 2027 are also facing issues.

Thus, these strategies may have both California and national implications for the truck market, as well as for clean air and climate policy. As the country continues to recover from inflationary spikes and supply chain constrictions, these corporate strategies appear to push in exactly the opposite direction by potentially raising prices and constraints for our supply chain.

This is not the first time that such questions have required government attention. For instance, the European Commission has previously fined heavy-duty truck makers for truck pricing collusion, suggesting that the practice can occur in the truck market, and that companies warrant careful oversight. Though we allege no specific violations here, we do believe that attention is warranted to review the facts on the ground.

Here, CARB and Oregon have both pointed to significant supply restrictions and pricing issues that implicate those laws. California has a further interest here because of its existing state investments in this market, which may now be in some jeopardy, and its climate and clean air policies, which CARB asserts face implementation challenges as a result of corporate behavior. Moreover, CARB previously reached an agreement with manufacturers to generally further the transition to cleaner vehicles to which the state, at least, had faithfully adhered; the spirit, at least, of that agreement now appears under pressure from manufacturers.

We hope you will ask manufacturers to provide information to the state, and to federal oversight bodies, to demonstrate that their actions comply with relevant law. Small truckers and fleets deserve cost-effective access to clean trucks. Moreover, the related clean truck rules rules are critical to environmental justice, public health, and climate protection, and cost-effective compliance with them is of considerable importance to small businesses state- and nation-wide.

Thank you for all you do for the people of California.

Sincerely,

Craig Holt Segall
SVP, Evergreen Action

Attachment 1: Additional Supporting Files

In addition to linked documents in the letter, we have compiled the following materials for review.

- Presentation from Daimler regarding sales limitations (attached)
  - Note Slides 10 and 11, limiting diesel engine availability, slide 5 specifying tying requirements, and slide 1, applying policy to all dealers
- Letter to Isuzu Dealerships in Oregon regarding sales limits
  - Note statement from Isuzu Commercial Trucks President stating that sales of specific diesel truck lines will be discontinued in relevant states
- Letter from Trask Chassis on sales limits
  - Indicating sales limitations in all 50 states, and stating tying ratio requirements for combustion truck sales
- Letter from Ballard Truck Center (MA) on sales limits
  - Describing "devastating" financial impacts of sales ratio requirements
- Letter from Oregon Department of Environmental Quality to Volvo Trucks making inquiries regarding OEM compliance strategies
  - Our understanding is that several manufacturers received a similar letter. Oregon DEQ notes in its letter that "[b]ased on our conversations with dealers, the manufacturers appear to have very similar market strategies"
- [November_2023_MSRC_Agenda_Final.pdf (cleantransportationfunding.org)]
  - MSRC had a presentation last fall that showed their projects were being quoted higher and higher prices for Class 8 ZEV tractors.
- Volvo Dealer letter to NY (see attached)
  - Volvo dealer letter talking to NY about the trouble 'if ratios are applied to me'.
- https://ww2.arb.ca.gov/sites/default/files/barcu/board/mt/2024/mt052324.pdf)May 23,2024 CARB Board Meeting_
  - James Wheeler, President of Municipal Maintenance Equipment, talks about trouble getting diesel chassis because the dealers aren't selling enough ZEVs (despite CARB's published data that there are enough ACT credits in the market)
  - "So we could buy the clean emissions. They're willing to buy the credits to offset. We just don't have that method, so all truck sales are running through California truck dealers. And there's a limited supply through California truck dealers, because they're not selling enough electrics yet. So ACT is limiting their ability to supply and there is no national supply currently."
- Tow-Truck Companies Warn CARB of Obstacles to Meeting ZEV Mandates | Regulation Status | newsdata.com

    - A trade press recap of May 23rd, 2024, Board Hearing testimony and discussion that included whether OEMs were actually using the credits and flexibilities available to them:
- How regulations impact truck buying and operation right now (fleetequipmentmag.com)
    - Cummins talking about OEM strategies
    - "This year's ICE-based truck sales in California have been affected," said Jim Nebergall, executive director of market strategy at Cummins. The range of impact on the market is between 30-50% according to figures shared by Cummins and other industry leaders.
    - "As Cummins, we're impacted because OEMs won't place an engine order on us unless they can actually sell it, and they can only sell it if they have sold enough zero-emissions vehicles. It's a dynamic real-time calculation to boot," Swenson added."
- CARB regulations are causing sales challenges for dealers | Trucks, Parts, Service (truckpartsandservice.com)
    - Eric Bassett, Owner of Riverview International Trucks, says because CARB's rules designate units into categories for Class 7-8 tractors (with a fifth wheel) and Class 4-8 trucks (without one), he's been able to place more orders for Class 8 chassis, straight trucks and medium-duty units. But those sales also have stipulations. Because of ACT's ZEV sales requirement, Bassett says this year he is required to sell and deliver one ZEV unit to earn ten ICE order slots.

40+ Orgs to Governors: Stay Committed to Clean Truck Standards

December 2, 2024

The Honorable Michelle Lujan Grisham

The Honorable Maura Healey

The Honorable Kathy Hochul

The Honorable Jay Inslee

The Honorable Tina Kotek

The Honorable Dan McKee

The Honorable Wes Moore

The Honorable Phil Murphy

The Honorable Jared Polis

The Honorable Gavin Newsom

The Honorable Phil Scott

Dear Governor:

We, the undersigned organizations representing millions of members and supporters across the country, urge **Governors to continue being leaders on reducing vehicle emissions and stay committed to the clean truck standards your states have adopted, which will deliver vital health, environmental, and economic benefits.** Your states have consistently led on clean air and climate policies that deliver health and economic benefits. That continued leadership is needed now more than ever as state action will be pivotal for common sense clean air and climate policies to advance during the next four years.

In addition to clean trucks standards, many of your states have passed ambitious policies to reduce carbon emissions to protect communities grappling with the profound impacts of climate change and cover the toll of increasingly common **billion-dollar disasters (https://www.ncei.noaa.gov/access/billions/time-series)**. Because pollution from heavy-duty vehicles has an outsized impact on public health and the climate crisis, transitioning to cleaner trucks is imperative for curbing carbon and diesel emissions at the pace required. These cost-effective and technologically-feasible clean trucks standards are essential for curbing local air pollution, addressing the worst effects of climate change, and ensuring the U.S. remains competitive in the growing global clean truck marketplace.

We are deeply concerned by the truck makers, whose reported vehicle pricing and availability strategies appear to be having significantly disruptive effects in the market for clean vehicles, accompanied by claims that the companies cannot meet the clean truck standards that have been adopted in your states. The trucking industry has launched a coordinated multi-state effort to recklessly pressure states to delay implementation of the Heavy-duty Omnibus (HDO) and Advanced Clean Trucks (ACT) standards. In a **recent letter to the Truck & Engine Manufacturers Association (https://www.politico.com/f/?id=00000193-1dbb-d194-adbf-1fbffc7d0000)** (EMA), many of you reminded truck makers that the ACT standards are achievable and contain ample compliance flexibilities, and we wholeheartedly agree.

According to the American Lung Association's **State of the Air Report (https://www.lung.org/research/sota/key-findings)**, 39 percent of Americans— over 131 million people—live in areas that have received failing grades for unhealthy levels of ozone or particulate matter in their air. Cleaner trucks are needed to address long standing air quality problems in communities located near trucking corridors and hubs, ports, and warehouses. These communities are often disproportionately affected by diesel exhaust emissions, experience increased health burdens due to poor air quality, and are more vulnerable to the impacts of climate change.

Adopting these clean trucks standards shows your commitment to ensuring more Americans are breathing clean air, thriving in healthy communities, and advancing the clean energy economy. We appreciate that each state led a comprehensive process carefully studying the benefits of the rules, leading public workshops, engaging industry and communities, and providing truck makers helpful considerations such as sufficient lead time and compliance flexibilities.

Prior to adopting these regulations, many of your states joined **the Multi-State Medium and Heavy Duty Zero-Emission Vehicle Initiative (https://www-f.nescaum.org/documents/multi-state-medium-and-heavy-duty-zero-emission-vehicle-action-plan/)**, which established goals to make at least 30 percent of new Medium and Heavy Duty (MHD) vehicle sales ZEVs by 2030, and 100 percent of sales ZEVs by no later than 2050. This concerted effort to get cleaner trucks on our roads requires that states continue with their original implementation plans and timeline.

Unfortunately, truck makers have a long track record of working **to undermine (https://influencemap.org/report/US-Heavy-Duty-Transport-Climate-Change-20434)** truck standards at the federal and state levels and now, they are **misleading dealers and stoking fear about the regulations (https://www.ccjdigital.com/regulations/emissions/article/15705512/oems-shift-burden-of-ghg-compliance-to-customers-and-dealers)**. The California Air Resources Board (CARB) published a recent **analysis (https://ww2.arb.ca.gov/sites/default/files/2024-09/240925_actmemo_ADA_0.pdf)** based on interviews with dealers, upfitters, fleets, and manufacturers outlining the complaints about alleged product shortages of cleaner HDO engines. CARB confirmed that the truck companies are well-situated to comply with the regulations.

CARB's recent analysis further shows that truck fleets in California are paying disproportionately high prices for zero emission trucks as compared to what they would pay for similar products in Europe. As battery prices (the most expensive part of a zero emission truck) are going down, basic economics suggest that the overall price of a truck should go down. In Europe that is true. In California it is not.

Federal antitrust, consumer protection, and unfair business practice laws defend consumers and the public when market power is used unfairly, and we urge you to use all relevant tools to hold industry accountable. Proposals to delay implementation of cleaner trucks that are being rushed through based upon unsubstantiated fears and the disruptive strategies of truck manufacturers are irresponsible and unacceptable. **It is critical that fleets are not unduly disadvantaged in the marketplace and we encourage you and your Attorney's General offices to investigate market behavior around cleaner trucks.**

The state truck standards took into consideration manufacturer needs by including credit flexibilities and extended compliance timelines. Manufacturers have received billions of dollars from the federal government to support truck electrification. State and federal governments are making major investments in the charging infrastructure to power these vehicles. These standards help fleets benefit from cost savings and avoid risks associated with the volatility of fossil fuel prices and supply, and help manufacturers spur innovation in the U.S.

Governors are responsible for protecting their residents from harm, and by adopting these crucial vehicle emissions standards you've demonstrated bold leadership. Do not let the trucking industry's disinformation and market tactics erode your efforts to safeguard the health of your residents and air quality of your communities. We call on you to remain firm and implement the clean truck standards that your state carefully adopted.

Sincerely,

November 8, 2024

Dear Truck and Engine Manufacturers Association Members:

As you know, Advanced Clean Trucks (ACT) is an important part of our states' plans to achieve our greenhouse gas emissions-reduction goals and reduce the threat of climate change to public health, the environment, and the economy. Across our states, transportation is collectively the highest-emitting sector, making up almost 40 percent of our states' total emissions. Nearly 20 percent of those emissions come from medium- and heavy-duty vehicles. Therefore, it is crucial that we have a roadmap for continuing to decarbonize these vehicles. We are eager to work closely with the trucking industry to spur the manufacturing and deployment of zero-emission vehicles (ZEVs).

ACT requires manufacturers to sell increasing percentages of ZEVs through model year 2035 or purchase credits from those who exceed the sales requirements. Recognizing that some vehicle types are more difficult to convert, ACT does not require fleet-wide compliance, but rather allows manufacturers to focus on the vehicle types for which zero-emission technologies are most favorable. ACT *does not* place any purchasing requirements on dealers or fleets. We have heard that several major medium- and heavy-duty vehicle engine manufacturers are placing blanket purchase requirements onto dealers rather than utilizing the flexibilities built into ACT. These existing flexibilities include:

- **Using early action credits**: Manufacturers are able to generate and bank credits for sales, which can be used for compliance starting in the first applicable model year, incentivizing early movers.
- **Banking and trading credits**: Manufacturers may continue generating and banking credits to use for compliance in the future, or purchase excess credits earned from other manufacturers, adding flexibility across the industry.
- **Adopting near-zero-emission vehicles**: A manufacturer may meet 50% of their compliance each year with credits earned from sales of plug-in hybrids, allowing for more vehicle types and routes to lower emissions.
- **Using non-tractor credits to meet tractor deficits for manufacturers with 25 or fewer tractor (e.g., semi-truck) deficits**: A manufacturer that sells very few Class 7-8 semi-trucks, or tractors, in a model year may use non-tractor credits for tractor compliance.
- **Using interchangeable non-tractor credits**: A manufacturer may use Class 2b-3 and Class 4-8 non-tractor credits interchangeably to make up those non-tractor deficits, providing flexibility for different product portfolios.

- **Carrying forward deficits**: A manufacturer that does not comply in a given model year has additional time to make up for their shortfall.

Additional ACT flexibilities were recently approved in California on October 24, 2024, as part of Clean Truck Partnership implementation. These include lengthening the amount of time manufacturers have to make up shortfalls, simplifying credit accrual, and allowing secondary manufacturers to participate in the credit market. The other undersigned states are considering updates to our respective ACT rules, as appropriate, to integrate these compliance flexibilities.

We are confident that ACT's requirements are achievable through close collaboration between the public and private sectors, and we recognize the important role of the trucking industry in meeting these goals. To that end, we propose a meeting to discuss implementable solutions to increase ZEV adoption and next steps to meeting existing compliance obligations across Section 177 states. One potential option for advancing a collaborative approach may be the establishment of a Clean Truck Partnership across Section 177 states. We are directing our air and climate regulatory agencies to participate in this meeting and engage in these conversations on our behalf.

We thank you for your continued partnership and look forward to our ongoing collaboration to decarbonize the transportation sector and combat climate change.

BATTERY ELECTRIC TRUCKS IN THE U.S. NORTHEAST: ELECTRIC UTILITIES AND PLANNING FOR TOMORROW

May 17, 2024 | By: Jasreet Kaur Gill and Yihao Xie

ore than 20,000 trucks travel the network of roads in the U.S. ortheast corridor every day, many delivering goods from the arbors of New York, New Jersey, and Boston to factories and onsumers throughout the country. Several signs now point to hese trucks beginning the electric transition.

nflation Reduction Act incentives coupled with declining costs re expected to make electric medium- and heavy-duty vehicles MHDVs) economically attractive to own and operate. anufacturers will be obliged to produce and sell electric trucks New York and Massachusetts because the states adopted the dvanced Clean Trucks rule. The U.S. Environmental Protection gency's final 2027–2032 HDV CO_2 emission standards set tighter mission limits on future MHDVs nationwide, and federal funding beginning to flow to support the switch to zero-emission trucks s part of the Biden administration's national goal of a zero-missions freight sector announced late last month.

hirty-one out of over 220 "zero-emission freight hubs" in Phase 1 nd 2 of the recently published National Zero-Emission Freight orridor Strategy are facilities located in Massachusetts, New ork, and New Jersey. The Northeast corridor also stood out in our ational infrastructure assessment of MHDV charging nfrastructure needs in 2025 and 2030: Five counties surrounding orts in New York and Massachusetts ranked the highest in the nited States for MHDV charging needs per square kilometer. igure 1 is a map of estimated county-level power draw amount n the distribution grid; it illustrates the peak load, per square ilometer, from electric MHDV depot charging in 2030. Coastal ounties near ports have the darkest shades, which indicate a igh peak load.

igure 1. Estimated peak load per square kilometer from fleet lepot charging in 2030 in Connecticut, Massachusetts, New York, lew Jersey, and Rhode Island counties. *Source: [Ragon et al. 2023)](https://theicct.org/)*.

hree investor-owned utilities–Consolidated Edison (Con Edison), lational Grid, and Eversource—serve the counties with the ighest MHDV charging needs in the Northeast. Their service erritories are illustrated in Figure 2.

igure 2. Service areas for National Grid, Con Edison, and versource in Massachusetts and downstate New York

et us highlight a few ways that these three are preparing to erve electric truck customers.

1. **Subsidies**. The high upfront costs associated with vehicle purchase and infrastructure installation for electric MHDVs is

a major hurdle for truck fleet operators, and the Joint Utilities of New York, which includes Con Edison and National Grid, created a make-ready pilot program with a $67 million budget to assist fleets with installing chargers and estimating their vehicle and infrastructure costs. This program provides eligible fleets with subsidies for up to 90% of utility-side charging infrastructure installation costs and 50% of customer-side costs.

2. Tools to aid fleet decision-making and cost analysis. Utilities have created tools for their own use and for their customers to better understand grid-planning timelines, future upgrades that might be needed, and the costs involved in electrifying trucks. National Grid provides fleet advisory services that help customers estimate power demand and distribution impacts, understand their future electricity costs, and explore options to reduce electricity costs.

Con Edison created a fleet electrification calculator to help fleets estimate the cost of a charging station for different types of vehicles (light, medium, heavy) and it shows fleet owners their costs and savings if they switch to electric MHDVs. Once fleets put these tools to use, utilities can also get valuable customer behavior and preference data, which can help identify locations that need the most amount of power.

The Massachusetts Clean Energy Center and CALSTART created a program with Eversource and National Grid that assigns a project team to help fleet owners with the entire process of electrification. The team helps with things including searching for truck models, understanding funding opportunities and taking advantage of incentives, and planning for charging equipment.

3. Reduced electricity rates. The cost of operating battery electric trucks is highly dependent on electricity cost. Con Edison offers a $0.03/kWh rate reduction for charging between midnight and 8 am, and additional incentives for avoiding charging during peak times. For Con Edison, this has an added benefit because it could help smooth out the demand on the overall system, especially when loads from other activities are high.

here are other potential supports. One example from outside he Northeast is to offer multilingual fleet services. California's acific Gas and Electric shares its EV fleet program in several anguages, which makes accessing the information easier for a arger group of people.

Vhat about distribution grid capacity? Can existing electrical ssets handle electric truck charging? Based on the estimates rom our 2023 infrastructure assessment, by 2030, the peak load rom truck depot charging in areas served by National Grid, Con dison, and Eversource could be up to 68 MW. The same study stimated that the nameplate capacity of chargers on local listribution grids, in other words, the theoretical maximum apacity where all MHDV chargers draw power simultaneously rom the grid at their rated powers, can exceed 500 MW. This loesn't account for public charging, which will also need lectricity. Adding half a gigawatt of new nameplate capacity cross the areas of service in the Northeast will likely involve new eeder lines, transformer upgrades, and potentially construction f substations that can cost hundreds of thousands or millions of lollars. It's important to overcome the challenges, because long vait times may put projects behind schedule and put ompliance with the Advanced Clean Trucks regulation at risk.

ı response to a New York State Department of Public Service roceeding to address MHDV charging infrastructure challenges, he Joint Utilities of New York acknowledged the imminent need o build MHDV charging infrastructure and agreed that grid ıvestments must be prioritized in areas where demand for ower is high and spare capacity is tight. With federal funding nd the help of CALSTART, National Grid has launched the Iortheast Freight Corridors Charging Plan through which it aims o map out an electric truck charging network for the entire Iortheast region.

ctions by the Joint Utilities of New York and National Grid reflect heir willingness to take action to expedite and expand truck harging. The next step is to translate these signals to proactive lanning, and for regulators to approve construction and onnection of MHDV customers to the grid.

Executive Summary

Mobile sources and the fossil fuels that power them are the largest contributors in California to the formation of ozone, greenhouse gas (GHG) emissions, fine particulate matter (PM2.5), and toxic diesel particulate matter (PM). In the State, the transportation sector alone accounts for 41 percent of total GHG emissions (50 percent when upstream emissions from fuel is included) and is a major contributor to oxides of nitrogen (NOx) and PM emissions. Medium- and heavy-duty vehicles contribute a quarter of the transportation sector's GHG emissions and a third of the transportation sector's NOx emissions, a disproportionately high share considering these vehicles represent only about 1.8 million trucks among the 30 million registered vehicles in the state. The proposed Advanced Clean Fleets (ACF) regulation, or "proposed ACF regulation," would contribute to achieving the State's criteria pollutant and GHG reduction goals as well as cleaner technology targets needed to protect communities. Implementing this proposed ACF regulation is expected to save over 5,000 Californian lives between 2024 and 2050. These avoided premature mortalities and other avoided adverse health benefits have an estimated value of over $57 billion dollars.

The proposed ACF regulation is part of a comprehensive strategy that would, consistent with public health needs, accelerate the widespread adoption of zero-emission vehicles (ZEV) in the medium- and heavy-duty truck sector and in light-duty package delivery vehicles. The proposed ACF regulation would require certain fleets to deploy ZEVs starting in 2024 and would establish a clear end date of new medium- and heavy-duty internal combustion engine (ICE) vehicle sales in 2040.

The proposed ACF regulation builds on other policies to continue reducing emissions, including the Advanced Clean Trucks (ACT) regulation.[1] It would be the next significant step in accelerating towards a zero-emission (ZE) transportation system as well as a more equitable future in California. With the adoption of the ACT regulation in 2020, the California Air Resources Board (CARB or Board) took a major step in securing a ZE future. The ACT regulation covers everything from heavy-duty pickups or work trucks to the semi-trucks used in drayage and long-haul applications, and requires truck manufacturers, beginning with the 2024 model year (MY), to produce and sell ZEVs into California's market in growing numbers. The proposed ACF regulation and the ACT regulation together are expected to result in about 510,000, 1,230,000, and 1,590,000 ZEVs in California in 2035, 2045, and 2050, respectively. These quantities of ZEVS are in turn projected to significantly reduce criteria and GHG pollutants when compared to Legal Baseline as shown *in* Table 1.

Table 1: Estimated ACF Emission Reductions in 2040 and 2050

Year	NOx	PM2.5	GHG
2040	47%	24%	41%
2050	57%	37%	62%

The proposed ACF regulation establishes aggressive, but achievable, emissions targets, and would comprise the next installment of policies to help transform the medium- and heavy-

[1] The ACT regulation is comprised of California Code of Regulations (Cal. Code Regs.) title 13, sections 1963, 1963.1, 1963.2, 1963.3, 1963.4, 1963.5, 2012, 2012.1, and 2012.2.

duty sector and light-duty package delivery vehicles to ZE by focusing on specific fleets where accelerated ZE transitions are feasible and critical to these goals. It is one of a range of policies – including potential commitments in the State Implementation Plan (SIP), incentive spending, infrastructure installations, and land use policies – that jointly can achieve a full transition to a ZE transportation system. Other policies, which are not the subject of this rulemaking, are cleaning up the remaining combustion fleet, including CARB's Heavy-Duty Omnibus Regulation and Heavy-Duty Vehicle Inspection and Maintenance Regulation (HD I/M). [2,3] Thus, vehicles powered by internal combustion engines are not in the ambit of this proposal, but CARB has established a comprehensive set of rules and policies aimed at all portions of the vehicle fleet in order to protect public health. The primary objectives of this proposal include the following:

- Achieve criteria pollutant and GHG emissions reductions consistent with the goals identified in the SIP Strategy and Scoping Plan, including supporting compliance with state and federal ambient air quality standards.
- Provide criteria pollutant and toxic air contaminant emissions reductions in disadvantaged communities (DAC), which is consistent with CARB's statewide strategy to reduce these emissions in communities affected by a high cumulative exposure burdens under Assembly Bill (AB) 617.[4]
- Support the 100 percent ZE transition targets set by the Board in Resolution 20-19 which calls for:
    - Drayage trucks, last mile delivery, and government fleets to be ZE by 2035.
    - Refuse trucks, local buses, and utility fleets to be ZE by 2040.
    - All trucks and buses to be ZE, where feasible by 2045.
- Support the goals of Executive Order N-79-20, which calls for accelerated ZEV deployment with these targets:
    - 100 percent ZE drayage by 2035.
    - 100 percent ZE trucks and buses where feasible by 2045.
- Ensure requirements, such as ZEV deployment schedules and related infrastructure build-out, are technologically feasible, cost-effective, and support market conditions.
- Lead the transition away from petroleum fuels and towards electric drivetrains.
- Contribute towards achieving carbon neutrality in California pursuant to Senate Bill (SB) 100,[5] and in accordance with Executive Order B-55-18.
- Complement the ACT regulation to enhance widespread ZEV deployment.
- Mindfully set requirements to allow time for public ZE infrastructure buildout for smaller fleets or for regional haul applications who would be reliant on a regional network of public chargers.

[2] The Omnibus regulation is comprised of Cal. Code Regs., title 13, sections 1900, 1956.8, 1961.2, 1965, 1968.2, 1971.1, 1971.5, 2035, 2036, 2111 through 2119, 2121, 2123, 2125 through 2131, 2133, 2137, 2139, 2139.5, 2140 through 2149, 2166, 2166.1, 2167 through 2170, 2423, and 2485; and Cal. Code Regs., tit. 17 sections 95662 and 95663.
[3] The rulemaking action for the HD I/M regulation has not yet been completed; the proposed HD I/M regulation is comprised of Cal. Code Regs., tit. 13, sections 2193, 2195, 2195.6, 2196 through 2196.8, 2197 through 2197.3, and 2198 through 2199.1.
[4] Assembly Bill 617 (C. Garcia, Stats. 2017, ch. 136).
[5] Senate Bill 100 (De León, Stats. 2018, ch. 312).

- Ensure manufacturers and fleets work together to place ZEVs in service suitably and successfully as market expands.
- Complement current and existing programs to achieve emissions reductions that are real, permanent, quantifiable, verifiable, and enforceable.
- Establish a fair and level playing field among fleet owners.
- Craft requirements in a way that ensures institutional capacity for CARB to manage, implement, and enforce requirements.

The proposed ACF regulation provides a ZEV phase-in approach which provides initial focus where the best fleet electrification opportunities exist, sets clear targets for regulated fleets to make a full conversion to ZEVs, and creates a catalyst to accelerate development of a heavy-duty public infrastructure network. In addition, it aggressively pushes drayage trucks to be ZE, given the suitability of their duty cycles, outsized impact on disproportionately impacted communities, and ability to maximize emissions reductions in heavily impacted communities. This approach gives fleets the flexibility to phase in ZEVs in the most suitable applications first and focuses initial ZEV infrastructure development to support community health around ports and railyards.

The proposed ACF regulation attempts to strike a balance between moving the market quickly to ZE while recognizing fleets more suited for electrification should lead the way for smaller fleets. Staff recognizes the complexities of applying purchase mandates to fleets affected by the proposed ACF regulation and acknowledges that additional tools may be needed to meet the 100 percent ZE by 2045 goal set in the Governor's Executive Order N-79-20. For instance, it is important that manufacturers continue to have strong reasons to set competitive prices, especially for small fleet owners who may experience more economic constraints on vehicle purchases; simply requiring ZEV purchases for these fleet owners could result in elevated prices for a key sector of the small business economy. Thus, CARB continues to investigate a range of tools that can address this portion of the fleet as well, in an equitable and effective way.

In addition to accelerating the deployment of ZEVs, the proposed ACF regulation states that 100 percent of manufacturer sales of all Class 2b-8 vehicles must be ZE by 2040, which sends a clear signal regarding the end of ICE powered truck sales in California. This end point for sales of new ICE vehicles in California ensures accelerated improvements in the economics of ZEVs and the investments needed to expand the market quickly. This increases confidence for infrastructure providers and ZEV components suppliers to invest in and supports a rapidly growing market, ensuring that ZEV technology advancements continue. It also provides more air quality benefits to our communities as well as more choices to fleets and consumers.

A. Purpose of The Proposed ACF regulation

The purpose of the proposed ACF regulation is to accelerate the widespread adoption and usage of ZEVs in the medium- and heavy-duty truck sector and light-duty vehicles used in mail and package delivery, to reduce harmful emissions generated from on-road mobile sources.

A number of policy, planning, and regulatory actions have led to the development of the proposed ACF regulation and the need to accelerate ZEV deployments everywhere feasible. In 2018, the Governor issued Executive Order B-55-18, which set a target to achieve carbon neutrality in California no later than 2045, and to achieve and maintain net negative emissions thereafter. In 2020, Executive Order N-79-20 set specific targets to transition the truck fleet to ZE technology by 2045. In January 2021, the ACT regulation was adopted by CARB as a key part of the holistic approach to accelerate a large-scale ZEV transition of medium- and heavy-duty trucks. The ACT regulation's ZEV sales requirement establishes a supply of medium- and heavy-duty ZEVs, while the ACT regulation's one-time fleet reporting requirement provided detailed information about fleets and how they use their vehicles. In October 2021, CARB released the 2020 Mobile Source Strategy, a top-down analysis of policy options and emissions reductions needs, which identified the proposed ACF regulation as part of a comprehensive strategy to achieve a ZE truck and bus fleet by 2045 everywhere feasible, and significantly earlier for certain well-suited market segments.[6] In addition, CARB released the 2022 State SIP Strategy (draft) which builds on 2020 Mobile Source Strategy, and includes ACF as well as a proposed commitment to accelerate the number of medium- and heavy-duty ZEV beyond the ACT and proposed ACF regulation.[7] Additionally, the 2022 Scoping Plan Update (draft) lists the proposed ACF regulation as a necessary policy to achieve climate change goals and includes it in the modeling. [8] The proposed ACF regulation directly supports achieving these goals through the regulatory transition of medium- and heavy-duty ZEVs in California.

B. Summary of Proposed ACF regulation

The proposed ACF regulation would require State and local government fleets, drayage trucks, high priority fleets, and federal fleets to phase in medium- and heavy-duty ZEVs over time. The proposed ACF regulation additionally sets a clear end date for new internal combustion-powered medium- and heavy-duty vehicle sales in California. The proposed ACF regulation includes four components: three sets of fleet requirements on State and local government fleets, drayage trucks, and high priority and federal fleets, and a ZEV sales requirement on medium- and heavy-duty truck manufacturers. The following provides information on each of the proposed components.

1. State and Local Government Fleets

- Applies to California cities, counties, public utilities, special districts, local agencies or districts, and State government agencies that own a Class 2b-8 vehicle.
  - o Excludes federal agencies, which are regulated under the high priority and federal fleet requirements.
- When adding vehicles to their California fleet, affected fleet owners must only add ZEVs per the following schedule.

[6] California Air Resources Board, *2020 Mobile Source Strategy*, October 28, 2021 (web link: https://ww2.arb.ca.gov/sites/default/files/2021-12/2020_Mobile_Source_Strategy.pdf, last accessed August 2022).

[8] California Air Resources Board, *The AB 32 Scoping Plan (draft)*, 2022 (web link: https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents, last accessed August 2022).

    - Fleets outside designated low-population counties: 50 percent of the total number of vehicle additions must be ZEVs beginning January 1, 2024, increasing to 100 percent beginning January 1, 2027.
    - Fleets in designated low-population counties: 100 percent of the total number of vehicle additions must be ZEVs beginning January 1, 2027.
- Compliance exemptions for backup vehicles, daily usage, infrastructure construction delays, ZEV unavailability, and mutual aid assistance.
- Annual reporting, starting April 1, 2024, with recordkeeping requirements.

2. Drayage Trucks

- Applies to Class 7-8 heavy-duty trucks transporting containerized, bulk, or break-bulk goods, empty containers or chassis' to and from California's intermodal seaports and railyards.
- All trucks added to CARB's Online System must be a ZEV beginning January 1, 2024.
    - All drayage trucks must visit a regulated seaport or intermodal railyard at least once each calendar year to remain in CARB's Online System.
    - Existing ICE drayage trucks may not exceed their minimum useful life to remain in the CARB's Online System.
    - All drayage trucks entering seaports and intermodal railyards would be required to be ZE by 2035.
- Compliance exemptions for dedicated use uni-body vehicles (e.g., auto transports), infrastructure construction delays, and ZEV vehicle delivery delays.
- Annual reporting starting January 1, 2024, with reporting or recordkeeping requirements for truck owners, seaports, railyards, and marine terminals.

3. High Priority and Federal Fleets

- Applies to fleets that meet the following criteria:
    - Any fleet owner who owns, operates, or directs 50 or more Class 2b-8 vehicles or off-road yard tractors including vehicles under common ownership and control, that operates at least 1 vehicle in California.
    - Any entity with $50 million or more in annual revenue and owns or operates at least 1 affected vehicle that is operated in California.
    - Federal government agencies that own, operate, or direct one or more affected vehicles in California.
- Affected vehicles include all Class 2b-8 on-road vehicles, off-road yard tractors, and light-duty package delivery vehicles in the fleet.
- High priority and federal fleets must meet the Model Year Schedule, or opt-in to the ZEV Milestones Option.
    - Model Year Schedule: Beginning January 1, 2024, all additions to the fleet must be ZEVs, and all ICE vehicles must be removed from the California fleet at the end of their useful life.
    - ZEV Milestones Option: ZEV phase-in requirement where a portion of the fleet must be ZE based on the schedule laid out in Table 2.

Table 2: High Priority and Federal Fleet ZEV Phase-In Schedule

Group	Percentage of Fleet that Must be ZEVs	10%	25%	50%	75%	100%
1	Box trucks, vans, two-axle buses, yard trucks, light-duty delivery vehicles	2025	2028	2031	2033	2035
2	Work trucks, day cab tractors, three-axle buses	2027	2030	2033	2036	2039
3	Sleeper cab tractors and specialty vehicles	2030	2033	2036	2039	2042

- Compliance exemptions for backup vehicles, daily usage, infrastructure construction delays, vehicle delivery delays, ZEV unavailability, declared emergency events, and mutual aid assistance.
- Annual reporting starting February 1, 2024, and recordkeeping requirements.

4. 100 Percent ZEV Sales Requirement

- Beginning 2040 MY, all new medium- and heavy-duty vehicles sold by manufacturers in California must be ZEV.
  - This requirement does not apply to authorized emergency vehicles.
- This requirement impacts all fleets and individuals who purchase medium- and heavy-duty vehicles in California.

C. Potential Impacts and Benefits of Proposed ACF regulation

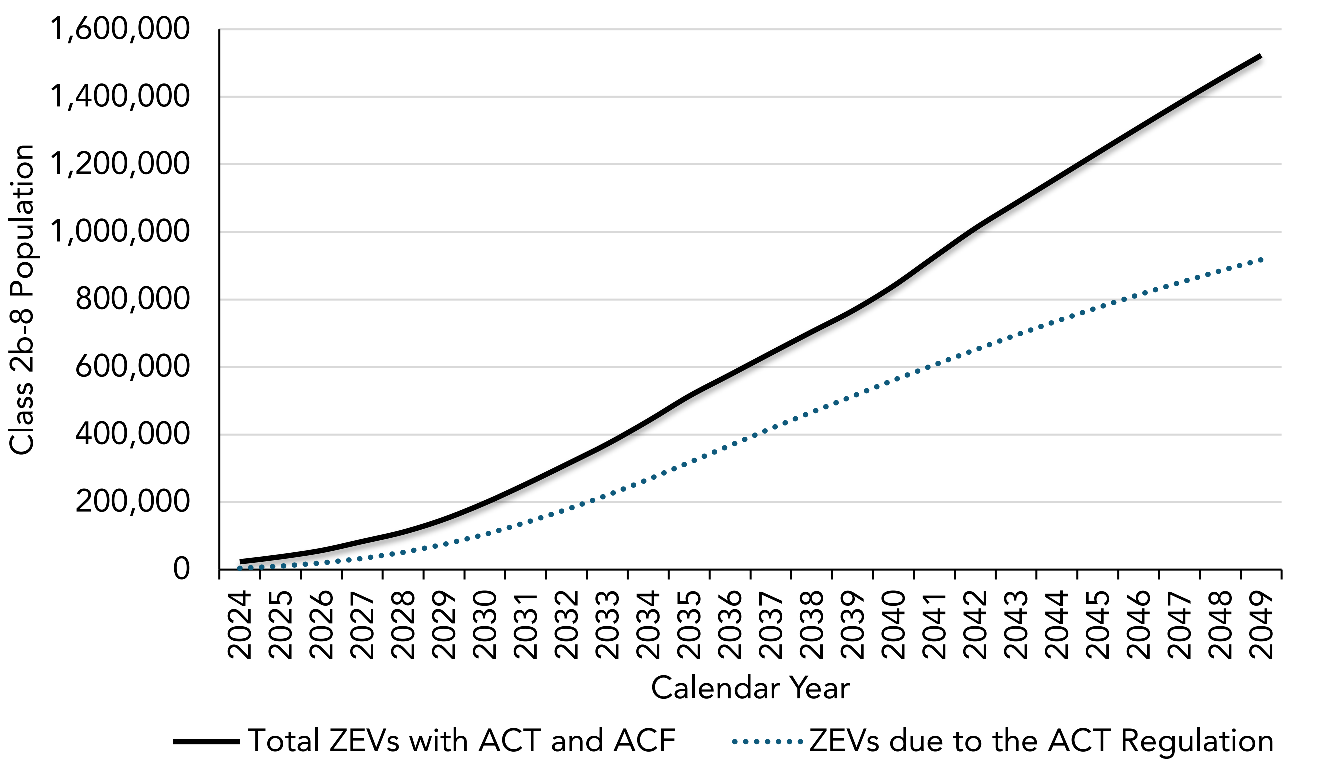
The proposed ACF regulation would help reduce emissions from fleets that pose acute health risks to local communities in which they operate and would contribute towards achieving CARB's emissions reductions goals for attaining federal health-based air quality standards and the State's GHG reduction goals. The proposed ACF regulation would result in cost-savings and reductions in criteria pollutants, toxic air contaminants, and GHG emissions at the statewide, regional, and local levels. This is a part of California's holistic plan to meet challenging federal air quality mandates and State climate goals, as well as protect the public health of all Californians. Table 3 enumerates the cumulative statewide benefits for emissions, cost-savings, and avoided premature deaths expected from full implementation of the proposed ACF regulation through calendar year 2050. The overall direct cost of the proposed ACF regulation to fleets is expected to be a savings of $22.2 billion, with additional health benefits savings of $57.8 billion, and social cost of carbon savings ranging from $9.4 billion to $36.4 billion. All costs are in 2021 constant dollars.

Table 3: Statewide Cumulative Benefits of Proposed ACF Regulation to 2050

Benefit Criteria	Cumulative Benefit by 2050
NOx Reduction	418,943 tons
PM2.5 Reduction	8,638 tons
GHG Reduction	307 MMT CO_2
Avoided Cardiopulmonary Mortalities	5,519
Health Benefits Savings	$57.8 billion
Social Cost of Carbon Savings	$9.4 to $36.4 billion
Net Fleet Cost-Savings	$22.2 billion

The proposed ACF regulation is projected to significantly increase the number of medium- and heavy-duty ZEVs in California beyond the ZEV sales expected from the ACT regulation as shown in Figure 1. The estimated number of ZEV would increase from about 320,000 to about 510,000 in 2035, from about 780,000 to about 1,230,000 ZEVs by 2045, and from about 950,000 to about 1,590,000 ZEVs by 2050.

Figure 1: Statewide Population Forecast with the Proposed ACF Regulation



The proposed ACF regulation is projected to result in significant NOx, PM2.5, and GHG emissions reductions above and beyond the ACT regulation. ZEVs produce no tailpipe emissions, reduce brake wear, PM emissions, and have lower upstream emissions. Table 4 summarizes the expected criteria pollutant emission benefits from 2031 through 2050. These emissions reductions, in tons per day (tpd), would contribute to the SIP Strategy and Climate Change Scoping Plan.

Table 4: Projected Emissions Reductions of the Proposed ACF Regulation

Calendar Year	NOx (tpd)	PM2.5 (tpd)	CO_2 (MMT/yr.)
2031	19.99	0.33	4.55
2037	51.99	0.95	10.91
2040	68.59	1.31	14.26
2045	83.89	1.86	19.89
2050	97.24	2.29	24.27

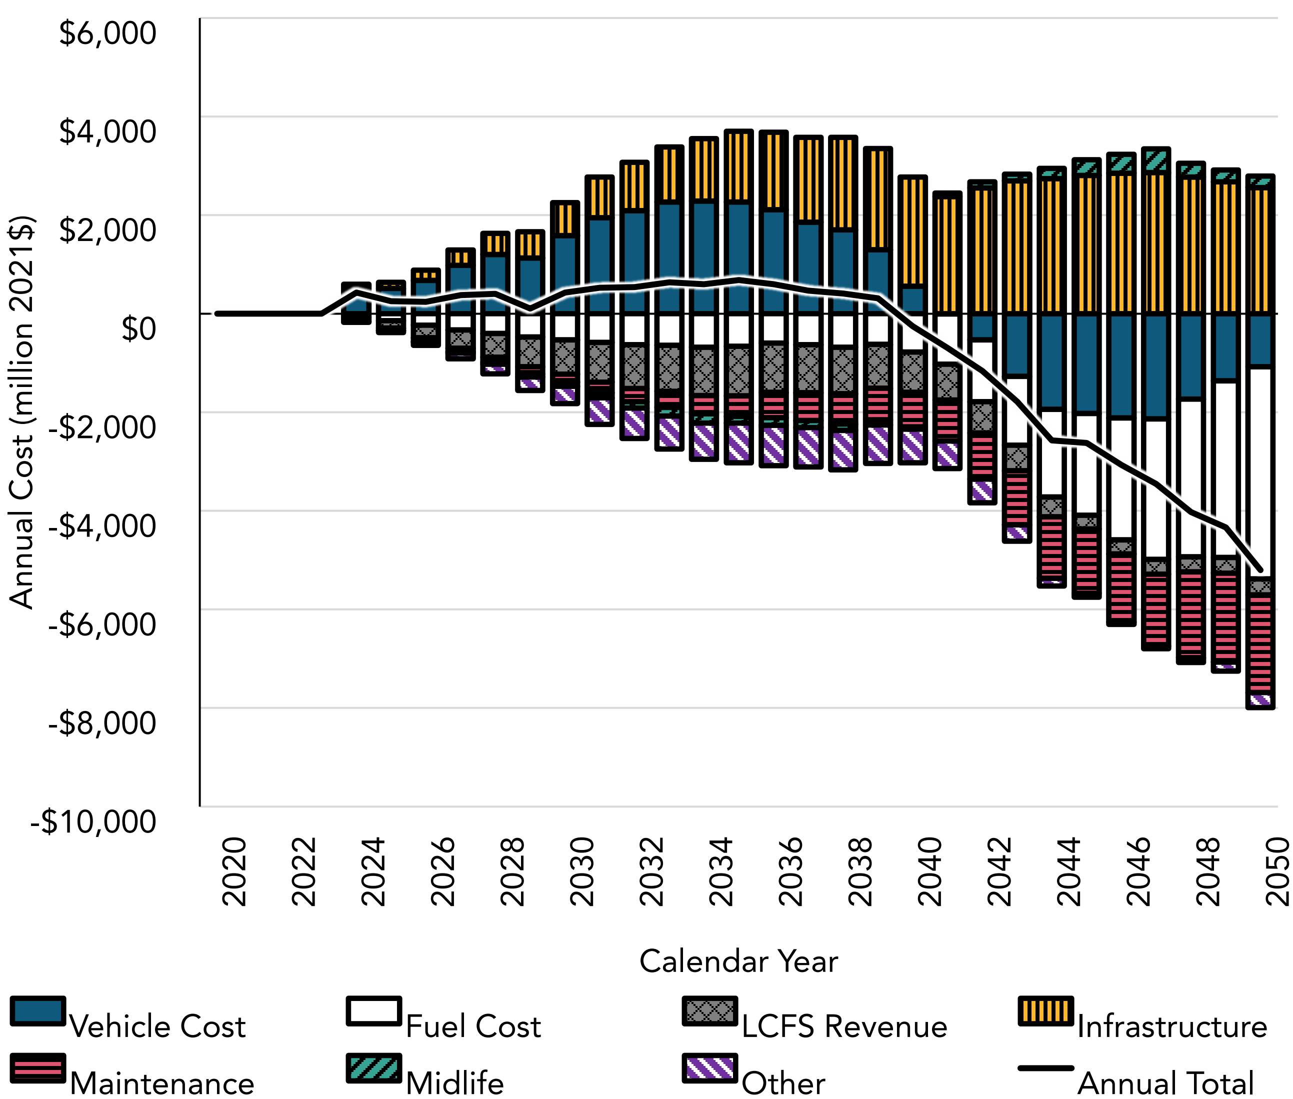
The proposed ACF regulation would also result in health benefits for individuals in California. The value of health benefits calculated for this regulation is due to fewer instances of premature mortality and hospital or emergency room (ER) visits. Table 5 displays the total cumulative number of avoided mortality and morbidity events and the total valuation to 2050.

Table 5: Estimated Cumulative Avoided Mortality and Morbidity Events and Total Valuation of Health Benefits to 2050

Cardiopulmonary Mortality	Hospitalizations for Cardiovascular Illness	Hospitalizations for Respiratory illness	ER Visits	Total Valuation
5,500	870	1,040	2,500	$57.7 Billion

Currently, ZEVs cost more than their combustion-powered counterparts due to higher vehicle costs and additional infrastructure expenses. However, due to a combination of lower fuel costs, maintenance cost-savings, and Low Carbon Fuel Standard (LCFS) revenue, ZEVs are expected to provide a positive total cost of ownership (TCO) for several use cases now and for most applications by 2030. Overall, the proposed ACF regulation is expected to result in a net savings to the California fleet. The proposed ACF regulation is expected to result in a net cost savings of $22.2 billion as illustrated in Figure 2. These costs do not include grants or rebates, so additional vehicle incentives, utility investments, and other investments will provide additional savings to fleet owners. This $22.2 billion in cost-savings are in addition to the $57.7 billion in health savings to the State.

Figure 2: Total Estimated Direct Costs of the Proposed ACF Regulation Relative to the Legal Baseline Scenario (Million 2021$)



D. Challenges and Long-Term Outlook

For over 50 years CARB has been ratcheting down on criteria and toxic pollution and more recently has been taking steps to reduce climate pollution. Pollution from black carbon and smog forming pollutants still impact Californians daily. For 5 decades, CARB has established a multitude of policies and plans and implemented numerous control measures and regulations to control and limit on- and off-road sources of emissions. However, trucks emit a disproportionate amount of air pollution. Additionally, trucks often operate in clusters centered around distribution warehouses, railyards, and ports which further exacerbates the air quality problem in these overburdened communities. A number of policies to reduce pollution from engines and their fuels have made significant progress, but more needs to be done, especially considering the long-life of trucks and the urgency of climate action. CARB found that expected efficiency gains from electrification of trucks and buses are better than previously estimated, especially for low-speed duty cycles.[9] Today, ZE trucks cost more upfront to purchase than their ICE counterparts and are in the early stages of a market transformation, but the ZEV service and support networks need to be expanded, along with charging and hydrogen fueling infrastructure. However, the efficiency of ZE trucks coupled with no tailpipe emissions means a win-win for all Californians who are disproportionately impacted by truck exhaust–including truck drivers. ZEVs have no tailpipe emissions and also have reduced PM associated with reduced brake wear, compared to conventionally fueled trucks. ICE truck exhaust emissions also increase with age which does not happen with ZEVs. In addition, ZEVs and associated lifecycle emissions from fuel and energy use are expected to continue to decline over time as the electrical grid gets even cleaner and as technology improves. Making this transition to ZE is critical to meet the State's air quality and climate change goals.

Some near-term challenges include the incremental cost to purchase the ZEV along with building-out chargers to recharge vehicles overnight at the fleet's yard, also known as depot chargers, and hydrogen fueling infrastructure, as well as the learning curve associated with adopting new technology. Most fleet vehicles travel relatively short distances each day and have operations that are suitable for electrification, but issues due to unknowns from using a new technology from the fleet perspective may exist. A mid-term challenge facing a long-haul and intrastate trucking operation is the need for publicly available charging and hydrogen fuel network. Faster chargers with capacities up to 350 kilowatts (kW) are being deployed in the field today and work is underway to develop and demonstrate chargers that exceed 1 megawatt that would allow even the largest vehicles to recharge in well under an hour. In addition, longer range trucks need supplemental storage capacity for batteries or hydrogen tanks, which can add more weight to the truck. State law allows ZEVs and near-zero-emission vehicles (NZEV) to exceed California maximum weight limits by 2,000 pounds (lbs.) which addresses some of the vehicle weight and payload capacity concerns of zero-emission technology for weight limited loads. [10] However, weight may only be an issue for a about 10 percent of the largest trucks on the road and may only affect about 2 percent of the most common dry van tractor trailer combination at maximum weight.[11] Additionally, payload capacity concerns are expected to diminish over time as battery energy densities improve and emphasis is placed on vehicle light-weighting. Weight is less of a concern for fuel cell electric vehicles (FCEV) as they have comparable range to combustion vehicles and weigh less than long-range BEVs with bigger batteries.[12] Staff anticipates these challenges to diminish with technology improvements and scale as BEVs and FCEVs become more commonplace.

Concerns have been raised around the availability and rollout of public and private ZEV infrastructure, including both charging and hydrogen stations, and the grid's ability to meet

[12] North American Council for Freight Efficiency, *Making Sense of Heavy-Duty Hydrogen Fuel Cell Tractors*, 2021 (Web link: https://nacfe.org/wp-content/uploads/2020/12/NACFE-Guidance-on-Hydrogen-Fuel-Cell-Tractors-FINAL-121620.pdf, last accessed August 2022).

the steadily growing electrical demand generated by the proposed ACF regulation and other rules promoting electrification. CARB staff have closely collaborated with multiple State agencies on this issue including the California Energy Commission (CEC), California Public Utilities Commission (CPUC), Governor's Office of Business and Economic Development (GO-Biz), and others. Robust modeling efforts by CEC have estimated that 157,000 chargers will be necessary by 2030 to support heavy-duty vehicle electrification.[13] This charging need will initially be focused "behind the fence" through depot charging, but publicly accessible options will be needed to enable a widespread charging network for long-range and interstate travels.

To meet the projected charging and refueling infrastructure needs, expanded incentive programs were launched by CEC. CPUC has directed the investor-owned utilities (IOU) to offer infrastructure support programs and incentives for fleet owners to install infrastructure in their territories. This includes funding programs such as the CEC's Energy Infrastructure Incentives for Zero-Emission Commercial Vehicles (EnergIIZE) program which is providing funding to support ZEV infrastructure as well as programs the CPUC has approved which authorize investor-owned utilities (IOUs) to invest in medium- and heavy-duty infrastructure. [14,15] Federal investments in charging and hydrogen stations are starting to takeoff through the Infrastructure Investment and Jobs Act. In addition, private companies are also making significant investments in ZE vehicles and infrastructure with billions of dollars in announcements.[16] Private efforts often target ZE vehicle fleet integration, charging needs, as well as to gather data to improve future products offerings. Private investments in hydrogen stations have also increased significantly in recent years as discussed on page 5 of the Assembly Bill 8 report.[17] In addition, Nikola Corporation has announced plans to build three hydrogen fueling stations for the fuel cell truck market in Colton, Ontario, and one serving the Port of Long Beach in collaboration with the Travel Centers of America.[18]

California's electric grid is designed to meet the highest demand, which in California occurs between 4 p.m. and 9 p.m. during the hottest days in summer. Fleet owners may opt to charge vehicles outside of these "peak hours." In addition, electric vehicles (EV) have the potential to serve as secondary storage to absorb excess renewable power from the grid and avoid curtailment. Work is ongoing to support the development of vehicle to load or back feeding into the grid. Other concerns have been raised about the impact public safety power

shutoff (PSPS) events may have on ZEV operations. The recent CPUC Decision 20-06-017 has potential to build support for distributed generation using localized microgrids that provide resiliency during power loss events, such as PSPS events and other declared emergencies.[19]

CARB staff is confident that the proposed ACF regulation targets fleets best suited for electrification while allowing flexibility over a longer time horizon for the more challenging use cases. The proposed ACF regulation is structured to phase in ZEV deployments where they are best suited to begin accelerating the transition to ZEVs in all truck market segments. This approach also considers infrastructure planning and network development strategies that will complement market expansion.

Implementation of both the existing ACT regulation and the proposed ACF regulation is expected to transition a vast majority of heavy-duty trucks to ZEVs. Shifting the remaining fleet to ZE technology requires additional policy tools to cost-effectively complete the transition for remaining fleets that are more dependent on purchasing trucks on the secondary market. The 2022 SIP Strategy identifies a Zero-Emission Truck Measure which would use targeted market signal tools, or a similar proposal that would start in 2030. Placing regulatory requirements on fleets is only one way to help accelerate the transition to ZE; for example, given the rapidly accelerating state of the truck market and working with State partners, it may also make sense to examine the current truck manufacturer requirements as they exist under ACT, as these requirements may be too low relative to public health needs and in light of accelerating technology deployments. Ensuring that manufacturers are motivated to partner with fleets and utilities to ensure that their product, ZE trucks, are being priced competitively and being used successfully is a critical underpinning of ensuing a successful accelerated transition to zero.

Federal action is also very important to support California's clean air policies. Federal adoption of cleaner NOx truck standards as well as an ACT regulation (or its CO_2 regulatory equivalent) will help California communities, but, critically, will also ensure that communities throughout the nation benefit from a robust clean truck market. National policies will help increase scale and further accelerate deployment of ZE technologies. The proposed ACF regulation is necessary to ensure California leads the nation in a shift to ZE and in meeting the State's air quality and climate targets.

I. Introduction and Background

This document summarizes staff's proposed ACF regulation to reduce emissions from light-duty delivery vehicles and Class 2b and larger medium- and heavy-duty vehicles with a manufacturer's gross vehicle weight rating (GVWR) greater than 8,500 lbs. that operate in California. The proposed ACF regulation is part of a holistic effort of achieving a ZE truck and bus California fleet by 2045 everywhere feasible and significantly earlier for certain market segments such as last mile delivery, State and local government fleets, and drayage applications. The initial focus is on drayage trucks, which have the largest impact in DACs, and on high priority fleets, with vehicles that are most suitable for early electrification. The

[19] California Public Utilities Commission, *Decision 20-06-017: Actions to Accelerate Microgrid Deployment and Other Resiliency Solutions*, June 11, 2020 (web link: https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M340/K748/340748922.PDF, last accessed August 2022).

goal of this effort is to accelerate the number of medium- and heavy-duty ZEV purchases to help achieve a full transition to ZEVs in California as soon as possible.

Mobile sources and the fossil fuels that power them are the largest contributors to the formation of ozone, GHG emissions, PM2.5, and toxic diesel PM. In California, the transportation sector alone accounts for 41 percent of total GHG emissions (50 percent when upstream emissions from fuel are included) and is a major contributor to ground level ozone and PM2.5. Statewide, about 12 million Californians live in 19 areas where levels of ozone and PM2.5 exceed the National Ambient Air Quality Standards (NAAQS) for ozone and PM2.5, (non-attainment areas). Exposure to PM2.5 and ozone is associated with increased risk of premature mortality, which has been estimated to contribute to 7,500 premature deaths each year in California.[20] The South Coast and San Joaquin Valley Air Basins have the most critical air quality challenges. These regions experience some of the nation's highest PM levels and are the only two areas in the nation with an "extreme" classification for non-attainment with the federal ozone standard. In addition, seven other areas in California are in serious or severe nonattainment with the federal ozone standard. Achieving federal air quality standards in these regions, as well as across California, provides essential public health protection by reducing hospitalizations for heart and lung related causes, decreasing ER visits, and reducing incidences of asthma.

In California, climate change is contributing to an escalation of serious problems along with worsening air quality challenges, including raging wildfires, coastal erosion, extreme weather, disruption of water supply, threats to agriculture, spread of insect-borne diseases, and continuing health threats from air pollution. Reducing GHG emissions helps put California on a trajectory to avoid the worst impacts of climate change and supports a growing clean energy economy.

In addition to regional air pollutant levels, many communities in the state experience measurable harm in the form of negative health impacts from high levels of localized pollution. There is an immediate need to reduce emissions and exposure in these highly impacted, low-income[21], and DACs throughout the state. Heavy-duty vehicle activity is often concentrated in and near these communities. This is not a coincidence. Decades of racist and classist practices, including red-lining and siting decisions, have concentrated heavy-duty vehicle and freight activities in these communities, with concomitant disproportionate pollution burdens. For instance, communities in and around ports move much of the nation's freight, and so experience pollution on a national scale in their neighborhoods. CARB has legal and moral obligations to lessen these burdens.

In light of all these needs, the proposed ACF regulation, in concert with existing State regulatory and incentive programs, seeks to accelerate the market transition to ZEVs. ZEV technologies eliminate all tailpipe emissions of criteria pollutants and greenhouse gases from the operation of vehicles, which positively affects our air quality and climate challenge. The proposed ACF regulation would help reduce emissions from fleets that pose acute health risks to local communities in which they operate and contribute towards achieving CARB's emissions reductions goals for attaining federal health-based air quality standards. The

[21] "Low-income communities" is defined in Health and Safety Code section 39713(d)(2) (added by Assembly Bill 1550 (Gomez, Stats. 2016, ch.369)).

proposed ACF regulation would result in reductions in criteria pollutants, toxic air contaminants, and GHG emissions at the statewide, regional, and local levels. This proposed ACF regulation is part of California's holistic plan to address challenging federal air quality mandates, protect the public health of all Californians, and meet climate change goals.

Medium- and heavy-duty ZEVs available today are already capable of meeting the average needs of local and regional trucking operations and a variety of vocational uses. Several data sources show the majority of trucks operating in California average less than 100 miles per day, except for semi-trucks where most average less than 200 miles per day.[22,23] Collected by CARB in 2021, recent Large Entity Reporting (LER) survey responses on daily mileage showed similar results for trucks that are owned by the responding entities. [24] Today's medium- and heavy-duty ZEVs have energy storage systems that can meet most of these daily operational requirements.

ZEVs also have unique advantages that eventually lead to shifts in fleet operational behaviors. Some of the advantages include quiet vehicle operation that improves safety on work sites, and enables later work shifts during times with less traffic and more efficient delivery schedules. Other benefits include less time spent on scheduled maintenance or out-of-service time due to the mechanical simplicity of ZEV systems. Over time, continued technology improvements, cost-reductions, and infrastructure growth would allow the ZEV market to continue expanding into all transportation service applications, including long-haul trucking.

Although medium- and heavy-duty ZEVs currently have higher upfront capital costs than vehicles powered by ICEs, they have lower fuel and maintenance costs that are expected to result in a positive TCO in most applications where they are suitable. Economic analyses by CARB and numerous third parties have found that medium- and heavy-duty ZEVs result in a

[22] United States Census Bureau, *2002 Vehicle Inventory and Use Survey*, 2002 (web link: https://www2.census.gov/library/publications/economic-census/2002/vehicle-inventory-and-use-survey/ec02tv-us.pdf, last accessed August 2022).

lower TCO when compared to purchasing new gasoline or diesel counterparts in some applications today, and in nearly all applications by 2030.[25,26,27,28,29,30,31,32]

Increasing public pressure to address our climate crisis is pushing governments and businesses to reduce California's carbon footprint through the development of sustainability plans and the adoption of carbon reducing incentive programs and regulations. As a result of such climate focused policies and other long economic drivers, the medium- and heavy-duty ZEV market has developed rapidly over the past several years in the United States.

Staff analysis shows there are more than 148 models in North America where manufacturers are accepting orders or pre-orders and more than 130 models are actively being produced and are being delivered to the customer. Currently, all major manufacturers have announced upcoming medium- and heavy-duty ZEV plans and all but one has ZEV models in development with plans to launch them commercially prior to 2024. In addition, companies like Amazon, DHL, and the U.S. Postal Service have commissioned or self-manufactured purpose-built ZEVs in quantity for their own delivery business use.[33,34,35,36] Finally, several companies including major truck parts suppliers have a variety of EV components and drivetrain solutions for vehicle manufacturers to use in their vehicles. Appendix J provides a

partial list of medium-and heavy-duty ZEVs that are currently available or that can be ordered.

California is not alone in adopting regulations that will accelerate the ZE market. Five other states have already completed adoption of the ACT regulation (Massachusetts, New Jersey, New York, Oregon, and Washington) and two more states (Colorado and Maine) are currently in the public process required to adopt. New York has signed legislation, including the same ZE deadlines as California Executive Order N-79-20 for heavy-duty, light-duty, and off-road vehicles. The multi-state Medium- and Heavy-Duty ZEV Memorandum of Understanding continues to grow with Quebec and Virginia joining in 2021 to now include 17 states, one province and the District of Columbia.[37] Additionally, five other states (Illinois, Indiana, Michigan, Minnesota, and Wisconsin) have created a Regional Electric Vehicle Midwest Coalition Memorandum of Understanding (MOU) to accelerate medium- and heavy-duty ZE technology deployment via collaboration on infrastructure, manufacturing, and equity actions.[38] In addition, a Memorandum of Cooperation signed in June 2022 lays the foundation for potential collaboration on medium- and heavy-duty ZE policy and regulation between California and Canada.[39] This builds on Canada's commitment to decarbonize the transportation sector that has already seen actions including the path to 100 percent sales of light duty trucks by 2035 and over a half a billion dollars in MHD ZEV incentive funding.[40] Figure 3 shows regions with commitments to MHD ZEV deployment. California is also collaborating with the 16 countries and numerous regional, city and private entities of the Global Commercial Vehicle Drive To Zero's 100 percent in 2040 goals, currently chairing the Transportation Decarbonisation Alliance of countries, regions, cities and companies, and promoting the goals of the Zero Emission Vehicle Transition Council with membership spanning from Mexico to Canada and Europe to Asia. [41,42,43] As more jurisdictions pass ACT regulations and supporting policies, the ZE supply chains will grow, prices will continue to drop (benefitting consumers and fleets), new economic opportunities for electric vehicle supply equipment (EVSE) providers will continue to expand, and growing numbers of communities will benefit from air quality improvements.

According to CALSTART's Zero-Emission Technology Inventory analytics, it is estimated that there will be more than 590 ZE truck and bus models available internationally by the end of 2022.[44] This shows that the ZEV market is expanding rapidly internationally, and these same drivetrains or configurations could be brought to California and United States market. For a market growth example beyond just models available, the monthly 2021 sales in China for "New Energy" heavy trucks (battery, battery swap and fuel cell) rose smoothly from a couple hundred per month initially to over three thousand a month by year's end totaling over 10,000 and poised to follow the rapid bus electrification trajectory already seen there.[45] ACEA and the major truck manufacturers supplying the European market (many of which are also suppliers to North America) have committed to all truck sales being fossil-free by 2040, underscoring the widespread and long term commitment to bringing ZEVs to market.[46]

.

A. Overview of Proposed ACF regulation

The proposed ACF regulation is part of CARB's portfolio of regulations already working to decarbonize the transportation sector. For the medium- and heavy-duty market, ZE focused regulations began with the Innovative Clean Transit (ICT) regulation adopted by CARB in 2018, which will transition the State's transit fleet to ZE by about 2040.[47] The Zero-Emission Airport Shuttle Bus (ASB) regulation and the Zero-Emission Powertrain Certification regulations were approved in 2019. [48,49] In January 2021, the ACT regulation was adopted by CARB and became effective under state law on March 15, 2021. It is a key part of the holistic approach to accelerate a large-scale ZEV transition of medium- and heavy-duty trucks. The ACT regulation requires manufacturers who certify Class 2b–8 chassis or complete vehicles with combustion engines to sell medium- and heavy-duty ZEVs as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, ZEV sales would need to be 55 percent of Class 2b–3 truck sales, 75 percent of Class 4–8 straight truck sales, and 40 percent of truck tractor sales.

The proposed ACF regulation would continue CARB's efforts to decarbonize the transportation sector by requiring State and local government fleets, drayage trucks, high priority fleets, and federal fleets to phase in medium- and heavy-duty ZEVs over time. As a backstop, the proposed ACF regulation sets a clear end date for new combustion-powered Class 2b-8 vehicle sales in California. The following is a summary of the proposed ACF regulation:

- State and local government fleets: Phased-in requirement for newly added medium- and heavy-duty vehicles to be ZEVs starting with 50 percent in 2024 and 100 percent in 2027. Municipalities in designated low-population counties would be excluded until 2027.
- Drayage trucks: ZEV registration requirements for newly added drayage trucks starting in 2024, while allowing useful life for legacy trucks. All trucks conducting drayage operations must be ZEVs by 2035.
- High priority and federal fleets: Fleets may only add ZEVs to their California fleets and must remove vehicles at the end of a minimum useful life. Optionally, fleets may choose a phased-in schedule with increasing ZEV targets as a percentage of the total vehicle fleet. High priority fleets include entities with more than $50 million in annual revenues, or those fleets that own, operate, or direct at least 50 medium- and heavy-duty trucks and buses under common ownership and control.
    - Affected vehicles include on-road medium- and heavy-duty vehicles, light-duty package delivery vehicles with GVWR equal to or less than 8,500 lbs., and off-road yard tractors that operate in California.
- Vehicle sales: 100 percent of all new Class 2b-8 vehicles vehicle sales into California must be ZE starting in 2040.

[47] The ICT regulation is comprised of Cal. Code Regs., tit. 13, sections 2023 to 2023.11.
[48] The ASB regulation is comprised of Cal. Code Regs., tit. 17, sections 95690.1 to 95690.8.
[49] The Zero-Emission Powertrain regulation is comprised of Cal. Code Regs., tit. 13, section 1956.8. and tit. 17 section 95663.

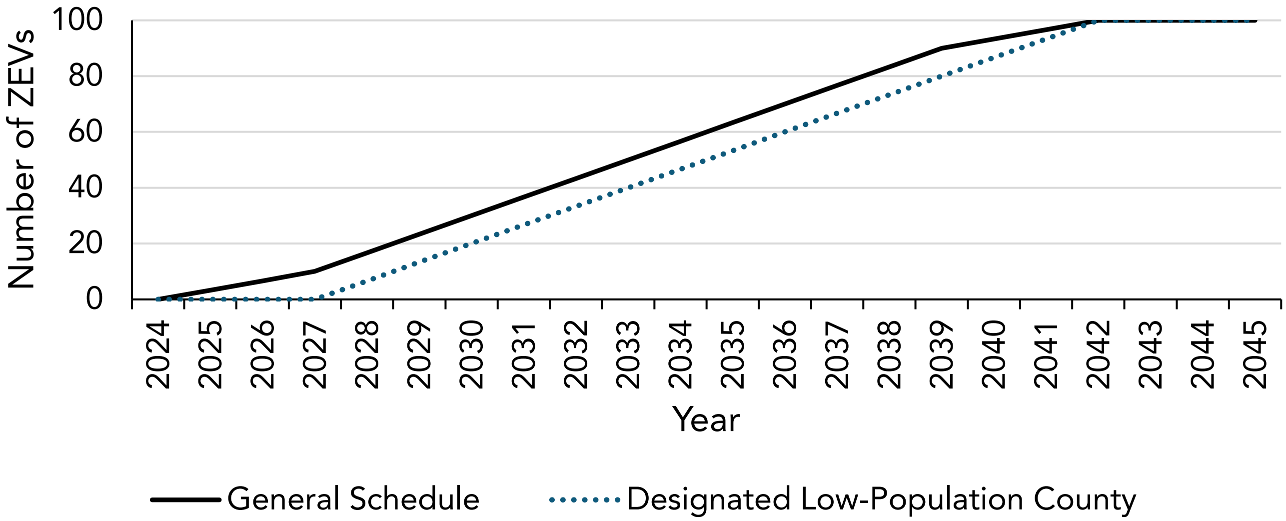
The proposed ACF regulation excludes certain vehicles with two-engines, military tactical vehicles, historical vehicles, heavy cranes, emergency vehicles, and dedicated snow removal vehicles. The proposed ACF regulation also does not apply to transit buses subject to the ICT regulation nor school buses. Staff has listened to stakeholder concerns and has designed several provisions for fleet owners who are complying with the regulation. The provisions have been designed for edge use cases that can serve as guardrails for fleets and are described in more detail in the following sections.

1. State and Local Government Fleet Requirements

State and local government agency fleet requirements were designed with the special needs and circumstances of these agencies in mind. The proposed requirements would apply to cities, counties, public utilities, special districts, local agencies and districts, and the State fleet, but excludes federal agencies. A ZEV purchase requirement at normal time of vehicle replacement was chosen as the appropriate framework to allow enough flexibility for budget fluctuations and cycles. State and local government agencies would not be required to retire trucks nor required to purchase additional vehicles to comply. However, when purchases are made, they would need to be ZEVs or NZEVs capable of ZE operation if a ZE version of a needed vehicle is not commercially available.

The proposed ACF regulation would require 50 percent of new vehicle additions to the fleet to be ZEV starting January 1, 2024, and 100 percent starting on January 1, 2027. Additional time would be provided to fleets based in designated low-population counties by exempting them from ZEV purchase requirements until 2027. Designated low-population counties include the counties of Alpine, Amador, Butte, Calaveras, Colusa, Del Norte, Glenn, Humboldt, Inyo, Lake, Lassen, Mariposa, Mendocino, Modoc, Mono, Nevada, Plumas, Shasta, Sierra, Siskiyou, Sutter, Tehama, Trinity, Tuolumne, and Yuba. Many of these areas have fewer air quality challenges than other parts of the state and the fleets based in these areas tend to have fewer vehicles, operate in remote areas that are expected to take longer for ZEV infrastructure and support networks to be developed, and tend to have more limited budgets. Figure 4 illustrates a compliance example showing the number of ZEVs in the fleet for two government fleets with 100 trucks each. One fleet meets the general requirements and would start adding ZEVs as 50 percent of their planned purchases starting in 2024. The other fleet represents one that is in a designated low population county and begins adding ZEVs in 2027. Both examples assume a business-as-usual 15-year replacement cycle. In this example, these fleets exceed 50 percent ZEVs in 2033 and 2035, respectively and complete the transition to all ZEVs in 2042.

Figure 4: 100 Truck Fleet Examples for State and Local Government Requirements



Annual reporting and recordkeeping would be required starting April 1, 2024. The proposed ACF regulation also includes exemptions and extensions to address certain situations as summarized below.

- Backup Vehicle Exemption. Allow fleet owners to purchase a new ICE vehicle and exclude it from the ZEV addition requirement if it operates less than 1,000 miles per year. Mileage accrued while operating in support of a declared emergency event would be excluded.
- Daily Usage Exemption. Fleet owners may receive a one-year exemption to purchase a new ICE vehicle if a comparable ZEV is available but cannot be placed anywhere in the California fleet while meeting the daily usage needs of any existing ICE vehicle.
- Infrastructure Construction Delay Extension. Excuses the fleet owner from taking immediate delivery of ordered ZEVs for one year due to a construction delay beyond the fleet owner's control.
- ZEV Unavailability Exemption. Allows fleet owners to purchase a new ICE vehicle if no ZEV nor NZEV of the needed configuration is commercially available. A list of vehicles that are not available as ZEVs or NZEVs will be kept on the CARB website.
- Mutual Aid Assistance. Allows a fleet owner to apply for an exemption to purchase ICE vehicles for up to 25 percent of the fleet if the vehicles are needed to provide emergency response services to fulfill the terms of a signed mutual aid agreement.

The exact regulatory language, and purpose and rationale for these provisions as they apply to State and local government fleets are provided in Appendix A-1 and Appendix H-1 of the Staff Report, respectively.

2. Drayage Truck Requirements

The proposed drayage truck requirements would apply to Class 7-8 drayage trucks operating at intermodal seaports and railyards. These drayage trucks would be required to transition to ZEVs by 2035. The proposed requirements include a phased-in approach for drayage trucks. All drayage trucks would be required to register in CARB's Online System, starting in late

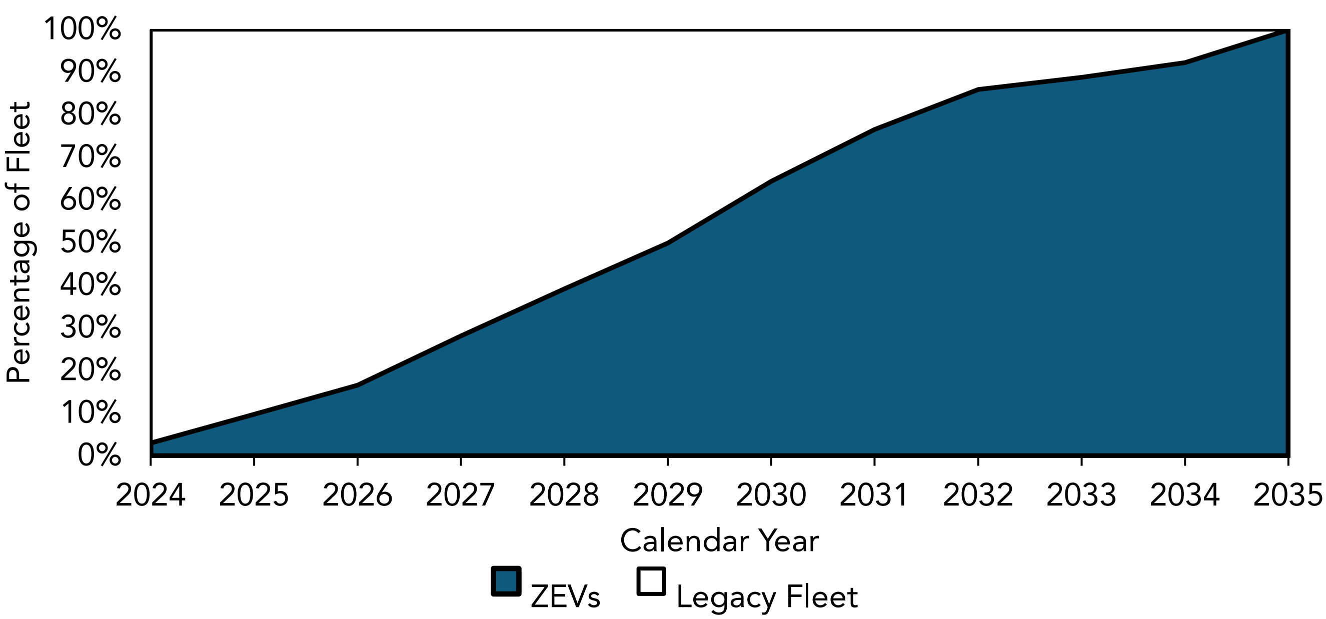
2023. Existing drayage trucks with ICEs, could remain in drayage service for a minimum period, defined as the later of the following two conditions:

- Thirteen (13) years from the MY that the engine and emissions control systems are first certified by CARB or the U.S. Environmental Protection Agency (U.S. EPA); or
- When the vehicle reaches 800,000 vehicle miles traveled (VMT) or 18 years from the MY that the engine and emissions control systems are first certified by CARB or the U.S. EPA, whichever is earlier.

Drayage trucks 12 years and older would be required to report their mileage annually. Beginning in 2024, any truck added to CARB's Online System must be a ZEV. All drayage trucks entering seaports and intermodal railyards must be ZEVs by 2035. To address infrastructure construction delays and vehicle delivery delays that are beyond the control of regulated entities, limited one-year compliance extensions provisions would be included. All drayage trucks must also visit a regulated seaport or intermodal railyard at least once each calendar year to remain in CARB's Online System. All regulated intermodal seaports and railyards would be required to report drayage truck visits annually. This approach builds on the structure of the existing drayage truck regulation and meets the goal of a complete transition of California's drayage fleet to ZE by 2035.

Figure 5 shows the projected portion of vehicles in the drayage fleet which will be zero-emission over time. ZEVs enter the drayage fleet beginning in 2024, reach 50 percent of the fleet in 2029, and reach 100 percent in 2035.

Figure 5: Drayage Fleet Over Time



Annual reporting and recordkeeping would be required before December 31, 2023. The proposed ACF regulation also includes exemptions and extensions to address certain situations as summarized below.

- Dedicated Use Vehicle Exemption. These include dedicated use or uni-body vehicles that do not have separate tractor and trailers or are vehicles using a power take off (PTO) with a hydraulic motor or blower, attached to the trailer that needs the PTO to load or unload. These vehicle types include but are not limited to (e.g., auto transport, fuel delivery vehicles, concrete mixers, on-road mobile cranes).
- Infrastructure Construction Delay Extension. Drayage truck owners may receive a one-year extension from the requirements and delay delivery of the ordered zero-emission vehicle(s) that would be reliant on the fueling infrastructure for one year.
- ZEV Vehicle Delivery Delay Extension. Drayage truck owners may exclude an existing legacy drayage truck from the requirements if the zero-emission vehicle is ordered one year in advance of the compliance date for the legacy drayage truck being replaced and the newly purchased zero-emission vehicle will not be delivered by the compliance deadline for reasons beyond the drayage truck owner's control.

The exact regulatory language, and purpose and rationale for these provisions as they apply to drayage fleets are provided in Appendix A-3 and Appendix H-3 of the Staff Report, respectively.

3. High Priority and Federal Fleet Requirements

High priority and federal fleets would be required to either add only ZEVs to their California fleets while retiring ICE vehicles at the end of minimum use life, or may opt to phase-in ZEVs as a percentage of the total fleet that operates in California. Affected California fleets would include all truck owners or controlling parties with an annual revenue greater than $50 million that operate at least 1 medium- or heavy-duty truck in California, or those who own, operate, or direct 50 or more medium- or heavy-duty trucks under common ownership and control and at least 1 of those trucks operates in California. The affected vehicles include all medium- and heavy-duty vehicles as well as any light-duty package delivery vehicles, as defined in the regulation. Controlling parties include the motor carrier, broker, or entity that directs or otherwise manages the day-to-day operation of multiple fleets under common ownership or control to serve the customers or clients of the controlling party. Controlling parties must include all vehicles in their fleet that are operated under common ownership or control in addition to their own vehicles that operate in California when determining compliance. In addition, all entities that hire and direct or hire and operate vehicles subject to portions of the proposed ACF regulation must verify that the fleets they hire comply with the regulations by looking them up on the CARB website to maintain consistency with other existing fleet rules which have similar requirements.

a) Model Year Schedule

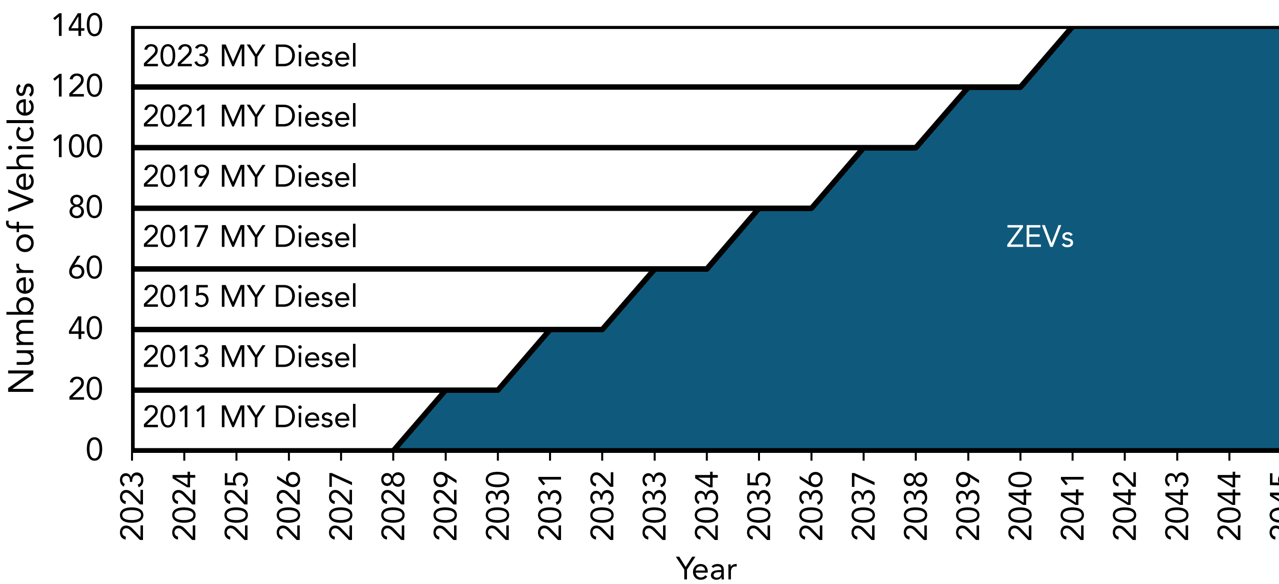
The proposed Model Year Schedule requires affected entities to add only ZEVs to their California fleets beginning in the 2024 calendar year and requires existing ICE vehicles to be removed from the California fleet at the end of their minimum useful life. Minimum useful life is defined as the latter date of two conditions:

- Thirteen (13) years commencing from the year the original engine and emissions control system in a vehicle was first certified for use by CARB or U.S. EPA; or

- The date that the vehicle exceeded 800,000 VMT or 18 years from the year the original engine and emissions control system of that vehicle was first certified for use by CARB or U.S. EPA, whichever is earlier.

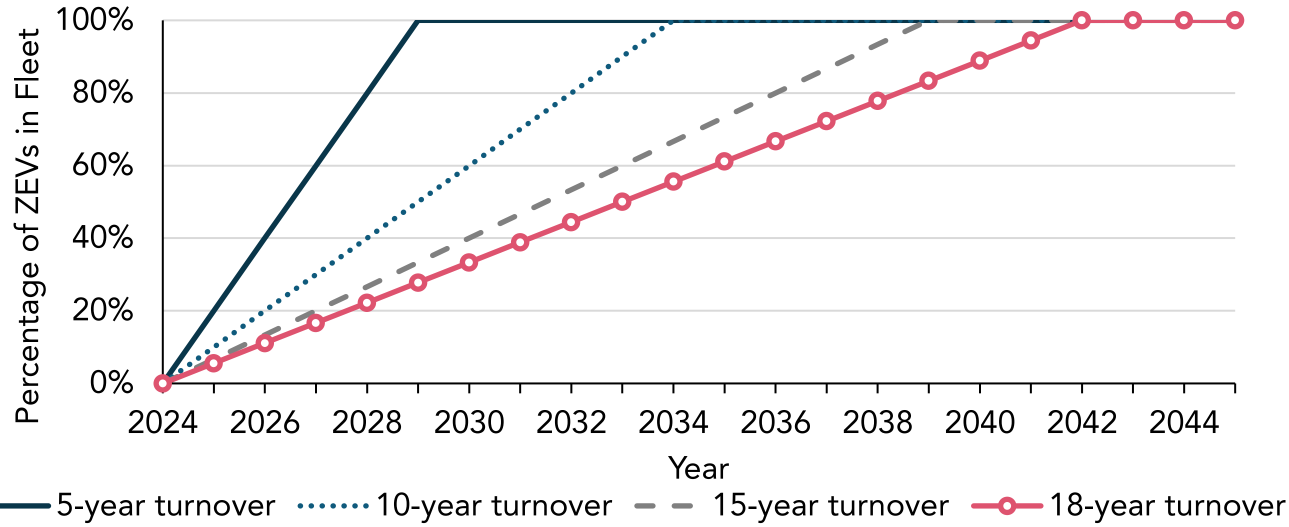
Vehicles that are 12 years and older would be required to report their mileage annually to determine when the vehicle is beyond its useful life. With this schedule, compliance is simply determined by the age and mileage of the existing ICE vehicles in the fleet. Figure 6 illustrates an example of a 140 vehicle fleet following the Model Year Schedule who purchases 20 new diesel vehicles every 2 years and keeps them for a full useful life of 18 years. The fleet would need to begin replacing their diesel-powered vehicles in 2029 when the first two vehicles become 18 years old and would make a full transition to ZEVs in 2041.

Figure 6: Model Year Schedule Fleet Example



However, fleet owners that replace their vehicles in shorter period would be required to add more ZEVs to their fleet at a faster rate with this schedule. Figure 7 illustrates how a fleet's replacement rate will affect how quickly they transition to ZEVs under the Model Year Schedule with their normal vehicle replacement cycle. The solid line shows that a fleet with a 5-year turnover cycle would need to be all ZEVs by 2029, a fleet with a 10-year turnover cycle would be all ZEVs by 2034, a fleet with a 15-year turnover cycle would be all ZEV by 2039, and a fleet with an 18-year turnover cycle would be all ZEVs by 2042.

Figure 7: Model Year Schedule Fleet Example Illustrating Impact of Turnover Rate



The proposed ACF regulation also includes exemptions and extensions for the Model Year Schedule to address certain situations as summarized below.

- Backup Vehicle Exemption. Allows a fleet owner to keep an existing ICE vehicle beyond its useful life if the vehicle is operated less than 1,000 miles per year. Mileage accrued while operating in support of a declared emergency event may be excluded.
- Daily Usage Exemption. A fleet owner may receive a one-year exemption to purchase a new ICE vehicle of a given configuration if a comparable ZEV is available but cannot be placed anywhere in the California fleet while meeting the daily usage needs of any existing ICE vehicle in the fleet.
- Infrastructure Construction Delay Extension. Allows a fleet owner to continue operating an existing vehicle up to one year beyond the end of its useful life and to delay delivery of the ordered ZEVs that would be reliant on the charging or hydrogen fueling infrastructure for one year due to construction delays beyond the control of the fleet owner.
- Vehicle Delivery Delay Extension. A fleet owner may continue operating an ICE vehicle beyond its useful life if a new ZEV is ordered to replace it one year in advance of its compliance date and the newly purchased ZEV is not be delivered by the compliance deadline for reasons beyond the fleet owner's control.
- ZEV Unavailability Exemption. Allows fleet owners to purchase a new ICE vehicle if no ZEV nor NZEV of the needed configuration is commercially available. A list of vehicles that are not available as ZEVs or NZEVs will be kept on the CARB website.
- Mutual Aid Assistance. Allows a fleet owner to apply for an exemption to purchase ICE vehicles for up to 25 percent of the fleet if the vehicles are needed to provide emergency response services to fulfill the terms of a signed mutual aid agreement.
- Declared Emergency Event Exemption. Allows any vehicle to be used to support an emergency event declared by the governor or other public official.

Beginning in 2024, affected fleets would need to report and keep records for eight years on certain information about the vehicles they operate or control in California. Reported vehicle information includes details necessary to enforce and track compliance with the proposed ACF regulation. The exact regulatory language, and purpose and rationale for these provisions as they apply to high priority and federal fleets are provided in Appendix A-2 and Appendix H-2 of the Staff Report, respectively.

b) ZEV Milestones Option

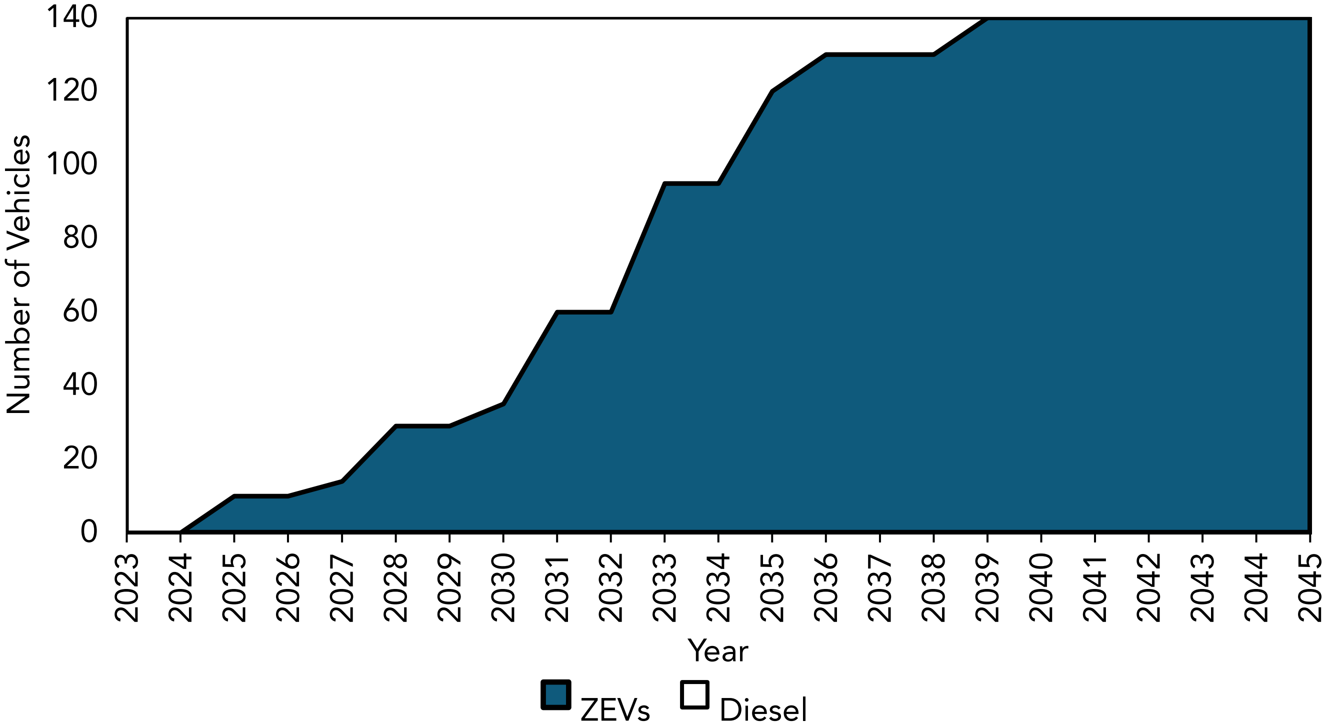
Under the optional ZEV Milestones Schedule, high priority and federal fleets must phase-in ZEVs as a percentage of their total California fleet starting at 10 percent and increasing to 100 percent based on vehicle body type as shown in Table 6. Vehicles in Group 1 are commonly used for local and regional delivery or passenger transportation and are already suitable for electrification. With this proposed schedule, all covered delivery vans and box trucks that operate in urban areas and frequent warehouses and distribution centers would be ZEVs by 2035, except for the expected small percentage of vehicles using exemptions. Vehicles in Group 2 and Group 3 are given more time because they are expected to have higher daily mileage needs, have more varied use cases and fewer of these ZEV models are available today.

Table 6: High Priority and Federal Fleet Zero-Emission Vehicle Phase-In Schedule

Group	Percentage of Fleet that Must be ZEV	10%	25%	50%	75%	100%
1	Box trucks, vans, two-axle buses, yard trucks, light-duty delivery vehicles	2025	2028	2031	2033	2035
2	Work trucks, day cab tractors, three-axle buses	2027	2030	2033	2036	2039
3	Sleeper cab tractors and specialty vehicles	2030	2033	2036	2039	2042

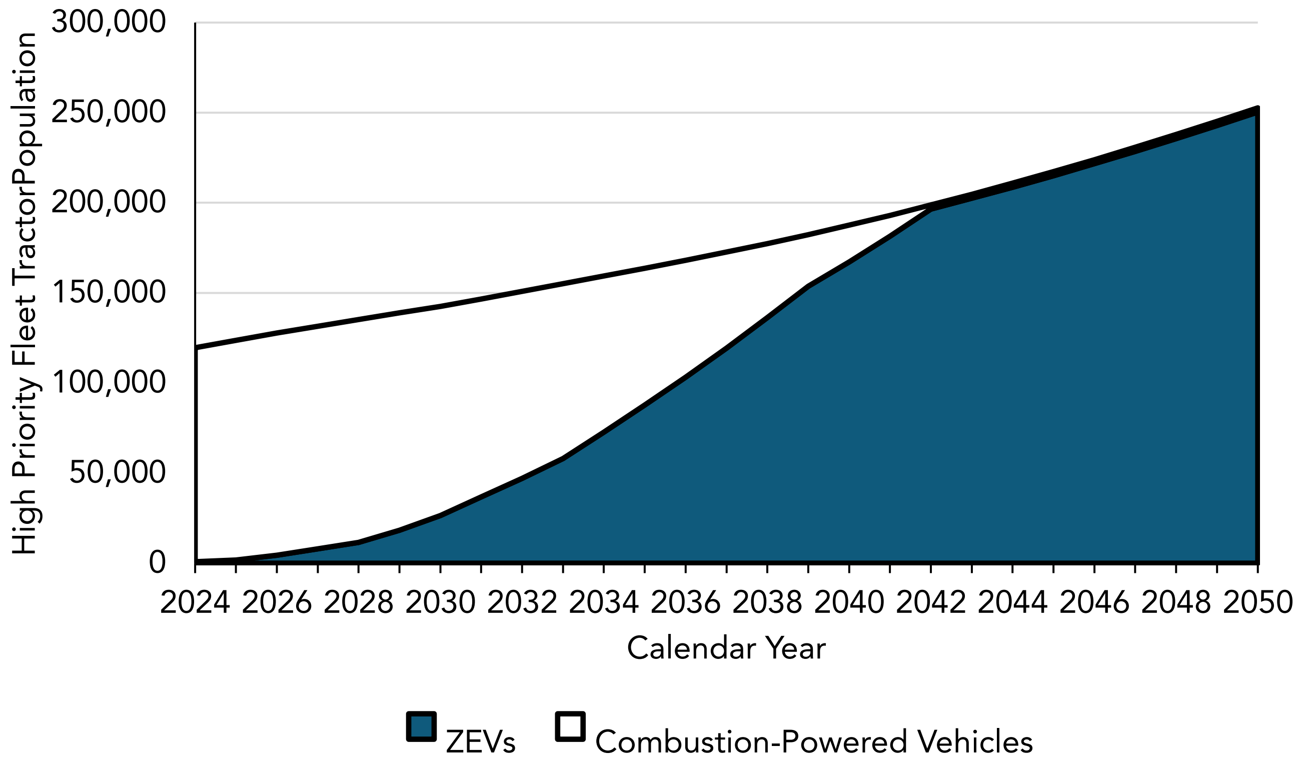
Fleet owners would have the flexibility to meet the ZEV milestones with any medium- or heavy-duty ZEVs in their fleet regardless of body type. For example, a mixed fleet with 100 box trucks and 40-day cab tractors would need 10 ZEVs to comply in 2025. The number of ZEVs required to meet the 2025 target is calculated as 10 percent of the 100 box trucks in this example. The tractors are not counted in 2025 because there is no ZEV target for day cab tractors in that year. However, fleet owners would have the flexibility to meet the 10 ZEV requirement with any combination of medium- and heavy-duty vehicles in the fleet. This means the fleet owner could meet the 2025 requirement with 10 ZEV tractors, 10 box trucks, or any combination that totals 10 ZEVs. Figure 8 illustrates the number of ZEVs this example fleet must have within their fleet to meet the ZEV Milestones Option.

Figure 8: ZEV Milestones Option Fleet Example with 100 Group 1 Vehicles and 40 Group 2 Vehicles



On these timelines, the majority of tractors that go to warehouses and transport products throughout the state would be ZEVs by 2035 and completely transition by 2042 as shown in Figure 9. This would result in direct health benefits to communities most impacted by warehouses, distribution centers, and high traffic corridors.

Figure 9: Tractor Population Over Time for High Priority and Federal Fleets



The proposed ACF regulation also includes exemptions and extensions for the ZEV Milestones Option to address certain situations as summarized below.

- Backup Vehicle Exemption. Allows fleet owners to exclude a vehicle from the ZEV milestone calculation if it operates less than 1,000 miles per year excluding any mileage accrued while operating in support of a declared emergency event.
- Daily Usage Exemption. Fleet owners may receive a one-year exemption to purchase a new ICE vehicle and exclude it from the ZEV milestone calculation if a new ZEV is available but cannot be placed anywhere in the California fleet while meeting the daily usage needs of any existing vehicle in the fleet.
- Infrastructure Construction Delay Extension. This extension applies to construction delays for ZE infrastructure that are beyond the fleet owners' control that were started at least one year ahead of the next ZEV compliance deadline. It allows the fleet owner to delay delivery of ordered ZEVs and count the existing ICE vehicle to be replaced as a ZEV when determining compliance with the ZEV milestone calculation until the ZEV is delivered.
- Vehicle Delivery Delay Extension. Fleet owners may count a vehicle to be replaced as a ZEV when determining compliance with the ZEV milestone calculation if a new ZEV is ordered one year in advance of the compliance date for the ICE vehicle being replaced and the newly purchased ZEV is not delivered by the compliance deadline for reasons beyond the fleet owner's control.
- ZEV Unavailability Exemption. Allows a fleet owner to purchase a new ICE vehicle and exclude it from the ZEV milestone calculation if all the remaining ICE vehicles in the fleet (that are not already using an exemption or extension) cannot be replaced with a ZEV or NZEV of the needed configuration because they are not available to purchase.

Additionally, if the remaining ICE vehicles in the fleet cannot be replaced with a ZEV or NZEV of the needed configuration because they are not available to purchase, those ICE vehicles may be excluded from the ZEV milestone calculation.

- Exemptions Pursuant to Declared Emergency Events. Fleet owners may purchase a new ICE vehicle and exclude it from the ZEV milestone calculation for up to 25 percent of the fleet if the vehicles are needed to provide emergency response services.
- Rental Vehicle Provision. Provides interstate rental fleet owners the options to report the average number of rental vehicles that are operated in California in lieu of counting all rental vehicles that operate in California when using the ZEV Milestones Option.

Beginning in 2024, affected fleets would need to report and keep records on certain information about the vehicles they operate or control in California. Reported vehicle information includes details necessary to enforce and track compliance with the proposed ACF regulation. The exact regulatory language, and purpose and rationale for these provisions as they apply to high priority and federal fleets are provided in Appendix A-2 and Appendix H-2 of the Staff Report, respectively. Annual reporting and recordkeeping would be required starting January 1, 2024.

c) Selecting the Appropriate Compliance Method

Both compliance options offer potential benefits for a given fleet situation. The Model Year Schedule ensures fleets can use their vehicles for their full useful life, is simple to understand, but it treats all existing vehicles the same based on age and mileage. This compliance method may present challenges for fleets, with high turnover rates (such as long-haul fleets), fleets with most vehicles already beyond their useful life, and would limit the ability of controlling parties to manage their fleet. With the Model Year Schedule, a control party cannot add or switch to another subhauler as part of their California fleet starting 2024 unless all of the vehicles in the newly added subhauler's fleet are ZEVs. The Model Year Schedule allows for a gradual transition to ZEV based on a percentage of the total California fleet regardless of vehicle age and mileage. The schedule more closely aligns projected ZEV feasibility and infrastructure buildout with the compliance requirements. The ZEV Milestones Option provides more flexibility for controlling parties to add and remove vehicles from the California fleet provided the fleet average continues to be met.

Figure 10 and Figure 11 illustrate two examples comparing the Model Year Schedule and optional ZEV Milestones Option. For a fleet with only Group 1 vehicles, they are able to keep their existing vehicles longer by using Model Year Schedule if they intend to keep all of their vehicles for the full useful life. For a mixed fleet with Group 1, Group 2, and Group 3 vehicles, the ZEV Milestones Option generally allows the fleet more time to transition to ZEVs while maintaining their normal vehicle purchase cycles because Group 2 and Group 3 vehicles have a delayed transition period.

Figure 10: Comparison Between Model Year Schedule and ZEV Milestones Option for a Fleet with 100 Group 1 Vehicles

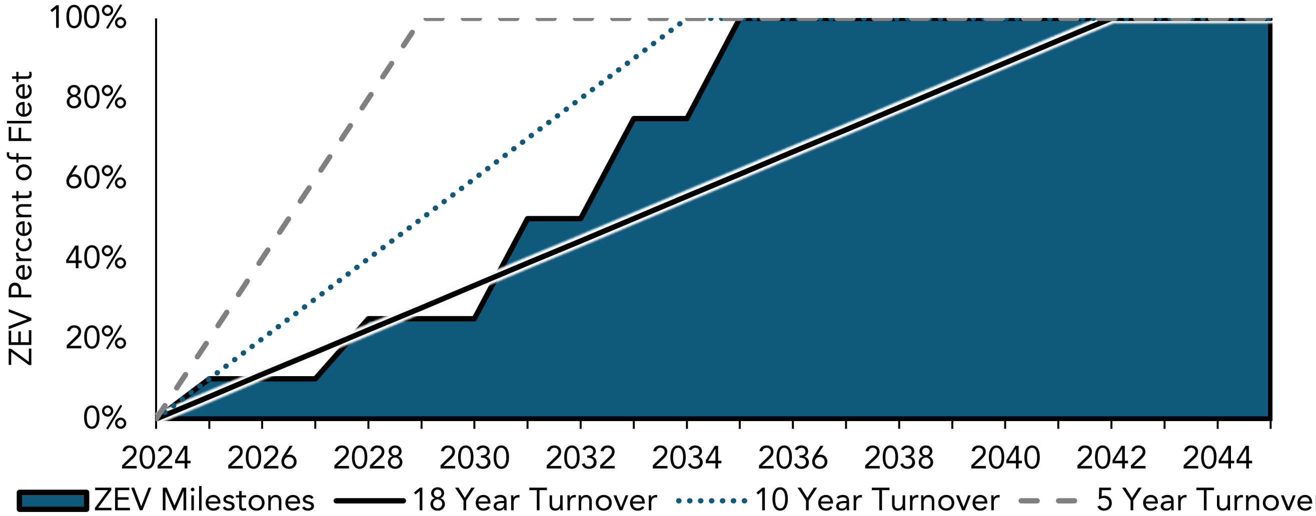


Figure 11: Comparison Between Model Year Schedule and ZEV Milestones Option for a Fleet with 60 Group 1, 20 Group 2, and 20 Group 3 Vehicles

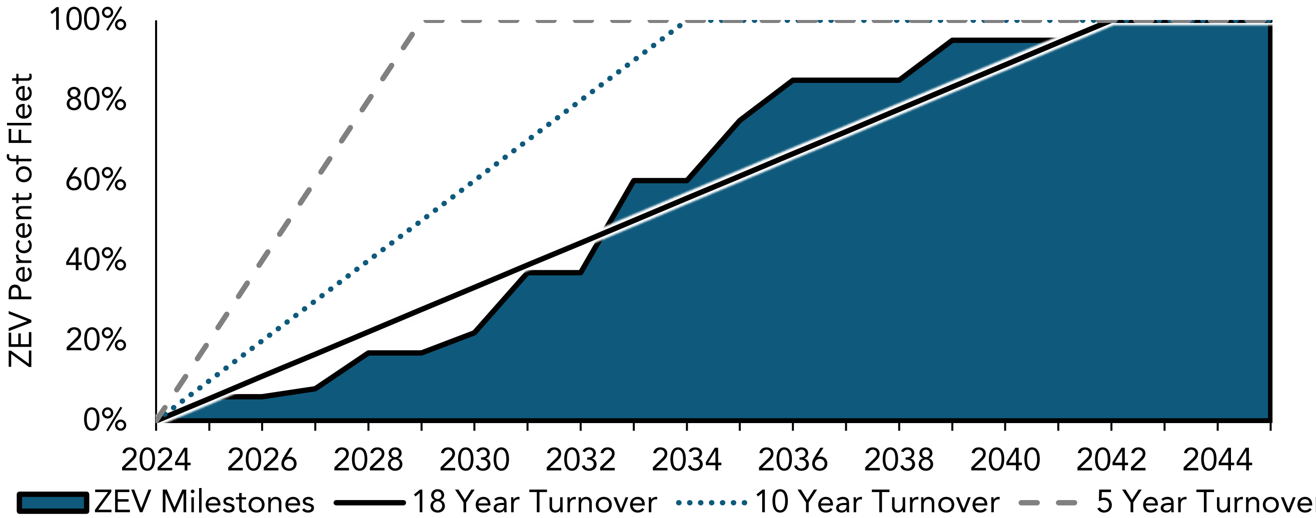

d) Light-Duty Package Delivery Vehicles

The population of package delivery vehicles is expected to grow rapidly with expanding e-commerce deliveries. The inclusion of light-duty delivery vehicles in the high priority and federal fleets requirements is necessary to ensure emissions reductions in this last mile delivery operations. In general, package and mail delivery fleets are well-suited for electrification because they primarily return to base daily, they operate on fixed or predictable routes in cities and neighborhoods, and have frequent stops. Several major delivery companies have begun the process of incorporating ZE light-duty package delivery vehicles into their fleets with 100,000 ordered by Amazon, 10,000 ordered by UPS, 4,500 ordered by Walmart, 500 ordered by FedEx, and over 10,000 ordered by the U.S Postal

Service for placement throughout the United States.[50,51,52,53,54] These strides towards electrification demonstrate clear operational and technological feasibility for integration into fleet applications. The proposed ACF regulation includes flexibility for fleets to make an orderly transition to ZEVs by selecting the compliance method and includes provisions to ensure feasibility of deploying ZEVs where they are suited.

4. 100 Percent Manufacturer Sales Requirement

Finally, the proposed ACF regulation would include a new requirement on all vehicle manufacturers that 100 percent of all new Class 2b-8 vehicle sales in California must be ZEV starting in 2040. The requirement would not apply to emergency vehicles. The exact regulatory language, and purpose and rationale for these requirements are provided in Appendix A-4 and Appendix H-4 of the Staff Report, respectively.

B. Crossover with Other Requirements

CARB is responsible for protecting the public from the harmful effects of air pollution and developing programs and actions to fight climate change. Meeting these public health goals has resulted in a suite of regulations to control the harmful emissions of various air pollutants emitted from the operation of medium- and heavy-duty ICE vehicles. The following is a summary of existing regulations and key requirements that apply to fleets that would be affected by the proposed ACF regulation including existing laws.

1. Public Agencies and Utilities Regulation

In 2005, the rule for On-Road Heavy-Duty Diesel-Fueled Public and Utility Fleets was approved by CARB to reduce diesel PM emissions from fleet vehicles operated by public agencies and utilities.[55] The rule required affected owners to equip their heavy-duty vehicles with Best Available Control Technology (BACT) by December 31, 2012, with later

requirements for designated low-population counties. Many of the same parties would be included in the proposed ACF regulation.

2. Drayage Truck Regulation

In 2007, the Drayage Truck regulation was adopted as part of CARB's efforts to reduce PM and NOx emissions from diesel-fueled engines, improve air quality associated with freight movement, and reduce near-source health risk from facilities where drayage trucks congregate.[56] Drayage trucks are on-road, heavy-duty trucks that transport containerized bulk or break-bulk goods, empty containers, and chassis to and from seaports and intermodal railyards. The Drayage Truck regulation will sunset at the end of 2022. At that time, the drayage fleet will be incorporated into the Truck and Bus regulation and must meet or exceed 2010 or newer engine emissions standards like all other diesel trucks. Drayage trucks would be included in the proposed ACF regulation.

3. Truck and Bus Regulation

In 2008, the Truck and Bus regulation was adopted by CARB as the final prong of the Diesel Risk Reduction Plan to reduce emissions of PM and NOx from heavy-duty trucks and buses over 14,000 lbs. GVWR.[57] The Truck and Bus regulation affects all vehicles travelling in California that are owned or operated by businesses, individuals, or federal entities. It requires retrofit, replacement, or repowering of older diesel vehicles, eventually ensuring that all affected vehicles meet or exceed 2010 or newer MY engine emissions by January 1, 2023. Federal fleets and a subset of fleets affected by the Truck and Bus regulation would be included in the proposed ACF regulation. Staff estimate that 36,900 California registered trucks and up to 192,000 trucks registered in other states will need to be upgraded to 2010 or newer MY engines by the end of 2023.[58]

4. Innovative Clean Transit Regulation

In December 2018, the ICT regulation was adopted by CARB which was the first medium- and heavy-duty ZEV fleet rule of its kind and it replaced the existing fleet rule for transit agencies. The ICT regulation requires all public transit agencies to gradually transition to a 100 percent zero-emission bus (ZEB) fleet where most will be ZE by 2040. The ICT regulation includes various exemptions and compliance options to provide safeguards and flexibility for transit agencies through the transition. The proposed ACF regulation would include some of the same public agencies that are subject to the ICT regulation if they also operate vehicles that are not transit buses such as a city that provides road maintenance or waste hauling services. The proposed ACF regulation builds upon the structure of the ICT purchase requirements for State and local government fleets.

5. Zero-Emission Airport Shuttle Bus Regulation

In June 2019, the ASB regulation was adopted by CARB. It promotes the development and use of ZE technologies in medium- and heavy-duty airport shuttles that operate on fixed routes at 13 California airports.[59] The ASB regulation requires airport shuttle operators to transition their vehicles to ZEVs beginning in 2027, with a complete transition by the end of 2035. The ASB regulation provides compliance extensions and other flexibilities to ensure service continuity as operators transition to ZE shuttles. The proposed ACF regulation could include some fleet operators that are also subject to the ASB regulation.

6. California and Federal Phase 2 Greenhouse Gas Regulation

CARB staff worked jointly with U.S. EPA and National Highway Traffic Safety Administration staff on the next phase of federal GHG emissions standards and fuel efficiency standards, respectively, for medium- and heavy-duty engines and vehicles. The federal Phase 2 GHG emissions standards build on the Phase 1 GHG emissions standards and represent significant further GHG reductions for 2018 (2021 in California) and later MY heavy-duty vehicles.[60] The Phase 2 GHG emissions standards are structured to provide a range of options to manufacturers to reduce emissions for medium- and heavy-duty vehicles using a wide range of technologies, including aerodynamics, more efficient engines, and others. Additionally, the Phase 2 GHG emissions standards provide an opportunity to average, bank, and trade credits, as well as recognize advanced technologies that would apply to plug-in hybrid electric vehicles (PHEV), all-electric vehicles, and FCEVs. In 2018, CARB adopted the California Phase 2 program, which generally aligns with the federal Phase 2 GHG standards with minor changes.[61] The existing California Phase 2 GHG regulation provides an incentive to build lower emitting GHG vehicles, but these regulations have no specific requirement for medium- and heavy-duty manufacturers to build ZEVs. There are some synergies in costs and emissions benefits between California Phase 2 GHG and the proposed ACF regulation, because ZEVs could be used to comply with both regulations. The California Phase 2 GHG regulation also includes a temporary credit multiplier for ZEVs through 2027.

7. Advanced Clean Trucks Regulation

In January 2021, the ACT regulation was adopted as part of a holistic approach to accelerate a large-scale ZEV transition of medium- and heavy-duty vehicles.[62] Like the proposed ACF regulation, the goal of the ACT regulation is to achieve NOx and GHG emissions reductions through advanced clean technology, and to increase the penetration of the first wave of ZE heavy-duty technology into applications that are well suited to its use. The ACT regulation has two components consisting of a manufacturer sales requirement and a one-time large entity reporting (LER) requirement for fleet owners.
